(1) Mont Saint-Hilaire, Canada; by electron microprobe, CO_2 and H_2O analyzed by TGA, $(HCO_3)^{1-}$ and H_2O confirmed by IR; corresponds to $(Na_{0.80}Ce_{0.18}Ca_{0.02})_{\Sigma=1.00}(Y_{0.48}Ce_{0.21}La_{0.20}Nd_{0.12}Pr_{0.04}Dy_{0.04}Er_{0.04}Sm_{0.03}Gd_{0.03}Yb_{0.03})_{\Sigma=1.22}(HCO_3)[(OH)_{2.97}F_{0.03}]_{\Sigma=3.00} \cdot 4.00H_2O$.

Occurrence: Rarely in a pegmatite dike associated with an intrusive alkalic gabbro-syenite complex.

Association: Aegirine, albite, analcime, ancylite-(Ce), astrophyllite, calcite, catapleiite, dawsonite, elpidite, epididymite, franconite, gaidonnayite, galena, genthelvite, microcline, molybdenite, natrolite, petersenite-(Nd), polylithionite, pyrochlore, rhodochrosite, rutile, sérandite, siderite, sphalerite, zircon.

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Professor Thomas Henry Clark (1893–1996), McGill University, Montreal, Canada, who studied the geology of the area in which Mont Saint-Hilaire is situated.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81553–81555.

(1) Tsumeb, Namibia; by electron microprobe, average of six analyses, total Fe as FeO, H_2O by TGA. (2) Do.; by electron microprobe, average of 26 analyses, total Fe as Fe_2O_3, confirmed by IR and Mössbauer spectroscopy, H_2O calculated from theory; corresponds to $Pb_{0.99}(Cu_{1.50}Zn_{0.41}Al_{0.07}Fe_{0.02})_{\Sigma=2.00}[(AsO_4)_{1.32}(SO_4)_{0.69}]_{\Sigma=2.01}[(H_2O)_{1.23}(OH)_{0.74}]_{\Sigma=1.97}$. (3) Gold Hill, Utah, USA; analysis not given, stated to correspond to $Pb_{0.98}(Cu_{1.14}Fe_{0.80}Zn_{0.02})_{\Sigma=1.96}(AsO_4)_{2.00}(OH,H_2O)_2$.

Mineral Group: Tsumcorite group.

Occurrence: A very rare secondary mineral from an oxidized zone in a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Anglesite, mimetite, gypsum (Tsumeb, Namibia).

Distribution: From Tsumeb, Namibia. At Gold Hill, Tooele Co., Utah, USA. From Moldava, 20 km northwest of Teplice, Czech Republic. At the Clara mine, near Oberwolfach, Black Forest, Germany. From Broken Hill, New South Wales, Australia.

Name: To honor Wilhelm Thometzek, former General Manager of the Tsumeb mining company.

Type Material: Mineralogical-Petrological Institute, Heidelberg University, Heidelberg, Germany.

Thomsenolite $NaCaAlF_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic ‖ [001], to 5.5 cm, commonly in parallel groups; may be pseudocubic through development of {001} and {110} or tabular on {001}, with a number of forms. Rarely spherulitic, stalactitic, or massive, in opaline crusts.

Physical Properties: *Cleavage:* {001}, perfect; {110}, distinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 2.981 D(calc.) = 2.986(3)

Optical Properties: Transparent to translucent. *Color:* Colorless to white, can be brownish or reddish with included iron oxide; colorless in transmitted light. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = -52°$; $Z = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.4072–1.4073$ $\beta = 1.4135–1.4136$ $\gamma = 1.4150–1.4152$ 2V(meas.) = 50°–55°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.563(2)$ $b = 5.541(2)$ $c = 16.115(1)$
$\beta = 96.35(3)°$ Z = 4

X-ray Powder Pattern: Ivigtut, Greenland.
4.02 (100), 1.963 (90), 1.996 (80), 2.92 (50), 1.761 (30), 2.16 (20), 1.640 (20)

Chemistry:

	(1)	(2)
Na	10.43	10.35
Ca	17.22	18.05
Al	13.26	12.15
F	50.61	51.34
H_2O	8.42	8.11
Total	99.94	100.00

(1) Ivigtut, Greenland. (2) $NaCaAlF_6 \cdot H_2O$.

Polymorphism & Series: Dimorphous with pachnolite.

Occurrence: As an alteration product of cryolite and other alkali aluminum fluorides, most commonly in granite pegmatites.

Association: Cryolite, pachnolite, ralstonite, chiolite, cryolithionite, elpasolite, sellaite, fluorite.

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland. At Miass, Ilmen Mountains, Southern Ural Mountains and other undefined localities in Russia. At Songshugang, Jiangxi Province, China. From near Lake Gjerdingen, Nordmarka, Norway. In the USA, at St. Peters Dome, near Pikes Peak, El Paso Co., Colorado; at the Spider mine, Honeycomb Hills, Juab Co., Utah; from the Quitman Mountains, Hudspeth Co., Texas; and in the Morefield pegmatite mine, Amelia, Amelia Co., Virginia. From near Saint-Amable, Quebec, Canada.

Name: To honor Hans Peter Jörgen Julius Thomsen (1826–1909), Danish physical chemist, who founded the Danish cryolite industry and first noted the species.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1868.1499.

Thomsonite $NaCa_2Al_5Si_5O_{20}\cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals commonly prismatic, acicular, or bladed, flattened on {010}, elongated and striated ‖ [001], to 12 cm; in radiated spherical or columnar aggregates; smooth, globular, botryoidal; compact, massive. *Twinning:* On {110}.

Physical Properties: *Cleavage:* Perfect on {010}, good on {100}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.23–2.39 D(calc.) = 2.366 Pyroelectric.

Optical Properties: Transparent to translucent. *Color:* White, yellowish, pink, brown, greenish, may be concentrically zoned; colorless in thin section. *Streak:* White. *Luster:* Vitreous to somewhat pearly.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, strong. $\alpha = 1.497–1.530$ $\beta = 1.513–1.533$ $\gamma = 1.518–1.544$ 2V(meas.) = 42°–75°

Cell Data: *Space Group: Pncn.* $a = 13.088(2)$ $b = 13.052(2)$ $c = 13.229(2)$ $Z = 4$

X-ray Powder Pattern: Kaden [*sic*, Kadaň (Kaaden)], Czech Republic. (ICDD 19-1344). 2.86 (100), 4.64 (90), 2.68 (80), 2.95 (70), 3.51 (65), 6.60 (60), 3.19 (45)

Chemistry:

	(1)	(2)

Al_2O_3	31.93	28.59
CaO	13.98	11.89
Na_2O	4.00	4.23
K_2O	trace	
H_2O	13.35	[13.80]
Total	100.43	[100.00]

(1) Old Kilpatrick, Scotland; corresponds to $Na_{1.04}Ca_{2.00}Al_{5.03}Si_{4.97}O_{20}\cdot 5.95H_2O$. (2) Goble, Oregon, USA; by electron microprobe, H_2O by difference; corresponds to $Na_{1.09}Ca_{1.70}Al_{4.48}Si_{5.52}O_{20}\cdot 6H_2O$.

Mineral Group: Zeolite group.

Occurrence: In amygdules and fractures in mafic igneous rocks, typically basalts; in some alkalic igneous rocks, contact metamorphic zones, and hypabyssal rocks. As an authigenic cement in some sandstones.

Association: Zeolites, calcite, prehnite, datolite, quartz.

Distribution: A common zeolite with many localities known; a few for good crystals are: from Old Kilpatrick, Dumbartonshire, and Bishopton, Renfrew, Scotland. At Mt. Monzoni, Val di Fassa, Trentino-Alto Adige, Italy. From Ostroh (Seeberg), Kadaň (Kaaden), and Ústí nad Lábem (Aussig), Czech Republic. At Hammer-Unterwiesenthal, Saxony, Germany. From Nolsoy, Essuroy, and Streymoy, Faeroe Islands. In the USA, from Paterson, Passaic Co., New Jersey; on North and South Table Mountain, Jefferson Co., Colorado; and in Oregon, at Springfield, Lane Co., Drain, Douglas Co., Goble, Columbia Co., Ritter Hot Springs, Grant Co., and elsewhere. At Flinders, Victoria, Australia.

Name: For Dr. Thomas Thomson (1773–1852), Scottish chemist and mineralogist of Glasgow, Scotland, who first analyzed the mineral.

SnO	21.1	23.36
Total	99.3	100.00

(1) Manono pegmatite, Congo; by electron microprobe, Sn^{2+}:Sn^{4+} from stoichiometric considerations; corresponding to $(Sn^{2+}_{0.89}Pb_{0.07}Sb_{0.04})_{\Sigma=1.00}(Ta_{1.80}Nb_{0.18}Sn^{4+}_{0.02})_{\Sigma=2.00}O_6$.
(2) $SnTa_2O_6$.

Polymorphism & Series: Forms a series with foordite.

Occurrence: A very rare mineral formed in differentiated granite pegmatites deficient in O, Fe, Mn, Na, Ca, and F.

Association: Cassiterite, lithiotantite, microlite, calciotantite, cesplumtantite (Manono pegmatite, Congo).

Distribution: In Congo (Zaire), from the Manono pegmatite, Katanga (Shaba) Province, and the Maniéma district, Kivu Province. From Gitebi, near Rutsiro, Rwanda. In the Urubú pegmatite, Itinga, Minas Gerais, Brazil. At Ungursai, Kazakhstan. From an undefined locality [Kalbinskiy Range] in Siberia, Russia.

Name: Honors Professor Jacques Thoreau (1886–1973), University of Liège, Liège, Belgium, authority on Congolese (Zairian) mineral occurrences.

Type Material: University of Liège, Liège, Belgium, 2067 and 2068.

(1) Betroka, Madagascar. (2) Galle district, Sri Lanka.

Polymorphism & Series: Forms a series with uraninite.

Occurrence: An accessory mineral in granite pegmatites, more rarely in carbonatites or serpentinites; commonly detrital in heavy mineral concentrates.

Association: Thorite, zircon, ilmenite, cassiterite, allanite (Sri Lanka); phlogopite, diopside, spinel (Andolobe, Madagascar).

Distribution: In Sri Lanka, at Balangoda and near Kondrugala; in the Galle district; at Bambarabotuwa; and elsewhere. In Madagascar, very large crystals from Taolañaro (Fort Dauphin); at Andranondambo, Antanimora, Betroka, Andolobe, and other localities. From Phalaborwa, Transvaal, South Africa. From Russia, in the Kovdor massif, Kola Peninsula; in the Yenisei Range, Siberia; and along the Boshogoch River, Siberia. In the USA, at Easton, Northampton Co., Pennsylvania; from the Nixon Fork and Wiseman districts, Alaska. In Canada, at a number of places in Pontiac Co., Quebec, and elsewhere. Many minor localities are known.

Name: For THORium in the composition.

Type Material: n.d.

Thorikosite $Pb_3(Sb^{3+},As^{3+})O_3Cl_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are extremely small prisms, tabular on {001}, composite and with curved faces.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Very brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 7.24

Optical Properties: Transparent to translucent. *Color:* Light yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $I4/mmm$. $a = 3.919(1)$ $c = 12.854(5)$ $Z = 1$

X-ray Powder Pattern: Laurium, Greece; might be easily confounded with related natural and synthetic phases.
2.891 (10), 3.754 (7), 2.775 (5), 6.39 (3), 3.203 (3), 2.099 (3), 1.621 (3)

Chemistry:

	(1)
As_2O_3	4.4
Sb_2O_3	9.8
PbO	77.6
Cl	7.7
H_2O	[2.2]
$-O = Cl_2$	1.7
Total	[100.0]

(1) Laurium, Greece; by electron microprobe, H_2O by difference; corresponds to $Pb_{2.9}(Sb^{3+}_{0.6}As^{3+}_{0.4})_{\Sigma=1.0}Cl_{1.8}H_{2.0}O_{4.5}$.

Occurrence: A rare secondary mineral formed through alteration of lead-bearing slag by sea water.

Association: Paralaurionite, laurionite, hydrocerussite, sphalerite, calcite, aragonite.

Distribution: From Laurium, Greece, in slag.

Name: For *Thorikos*, an ancient town in Greece, where ores obtained from the nearby Laurium mines were smelted.

Type Material: National Museum of Natural History, Washington, D.C., USA, 161928, 149042.

Thorite $(Th,U)SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal; commonly metamict. *Point Group:* $4/m\ 2/m\ 2/m$. In square prisms, terminated by {111}, or pseudo-octahedral crystals, to 8 cm; also massive and compact.

Physical Properties: *Cleavage:* {110}, distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 6.63–7.20 D(calc.) = 6.70 Paramagnetic; radioactive.

Optical Properties: Nearly opaque, transparent in thin fragments. *Color:* Yellow-orange, brownish yellow, brownish black, black. *Streak:* Light orange to dark brown. *Luster:* Vitreous to resinous or greasy.
Optical Class: Uniaxial (+). $n = 1.664$–1.87 (metamict). $\omega = 1.78$–1.837 $\epsilon = 1.79$–1.840

Cell Data: *Space Group:* $I4_1/amd$. $a = 7.1328(2)$ $c = 6.3188(2)$ $Z = 4$

X-ray Powder Pattern: Synthetic $ThSiO_4$.

Total	[100.00]	100.00

(1) Tuolumne River, California, USA; recalculated to 100.00% from original total of 97.24%.
(2) $ThSiO_4$.

Polymorphism & Series: Dimorphous with huttonite.

Occurrence: An accessory mineral in felsic igneous rocks and their associated pegmatites. As a detrital mineral in sediments.

Association: Zircon, monazite, gadolinite, fergusonite, uraninite, yttrialite, pyrochlore.

Distribution: In Norway, from Lomo, Brevik, and around the Langesundsfjord; at Ødegården, Bamble; also Arendal, Tvedestrand, Kragerö, and elsewhere. From Mendig, Eifel district, Germany. In Madagascar, at Ambatofotsy, Androtsabo, Befaritra, and elsewhere. In the USA, from the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., Texas; at St. Peters Dome, near Pikes Peak, El Paso Co., and the Powderhorn district, Gunnison Co., Colorado; from the Wet Mountains, Custer Co., Colorado. In Canada, as large but crude crystals from the McDonald mine, Hybla, and at Wilberforce, Ontario. Additional minor localities are known.

Name: For its content of *thorium*, in turn named for *Thor*, Scandinavian god of war.

Thornasite $(Na,K)ThSi_{11}(O,F,OH)_{25}\cdot 8H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$ or 32. As anhedral to parallel prismatic crystals, to 1.5 mm.

Physical Properties: *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.62(2) D(calc.) = 2.627 Pyroelectric; fluoresces bright apple-green or pale bluish under LW and SW UV; radioactive.

Optical Properties: Opaque to transparent. *Color:* Colorless to very pale green, beige. *Streak:* White. *Luster:* Vitreous to waxy or greasy, may be pearly.
Optical Class: Uniaxial (+). $\omega = 1.510(1)$ $\epsilon = 1.512(1)$

Cell Data: *Space Group:* $R3m$ or $R32$. $a = 29.08(1)$ $c = 17.30(1)$ $Z = 18$

X-ray Powder Pattern: Mont Saint-Hilaire, Canada; slightly metamict.
7.27 (100), 4.17 (70), 8.17 (30), 3.239 (30), 2.890 (25), 14.54 (20), 5.09 (20)

Total	99.53

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of five analyses, H_2O by TGA; corresponds to $(Na_{0.56}K_{0.26}Ca_{0.03})_{\Sigma=0.85}(Th_{0.94}U_{0.04})_{\Sigma=0.98}(Si_{10.69}Al_{0.31})_{\Sigma=11.00}O_{24.12}F_{0.23}Cl_{0.02}\cdot 8.5H_2O$.

Occurrence: In an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in a cavity in a nepheline syenite sill (Saint-Amable, Canada).

Association: Brockite, yofortierite, analcime, eudialyte, sérandite, polylithionite, leifite, natrolite, microcline, albite, mangan-neptunite, steacyite, catapleiite, epididymite, calcite (Mont Saint-Hilaire, Canada); natrolite, nenadkevichite, yofortierite, monazite-(Ce), eudialyte, rhodochrosite (Saint-Amable, Canada).

Distribution: From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: For THORium, sodium or NAtrium, and SIlicon in its composition.

Type Material: Royal Ontario Museum, Toronto, M42070; Canadian Museum of Nature, Ottawa, Canada, 50770.

Thorosteenstrupine $CaMnThSi_4O_{11}(OH)F \cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Metamict. *Point Group:* n.d. Platy crystals, with rough faces, to 1 cm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼4 D(meas.) = 3.02(2) D(calc.) = n.d. Weakly magnetic; radioactive.

Optical Properties: Opaque, translucent in thin fragments. *Color:* Dark brown, nearly black; reddish brown in transmitted light. *Streak:* Dark brown. *Luster:* Greasy to vitreous. *Optical Class:* Isotropic. $n = 1.63–1.66$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Chergien deposit, Russia; after heating at 900° for 30 minutes. 4.08 (10), 3.25 (10), 2.61 (10), 3.06 (9), 2.84 (8), 1.790 (8), 1.940 (7)

Total	100.96

(1) Chergien deposit, Russia; by microchemical analysis, corresponding to $(Ca_{1.11}Th_{1.01}Mn_{0.81}RE_{0.06}Fe^{3+}_{0.06})_{\Sigma=3.05}(Si_{3.96}Al_{0.04})_{\Sigma=4.00}[O_{11.24}(OH)_{0.76}]_{\Sigma=12.00}F_{0.95} \cdot 5.32H_2O$.

Occurrence: In metasomatic veins.

Association: Microcline, albite, "aegirine-augite," quartz, fluorite, thorite, miserite.

Distribution: From the Chergien rare-earth deposit, Turana Mountains, 60 km northwest of Chekunda, eastern Siberia, and on Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: For *thorium* in the composition and its close relation to *steenstrupine*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64285.

(1) Iveland, Norway. (2) Saetersdalen, Norway; by electron microprobe, $RE_2O_3 = Dy_2O_3$ 1.38%, Er_2O_3 1.65%, Tm_2O_3 0.54%, Yb_2O_3 7.01%, Lu_2O_3 1.68%; corresponds to $(Sc_{1.13}Y_{0.49}RE_{0.20}Fe_{0.08}Zr_{0.06}Mn_{0.03}Mg_{0.02}Ca_{0.01})_{\Sigma=2.02}(Si_{1.95}Al_{0.04})_{\Sigma=1.99}O_7$.

Occurrence: In granite pegmatite dikes (Norway).

Association: Euxenite, biotite, oligoclase, microcline, quartz (Iveland, Norway); monazite, fergusonite, ilmenorutile, beryl, muscovite, magnetite (Befanamo, Madagascar); kobeite, perrierite, tourmaline, euxenite, monazite, zircon, allanite, magnetite, ilmenite (Isanago mine, Japan).

Distribution: From a number of localities in Norway, including: in Iveland, at Saetersdalen, Ljosland, Frøysa, and Tuftane, near Frikstad; in Evje, at Flåt, Landverk, and Rampetrollsinken. At Befanamo, Madagascar. In Japan, in Kyoto Prefecture, in the Isanago mine, Oro, Nakagun, and at Shoroishi, Kobe, Omiya. From the Shilovo-Koneva massif, Ural Mountains, Russia. In the USA, from the Crystal Mountain fluorite mine, at Darby, Ravalli Co., Montana.

Name: For Olaus Thortveit, Norwegian mineralogist who discovered the mineral.

Type Material: n.d.

Total	99.6	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, H_2O by TGA on a separate sample; corresponding to $Al_{0.98}(UO_2)_{2.05}(PO_4)_{1.78}(OH)\cdot 8H_2O$. (2) $Al(UO_2)_2(PO_4)_2(OH)\cdot 8H_2O$.

Occurrence: A rare secondary mineral in the uraniferous zone of a complex zoned granite pegmatite.

Association: Meta-autunite, phosphuranylite, phuralumite, bolivarite, upalite, eylettersite, mundite.

Distribution: Found in the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). From the South Alligator Valley, Northern Territories, Australia.

Name: Honoring Ian Malcomb Threadgold (1929–), Australian mineralogist, University of Sydney, Sydney, Australia.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG5951; National Museum of Natural History, Washington, D.C., USA, 145687.

Tiemannite HgSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals are tetrahedral, to 0.5 cm; {111} is typically dull, {$\bar{1}$11} is bright; may be striated ‖ [1$\bar{1}$0]; commonly massive, compact, granular. *Twinning:* Common with [111] as twin axis.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 2.5 VHN = 22–26 (5 g load). D(meas.) = 8.19–8.47 D(calc.) = 8.239

Optical Properties: Opaque. *Color:* Steel-gray to brownish lead-gray; in polished section, pale gray. *Streak:* Nearly black. *Luster:* Metallic.

R: (400) 34.5, (420) 35.2, (440) 35.0, (460) 34.0, (480) 32.7, (500) 31.6, (520) 30.6, (540) 29.9, (560) 29.4, (580) 29.0, (600) 28.8, (620) 28.6, (640) 28.5, (660) 28.4, (680) 28.3, (700) 28.2

Cell Data: *Space Group:* $F\bar{4}3m$. a = 6.085 (synthetic). Z = 4

X-ray Powder Pattern: Synthetic.

(1) Utah, USA. (2) Hope's Nose, England; by electron microprobe. (3) HgSe.

Occurrence: In hydrothermal veins with other selenides and calcite.

Mineral Group: Sphalerite group.

Association: Clausthalite, eucairite, naumannite, klockmannite, umangite, metacinnabar, galena, sphalerite, barite, manganese oxides, calcite.

Distribution: In Germany, in the Harz Mountains, from Clausthal [TL], Tilkerode, Lerbach, and Zorge; at Niederschlema, Saxony. From Hope's Nose, Torquay, Devon, England. At Silver Glen, Alva, Scotland. In the Petrovice uranium deposit, near Ždăr, and the Předbořice uranium deposit, near Krásna Hora, Czech Republic. From the Zapadno-Ozernoe Cu–Zn deposit, Southern Ural Mountains, Russia. In the La'erma and Qiongmo gold deposits, western Qinling Mountains, Shaanxi Province, China. In Bolivia, at the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, Potosí. In Argentina, in the Sierra de Umango, at the Santa Brigida mine, and from Tuminico, Sierra de Cacho, La Rioja Province. In Mexico, at Rio Blanco, Pinal de Arvole, Artiaga district, and the Cadereyta district, Queretaro, Mexico. In the USA, near Marysvale, Ohio district, Piute Co., Utah; in California, from New Idria, San Benito Co., California. At Nicholson Bay, Lake Athabasca, Saskatchewan, Canada. From El Sharana, Northern Territories, Australia.

Name: To honor Johann Carl Wilhelm Ferdinand Tiemann (1848–1899), chemist of Berlin, Germany, who discovered the mineral.

Tienshanite $Na_2BaMn^{2+}TiB_2Si_6O_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m$. Microcrystalline monomineralic aggregates, to 6 cm.

Physical Properties: *Cleavage:* {001}, distinct. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 3.29 D(calc.) = [3.14]

Optical Properties: Transparent to translucent. *Color:* Pistachio-green. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.666$ $\epsilon = 1.653$

Cell Data: *Space Group:* $P6/m$. a = 16.722(5) $c = 10.434(4)$ Z = 6

X-ray Powder Pattern: Dara-i-Pioz massif, Tajikistan.
4.19 (100), 3.18 (90), 3.47 (80), 2.803 (50), 2.419 (50), 10.5 (35), 3.89 (30)

Chemistry:

	(1)		(1)
SiO_2	43.24	MgO	trace
TiO_2	6.90	CaO	1.95
B_2O_3	7.50	BaO	18.00
Fe_2O_3	1.00	Na_2O	5.93
Ta_2O_5	0.84	K_2O	2.12
Nb_2O_5	4.14	H_2O^+	0.00
MnO	7.80	Total	99.42

(1) Dara-i-Pioz massif, Tajikistan; corresponds to $(Ba_{0.97}K_{0.13})_{\Sigma=1.10}(Na_{1.58}Ca_{0.29}K_{0.24})_{\Sigma=2.11}(Mn^{2+}_{0.91}Fe^{3+}_{0.10})_{\Sigma=1.01}(Ti_{0.72}Nb_{0.26}Ta_{0.03})_{\Sigma=1.01}B_{1.78}Si_{5.93}O_{19.96}$.

Occurrence: In the central portions of alkalic pegmatites in syenite.

Association: Pyrochlore, astrophyllite, bafertisite, stillwellite, danburite, galena, titanite, calcite, datolite.

Distribution: From the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: For the occurrence in the Tien Shan (Tien Mountains), Tajikistan.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 16249; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 70146.

Tiettaite $(Na,K)_{17}Fe^{3+}TiSi_{16}O_{29}(OH)_{30}\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As acicular crystals, elongated along [001] and flattened $\perp$ {100}; in rounded aggregates, to 1 cm.

Physical Properties: *Cleavage:* On {100} and {010}, perfect. *Fracture:* Steplike. *Tenacity:* Friable, in aggregate. Hardness = 3 D(meas.) = 2.42(2) D(calc.) = 2.39 Tarnishes on exposure to air.

Optical Properties: Transparent. *Color:* Grayish white; colorless in thin section. *Streak:* [White.] *Luster:* Vitreous or silky.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$. $\alpha = 1.532(2)$ $\beta = 1.548(2)$ $\gamma = 1.559(2)$ 2V(meas.) = 79(1)° 2V(calc.) = 79°

Cell Data: *Space Group:* $Cmcm$, $Cmc2_1$, or $C2cm$. $a = 29.77(1)$ $b = 11.03(2)$ $c = 17.111(5)$ Z = 4

X-ray Powder Pattern: Khibiny massif, Russia.
10.38 (100), 2.773 (90), 3.097 (80), 4.516 (75), 3.220 (65), 2.972 (65), 3.702 (60)

Chemistry:

	(1)
SiO_2	47.65
TiO_2	3.91
Fe_2O_3	4.05
CaO	0.30
Na_2O	19.21
K_2O	9.93
H_2O	14.95
Total	[100.00]

(1) Khibiny massif, Russia; by electron microprobe, total Fe as Fe_2O_3, recalculated to 100.00% after deduction of rasvumite inclusions; corresponding to $(Na_{12.51}K_{4.25}Ca_{0.11})_{\Sigma=16.87}Fe_{1.02}Ti_{0.99}Si_{16}O_{29.10}(OH)_{29.80}\cdot 1.84H_2O$.

Occurrence: In unweathered ultra-alkalic pegmatites in an alkalic massif.

Association: Nepheline, orthoclase, sodalite, aegirine, rasvumite, natrite, many others.

Distribution: On Mts. Koashva and Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: From the Saamsk word *tietta*, for *science* or *knowledge*, also after the name of the first Khibiny research laboratory founded by A.E. Fersman.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r723/1.

Tikhonenkovite $SrAlF_4(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals equant to flattened on {100}, to 1 cm, with prominent {010}, {011}, {10$\overline{2}$}, {11$\overline{1}$}, and a number of rarer forms; may be in flat radial rosettes, or drusy incrustations.

Physical Properties: *Cleavage:* {100}, perfect. *Fracture:* Conchoidal to irregular. Hardness = 3.5 D(meas.) = 3.26(1) D(calc.) = [3.30]

Optical Properties: Transparent. *Color:* Colorless, may be pinkish when included with iron oxides; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.452(1)$ $\beta = 1.456(1)$ $\gamma = 1.458(1)$ 2V(meas.) = 70°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.02(2)$ $b = 10.62(4)$ $c = 8.73(3)$ $\beta = 102°43(10)'$ Z = [4]

X-ray Powder Pattern: Karasug deposit, Russia.
4.89 (10), 3.64 (9), 3.27 (8), 2.095 (7), 2.299 (6), 4.44 (5), 3.33 (5)

Chemistry:

	(1)
Na	0.007
K	0.012
Ca	0.93
Sr	36.74
Al	12.10
F	33.88
H_2O	[7.97]
OH	[7.62]
Fe_2O_3	0.52
Total	[99.78]

(1) Karasug deposit, Russia; alkalies by flame photometry, "H_2O^+ 12.0% recalculated into 15.59% H_2O and OH"; after deduction of Fe_2O_3 as impurity, corresponds to $(Sr_{0.94}Ca_{0.05})_{\Sigma=0.99}Al_{1.01}F_{4.00}(OH)_{1.01}\cdot 0.99H_2O$.

Polymorphism & Series: Dimorphous with acuminite.

Occurrence: A secondary mineral formed in fissures in the oxidation zone of veins of iron ores in tectonic breccias.

Association: Gearksutite, karasugite, fluorite, barian celestine, strontianite, "limonite", hematite, quartz.

Distribution: In the Karasug iron-rare earth-barite–fluorite deposit, 15 km north of Karasug, western Tannu-Ola Mountains, Tuva, Siberia, Russia.

Name: To honor Igor Petrovich Tikhonenkov (1927–1961), student of alkalic rocks and minerals, Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 994/1; Geological Survey Institute, Moscow; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67133, 67134, vis1209–1212.

(1) Långban, Sweden. (2) Sterling Hill, New Jersey, USA; by electron microprobe.
(3) $CaMg(AsO_4)F$.

Polymorphism & Series: Forms a series with maxwellite and with durangite.

Occurrence: Typically in metamorphosed manganese or zinc deposits containing arsenic.

Association: Manganoan diopside, manganberzeliite, svabite, allactite, pyroaurite, dixenite, bergslagite, hematite, calcite, barite (Långban, Sweden); spessartine, braunite, barite, quartz (Kajlidongri, India); friedelite, willemite, barite (Sterling Hill, New Jersey, USA).

Distribution: From Långban, Värmland, Sweden. In Switzerland, from the Falotta mine, Oberhalbstein, Graubünden, and on the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais. On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, and at Val Strona, Ossola, Italy. From the Urupskoye copper deposit, northern Caucasus Mountains, Russia. At Sailauf, northeast of Aschaffenburg, Bavaria, Germany. From near Nežilovo, Macedonia. At Kajlidongri, Madhya Pradesh, India. From Guettera, Algeria. In the Puttapa zinc deposit, near Beltana, South Australia. In the USA, at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; from the White Tail Deer mine, Bisbee, Cochise Co., Arizona; in the Monticello tin district, Sierra Co., New Mexico.

Name: Honoring Daniel Tilas (1712–1772), Swedish mining engineer and mineral collector of Stockholm, Sweden.

Total	99.91	99.77

(1) Crestmore, California, USA; corresponding to $(Ca_{5.19}Al_{0.06}Mg_{0.05}Fe^{3+}_{0.01})_{\Sigma=5.31}Si_{2.02}O_7(C_{0.91}O_3)_2$. (2) Carlingford, Ireland; corresponding to $(Ca_{5.04}Mg_{0.03}Al_{0.02}Fe^{3+}_{0.01})_{\Sigma=5.10}Si_{2.01}O_7(C_{0.94}O_3)_2$.

Occurrence: In the contact metamorphic zone between igneous rocks and limestones, formed at low pressure and high temperature.

Association: Merwinite, spurrite, gehlenite, vesuvianite, grossular, wollastonite, thaumasite, fluorite, calcite.

Distribution: At Crestmore, Riverside Co., California; on North Peak, Iron Mountains, Sierra Co., New Mexico; and near Helena, Lewis and Clark Co., Montana, USA. In Ireland, at Barnavave, near Carlingford, Co. Louth. From near Kilchoan, Ardnamurchan, Argyllshire, and Camas Mòr, Isle of Muck, also on the Isles of Skye and Rhum, Scotland. From the Güneyce-İkizdere area, Trabzon Province, Turkey. In Russia, from near Anakit Creek, at the mouth of the Lower Tunguska River, central Siberia, and several other less-well-defined localities. At Kushiro, Hiroshima Prefecture, and the Akagané mine, Iwate Prefecture, Japan. From Redcap Creek, Queensland, Australia.

Name: For Cecil Edgar Tilley (1894–1973), British petrologist, Cambridge University, Cambridge, England.

Type Material: Harvard University, Cambridge, Massachusetts, 97301; National Museum of Natural History, Washington, D.C., USA, 97246.

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Natural crystals are not known; in irregular rounded grains and aggregates, to 1.5 mm.

Physical Properties: *Fracture:* Hackly. *Tenacity:* Ductile, malleable. Hardness = 2 VHN = 7–9 (10 g load). D(meas.) = 7.31 D(calc.) = 7.286

Optical Properties: Opaque. *Color:* Tin-white. *Luster:* Metallic. *Anisotropism:* Moderate.

R_1–R_2: (400) 76.3–72.7, (420) 79.4–74.2, (440) 81.9–75.8, (460) 84.0–77.6, (480) 85.5–79.2, (500) 86.7–80.5, (520) 87.5–81.4, (540) 88.1–81.9, (560) 88.2–82.0, (580) 88.0–81.9, (600) 87.7–81.5, (620) 87.2–81.1, (640) 86.7–80.7, (660) 86.3–80.4, (680) 85.8–80.1, (700) 85.4–79.8

Cell Data: *Space Group:* $I4_1/amd$. $a = 5.831$ $c = 3.182$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.915 (100), 2.793 (90), 2.017 (74), 2.062 (34), 1.484 (23), 1.442 (20), 1.205 (20)

Chemistry: Typically nearly pure tin by electron micoprobe analyses.

Occurrence: Rare, in some placers; in unspecified kimberlite pipes; in seafloor spreading zones.

Association: Platinum, iridosmine, gold, copper, sorosite, cassiterite.

Distribution: From the Nesbitt LaBine uranium mines, Beaverlodge area, Saskatchewan, Canada. At a placer in Broad Brook, Five Corners Hamlet, Windsor Co., Vermont, USA. From the Rio Tamaná, the Department of Chocó, Cauca, Colombia. At the Ilímaussaq intrusion, southern Greenland. In Nigeria, from the Badiko district, Bauchi, and in the Agbaja ironstone formation. From Oued Berkou, Algeria. At the Gasborn district, Filipstad, Sweden. From the Elkiaidan River, eastern North Nuratin Range, Uzbekistan. At the Baimka gold-PGE placer deposit, in the Bol'shoy Anyuy River area, western Chukotka, Russian Far East, Russia. In the Aberfoyle and Sam Rivers, headwaters of the Clarence River, near Oban, New South Wales, Australia. From the Mid-Atlantic Ridge (26°N) and East Pacif Rise (21°S).

Name: A word of Old English origin, related to the Dutch *tin* and German *zinn*; the chemical symbol from the Latin *stannum*.

Tinaksite $K_2Na(Ca,Mn^{2+})_2TiSi_7O_{19}(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As well-formed long prismatic crystals, to 15 cm; commonly as bundles and rosettes of radiating crystals, or compact fibrous aggregates, to 10 cm.

Physical Properties: *Cleavage:* Perfect on {010}, imperfect on {110}; (010) ∧ (110) = 131.5°. Hardness = 6 VHN = 646–762 D(meas.) = 2.82–2.90 D(calc.) = 2.85

Optical Properties: Transparent to translucent. *Color:* White, colorless, light yellow, light pink. *Luster:* Vitreous on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = colorless; Z = pale orange-brown.
Orientation: $X' \wedge \{010\} = 1°–4°$; $Y \wedge \{010\} = 16°–18°$. *Dispersion:* Strong. $\alpha = 1.593–1.599$ $\beta = 1.621–1.627$ $\gamma = 1.666–1.673$ 2V(meas.) = 68°–78°

Cell Data: *Space Group:* $P\bar{1}$. $a = 10.377(3)$ $b = 12.166(3)$ $c = 7.059(1)$ $\alpha = 90.91(1)°$ $\beta = 99.3(1)°$ $\gamma = 92.76(3)°$ Z = 2

X-ray Powder Pattern: Murun massif, Russia.

(1) Murun massif, Russia; corresponds to $K_{1.97}Na_{1.02}(Ca_{1.88}Fe^{2+}_{0.10}Fe^{3+}_{0.08}Mn_{0.04})_{\Sigma=2.10}$ $Ti_{0.94}Si_{6.88}O_{19.76}(OH)_{0.98}$.

Occurrence: An accessory mineral in potassic feldspar metasomatites at the contact with limestones (Murun massif, Russia).

Association: Potassic feldspar, aegirine, quartz, canasite, xonotlite (Murun massif, Russia); orthoclase, pyroxene, aegirine, astrophyllite, hisingerite (Khibiny massif, Russia).

Distribution: In Russia, in the Murun massif, southwest of Olekminsk, Yakutia, and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula.

Name: For the *Ti, Na, K, Si* in the composition.

Type Material: n.d.

Total	99.39	100.00

(1) Kramer district, California, USA. (2) $Na_2B_4O_5(OH)_4 \cdot 3H_2O$.

Occurrence: Typically a dehydration product of other borates.

Association: Borax, kernite.

Distribution: Probably more widespread than the few recorded localities suggest. In the USA, from the Kramer borate deposit, Boron, Kern Co. and as crystals at Searles Lake, San Bernardino Co., California. From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. In the Kirka borate deposit, Eskiçehir Province, Turkey. At Larderello, Val di Cecina, Tuscany, Italy. From mud volcanoes, Kerch Peninsula, Ukraine.

Name: From *tincal*, an Oriental name for *borax*, and the Greek for *powder*, in allusion to the typical powdery habit.

Tinsleyite $KAl_2(PO_4)_2(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. Composite prismatic crystals, tabular on $\{\bar{1}01\}$, showing $\{\bar{1}01\}$, $\{\bar{1}11\}$, $\{011\}$, $\{110\}$, to 2 mm; in thin films and intergrown with leucophosphite.

Physical Properties: *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = 2.69(5) D(calc.) = 2.62

Optical Properties: Semitransparent. *Color:* Magenta to light brownish red, commonly zoned with colorless leucophosphite. *Streak:* Pink. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = pale orange-brown; Y = pale purple; Z = dark purplish red. *Orientation:* $X = b$. *Absorption:* $Z > Y > X$. $\alpha = 1.591(3)$ $\beta = 1.597(3)$ $\gamma = 1.604(3)$ 2V(meas.) = 86° 2V(calc.) = 86°

Cell Data: *Space Group:* $P2/n$ or Pn. a = 9.602(8) $b = 9.532(6)$ $c = 9.543(11)$ $\beta = 103.16(6)°$ Z = 4

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
6.68 (10), 5.91 (8), 3.006 (7), 2.616 (6b), 4.157 (5), 3.723 (5), 2.836 (5)

Chemistry:

	(1)	(2)

Al_2O_3	26.6	30.34
Fe_2O_3	5.2	
Mn_2O_3	1.1	
K_2O	12.4	14.02
H_2O	[12.5]	13.40
Total	[100.0]	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O by difference; corresponds to $K_{0.89}(Al_{1.75}Fe_{0.22}Mn_{0.05})_{\Sigma=2.02}(PO_4)_2(OH)_{0.95}\cdot 1.86H_2O$. (2) $KAl_2(PO_4)_2(OH)\cdot 2H_2O$.

Occurrence: Moderately abundant in highly altered triphylite pods in a complex zoned granite pegmatite (Tip Top mine, South Dakota, USA).

Association: Leucophosphite, triphylite, rockbridgeite–frondelite, tavorite, robertsite, jahnsite, carbonate-apatite, laueite (Tip Top mine, South Dakota, USA).

Distribution: Found in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA. At the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. Well-crystallized from the Bendada pegmatite, near Guarda, Portugal.

Name: To honor Frank C. Tinsley (1916–), Rapid City, South Dakota, USA, for his efforts to preserve mineral specimens for research.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149791, 159882.

References: (1) Dunn, P.J., R.C. Rouse, T.J. Campbell, and W.L. Roberts (1984) Tinsleyite, the aluminum analogue of leucophosphite, from the Tip Top pegmatite in South Dakota. Amer. Mineral., 69, 374–376.

(1) East Tintic district, Utah, USA. (2) Bruguers, Spain; corresponds to $Fe_4[(PO_4)_{2.70}(VO_4)_{0.30}]_{\Sigma=3.00}(OH)_3 \cdot 5H_2O$. (3) $Fe_4(PO_4)_3(OH)_3 \cdot 5H_2O$.

Occurrence: Formed by reaction between phosphatic solutions derived from bat guano and iron from oxidizing pyrite (East Tintic district, Utah, USA); formed by weathering rocks containing apatite and jarosite (Bruguers, Spain).

Association: Jarosite, "limonite" (East Tintic district, Utah, USA); montgomeryite, carbonate-apatite, goethite (Bruguers, Spain).

Distribution: In the USA, found in a limestone cave near the Tintic Standard mine, near Dividend, East Tintic district, Utah Co., Utah; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada; in the Foote mine, near Kings Mountain, Cleveland Co., North Carolina. From Bruguers, 15 km southwest of Barcelona, Barcelona Province, Spain. At the Leveäniemi mine, Svappavaara, near Kiruna, Sweden. From Hagendorf, Bavaria, and in the Clara Mine, near Oberwolfach, Black Forest, Germany. In an unspecified gold deposit, central Kyzylkum, Uzbekistan. At the Moculta phosphate quarry, northeast of Angaston, South Australia. From the Suwa mine, Nagano Prefecture, Japan.

Name: For its initially noted occurrence in the East Tintic distict, Utah, USA.

Type Material: The Natural History Museum, London, England, 1986,61; National Museum of Natural History, Washington, D.C., USA, 105407, 105609.

Polymorphism & Series: Forms a series with kobellite.

Occurrence: As small masses and veinlets in malachite-stained quartz (Tintina mines, Canada).

Association: Jamesonite, argentian tetrahedrite, galena, sphalerite, pyrite, arsenopyrite, marcasite, bournonite, owyheeite, pyrrhotite, chalcopyrite (Tintina mines, Canada); joséite, kobellite (Boliden, Sweden).

Distribution: In Canada, from the Tintina silver mines, Watson Lake, Yukon Territory [TL]; at the Deer Park mine, Rossland, British Columbia. In the Cofer deposit, near Mineral, Louisa Co., Virginia, USA. From Boliden, Västerbotten, Sweden. In Slovkia, at the Mária mine, Rožňava, and in the Däbrava deposit, Low Tatra Mountains. From the Shexingping mine, Cheng Co., Hunan Province, China. In the Srednegolgotaiskoe gold deposit, eastern Transbaikalia, Siberia, Russia.

Name: For the Tintina mines, Canada.

Type Material: Geological Survey of Canada, Ottawa, 12133 (Tintina material); Royal Ontario Museum, Toronto, Canada, M27173 (Rossland material).

References: (1) Harris, D.C., J.L. Jambor, G.R. Lachance, and R.I. Thorpe (1968) Tintinaite, the antimony analogue of kobellite. Can. Mineral., 9, 371–382. (2) (1969) Amer. (1) Tinzen, Switzerland; corresponds to $(Mn_{1.77}Ca_{1.32}Na_{0.05}K_{0.02}Mg_{0.02})_{\Sigma=3.18}(Al_{1.88}Fe^{3+}_{0.12})_{\Sigma=2.00}B_{0.96}Si_{4.01}O_{15}(OH)_{0.79}$. (2) Gambatesa mine, Italy; corresponds to $(Mn_{1.60}Ca_{1.42}Mg_{0.13}Na_{0.07}K_{0.06})_{\Sigma=3.28}(Al_{1.88}Fe^{3+}_{0.12})_{\Sigma=2.00}B_{0.85}Si_{4.06}O_{15}(OH)_{0.76}$.

Polymorphism & Series: Forms a series with manganaxinite.

Mineral Group: Axinite group; Ca < 1.5 per formula unit, Mn > Fe.

Occurrence: In metamorphosed manganese-bearing ophiolites (Liguria, Italy); in quartz veins in cherts of the greenschist facies (Akatore, New Zealand).

Association: Braunite, quartz.

Distribution: From near Tinzen, in the Val d'Err, Graubünden, Switzerland. In the Cassagna and Gambatesa mines, Val Graveglia, near Chiavari, Liguria, Italy. From Akatore, New Zealand.

Name: For the locality near Tinzen, Switzerland.

Type Material: Federal Institute of Technology, Zurich, Switzerland, 194804; The Natural History Museum, London, England, 1926,499–501; Harvard University, Cambridge, Massachusetts, USA.

CaO	4.3
Li_2O	4.5
Na_2O	6.1
K_2O	9.9
H_2O	3.4
Total	98.9

(1) Tip Top mine, South Dakota, USA; by electron microprobe, Li and Be by AA, H_2O by TGA; based on crystal-structure analysis, approximates $K_2(Li_{2.9}Na_{1.7}Ca_{0.7})_{\Sigma=5.3}$ $Be_6(PO_4)_6(OH)_2 \cdot 1.3H_2O$.

Occurrence: On fracture surfaces in earlier minerals in a complex zoned granite pegmatite.

Association: Roscherite, fransoletite, montgomeryite, englishite, beryl, quartz, microcline.

Distribution: From the Tip Top mine, about 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: For its first-noted occurrence at the Tip Top mine, South Dakota, USA.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 48833; Museum of Geology, South Dakota School of Mines, Rapid City, South Dakota, 81-5102; National Museum of Natural History, Washington, D.C., USA, 149609.

(1) Molinello mine, Italy; by electron microprobe, average of 28 analyses; corresponds to $(Mn^{2+}_{3.91}Ca_{0.08}Fe_{0.01})_{\Sigma=4.00}(As^{5+}_{0.84}V^{5+}_{0.12})_{\Sigma=0.96}Si_3O_{12}(OH)$. (2) Ködnitz Valley, Austria; by electron microprobe, average of 15 analyses; corresponds to $(Mn^{2+}_{3.66}Ca_{0.08}Fe_{0.04}Na_{0.01})_{\Sigma=3.79}$ $As^{5+}_{0.90}Si_{3.00}O_{12}(OH)$.

Occurrence: In veinlets cutting massive aggregates of braunite and quartz (Molinello mine, Italy); in manganese-rich lenses in quartzitic chlorite schists probably derived from marine sediments (Ködnitz Valley, Austria).

Association: Quartz, manganoan calcite, parsettensite, albite, medaite (Molinello mine, Italy); tephroite, pyroxmangite, rhodonite, spessartine, rhodochrosite (Ködnitz Valley, Austria).

Distribution: From the Molinello manganese mine, Val Graveglia, near Chiavari, Liguria, Italy. In the Ködnitz Valley, Tirol, Austria.

Name: For Paolo Tiragallo (1905–), amateur mineralogist of Liguria, Italy.

Type Material: University of Rome, Rome, 24314; Municipal Museum of Natural History, Milan, Italy; University of Oslo, Oslo, Norway.

Titanite $CaTiSiO_5$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic; may be metamict. *Point Group:* $2/m$. Crystals wedge-shaped, flattened ∥ {001} or prismatic by extension along [110], to 16 cm; compact, massive.
Twinning: On {100}, contact and penetration; less commonly lamellar on {221}.

Physical Properties: *Cleavage:* Good on {110}; parting due to twinning on {221}.
Hardness = 5–5.5 D(meas.) = 3.48–3.60 D(calc.) = [3.53]

Optical Properties: Transparent to opaque. *Color:* Black, brown, gray, colorless, green, yellow, red; colorless to yellow or brown in thin section. *Streak:* White. *Luster:* Adamantine to resinous.
Optical Class: Biaxial (+). *Pleochroism:* Distinct when deeply colored; X = nearly colorless; Y = yellow to green; Z = red to yellow-orange. *Orientation:* $Z \wedge c = 51°$. *Dispersion:* $r > v$, strong. $\alpha = 1.843–1.950$ $\beta = 1.870–2.034$ $\gamma = 1.943–2.110$ 2V(meas.) = 17°–40°

Cell Data: *Space Group:* $P2_1/a$ or $A2/a$. $a = 7.057$ $b = 8.707$ $c = 6.555$ $\beta = 113.81°$
Z = 4

Total	99.84	100.49

(1) Goschener Alp, Switzerland; by electron microprobe, total Fe as Fe_2O_3; corresponding to $Ca_{1.00}(Ti_{0.97}Fe^{3+}_{0.03})_{\Sigma=1.00}Si_{1.00}O_{4.96}$. (2) Pierceville [*sic*], New York, USA; by electron microprobe, total Fe as Fe_2O_3, F by ion microprobe; corresponding to $(Ca_{0.97}Nb_{0.01}RE_{0.01})_{\Sigma=0.99}(Ti_{0.74}Al_{0.19}Fe^{3+}_{0.07})_{\Sigma=1.00}Si_{1.00}O_{4.91}F_{0.23}$.

Occurrence: A common accessory mineral in intermediate and felsic plutonic rocks, pegmatites, and alpine veins. In gneisses, schists, and some skarns; rarely detrital.

Association: Albite, chlorite, epidote, apatite, allanite, monazite, magnetite, ilmenite, nepheline, biotite, diopside, calcite.

Distribution: Fine specimens from: in Switzerland, at Tavetsch, Graubünden; St. Gotthard, Ticino; Zermatt, Valais, and elsewhere. At Val Maggia and St. Marcel, Val d'Aosta, Italy. In Austria, in the Schwartzenstein and Rothenkopf Mountains, Zillertal, Tirol. From Arendal, Norway. At Nordmark, Värmland, Sweden. From the Lovozero and Khibiny massifs, Kola Peninsula, and large crystals in the Dodo mine, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains, Russia. In the USA, at the Tilly Foster mine, Brewster, Putnam Co., at Diana, Lewis Co., Natural Bridge, Jefferson Co., and Monroe, Orange Co., New York. In Canada, at Eganville and on Turner's Island, in Lake Clear, Renfrew Co., Ontario, and at Litchfield, Quebec. In Mexico, from Baja California, at El Rodeo, La Huerta, and Piño Solo. From Campo do Boa, Capelinha, Minas Gerais, Brazil. At Naevatanana and Ambalavaokely, Madagascar.

Total	[99.8]	100.3	100.00

(1) Tanco pegmatite, Canada; by electron microprobe, core of a grain; original total given as 99.7%. (2) Do.; rim of a grain, Fe^{2+}:Fe^{3+} calculated from stoichiometry. The average of (1) and (2) corresponds to $(Mn_{0.76}Fe^{2+}_{0.22})_{\Sigma=0.98}(Ti_{0.62}Sn_{0.30}Ta_{0.06}Fe^{3+}_{0.02})_{\Sigma=1.00}(Ta_{1.52}Nb_{0.48})_{\Sigma=2.00}O_8$.
(3) $Mn^{2+}TiTa_2O_8$.

Mineral Group: Wodginite group: $Li_A \leq 0.5$; $Fe^{2+}_A \leq 0.5$; $Ti_B > 0.5$.

Occurrence: In a complex zoned granite pegmatite (Tanco pegmatite, Canada).

Association: Microlite, manganocolumbite, albite, quartz, muscovite, beryl (Tanco pegmatite, Canada).

Distribution: In the Tanco pegmatite, Bernic Lake, Manitoba, Canada. From San Piero in Campo, Elba, Italy.

Name: For predominant TITANium and its relation to *wodginite*.

Type Material: R.B Ferguson Mineralogical Museum, University of Manitoba, Winnipeg, Canada.

(1) Rush Creek, California, USA; corresponds to $Ba_{3.86}(Ti_{1.94}Fe^{2+}_{0.96}Fe^{3+}_{0.37}Mg_{0.20}Mn_{0.02})_{\Sigma=3.49}B_{1.52}Si_8O_{29}Cl_{0.75}$.

Polymorphism & Series: Forms a series with taramellite.

Occurrence: In the contact zones around granite, quartz monzonite, and quartz diorite intrusives.

Association: Sanbornite, quartz, macdonaldite, walstromite, fresnoite, verplanckite, muirite, traskite, benitoite, pabstite, bazirite (Rush Creek and Big Creek areas, California, USA); tremolite, celsian, pabstite, galena, cassiterite, quartz (Kalkar quarry, California, USA).

Distribution: In the USA, in California, at Rush Creek and Big Creek, Fresno Co., at Chickencoop Canyon, Tulare Co., on Trumbull Peak, near Incline, Mariposa Co., and in the Kalkar quarry, Santa Cruz Co. From near Ross River [Gunn claim, Itsy Mountains, near Macmillan Pass], Yukon Territory, Canada. In the La Madrelena mine, Tres Pozos, Baja California, Mexico.

Name: For its TITANium content and relation to *taramellite*.

Type Material: n.d.

Crystal Data: Orthorhombic. *Point Group:* n.d. As velvety crusts composed of spherules or arcuate bands of subparallel lath-shaped crystals, to 10 μm.

Physical Properties: *Tenacity:* Gummy and sectile. Hardness = 1 D(meas.) = 4.55(1) D(calc.) = 4.58

Optical Properties: Semitransparent. *Color:* Capri blue; pale green in transmitted light. *Streak:* Very pale blue.
Optical Class: Biaxial (–). *Pleochroism:* X = green; $Y = Z$ = bluish green. *Absorption:* $Z > Y > X$. $\alpha = 1.758(2)$ $\beta = 1.796(2)$ $\gamma = 1.810(5)$ 2V(meas.) = 64° 2V(calc.) = 61°

Cell Data: *Space Group:* n.d. $a = 16.780(3)$ $b = 19.985(4)$ $c = 12.069(3)$ Z = 4

X-ray Powder Pattern: Bambollita mine, Mexico.
16.787 (10), 4.201 (10), 8.394 (8), 3.355 (6), 1.560 (5), 2.796 (3), 2.588 (3b)

Chemistry:

	(1)
TeO_3	15.0
TeO_2	6.1
CuO	31.0
ZnO	19.3
Cl	1.3
H_2O	27.7
$-O = Cl_2$	0.3
Total	100.1

(1) Bambollita mine, Mexico; results from several partial analyses, CuO and ZnO by AA, Te and Cl by spectrophotometry, H_2O by gravimetry; corresponds to $Cu_{9.92}Zn_{6.03}(Te^{4+}O_3)_{0.97}(Te^{6+}O_4)_{2.17}Cl_{0.93}(OH)_{24.69}\cdot 26.78H_2O$.

Occurrence: Very rare in partially oxidized portions of a tellurium-bearing polymetallic hydrothermal sulfide vein.

Association: Tenorite, azurite, malachite.

Distribution: From the Oriental (Bambollita) mine, northeast of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: For *Tlaloc*, the Toltec and Aztec god of rain, in allusion to the high essential water content.

Type Material: Natural History Museum, Paris; National School of Mines, Paris, France; The Natural History Museum, London, England; Harvard University, Cambridge, Massachusetts, 119091; National Museum of Natural History, Washington, D.C., USA, 135057.

Total		101.02

(1) Moctezuma mine, Mexico; with H^{1+} calculated for charge balance, corresponds to $H_{4.76}Ca_{2.00}Cu_{2.65}(SO_4)_{0.88}(Te^{4+}O_3)_{3.51}(Te^{6+}O_6)_{0.88}$. (2) Tombstone, Arizona, USA; H_2O by the Penfield method, with H^+ calculated for charge balance, corresponds to $H_{6.26}(Ca_{1.12}Pb_{0.88})_{\Sigma=2.00}(Cu_{2.88}Zn_{0.13})_{\Sigma=3.01}(SO_4)_{1.01}(Te^{4+}O_3)_{4.04}(Te^{6+}O_6)_{1.03}$.

Occurrence: Very rare in partially oxidized portions of a tellurium-bearing polymetallic hydrothermal sulfide deposit (Moctezuma mine, Mexico); an alteration product of tellurides in calcsilicate tactite (Tombstone, Arizona).

Association: Carlfriesite, calcite, barite, muscovite, quartz (Moctezuma mine, Mexico).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, at Tombstone, Cochise Co., Arizona, from the Lucky Cuss and Emerald mines.

Name: From the Nahua language for *paint*, in allusion to the typical habit as films as though painted on rock.

Type Material: The Natural History Museum, London, England; University of Arizona, Tucson, Arizona; Harvard University, Cambridge, Massachusetts, 119092; National Museum of Natural History, Washington, D.C., USA, 144519.

(1) Tobe, Japan; recalculated to 100.00% after deduction of 0.25% quartz; corresponds to $[(NH_4)_{0.53}K_{0.19}Na_{0.01}]_{\Sigma=0.73}(Al_{1.97}Mg_{0.05}Fe^{3+}_{0.03})_{\Sigma=2.05}(Si_{3.17}Al_{0.83})_{\Sigma=4.00}O_{10}(OH)_2$. (2) Horo, Japan; recalculated after deduction of 1% quartz and 20% ammonium-rich mica, analyzed separately, the "negative" Na_2O a result of this correction; corresponds to $[(NH_4)_{0.57}K_{0.27}]_{\Sigma=0.84}(Al_{1.95}Fe^{3+}_{0.05}Ti_{0.01}Mg_{0.01})_{\Sigma=2.02}(Si_{3.09}Al_{0.91})_{\Sigma=4.00}O_{10}(OH)_2$.

Polymorphism & Series: 1M, $2M_2$ polytypes.

Mineral Group: Mica group.

Occurrence: A hydrothermal alteration product of a biotite andesite dike (Tobe, Japan); in a hydrothermally altered rhyolite tuff (Horo, Japan).

Association: Quartz (Tobe, Japan); quartz, ammonium-rich mica, pyrophyllite, diaspore, kaolinite, corundum, andalusite (Horo, Japan).

Distribution: In the Ohgidani pottery stone deposit, Tobe, Ehime Prefecture, and in the Horo pyrophyllite deposit, Toyosaka, Hiroshima Prefecture, Japan.

Name: For the occurrence at Tobe, Japan.

Type Material: National Science Museum, Tokyo, Japan, M23773.

Tobermorite $Ca_5Si_6(O,OH)_{18}\cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic or monoclinic, pseudo-orthorhombic. *Point Group:* 2. As minute laths resembling fibers; as fibrous bundles, rosettes or sheaves, radiating or plumose, to 6 cm; fine granular, massive.

Physical Properties: *Cleavage:* Perfect on {001}, imperfect on {100}. Hardness = n.d. D(meas.) = 2.423–2.458 D(calc.) = [2.49]

Optical Properties: Transparent to translucent. *Color:* Pale pinkish white, white, brown; colorless in thin section. *Luster:* Vitreous, silky in fibrous aggregates.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* Weak.
$\alpha = 1.570(2)$ $\beta = 1.571(2)$ $\gamma = 1.575(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1$ (14 Å hydrate). $a = 11.17$ $b = 7.38$ $c = 27.94$ $\beta = [90.0°]$ Z = [4]

X-ray Powder Pattern: Crestmore, California, USA. (ICDD 29-331).
14.0 (100), 3.076 (65), 3.001 (45), 1.835 (35), 2.812 (30), 5.50 (25), 2.798 (13)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	46.51	48.08	CaO	33.40	35.24
Al_2O_3	2.40	3.96	Na_2O	0.36	0.03
Fe_2O_3	1.14		K_2O	1.45	0.03

(1) Tobermory, Scotland. (2) Portree, Scotland; by electron microprobe, H_2O by difference; corresponds to $(Ca_{4.30}Mg_{0.01}Na_{0.01}K_{0.01})_{\Sigma=4.33}(Si_{5.47}Al_{0.53})_{\Sigma=6.00}[O,(OH)]_{18}\cdot nH_2O$.

Mineral Group: A group name including the 9-Å, 10-Å, 11-Å, and 14-Å hydrates; dimorphous with clinotobermorite.

Occurrence: A hydrothermal alteration product of calcium carbonate rocks, due to contact metamorphism and metasomatism; filling vesicles and cavities in basaltic rocks.

Association: Zeolites, ettringite, portlandite, calcite.

Distribution: In Scotland, on the Isle of Mull, around Tobermory; on the Isle of Skye, at Dunvegan and Portree; and at Ardtornish Bay, Morvern, Argyllshire. From Ballycraigy, near Larne, Co. Antrim, Ireland. In Germany, on the Zeilberg, near Maroldsweisach, Bavaria. From the Hatrurim Formation, Israel. In the Güneyce-İkizdere area, Trabzon Province, Turkey. From Fuka, near Bicchu, Okayama Prefecture, Japan. At Golden Gully, Tokatoka district, about 150 km north of Auckland, New Zealand. In the USA, from Crestmore, Riverside Co., California. At Concepción del Oro, and in the Noche Buena mine, Mazapil, Zacatecas, Mexico. Large masses from the Wessels mine, near Kuruman, Cape Province, South Africa. A few additional minor occurrences are known.

Name: For the type locality, Tobermory, Isle of Mull, Scotland.

Type Material: The Natural History Museum, London, England, 1937,1490; National Museum of Natural History, Washington, D.C., USA, 119008.

Tochilinite $6Fe_{0.9}S \cdot 5(Mg, Fe^{2+})(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic or triclinic. *Point Group:* 2, m, $2/m$ or 1. As radiating aggregates of cylindrical acicular crystals, which may be hollow, to 1 cm; as paper-thin coatings, felted masses, and as clots.

Physical Properties: *Cleavage:* On {001}. Hardness = n.d. VHN = 15–49 (5 g load). D(meas.) = 2.96 D(calc.) = 3.03

Optical Properties: Opaque. *Color:* Bronze-black; yellowish brown in reflected light. *Luster:* Moderately metallic. *Pleochroism:* Strong, from yellowish brown to yellowish gray. *Anisotropism:* Strong, pinkish cream to gray.

R_1–R_2: (400) — , (420) — , (440) 9.3–15.0, (460) 9.2–15.8, (480) 9.1–16.3, (500) 8.9–16.9, (520) 8.8–17.4, (540) 8.8–17.8, (560) 8.7–18.2, (580) 8.6–18.8, (600) 8.4–19.3, (620) 8.3–19.8, (640) 8.2–20.2, (660) 8.1–20.5, (680) 8.0–20.8, (700) 8.0–21.0

Cell Data: *Space Group:* $P2$, Pm, or $P2/m$ with $a = 5.42$ $b = 15.77$ $c = 10.74$ $\beta = 95°$ Z = 6, or *Space Group:* $C1$ with $a = 5.37$ $b = 15.65$ $c = 10.72$ $\alpha = 90°$ $\beta = 95°$ $\gamma = 90°$ Z = 1

X-ray Powder Pattern: Voronezh region, Russia.
5.34 (10), 10.68 (9), 1.845 (7b), 2.20 (6b), 2.04 (5b), 1.537 (5vb), 3.57 (4)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
Fe	40.25	44.92	MgO	16.87		H_2O	11.25	
FeO	6.56		S	23.00	21.73	rem.	1.60	
Mg		10.94	$(OH)^{1-}$		[20.99]	Total	99.53	[98.58]

(1) Voronezh region, Russia; by electron microprobe, remainder deducted as gibbsite, $Al(OH)_3$; corresponds to $2(Fe_{0.88}S) \cdot 1.67[(Mg_{0.71}Fe_{0.29})_{\Sigma=1.00}(OH)_2]$ by analogy to valleriite.
(2) Dumont property, Canada; by electron microprobe, $(OH)^{1-}$ calculated; corresponds to $2(Fe_{0.94}S) \cdot 1.82[(Mg_{0.73}Fe_{0.27})_{\Sigma=1.00}(OH)_2]$.

Occurrence: In sulfide-rich serpentinized ultramafic bodies, where it may be of rock-forming mineral abundance; in some carbonaceous chondrite meteorites.

Association: Troilite, pyrrhotite, sphalerite, calcite, lizardite (Voronezh region, Russia); pyrrhotite, forsterite, clinohumite, hydromagnesite, graphite, calcite (Bancroft, Canada).

Distribution: In Russia, in the Voronezh district, from the Nizhnii Mamon Cu–Ni deposit, Nizhnii Mamon intrusive, 45 km southeast of Pavlovsk [TL], and in the Staromelovatskii intrusive; in the Mir, Udachnaya, and Obnazhennaya diamond pipes, Sakha. At the Grace mine, Morgantown, Berks Co., and the Cornwall open pit, Lebanon Co., Pennsylvania, USA. In Canada, in the Stephen Cross and Maxwell quarries, near Wakefield, and from the Dumont property, near Amos, Quebec; in the Muskox intrusion, Northwest Territories; from near Bancroft, Ontario; other occurrences are known. At the Jacupiranga mine, São Paulo, Brazil. In the Kamaishi mine, Iwate Prefecture, Japan. At the Mt. Keith nickel deposit, 15 km north of Betheno, Western Australia. From The Lizard, Cornwall, England. At Vâlsan, Romania.

Name: In honor of Professor Mitrofan Stepanovich Tochilin (1919–1968), mineralogist and geologist, Voronezh University, Voronezh, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Todoroki mine, Japan; corresponds to $(Ca_{0.48}Mn^{2+}_{0.40}K_{0.08}Na_{0.05})_{\Sigma=1.01}(Mn^{4+}_{5.06}Mn^{2+}_{0.77}Mg_{0.17})_{\Sigma=6.00}O_{12}\cdot 3.62H_2O$. (2) Tarantana mine, Cuba; corresponds to $(Mn^{2+}_{0.49}Na_{0.25}Ca_{0.19}K_{0.06})_{\Sigma=0.99}(Mn^{4+}_{5.17}Mg_{0.54}Mn^{2+}_{0.29})_{\Sigma=6.00}O_{12}\cdot 3.06H_2O$.

Occurrence: A secondary mineral produced from weathering or hydrothermal alteration of other manganese-bearing species; in sedimentary marine fumarolic deposits; the principal manganese oxide in deep-sea manganese nodules.

Association: Pyrolusite, cryptomelane, romanèchite, manganite, rhodochrosite, quartz, "opal".

Distribution: Widespread. Well-characterized material from: the Todoroki mine, south of Ginzan, Hokkaido, Japan. On Groote Eylandt, Northern Territory, Australia. In Cuba, an ore in the Charco Redondo–Taratana district, and elsewhere in Oriente Province. In the USA, at Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. From Urandi, Bahia, Brazil. At Nsuta, Ghana. Large crystals from the Smartt mine and elsewhere in the Kuruman district, Cape Province, South Africa. At Romanèche, Saône-et-Loire, France. From Bleiberg and Hüttenberg, Carinthia, Austria.

Name: For its first-noted occurrence in the Todoroki mine, Japan.

Type Material: Harvard University, Cambridge, Massachusetts, 106214; National Museum of Natural History, Washington, D.C., USA.

Tokkoite $K_2Ca_4Si_7O_{17}(O,OH,F)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As compact aggregates of columnar or radiating crystals, up to several cm long.

Physical Properties: *Cleavage:* Perfect on {010}, less perfect on {110}. *Fracture:* Splintery. Hardness = 4–5 D(meas.) = 2.761 D(calc.) = 2.77

Optical Properties: Transparent. *Color:* Light brown to pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Z \wedge c = 0°–15°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.570(2)$ $\beta =$ n.d. $\gamma = 1.577(2)$ 2V(meas.) = 38(5)°

Cell Data: *Space Group:* $P\bar{1}$. $a = 10.438(3)$ $b = 12.511(3)$ $c = 7.112(2)$ $\alpha = 89.92(2)°$ $\beta = 99.75(2)°$ $\gamma = 92.89(2)°$ Z = 2

X-ray Powder Pattern: Murun massif, Russia.
3.15 (100), 3.044 (91b), 3.32 (85), 3.125 (85), 3.075 (62), 3.34 (55), 3.26 (49)

Chemistry:

	(1)	(2)
SiO_2	55.65	54.17
TiO_2	1.42	1.18
Fe_2O_3	1.58	1.57

Total	99.95	99.22

(1) Murun massif, Russia; corresponds to $K_{1.85}(Ca_{3.45}Fe_{0.15}Na_{0.15}Ti_{0.13}Mn_{0.08}Mg_{0.06})_{\Sigma=4.02}Si_{7.13}O_{17}[(OH)_{2.02}O_{1.63}F_{0.61}]_{\Sigma=4.26}$. (2) Do.; by electron microprobe, average of two analyses; corresponds to $K_{2.09}(Ca_{3.32}Mg_{0.19}Fe_{0.15}Na_{0.13}Ti_{0.11}Mn_{0.06})_{\Sigma=3.96}Si_{6.95}O_{17}[(OH)_{2.05}O_{1.39}F_{0.61}]_{\Sigma=4.05}$.

Occurrence: In nearly monomineralic segregations in an alkalic massif.

Association: Charoite, tinaksite, miserite, aegirine, potassic feldspar.

Distribution: From the Magistral'nyi area, right bank of the Davan Stream, between the Chara and Tokko Rivers, in the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: For the Tokko River, nearby the type locality in Russia.

Type Material: Institute of Geology and Geophysics, Siberian Division, Academy of Sciences, Novosibirsk; Geological Museum, Yakutsk Scientific Center, Academy of Sciences, Yakutsk, Russia.

$[H_2O]$ `	1.59
Total	99.51

(1) The Shiromaru mine, Okutama Town, Tokyo, Japan; average of 6 electron microprobe analyses, H_2O calculated by analogy to gamagarite, corresponds to $(Ba_{1.92}Na_{0.02}Sr_{0.01}Ca_{0.01})_{\Sigma=1.96}(Mn^{3+}_{0.81}Fe^{3+}_{0.17}Al_{0.01})_{\Sigma=0.99}[(V_{1.99}Si_{0.01})O_{7.92}](OH)_{1.00}$.

Mineral Group: Brackebuschite group.

Occurrence: From an outcrop, in an abandoned Mn deposit in brecciated braunite and in veinlets in chert blocks enclosed in sandstone in an accretionary complex. Probably a primary mineral derived from the reaction of braunite with Ba- and V-bearing fluids.

Association: Braunite, hyalophane, tamaite.

Distribution: From the Shiromaru mine, Okutama Town, Tokyo, Japan.

Name: For the metropolitan area containing the first locality.

Type Material: National Science Museum, Tokyo, Japan (NSM-M 28569).

References: (1) Matsubara, S., R. Miyawaki, K. Yokoyama, M. Shimizu, and H. Imai (2004) Tokyoite, $Ba_2Mn^{3+}(VO_4)_2(OH)$, a new mineral from the Shiromaru mine, Okutama, Tokyo, Japan. J. Mineral. Petrol. Sci., 99, 363-367. (2) (2005) Amer. Mineral., 90, 1468 (abs. ref. 1).

Tolbachite $CuCl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, elongated, to 2 mm, in fibrous, mosslike growths incrusting basalt.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.42 Readily soluble in cold H_2O; hygroscopic, alters rapidly to eriochalcite in air.

Optical Properties: Semitransparent. *Color:* Brown to golden brown. *Luster:* Pearly. *Optical Class:* Biaxial; high birefringence. *Pleochroism:* Pale greenish $\perp$ elongation; dark reddish brown $\parallel$ elongation. *Orientation:* Elongation positive. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$ (synthetic). $a = 6.9038(9)$ $b = 3.2995(4)$ $c = 6.824(1)$ $\beta = 122.197(8)^\circ$ Z = 2

X-ray Powder Pattern: Tolbachik volcano, Russia.
5.76 (100), 2.915 (35), 3.445 (25), 1.923 (5), 2.373 (3)

Total	100.04	100.00

(1) Tolbachik volcano, Russia; analysis of a water extract. (2) $CuCl_2$.

Occurrence: As fumarolic incrustations on basalt (Tolbachik volcano, Russia); formed with other copper chlorides in an oxidized copper deposit (Bisbee, Arizona, USA).

Association: Tenorite, euchlorine, dolerophanite, piypite, ponomarevite, kamchatkite, klyuchevskite, chalcocyanite, cotunnite, sofiite, halite, sylvite, (Tolbachik volcano, Russia); paratacamite, nantokite, cuprite (Bisbee, Arizona, USA).

Distribution: At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. In the Southwest mine, Bisbee, Cochise Co., Arizona, USA.

Name: For its occurrence at the Tolbachik volcano, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1290/1.

References: (1) Bergasova, L.P. and S.K. Filatov (1983) The new mineral tolbachite $CuCl_2$. Doklady Acad. Nauk SSSR, 270, 415–417 (in Russian). (2) (1984) Amer. Mineral., 69, 408 (abs. ref. 1). Total	100.25	100.14	100.00

(1–2) Tolovka River, Russia; by electron microprobe, the average of which corresponds to $(Ir_{0.99}Pt_{0.01}Os_{0.01})_{\Sigma=1.01}Sb_{0.99}S_{0.99}$. (3) IrSbS.

Mineral Group: Cobaltite group.

Occurrence: In a placer derived from an Alpine-type gabbro massif (Tolovka River, Russia).

Association: Os–Ir alloys, laurite, pentlandite, heazlewoodite (Tolovka River, Russia).

Distribution: In Russia, from the Tolovka River placer, Ust'-Bel'skii massif, Magadan district [TL]; at the Voykar-Syn'ya and Rayiz massifs, Polar Ural Mountains. In the Similkameen River, British Columbia, Canada. From Fox Gulch, Goodnews Bay, Alaska, USA.

Name: For the type locality near the Tolovka River, Russia.

Type Material: Mining Institute, St. Petersburg, Russia; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72030.

H_2O	[1.36]	
Total	[97.83]	97.79

(1) Kalgoorlie, Western Australia; by electron microprobe, average of four analyses, total Fe as Fe_2O_3, total V as V_2O_3, total As as As_2O_3, total Sb as Sb_2O_3, H_2O calculated from stoichiometry; corresponding to $(V^{3+}_{3.08}Fe^{3+}_{0.94})_{\Sigma=4.02}Ti_{3.10}(As^{3+}_{0.76}Sb^{3+}_{0.06}Si_{0.02})_{\Sigma=O.84}O_{13}(OH)$.
(2) Hemlo deposit, Canada; by electron microprobe, average of several analyses Fe^{2+}:Fe^{3+} calculated from charge balance; corresponding to $(V^{3+}_{3.29}Fe^{3+}_{1.09}Al_{0.13}Fe^{2+}_{0.08})_{\Sigma=4.59}Ti_{2.41}(As^{3+}_{0.95}Ba_{0.35}Sb^{3+}_{0.04})_{\Sigma=1.34}O_{13}(OH)$.

Occurrence: In a specimen from a hydrothermal gold deposit (Kalgoorlie, Western Australia); in a gold deposit at the contact of felsic metavolcanic and metasedimentary rocks (Hemlo deposit, Canada).

Association: Vanadian muscovite, rutile, pyrite, calaverite, calcite, quartz (Kalgoorlie, Western Australia); quartz, microcline, barite, pyrite, molybdenite, stibnite, arsenic, sphalerite, zinkenite, aktashite, tetrahedrite, vanadian muscovite (Hemlo mine, Canada).

Distribution: In Western Australia, from Kalgoorlie, probably from the Perseverance mine. In the Hemlo gold deposit, Thunder Bay district, Ontario, Canada.

Name: To honor Stephan A. Tomich (1914–), consulting geologist, Perth, Western Australia, who presented the first specimen for examination.

Type Material: Western Australian Museum, Perth, Australia, M.67.1991, MDC6417; The Natural History Museum, London, England, 1979,532; National Museum of Natural History, Washington, D.C., USA, 146187.

H_2O	13.84	13.52	13.94
–O=Cl	3.79	3.85	4.12
Total	100.29	99.62	100.00

(1) Vesuvius, Italy; average of 15 electron microprobe analyses, H_2O calculated from stoichiometry assuming Cl^- and OH^- as the only anions; corresponding to $Cu_{3.29}Mg_{0.65}Mn_{0.05}(OH)_{6.11}Cl_{1.89}$. (2) Santo Domingo Cu Mine, Chile; average of 20 electron microprobe analyses, H_2O calculated from stoichiometry assuming Cl^- and OH^- as the only anions; corresponding to $Cu_{3.38}Mg_{0.62}(OH)_{6.06}Cl_{1.94}$. (3) $Cu_3Mg(OH)_6Cl_2$.

Occurrence: A secondary mineral in vesicles in phonolitic tephrite (Vesuvius); a secondary oxidation product of chalcocite, bornite and chalcopyrite in an environment rich in Cl in andesitic porphyric lavas and lava tuff (Chile).

Association: Leucite, sodalite, nepheline, sanidine, Fe oxides and hydroxides (Vesuvius); haydeeite, anhydrite, atacamite (Chile).

Distribution: From Vesuvius volcano, Italy, and from the Santo Domingo Cu Mine, Caleta Vitor district, Arica Province, Chile.

Name: Honors Matteo Tondi (1762-1835), an Italian mineralogist and co-author with R.J. Haüy of the classic *Traité de Minéralogie*.

Type Material: Collezione Vesuviana of the Real Museo Mineralogico, University of Naples, Italy (# 1178R), labeled as "1906 lava", and at the Mineralogical Museum, University of Hamburg, Germany (MD480).

References: (1) Malcherek, T., L. Bindi, M. Dini, M.R. Ghiara, A. Molina Donoso, F. Nestola, M. Rossi, and J. Schlüter (2014) Tondiite, $Cu_3Mg(OH)_6Cl_2$, the Mg-analog of herbertsmithite. Mineral. Mag., 78(3), 583-590. (2) (2015) Amer. Mineral., 100, 662-663 (abs. ref. 1).

Tongbaite Cr_3C_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Prismatic, pseudohexagonal crystals, to 0.3 mm, may have spearhead-shaped terminations.

Physical Properties: *Tenacity:* Brittle. Hardness = 8.5 VHN = 1885 (100 g load). D(meas.) = n.d. D(calc.) = 6.64

Optical Properties: Opaque. *Color:* Pale brownish yellow; pale violet in reflected light. *Streak:* Dark gray. *Luster:* Strong metallic.
Optical Class: Biaxial. *Pleochroism:* Distinct. *Anisotropism:* Strong; purplish yellow to yellow-orange. *Bireflectance:* Distinct.
R_1–R_2: (405) 46.54–49.10, (436) 48.50–51.28, (480) 51.14–53.86, (526) 53.72–55.94, (546) 54.68–56.89, (578) 57.07–57.51, (589) 57.38–57.82, (622) 58.72–57.68, (644) 60.33–59.02, (656) 61.50–59.97, (664) 61.56–59.97, (700) 61.35–59.20

Cell Data: *Space Group: Pnma.* $a = 5.57(5)$ $b = 11.47(8)$ $c = 2.816(8)$ Z = 4

X-ray Powder Pattern: China.
2.30 (100), 2.23 (80), 1.193 (70), 1.70 (40), 1.164 (40), 1.94 (30), 1.86 (30)

Chemistry:

	(1)	(2)
Cr	84.26	86.66
Fe	1.18	
Ni	1.25	
C	13.37	13.34
Total	100.06	100.00

(1) China; by electron microprobe, average of four analyses; corresponding to $(Cr_{2.91}Fe_{0.04}Ni_{0.04})_{\Sigma=2.99}C_{2.00}$. (2) Cr_3C_2.

Occurrence: In ultramafic rocks (China).

Association: Magnesiochromite, pyrrhotite, pentlandite, pyrite, chalcopyrite, cubanite, magnetite, ilmenite, altaite, violarite, awaruite, bismutohauchecornite, lead, chromium, gold, copper, platinum, iron, forsterite, phlogopite, apatite, diopside, enstatite, hydrogrossular (Liu Zhuang, China); iron sulfides, iron oxides, platinum-group minerals, copper, diamond, moissanite, olivine, pyroxene, pyrope (Hong district, Tibet, China).

Distribution: In China, from Liu Zhuang, Tongbai Co., Henan Province, and in the Hong district, Tibet.

Name: For Tongbai Co., China, where the mineral occurs.

Type Material: n.d.

Chemistry:

	(1)
SO_3	7.24
As_2O_5	38.61
Fe_2O_3	43.56
H_2O	9.80
Total	99.21

(1) U.S. mine, Utah, USA; by electron microprobe, average of 11 analyses, total Fe as Fe_2O_3, H_2O by the Penfield method; corresponds to $Fe_{7.58}[(AsO_4)_{4.73}(SO_4)_{1.27}]_{\Sigma=6.00}(OH)_{6.00} \cdot 4.66H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of a replacement orebody in metamorphosed limestone.

Association: Jarosite, scorodite, sulfur, kaatialaite, pyrite, arsenopyrite, galena, sphalerite, goethite, gypsum.

Distribution: From the U.S. mine, Gold Hill, Tooele Co., Utah, USA.

Name: For its initially noted occurrence in Tooele Co., Utah, USA.

Type Material: National School of Mines, Paris, France.

Topaz **$Al_2SiO_4(F,OH)_2$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Well-formed crystals common, typically morphologically complex, long to short prismatic, to 1.2 m. Prism faces commonly vertically striated, with etch and growth figures on non-prism faces; columnar, compact, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 8 D(meas.) = 3.49–3.57 D(calc.) = 3.55

Optical Properties: Transparent to opaque with inclusions. *Color:* Colorless, yellow, pink, red, orange, brown, green, blue, violet; in transmitted light, colorless, thick sections yellow, red, or blue. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* In thick sections, X = yellow; Y = yellow, violet, reddish; Z = violet, bluish, yellow, pink. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$. $\alpha = 1.606$–1.634 $\beta = 1.609$–1.637 $\gamma = 1.616$–1.644 2V(meas.) = 48°–68°

Cell Data: *Space Group: Pbnm.* $a = 4.6499(3)$ $b = 8.7968(6)$ $c = 8.3909(5)$ Z = 4

X-ray Powder Pattern: Minas Gerais, Brazil; Durango, Mexico; Thomas Range, Utah, USA; average of three patterns. (ICDD 12-765).
2.937 (100), 3.195 (66), 3.693 (60), 2.3609 (45), 2.1049 (44), 3.037 (37), 1.6706 (27)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	31.93	33.00	H_2O^+	0.19	2.67
Al_2O_3	56.26	56.76	H_2O^-		0.04
F	20.37	13.23	$-O = F_2$	8.58	5.57
			Total	100.17	100.13

(1) Thomas Range, Utah, USA; corresponds to $Al_{2.00}(Si_{0.98}Al_{0.02})_{\Sigma=1.00}O_{3.99}[F_{1.97}(OH)_{0.04}]_{\Sigma=2.01}$. (2) Brewer mine, Chesterfield Co., South Carolina, USA.

Occurrence: In veins and cavities in granite, granite pegmatite, rhyolite, and in greisen, formed from high-temperature, volatile-rich pneumatolytic hydrothermal fluids. From high-grade metamorphism of aluminous, quartz-rich, and fluorine-bearing sediments. As a heavy detrital mineral.

Association: Tourmaline, beryl, microcline, albite, fluorite, cassiterite, zinnwaldite, quartz.

Distribution: Widespread; only a few localities for the finest specimens can be mentioned. In Russia, near Mursinka, Ural Mountains, and in the Adun-Chilon and Borshchovochnoii Mountains, Nerchinsk district, Siberia. At Schneckenstein, Saxony, Germany. At Xilingeleimeng, Inner Mongolia, China. On Ghundao Hill, near Katlang, Mardan district, and in the Skardu and Gilgit districts, Pakistan. From the Mogok district, Myanmar (Burma). At Tanokamiyama, Shiga Prefecture, and the Naegi district, Gifu Prefecture, Japan. From Ouro Preto and near Virgem da Lapa, Minas Gerais, Brazil. In the USA, at Devils Head, Douglas Co., Colorado; from the Thomas Range, Juab Co., Utah; Lord's Hill, Stoneham, Oxford Co., Maine; Baldface Mountain, Carroll Co., New Hampshire; from Ramona, San Diego Co., California; near Streeter, Mason Co., Texas. At Tepetate, San Luis Potosí, Mexico. In the St. Anne's mine, Miami district, Zimbabwe. From the Alto Ligonha district, Mozambique. At Klein Spitzkopje, Namibia. In the Jos district, Nigeria.

Name: From the Greek *topazion*, meaning *to seek*, apparently in allusion to the Island of Zabargad (Zabirget or St. Johns), in the Red Sea, Egypt; the location of which was long hidden, known for olivine ("peridot" and "chrysolite"), referred to since antiquity as *topaz*.

Torbernite $Cu(UO_2)_2(PO_4)_2 \cdot 8{-}12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Thin to thick tabular crystals, square or octagonal, with prominent {001}, {011}, {110}, rarely pyramidal {111}, to 2.5 cm. Typically in subparallel aggregates, foliated, micaceous, scaly. *Twinning:* Rare on {110}.

Physical Properties: *Cleavage:* Perfect on {001}, micaceous; indistinct on {100}. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 3.22 D(calc.) = n.d. Radioactive. H_2O content varies with relative humidity.

Optical Properties: Transparent to translucent. *Color:* Emerald-green, grass-green, leek-green, siskin-green, apple-green. *Streak:* Pale green. *Luster:* Vitreous, subadamantine, waxy, pearly on cleavages; becoming dull on dehydration to metatorbernite.
Optical Class: Uniaxial (–). *Pleochroism: O* = dark green to sky-blue; *E* = green.
$\omega = 1.590–1.592$ $\epsilon = 1.581–1.582$

Cell Data: *Space Group:* $I4/mmm$. a = 7.025(5) $c = 20.63(2)$ Z = 2

X-ray Powder Pattern: Synthetic $Cu(UO_2)_2(PO_4)_2 \cdot 12H_2O$.
10.30 (10), 4.94 (9), 3.578 (9), 3.512 (8), 6.61 (4), 4.476 (4), 3.674 (4)

Chemistry:

	(1)	(2)

Total	100.15	100.00

(1) Leupoldsdorf, Bavaria, Germany. (2) $Cu(UO_2)_2(PO_4)_2 \cdot 12H_2O$.

Mineral Group: Autunite group.

Occurrence: An uncommon secondary mineral formed in the oxidized zone of some uraniferous copper deposits.

Association: Metatorbernite, autunite, zeunerite, uraninite.

Distribution: Many localities, but rarely in large amounts. From Jáchymov (Joachimsthal), Czech Republic. In Germany, at Schneeberg, Johanngeorgenstadt, and elsewhere in Saxony. Fine examples from Margabal, Aveyron, and at Les Bois Noirs, Puy-de-Dôme, France. In England, from a number of mines in Cornwall, as Wheal Basset, Stenna Gwyn, etc. From Richelle, near Visé, Belgium. At Sabugal, Portugal. Large crystals especially at the Musonoi mine, near Kolwezi, and as rich specimens from Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). On Mt. Painter, Flinders Ranges, South Australia; from the South Alligator Valley, Northern Territories, Australia. In the USA, at Chalk Mountain, near Spruce Pine, Mitchell Co., North Carolina; large crystals from the Majuba Hill mine, Antelope district, Pershing Co., Nevada.

Name: To honor Torbern Olof Bergmann (1735–1784), Swedish chemist and mineralogist, Professor of Chemistry, Uppsala University, Uppsala, Sweden.

Torreyite $(Mg, Mn^{2+})_9Zn_4(SO_4)_2(OH)_{22}\cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare blocky crystals, to 1 mm, in parallel growth; foliated, fine-grained granular to massive. *Twinning:* Ubiquitous microscopic polysynthetic twinning on a twin plane in [010].

Physical Properties: *Cleavage:* {010}, good. *Tenacity:* Somewhat brittle. Hardness = 3
D(meas.) = 2.665 D(calc.) = 2.65

Optical Properties: Translucent. *Color:* Bluish white to colorless; colorless in transmitted light. *Luster:* Vitreous to almost pearly, dull.
Optical Class: Biaxial (–). *Orientation:* $X = b$. $\alpha = 1.570$ $\beta = 1.584$ $\gamma = 1.585$
2V(meas.) = ∼40°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.522$ $b = 9.433$ $c = 16.443$ $\beta = 94.91°$ Z = 2

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
10.2 (100), 5.16 (50), 1.566 (50), 3.84 (40), 2.729 (40), 6.10 (30), 4.52 (20)

Chemistry:

	(1)
SO_3	11.64
SiO_2	0.08
MnO	17.98
ZnO	26.30
MgO	17.27
H_2O	26.39
Total	99.66

(1) Sterling Hill, New Jersey, USA; deducting SiO_2, corresponds to $(Mg_{5.60}Mn_{3.31})_{\Sigma=8.91}$ $Zn_{4.22}(SO_4)_{1.90}(OH)_{22.46}\cdot 7.928H_2O$.

Occurrence: Very rare, in veinlets cutting calcite–franklinite–willemite ore in a metamorphosed stratiform zinc orebody.

Association: Mooreite, fluoborite, pyrochroite, sussexite, rhodochrosite, zincite, franklinite, willemite, calcite.

Distribution: At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: Honors Dr. John Torrey (1796–1873), American naturalist who early studied Franklin, New Jersey, USA minerals.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 113732.

H_2O^-	6.87
rem.	0.37
Total	100.41

(1) Tooho mine, Japan.

Polymorphism & Series: A 1:1 regular interstratification of dioctahedral chlorite and smectite.

Occurrence: A hydrothermal alteration product of intermediate to felsic igneous rocks. From the alteration of sandstone by acidic pore waters.

Association: Rectorite, dickite, quartz, fluorite (Tooho mine, Japan).

Distribution: At Alushta, Crimea, Ukraine. From Huy, Belgium. At Ehrenfriedersdorf, Saxony, Germany. In Japan, in the Tooho mine, Aichi Prefecture; the Hokuno mine, Hokuno, Gifu Prefecture; the Takatama mine, Fukushima Prefecture; the Kurata mine, Yamaguchi Prefecture, and elsewhere. From the White Mountain gold mine, Cottonwood district, Washoe Co., Nevada, USA.

Name: Honors Professor Toshio Sudo (1911–), mineralogist and crystallographer, of the University of Tokyo, Tokyo, Japan.

Type Material: n.d.

References: (1) Frank-Kamenetskii, V.A., N.V. Logvinenko, and V.A. Drits (1963) A dioctahedral mixed-layer clay mineral, tosudite. Zap. Vses. Mineral. Obshch., 92, 560–565 (in Russian). Tounkite $(Na, Ca, K)_8Si_6Al_6O_{24}(SO_4)_2Cl \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 622. As elongated crystals, to 1 cm.

Physical Properties: *Cleavage:* $\{10\bar{1}0\}$, fair. Hardness = 5–5.5 D(meas.) = 2.557(4) D(calc.) = 2.60

Optical Properties: Transparent. *Color:* Yellowish bottle-green, may be tinted blue by included lazurite; colorless in thin section. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). *Pleochroism:* O = colorless; E = yellow-green. *Absorption:* $E > O$. $\omega = 1.528$ $\epsilon = 1.543$

Cell Data: *Space Group:* $P6_222$. a = 12.843(3) $c = 32.239(8)$ Z = 6

X-ray Powder Pattern: Malo-Bystrinskoye or Tultuy deposit, Russia.
3.711 (100), 3.314 (80), 4.842 (40), 2.687 (25), 2.139 (25), 3.035 (20), 2.988 (16)

Chemistry:

	(1)
SiO_2	30.71
Al_2O_3	25.43
CaO	10.82
Na_2O	10.25
K_2O	6.46
Cl	2.90
H_2O	0.77
SO_3	13.28
$-O = Cl_2$	0.66
Total	99.96

(1) Malo-Bystrinskoye or Tultuy deposit, Russia; by electron microprobe, H_2O by microcoulometry; corresponds to $(Na_{3.93}Ca_{2.30}K_{1.64})_{\Sigma=7.87}(Si_{6.07}Al_{5.93})_{\Sigma=12.00}O_{24}(SO_4)_{1.97}Cl_{0.96} \cdot 1.02H_2O$.

Mineral Group: Cancrinite group.

Occurrence: Replacing lazurite in diopside-lazurite rocks (Malo-Bystrinskoye deposit, Russia); in lazurite calciphyres (Tultuy deposit, Russia).

Association: Diopside, lazurite (Malo-Bystrinskoye deposit, Russia); calcite, diopside, pyrite, apatite (Tultuy deposit, Russia).

Distribution: In the Malo-Bystrinskoye and Tultuy lazurite deposits, near Slyudyanka, south of Lake Baikal, Siberia, Russia.

Name: For the Tunka (Tounka) Valley, which is nearby the two deposits.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Toyohaite $Ag_2FeSn_3S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. As tiny grains.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 7.25

Optical Properties: Opaque. *Color:* In polished section, white. *Anisotropism:* Distinct to strong; pale gray to steel-bluish black.

R_1–R_2: n.d.

Cell Data: *Space Group:* $B2/m$, $B2$, or Bm. $a = 13.349(10)$ $b = 26.538(20)$ $c = 4.092(7)$ $\beta = 92.77(7)°$ Z = 4

X-ray Powder Pattern: Treasury [*sic*] mine, Colorado, USA.
3.49 (100), 3.22 (80), 1.989 (60), 1.955 (60), 3.63 (50), 2.93 (50), 2.86 (50)

Chemistry:

	(1)	(2)
Ag	12.7	12.26
Pb	19.6	20.18
Bi	50.5	50.90
S	16.4	16.66
Total	99.2	100.00

(1) Treasury (*sic*) mine, Colorado, USA; by electron microprobe, corresponding to $Ag_{1.82}Pb_{1.46}Bi_{3.73}S_{7.89}$. (2) $Ag_7Pb_6Bi_{15}S_{32}$.

Occurrence: In hydrothermal vein material (Treasure Vault mine, Colorado, USA).

Association: A fine-grained decomposition product of treasurite having very similar optical properties (Treasure Vault mine, Colorado, USA).

Distribution: In the USA, from the Treasure Vault (misnamed Treasury) mine, Geneva district, Clear Creek Co., Colorado [TL]; and from a prospect, 10 km southwest of Tyrone, Grant Co., New Mexico. At the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the Beregovo district, near Mukachevo, Ukraine.

Name: For the Treasure Vault lode, Colorado, USA, where it occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, R9714.

Trabzonite $Ca_4Si_3O_{10}\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2 or $2/m$. As irregular grains, to 0.2 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 2.9 D(calc.) = 3.08

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $Z = a$; $X \wedge c = 8°$. *Dispersion:* $r > v$, weak to moderate. $\alpha = 1.632(2)$ $\beta = 1.634(2)$ $\gamma = 1.640(2)$ 2V(meas.) = 55(5)° 2V(calc.) = 60°

Cell Data: *Space Group:* $P2_1$ or $P2_1/m$. $a = 6.895(2)$ $b = 20.640(3)$ $c = 6.920(2)$ $\beta = 98°$ Z = 4

X-ray Powder Pattern: İkizdere, Turkey.
3.062 (100), 2.585 (90), 3.442 (60), 2.851 (50), 2.635 (50), 5.71 (35), 2.912 (30)

Chemistry:

	(1)
SiO_2	40.38
Al_2O_3	0.05
MnO	0.04
MgO	0.13
CaO	50.20
Na_2O	0.30
H_2O	7.0
Total	98.10

(1) İkizdere, Turkey; by electron microprobe, H_2O by weight loss; corresponds to $(Ca_{3.99}Na_{0.05}Mg_{0.01})_{\Sigma=4.05}Si_{3.07}O_{12}H_{3.66}$.

Occurrence: A product of retrograde alteration, in a skarn produced by intrusion of a granite into sediments.

Association: Spurrite, rustumite, calcite, vesuvianite, hillebrandite, defernite, tobermorite, killalaite, garnet, perovskite, molybdenite.

Distribution: From İkizdere, northwest of Varda Yaylasi, Trabzon Province, Turkey.

Name: For Trabzon Province, Turkey, where it was first found.

Type Material: Natural History Museum, Geneva, Switzerland, 435/78.

References: (1) Sarp, H. and G. Burri (1986) Trabzonite $Ca_4Si_3O_{10}\cdot 2H_2O$ a new hydrated silicate. Schweiz. Mineral. Petrog. Mitt., 66, 453 (abs.). (2) (1988) Mineral. Tranquillityite $Fe_8^{2+}(Zr,Y)_2Ti_3Si_3O_{24}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* n.d. As thin laths, to 65 μm, and as sheaves of laths.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.7(1)

Optical Properties: Opaque to semitransparent. *Color:* Gray; foxy-red [deep reddish brown] in strong transmitted light.
Optical Class: Isotropic to weakly anisotropic. $n = 2.11–2.13$

Cell Data: *Space Group:* n.d. $a = 11.69(5)$ $c = 22.25(10)$ $Z = 3$

X-ray Powder Pattern: Sea of Tranquillity, Moon.
3.23 (100), 1.781 (70), 2.155 (60), 4.04 (50), 3.34 (40), 3.18 (40), 3.13 (40)

Chemistry:

	(1)
SiO_2	14.00
TiO_2	19.45
ZrO_2	17.15
HfO_2	0.17
Al_2O_3	1.12
Cr_2O_3	0.11
Nb_2O_3	0.33
Y_2O_3	2.76
Nd_2O_3	0.24
FeO	42.48
MnO	0.29
CaO	1.26
Total	[99.36]

(1) Sea of Tranquillity, Moon; by electron microprobe, average of 12 analyses, original total given as 99.32%; corresponds to $(Fe_{7.36}Ca_{0.28}Ti_{0.25}Mn_{0.05})_{\Sigma=7.94}(Zr_{1.73}Y_{0.30}Nd_{0.02}Hf_{0.01})_{\Sigma=2.06}(Ti_{2.78}Al_{0.17}Nb_{0.03}Cr_{0.02})_{\Sigma=3.00}(Si_{2.90}Al_{0.10})_{\Sigma=3.00}O_{24}$.

Occurrence: A late-stage crystallization product of lunar basaltic magma.

Association: Troilite, pyroxferroite, tridymite, cristobalite, alkalic feldspar, felsic glass.

Distribution: On the Moon, at the Apollo 11, 12, 14, 16, and 17 collection sites.

Name: For the Sea of Tranquillity, Moon, from which the mineral was first collected.

Type Material: Lunar Science Institute, Houston, Texas, USA.

Total	100.06

(1) Stradner Kogel quarry, near Bad Gleichenberg, eastern Styria, Austria; average of 17 electron microprobe analyses, no H_2O detected by IR; Mg and Fe distributions from crystal structure analysis, Fe^{3+}/Fe^{2+} by charge balance; corresponding to $(K_{0.07}Na_{0.01})_{\Sigma=0.08}(Mg_{2.46}Fe^{3+}_{1.99}Fe^{2+}_{0.30}Mn_{0.08}Zn_{0.05}Al_{0.04}Ti_{0.01})_{\Sigma=4.93}[Si_{12}O_{30}]$.

Mineral Group: Milarite (osumilite) group.

Occurrence: In small cavities within a Si-rich xenolith in nephelinite volcanic rock.

Association: Sanidine, plagioclase, quartz, tridymite, hematite, orthopyroxene, clinopyroxene, clinoamphibole**.**

Distribution: From the Stradner Kogel haüyne–nephelinite quarry, near Bad Gleichenberg, eastern Styria, Austria.

Name: Honors the knowledgeable mineral collector, Walter Trattner, who found the specimen.

Type Material: Landesmuseum, Joanneum Graz and in the Natural History Museum, Vienna, Austria; 82775-82779.

References: (1) Postl, W., F. Walter, K. Ettinger, C. Hauzenberger, H.-P. Bojar (2004) Trattnerite, $(Fe,Mg)_2(Mg,Fe)_3[Si_{12}O_{30}]$, a new mineral of the milarite group: mineral data and crystal structure. Eur. J. Mineral., 16, 375-380. (2) (2005) Amer. Mineral., 90, 273-274 (abs. ref. 1).

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. As tiny grains.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 7.25

Optical Properties: Opaque. *Color:* In polished section, white. *Anisotropism:* Distinct to strong, in light gray to steel bluish black.
R_1–R_2: n.d.

Cell Data: *Space Group:* $B2/m$, $B2$, or Bm. $a = 13.349(10)$ $b = 26.538(20)$ $c = 4.092(7)$ $\beta = 92.77(7)°$ Z = 4

X-ray Powder Pattern: Treasury (sic) mine, Colorado, USA.
3.49 (100), 3.22 (80), 1.989 (60), 1.955 (60), 3.63 (50), 2.93 (50), 2.86 (50)

Chemistry:

	(1)	(2)
Ag	12.7	12.26
Pb	19.6	20.18
Bi	50.5	50.90
S	16.4	16.66
Total	99.2	100.00

(1) Treasury (sic) mine, Colorado, USA; by electron microprobe, corresponding to $Ag_{1.82}Pb_{1.46}Bi_{3.73}S_{7.89}$. (2) $Ag_7Pb_6Bi_{15}S_{32}$.

Occurrence: In hydrothermal vein material.

Association: A fine-grained decomposition product of treasurite having very similar optical properties (Treasure Vault mine, Colorado, USA).

Distribution: From the Treasure Vault (misnamed Treasury) mine, Geneva district, Park and Summit Cos., Colorado; and from a prospect, 10 km southwest of Tyrone, Grant Co., New Mexico, USA. In the Kochbulak deposit, eastern Uzbekistan, USSR.

Name: For the Treasure Vault lode, Colorado, USA, in which it occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, R9714.

Trechmannite $AgAsS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystals short prismatic; equant, also irregular. size??ckMinSwitz

Physical Properties: *Cleavage:* Good on $\{10\overline{1}1\}$, distinct on {0001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1.5–2 VHN = 97–100 (25 g load). D(meas.) = n.d. D(calc.) = 4.77 (synthetic).

Optical Properties: Opaque, except in thin pieces. *Color:* Scarlet-vermilion; in polished section, white having a bluish cast, with red-orange internal reflections. *Streak:* Scarlet-vermilion. *Luster:* Adamantine.
Optical Class: Uniaxial (–). *Pleochroism:* In transmitted light, faint; O = pale reddish; E = near colorless. $n = > 2.61$ (Li). *Anisotropism:* Moderate (synthetic).

R_1–R_2: (400) 26.2–37.6, (420) 25.7–36.9, (440) 24.9–35.5, (460) 23.7–33.8, (480) 23.0–32.6, (500) 23.4–31.6, (520) 23.7–30.7, (540) 23.4–29.9, (560) 22.7–29.1, (580) 22.1–28.5, (600) 21.5–28.0, (620) 21.0–27.6, (640) 20.6–27.2, (660) 20.3–26.9, (680) 20.0–26.4, (700) 19.9–26.2

Cell Data: *Space Group:* $R\overline{3}$. $a = 13.98$ $c = 9.12$ Z = 18

X-ray Powder Pattern: Binntal, Switzerland. (ICDD 16-700).
2.702 (100), 3.15 (80), 1.887 (80), 1.937 (70), 7.0 (60), 4.26 (60), 3.64 (60)

Chemistry:

Ag	43.9	43.69
As	30.8	30.34
S	26.1	25.97
Total	100.8	100.00

(1) Binntal, Switzerland; by electron microprobe. (2) $AgAsS_2$.

Polymorphism & Series: Dimorphous with smithite.

Occurrence: Of hydrothermal origin, in dolostone (Binntal, Switzerland).

Association: Seligmannite, tennantite, pyrite, chromian muscovite (Binntal, Switzerland).

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL]. At Niederbeerbach, Odenwald, Hesse, Germany.

Name: Honoring Dr. Charles Otto Trechmann (1851–1917), English crystallographer.

Type Material: n.d.

Trembathite $(Mg, Fe^{2+})_3B_7O_{13}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3*m*. As pseudocubic rhombohedra, to 2 cm, isolated or in groups. *Twinning:* Microscopic polysynthetic twinning typical.

Physical Properties: *Fracture:* Conchoidal. Hardness = 6–8 D(meas.) = 2.84–3.34 D(calc.) = 3.225

Optical Properties: Transparent. *Color:* Colorless to pale blue, pink; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.684(2)$ $\epsilon = 1.668(2)$

Cell Data: *Space Group: R*3*c*. $a = 8.588(2)$ $c = 21.050(6)$ Z = 6

X-ray Powder Pattern: Salt Springs deposit, Canada.
3.028 (100), 2.050 (73), 2.711 (66), 2.144 (37), 3.497 (34), 1.828 (25), 2.475 (23)

Chemistry:

	(1)	(2)
B_2O_3	57.33	55.67
FeO	13.59	23.51
MnO	0.49	0.37

CaO	0.01	0.01
Cl	9.29	8.00
$-O = Cl_2$	2.09	1.81
Total	[100.64]	100.02

(1) Salt Springs deposit, Canada; by electron microprobe, total Fe as FeO, weighted average of compositional zones, original total given as 100.63%; corresponding then to $Mg_{2.29}Fe_{0.79}Mn_{0.03}B_{6.89}O_{12.90}Cl_{1.10}$. (2) Boulby mine, England; by electron microprobe, total Fe as FeO; corresponding to $(Mg_{1.55}Fe_{1.43}Mn_{0.02})_{\Sigma=3.00}B_{7.00}O_{13.01}Cl_{0.99}$.

Polymorphism & Series: Dimorphous with boracite.

Occurrence: A rare component of marine evaporite borate deposits.

Association: Halite, hilgardite (Salt Springs deposit, Canada).

Distribution: In Canada, from the Salt Springs evaporite deposit, and in the Potash Corporation of America mine, Penobsquis evaporite deposit, near Sussex, New Brunswick, Canada. Large crystals from the Boulby potash mine, northwest of Whitby, Yorkshire, England.

Name: Honors Dr. Lowell T. Trembath (1936–1994), Canadian mineralogist, Professor of Mineralogy, University of New Brunswick, Fredericton, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M44741.

References: (1) Burns, P.C., F.C. Hawthorne, and J.A.R. Stirling (1992) Trembathite, $(Mg, Fe)_3B_7O_{13}Cl$, a new borate mineral from the Salt Springs potash deposit, Sussex, New Brunswick. Can. Tremolite $Ca_2(Mg,Fe^{2+})_5Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Elongated, stout prismatic, or flattened bladed crystals, to 20 cm; also fibrous, granular or columnar aggregates. *Twinning:* Simple or multiple, common ∥ {100}; rarely multiple ∥ {001}.

Physical Properties: *Cleavage:* Perfect on {110}, intersecting at 56° and 124°; partings on {010}, {100}. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 2.99–3.03 D(calc.) = 2.964

Optical Properties: Transparent to translucent. *Color:* White, gray, lavender to pink; colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = -21°$ to $-19°$; $X \wedge a = -6°$ to $-4°$. *Dispersion:* $r < v$, weak. α = 1.605–1.613 β = 1.616–1.624 γ = 1.630–1.636 2V(meas.) = 86°–88°

Cell Data: *Space Group:* $C2/m$. a = 9.863(1) b = 18.048(2) c = 5.285(1) β = 104.79(1)° Z = 2

X-ray Powder Pattern: St. Gotthard, Switzerland.
8.38 (100), 3.121 (100), 2.705 (90), 3.268 (75), 1.892 (50), 2.805 (45), 2.015 (45)

(1) Gouverneur, New York, USA; Fe_2O_3 trace; corresponds to $(Ca_{1.80}Na_{0.38}K_{0.12})_{\Sigma=2.30}(Mg_{5.00}Fe^{2+}_{0.01})_{\Sigma=5.00}(Si_{7.77}Al_{0.23})_{\Sigma=8.00}O_{22}[(OH)_{1.34}F_{0.66}Cl_{0.01}]_{\Sigma=2.01}$. (2) Balmat No. 3 mine, St. Lawrence Co., New York; by electron microprobe, original total given as 101.47%; corresponds to $(Ca_{1.74}Na_{0.54}K_{0.10})_{\Sigma=2.38}(Mg_{4.95}Al_{0.04})_{\Sigma=4.99}Si_{8.01}O_{22}[F_{1.64}(OH)_{0.35}Cl_{0.01}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with actinolite and ferro-actinolite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.90$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si \geq 7.5$.

Occurrence: From contact metamorphism of Ca-Mg siliceous sediments; in greenschist facies metamorphics derived from ultramafic or magnesium carbonate rocks.

Association: Calcite, dolomite, calcian garnet, wollastonite, talc, diopside, forsterite, cummingtonite, magnesio-cummingtonite, riebeckite, winchite.

Distribution: Notable localities include: on Campolungo Alp, Ticino, and Bristenstock, Uri, Switzerland. From St. Marcel, Piedmont, Italy. At Bilin, Czech Republic. In the USA, from Pierrepont, Gouverneur, Edwards, and Macomb, St. Lawrence Co., New York; at Franklin, Sussex Co., New Jersey; and Lee, Berkshire Co., Massachusetts. At Wilberforce, Ontario, Canada. From Kozano, Badakhshan Province, Afghanistan. At Lelatema, Tanzania. In the Brumado mine, Bahia, Brazil.

Name: For an occurrence in the Tremola Valley, southern St. Gotthard Mountains, Switzerland.

(1) Bon Accord, South Africa. (2) Mt. Clifford, Australia; by electron microprobe, total Fe as FeO; with Fe^{3+}:Fe^{2+} calculated from stoichiometry, corresponds to $(Ni_{0.66}Fe^{2+}_{0.30}Mg_{0.04})_{\Sigma=1.00}(Fe^{3+}_{1.99}Al_{0.01})_{\Sigma=2.00}O_4$. (3) $NiFe_2O_4$.

Mineral Group: Spinel group.

Occurrence: In a small tabular body of nickeliferous serpentinite, probably a contact deposit, along the junction of quartzite and an ultramafic intrusive (Bon Accord, South Africa); below a nickel sulfide deposit in gabbro intruding peridotites (Mt. Clifford, Australia).

Association: Nimite, willemseite, nickeloan talc, violarite, millerite, reevesite, goethite (Bon Accord, South Africa); nickel, heazlewoodite, millerite (Mt. Clifford, Australia).

Distribution: Found three km west of the Scotia talc mine, Bon Accord area, Barberton, Transvaal, South Africa. In the Mt. Clifford nickel deposit, 54 km north-northwest of Leonora, Western Australia. As a minor constituent of the widespread sediments marking major geological period boundaries, as the Cretaceous-Tertiary.

Name: Honors Major Tudor Gruffydd Trevor (1865–1958), Welsh–South African geologist, Mining Inspector for the Pretoria district, Transvaal, South Africa.

Type Material: National Museum of Natural History, Washington, D.C., USA, 132464, 132465.

Triangulite $Al_3(UO_2)_4(PO_4)_4(OH)_5 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Tablets, flattened on {100}, with triangular outline, to 0.2 mm, less commonly pseudo rhombohedral. *Twinning:* Common, about [011].

Physical Properties: Hardness = 2–3 D(meas.) = 3.7(2) D(calc.) = 3.68 Radioactive.

Optical Properties: Transparent. *Color:* Bright yellow, yellow-green. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Pleochroism:* Y = pale yellow-green; Z = bright yellow. *Orientation:* $X \perp \{100\}$; $Y \simeq [011]$; $Z \simeq [0\overline{1}1]$. $\alpha = [1.639]$ $\beta = 1.665(2)$ $\gamma = 1.704(2)$ 2V(meas.) = 80°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.39$ (3) $b = 10.56(3)$ $c = 10.60(3)$ $\alpha = 116.4(1)°$ $\beta = 107.8(1)°$ $\gamma = 113.4(1)°$ Z = 1

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
7.80 (100), 3.87 (80), 3.15 (70), 2.99 (50), 4.70 (30), 3.74 (20), 3.63 (20)

Chemistry:

Total	[100.00]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of seven analyses, H_2O by difference; corresponds to $Al_{3.01}(UO_2)_{4.04}(PO_4)_{3.94}(OH)_{5.29} \cdot 4.78H_2O$. (2) $Al_3(UO_2)_4(PO_4)_4(OH)_5 \cdot 5H_2O$.

Occurrence: A rare secondary species in the uraniferous oxidized zone of a complex zoned granite pegmatite.

Association: Meta-autunite, furongite, phosphuranylite, ranunculite, beryl, zircon, columbite, feldspar, quartz.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For the typical *triangular* habit of the crystals.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG6192.

References: (1) Deliens, M. and P. Piret (1982) Les phosphates d'uranyle et d'aluminium de Kobokobo. VI. La triangulite, $Al_3(UO_2.PO_4)_4(OH)_5.5H_2O$, nouveau minéral. Bull. Minéral., 105, 611–614 (in French with English abs.). (2) (1984) Amer. Mineral., 69, 212 (abs. ref. 1).

(1) Cerro San Cristóbal, Mexico; spectrographic analysis, SiO_2 by difference. (2) Mule Springs, Oregon, USA.

Polymorphism & Series: Quartz, cristobalite, stishovite, and coesite are polymorphs; high tridymite is formed between 870 °C and 1470 °C; a number of stacking polytypes are known, especially non-terrestrial.

Occurrence: Deposited from hot gases in vesicles and lithophysae; as phenocrysts in felsic volcanic rocks, and less commonly, in basalts; in contact metamorphosed sandstone.

Association: Cristobalite, sanidine, quartz, augite, fayalite, "hornblende," hematite, ferroan enstatite, troilite.

Distribution: Prominent localities include: on Cerro San Cristóbal, Pachuca, Hidalgo, Mexico. In the USA, in California, from near Portola, Plumas Co., Pomona, Los Angeles Co., and at Bumpass Hill, Lassen National Park, Shasta Co.; at Mule Springs, 160 km northeast of Lakeview, Harney Co., Oregon; in the San Juan Mountains, San Juan Co., Colorado; large crystals from the Thomas Range, Juab Co., Utah. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From the Colli Euganei, near Padua, Vicenza, and Marriabu, Sardinia, Italy. At Puy Capuchin, Puy-de-Dôme, France. On Tardree Mt., Co. Antrim, Ireland. In Japan, at Kumamoto, Kumamoto Prefecture, and Yugawara, Kanagawa Prefecture. In a number of meteorites.

Name: From the Greek meaning *three-twin*, in allusion to the common occurrence of trillings.

Trigonite $Pb_3Mn^{2+}(As^{3+}O_3)_2(As^{3+}O_2OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* As crystals with a trigonal outline from development of many domatic forms, flattened on {010}, to 5 mm; in subparallel growths.

Physical Properties: *Cleavage:* {010}, perfect; {101}, good. *Fracture:* Uneven. Hardness = 2–3 D(meas.) = 6.1–7.1 D(calc.) = 6.35

Optical Properties: Translucent. *Color:* Sulfur-yellow to yellowish brown, dark brown; pale yellow to brownish yellow in transmitted light. *Luster:* Vitreous to adamantine. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$. *Dispersion:* $r < v$, observable. $\alpha = 2.07$ $\beta = 2.10$ $\gamma = 2.12$ 2V(meas.) = Very large.

Cell Data: *Space Group: Pn.* $a = 7.258(3)$ $b = 6.822(4)$ $c = 11.088(6)$ $\beta = 94.45(4)°$ Z = 2

X-ray Powder Pattern: Långban, Sweden.
2.99 (10), 3.08 (9), 3.24 (7), 4.90 (6), 4.50 (4), 3.65 (4), 2.76 (4)

Chemistry:

	(1)	(2)
As_2O_3	28.83	28.36
FeO	0.15	
MnO	6.79	6.78
PbO	63.40	64.00
MgO	0.11	
CaO	0.23	
Cl	trace	
H_2O	0.81	0.86
insol.	0.13	
Total	100.45	100.00

(1) Långban, Sweden; averages of several analyses. (2) $Pb_3Mn(AsO_3)_2(AsO_2OH)$.

Occurrence: In a metamorphosed Fe–Mn orebody.

Association: Lead, dixenite, hausmannite, finnemanite, rouseite, dolomite, barite.

Distribution: At Långban, Värmland, Sweden.

Name: From the Greek for *triangle*, alluding to the characteristic crystal outline.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Trikalsilite $(K, Na)AlSiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 6. Extremely fine-grained; in parallel growth with nepheline and kalsilite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* [White.]
Optical Class: [Uniaxial.] ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P6_3$. $a = 15.339(4)$ $c = 8.501(2)$ Z = n.d.

X-ray Powder Pattern: Kabfumu volcanic flow, Congo.
3.076 (100), 3.050 (95), 2.558 (45), 4.269 (35), 2.410 (35), 3.932 (30), 3.384 (25)

Chemistry: Apparently no analysis is available.

Polymorphism & Series: Polymorphous with kaliophilite, kalsilite, and panunzite.

Occurrence: In lava.

Association: Nepheline, kalsilite.

Distribution: From the Kabfumu volcanic flow, between the Mt. Mikeno and Mt. Nyiragongo volcanos, Kivu Province, Congo (Zaire).

Name: For the length of the [100] axis, three times that of *kalsilite*.

Type Material: n.d.

Trimerite $CaMn_2^{2+}Be_3(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, pseudohexagonal by twinning, to 12 mm; as crystal intergrowths. *Twinning:* Triple twins with composition planes (110) and $(1\bar{1}0)$; in basal section, twin lamellae in three directions intersect at an angle of 120°.

Physical Properties: *Cleavage:* Distinct on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 3.474 D(calc.) = 3.47

Optical Properties: Transparent to translucent. *Color:* Salmon-pink, pale yellowish red to nearly colorless; in thin section, colorless. *Luster:* Vitreous, brilliant.
Optical Class: Biaxial (–). *Orientation:* $X \perp \{001\}$. *Dispersion:* Perceptible. $\alpha = 1.715$ $\beta = 1.720$ $\gamma = 1.725$ 2V(meas.) = 83°

Cell Data: *Space Group:* $P2_1/n$. $a = 8.098$ $b = 7.613$ $c = 14.065$ $\beta = 90°$ Z = 4

X-ray Powder Pattern: Harstigen mine, Sweden. (ICDD 17-477).
2.764 (100), 3.56 (40), 2.229 (35), 2.332 (30), 1.420 (30), 2.053 (25), 1.784 (25)

Chemistry:

	(1)	(2)
SiO_2	39.77	39.77
FeO	3.87	
MnO	26.86	31.30
BeO	17.08	16.56
MgO	0.61	
CaO	12.44	12.37
Total	100.63	100.00

(1) Harstigen mine, Sweden. (2) $CaMn_2Be_3(SiO_4)_3$.

Occurrence: A rare mineral, probably formed during late-stage hydrothermal activity associated with contact metamorphism and metasomatism.

Association: Calcite, hematite.

Distribution: At the Harstigen mine, near Persberg, at Jakobsberg, and at Långban, Värmland, Sweden.

Name: From the Greek for *three parts*, in allusion to the trilling twinning and associated optical effects.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 460.

Trimounsite-(Y) $Y_2Ti_2SiO_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, elongated along [001], up to 5 mm; showing {110}, {130}, {010}, {211}, {121}, {011}, striated on {110} and {130}.

Physical Properties: *Tenacity:* Brittle. Hardness = 7 D(meas.) = 5.0(1) D(calc.) = 4.85 Blue cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Light brown. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, strong. $\alpha = > 2.10$ $\beta = > 2.10$ $\gamma = > 2.10$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 12.299(2)$ $b = 11.120(2)$ $c = 4.854(1)$ $\beta = 95.62(1)^\circ$ Z = 4

X-ray Powder Pattern: Trimouns, France.
2.820 (100), 3.44 (90), 1.959 (60), 1.643 (60), 2.117 (50), 1.628 (50), 2.777 (40)

Chemistry:

	(1)
SiO_2	11.77
TiO_2	34.47
Y_2O_3	34.62
Sm_2O_3	0.40
Gd_2O_3	1.92

Dy_2O_3	5.67
Ho_2O_3	0.79
Er_2O_3	5.04
Yb_2O_3	4.83
Total	100.22

(1) Trimouns, France; by electron microprobe, mean of several analyses; corresponds to $(Y_{1.48}Dy_{0.15}Er_{0.13}Yb_{0.12}Gd_{0.05}Ho_{0.02}Tb_{0.02}Sm_{0.01})_{\Sigma=1.98}Ti_{2.08}Si_{0.94}O_9$.

Occurrence: In dolomitic portions of a talc deposit.

Association: Allanite, bastnäsite, monazite, parisite, synchysite, calcite, dolomite.

Distribution: From the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France.

Name: For the locality, the Trimouns talc deposit, France, and its *yttrium* content.

Type Material: Royal Institute of Natural Sciences of Belgium, Brussels, Belgium, RC3967.

Trinepheline $NaAlSiO_4$

Crystal Data: Hexagonal. *Point Group*: n.d. Pseudomorphous after jadeite, as skeletal crystals, to 20 mm, and rarely as pseudo prismatic crystals.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = ~5-5.5
D(meas.) = n.d. D(calc.) = 2.642

Optical Properties: Transparent. *Color*: White to yellow, colorless in thin section.
Streak: White. *Luster*: Vitreous to greasy.
Optical Class: n.d. *n*(calc.) = 1.538

Cell Data: *Space Group*: $P6_1$. a = 9.995 c = 24.797 Z = 24 [synthetic hexagonal $NaAlSiO_4$]

X-ray Powder Pattern: Calculated pattern. [identifiable only by a combination of scanning electron microscopy, electron microprobe analyses and electron backscatter diffraction]
3.163 (100), 3.834 (81), 4.133 (49), 3.272 (40), 2.403 (31), 4.328 (22), 2.401 (22)

Chemistry:

Total	99.88

(1) Tawmaw-Hpakant Jade Tract, Myanmar; average of 12 electron microprobe analyses; corresponding to $Na_{1.00}Al_{1.01}Si_{0.99}O_4$.

Occurrence: In serpentinized peridotite, replacing jadeite during late stage metamorphism along veins, likely related to decompression.

Association: Nepheline, fabriesite, more rarely with albite, banalsite, stronalsite.

Distribution: From the Tawmaw-Hpakant Jade Tract, Hpakant Township, Mohnyin District, Kachin State, Myanmar.

Name: For the naturally occurring polymorphs of synthetic $NaAlSiO_4$ with a value of the c crystallographic dimension that is three times that of nepheline.

Type Material: National Museum of Natural History, Paris, France (MNHN 212.001).

References: (1) Ferraris, C., G.C. Parodi, S. Pont, B. Rondeau, and J-P. Lorand (2014) Trinepheline and fabriesite: two new mineral species from the jadeite deposit of Tawmaw (Myanmar). European Journal of Mineralogy, 26(2), 257-265. (2) (2014) Amer. Mineral., 99, 1808-1809 (abs. ref. 1).

Triphylite $\mathbf{Li(Fe^{2+},Mn^{2+})PO_4}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals rare, typically prismatic, with large {011}, {100}, {010}, {021}, {120}, several other forms. Commonly subhedral, to 6.5 m, cleavable, compact, massive.

Physical Properties: *Cleavage:* {100}, perfect; {010}, imperfect; {011}, interrupted. *Fracture:* Uneven to subconchoidal. Hardness = 4–5 D(meas.) = 3.50–3.58 D(calc.) = 3.562

Optical Properties: Transparent to translucent. *Color:* Bluish gray to greenish gray; brownish to black where altered. *Streak:* White to grayish white. *Luster:* Vitreous to subresinous. *Optical Class:* Biaxial (+). *Orientation:* X = a or c; Y = c or b; Z = b or a. *Dispersion:* $r < v$, strong. α = 1.675–1.694 β = 1.684–1.695 γ = 1.685–1.700 2V(meas.) = 0°–55°

Cell Data: *Space Group: Pmnb.* a = 6.0285(6) b = 10.3586(9) c = 4.7031(3) Z = 4

(1) "Central Asia", Russia. (2) $Li(Fe,Mn)PO_4$ with Mn:Fe = 1:1.

Mineral Group: Forms a series with lithiophilite.

Occurrence: The most abundant primary phosphate in complex zoned granite pegmatites.

Association: Ferrisicklerite, heterosite, alluaudite, many other Fe–Mn phosphates and oxides.

Distribution: Occurs at numerous localities; in Germany, from Hühnerkobel, near Zwiesel, and Hagendorf, Bavaria. At Sukula and Tammela, Finland. From Varuträsk, Norrö, and Skrumpetorp, Sweden. In the La Vilate quarry, near Chanteloube, and at Huréaux, Haute-Vienne, France. From Dolni Borí, near Velké Meziříčí, Czech Republic. At the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. In the USA, large crystals from the G.E. Smith quarry, Newport, Sullivan Co., the Palermo #1 mine, near North Groton, Grafton Co., and elsewhere in New Hampshire; at Newry, Oxford Co. and other places in Maine; from the Dan Patch, Big Chief, and Hesnard mines, near Keystone, Pennington Co., and at the Bull Moose and Tip Top mines, near Custer, Custer Co., South Dakota; in the White Picacho district, Maricopa and Yavapai Cos., Arizona. At Point de Bois, Manitoba, Canada.

Name: From the Greek for *threefold* and *family*, as it contains three cations.

Triplite $(Mn^{2+}, Fe^{2+}, Mg, Ca)_2(PO_4)(F, OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are typically very rough, but may have many indistinct forms, to 4 m; usually nodular, massive.

Physical Properties: *Cleavage:* On {001}, good; on {010}, fair; on {100}, poor. *Fracture:* Uneven to subconchoidal. Hardness = 5–5.5 D(meas.) = 3.5–3.9 D(calc.) = 3.85–3.94

Optical Properties: Translucent to opaque. *Color:* Chestnut-brown, reddish brown, flesh-red, salmon-pink; brownish black to black if altered; in transmitted light, pale brownish yellow to dark reddish brown. *Streak:* White to brown. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (+). *Pleochroism:* Distinct; yellow-brown to reddish brown. *Orientation:* $Y = b$; $Z \wedge c = -41°$. *Dispersion:* $r > v$, , moderate to strong. *Absorption:* $X > Z = Y$.
$\alpha = 1.643–1.684$ $\beta = 1.647–1.693$ $\gamma = 1.668–1.703$ 2V(meas.) = 25°–76°

Cell Data: *Space Group:* $I2/a$. $a = 12.065–12.134$ $b = 6.454–6.546$ $c = 9.937–9.939$ $\beta = 106.08°–107.09°$ Z = 8

X-ray Powder Pattern: Palermo #1 mine, New Hampshire, USA; close to zwieselite. (ICDD 40-1499).
3.008 (100), 2.525 (81), 4.277 (76), 3.487 (70), 5.175 (34), 3.923 (26), 2.462 (25)

(1) Aurum, Reagan district, White Pine Co., Nevada, USA. (2) East Kemptville, Canada; by electron microprobe, total Fe as FeO, total Mn as MnO, corresponds to $(Mn_{1.43}Fe_{0.43}Mg_{0.12}Ca_{0.03})_{\Sigma=2.01}P_{0.97}O_{3.86}F_{1.14}$. (3) $(Mn, Fe)_2(PO_4)F$ with Mn:Fe = 1:1.

Polymorphism & Series: Forms a series with zwieselite.

Occurrence: A principal primary phosphate, or replacing earlier species, commonly lithiophilite, in complex zoned granite pegmatites; in hydrothermal tin veins.

Association: Triploidite–wolfeite, triphylite–lithiophilite, phosphosiderite, vivianite, apatite, tourmaline, sphalerite, pyrite, quartz.

Distribution: Many localities; some prominent occurrences follow: from Limoges and in the La Vilate quarry, near Chanteloube, Haute-Vienne, France. In Germany, from Hagendorf, and on the Kreuzberg, Pleystein, Bavaria. At Horní Slavkov (Schlaggenwald), Czech Republic. From the Mangualde pegmatite, near Mesquitela, Portugal. At Lemnäs, Finland. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. At the East Kemptville tin mine, Nova Scotia, Canada. In the USA, at the Mica Lode, Fremont Co., Colorado; in the White Picacho district, Maricopa and Yavapai Cos., Arizona; from Lord Hill, Stoneham, Oxford Co., Maine; at the Elk Ridge pegmatite, Custer, Custer Co., South Dakota. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina, large nodules.

Name: From the Greek for *threefold*, probably for its cleavages.

(1) Branchville, Connecticut, USA. (2) Wheal Owles, England; H_2O by difference, corresponds to $(Mn_{1.95}Ca_{0.01}Si_{0.03})_{\Sigma=1.99}[(P_{0.94}As_{0.07})_{\Sigma=1.01}O_4](OH)_{1.00} \bullet 0.49H_2O$. (3) $(Mn,Fe)_2(PO_4)(OH)$ with Fe:Mn = 1:1.

Polymorphism & Series: Forms a series with wolfeite.

Occurrence: An uncommon hydrothermal alteration product of primary phosphates in complex zoned granite pegmatites.

Association: Triplite, lithiophilite, triphylite, eosphorite, dickinsonite, rhodochrosite.

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; at the Ross (Highland Lode) mine, 6.5 km west of Custer, Custer Co. and the Peerless mine, near Keystone, Pennington Co., South Dakota; in the White Picacho district, Maricopa and Yavapai Cos., Arizona; from the Foote mine, Kings Mountain, Cleveland Co., North Carolina; in the Emmons quarry, Greenwood, Oxford Co., Maine. At Wheal Owles, St. Just, Cornwall, England. In the Hunnakko pegmatite, Alavus district, Finland. From Vídeň, near Velkého Meziříči, Czech Republic. In Germany, at Hagendorf and Waidhaus, Bavaria. In the Lion Hill mine, Urungwe, Zimbabwe. From Parelhas, Rio Grande do Norte, Brazil.

Name: From *triplite* and the Greek for *form*, as it closely resembles that species.

Type Material: Yale University, New Haven, Connecticut, USA, 5.5646–5.5648.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 853–855. (2) Waldrop, L. Trippkeite $CuAs_2^{3+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals short prismatic to equant, with {021}, {100}, {001} dominant, four additional forms, may be bent.

Physical Properties: *Cleavage:* {100}, perfect; {110}, good. *Tenacity:* Fibers formed by cleavage are easily bent. Hardness = Soft. D(meas.) = 4.8(5) D(calc.) = 4.48

Optical Properties: Semitransparent. *Color:* Greenish blue; pale bluish green in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.90(1)$ $\epsilon = 2.12(1)$

Cell Data: *Space Group:* $P4_2/mbc$ (synthetic). $a = 8.592(4)$ $c = 5.573(4)$ Z = 4

X-ray Powder Pattern: Synthetic; calculated from crystal structure.
3.16 (100), 6.07 (57), 3.04 (47), 2.34 (36), 1.95 (36), 2.72 (34), 1.64 (25)

Chemistry: Apparently no analysis has ever been performed.

Occurrence: In a copper deposit.

Association: Cuprite, malachite, olivenite, chalcopyrite.

Distribution: From near Copiapó, Atacama, Chile.

Name: To honor Dr. Paul Trippke (1851–1880), Polish mineralogist, who discovered the mineral.

Type Material: n.d.

Tripuhyite $Fe^{2+}Sb_2^{5+}O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* [$4/m$ $2/m$ $2/m$] (by analogy to the ferrotapiolite group). As fibrous to very fine-grained aggregates.

Physical Properties: Hardness = 6–7 D(meas.) = 5.82 D(calc.) = [6.70]

Optical Properties: Translucent. *Color:* Greenish yellow, dark brown to black; bright canary-yellow in transmitted light. *Streak:* Canary-yellow to dark brown with a greenish tinge. *Luster:* Dull.
Optical Class: Biaxial (+), anomalous. *Dispersion:* $r < v$, very strong. $\alpha = 2.19(1)$ $\beta = 2.20(1)$ $\gamma = 2.33(1)$ 2V(meas.) = Small.

Cell Data: *Space Group:* [$P4/mnm$] (by analogy to the ferrotapiolite group). $a = 4.63$ $c = 9.14$ Z = 2

X-ray Powder Pattern: El Antimonio, Mexico.
3.28 (10), 2.56 (9), 1.72 (9), 1.64 (5), 2.32 (4), 1.47 (4), 1.52 (3)

Total	98.81	[100.0]	100.00

(1) Tripuhy mine, Brazil; total Fe as FeO. (2) El Antimonio, Mexico; recalculated to 100% after deduction of quartz 36%. (3) $FeSb_2O_6$.

Mineral Group: Ferrotapiolite group.

Occurrence: An alteration product of stibnite and pyrite in the oxidation zone of some hydrothermal antimony deposits; a detrital mineral.

Association: Lewisite, monazite, rutile, kyanite, magnetite (Tripuhy mine, Brazil); selenium, sulfur, stibiconite, sénarmontite, roméite, mopungite (Mopung Hills, Nevada, USA).

Distribution: From the Tripuhy cinnabar mine, Ouro Prêto, Minas Gerais, Brazil. At Doncellas, Jujuy Province, Argentina. In the USA, from the Bear Mountain district, Socorro Co., New Mexico; at the McDermitt mine, Ophir district, Humboldt Co., from the Goldstrike mine, Lynn district, and the Gold Quarry mine, Maggie Creek district, Eureka Co., and at the Green prospect, Mopung Hills, Lake district, Churchill Co., and elsewhere in Nevada. At El Antimonio, Sonora, Mexico. From Djebel Nador, Qacentina (Constantine), Algeria. At Tsumeb, Namibia. In the Clara mine, near Oberwolfach, Black Forest, Germany. At the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. From Steel's Creek, near Yarra Glen, Victoria, Australia. In Japan, in the Kinka mine, Gifu Prefecture. From the Dzhizhikrut and Obi-Khunda deposits, Zeravshan–Hissar district, Hissar Range, Tien Shan, Tajikistan. From several antimony deposits in the southern Tien Shan, Kyrgyzstan.

Name: For its occurrence at the Tripuhy mine, Brazil.

Type Material: The Natural History Museum, London, England, 86044.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1024. (2) Mason, B. and C.J. Vitaliano (1953) The mineralogy of the antimony oxides and antimonates. Mineral. Mag., 30, 100–112.

Tristramite $(Ca, U^{4+}, Fe^{3+})(PO_4, SO_4)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Acicular to fibrous crystals, to 0.1 mm, in coarse- to fine-grained aggregates, which may be radial or cross-vein.

Physical Properties: Hardness = n.d. D(meas.) = 3.8–4.2 D(calc.) = 4.18 Radioactive.

Optical Properties: Semitransparent. *Color:* Yellow, greenish yellow; in transmitted light, pale yellow to greenish yellow, showing color banding. *Luster:* Vitreous.
Optical Class: Uniaxial (+); may exhibit anomalous blue birefringence. *Orientation:* Positive elongation. $\omega = 1.644(2)$ $\epsilon = 1.664(2)$

Cell Data: *Space Group:* $P6_222$. $a = 6.913(6)$ $c = 6.422(6)$ $Z = 3$

X-ray Powder Pattern: Wheal Trewavas, England.
2.99 (100), 2.83 (100), 2.14 (50), 1.850 (50), 5.99 (40), 4.37 (40), 3.46 (30)

Chemistry:

	(1)
SO_3	4.31
P_2O_5	25.09
CO_2	[1.46]
UO_2	35.08
Fe_2O_3	5.99
CaO	13.74
H_2O	[14.33]
Total	[100.00]

(1) Wheal Trewavas, England; by electron microprobe, total U as UO_2, total Fe as Fe_2O_3, CO_2 for charge balance, H_2O by difference; corresponds to $(Ca_{0.54}U_{0.29}Fe_{0.17})_{\Sigma=1.00}[(PO_4)_{0.79}(SO_4)_{0.12}(CO_3)_{0.07}]_{\Sigma=0.98}\cdot 1.77H_2O$.

Mineral Group: Rhabdophane group.

Occurrence: In fractures and cavities in hydrothermal veins.

Association: Uraninite, goethite, digenite, chalcopyrite, pyrite, sphalerite, galena, marcasite, quartz.

Distribution: In England, from Cornwall, at Wheal Trewavas, Breage; Trequeen; Wheal Buller, Redruth; Wheal Damsel, Gwennap; Wheals Providence and Alice, Lelant.

Name: For Sir Tristram, a figure in the Arthurian legend.

Type Material: Institute of Geological Sciences, London; The Natural History Museum, London, England, 1983,201.

References: (1) Atkin, D., I.R. Basham, and J.F.W. Bowles (1983) Tristramite, a new calcium uranium phosphate of the rhabdophane group. Mineral. Mag., 47, 393–396. (2) (1984) Amer. Mineral., 69, 813 (abs. ref. 1).

Tritomite-(Ce) $(Ce, La, Ca, Y, Th)_5(Si, B)_3(O, OH, F)_{13}(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Metamict; hexagonal after heating at 1000 °C. *Point Group:* n.d. As pseudotetrahedral crystals, also as rounded aggregates.

Physical Properties: Hardness = 5.5 VHN = 544 D(meas.) = 3.72–3.81; 4.20 D(calc.) = n.d. Radioactive.

Optical Properties: Translucent. *Color:* Dark red-brown, amber, black; amber in thin section. *Streak:* Yellowish grey. *Luster:* Resinous.
Optical Class: Isotropic to weakly anisotropic. $n = 1.685$–1.763

Cell Data: *Space Group:* n.d. $a = 9.35$, after heating at 1000 °C. $c = 6.88$ Z = n.d.

X-ray Powder Pattern: Langesundsfjord, Norway; after heating at 600 °C–1000 °C, and the appearance of an apatitelike phase.
2.81 (100), 3.44 (40), 1.84 (40), 1.24 (40), 3.08 (30), 2.70 (30), 1.94 (30)

Chemistry:

(1) Weisser Hirsch mine, Germany. (2) Do.; by electron microprobe, after drying at 210 °C; corresponds to $(UO_2)_{2.72}Bi_{0.18}Ca_{0.11}Pb_{0.07}Mg_{0.06}[(AsO_4)_{1.84}(PO_4)_{0.16}]_{\Sigma=2.00}$. (3) $(UO_2)_3(AsO_4)_2 \cdot 12H_2O$.

Mineral Group: Autunite group.

Occurrence: A rare mineral formed in the oxidation zone of some uranium deposits.

Association: Walpurgite, uranospinite, uranospathite, asselbornite, zeunerite, uranosphaerite, erythrite, cobaltian wad (Weisser Hirsch mine, Germany); realgar, orpiment, scorodite, mansfieldite, sodium uranospinite, arseniosiderite, metatorbernite, metazeunerite, uranophane, arsenopyrite, pyrite, galena (Bota-Burum deposit, Kazakhstan).

Distribution: From the Walpurgis vein, in the Weisser Hirsch mine, and at the Daniel mine, Neustädtel-Schneeberg, Saxony, Germany. From Marbruie, near Dalbeattie, Kirkcudbrightshire, Scotland. In the Rabéjac, Riviéral, and Mas-d'Alary uranium deposits, near Lodève, Hérault, France. At the Bota-Burum uranium deposit, 15 km southwest of Alakol Lake, Chu-Ili Mountains, southwestern Balkhash district, Kazakhstan. From the Bald Mountain district, Lawrence Co., South Dakota, USA.

Name: To honor Mining Foreman R. Tröger, Schneeberg, Germany, who found the first specimens.

Type Material: Mining Academy, Freiberg, Germany, 21800; Harvard University, Cambridge, Massachusetts, USA, 106035.

(1) Musonoi mine, Congo; by electron microprobe, corresponding to a cuproan-palladian variety $(Co_{0.65}Cu_{0.32}Pd_{0.09})_{\Sigma=1.06}Se_{2.00}$. (2) $CoSe_2$.

Polymorphism & Series: Dimorphous with hastite.

Mineral Group: Pyrite group.

Occurrence: Intergrown with clausthalite (Trogtal quarry, Germany).

Association: Clausthalite, hastite, bornhardtite, selenium, gold (Trogtal quarry, Germany); oosterboschite (Musonoi mine, Congo).

Distribution: From the Trogtal quarry, near Lautenthal, Harz Mountains, Germany [TL]. At the Musonoi Cu–Co mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In Argentina, from Tuminico, Sierra de Cacho, and at Los Llantenes, La Rioja Province.

Name: For the occurrence at the Trogtal quarry, Germany.

Type Material: The Natural History Museum, London, England, 1980,400; National Museum of Natural History, Washington, D.C., USA, 112811.

Total	98.10	98.0	100.00

(1) Del Norte Co., California, USA. (2) Cranbourne meteorite. (3) FeS.

Occurrence: In serpentine (Del Norte Co., California, USA); with Fe–Cu–Ni sulfides in a layered ultramafic intrusive (Sally Malay deposit, Australia); and as nodules in meteorites.

Association: Pyrrhotite, pentlandite, mackinawite, cubanite, valleriite, chalcopyrite, pyrite (Wannaway deposit, Australia); daubréelite, chromite, sphalerite, graphite, various phosphates and silicates (meteorites).

Distribution: From the Alta mine, Del Norte Co., California, USA. In the Wannaway Fe–Ni–Cu deposit, and at the Sally Malay Cu–Ni deposit, 120 km north of Halls Creek, Western Australia. In the Panzhihua-Xichang district, Sichuan Province, China. From Disco Island and the Ilímaussaq intrusion, southern Greenland. At Nordfjellmark, Norway. In many meteorites and some lunar rocks.

Name: In honor of Dominico Troili (1722–1792), Italian Jesuit, who described, in 1766, a meteorite which fell in Albareto, near Modena, Italy, which contained the species.

(1) Västanå mine, Sweden. (2) Hökensås, Sweden; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference. (3) $Al_4(PO_4)_3(OH)_3$.

Occurrence: In amphibolite-grade metamorphic rocks.

Association: Berlinite, attakolite, augelite, lazulite (Västanå mine, Sweden); scorzalite, augelite, viséite (Champion mine, California, USA); montebrasite, scorzalite, bertossaite, brazilianite, apatite, gatumbaite, samuelsonite, wyllieite (Buranga pegmatite, Rwanda).

Distribution: In Sweden, from the Västanå mine, near Näsum, Skåne; at Hålsjöberg, Värmland; from Hökensås, Västergötland. In the Buranga pegmatite, Rwanda. On Mt. Perry, 75 km southwest of Bundaberg, Queensland, Australia. In the USA, at the Kyanite Corporation mine on Willis Mountain, Buckingham Co., Virginia; four km west of Glendevey, Larimer Co., Colorado; in the Champion mine, White Mountains, Mono Co., California.

Name: To honor Hans Gabriel Trolle-Wachtmeister (1782–1871), Swedish chemist.

Type Material: Wroclaw University, Wroclaw, Poland, II–9575.

(1) Owens Lake, California, USA; average of several analyses. (2) $Na_3(CO_3)(HCO_3)\cdot 2H_2O$.

Occurrence: Deposited from saline lakes and along river banks as efflorescences in arid climates; rarely from fumarolic action.

Association: Natron, thermonatrite, halite, glauberite, thénardite, mirabilite, gypsum (alkali lakes); shortite, northupite, bradleyite, pirssonite (Green River Formation, Wyoming, USA).

Distribution: Widespread in arid regions. Historically important deposits in the lower Nile delta, near Memphis, Egypt, and elsewhere in the Sahara Desert, Africa. Large crystals at Lake Magadi, Kenya, about which 2 billion tons have formed. Around Lake Chad, Chad. At Lake Katwe, western Uganda. From Lake Nyassa, Tanzania. At the Otjiwalundo salt pan, about 400 km west-northwest of Otavi, Namibia. In the USA, in California, at Searles Lake, San Bernardino Co., Borax Lake, Lake Co., and Owens Lake, Inyo Co.; extensive deposits, aggregating over 100 billion tons, occur in the Green River Formation, Wyoming, Colorado, and Utah; in Nevada, from Little Soda Lake, Churchill Co., and elsewhere. At Lagunillas, about 80 km southeast of Merida, Venezuela. In the Beypazari deposit, west of Ankara, Turkey, estimated at over 200 million tons. On Vesuvius, and at Campi Flegrei, near Naples, Campania, Italy.

Name: A short form of the Arabic word for the natural compound.

Occurrence: In epithermal gold-silver quartz veins cutting altered pyroclastics (Toi mine, Japan).

Association: Quartz, adularia, rhodochrosite (Toi mine, Japan).

Distribution: At the Lebong Donok Au-Ag mine, Benkulen, Sumatra, Indonesia. In Japan, in the Toi mine, Shizuoka Prefecture. From the Hatrurim Formation, Israel. On Kilauea volcano, Hawaii, and from Yellowstone National Park, Wyoming, USA.

Name: For Professor Samuel John Truscott (1870–?), English mining geologist and formerly Manager of the Lebong Donok mine, Sumatra.

Type Material: The Natural History Museum, London, England, 1925,1044.

(1) Kuusamo, Finland; by X-ray fluorescence analysis; corresponds to $(Ni_{2.47}Co_{0.53})_{\Sigma=3.00}3Se_{4.00}$.
(2) Ni_3Se_4.

Polymorphism & Series: Dimorphous with wilkmanite.

Mineral Group: Linnaeite group.

Occurrence: In uranium-bearing calcite veins in sills of albite diabase in schist (Kuusamo, Finland); in stibnite-quartz-barite veins in schists (Qiongmo deposit, China).

Association: Clausthalite, penroseite, sederholmite, wilkmanite, kullerudite (Kuusamo, Finland); gold, tiemannite, clausthalite, selenian famatinite, selenian gersdorffite, antimonselite, selenian stibnite, quartz, barite (Qiongmo deposit, China).

Distribution: From Kuusamo, northeastern Finland [TL]. At the Qiongmo gold deposit, western Qinling Mountains, Shaanxi Province, China.

Name: In honor of Otto Trüstedt (1866–1929), Finnish mining engineer, whose work on prospecting methods lead to the discovery of the Outokumpu ore deposit, Finland.

Type Material: National School of Mines, Paris, France.

References: (1) Vuorelainen, Y., A. Huhma, and A. Häkli (1964) Sederholmite, wilkmanite, kullerudite, mäkinenite, and trüstedtite, five new nickel selenide minerals. Compt. Rendus Soc. Géol. Finlande, 36, 113–125. (2) (1965) Amer. Mineral., 50, 519–520 (abs. ref. 1).

(1) Hurry Inlet, Greenland; corresponds to $(Ca_{1.56}Na_{0.35}K_{0.06})_{\Sigma=1.97}(Mg_{3.35}Al_{1.22}Fe^{2+}_{0.96}Fe^{3+}_{0.51}Mn_{0.03}Ti_{0.03})_{\Sigma=6.10}(Si_{6.02}Al_{1.98})_{\Sigma=8.00}O_{22}(OH)_{0.45}$. (2) Central Bug region, Ukraine; corresponds to $(Ca_{1.71}Na_{0.48}K_{0.28})_{\Sigma=2.47}(Mg_{2.51}Fe^{2+}_{1.52}Fe^{3+}_{0.47}Al_{0.27}Ti_{0.22}Mn_{0.01})_{\Sigma=5.00}(Si_{6.10}Al_{1.90})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with ferrotschermakite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: From eclogites and other ultramafic igneous rocks, and in medium- to high-grade metamorphic rocks, typically amphibolites.

Association: Kyanite, garnet.

Distribution: Probably widespread. Well-studied material from: Hurry Inlet, Fiskenæsset, Greenland. At Glenelg and Knockormal, Ayrshire, Scotland. From Lake Kutemajärvi, Orivesi, and Perniö, Finland. In France, from Le Viala du Tarn, Aveyron. From the central Bug region, Ukraine.

Name: To honor Professor Gustav Tschermak von Seysenegg (1836–1927), Austrian mineralogist, University of Vienna, Vienna, Austria.

Type Material: n.d.

Tschermigite $(NH_4)Al(SO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As dominantly octahedral crystals, to 1 cm; also fibrous columnar aggregates, which may be spiral; most commonly powdery.

Physical Properties: *Fracture:* Conchoidal. Hardness = 1.5 D(meas.) = 1.645 D(calc.) = 1.641(1) Soluble in H_2O, sweetish astringent taste.

Optical Properties: Transparent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous, silky if fibrous.
Optical Class: Isotropic, may be anomalously birefringent. $n = 1.458$

Cell Data: *Space Group:* $Pa3$. $a = 12.242(1)$ $Z = 4$

X-ray Powder Pattern: Synthetic.

(1) Wamsutter, Wyoming, USA. (2) $(NH_4)Al(SO_4)_2 \cdot 12H_2O$.

Occurrence: An uncommon secondary mineral in lignite and brown coal deposits and bituminous shales and on burning coal seams or waste heaps; as efflorescences around solfataras or geothermal gas vents and fumaroles.

Association: Gypsum, ammoniojarosite, epsomite, rostite, alunogen (shales and coals); boussingaultite, mascagnite, voltaite (The Geysers, California, USA).

Distribution: In the Czech Republic, from Čermníky (Tschermig), east of Kaaden, at Libušín, near Kladno, Zastávka, near Brno, and elsewhere in the brown coal basins near Most and Bílina. From Voinesti, Romania. At Magyarórosbánya, Hungary. In Italy, in the Cetine mine, 20 km southwest of Siena, and at Larderello, Val di Cecina, Tuscany; from the Solfatara di Pozzuoli, Campi Flegri, near Naples, Campania. On the Nyamlagira volcano, near Goma, Kivu Province, Congo (Zaire). In the Te Kopia geothermal field, New Zealand. In the USA, on burning coal waste piles at Glen Lyon, Luzerne Co., and Williamstown, Dauphin Co., Pennsylvania; from The Geysers, Sonoma Co., and at Sulfur Bank, Lake Co., California; from coal deposits about five km south of Wamsutter, Sweetwater Co., Wyoming. A number of additional minor localities are documented.

Name: For the locality near the former Tschermig, Czech Republic.

(1) Tsumeb, Namibia; H_2O confirmed by IR. (2) Do.; by electron microprobe, average of 19 analyses, total Fe as Fe_2O_3, confirmed by IR and Mössbauer spectroscopy, H_2O from theory; corresponds to $Pb_{0.95}(Zn_{1.17}Fe_{0.85})_{\Sigma=2.02}(AsO_4)_{2.01}[(OH)_{0.70}(H_2O)_{1.17}]_{\Sigma=1.87}$.

Mineral Group: Tsumcorite group.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-bearing hydrothermal Pb–Zn deposits.

Association: Willemite, smithsonite, mimetite, scorodite, anglesite, arseniosiderite, beaverite, beudantite, carminite, ludlockite, o'danielite, zincroselite, stranskiite, leiteite (Tsumeb, Namibia); adamite, mimetite, smithsonite, goethite, quartz (Puttapa mine, Australia).

Distribution: From Tsumeb, Namibia. At Thasos, Greece. In Germany, from the Michael mine, Weiler, near Lahr, and the Clara mine, near Oberwolfach, Black Forest; and at the Rappold mine and a dump on the Roter Berg, Schneeberg, Saxony. In Mexico, from Mina Ojuela, Mapimí, Durango; at Las Animas, near Benjamin Hill, Sonora. In the USA, from the Richmond-Sitting Bull mine, Galena, Lawrence Co., South Dakota; in the Centennial Eureka mine, Tintic district, Juab Co., Utah. In Australia, at the Puttapa zinc mine, near Beltana, South Australia; from Broken Hill, New South Wales; at the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia.

Name: In recognition of the TSUMeb CORporation's support of mineralogical investigations of the Tsumeb, Namibia orebody.

Type Material: n.d.

Tsumebite $Pb_2Cu(PO_4)(SO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically well crystallized, platy, with large {110}, {101}, narrow {100}, many minor forms, to 3 mm. *Twinning:* Always twinned on $\{\overline{1}22\}$, may be multiple, with serrated re-entrants oscillatory between {011} and $\{\overline{1}04\}$.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 6.01–6.13 D(calc.) = 6.22

Optical Properties: Transparent. *Color:* Emerald-green, bluish green; green in transmitted light. *Luster:* Vitreous, brilliant.
Optical Class: Biaxial (+). *Pleochroism:* Faint; $X = Y$ = very pale blue to colorless; Z = robin's-egg-blue. *Dispersion:* $r < v$, strong. *Absorption:* $Z > X$. $\alpha = 1.885$–1.900 $\beta = 1.920$ $\gamma = 1.943$–1.956 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.70$ $b = 5.80$ $c = 7.85$ $\alpha = 111.5°$ Z = 2

X-ray Powder Pattern: Otavi mine, Southwest Africa [=Tsumeb, Namibia]; close to arsentsumebite. (ICDD 29-568).
3.24 (100), 2.897 (65), 2.936 (35), 2.718 (35), 2.267 (35), 4.70 (30), 2.619 (25)

(1) Tsumeb, Namibia. (2) $Pb_2Cu(PO_4)(SO_4)(OH)$.

Mineral Group: Brackebuschite group.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-bearing Pb–Cu deposits.

Association: Azurite, smithsonite, malachite, cerussite, mimetite, wulfenite, olivenite.

Distribution: From Tsumeb, Namibia. At Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, in Arizona, at Morenci, Greenlee Co.; from the Mammoth-St. Anthony mine, Tiger, Pinal Co.; from the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; on the Blue Bell claims, near Baker, San Bernardino Co., California; in the Black Pine mine, near Philipsburg, Granite Co., Montana. From Roughton Gill, Carrock Fell, Cumbria, England. At Altenmittlau, Hesse, and in the Clara mine, near Oberwolfach, Black Forest, Germany. From Broken Hill, New South Wales, Australia.

Name: For its first-noted occurrence at Tsumeb, Namibia.

Type Material: Destroyed by bombing.

(1) Tsumo mine, Japan; by electron microprobe, corresponding to $(Bi_{0.99}Pb_{0.02})_{\Sigma=1.01}Te_{1.00}$.
(2) BiTe.

Occurrence: In massive Ni–Cu–PGE deposits; in Cu–Zn–Pb deposits, with sulfosalts, formed at lower temperatures.

Association: Pentlandite, chalcopyrite, pyrrhotite, sperrylite, parkerite, maucherite, michenerite, tetradymite, pilsenite, cosalite, altaite, bismuthinite, galena.

Distribution: From Japan, in the Tsumo mine, about 50 km northwest of Hiroshima City, Shimane Prefecture [TL]. At the Dashuigou tellurium deposit, Sichuan Province, China. In the Ban Phuc deposit, northwestern Vietnam. From the Kolar Gold Fields, Karnataka, India. In Russia, at the Tyrnyauz W–Mo deposit, left bank of the Baksan River Valley, northern Caucasus Mountains; in the Alekseevskoye mine, Sutam district, Stanovoi Range, southeast Sakha. From the Ransko massif, about 18 km east-northeast of Havlíčkův Brod, Czech Republic. At Úhorná, Slovakia. From the Bjorkdal gold mine, Vasterbotten, and at Tunaberg, Sweden. From Sylvanite, Hidalgo Co., New Mexico, USA. In the Copper Cliff South mine, Sudbury, Ontario, Canada. A few additional poorly located localities are known.

Name: For the Tsumo mine, Japan, where it was first found.

Type Material: University Museum, University of Tokyo, Tokyo, Japan.

Tubulite ~ $Ag_2Pb_{22}Sb_{20}S_{53}$

Crystal Data: Monoclinic. *Point Group*: *m* or 2/*m*. Forms hollow thin-walled cylinders, to 600 μm, or fibrous.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: Non-plastic. Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color*: Black. *Streak*: n.d. *Luster*: Metallic.
Optical Class: n.d.

Cell Data: *Space Group*: *Pc*, *P*2/*c* or *P*2_1/*c*. a = 4.132(2) b = 43.1(2) c = 27.4(1) β = 93.2° Z = 2

X-ray Powder Pattern: Le Rivet quarry, France.
3.36 (100), 2.063 (75), 3.69 (60), 3.28 (55), 2.99 (55), 2.912 (55), 3.99 (35)

Chemistry:

	(1)
Ag	2.7
Pb	46.6
Sb	26.1
S	17.8
Total	93.2

(1) Biò, Italy; average of 8 electron microprobe analyses, microprobe analysis did not reveal any other elements (Z >10) in significant amount, low analytical total ascribed to thinness of sample material; corresponding to ~ $Ag_2Pb_{22}Sb_{20}S_{53}$.

Occurrence: In sulfide and sulfosalt-bearing veins of quartz, barite, calcite, dolomite and siderite, cutting metamorphosed volcano-sedimentary rocks (Le Rivet, France) or in metamorphosed clastic sedimentary rocks (Biò, Italy).

Association: Galena, boulangerite (Le Rivet); geocronite, bournonite, fizélyite (Biò).

Distribution: At the Le Rivet quarry, Peyerebrune Pb-Zn-Ag ore field, 6 km E-SE of Réalmont, on the commune of Montredon-Labessonié, Tarn department, France, and at Biò, in the upper galleries (Veneziana and Torinese) of the Pb-Ag-As-Sb Borgofranco mines, near Borgofranco d'Ivrea, 50 km north of Turin, Piedmont, Italy.

Name: For its appearance, as it occurs as thin micro-tubes.

Type Material: Specimens from Le Rivet quarry are in the Museum of Mineralogy, École Nationale Supérieure des Mines de Paris, France (M 82939); from Biò in the Museo Regionale di Scienze Naturali, Turin (# 15905), and the Museo di Storia Naturale, Università di Pisa, Italy (# 19630); and in the Musée Cantonal de Géologie, Université-Anthropole, Switzerland (MGL#92635).

Tučekite $Ni_9Sb_2S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As rims and irregular grains, to 20 μm, partly replacing millerite and gold.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. VHN = 718 (20 g load). D(meas.) = n.d. D(calc.) = 6.15

Optical Properties: Opaque. *Color:* Pale brass-yellow; in polished section, brownish yellow. *Luster:* Metallic. *Pleochroism:* Very weak to absent. *Anisotropism:* Very strong to distinct; deep brown to grayish blue.

R_1–R_2: (400) 37.5–38.2, (420) 38.0–39.4, (440) 38.6–41.0, (460) 39.5–42.5, (480) 40.7–44.0, (500) 42.3–45.6, (520) 44.0–47.0, (540) 45.4–48.0, (560) 46.6–48.8, (580) 47.6–49.4, (600) 48.4–50.1, (620) 49.2–50.7, (640) 49.9–51.4, (660) 50.6–52.0, (680) 51.2–52.6, (700) 51.8–53.1

Cell Data: *Space Group:* $P4/mmm$. $a = 7.174(6)$ $c = 5.402(7)$ $Z = 1$

X-ray Powder Pattern: Witwatersrand, South Africa.
2.76 (100), 2.38 (80), 2.28 (80b), 1.850 (80), 4.33 (70), 1.793 (70), 3.21 (60)

(1) Kanowna, Australia; by electron microprobe, selected representative values; corresponding to $(Ni_{8.21}Fe_{0.66}Co_{0.18})_{\Sigma=9.05}(Sb_{1.81}As_{0.12}Bi_{0.09}Te_{0.02})_{\Sigma=2.04}S_{8.00}$. (2) Witwatersrand, South Africa; by electron microprobe, average of a range of measurements, corresponding to $(Ni_{8.31}Fe_{0.69})_{\Sigma=9.00}(Sb_{1.83}As_{0.18}Bi_{0.05})_{\Sigma=2.06}S_{8.00}$. (3) $Ni_9Sb_2S_8$.

Mineral Group: Hauchecornite group.

Occurrence: In a hydrothermal deposit (Kanowna, Australia); in heavy mineral concentrates (Witwatersrand, South Africa); in serpentinites (Vozhmin massif, Russia).

Association: Millerite, pyrite, chalcopyrite, gersdorffite, pentlandite, magnetite, polydymite (Kanowna, Australia); gold, dyscrasite, michenerite, geversite, tetrahedrite, stibnite, sudburyite, stibiopalladinite (Klerkdorp, South Africa); vozhminite, heazlewoodite, nickeline, maucherite, melonite, cobaltite, gersdorffite, magnetite, geversite, copper, silver (Vozhmin massif, Russia).

Distribution: From Kanowna, north of Kalgoorlie [TL], and in the Whim Creek copper deposit, Pilbara district, Western Australia; at the Central Balstrup lease, Zeehan, Tasmania. In South Africa, from the Witwatersrand, in the Vaal Reefs mine, Klerkdorp. In the Vozhmin massif, Segezha district, central Karelia, Russia. From the Kapitanov chromite deposit, near Zvenyhorodka, Ukraine. At Rocheservières, Vendée, France.

Name: Honors Dr. Karel Tuček (1906–1990), Curator of Minerals in the National Museum, Prague, Czech Republic.

Tugarinovite $Mo^{4+}O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, prismatic to thick tabular, striated ‖ length, subangular, to 1.5 mm. *Twinning:* Typical, polysynthetic, on an unknown law.

Physical Properties: Hardness = 4.6 VHN = 300 (20 g load). D(meas.) = n.d. D(calc.) = 6.58

Optical Properties: Semitransparent. *Color:* Dark lilac-brown. *Streak:* Greenish gray. *Luster:* Greasy to metallic.
Optical Class: Biaxial. *Anisotropism:* Light gray to dark pink; pale yellow to bluish olive-brown. *Bireflectance:* Observed.
R_1–R_2: (440) 16.8–27.5, (460) 15.5–24.9, (480) 14.9–23.1, (500) 14.6–21.7, (520) 14.5–20.9, (540) 14.7–20.3, (560) 16.2–19.9, (580) 19.7–18.7, (600) 21.3–19.6, (620) 24.6–19.6, (640) 27.6–19.9, (660) 30.7–19.6, (680) 33.9–21.7, (700) 37.2–23.2

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to synthetic material). $a = 5.59(1)$ $b = 4.82(1)$ $c = 5.51(1)$ $\beta = 119°32'$ Z = 4

X-ray Powder Pattern: Lenskoye Mo–U deposit, Russia.
3.391 (100), 2.412 (8), 1.703 (8), 1.716 (6), 1.398 (6), 1.077 (5), 2.388 (4)

Chemistry: (1) Lenskoye Mo–U deposit, Russia; by electron microprobe, average of five analyses MoO_2 99.86%, with traces of Fe, Ti, Ca, Si.

Occurrence: Formed as a primary mineral, by metasomatism in a reducing environment deficient in sulfur.

Association: Uraninite, molybdenite, galena, zircon, wulfenite.

Distribution: From the Lenskoye Mo–U deposit, Amur district, eastern Siberia, Russia.

Name: For Aleksei Ivanovich Tugarinov (1917–1977), geochemist, Moscow University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81395.

Tugtupite $Na_4AlBeSi_4O_{12}Cl$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $\bar{4}$, $\bar{4}2m$ based on morphology. As short tetragonal prisms with pyramids, sphenoids, and bisphenoids, to 3 mm; fine-grained aggregates, massive. *Twinning:* Penetration twinning on (101) produces pseudocubic triplets; pseudotrigonal contact twins with composition planes $(10\bar{1})$ and $(01\bar{1})$.

Physical Properties: *Cleavage:* Distinct on {101}, fair on {110}. *Fracture:* Conchoidal. Hardness = ∼4 D(meas.) = 2.33(1) D(calc.) = 2.34–2.35 Piezoelectric; fluorescent and phosphorescent red to rose-pink under UV; photochromic, pale colors become pink on exposure to sunlight or X-rays.

Optical Properties: Transparent to translucent. *Color:* White, pink, carmine, bluish, greenish; colorless in thin section. *Luster:* Vitreous.
Optical Class: Uniaxial (+); anomalously biaxial. *Pleochroism:* Weak violet to weak red-orange. $\omega = 1.492–1.496$ $\epsilon = 1.499–1.502$ $2V(meas.) = < 10°$

Cell Data: *Space Group:* $I\bar{4}$. $a = 8.640(1)$ $c = 8.873(1)$ $Z = 2$

(1) Ilímaussaq intrusion, Greenland. (2) Lovozero massif, Russia. (3) $Na_4AlBeSi_4O_{12}Cl$.

Occurrence: Replaces chkalovite in hydrothermal veins cutting sodalite syenite and syenite (Ilímaussaq intrusion, Greenland); an alteration product in pegmatites in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Albite, analcime, aegirine, natrolite, tetranatrolite, chkalovite, lithian mica, epistolite, niobophyllite, monazite, rhabdophane, gerasimovskite, nenadkevichite, beryllite.

Distribution: In Greenland, in the Ilímaussaq intrusion, at Tugtup agtakôrfia, around the Tunugdliarfik Fjord and on the Kangerdluarssuk Plateau; on Qeqertaussaq Island; in the Gletscherelv Valley; and on the Kvanefjeld and Taseq Plateaus. From Mts. Sengischorr and Punkaruaiv, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For the occurrence at Tugtup agtakôrfia, Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1970.276; The Natural History Museum, London, England, 1967,394.

Tulameenite Pt_2FeCu

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2m$. As rounded to irregular grains, to 0.4 mm, which may have complex inclusions, typically associated with Pt–Fe alloys.

Physical Properties: Hardness = n.d. VHN = 420–456, 442 average (50 g load). D(meas.) = 14.9 (synthetic). D(calc.) = 15.62 Distinctly ferromagnetic.

Optical Properties: Opaque. *Color:* White in reflected light. *Luster:* Metallic. *Anisotropism:* Very weak.
R_1–R_2: (470) 61.0–65.3, (546) 60.0–66.5, (589) 61.5–65.5, (650) 61.1–64.9

Cell Data: *Space Group:* $P4/mmm$. $a = 3.891(2)$ $c = 3.577(2)$ $Z = 1$

X-ray Powder Pattern: Tulameen River, Canada.
2.179 (100), 1.163 (80), 1.093 (80), 1.946 (70), 1.016 (60), 1.317 (50), 2.753 (40)

(1) Similkameen River area, Canada; by electron microprobe, corresponding to $(Pt_{1.94}Ir_{0.06})_{\Sigma=2.00}Fe_{1.06}Cu_{0.94}$. (2) Tulameen River area, Canada; by electron microprobe, corresponding to $Pt_{2.04}Fe_{0.98}(Cu_{0.56}Ni_{0.54}Sb_{0.08})_{\Sigma=1.18}$. (3) Pt_2FeCu.

Occurrence: In placers (Canada); in Uralian ultramafics (Nizhni Tagil, Russia); in Cu–Ni–PGM deposits in dunite-troctolite-gabbro (Ioko-Dovyren massif, Russia).

Polymorphism & Series: Forms a series with ferronickelplatinum.

Association: Pt–Fe alloys, geversite, chalcopyrite, chromite, magnetite.

Distribution: In Canada, from placers in the Tulameen and Similkameen River areas, British Columbia [TL]. In the Stillwater complex, Montana, and in the Salmon River placers, Goodnews Bay, Alaska, USA. From Guma Water, Sierra Leone. At Yubdo, Ethiopia. In Russia, from Nizhni Tagil, Ural Mountains; in a placer in the Upper Miask River, Southern Ural Mountains; in the Ioko-Dovyren massif, northern Baikal region, Siberia; at the Konder massif, Aldan Shield, Sakha.

Name: For the Tulameen River, Canada, from the vicinity of which the mineral was first noted.

Type Material: Royal Ontario Museum, Toronto, Canada, M33256; National Museum of Natural History, Washington, D.C., USA, 128460.

ThO_2	24.3	27.07
Fe_2O_3	0.4	
CaO	0.1	
BaO	14.6	15.72
Na_2O	17.9	19.06
H_2O	14.0	11.08
Total	[96.8]	100.00

(1) Khibiny massif, Russia; by electron microprobe, total Fe as Fe_2O_3, CO_2 calculated from stoichiometry, H_2O by coulometry, crystal-structure analysis indicates $6H_2O$; presence of CO_2 and H_2O confirmed by IR; then corresponds to $Na_{5.99}(Ba_{0.99}Ca_{0.02})_{\Sigma=1.01}(Th_{0.95}Fe_{0.05})_{\Sigma=1.00}(CO_3)_{6.01} \cdot 8.06H_2O$. (2) $Na_6BaTh(CO_3)_6 \cdot 6H_2O$.

Occurrence: In hydrothermal veins in nepheline syenite pegmatite.

Association: Sidorenkite, vinogradovite, villiaumite, microcline (vein 1); pirssonite, shortite, trona, thermonatrite, natron, villiaumite, natrolite, aegirine, microcline (vein 2).

Distribution: From the Kirov apatite mine, Mt. Kukisvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: For the Tuliok River, Kola Peninsula, Russia, near where the mineral was first found.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5947; Mining Institute, St. Petersburg, 2024/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r430/2.

Tundrite-(Ce) $Na_3(Ce,La)_4(Ti,Nb)_2(SiO_4)_2(CO_3)_3O_4(OH)\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals acicular along [001] and flattened on {010}, to 3 cm; as stellate groups and spherulitic masses. *Twinning:* On {010}, producing pseudorhombohedra.

Physical Properties: *Cleavage:* Pronounced on {010}. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 3.70–4.12 D(calc.) = 4.06

Optical Properties: Transparent. *Color:* Brownish yellow, greenish yellow to bright light green. *Streak:* Yellowish gray. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = pale yellow; Z = greenish yellow.
Orientation: $Z \wedge c = 4°–14°$. $\alpha = 1.743$ $\beta = 1.80$ $\gamma = 1.88$ 2V(meas.) = 76°

Cell Data: *Space Group:* $P1$. $a = 7.533(4)$ $b = 13.924(6)$ $c = 5.010(2)$ $\alpha = 99°52(2)'$ $\beta = 70°50(3)'$ $\gamma = 100°59(2)'$ Z = 1

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.
13.49 (100), 2.505 (100), 3.448 (90), 2.766 (90), 3.535 (80), 6.784 (70), 1.914 (70)

Chemistry:

	(1)
SiO_2	10.03
TiO_2	12.20
La_2O_3	8.57
Ce_2O_3	24.38
Nd_2O_3	10.25
RE_2O_3	5.80
Nb_2O_5	3.44
CaO	0.75
Na_2O	8.20
CO_3	16.38
Total	[100.00]

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, C confirmed by loss on ignition; original analysis given as elements, here recalculated to oxides, corresponding to $Na_{3.17}(Ce_{1.78}Nd_{0.73}La_{0.63}RE_{0.41}Ca_{0.16})_{\Sigma=3.71}(Ti_{1.83}Nb_{0.31})_{\Sigma=2.14}(SiO_4)_{2.00}(CO_3)_{3.27}O_{4.25}$.

Occurrence: In pegmatite veins associated with nepheline syenites.

Association: Aegirine, lamprophyllite, lorenzenite, rhabdophane (Mt. Lepkhe-Nelm, Russia); natrolite, microcline, albite, aegirine, fluorite, rinkite, eudialyte (Ilímaussaq intrusion, Greenland).

Distribution: On Mt. Lepkhe-Nelm, Lovozero massif, Kola Peninsula, Russia. In southern Greenland, from the Ilímaussaq intrusion, at Kringlerne, on the Kangerdluarssuk Plateau, and at Kvanefjeld. From Mont Saint-Hilaire, Quebec, Canada.

Name: After the Lovozero massif (formerly the Lovozero tundra), Kola Peninsula, Russia, where it was discovered, and the *cerium* content.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72020.

©2001 Mineral Data Publishing, version 1.2

Crystal Data: [Triclinic] [by analogy to tundrite-(Ce)]. *Point Group:* [$\bar{1}$.] As spherulitic masses up to 5 mm.

Physical Properties: Hardness = n.d. D(meas.) = 4.02 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* [Brownish to greenish yellow.]
Optical Class: Biaxial (+). $\alpha = 1.731$ $\beta = > 1.80$ γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)
SiO_2	10.98
TiO_2	11.21
RE_2O_3	48.78
Fe_2O_3	1.00
Nb_2O_5	6.09
CaO	0.97
Na_2O	[7.08]
H_2O^+	13.65
H_2O^-	0.24
Total	[100.00]

(1) Ilímaussaq intrusion, Greenland; Na_2O by difference, CO_2 presumably driven off with H_2O^+; relative proportions of RE = La 24%, Ce 7.5%, Pr 12%, Nd 45%, Sm 6.6%, Eu 0.1%, Gd 4%, Tb 0.3%, Dy 0.5%.

Occurrence: In pegmatite veins associated with layered nepheline syenite.

Association: Microcline, arfvedsonite.

Distribution: In the Ilímaussaq intrusion, at Kringlerne, Kangerdluarssuk Plateau, southern Greenland.

Name: For its relation to *tundrite*-(Ce), and its *neodymium* content.

Type Material: n.d.

Tunellite $SrB_6O_9(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, to 10 cm, elongated along [001], or flattened on {100}, showing {100}, {001}, {110}, {011}, {111}; as compact fine-grained nodules.

Physical Properties: *Cleavage:* On {100}, perfect; on {001}, distinct. *Tenacity:* Flexible, inelastic, sectile. Hardness = 2.5 D(meas.) = 2.40(1) D(calc.) = 2.391

Optical Properties: Transparent. *Color:* Colorless to grayish white. *Luster:* Subvitreous, pearly on {100} faces and cleavages.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge a = 29°$; $Z \wedge c = -5°$. *Dispersion:* $r > v$, weak. $\alpha = 1.519(3)$ $\beta = 1.534(2)$ $\gamma = 1.569(2)$ 2V(meas.) = n.d. 2V(calc.) = 68°

Cell Data: *Space Group:* $P2_1/a$. $a = 14.415(3)$ $b = 8.213(1)$ $c = 9.951(2)$ $\beta = 114.05(1)°$ Z = 4

X-ray Powder Pattern: Furnace Creek district, California, USA.
6.57 (100), 4.525 (11), 3.867 (9), 5.138 (8), 3.592 (8), 2.503 (8), 6.78 (7)

Chemistry:

	(1)	(2)
B_2O_3	53.70	54.31
SrO	27.71	26.95
H_2O	18.71	18.74
Total	100.12	100.00

(1) Boron, California, USA; H_2O by loss on ignition. (2) $SrB_6O_9(OH)_2 \cdot 3H_2O$.

Occurrence: A rare secondary mineral formed in borate deposits.

Association: Inderite, kurnakovite, ulexite, hydroboracite, colemanite, realgar, stibnite, celestine, analcime.

Distribution: In the USA, in California, from the Kramer borate deposit, Boron, Kern Co.; at the Thompson mine, near Ryan, Furnace Creek district, Death Valley, and in the east Kramer district, Inyo Co. In Turkey, from the Günevi and Kireçlik deposits, Bigadiç borate district, Balıkesir Province; in the Killik and Espey borate mines, near Emet, and at Sarıkaya, near Kirka, Kütahya Province.

Name: To honor Dr. George Gerard Tunell, Jr. (1900–1996), Professor of Geology, University of California, Los Angeles, California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 123928.

Tungstenite WS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$ (2H); $3m$ (3R). Massive, fine scaly or feathery aggregates.

Physical Properties: *Cleavage:* {0001}. *Tenacity:* Sectile. Hardness = 2.5 VHN = n.d. D(meas.) = 7.4 D(calc.) = 7.732 Soils the fingers.

Optical Properties: Opaque. *Color:* Dark lead-gray; in polished section, pure white. *Luster:* Metallic. *Pleochroism:* Very high. *Anisotropism:* Strong; in striking colors including pink and deep blue.
R_1–R_2: (400) 24.4–53.4, (420) 22.6–48.0, (440) 20.8–48.6, (460) 19.9–40.5, (480) 19.3–39.0, (500) 18.8–37.8, (520) 18.5–36.8, (540) 18.2–36.0, (560) 18.0–35.3, (580) 17.8–35.0, (600) 17.8–34.9, (620) 17.9–34.9, (640) 18.0–34.8, (660) 18.1–34.7, (680) 18.0–34.5, (700) 17.9–34.2

Cell Data: *Space Group:* $P6_3/mmc$ (synthetic 2H). $a = 3.132(4)$ $c = 12.323(5)$ Z = 2, or *Space Group:* $R3m$ (synthetic 3R). $a = 3.158(1)$ $c = 18.49(1)$ Z = 3

X-ray Powder Pattern: Synthetic (2H).
6.18 (100), 2.2772 (35), 2.731 (25), 2.667 (25), 1.8335 (18), 1.5783 (16), 3.089 (14)

X-ray Powder Pattern: Emma mine, Utah, USA (3R). (ICDD 35-651).
6.13 (100), 1.528 (70), 2.674 (60), 1.571 (50), 2.037 (40), 1.100 (40), 3.04 (35)

Chemistry:

	(1)	(2)
W	73.8	74.14
S	25.5	25.86
Total	99.3	100.00

(1) Angokitsk deposit, Russia; by electron microprobe. (2) WS_2.

Polymorphism & Series: Both 2H and 3R polytypes occur naturally.

Occurrence: In a deposit replacing limestone (Emma mine, Utah, USA); replacing scheelite (Angokitsk deposit, Russia); in high-temperature fumaroles (Kudryavyy volcano, Russia).

Association: Pyrite, sphalerite, galena, cinnabar, tetrahedrite, wolframite, scheelite, quartz.

Distribution: In the USA, from the Emma mine, Little Cottonwood Canyon, Alta district, Salt Lake Co., Utah [TL, 2H and 3R]; at the Goldstrike mine, Lynn district, Eureka Co., Nevada. From near Chase, British Columbia, and in the Kidd Creek mine, near Timmins, Ontario, Canada. From Tsumeb, Namibia. At Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). From Crevola d'Ossola, Piedmont, Italy. In Russia, at the Angokitsk tungsten deposit, Buryat; an ore in the Tamvatnei As–Hg–W deposit, Kamchatka; and on Kudryavyy volcano, Iturup, Kuril Islands. From Lyangar, Uzbekistan.

Name: For the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94490.

Tungstibite Sb_2WO_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thin crystals, flattened on {001}, elongated, may be spearhead-shaped, to 0.5 mm; commonly in globular aggregates.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Irregular. Hardness = ∼2 D(meas.) = 6.69 (synthetic). D(calc.) = 6.90

Optical Properties: Translucent to opaque. *Color:* Green to dark green. *Streak:* Green. *Luster:* Dull, may be pearly.
Optical Class: Biaxial (+). *Pleochroism:* X = dark green to brownish green; Y = dark green; Z = pale green to yellowish. *Orientation:* $Z = c$. *Dispersion:* $r \ll v$, strong. $\alpha = 2.285(2)$ $\beta = 2.40(2)$ $\gamma = 2.58(2)$ 2V(meas.) = n.d. 2V(calc.) = 82°

Cell Data: *Space Group:* $P22_12_1$ (probable). $a = 8.59(2)$ $b = 9.58(2)$ $c = 6.12(2)$ Z = 4

X-ray Powder Pattern: Clara mine, Germany.
3.32 (10), 3.06 (10), 2.73 (6), 2.46 (5), 2.98 (4), 1.919 (4), 1.829 (3)

Chemistry:

Total	99.81	99.90	100.00

(1) Kootenay Belle mine, Canada. (2) Calacalani mine, Bolivia. (3) $WO_3 \cdot H_2O$.

Occurrence: An alteration product of tungsten minerals, especially wolframite and ferberite, in hydrothermal tungsten-bearing deposits.

Association: Hydrotungstite, ferritungstite, wolframite, ferberite, scheelite.

Distribution: In the USA, from Lane's bismuth mine, Monroe, north of Trumbull, Fairfield Co., Connecticut; in the Boriana mine, Mohave Co., and the Black Pearl mine, Camp Wood district, Yavapai Co., Arizona. From the San Alberto mine, near Alamos, Sonora, Mexico. In Canada, in the Kootenay Belle mine, Salmo, British Columbia; at Marlow, Quebec; and elsewhere. At La Vilate, near Chanteloube, Haute-Vienne, France. From Panasqueira, Portugal. In the Calacalani mine, near Colquiri, the Juliani mine, Conde-Auqui district, Tazna, and the San Antonio mines, La Paz, Oruro, Bolivia. At Kingsgate, New South Wales, Australia. In the Kirwa mine, Ubale, Uganda. From Nzombe, Kivu Province, Congo (Zaire). Other localities have been reported but require modern confirmation.

Name: For TUNGSTen in the composition.

Total	100.17	100.00

(1–2) Lower Tunguska River, Russia; average of two analyses, corresponds to $(Ca_{3.46}Na_{0.48}Mn_{0.06})_{\Sigma=4.00}(Fe^{2+}_{1.23}Al_{0.37}Mg_{0.21}Fe^{3+}_{0.17}Mn_{0.08})_{\Sigma=2.06}(Si_{5.94}Al_{0.06})_{\Sigma=6.00}O_{15}(OH)_6$.

Occurrence: A secondary mineral forming crusts lining cavities and amygdules in hydrothermally altered basalts.

Association: Analcime, apophyllite, gyrolite, calcite, quartz.

Distribution: Found along the Lower Tunguska River, near Tura, central Siberia, Russia.

Name: For the Tunguska River, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Sakiet Sidi Yousseff mine, Tunisia; CO_2 by volumetric-absorption gas analysis, alkalies by flame photometry, H_2O by the Penfield method. (2) Do.; by neutron activation.
(3) $NaCa_2Al_4(CO_3)_4Cl(OH)_8$.

Occurrence: A very rare hydrothermal mineral, filling cavities in calcite (Sakiet Sidi Yousseff mine, Tunisia).

Association: Calcite (Sakiet Sidi Yousseff mine, Tunisia); celestine, calcite, pyrite, chalcopyrite, gypsum, whewellite (Condorcet, France).

Distribution: From the Sakiet Sidi Yousseff Pb–Zn mine, between Le Kef and Souk Ahras, Tunisia. In the Slavyansk salt deposit, Dnieprovsk-Donets Basin, Ukraine. From Condorcet, Drôme, France.

Name: For Tunisia, the country in which it was first found to occur.

Type Material: National Museum, Prague, Czech Republic, 53823; National School of Mines, Paris, France.

(1) Tuperssuatsiait Bay, Greenland; by electron microprobe, average of seven analyses; original analysis given as elements, here recalculated to oxides, H_2O by difference; corresponds to $(Na_{0.88}K_{0.14})_{\Sigma=1.02}(Fe^{3+}_{2.18}Mn^{2+}_{0.63}Mg_{0.22}Zn_{0.08})_{\Sigma=3.11}(Si_{7.92}Al_{0.08})_{\Sigma=8.00}O_{20}(OH)_{1.38} \cdot 4.39H_2O$. (2) Windhoek, Namibia; by electron microprobe, average of 10 analyses, original analysis given as elements, here converted to oxides, H_2O by difference; corresponds to $(Na_{1.85}K_{0.01})_{\Sigma=1.86}(Fe^{3+}_{2.83}Mn^{2+}_{0.08}Mg_{0.04}Ca_{0.02}Zn_{0.02})_{\Sigma=2.99}(Si_{7.96}Al_{0.03}Ti_{0.02})_{\Sigma=8.01}O_{20}[(OH)_{2.47}F_{0.04}Cl_{0.03}]_{\Sigma=2.54} \cdot 3.90H_2O$.

Occurrence: A late-stage, low-temperature, hydrothermal mineral in veins cutting nepheline syenite and in sodalite-nepheline syenite pegmatite (Tuperssuatsiait Bay, Greenland); in miarolitic cavities in phonolite (Windhoek, Namibia).

Association: Natrolite, albite, orthoclase, aegirine, sodalite, steenstrupine (Tuperssuatsiait Bay, Greenland); microcline, aegirine, natrolite, eudialyte, bastnäsite, makatite, villiaumite, titanite, apophyllite, analcime, aragonite (Windhoek, Namibia).

Distribution: In the Ilímaussaq intrusion, at Tuperssuatsiait Bay, Kangerdluarssuk Fjord, and the north shore of Tunugdliarfik Fjord, southern Greenland. From the Aris quarry, about 25 km south of Windhoek, Namibia. In Canada, from near Saint-Amable, Quebec.

Name: For Tuperssuatsiait Bay, Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark; National Museum of Natural History, Washington, D.C., USA, 162402.

References: (1) Karup-Møller, S. and O.V. Petersen (1984) Tuperssuatsiaite, a new mineral species from the Ilímaussaq intrusion in South Greenland. Neues Jahrb. Mineral., Monatsh., 501–512. X-ray Powder Pattern: Locality unknown [Tyuya-Muyun Cave, Kyrgyzstan].
4.76 (10), 7.25 (8), 2.56 (6), 2.70 (4), 2.47 (3), 2.29 (3), 2.11 (3)

Chemistry: (1)

CuO	62.94
V_2O_5	28.90
H_2O	5.85
Total	97.69

(1) Tyuya-Muyun Cave, Kyrgyzstan; average of 4 electron microprobe analyses, H_2O from structural analysis, corresponding to $Cu^{2+}_{4.97}(V^{5+}O_4)_2(OH)_{4.08}$.

Occurrence: A rare secondary oxidation mineral in vanadium-bearing mineral deposits.

Association: Tangeite, other vanadates, uranovanadates, malachite, calcite, barite.

Distribution: From the Tyuya-Muyun Cave, Fergana Valley, Alai Range, Kyrgyzstan. In Nevada, USA, at the Van-Nav-San claim, Gibellini district and Gold Quarry mine, Maggie Creek district.

Name: For the Turan region, Kyrgyzstan, where the mineral was first found.

Type Material: A.E. Fersman Mineral Museum, Moscow, Russia; #3578.

$-O = (F,Cl)_2$	1.2
Total	100.6

(1) Långban, Sweden; by electron microprobe, total Mn as MnO, corresponding to $(Ca_{4.85}Mn_{0.16}Pb_{0.02})_{\Sigma=5.03}[(AsO_4)_{2.42}(PO_4)_{0.54}]_{\Sigma=2.96}(Cl_{0.56}F_{0.39})_{\Sigma=0.95}$.

Mineral Group: Apatite group.

Occurrence: A rare component of manganiferous ores in high-grade marbles.

Association: Andradite, magnetite, calcite (Långban, Sweden); magnetite, andradite, manganoan calcite (Franklin, New Jersey, USA); donpeacorite, tirodite, ferrian braunite, dravite, anhydrite, manganoan dolomite (Fowler, New York, USA).

Distribution: From Långban, Värmland, Sweden. At Franklin, Sussex Co., New Jersey and in the Balmat #4 mine, Fowler, St. Lawrence Co., New York, USA.

Name: Honors Dr. Frederick Stewart Turneaure (1899–1986), Professor Emeritus of Geology, University of Michigan, Ann Arbor, Michigan, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 124237; National Museum of Natural History, Washington, D.C., USA, 134981, C6270-1, C6270-2, 159862.

Turquoise **$CuAl_6(PO_4)_4(OH)_8 \cdot 4H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Rare steep pinacoidal crystals, {010}, {1$\overline{1}$0}, {001}, to 3 mm; fine granular to cryptocrystalline, nodular to globular crusts, veinlets, massive.

Physical Properties: *Fracture:* Small conchoidal to smooth. Hardness = 5–6
D(meas.) = 2.86, less if massive. D(calc.) = 2.91

Optical Properties: Transparent in crystals; translucent to opaque if massive.
Color: Sky-blue, bluish green, apple-green, greenish gray. *Streak:* White to pale greenish blue.
Luster: Vitreous in crystals; dull to waxy if massive.
Optical Class: Biaxial (+). *Pleochroism:* Weak in thick grains; X = colorless; Z = pale blue or pale green. *Orientation:* X (-30°,60°); Y (63°,83°); Z (163°,32°) [using (ϕ,ρ)]. *Dispersion:* $r < v$, strong. $\alpha = 1.61$ $\beta = 1.62$ $\gamma = 1.65$ 2V(meas.) = 40(2)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.409(1)$ $b = 9.914(2)$ $c = 7.635(1)$ $\alpha = 111.356°$ $\beta = 114.973°$ $\gamma = 69.532°$ Z = 1

X-ray Powder Pattern: Lynch Station, Virginia, USA; nearly identical to faustite.
3.674 (100), 2.900 (80), 6.165 (75), 5.986 (45), 4.786 (45), 3.429 (45), 2.062 (40)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	34.13	34.90	CuO	9.00	9.78
Al_2O_3	36.50	37.60	H_2O	20.12	17.72
Fe_2O_3	0.21		Total	99.96	100.00

(1) Lynch Station, Virginia, USA; H_2O by the Penfield method, corresponds to $Cu_{0.95}(Al_{5.98}Fe_{0.02})_{\Sigma=6.00}(PO_4)_{3.91}(PO_3OH)_{0.10}(OH)_8 \cdot 5.27H_2O$. (2) $CuAl_6(PO_4)_4(OH)_8 \cdot 4H_2O$.

Polymorphism & Series: Forms two series, with chalcosiderite, and with planerite.

Mineral Group: Turquoise group.

Occurrence: A secondary mineral formed in the potassic alteration zone of hydrothermal porphyry copper deposits; a vein-filling in volcanic rocks and phosphate-rich sediments.

Association: Kaolinite, montmorillonite, allophane, wavellite, pyrite.

Distribution: Dozens of localities, of which only a few can be mentioned, for commercial amounts or good crystals. In Iran, at Ma'dan, 45 km northwest of Neyshabur (Nishapur). From Ottré, near Vielsalm, Belgium. At the Bunny mine, St. Austell, and elsewhere in Cornwall, England. From Katonto, north of Kolwezi, Katanga Province, Congo (Shaba Province, Zaire), good crystals. In the USA, crystallized from the Bishop mine, Lynch Station, Campbell Co., Virginia; in the Cerrillos district, Santa Fe Co., and the Burro Mountains district, Grant Co., New Mexico; in Arizona, commercial production from Mineral Park, Mohave Co., Morenci, Greenlee Co., the Globe-Miami district, Gila Co., and others; numerous small deposits in Lander Co. and elsewhere in Nevada. In the Itatiaiuçu iron mine, southwest of Belo Horizonte, Minas Gerais, Brazil, large crystals. At Chuquicamata, Antofagasta, Chile. In Australia, at Narooma, New South Wales, as crystals; in the Iron Monarch quarry, Iron Knob, South Australia. In China, from Yunxian and Zhushan, Wudang Mountains, Hubei Province, and near Shanyang, Shaanxi Province.

Name: From the French *Turquie*, as Iranian material was early imported through Turkey.

Total	[100.38]	98.69	100.00

(1) Along the upper Tusion River, Tadjikistan; by electron microprobe, total Fe as FeO, total Mn as MnO, original total given as 100.38%; corresponds to $(Mn_{0.84}Fe_{0.15}Ca_{0.02})_{\Sigma=1.01}Sn_{1.02}(B_{0.98}O_3)_2$. (2) Belo Horizonte No. 1 pegmatite, California, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; B_2O_3 calculated for stoichiometry; corresponds to $(Mn_{0.78}Fe_{0.09}Ca_{0.09})_{\Sigma=0.96}Sn_{1.00}(BO_3)_2$. (3) $MnSn(BO_3)_2$.

Occurrence: Of late-stage hydrothermal origin, rare in granite pegmatites, typically in miarolitic cavities.

Association: Tetrawickmanite, hambergite, danburite, tourmaline, orthoclase, albite, quartz (along the upper Tusion River, Tajikistan); tourmaline, hambergite, danburite, hellandite, boromuscovite, cassiterite (Řečice, Czech Republic; Thomas Mountain, California, USA).

Distribution: From along the upper Tusion River, Shakhdara Range, southwestern Pamir Mountains, Tadjikistan. At Řečice, Czech Republic. In the Belo Horizonte No. 1 and New Columbia No. 1 pegmatites, Thomas Mountain, Riverside Co., California, USA.

Name: For its first-noted occurrence along the upper Tusion River, Tadjikistan.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 17096; Mining Institute, St. Petersburg, 1661/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82546.

Tuzlaite $NaCaB_5O_8(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic crystals, elongated along [001], showing {100}, {010}, {011}, {110}, $\{\bar{1}11\}$ to 0.5 mm, typically in nearly parallel aggregates; massive in veins.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = 2–3 D(meas.) = 2.21(2) D(calc.) = 2.23

Optical Properties: Semitransparent. *Color:* Colorless to white. *Streak:* White. *Luster:* Silky to pearly.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge a = 14°$. $\alpha = 1.532(2)$ $\beta = 1.544(2)$ $\gamma = 1.561(2)$ 2V(meas.) = 80.9°

Cell Data: *Space Group:* $P2_1/c$. $a = 6.506(1)$ $b = 13.280(3)$ $c = 11.462(3)$ $\beta = 92.97(2)°$ Z = 4

X-ray Powder Pattern: Tuzla mine, Bosnia-Herzegovina.
8.638 (100), 6.617 (30), 2.868 (29), 4.179 (17), 2.586 (15), 2.845 (14), 2.065 (14)

Chemistry:

	(1)	(2)
B_2O_3	52.19	52.24
Al_2O_3	0.26	
CaO	14.64	16.83
SrO	0.21	
Na_2O	10.25	9.30
H_2O	21.66	21.63
Total	99.21	100.00

(1) Tuzla mine, Bosnia-Herzegovina; average of six analyses, by flamephotometry, TGA, and crystal-structure analysis; corresponds to $Na_{1.00}(Ca_{0.87}Na_{0.10}Sr_{0.01})_{\Sigma=0.98}B_{4.98}Al_{0.02}O_{7.92}(OH)_2 \cdot 3H_2O$. (2) $NaCaB_5O_8(OH)_2 \cdot 3H_2O$.

Occurrence: In a saline evaporite deposit, as veins in dolomitic marl between salt layers.

Association: Halite.

Distribution: From the Tuzla salt mine, Bosnia-Herzegovina.

Name: For Tuzla, Bosnia-Herzegovina, the town near the salt mine in which the species was found.

Type Material: Croatian Museum of Natural History, Zagreb, Croatia, HPM 8888; Natural History Museum, Bern, Switzerland, B 8361; Royal Ontario Museum, Toronto, Canada, M45848a.

Tvalchrelidzeite $Hg_3(As,Sb)_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. As granular aggregates, to 1 cm, without well-formed crystals.

Physical Properties: *Cleavage:* Perfect in one direction. *Fracture:* Uneven and conchoidal. Hardness = < 3 VHN = 172 D(meas.) = 7.380(5) D(calc.) = 7.234

Optical Properties: Translucent. *Color:* Lead-gray; whitish in reflected light, with strong dark red internal reflections; in transmitted light, cherry-red. *Streak:* Nearly black, with a dark reddish tint. *Luster:* Adamantine. *Pleochroism:* White to grayish white, pale lilac to a distinctly greenish tint. *Anisotropism:* Distinct; dark olive to dark violet.

R_1–R_2: (400) 39.9–45.0, (420) 40.0–44.5, (440) 40.1–43.4, (460) 40.3–42.6, (480) 40.7–40.9, (500) 40.8–39.9, (520) 40.6–38.7, (540) 39.2–37.1, (560) 37.7–35.8, (580) 36.5–34.8, (600) 35.5–34.0, (620) 34.7–33.4, (640) 33.8–32.8, (660) 33.2–32.4, (680) 32.6–32.0, (700) 32.0–31.6

Cell Data: *Space Group:* $P1$. $a = 4.39$ $b = 11.57$ $c = 15.67$ $\alpha = 88.17°$ $\beta = 90.01°$ $\gamma = 89.98°$ Z = 1

X-ray Powder Pattern: Gomi deposit, Georgia.
3.49 (100), 2.92 (100), 2.89 (100), 2.080 (100), 3.29 (70), 2.031 (35), 3.19 (30)

Chemistry:

Fe		0.11	
Sb	13.75	12.9	14.0
As	8.60	8.54	8.4
S	10.95	10.3	10.9
Total	99.80	98.1	99.7

(1) Gomi deposit, Georgia; by electron microprobe, average of two analyses; corresponding to $Hg_{2.91}(As_{1.01}Sb_{0.99})_{\Sigma=2.00}S_{3.00}$. (2) Tyute deposit, Russia; by electron microprobe, corresponding to $Hg_{3.00}Cu_{0.02}Fe_{0.02}(As_{1.04}Sb_{0.96})_{\Sigma=2.00}S_{2.92}$. (3) Chauvai deposit, Russia; by electron microprobe, corresponding to $Hg_{2.92}(Sb_{1.01}As_{0.99})_{\Sigma=2.00}S_{2.99}$.

Occurrence: In gold-bearing hydrothermal As–Sb–Hg deposits.

Association: Cinnabar, metacinnabar, realgar, mercurian tennantite, mercury, cubanite, pyrrhotite, chalcopyrite, marcasite, fluorite, quartz.

Distribution: From the Gomi deposit, Caucasus Mountains, Georgia [TL]. At the Tyute mercury deposit, Altai Mountains, Russia. In the Chauvai Sb–Hg deposit, Fergana Valley, Alai Range, southern Kyrgyzstan. From the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. At the Getchell mine, Potosi district, Humboldt Co., Nevada, USA.

Name: In honor of Academician Aleksander Antonovich Tvalchrelidze (1881–1957), founder of the Georgian Mineralogical-Petrographic School, Tbilisi University, Tbilisi, Georgia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 77110; National Museum of Natural History, Washington, D.C., USA, 143827.

Tvedalite $(Ca, Mn^{2+})_4Be_3Si_6O_{17}(OH)_4 \cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* n.d. As spherulites of platy crystals, up to 3 mm, always incrusted with chiavennite.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 4.5 D(meas.) = 2.541(6) D(calc.) = 2.554

Optical Properties: Semitransparent. *Color:* Cream-white to pale beige, zoned.
Streak: White. *Luster:* Vitreous.
Optical Class: Biaxial. $n = 1.604$

Cell Data: *Space Group:* C-centered. $a = 8.724(6)$ $b = 23.14(1)$ $c = 4.923(4)$ $Z = 2$

X-ray Powder Pattern: Vevja quarry, Norway.
2.837 (100), 11.6 (93), 3.87 (75), 2.889 (75), 3.16 (74), 5.80 (68), 2.494 (58)

Chemistry:

	(1)
SiO_2	45.00
Al_2O_3	0.68
FeO	1.11
MnO	11.56
BeO	10.69
CaO	18.44
H_2O	11.8
Total	99.28

(1) Vevja quarry, Norway; by AA, H_2O by elemental analyzer; corresponding to $(Ca_{2.52}Mn_{1.25}Fe_{0.12})_{\Sigma=3.89}Be_{3.00}(Si_{5.74}Be_{0.27}Al_{0.10})_{\Sigma=6.11}O_{17}(OH)_4 \cdot 3.06H_2O$.

Occurrence: In nepheline syenite pegmatite.

Association: Chiavennite, analcime, natrolite, parisite-(Ce), bastnäsite-(Ce), leucophanite, epididymite, albite, calcite, chlorite, todorokite, fluorite, magnetite, molybdenite.

Distribution: In the Vevja quarry, Tvedalen, Norway.

Name: For the Tvedalen area in Norway, which has produced many interesting minerals from the nepheline syenites.

Type Material: University of Oslo, Oslo, Norway, 14770.

References: (1) Larsen, A.O., A. Åsheim, G. Raade, and J. Taftø (1992) Tvedalite, $(Ca, Mn)_4Be_3Si_6O_{17}(OH)_4 \cdot 3H_2O$, a new mineral from syenite pegmatite in the Oslo Region, Norway. Amer. Mineral., 77, 438–443.

Tveitite-(Y) $Ca_{14}Y_5F_{43}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystalline, massive. *Twinning:* Complex, polysynthetic, forming a three-dimensional grating of spindles, each of which is twinned internally in two directions.

Physical Properties: Hardness = n.d. D(meas.) = 3.94 D(calc.) = 3.99 Faint yellow-orange fluorescence under SW UV; dark blue cathodoluminescence.

Optical Properties: Transparent. *Color:* White to pale yellow. *Luster:* Greasy. *Optical Class:* Biaxial (–). $\alpha = 1.476$ $\beta = 1.479$ $\gamma = 1.481$ 2V(meas.) = 34°

Cell Data: *Space Group:* $R\overline{3}$. $a = 16.6920(9)$ $c = 9.6664(8)$ Z = 3

X-ray Powder Pattern: Høydalen, Norway.
3.184 (10), 1.265 (8), 1.949 (7), 1.664 (6), 2.764 (5), 1.963 (5), 3.222 (4)

Chemistry:

	(1)	(2)
Y	22.2	24.39
RE	8.06	
U	0.05	
Fe	0.08	
Mn	0.02	
Ca	27.4	30.79
F	41.3	44.82
Total	99.11	100.00

(1) Høydalen, Norway; RE = La 1.28%, Ce 3.86%, Pr 0.56%, Nd 0.90%, Sm 0.12%, Eu 0.04%, Gd 0.12%, Tb 0.03%, Dy 0.26%, Ho 0.05%, Er 0.17%, Tm 0.13%, Yb 0.35%, Lu 0.19%; corresponds to $Ca_{13.89}(Y_{4.09}RE_{0.98})_{\Sigma=5.07}F_{43}$. (2) $Ca_{14}Y_5F_{43}$.

Occurrence: In a pegmatite dike in amphibolites, probably formed by inversion of yttrofluorite.

Association: Kainosite, fluocerite, cerianite, monazite, beryl, topaz, muscovite, microcline, quartz.

Distribution: From Høydalen, Tørdal, Telemark, Norway.

Name: Honors John Tveit, in whose quarry in Norway the mineral was first found.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway; National Museum of Natural History, Washington, D.C., USA, 137096.

References: (1) Bergstøl, S., B.B. Jensen, and H. Neumann (1977) Tveitite, a new calcium yttrium fluoride. Lithos, 10, 81–87. (2) (1977) Amer. Mineral., 62, 1060 (abs. ref. 1). (3) Bevan, D.J.M., J. Twinnite $Pb(Sb,As)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, probable; pseudo-orthorhombic. *Point Group:* $2/m$ $2/m$ $2/m$, apparent. As grains, to 1.5 mm. *Twinning:* Polysynthetic, the trace of the composition plane parallel to {100}.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Brittle. Hardness = n.d. VHN = 147 (50 g load). D(meas.) = n.d. D(calc.) = 5.323 (for Sb:As=3:2).

Optical Properties: Opaque. *Color:* Black; white in polished section. *Streak:* Black, with a slightly brownish tint. *Luster:* Metallic. *Pleochroism:* Strong, displaying twin lamellae. R_1–R_2: (400) 39.1–45.2, (420) 38.2–44.7, (440) 37.3–44.2, (460) 36.6–43.7, (480) 36.2–43.2, (500) 35.8–42.9, (520) 35.5–42.5, (540) 35.0–42.0, (560) 34.4–41.4, (580) 34.0–40.8, (600) 33.5–40.0, (620) 33.2–39.4, (640) 32.8–38.7, (660) 32.3–38.1, (680) 31.7–37.5, (700) 31.0–37.0

Cell Data: *Space Group:* *Pnmn* pseudocell. $a = 19.6(2)$ $b = 7.99(5)$ $c = 8.60(5)$ $\alpha = 90°$ $\beta = 90°$ $\gamma = 90°$ Z = 8

X-ray Powder Pattern: Madoc, Canada.
3.51 (100), 2.344 (80), 2.78 (70), 4.18 (50), 3.91 (50), 2.689 (50), 2.645 (50)

Chemistry:

	(1)	(2)	(3)
Pb	41	39.3	38.7
Sb	28	28.1	24.8
As	11	8.9	12.0
S	23	23.7	23.9
Total	103	100.0	99.4

(1) Madoc, Canada; by electron microprobe, corresponding to $Pb_{1.10}(Sb_{1.28}As_{0.82})_{\Sigma=2.10}S_{4.00}$. (2) Do.; by electron microprobe, corresponding to $Pb_{1.03}(Sb_{1.25}As_{0.64})_{\Sigma=1.89}S_{4.00}$. (3) Novoye, Kyrgyzstan; by electron microprobe, corresponding to $Pb_{1.00}(Sb_{1.09}As_{0.86})_{\Sigma=1.95}S_{4.00}$.

Polymorphism & Series: Dimorphous with guettardite.

Occurrence: In marble with other lead sulfantimonides (Madoc, Canada).

Association: Chabournéite, pierrotite, parapierrotite, stibnite, pyrite, sphalerite, zinkenite, madocite, andorite, smithite, laffittite, routhierite, aktashite, wakabayashilite, realgar, orpiment (Jas Roux, France); sphalerite, pyrite, galena, playfairite, sorbyite, guettardite, baumhauerite, realgar, orpiment, cinnabar, fluorite, quartz (Novoye, Kyrgyzstan).

Distribution: In Canada, from near Madoc [TL], and in the Hemlo gold deposit, Thunder Bay district, Ontario. In France, from the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes. At the Rujevac Sb–Zn–Pb deposit, western Serbia. From Novoye, Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan.

Name: In honor of Robert Mitchell Thompson (1918–1967), Canadian mineralogist, University of British Columbia, Vancouver, Canada. Thompson is "son of Thomas"; the latter is Aramaic for "a twin". The name is doubly appropriate in alluding to the polysynthetic twinning present in the mineral.

Type Material: Canadian Geological Survey, Ottawa, 12175; Canadian Museum of Nature, Ottawa, Canada.

CO_2	33.50	33.68
MgO	15.80	15.42
Na_2O	35.57	35.58
Total	99.94	100.00

(1) Searles Lake, California, USA; average of two analyses. (2) $Na_6Mg_2(SO_4)(CO_3)_4$.

Polymorphism & Series: Forms a series with ferrotychite.

Occurrence: Uncommon in lake-bed evaporite deposits.

Association: Northupite, gaylussite, thénardite, schairerite, pirssonite (Searles Lake, California, USA); northupite (Katwe Lake, Uganda).

Distribution: In the USA, from Searles Lake, San Bernardino Co., California; and in the Green River Formation, Northern Piceance Creek Basin, Colorado. At Lake Katwe, western Uganda.

Name: From the Greek for *good fortune*, as the first and one of the last ten crystals examined were of this species, from a lot of about 5000 examined.

Type Material: Yale University, New Haven, Connecticut, USA, 3.1634.

(1) Tyret station, Russia; (2) Do.; analysis (1) after deduction of halite 6.64%, anhydrite 4.07%, dolomite 9.8%, calcite 0.13%, R_2O_3, and insoluble; corresponds to $(Ca_{1.80}Sr_{0.08})_{\Sigma=1.88}B_{5.02}O_{9.00}[(OH)_{0.69}Cl_{0.13}]_{\Sigma=0.82}\cdot 1.18H_2O$. (3) $Ca_2B_5O_9(OH)\cdot H_2O$.

Polymorphism & Series: The 1A polytype is known.

Occurrence: Very rare, in a cavity in dolomitic saline rock, in drillcore from a depth of 1233 m.

Association: Sylvite, halite, carnallite, halite.

Distribution: From near the Tyret railway station, on the east Siberian railway, in the Lena-Angara salt basin, Irkutsk district, Siberia, Russia.

Name: For its initial occurrence near the Tyret station, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76340.

Tyrolite $CaCu_5(AsO_4)_2(CO_3)(OH)_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Scaly to lathlike crystals, flattened on {010}, to 3 mm; typically foliated to fibrous, in radiating groups and crusts.

Physical Properties: *Cleavage:* On {001}, perfect, micaceous. *Tenacity:* Sectile, flexible in thin flakes. Hardness = ∼2 D(meas.) = 3.25 D(calc.) = 3.27

Optical Properties: Translucent. *Color:* Verdigris-green, pale apple-green, may be sky-blue; pale green in transmitted light. *Streak:* Pale green or pale blue. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Pleochroism:* $X = Z$ = pale grass-green; Y = pale yellowish green. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, strong. α = 1.673–1.694 β = 1.690–1.726 γ = 1.703–1.730 2V(meas.) = 36°–70°

Cell Data: *Space Group: Pmma.* a = 10.21–10.50 b = 54.71–55.51 c = 5.59–5.60 Z = 8

X-ray Powder Pattern: Peñamellera, Spain.

(1) Falkenstein, Austria. (2) $CaCu_5(AsO_4)_2(CO_3)(OH)_4 \cdot 6H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of hydrothermal copper deposits, typically formed by alteration of tennantite.

Association: Tennantite, malachite, azurite, brochantite, chrysocolla.

Distribution: Numerous minor localities; a few for good material include: in Austria, in the Tirol, on the Falkenstein, near Schwaz; at Kogel, near Brixlegg; from Rattenberg; and elsewhere. At L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In the Midezianka copper mine, near Kielce, Poland. In Germany, at Schneeberg, Saxony; from Saalfeld and Stahlberg, Thuringia; at Bieber and Richelsdorf, Hesse. From the Cap Garonne mine, near le Pradet, Var, France. In Spain, rich material from Peñamellera, Oviedo Province; at Villamanin, Léon Province. From the Gortdrum mine, Co. Tipperary, Ireland. In the Gwaithyafon mine, Cwmsymlog, Wales. In Russia, from the Turinsk copper mine, Bogoslovsk, Ural Mountains; at Nerchinsk, Transbaikalia. From the Talmessi mine, 35 km west of Anarak, Iran. In the USA, fine examples from the Centennial Eureka, Mammoth, and other mines, Tintic district, Juab Co., and the Gold Hill mine, Tooele Co., Utah; at the Majuba Hill mine, Antelope district, Pershing Co., and elsewhere in Nevada. From the Kitabira mine, Yamaguchi Prefecture, and Toroku mine, Miyazaki Prefecture, Japan.

Name: For its occurrence in the Tirol (Tyrol), Austria.

(1) Beaverlodge district [*sic*; Goldfields district], Canada; by electron microprobe, corresponding to $Cu_{1.01}Co_{1.52}Ni_{0.60}Se_{4.00}$. (2) Hope's Nose, England; by electron microprobe; corresponding to $Cu_{1.10}Ni_{1.04}Co_{1.00}Se_{4.00}$.

Mineral Group: Linnaeite group.

Occurrence: With other selenides, as the youngest hydrothermal replacements and open space fillings in sheared Precambrian rocks, which also contain uraninite deposits (Goldfields district, Canada).

Association: Umangite, klockmannite, clausthalite, pyrite, hematite, chalcopyrite, chalcomenite (Ato Bay, Canada); berzelianite, eucairite, crookesite, ferroselite, bukovite, kruťaite, athabascaite, calcite, dolomite (Petrovice deposit, Czech Republic).

Distribution: In Canada, from the western part of the Eagle claims, and also at the head of Ato Bay, Beaverlodge Lake, Goldfields district, Saskatchewan [TL]. From Bukov, near Tisnova, on Koksín Hill, near Mitov, and in the Petrovice uranium deposit, near Ždăr, Czech Republic. At Hope's Nose, Torquay, Devon, England. In Argentina, from Tuminico, Sierra de Cacho, and at Los Llantenes, La Rioja Province.

Name: Honors Joseph Burr Tyrell (1858–1957), American geologist, first to visit the area of discovery in Canada.

Type Material: Canadian Geological Survey, Ottawa, 61592; Royal Ontario Museum, Toronto, Canada.

Tyuyamunite $Ca(UO_2)_2(V_2O_8)\cdot 5–8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Elongated, platy crystals, flattened on {001}, elongated along [010], with {010}, {110}, several other forms, may be curved or scaly, to 2 mm. As fanlike or radial aggregates; in thin films, coatings, and massive impregnations.

Physical Properties: *Cleavage:* On {001}, perfect, micaceous; on {100}, {010}, distinct. Hardness = ∼2 D(meas.) = 3.57–4.35 D(calc.) = [3.59] Radioactive; may exhibit weak yellow-green fluorescence under UV.

Optical Properties: Translucent to opaque. *Color:* Canary-yellow, lemon-yellow, greenish yellow on exposure to sunlight; colorless to pale yellow in transmitted light. *Luster:* Adamantine, pearly on {001}, may be dull to waxy if massive.
Optical Class: Biaxial (–). *Pleochroism:* Faint; X = nearly colorless; Y = pale canary-yellow; Z = canary-yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$ weak to strong.
$\alpha = 1.675$ $\beta = 1.860–1.870$ $\gamma = 1.885–1.895$ 2V(meas.) = 30°–45°

Cell Data: *Space Group:* n.d. $a = 10.63$ $b = 8.36$ $c = 20.40$ Z = n.d.

X-ray Powder Pattern: Hudspeth Co., Texas, USA.

(1) Tyuya-Muyun Cave, Kyrgyzstan; the H_2O content varies zeolitically as a function of relative humidity, reversibly altering to metatyuyamunite. (2) $Ca(UO_2)_2(V_2O_8)\cdot 8H_2O$.

Occurrence: An uncommon mineral in the oxidized zone of U–V deposits, especially those of the Colorado Plateau-type.

Association: Metatyuyamunite, carnotite, corvusite, uranophane, volborthite, gypsum.

Distribution: From Tyuya-Muyun Cave, Fergana Valley, Alai Range, Kyrgyzstan. At West Wheal Owles, St. Just, Cornwall, England. In the USA, an ore mineral at the Jackpile mine, Laguna district, Cibola Co., and at a number of mines in the Grants district, New Mexico; in Colorado, from Paradox Valley, Montrose Co., Calamity Creek, Mesa Co., and elsewhere; at many mines in Utah, as Richardson and Thompsons, Grand Co. In Arizona, at the Monument No. 2 mine, Monument Valley, Apache Co., in the Ridenaur breccia pipe, Coconino Co., and many other places; from the Gold Quarry mine, near Carlin, Eureka Co., Nevada; at Warren and the Dandy mine, Pryor Mountains, Carbon Co., Montana. From Santa Eulalia, Chihuahua, Mexico. In the Malargüe district, Mendoza Province, and at the Urcal deposit, La Rioja Province, Argentina. In the Hatrurim Formation, Israel. A number of additional minor localities are known.

Name: For the Tyuya-Muyun Cave, Kyrgyzstan, its original locality.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 3575–3577.

Total	99.48	100.00

(1) Miessijoki River, Lemmenjoki area, Finnish Lapland, Finland; average of 10 electron microprobe analyses, corresponding to $(Pd_{10.85}Pt_{0.14})_{\Sigma=10.99}(As_{1.88}Sb_{0.11})_{\Sigma=1.99}(Te_{1.65}Sn_{0.29}Bi_{0.06})_{\Sigma=2.00}$. (2) $Pd_{11}As_2Te_2$.

Occurrence: In heavy concentrate from glaciofluvial gravels and sands derived from mafic-ultramafic intrusions in a granulitic complex.

Association: Gold, platinum, sperrylite, cooperite, braggite, irarsite, laurite, isomertieite, mertieite II, atokite, and Pt-Fe, Pt-Cu, Os-Ir-Ru, Cu-Pt-Pd, Cu-Pd-Pt-Au, Pd-Au, and Au-Ag natural alloys, and pyrite, rutile, uraninite-thorianite, galena, wolframite, magnetite, ilmenite, chromite, hematite, columbite-tantalite, tapiolite, almandine, zircon.

Distribution: Miessijoki River, Lemmenjoki area, Inari Commune, Finnish Lapland, Finland.

Name: Honors Professor Ragnar Törnroos (b. 1943), University of Helsinki, Finland, who first reported a mineral of similar composition at Finnish Lapland.

Type Material: Natural History Museum, London, England, (2010,100).

References: (1) Kojonen, K.K., A.M. McDonald, C.J. Stanley, and B. Johanson (2011) Törnroosite, $Pd_{11}As_2Te_2$, a new mineral species related to isomertierite from Miessijoki, Finnish Lapland, Finland. Canadian Mineralogist, 49, 1643-1651. (2) (2014) Amer. Mineral., 99, 874-875 (abs. ref. 1).

(1) Kushkanatau salt deposit, Uzbekistan; H_2O by TGA. (2) Do.; separate partial determinations. (3) $NaMg(SO_4)F \cdot 2H_2O$.

Occurrence: Of very rare occurrence in cavities in clays above the salt strata (Kushkanatau salt deposit, Uzbekistan); on gypsum, sulfate derived from oxidizing sulfides, the other elements from limestones and clays (Cetine mine, Italy).

Association: Glauberite, polyhalite (Kushkanatau salt deposit, Uzbekistan); jurbanite, rostite, tamarugite, ferrinatrite, sideronatrite (Cetine mine, Italy).

Distribution: From the Kushkanatau salt deposit, lower Amu Darya River, Kara-Kalpakii, Uzbekistan. In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: Honors Aleksandr Sergeevich Uklonskii (1882–1972), mineralogist, Tashkent University, Tashkent, Uzbekistan, who studied central Asian mineral deposits.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67132, 67135.

Ulexite **$NaCaB_5O_6(OH)_6 \cdot 5H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Rare as measurable crystals, which may have many forms; typically elongated to acicular along [001], to 5 cm, then forming fibrous cottonball-like masses; in compact parallel fibrous veins, and radiating and compact nodular groups. *Twinning:* Polysynthetic on {010} and {100}; possibly also on {$\overline{3}$40}, {2$\overline{3}$0}, and others.

Physical Properties: *Cleavage:* On {010}, perfect; on {1$\overline{1}$0}, good; on {110}, poor. *Fracture:* Uneven across fiber groups. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 1.955 D(calc.) = 1.955 Slightly soluble in H_2O; parallel fibrous masses can act as fiber optical light pipes; may fluoresce yellow, greenish yellow, cream, white under SW and LW UV.

Optical Properties: Transparent to opaque. *Color:* Colorless; white in aggregates, gray if included with clays. *Luster:* Vitreous; silky or satiny in fibrous aggregates. *Optical Class:* Biaxial (+). *Orientation:* X (11.5°,81°); Y (100°,21.5°); Z (107°,70°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. α = 1.491–1.496 β = 1.504–1.506 γ = 1.519–1.520 2V(meas.) = 73°–78°

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.816(3)$ $b = 12.870(7)$ $c = 6.678(1)$ $\alpha = 90.36(2)°$ $\beta = 109.05(2)°$ $\gamma = 104.98(4)°$ Z = 2

(1) Suckow mine, Boron, California, USA. (2) $NaCaB_5O_6(OH)_6 \cdot 5H_2O$.

Occurrence: Typically in playa and salt-marsh deposits in arid regions and bedded sedimentary deposits formed from these, the boron supplied from surrounding hot springs. Some occurrences contain upwards of one billion tons of ulexite.

Association: Colemanite, borax, meyerhofferite, hydroboracite, probertite, glauberite, trona, mirabilite, calcite, gypsum, halite.

Distribution: In Chile, from near Iquique, and in a large deposit at the Surire salt lake, southeast of Arica, Tarapacá; from the Salar de Ascotan, Antofagasta. At more than 60 deposits in Jujuy, Salta, and Catamarca Provinces, Argentina. From Laguna Salinas, 70 km east of Arequipa, Peru. In the USA, at Columbus Marsh, Rhodes Marsh, and Teels Marsh, Esmeralda Co., Nevada; in California, from Death Valley and Saline Valley, Inyo Co., in the Kramer borate deposit, Boron, Kern Co. In Canada, at Windsor, Nova Scotia; from Hillsborough, in the Potash Corporation of America mine, Penobsquis evaporite deposit, near Sussex, with other minor occurrences in New Brunswick. From Niederellenbach, Hesse, Germany. Found near Bela Stena, Jarandol Basin, Serbia, ??Yugoslavia. At the Inder boron deposit, Kazakhstan. From the Da-Chaidan and Zazangzaka salt lakes, Tibet, China. In Turkey, immense deposits in the Bigadiç borate district, Balıkesir Province; in the Kirka borate deposit, Eskiçehir Province.

Name: Honors George Ludwig Ulex (1811–1883), German chemist who obtained the first reliable analysis of the mineral.

Ullmannite NiSbS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. As cubes and, less commonly, octahedra, pyritohedra, tetrahedra, to 3 cm. Cube faces striated by [110], twin boundaries of enantiomorphs. *Twinning:* Forms penetration twins about [110] with {001} the approximate composition plane; re-entrants develop on cube edges.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 VHN = 592–627 (100 g load). D(meas.) = 6.65 ??6.85 D(calc.) = 6.793

Optical Properties: Opaque. *Color:* Steel-gray to silver-white; white in reflected light. *Streak:* Grayish black. *Luster:* Metallic. *Anisotropism:* Individuals may be weakly anisotropic revealing a fine lamellar structure.

(1) Gosenbach, Germany. (2) Petersbach mine, Germany; by electron microprobe. (3) Broken Hill, Australia; by electron microprobe. (4) NiSbS.

Polymorphism & Series: Forms a series with willyamite.

Mineral Group: Cobaltite group.

Occurrence: With nickel minerals in hydrothermal veins.

Association: Nickeline, gersdorffite, pentlandite, chalcopyrite, pyrrhotite, galena, tetrahedrite, dyscrasite.

Distribution: In Germany, in North Rhine-Westphalia, from [Freusburg [spelling OK = mindat.org, but see notes??], near Siegen?? ck USNM catalog??]; at the Friedrich mine, near Wissen; the Petersbach mine, near Eichelhardt; Gosenbach; Salchendorf; and at Ramsbeck; in the Harz Mountains, from Neudorf; and elsewhere From Lölling, Carinthia, Austria. In France, at Ar, near Eaux-Bonnes, Pyrénées-Atlantiques. From Monte Narba and Masaloni, Sarrabus, Sardinia, Italy. In the Settlingstones mine, Fourstones, Northumberland, and at New Brancepeth colliery, Durham, England. From the Talnakh area, Noril'sk region, western Siberia, Russia. In the Esperanza mine, Salta Province, Argentina. In Canada, at the Kerr Addison mine, Timiskaming district, Ontario; and from the Nicholson mine, near Goldfields, Saskatchewan. At Broken Hill, New South Wales, Australia. In the Champion Reef mine, Kolar Gold Fields, Karnataka, India. Dozens of additional minor localities are known.

Ulrichite $CaCu(UO_2)(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, composed of flat prismatic fibers with complex terminations, to 1 mm, in radial aggregates. *Twinning:* On {100}, common.

Physical Properties: Hardness = ~3.5 D(meas.) = n.d. D(calc.) = 3.71 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale apple-green to lime-green; in transmitted light, pale green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–) (?). *Orientation:* Parallel extinction, length slow. $\alpha = 1.622(2)$ β = n.d. $\gamma = 1.634(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. $a = 12.79(3)$ $b = 6.85(2)$ $c = 13.02(3)$ $\beta = 91.03(7)^\circ$ Z = 4

X-ray Powder Pattern: Lake Boga quarry, Australia.
6.389 (100), 3.193 (45), 2.879 (20), 4.498 (15), 2.373 (15), 5.602 (14), 3.480 (14)

Total	98.60	100.00

(1) Lake Boga quarry, Australia; by electron microprobe, average of 14 analyses, H_2O by CHN analyzer on a separate sample; corresponds to $Ca_{1.09}Cu_{0.92}(UO_2)_{1.07}(PO_4)_{2.06} \cdot 3.65H_2O$.
(2) $CaCu(UO_2)(PO_4)_2 \cdot 4H_2O$.

Occurrence: A secondary mineral in miarolitic cavities in pegmatoidal granite.

Association: Turquoise-chalcosiderite, cyrilovite, torbernite, libethenite, sampleite, saléeite, fluorapatite.

Distribution: From the Lake Boga granite quarry, near Swan Hill, Victoria, Australia.

Name: To honor George Henry Frederick Ulrich (1830–1900), for his contributions to the mineralogy of Victoria, Australia.

Type Material: Museum Victoria, Melbourne, Australia, M38576.

References: (1) Birch, W.D., W.G. Mumme, and E.R. Segnit (1988) Ulrichite: a new copper calcium uranium phosphate from Lake Boga, Victoria, Australia. Australian Mineral., 3, 125–131.

(1) Nass River Valley, British Columbia, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} from charge balance; corresponds to $(Fe^{2+}_{1.60}Ti_{0.73}Fe^{3+}_{0.46}Mg_{0.10}Al_{0.06}Mn_{0.02}Ca_{0.01}Si_{0.01}V_{0.01})_{\Sigma=3.00}O_4$.
(2) $TiFe_2O_4$.

Mineral Group: Spinel group.

Occurrence: A common component of titaniferous magnetite iron ores; in kimberlites; in strongly reduced iron-bearing basalts, terrestrial and lunar.

Association: Iron, magnetite, troilite, cohenite, graphite, ilmenite, pyrrhotite, chalcopyrite, olivine, pyroxene, biotite, plagioclase, apatite.

Distribution: A few localities for studied material include: from the Grundhamn and other mines, near Södra Ulvön mountain, and elsewhere in the Ulvö Islands, Ångermanland archipelago, northern Sweden. In Finland, at Susimäki, Kuisaari, Sammali, and elsewhere. At Bühl, near Weimar, Hesse, Germany. At Padvinsk, Ural Mountains, and in the Udachnaya kimberlite pipe, Sakha, Russia. On Disko Island, near Uivfaq and Kitdlît, Greenland. At the Mooihoek Farm, Lydenburg district; Spitzkop, near Middelburg; and Vygenhoek, Transvaal, South Africa. In Mozambique, from Chapanduka, Massamba, and Canjueira. At Chinumba, Gambos, and Chihamji, Angola. In the USA, in the Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota; around Lake Sanford, Essex Co., New York; large crystals from the Soda Springs vent, Gila Co., Arizona. At Lac de Blanche and Benoite Lake, Quebec, Canada. Abundant in some basalts on the Moon.

Name: For the occurrence on the Ulvö Islands, Sweden, and as a member of the *spinel* group.

Type Material: n.d.

(1) Sierra de Umango, Argentina. (2) Cu_3Se_2.

Occurrence: With other selenides in hydrothermal veins, formed below 112 °C.

Association: Clausthalite, tiemannite, berzelianite, guanajuatite, eucairite, klockmannite, hessite, naumannite, chalcomenite, chalcopyrite, cobaltite, pyrite, malachite, calcite.

Distribution: In Argentina, from the Sierra de Umango [TL], in the Santa Brigida mine, at Los Llantenes, and from Tuminico, Sierra de Cacho, La Rioja Province; and at the Cerro de Cacheuta, Mendoza Province. In Canada, from Lodge Bay on Lake Athabasca, to Ato Bay on Beaverlodge Lake, Saskatchewan, and on Christopher Island, Baker Lake, Northwest Territories. At Skrikerum, near Tryserum, Kalmar, Sweden. In Germany, in the Harz Mountains, at St. Andreasberg, Tilkerode, Zorge, Lerbach, and Clausthal. From the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France. At Hope's Nose, Torquay, Devon, England. From Kletno, Poland. In the Czech Republic, in the Bukov and Habrí mines, near Tisnova; at the Petrovice uranium deposit, near Ždăr; and from the Předbořice uranium deposit, near Krásna Hora. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From Tsumeb, Namibia. At Kalgoorlie, and from the Copper Hills prospect, East Pilbara region, Western Australia; in the Iron Monarch quarry, Iron Knob, South Australia. In the Frederik VII's mine, near Julianehåb, southern Greenland. A few additional localities are known.

Name: For the Sierra de Umango, Argentina, place of first discovery.

(1) Khibiny massif, Russia; by electron microprobe, average of three analyses; corresponds to $(K_{2.02}Na_{0.02})_{\Sigma=2.04}(Zr_{0.77}Ti_{0.18}Hf_{0.01}Fe_{0.01})_{\Sigma=0.97}Si_{3.00}O_{9.92}H_{2.38}F_{0.45}$. (2) $K_2ZrSi_3O_9 \cdot H_2O$.

Polymorphism & Series: Dimorphous with kostylevite.

Occurrence: In pegmatite in a differentiated alkalic massif.

Association: Kostylevite, wadeite, eudialyte, potassic feldspar, aegirine.

Distribution: In the valley of the Vuonnemiok River, Khibiny massif, Kola Peninsula, Russia.

Name: For Lake Umbozero, which separates the Khibiny massif from the Lovozero massif, Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity; Mineralogical Museum, St. Petersburg University, St. Petersburg, 17072; Mining Institute, St. Petersburg, 1631/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82758; The Natural History Museum, London, England, 1994,35.

Umbozerite $Na_3Sr_4ThSi_8(O, OH)_{24}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Metamict; tetragonal after recrystallization. *Point Group:* n.d. As acicular prismatic crystals, to 1.5 cm, sometimes curved; as irregular segregations.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ~5 VHN = 470–535, 506 average. D(meas.) = 3.60 D(calc.) = n.d. Radioactive.

Optical Properties: Translucent to transparent. *Color:* Bottle-green to mottled greenish brown. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.640$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Mt. Karnasurt, Russia; pattern after heating to 1100 °C.
3.29 (100), 1.701 (80), 3.38 (60), 1.999 (60), 2.98 (50), 2.82 (50), 2.09 (45)

Chemistry:

	(1)		(1)

Fe_2O_3	1.8	K_2O	0.74
U_3O_8	0.4	LOI	0.43
MnO	2.2	Total	96.8

(1) Mt. Karnasurt, Russia; by electron microprobe and flame photometry, average of six analyses; corresponds to $(Na_{2.56}K_{0.19})_{\Sigma=2.75}(Sr_{3.46}Mn_{0.40}Ba_{0.17}Ca_{0.05})_{\Sigma=4.08}(Th_{0.86}Fe_{0.30}Ti_{0.05}U_{0.02}Ce_{0.02})_{\Sigma=1.25}Si_8O_{23.35}(OH)_{0.68}$.

Occurrence: In pneumatolytic-hydrothermal veins cutting alkalic rocks in the upper part of a differentiated alkalic massif.

Association: Ussingite, sphalerite, belovite, manganoan pectolite, lorenzenite, niobium-bearing minerals of the lomonosovite group.

Distribution: Found on Mts. Karnasurt and Punkaruaiv, near Lake Umba, Lovozero massif, Kola Peninsula, Russia.

Name: For Lake Umbozero, Kola Peninsula, Russia, near where the mineral was discovered.

Type Material: Mining Institute, St. Petersburg, 992/1; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75150; National School of Mines, Paris, France.

Total		[100.00]	100.00

(1) Marysvale, Utah, USA. (2) Shinkolobwe, Congo; by electron microprobe, average of two analyses; H_2O by difference. (3) $(UO_2)MoO_4 \cdot 2H_2O$, determined from crystal-structure analysis.

Occurrence: A rare secondary mineral, typically in sediment-hosted uranium-bearing deposits, formed in the oxidation zone above the water table.

Association: Uraninite, ilsemannite, jordisite, iriginite, schoepite, uranophane, rutherfordine, calcurmolite, fluorite, pyrite, gypsum, quartz.

Distribution: From the USA, from the Freedom No. 2 mine, Marysvale, Ohio district, Piute Co., Utah; at the Lucky Mc mine, Gas Hills, Fremont Co., Wyoming; and in the Alyce Tolino mine, Cameron district, Coconino Co., Arizona. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From the Rabéjac and Mas-d'Alary uranium deposits, south of Lodève, Hérault, France. At the Kyzylsai Mo–U deposit, Chu-Ili Mountains, southwestern Balkhash region, Kazakhstan. From unspecified localities in the former Soviet Union.

Name: For Uranium, MOlybdenum, Hydrogen, and Oxygen in the composition.

Type Material: n.d.

Ungemachite $K_3Na_8Fe^{3+}(SO_4)_6(NO_3)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Tabular crystals, to 1 mm, thick on {0001}, bounded by large {0001} and {$10\overline{1}1$}, {$01\overline{1}2$}, {$11\overline{2}3$}, {$10\overline{1}4$}, with more than 20 other modifying forms noted.

Physical Properties: *Cleavage:* On {0001}, perfect. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.287(3) D(calc.) = [2.259]

Optical Properties: Transparent. *Color:* Colorless to pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.502(2)$ $\epsilon = 1.449(2)$

Cell Data: *Space Group:* $R\overline{3}$. $a = 10.898(1)$ $c = 24.989(6)$ Z = 3

X-ray Powder Pattern: Chuquicamata, Chile. (ICDD 20-1326).
3.43 (100), 8.33 (60), 2.72 (55), 2.59 (35), 8.82 (30), 7.55 (30), 1.880 (25)

Chemistry:

	(1)	(2)
SO_3	41.23	41.22
N_2O_5	trace	9.27
Fe_2O_3	7.88	6.85
Na_2O	22.15	21.27
K_2O	11.63	12.12
H_2O	17.11	9.27
Total	[100.00]	100.00

(1) Chuquicamata, Chile; recalculated to 100% after deduction of 2.07% insoluble, from an original total of 99.64%; stated then to correspond to $K_{2.88}Na_{8.34}Fe_{1.15}(SO_4)_{6.01}(OH)_2 \cdot 10H_2O$.
(2) $K_3Na_8Fe(SO_4)_6(NO_3)_2 \cdot 6H_2O$ as verified by crystal-structure analysis.

Occurrence: Rarely formed by the oxidation of pyrite in an arid climate, in veins and cavities in other massive iron sulfates.

Association: Clinoungemachite, jarosite, sideronatrite, metasideronatrite, metavoltine, fibroferrite.

Distribution: From Chuquicamata, Antofagasta, Chile.

Name: Honors Henri Léon Ungemach (1879–1936), Belgian crystallographer who studied the natural sulfates of Chile.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 98282, 98283.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 596–597. (2) Groat, L.A. and F.C. Hawthorne (1986) Structure of $K_3Na_8Fe^{3+}(SO_4)_6(NO_3)_2 \cdot 6H_2O$, a mixed sulfate-nitrate mineral. Amer. Mineral., 71, 826–829.

Total	[100.0]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, H_2O by difference.
(2) $Al(UO_2)_3O(PO_4)_2(OH)\cdot 7H_2O$.

Occurrence: A rare secondary mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Meta-autunite, phosphuranylite, threadgoldite, phuralumite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For Uranium, Phosphorus, and ALuminum in the composition.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG5951, RMG13457, RMG11888.

(1) Novofrolovskoye deposit, Russia; after deducting andradite–grossular and szaibélyite, corresponds to $Ca_{1.05}B_{2.00}O_{1.95}(OH)_4$. (2) Fuka, Japan; CaO by electron microprobe, B_2O_3 by ICP, H_2O by TGA; corresponds to $Ca_{1.01}B_{2.02}O_{2.07}(OH)_{3.93}$. (3) $CaB_2O_2(OH)_4$.

Polymorphism & Series: Dimorphous with vimsite.

Occurrence: A rare secondary mineral in boron-rich iron-ore skarns (Novofrolovskoye deposit, Russia); in a vein cutting limestone (Fuka, Japan).

Association: Andradite–grossular, magnetite, szaibélyite, frolovite (Novofrolovskoye deposit, Russia); sibirskite, borcarite, fluorite, calcite (Fuka, Japan).

Distribution: In Russia, from the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains, and in the Solongo boron deposit, Buryatia. Found at Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For the original locality in the URAL Mountains, Russia, and BORate in its composition.

Type Material: Vernadsky Geological Museum, Moscow, 48613; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64944, vis3597.

(1) Boevskoye deposit, Russia; H_2O taken as LOI, original total given as 102.05%; corresponding to $Ca_{1.73}Be_{4.11}(PO_4)_{3.00}(OH)_{2.94} \cdot 5.69H_2O$. (2) Dunton quarry, Maine, USA; corresponding to $Ca_{2.00}Be_{4.07}(PO_4)_{3.00}(OH)_3 \cdot 5H_2O$. (3) Weinebene Pass, Austria; by electron microprobe, H_2O by LOI. (4) $Ca_2Be_4(PO_4)_3(OH)_3 \cdot 5H_2O$.

Occurrence: In complex zoned granite pegmatites (Boevskoye deposit, Russia; Dunton quarry, Maine, USA); in a spodumene-rich pegmatite in high-grade metamorphic rocks (Weinebene Pass, Austria).

Association: Moraesite, beryllonite, apatite, carbonate-apatite, crandallite, beryl, fluorite (Boevskoye deposit, Russia); roscherite, hydroxyl-herderite, elbaite, beryllonite, lepidolite, albite (Dunton quarry, Maine, USA).

Distribution: In the Boevskoye beryllium deposit, 35 km southwest of Kamensk–Ural'skii, Middle Ural Mountains, Russia. At the Dunton quarry, Newry, Oxford Co., Maine, USA. From near Taquaral, Minas Gerais, Brazil. In the Weinebene Pass, Carinthia, Austria.

Name: For the Ural Mountain region, Russia, in which it was first found.

Type Material: Il'menskii Preserve Museum, Miass, 5523; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75439.

Uramarsite $(NH_4, H_3O)_2(UO_2)_2(AsO_4, PO_4)_2 \cdot 6H_2O$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As imperfect platy crystals, to 2 mm, as films and, less often, as flattened square crystals, to 0.1 mm; dominated by {001} with minor {010}.

Physical Properties: *Cleavage*: Perfect {001}, imperfect {010}. *Fracture*: Stepped. *Tenacity*: Brittle. Hardness = 2.5 D(meas.) = 3.22 D(calc.) = 3.286

Optical Properties: Transparent. *Color*: Pale green; colorless in thin section. *Streak*: White. *Luster*: Vitreous. Fluoresces green in UV.
Optical Class: Anomalously biaxial (–). $\alpha = 1.562(2)$ $\beta \approx \gamma = 1.593(2)$ $2V < 5°$
Orientation: $X = c$; $Y \approx b$.

Cell Data: *Space Group*: *P*4/*nmm*. $a = 7.19(1)$ $c = 9.15(2)$ $Z = 1$

X-ray Powder Pattern: Bota-Burum deposit, Southern Kazakhstan Region, Kazakhstan.
9.27 (100), 4.58 (25), 3.86 (20), 2.28 (20), 2.80 (13), 1.823 (8), 1.713 (7)

Chemistry:

	(1)	(2)
Na_2O	0.3	
UO_3	61.8	59.46
As_2O_5	15.0	23.89
P_2O_5	5.9	
$(NH_4)_2O$	3.2	5.41
H_2O	13.8	11.24
total	86.2	100.00

(1) Bota-Burum deposit, Southern Kazakhstan Region, Kazakhstan; electron microprobe analysis, NH_4 by ionometric electrode, H_2O by difference; water, hydronium and anionic groups confirmed by IR, corresponding to $[(NH_4)_{1.15}(H_3O)_{0.72}Na_{0.09}]_{\Sigma=1.96}(UO_2)_{2.02}[(AsO_4)_{1.22}(PO_4)_{0.78}]_{\Sigma=2} \cdot 6.1H_2O$.
(2) $(NH_4)_2(UO_2)_2(AsO_4)_2 \cdot 6H_2O$.

Occurrence: In the oxidized zone of pitchblende-sulfide mineralization in highly-fractured, hydrothermally-altered felsite porphyry and tuff breccia.

Association: Calcite, arsenopyrite, pyrite, galena, chistyakovaite, natrouranospinite, scorodite, arseniosiderite, mansfieldite, metazeunerite, trögerite.

Distribution: Bota-Burum deposit, south of Alakol' Lake, southwestern Balkhash area, Southern Kazakhstan Region, Kazakhstan.

Name: An acronym for the major chemical components URanium, AMmonium, ARSenate.

Type Material: Fedorovskiy All-Russia Research Institute of Mineral Resources, Moscow, 350/59/zel.

Uramphite $(NH_4)_2(UO_2)_2(PO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal (synthetic). *Point Group:* $4/m\ 2/m\ 2/m$. Square tablets, to 0.2 mm, in rosettes and coatings.

Physical Properties: *Cleavage:* Distinct in two directions. Hardness = n.d. D(meas.) = 3.7 D(calc.) = 3.26 Radioactive; fluoresces yellow-green.

Optical Properties: Semitransparent. *Color:* Bottle-green to pale green. *Luster:* Vitreous. *Optical Class:* Biaxial (–), anomalous. *Pleochroism:* X = colorless; $Y = Z$ = pale green. $\alpha = 1.564$ $\beta = 1.585$ $\gamma = 1.585$ 2V(meas.) = 0°–3°

Cell Data: *Space Group:* $P4/ncc$ (synthetic). $a = 7.02(1)$ $c = 18.08(4)$ Z = 4

X-ray Powder Pattern: Tura-Kavak deposit, Kyrgyzstan.
3.78 (10), 2.22 (9), 1.694 (8.5), 2.75 (8), 2.12 (8), 3.24 (7), 1.399 (7)

Chemistry:

	(1)	(2)
UO_3	68.70	66.66
P_2O_5	15.63	16.54
NH_4	4.60	4.20
H_2O	11.00	12.60
Total	99.93	100.00

(1) Tura-Kavak deposit, Kyrgyzstan; corresponds to $(NH_4)_{2.2}(UO_2)_{2.3}(PO_4)_{2.0} \cdot 5.5H_2O$.
(2) $(NH_4)_2(UO_2)_2(PO_4)_2 \cdot 6H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: In the oxidized zone of a uranium-coal deposit, in fractures in the coal at depths between 20 and 50 m.

Association: n.d.

Distribution: From the Tura-Kavak uranium-coal deposit, Kyrgyzstan.

Name: For its content of URanium, AMmonium, and PHosphate.

Type Material: n.d.

Urancalcarite $Ca(UO_2)_3(CO_3)(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Acicular crystals, elongated along [001] and flattened on {100}, showing {100}, {010}, and {001}, in radiating aggregates, to 4 mm.

Physical Properties: Hardness = 2–3 D(meas.) = 4.03 D(calc.) = 4.10 Radioactive.

Optical Properties: Transparent. *Color:* Bright yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* X = pale yellow; $Y = Z$ = bright yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.660(3)$ $\beta = 1.712(2)$ $\gamma = 1.736(2)$ 2V(calc.) = 66.6°

Cell Data: *Space Group:* $Pbnm$ or $Pbn2_1$. $a = 15.42(3)$ $b = 16.08(4)$ $c = 6.970(6)$ Z = 4

X-ray Powder Pattern: Shinkolobwe, Congo.
8.06 (100), 4.02 (80), 3.488 (70), 3.193 (50), 2.101 (50), 2.829 (40), 7.00 (30)

Chemistry:

	(1)	(2)	(3)

H_2O	10.61	13.27	10.14
Total	98.58	99.94	100.00

(1) Shinkolobwe, Congo; by electron microprobe, average of six analyses, CO_2 by gas chromatography, $CO_2 + H_2O$ by TGA; corresponds to $Ca_{0.83}(UO_2)_{2.93}(CO_3)_{1.19}(OH)_{5.14} \cdot 3.70H_2O$. (2) Hunan Province, China; CO_2 and H_2O determined on a separate sample. (3) $Ca(UO_2)_3(CO_3)(OH)_6 \cdot 3H_2O$.

Occurrence: In the oxidation zone of uranium deposits.

Association: Uraninite, uranophane, wyartite, masuyite (Shinkolobwe, Congo); fourmarierite, vandendriesscheite, studtite, uranophane-beta, rutherfordine (Hunan Province, China).

Distribution: From Shinkolobwe, Katanga Province, Congo [Shaba Province, Zaire]. Found at an undisclosed locality in Hunan Province, China.

Name: For URANium, CALcium, and CARbonate in the composition.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM13995.

References: (1) Deliens, M. and P. Piret (1984) L'urancalcarite, $Ca(UO_2)_3(CO_3)(OH)_6 \cdot 3H_2O$, nouveau minéral de Shinkolobwe, Shaba, Zaire. Bull. Uraninite UO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals uncommon, typically cubes modified by the octahedron and dodecahedron, to 11 cm; botryoidal to reniform, colloform banded, columnar, dense massive; may be dendritic. *Twinning:* On {111}, rare.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5–6 VHN = 499–548 (50 g load). D(meas.) = 10.63–10.95, decreasing markedly with oxidation, to as low as 6.5. D(calc.) = 10.88 Radioactive.

Optical Properties: Opaque, transparent in thinnest fragments. *Color:* Steel-black to velvet-black, brownish black, pale gray, pale green; in transmitted light, pale green, pale yellow, deep brown; pale gray with brownish tint in reflected light, may show dark brown internal reflections. *Streak:* Brownish black, gray, olive-green, shining. *Luster:* Submetallic to greasy, dull.
Optical Class: Isotropic.
R: (400) 17.6, (420) 17.3, (440) 17.0, (460) 16.8, (480) 16.5, (500) 16.3, (520) 16.2, (540) 16.0, (560) 15.9, (580) 15.8, (600) 15.9, (620) 15.9, (640) 16.0, (660) 16.0, (680) 16.1, (700) 16.2

Cell Data: *Space Group:* $Fm3m$ (synthetic $UO_{2.03}$). $a = 5.4682$ $Z = 4$

X-ray Powder Pattern: Synthetic $UO_{2.03}$; may be confused with thorianite or cerianite. 3.157 (100), 1.934 (49), 2.735 (48), 1.649 (47), 1.255 (18), 1.223 (15), 1.0523 (15)

(1) Placer de Guadalupe, Chihuahua, Mexico; average of two analyses, H_2O calculated from gain in weight on ignition. (2) Locality not stated; by electron microprobe; U^{4+}:U^{6+} from stoichiometry, original total given as 100.4%; corresponding to $(U^{4+}_{0.48}U^{6+}_{0.18}Pb_{0.16}Th_{0.15}Ca_{0.01}Ce_{0.01})_{\Sigma=0.99}O_{2.01}$.

Mineral Group: Forms a series with thorianite.

Occurrence: In granite and syenite pegmatites; in hydrothermal high-temperature tin and moderate-temperature Co–Ni–Bi–Ag–As and other sulfide veins; in Colorado Plateau-type sandstone-hosted U–V deposits; in uraniferous conglomerates; a detrital mineral.

Association: Zircon, monazite, tourmaline, mica, feldspar (pegmatitic); pyrite, chalcopyrite, galena, bismuth, silver, nickeline, barite, fluorite, carbonates (Co–Bi–Ag hydrothermal veins).

Distribution: Widespread; may form an important ore. At Jáchymov (Joachimsthal) and Horní Slavkov (Schlaggenwald), Czech Republic. In Germany, from Johanngeorgenstadt, Schneeberg, and Annaberg, Saxony; in Bavaria, from Wölsendorf and Hagendorf. From many mines in Cornwall, England. Large crystals from the Sierra Albarrana, Córdoba Province, Spain. At Wilberforce, Ontario, and Great Bear Lake, Northwest Territories, Canada. In the USA, from Branchville, Fairfield Co., Connecticut; Grafton, Grafton Co., New Hampshire; fine crystals from Standpipe Hill, Topsham, Sagadahoc Co., Maine; around Spruce Pine, Mitchell Co., North Carolina; in the Ingersoll mine, near Keystone, Pennington Co., South Dakota. From Shinkolobwe

Uranmicrolite $(U, Ca)_2(Ta, Nb)_2O_6(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; typically metamict. *Point Group:* $4/m\ \bar{3}\ 2/m$. As octahedra modified by {113}.

Physical Properties: *Fracture:* Irregular. *Tenacity:* [Brittle] (by analogy to the pyrochlore group). Hardness = 5.5 D(meas.) = 5.75–5.88 D(calc.) = [5.97] Radioactive.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Yellowish brown, greenish brown, brownish black; yellowish brown in transmitted light. *Streak:* Pale yellow. *Luster:* Greasy.
Optical Class: Isotropic. $n = 1.97$

Cell Data: *Space Group:* $Fd3m$. a = 10.40 Z = 8

X-ray Powder Pattern: n.d.

Chemistry:

(1) Posse Farm, Brazil. (2) Okangava Ost, Namibia; by electron microprobe, average of eight analyses; corresponding to $(Ca_{0.68}U_{0.30}Na_{0.15}Mn_{0.05}Sr_{0.03}Pb_{0.03})_{\Sigma=1.24}(Ta_{1.41}Nb_{0.55}Fe_{0.04})_{\Sigma=2.00}O_6(OH, F)$.

Mineral Group: Pyrochlore group, microlite subgroup; $U_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: In a granite pegmatite (Posse Farm, Brazil).

Association: Columbite, magnetite, samarskite, garnet, beryl, tourmaline, bismuth minerals, kaolinite, microcline, quartz (Posse Farm, Brazil); lepidolite (Okangava Ost, Namibia).

Distribution: In Brazil, on the Posse Farm, Brejaúba district, Minas Gerais. From Jooste's pegmatite, Okangava Ost, near Karibib, Namibia. At San Piero in Campo, Elba, Italy.

Name: As a member of the *microlite* subgroup with significant *uranium* content.

Type Material: n.d.

Uranophane $Ca(UO_2)_2(SiO_3OH)_2 \cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Crystals are composite needles, elongated ‖ [010], to over 1 cm, poorly developed, warped or bent. As stellate aggregates; in fibrous or felted crusts, and massive.

Physical Properties: *Cleavage:* Perfect on {100} (?); traces of another, parallel elongation. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 3.81–3.90 D(calc.) = 3.78 Crystals weakly fluorescent green under UV, typically not fluorescent when massive; radioactive.

Optical Properties: Transparent to translucent. *Color:* Lemon-yellow to pale straw-yellow or honey-brown; also greenish yellow to yellowish green, yellow-orange. *Luster:* Vitreous, pearly on the good cleavage; waxy or dull when massive.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = colorless; Y = pale canary-yellow; Z = canary-yellow. *Orientation:* $Z = b$; $X \perp$ {100} cleavage or a flat face. *Dispersion:* $r < v$, strong, crossed. $\alpha = 1.642–1.648$ $\beta = 1.661–1.667$ $\gamma = 1.667–1.675$ 2V(meas.) = 32°–49°

Cell Data: *Space Group:* $P2_1$. $a = 15.858–15.909$ $b = 6.985–7.002$ $c = 6.641–6.665$ $\beta = 97°27'–97°33'$ Z = 2

X-ray Powder Pattern: Ruggles pegmatite, Grafton Co., New Hampshire, USA.
7.88 (100), 3.94 (90), 2.99 (80), 2.91 (80), 1.969 (70), 4.76 (50), 3.20 (50)

Chemistry:

	(1)	(2)
SiO_2	12.66	14.03
UO_3	65.24	66.80
CaO	8.53	6.55
H_2O	13.02	12.62
Total	99.45	100.00

(1) Lusk, Wyoming, USA. (2) $Ca(UO_2)_2(SiO_3OH)_2 \cdot 5H_2O$.

Polymorphism & Series: Dimorphous with uranophane-beta.

Occurrence: A common secondary mineral in uranium deposits and pegmatites, formed by alteration of uraninite; as coatings, presumably through deposition from meteoric waters.

Association: Uranophane-beta, kasolite, meta-autunite, phosphuranylite, uranium oxides.

Distribution: Only a few localities can be given for exceptional crystals or abundant material. At Miedzianka (Kupferberg), Silesia, Poland. From Wölsendorf, Bavaria, and at Neustädtl, near Schneeberg, Saxony, Germany. From Jáchymov (Joachimsthal), Czech Republic. At Lachaux, Puy de Dôme, France. In the USA, at the Monument No. 2 mine, Apache Co., Arizona; from the Happy Jack mine, White Canyon, San Juan Co., Utah; as large crystals in the Hanosh mine, Grants district, McKinley Co., New Mexico. In the Silver Cliff mine, Lusk, Niobrara Co., Wyoming, and from the Spruce Pine district, Mitchell Co., North Carolina. Large crystals from the Faraday mine, near Bancroft, Ontario, Canada. On Mt. Painter, in the Flinders Ranges, South Australia. In Congo (Zaire), at Shinkolobwe, and the Musonoi mine, Kolwezi, Katanga (Shaba) Province. From Rössing, Namibia.

Name: From URANium and the Greek for *to appear*.

Uranophane-beta $Ca(UO_2)_2(SiO_3OH)_2 \cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic by extension on [100], to 5 mm, with square cross sections or flattened on {010}, terminated by large {001}. As subradial to fanlike aggregates, or velvety or bristly coatings. *Twinning:* Common on {001}, contact and penetration.

Physical Properties: *Cleavage:* Perfect on {010}; reported on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 3.90–3.95 D(calc.) = [4.11] Fluoresces faint green under UV; radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellowish green to citron-yellow. *Luster:* Vitreous; also silky, greasy, waxy in aggregates.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = lemon-yellow. *Orientation:* $X = b$; $Z \wedge c = 26°$. *Dispersion:* $r > v$, strong, crossed. *Absorption:* $Y = Z > X$.
$\alpha = 1.660–1.678$ $\beta = 1.682–1.723$ $\gamma = 1.689–1.730$ 2V(meas.) = 35°–71°

Cell Data: *Space Group:* $P2_1/a$. $a = 13.966(2)$ $b = 15.443(4)$ $c = 6.632(1)$ $\beta = 91.38(2)°$ Z = [4]

X-ray Powder Pattern: Jáchymov, Czech Republic; may convert to uranophane on crushing.
7.83 (100), 3.90 (90), 3.51 (60), 3.19 (50), 2.59 (50), 6.66 (40), 6.15 (40)

Chemistry:

	(1)	(2)
SiO_2	13.11	14.03
UO_3	66.29	66.80
CaO	7.32	6.55
H_2O	12.87	12.62
Total	99.59	100.00

(1) Jáchymov, Czech Republic. (2) $Ca(UO_2)_2(SiO_3OH)_2 \cdot 5H_2O$.

Polymorphism & Series: Dimorphous with uranophane.

Occurrence: A secondary mineral, altering from other uranium minerals under oxidizing conditions.

Association: Uraninite, uranophane.

Distribution: Now known from numerous localities; some for well-characterized material follow. From Jáchymov (Joachimsthal), Czech Republic. At Wölsendorf, Bavaria, Germany. From Bigay and La Crouzille, Puy-de-Dôme, France. At Sankra, near Nellore, Andhra Pradesh, India. In the USA, from Bedford, Westchester Co., New York; at Newry, Oxford Co., Maine; large crystals in the Ruggles mine, Grafton, and the Palermo mine, near North Groton, Grafton Co., New Hampshire; from near Spruce Pine and Deer Park, Mitchell Co., North Carolina; abundant in the Grants district, McKinley Co., New Mexico; in the Freedom No. 2 mine, Marysvale, Piute Co., Utah. In Canada, at Theano Point, Lake Superior, and in the Faraday mine, Bancroft district, Ontario. From Rössing, Namibia.

Name: In allusion to its dimorphous relation to *uranophane*.

Type Material: Natural History Museum, Vienna, Austria, J3747.

Uranopilite $(UO_2)_6(SO_4)(OH)_{10}\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As needles and laths, elongated along [001] and flattened on {010}, to 0.5 mm; in rosettes and fibrous velvety incrustations, also as warty, globular, and reniform masses; commonly in efflorescences and coatings.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = "Soft". D(meas.) = 3.7–4.0 D(calc.) = [3.74] Radioactive; strong lemon-yellow or yellow-green fluorescence under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Bright yellow, lemon-yellow, golden yellow, straw-yellow; colorless to pale yellow in transmitted light. *Luster:* Silky.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; $Y = Z$ = yellow. *Orientation:* $X \simeq b$; $Y \wedge c = 17°$–$23°$. *Dispersion:* $r < v$, very strong, also $r > v$. $\alpha = 1.621$–1.623 $\beta = 1.623$–1.625 $\gamma = 1.631$–1.634 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 14.03(1)$ $b = 14.60(1)$ $c = 9.184(6)$ $\beta = 96.87(6)°$ Z = 2

X-ray Powder Pattern: Wheal Owles, England.
7.12 (10), 9.18 (8), 4.28 (8), 3.65 (5), 5.51 (4), 3.31 (4), 2.99 (3)

Chemistry:

	(1)	(2)
SO_3	4.04	3.81
UO_3	81.20	81.62
CaO	0.93	
H_2O	14.03	14.57
Total	100.20	100.00

(1) Jáchymov, Czech Republic. (2) $(UO_2)_6(SO_4)(OH)_{10}\cdot 12H_2O$.

Occurrence: A locally abundant secondary mineral formed under acid conditions by the oxidation of sulfides in the presence of uraninite; may be of post-mining origin.

Association: Uraninite, zippeite, johannite, uranophane, soddyite, fourmarierite, gypsum.

Distribution: From Jáchymov (Joachimsthal) and Příbram, Czech Republic. At Johanngeorgenstadt, Saxony, Germany. In France, from the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, at La Crouzille, Haute-Vienne, and from Grury, Saône-et-Loire, France. In Wheal Owles, Wheal Edward, and the Geevor mine, St. Just, Cornwall, England. From Nowa Ruda, Lower Silesia, Poland. In the Urgeiriça mine, Viseu district, Portugal. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the Mounana uranium mine, Franceville, Gabon. From South Alligator Valley, Northern Territory, Australia. In Japan, in the Togo mine, Tottori Prefecture. In the USA, found at many localities in the Uravan district, Montrose Co., Colorado; also at the Happy Jack and Jomac mines, White Canyon district, San Juan Co., and at Capitol Wash, Wayne Co., Utah. In Canada, from Great Bear Lake and Hottah Lake, Northwest Territories, and at Goldfields, Saskatchewan.

Name: From its content of URANium and the Greek for *felt*, for its texture.

Uranopolycrase $(U,Y)(Ti,Nb)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; metamict. *Point Group:* $2/m\ 2/m\ 2/m$. Euhedral crystals, elongated along [001], tabular on {100}, with {100}, {010} and {011}, to 0.15 mm, intergrown with uranoan polycrase-(Y).

Physical Properties: *Cleavage:* {100}, good. Hardness = n.d. VHN = 659 (20 g load). D(meas.) = n.d. D(calc.) = [6.60] Radioactive.

Optical Properties: Opaque. *Color:* Red-brown; in reflected light, pale gray with bluish tint and dark red-brown internal reflections. *Streak:* Brown. *Luster:* Adamantine.
Optical Class: Isotropic.
R: (470) 23.6, (546) 21.5, (589) 22.3, (650) 25.1

Cell Data: *Space Group: Pbcn.* $a = 14.51(1)$ $b = 5.558(5)$ $c = 5.173(4)$ Z = [4]

X-ray Powder Pattern: San Piero in Campo, Elba, Italy; after heating at 900 °C for ten hours.
2.99 (100), 1.90 (50), 1.48 (40), 1.77 (35), 2.78 (25), 3.21 (12), 1.86 (10)

Chemistry:

	(1)
Nb_2O_5	11.27
Ta_2O_5	5.98
TiO_2	27.36
ThO_2	4.14
UO_2	39.08
Y_2O_3	7.78
Nd_2O_3	0.37
MnO	0.48
CaO	0.22
Total	[96.68]

(1) San Piero in Campo, Elba, Italy; by electron microprobe, original total given as 96.73%; corresponding to $(U_{0.62}Y_{0.29}Th_{0.07}Mn_{0.03}Ca_{0.02}Nd_{0.01})_{\Sigma=1.04}(Ti_{1.46}Nb_{0.36}Ta_{0.12})_{\Sigma=1.94}O_6$.

Occurrence: In a zoned pegmatite vein near the contact with granodiorite.

Association: Uranoan polycrase-(Y), euxenite-(Y), manganocolumbite, titanowodginite, uranmicrolite, beryl, stilbite, quartz, orthoclase, albite, lepidolite, elbaite.

Distribution: From San Piero in Campo, Elba, Italy.

Name: For its content of URANium and relation to *polycrase-(Y)*.

Type Material: University of Pisa, Pisa, Italy.

References: (1) Aurisicchio, C., P. Orlandi, M. Pasero, and N. Perchiazzi (1993) Uranopolycrase, the uranium-dominant analogue of polycrase-(Y), a new mineral from Elba Island, Italy, and its crystal structure. Eur. J. Mineral., 5, 1161–1165. (2) (1994) Amer. Mineral., 79, 766 (abs. ref. 1).

Uranosilite $U^{6+}Si_7O_{17}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222 or $2/m\ 2/m\ 2/m$. Needlelike crystals are visible only under the scanning electron microscope at high magnification.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.25 Radioactive.

Optical Properties: Semitransparent. *Color:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–) (probable). $\alpha = 1.570(2)$ β = n.d. $\gamma = 1.584(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P22_12_1$, $Pmmb$, or $Pmcb$. $a = 11.60$ $b = 14.68$ $c = 12.83$
Z = 6

X-ray Powder Pattern: Menzenschwand, Germany.
7.30 (10), 11.58 (9), 6.19 (9), 3.50 (8), 2.77 (7), 3.42 (6), 3.20 (6)

Chemistry:

	(1)	(2)
SiO_2	60.2	59.52
UO_3	36.8	40.48
PbO	1.6	
K_2O	1.4	
Total	[100.0]	100.00

(1) Menzenschwand, Germany; by electron microprobe, original analysis given as Si 28.5%, U 31.0%, Pb 1.5%, K 1.2%, O 38.0%, total 100.2%, here recalculated to oxides. (2) USi_7O_{17}.

Occurrence: In a uranium deposit.

Association: Studtite, uranophane, quartz, hematite.

Distribution: From Menzenschwand, Black Forest, Germany.

Name: For URANium and SILicon in the chemical composition.

Type Material: n.d.

Uranospathite $HAl(UO_2)_4(PO_4)_4 \cdot 40H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$ (probable). Rectangular platy crystals, to 1 mm, flattened on {001}, showing {100}, {010}, in fanlike groups. *Twinning:* May be twinned on {110}, forming cruciform groupings.

Physical Properties: *Cleavage:* On {001}, perfect; on {100}, {010}, good. Hardness = 2–2.5 D(meas.) = 2.50 D(calc.) = 2.49 Radioactive. Yellowish green fluorescence under UV. Readily dehydrates to sabugalite.

Optical Properties: Translucent. *Color:* Yellow to pale green.
Optical Class: Biaxial (–), anomalous. *Pleochroism:* X = pale yellow; $Y = Z$ = deep yellow.
Orientation: $X = c$; $Y = a$; $Z = b$. $\alpha = [\sim 1.49]$ $\beta = 1.510$ $\gamma = 1.521$ 2V(meas.) = 69°

Cell Data: *Space Group:* $P4_2/n$ (probable). $a = 7.00$ $c = 30.02$ Z = 2

X-ray Powder Pattern: Basset mines, Cornwall, England.
15.22 (10), 7.60 (10), 4.93 (10), 3.50 (8), 4.48 (6b), 2.21 (6), 4.08 (4)

Chemistry: (1) Basset mines, Cornwall, England; Al confirmed by electron microprobe, P and U confirmed by microchemical and spectrochemical techniques, formula established by analogy to the torbernite group.

Occurrence: A rare secondary mineral in the oxidized zone of uranium-bearing hydrothermal mineral deposits.

Association: Bassetite.

Distribution: From the Basset group of mines, Illogan, Cornwall, England. In France, at the La Crouzille and Sagnes mines, Haute-Vienne. From the Pedro Alvaro vanadium mine, Salamanca Province, and at El Padregal, Badajoz Province, Spain. In the Weisser Hirsch mine, Neustädtel-Schneeberg, Saxony, and at Menzenschwand, Black Forest, Germany. On Radium Hill, Olary, South Australia.

Name: For its content of *uranium* and the Greek for *a broad blade*, an allusion to the bladed character of its crystals.

Type Material: [Museum of Practical Geology, Ludlam collection, L1941] now in The Natural History Museum, London, England.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 990. (2) Walenta, K. (1978) Uranospathite and arsenuranospathite. Mineral. Mag., 42, 117–128.

Uranosphaerite $Bi_2U_2O_9 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (probable). *Point Group:* n.d. In concentric, radiated to spherulitic aggregates, to 0.5 mm, of tiny crystals elongated ‖ [001].

Physical Properties: *Cleavage:* {100}. Hardness = 2–3 D(meas.) = 6.36; 6.89 D(calc.) = n.d. Radioactive.

Optical Properties: Semitransparent. *Color:* Yellow-orange, golden to reddish orange, brick-red. *Streak:* Yellow. *Luster:* Greasy.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, strong.
$\alpha = 1.955$–1.959 $\beta = 1.981$–1.985 $\gamma = 2.05$–2.060 2V(meas.) = Large. 2V(calc.) = 56°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Schneeberg, Germany.
3.16 (10), 1.83 (8), 3.87 (7), 5.25 (6), 3.47 (6), 1.90 (5), 4.37 (4)

Chemistry:

	(1)	(2)	(3)
UO_3	50.88	52.62	52.38
Bi_2O_3	44.34	43.46	42.67
H_2O	4.75	3.59	4.95
Total	99.97	99.67	100.00

(1–2) Schneeberg, Germany. (3) $Bi_2U_2O_9 \cdot 3H_2O$.

Occurrence: An oxidation product of uraninite in a Co–Ni–Bi-bearing hydrothermal vein (Schneeberg, Germany).

Association: Walpurgite, uranospinite, uranospathite, asselbornite, trögerite, zeunerite, erythrite, cobaltian wad (Schneeberg, Germany); uraninite, wölsendorfite, renardite (Kersegalec, France).

Distribution: From the Walpurgis vein, Weisser Hirsch mine, Neustädtl, near Schneeberg, Saxony, Germany. At Kersegalec, near Lignol, Morbihan, France.

Name: For URANium in the composition, and the Greek for *sphere*, for the typical habit.

Uranospinite $Ca(UO_2)_2(AsO_4)_2 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$ (synthetic, probable). Rare as thin tabular crystals, flattened on {001}, to 1 mm; in aggregates and crusts.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {100}. Hardness = 2–3 D(meas.) = 3.45 D(calc.) = 3.30 Radioactive; bright lemon-yellow fluorescence under UV.

Optical Properties: Semitransparent. *Color:* Lemon-yellow to siskin-green. *Luster:* Waxy, pearly on {001}.
Optical Class: Uniaxial (–), commonly anomalously biaxial (–), may be zoned.
Pleochroism: $O = Y = Z$ = pale yellow; $E = X$ = nearly colorless. *Orientation:* $X = c$ in biaxial material. *Dispersion:* $r > v$, moderate. ω = 1.572–1.587 ϵ = 1.55–1.560 α = 1.55 β = 1.567–1.582 γ = 1.572–1.587 2V(meas.) = 0°–62°

Cell Data: *Space Group:* $P4/nmm$ (synthetic). a = 7.16 c = 20.4 Z = 2

X-ray Powder Pattern: Synthetic.
10.16 (10), 3.56 (9), 3.39 (8), 5.13 (7), 4.90 (6), 1.90 (6), 2.52 (5b)

Chemistry:

	(1)	(2)
UO_3	59.18	55.11
As_2O_5	19.37	22.14
CaO	5.47	5.40
H_2O	16.19	17.35
Total	100.21	100.00

(1) Weisser Hirsch mine, Germany. (2) $Ca(UO_2)_2(AsO_4)_2 \cdot 10H_2O$.

Mineral Group: Autunite group.

Occurrence: A secondary mineral in the oxide zone of U–As-bearing hydrothermal mineral deposits.

Association: Metazeunerite, metauranocircite, uranophane, trögerite, walpurgite, uranosphaerite, asselbornite (Weisser Hirsch mine, Germany); schoepite, paraschoepite, arsenuranylite, metazeunerite, nováčekite (Cherkasar deposit, Uzbekistan).

Distribution: In Germany, from the Walpurgis vein, Weisser Hirsch mine, Neustädtel-Schneeberg, Saxony; in the Black Forest, from the Clara mine, near Oberwolfach, the Sophia mine, near Wittichen, at the Gottesehre mine, near Urberg, and from Menzenschwand; from the Bühlskopf, near Ellweiler, Rhineland-Palatinate. In the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. At Tyndrum, Perthshire, Scotland. From the Cherkasar uranium deposit, 30 km northwest of Pap, Chaktal Mountains, Uzbekistan. In the Talmessi mine, 35 km west of Anarak, Iran. From near Myponga, Fleurieu Peninsula, and at the Radium Hill mine, Mt. Painter, Flinders Ranges, South Australia. In the USA, on the Clyde Long property, Elk Park, San Juan Co., Colorado; in Utah, from near Spanish Fork, Utah Co., and at Paria, Kane Co.; at the Orphan mine, Coconino Co., Arizona.

Name: For its *uranium* content and from the Greek for *siskin*, in allusion to its typical color.

Type Material: State Museum for Mineralogy and Geology, Dresden; Mining Academy, Freiberg, Germany, 21722.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 990–991. (2) Frondel, C. (1958) Systematic mineralogy of uranium and thorium. U.S. Geol. Sur. Bull. 1064, 183–187.

Uranotungstite $(Fe^{2+}, Ba, Pb)(UO_2)_2(WO_4)(OH)_4 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. Lathlike crystals, flattened on {010} in spherulitic aggregates, to 0.3 mm; as crusts.

Physical Properties: *Cleavage:* {010}, perfect. *Fracture:* Irregular. Hardness = ∼2 D(meas.) = > 4.03 D(calc.) = 4.27 Radioactive.

Optical Properties: Translucent. *Color:* Yellow, orange, pale brown. *Streak:* Yellow. *Luster:* Dull.
Optical Class: Biaxial (–). *Pleochroism:* X = nearly colorless, $Y = Z$ = yellow. *Orientation:* $X = b$. *Dispersion:* $r > v$. $\alpha = 1.682(5)$ $\beta = 1.845(5)$ $\gamma = 1.855(5)$ 2V(meas.) = 42°

Cell Data: *Space Group:* $Pmmm$, $Pmm2$. or $P222$. $a = 9.22$ $b = 13.81$ $c = 7.17$ Z = 2

X-ray Powder Pattern: Clara mine, Germany.
6.96 (10), 3.21 (7), 4.60 (6), 3.46 (5), 2.77 (4), 1.970 (4), 3.01 (3)

Chemistry:

	(1)
UO_3	45.1
WO_3	19.8
FeO	2.3
PbO	6.9
BaO	4.9
H_2O	22.5
Total	101.5

(1) Menzenschwand, Germany; by electron microprobe and AA, average of two analyses, total Fe as FeO, H_2O by loss on heating; corresponds to $(Fe_{0.38}Ba_{0.37}Pb_{0.36})_{\Sigma=1.11}(UO_2)_{1.82}(WO_4)_{0.99}(OH)_{3.88} \cdot 12.52H_2O$.

Occurrence: A rare secondary mineral formed in polymetallic base metal deposits.

Association: Metauranocircite, metaheinrichite, bergenite, metatorbernite, metazeunerite, schoepite, quartz.

Distribution: From Menzenschwand and the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For its content of URANium and TUNGsten.

Type Material: University of Stuttgart, Stuttgart, Germany.

(1) Mitchell Co., North Carolina, USA. (2) Near Kasenda, Uganda; by electron microprobe, total Fe as FeO, original total given as 99.51%; corresponding to $(Na_{0.78}Ca_{0.70}U_{0.44}Ce_{0.01}Y_{0.01}Sr_{0.01})_{\Sigma=1.95}(Nb_{1.10}Ti_{0.53}Ta_{0.32}Fe_{0.04}Zr_{0.01})_{\Sigma=2.00}O_6(OH, F)$.

Mineral Group: Pyrochlore group and subgroup; $U_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: In cemented calcareous tuffs associated with carbonatite (near Kasenda, Uganda).

Association: Calcite, feldspars, quartz, magnetite, ilmenite, almandine, apatite, epidote, diopside, "hypersthene", pyrite, rutile, anatase, pyrochlore, zircon, titanite, monazite (near Kasenda, Uganda).

Distribution: From Mitchell Co., North Carolina, USA. In the Antsakoa I pegmatite, Berere, 40 km northeast of Tsaratanana, Madagascar. Near Kasenda, Fort Portal area, Uganda. In Germany, from Hagendorf, Bavaria.

Name: As a member of the *pyrochlore* subgroup with significant *uranium* content.

Urea $CO(NH_2)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\overline{4}2m$. Elongated pyramidal crystals, to 3 mm, in massive groupings, crusts, and crystalline stalagmites.

Physical Properties: Hardness = n.d. D(meas.) = 1.33(1) D(calc.) = [1.33] Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Pale yellow to pale brown.
Optical Class: Uniaxial (+). $\omega = 1.484$ $\epsilon = 1.601$

Cell Data: *Space Group:* $P\overline{4}2_1m$. $a = 5.646(1)$ $c = 4.701(1)$ Z = [2]

X-ray Powder Pattern: Toppin Hill, Western Australia.
3.98 (10), 3.04 (3), 3.61 (2), 2.552 (1b), 2.172 (1), 1.837 (1), 4.70 (< 1)

Chemistry:

	(1)
$CO(NH_2)_2$	96.
NH_3	< 1.0
P	0.24
S	0.11
Ca	0.07
Mg	0.03
Na	0.13
K	0.35
H_2O^-	0.46
Total	< 98.39

(1) Toppin Hill, Western Australia; by urease reduction, remainder probably mostly H_2O^+.

Occurrence: Derived from bat guano and urine, stable only under very arid conditions.

Association: Ammonian aphthitalite, weddellite, phosphammite.

Distribution: In Australia, from Toppin Hill, near Lake Rason, about 320 km northeast of Kalgoorlie, and in Wilgie Mia Cave, Western Australia.

Name: From the Greek for *urine*, in which urea was first found.

Type Material: Western Australia Museum, Perth, Australia, S4688.

References: (1) Bridge, P.J. (1973) Urea, a new mineral, and neotype phosphammite from Western Australia. Mineral. Mag., 39, 346–348. (2) (1974) Amer. Mineral., 59, 874 (abs. ref. 1). Uricite $C_5H_4N_4O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. A component of guano.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.851 (synthetic).

Optical Properties: Semitransparent. *Color:* Colorless, white.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 14.464(3)$ $b = 7.403(2)$ $c = 6.208(1)$ $\beta = 65.10(5)^\circ$ Z = 4

X-ray Powder Pattern: Calculated from the crystal structure. (ICDD 28-2016).
3.093 (100), 3.087 (69), 3.180 (55), 4.91 (51), 6.55 (43), 3.864 (42), 2.866 (25)

Chemistry: (1) Presence inferred from chemical analysis of whole guanos.

Occurrence: Formed in guanos.

Association: Biphosphammite, brushite, syngenite (Dingo Donga Cave, Australia).

Distribution: From an undefined locality in Peru. In Dingo Donga Cave, near Rawlinna, Western Australia.

Name: For its composition, anhydrous *uric* acid.

Type Material: Western Australian Museum, Perth, MDC5295.

References: (1) Bridge, P.J. (1974) Guanine and uricite, two new organic minerals from Peru and Western Australia. Mineral. Mag., 39, 889–890. (2) Ringertz, H. (1966) The molecular and crystal structure of uric acid. Acta Cryst., 20, 397–403.

Urvantsevite $Pd(Bi,Pb)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. In irregular polymineralic intergrowths, to 4 mm.

Physical Properties: *Cleavage:* Perfect in one direction. Hardness = n.d. VHN = 47–68 (10 g load). D(meas.) = n.d. D(calc.) = 9.66

Optical Properties: Opaque. *Color:* Grayish white in reflected light. *Pleochroism:* Weak to none. *Anisotropism:* Slight.

R_1–R_2: (400) — , (420) — , (440) 48.7–50.5, (460) 53.2–54.9, (480) 54.6–53.8, (500) 54.1–53.3, (520) 54.8–53.7, (540) 55.2–54.0, (560) 56.2–54.9, (580) 56.7–55.2, (600) 57.0–56.1, (620) 58.3–56.8, (640) 59.2–57.8, (660) 60.1–58.6, (680) 60.9–59.6, (700) 61.3–59.6

Cell Data: *Space Group:* $I/4mmm$. $a = 3.3628(16)$ $c = 12.902(11)$ $Z = 2$

X-ray Powder Pattern: Majak mine, Russia.
2.643 (100), 2.372 (80), 1.420 (70), 1.111 (70), 1.166 (60), 2.043 (50), 1.685 (50)

Chemistry:

	(1)
Pd	20.5
Bi	64.6
Pb	15.3
Total	100.4

(1) Majak mine, Russia; by electron microprobe, corresponding to $Pd_{1.00}(Bi_{1.61}Pb_{0.38})_{\Sigma=1.99}$.

Occurrence: In massive zoned Cu–Ni sulfide ores (Talnakh area, Russia).

Association: Froodite, sobolevskite, paolovite, cabriite, silver, hibbingite, altaite, galena, pentlandite, cubanite, chalcopyrite (Talnakh area, Russia).

Distribution: From the Majak mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL]. From Tilkerode, Harz Mountains, Germany.

Name: Honors Professor Nikolai Nikolaevich Urvantsev (1893–1985), of St. Petersburg, Russia, one of the discoverers of the Noril'sk deposits.

Type Material: Mining Institute, St. Petersburg, Russia, 1176/1.

Ushkovite $\mathbf{MgFe_2^{3+}(PO_4)_2(OH)_2 \cdot 8H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As crystals, typically equant to short prismatic along [001], may be flattened on [001], showing prominent {001}, {010}, {1$\overline{1}$0}, minor {100}, {110}, {210}, {0$\overline{1}$1}, to 2 mm; in radiating fibrous aggregates. *Twinning:* On {*hk*0}.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Very brittle. Hardness = 3.5 D(meas.) = 2.38 D(calc.) = 2.40

Optical Properties: Transparent to translucent. *Color:* Pale yellow, yellow-orange, to light brown; faint yellow in transmitted light. *Streak:* Pale yellowish. *Luster:* Vitreous to pearly on cleavages, greasy on fractures.
Optical Class: Biaxial (–). *Orientation:* $Y \wedge c = 26°$; X and Y nearly in {010}.
Dispersion: $r > v$, strong. $\alpha = 1.584(2)$ $\beta = 1.637(2)$ $\gamma = 1.670(2)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 5.196(9)$ $b = 10.70(2)$ $c = 7.14(2)$
$\alpha = 108.6(1)°$ $\beta = 106.95(5)°$ $\gamma = 72.70(5)°$ Z = 1

X-ray Powder Pattern: Ilmen Mountains, Russia; close to laueite.
9.86 (100), 6.57 (80), 3.20 (80), 3.28 (60), 4.95 (50), 4.85 (50), 4.01 (40)

Chemistry:

	(1)	(2)	(3)
P_2O_5	30.47	28.2	28.16
Al_2O_3	0.00	0.1	
Fe_2O_3	29.87	31.8	31.68
FeO	0.00

MgO	8.79	8.1	8.00
CaO	2.54		
H_2O^+	14.83		
H_2O^-	12.28		
H_2O		[31.6]	32.16
Total	100.66	[100.0]	100.00

(1) Ilmen Mountains, Russia; part of H_2O thought lost during sample preparation; after deduction of Ca and some P as francolite, and Mn as Mn oxide, corresponds to $Mg_{1.15}Fe^{3+}_{1.98}(PO_4)_{2.12}(OH)_2 \cdot 7H_2O$. (2) Hagendorf, Germany; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponds to $(Mg_{1.01}Mn^{2+}_{0.01})_{\Sigma=1.02}(Fe^{3+}_{2.00}Al_{0.01})_{\Sigma=2.01}(PO_4)_{2.00}(OH)_2 \cdot 8H_2O$.
(3) $MgFe_2(PO_4)_2(OH)_2 \cdot 8H_2O$.

Mineral Group: Paravauxite group.

Occurrence: In granite pegmatites, as an alteration product of triplite formed by weathering.

Association: Triplite, francolite, mitridatite, beraunite, Fe–Mn oxides (Ilmen Mountains, Russia).

Distribution: On the southern shore of Lake Bol'shoy Tatkul', Il'men Mountains, Southern Ural Mountains, Russia. In the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; at the Dunton quarry, Newry, Oxford Co., Maine, USA. From the Sandamap pegmatite, west of Usakos, Namibia. At Boa Vista, near Galiléia, Minas Gerais, Brazil.

Name: To honor Sergei L'vovich Ushkov (1880–1951), Russian naturalist, student of the Il'men National Forest, Russia.

Type Material: Il'menskii Preserve Museum, Miass, iz4523; Mining Institute, St. Petersburg, 1293/1; Vernadsky Geological Museum, Moscow, 53492; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82364.

(1) Ilímaussaq intrusion, Greenland. (2) Lovozero massif, Russia; average of two analyses; corresponds to $(Na_{1.81}K_{0.05}Ca_{0.02})_{\Sigma=1.88}Al_{1.00}Si_{2.90}O_8(OH)_{1.11}$. (3) $Na_2AlSi_3O_8(OH)$.

Occurrence: A secondary mineral in pegmatites associated with sodalite syenite (Ilímaussaq intrusion, Greenland); in sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Microcline, natrolite, aegirine (Ilímaussaq intrusion, Greenland); natrolite, aegirine, microcline, albite, sodalite (Lovozero massif, Russia); villiaumite, lovozerite, eudialyte, lueshite, griceite, natrophosphate (Mont Saint-Hilaire, Canada).

Distribution: In southern Greenland, on the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion. From a number of places in both the Lovozero and Khibiny massifs, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Professor Niels Vigo Ussing (1864–1911), of Copenhagen, Denmark.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1970.527.

(1) Centennial Eureka mine, Utah, USA; by electron microprobe, average of six analyses, H_2O by difference, total Te as TeO_3, $(OH)^{1-}$ and H_2O confirmed by IR; corresponds to $Cu_{4.98}Zn_{2.99}(TeO_4)_{3.98}(OH)_8 \cdot 7.1H_2O$. (2) $Cu_5Zn_3(TeO_4)_4(OH)_8 \cdot 7H_2O$.

Occurrence: A very rare secondary mineral found on dump material from the oxidized zone of a Cu–Zn–Te-bearing hydrothermal ore deposit.

Association: Cesbronite, quartz.

Distribution: From the mine dumps of the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: After the state of Utah, USA, where the mineral was discovered.

Type Material: Canadian Geological Survey, Ottawa, Canada, 67415; The Natural History Museum, London, England, 1994,99.

(1) Temple Rock, Utah, USA. (2) $U_2V_6O_{21}\cdot 15H_2O$.

Occurrence: In a Colorado Plateau-type uranium deposit in asphaltic sandstone.

Association: Carnotite, rauvite, hewettite, metatorbernite, gypsum, "hyalite".

Distribution: From Temple Rock, about 70 km southwest of Green River, San Rafael district, Emery Co., Utah, USA.

Name: For Uranium and VANadium in the composition.

Type Material: Harvard University, Cambridge, Massachusetts, 62753; National Museum of Natural History, Washington, D.C., USA, 87512, R5708.

Uvarovite $Ca_3Cr_2(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Commonly as euhedral crystals, dodecahedra or trapezohedra, or in combination with other cubic forms, to 4.5 cm. Fine or coarse granular, compact, or massive.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 3.77–3.81 D(calc.) = 3.848

Optical Properties: Transparent to translucent. *Color:* Emerald-green to dark green; in thin section, green; may be sectored. *Streak:* White. *Luster:* Vitreous.
Optical Class: Isotropic; weak anisotropism due to internal strain is typical. $n = 1.865$

Cell Data: *Space Group: Ia3d.* a = 12.00 Z = 8

X-ray Powder Pattern: Synthetic.

(1) Outokumpu, Finland; corresponds to $(Ca_{2.88}Mg_{0.06})_{\Sigma=2.94}(Cr_{1.79}Al_{0.19}Fe^{3+}_{0.03})_{\Sigma=2.01}Si_{3.02}O_{12}$.
(2) $Ca_3Cr_2(SiO_4)_3$.

Polymorphism & Series: Forms a series with grossular.

Mineral Group: Garnet group.

Occurrence: From hydrothermal alteration of serpentinite containing chromite; in metamorphosed limestones and skarns from the reaction of dolomite and chromite.

Association: Chromite, diopside, zoisite, olivine, dolomite, tremolite, quartz, plagioclase, epidote, calcite, chromian clinochlore, pyroxenes.

Distribution: Although an uncommon garnet, still with numerous localities. From the Saranovskii mine, Biserskoye, in the Gorozavod district, and other localities around Yekaterinburg (Sverdlovsk), Ural Mountains, Russia. Exceptional crystals from Outokumpu, Finland. From Pico do Posets, near Vénasque, Pyrenees, Spain. In Canada, at South Ham, Wolfe Co., Quebec. In the USA, from Wood's Chrome mine, Lancaster Co., Pennsylvania; at Riddle, Grant Co., Oregon; in the Red Ledge mine, near Washington, Nevada Co., around Newcastle, Placer Co., near New Idria, San Benito Co., and elsewhere in California. On Taiwan, Formosa. From Ergani Maden and in the Kop Krom [chrome] mine, Kop Mountains, near Aşkale, Turkey.

Name: For Count Sergei Semenovich Uvarov (1786–1855), Russian nobleman, President of Academy of Sciences.

(1) Uva Province, Sri Lanka; corresponds to $(Ca_{0.96}Na_{0.04})_{\Sigma=1.00}(Mg_{2.69}Al_{0.14}Ti_{0.08}Fe^{2+}_{0.06})_{\Sigma=2.97}$ $Al_5Mg(B_{1.08}O_3)_3Si_{5.86}O_{18}[(OH)_{2.93}F_{0.77}O_{0.30}]_{\Sigma=4.00}$.

Mineral Group: Tourmaline group.

Occurrence: Typically in calcium-rich rocks subjected to contact metamorphism and metasomatic processes which added boron.

Association: Calcite, dolomite, tremolite, apatite, scapolite.

Distribution: In Uva Province, Sri Lanka. From the Sagaing district, Myanmar (Burma). In the USA, from Franklin and Hamburg, Sussex Co., New Jersey; in New York, at Gouverneur, Pierrepont, Dekalb and elsewhere in St. Lawrence Co., and at Horicon, Warren Co.; and from East Hampton, Middlesex Co., Connecticut. From Brumado, Bahia, Brazil. At Hnúšta, Slovakia.

Name: For the occurrence in Uva Province, Sri Lanka.

Type Material: Canadian Geological Survey, Ottawa, 13320; Royal Ontario Museum, Toronto, Canada; The Natural History Museum, London, England, 1976,426; Harvard University, Cambridge, Massachusetts, 116455; National Museum of Natural History, Washington, D.C., USA, C3283, C3287, C5212.

(1) Comstock Lode, Nevada, USA; by electron microprobe. (2) Zmeinogorsk, Russia; by electron microprobe. (3) Tambang Sawah, Indonesia; by electron microprobe. (4) Ag_3AuS_2.

Occurrence: In low-temperature hydrothermal Au–Ag quartz veins, in part of supergene origin.

Association: Acanthite, Au–Ag alloy, chlorargyrite, naumannite, quartz.

Distribution: In Indonesia, from Tambang Sawah, Benkoelen district, Sumatra [TL], and on Java, at the Pongkor Au–Ag deposit and in the Cirotan Au–Ag–Sn–W deposit. In the USA, in Nevada, from the Comstock Lode, Virginia City, Storey Co. [TL], at the Bullfrog and Original Bullfrog mines, Bullfrog district, Nye Co., and in the Life Preserver mine, Tolicha district; from the Equity mine, near Creede, Mineral Co., Colorado; in the Morning Star deposit, San Bernardino Co., California; at the Comstock mine, Dos Cabezos Mountains, Cochise Co., Arizona. From the Milluri prospect, Potosí, Bolivia. In Russia, at Zmeinogorsk (Schlangenberg), Altai Mountains [TL] and in the Gai deposit, Southern Ural Mountains. Als known from several undisclosed localities in China and Uzbekistan.

Name: To honor Willem Uytenbogaardt (1918–), Professor of Geology, Technical University, Delft, The Netherlands, prominent ore microscopist.

(1) Kasompi mine, Congo; corresponding to $(Ni_{0.86}Co_{0.07}Fe_{0.05})_{\Sigma=0.98}S_{2.02}$. (2) Kalgoorlie, Australia; by electron microprobe, corresponding to $(Ni_{1.02}Fe_{0.06}Co_{0.02})_{\Sigma=1.10}S_{1.90}$. (3) NiS_2.

Polymorphism & Series: Forms a series with cattierite.

Mineral Group: Pyrite group.

Occurrence: Disseminated through dolostone (Kasompi mine, Congo); an alteration product of arsenic-deficient nickel-skutterudite (Germany).

Association: Arsenic-deficient nickel-skutterudite, pyrite, polydymite, uraninite.

Distribution: From the Kasompi mine, 70 km west-southwest of Kambove [TL], and at Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From Schneeberg, Saxony; Nentershausen, ??ck, and Iserlohn, ??ck, Germany. In the Providencia mine, near Villamanín, Cármenes district, León Province, Spain. From the Saint Marina deposit, Haskovo district, and at the Medet deposit, Panagyurishte district, Bulgaria. From the Agyatagsk mercury deposit, Kel'badzhar, Azerbaijan. At the Miliken (Sweetwater) mine, Reynolds Co., Missouri, and from the Orphan mine, in the Grand Canyon, Coconino Co., Arizona, USA. At the San Santiago mine, La Rioja Province, Argentina. Found near the Scotia nickel deposit, Kalgoorlie, Western Australia. At the Kosaka mine, Akita Prefecture, Japan.

Name: In honor of Johannes F. Vaes (1902–1978), mineralogist for the Union Minière du Haut Katanga.

O	[17.21]	16.47
Total	[100.00]	100.00

(1) Tatasi, Bolivia; O by difference. (2) Sb_2O_3.

Polymorphism & Series: Dimorphous with sénarmontite.

Occurrence: An alteration product of antimony-bearing minerals in the oxidized zone of hydrothermal antimony deposits.

Association: Stibnite, antimony, stibiconite, cervantite, kermesite, tetrahedrite.

Distribution: Widespread; a few localities for good material include: in France, from the Chalanches mine, near Allemont, Isère. At Bräunsdorf, near Freiberg, Saxony, Germany. Large crystals from Příbram, Czech Republic. At Pernek, near Pezinok, Slovakia. From Baia Sprie (Felsőbánya), Romania. At the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. In several mines around St. Endellion and elsewhere in Cornwall, England. At Sensa (Haminate mine), Aïn-el-Bebbouch, Qacentina (Constantine), Algeria. In the Globe and Phoenix mine, Kwekwe (Que Que), Zimbabwe. From Canada, in the Lac Nicolet mine, South Ham, Quebec. At Sombrerete and Noche Buena, Mazapil, Zacatecas, Mexico. Fine crystals from the San José mine, near Oruro, and at Tatasi, Potosí, Bolivia. In the Xikuanshan antimony mine, Lengshuijiang, Shaoyang, Hunan Province, China. From Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan.

Name: To honor Basilius Valentinus, 15th century alchemist, who early wrote concerning antimony.

Valleriite $4(Fe,Cu)S{\cdot}3(Mg,Al)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal *Point Group:* $\overline{3}\ 2/m$ or $3m$. Massive, as nodules, to 5 mm; also in tiny splinters, very thin flakes, and thin crusts.

Physical Properties: *Cleavage:* On {0001}, excellent. Hardness = < 1, less than graphite. VHN = n.d. D(meas.) = 3.14 D(calc.) = 3.21

Optical Properties: Opaque. *Color:* Bronze-yellow, resembling pyrrhotite. *Luster:* Metallic to submetallic. *Pleochroism:* Strong; pale yellow to deep brown. *Anisotropism:* Strong; golden yellow.

R_1–R_2: (400) 10.5–11.1, (420) 10.8–11.3, (440) 10.7–12.7, (460) 10.6–14.2, (480) 10.5–15.8, (500) 10.5–17.3, (520) 10.3–18.8, (540) 10.3–20.1, (560) 10.3–21.3, (580) 10.2–22.4, (600) 10.3–23.4, (620) 10.3–24.4, (640) 10.3–25.1, (660) 10.4–25.8, (680) 10.3–26.4, (700) 10.3–26.9

Cell Data: *Space Group:* $R\overline{3}m$ or $R3m$. $a = 64.46$ $c = 34.10$ Z = [390]

(1) Kopparberg, Sweden; from five partial analyses. (2) Kaveltorp, Sweden. (3) Loolekop, South Africa.

Occurrence: An alteration product of chalcopyrite in chromitites and dunites (Cyprus); in copper-bearing carbonatites, replacing magnetite (Phalaborwa, South Africa); in Cu–Ni sulfide-bearing serpentinized and uralized ultramafic rocks.

Association: Chalcopyrite, cubanite, pyrrhotite, troilite, millerite, pentlandite, pyrite, marcasite, mackinawite, tochilinite, magnetite.

Distribution: An inconspicuous mineral, now recognized from a number of localities in addition to those listed here. In Sweden, in Kopparberg, from the Aurora mine, Ljusnarsberg [TL], and at Kaveltorp. In South Africa, in Transvaal, from the Loolekop carbonatite, Phalaborwa, and at the Mooihoek and Onverwacht pipes, in the Merensky Reef, Bushveld complex. From near Pefkos, Cyprus. In Canada, at the Little Chief mine, near Whitehorse, Yukon Territory; in the Marbridge mine, Malartic, Quebec; and at Sudbury, Ontario. In the USA, from the Elizabeth mine, South Strafford, Strafford Co., Vermont; in the Pima mine, near Tucson, Pima Co., and at the Christmas mine, Gila Co., Arizona; from the Continental mine, Fierro, Grant Co., New Mexico. In Russia, in the Talnakh area, Noril'sk region, western Siberia; from the Kovdor and Monchegorsk massifs, Kola Peninsula. At Alnalyk, Uzbekistan. In the Akagane mine, Iwate Prefecture, Japan. From Wannaway, Western Australia. On the East Pacific Rise (21°N).

Name: In honor of Johan Gottschalk Wallerius (Vallerius) (1709–1785), Swedish chemist and mineralogist.

Type Material: Wroclaw University, Wroclaw, Poland, II–14152.

Vanadinite $Pb_5(VO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Typically in well-developed hexagonal prismatic crystals, to 14 cm, short to long along [0001], with $\{10\bar{1}0\}$, $\{0001\}$, modified by $\{11\bar{2}0\}$, $\{10\bar{1}1\}$, $\{20\bar{2}1\}$, $\{11\bar{2}1\}$, many others. Commonly cavernous and in parallel groupings; may be acicular, hairlike, fibrous; rarely rounded, globular.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 6.88 D(calc.) = 6.95

Optical Properties: Subtransparent to opaque. *Color:* Red-orange, deep red, brownish red, brownish yellow, yellow, pale straw-yellow; may be concentrically zoned. *Streak:* White to pale red or pale yellow. *Luster:* Subresinous to subadamantine.
Optical Class: Uniaxial (–). *Absorption:* $E < O$. $\omega = 2.416$ $\epsilon = 2.350$

Cell Data: *Space Group:* $P6_3/m$. $a = 10.3174$ $c = 7.3378$ Z = 2

X-ray Powder Pattern: Synthetic.
2.987 (100), 2.995 (92), 3.069 (89), 3.380 (41), 4.470 (35), 3.397 (30), 4.224 (27)

(1) Obir, Carinthia, Austria. (2) $Pb_5(VO_4)_3Cl$.

Mineral Group: Apatite group.

Occurrence: A secondary mineral in the oxidized zone of lead-bearing deposits, the vanadium leached from wall-rock silicates.

Association: Mimetite, pyromorphite, descloizite, mottramite, wulfenite, cerussite, anglesite, calcite, barite, iron oxides.

Distribution: Many localities, even for fine crystals. From Zimapán, Hidalgo; at San Carlos and Los Lamentos, Chihuahua; and Rayon, Sonora, Mexico. In the USA, in Arizona, fine examples from the Old Yuma mine, near Tucson, Pima Co., at the Hamburg, Red Cloud, and North Geronimo mines, Silver district, La Paz Co., and in the Puzzler mine, Castle Dome district, Yuma Co., from the Mammoth-St. Anthony mine, Tiger, Pinal Co., at the Gallagher mine, near Charleston, Cochise Co., in the Apache mine, Gila Co., at the Western Union mine, near Cerbat, Mohave Co.; in New Mexico, from the Hillsboro and Lake Valley districts, Sierra Co. In Morocco, large crystals from Mibladen, at Taouz, and in the Touissit mine, near Oujda. At Keban, Turkey. Very large crystals from Abenab, Otavi district, Namibia. At Broken Hill, New South Wales, Australia.

Name: For its content of *vanadium*.

Type Material: Lost at sea.

Vanadoandrosite-(Ce) $Mn^{2+}CeV^{3+}AlMn^{2+}Si_2O_7SiO_4O(OH)$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As isolated, stout prismatic grains, to tens of micrometers, or as radiating aggregates.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.27

Optical Properties: Transparent. *Color*: Very dark brown to black. *Streak*: Brown.
Luster: Vitreous to adamantine.
Optical Class: Biaxial. α > 1.74 *n*(calc.) = 1.82 2V(meas.) = n.d. 2V(calc.) = n.d.
Orientation: n.d. *Pleochroism:* Strong; yellow-brown, red-brown, dark greenish brown.

Cell Data: *Space Group*: $P2_1/m$. a = 8.856(3) b = 5.729(2) c = 10.038(4) β = 113.088(4)°
Z = 2

X-ray Powder Pattern: Vielle Aure village, central Pyrénées, France. [calculated pattern]
2.8890 (100), 2.6124 (54), 3.5004 (43), 2.8645 (41), 2.7023 (34), 2.7114 (31), 2.5916 (26)

Chemistry:

(1) Vielle Aure village, central Pyrénées, France; average of 4 electron microprobe analyses, H_2O calculated from stoichiometry; corresponding to $[Mn^{2+}_{0.62}Ca_{0.38}]_{\Sigma=1.00}$ $[(Ce_{0.39}La_{0.15}Nd_{0.10}Sm_{0.02})_{\Sigma REE=0.66}Ca_{0.21}Sr_{0.11}]_{\Sigma=0.98}[V^{3+}_{0.80}Al_{0.16}Mg_{0.03}Ti_{0.01}]_{\Sigma=1.00}Al_{1.00}$ $[Mn^{2+}_{0.36}V^{3+}_{0.31}Fe^{2+}_{0.23}Fe^{3+}_{0.10}]_{\Sigma=1.00}Si_2O_7SiO_4O(OH)$.

Mineral Group: Epidote group, allanite subgroup.

Occurrence: In quartz-rhodochrosite-sulfide veins cross-cutting massive rhodochrosite ore, as well as in the ore itself, in quartz grains rimmed by chalcopyrite.

Association: Quartz, vuorelainenite, rhodochrosite, chalcopyrite, vanadian spessartine, friedelite.

Distribution: From the mine above Vielle Aure village, central Pyrénées, France.

Name: An epidote-group mineral in which Ce^{3+} is dominant in A2, Mn^{2+} in A1, V^{3+} in M1, Al in M2, and in which Mn^{2+} is the dominant charge-compensating (*i.e*. divalent) cation in M3.

Type Material: Mineral Museum, School of Mines, Paris, France, (73952).

Vanalite $NaAl_9V_{12}O_{42}(OH)_4 \cdot 33H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. In poorly-formed flattened and ragged crystals, may have diamond-shaped outlines, to 0.02 mm.

Physical Properties: *Cleavage:* {010}, perfect; {100}, less so. Hardness = n.d.
D(meas.) = 2.3–2.4 D(calc.) = 2.15

Optical Properties: Semitransparent. *Color:* Bright yellow to yellow-orange. *Luster:* Waxy to vitreous.
Optical Class: Biaxial. *Pleochroism:* Slight; in shades of yellow. *Orientation:* Extinction parallel; elongation negative. $\alpha = 1.710(6)$ β = n.d. $\gamma = 1.735(6)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. $a = 12.470$ $b = 21.40$ $c = 10.825$ $\beta = 97°$
Z = 2

Total	[102.60]	100.00

(1) Kurumsak River valley, Kazakhstan; original total given as 99.40%; corresponds to $Na_{0.90}(Al_{8.18}Fe^{3+}_{0.05})_{\Sigma=8.23}(V^{5+}_{10.29}V^{4+}_{0.43})_{\Sigma=10.72}[O_{37}(OH)_{4.76}]_{\Sigma=41.76} \cdot 30H_2O$.
(2) $NaAl_9V_{12}O_{42}(OH)_4 \cdot 33H_2O$.

Occurrence: Incrusting joints and cavities in weathered shales.

Association: Steigerite, hewettite, delvauxite, satpaevite, gypsum, halloysite, montmorillonite, other clay minerals.

Distribution: From a prospect in the Kurumsak River valley, northwestern Kara-Tau Mountains, south Kazakhstan.

Name: For VANadium and ALuminum in the composition.

Type Material: Mining Institute, St. Petersburg, 1271/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 85613.

Vandenbrandeite $Cu(UO_2)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals, flattened on {001}, may be lathlike, rounded, to 0.5 cm; in parallel aggregates, lamellar, scaly; massive.

Physical Properties: *Cleavage:* {110}, perfect; two others, in the [001] zone, indistinct. Hardness = 4 D(meas.) = 4.91–5.03 D(calc.) = [5.14] Radioactive.

Optical Properties: Translucent, transparent in thin fragments. *Color:* Dark green to nearly black; green in transmitted light. *Streak:* Green. *Luster:* Vitreous.
Optical Class: Biaxial, (+) or (–). *Pleochroism:* Yellow-green to blue-green. *Orientation:* $Z \wedge$ elongation $\simeq 40°$. *Dispersion:* Strong. $\alpha = 1.76$–1.77 $\beta = 1.78$–1.79 $\gamma = 1.78$–1.82 2V(meas.) = $\sim 90°$

Cell Data: *Space Group:* $P\overline{1}$ (probable). $a = 7.855(5)$ $b = 5.449(4)$ $c = 6.089(4)$ $\alpha = 91.44(5)°$ $\beta = 101.90(5)°$ $\gamma = 89.2(5)°$ Z = 2

X-ray Powder Pattern: Kalongwe, Congo.
4.29 (10), 2.92 (8), 5.06 (4), 2.56 (4), 2.09 (3), 1.85 (3), 1.47 (3)

Chemistry:

	(1)	(2)
UO_3	71.23	71.22
CuO	19.20	19.81
H_2O	9.57	8.97
Total	[100.00]	100.00

(1) Shinkolobwe, Congo; recalculated to 100% after deduction of SiO_2 0.28%, MgO 0.57%, CaO 0.26% as impurities. (2) $Cu(UO_2)(OH)_4$.

Occurrence: A rare secondary mineral in the oxide zone of hydrothermal copper-bearing uranium deposits.

Association: Cuprosklodowskite, kasolite, sklodowskite, malachite, chalcocite, chalcopyrite, uraninite, goethite (Kalongwe, Congo); curite, uranophane, sharpite (Shinkolobwe, Congo).

Distribution: In Congo (Zaire), in Katanga (Shaba) Province, from the Luiswishi mine; at Kalongwe; from Shinkolobwe; at Kambove; from Swambo; and in the Musonoi mine, near Kolwezi. In the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France.

Name: To honor Pierre Van den Brande (1896–1957), Belgian geologist, who discovered the uranium deposit at Kalongwe, Congo.

Type Material: Natural History Museum, Paris, France, 134-72; The Natural History Museum, London, England, 1933,261–263.

(1–2) Shinkolobwe, Congo. (3) Great Bear Lake, Canada; original total given as 97.65%; recalculated to 100% after deduction of insoluble 4.10%. (4) $PbU_7O_{22}\cdot 12H_2O$.

Occurrence: In the oxidized zone of uranium-bearing mineral deposits.

Association: Metavandendriesscheite, fourmarierite, becquerelite, metatorbernite, rutherfordine, uraninite (Shinkolobwe, Congo).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Great Bear Lake, Northwest Territories, Canada. From Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. At Les Bois Noirs, Loire, and in the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. From Menzenschwand and Wittichen, Black Forest, Germany. In Sweden, at the Stackebö pegmatite, near Holsljunga, Västergötland. From the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; in Leiper's quarry, Avondale, Delaware Co., Pennsylvania; at the Ruggles mine, Grafton, and the Palermo mine, near North Groton, Grafton Co., New Hampshire, USA. In the Palette mine, South Alligator Valley, Northern Territory, Australia.

Name: Honors Adrien Vandendriessche (1914–1940), Belgian mineralogist and geologist, University of Ghent, Ghent, Belgium.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 106523.

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As tabular crystals, flattened on {010} and elongated along [001], modified by {101}, $\{\bar{1}01\}$, {100}, to 0.4 mm; usually in divergent groups.

Physical Properties: *Cleavage:* Good on {010}; fair on {100}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.67 Fluoresces bright green in SW and LW UV. Radioactive.

Optical Properties: Semitransparent. *Color:* Canary-yellow. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; yellow to pale yellow. *Orientation:* $Y = c$. $\alpha = [1.704]$ $\beta = 1.715(2)$ $\gamma = 1.718(2)$ 2V(meas.) = 56°

Cell Data: *Space Group:* $P2_1mn$. $a = 17.06$ $b = 16.76$ $c = 7.023$ Z = 4

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
8.39 (100), 5.96 (80), 4.18 (70), 3.069 (70), 2.887 (70), 5.30 (50), 3.905 (50)

Chemistry:

	(1)	(2)
UO_3	80.76	81.02
P_2O_5	10.40	10.05
H_2O	[8.84]	8.93
Total	[100.00]	100.00

(1) Kobokobo pegmatite, Congo; average of five analyses, H_2O by difference; corresponds to $U(UO_2)_{2.96}(PO_4)_{2.06}(OH)_6 \cdot 3.87H_2O$. (2) $U(UO_2)_3(PO_4)_2(OH)_6 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the uraniferous zone of an altered granite pegmatite.

Association: Metavanmeersscheite, studtite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: To honor Professor Maurice Van Meerssche (1923–1990), Belgian crystallographer, Catholic University of Louvain, Louvain, Belgium.

Type Material: Catholic University of Louvain, Louvain, F360; Royal Museum of Central Africa, Tervuren, Belgium, RMG13749.

(1–2) Jo Dandy mine, Colorado, USA; analyses recalculated to 100% after deduction of unstated amounts of impurities. (3) $V_4^{4+}V_2^{5+}O_{13}\cdot 8H_2O$.

Occurrence: A replacement of fossil wood and cementing sandstone in Colorado Plateau-type U–V deposits.

Association: Gypsum, carnotite, hewettite, pintadoite, tyuyamunite, pascoite, pyrite.

Distribution: In the USA, in Colorado, from the Jo Dandy mine and the Bill Bryan claim, Wild Steer Canyon, about 10 km south of Gateway, and the Henry Clay claim, Long Park, Paradox Valley, Urvan district, Montrose Co.; in the Small Spot mine, Maverick Mesa, Mesa Co.; in Utah, from Poison Mesa, near Thompson, Grand Co.

Name: As a VANadium OXide.

Type Material: Harvard University, Cambridge, Massachusetts, 103477; National Museum of Natural History, Washington, D.C., USA, 95059.

Al_2O_3	30.46	33.65
Fe_2O_3	5.22	
H_2O	30.83	31.21
Total	100.33	100.00

(1) Bihain, Belgium; by electron microprobe, average of nine analyses; total Fe as Fe_2O_3, H_2O by TGA; corresponds to $(Al_{3.61}Fe_{0.39})_{\Sigma=4.00}[(PO_4)_{2.97}(SO_4)_{0.03}]_{\Sigma=3.00}(OH)_{3.03} \cdot 8.98H_2O$.
(2) $Al_4(PO_4)_3(OH)_3 \cdot 9H_2O$.

Occurrence: On dumps in a quartzite quarry, in quartz veinlets or lining schistosity planes.

Association: Wavellite, cacoxenite, variscite, turquoise, lithiophorite, cryptomelane, quartz, clinochlore, muscovite.

Distribution: Found about one km north of Bihain, Belgium.

Name: Honoring Dr. René Van Tassel (1916–), mineralogist, Royal Institute of Natural Sciences, Brussels, Belgium, for his work on Belgian mineralogy.

Type Material: University of Liège, Liège, Belgium.

(1) Hall, Austria. (2) $Na_6Mg(SO_4)_4$.

Occurrence: Restricted to evaporite deposits of oceanic origin.

Association: Löweite, langbeinite, halite (Berlepsch mine, Germany); blödite (Hall, Austria).

Distribution: In Germany, from the Wilhelmshall potash mine, northwest of Halberstadt, Saxony; in the Berlepsch mine and at Douglashall, Stassfurt-Westeregeln district, Magdeburg, Saxony-Anhalt. At Hall, Tirol, Austria. From Borislav, Ukraine. In the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China. From the Bikaner evaporite district, Rajasthan, India. In the USA, at Bertram Siding, Imperial Co., California; and about 36 km east of Carlsbad, Eddy Co., New Mexico.

Name: To honor Professor Jacobus Henricus van't Hoff (1852–1911), German physical chemist, University of Berlin, Berlin, Germany, who elucidated the equilibria involved in formation of oceanic salt deposits.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 430. (2) Madsen, B.M. Total	100.22	100.00

(1) Mounana mine, Gabon; corresponds to $Al_{1.02}(UO_2)_{2.11}(V_2O_8)(OH)\cdot 10.48H_2O$.
(2) $Al(UO_2)_2(V_2O_8)(OH)\cdot 11H_2O$.

Occurrence: In the oxidized zone of a lead-bearing U–V deposit (Mounana mine, Gabon).

Association: Metavanuralite, francevillite, curienite, duttonite, chervetite, brackebuschite, mottramite, carnotite, dewindtite, torbernite, uranopilite, johannite, kasolite.

Distribution: From the Mounana uranium mine, Franceville, Gabon.

Name: For VANadium, URanium, and ALuminum in the composition.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England.

Variscite $AlPO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Uncommon in crystals, then pseudo-octahedral {111}, may be lathlike; modified by numerous smaller forms, to 1.5 mm. Usually fine-grained massive, in nodules, stalactites, crusts, and veinlets.

Physical Properties: *Cleavage:* On {010}, good; on {001}, poor. *Fracture:* Uneven to splintery, conchoidal when glassy. Hardness = 4.5 D(meas.) = 2.57–2.61 D(calc.) = 2.59

Optical Properties: Transparent to translucent. *Color:* Pale green, emerald-green, bluish green, colorless, may be pale shades of brown or yellow, rarely red; typically pale green to colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to waxy.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$, perceptible.
$\alpha = 1.550$–1.563 $\beta = 1.565$–1.588 $\gamma = 1.570$–1.594 2V(meas.) = Moderate.

Cell Data: *Space Group: Pcab.* $a = 9.822(3)$ $b = 9.630(3)$ $c = 8.561(3)$ Z = 8

(1) Lucin, Utah, USA. (2) $AlPO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with metavariscite, forms a series with strengite.

Mineral Group: Variscite group.

Occurrence: Typically deposited from phosphate-bearing waters in contact with aluminous rocks. On islands and in caves, the phosphate provided by decomposition of guano.

Association: Crandallite, carbonate-fluorapatite, wardite, millisite, gordonite, montgomeryite, overite, kolbeckite, goyazite (Little Green Monster mine, Utah, USA).

Distribution: Many localities. In Germany, in Saxony, from Messbach, near Oelsnitz; at Langenstriegis, east of Frankenberg, and at Lichtenberg, near Ronneburg, Thuringia. In the Drachenhöhle, Austria. From Železnik, Třenice, and Zaječow, Czech Republic. At Palazuelo de las Arribas, Zamora, Spain. In the Gunheath and Hensbarrow china clay pits, St. Austell, and at the Treore mine, St. Teath, Cornwall, England. An ore at the Sarysai deposit, Alma-Ata, Kazakhstan. In the USA, in Utah, large nodules from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., on Utahlite Hill, about eight km northwest of Lucin, Box Elder Co., from Amatrice Hill, Stansbury Mountains, Tooele Co., and elsewhere; from the Henry de Linde mine #3, and Dug Hill, near Avant, Garland Co., Arkansas; at the Cole mine, Bisbee, Cochise Co., Arizona; crystallized in the Goldstrike and Genesis mines, Lynn district, and the Gold Quarry mine, Maggie Creek district, Eureka Co., Nevada; From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. In the West Driefontein Cave, Transvaal, South Africa. From Snake Hill, Voi, Kenya. At the Iron Monarch quarry, Iron Knob, South Australia, and in the Ninghanboun Hills, Western Australia. In the Kyusen-do Cave, Japan.

Name: From *Variscia*, an old name for Vogtland, the district in Germany which was the original source for the mineral.

(1–2) Varuträsk pegmatite, Sweden.

Polymorphism & Series: Forms a series with hagendorfite.

Mineral Group: Alluaudite group.

Occurrence: In complex granite pegmatites, either as a primary mineral or an alteration product of triphylite–lithiophilite; as nodules in shale.

Association: Alluaudite.

Distribution: In Sweden, in the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, and from Skrumpetorp, Östergötland. In Finland, at Hunnakko and Kaatiala, near Kuertane. From the Mangualde pegmatite, near Mesquitela, Portugal. Found in the Big Fish River and Boundary Creek areas, Yukon Territory, Canada.

Name: For its initially noted occurrence in the Varuträsk pegmatite, Sweden.

Type Material: n.d.

(1) Železník, Slovakia. (2) Do.; H_2O by TGA; corresponds to $(Al_{11.09}Fe^{3+}_{0.01})_{\Sigma=11.10}(PO_4)_{8.90}(OH)_{6.58} \cdot 37.51H_2O$. (3) Chvaletice, Czech Republic; corresponds to $(Al_{10.83}Fe^{3+}_{0.03})_{\Sigma=10.86}(PO_4)_{9.14}(OH)_{5.16} \cdot 42.68H_2O$. (4) $Al_{11}(PO_4)_9(OH)_6 \cdot 38H_2O$.

Occurrence: Filling cavities in boxwork "limonite" from an iron mine (Železník, Slovakia).

Association: Variscite, wavellite, evansite.

Distribution: From Zelezník (Vashegy), Slovakia. At Chvaletice, Czech Republic. From Haut-le-Wastia, Belgium. In the Feengrotten (Cave), near Saalfeld, Thuringia, Germany. In the USA, on the Van-Nav-Sand claim group, Fish Creek Range, 48 km south of Eureka, Eureka Co., and at the Train prospect, Manhattan district, Nye Co., Nevada.

Name: For its occurrence at Vashegy, Hungary (now Železník, Slovakia).

Type Material: Type specimen in Budapest destroyed in 1956; The Natural History Museum, London, England, 1910,101.

Vaterite $CaCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As very finely fibrous crystals, to 0.1 mm, typically in spherulitic aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 2.54 D(calc.) = 2.65

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Uniaxial (+). $\omega = 1.550$ $\epsilon = 1.644$–1.650

Cell Data: *Space Group:* $P6_3/mmc$. $a = 7.135$ $c = 8.524$ Z = 6

X-ray Powder Pattern: Synthetic.
3.30 (100), 2.73 (95), 1.823 (70), 2.065 (60), 3.57 (55), 1.858 (25), 1.647 (25)

Chemistry: (1) Identification depends on correspondence of the X-ray powder pattern with that of synthetic material.

Polymorphism & Series: Trimorphous with aragonite and calcite; metastable below ∼400 °C.

Occurrence: A major constituent of a carbonated calcium silicate hydrogel complex formed from larnite (Ballycraigy, Ireland); a rock-forming mineral formed at low temperatures by hydration of metamorphic calc-silicate rocks in the presence of atmospheric CO_2, in slightly metamorphosed marls and conglomerates, and in weathering crusts (Hatrurim Formation, Israel).

Association: Calcite, aragonite, tobermorite, hydrogarnet, kaolinite (Hatrurim Formation, Israel).

Distribution: From Ballycraigy, Larne, Co. Antrim, Ireland. At the Bellerberg and Emmelberg volcanoes, Eifel district, Germany. From Hopffeldboden, Salzburg, Austria. At Mont Saint-Hilaire, Quebec, Canada. From the Wessels mine, near Kuruman, Cape Province, South Africa. In the Hatrurim Formation, Israel. At Liawenee, near Great Lake, Tasmania, Australia. From the McMurdo area, Antarctica.

Name: To honor Heinrich Vater (1859–1930), Professor of Mineralogy and Chemistry, Tharandt, Germany.

Type Material: n.d.

Vaughanite $TlHgSb_4S_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic *Point Group:* $\overline{1}$ or 1. Anhedral grains, to 200 μm.

Physical Properties: *Cleavage:* A weak parting was observed. *Fracture:* Even, may be arcuate. *Tenacity:* Brittle. Hardness = 3–3.5 VHN = 100–115, 104 average (25 g load). D(meas.) = n.d. D(calc.) = 5.56

Optical Properties: Opaque. *Color:* Pale gray in reflected light; rare blood-red internal reflections. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak; greenish gray to bluish gray. *Anisotropism:* Moderate to strong; purple, purplish brown-gray, brownish yellow, greenish yellow, sage-green, bluish green, dark blue-bottle-green. *Bireflectance:* Weak to moderate.

R_1–R_2: (400) 35.2–41.0, (420) 35.1–40.8, (440) 34.6–40.2, (460) 33.9–39.4, (480) 33.3–39.1, (500) 32.8–39.1, (520) 32.5–39.4, (540) 32.0–39.4, (560) 31.4–39.2, (580) 30.9–38.8, (600) 30.4–38.5, (620) 30.1–37.9, (640) 29.7–36.9, (660) 29.2–35.9, (680) 28.6–35.9, (700) 28.0–34.2

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.012(3)$ $b = 13.223(3)$ $c = 5.906(2)$ $\alpha = 93.27(3)°$ $\beta = 95.05(4)°$ $\gamma = 109.16(3)°$ Z = 2

X-ray Powder Pattern: Hemlo deposit, Canada.
4.204 (100), 3.313 (60), 2.749 (40), 4.343 (30), 2.315 (30)

(1) Hemlo deposit, Canada; by electron microprobe, average of five analyses; corresponds to $Tl_{0.98}Hg_{0.95}(Sb_{3.90}As_{0.17})_{\Sigma=4.07}S_{7.00}$. (2) $TlHgSb_4S_7$.

Occurrence: A very rare primary mineral found in drill core from an epithermal-hydrothermal gold deposit.

Association: Pääkkönenite, stibarsen, realgar, arsenic, chalcostibite, quartz, calcite.

Distribution: From the Golden Giant orebody, Hemlo gold deposit, 35 km east of Marathon, Ontario, Canada [TL].

Name: To honor Professor David John Vaughan (1946–), Manchester University, Manchester, England, for his contributions to ore mineralogy.

Type Material: The Natural History Museum, London, England, 1987,95, E.1220; Canadian Geological Survey, Ottawa, Canada, 65497.

Vauquelinite $Pb_2Cu(PO_4)(CrO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are wedge-shaped, flattened on [100], to 5 mm, as nodules, reniform crusts, granular, compact massive. *Twinning:* On {102}.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5–3
D(meas.) = 6.16 D(calc.) = 6.16

Optical Properties: Translucent to transparent in thin fragments. *Color:* Apple-green, siskin-green, olive-green, canary-yellow, ocher-brown, liver-brown, nearly black. *Streak:* Greenish to brownish. *Luster:* Adamantine to resinous.
Optical Class: Biaxial (–). *Pleochroism:* X = pale green; $Y = Z$ = pale brown. $\alpha = 2.11(2)$ $\beta = 2.22(2)$ $\gamma = 2.22(2)$ 2V(meas.) = $\sim 0°$

Cell Data: *Space Group:* $P2_1/n$. $a = 13.754(5)$ $b = 5.806(6)$ $c = 9.563(3)$ $\beta = 94°34(2)'$ Z = 4

X-ray Powder Pattern: Musonoi mine, Congo.
3.271 (100B), 2.986 (80), 4.74 (70), 2.932 (70), 2.768 (70), 2.694 (70), 2.303 (70)

(1) Beresovsk, Russia. (2) $Pb_2Cu(PO_4)(CrO_4)(OH)$.

Occurrence: A rare mineral in the oxidized zones of some hydrothermal base-metal deposits.

Association: Crocoite, pyromorphite, mimetite, cerussite, beudantite, duftite (Beresovsk, Russia).

Distribution: At the Tsvetnoi mine, Mt. Uspenskaya, Beresov district, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. In Germany, from Öhrenstock, near Ilmenau, Thuringia; at Obercallenberg, near Glauchau, Saxony; and from Reichenbach, near Bensheim, and Raidelbach, Hesse. At the Exi mine, near Laurium, Greece. In the Mashamba West and Musonoi mines, near Kolwezi, and at Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, in Arizona, at a number of localities south and west of Wickenburg, Maricopa Co., as the Moon Anchor mine, the Rat Tail claim, the Potter-Kramer property, Vulture district, the Tonopah-Belmont mine, Osborne district; in the Florence Lead-Silver mine, Tortilla Mountains, Pinal Co.; at the Vanadinite mine, Lost Basin district, Mohave Co.; in Nevada, from the Killie mine, Spruce Mountain district, Elko Co., in the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., and elsewhere; at the Pequa mine, Lancaster, Lancaster Co., Pennsylvania; from the Blue Bell mine, near Baker, San Bernardino Co., California. At the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa. From Broken Hill, New South Wales, Australia. Additional reported localities require modern confirmation.

Name: Honoring Professor Louis Nicolas Vauquelin (1763–1829), French chemist, University of Paris, Paris, France, who discovered chromium.

Vauxite $Fe^{2+}Al_2(PO_4)_2(OH)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As crystals, tabular on {010}, elongated along [001] or [101], showing {010}, {1$\overline{1}$0}, {$\overline{1}\overline{1}$1}, {101}, {1$\overline{1}$1}, {$\overline{1}$01}, {1$\overline{4}$0}; radial to subparallel aggregates, to 6 mm, nodular. *Twinning:* On {010}, twin and composition plane.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.39–2.40 D(calc.) = 2.40

Optical Properties: Transparent. *Color:* Sky-blue to Venetian blue, greenish on exposure; pale blue in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; $X = Z$ = colorless; Y = blue. *Orientation:* $Z \simeq \perp$ {010}. *Dispersion:* $r > v$, marked. $\alpha = 1.551(3)$ $\beta = 1.555(3)$ $\gamma = 1.562(3)$ 2V(meas.) = 32°

Cell Data: *Space Group:* $P\overline{1}$. $a = 9.142(3)$ $b = 11.599(3)$ $c = 6.158(2)$ $\alpha = 98.29(2)°$ $\beta = 91.93(3)°$ $\gamma = 108.27(3)°$ Z = 2

(1) Llallagua, Bolivia. (2) $FeAl_2(PO_4)_2(OH)_2 \cdot 6H_2O$.

Occurrence: A secondary mineral derived from alteration of apatite.

Association: Wavellite, paravauxite (Llallagua, Bolivia); marcasite, wavellite (Huanuni, Bolivia).

Distribution: In Bolivia, from the Siglo XX mine, Llallagua, Potosí, and at Huanuni, Oruro.

Name: Honoring George Vaux, Jr. (1863–1927), American lawyer and mineral collector, Bryn Mawr, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 97561, 103542.

(1) Viitaniemi pegmatite, Finland; corresponds to $(Mn^{2+}_{0.84}Fe^{2+}_{0.14}Ca_{0.02})_{\Sigma=1.00}Be_{0.98}(PO_4)_{0.99}(OH)_{0.96}$. (2) "Chitral" [Pakistan or Afghanistan]; by AA, H_2O by difference; corresponds to $(Mn^{2+}_{0.92}Fe^{2+}_{0.08})_{\Sigma=1.00}Be_{0.83}(PO_4)_{0.97}(OH)_{1.02}$. (3) $MnBe(PO_4)(OH)$.

Occurrence: An alteration product of beryl and triphylite in complex zoned granite pegmatites.

Association: Eosphorite, moraesite, hurlbutite, beryllonite, amblygonite, apatite, tourmaline, topaz, muscovite, microcline, quartz.

Distribution: In the Viitaniemi pegmatite, near Eräjärvi, Finland. From the Norrö pegmatite, on Rånö Island, and from near Kapelludden, Utö Island, Sweden. In the Bendada pegmatite, near Guarda, Portugal. At the Fregeneda pegmatite, Salamanca Province, Spain. From the Kalba Range, eastern Kazakhstan. Large crystals found in Broghul Pass, Chitral Valley, Pakistan.

Name: To honor Professor Heikki Allan Väyrynen (1888–1956), Technical Institute, Helsinki, Finland.

Type Material: National Museum of Natural History, Washington, D.C., USA, R11807.

Veatchite $Sr_2B_{11}O_{16}(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. Platy crystals platy, flattened on {100}, elongated along [011], or slender primatic to fibrous, with {100}, {$0\bar{1}1$}, {111}, {$1\bar{1}1$}, with other minor forms, to 2 cm; in divergent groups and cross-fiber veinlets.

Physical Properties: *Cleavage:* On {100}, perfect; on {011}, less perfect. Hardness = 2
D(meas.) = 2.66 D(calc.) = 2.664

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous, pearly on cleavages; silky in fibrous masses.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y \wedge a = -2°$. *Dispersion:* $r > v$, perceptible.
$\alpha = 1.551(2)$ $\beta = [1.553]$ $\gamma = 1.621(2)$ 2V(meas.) = 37°

Cell Data: *Space Group:* Aa. $a = 20.860(5)$ $b = 11.738(3)$ $c = 6.652(2)$ $\beta = 92.10(3)°$
Z = 8

X-ray Powder Pattern: Kramer district, California, USA; nearly identical to *p*-veatchite.

(1) Sterling mine, California, USA. (2) $Sr_2B_{11}O_{16}(OH)_5 \cdot H_2O$.

Polymorphism & Series: Trimorphous with *p*-veatchite and veatchite-A.

Occurrence: Uncommon in evaporite borate deposits formed by volcanic activity.

Association: Howlite, colemanite (Sterling mine, California, USA).

Distribution: In the USA, in California, from the Sterling borax mine, Tick Canyon, near Lang, Los Angeles Co.; and in drillcore no. 5, Four Corner area, Kramer district, San Bernardino Co.; at the Billie mine, Furnace Creek district, Death Valley, Inyo Co. From the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada. At the Inder borate deposit, Kazakhstan. Large crystals from Mustafakemalpasa, Bursa Province, Turkey.

Name: Honors John A. Veatch (1808–1870), American physician and geologist, who first detected boron in mineral waters in California, USA in the late 1800's.

Type Material: Harvard University, Cambridge, Massachusetts, 92944; National Museum of Natural History, Washington, D.C., USA, 105697.

(1) Emet, Turkey; MgO and CaO by AA. (2) $Sr_2B_{11}O_{16}(OH)_5 \cdot H_2O$.

Polymorphism & Series: Trimorphous with *p*-veatchite and veatchite.

Occurrence: Uncommon in evaporite borate deposits formed by volcanic activity.

Association: Realgar, orpiment, colemanite, hydroboracite, montmorillonite.

Distribution: From the Killik, Hisarcık, and Espey borate mines, near Emet, Kütahya Province, Turkey.

Name: As a polytype of *veatchite*, crystallizing in the anorthic (triclinic) system.

Type Material: Mining Department, Istanbul Technical University, Istanbul, Turkey; National Museum of Natural History, Washington, D.C., USA, 145911.

References: (1) Kumbasar, I. (1979) Veatchite-A, a new modification of veatchite. Amer. Mineral., 64, 362–366.

p-Veatchite $Sr_2B_{11}O_{16}(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Crystals are platy, with rhombic outline, to 3 mm.

Physical Properties: *Cleavage:* On {010}, perfect; on {001}, good. Hardness = n.d. D(meas.) = 2.60–2.65 D(calc.) = [2.68–2.74]

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Z \wedge a = 29°40'$. $\alpha = 1.550(2)$ $\beta = 1.553(2)$ $\gamma = 1.620(2)$ 2V(meas.) = n.d. 2V(calc.) = 25°

Cell Data: *Space Group:* $P2_1$. $a = 6.70$–6.74 $b = 20.62$–20.80 $c = 6.58$–6.63 $\beta = 119°15'-119°40'$ Z = 2

X-ray Powder Pattern: Königshall-Hindenburg mine, Germany; nearly identical to veatchite.
10.4 (100), 3.31 (60), 2.592 (30), 5.64 (20), 3.46 (20), 3.38 (15), 5.10 (10)

Chemistry:

	(1)	(2)
B_2O_3	58.0	58.62

H_2O	9.6	9.65
Total	100.0	100.00

(1) Russia. (2) $Sr_2B_{11}O_{16}(OH)_5 \cdot H_2O$.

Polymorphism & Series: Trimorphous with veatchite and veatchite-A.

Occurrence: A very rare component of marine evaporite salt deposits.

Association: Halite, anhydrite, boracite, magnesite, pyrite, quartz.

Distribution: From the Königshall-Hindenburg potash mine, Reyershausen, near Göttingen, Lower Saxony, Germany. In the Boulby potash mine, northwest of Whitby, Yorkshire, England. From an undisclosed locality in Russia.

Name: The prefix "*p*" used to represent a primitive unit cell, and for its close relation to *veatchite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 113264.

Veenite $Pb_2(Sb,As)_2S_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$ or $2/m\ 2/m\ 2/m$. Rarely as equant prisms elongated along [100] and flattened on {010}, grooved and roughened; typically massive, to 2 cm, and as anhedral grains. *Twinning:* Lamellar.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. VHN = 146–167, 155 average (100 g load). D(meas.) = 5.92 D(calc.) = 5.96

Optical Properties: Opaque. *Color:* Steel-gray; white in reflected light. *Streak:* Black, faint brownish tinge against white background. *Pleochroism:* Weak; white to pale pinkish gray. *Anisotropism:* Moderate.

R_1–R_2: (400) 40.2–43.8, (420) 39.9–43.4, (440) 39.6–43.0, (460) 39.2–42.8, (480) 38.8–42.6, (500) 38.4–42.3, (520) 37.9–42.0, (540) 37.4–41.7, (560) 37.0–41.4, (580) 36.5–40.8, (600) 36.1–40.3, (620) 35.7–39.8, (640) 35.3–39.1, (660) 34.7–38.4, (680) 34.0–37.6, (700) 33.3–36.8

Cell Data: *Space Group:* $P2_1cn$ or $Pmcn$. $a = 8.44$ $b = 26.2$ $c = 7.90$ $Z = 8$

X-ray Powder Pattern: Madoc, Canada.
3.81 (100), 3.03 (90), 3.42 (80), 3.26 (80), 2.76 (70), 3.23 (50), 2.93 (50)

	(1)
Pb	51.2
Cu	0.08
Ag	0.09
Sb	19.1
As	7.9
S	21.2
Total	99.47

(1) Madoc, Canada; by electron microprobe, corresponds to $(Pb_{1.90}Cu_{0.01}Ag_{0.01})_{\Sigma=1.92}(Sb_{1.21}As_{0.81})_{\Sigma=2.02}S_{5.06}$.

Occurrence: As small masses, stringers, and disseminated grains in marbles developed in a sequence of Precambrian metasediments near a contact with plutonic granitic gneiss (Madoc, Canada).

Association: Gratonite, calcite, boulangerite, other lead antimonides, sphalerite, pyrite, chalcopyrite, arsenopyrite, galena (Madoc, Canada).

Distribution: In Canada, in Ontario, from near Madoc [TL] and in the Mattabi mine, 60 km north of Ignace. At Huachocolpa, Huancavelica, Peru.

Name: To honor R.W. van der Veen (1883–1925), Dutch economic geologist and metallographer.

Type Material: Canadian Geological Survey, Ottawa, 12170; Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada.

Vergasovaite $Cu_3O(MoO_4, SO_4)(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are stout prismatic, slightly elongated along [001], to 0.3 mm, with {100}, {110}, {120}, {130}, {111}, {263}, {315}, isolated and in radiating aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–5
VHN = 302–413, 357 average (25 g load). D(meas.) = n.d. D(calc.) = 4.32

Optical Properties: Transparent. *Color:* Olive-green; gray in reflected light with pale green internal reflections. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial. *Pleochroism:* Distinct; olive-green $\parallel c$; yellowish to brownish green $\perp c$.
α = [1.87] β = n.d. γ = [1.98] 2V(meas.) = n.d.

Cell Data: *Space Group: Pnma.* $a = 7.421(2)$ $b = 6.754(3)$ $c = 13.624(5)$ Z = 4

X-ray Powder Pattern: Tolbachik volcano, Russia.
3.077 (100), 3.391 (60), 3.342 (60), 2.542 (60), 2.500 (60), 2.275 (60), 3.71 (30)

Chemistry:

	(1)
SO_3	21.44
MoO_3	25.29
V_2O_5	0.88
CuO	49.81
ZnO	1.76
PbO	0.63
Total	99.81

(1) Tolbachik volcano, Russia; by electron micrprobe, average of 18 analyses, $(OH)^{1-}$ and H_2O shown absent by IR; corresponds to $(Cu_{2.82}Zn_{0.10}Pb_{0.01})_{\Sigma=2.93}O[(Mo_{0.79}S_{0.20}V_{0.04})_{\Sigma=1.03}O_4](SO_4)$.

Occurrence: A rare sublimation product in fumaroles.

Association: Chalcocyanite, dolerophanite, euchlorine, fedotovite, tenorite, cuprian anglesite, gold.

Distribution: From the Tolbachik fissure volcano, Kamchatka, Russia.

Name: Honors Dr. Lidia Pavlovna Vergasova (1941–), Institute of Vulcanology, Petropavlovsk-Kamchatskii, Russia, for her contributions to the mineralogy of that volcanic region.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; Natural History Museum, Basel, Switzerland.

			Total	100.00	100.01

(1) Ajmer, India; corresponds to $(Mg_{2.37}Fe^{3+}_{0.37}Ca_{0.18}Na_{0.05}Fe^{2+}_{0.03})_{\Sigma=3.00}(Si_{2.72}Al_{1.28})_{\Sigma=4.00}O_{10}(OH)_2 \cdot 4.01H_2O$. (2) Corundum Hill, Macon Co., North Carolina, USA; corresponds to $(Mg_{2.68}Al_{0.35}Fe^{3+}_{0.29}Fe^{2+}_{0.04})_{\Sigma=3.36}(Si_{2.65}Al_{1.35})_{\Sigma=4.00}O_{10}(OH)_{2.00} \cdot 4.52H_2O$.

Mineral Group: A group name; individual minerals within the group are not specified.

Occurrence: An alteration product of biotite or phlogopite, by weathering or hydrothermal action. Formed at the contact between felsic and mafic or ultramafic rocks such as pyroxenites and dunites; in carbonatites and metamorphosed limestones; a clayey constituent of soils.

Association: Corundum, apatite, serpentine, talc; interstratifies with chlorite, biotite.

Distribution: Uncommon in large amounts. In the USA, at Milbury, near Worcester, Worcester Co., Massachusetts; from near Franklin, Macon Co., and at the Rutherford quarry, near Tuxedo, Henderson Co., North Carolina; in Brinton's quarry, Westtown, Chester Co., and on Chestnut Hill, Easton, Northampton Co., Pennsylvania; from Magnet Cove, Hot Spring Co., Arkansas; and at Libby, Lincoln Co., Montana. From Ajmer, Rajasthan, India. At Phalaborwa, Transvaal, South Africa. In Australia, from Mud Tank, Valley Bore, Northern Territory, and at Bulong, Western Australia. From the Kovdor massif, Kola Peninsula, and in the Potaninskoye deposit, Southern Ural Mountains, Russia. Many other minor localities are known.

Name: From the Latin *to breed worms*, alluding to the mineral's exfoliation upon rapid heating.

			Total	100.32	100.15

(1) Kurchatov fracture zone, Pacific Ocean; corresponds to $MnO_2 \cdot (R_2O)_{0.04} \cdot (RO)_{0.32} \cdot (R_2O_3)_{0.14} \cdot 2.64H_2O$. (2) Lovozero massif, Russia; corresponds to $MnO_2 \cdot (R_2O)_{0.01} \cdot (RO)_{0.26} \cdot (R_2O_3)_{0.08} \cdot 1.42H_2O$.

Occurrence: A weathering product of other manganese oxides, carbonates, and silicates; easily formed by the action of Fe, Mn-oxidizing bacteria.

Association: Todorokite, pyrolusite, romanèchite, cryptomelane, manganite, ferrihydrite.

Distribution: Undoubtedly much more common than the few well-authenticated localities indicate. In Russia, from the Kusimovskoye manganese deposit, 25 km west-northwest of Magnitogorsk, Southern Ural Mountains; on Mt. Zarod, Sikhote-Alin Mountains, Primorskiy Territory; and on Lepkhe-Nelm, Lovozero massif, Kola Peninsula. On Groote Eylandt, Northern Territory, Australia. An important component of ocean-floor manganese nodules.

Name: For Professor Vladimir Ivanovich Vernadsky (1863–1945), Russian naturalist and geochemist, Moscow University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 43441, 43442.

(1) Big Creek, California, USA; by D-C arc spectroscopy, K and Cl by X-ray spectroscopy, loss on ignition taken as H_2O, recalculated to 100.0%; corresponds to $(Ba_{2.00}Ca_{0.02}K_{0.01})_{\Sigma=2.03}(Mn_{0.72}Fe_{0.16}Ti_{0.13}Mg_{0.02})_{\Sigma=1.03}(Si_{2.04}Al_{0.05})_{\Sigma=2.09}O_{6.19}[(OH)_{0.98}Cl_{0.58}O_{0.25}F_{0.18}]_{\Sigma=1.99} \cdot 2.96H_2O$.

Occurrence: In thin layers in a metamorphic sanbornite-quartz rock.

Association: Quartz, sanbornite, celsian, diopside, taramellite, fresnoite, muirite, traskite, pyrrhotite, pyrite.

Distribution: In the Esquire No. 7 mine, Big Creek, and on Rush Creek, Fresno Co., California, USA.

Name: For William E. Ver Planck (1916–1963), geologist of the California Division of Mines & Geology, California, USA.

Type Material: California Division of Mines & Geology, San Francisco, California, USA.

(1) Buca della Vena mine, Italy; by electron microprobe, Fe^{2+}:Fe^{3+} from crystal-structure analysis; corresponds to $Fe^{2+}_{4.65}Zn_{1.04}Fe^{3+}_{5.33}(Sb^{3+}_{11.76}As^{3+}_{1.34})_{\Sigma=13.10}O_{32}S_{1.33}$. (2) $Fe_4^{2+}Fe_8^{3+}Sb_{12}O_{32}S_2$.

Occurrence: In an iron ore deposit in barite formed by metasomatic processes at the contact between phyllites and dolostones.

Association: Schafarzikite, apuanite, derbylite, barite, magnetite, hematite, pyrite.

Distribution: In the Buca della Vena mine, northeast of Stazzema, Apuan Alps, Tuscany, Italy.

Name: For the Versilia Valley, Apuan Alps, Italy, where it was found.

Type Material: University of Pisa, Pisa, Italy, 3211.

(1) Friedrichroda, Germany; recalculated after deduction of insoluble, 3.3%, original total 99.5%.
(2) $BaCu_3(VO_4)_2(OH)_2$.

Occurrence: A rare secondary mineral formed in copper-bearing U–V deposits.

Association: Volborthite, malachite, tyuyamunite, carnotite, barite, calcite.

Distribution: From [the Gottlob mine], Friedrichroda, Thuringia, and Bad Lauterberg, Harz Mountains, Germany. At Perm, Ural Mountains, Russia. In the Agalyk U–V deposit, Kara-Tyube Mountains, 15 km south of Samarkand, Uzbekistan. At Vrančice, about 15 km south-southeast of Příbram, Czech Republic. From the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. In the Newhurst quarry, near Shepshed, and the Bardon quarry, Coalville, Leistershire, England. At the Mashamba West mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, from the Paradox Bell mine, Paradox Valley, Montrose Co., Colorado; in Arizona, at the Monument #1 mine, Navajo Co., from the Ridenaur breccia pipe, Coconino Co., and about six km south of Mercer Ranch, Copper Creek district, Pinal Co.; in the Gold Quarry mine, near Carlin, Maggie Creek district, and the Goldstrike mine, Lynn district, Eureka Co., Nevada. At the Edelweiss mine, Burra, South Australia. From the Gorob-Hope copper deposit, west-central Namibia.

Name: Honoring Colonel Jean Paul Louis Vésignié (1870–1954), noted French mineral collector.

Type Material: National School of Mines, Paris, France.

References: (1) Guillemin, C. (1955) Une nouvelle espèce minéral: la vésigniéite, $Cu_3Ba(VO_4)_2(OH)_2$. Compt. Rendus Acad. Sci. Paris, 240, 2331–2333 (in French). (2) (1955) Amer. Vesuvianite $Ca_{19}(Al,Mg)_{13}B_{0-5}Si_{18}O_{68}(OH,O,F)_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal or monoclinic. *Point Group:* $4/m\ 2/m\ 2/m$ or $2/m$. Commonly as short pyramidal to long prismatic crystals, to 15 cm, morphologically complex, with up to 30 forms reported on one crystal; columnar, granular, massive. *Twinning:* Twinned domains observed at a very fine scale.

Physical Properties: *Cleavage:* {110}, poor; {100} and {001}, very poor. *Fracture:* Subconchoidal to irregular. *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 3.32–3.43 D(calc.) = 3.42

Optical Properties: Transparent to translucent. *Color:* Yellow, green, brown; colorless to white, blue, violet, bluish green, pink, red, black, commonly zoned; in transmitted light, colorless to light yellow, green, brown. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Uniaxial (–); uniaxial (+) and biaxial examples are common, sectored. *Pleochroism:* Weak; O = colorless to yellowish; E = yellowish, greenish, brownish. *Dispersion:* Strong. $\omega = 1.703–1.752$ $\epsilon = 1.700–1.746$

Cell Data: *Space Group:* $P4/nnc$ or $P2/n$. $a = 15.4–15.7$ $c = 11.6–11.9$ $Z = 2$

X-ray Powder Pattern: Canzoccoli [Canzòcoli, Val di Fiemme, Trentino-Alto Adige], Italy. 2.759 (10), 2.599 (8), 1.625 (8), 2.948 (6), 2.465 (6), 2.128 (5), 1.767 (5)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
SiO_2	37.03	35.01	Fe_2O_3	1.91	3.76	CaO	36.70	35.31

Al_2O_3	17.04	12.13	MgO	2.17	4.84			

(1) Jeffrey mine, Asbestos, Canada; by electron microprobe, FeO by wet chemical analysis, H_2O calculated from stoichiometry; corresponds to $Ca_{19.14}(Al_{9.77}Mg_{1.57}Fe^{3+}_{0.70}Fe^{2+}_{0.58}Ti_{0.19}Mn_{0.02})_{\Sigma=12.83}Si_{18.16}O_{68}[(OH)_{9.10}O_{1.16}]_{\Sigma=10.26}$. (2) Tulare Co., California, USA; by electron microprobe, FeO by wet chemical analysis, H_2O calculated from stoichiometry; corresponds to $Ca_{19.00}(Al_{7.18}Mg_{3.62}Fe^{2+}_{1.54}Fe^{3+}_{1.42}Ti_{0.16}Mn_{0.06})_{\Sigma=13.98}B_{2.76}Si_{17.58}O_{68}[O_{7.30}(OH)_{2.88}]_{\Sigma=10.18}$.

Occurrence: In skarns formed during contact or regional metamorphism of limestones; in garnetized gabbros, mafic and ultramafic rocks, and serpentinites; uncommon in alkalic igneous rocks.

Association: Grossular, diopside, wollastonite, epidote, scapolite, spinel, calcite.

Distribution: Good crystals are found throughout the world. In Italy, at Monte Somma and Vesuvius, Campania; Ariccia, Lazio; Val di Fassa, Trentino-Alto Adige; and Val d'Ala, Piedmont. From near Zermatt, Valais, Switzerland. At Arendal, Stromskien, and Egg, Norway. In Russia, at the Akhmatovsk mine, near Zlatoust, Ural Mountains, and near Chernyshevsk, at the confluence of the Akhtaragdy and Vilyui Rivers, Yakutia. In the USA, at Amity, Orange Co., and Olmsteadville, Essex Co., New York; in the Belvidere Mountain quarries, Lowell, Orleans Co., Vermont; Sanford, York Co., and Auburn, Androscoggin Co., Maine; Georgetown, El Dorado Co., and Crestmore, Riverside Co., California; near Ludwig, Yerington district, Lyon Co., Nevada. In Canada, at Litchfield, Asbestos, and Mont Saint-Hilaire, Quebec. At Xalostoc, Morelos, and Lake Jaco, Chihuahua, Mexico. From Baluchistan, Pakistan.

Name: For its occurrence at Vesuvius, Italy.

Type Material: Mining Academy, Freiberg, Germany, 23278.

(1) Morávicza, Romania. (2) Arakawa mine, Japan; corresponds to $(Cu_{1.77}Zn_{1.24})_{\Sigma=3.01}(PO_4)(OH)_3 \cdot 2H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of some base-metal mineral deposits.

Association: Pseudomalachite, malachite, hemimorphite, pyromorphite, kipushite, vauquelinite, libethenite, quartz, iron oxides (Kipushi mine, Congo); hemimorphite, malachite, aurichalcite, brochantite (Wanlockhead, Scotland).

Distribution: From Ocna de Fier (Morávicza; Vaskő), Romania. At Zdravo Vrelo, near Sarajevo, Bosnia-Herzegovina. In the Straitstep vein, Wanlockhead, Dumfriesshire, Scotland. From Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). At Kabwe (Broken Hill), Zambia. In the Hisaichi (Arakawa) mine, Akita Prefecture, and the Kamioka mine, Gifu Prefecture, Japan. In the USA, large crystals from the Black Pine mine, near Philipsburg, Granite Co., Montana; from Gold Hill, Tooele Co., Utah. At the La Esperanza mine, Mayapa, Zacapoaxtla district, Puebla, Mexico.

Name: Honoring A. Veszelyi (1820–1888), Hungarian mining engineer, who discovered the species.

Type Material: n.d.

Vigezzite $(Ca, Ce)(Nb, Ta, Ti)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Euhedral prismatic crystals, elongated along [010], and flattened and striated ‖ [001] on {100}, terminated by {010}, to 3 mm.

Physical Properties: *Cleavage:* {010}, distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 VHN = 396 (50 g load). D(meas.) = n.d. D(calc.) = 5.54

Optical Properties: Transparent. *Color:* Bright yellow-orange; yellow in transmitted light. *Optical Class:* Biaxial. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* Extreme. $\alpha = [2.14(2)]$ $\beta =$ n.d. $\gamma = [2.315(2)]$ 2V(meas.) = Large.

Cell Data: *Space Group: Pnmb.* $a = 11.065(2)$ $b = 7.527(1)$ $c = 5.343(1)$ Z = 4

X-ray Powder Pattern: Orcesco, Italy.
3.036 (100), 2.974 (100), 4.821 (90), 3.784 (80), 1.6018 (70), 1.7128 (60), 2.864 (40)

Chemistry:

	(1)	(2)
Nb_2O_5	31.0	73.8
Ta_2O_5	36.0	6.4
TiO_2	10.5	4.2
La_2O_3		0.2
Ce_2O_3	10.5	0.6
FeO		0.4
CaO	12.0	14.2
Total	100.0	99.8

(1) Orcesco, Italy; by electron microprobe, average of 12 analyses; corresponds to $(Ca_{0.82}Ce_{0.24})_{\Sigma=1.06}(Nb_{0.90}Ta_{0.62}Ti_{0.50})_{\Sigma=2.02}O_6$. (2) Kola Peninsula, Russia; by electron microprobe, average of three analyses; corresponding to $(Ca_{0.83}Fe_{0.02}La_{0.01})_{\Sigma=0.86}(Nb_{1.82}Ti_{0.17}Ta_{0.09})_{\Sigma=2.08}O_6$.

Occurrence: In miarolitic cavities in an albitized pegmatite in amphibolite and biotite gneiss (Orcesco, Italy).

Association: Pyrochlore, columbite, fersmite (Orcesco, Italy).

Distribution: From near Orcesco, on Alpe Rosso, Val Vigezzo, Piedmont, Italy. At the Kovdor massif, Kola Peninsula, Russia.

Name: For Val Vigezzo, Italy, where the mineral occurs.

Type Material: Mineralogical Institute, University of Basel, Basel; Natural History Museum, Basel, Switzerland, MB27:336.

ZnO	14.39	$-O=F_2$	0.19
Fe_2O_3	2.00	Total	101.75

(1) Lovozero alkaline massif, Kola Peninsula, Russia; average of 9 electron microprobe analyses, H_2O by modified Penfield method, corresponds to $H_{7.42}(Zn_{1.30}Na_{0.23}Mn_{0.22}Ca_{0.07}Mg_{0.07}K_{0.05}Ba_{0.02})_{\Sigma=1.96}(Ti_{2.68}Nb_{0.41}Fe^{3+}_{0.18}Zr_{0.12})_{\Sigma=3.39}(Si_{3.95}Al_{0.05})_{\Sigma=4}O_{20.31}F_{0.18}$.

Mineral Group: Epistolite group.

Occurrence: In a zoned peralkaline pegmatite located in foyaite and lujavrite rocks of a layered alkaline igneous complex. Found at the periphery of the ussingite core near its contact with the aegirine-eudialyte zone.

Association: Microcline, ussingite, aegirine, analcime, natrolite, gmelinite-Na, gmelinite-K, chabazite-Ca.

Distribution: From pegmatite 71, Malyi Punkaruaiv Mt., Lovozero alkaline massif, Kola Peninsula, Russia.

Name: Honors the Russian amateur mineralogist and mineral collector Viktor G. Grishin (b. 1953) for his significant contribution to the mineralogy of the Lovozero complex, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; 4256/1.

Na_2O	11.6	11.4	Total	100.84	93.7

(1) Viitaniemi pegmatite, Finland; by AA, Mn and P colorimetrically, F by ion-active electrode, H_2O by the Penfield method; corresponds to $(Na_{0.91}K_{0.01})_{\Sigma=0.92}(Ca_{0.64}Mn^{2+}_{0.36}Fe^{2+}_{0.02}Mg_{0.02})_{\Sigma=1.04}Al_{1.07}P_{0.97}O_{4.11}[(F_{1.57}(OH)_{1.33}]_{\Sigma=2.90}$. (2) Francon quarry, Canada; by electron microprobe, corresponding to $Na_{0.91}(Ca_{0.98}Mg_{0.01})_{\Sigma=0.99}Al_{1.13}(P_{0.98}O_4)(F,OH)_3$.

Occurrence: An inclusion in eosphorite and rimming morinite, from a complex zoned granite pegmatite (Viitaniemi pegmatite, Finland); in druses in granite (Greifensteine, Germany).

Association: Eosphorite, fluorapatite, crandallite, montebrasite, morinite (Viitaniemi pegmatite, Finland); lacroixite, morinite, apatite, childrenite, roscherite, tourmaline (Greifensteine, Germany); cryolite, fluorite, weloganite, dresserite, dawsonite, calcite, pyrite, galena, sphalerite, quartz (Francon quarry, Canada).

Distribution: In the Viitaniemi pegmatite, near Eräjärvi, Finland. On the Greifensteine, near Ehrenfriedersdorf, Saxony, Germany. In the Francon quarry, Montreal Island, Montreal, Quebec, Canada. Large crystals from near Dassu, Braldu Valley, Pakistan.

Name: For its occurrence in the Viitaniemi pegmatite, Finland.

Type Material: Mineralogical Museum, Geological Survey of Finland, Helsinki, Finland.

Total	100.9	99.61	100.00

(1) Ivigtut, Greenland; by electron microprobe, corresponding to $Ag_{4,81}Cu_{0.18}Pb_{7.79}Bi_{13.26}S_{29.96}$. (2) La Roche-Balue quarry, France; by electron microprobe, corresponding to $Ag_{3.88}Cd_{0.27}Pb_{9.74}(Bi_{11.90}Sb_{0.02})_{\Sigma=11.92}(S_{30.16}Se_{0.03})_{\Sigma=30.19}$. (3) $Ag_5Pb_8Bi_{13}S_{30}$.

Occurrence: Associated with cosalite and as lamellae in galena in the gustavite-galena paragenesis (Ivigtut, Greenland).

Association: Cosalite, galena (Ivigtut, Greenland); gustavite, heyrovskyite, quartz (La Roche-Balue quarry, France).

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland [TL]. In the USA, from near Gabbs, Gabbs district, Nye Co., Nevada; at South Mountain, Owyhee Co., Idaho; and in the Apache Hills, southeast of Hachita, Grant Co., New Mexico. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At the La Roche-Balue quarry, west of Nantes, Loire Atlantique, France.

Name: For the Vikings, early settlers of Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1973.236; National Museum of Natural History, Washington, D.C., USA, 136172.

Total	99.2	101.0

(1) Providencia mine, Spain; corresponds to $(Cu_{0.47}Ni_{0.25}Fe_{0.12}Co_{0.08})_{\Sigma=0.92}S_{2.08}$. (2) Do.; by electron microprobe; corresponds to $(Cu_{0.48}Ni_{0.37}Co_{0.12}Fe_{0.05})_{\Sigma=1.02}(S_{1.96}Se_{0.02})_{\Sigma=1.98}$.

Occurrence: As subhedral disseminated grains in black bituminous dolostone; in white coarse-grained recrystallized dolostone; as nodular aggregates in vuggy dolomite veinlets (Providencia mine, Spain).

Association: Pyrite, chalcopyrite, dolomite, quartz (Providencia mine, Spain).

Distribution: From the Providencia mine, six km east-northeast of Villamanín, Cármenes district, León Province, Spain [TL]. In Poland, in the Lubin copper mine, near Legnica, Zechstein copper district, Lower Silesia, and at Karniowice. From Rum Jungle, Alligator River district, Northern Territory, Australia.

Name: For the town of Villamanín, Spain.

Type Material: The Natural History Museum, London, England, 1919,309; 1920,7.

(1) Los Islands, Guinea. (2) Lovozero massif, Russia. (3) NaF.

Occurrence: In nepheline syenite and nepheline syenite pegmatites; in lake-bed deposits.

Association: Aegirine, sodalite, nepheline, neptunite, lamprophyllite, pectolite, serandite, eudialyte, ussingite, chkalovite, zeolites.

Distribution: On Rouma Isle, Los Islands, Guinea. On Mts. Karnasurt and Alluaiv, Lovozero massif, and from the Khibiny massif, Kola Peninsula, Russia. At Kvanefjeld, Ilímaussaq intrusion, Greenland. From Aris, about 20 km south of Windhoek, Namibia. At Lake Magadi, Kenya. From Poços de Caldas, Minas Gerais, Brazil. In the USA, at Point of Rocks, Colfax Co., New Mexico, and on Porphyry Mountain, Jamestown district, Boulder Co., Colorado. Large crystals from Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Maxime Villiaume, French explorer, in whose collections of rocks from Guinea the mineral was first found.

Type Material: n.d.

X-ray Powder Pattern: Sainte-Marie-aux-Mines, France.
3.297 (100), 8.476 (90), 3.132 (60), 4.606 (50), 4.761 (40), 3.811 (40), 3.025 (40)

Chemistry:

	(1)	(2)
As_2O_5	52.99	50.6
FeO		0.1
MnO	22.40	36.2
ZnO		2.9
CaO	13.58	0.5
H_2O	11.42	9.9
Total	100.39	100.2

(1) Sainte-Marie-aux-Mines, France; by electron microprobe, total Mn as MnO, H_2O by TGA; corresponds to $H_{2.27}(Mn_{2.69}Ca_{2.07})_{\Sigma=4.76}(AsO_4)_{3.93} \cdot 4.28H_2O$. (2) Mapimí, Mexico; by electron microprobe, average of five points over several crystals; total Mn as MnO, H_2O by moisture evolution analyzer; corresponds to $(Mn_{4.62}Zn_{0.32}Ca_{0.08}Fe_{0.01})_{\Sigma=5.03}(AsO_4)_{2.08}(AsO_3OH)_{1.92} \cdot 4.04H_2O$.

Occurrence: A rare post-mine low-temperature reaction product of carbonate gangue with arsenical solutions derived from arsenic (Sainte-Marie-aux-Mines, France); on a museum specimen from the oxidized zone of an arsenic-rich base metal deposit (Mapimí, Mexico); on a single specimen from a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Fluckite, picropharmacolite, pharmacolite, arsenic (Sainte-Marie-aux-Mines, France); ogdensburgite, arseniosiderite, chalcophanite, adamite, Fe–Mn oxides (Mapimí, Mexico); manganoan calcite, willemite, franklinite (Sterling Hill, New Jersey, USA).

Distribution: Found at Sainte-Marie-aux-Mines, Haut-Rhin, France. From Jáchymov (Joachimsthal), Czech Republic. Large crystals at the Ojuela mine, Mapimí, Durango, Mexico. In the Veta Negra mine, Pampa Larga district, Tierra Amarilla, southeast of Copiapó, Chile. From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. At the Gozaisho mine, Iwaki, Fukushima Prefecture, Japan.

Name: To honor Dr. Villy Aellen, Director, Natural History Museum, Geneva, Switzerland.

Type Material: Natural History Museum, Geneva, Switzerland, 435/76.

(1) Novofrolovskoye deposit, Russia; corresponds to $(Ca_{1.07}Mg_{0.09})_{\Sigma=1.16}B_{1.84}O_{2.30}(OH)_{3.16}$.
(2) Solongo deposit, Russia; corresponds to $(Ca_{1.07}Mg_{0.04})_{\Sigma=1.11}B_{1.89}O_{1.84}(OH)_{4.11}$.
(3) $CaB_2O_2(OH)_4$.

Polymorphism & Series: Dimorphous with uralborite.

Occurrence: In boron-rich copper-bearing skarn (Novofrolovskoye deposit, Russia); in iron-bearing skarn (Solongo deposit, Russia).

Association: uralborite, andradite–grossular, calciborite, sibirskite, magnetite (Novofrolovskoye deposit, Russia); frolovite (Solongo deposit, Russia).

Distribution: In Russia, from the Novofrolovskoye copper deposit, Turinsk district, near Krasnoturinsk, Northern Ural Mountains, and in the Solongo boron deposit, Buryatia.

Name: For the 50th anniversary of the All-Union Scientific Research Institute of Mineral Resources [an acronym for Vses. Nauch.-Issled. Inst. Mineral. Syr'ya], Moscow, Russia.

Type Material: Vernadsky Geological Museum, Moscow, Russia.

X-ray Powder Pattern: Chizeuil, France.
3.088 (100), 1.895 (90), 1.614 (70), 2.676 (50), 1.227 (40), 1.091 (40), 4.37 (30)

Chemistry:

	(1)	(2)
Cu	40.90	42.6
Fe	14.63	13.2
Zn		0.7
Sn	7.33	8.3
As	3.43	4.5
Sb	1.60	
S	31.85	31.3
Total	99.74	100.6

(1) Chizeuil, France; by electron microprobe, average of six analyses, yielding $Cu_{10.19}Fe_{4.15}Sn_{0.98}(As_{0.73}Sb_{0.21})_{\Sigma=0.94}S_{15.74}$. (2) Maggie deposit, Canada; by electron microprobe, giving $Cu_{10.60}(Fe^{+3}_{3.00}Fe^{+2}_{0.74}Zn_{0.17})_{\Sigma=3.91}Sn_{1.11}As_{0.95}S_{15.44}$.

Occurrence: In a porphyry copper deposit with other tin-bearing sulfides (Maggie deposit, Canada).

Association: Pyrite, chalcopyrite, colusite, stannite, stannoidite, mawsonite, bornite, enargite, tetrahedrite–tennantite, quartz, barite.

Distribution: From Chizeuil, Saône-et-Loire, France. At Huaron, Peru. In the Maggie copper deposit, 15 km north of Ashcroft, British Columbia, Canada.

Name: To honor Professor Henri Vincienne (1898–1965), who first called attention to the mineral.

Type Material: National School of Mines, Paris, France.

K_2O	1.78	1.46
H_2O	4.80	3.68
Total	100.44	100.21

(1) Khibiny massif, Russia. (2) Mont Saint-Hilaire, Canada, by electron microprobe, H_2O by TGA; corresponds to $(Na_{4.18}K_{0.31}Ba_{0.14})_{\Sigma=4.63}(Ti_{3.67}Fe_{0.20}Nb_{0.11})_{\Sigma=3.98}(Si_{6.62}Al_{1.41})_{\Sigma=8.03}O_{26}\cdot(H_2O,Na)$.

Occurrence: A late-stage hydrothermal mineral in cavities and veins, and replacing titanium-bearing minerals, in alkalic pegmatites in differentiated alkalic massifs (Kola Peninsula, Russia).

Association: Lorenzenite, lamprophyllite, catapleiite, neptunite, labuntsovite, titanite, calcite.

Distribution: In the Khibiny, Lovozero, and Kovdor massifs, Kola Peninsula, and the Inagli massif, 30 km west of Aldan, Yakutia, Russia. At Mont Saint-Hilaire, Quebec, Canada. In the Ilímaussaq intrusion, southern Greenland.

Name: In honor of Academician Aleksander Pavlovich Vinogradov (1895–1975), Russian geochemist, Director of the Vernadsky Institute of Geochemistry and Analytical Chemistry, Academy of Sciences, Moscow, Russia.

Type Material: Vernadsky Geological Museum, Moscow, 44801; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 57962, vis4737, vis4739.

S	41.68	42.17	42.54
insol.	0.40	1.31	
Total	99.94	100.30	100.00

(1) Vermilion mine, Sudbury, Canada; contains trace chalcopyrite. (2) Friday mine, Julian, California, USA; contains trace chalcopyrite. (3) $FeNi_2S_4$.

Mineral Group: Linnaeite group.

Occurrence: Of hydrothermal origin, with other sulfides.

Association: Pyrrhotite, millerite, chalcopyrite, pentlandite.

Distribution: In the USA, from the Friday mine, Julian, San Diego Co., California; the Key West mine, Clark Co., Nevada; the Copper King mine, Gold Hill district, Boulder Co., Colorado; the Lick Fork deposit, Floyd Co., Virginia; and the Gap Nickel mine, Lancaster Co., Pennsylvania. In Canada, from the Vermilion, Levack, and Worthington mines, Sudbury, Ontario; at the Marbridge mine, Malartic, Quebec; in the Rottenstone mine, Saskatchewan; and from a number of other minor occurrences. At the Madziwa (Dry Nickel) mine, Bindura, Zimbabwe. From the Praborna mine, St. Marcel, Valle d'Aosta, Piedmont, Italy. At Kambalda, 56 km south of Kalgoorlie, and Kalgoorlie, Western Australia, and near Mount Colin, Queensland, Australia. Known from a few other localities.

Name: From the Latin for *violet*, its color on a polished surface.

(1) Visé, Belgium; average of four analyses, original total given as 99.91%; probably contained admixed "opal." (2) Do.; by electron microprobe, average of seven analyses, H_2O by difference. (3) $Ca_{10}Al_{24}(SiO_4)_6(PO_4)_{14}O_{13}\cdot 72H_2O$.

Occurrence: Presumably as a secondary mineral in phosphatic sedimentary rocks, and from the weathering or low-temperature hydrothermal alteration of aluminous skarn deposits.

Association: Delvauxite, trolleite, "opal."

Distribution: From Visé, Liège, Belgium. In the USA, at the Champion mine, near Laws, Mono Co., California.

Name: For the locality where the mineral was discovered, Visé, Belgium.

Type Material: University of Liège, Liège, Belgium, 9574–9476; National Museum of Natural History, Washington, D.C., USA, 106364.

Mineral Group: Cancrinite group.

Occurrence: In poikilitic aegirine-nepheline-sodalite syenites and associated pegmatites.

Association: Aegirine, nepheline, cancrinite, sodalite, scolecite.

Distribution: From the Kurochkin Valley, Vishnevy-Ilmen Mountains, Southern Ural Mountains; on Mts. Karnasurt and Alluaiv and along the Chinglusuai River, Lovozero massif, and in the Kovdor massif, Kola Peninsula; the Synnyrskii massif, north Pribaikal, and elsewhere in Russia. From Allt a' Mhuillin, Loch Borralan, Scotland. On Alnö Island, Sweden. In the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. On the Oldoinyo Lengai volcano, Tanzania. Along Beaver Creek, Iron Hill, Gunnison Co., Colorado, USA.

Name: For the locality in the Vishnevy Mountains, Russia.

Type Material: n.d.

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. [Massive.]

Physical Properties: Hardness = 3.9 VHN = 173 D(meas.) = n.d. D(calc.) = 4.073

Optical Properties: Semitransparent. *Color:* Pale yellow; dark gray in reflected light.
Luster: Vitreous.
Optical Class: Isotropic. $n = 1.735$

Cell Data: *Space Group: Pn3m.* a = 7.72(2) Z = 4

X-ray Powder Pattern: Mushiston deposit, Tajikistan.
3.840 (10), 1.728 (9), 1.570 (8), 2.217 (7), 1.031 (6), 1.117 (5), 1.287 (4)

Chemistry:

	(1)	(2)
Sn	41.8	41.49
Fe	0.9	
Cu	0.3	
Zn	20.45	22.85
OH	36.0	35.66
Total	99.5	100.00

(1) Mushiston deposit, Tajikistan; by electron microprobe, average of six analyses; corresponding to $(Zn_{0.89}Fe_{0.08}Cu_{0.01})_{\Sigma=0.98}Sn_{1.00}(OH)_{6.04}$. (2) $ZnSn^{4+}(OH)_6$.

Mineral Group: Schoenfliesite group.

Occurrence: Formed by oxidation of earlier tin sulfides in tin deposits.

Association: Stannite, natanite, malachite, azurite, goethite (Mushiston deposit, Tajikistan).

Distribution: In the Trudovoye tin deposit, Inyl'chek Mountains, eastern Kyrgyzstan. From the Mushiston tin deposit, Kaznok Valley, Zeravshan Mountains, 35 km south of Pendzhikent, Tajikistan.

Name: Honors Academician Vladimir Ivanovich Smirnov (1910–1988), Moscow University, Moscow, Russia, an early investigator of tin deposits in Central Asia.

Type Material: Mining Institute, St. Petersburg, 1997/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81651.

Vitusite-(Ce) $Na_3(Ce, La, Nd)(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $mm2$. Crystals prismatic, to 5 mm, elongated along [001], showing {100}, {010}, {110}, {120}, {210}, {101}; granular, and in fine-grained aggregates. *Twinning:* Common, on {160}, forming cross triplets, and on {120}, forming combined cross doublets; composition planes may be {130}, {140}, and {1.11.0}.

Physical Properties: *Cleavage:* On {100}, {010}, {001}, good. Hardness = 4.5
D(meas.) = 3.60–3.70 D(calc.) = [3.63]

Optical Properties: Transparent. *Color:* White, pale pink, pale green, pale yellow, pinkish tan, gray, black; colorless in thin section. *Luster:* Vitreous, may be greasy.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. α = 1.602–1.604
β = 1.646–1.650 γ = 1.649–1.654 2V(meas.) = 28.5°–30°

Cell Data: *Space Group:* $Pc2_1b$. $a = 5.3356(8)$ $b = 18.6722(9)$ $c = 14.0546(9)$ Z = 8

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.
2.811 (10), 2.801 (10), 6.580 (9), 4.665 (9), 4.634 (9), 3.512 (9), 2.690 (9)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	36.27	36.50	Pr_2O_3	1.24	1.13
SiO_2	0.25	0.15	Nd_2O_3	4.39	4.33
La_2O_3	15.56	12.20	CaO	0.92	4.75
Ce_2O_3	19.95	16.50	Na_2O	23.15	22.50
			Total	101.73	98.06

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, corresponds to $(Na_{2.92}Ca_{0.06})_{\Sigma=2.98}(Ce_{0.47}La_{0.38}Nd_{0.10}Pr_{0.03})_{\Sigma=0.98}[(PO_4)_{2.00}(SiO_4)_{0.01}]_{\Sigma=2.01}$. (2) Mt. Sengischorr, Kola Peninsula, Russia; by electron microprobe, corresponds to $(Na_{2.83}Ca_{0.33})_{\Sigma=3.16}(Ce_{0.39}La_{0.29}Nd_{0.10}Pr_{0.03})_{\Sigma=0.81}[(PO_4)_{2.00}(SiO_4)_{0.01}]_{\Sigma=2.01}$.

Occurrence: An alteration product of steenstrupine in differentiated alkalic massifs (Ilímaussaq massif; Kola Peninsula, Russia); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Steenstrupine, aegirine, analcime, lovozerite, sphalerite, villiaumite, arfvedsonite, albite, microcline, nepheline, sodalite (Ilímaussaq intrusion, Greenland); steenstrupine, belovite-(Ce), neptunite, leucosphenite, sazhinite-(Ce) (Jubilee pegmatite, Kola Peninsula, Russia); vuonnemite, sodalite, eudialyte, steenstrupine, kogarkoite, sidorenkite, rasvumite (Mont Saint-Hilaire, Canada).

Distribution: From Kvanefjeld, Ilímaussaq intrusion, southern Greenland. In the Jubilee pegmatite, on Mt. Karnasurt, and on Mt. Sengischorr, Lovozero massif; on Mts. Rasvumchorr and Koashva, Khibiny massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Vitus Bering (1681–1741), Danish-Russian explorer of the Arctic seas, and the dominant rare earth, *cerium*.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5544; Mining Institute, St. Petersburg, Russia, 1209/1; University of Copenhagen, Copenhagen, Denmark; National School of Mines, Paris, France; The Natural History Museum, London, England, 1994,36.

Vivianite $Fe_3^{2+}(PO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic crystals, to 1.3 m; flattened on [100] or [010], somewhat elongated along [100], many modifying forms, dominated by {100}, [010}, may be rounded or corroded; stellate groups, incrustations, concretionary, earthy, powdery. *Twinning:* Translation gliding T(010), t[001].

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Fibrous. *Tenacity:* Flexible, sectile. Hardness = 1.5–2 D(meas.) = 2.68(1) D(calc.) = 2.69

Optical Properties: Transparent to translucent. *Color:* Colorless, very pale green, with oxidation becoming dark blue, dark greenish blue, Indigo-blue, then black; colorless to blue in transmitted light. *Streak:* White, altering to dark blue, brown. *Luster:* Vitreous, pearly on the cleavage, dull when earthy.
Optical Class: Biaxial (+). *Pleochroism:* X = blue, deep blue, Indigo-blue; Y = pale yellowish green, pale bluish green, yellow-green; Z = pale yellowish green, olive-yellow. *Orientation:* $X = b$; $Z \wedge c = 28.5°$. *Dispersion:* $r < v$, weak. $\alpha = 1.579$–1.616 $\beta = 1.602$–1.656 $\gamma = 1.629$–1.675 2V(meas.) = 63.5°-83.5°

Cell Data: *Space Group:* $C2/m$. $a = 10.034$–10.086 $b = 13.434$–13.441 $c = 4.687$–4.714 $\beta = 102.65°-104.27°$ Z = 2

X-ray Powder Pattern: Synthetic.
6.73 (100), 3.210 (16), 7.93 (13), 4.90 (12), 4.081 (12), 2.985 (10), 2.728 (9)

Chemistry:

	(1)	(2)
P_2O_5	27.17	28.30
SiO_2	0.10	
FeO	44.10	42.97
H_2O	27.95	28.73
Total	99.32	100.00

(1) Cantwell's Bridge, New Castle Co., Delaware, USA. (2) $Fe_3(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Vivianite group.

Occurrence: A secondary mineral in the oxidized zone of metallic ore deposits and complex granite pegmatites; replacing organic material in fossil bones, lake sediments, and in bog-iron ores and peat bogs; rarely in caves.

Association: Metavivianite, ludlamite, pyrite, pyrrhotite.

Distribution: Numerous localities, even for well-crystallized material. In England, from [Wheal Kind,] St. Agnes, and other mines in St. Just and Kea, Cornwall. At Hagendorf, Bavaria, Germany. From the Stari Trg mine, Trepča, Serbia. On the Taman Peninsula, Russia. Around Kerch, Crimean Peninsula, Ukraine. Huge crystals from Anloua, near Ngaoundéré, Cameroon. In the USA, from the Blackbird Mine, Lemhi Co., Idaho; in the Treece and Ibex mines, Leadville, Lake Co., Colorado; at the Bingham Canyon mine, Salt Lake Co., Utah; from Richmond, Henrico Co., Virginia; at the Foote mine, Kings Mountain, Cleveland Co., North Carolina. In Mexico, from Santa Eulalia, Chihuahua. In Brazil, from the Énio pegmatite mine, northeast of Galiléia, Minas Gerais. Exceptional examples from Bolivia, as at Poopo, Llallagua, Avicaya, Tazna, Monserrat, Morococala, Tatasi, and elsewhere. In the Ashio mine, Tochigi Prefecture, Japan.

Name: Honoring John Henry Vivian (1785–1855), Welsh-Cornish mineralogist, of Truro, Cornwall, England, who discovered the species.

(1) Tuva, Russia. (2) Irhtem mine, Morocco. (3) $Ca_5(AsO_4)_2(AsO_3OH)_2 \cdot 5H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of arsenic-bearing mineral deposits.

Association: Picropharmacolite, erythrite, aragonite (Tuva, Russia).

Distribution: From the Vladimirovskoye cobalt deposit, Altai Mountains, and the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia. In the Bauhaus district, Richelsdorf Mountains, Hesse, Germany. From the Irhtem (Ightem) mine, Bou Azzer district, Morocco. In the USA, at the Mohawk mine, Keweenaw Co., Michigan.

Name: For its first-noted occurrence in the Vladimirovskoye deposit, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1220/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 57263.

Vladimirivanovite $Na_6Ca_2[Al_6Si_6O_{24}](SO_4,S_3,S_2,Cl)_2 \cdot H_2O$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. As rims around lazurite to 3 mm thick, as veinlets in lazurite or in granular aggregates to 4 mm, rarely to 2 cm.

Physical Properties: *Cleavage:* Distinct on {010}. *Fracture:* Stepped. *Tenacity:* Brittle. Hardness = 5-5.5 VHN = 575 (50 g load) D(meas.) = 2.48(3) D(calc.) = 2.436

Optical Properties: Translucent. *Color:* Dark blue to ink-blue, light blue or greenish-blue. *Streak:* Blue. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (-). α = 1.502-1.507 β = 1.509-1.514 γ = 1.512-1.517
2V(meas) = 63(1)° 2V(calc) = 66° *Pleochroism:* Light to dark blue. *Absorption:* Z = Y > X.

Cell Data: *Space Group: Pnaa*. a = 9.053(3) b = 12.837(3), c = 38.445(10) Z = 6

X-ray Powder Pattern: Tultuy deposit, Irkutsk region, Russia.
3.71 (100), 2.623 (30), 2.141 (14), 2.875 (12), 6.43 (11), 1.783 (9), 2.428 (6)

Chemistry:

	(1)
SiO_2	32.59
Al_2O_3	27.39
CaO	7.66
Na_2O	17.74
K_2O	<0.04

S	1.94
Cl	0.12
H_2O	1.0
-O = Cl	0.03
-O = S	0.16
Total	99.62

(1) Tultuy deposit, Irkutsk region, Russia; average of 15 electron microprobe analyses, H_2O by TGA, S by wet chemistry, S_3^- radical confirmed by Raman spectra; corresponding to $Na_{6.36}Ca_{1.52}(Si_{6.03}Al_{5.97})_{\Sigma=12}O_{23.99}(SO_4)_{1.58}(S_3)_{0.17}(S_2)_{0.08}Cl_{0.04} \cdot 0.62H_2O$.

Mineral Group: Sodalite group.

Occurrence: In highly metamorphosed rocks of granulite facies at the contacts of dolomitic marbles with granites.

Association: Lazurite, calcite, afhganite, tounkite, phlogopite, marialite.

Distribution: From the Lyajvardara lazurite deposit, South-Western Pamir, Tajikistan; at the Tultuy lazurite deposit, South-West of Lake Baikal, Irkutsk region, Russia.

Name: Honors Russian mineralogist and geochemist Vladimir Georgievich Ivanov (1947-2002).

Type Material: Mineralogical Museum, Saint Petersburg State University, Russia.

Vlasovite $Na_2ZrSi_4O_{11}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. In crystals, to 15 cm; more commonly as subrounded to irregularly shaped grains and aggregates of such grains. *Twinning:* Twin plane {010}, uncommon.

Physical Properties: *Cleavage:* {010}, good; {$h0l$}, poor. *Fracture:* Uneven to conchoidal. Hardness = 6 VHN = 770 D(meas.) = 2.92–2.97 D(calc.) = [3.07] Altered portions fluoresce brownish yellow under SW UV.

Optical Properties: Transparent. *Color:* Colorless, pink, pale brown, silvery; in transmitted light, colorless. *Luster:* Greasy; highly vitreous to pearly on cleavage surfaces.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, distinct. $\alpha = 1.605(3)$ $\beta = 1.623(3)$ $\gamma = 1.625(3)$ 2V(meas.) = 40°–56°

Cell Data: *Space Group:* $C2/c$. $a = 10.98(4)$ $b = 10.00(4)$ $c = 8.52(3)$ $\beta = 100°24'$ Z = 4

X-ray Powder Pattern: Kipawa River, Canada.
5.053 (100), 3.669 (75), 3.882 (45), 3.237 (40), 3.363 (35), 3.548 (25), 1.945 (20)

(1) Mt. Vavnbed, Russia; ZrO_2 includes HfO_2 1.7%; corresponds to $(Na, K, Ca)_{2.00}Zr_{0.96}Si_{3.91}O_{11}$.
(2) Ascension Island; corresponds to $(Na, K, Ca)_{2.02}Zr_{0.97}Si_{4.01}O_{11}$.

Polymorphism & Series: May invert to triclinic symmetry below 29 °C.

Occurrence: A late phase in nepheline syenites, syenitic pegmatites, and along the contact zone of a differentiated alkalic massif (Lovozero massif, Russia); in miarolitic cavities in ejected blocks of peralkalic granite (Ascension Island).

Association: Eudialyte, microcline, albite, lorenzenite, arfvedsonite, magnesio-katophorite, aegirine, aenigmatite, fayalite, pyrochlore, apatite, fluorite.

Distribution: In Russia, from near Mt. Vavnbed, Lovozero massif, Kola Peninsula; and in the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia. Large crystals from the [Sheffield Lake complex,] Kipawa River, Villedieu Township, Quebec, Canada. On Green Mountain, Ascension Island, southern Atlantic Ocean.

Name: In honor of the Russian mineralogist and geochemist Kuz'ma Alekseevich Vlasov (1905–1964), founder of the Institute of Mineralogy, Geochemistry, and Crystal Chemistry of Rare Elements, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1037/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 83207, vis5052; National School of Mines, Paris, France.

Vlodavetsite $Ca_2Al(SO_4)_2F_2Cl\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Square to rectangular, tabular to scaly crystals, to 0.3 mm, showing {001}, {100}; commonly fine-grained massive.

Physical Properties: *Cleavage:* On {100}, perfect. *Tenacity:* Plastic in masses. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.10–2.35

Optical Properties: Semitransparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.509(2)$ $\epsilon = 1.526(3)$

Cell Data: *Space Group:* $I4/m$. $a = 6.870(1)$ $c = 13.342(2)$ Z = 2

X-ray Powder Pattern: Tolbachik volcano, Kamchatka, Russia.
3.431 (100), 3.335 (80), 6.67 (60), 3.922 (50), 3.729 (40), 3.052 (40), 2.483 (40)

Chemistry:

	(1)	(2)
SO_3	35.97	36.00
Al_2O_3	12.37	11.46
CaO	25.11	25.22

Cl	6.08	7.97
H_2O	16.10	16.20
$-O = (F, Cl)_2$	4.78	5.39
Total	98.95	100.00

(1) Tolbachik volcano, Kamchatka, Russia; by electron microprobe, average of 11 analyses, F and Cl by wet methods, H_2O calculated from stoichiometry; corresponds to $Ca_{2.00}Al_{1.09}(SO_4)_{2.01}F_{1.94}Cl_{0.77}\cdot 4H_2O$. (2) $Ca_2Al(SO_4)_2F_2Cl\cdot 4H_2O$.

Occurrence: A product of low-temperature hydration of minerals on the fracture walls of volcanic fumaroles.

Association: Gypsum, sellaite, bischofite, hydrophilite, spinel.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Vladimir Ivanovich Vlodavets (1893–1993), volcanologist who founded the Kamchatka volcanological station.

Type Material: Mining Institute, St. Petersburg, Russia, 2078/1.

Vochtenite $(Fe^{2+},Mg)Fe^{3+}(UO_2)_4(PO_4)_4(OH)\cdot 12{-}13H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As crystals, with a squarish outline defined by {001} and {100}, to 1 mm, in subparallel aggregates.

Physical Properties: *Cleavage:* On {010}, distinct. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 3.650 D(calc.) = 3.663 Radioactive.

Optical Properties: Opaque, translucent in thin fragments. *Color:* Brown. *Streak:* Pale brown. *Luster:* Bronzy.
Optical Class: Biaxial (–). *Pleochroism:* Very weak. *Orientation:* $X = b$; $Z \wedge c$ = small.
$\alpha = 1.575(2)$ $\beta = 1.589(2)$ $\gamma = 1.603(2)$ 2V(meas.) = n.d. 2V(calc.) = 89(3)°

Cell Data: *Space Group:* n.d. $a = 12.606$ $b = 19.990$ $c = 9.990$ $\beta = 102.31°$ Z = 3

X-ray Powder Pattern: Wheal Basset, England.
9.998 (100), 3.475 (70), 3.333 (50), 4.892 (45), 2.152 (45), 2.111 (45), 3.087 (40)

	(1)
UO_3	63.07
P_2O_5	15.65
Fe_2O_3	4.04
FeO	3.30
MgO	0.63
H_2O	13.37
Total	[100.06]

(1) Wheal Basset, England; by electron microprobe, at ten points on each of three crystals; Fe^{2+}:Fe^{3+} by Mössbauer spectroscopy, H_2O by TGA, original total given as 100.96%; corresponds to $(Fe^{2+}_{0.82}Mg_{0.28})_{\Sigma=1.10}Fe^{3+}_{0.90}(UO_2)_4(PO_4)_4(OH)_{0.90}\cdot 12.96H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a uranium-bearing Cu–Sn hydrothermal mineral deposit.

Association: Bassetite.

Distribution: From Wheal Basset, Illogan, Cornwall, England.

Name: Honoring Professor Renaud F.C. Vochten (1933–), State University, Antwerp, Belgium, uranium mineralogist, who discovered the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA.

References: (1) Zwaan, P.C., C.E.S. Arps, and E. de Grave (1989) Vochtenite, $(Fe^{2+},Mg)Fe^{3+}[UO_2/PO_4]_4(OH)\cdot 12{-}13H_2O$, a new uranyl phosphate mineral from Wheal Basset, Redruth, Cornwall, England. Mineral. Mag., 53, 473–478. (2) (1990) Amer. Mineral., 75, 1212 (abs. ref. 1).

Voggite $Na_2Zr(PO_4)(CO_3)(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Needlelike pseudohexagonal crystals, elongated along [010], showing {100}, {$\bar{1}$01}, {001}, to 1 mm, in hairlike mats.

Physical Properties: *Cleavage:* {010}, poor. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.70(2) D(calc.) = 2.704 Blue cathodoluminescence under the electron beam.

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge a = 22°$. *Dispersion:* $r \ll v$, strong.
$\alpha = 1.569(1)$ $\beta = 1.594(1)$ $\gamma = 1.622(1)$ 2V(meas.) = 81(5)° 2V(calc.) = 88°

Cell Data: *Space Group:* $I2/m$. $a = 12.261(2)$ $b = 6.561(1)$ $c = 11.757(2)$
$\beta = 116.19(2)°$ Z = 4

X-ray Powder Pattern: Francon quarry, Canada.
10.2 (100), 5.58 (80), 3.89 (65), 4.06 (60), 3.281 (60), 2.546 (40), 2.039 (40)

Chemistry:

	(1)	(2)
P_2O_5	25.9	20.56
CO_2	12.	12.75
ZrO_2	43.3	35.69
Na_2O	7.4	17.95
H_2O	15.	13.05
Total	103.6	100.00

(1) Francon quarry, Canada; by electron microprobe, with severe decomposition; CO_2 and H_2O by TGA. (2) $Na_2Zr(PO_4)(CO_3)(OH)\cdot 2H_2O$ from crystal-structure analysis.

Occurrence: Very rare, in cavities in an altered amygdaloidal basalt dike intruding a zirconium-bearing silicocarbonatite sill in a limestone quarry.

Association: Dawsonite, calcite, quartz.

Distribution: Found in the Francon quarry, Montreal Island, Montreal, Quebec, Canada.

Name: Honoring Adolf Vogg (1931–), Canadian amateur mineralogist who collected the original specimens.

Type Material: Canadian Geological Survey, Ottawa, Canada, NMC 65631.

Voglite $Ca_2Cu(UO_2)(CO_3)_4 \cdot 6H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. As rhombic tabular to scaly crystals, to 0.5 mm, in parallel stacked aggregates and coatings. *Twinning:* Lamellar, with extinction angles up to 30°.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.8 D(calc.) = 3.06 Radioactive.

Optical Properties: Transparent. *Color:* Emerald-green to bright grass-green. *Streak:* Pale green. *Luster:* Pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* X = deep blue to blue-green; Y = deep bluish green to bluish green; Z = pale yellow to yellow. *Orientation:* $X = b$; $Z \wedge c = 33°–36°$. *Dispersion:* $r < v$, very strong. $\alpha = 1.513–1.544$ $\beta = 1.525–1.547$ $\gamma = 1.542–1.564$
2V(meas.) = 60°

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$ (probable). $a = 25.97–26.416$ $b = 23.702–24.50$ $c = 10.655–10.70$ $\beta = 103.63°–104.02°$ Z = 16

X-ray Powder Pattern: Jáchymov, Czech Republic.
12.6 (100), 8.70 (100), 9.65 (80), 7.10 (60), 4.32 (50), 6.13 (40), 4.65 (30)

Chemistry:

	(1)	(2)
CO_2	26.41	23.11
UO_3		37.54
UO_2	37.0	
CuO	8.40	10.44
CaO	14.09	14.72
H_2O	13.9	14.19
Total	99.8	100.00

(1) Jáchymov, Czech Republic; conversion from UO_2 gives UO_3 39.2% and a total of 102.0%; then corresponds to $Ca_{1.83}Cu_{0.77}(UO_2)_{1.00}(CO_3)_4 \cdot 6H_2O$. (2) $Ca_2Cu(UO_2)(CO_3)_4 \cdot 6H_2O$.

Occurrence: A rare oxidation product of uraninite.

Association: Liebigite, cuprosklodowskite, rösslerite, brassite, zellerite, uraninite (Jáchymov, Czech Republic).

Distribution: From the Eliáš mine, Jáchymov (Joachimsthal), Czech Republic. In the USA, at the White Canyon No. 1 mine, Frey Point, San Juan Co., Utah; and from a prospect near the Red Mesa Trading Post, Red Mesa district, Navajo Co., Arizona.

Name: Honors Josef Florian Vogl (1818–1896), Austrian mining officer and mineralogist, who studied the minerals of Jáchymov, Czech Republic and first described this species.

Type Material: n.d.

Volaschioite $Fe_4(SO_4)O_2(OH)_6 \cdot 2H_2O$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As radial clusters of bladed crystals to 0.1 mm, elongated along [010].

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* n.d. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.03

Optical Properties: Transparent. *Color:* Yellowish-orange. *Streak:* Orange. *Luster:* Vitreous to resinous. *Optical Class:* n.d. *n* >1.68 *Pleochroism*: Strong; red [010], yellowish-orange (010).

Cell Data: *Space Group: C2/m*. a = 18.068(4) b = 3.058(1) c = 10.929(2) β = 93.82(3)° Z = 2

X-ray Powder Pattern: Fornovolasco, Apuan Alps, Tuscany, Italy.
8.03 (s), 4.37 (m), 3.989 (m), 3.343 (mw), 2.633 (mw), 3.028 (w), 2.73 (w)

Chemistry:

	(1)	(2)
Fe_2O_3	63.33	65.24
SO_3	14.07	16.36
H_2O	17.18	18.40
Total	94.58	100.00

(1) Fornovolasco, Apuan Alps, Tuscany, Italy; average of 11 electron microprobe analyses, H_2O and OH^- calculated from structure analysis; corresponding to $Fe_{4.16}(SO_4)_{0.92}O_{2.32}(OH)_6 \cdot 2H_2O$.
(2) $Fe_4(SO_4)O_2(OH)_6 \cdot 2H_2O$.

Occurrence: An oxidation product of pyrite in tunnels through a magnetite-pyrite deposit.

Association: Pyrite, fibroferrite, goethite, melanterite, römerite.

Distribution: Cava del Ferro mining complex, Fornovolasco, Apuan Alps, Tuscany, Italy.

Name: Derived from the ancient name for the first known locality, believed to be derived from *forno* (furnace) and *Volaschio* (a locally significant proper noun).

Type Material: Museum of Natural History, University of Pisa, Italy; 19300.

References: (1) Biagioni, C., E. Bonnaccorsi, and P. Orlandi (2011) Volaschioite, $Fe_4(SO_4)O_2(OH)_6 \cdot 2H_2O$, a new mineral species from Fornovolasco, Apuan Alps, Tuscany, Italy. Canadian Mineralogist, 49, 605-614. (2) (2013) Amer. Mineral., 98, 813-814 (abs. ref. 1).

Volborthite $Cu_3V_2O_7(OH)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Typically as rosettelike aggregates of scaly crystals, which may have a hexagonal or triangular outline, to 5 mm.

Physical Properties: *Cleavage:* One, perfect. Hardness = 3.5 D(meas.) = 3.5–3.8 D(calc.) = 3.52

Optical Properties: Semitransparent. *Color:* Dark olive-green, green, yellowish green; green to yellowish green in transmitted light. *Luster:* Vitreous, oily, resinous, waxy, pearly on the cleavage.
Optical Class: Biaxial (–) or biaxial (+). *Pleochroism:* Faint. *Dispersion:* $r < v, r > v$, inclined. $\alpha = 1.820$–2.01 $\beta = 1.835$–2.05 $\gamma = 1.92$–2.07 2V(meas.) = 63°–83°

Cell Data: *Space Group:* $C2/m$. $a = 10.610(2)$ $b = 5.866(1)$ $c = 7.208(1)$ $\beta = 95.04(2)°$ Z = 2

X-ray Powder Pattern: Monument No. 1 mine, Arizona, USA.

(1) Scrava mine, Italy; by electron microprobe; V_2O_3 assumed for charge balance, H_2O by difference; corresponds to $Cu_{2.89}V^{5+}_{1.90}V^{3+}_{0.11}Si_{0.11}O_7(OH)_2 \cdot 2H_2O$. (2) $Cu_3V_2O_7(OH)_2 \cdot 2H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of vanadium-bearing hydrothermal mineral deposits.

Association: Brochantite, malachite, atacamite, tangeite, chrysocolla, barite, gypsum.

Distribution: In Russia, originally from an unknown locality; later identified at the Sofronovskii copper mine, near Perm, and at Syssersk and Nizhni Tagil, Ural Mountains. In Uzbekistan, in the Hodzha-Akhmet quarry, near Uch-Kuduk, Kyzylkum desert. From the Uzbekistana district, Fergana Valley, Alai Range, Kyrgyzstan. In the Scrava mine, Val Graveglia, Liguria, Italy. At the Blaby mine, Glen Parva, Leistershire, England. From Ronneburg, Thuringia, Germany. In the USA, at the Tennessee Queen mine, Richardson, near Thompson, Grand Co., and elsewhere in Utah; in the Radium No. 5 mine, San Juan No. 3 mine, and Cougar mine, Slick Rock district, San Miguel Co., and probably elsewhere in Colorado; from the Gold Quarry mine, near Carlin, Maggie Creek district, and in the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., Nevada; at the Monument No. 1 mine, Monument Valley, Navajo Co., Arizona; in the Green Monster mine, Inyo Co., California. At Menzies Bay, Vancouver Island, British Columbia, Canada. From the Luiswishi copper mine, Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). At Uris-Bobos, Namibia. There are additional minor localities.

Name: To honor Aleksandr Fedorovich von Volborth (1800–1876), Russian paleontologist, who first noticed the mineral.

Volkonskoite $Ca_{0.3}(Cr^{3+}, Mg, Fe^{3+})_2(Si, Al)_4O_{10}(OH)_2 \cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, presumably. *Point Group:* n.d. Fine scaly to fibrous; massive.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1–2 D(meas.) = 2.11–2.36 D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* Bright to dark green, emerald-green; in transmitted light, emerald-green. *Luster:* Dull.
Optical Class: Biaxial (–). $\alpha = 1.551$–1.560 $\beta = 1.569$ $\gamma = 1.564$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

(1) Okhansk region, Russia. (2) Mt. Efimyatskaya, Russia; by XRF and TGA, Fe^{2+}:Fe^{3+} by Mössbauer spectroscopy, original total given as 99.73% with additional "carbonate carbon;" corresponds to $(Ca_{0.11}Mg_{0.11}Fe^{2+}_{0.03}K_{0.02})_{\Sigma=0.27}(Cr_{1.18}Mg_{0.78}Fe^{3+}_{0.29}Ca_{0.02})_{\Sigma=2.27}(Si_{3.50}Al_{0.51})_{\Sigma=4.01}O_{10}(OH)_2 \cdot 3.64H_2O$. (3) Okhansk region, Russia; do.; corresponds to $(Ca_{0.25}Mg_{0.05}K_{0.03}Fe^{2+}_{0.01}Mn_{0.01})_{\Sigma=0.35}(Cr_{1.07}Mg_{0.75}Fe^{3+}_{0.35})_{\Sigma=2.17}(Si_{3.59}Al_{0.43})_{\Sigma=4.02}O_{10}(OH)_2 \cdot 4.22H_2O$.

Mineral Group: Smectite group.

Occurrence: An epigenetic mineral in sandstones, conglomerates, and red beds, commonly filling voids from the decomposition of organic matter (Okhansk region, Russia); a weathering product of serpentinite (Gotse Delchev, Bulgaria).

Association: Chlorite, tridymite.

Distribution: On Mt. Efimyatskaya and elsewhere in the Okhansk region, middle Kama River area, Perm basin, Ural Mountains, Russia. In the Belgorod-Dnestrovskii (Akkerman) area, Ukraine. In Bulgaria, near Gotse Delchev (Nevrokop), Pirin Mountains.

Name: For Prince Petr Mikhailovich Volkonskii (1776–1852), Minister of the Imperial Court, Russia, patron of the natural sciences.

Type Material: National Museum of Natural History, Washington, D.C., USA, R4820, 16308.

(2) Louann Salt Formation, Alabama, USA; H_2O by difference; corresponds to $K_{0.66}Ca_{4.29}B_{21.39}O_{46.03}H_{19.64}Cl_{0.97}$. (3) Denison-Potacan mine, Canada; by electron microprobe, B_2O_3 by wet methods, H_2O by TGA-EGA; corresponds to $K_{1.01}(Ca_{3.91}Sr_{0.05})_{\Sigma=3.96}B_{21.77}O_{46.01}H_{18.77}Cl_{0.99}$. (4) $KCa_4B_{22}O_{32}(OH)_{10}Cl \cdot 4H_2O$.

Occurrence: Uncommon in water-insoluble residues from salt domes and potash deposits.

Association: Halite, sylvite, hilgardite, boracite, anhydrite (Inder deposit, Kazakhstan).

Distribution: From the Inder borate deposit, Kazakhstan. In the Nepskoye potash deposit, eastern Siberia, Russia. From the Louann Salt Formation, Clarke Co., Alabama, USA. In the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada.

Name: To honor A.I. Volkovskaya, petrographer, who first noted the mineral.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; Royal Ontario Museum, Toronto, Canada, M44196.

Voltaite $K_2Fe_5^{2+}(Fe^{3+}, Al)_4(SO_4)_{12}\cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals are commonly octahedral, modified by the cube, dodecahedron, and rarely other minor forms, to 2 cm; granular, massive, and in efflorescences.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3 D(meas.) = 2.645 (synthetic). D(calc.) = 2.663 Soluble in H_2O, yielding an acid solution and citron-yellow residue.

Optical Properties: Opaque, translucent in thin splinters. *Color:* Greenish black, black, dark oil-green; pale green to oil-green in transmitted light. *Streak:* Grayish green. *Luster:* Resinous. *Optical Class:* Isotropic, but typically sectored with anomalously biaxial parts. n = 1.593–1.608

Cell Data: *Space Group:* $Fd3c$. $a = 27.254(8)$ Z = 16

X-ray Powder Pattern: Konomai mine, Hokkaido, Japan.

(1) Smolník, Czech Republic; corresponding to $(K_{2.06}Na_{0.33})_{\Sigma=2.39}(Fe^{2+}_{4.02}Zn_{0.43}Mg_{0.24}Cu_{0.14}Ni_{0.02})_{\Sigma=4.85}(Fe^{3+}_{3.46}Al_{0.64})_{\Sigma=4.10}(SO_4)_{11.98}\cdot 17.87H_2O$. (2) $K_2Fe_5^{2+}Fe_4^{3+}(SO_4)_{12}\cdot 18H_2O$.

Occurrence: In volcanic fumaroles, solfataras, and mud volcanos; an alteration product in mineral deposits high in pyrite, especially in arid climates, where it may also be a post-mining product.

Association: Halotrichite, pickeringite, alunogen, metavoltine, römerite, hexahydrite, coquimbite, copiapite, rhomboclase, krausite, jarosite, goldichite, botryogen, melanterite.

Distribution: From the Solfatara di Pozzuoli, Campi Flegrei, near Naples, and on Vesuvius, Campania, Italy. Large crystals in the Rio Tinto mine, Huelva Province, Spain. In Slovakia, at Smolník (Szomolnok), 16 km northeast of Rožňava, Baňská Štiavnica (Schemnitz), and Kremnica (Kremnitz), Czech Republic. At the Rammelsberg mine, near Goslar, Harz Mountains, Germany. In the Rozdol deposit, Ukraine. From volcanoes on the Kamchatka Peninsula, Russia. At Saghand, Yazd district, Iran. In Chile, at Chuquicamata, Quetena, west of Calama, and Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta. In Argentina, at the Jujuy and Capillitas mines, Catamarca Province, and in the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province. In the USA, large crystals from Bisbee, Cochise Co., at Jerome, Yavapai Co., and in the Magma mine, Superior, Gila Co.; in California, in the Redington mercury mine, Knoxville, Napa Co.; at the Geysers, Sonoma Co.; and from the Sulfur Hole prospect, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co.; at the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. There are many other minor localities.

Name: To honor Alessandro Giuseppe Antonio Anastasio Volta (1745–1827), Italian physicist, early experimenter with electricity.

(1) Burguillos, Spain; Al_2O_3, MnO, MgO, CoO by electron microprobe; corresponds to $(Fe^{2+}_{2.03}Mg_{0.02}Mn_{0.01})_{\Sigma=2.06}(Fe^{3+}_{0.99}Al_{0.01})_{\Sigma=1.00}B_{0.96}O_5$. (2) $Fe_2^{2+}Fe^{3+}BO_5$.

Polymorphism & Series: Forms a series with ludwigite.

Mineral Group: Ludwigite group.

Occurrence: Uncommon in boron-rich skarns.

Association: Magnetite, pyroxene, pyrrhotite.

Distribution: In the USA, from the Old City quarry, Riverside, Riverside Co., California; at the Jayville magnetite mine, Stevens Co., New York; on the northwest flank of Brooks Mountain, Seward Peninsula, Alaska. In Japan, in the Kamaishi mine, Iwate Prefecture, and at the Sengendera mine, Miyazaki Prefecture. From the Dading tin-iron deposits, Guizhou Province, China. In Italy, from near Cura di Vetralla, and at Montalto di Castro, Lazio; on Vesuvius, Campania; from Vulcano, Lipari Islands. At the St. Christophe mine, Breitenbrunn, Saxony, Germany. From the Monchi mine, Burguillos del Cerro, Badajoz Province, Spain.

Name: Honors Magnus Vonsen (1879–1954), amateur mineralogist and mineral collector of Petaluma, California, USA, who discovered the mineral.

Type Material: n.d.

Vuagnatite $CaAlSiO_4(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222. Highly modified prismatic crystals, to 3 mm, elongated along [001] or [100], rarely as disphenoidal euhedra.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6
D(meas.) = 3.42(2) D(calc.) = 3.41

Optical Properties: Semitransparent. *Color:* White; colorless in thin section.
Luster: Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless or yellowish brown; $Y = Z$ = colorless. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, strong to very strong. *Absorption:* $X \gg Y = Z$. $\alpha = 1.701(2)$ $\beta = 1.724(2)$ $\gamma = 1.727(2)$ 2V(meas.) = 44(1)°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 7.0538(4)$ $b = 8.5410(4)$ $c = 5.6839(3)$ Z = 4

X-ray Powder Pattern: Red Mountain, California, USA.
2.518 (100), 2.997 (95), 2.640 (85), 2.215 (85), 2.453 (70), 2.142 (65), 2.395 (60)

Chemistry:

	(1)	(2)
SiO_2	33.59	34.11
Al_2O_3	27.76	28.94
CaO	31.52	31.84
H_2O		5.11
Total	92.87	100.00

(1) Taurus Mountains, Turkey; by electron microprobe, average of 25 partial analyses.
(2) $CaAlSiO_4(OH)$; H_2O inferred from structure determination.

Occurrence: In rodingitized dikes of pegmatitic anorthositic gabbro crosscutting harzburgite-serpentines in an ophiolite (Taurus Mountains, Turkey); in rodingitized metagabbro dikes in serpentinized peridotite (Red Mountain, California, USA); all occurrences suggest formation under conditions of relatively low temperature and high pressure.

Association: Chantalite, prehnite, hydrogrossular, vesuvianite, chlorite (Taurus Mountains, Turkey); hydrogrossular, vesuvianite, chlorite, copper, chalcocite (Red Mountain, California, USA).

Distribution: From Böğürtlen Tepe Hill, 10 km northeast of Doğanbaba, Taurus Mountains, Burdur Province, Turkey. At Red Mountain, Mendocino Co., California, USA. In the Livingstone Mountains, Southland, New Zealand. From Shiraki, Toba, Mie Prefecture, Japan. At the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Professor Mark Bernard Vuagnat (1922–), student of ophiolites, University of Geneva, Geneva, Switzerland.

Type Material: Natural History Museum, Geneva, 435/1; University of Geneva, Geneva, Switzerland; National Museum of Natural History, Washington, D.C., USA, 146560.

Vulcanite CuTe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Minute (0.1 to 1.1 mm) prismatic or bladelike grains, massively incrusting and cementing rock fragments. *Twinning:* Very thin twin lamellae at approximately 45° to the prominent cleavage in some grains.

Physical Properties: *Cleavage:* One direction parallel to the length of the lath-shaped grains; another direction, less prominent, perpendicular to the first. *Tenacity:* Sectile. Hardness = 1–2 VHN = 34–40 (50 g load). D(meas.) = n.d. D(calc.) = 7.1

Optical Properties: Opaque. *Color:* Pale bronze to yellow-bronze. *Luster:* Metallic. *Pleochroism:* Very strong, bright yellow to blue-gray. *Anisotropism:* Very strong, brilliant yellow-white, grayish yellow-white, yellow-orange to gray.

R_1–R_2: (400) 25.6–30.7, (420) 24.4–30.0, (440) 23.0–30.5, (460) 21.3–37.0, (480) 19.7–47.9, (500) 18.1–56.8, (520) 16.6–63.4, (540) 15.2–67.8, (560) 13.8–70.8, (580) 12.7–73.1, (600) 11.8–74.9, (620) 11.3–76.4, (640) 11.2–77.4, (660) 11.6–78.2, (680) 12.9–78.9, (700) 15.0–79.3

Cell Data: *Space Group: Pmnm.* $a = 4.09$ $b = 6.95$ $c = 3.15$ Z = 2

X-ray Powder Pattern: Good Hope mine, Colorado, USA.

Cr_2O_3	19.5	4.7
FeO	5.7	7.6
MnO	26.4	22.0
ZnO	0.8	[2.4]
MgO	0.1	
Total	100.0	[100.0]

(1) Sätra mine, Sweden; by electron microprobe, total Fe as FeO; corresponds to $(Mn_{0.83}Fe_{0.18}Zn_{0.02}Mg_{0.01})_{\Sigma=1.04}(V_{1.41}Cr_{0.57})_{\Sigma=1.98}O_4$. (2) Outokumpu, Finland; by electron microprobe, total Fe as FeO, ZnO by difference; corresponds to $(Mn_{0.69}Fe_{0.23}Zn_{0.06})_{\Sigma=0.98}(V_{1.87}Cr_{0.14})_{\Sigma=2.01}O_4$.

Polymorphism & Series: Forms a series with manganochromite.

Mineral Group: Spinel group.

Occurrence: In a metamorphosed iron sulfide deposit associated with submarine felsic volcanism (Sätra mine, Sweden); in quartzite schists (Ol'khon Gate Straits, Lake Baikal, Russia).

Association: Pyrrhotite, rutile, pyrophanite, manganoan sphalerite, chalcopyrite, alabandite (Sätra mine, Sweden); rutile, eskolaite, karelianite, schreyerite, olkhonskite (Ol'khon Gate Straits, Lake Baikal, Russia).

Distribution: In the Sätra mine, Doverstorp, Bergslagen metallic province, Sweden. From Outokumpu, Finland. Found 4.5 km south of the Ol'khon Gate Strait, on the western shore of Lake Baikal, Siberia, Russia.

Name: To honor Yrjö Vuorelainen (1922–), Finnish exploration geologist, formerly with the Outokumpu Company, Finland.

Type Material: Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands, 153A4.

References: (1) Zakrzewski, M.A., E.A.J. Burke, and W.J. Lustenhouwer (1982) Vuorelainenite, a new spinel, and associated minerals from the Sätra (Doverstorp) pyrite deposit, central Sweden. Can. Mineral., 20, 281–290. (2) (1983) Amer. Mineral., 68, 472–473 (abs. ref. 1).

Vurroite $Pb_{20}Sn_2(Bi,As)_{22}S_{54}Cl_6$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As fibrous crystals, to 0.4 mm., in divergent fibrous aggregates. *Twinning:* Twinning on (001).

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: n.d.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.15

Optical Properties: Opaque. *Color*: Silver-gray; white in reflected light. *Streak*: n.d.
Luster: Metallic.
Optical Class: Biaxial (+). Anisotropism: Weak.
R: (470) 34.25, (546) 32.95, (589) 32.60, (650) 31.05

Cell Data: *Space Group: C2/c.* $a = 8.371(2)$ $b = 45.502(9)$ $c = 27.273(6)$ $\beta = 98.83(3)°$ Z = 4
Frequent twins and disordered domains in the structure were observed.

X-ray Powder Pattern: La Fossa crater, Vulcano Island, Italy.
2.07 (100), 3.34 (80), 2.85 (80), 2.69 (80), 2.10 (70), 3.17 (60), 2.17 (60)

Chemistry:

Br	0.24	.
Total	99.81	100.00

(1) La Fossa crater, Vulcano Island, Italy; average of 12 electron microprobe analyses, corresponding to $Pb_{18.95}Sn_{1.30}(Bi_{12.99}As_{10.73}Tl_{0.03})_{\Sigma=23.75}(S_{54.71}Se_{0.22}Cl_{5.00}Br_{0.29})_{\Sigma=60.22}$.
(2) $Pb_{20}Sn_2(Bi,As)_{22}S_{54}Cl_6$.

Occurrence: As encrustations around fumaroles (400-600°C) in an active volcanic crater.

Association: Bismuthinite, lillianite, kirkiite, heyrovskýite, galena.

Distribution: Fumarole FF (and others), La Fossa crater, Vulcano Island, Italy.

Name: Honors Filippo Vurro, (b. 1940), Professor of mineralogy at the University of Bari, Italy, and specialist in the mineralogy and geochemistry of modern volcanic deposits.

Type Material: Mineralogical museum, University of Bari, Italy, (6/nm).

Vyacheslavite $U^{4+}(PO_4)(OH)\cdot 2.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Crystals are lamellar, to 8 μm, in spherulitic to microcrystalline aggregates in veinlets.

Physical Properties: *Cleavage:* On {010}. Hardness = n.d. D(meas.) = 4.9(3) D(calc.) = 5.02 Radioactive.

Optical Properties: Semitransparent. *Color:* Green to dark green. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; in shades of green. *Orientation:* Positive elongation. $\alpha = 1.700$ $\beta = 1.726$–1.729 $\gamma = 1.729$–1.731 2V(meas.) = Small.

Cell Data: *Space Group:* $Cmcm$, $Cmc2_1$, or $C2cm$. a = 6.96(1) $b = 9.10(1)$ $c = 12.38(1)$ Z = 6

X-ray Powder Pattern: Kyzylkum region, Uzbekistan. 6.19 (10), 2.69 (7), 4.56 (6), 4.13 (6), 3.68 (5), 2.71 (5), 3.04 (3)

Chemistry:

	(1)
P_2O_5	17.0
UO_2	68.69
CaO	0.53
H_2O	[13.78]
Total	[100.00]

(1) Kyzylkum region, Uzbekistan; by electron microprobe, average of two analyses, H_2O by difference; corresponds to $(U^{4+}_{1.06}Ca_{0.04})_{\Sigma=1.10}(PO_4)_{0.96}(OH)_{1.32}\cdot 2.5H_2O$.

Occurrence: A rare secondary mineral in uranium deposits.

Association: Uraninite, ningyoite, sphalerite, covellite, chalcocite, pyrite, quartz.

Distribution: From the Dzhantuar and Rudnoye uranium deposits, Auminzatau Mountains, central Kyzylkum region, Uzbekistan.

Name: To honor Vyacheslav Gavrilovich Melkov (1911–1991), Russian mineralogist specializing in uranium minerals, Russian Research Institute of Mineral Resources, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1692/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82773.

Total	100.0	99.8	100.5

(1) Noril'sk region, Russia; by electron microprobe. (2–3) Stillwater complex, Montana, USA; by electron microprobe.

Polymorphism & Series: Forms a series with braggite.

Occurrence: In andesine diabases (Noril'sk region, Russia) and in ultramafic layered intrusives elsewhere. As disseminations that probably are crystallized products, at magmatic temperatures, of a residual immiscible sulfide melt.

Association: Chalcopyrite, millerite, nickelian pyrite, linnaeite, cooperite (Noril'sk region, Russia); pentlandite, pyrrhotite, chalcopyrite, cubanite, nickelian mackinawite, gold, braggite, cooperite, moncheite, isoferroplatinum, kotulskite, keithconnite, palladian tulameenite (Stillwater complex, Montana, USA); hongshiite, cooperite, sperrylite, isomertieite, magnetite, bornite, polydymite, diopside, actinolite, epidote (Yen deposit, China).

Distribution: One of most common and economically important platinum group minerals. From the Noril'sk region, western Siberia, Russia. In the Upper and Banded portions of the Stillwater complex, Montana; from near Moapa, Clark Co., Nevada; and from the Yuba River, Nevada Co., California, USA. At the Lac des Iles complex, Ontario, Canada. In the Yen deposit (a code name), China. From the Konttijärvi and Siikakämä intrusions, and in the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland.

Name: For Nikolai Konstaninovich Vysotskii (1864–1932), Soviet geologist, who first found platinum at Noril'sk, Russia.

Type Material: Mining Institute, St. Petersburg, 93a/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64853.

(1) Mt. Ploskaya, Russia; by electron microprobe, H_2O by difference, original total given as 100.10%; corresponds to $(Y_{1.78}Yb_{1.31}RE_{0.98})_{\Sigma=4.07}Al_{3.03}Si_{4.94}O_{18}(OH)_{4.96}$. (2) Do.; corresponds to $(Y_{3.08}Yb_{0.36}RE_{0.36})_{\Sigma=3.80}Al_{2.83}Si_{5.28}O_{18}(OH)_{5.18}$. (3) $Y_4Al_2AlSi_5O_{18}(OH)_5$.

Occurrence: Two generations of crystals occur in fluorite in "amazonite" pegmatites.

Association: Fluorite, gadolinite, xenotime, bastnäsite (Mt. Ploskaya, Russia).

Distribution: From Mt. Ploskaya, Keivy massif, Kola Peninsula, Russia. In the Evans Lou pegmatite, Wakefield, Quebec, Canada.

Name: For Mt. Vyuntspakhk, 5 km southeast of Mt. Ploskaya, Kola Peninsula, Russia, and its *yttrium* content.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5767; Mining Institute, St. Petersburg, 1341/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82544.

(1) Malmkärra iron deposit, Västmanland county, south-central Sweden; average of 3 electron microprobe analyses, H_2O estimated as 2OH per formula unit, Fe^{2+}/Fe^{3+} by Mössbauer spectroscopy, OH^- confirmed by IR spectroscopy; corresponding to $(Ce_{1.62}La_{0.93}Nd_{0.42}Pr_{0.14}Sm_{0.03}Y_{0.02}Gd_{0.01})_{\Sigma=3.17}$ $Ca_{0.92}Al_{1.88}(Mg_{1.52}\ Fe^{3+}_{0.37}Fe^{2+}_{0.18})_{\Sigma=2.07}(Si_{4.94}P_{0.01})_{\Sigma=4.95}O_{0.19}(F_{0.62}O_{0.38})_{\Sigma=1.00}(OH)_2$.

Polymorphism and Series: Forms a solid solution series with an Fe analog.

Occurrence: In disseminated magnetite-amphibole calc-silicate replacements in marble.

Association: Fluorbritholite-(Ce), tremolite, dolomite, magnetite, and minor arsenopyrite, bastnäsite-(Ce), bismuthinite, cerite-(Ce), chalcopyrite, dollaseite-(Ce), ferriallanite, gadolinite-(Ce), molybdenite, pyrite, talc, zircon.

Distribution: From the Malmkärra iron deposit (also the Bastnäs and Östanmossa deposits), Norberg district, Västmanland county, Bergslagen mining region, south-central Sweden.

Name: For the county in Norway in which the first specimens were collected.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden (01+0081).

(1) Wolgidee Hills, Western Australia; by electron microprobe, corresponding to $K_{2.04}(Zr_{0.93}Ti_{0.08})_{\Sigma=1.01}Si_{2.98}O_9$. (2) Khibiny massif, Russia.

Occurrence: In veins in leucite lamproites (Wolgidee Hills, Western Australia); in nepheline-feldspathoid and natrolite veins in a differentiated alkalic massif (Khibiny massif, Russia).

Association: Leucite, phlogopite, olivine, titanian potassian fluor-richterite, perovskite, apatite, calcite, barite, "chalcedony," zeolites (West Kimberley area, Western Australia); astrophyllite, biotite, aegirine, titanite, sodalite, barite, apatite, fluorite, zeolites (Khibiny massif, Russia).

Distribution: From the Wolgidee Hills and in the Argyle diamond mine, West Kimberley area, Western Australia. In the Khibiny and Kovdor massifs, Kola Peninsula, and the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: For Dr. Arthur Wade, Australian geologist who first collected the mineral.

Type Material: University of Western Australia, Perth, Australia, 18760.

Wadsleyite β–$(Mg, Fe^{2+})_2SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ (probable).
As microcrystalline aggregates with grain sizes to 5.0 μm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.84

Optical Properties: Transparent. *Color:* Pale fawn [light grayish brown].
Optical Class: Biaxial. $n = 1.76$ 2V(meas.) = n.d.

Cell Data: *Space Group:* *Imma* (probable). $a = 5.70(2)$ $b = 11.71(7)$ $c = 8.24(4)$
Z = 8

X-ray Powder Pattern: Peace River meteorite.
2.452 (100), 2.038 (80), 1.442 (80), 2.886 (50), 2.691 (40), 2.637 (30), 1.567 (30)

Chemistry:

	(1)
SiO_2	38.70
Cr_2O_3	0.01
FeO	22.37
MnO	0.43
NiO	0.11
MgO	38.21
CaO	0.07
ZnO	0.10
Total	100.00

(1) Peace River meteorite; by electron microprobe, corresponding to $(Mg_{1.48}Fe_{0.49}Mn_{0.01})_{\Sigma=1.98}Si_{1.01}O_4$.

Polymorphism & Series: Trimorphous with forsterite and ringwoodite.

Occurrence: In fragments within a vein in a "hypersthene"-olivine chondritic meteorite, believed to have formed during an extraterrestrial shock event.

Association: Majorite, ringwoodite, olivine, orthopyroxene, plagioclase, Fe–Ni alloys, troilite.

Distribution: In the Peace River meteorite.

Name: For Dr. A.D. Wadsley.

Type Material: Department of Geology, University of Alberta, Edmonton, Canada.

Wagnerite $(Mg,Fe^{2+})_2(PO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically in prismatic coarse anhedral crystals, elongated and striated along [001], complex vincinal form development, with more than thirty forms noted, to 20 cm; granular, massive.

Physical Properties: *Cleavage:* On {100}, {120}, imperfect; on {001}, interrupted. *Fracture:* Uneven, subconchoidal, splintery. Hardness = 5–5.5 D(meas.) = 3.15 D(calc.) = 3.15

Optical Properties: Translucent to nearly opaque. *Color:* Wine-yellow, orange, yellowish brown, pale gray, white, flesh-red, pale green; colorless in transmitted light. *Luster:* Vitreous to slightly resinous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -20°$ to $-21.5°$. *Dispersion:* $r > v$, weak, inclined. $\alpha = 1.568–1.588$ $\beta = 1.572–1.589$ $\gamma = 1.582–1.598$ 2V(meas.) = 25°–35°

Cell Data: *Space Group:* $P2_1/a$. $a = 11.945–11.985$ $b = 12.679–12.738$ $c = 9.644–9.70$ $\beta = 108.18°–108.36°$ Z = 16

X-ray Powder Pattern: Star Lake, Canada; close to magniotriplite.
2.985 (100), 3.297 (65), 3.123 (63), 2.854 (59), 2.758 (25), 2.710 (22), 1.584 (15)

Chemistry:

	(1)	(2)	(3)

Total	100.10	99.68	100.00

(1) Werfen, Austria; corresponds to $(Mg_{1.96}Fe_{0.02}Mn_{0.02})_{\Sigma=2.00}(PO_4)_{1.00}F_{0.99}$. (2) Miregn, Switzerland; by electron microprobe, total Fe as FeO, $(OH)^{1-}$ from IR and stoichiometry; corresponds to $(Mg_{1.82}Fe_{0.14}Mn_{0.02})_{\Sigma=1.98}(PO_4)_{1.01}[F_{0.72}(OH)_{0.28}]_{\Sigma=1.00}$. (3) $Mg_2(PO_4)F$.

Occurrence: A rare accessory mineral in metamorphic rocks of moderate to high grade; uncommon in pegmatites.

Association: Lazulite, ferroan magnesite, chlorite (Höllgraben, Austria); corundum, sillimanite, plagioclase, biotite, monazite-(Ce), apatite, andalusite, tourmaline (Santa Fe Mountain, Colorado, USA); surinamite, musgravite, garnet, sapphirine, chrysoberyl, cordierite (Casey Bay, Antarctica).

Distribution: In Austria, in Salzburg, from Höllgraben, Färbergraben, Radelgraben, and Schladming-graben, near Werfen, and Bischofshofen, and from Webing, near Abtenau. In Germany, in the Silberberg mine, Bodenmais, Bavaria; on the Nickenicher Sattel and Bellerberg volcanoes, Eifel district; and from the Zechstein salt deposit, Hannover, Lower Saxony. At Miregn, Val d'Ambra, Tessin, Switzerland. From Skřiářov, near Velká Bíteš, and Dolní Bory, near Velké Meziříčí, Czech Republic. Large crystals from Porsgrunn and Havredal, Bamble, Norway. At Hålsjöberget, Värmland, Sweden. In the Kyakhta sillimanite deposit, Buryatia. On Santa Fe Mountain, near Idaho Springs, Clear Creek Co., Colorado; in the Dome Rock Mountains, Yuma Co., Arizona, USA. From the Star Lake area, near Sherridon, Manitoba, Canada. At Bimbowrie, near Olary, South Australia. From Casey Bay, Enderby Land, Antarctica. Additional localities are known, many from single specimens.

Name: Honoring F.M. von Wagner (1768–1851), mining official in Munich, Germany.

Wairakite $CaAl_2Si_4O_{12}\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudocubic. *Point Group:* $2/m$. Subhedral trapezohedral crystals, to 1.5 cm; also as incrustations. *Twinning:* Lamellar on {110}, common.

Physical Properties: *Cleavage:* Two sets of possible partings intersecting at 90°. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.26 D(calc.) = 2.272

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in thin section. *Luster:* Vitreous to nearly dull.
Optical Class: Biaxial. *Orientation:* $X \simeq b$; $Y \simeq a$; $Z \simeq c$. *Dispersion:* $r > v$, weak.
$\alpha = 1.498(1)$ $\beta =$ n.d. $\gamma = 1.502(1)$ 2V(meas.) = 70°–105°

Cell Data: *Space Group:* $I2/a$. $a = 13.692(3)$ $b = 13.643(3)$ $c = 13.560(3)$
$\beta = 90.5(1)°$ Z = 8

X-ray Powder Pattern: Wairakei, New Zealand.
3.39 (10), 5.57 (8), 3.42 (6), 2.909 (5), 6.85 (4), 4.84 (4), 2.680 (4)

(1) Wairakei, New Zealand. (2) Seigoshi mine, Japan; by AA, gravimetry, and TGA.
(3) $CaAl_2Si_4O_{12}\cdot 2H_2O$.

Mineral Group: Zeolite group.

Occurrence: In pores and cavities in rocks in geothermal areas, deposited from hydrothermal fluids; may replace feldspar. In tuffaceous sandstones and breccias, vitric and welded tuffs, and in clay.

Association: Andesine, epidote, clinozoisite, prehnite, calcite, aragonite, quartz.

Distribution: Some of the known localities follow. In New Zealand, on North Island, at Wairakei, about six km north-northeast of Lake Taupo, and in the Tui mine, Te Aroha, Auckland. In the USA, from The Geysers, Sonoma Co., and near Rosamond, Kern Co., California; in Yellowstone National Park, Wyoming; and Mt. Rainier National Park, Pierce Co., Washington. On St. Thomas and St. Croix, American Virgin Islands. In the Buttle Lake area, Vancouver Island, British Columbia, Canada. In Japan, in the Seikoshi mine, Toi, and at Kawazu, Shizuoka Prefecture; from Koriyama, Fukushima Prefecture; Onikobe, Miyagi Prefecture; the Yugami district, Fukui Prefecture; Hikihara, Hyogo Prefecture, and at a number of other localities.

Name: For the first-noted locality at Wairakei, New Zealand.

Type Material: Geological Survey of New Zealand, Lower Hutt, New Zealand, P13871; National Museum of Natural History, Washington, D.C., USA, 137192.

Wairauite CoFe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* n.d. As euhedral grains up to 7 x 4 μm in diameter, but typically below 2 μm, many showing the cube and octahedron as common forms.

Physical Properties: Hardness = 4.5 VHN = 255 D(meas.) = n.d. D(calc.) = 8.32
Highly magnetic.

Optical Properties: Opaque. *Color:* In polished section, white. *Luster:* Metallic.
R: n.d.

Cell Data: *Space Group:* n.d. $a = 2.86$ $Z = [1]$

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)	(3)
Co	48.8	50.2	51.34
Fe	49.8	49.7	48.66
Ni	0.5	0.4	
Total	99.1	100.3	100.00

(1) Wairau Valley, New Zealand; by electron microprobe. (2) Muskox intrusion, Canada; by electron microprobe. (3) CoFe.

Occurrence: In a dominantly lizardite serpentine at the western contact of an ultramafic intrusion; thought to have formed under low-sulfur reducing conditions during the serpentinization process (Wairau Valley, New Zealand).

Association: Chromite, magnetite, awaruite, copper (Wairau Valley, New Zealand).

Distribution: From the Red Hills, Wairau Valley, Marlborough district, South Island, New Zealand. In the Muskox intrusion, Northwest Territories, Canada.

Name: For the Wairau Valley locality in New Zealand.

Type Material: Geological Survey of New Zealand, Lower Hutt, New Zealand, P25574; Cambridge University, Cambridge, England; National Museum of Natural History, Washington, D.C., USA, 137192.

Wakabayashilite $(As, Sb)_{11}S_{18}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* 2 or $2/m$. As fibers elongated ‖ [010], up to 2 cm long, or as prisms.

Physical Properties: *Cleavage:* {100}, {010}, {$10\overline{1}$}, perfect. *Tenacity:* Flexible. Hardness = ∼1.5 VHN = n.d. D(meas.) = 3.96 D(calc.) = 4.06

Optical Properties: Translucent. *Color:* Golden to lemon-yellow, with golden yellow internal reflections. *Streak:* Orange-yellow. *Luster:* Silky (for fibrous aggregates) to resinous. *Anisotropism:* Weak. *Pleochroism:* Strong.

R: (400) 28.4, (420) 27.8, (440) 27.2, (460) 26.0, (480) 24.5, (500) 23.3, (520) 22.5, (540) 22.0, (560) 21.8, (580) 21.6, (600) 21.6, (620) 21.5, (640) 21.4, (660) 21.3, (680) 21.2, (700) 21.2

Cell Data: *Space Group:* $P2_1$ or $P2_1/m$; $P6_3/mmc$ (pseudocell). $a = 29.128$ $b = 6.480$ $c = 29.128$ $\beta = 120.0°$ Z = [8]

X-ray Powder Pattern: White Caps mine, Nevada, USA.
6.28 (100), 3.488 (80), 4.78 (70), 3.239 (40), 3.078 (40), 2.423 (40), 1.590 (40)

S	39.0	39.5
Total	99.6	99.7

(1–2) White Caps mine, Nevada, USA; by electron microprobe.

Occurrence: As fibers in druses of quartz or embedded in calcite.

Association: Realgar, orpiment, stibnite, pyrite (Nishinomaki mine, Japan); realgar, orpiment, calcite (White Caps mine, Nevada, USA); chabournéite, pierrotite, parapierrotite, stibnite, pyrite, sphalerite, twinnite, zinkenite, madocite, andorite, smithite, laffittite, routhierite, aktashite, realgar, orpiment (Jas Roux, France).

Distribution: In the Nishinomaki mine, Gumma Prefecture, Japan. From the White Caps and Black Mammoth mines, Manhattan district, Nye Co., and in the Getchell mine, Potosi district, Humboldt Co., Nevada, USA. At the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France. In the Gal-Khaya deposit, Sakha, and from the Lukhumi arsenic deposit, central Caucasus Mountains, Russia. At Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan. From the Shuiluo arsenic deposit, Zhuang district, Guangxi Autonomous Region, China.

Name: For Yaichiro Wakabayashi (1874–1943), mineralogist for the Mitsubishi Mining Company, Japan.

Type Material: National Science Museum, Tokyo, Japan, MA5635; National Museum of Natural History, Washington, D.C., USA, C252, 98012, 94600.

Wakefieldite-(Ce) $(Ce, La, Nd, Pb)VO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals, to 4 mm, pyramidal {101}, or prismatic, with {100}, {001}, {110}, {111}.

Physical Properties: *Cleavage:* On {100}, good. *Tenacity:* Very brittle. Hardness = 4.5–5 VHN = 440 (100 g load). D(meas.) = 4.74(7) D(calc.) = [5.42]

Optical Properties: Translucent to opaque. *Color:* Dark red to coal-black, pale yellow to bluish gray; honey-yellow in thin section, may exhibit strong red internal reflections.
Streak: Rust-brown.
Optical Class: Uniaxial (+), may be biaxial (–). *Pleochroism:* Strong; O = light red, pale brown; E = very dark red, hazel-brown. $\omega = 1.990(5)$ $\epsilon = 2.160(5)$

Cell Data: *Space Group:* $I4_1/amd$. a = 7.33–7.35 c = 6.45–6.56 Z = 4

X-ray Powder Pattern: Kusu deposit, Congo.
3.678 (100), 2.766 (90), 1.891 (70), 4.89 (50), 2.594 (40), 1.638 (40), 2.291 (30)

Chemistry:

	(1)	(2)
V_2O_5	31.80	33.18
La_2O_3		15.53
Ce_2O_3	35.80	38.07
Nd_2O_3		7.43
Sm_2O_3		0.62
PbO_2	[18.27]	
PbO	[17.05]	
Total	[102.92]	94.83

(1) Kusu deposit, Congo; by electron microprobe, average of two analyses with Pb divided equally between Pb^{2+} and Pb^{4+}; then corresponds to $(Ce^{3+}_{0.60}Pb^{2+}_{0.22}Pb^{4+}_{0.22})_{\Sigma=1.04}V_{0.98}O_4$. (2) Yellow Lake, Canada; by X-ray fluorescence, total deficient as not all RE elements determined; corresponds to $(Ce_{0.63}La_{0.26}Nd_{0.12}Sm_{0.01})_{\Sigma=1.02}V_{0.99}O_4$.

Occurrence: In silicified limestone (Kusu deposit, Congo); in vesicles with zeolites (Yellow Lake, Canada).

Association: Mottramite (Kusu deposit, Congo); brewsterite, heulandite, analcime, mesolite, thomsonite, calcite, fluorite (Yellow Lake, Canada).

Distribution: In the Kusu vanadium deposit, 85 km south of Kinshasa, Bas-Congo Province, Congo (Bas-Zaire Province, Zaire). At Tifernine, Morocco. On the north side of Yellow Lake, British Columbia, Canada.

Name: Originally described as "kusuite"; the name later changed to reflect its identity as the *cerium* analog of *wakefieldite*-(Y).

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG5895; Natural History Museum, Paris, France, 178.119; National Museum of Natural History, Washington, D.C., USA, 136817.

Total	96.37	100.00

(1) Glücksstern Mine, Friedrichroda, Thuringia, Germany; average of 10 electron microprobe analyses, corresponding to $(La_{0.71}Nd_{0.15}Pr_{0.11}Sm_{0.01}Y_{0.01})_{\Sigma=0.99}V_{1.01}O_{4.00}$. (2) $LaVO_4$.

Mineral Group: Xenotime group.

Occurrence: A low temperature mineral in a hydrothermal barite vein.

Association: Hausmannite, barite, gottlobite.

Distribution: Glücksstern Mine, near the Gottlob quarry, Gottlob hill, Friedrichroda, Thuringia, Germany.

Name: As the La analogue of wakefieldite-(Ce) and wakefieldite-(Y).

Type Material: Mineralogical Collection, Bergakademie, Freiberg, Germany, 81876.

References: (1) Witzke, T., U. Kolitsch, J.M. Warnsloh, and J. Göske (2008) Wakefieldite-(La), $LaVO_4$, a new mineral species from the Glücksstern Mine, Friedrichroda, Thuringia, Germany. Eur. J. Mineral., 20, 1135–1139. (2) (2009) Amer. Mineral., 94, 649-650 (abs. ref. 1).

Wakefieldite-(Y) YVO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Prismatic crystals, to 0.1 μm, with basal or pyramidal terminations, in pulverulent masses.

Physical Properties: Hardness = ∼5 D(meas.) = n.d. D(calc.) = 4.25

Optical Properties: Semitransparent. *Color:* Canary-yellow, pale tan.
Optical Class: Uniaxial (+) (synthetic). $\omega = 2.00(1)$ $\epsilon = 2.14(1)$

Cell Data: *Space Group:* $I4_1/amd$ (synthetic). $a = 7.105(3)$ $c = 6.20(1)$ $Z = 4$

X-ray Powder Pattern: Evans-Lou quarry, Canada.
3.56 (100), 1.824 (75), 2.66 (50), 2.51 (30), 2.21 (25), 1.774 (20), 4.74 (17)

Chemistry: (1) Evans-Lou quarry, Canada; identity of wakefieldite-(Y) depends on Y and V determined as major elements, and correspondence of its X-ray pattern with synthetic YVO_4.

Occurrence: In quartz in a zoned granite pegmatite (Evans-Lou quarry, Canada).

Association: Hellandite, quartz, kainosite-(Y), montmorillonite (Evans-Lou quarry, Canada).

Distribution: In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada. From the White Tank Mountains, Maricopa Co., Arizona, USA.

Name: For Wakefield Lake, nearby the Evans-Lou quarry, Canada, and the dominant rare earth, *yttrium*.

Type Material: Geological Survey of Canada, Ottawa, 12165; University of Ottawa, Ottawa; Royal Ontario Museum, Toronto, Canada, M30382.

References: (1) Miles, N.M., D.D. Hogarth, and D.S. Russell (1971) Wakefieldite, yttrium vanadate, a new mineral from Quebec. Amer. Mineral., 56, 395–410.

Walentaite $\mathbf{H(Ca,Fe^{2+},Mn^{2+})Fe_3^{3+}(AsO_4,PO_4)_4 \cdot 7H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. Bladed crystals, to 200 μm, elongated along [001] and flattened on {010}, typically in aggregates of rosettes.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Brittle. Hardness = ~3 D(meas.) = 2.72 D(calc.) = 2.72

Optical Properties: Semitransparent. *Color:* Bright yellow, bright greenish yellow, pale brownish in aggregates. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = colorless; Y = pale yellow-green to pale yellow; Z = medium yellow-green to medium yellow. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Absorption:* $Z < Y$. α = 1.65–1.738 β = [1.707]–1.74 γ = 1.76–1.779 2V(meas.) = n.d.

Cell Data: *Space Group:* $Immm$, $Imam$, $Imm2$, $Ima2$, $I222$, or $I2_12_12_1$. a = 26.24(6) b = 10.31(1) c = 7.38(1) Z = 1

X-ray Powder Pattern: White Elephant mine, South Dakota, USA.
12.9 (100), 3.00 (50), 4.43 (30), 6.56 (20), 4.82 (20), 2.931 (20), 2.776 (20)

Chemistry:

	(1)	(2)		(1)	(2)
WO_3		14.5	FeO	3.2	
P_2O_5	12.5	16.5	MnO	3.1

Al_2O_3	0.5		F	trace	
Fe_2O_3	28.3	25.3	H_2O	16.6	[16.5]
			Total	[100.0]	[100.0]

(1) White Elephant mine, South Dakota, USA; by electron microprobe, Fe^{2+}:Fe^{3+} from stoichiometry, total Mn as MnO, H_2O by TGA-EGA, normalized to 100% from an original total of 111.2%; corresponding then to $H_{0.12}(Ca_{0.42}Fe^{2+}_{0.37}Mn_{0.36})_{\Sigma=1.15}(Fe^{3+}_{2.92}Al_{0.08})_{\Sigma=3.00}[(AsO_4)_{2.36}(PO_4)_{1.45}]_{\Sigma=3.81} \cdot 7.52H_2O$. (2) Griffin's Find mine, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; with $(OH)^{1-}$ calculated for charge balance, corresponding to $Ca_{0.36}Fe^{3+}_{2.82}W_{0.56}[(AsO_4)_{1.94}(PO_4)_{2.06}]_{\Sigma=4.00}(OH)_{0.54} \cdot 7.92H_2O$.

Occurrence: A rare secondary mineral in a complex zoned pegmatite, probably formed by alteration of löllingite and triphylite–lithiophilite (White Elephant mine, South Dakota, USA); a secondary mineral in the oxidized zone of a gold mine in granulite (Griffin's Find mine, Australia).

Association: Rockbridgeite, löllingite, spessartine, muscovite, quartz, tridymite (White Elephant mine, South Dakota, USA); pharmacosiderite, jarosite, iron oxides (Griffin's Find mine, Australia).

Distribution: From the White Elephant mine, near Pringle, Custer Co., South Dakota, USA. In the Griffin's Find gold mine, about 15 km northwest of Lake Grace, Western Australia.

Name: Honoring Dr. Kurt Walenta (1927–), Professor of Mineralogy, University of Stuttgart, Stuttgart, Germany, for his contributions to the mineralogy of arsenates and phosphates, especially from the Black Forest, Germany.

Type Material: The Natural History Museum, London, England, 1984,690; National Museum of Natural History, Washington, D.C., USA, 149782, 149783.

References: (1) Dunn, P.J., D.R. Peacor, W.L. Roberts, T.J. Campbell, and R.A. Ramik (1984) Walentaite, a new calcium iron arsenate phosphate from the White Elephant mine, Pringle, South Dakota. Walfordite $(Fe^{3+}, Te^{6+})Te_3^{4+}O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Crystals are cubic {100}, may be modified by minor {111}, to 0.2 mm.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.841

Optical Properties: Transparent to opaque. *Color:* Orange. *Streak:* Yellow-orange. *Luster:* Adamantine.
Optical Class: Isotropic. $n = [2.23]$ (by the rule of Gladstone and Dale).

Cell Data: *Space Group:* $Ia3$. a = 11.011(5) Z = 8

X-ray Powder Pattern: Tambo mine, Chile.
3.175 (100), 1.658 (45), 1.944 (44), 2.749 (37), 4.486 (29), 2.943 (23), 2.592 (22)

Chemistry:

	(1)
TeO_3	8.67
TeO_2	81.74
TiO_2	1.11
Fe_2O_3	8.30
MgO	0.38
Total	100.20

(1) Tambo mine, Chile; by electron microprobe, total Fe as Fe_2O_3; Te calculated for $Te^{4+}O_3$, the balance as Te^{6+}; then corresponds to $(Fe^{3+}_{0.61}Te^{6+}_{0.29}Ti_{0.08}Mg_{0.06})_{\Sigma=1.04}Te^{4+}_{3.00}O_8$.

Occurrence: Very rare in the brecciated oxidized zone of a tellurium-bearing hydrothermal gold deposit.

Association: Alunite, rodalquilarite, gold, emmonsite, jarosite, pyrite.

Distribution: From the Wendy open pit, El Indio-Tambo district, east of La Serena, Coquimbo, Chile.

Name: Honors Phillip Walford (1945—), Chief Geologist, LAC Minerals Ltd., who noted the first specimens.

Type Material: Royal Ontario Museum, Toronto, Canada, M47817, M47818.

Wallisite **$PbTl(Cu, Ag)As_2S_5$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As small crystals to 1 mm, more commonly massive.

Physical Properties: *Cleavage:* Pronounced on {001}. Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 5.71

Optical Properties: Opaque. *Color:* Lead-gray. *Luster:* Metallic.

R_1–R_2: n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.215$ $b = 8.524$ $c = 7.980$ $\alpha = 55°59(6)'$ $\beta = 62°30(6)'$ $\gamma = 69°24(6)'$ Z = 2

X-ray Powder Pattern: Binntal, Switzerland.
3.339 (100), 2.834 (50), 2.879 (30), 2.667 (30), 4.555 (25), 4.233 (25), 2.985 (25)

Chemistry:

	(1)	(2)
Pb	25.2	26.38
Tl	26.	26.03
Cu	6.9	8.09
Ag	2.7	
As	20.5	19.08
S	19.	20.42
Total	100.3	100.00

(1) Binntal, Switzerland; by electron microprobe. (2) $PbTlCuAs_2S_5$.

Occurrence: Overgrowing other lead sulfosalts.

Association: Dufrénoysite, rathite, pyrite.

Distribution: In Switzerland, at the Lengenbach quarry, Binntal, Valais.

Name: For Wallis, the German name for the Swiss Canton in which the Lengenbach quarry is located.

Type Material: Mineralogical-Petrographical Institute, University of Bern, Bern, Switzerland, L2533-63.

Wallkilldellite $\mathbf{Ca_4Mn_6^{2+}(AsO_4)_4(OH)_8 \cdot 18H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $\overline{6}m2$, or $6mm$. As flattened, radial clusters of platy crystals, to about 0.1 mm.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = ~3 D(meas.) = 2.85(5) D(calc.) = 2.90

Optical Properties: Semitransparent. *Color:* Dark red. *Streak:* Pale orange.
Luster: Vitreous on cleavage surfaces; slightly resinous on fracture surfaces.
Optical Class: Uniaxial (–). *Pleochroism:* O = reddish orange; E = pale pinkish orange.
Absorption: Moderate; $O > E$. $\omega = 1.728(4)$ ϵ = n.d.

Cell Data: *Space Group:* $P6_3/mmc$, $P\overline{6}2c$, or $P6_3mc$. a = 6.506(7) c = 23.49(3) Z = [1]

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
11.5 (100), 5.61 (90), 2.844 (60), 2.748 (50), 2.545 (50), 4.56 (40), 3.25 (40)

Chemistry:

	(1)	(2)
As_2O_5	27.4	30.52
SiO_2	1.7	
FeO	0.3	
MnO	27.0	28.26
CuO	3.3	
ZnO	0.0	
MgO	0.9	
CaO	12.4	14.90
H_2O	[27.0]	26.32
Total	100.0	100.00

(1) Sterling Hill, New Jersey, USA; H_2O by difference. (2) $Ca_4Mn_6(AsO_4)_4(OH)_8 \cdot 18H_2O$.

Occurrence: Extremely rare in massive granular franklinite-willemite ore from a metamorphosed stratiform zinc orebody.

Association: Manganoan cuprian adamite, franklinite, willemite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For the *dell* of the *Wallkill* River, in which both the Sterling Hill and the Franklin deposits were discovered.

Type Material: Harvard University, Cambridge, Massachusetts, 113445; National Museum of Natural History, Washington, D.C., USA, 149767.

References: (1) Dunn, P.J. and D.R. Peacor (1983) Kittatinnyite and wallkilldellite, silicate/arsenate analogues containing calcium and manganese, from Franklin and Sterling Hill, New Jersey. Amer. Mineral., 68, 1029–1032.

Walpurgite $Bi_4(UO_2)O_4(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals typically lathlike, elongated along [001], tabular on {010}, showing {010}, {110}, {1$\overline{1}$0}, {$\overline{1}\overline{1}$1}, a number of other forms, to 6 mm. In radial to subparallel aggregates. *Twinning:* Common, with {010} twin and composition plane.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = 3.5 D(meas.) = n.d. D(calc.) = 6.59 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Wax-yellow, straw-yellow, honey-yellow; pale yellow to colorless in transmitted light, commonly zoned. *Streak:* Pale brownish yellow. *Luster:* Adamantine to greasy.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = very faint greenish yellow. *Orientation:* $X \simeq [010]$. *Dispersion:* Small. $\alpha = 1.871$–1.90 $\beta = 1.975$–2.00 $\gamma = 2.005$–2.05 2V(meas.) = Medium large. 2V(calc.) = 52°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.135(2)$ $b = 10.426(4)$ $c = 5.494(1)$ $\alpha = 101.47(2)°$ $\beta = 110.82(2)°$ $\gamma = 88.20(2)°$ Z = 1

X-ray Powder Pattern: Schmiedestollen, Germany.
3.128 (100), 10.257 (41), 3.059 (38), 3.268 (32), 2.739 (26), 3.400 (23), 2.188 (20)

Chemistry:

	(1)	(2)	(3)
UO_3	18.7	16.16	19.28

Total	99.2	99.78	100.00

(1) Schneeberg, Germany; microchemical analysis. (2) Do. (3) $Bi_4(UO_2)O_4(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with orthowalpurgite.

Occurrence: A rare secondary mineral in the oxidized zone of Bi–U–As-bearing hydrothermal mineral deposits.

Association: Trögerite, zeunerite, uranosphaerite, uranospinite, torbernite (Schneeberg, Germany).

Distribution: In Germany, found in the Walpurgis vein, Weisser Hirsch mine, and on the dump of the Ritterzeche, Neustädtel-Schneeberg, Saxony; from the Schmiedestollen, near Wittichen, and at Nussbach, near Triberg, Black Forest. From the Geister vein, Eliáš mine, Jáchymov (Joachimsthal), Czech Republic. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland.

Name: For its first-noted occurrence in the Walpurgis vein, Schneeberg, Germany.

Type Material: Mining Academy, Freiberg, Germany, 21779.

(1–2) Fresno Co., California, USA; by D-C arc spectrography, stated to br recalculated to 100.00%. (3) $BaCa_2Si_3O_9$.

Occurrence: Disseminated in a sanbornite-quartz gneissic metamorphic rock, especially where the quartz content is high.

Association: Sanbornite, quartz, wollastonite, celsian, taramellite, pyrrhotite, pyrite, witherite, fresnoite.

Distribution: From the Rush Creek and Big Creek areas, Fresno Co., and on Trumbull Peak, near Incline, Mariposa Co., California, USA.

Name: For Robert E. Walstrom, mineral collector of Fresno, California, USA, who first recognized the distinctive character of the mineral.

Type Material: California Division of Mines & Geology, San Francisco, California, USA.

(1) Reina vein, Chile; by electron microprobe, average of six analyses, H_2O calculated for stoichiometry; corresponds to $(Ba_{0.48}Na_{0.04}K_{0.04}Ca_{0.01})_{\Sigma=0.57}Al_{3.00}(S_{1.96}O_{3.96})_2[(OH)_{5.99}F_{0.01}]_{\Sigma=6.00}$.

Mineral Group: Alunite group.

Occurrence: Rare, in open-space filling of a fault, formed by reaction of hydrothermal fluids with barite.

Association: Alunite, barite, jarosite, pyrite, quartz.

Distribution: From the Reina vein, about seven km southeast of the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile.

Name: To honor Dr. Thomas Nash Walthier (1923–1990), American economic geologist, St. Joseph Minerals Co., who worked in the Tambo district, Chile.

Type Material: National Museum of Natural History, Washington, D.C., USA, 170208, 170209.

(1) [Palermo #1 mine, New Hampshire,] USA. (2) $NaAl_3(PO_4)_2(OH)_4 \cdot 2H_2O$.

Occurrence: A component of low-temperature phosphatic nodules; an uncommon species in complex zoned pegmatites.

Association: Variscite, millisite, crandallite (Little Green Monster mine, Utah, USA); ferrisicklerite, mitridatite, whitlockite, montgomeryite, fairfieldite, hydroxyl-herderite, eosphorite, siderite roscherite (pegmatites).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah; in Maine, at the Dunton quarry and the Bell Pit, Newry; at the Palermo #1 mine, North Groton, Grafton Co., New Hampshire; in the Hugo pegmatite, near Keystone, Pennington Co., and the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. Large crystals from the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In Brazil, from the Lavra da Ilha pegmatite, in the Jequitinhonha River, three km north of Taquaral, and in the Pirineus mine, Itinga, Minas Gerais; at Alto Patrimonio, Piedras Lavradas, Paraíba. From Songo, Sierra Leone. At the Wolfsberg quarry, near Spittal, Carinthia, Austria. In France, from Ruffiac, Morbihan, and Montebras, Creuse. At the Iron Monarch quarry, Iron Knob, South Australia, from Wycheproof, Victoria, and on Milgun Station, Western Australia. A few other localities are known.

Name: Honoring Henry Augustus Ward (1834–1906), American collector and dealer in natural history objects (Ward's Natural Science Establishment) Rochester, New York, USA.

Type Material: n.d.

Wardsmithite $Ca_5MgB_{24}O_{42}\cdot 30H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal (?). *Point Group:* n.d. Subhedral to anhedral crystals, thin platy with hexagonal outline, to 15μm; in fine-grained clots and nodules, and irregular coatings.

Physical Properties: *Cleavage:* {001}, good. Hardness = 2.5 D(meas.) = 1.85–1.88 D(calc.) = n.d.

Optical Properties: Transparent. *Color:* White; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Uniaxial (–) or biaxial. $\omega = 1.490(2)$ $\epsilon = 1.476(2)$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Death Valley, California, USA.
13.5 (100), 12.3 (62), 6.12 (55), 4.721 (42), 2.744 (26), 7.73 (22), 2.918 (20)

Total	100.28	100.00

(1) Hard Scramble Claim, California, USA; H_2O by TGA, estimated to contain gowerite 3%; after correction corresponds to $Ca_{5.02}Mg_{0.98}B_{23.62}O_{42}\cdot 30.88H_2O$. (2) $Ca_5MgB_{24}O_{42}\cdot 30H_2O$.

Occurrence: A rare weathering product of priceite and colemanite.

Association: Gowerite, ulexite, nobleite, colemanite (Death Valley, California, USA).

Distribution: From the Hard Scramble claim, Black Mountains, 3 km north-northwest of Ryan, and on the Oliver Consolidated claim, 3 km west of Ryan, Death Valley, Inyo Co., California, USA. From about 15 km northwest of Tubutama, Sonora, Mexico.

Name: In honor of Ward Cromwell Smith (1906–1998), geologist with the U.S. Geological Survey, Menlo Park, California, USA, who studied southwestern U.S. borate occurrences.

Type Material: National Museum of Natural History, Washington, D.C., USA, 136414, 147955, 147956.

Warwickite $(Mg, Ti, Al)_2O(BO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are prismatic, {010}, {100}, {110}, {130}, {310}, with rounded terminations, to 5 mm; anhedral granular.

Physical Properties: *Cleavage:* On {100}, good. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 3.34–3.36 D(calc.) = 3.40

Optical Properties: Opaque, transparent in thinnest edges. *Color:* Dark brown to black; deep yellow, pale brown, reddish brown in thin section. *Streak:* Bluish black. *Luster:* Subvitreous to pearly, submetallic on cleavages, commonly dull if altered.
Optical Class: Biaxial (+). *Pleochroism:* Slight; X = yellow-brown; Y = reddish brown; Z = cinnamon-brown. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Absorption:* $X > Y > Z$. $\alpha = 1.806(5)$ $\beta = 1.809(5)$ $\gamma = 1.830(5)$ 2V(meas.) = Small, variable.

Cell Data: *Space Group: Pnam.* $a = 9.037$–9.255 $b = 9.358$–9.450 $c = 3.01$–3.116 Z = 4

X-ray Powder Pattern: Edenville, New York, USA.
2.57 (10), 2.75 (5), 6.55 (4), 4.20 (4), 2.97 (3), 1.979 (3), 1.721 (3)

Chemistry:

	(1)	(2)		(1)	(2)
B_2O_3	21.29	[25.8]	FeO	9.15	
SiO_2	1.39		MgO	35.71	39.3

Al_2O_3	2.91	7.7	Total	100.07	[100.6]
Fe_2O_3	4.76	7.1			

(1) Edenville, New York, USA; average of two analyses; corresponds to $(Mg_{1.28}Ti_{0.45}Fe^{2+}_{0.18}Al_{0.08}Fe^{3+}_{0.09})_{\Sigma=2.08}O(B_{0.88}O_3)$. (2) Do.; by electron microprobe, partial analysis, here converted to oxides from an elemental analysis; total Fe as Fe_2O_3, B_2O_3 calculated for stoichiometry; corresponds to $(Mg_{1.33}Ti_{0.34}Al_{0.21}Fe^{3+}_{0.12})_{\Sigma=2.00}O(B_{1.00}O_3)$.

Occurrence: A rare accessory mineral in boron-metasomatized limestone and associated skarns; in lamproitic rocks and carbonatitelike veinlets cutting them.

Association: Chondrodite, szaibélyite, sinhalite, spinel, diopside, titanite, dravite, apatite, fluorite, scapolite, graphite, magnetite, ilmenite, pyrite, pyrrhotite.

Distribution: From about 4 km southwest of Edenville, near Warwick, Orange Co., New York, USA. Found near Bancroft, Ontario, Canada. At La Ceila, near Jumilla, Murcia Province, Spain. In the Tayozhnoye iron deposit, 550 km south of Yakutsk, and the Taiga borate-magnetite deposit, Sakha, Siberia, Russia. At the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea.

Name: For its first-noted occurrence near Warwick, New York, USA.

Type Material: Natural History Museum, Paris, France, 74217, 99697; National Museum of Natural History, Washington, D.C., USA, 128712.

Wattevillite $Na_2Ca(SO_4)_2 \cdot 4H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic or monoclinic (?). *Point Group:* n.d. Acicular to hairlike crystals, minute, in aggregates. *Twinning:* Noted.

Physical Properties: Hardness = n.d. D(meas.) = 1.81 D(calc.) = n.d. Soluble in H_2O, with separation of gypsum after some time; taste initially sweet then astringent.

Optical Properties: Semitransparent. *Color:* Snow-white; colorless in transmitted light. *Luster:* Silky.
Optical Class: Biaxial (–). *Orientation:* Highly variable extinction. $\alpha = 1.435(3)$ $\beta = 1.455(3)$ $\gamma = 1.459(3)$ 2V(meas.) = 48(3)°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Bauersberg, Germany. (ICDD 41-1360).
4.39 (100), 4.20 (64), 2.892 (53), 2.945 (49), 5.44 (45), 4.03 (42), 5.10 (36)

(1) Einigkeit mine, Germany; after deduction of H_2O 33.69% as hygroscopic.
(2) $Na_2Ca(SO_4)_2 \cdot 4H_2O$.

Occurrence: In pyritic lignite.

Association: Pyrite, other sulfides.

Distribution: From the Einigkeit mine, on the Bauersberg, near Bischofsheim, Bavaria, Germany.

Name: Honors Oscar de Watteville, Paris, France.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 452.

Wavellite $Al_3(PO_4)_2(OH,F)_3 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Euhedral crystals uncommon, short to long prismatic, elongated and striated ‖ [001], with {010}, {110}, {101}, {111}, {121}, with many {hk0} forms, to several mm. Commonly in flat to spherical radial aggregates, to 3 cm; may be stalactitic, in crusts, rarely opaline massive.

Physical Properties: *Cleavage:* Perfect on {110}; good on {101}; distinct on {010}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.36 D(calc.) = 2.37

Optical Properties: Translucent. *Color:* White, greenish white, green, yellow, yellowish brown, turquoise-blue, brown, brownish black, may be zoned; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to resinous, pearly.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = greenish; Z = yellowish.
Absorption: $X > Z$. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, weak.
$\alpha = 1.518$–1.535 $\beta = 1.524$–1.543 $\gamma = 1.544$–1.561 2V(meas.) = 60°–72°

Cell Data: *Space Group:* $Pcmn$. $a = 9.621(2)$ $b = 17.363(4)$ $c = 6.994(3)$ Z = 4

(1) Clonmel, Ireland. (2) $Al_3(PO_4)_2(OH)_3 \cdot 5H_2O$.

Occurrence: A secondary mineral in low-grade metamorphic rocks and phosphate deposits; rare in hydrothermal veins.

Association: Crandallite, variscite.

Distribution: Many localities. In the High Down quarry, Filleigh, near South Moulton, Devon, England. At Clonmel, Co. Tipperary, Ireland. In Germany, in the Rotläufchen mine, Waldgirmes, at the Dünsberg, near Giessen, from Oberscheld, near Dillenburg, and elsewhere in the Lahr-Dill area, Hesse; on the Wachtelberg, Langenstriegis, west of Freiberg, Saxony; from the Lichtenberg quarry, near Ronneburg, Thuringia; and elsewhere. At Čerhovice, near Beroun (Beraun), Czech Republic. Near Bihain, Belgium, large rosettes. At Montebras, Creuse, France. In the USA, from General Trimble's mine, Chester Co., Pennsylvania; in the Wood mine, Cocke Co., Tennessee; abundant around Avant, as on Dug Hill, Garland Co., and from the Mauldin Mountain quarry, near Mt. Ida, Montgomery Co., Arkansas; in the Willard mine, Willard district, Pershing Co., Nevada. In Bolivia, fine examples from Llallagua, Potosí, and Oruro. At the Moculta phosphate quarry, northeast of Angaston, and the Iron Monarch quarry, Iron Knob, South Australia.

Name: For William Wavell (?–1829), physician, of Horwood Parish, Devon, England, discoverer of the species.

Wawayandaite $Ca_6Mn_2^{2+}BBe_9Si_6O_{23}(OH,Cl)_{15}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. Rarely as sharp, thin crystals, to 0.1 mm; commonly strongly curved in three dimensions; as fine-grained aggregates. *Twinning:* On {100}, probably universal.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Brittle; curved crystals are flexible. Hardness = ∼1 in aggregates. D(meas.) = ∼3.0 D(calc.) = 2.98

Optical Properties: Transparent to opaque. *Color:* Colorless to white. *Streak:* White. *Luster:* Pearly to dull.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z = c$; $X \wedge a = 11.5°$. *Dispersion:* $r < v$, strong. $\alpha = [1.619]$ $\beta = 1.631(1)$ $\gamma = 1.641(1)$ 2V(meas.) = 85°

Cell Data: *Space Group:* $P2/c$ or Pc. $a = 15.59(2)$ $b = 4.87(1)$ $c = 18.69(4)$ $\beta = 101.84(15)°$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
3.157 (100), 15.1 (90), 3.001 (70), 2.626 (70), 2.718 (60), 2.249 (50)

Chemistry:

Total	99.1

(1) Franklin, New Jersey, USA; by electron microprobe, B and Be by ion microprobe, H_2O by TGA-EGA; corresponds to $Ca_{5.56}Mn_{1.74}Mg_{0.60}Zn_{0.17}B_{1.38}Be_{8.86}Si_{5.90}O_{23.54}[(OH)_{13.40}Cl_{1.06}]_{\Sigma=14.46}$.

Occurrence: A late-stage vein mineral on willemite-franklinite ore in a metamorphosed stratiform zinc deposit.

Association: Willemite, friedelite, andradite, hodgkinsonite, cahnite, calcite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: From *wawayanda*, meaning *many or several windings* in the language of the Lenni Lenape Indians, early inhabitants of the Franklin area, in allusion to the grossly curved and winding habit of most crystals.

Type Material: National Museum of Natural History, Washington, D.C., USA, R5869, 93391; Royal Ontario Museum, Toronto, Canada, M44227.

Waylandite $(Bi, Ca)Al_3(PO_4, SiO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As crystals, to 0.5 mm; as a compact fine-grained powder forming crusts and veinlets. *Twinning:* Most crystals show twinning, typically cyclic.

Physical Properties: *Fracture:* Uneven (massive). Hardness = 4–5 D(meas.) = n.d. D(calc.) = 4.08

Optical Properties: Translucent. *Color:* Colorless, white, pale blue, pale brown.
Luster: Vitreous to dull.
Optical Class: Uniaxial (+). $\omega = 1.748$ $\epsilon = 1.774$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 6.9744$–6.9834 $c = 16.175$–16.293 Z = 3

(1) Wampewo pegmatite, Uganda. (2) Restormel mine, Cornwall, England; by electron microprobe, H_2O by difference. (3) $BiAl_3(PO_4)_2(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: A rare secondary mineral replacing primary bismuth minerals.

Association: Bismutite (Restormel mine, Cornwall, England); bismutotantalite (Ngusa, Congo).

Distribution: From the Wampewo pegmatite, Gamba Hill, near Kampala, southwest Uganda. At Ngusa, and in the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). From the Restormel mine, near Lostwithiel; at Wheal Owles and the Levant mine, St. Just; Phoenix mines, near Linkinhorne; and in the Gunheath china clay pit, St. Austell, Cornwall, England. From a dump on the Roter Berg, Schneeberg, Saxony, Germany. At the Rubicon pegmatite, south of Karibib, Namibia. From an undefined deposit in China.

Name: Honors Edgar James Wayland, first Director of the Uganda Geological Survey.

Type Material: n.d.

Weberite Na_2MgAlF_7

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. As subhedral pseudocubo-octahedral crystals, showing {001}, {010}, {110}, {011}, {101}, {111}, and {131}, and in anhedral cleavages, to several cm; as irregular grains, massive; as inclusions in cryolite and intergrowths with fluorite. *Twinning:* With $[\overline{1}11]$ as twin axis and {011} as composition plane, commonly as contact twins.

Physical Properties: *Cleavage:* {011}, poor; {010}, indistinct. *Fracture:* Uneven. Hardness = 3.5 D(meas.) = 2.96 D(calc.) = 2.966 Slightly soluble in H_2O.

Optical Properties: Translucent. *Color:* Light gray, mottled, rarely pale orange; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. α = 1.344–1.346 β = 1.346–1.348 γ = 1.347–1.350 2V(meas.) = 83(3)°

Cell Data: *Space Group:* $Imma$, $Imm2$, or $I2_12_12_1$. a = 7.060(1) b = 10.000(10) c = 7.303(1) Z = 4

X-ray Powder Pattern: Ivigtut, Greenland.
1.779 (10), 2.95 (9), 2.89 (9), 5.05 (6), 5.89 (5), 2.30 (5), 1.542 (5)

Chemistry:

F	57.58	57.75
insol.	0.16	
Total	100.54	100.00

(1) Ivigtut, Greenland. (2) Na_2MgAlF_7.

Occurrence: In the cryolite deposit and overlying pegmatite (Ivigtut, Greenland).

Association: Cryolite, chiolite, jarlite, stenonite, thomsenolite, prosopite, pachnolite, ralstonite, fluorite, topaz, potassian mica, pyrite, galena (Ivigtut, Greenland).

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland. At St. Peters Dome, near Pikes Peak, El Paso Co., and in the Goldie carbonatite, McClure Mountain-Iron Mountain, Fremont Co., Colorado; from the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada, USA. In the Mt. Cleveland tin mine, western Tasmania, Australia. At Perga, Volyn, Ukraine.

Name: Honors Theobald Weber (1823–1886), active in the early development of the Ivigtut cryolite deposit.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1981.936.

Weddellite $Ca(C_2O_4)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Typically as isolated crystals, with {011}, elongated along [010], terminated by {001}, to 4 cm; commonly corroded. *Twinning:* Single or multiple twins may have been noted.

Physical Properties: *Fracture:* Subconchoidal. Hardness = ∼4 D(meas.) = 1.94(1) D(calc.) = 1.962 Dehydrates to whewellite on exposure to the atmosphere.

Optical Properties: Transparent. *Color:* Colorless to white, may be yellowish brown to brown from organic impurities; colorless in transmitted light.
Optical Class: Uniaxial (+). $\omega = 1.523(3)$ $\epsilon = 1.544(3)$

Cell Data: *Space Group:* $I4/m$. $a = 12.371(3)$ $c = 7.357(2)$ Z = 8

X-ray Powder Pattern: Husvik, Antarctic Ocean.
2.744 (100), 6.19 (72), 3.35 (66), 2.231 (63), 1.892 (49), 4.43 (40), 2.792 (38)

Chemistry: (1) Analyses of natural material are lacking. Identification is by correspondence of optical and X-ray powder data with those of synthetic material.

Occurrence: Authigenic in bottom muds and in peat sediments; in calcareous lake-bottom sediments; may be formed by reaction of calcite with oxalic acid produced by lichens.

Association: Whewellite, urea, phosphammite, aphthitalite (from bat guano).

Distribution: From the central and marginal Weddell Sea, Antarctica. On South Georgia Island, southern Atlantic Ocean. In sediments from the Japan Sea and the Coral Sea. At Jingemia Cave, Toppin Hill Cave, and Petrogale Cave, near Madura, Western Australia. From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana. In the Tyllakh brown coal deposit, left bank of the Olenhinskii channel near its mouth, estuary of the Lena River, Bulun district, polar Sakha, Russia. From the Milltown quarry, Milltown, Derbyshire, England. In Canada, in the Saguenay and St. Lawrence Rivers, Quebec; from the east side of Moore Lake, near Norland, Ontario; and from Cape Herschel, Ellesmere Island, North West Territories. Large crystals from the Sami Tsubota jasper mine, four km south of Biggs, Sherman Co., Oregon, USA.

Name: For its first-noted occurrence in the Weddell Sea, Antarctica.

Type Material: The Natural History Museum, London, England, 1936,975–1936,977.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1101–1102. (2) Tazzoli, V. and C. (1) Green River Formation, Wyoming, USA; here recalculated to a conventional oxide analysis from an elemental analysis including direct determinations of $(CO_3)^{2-}$ and $(HCO_3)^{1-}$, totalling 99.75%, after deduction of Cl 0.06%, H_2O^- 0.36%, organic 4.38%. (2) $Na_5(HCO_3)_3(CO_3)$.

Occurrence: As a replacement of trona in a lacustrine deposit.

Association: Trona, halite.

Distribution: In the USA, in the Green River Formation, from the Perkins Well No. 1, the Perkins Well No. 2, about 10 km west, and as large crystals in the Grierson Well No. 1, about 20 km northwest, Sweetwater Co., Utah; in the Piceance Basin, Garfield and Rio Blanco Cos., Colorado. From the Biyang Basin, Henan Province, China.

Name: In honor of Rudolf Franz Johann Wegscheider (1859–1935), Austrian chemist, who first synthesized the compound.

Type Material: National Museum of Natural History, Washington, D.C., USA, 117710.

Weibullite $Pb_6Bi_8(S,Se)_{18}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Massive prismatic to fibrous or foliated habit; also as indistinct prismatic crystals.

Physical Properties: *Tenacity:* Very brittle, flexible. Hardness = 2–2.5 VHN = 136–156 (100 g load). D(meas.) = n.d. D(calc.) = [6.73]

Optical Properties: Opaque. *Color:* Steel-gray; white in reflected light. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Strong in reflected light, dark gray to red-brown.

R_1–R_2: (400) 43.6–51.5, (420) 43.0–51.0, (440) 42.4–50.5, (460) 41.8–49.3, (480) 41.4–48.4, (500) 40.9–47.8, (520) 40.5–47.4, (540) 40.0–46.6, (560) 39.5–45.9, (580) 38.9–45.1, (600) 38.4–44.4, (620) 38.0–43.9, (640) 37.5–43.3, (660) 37.0–42.8, (680) 36.7–42.5, (700) 36.4–42.2

(1–3) Falun, Sweden; by electron microprobe.

Occurrence: Intimately intergrown with laitakarite and bismuthinite in a "hornblende" rock.

Association: Laitakarite, bismuthinite, gold, chalcopyrite, bismuth, pyrrhotite, quartz.

Distribution: From Falun, Kopparberg, Sweden.

Name: For Mats Weibull (1856–1923), who first described the mineral.

Weilite $CaHAsO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Powdery, massive, typically pseudomorphous after pharmacolite or haidingerite.

Physical Properties: Hardness = n.d. D(meas.) = 3.48(5); 3.54 (synthetic). D(calc.) = 3.45; 3.541 (synthetic).

Optical Properties: Semitransparent. *Color:* White. *Luster:* Porcelaneous, may be greasy to slightly pearly.
Optical Class: Biaxial (–). *Orientation:* $X \wedge \{001\} = 20(2)°$; $Y \wedge \{001\} = 27(2)°$; $Z \wedge \perp \{001\} = 34(2)°$. $\alpha = 1.664(2)$ (α') $\beta =$ n.d. $\gamma = 1.688(2)$ (γ') 2V(meas.) = 82(1)°

Cell Data: *Space Group:* $P\overline{1}$ (synthetic). $a = 7.0591(8)$ $b = 6.8906(9)$ $c = 7.2006(16)$ $\alpha = 97°26(1)'$ $\beta = 103°33(1)'$ $\gamma = 87°45(1)'$ Z = 4

X-ray Powder Pattern: Gabe-Gottes mine, France.
3.43 (FFF), 3.07 (FFF), 3.42 (F), 2.80 (F), 2.58 (mF), 2.28 (mf), 3.60 (f), 3.21 (f)

Chemistry:

	(1)	(2)	(3)
As_2O_5	64.1	61.7	63.85
CaO	30.7	33.1	31.15
H_2O	5.2	5.2	5.00
Total	[100.0]	[100.0]	100.00

(1) Gabe-Gottes mine, France; recalculated to 100% after deduction of SiO_2 1% and pharmacolite 10% from an original total of 99.7%. (2) Schneeberg, Germany; recalculated to 100% after deduction of pharmacolite 10% from an original total of 100.0%. (3) $CaHAsO_4$.

Occurrence: A rare secondary mineral in the oxidized zone of arsenic-bearing hydrothermal mineral deposits.

Association: Pharmacolite, haidingerite, picropharmacolite.

Distribution: In Germany, from Schneeberg, at the Daniel mine, and at Schlema-Hartenstein, Saxony; from Wittichen, Black Forest; in the Bauhaus district, Richelsdorf Mountains, Hesse. In the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, and at Duranus, Alpes-Maritimes, France. From the Wanthwaite mine, St. John's in the Vale, Cumbria, England. In the Bou Azzer district, Morocco. From the Getchell mine, Humboldt Co., Nevada, USA.

Name: To honor Professor René Weil (1901–), French mineralogist, University of Strasbourg, Strasbourg, France.

Type Material: National School of Mines, Paris, France, 4073; National Museum of Natural History, Washington, D.C., USA, R5543.

Total	101.3	100.00

(1) Weinebene Pass, Austria; by electron microprobe, Be by AA, H_2O by LOI; corresponds to $Ca_{0.99}Be_{3.02}(PO_4)_{1.97}(OH)_{2.11} \cdot 4H_2O$. (2) $CaBe_3(PO_4)_2(OH)_2 \cdot 4H_2O$.

Mineral Group: Zeolite group.

Occurrence: In fractures in a spodumene-rich pegmatite in high-grade metamorphic rocks.

Association: Roscherite, fairfieldite, uralolite.

Distribution: From the Weinebene Pass, Carinthia, Austria.

Name: For its occurrence in the Weinebene Pass, Austria.

Type Material: Landesmuseum Joanneum, Graz; Kärtner Landesmuseum, Klagenfurt; Natural History Museum, Vienna, Austria.

Total	100.00

Poshan district, China; by electron microprobe, corresponding to $(Au_{2.89}Ag_{0.29})_{\Sigma=3.18}Hg_{1.99}$.

Occurrence: In the silicified zone of the silver-rich part of an Au-Ag deposit in biotite granulite.

Association: Gold, silver, acanthite, pyrite, galena, sphalerite, pyrrhotite, scheelite.

Distribution: From the Poshan mining district, Tongbai, Henan Province, China.

Name: Derivation not stated.

Type Material: National Geological Museum, Beijing, China.

Tl	52.7	52.37
Sb	31.2	31.20
S	16.4	16.43
Total	100.2	100.00

(1) Carlin mine, Nevada, USA; by electron microprobe, average of four analyses. (2) $TlSbS_2$.

Occurrence: In late-stage hydrothermal veins that brecciate silicified dolomitic carbonate rocks. The assemblage appears to fill open space between breccia fragments and to have been formed during the boiling stage at the end of the hydrothermal episode.

Association: Stibnite, quartz.

Distribution: From the east ore zone, Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., Nevada; in Lookout Pass, Toole Co., Utah, USA. At Alšar (Allchar), near Rošden, Macedonia.

Name: For Dr. Byron G. Weissberg, Chemistry Division, D.S.I.R., New Zealand.

Type Material: Department of Geology, Stanford University, Palo Alto, California, Epithermal Minerals Collection; National Museum of Natural History, Washington, D.C., USA, 144274.

References: (1) Dickson, F.W. and A.S. Radtke (1978) Weissbergite, $TlSbS_2$, a new mineral from the Carlin gold deposit, Nevada. Amer. Mineral., 63, 720–724.

Welshite $Ca_2Mg_4Fe^{3+}Sb^{5+}Si_4Be_2O_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\bar{1}$. Crystals stout prismatic ‖ [001], may be flattened on {010}, to 3 mm. *Twinning:* Polysynthetic on {010}.

Physical Properties: *Fracture:* Conchoidal. Hardness = 6 D(meas.) = 3.77 D(calc.) = [3.71]

Optical Properties: Transparent to translucent. *Color:* Deep reddish brown to reddish black; brownish orange in transmitted light. *Streak:* Pale brown. *Luster:* Subadamantine. *Optical Class:* Biaxial. $\alpha = 1.81(1)$ $\beta =$ n.d. $\gamma = 1.83(1)$ 2V(meas.) = ∼45°

Cell Data: *Space Group:* $P\bar{1}$. $a = 10.28$ $b = 10.69$ $c = 8.83$ $\alpha = 106.1°$ $\beta = 96.3°$ $\gamma = 124.5°$ Z = 2

X-ray Powder Pattern: Långban, Sweden.
2.530 (100), 7.32 (70), 2.910 (70), 1.489 (70), 1.460 (70), 4.73 (60), 2.670 (60)

Chemistry:

	(1)	(2)
SiO_2	19.6	29.84
Al_2O_3	2.1	
Fe_2O_3	9.1	9.92
As_2O_5	3.6	
Sb_2O_5	24.8	20.08
MnO	1.0	
BeO	4.0	6.21

CaO	14.2	13.93
Total	93.7	100.00

(1) Långban, Sweden; by electron microprobe, average of 20 analyses on three crystals, total Fe as Fe_2O_3, BeO by wet chemical analysis; corresponds to $Ca_{2.41}(Mg_{3.61}Mn^{2+}_{0.13})_{\Sigma=3.74}(Fe^{3+}_{1.08}Al_{0.39})_{\Sigma=1.47}Sb^{5+}_{1.46}(Si_{3.10}As^{5+}_{0.30})_{\Sigma=3.40}Be_{1.52}O_{20.47}$. (2) $Ca_2Mg_4FeSbSi_4Be_2O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: In hematitic-dolomitic skarn.

Association: Berzeliite, manganoan phlogopite, richterite, hausmannite, roméite, adelite, swedenborgite.

Distribution: From Långban, Värmland, Sweden.

Name: For Wilfred R. Welsh, amateur mineralogist of Upper Saddle River, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137022.

References: (1) Moore, P.B. (1978) Welshite, $Ca_2Mg_4Fe^{3+}Sb^{5+}O_2[Si_4Be_2O_{18}]$, a new member of the aenigmatite group. Mineral. Mag., 42, 129–132. (2) (1979) Amer. Mineral., 64, 244 (abs. ref. 1).

Wendwilsonite $Ca_2(Mg,Co)(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are stout prismatic, elongated along [100], showing {011}, {$\bar{1}$11}, {010}, {110}, to 6 mm. *Twinning:* On {100} as twin and composition plane; lamellar structure ∥ {010}, {011}, {111} visible optically.

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Uneven. Hardness = 3–4 D(meas.) = 3.52(8) D(calc.) = 3.57

Optical Properties: Transparent. *Color:* Pale to intense pink, may be red, commonly color zoned. *Streak:* Pale pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = violet-pink; Y = rose-pink; Z = colorless. *Orientation:* $Y = b$; $Z \wedge c = 92°$. *Dispersion:* $r < v$. *Absorption:* $X \geq Y > Z$. $\alpha = 1.694(3)$ $\beta = 1.703(3)$ $\gamma = 1.713(3)$ 2V(meas.) = 87(2)°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.806(1)$ $b = 12.912(2)$ $c = 5.623(2)$ $\beta = 107°24(1)'$ Z = 2

X-ray Powder Pattern: Bou Azzer, Morocco; close to roselite.
2.994 (100), 2.766 (80), 3.226 (60), 5.085 (50), 3.356 (40), 2.592 (40), 3.397 (30)

Total	99.9	100.00

(1) Bou Azzer, Morocco; by electron microprobe, H_2O by the Penfield method; corresponding to $Ca_{2.03}(Mg_{0.82}Co_{0.15})_{\Sigma=0.97}(AsO_4)_{2.09} \cdot 1.77H_2O$. (2) $Ca_2(Mg,Co)(AsO_4)_2 \cdot 2H_2O$ with Mg:Co = 1:1.

Polymorphism & Series: Forms a series with roselite.

Mineral Group: Roselite group.

Occurrence: A rare secondary mineral in cobalt-bearing hydrothermal mineral deposits.

Association: Talmessite, erythrite (Bou Azzer, Morocco).

Distribution: From Bou Azzer, Morocco. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. From an unknown locality in Coahuila, Mexico.

Name: To honor Dr. Wendell Eugene Wilson, Jr. (1946–), Editor and Publisher of the Mineralogical Record, for his contributions to specimen mineralogy.

Type Material: Royal Ontario Museum, Toronto, Canada, M42119; National Museum of Natural History, Washington, D.C., USA, 136288.

References: (1) Dunn, P.J., B.D. Sturman, and J.A. Nelen (1987) Wendwilsonite, the Mg analogue of roselite, from Morocco, New Jersey, and Mexico, and new data on roselite. Amer. Mineral., 72, 217–221.

(1) Candoglia, Italy. (2) Karagaila deposit, Russia; corresponds to $Ba_{3.7}(Ca_{5.5}Na_{0.5})_{\Sigma=6.0}(Si_{9.6}Al_{10.3})_{\Sigma=19.9}O_{38.9}[(OH),F,Cl]_{4.5}(SO_4)_{2.9}$.

Mineral Group: Cancrinite group.

Occurrence: Formed between barite layers and calc-silicate rock, a product of strong metamorphism of marbles (Candoglia, Italy).

Association: Barite, calcite (Candoglia, Italy).

Distribution: At Cava Mergozzoni, Candoglia, Piedmont, Italy. From the Karagaila barite deposit, "central Asia," Russia.

Name: For Professor Eduard Wenk (1907–), mineralogist and petrologist, University of Basel, Basel, Switzerland.

Type Material: Natural History Museum, Basel, Switzerland, MB14577.

Total	99.08

(1) Bok se Puts Farm, South Africa; by electron microprobe, B by ICP; corresponds to $(Mg_{1.35}Fe_{0.86})_{\Sigma=2.21}Al_{14.21}B_{3.56}Ti_{0.01}Si_{4.02}O_{36.91}$.

Occurrence: In granulite facies metamorphosed metasediments and metavolcanic cordierite-sillimanite and biotite gneisses.

Association: Kornerupine, grandidierite, sillimanite, zircon, rutile, hercynite.

Distribution: On the Bok se Puts Farm, Namaqualand, Cape Province, South Africa.

Name: For Dr. Günter Werding, of the Mineralogical Institute, Ruhr University, Bochum, Germany.

Type Material: South African Museum, SAMG 7140–7150, and the University of Cape Town, Cape Town, South Africa.

MgO	28.72
CaO	3.78
H_2O	[37.64]
Total	[100.00]

(1) Långban, Sweden; recalculated after deduction of calcite 5.73%, SO_3 and H_2O from crystal-structure analysis, $(SO_4)^{2-}$ confirmed by IR; corresponds then to $(Ca_{0.68}Mg_{0.14}Mn_{0.06})_{\Sigma=0.88}Mg_{7.00}(Al_{1.21}Fe^{3+}_{0.92})_{\Sigma=2.13}(SO_4)_2(OH)_{18.15} \cdot 11.86H_2O$.

Occurrence: Very rare in a metamorphosed Fe–Mn orebody in a low-temperature fissure-filling assemblage among large calcite crystals.

Association: Calcite, magnetite.

Distribution: From Långban, Värmland, Sweden.

Name: For Wermland, an earlier spelling of the Swedish province Värmland, in which the Långban deposit is located.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 38001; National Museum of Natural History, Washington, D.C., USA, 137023, 149523.

(1) La Gallega mine, Spain; by electron microprobe, average of eight determinations on one grain, corresponding to $(Fe_{0.640}Ni_{0.400}Co_{0.015})_{\Sigma=1.055}As_{1.000}$. (2) Birchtree mine, Canada; by electron microprobe, average of 12 determinations, corresponding to $(Fe_{0.73}Ni_{0.32}Co_{0.01})_{\Sigma=1.06}As_{1.00}$.

Occurrence: As minute inclusions in maucherite which occurs in chromite-nickeline ores. The chromite ores and associated cordierite rock are schlieren veins through serpentinized ultramafic rocks (La Gallega mine, Spain).

Association: Maucherite, nickeline, cobaltite, nickeloan löllingite, Fe–Co-rich gersdorffite, rammelsbergite, antimony, serpentine.

Distribution: At the La Gallega mine, 3 km west of Ojén, Málaga Province, Spain. From the Ilímaussaq intrusion, southern Greenland. From Seinäjoki, Finland. At the Birchtree mine, near Thompson, Manitoba, Canada.

Name: For Dr. Jan Westerveld (1905–1962), Professor of Geology and Mineralogy, University of Amsterdam, The Netherlands.

Type Material: Geological Institute, University of Amsterdam, Amsterdam; Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands.

(1) Huron River, Erie Co., Ohio; here converted to oxides. (2) $CaC_2O_4 \cdot H_2O$.

Occurrence: Of uncommon occurrence as a low-temperature primary hydrothermal mineral in carbonate-sulfide veins, geodes, or septarian nodules; may be associated with coal measures or formed by oxidation of organic material in surrounding rocks; in some uranium deposits.

Association: Calcite, barite, sphalerite, pyrite, weddellite, waxy hydrocarbons.

Distribution: Originally described from an unknown locality. Well characterized material from: in Germany, in Saxony, at Freital-Burgk, near Dresden, as large crystals; in the Himmelsfürst mine, Erbisdorf, near Freiberg; Zwickau, and Schlema-Hartenstein; at Paitzdorf, near Ronneburg, Thuringia. From Kladno, Pchery, near Slaný (Schlan), Czech Republic. At Cigelka, Slovakia. From the Boldut mine, Cavnic (Kapnikbánya), Romania, large crystals. In France, in the Saint-Sylvestre mine, Bas-Rhin, and at Condorcet, Drôme. In the Mealbank quarry, Ingleton, North Yorkshire, England. In Russia, from the Maikop district, Caucasus Mountains, and as large crystals from Dal'negorsk, Primorskiy Kray. In the USA, from about 11 km southeast of Havre, Hill Co., Montana; near Elm Springs, Meade Co., South Dakota, very large crystals; near Biggs, Sherman Co., Oregon; in the Radon mine, near Moab, San Juan Co., Utah; along the Huron River, about 2 km west of Milan, Erie Co., Ohio. There are numerous other minor localities.

Name: Honors William H. Whewell (1794–1866), English naturalist and philosopher.

Type Material: [Harvard University, Cambridge, Massachusetts, USA, 78102.]

(1) White Caps mine, Nevada, USA; average of 5 electron microprobe analyses, presence of H_2O, ($H^+\cdot nH_2O$) and an absence of OH^- confirmed by IR and Raman spectroscopy, XANES spectroscopy revealed the valences of Sb and Fe; H_2O, FeO and Fe_2O_3 calculated from structural analysis; corresponding to $H_{16}Mn^{2+}_{0.08}Fe^{2+}_{4.95}Fe^{3+}_{14.07}Sb^{3+}_{6.10}As^{5+}_{17.89}O_{88}\cdot 120H_2O$.

Occurrence: A secondary mineral in the oxidation zone of a hydrothermal sulfide deposit containing arsenopyrite, pyrite and stibnite.

Association: Picropharmacolite, guerinite, sulfur, gypsum; or metastibnite, jarosite, goethite, pitticite, gypsum, picropharmacolite.

Distribution: At the 310 foot level of the East orebody, White Caps mine, Manhattan district, Nye Co., Nevada, USA.

Name: For the locality that produced the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 93773).

Mineral Group: Jahnsite-whiteite group.

Occurrence: A secondary mineral in cavities within zwieselite crystals or as coronas (up to 1 mm in diameter) around cubic crystals of uraninite in the core zone of a complex granitic pegmatite that was altered and leached by low-temperature oxidizing hydrothermal solutions.

Association: Triplite-zwieselite, fluorapatite, nordgauite, columbite-(Fe), a Mn-analogue of montgomeryite, koninckite, jahnsite-(CaMnMn).

Distribution: From the Cornelia open pit, Hagendorf-Süd granitic pegmatite no. 25, Bavaria, Germany.

Name: For the chemical composition, in accordance with nomenclature for the whiteite group.

Type Material: Mineralogical Museum, St. Petersburg State University, Russia (1/19470).

(1) Palermo #1 mine, New Hampshire, USA; corresponds to $Ca_{8.97}(Mg_{0.67}Fe_{0.52})_{\Sigma=1.19}(PO_4)_6(PO_3OH)$. (2) Dayton meteorite; by electron microprobe, corresponds to $(Ca_{7.65}Na_{0.90})_{\Sigma=8.55}(Mg_{0.87}Fe_{0.03})_{\Sigma=0.90}(PO_4)_6(PO_3OH)$.

Occurrence: An uncommon secondary mineral in complex zoned granite pegmatites; in phosphate rock deposits; may be formed in caves from leached guano; in chondrite meteorites.

Association: Ludlamite, fairfieldite, triphylite, siderite, apatite, quartz (pegmatites); hydroxylapatite (caves and islands); stanfieldite, farringtonite, brianite (meteorites).

Distribution: In the USA, from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, as large crystals; in the Bell pit and Dunton quarry, Newry, Oxford Co., Maine; at the Tip Top and Bull Moose mines, near Custer, Custer Co., South Dakota. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada. On Table Mountain, Curaçao, and on Sombrero Island, West Indies. From Enderbury Island, Phoenix Islands, Kiribati. On the Los Monges keys, Gulf of Venezuela. In Isla Mona Cave, Puerto Rico. At Cueva Atabex, Siboney, Cuba. From the Ødegården apatite mines, Bamble, Norway. In the Drachenhöhle, Hungary. From a cave at Sebdou, Oran, Algeria. At the Niah Great Cave, Sarawak, Malaysia. In the Dayton finest octahedrite meteorite.

Name: To honor Herbert Percy Whitlock (1868–1948), American mineralogist, Curator, American Museum of Natural History, New York City, New York, USA.

Whitmoreite $Fe^{2+}Fe^{3+}_2(PO_4)_2(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Uncommon as isolated pseudo-orthorhombic crystals, prismatic to acicular ‖ [001], showing {110}, {100}, {011}, {021}, {112}, with chisel-shaped terminations, to 2 mm; typically in fans, radial sprays, and balls resembling burrs or naval mines. *Twinning:* By reflection on {100}, common.

Physical Properties: *Cleavage:* On {100}, fair. Hardness = 3 D(meas.) = 2.87(1) D(calc.) = 2.85

Optical Properties: Semitransparent. *Color:* Deep brown to pale tan, greenish brown. *Luster:* Vitreous to subadamantine.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = light greenish brown to yellow; Z = dark greenish brown to yellowish green. *Orientation:* $X = a$; $Y = b$; $Z = c$. α = 1.670–1.676 β = 1.712–1.725 γ = 1.745–1.750 2V(meas.) = 60°–65°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.00(2)$ $b = 9.73(2)$ $c = 5.471(8)$ $\beta = 93°49(6)'$ Z = 2

X-ray Powder Pattern: Palermo #1 mine, New Hampshire, USA.
10.05 (10), 7.01 (7), 4.98 (7), 4.21 (7), 2.802 (7), 4.42 (6), 3.476 (5)

Chemistry:

	(1)	(2)
P_2O_5	31.2	30.62
Fe_2O_3	40.0	34.45
FeO	4.9	15.50
MnO	4.2	
H_2O	[19.7]	19.43
Total	[100.0]	100.00

(1) Palermo #1 mine, New Hampshire, USA; by electron microprobe, originally given as Fe 27.8%, Mn 3.0%, P 13.0%; with H_2O by difference and $(OH)^{1-}$ for charge balance, corresponds to $(Fe^{2+}_{0.31}Fe^{3+}_{0.28}Mn^{2+}_{0.27})_{\Sigma=0.86}Fe^{3+}_{2.00}(PO_4)_{2.00}(OH)_{2.00} \cdot 3.97H_2O$. (2) $Fe^{2+}Fe^{3+}_2(PO_4)_2(OH)_2 \cdot 4H_2O$.

Mineral Group: Arthurite group.

Occurrence: A secondary mineral in complex zoned granite pegmatites.

Association: Siderite, triphylite, ludlamite, strunzite, laueite, beraunite, mitridatite, ushkovite, Fe–Mn oxides.

Distribution: In the USA, from the Palermo #1 mine, North Groton, Grafton Co., and at the Fitzgibbon mine, Alstead, Cheshire Co., New Hampshire; from the Bell Pit, Newry, Oxford Co., Maine; in the Big Chief mine, one km south of Glendale, Pennington Co., and the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. From the Gravel Hill mine, Perranzabuloe, Cornwall, England. In the Bendada pegmatite, near Guarda, Portugal. At Hagendorf, and Hühnerkobel, near Zwiesel, Bavaria, Germany.

Name: Honoring Robert William Whitmore (1936–), Weare, New Hampshire, USA, American collector of microscopic minerals and owner of the Palermo #1 mine.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128069.

Wickenburgite $Pb_3CaAl_2Si_{10}O_{27}\cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Tabular holohedral crystals, dominated by {0001} and $\{10\bar{1}1\}$, to 1.5 mm. As spongy aggregates of small, highly perfect individuals; as subparallel aggregates or rosettes; granular.

Physical Properties: *Cleavage:* {0001}, indistinct. *Tenacity:* Brittle but tough. Hardness = 5 D(meas.) = 3.85 D(calc.) = 3.88 Fluoresces dull orange under SW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to white; rarely salmon-pink. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Dispersion:* $r < v$, moderate. $\omega = 1.692$ $\epsilon = 1.648$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 8.53$ $c = 20.16$ $Z = 2$

X-ray Powder Pattern: Near Wickenburg, Arizona, USA.
10.1 (100), 3.26 (80), 3.93 (60), 3.36 (40), 2.639 (40), 5.96 (30), 5.04 (30)

Chemistry:

	(1)	(2)
SiO_2	42.1	40.53
Al_2O_3	7.6	6.88
PbO	44.0	45.17
CaO	3.80	3.78
H_2O	3.77	3.64
Total	101.27	100.00

(1) Near Wickenburg, Arizona, USA. (2) $Pb_3CaAl_2Si_{10}O_{24}(OH)_6$. [needsnew??formula]

Occurrence: In oxidized hydrothermal veins, carrying galena and sphalerite, in quartz and fluorite gangue (near Wickenburg, Arizona, USA).

Association: Phoenicochroite, mimetite, cerussite, willemite, crocoite, duftite, hemihedrite, alamosite, melanotekite, luddenite, ajoite, shattuckite, vauquelinite, descloizite, laumontite.

Distribution: In the USA, in Arizona, at several localities south of Wickenburg, Maricopa Co., including the Potter-Cramer property, Belmont Mountains, and the Moon Anchor mine; on dumps at a Pb-Ag-Cu prospect in the Artillery Peaks area, Mohave Co.; and in the Dives (Padre Kino) mine, Silver district, La Paz Co.

Name: For Wickenburg, Arizona, USA, the community near which it was discovered.

Type Material: Harvard University, Cambridge, Massachusetts, 119099; National Museum of Natural History, Washington, D.C., USA, 122875.

Wickmanite $Mn^{2+}Sn^{4+}(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Octahedra, to 4 mm.

Physical Properties: *Cleavage:* Good on {100}. Hardness = 3.5 D(meas.) = 3.89(5) D(calc.) = 3.72–3.75

Optical Properties: Transparent to translucent. *Color:* Brownish yellow, honey-yellow, yellow-orange, greenish yellow, colorless, pink. *Streak:* White. *Luster:* Resinous. *Optical Class:* Isotropic. n = 1.705–1.780

Cell Data: *Space Group: Pn3m.* a = 7.85–7.873 Z = 4

X-ray Powder Pattern: Långban, Sweden.
3.931 (10), 1.7618 (7), 2.778 (6), 1.6080 (5), 4.552 (4), 1.0536 (4), 2.372 (3)

Chemistry:

	(1)	(2)	(3)
SnO_2	59.9	55.1	54.67
MnO	21.4	15.3	25.73
FeO	0.1	8.5	
MgO	0.6	2.4	
CaO	0.4	0.0	
H_2O	[21.8]	[20.2]	19.60
Total	[104.2]	[101.5]	100.00

(1) Långban, Sweden; by electron microprobe, original analysis given as elements, here converted to oxides; total Fe as FeO, H_2O calculated from stoichiometry; corresponding to $(Mn_{0.78}Mg_{0.03}Ca_{0.01})_{\Sigma=0.82}Sn_{1.02}(OH)_{6.24}$. (2) Pitkäranta district, Russia; by electron microprobe, average of 17 points; total Fe as FeO, H_2O calculated from stoichiometry; corresponding to $(Mn_{0.58}Fe_{0.32}Mg_{0.16})_{\Sigma=1.06}Sn_{0.98}(OH)_{5.99}$. (3) $MnSn(OH)_6$.

Mineral Group: Schoenfliesite group.

Occurrence: A rare late-stage, low-temperature mineral in magnetite ore and jacobsite-richterite-manganoan biotite skarn in a metamorphosed Fe–Mn orebody (Långban, Sweden); in a nepheline syenite pegmatite (Tvedalen, Norway); in a hydrothermal mineral deposit in altered garnet skarn (Pitkäranta district, Russia).

Association: Bementite, allactite, calcite, barite, magnetite (Långban, Sweden); burtite, stokesite, datolite, pectolite, apophyllite (El Hamman, Morocco); stokesite, axinite, grossular, pargasite, apatite, titanite, orthoclase, chalcopyrite (Whealcock Zawn, England).

Distribution: From Långban, Värmland, Sweden. In the Heia quarry, Tvedalen, near Larvik, Norway. In the Pitkäranta district, Lake Ladoga, Karelia, Russia. At Whealcock Zawn, Botallack, Cornwall, England. On the west bank of the Beht River, El Hamman, central Morocco. At Tsumeb, Namibia. From Llallagua, Bolivia.

Name: To honor Professor Franz-Erik Wickman (1915–), Swedish-American mineralogist, for his contributions to Långban mineralogy.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 532405; National Museum of Natural History, Washington, D.C., USA, 120068, 162615.

References: (1) Moore, P.B. and J.V. Smith (1967) Wickmanite, $Mn^{+2}[Sn^{+4}(OH)_6]$, a new mineral from Långban. Arkiv Mineral. Geol., 4(16), 395–399. (2) (1968) Amer. Wicksite $NaCa_2(Fe^{2+},Mn^{2+})_4MgFe^{3+}(PO_4)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are platy on {010}, striated ‖ [100], to 1 cm; granular, massive.

Physical Properties: *Cleavage:* Good on {010}. Hardness = 4.5–5 D(meas.) = 3.54(2) D(calc.) = 3.58

Optical Properties: Opaque, transparent in thin fragments. *Color:* Dark blue to dark green, nearly black. *Streak:* Green. *Luster:* Submetallic.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = blue; Y = greenish blue; Z = pale yellowish brown. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, strong. *Absorption:* $X = Y > Z$. $\alpha = 1.713(3)$ $\beta = 1.718(3)$ $\gamma = 1.728(3)$ 2V(meas.) = 66(2)° 2V(calc.) = 72°

Cell Data: *Space Group: Pcab.* $a = 12.524(1)$ $b = 12.907(2)$ $c = 11.646(2)$ Z = 4

X-ray Powder Pattern: Big Fish River, Canada.
2.753 (100), 3.015 (80), 2.910 (80), 2.118 (60), 2.571 (40), 2.868 (30), 2.837 (30)

Chemistry:

	(1)
P_2O_5	41.64
Al_2O_3	0.51
Fe_2O_3	7.98
FeO	22.66
MnO	4.72
MgO	3.77
CaO	11.05
Na_2O	3.08
H_2O	3.70
Total	99.11

(1) Big Fish River, Canada; by electron microprobe, FeO 22.66% by titration, excess Fe as Fe_2O_3, H_2O by DTA-TGA; corresponding to $Na_{1.00}Ca_{1.96}(Fe^{2+}_{3.16}Mn^{2+}_{0.66})_{\Sigma=3.82}Mg_{0.94}(Fe^{3+}_{1.00}Al_{0.10})_{\Sigma=1.10}(P_{0.98}O_4)_6 \cdot 2.06H_2O$.

Occurrence: In nodules in shale beds in an iron formation.

Association: Wolfeite, satterlyite, marićite, ludlamite, vivianite, pyrite, quartz.

Distribution: At Big Bend, on the Big Fish River, Big Fish River–Blow River area, Yukon Territory, Canada.

Name: To honor Dr. Frederick John Wicks (1937—), Curator of Mineralogy, Royal Ontario Museum, Toronto, Canada.

Type Material: Canadian Geological Survey, Ottawa, 61309; Royal Ontario Museum, Toronto, Canada, M37364; National Museum of Natural History, Washington, D.C., USA, 145607, 145968.

Widenmannite $Pb_2(UO_2)(CO_3)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. Lathlike crystals, tabular on {010}, elongated along [001], to 100 μm, showing {100}, {010}, {001}, {101}; aggregated in tufts and mats.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 6.89 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Colorless, very pale greenish yellow, yellow. *Streak:* Pale yellow. *Luster:* Pearly to silky.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.803(5)$ $\beta = 1.905(5)$ $\gamma = 1.945(5)$ 2V(meas.) = 63°

Cell Data: *Space Group:* $Pnmm$, $Pnm2_1$, or $P22_12_1$. $a = 8.971$–8.99 $b = 9.36$–9.381 $c = 4.95$–5.002 Z = 2

X-ray Powder Pattern: Michael mine, Germany.
4.16 (10), 2.34 (10), 3.19 (8b), 3.34 (7), 1.911 (5), 1.869 (5), 1.473 (5b)

Chemistry:

	(1)	(2)	(3)
CO_2	16.5	16.1	15.27
UO_3	34.2	31.8	33.09
PbO	48.3	51.7	51.64
Total	99.0	99.6	100.00

(1) Michael mine, Germany; by electron microprobe. (2) Loe Warren zawn, England; by electron microprobe, here recalculated to oxides. (3) $Pb_2(UO_2)(CO_3)_3$.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal As–Pb-bearing deposit (Michael mine, Germany); an alteration product of sulfides by sea water (Loe Warren zawn, England).

Association: Hügelite, hallimondite, cerussite, galena, quartz (Michael mine, Germany); dewindtite, uraninite (Loe Warren zawn, England).

Distribution: From the Michael mine, Weiler, near Lahr, Black Forest, Germany. At Jáchymov (Joachimsthal), Czech Republic. From Loe Warren zawn, 0.75 km west of Botallack, St. Just, Cornwall, England.

Name: To honor Johann Friedrich Wilhelm Widenmann (1764–1798), German mineralogist who discovered uranium in the Black Forest.

Type Material: [University of Strassburg, Strassburg, France.]

Widgiemoolthalite $(Ni, Mg)_5(CO_3)_4(OH)_2 \cdot 4-5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* [2/*m*.] Radiating fibrous spheroids, to 3 mm, and in felted masses.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.13(1) D(calc.) = 3.24

Optical Properties: Semitransparent. *Color:* Bluish green, grass-green; bluish green in transmitted light. *Streak:* Pale bluish green. *Luster:* Silky.
Optical Class: Biaxial (+). *Orientation:* Length-fast. $\alpha = 1.630(5)$ β = n.d. $\gamma = 1.640(5)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to hydromagnesite). $a = 10.06(17)$ $b = 8.75(5)$ $c = 8.32(4)$ $\beta = 114.4(8)^\circ$ Z = 2

X-ray Powder Pattern: 132 North nickel mine, Western Australia.
5.75 (10), 6.30 (5), 4.36 (4), 2.871 (4), 4.14 (3), 2.120 (3), 2.458 (2)

Chemistry:

	(1)
CO_2	28.9
NiO	54.6
MgO	2.4
H_2O	17.0
Total	102.9

(1) 132 North nickel mine, Western Australia; by electron microprobe, average of 14 analyses, CO_2 and H_2O determined by CHN analyzer; corresponds to $(Ni_{4.62}Mg_{0.38})_{\Sigma=5.00}(CO_3)_{4.15}(OH)_{1.70} \cdot 5.12H_2O$.

Occurrence: In a stockpile of weathered ore from a hydrothermal nickel deposit.

Association: Gaspéite.

Distribution: From the 132 North nickel mine, 4 km southwest of Widgiemooltha, Western Australia.

Name: For its occurrence near Widgiemooltha, Western Australia.

Type Material: Western Australian Museum, Perth, Australia, M.1.1993.

References: (1) Nickel, E.H., B.W. Robinson, and W.G. Mumme (1993) Widgiemoolthalite: the new nickel analogue of hydromagnesite from Western Australia. Amer. Mineral., 78, 819–821.

Total	[100.38]	100.00

(1) Commercial quarry, California, USA; recalculated after deduction of szaibélyite estimated 3%; corresponds to $(Mg_{4.74}Ca_{0.16}Fe_{0.10})_{\Sigma=5.00}O[(B_{1.07}Al_{0.14})_{\Sigma=1.21}O_3](OH)_5 \cdot 2H_2O$.
(2) $Mg_5O(BO_3)(OH)_5 \cdot 2H_2O$.

Occurrence: Very rare in contact metamorphosed limestone.

Association: Fluoborite, szaibélyite, dolomite, calcite (Commercial quarry, California, USA).

Distribution: In the USA, from the Commercial quarry, near Crestmore, Riverside Co., and north of Huntington Lake, Twin Lakes region, Fresno Co., California.

Name: Honors Randall H. Wightman (1915–1969), Director of Exploration and Mining of the Riverside Cement Co., Riverside, California, USA.

Type Material: n.d.

References: (1) Murdoch, J. (1962) Wightmanite, a new borate mineral from Crestmore, California. Amer. Mineral., 47, 718–722. (2) Moore, P.B. and T. (1) Lone Pine mine, New Mexico, USA; by microanalysis, H_2O by the Penfield method.
(2) Deputatskoye deposit, Russia. (3) $MgAl(SO_4)_2F \cdot 18H_2O$.

Occurrence: A rare post-mine mineral deposited from solutions derived from an oxidizing breccia zone (Lone Pine mine, New Mexico, USA); in intensely oxidized cassiterite–tourmaline–quartz–polysulfide ore (Deputatskoye deposit, Russia).

Association: Fluorite, gypsum, khademite, lannonite, pyrite (Lone Pine mine, New Mexico, USA); melanterite, fibroferrite, gypsum, goethite, ice (Deputatskoye deposit, Russia).

Distribution: From the Lone Pine mine, Wilcox district, near Silver City, Catron Co., New Mexico, USA. In the Deputatskoye tin deposit, northeast Sakha, Russia. From the Valle del Cura, San Juan Province, Argentina.

Name: To honor William Wilcox (?–1880), discoverer of the Wilcox district, New Mexico, USA.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,545; National Museum of Natural History, Washington, D.C., USA, 149525.

Wilhelmkleinite $ZnFe_2^{3+}(AsO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Spearhead-shaped crystals, to 5 mm, exhibiting {100}, {430}, {$31\overline{1}$}, in aggregates. *Twinning:* Interpenetration twins on {101}.

Physical Properties: *Cleavage:* On {$23\overline{2}$}. Hardness = 4.5 D(meas.) = n.d. D(calc.) = 4.364

Optical Properties: Translucent. *Color:* Blackish green. *Streak:* Green. *Luster:* Dull, adamantine on fractures.
Optical Class: Biaxial. *Pleochroism:* Strong; olive-green to emerald-green to reddish brown. $n = \sim 1.94$ α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/n$. $a = 6.631(1)$ $b = 7.611(1)$ $c = 7.377(1)$ $\beta = 91.80(1)^\circ$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
3.385 (100), 3.315 (78), 2.939 (47), 1.621 (34), 1.652 (32), 2.381 (29), 2.839 (28)

Chemistry:

	(1)	(2)
As_2O_5	46.69	47.01
Fe_2O_3	33.60	32.66
ZnO	13.81	16.65
H_2O	[5.90]	3.68
Total	[100.00]	100.00

(1) Tsumeb, Namibia; by electron microprobe, average of five analyses, total Fe as Fe_2O_3, H_2O by difference; corresponding to $Zn_{0.84}Fe_{2.07}(AsO_4)_2(OH_{1.6})_2$. (2) $ZnFe_2(AsO_4)_2(OH)_2$.

Occurrence: Very rare from a deep oxidation zone in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Scorodite, gerdtremmelite, adamite.

Distribution: From Tsumeb, Namibia.

Name: To honor Wilhelm Klein (1889–1939), Manager of the Otavi Mining and Railroad Company mines in Namibia (1916–1939), an early collector of Tsumeb minerals.

Type Material: Mineralogical Museum, University of Hamburg, Hamburg, Germany.

H_2O	[13.4]	11.44
Total	[100.0]	100.00

(1) Hagendorf, Germany; by electron microprobe, originally given as PO_4 47.5%, Fe 13.3%, Mn 13.6%, Zn 2.1%, Ca 8.5%, H_2O 15.0% by difference, total 100.0%, here converted to oxides, total Fe as Fe_2O_3, total Mn as MnO, $(OH)^{1-}$ determined present by IR; stated to correspond to $(Ca_{0.85}Zn_{0.13})_{\Sigma=0.98}Mn^{2+}_{0.99}Fe^{3+}_{0.95}(PO_4)_2(OH)\cdot 2.33H_2O$. (2) $CaMn^{2+}Fe^{3+}(PO_4)_2(OH)\cdot 2H_2O$.

Mineral Group: Overite group.

Occurrence: A rare secondary mineral in a complex zoned granite pegmatite.

Association: Rockbridgeite, zwieselite.

Distribution: From Hagendorf, Bavaria, Germany.

Name: To honor Wilhelm Vierling (1901–1995), Weiden, Germany, a longtime student of Hagendorf minerals.

Type Material: Institute for Mineralogy and Crystallography, Technical University, Berlin, Germany.

			Total	98.26	100.41

(1) Warrumbungle volcano, Australia; by electron microprobe, average of 22 analyses of nine grains, Fe^{2+}:Fe^{3+} calculated from stoichiometry in empirical analysis; corresponds to $(Na_{2.04}Ca_{0.02}K_{0.01})_{\Sigma=2.07}(Fe^{2+}_{3.90}Mn_{0.15})_{\Sigma=4.05}(Fe^{3+}_{1.69}Nb_{0.11}Ti_{0.07}Zr_{0.01})_{\Sigma=1.88}(Si_{5.88}Al_{0.11})_{\Sigma=5.99}O_{20}$. (2) Wonchi volcano, Ethiopia; by electron microprobe, average of five analyses, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Na_{1.68}K_{0.14}Ca_{0.11})_{\Sigma=1.93}(Fe^{2+}_{1.75}Mg_{1.20}Fe^{3+}_{0.92}Mn_{0.26}Ni_{0.02})_{\Sigma=4.15}(Fe^{3+}_{1.93}Ti_{0.07})_{\Sigma=2.00}(Si_{4.27}Fe^{3+}_{1.71}Al_{0.01}Cr_{0.01})_{\Sigma=6.00}O_{20}$.

Polymorphism & Series: Forms a series with aenigmatite.

Mineral Group: Aenigmatite group.

Occurrence: In an eruptive peralkaline trachyte (Warrumbungle volcano, Australia); in syenite ejecta (Wonchi volcano, Ethiopia).

Association: Anorthoclase, sodalite, clinopyroxenes, nepheline, analcime, arfvedsonite, eudialyte (Warrumbungle volcano, Australia); riebeckite, biotite, aegirine, aenigmatite (Wonchi volcano, Ethiopia).

Distribution: At the Warrumbungle volcano and associated Bingie Grumble Mountain, New South Wales, Australia. On the Wonchi volcano, 90 km south of Addis Ababa, Ethiopia.

Name: For John Frederick George Wilkinson, Emeritus Professor of Geology, University of New England, Armidale, Australia.

Type Material: Petrological Museum, Bureau of Mineral Resources, Canberra, Australia, R29655.

References: (1) Duggan, M.B. (1990) Wilkinsonite, $Na_2Fe^{2+}_4Fe^{3+}_2Si_6O_{20}$, a new member of the aenigmatite group from the Warrumbungle Volcano, New South Wales, Australia. Amer. (1) Kuusamo, Finland; by electron microprobe. (2) Ni_3Se_4.

Polymorphism & Series: Dimorphous with trüstedtite.

Occurrence: A primary phase and an alteration product of sederholmite, in albite diabase sills that cut a schist formation, associated with low-grade uranium mineralization.

Association: Sederholmite, penroseite, selenium, ferroselite, selenian vaesite, cattierite, calcite.

Distribution: From Kuusamo, northeastern Finland.

Name: For W.W. Wilkman, geologist.

Type Material: n.d.

References: (1) Vuorelainen, Y., A. Huhma, and A. Häkli (1964) Sederholmite, wilkmanite, kullerudite, mäkinenite, and trüstedtite, five new nickel selenide minerals. Compt. Rendus Soc. Géol. Finlande, 36, 113–125. (2) (1965) 50, 519 (abs. ref. 1).

(1–2) Franklin, New Jersey, USA. (3) Zn_2SiO_4.

Occurrence: Of secondary origin, especially in zinc deposits developed in limestones; while uncommon, locally an important ore of zinc.

Association: Nasonite, glaucochroite, leucophoenicite (Franklin, New Jersey, USA); malachite, mimetite, rosasite, duftite, cerussite (Tsumeb, Namibia).

Distribution: In Belgium, from Altenberg, near Moresnet. At Tsumeb and Guchab, Namibia. From Kabwe (Broken Hill), Zambia. In the USA, large crystals at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; from Balmat, St. Lawrence Co., New York; in Arizona, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., at the Red Cloud mine, La Paz Co., and other minor localities; in California, at the Ygnacis and Cerro Gordo mines, Inyo Co.; in the Tres Hermanas district, Luna Co., New Mexico. From Mont Saint-Hilaire, Quebec, Canada. In a large deposit at the Puttapa zinc mine, near Beltana, South Australia. There are many other minor localities.

Name: For William I (1772–1843), King of the Netherlands (1815–1840).

(1) Ettringer Bellerberg volcano, Germany; by electron microprobe, H_2O by difference; corresponds to $K_{0.73}Ca_{1.03}Al_3Si_3O_{12}\cdot 4.5H_2O$. (2) San Venanzo quarry, Italy; by electron microprobe, H_2O by difference; corresponds to $K_{0.90}Ca_{1.01}Al_{2.93}Si_{3.08}O_{12}\cdot 5.4H_2O$.

Mineral Group: Zeolite group.

Occurrence: A secondary mineral formed by low-temperature hydrothermal alteration of potassic basaltic lavas (San Venanzo quarry, Italy); by contact metasomatism of limestone xenoliths in basalts (Ettringer Bellerberg volcano, Germany).

Association: Phillipsite, thomsonite, apophyllite, melilite (San Venanzo quarry, Italy); gismondine, chabazite, ettringite, thaumasite, phillipsite, thomsonite (Ettringer Bellerberg volcano, Germany).

Distribution: In the Vispi quarry, near San Venanzo, Umbria, Italy. In Germany, at the Ettringer Bellerberg volcano, near Mayen, Eifel district, Germany. From the Stradnerkogel, near Wilhelmsdorf, Styria, Austria.

Name: For Dr. William A. Henderson, Jr. of Stamford, Connecticut, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 119472; National Museum of Natural History, Washington, D.C., USA, 148655, 148656.

(1) Broken Hill, Australia. (2–3) Do.; by electron microprobe.

Polymorphism & Series: Forms a series with ullmannite.

Mineral Group: Cobaltite group.

Occurrence: In calcite–siderite veins.

Association: Dyscrasite, costibite, calcite, siderite.

Distribution: In the Consols lode, Broken Hill, Willyama Township, New South Wales, Australia.

Name: For the locality in Willyama Township, New South Wales, Australia.

Type Material: National Museum of Natural History, Washington, D.C., USA, R849A.

Winchite $[NaCa][(Mg,Fe^{2+})_4Al]Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. In stout prismatic to acicular crystals, to 4 cm. As blades, fibers, and in rosettes or spherules.

Physical Properties: *Cleavage:* [Perfect on {110}, intersecting at ∼56° and ∼124°; partings on {100}, {001}.] *Fracture:* [Uneven.] *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = 2.97–3.175 D(calc.) = [3.02] Crystals are commonly strongly zoned chemically.

Optical Properties: Transparent to translucent. *Color:* Colorless, cobalt blue to bluish violet; colorless to pale blue in thin section. *Luster:* [Vitreous.]
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = light blue-violet; Z = light blue. *Orientation:* [$Z \wedge c = 16°$.] *Dispersion:* $r > v$, strong. $\alpha = 1.629$ $\beta = 1.643$ $\gamma = 1.650$ 2V(meas.) = 64(2)°

Cell Data: *Space Group:* $C2/m$. $a = 9.834$ (ICDD 20-1390). $b = 18.062$ $c = 5.300$ $\beta = 104.449°$ Z = 2

X-ray Powder Pattern: Kajlidongri mine, India. (ICDD 20-1390).
2.699 (100), 8.40 (90), 2.528 (90), 4.48 (70), 3.40 (70), 3.12 (50), 2.976 (40)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
SiO_2	56.08	54.41	FeO		6.09	Na_2O	3.48	4.01
TiO_2	0.00	0.20	MnO	0.67	0.04	K_2O	0.55	0.16
Al_2O_3	1.91	7.00	MgO	20.66	14.25	Total	97.18	97.20
Fe_2O_3	5.27	4.72	CaO	8.56	6.32			

(1) Kajlidongri mine, India; by electron microprobe, total Fe as Fe_2O_3; corresponds to $(Ca_{1.27}Na_{0.94}K_{0.10})_{\Sigma=2.31}(Mg_{4.27}Fe^{3+}_{0.55}Al_{0.09}Mn_{0.08})_{\Sigma=4.99}(Si_{7.78}Al_{0.22})_{\Sigma=8.00}O_{22}(OH)_2$.
(2) Margarita Island, Venezuela; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Na_{1.09}Ca_{0.95}K_{0.03})_{\Sigma=2.07}(Mg_{2.97}Al_{0.79}Fe^{2+}_{0.71}Fe^{3+}_{0.50}Ti_{0.02}Mn_{0.01})_{\Sigma=5.00}(Si_{7.63}Al_{0.37})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with ferrowinchite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A < 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; $Si \geq 7.5$.

Occurrence: In schists with low-grade metamorphosed manganese deposits; in metabasalts of the jadeite-glaucophane and amphibolite-eclogite facies; in manganiferous cherts that have undergone blueschist facies metamorphism.

Association: Calcite, microcline, diopside, plagioclase, apatite, tremolite (Kajlidongri mine, India); omphacite, garnet, rutile, quartz, actinolite, epidote, albite, titanite, apatite (Margarita Island, Venezuela); actinolite, glaucophane, albite, quartz (Ward Creek, California, USA).

Distribution: In the Kajlidongri mine, Jhabua district, Madhya Pradesh, India. From near El Valle del Espiritu Santo, Margarita Island, Venezuela. In the Praborna mine, near St. Marcel, Val d'Aosta, Italy. At Ward Creek, Cazadero, Sonoma Co., California, USA. From north of Kitami City, Hokkaido, Japan.

Name: For H.J. Winch, who first found the mineral.

Type Material: n.d.

Winstanleyite $TiTe_3^{4+}O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Cubes, rarely modified by the octahedron, with concave faces, to 0.5 mm, in castellated groups.

Physical Properties: *Tenacity:* Brittle but tough. Hardness = 4 D(meas.) = 5.57(4) D(calc.) = [5.63]

Optical Properties: Semitransparent. *Color:* Bright yellow, tan, cream. *Streak:* Very pale yellow.
Optical Class: Isotropic. $n = 2.34(2)$

Cell Data: *Space Group:* $Ia3$. a = 10.963 Z = [8]

X-ray Powder Pattern: Grand Central mine, Arizona, USA.
3.165 (10), 1.938 (8), 1.653 (8), 2.741 (7), 4.474 (6), 2.930 (4), 2.583 (4)

Chemistry:

	(1)	(2)
TeO_2	85.8	85.70
TiO_2	10.9	14.30
Fe_2O_3	3.2	
Total	99.9	100.00

(1) Grand Central mine, Arizona, USA; corresponds to $Ti_{0.76}Fe_{0.11}Te_{3.00}O_8$. (2) $TiTe_3O_8$.

Occurrence: Very rare in strongly altered and pyritized granodiorite from the dump of a hydrothermal Au–Te-bearing ore deposit.

Association: Jarosite, chlorargyrite, rodalquilarite, "opal".

Distribution: From the Grand Central mine, Tombstone, Cochise Co., Arizona, USA.

Name: To honor Betty Jo Winstanley Williams (1934–), who collected the first specimen.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,538; Harvard University, Cambridge, Massachusetts, USA, 119095.

Wiserite $(Mn^{2+},Mg)_{14}B_8(Si,Mg)O_{22}Cl(OH)_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. In prismatic to fibrous crystals, elongated $\parallel$ [001], to 1 cm, showing {100} and {110}; in platy aggregates, very fine grained, massive.

Physical Properties: Hardness = 2.5 D(meas.) = 3.54(8) D(calc.) = 3.57

Optical Properties: Transparent. *Color:* White to light pinkish brown. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* O = colorless to bright orange-brown; E = bright to dark orange-brown. ω = 1.751–1.753 ϵ = 1.700–1.715

Cell Data: *Space Group:* $P4/n$. $a = 20.192(6)$ $c = 3.281(2)$ Z = 2

X-ray Powder Pattern: Kombat mine, Namibia.
3.365 (100), 2.854 (90), 6.40 (85), 2.654 (80), 2.753 (70), 2.702 (65), 2.522 (65)

Total	[100.00]	97.8	

(1) Gonzen, Switzerland; recalculated to 100.00% after deduction of Al_2O_3 1.00% and insoluble 1.20%. (2) Kombat mine, Namibia; by electron microprobe, B by titration, H_2O by TGA-EGA and the Penfield method; corresponds to $Mn_{12.98}Mg_{1.74}Ca_{0.08}Fe_{0.04}B_{7.17}Si_{0.48}O_{32.52}Cl_{0.85}H_{11.08}$. (3) Yaei mine, Japan; by electron microprobe, partial analysis.

Occurrence: An accessory mineral in stratiform manganese deposits.

Association: Hausmannite, jacobsite, alleghanyite, pyrochroite, pyrobelonite, calcite, rhodochrosite, jimboite, sussexite, alabandite, galaxite, tephroite, gageite.

Distribution: From the Gonzen mine, near Sargans, St. Gallen, Switzerland. In the Kombat mine, 49 km south of Tsumeb, Namibia. In Japan, at the Yaei mine, Tsuchiyama, Shiga Prefecture; the Kaso mine, Tochigi Prefecture; and the Azuma, Nakanoyama, and Rito mines, Gumma Prefecture.

Name: For David Friedrich Wiser (1802–1878), Swiss mineralogist who first analyzed the mineral.

Type Material: Federal Institute of Technology, Zurich, Switzerland, 194501; Harvard University, Cambridge, Massachusetts, 126918; National Museum of Natural History, Washington, D.C., USA, 163804, 163341.

Witherite $BaCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Pseudohexagonal dipyramidal due to repeated twinning, short prismatic to elongated along [001], {010}, {021}, {012}, other faces commonly rough and horizontally striated, to 12 cm. May be botryoidal to spherical, columnar fibrous, granular, massive. *Twinning:* On {110}, universal.

Physical Properties: *Cleavage:* On {010}, distinct; on {110}, {012}, poor. *Fracture:* Uneven. Hardness = 3–3.5 D(meas.) = 4.22–4.31 D(calc.) = 4.24–4.29 Fluorescent and phosphorescent under UV, X-rays, and electron beams.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale gray, may be tinted pale yellow, pale brown, or pale green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, resinous on fractures.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, very weak. $\alpha = 1.529$ $\beta = 1.676$ $\gamma = 1.677$ 2V(meas.) = 16°

Cell Data: *Space Group: Pmcn* (synthetic). $a = 5.314$ $b = 8.904$ $c = 6.430$ Z = 4

X-ray Powder Pattern: Synthetic.
3.72 (100), 3.68 (53), 2.150 (28), 2.628 (24), 2.590 (23), 2.019 (21), 3.215 (15)

Chemistry:

	(1)	(2)
CO_2	[22.50]	22.30
CaO	0.08	
SrO	0.68	
BaO	77.15	77.70
Total	[100.41]	100.00

(1) Anglezark, England; by electron microprobe, CO_2 calculated for stoichiometry; corresponds to $(Ba_{0.99}Sr_{0.01})_{\Sigma=1.00}CO_3$. (2) $BaCO_3$.

Polymorphism & Series: Forms a series with strontianite.

Mineral Group: Aragonite group.

Occurrence: Usually in minor amounts in low-temperature hydrothermal veins, typically an alteration product of barite; may be of anoxic sedimentary origin, barium supplied by volcanic hot-spring activity; uncommon in coal measures.

Association: Barite, fluorite, calcite, galena.

Distribution: Only a few localities are given here; in England, from Alston Moor, Cumbria; fine crystals from the Settlingstones mine, near Fourstones, and at Fallowfield, near Hexham, Northumberland. From Leogang and at Peggau, north of Graz, Styria, Austria. At Příbram, Czech Republic. From Freiberg and St. Andreasberg, Harz Mountains, Germany. In the Arkhyz deposit, Caucasus Mountains, Russia. In the USA, fine large crystals from several mines around Rosiclare, as in the Minerva #2 mine, Cave-in-Rock, Hardin Co., Illinois; at Pigeon Roost, Montgomery Co., Arkansas. In the Jason Pb–Zn deposits, Macmillan Pass, Yukon Territory, Canada. Large deposits occur from Ziyang to Chengkou, along the boundary between Shaanxi and Sichuan Provinces, China. At the Hasei mine, Akita Prefecture, Japan. In the Hunter Valley coal deposits, New South Wales, Australia.

Name: In honor of Dr. William Withering (1741–1799), English physician and mineralogist, who first noted the mineral.

Wittichenite Cu_3BiS_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Commonly massive. Crystals rare, prismatic parallel to [001]; prisms show striae and are typically blocky in aspect.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2–3 VHN = 170–187 (100 g load). D(meas.) = 6.01, 6.19 (synthetic). D(calc.) = 6.19

Optical Properties: Opaque. *Color:* Steel-gray to tin-white, tarnishing pale lead-gray or brass-yellow; white to creamy white to grayish white in reflected light. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Weak, shades of dark brown.

R_1–R_2: (400) 35.0–36.9, (420) 34.1–35.8, (440) 33.2–34.7, (460) 32.7–34.0, (480) 32.6–34.1, (500) 32.9–34.7, (520) 33.2–35.0, (540) 33.5–35.2, (560) 33.6–35.3, (580) 33.5–35.3, (600) 33.2–35.2, (620) 33.0–35.2, (640) 32.8–35.2, (660) 32.4–35.0, (680) 31.7–34.6, (700) 30.8–34.0

(1) Daniel mine, Wittichen, Germany; by electron microprobe. (2) Seathwaite Tarn, England; by electron microprobe. (3) Wittichen, Germany; by electron microprobe. (4) Cu_3BiS_3.

Occurrence: In hydrothermal veins with other bismuth minerals (Wittichen, Germany); with Cu-Fe sulfides (Seathwaite Tarn, England); with secondary uranium minerals and selenides of Cu, Pb, and Bi (Kletno, Poland).

Association: Bornite, chalcocite, chalcopyrite, djurleite, digenite, tennantite, pyrite, stromeyerite, bismuth, emplectite, rammelsbergite, calcite, aragonite, fluorite, barite.

Distribution: In the USA, at Butte, Silver Bow Co., Montana; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; and at Bisbee, Cochise Co., Arizona. In Canada, in the Maid of Erin mine, Rainy Hollow district, British Columbia; and at Cobalt, Ontario. In Germany, in the Schapbachtal, and at the Neuglück, Daniel, and King David mines, near Wittichen, Black Forest. In the Sedmochislenitsi mine, Vratsa district, Bulgaria. At the Colquijirca mine, Junín, Peru. From Seathwaite Tarn, northwest of Coniston, Cumbria, England. At Tjøstulflaten, Norway. In the Kletno mine, Sudetes Mountains, Poland. Additional localities are known.

Name: After the type locality, Wittichen, Germany.

Type Material: Royal Ontario Museum, Toronto, Canada, M23304; Harvard University, Cambridge, Massachusetts, USA, 82408, 82409.

Wodginite $Mn^{2+}(Sn^{4+}, Ta)Ta_2O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly flattened, dipyramidal {111}, may be prismatic, to 15 cm; in radiating groups; granular, massive. *Twinning:* Very common, as penetration twins with {001} or {100} as composition plane.

Physical Properties: *Fracture:* [Irregular] (by analogy to the wodginite group). *Tenacity:* [Brittle.] Hardness = [5.5] D(meas.) = 7.19–7.36 D(calc.) = 7.69–7.81

Optical Properties: Opaque, translucent in thin fragments. *Color:* Reddish brown, dark brown to black; light yellow to reddish brown in transmitted light; grayish white in reflected light.
Optical Class: Biaxial. *Anisotropism:* Weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $C2/c$. $a = 9.417$–9.533 $b = 11.394$–11.504 $c = 5.082$–5.142 $\beta = 90.00°-91.21°$ Z = 4

X-ray Powder Pattern: Wodgina, Western Australia; may be confused with columbite. 3.00 (100), 3.67 (70), 2.95 (70), 2.50 (29), 1.774 (27), 2.87 (25), 2.55 (21)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

				Total	100.22	98.57	100.00

(1) Wodgina, Western Australia; corresponds to $Mn_{1.00}(Ta_{0.44}Sn_{0.38}Fe_{0.12})_{\Sigma=0.94}(Ta_{1.63}Nb_{0.37})_{\Sigma=2.00}O_8$. (2) Tanco pegmatite, Canada; by electron microprobe, total Fe as Fe_2O_3; corresponds to $Mn_{0.99}(Sn_{0.56}Ta_{0.23}Ti_{0.12}Fe_{0.06})_{\Sigma=0.97}(Ta_{1.80}Nb_{0.20})_{\Sigma=2.00}O_8$. (3) $MnSnTa_2O_8$.

Mineral Group: Wodginite group: $Li_A \leq 0.5$; $Fe^{2+}_A \leq 0.5$; $Ti_B \leq 0.5$; $Fe^{3+}_B \leq 0.25$.

Occurrence: In a complex zoned pegmatite in amphibolite (Tanco pegmatite, Canada).

Association: Tantalite, albite, quartz, muscovite (Wodgina, Western Australia); tapiolite, microlite, microcline, albite, mica (Tanco pegmatite, Canada).

Distribution: A few localities for well-studied material include: from Wodgina, Marble Bar, and Greenbushes, Western Australia. An ore in the Tanco pegmatite, Bernic Lake, and elsewhere in Manitoba, Canada. In the USA, at the Strickland quarry, Portland, Middlesex Co., Connecticut; in the Herbb #2 pegmatite, six km northeast of Flat Rock, Powhatan Co., Virginia; from the McAllister mine, Rockford, Coosa Co., Alabama; in the Peerless mine, near Keystone, Pennington Co., South Dakota. In Brazil, from the Jabuti mine, Baixio, Galiléia, and large crystals from Araçuia and Sapucaia do Norte, Galilea, Minas Gerais; in the Seridozinho mine, Joazeiro, Paraíba; at the Alto do Giz pegmatite, near Parelhas, Rio Grande do Norte. From Krasonice, Czech Republic. In the Eräjärvi area, Orivesi, Finland. From Kalba, eastern Kazakhstan. From Ankole, Uganda. In the Benson pegmatite, Miami district, Zimbabwe. From Karibib and Kohero, Namibia.

Name: For its occurrence at Wodgina, Western Australia.

Type Material: Geological Survey, Perth, 8492; Western Australian Museum, Perth, Australia, S388B; Canadian Geological Survey, Ottawa, 12200; Royal Ontario Museum, Toronto, Canada, M25655.

Wöhlerite $NaCa_2(Zr,Nb)Si_2O_7(O,OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Crystals prismatic, to 3 cm, tabular on [100]; granular. *Twinning:* Twin plane {100}, common; may be complex, lamellar.

Physical Properties: *Cleavage:* {010}, distinct; {100} and {110}, poor. *Fracture:* Conchoidal to splintery. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 3.40–3.44 D(calc.) = 3.42 Blue-green cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Pale yellow to yellow, brown, or gray; in transmitted light, colorless to light yellow. *Streak:* Pale yellow. *Luster:* Vitreous, inclining to resinous, dull, and greasy.
Optical Class: Biaxial (–). *Pleochroism:* Weak to moderate; $X = Y$ = nearly colorless to pale yellow; Z = wine-yellow. *Orientation:* $Z = b$; $X \wedge c = 45°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.700–1.705$ $\beta = 1.716–1.720$ $\gamma = 1.726–1.728$ 2V(meas.) = 70°–77°

(1) Langesundsfjord, Norway; corresponds to $Na_{0.97}(Ca_{1.93}Fe_{0.09}Mn_{0.06}Mg_{0.01})_{\Sigma=2.09}(Zr_{0.52}Nb_{0.39}Ce_{0.02}Ti_{0.02})_{\Sigma=0.95}Si_{2.01}O_7[O,(OH),F_{0.63}]_2$. (2) Do.; by electron microprobe, corresponds to $Na_{1.01}(Ca_{1.84}Fe_{0.10}Mn_{0.05}Mg_{0.03})_{\Sigma=2.02}(Zr_{0.47}Nb_{0.37}Ti_{0.06}Ta_{0.03}Y_{0.02}Ce_{0.01}Hf_{0.01})_{\Sigma=0.97}Si_{2.05}O_7[O,(OH),F_{0.56}]_2$.

Occurrence: A late phase in alkalic pegmatites; an accessory mineral in nepheline syenites; in fenites associated with alkaline intrusives; and in carbonatites.

Association: Cancrinite, ferro-hornblende, aegirine, astrophyllite, mosandrite, eudialyte, catapleiite, rosenbuschite, låvenite, zircon, pyrochlore, betafite, latrappite, niobian perovskite, niobian zirconolite, albite, nepheline, biotite, fluorite.

Distribution: On a number of islands in the Langesundsfjord, around Brevik, and at Tvedalen, Norway. In Russia, from the Khibiny and Lovozero massifs, Kola Peninsula; in Siberia, in the Burpala massif, about 120 km north of Lake Baikal, at Zaangar'ya, Yenisei Ridge, and in the Sangilene massif. At Kruft and Mendig, Eifel district, Germany. In the USA, at Red Hill, Moultonborough, Carroll Co., New Hampshire, and Magnet Cove, Hot Spring Co., Arkansas. In Canada, at Mont Saint-Hilaire and Oka, Quebec; in the Prairie Lake complex, Ontario. On the Los Islands, Guinea. From the Tchivira Mountains, Quilengues, Angola. In the Muri Mountains, Guyana. From carbonatites at In Imanal and Wadi Anezrouf, Mali.

Name: For Professor Friedrich Wöhler (1800–1882), German chemist, Göttingen, Germany.

Wolfeite $(Fe^{2+},Mn^{2+})_2(PO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very rarely as tiny crystals; typically columnar to coarse fibrous aggregates, to 10 cm, or granular.

Physical Properties: *Cleavage:* {100}, good; {120}, fair; {010}, poor; {110}, very poor. *Fracture:* Uneven to subconchoidal. Hardness = 4.5–5 D(meas.) = 3.79–3.82 D(calc.) = 3.88

Optical Properties: Opaque, transparent in small grains. *Color:* Reddish brown, pinkish brown, clove-brown, pale brown. *Luster:* Vitreous to silky if fibrous.
Optical Class: Biaxial (+). *Dispersion:* $r > v$, very strong. $\alpha = 1.741$–1.750 $\beta = 1.742$–1.750 $\gamma = 1.746$–1.759 2V(meas.) = 51°

Cell Data: *Space Group:* $P2_1/a$. $a = 12.319(1)$ $b = 13.230(2)$ $c = 9.840(1)$ $\beta = 108°24(1)'$ Z = 16

X-ray Powder Pattern: Hagendorf, Germany; close to triploidite.
3.098 (100), 3.191 (80), 2.929 (70), 2.817 (60), 2.881 (30), 3.649 (25), 3.381 (20)

(1) Palermo #1 mine, New Hampshire, USA. (2) Hagendorf, Germany; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponding to $(Fe_{1.58}Mn_{0.40})_{\Sigma=1.98}(PO_4)_{1.02}(OH)_{1.18}$. (3) $(Fe,Mn)_2(PO_4)(OH)$ with Fe:Mn = 1:1.

Polymorphism & Series: Forms a series with triploidite.

Occurrence: A secondary mineral, formed by hydrothermal alteration of triphylite in complex zoned granite pegmatites; rarely in hydrothermal veins; in phosphatic nodules in shales.

Association: Triphylite, triplite, hagendorfite, arrojadite, apatite (pegmatites); wicksite, satterlyite, marićite (shales).

Distribution: In the USA, from the Palermo #1 mine, near North Groton, and at the Keyes mine, Orange, Grafton Co., New Hampshire; in the Big Chief, Bull Moose, and Ross (Highland Lode) mines, near Custer, Custer Co., South Dakota. Large examples from the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. At Hagendorf, Bavaria, Germany. From Congrier, Mayenne, France. At the Norrö pegmatite, on Rånö Island, and from Skrumpetorp, Sweden. In the Panasqueira Sn–W deposit, Portugal. From Wilson's quarry, Thackaringa district, 40 km southwest of Broken Hill, New South Wales, Australia.

Name: To honor Professor Caleb Wroe Wolfe (1908–1980), American crystallographer, Boston University, Boston, Massachusetts, USA.

Type Material: The Natural History Museum, London, England, 1963,230; Harvard University, Cambridge, Massachusetts, USA, 100868, 100870, 100871.

Wollastonite $CaSiO_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or triclinic. *Point Group:* $2/m$ or $\bar{1}$. Crystals tabular ∥ {100} or {001}, or short to long prismatic, to 20 cm. Commonly cleavable, parallel fibrous, or compact, massive. *Twinning:* Common; twin axis [010], composition plane {100}.

Physical Properties: *Cleavage:* {100} perfect; {001} and {$\bar{1}$02}, good; (100) ∧ (001) = 84.5°. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5–5. D(meas.) = 2.86–3.09 D(calc.) = 2.90 May exhibit yellow catholuminescence.

Optical Properties: Transparent to translucent. *Color:* White, colorless, brown, red, yellow, pale green; colorless in thin section. *Streak:* White. *Luster:* Vitreous, pearly on cleavage. *Optical Class:* Biaxial (–). *Orientation:* $X \wedge c = 30°–44°$; $Y \wedge b = 0°–5°$; $Z \wedge a = 37°–50°$. *Dispersion:* $r > v$, weak. $\alpha = 1.616–1.640$ $\beta = 1.628–1.650$ $\gamma = 1.631–1.653$ 2V(meas.) = 36°–60°

Cell Data: *Space Group:* $P2_1/a$. $a = 15.409(3)$ $b = 7.322(1)$ $c = 7.063(1)$ $\beta = 95.30(2)°$ Z = 12, or *Space Group:* $P\bar{1}$. $a = 7.94$ $b = 7.32$ $c = 7.07$ $\alpha = 90°2'$ $\beta = 95°22'$ $\gamma = 103°26'$ Z = 6

X-ray Powder Pattern: Sampo mine, Okayama Prefecture, Japan (1A).

(1) Remonmaki, Finland; corresponds to $(Ca_{1.01}Mg_{0.01})_{\Sigma=1.02}Si_{0.99}O_3$. (2) North mine, Broken Hill, New South Wales, Australia; corresponds to $(Ca_{0.76}Mn_{0.14}Fe_{0.09})_{\Sigma=0.99}(Si_{1.00}Al_{0.01})_{\Sigma=1.01}O_3$.

Polymorphism & Series: 1A, 2M, 3A, 4A, 5A, 7A polytypes.

Occurrence: Common in thermally metamorphosed siliceous carbonates, the intruding igneous rock, and skarn deposits along their contact; also in some alkalic igneous rocks and carbonatites.

Association: Calcite, grossular, diopside, vesuvianite, åkermanite, merwinite, larnite, spurrite.

Distribution: A widely distributed mineral; some prominent localities are: in Romania, at Dognecea (Dognáczka) and Csiklova, Banat. In Italy, at Sarrabus, Sardinia, and from Monte Somma and Vesuvius, Campania. In Ireland, at Dunmorehead, Mourne Mountains, and Scawt Hill, near Larne, Co. Antrim. From Kongsberg, Norway. At Göckum, Sweden. In Germany, at Harzburg, Harz Mountains, and Auerbach, Odenwald, Hesse. In the USA, at Natural Bridge and Diana, Lewis Co., New York; from Crestmore, Riverside Co., and Darwin, Inyo Co., California; in a large deposit two miles southeast of Gilbert, Esmeralda Co., Nevada. In Canada, at Oka and Asbestos, Quebec; at Outlet Post, Leeds Co., Ontario. From Pichucalo, Chiapas, and in the Pilares deposit, 55 km north of Hermosillo, Sonora, Mexico. At Hiiagiyama, Ibaragi Prefecture; Ishiyamadera, Shiga Prefecture; and Kushiro, Hiroshima Prefecture, Japan. Large crystals from Belafa, Madagascar.

Occurrence: A rare alteration product of uraninite in the oxide zone of uranium-bearing mineral deposits.

Association: Uraninite, rutherfordine, becquerelite, masuyite, kasolite, metastudtite (Shinkolobwe, Congo).

Distribution: From Wölsendorf, Bavaria, Germany. At Kerségalec, near Lignol, Morbihan, France. In the Val Rendena, Trentino-Alto Adige, Italy. From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Okla, near Franceville, Gabon. From Great Bear Lake, Northwest Territories, Canada. In the Williams quarry, near Easton, Northampton Co., Pennsylvania; at Branchville, Fairfield Co., Connecticut; and on the Hell Hole claims, Wheeler Basin, Grand Co., Colorado, USA. At Randboldal, northeastern Greenland. In the Córrego do Urucum pegmatite, near Galiléia, Minas Gerais, Brazil. From the Koongarra deposit, 225 km east of Darwin, Northern Territory, Australia.

Name: For the mineral's first-noted occurrence at Wölsendorf, Germany.

Type Material: National School of Mines, Paris, France.

MgO	22.11	Total	[100.70]

(1) Mt. Cube quadrangle, Vermont, USA; by electron microprobe, H_2O content is ideal for phlogopite; corresponds to $(Na_{0.40}K_{0.07})_{\Sigma=0.47}(Mg_{2.20}Fe_{0.40}Al_{0.31}Ti_{0.04})_{\Sigma=2.95}(Si_{3.24}Al_{0.76})_{\Sigma=4.00}O_{10}(OH,F)_2$.

Mineral Group: Mica group.

Occurrence: In metavolcanics with high Mg:Fe, moderate sodium, and very little calcium, metamorphosed at an estimated 535 °C.

Association: Phlogopite, talc, anthophyllite, cordierite, gedrite, chlorite, quartz.

Distribution: From Norwich, Windsor Co., Vermont, and elsewhere in the Post Pond Volcanics, southwest corner of the Mt. Cube quadrangle, New Hampshire and Vermont, USA.

Name: To honor petrologist David R. Wones (1932–1984), Professor of Geology, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 127103, 127104; National Museum of Natural History, Washington, D.C., USA, 145724, 162422–162428; The Natural History Museum, London, England, 1982,117.

(1) Sterling Hill, New Jersey, USA; Mn^{2+}:Mn^{4+} calculated from stoichiometry. (2) Sandur, India; original total given as 99.84%.

Occurrence: In the oxidized portion of a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA); in massive manganese ores (Sandur, India); in the oxidized zone of a Ag–Pb–Zn ore deposit (Lardeau, Canada); a component of ocean-floor Fe–Mn nodules.

Association: Franklinite, chalcophanite (Sterling Hill, New Jersey, USA); pyrolusite, cryptomelane (Sandur, India); smithsonite, gunningite, hydrozincite, aurichalcite (Lardeau, Canada).

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. At the Willett mine, Lardeau, British Columbia, Canada. From the Lecht mine, near Tomintoul, Aberdeenshire, Scotland. On Mont Chemin, Valais, Switzerland. From Maria Weitscach, near Hüttenberg, Carinthia, Austria. In Germany, at Juliushütte, Astfeld, Harz Mountains, in slag. From Sandur, Mysore, India.

Name: To honor Samuel Woodruff, American miner for the New Jersey Zinc Company, and prolific mineral collector of Franklin-Sterling Hill minerals.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 112987.

(1) Champion mine, California, USA. (2) $CaAl_3(PO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: In quartz veins in an andalusite deposit (Champion mine, California, USA); a product of sulphatic argillic wall-rock alteration in hydrothermal vein and disseminated ore deposits, replacing apatite (Summitville, Colorado, USA); rarely a cave deposit, formed from guano.

Association: Topaz, augelite, lazulite, pyrophyllite (Champion mine, California, USA).

Distribution: From the Champion mine, White Mountains, Mono Co., California, large crystals; in the Summitville district, Rio Grande Co., Colorado, USA. From Brumado, Bahia, Brazil. At La Escondida, about 150 km south-southeast of Antofagasta, Chile. From Hökensås, Västergötland, Sweden. In the Ødegården apatite mines, Bamble, Norway. At the Iron Monarch quarry, Iron Knob, South Australia. In the Jade Lotus Cave, Yangshuo, Jiangxi Province, China.

Name: To honor Professor Charles Douglas Woodhouse (1888–1975), University of California, Santa Barbara, California, USA, American mineralogist and mineral collector.

Type Material: n.d.

Woodwardite $Cu_4Al_2(SO_4)(OH)_{12}\cdot 2{-}4H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ (probable). Fibrous, spherulitic.

Physical Properties: Hardness = n.d. D(meas.) = 2.38 D(calc.) = n.d.

Optical Properties: Translucent to transparent. *Color:* Rich turquoise-blue to greenish blue. *Optical Class:* Biaxial (+). *Orientation:* Parallel extinction. α = 1.552–1.571 β = 1.555 γ = 1.565–1.576 2V(meas.) = n.d.

Cell Data: *Space Group:* $R\overline{3}m$ (probable). a = 5.306(2) c = 26.77(2) Z = n.d.

X-ray Powder Pattern: Cornwall, England.
8.9 (100), 4.47 (90), 2.55 (60), 2.28 (50), 2.65 (30), 1.98 (30), 1.53 (30)

Chemistry:

	(1)	(2)
SO_4	13.95	13.04
Al_2O_3	17.97	18.64
CuO	48.34	48.67
H_2O	18.48	[19.65]
Total	98.74	[100.00]

(1) Cornwall, England; corresponds to $Cu_{3.49}Al_{2.02}(SO_4)_{1.00}(OH)_{11.04}\cdot 0.36H_2O$. (2) Do.; H_2O by difference, corresponds to $Cu_{3.76}Al_{2.24}(SO_4)_{1.00}(OH)_{12.24}\cdot 0.58H_2O$. (3) Do.; by electron microprobe, analyses not given, Cu:Al ratios stated to fall between 1.73 and 2.03.

Occurrence: A rare secondary mineral in the oxidized zone of copper deposits.

Association: n.d.

Distribution: In England, from Cornwall, the original locality not known; at the South Caradon mine, St. Cleer, and from Wheals Cock and Hazard, and the Botallack mine, St. Just. At Klausen, Tirol, Italy. In the USA, from the Maid of Sunshine mine, Courtland, Cochise Co., Arizona, and at the Deer Trail mine, six km southwest of Marysvale, Paiute Co., Utah. From the Kabasaka and Nyukaku mines, Kyogo Prefecture, Japan. As the species definition is somewhat uncertain, all reported localities may need reassessment.

Name: Honors Samuel Pickford Woodward (1821–1865), English geologist and naturalist.

Total	[100.00]	100.00

(1) Loudville mine, Massachusetts, USA; by electron microprobe, H_2O by difference; with $(OH)^{1-}$ calculated for charge balance and H_2O adjusted for best agreement between measured and calculated densities, then corresponds to $Cu_{3.94}(SO_4)_{1.00}(OH)_{5.88} \cdot 2.11H_2O$.
(2) $Cu_4(SO_4)(OH)_6 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with langite.

Occurrence: An uncommon secondary mineral in the oxidation zone of copper-bearing hydrothermal mineral deposits; may be post-mine or formed in dumps and in slags.

Association: Langite, posnjakite, serpierite, brochantite, linarite, malachite, chalcocite, covellite.

Distribution: In the USA, from the Loudville mine, Southampton, Hampshire Co., Massachusetts. At Cumpas, Sonora, Mexico. In Wales, in the Ladywell mine, Shelve, Shropshire; at the Nantycagl (Eaglebrook) mine, Ceulanymaesmawr, in the Penrhiw mine, Ystumtuen, and the Frongoch mine, Dyfed; from the Drws-y-Coed mine, Llandwrog, Gwynedd. In the West Blackcraig mine, near Newton Stewart, Kirkcudbrightshire, Scotland. In England, from the Silver Gill and Red Gill mines, Carrock Fells, and the Tynebottom mine, near Garrigill, Cumbria; in the Penberthy Croft mine, St. Hilary, and the East Gunnislake mine, Calstock, Cornwall; at Wheal Friendship, Devon. In the Sheeffry mine, near Croagh Patrick, Co. Mayo, Ireland. From the Cap Garonne mine, near le Pradet, Var, France. In the Glücksrad mine, near Oberschulenberg, Harz Mountains, and at Ramsbeck, North Rhine-Westphalia, Germany. From Nandraž, Slovakia. In the Santa Lucia mine, Sardinia, Italy. At the Bastnäs mine, near Riddarhyttan, Västmanland, Sweden.

Name: To honor Professor Caleb Wroe Wolfe (1908–1980), American crystallographer, Boston University, Boston, Massachusetts, USA.

Wulfenite $PbMoO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$ or $\overline{4}$. Crystals commonly square, flat tabular on [001], showing {001} and flat or rounded vicinal faces, {010}, to 11 cm; may be elongated along [001], or pyramidal {011}. Commonly other {0*kl*}, {*hkl*} forms, some showing pyramidal hemihedrism; granular, massive. *Twinning:* On {001}, as contact twins, common.

Physical Properties: *Cleavage:* On {011}, distinct; on {001}, {013}, indistinct. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 2.75–3 D(meas.) = 6.5–7.5 D(calc.) = 6.88–7.48 Individuals may be piezoelectric.

Optical Properties: Transparent to opaque. *Color:* Bright yellow, wax-yellow, yellow-orange, bright orange, red-orange, bright red; gray, grayish white, rarely white, colorless; siskin-green, olive-green, pale to dark blue, reddish brown, brown, black. *Streak:* White. *Luster:* Resinous, subadamantine to adamantine.
Optical Class: Uniaxial (–), may be anomalously biaxial. *Pleochroism:* Weak; orange and yellow. $\omega = 2.405$ $\epsilon = 2.283$ 2V(meas.) = $\leq 8°$

Cell Data: *Space Group:* $I4_1/a$, with $a = 5.436(2)$ $c = 12.068(8)$ Z = 4, or
Space Group: $I\overline{4}$, with $a = 5.441(1)$ $c = 12.068(6)$ Z = 4

X-ray Powder Pattern: Synthetic.

WO_3		28.22	28.20
PbO	60.91	54.25	54.29
Total	99.78	99.99	100.00

(1) Oudida, Morocco; corresponds to $Pb_{1.01}Mo_{1.00}O_{4.00}$. (2) Chillago, Australia; corresponds to $Pb_{1.00}(Mo_{0.50}W_{0.50})_{\Sigma=1.00}O_{4.00}$. (3) $Pb(Mo,W)O_4$ with Mo:W = 1:1.

Occurrence: A secondary mineral formed in the oxidized zone of hydrothermal lead deposits, the molybdenum commonly introduced externally.

Association: Cerussite, anglesite, smithsonite, hemimorphite, vanadinite, pyromorphite, mimetite, descloizite, plattnerite, Fe–Mn oxides.

Distribution: Hundreds of localities; a few for fine examples include: from Bleiberg, Carinthia, Austria. At Mežica (Mies) and Črna pri Prevaljah (Schwartzenbach), Slovenia. In the USA, from Arizona, at the Red Cloud and nearby mines, Silver district, La Paz Co., in the Old Yuma mine, near Tucson, Pima Co., at the Mammoth-St. Anthony mine, Tiger, Pinal Co., large crystals from the Glove mine, near Amado, Tyndall district, Santa Cruz Co., at the Hilltop mine, Chiricahua Mountains, and in the Defiance mine, Gleeson, Cochise Co.; in New Mexico, at the Stevenson-Bennett mine, Organ Mountains, Doña Ana Co.; in the Lucin District, Elko Co., Nevada. In Mexico, from the San Francisco mine, Cerro Prieta, Magdalena, Sonora; at Los Lamentos and Santa Eulalia, Chihuahua; in the Ojuela mine, Mapimí, Durango. Large crystals at Tsumeb, Namibia. Ponderous crystals from Mfouati, Congo Republic. In the Tchah Kharboze mine, Anarak district, Iran. At the Touissit mine, near Oujda, Morocco. From Sidjak, Uzbekistan. At the Christmas mine, Chillago, Queensland, Australia.

Name: To honor Franz Xavier Wulfen (1728–1805), Austrian–German Jesuit, who wrote a monograph on the lead ores of Bleiberg, Austria.

Type Material: Mining Academy, Freiberg, Germany.

Wülfingite $Zn(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As very rare crystals, to 200 μm, in starlike clusters; in fine-grained incrustations.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3 D(meas.) = 3.05(2) D(calc.) = 3.06

Optical Properties: Transparent. *Color:* Colorless to whitish; colorless in transmitted light. *Streak:* White. *Luster:* Waxy.
Optical Class: Biaxial (–). *Dispersion:* $r \gg v$, extreme. $\alpha = 1.5722(3)$ $\beta = 1.5781(3)$ $\gamma = 1.5801(1)$ 2V(meas.) = 62.8(2)° 2V(calc.) = 60°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 8.490(1)$ $b = 5.162(1)$ $c = 4.917(1)$ Z = 4

X-ray Powder Pattern: Richelsdorf, Germany.
4.407 (100), 3.280 (100), 4.250 (80), 3.212 (80), 2.727 (80), 2.284 (80), 2.215 (80)

Chemistry:

	(1)	(2)
ZnO	81.5	81.88
H_2O	19.0	18.12
Total	100.5	100.00

(1) Richelsdorf, Germany; by electron microprobe, average of several determinations, H_2O by TGA. (2) $Zn(OH)_2$.

Polymorphism & Series: Trimorphous with ashoverite and sweetite.

Occurrence: A rare secondary mineral formed by weathering of zinc-bearing slag (Richelsdorf, Germany).

Association: Simonkolleite, hydrocerussite, diaboleite, zincite, hydrozincite, zinc (Richelsdorf, Germany); ashoverite, fluorite (near Ashover, England).

Distribution: On slag heaps from the foundry at Richelsdorf, Hesse, Germany. In a limestone quarry 200–300 m northwest of Milltown, near Ashover, Derbyshire, England.

Name: Honors Dr. Ernst Anton Wülfing (1860–1930), Professor of Mineralogy and Petrography, Heidelberg University, Heidelberg, Germany.

Type Material: Göttingen University, Göttingen; Heidelberg University, Heidelberg, Germany.

References: (1) Schmetzer, K., G. Schnorrer-Köhler, and O. Medenbach (1985) Wülfingite, ϵ–$Zn(OH)_2$, and simonkolleite, $Zn_5(OH)_8Cl_2 \cdot H_2O$, two new minerals from Richelsdorf, Hesse, F.R.G. Wupatkiite $(Co, Mg)Al_2(SO_4)_4 \cdot 22H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibers, to 8 mm, in incrustations composed of cross-fiber veins.

Physical Properties: *Cleavage:* One at 70° to fiber length. Hardness = 1.5, in aggregates. D(meas.) = 1.92 D(calc.) = 1.87 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Rose-red. *Streak:* White. *Luster:* Silky in masses.
Optical Class: Biaxial. *Pleochroism:* Weak; very pale pink ∥ fiber bundles. *Orientation: Z* ∧ extinction up to 12°. $\alpha = 1.477$ β = n.d. $\gamma = 1.484$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to halotrichite). $a = 6.819(4)$ $b = 24.234(10)$ $c = 21.204(10)$ $\beta = 100.33(5)°$ Z = [4]

X-ray Powder Pattern: Cameron district, Arizona, USA.
4.790 (100), 3.494 (92), 3.768 (33), 4.295 (27), 3.945 (26), 6.03 (22), 4.106 (22)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	35.97		CuO	0.12	
Al_2O_3	11.30	9.81	MgO	1.63	0.31
Fe_2O_3		[2.43]	CaO	0.10	
FeO	0.15	[3.25]	H_2O	42.26	
MnO	0.17	0.15	insol.	[4.37]	
CoO	3.41	3.92	Total	[100.00]	
NiO	0.52	0.29			

(1) Cameron district, Arizona, USA; by AA, CoO by colorimetry, CaO by ICP-ES, H_2O by the Penfield method, insoluble by difference, quartz and clay; corresponds to $(Co_{0.42}Mg_{0.38}Ni_{0.06}Mn_{0.02}Fe_{0.02}Ca_{0.02}Cu_{0.01})_{\Sigma=0.93}Al_{2.06}(SO_4)_{4.18} \cdot 21.83H_2O$. (2) Lorena deposit, Australia; by ICP, after deduction of insoluble 2.5%, original partial analysis here converted to oxides; FeO:Fe_2O_3 partitioned for stoichiometry; corresponds to $(Co_{0.47}Fe_{0.41}Mg_{0.07}Ni_{0.04}Mn_{0.02})_{\Sigma=1.01}(Al_{1.73}Fe_{0.27})_{\Sigma=2.00}(SO_4)_4 \cdot 22H_2O$.

Mineral Group: Halotrichite group.

Occurrence: A rare post-mine oxidation product of sooty U–Co–Ni–Mo primary mineralization (Cameron district, Arizona, USA).

Association: Pickeringite, moorhouseite, nickel-boussingaultite, quartz, clay (Cameron district, Arizona, USA).

Distribution: From a prospect 13 km east-southeast of Gray Mountain, Cameron district, Coconino Co., Arizona, USA. Abundant in the Lorena gold deposit, near Cloncurry, Queensland, Australia.

Name: For the prehistoric Wupatki Indian pueblos, now a National Monument, nearby the Cameron district, Arizona, USA.

Type Material: National School of Mines, Paris, France.

Wurtzite **(Zn, Fe)S**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6mm$. Crystals to 1.5 cm, commonly hemimorphic pyramidal $\{50\bar{5}2\}$ and $\{10\bar{1}1\}$; also short prismatic to tabular $\{0001\}$; typically striated horizontally on $\{10\bar{1}0\}$ and $\{10\bar{1}1\}$. The polytypes show steepening of the pyramid as the repeat distance increases along $\{0001\}$. As concentrically banded crusts, fibrous or columnar.

Physical Properties: *Cleavage:* Easy on $\{11\bar{2}0\}$; difficult on $\{0001\}$. *Tenacity:* Brittle. Hardness = 3.5–4 VHN = n.d. D(meas.) = 4.09 D(calc.) = 4.10

Optical Properties: Translucent. *Color:* Deep reddish brown to dark brown to brown-black; yellow to dark brown internal reflections common in reflected light. *Streak:* Brown.
Luster: Resinous, brilliant submetallic on crystal faces.
Optical Class: Uniaxial (+). $\epsilon = 2.378$ $\omega = 2.356$

R: (400) 19.2, (420) 18.7, (440) 18.2, (460) 17.8, (480) 17.4, (500) 17.1, (520) 16.9, (540) 16.6, (560) 16.4, (580) 16.3, (600) 16.2, (620) 16.1, (640) 16.1, (660) 16.1, (680) 16.0, (700) 15.8.

Cell Data: *Space Group:* $P6_3mc$ (synthetic, 2H). $a = 3.820$ $c = 6.260$ Z = 2

X-ray Powder Pattern: Synthetic (2H).
3.309 (100), 3.128 (86), 2.925 (84), 1.911 (74), 1.764 (52), 1.630 (45), 2.273 (29)

Chemistry:

Zn	62.64	67.10
Fe	2.43	
Cd	1.84	
Pb	0.41	
S	32.10	32.90
Total	99.42	100.00

(1) Příbram, Czech Republic. (2) ZnS.

Polymorphism & Series: Trimorphous with matraite and sphalerite. Polytypes 2H, 4H, 6H, 8H, 10H, 15R, 18R, and 21R are known.

Occurrence: Of hydrothermal origin in veins with other sulfides. Also along shrinkage fractures in clay-ironstone concretions, of low-temperature origin.

Association: Sphalerite, pyrite, chalcopyrite, barite, marcasite.

Distribution: Numerous localities; a few of those providing good crystals or especially rich material follow. In the USA, from near the Thomaston Dam, Litchfield Co., Connecticut; at the Leonard mine, Butte, Silver Bow Co., Montana; at Frisco, Beaver Co., Utah; and from the Joplin district, Jasper Co., Missouri. From Rachelshausen, near Gladenbach, Hesse, Germany. At Liskeard, Cornwall, England. From Mežica (Mies), Serbia. At Příbram, Czech Republic. In Romania, from Baia Sprie (Felsőbánya). At Quispisiza, near Castro Virreyna, Peru. In a number of mines in the Huanuni district, Oruro, and Chocaya, Potosí, Bolivia.

Name: For Charles Adolphe Wurtz (1817–1884), French chemist, of Paris, France.

Wüstite $Fe^{2+}O$

ⓒ2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As crusts, intergranular fillings, replacements of other minerals, massive; a component of microspherules, which may be hollow; may contain exsolved iron or magnetite.

Physical Properties: *Tenacity:* Brittle. Hardness = 5 D(meas.) = 5.88 D(calc.) = 5.97 Highly magnetic.

Optical Properties: Opaque. *Color:* Black to brown; gray in reflected light.
Luster: Metallic.
Optical Class: Isotropic.
R: n.d.

Cell Data: *Space Group:* $Fm3m$. a = 4.296 Z = 4

X-ray Powder Pattern: Scharnhausen, Germany.
2.146 (10), 1.518 (8), 2.476 (7), 1.297 (4), 1.243 (4), 1.074 (1), 0.985 (1)

Chemistry:

	(1)
SiO_2	0.14
TiO_2	0.01
Al_2O_3	0.01
Cr_2O_3	0.03
FeO	99.57
MnO	0.09
MgO	0.02
Total	[99.87]

(1) Pampa del Infierno meteorite; by electron microprobe; original total given as 99.82%.

Mineral Group: Periclase group.

Occurrence: Formed as an alteration product of other iron-bearing minerals at high temperatures in a highly reducing environment; in highly-reduced iron-bearing basalts; as inclusions in diamonds in kimberlites; in precipitates from deep-sea hot brines and in Fe–Mn nodules; in microspherules of likely extraterrestrial origin found in a variety of geological environments; in some meteorites.

Association: Iron, hematite, magnetite, goethite, akaganéite, lepidocrocite, ilmenite, maghemite, troilite, pyrrhotite, pyrite.

Distribution: At Scharnhausen, near Stuttgart, Baden-Württemberg, and at Bühl, near Weimar, Hesse, Germany. In Greenland, on Disko Island, near Uivfaq and Kitdlît. From the Pathardih colliery, Jharia coalfield, Bihar, India. In a number of diamond-bearing kimberlite pipes.

Name: The artificial compound was named for Friedrich Wüst (1860–1938), German metallurgist and Director for Iron Research of the Kaiser Wilhelm Institute, Düsseldorf, Germany; the name was then later transferred to the naturally-occurring equivalent.

Type Material: n.d.

(1) Old Mike mine, South Dakota, USA; corresponds to $(Na_{0.59}Ca_{0.26}Mn^{2+}_{0.10})_{\Sigma=0.95}(Mn^{2+}_{0.64}Fe^{2+}_{0.36})_{\Sigma=1.00}(Fe^{2+}_{0.57}Fe^{3+}_{0.21}Mg_{0.20}Zn_{0.02})_{\Sigma=1.00}(Al_{0.59}Fe^{3+}_{0.41})_{\Sigma=1.00}(PO_4)_3$. (2) Buranga, Rwanda; corresponds to $(Na_{0.80}K_{0.01})_{\Sigma=0.81}(Na_{0.70}Mn^{2+}_{0.27}Ca_{0.03})_{\Sigma=1.00}(Mn^{2+}_{0.94}Fe^{2+}_{0.06})_{\Sigma=1.00}(Fe^{2+}_{0.84}Mg_{0.16})_{\Sigma=1.00}(Al_{0.75}Fe^{3+}_{0.15}Mg_{0.10})_{\Sigma=1.00}(PO_4)_3$.

Polymorphism & Series: Forms two series, with ferrowyllieite, and with rosemaryite; $Mn^{2+} > Fe^{2+}$ in M(1); Fe^{2+} dominant in M(2a).

Occurrence: In zoned complex granite pegmatites.

Association: Trolleite, scorzalite (Buranga, Rwanda).

Distribution: In the USA, in South Dakota, from the Old Mike mine, six km north-northwest of Custer, Custer Co. At the Buranga pegmatite, near Gatumba, Rwanda. From Hålsjöberg, Värmland, Sweden. At the Lavra do Énio pegmatite, northeast of Galiléia, Minas Gerais, Brazil.

Name: To honor Dr. Peter John Wyllie (1930–), Professor of Petrology and Geochemistry, University of Chicago, Chicago, Illinois, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162557.

References: (1) Moore, P.B. and J. Ito (1979) Alluaudites, wyllieites, arrojadites: crystal chemistry and nomenclature. Mineral. Mag., 43, 227–235. (2) (1980) Amer. Xanthiosite $Ni_3(AsO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In microcrystalline to amorphous crusts, to 2 mm thick.

Physical Properties: Hardness = 4 D(meas.) = 4.98–5.42 D(calc.) = 5.388

Optical Properties: Semitransparent. *Color:* Sulfur-yellow, golden yellow.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$. $a = 10.174(5)$ $b = 9.548(2)$ $c = 5.766(1)$
$\beta = 92°58.5(1.0)'$ Z = 4

X-ray Powder Pattern: Johanngeorgenstadt, Germany.
2.529 (vvsb), 3.46 (vsb), 2.757 (vs), 2.739 (vs), 2.690 (vs), 2.666 (vs), 4.32 (sb)

Chemistry:

NiO	48.24	47.0	49.36
CuO	0.57	0.7	
Total	100.17	99.2	100.00

(1) Johanngeorgenstadt, Germany; corresponds to $(Ni_{2.96}Cu_{0.03}Co_{0.01})_{\Sigma=3.00}(AsO_4)_{2.01}$.
(2) South Terras mine, Cornwall, England; corresponds to $(Ni_{2.90}Co_{0.06}Cu_{0.04}Fe_{0.03})_{\Sigma=3.03}(AsO_4)_{2.00}$. (3) $Ni_3(AsO_4)_2$.

Occurrence: A rare secondary mineral in hydrothermal Ni–As–U ore deposits.

Association: Bismuth, bunsenite, aerugite (Johanngeorgenstadt, Germany); aerugite (South Terras mine, Cornwall, England).

Distribution: From Johanngeorgenstadt, Saxony, Germany. In the South Terras mine, St. Stephen-in-Brannel, Cornwall, England.

Name: From the Greek for *yellow* and *sulfur*, in allusion to its distinctive sulfur-yellow color.

Type Material: The Natural History Museum, London, England, 32590 and 1907,103.

Xanthoconite Ag_3AsS_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular on {001}, commonly producing flat rhombohedra, also as laths elongated along [010], to 0.5 cm; rarely pyramidal. Reniform and hemispherical radial aggregates. *Twinning:* On {001} producing pseudo-orthorhombic twins.

Physical Properties: *Cleavage:* Distinct on {001}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 2–3 VHN = 71–93 (25 g load). D(meas.) = 5.54(14) D(calc.) = 5.53

Optical Properties: Translucent. *Color:* Dark cochineal-red to dull orange to clove-brown; lemon-yellow in transmitted light. *Streak:* Orange-yellow. *Luster:* Adamantine. *Optical Class:* Biaxial (–). *Orientation:* $X \simeq c$; $Y \simeq a$; $Z = b$. *Dispersion:* $r < v$, very strong. $n = \sim 3$ 2V(meas.) = 34°

R_1–R_2: (400) 33.7–37.1, (420) 32.2–36.1, (440) 30.7–35.1, (460) 29.1–33.7, (480) 27.6–32.1, (500) 26.1–30.1, (520) 24.8–28.5, (540) 23.7–27.3, (560) 22.7–26.3, (580) 22.0–25.5, (600) 21.5–24.8, (620) 21.3–24.4, (640) 21.0–24.1, (660) 20.8–23.8, (680) 20.6–23.6, (700) 20.4–23.5

Total	98.85	100.00

(1) Freiberg, Germany. (2) Ag_3AsS_3.

Polymorphism & Series: Dimorphous with proustite.

Occurrence: Typically associated with other silver sulfosalts in hydrothermal veins.

Association: Proustite, pyrargyrite, acanthite, arsenic, calcite.

Distribution: In small amounts at numerous localities. From Jáchymov (Joachimsthal), Příbram, and Třebsko, Czech Republic. In Saxony, Germany, at Freiberg, Annaberg, Marienberg, Johanngeorgenstadt, and Schneeberg; at St. Andreasberg, in the Harz Mountains. From Baia Sprie (Felsőbánya), Romania. At Sainte-Marie-aux-Mines, Haut-Rhin, France. From Chañarcillo, south of Copiapó, Atacama, Chile. In several mines at Cobalt, Ontario, Canada. At the General Petite mine, Atlanta district, Elmore Co., Idaho, and from about 13 km north of Niarada, in the Flathead mine, Flathead Co., Montana, USA. From the Batopilas district, Chihuahua, Mexico.

Name: From the Greek for *yellow* and *powder* in allusion to its color.

Xanthoxenite $Ca_4Fe_2^{3+}(PO_4)_4(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\bar{1}$ or 1. Platy or lathlike crystals, in lamellar aggregates and crusts.

Physical Properties: *Cleavage:* {010}, perfect. Hardness = 2.5 D(meas.) = 2.97 D(calc.) = 3.38

Optical Properties: Semitransparent. *Color:* Pale yellow, brownish yellow; pale yellow to pale lemon-yellow in transmitted light. *Luster:* Dull to slightly waxy.
Optical Class: Biaxial (–). *Pleochroism:* Faint in thick grains; in shades of yellow.
Dispersion: $r < v$, strong. *Absorption:* $Y > X = Z$. $\alpha = 1.704(3)$ $\beta = 1.715(3)$ $\gamma = 1.724(3)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P\bar{1}$. $a = 6.70(4)$ $b = 8.85(4)$ $c = 6.54(3)$ $\alpha = 92.1(2)°$ $\beta = 110.1(2)°$ $\gamma = 93.2(2)°$ Z = 1

X-ray Powder Pattern: Palermo #1 mine, New Hampshire, USA.

(1) Palermo #1 mine, New Hampshire, USA; corresponds to $(Ca_{3.28}Mn_{0.47}Mg_{0.17})_{\Sigma=3.92}Fe_{2.00}(PO_4)_{3.90}(OH)_{2.14} \cdot 2.69H_2O$. (2) Přibyslavice, Czech Republic; recalculated to 100% after deduction of quartz 3.90% from an original total of 99.89%; corresponds to $(Ca_{3.90}Mg_{0.10}Na_{0.02})_{\Sigma=4.02}Fe_{1.98}(PO_4)_{4.00}(OH)_2 \cdot 2.51H_2O$. (3) $Ca_4Fe_2(PO_4)_4(OH)_2 \cdot 3H_2O$.

Occurrence: An uncommon alteration product of triphylite in complex zoned granite pegmatites.

Association: Apatite, whitlockite, childrenite–eosphorite, laueite, strunzite, stewartite, mitridatite, amblygonite, siderite.

Distribution: In the USA, from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; in the Tip Top, Linwood, and White Elephant mines, near Custer, Custer Co., South Dakota; at the Champion mine, White Mountains, Mono Co., California; in the Dunton quarry, Newry, and on Black Mountain and Red Hill, Rumford, Oxford Co., Maine. From Hühnerkobel, near Zwiesel, and at Hagendorf, Bavaria, Germany. From Přibyslavice and Otov, Czech Republic. At the Lavra da Ilha pegmatite, in the Jequitinhonha River, and Sabinópolis, near Taquaral, Minas Gerais, Brazil.

Name: From the Greek for *yellow* and supposed chemical resemblance to *cacoxenite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 119745 [xanthoxenite redefined]. The name was originally applied to a partially described mineral [= stewartite ?] from the Hühnerkobel pegmatite, Germany, type material destroyed in World War II.

(1) Gloserheia pegmatite, Froland, Norway; by electron microprobe, average of 8 analyses; RE_2O_3 = Nd_2O_3 0.17%, Sm_2O_3 0.49%, Eu_2O_3 0.07%, Gd_2O_3 2.69%, Tb_2O_3 0.58%, Dy_2O_3 4.93%, Ho_2O_3 1.27%, Er_2O_3 4.05%, Tm_2O_3 0.70%, Yb_2O_3 4.36%, Lu_2O_3 0.87%. (2) Switzerland; by electron microprobe, average of 82 analyses on 11 samples; RE_2O_3 = Eu_2O_3 0.04%, Gd_2O_3 1.89%, Tb_2O_3 0.60%, Dy_2O_3 5.15%, Ho_2O_3 1.06%, Er_2O_3 3.86%, Yb_2O_3 4.10%, Lu_2O_3 0.52. (3) YPO_4.

Mineral Group: Forms a series with chernovite-(Y).

Occurrence: An accessory mineral in alkalic to granitic rocks, well-developed in associated pegmatites; in gneiss and Alpine veins; a common detrital mineral in placers.

Association: Zircon, monazite, rutile, anatase, brookite, hematite, ilmenite, gadolinite, allanite, apatite, yttrotantalite, thorite.

Distribution: Numerous localities but fine crystals are unusual. In Norway, from Lindesnes; on Hidra (Hitterö) Island; around Tvedestrand and Arendal; at Raade, near Moss; and elsewhere. From Ytterby, on Resarö Island, near Vaxholm, Sweden. In Switzerland, from the Binntal, Valais; in the Maderanertal, Uri; in the Tavetsch, Graubünden; and many other places. Large crystals from the Yazgulem Ridge, western Pamir Mountains, Tajikistan. At Sahamandrevo, near Ampangabe, Madagascar. In the Ishikawa district, Fukushima Prefecture, Japan. In Brazil, from Ataleia and Ibitiara, Minas Gerais; at Brumado and Novo Horizonte, Bahia. In the USA, in North Carolina, from placers in Polk, McDowell, and Burke Cos.; on Cheyenne Mountain, El Paso Co., and elsewhere in Colorado. In the Gunter quarry, near McKenzie Lake, Ontario, Canada.

Name: From the Greek for *vain* and *honor*, as the contained *yttrium* had been mistaken for a new element.

$\beta = 93.0°$ Z = 4

X-ray Powder Pattern: Chaobuleng district, China.
3.386 (100), 2.177 (90), 2.073 (80), 2.051 (70), 1.955 (70), 1.788 (6), 1.396 (5)

Chemistry:

	(1)	(2)	(3)
Pb	52.074	52.06	50.45
Zn	0.653		
Cu	0.16		
Ag	0.75	0.50	
Bi	29.72	29.81	33.93
Sb	0.09		
S	15.09	15.25	15.62
oxides	1.333	1.62	
Total	99.87	99.24	100.00

(1) Chaobuleng district, China; ignoring minor components and oxides, corresponds to $Pb_{3.18}Bi_{1.81}S_{6.00}$. (2) Do.; by electron microprobe. (3) $Pb_3Bi_2S_6$.

Occurrence: In a skarn-type iron deposit.

Association: Magnetite, sphalerite, pyrrhotite, pyrite, arsenopyrite, chalcopyrite, digenite, bornite, molybdenite, galena, bismuth, bismuthinite.

Distribution: In the Chaobuleng district, Xilingola League, Inner Mongolia, China.

Name: For the Xilingola locality in China.

Type Material: n.d.

Ximengite $BiPO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Granular, to 0.1 mm, in veinlets and earthy aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 297–283, average 281. D(meas.) = n.d. D(calc.) = 5.534 Yellowish green cathodoluminescence under the electron beam.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (+). $\omega = > 1.77$ $\epsilon = > 1.77$

Cell Data: *Space Group:* $[P3_121]$ (by analogy to synthetic material). $a = 6.986(2)$ $c = 6.475(3)$ $Z = 3$

X-ray Powder Pattern: Ximeng Co., China.
3.024 (100), 4.420 (91), 3.493 (88), 6.052 (73), 2.854 (65), 1.7474 (48), 2.157 (47)

Chemistry:

	(1)	(2)
P_2O_5	22.92	23.35
Bi_2O_3	76.34	76.65
H_2O	0.76	
Total	100.02	100.00

(1) Ximeng Co., China; by electron microprobe, corresponding to $Bi_{1.01}P_{0.90}O_4$. (2) $BiPO_4$.

Occurrence: An alteration product of bismuthinite in a tin deposit.

Association: Bismuthinite, waylandite, monazite, cassiterite, tourmaline.

Distribution: From an undefined locality in Ximeng Co., about 420 km southwest of Kunming, Yunnan Province, China.

Name: For Ximeng Co., China, in which it was first noted to occur.

Type Material: Bureau of Geology and Mineral Resources, Kunming, China.

Xingzhongite $(Pb, Cu, Fe)(Ir, Pt, Rh)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic or pseudocubic. *Point Group:* n.d. As a rim around iridosmine.

Physical Properties: Hardness = n.d. VHN = 753 (50 g load). D(meas.) = n.d. D(calc.) = [7.94]

Optical Properties: Opaque. *Color:* Steel-gray; in reflected light, bluish gray. *Luster:* Metallic.

R: (466) 40.5, (544) 38.9, (589) 41.1, (656) 41.0

Cell Data: *Space Group:* n.d. $a = 9.970$ $Z = [8]$

X-ray Powder Pattern: China.
1.765 (10), 5.80 (8), 3.00 (8), 1.208 (8), 2.49 (6), 2.88 (5), 1.335 (4)

Chemistry:

	(1)
Pb	12.80
Cu	3.81
Fe	1.58
Ir	43.49
Pt	9.67
Rh	7.19
S	21.68
Total	100.22

(1) China; by electron microprobe, giving $(Pb_{0.37}Cu_{0.35}Fe_{0.17})_{\Sigma=0.89}(Ir_{1.33}Rh_{0.41}Pt_{0.29})_{\Sigma=2.03}S_{4.00}$.

Mineral Group: Linnaeite group.

Occurrence: In dunite-hosted platinum ores, related to chromium mineralization (China).

Association: Pt–Fe alloy, osmiridium, iridosmine, osmium, iridium, erlichmanite, cooperite, irarsite, osarsite, chromite, magnetite, pyrite, olivine, serpentine, talc (China).

Distribution: From an unstated locality in China. At Fox Gulch, Goodnews Bay, Alaska, USA. From Tiébaghi, New Caledonia.

Name: Presumably for the undefined Chinese type locality.

Type Material: n.d.

Xocomecatlite $Cu_3(Te^{6+}O_4)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (probable). *Point Group:* n.d. Needlelike crystals in subparallel radial and spherulitic aggregates, to 0.15 mm.

Physical Properties: *Tenacity:* Brittle but tough. Hardness = 4 D(meas.) = 4.65(1) D(calc.) = 4.42

Optical Properties: Semitransparent. *Color:* Bright emerald-green. *Streak:* Pale green. *Optical Class:* Biaxial (–). *Pleochroism:* In rich bluish greens. *Orientation:* $X \perp$ length; $Z \parallel$ length. *Absorption:* $Z > X = Y$. $\alpha = 1.775(5)$ $\beta = 1.900(5)$ $\gamma = 1.920(5)$ 2V(meas.) = n.d. 2V(calc.) = 41°

Cell Data: *Space Group:* n.d. $a = 12.140(60)$ $b = 14.318(100)$ $c = 11.662(60)$ Z = 12

X-ray Powder Pattern: Bambollita mine, Mexico.
4.627 (10), 2.673 (6), 3.439 (4), 3.099 (4), 2.434 (4b), 3.320 (3), 2.831 (3)

Chemistry:

	(1)	(2)
TeO_3	38.7	39.00
CuO	51.3	53.00
ZnO	2.4	
H_2O	8.0	8.00
Total	100.4	100.00

(1) Bambollita mine, Mexico; results of several partial microchemical analyses, CuO, ZnO by AA, TeO_3 by spectrophotometry, presence of Te^{6+} confirmed by microchemical test; after deduction of insoluble 12.4%, then corresponds to $(Cu_{2.93}Zn_{0.14})_{\Sigma=3.07}(TeO_4)_{1.0}(OH)_{4.13}$.
(2) $Cu_3(TeO_4)(OH)_4$.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal Au–Te deposits.

Association: Parakhinite, dugganite (Emerald mine, Arizona, USA); mcalpineite, leisingite, jensenite, hinsdalite–svanbergite, goethite (Centennial Eureka mine, Utah, USA).

Distribution: From the Oriental (Bambollita) mine, northeast of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, at the Emerald mine, Tombstone, Cochise Co., Arizona; from the dump of the Centennial Eureka mine, Tintic district, Juab Co., Utah.

Name: From the Nahua language *xocomecatl*, for *grape*, in allusion to its appearance as a bunch of grapes.

Type Material: Natural History Museum, Paris, France; National Museum of Natural History, Washington, D.C., USA, 135059.

References: (1) Williams S.A. (1975) Xocomecatlite, $Cu_3TeO_4(OH)_4$, and tlalocite, $Cu_{10}Zn_6(TeO_3)(TeO_4)_2Cl(OH)_{25} \cdot 27H_2O$, two new minerals from Moctezuma, Sonora, Mexico. Mineral. Mag., 40, 221–226. (2) (1976) Amer. Mineral., 61, 504 (abs. ref. 1).

Xonotlite $Ca_6Si_6O_{17}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As needlelike crystals, elongated ‖ [010], to 2 cm, with striated prism zones and tapering terminations; as flaky fibrous radiating bundles and rosettes; massive.

Physical Properties: *Cleavage:* Perfect in one $\{h0l\}$ direction. *Fracture:* Splintery. *Tenacity:* Tough. Hardness = 6–6.5 D(meas.) = 2.71–2.72 D(calc.) = 2.71

Optical Properties: Translucent. *Color:* Chalky white to bluish gray, pale pink, fading on exposure. *Luster:* Pearly, greasy.
Optical Class: Biaxial (+). *Orientation:* $Z = b$. $\alpha = 1.581–1.583$ $\beta = 1.581–1.583$ $\gamma = 1.591–1.593$ 2V(meas.) = Very low.

Cell Data: *Space Group:* $C2/m$. $a = 17.03$ $b = 3.678$ $c = 7.003$ $\beta = 90.32°$ Z = 1

X-ray Powder Pattern: Tetela de Xonotla, Mexico.
3.07 (vs), 2.04 (s), 1.95 (s), 3.65 (ms), 3.23 (ms), 2.83 (m), 2.71 (mw)

Chemistry:

	(1)	(2)
SiO_2	49.58	50.42
FeO	1.31	
MnO	1.79	
CaO	43.56	47.06
H_2O	3.70	2.52
Total	99.94	100.00

(1) Tetela de Xonotla, Mexico. (2) $Ca_6Si_6O_{17}(OH)_2$.

Occurrence: In contact metamorphic deposits within limestones, serpentinites, and metavolcanic rocks.

Association: Tobermorite, clinohedrite, wollastonite, diopside, thaumasite, laumontite, stilbite, apophyllite.

Distribution: Many localities. At Tetela de Xonotla, Puebla, Mexico. In the USA, at Leesburg, Loudoun Co., Virginia; from Franklin, Sussex Co., New Jersey; in the Hunting Hill quarry, Rockland, Montgomery Co., Maryland; on Isle Royale, Lake Superior, Michigan; at Crestmore, Riverside Co., California; and at Christmas, Gila Co., Arizona. In Canada, at Point Shivery, Bay of Islands, Newfoundland. Found near Yauco, Puerto Rico. At Arsiero, Vicenza, Italy. From Scawt Hill, near Larne, Co. Antrim, Ireland. At Broadford, Isle of Skye, Scotland. From Marrait, Greenland. At Hashidate and Kotaki, Niigata Prefecture; Kaisuka, Chiba Prefecture; and in the Mihara mine, Okayama Prefecture, Japan. From the Wessels and N'Chwaning mines, near Kuruman, Cape Province, South Africa.

Name: For the Mexican locality at Tetela de Xonotla, from which it was first described.

Yafsoanite **$Ca_3Zn_3(Te^{6+}O_6)_2$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals are cubo-octahedra or dodecahedra, to 0.5 mm; also radiating, forming spherical aggregates.

Physical Properties: Hardness = ∼6 VHN = 696 (30 g load). D(meas.) = 5.40–5.55 D(calc.) = 5.54

Optical Properties: Transparent to translucent. *Color:* Colorless, pale to dark brown. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.800(5)$

Cell Data: *Space Group: Ia3d.* $a = 12.632(2)$ Z = 8

X-ray Powder Pattern: Kuranakh deposit, Russia.
2.581 (10), 1.683 (10), 2.821 (9), 3.16 (8), 1.024 (5), 4.47 (3), 1.751 (3)

Chemistry:

	(1)	(2)	(3)
TeO_3	42.11	39.91	46.00
SiO_2	0.21	1.56	
ZnO	24.65	27.38	31.97
PbO	12.82	8.88	
CaO	16.79	18.47	22.03
excess O	2.02	2.77	
Total	98.60	98.97	100.00

(1) Kuranakh deposit, Russia; by electron microprobe, here calculated to oxides; corresponds to $(Ca_{2.62}Pb_{0.50})_{\Sigma=3.12}Zn_{2.64}(Te_{1.04}O_6)_2$. (2) Do.; corresponds to $(Ca_{2.84}Pb_{0.52})_{\Sigma=3.36}Zn_{2.92}(TeO_6)_2$. (3) $Ca_3Zn_3(TeO_6)_2$.

Occurrence: Very rare in a tellurium-bearing gold quartz deposit in dolomite–calcite (Kuranakh deposit, Russia); in the oxidized zone of a hydrothermal ore deposit (Empire mine, Arizona, USA).

Association: Gold, tiemannite, naumannite, clausthalite, altaite, cinnabar, orpiment, kuranakhite, Si-rich dugganite, cheremnykhite, kuksite, descloizite, calcite, quartz, iron oxides (Kuranakh deposit, Russia).

Distribution: From the Kuranakh gold deposit, near Aldan, southern Sakha, Russia. At the Empire mine, Tombstone, Cochise Co. Arizona, USA. In the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: For the *Yakutskii Filial Sibirskogo Otdeleniya Akademii Nauk* (Yakut Filial, Siberian Branch, Academy of Sciences, YAFSOAN in Russian).

Type Material: Geological Museum, Yakutsk Scientific Center, Academy of Sciences, Yakutsk, mk-111; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84397.

References: (1) Kim, A.A., N.V. Zayakina, and Y.G. Lavrent'ev (1982) Yafsoanite – $(Zn_{1.38}Ca_{1.36}Pb_{0.26})_3TeO_6$, a new tellurium mineral. Zap. Vses. Mineral. Yagiite $(Na,K)_{1.5}Mg_2(Al,Mg)_3(Si,Al)_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Interstitially in a 0.8 mm silicate inclusion surrounded by nickel-iron.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.70

Optical Properties: Semitransparent. *Color:* Colorless; colorless to very light blue in thin section.
Optical Class: Uniaxial (+). *Pleochroism:* Faint; O = very light blue; E = colorless.
$\omega = 1.536(2)$ $\epsilon = 1.544(2)$

Cell Data: *Space Group:* $P6/mcc$. $a = 10.09(1)$ $c = 14.29(3)$ $Z = 2$

X-ray Powder Pattern: Colomera meteorite.
3.228 (100), 5.059 (65), 3.726 (50), 2.765 (50), 2.909 (40), 7.12 (30), 2.003 (30)

Chemistry:

	(1)
SiO_2	61.7
TiO_2	0.8
Al_2O_3	19.1
Cr_2O_3	0.1
FeO	2.4
MnO	0.2
MgO	10.5
CaO	0.1
Na_2O	3.7
K_2O	1.4
Total	100.0

(1) Colomera meteorite; by electron microprobe, corresponds to $(Na_{1.20}K_{0.30})_{\Sigma=1.50}Mg_{2.00}(Al_{1.96}Mg_{0.60}Fe_{0.34}Ti_{0.10})_{\Sigma=3.00}(Si_{10.22}Al_{1.78})_{\Sigma=12.00}O_{30}$.

Mineral Group: Milarite group.

Occurrence: In silicate inclusions of an iron meteorite, crystallized in a magnesium-rich environment.

Association: Diopside, whitlockite, tridymite, plagioclase, nickel-iron.

Distribution: In the Colomera iron meteorite.

Name: For Dr. Kenzo Yagi, Professor of Geology, Hokkaido University, Sapporo, Japan.

Type Material: n.d.

SiO_2	54.83
TiO_2	0.00
Al_2O_3	0.08
Fe_2O_3	15.03
MnO	0.00
CuO	15.20
ZnO	0.40
MgO	6.21
CaO	2.62
Na_2O	0.00
K_2O	0.15
Total	94.52

(1) Pridorozhnoye deposit, Russia; by electron microprobe, corresponding to $(Ca_{0.20}K_{0.01})_{\Sigma=0.21}(Cu_{0.84}Fe^{3+}_{0.83}Mg_{0.67}Zn_{0.02}Al_{0.01})_{\Sigma=2.37}Si_4O_{10}(OH)_2$; wet chemical analysis of a mixture with malachite and pseudomalachite gives H_2O 14.5% and all Fe as Fe^{3+}.

Mineral Group: Smectite group.

Occurrence: As veins and coatings in deeply oxidized sulfide-cassiterite ores.

Association: Pyrrhotite, chalcopyrite, pyrite, stannite, malachite, pseudomalachite, chrysocolla, iron oxides, quartz.

Distribution: From the Pridorozhnoye [Roadside] tin deposit, right bank of the Silinka River, nine km from its confluence with the Amur River, near Komsomol'sk-on-Amur, Russia.

Name: For Liya Konstantinova Yakhontova (1925–), Russian mineralogist, Moscow Univesity, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84395.

Yangzhumingite $KMg_{2.5}Si_4O_{10}F_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m.* As platy crystals to 0.5 mm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: n.d. *Tenacity*: Flexible and elastic. Hardness = 3 [Synthetic] D(meas.) = n.d. D(calc.) = 2.807

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Pearly. *Optical Class*: Biaxial (n.d.). n = 1.532-1.537 2V(meas.) = 5-10°

Cell Data: *Space Group*: *C*2/*m*. a = 5.249(4) b = 9.095(5) c = 10.142(5) β = 99.96(6)° Z = 2

X-ray Powder Pattern: Bayan Obo, Inner Mongolia, China.
2.41 (100), 10.03 (95), 2.59 (67), 2.90 (49), 3.37, (48), 4.51 (45), 2.62 (43)

Chemistry:

	(1)	(2)
SiO_2	58.8	58.59
Al_2O_3	0.41	
MgO	24.7	24.56
FeO	1.00

Total	99.75	100.00

(1) Bayan Obo, Inner Mongolia, China; average of 15 electron microprobe analyses, SIMS analysis for Li, H_2O calculated from stoichiometry; corresponding to $(K_{0.70}Li_{0.30}Na_{0.01})_{\Sigma=1.01}(Mg_{2.48}Fe_{0.06})_{\Sigma=2.54}(Si_{3.96}Al_{0.03})_{\Sigma=3.99}O_{10}[F_{1.92}(OH)_{0.08}]_{\Sigma=2.00}$. (2) $KMg_{2.5}Si_4O_{10}F_2$.

Mineral Group: Mica group; Mg-analog of montdorite.

Occurrence: Formed in metamorphosed carbonate rock in the transition zone between dolomite and slate in a rare earth-bearing deposit.

Association: Dolomite, calcite, tremolite, norbergite, huanghoite-(Ce); with minor phlogopite, barite, bastnäsite-(Ce), parisite-(Ce), fluorite.

Distribution: From the southern part of the East orebody, Bayan Obo, Inner Mongolia, People's Republic of China.

Name: Honors Professor Yang Zhuming (b. 1951), mineralogist and crystallographer, for his contributions to the mineralogy of the Bayan Obo deposit.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSM-MF15361) and the Institute of Geology and Geophysics, Chinese Academy of Sciences, Beijing, People's Republic of China (KDX015).

Mineral., 97, 761 (abs. ref. 1).

Yanomamite $InAsO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Dipyramidal crystals, to 0.2 mm, epitaxially overgrown by scorodite; typically in crusts.

Physical Properties: Hardness = 3.5–4 VHN = 571–743, 631 average (25 g load). D(meas.) = n.d. D(calc.) = 3.876(3)

Optical Properties: Semitransparent. *Color:* Pale green to yellow-green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. $n = 1.65$ 2V(meas.) = 55°–76°

Cell Data: *Space Group: Pbca.* $a = 10.446(6)$ $b = 9.085(4)$ $c = 10.345(6)$ $Z = 8$

X-ray Powder Pattern: Mangabeira deposit, Brazil.
4.53 (100), 5.70 (70), 3.874 (60), 3.250 (60), 4.163 (50), 3.110 (50), 5.16 (40)

Chemistry:

Fe_2O_3	1.11	
H_2O	[12.78]	12.43
Total	[100.00]	100.00

(1) Mangabeira deposit, Brazil; by electron microprobe, average of 12 determinations on several crystals, H_2O by difference; corresponds to $(In_{0.94}Fe_{0.04}Al_{0.01})_{\Sigma=0.99}As_{1.00}O_4 \cdot 2.02H_2O$.
(2) $InAsO_4 \cdot 2H_2O$.

Mineral Group: Variscite group.

Occurrence: A rare secondary mineral replacing arsenopyrite in quartz-topaz greisen veins in granite.

Association: Scorodite, arsenopyrite, indium-rich sphalerite, topaz, cassiterite.

Distribution: From the Mangabeira tin deposit, near Passa e Fica, Goiás, Brazil.

Name: For the Yanomami Indians, residents of the Amazon basin.

Type Material: Institute of Geosciences, University of Brasilia, Brasilia, Brazil; National School of Mines, Paris, France.

References: (1) Botelho, N.F., G. Roger, F. d'Yvoire, Y. Moëlo, and M. Volfinger (1994) Yanomamite, $InAsO_4 \cdot 2H_2O$, a new indium mineral from topaz-bearing greisen in the Goiás tin province, Brazil. Eur. J. Mineral., 6, 245–254. (2) (1995) Amer. Mineral., 80, 186 (abs. ref. 1).

Yaroslavite $Ca_3Al_2F_{10}(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As compact oval to spherical growths with radiating fibrous structure, to 3 mm.

Physical Properties: *Cleavage:* One direction, pinacoidal. *Fracture:* Irregular. Hardness = n.d. VHN = 264 D(meas.) = 3.09 D(calc.) = 3.15 Pale violet fluorescence under UV.

Optical Properties: Transparent. *Color:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* Elongation negative. $\alpha = 1.413$ β = n.d. $\gamma = 1.423$ 2V(meas.) = 74°

Cell Data: *Space Group:* n.d. $a = 8.74(1)$ $b = 5.53(3)$ $c = 4.51(2)$ Z = [1]

X-ray Powder Pattern: Yaroslavsk deposit, Russia.
3.445 (10), 2.222 (8), 3.653 (7), 4.50 (6), 1.835 (6), 1.454 (6), 2.827 (5)

Chemistry:

	(1)	(2)
Al_2O_3	21.55	24.50
MgO	0.24	
CaO	42.77	40.42
F	46.90	45.64
H_2O^+	8.97	8.66
$-O = F_2$	19.70	19.22
Total	[100.73]	100.00

(1) Yaroslavsk deposit, Russia; original total given as 100.77%; corresponds to $Ca_{3.09}Al_{1.76}F_{10.08}(OH)_2 \cdot H_2O$. (2) $Ca_3Al_2F_{10}(OH)_2 \cdot H_2O$.

Occurrence: From the oxidized zone of a banded sellaite-tourmaline-fluorite deposit.

Association: Sellaite, gearksutite, chukhrovite-(Ce).

Distribution: From Russia, in the Yaroslavsk tin deposit, 50 km south of Lake Khanka, Primorskiy Territory, Siberia.

Name: For its occurrence in the Yaroslavsk deposit, Russia.

Type Material: Vernadsky Geological Museum, Moscow, Russia.

References: (1) Novikova, M.I., G.A. Sidorenko, and M.N. Kuznetsova (1966) Yaroslavite – a new calcium aluminum fluoride. Zap. Vses. Mineral. Obshch., 95, 39–44 (in Russian). (2) (1966) Amer. Mineral., 51, 1546–1547 (abs. ref. 1).

Yarrowite Cu_9S_8

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$, $3m$, or 32. Massive and as stellate aggregates.

Physical Properties: *Cleavage:* {0001}. Hardness = n.d. VHN = 93–98 (15 g load). D(meas.) = n.d. D(calc.) = 4.89

Optical Properties: Opaque. *Color:* Blue; blue with a slight violet tint in oil under reflected light. *Streak:* n.d. *Luster:* Metallic. *Pleochroism:* Blue to bluish white. *Anisotropism:* Strong, orange-red.

R_1–R_2: (400) 19.2–32.9, (420) 18.6–32.3, (440) 17.9–31.4, (460) 16.9–30.5, (480) 15.6–29.5, (500) 14.2–28.2, (520) 12.4–27.0, (540) 10.7–25.6, (560) 9.08–24.3, (580) 7.51–23.1, (600) 6.15–22.2, (620) 5.02–22.2, (640) 4.33–23.0, (660) 4.38–23.6, (680) 5.96–23.4, (700) 9.44–23.0

Cell Data: *Space Group:* $P\overline{3}m1$, $P3m1$, $P31m$, or $P321$. $a = 3.800(1)$ $c = 67.26(4)$ $Z = 3$

X-ray Powder Pattern: Spionkop Creek, Canada.
1.899 (100), 3.061 (55), 2.767 (35), 5.032 (30), 3.678 (25), 2.849 (25), 5.955 (20)

Chemistry:

	(1)	(2)	(3)
Cu	68.5	68.5	69.03
Fe		0.1	
Ag		0.2	
S	30.4	31.5	30.97
Total	98.9	100.3	100.00

(1) Yarrow and Spionkop Creeks, Canada; by electron microprobe. (2) Cannington Park, England; by electron microprobe. (3) Cu_9S_8.

Occurrence: As weathering-produced lamellar replacements of other copper sulfides in stratabound red-bed copper deposits (Yarrow and Spionkop Creeks, Canada).

Association: Anilite, djurleite, spionkopite, tennantite (Yarrow and Spionkop Creeks, Canada).

Distribution: In the Upper Grinnell Formation, Spionkop Creek and Yarrow Creek areas of southwestern Alberta, Canada. In the High Rolls district, Otero Co., New Mexico, and at Washington Pass, Okanogan Co., Washington, USA. From Cannington Park, Bridgwater, Somerset, England. In the Lubin and Rudna copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland.

Name: For the type locality at Yarrow Creek, Canada.

Type Material: Canadian Geological Survey, Ottawa; Queen's University, Kingston, Ontario, Canada; National Museum of Natural History, Washington, D.C., 149430, 149431; Harvard University, Cambridge, Massachusetts, USA, 122290.

Yavapaiite $KFe^{3+}(SO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 0.6 mm, slightly elongated along [010], showing poorly developed {001}, {101}, {100}, {201}, {110}; commonly equidimensional granular.

Physical Properties: *Cleavage:* Perfect on {001}, {100}; distinct on {110}. *Fracture:* Subconchoidal to uneven. *Tenacity:* Very brittle. Hardness = 2.5–3 D(meas.) = 2.88 D(calc.) = 2.891 Soluble in H_2O, with separation of $Fe(OH)_3$ from a weakly acid solution.

Optical Properties: Transparent. *Color:* Very pale purplish pink; colorless in transmitted light. *Streak:* White to pale yellow. *Luster:* Vitreous to nearly adamantine. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 6°$. *Dispersion:* $r > v$, strong, horizontal. $\alpha = 1.593(2)$ $\beta = 1.684(2)$ $\gamma = 1.698(1)$ 2V(meas.) = 30.5°

Cell Data: *Space Group:* $C2/m$. $a = 8.152(5)$ $b = 5.153(4)$ $c = 7.877(5)$ $\beta = 94.90(7)°$ Z = 2

X-ray Powder Pattern: Jerome, Arizona, USA.
2.97 (100), 7.85 (90), 3.87 (80), 2.394 (80), 3.73 (75), 2.842 (75), 3.49 (60)

Chemistry:

	(1)	(2)
SO_3	55.84	55.78
Al_2O_3	0.11	
Fe_2O_3	27.82	27.81
FeO	0.07	
MgO	0.08	
Na_2O	0.62	
K_2O	15.46	16.41
Total	[100.00]	100.00

(1) Jerome, Arizona, USA; recalculated to 100% from an original total of 99.94% after deduction of H_2O^- 0.14% and SiO_2 + insoluble 0.26%; corresponds to $(K_{0.93}Na_{0.06})_{\Sigma=0.99}(Fe_{1.00}Mg_{0.01})_{\Sigma=1.01}(SO_4)_{2.00}$. (2) $KFe(SO_4)_2$.

Occurrence: In the fire zone of a pyritic orebody, formed under fumarolic conditions.

Association: Voltaite, sulfur, jarosite.

Distribution: From the open pit at the United Verde mine, Jerome, Yavapai Co., Arizona, USA.

Name: For the Yavapai Indian tribe who inhabit the region around Jerome, Arizona, USA.

Type Material: n.d.

References: (1) Hutton, C.O. (1959) Yavapaiite, an anhydrous potassium, ferric sulphate from Jerome, Arizona. Amer. Mineral., 44, 1105–1114. (2) Graeber, E.J. and A. Yazganite $NaFe^{3+}_2(Mg,Mn)(AsO_4)_3 \cdot H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As prismatic crystals or aggregtes, to 10 mm., elongated on [001], flattened on {010} with forms {010}, {100}, {110}, {131}, {111}, and $\{\bar{3}\ 11\}$.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle.
Hardness = 5 D(meas.) = 4.18(2) D(calc.) = 4.182(1)

Optical Properties: Translucent (slightly metallic). *Color*: Brown or brown-black.
Streak: Bright brown to yellow-gray. *Luster*: Adamantine.
Optical Class: Biaxial (-). α = 1.870(2) β = 1.897(2) γ = 1.900(2) 2V(meas.) = 35(2)°
2V(calc.) = 36.5(3)° *Dispersion*: $r < v$, strong. *Orientation*: $X \wedge a = 5°$, $Y = b$, $Z \wedge c = 17°$.
Pleochroism: Moderate; X = orange brown, yellow; $Z = Y$ = grayish yellow, colorless.

Cell Data: *Space Group: C2/c.* a = 12.181(1) b = 12.807(1) c = 6.6391(5) β = 112.441(9)°
Z = 4

X-ray Powder Pattern: Erciyes volcanic complex, Kiranardi, Turkey.
2.780 (100), 3.202 (40), 2.611 (40), 3.575 (30), 6.400 (20), 5.630 (20), 3.766 (15)

Chemistry:

	(1)
Na_2O	5.10
MgO	4.12
MnO	3.70
ZnO	0.30
Fe_2O_3	27.20
As_2O_5	56.94
H_2O	2.64
Total	100.00

(1) Erciyes volcanic complex, Kiranardi, Turkey; average of 5 electron microprobe analyses, H_2O by difference and confirmed by IR spectroscopy; corresponding to $Na_{0.99}Fe^{3+}_{2.05}(Mg_{0.61}Mn_{0.32}Zn_{0.02})_{\Sigma=0.95}As_{2.99}O_{12} \bullet 0.88H_2O$.

Occurrence: A hydrothermal mineral in fissures cutting porphyritic andesite in a stratovolcano.

Association: Cassiterite, hematite, magnetite, orpiment, realgar, tridymite.

Distribution: Erciyes stratovolcanic complex, 10 km south of the prefecture of Kayseri, near Hisarcik, Kiranardi, Turkey.

Name: Honors Dr. Evren Yazgan (b. 1943), a geologist who found the first specimens.

Type Material: Department of Mineralogy, Natural History Museum of Geneva, Switzerland, (478.188).

References: (1) Sarp, H. and R. Černý (2005) Yazganite, $NaFe^{3+}_2(Mg,Mn)(AsO_4)_3 \cdot H_2O$, a new mineral: its description and crystal structure. Eur. J. Mineral., 17, 367-373. (2) (2005) Amer. Mineral., 90, 1950 (abs. ref. 1).

Yeatmanite $Mn_9^{2+}Zn_6Sb_2^{5+}Si_4O_{28}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As euhedral crystals, typically lath-shaped, rarely pseudohexagonal by twinning; as warped foliae. *Twinning:* Multiple lamellar on {010}; also on {023}.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Brittle. Hardness = 4
D(meas.) = 5.02 D(calc.) = 5.04

Optical Properties: Semitransparent. *Color:* Clove-brown. *Streak:* Very light brown. *Optical Class:* Biaxial (–). *Orientation:* $X \perp$ {100} cleavage. *Dispersion:* $r > v$, distinct. $\alpha = 1.864(4)$ $\beta = 1.895(4)$ $\gamma = 1.905(2)$ 2V(meas.) = 52° 2V(calc.) = 59°

Cell Data: *Space Group:* $P\bar{1}$. $a = 5.604(2)$ $b = 11.602(7)$ $c = 9.058(4)$ $\alpha = 92°10(3)'$ $\beta = 100°54(2)'$ $\gamma = 77°18(5)'$ Z = 1

X-ray Powder Pattern: Franklin, New Jersey, USA.
2.969 (100), 2.782 (60), 2.587 (60), 2.474 (60), 1.605 (60), 2.547 (40), 2.146 (40)

Chemistry:

	(1)
SiO_2	14.7
Sb_2O_5	18.9
FeO	1.0
MnO	37.8
ZnO	29.1
MgO	0.0
Total	101.5

(1) Franklin, New Jersey, USA; by electron microprobe, corresponds to $Mn_{8.89}Zn_{5.97}Sb_{1.95}Fe_{0.23}Si_{4.08}O_{28}$.

Occurrence: In veins in massive granular ore in a metamorphosed stratiform zinc deposit.

Association: Sarkinite, willemite, calcite, diopside, andradite, roméite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For Pope Yeatman (1861–1953), mining engineer at Franklin, New Jersey, USA.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 92878; National Museum of Natural History, Washington, D.C., USA, C6290.

Yedlinite $Pb_6CrCl_6(O,OH)_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As prismatic hexagonal crystals, to 1 mm, with dominant $\{11\overline{2}0\}$ and $\{1101\}$, and $\{0001\}$, $\{10\overline{1}0\}$, $\{20\overline{2}1\}$.

Physical Properties: *Cleavage:* $\{11\overline{2}0\}$, distinct. *Tenacity:* Somewhat sectile. Hardness = ∼2.5 D(meas.) = 5.85(4) D(calc.) = 5.80

Optical Properties: Transparent to translucent. *Color:* Red-violet, may be zoned. *Streak:* White.
Optical Class: Uniaxial (–). *Pleochroism:* Moderate; O = pale Cobalt blue; E = lavender.
$\omega = 2.125$ $\epsilon = 2.059$

Cell Data: *Space Group:* $R\overline{3}$. $a = 12.868(2)$ $c = 9.821(2)$ Z = 3

X-ray Powder Pattern: Mammoth-St. Anthony mine, Arizona, USA.
2.952 (100), 2.622 (68), 4.506 (65), 6.44 (32), 2.473 (27), 3.879 (23), 1.787 (19)

Chemistry:

	(1)	(2)
Pb	79.4	75.81
Mn	0.7	
Cr	3.8	3.17
Cl	7.5	12.97
H		0.25
O	[8.6]	7.80
Total	[100.0]	100.00

(1) Mammoth-St. Anthony mine, Arizona, USA; by electron microprobe, average of ten analyses, O by difference. (2) $Pb_6CrCl_6O_4(OH)_4$.

Occurrence: A very rare late-stage secondary mineral in an oxidized polymetallic hydrothermal ore deposit.

Association: Diaboleite, phosgenite, matlockite, wherryite, wulfenite, dioptase, cerussite, mimetite, willemite, hemimorphite, fluorite, quartz.

Distribution: From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA.

Name: To honor Leo Neal Yedlin (1908–1977), American mineral collector of microscopic specimens, of New Haven, Connecticut, USA, who first noted the mineral.

Type Material: Mineral Museum, University of Arizona, Tucson, Arizona, X5562; National Museum of Natural History, Washington, D.C., USA, R8171.

Ye'elimite $Ca_4Al_6O_{12}(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 432. Crystals, to 15 μm, in aggregates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.61 Decomposes in H_2O to give ettringite and $Al(OH)_3$.

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Isotropic. $n = 1.568(2)$

Cell Data: *Space Group:* $I4_132$ (synthetic). $a = 18.392$ Z = 16

X-ray Powder Pattern: Hatrurim Formation, Israel.
3.754 (100), 2.909 (15), 3.915 (10), 6.52 (4)

Chemistry:

	(1)	(2)
SO_3	14.54	13.12
Al_2O_3	47.84	50.12
Fe_2O_3	1.04	
CaO	36.56	36.76
Total	99.98	100.00

(1) Hatrurim Formation, Israel; by electron microprobe, average of two analyses, total Fe as Fe_2O_3; corresponds to $Ca_{3.98}(Al_{5.71}Fe_{0.08})_{\Sigma=5.79}O_{12}(S_{1.11}O_4)$. (2) $Ca_4Al_6O_{12}(SO_4)$.

Occurrence: In a high-temperature (> 900 °C) metamorphic assemblage in cobbles in a pseudo-conglomerate.

Association: Larnite, brownmillerite, sulfatian-phosphatian fluorapatite.

Distribution: In the lower part of the Hatrurim Formation, west of the Dead Sea, Israel.

Name: For Har Ye'elim and Nahal Ye'elim, the most conspicuous hill and wadi in the Hatrurim Basin, Israel.

Type Material: Geochemistry Department, Geological Survey of Israel; Department of Geology, Hebrew University, Jerusalem, Israel, 62815.

Yimengite $K(Cr^{3+}, Ti, Fe^{3+}, Mg)_{12}O_{19}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As irregular platy to tabular grains, to 2 mm; as rims around spinel grains.

Physical Properties: *Cleavage:* {0001}, perfect; $\{11\bar{2}1\}$, good; $\{10\bar{1}1\}$, poor. Hardness = 4.1 VHN = 273 (20 g load). D(meas.) = 4.34 D(calc.) = 4.35

Optical Properties: Opaque. *Color:* Black; gray to grayish white in reflected light. *Streak:* Brown. *Luster:* Metallic.
Optical Class: Uniaxial. *Pleochroism:* Weak.
R_1–R_2: (402) 12.7–17.7, (438) 11.3–18.2, (498) 15.1–16.0, (548) 15.7–16.2, (588) 13.0–16.5, (624) 13.5–16.7, (641) 12.6–15.5

Cell Data: *Space Group:* $P6_3/mmc$. $a = 5.875(11)$ $c = 22.9403(54)$ $Z = 2$

X-ray Powder Pattern: Yimeng Mountain area, China.
2.630 (10), 2.780 (9), 1.622 (9), 1.475 (8), 1.665 (6), 2.240 (5), 2.450 (4)

Chemistry:

	(1)	(2)
SiO_2	0.55	0.52
TiO_2	29.15	30.57
Al_2O_3	1.61	3.61
Fe_2O_3		2.76
Cr_2O_3	37.06	39.37
FeO	18.36	9.88
MgO	7.89	6.19
BaO	1.61	2.31
SrO		0.36
K_2O	3.75	4.50
Total	99.98	100.07

(1) Yimeng Mountain area, China; by electron microprobe, total Fe as FeO. (2) Guaniamo district, Venezuela; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponding to $(K_{0.88}Ba_{0.14}Sr_{0.03})_{\Sigma=1.05}(Cr_{4.74}Ti_{3.50}Mg_{1.40}Fe^{2+}_{1.26}Al_{0.65}Fe^{3+}_{0.32}Si_{0.08})_{\Sigma=11.95}O_{19}$.

Mineral Group: Magnetoplumbite group.

Occurrence: A metasomatic alteration product of chromian spinel in kimberlites.

Association: Chromian spinel, mathiasite, olivine, phlogopite, pyrope, chromite, ilmenite, chromian diopside, apatite, zircon, moissanite, perovskite (Yimeng Mountain area, China).

Distribution: From the Yimeng Mountain area, Shandong Province, China. In the Guaniamo district, Bolivar Province, Venezuela.

Name: For its occurrence in the Yimeng Mountain area, China.

Type Material: n.d.

Yingjiangite $K_2Ca(UO_2)_7(PO_4)_4(OH)_6 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Granular massive, to 0.015 mm.

Physical Properties: Hardness = 3–4 D(meas.) = 4.15; 4.54 D(calc.) = 4.17; 4.60 Radioactive; weak yellowish green fluorescence under UV.

Optical Properties: Transparent to translucent. *Color:* Golden yellow to yellow. *Luster:* Subadamantine to resinous.
Optical Class: Biaxial (–). *Pleochroism:* X = almost colorless; Y = pale yellow; Z = yellow. *Orientation:* Length-slow. α = 1.666–1.669 β = 1.692–1.703 γ = 1.707–1.710 2V(meas.) = 36°–38° 2V(calc.) = 36°

Cell Data: *Space Group:* $[C222_1]$ (by analogy to phosphuranylite). a = 13.73(1) b = 15.99(1) c = 17.33(2) Z = 8, or *Space Group:* $Bmmb$. a = 15.707(3) b = 17.424(3) c = 13.692(2) Z = 4

X-ray Powder Pattern: Tongbiguan village, China.
8.03 (100), 3.99 (90), 3.17 (70), 3.10 (70), 2.886 (60), 5.90 (40), 3.88 (40)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

				Total	100.00	99.61	100.00

(1) Tongbiguan village, China; by electron microprobe, average of four analyses, H_2O may be by difference; then corresponds to $(K_{1.26}RE_{0.06}Th_{0.04})_{\Sigma=1.36}Ca_{0.68}(UO_2)_{6.42}(PO_4)_{3.76}(OH)_4 \cdot 8H_2O$. (2) Xiazhuang uranium deposit, China; corresponds to $(K_{1.90}Na_{0.12})_{\Sigma=2.02}Ca_{0.95}(UO_2)_{7.02}(PO_4)_{3.93}(OH)_{6.16} \cdot 6.07H_2O$. (3) $K_2Ca(UO_2)_7(PO_4)_4(OH)_6 \cdot 6H_2O$.

Occurrence: A secondary mineral in an oxidized zone of a uranium deposit (Tongbiguan village, China).

Association: Studtite, calcurmolite, tengchongite, autunite (Tongbiguan village, China).

Distribution: From Tongbiguan village, Yingjiang Co., Yunnan Province, and in the Xiazhuang uranium deposit, Guangdong Province, China.

Name: For Yingjiang Co., China, within which it was first noted.

Type Material: National Geological Museum, Beijing, China.

Yixunite Pt_3In

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. A component of polycrystalline globules, to 2 mm, typically associated with damiaoite, always in the interior.

Physical Properties: *Tenacity:* "weakly malleble." Hardness = 5.8 VHN = 573–681, 634 average (50 g load). D(meas.) = n.d. D(calc.) = 18.21

Optical Properties: Opaque. *Color:* Steel-black; bright white with a yellowish tint in reflected light. *Streak:* Black. *Luster:* Metallic.
Optical Class: Isotropic.

R: (400) 49.9, (420) 51.7, (440) 53.8, (460) 55.3, (480) 56.9, (500) 58.5, (520) 60.1, (540) 61.7, (560) 63.5, (580) 64.9, (600) 66.5, (620) 68.4, (640) 70.3, (660) 72.4, (680) 74.5, (700) 76.6

Cell Data: *Space Group:* $Pm3m$. a = 3.988(3) Z = 1

X-ray Powder Pattern: Near Damiao village, China.
2.30 (100), 1.203 (80), 1.99 (60), 1.41 (40), 1.151 (40), 0.997 (20), 1.33 (10)

Chemistry:

	(1)	(2)
Pt	82.8	83.60
In	16.4	16.40
Total	99.2	100.00

(1) Near Damiao village, China; by electron microprobe, averge of eight analyses. (2) Pt_3In.

Occurrence: In a contact metasomatic Co–Cu–Pt-bearing vein in garnet-amphibole pyroxenite in contact with anorthosite and granite.

Association: Moncheite, sperrylite, cooperite, damiaoite, cobaltian malanite, bornite, chalcopyrite, carrolite, magnetite.

Distribution: From near Damiao village and the Yixun River, about 270 km north of Beijing, Hebei Province, China [TL].

Name: For its occurrence near the Yixun River, China.

Type Material: n.d.

Yoderite $Mg_2(Al,Fe^{3+})_6Si_4O_{18}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As anhedral grains, bladed or lathlike ‖ [010], to 12 mm.

Physical Properties: *Cleavage:* Partings [001], good and {100}, poor. Hardness = 6 D(meas.) = 3.39 D(calc.) = [3.33]

Optical Properties: Transparent. *Color:* Deep purple, emerald-green; in transmitted light, deep blue to olive-green, green to yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = pale Prussian blue, green; Y = indigo, light yellow; Z = pale olive-green, yellow. *Orientation:* $Y = b$; $X \wedge a \simeq 9°$; $Z \wedge c \simeq 7°$. *Absorption:* $Y > X > Z$. α = 1.689–1.691 β = 1.691–1.693 γ = 1.712–1.715 2V(meas.) = 25°–30°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.022(2)$ $b = 5.816(1)$ $c = 7.250(2)$ $\beta = 104.9(1)°$ Z = [1]

X-ray Powder Pattern: Mautia Hill, Tanzania.
3.50 (100), 3.03 (80), 2.61 (60), 2.00 (60), 1.82 (60), 3.23 (50), 3.19 (50)

Chemistry:

	(1)	(2)
SiO_2	35.94	36.07
TiO_2	0.11	0.07
Al_2O_3	42.95	42.76
Fe_2O_3	5.16	4.08
Mn_2O_3	0.62	0.85
FeO	0.24	0.19
MnO	0.23	0.13
MgO	12.05	11.83
H_2O^+	2.69	[2.69]
P_2O_5		0.36
Total	[99.99]	[99.03]

(1) Mautia Hill, Tanzania; Fe^{2+}:Fe^{3+} from Mössbauer spectroscopy. (2) Do.; by electron microprobe, Fe^{2+}:Fe^{3+} from Mössbauer spectroscopy, H_2O from (1); corresponds to $(Mg_{1.95}Fe^{2+}_{0.02}Mn^{2+}_{0.01})_{\Sigma=1.98}(Al_{5.57}Fe^{3+}_{0.34}Mn^{3+}_{0.07}Ti_{0.01})_{\Sigma=5.99}(Si_{3.98}P_{0.03})_{\Sigma=4.01}O_{18.02}(OH)_{1.98}$.

Occurrence: A major phase in quartz-kyanite-talc schist formed under conditions of ~10 kbar H_2O pressure and 800 °C.

Association: Kyanite, talc, hematite, quartz.

Distribution: On Mautia Hill, Kongwa, Central Province, Tanzania.

Name: For Hatten Schuyler Yoder, Jr. (1921–), petrologist with the Geophysical Laboratory, Washington, D.C., USA.

Type Material: Geological Survey of Tanzania, JH 2563/2, JH 2563/14; National Museum of Natural History, Washington, D.C., USA, 137854.

Yofortierite $(Mn^{2+},Mg)_5Si_8O_{20}(OH)_2 \cdot 8-9H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, probable. *Point Group:* m. As very fine radiating fibers, to 3 cm, divergent sprays, spherical aggregates.

Physical Properties: *Tenacity:* Elastic. Hardness = 2.5 D(meas.) = 2.18 D(calc.) = [2.82]

Optical Properties: Transparent to opaque. *Color:* Pink, purple, violet, beige, reddish to orange-brown, dark brown, bronze; in transmitted light, pale maroon. *Luster:* Silky. *Optical Class:* Biaxial. *Pleochroism:* Distinct. *Orientation:* $X \wedge$ fiber axis = 8°. *Absorption:* Maximum $\perp$ length of fibers. $\alpha = 1.530$ β = n.d. $\gamma = 1.559$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $[Pn]$ (ICDD 27-312, by analogy to paligorskite). $a = 12.759$ $b = 18.369$ $c = 5.024$ $\beta = 91.98°$ Z = 2

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
10.5 (100), 3.302 (90), 2.621 (30), 2.510 (20), 4.41 (18), 3.680 (15), 2.526 (15)

Chemistry:

	(1)
SiO_2	48.44
TiO_2	0.09
Al_2O_3	1.49
Cr_2O_3	0.007
MnO	28.41
ZnO	1.10
MgO	2.35
CaO	0.90
K_2O	0.05
H_2O	17.22
Total	100.057

(1) Mont Saint-Hilaire, Canada; by XRF, AA, and TGA; corresponds to $(Mn_{3.97}Mg_{0.58}Al_{0.29}Ca_{0.16}Zn_{0.13}K_{0.01}Ti_{0.01})_{\Sigma=5.15}Si_8O_{20.31}(OH)_{1.99} \cdot 9.06H_2O$.

Occurrence: A late-stage hydrothermal mineral in pegmatite veins within nepheline syenite in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada);

Association: Analcime, sérandite, eudialyte, polylithionite, aegirine, microcline, albite (Mont Saint-Hilaire, Canada).

Distribution: From Mont Saint-Hilaire and in the Saint-Amable sill, near Varennes, Quebec, Canada. On Mt. Karnasurt, Lovozero massif, Russia.

Name: For Yves Oscar Fortier (1914–), former Director of the Geological Survey of Canada (1964–1972).

Type Material: École Polytechnique, Montreal, 13017; Royal Ontario Museum, Toronto, M33627; Canadian Museum of Nature, Ottawa, Canada; National Museum of Natural History, Washington, D.C., USA, 131952; The Natural History Museum, London, England, 1975,418; University of Paris, Paris; Museum of Natural History, Paris; National School of Mines, Paris, France.

(1) Noda-Tamagawa mine, Japan; corresponds to $(Ba_{1.50}Sr_{0.30}Na_{0.04})_{\Sigma=1.84}(Mn_{1.70}Fe^{2+}_{0.14}Mg_{0.10}Zn_{0.04})_{\Sigma=1.98}(Ti_{0.85}Fe^{3+}_{0.11})_{\Sigma=0.96}Si_{2.08}O_8[(P_{0.76}S_{0.92})_{\Sigma=1.68}O_4](OH,Cl)_{1.45}$. (2) Taguchi mine, Japan; corresponds to $(Ba_{1.72}Sr_{0.20}Na_{0.01})_{\Sigma=1.93}(Mn_{1.55}Fe^{2+}_{0.30}Ca_{0.18}Mg_{0.04})_{\Sigma=2.07}(Ti_{0.65}Fe^{3+}_{0.29}Al_{0.02})_{\Sigma=0.96}Si_{1.99}O_{8.40}[(P_{0.44}S_{0.33})_{\Sigma=0.77}O_{3.08}](OH)_{0.82}$.

Occurrence: In the border facies of an alkalic pegmatite cutting a stratiform manganese deposit (Noda-Tamagawa mine, Japan).

Association: Richterite, rhodonite, barian potassic feldspar, "aegirine-augite," riebeckite, quartz.

Distribution: In the Noda-Tamagawa mine, Tamagawamura, and the Hijikuzu mine, Iwate Prefecture, and the Taguchi mine, Shidara, Aichi Prefecture, Japan.

Name: In honor of Professor Toyofumi Yoshimura, Kyushu University, Hakozaki, Japan.

Type Material: National Science Museum, Tokyo, Japan, M15110; The Natural History Museum, London, England; Harvard University, Cambridge, Massachusetts, 106170; National Museum of Natural History, Washington, D.C., USA, 107416.

Yoshiokaite $Ca(Al,Si)_2O_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. As anhedral, angular, strongly fractured crystal fragments, to 235 μm, in glass.

Physical Properties: *Cleavage:* Poor on {100}; commonly showis sets of {201} and {200} lamellae which are believed not to be related by twinning, but were probably shock-induced. Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* [White (?).]
Optical Class: Uniaxial (+); anomalously biaxial due to strain. ω = n.d. ϵ = n.d.
2V(meas.) = $< 5°$

Cell Data: *Space Group:* $P\bar{3}$, (probable). $a = 9.939(2)$ $c = 8.245(2)$ Z = n.d.

X-ray Powder Pattern: Moon.
8.57 (100), 2.979 (91), 3.718 (79), 2.871 (78), 1.158 (51), 2.062 (41), 4.123 (36)

Chemistry:

	(1)	(2)
SiO_2	28.0	15.8
TiO_2	0.07	0.12
Al_2O_3	45.9	56.3
FeO	0.18	0.41
MgO	0.98	0.40
CaO	25.5	27.8
Na_2O	0.00	0.09
K_2O	0.00	0.01
Total	100.7	100.9

(1) Moon; by electron microprobe, corresponding to $(Ca_{0.66}Mg_{0.04})_{\Sigma=0.70}(Al_{1.30}Si_{0.67})_{\Sigma=1.97}O_4$.
(2) Do.; by electron microprobe, corresponding to $(Ca_{0.73}Mg_{0.02}Fe_{0.01})_{\Sigma=0.76}$ $(Al_{1.64}Si_{0.39})_{\Sigma=2.03}O_4$.

Occurrence: A metastable phase, as shocked crystal fragments and in devitrified glasses in a regolith breccia. The glass may have resulted from shock melting of alkali anorthite on the ancient lunar highlands.

Association: Glass.

Distribution: On the Moon, near the Apollo 14 landing site.

Name: For T. Yoshioka (1935–1983), who studied the synthetic phase.

Type Material: NASA, Johnson Space Center, Houston, Texas, USA, regolith breccia 14076.

Yttrialite-(Y) $(Y,Th)_2Si_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic; commonly metamict. *Point Group:* $2/m$. Massive.

Physical Properties: *Cleavage:* Platy [*sic*]. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 4.56–4.58 D(calc.) = 4.0 Radioactive.

Optical Properties: Translucent to nearly opaque. *Color:* Olive-green, becoming yellow-orange with alteration. *Luster:* Vitreous to greasy or dull.
Optical Class: Biaxial. $n = 1.760$, metamict. $\alpha = 1.749$ (synthetic $Y_2Si_2O_7$). $\beta = 1.751$–1.758 $\gamma = 1.754$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/m$ (synthetic $Y_2Si_2O_7$). $a = 7.50$ $b = 8.06$ $c = 5.02$ $\beta = 112.00°$ Z = 2

X-ray Powder Pattern: Baringer Hill, Texas, USA; after heating to 985 °C.
3.056 (100), 3.463 (80), 2.627 (70), 2.058 (65), 2.393 (60), 4.696 (50), 3.177 (40)

(1) Baringer Hill, Texas, USA. (2) Ivedal, Norway; $RE_2O_3 = La_2O_3$ 0.14%, Pr_2O_3 0.15%, Nd_2O_3 1.09%, Sm_2O_3 1.17%, Eu_2O_3 0.05%, Gd_2O_3 2.44%, Tb_2O_3 0.61%, Dy_2O_3 5.35%, Ho_2O_3 1.00%, Er_2O_3 3.69%, Tm_2O_3 0.75%, Yb_2O_3 5.58%, Lu_2O_3 1.45%.

Occurrence: A late-stage mineral in some rare-earth-bearing pegmatites.

Association: Gadolinite, thalenite, thortveitite, britholite-(Y), fergusonite, xenotime, allanite, microcline, albite, quartz, biotite, zircon, magnetite, spessartine, fluorite, tombarthite.

Distribution: In the USA, in Texas, from the Baringer Hill pegmatite, 26 km west of Burnet, and from Rode Ranch, near Bluffton, Llano Co., and in the Clear Creek pegmatite, Burnet Co. At Ivedal and Högetveit, Evje, Norway. From Åskagen, Vårmland, Sweden. At Fusamata and Suishoyama, Fukushima Prefecture; Yashima, Kagawa Prefecture; and Komenono, Ehime Prefecture, Japan.

Name: For the *yttrium* in its composition.

(1) Alakurtti, Russia. (2) Do.; original total given as 99.88%. (3) Moon; by electron microprobe, total Fe as FeO, average of 13 analyses of several grains; $RE_2O_3 = Sm_2O_3$ 0.76%, Eu_2O_3 0.03%, Gd_2O_3 1.11%, Yb_2O_3 1.38%, remaining RE 6.70%; Fe^{2+}:Fe^{3+} calculated from stoichiometry, then corresponding to $(Ca_{0.61}Y_{0.42}RE_{0.32}Fe^{2+}_{0.25}Pb_{0.18}Th_{0.12}U_{0.07}La_{0.02}Mn_{0.01})_{\Sigma=2.00}(Ti_{1.24}Nb_{0.58}Fe_{0.14}Ta_{0.02}Zr_{0.01}W_{0.01})_{\Sigma=2.00}O_{6.80}$.

Mineral Group: Pyrochlore group, betafite subgroup; $RE_A > 20\%$ (with Y > Ce); $2Ti_B \geq (Nb + Ta)_B$.

Occurrence: In replacement bodies in a quartz-plagioclase-microcline pegmatite (Alakurtti, Russia); in a fragment of granophyre from soil and breccia (Moon).

Association: Yttropyrochlore-(Y), plumbian uranpyrochlore, garnet, fergusonite, columbite (Alakurtti, Russia); potassian feldspar, zircon, apatite, quartz, silica glass (Moon).

Distribution: From Alakurtti, northwestern Karelia, Russia. On the surface of the Moon.

Name: As the YTTRium-dominant *betafite* member of the pyrochlore group.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis337.

(1) Berg, Norway. (2) Hattevik, Norway.

Polymorphism & Series: Dimorphous with formanite-(Y).

Occurrence: A rare accessory mineral in granite pegmatites.

Association: Albite, garnet, topaz, fergusonite (Ytterby, Sweden); monazite, columbite, allanite, samarskite, xenotime, gadolinite, mica (Norway).

Distribution: In Sweden, from Ytterby, on Resarö Island, near Vaxholm, near Falun, at Finbo and Broddbo; and in the Skuleboda pegmatite, near Väne Ryr, Västergötland. In Norway, at Hattevik, east of Dillingö, and near Berg. In the Rare Metals mine, Aquarius Mountains, Mohave Co., Arizona, USA. From the Tanokamiyama district, Shiga Prefecture, Japan.

Name: For YTTRium in its composition and relation to *tantalite*.

Yttrotungstite-(Y) $YW_2O_6(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Lathlike crystals, flattened on {100} and elongated along [001], with {110} and very rare {101}, to 0.2 mm, in druses; typically earthy. *Twinning:* On {100}, probably universal, as contact twins.

Physical Properties: *Cleavage:* {010}, good; on $\{10\overline{1}\}$, probable, very poor. Hardness = n.d. D(meas.) = 5.96 D(calc.) = [5.98]

Optical Properties: Semitransparent. *Color:* Pale yellow.
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow; $Y = Z$ = dark yellow. *Orientation:* $Z = b$; $X \wedge c = 26°$. $\alpha = 1.89$ $\beta = 1.98$ $\gamma = 2.02$ 2V(meas.) = 68° 2V(calc.) = 65°

Cell Data: *Space Group:* $P2_1/m$. $a = 6.954(6)$ $b = 8.637(9)$ $c = 5.771(6)$ $\beta = 104°56(4)'$ Z = 2

X-ray Powder Pattern: Kramat Pulai mine, Malaysia.

(1) Zhuanmiao deposit, China; by electron microprobe, average of four analyses, B_2O_3 by wet methods, Fe_2O_3:FeO determined by Mössbauer spectroscopy; corresponds to $(Mg_{0.91}Fe^{2+}_{0.09})_{\Sigma=1.00}(Fe^{3+}_{0.56}Al_{0.19}Mg_{0.17}Ti_{0.11}Fe^{2+}_{0.10})_{\Sigma=1.13}O(B_{0.92}O_{3.00})$. (2) Inglefield Land, Greenland; by electron microprobe, B_2O_3 by ion microprobe; corresponds to $(Mg_{0.59}Al_{0.23}Fe^{2+}_{0.12}Fe^{3+}_{0.06}Mn_{0.01})_{\Sigma=1.01}(Fe^{3+}_{0.53}Mg_{0.38}Ti_{0.07}Cr_{0.02})_{\Sigma=1.00}O(B_{1.00}O_3)$.

Occurrence: In metamorphosed magnesian marble in a boron deposit (Zhuanmiao deposit, China); in ultramafic rocks (Inglefield Land, Greenland).

Association: Suanite, anhydrite, apatite (Zhuanmiao deposit, China); sinhalite, forsterite, calcite (Huayuangou deposit, China); forsterite, pleonaste, phlogopite, magnetite, apatite, tourmaline (Inglefield Land, Greenland).

Distribution: From the Zhuanmiao boron deposit, Kuandian Co., and the Huayuangou boron deposit, both in Liaoning Province, China. Found in central Inglefield Land, northwest Greenland.

Name: In honor of Professor Yuan Fuli (1893–1987), Chinese geologist, China University of Geosciences, Wuhan, China.

Type Material: Geological Museum of China, Beijing, China.

Yugawaralite $CaAl_2Si_6O_{16}\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. Crystals flat tabular ‖ {010}, to 8 cm; in groups of nearly parallel crystals.

Physical Properties: *Cleavage:* $\{40\bar{1}\}$, {100} distinct, $\{10\bar{1}\}$ imperfect; parting on {010}. *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = 4.5–5 D(meas.) = 2.20–2.23 D(calc.) = 2.26 Piezoelectric and pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in thin section. *Luster:* Vitreous to pearly, iridescent on {010}. *Streak:* White.
Optical Class: Biaxial (–) or (+). *Orientation:* $Z = b$; $X \wedge c = -9°$; $Y \wedge c = 6°$–$9°$.
Dispersion: $r < v$, weak to distinct. $\alpha = 1.492$–1.496 $\beta = 1.497$–1.499 $\gamma = 1.502$–1.504
2V(meas.) = 48°–89°

Cell Data: *Space Group:* Pc. $a = 6.72(2)$ $b = 13.98(2)$ $c = 10.05(2)$ $\beta = 111°31'$

(1) Yugawara Hot Spring, Japan. (2) Khandivali quarry, India; by electron microprobe, H_2O by difference; corresponds to $(Ca_{0.97}Na_{0.01})_{\Sigma=0.98}Al_{1.95}Si_{6.05}O_{16}\cdot 4H_2O$.

Mineral Group: Zeolite group.

Occurrence: As crystals lining cavities, and veinlets, typically deposited in active geothermal areas.

Association: Zeolites, gyrolite, okenite, prehnite, quartz, calcite.

Distribution: In Japan, from the Yugawara Hot Spring, Kanagawa Prefecture; at Shimoda, and in the Toi and Seikoshi mines, Shizuoka Prefecture; and at Takinoue, Kakkonda Hot Springs, Iwate Prefecture; several other localities are known. In the Khandivali and Malad quarries, near Bombay, Maharashtra, India. At Heinabergsjökull and Hvalsgod (Klif), Hvalfjord, and elsewhere in Iceland. From Osilo, near Sassari, Sardinia, Italy. In the USA, from Yellowstone National Park, Wyoming, and the Chena Hot Springs area, about 65 km east of Fairbanks, Alaska. From Yellow Lake, near Olalla, British Columbia, Canada.

Name: For the locality where first found, Yugawara Hot Spring, Japan.

Type Material: National Science Museum, Tokyo, Japan; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 106164, 106931.

Yukonite $Ca_7Fe^{3+}_{12}(AsO_4)_{10}(OH)_{20}\cdot 15H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous, gellike to very poorly crystalline. *Point Group:* n.d.
As irregular concretionary masses, typically strongly crackled.

Physical Properties: *Fracture:* Smooth to conchoidal. *Tenacity:* Extremely brittle. Hardness = 2–3 D(meas.) = 2.65; 2.86 after gas evolution. D(calc.) = n.d. May decrepitate when fresh, on exposure to air, H_2O, or warmth, with evolution of primarily CO_2.

Optical Properties: Translucent. *Color:* Dark brown, brownish black, violet to deep blood-red; in thin splinters, deep brown, yellowish brown, reddish purple. *Streak:* Brownish yellow. *Luster:* Vitreous to resinous.
Optical Class: Isotropic. n = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Tagish Lake, Canada.

(1) Tagish Lake, Canada; by electron microprobe, total Fe as Fe_2O_3, H_2O by TGA.
(2) Rędziny, Poland; by electron microprobe, total Fe as Fe_2O_3, H_2O calculated for charge balance; corresponds to $(Ca_{6.48}Mg_{0.29}Zn_{0.19}Mn_{0.17})_{\Sigma=7.13}Fe_{10.70}[(AsO_4)_{9.75}(SiO_4)_{0.10}(PO_4)_{0.09}(SO_4)_{0.04}]_{\Sigma=9.98}(OH)_{16.37}\cdot 15.72H_2O$. (3) $Ca_7Fe_{12}(AsO_4)_{10}(OH)_{20}\cdot 15H_2O$.

Occurrence: A secondary mineral typically altered from arsenopyrite.

Association: Symplesite, argentian galena, pyrargyrite, argentite, chalcopyrite, arsenopyrite, quartz (Tagish Lake, Canada); parasymplesite, köttigite, ogdensburgite, pharmacosiderite, legrandite, willemite, franklinite, sphalerite (Sterling Hill, New Jersey, USA); arsenopyrite, arseniosiderite, arsenolite, barian pharmacosiderite (Trout Creek, Colorado, USA); arsenopyrite, pharmacosiderite (Rędziny, Poland).

Distribution: Found on the west side of Windy Arm, Tagish Lake, Yukon Territory, Canada. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and the Crystal No. 8 mine, Trout Creek pegmatites, Chaffee Co., Colorado. In Germany, from Saalfeld, Thuringia; at Graulai mountain, near Lammersdorf, Eifel district; from Hasserode, near Wernigerode, Harz Mountains; and at Heubachtal, Black Forest. From Rędziny, Poland.

Name: For Yukon Territory, Canada, within which the mineral was first found.

Type Material: The Natural History Museum, London, England, 1916,454; Geological Survey of Canada, Ottawa, 18594; Royal Ontario Museum, Toronto, Canada, M11468; National Museum of Natural History, Washington, D.C., USA, R5783.

Yushkinite $V_{1-x}S \cdot n(Mg, Al)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$ (?). Fine flaky, scaly aggregates, up to 8 mm, and in veinlets, to 12 mm.

Physical Properties: *Tenacity:* Plastic. Hardness = < 1 VHN = n.d. D(meas.) = 2.94 D(calc.) = 3.00

Optical Properties: Opaque. *Color:* Pinkish violet. *Anisotropism:* Strong, orange-red with weak lilac tint in isotropic sections, red-lilac to pinkish dark gray in anisotropic sections.

R: (400) — , (420) — , (440) 26.0, (460) 22.4, (480) 19.0, (500) 17.6, (520) 17.8, (540) 18.7, (560) 20.7, (580) 23.3, (600) 26.4, (620) 29.6, (640) 32.8, (660) 35.7, (680) 38.2, (700) 40.1

Cell Data: *Space Group:* $P3m1$ (?). $a = 3.21$ $c = 11.3$ Z = n.d.

X-ray Powder Pattern: Pay-Khoy Mountains, Russia.
5.68 (10), 2.76 (6), 1.575 (6), 1.596 (4), 11.4 (3), 1.534 (3), 1.386 (3)

Chemistry:

	(1)
V	32.48
S	32.93
Mg	10.17
Al	5.66
O	19.89
H	1.26
Total	102.39

(1) Pay-Khoy Mountains, Russia; by electron microprobe, O and H calculated, average of three analyses, corresponding to $V_{1-x}S \cdot n(Mg, Al)(OH)_2$, n = 0.612, assigned by analogy to valleriite.

Occurrence: In quartz-carbonate veins in carbonate rocks.

Association: Cadmian sphalerite, sulvanite, fluorite.

Distribution: From near the Dolgozhdanny [Long-awaited] Waterfall, middle Silova-Yakha River, Pay-Khoy Mountains, far Northern Ural Mountains, Yugorskii Peninsula, Russia.

Name: For Academician Nikolai Pavlovich Yushkin (1936–), Russian mineralogist, Director of the Institute of Geology, Syktyvkar, Russia.

Type Material: Komi Branch of Academy of Sciences, Syktyvkar; Mining Institute, St. Petersburg, 1501/1; Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84284.

Total	100.5	100.00

(1) Salsigne mine, France; by electron microprobe, average of eight analyses; H_2O taken as loss on ignition; corresponds to $Cu_{0.99}Al_{0.02}H_{0.93}(AsO_4)_{0.99}\cdot 2.04H_2O$. (2) $Cu(AsO_3OH)\cdot 2H_2O$.

Occurrence: A secondary mineral formed on specimens from mine dumps at a gold-bearing arsenic sulfide deposit.

Association: Geminite, lindackerite, arsenopyrite, bismuth, chalcopyrite, pushcharovskite.

Distribution: From the Salsigne mine, 15 km north of Carcassone, Aude, France.

Name: To honor Klaus Yvon (1943–), Professor of Crystallography, Geneva University, Geneva, Switzerland.

Type Material: Natural History Museum, Geneva University, Geneva, Switzerland, 450/33.

(1) Zabuye Salt Lake, Tibet, China; after deduction of "gaylussite 5.84%, northupite 4.51%, lithium-rich magnesite 2.59%, sylvite 0.94%, aphthitalite 1.18%, borax 0.25%, aragonite 0.23%, nitratine 0.64%, and silicate, etc. 2.79%" then stated to correspond to $Li_{2.18}C_{1.18}O_3$. (2) Li_2CO_3.

Occurrence: Imbedded in halite in rock salt, and precipitated on the margins of a lithium-rich salt lake (Zabuye Salt Lake, Tibet, China); as solid inclusions in fluid inclusions in spodumene.

Association: Halite, gaylussite, northupite (Zabuye Salt Lake, Tibet, China).

Distribution: From the Zabuye Salt Lake, Nagri, Tibet, China. At Bikita and Kamativi, Zimbabwe. From Kings Mountain, Cleveland Co., North Carolina, USA. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada.

Name: For its initially-noted occurrence at the Zabuye Salt Lake, Tibet, China.

Type Material: Geology Museum, Beijing, China.

S	0.10
Total	96.09

(1) Loma Peguera chromitite, Cordillera Central, Dominican Republic; average of 3 electron microprobe analyses, corresponding to $(Rh_{1.01}Os_{0.01}Ir_{0.01}Ru_{0.01}Pd_{0.01})_{\Sigma=1.05}(Ni_{1.00}Fe_{0.02})_{\Sigma=1.02}(As_{0.92}S_{0.01})_{\Sigma=0.93}$.

Occurrence: A low temperature mineral formed during alteration of ophiolite, now in heavy-mineral concentrate derived from ophiolitic chromitite.

Association: Garutiite, hexaferrum, Ru-Os-Ir-Fe alloys, Ru-Os-Ir-Fe oxygenated compounds, chromite.

Distribution: Loma Peguera chromitite, Loma Caribe peridotite, Cordillera Central, Dominican Republic. From the Koryako-Kamchatskiy region and Nizhny Tagil, Ural-Alaskan chromitites, Urals, Russia. Also from the Chindwin area, Burma; the Onverwacht pipe, Bushveld Complex, South Africa; Thetford mine, Quebec, Canada; the Vourinos chromitites, Greece, and the Kempirsai chromitites, Kazakhstan.

Name: Honors Professor Federica Zaccarini (b. 1962), University of Leoben, Austria, in recognition of her contributions to the mineralogy of platinum-group elements and their deposits.

Type Material: Mineralogical Museum of Leoben, Austria (8241).

Zaherite $Al_{12}(SO_4)_5(OH)_{26}\cdot 20H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Fibers, which may be tubular, with a wavy texture, to hundreds of μm, in dense extremely fine-grained aggregates.

Physical Properties: *Cleavage:* One, well-developed. Hardness = ~3.5, in aggregates. D(meas.) = 2.007–2.011 D(calc.) = 2.01 Reversibly hydrates at room temperature, with changes in the most intense X-ray diffraction peak position.

Optical Properties: Semitransparent. *Color:* Chalk-white to pale bluish green; colorless in transmitted light. *Luster:* Pearly to earthy.
Optical Class: Biaxial (+), with extremely low birefringence, ~0.001. $\alpha = 1.498(1)$ β = n.d. $\gamma = 1.499(1)$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 18.475(0.942)$ $b = 19.454(0.591)$ $c = 3.771(0.231)$ $\alpha = 95°14.40'(1°6.60')$ $\beta = 91°21.80'(2°7.38')$ $\gamma = 80°14.40'(1°9.24')$ Z = 1

X-ray Powder Pattern: Punjab Salt Range, Pakistan.

(1) Punjab Salt Range, Pakistan; average of two analyses. (2) Hotson farm, South Africa; by XRF, H_2O by the Penfield method. (3) $Al_{12}(SO_4)_5(OH)_{26}\cdot 20H_2O$.

Occurrence: In veinlets in a kaolinite-böhmite rock (Punjab Salt Range, Pakistan); an alteration product of natroalunite or directly by hydrothermal sulfatization of sillimanite in massive sillimanite veins (Hotson farm, South Africa).

Association: Kaolinite, böhmite, aluminite (Punjab Salt Range, Pakistan); natroalunite, hotsonite (Hotson farm, South Africa).

Distribution: From the Punjab Salt Range, Pakistan. On the Hotson farm, 65 km west of Pofadder, Cape Province, South Africa.

Name: In honor of Mohammed Abduz Zaher (1935–), Geological Survey of Bangladesh, who discovered the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 143793.

Mineral Group: Crandallite group.

Occurrence: A rare mineral in the weathering zone of quartz wolframite deposits.

Association: Bismuth, bismutite, quartz, mica.

Distribution: From the Eta-Etu district, northern Kivu Province, Congo (Zaire).

Name: For the country, Zaire (now Congo), where the first specimens were collected.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG14065.

(1) Mt. Sherlova, Russia; after deduction of bismuthinite and bismutite, corresponds to $Bi_{1.10}O_{1.00}[F_{0.80}(OH)_{0.20}]_{\Sigma=1.00}$. (2) BiOF.

Occurrence: An alteration product of bismuthinite in bismuth-bearing hydrothermal ore deposits in quartz-topaz-siderophyllite greisens cutting a granite pluton (Mt. Sherlova, Russia); in a quartz-muscovite-topaz greisen (Torrington, Australia).

Association: Bismuthinite, bismuth, bismutite, gold (Mt. Sherlova, Russia); bismuthinite (Torrington, Australia).

Distribution: From Mt. Sherlova, Chita region, eastern Transbaikal, Siberia, Russia. At the Fielders Hill mine, near Torrington, New South Wales, Australia. In Japan, from the Ebisu mine, Hirugawa, Gifu Prefecture. In the Moldava fluorite mine, about 20 km northwest of Teplice, Krušné hory Mountains, Czech Republic. From the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada.

Name: To honor Academician Aleksandr Nikolaevich Zavaritskii (1884–1952), Russian petrographer, Institute of Geology, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64103, 64254–64256.

(1) Kola Peninsula, Russia; corresponds to $(Na_{3.16}Ca_{0.46}K_{0.11}Sr_{0.01})_{\Sigma=3.74}$ $(Mn^{2+}_{4.45}Fe^{3+}_{0.42}Mg_{0.02})_{\Sigma=4.89}Si_{10}O_{24}[(OH)_{5.60}O_{0.40}]_{\Sigma=6.00} \cdot 5.59H_2O$.

Occurrence: In ussingite veinlets cutting foyaite in differentiated alkalic massifs (Kola Peninsula, Russia).

Association: Ussingite (Kola Peninsula, Russia); terskite, lovozerite, ussingite, natrolite, microcline, yofortierite, analcime, natrolite, polylithionite (Mont Saint-Hilaire, Canada); eudialyte, varennesite, catapleiite, labuntsovite (Saint-Amable, Canada).

Distribution: At Mt. Karnasurt, Lovozero massif, and on Mts. Yukspor and Koashva, Khibiny massif, Kola Peninsula, Russia. From the Saint-Amable sill, near Varennes, and at Mont Saint-Hilaire, Quebec, Canada.

Name: For Professor Evgeii Evgen'evich Zakharov (1902–1980), Director of the Moscow Geological Exploration Institute, Moscow, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5713/6; Mining Institute, St.Petersburg, 1199; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81688; The Natural History Museum, London, England, 1994,38.

Zanazziite $\mathbf{Ca_2(Mg,Fe^{2+})(Mg,Fe^{2+},Al)_4Be_4(PO_4)_6(OH)_4 \cdot 6H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In barrel-shaped pseudohexagonal crystals, to 4 mm, showing {100}, {110}, and {001}, in subparallel groups and divergent hemispherical sprays, with mosaic terminations; rarely as bladed crystals.

Physical Properties: *Cleavage:* {100}, good; {010}, distinct. Hardness = ~5
D(meas.) = 2.76 D(calc.) = 2.77

Optical Properties: Translucent. *Color:* Pale to dark olive-green, antithetically zoned in Fe:Mn content, yellowish green; nearly colorless to tan. *Streak:* White. *Luster:* Vitreous to pearly on cleavages.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge a = 3°$. $\alpha = 1.606(2)$ $\beta = 1.610(2)$ $\gamma = 1.620(2)$ 2V(meas.) = 72° 2V(calc.) = 65°

Cell Data: *Space Group:* $C2/c$. $a = 15.874(4)$ $b = 11.854(3)$ $c = 6.605(1)$ $\beta = 95.34°$ Z = 2

X-ray Powder Pattern: Lavra da Ilha pegmatite, Brazil; close to roscherite.
5.91 (100), 9.50 (90), 3.16 (70), 3.05 (50), 2.766 (50), 1.642 (50b), 2.682 (40b)

Chemistry:

	(1)
SiO_2	0.36
P_2O_5	39.27
Al_2O_3	1.54
Fe_2O_3	0.76
FeO	9.63
MnO	1.77
BeO	9.81
MgO	11.66
CaO	10.65

Total	98.77

(1) Lavra da Ilha pegmatite, Brazil; by electron microprobe, average of 25 analyses on four grains, Fe^{2+}:Fe^{3+} from titrimetric analysis, Be by AA, H_2O by H analyzer; corresponds to $(Ca_{1.97}Mn_{0.03})_{\Sigma=2.00}(Mg_{0.61}Fe^{2+}_{0.40})_{\Sigma=1.01}(Mg_{2.38}Fe^{2+}_{1.08}Al_{0.31}Mn_{0.23}Fe^{3+}_{0.10})_{\Sigma=4.10}Be_4[(P_{0.96}Be_{0.01}Si_{0.01})_{\Sigma=0.98}O_4]_6(OH)_{3.4} \cdot 6.6H_2O$.

Occurrence: In a simply zoned granite pegmatite with other phosphates (Lavra da Ilha pegmatite, Brazil).

Association: Quartz, albite, muscovite, wardite, eosphorite, whiteite, apatite, pyrite, manganese oxides (Lavra da Ilha pegmatite, Brazil); fluorapatite, albite (Martin prospect, Newry, Maine, USA).

Distribution: From the Lavra da Ilha pegmatite, in the Jequitinhonha River, three km north of Taquaral, Minas Gerais, Brazil. In the Bell pit and from the Martin prospect, Newry, Oxford Co., Maine, USA.

Name: To honor Dr. Pier Francesco Zanazzi (1939–), Professor of Mineralogy, University of Perugia, Perugia, Italy, for his structural studies of many minerals, including this one.

Type Material: National Museum of Natural History, Washington, D.C., USA, R17847, 154805.

Total		100.00

(1) Luobusha mining district, Qusum county, Shannan Prefecture, Tibet, China; range of 10 electron microprobe analyses, corresponding to $(Ti_{0.99}\ Zr_{0.01})(Fe_{1.01}Cr_{0.02}Mn_{0.02})(Si_{2.00}\ Al_{0.03})$.
(2) $TiFeSi_2$.

Occurrence: In a heavy mineral separate from mining podiform chromitites hosted in harzburgite in an ophiolite complex.

Association: Native silicon, an unidentified Fe-Si mineral.

Distribution: No. 31 orebody, group II in the Luobusha mining district, Qusum county, Shannan Prefecture, Tibet, China.

Name: For the Yarlong Zangbo River (also known as the Brahmaputra River) that flows near the first described locality.

Type Material: Geological Museum of China (Beijing), (M11651).

P_2O_5	25.63	26.33
Al_2O_3	23.98	25.22
Fe_2O_3		
CuO	31.85	29.51
ZnO		
H_2O	18.54	18.94
Total	[100.00]	100.00

(1) Cerro Morita, Mexico; average of two analyses, recalculated to 100%; corresponds to $Cu_{3.23}Al_{3.80}(PO_4)_{2.93}(OH)_{9.23} \cdot 3.70H_2O$. (2) $Cu_3Al_4(PO_4)_3(OH)_9 \cdot 4H_2O$.

Occurrence: A secondary mineral in the oxidized zone of a hydrothermal base-metal prospect in silicified brecciated limestone.

Association: Libethenite, pseudomalachite, chrysocolla.

Distribution: In a prospect pit at the northwest end of Cerro Morita, about 27 km southwest of Agua Prieta, Sonora, Mexico. At Battle Mountain, Lander Co., Nevada, USA. From the Miguel Vacas mine, Villa Viçosa, near Estremoz, Portugal.

Name: To honor Emiliano Zapata (1879–1919), Mexican revolutionary.

Type Material: The Natural History Museum, London, England, 1972,174; National Museum of Natural History, Washington, D.C., USA, 135060.

References: (1) Williams, S.A. (1972) Zapatalite, a new mineral from Sonora, Mexico. Mineral. Mag., 38, 541–544. (2) (1972) Amer. Mineral., 57, 1911–1912 (abs. ref. 1).

Zaratite $Ni_3(CO_3)(OH)_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Coatings composed of fibrous to spherulitic microcrystals and gellike amorphous material.

Physical Properties: *Fracture:* Conchoidal, in aggregates. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.57–2.69 D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Emerald-green; green in transmitted light. *Luster:* Vitreous to greasy.
Optical Class: Biaxial, may be weakly birefringent, banded. *Pleochroism:* Emerald-green along fiber length; yellow-green perpendicular to fiber length. $n = 1.56–1.62$ $\alpha = 1.597$ $\beta = 1.602$ $\gamma = 1.609$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Lancaster Co., Pennsylvania, USA or Heazlewood, Tasmania, Australia; diffuse pattern, probably of a mixture.
5.07 (vs), 8.93 (s), 2.45 (s), 2.73 (m), 2.00 (mw), 1.91 (w), 1.55 (w)

Chemistry:

	(1)	(2)
CO_2	11.69	11.70
NiO	58.81	59.57
H_2O	29.50	28.73
Total	100.00	100.00

(1) Texas, Pennsylvania, USA. (2) $Ni_3(CO_3)(OH)_4 \cdot 4H_2O$.

Occurrence: An uncommon secondary mineral formed by alteration of chromite, pentlandite, pyrrhotite, and millerite in serpentinites and ultramafic rocks.

Association: Brucite, hydromagnesite, calcite, aragonite, dolomite.

Distribution: In the USA, in Pennsylvania, from Wood's, Carter's, and Low's mines, Texas, Lancaster Co., and at Phillip's chrome mine, West Nottingham, Chester Co. At Igdlokunguak, Greenland. In the Talmessi mine, 35 km west of Anarak, Iran. On Dun Mountain, Nelson, New Zealand. At the Lord Brassey mine, Heazlewood, Tasmania, Australia. In the Hagdale quarry, Unst, Shetland Islands, Scotland. On Cape Ortegal, Galicia, Spain. At Lillaz, Val d'Aosta, Piedmont, Italy. In Austria, at Kraubath, Styria, and in the Stubachtal, Tirol. From Vrapice and Dubi, near Kladno, Czech Republic. On Mabilikwe Hill, Cape Province, South Africa. A few additional minor occurrences are known.

Name: To honor Antonio Gil y Zarate (1793–1861), Spanish dramatist.

Zavalíaite $(Mn^{2+},Fe^{2+},Mg)_3(PO_4)_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As exsolution lamellae to 70 μm thick and 1.5 mm long in lithiophilite nodules.

Physical Properties: *Cleavage*: Perfect on {100} and {001}. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = ~ 4 D(meas.) = n.d. D(calc.) = 3.68

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Vitreous to resinous.
Optical Class: Biaxial (-). n = 1.66(1) 2V(meas.) = 15(5)° *Orientation*: $X \perp$ the cleavage plane at 45° to elongation.

Cell Data: *Space Group*: $P2_1/c$. a = 6.088(1) b = 4.814(2) c = 10.484(2) β = 89.42(3)° Z = 2

X-ray Powder Pattern: La Empleada pegmatite, Totoral pegmatite field, Argentina.
6.75 (vs), 1.894 (vs), 1.848 (vs), 1.652 (vs), 2.964 (s), 2.537 (s), 3.54 (w)

Chemistry:

	(1)	(2)
MgO	6.09	6.04
MnO	27.08	26.90
FeO	24.94	25.34
P_2O_5	41.38	41.72
Total	99.49	100.00

(1) La Empleada pegmatite, Totoral pegmatite field, Argentina; average of 27 electron microprobe analyses, absence of CO_2 and H_2O confirmed by structure analysis; corresponding to $(Mn^{2+}_{1.31}Fe^{2+}_{1.19}Mg_{0.52})_{\Sigma=3.02}(P_{1.00}O_4)_2$. (2) $(Mn^{2+}_{1.29}Fe^{2+}_{1.20}Mg_{0.51})_{\Sigma=3.00}(PO_4)_2$.

Mineral Group: Sarcopside group.

Occurrence: In the core margin of a zoned granitic pegmatite (beryl-columbite-phosphate subtype) as exsolution lamellae in ellipsoidal phosphate nodules.

Association: Lithiophilite, reddingite (by hydration).

Distribution: From the La Empleada granitic pegmatite, Totoral pegmatite field, San Luis Province, Argentina.

Name: Honors María Florencia de Fátima Márquez Zavalía (b. 1855), researcher and Head of the Department of Mineralogy, Petrography and Geochemistry, of the Argentine Institute of Snow Research, Glaciology and Environmental Sciences (IANIGLA), CCT Mendoza, National Research Council of Argentina (CONICET).

Type Material: Laboratory of Mineralogy, University of Liège, Belgium (# 20384).

Total	100.04	100.00

(1) Mt. Sherlova, Russia; after deduction of bismuthinite and bismutite, corresponds to $Bi_{1.10}O_{1.00}[F_{0.80}(OH)_{0.20}]_{\Sigma=1.00}$. (2) BiOF.

Occurrence: An alteration product of bismuthinite in bismuth-bearing hydrothermal ore deposits in quartz-topaz-siderophyllite greisens cutting a granite pluton (Mt. Sherlova, Russia); in a quartz-muscovite-topaz greisen (Torrington, Australia).

Association: Bismuthinite, bismuth, bismutite, gold (Mt. Sherlova, Russia); bismuthinite (Torrington, Australia).

Distribution: From Mt. Sherlova, Chita region, eastern Transbaikal, Siberia, Russia. At the Fielders Hill mine, near Torrington, New South Wales, Australia. In Japan, from the Ebisu mine, Hirugawa. Gifu Prefecture. In the Moldava fluorite deposit, Krusňé Hory Mountains, Czech Republic.

Name: To honor Academician Aleksandr Nikolayevich Zavaritskii (1884–1952), Russian petrographer.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Cap Garonne mine, France; by electron microprobe, average of 16 analyses, H_2O by TGA; corresponding to $Na_{1.15}Ca_{0.13}Pb_{0.92}Cu_{5.09}(AsO_4)_{3.90}Cl_{1.23} \cdot 4.91H_2O$.
(2) $NaPbCu_5(AsO_4)_4Cl \cdot 5H_2O$.

Occurrence: A rare post-mining mineral formed in the oxidized zone of a red-bed sandstone Pb–Cu deposit (Cap Garonne mine, France).

Association: Olivenite, geminite, antlerite, anglesite, covellite, tennantite, galena (Cap Garonne mine, France); mimetite, beudantite–segnitite (Broken Hill, Australia).

Distribution: From the Cap Garonne mine, near le Pradet, Var, France. At Broken Hill, New South Wales, Australia.

Name: Honoring Dr. Zdenek Johan (1935–), mineralogist and Director of Scientific Affairs, Bureau de Recherches Géologiques et Minières, Orlèans, France.

Type Material: Natural History Museum, Geneva, Switzerland; Natural History Museum, Paris, France.

References: (1) Chiappero, P.-J. and H. Sarp (1995) Zdenekite, $NaPbCu_5(AsO_4)_4Cl \cdot 5H_2O$, a new mineral from the Cap Garonne mine, Var, France. Eur. J. Mineral.. 7, 553–557. (2) (1996) Amer. Mineral., 81, 253 (abs. ref. 1).

(1) Washington Pass, Washington, USA; by electron microprobe, Li by flame photometry; corresponds to $Na_{1.01}Li_{0.99}Zr_{1.00}Si_{6.00}O_{15}$.

Occurrence: Rarely in miarolitic cavities in a riebeckite granite (Washington Pass, Washington, USA).

Association: Quartz, microcline, aegirine, riebeckite, astrophyllite, zircon, elpidite.

Distribution: From Kangaroo Ridge, near Washington Pass, Okanogan Co., Washington, USA. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: For Jack Zektzer (1936–), of Seattle, Washington, USA, who presented the mineral for study.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M34553; The Natural History Museum, London, England, 1976,423; Harvard University, Cambridge, Massachusetts, 116456; National Museum of Natural History, Washington, D.C., USA, 136030.

Zellerite $Ca(UO_2)(CO_3)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As fine hairlike fibers, to 2 mm, in roughly radial aggregates, veinlets, and incrustations.

Physical Properties: *Cleavage:* One, ‖ elongation, possible. Hardness = ∼2
D(meas.) = 3.25(1) D(calc.) = 3.242 Radioactive; fluoresces patchy green under SW and LW UV.

Optical Properties: Transparent. *Color:* Pale lemon-yellow; very pale yellow in transmitted light.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = colorless; Z = pale yellow. *Orientation:* $Z = c$. *Dispersion:* $r < v$. $\alpha = 1.536(5)$ $\beta = 1.559(5)$ $\gamma = 1.697(5)$ 2V(meas.) = 25°–30°

Cell Data: *Space Group:* $Pmmm$ or $Pmn2_1$. $a = 11.220(15)$ $b = 19.252(16)$ $c = 4.933(16)$ Z = 4

X-ray Powder Pattern: Lucky Mc mine, Wyoming, USA.
9.66 (100), 4.848 (50), 5.591 (35), 3.651 (35), 4.407 (25), 7.33 (18), 2.947 (13)

Chemistry:

	(1)	(2)
CO_2	16.9	16.92
UO_3	53.9	54.98
CaO	10.3	10.78
H_2O^+	12.3	
H_2O^-	6.6	
H_2O		17.32
Total	[100.0]	100.00

(1) Lucky Mc mine, Wyoming, USA; CO_2 and H_2O by CHN analyzer; recalculated to 100.0% after deduction of R_2O_3 1.0%, Na_2O 0.4%, K_2O 0.2%, SiO_2 + insoluble 0.5% from an original total of 100.2%; corresponds to $Ca_{1.00}(UO_2)_{1.03}(CO_3)_{2.09} \cdot 3.72H_2O$. (2) $Ca(UO_2)(CO_3)_2 \cdot 5H_2O$.

Occurrence: A rare weathering product of uranium ores, formed at low pH in the presence of oxidizing pyrite.

Association: Metazellerite, gypsum, "limonite", iron sulfides, schoepite, meta-autunite, uranophane, "opal".

Distribution: In the USA, from the Lucky Mc mine, Wind River Basin, Fremont Co., and the Pat No. 8 mine, Powder River Basin, Converse Co., Wyoming; in the White Canyon No. 1 mine, Frey Point, San Juan Co., Utah; at the Alta mine, Ambrosia Lake district, and Westwater Canyon, McKinley Co., New Mexico. In the Hatrurim Formation, Israel. From Jáchymov (Joachimsthal), Czech Republic.

Name: To honor Howard Davis Zeller (1922–), geologist with the U.S. Geological Survey, who discovered the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112827.

References: (1) Coleman, R.G., D.R. Ross, and R. Meyrowitz (1966) Zellerite and metazellerite, new uranyl carbonates. Amer. Mineral., 51, 1567–1578.

Zemannite $\mathbf{Mg_{0.5}ZnFe^{3+}(Te^{4+}O_3)_3 \cdot 4.5H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Crystals are hexagonal, prismatic $\{10\bar{1}0\}$, terminated by $\{10\bar{1}1\}$, to 1 mm.

Physical Properties: *Tenacity:* Very brittle. Hardness = "Soft". D(meas.) = n.d. D(calc.) = 4.19

Optical Properties: Translucent to transparent. *Color:* Pale to dark brown. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+). *Pleochroism:* O = reddish brown; E = yellowish brown. *Absorption:* $O > E$. $\omega = 1.85$ $\epsilon = 1.93$

Cell Data: *Space Group:* $P6_3/m$. $a = 9.404(2)$ $c = 7.636(4)$ Z = 2

X-ray Powder Pattern: Moctezuma mine, Mexico.
8.15 (10), 2.778 (9), 4.07 (8), 2.96 (6), 2.845 (6), 1.726 (6), 2.345 (5)

Chemistry:

	(1)
TeO_2	62.9
SeO_2	0.07
Fe_2O_3	10.8
MnO	0.11
ZnO	10.5
MgO	2.53
H_2O	10.25
Total	97.16

(1) Moctezuma mine, Mexico; by electron microprobe, H_2O by TGA, total Fe^{3+} as Fe_2O_3, confirmed by Mössbauer spectroscopy; corresponds to $Mg_{0.47}Zn_{1.04}Mn^{2+}_{0.01}Fe^{3+}_{1.02}(TeO_3)_{2.97} \cdot 4.2H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal Au–Te deposit.

Association: Tellurium, tellurite, paratellurite, spiroffite, mroseite.

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: To honor Dr. Josef Zemann (1923–), Austrian crystallographer, Professor of Mineralogy, University of Vienna, Vienna, Austria, specialist in tellurium minerals.

Type Material: Natural History Museum, Paris, France; Royal Ontario Museum, Toronto, Canada, M25933; National Museum of Natural History, Washington, D.C., USA, 128390.

References: (1) Mandarino, J.A., E. Matzat, and S.J. Williams (1976) Zemannite, a zinc tellurite from Moctezuma, Sonora, Mexico. Can. Mineral., 14, 387–390. (2) (1969) Amer. Zemkorite $Na_2Ca(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $\overline{6}m2$, or $6mm$. Rare fanlike aggregates of anhedral crystals, to 0.5 mm; granular massive in veinlets and fracture fillings.

Physical Properties: *Cleavage:* Lamellar, perfect. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 2.46(2) D(calc.) = 2.47 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous to pearly. *Optical Class:* Uniaxial (–). $\omega = 1.535(1)$ $\epsilon = 1.513(1)$

Cell Data: *Space Group:* $P6_3/mmc$, $P\overline{6}2c$, or $P6_3mc$. $a = 10.06(2)$ $c = 12.72(1)$ $Z = 8$

X-ray Powder Pattern: Udachnaya pipe, Russia.
4.36 (10), 3.04 (10), 2.52 (10), 2.06 (10), 6.36 (9), 1.797 (8), 2.18 (7)

Chemistry:

	(1)	(2)
CO_2	39.20	42.71
Al_2O_3	0.05	
CaO	28.39	27.21
Na_2O	25.72	30.08
K_2O	6.40	
Total	99.76	100.00

(1) Udachnaya pipe, Russia; by electron microprobe, average of two analyses, CO_2 by wet methods, corresponding to $(Na_{1.80}K_{0.29})_{\Sigma=2.09}Ca_{1.10}(CO_3)_{1.93}$. (2) $Na_2Ca(CO_3)_2$.

Polymorphism & Series: Trimorphous with natrofairchildite and nyerereite.

Occurrence: Filling fractures and as inclusions in unserpentinized but sodium metasomatized kimberlite at about 400–450 m depth.

Association: Shortite, halite.

Distribution: From the east Udachnaya twin pipe, Daldyn kimberlite field, Sakha, Russia.

Name: For Institute of the Earth's Crust (Institut ZEMnoy KORY in Russian), Russian Academy of Sciences, Siberian Branch, Irkutsk, Russia, where the mineral was studied.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87573.

Zenzénite $Pb_3(Fe^{3+},Mn^{3+})_4Mn_3^{4+}O_{15}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As euhedral to subhedral grains, to 150 μm, tabular on {0001}.

Physical Properties: *Cleavage:* {0001}, distinct. Hardness = 5.7 VHN = 739–795, 764 average (50 g load). D(meas.) = n.d. D(calc.) = 6.83 Weakly magnetic.

Optical Properties: Opaque. *Color:* Black; bright white in reflected light.
Optical Class: Uniaxial. *Anisotropism:* Distinct; in shades of gray and pale brown.
Bireflectance: Weak; visible only in oil.
R_1–R_2: (400) 32.0–25.9, (420) 31.7–26.2, (440) 31.6–26.5, (460) 31.2–26.2, (480) 30.8–25.9, (500) 30.4–25.6, (520) 30.0–25.4, (540) 29.6–25.1, (560) 29.2–24.8, (580) 28.7–24.5, (600) 28.3–24.2, (620) 27.8–23.9, (640) 27.4–23.6, (660) 27.1–23.3, (680) 26.8–22.9, (700) 26.5–22.6

Cell Data: *Space Group:* $P6_3/mcm$. $a = 10.008(4)$ $c = 13.672(8)$ $Z = 4$

X-ray Powder Pattern: Långban, Sweden.
2.663 (10), 3.18 (8), 1.687 (8), 2.828 (7), 2.366 (6), 3.42 (5), 2.104 (4)

Chemistry:

	(1)
SiO_2	0.03
TiO_2	0.19
MnO_2	23.63
Al_2O_3	0.19
Fe_2O_3	15.36
Mn_2O_3	8.88
ZnO	0.00
PbO	53.68
MgO	0.12
BaO	0.06
Total	[102.14]

(1) Långban, Sweden; by electron microprobe, Mn^{3+}:Mn^{4+} and Fe^{3+} from crystal-structure analysis, original total given as 102.15%; corresponding to $Pb_{2.87}Ba_{0.01}(Fe^{3+}_{2.30}Mn^{3+}_{1.35}Mg_{0.04}Al_{0.04})_{\Sigma=3.73}(Mn^{4+}_{3.24}Ti_{0.03}Si_{0.01})_{\Sigma=3.28}O_{15}$.

Occurrence: In a carbonate-phyllosilicate skarn rock, in a metamorphosed Fe–Mn orebody.

Association: Dolomite, hausmannite, jacobsite, calcite, barytocalcite, norsethite, manganoan chlorite, kinoshitalite, pinakiolite, macedonite.

Distribution: From Långban, Värmland, Sweden.

Name: For Dr. Nils Zenzén (1883–1959), formerly Senior Curator of the Swedish Museum of Natural History, Stockholm, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 401841.

References: (1) Holtstam, D., B. Lindqvist, M. Johnsson, and R. Zeophyllite $Ca_4Si_3O_8(OH,F)_4 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. As radiating platy crystals, to 1 cm; in hemispherical and spherical aggregates, or as botryoidal and spherulitic crusts.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = 3 D(meas.) = 2.747–2.764 D(calc.) = [2.75]

Optical Properties: Translucent. *Color:* White; in transmitted light, colorless.
Luster: Pearly.
Optical Class: Uniaxial (–); anomalously biaxial. ω = 1.565–1.577 ϵ = 1.560–1.569
2V(meas.) = 0°–10°

Cell Data: *Space Group:* $R\bar{3}$. $a = 9.36$ $c = 36.48$ Z = [9]

X-ray Powder Pattern: Litoměřice, Czech Republic.
12.0 (100), 3.03 (80), 6.09 (60), 2.946 (60), 3.71 (50), 2.648 (50), 2.547 (50)

Chemistry:

	(1)	(2)
SiO_2	36.0	38.84
Al_2O_3	1.5	1.73
Fe_2O_3	0.0	0.10
MgO	< 0.5	0.17
CaO	46.3	44.32
Na_2O	0.48	0.32
K_2O	0.09	0.24
F	7.49	8.23
H_2O	11.0	8.98
$-O = F_2$	3.15	3.47
Total	99.71	99.46

(1) Litoměřice, Czech Republic; corresponds to $(Ca_{4.20}Na_{0.08}Mg_{<0.06}K_{0.01})_{\Sigma=\sim4.3}(Si_{3.05}Al_{0.15})_{\Sigma=3.20}O_9F_{2.01} \cdot 6.22H_2O$. (2) Březno nad Lábem, Czech Republic; corresponds to $(Ca_{4.04}Al_{0.17}Na_{0.06}K_{0.03}Mg_{0.02}Fe_{0.01})_{\Sigma=4.33}Si_{3.31}O_9F_{2.22} \cdot 5.10H_2O$.

Occurrence: In cavities, as a secondary mineral from hydrothermal alteration of basalt (Litoměřice, Czech Republic); a late-stage mineral in low-temperature hydrothermal veins cutting alkalic intrusive rocks in a differentiated alkalic massif (Khibiny massif, Russia); in marble xenoliths in nepheline syenite in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Zeolites, apophyllite.

Distribution: In the Czech Republic, at Litoměřice (Leitmeritz), Březno nad Lábem (Gross-Priesen), Radejčín (Radzein), and near Teplice (Teplitz). In Germany, at the Schellkopf, near Brenk, Eifel district. From Monte Somma, Campania, Italy. In the Khibiny massif, Kola Peninsula, Russia. From Göbnehall Yuglingarum, Skåne, Sweden. In the Salmon River district, near Riggins, Idaho Co., Idaho, USA. At Mont Saint-Hilaire, Quebec, Canada.

Name: From the Greek *to boil* and *a leaf*, in allusion to its habit.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 86427.

References: (1) Dana, E.S. and W.E. Ford (1909) Dana's system of mineralogy, (6th edition), app. II, 113. (2) Parry, J., A.F. Williams, and F.E. Wright (1932) On bultfonteinite, a new fluorine-bearing hydrous calcium silicate from South Africa. Mineral. Mag., 23, 145–162.

Zeunerite $Cu(UO_2)_2(AsO_4)_2 \cdot 10-16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals, to 4 cm, flat tabular on {001}, commonly in subparallel growths.

Physical Properties: *Cleavage:* On {001}, perfect; on {100}, distinct. Hardness = 2.5 D(meas.) = 3.47 D(calc.) = [3.57] for $16H_2O$. Radioactive; commonly dehydrates to metazeunerite.

Optical Properties: Transparent, becoming translucent on dehydration. *Color:* Green to emerald-green. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = blue-green; E = pale blue-green.
$\omega = 1.610–1.613$ $\epsilon = 1.582–1.585$

Cell Data: *Space Group:* $I4/mmm$. a = 7.18 $c = 21.06$ Z = 2

X-ray Powder Pattern: Synthetic $Cu(UO_2)_2(AsO_4)_2 \cdot 16H_2O$.
10.65 (10), 3.59 (9), 5.04 (8), 3.39 (7), 1.926 (6), 6.86 (5), 2.08 (5)

Chemistry: (1) Identification rests on comparison of the X-ray powder pattern and optical data with those of synthetic $Cu(UO_2)_2(AsO_4)_2 \cdot 16H_2O$.

Mineral Group: Autunite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of arsenic-bearing hydrothermal uranium deposits.

Association: Olivenite, mansfieldite, scorodite, azurite, malachite.

Distribution: Material which is fully hydrated at the time of study is relatively rare, although most meta-zeunerite is a dehydration product of pre-existing zeunerite. In Germany, from the Walpurgis vein, Weisser Hirsch mine, Neustädtel-Schneeberg, Saxony; at Sailauf, northeast of Aschaffenburg, Bavaria; in the Anton mine, Heubachtal, near Schiltach, from Menzenschwand, and elsewhere in the Black Forest. In England, at a number of places in Cornwall, as at Wheals Gorland and Maid, Gwennap; in the South Terras mine, St. Stephen-in-Brannel; at Wheal Edward, St. Just. In France, from the Cap Garonne mine, near le Pradet, Var; at the Margnac mine, Compreignac, Haute-Vienne; in the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault. In the USA, from the Dexter mine, Calf Mesa, San Rafael district, Emery Co., Utah; at the Majuba Hill mine, Antelope district, Pershing Co., Nevada; in various of the Colorado Plateau-type U–V deposits, Colorado. Large crystals from Brumado, Bahia, Brazil.

Name: Honoring Gustav Anton Zeuner (1828–1907), Director, School of Mines, Freiberg, Germany.

Type Material: State Museum of Mineralogy and Geology, Dresden; Mining Academy, Freiberg, Germany, 21730; now metazeunerite.

Zn	~90
Sn, Pb, Cd	~10
Fe, Mn, B, Si, Cu, Ag, Ca, Ba	trace
Total	

(1) Elsa mine, Canada; combined X-ray fluorescence and spectrographic analyses.

Occurrence: In the oxidized zone of Pb-Zn-Ag sulfide deposits, derived from sphalerite by oxidation (Elsa mine, Canada); coatings on fibrous volcanic glass, as a volcanic sublimate (Mount Elbrus, Russia); in platinum concentrates (Aurora deposit, Russia).

Association: Silver, sulfur, oxidized sphalerite, "limonite", manganese oxides, cerussite, anglesite, freibergite, galena (Elsa mine, Canada); copper, Cu–Zn alloy, sphalerite, djurleite, cuprite (Dulcina de Lampos mine, Chile).

Distribution: In the Elsa mine, Keno Hill-Galena Hill area, Yukon Territory, Canada. From Mount Elbrus, Caucasus Mountains, and the Aurora deposit, locality not otherwise specified, Russia. From the Burobaiskii massif, eastern Kazakhstan. In the Dulcina de Lampos copper mine, near Copiapó, Atacama, Chile.

Name: From the German *zink*, of obscure origin.

(1) Bayan Obo, Inner Mongolia, China; average of 12 electron microprobe analyses, corresponding to $Ba_{0.99}F_{0.99}Cl_{1.02}$. (2) BaFCl.

Mineral Group: Matlockite group.

Occurrence: As inclusions in fluorite in a polymetallic Nb–REE–Fe deposit.

Association: Barite, hematite, norsethite, fluorite.

Distribution: Bayan Obo deposit, Inner Mongolia, China.

Name: Honors Professor Zhang Peishan (b. 1925) for his contributions to the mineralogy of Bayan Obo.

Type Material: National Museum of Nature and Science, Tokyo, Japan, NSM-MF14696; Institute of Geology and Geophysics, Chinese Academy of Sciences, Beijing, China, KDX013.

References: (1) Shimazaki, H., R. Miyawaki, K. Yokoyama, S. Matsubara, and Z. Yang (2008) Zhangpeishanite, BaFCl, a new mineral in fluorite from Bayan Obo, Inner Mongolia, China. Eur. J. Mineral., 20, 1141–1144. (2) (2009) Amer. Mineral., 94, 1081-1082 (abs. ref. 1).

Zharchikhite $AlF(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are prismatic, to 2.5 mm, elongated along [001], showing {110}, {010}, {101}, {111}, may be isolated; commonly in fine-grained masses and drusy aggregates.

Physical Properties: *Cleavage:* {010}, perfect. *Tenacity:* Very brittle. Hardness = 4.5 VHN = 596 ∥ elongation, 426 ⊥ elongation, 500 average. D(meas.) = 2.81(1) D(calc.) = 2.82

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 43°$–$44°$. *Dispersion:* $r > v$, inclined.
$\alpha = 1.532(2)$ $\beta = 1.552(2)$ $\gamma = 1.567(2)$ 2V(meas.) = n.d. 2V(calc.) = 80°

Cell Data: *Space Group:* $P2_1/a$. $a = 5.164(1)$ $b = 7.834(1)$ $c = 5.179(1)$
$\beta = 116.244(8)°$ Z = [4]

X-ray Powder Pattern: Zharchikha deposit, Russia.
3.98 (10), 1.833 (9), 2.92 (8), 2.31 (7), 1.737 (7), 1.289 (7), 1.926 (5)

Chemistry:

	(1)	(2)	(3)
SiO_2	2.54	0.5	
Al_2O_3	59.03	61.8	63.73

Total	100.00		100.00

(1) Zharchikha deposit, Russia; $(OH)^{1-}$ confirmed present by IR. (2) Do., by electron microprobe, partial analysis. (3) $AlF(OH)_2$.

Occurrence: In cavities in hydrothermally mineralized fault breccia in trachyte in a stockwork molybdenum deposit.

Association: Prosopite, ralstonite, gearksutite, barite, siderite.

Distribution: In the Zharchikha molybdenum deposit, 60 km south-southwest of Ulan-Ude, on the west side of Lake Baikal, Buryatia, eastern Siberia, Russia.

Name: For its occurrence in the Zharchikha deposit, Russia (the name simplified in transliteration).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87567.

Zhemchuzhnikovite $NaMg(Al, Fe^{3+})(C_2O_4)_3 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Crystals acicular to fibrous, showing {0001}, $\{11\bar{2}0\}$, $\{22\bar{4}1\}$.

Physical Properties: *Cleavage:* On {0001}, good. Hardness = 2 D(meas.) = 1.69 D(calc.) = 1.66 Soluble in H_2O, yielding a solution of about pH 5.51.

Optical Properties: Semitransparent. *Color:* Smoky green in daylight; may be violet-amethyst under artificial light. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = greenish yellow; E = reddish violet. $\omega = 1.479$ $\epsilon = 1.408$

Cell Data: *Space Group:* n.d. $a = 16.67(5)$ $c = 12.51(3)$ $Z = 6$

X-ray Powder Pattern: n.d.

Chemistry:

	(1)

(1) Chai-Tumus coal deposit, Russia; here converted to oxides, insoluble is coal; corresponds to $(Na_{0.92}K_{0.01})_{\Sigma=0.93}Mg_{1.06}(Al_{0.60}Fe^{3+}_{0.37})_{\Sigma=0.97}(C_2O_4)_{2.97} \cdot 8.07H_2O$.

Occurrence: In veinlets found at a depth of 230 m in a drill core in the permafrost zone, in brown coal naturally saturated with acetic acid.

Association: Calcite, dolomite, stepanovite.

Distribution: Chai-Tumus coal deposit, 200 km south of the Lena River estuary, Bulun district, polar Sakha, Russia.

Name: Honors Yurii Apollonovich Zhemchuzhnikov (1885–1957), specialist in coal geology and petrology, Karpinskii Russian Research Institute of Geology, St. Petersburg, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1955/1.

Ziesite β–$\mathbf{Cu_2V_2^{5+}O_7}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Anhedral crystals, to 200 μm, incrusting basalt.

Physical Properties: Hardness = n.d. D(meas.) = 3.86(5) (synthetic). D(calc.) = 3.87

Optical Properties: Opaque, transparent on very thin edges. *Color:* Black; reddish brown to dark reddish brown in transmitted light; white in reflected light. *Streak:* Reddish brown. *Luster:* Metallic.
Optical Class: Biaxial. *Absorption:* Weak. n = [2.055] *Anisotropism:* Moderate to strong.

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 7.6890(8)$ $b = 8.0289(9)$ $c = 10.1065(8)$ $\beta = 110.252(7)^\circ$ Z = 2

X-ray Powder Pattern: Synthetic.
3.60 (10), 3.09 (10), 3.06 (10), 5.34 (8), 2.302 (8), 2.111 (8), 2.641 (6)

Chemistry:

CuO	45.37	46.66
Total	98.19	100.00

(1) Izalco volcano, El Salvador; by electron microprobe, average of two analyses; corresponds to $Cu_{1.97}V_{2.01}O_7$. (2) $Cu_2V_2O_7$.

Polymorphism & Series: Dimorphous with blossite; stable above 712 °C.

Occurrence: In vanadium-bearing sublimates in fumaroles on a basaltic volcanic cone.

Association: Stoiberite, shcherbinaite, bannermanite, fingerite, mcbirneyite, blossite, chalcocyanite, chalcanthite.

Distribution: From the summit crater of the Izalco volcano, El Salvador.

Name: To honor Dr. Emanuel G. Zies, Carnegie Institute, Washington, D.C., USA.

Type Material: Carnegie Institute, Washington, D.C., USA.

(1) Elsa mine, Canada; combined X-ray fluorescence and spectrographic analyses.

Occurrence: In the oxidized zone of Pb-Zn-Ag deposits, derived from sphalerite by oxidation (Elsa mine, Canada); coatings on fibrous volcanic glass, as a volcanic sublimate (Mount Elbrus, USSR); in platinum concentrates (Aurora deposit, USSR).

Association: Silver, sulfur, oxidized sphalerite, "limonite", manganese oxides, cerussite, anglesite, freibergite, galena (Elsa mine, Canada); copper, Cu–Zn alloy, sphalerite, djurleite, cuprite (Dulcina mine, Chile).

Distribution: In the Elsa mine, Keno Hill-Galena Hill area, Yukon Territory, Canada. From Mount Elbrus, Caucasus Mountains, and the Aurora deposit, locality not otherwise specified, USSR. In the Dulcina de Lampos copper mine, near Copiapó, Chile.

Name: From the German *zink*, of obscure origin.

(1) Laurium, Greece; recalculated to 100% after deduction of minor gangue.
(2) $Zn_6Al_6(SO_4)_2(OH)_{26}\cdot 5H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a Ag–Zn mine.

Association: Smithsonite, aurichalcite, hydrozincite, serpierite, cyanotrichite, azurite, cuproadamite, agardite-(La), calcite, chrysocolla, gibbsite.

Distribution: In Greece, from Laurium, at the Kamariza mine.

Name: For *zinc* and *aluminum* in the composition, and its similarity to *aluminite*.

Type Material: Natural History Museum, Paris, France, 96.1432.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 579–580.

Total	99.99	[99.40]

(1) Sterling Hill, New Jersey, USA. (2) Do.; by electron microprobe, original total given as 99.39%.

Occurrence: A primary mineral in metamorphosed stratiform zinc orebodies (New Jersey, USA); a secondary mineral altered from other zinc minerals in oxidized zinc-rich ore deposits; a product of volcanism.

Association: Franklinite, willemite, calcite (New Jersey, USA); zinc, sphalerite, smithsonite, hemimorphite, hausmannite.

Distribution: In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Tonopah-Belmont mine, Osborne district, Maricopa Co., Arizona, the result of a mine fire; in volcanic ash from Mt. St. Helens, Skamania Co., Washington. At Tsumeb, Namibia. From Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). Other localities have been reported but lack supporting data or an accurate location.

Name: For ZINC in the composition.

Zinc-melanterite $(Zn, Cu, Fe^{2+})SO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are short prismatic, to 1.8 mm; in stalactites, crusts, granular and massive columnar aggregates.

Physical Properties: *Fracture:* Uneven. Hardness = 2–2.5 D(meas.) = 2.02–2.03 D(calc.) = 1.93 Dehydrates readily under ambient conditions.

Optical Properties: Transparent. *Color:* Yellowish green, greenish blue, apple-green; very pale blue-green in transmitted light. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (+). *Orientation:* $Y \wedge$ elongation $\simeq 34°$. *Dispersion:* Slight. $\alpha = 1.477$–1.479 $\beta = 1.483$–1.487 $\gamma = 1.488$–1.489 2V(meas.) = 80°–90° 2V(calc.) = 78.7°

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy with the melanterite group). Z = 4

X-ray Powder Pattern: n.d.

(1) Vulcan, Colorado, USA; corresponds to $(Zn_{0.46}Cu_{0.45}Fe_{0.09})_{\Sigma=1.00}(SO_4)_{1.04} \cdot 6.87H_2O$. (2) Leh-Yang Co., China; average of two analyses; corresponds to $(Zn_{0.57}Fe_{0.35}Mg_{0.10}Ca_{0.02})_{\Sigma=1.04}(SO_4)_{0.99} \cdot 6.88H_2O$. (3) $(Zn, Cu)SO_4 \cdot 7H_2O$ with Zn:Cu = 1:1.

Mineral Group: Melanterite group.

Occurrence: A rare mineral formed in the oxidation zone of pyritic ore deposits.

Association: Sphalerite, chalcopyrite, pyrite.

Distribution: In the USA, from the Good Hope and Vulcan mines, Vulcan, Gunnison Co., Colorado. In Leh-Yang Co., southern Shaanxi Province, China.

Name: As the *zinc*-dominant member of the *melanterite* group.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93244.

(1) Xitieshan mine, China; corresponds to $(Zn_{0.64}Mg_{0.27}Mn^{2+}_{0.11}Fe^{2+}_{0.05})_{\Sigma=1.07}Fe^{3+}_{1.00}(SO_4)_{1.96}(OH)_{1.00}\cdot 6.61H_2O$. (2) Rammelsberg mine, Germany; corresponds to $(Zn_{0.47}Mn^{2+}_{0.25}Mg_{0.20}Fe^{2+}_{0.08})_{\Sigma=1.00}Fe^{3+}(SO_4)_2(OH)\cdot 7H_2O$.

Occurrence: A rare secondary mineral formed in the oxidation zone, typically in an arid climate.

Association: Pickeringite, chaidamuite, coquimbite, copiapite, butlerite, pyrite (Xitieshan mine, China); zincian melanterite (Rammelsberg mine, Germany).

Distribution: From an undisclosed Pb–Zn deposit [Xitieshan mine, south of Mt. Qilianshan, Chaidamu], Qinghai Province, China. At the Rammelsberg mine, near Goslar, Harz Mountains, Germany. In the USA, from Bisbee, Cochise Co., Arizona; in Colorado, from the Prompt Pay and Running Lode mines, Central City district, Gilpin Co., in the Summitville mine, Rio Grande Co., and at the Bonanza mine, Bonanza district, Saguache Co.

Name: For its dominant content of *zinc* and relation to *botryogen*.

Type Material: n.d.

(1) Onega Lake, Russia; by electron microprobe, weighted average of four zones in six grains; total Fe as Fe_2O_3, total Cr as Cr_2O_3, total V as V_2O_3; corresponding to $Zn_{1.04}(Cr_{1.61}V_{0.11}Si_{0.11}Fe_{0.06}Al_{0.05})_{\Sigma=1.94}O_4$. (2) $ZnCr_2O_4$.

Mineral Group: Spinel group.

Occurrence: Replacing chromian aegirine in micaceous metasomatites.

Association: Quartz, chromian aegirine, and its amorphous breakdown products.

Distribution: From the Velikaya Guba uranium deposit, near Onega Lake, Padma, Zaonezhskii Peninsula, southern Karelia, Russia.

Name: For ZINC and CHROMium in the composition.

Type Material: Mining Institute, St. Petersburg, Russia, 1238/1.

(1) Xitieshan mine, China; corresponds to $(Zn_{0.82}Fe^{2+}_{0.08}Mn^{2+}_{0.06}Ca_{0.04})_{\Sigma=1.00}Fe^{3+}_{4.00}(SO_4)_{6.50}(OH)_2 \cdot 18.4H_2O$. (2) Les Vallettes, Switzerland; H_2O by TGA; corresponds to $Zn_{0.97}Fe^{3+}_{4.03}(SO_4)_{6.13}(OH)_{1.75} \cdot 17.69H_2O$.

Mineral Group: Copiapite group.

Occurrence: A rare secondary mineral formed in the oxidation zone of a Pb–Zn deposit in a very arid climate (Xitieshan mine, China); a precipitate from thermal hot springs (Kopet-Dag Mountains, Turkmenistan); an alteration product of pyrite and sphalerite in schists (Les Vallettes, Switzerland).

Association: Copiapite, halotrichite, coquimbite, römerite, sideronatrite, melanterite (Xitieshan mine, China); sulfur, gypsum, calcite, pyrite, sphalerite, quartz, "limonite" (Kopet-Dag Mountains, Turkmenistan); boyleite, gunningite, coquimbite, jarosite, melanterite, römerite, siderotil, voltaite, chalcanthite, hexahydrite, gypsum (Les Vallettes, Switzerland).

Distribution: From an undisclosed Pb–Zn deposit [Xitieshan mine, south of Mt. Qilianshan, Chaidamu], Qinghai Province, China. Along the northern front range of the Kopet-Dag Mountains, Turkmenistan. From Băişoara, Romania. At Les Vallettes, Valais, Switzerland.

Name: For its dominant content of *zinc* and relation to *copiapite*.

Type Material: n.d.

Zincolibethenite $CuZnPO_4OH$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As prismatic crystals along [100], to 1 mm., exhibiting {011}, {100}, {110} and possibly {111} or {101}, also as compact radial aggregates.

Physical Properties: *Cleavage*: One poor direction perpendicular to crystal length. *Fracture*: Uneven to conchoidal. *Tenacity*: Brittle. Hardness = 3.5 D(meas.) = n.d. D(calc.) = 3.972

Optical Properties: Transparent to translucent. *Color*: Bright blue-green to green. *Streak*: Very pale bluish. *Luster*: Vitreous.
Optical Class: Biaxial (-). $\alpha = 1.660$ $\beta = 1.705$ $\gamma = 1.715$ 2V(meas.) = n.d. 2V(calc.) = 49°
Dispersion: $r < v$, medium. *Pleochroism*: Weak or absent, $X = Y$ = nearly colorless with a greenish tint, and Z = pale bluish green. *Absorption*: $Z > X \sim Y$. *Orientation*: $Z = a$.

Cell Data: *Space Group: Pnnm*. $a = 8.3263(3)$ $b = 8.2601(3)$ $c = 5.8771(2)$ Z = 4

X-ray Powder Pattern: Broken Hill mines, Kabwe, Zambia.

Chemistry:

	(1)	(2)
Cu	26.0	26.4
Zn	27.7	27.1
P	12.8	12.9
H_2O	3.63	3.66

(1) Broken Hill mines, Kabwe, Zambia; average of 15 electron microprobe analyses, H_2O by difference, OH^- and PO_4 confirmed by IR spectroscopy; corresponding to $Cu_{0.987}Zn_{1.022}(P_{0.997}O_4)OH$. (2) $CuZnPO_4OH$.

Polymorphism & Series: Forms a solid-solution series with libethenite.

Occurrence: A secondary mineral in the oxidized zone of a polymetallic mineral deposit.

Association: Hopeite, tarbuttite (Zambia); corkite-hinsdalite, tsumebite, pyromorphite, sampleite, torbernite, dufienite, strengite, beraunite (Australia).

Distribution: Broken Hill mines, Kabwe, Zambia (formerly Northern Rhodesia). From Australia in the No 3 lens, 280RL level, Block14 open cut, Broken Hill, New South Wales.

Name: For its composition and relationship to *libethenite*.

Type Material: Institut für Mineralogie, Universität Salzburg, Austria; at the Royal Scottish Museum, Edinburgh, Scotland (RSWB 83-8), and the Natural History Museum, London, England.

References: (1) Braithwaite, R.S.W., R.G. Pritchard, W.H. Paar, and R.A.D. Pattrick (2005) A new mineral, zincolibethenite, $CuZnPO_4OH$, a stoichiometric species of specific site occupancy. Mineral. Zincospiroffite $Zn_2Te_3O_8$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As micrometric aggregates to 0.35 mm.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = Soft. D(meas.) = n.d. D(calc.) = 5.57

Optical Properties: Translucent. *Color:* Gray, in reflected light with no internal reflections. *Streak:* Dark green. *Luster:* Vitreous. Weak anisotropy, bireflectance and reflection pleochroism. R_1-R_2: (470 nm) 7.0-7.5, (546) 7.1-7.3, (589) 6.1-6.2, (650) 4.4-5.0

Cell Data: *Space Group: C*2/*c*. a = 12.72(4) b= 5.15(1) c = 11.82(3) β = 99.2(3)° Z = 4

X-ray Powder Pattern: Zhongshangou gold deposit, Hebei Province, China. 4.758 (w), 3.240 (w), 2.928 (m), 2.820 (w), 2.155 (w), 1.985 (w), 1.599 (w)

Chemistry:

	(1)
ZnO	24.57
PbO	1.64
MgO	0.24
TeO_2	71.90
Total	98.89

(1) Zhongshangou gold deposit, Hebei Province, China; electron microprobe analysis, minor FeO and SeO_2; corresponding to $(Zn_{1.97}Pb_{0.05}Mg_{0.04}Fe_{0.02})_{\Sigma=2.08}(Te_{2.95}Se_{0.01})_{\Sigma=2.96}O_{8.00}$.

Occurrence: A secondary mineral in an oxidized Te- and Au-bearing quartz vein.

Association: Occurs as a rim on, or a replacement of, calaverite, contains blebs of gold, sphalerite.

Distribution: Zhongshangou gold deposit, Chongli County, Hebei Province, People's Republic of China.

Name: As the zinc-dominant analogue of *spiroffite*.

Type Material: Geological Museum of China, Beijing, People's Republic of China; M10442.

References: (1) Zhang, Pei-Hua, Jin-Chu Zhu, Zhen-Hua Zhao, Xiang-Ping Gu, and Jin-Fu Lin (2004) Zincospiroffite, a new tellurite mineral species from the Zhongshangou gold deposit, Hebei Province, People's Republic of China. Zincowoodwardite $ZnAl(SO_4)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (by analogy to rosasite). *Point Group:* n.d. Radial fibrous, to 1.5 mm; in crusts.

Physical Properties: Hardness = ∼1 D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Pale blue to almost white. *Streak:* Pale blue. *Optical Class:* Biaxial (–) (by analogy to rosasite).

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: (1) Tsumeb, Namibia; no analysis presented, stated to have a ratio of Zn:Cu = 58.60:51.94 or greater.

Mineral Group: Rosasite group.

Occurrence: In an oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Azurite, cerussite, hemimorphite (Tsumeb, Namibia); cerussite, aurichalcite, malachite (Rudabánya, Hungary).

Distribution: From Tsumeb, Namibia. At Rudabánya, Hungary. In the Kamariza mine, Laurium, Greece.

Name: For its predominance of *zinc* content over copper content, and its relation to *rosasite*.

Type Material: Technical University, Berlin; National Museum of Natural History, Washington, D.C., USA, 163340.

Physical Properties: Hardness = ~1 D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Pale blue to almost white. *Streak:* Pale blue. *Optical Class:* Biaxial (–) (by analogy to rosasite).

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: (1) Tsumeb, Namibia; no analysis presented, stated to have a ratio of Zn:Cu = 58.60:51.94 or greater.

Mineral Group: Rosasite group.

Occurrence: In an oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Azurite, cerussite, hemimorphite (Tsumeb, Namibia); cerussite, aurichalcite, malachite (Rudabánya, Hungary).

Distribution: From Tsumeb, Namibia. At Rudabánya, Hungary. In the Kamariza mine, Laurium, Greece.

Name: For its predominance of *zinc* content over copper content, and its relation to *rosasite*.

Type Material: Technical University, Berlin; National Museum of Natural History, Washington, D.C., USA, 163340.

References: (1) Strunz, H. (1959) Tsumeb, seine Erze und Sekundär-mineralien, insbesondere der neu aufgeschlossen zweiten Oxydationszone. Fortschr. Mineral., 37, 87–90 (in German).
(2) (1959) Amer. Mineral., 44, 1373 (abs. ref. 1).

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals lathlike, elongated and striated along [001], with minor {$hk0$} and {hkl} forms, to 2 cm, in subparallel aggregates. *Twinning:* Common on {100}.

Physical Properties: *Cleavage:* {010}, good to perfect; {001}, traces. *Tenacity:* Brittle. Hardness = ~3 D(meas.) = 3.75 D(calc.) = 3.77

Optical Properties: Transparent to translucent. *Color:* Colorless, white. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 0°–5°$. *Dispersion:* $r \ll v$, strong. $\alpha = 1.703(3)$ $\beta = 1.710(4)$ $\gamma = 1.720(3)$ 2V(meas.) = 50° 2V(calc.) = 57°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.832(2)$ $b = 12.889(4)$ $c = 5.644(2)$ $\beta = 107.72(3)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
3.00 (10), 3.22 (8), 2.78 (8), 5.10 (6), 6.44 (5), 3.40 (5), 3.36 (5)

(1) Tsumeb, Namibia; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by LOI; corresponds to $Ca_{2.06}(Zn_{0.90}Mn_{0.06}Mg_{0.05}Fe_{0.01})_{\Sigma=1.02}(AsO_4)_{1.98} \cdot 1.97H_2O$.
(2) $Ca_2Zn(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with gaitite.

Mineral Group: Roselite group.

Occurrence: A rare secondary mineral in an oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Tsumcorite, stranskiite, leiteite, quartz, tennantite.

Distribution: From Tsumeb, Namibia.

Name: For its content of *zinc* and relation to *roselite*.

Type Material: University of Stuttgart, Stuttgart, Germany, NM16; National Museum of Natural History, Washington, D.C., USA, 163340.

References: (1) Keller, P., J. Innes, and P.J. Dunn (1986) Zincroselite, $Ca_2Zn(AsO_4)_2 \cdot 2H_2O$, a new mineral from Tsumeb, Namibia. Neues Jahrb. Mineral., Monatsh., 523–527. (2) (1988) Amer. Mineral., 73, 932 (abs. ref. 1).

Zincsilite $Zn_3Si_4O_{10}(OH)_2 \cdot 4H_2O(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: n.d. *Point Group:* n.d. As fine foliae or lamellae, to 2 mm.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = 1.5–2 D(meas.) = 2.67–2.71 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* White to bluish. *Luster:* Pearly on cleavage. *Optical Class:* Biaxial (–). *Orientation:* $X \simeq \perp \{001\}$; $Z \wedge c = 3°$. $\alpha = 1.514(2)$ $\beta = 1.559(3)$ $\gamma = 1.562(2)$ 2V(meas.) = 0°–22°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Batystau, Kazakhstan; strongest line 17.6 Å after glycerol treatment.
15.3 (100), 4.09 (70), 1.528 (60)

Chemistry:

	(1)	(2)	(3)
SiO_2	47.60	42.75	41.83
Al_2O_3	0.84	0.70	
Fe_2O_3	2.16	1.55

H_2O^-	6.35	8.50	
H_2O			15.68
Total	99.96	100.65	100.00

(1–2) Batystau, Kazakhstan; after recalculation by subtracting total Al_2O_3 and Fe_2O_3 and corresponding CaO and SiO_2 as garnet; remaining CaO and MgO and corresponding SiO_2 as diopside; and CuO, SiO_2, and H_2O as chrysocolla, the average corresponds to $Zn_3Si_{4.59}O_{12.18} \cdot 5.34H_2O$. (3) $Zn_3Si_4O_{10}(OH)_2 \cdot 4H_2O$.

Occurrence: In the zone of oxidation of a galena-sphalerite-chalcopyrite skarn deposit, as a pseudomorph after diopside.

Association: Chrysocolla, fluorite, "opal," manganese oxides.

Distribution: From the Batystau polymetallicdeposit, central Kazakhstan.

Name: For ZINC and SILicon in the composition.

Type Material: Vernadsky Geological Museum, Moscow, 46337; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61517, 80086, vis5396.

(1) Wolfsberg, Germany. (2) Red Mountain district, Colorado, USA. (3) $Pb_9Sb_{22}S_{42}$.

Occurrence: A constituent of hydrothermal veins, associated with base metal and tin sulfides and sulfosalts.

Association: Stibnite, jamesonite, boulangerite, bournonite, plagionite, fülöppite, cassiterite, stannite, andorite, pyrite, sphalerite, chalcopyrite, arsenopyrite, galena.

Distribution: In Germany, from Wolfsberg, in the Harz Mountains; and at Aldersbach, in the Kinzigtal, Bavaria. From Săcărîmb (Nagyág) and Baia Mare (Nagybánya), Romania. At Peschadoire, near Pontgibaud, Puy-de-Dôme; Saint-Pons, Alpes-de-Haute-Provence; and Bournac, Montagne Noire, Finistère, France. Fine crystals from the San José, Itos, and other mines, Oruro, Bolivia. At the Brobdignag prospect, near Silverton, Red Mountain district, San Juan Co., Colorado; from the Morey mine, Morey district, Nye Co., and Eureka, Eureka Co., Nevada, USA. In Canada, from Bonanza Creek, Bridge River district, British Columbia; and the Yellowknife Bay area, Northwest Territories. From Carrock Fell, Cumbria, England. Known from a few additional localities.

Name: For J.K.L. Zinken (sometimes Zincken) (1798–1862), German mineralogist and mining geologist.

Zinnwaldite $KLiFe^{2+}Al(AlSi_3)O_{10}(F,OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic; rarely hexagonal. *Point Group:* m. Well-formed short prismatic or tabular crystals, pseudohexagonal, to 20 cm. In rosettes or fan-shaped groups; lamellar or scaly aggregates; disseminated. *Twinning:* On composition plane {001}, twin axis [310].

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Laminae flexible, elastic. Hardness = 2.5–4 D(meas.) = 2.90–3.02 D(calc.) = 2.831

Optical Properties: Transparent to translucent. *Color:* Gray-brown, yellow-brown, pale violet, dark green, color zoning common; colorless to light brown in thin section. *Luster:* Vitreous, pearly on cleavage.
Optical Class: Biaxial (–). *Pleochroism:* Distinct; X = colorless to yellow-brown; Y = gray-brown; Z = colorless to gray-brown. *Orientation:* $Y = b$; $X \wedge a = 88°–90°$; $Z \wedge a = 0°–2°$. *Dispersion:* $r > v$, weak. *Absorption:* $Z > Y > X$. $\alpha = 1.535–1.558$ $\beta = 1.570–1.589$ $\gamma = 1.572–1.590$ 2V(meas.) = 0°–40°

Cell Data: *Space Group:* $C2$ (1M). $a = 5.296(1)$ $b = 9.140(2)$ $c = 10.096(3)$ $\beta = 100.83(2)°$ Z = 2

X-ray Powder Pattern: Cínovec, Czech Republic, 1M; resembles siderophyllite. 3.29 (100), 9.82 (82), 1.98 (54), 3.085 (38), 3.34 (36), 2.89 (32), 2.59 (30)

(1) Cínovec, Czech Republic; corresponds to $(K_{0.92}Na_{0.07})_{\Sigma=0.99}Li_{1.04}(Fe^{2+}_{0.60}Fe^{3+}_{0.06}Mn^{2+}_{0.04})_{\Sigma=0.70}Al_{1.05}(Si_{3.26}Al_{0.74})_{\Sigma=4.00}O_{10}[F_{1.66}(OH)_{0.41}]_{\Sigma=2.07}$. (2) Sadisdorf, Saxony, Germany; by electron microprobe, Li_2O and Fe^{2+}:Fe^{3+} by wet chemical analysis; corresponds to $(K_{0.90}Na_{0.05})_{\Sigma=0.95}Li_{0.67}(Fe^{2+}_{0.77}Fe^{3+}_{0.16}Mn_{0.04}Mg_{0.01}Ti_{0.01})_{\Sigma=0.99}Al_{1.05}(Si_{3.09}Al_{0.91})_{\Sigma=4.00}O_{10}[F_{1.21}(OH)_{0.79}]_{\Sigma=2.00}$.

Polymorphism & Series: 1M, $2M_1$, 3A polytypes.

Mineral Group: Mica group.

Occurrence: In tin-bearing pneumatolytic deposits in greisen; more rarely in granites, granite pegmatites, and high-temperature quartz veins.

Association: Topaz, cassiterite, wolframite, lepidolite, spodumene, beryl, tourmaline, fluorite.

Distribution: Numerous localities. From Cínovec (Zinnwald), Czech Republic. At Altenberg, Saxony, and Waldstein, Bavaria, Germany. From Törndal, Norway. Around St. Just, Cornwall, England. From Antaboaka and Ambatofinandrahana, Madagascar. In the USA, at Amelia, Amelia Co., Virginia; from the Pala district, San Diego Co., and Crestmore, Riverside Co., California; in the Black Hills, around Keystone, Pennington Co., South Dakota. From the York district, Seward Peninsula, Alaska. At Narssârssuk and on the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion, southern Greenland. From Kurobera, Yamanashi Prefecture, and in the Naegi district, Gifu Prefecture, Japan.

Name: For the locality Cínovec (Zinnwald), Czech Republic.

Zippeite $K(UO_2)_2(SO_4)(OH)_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Rare crystals are rhomboidal or elongated along [001], to 0.5 mm; in radial or vermicular aggregates, earthy efflorescences, powdery coatings, and crusts. *Twinning:* Probable, observed in synthetic material.

Physical Properties: Hardness = ∼2 D(meas.) = 4.8 D(calc.) = 4.696 Radioactive; commonly fluoresces yellow-green to green under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Deep yellow, yellow-orange, red, brownish yellow, brownish orange. *Luster:* Vitreous.
Optical Class: Biaxial (–) (synthetic). *Pleochroism:* X = nearly colorless; Y = pale yellow to yellow-orange; Z = deep yellow to yellow-orange. $\alpha = 1.625(1)$ $\beta = 1.710(2)$ $\gamma = 1.740(2)$ 2V(meas.) = Large. 2V(calc.) = 59°

Cell Data: *Space Group:* $C2/c$. $a = 8.656(2)$ $b = 14.240(4)$ $c = 17.706(5)$ $\beta = 104.112(4)°$ Z = 8

(1) Jáchymov, Czech Republic; probably an analysis of several undifferentiated "zippeite" species. (2) Do.; partial analysis. (3) $K(UO_2)_2(SO_4)(OH)_3 \cdot H_2O$, determined from the structure of the synthetic compound.

Occurrence: An uncommon secondary mineral, in part post-mine, in oxidized uranium deposits containing sulfides.

Association: Uranopilite, sodium-zippeite, nickel-zippeite, magnesium-zippeite, johannite, uranophane, schröckingerite, gypsum.

Distribution: From Jáchymov (Joachimsthal), Czech Republic. At Nowa Ruda, Lower Silesia, Poland. In England, from Cornwall, at the Gunnislake mine, Calstock; the South Terras mine, St. Stephen-in-Brannel; the Carharrack mine, St. Day; Wheal Buller, Redruth; Wheal Edward and Wheal Owles, St. Just. From the USA, in Colorado, at the Diamond Joe and Remington mines, Idaho Springs district, Clear Creek Co., and in the Telegraph, Wood, and Kirk mines, Gilpin Co.; at the Apex mine, Reese River district, Lander Co., Nevada; in Arizona, from the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., in the Monument No. 1 and Mitten No. 2 mines, Navajo Co., and at the Huskon No. 7 and No. 8 claims, and the Sun Valley mine, in the Cameron area, Coconino Co. Other localities are probable but require modern confirmation.

Name: To honor Dr. František Xaver Maximillian Zippe (1791–1863), Austrian mineralogist and geologist.

Zircon $ZrSiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal; may be metamict. *Point Group:* $4/m\ 2/m\ 2/m$. Most commonly as tabular to prismatic crystals, with square cross sections, terminated by {111}, to 30 cm; as irregular grains, massive. *Twinning:* On {101}, geniculated.

Physical Properties: *Cleavage:* Indistinct on {110} and {111}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7.5 D(meas.) = 4.6–4.7 D(calc.) = 4.714 Radioactive when metamict; thermoluminescent, cathodoluminescent, may fluoresce under UV.

Optical Properties: Transparent to opaque. *Color:* Reddish brown, yellow, green, blue, gray, colorless; in thin section, colorless to pale brown. *Streak:* White. *Luster:* Vitreous to adamantine; greasy when metamict.
Optical Class: Uniaxial (+); isotropic when metamict. *Pleochroism:* Very weak.
Absorption: In thick sections; $E > O$. *Dispersion:* Very strong. ω = 1.925–1.961
ϵ = 1.980–2.015

Cell Data: *Space Group:* $I4_1/amd$. a = 6.607(1) c = 5.982(1) Z = 4

X-ray Powder Pattern: Locality unspecified; nearly indistinguishable from hafnon.
3.302 (100), 4.434 (45), 2.518 (45), 1.712 (40), 2.066 (20), 1.908 (14), 1.651 (14)

Total	100.767

(1) Sitarampuram, India; corresponds to $(Zr_{0.99}Hf_{0.01})_{\Sigma=1.00}Si_{1.00}O_4$.

Occurrence: An accessory mineral in igneous and metamorphic rocks, with crystals reaching large size in mafic pegmatites and carbonatites; in sedimentary rocks and alluvial heavy-mineral sands.

Association: Feldspars, amphiboles, mica, quartz.

Distribution: An unusually common and widely distributed mineral, but fine crystals are rare. In Norway, at Larvik and Hakedal; on Seiland Island, Alta River, Finnmark. At Sillinjärvi, Finland. From Sibnitz, Saxony, Germany. At Miass, Ilmen Mountains, Southern Ural Mountains, Russia. In the USA, at Deer Hill, Orange Co., and Fine, St. Lawrence Co., New York; from near Franklin, Sussex Co., New Jersey; near Green River, Henderson Co., North Carolina; at Tigerville, Greenville Co., South Carolina; and from Cheyenne Mountain and St. Peters Dome, near Pikes Peak, El Paso Co., Colorado. On Turner's Island, in Lake Clear, and at Kuehl Lake, Renfrew Co., Ontario, Canada. In the Matura and Saffragam districts, Sri Lanka. From Mt. Ampanobe, near Fianarantsoa, and Itrongahy, near Betroka, Madagascar. At Teete, Mozambique. Large crystals from Mud Tank, Valley Bore, Northern Territory, Australia.

Name: Thought to be derived from the Persian *zar*, for *gold*, and *gun*, for *color*, through the Arabic *zarqun*.

Zirconolite $CaZrTi_2O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic; hexagonal; orthorhombic; commonly metamict. *Point Group:* $2/m$; 32; $2/m$ $2/m$ $2/m$. Crystals, typically prismatic, elongated along [001], to 5 cm; polytypes are commonly intergrown. *Twinning:* Polysynthetic.

Physical Properties: *Cleavage:* {100}, {010} in traces. *Fracture:* Irregular to conchoidal. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 4.017–4.237; 4.77–4.85 D(calc.) = [4.38] Radioactive.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Brown to black; yellowish or brownish in thin section. *Streak:* Brownish yellow to dark brown. *Luster:* Submetallic; adamantine to greasy.
Optical Class: Isotropic. n = 2.06–2.17; 2.215 ("polymignyte").

Cell Data: *Space Group:* $C2/c$ or Cc (2M), with $a = 12.431(1)$ $b = 7.224(1)$ $c = 11.483(3)$ $\beta = 100.33(1)°$ Z = 8, or *Space Group:* $P3_121$ (3T), with $a = 7.287(2)$ $c = 16.886(9)$ Z = 3, or *Space Group:* *Acam* (3O), with $a = 10.148(4)$ $b = 14.147(5)$ $c = 7.278(3)$ Z = [8]

X-ray Powder Pattern: Afrikanda massif, Russia; after heating at 1000 °C for two hours; polytypes cannot be distinguished by powder X-ray methods.
2.914 (10), 1.980 (9), 1.792 (9), 2.506 (4), 3.176 (3), 1.517 (1), 1.156 (1)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

(1) Afrikanda massif, Russia; LOI taken as H_2O, corresponds to $(Ca_{0.76}Ce_{0.15}Na_{0.04}U_{0.02}Th_{0.01})_{\Sigma=0.98}Zr_{1.03}(Ti_{1.53}Fe_{0.27}Nb_{0.09}Al_{0.08}Mg_{0.04})_{\Sigma=2.01}O_7$. (2) Kaiserstuhl, Germany; by electron microprobe, corresponding to $(Ca_{0.85}Th_{0.06}U_{0.02}RE_{0.02})_{\Sigma=0.95}Zr_{1.08}(Ti_{1.08}Nb_{0.45}Fe^{3+}_{0.25}Fe^{2+}_{0.12}Mn_{0.01})_{\Sigma=1.91}O_7$.

Polymorphism & Series: Polytypoids 2M, 3T, 3O are known.

Occurrence: In alkaline rocks, as carbonatites, kimberlites, syenites, sanidinites; more rarely in ultramafic rocks; in felsic pegmatite in gabbro; a detrital mineral.

Association: Apatite, clinohumite, phlogopite, richterite, pyrochlore, baddeleyite, perovskite, titanite, pyrrhotite, calcite.

Distribution: In the Afrikanda pyroxenite massif, Kola Peninsula, Russia. At Fredriksvärn, and Agnes Sandefjord, Vestfold, Norway. In the Kaiserstuhl carbonatite, Baden-Württemberg, Germany. From Monte di Procida, Campi Flegrei, Campania, Italy. In the Laouni intrusive, 250 km south of Tamanrasset, Algeria. In Sri Lanka, from Walaweduwa; in the Alupola stream, Bambarabotuwa district; and elsewhere in Sabaragamuwa Province. In some basalt samples from the Moon.

Name: As a ZIRCONium-bearing mineral.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 59249–59251, vis6008, vis6012, vis6018.

Zircophyllite $(K,Na)_3(Fe^{2+},Mn^{2+})_7(Zr,Nb)_2Si_8O_{24}(OH,F)_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, probable. *Point Group:* n.d. In platy micaceous crystals, to 2 cm.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Extremely brittle. Hardness = 4–4.5 D(meas.) = 3.34 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark brown to nearly black. *Streak:* Pale brown. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = dark yellow; Z = brown. *Orientation:* Y = a; $X \wedge b = 9°$–$11°$; $Z \perp \{001\}$. *Dispersion:* $r > v$, strong. $\alpha = 1.708$ $\beta = 1.738$ $\gamma = 1.747$ 2V(meas.) = 62°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Korgeredabinsh massif, Russia.

Total	99.75

(1) Korgeredabinsh massif, Russia; Hf by spectrographic analysis, traces of Y, Pb, Be, Sr, Ba; corresponds to $(K_{1.70}Na_{0.71}Mn_{0.35}Ca_{0.24})_{\Sigma=3.00}(Fe_{3.57}Mn_{3.43})_{\Sigma=7.00}(Zr_{1.58}Nb_{0.25}Ti_{0.17})_{\Sigma=2.00}(Si_{7.76}Ti_{0.24})_{\Sigma=8.00}O_{24}[(OH)_{3.24}O_{2.84}F_{0.90}]_{\Sigma=6.98} \bullet 0.9H_2O$.

Mineral Group: Astrophyllite group.

Occurrence: In the natrolite zone of alkalic pegmatites.

Association: "Aegirine-augite," leucophanite, fluorite, apatite, apophyllite.

Distribution: From the Korgeredaba alkaline massif, Sangilen Upland, southeastern Tuva, Russia.

Name: For ZIRCOnium in the composition and the Greek for *leaf*, in reference to its foliated, micaceous habit.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Kapustin, Y.L. (1972) Zircophyllite, the zirconium analogue of astrophyllite. Zap. Vses. Mineral. Obshch., 101, 459–463 (in Russian). (2) (1973) Amer. Mineral., 58, 967 (abs. ref. 1).

Zirkelite $(Ca, Th, Ce)Zr(Zr, Ti)_2O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; commonly metamict. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals are flattened octahedra, to 3 cm. *Twinning:* On {111}, very common, as complex fourlings and polysynthetic.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5
D(meas.) = 4.741 D(calc.) = n.d. Commonly radioactive.

Optical Properties: Opaque, transparent in very thin fragments. *Color:* Black; reddish brown to dark brown in transmitted light. *Luster:* Resinous.
Optical Class: Isotropic. $n = 2.19(1)$

Cell Data: *Space Group:* $Fm3m$. $a = 5.02$–5.06 Z = 2

X-ray Powder Pattern: Arbarastkh massif, Russia; after heating at 700–800 °C.

(1) Jacupiranga, Brazil; corresponds to $[(Ca, Na)_{0.82}Th_{0.12}RE_{0.07}U_{0.02}]_{\Sigma=1.03}$ $[Zr_{1.84}Ti_{0.80}(Fe, Mn, Mg, Al)_{0.48}]_{\Sigma=3.12}O_7$.

Polymorphism & Series: Dimorphous with calciobetafite.

Occurrence: In a magnetite-pyroxenite carbonatite (Jacupiranga, Brazil); a late-stage differentiate in a layered intrusion (Rhum, Scotland).

Association: Perovskite, baddeleyite.

Distribution: From the Jacupiranga carbonatite, São Paulo, Brazil. On St. Kilda, Outer Hebrides, and Rhum, Inner Hebrides, Scotland. In Russia, in the Vouriyarvi and Kovdor massifs, and in the Sevlyavr carbonatite complex, Kola Peninsula; from the Arbarastkh massif, Aldan Shield, Sakha. At Phalaborwa, Transvaal, South Africa. From Walawada, Sri Lanka. In some soils and breccia derived from granophyre on the Moon.

Name: Honors Ferdinand Zirkel (1838–1912), German petrographer, Professor of Mineralogy, University of Leipzig, Leipzig, Germany.

Type Material: The Natural History Museum, London, England, 80142.

Zirklerite $(Fe^{2+}, Mg, Ca)_9Al_4Cl_{18}(OH)_{12} \cdot 14H_2O(?)$

Crystal Data: Hexagonal. *Point Group:* n.d. Fibrous to granular, massive.

Physical Properties: *Cleavage:* Rhombohedral. Hardness = ~3.5 D(meas.) = ~2.6 D(calc.) = n.d. Decomposed by water with separation of Al_2O_3 and $Fe(OH)_2$.

Optical Properties: Semitransparent. *Color:* Light gray.
Optical Class: Uniaxial (+). n = ~1.552, birefringence < 0.009.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)
Al_2O_3	12.29
$FeCl_2$	57.20
$MgCl_2$	6.83
$CaCl_2$	2.47
H_2O	21.23
Total	[100.02]

(1) Hope, Germany; recalculated after deduction of anhydrite 5.08%, halite 15.64%, and insoluble 31.26%.

Occurrence: As the principal constituent of a rock composed of halite, anhydrite, quartz, and clay minerals, in brecciated layers intercalcated with halite and potash layers.

Association: Halite, anhydrite, rinneite, dolomite, chlorite, quartz, clay minerals.

Distribution: In the Adolfsglück mine, Hope, west of Hamelyn, Lower Saxony, Germany.

Name: For Dr.-Ing. Zirkler, General Director of the Aschersleben Potash Works, Germany.

Type Material: The Natural History Museum, London, England, 1929,40.

(1–2) Mt. Koashva, Russia; spectrographic analysis gives HfO_2 0.42% and traces of Y, Zn, Be, Sr, Ba, K. (3) $Na_6CaZrSi_6O_{18}$.

Mineral Group: Lovozerite group.

Occurrence: In pegmatitic veinlets cutting alkalic rocks in differentiated alkalic massifs.

Association: Aegirine, lomonosovite, barian lamprophyllite, lovozerite, eudialyte (Mt. Koashva, Russia).

Distribution: On Mts. Koashva and Yukspor, Khibiny massif, and in the Lovozero massif, Kola Peninsula, Russia.

Name: For ZIRconium, SIlicon, and sodium, NAtrium, in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75149.

Total	101.85		100.00

(1) Příbram, Czech Republic; by electron microprobe, average of 15 analyses, CO_2 and H_2O by thermal analysis; corresponds to $Ca_{1.15}Zn_{11.01}(UO_2)_{0.96}(CO_3)_{2.97}(OH)_{20.30}\cdot 3.34H_2O$.
(2) Mas-d'Alary deposit, France; by electron microprobe, average of 17 partial analyses; utilizing CO_2 and H_2O from (1), corresponds to $Ca_{1.02}Zn_{10.70}(UO_2)_{1.06}(CO_3)_{3.06}(OH)_{19.44}\cdot 4.16H_2O$.
(3) $CaZn_{11}(UO_2)(CO_3)_3(OH)_{20}\cdot 4H_2O$.

Occurrence: A rare secondary species at carbonate-hosted polymetallic veins, and nearby oxidizing uranium veins; on dump material and coating mine walls, apparently of post-mine origin.

Association: Gypsum, hydrozincite, serpierite, römerite, sphalerite, galena, pyrite, calcite, aragonite (Příbram, Czech Republic); adamite, metalodèvite, umohoite, calcurmolite, uranophane, studtite (Mas-d'Alary deposit, France).

Distribution: In the Czech Republic, from the Lill mine, Příbram, and in the Evangelista and Ondřej veins, Jáchymov (Joachimsthal). At the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France. In the St. Christophe mine, near Bärenhecke, Saxony, Germany.

Name: For Zn, U, and Ca in the composition.

Type Material: National Museum, Prague; Charles University, Prague, Czech Republic.

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, to 10 cm, typically deeply striated ‖ [010] and poorly terminated; columnar to compact, massive.

Physical Properties: *Cleavage:* {010}, perfect; {100}, imperfect. *Fracture:* Uneven, conchoidal. *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 3.15–3.36 D(calc.) = 3.35

Optical Properties: Transparent to translucent. *Color:* White, gray, greenish brown, greenish gray, pink, blue, purple; colorless to pink in thin section. *Luster:* Vitreous, pearly on cleavage. *Optical Class:* Biaxial (+). *Pleochroism:* X = pale pink to red-violet; Y = nearly colorless to bright pink or deep blue; Z = pale yellow to yellow-green. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$ or $r < v$, strong. α = 1.685–1.707 β = 1.688–1.711 γ = 1.697–1.725 2V(meas.) = 0°–69°

Cell Data: *Space Group: Pnma.* $a = 16.1909(15)$ $b = 5.5466(5)$ $c = 10.0323(6)$ Z = 4

X-ray Powder Pattern: Synthetic.
2.693 (100), 2.874 (65), 4.03 (50), 8.09 (40), 2.019 (35), 1.601 (35), 5.01 (30)

Chemistry:

	(1)		(1)
SiO_2	39.55	MgO	0.07
Al_2O_3	33.39	CaO	[24.44]
Fe_2O_3	0.04	SrO	0.05
V_2O_3	0.20	H_2O^+	2.00
		Total	[99.74]

(1) "Umba Valley," Tanzania; CaO originally given as 22.44%, and total given as 99.69%; corresponds to $(Ca_{1.99}Mg_{0.01})_{\Sigma=2.00}(Al_{2.98}V_{0.01})_{\Sigma=2.99}Si_3O_{12}(OH)_{1.01}$.

Polymorphism & Series: Dimorphous with clinozoisite.

Mineral Group: Epidote group.

Occurrence: Typically in medium-grade regionally metamorphosed crystalline schists formed from igneous, sedimentary, or metamorphic rocks relatively high in calcium; in eclogites and blueschist facies metamorphic rocks.

Association: Garnet, albite, biotite, "hornblende," quartz, calcite.

Distribution: Widespread. Classic localities for fine crystals and decorative rocks follow. On the Saualpe, Carinthia, and in the Zillertal, Tirol, Austria. From near Trondheim, Norway. In the USA, at Goshen and Williamsburg, Hampshire Co., Massachusetts; in the Keystone quarry, near Cornog, Chester Co., Pennsylvania; at Milford Heights, Baltimore Co., Maryland. From around Spruce Pine, Mitchell Co., North Carolina; from Ducktown, Polk Co., Tennessee; in Washington, in the Tunk Creek area, east of Riverside, Okanogan Co. From Asbestos, Quebec, Canada. In the Juarez district, Baja California, Mexico. From Tanzania, exceptional gem material in the Merelani Hills, Lelatema Mountains, 40 km southeast of Arusha. Well crystallized from Alchuri village, Shigar Valley, Baltistan, Pakistan.

Name: For Siegmund Zois, Baron von Edelstein (1747–1819), Austrian supporter of mineralogy who supplied the first specimens.

(1) Lovozero massif, Russia; spectrographic traces of Ta, Pb, Ba, Be.

Occurrence: On walls of fractures filled with nepheline in the central natrolite region of a pegmatite vein in a differentiated alkalic massif.

Association: Nepheline, aegirine, mountainite, natrolite, raite.

Distribution: In the Jubilee pegmatite, on Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: In reference to the Russian for "the rosy radiance of the sky at dawn" for the color.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3144, 3207; Mineralogical Museum, St. Petersburg University, St. Petersburg, 15286, 18102, 18155; Mining Institute, St. Petersburg, 1059/1–5; A.E. Pr_2O_3	1.68	H_2O	[32.41]
Nd_2O_3	6.50	Total	[100.01]

(1) Alum Cave Bluff, Tennessee, USA; by electron microprobe, C_2O_3 and H_2O calculated from stoichiometry; corresponding to $(Ce_{0.54}Nd_{0.26}La_{0.09}Pr_{0.07}Sm_{0.03}Eu_{0.01}Gd_{0.01})_{\Sigma=1.01}Al_{1.00}(SO_4)_{2.00}(C_{2.00}O_4)\cdot 12.00H_2O$.

Occurrence: Formed by evaporative precipitation during weathering of pyritiferous phyllite, the rare earths probably derived from monazite and xenotime.

Association: Levinsonite-(Y), epsomite, halotrichite.

Distribution: From Alum Cave Bluff, Great Smoky Mountains National Park, Tennessee, USA.

Name: Derived from the Cherokee Indian term for the Great Smoky Mountains, source of the mineral.

Type Material: University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA.

(1) Zuñi mine, Colorado, USA; corresponds to $Al_{13.21}Fe^{3+}_{0.03}P_{0.10}Si_{4.66}O_{20}Cl_{0.96}[(OH)_{14.04}F_{3.44}]_{\Sigma=17.48}$.

Occurrence: In highly aluminous shales and hydrothermally altered volcanic rocks.

Association: Pyrophyllite, kaolinite, alunite, diaspore, rutile, pyrite, hematite, quartz.

Distribution: In the USA, in the Zuñi mine, near Silverton, San Juan Co., and in the Charter Oak mine, Ouray Co., Colorado; near Silver City, Tintic district, Juab Co., Utah; in the Dome Rock Mountains, near Quartzsite, La Paz Co., Arizona, large crystals. At Postmasburg, Cape Province, South Africa. From Balıkesir, Balıkesir Province, Turkey. At Beni Embarek, Algeria. From Aït Azegour, High Atlas Mountains, Morocco. At Banská Belá, Banská Štiavnica district, Slovakia. In the Embleton quarry, near Cockermouth, Cumbria, England. From Aksakat, Uzbekistan. At Kochi, Iwate Prefecture; Iriyama, Gumma Prefecture; and several mines in Nagano Prefecture, Japan. Several other localities are known.

Name: For the Zuñi mine, Colorado, USA, where it was discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 49082.

Zussmanite $K(Fe^{2+}, Mg, Mn^{2+})_{13}(Si, Al)_{18}O_{42}(OH)_{14}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3 or $\overline{3}$. As tabular crystals, to about 1 mm.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = n.d. D(meas.) = 3.146 D(calc.) = [3.14]

Optical Properties: Translucent. *Color:* Pale green in thin section. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* Weak; O = pale green; E = colorless. $\omega = 1.643$ $\epsilon = 1.623$

Cell Data: *Space Group:* $R3$ or $R\overline{3}$. $a = 11.66(2)$ $c = 28.69(2)$ Z = 3

X-ray Powder Pattern: Laytonville district, California, USA. (ICDD 19-1500). 9.60 (100), 4.78 (45), 3.19 (25), 2.51 (16), 3.78 (10), 2.74 (10), 2.20 (10)

Chemistry: (1) No chemical analysis appears to have been published; the type description, however, gives the empirical formula $(K_{0.92}Na_{0.07})_{\Sigma=0.99}(Fe^{2+}_{10.85}Mg_{1.33}Mn_{0.46}Al_{0.34}Fe^{3+}_{0.11}Ti_{0.01})_{\Sigma=13.10}(Si_{16.6}Al_{1.4})_{\Sigma=18.0}O_{42.2}(OH)_{13.8}$.

Occurrence: In an exotic block of metamorphosed shales, siliceous ironstones, and impure limestones, probably representing deep ocean sediments subjected to blueschist facies metamorphism.

Association: Deerite, howieite, stilpnomelane, spessartine, riebeckite, quartz, aegirine, grunerite, aragonite, manganoan siderite, ferroan kutnohorite, graphite.

Distribution: In the Laytonville quarry, Mendocino Co., California, USA.

Name: For Jack Zussman (1924–), mineralogist-crystallographer, Manchester University, Manchester, England.

Type Material: National Museum of Natural History, Washington, D.C., USA, 109454; The Natural History Museum, London, England, 1964,545.

(1) Mt. Malyi Punkaruaiv, Kola Peninsula, Russia; average of 5 electron microprobe analyses, H_2O by modified Penfield method; corresponding to $Na_{1.24}K_{0.04}Ca_{0.11}Mn_{0.16}Fe_{0.03}Zn_{0.96}Nb_{1.66}Ti_{1.25}(Si_{3.97}Al_{0.03})_{\Sigma=4}O_{15.07}(OH)_{2.10}F_{0.83}(H_2O)_{4.64}$. (2) $NaZnNb_2Ti[Si_2O_7]_2O(OH)_3(H_2O)_4$.

Mineral Group: Epistolite group.

Occurrence: In a hydrothermally-altered peralkaline pegmatite lens in a peripheral part of the ussingite core near its contact with the aegirine-eudialite zone; the pegmatite is part of a larger complex alkaline igneous intrusion. Possibly the product of a cation exchange reaction between epistolite and low-alkali aqueous (late hydrothermal) solutions enriched in Zn^{2+}.

Association: Microcline, sodalite, arfvedsonite, sphalerite, pectolite-sérandite, mangan-neptunite, murmanite, vigrishinite, epistolite, belovite-(Ce), steenstrupine, chkalovite, tugtupite, polylithionite, galenite.

Distribution: From pegmatite #71, Mt. Malyi Punkaruaiv, Lovozero alkaline complex, Kola Peninsula, Russia.

Name: Honors Russian crystallographer, crystal chemist and physicist Boris Borisovich Zvyagin (1921-2002), who was a pioneer and expert in electron diffraction studies of materials.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 94140).

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As irregular grains up to 250 μm; massive in veinlets up to 120 μm long.

Physical Properties: Hardness = n.d. VHN = 241–318, 279 average (15 g load). D(meas.) = 13.32 (synthetic). D(calc.) = 13.42

Optical Properties: Opaque. *Color:* In reflected light, bright white with a cream tint. *Streak:* Black. *Luster:* Metallic.

R: (400) — , (420) — , (440) 62.0, (460) 63.3, (480) 63.0, (500) 63.7, (520) 64.6, (540) 65.5, (560) 66.7, (580) 67.7, (600) 67.4, (620) 67.3, (640) 67.9, (660) 68.0, (680) 68.0, (700) 68.1

Cell Data: *Space Group: Pm3m* (synthetic). a = 4.02(1) Z = 1

X-ray Powder Pattern: Synthetic Pd_3Pb.
2.32 (100), 1.215 (90), 2.01 (80), 1.423 (70), 0.923 (60), 0.900 (50), 1.163 (40)

Total	102.5	99.6

(1–2) Noril'sk region, Russia; by electron microprobe, averages.

Occurrence: As small irregular grains and veinlets in copper sulfides, associated with differentiated gabbro-diabase intrusives (Noril'sk region, Russia).

Association: Pt–Fe alloy, polarite, talnakhite, cubanite, pentlandite, magnetite, valleriite, Ag–Au alloy (Noril'sk region, Russia).

Distribution: From the Zapolyarni and Taimryskii mines, Noril'sk region, western Siberia, Russia. From the Upper and Banded zones of the Stillwater complex, Montana, USA. In the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland.

Name: For Professor Orest Evgen'evich Zvyagintsev (1894–1967), who did geochemical research on the platinum metals, Institute of General andInorganic Chemistry, Moscow, Russia.

Type Material: Canadian Geological Survey, Ottawa, Canada, 10401; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73001.

Zwieselite $(Fe^{2+}, Mn^{2+})_2(PO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Cleavable, massive, to several cm.

Physical Properties: *Cleavage:* [On {001}, good; on {010}, fair; on {100}, poor] (by analogy to triplite). *Fracture:* [Uneven to subconchoidal.] Hardness = [5–5.5] D(meas.) = 3.89–3.97 D(calc.) = 3.92

Optical Properties: Translucent to opaque. *Color:* Dark brown, clove-brown, yellowish brown; brownish black to black if altered. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (+). *Pleochroism:* [Distinct; yellow-brown to reddish brown.]
Dispersion: [$r > v$, , moderate to strong.] $\alpha = 1.696$ $\beta = 1.704$ $\gamma = 1.713$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $I2/a$. $a = 12.085$ $b = 6.536$ $c = 9.910$ $\beta = 105°38'$ Z = 8

X-ray Powder Pattern: Horní Slavkov, Czech Republic; close to triplite.
2.874 (10), 3.053 (9), 3.257 (7), 3.695 (5), 3.431 (4), 2.120 (4), 2.024 (4)

Chemistry:

	(1)	(2)

Total	99.88	100.00

(1) Hühnerkobel, Germany. (2) $(Fe, Mn)_2(PO_4)F$ with Fe:Mn = 1:1.

Mineral Group: Forms a series with triplite.

Occurrence: A primary phosphate in complex zoned granite pegmatites.

Association: Triphylite, huréaulite, rockbridgeite.

Distribution: In Germany, in Bavaria, from Hühnerkobel and in the Birkhöhe pegmatite, near Zwiesel; at Hörlberg; from Döfering; and at Hagendorf. From Horní Slavkov (Schlaggenwald), Czech Republic. In the Mangualde pegmatite, near Mesquitela, Portugal. At the Tremearne pegmatite, Breage, Cornwall, England. From the Storm Mountain pegmatite, Larimer Co., Colorado, USA.

Name: For its first-noted occurrence at Hühnerkobel, nearby Zwiesel and Rabenstein, Germany.

Zýkaite $Fe_4^{3+}(AsO_4)_3(SO_4)(OH)\cdot 15H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Fine acicular crystals, to 0.02 mm, covering and composing nodules, to 3 cm, and as a massive cavity filling.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Greasy. Hardness = Very soft. D(meas.) = 2.50 D(calc.) = 2.504

Optical Properties: Semitransparent. *Color:* Grayish white with pale yellowish green or brownish tint; colorless in transmitted light. *Streak:* Pale yellowish. *Luster:* Dull. *Optical Class:* Biaxial (–). *Orientation:* Positive elongation, parallel extinction. $\alpha = 1.632$ β = n.d. $\gamma = 1.646$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 20.853(20)$ $b = 7.033(4)$ $c = 36.991(23)$ Z = 8

X-ray Powder Pattern: Kaňk, Czech Republic.
10.4 (10), 10.6 (7), 6.92 (4), 5.610 (4), 3.812 (4), 2.831 (4), 3.516 (3)

Chemistry:

	(1)	(2)
SO_3	8.36	7.82
P_2O_5	0.12	
As_2O_5	33.67	33.69
Fe_2O_3	30.58	31.21
CaO	0.02

insol.	0.49	
Total	99.74	100.00

(1) Kaňk, Czech Republic; average of two analyses, H_2O by TGA; after deduction of gypsum, corresponds to $Fe_{3.96}[(AsO_4)_{3.03}(PO_4)_{0.02}]_{\Sigma=3.05}(SO_4)_{1.08}(OH)\cdot 14.91H_2O$.
(2) $Fe_4(AsO_4)_3(SO_4)(OH)\cdot 15H_2O$.

Occurrence: An alteration product of arsenopyrite and pyrite in ancient mine dumps.

Association: Kaňkite, scorodite, pitticite, "limonite", arsenopyrite, gypsum, quartz.

Distribution: From the Šafary mine dump, near Kaňk, Kutná Hora district, Czech Republic.

Name: To honor Dr. Václav Zýka (1926–), Director, Institute of Raw Materials, Kutná Hora, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 20558; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 144940, 144941.

References: (1) Čech, F., J. Jansa, and F. Novák (1978) Zýkaite, $Fe_4^{3+}(AsO_4)_3(SO_4)(OH)\cdot 15H_2O$, a new mineral. Neues Jahrb. Mineral., Monatsh., 134–144. (2) (1978) Amer. Mineral., 63, 1284 (abs. ref. 1).
