Distribution: Many localities. From Collobrières, Var, France. At Loch Duich, Ross-shire, and Glen Beag, Glenelg, Inverness-shire, Scotland. From the Botallack mine, St. Just, Cornwall, England. In Portugal, at Vila Real. At Strömshult, near Tunaberg, Sweden. Commercial production from the Penge area, Transvaal, South Africa. From around Michigamme, Marquette Co., Michigan, USA. In Canada, in the Labrador City area, Labrador, Newfoundland. At Gualilan, Argentina.

Name: To honor the French chemist, Louis Emmanuel Gruner (1809–1883), who provided the first analysis.

Gruzdevite $Cu_6Hg_3Sb_4S_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3 (probable). May be in zoned crystals with aktashite, to 4 mm; typically massive, presumably.

Physical Properties: Hardness = n.d. VHN = 295(5) (30 g load). D(meas.) = n.d. D(calc.) = 5.88

Optical Properties: Opaque. *Color:* Gray-black; white in reflected light. *Luster:* Metallic. *Anisotropism:* Weak.
R: (460) 33.1, (540) 32.8, (580) 32.7, (660) 31.9

Cell Data: *Space Group:* *R*3 (by analogy to aktashite). $a = 13.90(2)$ $c = 9.432$ Z = 3

X-ray Powder Pattern: Chauvai deposit, Kyrgyzstan.
3.16 (10), 1.929 (9), 1.645 (8), 1.113 (6), 1.251 (5), 2.12 (3), 1.363 (3)

Chemistry:

	(1)	(2)
Cu	19.99	20.55
Fe	0.29	
Hg	32.73	32.45
Sb	26.21	26.26
As	0.37	
S	20.44	20.74
Total	100.03	100.00

(1) Chauvai deposit, Kyrgyzstan; by electron microprobe, average of six samples, corresponding to $(Cu_{5.87}Fe_{0.10})_{\Sigma=5.97}Hg_{3.04}(Sb_{4.01}As_{0.09})_{\Sigma=4.10}S_{11.89}$. (2) $Cu_6Hg_3Sb_4S_{12}$.

Polymorphism & Series: Forms a series with aktashite.

Occurrence: In veinlets of probable low-temperature hydrothermal origin (Chauvai deposit, Kyrgyzstan).

Association: Aktashite, stibnite, cinnabar, metacinnabar, wurtzite, fluorite, calcite, barite (Chauvai deposit, Kyrgyzstan).

Distribution: From the Chauvai Sb–Hg deposit, Fergana Valley, Alai Range, southern Kyrgyzstan [TL]. In the San Miguel prospect, 10 km northwest of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. At the Goldstrike mine, Lynn district, Eureka Co., Nevada, USA.

Name: To honor the Russian mineralogist, Vyacheslav Sergeevich Gruzdev (1938–1977), Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Guanajuatite Bi_2Se_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Acicular crystals, to 2 cm, striated lengthwise, forming semicompact masses. Also massive, having granular, foliated, or fibrous texture.

Physical Properties: *Cleavage:* Distinct on {010}, indistinct on {001}. *Tenacity:* Somewhat sectile. Hardness = 2.5–3 VHN = 53–82 (10 g load). D(meas.) = 6.25–6.98 D(calc.) = 7.54

Optical Properties: Opaque. *Color:* Bluish gray; in polished section, white with a yellowish hue. *Streak:* Shiny gray. *Luster:* Metallic. *Pleochroism:* Distinct. *Anisotropism:* Strong. R_1–R_2: (400) 41.2–51.8, (420) 41.8–51.8, (440) 42.3–51.9, (460) 42.8–51.9, (480) 43.3–52.0, (500) 43.3–52.0, (520) 43.3–52.0, (540) 43.1–52.0, (560) 42.9–52.0, (580) 42.7–52.2, (600) 42.4–52.2, (620) 42.2–52.1, (640) 41.9–51.9, (660) 41.5–51.6, (680) 41.2–51.2, (700) 40.8–50.7

Cell Data: *Space Group: Pnma.* $a = 11.37$ $b = 11.55$ $c = 4.054$ $Z = 4$

X-ray Powder Pattern: Guanajuato, Mexico.
3.19 (100), 3.65 (90), 1.989 (70), 2.88 (60), 2.58 (50), 2.31 (50), 5.16 (40)

Chemistry:

	(1)	(2)	(3)
Bi	67.38	68.0	63.83
Se	24.13	24.5	36.17
S	6.60	6.6	
Total	98.11	99.1	100.00

(1) Guanajuato, Mexico; corresponds to $Bi_{1.89}(Se_{1.79}S_{1.21})_{\Sigma=3.00}$. (2) Do.; by electron microprobe, corresponds to $Bi_{1.89}(Se_{1.80}S_{1.20})_{\Sigma=3.00}$. (3) Bi_2Se_3.

Polymorphism & Series: Dimorphous with paraguanajuatite.

Occurrence: In hydrothermal deposits of low to medium temperatures.

Association: Bismuthinite, bismuth, clausthalite, nevskite, galena, pyrite, calcite.

Distribution: In Mexico, from the Santa Catarina [TL], La Industrial [TL], and Nuestra Señora de la Luz mines, Sierra de Santa Rosa, near Guanajuato. In the USA, near Salmon, Lemhi Co., Idaho; and at the Thomas and Essex mines, Darwin, Inyo Co., California. From the Roter Bär mine, St. Andreasberg, Harz Mountains, Germany. At Falun, Kopparberg, Sweden.

Name: For the locality in Guanajuato, Mexico.

Guanine $C_5H_3(NH_2)N_4O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as fine-grained granular crusts, to 2 mm in diameter.

Physical Properties: Hardness = "Soft". D(meas.) = n.d. D(calc.) = n.d. M.P. 360 °C.

Optical Properties: Transparent to translucent. *Color:* White.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 16.510$ $b = 11.277$ $c = 3.645$ $\beta = 98.84°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 28-2012).
3.22 (100b), 6.32 (70b), 3.53 (50), 2.63 (50), 2.00 (50), 1.80 (50), 7.9 (40)

Chemistry: (1) Identification is by coincidence of X-ray diffraction pattern with that of synthetic material.

Occurrence: An uncommon component of phosphatic crusts associated with guano from seabirds or bats.

Association: Aphthitalite, biphosphammite, brushite, gypsum, monetite, syngenite, taylorite, hannayite (Murra-el-elevyn Cave, Australia); biphosphammite, archerite, aphthitalite, halite, syngenite, stercorite, oxammite, weddellite, whitlockite, mundrabillaite, newberyite, calcite (Petrogale Cave, Australia).

Distribution: From North Chincha Island, off the coast of Peru. In Australia, in Murra-el-elevyn Cave, Cocklebiddy, and Petrogale Cave, near Madura, Western Australia.

Name: From the Peruvian *guanu*, for *dung*, in allusion to its mode of formation in nature.

References: (1) Bridge, P.J. (1973) Guano minerals from Murra-el-elevyn Cave, Western Australia. Mineral. Mag., 39, 467–469. (2) Bridge, P.J. Guarinoite $(Zn, Co, Ni)_6(SO_4)(OH, Cl)_{10} \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6, $6/m$, or 622. As thin hexagonal crystals, tabular on {0001}, to 0.2 mm; typically in rounded aggregates.

Physical Properties: *Cleavage:* On {0001}, perfect. *Fracture:* Irregular. *Tenacity:* "Fragile". Hardness = "Very soft". D(meas.) = 2.80(1) D(calc.) = 2.77

Optical Properties: Transparent. *Color:* Bright to deep pink. *Streak:* Pale pink. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; O = pink; E = pale pink. $\omega = 1.584(2)$ $\epsilon = 1.544(2)$

Cell Data: *Space Group:* $P6_3$, $P6_3/m$ or $P6_322$. $a = 8.344(4)$ $c = 21.59(2)$ $Z = 3$

X-ray Powder Pattern: Cap Garonne mine, France.
10.8 (100), 3.300 (90), 2.725 (60), 2.563 (50), 2.351 (40), 1.575 (30), 5.40 (25)

Chemistry:

	(1)
SO_3	11.85
CoO	22.17
NiO	6.74
CuO	0.05
ZnO	33.31
Cl	0.77
H_2O	24.4
$-O = Cl_2$	0.17
Total	99.12

(1) Cap Garonne mine, France; by electron microprobe, average of five analyses, H_2O by CHN analyzer; corresponds to $(Zn_{2.99}Co_{2.16}Ni_{0.66})_{\Sigma=5.81}(SO_4)_{1.08}[(OH)_{9.30}Cl_{0.16}]_{\Sigma=9.46} \cdot 5.23H_2O$.

Occurrence: A secondary mineral in the oxidized portions of a polymetallic sulfide deposit.

Association: Anglesite, antlerite, cobaltoan-nickeloan ktenasite, cerussite, brochantite, covellite, tennantite, gersdorffite, thérèsemagnanite, rutile, quartz.

Distribution: From the Cap Garonne mine, near le Pradet, Var, France.

Name: Honors André Guarino (1945–), mineral collector and medical technologist, Toulon, France, who first collected the mineral.

Type Material: Mineralogy Department, Natural History Museum, Geneva, Switzerland, 435/85.

References: (1) Sarp, H. (1993) Guarinoite $(Zn, Co, Ni)_6(SO_4)(OH, Cl)_{10} \cdot 5H_2O$ et theresemagnanite $(Co, Zn, Ni)_6(SO_4)(OH, Cl)_{10} \cdot 8H_2O$, deux nouveaux minéraux de la Mine de Cap Garonne, Var, France. Archs. Sci. Genève, 46(1), 37–44 (in French with English abs.).

Gudmundite FeSbS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Prismatic ‖ [001]; prism zone typically tapered, to 2 mm. *Twinning:* On {101}, forming penetration and contact twins, with cruciform and butterfly shapes, very common.

Physical Properties: *Tenacity:* Brittle. Hardness = ∼5–6 VHN = 572–673 (100 g load). D(meas.) = 6.72 D(calc.) = 6.95

Optical Properties: Opaque. *Color:* Silver-white to steel-gray in polished section. *Luster:* Metallic. *Pleochroism:* Distinct, in pure white and pinkish white. *Anisotropism:* Strong, in yellow and red tints.
R_1–R_2: (400) 49.1–54.3, (420) 49.4–55.7, (440) 49.5–56.1, (460) 49.7–56.4, (480) 49.9–56.8, (500) 50.2–57.1, (520) 50.7–57.0, (540) 51.3–56.7, (560) 52.0–56.3, (580) 52,7–55.8, (600) 53.2–55.1, (620) 53.6–54.5, (640) 53.9–53.9, (660) 54.1–53.4, (680) 54.2–52.7, (700) 54.4–52.4

Cell Data: *Space Group:* $P2_1/c$. $a = 10.00$ $b = 5.95$ $c = 6.73$ $\beta = 90°00'$ Z = 8

X-ray Powder Pattern: Gudmundstorp, Sweden.
2.55 (10), 1.917 (7), 4.09 (5), 1.416 (5), 2.81 (4), 1.098 (4), 1.024 (4)

Chemistry:

	(1)	(2)	(3)
Fe	26.79	26.4	26.63
Ni	trace		
Sb	57.31	58.3	58.08
As		0.2	
S	15.47	14.6	15.29
Total	99.57	99.5	100.00

(1) Gudmundstorp, Sweden; corresponds to $Fe_{0.99}Sb_{0.98}S_{1.00}$. (2) Vlastéjovice, Czech Republic; by electron microprobe, corresponds to $Fe_{0.98}Sb_{0.99}As_{0.01}S_{0.94}$. (3) FeSbS.

Mineral Group: Arsenopyrite group.

Occurrence: A late-stage hydrothermal mineral formed in sulfide deposits.

Association: Pyrite, pyrrhotite, chalcopyrite, lead sulfantimonides, antimony, bismuth, kermesite, arsenopyrite, argentian gold.

Distribution: In Sweden, from Gudmundstorp, 3 km north of Sala, Västmanland [TL]; also at Boliden, Holmtjärn, Malånäs, Tunaberg, and in the Vena mines, near Askersund, Örebro. In Finland, from Kalliolampi, near Nurma. At Sulitjelma, Norway. From Waldsassen, Bavaria, Germany. In the Salsigne mine, 15 km north of Carcassone, Aude, France. In the Czech Republic, at Vlastéjovice, Sáxova. From the Pezinok mine, Male Karpaty Mountains, Slovakia. In Ireland, at the Shallee and Gortnadyne mines, Silvermines, Co. Tipperary. From the Ilímaussaq intrusion, southern Greenland. An ore at the Lac Nicolet antimony mine, South Ham, Quebec; in the Hemlo gold deposit, Thunder Bay district; and from near Red Lake, Ontario, Canada. At Broken Hill, New South Wales, Australia. From Askot, Pithoragarh district, and in the Kolar Gold Fields, Karnataka, India. A number of other minor occurrences are known.

Name: For the occurrence at Gudmundstorp, Sweden.

Type Material: n.d.

Guérinite $Ca_5(AsO_4)_2(AsO_3OH)_2 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As wedge-shaped prismatic crystals, to 3 mm; in sprays, as spherulites or rosettes of acicular to platy crystals.

Physical Properties: *Cleavage:* Perfect, ‖ plane of the plates; good, ‖ elongation; poor, ⊥ to elongation. *Tenacity:* Brittle. Hardness = 1.5 D(meas.) = 2.68–2.76 D(calc.) = 2.74

Optical Properties: Translucent to opaque. *Color:* Colorless, white. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–). *Orientation:* Z = elongation; $X \wedge c = 10°$ ⊥ plane of the plates. *Dispersion:* $r > v$, strong; rarely $r < v$. $\alpha = 1.574(1)$ $\beta = 1.582(1)$ $\gamma = 1.582(1)$
2V(meas.) = 7°–15°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 17.63(1)$ $b = 6.734(3)$ $c = 23.47(2)$ $\beta = 90.6(1)°$ Z = 5

X-ray Powder Pattern: Wittichen, Germany.
14.0 (FFF), 3.89 (FF), 3.01 (FF), 2.90 (FF), 3.49 (F), 11.7 (mF), 4.84 (mF)

Chemistry:

	(1)	(2)
As_2O_5	49.76	49.95
CaO	30.06	30.47
H_2O	19.18	19.58
insol.	0.40	
Total	99.40	100.00

(1) Sainte-Marie-aux-Mines, France. (2) $Ca_5(AsO_4)_2(AsO_3OH)_2 \cdot 9H_2O$.

Polymorphism & Series: Dimorphous with ferrarisite.

Occurrence: A recent weathering product in oxidizing arsenic-rich mineral deposits.

Association: Realgar, erythrite, quartz, calcite.

Distribution: In Germany, from the Daniel mine, Schneeberg, Saxony; at the Bauhaus district, Richelsdorf, Hesse; from the Anton mine, Heubachtal, near Schiltach, and at Wittichen, Black Forest. At Sainte-Marie-aux-Mines, Haut-Rhin, France. In the USA, at Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and in the Getchell mine, Potosi district, Humboldt Co., Nevada.

Name: Honors Henri Guérin (1906–), who synthesized the compound.

Type Material: n.d.

Guettardite $Pb(Sb, As)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular crystals, to 2 mm, the faces of which are irregularly streaked parallel to the axis of elongation; also as small anhedral grains. *Twinning:* Polysynthetic twinning on {100}, common in polished section.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = n.d. VHN = 180–197 (50 g load). D(meas.) = 5.26 D(calc.) = 5.39

Optical Properties: Opaque. *Color:* Grayish black; in polished section, white with reddish internal reflections. *Luster:* Metallic. *Pleochroism:* Relatively strong.
R_1–R_2: (470) 37.6–42.6, (546) 36.1–41.2, (589) 34.8–39.3, (650) 32.8–36.7

Cell Data: *Space Group:* $P2_1/a$. $a = 20.05(5)$ $b = 7.95(2)$ $c = 8.44(2)$ $\beta = 101°46(10)'$
$Z = 8$

X-ray Powder Pattern: Madoc, Canada.
3.52 (100), 2.795 (90), 4.19 (50), 3.90 (50), 2.670 (50), 2.653 (50), 2.335 (40)

Chemistry:

Cu		0.49	
Sb	24.1	23.57	22.88
As	12.2	13.61	14.08
S	24.1	23.46	24.10
Total	99.2	99.63	100.00

(1) Madoc, Canada; by electron microprobe, corresponding to $Pb_{1.01}(Sb_{1.07}As_{0.88})_{\Sigma=1.95}S_{4.05}$.
(2) Pitone quarry, Italy; by electron microprobe; corresponding to $Pb_{1.04}Cu_{0.04}(Sb_{1.00}As_{0.94})_{\Sigma=1.94}S_{3.78}$. (3) $Pb(Sb, As)_2S_4$ with Sb:As = 1:1.

Polymorphism & Series: Dimorphous with twinnite.

Occurrence: Of low-temperature hydrothermal origin, in marbles (Madoc, Canada; Seravezza, Italy).

Association: Pyrite, sphalerite, wurtzite, galena, stibnite, orpiment, realgar, enargite, tetrahedrite, zinkenite, jordanite, bournonite, sterryite, boulangerite, jamesonite, sartorite (Madoc, Canada); zinkenite, boulangerite, semseyite, jordanite, enargite (Silverton, Colorado, USA).

Distribution: From Madoc, Ontario, Canada [TL]. At the Brobdingnag mine, near Silverton, San Juan Co., Colorado, USA. In the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France. At the Pitone, Tognetti, and Ceragiola marble quarries, near Seravezza, Tuscany, Italy. From Novoye, Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan.

Name: Honors Jean Etienne Guettard (1715–1786), French mineralogist and geologist.

Type Material: Canadian Geological Survey, Ottawa, 12167; Royal Ontario Museum, Toronto, Canada.

(1) Gugia, China. (2) Do.; original total given as 99.79%. (3) $Ca_2BeSi_2O_7$.

Polymorphism & Series: Dimorphous with jeffreyite.

Mineral Group: Melilite group.

Occurrence: In cavities in skarns and melanite adjacent to an alkalic syenite.

Association: Orthoclase, vesuvianite, aegirine, titanite, apatite, prehnite.

Distribution: Near the village of Gugia, otherwise unlocated in China.

Name: For the locality near Gugia, China.

Type Material: n.d.

Guidottiite $(Mn_2Fe^{3+})(SiFe^{3+})O_5(OH)_4$

Crystal Data: Hexagonal. *Point Group*: 6. As grains with a very fine (non-separable) fibrous structure perpendicular to cleavage, to 3 mm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: n.d. *Tenacity*: n.d. Hardness = 4.25 D(meas.) = 3.33(1) D(calc.) = 3.236-3.291 (for the observed compositional range)

Optical Properties: Nearly opaque. *Color*: Black. *Streak*: n.d. *Luster*: Vitreous to silky. *Optical Class*: n.d. n = 1.765

Cell Data: *Space Group*: (2H_2 polytype) $P6_3$. a = 5.5472(3) c = 14.293(2) Z = 2

X-ray Powder Pattern: N'chwaning 2 mine, Kalahari manganese field, South Africa.
7.21 (100), 3.543 (50), 2.568 (39), 1.982 (26), 2.381 (25), 2.706 (14), 1.640 (12)

Chemistry:

	(1)
MgO	5.65
MnO	34.21
Fe_2O_3	25.97
SiO_2	21.23
Total (anhydrous)	87.06
H_2O	9.4

(1) N'chwaning 2 mine, Kalahari manganese field, South Africa; average of 90 electron microprobe analyses, H_2O by loss on ignition, presence of Fe^{3+} and Mn^{2+} by analogy to cronstedtite; corresponding to $(Mn_{1.86}Fe^{3+}_{0.61}Mg_{0.54})_{\Sigma=3.01}(Si_{1.36}Fe^{3+}_{0.64})_{\Sigma=2.00}O_5(OH)_4$.

Mineral Group: Serpentine group.

Polymorphism and Series: 2H_1 polytype (i.e., ordered, no layer displacement), with minor amounts of the 2H_2 (with alternating + and –b/3 displacement) randomly interlayered.

Occurrence: In a pocket in a hydrothermally altered, bedded manganese deposit.

Association: Hematite, chlorite, leucophoenicite, caryopilite, barite, rhodochrosite, shigaite, gageite.

Distribution: N'chwaning 2 mine, Kalahari manganese field, Republic of South Africa.

Name: Honors Charles V. Guidotti (1935-2005), University of Maine, USA., for his many contributions to phyllosilicate mineralogy.

Type Material: National Museum of Natural History, Washington, D.C., USA., (174879).

References: (1) Wahle, M.W., T.J. Bujnowski, S. Guggenheim, and T. Kogure (2010) Guidottiite, the Mn-analogue of cronstedtite: A new serpentine-group mineral from South Africa. Clays and Clay Minerals, 58(3), 364-376. (2) (2014) Amer. Mineral., 99, 244-245 (abs. ref. 1).

Guildite $Cu(Fe^{3+}, Al)(SO_4)_2(OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As short prismatic pseudocubic to platy crystals, to 5 mm, showing {001}, {100}, {110}, {540}, {011}, {101}, {$\bar{1}$01}.

Physical Properties: *Cleavage:* Perfect on {001} and {100}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.695–2.72 D(calc.) = 2.717

Optical Properties: Translucent to transparent in thin fragments. *Color:* Honey-yellow, deep chestnut-brown. *Streak:* Pale canary-yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = Y = pale yellow; Z = greenish yellow.
Orientation: $X = a$; $Y = b$; $Z = c$. α = 1.622–1.623 β = 1.628–1.630 γ = 1.681–1.684
2V(meas.) = 62(2)°

Cell Data: *Space Group:* $P2_1/m$. a = 9.786(2) b = 7.134(1) c = 7.263(1)
β = 105.28(1)° Z = 2

X-ray Powder Pattern: United Verde mine, Arizona, USA.
3.144 (100), 9.46 (35), 4.998 (27), 3.606 (20), 2.076 (12), 2.909 (11), 2.355 (10)

Chemistry:

Na_2O	1.23	0.0	
H_2O	22.15	21.7	20.24
Total	101.56	100.5	100.00

(1) United Verde mine, Arizona, USA. (2) Do.; Cu, Fe, and Na by AA, Al by electron microprobe, H_2O by moisture analyzer; total Fe as Fe_2O_3. (3) $CuFe(SO_4)_2(OH)\cdot 4H_2O$.

Occurrence: A rare secondary mineral formed in mine workings by burning pyritic ores.

Association: Coquimbite, ransomite.

Distribution: From the United Verde mine, Jerome, Yavapai Co., Arizona, USA.

Name: Honors Professor Frank Nelson Guild (1870–1939), American mineralogist and economic geologist, University of Arizona, Tucson, Arizona, USA.

Type Material: National School of Mines, Paris, France; University of Arizona, Tucson, Arizona, M47; Harvard University, Cambridge, Massachusetts, 90540; National Museum of Natural History, Washington, D.C., USA, 95950.

H_2O	7.1	n.d.	4.20
Total	99.2		100.00

(1) Musonoi mine, Congo; H_2O by the Penfield method. (2) Do.; by electron microprobe. (3) $Ba(UO_2)_3O_2(SeO_3)_2 \cdot 3H_2O$, determined from crystal-structure analysis.

Occurrence: In the oxidized portions of a Cu–Co sulfide deposit (Musonoi mine, Congo).

Association: Malachite, cuprosklodowskite, kasolite, marthozite, derriksite, uranophane, wulfenite (Musonoi mine, Congo).

Distribution: From the Musonoi Cu–Co mine, near Kolwezi, and at Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Dr. Claude Guillemin (1923–1994), eminent French mineralogist, Bureau de Recherches Géologiques et Minières, Paris, France.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 119360.

Gunningite $(Zn, Mn^{2+})SO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As delicate, nearly cryptocrystalline, efflorescences.

Physical Properties: Hardness = ∼2.5 D(meas.) = 3.195 (synthetic). D(calc.) = 3.369 Readily soluble in H_2O.

Optical Properties: Translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+) (by analogy to other members of the kieserite group). $\alpha = 1.577$ (α') β = n.d. $\gamma = 1.630$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 6.925(2)$ $b = 7.591(2)$ $c = 7.635(3)$ $\beta = 118.19(1)^\circ$ Z = 4

X-ray Powder Pattern: Synthetic.
3.404 (100), 3.056 (47), 2.5185 (46), 4.81 (39), 4.759 (39), 3.307 (28), 3.348 (23)

Chemistry:

	(1)	(2)
SO_3		44.61
FeO	0.6	
MnO	3.1	
ZnO	40.8	45.35
CdO	1.0	
H_2O		10.04
Total		100.00

(1) Calumet mine, Galena Hill, Canada; partial XRF analysis of reprecipitated H_2O−soluble material. Identity in general can be established by spectrographic determination of dominant zinc and agreement of X-ray diffraction pattern with the synthetic compound. (2) $ZnSO_4 \cdot H_2O$.

Mineral Group: Kieserite group.

Occurrence: Of rare occurrence in dry areas of the oxidized portions of sphalerite-bearing deposits; occurs also as a post-mining efflorescence on museum specimens.

Association: Sphalerite, scorodite, gypsum, pharmacosiderite, jarosite, arsenopyrite, "limonite" (Keno Hill–Galena Hill district, Canada); woodruffite, smithsonite (Willett mine, Canada); szomolnokite, starkeyite, anhydrite, gypsum (Goldstrike mine, Nevada, USA); boyleite, coquimbite, zincocopiapite, jarosite, melanterite, römerite, siderotil, voltaite, chalcanthite, hexahydrite, gypsum (Les Vallettes, Switzerland).

Distribution: In Canada, from the Comstock-Keno mine and several other deposits in the Keno Hill–Galena Hill district, about 56 km northeast of Mayo, Yukon Territory; at the Willett mine, near Lardeau, British Columbia; in the Brunswick No. 2 mine, Bathurst, New Brunswick. In the USA, from Goldstrike mine, Lynn district, Eureka Co., Nevada, and at Bisbee, Cochise Co., Arizona. From Les Vallettes, Valais, Switzerland. At the Kamariza mine, Laurium, Greece. From Kropbach, Münstertal, Black Forest, Germany.

Name: Honors Dr. Henry Cecil Gunning (1901–1991), Geological Survey of Canada and Professor of Geology, University of British Columbia, Vancouver, Canada.

Type Material: Geological Survey of Canada, Ottawa, 12139; Royal Ontario Museum, Toronto, Canada.

Gunterite $Na_4(H_2O)_{16}(H_2V_{10}O_{28})\cdot 6H_2O$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. Crystals tabular on {001} and generally stacked into elongate curved multiple crystals, to 0.5 mm.

Physical Properties: *Cleavage:* {001}, {100}, {010}; imperfect. *Parting:* Perfect on (001). *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ~1 VHN = 440 (20 g. load). D(meas.) = n.d. D(calc.) = 2.398

Optical Properties: Transparent to translucent. *Color:* Orange-yellow. *Streak:* Yellow. *Luster:* Subadamantine.
Optical Class: Biaxial (+). α = 1.735(5) β = 1.770(5) γ(calc.) = 1.825(5)
2V(meas.) = 77(6)° 2V(calc.) = n.d. *Dispersion:* Strong; $v < r$. *Orientation:* $X = b$; $Y \approx c$. *Pleochroism*: X = yellow; Y = orange; Z = yellow. Absorption: $Y > X > Z$.

Cell Data: *Space Group: C*2/*m*. a = 19.848(2) b = 10.1889(11) c = 13.1184(15) β = 130.187(9)° Z = 2

X-ray Powder Pattern: West Sunday mine, San Miguel County, Colorado, USA.
10.01 (100), 8.44 (72), 8.09 (46), 20997 (29), 2.795 (21), 2.1443 (18), 1.9707 (18)

Chemistry:

	(1)
Na_2O	6.77
K_2O	0.05
CaO	3.34
Al_2O_3	0.02
V_2O_5	62.1
H_2O	27.73
Total	100.01

(1) West Sunday mine, San Miguel County, Colorado, USA; electron microprobe analysis, H_2O from structure analysis, corresponding to $(Na_{3.20}K_{0.02}Ca_{0.87})_{\Sigma=4.09}[H_{1.06}(V_{9.99}Al_{0.01})_{\Sigma=10}O_{28}]\bullet 22H_2O$.

Occurrence: In efflorescencent crusts on mine walls and in fractures in sandstone, formed by the oxidation of montroseite–corvusite assemblages.

Association: Montroseite, corvusite, huemulite, rossite, calcite, hewettite, hughesite, munirite, paramontroseite, pascoite, sherwoodite, rakovanite.

Distribution: At the West Sunday mine, Slick Rock district, San Miguel County, Colorado, USA.

Name: Honors Professor Mickey Eugene Gunter (b. 1953), University of Idaho, Moscow, Idaho, USA, for his studies in optical mineralogy and the mineralogy of asbestos minerals.

Type Material: Natural History Museum of Los Angeles County, California, USA; 63506 and 63507.

Fe	84.8	85.64
Mn	0.70	
Ni	0.8	
Si	13.3	14.36
Total	99.6	100.00

(1) Yanshan Mountains, China; by electron microprobe, average of five analyses; corresponding to $(Fe_{2.97}Ni_{0.03}Mn_{0.02})_{\Sigma=3.02}Si_{0.98}$. (2) Fe_3Si.

Occurrence: Innermost in spheres, surrounded by nickel-iron minerals and their oxidation products, apparently of extraterrestrial origin, found in placers.

Association: Xifengite, kamacite, taenite, magnetite, wüstite, maghemite.

Distribution: In the Yanshan Mountains, Hebei Province, China.

Name: For an eastern passageway, Gupeikou, of the Great Wall of China.

Type Material: Institute of Geology, Chinese Academy of Geological Sciences, Beijing, China.

(3) Camsell River, Canada; by electron microprobe, corresponding to $Pb_{1.06}Ag_{0.96}Bi_{2.82}S_{6.00}$. (4) $PbAgBi_3S_6$.

Polymorphism & Series: Forms a series with lillianite.

Occurrence: A rare mineral of hydrothermal origin; also in pegmatites.

Association: Aikinite, bismuthinite, cosalite, pavonite, benjaminite, bismuth, chalcopyrite, tetrahedrite, pyrrhotite, stannite, arsenopyrite.

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland [TL]. In Canada, at the deposit of the Terra Mining and Exploration Co., Camsell River, Northwest Territories, and from the Tanco pegmatite, Bernic Lake, Manitoba. In the USA, from the Silver Bell mine, Red Mountain district, Ouray Co., and at the Old Lout mine, Poughkeepsie Gulch, near Ouray, San Juan Co., Colorado; from South Mountain, Owyhee Co., Idaho; at Darwin, Inyo Co., and Randsburg, San Bernardino Co., California; in the Outlaw mine, about 17 km north of Manhattan, Round Mountain district, Nye Co., Nevada. From the Julcani mine, Peru. In the Monteneme Sn–W deposit, Galicia??[no, cf eskimoite??], Spain. At the Salsigne mine, 15 km north of Carcassone, Aude, and in the La Roche-Balue quarry, west of Nantes, Loire Atlantique, France. At Rotgülden, Salzburg, Austria. In the Ardino deposit, Bulgaria. From the Kti-Teberda deposit, northern Caucasus Mountains, and several other poorly specified localities in the Far Eastern Region, Russia. Additional localities for lillianite–gustavite series minerals are known.

Name: To honor Gustav Adolf Hageman (1842–1916), chemical engineer for the Cryolite Firm, Ivigtut, Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1973.188; National Museum of Natural History, Washington, D.C., USA, 136172.

Guyanaite $Cr^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m2/m2/m$. Very rarely as prismatic crystals, to 0.1 mm; in microcrystalline aggregates; commonly in alluvial grains.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.53–4.81

Optical Properties: Semitransparent. *Color:* Reddish brown, golden brown, greenish brown, green, probably variable with particle size and degree of oxidation; gray with greenish tint in reflected light, with strong red to yellowish brown internal reflections. *Streak:* Yellow-brown, greenish brown.
Optical Class: Biaxial. *Pleochroism:* In browns. α = n.d. β = n.d. γ = n.d.
2V(meas.) = n.d.

Cell Data: *Space Group: Pnnm.* $a = 4.857–4.862$ $b = 4.295–4.314$ $c = 2.951–2.958$
Z = 2

X-ray Powder Pattern: Merume River, Guyana.
3.224 (vvs), 2.432 (vs), 1.636 (s), 1.719 (ms), 1.609 (ms), 1.516 (ms), 2.524 (m)

Chemistry:

	(1)	(2)	(3)
Ti_2O_3	0.86		
Al_2O_3	4.0	1.03	
Fe_2O_3	4.4	1.47	
Mn_2O_3	0.98		
V_2O_3		6.78	
Cr_2O_3	71.7	75.76	89.40
H_2O^+	[14.3]	[14.96]	10.60
Total	[96.3]	[100.00]	100.00

(1) Merume River, Guyana; H_2O calculated from stoichiometry, original total given as 96.2%; H_2O 8.7% determined by the Penfield method on a separate sample, probably low due to oxidation of Cr with loss of H^{1+}. (2) Outokumpu, Finland; by electron microprobe, average of seven analyses; H_2O by difference. (3) CrO(OH).

Polymorphism & Series: Trimorphous with bracewellite and grimaldiite.

Occurrence: In fine-grained intergrowth with other chromium oxide-hydroxide minerals (Merume River, Guyana); in chromium-rich tremolite skarns, metaquartzites, and chlorite veins (Outokumpu, Finland).

Association: Bracewellite, eskolaite, grimaldiite, mcconnellite (Merume River, Guyana).

Distribution: Along the Merume River and its tributaries, Mazaruni district, Guyana. From Outokumpu, Finland.

Name: For its occurrence in Guyana.

Type Material: The Natural History Museum, London, England, 1979,136.

Gwihabaite $[(NH_4), K]NO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As slender prismatic crystals, composed of {110}, {100}, and {111} and elongated along [001], to 5 mm; as divergent aggregates or "cave flowers".

Physical Properties: Hardness = ∼2 D(meas.) = 1.77 D(calc.) = 1.80 Soluble in H_2O, deliquescent.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.458$ $\beta = 1.527$ $\gamma = 1.599$ 2V(meas.) = 90° 2V(calc.) = 87°

Cell Data: *Space Group: Pbnm.* $a = 7.075$ $b = 7.647$ $c = 5.779$ Z = 4

X-ray Powder Pattern: Gcwihaba Cave, Botswana.
3.194 (100), 3.212 (95), 2.595 (90), 3.364 (85), 3.863 (75), 2.400 (50), 3.805 (35)

Chemistry:

	(1)	(2)
N_2O_5	61.41	67.47
K_2O	10.40	
$(NH_4)_2O$	25.09	32.53
Total	96.90	100.00

(1) Gcwihaba Cave, Botswana; K by XRF, N and H by gas chromatography, original total reported as 98.90%; corresponds to $[(NH_4)_{0.81}K_{0.19}]_{\Sigma=1.00}(NO_3)_{1.00}$. (2) $(NH_4)NO_3$.

Occurrence: As crusts and efflorescences formed by bacterial action on bat guano in caves.

Association: Gypsum, syngenite, boussingaultite, dittmarite, weddellite, glushinskite, struvite, biphosphammite (Gcwihaba Cave, Botswana) struvite, biphosphammite (Wow Gdoom Pothole, Namibia); gypsum, wedellite, glushinskite, dittmarite (Temple of Doom Cave, South Africa).

Distribution: From Gcwihaba [!wihaba] Cave, 280 km west of Maun, northwestern Botswana. In the Temple of Doom Cave and Wow Gdoom Pothole, Namibia. At Hall's, Torch, and Chaos Caves, Transvaal, South Africa.

Name: For Gcwihaba Cave where the first specimens were collected, although the mineral name is spelled without the "c" (which stands for the "!" or "click" sound spoken by the San people who named the cave).

Type Material: Transvaal Museum, Pretoria, South Africa.

Gypsum $CaSO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular to stubby prismatic crystals, thin to thick tabular on {010}, typically exhibiting {010}, {011}, {110}, {$\overline{1}$11}, {$\overline{1}$03}, with more than 20 other forms noted, coarsely striated ‖ [001], to 17 m; lenticular in rosettes, may be curved, bent; fibrous, earthy, concretionary, granular, massive. *Twinning:* Very common by contact on {100} forming cruciform and V-shaped twins; as butterfly or heart-shaped twins by contact on {$\overline{1}$01}; rare on {$\overline{2}$09}.

Physical Properties: *Cleavage:* {010}, perfect; {100}, distinct; {011}. *Fracture:* Splintery parallel [001], conchoidal on {100}. *Tenacity:* Flexible, inelastic. Hardness = 1.5–2, varies with direction. D(meas.) = 2.317(5) D(calc.) = 2.31

Optical Properties: Transparent to translucent. *Color:* Colorless, white; if colored by impurities, yellow, tan, blue, pink, brown, reddish brown, gray, black; colorless in transmitted light. *Streak:* White. *Luster:* Subvitreous, pearly on {010} cleavages, silky if fibrous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 52°$. *Dispersion:* $r > v$, strong, inclined. $\alpha = 1.521$ $\beta = 1.523$ $\gamma = 1.530$ 2V(meas.) = 58°

Cell Data: *Space Group:* $I2/a$. $a = 5.679(5)$ $b = 15.202(14)$ $c = 6.522(6)$ $\beta = 118.43°$ Z = 4

X-ray Powder Pattern: Synthetic; shows preferred orientation on {010}). (ICDD 33-311). 7.63 (100), 4.283 (100), 3.065 (75), 2.873 (45), 2.865 (35), 2.086 (25), 3.799 (17)

Chemistry:

	(1)	(2)
SO_3	46.00	46.50
CO_2	0.28	
CaO	32.36	32.57
H_2O	20.82	20.93
insol.	0.16	
Total	99.62	100.00

(1) Zaleschiki, Ukraine. (2) $CaSO_4 \cdot 2H_2O$.

Occurrence: A common constituent of sedimentary rocks, particularly marine salt deposits, and soils formed directly by evaporation or later by hydration of anhydrite. Formed by the reaction between sulfuric acid and carbonate rock in oxidizing sulfide deposits, and by the action of sulfurous volcanic gases on surrounding Ca-bearing rock. As efflorescences in mines and speleothems in caves.

Association: Halite, celestine, calcite, aragonite, anhydrite, dolomite, sulfur.

Distribution: The most common sulfate mineral. Localities listed here have provided especially fine or large specimens. From Italy, on Sicily, as at Racalmuto, Girgenti, and Cianciana. In Germany, in several mines in the Eisleben–Mansfeld–Sangershausen district, Saxony-Anhalt, and from near Königslutter, Lower Saxony. At Bex, Valais, Switzerland. In Austria, from Aussee, Styria, and Hall, Tirol. At Zaragoza, Zaragoza Province, Spain. From Montmartre, Paris, France. In Poland, large crystals from Tarnobrzeg. At Meskerabad, near Teheran, Iran. From Cloncurry, Queensland, Australia. In Mexico, huge crystals in a cave complex in the Naica Pb–Ag mine, and also in the San Antonio mine, Santa Eulalia, Chihuahua. Large crystals in the El Teniente mine, 67 km west of Rancagua, O'Higgins Province, Chile. In the USA, large crystals at South Wash and elsewhere in Wayne Co., Utah; from Great Salt Plains, Alfalfa Co., Oklahoma; exceptional speleothems in Lechuguilla Cave, Carlsbad Caverns National Park, New Mexico.

Name: From the Greek for *calcined gypsum* used as plaster.

Gyrolite $NaCa_{16}(Si_{23}Al)O_{60}(OH)_8 \cdot 14H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudohexagonal. *Point Group:* $\overline{1}$. As spherical to radial masses, to 5 cm; massive, platy or plumose aggregates; as fibrous layers. *Twinning:* At a microscopical scale by rotation of 120° and 240° ⊥ (001).

Physical Properties: *Cleavage:* Perfect basal; poor prismatic. *Tenacity:* Flakes flexible. Hardness = 3–4 D(meas.) = 2.388–2.390 D(calc.) = 2.40

Optical Properties: Transparent to translucent, opaque. *Color:* Colorless to white, may be grayish, tan, yellowish, brownish, or pale green from inclusions; colorless in thin section. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–). $\omega = 1.540–1.550$ $\epsilon = 1.535–1.536$

Cell Data: *Space Group:* $P\overline{1}$. $a = 9.74(1)$ $b = 9.74(1)$ $c = 22.40(2)$ $\alpha = 95.7(1)°$ $\beta = 91.5(1)°$ $\gamma = 120.0(1)°$ Z = 4

X-ray Powder Pattern: Bombay, India; {00*l*} reflections only are sharp, may resemble truscottite or reyerite.
22. (vs), 11.0 (s), 4.20 (s), 1.82 (s), 3.65 (ms), 2.80 (ms), 8.4–7.4 (md)

(1) Isle of Skye, Scotland; corresponds to $Ca_{15.80}Mg_{0.12}(Si_{23.20}Al_{0.80})_{\Sigma=24.00}O_{60}(OH)_{7.04} \cdot 18.12H_2O$. (2) Qarusait, Greenland; by XRF and AA, H_2O by weight loss; corresponds to $Na_{1.18}Ca_{15.22}Mg_{0.50}Fe_{0.08}(Si_{23.07}Al_{0.93})_{\Sigma=24.00}O_{60}(OH)_{7.92} \cdot 16.72H_2O$.

Occurrence: As replacements of wall rocks and in vugs, amygdules, and veinlets in basalts; in hydrothermally altered rhyolites and sediments; in some ore deposits.

Association: Apophyllite, stilbite, laumontite, thomsonite, okenite, tobermorite, xonotlite, calcite.

Distribution: At Portree, Isle of Skye and 'S Airde Beinn, Isle of Mull, Scotland. From Ballhenry, Co. Antrim, Ireland. At Ortano, Elba, and at Monte Biaena, Pannone, Trentino-Alto Adige, Italy. At Ljósá, Eysturoy, and Gjónoyri, Streymoy, Faeroe Islands. From Qarusait and Tapaursak, Greenland. In India, from Nasik, Poona, on Bombay Island and around Bombay, Maharashtra. In Japan, at Sawayama Lake, Nagano Prefecture; Irakawa, Yamagata Prefecture; and Otemo, Niigata Prefecture. In the USA, from Fort Point, San Francisco Co., and in the New Almaden mine, Santa Clara Co., California; from Yellowstone National Park, Wyoming; in the Goose Creek quarry, Leesburg, Loudoun Co., Virginia. From 40 km southwest of Cape Blomiden, between Margaretville and Port George, Nova Scotia, Canada. A few other localities are known.

Name: From the Greek for *round*, in reference to its common habit.

(1) [Shinkolobwe,] Congo; by electron microprobe, averages of 21 analyses, H_2O by difference; corresponds to $Pb_{0.59}(Nd_{1.04}La_{0.15})_{\Sigma=1.19}(CO_3)_{2.05}(OH)_{0.63}\cdot 1.2H_2O$. (2) Sa Duchessa mine, Sardinia, Italy; by electron microprobe, average of six analyses, C 5.46% and H 0.52% by elemental microanalysis, $(OH)^{1-}$ and H_2O confirmed by IR spectroscopy; corresponds to $Pb_{0.66}(Nd_{0.50}La_{0.44}Pr_{0.22}Sm_{0.09}Gd_{0.05}Eu_{0.04})_{\Sigma=1.34}(CO_3)_{2.13}(OH)_{1.06}\cdot 0.68H_2O$.

Occurrence: A rare secondary mineral in the oxidized portions of rare-earth-bearing lead deposits, the rare-earths perhaps supplied from altered uraninite.

Association: Schuilingite-(Nd), malachite, cerussite, wulfenite, kasolite, gold, bornite, garnet, "talc-chlorite" (Shinkolobwe, Congo); chrysocolla, agardite-(Y), philipsburgite, theisite (Sa Duchessa mine, Sardinia, Italy).

Distribution: Originally found on a museum specimen labelled as coming from Shinkolobwe; however the associated minerals indicate the specimen is more likely from the Kasompi mine, both in Katanga Province, Congo (Shaba Province, Zaire). At the Sa Duchessa mine, Oridda district, Sardinia, Italy. In the Glücksrad mine, Oberschulenberg, Harz Mountains, Germany.

Name: Honors Marcel Gysin (1891–1974), Professor of Mineralogy, University of Geneva, Geneva, Switzerland.

Type Material: Geneva Natural History Museum, Geneva, Switzerland, 410/85, 435/60.

Hagendorfite $NaCaMn^{2+}(Fe^{2+}, Fe^{3+}, Mg)_2(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very rare as crystals, to 4 mm; commonly massive.

Physical Properties: *Cleavage:* Good on {001}; poor on {110}. Hardness = 4.5
D(meas.) = 3.71 D(calc.) = [3.84]

Optical Properties: Translucent. *Color:* Greenish black.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = yellowish brown, Y = green, Z = bluish green. *Orientation:* $Z = b$; $Y \wedge c$ = -22°. *Dispersion:* $r > v$. $\alpha = 1.735$ $\beta = 1.742$ $\gamma = 1.745$
2V(meas.) = 68°

Cell Data: *Space Group:* $I2_1/a$. $a = 10.933$ $b = 12.594$ $c = 6.515$ $\beta = 97.98°$ Z = 4

X-ray Powder Pattern: Hagendorf, Germany.
2.686 (10), 2.593 (8), 3.42 (7), 6.11 (6), 3.08 (6), 2.853 (6), 2.117 (6)

Chemistry:

	(1)
P_2O_5	42.26

FeO	15.44
MnO	18.50
MgO	0.66
CaO	1.68
Na_2O	8.47
K_2O	0.17
Total	100.48

(1) Hagendorf, Germany; corresponding to $Na_{1.37}Ca_{0.14}K_{0.02}Mn^{2+}_{1.30}(Fe^{2+}_{1.08}Fe^{3+}_{0.83}Mg_{0.08})_{\Sigma=1.99}(P_{0.99}O_4)_3$.

Polymorphism & Series: Forms a series with varulite.

Mineral Group: Alluaudite group.

Occurrence: In complex granite pegmatites; in phosphatic nodules in shale.

Association: Triphylite, wolfeite, hematite (Hagendorf, Germany).

Distribution: From Hagendorf, Bavaria, Germany. At Rapid Creek, Yukon Territory, Canada. In the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA.

Name: For Hagendorf, Germany, the locality which yielded the first specimens.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 107297.

(1) Russia, two localities; by electron microprobe, multiple determinations averaging V = 55.8%, here converted to $V_2^{5+}O_5$. (2) $V^{4+}V^{3+}O_2(OH)_3$.

Occurrence: In the oxidized zone of Colorado Plateau-type U–V deposits.

Association: Doloresite (USA); pyrite, selenium (Russia).

Distribution: In sandstone drill core at a depth of 55 m, from near Carlile, Crook Co., Wyoming; from the Runge mine, near Edgemont, Fall River Co., South Dakota; in the Grants district, McKinley Co., New Mexico; from the Jo Dandy mine, Paradox Valley, Uravan district, Montrose Co., Colorado; at the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada, USA. In Russia, at undefined localities in the Voronezh anticline, around Kursk. In the Syr Dar'ya basin, southern Kara-Tau Mountains, Kazakhstan. From an undefined locality in Turkmenistan.

Name: Honors Gunnar Hägg (1903–), chemist and crystallographer, of the University of Uppsala, Uppsala, Sweden.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162623.

(1) Jáchymov, Czech Republic. (2) $Ca(AsO_3OH)\cdot H_2O$.

Occurrence: Formed by dehydration of pharmacolite (Getchell mine, Nevada, USA).

Association: Pharmacolite, pitticite, weilite.

Distribution: At Jáchymov (Joachimsthal), Czech Republic. In Germany, from the Anton mine, Heubachtal, near Schiltach, and near Wittichen, Black Forest; at Richelsdorf, Hesse. At the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. From the Ruben mine, Kohlendorf, Poland. At the Khaydarkan deposit, Fergana Valley, Alai Range, Kyrgyzstan. In the White Caps mine, Manhattan district, Nye Co., and the Getchell mine, Potosi district, Humboldt Co., Nevada; from Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: Honors Wilhelm Karl von Haidinger (1795–1871), Austrian mineralogist.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 708–709. (2) Cassien, H., P. Herpin, and F. Haigerachite $KFe_3^{3+}(H_2PO_4)_6(HPO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As bladed crystals, to 0.4 mm, flattened on {110} and striated on {001} ‖ {010} and on {100} ‖ [001]; dominant forms include {110}, {100}, {010}, {001}; as fine-grained coatings.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = [2.5–3] (by analogy to parsonsite). D(meas.) = 6.39 (synthetic). D(calc.) = 6.40 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow; pale yellow in transmitted light. *Streak:* Pale yellow. *Luster:* Subadamantine.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = pale yellow; Z = nearly colorless.
Dispersion: $r > v$. *Absorption:* $X > Z$. $\alpha = 1.882(5)$ β = n.d. $\gamma = 1.915(5)$
2V(meas.) = ∼80°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.123$ $b = 10.469$ $c = 6.844$ $\alpha = 100°34'$ $\beta = 94°48'$ $\gamma = 91°16'$ Z = 2

X-ray Powder Pattern: Michael mine, Germany; nearly identical to parsonsite.
3.42 (10b), 2.85 (8), 4.42 (6), 3.03 (6), 4.26 (5), 3.33 (5b), 7.09 (3)

Chemistry: (1) Michael mine, Germany; microchemical and spectrographic analysis confirmed Pb, U, and As as major components, P absent; formula established by the similarity of the X-ray powder pattern with that of parsonsite and synthetic $Pb_2(UO_2)(AsO_4)_2$.

Occurrence: A secondary mineral found on a museum specimen from an oxidizing As–Pb-bearing deposit, formed by alteration of galena.

Association: Hügelite, widenmannite, mimetite, barite, galena, quartz.

Distribution: In Germany, from the Michael mine, Weiler, near Lahr, Black Forest, and on the Bühlskopf, near Ellweiler, Rhineland-Palatinate.

Name: Honors Dr. Arthur Francis Hallimond (1890–1968), British mineralogist, London, England, for his work with secondary uranium minerals.

Type Material: n.d.

References: (1) Walenta, K. (1965) Hallimondite, a new uranium mineral from the Michael mine near Reichenbach (Black Forest, Germany). Amer. Mineral., 50, 1143–1157.

Haineaultite $(Na,Ca)_5Ca(Ti,Nb)_5(Si,S)_{12}O_{34}(OH,F)_8 \cdot 5H_2O$

Crystal Data: Orthorhombic. *Point Group:* 222. As fan-like aggregates of tabular to bladed crystals or as isolated prismatic crystals, elongate on [001] to 6 mm, variably showing {100}, {010}, {001}, and {011}.

Physical Properties: *Cleavage:* Distinct to good on {100}, {010}, and {001}. *Tenacity:* Brittle. *Fracture:* Blocky to splintery. Hardness = 3-4 D(meas.) = n.d. D(calc.) = 2.28

Optical Properties: Transparent to translucent. *Color:* Pale orange, lemon-yellow, less commonly tan or off-white. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). α = 1.599(1) β = 1.610(1) γ = 1.696(1) 2V(meas) = 38(1)° 2V(calc) = 41(1)° *Dispersion: None. Orientation: X = b*; *Y = c*; *Z = a*. *Pleochroism*: *None*.

Cell Data: *Space Group: C*222. *a* = 7.204(4) *b* = 23.155(5) *c* = 6.953(2) Z = 1

X-ray Powder Pattern: Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada.
11.564 (100), 6.932 (90), 3.052 (75), 2.977 (70), 5.258 (40), 4.446 (40), 2.582 (40)

Chemistry:

	(1)		(1)
Na_2O	4.70	TiO_2	18.86
K_2O	2.09	ZrO_2	0.31

SiO_2	42.70	$-O = F_2$	0.07
		Total	97.83

(1) Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada; average of 16 electron microprobe analyses, H_2O and OH^- confirmed by structure analysis and IR, corresponding to $(Na_{2.41}Ca_{1.83}K_{0.71})_{\Sigma=4.95}Ca(Ti_{3.76}Nb_{0.67}Fe_{0.11}Mn_{0.06}Zr_{0.04}Mg_{0.03})_{\Sigma=4.67}(Si_{11.30}S_{0.52})_{\Sigma=11.82}O_{34}(OH_{7.86}F_{0.14})_{\Sigma=8.00} \cdot 5H_2O$.

Mineral Group: Labuntsovite group.

Occurrence: A late-stage mineral in altered marble zenoliths and breccia in a complex peralkaline intrusion (nepheline and sodalite syenties).

Association: Quartz, calcite, sodic amphibole, pectolite, fluorapophyllite, vesuvianite, tainiolite, albite, fluorite, microcline, aegirine, and 17 less-abundant minerals.

Distribution: From the Poudrette quarry, Mont Saint-Hilaire, Rouville County, Quebec, Canada.

Name: Honors Gilles Haineault (b. 1946) of St-Mathieu de Beloeil, Quebec, a collector and dealer of minerals from Mont Saint-Hilaire.

Type Material: Canadian Museum of Nature, Ottawa; 81547.

References: (1) McDonald, A.M., and G.Y. Chao (2004) Haineaultite, a new hydrated sodium calcium titanosilicate from Mont Saint-Hilaire, Quebec: description, structure determination and genetic implications. Can. Mineral., 42, 769–780. (2) (2005) Amer. Mineral., 90, 271 (abs. ref. 1).

Hainite $Na_4Ca_8(Ti, Zr, Mn^{2+})_3Si_8O_{28}F_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals, < 1 mm, slender needles and plates, elongated along [001] with {010}, {100}, and {$\bar{1}$10}. *Twinning:* On {100}.

Physical Properties: *Cleavage:* {010}, rather perfect; {100}, faint. *Fracture:* Brittle. Hardness = 5 D(meas.) = 3.148 D(calc.) = 3.157

Optical Properties: Semitransparent. *Color:* Wine-yellow, honey-yellow, colorless; light wine-yellow in thin section. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Z = wine-yellow. *Dispersion:* $r > v$, strong. *Absorption:* $Z > Y > X$. $n =$ ∼1.7, birefringence ∼0.012. 2V(meas.) = Large.

Cell Data: *Space Group:* $P\bar{1}$. $a = 5.676(2)$ $b = 7.259(3)$ $c = 9.586(3)$ $\alpha = 101.08(4)°$ $\beta = 101.14(4)°$ $\gamma = 90.27(4)°$ Z = 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ (probable). As spherulites consisting of minute, bladelike grains; also as single flakelike grains, flattened on {100}.

Physical Properties: *Cleavage:* Good on {100}. Hardness = 3.5 D(meas.) = 3.35 D(calc.) = [4.93] Fluoresces weakly dull green under UV; radioactive.

Optical Properties: Semitransparent. *Color:* Pale yellow to greenish yellow. *Luster:* Pearly on the cleavage.
Optical Class: Biaxial (–). *Pleochroism:* Y = pale yellow; Z = colorless. *Orientation:* $Y = b$. *Dispersion:* $r > v$, very strong. α = 1.533–1.571 β = 1.572–1.580 γ = 1.573–1.582 2V(meas.) = 15°–20°

Cell Data: *Space Group:* $P2/c$ (probable). $a = 15.4$ $b = 7.05$ $c = 7.10$ $\beta = 107°52'$ Z = [2]

X-ray Powder Pattern: Coso Mountains, California, USA.
9.14 (100), 4.56 (60), 4.42 (60), 3.19 (50), 3.11 (50), 7.05 (40), 3.54 (40)

Chemistry:

	(1)	(2)
SiO_2	33.1	33.42
UO_3	52.8	53.03
CaO	5.4	5.20
H_2O	8.7	8.35
Total	[100.0]	100.00

(1) Coso Mountains, California, USA; inseparably combined with metahaiweeite, average of four analyses, recalculated to 100.0% after deduction of insolubles, mainly quartz.
(2) $Ca(UO_2)_2Si_6O_{15}\cdot 5H_2O$.

Occurrence: On fracture surfaces in granite and in voids in neighboring loosely consolidated lake bed sediments (Coso Mountains, California, USA); along fractures in tourmaline-bearing granite and granite pegmatite (Perus, Brazil).

Association: Autunite, meta-autunite, uranophane, uranophane-beta, phosphuranylite, torbernite, meta-torbernite, chernikovite, uranian "opal" (Perus, Brazil).

Distribution: From the Haiwee Reservoir, Coso Mountains, Inyo Co., California, USA. At Perus, 25 km north of São Paulo, Brazil. On Portezuelo Hill, Ranquil district, Mendoza Province, Argentina. From Badgastein, Salzburg, Austria.

Name: For the Haiwee Reservoir, Coso Mountains, California, USA, above which the mineral was first found to occur.

Type Material: n.d.

(1) Předbořice, Czech Republic; by electron microprobe, corresponding to $(Cu_{10.78}Hg_{1.84})_{\Sigma=12.62}(Sb_{3.06}As_{1.03})_{\Sigma=4.09}(Se_{10.37}S_{2.63})_{\Sigma=13.00}$. (2) Do.; corresponding to $(Cu_{10.61}Hg_{1.81})_{\Sigma=12.42}(Sb_{3.98}As_{0.24})_{\Sigma=4.22}Se_{12.36}$.

Mineral Group: Tetrahedrite group.

Occurrence: In epithermal calcite veins.

Association: Berzelianite, clausthalite, umangite, chalcopyrite, pyrite, uraninite, hematite, goethite, gold.

Distribution: In the Czech Republic, from the Předbořice uranium deposit, near Krásna Hora [TL], at Bukov, near Tisnova; and in the Petrovice uranium deposit, near Ždár. At the Niederschlema-Alberoda uranium deposit, Saxony, Germany. From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: In honor of Jaroslav Hak (1931–), Czech mineralogist, Institute of Ore Research, Kutná Hora, Czech Republic.

Type Material: Charles University, Prague, Czech Republic; National School of Mines, Paris, France.

Halite NaCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. Crystals cubic, to 1 m, or octahedral; elongated along [100] or [111], skeletal with hopper-shaped faces. Rarely capillary or stalactitic; granular, compact, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 2.168 D(calc.) = 2.165 Soluble in H_2O, saline taste; rarely fluoresces red under SW UV.

Optical Properties: Transparent. *Color:* Colorless or white when pure; gray, yellow, orange, pink, red, blue, purple; colorless to faintly tinted in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Isotropic; weakly anisotropic due to stress. *Dispersion:* Moderately strong. $n = 1.5443$

Cell Data: *Space Group: Fm3m.* a = 5.6404(1) Z = 4

X-ray Powder Pattern: Synthetic.
2.821 (100), 1.994 (55), 1.628 (15), 3.258 (13), 1.261 (11), 1.1515 (7), 1.410 (6)

Chemistry:

	(1)	(2)
Na	39.00	39.34
K	0.12	
Mg	0.03	
Ca	0.08	
Cl	60.27	60.66
SO_4	0.27	
Total	99.77	100.00

(1) Cardona, Barcelona, Spain. (2) NaCl.

Occurrence: Typically in sedimentary rocks of evaporite association, may form immense beds; also as volcanic sublimates, efflorescences, cave deposits. Crystals are common in multiphase fluid inclusions; may be included in other minerals as a product of intermediate-grade metamorphism.

Association: Sylvite, polyhalite, kieserite, carnallite, gypsum, anhydrite, dolomite.

Distribution: Of worldwide occurrence. Well-studied deposits include: in Austria, around Hallstadt, Salzburg, and Hall, near Innsbruck, Tirol. From Bex, Vaud, Switzerland. In Germany, from Stassfurt-Leopoldshall, 34 km south of Magdeburg, Saxony-Anhalt. Deposits with large crystals at Wieliczka (Galicia) and Bochnia, Poland. At Girgenti and Racalmuto, Sicily, Italy. In the Salt Range, Punjab, India. In the USA, in the Michigan Basin, underlying Ohio, Michigan, and New York; as numerous salt domes along the Gulf Coast; and in the Permian Basin of Texas and New Mexico; large crystals at the Potash Corporation of America mine, Carlsbad potash district, Eddy Co., New Mexico.

Name: From the Greek for *salt*.

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As bladed crystals, to 0.4 mm, flattened on {110} and striated on {001} || {010} and on {100} || [001]; dominant forms include {110}, {100}, {010}, {001}; as fine-grained coatings.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = [2.5–3] (by analogy to parsonsite). D(meas.) = 6.39 (synthetic). D(calc.) = 6.40 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow; pale yellow in transmitted light. *Streak:* Pale yellow. *Luster:* Subadamantine.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = pale yellow; Z = nearly colorless. *Dispersion:* $r > v$. *Absorption:* $X > Z$. $\alpha = 1.882(5)$ $\beta =$ n.d. $\gamma = 1.915(5)$
2V(meas.) = ~80°

Cell Data: *Space Group:* $P\bar{1}$. $a = 7.123$ $b = 10.469$ $c = 6.844$ $\alpha = 100°34'$ $\beta = 94°48'$ $\gamma = 91°16'$ $Z = 2$

X-ray Powder Pattern: Michael mine, Germany; nearly identical to parsonsite.
3.42 (10b), 2.85 (8), 4.42 (6), 3.03 (6), 4.26 (5), 3.33 (5b), 7.09 (3)

Chemistry: (1) Michael mine, Germany; microchemical and spectrographic analysis confirmed Pb, U, and As as major components, P absent; formula established by the similarity of the X-ray powder pattern with that of parsonsite and synthetic $Pb_2(UO_2)(AsO_4)_2$.

Occurrence: A secondary mineral found on a museum specimen from an oxidizing As–Pb-bearing deposit, formed by alteration of galena.

Association: Hügelite, mimetite, barite, galena, quartz.

Distribution: In Germany, from the Michael mine, Weiler, near Lahr, Black Forest, and on the Bühlskopf, near Ellweiler, Rhineland-Palatinate.

Name: Honors Dr. Arthur Francis Hallimond (1890–1968), British mineralogist, London, England, for his work with secondary uranium minerals.

Type Material: n.d.

References: (1) Walenta, K. (1965) Hallimondite, a new uranium mineral from the Michael mine near Reichenbach (Black Forest, Germany). Amer. Mineral., 50, 1143–1157.

Halloysite $Al_2Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. Massive, claylike. On a microscopic scale, tubular, average 0.04 μm; tubes split open and unroll to form laths or spatula shapes; spherical.

Physical Properties: *Cleavage:* {001}, probable. *Fracture:* Conchoidal. Hardness = 2–2.5 D(meas.) = 2.55–2.565 D(calc.) = [2.57]

Optical Properties: Semitransparent. *Color:* White; gray, green, blue, yellow, red from included impurities. *Luster:* Pearly, waxy, or dull.
Optical Class: Biaxial. n = 1.55–1.56 2V(meas.) = n.d.

Cell Data: *Space Group:* Cc. $a = 5.14(4)$ $b = 8.90(4)$ $c = 14.9(1)$ $\beta = 101.9°$ Z = [4]

(1) Eureka, Utah, USA. (2) $Al_2Si_2O_5(OH)_4$.

Polymorphism & Series: Dickite, kaolinite, and nacrite are polymorphs.

Mineral Group: Kaolinite-serpentine group; called endellite in European literature.

Occurrence: A product of hydrothermal alteration or surface weathering of aluminosilicate minerals, as feldspars. Formed by dehydration of endellite above 110 °C.

Association: Kaolinite, endellite, allophane, alunite.

Distribution: Undoubtedly widespread. Probably at Angleur, Liège, Belgium, the "type" locality, now inaccessible. From Valença, Portugal. At Bergnersreuth, near Wunsiedel, Bavaria, Germany. In the USA, from Wagon Wheel Gap, Mineral Co., Colorado; at Gonzales, Gonzales Co., Texas; near Bedford, Lawrence Co., Indiana; at Horse Cove, Hart Co., Kentucky; in the Corundum Hill mine, Macon Co., North Carolina. Also from the Dragon Consolidated iron mine, Eureka, Tintic district, Juab Co., Utah; in a number of porphyry copper deposits in Arizona, as at Ray, Pinal Co., Globe-Miami, Gila Co., and others.

Name: To honor Baron Omalius d'Halloy (1707–1789), who first observed the mineral.

(1) Középső-György mine, Hungary; after subtraction of ferrohexahydrite impurity, corresponds to $(Fe^{2+}_{0.97}Mg_{0.02}Mn_{0.01})_{\Sigma=1.00}(Al_{1.98}Fe^{3+}_{0.02})_{\Sigma=1.00}(SO_4)_4 \cdot 22H_2O$. (2) $FeAl_2(SO_4)_4 \cdot 22H_2O$.

Polymorphism & Series: Forms a series with pickeringite.

Mineral Group: Halotrichite group.

Occurrence: As efflorescences in weathering sulfide deposits and oxidizing pyritic coals, with persistent accumulations in arid climates; as a precipitate around volcanic fumaroles and hot springs.

Association: Melanterite, copiapite, gypsum, epsomite, alunogen.

Distribution: Widespread but typically in small amounts; only a few of the classic localities will be mentioned. At the Solfatara di Pozzuoli, Campi Flegrei, near Naples, Campania, Italy. From the Középső-György mine, Recsk, Mátra Mountains, Hungary. At Falun, Sweden. From Huelgoat and Poullaouen, Finistère, France. At the Feengrotten, near Saalfeld, Thuringia, Germany. In the USA, from the Alum Mountain district, Grant Co., New Mexico; at the Sulfur Hole prospect, near Borate, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co., and at hot springs around Mt. Lassen, Shasta Co., California; from the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. In the Glace Bay coal deposits, Nova Scotia, Canada. In Chile, at Tierra Amarilla, southeast of Copiapó, Atacama; from Alcaparrosa, near Cerritos Bayos, southwest of Calama, and from Chuquicamata, Antofagasta. At volcanoes on the Kamchatka Peninsula, Russia.

Name: From the Latin, *halotrichum*, derived from the Old German, *Haarsalz*, for *hair salts*, in allusion to its common hairlike habit.

(1) Anjanabanoana, Madagascar; corresponds to $Be_{2.04}B_{0.98}O_3[(OH)_{0.93}F_{0.05}]_{\Sigma=0.98}$. (2) Little Three mine, California, USA; corresponds to $Be_{2.00}B_{1.00}O_3[(OH)_{0.70}F_{0.30}]_{\Sigma=1.00}$.

Occurrence: An uncommon accessory mineral in granite pegmatites.

Association: Beryl, danburite, apatite, spodumene, zircon, fluorite, feldspar, quartz.

Distribution: From Helgeroa, Langesundsfjord, Norway. In the Czech Republic, from Ctidružice; Recice; Kracovice, near Tribic; Sušice; and elsewhere. From between San Ilario and San Piero in Campo, Elba, Italy. In Madagascar, from Imalo, near Mania; at Maharitra, on Mt. Bity; and large crystals from Anjanabanoana. In the USA, fine crystals from the Little Three mine, near Ramona, and the Himalaya mine, Mesa Grande district, San Diego Co., and in the Jensen quarry, Riverside Co., California; large crystals from the Zapot pegmatite, 25 km northeast of Hawthorne, Mineral Co., Nevada; at the Animikie Red Ace pegmatite, near Pine River, Florence Co., Wisconsin. In Pakistan, around Stak Nala and Drot, Gilgit-Skardu road, Northern Areas. In the Rangkul pegmatite field, eastern Pamir Mountains, Tajikistan. In Russia, from the Mokrusha mine, Ural Mountains, and in the Malkhan pegmatite field, Chite region, Transbaikal.

Name: Honors Professor Axel Hamberg (1863–1933), Swedish mineralogist and geographer.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 332865; Natural History Museum, Paris, France, 10734; National Museum of Natural History, Washington, D.C., USA, 116994.

Hammarite $Pb_2Cu_2Bi_4S_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As short prisms or needles.

Physical Properties: *Cleavage:* Good on {010}. *Fracture:* Flat conchoidal. Hardness = 3–4 VHN = 186 D(meas.) = 6.74 D(calc.) = 7.05

Optical Properties: Opaque. *Color:* Steel-gray with red tint. *Streak:* Black. *Luster:* Metallic.
R_1–R_2: (400) 39.7–43.6, (420) 39.8–43.7, (440) 39.8–43.8, (460) 39.9–44.0, (480) 40.1–44.1, (500) 40.3–44.4, (520) 40.2–44.6, (540) 40.1–44.6, (560) 40.0–44.7, (580) 39.9–44.7, (600) 39.8–44.6, (620) 39.6–44.4, (640) 39.4–44.1, (660) 39.1–43.7, (680) 38.8–43.3, (700) 38.6–42.9

Cell Data: *Space Group:* *Pbnm* or $Pbn2_1$. $a = 33.7726(8)$ $b = 11.5857(3)$ $c = 4.01$ $Z = 4$

X-ray Powder Pattern: Dzhida deposit, Russia.
3.63 (10b), 3.14 (10b), 4.01 (9b), 3.56 (8), 2.83 (8b), 2.00 (8), 1.973 (8)

Chemistry:

	(1)	(2)	(3)
Pb	27.40	23.13	24.87
Cu	7.60	7.69	7.63
Bi	47.59	49.00	50.18
S	17.01	17.57	17.32
rem.	0.04	2.71	
Total	99.64	100.10	100.00

(1) Gladhammar, Sweden; remnant is insoluble; corresponds to $Pb_{2.24}Cu_{2.03}Bi_{3.86}S_{9.00}$.
(2) Dzhida deposit, Russia; remnant Zn 1.78%, SiO_2 0.50%, Ag 0.17%, Sb 0.14%, Fe 0.05%, Sn 0.05%, Te 0.02%, Se 0.004%; corresponds to $Pb_{1.83}Cu_{1.99}Bi_{3.85}S_{9.00}$. (3) $Pb_2Cu_2Bi_4S_9$.

Occurrence: Of hydrothermal origin.

Association: Paděraite, pekoite, bismuthinite, chalcopyrite, grossular, andradite (Băiţa, Romania); pyrite, sphalerite (Dzhida deposit, Russia).

Distribution: From Gladhammar, Kalmar, Sweden [TL]. In the Dzhida Mo–W deposit, and from Inkur, Transbaikal, Russia. At Băiţa (Rézbánya), and from Baia Borşa, Baia Mare (Nagybánya), Romania. Found in the Loch Shin monzogranite, near Lairg, Scotland. From along the Avoca River, Co. Wicklow, Ireland. At the Felbertal tungsten mine, Salzburg, Austria. In the Victoria district, Doña Ana Co., New Mexico, and from the Outlaw mine, Round Mountain district, Nye Co., Nevada, USA. In the Julcani district, Peru.

Name: For the locality at Gladhammar, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Hanawaltite $Hg_6^{1+}Hg^{2+}O_3(Cl,OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m2/m2/m$. Subhedral to anhedral crystals, platy to bladed, striated ‖ [001], to 0.3 mm.

Physical Properties: *Cleavage:* {001}, good. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = < 5 D(meas.) = n.d. D(calc.) = 9.51 Decrepitates on exposure to sunlight, photoreducing to mercury.

Optical Properties: Opaque to translucent on very thin edges. *Color:* Black to very dark brown-black; in reflected light, gray, may have red-orange internal reflections. *Streak:* Black to dark red-brown. *Luster:* Metallic.
Optical Class: Biaxial. *Pleochroism:* Weak; bright bluish white to grayish white.
Anisotropism: Bright metallic blue. *Bireflectance:* Moderate to strong.
R_1–R_2: (400) 26.2–37.6, (420) 25.2–34.8, (440) 24.2–32.5, (460) 23.3–30.6, (480) 22.4–29.0, (500) 21.8–27.7, (520) 21.2–26.7, (540) 20.8–25.9, (560) 20.5–25.2, (580) 20.3–24.6, (600) 20.1–24.1, (620) 20.0–23.7, (640) 20.2–23.3, (660) 20.3–23.1, (680) 20.2–22.9, (700) 20.0–22.8

Cell Data: *Space Group: Pbma.* $a = 11.790(3)$ $b = 13.881(4)$ $c = 6.450(2)$ $Z = 4$

X-ray Powder Pattern: Clear Creek mine, California, USA.
3.053 (100), 5.25 (80), 2.954 (70), 3.164 (60), 2.681 (50), 2.411 (50), 4.35 (40)

Chemistry:

	(1)
HgO	[14.27]
Hg_2O	[82.46]
Cl	3.33
S	0.00
H_2O	[0.34]
$-O = Cl_2$	0.75
Total	[99.65]

(1) Clear Creek mine, California, USA; by electron microprobe, calculated for Hg^{1+}:Hg^{2+} = 6:1 and H_2O for Cl+(OH) = 2.00; then corresponding to $Hg^{1+}_{6.00}Hg^{2+}_{1.00}[Cl_{1.43}(OH)_{0.57}]_{\Sigma=2.00}O_{3.00}$.

Occurrence: A rare alteration product of cinnabar, in a mercury deposit in silicate-carbonate rock hydrothermally altered from serpentinite.

Association: Calomel, mercury, cinnabar, montroydite, ferroan magnesite, quartz.

Distribution: Near the Clear Creek mercury mine, New Idria district, San Benito Co., California, USA.

Name: To honor Dr. Joseph Donald Hanawalt (1903–1987), American metallurgist, Ann Arbor, Michigan, USA, for his early work in X-ray powder diffraction.

Type Material: Canadian Geological Survey, Ottawa, Canada, 67396.

Hancockite $(Ca, Pb, Sr)_2(Al, Fe^{3+})_3(SiO_4)(Si_2O_7)O(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As very small lath-shaped crystals, showing {001}, {100}, {101}, {$\bar{1}$01}, and {$\bar{1}$11}, striated parallel to their length and with rounded faces; subhedral grains, sometimes hollow. In drusy cellular aggregates and compact masses.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 4.03 D(calc.) = [4.03]

Optical Properties: Translucent. *Color:* Crystals yellowish brown, yellow-green; massive material dull brick-red, brownish red, or maroon. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless, pale rose, greenish yellow; Y = pale brownish yellow, yellow; Z = pale rose, greenish yellow, green. *Dispersion:* $r > v$, perceptible. *Absorption:* $Z > X$. $\alpha = 1.788(3)$ $\beta = 1.81(1)$ $\gamma = 1.830(3)$ 2V(meas.) = ∼50°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.958(20)$ $b = 5.665(10)$ $c = 10.304(20)$ $\beta = 114.4(4)°$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA. (ICDD 17-212).
2.91 (100), 3.49 (50), 2.60 (50), 2.81 (40), 2.71 (40), 2.18 (40), 1.90 (40)

(1) Franklin, New Jersey, USA; corresponds to $(Ca_{1.17}Pb_{0.47}Sr_{0.21}Mn^{2+}_{0.17})_{\Sigma=2.02}(Al_{1.95}Fe_{0.88}Mn^{3+}_{0.10}Mg_{0.07})_{\Sigma=3.00}(Si_{2.95}Al_{0.05})_{\Sigma=3.00}O_{12}OH$. (2) Do.; by electron microprobe, H_2O from theoretical $CaPbFeAl_2Si_3O_{12}(OH)$. (3) Jakobsberg, Sweden; by electron microprobe, H_2O by difference; corresponds to $(Ca_{1.07}Pb_{0.95}Mn_{0.02}Ba_{0.01})_{\Sigma=2.05}(Al_{1.87}Fe^{3+}_{1.08}Ti_{0.01})_{\Sigma=2.95}Si_{3.00}O_{12}OH$.

Mineral Group: Epidote group.

Occurrence: In a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA); in a metamorphosed manganese-iron orebody in skarns enclosed in dolomitic marble (Jakobsberg, Sweden).

Association: Andradite, franklinite, manganaxinite, clinohedrite, roeblingite, datolite, prehnite, willemite, barite, hendricksite, barian feldspar, phlogopite, lead, copper (Franklin, New Jersey, USA); melanotekite, hematite, garnet (Jakobsberg, Sweden).

Distribution: From Franklin, Sussex Co., New Jersey, USA. At Jakobsberg, Värmland, Sweden.

Name: For Elwood P. Hancock (1836–1916), of Burlington, New Jersey, USA, collector of minerals from Franklin.

Type Material: Yale University, New Haven, Connecticut, USA, 2.4751.

Hanksite $KNa_{22}(SO_4)_9(CO_3)_2Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As short prismatic to tabular hexagonal crystals, to 20 cm, dominated by combinations of $\{10\bar{1}0\}$, $\{10\bar{1}2\}$, $\{10\bar{1}1\}$, and $\{0001\}$; $\{10\bar{1}0\}$ striated $\perp$ [0001].

Physical Properties: *Cleavage:* On $\{0001\}$, good. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 2.562 D(calc.) = 2.585 Soluble in H_2O, saline taste; fluoresces pale yellow under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to pale yellow, may be grayish green due to clay inclusions; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to dull.
Optical Class: Uniaxial (–). $\omega = 1.481$ $\epsilon = 1.461$

Cell Data: *Space Group:* $P6_3/m$. $a = 10.465(21)$ $c = 21.191(43)$ $Z = 2$

X-ray Powder Pattern: Searles Lake, California, USA.
3.812 (100), 3.531 (75), 2.787 (72), 3.425 (60), 2.618 (47), 2.930 (31), 1.907 (22)

Chemistry:

Total	100.00	100.00

(1) Skipton lava tube caves, Australia. (2) $(NH_4)_2Mg_3(PO_3OH)_4 \cdot 8H_2O$.

Occurrence: As rare druses on guano-derived phosphate mineral crusts in caves.

Association: Biphosphammite, guanine, monetite, syngenite, aphthitalite, struvite, brushite, newberyite, dittmarite, schertelite.

Distribution: In Australia, from the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria, and in the Murra-el-elevyn Cave, Cocklebiddy, Western Australia. At the Niah Great Cave, Sarawak, Malaysia.

Name: Honors James Ballantine Hannay (1855–1931), Scottish chemist, University of Manchester, Manchester, England.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 699–700. (2) Frazier, A.W., J.R. Lehr, and J.P. Hannebachite $2CaSO_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thin bladed crystals, flattened on {001}, elongated along [010], to 1 mm, dominated by {101} and {021} with some faces curved; typically in spraylike aggregates.

Physical Properties: *Cleavage:* Perfect on {110}. Hardness = ∼3.5 D(meas.) = 2.52 D(calc.) = 2.54

Optical Properties: Transparent. *Color:* Colorless; changes to milky white on exposure to humid air. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. $\alpha = 1.596(2)$ $\beta = 1.600(2)$ $\gamma = 1.634(2)$ 2V(meas.) = 38(5)° 2V(calc.) = 38°

Cell Data: *Space Group: Pbna.* $a = 6.473(5)$ $b = 9.782(9)$ $c = 10.646(9)$ Z = 4

X-ray Powder Pattern: Hannebacher Ley volcano, Germany.
3.15 (100), 2.617 (90), 3.79 (80), 1.843 (50), 5.54 (40), 1.950 (40), 1.671 (40)

Chemistry:

	(1)	(2)
SO_2	49.5	49.60
CaO	43.1	43.42
H_2O	[7.4]	6.98
Total	[100.0]	100.00

(1) Hannebacher Ley volcano, Germany; average of 10 electron microprobe analyses, H_2O by TGA, presence of SO_3 confirmed by IR. (2) $2CaSO_3 \cdot H_2O$.

Occurrence: Lining cavities in blocks of melilite-nepheline-leucitite at the base of a volcano.

Association: Calcite, aragonite, gypsum, barite, celestine, thaumasite, chabazite, phillipsite, gismondine, whewellite, perovskite.

Distribution: From the Hannebacher Ley volcano, one km east-northeast of Hannebach, and at Kalem, near Birresborn, Eifel district, Germany.

Name: For the locality, Hannebacher Ley volcano, Germany, from which the first specimens were collected.

Type Material: Natural History Museum, Mainz, Germany, M1990/3093.

References: (1) Hentschel, G., E. Tillmanns, and W. Hofmeister (1985) Hannebachite, natural calciumsulfite hemihydrate, $CaSO_3 \cdot 1/2H_2O$. Neues Jahrb. Mineral., Monatsh., 241–250. (2) (1988) Amer. Mineral., 73, 928 (abs. ref. 1).

Hapkeite $2/3Fe_2Si$

Crystal Data: Isometric. *Point Group:* 4/*m* $\bar{3}$ 2/*m*. As part of an irregular 0.035 mm diameter grain.

Physical Properties: *Cleavage:* n.d.. *Fracture:* n.d. *Tenacity:* n.d.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.83

Optical Properties: Opaque. *Color:* Yellowish white in reflected light. *Streak:* n.d.
Luster: Metallic.
R: (470) 47.1, (546) 48.8, (589) 50.0, (650) 50.9
Optical Class: Isotropic.

Cell Data: *Space Group: Pm*3*m*. *a* = 2.831(4) Z = 1

X-ray Powder Pattern: Lunar meteorite Dhofar 280.
2.831 (n.d.), 2.000 (n.d.), 1.631 (n.d.), 1.415 (n.d.), 1.267 (n.d.), 1.157 (n.d.), 1.000 (n.d.)

Chemistry:

	(1)
Fe	75.3
Si	18.4
Co	0.12
Ni	3.14
P	1.85
Cr	0.37
Total	99.2

(1) Lunar meteorite Dhofar 280; average of 5 electron microprobe analyses, corresponding to $(Fe_{1.27}Ni_{0.05}Cr_{0.01})_{\Sigma=1.33}(Si_{0.62}P_{0.06})_{\Sigma=0.68}$.

Occurrence: In a highland regolith breccia clast in the lunar meteorite Dhofar 280, formed by impact-induced, vapor-phase deposition under extreme reducing conditions in lunar soil.

Association: FeSi (fersilicite and ferdisilicite), vitrified plagioclase ("maskelynite"), FeNi.

Distribution: Lunar meteorite Dhofar 280 collected in Dhofar Province (Al Janubiyah Province), Oman.

Name: Honors Bruce Hapke (emeritus, University of Pittsburgh), who first predicted the presence of vapor-deposited elemental Fe as coatings on lunar soil grains.

Type Material: n.d.

(1) Yamato mine, Japan; corresponds to $(Sr_{3.26}Ba_{0.40}Ca_{0.28}Mn_{0.03}Fe_{0.02}K_{0.01})_{\Sigma=4.00}(V_{3.94}Al_{0.07}Ti_{0.01})_{\Sigma=4.02}(Si_{7.98}Al_{0.02})_{\Sigma=8.00}O_{28}$.

Occurrence: In coarse-grained rhodonite ore (Noda-Tamagawa mine, Japan); as veinlets cutting rhodonite-goldmanite ore (Yamato mine, Japan).

Association: Rhodonite, quartz.

Distribution: In Japan, in the Yamato mine and on Amamioshima Island, Kagoshima Prefecture; in the Noda-Tamagawa mine, Iwate Prefecture; and in the Matsuo mine, Kochi Prefecture. From the Gambatesa mine, near Chiavari, Val Graveglia, Liguria, Italy.

Name: For Zyunpei Harada (1898–1992), Emeritus Professor, Hokkaido University, Sapporo, Japan.

Type Material: National Science Museum, Tokyo, Japan, M15111.

Hardystonite $Ca_2ZnSi_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. In coarse, columnar masses; granular and as isolated grains.

Physical Properties: *Cleavage:* {001}, good; {100} and {110}, poor. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 3.396–3.443 D(calc.) = 3.42 A dull violet fluorescence can be observed in some samples under UV.

Optical Properties: Translucent. *Color:* White, pinkish, light brown; colorless in thin section. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.669$ $\epsilon = 1.657$

Cell Data: *Space Group:* $P\bar{4}2_1m$. $a = 7.8287(16)$ $c = 5.0140(4)$ Z = 2

(1) Franklin, New Jersey, USA. (2) Do.; by electron microprobe. (3) $Ca_2ZnSi_2O_7$.

Mineral Group: Melilite group.

Occurrence: In granular ore in a metamorphosed stratiform zinc deposit.

Association: Vesuvianite, apatite, franklinite, willemite, rhodonite, calcite, dolomite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For Hardyston Township in which Franklin is situated.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 113594, 113608.

Harkerite $Ca_{24}Mg_8Al_2(SiO_4)_8(BO_3)_6(CO_3)_{10}\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\bar{3}\ 2/m$. As simple pseudo-octahedral crystals, to 5 mm. *Twinning:* Observed, with four rhombohedral individuals each ideally oriented ‖ to one of the pseudocubic 3-fold axes.

Physical Properties: Hardness = n.d. D(meas.) = 2.95–2.96 D(calc.) = [3.02]

Optical Properties: Semitransparent. *Color:* Colorless. *Luster:* Vitreous.
Optical Class: Uniaxial, but typically sensibly isotropic; sections may separate into four fields with weak birefringence in the diagonal position. $n = 1.649–1.653$

Cell Data: *Space Group:* $R\bar{3}m$. $a = 10.439$ $c = 51.303$ $Z = 3$

X-ray Powder Pattern: Broadford area, Isle of Skye, Scotland.

(1) Camas Malag, Isle of Skye, Scotland. (2) Alban Hills, Italy; by electron microprobe, spectrophotometry, elemental analyzer, and mass spectrometer. (3) $Ca_{24}Mg_8Al_2(SiO_4)_8(BO_3)_6(CO_3)_{10}\cdot 2H_2O$.

Occurrence: In skarns in dolomitic limestones at the contact with granite (Camas Malag, Scotland); in volcanic ejecta (Alban Hills, Italy).

Association: Calcite, monticellite, diopside, magnetite, vesuvianite, cuspidine, phlogopite.

Distribution: At Camas Malag, near Broadford, Isle of Skye, Scotland. On the Chersky Ridge, Tas-haiatah, northeastern Siberia, Russia. From the Alban Hills, Lazio, Italy. Large crystals at Nordmark, Sweden.

Name: For Alfred Harker (1859–1939), British petrologist, Cambridge University, Cambridge, England.

Type Material: n.d.

Harmotome $(Ba,K)_{1-2}(Si,Al)_8O_{16}\cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals elongated ‖ [001] or tabular ‖ {010}; typically striated on {010} ‖ [001]. Commonly as interpenetrant twins, to 4 cm, alone, in groups, or radiating aggregates. *Twinning:* Repeated on {001}, {021}, {110}; three double twins may further twin to simulate a pseudotetragonal prism or dodecahedron.

Physical Properties: *Cleavage:* {010} distinct, {001} poor. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 2.41–2.47 D(calc.) = 2.448

Optical Properties: Transparent to translucent. *Color:* Colorless, white, gray, yellow, pink, brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge a = 63°–67°$. *Dispersion:* Weak, crossed.
$\alpha = 1.503–1.508$ $\beta = 1.505–1.509$ $\gamma = 1.508–1.514$ 2V(meas.) = ∼80°

Cell Data: *Space Group:* $P2_1/m$. $a = 9.8688(21)$ $b = 14.1295(7)$ $c = 8.7092(9)$
$\beta = 124.74°$ Z = 2

X-ray Powder Pattern: Korsnäs mine, Finland.
6.38 (100), 3.13 (80), 2.670 (70), 4.08 (60), 3.24 (60), 3.17 (60), 2.730 (60)

(1) St. Andreasberg, Germany. (2) Strontian, Scotland. (3) $BaSi_6Al_2O_{16}\cdot 6H_2O$.

Mineral Group: Zeolite group.

Occurrence: Of hydrothermal origin, in cavities in basalts, phonolites, trachytes; in gneisses, and in some ore veins.

Association: Zeolites, calcite, leucite, hyalophane, strontianite, quartz, kaolinite, barite, pyrite, sphalerite, galena.

Distribution: Many occurrences; some for well-studied material follow. In Germany, from St. Andreasberg, Harz Mountains; at Idar-Oberstein, Rhineland-Palatinate; and on the Silberberg, near Bodenmais, Bavaria. At Příbram, Czech Republic. From Sarrabus, Sardinia, Italy. Fine crystals from Strontian, Argyllshire, Scotland. From Kongsberg, Norway. At Kupferberg-Rudelstadt, Silesia, Poland. In the Korsnäs lead mine, south of Vaasa, Finland. In Russia, large crystals at Bukan, in the Kotuy River basin, Taimyr. In the USA, from Glen Riddle, Delaware Co., Pennsylvania; at Sing Sing, near Ossining, Westchester Co., New York. In the Beaver mine, Thunder Bay district, Ontario, Canada. At Batopilas, Chihuahua, Mexico.

Name: From the Greek *harmos*, for *a joint*, and *tome*, for *a cutting*, as the twinned crystals may be divided.

Type Material: Natural History Museum, Paris, France.

Harrisonite $Ca(Fe^{2+},Mg)_6(SiO_4)_2(PO_4)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. In anhedral grains, to 2 mm; as rims on fluorapatite.

Physical Properties: *Cleavage:* Observed, very poor. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = < 5 D(meas.) = 4.02(3) D(calc.) = 4.01

Optical Properties: Translucent to transparent on thin edges. *Color:* Yellow-brown to orange-brown; pale yellow in thin section. *Streak:* Pale yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (–); slightly biaxial due to strain. *Pleochroism:* Slight, in shades of pale yellow. $\omega = 1.770(5)$ $\epsilon = 1.759(3)$ 2V(meas.) = ∼5°

Cell Data: *Space Group:* $R\overline{3}m$. $a = 6.248(1)$ $c = 26.802(7)$ Z = 3

X-ray Powder Pattern: Arcedeckne Island, Canada.
3.119 (100), 2.558 (100), 2.689 (80), 2.505 (80), 1.560 (80), 5.00 (60), 1.903 (60)

Chemistry:

	(1)
SiO_2	15.99
FeO	52.27
MnO	0.11
MgO	3.89
CaO	7.65
P_2O_5	19.18
Total	99.09

(1) Arcedeckne Island, Canada; by electron microprobe, average of four analyses, Ti, Al, Cr, Na, K, Cl, F absent; corresponds to $Ca_{1.01}(Fe_{5.36}Mg_{0.71}Mn_{0.01})_{\Sigma=6.08}(Si_{0.98}O_4)_2(P_{0.99}O_4)_2$.

Occurrence: A minor but wide-spread constituent in a layered iron silicate-quartz-apatite body in gneisses, probably a shaly and phosphatic iron formation metamorphosed to the granulite facies.

Association: Fluorapatite, quartz, fayalite, ferrosilite, almandine, ilmenite, biotite, zircon, monazite-(Ce).

Distribution: From Arcedeckne Island, near the Boothia Peninsula, District of Franklin, Arctic Canada.

Name: To honor Dr. James Merritt Harrison (1915–1990), former Director of the Canadian Geological Survey.

Type Material: Canadian Geological Survey, Ottawa, 66402; Canadian Museum of Nature, Ottawa, Canada, 59685.

(1) Harstigen mine, Sweden; corresponds to $Ca_{5.88}(Mn_{0.86}Mg_{0.20})_{\Sigma=1.06}Be_{4.00}Si_{5.80}O_{21.34}(OH)_{2.40}$.

Occurrence: A rare mineral found in open fissures in a metamorphosed manganese deposit.

Association: Hausmannite, dolomite, calcite, rhodonite, andradite, manganoan humite, barite.

Distribution: At the Harstigen mine, near Persberg, Värmland, Sweden.

Name: For the Harstigen mine, Sweden, where it was found.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

C	87.47	87.45	87.51
H	12.05	12.55	12.49
Total	99.52	100.00	100.00

(1) Oberhart, Austria. (2) Bílina mine, Czech Republic. (3) $C_{20}H_{34}$, (+)-phyllocladane.

Occurrence: Rare, in lignite seams and fractures in fossil coalified and silicified tree trunks. Typically obtained by leaching lignite with organic solvents and reprecipitation.

Association: Siderite, "limonite" (Bílina mine, Czech Republic).

Distribution: In Austria, from Oberhart, near Gloggnitz, Lower Austria; at Rosenthal and Oberdorf, near Köflach, and from Göriach, near Turnau, Styria. In Italy, at Terni, Umbria, and from Castelnuovo di Valdarno, near Florence, Tuscany. In the Bílina coal mine, at the former village of Liptice, northwest of Bílina, and at the former village of Jenišův Újezd, west of Bílina, Czech Republic.

Name: For its discovery locality, Oberhart, Austria.

Type Material: Krahuletz Museum, Eggenburg, Austria.

Hashemite $Ba(Cr,S)O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As stubby doubly-terminated to tabular crystals, to 1 mm, showing {100}, {110}, {010}, {001}, and a number of other forms.

Physical Properties: *Cleavage:* {001}, perfect; {010}, {100}, good. Hardness = 3.5 D(meas.) = 4.54–4.59 D(calc.) = 4.46–4.52

Optical Properties: Semitransparent. *Color:* Brown, crystals typically zoned from pale yellowish brown to darker greenish brown in the core. *Luster:* Adamantine.
Optical Class: Biaxial (+). *Dispersion:* $r < v$, extreme. $\alpha = 1.810–1.952$ $\beta = 1.813–1.960$ $\gamma = 1.824–1.977$ 2V(meas.) = 35°–57° 2V(calc.) = 55°–69°

Cell Data: *Space Group: Pnma.* $a = 9.1028(14)$ $b = 5.5276(7)$ $c = 7.3314(11)$ $Z = 4$

X-ray Powder Pattern: Jordan.
3.516 (100), 3.171 (80), 3.669 (60), 2.175 (45), 2.150 (45), 2.770 (40), 3.403 (35)

Chemistry:

	(1)	(2)
SO_3	2.18	11.75
CrO_3	37.0	26.15
BaO	60.8	62.55
Total	99.98	100.45

(1) Jordan; by electron microprobe, average of five analyses of dark crystals; corresponding to $Ba_{1.00}(Cr_{0.93}S_{0.07})_{\Sigma=1.00}O_4$. (2) Jordan; by electron microprobe, average of four analyses of pale crystals; corresponding to $Ba_{1.00}(Cr_{0.64}S_{0.36})_{\Sigma=1.00}O_4$.

Mineral Group: Barite group.

Occurrence: Disseminated in veinlets cutting phosphate carbonate rock, the stratigraphic correlative of the Mottled Zone of the Hatrurim Formation, Israel.

Association: Chromian ettringite, apatite, bultfonteinite, calcite.

Distribution: From stone quarries 60 km southeast of Amman, west-central Jordan.

Name: Honors the Hashemite Kingdom of Jordan, within which the species occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, 146183.

(1) Wolfe Belt, Kargus Ridge, Lyndoch, Ontario, Canada; original total given as 99.53%, corresponds to $(Ca_{1.74}Na_{0.95}K_{0.30})_{\Sigma=2.99}(Fe^{2+}_{2.17}Mg_{1.17}Fe^{3+}_{0.79}Al_{0.58}Ti_{0.39}Mn_{0.04})_{\Sigma=5.14}(Si_{5.27}Al_{2.73})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Hastings Co., Ontario, Canada; by electron microprobe, corresponds to $(Ca_{1.56}Na_{1.01}K_{0.45})_{\Sigma=3.02}(Fe^{2+}_{2.71}Fe^{3+}_{0.94}Al_{0.53}Mg_{0.52}Ti_{0.12}Mn_{0.09})_{\Sigma=4.91}(Si_{5.93}Al_{2.07})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesio-hastingsite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.30$; $Fe^{3+} > Al^{vi}$; $(Na + K)_A \geq 0.5$; $(Ca + Na)_B \geq 1.34$; $Na_B < 0.67$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: In nepheline syenite and granite; in schists, gneisses, tactites, and amphibolites.

Association: Scapolite, apatite, magnetite, spinel (gneiss); garnet, epidote, hedenbergite, quartz (tactite).

Distribution: Analyzed material from many localities worldwide. In Canada, at Bancroft, and elsewhere in Hastings Co., Ontario; near Crescent Lake, Cassiar Mountains, Yukon Territory. In the USA, at Franklin, Sussex Co., New Jersey; Cornwall, Orange Co., New York; and Iron Hill, Gunnison Co., Colorado. From Koraput, Orissa, and elsewhere in India. In the Sampo mine, Okayama Prefecture, and the Obira mine, Bungo, Oita Prefecture, Japan. From Kakanui, New Zealand. In the Marangudzi ring complex, Zimbabwe. At Almunge, Sweden.

Name: For a locality in Hastings Co., Ontario, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M13724.

Hatrurite Ca_3SiO_5

©2001 Mineral Data Publishing, version 1.2

Crystal Data: n.d. *Point Group:* n.d. Crystals pseudohexagonal, to about 50 μ.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Light gray; colorless in thin section. *Optical Class:* Biaxial (–). n = n.d.; birefringence ~0.006 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Hatrurim Formation, Israel; stronger lines overlapped by larnite. 3.03 (m), 1.767 (mw), 2.96 (vw), 1.759 (vw), 1.484 (vw), 1.452 (vw)

Chemistry:

	(1)
SiO_2	26.1
TiO_2	0.3
Al_2O_3	0.4
Fe_2O_3	0.2
MgO	trace
CaO	72.8
Total	99.8

(1) Hatrurim Formation, Israel; by electron microprobe, corresponds to $Ca_{2.97}Al_{0.01}Ti_{0.01}SiO_5$.

Occurrence: In a high-temperature contact metamorphic assemblage in a larnite-brownmillerite-mayenite rock, probably derived from fine-grained sediments.

Association: Nagelschmidtite, larnite, brownmillerite, mayenite.

Distribution: In the Hatrurim Formation, Israel.

Name: For the Hatrurim Formation in Israel.

Type Material: n.d.

References: (1) Gross, S. (1977) The mineralogy of the Hatrurim Formation, Israel. Geol. Sur. Israel Bull. 70, 35–36. (2) (1978) Amer. Mineral., 63, 425–427 (abs. ref. 1).

Hauckite $(Mg, Mn^{2+})_{24}Zn_{18}Fe_3^{3+}(SO_4)_4(CO_3)_2(OH)_{81}(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As hexagonal crystals, extremely flattened on {0001}, with $\{01\bar{1}0\}$ and {0001}, to 1 mm; as almost spherical to imperfect rosettes.

Physical Properties: *Cleavage:* On {0001}, perfect. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 3.02, thought low due to adhering air bubbles. D(calc.) = 3.10

Optical Properties: Semitransparent. *Color:* Bright orange to pale yellow. *Streak:* Yellow to pale yellow. *Luster:* Vitreous to slightly pearly.
Optical Class: Uniaxial (+). *Pleochroism:* O = golden brown; E = pale yellow.
Absorption: $O > E$. $\omega = 1.630(2)$ $\epsilon = 1.638(2)$

Cell Data: *Space Group:* $6/mmm$ (Laue symmetry). $a = 9.17(4)$ $c = 30.21(9)$ Z = [1]

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
3.96 (100), 7.8 (90), 4.57 (60), 3.02 (60), 5.02 (50), 3.78 (50), 1.748 (30)

Chemistry:

	(1)
SO_3	7.4
CO_2	[2.1]
Al_2O_3	0.5
Fe_2O_3	6.0
MnO	17.1
ZnO	36.0
MgO	13.2
H_2O	[17.7]
Total	[100.0]

(1) Sterling Hill, New Jersey, USA; by electron microprobe, total Fe as Fe_2O_3, confirmed by microchemical test, total Mn as MnO, CO_2 and H_2O calculated for stoichiometry; corresponds to $(Mg_{13.5}Mn_{9.9}Fe^{2+}_{0.5}Zn_{0.2})_{\Sigma=24.1}Zn_{18.0}(Fe^{3+}_{2.6}Al_{0.4})_{\Sigma=3.0}(SO_4)_{3.8}(CO_3)_{2.0}(OH)_{80.8}$.

Occurrence: Very rare, found in several different parageneses in a metamorphosed stratiform zinc orebody.

Association: Mooreite, phlogopite, calcite; sussexite, pyrochroite, zincite; chlorophoenicite, calcite;

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: To honor Richard Philip Hauck (1935–), mineral collector of Bloomfield, New Jersey, USA, for his contributions to preserving scientifically significant specimens from Franklin and Sterling Hill, New Jersey, USA.

Type Material: Royal Ontario Museum, Toronto, Canada, M35860; American Museum of Natural History, New York City, New York, T45495; Harvard University, Cambridge, Massachusetts, 126591; National Museum of Natural History, Washington, D.C., USA, 142854, 164107.

(1–2) Raddusa, Sicily, Italy. (3) MnS_2.

Mineral Group: Pyrite group.

Occurrence: A low-temperature mineral commonly associated with solfataric waters, in clay deposits rich in sulfur, and from decomposed extrusive rocks.

Association: Sulfur, realgar, gypsum, calcite.

Distribution: From Slovakia, at Kalinka, near Banská Bystrica (Neusohl) [TL], and at Banská Štiavnica (Schemnitz). From Jeziorko and Grzybow, and in the Machow mine, Tarnobrzeg, Poland. In good crystals at the Destricella mine, Raddusa, Sicily, Italy. At the Ronneberg uranium deposit, Gera district, Thuringia, Germany. From the Yazovsk and Podgornensk deposits, Aktyubinsk, Ural Mountains, Russia. In the Lake Wakatipu district, and at Collingwood, New Zealand. In the USA, from Texas, at the Gulf and Big Hill salt domes, Matagorda Co.; the High Island salt dome, Galveston Co.; the Boling salt dome, Wharton Co.; and the Fannett salt dome, Jefferson Co.

Name: In honor of Joseph Ritter von Hauer (1778–1863), and his son Franz Ritter von Hauer (1822–1899), Austrian geologists.

Type Material: Natural History Museum, Vienna, Austria, A.h.894.

Hausmannite $Mn^{2+}Mn_2^{3+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m2/m2/m$. Crystals are pseudo-octahedral and striated ‖ [100], to 7.5 cm. Commonly granular or massive. *Twinning:* Repeated twins on {112}, producing fivelings or lamellar intergrowths.

Physical Properties: *Cleavage:* {001}, perfect; {112} and {011}, indistinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5 VHN = 437–572 (100 g load). D(meas.) = 4.84 D(calc.) = 4.84

Optical Properties: Opaque, transparent through thin edges. *Color:* Dark brown to black; deep reddish brown in transmitted light; gray in reflected light, with deep blood-red to reddish brown internal reflections. *Streak:* Dark reddish brown. *Luster:* Submetallic. *Optical Class:* Uniaxial (–). $\omega = 2.46(2)$ $\epsilon = 2.15(2)$ *Anisotropism:* Distinct. *Bireflectance:* Weak; O = light gray; E = dark gray. R_1–R_2: (400) 21.5–18.8, (420) 21.2–18.4, (440) 20.9–17.9, (460) 20.7–17.5, (480) 20.5–17.2, (500) 20.4–17.0, (520) 20.4–16.7, (540) 20.3–16.4, (560) 20.1–16.1, (580) 20.1–15.9, (600) 20.0–15.7, (620) 19.9–15.5, (640) 19.9–15.4, (660) 19.8–15.2, (680) 19.8–15.1, (700) 19.7–14.9

Cell Data: *Space Group: $I4_1/amd$.* $a = 5.765(1)$ $c = 9.442(2)$ $Z = 4$

X-ray Powder Pattern: Synthetic. 2.487 (100), 2.768 (85), 1.5443 (50), 3.089 (40), 4.924 (30), 1.7988 (25), 1.5762 (25)

(1) Batesville, Arkansas, USA. (2) $Mn^{2+}Mn_2^{3+}O_4$.

Occurrence: A primary mineral in hydrothermal veins. Also produced by metamorphism of manganiferous rocks.

Association: Rhodochrosite, pyrolusite, jacobsite, braunite, andradite, barite.

Distribution: Many localities, some economically important. In Germany, at Ilfeld, Harz Mountains; at Friedrichroda, Elgersburg, and Öhrenstock, near Ilmenau, Thuringia. From Långban, Jakobsberg, and the Harstigen mine, near Persberg, Värmland, and the Sjö mine, near Grythyttan, Örebro, Sweden. At the Tŷ Coch mine, Glamorgan, Wales. In the Wyndham Pit, near Egremont, Cumbria, England. In the USA, in Washington, on the Olympic Peninsula, abundant at a number of small deposits in Clallam, Jefferson, and Mason Cos.; in the Blue Jay mine, Trinity Co., California; from the Batesville district, Independence, Izard, and Stone Cos., Arkansas; in the Cannon mine, Stambaugh, Iron Co., Michigan. At the Magnet Cove mine, Hants, Nova Scotia, Canada. As fine crystals from the Miguel Burnier iron mine, near Ouro Prêto, Minas Gerais, Brazil. At the Iron Monarch quarry, Iron Knob, South Australia. Large crystals from the N'Chwaning mine, near Kuruman, Cape Province, South Africa. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: Honors Johan Friedrich Ludwig Hausmann (1782–1859), Professor of Mineralogy, University of Göttingen, Göttingen, Germany.

Haüyne $\mathbf{(Na,Ca)_{4-8}Al_6Si_6(O,S)_{24}(SO_4,Cl)_{1-2}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals dodecahedra or pseudo-octahedra, to 3 cm; in rounded grains. *Twinning:* On {111}, common, rarely as penetration twins; also as polysynthetic or contact twins.

Physical Properties: *Cleavage:* {110}, distinct. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.44–2.50 D(calc.) = n.d. May show reddish orange to purplish pink fluorescence under LW UV.

Optical Properties: Transparent to translucent. *Color:* Bright blue to greenish blue; white or shades of black, gray, brown, green, yellow, red, may be patchy; colorless or pale blue in thin section. *Streak:* Slightly bluish to colorless. *Luster:* Vitreous to greasy.
Optical Class: Isotropic; weakly birefringent when included. $n = 1.494–1.509$

Cell Data: *Space Group:* $P\bar{4}3n$. $a = 9.08–9.13$ $Z = 1$

X-ray Powder Pattern: Niedermendig, Germany.
3.72 (100), 2.623 (25), 6.47 (16), 2.873 (14), 2.141 (14), 1.781 (10), 2.428 (8)

(1) Monte Vulture, Italy; corresponds to $(Na_{3.55}Ca_{1.80}K_{1.22}Mg_{0.13})_{\Sigma=6.70}Al_{5.89}Fe_{0.11}Si_{6.00}O_{24}[(SO_4)_{1.33}Cl_{0.22}]_{\Sigma=1.55}$. (2) Anguillara, Italy; by electron microprobe, corresponds to $(Na_{4.76}Ca_{2.26}K_{0.90}Mg_{0.45})_{\Sigma=8.37}Al_{6.46}Fe_{0.01}Si_{5.53}O_{24}(SO_4)_{1.86}$.

Mineral Group: Sodalite group.

Occurrence: In phonolites and related leucite- or nepheline-rich igneous rocks; less commonly in nepheline-free extrusives.

Association: Nepheline, leucite, titanian andradite, melilite, augite, sanidine, biotite, phlogopite, apatite.

Distribution: In Italy, in Lazio, at many localities in the Alban Hills, as at Ariccia, Marino, Sacrofano, and Campagnaro; on Monte Somma, and near Melfi, on Monte Vulture, Campania; in the Pitigliano quarry, near Grosseto, Tuscany. From Mendig, Mayen, and elsewhere in the Eifel district, Germany. In the USA, from Winnett, Petroleum Co., Montana, and in the Edwards mine, St. Lawrence Co., New York. In the Niangniang Shan complex, Nanjing, Jiangsu Province, China. On the smaller island of Taiarupu, Tahiti. A few other localities are known.

Name: To honor Abbé René Just Haüy (1743–1822), French crystallographer and mineralogist.

Hawleyite CdS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Very fine-grained powdery coatings.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 4.87

Optical Properties: Opaque to subtranslucent. *Color:* Bright yellow.
R: n.d.

Cell Data: *Space Group:* $F\overline{4}3m$. $a = 5.818$ $Z = 4$

X-ray Powder Pattern: Hector-Calumet mine, Galena Hill, Canada.
3.36 (100), 2.058 (80), 1.753 (60), 2.90 (40), 1.337 (30), 1.186 (30), 1.120 (30)

Chemistry: Composition established by semiquantitative spectroscopic analysis.

Polymorphism & Series: Dimorphous with greenockite.

Mineral Group: Sphalerite group.

Occurrence: As coatings on fine-grained sphalerite and siderite in vugs; probably of secondary origin, deposited from meteoric waters in vugs and along late fractures.

Association: Sphalerite, siderite, greenockite.

Distribution: In Canada, in the Hector-Calumet mine, Keno-Galena Hill area, Yukon Territory [TL], and in the Strathcona mine, Sudbury, Ontario. In the USA, near Hanover, Grant Co., New Mexico; at the Crestmore quarry, Riverside Co., California; from near Bethel Church, Pike Co., Indiana; and at Franklin, Sussex Co., New Jersey. From near Komna, Czech Republic. In the Los Blancos mine, Sierra de Cartagena, Murcia Province, Spain. From Ragada, Greece. At Tynagh, near Killimor, Co. Galway, Ireland. In the Fall Hill quarry, Ashover, Derbyshire, England. From the Noril'sk region, western Siberia, Russia. In the Coquimbana mine, Cerro Blanco district, Chile. From the Tui mine, Mt. Te Aroha, New Zealand. In the Kolar Gold Fields, Karnataka, India. Likely yet to be discovered at additional localities, as easily mistaken for greenockite.

Name: To honor Professor James Edwin Hawley (1897–1965), Canadian mineralogist, Queen's University, Kingston, Ontario, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 12164; Harvard University, Cambridge, Massachusetts, USA, 123839.

Hawthorneite $Ba(Cr_4Ti_3Fe^{2+}_2Fe^{3+}_2Mg)O_{19}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m2/m2/m$. As grains, to 100 μm, surrounded by lindsleyite, oriented in spinel.

Physical Properties: Hardness = ∼5.8 VHN = 772–835, 801 average (100 g load). D(meas.) = n.d. D(calc.) = 5.02

Optical Properties: Opaque. *Color:* [Black or brown]; light gray in reflected light. *Optical Class:* Uniaxial (–). *Dispersion:* $r < v$. *Anisotropism:* Weak to moderate; in browns and grays. *Bireflectance:* Weak to moderate.
R_1–R_2: (400) 19.5–18.1, (420) 19.1–17.8, (440) 18.8–17.5, (460) 18.4–17.2, (480) 18.1–17.0, (500) 17.9–16.8, (520) 17.7–16.6, (540) 17.6–16.5, (560) 17.4–16.4, (580) 17.3–16.3, (600) 17.2–16.2, (620) 17.2–16.2, (640) 17.1–16.1, (660) 17.0–16.0, (680) 17.0–16.0, (700) 16.9–15.9

Cell Data: *Space Group:* $P6_3/mmc$. $a = 5.871(2)$ $c = 23.06(2)$ $Z = 2$

X-ray Powder Pattern: Calculated.

		Total	99.30

(1) Bultfontein mine, South Africa; by electron microprobe, average of 11 analyses, Fe^{2+}:Fe^{3+} calculated from charge balance; corresponds to $(Ba_{0.85}K_{0.12})_{\Sigma=0.97}(Cr_{4.68}Ti_{3.02}Fe^{2+}_{2.02}Fe^{3+}_{1.47}Mg_{0.80}Mn_{0.02}Nb_{0.01})_{\Sigma=12.02}O_{19}$.

Mineral Group: Magnetoplumbite group.

Occurrence: Formed during upper-mantle (75–100 km, 900–1100 °C, 20–30 kbar) metasomatism of chromian spinel in peridotite xenoliths in a kimberlite pipe.

Association: Olivine, enstatite, phlogopite, potassian richterite, diopside, magnesian chromian spinel, lindsleyite, mathiasite, niobian chromian rutile, magnesian chromian ilmenite.

Distribution: From the Bultfontein diamond mine, Kimberley, Cape Province, South Africa.

Name: For John Barry Hawthorne (1934–), formerly Chief Geologist (Diamonds), DeBeers Consolidated Mines, South Africa, in honor of his contributions to studies of the upper mantle.

Type Material: The Natural History Museum, London, England, 1988,71.

Haxonite $(Fe, Ni)_{23}C_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* n.d. As spiky plates and irregular patches, to 1 mm; in intricate intergrowths with taenite, schreibersite, and kamacite.

Physical Properties: Hardness = n.d. VHN = 850(50) D(meas.) = n.d. D(calc.) = 7.70
Strongly magnetic.

Optical Properties: Opaque. *Color:* Brilliant white; dark gray under reflected light.
Optical Class: Isotropic.
R: n.d.

Cell Data: *Space Group:* n.d. $a = 10.55$ Z = [4] (by analogy to $Mn_{23}C_6$ and $Cr_{23}C_6$).

X-ray Powder Pattern: Toluca meteorite.
2.356 (s), 2.151 (s), 1.863 (m), 1.242 (m), 1.755 (m/w), 1.218 (m/w), 1.060 (m/w)

Chemistry:

	(1)
Fe	89.5
Co	0.18
Ni	4.91
C	[5.4]
Total	[100.0]

(1) Canyon Diablo meteorite; by electron microprobe, C by difference, Cr and Cu each less than 0.05%.

Occurrence: In iron meteorites and carbonaceous chondrites.

Association: Kamacite, taenite, schreibersite, cohenite, pentlandite, magnetite.

Distribution: From the Toluca, Canyon Diablo, Edmonton (Kentucky), Tazewell, and many other iron meteorites, characteristic of group I and group IIIC-IIID; and in the Allan Hills carbonaceous chondrite ALHA 77307.

Name: Honors H.J. Axon, metallurgist at the University of Manchester, Manchester, England.

Type Material: n.d.

Haycockite $Cu_4Fe_5S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222. Observed in polished section as tiny grains, to about 500 μm. *Twinning:* On {103}, polysynthetic, may be visible in polished section.

Physical Properties: Hardness = n.d. VHN = 206–231 (100 g load). D(meas.) = n.d. D(calc.) = 4.33

Optical Properties: Opaque. *Color:* Brass-yellow, much like chalcopyrite; does not tarnish easily. *Anisotropism:* Weak to moderate.
R_1–R_2: (400) 13.9–13.5, (420) 15.5–15.9, (440) 18.3–19.4, (460) 21.7–23.2, (480) 25.1–26.8, (500) 28.2–29.9, (520) 31.0–32.5, (540) 33.3–34.5, (560) 35.1–36.1, (580) 36.6–37.3, (600) 37.8–38.3, (620) 38.6–38.9, (640) 39.2–39.4, (660) 39.6–39.6, (680) 39.8–39.7, (700) 40.0–39.8

Cell Data: *Space Group:* $P222$, $P222_1$, $P2_12_12$, or $P2_12_12_1$. $a = 10.705(5)$ $b = 10.734(5)$ $c = 31.630(15)$ $Z = 12$

X-ray Powder Pattern: Mooihoek mine, South Africa.
3.07 (100), 1.876 (80), 1.889 (60), 1.612 (60), 1.089 (60), 0.937 (60), 1.214 (50)

Chemistry:

	(1)	(2)	(3)
Cu	32.16	31.26	32.18
Fe	35.03	36.12	35.35
Ni	0.40	0.23	
S	32.41	32.86	32.47
Total	100.14	100.46	100.00

(1) Mooihoek mine, South Africa; by electron microprobe, average of fifteen analyses, leading to $Cu_{1.00}Fe_{1.24}Ni_{0.01}S_{2.00}$. (2) Minnesota, USA; by electron microprobe, average of four analyses. (3) $Cu_4Fe_5S_8$.

Occurrence: In a hortonolite dunite (replacement) pegmatite in the Bushveld complex (Mooihoek mine, South Africa).

Association: Mooihoekite, copper, troilite, pentlandite, cubanite, magnetite (Minnesota, USA).

Distribution: In South Africa, in the Bushveld complex, Transvaal, from the Mooihoek mine, Lydenburg district [TL], and in the Townlands ultramafic pipe, Rustenburg. At Krzemianka, Poland. From the Talnakh area, Noril'sk region, western Siberia, Russia. In the USA, in the basal Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota. From near Madera, Sonora, Mexico.

Name: To honor Maurice Hall Haycock (1900–?), former Head, Mineralogy Section, Mineral Sciences Division, Department of Energy, Mines, and Resources, Mines Branch, Ottawa, Canada.

Type Material: Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada, M30992; Princeton University, Princeton, New Jersey; National Museum of Natural History, Washington, D.C., USA, 124965; Heidelberg University, Heidelberg, Germany.

Total	100.72	100.00

(1) Haydee mine, Atacama Desert, northern Chile; average of 10 electron microprobe and combustion element analyzer analyses, corresponding to $Cu_{2.95}Mg_{0.95}H_{6.30}Cl_{1.92}O_{6.08}$.
(2) $Cu_3Mg(OH)_6Cl_2$.

Distribution: Haydee mine, western border of the southern end of Salar Grande, 110 km SE of Iquique, Atacama Desert, Tarapacá Province, northern Chile.

Name: For the Haydee mine, where the first specimens were collected.

Type Material: Mineralogical Museum, University of Hamburg, Germany.

References: (1) Schlüter, J. and T. Malcherek (2007) Haydeeite, $Cu_3Mg(OH)_6Cl_2$, a new mineral from the Haydee mine, Salar Grande, Atacama desert, Chile. Neus Jb. Mineral. Abh., 184, 39–43. (3) (2008) Amer. Mineral., 93, 1942-1943 (abs. ref. 1).

Haynesite $(UO_2)_3(Se^{4+}O_3)_2(OH)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Crystals are bladed, flattened on {010} and elongated along [001], to 3 mm; as divergent sprays and rosettes.

Physical Properties: *Cleavage:* On {010}, good. Hardness = 1.5–2 D(meas.) = 4.1 D(calc.) = 4.07 Radioactive; fluoresces yellowish green under SW UV.

Optical Properties: Transparent to translucent. *Color:* Amber-yellow; yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; bright yellow to pale yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.618(2)$ $\beta = 1.738(3)$ $\gamma = 1.765(5)$ 2V(meas.) = 45° 2V(calc.) = 48°

Cell Data: *Space Group:* $Pncm$ or $Pnc2$. $a = 8.025(5)$ $b = 17.43(1)$ $c = 6.935(3)$ Z = 2

X-ray Powder Pattern: Repete mine, Utah, USA.
8.01 (100), 2.912 (80), 4.01 (70), 3.119 (70), 3.468 (60), 3.186 (50), 2.471 (40)

Chemistry:

	(1)	(2)
UO_3	71.81	72.22
SeO_2	17.91	18.68
H_2O	8.56	9.10
Total	[98.28]	100.00

(1) Repete mine, Utah, USA; by electron microprobe, average of 12 analyses, C and H by CHN analyzer, recalculated after removal of CaO 0.85% and CO_2 1.51% as calcite; then corresponds to $(UO_2)_{3.08}(SeO_2)_{1.98}(OH)_{2.20} \cdot 4.72H_2O$. (2) $(UO_2)_3(SeO_3)_2(OH)_2 \cdot 5H_2O$.

Occurrence: Rare in an oxidized uranium deposit in mudstones and sandstones.

Association: Andersonite, boltwoodite, ferroselite, gypsum, barite, calcite.

Distribution: From the Repete mine, 34 km southeast of Blanding, San Juan Co., Utah, USA.

Name: Honors Patrick Eugene Haynes (1953-), American geologist, mineral collector and dealer, who found the first specimens.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC3922.

(1) Heazlewood, Tasmania, Australia. (2) Ni_3S_2.

Occurrence: In serpentinized dunites and lherzolites, and in ophiolites, probably of hydrothermal origin; in layered mafic intrusives nd chromitites, where it may be a low-temperature secondary mineral; in mantle xenoliths.

Association: Pentlandite, chalcopyrite, violarite, cubanite, millerite, mackinawite, orcelite, zaratite, shandite, awaruite, platinum group minerals, magnetite, chromite.

Distribution: In Australia, in Tasmania, from the Lord Brassey mine, near Heazlewood [TL], and at Trial Harbour. In the USA, from the Cedar Hill quarry, Lancaster Co., Pennsylvania; in Josephine Co., Oregon; and in California, crystals from the Dorleska mine, Trinity Co. In Canada, at Miles Ridge, Yukon Territory; and in Quebec, from the Marbridge mine, Malartic, La Motte Township; at the Jeffrey mine, Asbestos; and in a prospect pit near Mount Albert, Gaspé Peninsula. In the Kop Krom chrome mine, Kop Mountains, near Aşkale, Turkey. In Iran, at Tschagal, near Rabad Sefid. In Switzerland, from Poschiavo, Graubünden. At Hirt, near Friesach, Carinthia, Austria. From the Agoriani area, Othrys ophiolitic complex, Greece. At Vadu Dobrii, Romania. From Cap Corse, Corsica, France. In the Amianthus mine, Kaapsche Hoop, Barberton, Transvaal, South Africa. From the Ban Phuc deposit, Vietnam. In the Otoigawa district, Niigata Prefecture; from the Kamuikotan zone and the Horoman peridotite, Hokkaido; and elsewhere in Japan. In small amounts from a large number of other localities.

Name: For the locality near Heazlewood, Tasmania, Australia.

Type Material: National Museum of Natural History, Washington, D.C., USA, R641.

Hechtsbergite $Bi_2O(VO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As rounded or etched crystals, dominantly {111}, with {112}, {113}, {$\bar{1}$01}, {$\bar{1}$02}, {$\bar{3}$02}, to 0.2 mm, commonly in aggregates.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4.5 VHN = 320 (15 g load). D(meas.) = n.d. D(calc.) = 6.87

Optical Properties: Transparent to translucent. *Color:* Brown. *Streak:* Yellow. *Luster:* Adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c \simeq 35°$. $\alpha = 2.26(2)$ $\beta = [2.27]$ $\gamma = 2.30(2)$ 2V(meas.) = 50(5)°

Cell Data: *Space Group:* $P2_1/c$. $a = 6.791(1)$ $b = 7.535(1)$ $c = 10.881(1)$ $\beta = 107.00(1)°$ Z = 4

X-ray Powder Pattern: Hechtsberg quarry, Germany.
3.267 (100), 3.150 (63), 4.279 (41), 2.734 (35), 2.036 (29), 2.549 (27), 2.133 (27)

Chemistry:

As_2O_5	0.52	
V_2O_5	15.18	16.07
Bi_2O_3	83.02	82.34
H_2O	[1.59]	1.59
Total	[100.31]	100.00

(1) Hechtsberg quarry, Germany; by electron microprobe, H_2O from theory; corresponds to $Bi_{2.03}O_{1.08}[(VO_4)_{0.95}(AsO_4)_{0.03}]_{\Sigma=0.98}(OH)_{1.01}$. (2) $Bi_2O(VO_4)(OH)$.

Occurrence: In cavities in gneiss.

Association: Bismutite, namibite, eulytite, mixite, beyerite, chrysocolla.

Distribution: In the Hechtsberg quarry, near Hausach, Black Forest, Germany.

Name: For the Hechtsberg quarry, Germany, source of the first specimens.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany.

Hectorfloresite $Na_9(IO_3)(SO_4)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As crystals, to 1.5 mm, prismatic along [010], typically doubly terminated and pseudohexagonal due to cyclic twinning, exhibiting {100}, {212}, {001}. *Twinning:* Multiple contact twins parallel [010], ubiquitous, on twin planes {001}, {601}, and $\{\overline{6}04\}$, giving a pseudohexagonal outline.

Physical Properties: *Cleavage:* Irregular parting $\perp$ and $\parallel$ to elongation.
Fracture: Conchoidal. *Tenacity:* Brittle. Hardness = ∼2 D(meas.) = 2.80(3) D(calc.) = 2.90

Optical Properties: Transparent to translucent. *Color:* White; colorless in transmitted light.
Luster: [Adamantine.]
Optical Class: Biaxial (–). *Dispersion:* $r < v$, barely perceptible. $\alpha = 1.493(2)$ $\beta = 1.521(2)$ $\gamma = 1.523(2)$ 2V(meas.) = 26(2)°

Cell Data: *Space Group:* $P2_1/a$. $a = 18.775(4)$ $b = 6.9356(7)$ $c = 14.239(2)$ $\beta = 108.91(2)°$ Z = 4

X-ray Powder Pattern: Alianza mine, Chile.
3.880 (100), 2.700 (80), 2.788 (30), 1.9420 (20), 4.69 (15), 6.17 (10), 1.6780 (10)

Chemistry:

	(1)	(2)

SO_3	42.3	41.80
Na_2O	34.5	36.41
Total	100.0	100.00

(1) Alianza mine, Chile; by electron microprobe, average of eight analyses, presence of $(IO_3)^{1-}$ and $(SO_4)^{2-}$ confirmed by IR. (2) $Na_9(IO_3)(SO_4)_4$.

Occurrence: In dessication cavities in a nitrate deposit; may be more widespread than this single locality indicates.

Association: Glauberite, nitratine, blödite, darapskite, halite.

Distribution: From the Alianza nitrate mine, Oficina Victoria, Tarapacá, Chile.

Name: Honors Professor Hector Flores W. (1906–1984), Chilean economic geologist and teacher, University of Chile, Santiago, Chile.

Type Material: National Museum of Natural History, Washington, D.C., USA.

References: (1) Ericksen, G.E., H.T. Evans, Jr., M.E. Mrose, J.J. McGee, J.W. Marinenko, and J.A. Konnert (1989) Mineralogical studies of the nitrate deposits of Chile: VI. Hectorfloresite, $Na_9(IO_3)(SO_4)_4$, a new saline mineral. Amer. Mineral., 74, 1207–1214.

Hectorite $Na_{0.3}(Mg, Li)_3Si_4O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As thin laths, to 2 μm, and as aggregates of such laths.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. Hardness = 1–2 D(meas.) = ~2.3 D(calc.) = n.d. Swells on addition of H_2O. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent, transparent in thin section. *Color:* White, cream, pale brown, mottled. *Luster:* Earthy to waxy, dull.
Optical Class: Biaxial (–). α = ~1.49 β = 1.50 γ = 1.52 2V(meas.) = Small.

Cell Data: *Space Group:* $C2/m$. a = 5.2 b = 9.16 c = 16.0 β = ~ 99° Z = n.d.

X-ray Powder Pattern: Hector, California, USA; spacings variable by humidity, intensities variable by orientation.

(1) Hector, California, USA; corresponds to $(Na_{0.42}Ca_{0.04}K_{0.01})_{\Sigma=0.47}(Mg_{2.73}Li_{0.33})_{\Sigma=3.06}(Si_{3.89}Al_{0.05})_{\Sigma=3.94}O_{10}(OH)_2$. (2) Do.; corresponds to $(Na_{0.42}K_{0.02}Ca_{0.01})_{\Sigma=0.45}(Mg_{2.78}Li_{0.36})_{\Sigma=3.14}(Si_{3.89}Al_{0.01})_{\Sigma=3.90}O_{10}(OH)_2 \cdot 0.35H_2O$.

Mineral Group: Smectite group.

Occurrence: In a bentonite deposit, altered from clinoptilolite derived from volcanic tuff and ash with a high glass content, related to hot spring activity (Hector, California, USA).

Association: Calcite, clinoptilolite (Hector, California, USA).

Distribution: In the USA, five km south of Hector, San Bernardino Co., California; in the Lyles deposit, 38 km northeast of Hillside, Yavapai Co., Arizona; and at Disaster Peak, in the Montana Mountains, near McDermitt, Disaster district, Humboldt Co., Nevada. From around Puy Chalard, Puy-de-Dôme, France. In the Balıkesir colemanite deposit, Balıkesir Province, Turkey.

Name: For the locality at Hector, California, USA.

Type Material: n.d.

(1) Tignitoio iron deposit, Elba, Italy; corresponds to $(Ca_{0.90}Mg_{0.13})_{\Sigma=1.03}(Fe^{2+}_{0.77}Fe^{3+}_{0.10}Mn_{0.03}Na_{0.03}Al_{0.01}K_{0.01})_{\Sigma=0.95}(Si_{1.98}Al_{0.02})_{\Sigma=2.00}O_6$. (2) Dal'negorsk, Russia; corresponds to $Ca_{1.00}(Fe^{2+}_{0.81}Mn_{0.13}Mg_{0.05}Al_{0.01})_{\Sigma=1.00}(Si_{1.99}Al_{0.01})_{\Sigma=2.00}O_6$. (3) $CaFeSi_2O_6$.

Polymorphism & Series: Forms two series, with diopside, and with johannsenite.

Mineral Group: Pyroxene group.

Occurrence: A common constituent of metamorphosed iron formations or other ferruginous siliceous sediments; common in Fe-Mn skarns. In alkalic granites, syenites, and in xenoliths in kimberlite.

Association: Grunerite (iron formations); arfvedsonite, quartz, fayalite (granites, syenites).

Distribution: A few localities for studied material include: in Sweden, at Nordmark, Värmland, and Yxsjö, Örebro. From Prägraten, Tirol, Austria. At Fürstenberg, Saxony, Germany. From Rio Marina, Elba, Italy. On Seriphos, Greece. In the USA, at Iron Hill, Gunnison Co., Colorado; fine crystals from the Laxey mine, South Mountain, Owyhee Co., Idaho; in the Pima district, Pima Co., and the Westinghouse mine, Santa Cruz Co., Arizona; at Hanover, Grant Co., New Mexico. In the Vesturhorn intrusion, southeast Iceland. Large crystals from Broken Hill, New South Wales, Australia. In the Obira mine, Bungo, Oita Prefecture, Japan. At Tirodi, Madhya Pradesh, and Kacharwali, Nagpur district, Maharashtra, India. Fine crystals from the Skardu area, Pakistan. At Dal'negorsk, Primorskiy Kray, Russia.

Name: To honor the Swedish chemist, M.A. Ludwig Hedenberg, who first described the species.

(1) Good Hope claim, Hedley, Canada; average of two analyses, corresponds to $Bi_{2.19}(Te_{0.80}S_{0.01})_{\Sigma=0.81}$. (2) Millapaya, Bolivia; by electron microprobe, corresponds to $Bi_{2.19}(Te_{0.77}Se_{0.02}S_{0.02})_{\Sigma=0.81}$. (3) Vostok-2 deposit, Russia; by electron microprobe, corresponds to $Bi_{2.12}(Te_{0.82}Se_{0.04})_{\Sigma=0.86}$. (4) Bi_2Te.

Occurrence: Typically a late-stage hydrothermal mineral in quartz veins and massive sulfides associated with skarns and breccias; less commonly in pegmatites.

Association: Bismuth, bismuthinite, tellurobismuthite, tsumoite, joséite, hessite, maldonite, gold, arsenopyrite, pyrrhotite, chalcopyrite, galena, sphalerite, pyrite.

Distribution: In Canada, in British Columbia, from the Good Hope mineral claim, about six km southeast of Hedley, Osoyoos mining division [TL]; also at the Oregon mine, near Hedley; in the Upper Burwash Creek placer, Kluane Lake district, Yukon Territory; from the Bannockburn gold deposit, Eldorado, Ontario. In the McCoy mine, McCoy district, Lander Co., Nevada, USA. From Millapaya, Sorata, La Paz, Bolivia. In the Kumbel' skarn deposit, northern Kyrgyzstan. From Ugat, western Uzbekistan. At the Vostok-2 deposit, Lukkulaisvaara layered intrusion, Karelia, Russia. From the Osikonmaki gold deposit, Rantasalmi, at Ramepuro, and in Fe-Co-Au deposits of the Kuusamo schist belt, Finland. At the Radzimowice and Bardo Slaskie deposits, Silesia, Poland. From the Rifugio Borromeo deposit, Martello Valley, Trentino-Alto Adige, Italy. In the Ortosa Au–Bi–Te deposit, Asturias, Spain. From the Carrock mine, Caldbeck Fells, Cumbria, England. In the Kolar Gold Fields, Karnataka, India. A few other occurrences have been noted.

Name: For the locality being near Hedley, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M37250.

Hedyphane $Pb_3Ca_2(AsO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As dipyramidal, tabular, or prismatic crystals, with $\{10\bar{1}0\}$, $\{10\bar{1}1\}$, $\{0001\}$, several modifying forms, to 3 cm; commonly massive.

Physical Properties: *Cleavage:* On $\{10\bar{1}1\}$, poor. *Fracture:* Subconchoidal. *Tenacity:* Moderately brittle. Hardness = 4.5 D(meas.) = 5.71–5.85 D(calc.) = 5.99 Pale yellow fluorescence in LW UV.

Optical Properties: Translucent. *Color:* Yellow, violet, white, colorless, gray, brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (+). $\omega = 1.948$ $\epsilon = 1.958$

Cell Data: *Space Group:* $P6_3/m$. $a = 10.053$–10.140 $c = 7.185$–7.284 Z = 2

X-ray Powder Pattern: Långban, Sweden.
3.014 (10), 2.929 (8), 1.943 (8), 3.586 (7), 4.135 (5), 8.77 (4), 5.070 (4)

(1) Långban, Sweden; by electron microprobe, corresponding to $Ca_{2.05}(Pb_{2.90}Sr_{0.10})_{\Sigma=3.00}[(AsO_4)_{2.75}(PO_4)_{0.05}]_{\Sigma=2.80}Cl_{1.05}$. (2) Franklin, New Jersey, USA; by electron microprobe. (3) $Pb_3Ca_2(AsO_4)_3Cl$.

Mineral Group: Apatite group.

Occurrence: A rare secondary mineral in metamorphosed manganese deposits (Sweden); in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Barite, barylite, rhodonite, hausmannite, bixbyite, phlogopite, amphibole, calcite (Långban, Sweden); barylite, calcite, copper, rhodonite, barite, manganaxinite, willemite, cahnite (Franklin, New Jersey, USA).

Distribution: In Sweden, from Långban, Nordmark, and the Harstigen mine, near Persberg, Värmland, and the Sjö mine, near Grythyttan, Örebro. At Brandy Gill, Caldbeck Fells, Cumbria, England. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. From Franklin, Sussex Co., New Jersey, and the Balmat #4 mine, Fowler, St. Lawrence Co., New York, USA. In the San Carlos mine, Santa Eulalia, Chihuahua, Mexico. Large crystals from Tsumeb, Namibia. In the Puttapa zinc mine, near Beltana, South Australia.

Name: From the Greek for *beautifully bright*, in allusion to the typical luster of specimens.

Type Material: Mining Academy, Freiberg, Germany, 45154; Harvard University, Cambridge, Massachusetts, USA, 90417.

Ti	28.5	29.5
Fe	25.1	25.1
Cr	2.9	
S	44.9	45.2
Total	101.4	99.8

(1) Bustee meteorite; by electron microprobe, average of analyses of five grains, corresponding to $(Fe^{2+}_{0.99}Cr^{2+}_{0.16})_{\Sigma=1.15}(Ti^{3+}_{1.70}Fe^{2+}_{0.30})_{\Sigma=2.00}S_{4.00}$. (2) Synthetic heideite.

Occurrence: As minute anhedral grains (Bustee meteorite).

Association: Titanian troilite, ferroan alabandite, daubréelite, oldhamite, osbornite, niningerite, forsterite, iron (Bustee meteorite).

Distribution: From the Bustee enstatite achondrite meteorite [TL]. In the Kaidun [??type??ck??] meteorite.

Name: Honors Professor Fritz Heide (1891–1973), meteoriticist of Jena, Germany.

Type Material: n.d. [??where is Bustee??ASU provided samples to NM Inst??]

(1) Near Nordhorn, Germany. (2) $Na_2Ca_3B_5O_8(SO_4)_2(OH)_2Cl$.

Occurrence: Very rare, in a cavity in a marine evaporite deposit.

Association: Glauberite, anhydrite.

Distribution: From Frenswegen, northwest of Nordhorn, Lower Saxony, Germany.

Name: Honors Dr. F. Heidorn, Bentheim, Germany, for his scientific study of the Zechstein deposits.

Type Material: The Natural History Museum, London, England, 1957,370; Harvard University, Cambridge, Massachusetts, USA, 109587.

Heinrichite $Ba(UO_2)_2(AsO_4)_2 \cdot 10-12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As tabular crystals, flattened on {001}, with square to rectangular outline, showing {001}, {100} and {110}, to 2 mm; in scaly aggregates.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {100}. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = n.d. D(calc.) = 3.61 Fluoresces bright green to greenish yellow under SW and LW UV; dehydrates rapidly to metaheinrichite. Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow to greenish yellow; pale yellow to colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–), anomalously biaxial (–). *Pleochroism:* O = pale yellow; E = colorless. *Absorption:* $E < O$. $\omega = 1.605(2)$ $\epsilon = 1.573(2)$ 2V(meas.) = 20°–38°

Cell Data: *Space Group:* n.d. $a = 7.13$ $c = 20.56$ Z = 2

X-ray Powder Pattern: Black Forest, Germany.
3.57 (10), 8.89 (8), 5.03 (8), 3.38 (7), 2.25 (5), 2.11 (5), 2.53 (2)

Chemistry: (1) No chemical analysis has been made; the formula is based on the similarity of its X-ray pattern to that of zeunerite and synthetic $Ba(UO_2)_2(AsO_4)_2 \cdot 10H_2O$, and chemical analyses of metaheinrichite.

Mineral Group: Autunite group.

Occurrence: A secondary mineral in oxidized uranium deposits.

Association: Metaheinrichite, zeunerite, nováčekite, erythrite, pitticite, arseniosiderite, uraninite.

Distribution: From the White King mine, about 22 km northwest of Lakeview, Lake Co., Oregon, USA. In Germany, in the Black Forest, from the Sophia mine and on the Schmiedestollen dump, near Wittichen; at Reinerzau, near Alpirsbach; in the Michael mine, Weiler, near Lahr; near Schramberg and Triberg, Hammereisenbach, Menzenschwand; in the Anton mine, Heubachtal, near Schiltach; and in Bavaria, at Sailauf, northeast of Aschaffenburg. In the Riviéral mine, Lodève, Hérault, France.

Name: Honors Professor Eberhardt William Heinrich (1918–1991), mineralogist, University of Michigan, Ann Arbor, Michigan, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121950.

References: (1) Gross, E.B., A.S. Corey, R.S. Mitchell, and K. Walenta (1958) Heinrichite and metaheinrichite, hydrated barium uranyl arsenate minerals. Amer. Mineral., 43, 1134–1143. (2) Walenta, K. Hejtmanite $Ba(Mn^{2+},Fe^{2+})_2TiO(Si_2O_7)(OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As laths and platy crystals, with dominant {100} and elongated along [001], up to 2 cm, and in groups.

Physical Properties: *Cleavage:* Perfect on {100}; poor parting on {0*kl*}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.97–4.06, average 4.02 D(calc.) = 4.29

Optical Properties: Transparent to translucent. *Color:* Brownish or golden to yellow. *Streak:* Brownish yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = light yellow-green; Y = dark golden yellow; Z = light yellow. *Orientation:* $X = b$; $Y \wedge c = 37.9°$; $Z \wedge a = 15.9°$. *Absorption:* $Y > Z = X$.
$\alpha = 1.814(1)$ $\beta = 1.846(1)$ $\gamma = 1.867(1)$ 2V(meas.) = 76.4° 2V(calc.) = 76.8°

Cell Data: *Space Group:* $P2_1/m$. $a = 11.748(4)$ $b = 13.768(5)$ $c = 10.698(4)$
$\beta = 112.27(2)°$ Z = 8

X-ray Powder Pattern: Mbolwe Hill, Zambia.
2.726 (100), 5.472 (32), 3.241 (21), 3.215 (21), 3.455 (17), 2.180 (16), 3.669 (14)

Chemistry:

CaO	0.00	Total	[98.43]

(1) Mbolwe Hill, Zambia; by electron microprobe, Nb by energy-dispersive analysis, H_2O from stoichiometry; corresponds to $(Ba_{1.04}K_{0.03}Mg_{0.02}Na_{0.01})_{\Sigma=1.10}(Mn_{1.05}Fe_{0.82})_{\Sigma=1.87}(Ti_{0.87}Nb_{0.06})_{\Sigma=0.93}(Si_{2.06}Al_{0.04})_{\Sigma=2.10}O_8[(OH)_{1.09}F_{0.91}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with bafertisite.

Occurrence: In arfvedsonite veins in pegmatite cutting alkalic granite and syenite (Mbolwe Hill, Zambia).

Association: Manganoan arfvedsonite, albite, bastnäsite, chevkinite, manganoan ilmenite, apatite, aegirine (Mbolwe Hill, Zambia).

Distribution: On Mbolwe Hill, Mkushi River area, Central Province, Zambia. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: To honor Dr. Bohuslav Hejtman, Emeritus Professor of Petrology, Charles University, Prague, Czech Republic.

Type Material: Charles University and the National Museum, Prague, Czech Republic.

References: (1) Vrána, S., M. Rieder, and M.E. Gunter (1992) Hejtmanite, a manganese-dominant analogue of bafertisite, a new mineral. Eur. J. Mineral., 4, 35–43. (2) (1992) Amer. Mineral., 77, 1306 (abs. ref. 1).

(1) Kragerö, Norway. (2) Predazzo, Italy; total Fe as Fe_2O_3, B_2O_3 and H_2O from stoichiometry. (3) Evans-Lou quarry, Canada; total Fe as Fe_2O_3.

Occurrence: In granite pegmatite (Kragerö, Norway; Wakefield Lake, Canada).

Association: Tourmaline, thorite, allanite, apatite, phenakite, zircon, titanite (Kragerö, Norway); quartz, chlorite, fergusonite, kainosite-(Y), tengerite, xenotime, wakefieldite, thorogummite (Evans-Lou quarry, Canada); microcline, albite, schorl, monazite, zircon (Crestmore, California, USA).

Distribution: From the Lindvikskollen pegmatite dike, near Kragerö, Norway. At Predazzo, Trentino-Alto Adige; Lago Vico, Viterbo, and near Vetralla, Lazio, Italy. In the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. At Crestmore, Riverside Co., California, USA. In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada.

Name: For geologist Amund Theodor Helland (1846–1918), of Oslo, Norway.

Type Material: n.d.

Hellyerite $NiCO_3 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystal fragments and microcrystalline coatings, to 2 mm. *Twinning:* Fine lamellar twinning parallel to the perfect cleavage.

Physical Properties: *Cleavage:* One perfect direction; two directions, less perfect, at 112° to one another and both approximately perpendicular to the first. Hardness = 2.5 D(meas.) = 1.97 D(calc.) = [1.98]

Optical Properties: Semitransparent. *Color:* Pale blue. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* $X = Y$ = very pale greenish blue; Z = pale greenish blue. $\alpha = 1.455(2)$ $\beta = 1.503(2)$ $\gamma = 1.549(2)$ 2V(meas.) = 85°

Cell Data: *Space Group:* $C2/c$. $a = 10.770$ $b = 7.299$ $c = 18.681$ $\beta = 94.00°$ Z = 8

X-ray Powder Pattern: Lord Brassey mine, Tasmania, Australia.
9.4 (10), 6.06 (10), 3.65 (7), 3.40 (6), 2.38 (5), 3.11 (4), 2.78 (4)

Chemistry:

	(1)	(2)
NiO	32.9	32.93
CO_2	22.8	19.41
H_2O	45.0	47.66
Total	100.7	100.00

(1) Lord Brassey mine, Tasmania, Australia; CO_2 by LOI after H_2O determined by the Penfield method. (2) $NiCO_3 \cdot 6H_2O$.

Occurrence: Very rare, as coatings on shear surfaces in serpentinite.

Association: Zaratite, theophrastite, otwayite.

Distribution: From the Lord Brassey mine, near Heazlewood, Tasmania, Australia.

Name: Honors Henry Hellyer (1791–1832), first Surveyor-General of the Van Diemen's Land Company and explorer of northwestern Tasmania.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 108400.

Helmutwinklerite $PbZn_2(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. As crystals, tabular on {001}, to 5 mm, modified by {100}, {010}, {011}, {101}, {111}, {112}.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4.5 D(meas.) = 5.3(1) D(calc.) = 5.21–5.29

Optical Properties: Translucent to transparent. *Color:* Colorless, light blue, sea-green. *Streak:* White. *Luster:* Vitreous, resinous on fracture surfaces. *Optical Class:* Biaxial (–). *Orientation:* X (11°,-145°); Y (82°,-35°); Z (82°,56°) [with a (90°,90°) and b (90°,0°) using (ϕ,ρ)]. *Dispersion:* $r < v$, distinct. $\alpha = 1.83(2)$ $\beta = [1.87]$ $\gamma = 1.89(2)$ 2V(meas.) = 70(5)° 2V(calc.) = 73°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.606(2)$ $b = 5.610(2)$ $c = 7.617(1)$ $\alpha = 70.19(2)°$ $\beta = 69.91(2)°$ $\gamma = 69.18(2)°$ Z = 1

X-ray Powder Pattern: Tsumeb, Namibia.
2.579 (100), 4.697 (80), 3.075 (75), 3.269 (70), 2.768 (50), 1.735 (50), 6.953 (40)

Total	100.75	[101.31]	100.00

(1) Tsumeb, Namibia; by electron microprobe, average of 10 analyses on two crystals, H_2O by the Karl Fischer method; corresponding to $Pb_{0.90}(Zn_{2.17}Cu_{0.12})_{\Sigma=2.29}(As_{0.96}O_4)_2 \cdot 2.19H_2O$. (2) Do.; by electron microprobe, average of 39 analyses, H_2O calculated from theory; corresponds to $Pb_{0.98}(Zn_{1.85}Cu_{0.13})_{\Sigma=1.98}(AsO_4)_{2.03} \cdot 2.00H_2O$. (3) $PbZn_2(AsO_4)_2 \cdot 2H_2O$.

Mineral Group: Tsumcorite group.

Occurrence: A very rare secondary mineral in corroded tennantite ore from a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Tennantite, willemite, quartz.

Distribution: Found at Tsumeb, Namibia.

Name: Honors Professor Helmut G.F. Winkler (1915–1980), University of Göttingen, Göttingen, Germany, for his contributions to petrology, mineralogy, and crystallography.

Type Material: Göttingen University, Göttingen, Germany.

Helvite $Mn_4^{2+}Be_3(SiO_4)_3S$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As tetrahedra, dodecahedra, and pseudo-octahedral crystals, up to 12 cm; as rounded grains.

Physical Properties: *Cleavage:* Distinct on {111}, {1$\bar{1}$1}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 741–873 D(meas.) = 3.20–3.44 D(calc.) = [3.23] Pyroelectric.

Optical Properties: Translucent. *Color:* Yellow, brown, red, gray-yellow, yellow-green. *Streak:* White. *Luster:* Vitreous to resinous.
Optical Class: Isotropic. n = 1.728–1.749

Cell Data: *Space Group:* $P\bar{4}3n$. a = 8.24–8.29 Z = 2

X-ray Powder Pattern: Butte, Montana, USA.
3.382 (100), 1.955 (80), 2.215 (70), 2.618 (65), 1.692 (65), 1.510 (50), 1.466 (50)

Chemistry:

(1) East Moultan mine, Butte, Montana, USA; by electron microprobe; BeO calculated assuming (Fe^{2+}, Mn, Zn, Mg, Ca):Be = 4:3. (2) Pitkäranta, Finland; by electron microprobe, BeO calculated as in (1). (3) $Mn_4Be_3(SiO_4)_3S$.

Polymorphism & Series: Forms two series, with danalite, and with genthelvite.

Occurrence: May be locally abundant in granites, granite pegmatites, gneisses, and contact zones and skarns.

Association: Garnet, magnetite, fluorite, chlorite, diopside, vesuvianite.

Distribution: From Schwarzenberg and Breitenbrunn, Saxony, Germany. Exceptionally large crystals from Yxsjö, Örebro, Sweden. At Luppikko, Karelia. In Russia, near Miass, Ilmen Mountains, Southern Ural Mountains. From the Inyl'chek Mountains, Tien Shan, southeastern Kyrgyzstan. At Kara-Oba, Kazakhstan. From the Langesundsfjord, at Hørtekollen, and several other localities in Norway. In Finland, at Pitkäranta. In the USA, at Butte, Silver Bow Co., Montana; from Amelia, Amelia Co., Virginia; in the American Tunnel, Silverton, San Juan Co., Colorado; on the east fork of Benedict Creek, Sawtooth Mountains, Boise Co., Idaho; from the Clark vein, Rincon, San Diego Co., California; at Iron Mountain, Sierra Co., New Mexico. In the Hongo mine, Iwate Prefecture; the Oashi mine, Tochigi Prefecture; the Yagisawa mine, Nagano Prefecture; and several other places in Japan. A few additional localities are known.

Name: From the Greek for *sun*, in allusion to its yellow color.

Type Material: Mining Academy, Freiberg, Germany, 22941.

Hematite α–Fe_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}2/m$. Crystals complex rhombohedral, pseudocubic, prismatic, rarely scalenohedral, to 13 cm, with triangular striations on {0001} and {10$\bar{1}$1}; thin tabular, to micaceous or platy, commonly in rosettes; radiating fibrous, reniform, botryoidal or stalactitic masses, columnar; earthy, granular, oolitic, concretionary. *Twinning:* Penetration twins on {0001} or with {10$\bar{1}$0} as composition plane; also lamellar on {10$\bar{1}$1}.

Physical Properties: *Cleavage:* Parting on {0001} and {10$\bar{1}$1} due to twinning. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle; elastic in thin laminae. Hardness = 5–6 VHN = 1000–1100 (100 g load). D(meas.) = 5.26 D(calc.) = 5.255

Optical Properties: Opaque, transparent on thin edges. *Color:* Steel-gray, may have iridescent tarnish, dull to bright red; white to gray-white, with a bluish tint, in reflected light, with deep blood-red internal reflections. *Streak:* Cherry-red or reddish brown. *Luster:* Metallic or submetallic to dull.
Optical Class: Uniaxial (–). *Pleochroism:* O = brownish red; E = yellowish red. *Dispersion:* Very strong. *Absorption:* $O > E$. $\omega = 3.15–3.22$ $\epsilon = 2.87–2.94$ *Anisotropism:* Distinct.
R_1–R_2: (400) 32.0–34.5, (420) 31.0–34.0, (440) 30.0–33.5, (460) 29.1–32.7, (480) 28.4–32.2, (500) 27.8–31.6, (520) 27.2–31.0, (540) 27.0–30.6, (560) 26.8–30.4, (580) 26.4–30.0, (600) 25.5–29.2, (620) 24.8–28.3, (640) 24.1–27.5, (660) 23.5–26.7, (680) 23.1–26.1, (700) 22.8–25.6

X-ray Powder Pattern: Elba, Italy. (ICDD 24-72).
2.703 (100), 2.519 (70), 1.6966 (36), 3.686 (33), 1.8428 (31), 1.4873 (22), 1.4543 (21)

Chemistry:

	(1)		(1)
Fe_2O_3	98.14	FeO	1.29
Mn_2O_3	0.54	MnO	0.38
		Total	100.35

(1) Franklin, Sussex Co., New Jersey, USA.

Polymorphism & Series: Dimorphous with maghemite.

Mineral Group: Hematite group.

Occurrence: An accessory mineral in felsic igneous rocks, a late-stage sublimate in volcanic rocks, and in high-temperature hydrothermal veins. A product of contact metamorphism and in metamorphosed banded iron formations. A common cement in sedimentary rocks and a major constituent in oolitic iron formations. Abundant on weathered iron-bearing minerals.

Association: Ilmenite, rutile, magnetite (metamorphic and igneous); goethite, siderite, lepidocrocite (sedimentary).

Distribution: Widespread. Exceptional crystals from Switzerland, as at Fibbia, St. Gotthard, Uri; Binntal, Valais; Cavradi, Tavetsch, Graübunden; and many other places. At Ocna de Fier (Morávicza; Vaskő), Romania. From Rio Marina, Elba, Italy. At Cleator Moor, Cumbria, England. From Kragerøand Hiassen, Norway. In Brazil, large crystals from Mesa Redonda and Congonhas do Campo, Minas Gerais; at Itabira and in the Brumado mine, Bahia; at Miguel Burnier, Ouro Prêto. From the Kuruman district, Cape Province, South Africa. At Nador, Algeria. In the USA, in the Thomas Range, Juab Co., Utah, and near Quartzsite, La Paz Co., Arizona.

Name: From the Greek for *blood*, in allusion to its color.

(1) Nordmark, Sweden. (2) $Mn_{10}Mg_3Al_2(As^{3+}O_3)(As^{5+}O_4)_2(OH)_{23}$.

Occurrence: In fissures in metamorphosed limestone in metamorphosed Fe–Mn orebodies.

Association: Manganosite, pyrochroite, magnetite, jacobsite, calcite, barite, fluorite.

Distribution: In Sweden, in the Moss mine, Nordmark, and from Långban, Värmland.

Name: From the Greek for *blood*, in allusion to the color.

Type Material: National Museum of Natural History, Washington, D.C., USA, C4228.

Hematophanite $Pb_4Fe_3^{3+}O_8(OH, Cl)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 4*mm*. As tablets, thin ⊥ {001}, to 5 mm, and in lamellar to granular aggregates.

Physical Properties: *Cleavage:* {001}, good; a parting inclined to {001} suspected. Hardness = 2–3 D(meas.) = 7.70 D(calc.) = 8.186

Optical Properties: Opaque, transparent through thin edges. *Color:* Deep reddish brown; blood-red in transmitted light. *Streak:* Orange. *Luster:* Submetallic.
Optical Class: Uniaxial (–); low birefringence.
R_1–R_2: n.d.

Cell Data: *Space Group: P4mm*. $a = 3.92$ $c = 15.31$ $Z = 1$

X-ray Powder Pattern: Långban, Sweden. (ICDD 27-271).
2.76 (100), 2.71 (100), 3.90 (60), 1.590 (60), 3.77 (40), 1.566 (40), 2.24 (35)

Chemistry:

	(1)		(1)
Fe_2O_3	22.01	Na_2O	0.38
$FeTiO_3$	0.20	K_2O	0.17
FeO	0.22	Cl	2.17
MnO	0.29	H_2O^+	0.73
PbO	73.26	$-O = Cl_2$	0.49
MgO	0.06	insol.	0.42
CaO	0.26	Total	99.68

(1) Jakobsberg, Sweden; average of two analyses, corresponding to $(Pb_{3.59}Na_{0.13}Ca_{0.05}K_{0.04})_{\Sigma=3.81}(Fe^{3+}_{3.01}Mn_{0.05}Fe^{2+}_{0.05}Mg_{0.02}Ti_{0.01})_{\Sigma=3.14}O_{8.49}H_{0.88}Cl_{0.67}$.

Occurrence: In a metamorphosed banded Fe–Mn ore deposit in dolostone (Jakobsberg, Sweden).

Association: Plumboferrite, jacobsite, andradite, copper, cuprite, cerussite, calcite (Jakobsberg, Sweden); copper, jacobsite, hematite, damaraite (Kombat mine, Namibia).

Distribution: From Jakobsberg and Långban, Värmland, Sweden. From Reichelsdorf, Hesse, Germany, in slag. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: From the Greek for *blood* and *visible*, presumably for the blood-red color exhibited in transmitted light.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

(1) Florence Lead-Silver mine, Arizona, USA; average of several analyses, corrected for $PbMoO_4$ and $PbCO_3$ impurities, ZnO originally given as 3.93%; recalculated to 100.0%.
(2) $Pb_{10}Zn(CrO_4)_6(SiO_4)_2F_2$.

Polymorphism & Series: Forms a series with iranite.

Occurrence: Formed through oxidation of galena, sphalerite, and pyrite, in the oxide zone of hydrothermal lead-bearing veins.

Association: Cerussite, phoenicochroite, vauquelinite, willemite, wulfenite, galena, sphalerite, pyrite, tennantite, chalcopyrite (Florence Lead-Silver mine, Arizona, USA).

Distribution: From the Florence Lead-Silver mine, Tortilla Mountains, Pinal Co., and the Pack Rat claim, the Moon Anchor mine, and the Potter-Cramer property, Belmont Mountains, Maricopa Co., Arizona; also from near Boulder City, Clark Co., Nevada, USA. In the Seh-Changi mine, near Neyband, Khorassan, Iran.

Name: In allusion to its distinctive *hemihedral* morphology.

Type Material: The Natural History Museum, London, England, 1968,246; University of Arizona, Tucson, Arizona; National Museum of Natural History, Washington, D.C., USA, 141026.

Hemimorphite $Zn_4Si_2O_7(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Commonly crystallized, thin tabular $\perp$ {010}, striated $\parallel$ [001], to 10 cm; doubly-terminated crystals show hemimorphism. Typically in sheaflike or fan-shaped aggregates; stalactitic, mammillary, botryoidal; as compact fibrous and chalky coatings. *Twinning:* On {001}, rare, with antilogous poles in contact.

Physical Properties: *Cleavage:* Perfect on {110}, poor on {101}; {001}, rare. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 3.475 D(calc.) = 3.484 Strongly pyroelectric; may fluoresce bluish under SW UV.

Optical Properties: Translucent, transparent in small crystals. *Color:* Colorless, white; pale blue, pale green, gray, brown from impurities. *Streak:* White. *Luster:* Vitreous, subpearly, adamantine, rarely silky.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, strong. $\alpha = 1.614$ $\beta = 1.617$ $\gamma = 1.636$ 2V(meas.) = 46°

Cell Data: *Space Group:* $Imm2$. $a = 8.367(5)$ $b = 10.730(6)$ $c = 5.155(3)$ Z = 2

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
3.104 (100), 6.60 (86), 3.288 (75), 3.296 (73), 5.36 (55), 2.400 (54), 2.559 (51)

Chemistry:

	(1)	(2)
SiO_2	25.01	24.94
ZnO	67.42	67.58
H_2O	8.32	7.48
Total	100.75	100.00

(1) Pulaski Co., Virginia, USA. (2) $Zn_4Si_2O_7(OH)_2 \cdot H_2O$.

Occurrence: A secondary mineral typically found in the oxidized zone of zinc-bearing mineral deposits.

Association: Smithsonite, sphalerite, galena, cerussite, anglesite, calcite, aurichalcite, rosasite, hydrozincite, chrysocolla.

Distribution: Only a few localities for fine examples can be mentioned. From Băiţa (Rézbánya), Romania. At Banská Štiavnica (Schemnitz), Slovakia. From Caldbeck Fells, Cumbria, England. At Moresnet, Belgium. In Germany, at Freiberg and Altenberg, Saxony. In the Sa Duchessa mine, Oridda district, Sardinia, Italy. Large crystals from Nerchinsk, Siberia, Russia. At Tchah Kuh, Esfahan, Iran. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in Arizona, from Bisbee, Cochise Co., and in the 79 mine, Gila Co.; in Utah, at the Emma mine, Little Cottonwood Canyon, Salt Lake Co.; in the Ibex and Wolftone mines, Leadville, Lake Co., Colorado; in the Elkhorn mine, Elkhorn district, Jefferson Co., Montana. In Mexico, large crystals from Santa Eulalia, Chihuahua, and in the Ojuela mine, Mapimí, Durango.

Name: In allusion to the mineral's *hemimorphic* morphology.

Hemloite $(As^{3+}, Sb^{3+})_2(Ti, Fe^{3+}, V^{3+}, Fe^{2+})_{12}O_{23}(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As subhedral to anhedral grains, to 600 μm.

Physical Properties: *Fracture:* Curved to irregular. Hardness = 6.5–7 VHN = 858–967, 913 average (100 g load). D(meas.) = n.d. D(calc.) = 4.613

Optical Properties: Opaque. *Color:* Black; gray in reflected light. *Streak:* Black.
Luster: Metallic to submetallic.
Optical Class: Biaxial. *Dispersion:* Weak. *Anisotropism:* Very weak; dark gray to dark brown.
R_1–R_2: (400) 18.9–20.5, (420) 18.6–19.8, (440) 18.2–19.1, (460) 17.8–18.7, (480) 17.6–18.4, (500) 17.4–18.2, (520) 17.2–18.0, (540) 17.1–17.8, (560) 17.0–17.7, (580) 17.0–17.6, (600) 16.9–17.5, (620) 16.9–17.4, (640) 16.8–17.4, (660) 16.8–17.3, (680) 16.8–17.3, (700) 16.8–17.2

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.158(1)$ $b = 7.552(1)$ $c = 16.014(3)$ $\alpha = 89.06(1)°$ $\beta = 104.32(2)°$ $\gamma = 84.97(1)°$ $Z = 2$

X-ray Powder Pattern: Hemlo deposit, Canada.
2.924 (100), 2.722 (90), 2.665 (90), 2.799 (80), 3.045 (70), 2.498 (70), 1.774 (60)

Chemistry:

	(1)
TiO_2	39.0
Al_2O_3	1.3
Fe_2O_3	27.0
V_2O_3	12.7
As_2O_3	12.0
Sb_2O_3	5.7
Total	97.7

(1) Hemlo deposit, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} and OH calculated from charge balance; corresponds to $(As^{3+}_{1.42}Sb^{3+}_{0.46})_{\Sigma=1.88}(Ti_{5.74}Fe^{3+}_{3.60}V^{3+}_{2.00}Fe^{2+}_{0.38}Al_{0.30})_{\Sigma=12.02}O_{23}(OH)$.

Occurrence: In a hydrothermal gold deposit.

Association: Quartz, barian microcline, pyrite, molybdenite, sphalerite, arsenopyrite, vanadian muscovite, rutile, titanite.

Distribution: From the Hemlo gold deposit, in the Page-Williams mine, three km east of Hemlo, Thunder Bay district, Ontario, Canada.

Name: For the Hemlo deposit, Ontario, Canada, where it occurs.

Type Material: The Natural History Museum, London, England, 1986,512 and E.1210; Canadian Geological Survey, Ottawa, Canada, 65544.

(1) Chelopech, Bulgaria; by electron microprobe, corresponds to $Cu_{5.98}Sn_{0.94}Fe_{0.40}As_{0.01}Mo_{1.06}S_{7.61}$. (2) Kawazu mine, Japan; by electron microprobe, corresponds to $(Cu_{5.91}Fe_{0.09}Zn_{0.01}Ag_{0.01})_{\Sigma=6.02}(Sn_{0.87}Bi_{0.06}Te_{0.03})_{\Sigma=0.96}Mo_{0.93}(S_{7.97}Se_{0.12})_{\Sigma=8.09}$. (3) $Cu_4^{1+}Cu_2^{2+}SnMoS_8$.

Occurrence: Of hydrothermal origin, early formed in the mineral association (Chelopech, Bulgaria); in a polymetallic deposit in carboniferous porphyritic andesites (Kochbulak deposit, Uzbekistan).

Association: Enargite, luzonite, colusite, stannoidite, reniérite, tennantite, chalcopyrite, pyrite (Chelopech, Bulgaria).

Distribution: At the Chelopech deposit, Sofia, Bulgaria [TL]. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In Japan, in the Kawazu mine, Shizuoka Prefecture, and at the Iriki mine, Kagoshima Prefecture.

Name: After an ancient name for the Balkan Mountains, on the southern slope of which the Chelopech deposit occurs; probably of Thracian origin.

Type Material: University of Sofia, Sofia; Geological Institute, Bulgarian Academy of Sciences, Sofia, Bulgaria.

References: (1) Terziev, G.I. (1971) Hemusite – a complex copper-tin-molybdenum sulfide from the Chelopech ore deposit, Bulgaria. Amer. Mineral., 56, 1847–1854. (2) Shimizu, M., A. Kato, and S. Physical Properties: *Tenacity:* "Fragile". Hardness = < 2.5 D(meas.) = 2.51 D(calc.) = 2.523

Optical Properties: Transparent. *Color:* Blue-violet. *Streak:* Pale violet to nearly white. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = pale pink; Y = pale purple; Z = very pale blue. *Orientation:* Inclined extinction. $\alpha = 1.585(2)$ $\beta = [1.608]$ $\gamma = 1.615(2)$ 2V(meas.) = ∼58°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.7617(5)$ $b = 7.9774(6)$ $c = 5.6488(4)$ $\alpha = 109.611(6)°$ $\beta = 91.473(7)°$ $\gamma = 83.686(7)°$ Z = 1

X-ray Powder Pattern: Fuka, Japan.
5.25 (vs), 4.35 (s), 3.709 (s), 3.302 (s), 2.494 (sb), 2.427 (sb), 2.346 (s)

Chemistry:

	(1)	(2)
B_2O_3	19.49	18.85
CuO	21.56	21.53
CaO	29.24	30.36
H_2O	29.57	29.26
Total	99.86	100.00

(1) Fuka, Japan; corresponds to $Ca_{1.91}Cu_{0.99}B_{2.05}(OH)_{12}$. (3) $Ca_2CuB_2(OH)_{12}$.

Occurrence: Very rare, in cavities in borate veins in contact-metasomatized limestone.

Association: Pentahydroborite, tenorite, sillenite, bultfonteinite, cuspidine, thaumasite, brucite, calcite.

Distribution: From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: Honors Professor Kitinosuke Henmi (1919–1997), and his daughter Dr. Chiyoko Henmi (1949–), Department of Earth Science, Okayama University, Okayama, Japan, in recognition of their mineralogical work on the skarn deposit at Fuka, Japan.

Type Material: National Science Museum, Tokyo, Japan, M-24641; National Museum of Natural History, Washington, D.C., USA, 165482.

References: (1) Nakai, I., H. Okada, K. Masutomi, E. Koyama, and K. Nagashima (1986) Henmilite, $Ca_2Cu(OH)_4[B(OH)_4]_2$, a new mineral from Fuka, Okayama Prefecture, Japan. Part I. Hennomartinite $SrMn_2^{3+}Si_2O_7(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely in feltlike masses; as irregular aggregates, to 1 mm, embedded in other minerals.

Physical Properties: Hardness = ∼4 D(meas.) = n.d. D(calc.) = 3.68

Optical Properties: Translucent. *Color:* Yellow-brown; yellow-brown in thin section.
Luster: Vitreous.
Optical Class: Biaxial. *Pleochroism:* Strong; from yellowish brown to dark red-brown.
$n = > 1.82$. α = n.d. β = n.d. γ = n.d. 2V(meas.) = 63(1)°

Cell Data: *Space Group: Cmcm.* $a = 6.255(1)$ $b = 9.034(2)$ $c = 13.397(2)$ Z = 4

X-ray Powder Pattern: Wessels mine, South Africa; intensities calculated.
2.833 (100), 2.695 (98), 4.804 (86), 2.807 (82), 2.401 (68), 3.373 (66), 2.715 (58)

Chemistry:

	(1)
SiO_2	28.22
TiO_2	0.00
Al_2O_3	0.00
Fe_2O_3	0.53
Mn_2O_3	37.82
CaO	0.02
SrO	24.32
BaO	0.46
H_2O	[8.62]
Total	[99.99]

(1) Wessels mine, South Africa; by electron microprobe, average of 13 analyses, Li and F not detected by ion microprobe, H_2O from ideal stoichiometry; corresponds to $(Sr_{0.98}Ba_{0.01})_{\Sigma=0.99}(Mn^{3+}_{2.01}Fe^{3+}_{0.03})_{\Sigma=2.04}Si_{1.97}O_7(OH)_2 \cdot H_2O$.

Occurrence: From a hand specimen, in veinlets of sérandite-pectolite cutting sugilite, probably of hydrothermal origin in a bedded manganese deposit.

Association: Sérandite-pectolite, sugilite, braunite, taikanite, kornite.

Distribution: In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Henno Martin, German geologist, who has worked on the Precambrian geology of the general area where the mineral occurs.

Type Material: Natural History Museum, Bern, Switzerland, B5564.

Henritermierite $Ca_3(Mn^{3+},Al)_2(SiO_4)_2(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As pseudo-octahedral crystals, to 3 mm, and as aggregates of small grains. *Twinning:* Common on {101}, sectored.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 3.34(2) D(calc.) = 3.40

Optical Properties: Translucent. *Color:* Clove-brown to apricot-brown; lemon-yellow to pale yellow in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+); may be anomalously biaxial. *Pleochroism:* Weak; O = very pale yellow; E = lemon-yellow. $\omega = 1.765(5)$ $\epsilon = 1.800(5)$ 2V(meas.) = Small.

Cell Data: *Space Group:* $I4_1/acd$. $a = 12.39(1)$ $c = 11.91(1)$ Z = 8

X-ray Powder Pattern: Tachgagalt mine, Morocco.
2.75 (vvs), 2.516 (vs), 4.37 (s), 3.09 (s), 2.98 (s), 2.684 (ms), 1.614 (ms)

Chemistry:

	(1)
SiO_2	24.65
Al_2O_3	5.95
Fe_2O_3	0.95
MnO	22.38
CaO	35.45
active O_2	2.56
H_2O^+	7.85
H_2O^-	0.08
Total	99.87

(1) Tachgagalt mine, Morocco; corresponds to $Ca_{2.97}(Mn^{3+}_{1.48}Al_{0.54}Fe_{0.06})_{\Sigma=2.08}Si_{1.93}O_{7.90}(OH)_{4.10}$.

Occurrence: As small grains filling interstices between crystals of other minerals in a manganese ore deposit (Tachgagalt mine, Morocco).

Association: Marokite, hausmannite, gaudefroyite, calcite (Tachgagalt mine, Morocco); hausmannite, manganite, hematite, calcite, barite, andradite (N'Chwaning mine, South Africa).

Distribution: In the Tachgagalt manganese mine, Anti-Atlas Mountains, Morocco. From the N'Chwaning and Wessels mines, near Kuruman, Cape Province, South Africa.

Name: For Henri F.E. Termier (1897–), Professor of Geology at the Sorbonne, Paris, France.

Type Material: National School of Mines, Paris, France.

Cu	22.3	23.36
Ag	30.2	29.74
Te	47.5	46.90
Total	100.0	100.00

(1) Bisbee, Arizona, USA; by electron microprobe, average of five analyses; corresponding to $Cu_{3.77}Ag_{3.01}Te_{4.00}$. (2) $Cu_4Ag_3Te_4$.

Occurrence: Of hydrothermal origin, with other Cu–Ag tellurides.

Association: Hessite, petzite, sylvanite, altaite, rickardite, pyrite.

Distribution: From the Campbell mine, Bisbee, Cochise Co., Arizona, USA [TL].

Name: In honor of Professor Norman Fordyce McKerron Henry (1909–1983), mineralogist and ore microscopist, University of Cambridge, Cambridge, England.

Type Material: The Natural History Museum, London, England, 1982,209; National Museum of Natural History, Washington, D.C., USA, 162714.

(1) Kovodor, Kola Peninsula, Russia; average of 8 electron microprobe analyses, total iron as Fe^{2+}, corresponding to $(Ba_{0.96}Na_{0.10}K_{0.01}REE_{0.05})_{\sum= 1.12}(Fe^{2+}{}_{1.03}Ti_{6.82}Nb_{0.06}Si_{0.04})_{\sum=7.95}O_{16}$.
(2) Oasis Dzetti, Prince Charles Mountains, eastern Antarctica; total iron as Fe^{2+}, corresponding to $(Ba_{0.95}Ca_{0.03}K_{0.03}Na_{0.10})_{\sum=1.11}(Fe_{0.90}\ Mg_{0.17})_{\sum=1.07}(Ti_{6.65}Nb_{0.03}Si_{0.24}Al_{0.02})_{\sum=6.94}O_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: In late-stage veins associated with metasomatized phoscorite-carbonatite rocks of an alkaline ultramafic complex (Kovodor, Russia); in carbonate-metasomatized lherzolitic and harzburgitic mantle xenoliths (Prince Charles Mountains, Antarctica).

Association: Dolomite, fluorapatite, niobian anatase (?), tetra-ferriphlogopite, rimkorolgite, catapleiite, collinsite, pyrite (Kovodor, Russia); ferroan magnesite, clinohumite, mica, calcite, dolomite, chlorapatite (Prince Charles Mountains, Antarctica).

Distribution: From the Kovodor and Seblyavr Complexes, Kola Peninsula, Russia; near Oasis Dzetti, Prince Charles Mountains, Eastern Antarctica.

Name: Honors Professor Henry O.A. Meyer (1937–1995) for his contributions to the petrology and mineralogy of mantle-derived xenoliths and kimberlitic rocks.

Type Material: Geological Museum of the Kola Science Center, Apatity, Russia.

Hentschelite $CuFe_2^{3+}(PO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As wedge-shaped crystals, elongated along [102], to 1 mm, composed of $\{\bar{1}11\}$, $\{11\bar{1}\}$, $\{011\}$, $\{01\bar{1}\}$, in parallel composites, and as pseudo-octahedra; in spherulites with radial structure. *Twinning:* Common, contact twins by rotation around [102], yielding a triangular composite.

Physical Properties: *Fracture:* Irregular. Hardness = 3.5 D(meas.) = n.d. D(calc.) = 3.79

Optical Properties: Translucent. *Color:* Dark green to greenish black. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = blue-green; Y = yellow-green or yellowish brown. *Orientation:* $Y = b$; $X \wedge a = 61(2)°$; $X \simeq [101]$. *Dispersion:* $r \gg v$, strong. $\alpha = 1.843(3)$ $\beta = 1.848(3)$ $\gamma = 1.945(3)$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1/n$. $a = 6.984(3)$ $b = 7.786(3)$ $c = 7.266(3)$ $\beta = 117.68(2)°$ Z = 2

X-ray Powder Pattern: Reichenbach, Germany.
3.331 (100), 3.287 (58), 4.798 (38), 1.665 (24), 1.644 (18), 4.960 (17), 6.091 (15)

(1) Reichenbach, Germany; by electron microprobe, average of ten analyses, total Fe as Fe_2O_3, H_2O calculated for neutrality as OH^-; corresponding to $Cu_{1.03}(Fe^{3+}_{1.87}Al_{0.12})_{\Sigma=1.99}[(PO_4)_{1.92}(AsO_4)_{0.08}]_{\Sigma=2.00}(OH)_2$. (2) Spring Creek mine, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by DTA, Fe^{2+} estimated by analogy to the ideal structural formula of the lazulite group, then corresponding to $(Cu_{0.84}Fe^{2+}_{0.15})_{\Sigma=0.99}(Fe^{3+}_{1.93}Al_{0.02})_{\Sigma=1.95}[(PO_4)_{2.05}(AsO_4)_{0.03}]_{\Sigma=2.08}(OH)_{1.79}$. (3) $CuFe_2(PO_4)_2(OH)_2$.

Mineral Group: Lazulite group.

Occurrence: A rare secondary mineral in some oxidized copper deposits.

Association: Mimetite, beudantite, phosphogartrellite, goethite, quartz (Reichenbach, Germany); rockbridgeite, chalcosiderite, goethite, cuprite (West Phoenix mine, England); cuprite, copper, malachite, barite (Spring Creek mine, Australia); phosphosiderite, lipscombite, metatorbernite (El Criollo mine, Argentina).

Distribution: From Reichenbach, near Bensheim, Hesse, Germany. In the West Phoenix mine, near Liskeard, and the Phoenix United mines, Linkinhorne, Cornwall, England. At the Bendada pegmatite, near Guarda, Portugal. From the Spring Creek copper mine, near Wilmington, South Australia. In the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina.

Name: Honors Dr. Gerhard Hentschel (1930–), Geological Survey of Hesse, Wiesbaden, Germany.

Type Material: Natural History Museum, Mainz; Mineralogical Museum, University of Würzburg, Würzburg, Germany.

(1) La Fossa crater, Vulcano, Aeolian Islands, Italy; average of 8 EDS electron microprobe analyses, corresponding to $Tl_{0.94}Pb_{2.01}(Cl_{4.85}Br_{0.14}F_{0.07})_{\Sigma=5.06}$. (2) $TlPb_2Cl_5$.

Occurrence: On fragments of altered pyroclastic breccia in a high temperature (400° C) fumarole, most likely formed as a sublimate.

Association: Bismuthinite, cotunnite, challacolloite, pseudocotunnite.

Distribution: La Fossa crater, Vulcano, Aeolian Islands, Italy.

Name: For *Hephaistos*, the Greek god of fire, whose workshops were believed to be located at Vulcano.

Type Material: Reference Collection, Dipartimento di Chimica Strutturale e Stereochimica Inorganica, Università degli Studi, Milan, Italy, 2006-2.

Polymorphism & Series: Forms a solid-solution series with Zn-stabilized paratacamite.

Occurrence: A secondary mineral in the oxidation zone of polymetallic mineral deposits.

Association: Gypsum, opal, dioptase (Chile); wulfenite, hemimorphite, chrysocolla, rosasite, iranite, diaboléite (Iran).

Distribution: Mina Los Tres Presidentes, Sierra Gorda, Chile; at the Kali Kafi and Chah Khouni mines, Anarak, Iran.

Name: Honors G.F. Herbert Smith (1872-1953), British Museum (Natural History), who discovered paratacamite.

Type Material: Natural History Museum, London, England; BM 2003.33.

References: (1) Braithwaite, R.S.W., K. Mereiter, W.H. Paar, and A.M. Clark (2004) Herbertsmithite, $Cu_3Zn(OH)_6Cl_2$, a new species, and the definition of paratacamite. Mineral. Mag., 68, 527-539. (2) (2005) Amer. Mineral., 90, 519 (abs. ref. 1).

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Massive, granular, or embedded in other minerals. *Twinning:* On {111} as both twin and composition plane, the spinel law, simple, multiple, and lamellar.

Physical Properties: *Cleavage:* Parting on {111}, probable. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7.5–8 D(meas.) = 4.40 D(calc.) = [4.26]

Optical Properties: Opaque, translucent through thin edges. *Color:* Dark green to black; dark green in thin section. *Streak:* Dark grayish green to dark green. *Luster:* Vitreous. *Optical Class:* Isotropic. n = 1.80–1.83

Cell Data: *Space Group: Fd3m* (synthetic). a = 8.15579(6) Z = 8

X-ray Powder Pattern: Synthetic.

(1) Plössberg, Germany. (2) Lake Lherz, France. (3) $FeAl_2O_4$.

Mineral Group: Forms three series, with spinel, with gahnite, and with chromite.

Mineral Group: Spinel group.

Occurrence: In high-grade metamorphosed ferruginous argillaceous sediments and in some mafic and ultramafic igneous rocks. Also in placers.

Association: Magnetite, corundum, ilmenite, sillimanite, andalusite.

Distribution: Numerous localities; a few well-studied occurrences include: from Načetín and Hoslau, near Ronsberg, Czech Republic. At Schenkenzell, Black Forest; at Plössberg, Bodenmais, Bavaria; and at Mendig, Eifel district, Germany. From Lake Lherz, Ariège, France. On the Island of Mull, Scotland. In the Khibiny massif, Kola Peninsula, Russia. From near Erode, Coimbatore, Madras, India. From between Farafangana and Vangaindrano, Madagascar. At Peekskill, Westchester Co., New York; near Whittles, Pittsylvania Co., Virginia; and from Rice, near San Carlos, Gila Co., Arizona, USA. From Cuauhtémoc, Chihuahua, Mexico. Found near Moorina, Tasmania.

Name: From the Latin, *Silva Hercynia*, for the Bohemian Forest, Czech Republic, where the mineral was first found.

Herderite $CaBe(PO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Monoclinic, pseudo-orthorhombic] (by analogy to hydroxylherderite). *Point Group:* $2/m$. Crystalline.

Physical Properties: Hardness = 5–5.5 D(meas.) = 3.02 D(calc.) = n.d. Fluoresces violet under UV; cathodoluminesces and phosphoresces pinkish orange under X-rays.

Optical Properties: Transparent. *Color:* Light green; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* r > v, moderate. α = 1.556–1.59 β = 1.578–1.61 γ = 1.589–1.62 2V(meas.) = n.d. 2V(calc.) = 70°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Cannot be distinguished from hydroxylherderite; similar to datolite.

Chemistry: (1) Electron microprobe analysis of a gemstone from "Brazil" shows F 7.0% (so with F> 5.86%, the series midpoint).

Polymorphism & Series: Forms a series with hydroxylherderite.

Occurrence: Probably from a complex granite pegmatite.

Association: n.d.

Distribution: Originally found in Germany, at Ehrenfriedersdorf, Saxony, but the analysis showing F > OH is suspect and any material from this locality seems unavailable. A gemstone from "Brazil" is the only known fluorine-dominant herderite proven by modern analytical methods.

Name: To honor Siegmund August Wolfgang von Herder (1776–1838), mining official, Freiberg, Saxony, Germany.

(1) Maria-Teresa mine, Bolivia; by electron microprobe. (2) SnS.

Occurrence: Of hydrothermal origin, later than the deposition of cassiterite.

Association: Cassiterite, stannite, romarchite, ottemannite, černýite, berndtite, pyrite, chalcopyrite, sphalerite, arsenopyrite, quartz.

Distribution: Fom the Maria-Teresa mine, near Huari, between Oruro and Uyuni, Bolivia [TL]. At the Stiepelmann mine, near Arandis, Namibia. From Shinkiura and in the Hoei tin mine, Oita Prefecture, Japan. In Russia, from the Goluboye deposit, Primorskiy Kray; at the Baimka placer deposit, western Chukotka; and in the Druzhba deposit, Sakha. In Sweden, from Järkvissle, 55 km northwest of Sundsvall, Västernorrland, and at Björkskogsnaes, Hällefors. In the Barquilla deposit, Salamanca Province, Spain.

Name: To honor Robert Herzenberg (1885–1956), Latvian–German chemist of Oruro, Bolivia.

Type Material: The Natural History Museum, London, England, 1933,93; Harvard University, Cambridge, Massachusetts, USA, 92713.

Hessite Ag_2Te

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals pseudocubic, highly modified and generally irregularly developed and distorted, to 1.7 cm. Also massive, compact, or fine-grained. *Twinning:* Twin lamellae visible in polished section.

Physical Properties: *Cleavage:* {100}, indistinct. *Fracture:* Even, smooth. *Tenacity:* Sectile. Hardness = 2–3 VHN = 22–24 (100 g load). D(meas.) = 8.24–8.45 D(calc.) = 8.395

Optical Properties: Opaque. *Color:* Lead-gray to steel-gray, tarnishing to black. *Luster:* Metallic. *Anisotropism:* Distinct, from dark orange to dark blue.
R_1–R_2: (400) 40.7–42.6, (420) 40.3–41.8, (440) 40.0–41.1, (460) 39.7–40.6, (480) 39.7–40.1, (500) 39.9–39.7, (520) 40.3–39.4, (540) 40.8–39.4, (560) 41.3–39.3, (580) 41.9–39.4, (600) 42.4–39.3, (620) 42.8–39.3, (640) 43.2–39.3, (660) 43.5–39.3, (680) 43.6–39.2, (700) 43.5–39.0

(1) Zavodinskii mine, Kazakhstan. (2) San Sebastián, Mexico. (3) Boteş, Romania. (4) Ag_2Te.

Polymorphism & Series: Inverts to a cubic form above 155 °C.

Occurrence: In hydrothermal medium- and low-temperature veins; also in small quantities in some massive pyrite deposits.

Association: Calaverite, sylvanite, altaite, petzite, empressite, rickardite, gold, tellurium, pyrite, galena, tetrahedrite, chalcopyrite.

Distribution: In Romania, from Săcărîmb (Nagyág) [TL], Băiţa (Rézbánya), and in exceptional crystals and masses from Boteş, near Zlatna. In Kazakhstan, from the Zavodinskii mine, near Ziryanovsk, Altai Mountains. In the Bereznyakov gold deposit and the Yaman-Kasy Cu–Zn–pyrite deposits, Southern Ural Mountains, Russia. At Sulitjelma, northern Norway. From Kalgoorlie, Western Australia. In the Emperor mine, Vatukoula, and in the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. At the Bulawan deposit, Negros Occidental, Phillipines. In Chile, from the Condorriaco mine, near Coquimbo, and in the Wendy open pit, El Indio-Tambo district, east of La Serena, Coquimbo. In the USA, from Gold Hill, Boulder Co., and in the Eagle mine, Gilman district, Eagle Co., Colorado; in California, from the Stanislaus mine, Carson Hill district, Calaveras Co.; the McAlpine mine, Sonora, and the Jamestown mine, Tuolumne Co.; and Nevada City, Nevada Co.; in Arizona, from the Campbell mine, Bisbee, and at Tombstone, Cochise Co. In small amounts at numerous localities in Ontario, British Columbia, and Quebec, Canada, and other localities world-wide.

Name: To honor Germain Henri Hess (1802–1850), Swiss-Russian physician and chemist, of St. Petersburg, Russia.

Hetaerolite $ZnMn_2^{3+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m2/m2/m$. As pyramidal crystals, to 1 cm; also as botryoidal to stalactitic aggregates, and fibrous. As exsolution lamellae in franklinite. *Twinning:* On {112}, producing fivelings, very rare.

Physical Properties: *Cleavage:* {001}, indistinct; two additional, probably on {112} and {011}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6 VHN = 528–707 (100 g load). D(meas.) = 5.18 D(calc.) = [5.21]

Optical Properties: Opaque, transparent through thin edges. *Color:* Brownish black to black; deep reddish brown in transmitted light; gray under reflected light. *Streak:* Dark brown. *Luster:* Metallic to submetallic.
Optical Class: Uniaxial (–). *Absorption:* Faint; $E > O$. $\omega = 2.34(2)$ $\epsilon = 2.14(2)$
Anisotropism: Strong.
R_1–R_2: (400) 19.3–25.8, (420) 18.3–24.0, (440) 17.3–22.2, (460) 16.5–21.0, (480) 15.8–20.1, (500) 15.4–19.4, (520) 15.0–18.9, (540) 14.7–18.4, (560) 14.5–18.1, (580) 14.2–17.8, (600) 14.0–17.6, (620) 13.9–17.4, (640) 13.7–17.2, (660) 13.6–17.0, (680) 13.5–16.9, (700) 13.4–16.8

Cell Data: *Space Group:* $I4_1/amd$. a = 5.75 c = 9.22–9.23 Z = 4

(1) Sterling Hill, New Jersey, USA; corresponds to $(Zn_{0.94}Mn^{2+}_{0.06})_{\Sigma=1.00}(Mn^{3+}_{1.93}Fe^{3+}_{0.10}Si_{0.01})_{\Sigma=2.04}O_{3.92}\bullet 0.02H_2O$. (2) Kennack Sands, England; by electron microprobe, total Mn as Mn_2O_3, total Fe as Fe_2O_3; corresponds to $Zn_{0.95}Mn_{2.03}O_4$. (3) $ZnMn^{3+}_2O_4$.

Occurrence: A secondary mineral associated with other manganese minerals, primarily in hydrothermal ore deposits.

Association: Franklinite, chalcophanite, hodgkinsonite, willemite, hemimorphite, manganite, romanechite, calcite.

Distribution: In the USA, from Sterling Hill, Ogdensburg, and Franklin, Sussex Co., New Jersey; in Arizona, in Cochise Co., at the Lucky Cuss mine, Tombstone, and the Campbell and Junction mines, Bisbee; the 79 mine, Banner district, Gila Co.; and the Domeroy property, Pioneer district, Pinal Co. From the Contact mine, Grant Co., New Mexico; in the Mohawk mine, San Bernardino Co., California; and the Wolftone mine, Leadville, Lake Co., Colorado. In Romania, at Rodna. At Moresnet, Belgium. On Mont Chemin, Valais, Switzerland. From Kennack Sands, Cornwall, England. In the Maruyama and Oe mines, Aomori Prefecture, Japan. From the EZ mine, near Beltana, South Australia. Other occurrences are known.

Name: From the Greek for *companion*, for its occasional association with chalcophanite.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 134145.

Heterogenite $Co^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}2/m$ or $6/m2/m2/m$. Crystals very rare, hexagonal, prismatic, to 1 mm; commonly massive, globular to reniform, stalactitic; as thin coatings, earthy. *Twinning:* Commonly observed in polished section.

Physical Properties: *Cleavage:* In crystals, {0001}. *Fracture:* Conchoidal. Hardness = 3–5 VHN = 420–640 (100 g load). D(meas.) = 3.07–4.32; 4.72 (synthetic). D(calc.) = 4.92

Optical Properties: Opaque. *Color:* Black, blackish brown, reddish brown; in reflected light, white with brownish tinge. *Streak:* Dark brown. *Luster:* Dull to vitreous.
Optical Class: Uniaxial. *Anisotropism:* Strong; bluish to yellowish white, browns.
Bireflectance: Very strong.
R_1–R_2: (400) 15.0–30.4, (420) 15.8–30.4, (440) 16.6–30.4, (460) 16.7–29.8, (480) 16.6–28.8, (500) 16.3–27.8, (520) 16.2–27.0, (540) 16.3–26.4, (560) 16.6–26.0, (580) 16.7–25.6, (600) 16.7–25.3, (620) 16.5–25.0, (640) 16.4–24.8, (660) 16.2–24.5, (680) 16.0–24.2, (700) 15.8–23.8 (3R).

(1) Katanga (Shaba Province), Congo; H_2O by difference. (2) Mindigi, Congo; by electron microprobe, H_2O by TGA. (3) CoO(OH).

Polymorphism & Series: 3R and 2H polytypes.

Occurrence: A weathering product of smaltite (Schneeberg, Germany); an alteration product of linnaeite, constituting an important ore of cobalt (Shaba Province, Congo); widespread in residual soils above ultramafic rocks (New Caledonia).

Association: Smaltite, pharmacosiderite, calcite (Schneeberg, Germany); linnaeite, sphaerocobaltite, malachite, cuprite (Shaba Province, Congo).

Distribution: Localities for well-characterized material include: at Schneeberg, Saxony; at the Anton mine, Heubachtal, and Wittichen, Black Forest; and at Richelsdorf, Hesse, Germany. From Congo (Zaire), in Katanga (Shaba) Province, in the Star of the Congo mine, near Lubumbashi; from Shinkolobwe; and at Mindigi. From Tsumeb, Namibia. At Bou Azzer, Morocco. In the Pabellón mine, Rio Copiapó, Atacama, Chile. In the USA, from Goodsprings, Clark Co., Nevada. At the Nanganobori Co–Ni mine, Yamaguchi Prefecture, Japan. Found in Rocky's Reward pit, near Agnew, Western Australia. Many occurrences in New Caledonia.

Name: From the Greek for *of another kind*, as differing in composition from similar minerals.

Type Material: Mining Academy, Freiberg, Germany, 11752; Royal Museum of Central Africa, Tervuren, Belgium, RGM10800.

(1) Arnsberg, Germany. (2) $Pb_7Sb_8S_{19}$.

Occurrence: Of hydrothermal origin.

Association: Sphalerite, plagionite, semseyite.

Distribution: In Germany, from Arnsberg, North Rhine-Westphalia [TL], and Wolfsberg, Harz Mountains. At Příbram, Czech Republic. In the Kara Kamar deposit, Tajikistan. From Yecora, five km west of Iglesia, Sonora, Mexico.

Name: From the Greek for *different* and *form*, in allusion to the difference between this mineral and a proposed dimorphous species.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 465–466. (2) Jambor, J.L. (1969) Sulphosalts of the plagionite group. Mineral. (1) Hill City, South Dakota, USA. (2) $(Fe, Mn)PO_4$ with Fe:Mn = 1:1.

Polymorphism & Series: Forms a series with purpurite.

Occurrence: A secondary mineral in the oxidized zone of complex granite pegmatites, replacing primary phosphate minerals, principally triphylite.

Association: Triphylite, ferrisicklerite, many secondary Fe–Mn phosphates.

Distribution: Widespread in weathered phosphate-bearing pegmatites. Some prominent localities include: in France, in Haute-Vienne, from near Limoges, Huréaux, and in the La Vilate quarry, near Chanteloube. At Hagendorf, and Hühnerkobel, near Zwiesel, Bavaria, Germany. From the Norrö pegmatite, on Rånö Island; Skrumpetorp, Östergötand; and in the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. At Sukula and Tammela, Finland. In the USA, from the Fletcher and Palermo #1 mines, near North Groton, Grafton Co., New Hampshire; at Newry, Oxford Co., Maine; around Hill City, Pennington Co., and elsewhere in South Dakota. In the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and several other localities in Minas Gerais, Brazil. At the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. From the Angarf-Sud pegmatite, Tazenakht Plain, Anti-Atlas Mountains, Morocco.

Name: From the Greek for *another*, probably because it was the second manganese-bearing species described from the type locality.

(1) Col Aut, Buffaure, Trentino-Alto Adige, Italy; corresponds to $(Ca_{0.56}Na_{0.24}K_{0.10}Sr_{0.09}Mg_{0.07}Ba_{0.03})_{\Sigma=1.09}Al_{1.89}Fe_{0.10}Si_{7.05}O_{18}\cdot 6.08H_2O$. (2) Faeroe Islands; corresponds to $(Ca_{0.89}Na_{0.32}K_{0.11}Ba_{0.02}Sr_{0.01})_{\Sigma=1.35}Al_{2.34}Si_{6.68}O_{18}\cdot 6.50H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in basalts; in highly weathered andesites and diabases; as a devitrification product of volcanic glasses and tuffs.

Association: Zeolites, datolite, apophyllite, calcite.

Distribution: Many localities, even for fine specimens. Exceptional crystals from the Teigarhorn, Berufjord, Iceland. At Haldarsvik, on Streymoy, Faeroe Islands. Around Glasgow, Dumbartonshire, Scotland. At Giebelsbach, near Fiesch, Valais, Switzerland. In the USA, at Paterson, Passaic Co., and Bergen Hill, Hudson Co., New Jersey; at Goble, Columbia Co., and elsewhere in Oregon; at Skookumchuck Dam, near Bucoda, Thurston Co., Washington. From Cape Blomiden, Nova Scotia, Canada. From near Bento Gonçalves, Rio Grande do Sul, Brazil. Large crystals from the Nasik, Poona, and Bombay districts, Maharashtra, India. At Tambar Springs, near Gunnedah, New South Wales, Australia.

Name: For the English mineral collector and dealer John Henry Heuland (1778–1856).

(1) Northern Ravnås prospect, Kongsberg ore district, Norway; average of 14 electron microprobe analyses, H_2O by thermogravimetric analysis and confirmed by IR spectroscopy, corresponding to $(Ba_{2.49}Ca_{1.41}Sr_{0.30}K_{0.37}Na_{0.33})_{\Sigma=4.90}Al_{8.96}Si_{27.00}O_{72.00}\cdot 21.75H_2O$.

Occurrence: A late stage mineral in hydrothermal quartz-calcite veins.

Association: Acanthite, barite, chalcopyrite, fluorite, galena, sphalerite, silver, brewsterite, other heulandite-series zeolites, calcite, harmotome.

Distribution: From the Northern Ravnås prospect, southern Vinoren, Kongsberg ore district, Flesberg community, Buskerud county, and from the Bratteskjerpet mine, Saggrenda, and at Sjoa in Sel community, Oppland county, Norway.

Name: For its chemical composition and relationship to other heulandite minerals.

Type Material: Geological Museum, University of Oslo, Norway (33929).

References: (1) Larsen, A.O., F.S. Nordrum, N. Döbelin, T. Armbruster, O.V. Petersen, and M. Erambert. (2005) Heulandite-Ba, a new zeolite species from Norway. Eur. J. Mineral., 17, 143-153. (2) (2005) Amer. Mineral., 90, 1945-1946 (abs. ref. 1).

Hewettite $CaV_6^{5+}O_{16}\cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As needles and fibers, elongated and intertwined ‖ [010], to 2 cm; in nodular aggregates, as fracture fillings, and coatings.

Physical Properties: Hardness = Extremely soft. D(meas.) = 2.51–2.61 D(calc.) = 2.67 Reversibly dehydrates to metahewettite.

Optical Properties: Transparent. *Color:* Deep red, to chocolate-brown on exposure; red to orange in transmitted light. *Luster:* Silky to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = Y = light yellow-orange; Z = dark red.
Orientation: $Z = c$. $\alpha = 1.77$ $\beta = 2.18$ $\gamma = 2.35$–2.4 2V(meas.) = Medium.

Cell Data: *Space Group:* $P2_1/m$. $a = 12.290(1)$ $b = 3.590(1)$ $c = 11.174(2)$ $\beta = 97.24(1)^\circ$ Z = 1

(1) Minasragra, Peru. (2) $CaV_6O_{16}\cdot 9H_2O$.

Occurrence: As an alteration product of patronite (Minasragra, Peru); an alteration product of less-oxidized vanadium minerals in Colorado Plateau-type U–V deposits.

Association: Metahewettite, corvusite, montroseite, rauvite, steigerite, fervanite, navajoite, carnotite, tyuyamunite (Colorado Plateau deposits, USA).

Distribution: From Minasragra, 46 km from Cerro de Pasco, Peru. In the USA, in the Jo Dandy mine, Bull Canyon district, Paradox Valley, Uravan district, Montrose Co., Colorado; in Utah, from the Cactus Rat mine group, Yellow Cat district, 24 km southeast of Thompson, Grand Co.; in Arizona, long fibers from the Monument No. 2 mine, Monument Valley, also in the Carrizo and Lukachukai Mountains, Apache Co., and in the Monument No. 1 and Mitten No. 2 mines, Navajo Co.; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada. From the Edgemont district, Fall River Co., South Dakota; and in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas. In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan.

Name: For Donnel Foster Hewett (1881–1971), geologist with the U.S. Geological Survey, who described the mineralogy of Minasragra, Peru.

Type Material: National Museum of Natural History, Washington, D.C., USA, 87459.

Hexahydrite $MgSO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very rare crystals, thick tabular {001}; typically coarse columnar to thin fibrous, to 10 cm; massive. *Twinning:* On {001}; on {110}.

Physical Properties: *Cleavage:* On {100}, perfect. *Fracture:* Conchoidal. Hardness = 2–2.5 (by analogy to epsomite). D(meas.) = 1.757 D(calc.) = 1.745 Soluble in H_2O, bitter salty taste.

Optical Properties: Transparent to opaque. *Color:* Colorless to white, may be pale green; colorless in transmitted light. *Luster:* Pearly to vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 25°$. $\alpha = 1.426$ $\beta = 1.453$ $\gamma = 1.456$ 2V(meas.) = 38°

Cell Data: *Space Group:* $C2/c$. $a = 10.110(5)$ $b = 7.212(4)$ $c = 24.41(1)$ $\beta = 98.30(5)°$ Z = 8

X-ray Powder Pattern: Synthetic. (ICDD 24–719).
4.39 (100), 5.45 (50), 5.10 (45), 4.04 (45), 4.16 (35), 4.88 (30), 2.941 (30)

Chemistry:

	(1)	(2)
SO_3	34.52	35.04

Total	99.87	100.00

(1) Bonaparte River, Canada. (2) $MgSO_4 \cdot 6H_2O$.

Mineral Group: Hexahydrite group.

Occurrence: By dehydration of epsomite; as efflorescences on magnesian rock exposures and in mine workings; as speleothems in caves; may be widespread as an evaporative precipitate in saline lakes and soils; rarely a fumarolic precipitate.

Association: Epsomite, siderotil.

Distribution: Likely more widespread than the following list of localities indicates. In Canada, from along the Bonaparte River between Scottie and Carquill Creeks, Clinton district, British Columbia; along Rapid Creek, Yukon Territory. In the USA, from near Oroville, Okanogan Co., Washington; in the Campbell mine, Bisbee, Cochise Co. and the San Manuel mine, Pinal Co., Arizona; long fibers from the Nevada Dominion adit, Pyramid district, Washoe Co., Nevada; in the Long Park #15 mine, Montrose Co., Colorado; at Sterling Hill, Sussex Co., New Jersey; from Alum Cave Bluff, Sevier Co., Tennessee. In the North Ballaird Bore No. 3, Balsalloch Farm, near Ballantrae, Ayrshire, Scotland. In Germany, at Wathlingen, Lower Saxony, and elsewhere. From Kladno and Kelčany, Czech Republic. At Boleslaw, Poland. In Turkey, from the Great Konya Basin, near Çakmak, Konya Province. At the Saki salt lakes, Crimea, Ukraine. A volcanic sublimate at volcanoes on the Kamchatka Peninsula, Russia. In the Epsom Pot Cave, Transvaal, South Africa. At the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province, Argentina.

Name: With the Greek prefix, *hexa*, in recognition of a magnesium sulfate *hydrate* with six essential water molecules.

Type Material: n.d.

	(1)	(2)
B_2O_3	28.50	29.78
MgO	0.51	
CaO	25.03	23.99
H_2O	45.96	46.23
Total	[100.00]	100.00

(1) Solongo deposit, Russia; $(OH)^{1-}$ and H_2O confirmed by IR, recalculated to 100% after deduction of diopside and calcite impurities from an original total of 101.30%; then corresponds to $(Ca_{1.04}Mg_{0.03})_{\Sigma=1.07}B_{1.91}(OH)_{7.87} \cdot 2.02H_2O$. (2) $Ca[B(OH)_4]_2 \cdot 2H_2O$.

Occurrence: A rare component of boron-enriched skarn deposits in metasomatized limestones.

Association: Pentahydroborite, frolovite, kurchatovite, sakhaite (Solongo deposit, Russia); olshanskyite, calcite (Fuka, Japan).

Distribution: From the Solongo boron deposit, Buryatia, Russia. At the Sayak-IV boron deposit, northeast Balkhash region, Kazakhstan. From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For the composition, originally thought to contain six waters of hydration (later found by crystal-structure analysis to be incorrect).

Type Material: Russian Institute of Mineral Resources, Moscow; Moscow University, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80438.

(1) Locality "Y", China; by electron microprobe, corresponding to $(Ni_{0.69}Pd_{0.31})_{\Sigma=1.00}(Te_{0.50}Sb_{0.49}Bi_{0.01})_{\Sigma=1.00}$.

Mineral Group: Nickeline group.

Occurrence: In ore concentrates from Cu–Ni sulfide deposits.

Association: Testibiopalladite.

Distribution: In southwestern China, at locality "Y" – a code name.

Name: Presumably named for the crystal system and composition.

Type Material: n.d.

Total	[100.00]	100.00

(1) Betty Jo claim, Nevada, USA; by electron microprobe, average of three analyses, normalized from a total of 97.3% to 100%, total Fe as FeO; corresponding to $Pb_{5.01}(Fe_{1.71}Zn_{0.17})_{\Sigma=1.88}O_{3.80}(VO_4)_{2.06}$. (2) $Pb_5Fe_2O_4(VO_4)_2$.

Occurrence: A very rare secondary mineral in the oxidized portions of a polymetallic sulfide deposit (Betty Jo claim, Nevada, USA); along a fault through a stockwork disseminated gold deposit (Gold Quarry mine, Nevada, USA).

Association: Tungstenian wulfenite, pyromorphite, mimetite, cerussite, shattuckite, chrysocolla, quartz (Betty Jo claim, Nevada, USA).

Distribution: From the Betty Jo claim, about 13 km southeast of Ely, Nevada district, White Pine Co., in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., and at the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada, USA. From the Kusu vanadium deposit, 85 km south of Kinshasa, Bas-Congo Province, Congo (Bas-Zaire Province, Zaire).

Name: Honors Dr. Max Hutchinson Hey (1904–1984), eminent British mineralogist and chemist, British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 1972,194; National Museum of Natural History, Washington, D.C., USA, 127424, 135056.

(2) La Roche-Balue quarry, France; by electron microprobe, average of five analyses; corresponding to $Pb_{3.60}Cd_{0.04}Ag_{1.13}Cd_{0.04}Bi_{3.32}Sb_{0.01}S_{9.00}$. (3) $Pb_4AgBi_3S_9$.

Occurrence: In high-temperature quartz veins.

Association: Pyrite, sphalerite, galena, molybdenite, cosalite, bismuth, galenobismutite, chalcopyrite, covellite, bursaite, arsenopyrite, siderite, quartz, albite, microcline.

Distribution: In the Czech Republic, near Hůrky, about 65 km west of Prague [TL]. From the Toroiaga mine, Baia Borą district, and at Ocna de Fier (Morávicza; Vaskő), Romania. In the Furka Pass, Uri, and at Goppenstein, Lotschentnal, Valais, Switzerland. From Rauriser Goldberg, Salzburg, Austria. In the La Roche-Balue quarry, west of Nantes, Loire Atlantique, France. At the Clara mine, near Oberwolfach, Black Forest, Germany. In Italy, on Vulcano, in the Lipari Islands. From the Corrie Buie deposit, south Loch Tayside, Scotland. In the Balıkesir Balya deposit, Balıkesir Province, Turkey. From the Spokoinoe deposit, eastern Transbaikal, and at the Shumilovsk Sn–W deposit, western Transbaikal, Russia. From 27 km west of Castlegar, British Columbia, Canada. In the USA, from Darwin, Inyo Co., California; at the Reward prospects, Ravenswood district, Lander Co., Nevada; in the Idarado mine, Ouray Co., and the Alaska mine, Poughkeepsie Gulch, near Ouray, San Juan Co., Colorado. At the Yakuki mine, Fukushima Prefecture, Japan. From the Juno mine, Tennant Creek, Northern Territory, Australia.

Name: In honor of Jaroslav Heyrovský (1890–1967), Czech Nobel Laureate in chemistry.

(1) Esiva, Madagascar; all RE taken as Ce, corresponds to $(Ca_{0.80}RE_{0.15})_{\Sigma=0.95}(Al_{10.16}Ti_{0.74}Mg_{0.56}Fe^{2+}_{0.22}Si_{0.18}Fe^{3+}_{0.04})_{\Sigma=11.90}O_{18.95}$. (2) Mahenge, Tanzania; by electron microprobe, average of 14 analyses, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Ca_{0.80}Ce_{0.09}La_{0.08}Nd_{0.01})_{\Sigma=0.98}(Al_{10.38}Fe^{2+}_{0.74}Ti_{0.51}Fe^{3+}_{0.25}Si_{0.09}Mg_{0.05})_{\Sigma=12.02}O_{19}$.

Mineral Group: Magnetoplumbite group.

Occurrence: In metamorphosed limestone, pyroxenite, gneiss, and granulite of the amphibolite to granulite facies; also alluvial. A common accessory in Ca–Al-rich inclusions in some carbonaceous chondrites.

Association: Calcic plagioclase, corundum, spinel, thorianite, titanite (Esiva, Madagascar); anorthite, grossular, titanite, zoisite, clinozoisite (Mahenge, Tanzania); vesuvianite, hercynite, corundum, andalusite, kyanite, diopside, rutile, titanite, magnetite (Shoriya Mountains, Russia).

Distribution: From Esiva, near Taolañaro (Fort Dauphin), and near Ambindandrakemba, Madagascar. In Tanzania, in the Furura granulite complex, southwest of Mahenge. In the Shoriya Mountains, about 400 km southeast of Novosibirsk, western Siberia, and several other less-well-defined places in Russia. From Punalur, Kerala, India. Noted in some carbonaceous chondrite meteorites, as Allende, Murchison, etc.

Name: For Paul Hibon, who discovered the mineral.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, USA, 106213.

(1) Bug River, Russia. (2) Mariánská Hora, Czech Republic; by electron microprobe, H_2O by difference; corresponds to $Ca_{3.00}(Al_{1.61}Fe_{0.22}Mg_{0.10})_{\Sigma=1.93}(Si_{1.50}S_{0.17})_{\Sigma=1.67}[O_{6.64}(OH)_{5.36}]_{\Sigma=12.00}$.

Polymorphism & Series: Forms a series with grossular and katoite.

Mineral Group: Garnet group.

Occurrence: In a calcareous marl (Mariánská Hora, Czech Republic); in zeolite-calcite rocks and low-grade metamorphosed marls (Hatrurim Formation, Israel).

Association: Quartz, tremolite, gypsum (Mariánská Hora, Czech Republic); calcite, aragonite, vaterite, portlandite, ettringite, tobermorite, jennite, afwillite (Hatrurim Formation, Israel).

Distribution: At Mariánská Hora (Marienberg), near Ústí nad Lábem (Aussig), Czech Republic. At Aubenas, Ardèche, France. In the Hatrurim Formation, Israel. From Nikortzminda, Caucasus Mountains, Georgia. Along the Bug River, locality not further specified, in Russia. At Crestmore, Riverside Co., California, USA. From Velardeña, Durango, Mexico. From the Tokatoka district, about 150 km north of Auckland, New Zealand.

Name: After Professor Josef Emanuel Hibsch (1852–1940), German Agricultural Academy, Tetschen, Czech Republic.

Type Material: Natural History Museum, Vienna, Austria, J4774.

Hidalgoite $PbAl_3(AsO_4)(SO_4)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Commonly as compact porcelaneous to porous masses; in tiny spherulitic aggregates.

Physical Properties: *Fracture:* Irregular to conchoidal. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.71–3.96 D(calc.) = 4.15–4.27

Optical Properties: Translucent. *Color:* White, pale green, pistachio-green, emerald-green. *Streak:* White. *Luster:* Dull in aggregates.
Optical Class: Uniaxial (+). *Dispersion:* Strong. $\omega = 1.713–1.730$ $\epsilon = 1.715–1.735$

Cell Data: *Space Group: R3m.* a = 7.04(2) $c = 16.99(2)$ Z = 3

X-ray Powder Pattern: San Pascual mine, Mexico.
2.981 (10), 5.73 (9), 3.51 (9), 1.911 (8), 2.257 (7), 1.761 (6), 1.496 (6)

Chemistry:

H_2O	9.70	13.8	8.65
Total	100.06	99.8	100.00

(1) San Pascual mine, Mexico; H_2O by a modified Penfield method. (2) Gold Hill mine, Utah, USA; H_2O by loss on ignition. (3) $PbAl_3(AsO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral of the oxide zone of polymetallic sulfide deposits.

Association: Beudantite, tourmaline, "limonite" (San Pascual mine, Mexico); mansfieldite, carbonate-cyanotrichite (Cap Garonne mine, France).

Distribution: From the San Pascual mine, nine km northwest of Zimapán, Hidalgo, Mexico. In the USA, from the Gold Hill mine, Tooele Co., Utah; in the Mohawk mine, Clark Mountains, San Bernardino Co., California; and from Tombstone, Cochise Co., and in the Silver Crown mine, Yavapai Co., Arizona. At the Cap Garonne mine, near le Pradet, Var, France. In the Falotta mine, Oberhalbstein, Graubünden, Switzerland. At Ramsbeck, North Rhein-Westphalia, Germany. From the Penberthy Croft mine, St. Hilary, Cornwall, England. In Australia, from the Adelaide mine, Dundas, Tasmania, and at Broken Hill, New South Wales. From Tsumeb, Namibia.

Name: For Hidalgo, the state in Mexico that produced the first specimens.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 106373–106375; National Museum of Natural History, Washington, D.C., USA, 112726, 112727.

Hieratite K_2SiF_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. As cubo-octahedra and octahedra; stalactitic concretionary, spongy to dense.

Physical Properties: *Cleavage:* {111}, perfect. Hardness = ∼2.5 D(meas.) = 2.665 (synthetic). D(calc.) = 2.668 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless, white to gray; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.340$

Cell Data: *Space Group:* $Fm3m$(synthetic). $a = 8.133$ Z = 4

X-ray Powder Pattern: Synthetic.
4.699 (100), 2.349 (70), 2.877 (65), 2.034 (50), 1.438 (16), 1.565 (14), 1.661 (12)

Chemistry:

F	51.9	51.75
Total	100.0	100.00

(1) Vulcano, Italy. (2) K_2SiF_6.

Occurrence: As a deposit around volcanic fumaroles.

Association: Sassolite, mirabilite, glauberite, selenian sulfur, realgar, alums (Vulcano, Italy); avogadrite, malladrite (Vesuvius, Italy).

Distribution: In Italy, on Vulcano, Lipari Islands, and from Vesuvius, Campania.

Name: From the Greek *Hiera*, an ancient name for Vulcano.

Type Material: n.d.

Hilairite $Na_2ZrSi_3O_9 \cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 32. As nearly equidimensional rhombohedral crystals, displaying $\{11\bar{2}0\}$ and $\{01\bar{1}2\}$, to 4 mm. *Twinning:* Multiple twinning by rotation about $[2\bar{2}01]$ and about [0001], common; typically multiply twinned after both laws, involving four, eight, or more individuals.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = > 4
D(meas.) = 2.724(4) D(calc.) = 2.739

Optical Properties: Transparent to opaque. *Color:* Pale to dark brown, yellow, colorless, white, flesh-pink, rose-red. *Streak:* White. *Luster:* Vitreous to porcelaneous.
Optical Class: Uniaxial (–). $\omega = 1.609(1)$ $\epsilon = 1.596(1)$

Cell Data: *Space Group: R*32. $a = 10.556(1)$ $c = 15.855(2)$ Z = 6

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
5.28 (100), 6.00 (60), 3.168 (50), 3.046 (40), 1.759 (40), 2.994 (30), 2.639 (30)

Chemistry:

	(1)
SiO_2	42.08
TiO_2	0.04
ZrO_2	29.72

Total	99.62

(1) Mont Saint-Hilaire, Canada; by electron microprobe, H_2O by TGA; corresponding to $(Na_{1.85}K_{0.05}Ca_{0.02})_{\Sigma=1.92}Zr_{1.03}Si_{2.99}O_{9.30} \cdot 3.21H_2O$.

Occurrence: In miarolitic cavities and altered pegmatite dikes in nepheline syenite in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Catapleiite, elpidite, gaidonnayite, aegirine, analcime, albite, microcline, chlorite, calcite, epididymite, natrolite, fluorite, pyrite, sphalerite, galena (Mont Saint-Hilaire, Canada).

Distribution: In Canada, at Mont Saint-Hilaire, and in the Strange Lake complex, Quebec. From Bratthagen, near Larvik, Norway. On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. At Poços de Caldas, Minas Gerais, Brazil.

Name: For the locality at Mont Saint-Hilaire, Quebec, Canada.

Type Material: Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada, 34803.

Hilarionite $Fe^{3+}_2(SO_4)(AsO_4)(OH)\cdot 6H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*, *m*, or 2. As sub-parallel to divergent aggregates of prismatic to acicular crystals, to 0.5 mm, also as crusts or as spherulites, to 1 mm.

Physical Properties: *Cleavage*: Good parallel to elongation. *Fracture*: Uneven or splintery. *Tenacity*: Ductile, flexible fibers. Hardness = 2 D(meas.) = 2.40(5) D(calc.) = 2.486

Optical Properties: Translucent. *Color*: Light green (with olive or grayish tint) to yellowish green, colorless in transmitted light. *Streak*: n.d. *Luster*: Vitreous to silky. *Optical Class*: Biaxial(+). α = 1.575(2) β = n.d. γ = 1.640(2) 2V = Large. *Dispersion*: Strong, *r* > *v*. *Orientation:* *Z* is close to elongation.

Cell Data: *Space Group*: *C*2/*m*, *Cm*, or *C*2. *a* = 18.53(4) *b* = 17.43(3) *c* = 7.56(1) β = 94.06(15)° Z = 8

X-ray Powder Pattern: Hilarion mine, Lavrion ore district, Atliki Prefecture, Greece. 12.66 (100), 5.00 (10), 4.70 (10), 4.33 (7), 7.60 (6), 2.887 (5), 3.215 (4)

Chemistry:

	(1)
MnO	0.03
CuO	0.18
ZnO	0.17
Fe_2O_3	33.83
P_2O_5	0.22
As_2O_5	18.92
SO_3	22.19
H_2O	26.3
Total	101.82

(1) Hilarion mine, Lavrion ore district, Atliki Prefecture, Greece; average of 7 electron microprobe analyses, Fe^{+3} confirmed by Mössbauer spectroscopy, H_2O determined by Alimarin method, complex anions confirmed by IR spectroscopy; corresponding to $(Fe^{3+}_{1.90}Cu_{0.01}Zn_{0.01})_{\Sigma=1.92}[(SO_4)_{1.24}(AsO_4)_{0.74}(PO_4)_{0.01}]_{\Sigma=1.99}(OH)_{1.01}\cdot 6.03H_2O$.

Occurrence: A secondary mineral in the oxidized zone of a sulfide-rich (pyrite, sphalerite, chalcopyrite, galena) orebody.

Association: Goethite, gypsum, bukovskyite, jarosite, melanterite, chalcanthite, allophane, azurite, hematite, unidentified hydrous copper sulfates.

Distribution: At the Hilarion mine, near Agios Konstantinos (Kamariza), Lavrion ore district, Atliki Prefecture, Greece.

Name: For the mine that produced the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (92988) and the Mineralogical Museum, Athens University, Greece.

Hilgardite $Ca_2B_5O_9Cl \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic or triclinic. *Point Group:* m or 1. Distorted triangular crystals are tabular on {010} and hemimorphic, to 2 cm, with 18 forms described.

Physical Properties: *Cleavage:* On {010}, perfect; on {100}, good. *Fracture:* Conchoidal. Hardness = 5 D(meas.) = 2.67–2.71 D(calc.) = 2.688–2.694 Piezoelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless, slightly reddish brown; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 1.5°$. *Dispersion:* $r > v$, moderate.
$\alpha = 1.623–1.630$ $\beta = 1.628–1.636$ $\gamma = 1.656–1.664$ 2V(meas.) = 34(2)°

Cell Data: *Space Group:* *Aa* (4M polytype), with $a = 11.438(2)$ $b = 11.318(2)$ $c = 6.318(1)$ $\beta = 90.06(1)°$ Z = 4, or *Space Group:* $P1$ (1A polytype), with $a = 6.452(1)$ $b = 6.559(1)$ $c = 6.286(1)$ $\alpha = 61.60(1)°$ $\beta = 118.72(1)°$ $\gamma = 105.86(1)°$ Z = 1

X-ray Powder Pattern: Choctaw salt dome, Louisiana, USA (4M polytype).
2.859 (100), 2.839 (100), 2.113 (80), 2.109 (80), 2.096 (80b), 1.985 (80), 2.755 (60)

X-ray Powder Pattern: Choctaw salt dome, Louisiana, USA (1A polytype).
2.87 (100), 2.83 (100), 2.755 (80), 2.12 (80), 2.033 (80), 5.7 (60), 3.14 (60)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

				Total	[100.00]	[98.2]	100.00

(1) Choctaw salt dome, Louisiana, USA; recalculated to 100% after removal of insoluble 1.89%; corresponds to $Ca_{2.02}B_{4.65}O_9Cl_{0.98} \cdot 1.15H_2O$. (2) New Brunswick, Canada; by electron microprobe, B and H_2O calculated for stoichiometry. (3) $Ca_2B_5O_9Cl \cdot H_2O$.

Polymorphism & Series: 4M, 1Tc, 3Tc, and 1A polytypes are known.

Occurrence: In marine evaporite deposits.

Association: Boracite, anhydrite, danburite, dolomite, magnesite, pyrite, hauerite, calcite, quartz, sulfur, gypsum (Choctaw salt dome, Louisiana, USA); boracite, szaibélyite (New Brunswick, Canada).

Distribution: In the USA, from the Choctaw salt dome, Iberville Parish, Louisiana, and in Wayne Co., Mississippi; in the Louann Salt Formation, Clarke Co., Alabama. From the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada. At the Königshall-Hindenburg potash mine, Reyershausen, near Göttingen, Lower Saxony, Germany. In the Boulby potash mine, northwest of Whitby, Yorkshire, England. In the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan. From the Ilga Basin, eastern Siberia, Russia. In the Sedom Formation, on Mount Sedom, Dead Sea, Israel.

Name: Honors Eugene Woldemar Hilgard (1833–1916), German–American geologist, one of the first to study the Louisiana salt diapir deposits.

Type Material: Harvard University, Cambridge, Massachusetts, 100899, 100947, 106583; National Museum of Natural History, Washington, D.C., USA, R7822.

Total	100.24	100.00

(1) Velardeña, Mexico; total Fe as Fe_2O_3. (2) $Ca_2SiO_3(OH)_2$.

Occurrence: In limestone affected by high-grade contact metamorphism.

Association: Wollastonite, garnet (Velardeña, Mexico); calcite, vesuvianite, grossular (Carlingford, Ireland); foshagite (Crestmore, California, USA).

Distribution: In the Terneras mine, Velardeña, Durango, Mexico. In the USA, from Crestmore, Riverside Co., California. At Carlingford, Co. Louth, Ireland. In the Güneyce-İkizdere area, Trabzon Province, Turkey. From Mt. Chapchachi, north of the Caspian Sea, Kazakhstan. At Nugrah, Saudi Arabia. In the Hatrurim Formation, Israel. From Kushiro, Hiroshima Prefecture, and in the Mihari mine and at Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For William Francis Hillebrand (1853–1925), American geochemist and analytical chemist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 86531.

Hillite $Ca_2(Zn,Mg)(PO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As delicate needles, to several mm long.

Physical Properties: Hardness = n.d. D(meas.) = 1.43 D(calc.) = 1.467

Optical Properties: Semitransparent. *Color:* Yellow, yellowish green.
Optical Class: [Biaxial (+).] *Orientation:* $X \parallel$ elongation. $\alpha = \sim 1.75$ $\beta = \sim 1.75$ $\gamma = \sim 2.0$
2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$. $a = 15.81$ $b = 3.967$ $c = 7.876$ $\beta = 102.67°$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 28-2002).
3.52 (100), 7.69 (95), 3.36 (80), 6.16 (50), 3.84 (35), 3.14 (14), 3.79 (10)

Chemistry: (1) Modern identification would depend on coincidence of X-ray powder diffraction pattern with that of synthetic material (anthraquinone).

Occurrence: Very rare, in crusts around the surface vents of a burning coal deposit.

Association: Sal ammoniac, sulfur.

Distribution: On Mt. Pyramide, Spitsbergen, Norway.

Name: Honors Adolf Hoel (1879–1964), leader of the discovery expedition to Spitsbergen during which the mineral was found.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway, 21981.

(3) $CeBeSiO_4(OH)$.

Mineral Group: Gadolinite group.

Occurrence: In drusy pegmatite.

Association: Quartz, potassium feldspar, albite, zinnwaldite, cassiterite, stokesite, fluorite, chlorite, titanite,

Distribution: In the Iwaguro Sekizai quarry, Tahara, Gifu Prefecture, Japan.

Name: For the predominance of cerium and relation to *hingganite-(Y).*

Type Material: National Science Museum, Tokyo, Japan (NSM-M28552).

(3) Heilungkiang Province, China, by XRF and wet chemical analysis, analytical results not available; stated to correspond to $(Y_{0.33}Ce_{0.19}Nd_{0.10}La_{0.05}RE_{0.20}Fe^{3+}_{0.05}Fe^{2+}_{0.03}Na_{0.03})_{\sum=0.98}(Be_{0.97}Al_{0.03})_{\sum=1.00}(Si_{0.98}Al_{0.05})_{\sum=1.03}O_{4.00}[(OH)_{0.77}O_{0.23}]_{\sum=1.00}$.

Mineral Group: Gadolinite group.

Occurrence: In a RE, Be-bearing granophyre (Greater Khingan Range, China); in "amazonite"-rich pegmatite in a differentiated alkalic massif (Kola Peninsula, Russia).

Association: Hingganite-(Ce), quartz, potassium feldspar, albite, zinnwaldite, cassiterite, stokesite, fluorite, chlorite, titanite (Tahara area, Japan); aegirine, zircon, quartz (Mt. Malosa, Malawi).

Distribution: From an unspecified locality in the Greater Khingan Range, Heilungkiang Province, China. In the Trimouns talc deposit, six km northeast of Luzenac, Ariμege, France. From the [Keivy massif,] Kola Peninsula, and at Tastyg, Tuva, Russia. In the Iwaguro Sekizai quarry, Tahara area, Gifu Prefecture, Japan. On North Sugarloaf Mountain, Bethlehem, Grafton Co., New Hampshire, USA. On Mt. Malosa, Zomba district, Malawi.

Name: Presumably for the occurrence in the Greater Khingan (Hinggan) Range, China, and predominance of yttrium.

Type Material: Geology Bureau, Chinese Academy of Geological Sciences, Beijing, China.

Total	100.21	100.00

(1) Golden Fleece mine, Colorado, USA. (2) $(Pb,Sr)Al_3(PO_4)(SO_4)(OH)_6$ with Pb:Sr = 1:1.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral in the oxidized zone of polymetallic sulfide deposits.

Association: Barite, pyrite, galena, tetrahedrite, rhodochrosite (Golden Fleece mine, Colorado, USA).

Distribution: In the USA, large crystals from the Golden Fleece mine, near Lake City, Hinsdale Co., Colorado; in the Mineral Park mine, Mohave Co., Arizona; and at the Daisy Creek prospect, 25 km north of Thompson Falls, Sanders Co., Montana. In the Sylvester mine, Zeehan, and the Comet mine, Dundas, Tasmania; from Broken Hill, New South Wales, Australia. At Penkiln Burn, 13 km north-northeast of Newton Stewart, Kirkcudbrightshire, Scotland. In the Colettes massif, about 45 km southeast of Montluçon, Allier, France. From Bad Ems, Rhineland-Palatinate, Germany.

Name: For Hinsdale Co., Colorado, USA, source of the first specimens.

Type Material: Harvard University, Cambridge, Massachusetts, 101680, 101682, 101683; National Museum of Natural History, Washington, D.C., USA, 86987, 92971.

(1) Kipawa River, Canada; corresponding to $(Ca_{2.01}Na_{0.85}Y_{0.12}RE_{0.04})_{\Sigma=3.02}(Zr_{0.58}Nb_{0.02}Mn_{0.02}Ti_{0.01}Fe_{0.01}Mg_{0.01}Al_{0.01})_{\Sigma=0.66}Si_{2.05}O_7[F_{1.34}O_{0.41}(OH)_{0.18}]_{\Sigma=1.93}$.

Polymorphism & Series: Topological variants I and II, both triclinic.

Occurrence: A rare mineral in alkalic rocks, their pegmatites, and metamorphosed equivalents; in miarolitic cavities in sanidinites.

Association: Feldspar, biotite, meliphanite, titanite (Langesundsfjord, Norway); aegirine, astrophyllite, nepheline (Korgeredaba massif, Russia).

Distribution: In Norway, on Mittel Arø, Lille Arø, and Stokkø Islands, in the Langesundsfjord. In Italy, at Monte Somma and Vesuvius, Campania. From Mayen, Eifel district, Germany. At the Kangerdlugssuaq Fjord, Greenland. In Russia, in the Korgeredaba massif, Sangilen, Tuva. From the [Sheffield Lake complex,] Kipawa River, Villedieu Township, Quebec, Canada. On the Los Islands, Guinea. From the Jingera complex, New South Wales, Australia.

Name: After Professor Thorstein Hallager Hiortdahl (1839–1925), mineralogist of Kristiania (now Oslo), Norway.

Hisingerite $Fe_2^{3+}Si_2O_5(OH)_4 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Amorphous to poorly crystalline. *Point Group:* n.d. Commonly massive, compact; may be minutely spherical.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3
D(meas.) = 2.43–2.67 D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Black, dark brown; dark green masses may turn brown in light; in thin section, greenish brown or golden yellow. *Streak:* Yellowish brown. *Luster:* Resinous, vitreous, greasy.
Optical Class: Isotropic; locally anisotropic. n = 1.50–1.66

Cell Data: *Space Group:* n.d.

X-ray Powder Pattern: Riddarhyttan, Sweden; easily confused with neotocite.
4.45 (s), 3.53 (s), 2.56 (s), 1.71 (s), 1.54 (s)

Chemistry:

	(1)	(2)
SiO_2	35.08	34.15
Al_2O_3	1.38	
Fe_2O_3	40.28	45.38
FeO	2.23	
MgO	0.35	
CaO	0.36	
H_2O	20.78	20.47
Total	100.46	100.00

(1) Riddarhyttan, Sweden. (2) $Fe_2Si_2O_5(OH)_4 \cdot 2H_2O$.

Occurrence: A secondary mineral, formed from the weathering, or late-stage deuteric or hydrothermal alteration, of iron-bearing silicates or sulfides; by late-stage hydrothermal activity during sulfide ore deposition.

Association: Olivine, pyroxene, pyrite, chalcopyrite, pyrrhotite.

Distribution: In small amounts, easily overlooked, from many localities worldwide. Some for described material are: at Riddarhyttan, Västmanland, and Långban, Värmland, Sweden. From Fagul Cetatii, Balan, Romania. At Salberg, Norway. Found near Helsingfors, Finland. From Llallagua, Bolivia. In the USA, in the Hibbing district, St. Louis Co., Minnesota; in Arizona, at the Castle Dome mine, Gila Co., and on the Mildren and Steppe claims, Cababi district, Pima Co.; at the Gap Nickel mine, Lancaster Co., Pennsylvania. In Canada, from the Wilcox mine, Parry Sound, Ontario; at the Tetrault mines, near Montauban-les-mines, Quebec; and from Goldfields, Saskatchewan. In the Kawayama mine, Yamaguchi Prefecture; the Sano mine, Wakayama Prefecture; the Suzuyama mine, Kagoshima Prefecture; and other localities in Japan.

Name: For the Swedish chemist and mineralogist, Vilhelm Hisinger (1766–1852).

S	26.0	24.0	24.73
Total	100.6	99.9	100.00

(1) Tacama, Bolivia; by electron microprobe, corresponding to $(Ag_{1.65}Cu_{0.14})_{\Sigma=1.79}(Fe_{0.67}Zn_{0.32})_{\Sigma=0.99}Sn_{1.04}S_{4.00}$. (2) Himmelsfürst mine, Germany; by electron microprobe, corresponding to $(Ag_{2.10}Cu_{0.02})_{\Sigma=2.02}Fe_{0.96}Sn_{1.05}S_{4.00}$. (3) Ag_2FeSnS_4.

Polymorphism & Series: Forms a series with pirquitasite.

Mineral Group: Stannite group.

Occurrence: Of relatively high-temperature origin, typically in hydrothrmal tin-bearing deposits.

Association: Cassiterite, cylindrite, franckeite, suredaite, stannite, canfieldite, tetrahedrite, pyrargyrite, silver, sphalerite, wurtzite, siderite, fluorite.

Distribution: In Bolivia, from Tacama [TL], Hocaya, Colquechaca, Potosí, and Chocaya. In the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. At Fournial, Cantal, France [TL]. From the Himmelsfürst mine, Erbisdorf, near Freiberg, Saxony, Germany. In the Chat-Karagai tin deposit, Tallas Alatan, Russia. At the Huangshaping Pb–Zn deposit, Giuyang, Hunan Province, China. From the Toyoha mine, Hokkaido, Japan. In the USA, at Bisbee, Cochise Co., Arizona, and in the Dean mine, southeast of Battle Mountain, Lewis district, Lander Co., Nevada.

Name: Honors Raymond Hocart (1896–1983), Professor of Mineralogy, University of Paris, Paris, France.

Type Material: National School of Mines, Paris, France.

Hochelagaite $(Ca, Na, Sr)Nb_4O_{11}\cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Intimately intergrown with franconite, in bladed crystals, to 0.03 mm, radiating in globules, to 150 μm, commonly with a granular core; in radial spherical aggregates and matted fibrous masses.

Physical Properties: *Tenacity:* Brittle; flexible when fibrous. Hardness = ∼4 D(meas.) = 2.89(1) D(calc.) = 2.883 May show a weak pale yellow fluorescence under SW and LW UV.

Optical Properties: Semitransparent. *Color:* White. *Streak:* White. *Luster:* Vitreous to silky.
Optical Class: Biaxial (–). *Orientation:* Z = elongation; $X \perp$ blades. $\alpha = 1.72(1)$ $\beta = [1.81(1)]$ $\gamma = 1.82(1)$ 2V(meas.) = 35(5)°

Cell Data: *Space Group:* n.d. $a = 19.98(2)$ $b = 12.88(1)$ $c = 6.446(6)$ $\beta = 93.41(8)°$ Z = 4

X-ray Powder Pattern: Francon quarry, Canada.
10.0 (10), 3.115 (8), 3.208 (7), 5.39 (5), 4.96 (5b), 2.799 (4), 1.979 (3b)

Chemistry:

Total	[100.0]

(1) Francon quarry and Mont Saint-Hilaire, Canada; by electron microprobe, average of eight analyses, H_2O by difference, considered to be partially dehydrated from 8–9 H_2O required to match measured densities; corresponds to $(Ca_{0.84}Na_{0.16}Sr_{0.02})_{\Sigma=1.02}(Nb_{3.70}Si_{0.14}Ti_{0.11}Al_{0.05})_{\Sigma=4.00}O_{10.71}\cdot 5.47H_2O$. (2) Saint-Amable, Canada; by electron microprobe, corresponding to $(Ca_{0.87}Na_{0.13})_{\Sigma=1.00}(Nb_{3.81}Ti_{0.19}Mg_{0.05})_{\Sigma=4.05}O_{10.89}\cdot 8H_2O$.

Occurrence: In vugs of a dawsonite-bearing sill in a limestone deposit (Francon quarry, Canada); in cavities in altered pegmatite dikes, hornfels, sodalite syenite, or miarolitic cavities, associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in miarolitic cavities in a syenite sill (near Saint-Amable, Canada).

Association: Franconite, weloganite, calcite, quartz (Francon quarry, Canada).

Distribution: In the Francon quarry, Montreal Island, Montreal, at Mont Saint-Hilaire, and near Saint-Amable, Quebec, Canada. From Vardeåsen, Langesundsfjord, Norway.

Name: For *Hochelaga*, an early name for Montreal, Canada and its surrounds, within which the mineral occurs.

Type Material: Geological Survey of Canada, Ottawa, 64285–64288; Royal Ontario Museum, Toronto, Canada, M37547, M37548.

Hodgkinsonite $Mn^{2+}Zn_2(SiO_4)(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As euhedral crystals, stout prismatic and terminated by steep pyramids, also dominated by pyramidal forms, to 2 cm. Granular to massive in veinlets.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = < 5 D(meas.) = 4.06–4.08 D(calc.) = 4.07 Fluoresces weak pinkish red in LW UV.

Optical Properties: Transparent to translucent. *Color:* Bright pink or red to reddish brown and orange, rarely yellow; black from tarnish or inclusions.
Optical Class: Biaxial (–). *Pleochroism:* In shades of lavender and pale purple. *Orientation:* $Y = b$; $Z \wedge c = 38°$. *Dispersion:* $r > v$, strong. $\alpha = 1.720–1.724$ $\beta = 1.741–1.742$ $\gamma = 1.746$ 2V(meas.) = 50°–60°

Cell Data: *Space Group:* $P2_1/a$. $a = 8.171(2)$ $b = 5.316(2)$ $c = 11.761(2)$ $\beta = 95°15(5)'$ Z = 4

X-ray Powder Pattern: Franklin, New Jersey, USA.

Total	100.21	99.86	100.00

(1) Franklin, New Jersey, USA; average of three analyses. (2) Do.; by electron microprobe, average of eight samples, H_2O by the Penfield method. (3) $MnZn_2SiO_4(OH)_2$.

Occurrence: As seams in massive willemite-franklinite granular ore in a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA).

Association: Barite, willemite, franklinite, tephroite, pyrochroite, calcite, manganoan garnet, copper.

Distribution: From Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For H.H. Hodgkinson, Assistant Underground Superintendent of the Franklin mine, who discovered the mineral.

Type Material: Harvard University, Cambridge, Massachusetts, 89875, 89880, 89881; National Museum of Natural History, Washington, D.C., USA, 87231.

Hodrušhite $Cu_4Bi_6S_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely as needlelike, columnar or platy crystals, vertically striated, to 5 mm. Commonly as irregular grains and fine-grained aggregates. *Twinning:* Polysynthetic.

Physical Properties: *Tenacity:* Very brittle. Hardness = 3–4 VHN = 187–213, 200 average. D(meas.) = 6.35 D(calc.) = 6.451

Optical Properties: Opaque. *Color:* Steel-gray with slightly yellowish tint on fresh surface, tarnishes quickly to brownish orange; in polished section, creamy with very slight pinkish tint. *Luster:* Metallic. *Pleochroism:* Very weak. *Anisotropism:* Very feeble, in grays.
R_1–R_2: (400) 36.2–39.8, (420) 36.2–40.4, (440) 36.2–41.0, (460) 36.3–41.6, (480) 36.4–42.0, (500) 36.6–42.4, (520) 36.9–42.6, (540) 37.4–42.8, (560) 37.6–43.0, (580) 37.8–43.2, (600) 37.9–43.3, (620) 38.0–43.5, (640) 38.0–43.7, (660) 38.0–43.7, (680) 37.9–43.6, (700) 37.8–43.4

Cell Data: *Space Group:* $A2/m$. $a = 27.205(50)$ $b = 3.927(15)$ $c = 17.575(50)$ $\beta = 92°9(10)'$ $Z = 4$

X-ray Powder Pattern: Banská Hodruša, Slovakia.
3.102 (vs), 3.62 (s), 2.715 (s), 3.22 (m/s), 3.48 (m), 1.722 (m), 1.450 (w/m)

Chemistry:

	(1)	(2)	(3)
Cu	13.88	13.30	13.66
Fe	0.44	0.34	
Pb		0.65	
Cd		0.06	
Ag		1.01	
Bi	64.92	64.41	67.39
S	18.98	18.90	18.95
Total	98.22	98.67	100.00

(1) Banská Hodruša, Slovakia; by electron microprobe, corresponding to $Cu_{4.06}Fe_{0.15}Bi_{5.77}S_{11.00}$. (2) Ocna de Fier, Romania; by electron microprobe, average of ten analyses; corresponding to $Cu_{3.90}Ag_{0.18}Fe_{0.12}Pb_{0.06}Cd_{0.01}Bi_{5.74}S_{11.00}$. (3) $Cu_4Bi_6S_{11}$.

Occurrence: In a polymetallic ore deposit of subvolcanic type, in a quartz vein system developed in propylitized pyroxenite andesite (Banská Hodruša, Slovakia).

Association: Quartz, hematite, chalcopyrite, wittichenite (?), pavonite (Banská Hodruša, Slovakia).

Distribution: From the Rosalia mine, Banská Hodruša, near Banská Štiavnica (Schemnitz), Slovakia [TL]. In the Paulus mine, Ocna de Fier (Morávicza; Vaskő); at Băiţa (Rézbánya); and from Valea Seacă, Romania. In the USA, at the Black Metals (Jackrabbit) mine, Bristol district, Lincoln Co., Nevada; from the Alice mine, Clear Creek Co., Colorado; and in the Campbell mine, Bisbee, Cochise Co. From the Julcani district, Peru.

Name: For the mining community of Banská Hodruša, Slovakia.

Type Material: n.d.

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As delicate needles, to several mm long.

Physical Properties: Hardness = n.d. D(meas.) = 1.43 D(calc.) = 1.467

Optical Properties: Semitransparent. *Color:* Yellow, yellowish green.
Optical Class: [Biaxial (+).] *Orientation:* $X \parallel$ elongation. $\alpha = \sim 1.75$ $\beta = \sim 1.75$ $\gamma = \sim 2.0$
2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$. $a = 15.81$ $b = 3.967$ $c = 7.876$ $\beta = 102.67°$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 28-2002).
3.52 (100), 7.69 (95), 3.36 (80), 6.16 (50), 3.84 (35), 3.14 (14), 3.79 (10)

Chemistry: (1) Modern identification would depend on coincidence of X-ray powder diffraction pattern with that of synthetic material (anthraquinone).

Occurrence: Very rare, in crusts around the surface vents of a burning coal deposit.

Association: Sal ammoniac, sulfur.

Distribution: On Mt. Pyramide, Spitsbergen, Norway.

Name: Honors Adolf Hoel (1879–1964), leader of the discovery expedition to Spitsbergen during which the mineral was found.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway, 21981.

References: (1) Oftedal, I. (1922) Minerals from the burning coal seam at Mt. Pyramide, Spitsbergen. Resultater av de Norske Statsunderstøttede Spitsbergenekspeditioner, 1(3), 9–14.

Hoganite $Cu(C_2H_3O_2)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Isolated crystals are short prismatic, thick tabular, showing {110}, {10$\overline{1}$}, {01$\overline{1}$}, {2$\overline{1}\overline{1}$}, {1$\overline{1}\overline{2}$}, to 0.6 mm.

Physical Properties: *Cleavage:* On {001}, perfect; on {110}, distinct (synthetic). *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1.5 D(meas.) = n.d. D(calc.) = 1.910

Optical Properties: Transparent. *Color:* Dark bluish green. *Streak:* Pale blue. *Luster:* Vitreous.
Optical Class: Biaxial (+) (synthetic). *Pleochroism:* Strong; X = blue; Y = pale blue; Z = pale bluish green. *Dispersion:* $r < v$, medium. *Absorption:* $X > Y > Z$. $\alpha = 1.533(2)$ $\beta = 1.541(3)$ $\gamma = 1.554(2)$ 2V(meas.) = 85(5)° 2V(calc.) = 76.8°

Cell Data: *Space Group:* $C2/c$. $a = 13.162(3)$ $b = 8.555(2)$ $c = 13.850(3)$ $\beta = 117.08(3)°$ Z = 8

X-ray Powder Pattern: Potosi pit, Australia.
6.921 (100), 3.532 (28), 6.176 (14), 3.592 (11), 5.382 (10), 2.278 (10), 5.872 (9)

Chemistry:

	(1)	(2)
Cu	31.6	31.83
Fe	0.4	
C	23.85	24.06
H	3.95	4.04
O	[40.2]	40.07
Total	[100.0]	100.00

(1) Potosi pit, Australia; by AA, C and H by CHN analyzer, average of two analyses, O by difference; corresponds to $Cu_{1.00}Fe_{0.01}C_{4.00}H_{7.89}O_{5.07}$; equivalence to the synthetic compound was established by crystal-structure analysis. (2) $Cu(C_2H_3O_2)_2 \cdot H_2O$.

Occurrence: Formed in ferruginous gossan by reaction of oxidized zone metallic minerals with decaying vegetable matter provided by leaf litter and possibly mine timbers.

Association: Paceite, linarite, malachite, azurite, cuprian smithsonite, cerussite, goethite, hematite, quartz.

Distribution: From the Potosi Ag–Pb–Zn pit, two km northeast of Broken Hill, New South Wales, Australia.

Name: To honor Graham P. Hogan (1957–), Broken Hill, Australia, miner and collector of Broken Hill minerals, who found the first specimens.

Type Material: Broken Hill Geocentre, Broken Hill; Australian Museum, Sydney; Museum of Victoria, Melbourne, Australia, M47465.

(1) Near Mo i Rana, Norway; by electron microprobe and ICP, average of four samples, Fe^{2+}:Fe^{3+} by wet chemical analysis and Mössbauer spectroscopy; corresponding to $(Ca_{1.63}Na_{0.43})_{\Sigma=2.06}(Fe^{2+}_{3.42}Fe^{3+}_{2.08}Ti_{0.30}Mg_{0.09}Mn_{0.03}Sn_{0.03})_{\Sigma=5.95}(Si_{4.60}Be_{0.92}Al_{0.45})_{\Sigma=5.97}O_{20}$. (2) Ilmen Mountains, Russia; original total given as 100.28%; corresponding to $(Ca_{2.09}Na_{0.38}K_{0.03})_{\Sigma=2.50}(Fe^{2+}_{3.29}Fe^{3+}_{1.22}Ti_{0.66}Mg_{0.30}Mn_{0.08})_{\Sigma=5.55}(Si_{4.39}Be_{0.81}Al_{0.61})_{\Sigma=5.81}O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: As a late-stage metamorphic mineral in peraluminous granitic gneisses and mafic pegmatites associated with a beryllium deposit (near Mo i Rana, Norway).

Association: Quartz, albite, microcline, biotite, phenakite, zircon, fluorite, calcite, many minor beryllium and sulfide minerals (near Mo i Rana, Norway).

Distribution: Found about 16 km northwest of Mo i Rana, Norway. In the Ilmen Mountains, Southern Ural Mountains, Russia.

Name: For Høgtuva Mountain, near the type locality in Norway.

Type Material: University of Oslo, Oslo, Norway; National Museum of Natural History, Washington, D.C., USA.

Hohmannite $Fe_2^{3+}O(SO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are short prismatic along [001], to 1 mm, typically with dull or rounded and striated faces; as granular aggregates.

Physical Properties: *Cleavage:* {010}, perfect; {110} and {1$\overline{1}$0}, less perfect (referred to morphological axes; relation to X-ray axes uncertain). Hardness = 3 D(meas.) = 2.255 D(calc.) = 2.250 Decomposes in hot H_2O; rapidly dehydrates to metahohmannite on exposure to air.

Optical Properties: Transparent to translucent. *Color:* Chestnut-brown to burnt orange, pale amaranth-red. *Streak:* Yellow-orange. *Luster:* Vitreous, brilliant.
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow; Y = pale greenish yellow; Z = dark greenish yellow. *Orientation:* $Y \wedge c = 23°$. *Dispersion:* $r > v$, extreme. $\alpha = 1.553$–1.559 $\beta = 1.643$ $\gamma = 1.655$–1.657 2V(meas.) = 40°

Cell Data: *Space Group:* $P\overline{1}$. $a = 9.148(1)$ $b = 10.922(1)$ $c = 7.183(3)$ $\alpha = 90.29(6)°$ $\beta = 90.79(4)°$ $\gamma = 107.36(2)°$ Z = 2

X-ray Powder Pattern: Sierra Gorda district, Chile.
7.92 (FFF), 8.69 (FF), 10.36 (F), 3.46 (F), 5.31 (mF), 3.12 (mF), 3.95 (mf)

Chemistry:

	(1)	(2)
SO_3	33.80	34.52
Fe_2O_3	33.92	34.42
H_2O	30.76	31.06
insol.	1.15	
Total	99.63	100.00

(1) Sierra Gorda district, Chile. (2) $Fe_2O(SO_4)_2 \cdot 8H_2O$.

Occurrence: An uncommon low-temperature precipitate in oxidized iron sulfide deposits.

Association: Metahohmannite, copiapite, amarantite, sideronatrite (Sierra Gorda district, Chile); chalcanthite, picromerite, amarantite, fibroferrite, copiapite (Chuquicamata, Chile); metahohmannite, sulfur, cinnabar (Redington mine, California, USA).

Distribution: In Chile, in Antofagasta, from near Caracoles, Sierra Gorda district, and at Alcaparrosa, near Cerritos Bayos, both southwest of Calama; at Quetena, west of Calama; and from Chuquicamata. At the Redington mine, Knoxville, Napa Co., California, USA. From Saghand, Yazd, Iran. In the Plaka mine, near Laurium, Greece.

Name: Honors Thomas Hohmann (1843–1897), mining engineer of Valparaiso, Chile who discovered the first specimens.

Type Material: Mining Academy, Freiberg, Germany, 18623.

Holdawayite $Mn_6^{2+}(CO_3)_2(OH)_7(Cl,OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibrous along [001]; commonly in granular aggregates, or massive, with individual grains to 2 cm.

Physical Properties: *Cleavage:* On {100}, perfect. *Fracture:* Irregular.
Tenacity: Moderately brittle. Hardness = ∼3 D(meas.) = 3.19(4) D(calc.) = 3.24

Optical Properties: Transparent to translucent. *Color:* Pale to dark pink if fresh, turning brown on exposure, developing a dark sooty coating. *Streak:* Pale pink. *Luster:* Vitreous, silky in fibrous aggregates.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 45(3)°$. *Dispersion:* $r < v$, moderate.
$\alpha = 1.644(1)$ $\beta = 1.719(1)$ $\gamma = 1.721(1)$ 2V(meas.) = 12(3)° 2V(calc.) = 18°

Cell Data: *Space Group:* $C2/m$. $a = 23.437(5)$ $b = 3.3137(3)$ $c = 16.618(6)$
$\beta = 111.15(2)°$ Z = 4

X-ray Powder Pattern: Kombat mine, Namibia.
10.93 (100), 5.459 (80), 3.879 (70), 2.690 (60b), 2.589 (50b), 7.77 (40), 2.926 (40)

Chemistry:

	(1)
CO_2	14.2
B_2O_3	1.2
FeO	0.2
MnO	64.6
MgO	4.4
CaO	0.5
Cl	4.4
H_2O	11.47
$-O = Cl_2$	1.0
Total	100.0

(1) Kombat mine, Namibia; by electron microprobe, C by Leco analyzer, H_2O by the Penfield method, B may be due to sussexite contamination; corresponds to $(Mn_{5.24}Mg_{0.62}Ca_{0.06}Fe_{0.02})_{\Sigma=5.94}[(CO_3)_{1.86}(BO_3)_{0.20}]_{\Sigma=2.06}[(OH)_{7.34}Cl_{0.74}]_{\Sigma=8.08}$.

Occurrence: Locally abundant as a rare vein mineral in low-grade metamorphosed Mn-rich sedimentary rocks intercalated with sedimentary iron deposits.

Association: Kutnohorite, ribbeite, alleghanyite, manganoan jacobsite, pyrochroite, sussexite, galena, copper, hydroxylapatite, calcian rhodochrosite, hematite, siderite, dolomite, calcite (Kombat mine, Namibia).

Distribution: From the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. At Răzore, Preluca Mountains, Romania.

Name: Honors Dr. Michael Jon Holdaway (1936–), Professor of Petrology, Southern Methodist University, Dallas, Texas, USA.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 51510, 51511; National Museum of Natural History, Washington, D.C., USA, 163209.

Holdenite $(Mn^{2+},Mg)_6Zn_3(AsO_4)_2(SiO_4)(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As complex crystals tabular on {100}, with {110}, {7.16.2}, {211}, {131}, to 1 cm. In aggregates of highly irregular microcrystals; fibrous, fine-grained, massive.

Physical Properties: *Cleavage:* {010}, poor. *Fracture:* Subconchoidal. Hardness = 4
D(meas.) = 4.11(1) D(calc.) = 4.11

Optical Properties: Transparent to translucent. *Color:* Pink, orange, yellowish to deep red; pink in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z =$ a. *Dispersion:* $r > v$, distinct.
$\alpha = 1.769$ $\beta = 1.770$ $\gamma = 1.785$ 2V(meas.) = 30°20′ 2V(calc.) = 28°58′

Cell Data: *Space Group: Abma.* a = 11.99(1) $b = 31.46(4)$ $c = 8.697(6)$ Z = 8

X-ray Powder Pattern: Franklin, New Jersey, USA.
2.838 (10), 3.582 (8), 2.583 (8), 1.531 (8), 2.464 (7), 3.406 (6), 5.740 (5)

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O from theoretical composition.
(2) Sterling Hill, New Jersey, USA; by electron microprobe, H_2O from theoretical composition.
(3) $(Mn_{5.45}Mg_{0.55})_{\Sigma=6.00}Zn_3(AsO_4)_2(SiO_4)(OH)_8$.

Occurrence: A secondary mineral in veinlets, on slip surfaces, and as interstitial fillings within a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA).

Association: Franklinite, willemite, pyrochroite, barite, kolicite, sussexite, kraisslite, zincite, sphalerite, galena, calcite, rhodochrosite.

Distribution: From Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For the mining engineer Albert Fairchild Holden (1866–1913), of Salt Lake City, Utah, USA, in whose collection the mineral was first noticed.

Type Material: Harvard University, Cambridge, Massachusetts, 89996; National Museum of Natural History, Washington, D.C., USA, 95434, 162601.

Hollandite $Ba(Mn^{4+},Mn^{3+})_8O_{16}$

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Crystals short prismatic with flat pyramidal termination, to several cm; radial fibrous, massive. *Twinning:* Common on {101} or $\{10\bar{1}\}$.

Physical Properties: *Cleavage:* Prismatic, distinct. *Tenacity:* Brittle. Hardness = 6 VHN = 488–560 || [001], 620–689 ⊥ [001] (100 g load). D(meas.) = 4.95 D(calc.) = [4.93]

Optical Properties: Opaque. *Color:* Black, grayish black to silvery gray; in reflected light, white. *Streak:* Black. *Luster:* Metallic, splendent.
Optical Class: Biaxial. *Pleochroism:* Weak. *Anisotropism:* Strong.
R_1–R_2: (400) 31.3–37.7, (420) 31.2–37.4, (440) 31.1–37.1, (460) 30.5–36.5, (480) 29.7–35.9, (500) 29.1–35.0, (520) 28.5–34.2, (540) 27.8–33.1, (560) 27.1–32.2, (580) 26.6–31.5, (600) 26.3–30.9, (620) 26.1–30.4, (640) 25.8–30.0, (660) 25.6–29.5, (680) 25.3–29.0, (700) 25.0–28.4

(1) Kajlidongri, India; corresponds to $Ba_{0.95}[Mn^{4+}_{6.23}Mn^{2+}_{0.59}(Fe,Al)_{1.24}]_{\Sigma=8.06}O_{16}$. (2) Stuor Njvoskes, Sweden; by electron microprobe, average of several analyses, Mn^{4+}:Mn^{3+} calculated for charge balance; corresponds to $(Ba_{0.75}Pb_{0.16}Na_{0.10}K_{0.04})_{\Sigma=1.05}(Mn^{4+}_{6.08}Fe^{3+}_{1.32}Mn^{3+}_{0.50}Al_{0.23}Si_{0.08})_{\Sigma=8.21}O_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: A primary mineral in contact metamorphic manganese ores, and a secondary weathering product of earlier manganese-bearing minerals.

Association: Bixbyite, braunite, piemontite, other manganese oxides.

Distribution: In India, at Kajlidongri and Sitapar, Chhindwara district, Madhya Pradesh; in the Nagpur and Balaghat districts, Maharashtra; at Banswara, Rajasthan; and elsewhere. From Sörhårrås, Ultevis, Sweden. In Norway, from Tangen, Hurdal. At Langenberg, Saxony, Germany. From Inken, Tiovine region, Morocco. In the USA, in the Artillery Mountains, Mohave Co., and in the Apache mine, Sierra Ancha district, Gila Co., Arizona.

Name: For Dr. Thomas Henry Holland (1868–1947), Director of the Indian Geological Survey.

Type Material: n.d.

(2) Noril'sk, Russia; by electron microprobe, corresponding to $(Rh_{0.60}Pt_{0.25}Ru_{0.10}Ir_{0.06})_{\Sigma=0.98}As_{1.15}S_{0.84}$. (3) Shetland Islands; by electron microprobe, corresponding to $(Rh_{0.97}Fe_{0.02})_{\Sigma=0.99}As_{1.03}S_{0.98}$.

Polymorphism & Series: Forms a series with irarsite.

Mineral Group: Cobaltite group.

Occurrence: In platinum deposits in dunite pipes, layered ultramafic intrusives, and chromatites; in Cu–Ni sulfide ores.

Association: Sperrylite, geversite, erlichmanite, irarsite, Pt–Fe alloys (South Africa); chalcopyrite, cobaltite, gersdorffite, pyrrhotite (Canada); Au–Ag alloy, braggite, sperrylite, cobaltite, pyrrhotite, pentlandite, pyrite, chalcopyrite (Stillwater complex, Montana, USA).

Distribution: Increasingly recognized as an economically important platinum-group mineral. In South Africa, in the Merensky Reef, Bushveld complex, Transvaal, from the Driekop [TL], Onverwacht, and Tweefontein mines. In the Upper and Banded zones of the Stillwater complex, Montana; from the Yuba River, Nevada Co., California; and at Goodnews Bay, Alaska, USA. In Canada, at Sudbury and Werner Lake, Ontario. From the Noril'sk region, western Siberia, and around Nizhni Tagil, Ural Mountains, Russia. In Finland, from the Hitura Ni–Cu deposit, and in the Siikakämä intrusion. At the Maja e Sukës chromite deposit, Tropoja massif, Albania. From the Cliff and Harold's Grave quarries, Shetland Islands. Numerous other trace occurrences are now known.

Name: To honor Professor Sidney Ewart Hollingworth (1899–1966), eminent British geologist, University College, London, England.

Type Material: National School of Mines, Paris, France.

Polymorphism & Series: Dimorphous with clinoholmquistite; forms a series with ferroholmquistite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: 0.1 $Mg/(Mg + Fe^{2+})$ 0.89; $(Ca + Na)_B < 1.34$; $Li \geq 1.0$.

Occurrence: As metasomatic replacements near the outer margins of lithium-rich pegmatites.

Association: Quartz, clinoholmquistite, tourmaline, spodumene, plagioclase, biotite, clinozoisite, "hornblende."

Distribution: At Utö, Sweden. From Brandrücken, Austria. In the USA, from Hiddenite, Alexander Co., and the Foote mine, Kings Mountain, Cleveland Co., North Carolina; in the Harding pegmatite, Dixon, Taos Co., New Mexico; and around Keystone, Pennington Co., South Dakota. At Barraute, and near St. Benoit, Quebec, and in the Tanco pegmatite, Bernic Lake, Manitoba, Canada. In the Benson pegmatite mine, Mtoko-Fungwe area, Zimbabwe. From the Vredefort Ring crater, Orange Free State, South Africa. At Greenbushes, Western Australia.

Name: To honor the Swedish petrologist, Per Johan Holmquist (1866–1946), of Stockholm.

Type Material: n.d.

Holtedahlite $Mg_{12}(PO_4)_5(PO_3OH, CO_3)(OH, O)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Massive, in patches to 1 cm.

Physical Properties: *Fracture:* Uneven. Hardness = 4.5–5 D(meas.) = 2.94(2) D(calc.) = 2.936

Optical Properties: Transparent. *Color:* Colorless, grayish from inclusions of magnetite. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.599(1)$ $\epsilon = 1.597(1)$

Cell Data: *Space Group:* $P31m$. $a = 11.203(3)$ $c = 4.977(1)$ $Z = 1$

X-ray Powder Pattern: Tingelstadtjern quarry, Norway.
2.438 (100), 3.722 (90), 3.475 (50), 3.234 (30), 2.796 (30), 2.177 (30), 1.859 (30)

Chemistry:

	(1)
P_2O_5	41.19
CO_2	2.06
MnO	0.06
MgO	50.01
Na_2O	0.22
F	0.34
H_2O	6.22
$-O = F_2$	0.14
Total	99.96

(1) Tingelstadtjern quarry, Norway; by electron microprobe, $(OH)^{1-}$, CO_2, and PO_4 confirmed by IR and elemental analyser; corresponds to $(Mg_{11.84}Na_{0.07})_{\Sigma=11.91}(PO_4)_5[(PO_3OH)_{0.54}(CO_3)_{0.44}]_{\Sigma=0.98}[(OH)_{5.83}F_{0.17}]_{\Sigma=6.00}$.

Polymorphism & Series: Dimorphous with althausite.

Occurrence: In a serpentine–magnesite deposit (Tingelstadtjern quarry, Norway); a common accessory mineral, of likely pneumatolytic origin, in an igneous magnetite–apatite deposit (Gole Gohar, Iran).

Association: Althausite, szaibelyite, apatite, talc, magnetite, magnesite (Tingelstadtjern quarry, Norway).

Distribution: From the Tingelstadtjern quarry, Modum, Norway. Into the millions of tons at the Gole Gohar iron deposit, Bafq district, Iran.

Name: Honors Olaf Holtedahl (1885–1975), Professor of Geology, University of Oslo, Oslo, Norway.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway; National Museum of Natural History, Washington, D.C., USA, 128674.

Holtite $\mathbf{Al_6(Al,Ta)(BO_3)[(Si,Sb,As)O_4]_3(O,OH)_3}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. In blocky crystals, to 2 cm; as pseudohexagonal needles, elongated along [100], typically S-shaped; finely crystalline. *Twinning:* Multiple on {011}.

Physical Properties: *Cleavage:* Good on {001}, may be parting. Hardness = 8.5 D(meas.) = 3.60–3.90 D(calc.) = [3.92] Fluoresces dull orange under SW UV and bright yellow under LW UV.

Optical Properties: Semitransparent. *Color:* Light buff to cream-buff or deep olive-buff, brown, russet. *Streak:* Light buff. *Luster:* Resinous, vitreous, dull when weathered. *Optical Class:* Biaxial (–). *Pleochroism:* Various shades of yellow to colorless. *Orientation:* $X = a$. *Dispersion:* $r < v$. $\alpha = 1.705$–1.746 $\beta = 1.728$–1.759 $\gamma = 1.730$–1.761 2V(meas.) = 20°–55°

Cell Data: *Space Group: Pnma.* $a = 4.6914(5)$ $b = 11.896(2)$ $c = 20.383(4)$ Z = 4

X-ray Powder Pattern: Greenbushes, Western Australia.
10.28 (100), 2.94 (40), 5.89 (34), 5.93 (32), 5.08 (32), 2.338 (26), 5.12 (24)

(1) Greenbushes, Western Australia; B_2O_3 thought to be low; corresponding to $Al_{24.50}Ta_{1.36}Nb_{0.16}Fe^{3+}_{0.10}Be_{0.05}Ti_{0.03}Mn_{0.02}B_{1.40}Si_{9.09}Sb^{3+}_{2.56}Sb^{5+}_{0.76}O_{66.62}(OH)_{1.13}$. (2) Kola Peninsula, Russia; corresponding to $Al_{23.23}Ta_{1.49}Nb_{0.03}Fe_{0.09}Mg_{0.06}Ca_{0.06}Ti_{0.03}B_{3.84}Si_{10.64}Sb^{5+}_{1.15}As^{5+}_{0.72}O_{69.57}(OH)_{2.09}$.

Occurrence: As coatings on stibiotantalite and replacing tantalite in a pegmatite (Greenbushes, Western Australia); in pegmatites cutting amphibolites (Voron'i massif, Russia).

Association: Stibiotantalite, tantalite, tourmaline, microlite, quartz (Greenbushes, Western Australia); stibiotantalite, microlite, tantite (Voron'i massif, Russia).

Distribution: At Bunbury Gully, Greenbushes, Western Australia. From the Voron'i massif, Kola Peninsula, Russia.

Name: For Harold Edward Holt (1908–1967), Prime Minister of Australia (1966–1967).

Type Material: Government Chemical Laboratories, Perth, Australia, MDC550.

Holtstamite $Ca_3(Al,Mn^{3+})_2(SiO_4)_{3-x}(H_4O_4)_x$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As rounded composite grains to 3 mm; individual crystals, to 0.2 mm, are pseudo-octahedral by twinning. *Twinning:* Around [111].

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6 D(meas.) = n.d. D(calc.) = 3.25

Optical Properties: Transparent. *Color*: Pale brownish yellow. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Uniaxial (+). ω = 1.718(2) ε = 1.746(2) *Pleochroism*: Weak; *O* = pale orange; *E* = lemon yellow. *Absorption*: *E* > *O*.

Cell Data: *Space Group*: $I4_1/acd$. *a* = 12.337(3) *c* = 11.930(5) *Z* = 8

X-ray Powder Pattern: Wessels mine, Kalahari manganese field, South Africa.
2.743 (100), 1.614 (56), 2.757 (55), 2.685 (54), 2.501 (47), 2.978 (45), 3.082 (44)

Chemistry:

	(1)
SiO_2	26.26
Al_2O_3	10.77
Mn_2O_3	11.64
Fe_2O_3	6.30
CaO	36.76
$[H_2O]$	7.87
Total	99.61

(1) Wessels mine, Kalahari manganese field, South Africa; average of 15 electron microprobe analyses, H_2O calculated, OH^- confirmed by IR spectroscopy, Mn^{3+} confirmed by optical absorption spectroscopy; corresponding to $Ca_3(Al_{0.96}Mn^{3+}_{0.68}Fe^{3+}_{0.37})_{\Sigma=2.01}(SiO_4)_{2.00}(H_4O_4)_{0.99}$.

Polymorphism and Series: Polymorphous with hibschite; is the Al-analogue of henritermierite. Forms a solid solution series with henritermierite; crystals commonly compositionally zoned with cores of henritermierite and rims of holtstamite.

Occurrence: In a manganese-rich calc-silicate contact metamorphic rock.

Association: Mn^{3+}-bearing vesuvianite, calcite, henritermierite

Distribution: Wessels mine, Kalahari manganese field, South Africa.

Name: Honors Dr. Dan Holtstam (b. 1963) for his contributions to Swedish mineralogy and specifically Mn deposits of the Långban type.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden (960380).

References: (1) Hålenius, U., U. Häussermann, and H. Harryson. (2005) Holtstamite, $Ca_3(Al,Mn^{3+})_2(SiO_4)_{3-x}(H_4O_4)_x$, a new tetragonal hydrogarnet from Wessels Mine, South Africa. Eur. J. Mineral., 17, 375-382. (2) (2005) Amer. Mineral., 90, 1946 (abs. ref. 1).

Homilite $Ca_2(Fe^{2+},Mg)B_2Si_2O_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly tabular on {001}, also with {100} prominent; pseudo-octahedral by development of {110} and {012} or $\{\bar{1}11\}$, to 5 cm. *Twinning:* On {001} and {100}; also on {034} to produce cruciform twins.

Physical Properties: *Cleavage:* Indistinct. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.34–3.38 D(calc.) = 3.451

Optical Properties: Opaque, translucent only in thin fragments. *Color:* Black to blackish brown. *Streak:* Grayish. *Luster:* Resinous to vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = bluish green; Y = deep brownish red to brownish gray; Z = smoky gray or brownish yellow. *Orientation:* $Z = b$; $Y \wedge c = -1°$. *Dispersion:* $r > v$, distinct, with strong horizontal dispersion. *Absorption:* $Y > X > Z$. $\alpha = 1.715$ $\beta = 1.725$ $\gamma = 1.738$ 2V(meas.) = 80°

Cell Data: *Space Group:* $P2_1/a$. $a = 9.786(2)$ $b = 7.621(2)$ $c = 4.776(1)$ $\beta = 90.61(2)°$ Z = 2

X-ray Powder Pattern: Store-Arø Island, Langesundsfjord, Norway. (ICDD 17-211).

Total	[100.00]	[100.00]	100.00

(1) Langesundsfjord, Norway; B_2O_3 by difference. (2) Do.; by electron microprobe, B_2O_3 by difference. (3) $Ca_2FeB_2Si_2O_{10}$.

Mineral Group: Gadolinite group.

Occurrence: In pegmatite.

Association: Allanite, meliphanite, titanite, zircon, aegirine, löllingite, astrophyllite, melanocerite, nordenskiöldine, wöhlerite, hiortdahlite, molybdenite.

Distribution: On Stokkø, Store-Arø, and Øvre-Arø Islands, in the Langesundsfjord, Norway.

Name: From the Greek for *to occur together*, in allusion to its association with meliphanite and "erdmannite" (allanite).

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 505–507.

Total	97.9		100.00

(1) Linden, Iowa, USA. (2) Unst, Scotland; by electron microprobe, $(SO_4)^{2-}$ confirmed by IR, low amount may be due to $(CO_3)^{2-}$ in reevesite admixture; corresponds to $Ni_{5.8}Fe_{2.2}(SO_4)_{0.5}(OH)_{16}\cdot 4H_2O$. (3) $Ni_6Fe_2(SO_4)(OH)_{16}\cdot 4H_2O$.

Occurrence: A rare oxidation product of nickel sulfide minerals.

Association: Millerite, violarite, bravoite (Linden, Wisconsin, USA); reevesite, hydrohonessite, theophrastite (Unst, Scotland).

Distribution: In the USA, from the Linden Pb–Zn deposit, near Linden, Iowa Co., and at Hall's Gap, Lincoln Co., Wisconsin. At the Kamariza mine, Laurium, Greece. In the Hagdale quarry, Unst, Shetland Islands, Scotland.

Name: Honors Professor Arthur Pharoah Honess (1887–1942), American mineralogist, Pennsylvania State University, State College, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 117698.

Total	99.45	99.84	100.00

(1) China; by electron microprobe, average of analyses on four grains. (2) Itabira district, Brazil; by electron microprobe. (3) PtCu.

Occurrence: In an actinolized diopside-type of platinum deposit (China); in high-grade hematitic veins in itabirite, typically rimmed by platinum from which copper has been leached (Brazil); in Alpine-type ultramafic intrusives and related placers.

Association: Cooperite, sperrylite, vysotskite, isomertieite, magnetite, bornite, polydymite, diopside, actinolite, epidote (China); sperrylite, isomertieite, atheneite, sudovicovite, palladian gold, platinum, platinian tetra-auricupride (Brazil)

Distribution: In China [originally described from the "Yen" district, a code name, previously given as the "Hong", "Huang", or "Hung" district], in Hebei Province, from near Hongshi village, Fengning Co. [TL]. In Russia, in a placer in the Upper Miask River, Southern Ural Mountains; from the Konder massif, Aldan Shield, Sakha; and in placers on the Pustaya River, Kamchatka. From Fox Gulch, Goodnews Bay, Alaska, USA. In a placer on the North Saskatchewan River, near Edmonton, Alberta, Canada. From placers along the Santiago River, Esmeraldas Province, Ecuador. In the Cauê and Conceição iron mines, Itabira district, Minas Gerais, Brazil.

Name: For its occurrence near Hongshi village, China.

Type Material: Institute of Geology, Chinese Academy of Geological Sciences, Beijing, China.

Hopeite $Zn_3(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic along [001] or tabular on {010}, showing {010}, {110}, {031}, {131}, to 6 mm; in divergent aggregates or as crusts; compact reniform.

Physical Properties: *Cleavage:* Perfect on {010}; good on {100}; poor on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 3.05–3.065 D(calc.) = 3.116

Optical Properties: Transparent to translucent. *Color:* Colorless, grayish white, pale yellow; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, pearly on {010} cleavages. *Optical Class:* Biaxial (–); sections ∥ {100} are optically sectorially zoned. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$, perceptible. $\alpha = 1.574–1.589$ $\beta = 1.582–1.598$ $\gamma = 1.582–1.599$ $2V(meas.) = 37°$

Cell Data: *Space Group: Pnma.* $a = 10.597(3)$ $b = 18.318(8)$ $c = 5.031(1)$ $Z = 4$

X-ray Powder Pattern: Kabwe, Zambia. (ICDD 37-465).
4.568 (100), 2.853 (65), 9.12 (60), 3.460 (25), 3.388 (25), 4.410 (20), 1.939 (19)

Chemistry:

	(1)	(2)
P_2O_5	31.8	30.98
ZnO	52.1	53.29
H_2O	16.1	15.73
Total	100.0	100.00

(1) Kabwe, Zambia. (2) $Zn_3(PO_4)_2 \cdot 4H_2O$.

Polymorphism & Series: Dimorphous with parahopeite.

Occurrence: A rare, late-stage mineral in some hydrothermal zinc deposits and complex granite pegmatites; incrusting bone breccia in a limestone cave.

Association: Tarbuttite, hemimorphite, spencerite, smithsonite, vanadinite (Kabwe, Zambia); triphylite, ferrisicklerite, leucophosphite, laueite, robertsite, hydroxylapatite, sphalerite (Tip Top mine, South Dakota, USA).

Distribution: Found at Vieille Montagne (Altenberg), Moresnet district, Belgium. In Germany, at Bad Ems, Rhineland-Palatinate; from Hagendorf, Bavaria; and at Oberschulenberg, Harz Mountains. Large crystals at Kabwe (Broken Hill), Zambia. From the Hudson Bay mine, about eight km southeast of Salmo, British Columbia, Canada. In the USA, at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; and in the Iron Cap Pb–Zn mine, near Aravaipa, Graham Co., Arizona.

Name: Honors Thomas Charles Hope (1766–1844), Professor of Chemistry, University of Edinburgh, Edinburgh, Scotland.

Hörnesite $Mg_3(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, elongated along [001] and flattened on {010}, with a few other forms, to 1.5 mm; radial, foliated, columnar.

Physical Properties: *Cleavage:* Perfect on {010}, poor on {100}. *Tenacity:* Flexible. Hardness = 1 D(meas.) = 2.57–2.73 D(calc.) = 2.57

Optical Properties: Transparent. *Color:* White; colorless in transmitted light. *Luster:* Resinous to waxy, pearly on cleavages. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 31°$. $\alpha = 1.563$ $\beta = 1.571$ $\gamma = 1.596$ 2V(meas.) = 60°

Cell Data: *Space Group:* $C2/m$. $a = 10.26(2)$ $b = 13.44(2)$ $c = 4.74(1)$ $\beta = 104.9(1)°$ Z = 2

X-ray Powder Pattern: Băiţa (Rézbánya), Romania. 6.692 (100), 3.005 (50), 2.712 (50), 3.217 (30), 2.779 (30), 2.734 (30), 1.692 (25)

Chemistry:

Total	100.94	100.00

(1) "Banat, Hungary" [probably Oraviţa or Csiklova, Romania]. (2) $Mg_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Forms a series with erythrite.

Mineral Group: Vivianite group.

Occurrence: In limestone blocks, thermally metamorphosed, in a volcanic tuff (Fiano, Italy).

Association: Fluoborite, fluorite, hydromagnesite (Fiano, Italy).

Distribution: In Romania, from Oraviţa (Oravicza), Băiţa (Rézbánya), and Săcărîmb (Nagyág). At Jáchymov (Joachimsthal), Czech Republic. From Glatschach and Hirt, Carinthia, Austria. In Germany, in the Bauhaus district, Richelsdorf Mountains, Hesse. From Långban, Värmland, Sweden. At Fiano, near Naples, Italy. From Huercal-Overa, Almería Province, Spain. In the USA, at the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; in a cave in Peach Springs Canyon, Mohave Co., Arizona; at the White Caps mine, Manhattan district, Nye Co., Nevada. From the Córrego do Urucum pegmatite, near Galiléia, Minas Gerais, Brazil.

Name: Honors Moritz Hörnes (1815–1868), Curator of the Imperial Cabinet, Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria, A.a.415.

Horomanite $(Fe,Ni,Co,Cu)_9S_8$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As grains, to 0.1 mm.

Physical Properties: *Cleavage*: Pronounced. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 3 VHN = 135 (50 g load). D(meas.) = n.d. D(calc.) = 6.44

Optical Properties: Opaque. *Color*: White with a yellowish tint macroscopically and in reflected light. *Streak*: n.d. *Luster*: Metallic.
Optical Class: n.d. *Pleochroism*: Very weak, white with a yellowish tint to white.
Anisotropism: Weak, dark-gray to slightly light-gray.
R_1-R_2: (436) 34.7-37.8, (497) 40.0-43.2, (543) 43.2-46.4, (586) 45.4-48.5, (648) 47.8-50.7

Cell Data: *Space Group*: *P*4/*mmm*. *a* = 8.707(1) *c* = 10.436(6) *Z* = 4

X-ray Powder Pattern: Horoman massif, Samani-cho, Samani-gun, Hokkaido, Japan.
3.080 (100), 1.825 (60), 1.805 (54), 1.947 (51), 2.955 (32), 1.984 (25), 6.16 (10)

Chemistry:

	(1)
Cu	0.43
Fe	41.82
Ni	23.76
Co	0.52
S	33.29
Total	99.82

(1) Horoman massif, Samani-cho, Samani-gun, Hokkaido, Japan; average of 15 electron microprobe analyses, corresponding to $(Fe_{5.77}Ni_{3.12}Co_{0.07}Cu_{0.05})_{\Sigma=9.01}S_8$.

Occurrence: Filling space between silicate minerals in lherzolites of a peridotite massif.

Association: Samaniite and sugakiite as intergrowths; bornite, talnakhite, copper, troilite, heazlewoodite, pentlandite, magnetite, olivine, clino- and orthopyroxenes.

Distribution: Horoman peridotite massif, Samani-cho, Samani-gun, Hokkaido, Japan.

Name: For the ultramafic massif (*Horoman)* from which the first specimens were collected.

Type Material: Tohoku University Museum, Japan.

References: (1) Kitakaze, A., H. Itoh, and R. Journal of Mineralogical and Petrological Sciences, 106, 204-210. (2) (2014) Amer. Mineral., 99, 552-553 (abs. ref. 1).

Horsfordite Cu_5Sb

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Massive.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–5 VHN = n.d. D(meas.) = 8.81 D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Silver-white, easily tarnished; in polished section, slightly cream-colored to silver-blue and grayish white. *Luster:* Metallic, brilliant.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
Cu	73.37	72.29
Sb	26.86	27.71
Total	100.23	100.00

(1) Turkey, near Lesbos; average of three analyses. (2) Cu_5Sb.

Occurrence: In "an extensive vein underlying the entire area of a Turkish village".

Association: n.d.

Distribution: On the Turkish mainland, near the Greek Aegean island of Lesbos (Mytilene).

Name: In honor of Professor Eben Norton Horsford (1818–1893), American chemist, Harvard University, Cambridge, Massachusetts, USA.

Type Material: n.d. [no type material can be located at Harvard University, Cambridge, Massachusetts, or the University of Cincinnati, Cincinnati, Ohio, USA, where it was described].

Total	[97.90]

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of two analyses, CO_2 calculated for stoichiometry; corresponding to $(Na_{0.90}Ca_{0.07})_{\Sigma=0.97}(Y_{0.89}Er_{0.04}Dy_{0.03}Yb_{0.02}Gd_{0.01}Ho_{0.01})_{\Sigma=1.00}(CO_3)F_{2.01}$.

Occurrence: A very rare, late-forming mineral in an altered pegmatite dike in nepheline syenite, part of an alkalic igneous complex.

Association: Microcline, aegirine, dawsonite, rhodochrosite, sodalite, natrolite, albite, serandite, siderite, taeniolite, catapleiite, astrophyllite, genthelvite.

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Elsa Horváth (1947–) and László Horváth (1937–), husband and wife collectors of Mont Saint-Hilaire, Canada minerals.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81536.

References: (1) Grice, J.C. and G.Y. Chao (1997) Horváthite-(Y), rare-earth fluorocarbonate, a new mineral species from Mont Saint-Hilaire, Quebec. Can. Mineral., 35, 743–749. (2) (1998) Amer. Mineral., 83, 401 (abs. ref. 1).

(1) Koenabib, South Africa; by X-ray fluorescence, average of four analyses, H_2O by a modified Penfield method, P_2O_5 and SO_3 by wet chemical methods. (2) Blyavinski mine, Russia. (3) $Al_5(PO_4)(SO_4)(OH)_{10}\cdot 8H_2O$.

Occurrence: A weathering product derived from natroalunite and zaherite in an arid climate (Koenabib, South Africa).

Association: Zaherite, natroalunite, sillimanite (Koenabib, South Africa).

Distribution: Found in the Hotson 6 quarry, Koenabib, 65 km west of Pofadder, Cape Province, South Africa. From the Blyavinski mine, Ural Mountains, Russia.

Name: For Hotson 42, the farm in South Africa on which the first specimens were collected.

Type Material: National Museum, Bloemfontein, South Africa, K2359; National Museum of Natural History, Washington, D.C., USA, 162230.

Howieite $Na(Fe^{2+},Mn)_{10}(Fe^{3+},Al)_2Si_{12}O_{31}(OH)_{13}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$ or 1. As bladed crystals, to 1 cm; in plumose aggregates and rosettes.

Physical Properties: *Cleavage:* Good on {010}, fair on {100}, poor on $\{2\bar{1}0\}$.
Hardness = n.d. D(meas.) = 3.378 D(calc.) = [3.34]

Optical Properties: Transparent to translucent. *Color:* Dark green to black.
Luster: Greasy.
Optical Class: Biaxial (–). *Pleochroism:* Marked; X = golden; Y = dark lilac gray; Z = green.
Dispersion: $r < v$, strong. $\alpha = 1.701$ $\beta = 1.720$ $\gamma = 1.734$ 2V(meas.) = 65°

Cell Data: *Space Group:* $P\bar{1}$ or $P1$. $a = 10.170(4)$ $b = 9.774(4)$ $c = 9.589(4)$
$\alpha = 91.22(5)°$ $\beta = 70.76(5)°$ $\gamma = 108.09(5)°$ Z = 1

X-ray Powder Pattern: Laytonville, California, USA. (ICDD 19-571).
9.18 (100), 7.91 (80), 3.25 (65), 2.62 (60), 2.68 (45), 2.78 (40), 3.06 (35)

Chemistry: (1) Laytonville district, California, USA; analysis not given, stated to correspond to $(Na_{1.03}Ca_{0.02})_{\Sigma=1.05}(Fe^{2+}_{6.41}Mn_{2.98}Mg_{0.45})_{\Sigma=9.84}(Fe^{3+}_{1.57}Al_{0.62})_{\Sigma=2.19}(Si_{11.96}Ti_{0.04})_{\Sigma=12.00}[O_{31.31}(OH)_{12.69}]_{\Sigma=44.00}$.

Occurrence: An essential mineral in some of the metamorphosed shales, siliceous ironstones, and impure limestones of the Franciscan Formation (Laytonville district, California, USA).

Association: Deerite, zussmanite, stilpnomelane, spessartine, riebeckite, quartz, aegirine, grunerite, aragonite, manganoan siderite, ferroan kutnohorite (Laytonville district, California, USA).

Distribution: In the USA, in California, from the Laytonville quarry, and at Covelo, Mendocino Co.; at Ward Creek, Sonoma Co.; in Panoche Pass, San Benito Co.; at Pacheco Pass, Santa Clara and Merced Cos.; and in the Powers quarry, Coos Co., Oregon. From Brezovica, Yugoslavia. In the Tanemaya mine, Kumamoto Prefecture, Japan.

Name: For Professor Robert Andrew Howie (1923–), British mineralogist and petrologist, London University, London, England.

Type Material: National Museum of Natural History, Washington, D.C., USA, 109453, 144184; The Natural History Museum, London, England, 1964,544.

Howlite $Ca_2B_5SiO_9(OH)_5$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular, flattened on {100}, with {100} dominant and terminated by {011} and {001}, to 1 cm. Most commonly nodular. When massive, chalky to porcelaneous.

Physical Properties: *Fracture:* For porcelaneous types, nearly even and smooth.
Hardness = 3.5 D(meas.) = 2.53–2.59 D(calc.) = 2.61

Optical Properties: Translucent in thin fragments. *Color:* White; in thin section, colorless.
Luster: Subvitreous, glimmering.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c \simeq 51°$. α = 1.583–1.586
β = 1.596–1.598 γ = 1.605 2V(meas.) = 73°

Cell Data: *Space Group:* $P2_1/c$. a = 12.820(3) b = 9.351(1) c = 8.608(2)
β = 104.84(2)° Z = 4

X-ray Powder Pattern: Sterling Borax mine, California, USA.
6.2 (100), 3.10 (90), 3.90 (80), 2.04 (70), 2.07 (50), 1.794 (50), 12.4 (40)

Chemistry:

SiO_2	15.33	15.50	15.35
B_2O_3	44.52	44.38	44.48
CaO	27.94	28.45	28.66
Na_2O	0.53		
K_2O	0.13		
H_2O	11.55	11.58	11.51
rem.		0.09	
Total	[100.00]	100.00	100.00

(1) Windsor, Canada; recalculated to 100.00% after deduction of 4.32% gypsum. (2) Daggett, California, USA; remainder is Na_2O and MgO. (3) $Ca_2B_5SiO_9(OH)_5$.

Occurrence: In borate deposits.

Association: Colemanite, ulexite, bakerite.

Distribution: In Canada, near Windsor; at Wentworth; large crystals on the shore of Bras D'Or Lake, 2.5 km south of Iona, Cape Breton Island, Nova Scotia. In the USA, in California, in the Sterling Borax mine, Tick Canyon, near Lang, Los Angeles Co.; near Calico, San Bernardino Co.; in Gower Gulch and at the Billie mine, near Ryan, Inyo Co.; at the Russell and other borate mines north of Lockwood Valley, Ventura Co.; and in the Kramer deposit, Kern Co. From Magdalena, Sonora, Mexico. At Susurluk, Turkey. From Baljevac na Ibru, near Kraljevo, and near Bela Stena, Yugoslavia.

Name: For Henry How (1828–1879), Canadian chemist, geologist, and mineralogist, University of King's College, Windsor, Nova Scotia, Canada, who first described the species.

(1) Hunan Province, China; corresponds to $Li_{1.95}Ca_{3.07}Be_{3.13}(SiO_4)_3F_{2.00}$. (2) Do.; corresponds to $Li_{1.85}Ca_{3.08}Be_{3.20}(SiO_4)_3F_{2.06}$.

Occurrence: In phlogopite veins in a fluorine-rich metamorphosed Devonian limestone intruded by a beryllium-bearing granite.

Association: Fluorite, zinnwaldite, chrysoberyl, taaffeite, liberite.

Distribution: On Hsianghua Ridge, Linwu Co., Hunan Province, China.

Name: For the place of discovery; the word means *fragrant flower* in Chinese.

Type Material: n.d.

Total	99.01	100.00

(1) Bayan Obo deposit, China; Ce > La confirmed by X-ray spectographic analysis.
(2) $BaCe(CO_3)_2F$.

Occurrence: An uncommon mineral in hydrothermal veins associated with rare-earth-bearing carbonatite deposits in alkaline igneous complexes.

Association: Aegirine, fluorite, magnetite, hematite, monazite, bastnäsite, parisite, aeschynite, calcite (Bayan Obo, China); "chlorite", barite, strontianite, pyrite, hematite, ankerite, dolomite (Siberia, Russia).

Distribution: From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. In Russia, from an unspecified carbonatite in Siberia, and in the Khibiny massif, Kola Peninsula. From the Aley carbonatite, east of Williston Lake, British Columbia, Canada. At the Qaqarssuk carbonatite, near Sukkertoppen, Greenland.

Name: For the Huang Ho (Yellow River), China, 150 km south of the Bayan Obo deposit, China, where the first specimens were collected.

Type Material: National Museum of Natural History, Washington, D.C., USA, 144184.

(1) El Indio mine, Chile; by electron microprobe, average of seven analyses; corresponds to $(Ca_{0.44}Na_{0.06}K_{0.06})_{\Sigma=0.56}(Al_{2.99}Fe_{0.01})_{\Sigma=3.00}(S_{0.96}O_{3.88})_2[(OH)_{5.98}F_{0.02}]_{\Sigma=6.00}$.

Mineral Group: Alunite group.

Occurrence: A product of acid sulfate hydrothermal alteration of rhyolite tuffs and andesites.

Association: Kaolinite, pyrite, woodhouseite (El Indio mine, Chile); alunite, natroalunite, minamiite (Okumanza, Japan).

Distribution: From the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. At Okumanza, near the Kusatsu-Shirane volcano, Gumma Prefecture, Japan.

Name: Honors Yunhui Huang (1926–), Chinese mineralogist, Institute of Mineral Deposit Geology and Mineral Resources, Beijing, China, in part for her contributions to the study of contact-metamorphic beryllium deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 170208, 170209.

(1) Huanzala mine, Bolognesi Province, Ancash Department, Peru; average of 10 electron microprobe analyses, corresponding to $(Mg_{0.85}Mn_{0.07}Fe_{0.05})_{\Sigma=0.97}W_{1.01}O_4$. (2) $MgWO_4$.

Mineral Group: Wolframite group.

Occurrence: As inclusions in scheelite in the Mg-metasomatized contact skarns of an intrusive granodiorite and quartz porphyry.

Association: Scheelite, enargite, pyrite, sphalerite, quartz, calcite, 'sericite', chlorite, dolomite, sellaite, talc, phlogopite.

Distribution: Huanzala mine, Huallanca district, Bolognesi Province, Ancash Department, Peru.

Name: For the first described locality, the Huanzala mine, Peru.

Type Material: National Museum of Nature and Science, Tokyo, Japan (catalog no. NSM-MF15366).

References: (1) Miyawaki, R., K.Yokoyama, T. Matsubara, I. Furuta, A. Gomi, and R. Murakami (2010) Huanzalaite, $MgWO_4$, a new mineral species from the Huanzala Mine, Peru. Can. Mineral., 48, 105–112. (2) (2010) Amer. Mineral., 95, 1598 (abs. ref. 1).

Hübnerite $Mn^{2+}WO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are typically prismatic and striated along [001], to 15 cm; also tabular to bladed, flattened on {100}; show {010}, {110}, {100}, {310}, {112}, {001}, {102}, {011}, and a multiplicity of other forms; in radiating groups or in parallel. *Twinning:* Common as simple contact twins with composition plane {100}, or rarely {001}; as interpenetrant twins; lamellar.

Physical Properties: *Cleavage:* Perfect on {010}; partings on {100} and {102}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–4.5, directional. D(meas.) = 7.12–7.18 D(calc.) = 7.234

Optical Properties: Transparent to translucent. *Color:* Yellowish brown to reddish brown, blackish brown, black, rarely red; white to gray in reflected light with deep blood-red internal reflections. *Streak:* Yellow to reddish brown, greenish gray. *Luster:* Metallic-adamantine towards resinous.
Optical Class: Biaxial (+). *Pleochroism:* Perceptible; X = yellow to green, red-orange; Y = yellowish brown to greenish yellow, red-orange to red; Z = green; brick-red to red. *Orientation:* $X = b$; $Z \wedge c = 17°–21°$. *Absorption:* $Z > Y > X$. $\alpha = 2.17–2.20$ $\beta = 2.22$ $\gamma = 2.30–2.32$ 2V(meas.) = Large. 2V(calc.) = 73(5)° *Anisotropism:* Distinct.
R_1–R_2: (400) 17.1–19.8, (420) 16.3–19.3, (440) 15.5–18.8, (460) 15.1–18.3, (480) 14.6–17.5, (500) 14.4–17.2, (520) 14.2–17.0, (540) 13.9–16.7, (560) 13.8–16.5, (580) 13.7–16.3, (600) 13.6–16.2, (620) 13.5–16.1, (640) 13.5–16.0, (660) 13.4–15.9, (680) 13.4–15.8, (700) 13.3–15.7

FeO	0.24				

(1) Uncompahgre district, Colorado, USA. (2) $MnWO_4$.

Polymorphism & Series: Forms a series with ferberite.

Occurrence: Typical of high-temperature hydrothermal vein deposits and pneumatolytically altered granites yielding greisen; in granite pegmatites; also in alluvial and eluvial deposits.

Association: Cassiterite, arsenopyrite, molybdenite, tourmaline, topaz, rhodochrosite, fluorite.

Distribution: May be an ore of tungsten at some localities. In the USA, from the Erie and Enterprize veins, Ellsworth (Mammoth) district, Nye Co., Nevada; at numerous deposits in Colorado, as the Adams mine, Bonita Mountain, near Silverton, and from Gladstone, San Juan Co., in the Sweet Home mine, Alma district, Park Co., and large crystals from the Quartz Creek district, Gunnison Co.; in the Blue Wing district, Lemhi Co., Idaho; large crystals from the Little Dragoon Mountains, Cochise Co., Arizona; in the Nogal and White Oaks districts, Lincoln Co., New Mexico. In Peru, superb large crystals from the Huallapón mine, Pasto Bueno, Ancash Province. From Wheal Gorland, Gwennap, and in the Hingston Down quarry, Cornwall, England. At Baia Sprie (Felsőbánya), Romania. From Horní Slavkov (Schlaggenwald), Czech Republic. In France, at Valcroze, Lozère, and Adervielle, Hautes-Pyrénées. At the Duoluoshan mine, Huaiji County, Guangdong Province, China.

Name: Honors Adolph Hübner, metallurgist of Freiberg, Germany.

Huemulite $Na_4MgV_{10}^{5+}O_{28}\cdot 24H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1 or $\overline{1}$. In aggregates of fine fibers and thin films; botryoidal, massive.

Physical Properties: Hardness = 2.5–3, recrystallized. D(meas.) = 2.39(5) D(calc.) = 2.404, recrystallized. Easily soluble in H_2O, from which it can be recrystallized by slow evaporation.

Optical Properties: Semitransparent. *Color:* Yellowish orange to orange. *Streak:* Yellow. *Luster:* Dull.
Optical Class: Biaxial (–) (recrystallized synthetic). *Pleochroism:* X = light yellow; Y = golden yellow; Z = yellowish orange. *Dispersion:* $r > v$, strong. $\alpha = 1.679(3)$ $\beta = 1.734(3)$ $\gamma = 1.742(3)$ 2V(meas.) = 25°–30°

Cell Data: *Space Group:* $P1$ or $P\overline{1}$, (recrystallized). $a = 11.770(19)$ $b = 11.838(8)$ $c = 9.018(9)$ $\alpha = 107°13(5)'$ $\beta = 112°10(6)'$ $\gamma = 101°30(5)'$ Z = 1

(1) Malargüe district, Argentina; dissolved in H_2O, CaO and SO_3 are gypsum. (2) Recrystallized. (3) $Na_4MgV_{10}O_{28}\cdot 24H_2O$.

Occurrence: Formed after opening Cu–U deposits in sandstones and conglomerates; the vanadium may be derived from associated asphalt.

Association: Hummerite, rossite, thenardite, gypsum, epsomite.

Distribution: In the Agua Botada, Huemul, and Agua Botada Sur mines, Malargüe district, Mendoza Province, Argentina.

Name: For the Huemul mine, Argentina, where it occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120076.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. Prismatic crystals, flattened on {100}, elongated and striated along [001], showing {001}, {100}, {011}, {110}, to 3 mm.

Physical Properties: *Cleavage:* On {100}, good; on {110}, probable. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = ∼5.1 D(calc.) = 5.80 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow-orange to yellowish brown, brown. *Streak:* Pale yellow. *Luster:* Greasy to adamantine.
Optical Class: Biaxial (+) to uniaxial (+). *Pleochroism:* Moderately strong; X = yellow; Y = yellow with orange tint; Z = colorless to pale yellow. *Orientation:* $Y = c$. *Dispersion:* $r \ll v$; extreme, showing anomalous interference colors and incomplete extinction. $\alpha = 1.898(5)$ $\beta = 1.915(5)$ γ = n.d. 2V(meas.) = Small [red] to large [blue]; 0°–25°.

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. a = 8.13(20) $b = 17.27(20)$ $c = 7.01(20)$ $\beta = 109.0°$ Z = 2

X-ray Powder Pattern: Michael mine, Germany.
3.73 (10b), 3.06 (9), 3.00 (7), 2.89 (7), 1.833 (7), 4.33 (6b), 2.70 (6)

Chemistry: (1) Michael mine, Germany; microchemical tests show Pb, U, As as the main components, H_2O determined as 5.3%; from X-ray data, presumed to be the arsenate analog of dumontite.

Occurrence: A rare secondary mineral in cavities in hornstone breccia.

Association: Hallimondite, widenmannite, zeunerite, mimetite, cerussite.

Distribution: From the Michael mine, Weiler, near Lahr, Black Forest, Germany.

Name: To honor Baron Friedrich von Hügel (1852–1925), Austrian-British theologian.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 815. (2) Walenta, K. (1979) Über den Hügelite. Tschermaks Mineral. Petrog. Hughesite $Na_3Al(V_{10}O_{28})\cdot 22H_2O$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As platy, spear-shaped or blocky crystals, to 2 mm.

Physical Properties: *Cleavage*: Perfect on (001). *Fracture*: n.d. *Tenacity*: Brittle.
Hardness = 1 (estimated) D(meas.) = n.d. D(calc.) = 2.29
Highly soluble in water, acetone and alcohol; dehydrates under conditions of low humidity.

Optical Properties: Transparent to translucent. *Color*: Orange to golden orange. *Streak*: Yellow.
Luster: Subadamantine.
*Optical Class: B*iaxial (–). $\alpha = 1.698(5)$ $\beta = 1.740(5)$ $\gamma = 1.770(5)$ 2V(meas.) = 84(2)°
Dispersion: Strong, $r > v$. *Pleochroism*: $X = Y$ = light golden yellow, Z = dark golden yellow.
Absorption: $X = Y < Z$.

Cell Data: *Space Group*: $P\bar{1}$. $a = 8.668(4)$ $b = 10.295(4)$ $c = 12.908(5)$ $\alpha = 105.826(9)°$
$\beta = 97.899(9)°$ $\gamma = 103.385(9)°$ $Z = 1$

X-ray Powder Pattern: Sunday mine, San Miguel County, Colorado, USA.
12.24 (100), 8.246 (38), 9.408 (30), 8.994 (28), 2.724 (23), 3.354 (18), 7.561 (15)

Chemistry:

	(1)	(2)
Na_2O	8.00	6.41
Al_2O_3	4.63	3.52
V_2O_5	78.51	62.73
H_2O	[8.86]	27.34
Total	[100.00]	100.00

(1) Sunday mine, San Miguel County, Colorado, USA; average of 4 electron microprobe analyses of partially dehydrated material, H_2O by difference, corresponding to $Na_{2.99}Al_{1.05}(V_{10}O_{28})\cdot 5.70H_2O$.
(2) $Na_3Al(V_{10}O_{28})\cdot 22H_2O$.

Occurrence: As efflorescent crusts on the sandstone walls of mine workings and in rock fractures, through the oxidation of primary vanadium oxides (corvusite and montroseite) that react with acidic, oxidizing groundwater in roll-front type U deposits, usually in organic-carbon-rich zones.

Association: Rossite, lasalite, hewettite, sherwoodite, corvusite, montroseite, rakovanite, gunterite.

Distribution: Sunday mine, Gypsum Valley, San Miguel County, Slick Rock District, Colorado, USA.

Name: Honors John Michael Hughes (b. 1952), Professor of Mineralogy, University of Vermont, USA, for his long and outstanding career in mineralogy, including his extensive work on the pascoite family of minerals and vanadium bronzes.

Type Material: National Museum of Natural History, Washington D.C., USA, (NMNH 174253).

Hulsite $(Fe^{2+}, Mg)_2(Fe^{3+}, Sn)BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rough rectangular tabular crystals, showing {100}, {010}, {001}, {110}, to 1 cm; in aggregates of parallel prismatic individuals. *Twinning:* Simple twins by 120° rotation.

Physical Properties: *Cleavage:* On {110}, good. Hardness = ∼3 D(meas.) = 4.28–4.57 D(calc.) = 4.62

Optical Properties: Opaque. *Color:* Black with greenish, brownish, or reddish tinge. *Streak:* Black. *Luster:* Submetallic to vitreous.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2/m$. $a = 10.695(4)$ $b = 3.102(1)$ $c = 5.431(1)$ $\beta = 94.21(3)°$ Z = 2

X-ray Powder Pattern: Brooks Mountain, Alaska, USA.
2.664 (100), 5.35 (70), 2.585 (70), 2.039 (50), 4.99 (35), 2.491 (35), 2.370 (20)

Chemistry:

MnO	0.74
MgO	10.45
Total	100.00

(1) Brooks Mountain, Alaska, USA; corresponds to $(Fe^{2+}_{1.43}Mg_{0.63}Mn_{0.03})_{\Sigma=2.09}(Fe^{3+}_{0.61}Sn_{0.19}Al_{0.06}Ti_{0.01})_{\Sigma=0.87}BO_5$.

Mineral Group: Ludwigite group.

Occurrence: Very rare, in a contact-metamorphosed limestone, close by an intrusive granite.

Association: Calcite, vesuvianite, magnetite, garnet, fluorite, diopside.

Distribution: From a prospect pit on the northwest flank of Brooks Mountain, Seward Peninsula, Alaska, USA.

Name: Honors Alfred Hulse Brooks (1871–1924), geologist in charge of the Division of Alaskan Mineral Resources, U.S. Geological Survey.

Type Material: Natural History Museum, Paris, France, 110240; The Natural History Museum, London, England, 1912,612; Harvard University, Cambridge, Massachusetts, 96246, 96247; National Museum of Natural History, Washington, D.C., USA, 86791, 86989.

Humberstonite $K_3Na_7Mg_2(SO_4)_6(NO_3)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As hexagonal crystals, platy on {0001}, with $\{10\overline{1}1\}$, to 0.3 mm; typically in massive aggregates.

Physical Properties: *Cleavage:* Perfect on {0001}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 2.252 D(calc.) = 2.252 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.474(2)$ $\epsilon = 1.436(2)$

Cell Data: *Space Group:* $R\overline{3}$. $a = 10.9055(3)$ $c = 24.3949(9)$ Z = 3

X-ray Powder Pattern: Oficina Alemania, Chile.
3.39 (100), 2.724 (70), 8.14 (60), 8.80 (35), 4.53 (35), 2.583 (35), 1.866 (35)

Chemistry:

Total	100.38	100.00

(1) Oficina Alemania, Chile; after removal of $NaNO_3$ impurity with acetone, $(SO_4)^{2-}$ and $(NO_3)^{1-}$ confirmed by IR. (2) $K_3Na_7Mg_2(SO_4)_6(NO_3)_2 \cdot 6H_2O$.

Occurrence: Formed by repeated natural leaching of nitrate ore with reprecipitation in irregular pods above the local regolith.

Association: Blödite, nitratine, kieserite.

Distribution: In Chile, from near Oficina Alemania and ten km west of Oficina María Elena; an ore in the Taltal nitrate district, Antofagasta; locally abundant in near-surface nitrate layers throughout the Atacama Desert.

Name: Honors James Thomas Humberstone (1850–1939), industrial chemist whose contributions permit economical extraction of nitrate from the Chilean deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120898.

Humboldtine $Fe^{2+}C_2O_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare small crystals are prismatic along [001] or platy, showing {100}, {001}, {110}, {101}; typically in botryoidal incrusting masses with fibrous to earthy internal structure.

Physical Properties: *Cleavage:* {110}, perfect; {100} and {010}, imperfect.
Hardness = 1.5–2 D(meas.) = 2.28 D(calc.) = 2.307

Optical Properties: Transparent to translucent. *Color:* Yellow to amber-yellow. *Luster:* Dull to resinous.
Optical Class: Biaxial (+). *Pleochroism:* X = very pale yellowish green; Y = pale greenish yellow; Z = bright yellow. *Orientation:* $X = a$, $Y = b$, $Z = c$. $\alpha = \sim 1.494$ $\beta = 1.561$ $\gamma = 1.692$ 2V(meas.) = Large.

Cell Data: *Space Group:* $I2/c$ (synthetic). $a = 9.707(1)$ $b = 5.556(1)$ $c = 9.921(1)$ $\beta = 104.50(1)°$ Z = 4

X-ray Powder Pattern: Synthetic.
4.80 (100), 4.70 (65), 3.004 (50), 2.654 (30), 3.880 (25), 3.597 (25), 2.616 (25)

(1) Capo d'Arco, Elba, Italy. (2) $FeC_2O_4 \cdot 2H_2O$ (ferrous oxalate).

Occurrence: Typically coating fractures in brown coal deposits; very rarely in granite pegmatites and hydrothermal mineral deposits.

Association: Gypsum, tschermigite (coal seams); cassiterite, tourmaline, quartz (pegmatites and hydrothermal).

Distribution: In the Czech Republic, from Korozluky (Korozoluk), southwest of Bílina (Bilin), at Čermniky (Tschermig), Lužice (Luschitz), and Lomnice, near Sokolov (Lant, near Falkenau). In Germany, at Grossalmerode, Hesse; from Potschappel, south of Dresden, Saxony; at Sailauf, northeast of Aschaffenburg, Spessart Mountains, Bavaria. In the Pendarves mine, Camborne, Cornwall, England. At Capo d'Arco and Capo Calamita, Elba, Italy. From Kettle Point and in the Francon quarry, Montreal Island, Montreal, Quebec, Canada. From Santa Maria de Itabira, Minas Gerais, Brazil.

Name: Honors Friedrich Heinrich Alexander von Humboldt (1769–1859), German naturalist and explorer.

(1) Lohja, Finland; corresponds to $(Mg_{6.75}Fe^{2+}_{0.23}Ti_{0.12}Al_{0.08}Mn_{0.06}Fe^{3+}_{0.02})_{\Sigma=7.26}(Si_{0.99}O_4)_3[F_{0.73}(OH)_{0.50}]_{\Sigma=1.23}$. (2) Sillböle, Finland; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Mg_{6.60}Fe_{0.35}Mn_{0.04})_{\Sigma=6.99}(SiO_4)_3[F_{1.06}(OH)_{0.93}O_{0.01}]_{\Sigma=2.00}$.

Mineral Group: Humite group.

Occurrence: Typically in contact metamorphic zones in limestones and dolostones associated with felsic, or more rarely, alkalic plutonic rocks, especially where metasomatism has introduced Fe, B, and F.

Association: Grossular, wollastonite, forsterite, monticellite, cuspidine, fluoborite, ludwigite, spinel, brucite, calcite, dolomite, serpentine, diopside, corundum, phlogopite, pyrrhotite.

Distribution: At Monte Somma and Vesuvius, Campania, Italy. At Lohja, Sillböle, and Hermala, Finland. In the Norberg area, and at the Ladu mine, Persberg, Värmland, Sweden. From Sorfinnset, Glomfjord, Norway. In the Tilly Foster mine, Brewster, Putnam Co., New York, and at Franklin, Sussex Co., New Jersey, USA. From Llanos de Juanar, Málaga Province, Spain. At Anzahamazonono, Madagascar.

Name: After Sir Abraham Hume (1749–1838), English connoisseur and collector of works of art, gems, and minerals.

Hummerite $K_2Mg_2V_{10}^{5+}O_{28}\cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic (after recrystallization). *Point Group:* $\overline{1}$. Massive, in veins and efflorescences.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.53] Soluble in H_2O, from which it may be recrystallized.

Optical Properties: Translucent. *Color:* Bright orange.
Optical Class: Biaxial (–) (recrystallized). *Dispersion:* Strong. α = n.d. $\beta = 1.81$ γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.735(2)$ $b = 11.085(2)$ $c = 8.831(1)$ $\alpha = 106.01(1)^\circ$ $\beta = 108.04(1)^\circ$ $\gamma = 65.81(1)^\circ$ Z = [2]

X-ray Powder Pattern: Hummer mine, Colorado, USA.
8.2 (10), 7.4 (7), 2.73 (6), 7.0 (5), 3.31 (4), 3.13 (4), 2.11 (4)

Chemistry: No chemical analysis has been performed; characterized by correspondence of properties with synthetic material.

Occurrence: Leached from vanadium oxide ores and deposited in veins in clay and as efflorescences on sandstone.

Association: Huemulite, rossite, thenardite, gypsum, epsomite (Malargüe district, Argentina).

Distribution: In the USA, in the Hummer mine, Jo Dandy group, and the North Star mine, Paradox Valley, Uravan district, Montrose Co., Colorado; in the Mesa No. 1 mine, Lukachukai Mountains, Apache Co., Arizona; from the Grants district, McKinley Co., New Mexico; in the Corvusite mine, Beaver Mesa, La Sal Mountains, Grand Co., Utah; and in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada. From the Malargüe district, Mendoza Province, Argentina.

Name: For the Hummer mine, Colorado, USA, where it occurs.

Type Material: Harvard University, Cambridge, Massachusetts, 102345; National Museum of Natural History, Washington, D.C., USA, 106899.

Hunchunite Au_2Pb

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Anhedral grains, in aggregates to 0.5 mm.

Physical Properties: Hardness = n.d. VHN = 128–149, 140 average (5 g load).
D(meas.) = n.d. D(calc.) = 15.99

Optical Properties: Opaque. *Color:* Silver-gray; silver-gray in reflected light, tarnishing to dull gray. *Luster:* Metallic.
Optical Class: Isotropic.
R: (480) 58.4, (546) 59.5, (589) 60.0, (656) 60.0

Cell Data: *Space Group:* $Fd3m$ (by analogy to synthetic Au_2Pb). $a = 7.933$ $Z = 8$

X-ray Powder Pattern: Hunchun River, China.
2.391 (100), 2.810 (30), 1.196 (26), 2.301 (24), 1.526 (23), 4.595 (21), 1.402 (19)

Chemistry:

MgO	11.86	11.80
H_2O	49.74	47.45
Total	101.18	100.00

(1) China; original total given as 100.00%. (2) $MgB_4O_5(OH)_4 \cdot 7H_2O$.

Occurrence: In lacustrine saline borate deposits (China); an efflorescence on weathered colemanite and priceite veins (Death Valley, California, USA).

Association: Ulexite, hydroboracite, szaibélyite, gypsum (China); ginorite, mcallisterite, sborgite, sassolite, nobleite, ulexite, gypsum, kurnakovite, inderite, montmorillonite, analcime (Death Valley, California, USA).

Distribution: From China, at an unspecified locality [the Qinghai-Xizang Plateau, Tibet]. From the Hard Scramble claim and elsewhere in the Furnace Creek district, Death Valley, Inyo Co., California, USA.

Name: Honors Professor Chang Hung-chao (1877–1951), Chinese geologist and mineralogist.

Type Material: n.d.

(1) Ala-Mar deposit, Nye Co., Nevada, USA. (2) Geelong, Australia; original total given as 99.26%. (3) $CaMg_3(CO_3)_4$.

Occurrence: Filling vugs and coating fractures in rock; as flowstone and incrustations in caves; typically precipitated by evaporative concentration of meteoric solutions weathering magnesite- or dolomite-bearing rocks, or serpentinites and ophiolites.

Association: Magnesite, dolomite, aragonite, calcite, hydromagnesite.

Distribution: In the USA, in Nevada, from the Ala-Mar deposit, Currant Creek district, and the Gabbs mine, Gabbs district, Nye Co., and the Nevada Magnesite and Snowball deposits, White Pine Co.; in the Chief Consolidated mine, Eureka, Eureka Co., Utah; at the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; in the Line Pit, Lancaster Co., Pennsylvania. In Australia, from Tea Tree Gully, South Australia; at Katherine, Northern Territory; and from Deer Park and Geelong, Victoria. In the Kurgashinkan Pb–Zn deposit, Uzbekistan. Studied from cave deposits at: Carlsbad Cavern, New Mexico, USA. From Castleguard Cave, Columbia Icefields, Alberta, Canada. In the Dorog and Beremend Crystal Cave, Hungary. From the Pestera Fagului Cave, Romania. In the Gunung Mulu National Park, Sarawak, Malaysia. A number of other minor localities are known.

Name: Honors Professor Walter Frederick Hunt (1882–1975), University of Michigan, Ann Arbor, Michigan, USA, and chemist with the U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, 106372; National Museum of Natural History, Washington, D.C., USA, 112519.

Huréaulite $Mn_5^{2+}(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals long to short prismatic, elongated along [001], with {100}, {110}, or tabular {100}, to 3 cm, may be equant; in bundled fascicles, less commonly fibrous, scaly, compact, massive.

Physical Properties: *Cleavage:* On {100}, good. Hardness = 3.5 D(meas.) = 3.15–3.19 D(calc.) = 3.19

Optical Properties: Transparent to translucent. *Color:* Light pink, rose-violet, pale rose, amber, orange, red-orange, red, brownish orange, reddish to yellowish brown. *Streak:* Nearly white. *Luster:* Vitreous, inclined towards greasy.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = yellow to pale rose; Z = reddish yellow to reddish brown. *Orientation:* $X = b$; $Z \wedge c = 75°$. *Dispersion:* $r < v$, very strong, crossed. $\alpha = 1.647$–1.654 $\beta = 1.654$–1.662 $\gamma = 1.660$–1.667 2V(meas.) = 75°–82°

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 17.587(4)$ $b = 9.127(3)$ $c = 9.497(5)$ $\beta = 96.68(3)°$ Z = 4

X-ray Powder Pattern: Stewart mine, Pala, California, USA. (ICDD 34-146).
3.152 (100), 8.09 (70), 2.992 (65), 8.75 (40), 2.630 (40), 4.545 (35), 3.198 (30)

(1) Huréaux, France. (2) São Jose de Safira, Brazil; by electron microprobe, average of three analyses, total Fe as FeO, H_2O by difference. (3) $Mn_5(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$.

Occurrence: A late-stage secondary mineral formed by alteration of primary phosphates in complex granite pegmatites.

Association: Lithiophilite, triphylite, heterosite, rockbridgeite, cacoxenite, vivianite, fairfieldite, dickinsonite, eosphorite, stewartite, strengite, phosphosiderite, roscherite, many rarer phosphates.

Distribution: Many localities. In France, from Huréaux, St. Sylvestre, and in the La Vilate quarry, near Chanteloube, Haute-Vienne. At the Mangualde pegmatite, near Mesquitela, Portugal. In Germany, fine crystals from Hagendorf, at Pleystein, and Hühnerkobel, near Zwiesel, Bavaria. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. From the Viitaniemi pegmatite, near Eräjärvi, Finland. In the USA, from the Strickland quarry, Portland, Middlesex Co., and at Branchville, Fairfield Co., Connecticut; in the Fletcher and Palermo #1 mines, near North Groton, Grafton Co., New Hampshire; from the Emmons quarry, Greenwood, Oxford Co., and many other places in Maine; in the Bull Moose and Tip Top mines, near Custer, and the White Elephant mine, near Pringle, Custer Co., and elsewhere in South Dakota. In Brazil, at the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares; fine examples from the Criminoso mine, near São Jose de Safira, and the Joca mine, Galiléia, Minas Gerais. At the Buranga pegmatite, near Gatumba, Rwanda. Extraordinary crystals from Shengus, Gilgit district, Pakistan.

Name: For its first-noted occurrence near Huréaux, France.

Hurlbutite $CaBe_2(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Stout prismatic crystals, dominant {001}, {110}, smaller {010}, {201}, to 2.5 cm; as spheres with a radial fibrous structure.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6
D(meas.) = 2.877(5) D(calc.) = [2.90]

Optical Properties: Transparent to translucent. *Color:* Colorless to greenish white.
Streak: White. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, weak.
$\alpha = 1.595(3)$ $\beta = 1.601(3)$ $\gamma = 1.604(3)$ 2V(meas.) = 70° 2V(calc.) = 70°18′

Cell Data: *Space Group:* $P2_1/a$. $a = 8.299(1)$ $b = 8.782(2)$ $c = 7.798(3)$ $\beta = 90.5°$
Z = 4

X-ray Powder Pattern: G.E. Smith mine, New Hampshire, USA.
3.67 (10), 3.03 (9), 2.78 (9), 2.21 (9), 3.50 (7), 2.50 (7), 3.28 (6)

Chemistry:

	(1)	(2)
P_2O_5	56.19	57.22
BeO	21.30	20.17
CaO	21.84	22.61

Total	100.09	100.00

(1) G.E. Smith mine, New Hampshire, USA; corresponds to $Ca_{0.98}Be_{2.13}(PO_4)_{1.98}$.
(2) $CaBe_2(PO_4)_2$.

Occurrence: A late-stage mineral in complex granite pegmatites; observed as an alteration product of beryl.

Association: Triphylite, siderite, muscovite, albite, quartz (G.E. Smith mine, New Hampshire, USA); montebrasite, beryllonite, lithiophilite (Viitaniemi pegmatite, Finland); tiptopite, englishite, montgomeryite (Tip Top mine, South Dakota, USA).

Distribution: In the USA, large crystals from the G.E. Smith mine, Newport, Sullivan Co., and at the Beauregard pegmatite, Gilsum, Cheshire Co., New Hampshire; in the Black Mountain quarry, Rumford, Oxford Co., Maine; at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. In the Viitaniemi pegmatite, near Eräjärvi, Finland. At the Norrö pegmatite, on Rånö Island, and from near Kapelludden, Utö Island, Sweden. From Otov, near Ronsperk, Czech Republic. At the Grand Slam, Kondo, and Lion Hill mines, Urungwe, and on the Jaffie tin claims, Wankie, Zimbabwe. Several other localities are reported.

Name: To honor Prof. Cornelius Searle Hurlbut, Jr. (1906–), American mineralogist, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 103923, 104958, 104602, 134548.

Hutchinsonite $(Pb,Tl)_2As_5S_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are prismatic to acicular ‖ [001], to 1 cm; also as radiating tufts.

Physical Properties: *Cleavage:* Good on {010}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1.5–2 VHN = 170 D(meas.) = 4.6–4.7 D(calc.) = 4.58

Optical Properties: Opaque, translucent in thin fragments. *Color:* Scarlet-vermilion to deep cherry-red, with strong red internal reflections; transmits red light in thin fragments. *Luster:* Adamantine to submetallic.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, extreme. $\alpha = 3.078(18)$ $\beta = 3.176(3)$ $\gamma = 3.188(3)$ 2V(meas.) = 37° (589). *Anisotropism:* Strong. R_1–R_2: (400) 32.6–36.9, (420) 31.8–35.9, (440) 31.2–35.2, (460) 30.5–34.3, (480) 29.5–33.2, (500) 29.0–32.1, (520) 29.1–31.3, (540) 28.8–30.4, (560) 28.0–29.4, (580) 26.9–28.4, (600) 26.0–27.6, (620) 25.3–26.8, (640) 24.8–26.4, (660) 24.3–26.0, (680) 23.9–25.6, (700) 23.6–25.3

(1) Slyudyanka, Russia; corresponding to $(K_{0.67}Ba_{0.13}Na_{0.09}Ca_{0.04}Mg_{0.01})_{\Sigma=0.94}(Si_{2.85}Al_{1.16})_{\Sigma=4.01}O_8$. (2) Busovača, Bosnia-Herzegovina; by electron microprobe, corresponding to $(K_{0.43}Ba_{0.39}Na_{0.17}Ca_{0.01})_{\Sigma=1.00}(Si_{2.59}Al_{1.42})_{\Sigma=4.01}O_8$.

Polymorphism & Series: Intermediate member of the series orthoclase-celsian.

Mineral Group: Feldspar group.

Occurrence: Typically associated with metamorphosed manganiferous rocks or in mineral deposits rich in manganese.

Association: Manganiferous epidote, rhodonite, rhodochrosite, spessartine, manganiferous tremolite, plagioclase, analcime.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland. At Jakobsberg, Långban, and in the Harstigen mine, near Persberg, Värmland, and in the Sjö mine, near Grythyttan, Örebro, Sweden. From Slyudyanka, near Lake Baikal, Siberia, Russia. Large crystals from Zagradski Creek, near Busovača, Bosnia-Herzegovina. At Aberfeldy, Scotland. In the USA, from Franklin, Sussex Co., New Jersey, and Johnsburg, Warren Co., New York. At Nisikkatch Lake, Saskatchewan, Canada. From Piggery Creek, Broken Hill, New South Wales, Australia. In the Kaso mine, Tochigi Prefecture, and at Minakami, Gumma Prefecture, Japan. From Otjosondu, Namibia. A few other localities are known.

Name: From the Greek for *glass* and *to appear*, in reference to its transparency in crystals.

Hyalotekite $(Ba, Pb, Ca)_6(B, Si, Al)_2(Si, Be)_{10}O_{28}(F, Cl)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Coarsely crystalline, massive.

Physical Properties: *Cleavage:* Easy in two directions at ~90°; indistinct in a third direction in the same zone as the other two. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 3.81–3.82 D(calc.) = 3.83 Fluoresces blue, light brownish orange, or yellow in SW UV; bright yellow or blue cathodoluminescence.

Optical Properties: Transparent in very thin plates. *Color:* White to pearly gray.
Luster: Vitreous to greasy.
Optical Class: Biaxial (+). *Dispersion:* $r < v$, weak to strong. α = 1.646–1.656 β = 1.649–1.660 γ = 1.659–1.671 2V(meas.) = 57°–60.5° 2V(calc.) = 55.4°–62.5°

Cell Data: *Space Group:* $I\bar{1}$. a = 11.310(2) b = 10.955(2) c = 10.317(3) α = 90.43(2)° β = 90.02(2)° γ = 90.16(2)° Z = 2

X-ray Powder Pattern: Långban, Sweden. (ICDD 19-572).
3.45 (100), 3.53 (80), 2.94 (80), 3.81 (70), 2.297 (65), 2.143 (65), 7.7 (60)

Chemistry:

(1) Långban, Sweden; original total given as 100.37%, corresponds to $(Ca_{2.07}Ba_{1.94}Pb_{1.67}K_{0.28}Na_{0.08})_{\Sigma=6.04}(B_{1.60}Si_{0.19}Al_{0.05}Mn_{0.06}Mg_{0.03}Cu_{0.02}Fe_{0.01})_{\Sigma=1.96}(Si_{9.56}Be_{0.44})_{\Sigma=10.00}O_{28}(F_{0.78}Cl_{0.02})_{\Sigma=0.80}$. (2) Dara-i-Pioz massif, Tajikistan; by electron and ion microprobe, corresponds to $(Ba_{2.58}Ca_{1.76}Pb_{1.13}Na_{0.36}K_{0.23}Sr_{0.01})_{\Sigma=6.07}(B_{1.85}Si_{0.14}Mg_{0.03}Fe_{0.01})_{\Sigma=2.03}(Si_{9.67}Be_{0.33})_{\Sigma=10.00}O_{28.5}F_{0.58}$.

Occurrence: Sparingly in feldspar in a metamorphosed Fe–Mn deposit (Långban, Sweden); in reedmergnerite pegmatite in an alkaline massif (Dara-i-Pioz massif, Tajikistan).

Association: Quartz, calcite, hematite, barylite, barite, manganoan pectolite, ferrian potassic feldspar, calderitic andradite, melanotekite, barian hedyphane, plumboan taramellite, rhodonite, manganoan aegirine (Långban, Sweden); feldspars, reedmergnerite, aegirine, pyrochlore, eudialyte, polylithionite (Dara-i-Pioz massif, Tajikistan).

Distribution: At Långban, Värmland, Sweden. From the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: From the Greek for *glass* and *to melt*, in allusion to its easy fusibility.

Total	99.71

(1) Shoals, Indiana, USA; corresponds to $Al_{4.14}(SO_4)_{1.00}(OH)_{10.42}\cdot 11.67H_2O$.

Occurrence: Infilling vertical fissures in the weathering zone of siderite–chamosite ironstones (Irchester, England); in cave passages in argillaceous dolostone by the reaction of sulfuric acid with kaolinite (Cottonwood Cave, New Mexico, USA); a reaction product between migrating aluminum-bearing acid sulfate solutions and carbonate concretions (Chickerell, England).

Association: Basaluminite, gypsum, aragonite, halloysite, gibbsite, allophane, "limonite" (Irchester, England); gibbsite, amorphous silica (New Mexico, USA).

Distribution: In England, from the Lodge pit, Irchester, Northamptonshire; on Clifton Hill, Brighton, Sussex; and at the Crook Hill Brickyard, Chickerell, near Weymouth, Dorset. In the USA, from three km west of Shoals, Martin Co., Indiana; in Cottonwood Cave, Guadalupe Mountains, New Mexico; from the Holbrook pit and in the Southwest mine, Bisbee, Cochise Co., Arizona. In Alum Cave, Vulcano, Lipari Islands, Italy.

Name: As the hydrated analog of *basaluminite*.

Type Material: n.d.

(1) Libby. Montana; corresponds to $(Mg_{2.38}Fe^{3+}_{0.61}K_{0.32}Ca_{0.12}Ti_{0.07}Fe^{2+}_{0.05}Na_{0.03}Ba_{0.01})_{\Sigma=3.59}(Si_{2.82}Al_{1.18})_{\Sigma=4.00}O_{10}[(OH)_{1.95}F_{0.05}]_{\Sigma=2.00}\cdot 3.01H_2O$.

Polymorphism & Series: A 1:1 regular interstratification of biotite and vermiculite.

Mineral Group: Mica group.

Occurrence: As an alteration product of other micas.

Association: Vermiculite, biotite, apatite, zircon.

Distribution: Perhaps at Křemže, Czech Republic. A few other localities for well-characterized material include: in the USA, in the Rainy Creek complex, near Libby, Lincoln Co., Montana, and from the Enoree area, Spartanburg Co., South Carolina. At Phalaborwa, Transvaal, South Africa.

Name: For its resemblance to *biotite*, but hydrated.

(1) Inder deposit, Kazakhstan. (2) $CaMgB_6O_8(OH)_6 \cdot 3H_2O$.

Occurrence: Typically formed by groundwater alteration of colemanite; may be primary.

Association: Colemanite, hydroboracite, tunellite.

Distribution: Originally described from an unknown locality in the "Caucasus", at that time a general name for the areas south of European Russia. From the Inder boron deposit, Kazakhstan. At the Niedersachswerfen anhydrite deposit, near Nordhausen, Harz Mountains, Germany. In the USA, from the Thompson mine, near Ryan, in the Terry deposit, and at the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., in the Kramer borate deposit, Boron, Kern Co., and elsewhere in California. From the Potash Corporation of America mine, Penobsquis evaporite deposit, and in the Salt Springs evaporite deposit, near Sussex, New Brunswick, Canada. In Turkey, from several deposits in the Bigadiç borate district, Balıkesir Province; at the Killik, Hisarcık, and Espey borate mines, near Emet, Kütahya Province. Fine examples from Kara Göl, Zanjan, Iran. From Pampa Pique III, about one km north of Oficina Lautaro, Taltal district, Antofagasta, Chile. At Pastos Grandes, and in the Monte Amarillo and Apalacheana mines, Sijes district, Salta Province, Argentina.

Name: In allusion to essential water and a supposed relation to *boracite*.

Type Material: Lost.

Hydrocalumite $Ca_2Al(OH)_6[Cl_{1-x}(OH)_x]\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Pseudohexagonal crystals, tabular on {001}, bounded by {120}, {$\bar{1}$20}, and {10$\bar{1}$}, to 1 cm; massive. *Twinning:* Common on {32$\bar{2}$} as contact twins.

Physical Properties: *Cleavage:* {001}, perfect; another inclined at ∼60° to {100}, poor. Hardness = 3 D(meas.) = 2.09–2.15 D(calc.) = 2.09–2.15 Strongly pyroelectric.

Optical Properties: Transparent. *Color:* Colorless to light green; colorless in thin section. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 3°$. $\alpha = 1.528–1.535$ $\beta = 1.552–1.553$ $\gamma = 1.556–1.557$ 2V(meas.) = 24°–40°

Cell Data: *Space Group:* $P2/c$. $a = 9.953–10.047$ $b = 11.466–11.523$ $c = 16.271–16.292$ $\beta = 104.20°–104.46°$ Z = 8

X-ray Powder Pattern: Scawt Hill, Ireland.
7.92 (vvs), 3.99 (vs), 2.87 (s), 2.46 (s), 1.657 (ms), 2.70 (m), 2.24 (m)

(1–2) Scawt Hill, Ireland. (3) Boisséjour, France; corresponding to $(Ca_{1.92}Mg_{0.07}Na_{0.01})_{\Sigma=2.00}$ $Al(OH)_6[Cl_{0.48}(OH)_{0.37}(CO_3)_{0.06}]_{\Sigma=0.91}\cdot 4H_2O$.

Occurrence: A rare late-stage hydrothermal mineral in skarns formed from contact metamorphism of limestone or in xenoliths in lava.

Association: Afwillite, portlandite, ettringite, larnite, plombièrite, hydrogrossular, calcite.

Distribution: At Scawt Hill, near Larne, Co. Antrim, Ireland. From Boisséjour, near Ceyrat, Puy-de-Dôme, France. At Campomorto, Montalto di Castro, Lazio, Italy. From the Bellerberg, Rothenberg, and Emmelberg volcanos, near Mayen, Eifel district, Germany. At Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia. In the Daba marbles, Jordan.

Name: For a HYDROus mineral containing CAlcium and ALUMinum.

Type Material: n.d.

Hydrocerussite $Pb_3(CO_3)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As steep hexagonal $\{h0\overline{h}l\}$ pyramidal to tabular crystals, to 4 cm; in lenticular to thin scaly crystal aggregates; cleavable massive.

Physical Properties: *Cleavage:* On {0001}, perfect. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 6.80–6.82 D(calc.) = 6.873

Optical Properties: Transparent to translucent. *Color:* Colorless to white, gray, may display greenish tint; colorless in transmitted light. *Luster:* Adamantine, pearly on {0001}. *Optical Class:* Uniaxial (–). $\omega = 2.09$ $\epsilon = 1.94$

Cell Data: *Space Group:* n.d. $a = 5.239(5)$ $c = 23.65(2)$ $Z = 3$

X-ray Powder Pattern: Synthetic; near to plumbonacrite.
2.623 (10), 3.611 (9), 3.286 (9), 4.47 (6), 4.247 (6), 2.231 (5), 1.696 (4)

Chemistry:

	(1)	(2)
CO_2	11.21	11.35
PbO	86.52	86.33
Cl	0.27	
H_2O	2.23	2.32
$-O = Cl_2$	0.06	
Total	100.17	100.00

(1) Mendip Hills, England. (2) $Pb_3(CO_3)_2(OH)_2$.

Occurrence: An uncommon secondary mineral in the oxidized portions of lead deposits.

Association: Lead (Långban, Sweden); cerussite, leadhillite, matlockite, paralaurionite, diaboleite, leadhillite, galena (Mammoth-St. Anthony mine, Arizona, USA).

Distribution: From Långban, Värmland, Sweden. At Tvedalen, near Larvik, Norway. In England, relatively abundant on the Higher Pitts Farm, Mendip Hills, and as large crystals in the Merehead quarry, near Shepton Mallet, Somerset; at many mines in Caldbeck Fells, Cumbria. From Wanlockhead, Dumfriesshire and Leadhills, Lanarkshire, Scotland. At the Kamariza mine, Laurium, Greece. In the Ilímaussaq intrusion, Greenland. From Tsumeb, Namibia. In the Seh-Changi mine, near Neyband, Khorassan, Iran. At Mont Saint-Hilaire, Quebec, Canada. In the USA, in Arizona, exceptional crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co.; at the C & B mine, Gila Co.; in the Bunker Hill mine, Shoshone Co., Idaho. Additional minor localities are known.

Name: In allusion to the essential chemical components, water and the lead and carbonate of *cerussite*.

Type Material: n.d.

Hydrochlorborite $Ca_2B_4O_4Cl(OH)_7 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As well-formed tabular {001} crystals, with wedgelike terminations, to 13 mm; {001}, {110}, {$\overline{2}$11} define the typical habit, with four other forms reported; in dense masses.

Physical Properties: *Cleavage:* On {001}, good. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 1.83–1.85 D(calc.) = 1.841 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 25°$. *Dispersion:* $r < v$. $\alpha = 1.499–1.501$ $\beta = 1.502–1.504$ $\gamma = 1.520–1.521$ 2V(meas.) = 45°–45.8°

Cell Data: *Space Group:* $I2/a$. $a = 22.783(3)$ $b = 8.745(1)$ $c = 17.066(1)$ $\beta = 96.705(1)°$ Z = 8

X-ray Powder Pattern: Salar Carcote, Chile.
8.48 (100), 6.01 (24), 3.604 (9), 2.798 (8), 2.825 (7), 2.186 (7), 8.18 (6)

Chemistry:

	(1)	(2)	(3)
SO_3	trace		
B_2O_5	29.50	29.2	29.75
FeO		0.04	
MgO	0.00	0.01

Total	100.62	100.33	100.00

(1) China; corresponds to $Ca_{1.94}B_{3.94}O_4Cl(OH)_7 \cdot 7.8H_2O$. (2) Salar Carote, Chile; corresponds to $Ca_{2.04}B_{4.00}O_4Cl_{0.97}(OH)_7 \cdot 7.5H_2O$. (3) $Ca_2B_4O_4Cl(OH)_7 \cdot 7H_2O$ established by crystal-structure analysis.

Occurrence: A rare dry-season evaporite mineral in playa sediment (Salar Carcote, Chile).

Association: Ulexite, halite, gypsum (China).

Distribution: From China, at an unspecified locality [the Qinghai-Xizang Plateau, Tibet]. From Salar Carote, Antofagasta, Chile.

Name: In allusion to the essential chemical components, water, chlorine and borate.

Type Material: National Museum of Natural History, Washington, D.C., USA, 131036.

References: (1) Chien Tzu-Chiang and Chen Shu-Chen (1965) Brief note on preliminary results of study of a new borate mineral – hydrochlorborite: ($Ca_4B_5O_{15}Cl_2 \cdot 22H_2O$). Hydrodelhayelite $KCa_2AlSi_7O_{17}(OH)_2 \cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Habit not stated.

Physical Properties: *Cleavage:* {010}, very perfect; {100} and {001}, imperfect. Hardness = ∼4 D(meas.) = 2.168 D(calc.) = 2.22

Optical Properties: Semitransparent. *Color:* Grayish white. *Luster:* Vitreous. *Optical Class:* Biaxial. $\alpha = 1.503$ β = n.d. $\gamma = 1.518$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $Pnm2_1$. $a = 6.6483$ $b = 23.8462$ $c = 7.0727$ $Z = 2$

X-ray Powder Pattern: Khibiny massif, Russia.
2.923 (100), 3.069 (75), 2.800 (55), 3.319 (43), 6.79 (38)

Chemistry:

	(1)	(2)		(1)	(2)

			Total	99.64	100.00

(1) Mt. Rasvumchorr, Khibiny massif, Russia. (2) $KCa_2AlSi_7O_{17}(OH)_2 \cdot 6H_2O$.

Occurrence: A secondary alteration product of delhayelite from ijolite-urtite pegmatites in a differentiated alkalic massif.

Association: Delhayelite, lamprophyllite, eudialyte, hisingerite, aegirine, orthoclase.

Distribution: On Mts. Rasvumchorr and Yukspor, in the Khibiny massif, Kola Peninsula, Russia.

Name: For its relation to *delhayelite*, and the water in its composition.

Type Material: Mining Institute, St. Petersburg, 1178/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79785.

Hydrodresserite $BaAl_2(CO_3)_2(OH)_4 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Typically as spherical or hemispherical aggregates of divergent crystals, acicular along [001], to 1 mm; individual crystals display prominent {010}, and narrow {$2\overline{1}0$} and {102}.

Physical Properties: *Cleavage:* Perfect on {010} and {$2\overline{1}0$}. Hardness = 3–4
D(meas.) = 2.80(2) D(calc.) = 2.817 Easily dehydrates to dresserite.

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* White.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* X (65°,88°); Y (–27°,46°); Z (158.25°,44.5°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. $\alpha = 1.502(2)$ $\beta = 1.594(1)$ $\gamma = 1.595(1)$
2V(meas.) = 17(1)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 9.7545(5)$ $b = 10.4069(5)$ $c = 5.6322(3)$
$\alpha = 95.695(5)°$ $\beta = 92.273(5)°$ $\gamma = 115.643(4)°$ Z = 2

X-ray Powder Pattern: Francon quarry, Canada.
8.52 (10), 3.42 (7), 3.10 (6), 4.26 (5), 8.75 (4), 9.30 (3), 5.32 (3)

Chemistry:

	(1)	(2)
CO_2	21.8	20.31
Al_2O_3	23.7	23.53
BaO	35.0	35.38
H_2O	20.3	20.78
Total	100.8	100.00

(1) Francon quarry, Canada; by electron microprobe, corresponding to $Ba_{0.98}Al_{1.99}(CO_3)_{2.12}(OH)_{3.68} \cdot 2.97H_2O$. (2) $BaAl_2(CO_3)_2(OH)_4 \cdot 3H_2O$.

Occurrence: Very rare, in vugs in metamorphosed limestone, near the contact zone of a dawsonite-rich silicocarbonatite sill.

Association: Dresserite, weloganite, quartz.

Distribution: From the Francon quarry, Montreal Island, Montreal, Quebec, Canada.

Name: For essential water and characteristic dehydration to *dresserite* under low humidity conditions.

Type Material: Geological Survey of Canada, Ottawa, 13936; Royal Ontario Museum, Toronto, Canada, M34547, M34600.

References: (1) Jambor, J.L., A.P. Sabina, and B.D. Sturman (1977) Hydrodresserite, a new Ba-Al carbonate from a silicocarbonatite sill, Montreal Island, Quebec. Can. Mineral., 15, 399–404. Hydroglauberite $Na_{10}Ca_3(SO_4)_8 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. As felted aggregates of fibrous crystals, striated ‖ elongation, to 0.1 mm, in dense masses.

Physical Properties: *Cleavage:* Three noted, one of which is parallel to elongation. Hardness = n.d. D(meas.) = 1.510 D(calc.) = n.d. Soluble in H_2O, slightly bitter, salty taste.

Optical Properties: Translucent. *Color:* White. *Luster:* Silky in aggregates. *Optical Class:* Biaxial (–). *Orientation:* Positive elongation, parallel extinction. $\alpha = 1.488$ (α') β = n.d. $\gamma = 1.500$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Kushkanatau salt deposit, Uzbekistan.
3.08 (100), 9.20 (90), 2.78 (90b), 4.60 (80), 2.90 (70), 4.20 (60), 3.52 (60)

Chemistry:

	(1)	(2)
SO_3	52.16	52.21
MgO	0.00	
CaO	13.59	13.72
Na_2O	25.40	25.26
K_2O	0.19	
Cl	0.58	
H_2O	8.20	8.81
$-O = Cl_2$	[0.13]	
Total	[99.99]	100.00

(1) Kushkanatau salt deposit, Uzbekistan; original total given as 100.12%.
(2) $Na_{10}Ca_3(SO_4)_8 \cdot 6H_2O$.

Occurrence: An uncommon alteration product of glauberite.

Association: Glauberite, halite, mirabilite, polyhalite, thénardite, blödite (Kushkanatau salt deposit, Uzbekistan); gypsum, mirabilite, halite (Salar de Pintados, Chile).

Distribution: From the Kushkanatau salt deposit, lower Amu Darya River, Kara-Kalpakia, Uzbekistan. In the Cesano geothermal field, Latium, Italy. From Kalkberg, near Lüneburg, Lower Saxony, Germany. At the Salar de Pintados, near La Guaica, Tarapacá, Chile. From near San Simon, Cochise Co., Arizona, USA.

Name: For the essential water content and chemical similarity to *glauberite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72170, 72171; National Museum of Natural History, Washington, D.C., USA, 148423.

Hydrohalite $NaCl \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Elongated crystals, to 1 cm, intergrown with halite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [1.65] Melts under its own vapor pressure at –0.1 °C, converting to halite.

Optical Properties: Transparent. *Color:* Colorless to white.
Optical Class: Biaxial. *Orientation:* Extinction 35° from a prism face; length-slow. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d. *Anisotropism:* Moderately strong.

Cell Data: *Space Group:* $P2_1/c$ probable (synthetic at 105 K). $a = 6.3313(5)$ $b = 10.1178(9)$ $c = 6.5029(6)$ $\beta = 114.407(7)°$ Z = 4

X-ray Powder Pattern: Synthetic; taken at –5 °C.
2.98 (10), 2.67 (10), 2.52 (10), 3.82 (9), 2.24 (9), 3.87 (8), 2.88 (6)

Chemistry: Natural material has not been analyzed.

Occurrence: Formed from sea water or in bottom sediments of hypersaline lakes at near-freezing temperatures.

Association: Halite, gypsum.

Distribution: From Hallein, Salzburg, Austria. In Lake Bonney, Taylor Valley, Victoria Land, Antarctica.

Name: As a hydrate of *halite*.

Hydrohetaerolite $Zn_2Mn_4^{3+}O_8 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are fibrous, elongated ‖ [110]; radiating, in botryoidal crusts, finely granular, massive.

Physical Properties: *Cleavage:* Parallel fiber elongation. Hardness = 5–6 D(meas.) = 4.64 D(calc.) = [5.57]

Optical Properties: Opaque, transparent on thin edges. *Color:* Dark brown to brownish black; dark brown in transmitted light; creamy gray in reflected light. *Streak:* Dark brown. *Luster:* Submetallic.
Optical Class: Uniaxial (–). $\omega = 2.26(2)$ $\epsilon = 2.10(2)$

Cell Data: *Space Group:* $I4_1/amd$. $a = 5.735(1)$ $c = 9.005(1)$ Z = 2

X-ray Powder Pattern: Wolftone mine, Colorado, USA.
2.47 (10), 2.66 (8), 3.02 (7), 1.508 (7), 1.570 (5), 2.87 (4), 1.434 (4)

Chemistry:

	(1)	(2)	(3)
SiO_2	2.69	1.71	
Fe_2O_3		0.77	
Mn_2O_3	56.00	60.44	63.59
ZnO	37.56	33.43	32.78
H_2O^+		1.42	3.63
H_2O^-		2.47	
H_2O	4.36		
Total	100.61	100.24	100.00

(1) Wolftone mine, Colorado, USA; average of two analyses; corresponding to $Zn_{2.26}(Mn^{3+}_{3.50}Si_{0.22})_{\Sigma=3.77}O_{7.94} \cdot 1.20H_2O$. (2) Franklin, New Jersey, USA; corresponding to $Zn_{2.02}(Mn^{3+}_{3.77}Si_{0.14}Fe^{3+}_{0.04})_{\Sigma=3.97}O_{8.03} \cdot 1.06H_2O$. (3) $Zn_2Mn_4O_8 \cdot H_2O$.

Occurrence: In oxidized manganese-bearing zinc deposits.

Association: Chalcophanite, hemimorphite, smithsonite (Leadville, Colorado, USA); chalcophanite (Franklin, New Jersey, USA).

Distribution: In the USA, from the Wolftone mine, Leadville, Lake Co., Colorado; at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Mohawk mine, San Bernardino Co., California; in Arizona, from the Campbell mine, Bisbee, and the Emerald mine, Tombstone, Cochise Co. In England, from the Copperthwaite vein, Swaledale, North Yorkshire. At Silvermines, Co. Tipperary, Ireland. On Mont Chemin, Valais, Switzerland. In the Orzel Bialy mine, Upper Silesia, Poland. In Japan, from the Maruyama mine, Aomori Prefecture.

Name: For a HYDROus mineral, and its relation to *hetaerolite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 112011.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 717–718. (2) Frondel, C. Hydrohonessite $Ni_6Fe_2^{3+}(SO_4)(OH)_{16}\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As microscopic hexagonal flakes, to 10 μm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.96

Optical Properties: Transparent to translucent. *Color:* Bright yellow; bright yellow in transmitted light. *Luster:* [Adamantine.]
Optical Class: Uniaxial (–). $\omega = 1.63$ $\epsilon = 1.59$

Cell Data: *Space Group:* n.d. $a = 3.09$ $c = 10.80$ Z = n.d.

X-ray Powder Pattern: Otter Shoot mine, Western Australia.
11.0 (10), 5.56 (5), 3.68 (4), 2.709 (3), 2.595 (2), 2.394 (2), 2.152 (1)

Chemistry: (1) Otter Shoot mine, Kambalda, and Carr Boyd Rocks mine, Australia; by electron microprobe, partial analysis yielded Ni 25.7%, Fe 10.3%, SO_4 15.6%, which, after a number of crystal-structure assumptions, is stated to correspond to $Ni_{6.4}Fe^{3+}_{2.6}(SO_4)_{2.3}(OH)_{16}\cdot 7.0H_2O$.

Occurrence: Incrusting fractures in the oxidized portions of Ni–Fe sulfide deposits (Otter Shoot mine and Carr Boyd mine, Australia); or in chromitite (Unst, Scotland; Linden, Wisconsin, USA).

Association: Honessite, reevesite, magnesite, gaspéite, pecoraite, goethite, gypsum (Otter Shoot mine and Carr Boyd mine, Australia); honessite, reevesite, theophrastite (Unst, Scotland); wupatkiite, nickel-boussingaultite, pickeringite (Cameron district, Arizona, USA).

Distribution: In Australia, from the Otter Shoot nickel mine, Kambalda, 56 km south of Kalgoorlie; at the Carr Boyd Rocks nickel mine, Yerilla district, 80 km north-northeast of Kalgoorlie; and in the 132 North nickel mine, four km southwest of Widgiemooltha, Western Australia. At the Hagdale quarry, Unst, Shetland Islands, Scotland. In the USA, from near Linden, Iowa Co., Wisconsin; in a prospect 13 km east-southeast of Gray Mountain, Cameron district, Coconino Co., Arizona.

Name: As the hydrated analog of *honessite*.

Type Material: Western Australian Museum, Perth, Australia, M.77a.1991, M.77b.1991; National Museum of Natural History, Washington, D.C., USA, 150420.

References: (1) Nickel, E.H. and J.E. Wildman (1981) Hydrohonessite — a new hydrated Ni–Fe hydroxy-sulphate mineral; its relationship to honessite, carrboydite, and minerals of the pyroaurite group. Hydromagnesite $Mg_5(CO_3)_4(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As acicular to bladed crystals, flattened on {100}, terminated by {011} with {100} striated ‖ [001] by repetition of {110} and {100}, to 10 cm; in divergent sprays, massive, chalky. *Twinning:* Polysynthetic lamellar twinning on {100}, common.

Physical Properties: *Cleavage:* {010}, perfect. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.24–2.25 D(calc.) = 2.25

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous; silky to pearly to dull in aggregates.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge c = 47°09'$. $\alpha = 1.523(3)$ $\beta = 1.527(3)$ $\gamma = 1.545(1)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.105(5)$ $b = 8.954(2)$ $c = 8.378(4)$ $\beta = 114.44(5)°$ Z = 2

X-ray Powder Pattern: Soghan mine, Iran.
5.79 (100), 2.899 (82), 9.20 (39), 6.40 (38), 2.298 (33), 4.186 (31), 3.317 (28)

Chemistry:

	(1)	(2)
CO_2	37.10	37.64
MgO	43.16	43.10
H_2O	19.65	19.26
Total	99.91	100.00

(1) Emarese, Italy. (2) $Mg_5(CO_3)_4(OH)_2 \cdot 4H_2O$.

Occurrence: Incrusting and filling fractures in altered ultramafic rocks and serpentinites; in low-temperature hydrothermally altered dolomitic xenoliths and marble; common in caves as a component of "moonmilk" and speleothems.

Association: Calcite, dolomite, aragonite, brucite, magnesite, artinite, pyroaurite, periclase, "opal", chromite.

Distribution: Widespread, with numerous minor localities. Studied material from: in the USA, from Hoboken, Hudson Co., New Jersey; at Wood's Chrome and Low's mines, near Texas, Lancaster Co., Pennsylvania; in Nevada, abundant at Luning, Mineral Co., and near Gabbs, Gabbs district, Nye Co.; numerous localities in California, as at the Crestmore quarry, Riverside Co.; to 25% in a surface zone, about 55 km northwest of Coalinga, Fresno Co.; near Red Mountain, Stanislaus Co.; at Fort Point, San Francisco Co. In Canada, in the Cariboo, Atlin, and Kamloops districts, British Columbia. In the São Felix do Minato mine, Bahia, Brazil. From Kraubath, Salzburg, Austria. In Italy, from Emarese and Montjovet, Val d'Aosta, Piedmont; at Predazzo, Trentino-Alto Adige, on Monte Somma, Campania. In Iran, exceptional crystals from the Soghan mine, south of Kerman, Esfandaque district; and in the Dovez open pit, near the Shariar mine, Minab district. From the Shabani and Mtoroshanga areas, Zimbabwe. In the Vestfold Hills, East Antarctica. The most common carbonate after calcite and aragonite in caves worldwide.

Name: In allusion to its content of water and similarity to *magnesite*.

Type Material: Natural History Museum, Paris, France, 97592.

Hydrombobomkulite $(Ni, Cu)Al_4[(NO_3)_2, SO_4](OH)_{12} \cdot 13-14H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Monoclinic.] (by analogy to mbobomkulite). *Point Group:* n.d. As powdery nodules and microcrystalline coatings; on dehydration exfoliates into "tiny" hexagonal plates.

Physical Properties: *Cleavage:* [On {001}, perfect.] *Tenacity:* Friable in aggregates. Hardness = ["Very soft".] D(meas.) = n.d. D(calc.) = n.d. Dehydrates readily to mbobomkulite.

Optical Properties: Translucent. *Color:* Blue; colorless in transmitted light. *Optical Class:* [Biaxial, weakly birefringent.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 10.145$ $b = 17.155$ $c = 20.870$ $\beta = 90.55°$ Z = 8

X-ray Powder Pattern: Mbobo Mkulu Cave, South Africa.
10.45 (100), 5.229 (50), 3.485 (30), 2.489 (15), 6.233 (10), 4.899 (10), 4.172 (10)

Chemistry: (1) Mbobo Mkulu Cave, South Africa; desiccation of hydrombobomkulite with 32.10% weight loss of H_2O, then identity of X-ray pattern with that of mbobomkulite establishes the formula.

Occurrence: By the interaction of solutions of nickel sulfate from weathering Cu–Ni-bearing sulfides with aluminosilicate minerals and nitrate derived from bat guano (Mbobo Mkulu Cave, South Africa); in a sedimentary U–V deposit (Jomac mine, Utah, USA).

Association: Allophane, mbobomkulite, chalcoalumite (Mbobo Mkulu Cave, South Africa); oswaldpeetersite, cuprite, antlerite, goethite, lepidocrocite, mbobomkulite, sklodowskite, gypsum (Jomac mine, Utah, USA).

Distribution: From the Mbobo Mkulu Cave, near Ngodwana, Eastern Transvaal, South Africa. At the Jomac mine, White Canyon district, San Juan Co., Utah, USA.

Name: As the hydrated equivalent of *mbobomkulite*.

Type Material: Museum of the Geological Survey, Pretoria, South Africa.

References: (1) Martini, J.E.J. (1980) Mbobomkulite, hydrombobomkulite and nickelalumite, new minerals from Mbobo Mkulu Cave, Eastern Transvaal. Ann. Geol. Surv. South Africa, 14(2), 1–10. (2) (1982) Amer. Mineral., 67, 415–416 (abs. ref. 1).

Hydronium jarosite $(H_3O)Fe_3^{3+}(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As microscopic plates or rhombohedra; reniform, scaly, earthy.

Physical Properties: *Cleavage:* [On {0001}, distinct.] (by analogy to jarosite). *Fracture:* [Uneven to conchoidal.] *Tenacity:* [Brittle.] Hardness = 4–4.5 D(meas.) = 2.50–2.90 D(calc.) = 3.01

Optical Properties: Translucent. *Color:* Bright yellow to pale yellow. *Luster:* Dull to resinous.
Optical Class: Uniaxial (–). *Pleochroism:* O = deep yellow; E = pale yellow. $\omega = 1.816$ $\epsilon = 1.728$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.3559$ $c = 17.0097$ Z = 3

X-ray Powder Pattern: Synthetic. (ICDD 31-650).
5.10 (100), 3.13 (90), 3.09 (65), 1.839 (30), 1.990 (20), 5.67 (18), 5.97 (16)

Chemistry:

	(1)	(2)
SO_3	32.71	33.31
Fe_2O_3	48.90	49.83
Na_2O	0.43	
K_2O	0.52	
H_2O	15.09	16.86
insol.	2.35	
Total	100.00	100.00

(1) Thorez mine, Poland; corresponds to $[(H_3O)_{0.88}Na_{0.07}K_{0.05}]_{\Sigma=1.00}Fe_3(SO_4)_2(OH)_6$.
(2) $(H_3O)Fe_3(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: In the oxidized zone of rapidly weathering sulfide-bearing rocks; may be of post-mining formation. A relatively uncommon member of the group because the ubiquitous abundance of alkali ions in surface waters normally precludes its stability.

Association: Melanterite, goethite.

Distribution: Material confirmed by modern techniques from: in Poland, at the Staszic mine, Holy Cross Mountain, near Kielce, and at Rudawka, Rymanowska, Carpathian Mountains; in the Thorez mine, Walbrzych, Lower Silesia. From Jáchymov (Joachimsthal), Czech Republic. At the Kamariza mine, Laurium, Greece. Found north of Ballybunion, Co. Kerry, Ireland. In the Malka mine, southeast of Pyatigorsk, Caucasus Mountains, Russia. At Paddy's River mine, Australian Capital Territory. In the USA, from the Black Brush deposit, Cherry Creek area, Pinal Co., Arizona; at the Bristol silver mine, Lincoln Co., New Mexico; in Nevada, from the Boss mine, Goodsprings district, Clark Co.; the Goldstrike mine, Lynn district, and the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co.; and at Majuba Hill, Pershing Co.; from the Centennial Eureka mine, Tintic Co., Juab Co., Utah. More localities undoubtedly could be confirmed.

Name: As the H_3O^+, *hydronium*, analog of *jarosite*.

Type Material: Academy of Mining and Metallurgy, Krakow, Poland.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 566–567 [carphosiderite = hydronium jarosite, part]. (2) Kubisz, J. Hydrophilite $CaCl_2(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (synthetic), pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. In pseudocubic crystals, modified by {111} and {011}; as a crystalline to mealy crust.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.175 (synthetic). Hygroscopic, deliquescent, soluble in H_2O; intensely bitter taste.

Optical Properties: Transparent to translucent. *Color:* White, may be stained violet. *Optical Class:* Biaxial (+) (synthetic). $\alpha = 1.600(3)$ $\beta = 1.605(3)$ $\gamma = 1.613(3)$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* *Pnnm* (synthetic). $a = 6.261(2)$ $b = 6.429(2)$ $c = 4.167(1)$ Z = 2

X-ray Powder Pattern: Synthetic.
3.050 (100), 4.48 (85), 2.331 (50), 2.858 (35), 2.244 (30), 2.356 (25), 1.906 (25)

Chemistry: An analysis of natural material is not available.

Occurrence: In a boracite deposit, as a coating on gypsum.

Association: Anhydrite, gypsum, halite.

Distribution: From Lüneburg, Lower Saxony, Germany. Reported from a few additional localities. All occurrences require modern confirmation.

Name: From the Greek for *water* and *friend*, in allusion to the mineral's hygroscopic property.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 161. (2) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 41–42. Hydroromarchite $Sn_3^{2+}O_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. In thin crusts intermixed with romarchite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.40]

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P4/mnc$ (synthetic). $a = 7.98(1)$ $c = 9.17(1)$ Z = 2

X-ray Powder Pattern: Boundary Falls, Canada. (ICDD 25-1303).
3.50 (100), 2.77 (90), 2.96 (80), 3.26 (50), 1.92 (50), 1.90 (50), 2.48 (40)

Chemistry: Boundary Falls, Canada; X-ray spectrographic scans detected only tin.

Occurrence: As an alteration product on tin pannikins immersed in a river.

Association: Romarchite.

Distribution: At Boundary Falls, Winnipeg River, Ontario, Canada, where tin pannikins had been dropped by a voyageur between 1801 and 1821.

Name: As a HYDROus mineral related to *romarchite*.

Type Material: Royal Ontario Museum, Toronto, Canada, M28744.

References: (1) Organ, R.M. and J.A. Mandarino (1971) Romarchite and hydroromarchite, two new stannous minerals. Can. Mineral., 10, 916 (abs.). (2) (1972) Amer. Mineral., 57, 1555 (abs. ref. 1). Hydroscarbroite $Al_{14}(CO_3)_3(OH)_{36}\cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. [Compact, massive.] (by analogy to scarbroite)

Physical Properties: *Tenacity:* [Friable, clayey.] Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d. Dehydrates irreversibly to scarbroite.

Optical Properties: Semitransparent. *Color:* [White.] *Luster:* [Dull.]
Optical Class: n.d. n = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Scarborough, England; after removal of lines due to scarbroite impurity.
9.0 (vvs), 4.713 (m), 4.386 (m), 1.167 (m), 6.77 (wm), 6.69 (wm), 5.72 (wm)

Chemistry: From work done on a mixture of scarbroite and hydroscarbroite; the fully hydrated form "may well be $Al_2(CO_2)_3\cdot 12Al(OH)_3$ with a large amount of H_2O."

Occurrence: In vertical fissures in sandstone, intermixed with scarbroite.

Association: Scarbroite, gibbsite, kaolinite, calcite, quartz.

Distribution: From South Bay, near Scarborough, Yorkshire, and at Weston Favell, Northamptonshire, England.

Name: As a higher hydrate of *scarbroite*.

Type Material: n.d.

References: (1) Duffin, W.J. and J. Goodyear (1960) A thermal and X-ray investigation of scarbroite. Mineral. Mag., 32, 353–362. (2) Brindley, G.W. and J.J. Hydrotalcite $Mg_6Al_2(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Typically subhedral crystals, platy on {0001}, lamellar-fibrous, rarely euhedral prismatic, to 4 mm; commonly foliated, massive.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Flexible but not elastic. Hardness = 2 D(meas.) = 2.03–2.09 D(calc.) = 2.11 Greasy feel.

Optical Properties: Transparent. *Color:* White, may have a brownish tint; colorless in transmitted light. *Streak:* White. *Luster:* Satiny to greasy or waxy.
Optical Class: Uniaxial (–); may be biaxial due to strain. ω = 1.510–1.518 ϵ = 1.494–1.504 2V(meas.) = Small.

Cell Data: *Space Group:* $R\overline{3}m$. a = 3.054–3.070 c = 22.81–23.23 Z = 3/8

X-ray Powder Pattern: Snarum, Norway; nearly identical to pyroaurite. (ICDD 14-191). 7.69 (100), 3.88 (70), 2.58 (20), 2.30 (20), 1.96 (20), 1.53 (20), 1.50 (20)

Chemistry:

	(1)	(2)
Al_2O_3	14.42	16.88
Fe_2O_3	2.44	
MgO	39.52	40.04
H_2O	36.28	35.79
CO_2	7.33	7.29
insol.	0.56	
Total	100.55	100.00

(1) Snarum, Norway; probably intermixed with manasseite. (2) $Mg_6Al_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with manasseite.

Mineral Group: Hydrotalcite group.

Occurrence: A secondary mineral in serpentinite.

Association: Manasseite, serpentine, dolomite.

Distribution: From Snarum, Norway. At Tonezza, Vicenza, Italy. From Věžná, Czech Republic. Found at Goles, Bosnia-Herzegovina. On Gladner Hill, Styria, Austria. In Canada, from the Kilmar mine, Argenteuil Co., Quebec; numerous other localities are noted but not distinguished from manasseite. In the USA, around Amity, Orange Co., and Somerville, St. Lawrence Co., New York; and at Franklin, Sussex Co., New Jersey; additional localities are known but material may be intermixed with manasseite. Well-crystallized in the Kovdor massif, and in the Vuoriyarvi carbonatite complex, Kola Peninsula, and probably elsewhere in Russia.

Name: As a HYDROus mineral with a resemblance to *talc*.

Hydrotungstite $WO_2(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Platy crystals bounded by {210}, {100}, and {010}, to 75 μm, in fine reticulated intergrowths. *Twinning:* On {210}, polysynthetic, may be gridlike, universal.

Physical Properties: *Cleavage:* {010}, imperfect. Hardness = 2 D(meas.) = 4.60 D(calc.) = [4.66]

Optical Properties: Semitransparent. *Color:* Dark green, becoming yellowish on exposure to air. *Luster:* Vitreous to dull.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = yellow-green; Z = dark green. *Orientation:* $Y = b$; $X \wedge c = 3°$. *Dispersion:* $r < v$. *Absorption:* $Z > Y > X$. $\alpha = 1.70(2)$ $\beta = 1.95(2)$ $\gamma = 2.04(2)$ 2V(meas.) = ∼52°

Cell Data: *Space Group:* $P2/m$ (probable). $a = 7.379(5)$ $b = 6.901(5)$ $c = 3.748(5)$ $\beta = 90°22(10)'$ Z = 2

X-ray Powder Pattern: San Antonio mine, Bolivia.
6.95 (vvs), 3.27 (vs), 3.73 (s), 3.46 (ms), 1.96 (ms), 2.63 (m), 2.54 (m)

Chemistry:

	(1)	(2)	(3)
WO_3	80.31	86.47	86.55
SiO_2	6.65		
Fe_2O_3	0.08		
H_2O	12.52	13.53	13.45
Total	99.56	[100.00]	100.00

(1) Calacalani mine, Bolivia. (2) Analysis (1), recalculated to 100% after deduction of ferberite and quartz. (3) $WO_2(OH)_2 \cdot H_2O$.

Occurrence: An alteration product of ferberite in the oxidized zone of a hydrothermal tungsten deposit, where it was an ore mineral (Calacalani mine, Bolivia).

Association: Ferberite, tungstite.

Distribution: In Bolivia, from the Oruro district, at the San Antonio de Calacalani mine, near Colquiri, and in the Juliani mine. At Panasqueira, Portugal. From the Grancarica scheelite deposit, southwest of Velingrad, Bulgaria.

Name: For its content of H_2O and relation to *tungstite*.

Type Material: Harvard University, Cambridge, Massachusetts, 98896; National Museum of Natural History, Washington, D.C., USA, 104901.

References: (1) Kerr, P.F. and F. Young (1944) Hydrotungstite, a new mineral from Oruro, Bolivia. Amer. Mineral., 29, 192–210. (2) Mitchell, R.S. (1963) X-ray data for hydrotungstite. Amer. Hydrowoodwardite $Cu_2Al_2(SO_4)(OH)_8 \cdot nH_2O$.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ (probable). As porous botryoidal crusts and small stalactitic aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle upon partial dehydation. Hardness = n.d. D(meas.) = 2.33(8) D(calc.) = 2.48 Slowly and reversibly dehydrates to woodwardite.

Optical Properties: Translucent. *Color:* Blue to pale blue. *Streak:* Pale blue. *Luster:* Vitreous.
Optical Class: [Uniaxial.] $n = 1.549(5)$–$1.565(5)$ ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}m$ (probable). $a = 3.070(7)$ $c = 31.9(2)$ $Z = 3$

X-ray Powder Pattern: St. Briccius mine, Germany.
10.5 (100), 5.26 (17), 3.50 (6), 2.60 (5b), 1.524 (4b), 2.46 (2b), 2.23 (2b)

Chemistry:

	(1)
SO_3	15.50
SiO_2	5.60
Al_2O_3	19.20
CuO	28.39
ZnO	0.41
Na_2O	0.10
H_2O	30.10
Total	[99.30]

(1) St. Briccius mine, Germany; by ICP-MS, SiO_2 from admixed amorphous silica, H_2O by TGA, $(SO_4)^{2-}$, $(OH)^{1-}$ and H_2O confirmed by IR, original total given as 99.3%; corresponds to $(Cu_{1.92}Zn_{0.04})_{\Sigma=1.96}Al_{2.04}(SO_4)_{1.04}(OH)_{7.96} \cdot 5.08H_2O$. (2) St. Christoph mine, Germany; analysis not given, $(CO_3)^{2-}$ from stoichiometry and presence confirmed by IR; then stated to correspond to $(Cu_{1.96}Zn_{0.04})_{\Sigma=2.00}(UO_2)_{0.04}Al_{2.00}[(SO_4)_{0.64}(CO_3)_{0.36}]_{\Sigma=1.00}(OH)_8 \cdot nH_2O$.

Occurrence: Rare in the oxidized portions of base metal sulfide mines.

Association: Woodwardite, schulenbergite, namuwite, brianyoungite, langite, linarite, allophane, amorphous silica.

Distribution: In Germany, in Saxony, from the St. Briccius mine, Königswalde, near Annaberg; in the Gelbe Birke mine, Schwarzenberg; at the St. Johannes mine, Wolkenstein, near Marienberg; and from the St. Christoph mine, Bärenhecke. At Simdde Dyllhan, Drws-y-Coed, near Nantlle, Gwynedd, Wales.

Name: As the hydrated analog of *woodwardite*.

Type Material: Mining Academy, Freiberg, Germany, 76639.

Hydroxyapophyllite $KCa_4Si_8O_{20}(OH,F)\cdot 8H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are equant or tabular on {001}, to 15 cm, with {100}, {001}, and {111}; some crystals striated on {100} ‖ [001]. *Twinning:* Multiply twinned.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* [Uneven] (by analogy to fluorapophyllite). *Tenacity:* [Brittle.] Hardness = 4.5–5 D(meas.) = 2.37 D(calc.) = 2.36

Optical Properties: Transparent to translucent, opaque. *Color:* Colorless to white; may be pink, light green, or light yellow. *Streak:* White. *Luster:* Vitreous on {100} and pearly on {001}.
Optical Class: Uniaxial (+). $\omega = 1.536–1.542$ $\epsilon = 1.537–1.543$

Cell Data: *Space Group:* $P4/mnc$. $a = 8.978(3)$ $c = 15.83(1)$ $Z = 2$

X-ray Powder Pattern: Jefferson, North Carolina, USA.
3.965 (100), 2.990 (67), 1.588 (26), 4.554 (23), 2.494 (22), 7.90 (13), 7.82 (13)

Chemistry:

	(1)	(2)	(3)
SiO_2	51.93	52.59	53.10
Al_2O_3	0.30	0.12	
CaO	25.78	25.44	24.78
K_2O	4.76	5.00	5.20
Na_2O	0.09	0.00	
H_2O	16.76	16.89	16.92
Total	99.62	100.04	100.00

(1) Jefferson, North Carolina, USA; by electron microprobe, H_2O by the Penfield method.
(2) Kimberley, South Africa; by electron microprobe, H_2O by the Penfield method.
(3) $KCa_4Si_8O_{20}(OH)\cdot 8H_2O$.

Polymorphism & Series: Forms a series with fluorapophyllite.

Occurrence: Typically a secondary mineral in amygdules or druses in basalts.

Association: Zeolites, fluorapophyllite, datolite, pectolite, calcite.

Distribution: In the USA, in the Ore Knob mine, Jefferson, Ashe Co., and the Foote mine, Kings Mountain, Cleveland Co., North Carolina; at Great Notch and Paterson, Passaic Co., and Franklin, Sussex Co., New Jersey; from the Fairfax quarry, Centreville, Fairfax Co., Virginia. From the Valenciana and La Luz mines, Guanajuato, Mexico. In India, around Bombay, Poona, and Nasik, Maharashtra. From Kimberley, and in large crystals, from near Kuruman, Cape Province, South Africa. In Norway, from the Mofjellet mine, Mo i Rana. These occurrences have been authenticated, which requires chemical analysis; there are undoubtedly additional ones.

Name: For the predominance of *hydroxyl* and relation to other *apophyllite* species.

Type Material: The Natural History Museum, London, England, 1977,58; Geological Survey of Canada, Ottawa, 14099; Royal Ontario Museum, Toronto, Canada; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 115268.

Hydroxycancrinite $Na_8Al_6Si_6O_{24}(OH, CO_3)_2 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 6. Massive aggregates, with grains to 1.5 cm.

Physical Properties: *Cleavage:* Perfect on $\{10\bar{1}0\}$. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 2.32(2) D(calc.) = 2.26

Optical Properties: Transparent. *Color:* Light blue; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.494(2)$ $\epsilon = 1.501(2)$

Cell Data: *Space Group:* $P6_3$. $a = 12.740(3)$ $c = 5.182(2)$ $Z = 1$

X-ray Powder Pattern: Lovozero massif, Russia; resembles cancrinite.
3.26 (100), 3.68 (70), 4.70 (60), 2.756 (50), 2.433 (30), 6.43 (25), 4.17 (20)

Chemistry:

	(1)
SiO_2	36.32
Al_2O_3	31.15
Fe_2O_3	0.18
MnO	0.03
MgO	0.11
CaO	0.92
Na_2O	23.43
K_2O	0.45
H_2O	5.41
CO_2	1.59
Total	99.59

(1) Lovozero massif, Russia, corresponding to $(Na_{7.46}Ca_{0.16}K_{0.10}Mg_{0.03}Fe^{3+}_{0.02})_{\Sigma=7.77}(Al_{6.03}Si_{5.97})_{\Sigma=12.00}O_{24}[(OH)_{1.23}(CO_3)_{0.36}]_{\Sigma=1.59} \cdot 2.35H_2O$.

Mineral Group: Cancrinite group.

Occurrence: In veins in ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Natrolite, steenstrupine, vuonnemite, epistolite, mountainite, ilmajokite, nastrophite.

Distribution: On Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: For predominant *hydroxyl* in its composition, and its relation to *cancrinite*.

Type Material: Vernadsky Geological Museum, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Hydroxylapatite $Ca_5(PO_4)_3(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As tabular to prismatic crystals, to 30 cm; usually as stalagmites, nodules, in crystalline to massive crusts.

Physical Properties: *Cleavage:* Poor on {0001} and $\{10\bar{1}0\}$. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.14–3.21 D(calc.) = 3.16

Optical Properties: Transparent to translucent. *Color:* White, wax-yellow, sea-green, brown, black. *Luster:* Vitreous to subresinous, earthy.
Optical Class: Uniaxial (–). *Pleochroism:* Weak to moderate; colorless to pale colors.
Absorption: $E > O$. $\omega = 1.642$–1.658 $\epsilon = 1.637$–1.654

Cell Data: *Space Group:* $P6_3/m$. $a = 9.4166$ $c = 6.8745$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 9-432).
2.814 (100), 2.778 (60), 2.720 (60), 3.44 (40), 1.841 (40), 1.943 (30), 2.631 (25)

Chemistry:

	(1)	(2)
P_2O_5	42.05	42.39
MnO	0.07	
MgO	0.10	
CaO	55.84	55.82
F	0.16	
Cl	trace	
H_2O	1.86	1.79

Total	100.01	100.00

(1) Holly Springs, Georgia, USA; corresponding to $(Ca_{5.05}Mg_{0.01})_{\Sigma=5.06}(PO_4)_3[(OH)_{1.04}F_{0.08}]_{\Sigma=1.12}$. (2) $Ca_5(PO_4)_3(OH)$.

Mineral Group: Apatite group; OH > F or Cl.

Occurrence: Much less common than fluorapatite. Formed by the reaction of limestone with phosphatic solutions derived from guano. In talc schists associated with serpentinite. As a fracture-localized alteration of montebrasite in a complex granite pegmatite.

Association: Brushite, calcite (caves); talc, serpentine (schists); montebrasite, crandallite, muscovite (pegmatite).

Distribution: From Chämleten (Kemmleten), near Hospental, Uri, Switzerland. In the Kaiserstuhl, Baden-Württemberg, Germany. At Punta della Rossa, Val Devero, Ossola, Italy. In the USA, in the Verde Antique quarry, Holly Springs, Cherokee Co., Georgia; from the Midnight Owl pegmatite, White Picacho district, Maricopa Co., Arizona. Large crystals in the Gardiner complex, beyond the head of Kangerdlugssuaq Fiord, East Greenland. On Mona Island, West Indies, Caribbean Sea. From caves worldwide; studied material from Low Water Bridge Cave, Greene Co., Missouri, USA.

Name: For dominant *hydroxyl* and membership in the *apatite* group; see fluorapatite.

Hydroxylbastnäsite-(Ce) $(Ce, La)(CO_3)(OH, F)$

ⓒ2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{6}m2$. Tabular crystals exhibit {0001} and {$11\overline{2}0$}, to 0.5 mm; granular to short prismatic, reniform, and in sheaflike aggregates. *Twinning:* On {$11\overline{2}0$}.

Physical Properties: *Cleavage:* {$11\overline{2}0$}, imperfect. *Fracture:* Uneven. Hardness = ∼4
D(meas.) = 4.745 D(calc.) = [4.79]

Optical Properties: Translucent to nearly opaque. *Color:* Colorless, wax-yellow, dark brown; colorless in transmitted light. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (+). $\omega = 1.760(3)$ $\epsilon = 1.870(6)$

Cell Data: *Space Group:* $P\overline{6}2c$. $a = 7.23(2)$ $c = 9.98(5)$ $Z = 6$

X-ray Powder Pattern: Vuoriyarvi complex, Kola Peninsula, Russia [close to bastnäsite-(Ce)].
2.92 (10), 3.59 (9), 2.09 (9), 1.923 (9), 2.05 (8), 1.698 (7), 1.319 (7)

Chemistry:

	(1)		(1)		(1)
SO_3	0.40	Ce_2O_3	37.50	CaO	0.40
P_2O_5	0.23	Nd_2O_3	3.43	BaO	0.70
CO_2	19.70	Sm_2O_3	1.59	Na_2O	0.13
SiO_2	0.30	$(Y + Dy)_2O_3$	1.47	F	1.15
TiO_2	0.04	Fe_2O_3	2.17	H_2O^+	3.96
ThO_2	0.50	MnO	0.06	H_2O^-	0.11
La_2O_3	26.86	MgO	0.16	$-O = F_2$	0.50
				Total	100.36

(1) Vuoriyarvi complex, Kola Peninsula, Russia; after deduction of about 5% impurities such as quartz, anatase, dolomite, barite, rhabdophane, and goethite, corresponds to $(Ce_{0.53}La_{0.38}Nd_{0.05}Sm_{0.02}Y_{0.02})_{\Sigma=1.00}(CO_3)_{1.03}[(OH)_{0.86}F_{0.14}]_{\Sigma=1.00}$.

Polymorphism & Series: Forms a series with bastnäsite-(Ce).

Occurrence: In calcite–dolomite carbonatite veins in pyroxenite of an alkalic ultramafic complex (Vuoriyarvi complex, Kola Peninsula, Russia); in a vug in perthitic pegmatite (Kamihori, Japan); in veins and lenses in marble (Desmont mine, Canada).

Association: Barite, strontianite, ancylite, fluorite, pyrrhotite, pyrite, chalcopyrite, magnetite, anatase, monazite, burbankite, quartz (Vuoriyarvi complex, Kola Peninsula, Russia); beryl, zircon, xenotime, allanite, fergusonite, gadolinite, ilmenite (Kamihori, Japan); stillwellite, calcite, apatite, titanite, thorite, thorianite, uranothorite, scapolite, tourmaline (Desmont mine, Canada).

Distribution: From the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. In the Ossling quarry, between Kamenz and Hoyerswenda, Saxony, Germany. At Kamihori, Miyazaki Prefecture, Japan. In the Desmont mine, two km northwest of Wilberforce, Ontario, Canada.

Name: For a member of the *bastnäsite* group with $(OH)^{1-} > F^{1-}$ and with *cerium* the dominant rare earth element.

Type Material: n.d.

Hydroxylbastnäsite-(Nd) $(Nd, Ce, La)(CO_3)(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{6}m2$. Stacked platy crystals, to 0.2 mm, in massive intergrowths.

Physical Properties: *Cleavage:* On {0001}, a parting. Hardness = 1–2 in aggregates. D(meas.) = n.d. D(calc.) = 4.89

Optical Properties: Translucent. *Color:* White. *Streak:* White. *Luster:* Dull in aggregates. *Optical Class:* Uniaxial (+). $\omega = 1.715(2)$ $\epsilon = 1.81(1)$

Cell Data: *Space Group:* $[P\overline{6}2c]$ (by analogy to other bastnäsite species). $a = 7.191(1)$ $c = 9.921(2)$ Z = 6

X-ray Powder Pattern: Near Nikšić, Yugoslavia.
2.911 (100), 4.95 (88), 3.596 (79), 2.042 (51), 1.914 (30), 2.077 (29), 2.481 (16)

Chemistry:

	(1)		(1)
CO_2	20.63	Eu_2O_3	1.3
Y_2O_3	0.2	Gd_2O_3	1.4
La_2O_3	27.1	CaO	0.3
Ce_2O_3	0.3	F	3.3
Pr_2O_3	8.5	H_2O	2.26
Nd_2O_3	31.5	$-O = F_2$	1.39
Sm_2O_3	4.4	Total	99.80

(1) Near Nikšić, Yugoslavia; by electron microprobe, CO_2 and H_2O by TGA and mass spectrometer, presence of $(CO_3)^{2-}$ and H_2O confirmed by IR; corresponds to $(Nd_{0.41}La_{0.36}Pr_{0.11}Sm_{0.06}Gd_{0.02}Eu_{0.02}Ca_{0.01})_{\Sigma=0.97}[(OH)_{0.55}F_{0.38}]_{\Sigma=0.93}(CO_3)_{1.03}$.

Polymorphism & Series: Dimorphous with kozoite-(Nd).

Occurrence: As a rare authigenic mineral in a bauxite deposit developed on limestone.

Association: "Bauxite".

Distribution: From the Zagrad bauxite deposit, near Nikšić, Montenegro, Yugoslavia.

Name: For a member of the *bastnäsite* group with $(OH)^{1-} > F^{1-}$ and with *neodymium* the dominant rare earth element.

Type Material: University of Belgrade, Belgrade, Yugoslavia, Zagrad 10,8397; Hungarian Academy of Sciences, Budapest, Hungary; Royal Ontario Museum, Toronto, Canada.

Hydroxylborite $Mg_3(BO_3)(OH)_3$

Crystal Data: Hexagonal. *Point Group*: 6/*m*. As prismatic crystals dominated by {10$\bar{1}$ 0}, to 1.5 mm; in radial aggregates.

Physical Properties: *Cleavage*: Imperfect on {0001}. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 3.5 D(meas.) = 2.89(1) D(calc.) = 2.872

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Uniaxial (-). ω = 1.566(1) ε = 1.531(1)

Cell Data: *Space Group*: $P6_3/m$. a = 8.912(8) c = 3.112(4) Z = 2

X-ray Powder Pattern: Visyachy area, Sakha-Yakutia Republic, Russia.
2.422 (100), 4.45 (82), 2.573 (65), 2.128 (60), 7.69 (52), 2.551 (49), 2.141 (44)

Chemistry:

	(1)	(2)
MgO	65.71	66.16
B_2O_3	18.43	19.05
F	45.45	
H_2O	9.73	14.79
$-O=F_2$	4.31	
Total	99.79	100.00

(1) Visyachy area, Sakha-Yakutia Republic, Russia; average of 3 electron microprobe analyses, H_2O by Penfeld method, IR confirms OH, corresponding to $Mg_{3.03}(B_{0.98}[(OH)_{2.00}F_{1.00}]O_{3.00}$.
(2) $Mg_3(BO_3)(OH)_3$.

Occurrence: As disseminations and veinlets in boron-mineralized calcsilicate marbles.

Association: Calcite, dolomite, Mg-rich ludwigite, kotoite, szaibelyite, clinohumite, magnetite, serpentine, chlorite.

Distribution: Visyachy area, Titovsky deposit, Chersky Range, Dogdo Basin, Sakha-Yakutia Republic, Russia.

Name: For its chemical composition, as a hydroxyl dominant analog of fluoborite.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (91968); Geological Museum of All-Russia Institute of Mineral Resources, Moscow (M-1663).

H_2O	3.48
$–O=F_2$	0.54
Total	100.41

(1) Chuvashskie Mountains, Zlatoust region, South Urals, Russia; average of 11 electron microprobe analyses, H_2O by the Alimarin method; corresponding to $(Mg_{4.52}Ti_{0.31}Fe_{0.07})_{\Sigma=4.90}(Si_{1.98}P_{0.02})_{\Sigma=2.00}O_8[(OH)_{1.33}O_{0.44}F_{0.23}]_{\Sigma=2.00}$.

Mineral Group: Humite group.

Occurrence: In the contact zone between magnesium skarn and marble.

Association: Calcite, clinochlore, dolomite, tremolite, diopside, andradite-grossular, magnetite, perovskite, hydroxylclinohumite, titanite.

Distribution: Perovskite pit, western slope of the Chuvashskie Mountains, Zlatoust region, South Urals, Russia.

Name: Reflects the mineral's identity as the OH (*hydroxyl*) analogue of *chondrodite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3986/1).

Hydroxylellestadite $Ca_{10}(SiO_4)_3(SO_4)_3(OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As cleavable aggregates, to 2 cm.

Physical Properties: Hardness = 4.5 D(meas.) = 3.01(8) D(calc.) = ∼3.080

Optical Properties: Translucent. *Color:* Pale purplish. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.654(1)$ $\epsilon = 1.650(1)$

Cell Data: *Space Group:* $P2_1/m$, pseudo-$P6_3/m$. $a = 9.476(2)$ $b = 9.508(2)$ $c = 6.919(1)$ $\beta = 119.53(2)^\circ$ Z = [2]

X-ray Powder Pattern: Chichibu mine, Japan.
2.839 (100), 2.739 (60), 2.655 (45), 2.801 (44), 1.853 (43), 3.462 (40), 1.484 (20)

(1) Chichibu mine, Japan; corresponds to $(Ca_{9.66}Na_{0.11}Sr_{0.03}Fe_{0.03}K_{0.02})_{\Sigma=9.85}[(SiO_4)_{2.86}(SO_4)_{2.68}(CO_3OH)_{0.37}(PO_4)_{0.09}]_{\Sigma=6.00}[(OH)_{1.88}Cl_{0.26}F_{0.15}]_{\Sigma=2.29}$.

Polymorphism & Series: Forms a series with fluorellestadite.

Mineral Group: Ellestadite group.

Occurrence: In pre-ore contact metamorphic skarns.

Association: Diopside, wollastonite, xanthophyllite, vesuvianite, calcite.

Distribution: In the Chichibu mine, Saitama Prefecture, Japan.

Name: For *hydroxyl* in the chemical composition and analogy to *ellestadite*.

Type Material: National Science Museum, Tokyo, Japan, M15761.

Hydroxylherderite $CaBe(PO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic or pseudohexagonal. *Point Group:* $2/m$. As stout prismatic crystals, elongated along [001] or [100], may be thick tabular {001}, typically with complex but rounded form development, to 17 cm; botryoidal to spherical, radial fibrous, in aggregates. *Twinning:* On {100} or {001} or both, as "fishtail" contact twins, common.

Physical Properties: *Cleavage:* On {110}, irregular. *Fracture:* Subconchoidal. Hardness = 5–5.5 D(meas.) = 2.95 D(calc.) = 2.94–2.97 May fluoresce weak yellow under SW UV, perhaps with bright yellow-orange phosphorescence.

Optical Properties: Transparent to translucent. *Color:* Colorless, gray, brown, pale yellow, greenish white, light blue, purple; colorless in transmitted light; may be blue-green or blue in daylight, lavender or light violet in incandescent light. *Luster:* Vitreous to subvitreous, resinous. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $X \wedge c \simeq 87°$; $Z \wedge c \simeq -3°$. *Dispersion:* $r > v$, inclined. $\alpha = 1.59–1.615$ $\beta = 1.61–1.634$ $\gamma = 1.62–1.643$ 2V(meas.) = 70°–77°

Cell Data: *Space Group:* $P2_1/a$. $a = 9.789(2)$ $b = 7.661(1)$ $c = 4.804(1)$ $\beta = 90.02(1)°$ Z = 4

X-ray Powder Pattern: Palermo #1 mine, New Hampshire, USA; cannot be distinguished from herderite, and very similar to datolite. (ICDD 29-1403).

(1) Paris, Maine, USA. (2) Virgem da Lapa, Brazil; by electron microprobe, H_2O by the Penfield method, BeO calculated from stoichiometry. (3) $CaBe(PO_4)(OH, F)$ with OH:F = 1:1.

Polymorphism & Series: Forms a series with herderite.

Occurrence: A late-stage mineral in miarolitic cavities in complex granite pegmatites, of hydrothermal or probable pneumatolytic origin; may form from the alteration of beryl or beryllonite.

Association: Elbaite, topaz, cassiterite, albite, microcline, muscovite, lepidolite, quartz.

Distribution: Many localities, but uncommon at most. Some for analyzed material include: in the USA, in Maine, at Paris, Hebron, Greenwood, Stoneham, and Newry, Oxford Co., at Topsham, Sagadahoc Co., Poland and Auburn, Androscoggin Co., and elsewhere; in the Fletcher and Palermo #1 mines, near North Groton, Grafton Co., and at the Keyes mine, Orange, Grafton Co., New Hampshire; from the Blue Chihuahua pegmatite, near Oak Grove, San Diego Co., California. In Germany, at the Epprechtstein and Waldheim quarries, Fichtelgebirge, Bavaria. In the Viitaniemi pegmatite, near Eräjärvi, Finland. From Mursinsk, Ural Mountains, Russia. At Ungursuay, Kazakhstan. In Brazil, large crystals from the Xandá mine, Virgem da Lapa, and at the Golconda mine, near Governador Valadares, Minas Gerais.

Name: For predominance of *hydroxyl* over fluorine in its composition and relation to *herderite*.

Type Material: Yale University, New Haven, Connecticut, USA, Brush 1971, 1972, 1974, 1975.

Total	100.11

(1) Mendig, Laacher See area, Eifel volcanic region, Germany; average of 7 electron microprobe analyses, H_2O calculated for charge balance; corresponding to $(Mn_{0.51}Th_{0.37}Na_{0.35}Ca_{0.29}Ce_{0.18}La_{0.09}Nd_{0.02}U_{0.04})_{\Sigma=1.85}(Nb_{0.97}Ti_{0.85})_{\Sigma=2.01}O_6[(OH)_{0.65}O_{0.24}F_{0.11}]$.

Mineral Group: Pyrochlore group.

Occurrence: In small miarolitic cavities in sanidinite as a late pneumatolytic phase.

Association: Sanidine, nosean, biotite, tephroite, jacobsite, and spinellides of the gahnite–hercynite series.

Distribution: From a pumice quarry, near Mendig, Laacher See area, Eifel volcanic region, Rheinland-Pfalz, Germany.

Name: Reflects the mineral's identity as a member of the *pyrochlore* group with dominant OH (*hydroxyl*) and Mn^{2+} respectively in the Y and A structural sites.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Hydrozincite $Zn_5(CO_3)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Uncommonly as lathlike or bladed crystals, flattened on {100} and elongated along [001], with pointed terminations, to 6 mm; fibrous, stalactitic, reniform, pisolitic, isolated spheroidal and in aggregates, earthy, chalky, massive. *Twinning:* Contact twins on {100}.

Physical Properties: *Cleavage:* On {100}, perfect. *Tenacity:* Very brittle. Hardness = 2–2.5 D(meas.) = 4.00(3) D(calc.) = 4.01 Fluoresces pale blue to lilac under UV.

Optical Properties: Transparent. *Color:* Colorless, white, gray, pale shades of yellow, brown, pink, green, spherules may be concentrically color banded; colorless in transmitted light. *Luster:* Pearly, silky to dull or earthy in aggregates.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c \simeq 40°$. *Dispersion:* $r < v$, strong.
$\alpha = 1.635$–1.640 $\beta = 1.736$ $\gamma = 1.740$–1.750 2V(meas.) = n.d. 2V(calc.) = 40°

Cell Data: *Space Group:* $C2/m$. $a = 13.62$ $b = 6.30$ $c = 5.42$ $\beta = 95°50'$ Z = 2

X-ray Powder Pattern: Goodsprings, Nevada, USA.
6.77 (10), 2.480 (7), 2.72 (6), 3.14 (5), 1.688 (4), 2.85 (3), 1.908 (3b)

Chemistry:

	(1)	(2)
CO_2	[16.41]	16.03
ZnO	74.67	74.12
H_2O	8.92	9.85
Total	[100.00]	100.00

(1) Goodsprings, Nevada, USA; CO_2 by difference. (2) $Zn_5(CO_3)_2(OH)_6$.

Occurrence: Uncommonly formed in the oxidized portions of zinc-bearing deposits, at the expense of sphalerite or smithsonite, and as incrustations in mine workings and caves.

Association: Smithsonite, hemimorphite, willemite, cerussite, aurichalcite, calcite, "limonite".

Distribution: Widespread. A few localities affording good specimens include: from Bleiberg, Carinthia, Austria. On Monte Malfidano, near Buggerru, and in the Gutturu Pala mine, north of Iglesias, Sardinia, Italy. In commercial amounts at Picos de Europa, near Santander, and at Udias, Cantabria Province, Spain. In the USA, from Friedensville, Lehigh Co., Pennsylvania; Linden, Iowa Co., Wisconsin; at Joplin, Jasper Co., Missouri; around Galena, Cherokee Co., Kansas; abundant at Goodsprings, Clark Co., Nevada; from the Tintic district, Juab Co., Utah; pure masses in the Texas-Arizona mine, Gunnison Hills, Cochise Co., Arizona. Fine crystals from the Ojuela mine, Mapimí, Durango, Mexico. From the Tchah Kuh mine, Esfahan, and the Dareh-Bandjir and Mehdi-Abad mines, near Anjireh, Iran. In Australia, at Paddy's River mine, Australian Capital Territory; in the Billy Springs mine, near Mt. Fitton, Flinders Ranges, South Australia; and at Broken Hill, New South Wales. From Island Ford Cave, Virginia, USA. In the Shopov's cave system, Bulgaria.

Name: For the non-carbonate essential chemical components, water and *zinc*.

Hypercinnabar HgS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Intimately associated with metacinnabar.

Physical Properties: *Fracture:* Subconchoidal to uneven. Hardness = 3 VHN = 51.5(8.0) (25 g load). D(meas.) = 7.43 D(calc.) = 7.54

Optical Properties: Translucent. *Color:* Black with purple cast; in polished section, grayish white. *Streak:* Dark black-purple. *Luster:* Adamantine. *Anisotropism:* Distinct in oil. R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 7.01(3)$ $c = 14.13(7)$ Z = 12

X-ray Powder Pattern: Synthetic. (ICDD 19-798).
3.08 (100), 1.980 (100), 1.892 (100), 2.80 (90), 3.43 (80), 3.70 (70), 2.97 (60)

Chemistry: Composition established by similarity of X-ray pattern with synthetic material.

Polymorphism & Series: Trimorphous with cinnabar and metacinnabar.

Occurrence: Intimately associated with metacinnabar, which it generally resembles.

Association: Metacinnabar.

Distribution: In the USA, from the Mt. Diablo mine, Contra Costa Co., California [TL]; at the White Caps mine, Manhattan district, Nye Co., Nevada.

Name: In allusion to the fact that the stability field of the species extends to higher temperatures than that of cinnabar or metacinnabar.

Type Material: n.d.

H_2O	[9.90]	9.58
Total	[100.00]	100.00

(1) Shinkolobwe, Congo; H_2O by difference, corresponds to $UO_2 \cdot 5UO_3 \cdot 10.56H_2O$.
(2) $UO_2 \cdot 5UO_3 \cdot 10H_2O$.

Occurrence: A rare secondary mineral in the unoxidized portions of uranium deposits.

Association: Uraninite, schoepite, becquerelite, kasolite, parsonsite, dewindtite, fourmarierite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the Marshall Pass district, Gunnison and Saguache Co., Colorado, and in the Lucky Strike mine, La Sal Mountains, San Juan Co., Utah, USA. From Wölsendorf, Bavaria, and Menzenschwand, Black Forest, Germany. At Sabugal, Portugal. In France, from La Crouzille, Haute-Vienne; Bigay, and Les Bois Noirs, Puy-de-Dôme; Limouzat-St. Priest-la-Prugne, Loire; Les Brosses, near Grury, Saône-et-Loire; and in the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault.

Name: From the Greek for *violet*, in allusion to its color when fresh.

Type Material: n.d.

Ice H_2O

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals hexagonal, prismatic, to 0.5 m; as "snow" crystals, stellate, skeletal, flattened on [0001]; as "hail", rounded and concentrically zoned; stalactitic, compact, massive; as "frost", columnar, arborescent, feathery. *Twinning:* On {0001}; glides on {0001}.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1.5 D(meas.) = 0.9167 D(calc.) = [0.93] A liquid above 0 °C; diamagnetic.

Optical Properties: Transparent to translucent. *Color:* Colorless, white from inclusions, pale blue to pale green in thick layers. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.30907$ $\epsilon = 1.31052$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 4.498$ $c = 7.338$ $Z = 4$

X-ray Powder Pattern: Synthetic.
3.90 (100), 3.66 (100), 2.25 (90), 3.4 (80), 2.07 (60), 1.92 (50), 2.67 (35)

Chemistry: H_2O of varying degrees of purity.

Occurrence: Formed at low temperatures by sublimation in the atmosphere and in layers over open bodies of water; in glacial flows and thick masses of near-continental dimensions.

Association: None.

Distribution: Worldwide; especially in polar icecaps and glaciers.

Name: From Middle English *is, iis*, in turn from Old English *is*.

Idaite Cu_3FeS_4(?)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Massive, as rare discrete anhedral grains, as rims on chalcopyrite and as fracture fillings in chalcopyrite; also as exsolution lamellae in bornite.

Physical Properties: Hardness = 2.5–3.5 VHN = n.d. D(meas.) = 4.20 D(calc.) = 4.21

Optical Properties: Opaque. *Color:* Coppery red to pinchbeck-brown, bornitelike but not tarnished. *Luster:* Metallic. *Anisotropism:* Strong, reddish orange to reddish brown.
R_1–R_2: (400) 13.9–17.7, (420) 14.8–18.5, (440) 15.7–19.3, (460) 16.9–21.0, (480) 18.4–23.2, (500) 20.5–25.5, (520) 23.2–27.8, (540) 26.1–29.4, (560) 28.9–30.6, (580) 30.6–31.4, (600) 31.9–31.6, (620) 32.8–31.9, (640) 33.5–32.2, (660) 34.1–32.8, (680) 34.7–33.2, (700) 35.2–33.7

Cell Data: *Space Group:* n.d. $a = 3.90$ $c = 16.95$ $Z = 1$

X-ray Powder Pattern: Ida mine, Khan, Namibia.
3.14 (100), 2.82 (100), 1.89 (100), 1.85 (100), 1.564 (100), 2.70 (80), 1.317 (80)

Chemistry:

	(1)	(2)
Cu	51.34	50.87
Fe	14.5	14.90
S	33.66	34.23
Total	99.50	100.00

(1) Skouriotissa, Cyprus; by electron microprobe, average of five analyses. (2) Cu_3FeS_4.

Occurrence: A lamellar decomposition product of bornite, commonly associated with fine spindles of chalcopyrite; apparently of secondary origin, a first product of enrichment.

Association: Chalcopyrite, bornite, pyrite, sphalerite, chalcocite, pyrrhotite, mackinawite (Skouriotissa, Cyprus).

Distribution: Now noted at numerous localities world-wide. In Namibia, from the Ida mine, Khan River Valley, Swakopmund district [TL]; and at Tsumeb. Found near Bou Azzer, Morocco. At Nchanga, Zambia. From Skouriotissa, Cyprus. In Switzerland, near Grimentz, Valais. From the Clara mine, near Oberwolfach, Black Forest, Germany. At the Repparfjord copper deposit, Finnmark, Norway. From Gruvberget, Sweden. At Sasca Montană and Ciresu, Mehedinti Mountains, Romania. From the Radka deposit, Pazardzhik, and the Chelopech deposit, Sofia, Bulgaria. In the USA, at upper White Canyon, San Juan Co., Utah. From Canada, at Algoma, Jarvis Township, Ontario. In Brazil, at Caraiba, Bom Fin, Bahia. In Chile, from several mines in the Copiapó district, Atacama, and at El Indio, east of Coquimbo. In the Kaikita mine, Aomori Prefecture; the Ojamine mine, Yamagata Prefecture; and other localities in Japan.

Name: For the Ida mine in Namibia.

Type Material: n.d.

Idrialite $C_{22}H_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Small irregular square or six-sided crystals; tabular crystals are precipitated from a chloroform extraction of cinnabar ore.

Physical Properties: *Cleavage:* {001}, perfect; {100}, poor. *Fracture:* Conchoidal. Hardness = 1–1.5 D(meas.) = 1.22–1.236 D(calc.) = 1.286 M.P. 319 °C; fluoresces pale blue under UV.

Optical Properties: Semitransparent. *Color:* Pale brown to pale greenish yellow. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* X = pale yellow; $Y = Z$ = yellow. *Orientation:* $X = b$; $Y = a$, $Z = c$. *Dispersion:* $r > v$, weak. $\alpha = 1.557$ $\beta = 1.734$ $\gamma = 2.07$ 2V(meas.) = 84°

Cell Data: *Space Group:* n.d. $a = 8.07$ $b = 6.42$ $c = 27.75$ Z = 4

X-ray Powder Pattern: Idrija mine, Slovenia.
4.94 (100), 3.40 (80), 4.04 (60), 2.48 (30), 7.08 (20), 4.43 (20), 2.06 (20)

Chemistry: (1) Identification depends on correspondence of X-ray powder patterns and other data with that of synthetic material (dimethylbenzphenanthrene).

Occurrence: Probably formed by pyrolysis of organic material near hot springs or by hydrothermal fluids.

Association: Cinnabar, pyrite, gypsum, quartz, "clay" (Idrija mine, Slovenia); metacinnabar, realgar, "opal" (Skaggs Springs, California, USA).

Distribution: From the Idrija (Idria) mercury mine, 38 km west of Ljubljana, northwestern Slovenia. In the USA, in California, at Skaggs Springs, Sonoma Co.; from the Great Western, Mirabel, Helen, and Research mines, Lake Co.; in the Knoxville mine, Napa Co.

Name: For the Idrija (Idria) mine, Slovenia, from which the first specimens were collected.

Type Material: n.d.

Iimoriite-(Y) $Y_2(SiO_4)(CO_3)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As masses up to 3 cm.

Physical Properties: *Cleavage:* Distinct on {011}. Hardness = 5.5–6 D(meas.) = 4.47 D(calc.) = 4.91

Optical Properties: Semitransparent. *Color:* Buff-tan, light purplish gray; in thin section, colorless. *Streak:* White. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (–). $\alpha = 1.75$–1.79 $\beta = 1.82$–1.83 $\gamma = 1.83$ 2V(meas.) = 31° 2V(calc.) = 31.5°

Cell Data: *Space Group:* $P\bar{1}$. $a = 6.573(1)$ $b = 6.651(1)$ $c = 6.454(1)$ $\alpha = 116.44°$ $\beta = 92.34°$ $\gamma = 95.63°$ Z = 2

X-ray Powder Pattern: Bokan Mountain, Alaska, USA.
2.881 (100), 2.954 (80), 2.784 (40), 3.023 (36), 2.841 (35), 2.705 (29), 3.20 (27)

Chemistry:

	(1)
SiO_2	19.0
TiO_2	0.05
Y_2O_3	45.7
RE_2O_3	22.8
Fe_2O_3	0.4
CaO	0.1
MnO	0.01
H_2O^+	0.39
H_2O^-	0.10
CO_2	11.3
P_2O_5	< 0.2
Total	99.85

(1) Bokan Mountain, Alaska, USA; primarily by emission spectrographic analysis; corresponds to $(Y_{1.44}RE_{0.49}Fe^{3+}_{0.20}Ca_{0.02})_{\Sigma=2.15}Si_{1.12}O_4[(CO_3)_{0.91}(H_2O)_{0.14}]_{\Sigma=1.05}$.

Occurrence: In quartz-microcline pegmatite (Fusamata, Japan); in veins in peralkalic riebeckite-aegirine granite (Bokan Mountain, Alaska, USA).

Association: Biotite, monazite, fergusonite, uraninite, thalenite (Fusamata, Japan); quartz, albite, siderite, pyrite, fluorite, sphalerite, galena, zircon (Bokan Mountain, Alaska, USA).

Distribution: In Japan, at Fusamata and Suishoyama, Fukushima Prefecture, and Soraku, Kyoto Prefecture. On the I and L No. 4 claim, Bokan Mountain, Prince of Wales Island, Alaska, USA. From the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France.

Name: For Takeo Iimori and Satoyasu Iimori (1885–?), Japanese mineralogists, and *yttrium* in the composition.

Type Material: National Science Museum, Tokyo, Japan, M16288; National Museum of Natural History, Washington, D.C., USA, 120635.

Ikaite $CaCO_3 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular {001} or pseudomorphous after a rhombohedral carbonate mineral, to 5 cm; may also be massive in porous mounds.

Physical Properties: *Tenacity:* Friable in aggregates. Hardness = n.d. D(meas.) = 1.77 D(calc.) = [1.833] Readily dehydrates to calcite above 8 °C.

Optical Properties: Translucent. *Color:* Brown.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 17°$. α = 1.455–1.460 β = 1.535–1.538 γ = 1.545 2V(meas.) = 38°–45°

Cell Data: *Space Group:* $C2/c$. $a = 8.792(2)$ $b = 8.310(2)$ $c = 11.021(2)$ $\beta = 110.53(5)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 37-416).
5.171 (100), 2.643 (85), 2.629 (70), 2.804 (50), 2.464 (33), 4.162 (29), 2.774 (27)

Chemistry:

	(1)	(2)
CO_2	21.12	21.14
CaO	26.92	26.94
H_2O	51.34	51.92
Total	99.38	100.00

(1) Sub-bottom sediment, Bransfield Strait, Antarctica; CO_2 and H_2O partitioned from weight loss according to stoichiometry. (2) $CaCO_3 \cdot 6H_2O$.

Occurrence: Forms in sea water and lake water in anerobic, organic-rich periglacial and glaciomarine environments near 0 °C, readily converting to calcite at higher temperatures.

Association: n.d.

Distribution: Likely more widespread than the following studied localities would indicate. From the waters of the Ika Fjord, eight km south of Ivigtut, Greenland. In sub-bottom sediment, Bransfield Strait, King George Basin, Antarctica. In the Zaire deep-sea fan, Atlantic Ocean. In sediments of the Nankai Trough, south of Japan. Seasonally at the tufa mounds of Mono Lake, Mono Co., California, USA.

Name: For the Ika Fjord, Greenland, where the first specimens were collected.

Type Material: n.d.

(1) Ikuno mine, Japan; remainder, by difference, is ferberite and quartz; corresponds to $Bi_{3.78}(S_{2.75}Se_{0.25})_{\Sigma=3.00}$. (2) Ashio mine, Japan; by electron microprobe, corresponds to $Bi_{4.33}(S_{2.38}Se_{0.62})_{\Sigma=3.00}$.

Occurrence: In a quartz vein (Ikuno mine, Japan).

Association: Ferberite, bismuth, bismuthinite, joséite, molybdenite, arsenopyrite, cassiterite, chalcopyrite, quartz (Ikuno mine, Japan).

Distribution: In Japan, from the Ikuno [TL] and Akenobe mines, Hyogo Prefecture, and at the Ashio mine, Tochigi Prefecture. From Kingsgate, New South Wales, Australia. In Sweden, at the Falu mine, Falun, Kopparberg. In the Osikonmaki gold deposit, Rantasalmi, Finland. From the Mullenbach uranium deposit, Black Forest, Germany. In the Vysokogorsk tin deposit, Primorskiy Kray, and from the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan.

Name: For the Ikuno mine, Japan, where it was first found.

Type Material: National Science Museum, Tokyo, Japan, M15837; The Natural History Museum, London, England.

Total	100.13

(1) Hall Valley, Colorado, USA; corresponds to $(Mn_{0.70}Zn_{0.17}Fe_{0.13})_{\Sigma=1.00}SO_4 \cdot 4H_2O$.

Mineral Group: Rozenite group.

Occurrence: A rare secondary mineral in the oxidized zones of sulfide deposits.

Association: Pyrite, sphalerite, galena (McDonnell claim, Colorado, USA); rozenite, epsomite, copiapite, gypsum, melanterite, chvaleticeite (Chvaletice, Czech Republic).

Distribution: In the USA, from the McDonnell claim, Montezuma district, Hall Valley, Park Co., and at the Penn mine, Summit Co., Colorado. In the Silver King mine, Galena Hill, Yukon Territory, Canada. From Chvaletice, Czech Republic. At the Jokoku mine, southwest Hokkaido, Japan.

Name: Honors Malvern Wells Iles (1852–1890), American metallurgist of Denver, Colorado, USA, who made the first chemical analysis of the species.

LOI	6.43	
Total	100.75	100.00

(1) Ilímaussaq intrusion, Greenland; alkalis by flame photometry, RE in proportions $Ce_{55}La_{23.6}Nd_{14.7}Pr_{6.7}$. (2) $Ba_2Na_4CeFeNb_2Si_8O_{28}\cdot 5H_2O$.

Occurrence: In a hydrothermal ussingite-analcime vein cutting sodalite syenite in an alkalic massif.

Association: Chkalovite, epistolite.

Distribution: At Nákâlâq, in the Ilímaussaq intrusion, southern Greenland.

Name: For the Ilímaussaq intrusion, where it was discovered.

Type Material: n.d.

References: (1) Semenov, E.I., M.E. Kazakova, and V.J. Bukin (1968) Ilimaussite, a new rare-earth-niobium-barium silicate from Ilímaussaq, South Greenland. Medd. Grønland, 181(7), 3–7. (2) (1969) Amer. Mineral., 54, 992–993 (abs. ref. 1).

Ilmenite $Fe^{2+}TiO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As thick tabular crystals, with dominant base, to rhombohedral, to 25 cm. Skeletal, granular, massive; as lamellar exsolutions in hematite or magnetite. *Twinning:* Simple on {0001}; lamellar on $\{10\overline{1}1\}$.

Physical Properties: *Cleavage:* {0001} and $\{10\overline{1}1\}$, partings. *Fracture:* Conchoidal to subconchoidal. *Tenacity:* Brittle. Hardness = 5–6 VHN = 566–698 (100 g load). D(meas.) = 4.72 D(calc.) = 4.789 Weakly magnetic.

Optical Properties: Opaque. *Color:* Iron-black; gray with a brownish tint in reflected light. *Streak:* Black to reddish brown. *Luster:* Metallic to submetallic.
Optical Class: Uniaxial (–). *Anisotropism:* Strong; in shades of gray. *Bireflectance:* Strong; *O* = pinkish brown, *E* = dark brown.
R_1–R_2: (400) 20.0–21.2, (420) 19.5–20.8, (440) 19.0–20.4, (460) 18.5–20.1, (480) 18.1–20.0, (500) 18.0–19.8, (520) 18.0–19.8, (540) 18.0–19.7, (560) 18.0–19.6, (580) 18.0–19.8, (600) 18.1–19.9, (620) 18.2–19.9, (640) 18.3–19.9, (660) 18.4–20.0, (680) 18.5–20.1, (700) 18.6–20.4

(1) Marcy massif, Adirondacks, New York, USA; by electron microprobe, Fe^{2+}:Fe^{3+} from charge balance; corresponds to $(Fe^{2+}_{0.88}Mg_{0.08}Fe^{3+}_{0.04}Mn_{0.01})_{\Sigma=1.01}Ti_{0.98}O_3$. (2) $FeTiO_3$.

Polymorphism & Series: Forms three series, with ecandrewsite, with geikielite, and with pyrophanite.

Mineral Group: Ilmenite group.

Occurrence: A common accessory mineral disseminated in igneous rocks, as granites, gabbros, and kimberlites; in granite pegmatites, carbonatites, and high-grade metamorphic rocks; may attain economic concentration in layered mafic intrusions and in "black sand" placer deposits.

Association: Magnetite, hematite, rutile, ulvöspinel, pyrrhotite, apatite.

Distribution: Widespread; well-crystallized from numerous localities. In the Vishnevy-Il'men Mountains, Southern Ural Mountains, Russia, large crystals; from the Lovozero massif, Kola Peninsula. In Norway, at Tellnes and Snarum; large crystals from Kragerøand Arendal. From Binntal, Valais, Switzerland. At St. Cristophe, Bourg d'Oisans, Isère, France. In the USA, at Quincy, Norfolk Co., Massachusetts; from Litchfield, Litchfield Co., Connecticut; large crystals from the Lake Sanford area, Essex Co., New York. At Allard Lake, Quebec; Bancroft, Ontario; and elsewhere in Canada. From Arkaroola Bore, Flinders Ranges, and near Bimbowrie, South Australia.

Name: For the early-noted occurrence in the Il'men Mountains, Russia.

Ilmenorutile $(Ti, Nb, Fe^{2+})O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As dipyramidal, prismatic crystals, to 10 cm, with striated prism faces. Typically intergrown with unmixed columbite or, more rarely, ilmenite. *Twinning:* Common on {101}, rarely on {301}.

Physical Properties: *Cleavage:* {110}, distinct; {100}, imperfect. *Fracture:* Conchoidal. Hardness = 6–6.5 VHN = 860–933 D(meas.) = 4.35–4.92 D(calc.) = [4.73]

Optical Properties: Opaque, translucent through thin edges. *Color:* Black; dark yellow-green to red or reddish brown in transmitted light; pale cream in reflected light. *Streak:* Dark greenish brown to greenish black. *Luster:* Adamantine, resinous.
Optical Class: Uniaxial (+). *Pleochroism:* Strong; E = brown; O = dark bluish green or greenish blue. *Absorption:* $E > O$. $n = > 2.6$ *Anisotropism:* Strong. *Bireflectance:* Weak. R_1–R_2: n.d.

Cell Data: *Space Group:* $P4_2/mnm$. a = 4.62–4.64 c = 2.98–3.00 Z = 2

X-ray Powder Pattern: Ilmen Mountains, Russia; almost identical to strüverite.
1.695 (10), 3.269 (8), 2.497 (6), 1.626 (6), 1.047 (6), 1.456 (4), 1.386 (4)

Chemistry:

	(1)	(2)
Nb_2O_5	28.75	22.07
Ta_2O_5	1.65	1.50
TiO_2	59.49	60.31
FeO	9.31	14.62
insol.		∼1.
Total	99.20	[99.50]

(1) Věžná, Czech Republic; corresponds to $(Ti_{0.71}Nb_{0.20}Fe^{2+}_{0.12})_{\Sigma=1.03}O_2$. (2) Ampangabé, Madagascar; corresponds to $(Ti_{0.70}Nb_{0.15}Fe^{2+}_{0.19})_{\Sigma=1.04}O_2$.

Polymorphism & Series: Forms a series with strüverite; Nb:Ta > 1.

Occurrence: A late primary mineral in granite pegmatites; also in carbonatites; in alluvial placers.

Association: Columbite, ilmenite, titanite, pyrochlore, zircon, topaz, albite, microcline.

Distribution: Well-studied material from: Miass, Ilmen Mountains, also in the Vishnevy Mountains, Southern Ural Mountains, Russia. Near Iveland, Evje, Tvedestrand, and elsewhere in Norway. From Penikoja, Somero, Finland. At Věžná, near Rožná, and Údraž, near Písek, Czech Republic. On Elba, Italy, at Grotta del Guerrino. In the Gunheath china clay pit, St. Austell, Cornwall, England. From near Salak North, Kuala Kangsar, Perak, Malaya. In Japan, at Teshirogi, and in the Uzi mine, Fukushima Prefecture. From Nampoca, Alto Ligonha, Mozambique. At Ampangabé, Madagascar. Other localities are reported, some of which require modern confirmation.

Name: For the occurrence in the Ilmen Mountains, Russia, and relation to *rutile*.

Ilsemannite $Mo_3O_8 \cdot nH_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. As earthy masses, crusts, massive; commonly as stains and admixtures with other minerals.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d. Solublizes in H_2O giving a deep molybdenum-blue solution.

Optical Properties: Translucent. *Color:* Black, bluish black, blue. *Streak:* Pale blue. *Optical Class:* n.d. n = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: Adequate analyses of natural material are not available, usually being of mixtures. The mineral is thought to be identical with synthetic molybdic oxide.

Occurrence: A secondary mineral formed by the oxidation of molybdenum-bearing minerals.

Association: Jordisite, molybdenite, molybdite, wulfenite, melanterite, halotrichite, gypsum, oxidized uranium minerals.

Distribution: In Austria, at Bleiberg, Carinthia. Other localities noted for material seemingly meeting the properties characterizing the species include: from the Himmelsfürst mine, Erbisdorf, near Freiberg, Saxony, Germany. In the USA, at Marysvale, Ohio district, Piute Co., Utah; from the Kiggins mine, about 80 km southeast of Portland, Clackamas Co., Oregon; at Quinn Draw, Shannon Co., and in the Runge mine, about 10 km north of Edgemont, Fall River Co., South Dakota; about six km west of Gibson, Shasta Co., and in the Kern River Canyon district, Kern Co., California. From Cripple Creek, Teller Co., Northgate, Jackson Co., the Placerville district, San Miguel Co., and a number of other places in Colorado; at Poison Spring, Esmeralda Co., and in the Getchell mine, Humboldt Co., Nevada; in the Monument Valley No. 2 mine, Monument Valley, Apache Co., from the Cameron area, Coconino Co., and elsewhere in Arizona. In the Merced mine, Sierra de Berejillo, Durango, Mexico. From Kingsgate, New South Wales, Australia.

Name: Honors Johann Christoph Ilsemann (1727–1822), Mining Commissioner at Clausthal, Germany, for his studies on molybdenite.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 603–604. (2) Staples, L.W. (1951) Ilsemannite and jordisite. Amer. Mineral., 36, 609–614.

(1) Ilímaussaq intrusion, Greenland. (2) $CaFe_2^{2+}Fe^{3+}OSi_2O_7(OH)$.

Polymorphism & Series: Orthorhombic and monoclinic forms are known.

Occurrence: In contact metasomatic rocks and iron deposits; in metamorphosed limestones and dolostones with other calc-silicate minerals.

Association: Quartz, magnetite, hedenbergite, sphalerite, fluorite.

Distribution: Many localities, even for fine material. From Elba, at Rio Marina and Capo Calamita; on Mt. Mulatto, near Predazzo, Trentino-Alto Adige, Italy. Very large crystals from Seriphos, Cyclades Islands, Greece. In Germany, at St. Andreasberg, Harz Mountains; near Herborn, Hesse; and Schneeberg, Saxony. In Norway, at Fossum, near Skeen. At Thyrill, Iceland. From the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion, southern Greenland. In the Kamioka mine, Gifu Prefecture, and the Obira mine, Bungo, Oita Prefecture, Japan. Fine crystals at Dal'negorsk, Primorskiy Kray, Russia. In the USA, splendid crystals from the Laxey mine, South Mountain, Owyhee Co., Idaho; from Middlemarch Pass, Dragoon Mountains, Cochise Co., Arizona; on Copper Mountain, Prince of Wales Island, Alaska.

Name: From the Latin name, *Ilva*, for the Island of Elba, on which it was first found.

Imandrite $Na_{12}Ca_3Fe_2^{3+}Si_{12}O_{36}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Anhedral grains, to 3 mm; as rims around eudialyte.

Physical Properties: Hardness = ∼4 D(meas.) = 2.93 D(calc.) = 2.92

Optical Properties: Semitransparent. *Color:* Honey-yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (+). $\alpha = 1.605$ $\beta = 1.608$ $\gamma = 1.612$ 2V(meas.) = 75°

Cell Data: *Space Group: Pmnn.* $a = 10.331(1)$ $b = 10.546(1)$ $c = 7.426(4)$ Z = 1

X-ray Powder Pattern: Khibiny massif, Russia.
2.63 (100), 1.853 (70), 3.33 (60), 3.73 (50), 1.520 (50)

Chemistry:

	(1)	(2)
SiO_2	50.95	50.75
TiO_2	0.95	
ZrO_2	1.43	
Fe_2O_3	5.47	11.24
MnO	2.30	
MgO	0.26	
CaO	12.00	11.84
Na_2O	26.66	26.17
Total	100.02	100.00

(1) Khibiny massif, Russia; by electron microprobe, total Fe as Fe_2O_3. (2) $Na_{12}Ca_3Fe_2Si_{12}O_{36}$.

Mineral Group: Lovozerite group.

Occurrence: In apatite-bearing alkalic pegmatitic rocks in a differentiated alkalic massif.

Association: Eudialyte, aegirine, orthoclase, alkalic amphibole, pectolite.

Distribution: From a drill core in the Khibiny massif, Vounnemiok River area, west of Lake Imandra, Kola Peninsula, Russia.

Name: For Lake Imandra on the Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity,5530; Mining Institute, St. Petersburg, 1298/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80181; The Natural History Museum, London, England, 1994,10.

Imhofite $Tl_6As_{15.33}S_{26}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As thin plates, which may be aggregated into radial or spherical forms, less than 1 mm.

Physical Properties: Hardness = ∼2 VHN = 38 D(meas.) = n.d. D(calc.) = 4.39

Optical Properties: Translucent. *Color:* Copper-red; in polished section, pure white, inclining to cream colored compared to galena, with strong bright red internal reflections. *Anisotropism:* Very strong.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/n$. $a = 8.755(5)$ $b = 24.425(15)$ $c = 5.739(3)$ $\beta = 108.28(5)^\circ$ Z = 2

X-ray Powder Pattern: Binntal, Switzerland.
2.675 (100), 2.88 (90), 3.96 (70), 3.67 (65), 4.10 (40), 3.58 (40), 3.18 (40)

Chemistry:

	(1)	(2)
Tl	33.6	38.22
Cu	1.67	
As	30.2	35.80
S	33.7	25.98
Total	99.17	100.00

(1) Binntal, Switzerland; by electron microprobe. (2) $Tl_6As_{15.33}S_{26}$ as determined by crystal structure analysis.

Occurrence: Of hydrothermal origin.

Association: Realgar, lead sulfantimonides.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: To honor Josef Imhof (1902–1969), professional mineral collector of Binn, Switzerland.

Type Material: Mineralogical-Petrographical Institute, University of Bern, Bern, Switzerland, L3491-64.

Imiterite Ag_2HgS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, to 1 cm, and anhedral grains.

Physical Properties: Hardness = n.d. VHN = 86 (100 g load). D(meas.) = n.d. D(calc.) = 7.846(4)

Optical Properties: Opaque. *Color:* Pale gray, steel-gray; pale greyin reflected light. *Luster:* Brilliant metallic. *Pleochroism:* Bluish to pinkish. *Anisotropism:* Strong, from bluish gray to reddish brown. *Bireflectance:* Strong.
R_1–R_2: (400) — , (420) 29.8–33.8, (440) 33.4–38.3, (460) 32.1–36.4, (480) 31.3–34.8, (500) 30.6–33.7, (520) 29.9–32.8, (540) 29.5–32.1, (560) 29.2–31.5, (580) 28.9–31.1, (600) 28.8–30.8, (620) 28.6–30.5, (640) 28.5–30.3, (660) 28.2–29.9, (680) 27.9–29.7, (700) 27.5–29.4

Cell Data: *Space Group:* $P2_1/c$. $a = 4.0394(8)$ $b = 8.0050(6)$ $c = 6.5812(8)$ $\beta = 107.12(2)^\circ$ $Z = 2$

X-ray Powder Pattern: Imiter mine, Morocco.
2.768 (100), 2.746 (100), 2.461 (80), 3.466 (50), 1.467 (35), 4.88 (30), 3.138 (30)

Chemistry:

	(1)	(2)	(3)
Ag	42.89	43.3	44.90
Hg	42.64	41.8	41.75
S	13.34	13.0	13.35
Total	98.87	98.1	100.00

(1) Imiter mine, Morocco; by electron microprobe, average of 20 analyses; corresponding to $Ag_{1.91}Hg_{1.02}S_{2.00}$. (2) Ramsbeck, Germany; by electron microprobe, corresponding to $Ag_{1.96}Hg_{1.02}S_{2.00}$. (3) Ag_2HgS_2.

Occurrence: In a pyritic deposit (Imiter mine, Morocco); in a hydrothermal vein deposit (Ramsbeck, Germany).

Association: Chalcopyrite, sphalerite, acanthite, polybasite, galena, arsenopyrite (Imiter mine, Morocco); acanthite, pyrite, marcasite, polybasite, calcite (Ramsbeck, Germany).

Distribution: From the Imiter mine, Djebel Sarhro, Anti-Atlas Mountains, Morocco [TL]. At Ramsbeck, North Rhine-Westphalia, Germany.

Name: For the Imiter mine locality in Morocco.

Type Material: Bureau de Recherches Géologiques et Minières (B.R.G.M.), Orléans; National School of Mines, Paris, France.

Imogolite $Al_2SiO_3(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: n.d. *Point Group:* n.d. Conchoidal to earthy; as microscopic threadlike particles, and bundles of fine tubes, each about 20 Å in diameter.

Physical Properties: *Fracture:* Conchoidal, earthy. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 2.70 D(calc.) = 2.70

Optical Properties: Transparent to translucent. *Color:* White, blue, green, brown, black. *Luster:* Vitreous, resinous, waxy.
Optical Class: Isotropic. n = 1.47–1.51

Cell Data: *Space Group:* n.d. c = 8.4; 5.1 $\perp$ c Z = n.d.

X-ray Powder Pattern: Uemura, Japan; by electron diffraction.
21.0 (100b), 4.12 (100), 1.40 (100), 11.7 (80b), 7.8 (80b), 3.75 (80b), 2.32 (80b)

Chemistry: An analysis of natural material does not appear to be available.

Occurrence: In soils derived from volcanic ash.

Association: Allophane, quartz, cristobalite, gibbsite, vermiculite, "limonite".

Distribution: Probably quite widespread in volcanic-ash-derived soils. In the Misutsuchi bed, Iijima, Nagano Prefecture; the Kanumatsuchi bed, Kanuma, Tochigi Prefecture; and from Uemura, Kumamoto Prefecture, Japan.

Name: For the name, *Imogo*, of the brownish yellow volcanic ash soil of Japan in which it occurs.

Type Material: n.d.

Inaglyite $PbCu_3(Ir,Pt)_8S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6, $6/m$ $2/m$ $2/m$, 622, or $\overline{6}m2$. Irregular grains, to 150 μm; as inclusions in isoferroplatinum, intergrown with erlichmanite and malanite, and rimming iridosmine and laurite.

Physical Properties: *Cleavage:* In two directions. *Tenacity:* Brittle. Hardness = n.d. VHN = 347–726, 575 average. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Steel-gray. *Luster:* Metallic. *Anisotropism:* Weak. R_1–R_2: (400) — , (420) 41.6–42.8, (440) 41.0–42.3, (460) 40.8–42.0, (480) 40.4–41.8, (500) 40.2–41.6, (520) 40.1–41.6, (540) 40.1–41.6, (560) 40.1–41.8, (580) 40.2–42.2, (600) 40.4–42.4, (620) 40.5–42.6, (640) 40.6–42.7, (660) 40.9–42.8, (680) 41.1–43.1, (700) 41.4–43.2

Cell Data: *Space Group:* $P6_3$, $P6$, $P6/mmm$, $P622$, or $P\overline{6}2m$. $a = 7.03(1)$ $c = 16.44(1)$ Z = [1]

X-ray Powder Pattern: Inaglyi massif, Russia.
2.98 (10), 5.7 (9), 2.438 (8), 1.753 (7), 1.699 (5), 1.292 (5), 1.082 (5)

Chemistry:

	(1)
Ir	39.6
Pt	20.9
Rh	2.25
Pb	8.91
Fe	0.32
Cu	6.97
Ni	0.06
S	20.3
Total	99.31

(1) Inaglyi massif, Russia; by electron microprobe, corresponding to $Pb_{1.07}(Cu_{2.72}Fe_{0.14}Ni_{0.02})_{\Sigma=2.88}(Ir_{5.12}Pt_{2.66}Rh_{0.54})_{\Sigma=8.32}S_{15.72}$.

Occurrence: With other platinum group minerals in ultramafic intrusives.

Association: Isoferroplatinum, erlichmanite, malanite, iridosmine, laurite (Inaglyi massif, Russia).

Distribution: In Russia, from the Inaglyi massif, Aldan region, Sakha [TL], and the Aleksandrov Log platinum deposit, Mt. Solov'eva, Nizhni Tagil massif, Ural Mountains.

Name: For the occurrence in the Inaglyi massif, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1499/1.

Incaite $Pb_4Sn_4FeSb_2S_{15}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, perhaps triclinic. *Point Group:* $2/m$, m, or 2; perhaps $\overline{1}$ or 1. As very fine lamellae, typically intergrown with cylindrite.

Physical Properties: *Cleavage:* Excellent on {100}. Hardness = Very soft. VHN = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* In polished section, pale gray. *Anisotropism:* Distinct in greenish brown and brownish gray.
R_1–R_2: (480) 29.8–33.7, (540) 29.0–33.2, (600) 28.6–32.9, (640) 28.1–32.5

Cell Data: *Space Group:* Two subcells are recognized, both $A2/m$, Am, or $A2$; the first (pseudotetragonal) has: $a = 17.29(2)$ $b = 5.79(1)$ $c = 5.83(2)$ $\beta = 94.14(30)°$ and the second (pseudohexagonal) has: $a = 17.25(2)$ $b = 3.66(1)$ $c = 6.35(2)$ $\beta = 91.13(20)°$
Z = n.d.

X-ray Powder Pattern: Poopó, Bolivia.
2.862 (100), 2.029 (80), 3.43 (70), 4.31 (60), 3.83 (40), 3.23 (40), 3.12 (40)

Chemistry:

	(1)	(2)
Pb	36.53	39.77
Ag	2.15	
Sn	23.09	22.79
Fe	2.35	2.68
Sb	12.70	11.68
S	23.20	23.08
Total	100.02	100.00

(1) Poopó, Bolivia; by electron microprobe, average of five analyses; corresponding to $(Pb_{3.67}Ag_{0.37})_{\Sigma=4.04}Sn_{4.07}Fe_{0.88}Sb_{2.23}S_{15.00}$. (2) $Pb_4Sn_4FeSb_2S_{15}$.

Occurrence: In hydrothermal Ag–Sn ores (Poopó, Bolivia).

Association: Cylindrite, stannite, miargyrite (Poopó, Bolivia).

Distribution: From Poopó, Bolivia [TL]. Found near Mejillones, north of Antofagasta, Chile. In the Hoei tin mine, Oita Prefecture, Japan.

Name: For the Incas, first recorded miners of the Ag–Sn ores in the Poopó–Oruro district, Bolivia.

Type Material: Redpath Museum, McGill University, Montreal, Canada, 898.

Inderborite $CaMg[B_3O_3(OH)_5]_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As well-formed prismatic crystals, to 10 cm, with a dozen forms noted; coarsely crystalline aggregates.

Physical Properties: *Cleavage:* On {100}, good. *Fracture:* Conchoidal. Hardness = 3.5 D(meas.) = 1.93–2.00 D(calc.) = [1.92] Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless to white. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 2.5°$. α = 1.482–1.496 β = 1.512–1.521 γ = 1.530–1.54 2V(meas.) = 77°–86°

Cell Data: *Space Group:* $C2/c$. a = 12.137(2) b = 7.433(1) c = 19.234(3) β = 90.29(1)° Z = 4

X-ray Powder Pattern: Inder deposit, Kazakhstan.
3.35 (100), 3.26 (80), 3.07 (80), 2.45 (80), 2.29 (80), 1.801 (80), 6.13 (50)

Chemistry:

	(1)	(2)
B_2O_3	41.70	41.49
MgO	8.00	8.01
CaO	11.27	11.14
H_2O	39.48	39.36
Total	100.45	100.00

(1) Inder deposit, Kazakhstan. (2) $CaMg[B_3O_3(OH)_5]_2 \cdot 6H_2O$.

Occurrence: With other borates in the caprock of a salt diapir (Inder deposit, Kazakhstan); in lacustrine borate deposits (Sarıkaya, Turkey).

Association: Inyoite, colemanite, ulexite, szaibélyite (Inder deposit, Kazakhstan).

Distribution: Large crystals from the Inder borate deposit, Kazakhstan. In Turkey, at Sarıkaya, near Kirka, Eskiçehir Province; in the Günevi mine, Bigadiç borate district, Balıkesir Province. In the USA, from the Furnace Creek district, Death Valley, Inyo Co., California. At the Santa Rosa mine, Sijes district, Salta Province, Argentina.

Name: For the locality that produced the first specimens, the Inder deposit, Kazakhstan, and *boron*, an essential chemical component.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 43443–43447.

Inderite $MgB_3O_3(OH)_5 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As long prismatic crystals with nearly square cross-section, to 30 cm, dominated by {110}, {120}, and {001}; may be as aggregates of minute needles; reniform nodular, massive.

Physical Properties: *Cleavage:* {010}, perfect; $\{1\bar{1}0\}$, good. Hardness = 3
D(meas.) = 1.80 D(calc.) = 1.794

Optical Properties: Translucent to transparent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous to pearly on cleavages, dull, greasy.
Optical Class: Biaxial (+). *Orientation:* $X \simeq b$; $Z \wedge c = 9°$. *Dispersion:* $r > v$, weak.
$\alpha = 1.488$ $\beta = 1.491$ $\gamma = 1.505$ 2V(meas.) = 37°–43°

Cell Data: *Space Group:* $P2_1/a$. $a = 12.0350(9)$ $b = 13.1145(13)$ $c = 6.8221(3)$
$\beta = 104.552(8)°$ Z = 4

X-ray Powder Pattern: Jenifer mine, Boron, California, USA. (ICDD 36–423).
5.052 (100), 3.357 (68), 5.72 (60), 6.61 (44), 2.662 (44), 2.558 (44), 5.84 (40)

Chemistry:

	(1)	(2)
B_2O_3	37.33	37.32
MgO	14.41	14.40
H_2O	48.28	48.28
insol.	0.08	
Total	100.10	100.00

(1) Jenifer mine, California, USA. (2) $MgB_3O_3(OH)_5 \cdot 5H_2O$.

Polymorphism & Series: Dimorphous with kurnakovite.

Occurrence: Relatively rare as a primary mineral in lacustrine borate deposits.

Association: Hydroboracite (Inder deposit, Kazakhstan); kurnakovite (Sarıkaya, Turkey); borax, ulexite, orpiment, realgar (Boron, California, USA).

Distribution: From Kyzyl Tau Mountain, Inder boron deposit, Kazakhstan. In the USA, in California, large crystals in the Boron open pit, and from the Baker and Jenifer mines, Kramer borate deposit, Kern Co.; at the Hard Scramble claim, Furnace Creek district, Death Valley, Inyo Co. In the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. From Sarıkaya, near Kirka, Eskiçehir Province, Turkey.

Name: For Inder Lake, Kazakhstan, near which the first specimens were collected.

Type Material: n.d.

Indialite $(Mg, Fe^{2+})_2Al_4Si_5O_{18}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As small hexagonal grains and clusters of spiral-shaped grains, some with tentacles or multiple terminations.

Physical Properties: Hardness = 7–7.5 D(meas.) = 2.512 (synthetic $Mg_2Al_4Si_5O_{18}$). D(calc.) = 2.59

Optical Properties: Transparent. *Color:* Colorless in thin section. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\epsilon = 1.532–1.535$ $\omega = 1.537–1.539$

Cell Data: *Space Group:* $P6/mcc$. $a = 9.800(3)$ $c = 9.345(3)$ $Z = 2$

X-ray Powder Pattern: Synthetic $Mg_2Al_4Si_5O_{18}$.
8.48 (100), 3.027 (85), 3.138 (65), 3.379 (55), 4.094 (50), 4.89 (30), 1.6882 (30)

Chemistry:

	(1)	(2)
SiO_2	48.6	47.33
Al_2O_3	34.7	32.96
FeO	7.8	12.30
MnO		0.35
MgO	9.3	5.64
Na_2O		0.36
Total	100.4	98.94

(1) Bokaro coalfield, India; by electron microprobe, corresponding to $(Mg_{1.40}Fe_{0.66})_{\Sigma=2.06}Al_{4.11}Si_{4.89}O_{18}$. (2) Unazuki, Japan; by electron microprobe, corresponding to $(Fe_{1.07}Mg_{0.88}Na_{0.07}Mn_{0.03})_{\Sigma=2.05}Al_{4.06}Si_{4.95}O_{18}$.

Polymorphism & Series: Dimorphous with cordierite.

Occurrence: Formed by fusion and recrystallization of sedimentary rocks as a result of the burning of underlying coal seams (Bokaro coalfield, India); in cordierite veins in a polymetamorphosed pelitic rock (Unazuki, Japan).

Association: Enstatite, magnetite, labradorite, corundum, glass (Bokaro coalfield, India); cordierite, andalusite, sillimanite, biotite, quartz (Unazuki, Japan).

Distribution: In the Bokaro coal seam, southwest of Hazaribagh, Bihar, India. From the Unazuki area, Toyama Prefecture, Japan. At Pyramid Lake, Washoe Co., Nevada, USA. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany.

Name: For the country of first occurrence, India.

Type Material: n.d.

CaO	0.45	
H_2O	44.36	44.56
insol.	1.60	
Total	98.34	100.00

(1) Sarylakh deposit, Russia; $(CO_3)^{2-}$, $(OH)^{1-}$, H_2O confirmed by IR; after deduction of insoluble as quartz, CaO and SO_3 as gypsum, and Fe_2O_3 as "limonite", corresponds to $Mg_{2.00}Al_{2.00}(CO_3)_{3.86}(OH)_{2.00} \cdot 15.36H_2O$. (2) $Mg_2Al_2(CO_3)_4(OH)_2 \cdot 15H_2O$.

Occurrence: A rare filling in cracks in shale in the oxidized portions of a hydrothermal vein Au–Sb deposit.

Association: Gypsum, gibbsite, kaolinite, hexahydrite, melanterite, amorphous Fe oxide, stibnite, quartz.

Distribution: From the Sarylakh Au–Sb deposit, upper Indigirka River, northeast Sakha, Russia.

Name: For the Indigirka River, Russia, near where the first specimens were collected.

Type Material: Geological Museum, Yakutsk Scientific Center, Yakutsk, mk-192; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76565, 76566.

	(1)	(2)
Fe	8.84	13.50
In	59.3	55.50
S	31.85	31.00
Total	99.99	100.00

(1) Dzhalinda deposit, Russia; by microspectrographic analysis, corresponding to $Fe_{0.64}In_{2.08}S_{4.00}$.
(2) $FeIn_2S_4$.

Mineral Group: Linnaeite group.

Occurrence: Of primary hydrothermal origin, replacing botryoidal cassiterite.

Association: Cassiterite, dzhalindite.

Distribution: In the Dzhalinda deposit, Little Khingan Ridge, Far Eastern Region, Russia [TL].

Name: For the indium in its composition.

Type Material: Mining Institute, St. Petersburg, 106a/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 62579.

References: (1) Genkin, A.D. and I.V. Murav'eva (1963) Indite and dzhalindite – new indium minerals. Zap. Vses. Mineral. Obshch., 92, 445–457 (in Russian). (2) (1964) Amer. Indium In

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Massive, as grains, to 1 mm.

Physical Properties: Hardness = n.d. VHN = 130–159, 142 average. D(meas.) = n.d. D(calc.) = 7.29

Optical Properties: Opaque. *Color:* Gray with yellowish tint; in polished section, pale rose. *Luster:* Metallic. *Anisotropism:* Weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I4/mmm$. $a = 3.2517$ $c = 4.9459$ Z = 2

X-ray Powder Pattern: Synthetic.
2.715 (100), 2.298 (36), 1.683 (24), 1.395 (23), 2.471 (21), 1.470 (16), 1.0904 (12)

Chemistry: Composition established by microspectrographic analysis.

Occurrence: In greisenized and albitized granite (Orlovskoye deposit, Russia).

Association: Silver (Orlovskoye deposit, Russia).

Distribution: In Russia, from the Orlovskoye tantalum deposit, eastern Transbaikal [TL], and an undefined locality in the Ukrainian Shield.

Name: From its indigo blue emission spectrum.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis54.

Inesite $\mathbf{Ca_2Mn_7^{2+}Si_{10}O_{28}(OH)_2 \cdot 5H_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals slender laths, may be chisel-shaped, to 7 cm, typically forming radiating fan-shaped clusters; fibrous, in veinlets, and massive.

Physical Properties: *Cleavage:* Perfect on {010}, good on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 3.03–3.04 D(calc.) = 3.03

Optical Properties: Transparent to translucent. *Color:* Rose-red, pink, orange-pink, orange-red-brown, deep wine-red; changes to ginger-brown on exposure. *Streak:* White. *Luster:* Vitreous to silky.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = 74°$; $Y \wedge c = 32°$; $Z \wedge c = 62°$.
Dispersion: $r > v$, weak, distinct. $\alpha = 1.6178–1.6183$ $\beta = 1.6384–1.6390$ $\gamma = 1.6519–1.6526$
2V(meas.) = 74°–77°

Cell Data: *Space Group:* $P\bar{1}$. $a = 8.889(2)$ $b = 9.247(2)$ $c = 11.975(3)$ $\alpha = 88.15(2)°$ $\beta = 132.07(2)°$ $\gamma = 96.64(2)°$ Z = 1

X-ray Powder Pattern: Broken Hill, Australia.
9.16 (100), 2.92 (80), 2.84 (80), 2.73 (70), 2.19 (60), 4.59 (50), 4.01 (50)

Chemistry:

	(1)	(2)	(3)
SiO_2	45.67	45.00	45.60
Al_2O_3		0.32	
FeO	0.92	1.73	
MnO	35.10	37.48	37.69
MgO	0.86	0.47	
CaO	9.33	6.78	8.51
K_2O		0.01	
H_2O	8.66	8.27	8.20
Total	100.54	[100.06]	100.00

(1) Quinault, Washington, USA. (2) Equity mine, Colorado, USA; original total given as 100.10%. (3) $Ca_2Mn_7Si_{10}O_{28}(OH)_2 \cdot 5H_2O$.

Occurrence: A late-stage hydrothermal mineral in manganese deposits.

Association: Rhodochrosite, bementite, hausmannite (Hale Creek mine, California, USA); datolite, pectolite, apophyllite, ruizite, orientite, quartz (Wessels mine, South Africa).

Distribution: In Germany, from Nanzenbach, near Dillenburg, Hesse. At Långban and in the Harstigen mine, near Persberg, Värmland, Sweden. From Săcărâmb (Nagyág), Romania. At Banská Štiavnica (Schemnitz), Slovakia. From the Wessels and N'Chwaning mines, near Kuruman, Cape Province, South Africa. In the USA, from Quinault, Grays Harbor Co., and in the Crescent mine, Olympic Peninsula, Clallam Co., Washington; in the Equity mine, near Creede, Mineral Co., Colorado; at the Hale Creek mine, near Red River, Trinity Co., and several other places in California. At Broken Hill, New South Wales, Australia. In Japan, at the Yugashima, Seikoshi, and Kawazu mines, Shizuoka Prefecture; the Innai mine, Akita Prefecture; the Kocho mine, Kochi Prefecture; and the Todoroki mine, Hokkaido.

Name: From the Greek for *flesh fibers*, in allusion to its color and structure.

Ingersonite $Ca_3Mn^{2+}Sb_4^{5+}O_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. As crystals with imperfect hexagonal cross sections or as laths, to 0.4 mm; in massive aggregates.

Physical Properties: *Cleavage:* {0001}, perfect; imperfect rhombohedral cleavage. *Fracture:* Uneven. Hardness = n.d. VHN = 974–1097 (100 g load). D(meas.) = n.d. D(calc.) = 5.42

Optical Properties: Transparent to translucent. *Color:* Brownish yellow; medium to light yellow in transmitted light; light gray with yellow and white internal reflections in reflected light. *Streak:* Brownish yellow. *Luster:* Vitreous.
Optical Class: Uniaxial (–).
R_1–R_2: (400) 11.16–11.40, (420) 10.94–11.13, (440) 10.74–10.88, (460) 10.52–10.66, (480) 10.34–10.48, (500) 10.18–10.32, (520) 10.05–10.19, (540) 9.96–10.09, (560) 9.91–10.04, (580) 9.89–10.01, (600) 9.89–10.02, (620) 9.90–10.03, (640) 9.90–10.03, (660) 9.91–10.03, (680) 9.91–10.03, (700) 9.91–10.03

Cell Data: *Space Group:* $P\overline{3}m$, $P3m1$, $P31m$, $P32$, $P3_12$, or $P3_22$. $a = 7.287(3)$ $c = 17.679(9)$ $Z = 3$

X-ray Powder Pattern: Långban, Sweden.
2.965 (100), 1.549 (60), 1.820 (50), 1.810 (50), 2.565 (40), 1.543 (40), 0.9894 (30)

Chemistry:

	(1)	(2)	(3)
Sb_2O_5	74.7	72.6	73.01
FeO	0.2	0.3	
MnO	9.4	9.1	8.01
MgO	0.0	0.3	
CaO	15.9	19.9	18.98
Total	100.2	102.2	100.00

(1–2) Långban, Sweden; by electron microprobe, F present between 1.4% and 3%, total not corrected for $-O = F_2$; (2) corresponds to $Ca_{3.01}Mn_{0.99}(Sb_{3.80}Mn_{0.09}Mg_{0.06}Fe_{0.04})_{\Sigma=3.99}O_{13.70}F_x$. (3) $Ca_3MnSb_4O_{14}$.

Occurrence: In dump material from a metamorphosed Fe–Mn orebody.

Association: Filipstadite, jacobsite, calcite, clinohumite (?).

Distribution: At Långban, Värmland, Sweden.

Name: Honors Dr. Fred Earl Ingerson (1906–1993), geochemist with the U.S. Geological Survey and Emeritus Professor, University of Texas, Austin, Texas, USA.

Type Material: The Natural History Museum, London, England, 1986,410, E.1177; National Museum of Natural History, Washington, D.C., USA, 163012.

Ingodite $Bi_2(S, Te)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. Massive, presumably.

Physical Properties: *Cleavage:* Perfect. *Tenacity:* Brittle. Hardness = Soft.
VHN = 60.9–64.6 D(meas.) = n.d. D(calc.) = 7.88

Optical Properties: Opaque. *Color:* Silver-white. *Luster:* Metallic. *Pleochroism:* Noticeable in air, from creamy to grayish white. *Anisotropism:* Moderate.
R_1–R_2: (460) 55.5–51.4, (540) 57.7–52.5, (580) 57.8–52.4, (660) 56.9–51.6

Cell Data: *Space Group:* $P\overline{3}m$, $P3m1$, $P31m$, or $P321$. $a = 4.2477(24)$ $c = 23.075(22)$
$Z = 3$

X-ray Powder Pattern: Ingoda deposit, Russia or Brandy Gill, England.
3.10 (10), 2.27 (5), 1.647 (5), 2.13 (4), 1.929 (3), 1.254 (3), 1.224 (3)

Chemistry:

	(1)	(2)
Bi	73.3	72.36
Pb	0.6	
Te	19.3	22.09
Se	0.1	
S	6.3	5.55
Total	99.6	100.00

(1) Ingoda deposit, Russia or Brandy Gill, England; by electron microprobe, corresponds to $Bi_{2.00}Pb_{0.02}(S_{1.12}Te_{0.86}Se_{0.01})_{\Sigma=1.99}$. (2) $Bi_2(S, Te)$ with S:Te = 1:1.

Occurrence: In feldspar-quartz veins and greisen (Ingoda deposit, Russia).

Association: Bismuthinite, joséite, tetradymite (Ingoda deposit, Russia); gold, bismuthinite, baksanite, joséite-A (Tyrnyauz deposit, Russia).

Distribution: In Russia, from the Verkhne-Ingodinskoye (Ingoda) tin deposit, near the source of the Ingoda River, central Transbaikal [TL]; and otherwise unspecified localities in Kamchatka and the Southern Ural Mountains; in the Tyrnyauz W–Mo deposit, left bank of the Baksan River Valley, northern Caucasus Mountains. At Brandy Gill, Cumbria, England [TL]. From Băiţa (Rézbánya), Romania. At the Bluebird mine, Little Dragoon Mountains, Cochise Co., Arizona, USA.

Name: For the Ingoda deposit, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis1803.

(1) Inagli massif, Russia; corresponds to $(Na_{2.33}Mg_{0.27}Ca_{0.16}Fe^{2+}_{0.11}Fe^{3+}_{0.10})_{\Sigma=2.97}$ $(Ba_{3.69}K_{0.20}Mn_{0.19})_{\Sigma=4.08}Ti_{2.96}(Si_2O_7)_2(S_{0.58}O_4)_2[O_{2.75}(OH)_{1.25}F_{0.27}]_{\Sigma=4.27}$.

Occurrence: In miarolitic cavities of aegirine-eckermannite-microcline pegmatites in dunites; in pulaskite and shonkinite.

Association: Natrolite, albite, lorenzenite, batisite.

Distribution: In the Inagli massif, 30 km west of Aldan, and the Yakokut massif, near Schelochnoy Spring, Yakutia, Russia.

Name: From the Yakut name, *Inneli*, for the Inagli River, Yakutia, Russia.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; Mining Institute, St. Petersburg, 846a/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; National Museum of Natural History, Washington, D.C., USA, 143822.

(1) Insizwa deposit, South Africa; by electron microprobe, average of five analyses; corresponding to $Pt_{1.00}(Bi_{1.35}Sb_{0.57})_{\Sigma=1.92}$. (2) Sudbury, Canada; by electron microprobe; corresponding to $(Pt_{0.90}Pd_{0.08}Ni_{0.02})_{\Sigma=1.00}(Bi_{1.49}Te_{0.34}Sb_{0.11}Sn_{0.06})_{\Sigma=2.00}$.

Mineral Group: Pyrite group.

Occurrence: Of hydrothermal origin, in a vein cutting massive pyrrhotite ore (Insizwa deposit, South Africa); in Cu–Ni sulfide ore (Sudbury, Canada).

Association: Pentlandite, cubanite, hessite, altaite, argentopentlandite, chalcopyrite, mackinawite, niggliite, froodite, parkerite, galena, sphalerite, magnetite, pyrrhotite.

Distribution: From the Insizwa Cu–Ni deposit, Waterfall Gorge, East Cape, South Africa [TL]. In the Coleman mine, Sudbury, and the Strathcona mine, Falconbridge, Ontario, Canada. At Fox Gulch, Goodnews Bay, Alaska, USA. From the Noril'sk region, western Siberia, Russia.

Name: For the Insizwa deposit, South Africa, where it was discovered.

Type Material: Geological Survey of Canada, Ottawa, 10400; Canadian Museum of Nature, Ottawa, Canada.

Inyoite $CaB_3O_3(OH)_5 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as crystals, short prismatic along [001], tabular on {001}, exhibiting prominent {110} and {001} and a dozen other minor forms, to 2.5 cm; in cockscomb aggregates of pseudorhombohedral crystals; also coarse spherulitic, granular.

Physical Properties: *Cleavage:* {001}, good; {010}, distinct. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 1.875 D(calc.) = 1.87 Soluble in H_2O.

Optical Properties: Transparent, translucent on dehydration. *Color:* Colorless, white on dehydration. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 37°$; $Z \wedge c = -53°$. *Dispersion:* $r < v$, slight. $\alpha = 1.490–1.495$ $\beta = 1.501–1.505$ $\gamma = 1.516–1.520$ 2V(meas.) = 70°–86°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.621(1))$ $b = 12.066(1)$ $c = 8.408(1)$ $\beta = 114°1.2°$ Z = 4

(1) Hillsborough, Canada; remnant is gypsum. (2) $CaB_3O_3(OH)_5 \cdot 4H_2O$.

Occurrence: Along fractures and nodular in sedimentary borate deposits; may be authigenic in playa sediments.

Association: Meyerhofferite, colemanite, priceite, hydroboracite, ulexite, gypsum.

Distribution: In the USA, in California, from an adit on Mount Blanco, Furnace Creek district, Death Valley, Inyo Co., and in the Kramer borate deposit, Boron, Kern Co. From Hillsborough and Wentworth, New Brunswick, Canada. In large amounts in the Inder boron deposit, Kazakhstan. From many deposits in the Bigadiç borate district, Balıkesir Province, Turkey. In Argentina, from the Loma Blanca deposit, eight km southwest of Coranzulí, Jujuy Province; in the Tincalayu borax deposit, Salar del Hombre Muerto, and at the Monte Azul mine, south of Sijes, Salta Province. From Laguna Salinas, about 65 km east of Arequipa, Arequipa Province, Peru.

Name: For Inyo Co., California, USA, wherein the first specimens were collected.

Type Material: National Museum of Natural History, Washington, D.C., USA, 87237, 93639.

Iodargyrite AgI

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6mm$. As prismatic to tabular hexagonal crystals, commonly hemimorphic, may have complex pyramid development, possibly with a cavity on {0001}, to 1.5 cm. Also lamellar or scaly ∥ {0001}; barrel-shaped to globular, in rosettes, massive. *Twinning:* On $\{30\overline{3}4\}$, may produce fourlings.

Physical Properties: *Cleavage:* {0001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Sectile, flexible. Hardness = 1.5 D(meas.) = 5.69 D(calc.) = 5.709

Optical Properties: Transparent. *Color:* Colorless, becoming yellow on exposure to light; greenish yellow, brown, pearl-gray; colorless in transmitted light, with abnormal green interference colors. *Streak:* Yellow, shining. *Luster:* Resinous to adamantine, pearly on cleavage surfaces. *Optical Class:* Uniaxial (+); anomalously biaxial due to deformation. *Dispersion:* Very large. $\omega = 2.21$ $\epsilon = 2.22$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P6_3mc$ (synthetic). $a = 4.594(1)$ $c = 7.513(2)$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 9-374).
3.75 (100), 2.296 (85), 3.98 (60), 1.959 (50), 3.51 (40), 2.119 (30), 2.731 (18)

Chemistry: Modern analyses are not available; early analyses confirm AgI.

Occurrence: A secondary mineral in the oxidized portions of silver-bearing deposits.

Association: Silver, acanthite, chlorargyrite, bromargyrite, cerussite, "limonite".

Distribution: Many localities; some for abundant or well-crystallized material include: in Mexico, at Abarradón, near Mazapil, Zacatecas. In the USA, at Tonopah, Nye Co., and Goldfield, Esmeralda Co., Nevada; from Lake Valley, Sierra Co., New Mexico; in the Commonwealth mine, Pearce, Cochise Co., and elsewhere in Arizona. In Chile, at Chañarcillo, south of Copiapó, Atacama; at Caracoles, Sierra Gorda district, Antofagasta; and at Algodones, near Coquimbo. Large amounts at Broken Hill, New South Wales, Australia. In Germany, from the Schöne Aussicht mine, Dernbach, Rhineland-Palatinate, and at Reichenbach, Odenwald, Hesse. From Hiendelaencina, Guadalajara Province, Spain. At Montmins, Allier, France. From Dzhezkazgan, Kazakhstan.

Name: From IODine and the Greek for *silver*, ARGYRos, in the composition.

Iowaite $Mg_6Fe_2^{3+}Cl_2(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As platy crystals, to 2.5 cm, in masses in veins.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Waxy, becoming friable after contact with air. Hardness = 1.5–2.5 D(meas.) = 2.09 D(calc.) = 2.04 Greasy or soapy feel.

Optical Properties: Opaque to translucent. *Color:* Bluish green, becoming pale green with a rusty red tint on exposure to air (alteration to pyroaurite), yellowish to colorless, may be zoned; colorless in transmitted light. *Streak:* White. *Luster:* Greasy.
Optical Class: Uniaxial (–); commonly anomalously biaxial. *Pleochroism:* Intense; O = pale yellow; E = deep blue-green. ω = 1.543–1.561 ϵ = 1.533–1.543 2V(meas.) = 5°

Cell Data: *Space Group:* $R\overline{3}m$. a = 3.1183(9) c = 24.113(8) Z = 3/8

X-ray Powder Pattern: Sioux Co., Iowa, USA.
8.109 (100), 4.047 (40), 2.363 (27), 2.019 (23), 2.639 (17), 1.530 (13), 1.560 (8)

Chemistry:

	(1)	(2)
Fe_2O_3	24.6	23.74
MgO	35.3	35.95
Cl	7.0	10.54
$H_2O^{200°C}$	11.	
H_2O		32.14
CO_2	0.4	
$-O = Cl_2$		2.37
Total		100.00

(1) Phalaborwa mine, South Africa; by electron microprobe, total Fe as Fe_2O_3, $H_2O^{200°C}$ by TGA. (2) $Mg_6Fe_2Cl_2(OH)_{16}\cdot 4H_2O$.

Mineral Group: Hydrotalcite group.

Occurrence: An alteration product of serpentine.

Association: Chrysotile, dolomite, brucite, calcite, magnesite, pyrite, pyroaurite (Sioux Co., Iowa, USA); magnetite, chondrodite, clinochlore, brucite, hydrotalcite, phlogopite, fluoborite, apatite, celestine, antigorite, calcite, dolomite (Phalaborwa mine, South Africa).

Distribution: In drill core from the Precambrian basement of Sioux Co., Iowa, USA. In the Phalaborwa mine, Transvaal, South Africa. Large crystals from the Komsomolsk mine, Talnakh, Noril'sk region, western Siberia, Russia. In the Almalyk district, Uzbekistan. From sea floor sediments in the Bonin-Mariana area, Pacific Ocean. At the Mount Keith nickel deposit, 400 km north-northwest of Kalgoorlie, Western Australia.

Name: For its occurrence in the state of Iowa, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121706.

References: (1) Kohls, D.W. and J.L. Rodda (1967) Iowaite, a new hydrous magnesium hydroxide-ferric oxychloride from the Precambrian of Iowa. Amer. Mineral., 52, 1261–1271. (2) Allmann, R. and J.D.H. Iquiqueite $K_3Na_4Mg(CrO_4)B_{24}O_{39}(OH)\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As hexagonal platelets, composed of $\{10\bar{1}0\}$ and {0001}, to 100 μm; typically stacked in compound groups or columnar to vermiform aggregates.

Physical Properties: *Cleavage:* {0001}, perfect; $\{10\bar{1}0\}$, imperfect. *Tenacity:* Brittle. Hardness = 1.5–2 D(meas.) = 2.05(9) D(calc.) = 2.05 Slightly hygroscopic; slowly soluble in H_2O.

Optical Properties: Translucent. *Color:* Bright yellow. *Streak:* Yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (–); may be anomalously biaxial, thought due to misaligned stacking. ω = 1.496–1.502 ϵ = 1.447–1.448

Cell Data: *Space Group:* $P31c$. $a = 11.6369(14)$ $c = 30.158(7)$ Z = 3

X-ray Powder Pattern: Tarapacá Province, Chile.
3.02 (100), 2.856 (100), 10.11 (85), 6.04 (85), 3.28 (85), 3.22 (85), 2.910 (80)

Chemistry:

	(1)	(2)

CrO_3	6.8	6.82
MgO	2.9	2.75
Na_2O	8.2	8.45
K_2O	10.5	9.64
H_2O	14.6	15.36
Total	100.0	100.00

(1) Tarapacá Province, Chile; recalculated after removal of a variety of likely impurities, corresponds to $K_{3.2}Na_{3.8}Mg_{1.1}(CrO_4)B_{24}O_{39.6}\cdot 11.9H_2O$. (2) $K_3Na_4Mg(CrO_4)B_{24}O_{39}(OH)\cdot 12H_2O$.

Occurrence: A widespread but very minor constituent of nitrate deposits in saline cemented alluvium and fractured bedrock.

Association: Nitratine, halite, niter, darapskite, blödite, glauberite, dietzeite, brüggenite, lopezite, ulexite, gypsum (Tarapacá Province, Chile); nitratine, halite, sylvite, darapskite, lopezite, tarapacáite (Salar del Miraje, Chile).

Distribution: In Chile, the first samples appear to have originated from the vicinity of Zapiga, Tarapacá; later found at Salar del Miraje, Maria Elena, Tamarugal Pampa, Antofagasta.

Name: For Iquique, a major historic port for nitrate exports from Tarapacá, Chile.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163774.

Polymorphism & Series: Forms a series with hemihedrite.

Occurrence: In the oxidized portions of lead-bearing hydrothermal veins.

Association: Dioptase, fornacite, wulfenite, mimetite, cerussite, diaboleite.

Distribution: In Iran, from the Sébarz and Tchah Khuni mines, Anarak district; in the Seh-Changi mine, near Neyband, Khorassan. From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, and the Bozo #1 mine, Skull Creek, Moffat Co., Colorado, USA.

Name: For the country of first occurrence, Iran.

Type Material: University of Pierre and Marie Curie, Paris; National School of Mines, Paris, France; The Natural History Museum, London, England, 1969,52.

Iraqite-(La) $K(Ca,Na)_4(La,Ce,Th)_2(Si,Al)_{16}O_{40}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Anhedral, massive.

Physical Properties: *Cleavage:* Three orthogonal, two good and one poor. *Fracture:* Uneven. Hardness = 4.5 VHN = 245–314 D(meas.) = [3.27] (slightly corrected for impurities). D(calc.) = 3.28

Optical Properties: Semitransparent. *Color:* Pale greenish yellow; in thin section, colorless. *Streak:* Whitish. *Luster:* Dull to pearly.
Optical Class: Uniaxial (–); anomalously biaxial. *Orientation:* Extinction angles to 7°.
$\omega = 1.590$ $\epsilon = 1.585$

Cell Data: *Space Group:* $[P4/mcc]$ (by analogy to ekanite). $a = 7.61(1)$ $c = 14.72(2)$ Z = 1

X-ray Powder Pattern: Shakhi-Rash Mountain, Iraq.
5.28 (100), 3.31 (100), 2.64 (100), 7.36 (80), 3.38 (80), 3.40 (60), 2.17 (40)

Chemistry:

(1) Shakhi-Rash Mountain, Iraq; Zr, Th, RE by XRF, U by delayed neutron activation; $RE_2O_3 = La_2O_3$ 6.78%, Ce_2O_3 6.44%, Pr_2O_3 0.44%, Nd_2O_3 0.88%, Sm_2O_3 0.17%, Gd_2O_3 0.10%, Yt_2O_3 [*sic*] 0.25%; after deduction of calcite 2.27% and pyrite 0.26%, corresponds to $K_{1.07}[Ca_{3.49}(La,Ce)_{0.35}Na_{0.16}]_{\Sigma=4.00}[(La,Ce)_{1.33}Th_{0.66}]_{\Sigma=1.99}(Si_{15.69}Al_{0.27})_{\Sigma=15.96}(O_{39.93}F_{0.07})_{\Sigma=40.00}$.

Occurrence: In granite in contact with dolomitic marble containing olivine and diopside.

Association: n.d.

Distribution: At Shakhi-Rash Mountain, Hero Town, Qala-Diza, Iraq.

Name: For the country of origin, *Iraq*, and *lanthanum* in the composition.

Type Material: The Natural History Museum, London, England, 1973,481; National School of Mines, Paris, France.

(1) Driekop mine, South Africa; by electron microprobe, corresponding to $(Ir_{0.29}Ru_{0.23}Rh_{0.17}Pt_{0.16})_{\Sigma=0.85}As_{1.12}S_{0.88}$. (2) Papua New Guinea; by electron microprobe, corresponding to $(Ir_{1.01}Ru_{0.03}Fe_{0.02}Os_{0.01})_{\Sigma=1.07}As_{0.89}S_{1.11}$. (3) Ioma placer, Shetland Islands; by electron microprobe, corresponding to $Ir_{0.91}As_{1.00}S_{1.00}$.

Polymorphism & Series: Forms a series with hollingworthite.

Mineral Group: Cobaltite group.

Occurrence: In chromite in hortonolite dunite (South Africa); as inclusions in chrompicotites (Bulgaria); and as rims around Pt-group alloys.

Association: Platinum, ruthenian hollingworthite, sperrylite, laurite, iridarsenite, ruthenarsenite, rutheniridosmine, chalcopyrite, chalcocite, pyrrhotite, cobaltite, gersdorffite, pentlandite, nickeline, magnetite, chromite, olivine.

Distribution: In South Africa, in the Merensky Reef, Bushveld complex, Transvaal, from the Onverwacht [TL] and Driekop mines. At the Hitura Ni–Cu deposit, western Finland. From Vourinos, Greece. In the Pletene chromite deposit, Bulgaria. From the Kapitanov chromite deposit, near Zvenyhorodka, Ukraine. At Chromwerk, Kraubath ultramafic massif, Styria, Austria. In the Cliff and Harold's Grave quarries, Shetland Islands. In the USA, from the American River, Sacramento Co., and in the Stanislaus River near Knight's Ferry, Stanislaus Co., California; from Fox Gulch, Goodnews Bay, Alaska. In Canada, at Werner Lake and Sudbury, Ontario, and the Pipe mine, in Manitoba. From the Anduo chromite deposit, Tibet, China. At the Baimka placers, Chukota, Far Eastern Region, Russia. From the Ioma placer, Waria River, Yodda goldfield, Papua New Guinea.

Name: For IRidium and ARSenic in the composition.

Type Material: n.d.

Irhtemite $Ca_4Mg(AsO_4)_2(HAsO_3OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Commonly as crystals, in spherulitic aggregates, to 1 mm; may be powdery.

Physical Properties: Hardness = n.d. D(meas.) = 3.09 D(calc.) = 3.153

Optical Properties: Transparent. *Color:* Colorless, white, pale rose with traces of cobalt. *Luster:* Silky.
Optical Class: Biaxial (+). *Orientation:* Elongation negative, extinction angle = 25°.
$\alpha = 1.634$ $\beta =$ n.d. $\gamma = 1.642$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 16.736(5)$ $b = 9.483(3)$ $c = 10.840(5)$
$\beta = 97°15(20)'$ Z = 4

X-ray Powder Pattern: Irhtem mine, Morocco.
2.97 (10), 3.24 (9), 2.82 (9), 5.08 (4), 3.68 (4), 9.42 (3), 6.85 (3)

Chemistry:

	(1)	(2)
As_2O_5	55.5	56.45
MgO	4.4	4.95

H_2O	11.5	11.06
Total	99.6	100.00

(1) Salsigne mine, 15 km north of Carcassone, Aude, France; artificially dehydrated picropharmacolite, corresponding to $Ca_{4.16}Mg_{0.90}H_2(AsO_4)_4 \cdot 5.28H_2O$. (2) $Ca_4MgH_2(AsO_4)_4 \cdot 4H_2O$.

Occurrence: Probably a dehydration product of picropharmacolite in hydrothermal ore deposits.

Association: Sainfeldite, erythrite (Irhtem mine, Morocco).

Distribution: From the Irhtem (Ightem) mine, Bou Azzer district, Anti-Atlas Mountains, Morocco. In Germany, in the Bauhaus district, Richelsdorf Mountains, Hesse.

Name: For its occurrence in the Irhtem (Ightem) mine, Morocco.

Type Material: National School of Mines, Paris, France.

Iridarsenite $(Ir, Ru)As_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As irregular inclusions, to 60 μm, in a matrix of rutheniridosmine.

Physical Properties: Hardness = n.d. VHN = 488 and 686 (100 g load) on two grains. D(meas.) = n.d. D(calc.) = 10.9

Optical Properties: Opaque. *Color:* In polished section, medium gray with brownish tint. *Luster:* Metallic. *Pleochroism:* Weak to none. *Anisotropism:* Weak but distinct, from medium gray to pale orange-brown.
R_1–R_2: (470) 47.2–46.9, (546) 45.4–46.1, (589) 44.9–46.6, (650) 41.4–44.0

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 6.05$ $b = 6.06$ $c = 6.18$ $\beta = 113°17'$ $Z = 4$

X-ray Powder Pattern: Papua New Guinea.
3.90 (100), 2.840 (70), 2.069 (60), 2.610 (50), 1.910 (50), 1.943 (40), 1.875 (40)

Chemistry:

	(1)	(2)
Ir	40.7	52.2
Ru	10.3	1.7
Os	1.3	0.4
Pt	0.5	1.1
Rh	0.9	0.2
Pd		0.1
As	46.2	44.0
S		0.2
Total	99.0	99.9

(1) Papua New Guinea; by electron microprobe, corresponds to $(Ir_{0.69}Ru_{0.33}Os_{0.02})_{\Sigma=1.04}As_{2.00}$.
(2) Do.; by electron microprobe, average of four other grains; corresponds to $(Ir_{0.92}Ru_{0.06}Os_{0.01}Pt_{0.02}Rh_{0.01})_{\Sigma=1.02}(As_{1.97}S_{0.03})_{\Sigma=2.00}$.

Occurrence: In nuggets or fragments of natural Os–Ir–Ru alloys.

Association: Irarsite, ruthenarsenite, rutheniridosmine.

Distribution: From an unspecified locality [probably the Waria River, Bowutu Mountains, or the Yodda Goldfield] in Papua New Guinea [TL]. In the Merensky Reef, Bushveld complex, Witwatersrand, Transvaal, South Africa. From near Zlatoust, Ural Mountains, Russia. In placers at Anduo, Tibet, China. From Fox Gulch, Goodnews Bay, Alaska, USA.

Name: For the IRIDium and ARSENic in the composition.

Type Material: Geological Survey of Canada, 12160; Canadian Museum of Nature, Ottawa, Canada.

Total	99.16	100.6	98.1

(1) Nizhni Tagil, Russia; corresponds to $(Ir_{0.74}Pt_{0.19}Cu_{0.05}Pd_{0.02})_{\Sigma=1.00}$. (2) Sorashigawa placer, Japan; by electron microprobe, corresponds to $(Ir_{0.62}Os_{0.32}Ru_{0.03}Cu_{0.02}Fe_{0.01})_{\Sigma=1.00}$. (3) Do.; by electron microprobe, corresponds to $(Ir_{0.41}Ru_{0.38}Pt_{0.18}Os_{0.02}Cu_{0.01})_{\Sigma=1.00}$.

Occurrence: As exsolution particles in Pt–Fe alloys.

Association: Platinum, Pt–Fe alloys.

Distribution: From Nizhni Tagil, Ural Mountains, Russia. In Japan, at the Sorashigawa placer, ?? Prefecture, elsewhere??. In Canada, from Bear Creek, in the Tulameen River district, British Columbia, and at the Wellgreen Ni–Cu–PGE deposit, Yukon Territory. In the USA, from Goodnews Bay, Alaska, and in the Boss mine, Goodsprings district, Clark Co., Nevada. On the Witwatersrand, South Africa. In the Ioma placer, Waria River, Yodda goldfield, Papua New Guinea

Name: From the Latin *iris*, *rainbow*, as the element's compounds are typically highly colored.

Type Material: n.d.

Total	99.6	101.3

(1) Ruby Creek, Canada; by electron microprobe. (2) Sorashigawa placer, Japan; by electron microprobe.

Occurrence: In magmatic segregation deposits, and concentrated into placers on their reduction by weathering.

Association: Osmiridium, irarsite, laurite, isoferroplatinum, platinum, rutheniridosmine.

Distribution: In Canada, in British Columbia, from Ruby Creek, Atlin district; Spruce Creek; and Granite Creek, in the Tulameen River area. From the Sorashigawa placer and other localities in Japan. From the Heazlewood Complex and the Adamsfield district, Tasmania, Australia. In the Guma Water placers, Sierra Leone. From near Vershilo, Bourgas district, Bulgaria. From Vourinos, Greece. At Anduo, Tibet, China. In the Inagli and Konder massifs, Aldan Shield, Yakutia; and a number of other less well defined localities in the USSR.

Name: For the composition, intermediate between iridium and osmium.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 111–113. (2) Harris, D.C. and L.J. Total	99.73	[100.00]	100.00

(1) Aleksandrovskii Golets deposit, Russia; H_2O taken as loss on ignition. (2) Analysis (1) recalculated to 100% after deduction of CaO as unessential and insoluble; then corresponding to $(UO_2)Mo_{1.84}O_{6.52} \cdot 3.70H_2O$. (3) $(UO_2)Mo_2O_7 \cdot 3H_2O$.

Occurrence: In granulated albite, in part replacing brannerite (Aleksandrovskii Golets deposit, Russia); in a stream channel in sandstone (Hart Table, South Dakota, USA); may be of post-mining origin.

Association: Ferrimolybdite, ilsemannite, metauranocircite, uranyl sulfates, gypsum.

Distribution: Found in considerable abundance in some deposits. From the Aleksandrovskii Golets Mo–U deposit, upper Chetkanda River, Chara district, Udokan Range, northern Transbaikal, Russia. Found in the Shunak Mountains, 60 km west of the Mointy railroad station, and at the Kyzylsai Mo–U deposit, Chu-Ili Mountains, southwestern Balkhash region, Kazakhstan. In the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. In the USA, at Hart Table, southwest of Scenic, Pennington Co., South Dakota; east of Cameron, Coconino Co., Arizona; and at the Clyde Long property, Elk Park area, San Juan Co., Colorado. From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the Hervey's Range deposit, 55 km west of Townsville, Queensland, Australia.

Name: A euphonious construction, devoid of connotation.

Type Material: Mining Institute, St. Petersburg, Russia, 1257/2.

Iron Fe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Typically in small blebs but also in masses up to 25 tons; crystals rare. *Twinning:* On {111}; also on {112} if in lamellar masses.

Physical Properties: *Cleavage:* {001}; parting on {112}. *Fracture:* Hackly. *Tenacity:* Malleable. Hardness = 4 VHN = 160 (100 g load). D(meas.) = 7.3–7.87 D(calc.) = 7.874 Magnetic.

Optical Properties: Opaque. *Color:* Steel-gray to iron-black; in polished section, white. *Luster:* Metallic.

R: (400) 56.8, (420) 57.2, (440) 57.6, (460) 57.8, (480) 57.9, (500) 58.0, (520) 58.1, (540) 58.1, (560) 58.1, (580) 58.1, (600) 58.1, (620) 58.2, (640) 58.2, (660) 58.4, (680) 58.6, (700) 58.8

Cell Data: *Space Group:* $Im3m$. $a = 2.8664$ $Z = 2$

X-ray Powder Pattern: Synthetic.
2.0268 (100), 1.1702 (30), 1.4332 (20), 0.9064 (12), 1.0134 (10), 0.8275 (6)

Chemistry:

	(1)	(2)
Fe	93.16	99.16
Ni	2.01	
Co	0.80	
Cu	0.12

Total	99.18	99.802

(1) Blaafjeld, Greenland. (2) Cameron, Missouri, USA.

Occurrence: Rare in igneous rocks, especially basalts; in carbonaceous sediments; in volcanic fumaroles; and in petrified wood, mixed with "limonite" and organic matter.

Association: Pyrite, magnetite, troilite, wüstite, cohenite.

Distribution: In Greenland, at Fortune Bay, Mellemfjord, Asuk, and elsewhere on the west coast; on Disko Island, near Uivfaq and Kitdlît. From Ben Bhreck, Scotland. At Bühl, near Weimar, Hesse, Germany. In Poland, near Rouno, Wolyn district. In Russia, at Grushersk, in the Don district; from the Hatanga region, Siberia; in the Huntukungskii massif, Krasnoyarsk Kray; and on the Tolbachik fissure volcano, Kamchatka Peninsula. In the USA, at Cameron, Clinton Co., Missouri; and near New Brunswick, Somerset Co., New Jersey. In Canada, in Ontario, from Cameron Township, Nipissing district, and on St. Joseph Island, Lake Huron. Noted in small amounts at a number of additional localities.

Name: An Old English word for the metal; the chemical symbol from the Latin *ferrum*.

Irtyshite $Na_2(Ta, Nb)_4O_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6. Massive, in veinlets, to 0.2 mm wide, and as granular inclusions.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = n.d. VHN = 1030 (40 g load). D(meas.) = n.d. D(calc.) = 7.03 Bright yellow-green cathodoluminescence.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Adamantine.
Optical Class: Uniaxial. *Anisotropism:* Noted. *Bireflectance:* Noted.
R_1–R_2: (486) 18.0–19.0, (553) 18.6–19.5, (589) 18.9–19.6, (656) 18.5–18.7

Cell Data: *Space Group:* $P6_3/m$ or $P6_3$ (?). $a = 6.231$ $c = 36.77$ Z = 6

X-ray Powder Pattern: Near the Irtysh River, Kazakhstan.
3.029 (10), 3.082 (9), 2.780 (9), 6.13 (7), 5.18 (6), 2.481 (6), 1.929 (4)

Total	99.72

(1) Near the Irtysh River, Kazakhstan; by electron microprobe, average of three analyses; corresponds to $(Na_{1.83}Ca_{0.03}Pb_{0.02})_{\Sigma=1.88}(Ta_{3.19}Nb_{0.80}Sn_{0.03})_{\Sigma=4.02}O_{11}$.

Occurrence: As veinlets in altered thoreaulite, and inclusions in ixiolite and lithiotantite, in granite pegmatites.

Association: Thoreaulite, ixiolite, lithiotantite.

Distribution: From the Ungursai tantalum deposit, Kalba Mountains, near the Irtysh River, eastern Kazakhstan.

Name: For the Irtysh River, Kazakhstan, near which it occurs.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 43776.

Ishikawaite $(U, Fe, Y, Ca)(Nb, Ta)O_4(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As prismatic crystals, tabular on {100}, with nine forms noted, to 1 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 5–6 D(meas.) = 6.2–6.4 D(calc.) = n.d. Radioactive.

Optical Properties: Opaque. *Color:* Black. *Streak:* Dark brown. *Luster:* Waxy, resinous to vitreous.
Optical Class: Isotropic.
R: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)		(1)	(2)

			Total	99.66	97.6

(1) Ishikawa district, Japan. (2) Honeycomb Hill, Utah, USA; by electron microprobe, RE_2O_3 = Y_2O_3 1.05%, La_2O_3 0.03%, Ce_2O_3 0.41%, Nd_2O_3 0.73%, Sm_2O_3 0.33%, Gd_2O_3 0.50%, Tb_2O_3 0.21%, Dy_2O_3 1.37%, Er_2O_3 1.27%, Yb_2O_3 2.87%, Lu_2O_3 0.40%.

Occurrence: In pegmatite, and alluvium (Ishikawa district, Japan); as microinclusions in vitrophyre clasts in highly differentiated, rare-element rich, pyroclastic rhyolites (Honeycomb Hills, Utah, USA).

Association: Samarskite (Ishikawa district, Japan).

Distribution: From the Ishikawa district, Fukushima Prefecture, Japan. Reported from other localities in Japan and elsewhere, but confirmation is impossible, lacking type material. Material from the Honeycomb Hills, Juab Co., Utah, USA, for example, seems very similar but is regarded as uranoan samarskite.

Name: For the occurrence in the Ishikawa district, Japan.

Type Material: Destroyed.

Isocubanite $CuFe_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Euhedral grains and cubo-octahedra, to 400 μm, intergrown with chalcopyrite; rimming cubanite.

Physical Properties: Hardness = n.d. VHN = 175 (100 g load). D(meas.) = n.d. D(calc.) = [3.93]

Optical Properties: Opaque. *Color:* Bronze; in reflected light, pinkish brown. *Luster:* Metallic.
R: (400) 20.9, (420) 22.7, (440) 24.6, (460) 26.9, (480) 29.2, (500) 31.4, (520) 33.2, (540) 34.8, (560) 36.2, (580) 37.4, (600) 38.2, (620) 39.1, (640) 39.7, (660) 40.3, (680) 40.9, (700) 41.3

Cell Data: *Space Group: Fm3m.* $a = 5.303(3)$ $Z = [4/3]$

X-ray Powder Pattern: East Pacific Rise (21°N).
3.059 (100), 1.876 (70), 1.602 (50), 2.647 (20), 1.327 (20)

Chemistry:

	(1)	(2)
Cu	21.23	23.42
Fe	41.64	41.15
Zn	0.96	
S	35.57	35.43
Total	99.40	100.00

(1) East Pacific Rise (21°N); by electron microprobe. (2) $CuFe_2S_3$.

Polymorphism & Series: Dimorphous with cubanite, from which it can be formed by heating to between 200 °C and 270 °C.

Occurrence: In mixtures of sulfides formed around modern undersea "black smoker" chimneys; in hydrothermal copper sulfide deposits; in pumice from volcanic eruptions.

Association: Chalcopyrite, pyrrhotite, pyrite, sphalerite, wurtzite, anhydrite.

Distribution: From the East Pacific Rise (21°N [TL], 23°N, 13°N) and the Mid-Atlantic Ridge (14°45′N, 29°N, 36°14′N). On Axial Seamount, Juan de Fuca Ridge, northeast Pacific Ocean. In the Atlantis II Deep of the Red Sea. At Kilauea, Hawaii, USA. From the Talnakh area, Noril'sk region, western Siberia, Russia. At Tunaberg, Sweden. In the Mooihoek mine, Lydenburg district, Transvaal, South Africa. From the Strathcona mine, Sudbury, Ontario, Canada.

Name: For the cubic structure and relation to cubanite.

Type Material: National School of Mines, Paris, France.

References: (1) Caye, R., B. Cervelle, F. Cesbron, E. Oudin, P. Picot, and F. Pillard (1988) Isocubanite, a new definition of the cubic polymorph of cubanite $CuFe_2S_3$. Mineral. Mag., 52, 509–514. Isoferroplatinum Pt_3Fe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rarely as crystals, to 3 mm, also skeletal and cubic grains, which may exhibit stepped facets, and as wormlike intergrowths and veinlets.

Physical Properties: Hardness = n.d. VHN = 503–572 (100 g load). D(meas.) = n.d. D(calc.) = 18.41

Optical Properties: Opaque. *Color:* Bright white in reflected light. *Luster:* Metallic. R: (400) 61.2, (420) 61.2, (440) 61.1, (460) 61.3, (480) 62.3, (500) 63.3, (520) 63.8, (540) 64.3, (560) 64.9, (580) 65.9, (600) 66.4, (620) 67.5, (640) 67.9, (660) 68.7, (680) 69.2, (700) 69.5

Cell Data: *Space Group:* $Pm3m$. a = 3.866 Z = 1

X-ray Powder Pattern: Gusevogorskii pluton, Russia. 1.164 (10), 2.22 (7), 1.364 (6), 1.926 (4), 1.114 (4)

Chemistry:

	(1)	(2)
Pt	90.2	91.29
Fe	7.6	8.71
Cu	0.94	
Ni	0.06	
Total	98.8	100.00

(1) Tulameen River, Canada; by electron microprobe, corresponding to $Pt_{3.01}(Fe_{0.88}Cu_{0.10}Ni_{0.01})_{\Sigma=0.99}$. (2) Pt_3Fe.

Occurrence: In Pt–Fe and Cu–Ni sulfide deposits in ultramafic rocks, also in chromatites, and placers derived from them.

Association: Platinum, iridium, osmium, Pt–Fe alloy, braggite, sperrylite, inclusions of many other PGE minerals, gold, pyrite.

Distribution: In Canada, in British Columbia, from the Tulameen [TL] and Similkameen Rivers. In the Stillwater complex, Montana, and at Fox Gulch, Goodnews Bay, Alaska, USA. From the Department of Chocó, Cauca, Colombia. In the Inagli and Konder massifs, Aldan Shield, Sakha; the Noril'sk region, western Siberia; along the Vilyui River and on the Kamchatka Peninsula; in the Gusevogorskii pluton and the Kytlym and Uktus complexes, Ural Mountains; and at a number of other minor localities in Russia. From the Birbir River, Ethiopia. In the Onverwacht and Tweefontein pipes, Merensky Reef, Bushveld complex, Transvaal, South Africa. On the Riam Kanan River, Borneo. From the Qilian Mountains, Qinghai Province, China. At Round Hill, near Orepuki, New Zealand. Numerous additional localities have been recognized.

Name: For the cubic (ISOmetric) structure, and iron (FERRum) and PLATINUM in its composition.

Type Material: n.d.

References: (1) Cabri, L.J. and C.E. Feather (1975) Platinum–iron alloys: a nomenclature based on a study of natural and synthetic alloys. Can. Mineral., 13, 117–126. (2) (1976) Amer. Isokite $CaMg(PO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are flattened on {010}, elongated along [100], and obliquely terminated by {101}, {100}, $\{10\overline{1}\}$, $\{10\overline{2}\}$; generally as spherulites of bladed to fibrous crystals, to 3 mm.

Physical Properties: *Cleavage:* Very good on {010}. *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 3.15–3.27 D(calc.) = 3.29 Fluoresces blue under LW UV.

Optical Properties: Translucent. *Color:* White, buff, pale pink. *Luster:* Silky (fibers), slightly pearly (plates).
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge c = 32°$. *Dispersion:* $r > v$. $\alpha = 1.590(2)$ $\beta = 1.595(2)$ $\gamma = 1.615(2)$ 2V(meas.) = 51.5(2)°

Cell Data: *Space Group:* $C2/c$. $a = 6.52(5)$ $b = 8.75(5)$ $c = 7.51(5)$ $\beta = 121°28(12)'$ Z = 4

X-ray Powder Pattern: Nkombwa Hill, Zambia; nearly identical to panasqueiraite.
3.185 (vvs), 3.023 (vvs), 2.630 (vvs), 2.301 (s), 1.720 (s), 2.784 (m), 2.586 (m)

Chemistry:

	(1)	(2)

$-O = F_2$	4.15	4.48
Total	[100.00]	100.00

(1) Nkombwa Hill, Zambia; from an original total of 100.07%, after deduction of 2.14% ankeritic dolomite and 0.99% strontian apatite, then corresponds to $(Ca_{0.98}Sr_{0.03})_{\Sigma=1.01}(Mg_{0.98}Fe_{0.01})_{\Sigma=0.99}(P_{0.98}O_{3.94})[F_{0.93}(OH)_{0.10}]_{\Sigma=1.03}$. (2) $CaMg(PO_4)F$.

Occurrence: A late stage metasomatic mineral in ankeritic carbonatite (Nkombwa Hill, Zambia); replacing wagnerite in a pegmatite dike in sillimanite grade gneiss (Benson mines, New York, USA); an alteration product of triplite in granite pegmatites (Mangualde and Ribeira, Portugal; Horní Slavkov, Czech Republic).

Association: Dolomite, strontian fluorapatite, monazite, daqingshanite-(Ce), strontianite, quartz, phlogopite, pyrochlore (Nkombwa Hill, Zambia).

Distribution: On Nkombwa Hill, 24 km east of Isoka, Zambia. At the Benson Mines, near Star Lake, St. Lawrence Co., New York, USA. From Horní Slavkov (Schlaggenwald), Czech Republic. In Portugal, at the Mangualde pegmatite, near Mesquitela, from Folgorinho, and in the Ribeira and Panasqueira Sn–W deposits. From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. At Brumado, Bahia, Brazil.

Name: For Isoka, Zambia, the town near which the first specimens were collected.

Type Material: The Natural History Museum, London, England, 1957,3 and 1957,4.

References: (1) Deans, T. and J.D.C. McConnell (1955) Isokite, $CaMgPO_4F$, a new mineral from Northern Rhodesia. Mineral. Mag., 30, 681–690. (2) (1956) Amer. Mineral., 41, 167 (abs. ref. 1). Isomertieite $Pd_{11}Sb_2As_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Grains, to 0.8 mm, rarely showing crystal outlines.

Physical Properties: Hardness = n.d. VHN = 587–597, 592 average (100 g load). D(meas.) = n.d. D(calc.) = 10.33

Optical Properties: Opaque. *Color:* In polished section, pale yellow. *Anisotropism:* Weak, in shades of dull brown.
R: (400) 43.2, (420) 44.1, (440) 45.5, (460) 47.2, (480) 49.2, (500) 51.2, (520) 53.1, (540) 54.8, (560) 56.2, (580) 57.4, (600) 58.6, (620) 59.4, (640) 60.1, (660) 60.5, (680) 60.8, (700) 61.1

Cell Data: *Space Group: Fd3m.* $a = 12.283$ $Z = 8$

X-ray Powder Pattern: Itabira district, Brazil.
2.167 (100), 2.356 (90), 1.533 (70), 1.253 (70), 1.188 (70), 0.996 (70), 1.446 (60)

Chemistry:

	(1)	(2)	(3)
Pd	72.53	74.07	74.85
Au	0.37	1.05	
Cu	1.08	0.13	
Sb	14.61	15.65	15.57
As	10.42	9.53	9.58
Total	99.01	100.43	100.00

(1) Itabira district, Brazil; by electron microprobe, corresponding to $(Pd_{10.66}Cu_{0.27}Au_{0.03})_{\Sigma=10.96}Sb_{1.88}As_{2.17}$. (2) Hope's Nose, England; by electron microprobe, average of two grains; corresponding to $(Pd_{10.89}Au_{0.08}Cu_{0.03})_{\Sigma=11.00}Sb_{2.01}As_{0.99}$. (3) $Pd_{11}Sb_2As_2$.

Polymorphism & Series: Dimorphous with mertieite-I.

Occurrence: In heavy-metal concentrates from Precambrian iron-precious metal deposits (Itabira district, Brazil).

Association: Arsenopalladinite, atheneite, palladseite, hematite, gold (Itabira district, Brazil); chalcopyrite, millerite, kotulskite, arsenopalladinite, hematite (Lac des Iles complex, Canada); hongshiite, cooperite, sperrylite, vysotskite, magnetite, bornite, polydymite, diopside, actinolite, epidote ("Yen" district, China).

Distribution: In Brazil, in gold placers from the Itabira district, Minas Gerais [TL] and in the Serra Pelada Au–Pd–Pt deposit, Pará. At the Lac des Iles complex, Ontario, Canada. In the Konttijärvi intrusion, northern Finland. At Hope's Nose, Torquay, Devon, England. In China, in the "Yen" district – a code name. In Russia, from around Zlatoust, Ural Mountains, and in the Lukkulaisvaara layered intrusion, Karelia. Along the Waiau River, western Southland, New Zealand.

Name: For its structural and compositional relation to mertieite-I.

Type Material: The Natural History Museum, London, England, 1934,72; National Museum of Natural History, Washington, D.C., USA, 142504.

Itoite $\mathbf{Pb_3Ge^{4+}O_2(SO_4)_2(OH)_2(?)}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (by analogy to anglesite). *Point Group:* n.d. As a very fine-grained incrustation or alteration of fleischerite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.67

Optical Properties: Transparent to translucent. *Color:* White; colorless in transmitted light. *Luster:* Silky.
Optical Class: [Biaxial.] n = 1.84–1.85 α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* [*Pnma*] (*by analogy to anglesite*). $a = 8.47$ $b = 5.38$ $c = 6.94$ Z = 4

X-ray Powder Pattern: Tsumeb, Namibia; close to anglesite.
2.065 (10), 3.326 (9), 3.003 (9), 4.240 (8), 3.209 (7), 3.794 (6), 3.604 (6)

Chemistry: (1) Tsumeb, Namibia; presence of essential Pb, Ge, $(SO_4)^{2-}$ confirmed by qualitative analysis; the composition proposed is that of anglesite with replacement of 1/3 $(SO_4)^{2-}$ by $[GeO_2(OH)_2]^{2-}$.

Occurrence: Very rare, in an oxidized zone of a polymetallic germanium-bearing sulfide deposit, as an alteration product of fleischerite, perhaps produced by grinding for X-ray analysis.

Association: Fleischerite, mimetite, cerussite, anglesite, plumbojarosite, tennantite, dolomite.

Distribution: From Tsumeb, Namibia.

Name: Honors Professor Tei-ichi Ito (1898–1980), Japanese mineralogist and crystallographer, University of Tokyo, Tokyo, Japan.

Type Material: Technical University, Berlin, Germany, 57/1405; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 162597.

References: (1) Frondel, C. and H. Strunz (1960) Fleischerit und Itoit, zwei neue Germanium-Mineralien von Tsumeb. Neues Jahrb. Mineral., Monatsh., 132–142 (in German with English abs.). (2) (1960) Amer. Mineral., 45, 1313 (abs. ref. 1).

Al_2O_3	0.32
Fe_2O_3	44.42
Mn_2O_3	22.70
MnO	30.34
MgO	0.61
SrO	0.04
Na_2O	0.02
K_2O	0.02
Total	99.24

(1) Gozaisho mine, Japan; corresponds to $(Mn^{2+}_{0.98}Mg_{0.04})_{\Sigma=1.02}(Fe^{3+}_{1.28}Mn^{3+}_{0.66}Si_{0.02}Al_{0.01}Ti_{0.01})_{\Sigma=1.98}O_4$.

Polymorphism & Series: Dimorphous with jacobsite.

Occurrence: In a regionally metamorphosed bedded manganese deposit.

Association: Rhodonite, braunite, rhodochrosite, hematite, spessartine, quartz.

Distribution: From the Gozaisho mine, Iwaki, Fukushima Prefecture, Japan.

Name: For its occurrence near Iwaki, Japan.

Type Material: National Science Museum, Tokyo, Japan, M21865; National Museum of Natural History, Washington, D.C., USA, 132923.

References: (1) Matsubara, S., A. Kato, and K. Nagashima (1979) Iwakiite, $Mn^{+2}(Fe^{+3}, Mn^{+3})_2O_4$, a new tetragonal spinelloid mineral from the Gozaisho mine, Fukushima Prefecture, Japan. P_2O_5	32.65	33.15
Total	100.07	100.00

(1) Tanohata mine, Japan; average of 10 electron microprobe analyses, PO_4 confirmed by Raman spectroscopy; corresponding to $Na_{2.026}(Ba_{0.993}Sr_{0.101})_{\Sigma=1.094}(Mn_{0.801}Mg_{0.164})_{\Sigma=0.965}P_{1.971}O_8$.
(2) $Na_2BaMn(PO_4)_2$.

Occurrence: In a Ba- and Sr-bearing manganese deposit.

Association: Sérandite.

Distribution: From the No. 3 (Matsumaezawa) deposit, Tanohata mine, Tanohata Village, Iwate Prefecture, Japan.

Name: For the Japanese Prefecture (*Iwate*) that contains the locality that produced the first specimens.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSM-M43779).

References: (1) Nishio-Hamane, D., T. Minakawa, and H. Okada (2014) Iwateite, $Na_2BaMn(PO_4)_2$, a new mineral from the Tanohata mine, Iwate Prefecture, Japan. Journal of Mineralogical and Petrological Sciences, 109(1), 34-37. (2) (2015) Amer. Mineral., 100, 335-336 (abs. ref. 1).

Ixiolite $(Ta, Nb, Sn, Fe, Mn)O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As crudely prismatic crystals, to 10 cm; commonly as irregular grains. *Twinning:* On {013}, uncommon.

Physical Properties: *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 836–967 (100 g load). D(meas.) = 6.94–7.23 D(calc.) = [7.34] Significant Sn, along with Mn, Fe, and Ti in its composition, is essential to the definition of this species, the disordered counterpart of wodginite, to which it alters on heating.

Optical Properties: Opaque. *Color:* Blackish gray to steel-gray. *Streak:* Dark brown. *Luster:* Submetallic.

R_1–R_2: n.d.

Cell Data: *Space Group:* $P2/c$. $a = 9.481(3)$ $b = 11.494(5)$ $c = 5.158(2)$ $\beta = 90°8(2)'$ Z = 16

X-ray Powder Pattern: Skogböle, Finland; may be confused with columbite.
2.98 (100), 3.65 (32), 1.459 (29), 1.722 (24), 2.51 (20), 1.746 (17), 2.57 (13)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

ZrO_2	0.60	0.20	FeO	8.08	2.98	Total	99.63	98.44

(1) Skogböle, Finland; corresponds to $(Ta_{0.44}Fe_{0.18}Sn_{0.13}Nb_{0.12}Mn_{0.12}Zr_{0.01}Ti_{0.01})_{\Sigma=1.01}O_2$.
(2) Bradlo, Czech Republic; by electron microprobe, total Fe as FeO, corresponding to $(Ta_{0.46}Mn_{0.21}Sn_{0.12}Nb_{0.07}Fe_{0.07}Ti_{0.05}W_{0.01})_{\Sigma=0.99}O_2$.

Occurrence: An accessory mineral in granite pegmatites.

Association: Microcline, tapiolite, cassiterite, microlite, niobian rutile.

Distribution: Found at Skogböle, Kemiö (Kimito) Island, Finland. From Bradlo, Czech Republic. At the Swanson mine, East Hampton, Middlesex Co., Connecticut, USA. In the Yellowknife district, Northwest Territories, Canada. At Bikita, Zimbabwe. In the Kalbinskiy Range, eastern Kazakhstan. From Wodgina, Pilbara, Western Australia. At an undefined locality in the Xinjiang Uygur Autonomous Region, China.

Name: For *Ixion*, of Greek mythology, who was related to Tantalus, in allusion to the mineral's relation to tantalite.

Type Material: University of Finland, Helsinki, Finland, 1014; Wroclaw University, Wroclaw, Poland, II–4874; Royal Ontario Museum, Toronto, Canada, M6591.

Izoklakeite $\mathbf{Pb_{27}(Cu,Fe)_2(Sb,Bi)_{19}S_{57}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Aggregates of acicular crystals, to 1 mm.

Physical Properties: *Cleavage:* {001}, good. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.7–4.2 VHN = 150–212 (50 g load). D(meas.) = 6.47 D(calc.) = 6.505

Optical Properties: Opaque. *Color:* Lead-gray. *Streak:* Gray-black. *Luster:* Metallic. *Pleochroism:* From pale greenish white to darker greenish white or gray. *Anisotropism:* Distinct, from greenish gray to dark gray to brownish gray.
R_1–R_2: (400) 44.6–48.5, (420) 44.1–48.4, (440) 43.5–48.0, (460) 42.5–47.4, (480) 42.2–46.9, (500) 41.6–46.2, (520) 41.0–45.7, (540) 40.6–45.2, (560) 40.1–44.8, (580) 39.8–44.4, (600) 39.6–44.1, (620) 39.3–43.8, (640) 39.1–43.5, (660) 38.8–43.2, (680) 38.5–42.9, (700) 38.2–42.5

Cell Data: *Space Group: Pnnm.* $a = 33.88(2)$ $b = 38.02(2)$ $c = 4.070(2)$ $Z = 1$

X-ray Powder Pattern: Izok Lake, Canada.
3.398 (100), 2.149 (60), 3.305 (40), 2.038 (40b), 2.878 (40), 1.745 (40), 3.159 (30)

Chemistry:

	(1)	(2)		(1)	(2)
Pb	46.6	50.01	Sb	13.3	11.67
Cu	1.0	0.88	Bi	20.5	19.20
Fe	0.2	0.19	S	17.0	16.91
Ag	2.0	0.59	Total	100.6	99.45

(1) Izok Lake, Canada; by electron microprobe, average of three analyses; corresponds to $Pb_{22.96}Ag_{1.89}(Cu_{1.61}Fe_{0.37})_{\Sigma=1.98}(Sb_{11.15}Bi_{10.02})_{\Sigma=21.17}S_{54.13}$. (2) Vena mines, Sweden; by electron microprobe, average of 19 analyses; corresponds to $Pb_{25.64}Ag_{0.58}(Cu_{1.47}Fe_{0.36})_{\Sigma=1.83}(Sb_{10.18}Bi_{9.76})_{\Sigma=19.94}S_{56.02}$.

Polymorphism & Series: Forms a series with giessenite.

Occurrence: In a massive Zn–Cu–Pb sulfide deposit (Izok Lake, Canada); from a Cu–Co sulfide deposit in skarn (Vena mines, Sweden).

Association: Galena, pyrrhotite, pyrite, jaskólskiite (Izok Lake, Canada); galena, jaskólskiite, pyrrhotite, bismuth, antimony, antimonian bismuthinite, kobellite (Vena mines, Sweden).

Distribution: From Izok Lake, Northwest Territories, Canada [TL]. At the Vena mines, near Askersund, Örebro, Sweden. From near Lake Zervreila, Vals, Graubünden, Switzerland. At Bazoges, Vendée, and in the Chalanches mine, near Allemont, Isère, France. In the Toroiaga mine, Baia Borą district, Romania. From the Srednegolgotaiskoe gold deposit, eastern Transbaikalia, Siberia, Russia. At the Otome mine, Yamanashi Prefecture, Japan. From Mangchang, Guangxi Autonomous Region, China.

Name: For the locality at Izok Lake, Canada.

Type Material: The Natural History Museum, London, England, 1983,75; Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada; National Museum of Natural History, Washington, D.C., USA, 165272.

Jáchymovite $(UO_2)_8(SO_4)(OH)_{14}\cdot 13H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. As crusts of acicular crystals, to 0.1 mm.

Physical Properties: *Cleavage:* On {010}, very good. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.79 Radioactive; fluoresces yellow under SW and LW UV.

Optical Properties: Translucent. *Color:* Yellow. *Streak:* Pale yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Y = pale yellow; Z = yellow. $\alpha = 1.715(2)$ $\beta = 1.718(2)$ $\gamma = 1.720(2)$ 2V(meas.) = n.d. 2V(calc.) = 78°

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. $a = 18.553(8)$ $b = 9.276(2)$ $c = 13.532(7)$ $\beta = 125.56(2)°$ Z = 2

X-ray Powder Pattern: Jáchymov, Czech Republic.
7.56 (100), 7.13 (48), 3.771 (34), 3.554 (20), 3.206 (13), 3.234 (10), 2.052 (8)

Chemistry:

	(1)	(2)
SO_3	2.79	2.93
UO_3	84.20	83.86
H_2O	13.32	13.21
Total	100.31	100.00

(1) Jáchymov, Czech Republic; H_2O by TGA, corresponds to $(UO_2)_{8.01}(SO_4)_{0.95}(OH)_{14.12}\cdot 13.06H_2O$. (2) $(UO_2)_8(SO_4)(OH)_{14}\cdot 13H_2O$.

Occurrence: Found on a museum specimen from the heavily oxidized portions of a uraninite-bearing vein in dolomite.

Association: Gypsum, uranopilite, uraninite.

Distribution: From Jáchymov (Joachimsthal), Czech Republic.

Name: For the uranium deposit at Jáchymov, Czech Republic, where the specimen was collected.

Type Material: Natural History Museum, Prague, Czech Republic, P1N-68905.

Jacobsite $(Mn^{2+}, Fe^{2+}, Mg)(Fe^{3+}, Mn^{3+})_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rarely in octahedral crystals, to 4 mm, which may exhibit exsolved hausmannite or galaxite; coarse to fine granular, massive. *Twinning:* On {111} as both twin and composition plane, the spinel law, flattened on {111} or lamellar.

Physical Properties: *Cleavage:* {111}, probably a parting. Hardness = 5.5–6.5 VHN = 665–707 (100 g load). D(meas.) = 4.76 D(calc.) = 5.03 Weakly magnetic.

Optical Properties: Opaque, translucent on thin edges. *Color:* Black to brownish black; grayish white with olive tint in reflected light, with brown internal reflections. *Streak:* Brown. *Luster:* Metallic, splendent to semimetallic, dull.
Optical Class: Isotropic. $n = \sim 2.3$
R: (400) 19.0, (420) 18.8, (440) 18.6, (460) 18.4, (480) 18.2, (500) 18.1, (520) 18.0, (540) 17.8, (560) 17.6, (580) 17.4, (600) 17.2, (620) 17.0, (640) 16.8, (660) 16.6, (680) 16.5, (700) 16.4

Cell Data: *Space Group:* $Fd3m$ (synthetic $MnFe_2O_4$). $a = 8.499$ $Z = 8$

X-ray Powder Pattern: Synthetic $MnFe_2O_4$.

(1) Jakobsberg, Sweden. (2) Bald Knob, North Carolina, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Mn^{2+}_{0.99}Fe^{2+}_{0.02}Mg_{0.01})_{\Sigma=1.02}(Fe^{3+}_{1.62}Al_{0.35}Ti_{0.01})_{\Sigma=1.98}O_4$.

Polymorphism & Series: Forms a series with magnetite, dimorphous with iwakiite.

Mineral Group: Spinel group.

Occurrence: A primary mineral or an alteration product of other manganese-bearing minerals in some metamorphosed manganese deposits.

Association: Hausmannite, galaxite, braunite, pyrolusite, coronadite, hematite, magnetite.

Distribution: In Sweden, from Jakobsberg and Långban, Värmland, and Väster Silfberg, Dalarne; and in the Sjö mine, near Grythyttan, Örebro. From the Benallt mine, near Rhiw, Lleyn Peninsula, Wales. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, and from the Otjiwarongo district, Namibia. At the N'Chwaning mine, near Kuruman, Cape Province, South Africa, in crystals large for the species. From Broken Hill, New South Wales, and at the Iron Monarch quarry, Iron Knob, South Australia. From mines around Kodur, Andhra Pradesh, India. In Japan, from the Kiuragi mine, Saga Prefecture, the Noda-Tamagawa mine, Iwate Prefecture, the Kunimiyama mine, Kochi Prefecture, and many others. From the Urandi district, Bahia, Brazil. In the USA, from Bald Knob, near Sparta, Alleghany Co., North Carolina. A few additional localities are known.

Name: For its original occurrence at Jakobsberg (formerly Jacobsberg), Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Total	107.21	100.0

(1) Tachgagalt mine, Morocco; average of 8 electron microprobe analyses, B_2O_3 and H_2O calculated from structure analysis, Ca and Si considered impurities and disregarded; corresponding to $Cu_{3.02}Zn_{0.96}(OH)_{5.91}H_{0.03}Cl_{2.08}$. (2) $Cu_2[BO(OH)_2](OH)_3$.

Occurrence: Probably formed as a secondary, low-temperature product of hydrothermal reworking of boron-bearing manganese-oxide ore (gaudefroyite).

Association: Henritermierite, gaudefroyite, calcite.

Distribution: From Vein #2, Tachgagalt mine, near Ouarzazate, Anti-Atlas Mountains, Morocco.

Name: Honors French geologist Jacques Emile Dietrich (b. 1926), who collected the first specimens.

Type Material: Natural History Museum of Los Angeles County, California, USA; 52461.

(1) Cauê deposit, Itabira District, Minas Gerais, Brazil; average of 3 electron microprobe analyses; corresponding to $(Pt_{1.46}Pd_{0.42}Cu_{0.10}Ag_{0.01})_{\Sigma=1.99}Hg_{0.98}Se_{3.04}$.

Occurrence: In heavy-mineral concentrate from a friable, hematite-rich auriferous vein that cuts metamorphosed banded iron formation.

Association: Potarite, atheneite, hematite.

Distribution: Cauê iron-ore deposit, Itabira District, Minas Gerais, Brazil.

Name: After vein-type gold mineralization rich in specular hematite, known as "jacutinga" in Minas Gerais, Brazil.

Type Material: GeoMuseum, Technical University of Clausthal, Germany (# 26580).

H_2O	4.3	4.11
Total	100.2	100.00

(1) Jadar Basin, Serbia; wet chemical, ICPAES and CHN analyses, IR spectroscopy confirms presence of OH, BO_3 and perhaps BO_4, corresponding to $Li_{1.08}Na_{1.07}Si_{0.97}B_3O_{6.99}(OH)_{1.06}$.
(2) $LiNaSiB_3O_7(OH)$.

Occurrence: In a sequence of interbedded oil-shales, dolomicrites and pyroclastic tuffaceous deposits of lacustrine basin fill and marine origin.

Association: Calcite, dolomite, K-feldspar, rutile, albite, ilmenite, pyrite, fine-grained muscovite, searlesite.

Distribution: From drill core collected in the Jadar Basin, Serbia (44° 32′ N, 19° 18′ E).

Name: For the Jadar Basin in Serbia, where the first samples were collected.

Type Material: Natural History Museum, London, England, BM 2006, 16; Systematic Reference Series of the National Mineral Collection of Canada, Geological Survey of Canada, Ottawa, Canada, NMCC 068101; the Natural History Museum, Budapest, Hungary and the Belgrade Natural History Museum, Belgrade, Serbia.

Jadeite $Na(Al, Fe^{3+})Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals rare, prismatic with {110}, {111}, and {100} as dominant forms, showing cleavage faces to 1 cm. Commonly massive, or fibrous, granular, compact. *Twinning:* Single and lamellar twinning on {100} and {001}.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ (1$\bar{1}$0) ∼87°. *Fracture:* Splintery. *Tenacity:* Very tough when massive. Hardness = 6–7 D(meas.) = 3.24–3.43 D(calc.) = 3.330

Optical Properties: Translucent. *Color:* Apple-green, emerald-green, bluish green, leek-green, greenish white, white, may show green spots, rarely blue or violet; colorless in thin section. *Streak:* White. *Luster:* Subvitreous, pearly on cleavages.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 32°–55°$. *Dispersion:* $r > v$, moderate to strong. $\alpha = 1.640–1.681$ $\beta = 1.645–1.684$ $\gamma = 1.652–1.692$ 2V(meas.) = 60°–96°

Cell Data: *Space Group:* $C2/c$. $a = 9.418$ $b = 8.562$ $c = 5.219$ $\beta = 107.58°$ Z = 4

			Total	99.96	99.87

(1) New Idria district, California, USA; corresponds to $(Na_{0.98}Ca_{0.01})_{\Sigma=0.99}(Al_{0.98}Fe^{3+}_{0.01}Mg_{0.01})_{\Sigma=1.00}Si_{2.00}O_6$. (2) Cloverdale, California, USA; corresponds to $(Na_{0.80}Ca_{0.05}K_{0.02})_{\Sigma=0.87}(Al_{0.87}Mg_{0.05}Fe^{3+}_{0.01}Fe^{2+}_{0.01})_{\Sigma=0.94}Si_{2.08}O_6$.

Mineral Group: Pyroxene group.

Occurrence: In high-pressure metamorphic rocks of the glaucophane facies; a component of eclogite.

Association: Albite, quartz, muscovite, omphacite, glaucophane, calcite, aragonite, analcime, zeolites.

Distribution: In small amounts at many places; the origin of many specimens is obscure. Some well-known localities are: around Tawmaw, Myitkyina-Mogaung district, Kachin State, northern Myanmar (Burma). In the Ohmi area, along the Hashidate and Kotake Rivers, Niigata Prefecture, and at Shibukawa, Gumma Prefecture, Japan. Around Lake Baikal, Siberia, Russia. In the USA, in California, as crystals in boulders along the Russian River, about 3.5 km north of the Sonoma-Mendocino Co. line, near Cloverdale; at Clear Creek, near New Idria, San Benito Co.; and at several places in Mendocino Co. At Manzanal, in the Motagua Valley, near the Sierra de las Minas, Guatemala.

Name: From *jade*, a material commonly containing jadeite, in turn from the Spanish *Piedra de yjada*, or *colic stone*, for its supposedly curative powers for nephritic colic.

Total	100.19	100.00

(1) Yukon Territory, Canada; molecular H_2O shown absent by IR; recalculated after deduction of quartz impurity, then corresponds to $Ba_{1.07}(Al_{2.15}Fe_{0.01})_{\Sigma=2.16}[(P_{0.94}S_{0.01})_{\Sigma=0.95}O_4]_2(OH)_2$.
(2) $BaAl_2(PO_4)_2(OH)_2$.

Occurrence: In quartz veins filling tension fractures in carbonaceous argillite.

Association: Pyrite, hinsdalite.

Distribution: From a locality about 25 km north of the Hess River, N.T.S. area 105–N–7, Yukon Territory, Canada.

Name: Honors John Arthur Gower (1921–1972), Professor of Mineralogy, University of British Columbia, Vancouver, Canada.

Type Material: Department of Geological Sciences, University of British Columbia, Vancouver, Canada, S-75-4220; The Natural History Museum, London, England, 1978,450; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 128337.

Jahnsite-(CaMnFe) $\mathbf{CaMn^{2+}Fe_2^{2+}Fe_2^{3+}(PO_4)_4(OH)_2 \cdot 8H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed crystals and warty crystal aggregates, to 3 mm; in "splinters" intergrown with rockbridgeite.

Physical Properties: *Cleavage:* [Good on {001}] [by analogy to jahnsite-(CaMnMg)]. *Fracture:* Splintery. *Tenacity:* [Brittle.] Hardness = [4] D(meas.) = 2.86 D(calc.) = [2.88]

Optical Properties: Translucent. *Color:* Yellow-brown. *Luster:* [Vitreous to subadamantine.]
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow-brown; Y = yellow-brown; Z =dark yellow-brown. *Dispersion:* $r > v$, strong. $\alpha = 1.682$ $\beta = 1.695$ $\gamma = 1.707$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P2/a$. $a = 15.01(3)$ $b = 7.15(2)$ $c = 9.87(2)$ $\beta = 111°14(10)'$ Z = 2

X-ray Powder Pattern: Fletcher mine, New Hampshire, USA.
9.150 (100), 2.808 (55), 4.602 (40), 3.483 (30), 3.451 (30), 4.961 (25), 1.874 (20)

Chemistry:

	(1)
P_2O_5	29.6
Fe_2O_3	22.8
MnO	10.2
MgO	2.7
CaO	2.6
Na_2O	0.4
Total	

(1) Fletcher mine, New Hampshire, USA; partial electron microprobe analysis, total Fe as Fe_2O_3, total Mn as MnO; which approximates $(Ca_{0.50}Mn^{2+}_{0.36}Na_{0.14})_{\Sigma=1.00}Mn^{2+}_{1.00}(Fe^{2+}_{0.96}Mg_{0.72}Mn^{2+}_{0.20}Fe^{3+}_{0.12})_{\Sigma=2.00}Fe^{3+}_{2.00}(PO_4)_4(OH)_2 \cdot 8H_2O$.

Mineral Group: Whiteite group; $Fe^{3+} >$ Al in the M(3) structural site.

Occurrence: A late-stage hydrothermal decomposition product of primary phosphate minerals in complex granite pegmatites.

Association: Rockbridgeite (Fletcher mine, New Hampshire, USA); frondelite, bermanite, huréaulite, strunzite, johnsomervilleite (Sapucaia mine, Brazil).

Distribution: In the USA, from the Fletcher and Palermo # 1 mines, near North Groton, Grafton Co., New Hampshire; in the Dunton quarry and the Bell pit, Newry, Oxford Co., Maine. At Hagendorf, Bavaria, Germany. From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil.

Name: By analogy to *jahnsite*-(CaMnMg); the suffix indicates sequentially the dominant atom in the X, M(1), and M(2) structural positions.

Type Material: National Museum of Natural History, Washington, D.C., USA, 127153.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular to elongated prismatic crystals, striated on $\{\overline{2}01\}$ and $\{100\} \parallel [010]$, to 1 cm; common forms include {001}, {100}, {201}, $\{\overline{2}01\}$, $\{\overline{1}01\}$, {011}, {110}, $\{\overline{1}11\}$. May be acicular; in twinned parallel aggregates; as warty granular masses. *Twinning:* By reflection on {001}, producing a pseudo-orthorhombic appearance.

Physical Properties: *Cleavage:* Good on {001}. *Tenacity:* Brittle. Hardness = 4
D(meas.) = 2.706–2.718 D(calc.) = 2.715

Optical Properties: Transparent to translucent. *Color:* Nut-brown, purplish brown, yellow, yellow-orange, greenish yellow, red-brown, red-orange, pale green. *Luster:* Vitreous to subadamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = pale purple; Y = deep purplish brown; Z = yellow with a tinge of green. *Orientation:* $Z = b$; $Y \wedge c \simeq 18°$. *Absorption:* $Y >> Z > X$.
$\alpha = 1.640(3)$ $\beta = 1.658(3)$ $\gamma = 1.670(3)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P2/a$. $a = 14.94(2)$ $b = 7.14(1)$ $c = 9.93(1)$ $\beta = 110.16(8)°$
Z = 2

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
9.27 (10), 2.825 (8b), 4.91 (6b), 3.522 (5), 2.950 (5), 5.66 (4), 4.63 (4)

Chemistry:

	(1)		(1)
P_2O_5	32.2	MgO	9.4
Al_2O_3	2.1	CaO	6.6
Fe_2O_3	15.1	H_2O^+	18.8
MnO	8.0	Total	92.2

(1) Tip Top mine, South Dakota, USA; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO, H_2O by the Penfield method; corresponding to $Ca_{1.00}Mn^{2+}_{1.15}Mg_{1.75}(Fe^{3+}_{1.65}Al_{0.40})_{\Sigma=2.05}(OH)_{2.05}(PO_4)_4 \cdot 7.9H_2O$.

Mineral Group: Whiteite group; $Fe^{3+} >$ Al in the M(3) structural site.

Occurrence: A late-stage hydrothermal decomposition product of primary triphylite-lithiophilite in complex granite pegmatites.

Association: Leucophosphite, huréaulite, collinsite, ferrisicklerite, robertsite, rockbridgeite, triphylite, tavorite, messelite, vivianite (Custer Co., South Dakota, USA); laueite, strunzite (Palermo #1 mine, New Hampshire, USA); graftonite, johnsomervilleite, mitridatite, phosphosiderite, rockbridgeite, vivianite, apatite, garnet (Glen Chosaidh, Scotland).

Distribution: In the USA, from the Tip Top, White Elephant, Bull Moose, Big Chief, and Linwood mines, near Custer, Custer Co., South Dakota. In the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. From Glen Chosaidh, Loch Quoich, Inverness-shire, Scotland.

Name: Honors Professor Richard Henry Jahns (1915–1983), specialist in pegmatite mineralogy, Stanford University, California, USA; the suffix indicates sequentially the dominant atom in the X, M(1), and M(2) structural positions.

Type Material: National Museum of Natural History, Washington, D.C., USA.

Total	99.78	[100.0]	100.00

(1) Jalpa, Mexico. (2) Silver Plume, Colorado, USA; average of four analyses, S by difference. (3) Ag_3CuS_2.

Occurrence: Formed under low-temperature (below 117 °C) hydrothermal conditions.

Association: Acanthite, mckinstryite, galena, sphalerite, pyrite, chalcopyrite, stromeyerite, polybasite, pearceite, tetrahedrite–tennantite, silver.

Distribution: In Mexico, at the La Leonora mine, Jalpa, Zacatecas [TL], and at La Mesa, Chihuahua. In the USA, in Colorado, at the Payrock mine, Silver Plume, Clear Creek Co.; the Bulldog Mountain mine, Creede, Mineral Co.; the Hock Hocking mine, near Alma, Park Co.; also from Boulder Co., at the E.C. Hite mine, and the Caribou mine, near Nederland. From the Savage and Yellow Jacket mines, Comstock district, Storey Co., Nevada; at Mogollon, Catron Co., New Mexico. From Kongsberg, Norway. In France, at Barreins, Aude. From Bohutin, near Příbram, and in the Vrancice deposit, Czech Republic. In the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. From Keel, Aedagh, Co. Longford, Ireland. At Boarezzo, Lombardy, Italy. In the ??S?? Zavodinskii mine, near Ziryanovsk, Altai Mountains, Kazakhstan. From the Sado mine, Niigata Prefecture, and the Koryu mine, Hokkaido, Japan. In Australia, from Broken Hill, New South Wales. A number of additional localities have lately been recognized.

Name: For the Mexican locality at Jalpa.

Type Material: Mining Academy, Freiberg, Germany, 4705; National School of Mines, Paris, France.

Jamborite $(Ni^{2+}, Ni^{3+}, Fe)(OH)_2(OH, S, H_2O)(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal (probable). *Point Group:* n.d. As aggregates of parallel fibers and lamellae, some bent, replacing millerite needles; cryptocrystalline massive.

Physical Properties: Hardness = n.d. D(meas.) = 2.67 D(calc.) = 2.69

Optical Properties: Semitransparent. *Color:* Green.
Optical Class: Uniaxial (–); appears isotropic in fine aggregates. $\omega = 1.607(2)$ $\epsilon = 1.602(2)$

Cell Data: *Space Group:* n.d. $a = 3.07$ $c = 23.3$ $Z = 3/8$

X-ray Powder Pattern: Italy.
7.78 (10), 2.592 (6), 1.530 (5), 3.89 (4), 1.500 (3), 2.320 (1), 1.321 (1)

Chemistry: (1) Italy; by electron microprobe, original analysis Ni 42.0–49.4%, thought to be both Ni^{2+} and Ni^{3+}; Co 1.9%, Fe 0.9%, Mg < 0.2%, S 3.5%.

Occurrence: In small cavities in ophiolitic rocks (Italy); in serpentinites (Shinshiro, Japan).

Association: Millerite, calcite, dolomite, quartz (Italy); gaspéite, glaukosphaerite, mcguinnessite (Shinshiro, Japan).

Distribution: In Italy, from Ca'dei Ladri and Monteacuto Ragazza, 50 km southwest of Bologna, and Catelluccio di Moscheda, Modena, Emilia-Romagna. In the Sterling mine, Antwerp, Jefferson Co., New York; the Volstead quarry, Hillview, Greene Co., Illinois; and at Hall's Gap, Lincoln Co., Kentucky, USA. Found at Shinshiro, Aichi Prefecture, Japan.

Name: To honor John Leslie Jambor (1936–), Canadian mineralogist with the Geological Survey of Canada.

Type Material: University of Bologna, Bologna, Italy.

(1) Tsumeb, Namibia; by electron microprobe, total Fe as Fe_2O_3, $(OH)^{1-}$ assumed for charge balance; corresponding to $Pb_{1.92}Zn_{2.15}Fe^{3+}_{5.06}(AsO_4)_{4.00}(OH)_{11.32}$. (2) Do.; by electron microprobe, average of two analyses, total Fe as Fe_2O_3, H_2O calculated by crystal-structure analysis; corresponds to $Pb_{2.01}Zn_{1.00}Fe^{3+}_{2.00}(Fe^{3+}_{2.78}Zn_{1.09}Ga_{0.05}Cu_{0.04}Al_{0.03})_{\Sigma=3.99}(AsO_4)_{3.99}[(OH)_{9.20}O_{0.80}]_{\Sigma=10.00}$.

Occurrence: A secondary mineral in oxidized lead ore in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Duftite, tsumcorite, goethite.

Distribution: From Tsumeb, Namibia.

Name: Honors Christopher James, one of the first mining engineers at the Tsumeb mine, Namibia.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany, NM05; National Museum of Natural History, Washington, D.C., USA, 143995.

(1) Cornwall, England; average of three analyses. (2) Tresungers mine, St. Endellion, England; by electron microprobe. (3) $Pb_4FeSb_6S_{14}$.

Polymorphism & Series: Dimorphous with parajamesonite; forms a series with benavidesite.

Occurrence: Typically a late-stage hydrothermal mineral in Pb–Ag–Zn veins formed at low to medium temperatures.

Association: Other lead sulfosalts, pyrite, sphalerite, galena, tetrahedrite, stibnite, quartz, siderite, calcite, dolomite, rhodochrosite.

Distribution: From numerous localities, but only a few have provided rich material. From Cornwall, England, around St. Endellion [TL] and St. Kew. In Germany, at Freiberg, Saxony; and near Magdesprung, Selke Valley, and Clausthal, Harz Mountains. From Příbram, Czech Republic. At Aranyidka, Baia Sprie (Felsőbánya), and Herja (Kisbánya), Baia Mare (Nagybánya) district, Romania. From Trepča, Serbia. At Sala, Västmanland, Sweden. From Machacamarca, Poopó, and Huanuni, Oruro, Bolivia. In Mexico, from the Noche Buena mine, near Mazapil; the Santa Rita mine, Nieves; and in relatively thick crystals from the Noria mine, near Sombrerete, Zacatecas. In the USA, in Idaho, at Slate Creek, Shoshone Co. From the Dachang district, Guangxi Autonomous Region, China.

Name: In honor of Robert Jameson (1774–1854), Scottish mineralogist, Edinburgh, Scotland, who first described the mineral.

Janggunite $\mathbf{Mn^{4+}_{5-x}(Mn^{2+},Fe^{3+})_{1+x}O_8(OH)_6}$ (x = 0.2)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As flaky crystals, to 0.13 mm, elongated ‖ cleavage and flattened on {010}, probable; in radiating groups, dendritic or arborescent masses, and in colloform bands and very fine-grained aggregates.

Physical Properties: *Cleavage:* One direction, perfect. *Tenacity:* Very fragile [*sic*]. Hardness = 2–3 D(meas.) = 3.59 D(calc.) = 3.58

Optical Properties: Opaque. *Color:* Black; grayish white to gray in reflected light. *Streak:* Brownish black to dark brown. *Luster:* Dull.
Optical Class: Biaxial. *Pleochroism:* Distinct; whitish to light gray in oil. *Anisotropism:* Very strong; yellowish brown with bluish tint, to gray. *Bireflectance:* Observed.
R_1–R_2: 13–15

Cell Data: *Space Group:* n.d. $a = 9.324$ $b = 14.05$ $c = 7.956$ Z = 4

X-ray Powder Pattern: Janggun mine, South Korea.

MnO_2	74.91
Fe_2O_3	4.19
MnO	11.33
PbO	0.03
H_2O^+	9.46
Total	99.92

(1) Janggun mine, South Korea; Fe and Pb by electron microprobe, total Fe as Fe_2O_3, H_2O as OH verified by IR; corresponds to $Mn^{4+}_{4.86}(Mn^{2+}_{0.90}Fe^{3+}_{0.30})_{\Sigma=1.20}O_{8.09}(OH)_{5.92}$.

Occurrence: Formed at a late stage of oxidation in a cementation zone of a manganese deposit.

Association: Nsutite, todorokite, calcite, rhodochrosite.

Distribution: In the Janggun mine, Bonghwa district, South Korea.

Name: For the Janggun mine, South Korea, its first locality.

Type Material: National Museum of Natural History, Washington, D.C., USA, 143150.

(1) Ivigtut, Greenland; corresponds to $Na_{1.00}(Sr_{5.67}Na_{0.96}Ca_{0.19}Li_{0.16}Ba_{0.10})_{\Sigma=7.08}Mg_{0.52}(Al_{6.28}Fe_{0.04})_{\Sigma=6.32}F_{31.75}(H_2O)_{2.25}$.

Occurrence: In vugs in a cryolite deposit with other fluorides.

Association: Cryolite, gearksutite, chiolite, thomsenolite, ralstonite, prosopite, stenonite, acuminite, bøgvadite, jørgensenite, fluorite, topaz, barite.

Distribution: From the Ivigtut cryolite deposit, Greenland.

Name: For Carl Frederik Jarl (1872–1951), formerly President of the Danish Cryolite Company, who first noted the mineral.

Type Material: Holotype probably lost; University of Copenhagen, Copenhagen, Denmark; The Natural History Museum, London, England.

(2) $KFe_3(SO_4)_2(OH)_6$.

Polymorphism & Series: Forms a series with natrojarosite.

Mineral Group: Alunite group.

Occurrence: A secondary mineral in oxidized portions of sulfide-bearing rocks, typically altering from pyrite; less common as a low-temperature, primary hydrothermal mineral, including as deposits around hot springs.

Association: Alunite, pyrite.

Distribution: Widespread. A few localities for studied material include: in Spain, in the Barranco del Jaroso, Sierra Almagrera, Almería Province. At Horní Slavkov (Schlaggenwald), Czech Republic. From the Frisches Glück mine, Fürstenberg, near Schwarzenberg, Saxony, Germany. In the Kamariza mine, Laurium, Greece. In the USA, from Marysvale, Ohio district, Piute Co., and at the Mammoth mine, Tintic, Juab Co., Utah; in the Vulture mine, near Wickenburg, Maricopa Co., at Tombstone, Cochise Co., and many other places in Arizona; from the Meadow Valley mines, Pioche district, Lincoln Co., Nevada. Immense crystals from the La Domitila mine, Sierra Peña Blanca uranium district, Sierra del Cuervo, Chihuahua, Mexico. In Chile, at Chuquicamata, from Quetena, west of Calama, and at Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta. At volcanoes on the Kamchatka Peninsula, Russia.

Name: For the Barranco del Jaroso, Spain, from where the first scientifically studied specimens were obtained.

Type Material: Mining Academy, Freiberg, Germany, 17.966.

X-ray Powder Pattern: Vena mines, Sweden.
3.710 (100), 2.970 (80), 3.333 (60), 2.761 (60), 3.595 (50), 2.751 (50), 2.050 (50)

Chemistry:

	(1)	(2)
Pb	50.74	48.5
Cu	1.31	0.8
Sb	15.74	14.6
Bi	14.35	17.4
S	17.52	17.6
Total	99.65	98.9

(1) Vena mines, Sweden; by electron microprobe, average of 16 analyses, corresponding to $Pb_{2.22}Cu_{0.19}(Sb_{1.17}Bi_{0.62})_{\Sigma=1.79}S_{5.00}$. (2) Izok Lake, Canada; by electron microprobe, corresponding to $Pb_{2.13}Cu_{0.11}(Sb_{1.09}Bi_{0.76})_{\Sigma=1.85}S_{5.00}$.

Occurrence: In aggregates of sulfosalts and sulfides in polymetallic hydrothermal veins.

Association: Galena, pyrrhotite, chalcopyrite, arsenopyrite, cobaltite, pyrite, sphalerite, bismuth, antimony, cubanite, freibergite, izoklakeite, gudmundite, gersdorffite, meneghinite.

Distribution: From the Vena mines, near Askersund, Örebro, Sweden [TL]. At the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. From the Apollo mine, near Raubach, Siegerland, Germany. In the Srednegolgotaiskoe gold deposit, eastern Transbaikalia, Siberia, Russia. From Izok Lake, Northwest Territories, Canada.

Name: To honor Professor Stanislaw Jaskólski (1896–1981), Polish mineralogist, Akademia Górniczo-Hutnicza, Kraków, Poland.

Type Material: Wroclaw University, Wroclaw, Poland, II–6801; Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands, 150-J-2; National Museum of Natural History, Washington, D.C., USA, 162203, 162481.

(1) Jas Roux, France; average of 12 electron microprobe analyses; corresponding to $Ag_{14.64}Cu_{0.79}Pb_{4.10}Tl_{0.05}Sb_{24.87}As_{15.37}S_{72.18}$.

Occurrence: An early hydrothermal (epithermal) mineral along veins in silicified meta-sedimentary rocks.

Association: Coated by a myrmekitic aggregate of stibnite, baumhauerite-boscardinite, and smithite and associated with realgar, pyrite, sphalerite, and other lead sulfosalts.

Distribution: Jas Roux, in the Pelvoux Massif, Hautes-Alpes département, France.

Name: For the locality that produced the first specimens.

Type Material: Department of Materials Engineering and Physics, University of Salzburg, Austria; Mineral Collection, Institute of Mineralogy, Materials Physics and Cosmochemistry, Pierre and Marie Curie University, Paris, and in the Museum of Mineralogy, Mines Paris Tech, France.

(1) Crestmore, California, USA; by electron microprobe; H_2O by TGA; corresponds to $Ca_{8.76}H_{2.00}Si_{6.00}O_{17.6}(OH)_{8.00}{\bullet}6.24H_2O$. (2) Fuka, Japan; by electron microprobe, H_2O by gravimetry; corresponds to $Ca_{9.00}H_{2.00}(Si_{5.95}Al_{0.02})_{\Sigma=5.97}O_{17.93}(OH)_{8.00}{\bullet}6.07H_2O$. (3) Structure analysis and IR and Raman spectroscopy suggest the revised formula $Ca_9Si_6O_{18}(OH)_6{\cdot}8H_2O$.

Occurrence: A late-stage mineral, partially filling open spaces and in veins in fractured contact metamorphic rocks.

Association: Tobermorite, scawtite, calcite (Crestmore, California, USA); afwillite, oyelite, spurrite (Fuka, Japan).

Distribution: From Crestmore, Riverside Co., California, USA. At Campomorto, Montalto di Castro, Lazio, Italy. In Germany, from the Bellerberg volcano, two km north of Mayen, Eifel district, and fine crystals from the Zeilberg, near Maroldsweisach, Bavaria. In the Hatrurim Formation, Israel. In the Wessels mine, near Kuruman, Cape Province, South Africa. In Japan, from Fuka, near Bicchu, Okayama Prefecture.

Name: For Colonel Clarence M. Jenni (1896-1974?), Director of the Geological Museum, University of Missouri, Rollo, Missouri, USA, the mineral's discoverer.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119007.

Jentschite **$PbTlAs_2SbS_6$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are platy to long prismatic, showing {010}, {130}, {001}, {041}, {$\bar{1}$01}, {$\bar{1}$21}, {$\bar{1}$51}, to 2 mm, in aggregates. *Twinning:* Polysynthetic on {010} and contact twins on {100}.

Physical Properties: *Cleavage:* Perfect on {$\bar{1}$01}. *Fracture:* Uneven to conchoidal. *Tenacity:* Extremely brittle. Hardness = 2–2.5 VHN = 38–51 (10 g load). D(meas.) = n.d. D(calc.) = 5.24

Optical Properties: Opaque; translucent in thin fragments. *Color:* Black; in transmitted light, dark red with red internal reflections; pale gray in reflected light. *Streak:* Dark red. *Luster:* Metallic to submetallic. *Anisotropism:* Distinct.
R_1–R_2: (470) 29.7–35.4, (543) 28.8–33.1, (587) 26.7–30.3, (657) 26.6–29.9

Cell Data: *Space Group:* $P2_1/n$. $a = 8.0958(5)$ $b = 23.917(2)$ $c = 5.8876(5)$ $\beta = 108.063(8)^\circ$ Z = 4

X-ray Powder Pattern: Binntal, Switzerland.
2.823 (100), 3.587 (86), 2.778 (84), 3.998 (74), 2.670 (58), 3.816 (54), 5.346 (32)

Chemistry:

	(1)	(2)	(3)
Pb	21.44	24.45	23.67
Tl	23.92	23.94	23.34
As	19.16	21.69	17.11
Sb	12.53	7.68	13.91
S	22.42	22.29	21.97
Total	99.47	[100.05]	100.00

(1) Binntal, Switzerland; by electron microprobe, average of 15 analyses; corresponds to $Pb_{0.89}Tl_{1.01}As_{2.20}Sb_{0.89}S_{6.02}$. (2) Do.; by electron microprobe, average of 24 analyses, original total given as 100.1%; corresponds to $Pb_{1.01}Tl_{1.00}As_{2.48}Sb_{0.54}S_{5.96}$. (3) $PbTlAs_2SbS_6$.

Occurrence: Very rare in a hydrothermal deposit in dolostone.

Association: Realgar, orpiment, hutchinsonite, hatchite, wallisite, edenharterite, bernardite, sicherite.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: In honor of Franz Jentsch (1868–1908), an early prolific collector of Lengenbach minerals.

Type Material: Natural History Museum; Mineralogical Institute, University of Basel, Basel, Switzerland.

References: (1) Graeser. S. and A. Edenharter (1997) Jentschite ($TlPbAs_2SbS_6$) – a new sulphosalt mineral from Lengenbach, Binntal (Switzerland). Mineral. Mag., 61, 131–137. (2) (1997) Amer. Jeppeite $(K, Ba)_2(Ti, Fe^{3+})_6O_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In finely prismatic to acicular single crystals, elongated along [010], to 1 cm, showing {100}, {20$\overline{1}$}, and {010}, typically overgrown on priderite.

Physical Properties: *Cleavage:* Perfect on {100}; good on {20$\overline{1}$}. *Tenacity:* Brittle. Hardness = 5–6 VHN = 664–773 $\perp$ [010] (100 g load). D(meas.) = 3.94 D(calc.) = 3.972

Optical Properties: Opaque. *Color:* Black; gray in reflected light, may have pale golden internal reflections. *Streak:* Pale brown. *Luster:* Submetallic.
Optical Class: Biaxial. *Pleochroism:* X = Capri blue; Y = dark greenish brown to almost opaque; Z = dark olive-buff. *Orientation:* $X \wedge a = 10°$; $Y = b$; $Z = c$. *Absorption:* $Y > Z > X$. α = [2.13] β = [2.21] γ = [2.35] 2V(meas.) = n.d. *Bireflectance:* Weak.
R_1–R_2: (400) 16.1–19.5, (420) 15.5–18.9, (440) 15.0–18.4, (460) 14.5–18.0, (480) 14.2–17.6, (500) 13.9–17.3, (520) 13.6–17.0, (540) 13.4–16.8, (560) 13.2–16.6, (580) 13.1–16.5, (600) 13.0–16.4, (620) 12.9–16.2, (640) 12.9–16.2, (660) 12.9–16.1, (680) 12.8–16.0, (700) 12.8–16.0

Cell Data: *Space Group:* $C2/m$. a = 15.453(2) b = 3.8368(7) c = 9.123(2) $\beta = 99.25(1)°$ Z = 2

X-ray Powder Pattern: Wolgidee Hills, Western Australia.
3.07 (10), 2.990 (10), 2.812 (10), 1.919 (8), 2.091 (6), 2.074 (6), 1.412 (5)

Chemistry:

	(1)	(2)
TiO_2	69.29	68.01
ZrO_2		0.00
Fe_2O_3	4.74	4.94
MgO		0.47
BaO	17.35	16.93
SrO		0.50
Na_2O		0.50
K_2O	8.47	8.54
Total	99.85	99.89

(1) Wolgidee Hills, Western Australia; by electron microprobe, average of seven analyses, Fe confirmed by magnetic measurements as Fe^{3+}; corresponding to $(K_{1.15}Ba_{0.73})_{\Sigma=1.88}(Ti_{5.56}Fe^{3+}_{0.38})_{\Sigma=5.94}O_{13}$. (2) Do; by electron microprobe, corresponding to $(K_{1.17}Ba_{0.71}Na_{0.10}Mg_{0.08}Sr_{0.03})_{\Sigma=2.09}(Ti_{5.47}Fe^{3+}_{0.40})_{\Sigma=5.87}O_{13}$.

Occurrence: In some abundance, in a large weathered lamproite plug.

Association: Priderite, celadonite, chlorite, titanite, shcherbakovite, wadeite, perovskite, apatite, richterite, calcite.

Distribution: In the Wolgidee Hills, West Kimberley district, Western Australia.

Name: For Dr. John Frederik Biccard Jeppe (1920–), geologist of Nedlands, Western Australia, discoverer of the mineral.

Type Material: Western Australian Musesum, Perth, Australia, MDC6401; The Natural History Museum, London, England, 1983,604–609 and E.870–871.

References: (1) Pryce, M.W., L.C. Hodge, and A.J. Criddle (1984) Jeppeite, a new K–Ba–Fe titanate from Walgidee [*sic*] Hills, Western Australia. Mineral. Mag., 48, 263–266. (2) Bagshaw, A.N., B.H. Jeremejevite $Al_6(BO_3)_5(F,OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Crystals are typically hexagonal prismatic $\{11\bar{2}0\}$, may be tapered by vincinal forms, with pyramidal $\{10\bar{1}1\}$ termination, to 10 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 6.5–7.5 D(meas.) = 3.29(1) D(calc.) = 3.284 [F^{1-} end-member]; 3.198 [$(OH)^{1-}$ end-member]. Piezoelectric.

Optical Properties: Transparent. *Color:* Colorless, pale yellowish brown, pale to dark cornflower-blue; colorless to pale blue in transmitted light, typically sector zoned.
Luster: Vitreous.
Optical Class: Uniaxial (–), may be anomalously biaxial (–) in sector-zoned crystals.
Pleochroism: Colorless to pale blue-violet if colored. *Dispersion:* $r > v$, distinct.
ω = 1.644–1.647 ϵ = 1.637 α = 1.637 β = 1.644–1.647 γ = 1.644–1.652
2V(meas.) = 18°–33°

Cell Data: *Space Group:* $P6_3/m$. $a = 8.5591(3)$ $c = 8.1814(6)$ Z = 2

X-ray Powder Pattern: Mt. Soktui, Russia.
4.282 (100), 3.791 (57), 2.055 (44), 2.196 (35), 2.650 (33), 2.470 (30), 1.391 (30)

Chemistry:

	(1)	(2)
SiO_2	0.03	0.17
B_2O_3	33.51	33.81
Al_2O_3	59.90	59.79
Fe_2O_3	0.01	0.14
F	10.18	10.23
H_2O	n.d.	n.d.
$-O = F_2$	4.29	4.31
Total	99.34	99.83

(1) Mt. Soktui, Russia; by electron microprobe. (2) Cape Cross, Namibia; by electron microprobe, $(OH)^{1-}$ calculated for charge balance; corresponds to $Al_{6.00}Fe_{0.01}(B_{0.99}O_3)_5[F_{2.76}(OH)_{0.24}]_{\Sigma=3.00}$.

Occurrence: A rare late hydrothermal mineral formed in granitic pegmatites.

Association: Albite, tourmaline, quartz, gypsum (Cape Cross, Namibia).

Distribution: Large crystals from Mt. Soktui, Nerschinsk district, Adun-Chilon Mountains, Siberia, Russia. In the Kukurt massif, Pamir Mountains, Tajikistan. In Namibia, gem crystals from a prospect near Cape Cross, at Mile 72, about 100 km north of Swakopmund, and from Ameib, Erongo Mountains. At Wannerköpfe and Emmelberg, near Üdersdorf, Eifel district, Germany.

Name: Honors Pavel Vladimirovich Eremeev (Jeremejev, *German*) (1830–1899), Russian mineralogist and crystallographer, who first recognized this species.

Type Material: Mining Institute, St. Petersburg, Russia, 412/1.

FeO	0.3
MnO	64.1
ZnO	3.9
MgO	1.4
CaO	0.4
F	0.0
H_2O	2.13
Total	99.3

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O by the Penfield method; corresponds to $(Mn_{7.86}Zn_{0.59}Mg_{0.24}Ca_{0.16}Fe_{0.14})_{\Sigma=8.99}(SiO_4)_4(OH)_2$.

Polymorphism & Series: Dimorphous with sonolite.

Mineral Group: Leucophoenicite group.

Occurrence: In a metamorphosed stratiform Zn-Mn deposit.

Association: Franklinite, willemite, zincite, sonolite, leucophoenicite, tephroite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: In honor of Professor Gerald V. Gibbs, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 125030; National Museum of Natural History, Washington, D.C., USA, C3209, R18772, 149037; The Natural History Museum, London, England1983,236.

Jianshuiite $(Mg, Mn^{2+})Mn_3^{4+}O_7 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ or 3. Very fine granular, to 5 μm, in porous aggregates; massive.

Physical Properties: Hardness = Soft. D(meas.) = 3.50–3.60 D(calc.) = 3.598

Optical Properties: Opaque. *Color:* Brown to brownish black; grayish white in reflected light, with brown internal reflections.
Optical Class: Uniaxial. *Anisotropism:* Distinct.
R: (470) 23.0, (546) 19.9, (589) 19.1, (650) 18.6

Cell Data: *Space Group:* [$R\overline{3}$ or $R3$] (by analogy to the chalcophanite group). a = [7.54] c = [20.82] Z = [6]

X-ray Powder Pattern: Lu Village, China; nearly indistinguishable from chalcophanite and aurorite.
6.965 (100), 2.230 (23), 3.483 (11), 4.086 (8), 2.449 (7), 2.396 (6), 5.539 (3)

Chemistry:

	(1)	(2)
SiO_2	1.20	3.94
MnO_2	67.65	68.49
Al_2O_3	0.78	0.91
Fe_2O_3	0.52	1.41
MnO	8.02	0.92
MgO	5.29	8.52
CaO	1.97	2.03
H_2O^+	13.37	12.60
P_2O_5	0.59	1.63
Total	99.39	100.45

(1) Lu Village, China; corresponds to $(Mg_{0.51}Mn^{2+}_{0.44}Ca_{0.08})_{\Sigma=1.03}Mn^{4+}_{3.03}O_{7.10} \cdot 2.90H_2O$. (2) Do.; corresponds to $(Mg_{0.85}Mn^{2+}_{0.05}[Ca_{0.08}])_{\Sigma=0.98}Mn^{4+}_{3.15}O_{7.20} \cdot 2.80H_2O$.

Occurrence: A hypogene mineral in manganese ore (Lu Village, China); authigenic in manganese oxide concretions in siltstone (San Felipe, Mexico).

Association: Hydrated manganese oxides (Lu Village, China); magnetite, maghemite, goethite, hematite, calcite, quartz, mica, clay minerals (San Felipe, Mexico).

Distribution: In China, near Lu Village, Jianshui Co., Yunnan Province. From 56 km south of San Felipe, Baja California, Mexico.

Name: For its occurrence in Jianshui Co., Yunnan Province, China.

Type Material: Geology Exhibit Museum, Yunnan; Museum of Geology, Beijing, China.

(1) Kaso mine, Japan; after deducting rhodochrosite and tephroite impurity, corresponds to $(Mn_{2.67}Mg_{0.23}Fe_{0.06})_{\Sigma=2.96}(B_{1.01}O_{3.00})_2$. (2) $Mn_3(BO_3)_2$.

Occurrence: Likely formed by metasomatic reactions between boron-bearing hydrothermal solutions and rhodochrosite in banded manganese deposits.

Association: Rhodochrosite, tephroite, galaxite, jacobsite, alabandite, galena, pyrrhotite, chalcopyrite.

Distribution: In Japan, from the Kaso mine, Kanuma, Tochigi Prefecture; the Rito mine, Seta, Gumma Prefecture; the Fuji mine, Fukui Prefecture, and elsewhere.

Name: Honors Professor Kotora Jimbo (1867–1924), founder of the Mineralogical Institute, University of Tokyo, Tokyo, Japan.

Type Material: National Science Museum, Tokyo, Japan, M15-112; The Natural History Museum, London, England.

Jimthompsonite $(Mg, Fe^{2+})_5Si_6O_{16}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As radiating sprays of crystals, to 5 cm; as fibrous intergrowths parallel to {010} in anthophyllite and cummingtonite.

Physical Properties: *Cleavage:* Perfect on {210}, intersecting at 38° and 142°; breakage on {100} and {010} may be partings. Hardness = n.d. D(meas.) = n.d. D(calc.) = [3.02]

Optical Properties: Transparent. *Color:* Colorless to very light pinkish brown; colorless in thin section.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, weak.
$\alpha = 1.605(5)$ $\beta = 1.626(5)$ $\gamma = 1.633(5)$ 2V(meas.) = 62(2)°

Cell Data: *Space Group: Pbca.* $a = 18.6263(3)$ $b = 27.2303(6)$ $c = 5.2970(3)$ Z = 8

X-ray Powder Pattern: Calculated. (ICDD 31-638).

(1) Chester, Vermont, USA; by electron microprobe; H_2O assuming (OH) sites filled by $(OH)^{1-}$.

Polymorphism & Series: Dimorphous with clinojimthompsonite.

Occurrence: In the black wallrock between chlorite and actinolite zones of a metamorphosed ultramafic body.

Association: Chesterite, clinojimthompsonite, anthophyllite, cummingtonite, talc.

Distribution: In the Carleton talc quarry, near Chester, Windsor Co., Vermont, USA.

Name: For Professor James Burleigh Thompson, Jr. (1921–), eminent petrologist of Harvard University, Cambridge, Massachusetts, USA.

Type Material: Royal Ontario Museum, Toronto, Canada, M36083; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 145689.

		Total	[100.00]

(1) San Benito Co., California, USA; by electron microprobe, average of six points on five grains, intergrown with orthojoaquinite-(Ce) of presumably nearly identical composition; RE_2O_3 = La_2O_3 2.14%, Ce_2O_3 10.69%, Pr_2O_3 1.25%, Nd_2O_3 3.21%, Sm_2O_3 0.70%, Gd_2O_3 0.26%, Dy_2O_3 0.21%, Er_2O_3 0.00%, H_2O by difference; corresponds to $Na_{0.83}K_{0.01}Ba_{2.01}Ca_{0.05}Mg_{0.02}(Ce_{0.90}RE_{0.72}Sr_{0.42})_{\Sigma=2.04}Fe_{0.78}Ti_{2.04}Th_{0.02}Si_{8.00}O_{24.68}(OH)_{3.32}$.

Polymorphism & Series: Dimorphous with orthojoaquinite-(Ce).

Mineral Group: Joaquinite group.

Occurrence: In a natrolite vein cutting a glaucophane schist inclusion in a serpentinite body (San Benito Co., California, USA); in fenitized gneisses and alkalic syenites (Seal Lake, Canada).

Association: Orthojoaquinite-(Ce), benitoite, neptunite, natrolite (San Benito Co., California, USA); aegirine, barylite, eudidymite, neptunite (Seal Lake, Canada).

Distribution: At the Gem mine and to its north, on Santa Rita peak; at Mina Numero Uno and on the Victor claim, San Benito Co., California; from Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA. In Canada, at Seal Lake, Labrador, Newfoundland, and Mont Saint-Hilaire, Quebec. Along the Narssaq river, near Kvanefjeld, in the Ilímaussaq intrusion, southern Greenland.

Name: For Joaquin Ridge, near the original locality at the Gem mine, California, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 90840.

PbO	20.7	F	0.3
BeO	[4.2]	$-O = F_2$	0.1
MgO	9.6	Total	[100.0]

(1) Långban, Sweden; by electron microprobe, average of four analyses, presence of Be confirmed by ion microprobe; Fe^{2+}:Fe^{3+} calculated from charge balance, BeO from stoichiometry, H_2O by difference; corresponds to $(Pb_{0.98}Ba_{0.02})_{\Sigma=1.00}(Ca_{1.86}Na_{0.16})_{\Sigma=2.02}(Mg_{2.52}Fe^{3+}_{1.63}Fe^{2+}_{0.38}Mn_{0.34}Al_{0.10})_{\Sigma=4.97}(Si_{6.22}Be_{1.78})_{\Sigma=8.00}O_{22}[(OH)_{1.81}F_{0.19}]_{\Sigma=2.00}$.

Mineral Group: Amphibole (calcic) group: $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$.

Occurrence: A rare mineral in a metamorphosed Fe–Mn orebody.

Association: Hematite, magnetite, manganoan aegirine, quartz, barite, calcite.

Distribution: At Långban, Värmland, Sweden.

Name: For Professor Joseph Victor Smith (1928–), English-American mineralogist and petrologist of the University of Chicago, Chicago, Illinois, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120064, 162612.

Total	99.94	100.00

(1) Johachido district, North Korea; apparently of a mixture. (2) $CaAlB_3O_7$, established by crystal-structure analysis and presence of Ca and Al with absence of F by electron microprobe.

Occurrence: In a nepheline dike cutting limestone (Johachido district, North Korea).

Association: Scapolite, diopside, albite, nepheline, apatite, phlogopite (Johachido district, North Korea).

Distribution: From the Johachido district, Kankyo Hodu Prefecture, North Korea. A cut stone considered of natural origin is attributed to the Mogok region, Myanmar.

Name: For the Johachido district, North Korea, which produced the first specimens.

Type Material: Unknown; National Museum of Natural History, Washington, D.C., USA, 105479 was used for species redefinition.

Total	99.84	100.00

(1) Jáchymov, Czech Republic. (2) $Cu(UO_2)_2(SO_4)_2(OH)_2 \cdot 8H_2O$.

Occurrence: A rare secondary mineral in the oxidized portions of sulfide-bearing uraninite deposits, commonly of post-mine formation.

Association: Gypsum, zippeite, uranopilite, brochantite, chalcanthite.

Distribution: From the Eliáš mine, Jáchymov (Joachimsthal), Czech Republic. At Johanngeorgenstadt, Saxony, and Wölsendorf, Bavaria, Germany. From South Wheal Basset, Illogan, and the Geevor mine, St. Just, Cornwall, England. In France, from the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, and at the Limouzat mine, St.-Priest-la-Prugne, Loire. From the Taboshar uranium deposit, Kara-Mazar Mountains, Tajikistan. In the Mounana uranium mine, Franceville, Gabon. In the USA, from the Kirk, Wood, and other mines, Central City, Gilpin Co., in the Schwartzwalder mine, near Golden, Jefferson Co., and elsewhere in Colorado; in Utah, at the Oyler mine, Henry Mountains district, the Frey No. 4 mine, and the Happy Jack mine, White Canyon district, San Juan Co., and at Marysvale, Ohio district, Piute Co.; from Arizona, in the Hillside mine, about 5.5 km north of Bagdad, Yavapai Co.; on the Ram claims, Pinto Mountains, Riverside Co., California. From Great Bear Lake, Northwest Territory, Canada.

Name: Honors Austrian Archduke Johann Baptist Josef Fabian Sebastian (1782–1859), founder of the Landesmuseum, Graz, Austria.

Type Material: Natural History Museum, Vienna, Austria, A.a.186.

(1) Tetela de Ocampo, Mexico; corresponds to $(Ca_{0.97}Mg_{0.03})_{\Sigma=1.00}(Mn^{2+}_{0.96}Fe^{2+}_{0.02}Al_{0.02})_{\Sigma=1.00}(Si_{1.97}Al_{0.03})_{\Sigma=2.00}O_6$. (2) Aravaipa district, Arizona, USA; corresponds to $(Ca_{0.96}Na_{0.01})_{\Sigma=0.97}(Mn^{2+}_{0.78}Mg_{0.14}Fe^{2+}_{0.05}Al_{0.03}Fe^{3+}_{0.02})_{\Sigma=1.02}(Si_{1.99}Al_{0.01})_{\Sigma=2.00}O_6$.

Polymorphism & Series: Forms two series, with diopside, and with hedenbergite.

Mineral Group: Pyroxene group.

Occurrence: In metasomatized limestones and manganiferous skarns; in quartz or calcite veins cutting rhyolite.

Association: Rhodonite, manganese oxides.

Distribution: From Tetela de Ocampo, Puebla, and Pachuca, Hidalgo, Mexico. In the USA, at Franklin, Sussex Co., New Jersey; from the Bohemia district, Lane Co., Oregon; at the Aravaipa district, Graham Co., Arizona; and in the Empire Zinc Co. mine, Hanover, Grant Co., New Mexico. From Schio, Vicenza, and Campiglia, Tuscany, Italy. In the Akatani mine, Niigata Prefecture; the Nakatatsu mine, Fukui Prefecture; the Onagusa mine, Katsuyam, Okayama Prefecture; and elsewhere in Japan. A number of other localities are known.

Name: To honor Professor Albert Johannsen (1871–1962), petrologist, University of Chicago, Chicago, Illinois, USA.

(2) $Ca_5(AsO_4)_3(OH, F)$ with OH:F = 1:1.

Mineral Group: Apatite group.

Occurrence: A very rare mineral, part of a metamorphic skarn assemblage in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Yeatmanite, diopside, andradite, franklinite, copper, roméite (Franklin, New Jersey, USA); tilasite (Långban, Sweden).

Distribution: From Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. In Russia, at undisclosed deposits in the Ural Mountains and Siberia [Novofrolovskoye copper deposit, Turinsk district, near Krasnoturinsk, Northern Ural Mountains; Yuliya Svintsovaya Pb–Zn deposit, 20 km east-northeast of Son railway station, western Siberia]. At Långban, Värmland, Sweden.

Name: Honors John L. Baum (1916–), Hamburg, New Jersey, USA, Curator of the Franklin Mineral Museum, and collector of the first specimen containing the mineral.

Type Material: Royal Ontario Museum, Toronto, Canada; The Natural History Museum, London, England; Harvard University, Cambridge, Massachusetts, 116461; National Museum of Natural History, Washington, D.C., USA, 144444.

(1) Loch Quoich, Scotland; by electron microprobe, average of eight analyses, total Fe as FeO, total Mn as MnO; corresponding to $Na_{1.43}Ca_{1.05}(Fe_{3.47}Mg_{3.05}Mn_{0.70})_{\Sigma=7.22}(PO_4)_6$.

Occurrence: As one of several primary accessory minerals forming clusters in podiform metamorphic segregations in kyanite-sillimanite-grade gneiss (Loch Quoich, Scotland); a primary mineral in a complex granite pegmatite in staurolite-grade mica schist (Sapucaia mine, Brazil); in type IIIAB iron meteorites.

Association: Graftonite, apatite, jahnsite, phosphosiderite, vivianite, rockbridgeite, mitridatite, almandine-spessartine, muscovite, plagioclase, quartz (Loch Quoich, Scotland); triphylite, frondelite, huréaulite, bermanite, jahnsite, rockbridgeite, phosphosiderite, vivianite, autunite, zircon, tourmaline, microcline, albite, quartz (Sapucaia mine, Brazil).

Distribution: From near the entrance to Glen Cosaidh, Loch Quoich, Inverness-shire, Scotland. In the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. At the Kiluli pegmatite, Rwanda.

Name: Honors John M. Somerville (1908–1978), who collected the first specimens.

Type Material: Royal Scottish Museum, Edinburgh, Scotland; The Natural History Museum, London, England, 1981,70.

References: (1) Livingstone, A. (1980) Johnsomervilleite, a new transition-metal phosphate mineral from the Loch Quoich area, Scotland. Mineral. Mag., 43, 833–836. (2) (1981) Amer. Johnwalkite $K(Mn^{2+}, Fe^{3+}, Fe^{2+})_2(Nb, Ta)O_2(PO_4)_2(H_2O, OH)_2$

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As prismatic crystals, to 6 mm, elongated along [010] and flattened on {001}; forms include {001}, {100}, {111}, {110}; in radial aggregates.

Physical Properties: *Cleavage:* Good on {001} and {100}; poor on {010}. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 3.40(3) D(calc.) = 3.44

Optical Properties: Opaque, transparent on thin edges. *Color:* Very dark reddish brown. *Streak:* Medium greenish yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Very strong; X = blue-green; Y = yellow to pale brown; Z = brown. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Absorption:* $X \gg Z \gg Y$. $\alpha = 1.748(5)$ $\beta = 1.763(5)$ $\gamma = 1.84(1)$ 2V(meas.) = 53(2)°

Cell Data: *Space Group:* $[Pb2_1m]$ (by analogy to olmsteadite). $a = 7.516(4)$ $b = 10.023(8)$ $c = 6.502(4)$ $Z = 1$

X-ray Powder Pattern: Champion mine, South Dakota, USA.
6.01 (100), 3.005 (80), 3.054 (70), 2.862 (70), 6.51 (40), 2.563 (40), 7.54 (30)

Chemistry:

	(1)
P_2O_5	27.3
Nb_2O_5	21.5
Ta_2O_5	5.1
Fe_2O_3	12.5
FeO	3.3
MnO	14.8
MgO	0.5
K_2O	8.6
H_2O	6.5
Total	100.1

(1) Champion mine, South Dakota, USA; by electron microprobe, oxidation state of Fe determined by titration, total Mn as MnO, H_2O by thermoanalyzer-mass spectrometer; corresponding to $K_{0.92}(Mn_{1.04}Fe^{3+}_{0.71}Fe^{2+}_{0.23}Mg_{0.06})_{\Sigma=2.04}(Nb_{0.81}Ta_{0.12}Fe^{3+}_{0.08})_{\Sigma=1.01}O_2(PO_4)_{1.93}[(H_2O)_{1.42}(OH)_{0.78}]_{\Sigma=2.20}$.

Occurrence: A rare secondary mineral derived from the dissolution of triphylite-lithiophilite and columbite-tantalite in a complex granite pegmatite.

Association: Fluorapatite, childrenite–eosphorite, rockbridgeite–frondelite, huréaulite, fairfieldite, ludlamite, jahnsite–whiteite, goethite, manganese oxides, quartz.

Distribution: In the Expectation pegmatite at the Champion mine, about 2.5 km southeast of Keystone, Pennington Co., South Dakota, USA.

Name: Honoring Richard JOHNson (1936–1998) and Frank WALKup (1943–1993), mineral preparators, National Museum of Natural History, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162676.

Jokokuite $Mn^{2+}SO_4 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Massive stalactitic, to 5 cm long.

Physical Properties: Hardness = ∼2.5 D(meas.) = 2.03 D(calc.) = 2.094 Readily soluble in H_2O; dehydrates to ilesite in dry air.

Optical Properties: Transparent to translucent. *Color:* Pale pink; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Dispersion:* Very weak. $\alpha = 1.498(3)$ $\beta = 1.510(3)$ $\gamma = 1.517(3)$ 2V(meas.) = 70°–80°

Cell Data: *Space Group:* $[P\overline{1}]$ (by analogy to chalcanthite). $a = 6.37$ $b = 10.77$ $c = 6.13$ $\alpha = 98°46'$ $\beta = 109°58'$ $\gamma = 77°50'$ Z = 2

X-ray Powder Pattern: Jokoku mine, Japan.
5.84 (100), 2.727 (72), 4.98 (61), 5.66 (56), 1.622 (31), 2.290 (27), 3.28 (25)

Chemistry:

	(1)	(2)

MnO	27.34	29.42
ZnO	0.94	
MgO	0.00	
CaO	0.00	
H_2O	37.68	37.37
Total	100.15	100.00

(1) Jokoku mine, Japan; corresponds to $(Mn_{0.94}Fe_{0.04}Zn_{0.03})_{\Sigma=1.01}(S_{1.00}O_4) \cdot 5.07H_2O$.
(2) $MnSO_4 \cdot 5H_2O$.

Mineral Group: Chalcanthite group.

Occurrence: As efflorescences in oxidized portions of mine workings, apparently deposited from mine waters at 25 °C.

Association: Gypsum, szmikite, ilesite, rozenite, siderotil, ferrohexahydrite, mallardite, melanterite, goslarite (Jokoku mine, Japan).

Distribution: In the Jokoku and Inakuraishi mines, Hokkaido, Japan. At Chvaletice, Czech Republic.

Name: For the Jokoku mine, Japan, where the first specimens were collected.

Type Material: Tohoku University, Sendai; National Science Museum, Tokyo, Japan, M-21492; National Museum of Natural History, Washington, D.C., USA, 136582.

Joliotite $(UO_2)(CO_3)\cdot nH_2O$ ($x \leq 2$)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, 222, or $mm2$. As crystals, scaly and flattened on {100}, exhibiting {100}, {010}, and {011}; typically in radial spherulitic aggregates, to 0.1 mm.

Physical Properties: *Cleavage:* {100}, probable. Hardness = 1–2 D(meas.) = 4.04 D(calc.) = 4.55 Radioactive; fluoresces pale green to pale yellow under SW and LW UV.

Optical Properties: Translucent. *Color:* Citron-yellow. *Streak:* Yellow. *Luster:* [Vitreous.] *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless; Z = yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.596$–1.604 $\beta = 1.636$ $\gamma = 1.637$–1.651 2V(meas.) = Small.

Cell Data: *Space Group:* $Pmmm$, $P222$, or $Pmm2$. $a = 8.16$ $b = 10.35$ $c = 6.32$ Z = 4

X-ray Powder Pattern: Menzenschwand, Germany.
8.09 (10), 3.42 (9b), 3.18 (8b), 4.10 (5), 1.882 (4), 2.11 (3), 4.48 (2)

Chemistry:

	(1)	(2)
CO_2	12.5	12.02
UO_3	73.7	78.14
(Pb + Ba)O	1.2	
H_2O		9.84
Total		100.00

(1) Menzenschwand, Germany; by electron microprobe, average of two partial analyses.
(2) $(UO_2)(CO_3)\cdot 2H_2O$.

Occurrence: A rare secondary mineral in the oxidized portions of a uranium deposit.

Association: Billietite, rutherfordine, studtite, barite, "limonite".

Distribution: From Menzenschwand, Black Forest, Germany.

Name: Honors the French physicist Jean Frédéric Joliot (1900–1958), Institute du Radium, University of Paris, Paris, France, an early worker on radioactivity.

Type Material: n.d.

Jolliffeite NiAsSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Grains, to 240 μm.

Physical Properties: Hardness = > 3 (harder than clausthalite). D(meas.) = n.d. D(calc.) = 7.10

Optical Properties: Opaque. *Color:* White in reflected light.
R_1–R_2: (400) 50.1–50.4, (420) 50.3–50.6, (440) 50.5–50.7, (460) 50.7–50.8, (480) 50.8–50.9, (500) 50.9–51.0, (520) 51.0–51.1, (540) 51.1–51.1, (560) 51.1–51.2, (580) 51.2–51.3, (600) 51.3–51.3, (620) 51.1–51.4, (640) 51.4–51.3, (660) 51.4–51.3, (680) 51.3–51.3, (700) 51.2–51.1

Cell Data: *Space Group: Pa*3. $a = 5.831(1)$ Z = 4

X-ray Powder Pattern: Shirley Peninsula, Canada.
2.602 (100), 2.378 (80), 1.757 (80), 2.916 (50), 1.559 (50), 1.617 (40), 2.062 (30)

Chemistry:

	(1)
Ni	22.6
Co	6.0
As	36.9
Se	34.9
S	0.51
Total	100.9

(1) Shirley Peninsula, Canada; by electron microprobe, corresponds to $(Ni_{0.81}Co_{0.21})_{\Sigma=1.02}As_{1.03}(Se_{0.92}S_{0.03})_{\Sigma=0.95}$.

Mineral Group: Cobaltite group.

Occurrence: From a drill core in a fracture zone near a dolomite–peridotite contact.

Association: Clausthalite, Pb–Bi–Ag selenides, gold, "pitchblende".

Distribution: From the Fish Hook Bay area, Shirley Peninsula, north shore of Lake Athabaska, 18 km south of Uranium City, Saskatchewan, Canada [TL].

Name: To honor Professor Alfred Watson Jolliffe (1907–1988), Canadian geologist, Queen's University, Kingston, Ontario, Canada, for his contributions to mineral exploration of northern Saskatchewan, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 65747.

Jonesite $\mathbf{Ba_4(K,Na)_2Ti_4Al_2Si_{10}O_{36}\cdot 6H_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222. Crystals are slender blades, with prismatic {210}, {310}, and terminated by the dome {101}. Commonly as rosettes of many such crystals, to 3 mm.

Physical Properties: *Cleavage:* Distinct on {010}. *Fracture:* Irregular. Hardness = 3–4 D(meas.) = 3.25(1) D(calc.) = 3.239 Fluoresces dull orange under SW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.641(1)$ $\beta = 1.660(1)$ $\gamma = 1.682(1)$ 2V(meas.) = 76°–78°

Cell Data: *Space Group:* $B22_12$. $a = 13.730(5)$ $b = 25.904(5)$ $c = 10.608(3)$ Z = 4

X-ray Powder Pattern: Gem mine, California, USA.
12.95 (100), 3.031 (45), 2.652 (30), 2.228 (20), 3.008 (18), 2.073 (18), 2.596 (17)

Chemistry:

	(1)		(1)
SiO_2	32.54	MgO	0.111
TiO_2	17.31	CaO	0.045
B_2O_3	0.008	SrO	0.051

Fe_2O_3	0.16	Na_2O	0.67
Nb_2O_5	0.022	K_2O	2.70
MnO	0.035	H_2O	5.9
		Total	99.952

(1) Gem mine, California, USA; weighted average of 20 electron microprobe and ion probe analyses; corresponds to $(Ba_{4.19}Mg_{0.05}Fe_{0.04}Mn_{0.01}Ca_{0.01}Sr_{0.01})_{\Sigma=4.31}(K_{1.06}Na_{0.40})_{\Sigma=1.46}$ $Ti_{3.99}Al_{1.99}Si_{9.97}O_{36}\cdot 6H_2O$.

Occurrence: In fractures and cavities of brecciated greenstone enclosed in blueschist.

Association: Neptunite, benitoite, joaquinite, natrolite.

Distribution: In the USA, at the Gem mine, San Benito Co., California.

Name: For Francis Tucker Jones (1905–1993), Research Chemical Microscopist of Berkeley, California, USA, who discovered the mineral.

Type Material: University of California, Santa Barbara, California, 7325; American Museum of Natural History, New York, New York, USA.

References: (1) Wise, W.S., A. Pabst, and J.R. Hinthorne (1977) Jonesite, a new mineral from the Benitoite Gem mine, San Benito County, California. Mineral. Record, 8, 453–456.

Jordanite $Pb_{14}(As,Sb)_6S_{23}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular with pseudohexagonal aspect, to 4 cm. Rarely reniform. *Twinning:* On {001} common, may be lamellar on $\{\bar{2}01\}$, rare on $\{\bar{1}01\}$ and {101}.

Physical Properties: *Cleavage:* Perfect on {010}; parting on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3 VHN = 106–141 (50 g load). D(meas.) = 6.44 D(calc.) = 6.38

Optical Properties: Opaque. *Color:* Lead-gray, commonly tarnished, iridescent. *Streak:* Black. *Luster:* Metallic.
R_1–R_2: (400) 41.8–44.6, (420) 41.0–43.7, (440) 40.2–42.8, (460) 39.7–42.2, (480) 39.3–41.8, (500) 38.9–41.4, (520) 38.5–41.0, (540) 38.1–40.7, (560) 37.8–40.3, (580) 37.5–40.0, (600) 37.3–39.6, (620) 37.1–39.2, (640) 36.7–38.6, (660) 36.3–38.0, (680) 35.8–37.6, (700) 35.3–37.1

Cell Data: *Space Group:* $P2_1/m$. $a = 8.918(1)$ $b = 31.899(4)$ $c = 8.462(1)$ $\beta = 117.79(1)°$ Z = 2

X-ray Powder Pattern: Binntal, Switzerland.
3.51 (10), 3.16 (9), 3.04 (8), 2.87 (8), 3.68 (7), 3.35 (7), 2.96 (5)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Pb	69.22	72.2	70.96	Sb		2.3	
Tl		1.0		S	18.36	16.4	18.04
As	12.42	7.6	11.00	Total	[100.00]	99.5	100.00

(1) Binntal, Switzerland; recalculated to 100.00% from an original total of 99.12%. (2) Do.; by electron microprobe. (3) $Pb_{14}As_6S_{23}$.

Polymorphism & Series: Forms a series with geocronite.

Occurrence: In metamorphosed Pb–As occurrences in dolostone (Binntal, Switzerland); in low-temperature epithermal veins (Aomori Prefecture, Japan); in epithermal gold-quartz veins (Săcărîmb, Romania); from "black smoker" undersea chimneys.

Association: Tennantite, seligmannite, dufrenoysite, boulangerite, semseyite, quadratite, guettardite, zinkenite, tsugaruite, kirkiite, enargite, sphalerite, galena.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL]. At Beuthen, Upper Silesia, Poland. In Germany, from Wiesloch, near Heidelberg, Black Forest. At Săcărîmb (Nagyág), Romania. From Horní Benešov, Czech Republic. In the Pitone and Ceragiola marble quarries, near Seravezza, Tuscany, Italy. At the Aghios Philippos Pb–Zn deposit, near Kirki, Greece. From Sulitjelma, and at the Bleikvassli Pb–Zn–Cu deposit, Nordland, Norway. At the Langdal deposit, Boliden district, Västerbotten, Sweden. In the Penberthy Croft mine, St. Hilary, Cornwall, England. In Japan, from the Yunosawa and Okoppe mines, Aomori Prefecture. In the USA, at the Zuni mine and Brobdingnag prospect, near Silverton, San Juan Co., Colorado; in the Keystone mine, Birmingham, Blair Co., Pennsylvania; and in the Balmat-Edwards mine, Balmat, St. Lawrence Co., New York. Along the East Pacific Rise (21°N) and on Axial Seamount, Juan de Fuca Ridge, northeast Pacific Ocean.

Name: Honors Dr. H. Jordan (1808–1887), of Saarbrücken, Germany, who provided the original specimens for study.

Jordisite MoS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous to X-rays; nearly so to electrons. *Point Group:* n.d. Massive, as associations of colloidal-sized particles and disseminations.

Physical Properties: *Tenacity:* Sectile. Hardness = Soft. VHN = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Gray-black to lead-gray. *Luster:* Submetallic, dull. R: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Himmelsfürst mine, Germany; by selected area electron diffraction. ∼6 (diffuse)

Chemistry: Established as MoS_2 on very impure materials.

Polymorphism & Series: Trimorphous with molybdenite and molybdenite-3R.

Occurrence: As veinlets and coatings of probable medium- to low-temperature hydrothermal origin.

Association: Ilsemannite, molybdenite, uraninite, coffinite, kerogen, cinnabar, pyrite, fluorite, apatite, stilbite, calcite, quartz.

Distribution: In Germany, from the Himmelsfürst mine, Erbisdorf, near Freiberg, Saxony [TL]. In Austria, at Bleiberg, Carinthia. From Hromnice, Czech Republic. In the USA, in the Sun Valley mine, east of Jacob Lake, Coconino Co., Arizona; in Oregon, at the Kiggins mercury mine on the Oak fork of the Clackamas River, about 80 km southeast of Portland, Clackamas Co.; at Ambrosia Lake, McKinley Co., New Mexico; in the Schwalder mine, Ralston Creek district, Jefferson Co., and near Lake Como, Hinsdale Co., Colorado; from near Marysvale, Piute Co., Utah; in the Goldstrike mine, Lynn district, Eureka Co., Nevada; from the Lucky Mc mine, Gas Hills, Fremont Co., Wyoming. In Chile, from Carrizal Alto, Atacama. At the Agostinho deposit, Poços de Caldas Plateau, Minas Gerais, Brazil.

Name: In honor of Eduard Friedrich Alexander Jordis (1868–1917), colloidal chemist.

Type Material: Mining Academy, Freiberg, Germany.

Jørgensenite $\mathbf{Na(Sr,Ba)_7(Na,Mg)Al_6F_{32}(OH,F)_2}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [010], to 1 cm; commonly in flat fan-shaped or columnar aggregates, intimately intergrown with jarlite or stenonite; massive.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4
D(meas.) = 3.89(1) D(calc.) = 3.94

Optical Properties: Semitransparent. *Color:* Colorless to white; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$. $\alpha = 1.436(1)$ $\beta = 1.442(1)$ $\gamma = 1.442(1)$
2V(meas.) = 0°–5(5)° ($2V_z$) 2V(calc.) = 0°

Cell Data: *Space Group:* $C2/m$. $a = 16.046(1)$ $b = 10.971(1)$ $c = 7.281(1)$
$\beta = 101.734(6)°$ Z = 2

X-ray Powder Pattern: Ivigtut, Greenland.
3.453 (10), 3.193 (10), 3.643 (9), 3.112 (9), 2.989 (9), 2.173 (9), 7.844 (8)

Chemistry:

	(1)
Na	3.25
K	0.30
Mg	0.38
Ca	0.28
Ba	8.63
Sr	32.76
Al	10.97
F	42.50
H_2O	[1.22]
Total	100.29

(1) Ivigtut, Greenland; by electron microprobe, average of 11 analyses, H_2O calculated from stoichiometry, $(OH)^{1-}$ confirmed by microbeam IR spectroscopy; corresponds to $Na_{1.00}(Sr_{5.52}Ba_{0.92}Na_{0.32}K_{0.12}Ca_{0.10})_{\Sigma=6.98}(Na_{0.77}Mg_{0.23})_{\Sigma=1.00}Al_6F_{33.00}(OH)_{1.00}$.

Occurrence: In vugs and as fissure fillings in a cryolite deposit with other fluorides.

Association: Jarlite, stenonite, thomsenolite, gearksutite, topaz, muscovite.

Distribution: From the Ivigtut cryolite deposit, Greenland.

Name: For Vilhelm Jørgensen (1844–1925), cofounder, in 1870, of the cryolite factory at Ivigtut, Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1996.168.

References: (1) Pauly, H., F.C. Hawthorne, P.C. Burns, and G.D. Ventura (1997) Jørgensenite, $Na_2(Sr,Ba)_{14}Na_2Al_{12}F_{64}(OH,F)_4$, a new aluminofluoride mineral from Ivigtut, Greenland. Can. Mineral., 35, 175–179.

Occurrence: In bismuth-rich hydrothermal deposits.

Association: Gold, bismuth, bismuthinite, galenobismutite, hessite, cosalite, laitakarite, tetradymite, joséite-B.

Distribution: From San José, near Marianna, Minas Gerais, Brazil [TL]. In Canada, at Glacier Gulch, Hudson Bay Mountain, near Smithers; and the Windpass mine, near Chu Chua, British Columbia; and in Yukon Territory, from placers in Clear Creek, McQuesten district, and in Highet Creek, Mayo district. In Spain, at Serrania de Ronda, Málaga Province. From the Carrock mine, Caldbeck Fells, and the Coniston mines, Cumbria, and at Penlee Quarry, Cornwall, England. From Băiţa (Rézbánya), Romania. In the Sosukchan deposit, northeastern Sakha, and the Tyrnyauz W–Mo deposit, left bank of the Baksan River Valley, northern Caucasus Mountains, Russia. At Kingsgate, New South Wales, and Maldon, Victoria, Australia. From Chilu, Fuijan Province, China. In the Tsumo mine, about 50 km northwest of Hiroshima City, Akita Prefecture, Japan. Additional localities are increasingly becoming known.

Name: For the locality at San José in Brazil.

Type Material: National Museum of Natural History, Washington, D.C., USA, R400.

Jouravskite $Ca_3Mn^{4+}(SO_4)(CO_3)(OH)_6 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6. As stubby hexagonal pyramidal crystals, exhibiting $\{10\bar{1}0\}$ and $\{10\bar{1}2\}$, to 0.3 mm, imbedded in marokite, in sugary masses and blotches.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, good. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 1.81–1.95 D(calc.) = 1.88–1.93

Optical Properties: Transparent to translucent. *Color:* Greenish yellow to greenish orange, pink (aluminous); bright yellow in transmitted light. *Luster:* [Vitreous.]
Optical Class: Uniaxial (–). *Pleochroism:* Barely perceptible. $\omega = 1.548–1.556$ $\epsilon = 1.540$

Cell Data: *Space Group:* $P6_3/m$ or $P6_3$. $a = 10.997–11.06$ $c = 10.50–10.610$ Z = 2

X-ray Powder Pattern: Tachgagalt, Morocco.
9.6 (FFF), 5.53 (F), 3.81 (F), 3.42 (mF), 2.73 (mF), 2.52 (mF), 2.17 (mF)

Chemistry:

	(1)	(2)	(3)
SO_3	10.20	8.7	12.33
CO_2	7.45	7.2	6.78
SiO_2		0.7	
Al_2O_3		2.2

Total	100.00	99.1	100.00

(1) Tachgagalt, Morocco. (2) Do.; by electron microprobe, total Mn as MnO, H_2O by the Penfield method; excluding impurities and converting Mn^{2+} to Mn^{4+} with excess O, corresponds to $Ca_3(Mn^{4+}_{0.78}Al_{0.26})_{\Sigma=1.04}(SO_4)_{0.68}(CO_3)_{1.02}(OH)_6 \cdot 12H_2O$.
(3) $Ca_3Mn(SO_4)(CO_3)(OH)_6 \cdot 12H_2O$.

Occurrence: Rare in the oxidized portions of manganese deposits; an aluminian variety formed by the action of volcanic fumaroles.

Association: Manganite, calcite, marokite, gaudefroyite, henritermierite, despujolsite, barite (Tachgagalt, Morocco).

Distribution: From Tachgagalt, 17 km south of Ouarzazate, Anti-Atlas Mountains, Morocco. In the N'Chwaning mine, near Kuruman, Cape Province, South Africa.

Name: Honors Georges Jouravsky (1896–1964), Chief Geologist, Geological Survey of Morocco, for his work on the mineral deposits of Morocco.

Type Material: Natural History Museum, Paris, 175.152; National School of Mines, Paris, France.

Total	[98.84]	100.00

(1) Centennial Eureka mine, Utah, USA; by electron microprobe, total Fe as FeO, H_2O calculated from stoichiometry; corresponds to $(Ca_{0.92}Fe_{0.07})_{\Sigma=0.99}Cu_{9.94}(Te_{0.96}O_3)_4(As_{1.04}O_4)_4(OH)_2 \cdot 4H_2O$.
(2) $CaCu_{10}(TeO_3)_4(AsO_4)_4(OH)_2 \cdot 4H_2O$.

Occurrence: A very rare secondary mineral formed by the reaction of enargite and tellurium-enriched solutions.

Association: Enargite, beudantite, quartz.

Distribution: Found on a dump at the Centennial Eureka mine, 1.5 km southwest of Eureka, Tintic district, Juab Co., Utah, USA.

Name: For Juab Co., Utah, USA, where the first specimen was collected.

Type Material: The Natural History Museum, London, England, 1997,1; Canadian Geological Survey, Ottawa, Canada, 67959.

(1) Iron Hill, Colorado, USA. (2) Kuznetsk, Kazakhstan. (3) $Ca_{10}Mg_4Al_2Si_{11}O_{39}\cdot 4H_2O$.

Occurrence: Formed by hydrothermal alteration of a coarse-grained melilite rock (uncompahgrite) previously subjected to deuteric alteration (Iron Hill, Colorado, USA); in skarns at a contact zone with carbonates in a gabbro-urtite massif (Kuznetsk, Kazakhstan).

Association: Perovskite, phlogopite, magnetite, titaniferous garnet, melilite, diopside, vesuvianite, brugnatellite, hastingsite, tremolite, aegirine, cebollite (Iron Hill, Colorado, USA); melilite, pyroxene, wollastonite, vesuvianite, cebollite, calcite (Kuznetsk, Kazakhstan).

Distribution: In the Iron Hill carbonatite, Powderhorn-Cebolla district, Gunnison Co., Colorado, USA. From the Kiya-Shaltyrsk massif, Kuznetsk, Ala-Tau Range, Tien Shan, Kazakhstan. In the Kovdor massif, Kola Peninsula, Russia.

Name: For the San Juan Mountains, Colorado, USA, where the mineral was discovered.

Type Material: Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 105990.

(1) Långban, Sweden; by emission spectroscopy, corresponds to $(Ca_{8.8}Mn_{0.1})_{\Sigma=8.9}(Fe^{2+}_{2.7}Fe^{3+}_{1.2}Mg_{0.1})_{\Sigma=4.0}(Fe^{3+}_{7.2}Al_{0.6})_{\Sigma=7.8}Si_{12.7}O_{44.7}(OH)_{11.7}$. (2) Auchinstarry quarry, Scotland; by electron microprobe, Fe^{2+}:Fe^{3+} by Mössbauer spectroscopy, H_2O by difference; corresponds to $Ca_{8.01}Fe^{3+}_{8.55}Al_{0.30}Fe^{2+}_{3.00}Mg_{0.13}Si_{12.03}O_{48.47} \cdot (H_2O)_{9.18}$.

Polymorphism & Series: Forms two series, with pumpellyite-(Fe^{2+}), and with pumpellyite-(Mg).

Mineral Group: Pumpellyite group.

Occurrence: In hematite-magnetite ore (Långban, Sweden); in quartz-diabase (Scotland).

Association: Apophyllite, barite, hematite, magnetite, ilvaite, calcite, quartz, chlorite, prehnite, epistilbite, stilbite, pectolite, laumontite, babingtonite, titanite.

Distribution: At Långban, Värmland, Sweden. Between Tafjord and Fjøra, Sunnmøre district, Norway. In the Ratho quarry, near Edinburgh, and the Auchinstarry quarry, Kilsyth, Scotland. In Germany, from the Wolfmühl quarry, Waldgrehweiler, Rhineland-Palatinate. From Hale Creek, Trinity Co., California, and in the Clark mine, Copper Harbor, Keweenaw Co., Michigan, USA. At Sawda, near Jalgoan, and Bombay, Maharashtra, India. In the Marlin Norite quarry, Bushveld complex, South Africa.

Name: For Professor Julian Royce Goldsmith (1918–), mineralogist and geochemist, University of Chicago, Chicago, Illinois, USA, and its *ferrous iron* content.

Julienite $Na_2Co(SCN)_4 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Minute needles, elongated along [001], aggregated in crusts. *Twinning:* On {110} as twin plane, or around [001].

Physical Properties: *Cleavage:* ‖ elongation. Hardness = n.d. D(meas.) = 1.648 D(calc.) = 1.61 Readily soluble in H_2O, forming a pink solution.

Optical Properties: Translucent. *Color:* Blue. *Streak:* Blue.
Optical Class: Uniaxial (+). $\omega = 1.556$ $\epsilon = 1.645$

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 18.941(2)$ $b = 19.209(2)$ $c = 5.460(1)$ $\beta = 91.64(1)°$ Z = 4

X-ray Powder Pattern: Chamibumba, Congo.
0.935 (100), 0.903 (100), 3.55 (85), 3.23 (85), 1.375 (85), 1.220 (85), 6.50 (58)

Chemistry:

	(1)	(2)
Na	10.35	9.55
Co	12.5	12.24
SCN	47.6	48.27

Total	100.32	100.00

(1) Chamibumba, Congo. (2) $Na_2Co(SCN)_4 \cdot 8H_2O$.

Occurrence: A very rare incrustation on talc schist.

Association: Cobaltian "wad".

Distribution: From Chamibumba, near Kambove, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Henry Julien (?–1920), Belgian scientist who discovered the mineral.

Type Material: n.d.

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As flakes or as rosettes of thin, sometimes bent, tabular crystals, to 1 cm; forms observed include {010}, {201}, {100}.

Physical Properties: *Cleavage:* Perfect, micaceous, on {010}. Hardness = 1
D(meas.) = 2.843 D(calc.) = 2.849

Optical Properties: Translucent. *Color:* Yellow to greenish yellow. *Streak:* Yellow.
Luster: Silky in aggregates, vitreous.
Optical Class: Biaxial (–) (?). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, strong.
α = n.d. $\beta = 1.658$ $\gamma = 1.664$ 2V(meas.) = ~60°

Cell Data: *Space Group:* $Pcmm$, $Pcm2_1$, or $Pc2m$. $a = 11.98(8)$ $b = 20.37(10)$
$c = 9.95(8)$ $Z = 2$

X-ray Powder Pattern: Hagendorf, Germany.
9.96 (10b), 5.09 (5), 3.37 (5), 3.30 (5), 3.79 (4), 4.91 (3), 3.08 (3)

Chemistry:

Total	100.68	100.00

(1) Hagendorf, Germany; corresponds to $Ca_{2.18}Zn_{3.71}Mn^{2+}_{0.82}Fe^{3+}_{7.35}(PO_4)_{9.03}(OH)_9 \cdot 16H_2O$.
(2) $Ca_2Zn_4Fe_8(PO_4)_9(OH)_9 \cdot 16H_2O$.

Occurrence: A late-forming mineral in a complex granite pegmatite.

Association: Mitridatite, manganese oxides.

Distribution: From Hagendorf, Bavaria, Germany.

Name: Honors Dr. Gerhard Jung, Albbruck, Germany, who found the first specimen.

Type Material: n.d.

References: (1) Moore, P.B. and J. Ito (1980) Jungit und Matulait: Zwei neue taflige phosphat-mineralien. Aufschluss, 31, 55–61 (in German with English abs.). (2) (1980) Amer. Mineral., 65, 1067 (abs. ref. 1). (3) (1981) Amer. Mineral., 66, 1280 (correction).

Junitoite $CaZn_2Si_2O_7 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Only as crystals, to 5 mm, with excellent faces and good evidence of hemihedrism; as sprays of individuals.

Physical Properties: *Cleavage:* Good on {100}; poor on {010} and {011}. *Tenacity:* Brittle to semi-sectile as a result of alteration. Hardness = 4.5 D(meas.) = 3.5(1) D(calc.) = 3.516 Strongly pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless, milk-white, or colored in various tints as a result of alteration. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, very weak.
$\alpha = 1.656$ $\beta = 1.664$ $\gamma = 1.672$ 2V(meas.) = n.d. 2V(calc.) = 86°

Cell Data: *Space Group:* $Ama2$. $a = 12.510(7)$ $b = 6.318(3)$ $c = 8.561(6)$ $Z = 4$

X-ray Powder Pattern: Christmas, Arizona, USA.
3.528 (100), 2.816 (100), 2.540 (100), 2.352 (70), 1.540 (60), 4.703 (50), 2.521 (50)

Chemistry:

	(1)	(2)
SiO_2	31.0	33.65
ZnO	44.8	45.59
CaO	15.5	15.71
H_2O	5.8	5.05
Total	97.1	100.00

(1) Christmas, Arizona, USA. (2) $CaZn_2Si_2O_7 \cdot H_2O$.

Occurrence: In a retrogressively altered tactite zone, closely related to the breakdown of sphalerite in the ores.

Association: Kinoite, apophyllite, calcite, xonotlite, smectite.

Distribution: In the USA, from the Christmas copper mine, Gila Co., Arizona.

Name: For Dr. Jun Ito (1926–1978), Japanese-American mineral chemist, Harvard University, Cambridge, Massachusetts, USA.

Type Material: University of Arizona, Tucson, Arizona; Harvard University, Cambridge, Massachusetts, 119097; National Museum of Natural History, Washington, D.C., USA, 136688; University of Paris, Paris; National School of Mines, Paris, France; The Natural History Museum, London, England, 1980,535.

Junoite **$Pb_3Cu_2Bi_8(S,Se)_{16}$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular crystals, to 150 μm, and irregular grains.

Physical Properties: *Cleavage:* One good. Hardness = n.d. VHN = 114–213
D(meas.) = n.d. D(calc.) = 6.77

Optical Properties: Opaque. *Color:* In polished section, creamy white. *Pleochroism:* Strong, from cream to gray with green and mauve tints. *Anisotropism:* Strong.
R_1–R_2: (400) 34.7–42.8, (420) 34.8–42.7, (440) 35.0–42.5, (460) 35.0–42.5, (480) 35.0–42.5, (500) 34.8–42.4, (520) 34.7–42.7, (540) 34.6–42.2, (560) 34.6–42.3, (580) 34.6–42.5, (600) 34.6–42.7, (620) 34.8–42.8, (640) 34.9–42.6, (660) 35.0–42.4, (680) 35.0–42.1, (700) 35.0–41.9

Cell Data: *Space Group:* $C2/m$. $a = 26.66(1)$ $b = 4.06(1)$ $c = 17.03(1)$ $\beta = 127.20(2)^\circ$
$Z = 2$

X-ray Powder Pattern: Juno mine, Australia.
3.55 (100), 3.90 (80), 2.919 (70), 3.23 (50), 2.970 (50), 3.39 (40), 2.213 (40)

Chemistry:

	(1)	(2)
Pb	19.3	18.8
Cu	4.1	3.9
Ag	0.1	0.4
Bi	54.7	52.3
Se	7.6	14.7
S	13.5	10.1
Total	102.1	100.2

(1) Juno mine, Australia; by electron microprobe, corresponding to $Pb_{2.88}Cu_{1.99}Ag_{0.03}Bi_{8.09}(Se_{2.98}S_{13.02})_{\Sigma=16.00}$. (2) Kidd Creek mine, Canada; by electron microprobe, corresponding to $Pb_{2.89}Cu_{1.86}Ag_{0.12}Bi_{7.99}(Se_{5.94}S_{10.06})_{\Sigma=16.00}$.

Occurrence: Of hydrothermal origin.

Association: Gold, selenian heyrovskýite, krupkaite, proudite, chalcopyrite, magnetite (Juno mine, Australia); chalcopyrite, sphalerite, cobaltite, këesterite, mawsonite (Kidd Creek, Canada); pekoite, tetradymite, aikinite, gladite, cassiterite (Kochbulak deposit, Uzbekistan).

Distribution: From the Juno mine, Tennant Creek, Northern Territory, Australia [TL]. At the Kidd Creek mine, near Timmins, Ontario, Canada. From the Linka mine, Spencer Hot Springs district, Lander Co., Nevada, USA. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At the Baoshan mine, Hunan Province, and the Funiushan copper skarn deposit, near Nanjing, Jiangsu Province, China. From the Felbertal tungsten mine, Salzburg, Austria.

Name: For the Juno mine, Australia, where it was first found.

Type Material: Geology Department, University of New England, Armidale, Australia, R27790.

References: (1) Mumme, W.G. (1975) Junoite, $Cu_2Pb_3Bi_8(S,Se)_{16}$, a new sulfosalt from Tennant Creek, Australia: its crystal structure and relationship with other bismuth sulfosalts. Amer. Juonniite $CaMgSc(PO_4)_2(OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Platy crystals, subparallel, curved, to 12 μm, in spherulites.

Physical Properties: Hardness = 4–4.5 VHN = 315–355, 330 average (20 g load). D(meas.) = 2.43(3) D(calc.) = 2.44

Optical Properties: Translucent. *Color:* Bright orange, pale yellow, yellowish brown, gray, colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.574(1)$ $\beta = 1.579(1)$ $\gamma = 1.582(2)$ 2V(meas.) = n.d. 2V(calc.) = 70.2°

Cell Data: *Space Group:* [*Pbca*] (by analogy to overite). $a = 15.03(5)$ $b = 18.95(4)$ $c = 7.59(1)$ Z = 8

X-ray Powder Pattern: Kovdor massif, Kola Peninsula, Russia.
9.49 (100), 2.912 (44), 2.890 (35), 3.440 (31), 2.942 (27), 4.75 (17), 2.018 (15)

Chemistry:

	(1)	(2)
P_2O_5	36.16	36.55
TiO_2	0.38	
Sc_2O_3	13.17	17.76
FeO	1.07	
MnO	1.28	
MgO	12.08	10.38
CaO	12.33	14.44
SrO	0.53	
BaO	1.58	
H_2O	[21.42]	20.87
Total	[100.00]	100.00

(1) Kovdor massif, Kola Peninsula, Russia; by electron microprobe, average of nine analyses, total Fe as FeO, total Mn as MnO, H_2O by difference; PO_4, $(OH)^{1-}$, H_2O confirmed by IR; corresponds to $(Ca_{0.86}Mn_{0.07}Ba_{0.04}Sr_{0.02})_{\Sigma=0.99}Mg_{1.00}(Sc_{0.75}Mg_{0.18}Fe_{0.05}Ti_{0.02})_{\Sigma=1.00}(PO_4)_2(OH)_{0.83}\cdot 4.25H_2O$. (2) $CaMgSc(PO_4)_2(OH)\cdot 4H_2O$.

Occurrence: A rare mineral in cavities and contacts with ore minerals in a metasomatized carbonatite stockwork.

Association: Dolomite, magnesite, bobierrite, kovdorskite, manasseite, hydrotalcite, apatite, strontiowhitlockite, pyrite, strontian collinsite, rimkorolgite, talc, baddeleyite, zircon, gypsum.

Distribution: From the Zheleznyi iron mine, Kovdor alkalic massif, Kola Peninsula, Russia.

Name: From the Finnish name (Juonni) for the Yona River, in allusion to the locality of first occurrence of the species.

Type Material: St. Petersburg Mining Institute, St. Petersburg, Russia.

References: (1) Liferovich, R.P., V.N. Yakovenchuk, Y.A. Pakhomovskii, A.N. Bogdanova, and S.N. Jurbanite $Al(SO_4)(OH)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As short prismatic crystals, dominated by {110} and {011}, to 0.3 mm; commonly in stalactites and crusts.

Physical Properties: *Tenacity:* Brittle. Hardness = ~2.5 D(meas.) = 1.786(8) D(calc.) = 1.828 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* [Vitreous.] *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \wedge a = -5°$. $\alpha = 1.459(2)$ $\beta = 1.473(2)$ $\gamma = 1.483(2)$ 2V(meas.) = 80° 2V(calc.) = 80°

Cell Data: *Space Group:* $P2_1/n$. $a = 8.3965(6)$ $b = 12.479(2)$ $c = 8.1549(9)$ $\beta = 101.917(6)°$ Z = 4

X-ray Powder Pattern: San Manuel mine, Arizona, USA.
3.723 (100), 4.013 (90), 6.80 (80b), 4.954 (80), 4.494 (80), 5.74 (70), 3.922 (70)

Chemistry: (1) San Manuel mine, Arizona, USA; qualitative emission spectroscopy confirmed major Al and very minor Fe, Mg, Mn, Si, Cu and Ca; stoichiometry established by the congruity of X-ray diffraction patterns of natural and synthetic material.

Polymorphism & Series: Dimorphous with rostite.

Occurrence: As rare secondary crusts in humid tunnels in oxidized portions of sulfide deposits in aluminous rocks; apparently deposited directly from mine water at about 27 °C and 100% humidity (San Manuel mine, Arizona, USA).

Association: Epsomite, hexahydrite, pickeringite, starkeyite (San Manuel mine, Arizona, USA); rostite, gypsum, pickeringite, metavoltine, ferrinatrite, sideronatrite, tamarugite, uklonskovite (Cetine mine, Italy).

Distribution: From the San Manuel mine, Mammoth district, Pinal Co., Arizona, USA. At the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: Honors Joseph John Urban (1915–1997), Tucson, Arizona, USA, mineral collector who first observed the natural material.

Type Material: National Museum of Natural History, Washington, D.C., USA, 144003.

References: (1) Anthony, J.W. and W.J. McLean (1976) Jurbanite, a new post-mine aluminum sulfate mineral from San Manuel, Arizona. Amer. Mineral., 61, 1–4. (2) Sabelli, C. (1985) Refinement of the crystal structure of jurbanite, $Al(SO_4)(OH)\cdot 5H_2O$. Zeits. Krist., 173, 33–39.

Kaatialaite $Fe^{3+}(H_2AsO_4)_3 \cdot 3–5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2 or $2/m$. As acicular crystals, to 50 μm, in aggregates; as powdery coatings on löllingite.

Physical Properties: Hardness = n.d. D(meas.) = 2.64(2) (synthetic). D(calc.) = 2.64 H_2O is variable according to relative humidity; becomes cloudy on exposure to light.

Optical Properties: Semitransparent. *Color:* White, gray, greenish gray to yellow. *Luster:* Earthy.
Optical Class: Biaxial (+). *Orientation:* Z $\wedge$ c $\simeq 3°$. α = 1.573–1.581 β = 1.573–[1.582] γ = 1.626–1.636 2V(meas.) = 13°–15°

Cell Data: *Space Group:* $P2_1$ or $P2_1/n$ (synthetic $Fe(H_2AsO_4)_3 \cdot 5H_2O$). a = 15.25–15.363 b = 19.60–19.844 c = 4.72–4.752 β = 91.77°–91.90° Z = 4

X-ray Powder Pattern: Kaatiala pegmatite, Finland.
8.35 (vs), 9.91 (s), 7.72 (s), 6.09 (m), 3.76 (m), 3.53 (m), 3.408 (m)

Chemistry:

Total	[99.05]	99.5

(1) Kaatiala pegmatite, Finland; by AA, As determined after volatilization of arsenolite impurity, H_2O and CO_2 by elemental analyzer; after deduction of small amounts of Ca, Mg, As_2O_3, CO_2 as impurities, corresponds to $(Fe_{0.93}Al_{0.08})_{\Sigma=1.01}(H_2AsO_4)_{3.00} \cdot 5.97H_2O$. (2) Niederbeerbach, Germany; corresponds to $Fe_{1.00}(H_2AsO_4)_{3.02} \cdot 5.26H_2O$.

Occurrence: A secondary mineral in a granite pegmatite (Kaatiala pegmatite, Finland); in an oxidized Ag–As vein in gabbro (Niederbeerbach, Germany).

Association: Arsenolite, löllingite, calcite, gypsum (Kaatiala pegmatite, Finland).

Distribution: From the Kaatiala pegmatite, near Kuortane, Finland. In Germany, at Glasberg, Niederbeerbach, Odenwald, Hesse; Wittichen, Black Forest; St. Andreasberg, Harz Mountains; and Lauta, near Marienberg, Saxony. From Jáchymov (Joachimsthal), Czech Republic. In the U.S. mine, Gold Hill, Tooele Co., Utah, USA.

Name: For the Kaatiala pegmatite, Finland, in which it was first found.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway; The Natural History Museum, London, England.

References: (1) Raade, G., M.H. Mladeck, R. Kristiansen, and V.K. Din (1984) Kaatialaite, a new ferric arsenate mineral from Finland. Amer. Mineral., 69, 383–387. (2) Schmetzer, K. and O. Kadyrelite $Hg_6^{1+}H(Br,Cl)_3O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. In grains, to 0.5 mm.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 2.5–3 VHN = 143–192, 175 average (25 g load). D(meas.) = n.d. D(calc.) = 8.79

Optical Properties: Transparent. *Color:* Bright to dull orange; bright yellow-orange in transmitted light; grayish white in reflected light, with intense orange internal reflections, tarnishing to bluish then brownish. *Streak:* Yellow-orange. *Luster:* Vitreous to adamantine. *Optical Class:* Isotropic. $n = > 2$
R: (436) 27.7, (460) 25.3, (500) 21.2, (546) 19.4, (589) 18.1, (620) 17.8, (656) 16.6

Cell Data: *Space Group:* [$Ia3d$] (by analogy to eglestonite). $a = 16.22$ Z = [16]

X-ray Powder Pattern: Kadyrel deposit, Russia.
3.32 (100), 1.912 (85), 2.57 (65), 4.06 (30), 2.63 (20), 2.344 (20), 1.731 (20)

Chemistry:

	(1)	(2)
Hg	84.36	85.39
O	[1.70]	1.70
Cl	2.93	3.77
Br	10.19	8.50
I	0.01	
H_2O		0.64
Total	[99.19]	100.00

(1) Kadyrel deposit, Russia; by electron microprobe, average of five analyses.
(2) $Hg_6H(Br,Cl)_3O_2$ with Br:Cl = 1:1.

Polymorphism & Series: Forms a series with eglestonite.

Occurrence: In cavities in carbonate veins in a mercury deposit.

Association: Eglestonite, calomel, kuzminite, corderoite, lavrentievite.

Distribution: In the Kadyrel mercury deposit, Pii-Khem district, right bank of the Oorash-Khem River Valley, Tuva, Siberia, Russia [TL].

Name: For the Kadyrel deposit, Russia, where it occurs.

Type Material: Central Siberian Geological Museum, Siberian Division, Academy of Sciences, Novosibirsk, VI-29/1; Mining Institute, St. Petersburg, Russia, 1992/1–2.

Kaersutite $NaCa_2[(Mg,Fe^{2+})_4Ti](Si_6Al_2)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly as well-formed phenocrysts with rhombic basal sections; prismatic, to 10 cm; as granular aggregates. *Twinning:* Simple or multiple twinning ∥ {100}.

Physical Properties: *Cleavage:* Perfect on {110}, intersecting at 56° and 124°; partings on {100}, {001}. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.2–3.28 D(calc.) = [3.11]

Optical Properties: Semitransparent. *Color:* Dark brown to black, typically zoned; yellow-brown, green-brown, or red-brown in thin section. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = yellow, yellow-brown; Y = red, red-brown; Z = deep brown, dark red-brown. *Orientation:* $Y = b$; $Z \wedge c = 0°$–19°. *Dispersion:* $r > v$. *Absorption:* $Z \geq Y > X$. α = 1.670–1.689 β = 1.690–1.741 γ = 1.700–1.772 2V(meas.) = 66°–82°

Cell Data: *Space Group:* $C2/m$. a = 9.8903(3) b = 18.0596(5) c = 5.3152(2) β = 105.4(1)° Z = 2

X-ray Powder Pattern: Boulder Dam area, Arizona, USA. (ICDD 17-478). 2.693 (100), 3.11 (80), 8.38 (65), 3.36 (65), 2.548 (65), 2.589 (55), 1.439 (55)

(1) Qaersut, Greenland; corresponds to $(Na_{1.11}K_{0.28})_{\Sigma=1.39}Ca_{1.76}(Mg_{2.89}Fe^{2+}_{1.19}Ti_{1.17}Fe^{3+}_{0.01}Mn_{0.01})_{\Sigma=5.27}(Si_{5.93}Al_{1.97})_{\Sigma=7.90}O_{22}(OH)_{0.59}$. (2) Vlčí Hora, Czech Republic; by microanalysis, corresponds to $(Na_{0.53}K_{0.41})_{\Sigma=0.94}Ca_{2.06}(Mg_{3.10}Fe^{3+}_{1.06}Ti_{0.52}Al_{0.34}Fe^{2+}_{0.01}Mn_{0.01})_{\Sigma=5.04}(Si_{5.87}Al_{2.13})_{\Sigma=8.00}O_{22}[(OH)_{1.94}F_{0.06}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with ferrokaersutite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.50$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.5$; $Ti \geq 0.5$.

Occurrence: Common as phenocrysts in alkalic volcanic rocks; in gabbroic and peridotitic nodules in alkalic basalts; in syenites, monzonites, carbonatite tuffs, and alkalic gabbros.

Association: Titanian augite, rhönite, olivine, ilmenite, spinel, plagioclase, titanian pargasite.

Distribution: In Greenland, from Østerfjeld, near Qaersut, at Nûgssuaq, and elsewhere in the Kangerdlugssuaq Fjord and Skaergaard areas. On Linosa, Pelagian Islands, south of Sicily, Italy. From Vlčí Hora, Czech Republic. From near Boulder Dam, Mohave Co., and near San Carlos, Gila Co., Arizona, USA. At Mont Saint-Hilaire, Quebec, Canada. From Chikaishi, Oki Island, Shimane Prefecture, and at Mushozu and Numazu, Iki Island, Nagasaki Prefecture, Japan. At Kakanui, New Zealand. A number of other localities are known.

Name: For the occurrence near Qaersut (formerly Kaersut), Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Kahlerite $Fe^{2+}(UO_2)_2(AsO_4)_2 \cdot 10-12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As thin tablets, flattened on {001}, displaying {111}, {021}, {012}, {011}, {010}, to 2 mm.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.22 Radioactive.

Optical Properties: Semitransparent. *Color:* Lemon-yellow to yellowish green. *Optical Class:* Uniaxial, nearly, to anomalously biaxial (–). α = n.d. $\beta = 1.632(5)$ $\gamma = 1.633(5)$ 2V(meas.) = 9°–33°

Cell Data: *Space Group:* $P4_2/n$. $a = 14.30$ $c = 21.97$ Z = 8

X-ray Powder Pattern: Synthetic $Fe(UO_2)_2(AsO_4)_2 \cdot 12H_2O$.
3.53 (100), 11.1 (80), 5.55 (50), 3.59 (50), 1.603 (40), 1.763 (30), 3.20 (20)

Chemistry: (1) Hüttenberg, Austria; qualitative analysis confirms a ferrous uranium arsenate hydrate.

Mineral Group: Autunite group.

Occurrence: A very rare secondary mineral in the oxidized zone of a uraninite-bearing iron deposit (Hüttenberg, Austria).

Association: Arsenosiderite, scorodite, symplesite, pitticite, löllingite (Hüttenberg, Austria); lavendulan, zeunerite, metazeunerite, malachite, cornubite, mixite, tyrolite, wulfenite, metakahlerite (Southwick Cliffs, Scotland).

Distribution: From Hüttenberg, Carinthia, Austria. On the Sophia and St. Joseph mine dumps, near Wittichen, and at Menzenschwand, Black Forest, Germany. From the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland.

Name: Honors Dr. Franz Kahler, geologist, Carinthian Landesmuseum, Klagenfurt, Austria.

Type Material: Carinthian Landesmuseum, Klagenfurt, Austria; Cambridge University, Cambridge, England.

Kainite $KMg(SO_4)Cl{\cdot}3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are equant to thick tabular on {100}, showing {100}, {010},{011}, {421}, {$\bar{4}$21}, many other forms, to 10 cm; commonly in aggregates of crystals, fibrous, in crusts, granular massive.

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* Smooth to splintery. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 2.15 D(calc.) = 2.24 Soluble in H_2O; taste salty and bitter.

Optical Properties: Transparent to translucent. *Color:* Colorless, may be gray, blue, violet, yellow, pink from inclusions; colorless in transmitted light. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* If blue, may show X = violet; Y = blue; Z = yellow. *Orientation:* $X = a$; $Y = b$; $Z \wedge c = 13°$. *Dispersion:* $r > v$, very weak. $\alpha = 1.494$ $\beta = 1.505$ $\gamma = 1.516$ 2V(meas.) = ∼90°

Cell Data: *Space Group:* $C2/m$. a = 19.72(2) $b = 16.23(1)$ $c = 9.53(1)$ $\beta = 94°55(5)'$ Z = 16

X-ray Powder Pattern: Calculated from the crystal structure. (ICDD 25-1237). 7.372 (100), 3.080 (86), 7.771 (83), 8.115 (69), 3.029 (66), 3.048 (42), 4.616 (37)

(1) Eddy Co., New Mexico, USA; recalculated to oxides from a partial elemental analysis.
(2) $KMg(SO_4)Cl{\cdot}3H_2O$.

Occurrence: A secondary mineral in marine potash deposits, formed due to metamorphism or resolution by ground waters; rarely a volcanic sublimate.

Association: Sylvite, halite, carnallite, kieserite, polyhalite, langbeinite, picromerite.

Distribution: An ore of potassium and magnesium. In Germany, from Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt, and many other places nearby; in the Werra-Fulda district, Hesse and Thuringia; on the Asse Mountain, near Wolfenbüttel, and at the Kaliwerk Hansa Empelde, near Hannover, Saxony. From Racalmuto, Realmonte, and elsewhere on Sicily, Italy. Large deposits in the Kalusz and Stebnyk areas, Carpathian Mountains, Ukraine. At volcanos on the Kamchatka Peninsula, Russia. From Lake Inder, Kazakhstan. In the USA, in the Carlsbad potash district, Eddy Co., New Mexico.

Name: From the Greek for *recent*, alluding to its recent origin.

Occurrence: In vugs in pegmatites in granites and alkalic complexes.

Association: Chamosite, pyrite, quartz, calcite, sphalerite, fluorite, uraninite, zircon, molybdenite (Bancroft, Canada); diopside, magnetite, clinochlore, apatite (Nordmark, Sweden).

Distribution: At Igeltjern, on Hitterö Island, Flekkefjord, Norway. In the Ko mine, Nordmark, Värmland, Sweden. In Switzerland, at Grubhorn, Baltschiedertal, Valais; near Guttannen, Uri; Piz Gannaretsch, Val Curnera, in the Gotthard freeway tunnel, Ticino; at Tavetsch, Graubünden; and elsewhere. From Hopffeldboden, in the Obersulzbachtal, Salzburg, Austria. At Baveno, Piedmont, Italy. In the Dodo mine, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains, Russia. In the USA, from near Cotopaxi, Fremont Co., Colorado; in Washington Pass, Okanogan Co., Washington; and east of Porthill, Boundary Co., Idaho. In Canada, from North Burgess Township, Lanark Co., and from the Bicroft mine, near Bancroft, Ontario; in the Evans-Lou quarry, near Wakefield Lake, and at Mont Saint-Hilaire, Quebec; and in a commercial deposit at the Strange Lake complex, northern Quebec and Labrador, Newfoundland.

Name: From the Greek for *unusual*, for its rarity and exotic composition.

Kalborsite $K_6BAl_4Si_6O_{20}Cl(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. As grains up to 2 mm.

Physical Properties: *Cleavage:* Perfect on {110}. Hardness = ∼6 VHN = 733–897, 838 average. D(meas.) = 2.5 D(calc.) = 2.48

Optical Properties: Translucent to transparent. *Color:* Colorless with a slight brownish rose tint. *Luster:* Vitreous to pearly on cleavages.
Optical Class: Uniaxial (+). $\omega = 1.525$ $\epsilon = 1.525$; birefringence < 0.001.

Cell Data: *Space Group:* $P\bar{4}2_1c$. $a = 9.851(5)$ $c = 13.060(5)$ Z = 2

X-ray Powder Pattern: Mt. Rasvumchorr, Russia.
3.08 (10), 2.79 (9), 3.44 (8), 2.94 (8), 3.26 (5), 2.24 (5), 2.08 (5)

Chemistry:

	(1)
SiO_2	38.54
B_2O_3	4.98
Al_2O_3	21.18
K_2O	30.06
Cl	3.71
H_2O	[3.81]
$-O = Cl_2$	0.84
Total	[101.44]

(1) Mt. Rasvumchorr, Russia; by electron microprobe, average of three analyses, H_2O from stoichiometry; corresponds to $K_{6.04}B_{1.35}(Al_{3.93}Si_{6.07})_{\Sigma=10.00}O_{22.58}Cl_{0.99}(OH)_4$.

Occurrence: Forms rims around lovozerite in segregations of pectolite, in rischorrite pegmatite from a differentiated alkalic massif.

Association: Pectolite, lovozerite.

Distribution: On Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: For potassium, KALium, BORate, and SIlicon in the composition.

Type Material: Mining Institute, St. Petersburg, 1300/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81596.

(1) Schmidtmannshall, Germany; B_2O_3 by difference. (2) $KHMg_2B_{12}O_{16}(OH)_{10}\cdot 4H_2O$.

Occurrence: An uncommon component in marine potash deposits; rarely in efflorescences.

Association: Boracite, pinnoite, kainite (Germany); anhydrite, halite (Inder deposit, Kazakhstan).

Distribution: In Germany, in Saxony-Anhalt, from Schmidtmannshall, near Aschersleben; Neustassfurt and Leopoldshall, in Stassfurt, 34 km south of Magdeburg. At Sallent-Balsareny, Barcelona Province, Spain. From Monte Sambuco, Calascibetta, Sicily, Italy. At the Inder borate deposit, Kazakhstan. In the USA, from the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California.

Name: For potassium, KALIum, and BORate in the composition.

Kalicinite $KHCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As a massive aggregate of minute crystals.

Physical Properties: *Cleavage:* {100}, {001}, {101}. Hardness = "Soft".
D(meas.) = 2.168 (synthetic). D(calc.) = 2.15 Soluble in H_2O.

Optical Properties: Transparent. *Luster:* Dull. *Color:* Colorless to white, pale yellow; colorless in transmitted light.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 30°$. $\alpha = 1.380$ $\beta = 1.482$ $\gamma = 1.578$
2V(meas.) = 81.5°

Cell Data: *Space Group:* $P2_1/a$. $a = 15.1725(11)$ $b = 5.6283(5)$ $c = 3.7110(4)$
$\beta = 104.631(6)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 12-292).
3.67 (100), 2.630 (90), 2.863 (85), 2.816 (80), 2.97 (75), 2.377 (35), 1.832 (30)

Chemistry: (1) Identification depends on agreement of optical and X-ray data with synthetic material.

Occurrence: As a result of the decomposition of a dead tree.

Association: n.d.

Distribution: From Chippis, Valais, Switzerland.

Name: For potassium, *kalium*, in the composition.

Type Material: Natural History Museum, Paris, France, 99.775.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 136–137. (2) Thomas, J.O., R. Tellgren, and I. Olovsson (1974) Hydrogen bond studies. Kalininite $ZnCr_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Irregular slablike aggregates, to 0.5 mm.

Physical Properties: Hardness = n.d. VHN = 468 (50 g load). D(meas.) = n.d. D(calc.) = 4.045 Strongly magnetic.

Optical Properties: Opaque. *Color:* Black, may be tarnished to colors; in reflected light, light creamy. *Luster:* Adamantine.
R: (400) — , (420) — , (440) 34.4, (460) 35.2, (480) 35.3, (500) 35.4, (520) 35.4, (540) 35.2, (560) 35.3, (580) 35.2, (600) 34.8, (620) 34.1, (640) 33.8, (660) 32.7, (680) 32.5, (700) —

Cell Data: *Space Group:* $Fd3m$. a = 9.997 Z = 8

X-ray Powder Pattern: Southern Baikal region, Russia.
1.757 (10), 1.019 (10), 2.98 (9), 1.910 (8), 2.47 (7), 3.48 (5), 1.153 (5)

Chemistry:

	(1)	(2)
Zn	18.89	21.96
Cu	2.73	
Cr	34.10	34.94
V	0.61	
Sb	0.73	
S	42.22	43.10
Total	99.28	100.00

(1) Southern Baikal region, Russia; by electron microprobe, average of nine analyses on three grains; corresponding to $Zn_{0.87}Cu_{0.13}Cr_{1.98}V_{0.04}Sb_{0.02}S_{3.97}$. (2) $ZnCr_2S_4$.

Mineral Group: Linnaeite group.

Occurrence: In a garnet-pyroxene mixture in diopside-quartz-calcite rocks.

Association: Karelianite, eskolaite, diopside, quartz, calcite, barite, zircon, chromian-vanadian tremolite, goldmanite–uvarovite, pyrite.

Distribution: From the Pereval marble quarry, near Slyudyanka, Sayan Mountains, southern Baikal region, eastern Siberia, Russia [TL].

Name: For Pavel Vasil'evich Kalinin (1905–1981), Russian mineralogist and petrologist, Moscow Geological Exploration Institute, investigator of the southern Baikal region.

Type Material: Mining Institute, St. Petersburg, 1098/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 88049.

Kalinite $KAl(SO_4)_2 \cdot 11-12H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically fibrous, in crusts or massive.

Physical Properties: Hardness = 2–2.5 D(meas.) = 1.75 D(calc.) = 2.00 Soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* White to pale blue.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $Y \wedge c = 13°$. *Dispersion:* Weak. $\alpha = 1.430$ $\beta = 1.452$ $\gamma = 1.458$ 2V(meas.) = 52(1)°

Cell Data: *Space Group:* $C2/c$. $a = 19.92(16)$ $b = 9.27(3)$ $c = 8.304(13)$ $\beta = 98.79(19)°$ Z = 4

X-ray Powder Pattern: Alma mine, California, USA. (ICDD 41-1362).
4.80 (100), 4.31 (86), 3.494 (79), 4.12 (71), 4.94 (64), 4.60 (50), 2.679 (29)

Chemistry: (1) No modern analyses appear extant.

Occurrence: A rare secondary mineral observed in the oxidized zone of mineral deposits, as efflorescences on alum slates, in caves, and as a volcanic sublimate.

Association: Jarosite, pisanite (Quetena, Chile).

Distribution: All localities require modern characterization as many older samples have been found to be cubic potassium alum. From Mount Wingen, New South Wales, Australia. At Quetena, west of Calama, Antofagasta, Chile. In the USA, from Turkey Creek, Jefferson Co., Colorado; at the Alum mine, Silver Peak district, Esmeralda Co., Nevada; in the Alma pyrite mine, Alameda Co., California. Found on volcanoes in the Lipari Islands and Sicily, Italy, and on the Kamchatka Peninsula, Russia.

Name: For its potassium, *kalium*, content. Here applied to a partially characterized fibrous birefringent mineral, distinct from cubic potassium alum.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 471. (2) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 951.

Kaliophilite $KAlSiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 622. In bundles of slender acicular to threadlike crystals.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Brittle. Hardness = 6
D(meas.) = 2.493–2.649 D(calc.) = [2.65]

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Silky, brilliant.
Optical Class: Uniaxial (–). $\omega = 1.536$ $\epsilon = 1.531$

Cell Data: *Space Group:* $P6_322$. $a = 26.930$ $c = 8.522$ Z = 54

X-ray Powder Pattern: Vesuvius, Italy.
3.09 (100), 2.593 (30), 2.131 (25), 4.26 (15), 3.76 (12), 3.02 (12), 2.814 (12D)

Chemistry:

K_2O	24.13	28.76	29.78
Total	100.04	100.41	100.00

(1) Monte Somma, Italy. (2) Do.; by electron microprobe. (3) $KAlSiO_4$.

Polymorphism & Series: Polymorphous with kalsilite, panunzite, and trikalsilite.

Occurrence: In blocks of biotite-pyroxenite volcanic ejecta.

Association: Biotite, pyroxene, augite, melilite, calcite (Monte Somma, Italy); clinopyroxene, garnet, leucite, haüyne, latiumite (Albano, Italy).

Distribution: In Italy, from Monte Somma and Vesuvius, Campania; at Albano and Marino, Colle Cimino, near Rome, Lazio.

Name: From the Greek for potassium, *kalium*, and for *friend*, recognizing potassium's presence.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 427.

(1) Lueshe, Congo; original total given as 100.192%, corrected for goyazite 7.8%, ilmenite 2.0%, (rutile, brookite, anatase) 1.3%, calcite 0.9%, kaolinite 0.55%, goethite 0.3%, $H_2O^{+130^\circ C}$. (2) Do.; original total given as 100.066%, corrected for goyazite 7.5%, ilmenite 1.9%, (rutile, anatase) 1.1%, calcite 1.6%, kaolinite 0.4%, goethite 0.2%, $H_2O^{+130^\circ C}$. (3) Do.; by electron microprobe, H_2O from crystal-structure analysis; corresponds to $[(H_2O)_{0.99}Sr_{0.05}Ca_{0.01}]_{\Sigma=1.05}(Nb_{1.80}Ti_{0.20})_{\Sigma=2.00}[O_{4.06}(OH)_{1.94}]_{\Sigma=6.00}[(H_2O)_{0.86}K_{0.14}]_{\Sigma=1.00}$.

Mineral Group: Pyrochlore group and subgroup; $K_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: In alluvial deposits and residual soils from a carbonatite deposit, formed from pyrochlore by the leaching of Na, Ca, and F in waters rich in K ions.

Association: Na–Ca pyrochlores, lueshite, columbite, fersmite, ilmenite, rutile, barian goyazite.

Distribution: In the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire).

Name: Originally for a member of the *pyrochlore* group with significant potassium, KALIum, although recent work shows only a minor amount of that element in natural material.

Type Material: National Museum of Natural History, Washington, D.C., USA, 136440.

References: (1) Hogarth, D.D. (1977) Classification and nomenclature of the pyrochlore group. Amer. Mineral., 62, 403–410, esp. 405–406 [kalipyrochlore]. (2) Van Wambeke, L. (1) Alshtan, Russia. (2) Analysis (1) recalculated after deduction of included halite and anhydrite; corresponds to $(K_{0.85}Na_{0.14})_{\Sigma=0.99}(Sr_{0.94}Mg_{0.01})_{\Sigma=0.95}(SO_4)_2$. (3) Pleismar, Germany. (4) $K_2Sr(SO_4)_2$.

Occurrence: In a drillhole into anhydrite beds, probably formed by the reaction of sylvite with strontium-bearing solutions (Alshtan, Russia); an alteration product of celestine (Pleismar, Germany); in a lake-bed evaporite (Omongwa Pan, Namibia).

Association: Halite, anhydrite, dolomite, sylvite, clay (Alshtan, Russia); halite, sylvite, anhydrite (Pleismar, Germany); gypsum (Omongwa Pan, Namibia).

Distribution: From near Alshtan, Sterlitamak district, southwestern Ural Mountains, Russia. In Germany, at Bohrung, near Pleismar, Saxony-Anhalt, and from Kalkberg, near Lüneburg, Lower Saxony. From Stebnyk, Ukraine. In the Cesano geothermal field, Latium, Italy. At the Omongwa Pan, southwestern Kalahari, Namibia.

Name: For potassium, KALIum, and STRONTium in the composition.

Type Material: Mining Institute, St. Petersburg, 1397/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69943.

Total	97.2	100.00

(1) Mafuru crater, Uganda. (2) $KAlSiO_4$.

Polymorphism & Series: Polymorphous with kaliophilite, panunzite, and trikalsilite.

Occurrence: In the groundmass of some potassium-rich and silica-deficient lavas and tuffs; rare in syenites; may be formed by the breakdown of silica-rich leucite in alkalic ultramafic rocks; from a granulite-facies emery deposit.

Association: Olivine, melilite, clinopyroxene, phlogopite, nepheline, leucite.

Distribution: In the Mafuru and Katunga craters, Uganda. From Congo (Zaire), in the Baruta crater, Nyiragongo area, Kivu Province. From Italy, at Monte Somma and Vesuvius, Campania; Ariccia, near Rome, Lazio; and in the San Venanzo and Pian di Celle volcanos, Umbria. At Ödersdorf, Eifel district, Germany. In the Batbjerg alkalic ultramafic intrusion, Kangerdlugssuaq Glacier, Greenland. From the Khibiny massif, Kola Peninsula; the Murun massif, southwest of Olekminsk, Yakutia; and in the Tazheran alkalic massif, west of Lake Baikal, eastern Siberia, Russia. From the Punalar district, Kerala, India. In the Colima graben, about 50 km south-southwest of Guadalajara, Jalisco, Mexico. A few other localities are known.

Name: For potassium, Kalium, ALuminum, and SILicate in the composition.

Type Material: The Natural History Museum, London, England, 1942,42; Harvard University, Cambridge, Massachusetts, 101998; National Museum of Natural History, Washington, D.C., USA, 105856.

(1) North Chile hexahedrite. (2) Welland octahedrite.

Occurrence: A major constituent of iron meteorites (siderites) and present in varying amounts in most other meteorites except certain of the stony meteorites (aerolites).

Association: Taenite, graphite, cohenite, moissanite, schreibersite, troilite, daubréelite, oldhamite, other meteorite minerals.

Distribution: Terrestrial occurrences at Blaafjeld, near Ovifak, Disko Island, Greenland. In Germany, from Bühl, near Weimar, Hesse. On the Putorana Plateau, Taimyr Peninsula, Russia. Otherwise from meteorites.

Name: From the Greek for *shaft* or *lath*.

Type Material: n.d.

Kamaishilite $Ca_2Al_2SiO_6(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* n.d. As grains up to about 0.1 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.82]

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Isotropic, nearly. $n = 1.629$

Cell Data: *Space Group:* Body-centered cell. $a = 8.850$ $c = 8.770$ Z = 4

X-ray Powder Pattern: Kamaishi mine, Japan.
3.607 (100), 2.799 (85), 2.777 (40), 2.547 (40), 1.557 (35), 2.085 (30)

Chemistry:

	(1)
SiO_2	20.03
Al_2O_3	34.15
FeO	0.21
MgO	0.02
CaO	37.42
H_2O^+	6.1
H_2O^-	0.2
Total	98.13

(1) Kamaishi mine, Japan; by electron microprobe, H_2O by wet chemical analysis; corresponds to $(Ca_{1.99}Fe_{0.01})_{\Sigma=2.00}Al_{2.00}Si_{0.99}O_{5.98}(OH)_{2.02}$.

Polymorphism & Series: Dimorphous with bicchulite.

Occurrence: In vesuvianite skarn in a marble, apparently altering from vesuvianite.

Association: Vesuvianite, perovskite, calcite, magnetite, chalcopyrite.

Distribution: At the Kamaishi mine, Iwate Prefecture, Japan.

Name: For the Kamaishi mine, Japan.

Type Material: National Science Museum, Tokyo, Japan, M23560.

References: (1) Uchida, E. and J.T. Iiyama (1981) On kamaishilite, $Ca_2Al_2SiO_6(OH)_2$, a new mineral (tetragonal), dimorphous with bicchulite, from the Kamaishi mine, Japan. Proc. Japan Acad., 57B, 239–243 (in English). (2) (1982) Amer. Mineral., 67, 855 (abs. ref. 1).

Kambaldaite $NaNi_4(CO_3)_3(OH)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6. As hexagonal prisms $\{10\bar{1}0\}$, terminated by $\{0001\}$ and $\{11\bar{2}1\}$, to about 50 μm, as individual crystals or in radiating spherical nodules; in cryptocrystalline veins, concretionary, chalky, massive.

Physical Properties: Hardness = ∼3 D(meas.) = 3.18 D(calc.) = 3.193

Optical Properties: Transparent to translucent. *Color:* Bright grass-green to emerald-green, crystals may be zoned with a clear core and translucent margins; pale green if massive.
Streak: Pale green. *Luster:* Silky on fractures.
Optical Class: Uniaxial (+). *Pleochroism:* O = pale green; E = emerald-green. $\omega = 1.65$ $\epsilon = 1.69$

Cell Data: *Space Group:* $P6_3$. $a = 10.340(3)$ $c = 6.097(2)$ $Z = 2$

X-ray Powder Pattern: Kambalda, Western Australia.
9.03 (10), 4.490 (9), 3.613 (4), 2.681 (4), 2.584 (4), 2.519 (4), 2.263 (4)

Chemistry:

	(1)	(2)
SO_3	0.3	
SiO_2	0.2	
CO_2	27.5	24.32
Al_2O_3	0.4	
NiO	52.9	55.04
MgO	1.3	
Na_2O	3.0	5.71
H_2O	12.5	14.93
Total	98.1	100.00

(1) Kambalda, Western Australia; by electron microprobe, C and H by microanalysis; corresponds to $Na_{0.52}(Ni_{3.90}Mg_{0.18})_{\Sigma=4.08}[(C_{1.15}Al_{0.01}Si_{0.01})_{\Sigma=1.17}O_{3.46}]_3(OH)_{1.98} \cdot 2.84H_2O$.
(2) $NaNi_4(CO_3)_3(OH)_3 \cdot 3H_2O$.

Occurrence: A secondary mineral in goethitic residues formed by oxidation of violarite–pyrite in the presence of wallrock carbonates and saline groundwater (Kambalda, Western Australia).

Association: Gaspéite, reevesite, aragonite, pyrite, goethite (Kambalda, Western Australia).

Distribution: In Australia, from the Otter Shoot, Kambalda, 56 km south of Kalgoorlie, and in the 132 North nickel mine, 4 km southwest of Widgiemooltha, Western Australia.

Name: For Kambalda, Western Australia, its locality of discovery.

Type Material: Western Australian Museum, Perth, M.62.1991; Museum Victoria, Melbourne, M37494; Australian Museum, Sydney, Australia, D48054; The Natural History Museum, London, England, 1985,497; National Museum of Natural History, Washington, D.C., USA, 162706.

Kamchatkite $KCu_3(SO_4)_2OCl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Rodlike crystals, elongated along [001], rectangular or rhombic in cross-section, to 3 mm, exhibiting {110}, {100}, {010}, {001}.

Physical Properties: *Cleavage:* On {011} and {100}, perfect. *Tenacity:* "Fragile". Hardness = 3.5 D(meas.) = 3.48(1) D(calc.) = 3.58 Soluble in H_2O; decomposes in air in a few weeks due to hydration.

Optical Properties: Transparent. *Color:* Greenish yellow-brown; yellow in transmitted light. *Streak:* Yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.695(2)$ $\beta = 1.718(2)$ $\gamma = 1.759(2)$ 2V(meas.) = n.d. 2V(calc.) = 75°

Cell Data: *Space Group:* $Pna2_1$. $a = 9.741(5)$ $b = 12.858(6)$ $c = 7.001(3)$ Z = 4

X-ray Powder Pattern: Tolbachik volcano, Russia.
7.76 (100), 3.501 (65), 2.591 (41), 3.217 (30), 2.682 (30), 2.274 (23), 2.898 (20)

Total	100.80	100.00

(1) Tolbachik volcano, Russia; by AA, flame photometry, and volume-weight analysis; after deduction of H_2O and calculation of O^{2+} for charge balance, corresponds to $(K_{1.06}Na_{0.03})_{\Sigma=1.09}(Cu_{2.92}Zn_{0.04})_{\Sigma=2.96}(SO_4)_{2.03}O_{1.04}Cl_{0.84}$. (2) $KCu_3(SO_4)_2OCl$.

Occurrence: A volcanic sublimate formed between 120 °C and 140 °C.

Association: Ponomarevite, tolbachite, klyuchevskite, hematite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For its occurrence on the Kamchatka Peninsula, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1947/1.

References: (1) Vergasova, L.P., S.K. Filatov, Y.K. Serafimova, and T.V. Varaksina (1988) Kamchatkite $KCu_3OCl(SO_4)_2$ – a new mineral from volcanic sublimates. Zap. Vses. Mineral. Total	98.70	100.11	100.00

(1) Kamioka mine, Japan; by electron microprobe, average of three analyses; original analysis Fe 21.02%, Mn 0.32%, Mo 53.43%, here calculated to oxides; corresponding to $(Fe_{2.01}Mn_{0.03})_{\Sigma=2.04}Mo_{2.98}O_8$. (2) Mohawk mine, Michigan, USA; by electron microprobe, average of seven analyses, Fe^{2+}:Fe^{3+} from structural considerations; corresponds to $(Fe^{2+}_{1.54}Cu_{0.16}Fe^{3+}_{0.15}Si_{0.08}Al_{0.04}Zn_{0.03})_{\Sigma=2.00}(Mo_{2.52}Fe^{3+}_{0.15}V_{0.14}Fe^{2+}_{0.08}Ti_{0.07}Al_{0.04})_{\Sigma=3.00}O_8$. (3) $Fe_2Mo_3O_8$.

Occurrence: In quartz-molybdenite stockwork veins associated with granite porphyry dikes (Japan); in fissure veins filled during low-grade regional metamorphism of basalt (Michigan, USA).

Association: Molybdenite, potassic feldspar, fluorite, ilmenite, scheelite, quartz (Kamioka mine, Japan); domeykite, algodonite, nickeline, maucherite, koutekite, safflorite, silver, molybdenite, calcite (Michigan, USA); magnetite, ilmenite, molybdenite, graphite (Carajas deposit, Brazil).

Distribution: From the Kamioka Ag–Pb–Zn mine, Gifu Prefecture, Japan. In the USA, in the Mohawk and Ahmeek mines, Keweenaw Co., Michigan. From the Carajas deposit, locality not otherwise specified, Brazil.

Name: For the occurrence at the Kamioka mine, Japan.

Type Material: Geological Survey of Japan, Tsukuba, M17968; National Science Museum, Tokyo, Japan.

Kamitugaite $PbAl(UO_2)_5(PO_4, AsO_4)_2(OH)_9 \cdot 9.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As thin tablets elongated along [100], with {010} dominant, {001} less developed, and terminated by {100} and {101}, to 0.5 mm.

Physical Properties: *Cleavage:* Good on {010} and {001}. Hardness = 3 (probable). D(meas.) = 4.03 D(calc.) = 4.47 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Bright yellow. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless; Y = yellow. *Orientation:* $X \simeq b^*$; $Y \wedge a = 1°$–$2°$; $Z \perp a$ and b^*. α = [1.709] β = 1.735(2) γ = 1.744(2)
2V(meas.) = 60(3)°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.98(2)$ $b = 15.96(2)$ $c = 9.068(6)$
$\alpha = 95.1(2)°$ $\beta = 96.1(2)°$ $\gamma = 89.0(2)°$ Z = 2

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
7.95 (100), 3.972 (80), 3.271 (40), 3.175 (40), 15.92 (30), 3.493 (30), 4.307 (25)

Chemistry:

	(1)
UO_3	71.76
P_2O_5	5.48
As_2O_5	2.12
Al_2O_3	2.39
PbO	9.86
H_2O	[8.39]
Total	[100.00]

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of three analyses, H_2O by difference; corresponding to $Pb_{0.90}Al_{0.96}(UO_2)_{5.10}[(P_{0.79}As_{0.19})_{\Sigma=0.98}O_4]_2(OH)_9 \cdot 9.5H_2O$.

Occurrence: A rare secondary mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Dumontite, studtite, triangulite, threadgoldite, phuralumite, upalite, mundite, metatorbernite, muscovite, albite, quartz.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For Kamituga, Congo, the mining center on which exploitation of Kobokobo depended.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG13985, RMG13986.

References: (1) Deliens, M. and P. Piret (1984) La kamitugaïte, $PbAl(UO_2)_5[(P, As)O_4]_2(OH)_9 \cdot 9.5H_2O$, nouveau minéral de Kobokobo, Kivu, Zaïre. Bull. Minéral., 107, 15–19 (in French with English abs.). (2) (1985) Amer. Mineral., 70, 437 (abs. ref. 1).

Gd_2O_3	2.10
Dy_2O_3	1.64
CO_2	7.24
H_2O	[14.30]
Total	[99.13]

(1) Kamoto mine, Congo; by electron microprobe, average of 19 analyses on several specimens; CO_2 by chromatography, H_2O taken as loss on ignition less CO_2 on separate samples; corresponds to $(Y_{1.00}Nd_{0.26}Gd_{0.22}Sm_{0.20}Gd_{0.16})_{\Sigma=1.84}U_{4.07}(CO_3)_{3.02}O_{11.95}\cdot 14.55H_2O$.

Occurrence: Formed in the oxidized zone above a uranium-bearing Cu–Co deposit.

Association: Uraninite, uranophane, curite, schoepite, becquerelite, rutherfordine, kasolite, soddyite, schulingite-(Nd), astrocyanite-(Ce), shabaite-(Nd), françoisite-(Nd), masuyite, malachite.

Distribution: From the Kamoto mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: For the occurrence at the Kamoto mine, Congo (Zaire), and its *yttrium* content.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG14025, RMG14350; National Museum of Natural History, Washington, D.C., USA, 163786.

Kamphaugite-(Y) $CaY(CO_3)_2(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 422. Crystals are rough, platy on {001}, with a square or octagonal outline, commonly in subparallel aggregates forming rosettes or spherules, to 4 mm; also as fine-grained masses and coatings.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2–3
D(meas.) = 3.19(5) D(calc.) = 3.11

Optical Properties: Transparent to translucent. *Color:* White to colorless, may be pale brown, pale yellow, or grayish brown. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+), anomalously biaxial (+). *Orientation:* $X = c$. $\omega = 1.611$–1.620 $\epsilon = 1.636$–1.642 $\alpha = 1.627(2)$ $\beta = 1.663(2)$ $\gamma = 1.663(2)$ 2V(meas.) = $\sim 15°$

Cell Data: *Space Group:* $P4_12_12$. $a = 7.434(1)$ $c = 21.793(3)$ $Z = 8$

X-ray Powder Pattern: Hørtekollen deposit, Norway.
6.140 (100), 2.631 (90), 4.381 (80), 3.516 (60), 2.831 (50), 1.891 (30), 2.723 (20)

Chemistry:

	(1)	(2)
CO_2	29.6	31.00
Y_2O_3	30.5	39.75
Nd_2O_3	1.4	
Sm_2O_3	0.8	
Gd_2O_3	1.6	
Dy_2O_3	2.1	
Er_2O_3	1.2	
Yb_2O_3	1.1	
CaO	18.4	19.74
H_2O	12.1	9.51
Total	98.8	100.00

(1) Hørtekollen deposit, Norway; by electron microprobe, average of five analyses, BeO 0.8% by AA from helvite subtracted, CO_2 and H_2O by CHN analyzer; corresponds to $Ca_{0.98}(Y_{0.80}RE_{0.14})_{\Sigma=0.94}(CO_3)_2(OH)_{0.77}\cdot 1.61H_2O$. (2) $CaY(CO_3)_2(OH)\cdot H_2O$.

Occurrence: A late, low-temperature mineral formed in a contact-metamorphic skarn (Hørtekollen deposit, Norway); in metasomatically altered alkali granite (Kazakhstan); in a quartz–barite vein in a carbonatized volcano (South Africa).

Association: Kuliokite-(Y) (Norway); gagarinite (Kazakhstan); kainosite-(Y), hingganite-(Y) (Cal Francese, Sardinia, Italy); caysichite-(Y), donnayite-(Y), decrespignyite-(Y) (Paratoo mine, Australia).

Distribution: In Norway, from the Hørtekollen deposit, Lier, Buskerud; at the Høydalen granite pegmatite, Tørdal, Telemark; and in the Tangen granite pegmatite, near Kragerø. From the Cala Francese, Sardinia, Italy. At an undisclosed locality [Verkhne-Espe alkaline massif, Tarbagatai Range], Kazakhstan. From an undefined locality [Mt. Ploskaya, Keivy massif], Kola Peninsula, Russia. At Szarvaskő, Bükk Mountains, Hungary. On the Goudini volcano, Transvaal, South Africa. In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada. At the Gronci-Ellis granite quarry, Mount Desert, Hancock Co., Maine, USA. From the Paratoo copper mine, 30 km southwest of Yunta, Olary district, South Australia.

Name: To honor Erling Kamphaug (1931–), Norwegian mineral collector, who supplied the first specimens.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway, 14769.

Kanemite $NaHSi_2O_4(OH)_2 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals platy with {010} dominant; in spherulites, to 2 mm, isolated and as aggregations.

Physical Properties: *Cleavage:* Perfect on {010}, good on {100}. Hardness = ∼4 D(meas.) = 1.926(4) D(calc.) = 1.933

Optical Properties: Translucent to transparent. *Color:* White to brown. *Luster:* Silky. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$. $\alpha = 1.451(2)$ $\beta = 1.470(2)$ $\gamma = 1.478(2)$ 2V(meas.) = 46(2)°

Cell Data: *Space Group: Pnmb.* $a = 7.282(2)$ $b = 20.507(5)$ $c = 4.956(1)$ $Z = 4$

X-ray Powder Pattern: Andjia, Chad.
10.33 (10), 4.014 (10), 3.435 (9), 2.480 (8), 3.162 (7), 3.093 (7), 2.386 (6)

Chemistry:

	(1)	(2)
SiO_2	56.68	57.5
Al_2O_3	0.40	
CaO	0.20	0.5
Na_2O	13.25	13.2
K_2O	0.10	1.2
$H_2O(>280°)$	4.25	
$H_2O(170°-280°)$	8.45	
$H_2O(<170°)$	16.30	
H_2O		27.5
Total	99.63	99.9

(1) Andjia, Chad; corresponding to $(Na_{0.93}K_{0.07})_{\Sigma=1.00}H_{1.03}(Si_{2.06}Al_{0.01})_{\Sigma=2.07}O_{4.13}(OH)_{2.04} \cdot 1.97H_2O$. (2) Lake Bogoria, Kenya; by AA, H_2O by TGA.

Occurrence: In evaporites in an interdunary depression (Andjia, Chad).

Association: Gaylussite, trona (Andjia, Chad); magadiite, analcime, mordenite (Lake Bogoria, Kenya).

Distribution: In the Kanem region, near Andjia, Chad. From Lake Bogoria, Rift Valley, Kenya.

Name: After Kanem, a region on the northeastern edge of Lake Chad, Chad, where the mineral was discovered.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 123219, 142501.

Kaňkite **$Fe^{3+}AsO_4 \cdot 3.5H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As spherulites and botyroidal crusts of fibrous to elongated tabular spearlike crystals, less than 10 μm.

Physical Properties: *Fracture:* Uneven. Hardness = 2–3 D(meas.) = 2.60–2.70 D(calc.) = 2.732

Optical Properties: Translucent. *Color:* Yellowish green, paler greenish yellow on exposure to air; very pale grayish yellow to pale yellow in transmitted light. *Streak:* Grayish yellow. *Luster:* Dull to vitreous.
Optical Class: Biaxial. *Orientation:* Length-fast. $\alpha = 1.664(2)$ β = n.d. $\gamma = 1.680(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 18.803(15)$ $b = 17.490(18)$ $c = 7.633(5)$ $\beta = 92.71(5)^\circ$ Z = 16

X-ray Powder Pattern: Kaňk, Czech Republic.
12.8 (100), 4.764 (34), 2.630 (29), 7.56 (25), 4.258 (25), 3.697 (22b), 7.22 (21)

Chemistry:

	(1)	(2)	(3)
SO_3	0.41	2.25	
As_2O_5	43.92	41.11	44.57
Fe_2O_3	31.84	35.02	30.97
H_2O^+	13.91		
H_2O^-	9.91		
H_2O		21.00	24.46
Total	[99.99]	99.38	100.00

(1) Kaňk, Czech Republic; presence of SO_4, AsO_4, and H_2O confirmed by IR; original total 100.40%, after deduction of gypsum and quartz impurities, corresponds to $Fe_{1.02}(As_{0.97}S_{0.07})_{\Sigma=1.04}O_4 \cdot 3.37H_2O$. (2) Suzukura mine, Japan; corresponds to $Fe_{1.07}(As_{0.87}S_{0.07})_{\Sigma=0.94}O_4 \cdot 2.85H_2O$. (3) $Fe(AsO_4) \cdot 3.5H_2O$.

Occurrence: A rare secondary mineral in highly weathered mine dumps containing arsenopyrite (Kaňk, Czech Republic).

Association: Scorodite, pitticite, parascorodite, zýkaite, arsenopyrite, gypsum, "limonite", quartz (Kaňk, Czech Republic); scorodite, parascorodite, vajdakite, arsenic, pyrite, proustite (Svornost mine, Czech Republic).

Distribution: From the Šafary and Kuntery mine dumps, near Kaňk, Kutná Hora district, and in the Svornost mine, Jáchymov (Joachimsthal), Czech Republic. In Germany, at Munzig, near Meissen, and at Brand-Erbisdorf, Saxony; from Menzenschwand, Black Forest. In England, at the King's Wood mine, Buckfastleigh, Devon, and from the South Terras mine, St. Stephen-in-Brannel, Cornwall. At the Suzukura mine, seven km north-northeast of Enzan, Yamanashi Prefecture, Japan.

Name: For the locality that yielded the first specimens, Kaňk, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 20135; National Museum of Natural History, Washington, D.C., USA, 144939.

Kanoite $(Mn^{2+},Mg)_2Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$, (probable). As grains up to 0.1 mm. *Twinning:* Polysynthetic on {100}, common.

Physical Properties: *Cleavage:* Perfect on {110}, (110) $\wedge$ $(1\bar{1}0)$ ~88°. Hardness = 6
D(meas.) = 3.66 D(calc.) = 3.60

Optical Properties: Semitransparent. *Color:* Light pinkish brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 42°$. $\alpha = 1.715(2)$ $\beta = 1.717(2)$ $\gamma = 1.728(2)$ 2V(meas.) = 40°–42°

Cell Data: *Space Group:* $P2_1/c$ (probable). $a = 9.739$ $b = 8.939$ $c = 5.260$ $\beta = 108.56°$ Z = 4

X-ray Powder Pattern: Tatehira, Japan.
3.211 (100), 3.021 (90), 2.910 (90), 2.921 (80), 2.493 (40), 1.627 (40), 2.573 (30)

Chemistry:

	(1)
SiO_2	50.20
Al_2O_3	0.04
Fe_2O_3	0.39
FeO	2.64
MnO	31.19
MgO	15.08
CaO	[0.61]
Na_2O	0.03
K_2O	0.03
Total	[100.21]

(1) Tatehira, Japan; by electron microprobe, average of three analyses; Fe_2O_3, FeO, Na_2O, and K_2O by wet chemical analysis; original CaO 0.57% and original total given as 100.17%; corresponds to $(Mn^{2+}_{1.04}Mg_{0.88}Fe^{2+}_{0.09}Ca_{0.02}Fe^{3+}_{0.01})_{\Sigma=2.04}Si_{1.97}O_6$.

Polymorphism & Series: Dimorphous with donpeacorite.

Mineral Group: Pyroxene group.

Occurrence: In a seam cutting a pyroxmangite-cummingtonite metamorphic rock.

Association: Spessartine, manganoan cummingtonite, pyroxmangite.

Distribution: From near Tatehira, Oshima Peninsula, Hokkaido, Japan.

Name: To honor Dr. Hiroshi Kano, Professor of Petrology, Akita University, Akita, Japan.

Type Material: Shimane University, Matuse; National Science Museum, Tokyo, Japan, M21331.

Kanonaite $(Mn^{3+}, Al)AlSiO_5$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As anhedral nodular porphyroblasts, to 1.2 cm.

Physical Properties: *Cleavage:* Poor on {110}. Hardness = 6.5 VHN = 906–1017 (100 g load). D(meas.) = n.d. D(calc.) = 3.395

Optical Properties: Transparent to translucent. *Color:* Greenish black. *Streak:* Gray-green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = yellow-green; Y = bluish green; Z = deep golden yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.702$ $\beta = 1.730$ $\gamma = 1.823$
2V(meas.) = 53(3)°

Cell Data: *Space Group: Pnnm.* $a = 7.959(2)$ $b = 8.047(2)$ $c = 5.616(1)$ Z = 4

X-ray Powder Pattern: Kanona, Zambia.
5.669 (100), 2.827 (94), 3.577 (90), 2.517 (90), 2.212 (83), 4.590 (75), 2.299 (69)

Chemistry:

	(1)	(2)
SiO_2	32.2	32.48
TiO_2	0.01	
Al_2O_3	33.9	31.60
Fe_2O_3	0.66	2.57
Mn_2O_3	32.2	33.48
CuO	0.01	
ZnO	0.13	
PbO	0.01	
MgO	0.04	
CaO	0.01	
BaO	0.04	
Total	99.21	100.13

(1) Kanona, Zambia; by electron microprobe; corresponds to $(Mn^{3+}_{0.76}Al_{0.23}Fe^{3+}_{0.02})_{\Sigma=1.01}Al_{1.00}Si_{0.99}O_5$. (2) Salmchâteau, Belgium; by electron microprobe, corresponds to $(Mn^{3+}_{0.79}Al_{0.15}Fe^{3+}_{0.06})_{\Sigma=1.00}Al_{1.00}Si_{1.00}O_5$.

Polymorphism & Series: Forms a series with andalusite.

Occurrence: Formed under low-grade metamorphic conditions, in a gahnite schist (Kanona, Zambia); in a schist (Salmchâteau, Belgium).

Association: Gahnite, magnesian chlorite, coronadite, braunite (Kanona, Zambia); quartz, muscovite, paragonite, chlorite, hematite, braunite, rutile, apatite (Salmchâteau, Belgium).

Distribution: From 13 km north of Kanona, Serenje, Zambia. On the Salm River, one km north of Salmchâteau, near Ottré, Ardennes Mountains, Belgium.

Name: For Kanona, near the locality in Zambia.

Type Material: Charles University, Prague, Czech Republic, 17352; National Museum of Natural History, Washington, D.C., USA, 144523.

Kanonerovite $MnNa_3P_3O_{10}\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Wedgelike crystals are tabular on {001}, also showing {111}, {$\overline{1}$11}, to 2 mm, in sprays.

Physical Properties: Hardness = Soft. D(meas.) = 2.35 D(calc.) = 2.379

Optical Properties: Transparent to translucent. *Color:* Colorless, white, beige. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.566$ $\beta = 1.574$ $\gamma = 1.582$ 2V(meas.) = n.d. 2V(calc.) = 91°–95°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.0102(3)$ $b = 10.2050(7)$ $c = 10.5040(7)$ $\alpha = 71.82(1)°$ $\beta = 89.62(1)°$ $\gamma = 69.90(1)°$ Z = 2

X-ray Powder Pattern: Waidhaus, Germany.
9.917 (100), 4.957 (50), 6.541 (36), 3.001 (30), 3.095 (28), 1.653 (25), 3.312 (23)

Chemistry:

	(1)
P_2O_5	37.96
Al_2O_3	24.49
FeO	6.07
MnO	11.30
MgO	0.64
H_2O	[19.54]
Total	[100.00]

(1) Waidhaus, Germany; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponds to $(Mn_{0.66}Fe_{0.35}Mg_{0.06})_{\Sigma=1.07}Al_{2.00}(P_{1.12}O_4)_2(OH)_2 \cdot 3.56H_2O$.

Polymorphism & Series: Dimorphous with mangangordonite.

Occurrence: A rare secondary mineral in a zoned granite pegmatite.

Association: Variscite, paravauxite, albite, mica, quartz.

Distribution: From the Silbergrube quarry, near Waidhaus, and at Hagendorf, Bavaria, Germany.

Name: To honor Jürgen Kastning, mineral collector and dealer, Reinbek, near Hamburg, Germany, who found the original material.

Type Material: Mineralogical Museum, University of Hamburg, Hamburg, Germany.

Kaolinite $Al_2Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1. Rarely as crystals, thin platy or stacked, to 2 mm. More commonly as microscopic pseudohexagonal plates and clusters of plates, aggregated into compact, claylike masses.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Flexible but inelastic. Hardness = 2–2.5 D(meas.) = 2.61–2.68 D(calc.) = 2.63

Optical Properties: Transparent to translucent as single crystals. *Color:* White to tan, may be variously colored by impurities. *Luster:* Pearly to dull earthy.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = -13°$ to $-10°$; $Y \wedge a = 1°$–$4°$.
Dispersion: $r > v$, weak. $\alpha = 1.553$–1.565 $\beta = 1.559$–1.569 $\gamma = 1.560$–1.570
2V(meas.) = 24°–50°

Cell Data: *Space Group:* $P1$. $a = 5.15$ $b = 8.95$ $c = 7.39$ $\alpha = 91.8°$ $\beta = 104.5°-105.0°$ $\gamma = 90°$ Z = [2]

X-ray Powder Pattern: Scalby, Yorkshire, England (1A).
7.16 (vvs), 3.573 (vvs), 4.336 (vs), 2.491 (s), 2.289 (s), 2.558 (ms), 2.379 (ms)

Chemistry:

	(1)
SiO_2	45.80
Al_2O_3	39.55
Fe_2O_3	0.57
FeO	0.18
MgO	0.14
CaO	0.41
K_2O	0.03
H_2O^+	13.92
H_2O^-	0.17
Total	100.77

(1) Mikawo mine, Niigata Prefecture, Japan; corresponds to $(Al_{2.00}Fe^{3+}_{0.02}Mg_{0.01}Ca_{0.02})_{\Sigma=2.05}Si_2O_5(OH)_{3.99}$.

Polymorphism & Series: Dickite, halloysite, and nacrite are polymorphs.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Replaces other aluminosilicate minerals during hydrothermal alteration and weathering. A common constituent of the clay-size fraction of sediments, where it may be formed by direct precipitation.

Association: Quartz, feldspar, muscovite.

Distribution: Pure material from many localities, including: at Kauling, Kiangsi Province, China. In numerous china-clay pits in Cornwall and Devon, England. At Limoges, Haute-Vienne, France. Near Dresden, Kemmlitz, and Zettlitz, Saxony, and elsewhere in Germany. Large deposits in the Donets Basin, Ukraine. In the USA, at Macon, Bibb Co., Georgia; at the Dixie Clay Company mine, and in the Lamar Pit, near Bath, Aikin Co., South Carolina; near Webster, Jackson Co., North Carolina; near Murfreesboro, Pike Co., and at Greenwood, Sebastian Co., Arkansas; from Mesa Alta, Rio Arriba Co., New Mexico. At Huberdeau, Quebec, and near Walton, Nova Scotia, Canada.

Name: From a corruption of the Chinese *Kauling*, *high ridge*, for a Chinese occurrence.

Kapustinite $Na_{5.5}Mn_{0.25}ZrSi_6O_{16}(OH)_2$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As equant grains to 4 cm; in clusters to 8 cm.

Physical Properties: *Cleavage:* None. *Fracture:* Conchoidal. *Tenacity:* Brittle.
Hardness = 6 D(meas.) = 2.78(1) D(calc.) = 2.815

Optical Properties: Transparent to translucent. *Color:* Dark cherry-red. *Streak:* Pale lilac.
Luster: Vitreous.
Optical Class: Biaxial (-). $\alpha = 1.585(2)$ $\beta = \gamma = 1.589(2)$ 2V(meas) = <5° 2V(calc) = 0°
Dispersion: None. *Pleochroism*: *None*.

Cell Data: *Space Group: C*2/*m*. $a = 10.693(4)$ $b = 10.299(4)$ $c = 7.373(4)$ $\beta = 91.91(5)°$ Z = 2

X-ray Powder Pattern: Kedykverpakhk Mountain, Kola Peninsula, Russia.
2.651 (100), 3.270 (92), 2.580 (91), 3.342 (84), 5.313 (51), 3.690 (43), 1.849 (39)

Chemistry:

	(1)		(1)
Na_2O	24.42	Ce_2O_3	0.20
K_2O	0.02	Nd_2O_3	0.24
MgO	0.02	SiO_2	52.82
CaO	0.18	TiO_2	0.54
MnO	2.36	ZrO_2	16.38
ZnO	0.05	UO_2	0.28
Fe_2O_3	0.36	H_2O	2.80
Y_2O_3	0.17	Total	100.84

(1) Kedykverpakhk Mountain, Kola Peninsula, Russia; electron microprobe analysis, H_2O by Penfield method, corresponding to $Na_{5.38}Y_{0.01}Ce_{0.01}Nd_{0.01}U_{0.01}Ca_{0.02}Mn_{0.23}Fe_{0.03}Ti_{0.05}Zr_{0.91}Si_6O_{15.91}(OH)_{2.12}$.

Mineral Group: Lovozerite group, zirsinalite–lovozerite subgroup.

Occurrence: In hyperagpaitic pegmatite in an alkaline massif.

Association: Microcline, aegirine, kazakovite, ussingite, sodalite, analcime, natrosilite, villiaumite.

Distribution: From the Palitra pegmatite, Kedykverpakhk Mountain, Lovozero alkaline massif, Kola Peninsula, Russia.

Name: Honors mineralogist Yu. L. Kapustin (1933–2002), who extensively studied alkaline massifs.

Type Material: A.E. Fersman Mineralogical Museum, Moscow, Russia.

Karasugite $SrCaAl(F,OH)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals very thin bladed, twinned and flattened on {100} and elongated along [001], to 0.25 mm, in rosettes and fan-shaped aggregates. *Twinning:* On {100} as composition and twin plane.

Physical Properties: *Cleavage:* Perfect on {100}, may be a parting. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.06–3.11 D(calc.) = 3.206

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge c \simeq 7°$. $\alpha = 1.4240(5)$ $\beta = 1.4320(5)$ $\gamma = 1.4415(5)$ 2V(meas.) = 94.5(2.0)° 2V(calc.) = 94°

Cell Data: *Space Group:* $P2_1/c$. $a = 8.215(5)$ $b = 11.989(3)$ $c = 6.076(3)$ $\beta = 96.22(1)°$ Z = 4

X-ray Powder Pattern: Karasug deposit, Russia.
4.25 (10), 3.64 (8), 3.06 (8), 2.125 (8), 6.76 (7), 3.15 (7), 3.03 (7)

Chemistry:

	(1)	(2)
Na	0.04	0.43
K	0.05	0.33
Ca	14.32	13.05
Sr	29.91	29.12
Al	10.08	9.13
O	[15.12]	7.05
H	[0.95]	[0.44]
F	29.53	40.20
Total	[100.00]	[99.75]

(1) Karasug deposit, Russia; by electron microprobe, average of four analyses, $(OH)^{1-}$ by difference and charge balance; corresponds to $Sr_{1.02}Ca_{0.96}Al_{1.01}[F_{4.19}(OH)_{2.54}]_{\Sigma=6.73}$. (2) Do.; by electron microprobe, average of 12 analyses, O directly determined, $(OH)^{1-}$ by difference and charge balance; corresponds to $Sr_{1.02}(Ca_{0.90}Na_{0.05}K_{0.02})_{\Sigma=0.97}Al_{0.94}[F_{5.85}(OH)_{1.22}]_{\Sigma=7.07}$.

Occurrence: A secondary mineral formed in fissures in the oxidation zone of veins of iron ores in tectonic breccias.

Association: Gearksutite, tikhonenkovite, fluorite, barian celestine, "limonite", hematite, quartz.

Distribution: In the Karasug F–RE–barite–fluorite deposit, 15 km north of Karasug, western Tannu-Ola Mountains, Tuva, Siberia, Russia.

Name: For its occurrence in the Karasug deposit, Russia.

Type Material: University of Copenhagen, Copenhagen, Denmark; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Petersen, O.V., A.P. Khomyakov, E.S. Leonardsen, H.I. Micheelsen, and O. Karchevskyite $Mg_{18}Al_9(OH)_{54}Sr_2(CO_3,PO_4)_9(H_2O,H_3O)_{11}$

Crystal Data: Hexagonal. *Point Group*: n.d. As thin bent plates; as spherulites, to 1.5 mm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: n.d. *Tenacity*: Flexible. Hardness = 2 D(meas.) = 2.21(2) D(calc.) = 2.18(1)

Optical Properties: Transparent. *Color*: Colorless; white in aggregates.
Luster: Vitreous, pearly on cleavage surfaces.
Optical Class: Uniaxial (-). $\omega = 1.542(2)$ $\varepsilon = 1.534(2)$ Anomalously biaxial, with 2V = 20°.

Cell Data: *Space Group*: $P\bar{3}$, *P*3, $P\bar{3}$ 1*m*, *P*31*m*, $P\bar{3}$ *m*1, *P*3*m*1, *P*312, or *P*321.
$a = 16.055(6)$ $c = 25.66(1)$ $Z = 3$

X-ray Powder Pattern: Zhelezny open-pit mine, Kovdor massif, Kola Peninsula, Russia.
8.52 (100), 3.665 (90), 3.547 (90), 4.27 (60), 3.081 (60), 6.41 (40), 5.13 (30)

Chemistry:

	(1)
Al_2O_3	18.3
MgO	29.7
CaO	0.2
SrO	7.4
P_2O_5	1.3
CO_2	14.5
H_2O	28.6
Total	100.0

(1) Zhelezny open-pit mine, Kovdor carbonatite massif, Kola Peninsula, Russia; average of 10 electron microprobe analyses, H_2O by difference, IR confirms OH, CO_3, H_3O and H_2O, corresponding to $Mg_{18.00}Al_{9.00}(OH)_{54}(Sr_{1.79}Mg_{0.48}Ca_{0.09})_{\Sigma=2.36}(CO_3)_{8.26}(PO_4)_{0.46}(H_2O)_{6.34}(H_3O)_{4.18}$.

Occurrence: A late-stage hydrothermal mineral, finely intergrown with quintinite-3T, in cavities in dolomite in a carbonatite complex.

Association: Dolomite, magnetite, quintinite-3T, strontium carbonate-fluorapatite.

Distribution: Zhelezny open-pit mine, Kovdor carbonatite massif, Kola Peninsula, Russia.

Name: Honors Russian mineralogist Pavel Karchevsky (1976–2002) for significant contributions to the study of carbonatites.

Type Material: Mineralogical Museum, St. Petersburg State University, and at the A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia.

Karelianite V_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $[\overline{3}\ 2/m]$ (by analogy to the hematite group). As prismatic grains, to 0.5 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 8–9 VHN = 1790 (50 g load). D(meas.) = n.d. D(calc.) = [4.95]

Optical Properties: Opaque. *Color:* Black; brownish olive-gray in reflected light.
Streak: Black.
Optical Class: Uniaxial. *Anisotropism:* Strong; reddish brown to gray. *Bireflectance:* Weak.
R: (400) 14.3, (420) 14.4, (440) 14.5, (460) 14.8, (480) 15.2, (500) 15.8, (520) 16.3, (540) 16.8, (560) 17.2, (580) 17.6, (600) 18.0, (620) 18.3, (640) 18.7, (660) 19.2, (680) 19.8, (700) 20.6

Cell Data: *Space Group:* $R\overline{3}c$. a = 4.99 c = 13.98 Z = 6

X-ray Powder Pattern: Outokumpu mine, Finland; close to hematite.
1.70 (100), 2.71 (90), 2.49 (80), 3.67 (70), 1.44 (40), 1.84 (25), 2.20 (20)

Chemistry:

	(1)
Fe_2O_3	4.1
V_2O_3	92.9
Cr_2O_3	3.7
MnO	1.5
Total	102.2

(1) Outokumpu mine, Finland; by electron microprobe.

Mineral Group: Hematite group.

Occurrence: In sulfide-rich portions of glacial boulders derived from high-grade metamorphic rocks, as schists and quartzites (Outokumpu mine, Finland); in primary unoxidized U–V ores (Mounana mine, Gabon); in vanadiferous anthraxolite bitumen (Guangxi, China).

Association: Pyrrhotite, chalcopyrite, pyrite, tremolite, graphite, titanite, quartz (Outokumpu mine, Finland); corvusite, montroseite, uraninite, quartz (Mounana mine, Gabon); millerite, violarite, montroseite (Guangxi, China).

Distribution: At the Outokumpu mine, northern Karelia, Finland. From the Roter Bär mine, St. Andreasberg, Harz Mountains, Germany. In Russia, near Lake Baikal, Siberia, in the Slyudyanka complex, Sayan Mountains, and 4.5 km south of Olkhon Gate Strait. In the Shanglin and Hechi bitumens, Guangxi, Zhuang Autonomous Region, China. From the Mounana uranium mine, Franceville, Gabon. At the Urcal deposit, La Rioja Province, Argentina. In the Hemlo gold mine, Thunder Bay district, Ontario, Canada.

Name: For the Karelian schist belt, the region of Finland where the mineral occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121785 and 121786.

Karibibite $Fe_2^{3+}As_4^{3+}(O,OH)_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As sharply pointed, spindle-shaped bundles of radiating fibers, to 1 mm, with anhedral individuals, < 1 μ thick. Also massive, cross-vein fibrous, or as reticulated coatings.

Physical Properties: *Cleavage:* Possibly on {100} or {010}, as indicated by preferred orientation of fibers. *Tenacity:* Flexible. Hardness = Very soft. D(meas.) = 4.07 D(calc.) = 4.04 Paramagnetic; may fluoresce yellow under SW UV.

Optical Properties: Transparent. *Color:* Brownish yellow, pale to brownish orange. *Streak:* Bright yellow.
Optical Class: Biaxial (–). *Pleochroism:* Weak; light brownish yellow to straw-yellow.
Orientation: $Z \parallel$ fiber axis. $\alpha = 1.96$ $\beta =$ n.d. $\gamma = > 2.10$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 27.91(4)$ $b = 6.53(2)$ $c = 7.20(3)$ Z = 6

X-ray Powder Pattern: Karibib, Namibia.
2.384 (100), 3.176 (80), 2.802 (80), 3.088 (70), 3.496 (50), 2.672 (45), 6.35 (40)

Chemistry:

	(1)	(2)
Fe_2O_3	29.1	28.69
As_2O_3	68.8	71.14
H_2O^+	1.7	
H_2O^-	0.2	
H_2O		0.28
Total	99.8	100.11

(1) Karibib, Namibia; absence of arsenate groups confirmed by IR; corresponds to $Fe^{3+}_{1.95}As^{3+}_{3.72}O_{7.98}(OH)_{1.02}$. (2) Urucum pegmatite, Brazil.

Occurrence: In granite pegmatites.

Association: Löllingite, eosphorite, scorodite, quartz (Karibib, Namibia); löllingite, scorodite, schneiderhöhnite, parasymplesite, quartz (Bou Azzer, Morocco).

Distribution: From the Rubicon pegmatite, and perhaps others, in the Karibib district, Namibia. In the Kiura mine, Oita Prefecture, Japan. From Bou Azzer, Morocco. In the Córrego do Urucum pegmatite, near Galiléia, and the Mulundu pegmatite, locality not further specified, Minas Gerais, Brazil. From an unidentified pegmatite in eastern Kazakhstan.

Name: For the Karibib pegmatite district, Namibia, where the species occurs.

Type Material: Department of Earth Sciences, University of Leeds, Leeds, England; Department of Geology, University of Helsinki, Helsinki, Finland.

References: (1) von Knorring, O., T.G. Sahama, and P. Rehtijärvi (1973) Karibibite, a new FeAs mineral from South West Africa. Lithos, 6, 265–271. (2) (1974) Amer. Mineral., 59, 382 (abs. ref. 1). (3) Cassedanne, J.P. (1986) The Urucum pegmatite, Minas Gerais, Brazil. Mineral. Record, 17, 307–314.

Karlite $Mg_7(BO_3)_3(OH)_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. As needles, elongated along [001], composed of subparallel crystallites showing {110} and {001}, to 0.5 mm; always in rosettelike and fibrous aggregates.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 5.5 D(meas.) = 2.80–2.85 D(calc.) = 2.85

Optical Properties: Semitransparent. *Color:* White, pale green, may have a brown oxidization crust; colorless in transmitted light. *Streak:* White. *Luster:* Silky.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.589$ $\beta = 1.632$ $\gamma = [1.634]$ 2V(meas.) = 22°–25°

Cell Data: *Space Group:* $P2_12_12$. $a = 17.631(1)$ $b = 17.965(1)$ $c = 3.1041(2)$ Z = 4

X-ray Powder Pattern: Schlegeistal, Austria.
2.829 (100), 2.2522 (94), 12.53 (83), 3.947 (72), 2.6211 (72), 6.27 (67), 1.1907 (67)

Chemistry:

	(1)		(1)
SiO_2	0.02	K_2O	0.01
B_2O_3	22.92	F	0.16
Al_2O_3	2.96	Cl	3.26
FeO	2.27	H_2O^+	10.40
MnO	0.17	H_2O^-	0.63
MgO	58.90	$-O = (F, Cl)_2$	0.82
CaO	0.14	Total	[101.03]
Na_2O	0.01		

(1) Schlegeistal, Austria; by electron microprobe, total Fe as FeO, total Mn as MnO, B_2O_3 determined photometrically, H_2O by TGA, only $(OH)^{1-}$ present by IR, original total given as 100.40%; corresponds to $(Mg_{6.60}Al_{0.26}Fe_{0.14}Mn_{0.01}Ca_{0.01})_{\Sigma=7.02}(B_{0.99}O_{2.97})_3[(OH)_{4.37}O_{0.26}Cl_{0.42}F_{0.04}]_{\Sigma=5.09}$. (2) Do.; by electron microprobe, analysis not given; stated to correspond to $(Mg_{6.05}Al_{0.30}Fe^{3+}_{0.10}Fe^{2+}_{0.05})_{\Sigma=6.50}(BO_3)_3(OH)_4Cl_{0.40}$.

Occurrence: Probably formed by Alpine metamorphism, in a calcsilicate–carbonate lens in amphibolites (Schlegeistal, Austria).

Association: Calcite, dolomite, "chlorite", clinohumite, brucite, ludwigite (Schlegeistal, Austria); sakhaite (Siberia, Russia).

Distribution: Found in the Furtschaglkar, in the Schlegeistal, Zillertal, Tirol, Austria. From the Cerdagne district, Pyrénées-Orientales, France. At an undefined locality [Titovskoye boron deposit, Tas-Khayakhtakh Mountains, Sakha] in Russia

Name: To honor Dr. Franz Karl (1918–1972), Professor of Mineralogy and Petrography, Christian Albrechts University, Kiel, Germany, for his studies of the geology of the eastern Alps.

Type Material: Mineralogical Institute and Museum, University of Kiel, Kiel; Institute for Mineralogy and Crystallography, Technical University, Berlin, Germany, 85/72; Natural History Museum, Vienna, Austria, L7676; Natural History Museum, Paris, France; National Museum of Natural History, Washington, D.C., USA, 149050–149052.

Karnasurtite-(Ce)

$(Ce, La, Th)(Ti, Nb)$
$(Al, Fe^{3+})(Si, P)_2O_7(OH)_4 \cdot 3H_2O(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Amorphous; hexagonal (?). *Point Group:* n.d. Platy crystals up to 1 cm; as aggregates and individual grains.

Physical Properties: *Cleavage:* Good in one direction, imperfect in another. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 2.89–2.95 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Honey-yellow when fresh to pale yellow when altered; in thin section, pale yellow. *Streak:* Yellow. *Luster:* Greasy. *Optical Class:* Uniaxial (–); may be anomalously slightly biaxial. $\omega = 1.617$ $\epsilon = 1.595$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Mt. Karnasurt, Russia; X-ray amorphous; on heating to 900°, it yields a pattern close to that of monazite.
3.10 (7), 2.88 (7), 3.29 (6), 3.49 (5), 1.723 (5), 2.44 (4), 2.14 (4)

(1) Mt. Karnasurt, Russia; corresponds to $(Ce_{0.54}Na_{0.15}Ca_{0.14}Th_{0.12}K_{0.08}Ba_{0.02})_{\Sigma=1.05}(Ti_{0.76}Nb_{0.31})_{\Sigma=1.07}(Al_{0.73}Mg_{0.11}Fe^{3+}_{0.07})_{\Sigma=0.91}(Si_{1.70}P_{0.23})_{\Sigma=1.93}O_7[(OH)_{3.46}F_{0.23}]_{\Sigma=3.69} \cdot 3H_2O$.
(2) Mt. Punkaruaiv, Russia.

Occurrence: In the intermediate replacement zone, composed largely of microcline, of a zoned pegmatite stock in a differentiated alkalic massif (Mt. Karnasurt, Russia).

Association: Manganoan pectolite, natrolite, epididymite, polylithionite, ussingite.

Distribution: On Mts. Karnasurt and Punkaruaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For the locality, Mt. Karnasurt, Kola Peninsula, Russia, and its high *cerium* content.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 59412, vis3348; National Museum of Natural History, Washington, D.C., USA, 143823.

Karpatite $C_{24}H_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are acicular, thin tabular parallel to [001], showing {001}, {100}, {$\overline{2}$01}, many other forms, to 1 cm; typically in bladed groups and fibrous radiating aggregates.

Physical Properties: *Cleavage:* On {001}, {100}, {$\overline{2}$01}, perfect. *Fracture:* Splintery. *Tenacity:* Flexible, nearly plastic. Hardness = ∼1 D(meas.) = 1.35–1.40 D(calc.) = 1.29–1.42 Flammable; fluoresces sky-blue under LW and SW UV.

Optical Properties: Subtranslucent. *Color:* Yellow, yellowish brown on exposure.
Luster: Vitreous.
Optical Class: Biaxial (–) or (+). *Orientation:* $X = b$; $Z \wedge c = 21°$. *Dispersion:* $r \gg v$, extreme.
$\alpha = 1.780(2)$ $\beta = 1.977$–1.982 $\gamma = 2.05$–2.15 2V(meas.) = 96°–115°

Cell Data: *Space Group:* $P2_1/c$ or $P2/c$ (synthetic). $a = 10.035$ $b = 4.695$ $c = 16.014$ $\beta = 112°$ Z = 2

X-ray Powder Pattern: Olenevo, Ukraine.
9.40 (10), 3.52 (9), 7.52 (8), 3.97 (7), 3.05 (6), 7.25 (5), 3.43 (4)

Chemistry:

	(1)	(2)
C	96.04	95.97
H	4.04	4.03
O		
Total	100.08	100.00

(1) Olenevo, Ukraine. (2) $C_{24}H_{12}$ (coronene).

Occurrence: In cavities at the contact of diorite porphyry with argillites (Olenevo, Ukraine); a low-temperature hydrothermal mineral (California, USA).

Association: Idrialite, amorphous organic material, calcite, barite, quartz, cinnabar, metacinnabar (Olenevo, Ukraine); cinnabar, quartz (California, USA).

Distribution: From near Olenevo, Transcarpathian region, western Ukraine. At Tamvotney, Kamchatka Peninsula, Russia. From the Picacho mercury mine, south of New Idria, San Benito Co., California, USA.

Name: From the Russian *Karpaty*, for the place of discovery in the Transcarpathian district, Ukraine.

Type Material: n.d.

References: (1) Piotrovsky, G.L. (1955) Karpatite – a new organic mineral from Transcarpathia. Lvovskoe geol. Obshch., Mineral. Sbornik, 9, 120–127 (in Russian). (2) (1957) Amer. Karpinskite $(Mg,Ni)_2Si_2O_5(OH)_2(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic (?). *Point Group:* n.d. As minute plates and monoclinic prisms, to 0.8 mm; appears to be cryptocrystalline.

Physical Properties: Hardness = 2.5–3 D(meas.) = 2.53–2.63 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Colorless, light blue to deep greenish blue.
Luster: Dull to weakly greasy.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = 0°$–$12°$. α = 1.553–1.570 β = n.d.
γ = 1.569–1.594 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Nizhni Tagil massif, Russia.
11., 7.71, 4.76, 3.75, 1.555 [strongest lines]

Chemistry:

	(1)
SiO_2	47.55
Al_2O_3	0.48
NiO	21.12
CuO	0.01
MgO	17.56
CaO	0.80
H_2O^+	6.50
H_2O^-	3.50
LOI	2.30
Total	99.82

(1) Nizhni Tagil massif, Russia; corresponds to $(Mg_{1.30}Ni_{0.70})_{\Sigma=2.00}Si_2O_5(OH)_2$.

Occurrence: As veinlets in "kerolitized" serpentinite.

Association: n.d.

Distribution: In the Nizhni Tagil massif, Ural Mountains, Russia.

Name: For Alexander Petrovich Karpinsky (1847–1936), Russian geologist and President of the Russian Academy of Sciences, Moscow, Russia.

Type Material: n.d.

References: (1) Rukavishnikova, I.A. (1956) Some magnesium-nickel hydrous silicates of the Nizhne-Tagilsk serpentine massif. Kora Vyvetrivaniya [The crust of weathering], 2, 124–178 (in Russian). (2) (1957) Amer. Mineral., 42, 584 (abs. ref. 1).

Kasatkinite $Ba_2Ca_8B_5Si_8O_{32}(OH)_3 \cdot 6H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m* or *m*. As subparallel or sheaf-like aggregates and spherulites of acicular crystals, ~ 500 × 5 μm, rarely 600 × 20 μm.

Physical Properties: *Cleavage:* None observed. *Tenacity:* Brittle, individual fibers are elastic and resilient, aggregates are tough (similar to nephrite). *Fracture:* Uneven to jagged.
Hardness = 4-4.5 D(meas.) = 2.95(5) D(calc.) = 2.89

Optical Properties: Translucent to nearly opaque. *Color:* Colorless, snow-white (aggregates); colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to silky.
Optical Class: Biaxial (+). α = 1.600(5) b = 1.603(2) γ = 1.626(2) 2V(meas.) = 30(20)°
2V(calc.) = 40° *Pleochroism:* None.

Cell Data: Space Group: $P2_1/c$, $P2/c$, or Pc. a = 5.745(3) b = 7.238(2) c = 20.79(1)
β = 90.82(5)° Z = 1

X-ray Powder Pattern: Bazhenovskoe chrysotile-asbestos deposit, Middle Urals, Russia.
3.009 (100), 2.925 (65), 2.633 (33), 2.116 (29), 5.89 (24), 3.36 (24), 3.48 (23), 10.52 (14)

Chemistry:

	(1)
Na_2O	0.23
K_2O	0.57
CaO	28.94
BaO	16.79
B_2O_3	11.57
Al_2O_3	0.28
SiO_2	31.63
F	0.05
H_2O	9.05
$-O=F_2$	0.02
Total	99.09

(1) Bazhenovskoe chrysotile-asbestos deposit, Middle Urals, Russia; average of 17 electron microprobe analyses, IR spectroscopy and the ^{11}B MAS NMR spectrum confirm the presence of BO_4, H_2O by TGA; corresponds to $Na_{0.11}K_{0.18}Ba_{1.66}Ca_{7.84}B_{5.05}Al_{0.08}Si_{8.00}O_{31.80}(OH)_{3.06}F_{0.04} \cdot 6.10H_2O$.

Occurrence: Of hydrothermal origin in cavities in rhodingite.

Association: Prehnite, pectolite, calcite, clinochlore; or grossular, diopside, chrysotile, pectolite, minerals of the tobermorite and hydrotalcite families.

Distribution: From the Bazhenovskoe chrysotile-asbestos deposit (eastern part of the open pit Yuzhnyi), near Asbest, Middle Urals, Russia.

Name: Honors Russian amateur mineralogist and mineral collector Anatoly V. Kasatkin (b. 1970).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; 41291/1.

References: (1) Pekov, I.V., N.V. Chukanov, Ya.E. Filinchuk, A.E. Zadov, N.N. Kononkova, S.G. Epanchintsev, P. Kaden, A. Kutzer, and J. Obshch., 141(3), 39-49 (in Russian, English abstract). (2) (2013) Amer. Mineral., 98, 2201-2202 (abs. ref. 1).

Kashinite $(Ir, Rh)_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As subhedral granular crystals, to 0.2 mm; on the rims of platinum or iridosmine grains.

Physical Properties: *Fracture:* Flinty. *Tenacity:* Brittle, weakly elastic. Hardness = n.d. VHN = 1529(477) (50 g load). D(meas.) = n.d. D(calc.) = 9.10

Optical Properties: Opaque. *Color:* Grayish black; light gray in reflected light. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Moderate to strong, with reddish violet tints.
R_1–R_2: (400) — , (420) — , (440) 43.7–45.9, (460) 45.1–45.5, (480) 46.1–45.5, (500) 46.8–45.6, (520) 47.2–45.7, (540) 47.5–45.8, (560) 47.6–46.0, (580) 47.6–46.2, (600) 47.4–46.3, (620) 47.1–46.5, (640) 46.8–46.6, (660) 46.6–46.8, (680) 46.3–46.9, (700) 46.0–47.0

Cell Data: *Space Group: Pbcn.* $a = 8.464$ $b = 6.001$ $c = 6.146$ Z = 4

X-ray Powder Pattern: Nizhni Tagil, Russia.
2.99 (10), 1.736 (6b), 2.14 (4), 1.758 (4), 1.136 (4b), 1.028 (4), 0.982 (4)

Chemistry:

	(1)	(2)	(3)
Ir	53.6	52.4 – 75.8	57.9
Rh	21.5	1.7 – 22.9	15.7
Pt	0.8		0.2
Ru	0.5		
Fe	0.1		0.1
Cu	0.7	0.0 – 0.8	0.7
S	24.0	21.6 – 24.8	23.0
Total	97.6		97.6

(1) Russia; by electron microprobe, average of five analyses; corresponds to $(Ir_{1.12}Rh_{0.84}Ru_{0.02}Pt_{0.02})_{\Sigma=2.00}S_{3.00}$. (2) Nizhni Tagil, Russia; by electron microprobe, range of 18 analyses. (3) China; by electron microprobe, average of analyses on four grains; corresponds to $(Ir_{1.26}Rh_{0.64}Cu_{0.05}Fe_{0.01})_{\Sigma=1.96}S_{3.00}$.

Occurrence: In placer deposits derived from ultramafic rocks.

Association: Iridosmine, platinum, osmiridium, laurite, erlichmanite, cuproiridisite, cherepanovite, rhodian pentlandite, irarsite, Fe–Pt alloy, sulfides of Fe, Cu, Ir, Rh, chromite.

Distribution: In Russia, from the Aleksandrov Log platinum deposit, Mt. Solov'eva, Nizhni Tagil massif, Ural Mountains [TL]; at the Ray-Iz ophiolite complex, Polar Ural Mountains; in the Vaimka River placers, Aluchinskii massif, and the Baimka placers, Aluchin horst, Chukota region, Far Eastern Region. At an unspecified placer in China. From Chromwerk, Kraubath ultramafic massif, Styria, Austria. At Goodnews Bay, Alaska, USA.

Name: To honor Stepan Aleksandrovich Kashin (1900–1981), Central Institute of Geological Exploration for Base and Precious Metals, Moscow, Russia, a Russian investigator of ore deposits in the Ural Mountains.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Kaskasite $(Mo,Nb)S_2 \cdot (Mg_{1-x}Al_x)(OH)_{2+x}$

Crystal Data: Hexagonal. *Point Group*: 3*m*, 32, or $\bar{3}$ 2/*m*. As lamellar or flaky, mica-like crystals flattened on [001], to 1.5 mm; epitaxial and coplanar with {001} of pyrrhotite; as irregular lamellae, sometimes with crude hexagonal outline; striations on {001} cross at 60°.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: Laminated. *Tenacity*: Flexible, inelastic. VHN = 34-38 (5 g load). Hardness = ~1 D(meas.) = n.d. D(calc.) = 3.83

Optical Properties: Opaque. *Color*: Iron black; light to dark gray in reflected light.
Streak: Black. *Luster*: Metallic. *Anisotropism:* Strong. *Pleochroism*: Strong, light gray with a yellowish hue to gray.
Optical Class: n.d.
R_1-R_2: (470) 8.6-21.5, (546) 9.2-21.6, (589) 9.2-21.5, (650) 8.9-21.3

Cell Data: *Space Group*: $P\bar{3}\,m1$, $P3m1$, or $P321$. [a = 3.220(2) c = 11.47(2) sulfide sub-lattice] [a = 3.073(2) c = 11.50(2) hydroxide sub-lattice] One-layer polytypes. Z = 1

X-ray Powder Pattern: Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia.
5.72 (100), 11.46 (97), 2.786 (51), 1.613 (33), 1.557 (10), 2.627 (7), 2.219 (7)

Chemistry:

	(1)		(1)
Mg	5.94	Nb	13.39
Al	3.67	Mo	23.18
Ca	0.04	W	7.59
V	0.16	S	27.09
Mn	0.23	O	15.66
Fe	1.44	H	[0.99]
		Total	99.08

(1) Mt. Kaskasnyunchorr, Russia; average of 5 electron microprobe analyses, H calculated so that all O are OH-, presence of OH^- confirmed by Raman spectroscopy; corresponding to $(Mo_{0.57}Nb_{0.34}W_{0.10}V_{0.01})_{\Sigma=1.02}S_2 \cdot (Mg_{0.58}Al_{0.32}Fe_{0.06}Mn_{0.01})_{\Sigma=0.97}(OH)_{2.32}$.

Mineral Group: Valleriite group.

Polymorphism & Series: Forms a series with manganokaskasite.

Occurrence: Of hydrothermal origin in fenites formed by the influence of a peralkaline fluid acting as a source of Nb on a large xenolith of alumina-rich metamorphic rocks (metapelites) located inside a huge intrusion of agpaitic nepheline syenite.

Association: Orthoclase, anorthoclase, nepheline, fluorophlogopite, corundum, pyrrhotite, pyrite, rutile, monazite-(Ce), graphite, edgarite, molybdenite, tungstenite, alabandite.

Distribution: From Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia.

Name: For Mount Kaskasnyunchorr, the locality that produced the first specimens, whose name is based on the word for "juniper" - *kaskas* - in the Saami language of the Kola aboriginal people.

Type Material: The A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 94231).

Kasolite $Pb(UO_2)SiO_4 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals stout prismatic, flattened on {001} and lathlike by extension along [010], to several mm. As groups of divergent crystals, rosettes, and radial fibrous aggregates; in dense gumlike crusts and compact, colloform masses.

Physical Properties: *Cleavage:* Perfect on {001}, indistinct on {100} and {010}. *Tenacity:* Brittle. Hardness = 4–5 D(meas.) = 5.83–6.5 D(calc.) = 6.256 Radioactive.

Optical Properties: Transparent to translucent, opaque. *Color:* Ocher-yellow to brownish yellow; amber-brown when transparent; rarely lemon-yellow to green or reddish orange. *Streak:* Pale yellow-brown. *Luster:* Subadamantine to greasy, dull to earthy when massive. *Optical Class:* Biaxial (+). *Pleochroism:* Weak, rarely; $X = Y$ = very pale yellow; Z = colorless to slightly grayish. *Orientation:* $X = b$; $Z \simeq c$. α = 1.877–1.900 β = 1.880–1.910 γ = 1.935–1.970 2V(meas.) = 43°

Cell Data: *Space Group:* $P2_1/a$. a = 13.24 b = 6.94 c = 6.70 $\beta = 104°20'$ Z = 4

X-ray Powder Pattern: Kasolo, Congo.
3.26 (10), 2.93 (9), 4.19 (8b), 3.53 (7), 6.61 (6), 3.07 (5), 1.962 (5)

Chemistry:

	(1)	(2)
SiO_2	9.42	10.23
UO_3	49.28	48.70
Fe_2O_3	0.41	
PbO	36.2	38.00
MgO	0.03	
CaO	0.06	
H_2O	3.59	3.07
CO_2	0.85	
Total	99.84	100.00

(1) Kasolo, Congo. (2) $Pb(UO_2)SiO_4 \cdot H_2O$.

Occurrence: An oxidization product of uraninite.

Association: Uraninite, torbernite, curite, dewindtite (Kasolo, Congo); rutherfordine, sklodowskite, curite (Nabarlek, Australia).

Distribution: From Shinkolobwe, and the Musonoi mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). At Mounana, Gabon. In Germany, at Wölsendorf, Bavaria. In France, at Kersegalec, Lignol, Morbihan; Grury, Saône-et-Loire; and at Reliez and Bigay, Lachaux, Puy-de-Dôme. At Loe Warren, St. Just, Cornwall, England. In the Nabarlek and Koongarra uranium deposits, Northern Territory, and at Wodgina, Pilbara district, Western Australia. In the USA, in the Ruggles pegmatite, near Grafton, Grafton Co., New Hampshire; from the Green Monster mine, Goodsprings district, Clark Co., and the 4-D mine, Marietta district, Mineral Co., Nevada; and in the Ross-Adams mine, Bokan Mountain, Prince of Wales Island, Alaska. In Canada, at Great Bear Lake, Northwest Territories, and at Lake Athabasca, Saskatchewan, from the Nicholson mines. In the Santo Domingo mine, Santa Eulalia, Chihuahua, Mexico. A number of other minor localities are known.

Name: For the occurrence at Shinkolobwe, near Kasolo Hill, Congo (Zaire).

Type Material: Natural History Museum, Paris, France, 121.287.

(1) Afrikanda massif, Russia; after deduction of SiO_2 as titanite, corresponds to $[Ca_{0.95}(H_3O)_{0.04}Na_{0.01}]_{\Sigma=0.96}(Ti_{1.92}Fe_{0.06}Al_{0.05})_{\Sigma=2.03}O_{3.96}(OH)_{2.04}$. (2) Josephine Creek, Oregon, USA; by electron microprobe, analysis not given; stated to correspond to $Ca(Ti_{1.87}Fe_{0.13})_{\Sigma=2.00}O_{3.87}(OH)_{2.13}$. (3) $CaTi_2O_4(OH)_2$.

Occurrence: Lining miarolitic cavities in alkalic pegmatites (Afrikanda massif, Russia); in nepheline syenite (Diamond Jo quarry, Arkansas, USA).

Association: Cafetite, perovskite, titanite (Afrikanda massif, Russia); perovskite, rutile, ilmenite, titanite (Josephine Creek, Oregon, USA).

Distribution: From the Afrikanda pyroxenite massif, Kola Peninsula, Russia. In the USA, from the Diamond Jo quarry, Magnet Cove, Hot Spring Co., Arkansas; and in a mantle xenolith from Josephine Creek, Josephine Co., Oregon. At the Wuyang iron deposit, Henan Province, China.

Name: Honors Academician Nikolai Grigor'evich Kassin (1885–1949), the geologist who discovered the Afrikanda massif, Russia.

Type Material: Mineralogcal Museum, St. Petersburg University, St. Petersburg, Russia, 17402.

Kastningite $(Mn^{2+}, Fe^{2+})Al_2(PO_4)_2(OH)_2 \cdot 8H_2O$

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Wedgelike crystals are tabular on {001}, also showing {111}, {$\bar{1}$11}, to 2 mm, in sprays.

Physical Properties: Hardness = Soft. D(meas.) = 2.35 D(calc.) = 2.379

Optical Properties: Transparent to translucent. *Color:* Colorless, white, beige. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.566$ $\beta = 1.574$ $\gamma = 1.582$ 2V(meas.) = n.d. 2V(calc.) = 91°–95°

Cell Data: *Space Group:* $P\bar{1}$. $a = 7.0102(3)$ $b = 10.2050(7)$ $c = 10.5040(7)$ $\alpha = 71.82(1)°$ $\beta = 89.62(1)°$ $\gamma = 69.90(1)°$ $Z = 2$

X-ray Powder Pattern: Waidhaus, Germany.
9.917 (100), 4.957 (50), 6.541 (36), 3.001 (30), 3.095 (28), 1.653 (25), 3.312 (23)

Chemistry:

	(1)
P_2O_5	37.96
Al_2O_3	24.49
FeO	6.07
MnO	11.30
MgO	0.64
H_2O	[19.54]
Total	[100.00]

(1) Waidhaus, Germany; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponds to $(Mn_{0.66}Fe_{0.35}Mg_{0.06})_{\Sigma=1.07}Al_{2.00}(P_{1.12}O_4)_2(OH)_2 \cdot 3.56H_2O$.

Polymorphism & Series: Dimorphous with mangangordonite.

Occurrence: A rare secondary mineral in a zoned granite pegmatite.

Association: Variscite, paravauxite, albite, mica, quartz.

Distribution: From the Silbergrube quarry, near Waidhaus, and at Hagendorf, Bavaria, Germany.

Name: To honor Jürgen Kastning, mineral collector and dealer, Reinbek, near Hamburg, Germany, who found the original material.

Type Material: Mineralogical Museum, University of Hamburg, Hamburg, Germany.

Katoite $\mathbf{Ca_3Al_2(SiO_4)_{3-x}(OH)_{4x}}$ (x = 1.5 to 3.0)

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Octahedra crystals, typically rounded, to 0.3 mm, in thin crusts of columnar aggregates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.76

Optical Properties: Transparent to translucent. *Color:* Milky white; in transmitted light, colorless.
Optical Class: Isotropic; may be weakly birefringent. $n = 1.632(1)$

Cell Data: *Space Group: Ia3d.* a = 12.358(2) Z = 8

X-ray Powder Pattern: Campomorto quarry, Italy.
2.763 (100), 2.257 (58), 2.004 (58), 3.089 (50), 5.046 (37), 1.6507 (37), 3.303 (32)

Chemistry:

	(1)
SiO_2	10.58
Al_2O_3	24.01
MgO	0.07
CaO	42.27
H_2O	20.8
SO_3	2.27
Total	[100.00]

(1) Campomorto quarry, Italy; by electron microprobe, H_2O by TGA, recalculated slightly to 100.00%; corresponds to $Ca_{2.96}(Al_{1.85}Mg_{0.01})_{\Sigma=1.86}(Si_{0.69}S_{0.11})_{\Sigma=0.80}[(OH)_{9.07}O_{2.93}]_{\Sigma=12.00}$.

Polymorphism & Series: Forms a series with grossular and hibschite.

Mineral Group: Garnet group.

Occurrence: A hydrothermal mineral in cavities in a phonolitic lava flow that erupted through an argillaceous marl.

Association: Tobermorite, afwillite, gehlenite, hydrocalumite, "opal," portlandite, apophyllite, cordierite, jennite, strätlingite, chabazite, gismondine, phillipsite, vertumnite, ettringite, garnet, wollastonite, gypsum, calcite, quartz, hematite.

Distribution: In the Campomorto quarry, near Montalto di Castro, Lazio, Italy.

Name: In honor of Akira Kato, mineralogist of the National Science Museum, Tokyo, Japan.

Type Material: Municipal Museum of Natural History, Milan, Italy; National Museum of Natural History, Washington, D.C., USA, 163797.

References: (1) Passaglia, E. and R. Rinaldi (1984) Katoite, a new member of the $Ca_3Al_2(SiO_4)_3$ – $Ca_3Al_2(OH)_{12}$ series and a new nomenclature for the hydrogrossular group of minerals. Bull. Minéral., 107, 605–618. (2) (1985) Amer. Mineral., 70, 873 (abs. ref. 1).

Katophorite $\mathbf{Na[NaCa][(Fe^{2+},Mg)_4Al](Si_7Al)O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic, granular, also as fibrous aggregates or dendrites and skeletal crystals. Commonly rimming other minerals. *Twinning:* ∥ {100}.

Physical Properties: *Cleavage:* Perfect on {110}, intersecting at ∼56° and ∼124°; parting on {010}. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.2–3.5 D(calc.) = [3.31]

Optical Properties: Transparent to translucent. *Color:* Black, dark green-black, bluish black; reddish yellow, bluish green in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; reddish yellow, reddish brown, and dark green to black. *Orientation:* $Z = b$. *Dispersion:* $r > v$. *Absorption:* $Z > Y > X$. α = 1.639–1.681 β = 1.658–1.688 γ = 1.600–1.690 2V(meas.) = ∼0°–50°

Cell Data: *Space Group:* $C2/m$. a = 10.019(2) b = 18.036(7) c = 5.286(3) β = 104.98(3)° Z = 2

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)		(1)	(2)

Cr_2O_3	0.09		Na_2O	4.18	4.85
FeO	25.58	28.97	K_2O	1.34	1.23
			Total	100.79	97.83

(1) Baie-des-Moutons complex, Canada; by electron microprobe, corresponds to $(Na_{0.54}K_{0.26})_{\Sigma=0.80}(Ca_{1.31}Na_{0.69})_{\Sigma=2.00}(Fe^{2+}_{3.25}Mg_{1.45}Ti_{0.23}Mn_{0.15})_{\Sigma=5.08}(Si_{7.29}Al_{0.69}Ti_{0.01}Cr_{0.01})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Rallier-du-Baty Peninsula, Kerguelen Island; by electron microprobe, corresponds to $(Na_{0.80}K_{0.25})_{\Sigma=1.05}(Ca_{0.98}Na_{0.70}Fe^{2+}_{0.32})_{\Sigma=2.00}(Fe^{2+}_{3.54}Mg_{1.24}Mn_{0.15}Ti_{0.07})_{\Sigma=5.00}(Si_{7.32}Al_{0.52}Ti_{0.16})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesiokatophorite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Na + K)_A \geq 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; 6.5 Si 7.49.

Occurrence: In alkalic volcanic and plutonic igneous rocks; in blueschist facies jadeitites.

Association: Arfvedsonite, aegirine, nepheline, pyroxenes, eckermannite, chromite.

Distribution: May occur in the Oslo (Christiania) district, Norway, from where it was originally described. On the Rallier-du-Baty Peninsula, Kerguelen Island, in the south Indian Ocean. In the Baie-des-Moutons complex, La Tabatière, Quebec, Canada. At Tawmaw, Kachin State, northern Myanmar (Burma).

Name: From the Greek for *a carrying down*, in allusion to its volcanic origin.

Type Material: n.d.

(1) Långban, Sweden; average of four analyses. (2) Do.; by electron microprobe; corresponds to $(Mn^{2+}_{11.7}Mg_{1.4})_{\Sigma=13.1}(Al_{3.3}Fe_{0.5})_{\Sigma=3.8}Sb^{5+}_{2.1}Si_{2.0}O_{28}$.

Occurrence: In metamorphosed limestone (Brattfors mine, Sweden).

Association: Magnetite, garnet, manganosite (Brattfors mine, Sweden).

Distribution: In Sweden, in the Brattfors, Moss, and Jakobsberg mines, near Nordmark, and at Långban, Värmland; in the Sjö mine, near Grythyttan, Örebro.

Name: From the Greek for *mirror*, for the perfectly reflecting cleavage surfaces.

Bi	55.4	58.9
Te	31.9	25.9
Se	9.9	12.9
S	0.1	1.9
Total	97.3	99.6

(1) Kawazu mine, Japan; by electron microprobe, corresponding to $Bi_{2.07}(Te_{1.95}Se_{0.97}S_{0.03})_{\Sigma=2.95}$.
(2) Suttsu mine, Japan; by electron microprobe, corresponding to $Bi_{2.01}(Te_{1.42}Se_{1.15}S_{0.42})_{\Sigma=2.99}$.

Mineral Group: Tetradymite group.

Occurrence: Of hydrothermal origin, in a quartz veins (Kawazu and Suttsu mines, Japan); in a breccia pipe cutting dacitic ignimbrites (Mazenod Lake, Canada).

Association: Selenian tellurium (Kawazu mine, Japan); tellurobismuthite, uraninite, hematite, yarrowite (Mazenod Lake, Canada); selenian bismuthinite, selenian pavonite, cassiterite, chalcopyrite, pyrite (Suttsu mine, Japan).

Distribution: In Japan, from the Kawazu mine, three km north of Shimoda, Izu Peninsula, Shizuoka Prefecture [TL], and at the Suttsu mine, Hokkaido. From the Dianne Cu–U claims, Mazenod Lake, Northwest Territories, Canada. In the USA, at the Lone Pine mine, near Silver City, Grant Co., New Mexico; in the Ward mine, south of Ely, Ward district, White Pine Co., and at Montreal Canyon, Fitting district, Mineral Co., Nevada. From Jilové, Czech Republic. At Ocna de Fier (Morávicza; Vaskő), Romania.

Name: For the Kawazu mine, Japan.

Type Material: National Science Museum, Tokyo, Japan, M16403; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 121926, 160136.

Mineral Group: Lovozerite group.

Occurrence: In sodalite-rich syenites in an alkalic massif (Lovozero massif, Russia).

Association: Nordite, belovite, vuonnemite, alkalic feldspars, ussingite (Lovozero massif, Russia); villiaumite, delhayelite, lamprophyllite, lomonosovite, feldspars, nepheline, aegirine (Khibiny massif, Russia).

Distribution: On Mts. Karnasurt and Alluaiv, Lovozero massif, and in the Khibiny massif, Kola Peninsula, Russia.

Name: For Mariya Efimovna Kazakova (1913–1982), Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia, analytical chemist who provided the mineral's analysis.

Type Material: Mining Institute, St. Petersburg, 1081/2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75513, 76106, vis3466.

Keckite $\mathbf{Ca(Mn^{2+},Zn)_2Fe_3^{3+}(PO_4)_4(OH)_3 \cdot 2H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [001], to 2 mm; in tufted or fan-shaped groups. *Twinning:* Reported, probably on {111} and {110}.

Physical Properties: *Cleavage:* Poor on {001}, and poorer on {100}. *Tenacity:* Flexible but not elastic. Hardness = 4.5 D(meas.) = 2.60 D(calc.) = 2.649

Optical Properties: Translucent. *Color:* Dirty gray-brown to brown, yellow-brown.
Luster: Dull.
Optical Class: Biaxial (–); undulatory extinction. *Pleochroism:* X = reddish brown; Y = yellow; Z = paler yellow. *Orientation:* $Z = b$; $X \wedge c = 15$–$22°$. *Absorption:* $X \gg Y \geq Z$. α = n.d. $\beta = 1.692$ $\gamma = 1.699$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$. $a = 15.02(1)$ $b = 7.19(5)$ $c = 19.74(2)$ $\beta = 110°30(1)'$ Z = 2

X-ray Powder Pattern: Hagendorf, Germany.
2.86 (10), 9.3 (8), 4.98 (5), 3.51 (5d), 2.59 (4), 1.879 (4), 4.63 (3)

Chemistry:

	(1)
P_2O_5	35.75
Fe_2O_3	30.02
MnO	14.85
ZnO	2.24
MgO	0.66
CaO	5.88
H_2O	[10.60]
Total	[100.00]

(1) Hagendorf, Germany; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO, H_2O by difference, $(OH)^{1-}$ determined by IR; corresponding to $(Ca_{0.83}Mg_{0.13})_{\Sigma=0.96}(Mn_{1.66}Zn_{0.22})_{\Sigma=1.88}$ $Fe^{3+}_{2.99}(PO_4)_4(OH)_{2.65} \cdot 2.03H_2O$.

Mineral Group: Whiteite group.

Occurrence: A weathering product of phosphate minerals in a complex granite pegmatite.

Association: Rockbridgeite, phosphophyllite, scholzite, fairfieldite, vivianite, reddingite, huréaulite, strengite, apatite.

Distribution: In Germany, in Bavaria, from Hagendorf, at the Silbergrube quarry, near Waidhaus, and at Hühnerkobel, near Zwiesel. In the Bendada pegmatite, near Guarda, Portugal.

Name: Honors Erich Keck, Etzenricht, Germany, collector of Hagendorf minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145616, 145617.

Kegelite $Pb_8Al_4Si_8O_{20}(SO_4)_2(CO_3)_4(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$, 2, or m. As pseudohexagonal plates with dominant {100}, to 0.3 mm, forming spherical aggregates.

Physical Properties: *Cleavage:* {100}, perfect. *Tenacity:* Extremely flexible. Hardness = n.d. D(meas.) = ∼4.5 D(calc.) = 4.76

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous. *Optical Class:* Biaxial (–). $n = 1.81 \parallel \{100\}$. 2V(meas.) = n.d.

Cell Data: *Space Group:* $A2/m$, $A2$, or Am. $a = 21.04(1)$ $b = 15.55(1)$ $c = 8.986(6)$ $\beta = 91.0(1)^\circ$ Z = 3

X-ray Powder Pattern: Tsumeb, Namibia.
21.0 (100), 2.591 (90), 3.82 (80), 7.01 (50), 3.006 (50), 2.339 (50), 3.74 (40)

Chemistry:

	(1)
SiO_2	17.0
Al_2O_3	7.1
FeO	trace
MnO	0.0
CuO	1.5
ZnO	trace
PbO	60.9
CaO	0.0

CO_2	7.0
SO_3	5.5
Total	101.6

(1) Tsumeb, Namibia; by electron microprobe, CO_2 by a C analyzer, H_2O and SO_3 by TGA and EGA; corresponding to $Pb_{7.55}Cu_{0.52}Al_{3.85}Si_{7.83}O_{19.22}(SO_4)_{1.90}(CO_3)_{4.40}(OH)_{7.98}$.

Occurrence: In a deep oxidation zone in a polymetallic mineral deposit.

Association: Quartz, galena, mimetite, hematite, leadhillite, anglesite, fleischerite, melanotekite, alamosite.

Distribution: From Tsumeb, Namibia.

Name: For Friedrich Wilhelm Kegel (?–1948), Director of mining operations (1922–1938) at Tsumeb, Namibia.

Type Material: National Museum of Natural History, Washington, D.C., USA, 134514, 147460.

Keilite $(Fe^{2+}, Mg)S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Granular, to several hundred μm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.59–3.67

Optical Properties: Opaque. *Color:* Gray.
Optical Class: Isotropic.
R: (400) 27.0, (420) 27.1, (440) 27.6, (460) 27.2, (480) 27.1, (500) 26.6, (520) 26.6, (540) 26.6, (560) 26.5, (580) 26.7, (600) 25.9, (620) 26.2, (640) 26.1, (660) 25.9, (680) 26.0, (700) 25.9

Cell Data: *Space Group:* $Fm3m$ (by analogy to synthetic MgS). a = 5.17–5.18 Z = 4

X-ray Powder Pattern: Abee meteorite.
2.584 (vs), 1.829 (s)

Chemistry:

	(1)	(2)
Fe	40.14	38.71
Mg	10.05	16.84
Mn	3.37	
Ca	1.98	
Cr	1.91	
Zn	0.24	
Ti	0.06	
Ni	0.01	
S	41.39	44.45
Total	99.15	100.00

(1) Abee meteorite; by electron microprobe, corresponding to $(Fe_{0.56}Mg_{0.32}Mn_{0.05}Ca_{0.04}Cr_{0.03})_{\Sigma=1.00}S_{1.00}$. (2) (Fe, Mg)S with Fe:Mg = 1:1.

Mineral Group: Galena group.

Occurrence: An accessory mineral in enstatite chondrite meteorites.

Association: Niningerite, enstatite, kamacite, troilite.

Distribution: From the Abee [TL], Adhi-Kot, Saint-Sauveur, LEW 88180, RKP A80259, LEW 87119, LEW 88714, Y-791790, Y-791811, Y-86760, Y8404 meteorites.

Name: In honor of Dr. Klaus Keil (1934–), Hawaii Institute of Geophysics and Planetology, University of Hawaii, Honolulu, Hawaii, USA, for his research on chondritic meteorites.

Type Material: University of Hawaii, Honolulu, Hawaii, USA, 13.

References: (1) Shimizu, M., H. Yoshida, and J.A, Mandarino (2002) The new mineral species keilite, (Fe, Mg)S, the iron-dominant analog of niningerite. Can. Mineral., 40, 1687–1692. (2) (??) Amer. Mineral., ??, ?? (abs. ref. 1).

Keithconnite $Pd_{20}Te_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As grains, to 220 μm, and inclusions in platinum-group element nuggets.

Physical Properties: Hardness = n.d. VHN = 394–424, 410 average (15 g load). D(meas.) = n.d. D(calc.) = 11.72

Optical Properties: Opaque. *Color:* In polished section, cream colored, where isolated; dull cream with brownish tint with kotulskite; gray next to telluropalladinite. *Pleochroism:* Not detectable in air; very slight in oil. *Anisotropism:* Moderate to strong.
R_1–R_2: (400) 40.8–40.6, (420) 41.6–41.1, (440) 41.8–41.5, (460) 42.0–42.0, (480) 42.3–42.6, (500) 42.9–43.4, (520) 43.6–44.1, (540) 44.4–44.9, (560) 45.3–45.8, (580) 46.0–46.6, (600) 46.8–47.5, (620) 48.0–48.8, (640) 49.3–49.9, (660) 50.6–50.9, (680) 52.0–52.1, (700) 53.5–53.4

Cell Data: *Space Group:* $R\overline{3}$. $a = 11.458(10)$ $c = 11.296(12)$ $Z = 3$

X-ray Powder Pattern: Stillwater complex, Montana, USA.
2.26 (100), 2.16 (90), 0.791 (40), 1.32 (30), 0.885 (30), 2.22 (20), 1.40 (20)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
Pd	68.7	67.31	70.44	Pb	1.6		
Pt		3.19		As		0.32	
Rh		0.13		Bi	1.0		
Fe		0.11		Te	29.1	30.45	29.56
				Total	100.4	101.51	100.00

(1) Stillwater complex, Montana, USA; by electron microprobe, corresponding to $Pd_{19.81}Pb_{0.24}Bi_{0.15}Te_{7.00}$. (2) Pustaya River, Russia; by electron microprobe, corresponding to $Pd_{18.55}Pt_{0.48}Fe_{0.06}Rh_{0.04}As_{0.12}Te_{7.00}$. (3) $Pd_{20}Te_7$.

Occurrence: Rare with other platinum-group minerals in layered ultrabasic complexes and their placers.

Association: Merenskyite, kotulskite, telluropalladinite, moncheite, vysotskite, gold, magnetite (Stillwater complex, Montana, USA).

Distribution: From the Stillwater complex, Montana, USA [TL]. In the Bird River sill, Manitoba, Canada. From the Department of Chocó, Cauca, Colombia. At the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland. From the Pustaya River placers, Kamchatka, Russia. In placers in the Veluće ophiolite complex, Serbia. Found in rocks of the Mine Series, Katanga Province, Congo (Shaba Province, Zaire). In the Manampotsy district, Madagascar. In Burma, from the Chindwin River placers.

Name: Honors H. Keith Conn (1923–), the geologist largely responsible for the discovery of Pt–Pd mineralization of parts of the Stillwater complex, Montana.

Type Material: Canadian Geological Survey, Ottawa, 12187, 12188; Royal Ontario Museum, Toronto, Canada, M35867; National Museum of Natural History, Washington, D.C., USA, 114975.

References: (1) Cabri, L.J., J.F. Rowland, J.H.G. Laflamme, and J.M. Stewart (1979) Keithconnite, telluropalladinite, and other Pd–Pt tellurides from the Stillwater Complex, Montana. Can. Lu_2O_3	2.61	1.05
CaO	0.00	0.30
Total	100.73	99.83

(1–2) Mt. Ploskaya, Russia; by electron microprobe; when averaged with another intermediate analysis, corresponds to $(Y_{1.55}Yb_{0.20}Er_{0.10}Dy_{0.08}Ca_{0.04}Tm_{0.02}Lu_{0.02}Ho_{0.02}Gd_{0.01})_{\Sigma=2.04}Si_{1.98}O_7$.

Polymorphism & Series: Forms a series with keiviite-(Yb).

Occurrence: In fissures in quartz and fluorite in "amazonite" pegmatites.

Association: Keiviite-(Yb), thalenite, xenotime, bastnäsite, kuliokite-(Y), quartz, fluorite.

Distribution: From Mt. Ploskaya, Keivy massif, Kola Peninsula, Russia.

Name: For the relation to *keiviite*-(Yb) and the *yttrium* content.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5958/6; Mining Institute, St. Petersburg, 1343-1/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia,

Total	98.92	99.52

(1) Lovozero massif, Russia; average of three partial analyses. (2) Do.; corresponds to $(Na_{1.79}Ca_{0.07})_{\Sigma=1.86}(Zr_{0.97}Ti_{0.01}Fe_{0.01})_{\Sigma=0.99}Si_2O_{6.94}$.

Occurrence: A primary mineral in foyaites composed of partly albitized microcline, nepheline, sodalite, aegirine, and alkali amphibole, in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Eudialyte, lorenzenite (Lovozero massif, Russia).

Distribution: In the vicinity of the Tavaiok and Angoundasiok Rivers and on Mt. Alluaiv, Lovozero massif, and at Tachtarvumchorr, Khibiny massif, Kola Peninsula, Russia. From Lågendalen, near Larvik, Norway.

Name: For Russian mathematician Mstislav Vsevolodovich Keldysh (1911–1978), President of the Academy of Sciences, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64710, 64711.

Kellyite $(Mn^{2+}, Mg, Al)_3(Si, Al)_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 6. As irregular to platy tablets and laths, to 3 mm.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = n.d. D(meas.) = 3.07 D(calc.) = 3.11

Optical Properties: Transparent. *Color:* Yellow; light yellow in thin section. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless to greenish yellow; $Y = Z$ = pale yellow to reddish brown. *Orientation:* $X \perp (0001)$. *Dispersion:* $r > v$, moderate. $\alpha = 1.639(1)$ $\beta = 1.646(1)$ $\gamma = 1.646(1)$ 2V(meas.) = 30°–16°

Cell Data: *Space Group:* $P6_3$. $a = 5.438(8)$ $c = 14.04(1)$ Z = [4]

X-ray Powder Pattern: Bald Knob, North Carolina, USA.
3.51 (100), 7.0 (90), 2.53 (60), 2.67 (40), 2.34 (40), 1.954 (30), 1.570 (30)

Chemistry:

	(1)
SiO_2	17.60
TiO_2	< 0.05
Al_2O_3	28.55
Fe_2O_3	2.18
MnO	38.84
MgO	2.97
H_2O	[10.82]
Total	[100.96]

(1) Bald Knob, North Carolina, USA; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Mn_{1.82}Al_{0.84}Mg_{0.24}Fe_{0.09})_{\Sigma=2.99}(Al_{1.02}Si_{0.98})_{\Sigma=2.00}O_5(OH)_4$.

Polymorphism & Series: two-layer hexagonal and six-layer rhombohedral polytypes noted.

Mineral Group: Kaolinite-serpentine group.

Occurrence: In banded Ca-Mn carbonate-rich rocks (Bald Knob mine, North Carolina, USA); in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Kutnohorite, galaxite, jacobsite, manganoan chlorite, alleghanyite, sonolite (Bald Knob mine, North Carolina, USA); aegirine, analcime, calcite, catapleiite, microcline, natrolite (Mont Saint-Hilaire, Canada).

Distribution: In the Bald Knob mine, near Sparta, Alleghany Co., North Carolina, USA. From Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Professor William Crowe Kelly (1929–), geologist, of the University of Michigan, Ann Arbor, Michigan, USA.

Type Material: Department of Geological Sciences, University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA, 127101, 137140, 137141.

Kelyanite $Hg_{36}Sb_3O_{28}(Cl,Br)_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. As irregular grains, to 2 mm.

Physical Properties: Hardness = 3–3.5 VHN = 247 (20 g load). D(meas.) = 8.51–8.63, 8.57 average. D(calc.) = 8.51

Optical Properties: Translucent. *Color:* Reddish brown; grayish white in reflected light, with deep brownish red to raspberry-red internal reflections. *Streak:* Resinous to vitreous. *Optical Class:* Biaxial. $n = > 2.0$ 2V(meas.) = n.d. *Pleochroism:* Reddish brown to pale brown. *Anisotropism:* Noted. *Bireflectance:* Weak.
R_1–R_2: (460) 20.5–19.9, (546) 18.9–18.1, (620) 17.8–17.1

Cell Data: *Space Group:* $C2/m$, $C2/c$, Cm, Cc, or $C2$. $a = 23.50(12)$ $b = 13.62(6)$ $c = 10.31(5)$ $\beta = 97.01(12)^\circ$ $Z = 2$

X-ray Powder Pattern: Kelyana mine, Russia.
3.30 (10), 3.78 (6), 2.72 (6), 2.53 (6), 3.24 (5), 2.364 (5), 1.954 (5)

Chemistry:

	(1)
Hg	85.6
Sb	4.70
O	5.35
Cl	3.31
Br	0.91
Total	99.87

(1) Kelyana mine, Russia; by electron microprobe, average of 12 analyses; corresponding to $Hg_{35.99}Sb_{3.28}O_{28.07}(Cl_{7.82}Br_{0.93})_{\Sigma=8.75}$, probably $Hg_{20}^{2+}Hg_{16}^{1+}Sb_3^{3+}O_{28}(Cl,Br)_9$.

Occurrence: In the oxidation zone of a stibnite-cinnabar ore deposit.

Association: Calomel, eglestonite, mercury, shakhovite, antimony oxides.

Distribution: In the Kelyana Sb–Hg mine, North Muya Range, Buryatia, Transbaikal region, Siberia, Russia.

Name: For the Kelyana mine, Russia, where it was first found.

Type Material: Central Siberian Geological Museum, Siberian Division, Academy of Sciences, Novosibirsk, VI-20/1; Mining Institute, St. Petersburg, 1203/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80163.

Kemmlitzite $(Sr,Ce)Al_3(AsO_4)(SO_4)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. As pseudocubic rhombohedral crystals, to 0.15 mm, rarely modified by {0001}.

Physical Properties: *Cleavage:* Poor on {0001}. Hardness = 5.5 D(meas.) = 3.63 D(calc.) = 3.601 Low magnetic susceptibility.

Optical Properties: Transparent to translucent. *Color:* Pale gray-brown with a yellow tint, brownish; in transmitted light, colorless to brown-yellow, commonly zoned.
Optical Class: Uniaxial (+). $\omega = 1.701(1)$ $\epsilon = 1.707(1)$

Cell Data: *Space Group:* $[R\overline{3}m]$ (by analogy to beudantite). $a = 7.027(1)$ $c = 16.51(1)$ Z = 3

X-ray Powder Pattern: Kemmlitz, Germany.
2.959 (10), 3.514 (9), 1.903 (9), 2.203 (8), 1.757 (8), 5.71 (7), 1.292 (6)

Chemistry:

	(1)
SO_3	5.99

Total	98.16

(1) Kemmlitz, Germany; $RE_2O_3 = Ce_2O_3$ 57.00%, La_2O_3 26.35%, Nd_2O_3 15.77%, Sm_2O_3 0.88%; AsO_4, SO_4, PO_4, $(OH)^{1-}$, and H_2O confirmed by IR; corresponding to $(Sr_{0.42}RE_{0.40}Mg_{0.12}Ca_{0.08})_{\Sigma=1.02}(Al_{2.79}Fe^{3+}_{0.05})_{\Sigma=2.84}(AsO_4)_{0.98}[(PO_4)_{0.42}(SO_4)_{0.39}(SiO_4)_{0.19}]_{\Sigma=1.00}(OH)_{5.22}\bullet 0.88H_2O$.

Mineral Group: Beudantite group.

Occurrence: In a kaolinized quartz porphyry, in a heavy-fraction separate of undetermined origin as to primary or secondary formation.

Association: Kaolinite, zircon, anatase, apatite, 13 other less-abundant heavy minerals.

Distribution: From the Kemmlitz kaolin deposit, near Oschatz, Saxony, Germany.

Name: For the locality of the first specimens, Kemmlitz, Germany.

Type Material: National Museum, Prague, Czech Republic, 53508; National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, USA, 109097.

H_2O	11.60	13.76
Total	[100.00]	100.00

(1) Alum Rock Canyon, California, USA; O by difference, recalculated to 100% after deduction of insoluble material. (2) $Mn_2Cl(OH)_3$.

Occurrence: In an erratic boulder with other manganese-bearing species.

Association: Pyrochroite, hausmannite, rhodochrosite, tephroite, "psilomelane".

Distribution: In Alum Rock Canyon, eight km east of San Jose, Santa Clara Co., California, USA.

Name: Honors economic geologist James Furman Kemp (1859–1926), Professor of Geology, Columbia University, New York City, New York, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R1352.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 73–74.

Kenhsuite γ–$Hg_3S_2Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. Crystals elongated ‖ [010], lath-shaped on {001}, to 18 cm; typically in radiating agregates, may be tufted and hairlike. *Twinning:* On {$\overline{4}$11}.

Physical Properties: *Cleavage:* Perfect on {001}; parting on {010}. *Tenacity:* Sectile, thin fragments flexible. Hardness = 1–1.5 VHN = 30–90 (5 g load). D(meas.) = 4.68 D(calc.) = 4.88

Optical Properties: Translucent. *Color:* Cherry-red; red in thin fragments. *Streak:* Brownish red. *Luster:* Adamantine to semimetallic.
Optical Class: Biaxial (+). *Orientation:* $Z = b$. $\alpha = 2.99$ $\beta = 3.14$ $\gamma = 3.48$
Anisotropism: Very strong to extreme.
R_1–R_2: (400) 31.1–37.5, (420) 30.0–36.4, (440) 29.0–35.2, (460) 28.0–34.0, (480) 27.2–33.0, (500) 26.4–32.2, (520) 25.7–31.3, (540) 25.2–30.6, (560) 24.8–30.0, (580) 24.4–29.4, (600) 24.0–29.0, (620) 23.8–28.6, (640) 23.5–28.2, (660) 23.4–28.0, (680) 23.2–27.8, (700) 23.1–27.7

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.147(1)$ $b = 10.709(1)$ $c = 5.785(1)$ $\alpha = 102.78(2)°$ $\beta = 110.63(2)°$ $\gamma = 101.00(1)°$ Z = 4

X-ray Powder Pattern: Zimbabwe. (ICDD 11-91).
2.92 (100), 3.13 (90), 2.69 (70), 4.06 (60), 1.782 (60), 5.29 (50), 2.49 (50)

Chemistry:

	(1)	(2)
Sb	75.2	75.24
O	4.8	4.94
S	19.9	19.82
Total	99.9	100.00

(1) Globe and Phoenix mine, Zimbabwe; by electron microprobe. (2) Sb_2OS_2.

Occurrence: A secondary mineral, as an alteration of stibnite, in antimony deposits.

Association: Stibnite, antimony, sénarmontite, valentinite, cervantite, stibiconite.

Distribution: In small amounts in many deposits. From Bräunsdorf, near Freiberg, Saxony, Germany. Fine examples from the Kriznica mine, near Pernek, and in the Pezinok mine, Malé Karpaty Mountains, Slovakia. At Příbram, Czech Republic. In the Chalanches mine, near Allemont, Isère, France. From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. At Kadamdja, Kyrgyzstan. In the Santa Cruz and San Francisco mines, Poopó, Oruro, Bolivia. Exceptional radiating groups from the Globe and Phoenix mine, Kwekwe (Que Que), Zimbabwe. At Sombrerete, Zacatecas, Mexico. From Canada, in the Lac Nicolet mine, South Ham, Quebec, and at other localities. In the USA, at the Mohave mine, Kern Co., California; noted at nearly 30 localities in Nevada, all minor. From Broken Hill, New South Wales, Australia. Outstanding examples from ??, China.

Name: From *kermes* (after Persian *qurmizq, crimson*) for red amorphous antimony trisulfide.

				Total	98.00	96.99	100.00

(1) "Chile." (2) Långban, Sweden; by electron microprobe, corresponding to $Pb_{1.98}(Mn_{1.28}Fe_{0.61}Al_{0.04}Ti_{0.04}Mg_{0.01})_{\Sigma=1.98}Si_{2.02}O_9$. (3) $Pb_2Mn_2O_2Si_2O_7$.

Polymorphism & Series: Forms a series with melanotekite.

Occurrence: In a cavity in calcite in a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA); in veinlets cutting franklinite ore in bedded manganese deposits (Ushkatyn deposits, Kazakhstan).

Association: Quartz, barite, apatite ("Chile"); braunite, richterite, barite (Långban, Sweden); calcite, willemite, franklinite (Franklin, New Jersey, USA); garnet, tephroite, franklinite, braunite (Ushkatyn deposits, Kazakhstan).

Distribution: The unknown type locality is "southern Chile." From Långban; Jakobsberg; the Harstigen mine, near Persberg; and the Klintgruvan mine, near Kryibo, Värmland, Sweden. From Bona de Padru, near Ozieri, Sardinia, Italy. At Higher Pitts Farm, Priddy, Somerset, England. In the Kombat mine, 49 km south of Tsumeb, Namibia. In South Africa, in the Wessels mine, near Kuruman, Cape Province. From the Ushkatyn deposits, Atasui area, Kazakhstan. At Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *spike* or *thorn*, for its prismatic habit.

(1) Lake Magadi, Kenya. (2) $Na_2Si_{22}O_{41}(OH)_8 \cdot 6H_2O$.

Occurrence: As concretions, with chert cores, embedded in magadiite; perhaps as a reaction product between the two (Lake Magadi, Kenya); in altered volcanic rocks (Trinity Co., California, USA).

Association: Magadiite, quartz.

Distribution: From Lake Magadi, Rift Valley, Kenya. In Niger, at Kafra. In the USA, from five km north of Trinity Lake, Trinity Co., California.

Name: For the locality in Kenya.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 121336, 121337.

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\bar{1}$. Crystals elongated || [010], lath-shaped on {001}, in radiating aggegates to 5 cm, sometimes tufted and hair-like.

Physical Properties: *Cleavage:* Perfect on {001}; parting on {010}. *Tenacity:* Sectile, thin splinters flexible. Hardness = 1–1.5 VHN = 30–90 (5 g load). D(meas.) = 4.68 D(calc.) = 4.69

Optical Properties: Translucent. *Color:* Cherry-red; red in thin splinters. *Streak:* Brownish red. *Luster:* Adamantine to semimetallic.
Optical Class: Biaxial (+). *Orientation:* $Z = b$ = elongation. $\alpha = > 2.72$ $\beta = > 2.72$ $\gamma = > 2.72$ *Anisotropism:* Very strong to extreme.
R_1–R_2: (400) 31.1–37.5, (420) 30.0–36.4, (440) 29.0–35.2, (460) 28.0–34.0, (480) 27.2–33.0, (500) 26.4–32.2, (520) 25.7–31.3, (540) 25.2–30.6, (560) 24.8–30.0, (580) 24.4–29.4, (600) 24.0–29.0, (620) 23.8–28.6, (640) 23.5–28.2, (660) 23.4–28.0, (680) 23.2–27.8, (700) 23.1–27.7

Cell Data: *Space Group:* $C2/m$ (apparent). $a = 10.784$ $b = 4.065$ $c = 10.206$ $\beta = 101°31'$ Z = 4

X-ray Powder Pattern: Zimbabwe. (JCPDS 11-91).
2.92 (100), 3.13 (90), 2.69 (70), 4.06 (60), 1.782 (60), 5.29 (50), 2.49 (50)

Sb	75.2	75.24
S	19.9	19.82
O	4.8	4.94
Total	99.9	100.00

(1) Globe and Phoenix mine, Zimbabwe; by electron microprobe. (2) Sb_2S_2O.

Occurrence: A secondary mineral, as an alteration of stibnite, in antimony deposits.

Association: Stibnite, antimony, senarmontite, valentinite, cervantite, stibiconite.

Distribution: In small amounts in many deposits. At Braunsdorf, near Freiberg, Saxony, Germany. From Pernek, Pezinok, and Příbram, Czechoslovakia. In the Chalanches mine, near Allemont, Iseré, France. From the Cetine mine, near Siena, Tuscany, Italy. At Kadamdja, Kirgizia, USSR. In the Santa Cruz and San Francisco mines, Poopó, Oruro, Bolivia. From Broken Hill, New South Wales, Australia. Exceptional radiating groups from the Globe and Phoenix mine, Que Que, Zimbabwe. At Sombrerete, Zacatecas, Mexico. From Canada, in the Lac Nicolet mine, South Ham Township, Wolfe Co., Quebec, and at other localities.

Name: From *kermes* (after Persian *qurmizq, crimson*) for red amorphous antimony trisulfide.

Kernite $Na_2B_4O_6(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly nearly equant, with over 30 forms noted; typically as cleavable masses, to 3.5 m, bent or warped; massive. *Twinning:* On {011}.

Physical Properties: *Cleavage:* On {100} and {001}, perfect; on $\{\bar{1}02\}$, fair. *Fracture:* Splintery. *Tenacity:* Flexible and elastic in cleavage fragments. Hardness = 2.5 D(meas.) = 1.906(3) D(calc.) = 1.905 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless, white if surficially altered to tincalconite. *Streak:* White. *Luster:* Vitreous, satiny on fibrous cleavages.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 70.5°$. *Dispersion:* $r > v$, slight to distinct. $\alpha = 1.454$ $\beta = 1.472$ $\gamma = 1.488$ 2V(meas.) = 80°

Cell Data: *Space Group:* $P2_1/c$. $a = 7.0172(2)$ $b = 9.1582(2)$ $c = 15.6774(5)$ $\beta = 108.861(2)°$ Z = 4

(1) Kern Co., California, USA. (2) $Na_2B_4O_6(OH)_2 \cdot 3H_2O$

Occurrence: An important ore mineral of borax in sedimentary borate deposits, deposited under warm conditions or formed by metamorphism.

Association: Borax, inyoite, ulexite, colemanite.

Distribution: From the Kramer borate deposit, Boron, Kern Co., California, USA. In the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. From the Kirka borate deposit, Kütahya Province, Turkey.

Name: For Kern Co., California, USA, in which Boron is located.

Type Material: Harvard University, Cambridge, Massachusetts, 88508; National Museum of Natural History, Washington, D.C., USA, 95643.

Kesterite $Cu_2(Zn, Fe)SnS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $\overline{4}$. Massive.

Physical Properties: Hardness = 4.5 VHN = 328–348 (100 g load). D(meas.) = 4.54–4.59 D(calc.) = 4.524

Optical Properties: Opaque. *Color:* Greenish black. *Streak:* Black. *Luster:* Metallic. R_1–R_2: (400) 23.7–24.5, (420) 24.4–25.2, (440) 24.9–25.8, (460) 25.4–26.0, (480) 25.6–26.0, (500) 25.6–25.9, (520) 25.2–25.7, (540) 24.9–25.6, (560) 24.6–25.5, (580) 24.5–25.5, (600) 24.4–25.4, (620) 24.3–25.3, (640) 24.2–25.1, (660) 24.2–25.1, (680) 24.3–25.2, (700) 24.6–25.4

Cell Data: *Space Group:* $I\overline{4}$. $a = 5.427$ $c = 10.871$ Z = 2

X-ray Powder Pattern: Kester deposit, Russia.
3.15 (100), 1.929 (70), 1.645 (50), 1.113 (40), 2.73 (30), 1.248 (30), 0.860 (30)

Chemistry:

	(1)	(2)
Cu	30.56	29.40
Zn	11.16	10.18
Fe	1.68	3.12
Sn	25.25	28.07
S	28.40	29.19
rem.	0.98	
Total	98.03	99.96

(1) Kester deposit, Russia; remainder Mn 0.07%, Sb 0.90%, Se 0.01%; corresponding to $Cu_{2.17}(Zn_{0.77}Fe_{0.14})_{\Sigma=0.91}Sn_{0.96}S_{4.00}$. (2) St. Michael's Mount, England; by electron microprobe corresponding to $Cu_{2.03}(Zn_{0.68}Fe_{0.24})_{\Sigma=0.92}Sn_{1.04}S_{4.00}$.

Occurrence: In quartz-sulfide hydrothermal veinlets in tin deposits.

Association: Arsenopyrite, stannoidite, chalcopyrite, chalcocite, sphalerite, tennantite.

Distribution: From the Kester deposit, Arga-Ynnakh-Khai granite massif, Yana-Adycha River region, Sakha, Russia [TL]. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. From the Dachang district, Guangxi Autonomous Region, China. In the Ikuno mine, Hyogo Prefecture, and the Toyoha mine, Hokkaido, Japan. At Cínovec (Zinnwald), Czech Republic. From St. Michael's Mount, Marazion, and in the Cligga mine, Perranzabuloe, Cornwall, England. From Chizeuil, Saône-et-Loire, France. At Kirki, Thrace, Greece. In Canada, from the Snowflake mine, Revelstoke mining division, British Columbia; at the Brunswick tin mine, 55 km southwest of Fredericton, New Brunswick; and in the Kidd Creek mine, near Timmins, Ontario. In the USA, from the Hugo mine and in the Peerless pegmatite, near Keystone, Pennington Co., South Dakota; at the Cove mine, McCoy district, Lander Co., Nevada; in the Campbell mine, Bisbee, Cochise Co., Arizona. From the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. At Oruro, Bolivia. A few other minor occurrences are known.

Name: For the locality in Russia at the Kester deposit.

Type Material: Mineralogical Museum, St. Petersburg University, 16188, 16324–16326, 16351, 16352; Mining Institute, St. Petersburg, Russia, 163a/2.

Kettnerite $CaBiO(CO_3)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal by twinning. *Point Group:* $2/m\ 2/m\ 2/m$. Crystal plates, to 0.3 mm, showing {001}, {111}, {10•10}; in spherical aggregates. *Twinning:* At a very fine scale.

Physical Properties: Hardness = "Soft". D(meas.) = 5.80 D(calc.) = [5.85]

Optical Properties: Semitransparent. *Color:* Brown, brownish yellow, lemon-yellow. *Optical Class:* Biaxial or uniaxial. $n = > 2.05$ α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group: Pmmn.* a = 3.7976(2) b = 3.7976(2) c = 13.569(4) Z = 2

X-ray Powder Pattern: Krupka, Czech Republic.
2.89 (10), 1.732 (9), 1.589 (9), 1.893 (8), 1.200 (8), 2.104 (7), 1.278 (6)

Chemistry:

	(1)	(2)
CO_2	12.6	12.79
Bi_2O_3	67.9	67.71
CaO	8.3	8.15
CaF_2	10.6	11.35
H_2O	0.5	
Total	99.9	100.00

(1) Krupka, Czech Republic; by microchemical analysis. (2) $CaBiO(CO_3)F$.

Occurrence: In a quartz vein cutting pegmatitic potassian feldspar (Krupka, Czech Republic).

Association: Fluorite, bismuth, bismuthinite, hematite, topaz (Krupka, Czech Republic); perite, hemimorphite, embolite, fluorite, chrysocolla, quartz (Blue Bell claims, California, USA).

Distribution: From Krupka, Krušné hory Mountains, and at Jáchymov (Joachimsthal), Czech Republic. From Niederschlema and from the Waldschacht, near Schneeberg, Saxony, and in the Clara mine, near Oberwolfach, Black Forest, Germany. In the USA, from near Bowie, Cochise Co., Arizona; at the Apache mine, Hidalgo Co., New Mexico; from the Blue Bell claims, near Baker, San Bernardino Co., California. At Kudul, Tajikistan.

Name: Honoring Radim Kettner (1891–1968), Professor of Geology, Charles University, Czech Republic.

Type Material: National Museum, Prague, Czech Republic, 43298.

(1) Tsumeb, Namibia; by electron microprobe, average of six analyses on five crystals; no H_2O detected; with H_2O from crystal-structure analysis, corresponds to $Cu_3(Zn_{3.33}Cu_{0.58})_{\Sigma=3.91}(Cd_{1.66}Mn_{0.23}Ca_{0.21}Pb_{0.03})_{\Sigma=2.13}(AsO_4)_{5.98} \cdot 2H_2O$. (2) Do.; by electron microprobe, H_2O determined from crystal-structure analysis; corresponds to $Cu_3(Zn_{3.68}Cu_{0.14})_{\Sigma=3.82}(Cd_{1.69}Mn_{0.20}Ca_{0.14}Pb_{0.10})_{\Sigma=2.13}(AsO_4)_{6.02} \cdot 2H_2O$.

Occurrence: A secondary mineral in the oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Cuprian adamite, schulténite, metazeunerite, zincian olivenite, tennantite.

Distribution: From Tsumeb, Namibia.

Name: Honors Charles Locke Key (1935–), Windhoek, Namibia, American mineral dealer who furnished the first specimen.

Type Material: The Natural History Museum, London, England, 1973,236, 1975,660; Harvard University, Cambridge, Massachusetts, USA, 119917.

$-O = F_2$			1.73
Total	98.5		100.00

(1) Saghand, Iran; SO_3 and H_2O by TGA, corresponding to $Al_{1.00}(SO_4)_{1.04}(OH)_{0.92} \cdot 4.99H_2O$; however crystal-structure analysis obviates the presence of $(OH)^{1-}$. (2) Lone Pine mine, New Mexico, USA; partial analysis, Al_2O_3 calculated from Al 8.3%. (3) $Al(SO_4)(F, OH) \cdot 5H_2O$ with F:OH = 1:1.

Occurrence: Rarely formed in the oxidized zone of hydrothermal base-metal deposits.

Association: Copiapite, amarantite, parabutlerite, butlerite, jarosite (Saghand, Iran); wilcoxite, lannonite, gypsum (Lone Pine mine, New Mexico, USA).

Distribution: From Saghand, Yazd, Iran. At the Rammelsberg mine, near Goslar, Harz Mountains, Germany. In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. From the Schoeller mine, Libušin, near Kladno, Czech Republic. In the Lone Pine mine, Wilcox district, near Silver City, Catron Co., New Mexico, USA.

Name: To honor Nasrollah Khadem (1910–), Director of the Geological Survey of Iran.

Type Material: n.d.

Total	[97.64]

(1) Chatkal Range, Russia; by electron microprobe, average of five analyses, C calculated; corresponding to $(Ti_{0.90}V_{0.08}Fe_{0.02})_{\Sigma=1.00}C_{1.04}$.

Occurrence: In amygdaloidal basaltic porphyries (Chatkal Range, Russia); in spheroidal groups in granodiorites that have undergone silica metasomatism (Chinorsaisk massif, Tadzhikistan).

Association: Suessite (Chatkal Range, Russia); magnetite, iron, carbonaceous material (Chinorsaisk massif, Tadzhikistan).

Distribution: From undefined localities [Ir-Tash stream basin] in the Arashan Mountains, Chatkal Range, and in the Chinorsaisk massif, Zeravshan Range, Tadzhikistan.

Name: Honors Ibragim Khamrabaevich Khamrabaeva (1920–), Director, Institute of Geology and Geophysics, Tashkent, Uzbekistan.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

X-ray Powder Pattern: Listvenitovyi Stream, Russia.
4.27 (10), 2.119 (8), 2.372 (7), 1.920 (7), 3.04 (5), 1.894 (4), 2.156 (2)

Chemistry:

	(1)
Cu	53.93
Zn	1.28
Al	45.11
Total	100.32

(1) Listvenitovii Stream, Russia; by electron microprobe, average of analyses on nine grains; corresponding to $(Cu_{1.02}Zn_{0.02})_{\Sigma=1.04}Al_{2.00}$.

Occurrence: In black slick washed from greenish gray cover weathering from serpentine.

Association: Cupalite, two unnamed zinc aluminides.

Distribution: From near the Listvenitovyi Stream, Khatyrka ultramafic zone of the Koryak–Kamchata fold area, Koryak Mountains, Magadan district, Russia [TL].

Name: For the occurrence in the Khatyrka ultramafic zone, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1687/1.

Khibinskite $K_2ZrSi_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As irregular grains, to 3 mm, in small ovoids zoned with eudialyte.

Physical Properties: Hardness = 4.5–5.5 D(meas.) = 3.40 D(calc.) = 3.33

Optical Properties: Translucent. *Color:* Pale yellowish to white. *Luster:* Dull or greasy. *Optical Class:* Biaxial (–). $\alpha = 1.665$ $\beta = 1.715$ $\gamma = 1.715$ 2V(meas.) = 6°–16°

Cell Data: *Space Group:* $B2/m$ (synthetic). $a = 19.188$ $b = 14.072$ $c = 11.075$ $\gamma = 117°04'$ Z = 16

X-ray Powder Pattern: Khibiny massif, Russia.
2.76 (100), 2.95 (70), 1.630 (65), 2.133 (50), 1.381 (50), 1.252 (45), 1.595 (40)

Chemistry:

	(1)
SiO_2	33.8
TiO_2	0.6
ZrO_2	37.8
CaO	trace
K_2O	27.0
Total	99.2

(1) Khibiny massif, Russia; by electron microprobe, corresponds to $K_{1.98}(Zr_{1.06}Ti_{0.03})_{\Sigma=1.09}Si_{1.94}O_{7.05}$.

Occurrence: In aegirine-rich metasomatic rocks in a differentiated alkalic massif.

Association: Eudialyte, zircon.

Distribution: From the Khibiny massif, in the Hackmann Valley, Kola Peninsula, Russia.

Name: For the locality in the Khibiny massif, Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5089; Mining Institute, St. Petersburg, 1078/1; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76326–76328; National School of Mines, Paris, France; The Natural History Museum, London, England, 1994,11.

Khinite $PbCu_3Te^{6+}O_6(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are dipyramidal, curved and corroded, to 0.15 mm.

Physical Properties: *Cleavage:* On {001}, fair. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 6.5–7.0 D(calc.) = 6.69

Optical Properties: Semitransparent. *Color:* Dark green, bottle-green. *Streak:* Green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = emerald-green; $Y = Z$ = yellowish green. *Absorption:* $Z = Y > X$. $\alpha = 2.110(4)$ $\beta = 2.112(4)$ $\gamma = 2.165(4)$ 2V(meas.) = 20°

Cell Data: *Space Group: Fddd.* $a = 5.740(5)$ $b = 9.983(9)$ $c = 23.96(9)$ Z = 8

X-ray Powder Pattern: Tombstone, Arizona, USA.
2.491 (10), 3.451 (9), 4.866 (8), 2.996 (7), 2.204 (7), 2.818 (6), 1.916 (6)

Chemistry:

	(1)	(2)	(3)
TeO_3	24.5	26.4	26.79
CuO	33.2	35.8	36.41
PbO	32.4	35.0	34.05
H_2O		[2.75]	2.75
Total		[100.0]	100.00

(1) Tombstone, Arizona, USA; insoluble quartz and chlorargyrite present but in an amount too small to be weighed. (2) Analysis (1) recalculated to 100.0% with theoretical H_2O as determined by crystal-structure analysis; corresponding to $Pb_{1.04}Cu_{3.00}Te_{1.00}O_6(OH)_2$. (3) $PbCu_3TeO_6(OH)_2$.

Polymorphism & Series: Dimorphous with parakhinite.

Occurrence: A very rare secondary mineral formed under acid oxidizing conditions from gold–telluride ores in massive vein quartz.

Association: Chlorargyrite, dugganite, quetzalcoatlite, tlapallite, gold, chrysocolla, tenorite, quartz.

Distribution: From the dump of the Old Guard mine, and at the Lucky Cuss, Emerald, and Empire mines, Tombstone, Cochise Co., Arizona, USA.

Name: To honor BaSaw Khin (1931–), Burmese–American mineralogist, Phelps Dodge Corporation.

Type Material: The Natural History Museum, London, England, 1980,541.

References: (1) Williams, S.A. (1978) Khinite, parakhinite, and dugganite, three new tellurates from Tombstone, Arizona. Amer. Mineral., 63, 1016–1019. (2) Burns, P.C., M.A. Cooper, and F.C. Kidwellite $\mathbf{NaFe_9^{3+}(PO_4)_6(OH)_{10}\cdot 5H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. Acicular crystals are elongated along [010] and flattened on {100}, to 50 μm; typically in mats, tufts, or rosettes of feathery crystals; as spheroidal to botyroidal masses and crusts.

Physical Properties: *Cleavage:* Perfect on {100}. Hardness = 3 D(meas.) = > 3.3 D(calc.) = 3.34

Optical Properties: Transparent to translucent. *Color:* Bright yellow to greenish yellow, pale chartreuse-green, greenish white; colorless in transmitted light. *Streak:* Yellow. *Luster:* Silky. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$. $\alpha = 1.787(5)$ $\beta = 1.800(5)$ $\gamma = 1.805(5)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $A2/m$, Am, or $A2$. $a = 20.61(7)$ $b = 5.15(1)$ $c = 13.75(6)$ $\beta = 112.64(15)^\circ$ Z = 2

X-ray Powder Pattern: Fodderstack Mountain, Arkansas, USA.
9.41 (100), 3.413 (55), 3.813 (40), 3.193 (40), 4.017 (35), 3.173 (35), 6.43 (30)

Chemistry:

	(1)	(2)
P_2O_5	31.3	31.41
SiO_2	0.27	
Al_2O_3	0.98	
Fe_2O_3	52.3	53.01
MnO	0.02	
MgO	0.01	
Na_2O	1.60	2.29
H_2O^+	13.3	
H_2O^-	0.3	
H_2O		13.29
Total	[100.08]	100.00

(1) Fodderstack Mountain, Arkansas, USA; original total given as 100.07%, corresponds to $Na_{0.71}(Fe^{3+}_{8.91}Al_{0.26})_{\Sigma=9.17}(PO_4)_6(OH)_{10}\cdot 5H_2O$. (2) $NaFe_9(PO_4)_6(OH)_{10}\cdot 5H_2O$.

Occurrence: As a late-stage replacement of earlier phosphate minerals.

Association: Rockbridgeite, beraunite, strengite, laubmannite, dufrénite, chalcosiderite, goethite.

Distribution: In the USA, in Arkansas, from the Coon Creek and York mines, Polk Co; on Fodderstack Mountain, Montgomery Co.; and on Buckeye Mountain, at Three Oak Gap; in Alabama, from Indian Mountain, Cherokee Co.; at Irish Creek, Rockbridge Co., Virginia. In Germany, from the Rotläufchen mine, Waldgirmes, near Giessen, and the Eleonore mine, Hesse; and in the Clara mine, near Oberwolfach, Black Forest. At the Phoenix United mines, Linkinhorne, Cornwall, England. In Australia, from Broken Hill, New South Wales; in the Iron Monarch quarry, Iron Knob, South Australia; and at the Lake Boga granite quarry, near Swan Hill, Victoria. In the Okatjimukuju pegmatite, near Karibib, Namibia.

Name: Honors Albert Laws Kidwell (1919–), Houston, Texas, USA, for his study of Arkansas phosphate deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137024.

Kieftite $CoSb_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As euhedral to subhedral crystals, showng {100}, {110}, {111}, to 400 μm, in aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. VHN = 420–514, 464 average (100 g load). D(meas.) = 7.2 D(calc.) = 7.63 (for $CoSb_3$).

Optical Properties: Opaque. *Color:* Tin-white in reflected light. *Streak:* Gray. *Luster:* Metallic.
R: (470) 59.0, (546) 58.7, (589) 58.7, (650) 58.7

Cell Data: *Space Group:* $Im3$. a = 9.0411(3) Z = 8

X-ray Powder Pattern: Tunaberg, Sweden.
2.86 (10), 2.02 (8), 0.933 (8), 1.331 (7), 2.42 (6), 1.77 (6), 1.55 (6)

Chemistry:

	(1)
Co	12.8
Ni	0.7
Cu	0.2
Fe	0.3
Sb	85.8
Cl	0.3
Total	100.1

(1) Tunaberg, Sweden; by electron microprobe, average of 30 analyses; corresponding to $(Co_{0.91}Ni_{0.05}Fe_{0.02}Cu_{0.02})_{\Sigma=1.00}(Sb_{2.97}Cl_{0.03})_{\Sigma=3.00}$.

Occurrence: In a polymetallic sulfide skarn deposit.

Association: Chalcopyrite, dyscrasite, bornite, galena, bismuth, silver, gudmundite, tetrahedrite.

Distribution: From Tunaberg, Sweden [TL].

Name: Honors Dr. Cornelis Kieft (1924–), for his contributions to ore mineralogy.

Type Material: Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands.

References: (1) Dobbe, R.T.M., W.J. Lustenhouwer, M.A. Zakrzewski, K. Goubitz, J. Fraanje, and H. Schenk (1994) Kieftite, $CoSb_3$, a new member of the skutterudite group from Tunaberg, Sweden. Can. Mineral., 32, 179–183. (2) (1995) Amer. Mineral., 80, 185 (abs. ref. 1).

Kieserite $MgSO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are uncommon, dipyramidal $\{\overline{1}11\}$, with {110} and perhaps another dozen forms, to 10 cm; typically coarse- to fine-grained, massive. *Twinning:* On {001}, contact; polysynthetic about [110].

Physical Properties: *Cleavage:* On {110}, {111}, perfect; on $\{\overline{1}11\}$, $\{\overline{1}01\}$, {011}, imperfect. *Tenacity:* Friable to firm. Hardness = 3.5 D(meas.) = 2.571 D(calc.) = 2.571 Slowly soluble in H_2O.

Optical Properties: Translucent. *Color:* Colorless, pale gray, pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -76.5°$. *Dispersion:* $r > v$, moderate. $\alpha = 1.520$ $\beta = 1.533$ $\gamma = 1.584$ 2V(meas.) = 55°

Cell Data: *Space Group:* $C2/c$. $a = 6.912(2)$ $b = 7.624(2)$ $c = 7.642(2)$ $\beta = 118.09(2)°$ Z = 4

X-ray Powder Pattern: Klodawa, Poland. (ICDD 13-102).
3.41 (10), 4.84 (9), 3.33 (9), 2.527 (9), 2.055 (9), 3.05 (8), 2.567 (8)

Chemistry:

	(1)	(2)
SO_3	57.93	57.85
MgO	29.00	29.13
H_2O	13.07	13.02
Total	100.00	100.00

(1) Stassfurt, Germany. (2) $MgSO_4 \cdot H_2O$.

Mineral Group: Kieserite group.

Occurrence: Typically in marine salt deposits; rarely as a volcanic sublimate or efflorescence.

Association: Halite, carnallite, polyhalite, anhydrite, boracite, sulfoborite, leonite, epsomite, celestine.

Distribution: In Germany, from the Stassfurt-Westeregeln district, with large crystals from the Bartensleben mine, Saxony-Anhalt; in the Hildesia mine, near Hannover, and at Wathlingen, Lower Saxony, and many other places. From Hallstatt, Austria. At Stebnyk and Kalusz, Ukraine. From Klodawa, near Kutno, Poland. At Sleights, Eskdale, Yorkshire, England. From Monte Sambuco, Sicily, Italy. At Ozinky, southwest of Saratov, Russia. In the Mayo mine, Salt Range, Punjab, India. In the USA, from the Carlsbad potash district, Eddy Co., New Mexico, extending into west Texas; in the Paradox Basin, Grand Co., Utah.

Name: Honoring Dietrich Georg Kieser (1779–1862), President, Jena Academy, Jena, Germany.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 477–479. (2) Hawthorne, F.C., L.A. Groat, M. Raudsepp, and T.S. Kilchoanite $Ca_3Si_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. No crystal forms observed as typically a replacement of rankinite; massive, to 2 mm.

Physical Properties: Hardness = n.d. D(meas.) = 2.992(2) D(calc.) = [3.00]

Optical Properties: Semitransparent. *Color:* Colorless; in thin section, interference colors are typically weak ultra-blue or ultra-brown.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, distinct to strong. $\alpha = 1.646$–1.647 $\beta = 1.648$ $\gamma = 1.650$ 2V(meas.) = 46°–60°

Cell Data: *Space Group:* $Imam$ or $Ima2$. $a = 11.42(5)$ $b = 5.09(5)$ $c = 21.95(5)$ Z = 8

X-ray Powder Pattern: Kilchoan, Scotland.
2.89 (s1), 3.07 (s2), 2.68 (s3), 3.56 (ms), 2.36 (ms), 1.964 (ms), 5.17 (m)

Chemistry: (1) Kilchoan, Scotland; an analysis, not given, from which CO_2 was deducted as spurrite, yielded $(Ca_{2.93}Fe^{3+}_{0.01})_{\Sigma=2.94}(Si_{1.96}Al_{0.04})_{\Sigma=2.00}[O_{6.94}(OH)_{0.06}]_{\Sigma=7.00}$. (2) Fuka, Japan; an analysis, not available, yielded $(Ca_{3.13}Fe^{2+}_{0.01}Na_{0.01}K_{0.01})_{\Sigma=3.16}(Si_{1.91}Al_{0.02})_{\Sigma=1.93}O_7$.

Polymorphism & Series: Dimorphous with rankinite.

Occurrence: In limestones thermally metamorphosed by invasion of gabbro; thought to have formed during retrograde metamorphism following decarbonation of limestone and thus under low pressure of CO_2 (Kilchoan, Scotland; Carlingford, Ireland).

Association: Rankinite, spurrite, tilleyite, melilite, cuspidine, grossular, wollastonite, vesuvianite (Kilchoan, Scotland); rankinite, larnite, spurrite (Golden Gully, New Zealand).

Distribution: From near Kilchoan, Ardnamurchan, Argyllshire, Scotland. At Carlingford, Co. Louth, Ireland. In New Zealand, at Golden Gully, Tokatoka district, about 150 km north of Auckland. In Japan, from Fuka, near Bicchu, Okayama Prefecture. In the Ozerskii massif, near Lake Baikal, eastern Siberia, Russia.

Name: For Kilchoan, Scotland, where it was first found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119424, 119425.

References: (1) Agrell, S.O. and P. Gay (1961) Kilchoanite, a polymorph of rankinite. Nature, 189, 743. (2) (1961) Amer. Mineral., 46, 1203 (abs. ref. 1). (3) (1962) Amer. Killalaite $Ca_3Si_2O_7 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are well-formed, elongated along [010], to 2 mm. *Twinning:* Complex penetration twinning, the composition plane of which includes [010]; they display characteristic rhombic cross sections showing crossed "bow tie" twins under crossed nicols.

Physical Properties: *Cleavage:* Perfect on {100}; poor on {010} and {001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.94

Optical Properties: Translucent. *Color:* [White]; colorless in thin section. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c \simeq 16°$. $\alpha = 1.634$–1.635 $\beta = 1.646$ $\gamma = 1.642$–1.648 2V(meas.) = 26(2)° 2V(calc.) = 38°

Cell Data: *Space Group:* $P2_1/m$. $a = 6.807$ $b = 15.459$ $c = 6.811$ $\beta = 97.76°$ Z = 4

X-ray Powder Pattern: Killala Bay, Ireland.
2.824 (100), 3.03 (80), 2.724 (60), 2.275 (45), 2.224 (45), 1.413 (40), 1.688 (35)

Chemistry:

	(1)	(2)
SiO_2	39.8	39.22
CaO	57.0	54.90
H_2O	[3.2]	5.88
Total	[100.0]	100.00

(1) Killala Bay, Ireland; by electron microprobe, H_2O by difference, MgO, FeO, and Al_2O_3 each $< 0.1\%$. (2) $Ca_3Si_2O_7 \cdot H_2O$.

Occurrence: A secondary mineral in cavities and veins in hydrothermally altered and thermally metamorphosed limestones.

Association: Calcite, afwillite, spurrite, wollastonite (Killala Bay, Ireland); larnite, magnetite, perovskite, spinel, spurrite (Carneal, Ireland).

Distribution: From near Inishcrone, along the east shore of Killala Bay, Co. Sligo, and at Carneal, Co. Antrim, Ireland. In Turkey, from the Güneyce-İkizdere region, Trabzon Province.

Name: For the locality at Killala Bay, Ireland.

Type Material: Ulster Museum, Belfast, Ireland; The Natural History Museum, London, England, 1973,484; National Museum of Natural History, Washington, D.C., USA, 128672.

Kimrobinsonite $(Ta, Nb)(OH)_3(O, CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* n.d. In masses of cryptocrystalline individuals.

Physical Properties: *Tenacity:* Friable. Hardness = Soft. VHN = 70 (20 g load). D(meas.) = n.d. D(calc.) = 6.865

Optical Properties: Semitransparent. *Color:* White. *Streak:* White. *Luster:* Dull chalky. *Optical Class:* Isotropic. n = [2.23] (by rule of Gladstone and Dale).

Cell Data: *Space Group:* n.d. $a = 3.812(1)$ Z = 1

X-ray Powder Pattern: Mt. Holland, Western Australia.
3.808 (10), 2.696 (7), 1.702 (5), 1.555 (4), 1.907 (3), 2.202 (2), 1.270 (2)

Chemistry:

	(1)
Nb_2O_5	6.6
Ta_2O_5	78.5
Sb_2O_3	0.7
FeO	0.4
Na_2O	0.7
H_2O	[8.9]
CO_2	[4.2]
Total	[100.0]

(1) Mt. Holland, Western Australia; by electron microprobe, H_2O 5.9% and CO_2 2.8% by CHN microanalysis on a somewhat impure sample, recalculated to 100% for analytical shortfall of volatiles; then corresponding to $(Ta_{0.82}Nb_{0.11}Na_{0.05}Fe_{0.01}Sb_{0.01})_{\Sigma=1.00}(OH)_{2.27}[O_{1.02}(CO_3)_{0.22}]_{\Sigma=1.24}$.

Occurrence: The weathering product of an undetermined Ta–Sb pegmatite mineral.

Association: Cesstibtantite, manganotantalite, antimonian microlite.

Distribution: From near Mt. Holland, Western Australia.

Name: Honors Kim Robinson (1951–), Australian geologist of Perth, Australia, who discovered the specimen in which the mineral occurs.

Type Material: Western Australian Museum, Perth, M.59.1991; Museum Victoria, Melbourne, Australia, M37922; The Natural History Museum, London, England, 1986,250; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 163342.

Kimuraite-(Y) $CaY_2(CO_3)_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. As spherulitic aggregates of scaly tabular crystals, to 100 μm.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 2.5 D(meas.) = 2.6(1) D(calc.) = 2.98 Bright reddish purple to purple fluorescence under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Pale purple to pinkish white. *Luster:* Vitreous to silky on cleavages.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, weak.
$\alpha = 1.584(2)$ $\beta = 1.612(2)$ $\gamma = 1.626(2)$ 2V(meas.) = 70(5)°

Cell Data: *Space Group:* $Immm$, $Imm2$, $I2_12_12_1$, or $I222$. $a = 9.2545(8)$ $b = 23.976(4)$ $c = 6.0433(7)$ Z = 4

X-ray Powder Pattern: Kirigo, Japan.
12.06 (100), 6.02 (40), 3.76 (30), 5.93 (20), 4.01 (20), 2.05 (12), 4.87 (10)

Chemistry:

	(1)		(1)
CO_2	29.13	Dy_2O_3	2.44
Y_2O_3	29.41	Ho_2O_3	0.62

Kimzeyite $\mathbf{Ca_3(Zr,Ti)_2(Si,Al,Fe^{3+})_3O_{12}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As dodecahedra modified by trapezohedra, up to 5 mm; also in rounded grains.

Physical Properties: Hardness = ∼7 D(meas.) = 4.0 D(calc.) = 4.03

Optical Properties: Transparent. *Color:* Dark brown; light brown in thin section.
Streak: Light brown. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.94(1)$

Cell Data: *Space Group: Ia3d.* a = 12.46 Z = 8

X-ray Powder Pattern: Magnet Cove, Arkansas, USA.
1.667 (10), 2.539 (9), 2.79 (8), 3.12 (6), 4.42 (4), 1.728 (4), 1.395 (4)

Chemistry:

	(1)	(2)
SiO_2	9.6	16.63
TiO_2	5.6	6.95
ZrO_2	29.9	27.38
Al_2O_3	11.0	9.37
Fe_2O_3	13.4	
Nb_2O_5	1.0	
FeO	0.8	6.43
MgO	0.5	3.32
CaO	29.8	30.25
Total	101.6	100.33

(1) Magnet Cove, Arkansas, USA; corresponding to $(Ca_{3.11}Fe^{2+}_{0.07}Mg_{0.07})_{\Sigma=3.25}(Zr_{1.42}Ti_{0.40}Nb_{0.05})_{\Sigma=1.87}(Al_{1.26}Fe^{3+}_{0.98}Si_{0.94})_{\Sigma=3.18}O_{12}$. (2) Stromboli, Italy; by electron microprobe, average of three analyses; corresponding to $(Ca_{2.94}Mg_{0.06})_{\Sigma=3.00}(Zr_{1.21}Ti_{0.47}Mg_{0.32})_{\Sigma=2.00}(Si_{1.51}Al_{1.00}Fe^{3+}_{0.49})_{\Sigma=3.00}O_{12}$.

Mineral Group: Garnet group.

Occurrence: In a carbonatite associated with ijolite (Magnet Cove, Arkansas, USA); in a shoshonitic basaltic lava (Stromboli, Italy).

Association: Apatite, calcite, monticellite, magnetite, perovskite, anhydrite, vesuvianite, biotite, pyrite (Magnet Cove, Arkansas, USA).

Distribution: In the Kimzey quarry, Magnet Cove, Hot Spring Co., Arkansas, USA. On Stromboli, Lipari Islands, Italy.

Name: For Joe Kimzey, the mineral's discoverer, and the Kimzey family, of Magnet Cove, Arkansas, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 117124.

References: (1) Milton, C., B.L. Ingram, and L.V. Blade (1961) Kimzeyite, a zirconium garnet from Magnet Cove, Arkansas. Amer. Mineral., 46, 533–548. (2) Munno, R., G. Rossi, and C. Tadini (1980) Crystal chemistry of kimzeyite from Stromboli, Aeolian Islands, Italy. Amer. Mineral., 65, 188–191.

Kingite $Al_3(PO_4)_2(OH,F)_3 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As platelets or irregular fragments, to 1 μm, aggregated in nodules; as crusts of intergrown spheroids resembling fish roe.

Physical Properties: Hardness = n.d. D(meas.) = 2.21–2.30 D(calc.) = 2.465

Optical Properties: Translucent. *Color:* White, colorless, greenish yellow. *Luster:* Vitreous to dull.
Optical Class: Biaxial. $n = 1.514$

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.15(1)$ $b = 10.00(1)$ $c = 7.24(2)$
$\alpha = 98.6(1)^\circ$ $\beta = 93.6(1)^\circ$ $\gamma = 93.2(1)^\circ$ Z = 2

X-ray Powder Pattern: Near Robertstown, Australia.
9.1 (100), 3.45 (80), 3.48 (65), 5.28 (52), 3.17 (39), 3.108 (30), 5.43 (28)

Chemistry:

	(1)	(2)
P_2O_5	28.93	29.20
Al_2O_3	32.25	31.47
F	0.85	3.91
H_2O^+	38.32	37.07
$-O = F_2$	0.35	1.65
Total	[100.00]	100.00

(1) Near Robertstown, Australia; after deduction of Na 0.47% and Cl as halite impurity.
(2) $Al_3(PO_4)_2(OH)_2F \cdot 9H_2O$.

Occurrence: Of secondary origin, precipitated in fractured rock by meteoric water.

Association: Halite, talc, quartz, "limonite" (near Robertstown, Australia); "opal", sanidine (Wilson Springs mine, Arkansas, USA).

Distribution: In Australia, from the Fairview phosphate quarry, about 21 km north of Robertstown, in a quarry near Clinton, and at Tom's quarry, near Kapunda, South Australia. In the USA, from the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada. In Germany, in the Weckersdorf quarry, near Schleitz, and Ronneburg, Thuringia.

Name: Honors Mr. D. King (1926–1990), geologist, Department of Mines, Adelaide, South Australia, who collected the first specimens.

Type Material: Natural History Museum, Paris, France, 175.300; Harvard University, Cambridge, Massachusetts, 109441; National Museum of Natural History, Washington, D.C., USA, 112693.

Kingsmountite $(Ca,Mn^{2+})_4(Fe^{2+},Mn^{2+})Al_4(PO_4)_6(OH)_4 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2 (probable). As imperfect bladed crystals, usually in radial hemispherical aggregates, to 2 mm.

Physical Properties: Hardness = ~2.5 D(meas.) = 2.51(3) D(calc.) = 2.58

Optical Properties: Translucent. *Color:* White to very pale brown. *Streak:* White. *Luster:* Pearly to fibrous.
Optical Class: Biaxial (–). *Orientation:* $Y \perp$ lath flattening; X and $Z \parallel$ lath flattening; $Z \wedge$ lath length = 35(5)°. $\alpha = 1.573(3)$ $\beta = 1.581(3)$ $\gamma = 1.583(3)$ 2V(meas.) = 62(5)°

Cell Data: *Space Group:* $[C2]$ (by analogy to montgomeryite). $a = 10.029(6)$ $b = 24.46(1)$ $c = 6.258(4)$ $\beta = 91.16(7)°$ Z = 2

X-ray Powder Pattern: Foote mine, North Carolina, USA.
5.15 (100), 2.624 (60), 12.23 (50), 2.950 (40), 6.33 (30), 3.31 (30), 2.915 (30)

Chemistry:

	(1)
P_2O_5	35.9
Al_2O_3	16.7
FeO	4.1
MnO	8.1
MgO	0.2
CaO	14.9
H_2O	20.6
Total	100.5

(1) Foote mine, North Carolina, USA; by electron microprobe, average of three analyses, total Fe as FeO, total Mn as MnO, H_2O by DTA/TGA, Mn^{2+} assigned to fill Ca deficiency and Fe^{3+} calculated to fill Al deficiency; then corresponding to $(Ca_{3.15}Mn_{0.85})_{\Sigma=4.00}(Fe^{2+}_{0.56}Mn^{2+}_{0.50}Mg_{0.06})_{\Sigma=1.12}(Al_{3.88}Fe^{3+}_{0.12})_{\Sigma=4.00}(PO_4)_{6.00}(OH)_4 \cdot 11.6H_2O$.

Mineral Group: Montgomeryite group.

Occurrence: A secondary mineral formed from alteration of primary phosphates by descending oxidizing ground water in complex granite pegmatites.

Association: Mitridatite, birnessite (Foote mine, North Carolina, USA); whitlockite, cyrilovite (Tip Top mine, South Dakota, USA); eosphorite, laueite, lun'okite, fairfieldite, mitridatite (Mt. Vasin-Myl'k, Russia).

Distribution: In the USA, at the Foote mine, near Kings Mountain, Cleveland Co., North Carolina; from the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; in the Twin Creeks mine, Potosi district, Humboldt Co., Nevada. On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia. In the Bendada pegmatite, near Guarda, Portugal. From the Silbergrube quarry, near Waidhaus, and at Hagendorf, Bavaria, Germany.

Name: For the town, KINGS MOUNTain, North Carolina, USA, near which the mineral was first collected.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120972, 120973.

References: (1) Dunn, P.J., D.R. Peacor, J.S. White, and R.A. Ramik (1979) Kingsmountite, a new mineral isostructural with montgomeryite. Can. Mineral., 17, 579–582. (2) (1981) Amer. Mineral., 66, 1275–1276 (abs. ref. 1).

Kinichilite $Mg_{0.5}(Mn^{2+}, Zn)Fe^{3+}(Te^{4+}O_3)_3 \cdot 4.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As imperfect hexagonal prisms, to 2 mm, with curved {0001}.

Physical Properties: *Tenacity:* "Fragile". Hardness = "Soft". D(meas.) = n.d. D(calc.) = 4.11

Optical Properties: Translucent. *Color:* Dark brown. *Streak:* Brown.
Luster: Subadamantine.
Optical Class: Uniaxial (+). *Pleochroism:* Weak; pale brown to yellowish brown. $\omega = > 1.8$ $\epsilon = > 1.8$

Cell Data: *Space Group:* $P6_3/m$. $a = 9.451(7)$ $c = 7.687(9)$ $Z = 2$

X-ray Powder Pattern: Kawazu mine, Japan.
4.079 (100), 8.15 (90), 2.790 (85), 2.861 (50), 3.824 (35), 2.966 (30), 1.735 (20)

Chemistry:

	(1)	(2)
TeO_2	58.4	65.05
SeO_2	0.14	
Fe_2O_3	9.7	10.85
MnO	5.5	4.82
ZnO	5.9	5.53
MgO	2.77	2.74
Na_2O	0.02	
H_2O	n.d.	11.01
Total		100.00

(1) Kawazu mine, Japan; by electron microprobe, total Fe as Fe_2O_3, Fe^{3+} confirmed by Mössbauer spectroscopy; corresponds to $Mg_{0.55}(Mn^{2+}_{0.62}Zn_{0.54})_{\Sigma=1.16}Fe^{3+}_{0.97}(TeO_3)_{2.92} \cdot 4.5H_2O$.
(2) $Mg_{0.5}(Mn, Zn)Fe(TeO_3)_3 \cdot 4.5H_2O$ with Mn:Zn = 1:1.

Occurrence: A very rare mineral in low-temperature hydrothermal Au–Ag–Te quartz veins.

Association: Quartz.

Distribution: From the Kawazu mine, three km north of Shimoda, Izu Peninsula, Shizuoka Prefecture, Japan.

Name: Honors Dr. Kin-ichi Sakurai (1912–), prominent collector and amateur mineralogist, for his descriptions of tellurium minerals from the Kawazu mine, Japan.

Type Material: National Science Museum, Tokyo, Japan, M-23380; National Museum of Natural History, Washington, D.C., USA, 164269.

References: (1) Hori, H., E. Koyama, and K. Nagashima (1981) Kinichilite, a new mineral from the Kawazu mine, Shimoda city, Japan. Mineral. J. (Japan), 10, 333–337. (2) (1982) Amer. Kinoite $Ca_2Cu_2Si_3O_8(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As well-formed crystals, to 1.5 mm, tabular on [100], somewhat elongated along [001]; also in veinlets, massive.

Physical Properties: *Cleavage:* Excellent on {010}; distinct on {100} and {001}. Hardness = 4–5 D(meas.) = 3.16(3) D(calc.) = [3.20]

Optical Properties: Transparent to translucent. *Color:* Deep azurite-blue. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = pale greenish blue; Y = blue; Z = deep blue. *Orientation:* $X = b$; $Z \wedge c \simeq 0°$. *Dispersion:* $r < v$, distinct. *Absorption:* $Z > Y > X$. $\alpha = 1.638$–1.640 $\beta = 1.663$–1.665 $\gamma = 1.676$–1.680 2V(meas.) = 68° 2V(calc.) = 64°–80°

Cell Data: *Space Group:* $P2_1/m$. $a = 6.991(2)$ $b = 12.884(3)$ $c = 5.655(2)$ $\beta = 96°11(2)'$ Z = 2

X-ray Powder Pattern: Santa Rita Mountains, Arizona, USA.
4.72 (100), 3.052 (81), 6.44 (74), 2.116 (41), 3.138 (30), 2.315 (30), 3.951 (26)

Chemistry:

	(1)	(2)
SiO_2	35.90	36.97
CuO	31.10	32.63
MgO	0.15	
CaO	23.55	23.01
H_2O	8.16	7.39
Total	98.86	100.00

(1) Santa Rita Mountains, Arizona, USA. (2) $Ca_2Cu_2Si_3O_8(OH)_4$.

Occurrence: In vugs and veinlets in skarn (Santa Rita Mountains, Arizona, USA); in amygdules in basaltic lava flows (Calumet, Michigan, USA).

Association: Apophyllite, copper (Santa Rita Mountains, Arizona, USA); quartz, calcite, copper, silver, epidote, pumpellyite, chlorite (Calumet, Michigan, USA).

Distribution: In the USA, in Arizona, between Helvetia and Rosemont, Santa Rita Mountains, Pima Co., and in the Christmas copper mine, Gila Co.; in the Bawana mine, about six km northwest of Milford, Beaver Co., Utah; and in Michigan, in the Laurium and La Salle mines, Calumet, Houghton Co. and at the Northwestern mine, Keweenaw Co.

Name: For Fr. Eusebio Francisco Kino (1645–1711), Jesuit pioneer of the Sonora-Arizona-California frontier.

Type Material: Harvard University, Cambridge, Massachusetts, 109439; National Museum of Natural History, Washington, D.C., USA, 122395.

Kinoshitalite $(Ba,K)(Mg,Mn,Al)_3Si_2Al_2O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Forms small scales, < 1 mm.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Brittle. Hardness = 2.5–3
D(meas.) = 3.30 D(calc.) = 3.33

Optical Properties: Semitransparent. *Color:* Yellow-brown to colorless; light yellow to colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = very light yellow to light yellow; $Y = Z$ = light yellow with brownish tinge. *Absorption:* $Y \simeq Z > X$. $\alpha = 1.619$ $\beta = 1.628$–1.633 $\gamma = 1.635$
2V(meas.) = 23°

Cell Data: *Space Group:* $C2/m$. $a = 5.345(3)$ $b = 9.250(4)$ $c = 10.256(8)$
$\beta = 99.99(6)°$ Z = 2

X-ray Powder Pattern: Noda-Tamagawa mine, Japan.
3.37 (100), 2.52 (55), 2.020 (55), 5.05 (50), 10.1 (45), 1.684 (15), 3.16 (5)

Chemistry:

	(1)	(2)		(1)	(2)

(1) Noda-Tamagawa mine, Japan; corresponds to $(Ba_{0.58}K_{0.35}Na_{0.11}Ca_{0.01})_{\Sigma=1.05}(Mg_{2.06}Mn^{2+}_{0.52}Al_{0.22}Mn^{3+}_{0.21}Fe^{3+}_{0.04}Ti_{0.01})_{\Sigma=3.06}Si_{2.05}Al_{1.94}O_{10}[(OH)_{1.62}O_{0.33}F_{0.06}]_{\Sigma=2.01}$. (2) Netra, India; by electron microprobe, total Fe as Fe_2O_3; corresponding to $(Ba_{0.93}K_{0.03}Na_{0.02}Ca_{0.01})_{\Sigma=0.99}(Mg_{2.80}Mn_{0.19}Fe_{0.08})_{\Sigma=3.07}Si_{2.01}(Al_{1.94}Fe_{0.05})_{\Sigma=1.99}O_{10}(OH)_2$.

Polymorphism & Series: 1M, $2M_1$ polytypes.

Mineral Group: Mica group.

Occurrence: In hausmannite-tephroite ore (Noda-Tamagawa mine, Japan); in manganese-rich rocks invaded by silicic pegmatite and carbonate veins (Netra, India).

Association: Hausmannite, tephroite, celsian, quartz, spessartine, rhodonite, chalcopyrite, pyrrhotite, rhodochrosite, hübnerite, sonolite (Noda-Tamagawa mine, Japan); braunite, hausmannite, bixbyite, alkalic feldspar, hematite, calcite, dolomite, quartz (Netra, India).

Distribution: In the Noda-Tamagawa mine, Iwate Prefecture, and at Hokkejino, Kyoto Prefecture, Japan. From Netra, Balaghat district, Madhya Pradesh, India. On Trumbull Peak, near Incline, Mariposa Co., California, USA. From Långban, Värmland, Sweden.

Name: For Dr. Kameki Kinoshita (1896–1974), investigator of ore deposits in Japan.

Type Material: National Science Museum, Tokyo, Japan, M19511; National School of Mines, Paris, France.

References: (1) Yoshii, M., K. Maeda, T. Kato, T. Watanabe, S. Yui, A. Kato, and K. Nagashima (1973) Kinoshitalite, a new mineral from the Noda-Tamagawa mine, Iwate Prefecture. Kintoreite $\mathbf{PbFe_3^{3+}(PO_4)_2(OH,H_2O)_6}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Crystals are rhombohedral, $\{11\overline{2}2\}$, to 2 mm; as hemispheres and globular crusts.

Physical Properties: *Cleavage:* Good on {0001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4 D(meas.) = > 4.2 D(calc.) = 4.34

Optical Properties: Transparent to translucent. *Color:* Cream to yellowish green. *Streak:* Pale yellowish green. *Luster:* Vitreous to adamantine (crystals); greasy to waxy (aggregates).
Optical Class: Uniaxial (–). *Pleochroism:* Light yellowish green to medium yellow.
n = 1.935–1.955

Cell Data: *Space Group:* $[R\overline{3}m]$ (by analogy to crandallite). a = 7.3310(7) c = 16.885(2) Z = 3

X-ray Powder Pattern: Kintore open cut, Broken Hill, Australia.
3.07 (100), 5.96 (90), 3.67 (60), 2.538 (50), 2.257 (50), 1.979 (50), 2.971 (40)

Chemistry:

CuO	0.25
ZnO	1.58
PbO	31.37
BaO	0.09
H_2O	9.0
Total	[98.80]

(1) Kintore open cut, Broken Hill, Australia; by electron microprobe, average of six analyses, original total given as 98.90%, total Fe as Fe_2O_3, H_2O and CO_2 by CHN analyzer; corresponding to $Pb_{0.97}(Fe_{2.95}Zn_{0.13}Cu_{0.02})_{\Sigma=3.10}[(PO_4)_{1.30}(AsO_4)_{0.39}(SO_4)_{0.18}(CO_3)_{0.11}]_{\Sigma=1.98}(OH)_{5.45}\bullet 0.74H_2O$.

Mineral Group: Crandallite group.

Occurrence: A rare secondary mineral in the oxidized zone of a Pb–Zn deposit.

Association: Segnitite, pyromorphite, mimetite, libethenite, hinsdalite, rockbridgeite–dufrénite, apatite, goethite.

Distribution: In Australia, from the Kintore and Block 14 open cuts, Broken Hill, New South Wales. In Germany, from the Clara mine, near Oberwolfach, and the Igelschlatt mine, near Grafenhausen, Black Forest.

Name: For the site from which the best specimens were first collected, the Kintore open cut, Broken Hill, Australia.

Type Material: The South Australia Museum, Adelaide, G14354; Museum Victoria, Melbourne, Australia, M42891.

Kipushite $(Cu, Zn)_6(PO_4)_2(OH)_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, elongated along $[10\overline{1}]$, exhibiting {111} with uneven, rounded faces and terminated by {100}, to 5 mm; additional forms include {102}, $\{01\overline{2}\}$, $\{11\overline{1}\}$. More commonly as aggregates of subparallel prismatic crystals.

Physical Properties: *Fracture:* Uneven. Hardness = 4 D(meas.) = 3.8 D(calc.) = 3.904

Optical Properties: Transparent to translucent. *Color:* Emerald-green. *Streak:* Pale blue. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = blue; Z = bright blue.
$\alpha = 1.693(2)$ $\beta = 1.738(2)$ $\gamma = 1.740(2)$ 2V(meas.) = Small. 2V(calc.) = 23°

Cell Data: *Space Group:* $P2_1/c$. $a = 12.197(2)$ $b = 9.156(2)$ $c = 10.667(2)$
$\beta = 96.77(2)°$ Z = 4

X-ray Powder Pattern: Kipushi, Congo.
4.03 (100), 2.554 (90), 2.970 (60), 1.531 (60b), 12.2 (50), 3.386 (45), 6.06 (40)

Chemistry:

	(1)
P_2O_5	20.9
CuO	43.0
ZnO	24.4
H_2O	11.1
Total	99.4

(1) Kipushi, Congo; by electron microprobe, average of 14 analyses on two crystals, H_2O by TGA; $(OH)^{1-}$ calculated for charge balance, corresponding to $(Cu_{3.77}Zn_{2.09})_{\Sigma=5.86}(PO_4)_{2.06}(OH)_{5.54} \cdot 1.5H_2O$.

Occurrence: A secondary mineral in the oxidized zone of a Cu–Zn deposit (Kipushi, Congo).

Association: Pseudomalachite, malachite, hemimorphite, pyromorphite, veszelyite, vauquelinite, libethenite, reichenbachite, quartz, iron oxides (Kipushi, Congo).

Distribution: From Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, in the Black Pine mine, near Philipsburg, Granite Co., Montana, and at the Snowstorm mine, near Battle Mountain, Lander Co., Nevada. From Broken Hill, New South Wales, Australia.

Name: For Kipushi, Congo, where the first specimens were collected.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG14026.

Kirchhoffite $CsBSi_2O_6$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As equant grains to 80 μm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6-6.5 D(meas.) = 3.62(2) D(calc.) = 3.639

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Vitreous. *Optical Class:* Uniaxial (+). ω = 1.592(2) ε = 1.600(2)

Cell Data: *Space Group*: $I4_1/acd$. a = 13.019(2) c = 12.900(3) Z = 16

X-ray Powder Pattern: Darai-Pioz alkaline massif, Tajikistan.
3.26 (100), 3.48 (82), 2.770 (67), 2.294 (41), 2.109 (34), 5.32 (32), 1.768 (22)

Chemistry:

	(1)
SiO_2	40.47
B_2O_3	11.27
K_2O	0.11
Cs_2O	48.16
Rb_2O	0.09
Total	100.10

(1) Darai-Pioz alkaline massif, Tajikistan; average of 50 electron microprobe analyses, B_2O_3 and Rb_2O by SIMS, corresponding to $(Cs_{1.02}K_{0.01})_{\Sigma=1.03}B_{0.96}Si_{2.02}O_6$.

Mineral Group: Analcime group.

Occurrence: In a massif composed of a variety of granitic, alkaline granitic and syenitic pegmatites, various hydrothermal rocks (albitites, fenites) and carbonatites.

Association: Quartz, pectolite, and subordinate fluorite, sokolovaite, baratovite, aegirine, polylithionite, stillwellite-(Ce), neptunite, pekovite, senkevichite, mendeleevite-(Ce).

Distribution: In glacial moraine, upper reaches of the Darai-Pioz River, near the junction of the Turkestan, Zeravshan, and Alai ridges, Darai-Pioz alkaline massif, Garm District, Tajikistan.

Name: Honors Professor Gustav Robert Kirchhoff (1824-1887), the German physicist at the universities of Breslau and Berlin, one of the founders of spectral analysis and co-discoverer (with Robert Bunsen) of cesium and rubidium.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3923/1).

Kirkiite $Pb_{10}(As,Bi)_6S_{19}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal and monoclinic, pseudohexagonal. *Point Group:* $6/m$ and $2/m$ (actual); 622 ($6/m$ $2/m$ $2/m$ apparent). Crystals are prismatic, to 100 μm, composed of stacked pseudohexagonal plates; as subhedral grains. *Twinning:* Polysynthetically twinned, common.

Physical Properties: Hardness = n.d. VHN = 150 (100 g load). D(meas.) = n.d. D(calc.) = 6.82

Optical Properties: Opaque. *Color:* Steel-gray; pale gray to white in reflected light. *Anisotropism:* Weak to strong. *Bireflectance:* Very weak.
R_1–R_2: (400) — , (420) 40.2–45.3, (440) 40.9–45.7, (460) 40.9–45.2, (480) 40.8–45.1, (500) 40.4–44.5, (520) 39.9–43.9, (540) 39.4–43.5, (560) 39.0–43.1, (580) 38.6–42.6, (600) 38.3–42.3, (620) 39.0–42.1, (640) 37.8–41.8, (660) 37.5–41.5, (680) 37.2–41.0, (700) 36.9–40.9

Pb	59.4	59.25	58.65
Bi	15.2	15.62	17.75
As	6.2	7.20	6.36
Sb	0.5		
S	17.4	17.15	17.24
Se		0.96	
Total	98.7	100.18	100.00

(1) Kirki, Greece; by electron microprobe, average of six analyses; corresponding to $Pb_{10.15}(As_{2.93}Bi_{2.57}Sb_{0.14})_{\Sigma=5.64}S_{19.21}$. (2) Vulcano, Italy; by electron microprobe, average of 12 analyses; corresponding to $Pb_{9.97}(As_{3.35}Bi_{2.61})_{\Sigma=5.96}(S_{18.65}Se_{0.42})_{\Sigma=19.07}$. (2) $Pb_{10}(As,Bi)_6S_{19}$ with As:Bi = 1:1.

Occurrence: In a hydrothermal Pb–Zn deposit (Kirki, Greece); in a volcanic fumarole, formed at about 470 °C (Vulcano, Italy).

Association: Cosalite, bismuthinite, bismuthian jordanite, seligmannite, levyclaudite, sphalerite, pyrite, galena (Kirki, Greece); sphalerite, cannizzarite (Vulcano, Italy).

Distribution: From the Aghios Philippos Pb–Zn deposit, near Kirki, Thrace, Greece [TL]. At the La Fossa crater, Vulcano, Lipari Islands, Italy.

Name: For Kirki, Greece.

Type Material: n.d.

Total	100.18	100.00

(1) Mt. Shaheru, Congo. (2) $CaFeSiO_4$.

Polymorphism & Series: Forms a series with monticellite.

Occurrence: In melilite-nephelinite lava (Mt. Shaheru, Congo); in calcareous skarn (Tazheran massif, Russia).

Association: Melilite, nepheline, clinopyroxene, kalsilite, götzenite, combeite, sodalite, magnetite, perovskite, apatite, "hornblende," biotite (Mt. Shaheru, Congo); titanian augite, wollastonite, melilite, garnet, calcite, cuspidine, diopside, perovskite, troilite, graphite (Tazheran massif, Russia).

Distribution: On Mt. Shaheru, the extinct southern cone of Mt. Nyiragongo, Kivu Province, Congo (Zaire). In the Wessels mine, near Kuruman, Cape Province, South Africa. From the Tazheran alkalic massif, west of Lake Baikal, eastern Siberia, Russia. In the Angra dos Reis meteorite.

Name: For Dr. Egon Kirschstein, German geologist, a pioneer in the geological exploration of Kivu Province, Congo (Zaire).

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM8037; Harvard University, Cambridge, Massachusetts, USA.

Kitagohaite Pt_7Cu

Crystal Data: Isometric. *Point Group*: 4/*m* $\bar{3}$ 2/*m.* As grain cores or rims on grains to ~0.5 mm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Malleable. Hardness = 3.5 VHN = 206-237 (100 g load). D(meas.) = n.d. D(calc.) = 19.958

Optical Properties: Opaque. *Color*: Grayish white, white in reflected light. *Streak*: Gray. *Luster*: Metallic.
Optical Class: Isotropic.
R: (470) 63.2, (546) 66.6, (589) 68.2, (650) 70.1

Cell Data: *Space Group*: *Fm*$\bar{3}$ *m.* *a* = 7.7891(3) Z = 4

X-ray Powder Pattern: Kitagoha river, Lubero region, Democratic Republic of the Congo.
2.246 (100), 1.377 (77), 1.123 (31), 1.174 (27), 0.893 (13), 1.948 (8), 3.871 (3)

Chemistry:

	(1)	(2)
Pt	95.49	95.55
Cu	4.78	4.45
Total	100.26	100.00

(1) Kitagoha river, Lubero region, Democratic Republic of the Congo; average of 13 electron microprobe analyses; corresponding to $Pt_{6.93}Cu_{1.07}$. (2) Pt_7Cu.

Occurrence: In heavy mineral concentrates from river sediment perhaps derived from hydrothermal quartz vein deposits of unknown type.

Association: Commonly rimmed by hongshiite, with luberoite, quartz, zircon, hematite.

Distribution: From the Kitagoha river basin, Lubero region, Democratic Republic of the Congo; also reported from sediment in the Lemmenjoki and Ivalojoki river systems, Finnish Lapland.

Name: For the Kitagoha river, Democratic Republic of the Congo. The river's name probably comes from 'kitahuha', which in the local Bantu language means 'the river that does not make noise'.

Type Material: Clausthal University of Technology, Clausthal-Zellerfeld, Germany (# 11331).

Total	100.57	99.7	100.00

(1) Kuusamo, Finland; corresponding to $(Ni_{1.01}Co_{0.02})_{\Sigma=1.03}Te_{0.99}Se_{1.01}$. (2) Do.; by electron microprobe, corresponding to $(Ni_{1.07}Fe_{0.01}Co_{0.01})_{\Sigma=1.09}Te_{0.92}Se_{1.05}S_{0.03}$. (3) NiTeSe.

Mineral Group: Melonite group.

Occurrence: In narrow carbonate-bearing fissure veinlets in albite.

Association: Clausthalite, hematite, selenian polydymite, selenian linnaeite, pyrite.

Distribution: From Kuusamo, northeastern Finland [TL].

Name: For the Kitka River, Finland, in the valley of which the mineral was found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120267.

References: (1) Häkli, T.A., Y. Vuorelainen, and T.G. Sahama (1965) Kitkaite (NiTeSe), a new mineral from Kuusamo, northeast Finland. Amer. Mineral., 50, 581–586. (2) Criddle, A.J. and C.J. Stanley, Eds. (1993) Quantitative data file for ore minerals, 3rd ed. Chapman & Hall, London, 289.

H_2O	[29.2]	30.05
Total	[100.0]	100.00

(1) Franklin, New Jersey, USA; by electron microprobe, Mn^{2+}:Mn^{3+} from charge balance, H_2O by difference. (2) $Ca_4Mn_2^{2+}Mn_4^{3+}Si_4O_{16}(OH)_8 \cdot 18H_2O$.

Occurrence: A secondary mineral coating fractures in a metamorphosed stratiform zinc deposit.

Association: Bostwickite, calcite, franklinite, fluorite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: Derived from *kittatinny*, which in the language of the Algonquin Indians meant *endless hills*, in allusion to the topography of the Franklin area.

Type Material: Harvard University, Cambridge, Massachusetts, 113514; National Museum of Natural History, Washington, D.C., USA, C4222.

Kladnoite $C_6H_4(CO)_2NH$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Forms elongated crystals, with prominent {100}, {110}, {230}, {120}.

Physical Properties: Hardness = n.d. D(meas.) = 1.47 D(calc.) = 1.469 M.P. 234(1) °C.

Optical Properties: Semitransparent. *Color:* Colorless, white, pale yellow.
Optical Class: Biaxial (+). *Orientation:* $Y \wedge c \simeq 16°$. $\alpha = 1.501$ $\beta = 1.519$ $\gamma = 1.755$
2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 22.83(1)$ $b = 7.651(4)$ $c = 3.810(2)$
$\beta = 91.36(2)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 28-2013).
5.70 (100), 6.35 (95), 3.28 (30), 11.4 (18), 3.74 (14), 3.38 (14), 3.13 (14)

Chemistry: (1) Stated to be identical to phthalimide.

Occurrence: Formed as a result of fires in coal heaps.

Association: n.d.

Distribution: From the Scholler coal mine, Libušín, Kladno coal basin, about 30 km west-northwest of Prague, and at Radvanice, Czech Republic.

Name: For its occurrence in the Kladno district, Czech Republic.

Type Material: n.d.

Klebelsbergite $Sb_4^{3+}O_4(SO_4)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are platy, flattened on {010}, or acicular, elongated along [001], to 1 cm; rarely isolated, typically in bladed radial to tufted aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 200 (10 g load). D(meas.) = 4.62(6) D(calc.) = 4.67–4.69 May be weakly magnetic if iron is present as an impurity.

Optical Properties: Semitransparent. *Color:* Colorless, pale yellow, yellow-orange, pink. *Streak:* White to yellow. *Luster:* Vitreous to silky.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. α = n.d. $\beta = \sim 1.95$ γ = n.d. 2V(meas.) = $\sim 70°$

Cell Data: *Space Group:* $Pc2_1b$. $a = 11.279(2)$ $b = 14.909(3)$ $c = 5.7648(6)$ Z = 4

X-ray Powder Pattern: Baia Sprie, Romania.
3.131 (vs), 6.22 (s), 3.892 (s), 3.545 (s), 3.150 (s), 2.830 (s), 2.435 (s)

Chemistry:

	(1)	(2)
SO_3	8.0	11.75
Sb_2O_5	84.8	85.60
Fe_2O_3	0.7	
H_2O		2.65
Total		100.00

(1) Baia Sprie, Romania; by electron microprobe, partial analysis, here converted from an elemental analysis, valence determination of Fe by microchemistry found $Fe^{3+} \gg Fe^{2+}$, $(OH)^{1-}$ determined present by IR. (2) $Sb_4O_4(SO_4)(OH)_2$.

Occurrence: An alteration product of stibnite in antimony deposits.

Association: Stibnite, valentinite, cervantite, kermesite, stibiconite, coquandite, peretaite, onoratoite, cetineite.

Distribution: In Romania, from Baia Sprie (Felsőbánya). In Italy, in Tuscany, at the Cetine mine, 20 km southwest of Siena; in the Pereta mine, Scansano; and at Micciano, near Larderello.

Name: Honoring Kunó Klebelsberg (1875–1932), Hungarian Minister of Education.

Type Material: Hungarian Natural History Museum, Budapest, Hungary, A85135; National Museum of Natural History, Washington, D.C., USA, R6365, B12631, B12640, B12647, 137949.

Kleemanite $ZnAl_2(PO_4)_2(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. As thin veins, to 2 mm thick, and matted coatings of very fine-bladed acicular crystals. *Twinning:* Multiple twinning parallel to fiber elongation probable.

Physical Properties: Hardness = 3 D(meas.) = 2.84 D(calc.) = 2.76

Optical Properties: Transparent. *Color:* Colorless to pale brownish yellow. *Luster:* Bright [*sic*].
Optical Class: Biaxial. *Orientation:* Inclined extinction up to 40° in opposite directions in adjacent crystals. $\alpha = 1.598(2)$ $\beta =$ n.d. $\gamma = 1.614(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2/m$, $P2_1/m$, $P2$, or $P2_1$. $a = 7.274$–7.290 $b = 7.185$–7.194 $c = 9.788$–9.762 $\beta = 110.20°$–$110.244°$ Z = 2

X-ray Powder Pattern: Iron Monarch quarry, Australia.
4.76 (10), 3.09 (8), 9.09 (6), 3.30 (6), 5.66 (5), 3.88 (5), 3.64 (5)

Chemistry:

H_2O	18.2	19.79	18.14
Total	101.4	100.39	100.00

(1) Iron Monarch quarry, Australia; Al, Fe, Mn, and Zn by AA, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O by TGA; corresponding to $Zn_{1.01}(Al_{1.90}Mn_{0.07}Fe_{0.06})_{\Sigma=2.03}(PO_4)_2(OH)_{2.08} \cdot 2.98H_2O$. (2) Baokeng, China; by electron microprobe, average of five analyses, H_2O by TGA; corresponding to $Zn_{1.02}(Al_{1.96}Fe_{0.04})_{\Sigma=2.00}(PO_4)_{1.95}(OH)_{2.01} \cdot 3.14H_2O$. (3) $ZnAl_2(PO_4)_2(OH)_2 \cdot 3H_2O$.

Occurrence: A rare secondary mineral in the weathering zone of manganiferous iron ore.

Association: Jacobsite (Iron Monarch quarry, Australia); turquoise (Broken Hill, Australia).

Distribution: In Australia, in the Iron Monarch quarry, Iron Knob, South Australia, and at Broken Hill, New South Wales. In the Baokeng manganese deposit, Guangdong Province, China.

Name: Honors Dr. Alfred William Kleeman (1913–1982), mineralogist, University of Adelaide, Adelaide, Australia.

Type Material: Museum Victoria, Melbourne, M34218; Division of Mineral Chemistry, CSIRO, Melbourne, Australia, MC637; National Museum of Natural History, Washington, D.C., USA, 145805.

Kleinite $Hg_2N(Cl,SO_4)\cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal or triclinic. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals short prismatic to equant, to 3 mm, showing prominent $\{10\overline{1}0\}$, $\{20\overline{2}1\}$, and $\{0001\}$.

Physical Properties: *Cleavage:* $\{0001\}$, uneven; $\{10\overline{1}0\}$, imperfect. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 7.9–8.0 D(calc.) = [7.87]

Optical Properties: Transparent to translucent. *Color:* Pale yellow, canary-yellow to orange, may be zoned, yellow cores with reddish orange rims; tenebrescent, deepening in color in daylight, the original color restored in darkness; yellow to colorless in transmitted light. *Streak:* Sulfur-yellow. *Luster:* Adamantine to greasy.
Optical Class: Biaxial (–); uniaxial (+) $\geq$ 130 °C; isotropic $\geq \sim$190 °C. *Dispersion:* $r < v$, very strong. $\omega = 2.19$ $\epsilon = 2.21$ $\alpha = 2.16$ $\beta = 2.18$ $\gamma = 2.18$ 2V(meas.) = Small to 80°.

Cell Data: *Space Group:* $C6/mmc$. $a = 13.56$ $c = 11.13$ Z = [18]

X-ray Powder Pattern: Terlingua, Texas, USA.
2.914 (10), 2.615 (10), 3.884 (6), 2.013 (6), 1.434 (4), 1.242 (4), 5.228 (2)

Chemistry:

	(1)
Hg	85.86
N	2.57
Cl	7.30
H_2O	1.03
SO_4	3.10
Total	99.86

(1) Terlingua, Texas, USA; averages of numerous partial analyses, corresponds to $Hg_{2.00}N_{0.86}[Cl_{0.96}(SO_4)_{0.15}]_{\Sigma=1.11}\cdot 0.53H_2O$.

Occurrence: In hydrothermal mercury deposits.

Association: Terlinguaite, gypsum, barite, calcite, other mercury minerals (Terlingua, Texas, USA); mosesite, calomel, montroydite (McDermitt mine, Nevada, USA).

Distribution: In the USA, from Terlingua, Brewster Co., Texas; the New Idria district, San Benito Co., California; and in the McDermitt and Cordero mercury mines, Opalite district, Humboldt Co., Nevada.

Name: To honor Carl Klein (1842–1907), Professor of Mineralogy, University of Berlin, Berlin, Germany.

Type Material: Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 86639–86641, 86647.

Klockmannite CuSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As granular aggregates, some with thick and thin tabular grains.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = 2–3 VHN = 82–104 (100 g load). D(meas.) = 5.99 (synthetic). D(calc.) = 6.12

Optical Properties: Opaque. *Color:* Slate-gray, tarnishing to blue-black. *Luster:* Metallic when freshly broken, soon becoming dull. *Anisotropism:* Strong; brownish gray to gray-white. R_1–R_2: (400) 16.2–38.9, (420) 16.6–40.2, (440) 16.9–40.8, (460) 17.0–40.6, (480) 17.0–40.2, (500) 17.0–39.6, (520) 16.8–38.9, (540) 16.4–38.0, (560) 15.8–37.0, (580) 15.0–36.0, (600) 14.3–34.7, (620) 13.9–33.6, (640) 13.9–32.5, (660) 14.5–31.5, (680) 15.8–30.5, (700) 17.7–29.9

Cell Data: *Space Group:* $P6_3/mmc$. $a = 3.938$ $c = 17.25$ $Z = 6$

X-ray Powder Pattern: Synthetic.
2.88 (100), 3.18 (90), 1.969 (80), 3.34 (60), 1.821 (60), 1.623 (50), 2.00 (40)

Chemistry:

	(1)	(2)
Cu	44.7	44.59
Ag	0.3	
Se	54.1	55.41
Total	99.1	100.00

(1) Locality uncertain; by electron microprobe. (2) CuSe.

Occurrence: Of hydrothermal origin, in deposits rich in copper and tellurium.

Association: Clausthalite, umangite, eucairite, berzelianite, crookesite, chalcomenite.

Distribution: In Argentina, from the Sierra de Umango [TL], and in the Santa Brigida mine and at Tuminico, Sierra de Cacho, La Rioja Province; from Cerro de Cacheuta, Mendoza Province. At Lerbach, Tilkerode, and Zorge, Harz Mountains, Germany. From Skrikerum, Kalmar, Sweden. In the Czech Republic, at Bukov, near Tisnova; in the Petrovice uranium deposit, near Ždár; and the Předbořice uranium deposit, near Krásna Hora. In the Pinky Fault uranium deposit, Lake Athabasca, Saskatchewan, and at the Ranwick uranium mine, north of Sault Ste Marie, Ontario, Canada. From Mexico, at the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora. In Australia, at the Dianne mine, near Mareeba, Queensland.

Name: For Professor Friedrich Ferdinand Hermann Klockmann (1858–1937), German mineralogist, Technical High School, Aachen, Germany.

Type Material: n.d.

Total	100.39	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, average of 25 grains; corresponds to $K_{3.00}(Cu_{3.05}Pb_{0.02})_{\Sigma=3.07}(Fe_{0.77}Al_{0.21})_{\Sigma=0.98}O_2(S_{1.00}O_4)_{4.00}$. (2) $K_3Cu_3FeO_2(SO_4)_4$.

Occurrence: In cavities in volcanic fumaroles.

Association: Alarsite, fedotovite, lammerite, nabokoite, atlasovite, langbeinite, ponomarevite, tolbachite, kamchatkite, hematite, tenorite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For the locality, as one of the Klyuchevskaya group of volcanoes.

Type Material: Mining Institute, St. Petersburg, Russia, 979/1.

B	1.50	1.50
Total	100.61	100.00

(1) La Fossa crater, Vulcano, Sicily, Italy; average of 10 EDS analyses, B calculated from the structure, corresponding to $K_{3.09}Na_{4.11}Si_{2.91}B_{1.00}F_{21.89}$.
(2) $K_3Na_4[SiF_6]_3[BF_4]$.

Occurrence: On altered pyroclastic breccia in an active low-temperature volcanic fumarole.

Association: Hieratite, avogadrite, demartinite.

Distribution: La Fossa crater, Vulcano, Aeolian Islands, Sicily, Italy.

Name: An acronym based on the chemical symbols for its essential components.

Type Material: Dipartimento di Chimica Strutturale e Stereochimica Inorganica, Università degli Studi, Milan, Italy, 2006-03.

References: (1) Demartin, F., C.M. Gramaccioli, I. Campostrini, and P. Knorringite $Mg_3Cr_2^{3+}(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive and as minute grains.

Physical Properties: Hardness = ∼7 D(meas.) = 3.756 D(calc.) = 3.852

Optical Properties: Semitransparent. *Color:* Bluish green, greenish. *Luster:* Vitreous. *Optical Class:* Isotropic. $n = 1.803$

Cell Data: *Space Group: Ia3d.* $a = 11.65$ Z = 8

X-ray Powder Pattern: Kao kimberlite pipe, Lesotho.
2.92 (100), 2.61 (100), 2.382 (80), 1.560 (80), 2.489 (60), 2.288 (60), 1.894 (60)

Chemistry:

	(1)	(2)
SiO_2	39.92	39.78
TiO_2	0.11	
Al_2O_3	9.74	
Cr_2O_3	17.47	33.54
Fe_2O_3	1.20	
FeO	6.53	
MnO	0.60	
MgO	16.97	26.68
CaO	8.14	
Total	100.68	100.00

(1) Kao kimberlite pipe, Lesotho; by electron microprobe, corresponding to $(Mg_{1.90}Ca_{0.66}Fe^{2+}_{0.41}Mn_{0.17})_{\Sigma=3.14}(Cr_{1.04}Al_{0.86}Fe^{3+}_{0.07})_{\Sigma=1.97}Si_{3.01}O_{12}$. (2) $Mg_3Cr_2(SiO_4)_3$.

Polymorphism & Series: Forms a series with pyrope.

Mineral Group: Garnet group.

Occurrence: A rare component of ultramafic kimberlite nodules (Kao kimberlite pipe, Lesotho).

Association: Olivine, enstatite, chromian diopside, chromian pyrope, chromian spinel, ilmenite, perovskite, zircon, diamond, omphacite, rutile, carbonates, micas (Kao kimberlite pipe, Lesotho).

Distribution: In the Kao kimberlite pipe, Lesotho. From the Red Ledge mine, Nevada Co., California, USA.

Name: To honor Dr. Oleg von Knorring (1915–1994), Department of Earth Sciences, Leeds University, Leeds, England.

Type Material: n.d.

ThO_2	1.25	1.31	H_2O^+	3.87	2.81
Al_2O_3	0.33	0.35	H_2O^-	0.47	0.42
Y_2O_3	24.40	21.98	Total	[99.41]	99.60

(1) Shiraishi pegmatite, Japan; total Fe as Fe_2O_3; H_2O^+ as loss on ignition; original total given as 99.73%. (2) Ushio mine, Japan; H_2O^+ as loss on ignition.

Occurrence: In granite pegmatites (Japan); in a stream cobble of graphic granite (Paringa River, New Zealand).

Association: Anatase, parisite, zircon, monazite, chevkinite, xenotime, allanite, biotite, albite, quartz, muscovite (Shiraishi pegmatite, Japan); plagioclase, allanite, zircon, fergusonite, magnetite, ilmenite, pyrite (Ushio mine, Japan); plagioclase, microcline, epidote, muscovite, chlorite, quartz (Paringa River, New Zealand).

Distribution: In Japan, from the Shiraishi pegmatite, Oyama, and in the Ushio mine, Omiya, Kyoto Prefecture; from Senogawa-machi, Hiroshima Prefecture. In a cobble found in the Paringa River, about 1.2 km upstream from the Weheka-Paringa highway bridge, South Westland, New Zealand.

Name: For Kobe-Mura [presently Oyama-cho], Japan, from where it was first noted.

Type Material: n.d.

Kobellite $Cu_2Pb_{10}(Bi,Sb)_{16}S_{35}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Bladed, to 2 mm; commonly fibrous, massive, granular.

Physical Properties: *Cleavage:* Good on {010}. Hardness = 2.5–3 VHN = n.d. D(meas.) = 6.48 D(calc.) = 6.51

Optical Properties: Opaque. *Color:* Blackish lead-gray to steel-gray; in polished section, white. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Distinct. R_1–R_2: (400) 48.6–51.8, (420) 48.0–51.1, (440) 47.5–50.5, (460) 47.0–49.9, (480) 46.6–49.3, (500) 46.1–48.7, (520) 45.6–48.1, (540) 45.0–47.5, (560) 44.6–46.9, (580) 44.1–46.4, (600) 43.8–45.9, (620) 43.5–45.7, (640) 43.3–45.5, (660) 43.1–45.4, (680) 42.9–45.3, (700) 42.7–45.2

Cell Data: *Space Group: Pnnm* or *Pnmm*. $a = 22.62$ $b = 34.08$ $c = 4.02$ $Z = 2$

X-ray Powder Pattern: Vena mines, Sweden.
3.54 (100), 3.41 (90), 2.72 (50), 3.98 (40), 3.27 (40), 2.85 (20), 2.150 (20)

Chemistry:

	(1)	(2)		(1)	(2)
Pb	33.2	38.0	Bi	37.6	28.5
Cu	1.0		Sb	9.6	15.0
Ag	0.5		S	18.6	18.0
Fe	0.6		Total	101.1	99.5

(1) Vena mines, Sweden; by electron microprobe; corresponds to $Cu_{0.96}Pb_{9.80}Fe_{0.66}Ag_{0.28}(Bi_{11.00}Sb_{4.82})_{\Sigma=15.82}S_{35.00}$. (2) Raleigh, North Carolina, USA; by electron microprobe, corresponds to $Pb_{11.44}(Bi_{8.56}Sb_{7.73})_{\Sigma=16.29}S_{35.00}$.

Polymorphism & Series: Forms a series with tintinaite.

Occurrence: A high-temperature hydrothermal mineral.

Association: Cobaltite, arsenopyrite, chalcopyrite (Vena mines, Sweden); bismuthinite, jamesonite, tetrahedrite (Raleigh, North Carolina, USA).

Distribution: In Sweden, from the Vena mines, near Askersund, Örebro [TL], and at Boliden, Västerbotten. From the Srednegolgotaiskoe gold deposit, Transbaikalia, Siberia, Russia. In the Ustarasai bismuth deposit, near Brichmulla village, Pskem Range, south Tien Shan, northeastern Uzbekistan. At the Salsigne mine, 15 km north of Carcassone, Aude, France. In the Aljustrel deposit, Portugal. From Smolotely, near Příbram, Czech Republic. At St. Andreasberg, Harz Mountains, Germany. From Ciclova, Romania. At Zeehan, Tasmania, Australia. In the USA, from the Superior stone quarry, Raleigh, Wake Co., North Carolina; in the Cofer deposit, near Mineral, Louisa Co., Virginia; at the Silver Bell mine, Red Mountain district, Ouray Co., Colorado. In Canada, from the Deer Park mine, in the Rossland area, and in the Dodger tungsten mine, Salmo, British Columbia; at the Tintina silver mines, Watson Lake, Yukon Territory.

Name: In honor of Wolfgang Franz von Kobell (1803–1882), German mineralogist.

Kobokoboite $Al_6(PO_4)_4(OH)_6 \cdot 11H_2O$

Crystal Data: Triclinic. *Point Group*: 1 or $\bar{1}$. As crusts of hexagonal crystals, bladed to platy on (001), to 50 μm.

Physical Properties: *Cleavage*: None. *Fracture*: Irregular. *Tenacity*: Brittle. Hardness = 2 (estimated). D(meas.) = 2.21(3) D(calc.) = 2.287

Optical Properties: Translucent to transparent. *Color*: White. *Streak*: White. *Luster*: Pearly. *Optical Class:* Biaxial (-). α (calc.) = 1.556 β = 1.558(2) γ = 1.562(2) 2V (meas.) = 60-80° Orientation: $X \approx c$.

Cell Data: *Space Group*: $P1$ or $P\bar{1}$. a = 7.460(1) b = 7.737(1) c = 12.385(5) α = 102.79(2)° β = 90.20(3)° γ = 116.33(2)° Z = 1

X-ray Powder Pattern: Kobokobo pegmatite, Democratic Republic of the Congo. 11.990 (100), 6.868 (45), 3.552 (39), 6.006 (33), 3.081 (29), 3.714 (27), 3.028 (22)

Chemistry:

Total	99.93	100.00

(1) Kobokobo pegmatite, Democratic Republic of the Congo; average of 9 electron microprobe analyses, H_2O by CHN method, corresponding to $(Al_{5.85}Fe^{3+}_{0.14}Ca_{0.03}Na_{0.02})_{\Sigma=6.04}(PO_4)_{3.97}[(OH)_{5.80}F_{0.34}]_{\Sigma=6.14} \cdot 10.98H_2O$. (2) $Al_6(PO_4)_4(OH)_6 \cdot 11H_2O$.

Occurrence: A secondary mineral formed by weathering of the upper branch of a zoned albite-beryl-microcline pegmatite of the LCT family, rare-element class, Li subclass, beryl type, beryl–columbite/beryl–phosphate subtype.

Association: Frondelite, keckite, planerite, variscite, wavellite ("coeruleolactite"), muscovite-2M_2, evansite, apatite-(CaOH).

Distribution: Kobokobo pegmatite, South Kivu Province, Democratic Republic of the Congo.

Name: For the pegmatite body (*Kobokobo*) from which the first specimens were collected.

Type Material: Museum Victoria, Melbourne, Australia, (M49194).

Kochkarite $PbBi_4Te_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$, $\overline{4}3m$, or 432. Crystals are cubo-octahedral, to 100 μm; massive.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5–4 VHN = 220–267, 247 average (20 g load). D(meas.) = 13.0 D(calc.) = 13.1

Optical Properties: Opaque. *Color:* Tin-white on fresh fracture, quickly altering in moist air to brownish black; creamy white in reflected light. *Luster:* Metallic.
R: (400) — , (420) 59.0, (440) 61.4, (460) 63.8, (480) 66.8, (500) 69.4, (520) 71.2, (540) 72.1, (560) 72.8, (580) 73.6, (600) 74.0, (620) 74.6, (640) 75.3, (660) 76.0, (680) 76.9, (700) 77.8

Cell Data: *Space Group:* $Im3m$, $I432$, or $I\overline{4}3m$. Synthetic material is $I\overline{4}3m$.
a = 9.414–9.418 Z = 4

X-ray Powder Pattern: Krokhalin deposit, Russia.
2.22 (100), 2.52 (42), 2.98 (25), 2.09 (25), 2.01 (25), 1.279 (25b), 1.524 (18b)

Chemistry:

	(1)	(2)	(3)
Cu	26.6	26.76	26.98
Ag		2.19	
Hg	72.6	70.21	73.02
Total	99.2	99.16	100.00

(1) Krokhalin deposit, Russia; by electron microprobe, average of nine analyses; corresponding to $Cu_{6.97}Hg_{6.03}$. (2) Gould-Curry mine, Nevada, USA; by electron microprobe, silver considered to be a contaminent; then corresponding to $Cu_{7.10}Hg_{5.90}$. (3) Cu_7Hg_6.

Polymorphism & Series: Dimorphous with belendorffite.

Occurrence: In the heavy mineral fraction of concentrates (Krokhalin deposit, Russia).

Association: Copper, stibnite, berthierite, pyrite, arsenopyrite, quartz (Krokhalin deposit, Russia); moschellandsbergite, mercury (Mexico); moschellandsbergite (Gould-Curry mine, Nevada, USA); cinnabar, azurite, malachite (Marcelita, Chile).

Distribution: From the Krokhalin Au–Sb deposit, 60 km southeast of Yagodnoye, basin of the Kolyma River, Magadan region, Sakha, Russia [TL]. In the Gould-Curry mine, Comstock Lode, Virginia City, Storey Co., Nevada, USA. At an undefined locality in Mexico. From a prospect near Marcelita, about 70 km southeast of Copiapó, Atacama, Chile.

Name: For the locality near the Kolyma River, Russia.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80178, vis176.

Kochsándorite $CaAl_2(CO_3)_2(OH)_4 \cdot H_2O$

Crystal Data: Orthorhombic. *Point Group*: 2/*m 2/m 2/m*. As acicular to bladed crystals, with {100} and {110} dominant, typically in radial aggregates to 200-300 μm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Very brittle. Hardness = 2-2.5 D(meas.) = 2.486(20) D(calc.) = 2.514 Fluoresces pale yellow under SW and LW UV. Dissolves quickly in dilute HCl with effervescence.

Optical Properties: Transparent to translucent. *Color*: White to colorless. *Streak*: White. *Luster*: Vitreous, silky in aggregates.
Optical Class: Biaxial (-). α = 1.597(3) β = n.d. γ = 1.603(6) 2V(meas.) = n.d. 2V(calc.) = n.d. *Orientation*: n.d. *Dispersion*: Weak, $r < v$.

Cell Data: *Space Group*: *Pnma*. a = 15.564(6) b = 5.591(4) c = 9.112(4) Z = 4

X-ray Powder Pattern: Mány, Tatabánya coalfield, Hungary.
5.9154 (100), 7.8607 (87), 4.3718 (86), 7.7830 (62), 2.9570 (48), 2.9455 (44), 1.9021 (26)

Chemistry:

(1) Mány, Tatabánya coalfield, northeastern Transdanubian Mountains, Hungary; analyses by prompt gamma activation analysis (PGAA), energy-dispersive X-ray spectrometry (EDS), H_2O by thermogravimetry, CO_2 by mass spectrometry correspond to $Ca_{0.9}Al_2(CO_3)_{1.9}(OH)_4 \cdot 1.3H_2O$.

Mineral Group: Dundasite group.

Occurrence: A secondary mineral formed by the contemporaneous weathering of böhmite, pyrite and calcite in brown coal beds.

Association: Intimately intergrown with gibbsite, commonly associated with calcite and gypsum; quartz, pyrite, böhmite, dolomite, calcite, gibbsite, kaolinite, illite, alumohydrocalcite, gypsum, felsöbányaite.

Distribution: From the I/A shaft of the coal mine in Mány, Tatabánya coalfield, northeastern Transdanubian Mountains, Hungary.

Name: Honors Sándor Koch (1896-1983), Professor in the Department of Mineralogy, Petrography and Geochemistry, József Attila University (now University of Szeged), Hungary.

Type Material: Hungarian Natural History Museum, Budapest (568/2004), Herman Ottó Museum, Miskolc (2004-72) and Minerals of the Carpathian Basin (Lajos Kövecses-Varga collection), Siófok, Hungary (12004/1-3).

Koechlinite Bi_2MoO_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $mm2$. As thin, square to rectangular, striated plates and laths flattened on {010}; as spheroidal aggregates of laths, to 0.4 mm. Also as massive or earthy incrustations. *Twinning:* With {101} as twin plane, penetration and contact twins on {101} and contact twins on {010}.

Physical Properties: *Cleavage:* {010}, perfect; {0*kl*}, imperfect. *Tenacity:* Very brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 8.26

Optical Properties: Transparent. *Color:* Greenish yellow, white to light gray; greenish yellow in transmitted light. *Streak:* Pale greenish yellow. *Luster:* Silky.
Optical Class: Biaxial (–). *Pleochroism:* Weak; in greenish yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, strong. $\alpha = 2.52$ $\beta = 2.61$ $\gamma = 2.67$ 2V(meas.) = Large.

Cell Data: *Space Group:* $Pna2_1$ (synthetic). $a = 5.4822(3)$ $b = 16.1986(8)$ $c = 5.5091(3)$ Z = 4

X-ray Powder Pattern: Daniel mine, Schneeberg, Germany.
3.131 (10), 1.647 (9), 1.918 (8), 1.628 (7), 2.733 (6), 1.936 (6), 1.570 (6)

Chemistry:

	(1)	(2)	(3)
Bi_2O_3	77.1	74.96	76.40
MoO_3	22.4	25.04	23.60
H_2O	0.2		
Total	[99.7]	[100.00]	100.00

(1) Daniel mine, Schneeberg, Germany; average of three partial analyses, after deduction of quartz; corresponds to $Bi_{2.06}Mo_{0.97}[O_{5.99}(OH)_{0.01}]_{\Sigma=6.00}$. (2) Torgovsk mine, Russia; recalculated to 100% after removal of ∼25% bismuthinite, wulfenite, and quartz; corresponds then to $Bi_{1.92}Mo_{1.04}O_6$. (3) Bi_2MoO_6.

Occurrence: As a rare alteration product in the oxidation zone of Bi–Mo deposits.

Association: Bismuth, skutterudite, quartz (Daniel mine, Schneeberg, Germany); molybdenite, bismuthinite, aikinite, bismite, wulfenite, quartz (Torgovsk mine, Russia).

Distribution: In the Daniel mine, Schneeberg, Saxony, and the Clara mine, near Oberwolfach, Black Forest, Germany. From Cínovec (Zinnwald), Czech Republic. At the Sa Duchessa mine, Oridda district, Sardinia, Italy. From the Kerrouchene tungsten mine, Middle Atlas Mountains, Morocco. At the Torgovsk Bi–Mo–W mine, Polar Ural Mountains, Russia. In the USA, at the Outlaw mine, Mariposa Canyon, Round Mountain district, Nye Co., Nevada, and from the Climax mine, Lake Co., Colorado. In Australia, at the Dunallan mine, Coolgardie, and near Poona, Western Australia; and at Bygoo and Elsmore, New South Wales. At the Ebisu mine, Gifu Prefecture, and the Kamo mine, Okayama Prefecture, Japan. From Chilu, Fujian Province, China. Several other minor localities are known.

Name: Honors Rudolf Ignatz Koechlin (1862–1939), Austrian mineralogist and Curator of the Vienna Natural History Museum, Vienna, Austria.

Type Material: Harvard University, Cambridge, Massachusetts, 64801; National Museum of Natural History, Washington, D.C., USA, R6411, 93646.

(1) Justus I mine, Germany; recalculated to 100% after removal of alkali chlorides.
(2) Jiangcheng, China; after partial leaching in H_2O, leading to $Mg_7Al_4Cl_4(OH)_{22} \cdot H_2O$.
(3) $Na_4Mg_9Al_4Cl_{12}(OH)_{22}$.

Occurrence: In marine evaporite deposits.

Association: Hematite, carnallite, sylvite, halite, kieserite, anhydrite.

Distribution: At the Justus I, Glückauf-Sarstedt, Wathlingen, and other mines in the Zechstein potash beds, Lower Saxony, and at Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt, Germany. From Pilluana, on the Big Huallaga River, about 25 km south of Tarapoto, Peru. In drill cores from the Prairie Evaporite Formation, Saskatchewan, Canada. At Jiangcheng, Yunnan Province, China.

Name: Honors Adolph von Koenen (1837–1915), German geologist of Göttingen, Germany, who discovered the first specimens.

Type Material: n.d.

Kogarkoite $Na_3(SO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudorhombohedral. *Point Group:* $2/m$. As tabular to pseudorhombohedral crystals, to 2 cm, and in grains and earthy aggregates. *Twinning:* Common, by rotation about [102] (pseudohexagonal [0001]), giving intergrown and contact trillings.

Physical Properties: Hardness = 3.5 D(meas.) = 2.66(6) D(calc.) = 2.679 Slowly soluble in H_2O; fluoresces cream to pale blue under SW UV and green under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, pale sky-blue, pale pink, lilac. *Streak:* White. *Luster:* Vitreous to dull.
Optical Class: Biaxial (+), nearly uniaxial (+). *Pleochroism:* Slight. $\omega = 1.435$ $\epsilon = 1.439$ $\alpha = 1.439(1)$ $\beta = 1.439(1)$ $\gamma = 1.442(1)$ 2V(meas.) = 0° to very small.

Cell Data: *Space Group:* $P2_1/m$ (synthetic). $a = 18.079(2)$ $b = 6.958(1)$ $c = 11.443(2)$ $\beta = 107.71°$ Z = 12

X-ray Powder Pattern: Synthetic.
3.48 (100), 2.991 (85), 2.718 (85), 2.705 (85), 2.1419 (85), 3.80 (70), 2.564 (70)

Total	99.44	100.00

(1) Mt. Alluaiv, Kola Peninsula, Russia; here recalculated to oxides. (2) $Na_3(SO_4)F$.

Occurrence: A sublimate from steam around a hot spring (Hortense Hot Spring, Colorado, USA); in nepheline syenite pegmatite veins in a differentiated alkalic massif (Mt. Alluaiv, Kola Peninsula, Russia); in sodalite–syenite xenoliths associated with an intrusive alkalic gabbro–syenite complex (Mont Saint-Hilaire, Canada).

Association: Burkeite, trona, halite, fluorite, calcite, phillipsite (Hortense Hot Spring, Colorado, USA); villiaumite, thermonatrite, sidorenkite, nepheline, feldspar, aegirine, lorenzenite, apatite, lamprophyllite (Mt. Alluaiv, Kola Peninsula, Russia).

Distribution: In the USA, from Hortense Hot Spring and at Wright's Well, Chalk Creek, west of Buena Vista, Chaffee Co., Colorado; from Point of Rocks, Colfax Co., New Mexico. At Mont Saint-Hilaire, Quebec, Canada. On Mts. Alluaiv and Kedykverpakhk, Lovozero massif, Kola Peninsula, Russia. From Lake Magadi, Kenya. At Lake Natron, Tanzania.

Name: Honoring Liya Nikolaevna Kogarko (1936–), Russian geochemist and petrologist, investigator of alkaline rocks.

Type Material: National Museum of Natural History, Washington, D.C., USA, 127420, 128029, 128030.

Kokchetavite $KAlSi_3O_8$

Crystal Data: Hexagonal. *Point Group*: n.d. Crystals platy or prismatic, to 7 μm, with well developed (0001) steps and $(10\bar{1}\ 0)$ planes.

Physical Properties: *Cleavage:* n.d. *Tenacity:* n.d. *Fracture:* n.d. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 2.45

Optical Properties: n.d. *Color:* n.d. *Streak:* n.d. *Luster:* n.d.
Optical Class: Biaxial (n.d.).

Cell Data: Space Group: n.d. a =5.27(1) c = 7.82(1) Z = 1

X-ray Powder Pattern: Kokchetav Massif, northern Kazakhstan. (selective area diffraction pattern) 7.82(001), 4.56(100), 3.93(101), 2.98(102), 2.63(110), 2.51(111), 2.26(103), 1.80(104), 1.72(210), 1.68(211)

Chemistry:

	(1)
SiO_2	64.6
Al_2O_3	18.0
K_2O	15.5
Na_2O	< 0.3
Total	100.1

(1) Kokchetav Massif, northern Kazakhstan; average of several EDS analyses, Raman spectroscopic analysis similar to sanidine, IR spectroscopy confirms absence of OH^- and H_2O; stated to be close to $KAlSi_3O_8$.

Polymorphism & Series: A metastable polymorph of orthoclase, microcline and sanidine.

Mineral Group: Feldspar group.

Occurrence: As inclusions in clinopyroxene and garnet within ultrahigh-grade granitic and biotite gneiss (estimated 900-1000^o C and 5.8-6.5 GPa).

Association: Diopside, grossular-rich garnet, phengite mica, potassium feldspar, pyrrhotite, cristobalite, quartz, titanite, zircon, talc.

Distribution: From Kumdy-Kol, Kokchetav Massif, northern Kazakhstan.

Name: For the locality of the first specimens, the Kokchetav Massif.

Type Material: National Museum of Natural Science, Taichung, (Taiwan) Republic of China (NMNS004438-P010220).

Kokinosite $Na_2Ca_2(V_{10}O_{28})\cdot 24H_2O$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As tablets or blades with stepped faces, to 1 mm, also as irregularly stepped crystal masses to several millimeters.

Physical Properties: *Cleavage*: Good on {$01\bar{1}$}. *Fracture*: Irregular. *Tenacity*: Brittle. Hardness = ~1.5 D(meas.) = n.d. D(calc.) = 2.35

Optical Properties: Translucent. *Color*: Yellow-orange, sometimes with an orange-brown tint. *Streak*: Yellow. *Luster*: Subadamantine.
Optical Class: Biaxial (-). α = 1.725(3) β = 1.770(5) γ = 1.785(3) 2V(meas.) = 56.6(3)° 2V(calc.) = 58.7° *Orientation*: $X \wedge a = 15°$, $Y \approx b$. *Pleochroism*: $X = Z$ = orange-yellow, Y = orange. *Absorption*: $X = Z < Y$. *Dispersion*: Moderate, $r < v$.

Cell Data: *Space Group*: $P\bar{1}$. a = 8.74899(19) b = 10.9746(3) c = 12.8216(9) α = 114.492(8)° β = 105.093(7)° γ = 91.111(6)° Z = 1

X-ray Powder Pattern: St. Jude mine, Slick Rock district, San Miguel County, Colorado, USA. 9.88 (100), 7.92 (35), 8.42 (33), 6.01 (31), 11.24 (30), 2.814 (28), 1.9613 (26)

Chemistry:

H_2O	n.d.	28.52	28.52
Total	86.20	100.00	100.00

(1) St. Jude mine, San Miguel County, Colorado, USA; average of 10 electron microprobe analyses, loss of H_2O during analysis. (2) Analysis (1) with H_2O calculated from stoichiometry and analytical results normalized; corresponding to $(Na_{1.88}K_{0.01})_{\Sigma=1.89}(Ca_{1.81}Sr_{0.12})_{\Sigma=1.93}(V_{10}O_{28})\cdot 24H_2O$.
(3) $Na_2Ca_2(V_{10}O_{28})\cdot 24H_2O$.

Occurrence: In a moist part of the oxidation zone of a corvusite-montroseite-bearing sandstone.

Association: Gypsum, huemulite, metarossite, pascoite, rossite, wernerbaurite.

Distribution: From the St. Jude mine, Gypsum Valley, Slick Rock district, San Miguel County, Colorado, USA.

Name: Honors Michael (Mike) Kokinos (b. 1927) of Shingle Springs, California, USA., member of the Micromounters' Hall of Fame, and for his role as a mentor in the collecting community.

Type Material: The Natural History Museum of Los Angeles County, Los Angeles, California, USA (# 64004, 64074, 64075, 64076, 64077, 64078).

References: (1) Kampf, A.R., J.M. Hughes, B. Nash, and J. Total	98.76	100.00

(1) Bezymyannyi volcano, Russia; average of 3 electron microprobe analyses; corresponding to $Na_{0.24}K_{0.01}Ca_{0.63}Mg_{2.30}Mn_{0.06}Ni_{0.01}Al_{0.59}Fe^{3+}_{2.94}Ti_{0.30}Si_{0.03}P_{0.14}V_{5.83}O_{24}$. (2) $CaMg_2Fe^{3+}_4(VO_4)_6$.

Mineral Group: Howardevansite group.

Occurrence: A sublimate from fumarolic gas deposited on andesitic scoria.

Association: Bannermanite, biotite, quartz, (Ti,V)-rich magnetite.

Distribution: From the Bezymyannyi volcano, Kamchatka Peninsula, Russia.

Name: Honors Professor Nikolay Ivanovich Koksharov (1818-1892), Academician of the Russian Academy of Sciences and former Director of the Russian Mineralogical Society, for his contributions to the mineralogical sciences.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 94125).

Koktaite $(NH_4)_2Ca(SO_4)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are acicular to lamellar, fibrous, showing {100}, {110}, {001}, {011}, {101}, as very fine-grained aggregates. *Twinning:* Common on {100}.

Physical Properties: Hardness = n.d. D(meas.) = 2.09 D(calc.) = 2.114 Soluble in H_2O, leaving a residue of gypsum.

Optical Properties: Semitransparent. *Color:* Colorless to white.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z' \wedge c$ (on {110}) = 2°. $\alpha = 1.524$ $\beta = 1.532$ $\gamma = 1.536$ 2V(meas.) = 72°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.17$ $b = 7.15$ $c = 6.34$ $\beta = 102.75°$ Z = 2

X-ray Powder Pattern: Žeravice, Czech Republic. (ICDD 11-475).
9.83 (100), 3.30 (65), 4.96 (40), 5.83 (25), 3.00 (25), 3.56 (20), 2.89 (20)

Chemistry: (1) Optical data and X-ray pattern are found to be identical with synthetic $(NH_4)_2Ca(SO_4)_2 \cdot H_2O$.

Occurrence: On waste piles of a lignite mine.

Association: Gypsum, mascagnite, tschermigite.

Distribution: From Žeravice, near Kyjov, Czech Republic.

Name: To honor Jaroslav Kokta (1904–1970), Czech chemist who analyzed the synthetic compound.

Type Material: Moravian Museum, Brno, Czech Republic, A6109; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 137963.

Kolarite $PbTeCl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. As flamelike aggregates and veinlets, to 20 μm across, in rims and intergrowths with other tellurides and sulfides.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 9.14

Optical Properties: Opaque. *Color:* Gray in reflected light.
Optical Class: Biaxial.
R_1–R_2: (400) 25.0–26.1, (420) 25.3–26.2, (440) 25.6–26.5, (460) 25.9–27.0, (480) 26.5–27.5, (500) 27.0–27.9, (520) 27.4–28.3, (540) 27.7–28.6, (560) 28.1–29.0, (580) 28.3–29.2, (600) 28.5–29.4, (620) 28.6–29.6, (640) 28.6–29.6, (660) 28.6–29.5, (680) 28.6–29.5, (700) 28.6–29.5

Cell Data: *Space Group:* $Pmmm$, $Pmm2$, or $P222$. $a = 5.93(5)$ $b = 3.25(5)$ $c = 3.89(5)$
Z = 1

X-ray Powder Pattern: Champion Reef mine, India; by electron diffraction.
3.27 (100), 2.35 (50), 3.91 (40), 2.00 (40), 1.86 (30), 1.79 (30), 1.50 (30)

Chemistry:

	(1)	(2)
Pb	50.05	51.07
Te	32.87	31.45
S	0.00	
Cl	16.88	17.48
Total	[99.80]	100.00

(1) Champion Reef mine, India; by electron microprobe, original total given as 99.60%; leading to $Pb_{1.00}Te_{1.06}Cl_{1.94}$. (2) $PbTeCl_2$.

Occurrence: Of primary origin, in a hydrothermal gold-quartz vein containing sulfides and selenides.

Association: Galena, altaite, cotunnite, radhakrishnaite, volynskite, hessite, pyrrhotite, chalcopyrite, ullmannite, hawleyite, cadmian tetrahedrite, cadmian sphalerite.

Distribution: From the Champion Reef mine, Kolar Gold Fields, Karnataka, India.

Name: For its occurrence in the Kolar deposit, India.

Type Material: Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Kolbeckite $ScPO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are typically short prismatic along [001], with prominent {110}, {011}, smaller {010}, {001}, {101}, {130}, to 4 mm; less commonly as platy crystals in radiating aggregates. *Twinning:* On {100}, common; may exhibit diagonal sutures on {001}.

Physical Properties: *Cleavage:* On {010}, distinct; on {100} and {001}, poor. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3–5 D(meas.) = 2.36 D(calc.) = 2.35

Optical Properties: Transparent. *Color:* Colorless, pale yellow; Cyan-blue, blue-gray, apple-green when impure. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–). *Pleochroism:* Strong in colored material. *Orientation:* $Y = b$; $X \simeq c$; $Z \simeq a$. *Dispersion:* $r > v$, very weak. $\alpha = 1.572$–1.575 (α') $\beta = 1.590$ $\gamma = 1.598$–1.601 (γ') 2V(meas.) = 60(10)°

Cell Data: *Space Group:* $P2_1/n$. $a = 5.42$–5.45 $b = 10.08$–10.26 $c = 8.88$–8.93 $\beta = 90°40'$–$90°51'$ Z = 4

X-ray Powder Pattern: Schlarbaum quarry, Austria. (ICDD 38–431).
4.78 (100), 4.44 (100), 2.878 (70), 2.614 (60), 2.849 (50), 3.708 (40), 5.1 (30)

Chemistry:

	(1)	(2)	(3)
P_2O_5	40.10	40.5	40.33
V_2O_5		0.01	
SiO_2		0.05	
Al_2O_3		0.4	
Sc_2O_3	39.07	41.3	39.19
Fe_2O_3		0.03	
H_2O	20.36	[17.7]	20.48
Total	99.53	[100.0]	100.00

(1) Fairfield, Utah, USA; Sc_2O_3 originally reported as Al_2O_3, later confirmed as Sc by X-ray fluorescence. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponds to $(Sc_{1.05}Al_{0.01})_{\Sigma=1.06}P_{1.00}O_4[(H_2O)_{1.62}(OH)_{0.18}]_{\Sigma=1.80}$. (3) $ScPO_4 \cdot 2H_2O$.

Occurrence: A very rare secondary mineral in some hydrothermal metallic veins and phosphate deposits.

Association: Chlorite, quartz (Sadisdorf mine, Germany); miargyrite, diaphorite (Baia Sprie, Romania); wardite, crandallite, variscite (Fairfield, Utah, USA); mahlmoodite (Wilson Springs mine, Arkansas, USA); lithiophorite, vernadite, gypsum (Putty Beach, Australia).

Distribution: In Germany, at the Sadisdorf copper mine, near Schmiedeberg, Saxony. From Baia Sprie (Felsőbánya), Romania. In the Schlarbaum quarry, near Gleichenberg, Styria, Austria. In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah; in Arkansas, in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., and as large crystals from the Christy Pit, Magnet Cove, Hot Spring Co.; at the Flambeau mine, southwest of Ladysmith, Rusk Co., Wisconsin. From Sakpur, Kathiawar Peninsula, Gujarat, India. At the Tigrinoye deposit, Sikhote-Alin Range, Primorskiy Kray, Russia. On Putty Beach, near Woy Woy, New South Wales, Australia.

Name: To honor Dr. Friedrich Ludwig Wilhelm Kolbeck (1860–1943), German mineralogist, Mining Academy, Freiberg, Germany.

Type Material: Mining Academy, Freiberg, Germany, 50268; National Museum of Natural History, Washington, D.C., USA, 10632.

Kolfanite $Ca_2Fe_3^{3+}O_2(AsO_4)_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As flattened crystals, compact radiating in nodules, to 1.5 mm, and in incrustations.

Physical Properties: *Cleavage:* One, parallel to flattening. *Tenacity:* Brittle. Hardness = n.d. VHN = 73 (100 g load). D(meas.) = 3.3 D(calc.) = 3.75

Optical Properties: Semitransparent. *Color:* Red; orange to yellow in transmitted light. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow; $Y = Z$ = dark orange. $\alpha = 1.810$ $\beta = 1.923$ $\gamma = 1.933$ 2V(meas.) = 5°–7°

Cell Data: *Space Group:* n.d. $a = 17.86(4)$ $b = 19.66(5)$ $c = 11.11(3)$ $\beta = 96°$ Z = 12

X-ray Powder Pattern: Mt. Vasin-Myl'k, Russia.
8.90 (10), 2.72 (10), 3.29 (9), 2.95 (9), 2.216 (8), 1.646 (8), 5.64 (5)

Chemistry:

	(1)	(2)
P_2O_5	0.96	
As_2O_5	43.30	47.07
Sb_2O_5	2.20	
SiO_2	1.20	
Al_2O_3	0.05	
Fe_2O_3	32.09	32.70
CaO	14.97	15.31
H_2O	5.10	4.92
Total	99.87	100.00

(1) Mt. Vasin-Myl'k, Russia; by electron microprobe, total Fe as Fe_2O_3, H_2O by TGA; corresponds to $Ca_{1.95}(Fe_{2.93}Al_{0.01})_{\Sigma=2.94}(As_{2.74}Si_{0.14}P_{0.10}Sb_{0.10})_{\Sigma=3.08}O_{14} \cdot 2.06H_2O$.
(2) $Ca_2Fe_3O_2(AsO_4)_3 \cdot 2H_2O$.

Occurrence: An alteration product of holtite in a hydrothermally altered granite pegmatite.

Association: Mitridatite, arseniosiderite, laueite, apatite, montebrasite.

Distribution: From Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia.

Name: An abbreviation for the Russian KOL'skii Filial Akademii Nauk SSSR [Kola Branch of the Academy of Sciences of the USSR].

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5537; Mining Institute, St. Petersburg, 1654/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82769.

Kolicite $Mn_7^{2+}Zn_4(AsO_4)_2(SiO_4)_2(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 0.5 mm, of pinacoidal habit, predominantly tabular; as fractured grains.

Physical Properties: *Fracture:* Even. *Tenacity:* Brittle. Hardness = ∼4.5
D(meas.) = 4.17(2) D(calc.) = 4.20

Optical Properties: Semitransparent. *Color:* Bright yellowish orange. *Streak:* Light orange. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless or pale yellow; Y = yellowish orange; Z = light yellow. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, strong. *Absorption:* $Z = Y > X$. $\alpha = 1.779(2)$ $\beta = 1.786(2)$ $\gamma = 1.790(2)$ 2V(meas.) = 78(2)°
2V(calc.) = 74°

Cell Data: *Space Group: Cmca.* $a = 18.59(3)$ $b = 8.789(5)$ $c = 12.04(1)$ Z = 4

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
2.970 (100), 1.540 (70), 3.58 (60), 2.608 (50), 2.815 (40), 2.479 (40), 2.342 (40)

Chemistry:

	(1)
SiO_2	10.4
As_2O_5	18.9
FeO	0.4
MnO	39.2
ZnO	26.0
MgO	0.8
H_2O	5.5
Total	101.2

(1) Sterling Hill, New Jersey, USA; by electron microprobe, H_2O by TGA; corresponds to $(Mn_{6.70}Mg_{0.24}Fe_{0.06})_{\Sigma=7.00}Zn_{3.87}(AsO_4)_2(Si_{1.05}O_4)_2(OH)_8$.

Occurrence: Incrusting willemite-franklinite ore from metamorphosed stratiform zinc orebodies.

Association: Willemite, franklinite, sonolite, friedelite, holdenite, calcite.

Distribution: At Sterling Hill, Ogdensburg, and at Franklin, Sussex Co., New Jersey, USA.

Name: For John Kolic, of Rockaway, New Jersey, USA, who first discovered the mineral.

Type Material: Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 143765.

Kolovratite $Ni_xZn_y(VO_4)_z \cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. As fibrous and felted aggregates, in botryoidal crusts and thin incrustations.

Physical Properties: *Fracture:* Even to conchoidal. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = n.d. D(calc.) = n.d. Slightly radioactive.

Optical Properties: Semitransparent. *Color:* Citrine-yellow, greenish yellow. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: n.d. ; low birefringence. *Orientation:* Parallel extinction. $n = 1.577(5)$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Kara-Chagyr, Kyrgyzstan.
11.6 (s), 5.83 (s), 3.88(s), 2.62 (mw), 2.57 (mw), 2.39 (mwb), 1.52 (mw)

Chemistry:

	(1)	(2)
V_2O_5	12.	29.1 – 31.5
NiO	12.	9.1 – 10.7
CuO		0.5 – 0.8
ZnO	15.	4.9 – 7.0

(1) Kara-Chagyr, Kyrgyzstan; partial analysis, H_2O present in a closed tube test. (2) Agalyk U–V deposit, Uzbekistan; by electron microprobe, partial analysis.

Occurrence: In quartz schists and carbonaceous slates.

Association: n.d.

Distribution: In Kyrgyzstan, from Kara-Chagyr, near the Tyuya-Muyun Cave, Alai Mountains, and over a broad area in the Fergana Valley, as at Iski-Naukat, Charku, and at Uch-Kurgan. At the Agalyk U–V deposit, Kara-Tyube Mountains, 15 km south of Samarkand, Uzbekistan.

Name: In honor of Lev Stanislovich Kolovrat-Chervinskii (1884–1921), Russian physicist and radiologist, Mineralogical Laboratory, Russian Academy of Science, St. Petersburg, Russia, who studied the Tyuya-Muyun uranium deposit, Kyrgyzstan.

Type Material: n.d.

Kolwezite $(Cu,Co)_2(CO_3)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. In spherical aggregates, to 1 cm, and microcrystalline crusts.

Physical Properties: Hardness = ∼4 D(meas.) = 3.97(1) D(calc.) = 3.94

Optical Properties: Semitransparent. *Color:* Blackish brown to pale beige, greenish.
Streak: Beige.
Optical Class: Biaxial. $\alpha = 1.688(2)$ β = n.d. $\gamma = 1.90$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.50$ $b = 12.15$ $c = 3.189$ $\alpha = 93.32°$ $\beta = 90.74°$ $\gamma = 91.47°$ Z = 4

X-ray Powder Pattern: Musonoi mine, Congo.
3.69 (100), 6.08 (80), 5.08 (80), 2.599 (70), 3.02 (40), 2.958 (40), 2.531 (40)

Chemistry:

	(1)
CO_2	19.44
CoO	22.98
CuO	48.40
H_2O	8.78
Total	99.60

(1) Musonoi mine, Congo; by X-ray fluorescence, CO_2 by gas evolution, CO_2 + H_2O by TGA; corresponding to $(Cu_{1.33}Co_{0.67})_{\Sigma=2.00}(CO_3)_{0.98}(OH)_{2.07}$.

Mineral Group: Rosasite group.

Occurrence: An uncommon secondary mineral in the oxidation zone of some Cu–Co hydrothermal ore deposits.

Association: Cobaltian malachite, cobaltian dolomite, heterogenite.

Distribution: From the Musonoi and Kamoto Cu–Co mines, near Kolwezi, and the Mupine, and Mashamba West mines, Katanga Province, Congo (Shaba Province, Zaire).

Name: For its occurrence at Kolwezi, Congo.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG12975; National Museum of Natural History, Washington, D.C., USA, R17228.

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$, $\bar{4}3m$, or 432. Intergrown with copper aggregates, with individual crystals of cubo-octahedral form, less than 5 μm in size.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 220–267, 247 average (20 g load). D(meas.) = 13.0 D(calc.) = 13.1

Optical Properties: Opaque. *Color:* Tin-white on fresh fracture, quickly altering in moist air to brownish black. *Luster:* Metallic.
R: (400) — , (420) 59.0, (440) 61.4, (460) 63.8, (480) 66.8, (500) 69.4, (520) 71.2, (540) 72.1, (560) 72.8, (580) 73.6, (600) 74.0, (620) 74.6, (640) 75.3, (660) 76.0, (680) 76.9, (700) 77.8

Cell Data: *Space Group:* $Im3m$, $I432$, or $I\bar{4}3m$. Synthetic material is $I\bar{4}3m$. $a = 9.418(4)$ Z = 4

X-ray Powder Pattern: Magadan region, USSR.
2.22 (100), 2.52 (42), 2.98 (25), 2.09 (25), 2.01 (25), 1.279 (25b), 1.524 (18b)

Chemistry:

	(1)	(2)
Cu	26.6	26.98
Hg	72.6	73.02
Total	99.2	100.00

(1) Magadan region, USSR; by electron microprobe, average of nine analyses, corresponding to $Cu_{6.97}Hg_{6.03}$. (2) Cu_7Hg_6.

Occurrence: Found in the heavy mineral fraction of concentrates (Magadan region, USSR).

Association: Copper, stibnite, berthierite, pyrite, arsenopyrite, quartz (Magadan region, USSR).

Distribution: At the Krokhalin antimony deposit, Magadan region, basin of the Kolyma River, Yakutia, USSR. At a prospect near Marcelita, about 70 km southeast of Copiapó, Chile.

Name: For the locality near the Kolyma River, USSR.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, USSR.

Komarovite $(Ca,Mn)Nb_2(Si_2O_7)(O,F)_3 \cdot 3.5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* n.d. Platy, foliated, massive.

Physical Properties: *Cleavage:* Fair on {001}. Hardness = 1.5–2 D(meas.) = 3.0 D(calc.) = 2.96

Optical Properties: Transparent to translucent. *Color:* Pale rose. *Streak:* White. *Luster:* Dull.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. $\alpha = 1.750(2)$ $\beta = 1.766(2)$ $\gamma = 1.85(2)$ 2V(meas.) = 48°

Cell Data: *Space Group:* n.d. $a = 21.30(7)$ $b = 14.00(5)$ $c = 17.19(7)$ Z = 18

X-ray Powder Pattern: Mt. Karnasurt, Russia.
3.16 (100), 12.2 (70), 1.783 (45), 3.118 (42), 6.35 (35), 2.740 (35), 2.715 (35)

Chemistry:

	(1)
SiO_2	23.50
TiO_2	2.50
Al_2O_3	1.00
Fe_2O_3	1.50
Nb_2O_5	47.00
MnO	5.00
CaO	4.70
Na_2O	0.85
K_2O	0.30
F	1.21
H_2O	12.00
$-O = F_2$	0.51
Total	99.05

(1) Mt. Karnasurt, Russia; corresponding to $(Ca_{0.43}Mn_{0.36}Na_{0.14}K_{0.03})_{\Sigma=0.96}(Nb_{1.82}Ti_{0.16}Al_{0.10}Fe_{0.10})_{\Sigma=2.18}Si_2O_9(O_{0.88}F_{0.33})_{\Sigma=1.21} \cdot 3.5H_2O$.

Occurrence: With late albite and redeposited fine-grained natrolite in alkalic rocks in a differentiated alkalic massif.

Association: Natrolite, albite.

Distribution: On Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: For the Russian cosmonaut, Vladimir Mikhailovich Komarov (1927–1967).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73302.

References: (1) Portnov, A.M., G.K. Krivokoneva, and T.I. Stolyarova (1971) Komarovite, a new niobosilicate of calcium and manganese. Zap. Vses. Mineral. Obshch., 100, 599–602 (in Russian). (2) (1972) Amer. Mineral., 57, 1315–1316 (abs. ref. 1).

Kombatite $Pb_{14}O_9(VO_4)_2Cl_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Anhedral grains, to 0.2 mm.

Physical Properties: *Cleavage:* On {010}, perfect. *Tenacity:* Brittle. Hardness = [Very soft; 2–3] (by analogy to sahlinite). D(meas.) = > 4.3 D(calc.) = 7.979

Optical Properties: Semitransparent. *Color:* Bright yellow. *Streak:* Pale yellow.
Luster: Adamantine.
Optical Class: Biaxial (–). $n =$ > 1.90

Cell Data: *Space Group:* $C2/c$. $a = 12.682(2)$ $b = 22.566(2)$ $c = 11.279(2)$ $\beta = 118.11(1)^\circ$ Z = 4

X-ray Powder Pattern: Kombat mine, Namibia; pattern close to sahlinite.
3.006 (10), 2.958 (10), 2.812 (10), 2.253 (7), 1.756 (7), 1.590 (6), 1.989 (5)

Chemistry:

	(1)	(2)
V_2O_5	5.9	5.33
PbO	92.4	91.46
Cl	4.2	4.15
$-O = Cl_2$	0.9	0.94
Total	101.6	100.00

(1) Kombat mine, Namibia; by electron microprobe, corresponds to $Pb_{13.7}V_{2.10}O_{17.1}Cl_{3.9}$.
(2) $Pb_{14}O_9(VO_4)_2Cl_4$.

Occurrence: A rare component of layered manganese ores.

Association: Hematite, calcite, hausmannite, kentrolite, a mineral similar to harkerite.

Distribution: At the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: For the Kombat mine, Namibia, in which it occurs.

Type Material: Canadian Geological Survey, Ottawa, Canada, 64563.

References: (1) Rouse, R.C., P.J. Dunn, and J. Innes (1986) Kombatite, the vanadium analogue of sahlinite, from the Kombat mine, South West Africa. Neues Jahrb. Mineral., Monatsh., 519–522. Komkovite $BaZrSi_3O_9 \cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 32. As equant crystals terminated by trigonal pyramids, to 5 mm.

Physical Properties: *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 3.31(5) D(calc.) = 3.31 Light blue cathodoluminescence.

Optical Properties: Semitransparent. *Color:* Brown. *Streak:* Light brown. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.671(1)$ $\epsilon = 1.644(1)$

Cell Data: *Space Group: R*32. $a = 10.526(6)$ $c = 15.736(9)$ Z = 6

X-ray Powder Pattern: Vuoriyarvi complex, Russia.
5.23 (100), 2.96 (90), 3.59 (80), 3.02 (80), 2.57 (60), 2.106 (60)

Chemistry:

	(1)
SiO_2	34.44
ZrO_2	24.94
HfO_2	0.46
FeO	0.33
MnO	0.00
CaO	0.08
BaO	28.19
K_2O	0.13
H_2O	[11.43]
Total	[100.00]

(1) Vuoriyarvi complex, Russia; by electron microprobe, H_2O by difference (H_2O 10% to 11.5% by coulometric analysis); corresponds to $(Ba_{0.95}Fe_{0.02}Ca_{0.01}K_{0.01})_{\Sigma=0.99}(Zr_{1.04}Hf_{0.01})_{\Sigma=1.05}$ $Si_{2.95}O_9 \cdot 3.08H_2O$.

Occurrence: Apparently altering from catapleiite, in dolomitic veinlets cutting metasomatically altered pyroxenites, in a carbonatite.

Association: Dolomite, strontianite, phlogopite, barite, georgechaoite, pyrite.

Distribution: In the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia.

Name: To honor Russian mineralogist and crystallographer Aleksandr Ivanovich Komkov (1926–1987), Karpinskii All-Union Research Institute of Geology, St. Petersburg, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity; Mining Institute, St. Petersburg, 2037/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p462/1.

Koninckite $(Fe^{3+}, Al)PO_4 \cdot 3H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. Crystals, fibrous in spherical aggregates, to 0.8 mm.

Physical Properties: *Cleavage:* One, transverse to elongation. Hardness = 3.5
D(meas.) = 2.40(3) D(calc.) = [2.56]

Optical Properties: Transparent. *Color:* Yellow to white; pale yellow to colorless in transmitted light. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Uniaxial (+), may be biaxial to nearly isotropic. *Orientation:* X = elongation.
ω = 1.645–1.648 ϵ = 1.655–1.669 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. a = 11.95–11.977 c = 14.52–14.625 Z = 16

X-ray Powder Pattern: Richelle, Belgium.
8.42 (100), 3.77 (28), 2.98 (18), 3.85 (10), 2.83 (9), 5.99 (8), 4.48 (4)

Chemistry:

	(1)	(2)	(3)
P_2O_5	34.8	35.16	34.64
Al_2O_3	4.6	2.52	
Fe_2O_3	34.4	35.73	38.98
H_2O	[26.2]	[26.59]	26.38
Total	[100.0]	[100.00]	100.00

(1) Richelle, Belgium; average of two analyses, H_2O by difference; corresponds to $(Fe_{0.83}Al_{0.17})_{\Sigma=1.00}PO_4 \cdot 3H_2O$. (2) Suwa mine, Japan; by electron microprobe, H_2O by difference; corresponds to $(Fe_{0.90}Al_{0.10})_{\Sigma=1.00}P_{1.00}O_4 \cdot 2.98H_2O$. (3) $FePO_4 \cdot 3H_2O$.

Occurrence: Presumably as a secondary mineral in phosphatic sedimentary rocks (Richelle, Belgium); in a hydrothermally altered andesite enriched in Fe, SO_4, and PO_4 (Suwa mine, Japan).

Association: Richellite, halloysite, allophane (Richelle, Belgium); tinticite, strengite, jarosite, goethite (Suwa mine, Japan).

Distribution: From Richelle, near Visé, Belgium. In Japan, from a cave near Oni-Ana, Fukushima Prefecture, and at the Suwa mine, about seven km south-southwest of Mt. Tateshina, Nagano Prefecture, Japan. In the Kovdor massif, Kola Peninsula, Russia.

Name: Honors Laurent Guillaume de Koninck (1809–1887), Belgian geologist, University of Liège, Liège, Belgium.

Type Material: University of Liège, Liège, Belgium, 9251–9257.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 763. (2) Van Tassel, R. (1968) Données cristallographiques sur la koninckite. Bull. Konyaite $Na_2Mg(SO_4)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As powdery aggregates of minute crystals.

Physical Properties: Hardness = 2.5 D(meas.) = 2.088(6) D(calc.) = 2.097 Readily soluble in H_2O; very unstable, commonly transforming to blödite in a matter of days.

Optical Properties: Transparent. *Color:* White, may be colorless.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 70(2)°$. $\alpha = 1.464(1)$ $\beta = 1.468(1)$ $\gamma = 1.474(1)$ 2V(meas.) = 74(2)° 2V(calc.) = 79°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.786(3)$ $b = 24.029(9)$ $c = 8.060(3)$ $\beta = 95.38°$ Z = 4

X-ray Powder Pattern: Synthetic.
4.541 (100), 4.017 (45), 3.960 (45), 2.597 (45), 12.01 (40), 4.202 (40), 2.659 (40)

Chemistry: (1) Identification depends on the identity of the X-ray pattern of the natural mineral with synthetic material, with the qualitative presence of Na, Mg, and SO_4.

Occurrence: Widespread in salt efflorescences on saline soils, formed between 30 °C and 50 °C by evaporation of ground and surface waters.

Association: Gypsum, hexahydrite, blödite, halite, starkeyite, löweite, mirabalite, thénardite, epsomite, burkeite, tychite.

Distribution: In Turkey, from near Çakmak, between Ereğli and Niğde, Great Konya Basin, Konya Province. In the Tăuçoare Cave, Rodna Mountains, Romania. In the USA, found at many places in North Dakota. In Canada, noted across central and southern Alberta.

Name: For its occurrence in the Great Konya Basin, Turkey.

Type Material: National Museum of Geology and Mineralogy, Leiden, The Netherlands.

References: (1) van Doesburg, J.D.J., L. Vergouwen, and L. van der Plas (1982) Konyaite, $Na_2Mg(SO_4)_2 \cdot 5H_2O$, a new mineral from the Great Konya Basin, Turkey. Amer. Mineral., 67, 1035–1038.

Koritnigite $Zn(AsO_3OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. As imperfect platy crystals, to 5 mm, in aggregates.

Physical Properties: *Cleavage:* {010}, perfect; cleavage traces ∥ [001] and ∥ [100], visible on {010}. *Tenacity:* Flexible. Hardness = 2 D(meas.) = 3.54 D(calc.) = 3.56

Optical Properties: Transparent. *Color:* Colorless, white, rose. *Luster:* Pearly on {010}. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y \wedge a \simeq 28°$; $Z \wedge c \simeq 22°$. $\alpha = 1.632(5)$ $\beta = 1.652(3)$ $\gamma = 1.693(3)$ 2V(meas.) = 70(5)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.948(2)$ $b = 15.829(5)$ $c = 6.668(2)$ $\alpha = 90.86(2)°$ $\beta = 96.56(2)°$ $\gamma = 90.05(2)°$ Z = 8

X-ray Powder Pattern: Tsumeb, Namibia; very close to cobaltkoritnigite.
7.90 (10), 3.16 (9), 3.83 (7), 2.461 (6), 2.186 (5), 3.95 (4), 2.926 (4)

Chemistry:

	(1)	(2)	(3)

H_2O	[12.3]	[12.47]	12.10
Total	[100.0]	[100.00]	100.00

(1) Tsumeb, Namibia; by electron microprobe, $(AsO_3OH)^{2-}$ confirmed by IR, H_2O by difference. (2) Jáchymov, Czech Republic; H_2O by difference. (3) $Zn(AsO_3OH)\cdot H_2O$.

Occurrence: A secondary mineral of the lower oxidation zone in a dolostone-hosted polymetallic hydrothermal ore deposit (Tsumeb, Namibia).

Association: Tennantite, cuprian adamite, stranskiite, lavendulan, köttigite, tsumcorite, prosperite, o'danielite (Tsumeb, Namibia); erythrite, arsenolite, sphalerite (Jáchymov, Czech Republic).

Distribution: Found at Tsumeb, Namibia. From Jáchymov (Joachimsthal), Czech Republic. At Richelsdorf, Hesse, Germany.

Name: Honors Professor Sigmund Koritnig (1912–1984), petrologist, University of Göttingen, Göttingen, Germany.

Type Material: University of Stuttgart, Stuttgart, NM02; University of Göttingen, Göttingen, Germany; Harvard University, Cambridge, Massachusetts, 125338; National Museum of Natural History, Washington, D.C., USA, 143369.

Kornelite $Fe_2^{3+}(SO_4)_3 \cdot 7{-}8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are lathlike, flattened on {010}, acicular, elongated along [001], to several mm, with about 15 forms reported; in radial fibrous, globular, or tufted aggregates; in crusts. *Twinning:* On {100}, polysynthetic.

Physical Properties: *Cleavage:* On {100}. Hardness = n.d. D(meas.) = 2.306 D(calc.) = [2.254] Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Pale rose-pink to violet under artificial light. *Luster:* Silky if fibrous.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge c = 20(2)°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.567$ $\beta = 1.581$ $\gamma = 1.638$ 2V(meas.) = 49°–62°

Cell Data: *Space Group:* $P2_1/n$. a = 14.30(1) $b = 20.12(2)$ $c = 5.425(4)$ $\beta = 96.8(1)°$ Z = 4

X-ray Powder Pattern: Tintic Standard mine, Utah, USA.
10.0 (FFF), 6.64 (FF), 4.67 (FF), 4.30 (F), 3.14 (F), 4.39 (mF), 3.50 (mF)

Chemistry:

	(1)	(2)	(3)
SO_3	43.88	45.67	44.15
Fe_2O_3	29.72	30.36	29.36
H_2O	26.40	23.97	26.49
Total	[100.00]	100.00	100.00

(1) Tintic Standard mine, Utah, USA; recalculated to 100% from an original total of 99.82%, after deduction of 1.48% soluble and insoluble residue. (2) $Fe_2(SO_4)_3 \cdot 7H_2O$. (3) $Fe_2(SO_4)_3 \cdot 8H_2O$.

Occurrence: An uncommon secondary mineral formed by oxidation of pyrite.

Association: Voltaite, coquimbite (Smolník, Slovakia); coquimbite, römerite, copiapite, voltaite, rhomboclase (Copper Queen mine, Arizona, USA).

Distribution: From Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia. On Mt. Kozhokh, Bulgaria. From the Lanjarón mineral springs, Granada, Spain. In the USA, at the Tintic Standard mine, near Dividend, East Tintic district, Utah Co., Utah; in the Copper Queen mine, Bisbee, Cochise Co., Arizona; at the Island Mountain mine, Trinity Co., and from Coso Hot Springs, Inyo Co., California.

Name: To honor Kornel Hlavacsek (1835–1914), Hungarian mining engineer at the pyrite mines, Banská Štavnica, Slovakia.

Type Material: Natural History Museum, Budapest, Hungary, destroyed in 1956; topotypes remain.

Kornerupine $(Mg, Fe^{2+})_4Al_6(Si, Al, B)_5O_{21}(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, to over 20 cm, showing principally {110}, {100}, and {010}, rarely terminated; as radiating aggregates.

Physical Properties: *Cleavage:* Good on {110}. Hardness = 6–7 D(meas.) = 3.29–3.35 D(calc.) = 3.288

Optical Properties: Transparent to translucent and opaque. *Color:* Colorless, white, blue, green, dark green, greenish yellow, yellow-brown, black. *Luster:* Vitreous. *Optical Class:* Biaxial (–); may be pseudouniaxial (–). *Pleochroism:* X = colorless to green; Y = colorless, pale brownish yellow, pale yellowish green; Z = pale brownish green, green, light amber. *Orientation:* X = c; Y = a; Z = b. *Dispersion:* $r < v$ or $r > v$. α = 1.660–1.671 β = 1.673–1.683 γ = 1.674–1.684 2V(meas.) = 3°–48°

Cell Data: *Space Group: Cmcm.* $a = 16.041(3)$ $b = 13.746(2)$ $c = 6.715(2)$ Z = 4

X-ray Powder Pattern: Mautia Hill, Tanzania.
2.639 (100), 3.03 (80), 3.37 (60), 2.118 (60), 1.503 (40), 2.096 (30), 1.685 (30)

Chemistry:

	(1)		(1)
SiO_2	29.80	MgO	18.96
TiO_2	0.06	CaO	0.07

		Total	[99.17]

(1) Fiskenæsset, Greenland; by electron microprobe, Li, B, F by ion microprobe, H_2O from stoichiometry; corresponds to $(Mg_{3.48}Fe_{0.16}Li_{0.04}Ca_{0.01}Na_{0.01})_{\Sigma=3.70}(Al_{5.64}Ti_{0.01})_{\Sigma=5.65}(Si_{3.67}Al_{1.02}B_{0.31})_{\Sigma=5.00}O_{21}[(OH)_{0.99}F_{0.01}]_{\Sigma=1.00}$.

Occurrence: In boron-rich volcanic and sedimentary rocks subjected to amphibolite to granulite facies metamorphism; in metamorphosed anorthosite complexes.

Association: Sapphirine, cordierite, spinel, corundum, tourmaline, grandidierite, dumortierite, kyanite, sillimanite, andalusite, biotite, phlogopite, magnetite, ilmenite, hematite, rutile.

Distribution: Some localities for well-studied material follow. In Greenland, at Fiskenæsset. At Bjordam, near Kragerö, Norway. In Germany, from Waldheim, Saxony. From Mautia Hill, Tanzania. On the Bok se Puts Farm, Namaqualand, Cape Province, South Africa. Gem crystals from Itrongahy, near Betroka, and elsewhere in Madagascar. From gem gravels of the Matale, Ratnapura, and Embilipitiya districts, Sri Lanka. In the Harts and Strangways Ranges, Northern Territory, Australia. At Lac Ste-Marie, Quebec, Canada.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1883.754.

Name: For the Danish geologist, Andreas Nikolaus Kornerup (1857–1883).

Type Material: University of Copenhagen, Copenhagen, Denmark.

(1) Wessels mine, South Africa; by electron microprobe, Li by ion microprobe, average of seven analyses, H_2O by difference; corresponds to $(K_{0.65}Na_{0.31})_{\Sigma=0.96}(Na_{1.79}Li_{0.21})_{\Sigma=2.00}(Mg_{2.12}Mn^{3+}_{1.43}Li_{0.91}Fe^{3+}_{0.52})_{\Sigma=4.98}Si_{8.00}O_{22}(OH)_2$.

Mineral Group: Amphibole (alkali) group: $Na_B \geq 1.34$; $Li_C \geq 0.5$; $Mn^{3+} > Fe^{3+}$.

Occurrence: From a hand specimen, in veinlets of sérandite-pectolite cutting sugilite, probably of hydrothermal origin in a bedded manganese deposit.

Association: Sérandite-pectolite, sugilite, braunite, taikanite, hennomartinite.

Distribution: From the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Hermann Korn (?–1946), German geologist, professionally associated with Henno Martin, for whom an associated mineral is named.

Type Material: Natural History Museum, Bern, Switzerland, B5564.

Total	99.19

(1) Korshunov deposit, Russia; (OH) and H_2O confirmed by IR; after deduction of magnesite and dolomite ~16%, minor magnetite, and antigorite, corresponds to $Mg_{2.00}Cl_{1.03}(OH)_3 \cdot 3.5H_2O$.

Occurrence: From a drill core taken at 770 m in an iron ore deposit, in low-temperature hydrothermal veinlets in dolomitic marble.

Association: Ekaterinite, shabynite, magnetite, antigorite, dolomite, magnesite.

Distribution: From the Korshunov iron deposit, Irkutsk region, Siberia, Russia.

Name: For the Korshunov deposit, Russia, where it was first discovered.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Novofrolovskoye deposit, Russia; analysis on material estimated 50% pure; after deduction of calcite, dolomite, garnet, major sibirskite, minor calciborite, then stated to correspond to $CaB_{2.10}O_{4.15} \cdot H_2O$; identification depends on correspondence of X-ray pattern with synthetic $CaB_2O_4 \cdot 0.5H_2O$. (2) $CaB_2O_4 \cdot 0.5H_2O$.

Occurrence: In boron-rich iron-ore skarn.

Association: Andradite–grossular, dolomite, calcite, sibirskite, calciborite.

Distribution: From the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains, Russia.

Name: Honoring Dmitrii Sergeevich Korzhinskii (1899–1985), Russian petrologist, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: Vernadsky Geological Museum, Moscow, 48612; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72025.

Kosmochlor $NaCr^{3+}Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Short prismatic crystals, to 2 mm; in fibrous and polycrystalline aggregates. *Twinning:* Simple, lamellar on {100}, {001}.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ $(1\bar{1}0)$ ∼87°; parting on {001}. Hardness = ∼6 D(meas.) = 3.51–3.60 D(calc.) = 3.60

Optical Properties: Semitransparent. *Color:* Emerald-green; green or yellow in thin section. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = yellowish green; Y = blue-green, grass-green; Z = emerald-green. *Orientation:* $Y = b$; $Z \wedge a = 8°$–$22°$. *Dispersion:* $r > v$, moderate to strong. $\alpha = 1.740$–1.766 $\beta = 1.756$–1.778 $\gamma = 1.745$–1.781 2V(meas.) = 6°–70°

Cell Data: *Space Group:* $C2/c$. $a = 9.550$ $b = 8.712$ $c = 5.273$ $\beta = 107.44°$ Z = 4

X-ray Powder Pattern: Synthetic.
2.956 (100), 2.867 (100), 2.5166 (90), 2.4476 (70), 2.0985 (70), 1.5957 (70), 1.3802 (60)

Chemistry:

	(1)	(2)		(1)	(2)

(1) Coahuila meteorite; by electron microprobe, corresponds to $(Na_{0.83}Ca_{0.07})_{\Sigma=0.90}(Cr_{0.90}Mg_{0.04})_{\Sigma=0.94}Si_{2.06}O_6$. (2) Myanmar; by electron microprobe, average of seven analyses, average sum originally given as 100.19%; corresponds to $(Na_{0.93}Ca_{0.02})_{\Sigma=0.95}(Cr_{0.69}Al_{0.17}Fe_{0.10}Mg_{0.03})_{\Sigma=0.99}Si_{2.02}O_6$.

Mineral Group: Pyroxene group.

Occurrence: A major constituent of some jadeitites; an accessory constituent of some iron meteorites.

Association: "Cliftonite" [graphite], chromian diopside, troilite (Toluca); daubréelite (Coahuila); krinovite, roedderite, high albite, richterite, chromite (Canyon Diablo); jadeite, chromite, chlorite (Myanmar).

Distribution: In the Toluca, Coahuila, Hex River Mountains, and Canyon Diablo meteorites. Around Tawmaw and other towns, Myitkyina-Mogaung district, Kachin State, Myanmar (Burma). At Mocchie, Susa, Piedmont, Italy. From Williams Creek, Mendocino Co., California, USA.

Name: From the German *kosmisch*, for *cosmic*, in allusion to its meteoritic occurrence, and the Greek *chlor*, for *green*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 81869, 81870; The Natural History Museum, London, England, 81869–81870.

Total	99.97	100.57	100.00

(1) Mt. Mica, Maine, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(K_{0.93}Na_{0.08}Rb_{0.01})_{\Sigma=1.02}(Zr_{1.81}Na_{0.15}Mn_{0.07}Fe_{0.01}Hf_{0.01})_{\Sigma=2.05}[P_{1.02}(O_{3.98}F_{0.02})_{\Sigma=4.00}]_3$. (2) Black Mountain, Maine, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(K_{0.99}Rb_{0.01})_{\Sigma=1.00}(Zr_{1.96}Hf_{0.02})_{\Sigma=1.98}[P_{1.00}(O_{3.98}F_{0.02})_{\Sigma=4.00}]_3$. (3) $KZr_2(PO_4)_3$.

Occurrence: A very rare mineral, formed by late hydrothermal alteration, probably of beryl and zircon, in complex granite pegmatites.

Association: Eosphorite, fluorapatite, moraesite, siderite, zircon, quartz (Mt. Mica, Maine, USA); siderite, albite, quartz (Black Mountain quarry, Maine, USA); wycheproofite, eosphorite, selwynite, cyrilovite, schorl (Wycheproof, Australia).

Distribution: In the USA, at Mt. Mica, near Paris, and in the Black Mountain quarry, near Rumford, Oxford Co., Maine. From Wycheproof, Victoria, Australia.

Name: For Richard A. Kosnar (1946–), American mineral dealer of Black Hawk, Colorado, USA, long interested in pegmatite minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 170369, 170370.

Te	67.6	64.4	63.97	66.21
S		0.1		
Total	100.9	99.6	100.22	100.00

(1) Chelopech, Bulgaria; by electron microprobe, corresponding to $(Cu_{0.92}Ag_{0.03})_{\Sigma=0.95}Au_{0.97}Te_{4.00}$. (2) Bisbee, Arizona, USA; by electron microprobe; corresponding to $(Cu_{0.90}Ag_{0.04})_{\Sigma=0.94}Fe_{0.01}Au_{1.09}(Te_{3.98}S_{0.02})_{\Sigma=4.00}$. (3) Kochbulak deposit, Uzbekistan; by electron microprobe, corresponding to $(Cu_{0.61}Ag_{0.30})_{\Sigma=0.91}Au_{1.11}Te_{4.00}$. (4) $CuAuTe_4$.

Occurrence: From gold- and tellurium-bearing replacement copper deposits (Chelopech, Bulgaria; Campbell mine, Arizona, USA).

Association: Kesterite, tellurium, chalcopyrite, tennantite, barite (Chelopech, Bulgaria); tellurium, hessite, sylvanite (Buckeye Gulch, Colorado, USA); tellurium, altaite, calaverite, sylvanite, petzite, hessite, tellurantimony, melonite, chalcopyrite, tetrahedrite, sphalerite (Kochbulak deposit, Uzbekistan).

Distribution: From the Chelopech deposit, Sofia, Bulgaria [TL]. In the Campbell mine, Bisbee, Cochise Co., Arizona, and at Buckeye Gulch, near Leadville, Lake Co., Colorado, USA. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the Guilaizhuang gold deposit, Shandong Province, China. At the Ashanti gold deposit, Obuasi, Ghana.

Name: To honor Professor Ivan Kostov (1913–), Bulgarian mineralogist, University of Sophia, Bulgaria.

Type Material: Geological Institute, Bulgarian Academy of Sciences; University of Sophia, Bulgaria; Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry, Moscow, Russia.

(1) Hol Kol mine, North Korea; forsterite and spinel impurities. (2) $Mg_3(BO_3)_2$.

Occurrence: An uncommon mineral typically formed in the contact zone of magnesium-rich skarn borate deposits.

Association: Forsterite, clinohumite, ludwigite, spinel, fluoborite, szaibélyite (Hol Kol mine, North Korea); ludwigite, suanite, szaibélyite, warwickite (Neichi mine, Japan).

Distribution: From the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. In the Neichi mine, Miyako, Iwate Prefecture, Japan. At Qiliping, Hunan Province, and near Dading, Guizhou Province, China. In Russia, in the Korotkov skarn deposit, central Transbaikal, and at the Titovskoye boron deposit, Tas-Khayakhtakh Mountains, Sakha. From Băiţa (Rézbánya), Romania. In the Brosso mine, northwest of Ivrea, Torino, Italy. In the USA, on Jumbo Mountain, south of Darrington, Snohomish Co., Washington, and near Brighton, Big Cottonwood district, Salt Lake Co., Utah.

Name: To honor Professor Bundjiro Koto (1856–1935), Japanese geologist and petrographer, University of Tokyo, Tokyo, Japan, who studied the ore deposits of Hol Kol, North Korea.

Type Material: The Natural History Museum, London, England, 1938,1286; Harvard University, Cambridge, Massachusetts, 94750; National Museum of Natural History, Washington, D.C., USA, 103502.

Total	101.77	100.00

(1) Bellerberg, near Kottenheim, Eastern Eifel area, Germany; average of 6 electron microprobe analyses, Fe^{+3} confirmed by Mössbauer spectroscopy, H_2O and CO_2 were determined by gas chromatography, OH, CO_3 and SO_4 confirmed by IR spectroscopy; corresponding to $Ca_{3.015}Mg_{0.03}Fe_{0.02}Al_{0.03}Si_{0.97}(OH)_{5.94}(SO_4)_{1.97}(CO_3)_{0.09} \cdot 11.91H_2O$. (2) $Ca_3Si(OH)_6(SO_4)_2 \cdot 12H_2O$.

Mineral Group: Ettringite group.

Occurrence: In miarolitic cavities in alkali basalt.

Association: Wollastonite, clinochlore, ellestadite, melilite, cuspidine, and earlier-formed sanidine, clinopyroxene, magnetite.

Distribution: At Bellerberg, near Kottenheim, Eastern Eifel area, Rhineland-Palatinate (Rheinland-Pfalz), Germany.

Name: For the town near the locality that produced the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (4102/1).

References: (1) Chukanov, N.V., S.N. Britvin, K.V. Van, S. Möckel, and A.E. Zadov (2012) Kottenheimite, $Ca_3Si(OH)_6(SO_4)_2 \cdot 12H_2O$, a new member of the ettringite group from the Eifel area, Germany. Can. Mineral., 50, 55-63. (2) (2014) Amer. Mineral., 99, 1515 (abs. ref. 1).

Köttigite $Zn_3(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are prismatic to acicular along [001], flattened on {010}, to 6 cm, prominent {010}, {201}, smaller {100}, {110}, {$\overline{2}$21}, in radiating sprays; as fibrous crusts, massive.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = 2–3 D(meas.) = 3.33 D(calc.) = 3.24

Optical Properties: Translucent. *Color:* White, colorless; light carmine, peach-blossom-red (cobaltian); blue, grayish blue (ferroan); in transmitted light, colorless, may be pale rose. *Streak:* White to reddish white. *Luster:* Silky on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* Weak; $X = Y$ = colorless; Z = pale red. *Orientation:* $X = b$; $Z \wedge c = 32°–37°$. *Dispersion:* $r < v$. *Absorption:* $Z > X = Y$. $\alpha = 1.619–1.622$ $\beta = 1.638–1.645$ $\gamma = 1.671–1.681$ 2V(meas.) = 74°–85° 2V(calc.) = 72°–83°

Cell Data: *Space Group:* $C2/m$. $a = 10.241–10.259$ $b = 13.405–13.430$ $c = 4.757–4.762$ $\beta = 105.21°–105.38°$ Z = 2

X-ray Powder Pattern: Schneeberg, Germany.
6.66 (100), 2.994 (90), 7.87 (70), 2.734 (60), 3.220 (50), 3.006 (50), 2.462 (50)

Total	[100.00]	[100.00]	100.00

(1) Schneeberg, Germany; As_2O_5 by difference. (2) Do.; by electron microprobe, H_2O by difference; corresponds to $(Zn_{2.44}Co_{0.42}Ni_{0.14})_{\Sigma=3.00}(AsO_4)_2 \cdot 8H_2O$. (3) $Zn_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Forms a series with parasymplesite.

Mineral Group: Vivianite group.

Occurrence: A rare secondary mineral in the oxidation zone of some zinc deposits.

Association: Symplesite, parasymplesite, adamite, legrandite, metaköttigite, gypsum (Ojuela mine, Mexico); pharmacosiderite, legrandite, scorodite, adamite (Sterling Hill, New Jersey, USA); cuprian adamite (Tsumeb, Namibia).

Distribution: In Germany, from the Daniel mine, Schneeberg, Saxony; in the Richelsdorf Mountains, Hesse; at the Michael mine, Weiler, near Lahr, and the Clara mine, near Oberwolfach, Black Forest. At Jáchymov (Joachimsthal) and Příbram, Czech Republic. Large crystal groups from the Ojuela mine, Mapimí, Durango, Mexico. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and in the Clan Alpine Mountains, east side of Stingaree Valley, Churchill Co., Nevada, USA. From Tsumeb, Namibia. In the Ogibira mine, Osa, Okayama Prefecture, Japan. From the Puttapa zinc mine, near Beltana, South Australia.

Name: To honor Otto Köttig (1824–1892), chemist, of Schneeberg, Germany, who published the first description of the mineral.

Kotulskite Pd(Te, Bi)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As minute grains included in other minerals.

Physical Properties: Hardness = n.d. VHN = 165–184; 277–322, 291 average (15 g load). D(meas.) = n.d. D(calc.) = 9.18

Optical Properties: Opaque. *Color:* Steel-gray; in polished section, cream or pale yellow. *Luster:* Metallic. *Pleochroism:* Distinct, from pale cream to darker grayish cream. *Anisotropism:* Strong, from gray to dark bluish gray.
R_1–R_2: (400) — , (420) 46.3–46.5, (440) 50.5–52.1, (460) 54.2–57.1, (480) 57.1–61.1, (500) 59.7–64.2, (520) 61.4–66.3, (540) 62.7–67.9, (560) 64.0–69.4, (580) 64.6–70.2, (600) 65.8–71.2, (620) 66.3–72.7, (640) 67.0–72.9, (660) 67.5–73.4, (680) 67.3–73.5, (700) 68.6–74.6

Cell Data: *Space Group:* n.d. $a = 4.145(5)$ $c = 5.67(1)$ Z = [1]

X-ray Powder Pattern: Rustenburg mine, South Africa.
3.03 (100), 2.22 (90), 2.08 (70), 1.52 (30), 1.72 (20), 1.67 (20), 1.32 (10)

Chemistry:

	(1)	(2)	(3)	(4)
Pd	44.3	43.0	45.9	45.47
Pt	2.3			
Bi	1.8	7.0	17.2	
Te	53.5	49.4	38.0	54.53
Total	101.9	99.4	101.1	100.00

(1) Thierry mine, Canada; by electron microprobe, corresponds to $(Pd_{0.97}Pt_{0.03})_{\Sigma=1.00}(Te_{0.98}Bi_{0.02})_{\Sigma=1.00}$. (2) Messina, South Africa; by electron microprobe, corresponds to $Pd_{1.00}(Te_{0.96}Bi_{0.08})_{\Sigma=1.04}$. (3) Rustenburg mine, South Africa; by electron microprobe, corresponds to $Pd_{1.00}(Te_{0.69}Bi_{0.19})_{\Sigma=0.88}$. (4) PdTe.

Occurrence: A minor accessory mineral, of primary or secondary hydrothermal origin, in many Pt–Pd-bearing Cu–Ni deposits in ultramafic rocks.

Polymorphism & Series: Forms a series with sobolevskite.

Association: Sobolevskite, merenskyite, melonite, michenerite, moncheite, braggite, many other Pt–Pd minerals, chalcopyrite, bornite, pentlandite, pyrrhotite, pyrite.

Distribution: Some prominent localities include: in Russia, from the Monchegorsk Cu–Ni deposit, Kola Peninsula [TL]; in the Noril'sk region, western Siberia; from the Lukkulaisvaara layered intrusion, Karelia. In South Africa, at the Rustenburg platinum mine, in the Merensky Reef of the Bushveld complex; and in the Artonvilla mine, Messina, Transvaal. In Canada, in the Levak West and Creighton mines, Sudbury; the Lac des Iles complex; and from the Thierry mine, near Pickle Lake, Ontario. In the Stillwater complex, Montana; at the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; in the Key West mine, east of Moapa, Bunkerville district, Clark Co., Nevada. In China, at Shiaonanshan, Inner Mongolia, and at Danba, Sichuan Province.

Name: To honor Vladimir Klement'evich Kotul'skii (1879–1949), Russian economic geologist and authority on Cu–Ni sulfide deposits, of the Mining Institute, St. Petersburg, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, Russia, 5966.

Total	100.7	99.77	100.00

(1) Daluis, France; by electron microprobe. (2) Wasserfall, France; by electron microprobe. (3) Cu_5As_2.

Occurrence: In arsenical copper deposits.

Association: Paxite, arsenic, silver, skutterudite, nickeline, löllingite, chalcocite, algodonite, domeykite, allargentum, kutínaite, calcite.

Distribution: From the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic [TL]. In France, at Daluis, Alpes-Maritimes; Lautaret, Hautes-Alpes; and Wasserfall, about 20 km northwest of Belfort, Haute-Saône. From Långban, and at the Harstigen mine, near Persberg, Värmland, Sweden. From the Talmessi and Meskani deposits, Anarak district, Iran. In India, at Romehra, Himachal Pradesh. From Mohawk, Keeweenaw Co., Michigan, USA. Also noted from ill-defined localities in Israel and Kazakhstan.

Name: For Jaromir Koutek (1902–1983), Professor of Economic Geology, Charles University, Prague, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 18269; National Museum of Natural History, Washington, D.C., USA, 162605.

Kovdorskite $Mg_2(PO_4)(OH)\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rough prismatic crystals, to 2 cm, with measurable {110}, {010}, {580}, {001}, {101}, {111}; granular.

Physical Properties: *Fracture:* Conchoidal to uneven. Hardness = 4 VHN = 420–450 D(meas.) = 2.28 D(calc.) = 2.30

Optical Properties: Transparent to opaque. *Color:* Colorless, pale rose, bright pink, pale blue, may be blue with pink terminations; colorless to pale rose in transmitted light.
Optical Class: Biaxial (–). *Orientation:* $Z \wedge c = 1°$–$3°$. *Dispersion:* $r > v$, very weak.
$\alpha = 1.528(2)$ $\beta = 1.542$ $\gamma = 1.549$ 2V(meas.) = 80°–82°

Cell Data: *Space Group:* $P2_1/c$. $a = 4.74(2)$ $b = 12.90(4)$ $c = 10.35(4)$
$\beta = 102°00(30)'$ Z = 4

X-ray Powder Pattern: Kovdor massif, Russia.
7.96 (100), 2.258 (64), 2.821 (59), 5.44 (46), 4.32 (36), 1.884 (27), 2.658 (25)

Chemistry:

	(1)	(2)
P_2O_5	32.95	33.07
MgO	37.34	37.55
H_2O	29.47	29.38
Total	99.76	100.00

(1) Kovdor massif, Russia. (2) $Mg_2(PO_4)(OH)\cdot 3H_2O$.

Occurrence: A very rare mineral in an explosive breccia pipe cutting an iron ore deposit in a carbonatized ultramafic-alkalic intrusive.

Association: Collinsite, magnesite, dolomite, hydrotalcite, apatite, magnetite, forsterite.

Distribution: From the Kovdor massif, Kola Peninsula, Russia.

Name: For the Kovdor massif, Russia, in which it was first found to occur.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81408.

$(Mn^{2+}, Mg)_{24}Zn_3Fe^{3+}(As^{3+}O_3)_2(As^{5+}O_4)_3(SiO_4)_6(OH)_{18}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As thin, curved, compact foliated scales and coarse plates, to 1 cm; in sprays; in veinlets and lenses.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Brittle. Hardness = 3–4
D(meas.) = 3.876 D(calc.) = 3.918

Optical Properties: Translucent. *Color:* Deep coppery brown; rich brown in thin section.
Streak: Golden brown. *Luster:* Submetallic.
Optical Class: Uniaxial (+). $\omega = 1.805(2)$ $\epsilon =$ n.d. ; weak birefringence.

Cell Data: *Space Group:* $P6_322$. $a = 8.22(1)$ $c = 43.88(5)$ Z = 2

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
2.74 (100), 2.437 (55), 2.194 (55), 4.385 (45), 3.651 (35), 3.13 (20), 1.219 (7)

Chemistry:

	(1)	(2)
SiO_2	13.8	12.9
Al_2O_3	0.21	0.2
Fe_2O_3		2.0
As_2O_3	0.87	6.69
As_2O_5	17.7	10.35
FeO	1.92	
MnO	51.6	52.0
ZnO	8.47	8.6
MgO	2.53	2.6
H_2O	3.68	[3.68]
Total	100.78	[99.02]

(1) Sterling Hill, New Jersey, USA. (2) Do.; by electron microprobe and other chemical tests; average of five analyses, excepting As_2O_3 and As_2O_5 which are averages of three; H_2O from (1); corresponds to $(Mn_{21.96}Mg_{1.90})_{\Sigma=23.86}Zn_{3.16}Fe^{3+}_{0.74}(As^{3+}O_3)_{2.02}(As^{5+}O_4)_{2.70}(SiO_4)_{6.44}(OH)_{18}$.

Occurrence: In the zincite zone, as films and lenses in fractures, probably of secondary origin, in a metamorphosed stratiform zinc deposit.

Association: Zincite, willemite, franklinite, calcite, pyrochroite, barite, sphalerite, rhodochrosite, adelite, holdenite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For Frederick Kraissl, Jr. (1899–1986) and Alice L. Kraissl (1905–1986), of Hackensack, New Jersey, USA, American amateur mineralogists who specialized in Franklin and Sterling Hill minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137017, 137018.

Krasnovite $Ba(Al,Mg)(PO_4,CO_3)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Fibers, elongated along [010], in spherulites, to 3 mm.

Physical Properties: *Cleavage:* Two ∥ [010], perfect. *Fracture:* Fibrous. Hardness = 2 D(meas.) = 3.70(5) D(calc.) = 3.69

Optical Properties: Translucent. *Color:* Pale blue. *Streak:* White. *Luster:* Silky. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$. *Dispersion:* $r > v$, weak. $\alpha = 1.616(2)$ $\beta = 1.629(2)$ $\gamma = 1.640(2)$ 2V(meas.) = 70°–90° 2V(calc.) = 85°

Cell Data: *Space Group:* *Pnnn* or *Pnna*. $a = 8.939(2)$ $b = 5.669(3)$ $c = 11.073(3)$ Z = 4

X-ray Powder Pattern: Kovdor massif, Russia.
2.768 (100), 3.479 (82), 5.54 (79), 2.543 (61), 3.345 (59), 2.072 (41), 2.354 (32)

Chemistry:

	(1)
P_2O_5	19.8
CO_2	[3.55]
Al_2O_3	14.3
FeO	0.3
MgO	1.7
SrO	0.7
BaO	49.1
K_2O	0.05
H_2O	10.5
Total	[100.00]

(1) Kovdor massif, Russia; by electron microprobe, average of three analyses; total Fe as FeO, confirmed by microchemical tests, H_2O by the Penfield method, CO_2 by difference, confirmed by IR; corresponds to $(Ba_{1.00}Sr_{0.02})_{\Sigma=1.02}(Al_{0.88}Mg_{0.13}Fe_{0.01})_{\Sigma=1.02}[(PO_4)_{0.87}(CO_3)_{0.25}]_{\Sigma=1.12}(OH)_{1.85} \cdot 0.90H_2O$.

Occurrence: A very rare mineral from an iron ore deposit in a carbonatized ultramafic-alkalic intrusive.

Association: Dolomite, manasseite, carbonate-apatite, crandallite, barite.

Distribution: From the Iron mine, Kovdor massif, Kola Peninsula, Russia.

Name: Honoring Natal'ya Ivanovna Krasnova (1941–), mineralogist and specialist on the Kovdor massif, St. Petersburg University, St. Petersburg, Russia, in whose collection the first specimen was found.

Type Material: Mining Institute, St. Petersburg, Russia, 2044/1.

Kratochvílite $C_{13}H_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. [Crystalline massive.]

Physical Properties: Hardness = n.d. D(meas.) = 1.206 D(calc.) = 1.197 Fluoresces bright blue-violet under SW UV.

Optical Properties: Semitransparent. *Color:* [Colorless.]
Optical Class: Biaxial. $\alpha = 1.557$ $\beta = 1.725$ γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group: Pnam.* $a = 8.50$ $b = 5.71$ $c = 19.00$ $Z = 4$

X-ray Powder Pattern: Synthetic $C_{13}H_{10}$. (ICDD 28-2011).
4.68 (100b), 3.38 (90), 9.39 (70), 4.21 (70b), 2.54 (60), 3.79 (50), 2.45 (50)

Chemistry: (1) Identification depends on the identity of X-ray powder pattern and physical properties with synthetic material (fluorene).

Occurrence: Formed as a result of burning pyritic shale (Kladno, Czech Republic).

Association: n.d.

Distribution: In the Czech Republic, in the Kladno district, at the Nejedlý I coal mine, Libušín. Material from other localities may be the natural analog of fluorene; but the original material perhaps was not.

Name: To honor Professor Josef Kratochvíl (1878–1958), Czech petrographer, Charles University, Prague, Czech Republic.

Type Material: Lost.

Krausite $KFe^{3+}(SO_4)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are equant, may be tabular on {001} or short prismatic along [001]. Small crystals may exhibit prominent {110}, with {$\overline{1}$01}, {$\overline{1}$02}, {$\overline{1}$12}, {001}, {100}, {210}, {$\overline{2}$11}; larger crystals, to 5 mm, are typically rough; forms massive crusts.

Physical Properties: *Cleavage:* On {001}, perfect; on {100}, good. Hardness = 2.5 D(meas.) = 2.840 D(calc.) = 2.839 Slowly decomposed by H_2O, leaving Fe_2O_3.

Optical Properties: Transparent to opaque. *Color:* Pale lemon-yellow, yellowish green, gray; pale yellow to colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Pleochroism:* Distinct; X = colorless; $Y = Z$ = pale yellow. *Orientation:* $Z = b$; $X \wedge c = -35°$. $\alpha = 1.588$ $\beta = 1.650$ $\gamma = 1.722$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1/m$. $a = 7.908$–7.920 $b = 5.152$–5.146 $c = 8.988$–9.014 $\beta = 102.75°$–$102.76°$ Z = 2

X-ray Powder Pattern: Borate, California, USA.
3.09 (100), 4.40 (74), 6.59 (66), 3.69 (64), 4.26 (45), 2.768 (40), 2.579 (38)

Chemistry:

	(1)	(2)	(3)
SO_3	51.05	53.02	52.49
SiO_2	2.19		
Fe_2O_3	24.94	25.90	26.17
FeO	0.24		
CaO	0.12		
Na_2O	0.64		
K_2O	14.71	15.28	15.44
H_2O	5.59	5.80	5.90
insol.	0.92		
Total	100.40	[100.00]	100.00

(1) Borate, California, USA; with estimated 1%–2% impurities including coquimbite, metavoltine, clay. (2) Analysis (1) recalculated to 100% after deduction of impurities; corresponds to $K_{0.98}Fe_{0.98}(SO_4)_{2.00} \cdot 0.98H_2O$. (3) $KFe(SO_4)_2 \cdot H_2O$.

Occurrence: An uncommon secondary mineral in sulfate-bearing cherts (Borate, California, USA); formed on a dump by post-mine oxidation of pyrite (Velardeña mine, Mexico).

Association: Alunite, coquimbite, römerite, voltaite, metavoltine (Borate, California, USA): copiapite, voltaite, halotrichite (Velardeña mine, Mexico).

Distribution: In the USA, in the Sulfur Hole prospect, near Borate, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co., California, and in the Coral Reefs district, Wayne Co., Utah, USA. At the Santa Maria mine, Velardeña, Durango, Mexico. In the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province, Argentina. From Campi Flegrei, near Naples, Campania, Italy.

Name: To honor Dr. Edward Henry Kraus (1875–1973), American mineralogist, Professor of Mineralogy and Crystallography, University of Michigan, Ann Arbor, Michigan, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 96094, R7652.

Krauskopfite $BaSi_2O_4(OH)_2 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As equant to short prismatic grains, subhedral to anhedral, to 6 mm.

Physical Properties: *Cleavage:* Perfect on {010} and {001} intersecting at 90°, with a third poor cleavage at a high angle to the other two. Hardness = ∼4 D(meas.) = 3.14(2) for impure material. D(calc.) = 3.10

Optical Properties: Transparent to translucent. *Color:* White to colorless; colorless in thin section. *Streak:* White. *Luster:* Subvitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y \wedge a = 6°$; $Z \wedge c = 10.5°$. *Dispersion:* $r > v$, distinct. $\alpha = 1.574(2)$ $\beta = 1.587(2)$ $\gamma = 1.599(2)$ 2V(meas.) = 88(5)° 2V(calc.) = 87°42′

Cell Data: *Space Group:* $P2_1/a$. $a = 8.460(5)$ $b = 10.622(6)$ $c = 7.837(4)$ $\beta = 94°32(8)'$ Z = 4

X-ray Powder Pattern: Rush Creek area, California, USA.
3.84 (100), 6.36 (45), 5.34 (45), 3.01 (40), 6.7 (30), 3.94 (30), 3.66 (30)

Chemistry:

	(1)
SiO_2	35.2
TiO_2	0.01

(1) Cripple Creek, Colorado, USA; corresponds to $(Au_{1.02}Ag_{0.02})_{\Sigma=1.04}Te_{2.00}$. (2) Moose mine, Cripple Creek, Colorado, USA; Fe is from pyrite; corresponds to $(Au_{0.80}Ag_{0.20})_{\Sigma=1.00}Te_{2.00}$. (3) Săcărîmb, Romania; corresponds to $(Au_{0.77}Ag_{0.24})_{\Sigma=1.01}Te_{2.00}$. (4) $AuTe_2$.

Polymorphism & Series: Dimorphous with calaverite.

Occurrence: In hydrothermal veins with other tellurides.

Association: Calaverite, coloradoite, sylvanite, krennerite, petzite, hessite, tellurium, gold, pyrite, quartz.

Distribution: In Romania, from Săcărîmb (Nagyág) [TL] and Faţa Băii (Facebánya). In the Konstantin-Ovkoye gold deposit, Krasnoyarskii region, and the Bereznyakov gold deposit, Southern Ural Mountains, Russia. From the Zhana-Tyube Au–Te deposit, northern Kazakhstan. In the USA, in Colorado, at several mines in Cripple Creek, Teller Co.; the Smoky Hill mine, Boulder Co.; the Central City district, Gilpin Co., and several other minor localities; in the Campbell mine, Bisbee, and at Tombstone, Cochise Co., Arizona; from the Golden Sunlight mine, near Whitehall, Jefferson Co., Montana. In Canada, at the Bencourt mine, Louvricourt, Quebec. At Kalgoorlie and Mulgabbie, Western Australia. From the Emperor mine, Vatukoula, and in the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. In the Date mine, Hokkaido, and at the Susaki mine, Shizuoka Prefecture, Japan.

Name: For József A. Krenner (1839–1920), Hungarian mineralogist who first noted the species.

Total	100.01	100.00

(1) Kristineberg mine, Sweden. (2) $Al_5(PO_4)_3(SO_4)(OH)_4 \bullet 4H_2O$.

Occurrence: Filling fractures in cupriferous pyrite.

Association: Pyrite.

Distribution: From the Kristineberg mine, Västerbotten, Sweden.

Name: A contraction of the type locality, the KRIstineBERG mine, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, RM450003.

(1) Canyon Diablo meteorite; by electron microprobe. (2) $Na_2Mg_4Cr_2Si_6O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: Disseminated within graphite nodules in some octahedrite iron meteorites.

Association: Graphite, roedderite, high albite, richterite, forsterite, kosmochlor, chromite.

Distribution: In the Canyon Diablo, Wichita County, and Youndegin meteorites.

Name: For Evgeny Leonidovich Krinov, noted Russian investigator of meteorites.

Type Material: n.d.

Krivovichevite $Pb_3[Al(OH)_6](SO_4)(OH)$

Crystal Data: Hexagonal. *Point Group*: 3*m*. Grains, to 1 cm, are equant.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 3 D(meas.) = n.d. D(calc.) = 5.37 Easily soluble in water.

Optical Properties: Transparent to translucent. *Color*: Pale gray to colorless. *Streak*: White. *Luster*: Vitreous.
Optical Class: Uniaxial (-). *n*(meas.) ≈ 1.9 *n*(calc.) = 1.85

Cell Data: *Space Group*: *R*3*c*. *a* = 7.742(9) *c* = 32.082(9) *Z* = 6

X-ray Powder Pattern: Mt. Lepkhe-Nelm, Lovozero alkaline massif, Kola Peninsula, Russia. 3.58 (100), 2.591 (90), 1.704 (80), 2.048 (70), 3.10 (60), 2.216 (50), 1.893 (50)

H_2O	7.20	7.30
Total	98.36	100.00

(1) Mt. Lepkhe-Nelm, Lovozero alkaline massif, Kola Peninsula, Russia; average of 5 electron microprobe analyses, H_2O by Penfield method, SO_4 and OH groups confirmed by IR spectroscopy; corresponding to $Pb_{3.04}Al_{0.94}(S_{1.03}O_{3.98})(OH)_{7.08}$. (2) $Pb_3Al(SO_4)(OH)_7$.

Occurrence: A low-temperature hydrothermal alteration product of galena and natrolite by oxidizing solutions in a zoned pegmatite vein within lujavrite. Possibly a metastable ephemeral phase that forms in the early stages of oxidation of galena prior to a transformation to stable plumbojarosite–hinsdalite-like phases.

Association: Galena, anglesite, cerrusite, hydrocerussite, lanarkite, leadhillite.

Distribution: From Mt. Lepkhe-Nelm, Lovozero alkaline massif, Kola Peninsula, Russia.

Name: Honors Sergey Vladimirovich Krivovichev (b. 1972), Professor of mineralogy and crystallography, St. Petersburg State University, Russia, for his contributions to the mineralogy of alkaline massifs and the structural mineralogy of sulfate and lead minerals.

Type Material: Mineralogical Museum, St. Petersburg State University and the Geological and Mineralogical Museum, Geological Institute of the Kola Science Center, Academy of Sciences, Apatity, Russia (no. 6281/1.07.2005).

Kröhnkite $Na_2Cu(SO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are pseudo-octahedral, equant to short prismatic along [001] or [100], to 7 cm; typically they exhibit {110}, {011}, {010}, {021}, $\{\overline{1}11\}$, with over two dozen more forms recorded. In crusts and aggregates, granular, massive. *Twinning:* Common on {101}, may be heart-shaped.

Physical Properties: *Cleavage:* Perfect on {010}; poor on $\{\overline{1}01\}$. *Fracture:* Conchoidal. Hardness = 2.5–3 D(meas.) = 2.90 D(calc.) = 2.913 Easily soluble in H_2O.

Optical Properties: Transparent. *Color:* Sky-blue to pale blue or greenish blue, becoming green and opaque on exposure; pale blue to colorless in transmitted light. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 48°$. *Dispersion:* $r < v$, weak, inclined. $\alpha = 1.544$ $\beta = 1.578$ $\gamma = 1.601$ 2V(meas.) = 78°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.807(1)$ $b = 12.656(2)$ $c = 5.517(1)$ $\beta = 108.32(1)°$ Z = 2

X-ray Powder Pattern: Chuquicamata, Chile. (ICDD 11-90).
6.33 (100), 3.278 (90), 2.757 (90), 2.925 (80), 3.715 (60), 4.145 (40), 3.099 (40)

Chemistry:

	(1)	(2)
SO_3	47.60	47.42
CuO	23.25	23.56
Na_2O	18.89	18.35
H_2O	10.72	10.67
Total	100.46	100.00

(1) Chuquicamata, Chile. (2) $Na_2Cu(SO_4)_2 \cdot 2H_2O$.

Occurrence: An uncommon secondary mineral formed in the oxidized zone of copper deposits, typically in very arid climates.

Association: Atacamite, blödite, chalcanthite, antlerite, natrochalcite (Chuquicamata, Chile).

Distribution: In Chile, abundantly and in large crystals from Chuquicamata, at Quetena, west of Calama, and at Collahuasi, Antofagasta; from El Cobre de Mejillones and in the Incahuasi district, Atacama. In Wheal Hazard, St. Just, Cornwall, England. From the Recsk copper deposit, Mátra Mountains, Hungary. At Capo Calamita, Elba, Italy. From Broken Hill, New South Wales, Australia.

Name: Honoring B. Kröhnke, who provided the first analysis of the mineral.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 444–446. (2) Hawthorne, F.C. and R.B. Ferguson (1975) Refinement of the crystal structure of kröhnkite. Acta Cryst., 31, 1753–1755.

Krupkaite $PbCuBi_3S_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Typically as fibrous aggregates of parallel intergrowths with other bismuthinite–aikinite minerals.

Physical Properties: Hardness = n.d. VHN = 148–188 (100 g load). D(meas.) = n.d. D(calc.) = 6.98

Optical Properties: Opaque. *Color:* Steel-gray; in polished section, grayish white. *Luster:* Metallic.
R_1–R_2: (400) 39.8–46.9, (420) 40.0–46.7, (440) 40.1–46.3, (460) 40.2–46.2, (480) 40.1–46.3, (500) 39.9–46.5, (520) 39.7–46.7, (540) 39.4–46.9, (560) 39.1–47.0, (580) 38.9–46.9, (600) 38.8–46.8, (620) 38.6–46.5, (640) 38.3–46.2, (660) 38.0–45.8, (680) 37.8–45.4, (700) 37.5–44.8

Cell Data: *Space Group:* $Pb2_1m$ $a = 11.200(9)$ $b = 11.560(9)$ $c = 4.003(3)$ $Z = 2$

X-ray Powder Pattern: Juno mine, Australia.
3.137 (100), 2.841 (37), 3.645 (30), 3.160 (27), 2.660 (26), 1.970 (26), 3.552 (24)

Chemistry:

	(1)	(2)	(3)
Pb	19.9	19.3	19.01

Bi	57.4	59.8	57.51
Se		0.95	
S	18.0	17.25	17.65
Total	[99.9]	103.25	100.00

(1) Krupka, Czech Republic; by electron microprobe, average of three analyses; corresponds to $Pb_{1.03}Cu_{0.77}Bi_{2.94}S_{6.00}$. (2) Juno mine, Australia; by electron microprobe, corresponds to $Pb_{1.02}Cu_{1.02}Bi_{3.12}(S_{5.87}Se_{0.13})_{\Sigma=6.00}$. (3) $PbCuBi_3S_6$.

Occurrence: Rare in hydrothermal veins.

Association: Gladite, bismuthinite, aikinite, bismuth, cassiterite, quartz.

Distribution: In the Czech Republic, from the Barbora gallery, Krupka, Krušné hory Mountains [TL] and at Bohutin, near Příbram. At Dobšiná (Dobschau), Slovakia. From Ocna de Fier (Morávicza; Vaskő); Baia Borşa, Baia Mare (Nagybánya); and Sasca Montană, Romania. At the Zidarovo copper deposit, Bulgaria. In Austria, in the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, and from the Felbertal tungsten mine, Salzburg. In the Loch Shin monzogranite, near Lairg, Scotland. From the Carrock mine, Caldbeck Fells, Cumbria, England. From Inkur, Transbaikal, Russia. At the Funiushan copper skarn, near Nanjing, Jiangsu Province, China. From Australia, in the Juno mine, Tennant Creek, Northern Territory. At Temiskaming, Quebec, Canada. In the USA, from Cucomungo Spring, Tule Canyon district, Esmeralda Co., Nevada; in Ball's mine, Little Cottonwood district, Salt Lake Co., Utah; and at the Alice mine, Alice district, Clear Creek Co., Colorado. At the Cordón do los Galeses, Andes Mountains, Chubut Province, Argentina.

Name: For the locality in the Czech Republic at Krupka.

Type Material: Charles University, Prague, Czech Republic, 14522.

Krutovite $NiAs_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. As grains, to 0.1 mm, in close intergrowth with other sulfides.

Physical Properties: Hardness = 5.5 VHN = 624–633; 645–760, 719 average. D(meas.) = n.d. D(calc.) = [7.08–7.12]

Optical Properties: Opaque. *Color:* Pale gray, paler than associated nickel-skutterudite; in polished section, bright white with a rose tint. *Luster:* Metallic.
R: (400) — , (420) — , (440) 66.2, (460) 65.4, (480) — , (500) 64.0, (520) — , (540) 64.7, (560) — , (580) 65.7, (600) — , (620) 66.7, (640) — , (660) 66.8, (680) — , (700) 66.8

Cell Data: *Space Group:* $P2_13$. $a = 5.786–5.794$ $Z = 4$

X-ray Powder Pattern: Jáchymov, Czech Republic.
2.593 (10), 2.365 (8), 1.746 (8), 2.897 (6), 1.548 (6), 1.0242 (6), 2.051 (5)

(1) Jáchymov, Czech Republic; by electron microprobe, average of 32 analyses; corresponds to $(Ni_{0.87}Cu_{0.03}Co_{0.01})_{\Sigma=0.91}As_{2.00}$. (2) Do.; by electron microprobe, average of 31 analyses; corresponds to $(Ni_{0.94}Cu_{0.03}Co_{0.01}Fe_{0.01})_{\Sigma=0.99}(As_{1.99}S_{0.01})_{\Sigma=1.00}$. (3) Khovu-Aksy deposit, Russia; by electron microprobe, average of 10 analyses; corresponds to $(Ni_{0.88}Co_{0.03}Fe_{0.01})_{\Sigma=0.92}As_{2.00}$. (4) $NiAs_2$.

Polymorphism & Series: Trimorphous with rammelsbergite and pararammelsbergite.

Occurrence: In Co–Ni–As sulfide veins of hydrothermal origin.

Association: Nickel-skutterudite, tennantite (Jáchymov, Czech Republic); nickeline, breithauptite, löllingite, nickel-skutterudite, rammelsbergite, pararammelsbergite, silver (Khovu-Aksy deposit, Russia).

Distribution: From the Geshiber vein, Jáchymov (Joachimsthal), Czech Republic [TL]. At the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia.

Name: For Georgi Alekseevich Krutov (1902–1989), Professor of Mineralogy, Moscow State University, Moscow, Russia.

Type Material: National Museum, Prague, Czech Republic, 61625; Mining Institute, St. Petersburg; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Kryzhanovskite $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are typically rough pseudo-octahedra, prismatic or as plates flattened on {010}, to 5 cm; may be granular.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Uneven. Hardness = 3.5–4 D(meas.) = 3.31 D(calc.) = 3.35–3.46

Optical Properties: Translucent. *Color:* Deep red-brown, dark blackish brown to light golden-brown, bronze on cleavage surfaces. *Streak:* Yellowish brown. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Pleochroism:* Strong; X = wine-yellow; Y = orange-brown; Z = reddish brown. *Orientation:* OAP $\perp$ {001}. *Dispersion:* $r < v$ or $r > v$, strong. *Absorption:* $X > Y > Z$ or $Z{=}X > Y$. $\alpha = 1.79(5)$ $\beta = 1.80$ $\gamma = 1.82(1)$ 2V(meas.) = 40°–82°

Cell Data: *Space Group: Pbna.* $a = 9.450(2)$ $b = 10.013(2)$ $c = 8.179(2)$ Z = 4

X-ray Powder Pattern: Kalba Range, Kazakhstan.

(1) Kalba Range, Kazakhstan; $(OH)^{1-}$ calculated for charge balance, corresponding to $(Mn^{2+}_{0.95}Ca_{0.12}Mg_{0.10})_{\Sigma=1.17}Fe^{3+}_{1.82}(PO_4)_2(OH)_{1.82} \cdot 1.18H_2O$. (2) $Mn^{2+}Fe^{3+}_2(PO_4)_2(OH)_2 \cdot H_2O$.

Polymorphism & Series: Forms a series with garyansellite.

Occurrence: A rare low-temperature oxidation product of phosphate minerals in complex granite pegmatites and iron formations.

Association: Sicklerite, triphylite (Kalba Range, Kazakhstan); ferrisicklerite, triphylite (Clementine II pegmatite, Namibia); garyansellite, ludlamite, arrojadite, vivianite, metavivianite, souzalite, quartz (Rapid Creek, Canada).

Distribution: From [the Ak-Kezen' pegmatites,] near Belogorskii, Kalba Range, Kazakhstan. Abundant at the Clementine II pegmatite, Okatjimukuju farm, near Karibib, Namibia. Large crystals on the east side of Rapid Creek, one km north of Lake Creek, Yukon Territory, Canada. In the USA, in South Dakota, from the Bull Moose, Dan Patch, and Ferguson mines, near Keystone, and the Big Chief mine, one km south of Glendale, Pennington Co.; from the Tip Top mine, 8.5 km southwest of Custer, Custer Co.; in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire. At Hagendorf, Bavaria, Germany. From the Bendada pegmatite, near Guarda, and in the Mangualde pegmatite, near Mesquitela, Portugal. From the Pinilla de Fermoselle pegmatite, Zamora, Spain.

Name: Honors Vladimir Il'ich Kryzhanovskii (1881–1947), Russian mineralogist, Curator of the A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 50109–50115.

Ktenasite $(Cu, Zn)_5(SO_4)_2(OH)_6 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular crystals, to 1 mm, showing {011}, {100}, {013}, {201}, {401}.

Physical Properties: Hardness = 2–2.5 D(meas.) = 2.94–2.97 D(calc.) = 2.97

Optical Properties: Transparent. *Color:* Blue-green to emerald-green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless; Y = bluish green; Z = pale green. *Orientation:* $Z = b$; $X \simeq c$. $\alpha = 1.574$ $\beta = 1.613$–1.615 $\gamma = 1.623$–1.628 2V(meas.) = 51°–59°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.595$–5.598 $b = 6.121$–6.123 $c = 23.762$–23.771 $\beta = 95.81°-99.5°$ Z = 2

X-ray Powder Pattern: Kamariza mine, Greece.
11.9 (10b), 2.74 (10), 5.87 (9), 4.85 (9), 3.53 (9), 1.704 (9), 2.95 (6)

Chemistry:

	(1)	(2)
SO_3	19.92	24.0
CuO	32.44	37.9
ZnO	[28.14]	16.6
H_2O	19.50	22.0
Total	[100.00]	100.5

(1) Kamariza mine, Greece; H_2O taken as loss on ignition, ZnO by difference. (2) Glomrudskollen mine, Norway; H_2O average of two analyses by elemental analyzer, H_2O and $(OH)^{1-}$ shown present by IR, $(OH)^{1-}$ calculated for charge balance; corresponds to $(Cu_{3.40}Zn_{1.46})_{\Sigma=4.86}(SO_4)_{2.14}(OH)_{5.44} \cdot 6.00H_2O$.

Occurrence: An uncommon secondary mineral formed by oxidation of chalcopyrite and sphalerite in Cu–Zn hydrothermal mineral deposits and in mine dumps.

Association: Glaucocerinite, serpierite, smithsonite, gypsum, namuwite, schulenbergite.

Distribution: In Greece, at Laurium, from the Kamariza mine, and in slag. In Italy, at the Trentini and Veneziana mine, near Torrebelvicino, Veneto. In the Glomrudskollen zinc mine, and at Skutterud, Modum, Norway. In England, in the Drakewalls mine, Gunnislake, Cornwall. At the Rammelsberg mine, near Goslar, and in slag at the Juliushütte, Astfeld, Harz Mountains, Germany. In the Komsomolsk deposit, Noril'sk, Siberia, Russia. From the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa. At Broken Hill, New South Wales, Australia. In the Tui mine, Te Aroha, New Zealand. In the USA, in Colorado, at the Commodore mine, Creede, Mineral Co., and in the Eagle mine, Gilman district, Eagle Co.; from the Lynchburg mine, nine km south of Magdalena, Socorro Co., New Mexico; in the 79 mine and on the Brick claims, Banner district, Gila Co., Arizona. Additional occurrences are known.

Name: Honoring Professor Konstantin Anton Ktenas (1884–1935), Greek mineralogist.

Type Material: University of Thessalonika, Thessalonika, Greece.

Kuksite $\mathbf{Pb_3Zn_3Te^{6+}O_6(PO_4)_2}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, *or* 222. As thin tabular crystals, to 0.3 mm, with well-developed {100}.

Physical Properties: *Cleavage:* One, perfect. *Tenacity:* Brittle. Hardness = n.d. VHN = 325 (10 g load). D(meas.) = n.d. D(calc.) = 6.21 Fluoresces weakly under UV.

Optical Properties: Translucent, transparent in thin fragments. *Color:* Gray. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Orientation:* $Z = c$; positive elongation. *Dispersion:* $r > v$.
$\alpha = 1.971(5)$ β = n.d. $\gamma = 1.981(5)$ 2V(meas.) = 12°–20°

Cell Data: *Space Group:* $Cmmm$, $C222$, $Cmm2$, or $Cm2m$. $a = 8.50(3)$ $b = 14.72(5)$ $c = 5.19(3)$ Z = 2

X-ray Powder Pattern: Kuranakh deposit, Russia.
3.29 (10), 3.00 (8), 1.903 (5), 2.594 (4), 1.606 (3), 5.18 (2), 3.68 (2b)

Chemistry:

	(1)	(2)
TeO_3	14.30	14.26
P_2O_5	10.38	11.53
As_2O_5	0.07	
V_2O_5	1.81	
SiO_2	0.40	
ZnO	20.76	19.83
PbO	50.59	54.38
CaO	1.46	
Total	99.77	100.00

(1) Kuranakh deposit, Russia; by electron microprobe, average of nine analyses, corresponds to $(Pb_{2.68}Ca_{0.31})_{\Sigma=2.99}Zn_{3.01}Te_{0.96}O_{5.94}[(P_{0.86}V_{0.12}Si_{0.04})_{\Sigma=1.02}O_4]_2$. (2) $Pb_3Zn_3TeO_6(PO_4)_2$.

Occurrence: A late-stage mineral in the oxidized zone of a tellurium-bearing gold deposit.

Association: Cheremnykhite, Si-rich dugganite, yafsoanite, descloizite, calcite.

Distribution: In the Kuranakh gold deposit, near Aldan, Sakha, Russia.

Name: To honor A.I. Kuks (1906–), a discoverer of the Kuranakh deposit.

Type Material: Institute of Geosciences, Yakutsk Scientific Center, Academy of Sciences, Yakutsk, Russia, mk-112.

References: (1) Kim, A.A., N.V. Zayakina, and V.F. Makhotko (1990) Kuksite $Pb_3Zn_3TeO_6(PO_4)_2$ and cheremnykhite $Pb_3Zn_3TeO_6(VO_4)_2$ – new tellurates from the Kuranakh gold deposit (central Aldan, southern Yakutia [Sakha]). Zap. Vses. Kulanite $\mathbf{Ba(Fe^{2+},Mn,Mg)_2Al_2(PO_4)_3(OH)_3}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As plates, to 1.5 cm, tabular on $\{\bar{1}01\}$, with $\{10\bar{1}\}$, {100}, {001}, {011}, {161}, several others; aggregated in rosettes. Commonly in zoned intergrowth with penikisite.

Physical Properties: *Cleavage:* Fair to good on {010} and {100}. Hardness = ~4
D(meas.) = 3.91(3) D(calc.) = 3.92

Optical Properties: Transparent to translucent. *Color:* Green to blue. *Streak:* Very pale green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = brownish green; Y = green; Z = very pale brown. *Orientation:* $Y \simeq b$; $Z \wedge c = -8°$. *Dispersion:* $r \gg v$, very strong and asymmetrical, suggesting a triclinic structure. *Absorption:* $X \simeq Y \gg Z$. $\alpha = 1.703$ $\beta = 1.705$ $\gamma = 1.723$
2V(meas.) = 32° 2V(calc.) = 38°

Cell Data: *Space Group:* $P2_1/m$. $a = 9.014(1)$ $b = 12.074(1)$ $c = 4.926(1)$
$\beta = 100.48(1)°$ Z = 2

X-ray Powder Pattern: Cross-cut Creek, Canada; almost identical to penikisite.
3.108 (100), 2.927 (80), 3.044 (70), 2.659 (70), 8.84 (60), 2.690 (60), 4.51 (50)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	33.28	33.80	MgO	3.08	3.89
SiO_2	0.19		CaO	0.77	0.42
Al_2O_3	14.30	15.06	BaO	23.66	24.99
Fe_2O_3	2.14	1.61	Na_2O	0.02	
FeO	10.50	13.47	H_2O^+	3.83	[4.27]
MnO	6.32	0.95	Total	98.09	[98.46]

(1) Cross-cut Creek, Canada; H_2O by DTA-TGA, corresponding to $Ba_{1.00}(Fe^{2+}_{0.94}Mn_{0.58}Mg_{0.50}Ca_{0.09})_{\Sigma=2.11}(Al_{1.81}Fe^{3+}_{0.18})_{\Sigma=1.99}(PO_4)_{3.02}(OH)_{2.74}$. (2) Do.; by electron microprobe, average of ten analyses, Fe^{2+}:Fe^{3+} ratio and H_2O from structure analysis; corresponding to $Ba_{1.03}(Fe^{2+}_{1.19}Mg_{0.61}Mn_{0.08})_{\Sigma=1.88}Al_{1.87}(PO_4)_{3.02}(OH)_3$.

Polymorphism & Series: Forms a series with penikisite.

Mineral Group: Bjarebyite group.

Occurrence: A weathering product in fractures in sideritic iron formation (Cross-cut Creek, Canada); as disseminations and veinlets in granite pegmatite (Xiyuantou, China).

Association: Penikisite, quartz, siderite, fluorapatite, rapidcreekite, brazilianite, arrojadite, anatase, goyazite (Cross-cut Creek, Canada); palermoite, montebrasite, triphylite (Palermo #1 mine, New Hampshire, USA).

Distribution: From Cross-cut Creek, 1.5 km upstream from the confluence with Rapid Creek, Big Fish-Blow River area, Yukon Territory, Canada. In the White Picacho district, Maricopa and Yavapai Cos., Arizona, and at the Palermo #1 mine, North Groton, Grafton Co., New Hampshire, USA. From the Xiyuantou pegmatite, Nanping, Fujian Province, China.

Name: Honors Mr. Alan Kulan, Ross River, Yukon Territory, Canada, a co-discoverer of the Rapid Creek phosphate occurrences.

Type Material: Royal Ontario Museum, Toronto, Canada, M34170; National Museum of Natural History, Washington, D.C., USA, 137304, 145737.

Yb_2O_3	2.71
Lu_2O_3	0.11
F	13.45
H_2O	[3.58]
$-O = F_2$	5.66
Total	[100.00]

(1) Mt. Ploskaya, Russia; by electron microprobe, H_2O by difference; corresponding to $(Y_{3.58}RE_{0.27})_{\Sigma=3.85}Al_{1.04}Si_{2.12}O_{7.60}(OH)_{2.88}F_{5.08}$.

Occurrence: As inclusions in fluorite or on fissures in microcline pegmatites.

Association: Thalenite, xenotime, kainosite, bastnäsite, keiviite-(Y), keiviite-(Yb), quartz, fluorite.

Distribution: From the Mt. Ploskaya, Keivy massif, Kola Peninsula, Russia.

Name: For the Kuliok River, Kola Peninsula, Russia, and *yttrium* in its composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5958/7; Mining Institute, St. Petersburg, 945/2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 85666, 85670.

Na_2O	1.20
K_2O	0.07
H_2O	[9.24]
Total	[96.93]

(1) Derrag, Algeria; by electron microprobe, H_2O from theoretical formula; corresponding to $(Na_{0.38}K_{0.01})_{\Sigma=0.39}Mg_{8.02}Al_{0.99}(Si_{6.57}Al_{1.43})_{\Sigma=8.00}O_{20}(OH)_{10}$.

Polymorphism & Series: A 1:1 regular interstratification of trioctahedral chlorite and talc.

Occurrence: In dolostone, metamorphosed below 400 °C, with evaporites.

Association: Talc, chlorite, phlogopite, tourmaline.

Distribution: From El Mourdur Hill, near Derrag, 35 km west of Ksar El Boukhari, Tell Atlas Mountains, Algeria.

Name: For Dr. Holger Kulke, geologist of Essen, Germany, who provided the original specimen.

Type Material: Ruhr University, Bochum, Germany; National Museum of Natural History, Washington, D.C., USA, 147361.

References: (1) Abraham, K., W. Schreyer, O. Medenbach, and W. Gebert (1980) Kulkeite, ein geordnetes 1:1 Mixed-Layer-Mineral zwischen Klinochlor und Talk. Fortschr. Fe	1.91	
Cu	0.5	
Se	73.1	72.90
Total	100.01	100.00

(1) Kuusamo, Finland; by X-ray fluorescence. (2) $NiSe_2$.

Polymorphism & Series: Dimorphous with penroseite.

Mineral Group: Marcasite group.

Occurrence: In calcite veins in sills of albite diabase in schist, associated with low-grade uranium mineralization, almost exclusively as an alteration product of wilkmanite.

Association: Wilkmanite, sederholmite, penroseite, selenium, ferroselite.

Distribution: From Kuusamo, northeastern Finland [TL].

Name: In honor of Gunnar Kullerud (1921–1989), Norwegian-American mineralogist, Geophysical Laboratory, Washington, D.C., USA.

Type Material: n.d.

MgO	trace	Total	98.92

(1) Alai Range, Tajikistan; corresponds to $(Cs_{1.22}Na_{1.14}K_{0.35}Ca_{0.09})_{\Sigma=2.80}(Mn_{3.99}Fe^{2+}_{2.00}Fe^{3+}_{0.55}Li_{0.44})_{\Sigma=6.98}(Ti_{1.49}Nb_{0.54}Zr_{0.12})_{\Sigma=2.15}(Si_{7.92}Al_{0.15})_{\Sigma=8.07}O_{24}[O_{3.69}(OH)_{2.35}F_{0.96}]_{\Sigma=7.00}$.

Polymorphism & Series: Forms a series with kupletskite.

Mineral Group: Astrophyllite group.

Occurrence: At the border of aegirine-microcline-quartz pegmatites, and in polylithionite-quartz replacement complexes in pegmatites.

Association: Pyrochlore, stillwellite, tienshanite, sogdianite, thorite.

Distribution: In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: For the *cesium* in the composition and similarity to *kupletskite*.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 16537; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74170.

(1) Mt. Kuivchorr, Lovozero massif, Russia; total Fe as Fe_2O_3. (2) Mt. Lepkhe-Nelm, Lovozero massif, Russia.

Polymorphism & Series: Forms two series, with astrophyllite, and with cesium kupletskite.

Mineral Group: Astrophyllite group.

Occurrence: In the natrolite-rich central part and in the wall rocks of nepheline syenite pegmatites in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Manganoan pectolite, neptunite, microcline, eudialyte, nepheline, aegirine (Lovozero massif, Russia); aegirine, analcime, gonnardite, apophyllite, eggletonite, pyrophanite (Little Rock, Arkansas, USA).

Distribution: In Russia, on Mts. Kuivchorr and Lepkhe-Nelm, Lovozero massif, Kola Peninsula, and some other less-well-defined localities. From the Oktyabr massif, eastern Azov area, Ukraine. In the Ilímaussaq intrusion and the Werner Berge complex, Greenland. At Gjerdingen, north of Oslo, Norway. On Granite Mountain, near Little Rock, Pulaski Co., and the Diamond Jo quarry, Magnet Cove, Hot Spring Co., Arkansas, USA. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Boris Mikhailovich Kupletskii (1894–1965), Russian geologist, Institute of Geosciences, Moscow, and El'za Maximilianovna Bohnshtedt-Kupletskaya (1898–1974), Russian mineralogist, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Kuramite Cu_3SnS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. As minute inclusions, to 80 μm, aggregated with goldfieldite in round to elongated grains.

Physical Properties: Hardness = n.d. VHN = 322–373, 353 average (100 g load). D(meas.) = n.d. D(calc.) = 4.56

Optical Properties: Opaque. *Color:* In polished section, neutral gray. *Streak:* Metallic. *Anisotropism:* Distinct, in shades of brown.

R_1–R_2: (400) 21.0–21.6, (420) 21.4–22.1, (440) 21.9–22.9, (460) 22.5–23.8, (480) 23.0–24.5, (500) 23.5–25.1, (520) 23.9–25.5, (540) 24.4–25.9, (560) 24.9–26.2, (580) 25.4–26.6, (600) 25.8–26.8, (620) 26.2–27.0, (640) 26.5–27.2, (660) 26.9–27.3, (680) 27.3–27.5, (700) 27.7–27.7

Cell Data: *Space Group:* $I\bar{4}2m$. $a = 5.445(5)$ $c = 10.75(2)$ $Z = 2$

X-ray Powder Pattern: Kochbulak deposit, Uzbekistan.
3.13 (10), 1.914 (8), 1.640 (6), 1.108 (4), 1.244 (3), 2.70 (2), 1.044 (2)

Chemistry:

	(1)	(2)	(3)
Cu	37.27	38.3	43.56
Fe	2.36	5.6	
Zn	1.88	0.7	
Sn	30.12	26.7	27.13
In	0.32		
S	27.86	28.6	29.31
Total	99.81	99.9	100.00

(1) Kochbulak deposit, Uzbekistan; by electron microprobe, average of five analyses; corresponds to $(Cu_{2.70}Fe_{0.20}Zn_{0.13})_{\Sigma=3.03}(Sn_{1.17}In_{0.01})_{\Sigma=1.18}S_{4.00}$. (2) Gunheath china clay pit, England; by electron microprobe, corresponds to $(Cu_{2.70}Fe_{0.45}Zn_{0.05})_{\Sigma=3.20}Sn_{1.01}S_{4.00}$. (3) Cu_3SnS_4.

Mineral Group: Stannite group.

Occurrence: In gold–sulfide–quartz veins, as inclusions in goldfieldite (Kochbulak deposit, Uzbekistan).

Association: Goldfieldite, famatinite, hessite, petzite, sylvanite, altaite, gold, chalcostibite, emplectite, mohite, mawsonite, cassiterite (Kochbulak deposit, Uzbekistan).

Distribution: From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan [TL]. In the USA, at Bisbee, Cochise Co., Arizona; from the Zuni mine, near Silverton, San Juan Co., Colorado; in the Gold Crater district, Nye Co., Nevada. From the Gunheath china clay pit, St. Austell, Cornwall, England.

Name: For the occurrence in the Kuramin Mountains, Uzbekistan.

Type Material: Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80176.

Kuranakhite $PbMn^{4+}Te^{6+}O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* n.d. As tiny grains, to 0.25 mm, which may be in aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 4–5 VHN = 228–441
D(meas.) = 6.72(2) D(calc.) = 6.66

Optical Properties: Translucent. *Color:* Pale brown to nearly black; pale gray with a bluish tint in reflected light. *Streak:* Brown. *Luster:* Vitreous.
Optical Class: Biaxial (–) or (+). $\alpha = 1.952–1.96$ $\beta = 1.98$ $\gamma = 2.002–2.01$ 2V(meas.) = n.d.
Anisotropism: Distinct; bright blue to brown. *Bireflectance:* Weak; in rose tints.
R: (460) 24.4, (540) 24.0, (580) 24.5, (660) 23.0

Cell Data: *Space Group:* *C* (possible). $a = 5.11(1)$ $b = 8.91(1)$ $c = 5.32(1)$ Z = 2

X-ray Powder Pattern: Kuranakh deposit, Russia.
3.40 (10), 2.558 (6), 2.050 (5), 1.851 (5), 1.596 (4), 2.322 (1), 1.668 (1)

Chemistry:

	(1)	(2)	(3)
TeO_3	38.2	38.10	36.15
MnO_2	15.4	16.41	17.90
PbO	45.4	45.40	45.95
Total	99.0	99.91	100.00

(1) Kuranakh deposit, Russia; by electron microprobe, average of three analyses, total Mn as MnO_2, total Te as TeO_3; corresponds to $Pb_{0.93}Mn_{0.81}Te_{1.00}O_6$. (2) Jialu deposit, China; by electron microprobe, average of six analyses, total Mn as MnO_2, total Te as TeO_3; corresponds to $Pb_{0.99}Mn_{0.92}Te_{1.06}O_6$. (3) $PbMnTeO_6$.

Occurrence: In the oxidized zone of a gold quartz deposit (Kuranakh deposit, Russia; Jialu deposit, China).

Association: Gold, "electrum", iron oxides (Kuranakh deposit, Russia); gold, calaverite, pyrite, galena, chalcopyrite, sphalerite, altaite, cerussite, anglesite, pyromorphite, quartz (Jialu deposit, China); gold (Ashley deposit, Canada); cuzticite, eztlite, emmonsite, schmitterite, pyrite (Moctezuma mine, Mexico).

Distribution: In the Kuranakh gold deposit, near Aldan, southern Sakha, Russia. At the Jialu gold deposit, Xiaoqinling district, Shaanxi Province, China. From the Ashley gold deposit, Bannockburn Township, Ontario, Canada. In Mexico, at the Oriental (Bambollita) mine, northeast of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora.

Name: For the Kuranakh deposit, Russia, where it was first found to occur.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76494.

Kurchatovite $Ca(Mg, Mn^{2+}, Fe^{2+})B_2O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Granular, to 4 mm.

Physical Properties: *Cleavage:* One perfect, parallel elongation; two others, imperfect. Hardness = 4.5 D(meas.) = 3.02 D(calc.) = n.d. Fluoresces bright violet under LW UV.

Optical Properties: Semitransparent. *Color:* Pale gray. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, slight. $\alpha = 1.635(1)$ $\beta = 1.681(1)$ $\gamma = 1.698(1)$ 2V(meas.) = 66°

Cell Data: *Space Group:* n.d. $a = 11.15(2)$ $b = 36.4(1)$ $c = 5.55(1)$ Z = 24

X-ray Powder Pattern: Solongo deposit, Russia.
2.78 (10), 1.922 (9), 2.67 (8), 1.232 (8), 2.26 (7), 2.01 (7), 1.633 (6)

Chemistry:

	(1)	(2)		(1)	(2)
As_2O_5	0.31		FeO	1.48	
CO_2	1.60		MnO	6.84	
SiO_2	0.49		ZnO	0.28

Al_2O_3	0.65		H_2O^+	0.66	
Fe_2O_3	0.00		Total	100.46	100.00

(1) Solongo deposit, Russia; $(B_2O_5)^{4-}$ confirmed by IR; after deduction of calcite, szaibélyite, "chlorite", and svabite, corresponds to $Ca_{0.95}(Mg_{0.81}Mn_{0.18}Fe_{0.04})_{\Sigma=1.03}B_{1.98}O_5$. (2) $CaMgB_2O_5$.

Polymorphism & Series: Dimorphous with clinokurchatovite.

Occurrence: In an iron-bearing skarn (Solongo deposit, Russia).

Association: Clinokurchatovite, szaibélyite, solongoite, hexahydroborite, calcite, "chlorite", vesuvianite, garnet, svabite, magnetite, sphalerite (Solongo deposit, Russia).

Distribution: In Russia, from the Solongo boron deposit, Buryatia, and at the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains.

Name: To honor Igor Vasil'evich Kurchatov (1903–1960), Russian physicist, Institute of Nuclear Energy, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 998/2, 4; Vernadsky Geological Museum, Moscow, 49712; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 68717, 72769.

Kurgantaite $CaSr[B_5O_9]Cl \cdot H_2O$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. Forms fine-grained nodules, to 4 cm; also as spherulites of crystals with wedge-shaped terminations, to 0.7 mm.

Physical Properties: *Cleavage*: Present in two directions. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 6-6.5 D(meas.) = 2.99(1) D(calc.) = 3.07(1)

Optical Properties: Transparent. *Color*: Colorless to white, light to dark yellow-orange to orange. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (+). α = 1.637(1) β = 1.638(1) γ = 1.675(1) 2V(meas.) < 10° 2V(calc.) = 19(19)°

Cell Data: *Space Group*: $P\bar{1}$. a = 6.573(1) b = 6.445(1) c = 6.369(1) α = 60.995(2)° β = 61.257(2)° γ = 77.191(2)° Z = 1

X-ray Powder Pattern: Chelkar, Kazakhstan.
2.92 (100), 3.22 (90), 2.84 (90), 5.69 (80), 2.79 (80), 3.13 (70), 2.14 (70)

Chemistry:

(1) Kargan-tau, Kazakhstan; electron microprobe analysis, H_2O calculated from structure refinement; corresponding to $Ca_{1.01}Sr_{0.98}[B_{5.02}O_9]Cl_{1.04} \cdot H_2O$. (2) Nepskoye, Russia, electron microprobe analysis, H_2O calculated from structure refinement; corresponding to $Ca_{1.04}Sr_{0.98}[B_{4.99}O_9]Cl_{1.01} \cdot H_2O$. (3) Penobsquis deposit, New Brunswick, Canada; average of 3 electron microprobe analyses, H_2O calculated; corresponding to $Ca_{1.08}Sr_{0.93}[B_5O_9]Cl_{0.98} \cdot H_2O$.

Mineral Group: Hilgardite group.

Occurrence: In marine evaporite salt deposits and salt domes.

Association: Sylvite, halite, boracite, anhydrite, gypsum, magnesite, quartz (Kazakhstan); hydroboracite, boracite, walkerite, veatchite, szaibélyite, pringleite, congolite, a clay-group mineral (New Brunswick, Canada).

Distribution: In western Kargan-tau, Inder uplift and from Chelkar, Caspian region, Kazakhstan; in the Nepskoye potassium salt deposit, near Ust'-Kut, Irkutsk district, Siberia, Russia. In the Penobsquis evaporite deposits, 12 km NE of Sussex, New Brunswick, Canada.

Name: For the region, *Kargan-ta*u, Kazakhstan, that produced the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia.

(1) Inder deposit, Kazakhstan. (2) $MgB_3O_3(OH)_5 \cdot 5H_2O$.

Polymorphism & Series: Dimorphous with inderite.

Occurrence: An uncommon mineral, typically in lake-bed borate deposits.

Association: Szaibélyite (Lake Inder, Kazakhstan).

Distribution: From the Inder borate deposit, Kazakhstan. At the Zhacang-Caka brine lake, and others, Qinghai Province and Xizang, Tibet, China. In the Kirka borate deposit, Kütahya Province, Turkey. Very large crystals from the Kramer borate deposit, Boron, Kern Co., California, USA. At the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina.

Name: To honor Professor Nikolai Semenovich Kurnakov (1860–1941), Russian mineralogist and chemist, Institute of General and Inorganic Chemistry, Moscow, Russia.

Type Material: Karpinskii All-Union Research Institute of Geology, St. Petersburg; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61590.

(1) Kurumsak, Kazakhstan.

Occurrence: In bituminous schists in the walls of cavities and open fissures.

Association: n.d.

Distribution: From the Kurumsak vanadium deposit, near Dzhambul, Kara-Tau Mountains, Kazakhstan.

Name: For the locality at Kurumsak, Kazakhstan.

Type Material: Mining Institute, St. Petersburg, Russia, 1273/1.

References: (1) Ankinovich, E.A. (1954) [title unknown] Izv. Akad. Nauk Kazakhstan SSR, 134, Ser. Geol. 19, 116. (2) Bohnshtedt-Kupletskaya, E.N. (1955) Zap. Vses. Mineral. Kusachiite $CuBi_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As short prismatic crystals, to 0.5 mm; in globular aggregates.

Physical Properties: *Cleavage:* {110}, perfect. Hardness = 4.5 VHN = 292–357 (25 g load). D(meas.) = 8.5(3) D(calc.) = 8.64

Optical Properties: Opaque. *Color:* Black; gray in reflected light, with deep red to dark brown internal reflections. *Streak:* Black. *Luster:* Metallic.
Optical Class: Uniaxial. *Pleochroism:* Gray, with faint bluish tint, and brownish gray. *Anisotropism:* Weak to distinct. *Bireflectance:* Weak.
R_1–R_2: (482) 19.0–21.1, (545) 18.0–20.2, (589) 17.6–19.7, (659) 17.3–19.5

Cell Data: *Space Group:* $P4/ncc$. $a = 8.511(2)$ $c = 5.823(2)$ $Z = 4$

X-ray Powder Pattern: Fuka, Japan.
3.191 (100), 2.695 (18), 1.947 (18), 4.26 (17), 2.913 (16), 2.404 (13), 1.728 (12)

Chemistry:

	(1)	(2)
Bi_2O_3	86.00	85.42
CuO	13.91	14.58
Total	99.91	100.00

(1) Fuka, Japan; by electron microprobe, average of six analyses; corresponding to $Cu_{0.96}Bi_{2.03}O_{4.00}$. (2) $CuBi_2O_4$.

Occurrence: On calcite crystals in a calcite vein between gehlenite-spurrite skarn and limestone; thought to be of low-temperature hydrothermal origin.

Association: Henmilite, sillénite, bakerite, tenorite, bultfonteinite, apophyllite, cuspidine, thaumasite.

Distribution: From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: To honor Dr. Isao Kusachi (1942–), Professor of Mineralogy, Okayama University, Okayama, Japan, for his work on skarn minerals of the Fuka area.

Type Material: National Science Museum, Tokyo, Japan.

References: (1) Henmi, C. (1995) Kusachiite, $CuBi_2O_4$, a new mineral from Fuka, Okayama Prefecture, Japan. Mineral. Mag., 59, 545–548. (2) (1996) Amer. Mineral., 81, 517 (abs. ref. 1).

Kutínaite $Cu_{14}Ag_6As_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Fine-grained, as intergrowths with novákite.

Physical Properties: *Tenacity:* Malleable. Hardness = ∼4.5 VHN = 237–270 (25 g load). D(meas.) = 8.38(7) (synthetic). D(calc.) = 8.400

Optical Properties: Opaque. *Color:* Silvery gray; in polished section, grayish white to pale blue-gray. *Luster:* Metallic.

R: (400) 49.6, (420) 48.8, (440) 48.0, (460) 46.8, (480) 45.6, (500) 44.5, (520) 43.5, (540) 42.6, (560) 42.0, (580) 41.4, (600) 41.1, (620) 40.8, (640) 40.5, (660) 40.4, (680) 40.5, (700) 40.9

Cell Data: *Space Group:* $Pm3m$. $a = 11.78079(2)$ (synthetic). $Z = 4$

X-ray Powder Pattern: Černý Důl mine, Czech Republic.
2.259 (100), 2.078 (100), 2.702 (90), 2.398 (80), 1.991 (70), 1.959 (70), 1.776 (70)

Chemistry:

	(1)	(2)	(3)
Cu	43.68	43.89	43.16
Ag	31.63	31.63	31.40
As	25.16	24.26	25.44
Total	100.47	99.78	100.00

(1) Černý Důl mine, Czech Republic; by electron microprobe. (2) Wasserfall, France; by electron microprobe. (3) $Cu_{14}Ag_6As_7$.

Occurrence: In carbonate-rich hydrothermal veins (Černý Důl mine, Czech Republic).

Association: Novákite, koutekite, paxite, arsenolamprite, löllingite (Černý Důl mine, Czech Republic); allargentum, koutekite, domeykite (Wasserfall, France); koutekite, domeykite (Meskani, Iran); paxite, lautite, arsenic, silver, löllingite, proustite (Niederbeerbach, Germany).

Distribution: From the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic [TL]. At Wasserfall, about 20 km northwest of Belfort, Haute-Saône, France. From Mühltal, Niederbeerbach, Odenwald, Hesse, Germany. At the Meskani mine, Anarak district, Iran. In the East Arm area, Great Slave Lake, Northwest Territories, Canada.

Name: For Dr. Jan Kutina (1924–), Lecturer at the Charles University, Prague, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 14428; Yale University, New Haven, Connecticut, USA.

Kutnohorite $Ca(Mn^{2+}, Mg, Fe^{2+})(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. In polycrystalline spherules, to 2 cm, aggregates, and cleavages.

Physical Properties: *Cleavage:* [On $\{10\overline{1}1\}$, perfect.] (by analogy to dolomite group). *Fracture:* [Subconchoidal.] *Tenacity:* [Brittle.] Hardness = [3.5–4] D(meas.) = 3.12 D(calc.) = 3.15

Optical Properties: Translucent. *Color:* White, pale pink to bright pink. *Optical Class:* Uniaxial (–). $\omega = 1.710$–1.727 $\epsilon = 1.519$–1.535

Cell Data: *Space Group:* $R\overline{3}$. $a = 4.8518(3)$ $c = 16.217(2)$ $Z = 3$

X-ray Powder Pattern: Franklin, New Jersey, USA.
2.935 (100), 1.814 (31), 1.837 (27), 3.753 (20), 2.225 (19), 2.043 (19), 2.437 (14)

Chemistry:

MnO	23.76	28.31	32.99
MgO	5.18	2.21	
CaO	24.66	27.44	26.08
Total	100.49	100.26	100.00

(1) Kutná Hora, Czech Republic. (2) Franklin, New Jersey, USA. (3) $CaMn(CO_3)_2$.

Polymorphism & Series: Forms two series, with dolomite, and with ankerite.

Mineral Group: Dolomite group; ordered Ca:Mn $\simeq$ 1:1, commonly with substitution by Mg and Fe^{2+}.

Occurrence: Typically in deposits associated with manganiferous sediments.

Association: Rhodochrosite, aragonite, calcite.

Distribution: Analyzed material, shown to have the dolomite structure type, occurs at: Kutná Hora and Chvaletice, Czech Republic. At Långban, Värmland, Sweden. From near Levane, Tuscany, Italy. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Sunnyside and Silver King mines, Silverton district, San Juan Co., Colorado; in the Longvale quarry, Laytonville, Mendocino Co., California; from Bald Knob, Alleghany Co., North Carolina. At Mont Saint-Hilaire, Quebec, Canada. In the Providencia district, Zacetecas, Mexico. Fine examples from the N'Chwaning mine, near Kuruman, South Africa. In Japan, in the Hoei tin mine, Oita Prefecture, from the Chichibu mine, Saitama Prefecture, and at the Ryujima mine, 15 km southwest of Matsumo, Nagano Prefecture. From Broken Hill, New South Wales, Australia.

Name: For its first described occurrence at Kutná Hora, Czech Republic [the original label translated as kutnohorite].

Type Material: Harvard University, Cambridge, Massachusetts, USA, 109033, 111690, 85670.

Total	100.45	100.00

(1) Zeilberg quarry, Germany; by electron microprobe, H_2O by TGA; corresponding to $Ca_{3.83}Al_{2.40}(SO_4)(OH)_{12.86}\cdot 6H_2O$. (2) $Ca_4Al_2(SO_4)(OH)_{12}\cdot 6H_2O$.

Occurrence: A rare mineral in carbonaceous xenoliths in basalt, formed above 100 °C by decomposition of ettringite.

Association: Ettringite, afwillite, natrolite, calcite, torbermorite, gyrolite, portlandite, apophyllite (Zeilberg quarry, Germany); hydrocalumite, ettringite, tobermorite, strätlingite–vertumnite, portlandite, calcite, gypsum (Bellerberg volcano, Germany).

Distribution: In Germany, from the Zeilberg quarry, Maroldsweisach, Bavaria, and at the Bellerberg volcano, two km north of Mayen, Eifel district.

Name: Honoring Professor Hans Jürgen Kuzel (1932–1997), German mineralogist, Mineralogical Institute, Erlangen, Germany, who first synthesized the compound.

Type Material: Martin Luther University, Halle, Germany.

Kuzminite $Hg^{1+}(Br, Cl)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2m$. As elongated grains, to 0.5 mm; in aggregates and powdery masses.

Physical Properties: *Cleavage:* {100}, good. *Fracture:* Uneven. Hardness = ≤ 2 VHN = 21–29, 25 average (25 g load). D(meas.) = n.d. D(calc.) = [7.36]

Optical Properties: Transparent. *Color:* Colorless, white, creamy white, pale yellow, pale brownish, bluish gray; gray to pale gray in reflected light, with colorless to pale yellow internal reflections. *Streak:* White to gray. *Luster:* Adamantine.
Optical Class: Uniaxial (+); high birefringence. *Pleochroism:* Weak; light yellow to very pale brown. $n = > 2.00$ *Anisotropism:* Yellowish gray, grayish brown, and bluish gray. *Bireflectance:* Strong.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I4/mmm$. $a = 4.597(5)$ $c = 11.034(8)$ $Z = 4$

X-ray Powder Pattern: Kadyrel deposit, Russia.
3.25 (100), 4.26 (55), 2.103 (50), 2.76 (40), 1.989 (35), 2.296 (25b), 1.768 (20)

Chemistry:

	(1)
Hg	77.00
Cl	5.66
Br	16.60
Total	99.26

(1) Kadyrel deposit, Russia; by electron microprobe, average of four analyses; corresponds to $Hg_{1.02}(Br_{0.56}Cl_{0.42})_{\Sigma=0.98}$.

Polymorphism & Series: Forms a series with calomel.

Occurrence: In vugs in mercury sulfides, in calcite veins in a mercury ore deposit (Kadyrel deposit, Russia).

Association: Eglestonite, lavrentievite, kadyrelite, calomel, mercury, corderoite, cinnabar, iron oxides (Kadyrel deposit, Russia).

Distribution: From the Kadyrel mercury deposit, Pii-Khem district, Tuva, Siberia, Russia. At Landsberg, near Obermoschel, Rhineland-Palatinate, Germany.

Name: Honors Aleksei Mikhailovich Kuzmin (1891–1980), Russian mineralogist of the Tomsk Polytechnic Institute, Tomsk, Russia.

Type Material: Central Siberian Geological Museum, Siberian Division, Academy of Sciences, Novosibirsk, VI-28/1; Mining Institute, St. Petersburg, Russia, 1908/1–2.

As	8.75	8.87	9.65
Cl	4.50	4.55	4.57
O	8.97	9.33	8.25
Total	99.84	100.72	100.00

(1) Arzak deposit, Russia; by electron microprobe, average of seven grains; corresponding to $Hg_{3.08}As_{0.93}O_{4.48}Cl_{1.02}$. (2) Khaydarkan deposit, Kyrgyzstan; by electron microprobe, average of three grains; corresponding to $Hg_{3.03}As_{0.92}O_{4.54}Cl_{1.00}$. (3) $Hg_2^{1+}Hg^{2+}(AsO_4)Cl$.

Occurrence: In the oxidation zone of hydrothermal mercury deposits.

Association: Cinnabar, calomel, eglestonite, corderoite, mercury (Arzak deposit, Russia); cinnabar, calomel, eglestonite, corderoite, mercury, livingstonite, montroydite, shakhovite, chursinite (Khaydarkan deposit, Kyrgyzstan).

Distribution: In the Arzak mercury deposit, Pii-Khem district, Tuva, and the Kelyan Sb–Hg deposit, Buryatia, Siberia, Russia. From the Khaydarkan mercury deposit, Fergana Valley, Alai Range, Kyrgyzstan.

Name: Honors Academician Valerii Alekseevich Kuznetsov (1906–1985), Institute of Geology and Geophysics, Novosibirsk, Russia, student of mercury deposits.

Type Material: Central Siberian Geological Museum, Novosibirsk, Russia, VI-18/1; Mining Institute, St. Petersburg, 1122/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81062.

K_2O	< 0.02
Total	97.59

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, average of 16 analyses on two grains; TGA gave 4% weight loss at 600 °C; corresponds to $Na_{3.96}(Ca_{0.84}Mn_{0.12}Y_{0.02})_{\Sigma=0.98}Si_{6.01}O_{14}(OH)_2$.

Occurrence: As patches, streaks, and veinlets cutting arfvedsonite-bearing nepheline syenite; probably of late-stage hydrothermal origin.

Association: Villiaumite, analcime.

Distribution: On the Kvanefjeld Plateau, in the Ilímaussaq intrusion, southern Greenland.

Name: For the type locality, which is Danish for *the mountain where the* angelica *grows*.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1983.136, GGU 47887; Harvard University, Cambridge, Massachusetts, 127475; National Museum of Natural History, Washington, D.C., USA, 162234.

(1) Elovyi, Karelia; by electron microprobe. (2) Al_2SiO_5.

Polymorphism & Series: Trimorphous with andalusite and sillimanite.

Occurrence: In gneisses, schists, included pegmatites, and quartz veins, from moderately high-pressure regional metamorphism of principally pelitic rocks; detrital in sedimentary rocks.

Association: Staurolite, andalusite, sillimanite, talc, "hornblende," gedrite, mullite, corundum.

Distribution: Widely distributed, even in good crystals. From Mt. Greiner, Zillertal, Tirol, Austria. At Alpe Sponda, Pizzo Forno, and at Alpe Campolungo, Tessin, Switzerland. In the Pfitschtal, Trentino-Alto Adige, Italy. From Röros, Norway. Around Yekaterinburg (Sverdlovsk), Ural Mountains, Russia. At Elovyi, Klavoloke, Karelia. From Sultan Hamud, Machakos district, Kenya. Large crystals from a number of localities in Minas Gerais, Brazil, as at Barro Prêto, São José do Jacuri. In the USA, at Lyme, Grafton Co., New Hampshire; at Judd's Bridge, Litchfield Co., Connecticut; at Darby, Delaware Co., Pennsylvania; from near Bakersville, Mitchell Co., and near Burnsville, Yancy Co., North Carolina; on Willis Mountain, Buckingham Co., Virginia.

Name: From the Greek for *blue*, in allusion to its common dark blue color.

Type Material: Mining Academy, Freiberg, Germany, 22491.

Cr_2O_3	1.2	
Total	99.8	100.00

(1) Koscheka deposit, Uzbekistan; by electron microprobe, average of ten grains, V^{3+} confirmed by titration, total Fe as Fe_2O_3; corresponds to $(V^{3+}_{1.90}Fe_{0.04}Cr_{0.01})_{\Sigma=1.95}Ti_{3.05}O_{9.09}$. (2) $V_2Ti_3O_9$.

Polymorphism & Series: Dimorphous with schreyerite.

Occurrence: In veins cutting siliceous schists.

Association: Chlorite, pyrite, rutile.

Distribution: From the Koscheka uranium deposit, Auminzatau Mountains, central Kyzylkum region, Uzbekistan.

Name: For the Kyzylkum Desert, Uzbekistan, where it was first found.

Type Material: Mineralogical Museum, St. Petersburg University, 17408; Mining Institute, St. Petersburg, Russia, 1197/1.

Total	99.52

(1) ''Zieglowski''quarry, Eifel region, Rheinland-Pfalz, Germany; average of 5 electron microprobe analyses, absence of H_2O, OH^-, CO_3^{2-} confirmed by Raman spectroscopy; corresponding to $(Ca_{0.66}Mn_{0.37}Th_{0.25}Y_{0.20}La_{0.11}Ce_{0.34}Nd_{0.11})(Zr_{1.36}Mn_{0.64})(Nb_{1.81}Ti_{1.19})(Fe_{0.69}Al_{0.17}Mn_{0.14})O_{14.00}$.

Occurrence: In vesicular sanidinite volcanic ejectum.

Association: Sanidine, allanite-(Ce), baddeleyite, haüyne, hedenbergite, intermediate members of the jacobsite-magnetite series, phlogopite, rhodonite, spessartine, tephroite, thorite, zircon, a pyrochlore-group mineral.

Distribution: From the ''Zieglowski'' pumice quarry, 1.5 km NE of Mendig, near Laach Lake (Laacher See), Eifel volcanic region, Rheinland-Pfalz, Germany.

Name: For the locality that produced the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (4361/1).

Labradorite $Na_{0.5-0.3}Ca_{0.5-0.7}Al_{1.5-1.7}Si_{2.5-2.3}O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals typically thin, tabular along [010], and rhombic in section, to 4 cm. Cleavable, granular, or massive. *Twinning:* Common according to Albite, Pericline, Carlsbad, Baveno, or Manebach laws.

Physical Properties: *Cleavage:* Perfect on {001}, less perfect on {010}, intersecting at 90°; distinct on {110}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 2.68–2.72 D(calc.) = 2.685–2.710

Optical Properties: Translucent to transparent. *Color:* Gray, brown, greenish, blue, yellow, colorless; commonly exhibits iridescence, especially on {010}; colorless in thin section. *Streak:* White. *Luster:* Vitreous; pearly on cleavages.
Optical Class: Biaxial (+). *Dispersion:* $r > v$, weak. $\alpha = 1.555–1.565$ $\beta = 1.558–1.569$ $\gamma = 1.563–1.573$ 2V(meas.) = 78°–87° (low); 80° to −81° (high).

Cell Data: *Space Group:* $C\bar{1}$ (low). $a = 8.1648$ $b = 12.8585$ $c = 7.0973$ $\alpha = 90°34'$ $\beta = 116°06'$ $\gamma = 89°47'$ Z = 4

CaO	12.59	10.38	14.36	Total	100.18	100.00	100.00

(1) San Marcos Mountains, California, USA. (2) $Na_{0.50}Ca_{0.50}Al_{1.50}Si_{2.50}O_8$.
(3) $Na_{0.30}Ca_{0.70}Al_{1.70}Si_{2.30}O_8$.

Polymorphism & Series: High- and low-temperature structural varieties are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: In mafic igneous rocks and anorthosites. Rarer in metamorphic rocks, as amphibolites. As detrital grains in sedimentary rocks.

Association: Olivine, pyroxenes, amphiboles, magnetite.

Distribution: Widespread. From Ford Harbour, Pauls Island, Labrador, Newfoundland; at Lake St. John, Quebec; and elsewhere in Canada. In the USA, especially in northern New York, forming the Adirondack Mountains; crystals from Sagebrush Flat, about 37 km north of Plush, Lake Co., Oregon; atop the San Marcos Mountains, San Diego Co., and in the western San Gabriel Mountains, Los Angeles Co., California. Abundant gem crystals in the Pinacate volcanic field, Sonora, Mexico. At Vesuvius, Campania, and on Mt. Etna, Sicily, Italy. From Ylämaa, near Lappeenranta, Finland. In the Langesundsfjord- Larvik-Tvedalen area, Norway. On Surtsey Island, south of Iceland.

Name: For the type locality on Pauls Island, off the coast of Labrador, Canada.

F	12.3	11.59
$-O = F_2$	5.17	4.88
Total	100.3	100.00

(1) Greifensteine, Germany; by electron microprobe; $(OH)^{1-}$ absent by IR and structure analysis.
(2) $NaAl(PO_4)F$.

Occurrence: In druses in granite (Greifensteine, Germany); an alteration product rimming natromontebrasite in a complex granite pegmatite (Rusororo, Rwanda).

Association: Morinite, viitaniemiite, apatite, childrenite, roscherite, feldspar, tourmaline, quartz (Greifensteine, Germany); montebrasite, scorzalite, berlinite (Rusororo pegmatite, Rwanda); apatite, augelite, brazilianite, natromontebrasite (Strickland quarry, Connecticut, USA).

Distribution: Large crystals [from the Koppar quarry,] on the Greifensteine, near Ehrenfriedersdorf, Saxony, Germany. At Lázně Kynzvart, near Mariánské Lázně (Königswart, near Marienbad), and Ječlov, near Jihlava, Czech Republic. From Montebras, Creuse, France. In the Rusororo and Buranga pegmatites, near Gatumba, Rwanda. At the Strickland quarry, Portland, Middlesex Co., Connecticut, and in the Mount Rubellite quarry, Hebron, Oxford Co., Maine, USA.

Name: Honors François Antoine Alfred Lacroix (1863–1948), French mineralogist, Natural History Museum, Paris, France.

Type Material: Charles University, Prague, Czech Republic, 7400; Harvard University, Cambridge, Massachusetts, USA, 86746.

(1) Jas Roux, France; by electron microprobe, corresponding to $Ag_{0.97}Hg_{0.98}As_{1.01}S_{3.04}$. (2) Chauvai deposit, Kyrgyzstan; by electron microprobe, corresponding to $Ag_{0.97}Hg_{1.00}(As_{0.96}Sb_{0.06})_{\Sigma=1.02}S_{3.00}$. (3) $AgHgAsS_3$.

Occurrence: With other arsenic sulfides, in hydrothermal deposits.

Association: Smithite, stibnite, pierrotite, parapierrotite, aktashite, realgar, wakabayashilite, sphalerite, pyrite, routhiérite, chabournéite (Jas Roux, France); orpiment, realgar, stibnite, getchellite, sphalerite (Getchell mine, Nevada, USA); galkhaite, stibnite, cinnabar, metacinnabar, sphalerite, fluorite, calcite, quartz (Chauvai deposit, Kyrgyzstan).

Distribution: From the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France [TL]. In the USA, at the Getchell mine, Potosi district, Humboldt Co., Nevada. From the Chauvai Sb–Hg deposit, Fergana Valley, Alai Range, southern Kyrgyzstan.

Name: For Pierre Laffitte (1925–), Director, National School of Mines, Paris, France.

Type Material: National School of Mines, Paris, France.

(1) Kirakkajuppura deposit, Finland; by electron microprobe, average of 26 analyses on two grains; corresponds to $(Pd_{2.96}Ir_{0.05})_{\Sigma=3.01}Pb_{2.02}S_{1.98}$. (2) $Pd_3Pb_2S_2$.

Occurrence: In a platinum-group-element deposit in a layered ultramafic intrusive complex, formed under relatively high-Pb, low-S conditions.

Association: Vysotskite, zvyagintsevite, cuprorhodsite–malanite, laurite–erlichmanite, irarsite, keithconnite, gold, chalcopyrite, bornite, millerite.

Distribution: From the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland [TL].

Name: In honor of Joseph Hector Gilles Laflamme (1947–), Canada Centre for Mineral and Energy Technology (CANMET), Ottawa, Canada, for his work on platinum-group minerals.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 83195.

Total	100.39	100.17	100.00

(1) Montgros mine, France; by electron microprobe, average of eight analyses on two grains; corresponds to $Ag_{0.99}In_{1.00}S_{2.00}$. (2) Toyoha mine, Japan; by electron microprobe, corresponds to $Ag_{1.00}Zn_{0.06}Cu_{0.02}Fe_{0.01}In_{0.98}S_{1.93}$. (3) $AgInS_2$.

Mineral Group: Chalcopyrite group.

Occurrence: In a dump sample from a vein-type hydrothermal ore deposit (Montgros mine, France); in a vein-type hydrothermal ore deposit (Toyoha mine, Japan).

Association: Galena, sphalerite, barite, ankerite, quartz (Montgros mine, France); sphalerite, hocartite, pyrargyrite (Toyoha mine, Japan).

Distribution: From the Montgros Pb–Zn mine, near La Boriette, about 10 km southwest of Langeac, Haute-Loire, France [TL]. At the Toyoha Pb–Zn–Ag mine, 40 km southwest of Sapporo, Hokkaido, Japan.

Name: In honor of Claude P. Laforêt (1936–), French metallographer, Bureau de Recherches Géologiques et Minières, Orléans, France, who first observed the species.

Type Material: Geological Museum, Lausanne, Switzerland, MGL 58600; B.R.G.M., Orléans; Natural History Museum, Paris, France.

Lahnsteinite $Zn_4(SO_4)(OH)_6 \cdot 3H_2O$

Crystal Data: Triclinic (pseudo-orthorhombic). *Point Group*: 1. As hexagonal tabular crystals, to 0.7 mm, displaying {001}, {00$\bar{1}$}, {110}, {130}, {010}, {$\bar{1}$ $\bar{1}$ 0}, {$\bar{1}$ $\bar{3}$ 0}, and {0$\bar{1}$ 0}.

Physical Properties: *Cleavage*: Perfect on {001}, 2 more less-perfect sets perpendicular to (001). *Fracture*: n.d. *Tenacity*: Sectle. Hardness = 1.5 D(meas.) = 2.98(2) D(calc.) = 2.995

Optical Properties: Translucent. *Color*: Colorless. *Streak*: n.d. *Luster*: n.d.
Optical Class: Biaxial (–). α = 1.568(2) β = 1.612(2) γ = 1.613(2) 2V(meas.) = 18(3)° 2V(calc.) = 17° *Orientation*: $X \sim c$, $Y \sim b$, $Z \sim a$. *Dispersion*: None.

Cell Data: *Space Group*: $P1$. a = 8.312(1) b = 14.545(1) c = 18.504(2) α = 89.71(1)° β = 90 05(1)° γ = 90 13(1)° Z = 8

X-ray Powder Pattern: Friedrichssegen mine, near Lahnstein, Rhineland-Palatinate, Germany. 9.30 (100), 2.723 (57), 2.624 (36), 2.503 (35), 1.574 (23), 3.476 (19), 3.290 (19)

Chemistry:

	(1)
FeO	3.87
CuO	1.68
ZnO	57.85
SO_3	15.83
H_2O	22.3
Total	101.53

(1) Friedrichssegen mine, near Lahnstein, Rhineland-Palatinate, Germany; average of 6 electron microprobe analyses, H_2O by gas chromatography; corresponding to $(Zn_{3.53}Fe_{0.27}Cu_{0.11})_{\Sigma=3.91}(S_{0.98}O_4)(OH)_6 \cdot 3H_{2.10}O$.

Occurrence: In the oxidized zone of a hydrothermal polymetallic sulfide deposit.

Association: Hydrozincite, pyromorphite, native copper, goethite.

Distribution: From dumps at the Friedrichssegen mine, near Lahnstein, Ems District, Rhineland-Palatinate (Rheinland-Pfalz), Germany.

Name: For the city nearby the locality from which the first specimens were collected.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (4352/1).

Laihunite $Fe^{2+}Fe^{3+}_2(SiO_4)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals subhedral, thick tabular to short prismatic, to 1 mm; as anhedral grains.

Physical Properties: *Cleavage:* Perfect on {100} and {010}, two less perfect $\sim\perp$ {100} and intersecting at 60°. Hardness = 5.5–6.5 VHN = 617–833 D(meas.) = 3.967 D(calc.) = 4.11 Moderately magnetic and electromagnetic.

Optical Properties: Opaque, translucent in very thin section. *Color:* Black; gray in reflected light. *Streak:* Pale brown, blackish brown. *Luster:* Submetallic to metallic. *Pleochroism:* Gray to grayish black. *Anisotropism:* Weak.

Cell Data: *Space Group:* $P2_1/b$. $a = 4.805(2)$ $b = 10.189(9)$ $c = 17.403(9)$ $\alpha = 91.0(2)°$ $Z = 12$

X-ray Powder Pattern: Little Lai-He Village, China.
3.488 (10b), 2.521 (10), 2.774 (9), 1.745 (8), 2.405 (7), 2.246 (7), 2.175 (6)

Chemistry:

	(1)
SiO_2	31.07
Fe_2O_3	44.24
FeO	23.64
MgO	0.87
CaO	0.21
Total	100.03

(1) Little Lai-He Village, China; corresponds to $(Fe^{2+}_{1.18}Mg_{0.08})_{\Sigma=1.26}Fe^{3+}_{2.00}(Si_{0.93}O_4)_2$.

Polymorphism & Series: 3M, 2M polytypes.

Occurrence: In a Precambrian metamorphic iron deposit, probably derived by oxidation of fayalite (Little Lai-He Village, China).

Association: Quartz, "hypersthene," magnetite, "hornblende," augite, plagioclase (Little Lai-He, China).

Distribution: At Little Lai-He village, Liaoning Province, China. From Kamitaga, Shizuoka Prefecture, and Yugawara, Kanagawa Prefecture, Japan. In the Cherkassk massif, Kuraminsk, Siberia, Russia. From the St. Peters Dome area, El Paso Co., Colorado, USA.

Name: For the occurrence at Little Lai-He Village, China.

Type Material: n.d.

Laitakarite $Bi_4(Se,S)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As foliated plates and sheets, elongated along [001]; as grains, to 2 mm.

Physical Properties: *Cleavage:* {001}, excellent. Hardness = n.d. VHN = 54–78 (100 g load). D(meas.) = 8.12 D(calc.) = [8.28]

Optical Properties: Opaque. *Color:* In polished section, galena-white. *Luster:* Metallic. *Anisotropism:* Moderate, pale brown to dark gray.
R_1–R_2: (400) 50.6–53.8, (420) 50.4–54.0, (440) 50.2–54.2, (460) 50.1–54.5, (480) 49.9–54.6, (500) 49.8–54.6, (520) 49.4–54.6, (540) 49.1–54.6, (560) 48.8–54.6, (580) 48.5–54.6, (600) 48.2–54.5, (620) 47.9–54.4, (640) 47.6–54.0, (660) 47.2–53.5, (680) 46.5–52.9, (700) 45.9–52.3

Cell Data: *Space Group:* $R\overline{3}m$. $a = 4.2239(14)$ $c = 39.94(3)$ $Z = 3$

X-ray Powder Pattern: Orijärvi mine, Finland.
3.072 (100), 2.246 (80), 2.112 (80), 1.741 (70), 4.425 (60), 3.586 (60), 1.538 (60)

Chemistry:

	(1)	(2)		(1)	(2)
Bi	78.28	77.9	Zn	0.14	
Pb	0.78	3.4	Se	15.50	15.4
Ag	0.71		S	3.28	3.3
Cu	0.26		insol.	0.93	
			Total	99.88	100.0

(1) Orijärvi mine, Finland; after deducting 4% of galena, sphalerite, and chalcopyrite this yields $Bi_{3.95}(Se_{2.07}S_{0.93})_{\Sigma=3.00}$. (2) Falun, Sweden; by electron microprobe; corresponds to $(Bi_{3.75}Pb_{0.16})_{\Sigma=3.91}(Se_{1.96}S_{1.04})_{\Sigma=3.00}$.

Occurrence: In veinlets in quartz-anthophyllite-cordierite-biotite rocks (Orijärvi mine, Finland).

Association: Chalcopyrite, bismuth, sphalerite, molybdenite, silver, pyrite, galena (Orijärvi mine, Finland); tetrahedrite–tennantite, luzonite–famatinite, pyrite, mawsonite, nekrasovite, chalcopyrite, emplectite, bismuth, calcite, quartz, barite (Kuramin Mountains, Uzbekistan); nevskite, wolframite, natanite, wittite, selenian bismuthinite, selenian cosalite, cassiterite, guanajuatite (Nevskoye deposit, Russia).

Distribution: In southwestern Finland, from the Orijärvi mine, Orijärvi [TL]. At Falun, Kopparberg, and Boliden, Skellefte district, Sweden. From La Creusaz, Valais, Switzerland. In the Bonser vein, Coniston mines, Cumbria, England. At the Khayragatsch gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. From the Nevsky W–Sn deposit, 25 km northwest of Omsukchan, Magadan region, Russia. In the Akenobe mine, Hyogo Prefecture, Japan. From the Kidd Creek mine, near Timmins, Ontario, Canada. At the Lega Dembi gold deposit, Sidamo Province, Ethiopia.

Name: For Professor Aarne Laitakari (1890–1975), Director, Geological Survey of Finland, who collected the original material.

Type Material: n.d.

(1) Great fissure Tolbachik eruption, Kamchatka peninsula, Russia; average of 5 electron microprobe analyses; corresponding to $Cu_{3.00}Zn_{0.02}As_{1.99}O_8$.

Polymorphism & Series: The polymorph of lammerite.

Occurrence: The product of post-eruption fumarolic reactions (400–650 °C) in an active volcano.

Association: Euchlorine, piypite, alumokluchevskite, alarsite, lammerite.

Distribution: Second Scoria cone of the Northern Branch of the Great fissure Tolbachik eruption (1975–1976), Kamchatka peninsula, Russia.

Name: Signifies the monoclinic polymorph of *lammerite*, named to honor Franz Lammer, mineral collector of Leoben, Austria, who provided the first specimen.

Type Material: Mineralogical Museum, Saint Petersburg University, Saint Petersburg, Russia.

Lammerite $Cu_3(AsO_4, PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 2 mm, are prismatic along [001] to tabular on {100} and terminated by {011}; additional forms include {010} and striated {120}; in radial spheroidal aggregates.

Physical Properties: *Cleavage:* Perfect on {010}; good on {100}; imperfect on {001}. Hardness = 3.5–4 D(meas.) = 4.9–5.18 D(calc.) = 5.263

Optical Properties: Transparent. *Color:* Dark green. *Streak:* Pale green. *Luster:* Adamantine, vitreous on cleavage surfaces. *Optical Class:* Biaxial (+). *Pleochroism:* Strong; X = pale blue; Y = sky-blue; Z = pale bluish green. *Orientation:* $X = b$; $Z \wedge c \simeq 40°$. *Dispersion:* $r \gg v$, very strong. $\alpha = \sim 1.89$ $\beta = 1.90$–2.06 $\gamma = 1.95$–2.14 2V(meas.) = 54(5)° 2V(calc.) = 50°

Cell Data: *Space Group:* $P2_1/a$. $a = 5.079(1)$ $b = 11.611(2)$ $c = 5.394(1)$ $\beta = 111.72(2)°$ Z = 2

X-ray Powder Pattern: Laurani, Bolivia.
2.89 (10), 2.52 (9), 3.06 (8), 3.00 (8), 2.62 (8), 2.59 (8), 2.84 (7)

(1) Laurani, Bolivia; by electron microprobe, absence of $(OH)^{1-}$ and H_2O confirmed by IR; corresponding to $(Cu_{2.90}Zn_{0.05}Mg_{0.02}Fe_{0.01})_{\Sigma=2.98}(As_{1.00}O_4)_2$. (2) Tolbachik fissure volcano, Russia; by electron microprobe, corresponding to $(Cu_{2.96}Zn_{0.01})_{\Sigma=2.97}[(As_{0.62}P_{0.38})_{\Sigma=1.00}O_4]_2$.

Occurrence: On an old mineral specimen (Laurani, Bolivia); in an oxidized zone in a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia); in volcanic sublimates (Tolbachik fissure volcano, Russia).

Association: Olivenite (Laurani, Bolivia); chalcanthite, anhydrite, leightonite (Tsumeb, Namibia); euchlorine, melanothallite, dolerophanite, chalcocyanite, leningradite, tolbachite, anglesite, alarsite, fedotovite, klyuchevskite, nabokoite, atlasovite, langbeinite, hematite, tenorite (Tolbachik fissure volcano, Russia).

Distribution: From Laurani, Oruro, Bolivia. At Tsumeb, Namibia. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Franz Lammer, mineral collector of Leoben, Austria, who provided the first specimen.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany; The Natural History Museum, London, England, 1980,357; Harvard University, Cambridge, Massachusetts, 117006; National Museum of Natural History, Washington, D.C., USA, 146966, 148264.

Lamprophyllite $(Na,Mn,K)_3(Sr,Ba)_2Ti_3O_2(Si_2O_7)_2(O,OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals flattened on {100}, elongated along [001], rarely terminated, to 20 cm; as stellate clusters and sheaflike aggregates. *Twinning:* Common on {100}, rarely polysynthetic.

Physical Properties: *Cleavage:* Perfect micaceous on {100}; poor on {010}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 3.44–3.53 D(calc.) = [3.48]

Optical Properties: Opaque, transparent to translucent in thin section. *Color:* Dark brown, brownish yellow, straw-yellow, reddish brown with a golden tint. *Streak:* Pale yellow, may have an orange tint. *Luster:* Submetallic on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow; Y = straw-yellow; Z = orange or straw-yellow. *Orientation:* $X \perp b$; $Z \wedge c \simeq 4°$–$8°$. *Dispersion:* $r > v$, strong. $\alpha = 1.735$–1.749 $\beta = 1.747$–1.754 $\gamma = 1.770$–1.781 2V(meas.) = 21°–41°

(1) Kukisvumchorr apatite deposit, Khibiny massif, Russia. (2) Mt. Karnasurt, Lovozero massif, Russia.

Occurrence: In all rock types and most pegmatites of a differentiated alkalic massif (Lovozero massif, Russia).

Association: Microcline, nepheline, aegirine, lorenzenite, eudialyte, lomonosovite, murmanite, villiaumite (Lovozero massif, Russia); microcline, nepheline, catapleiite, aegirine, calcite, fluorite, analcime, pectolite (Pilansberg, South Africa).

Distribution: In Russia, in the Lovozero and Khibiny assifs, Kola Peninsula; in the Konder, Inagli, and Yllymakh massifs, Yakutia. In the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. From the Langesundsfjord, Norway. At Pilansberg, Transvaal, South Africa. In the Rocky Boy stock, Bear Paw Mountains, Hill Co., Montana, USA. At Mont Saint-Hilaire, Quebec, Canada. From Pedro Balao, Poços de Caldas, Minas Gerais, and Serrote, Cascata, São Paulo, Brazil.

Name: From the Greek for *shining* and *leaf*, for its lustrous cleavage.

Lanarkite $Pb_2O(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 5 cm, are elongated along [010], showing {001}, {110}, with many {$h0l$} forms, may form radial aggregates; massive. *Twinning:* Rare, along the [010] zone.

Physical Properties: *Cleavage:* On {$\overline{2}01$}, perfect; on {$\overline{4}01$}, {201}, {010}, imperfect. *Tenacity:* Flexible in thin laminae. Hardness = 2–2.5 D(meas.) = 6.92 D(calc.) = 7.08 Fluoresces yellow under X-rays and LW UV.

Optical Properties: Transparent to translucent. *Color:* Gray, pale green, pale yellow; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine to resinous, pearly on cleavage surfaces.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 30°$. *Dispersion:* $r > v$, strong, inclined. $\alpha = 1.928(3)$ $\beta = 2.007(3)$ $\gamma = 2.036(3)$ 2V(meas.) = 60(2)°

Cell Data: *Space Group:* $C2/m$ (synthetic). $a = 13.769(5)$ $b = 5.698(3)$ $c = 7.079(2)$ $\beta = 115°56(10)'$ Z = 4

(1) Leadhills, Scotland; recalculated to 100% after deduction of ignition loss 0.83% from an original total of 98.66%. (2) $Pb_2O(SO_4)$.

Occurrence: A rare secondary mineral in the oxidized zone of lead sulfide deposits.

Association: Cerussite, leadhillite, susannite, hydrocerussite, caledonite.

Distribution: In Scotland, large crystals from the Susanna mine, Leadhills, Lanarkshire; at the Meadowfoot smelter, near Wanlockhead, Dumfriesshire, in slag. In England, from several mines in Caldbeck Fells, Cumbria; in the Gravel Hill mine, Perranzabuloe, Cornwall. At the Frongoch mine, Dyfed, Wales. In Germany, at Giepenbach, near Tanne, Harz Mountains; in the Herrensegen mine, Kinzigtal, and from near Badenweiler, Black Forest. From the Silberleiten mine, near Bieberwier, northwest of Innsbruck, Tirol, Austria. At the Laquorre mine, near Aulus, Ariège, France. At Laurium, Greece, in slag. In the Tchah Milleh mine, near Anarak, Iran. From the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa, in slag. In the Ediacara lead mine, 19 km west of Beltana, South Australia. In the USA, in the Leadville district, Lake Co., Colorado; at the C & B mine, Dripping Springs Mountains, Gila Co., Arizona. From the Buena Esperanza mine, Challacollo, Tarapacá, Chile.

Name: For the occurrence in the Susanna mine, Lanarkshire, Scotland.

Type Material: Natural History Museum, Paris, France.

Landauite $\mathbf{NaMn^{2+}Zn_2(Ti, Fe^{3+})_6Ti_{12}O_{38}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As prismatic crystals and irregular grains, to 1 mm, in aggregates. *Twinning:* Commonly as complex cyclic twins.

Physical Properties: *Fracture:* Conchoidal. Hardness = 7.5 D(meas.) = 4.42 D(calc.) = 4.46

Optical Properties: Opaque, translucent through thin edges. *Color:* Black; brownish green through thin edges. *Streak:* Gray. *Luster:* Submetallic.
Optical Class: Biaxial (–). *Pleochroism:* Strong; $X = Z$ = bottle-green; Y = green.
Dispersion: $r > v$, weak. *Absorption:* $Z > Y > X$. $\alpha = 2.373$ β = n.d. $\gamma = 2.388$
2V(meas.) = ∼60°

Cell Data: *Space Group:* $R\overline{3}$. $a = 10.366(7)$ $c = 20.77(1)$ Z = 3

X-ray Powder Pattern: Burpala massif, Russia.
2.83 (10), 2.11 (9), 1.780 (8), 1.582 (8), 1.429 (8), 2.21 (7), 3.36 (6)

Total	100.09

(1) Burpala massif, Russia; by electron microprobe, Fe^{2+}:Fe^{3+} ratio approximated from charge balance; corresponds to $(Na_{0.76}K_{0.16}Pb_{0.16})_{\Sigma=1.08}Mn_{1.00}Zn_{2.30}Ti_{15.70}Fe_{1.75}(Nb, Zr)_{0.08}O_{38}$.

Mineral Group: Crichtonite group.

Occurrence: An accessory mineral in albite veins cutting syenite pegmatite associated with an alkalic pluton.

Association: Albite, polylithionite, brookite, chabazite, monazite, bastnäsite, murataite.

Distribution: In the Burpala massif, 120 km north of Lake Baikal, eastern Siberia, Russia.

Name: Honors Lev Davidovich Landau (1908–1968), noted Russian physicist.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67187, vis5882, vis5883; National Museum of Natural History, Washington, D.C., USA, 144009.

Total	100.38

(1) Berry quarry, Maine, USA; corresponds to $(Mn^{2+}_{7.2}Mg_{1.2}Ca_{0.5})_{\Sigma=8.9}(Fe^{3+}_{2.7}Mn^{3+}_{0.5})_{\Sigma=3.2}(PO_4)_8(OH)_{3.2} \cdot 8.8H_2O$.

Occurrence: Replacing reddingite in a complex granite pegmatite (Berry quarry, Maine, USA).

Association: Reddingite, lithiophilite, rhodochrosite, eosphorite, fairfieldite, apatite (Berry quarry, Maine, USA).

Distribution: In the USA, in the Berry quarry, Poland, Androscoggin Co., and the Emmons quarry, Greenwood, Oxford Co., Maine; from Branchville, Fairfield Co., Connecticut. At Hagendorf, Bavaria, Germany.

Name: Honors Dr. Kenneth Knight Landes (1899–1984), Professor of Geology, University of Michigan, Ann Arbor, Michigan, USA, for his study of Maine pegmatites.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 91214.

(1) Hall, Austria. (2) $K_2Mg_2(SO_4)_3$.

Occurrence: A principal ore of potash, mined from marine salt deposits.

Association: Carnallite, halite, sylvite.

Distribution: In Germany, from Wilhelmshall, near Halberstadt; at Solvayhall, near Bernberg; from Hattord, Hesse; and elsewhere. At Hall and Hallstatt, Austria. From Stebnyk, near Drogobych, Ukraine. At Sleights, Eskdale, Yorkshire, England. In the Mayo mine, Salt Range, Punjab, India. From the Qarhan salt lake, Qinghai Province, and the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China. In the USA, in New Mexico, in commercial quantities in the Carlsbad potash district, Eddy Co.

Name: To honor A. Langbein, of Leopoldshall [Stassfurt], Germany.

Langisite $(Co, Ni)As$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As irregular grains and lamellae in safflorite.

Physical Properties: Hardness = n.d. VHN = 780–857 (50 g load). D(meas.) = n.d. D(calc.) = 8.174

Optical Properties: Opaque. *Color:* In reflected light, pinkish buff. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Moderate, in bluish gray and light brown. *Bireflectance:* Weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. a = 3.538 $c = 5.127$ Z = 2

X-ray Powder Pattern: Langis mine, Canada.
2.631 (10), 1.966 (9), 1.770 (8), 1.493 (4), 1.470 (3), 1.315 (3), 1.141 (3)

Chemistry:

	(1)
Co	35.5
Ni	7.0
As	56.0
Total	98.5

(1) Langis mine, Canada; by electron microprobe, corresponding to $(Co_{0.84}Ni_{0.16})_{\Sigma=1.00}As_{1.04}$.

Mineral Group: Nickeline group.

Occurrence: In pockets of ore minerals, mineralized fault gouge, and breccia cemented with calcite and quartz.

Association: Cobalt pentlandite, siegenite, parkerite, bravoite, safflorite, maucherite, pyrite, marcasite.

Distribution: From the Langis mine, Casey Township, Cobalt-Gowganda area, Ontario, Canada [TL].

Name: For the Langis mine in Canada, where it was discovered.

Type Material: Canadian Geological Survey, Ottawa, 12140; Royal Ontario Museum, Toronto, Canada.

References: (1) Petruk, W., D.C. Harris, and J.M. Stewart (1969) Langisite, a new mineral, and the rare minerals cobalt pentlandite, siegenite, parkerite and bravoite from the Langis mine, Cobalt–Gowganda area, Ontario. Can. Mineral., 9, 597–616. Langite $Cu_4(SO_4)(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic or pseudohexagonal. *Point Group:* *m*. Crystals, showing {001}, {010}, {100}, {110}, {021}, to 7 mm, commonly skeletal; in wavy to flat crusts, earthy, massive. *Twinning:* On {110}, typically repeated to give snowflakelike or star-shaped groupings.

Physical Properties: *Cleavage:* On {001} and {010}. Hardness = 2.5–3
D(meas.) = 3.28–3.34 D(calc.) = 3.26–3.37

Optical Properties: Translucent. *Color:* Deep blue, greenish blue, blue-green.
Luster: Vitreous to silky.
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellowish green; Y = blue-green; Z = sky-blue. *Orientation:* $Y = b$; $X \simeq c$; $Z \simeq a$. α = 1.641–1.654 β = 1.690–1.713 γ = 1.705–1.722 2V(meas.) = 56°–104°

Cell Data: *Space Group:* *Pc* [morphological orientation b > c > a]. a = 7.118–7.137 b = 6.031–6.034 c = 11.209–11.217 β = 90.00°–90.02° Z = 2

X-ray Powder Pattern: Lubietová, Slovakia.
7.063 (10), 3.567 (9), 2.134 (9), 2.493 (8), 2.662 (7), 2.616 (7), 1.773 (7)

Chemistry:

	(1)	(2)
SO_3	16.42	16.40
CuO	65.82	65.16
H_2O	18.32	18.44
Total	100.56	100.00

(1) Cornwall, England. (2) $Cu_4(SO_4)(OH)_6 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with wroewolfeite.

Occurrence: An uncommon but widespread secondary mineral in the oxidation zone of copper sulfide deposits; may be of post-mine formation.

Association: Wroewolfeite, posnjakite, serpierite, devilline, chalcophyllite, connellite, brochantite, malachite, gypsum.

Distribution: Some localities for rich or well-crystallized examples include: in England, in Cornwall, from a number of mines, as the Fowey Consols mine, Tywardreath; Botallack mine, St. Just; large crystals at the Bedford United mine, Tavistock, Devon; in the Engine Vein mine, Alderley Edge, Cheshire; at several mines in Caldbeck Fells, Cumbria. Found in the Dooneen mine, Allihies, Co. Cork, Ireland. In France, at Mazega, Aveyron; in the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, and elsewhere. At L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In Germany, from the Clara mine, near Oberwolfach, Black Forest; Richelsdorfer Mountains, Hesse; in Saxony, at Schneeberg, Schwartzenberg, Freiberg; and others. At Klausen, Alto Adige, Italy. From Tsumeb, Namibia. At the Paddy's River mine, Australian Capital Territory, Australia. In the USA, from the Silver King mine, near Ely, White Pine Co., Nevada; at the Grandview mine, Grand Canyon, Coconino Co., and from Bisbee, Cochise Co., Arizona. In the El Teniente mine, 67 km west of Rancagua, O'Higgins Province, Chile. Many older localities require modern confirmation.

Name: Honoring Victor von Lang (1838–1921), physicist and crystallographer, Professor of Physics, University of Vienna, Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria, A.a.4353.

Lanmuchangite $TlAl(SO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As anhedral grains, to 90 μm, columnar or in aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.1–3.4 VHN = 94–124
D(meas.) = 2.22 D(calc.) = [2.33] Soluble in H_2O.

Optical Properties: Transparent. *Color:* White to pale yellow. *Streak:* White.
Luster: Vitreous.
Optical Class: Isotropic. $n = 1.495$

Cell Data: *Space Group:* $Pa3$. $a = 12.212(5)$ $Z = 4$

X-ray Powder Pattern: Lanmuchang deposit, China.
4.314 (100), 2.801 (70), 7.03 (54), 2.731 (35), 6.11 (27), 3.524 (24), 3.676 (22)

Chemistry:

Total	100.60	100.00

(1) Lanmuchang deposit, China; by electron microprobe, average of six analyses, H_2O by TGA, $(SO_4)^{2-}$ and H_2O confirmed by IR; corresponds to $(Tl_{1.00}K_{0.05})_{\Sigma=1.05}(Al_{1.01}Si_{0.02}Ca_{0.01}Mg_{0.01}Fe_{0.01})_{\Sigma=1.06}(SO_4)_{2.02} \cdot 11.86H_2O$. (2) $TlAl(SO_4)_2 \cdot 12H_2O$.

Occurrence: In the oxidation zone of a Tl–Hg deposit.

Association: Melanterite, pickeringite, jarosite, gypsum, potassium alum, arsenolite, sulfur.

Distribution: From the Lanmuchang Tl–Hg deposit, Xinren Co., Guizhou Province, China [TL].

Name: For its occurrence in the Lanmuchang deposit, China.

Type Material: Geological Museum of China, Beijing, China.

Total	99.45	100.00

(1) Lone Pine mine, New Mexico, USA; by microanalysis, H_2O by the Penfield method.
(2) $HCa_4Mg_2Al_4(SO_4)_8F_9 \cdot 32H_2O$.

Occurrence: A rare post-mine mineral deposited from solutions derived from an oxidizing breccia zone.

Association: Fluorite, gypsum, khademite, wilcoxite, pyrite.

Distribution: From the Lone Pine mine, Wilcox district, near Silver City, Catron Co., New Mexico, USA.

Name: Honoring Dan Lannon, who early staked claims in the Wilcox district, New Mexico, USA.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,546; National Museum of Natural History, Washington, D.C., USA, 149526.

Lansfordite $MgCO_3 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals, elongated along [001], with principal forms {100}, {110}, {001}, a dozen additional forms, to 4 mm; as stalactites, which may be terminated by crystal faces; in parallel growths, and as efflorescences. *Twinning:* Observed.

Physical Properties: *Cleavage:* {001}, perfect; {100}, less perfect. Hardness = 2.5 D(meas.) = 1.692 D(calc.) = 1.693 Slowly effloresces at room temperature to produce nesquehonite.

Optical Properties: Transparent to translucent, becoming opaque on exposure. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous if fresh. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Z = c$; $Y \perp \{100\}$. $\alpha = 1.456$–1.465 $\beta = 1.468$–1.469 $\gamma = 1.507$–1.508 2V(meas.) = 59°30′ 2V(calc.) = 59°20′

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 12.4758(7)$ $b = 7.6258(4)$ $c = 7.3463(6)$ $\beta = 101.762(6)°$ Z = 4

X-ray Powder Pattern: Synthetic.
2.839 (100), 4.583 (95), 3.237 (55), 1.710 (33), 5.239 (31), 5.110 (31), 7.178 (30)

Chemistry:

	(1)	(2)
CO_2	25.09	25.23

H_2O	51.75	51.65
Total	100.11	100.00

(1) Cogne, Italy. (2) $MgCO_3 \cdot 5H_2O$.

Occurrence: Stalactites pendant from the shale roof of an anthracite coal mine (Nesquehoning, Pennsylvania, USA); in a hydromagnesite deposit (Atlin, Canada); a weathering product of an ultramafic body (Sør-Trøndelag, Norway).

Association: Nesquehonite, hydromagnesite, dypingite.

Distribution: In the USA, from Nesquehoning, near Lansford, Carbon Co., Pennsylvania; near the Robinson Gulch pegmatite, Jefferson Co., Colorado. From Atlin, British Columbia, Canada. At Cogne, Val d'Aosta, Piedmont, Italy. From the Feragen ultramafic body, Sør-Trøndelag, Norway. Found in seafloor precipitates in the Japan Sea.

Name: For its occurrence near Lansford, Pennsylvania, USA.

Lanthanite-(Ce) $(Ce, La, Nd)_2(CO_3)_3 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are platy, flattened on {010}, with a rhombic outline, to 5 mm; commonly as a powdery crust. *Twinning:* On {101}, twin and composition plane.

Physical Properties: *Cleavage:* {010}, perfect, micaceous. *Tenacity:* Sectile. Hardness = ∼2.5 D(meas.) = 2.76 D(calc.) = 2.79

Optical Properties: Transparent. *Color:* Colorless, white, pink, yellow. *Streak:* White. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, weak.
$\alpha = 1.532(2)$ $\beta = 1.594(2)$ $\gamma = 1.616(2)$ 2V(meas.) = 60(2)° 2V(calc.) = 62°

Cell Data: *Space Group: Pbnb.* $a = 9.482(6)$ $b = 16.938(11)$ $c = 8.965(3)$ Z = 4

X-ray Powder Pattern: Britannia mine, Wales; close to lanthanite-(La) and lanthanite-(Nd).
8.47 (100), 3.255 (73), 4.746 (65), 3.028 (65), 4.462 (62), 4.125 (40), 3.943 (38)

Chemistry:

	(1)		(1)
CO_2	21.0	Sm_2O_3	2.50
Y_2O_3	0.74	Gd_2O_3	1.53
La_2O_3	14.44	H_2O	23.0
Ce_2O_3	20.61	Total	98.6
Nd_2O_3	14.78		

(1) Britannia mine, Wales; by electron microprobe, average of five analyses, CO_2 by CHN analyzer, H_2O by TGA, O^{2-} calculated for charge balance; corresponds to $(Ce_{0.78}La_{0.55}Nd_{0.55}Sm_{0.09}Gd_{0.05}Y_{0.04})_{\Sigma=2.06}C_{2.97}O_{9.03} \cdot 7.96H_2O$.

Occurrence: A rare secondary mineral typically formed by alteration or weathering from earlier rare-earth-element-bearing minerals.

Association: Allanite-(Ce), cerite-(Ce).

Distribution: From the Britannia mine, Snowdonia, Gwynedd, Wales. In Sweden, from the Bastnäs mine, near Riddarhyttan, Västmanland. At the Vuoriyarvi carbonatite massif, Kola Peninsula, Russia. In China, from Bayan Obo, Chengde and Chicheng, Hebei Province. The following lanthanite occurrences are listed here, but require a full analysis to establish the dominant rare-earth element. In the USA, from the Sanford mine, Moriah, Essex Co., New York; at the Medford quarry, 50 km west of Baltimore, Carroll Co., Maryland; from the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., Texas. from vermiculite prospects at the head of Big Sandy Creek, Rocky Boy's Indian Reservation, about 40 km east of Box Elder, Hill Co., Montana; At Mont Saint-Hilaire, Quebec, Canada. In the Qaqarssuk carbonatite, near Sukkertoppen, Greenland.

Name: For its relation to *lanthanite*-(La), and preponderance of *cerium* over other rare-earth elements.

Type Material: National Museum, Cardiff, Wales, 84.6G.M1; The Natural History Museum, London, England, 1984,614; National Museum of Natural History, Washington, D.C., USA, 162169.

Lanthanite-(La) $(La,Nd)_2(CO_3)_3 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Orthorhombic.] [by analogy to lanthanite-(Nd).] *Point Group:* [$2/m$ $2/m$ $2/m$.] [Crystals are platy, flattened on {010}, with a rhombic outline; may be a powdery crust.] *Twinning:* [On {101}, twin and composition plane.]

Physical Properties: *Cleavage:* [{010}, perfect, micaceous.] *Fracture:* [Uneven.] *Tenacity:* [Sectile.] Hardness = [~2.5] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* [Bright pink, violet; colorless in transmitted light.] *Streak:* [White.] *Luster:* [Vitreous to pearly.]
Optical Class: [Biaxial (–).] *Orientation:* [$X = b$; $Y = c$; $Z =$ a.] *Dispersion:* [$r < v$, weak.] $\alpha =$ n.d. $\beta =$ n.d. $\gamma =$ n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* [*Pbnb*.] $a =$ n.d. $b =$ n.d. $c =$ n.d. Z = [4]

X-ray Powder Pattern: Curitiba, Brazil; here made identical to lanthanite-(Nd).
8.50 (100), 3.252 (63), 3.038 (58), 4.473 (56), 4.741 (52), 4.139 (34), 3.953 (32)

Chemistry: (1) Curitiba, Brazil; by electron microprobe, partial analysis of rare-earth elements only: La 41.8%, Ce 0.1%, Pr 9.1%, Nd 38.3%, Sm 6.6%, Eu 1.2%, Gd 1.8%, Tb 1.2%, Dy 0.7%, Ho 0.1%, Yb 0.1%.

Occurrence: A rare secondary mineral typically formed by alteration or weathering from earlier rare-earth-element-bearing minerals.

Association: Allanite-(Ce) (Saucon Township, Pennsylvania, USA).

Distribution: In Sweden, originally described from the Bastnäs mine, near Riddarhyttan, Västmanland; thought to be lanthanum-rich but a recent analysis, not on type material, shows Ce > La. From Curitiba, Paraná, and at Santa Isabel, São Paulo, Brazil. In the USA, found in lower Saucon Township, Northampton Co., Pennsylvania, and at the Scovill iron mine, Salisbury, Litchfield Co., Connecticut. From Niikoba, Saga Prefecture, Japan.

Name: For dominant *lanthanum* in its composition.

Type Material: Natural History Museum, Vienna, Austria, A.x.564.

(1) Curitiba, Brazil; H_2O by the Penfield method; corresponds to $(Nd_{0.79}La_{0.73}Pr_{0.19}Sm_{0.14}Gd_{0.06}Eu_{0.06}Dy_{0.01}Y_{0.01})_{\Sigma=1.99}(CO_3)_3 \cdot 8H_2O$. (2) Santa Isabel, Brazil; by X-ray fluorescence spectrometry, Eu by polarography, CO_2 and H_2O by elemental analyzer.

Occurrence: A rare secondary mineral typically formed by alteration or weathering from earlier rare-earth-element-bearing minerals.

Association: n.d.

Distribution: In Brazil, from Curitiba, Paraná, at Santa Isabel, São Paulo, and near Morro do Ferro, Minas Gerais. At Kirigo and Niikoba, Saga Prefecture, Japan. From Pavlovsk, Primorskiy Kray, Russia. At South Mountain, Bethlehem, Lehigh Co., Pennsylvania, USA.

Name: For *lanthanum* in its composition, and preponderance of *neodymium* over other rare-earth elements.

Type Material: Pierre and Marie Curie University, Paris, France; Canadian Geological Survey, Ottawa, Canada, 12213; National Museum of Natural History, Washington, D.C., USA, 147003.

Laphamite $As_2(Se,S)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, to less than 5 mm, elongated along [100] and tabular (010). Crystals are commonly resorbed to give incomplete individuals.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Flexible but not elastic, extremely malleable. Hardness = Soft. VHN = n.d. D(meas.) = 4.5(1) D(calc.) = 4.60

Optical Properties: Nearly opaque. *Color:* Dark red; gray-white in reflected light, strong fiery red internal reflections, golden yellow internal reflections occur along scratches. *Streak:* Reddish orange. *Luster:* Resinous. *Pleochroism:* Moderate, from white to gray. *Anisotropism:* Moderate, in tints of gray.

R_1–R_2: (400) 34.4–42.1, (420) 33.9–41.0, (440) 33.8–39.9, (460) 33.8–38.8, (480) 33.2–37.4, (500) 32.3–36.3, (520) 30.9–35.1, (540) 29.5–34.0, (560) 28.4–33.1, (580) 27.6–32.3, (600) 26.9–31.6, (620) 26.4–31.1, (640) 26.4–30.9, (660) 26.3–30.6, (680) 26.1–30.4, (700) 25.9–30.1

(1) Burnside, Pennsylvania, USA; by electron microprobe, corresponding to $As_{2.00}(Se_{1.91}S_{0.93}As_{0.16})_{\Sigma=3.00}$.

Occurrence: As a secondary incrustation, probably by sublimation, on clinker adjacent to a surface vent on a burning pile of waste material from an anthracite coal mine.

Association: Arsenolite, orpiment.

Distribution: From Burnside, Northumberland Co., Pennsylvania, USA [TL].

Name: To honor Dr. Davis M. Lapham (1931–1974), former Chief Mineralogist of the Pennsylvania Geological Survey.

Type Material: The Natural History Museum, London, England, 1984,843 and E.1036; National Museum of Natural History, Washington, D.C., USA, 163039.

S	27.7	28.00	28.27
Total	98.5	99.14	100.00

(1) Lapie River, Canada; by electron microprobe, average of four grains; corresponding to $Cu_{1.01}(Ni_{1.01}Fe_{0.01})_{\Sigma=1.02}(Sb_{1.00}As_{0.01})_{\Sigma=1.01}S_{3.00}$. (3) Tyrnyauz deposit, Russia; by electron microprobe, corresponding to $Cu_{1.00}(Ni_{1.00}Fe_{0.01})_{\Sigma=1.01}(Sb_{0.99}As_{0.01})_{\Sigma=1.00}S_{3.00}$. (4) $CuNiSbS_3$.

Occurrence: In a highly altered and mineralized glacial erratic (Lapie River, Canada).

Association: Nickelian pyrite, gersdorffite, polydymite, millerite, marcasite, tetrahedrite, chalcopyrite, spinel, magnetite, mica, quartz (Lapie River, Canada); zinkenite, ullmannite, chalcostibite (Tyrnyauz deposit, Russia); mückeite, millerite, bismuthinite, sphalerite, aikinite, polydymite (Grüne Au mine, Germany).

Distribution: From near the confluence of Glacier Creek and the Lapie River, St. Cyr Ranges, Yukon Territory, Canada [TL]. In the Tyrnyauz deposit, left bank of the Baksan River Valley, northern Caucasus Mountains, Russia. At the Grüne gold mine, Schutzbach, 15 km southwest of Siegen, North-Rhine-Westphalia, Germany.

Name: For the Lapie River, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 63844, 63845, and 63846.

(1) Upper Darai-Pioz alkaline massif, Northern Tajikistan; average of 42 electron microprobe analyses; corresponding to $(Na_{0.88}REE_{0.12})_{\Sigma=1.00}(Fe_{0.54}Mn_{0.37}Ti_{0.09})_{\Sigma=1.00}(REE_{6.79}Ca_{5.40}Y_{2.60}Sr_{0.24}U_{0.06}Th_{0.04})_{\Sigma=15.13}(SiO_4)_4(Si_{2.78}B_{2.68}P_{0.55}O_{17.33}F_{0.67})(B_{1.05}O_3)F_{11}$, with REE = $Ce_{2.68}La_{2.32}Nd_{0.80}Pr_{0.44}Gd_{0.22}Dy_{0.19}Sm_{0.15}Yb_{0.04}Tb_{0.04}Tm_{0.02}Eu_{0.01}$.

Mineral Group: Vicanite group.

Occurrence: A mineral of hydrothermal origin, discovered in a glacial moraine boulder of calcite-bafertisite-aegirine-microcline rock.

Association: Quartz, fluorite, polylithionite, albite, and intergrown with bafertisite, "calcy-beborosilite-(Y)", stillwellite-(Ce).

Distribution: Darai-Pioz glacier, at the junction of the Turkestan, Zeravshan, and Alay Mt. Ranges, Tien-Shan, Garmskii district, Northern Tajikistan.

Name: Honors Tatyana Mikhailovna Lapteva (1928-2011), a Russian geologist and petrologist who worked on the geology of Central Asia.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4195/1).

Larderellite $(NH_4)B_5O_7(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are rhombic, flattened on {001}, to 0.1 mm; typically powdery.

Physical Properties: *Cleavage:* On {100}, {010}, perfect. Hardness = n.d.
D(meas.) = 1.905(4) D(calc.) = 1.887

Optical Properties: Semitransparent. *Color:* White, pale yellow if impure.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c \simeq 15°$. *Dispersion:* $r > v$ or $r < v$.
$\alpha = 1.493(1)$ $\beta = 1.509(1)$ $\gamma = 1.561(1)$ 2V(meas.) = 58°

Cell Data: *Space Group:* $P2_1/a$. $a = 11.63$–11.65 $b = 7.615$–7.63 $c = 9.447$–9.47
$\beta = 96°45'$–$97°05'$ Z = 4

X-ray Powder Pattern: Larderello, Italy.
4.70 (100), 2.921 (100), 2.887 (100), 5.44 (71), 2.960 (71), 9.45 (50), 5.12 (50)

Chemistry:

	(1)	(2)
B_2O_3	71.64	68.49
$(NH_4)_2O$	9.93	10.24
H_2O	[18.43]	21.27
Total	[100.00]	100.00

(1) Larderello, Italy; average of four analyses, H_2O by difference. (2) $(NH_4)B_5O_7(OH)_2 \cdot H_2O$.

Occurrence: In boric-acid-rich fumarolic lagoons.

Association: Sassolite, ammonioborite, santite.

Distribution: From Larderello, Val di Cecina, Tuscany, Italy.

Name: Honoring Francesco de Larderel (1848–1925), principal operator of the Tuscan borax works.

Type Material: Natural History Museum, Paris, France, 100.1384, 100.1386, 100.1388.

(1) Scawt Hill, Ireland; minor spurrite impurity. (2) Do.; by electron microprobe, average of three analyses. (3) Ca_2SiO_4.

Occurrence: In contact metamorphic terranes involving sedimentary carbonate rocks.

Association: Spurrite, melilite, gehlenite, merwinite, perovskite, wollastonite (Scawt Hill, Ireland); rankinite, kilchoanite, scawtite, hydrogrossular (Tokatoka district, New Zealand); brownmillerite, mayenite, melilite, spurrite (Hatrurim Formation, Israel).

Distribution: At Scawt Hill and Ballycraigy, near Larne, Co. Antrim, Ireland. In Scotland, from Camas Mòr, Isle of Muck, and at Camphouse, Ardnamurchan, Argyllshire. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. In the Hatrurim Formation, Israel. From near Rehia, and in Golden Gully, Tokatoka district, about 150 km north of Auckland, New Zealand. From near Gosse Pile, Tomkinson Ranges, and in the Deering Hills, South Australia. In the USA, at Marble Canyon, Culberson Co., Texas.

Name: For Larne, Ireland, in the vicinity of which the mineral was initially observed.

Type Material: n.d.

(1) Franklin, New Jersey, USA; average of two analyses. (2) Do.; by electron microprobe. (3) $PbZnSiO_4$.

Occurrence: A very rare secondary mineral in veins cutting and replacing coarse, massive willemite-franklinite ore in a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA).

Association: Willemite, clinohedrite, esperite, hardystonite, hodgkinsonite, andradite, calcite, smithsonite, zincite, franklinite, roeblingite (Franklin, New Jersey, USA); queitite, alamosite (Tsumeb, Namibia).

Distribution: From Franklin, Sussex Co., New Jersey, USA. At Tsumeb, Namibia. In the Puttapa zinc mine, near Beltana, South Australia.

Name: For Esper Signius Larsen, Jr. (1879–1961), American petrologist, Harvard University, Cambridge, Massachusetts, USA.

Type Material: n.d.

Lasalite $Na_2Mg_2[V_{10}O_{28}]\cdot 20H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Typically as crusts of rounded crystals; as blocky prismatic crystals, elongated on [010] and exhibiting {100}, {010}, {001}, { $\bar{1}$ 11}, and {111}, to 2 mm.

Physical Properties: *Cleavage*: None. *Tenacity*: Very brittle. Hardness = 1
D(meas.) = 2.38(2) D(calc.) = 2.362 Crystals dehydrate to a yellow powder. Soluble in water.

Optical Properties: Transparent. *Color*: Yellow to yellow-orange. *Streak*: Yellow.
Luster: Adamantine.
Optical Class: Biaxial (–). α = 1.743(5) β = 1.773(5) γ = 1.780(5) 2V(meas.) = 43(1)°
Dispersion: $r > v$, strong. *Pleochroism*: *X* = light greenish yellow; *Y* = light yellow; *Z* = light brown.

Cell Data: *Space Group*: *C*2/*c*. a = 23.9019(7) b = 10.9993(3) c = 17.0504(5)
β = 118.284(1)° Z = 2

X-ray Powder Pattern: Vanadium Queen Mine, Utah.
9.72 (100), 6.67 (80), 7.42 (70), 9.09 (60), 8.19 (60), 2.882 (50), 2.706 (50)

Chemistry:

	(1)
Na_2O	4.06
MgO	5.42
CaO	1.75
K_2O	0.47
V_2O_5	61.87
SO_3	2.55
H_2O	23.88
Total	100.00

(1) Vanadium Queen Mine, Utah; average of 2 argon-plasma spectrometric analyses, H_2O by difference, corresponding to $(Na_{1.84}Ca_{0.44}K_{0.14})_{\Sigma=2.42}Mg_{1.89}(V_{9.55}S_{0.45})_{\Sigma=10.00}O_{28.55}\cdot 18.61H_2O$.

Occurrence: As efflorescences in oxidized portions of paleochannel uranium vanadium deposits of the Colorado Plateau type.

Association: Rossite, dickthomssenite, hewettite.

Distribution: Vanadium Queen Mine, La Sal district, and Firefly-Pigmay and Blue Cap mines, Utah, USA. Likely widespread in other similar deposits on the Colorado Plateau, e.g. Yellow Cat district, Grand County, Utah, USA.

Name: For the mining district that provided the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA (174744).

CaO	29.41	$-O = Cl_2$	0.03
Na_2O	1.11	Total	99.95

(1) Albano, Italy; combination of two partial analyses, corresponding to $(Ca_{5.91}K_{1.73}Na_{0.40})_{\Sigma=8.04}(Al_{0.76}Mg_{0.21}Fe^{2+}_{0.09}Fe^{3+}_{0.07})_{\Sigma=1.03}(Si_{5.31}Al_{4.69})_{\Sigma=10.00}O_{25}[(SO_4)_{0.76}(CO_3)_{0.40}Cl_{0.02}]_{\Sigma=1.18}$.

Occurrence: In blocks of metamorphosed limestone ejected by volcanism.

Association: Hedenbergite, grossular-andradite, melilite, leucite, haüyne, kaliophilite.

Distribution: From Albano, in the Alban Hills, Lazio, and from Pitigliano, near Grosseto, Tuscany, Italy.

Name: For the Latin name of the district of origin, Latium, Italy.

Type Material: Cambridge University, Cambridge, England, 45482, 29799.

(1) Oka complex, Canada; total Fe as Fe_2O_3, after deduction of diopside and pyrite, corresponds to $(Ca_{0.75}Na_{0.21}RE_{0.02})_{\Sigma=0.98}(Nb_{0.54}Ti_{0.21}Fe_{0.16}Mg_{0.08}Mn_{0.02})_{\Sigma=1.01}O_3$.
(2) Badloch quarry, Germany; original total given as 100.65%; corresponds to $[Ca_{0.55}Na_{0.34}Fe_{0.01}(RE, Sr, K, Mn)_{0.02}]_{\Sigma=0.92}[Nb_{0.59}Ti_{0.29}Fe_{0.10}Zr_{0.01}(Ta, Si, Al, V)_{0.01}]_{\Sigma=1.00}O_3(OH)_{0.02}$.

Mineral Group: Perovskite group; $Ca_A > 0.5$; $Nb_B > 0.5$.

Occurrence: In sövite zones of carbonatite complexes.

Association: Calcite, apatite, diopside, biotite, pyrochlore, magnetite, niocalite, dolomite, nepheline, monticellite (Oka complex, Canada); columbite (Badloch quarry, Germany).

Distribution: From the St. Lawrence Columbium and Metals Corporation mine, near La Trappe, Quebec, Canada. Found in the Badloch quarry, in the Kaiserstuhl, Baden-Württemberg, Germany.

Name: For the small community, La Trappe, Quebec, Canada, near the mine from which the first crystals were recovered.

Type Material: Royal Ontario Museum, Toronto, Canada, M26143.

			Total	99.76	100.00

(1) Hagendorf, Germany. (2) $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot 8H_2O$.

Polymorphism & Series: Trimorphous with pseudolaueite and stewartite.

Mineral Group: Paravauxite group.

Occurrence: A common late-stage hydrothermal mineral in oxidized triphylite-bearing complex granite pegmatites.

Association: Rockbridgeite (Hagendorf, Germany); rockbridgeite, strunzite, stewartite, pseudolaueite, siderite, ludlamite (Palermo #1 mine, New Hampshire, USA).

Distribution: Well-crystallized from Hagendorf, Bavaria, Germany. At the Mangualde pegmatite, near Mesquitela, and in the Bendada pegmatite, near Guarda, Portugal. In the Norrö pegmatite, on Rånö Island, Sweden. On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia. In the USA, at the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., and the Fitzgibbon mine, Alstead, Cheshire Co., New Hampshire; in the Emmons quarry, Greenwood, Oxford Co., Maine; in South Dakota, from the White Elephant and Etta mines, near Keystone, Pennington Co., at the Big Chief mine, near Glendale, and the Linwood, Hesnard, and Tip Top mines, near Custer, Custer Co.; at the Foote mine, Kings Mountain, Cleveland Co., North Carolina. From the Énio pegmatite mine, northeast of Galiléia, and the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. In the Wiperaminga Hill West quarry, near Olary, South Australia. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. Other minor occurrences are known.

Name: Honors Max Theodor Felix von Laue (1879–1960), German physicist, University of Munich, Munich, Germany, awarded the Nobel prize for his discovery of X-ray diffraction.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 119478.

Laumontite $CaAl_2Si_4O_{12}\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals square prisms with steep oblique terminations, stout, commonly elongated, to 20 cm. Radiating, columnar, fibrous; in interlocking aggregates, massive. *Twinning:* On {100}, typically with terminal re-entrants.

Physical Properties: *Cleavage:* {010}, {110}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 2.23–2.41 D(calc.) = 2.25 Undergoes a partial loss of H_2O on exposure to air.

Optical Properties: Transparent to translucent. *Color:* White to gray, pink, yellowish, brownish, golden brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous to pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge a = 10°–26°$; $Z \wedge c = 8°–33°$.
Dispersion: $r < v$, distinct, weakly inclined. $\alpha = 1.502–1.514$ $\beta = 1.512–1.522$
$\gamma = 1.514–1.525$ 2V(meas.) = 26°–47°

Cell Data: *Space Group:* $C2/m$. $a = 14.724(9)$ $b = 13.075(6)$ $c = 7.559(2)$
$\beta = 112.01(3)°$ Z = 4

X-ray Powder Pattern: Synthetic.
4.16 (100), 3.51 (80), 9.5 (60), 3.27 (55), 6.84 (40), 3.66 (35), 3.03 (35)

Chemistry:

	(1)
SiO_2	50.70
Al_2O_3	22.53
Fe_2O_3	0.04
CaO	11.54
Na_2O	0.40
K_2O	0.30
H_2O^+	12.00
H_2O^-	2.41
Total	99.92

(1) Halle, Germany; corresponds to $(Ca_{0.96}Na_{0.06}K_{0.03})_{\Sigma=1.05}Al_{2.07}Si_{3.94}O_{12}\cdot 3.12H_2O$.

Mineral Group: Zeolite group.

Occurrence: Of hydrothermal origin, lining cavities in igneous rocks. Thick sedimentary beds rich in laumontite may form by decomposition of analcime or metamorphism of plagioclase. May be authigenic, cementing sandstones.

Association: Zeolites, apophyllite, datolite, calcite, chlorite.

Distribution: Relatively common. Well-crystallized specimens: from Huelgoat, Finistère, France. From Săcărâmb (Nagyág), Romania. At St. Gotthard, Ticino, Switzerland. From Floitental, Zillertal, and other places in Tirol, Austria. In Italy, from Baveno, Piedmont. From Poona and in the Khandivali quarry, near Bombay, Maharashtra, India, large crystals. In the USA, exceptional crystals from the Pine Creek tungsten mine, Bishop, Inyo Co., California; from Drain, Douglas Co., Oregon; at Bergen Hill, Hudson Co., and Paterson, Passaic Co., New Jersey; in the Goose Creek quarry, Leesburg, Loudoun Co., Virginia; on the Keweenaw Peninsula, Houghton and Keweenaw Cos., Michigan.

Name: For François Pierre Nicolas Gillet de Laumont (1747–1834), who first found the mineral.

Launayite $Pb_{22}Sb_{26}S_{61}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2, m, or $2/m$. Material dug from polished surfaces tends to be somewhat fibrous by elongation ‖ [010], resulting from the two perfect cleavages.

Physical Properties: *Cleavage:* Perfect on {100} and {001}. Hardness = n.d. VHN = 179 D(meas.) = n.d. D(calc.) = 5.83

Optical Properties: Opaque. *Color:* Lead-gray. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Fairly strong, from white to gray. *Anisotropism:* Strong.
R_1–R_2: (470) 42.6–38.6, (546) 43.8–36.9, (589) 42.7–36.2, (650) 40.9–35.5

Cell Data: *Space Group:* $C2$, Cm, or $C2/m$ (pseudocell). $a = 42.6$ $b = 8.04$ $c = 32.3$ $\beta = 102°5(45)'$ Z = 2

X-ray Powder Pattern: Madoc, Canada.
3.45 (100), 4.17 (80), 2.92 (80), 2.010 (70), 3.40 (60), 2.836 (50), 3.97 (30)

S	21.25	20.85	20.21
Total	100.75	100.25	100.00

(1) Madoc, Canada; by electron microprobe, average of two analyses; corresponds to $Pb_{21.55}(Sb_{22.30}As_{1.84})_{\Sigma=24.14}S_{61.00}$. (2) Do.; by electron microprobe, average of two analyses; corresponds to $Pb_{20.35}Cu_{1.99}(Sb_{24.16}As_{2.19})_{\Sigma=26.35}S_{61.00}$. (3) $Pb_{22}Sb_{26}S_{61}$.

Occurrence: Of hydrothermal origin, in marbles.

Association: Veenite, boulangerite.

Distribution: From Madoc, Ontario, Canada [TL].

Name: For Professor Louis Alphonse Auguste de Launay (1860–1938), French student of mineral deposits, National School of Mines, Paris, France.

Type Material: Canadian Geological Survey, Ottawa, 12176; Canadian Museum of Nature, Ottawa, Canada.

Pb	82.0	82.92
F	13.0	13.03
Cl	3.6	4.05
OH	0.9	
Total	99.5	100.00

(1) Grand Reef mine, Arizona, USA; by electron microprobe, H_2O by moisture titration; corresponding to $Pb_{0.97}[F_{1.68}Cl_{0.25}(H_2O)_{0.07}]_{\Sigma=2.00}$. (2) $Pb_7F_{12}Cl_2$.

Occurrence: In a vug isolated from acidic sulfate-rich solutions in the oxidized zone of a low-temperature Pb–Cu–Ag deposit.

Association: Grandreefite, pseudograndreefite, aravaipaite, galena, fluorite, anglesite, linarite, caledonite, quartz.

Distribution: From the Grand Reef mine, about six km northeast of Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: For Laurel Canyon, Arizona, USA, where the Grand Reef mine is located.

Type Material: Natural History Museum, Los Angeles, California, 33608; National Museum of Natural History, Washington, D.C., USA, 166057.

References: (1) Kampf, A.R., P.J. Dunn, and E.E. Foord (1989) Grandreefite, pseudograndreefite, laurelite, and aravaipaite: four new minerals from the Grand Reef mine, Graham County, Arizona. Amer. H_2O	[17.93]	18.13
Total	98.38	100.00

(1) Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada; average of 12 electron microprobe analyses, H_2O inferred from Raman spectroscopy and crystal structure analysis; corresponding to $(Nb_{0.99}Ti_{0.01})_{\Sigma=1.00}O(H_2O)]_3(Si_{2.00}O_7)_2[(Na_{0.86}\square_{0.10}K_{0.02}Ca_{0.01})_{\Sigma=0.99}(H_2O)_2]_3$.
(2) $[NbO(H_2O)]_3(Si_2O_7)_2[Na(H_2O)_2]_3$.

Occurrence: From a highly oxidized waste-rock pile of siderite-dominant pods attributed to altered sodalite syenite. The mineral is likely a late-stage alteration product.

Association: Quartz, pyrite, franconite, rutile, lepidochrocite.

Distribution: At the Poudrette quarry, Mont Saint-Hilaire, Montérégie (formerly Rouville County), Quebec, Canada.

Name: For Laurentian University, Sudbury, Ontario, Canada, where the research characterizing this mineral as a new species was conducted.

Type Material: Royal Ontario Museum, Toronto, Canada (M55369).

Total	100.00	100.00

(1) Laurium, Greece. (2) PbCl(OH).

Polymorphism & Series: Dimorphous with paralaurionite.

Occurrence: Produced by the action of saline water on lead-bearing slag. In the oxidized zone of lead-bearing mineral deposits.

Association: Paralaurionite, penfieldite, fiedlerite, phosgenite, cerussite, anglesite.

Distribution: Probably more widespread than the known localities indicate. An alteration product of slag from: Laurium, Greece. Along Baratti Beach, Tuscany, Italy. From Juliushütte, Astfeld, Harz Mountains, Germany. From the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa. In mineral deposits at: Wheal Rose, near Sithney, Cornwall, and the Wesley mine, near Higher Pitts, Somerset, England. From the Nant-y-Cagl (Eaglebrook) mine, Ceulanymaesmawr, Dyfed, Wales. In the Kara Elchi mercury deposit, Turkmenistan. Found at the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia, and in the Elura deposit, 43 km northeast of Cobar, New South Wales, Australia. From the Minnamax Cu–Ni sulfide deposit, Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota, USA.

Name: For the occurrence at Laurium, Greece.

(1) Borneo; placer material; Os by difference. (2) Goodnews Bay, Alaska, USA; by electron microprobe. (3) Rio Pilpe, Colombia; by electron microprobe. (4) RuS_2.

Polymorphism & Series: Forms a series with erlichmanite.

Mineral Group: Pyrite group.

Occurrence: In ultramafic complexes and in placer deposits.

Association: Cooperite, braggite, sperrylite, other minerals of the platinum-group elements, chromite.

Distribution: From placers in Borneo, as at Kalimantan (formerly Pontijn, Tanah Laut) [TL]. In South Africa, from the Merensky Reef of the Bushveld complex, at Potgietersrus; in the Rustenburg and Union mines; also the Driekop and Onverwacht mines. In the USA, in the Stillwater complex, Montana; on the Yuba River, Nevada Co., and from the Trinity River near Douglas City, Trinity Co., California; at Goodnews Bay, Alaska. In Canada, in the Tulameen area, British Columbia. In Sierra Leone, from placers at Guma Water, and the Senduma chrome mines. From the Konder massif, Aldan Shield, Sakha, Russia. In the Kapitanov chromite deposit, near Zvenyhorodka, Ukraine. At Maud Creek, Howard River, New Zealand. Known in small amounts from other localities.

Name: For Laura R. Joy, wife of Charles A. Joy, American chemist, Columbia University, New York City, USA.

Type Material: University of Göttingen, Göttingen, Germany, 24541.

Lautenthalite $PbCu_4(SO_4)_2(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular crystals, to 0.7 mm, flattened on {100}, may be elongated along [010], with prominent {100}, {010}, {101}, also {102}, {110}, {$\bar{5}$14}; in sheaflike or irregular aggregates. *Twinning:* With {100} as twin plane, commonly polysynthetic.

Physical Properties: *Cleavage:* On {001} and {010}, good. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.84

Optical Properties: Transparent. *Color:* Bright blue. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Faint; X = pale blue; $Y = Z$ = blue. *Orientation:* $Z = b$; $Y \wedge c = 4(1)°$. *Dispersion:* $r > v$, distinct. $\alpha = 1.659(2)$ $\beta = 1.703(2)$ $\gamma = 1.732(2)$ 2V(meas.) = 79(1)° 2V(calc.) = 78°

Cell Data: *Space Group:* $P2_1/c$. $a = 21.642(8)$ $b = 6.040(2)$ $c = 22.544(8)$ $\beta = 108.2(1)°$ Z = 8

X-ray Powder Pattern: Lautenthal, Germany.
5.14 (100), 3.40 (80), 4.53 (60), 2.631 (50), 2.531 (40), 2.821 (30), 2.421 (30)

Chemistry:

	(1)	(2)
SO_3	19.7	19.78
CuO	39.3	39.30
PbO	27.2	27.57
H_2O	[13.8]	13.35
Total	[100.0]	100.00

(1) Lautenthal, Germany; by electron microprobe, average of determinations on three crystals, H_2O by difference, both $(OH)^{1-}$ and H_2O shown to be present by IR; corresponds to $Pb_{0.99}Cu_{4.01}(SO_4)_{2.00}(OH)_6 \cdot 3.10H_2O$. (2) $PbCu_4(SO_4)_2(OH)_6 \cdot 3H_2O$.

Occurrence: Formed in the oxidation zone of Pb–Cu sulfide deposits (Wales); an oxidation product in cavities in smelter slag (Germany, Austria, Scotland).

Association: Anglesite, devilline–serpierite, galena (Lautenthal, Germany); linarite, brochantite, schulenbergite, wroewolfeite (Penrhiw mine, Wales).

Distribution: From [the Trogtal quarry, near] Lautenthal, Harz Mountains, Germany. At Öblarn, Steiermark, Austria. Found at the Meadowfoot smelter, northwest of Wanlockhead, Dumfriesshire, Scotland. In Wales, from the Hendrefelen mine, Central Wales district; in Dyfed, at the Penrhiw mine, Ystumtuen, and the Frongoch mine.

Name: For its occurrence at Lautenthal, Germany.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany.

Total	99.64	99.9	100.00

(1) Lauta, Germany. (2) Do.; by electron microprobe. (3) CuAsS.

Occurrence: In hydrothermal veins formed at medium temperatures.

Association: Arsenic, tennantite, proustite, chalcopyrite, galena, barite (Lauta, Germany); kutínaite, paxite (Niederbeerbach, Germany); arsenic, bismuth, tennantite, löllingite, rammelsbergite, proustite, quartz (Gabe Gottes mine, France).

Distribution: In Germany, from Lauta, near Marienberg, Saxony [TL]; and at Mühltal, Niederbeerbach, Odenwald, Hesse. In the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. From Turţ, Romania. At the Laerma Au–Cu–U deposit, Sichuan Province, China.

Name: For the Lauta, Germany occurrence.

Type Material: Mining Academy, Freiberg, Germany, 44485.

(1) San Juan, Chile; H_2O by difference. (2) Dome Rock mine, Australia; by electron microprobe, H_2O by difference; corresponds to $Na_{1.07}(Ca_{1.01}Mg_{0.01})_{\Sigma=1.02}Cu_{4.80}[(As_{0.79}P_{0.21})_{\Sigma=1.00}O_4]_4Cl_{1.55} \cdot 5H_2O$. (3) $NaCaCu_5(AsO_4)_4Cl \cdot 5H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of some copper deposits.

Association: Erythrite, cuprite, malachite, cobaltian wad (San Juan, Chile); chalcophyllite, cyanotrichite, parnauite, mansfieldite, olivenite, tennantite, covellite, chalcanthite, antlerite, brochantite, geminite (Cap Garonne mine, France); cuprian adamite, conichalcite, o'danielite, tsumcorite, fahleite, quartz, calcite, gypsum (Tsumeb, Namibia).

Distribution: From Annaberg, Saxony, Germany. At Jáchymov (Joachimsthal), Czech Republic. In England, from the Littleham Cove area, Budleigh Salterton, Devon; in the Cligga mine, Perranzabuloe, and the Pentireglaze mine, Cornwall. From Bunmahon, Co. Waterford, Ireland. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. In France, from the Cap Garonne mine, near le Pradet, Var, and at the Salsigne mine, 15 km north of Carcassone, Aude. Fine crystals from Pastrana Hill, Mazarrón area, Murcia Province, Spain. At Qued Mahisser, Tunisia. From the Talmessi and Meskani mines, Anarak district, Iran. At Tsumeb, Namibia. From the Arhbar (Aghbar) mine, Bou Azzer district, Morocco. In Chile, at the Blanca mine, San Juan, Freirina, and at several mines in the Sierra Gorda district, southwest of Calama, Antofagasta. In Australia, in the Dome Rock copper mine, about 40 km northwest of Mingary, and the Preamimma mine, near Callington, South Australia; from the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, at the Alice Mary copper mine, Kundip, and several other places in Western Australia. From Gold Hill, Tooele Co., Utah, USA.

Name: For its conspicuous *lavender* color.

Type Material: Mining Academy, Freiberg, Germany, 20944.

(1) Lille Arø Island, Norway. (2) Låven Island, Norway; by electron microprobe, corresponds to $(Na_{1.62}Ca_{0.37}Y_{0.01})_{\Sigma=2.00}(Mn_{0.31}Ca_{0.23}Fe^{2+}_{0.22}Zr_{0.21}Mg_{0.01})_{\Sigma=0.98}(Zr_{0.70}Ti_{0.16}Nb_{0.14})_{\Sigma=1.00}(Si_2O_7)(F_{0.99}O_{0.95})_{\Sigma=1.94}$. (3) Lovozero massif, Russia.

Polymorphism & Series: Dimorphous with burpalite.

Occurrence: In alkalic rocks and related pegmatites.

Association: Feldspars, nepheline, titanite, ilmenite, apatite, zircon, amphibole, biotite, eudialyte, catapleiite, astrophyllite, rinkite, lorenzenite, aegirine.

Distribution: In Norway, on Låven and the Arø Islands, in the Langesundsfjord. In Italy, from the Isle of Ischia, near Naples, Campania. In Russia, in the Lovozero, Khibiny, and Kovdor massifs, Kola Peninsula; the Burpala massif, about 120 km north of Lake Baikal, and from Zaangar'ya, Yenisei Ridge, Siberia. At Kruft, Mendig, and other places in the Laacher Kessel, Eifel district, Germany. From the Kangerdlugssuaq Fjord, Greenland. On Tamara Isle, Los Islands, Guinea. On Boa Vista Island, Cape Verde Islands. From Tenerife, Canary Islands. At Mont Saint-Hilaire and in the Saint-Amable sill, near Varennes, Quebec, Canada. From Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA.

Name: For its occurrence on Låven Island, Langesundsfjord, Norway.

Type Material: Wroclaw University, Wroclaw, Poland, II–14583.

Total	100.63

(1) Punta Gensane, Viù Valley, Piedmont, Italy; average of 3 electron microprobe analyses, H_2O calculated from structure, O/OH ratio adjusted for charge balance, MnO and Mn_2O_3 calculated from structure; corresponding to $(Mn^{2+}_{5.34}Mg_{1.81}Ca_{0.69}Na_{0.01})_{\Sigma=7.85}(Al_{8.92}Mn^{3+}_{1.74}Mg_{1.01}Fe^{3+}_{0.21}Cr_{0.08}Ti_{0.03})_{\Sigma=11.99}(Si_{11.50}P_{0.58}V_{0.08})_{\Sigma=12.16}O_{44.00}(OH)_{12.00}$.

Occurrence: In piemontite-bearing mica schists related to the Alpine tectono-metamorphism of (Mn, Al)-rich sediments.

Association: Quartz, "mica", sursassite, piemontite, spessartine, braunite, "tourmaline".

Distribution: From Punta Gensane, Viù Valley, Piedmont, Western Alps, Italy.

Name: Honors the French chemist and biologist Antoine-Laurent de Lavoisier (1743-1794), one of the fathers of modern chemistry.

Type Material: In Italy, at the Natural History Musuem, University of Pisa (# 19637), and in the mineralogical collections, Regional Museum of Natural Science, Torino (M/U 16359).

Total	100.33	99.81	100.24	100.00

(1) Arzak deposit, Russia; by electron microprobe, average of ten analyses; corresponding to $Hg_{3.01}S_{1.96}(Cl_{1.91}Br_{0.12})_{\Sigma=2.03}$. (2) Do.; by electron microprobe, corresponding to $Hg_{3.01}S_{2.00}(Cl_{1.31}Br_{0.67})_{\Sigma=1.98}$. (3) Kadyrel deposit, Russia, by electron microprobe, average of eight grains; corresponding to $Hg_{3.11}S_{1.97}(Cl_{1.16}Br_{0.76})_{\Sigma=1.92}$. (4) $Hg_3S_2(Cl,Br)_2$ with Cl:Br = 1:1.

Polymorphism & Series: Dimorphous with corderoite; forms a series with arzakite.

Occurrence: In the oxidized zone of hydrothermal mercury-bearing deposits (Arzak and Kadyrel deposits, Russia).

Association: Arzakite, cinnabar, corderoite, quartz, kaolinite (Arzak deposit, Russia); bromian calomel, bromian corderoite, bromian eglestonite, kuzminite, mercury, cinnabar, iron oxides (Kadyrel deposit, Russia).

Distribution: In Russia, in the Pii-Khem district, Tuva, Siberia, from the Arzak mercury deposit, Uyuk Range [TL] and the Kadyrel mercury deposit, right bank of the Oorash-Khem River Valley.

Name: For Mikhail Alekseevich Lavrent'ev (1900–1980), Institute of Hydrodynamics, Novosibirsk, Russia, founder of the Siberian Academy of Science.

Type Material: Central Siberian Geological Museum, Novosibirsk, VI-24/3; Mining Institute, St. Petersburg, 1676/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84398.

Lawrencite $(Fe^{2+}, Ni)Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As massive efflorescences.

Physical Properties: *Cleavage:* {0001}, inferred from crystal structure. Hardness = Soft. D(meas.) = 3.16 (synthetic). D(calc.) = [3.26] Deliquescent.

Optical Properties: Translucent. *Color:* Green to brown; fresh synthetic material is white. *Optical Class:* Uniaxial (–); weak birefringence. $\omega = 1.567(5)$ $\epsilon =$ n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 3.58$ $c = 17.5$ Z = 3

X-ray Powder Pattern: Synthetic $FeCl_2$. (ICDD 1-1106).
2.54 (100), 5.9 (63), 1.800 (63), 3.07 (30), 1.467 (20), 1.138 (18), 1.953 (13)

Chemistry: Analyses of H_2O extracts of iron meteorites appear to agree with $FeCl_2$ with additional nickel; modern work does not support the species however, finding only akaganéite as the principal alteration product.

Occurrence: In iron meteorites, presumed to be a terrestrial alteration of meteoritic iron. Also as a volcanic sublimate.

Association: Iron, molysite.

Distribution: Noted in the Tazewell, Ovifak, Canyon Diablo, and other iron meteorites. At Vesuvius, Campania, Italy.

Name: Honors John Lawrence Smith (1818–1883), American chemist, mineralogist, and student of meteorites, who discovered the mineral.

Lawsonbauerite $(Mn^{2+},Mg)_9Zn_4(SO_4)_2(OH)_{22}\cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed prismatic crystals, elongated along [010], flattened on {001}, showing {001}, {100}, to 0.5 mm, typically in parallel growths.

Physical Properties: *Fracture:* Even. *Tenacity:* Moderately brittle. Hardness = ∼4.5
D(meas.) = 2.87(4) D(calc.) = 2.92

Optical Properties: Semitransparent. *Color:* Colorless to white, coated by black manganese oxides. *Luster:* Dull to vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 7°$. *Dispersion:* $r > v$, strong.
$\alpha = 1.590(2)$ $\beta = 1.608(2)$ $\gamma = 1.611(2)$ 2V(meas.) = 42(1)° 2V(calc.) = 45°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.50(5)$ $b = 9.64(5)$ $c = 16.41(8)$ $\beta = 95.21(10)°$
Z = 2

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
10.5 (100), 5.24 (60), 3.90 (50), 1.587 (50), 2.772 (40), 6.24 (30), 3.33 (30)

Chemistry:

	(1)
SO_3	10.8
FeO	0.1
MnO	32.6
ZnO	23.1
MgO	8.4
H_2O	[25.0]
Total	[100.0]

(1) Sterling Hill, New Jersey, USA; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponds to $(Mn_{6.81}Mg_{3.09}Fe_{0.02})_{\Sigma=9.92}Zn_{4.21}(SO_4)_{2.00}(OH)_{24.26}\cdot 8.44H_2O$; later crystal-structure analysis established the formula as $(Mn,Mg)_9Zn_4(SO_4)_2(OH)_{22}\cdot 8H_2O$.

Occurrence: A rare secondary mineral formed in a metamorphosed stratiform zinc orebody.

Association: Sussexite, pyrochroite, zincite, franklinite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: Honors Lawson H. Bauer (1889–1954), American chemist, New Jersey Zinc Company, Franklin, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 143003.

(1) Tiburon Peninsula, California, USA; corresponds to $(Ca_{0.98}K_{0.02}Mg_{0.01}Na_{0.01})_{\Sigma=1.02}(Al_{1.94}Fe^{3+}_{0.03}Ti_{0.02})_{\Sigma=1.99}Si_{2.02}O_7(OH)_{1.92} \cdot H_2O$ (2) Santa Clara, Cuba; corresponds to $(Ca_{0.91}Na_{0.05}Mg_{0.02}Fe^{2+}_{0.02}K_{0.02})_{\Sigma=1.02}(Al_{2.00}Ti_{0.03})_{\Sigma=2.03}(Si_{1.98}Al_{0.02})_{\Sigma=2.00}O_7(OH)_{1.94} \cdot H_2O$ (3) $CaAl_2Si_2O_7(OH)_2 \cdot H_2O$

Polymorphism & Series: Dimorphous with parthéite.

Occurrence: Formed at high pressures and low temperatures, especially in low-grade regionally metamorphosed glaucophane schists; formed from plagioclase during saussuritization of gabbros and diabases; rarely in eclogites.

Association: Pumpellyite, epidote, garnet, crossite, muscovite, jadeite, glaucophane, quartz, calcite.

Distribution: In the USA, in California, numerous localities, as near Reed Station and elsewhere on the Tiburon Peninsula, Marin Co.; at Arroyo Mocho, Alameda Co.; on Porter Creek, Sonoma Co.; Panoche Pass, San Benito Co.; in the Pacheco Pass area, Santa Clara Co.; large crystals from Covelo, Mendocino Co., etc. At Darrington, Snohomish Co., Washington. Other localities for well-crystallized or studied materials include many in the French and Italian Alps. Near Tavşanlı, Turkey. At Ogose, Saitama Prefecture; Ubusan, Akita Prefecture; Kamba, Okayama Prefecture; and Kamuikotan, Hokkaido, Japan. From the Ouégoa district and elsewhere on New Caledonia. In the southeast part of Celebes Island.

Name: For Professor Andrew Cowper Lawson (1861–1952), Scottish-American geologist, University of California, Berkeley, California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 83635; The Natural History Museum, London, England, 1933,239–240.

Lazarenkoite $(Ca, Fe^{2+})Fe^{3+}As_3^{3+}O_7 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* n.d. As fibrous crystals, in incrustations.

Physical Properties: Hardness = 1 D(meas.) = 3.450(5) D(calc.) = 3.59

Optical Properties: Semitransparent. *Color:* Bright orange. *Luster:* Resinous to silky. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = pale yellow; Y = pale brown; Z = rose-brown. $\alpha = 1.820(3)$ $\beta = 1.920(3)$ $\gamma = 1.955(3)$ 2V(meas.) = ∼30°

Cell Data: *Space Group:* n.d. $a = 21.80$ $b = 12.64$ $c = 8.40$ Z = 10

X-ray Powder Pattern: Khovu-Aksy deposit, Russia.
8.40 (10), 11.2 (9), 4.66 (9), 6.55 (8), 3.31 (4), 3.20 (4), 3.135 (4)

Chemistry:

	(1)
Fe_2O_3	16.7
As_2O_3	61.5
FeO	5.6
MgO	0.7
CaO	5.1
H_2O	12.2
Total	101.8

(1) Khovu-Aksy deposit, Russia; average of two analyses, absence of arsenate and arsenite and presence of H_2O shown by IR; corresponding to $(Ca_{0.44}Fe^{2+}_{0.38}Mg_{0.09})_{\Sigma=0.91}$ $Fe^{3+}_{1.02}As^{3+}_{3.04}O_7 \cdot 3.32H_2O$.

Occurrence: In the oxidation zone of a metallic ore deposit.

Association: Annabergite, skutterudite, löllingite.

Distribution: From the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia.

Name: Honors Academician Evgenii Konstantinovich Lazarenko (1912–1979), mineralogist, Lvov University, Lvov, Ukraine.

Type Material: Mining Institute, St. Petersburg, 1263/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81172.

Lazulite $MgAl_2(PO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, stubby to acute dipyramidal with forms {111}, {$\bar{1}$11}, {101}, to 15 cm, or tabular on {$\bar{1}$11} or {101}, with several other forms noted; granular, massive. *Twinning:* Common on {100} with composition plane {001} and marked re-entrant, occasionally producing lamellar or polysynthetic groups; rare on {223}; by reflection on {$\bar{2}$21} with composition plane {331}; several other twin laws reported.

Physical Properties: *Cleavage:* Poor to good on {110}; indistinct on {101}. *Fracture:* Uneven to splintery. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 3.122–3.240 D(calc.) = 3.144

Optical Properties: Transparent to translucent, may be nearly opaque. *Color:* Azure-blue, sky-blue, bluish white, yellow-green, blue-green, rarely green. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = colorless; Y = blue; Z = darker blue. *Orientation:* $Y = b$; $X \wedge c = 10°$. *Dispersion:* $r < v$, weak. *Absorption:* $Z > Y \gg X$. $\alpha = 1.604–1.626$ $\beta = 1.626–1.654$ $\gamma = 1.637–1.663$ 2V(meas.) = ∼70°

Cell Data: *Space Group:* $P2_1/c$. $a = 7.144(1)$ $b = 7.278(1)$ $c = 7.228(1)$ $\beta = 120.50(1)°$ Z = 2

X-ray Powder Pattern: Werfen, Austria; nearly identical to scorzalite.
3.23 (100), 3.20 (59), 3.14 (55), 3.077 (42), 4.73 (18), 2.548 (18), 1.571 (18)

Chemistry:

TiO_2	0.20		MgO	10.38	6.34
Al_2O_3	32.49	32.06	CaO	0.06	
Fe_2O_3	0.60		H_2O	6.48	5.66
			Total	99.95	100.00

(1) Graves Mountain, Georgia, USA. (2) $(Fe,Mg)Al_2(PO_4)_2(OH)_2$ with Fe:Mg = 1:1.

Polymorphism & Series: Forms a series with scorzalite.

Mineral Group: Lazulite group.

Occurrence: Disseminated in metamorphic quartzites, schists and quartz veins; in the border zones of complex granite pegmatites; in alluvium and colluvium.

Association: Quartz, andalusite, rutile, kyanite, corundum, muscovite, pyrophyllite, dumortierite, wagnerite, svanbergite, berlinite (metamorphic); albite, quartz, muscovite, tourmaline, beryl (pegmatites).

Distribution: Many minor localities. Well-crystallized or rich material from: Färbergraben and Höllgraben, near Werfen, Salzburg, Austria. In Sweden, very large crystals from Hålsjöberg, Värmland, and in the Västanå iron mine, Nasüm, Skåne. In the USA, large crystals from Graves Mountain, Lincoln Co., Georgia; from about 30 km southeast of Beatty, Nye Co., Nevada; at the Champion mine and the nearby Vulcanus claim, White Mountains, Mono Co., California. Fine crystals along Cross-cut Creek, Big Fish River–Rapid Creek area, Yukon Territory, Canada. From 15 km west of Dattas, Minas Gerais, Brazil. On Mt. Bity, Ranomainty, and near Jamalezo, Madagascar. Fine gemmy crystals from the Chilas area, near Nanga Parbat Peak, Pakistan.

Name: From the German *lazurstein*, for *blue stone*.

Type Material: The Natural History Museum, London, England, 83304.

Lazurite $Na_6Ca_2Al_6Si_6O_{24}[(SO_4), S, Cl, (OH)]_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic; also monoclinic or triclinic. *Point Group:* $\bar{4}3m$. In dodecahedra, or more rarely cubes, up to 5 cm; granular, disseminated, or massive.

Physical Properties: *Cleavage:* {110}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.38–2.45 D(calc.) = 2.39–2.42

Optical Properties: Translucent to opaque. *Color:* Deep blue, azure, violet-blue, greenish blue; blue in thin section. *Streak:* Bright blue. *Luster:* Vitreous.
Optical Class: Isotropic; anomalously anisotropic. $n = 1.502–1.522$

Cell Data: *Space Group:* $P\bar{4}3n$. $a = 9.09$ Z = 1

X-ray Powder Pattern: Sar-e-Sang, Afghanistan. (ICDD 17-749).
3.71 (100), 2.622 (80), 2.872 (45), 6.43 (40), 2.141 (35), 1.782 (30), 2.272 (25)

Chemistry:

	(1)
SiO_2	31.34
Al_2O_3	26.27
Fe_2O_3	0.27
MgO	2.47
CaO	7.97
Na_2O	15.75
K_2O	1.02
Cl	0.78
H_2O	3.87
SO_3	8.71
S	1.84
$-O = S, Cl_2$	0.67
Total	99.62

(1) Sar-e-Sang, Afghanistan; corresponds to $(Na_{5.88}K_{0.25})_{\Sigma=6.13}(Ca_{1.65}Mg_{0.71}Fe_{0.04})_{\Sigma=2.40}Si_{6.04}Al_{5.96}O_{24}[(SO_4)_{1.26}S_{0.66}Cl_{0.26}]_{\Sigma=2.18}$.

Polymorphism & Series: Triclinic and monoclinic polymorphs are known.

Mineral Group: Sodalite group.

Occurrence: A contact metamorphic mineral in limestones.

Association: Calcite, pyrite, diopside, humite, forsterite, haüyne, muscovite.

Distribution: Exceptional crystals from Sar-e-Sang, Badakhshan Province, Afghanistan. Well-crystallized material from the basins of the Slyudyanka and Bystraya Rivers, Sayan Mountains, near Lake Baikal, Siberia, Russia. At Lyadzhuar-Darinsk, near Ishkashima, Pamir Mountains, Tajikistan. From Monte Somma, Campania, and in the Alban Hills, Lazio, Italy. In the USA, at Ontario Peak and Cascade Canyon, San Bernardino Co., California, and on North Italian Mountain, Gunnison Co., Colorado. In Canada, about 15 km north of Lake Harbour, Baffin Island, Northwest Territory. At Thabapin, near Mogok, Myanmar (Burma). From along the Cazadero River, near Ovalle, Chile.

Name: For its color resemblance to azurite, named from the Persian *lazhward*, for *blue*.

Lead Pb

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals rare, to 6 cm; octahedral, cubic, and dodecahedral; commonly as rounded masses and plates, up to 60 kg in weight. Assumes wirelike and dendritic forms. *Twinning:* On {111}.

Physical Properties: *Tenacity:* Very malleable, moderately sectile. Hardness = 1.5 VHN = 5 (100 g load). D(meas.) = 11.37 D(calc.) = 11.341

Optical Properties: Opaque. *Color:* Gray-white, tarnishing to dull lead-gray; in polished section, gray-white, quickly tarnishing. *Streak:* Lead-gray. *Luster:* Metallic.
R: (400) 68.7, (420) 69.0, (440) 69.4, (460) 69.5, (480) 69.6, (500) 69.7, (520) 69.8, (540) 69.6, (560) 69.3, (580) 69.1, (600) 69.1, (620) 69.2, (640) 69.3, (660) 69.4, (680) 69.5, (700) 69.6

Cell Data: *Space Group: Fm3m.* $a = 4.9396(3)$ Z = 4

X-ray Powder Pattern: Synthetic.
2.855 (100), 2.475 (50), 1.493 (32), 1.750 (31), 1.1359 (10), 1.429 (9), 0.8369 (9)

Chemistry: Nearly pure lead, commonly with a little silver, copper, zinc, iron, tin, or antimony.

Occurrence: A rare mineral of hydrothermal origin, and found in placers; possibly also formed by authigenic processes and known to replace tree roots.

Association: Hydrocerussite, caryopilite, sarkinite, brandtite (Harstigen mine, Sweden); galena, minium, cerussite (Jay Gould mine, Idaho, USA; Red Cap mine, Australia); willemite, andradite, axinite (Franklin, New Jersey, USA).

Distribution: In the USA, in the Parker shaft at Franklin, Sussex Co., New Jersey; in Idaho, at the Jay Gould mine, Wood River district, and near Hailey, Mineral Hill district, Blaine Co.; in Arizona, from near Tubac, Santa Cruz Co., where it replaced tree roots; and in the Shafter district, Presidio Co., Texas. From El Dorado, Gran Sabana, Venezuela. At Keno Hill, Yukon Territory, Canada. From the Ilímaussaq intrusion, southern Greenland. In Sweden, in fine crystals and large masses from Långban, and at the Harstigen mine, near Persberg, Värmland. In the Zechstein copper district, near Legnica, Lower Silesia, Poland. From the Red Cap mine, near Chilliago, Queensland; and as minute balls in the Hawkesbury Sandstone, New South Wales, Australia. Reported from numerous other localities, but confirmation by modern methods is desirable.

Name: An Old English word for the metal; the chemical symbol from the Latin *plumbum*.

Cell Data: *Space Group:* $I4/mmm$. $a = 3.545(16)$ $c = 4.525(20)$ Z = n.d.

X-ray Powder Pattern: Shiaonanshan, China.
1.49 (vs), 1.40 (vs), 2.49 (m), 2.25 (m), 1.78 (m), 1.68 (m), 2.78 (w)

Chemistry:

	(1)	(2)	(3)
Hg	33.03	31.48	32.62
Pb	66.96	68.42	67.38
Total	99.99	99.90	100.00

(1–2) Shiaonanshan, China; by electron microprobe. (3) $HgPb_2$.

Occurrence: In heavy concentrates of crushed ores from a platinum-bearing Cu–Ni sulfide deposit.

Association: Gersdorffite, pyrite, chalcopyrite, violarite, millerite, galena, stibnite, argentian gold, niggliite, sperrylite, iridosmine, platinum, merenskyite, kotulskite, chromite, ilmenite, magnetite.

Distribution: From Shiaonanshan, Inner Mongolia, China [TL].

Name: For the composition, by analogy to mercury–silver amalgam.

Type Material: n.d.

References: (1) Chen Keqiao, Yang Huifang, Ma Letian, and Peng Zhizhong (1981) The discovery of two new minerals– γ–goldamalgam and leadamalgam. Dizhi Pinglun [Geological Review (Peking)], 27, 107–115 (in Chinese with English abs.). (2) (1985) Amer. Mineral., 70, 215–216 (abs. ref. 1).

Leadhillite $Pb_4(SO_4)(CO_3)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudorhombohedral. *Point Group:* $2/m$. Crystals, to 13 cm, are thick to thin tabular along [001], may be barrel-shaped, or pseudorhombohedral {101} and {$\bar{1}$42}, with over 40 forms noted; granular, massive. *Twinning:* On {140}, {340}, {1$\bar{4}$0}, very common, giving pseudohexagonal groupings.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Sectile. Hardness = 2.5–3 D(meas.) = 6.55 D(calc.) = 6.57 Decomposed by hot H_2O; may fluoresce pale yellow under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, gray, pale yellow, yellow, yellowish green, pale green, pale bluish green, pale blue, brown; colorless in transmitted light. *Luster:* Resinous to adamantine, pearly on {001}.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = -5.5°$. *Dispersion:* $r < v$, strong, horizontal. $\alpha = 1.87(1)$ $\beta = 2.00(1)$ $\gamma = 2.01(1)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/a$. $a = 9.11(2)$ $b = 11.59(3)$ $c = 20.82(4)$ $\beta = 90.46(2)°$ Z = 8

X-ray Powder Pattern: Leadhills, Scotland; nearly identical to susannite. (ICDD 18-705). 3.53 (100), 2.917 (60), 2.605 (50), 1.549 (35), 2.303 (30), 2.099 (30), 2.874 (25)

Chemistry:

	(1)	(2)
SO_3	7.33	7.42
CO_2	8.14	8.16
PbO	82.44	82.75
H_2O	1.68	1.67
Total	99.59	100.00

(1) Granby, Missouri, USA. (2) $Pb_4(SO_4)(CO_3)_2(OH)_2$.

Polymorphism & Series: Trimorphous with macphersonite and susannite.

Occurrence: An uncommon secondary mineral in the oxidation zone of lead deposits.

Association: Cerussite, anglesite, lanarkite, caledonite, linarite (Leadhills, Scotland); cerussite, caledonite, linarite, diaboleite, boleite, wherryite, paralaurionite, brochantite (Mammoth-St. Anthony mine, Arizona, USA).

Distribution: In Scotland, from Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire; in the Drumruck mine, Kirkcudbrightshire. In England, from Caldbeck Fells, Cumbria; at Penberthy Croft, St. Hilary, and in the Greystone quarry, Levant, Cornwall. From Bleiberg, Carinthia, Austria. In the USA, from the Beer Cellar mine, Granby, Newton Co., Missouri; in the Tintic district, Juab Co., Utah; in Arizona, fine crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co., in the Rowley mine, near Theba, Maricopa Co., at the Grand Reef mine, Gila Co., and from Bisbee, Cochise Co. In California, at the Blue Bell claims, near Baker, San Bernardino Co.; from the Searchlight district, Clark Co., and in the Chalk Mountain mine, Chalk Mountain district, Churchill Co., Nevada; from Leadville, Lake Co., Colorado. Very large crystals from Tsumeb, Namibia. At Dundas, Tasmania, Australia. A few other localities are known.

Name: For its initially-noted occurrence at Leadhills, Scotland.

Type Material: Natural History Museum, Paris, France.

Leakeite $NaNa_2[Mg_2Fe^{3+}_2Li]Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Anhedral crystals, prismatic along [001], to 1 mm, bounded by cleavage planes and terminated by irregular fracture surfaces.

Physical Properties: *Cleavage:* Perfect on {110} [intersecting at ∼56° and ∼124°.] *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 3.11 D(calc.) = 3.107

Optical Properties: Translucent. *Color:* Deep red. *Streak:* Very pale pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; $X \simeq Y$ = dark mauve-red; Z = light pinkish red. *Orientation:* $Z = b$; $X \wedge c = 10°$; $Y \wedge a = 4°$. *Dispersion:* $r \ll v$, strong. *Absorption:* $X \simeq Y > Z$. $\alpha = 1.667(1)$ $\beta = 1.675(1)$ $\gamma = 1.691(1)$ 2V(meas.) = 59°–71° 2V(calc.) = 72(10)°

Cell Data: *Space Group:* $C2/m$. $a = 9.822(3)$ $b = 17.836(6)$ $c = 5.286(2)$ $\beta = 104.37(3)°$ Z = 2

X-ray Powder Pattern: Kajlidongri mine, India.
3.122 (100), 8.399 (56), 2.798 (48), 3.254 (20), 3.383 (18), 2.696 (15), 4.461 (13)

Chemistry:

	(1)
SiO_2	55.80
TiO_2	0.03
Al_2O_3	1.27
Fe_2O_3	12.23
Mn_2O_3	3.86
MgO	10.96
CaO	0.50
Li_2O	[1.42]
Na_2O	9.69
K_2O	1.12
F	1.08
H_2O	[1.63]
$-O = F_2$	0.45
Total	[99.14]

(1) Kajlidongri mine, India; by electron microprobe, average of six analyses, Li and H_2O calculated from stoichiometry, original total given as 99.11%; corresponds to $(Na_{2.67}K_{0.20}Ca_{0.08})_{\Sigma=2.95}(Mg_{2.32}Fe^{3+}_{1.31}Li_{0.81}Mn^{3+}_{0.42}Al_{0.14})_{\Sigma=5.00}(Si_{7.98}Al_{0.07})_{\Sigma=8.00}O_{22}[(OH)_{1.49}F_{0.51}]_{\Sigma=2.00}$.

Mineral Group: Amphibole (alkali) group: $Na_B \geq 1.34$; $Li_C \geq 0.5$; $Fe^{3+} > Mn^{3+}$.

Occurrence: In a metasediment rich in manganese minerals, crosscut by epigenetic veins.

Association: Albite, braunite, bixbyite.

Distribution: In the Kajlidongri manganese mine, Jhabua district, Madhya Pradesh, India.

Name: To honor Bernard E. Leake, Professor of Geology, Glasgow University, Glasgow, Scotland, for his work on amphiboles.

Type Material: Canadian Museum of Nature, Ottawa, Canada.

References: (1) Hawthorne, F.C., R. Oberti, L. Ungaretti, and J. Grice (1992) Leakeite, $NaNa_2(Mg_2Fe^{3+}_2Li)Si_8O_{22}(OH)_2$, a new alkali amphibole from the Kajlidongri manganese mine, Jhabua district, Madhya Pradesh, India. Amer. Mineral., 77, 1112–1115.

Lecontite $(NH_4,K)Na(SO_4)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Small prismatic crystals, short along [001]; commonly very fine-grained.

Physical Properties: Hardness = 2–2.5 D(meas.) = 1.745 (synthetic). D(calc.) = 1.747 Soluble in H_2O, taste saline, bitter.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (–) (synthetic). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, or $r < v$, strong. $\alpha = 1.440(3)$ $\beta = 1.452(3)$ $\gamma = 1.453(3)$ 2V(meas.) = 40°–43° 2V(calc.) = 29°44′

Cell Data: *Space Group:* $P2_12_12_1$ (synthetic). $a = 8.216(8)$ $b = 12.854(1)$ $c = 6.232(8)$ Z = 4

X-ray Powder Pattern: Las Piedras Cave, Honduras.
3.038 (100), 5.085 (83), 4.649 (83), 4.972 (67), 3.783 (56), 3.325 (56), 3.923 (50)

Chemistry:

	(1)
SO_3	44.97
P_2O_5	trace
Na_2O	17.56
K_2O	2.76
$(NH_4)_2O$	12.94
H_2O	19.45
insol.	2.41
Total	100.09

(1) Las Piedras Cave, Honduras; insoluble residue is organic 2.30%, inorganic 0.11%; corresponds to $[(NH_4)_{0.88}K_{0.10}]_{\Sigma=0.98}Na_{1.01}(SO_4)_{1.00}\cdot 1.92H_2O$.

Occurrence: An early product of the breakdown of bat guano.

Association: Thénardite, mascagnite, probable.

Distribution: From Las Piedras Cave, near Comayagua, 62 km northwest of Tegucigalpa, Honduras.

Name: Honoring John Lawrence LeConte (1825–1883), American entomologist, University of California, Berkeley, California, USA, who discovered the mineral.

Type Material: Philadelphia Academy of Natural Sciences, Philadelphia, Pennsylvania, Vaux 15337; Yale University, New Haven, Connecticut, USA, 1696.

Total	98.41	100.00

(1) Poudrette dike, Mont Saint-Hilaire, Quebec, Canada; average of 7 electron microprobe analyses, H_2O by the Alimarin method, CO_2 by selective absorption, IR confirms OH, CO_3, and H_2O, corresponding to $Na_{2.94}(Y_{0.755}Dy_{0.085}Er_{0.08}Yb_{0.035}Ho_{0.03}Gd_{0.02}Nd_{0.015}Sm_{0.01})_{\Sigma=1.03}(CO_3)_{2.91}(OH)_{0.21}(H_2O)_{6.06}$. (2) $Na_3Y(CO_3)_3{\cdot}6H_2O$.

Occurrence: A late-stage hydrothermal mineral associated with a hyperagpaitic pegmatite.

Association: Microcline, albite, natrolite, gonnardite, aegirine, siderite, elpidite, gaidonnayite, zircon, franconite, dawsonite, rhodochrosite, cryolite, rutile, sphalerite.

Distribution: Poudrette pegmatite dike, Mont Saint-Hilaire, Quebec, Canada.

Name: Honors the French chemist P.É. Lecoq de Boisbaudran (1838–1912) and for the dominant rare earth element in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 3761/1); Canadian Museum of Nature, Ottawa, Ontario, Canada (catalog no. CMNMC 86065).

Legrandite $Zn_2(AsO_4)(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, elongated along [001], to 28 cm, with dominant {110}, striated ‖ {001} and {$\bar{1}$11}, {100}, {001}; typically in sprays or sheaflike aggregates.

Physical Properties: *Cleavage:* Fair to poor on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.98–4.01 D(calc.) = 4.015

Optical Properties: Transparent to translucent. *Color:* Bright yellow, wax-yellow, colorless; pale yellow to colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = colorless to yellow; Z = yellow. *Orientation:* $X = b$; $Z \wedge c = 40°$. *Dispersion:* $r < v$, distinct. $\alpha = 1.702(2)$ $\beta = 1.709(2)$ $\gamma = 1.740(2)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P2_1/c$. $a = 12.805(2)$ $b = 7.933(1)$ $c = 10.215(2)$ $\beta = 104°23.3(3)'$ Z = 8

X-ray Powder Pattern: Ojuela mine, Mexico.
4.08 (100), 6.68 (71), 5.93 (71), 3.09 (71), 4.19 (50), 12.36 (35), 3.03 (35)

Chemistry:

	(1)	(2)
As_2O_5	37.7	37.71
FeO	1.4	
MnO	1.7	
ZnO	50.1	53.42
H_2O^+	8.8	8.87
H_2O^-	0.1	
insol.	0.2	
Total	100.0	100.00

(1) Ojuela mine, Mexico; H_2O by the Penfield method. (2) $Zn_2(AsO_4)(OH)\cdot H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of Zn–As-bearing deposits; rare in granite pegmatite.

Association: Adamite, paradamite, köttigite, scorodite, smithsonite (Ojuela mine, Mexico); leiteite, smithsonite, reniérite (Tsumeb, Namibia); köttigite, adamite, pharmacosiderite, scorodite (Sterling Hill, New Jersey, USA).

Distribution: In Mexico, from the Flor de Peña mine, Lampazos, Nuevo León; large crystals found in the Ojuela mine, Mapimí, Durango; at the Potosí mine, Santa Eulalia, Chihuahua. From Tsumeb, Namibia. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. In Japan, from the Ogibira mine, near Osa, Okayama Prefecture, and the Toroku mine, Miyazaki Prefecture. From Boa Vista, near Galiléia, Minas Gerais, Brazil.

Name: Honors a Mr. Legrand, Belgian mine manager, who collected the first specimen.

Type Material: The Natural History Museum, London, England, 1932,131; Harvard University, Cambridge, Massachusetts, 92567; National Museum of Natural History, Washington, D.C., USA, 114810.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 958–959. (2) Desautels, P.E. and R.S. Clarke, Jr. (1963) Re-examination of legrandite. Total	[100.0]	100.00

(1) Hagendorf, Germany; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponding to $(Mn_{0.99}Fe_{0.03})_{\Sigma=1.02}(UO_2)_{2.07}(PO_4)_{2.00} \cdot 7.41H_2O$.
(2) $Mn(UO_2)_2(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral in the oxidized zone of a complex granite pegmatite.

Association: Zwieselite, rockbridgeite.

Distribution: From Hagendorf, Bavaria, Germany.

Name: Honors Ferdinand Lehner (1868–1943), Pleystein, Germany, an early collector of Hagendorf minerals.

Type Material: n.d.

References: (1) Mücke, A. (1988) Lehnerit $Mn[UO_2|PO_4]_2$ $8H_2O$, ein neues Mineral aus dem Pegmatit von Hagendorf/Oberpfalz. Aufschluss, 39, 209–217 (in German with English abs.).

(1) Narssârssuk, Greenland. (2) Mt. Karnasurt, Russia; apparently contaminated with zincian montmorillonite.

Occurrence: In pegmatite (Narssârssuk, Greenland); in a differentiated alkalic massif (Lovozero massif, Russia); associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Microcline, aegirine, zinnwaldite, calcite (Narssârssuk, Greenland); albite, natrolite (Lovozero massif, Russia); rhodochrosite, sérandite (Mont Saint-Hilaire, Canada).

Distribution: From Narssârssuk, Greenland. On Mt. Karnasurt, Lovozero massif, and in the Kukisvumchorr apatite deposit, Khibiny massif, Kola Peninsula, Russia. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: For Leif Ericson, Norse adventurer and discoverer of Greenland in 982.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1915–1918; National Museum of Natural History, Washington, D.C., USA, 136173.

Leightonite $K_2Ca_2Cu(SO_4)_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Lathlike crystals, flattened on {100}, elongated along [010], or equant, showing {100}, {101}, {110}, {113}, several other forms, to 4 mm; commonly forms cross-fiber veinlets. *Twinning:* On $\{20\overline{1}\}$.

Physical Properties: Hardness = 3 D(meas.) = 2.95 D(calc.) = 2.95

Optical Properties: Transparent to translucent. *Color:* Pale watery blue to greenish blue; pale blue in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, moderately strong. $\alpha = 1.574$–1.578 $\beta = 1.587$ $\gamma = 1.595$ 2V(meas.) = ∼60° 2V(calc.) = 89°06′

Cell Data: *Space Group: Fmmm.* $a = 11.654(2)$ $b = 7.497(1)$ $c = 10.097(1)$
$\beta = 125.21(1)°$ Z = 2

X-ray Powder Pattern: Chuquicamata, Chile.
2.90 (100), 3.18 (60), 1.781 (30), 2.22 (20), 2.51 (10), 2.40 (10), 1.461 (10)

Chemistry:

	(1)	(2)
SO_3	49.33	49.87
CuO	11.97	12.39
CaO	18.41	17.46
Na_2O	0.56	
K_2O	13.93	14.67
H_2O	5.71	5.61
Total	99.91	100.00

(1) Chuquicamata, Chile; corresponds to $(K_{1.92}Na_{0.12})_{\Sigma=2.04}Ca_{2.13}Cu_{0.98}(SO_4)_{4.00} \cdot 2.06H_2O$.
(2) $K_2Ca_2Cu(SO_4)_4 \cdot 2H_2O$.

Occurrence: Of localized occurrence in the oxidized zone of a copper deposit, probably formed under conditions of low acidity (Chuquicamata, Chile).

Association: Natrochalcite, blödite, atacamite, bellingerite, kröhnkite, gypsum, quartz (Chuquicamata, Chile); chalcanthite, anhydrite, lammerite (Tsumeb, Namibia).

Distribution: From Chuquicamata, Antofagasta, Chile. At Tsumeb, Namibia.

Name: Honors Tomás Leighton Donoso (1896–1967), Chilean mining engineer and Professor of Mineralogy, University of Santiago, Santiago, Chile.

Type Material: The Natural History Museum, London, England, 1938,56; Harvard University, Cambridge, Massachusetts, 97540–97544; National Museum of Natural History, Washington, D.C., USA, C5536.

Leisingite $(Cu, Mg, Zn)_2(Mg, Fe^{2+})Te^{6+}O_6 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Hexagonal plates, to 0.2 mm, prominent {0001} and $\{000\bar{1}\}$, with $\{10\bar{1}0\}$, $\{11\bar{2}0\}$; may be isolated or in clusters.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle to flexible. Hardness = 3–4 D(meas.) = n.d. D(calc.) = 3.41

Optical Properties: Transparent to translucent. *Color:* Pale yellow to pale yellow-orange. *Streak:* Pale yellow. *Luster:* Vitreous, may be satiny or frosted.
Optical Class: Uniaxial (–). $\omega = 1.803(3)$ $\epsilon = [1.581]$ calculated by Gladstone-Dale relation.

Cell Data: *Space Group:* $P\bar{3}1m$. $a = 5.316(1)$ $c = 9.719(2)$ $Z = 1$

X-ray Powder Pattern: Centennial Eureka mine, Utah, USA.
9.70 (100), 4.834 (80), 2.556 (70), 2.326 (70), 4.604 (60), 2.655 (60), 1.789 (40)

Chemistry:

	(1)
TeO_3	36.94
FeO	6.86
CuO	24.71
ZnO	0.45
MgO	6.19
H_2O	[21.55]
Total	[96.70]

(1) Centennial Eureka mine, Utah, USA; by electron microprobe, total Fe as Fe^{2+} [although the crystal-structure analysis indicates a probability of Fe^{3+}], H_2O confirmed as present by IR; corresponds to $(Cu^{2+}_{1.56}Mg_{0.25}Zn_{0.03})_{\Sigma=1.84}(Mg_{0.52}Fe_{0.48})_{\Sigma=1.00}Te^{6+}_{1.06}O_{6.02} \cdot 5.98H_2O$.

Occurrence: A very rare secondary mineral in dump material from the oxidized zone of a tellurium-bearing Cu–Au–Ag deposit.

Association: Quartz, jensenite, cesbronite, hematite.

Distribution: From the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: Honoring Joseph F. Leising (1949–), Reno, Nevada, USA, geologist and mineral collector, who helped collect the material.

Type Material: Canadian Geological Survey, Ottawa, Canada, 67882.

Leiteite $ZnAs_2^{3+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Rare crystals, with pyramidal terminations, in parallel growths; more commonly as cleavable masses, to 17 cm.

Physical Properties: *Cleavage:* {100}, perfect. *Tenacity:* Cleavage lamellae are flexible, inelastic; somewhat sectile. Hardness = 1.5–2 D(meas.) = 4.3(1) D(calc.) = 4.619

Optical Properties: Transparent. *Color:* Colorless to pale brown. *Luster:* Pearly on the cleavage.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge a = 11°$; $Z \wedge c = 10°$. *Dispersion:* $r < v$, very strong. $\alpha = 1.87(1)$ $\beta = 1.880(5)$ $\gamma = 1.98(1)$ 2V(meas.) = 26.5(1.0)°

Cell Data: *Space Group:* $P2_1/c$. $a = 4.542(1)$ $b = 5.022(1)$ $c = 17.597(5)$ $\beta = 90.81(3)°$ Z = 4

X-ray Powder Pattern: Tsumeb, Namibia; strong preferred orientation.
2.940 (400), 4.405 (100), 8.808 (32), 1.761 (22), 3.133 (21), 2.884 (19), 3.163 (18)

Chemistry:

	(1)
As_2O_3	71.4
FeO	0.5
ZnO	28.5
Total	100.4

(1) Tsumeb, Namibia; corresponds to $(Zn_{0.97}Fe_{0.02})_{\Sigma=0.99}As_2^{3+}O_4$.

Occurrence: With other zinc- and arsenic-bearing minerals, apparently formed at low temperatures in an oxidized zone in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Chalcocite, tennantite, reinerite, schneiderhöhnite, zincian stottite, zincroselite, tsumcorite, stranskiite, legrandite, smithsonite.

Distribution: From Tsumeb, Namibia.

Name: For Luis Antonio Bravo Teixeira-Leite (1942–1999), Portuguese-South African amateur mineralogist of Pretoria, South Africa, who noted the first specimen.

Type Material: University of Pierre and Marie Curie, Paris, France; The Natural History Museum, London, England, 1976,432; Royal Ontario Museum, Toronto, Canada, M34727; National Museum of Natural History, Washington, D.C., USA, 137105.

Lemoynite **$(Na,K)_2CaZr_2Si_{10}O_{26}\cdot 5-6H_2O$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals bladed prismatic, elongated along [100], to about 0.05 mm. Commonly in subparallel, sheaflike arrangements and in spherules, to about 0.5 cm.

Physical Properties: *Cleavage:* Perfect on {100} and {010}; imperfect or parting on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 2.29 D(calc.) = 2.38

Optical Properties: Transparent to opaque. *Color:* White to slightly yellowish, colorless. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge a = 5°$. $\alpha = 1.540$ $\beta = 1.553$ $\gamma = 1.570$ 2V(meas.) = 80° 2V(calc.) = 83°

Cell Data: *Space Group:* $C2/c$. $a = 10.384(3)$ $b = 15.947(7)$ $c = 18.601(6)$ $\beta = 104.59(3)°$ Z = 4

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
8.01 (100), 3.562 (49), 2.807 (48), 9.0 (37), 3.034 (33), 3.482 (29), 4.39 (27)

(1) Mont Saint-Hilaire, Canada. (2) Do.; by XRF and AA, corresponding to $(Na_{1.05}K_{0.85})_{\Sigma=1.90}(Ca_{0.85}Fe_{0.08}Mg_{0.04}Zn_{0.02}Cu_{0.01})_{\Sigma=1.00}(Zr_{1.78}Nb_{0.07}Ti_{0.06})_{\Sigma=1.91}(Si_{9.95}Al_{0.05})_{\Sigma=10.00}O_{26}\cdot 5.69H_2O$.

Occurrence: An uncommon mineral, in pegmatite in an intrusive alkalic gabbro-syenite complex (Mpnt Saint-Hilaire, Canada); in miarolytic cavities in a nepheline syenite sill (near Saint-Amable, Canada).

Association: Sodalite, nepheline, eudialyte, catapleiite, elpidite, zircon, microcline (Mont Saint-Hilaire, Canada); albite, natrolite, zakharovite, aegirine, eudialyte, polylithionite (near Saint-Amable, Canada).

Distribution: From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: For Charles Lemoyne (1625–1685), Lord of Longuevil, and his four sons, well-known personalities in French-Canadian history.

Type Material: Royal Ontario Museum, Toronto, Canada, M32124; National School of Mines, Paris, France.

Hg	0.3	
Fe	24.08	24.51
S	28.86	28.15
Total	99.8	100.00

(1) Khachakchansky deposit, Russia; by electron microprobe, average of 22 analyses; corresponds to $Ag_{0.98}Fe_{0.98}S_{2.04}$. (2) $AgFeS_2$.

Occurrence: In goethite pseudomorphs after magnesian siderite, in quartz-siderite veins.

Association: Acanthite, stephanite, Ag–Hg amalgam, chalcopyrite, tetrahedrite, galena, goethite.

Distribution: From the Khachakchansky Ag–Pb deposit, near the Lena River, eastern Sakha, Russia [TL].

Name: For its occurrence near the Lena River, Russia.

Type Material: Geological Museum, Yakutsk Scientific Center, Academy of Sciences, Yakutsk, Russia.

(1) Tolbachik volcano, Russia; by electron microprobe, average of ten analyses on five grains; corresponds to $Pb_{1.01}(Cu_{2.89}Zn_{0.05})_{\Sigma=2.94}[(V_{1.01}As_{0.01})_{\Sigma=1.02}O_4]_2(Cl_{1.90}O_{0.10})_{\Sigma=2.00}$.
(2) $PbCu_3(VO_4)_2Cl_2$.

Occurrence: In volcanic fumaroles, deposited at about 140° C.

Association: Tolbachite, lammerite, anglesite, hematite.

Distribution: At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For the city of Leningrad (once and again St. Petersburg), in the Universities of which this and related minerals have been studied.

Type Material: Mining Institute, St. Petersburg, Russia, 2003/1.

References: (1) Vergasova, L.P., S.K. Filatov, T.F. Semenova, and V.V. Anan'ev (1990) Leningradite $PbCu_3(VO_4)_2Cl_2$, a new mineral from volcanic exhalations. Doklady Acad. Nauk SSSR, 310, 1434–1437 (in Russian). (2) (1991) Amer. Mineral., 76, 1434–1435 (abs. ref. 1).

(1) Franklin, New Jersey, USA; by electron microprobe, Fe^{2+}:Fe^{3+} and H_2O separately determined, total recalculated to 100.0% from 102.2%; corresponds to $(K_{5.36}Ba_{0.71}Na_{0.54})_{\Sigma=6.61}(Mg_{14.63}Mn_{13.78}Fe^{2+}_{7.50}Zn_{6.52}Fe^{3+}_{5.57})_{\Sigma=48.00}(Si_{62.42}Al_{8.93}Fe^{3+}_{0.65})_{\Sigma=72.00}[O_{171.29}(OH)_{44.71}]_{\Sigma=216.00} \cdot 16.94H_2O$. (2) Do.; H_2O by difference, corresponds to $(K_{4.79}Na_{1.01}Ca_{0.86}Ba_{0.48})_{\Sigma=7.14}(Mg_{23.12}Fe^{2+}_{8.33}Mn_{7.17}Zn_{4.95}Fe^{3+}_{4.43})_{\Sigma=48.00}(Si_{61.42}Al_{7.69}Fe^{3+}_{2.89})_{\Sigma=72.00}[O_{170.33}(OH)_{45.67}]_{\Sigma=216.00} \cdot 15.57H_2O$.

Polymorphism & Series: Forms a series with franklinphilite.

Occurrence: Apparently as both a primary and a late-stage low-temperature hydrothermal mineral in a metamorphosed stratiform zinc deposit.

Association: Nelenite, tirodite, franklinite, willemite, sphalerite, dolomite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For the *Lenni Lenape* Indians (*original people* in the Algonquin Indian language) who inhabited the Franklin area.

Type Material: Harvard University, Cambridge, Massachusetts, 105542; National Museum of Natural History, Washington, D.C., USA, R582, 140297.

H_2O	17.93	19.20	17.84
insol.	0.50	3.20	
Total	99.66	98.84	100.00

(1) Mounana mine, Gabon; after correction for oxidation of vanadium and deduction of insoluble quartz, corresponds to $V^{4+}_{2.00}O_{4.12} \cdot 2.09H_2O$. (2) Kyzylkum Desert, Uzbekistan; after deduction of insoluble, corresponds to $V_{1.93}O_4 \cdot 2.22H_2O$. (3) $V_2O_4 \cdot 2H_2O$.

Occurrence: In a zone of reduction below the oxidized zone of a uranium deposit (Mounana mine, Gabon).

Association: Duttonite (Mounana mine, Gabon).

Distribution: From the Mounana uranium mine, Franceville, Gabon. From Kokpatas, in the Kyzylkum Desert, Uzbekistan.

Name: For André Lenoble (?–1968), formerly Head of the Laboratory of Mineralogy and Chief of Exploration, French Atomic Energy Commission.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1970,150; National Museum of Natural History, Washington, D.C., USA, 145134.

Leogangite $Cu_{10}(AsO_4)_4(SO_4)(OH)_6 \cdot 8H_2O$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As aggregates of platelets, flattened on (100) and elongated on [010], to 0.1 mm.

Physical Properties: *Cleavage:* Perfect (100). *Fracture:* Partings parallel to (010) and (001). *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.55

Optical Properties: Transparent. *Color:* Green with a bluish tint. *Streak:* Light green. *Luster:* Vitreous.
Optical Class: Biaxial (-). $\alpha = 1.590(2)$ $\beta = 1.740(2)$ $\gamma = 1.744(2)$ 2V(meas) = 18(2)° 2V(calc) = 17.3° *Dispersion:* Weak, $r > v$. *Pleochroism*: X = blue-green, Y=Z = pale green. Orientation: $X = a^*$; $Y = b$; $Z = c$.

Cell Data: *Space Group: C*2/*c*. $a = 21.770(7)$ $b = 12.327(4)$ $c = 10.720(3)$ $\beta = 92.85(1)°$ Z = 4

X-ray Powder Pattern: Danielstollen mining area, near Leogang, Salzburg Province, Austria. 10.85 (100), 2.630 (60), 5.44 (50), 3.625 (50), 3.090 (40), 2.672 (40), 4.9 (30)

Chemistry:

	(1)
CuO	51.1
As_2O_5	29.7
SO_3	5.1
SiO_2	0.2
H_2O	13.9
Total	100.0

(1) Danielstollen mining area, near Leogang, Salzburg Province, Austria.; average of 5 electron microprobe analyses, H_2O by difference, corresponding to $Cu_{9.94}(As_{0.99}Si_{0.01}O_4)_{\Sigma=4}(S_{0.99}O_4)(OH)_6 \cdot 8.89H_2O$.

Occurrence: A secondary mineral coating limonitic dolostone breccia and filling voids in the oxidized zone of a pyrite, galena, tennantite deposit.

Association: Olivenite, malachite, tyrolite, parnauite, strashimirite, euchroite, brochantite, langite, posnjakite, devilline.

Distribution: Found on one dump in both the Danielstollen and Inschlagalm mining areas, Schwarzleo Valley, about 10 km from Leogang, Salzburg Province, Austria.

Name: For the city (Leogang) in Austria near the first found specimens.

Type Material: Natural History Museum, Vienna, Austria; M8873.

References: (1) Lengauer, C.L., G. Giester, and E. Kirchner (2004) Leogangite, $Cu_{10}(AsO_4)_4(SO_4)(OH)_6 \cdot 8H_2O$, a new mineral from the Leogang mining district, Salzburg province, Austria. Mineral. Petrology, 81, 187–201. (2) (2005) Amer. Mineral., 90, 272 (abs. ref. 1).

Leonardsenite $MgAlF_5(H_2O)_2$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As earthy crusts of flattened prismatic crystals dominated by {011} and {101}, to 20 μm.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 2.31

Optical Properties: Translucent. *Color*: White. *Streak*: White. *Luster*: Earthy (aggregates).
Optical Class: n.d. n = 1.38 [calculated]
R_1-R_2: (470) 15.3-16.8, (546) 14.1-15.9, (589) 13.8-15.3, (650) 13.4-14.8

Cell Data: *Space Group*: *Imma*. *a* = 7.055(1) *b* = 10.117(2) *c* = 6.813(1) Z = 4

X-ray Powder Pattern: Eldfell volcano, Heimaey island, Iceland.
5.66 (100), 3.00 (38), 3.03 (31), 4.92 (29), 3.53 (27), 1.76 (24), 1.77 (19)

Chemistry:

	(1)	(2)
Mg	14.66	13.33
Al	16.16	14.80
F	52.98	52.11
O	[15.88]	17.55
H	[1.78]	2.22
Total	101.46	100.00

(1) Eldfell volcano, Iceland; average of 6 electron microprobe analyses, O calculated from the OH^- required for charge neutrality plus remaining O as H_2O; corresponding to $Mg_{1.00}Al_{1.00}[F_{4.64}(OH)_{0.36}]_{\Sigma=5.00}(H_2O)_{1.29}$. (2) $MgAlF_5(H_2O)_2$.

Occurrence: A sublimated encrustations from fluorine-rich fumarolic gas.

Association: Jakobssonite, anhydrite, ralstonite, jarosite, anhydrous AlF_3, opal-A, oskarssonite (Heimaey); ralstonite, opal-A, jakobssonite, malladrite, fluorite (Heckla).

Distribution: From the northeast rim of the main crater, Eldfell volcano, Heimaey island, and from Heckla volcano, Iceland.

Name: Honors Erik Leonardsen (b. 1934), the former leader of the X-ray Diffraction Laboratory of the Geological Institute, University of Copenhagen, Denmark, for his work on the characterization of the fumarolic minerals from Icelandic volcanoes by X-ray diffraction.

Type Material: Mineral collection, Icelandic Institute of Natural History, Gardabaer, Iceland (NI 12256) and in the "C.L. Garavelli" Museum, Dipartimento di Scienze della Terra e Geoambientali, Università di Bari, Italy (14/nm-V28).

Total	99.82	100.00

(1) Leopoldshall, Germany. (2) $K_2Mg(SO_4)_2 \cdot 4H_2O$.

Occurrence: An uncommon secondary mineral of metamorphic origin in marine salt deposits; may occur in volcanic fumaroles.

Association: Kainite, polyhalite, halite, sylvite (New Mexico, USA).

Distribution: In Germany, in the Stassfurt potash district, as at Westeregeln, Leopoldshall, Aschersleben, Vienenburg, Riedel-Hänigsen, Saxony-Anhalt; large crystals from the Sigmundshall mine, Bokeloh bei Wunstorf, Lower Saxony. At Vesuvius, Campania, Italy. From Stebnyk, Poland. In the Carlsbad potash district, Eddy Co., New Mexico, USA.

Name: To honor Leo Strippelmann, Director of the salt works at Westeregeln, Germany.

	(1)	(2)
Fe_2O_3	89.90	89.86
H_2O	10.77	10.14
Total	100.67	100.00

(1) Eleonore mine, Mt. Dünsberg, Germany. (2) FeO(OH).

Polymorphism & Series: Trimorphous with feroxyhyte and goethite.

Occurrence: A weathering or oxidation product of other iron-bearing minerals, in soils and mineral deposits; a precipitate from ground water. In marine manganese nodules.

Association: Goethite, pyrite.

Distribution: Many minor localities; well-studied material from: in Germany, from Eiserfeld, Siegen, and at Herdorf and Müsen, North Rhine-Westphalia; on Mt. Dünsberg, near Giessen, Hesse; and elsewhere. In France, at Rancié-en-Sem, Ariège, and Chizeuil, Saône-et-Loire. From a cave at Dachstein-Mammuthöhle, Austria. At Příbram, Czech Republic. From Traversella, Piedmont, Italy. At the Great Retallack and Gravel Hill mines, Perranzabuloe, and the Trewethen mine, St. Kew, Cornwall, England. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the USA, in Pennsylvania, at Easton, Northampton Co., Chestnut Hill, Lancaster Co., and other localities; from the Iron Mountain mine, Shasta Co., California; at Bisbee, Cochise Co., Arizona. At the Iron Monarch quarry, Iron Knob, South Australia. From Tsumeb, Namibia.

Name: From the Greek for *scale* and *thread*, for the occasionally feathery or scaly habit.

Polymorphism & Series: 1M, $2M_2$, 3A polytypes common; $2M_1$, $3M_2$ rare; a group name.

Mineral Group: Mica group.

Occurrence: In granite pegmatites, derived by metasomatic replacement of muscovite or biotite; in some high-temperature quartz veins, greisens, and granites.

Association: Spodumene, elbaite, amblygonite, columbite, cassiterite, topaz, beryl, micas.

Distribution: At Rožná, near Bystřice, Czech Republic. From Alabashka, Ural Mountains, Russia. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. In the USA, at Mt. Mica, near Paris, Oxford Co., and Auburn, Androscoggin Co., Maine; in the Mesa Grande and Pala districts, San Diego Co., California; from the Brown Derby pegmatite, Gunnison Co., Colorado; in the Ingersoll mine, near Keystone, Pennington Co., South Dakota. From the Tanco mine, Bernic Lake, Manitoba, Canada. At Maharitra, Mt. Bity, Madagascar. From Bikita,

(1) Pegmatite no. 45, Mount Lepkhe-Nel'm, Lovozero massif, Russia; electron microprobe analyses, H_2O by TGA; corresponding to $(Ba_{0.92}K_{0.54}Ca_{0.26}Na_{0.24}Sr_{0.22})_{\Sigma=2.18}(Zn_{0.58}Mn_{0.15}Fe_{0.04}Mg_{0.01})_{\Sigma=0.78}(Ti_{2.97}Nb_{1.02})_{\Sigma=3.99}(Si_{7.89}Al_{0.11})_{\Sigma=8.00}O_{24}[O_{2.01}(OH)_{1.99}]_{\Sigma=4.00} \cdot 7.39H_2O$.

Polymorphism & Series: Forms a series with kuzmenkoite-Zn.

Mineral Group: Labuntsovite group.

Occurrence: A late-stage hydrothermal mineral in a complex granitic (eudialite, agerine, feldspar) pegmatite.

Association: Lamprophyllite, eudialyte, tsepinite-Na, kuzmenkoite-Zn, paratsepinite-Ba.

Distribution: From Pegmatite no. 45, north slope of Mount Lepkhe-Nel'm, Lovozero massif, Kola peninsula, Russia.

Name: For the locality that produced the first specimens and the dominant element in the D structural site, Zn.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 2709/1.

Total	[100.00]	100.00

(1) Beshtau deposit, Russia; by electron microprobe, average of four analyses, H_2O by difference; corresponding to $(U_{0.93}Tl_{0.17}Ca_{0.02})_{\Sigma=1.12}(PO_4)(OH)_{0.93}\cdot 0.8H_2O$. (2) $U(PO_4)(OH)\cdot H_2O$.

Occurrence: In uranium-bearing veins in a granite porphyry stock.

Association: Halloysite, vrbaite, lorandite, evansite, uraninite, marcasite, molybdenum sulfate.

Distribution: From the Beshtau uranium deposit, near Pyatigorsk, northern Caucasus Mountains, Russia.

Name: Honors Mikhail Yur'evich Lermontov (1814–1841), Russian poet.

Type Material: n.d.

(1) Kladno, Czech Republic. (2) $H(NH_4)_3(SO_4)_2$.

Occurrence: A rare secondary mineral, formed from burning coal (Czech Republic); deposited from hot springs (The Geysers, California, USA).

Association: Sulfur (Letovice, Czech Republic); mascagnite, boussingaultite (The Geysers, California, USA).

Distribution: In the Czech Republic, from Písěcná, near Letovice; at Libušin, near Kladno; and from Radvanice. At Ormosbánya, Hungary. Found at The Geysers, Sonoma Co., California, USA.

Name: For Letovice, Czech Republic, the locality first noted for the mineral.

Type Material: Moravian Museum, Brno, Czech Republic, A6110.

Leucite $KAlSi_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m$. Commonly euhedral, pseudocubic crystals, showing {112}, with {100}, {110} may be present, to 9 cm, typically showing fine twin striae. As disseminated grains; rarely granular, massive. *Twinning:* Common and repeated on {110}, {101}, and other orientations, from two complex displacive phase transformations during cooling.

Physical Properties: *Cleavage:* Very poor on {110}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.45–2.50 D(calc.) = [2.46]

Optical Properties: Transparent to translucent. *Color:* White, gray; colorless in thin section. *Luster:* Vitreous.
Optical Class: Uniaxial (+); may be anomalously biaxial. *Dispersion:* Moderate. $\omega = 1.508$ $\epsilon = 1.509$ 2V(meas.) = Very small.

Cell Data: *Space Group:* $I4_1/a$. $a = 13.055$–13.057 $c = 13.749$–13.753 Z = 16

X-ray Powder Pattern: Villa Senni, Italy. (ICDD 15-47).
3.266 (100), 3.438 (85), 5.39 (80), 2.918 (70), 2.842 (70), 2.366 (65), 2.808 (55)

Chemistry:

(1) Villa Senni, Italy. (2) Central Sierra Nevada, California, USA; by electron microprobe, average of nine analyses. (3) $KAlSi_2O_6$.

Occurrence: With potassium-rich mafic and ultramafic lavas and hypabyssal rocks, and may almost entirely compose them.

Association: Potassic feldspar, nepheline, analcime, natrolite, kalsilite.

Distribution: From numerous localities worldwide, typically in good crystals. Especially from Italy, as at Vesuvius, Monte Somma, and Roccamonfina, Campania; at Villa Senni, Frascati, and Ariccia, Lazio; and on Vulcano, Lipari Islands. Around the Laacher See, Eifel district, Germany. In the USA, from the Leucite Hills, Sweetwater Co., Wyoming; the Bear Paw Mountains, Hill Co., Montana; and at Magnet Cove, Hot Spring Co., Arkansas. In the West Kimberley district, Western Australia. In Tanzania, on Kilimanjaro. In Uganda, found around Ruwenzori and Kariya. From Mt. Nyiragongo, Kivu Province, Congo (Zaire).

Name: From the Greek *leucos* for *white*, in allusion to its color.

(1) Arø Island, Langesundsfjord, Norway; corresponds to $(Ca_{1.01}Mg_{0.02})_{\Sigma=1.03}Na_{0.99}Be_{0.98}(Si_{1.98}Al_{0.02})_{\Sigma=2.00}O_{5.96}[F_{0.77}(OH)_{0.30}]_{\Sigma=1.07}$. (2) Lovozero massif, Russia; corresponds to $(Ca_{1.04}Mg_{0.02})_{\Sigma=1.06}(Na_{0.86}K_{0.04})_{\Sigma=0.90}Be_{1.14}(Si_{1.89}Al_{0.11})_{\Sigma=2.00}O_6[F_{0.91}(OH)_{0.23}]_{\Sigma=1.14}$.

Occurrence: In pegmatites in augite syenite (Langesundsfjord, Norway); in albitization zones in pegmatites at the contact of alkalic massifs intruding Proterozoic carbonaceous quartz-sericite schists (Baikal massif, Russia).

Association: Albite, orthoclase, natrolite, analcime, sérandite, aegirine, polylithionite, ancylite, astrophyllite, catapleiite, epididymite, rhodochrosite, fluorite.

Distribution: In Norway, on Låven, Arø, Stokkø and other islands in the Langesundsfjord; at Morje, Telemark; and in the Vevja and Saga quarries, Tvedalen. In Russia, in the Lovozero massif, Kola Peninsula; in the Baikal massif, eastern Siberia; and in several other poorly specified localities. From Narssârssuk, Greenland. At Mont Saint-Hilaire, Quebec, Canada.

Name: From the Greek for *white* and *to appear*, its common color.

(1) Franklin, New Jersey, USA; composite of two analyses, corresponding to $(Mn_{5.89}Ca_{0.70}Zn_{0.32}Na_{0.04}Mg_{0.03}K_{0.01})_{\Sigma=6.99}(Si_{1.01}O_4)_3(OH)_2$. (2) Kombat mine, Namibia; by electron microprobe, H_2O by difference; corresponding to $(Mn_{5.98}Mg_{0.92}Ca_{0.29}Fe_{0.02})_{\Sigma=7.21}(SiO_4)_3(OH)_{1.72}$.
(3) Valsesia-Valtournanche area, Italy; by electron microprobe, H_2O by difference; corresponding to $(Mn_{6.16}Mg_{0.45}Ca_{0.34}Fe_{0.03})_{\Sigma=6.98}(SiO_4)_3(OH)_{2.10}$.

Mineral Group: Leucophoenicite group.

Occurrence: A late-stage hydrothermal or contact zone mineral in veins and skarns in a metamorphosed stratiform Zn-Mn orebody (Franklin, New Jersey, USA).

Association: Willemite, franklinite, calcite, vesuvianite, garnet, sussexite, rhodochrosite, pyrochroite, tephroite, sonolite, jerrygibbsite, glaucochroite, manganosite, copper, zincite (Franklin, New Jersey, USA); barysilite, spessartine, vesuvianite, barite, copper, hausmannite (Kombat mine, Namibia).

Distribution: At Franklin, Sussex Co., New Jersey, USA. From Pajsberg, Värmland, Sweden. In the Valsesia-Valtournanche area, Val d'Aosta, Italy. In the Kombat mine, 49 km south of Tsumeb, Namibia. From Hotazel, near Kuruman, Cape Province, South Africa.

Name: From the Greek for *pale* and *purplish red* in reference to its conspicuous color.

Type Material: Yale University, New Haven, Connecticut, 2.4830; Harvard University, Cambridge, Massachusetts, USA, 114565.

References: (1) Dana, E.S. and W.E. Ford (1909) Dana's system of mineralogy, (6th edition), app. II, 63. (2) Palache, C. (1935) The minerals of Franklin and Sterling Hill, Sussex County, New Jersey. Leucophosphite $KFe_2^{3+}(PO_4)_2(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are diamond-shaped, to 1 cm, showing {100}, {210}, {111}, {$\overline{1}$11}; fine-grained, chalklike massive, amorphous in part.

Physical Properties: *Cleavage:* {100}, perfect. Hardness = n.d. D(meas.) = 2.948 D(calc.) = 2.911

Optical Properties: Semitransparent. *Color:* White, buff, yellow-brown, orange-brown, pink, greenish brown, brownish purple; may be grayish green in daylight, purplish gray in incandescent light. *Luster:* Vitreous to waxy, chalky.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 26°$. *Dispersion:* $r < v$, very strong. $\alpha = 1.707(2)$ $\beta = 1.721(2)$ $\gamma = 1.739(2)$ 2V(meas.) = n.d. 2V(calc.) = 84°

Cell Data: *Space Group:* $P2_1/n$. $a = 9.782(9)$ $b = 9.658(9)$ $c = 9.751(9)$ $\beta = 102.24(12)°$ Z = 4

X-ray Powder Pattern: Sapucaia mine, Brazil.
6.79 (10), 5.99(7), 3.06 (7), 2.916 (4), 2.829 (4), 7.60 (3), 4.76 (3)

Chemistry:

	(1)	(2)		(1)	(2)		(1)	(2)
P_2O_5	34.99	36.05	Mn_2O_3	0.57		H_2O	11.29	11.44
Al_2O_3	0.25		Na_2O	0.53		Total	[100.00]	100.00
Fe_2O_3	41.35	40.55	K_2O	11.02	11.96			

(1) Sapucaia mine, Brazil; recalculated after deduction of insoluble 0.45% from an original total of 99.66%; corresponds to $(K_{0.93}Na_{0.04})_{\Sigma=0.97}(Fe_{2.05}Mn_{0.03}Al_{0.02})_{\Sigma=2.10}(PO_4)_{1.95}(OH)_{0.45}\cdot 2.01H_2O$.
(2) $KFe_2(PO_4)_2(OH)\cdot 2H_2O$.

Occurrence: Formed by reaction between bat or bird guano and earlier iron-bearing minerals; by hydrothermal alteration of iron-rich phosphates in complex granite pegmatites; crosscutting fluorapatite nodules in black shale; replacing fossil wood; in phosphate rock deposits.

Association: Variscite, "chalcedony", "opal" (Ninghanboun Hills, Australia); strengite, phosphosiderite (Liberia); cyrilovite, phosphosiderite, manganoan lipscombite, frondelite (Sapucaia mine, Brazil); vivianite, aluminian strengite, diadochite, ferrostrunzite, fluorapatite (Bethel Church, Indiana, USA); rockbridgeite, triphylite (Tip Top mine, South Dakota, USA).

Distribution: In Australia, from the Ninghanboun Hills, on the shore of Weelhamby Lake, Western Australia; in the Moculta phosphate quarry, northeast of Angaston, and at the Fairview quarry, near Robertstown, South Australia. In the Bomi Hill, Bambuta, and other caves, Liberia. In Namibia, from the Tsaobismund pegmatite, 60 km south of Karibib, and in the Sandamap pegmatite, west of Usakos. At Marivolanitra, Ambatofindrahana, Madagascar. From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and in a cave at the west end of the Serra do Tamanduá, Minas Gerais, Brazil. In the USA, at the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from near Bethel Church, Pike Co., Indiana; large crystals in the Tip Top pegmatite, 8.5 km southwest of Custer, also at the Gap Lode, White Elephant, and Bull Moose mines, near Custer, Custer Co., South Dakota. In England, at Wheal Gorland, Gwennap, and the Gunheath china clay pit, St. Austell, Cornwall. From the Mangualde pegmatite, near Mesquitela, Portugal. On Rockall Island, North Atlantic. Several other minor localities are known.

Name: From the Greek for *white* and the *phosphate* in its composition.

Type Material: Western Australian Museum, Perth, Australia, M.69.1991, MDC6129; The Natural History Museum, London, England, 1932,1092; Harvard University, Cambridge, Massachusetts, 103879; National Museum of Natural History, Washington, D.C., USA, 96772.

Leucosphenite $BaNa_4Ti_2B_2Si_{10}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular and elongated ‖ [100], typically wedge-shaped, to 3 cm; as rosettes and laminated masses. *Twinning:* Common ⊥ {001}, contact plane {001}.

Physical Properties: *Cleavage:* {010}, {001}, distinct. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 3.04–3.09 D(calc.) = 3.103

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale to dark green, pale yellow, pale gray to blue; brown to black and sectored from inclusions. *Streak:* White. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $Y \wedge c \simeq 0°$. *Dispersion:* $r > v$, may be crossed. $\alpha = 1.644$–1.648 $\beta = 1.660$–1.664 $\gamma = 1.687$–1.691 2V(meas.) = 75°–78°

Cell Data: *Space Group:* $C2/m$. $a = 9.814(4)$ $b = 16.851(5)$ $c = 7.210(3)$ $\beta = 93.35(3)°$ Z = 2

(1) Inagli massif, Russia; corresponds to $(Ba_{0.94}Fe_{0.04}Mg_{0.04})_{\Sigma=1.02}(Na_{3.82}K_{0.18})_{\Sigma=4.00}$ $Ti_{1.92}B_{2.02}Si_{10}O_{29.95}$. (2) Mont Saint-Hilaire, Canada; by electron microprobe, corresponds to $(Ba_{0.94}Ca_{0.01})_{\Sigma=0.95}(Na_{4.10}K_{0.12})_{\Sigma=4.22}(Ti_{1.99}Nb_{0.06})_{\Sigma=2.05}B_{2.08}Si_{9.78}O_{29.90}$.

Occurrence: In pegmatite in syenite (Greenland, Russia, Canada); in aegirine-feldspar veins (Inagli massif, Russia); an authigenic mineral in shales (Utah and Wyoming, USA).

Association: Elpidite, aegirine, epididymite, albite, polylithionite (Narssârssuk, Greenland); arfvedsonite, eudialyte, neptunite, lamprophyllite, lorenzenite (Inagli massif, Russia); albite, aegirine, narsarsukite, molybdenite, calcite, fluorite (Mont Saint-Hilaire, Canada).

Distribution: From Narssârssuk, Greenland. In the USA, from the Green River Formation, in the Uinta basin, Utah and in the Bridger basin, Sweetwater Co., Wyoming. At Mont Saint-Hilaire, Quebec, Canada. From the Inagli massif, 30 km west of Aldan, Yakutia, and in the Lovozero massif, Kola Peninsula, Russia. From the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. At Ohmi, Niigata Prefecture, Japan.

Name: From the Greek for *white* and *wedge*, its color and crystal habit.

		Total	[100.00]

(1) Alum Cave Bluff, Tennessee, USA; by electron microprobe, C_2O_3 and H_2O calculated from stoichiometry; corresponding to $(Y_{0.33}Nd_{0.23}Ce_{0.12}Sm_{0.12}Gd_{0.08}Dy_{0.04}Pr_{0.03}La_{0.02}Eu_{0.02}Er_{0.01})_{\Sigma=1.00}Al_{1.00}(SO_4)_{2.00}(C_{2.00}O_4)\cdot 12.00H_2O$.

Occurrence: Formed by evaporative precipitation during weathering of pyritiferous phyllite, the rare earths probably derived from monazite and xenotime.

Association: Zugshunstite-(Ce), epsomite, halotrichite.

Distribution: From Alum Cave Bluff, Great Smoky Mountains National Park, Tennessee, USA.

Name: To honor Dr. Alfred Abraham Levinson (1927–), mineralogist, University of Calgary, Calgary, Canada, who originated the nomenclature system in use for rare-earth-bearing minerals.

Type Material: University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA.

(1) Table Mountain, Colorado, USA. (2) Kuniga, Oki Islands, Japan; corresponds to $(Ca_{0.96}Na_{0.33}K_{0.09})_{\Sigma=1.38}Al_{2.27}Si_{3.72}O_{12}\cdot 5.8H_2O$. (3) Near Montresta, Sardinia, Italy; by electron microprobe, H_2O by TGA; corresponding to $(Ca_{0.79}Na_{0.27}K_{0.11})_{\Sigma=1.17}Al_{1.86}Si_{4.12}O_{12}\cdot 5.38H_2O$.

Mineral Group: Zeolite group.

Occurrence: Typically as a crystalline lining in cavities in basalts.

Association: Zeolites, especially offretite and erionite.

Distribution: Numerous localities, even for fine specimens. From near Dalsnipa, on Sandoy; Rossafelli and Nesvik, on Streymoy; and elsewhere on the Faeroe Islands. In Iceland, many localities, as at Mjöadalsá Canyon; Onundarfjord; Dyrafjord; around Berufjord, etc. In the USA, at Table Mountain, Jefferson Co., Colorado; from Spray, Wheeler Co., Beech Creek, Grant Co., and Goble, Colombia Co., Oregon. In Ireland, from Dungiven, Magilligan, and elsewhere in Co. Londonderry; and on Island Magee and in the Parkgate quarry, Templepatrick, Co. Antrim. From Cinchwad, Poona district, Maharashtra, India. Found at Flinders and on Victoria Island, Victoria, Australia.

Name: After Armand Lévy (1794–1841), French mineralogist and crystallographer.

Total	100.72	100.54

(1–2) Tripuhy, Brazil.

Mineral Group: Stibiconite group.

Occurrence: In eluvial sands (Tripuhy, Brazil); an alteration of large tetrahedrite crystals (Johnny Lyon Hills, Arizona, USA).

Association: Mica, cinnabar, tripuhyite (Tripuhy, Brazil); tetrahedrite (Johnny Lyon Hills, Arizona, USA).

Distribution: At the Tripuhy cinnabar mine, Ouro Prêto, Minas Gerais, Brazil. Abundant from Tres Alamos Wash, in the Johnny Lyon Hills, Cochise Co., Arizona, USA. In the Miniera del Tafone, Grosseto, Tuscany, Italy.

Name: For William James Lewis (1847–1926), Professor of Mineralogy, Cambridge University, Cambridge, England.

Type Material: The Natural History Museum, London, England, 80141; National Museum of Natural History, Washington, D.C., USA, R5741.

Liandratite $U^{6+}(Nb,Ta)_2O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal; metamict. *Point Group:* $\overline{3}\ 2/m$. In crusts, to 2 mm thick, over petscheckite crystals.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3.5 D(meas.) = 7.0 (after heating). D(calc.) = 6.87 (for $U(Nb,Ta)_2O_8$ with Nb:Ta = 5:1). Radioactive.

Optical Properties: Translucent. *Color:* Yellow to yellow-brown. *Streak:* Pale yellow. *Luster:* Glassy.
Optical Class: Isotropic. $n = 1.83$

Cell Data: *Space Group:* $P\overline{3}1m$ after heating at 650 °C. $a = 6.36$ $c = 4.01$ Z = 1

X-ray Powder Pattern: Berere, Madagascar; after heating at 650 °C.
3.18 (10), 4.01 (8), 2.49 (4), 1.838 (3), 1.692 (2), 1.200 (2), 2.00 (1)

Ta_2O_5		12.67
H_2O	∼0.5	
Total		100.00

(1) Berere, Madagascar; by microchemical analysis. (2) $U(Nb,Ta)_2O_8$ with Nb:Ta = 5:1.

Occurrence: In a zoned pegmatite in amphibolite-grade gneiss, as an oxidized crust over petscheckite.

Association: Petscheckite, columbite, pyrochlore, strüverite, monazite, ilmenite, garnet, tourmaline, beryl, quartz, feldspar.

Distribution: From the Antsakoa I pegmatite, Fianavantsoa, near Berere, about 40 km northeast of Tsaratanana, Madagascar.

Name: Honors Professor George Liandrat, of Samoëns, France, who prospected in Madagascar.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145619.

Liberite Li_2BeSiO_4

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. As aggregates of minute crystals, rarely showing pinacoidal faces.

Physical Properties: *Cleavage:* Perfect on {010}, distinct on {100} and {001}. *Tenacity:* Brittle. Hardness = ∼7 D(meas.) = 2.688(1) D(calc.) = [2.69]

Optical Properties: Transparent to translucent. *Color:* Pale yellow to brown; colorless in thin grains. *Luster:* Oily, vitreous on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Z \wedge c = 41°$. $\alpha = 1.6220$ $\beta = 1.6332$ $\gamma = 1.6380$
2V(meas.) = 66°18′

Cell Data: *Space Group:* Pn. $a = 4.68$ $b = 4.95$ $c = 6.13$ $\beta = 90°30'$ Z = [2]

X-ray Powder Pattern: Synthetic.
3.84 (100), 3.72 (100), 2.596 (80), 2.349 (80), 2.471 (60), 2.273 (60), 3.41 (40)

Total	99.44	100.00

(1) "Nan Ling Ranges, south China." (2) Li_2BeSiO_4.

Occurrence: In veins cutting a lepidolite-fluorite-magnetite "ribbon rock" in tactite.

Association: Lepidolite, natrolite, eucryptite, hsianghualite, cassiterite, scheelite.

Distribution: At an undefined locality in the "Nan Ling Ranges, south China" [Hsianghua Ridge, Linwu Co., Hunan Province, China].

Name: Presumably for LIthium and BERyllium in the composition.

Type Material: Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 135815.

References: (1) Ch'un-Lin Chao (1964) Liberite (Li_2BeSiO_4), a new lithium-beryllium silicate mineral from the Nanling Ranges, south China. Ti Chih Hsueh Pao, 44, 334–342. (2) (1964) Chem. Libethenite $Cu_2(PO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As wedge-topped prismatic crystals, elongated along [100] or [001], or equant to pseudo-octahedral, dominant forms include {110}, {011}, {111}, which may be striated, with a number of other forms noted, to 3 cm; in sprays of bladed to acicular crystals, and as druses; may be composite to compact fibrous.

Physical Properties: *Cleavage:* Imperfect on {100} and {010}. *Fracture:* Conchoidal to uneven. Hardness = 4 D(meas.) = 3.97 D(calc.) = 3.972

Optical Properties: Translucent. *Color:* Light to dark olive-green, dark green, blackish green, black; bluish green to pale green in transmitted light. *Luster:* Vitreous, greasy on fracture surfaces.
Optical Class: Biaxial (–). *Pleochroism:* May be faint; X = pale yellowish blue; Z = pale greenish blue. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, strong. $\alpha = 1.701$–1.704 $\beta = 1.743$–1.747 $\gamma = 1.787$–1.790 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P2_1/n$. $a = 8.062(5)$ $b = 8.384(4)$ $c = 5.881(2)$ $\beta =\sim 90°$ Z = 4

X-ray Powder Pattern: L'ubietová, Slovakia. (ICDD 36-404).
4.820 (100), 5.807 (80), 4.756 (70), 2.627 (60), 3.720 (50), 2.644 (40), 2.412 (30)

Total	99.47	99.09	100.00

(1) Mercedes mine, Coquimbo, Chile. (2) L'ubietová, Slovakia. (3) $Cu_2(PO_4)(OH)$.

Occurrence: An uncommon secondary mineral in the oxidized zone of copper deposits.

Association: Pseudomalachite, malachite, azurite, chrysocolla, iron oxides.

Distribution: Many minor localities, typically in small amounts. From L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In England, good crystals at Wheal Phoenix, mines around Calstock, Illogan, and elsewhere in Cornwall. Around Nizhni Tagil, Ural Mountains, Russia. In Portugal, at the Miguel Vacas mine, near Vila Viçosa, and from near Alcoutim. Very large crystals from the Rokana mine, near Kitwe, and at Chingola, Zambia. At Kakanda, Mindouli, and Likasi, Katanga Province, Congo (Shaba Province, Zaire). From the Burra Burra mine, Mount Lofty Ranges, South Australia. In the USA, from the Empire-Nevada and Blue Jay mines, Yerington, Lyon Co., Nevada; at the Castle Dome mine, Globe-Miami, Gila Co., the Old Reliable mine, Copper Creek, Pinal Co., and elsewhere in Arizona; at the Santa Rita mine, Silver City, Grant Co., New Mexico. From Chuquicamata, Antofagasta, Chile.

Name: For the locality from which it was first described, L'ubietová, Slovakia (formerly Libethen, Hungary).

Liddicoatite $Ca(Li,Al)_3Al_6(BO_3)_3Si_6O_{18}(O,OH,F)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3*m*. Crystals stout prismatic, with curved convex trigonal outline, deeply striated ‖ [0001], to 25 cm.

Physical Properties: *Cleavage:* Poor on {0001}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 7.5 D(meas.) = 3.02 D(calc.) = 3.05

Optical Properties: Transparent to translucent. *Color:* Brown, green, pink, red, blue; commonly zoned parallel to pyramid faces. *Streak:* Very light brown. *Luster:* Vitreous on fractures.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; *O* = dark brown; *E* = light brown.
$\omega = 1.637$ $\epsilon = 1.621$

Cell Data: *Space Group: R3m.* $a = 15.875(3)$ $c = 7.126(2)$ $Z = 3$

X-ray Powder Pattern: Antsirabe, Madagascar. (ICDD 30-478).
2.933 (100), 2.559 (85), 3.962 (55), 4.197 (50), 3.445 (50), 2.025 (40), 1.9054 (35)

(1) Antsirabe, Madagascar; corresponds to $(Ca_{0.72}Na_{0.27})_{\Sigma=0.99}(Li_{1.59}Al_{1.13}Fe^{2+}_{0.11}Ti_{0.05}Mn_{0.04}Mg_{0.03})_{\Sigma=2.95}Al_6(BO_3)_3Si_{6.02}O_{18}[(OH)_{2.86}F_{0.87}O_{0.27}]_{\Sigma=4.00}$.

Mineral Group: Tourmaline group.

Occurrence: Detrital in soil, an apparent product of the local pegmatites.

Association: Quartz, elbaite, albite, micas.

Distribution: From Antsirabe, Tsilaizina, and Anjanabonoina, Madagascar. There are probably other localities but chemical analysis is required for distinction from other tourmaline group minerals.

Name: For Richard Thomas Liddicoat, Jr. (1918–), American gemologist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135815; The Natural History Museum, London, England, 1977,59.

Liebauite $Ca_3Cu_5Si_9O_{26}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, to < 0.03 mm.

Physical Properties: Hardness = 5–6 D(meas.) = n.d. D(calc.) = 3.62

Optical Properties: Transparent. *Color:* Bluish green. *Luster:* Vitreous.
Optical Class: Biaxial (+). $\alpha = 1.722(1)$ $\beta = 1.723(1)$ $\gamma = 1.734(1)$ 2V(meas.) = 72.8°

Cell Data: *Space Group:* $C2/c$. $a = 10.160(1)$ $b = 10.001(1)$ $c = 19.973(2)$
$\beta = 91.56(1)°$ Z = 4

X-ray Powder Pattern: Sattelberg volcano, Germany.
3.00 (100), 3.12 (90), 6.70 (70), 2.41 (70), 7.13 (60), 2.45 (60), 1.78 (50)

Chemistry:

	(1)
SiO_2	48.5
CuO	34.9
CaO	15.0
Total	98.4

(1) Sattelberg volcano, Germany; by electron microprobe, average of six analyses; corresponding to $Ca_{2.99}Cu_{4.91}Si_{9.05}O_{26}$.

Occurrence: In cavities in argillaceous sedimentary xenoliths subjected to very high-grade thermal metamorphism.

Association: Cuprorivaite, tenorite, volborthite, calciovolborthite.

Distribution: In Germany, at the Sattelberg and Nickenicher Sattel volcanos and the Emmelberg cone, near Kruft, Eifel district.

Name: For Dr. Friedrich Liebau, Kiel, Germany, prominent worker on silicate minerals.

Type Material: University of Würzburg, Würzburg; and University of Kiel, Kiel, Germany.

References: (1) Zöller, M.H., E. Tillmanns, and G. Hentschel (1992) Liebauite, $Ca_3Cu_5Si_9O_{26}$: a new silicate mineral with 14er single chain. Zeits. Krist., 200, 115–126. (2) (1993) Amer. Mineral., 78, 673 (abs. ref. 1).

Liebenbergite $(Ni,Mg)_2SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Grains, to 1 mm, filling interstices between trevorite grains.

Physical Properties: *Cleavage:* {010}, fair to poor; {100}, poor. Hardness = 6–6.5 D(meas.) = 4.60 D(calc.) = 4.60

Optical Properties: Transparent to translucent. *Color:* Yellowish green; colorless to pale green to greenish yellow in thin section.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = colorless to pale green; Z = greenish yellow. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.820(3)$ $\beta = [1.854]$ $\gamma = 1.888(3)$ 2V(meas.) = 88(2)°

Cell Data: *Space Group: Pbnm.* $a = 4.727(1)$ $b = 10.191(3)$ $c = 5.955(2)$ $Z = 4$

X-ray Powder Pattern: Bon Accord, South Africa.
2.442 (100), 2.759 (90), 1.738 (90), 2.503 (80), 3.47 (60), 5.09 (30), 2.252 (30)

Chemistry:

	(1)
SiO_2	29.39
FeO	4.37
CoO	1.80
NiO	56.32
MgO	6.50
Total	98.38

(1) Bon Accord, South Africa; by electron microprobe, average of eight grains; corresponds to $(Ni_{1.52}Mg_{0.33}Fe_{0.12}Co_{0.05})_{\Sigma=2.02}Si_{0.99}O_4$.

Mineral Group: Olivine group.

Occurrence: In a small tabular nickel deposit at the contact between quartzite and serpentinized ultramafics; it appears to have formed at ~730 °C and < 2 kbar during thermal metamorphism, possibly of a nickel-rich meteorite.

Association: Trevorite, nickeloan serpentine, nickeloan ludwigite, bunsenite, violarite, millerite, gaspéite, nimite, bonaccordite.

Distribution: From three km west of the Scotia Talc mine, Bon Accord, Barberton, Transvaal, South Africa.

Name: For W.R. Liebenberg, Deputy Director-General of the National Institute for Metallurgy of South Africa.

Type Material: Royal Ontario Museum, Toronto, Canada, M33443; Harvard University, Cambridge, Massachusetts, 133404; National Museum of Natural History, Washington, D.C., USA, 132463.

UO_3		39.27	Total	99.89	100.00

(1) Jáchymov, Czech Republic. (2) $Ca_2(UO_2)(CO_3)_3 \cdot 11H_2O$.

Occurrence: An uncommon secondary mineral typically formed as an alteration product of uraninite in alkaline carbonate solutions.

Association: Uraninite, schröckingerite, uranophane-beta, tyuyamunite, autunite, uranophane, bayleyite, carnotite, gypsum, calcite.

Distribution: From Edirne (Adrianople) Province, Turkey. Abundant in a number of mines around Jáchymov (Joachimsthal), Czech Republic. In Germany, from Schneeberg, Saxony; at Eisleben and Hasserode, Saxony-Anhalt; and from Müllenbach, near Baden-Baden, Black Forest. At Schmiedeberg, Poland. From Wheal Basset, Redruth, Cornwall, England. At Tyndrum, Perthshire, Scotland. From the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France. In the USA, at the Midnite mine, Wellpinit, Stevens Co., Washington; in the Schwartzwalder mine, near Golden, Jefferson Co., Colorado; in Wyoming, in the Pumpkin Buttes area, Powder River basin, and at the Silver Cliff mine, Lusk, Niobrara Co., and in the Lucky Mc mine, Wind River basin, Fremont Co.; from the Black Ape mine, Thompsons district, Grand Co., and in the Mi Vida mine, Big Indian district, San Juan Co., Utah; at Ambrosia Lake and Westwater Canyon, Grants district, McKinley Co., New Mexico; from Mt. Pisgah, Jim Thorpe, Carbon Co., Pennsylvania. At Rabbit Lake, Saskatchewan, Canada. In the Tono mine, Gifu Prefecture, Japan. From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Professor Justus von Liebig (1803–1873), German chemist, University of Munich, Munich, Germany.

Type Material: American Museum of Natural History, New York, New York, USA, 16847.

Likasite $Cu_3(NO_3)(OH)_5 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, to 1.5 mm, show a rectangular section, tabular on {001}, with {010}, {100}, {101}, {012}, {014}, {018}.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. D(meas.) = 2.96–2.98 D(calc.) = 2.97

Optical Properties: Transparent. *Color:* Sky-blue.
Optical Class: Biaxial. *Pleochroism:* X = pale greenish blue; Y = purplish blue. *Orientation:* $X = a$; $Z = b$. $\alpha = 1.61$–1.615 β = n.d. $\gamma = 1.685$–1.69 2V(meas.) = n.d.

Cell Data: *Space Group: Pcmn.* $a = 5.830(1)$ $b = 6.775(1)$ $c = 21.711(5)$ Z = 4

X-ray Powder Pattern: Likasi, Congo.
5.75 (FFF), 10.8 (FF), 2.722 (mF), 2.518 (mF), 2.168 (mF), 3.23 (m), 3.18 (m)

Chemistry: (1) Composition established by crystal-structure analysis.

Occurrence: A rare secondary mineral in the oxidized zone of copper deposits.

Association: Cuprite, brochantite, malachite, copper, silver, buttgenbachite, gerhardtite, miersite, iron oxides (Likasi mine, Congo).

Distribution: From Likasi, Katanga Province, Congo (Shaba Province, Zaire). At Dzhezkazgan, Kazakhstan. In the Hingston Down quarry, Calstock, Cornwall, England. From Huelgoat, Brittany, France. In the Copper Cities deposit, Gila Co., Arizona, USA. From the Spring Creek mine, near Wilmington, South Australia.

Name: For the locality where it was first found, Likasi, Congo.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM655; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 107463, 112521, 137714.

(1) Spokoinoe deposit, Russia; corresponds to $(Pb_{3.00}Ag_{0.25}Cu_{0.03})_{\Sigma=3.28}(Bi_{1.88}Sb_{0.06})_{\Sigma=1.94}S_{6.00}$. (2) Baoshan mine, Hunan Province, China; by electron microprobe, corresponds to $(Pb_{2.71}Ag_{0.31}Cu_{0.08})_{\Sigma=3.10}Bi_{2.01}S_{6.00}$. (2) $Pb_3Bi_2S_6$.

Polymorphism & Series: Forms a series with gustavite.

Occurrence: In hydrothermal deposits of probable high-temperature origin.

Association: At a number of early reported occurrences the "lillianite" was shown to be mixtures, especially of galena and galenobismutite; cosalite, cannizzarite, sphalerite.

Distribution: In the USA, the "type locality" [Lillian mine, Leadville, Lake Co., Colorado] has been discredited; found at Twin Lakes, Fresno Co., California. At Yecora, five km west of Iglesia, Sonora, Mexico. From the Ivigtut cryolite deposit, southwestern Greenland. In Russia, at the Spokoinoe and Bukuka tungsten deposits, eastern Transbaikal. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In Finland, at Jilijärvi, near Orijärvi. From the Felbertal tungsten mine, Salzburg, Austria. Found near Narechenski Basni, southern Rhodope Mountains, Bulgaria. On Vulcano, in the Lipari Islands, Italy. From the Baoshan mine, Hunan Province, China. At the Tsubakihara mine, Gifu Prefecture, Japan. A few additional localities for mixed lillianite–gustavite are known.

Name: For the Lillian mine, Leadville, Colorado, USA, the discredited type locality.

Type Material: n.d.

Lime CaO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. [Massive.]

Physical Properties: *Cleavage:* {001}, perfect; parting on {011} (synthetic). Hardness = 3.5 D(meas.) = n.d. D(calc.) = 3.35

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Isotropic. $n = 1.837$

Cell Data: *Space Group:* $Fm3m$ (synthetic). $a = 4.81059(9)$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.4059 (100), 1.7009 (54), 2.777 (34), 1.4505 (16), 1.3888 (16), 1.0758 (16), 0.8018 (16)

Chemistry: No analyses of natural material appear to be available.

Occurrence: In thermally metamorphosed calcareous ejecta (Vesuvius, Italy); in burning coal measures (Kopeysk, Russia).

Association: Calcite (Vesuvius, Italy); fluorellestadite, periclase, magnesioferrite, hematite, srebrodolskite, anhydrite (Kopeysk, Russia).

Distribution: On Vesuvius, Campania, Italy. From around Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia. In the Campbell mine, Bisbee, Cochise Co., Arizona, USA.

Name: From the Old English, *quicklime*.

(1) Arenas, Italy; recalculated to 100% after deduction of ZnO 0.04% and MgO 0.26%.
(2) $PbCu(SO_4)(OH)_2$.

Occurrence: An uncommon secondary mineral in the oxidized zone of Pb–Cu deposits.

Association: Brochantite, anglesite, caledonite, leadhillite, cerussite, malachite, hemimorphite.

Distribution: In small amounts from many localities, of which only a few are given here. From Linares, Jaén Province, Spain. At Arenas and San Giovanni, Sardinia, Italy. Fine crystals from the Red Gill and other mines, Caldbeck Fells, Cumbria, England. At Leadhills, Lanarkshire, Scotland. Large crystals in the Kisamori mine, Akita Prefecture, Japan. In Australia, from Broken Hill, New South Wales. In the USA, large crystals at the Mammoth-St. Anthony mine, Tiger, Pinal Co., and in the Grand Reef mine, Santa Teresa Mountains, Graham Co., Arizona; from the Blanchard and Mex-Tex mines, near Bingham, Hansonburg district, Socorro Co., New Mexico; in the Tintic district, Juab Co., Utah; at Cerro Gordo, Inyo Co., and on the Blue Bell claims, near Baker, San Bernardino Co., California. Large crystals from Tsumeb, Namibia.

Name: For its occurrence at Linares, Spain.

Type Material: Mining Academy, Freiberg, Germany, 46.527.

H_2O	16.4	[18.93]	[18.08]
Total	100.0	[100.00]	[100.00]

(1) Jáchymov, Czech Republic. (2) Do.; by electron microprobe, H_2O by difference, corresponds to $(Cu_{4.36}Co_{0.47})_{\Sigma=4.83}(AsO_4)_{2.03}[(AsO_3)_{2.03}(OH)_{1.55}] \cdot 10.2H_2O$. (3) Cap Garonne mine, France; by electron microprobe, H_2O by difference; corresponds to $(Cu_{4.90}Co_{0.18}Ni_{0.07})_{\Sigma=5.15}(AsO_4)_{2.02}[(AsO_3)_{2.03}(OH)_{2.21}] \cdot 9.61H_2O$.

Occurrence: In the oxidized zone of some arsenic-rich copper deposits.

Association: Erythrite, pitticite, annabergite, lavendulan (Jáchymov, Czech Republic); olivenite, chalcanthite, antlerite, pushcharovskite, covellite, tennantite, quartz (Cap Garonne mine, France).

Distribution: From the Geister and Červená veins, Eliáš mine, Jáchymov (Joachimsthal), Czech Republic. At the Cap Garonne mine, near le Pradet, Var, and in the Salsigne mine, 15 km north of Carcassone, Aude, France. From the Carmenes copper mine, Villamanin, Léon Province, Spain. Found at the Talmessi mine, 35 km west of Anarak, Iran.

Name: To honor Joseph Lindacker, Austrian pharmacist-chemist, who made the first analyses.

Type Material: National School of Mines, Paris, France.

PbO		0.46	
H_2O	3.48	[3.30]	3.31
Total	[100.00]	[99.82]	100.00

(1) Chuquicamata, Chile; recalculated from an original total of 99.66% after deduction of Fe_2O_3 1.43% and SiO_2 3.34%; corresponds to $Cu_{2.88}(MoO_4)_{2.00}(OH)_{2.08}$. (2) Do.; by electron microprobe, average of ten analyses; total Fe as FeO, H_2O calculated from stoichiometry; corresponds to $Cu_{2.95}Si_{0.01}Fe_{0.01}Pb_{0.01}(MoO_4)_{2.01}(OH)_2$. (2) $Cu_3(MoO_4)_2(OH)_2$.

Occurrence: An uncommon secondary mineral in the oxidized zone of molybdenum-bearing copper deposits.

Association: Antlerite, molybdenite, powellite, brochantite, chrysocolla, iron oxides, quartz.

Distribution: In Chile, from Chuquicamata, Antofagasta; at the San Samuel mine, Carrara Pinto, and in the Jardinera No. 1 mine, five km east of Inca de Oro, Atacama. From the Brandy Gill mine, Caldbeck Fells, Cumbria, England. In the USA, at the Lodi No. 4 mine, Spring Creek district, Plumas Co., California; from Arizona, in the Live Oak pit, Inspiration mine, Globe-Miami district, Gila Co.; in the Cave Creek district, Maricopa Co.; at the Esperanza mine, Pima Co.; in the Childs-Aldwinkle mine, Copper Creek district, and on the Hull claims, south of Ray, Pinal Co.; from the Helena mine, Seven Devils district, Adams Co., Idaho.

Name: Honors Professor Waldemar Lindgren (1860–1939), Swedish–American economic geologist, Massachusetts Institute of Technology, Cambridge, Massachusetts, USA.

Type Material: The Natural History Museum, London, England, 1936,102; Harvard University, Cambridge, Massachusetts, USA, 97527, 97528.

(1) Jakobsberg, Sweden; by electron microprobe, average of six analyses, all Mn as Mn^{2+} from associated minerals, Fe^{2+} absent by Mössbauer spectroscopy; corresponds to $Pb_{2.04}Mn^{2+}_{1.27}Mg_{0.71}Zn_{0.04}Fe^{3+}_{14.84}Si_{0.05}Ti_{0.03}Al_{0.02}O_{27}$.

Occurrence: In a regionally metamorphosed lead-bearing Fe–Mn skarn deposit.

Association: Jacobsite, plumboferrite, hematite, phlogopite, andradite, calcite, hedyphane, barite, copper, cuprite, malachite, azurite.

Distribution: From Jakobsberg, Värmland, Sweden.

Name: For Dr. Bengt Lindqvist (1927–), formerly Senior Curator of the Swedish Museum of Natural History, Stockholm, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 38126; The Natural History Museum, London, England, 1992,375.

References: (1) Holtstam, D. and R. Norrestam (1993) Lindqvistite, $Pb_2MeFe_{16}O_{27}$, a novel hexagonal ferrite mineral from Jakobsberg, Filipstad, Sweden. Amer. Mineral., 78, 1304–1312.

Lindsleyite $(Ba,Sr)(Ti,Cr,Fe,Mg,Zr)_{21}O_{38}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ or 3. Grains, to 5 mm, rimmed by and enclosed in other minerals.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. VHN = [1378–1714, 1505 average (100 g load)] ("comparable to mathiasite"). D(meas.) = n.d. D(calc.) = 4.63

Optical Properties: Opaque. *Color:* Black; tan in reflected light. *Luster:* Metallic. *Optical Class:* Uniaxial. *Pleochroism:* Weak; buff-white to tan. *Anisotropism:* Weak; pale tan to brown.
R_1–R_2: (400) 19.4–19.8, (420) 19.0–19.2, (440) 18.6–18.9, (460) 18.1–18.4, (480) 17.8–18.1, (500) 17.5–17.8, (520) 17.2–17.5, (540) 17.1–17.3, (560) 16.9–17.1, (580) 16.7–17.0, (600) 16.7–16.9, (620) 16.6–16.9, (640) 16.5–16.8, (660) 16.5–16.9, (680) 16.5–16.9, (700) 16.5–16.9

Mineral Group: Crichtonite group.

Occurrence: A mantle-derived phase in veinlets in metasomatized kimberlite (South Africa).

Association: Mathiasite, phlogopite, perovskite, chromian diopside, potassian richterite, Nb–Cr rutile, Mg–Cr–Nb ilmenite, chromian spinel (South Africa).

Distribution: From the De Beers and Bultfontein diamond mines, Kimberley, Cape Province, South Africa. At an undisclosed locality [Yimeng Mountain area] in Shandong Province, China.

Name: For Professor Donald Hale Lindsley (1934–), State University of New York, Stony Brook, New York, USA, for his work in high-pressure petrology.

Type Material: South African National Museum, Cape Town, South Africa; The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA.

(1) Gladhammar, Sweden; S by difference, corresponds to $Pb_{2.79}Cu_{2.67}Bi_{6.63}S_{15.00}$. (2) Silver Miller mine, Canada; by electron microprobe, corresponds to $Pb_{2.80}Cu_{2.70}(Bi_{7.18}Sb_{0.09})_{\Sigma=7.27}S_{15.00}$. (3) $Pb_3Cu_3Bi_7S_{15}$.

Occurrence: Of hydrothermal origin.

Association: Krupkaite, other aikinite–bismuthinite series members, bismuth.

Distribution: From Gladhammar, Kalmar, Sweden [TL]. In the Beresovsk district, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, and at Inkur, Transbaikal, Russia. From Baia Borşa, Baia Mare (Nagybánya), Romania. At the Spissko-Gemerske Rudohorie Mountains, Slovakia. In the Loch Shin monzogranite, near Lairg, Scotland. From the Morro Potosi greisen, Rondonia, ??, Brazil. At Yecora, five km west of Iglesia, Sonora, Mexico. From the Beaver Mountains, near Milford, Beaver Co., Utah, and at Manhattan, Nye Co., Nevada, USA. In Canada, in the Drummond (Silver Miller) mine, three km south of Cobalt, Ontario.

Name: Honors Gustav Lindström (1838–1916), Swedish mineral chemist of the Swedish Museum of Natural History, Stockholm, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

(1) Gladhammar, Sweden; corresponds to $(Co_{2.14}Cu_{0.43}Ni_{0.39}Fe_{0.07})_{\Sigma=3.03}S_{4.00}$. (2) Carroll Co., Maryland, USA; corresponds to $(Co_{2.54}Ni_{0.25}Fe_{0.13}Cu_{0.12})_{\Sigma=3.04}S_{4.00}$. (3) $Co^{2+}Co_2^{3+}S_4$.

Polymorphism & Series: Forms a series with polydymite.

Mineral Group: Linnaeite group.

Occurrence: In hydrothermal veins with other cobalt and nickel sulfides.

Association: Chalcopyrite, pyrrhotite, millerite, bismuthinite, gersdorffite, carrollite, cattierite, ullmannite, marcasite, pyrite, galena, sphalerite.

Distribution: In Sweden, from the Bastnäs mine, near Riddarhyttan, Västmanland [TL], and at Gladhammar, Kalmar. At Outokumpu, Finland. In Germany, from Müsen, North Rhine-Westphalia; at Altenberg, Saxony; in the Grube Georg, near Horhausen, Westerwald. At Kladno, Czech Republic. In the USA, from the Springfield and Mineral Hill mines, Carroll Co., Maryland; and at the Mine La Motte, Madison Co., Missouri. In Congo (Zaire), in the Musonoi mine, near Kolwezi, Katanga (Shaba) Province. At the N'Kana mine, Kitwe, from the Chambishi Southeast prospect, and in the Rhokana mine, Zambia. In the Wonderland and Selukwe Peak mines, Selukwe, Zimbabwe. From Tsumeb, Namibia. Known from a number of other minor occurrences.

Name: In honor of Carl von Linné [Carolus Linnaeus] (1707–1778), Swedish taxonomist.

Lintisite **$Na_3LiTi_2(Si_2O_6)_2O_2 \cdot 2H_2O$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Needlelike crystals, elongated along [001], flattened on {100}, to 5 mm; in fibrous or columnar aggregates. *Twinning:* Twin axis [100].

Physical Properties: *Cleavage:* {100} and {010}, perfect. *Fracture:* Splintery. *Tenacity:* Elastic. Hardness = 5–6 D(meas.) = 2.77(5) D(calc.) = 2.825 Fluoresces weak yellow in UV.

Optical Properties: Transparent. *Color:* Colorless, white to pale yellow. *Luster:* Vitreous on fractures, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 2°$. *Dispersion:* $r < v$, strong.
$\alpha = 1.672(2)$ $\beta = 1.739(2)$ $\gamma = [1.802]$ 2V(meas.) = 85(1)°

Cell Data: *Space Group:* $C2/c$. $a = 28.583(4)$ $b = 8.600(1)$ $c = 5.219(1)$ $\beta = 91.03(2)°$ $Z = 4$

X-ray Powder Pattern: Lovozero massif, Russia.
14.29 (s), 2.996 (s), 6.39 (m), 4.77 (m), 3.69 (m), 2.744 (m), 2.709 (m)

Chemistry:

	(1)
SiO_2	44.03
TiO_2	27.68
Nb_2O_5	1.10
FeO	0.28
MnO	0.05
Li_2O	2.68
Na_2O	16.72
K_2O	0.03
LOI	6.55
Total	99.12

(1) Lovozero massif, Russia; by electron microprobe, average of four analyses; Li by flame photometry, loss on ignition taken as H_2O; corresponding to $Na_{2.97}Li_{0.99}(Ti_{1.91}Nb_{0.05}Fe_{0.02})_{\Sigma=1.98}Si_{4.03}O_{14} \cdot 2.00H_2O$.

Occurrence: Coating and replacing lorenzenite in ultra-agpaitic syenite pegmatites in a differentiated alkalic massif (Lovozero massif, Russia); in sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Lorenzenite, nepheline, sodalite, potassic feldspar, arfvedsonite, aegirine, eudialyte, ussingite, gmelinite (Lovozero massif, Russia); ussingite, natrolite, sérandite, aegirine, steenstrupine, sidorenkite, rasvumite, eudialyte, terskite, vuonnemite, vitusite (Mont Saint-Hilaire, Canada).

Distribution: On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. From Mont Saint-Hilaire, Quebec, Canada.

Name: For LIthium, sodium (Natrium), TItanium, and SIlicon in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p503/3; The Natural History Museum, London, England, 1994,13.

Mn	0.28	.
Total	100.01	100.00

(1) Luobusha mining district, Qusong County, Tibet, China; average of 12 electron microprobe analyses; corresponding to $(Fe_{0.98}Al_{0.03}Mn_{0.01})_{\Sigma=1.02}Si_{1.99}$. (2) $FeSi_2$.

Occurrence: In the heavy mineral fraction of a podiform chromitite deposit in the peridotite of an ophiolitic harzburgite. Likely the product of a strongly reducing environment and possibly are xenocrysts derived from a mantle source.

Association: Zangboite, native silicon.

Distribution: In a heavy mineral fraction from ore body 31, Group II of the Luobusha ("Luobusa") mining district, 200 km southeast of Lhasa, Qusong County, Shannan Prefecture, Tibet, People's Republic of China. From placers and drill-core samples from the Poltava series, Ukraine.

Name: For Linzhi Prefecture, near the locality that produced the first samples.

Type Material: Geological Museum of China, (M11799) and at the Institute of Geology, Academy of Geological Sciences (97-6), Beijing, People's Republic of China.

References: (1) Li, G., W. Bai, N. Shi, Q. Fang, M. Xiong, J. Yang, Z. Ma, and H. Rong (2012) Linzhiite, $FeSi_2$, a redefined and revalidated new mineral species from Luobusha, Tibet, China. European Jour. Mineral., 24, 1047-1052. (2) (2014) Amer. Mineral., 99, 1516 (abs. ref. 1).

Liottite $(Ca, Na, K)_8(Si, Al)_{12}O_{24}[(SO_4), Cl, (CO_3), OH]_4 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. As short prismatic crystals with pyramidal and pinacoidal terminations, up to 1 cm.

Physical Properties: Hardness = 5 D(meas.) = 2.56(2) D(calc.) = 2.61

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (–). $\omega = 1.530$ $\epsilon = 1.528$

Cell Data: *Space Group:* $P\bar{6}m2$. a = 12.842(3) c = 16.091(5) Z = 6

CO_2	2.1
SO_3	8.66
$-O = Cl_2$	0.58
Total	100.00

(1) Pitigliano, Italy; by AA and XRF, corresponds to $(Ca_{3.59}Na_{3.10}K_{1.27}Fe^{3+}_{0.05})_{\Sigma=8.01}(Si_{6.11}Al_{5.89})_{\Sigma=12.00}O_{24}[(SO_4)_{1.30}Cl_{0.87}(CO_3)_{0.57}(OH)_{1.19}]_{\Sigma=3.93} \cdot 0.61H_2O$.

Mineral Group: Cancrinite group.

Occurrence: In cavities in ejecta blocks of metasomatized carbonate rocks in a pumice deposit.

Association: Melilite, latiumite, clintonite, anorthite, vesuvianite, grossular, andradite, pyroxene.

Distribution: At Pitigliano, near Grosseto, Tuscany, Italy.

Name: For mineral collector Luciano Liotti, who donated the specimen in which this mineral was first found.

Type Material: University of Pisa, Pisa, 3209; University of Modena, Modena, Italy.

References: (1) Merlino, S. and P. Orlandi (1977) Liottite, a new mineral in the cancrinite–davyne group. Amer. Mineral., 62, 321–326.

Lipscombite $(Fe^{2+}, Mn^{2+})Fe_2^{3+}(PO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 422. As very small acicular crystals, in radial aggregates; massive.

Physical Properties: Hardness = n.d. D(meas.) = 3.66(1) D(calc.) = [3.68]

Optical Properties: Translucent to opaque. *Color:* Olive-green to black, yellowish brown.
Luster: Vitreous.
Optical Class: [Uniaxial.]
R_1–R_2: n.d.

Cell Data: *Space Group:* $P4_12_12$. $a = 7.40$ $c = 12.81$ $Z = 4$

X-ray Powder Pattern: Sapucaia mine, Brazil.
3.314 (10), 3.206 (6), 1.656 (4), 1.601 (4), 4.84 (3), 2.302 (3), 2.054 (3)

Chemistry:

	(1)	(2)	(3)
P_2O_5	33.37	33.76	36.26
Fe_2O_3	50.45	57.16	40.79
FeO	3.75	1.72	18.35
MnO	7.91		
H_2O	4.45	6.65	4.60
Total	99.93	99.29	100.00

(1) Sapucaia mine, Brazil; corresponds to $(Mn^{2+}_{0.44}Fe^{2+}_{0.21})_{\Sigma=0.65}Fe^{3+}_{2.49}(PO_4)_{1.85}O_{1.22}(OH)_{0.78}$.
(2) Anloua, Cameroon; corresponds to $Fe^{2+}_{0.09}Fe^{3+}_{2.82}(PO_4)_{1.87}O_{1.03}(OH)_{0.97}$. (3) $Fe^{2+}Fe^{3+}_2(PO_4)_2(OH)_2$.

Mineral Group: Dimorphous with barbosalite.

Occurrence: In a hydrothermally altered phosphate zone of a complex granite pegmatite (Sapucaia mine, Brazil).

Association: Cyrilovite, leucophosphite, phosphosiderite, frondelite (Sapucaia mine, Brazil); heterosite, strengite, cyrilovite, leucophosphite (Hagendorf, Germany).

Distribution: From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. At the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. In the USA, on Fodderstack Mountain, Montgomery Co., Arkansas; at the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., and in the Rain mine, Carlin district, Elko Co., Nevada. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. At Anloua, near Ngaoundéré, Cameroon. From Hagendorf, Bavaria, Germany. In the Wolf Creek meteorite.

Name: To honor William Nunn Lipscomb (1909–), mineralogist, University of Minnesota, Minneapolis, Minnesota, USA, who determined the crystal structure of the synthetic compound.

Type Material: n.d.

Liroconite $Cu_2Al(AsO_4)(OH)_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as crystals with a flattened octahedral or lenticular aspect, dominated by {110} and {011} and striated parallel to their intersections, also {001}, {010}, {100}, to 3.6 cm, alone and in sub-parallel groups. May be granular, massive.

Physical Properties: *Cleavage:* On {110}, {011}, indistinct. *Fracture:* Uneven to conchoidal. Hardness = 2–2.5 D(meas.) = 2.94–3.01 D(calc.) = [3.03]

Optical Properties: Transparent to translucent. *Color:* Sky-blue, bluish green, verdigris-green, emerald-green; pale blue to pale bluish green in transmitted light. *Streak:* Pale blue to pale green. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge a = 25°$. *Dispersion:* $r < v$, moderate.
$\alpha = 1.612(3)$ $\beta = 1.652(3)$ $\gamma = 1.675(3)$ 2V(meas.) = n.d. 2V(calc.) = 72(5)°

Cell Data: *Space Group:* $I2/a$. $a = 12.664(2)$ $b = 7.563(2)$ $c = 9.914(3)$ $\beta = 91.32(2)°$
Z = 4

X-ray Powder Pattern: Cornwall, England.
6.46 (10), 3.01 (10), 5.95 (9), 2.69 (6), 3.92 (5), 2.79 (5), 2.21 (5)

Chemistry:

	(1)	(2)
P_2O_5	3.73	
As_2O_5	23.05	26.54
Al_2O_3	10.85	11.77

CuO	36.38	36.73
H_2O	25.01	24.96
Total	100.00	100.00

(1) Cornwall, England. (2) $Cu_2Al(AsO_4)(OH)_4 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of some copper deposits.

Association: Olivenite, chalcophyllite, clinoclase, cornwallite, strashimirite, malachite, cuprite, "limonite".

Distribution: In England, in Cornwall, large crystals from Wheals Muttrell and Gorland, also Wheal Unity and the Ting Tang mine, near Gwennap; from Wheal Cock, St. Just. In Germany, in Saxony, from Schwarzenberg; at the Sadisdorf copper mine, near Schmiedeberg; in the Altväter samt Eschig mine, near Sayda; and from Ullersreuth, near Hirschberg, Thuringia. At Špania Dolina (Herrengrund), and at L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In the Preobrazhensky mine, Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and at Bisbee, Cochise Co., Arizona.

Name: From the Greek for *pale* and *powder*, for its pale blue to green streak.

Na_2O	10.84
K_2O	0.01
Total	100.26

(1) Liset eclogite pod, Norway; by electron microprobe, average of 15 analyses; corresponds to $(Ca_{0.98}Fe_{0.01})_{\Sigma=0.99}Na_{1.96}Al_{3.99}Si_{4.02}O_{16}$.

Occurrence: Formed by retrograde metamorphism of a Na, Al-rich and K, Mg-poor eclogite pod in the highest pressure part of the greenschist, amphibolite, or granulite facies.

Association: Taramite, jadeite, hematite, ilmenite, högbomite, albite, quartz.

Distribution: In the Liset eclogite pod, Selje district, southwestern Norway.

Name: For the Liset eclogite pod, Norway.

Type Material: Natural History Museum, Paris, France, G201b7; University of Pavia, Pavia, Italy, G201b.

Lishizhenite $ZnFe_2^{3+}(SO_4)_4 \cdot 14H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are tabular to prismatic, elongated along [100], to 8 mm, showing {010}, {100}, {001}, typically in aggregates.

Physical Properties: *Cleavage:* On {010}, nearly perfect; on {001}, poor. Hardness = 3.5 D(meas.) = 2.206 D(calc.) = 2.201 Soluble in H_2O; becomes dull and dark red or yellowish brown on exposure to air.

Optical Properties: Transparent if fresh. *Color:* Pale violet to yellowish brown; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* OAP $\wedge$ {010} = 86°. *Dispersion:* $r > v$, strong.
$\alpha = 1.522(2)$ $\beta = 1.568(1)$ $\gamma = 1.578(4)$ 2V(meas.) = 47°

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.477(1)$ $b = 15.298(3)$ $c = 6.309(1)$ $\alpha = 90.20(1)°$ $\beta = 101.11(1)°$ $\gamma = 93.97(1)°$ Z = 1

X-ray Powder Pattern: Xitieshan mine, China.
4.79 (100), 3.61 (78), 5.07 (70), 4.06 (68), 3.98 (38), 2.859 (36), 4.11 (29)

Chemistry:

	(1)	(2)
SO_3	41.00	39.37
Al_2O_3	0.37	
Fe_2O_3	18.28	19.63

CaO	2.25	
Na_2O	0.02	
H_2O	29.20	31.00
Total	100.23	100.00

(1) Xitieshan mine, China; average of two analyses, Fe^{3+} confirmed by Mössbauer spectroscopy; neglecting CaO as anhydrite impurity, corresponds to $(Zn_{0.86}Mn_{0.09}Fe^{2+}_{0.01}Mg_{0.01})_{\Sigma=0.97}(Fe^{3+}_{1.96}Al_{0.06})_{\Sigma=2.02}S_{4.04}O_{16.13} \cdot 13.87H_2O$. (2) $ZnFe_2(SO_4)_4 \cdot 14H_2O$.

Occurrence: In cavities and veinlets in anhydrite in the oxidation zone of a Pb–Zn deposit.

Association: Anhydrite, römerite, copiapite, sulfur, gypsum, pyrite, quartz.

Distribution: From the Xitieshan Pb–Zn mine, south of Mt. Qilianshan, Chaidamu, Qinghai Province, China.

Name: To honor Li Shizhen (1518–1593), famous Chinese pharmacologist.

Type Material: Department of Geology, Lanzhou University, Lanzhou; Geology Museum, Beijing, China.

Lisiguangite $CuPtBiS_3$

Crystal Data: Orthorhombic. *Point Group*: 2 2 2. Crystals, tabular or lamellar on {010}, elongated along [100], to 2 mm.

Physical Properties: *Cleavage*: Perfect on {010}, distinct on {001}, visible on {100}. *Fracture*: Stepped. *Tenacity*: Brittle. Hardness = 2.5 VHN = 46.7–49.8 (25 g load). D(meas.) = n.d. D(calc.) = 7.42

Optical Properties: Opaque (?). *Color*: n.d.; in reflected light, bright white with a yellowish tint. *Streak*: n.d. *Anisotropism*: Weak to moderate; blue-green to brown. Parallel extinction. *Luster*: n.d.
Optical Class: n.d.
R_1-R_2: (470) 39.2-36.7, (546) 40.3-37.3, (589) 40.7-37.9, (650) 40.8-37.9

Cell Data: *Space Group*: $P2_12_12_1$. a = 7.7152(15) b = 12.838(3) c = 4.9248(10) Z = 4

X-ray Powder Pattern: Yanshan Mountains, Hebei Province, China.
3.03 (100), 3.24 (80), 1.865 (60), 2.14 (50), 2.27 (40), 6.40 (30), 1.423 (30)

Chemistry:

	(1)	(2)
Cu	12.98	11.27
Pd	2.69	
Pt	30.04	34.60
Bi	37.65	37.70
S	17.55	17.06
Total	100.91	100.00

(1) Yanshan Mountains, Hebei Province, China; average of 8 electron microprobe analyses, corresponding to $Cu_{1.10}(Pt_{0.83}Pd_{0.14})_{\Sigma=0.97}Bi_{0.97}S_{2.96}$. (2) $CuPtBiS_3$.

Mineral Group: Lapieite group.

Occurrence: Of contact metamorphic origin, along veins in an exoskarn associated with mafic igneous rocks (garnet pyroxenite).

Association: From a heavy mineral concentrate with chalcopyrite, bornite, galena, carrolite, molybdenite, pyrite, tenorite, daomanite, Co-bearing malanite, sperrylite, moncheite, cooperate, damiaoite, yixunite, malyshevite.

Distribution: Near Sandao Village, 250 km northeast of Beijing, Yanshan Mountains, Hebei Province, China.

Name: Honors Chinese geologist, Li Siguang (J.S. Lee) (1889–1971), Minister of Geology of China (1952–1971), Vice President of the Chinese Academy of Sciences, and Chairman of the China National Association of the Sciences.

Type Material: Geological Museum of China, Beijing (cat. no. M-11031).

References: (1) Yu, Z., F. Cheng, and H. Ma (2009) Lisiguangite, $CuPtBiS_3$, a new platinum-group mineral from the Yanshan Mountains, Hebei, China. Acta Geol. Sinica, 83, 238–244.

Liskeardite $(Al, Fe^{3+})_3(AsO_4)(OH)_6 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Radially fibrous, in incrustations, to 6 mm thick.

Physical Properties: Hardness = Soft. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* White, pale shades of green, blue, or brown; colorless in transmitted light.
Optical Class: Biaxial (+). *Orientation:* Z = elongation. $\alpha = 1.661$ $\beta = 1.675$ $\gamma = 1.689$
2V(meas.) = $\simeq 90°$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Type material gives a poor X-ray pattern.

Chemistry:

	(1)	(2)
SO_3	1.11

Total	99.74	100.00

(1) Liskeard, England. (2) $(Al, Fe)_3(AsO_4)(OH)_6 \cdot 5H_2O$ with Fe:Al = 1:6.

Occurrence: An oxidation product of arsenic-bearing sulfides.

Association: Scorodite, arsenopyrite, chalcopyrite, pyrite, quartz (Liskeard, England).

Distribution: In England, from the Marke Valley mine, Liskeard, and at the Penberthy Croft mine, St. Hilary, Cornwall. From the Cap Garonne mine, near le Pradet, Var, France. In the Tannenberg tin mine, Mühlleithen, Saxony, Germany.

Name: For its first-noted occurrence, near Liskeard, England.

Type Material: The Natural History Museum, London, England, 50821.

Litharge **PbO**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As alteration rims on other lead minerals, and as crusts.

Physical Properties: *Cleavage:* {110}. Hardness = 2 D(meas.) = 9.14 (synthetic). D(calc.) = [9.35]

Optical Properties: Transparent. *Color:* Red; red to red-orange in transmitted light. *Luster:* Greasy to dull.
Optical Class: Uniaxial (–). $\omega = 2.665$ (Li). $\epsilon = 2.535$ (Li).

Cell Data: *Space Group:* $P4/nmm$ (synthetic). $a = 3.9729$ $c = 5.0217$ Z = 2

X-ray Powder Pattern: Synthetic.
3.115 (100), 2.809 (62), 1.872 (37), 1.675 (24), 2.510 (18), 1.542 (11), 1.988 (8)

Chemistry: Analyses of natural material are not available.

Occurrence: As an alteration product of other lead-bearing minerals.

Association: Lead, galena, massicot, plattnerite, hydrocerussite.

Distribution: In the USA, from Cucamonga Peak, San Bernardino Co., California, and from near Hailey, Mineral Hill district, Blaine Co., Idaho. In the Ilímaussaq intrusion, Greenland. At Mežica (Mies), Slovenia. From Laurium, Greece, in slag. At Långban, Värmland, Sweden. In Germany, from Urberg, St. Blasien, and Badenweiler, Black Forest. Probably more common than indicated here.

Name: From the Greek word given by Dioscorides to the lead oxide obtained in parting lead from silver by fire metallurgy; a name long applied to the synthetic product.

K_2O	10.92	5.82	11.83
Total	99.78	99.49	100.00

(1) Vesuvius, Italy; average of two analyses of undoubtedly contaminated samples. (2) Do.; considered to contain tridymite ~40%. (3) $KNaCuSi_4O_{10}$.

Occurrence: In lapilli strongly modified by fumerolic action subsequent to the 1873 eruption of Vesuvius.

Association: Tridymite, wollastonite, glass.

Distribution: Found in the crater of Vesuvius, Campania, Italy.

Name: From the Greek for *pebble*, [Greek diminutive of *lithos*, for *stone*; *lithidion* in English, *litidion* in Italian] presumably for the size and shape of the lapilli on which the mineral occurs.

Type Material: Natural History Museum, Paris, France, 99.788.

H_2O	[1.55]
Total	[98.9]

(1) Foote mine, North Carolina, USA; by electron microprobe, Li by ion microprobe, H_2O calculated from stoichiometry; corresponds to $Li_{1.01}Ca_{1.98}(Mn_{1.35}Fe_{0.56}Mg_{0.10})_{\Sigma=2.01}H_{1.00}Si_5O_{15}$.

Occurrence: In small vugs within a complex Li-Sn-rich pegmatite.

Association: Tetrawickmanite, brannockite, parsettensite, bavenite, fluorapatite, albite, pyrite.

Distribution: At the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA.

Name: As the *lithium* analogue of *marsturite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 165268, 165460.

References: (1) Peacor, D.R., P.J. Dunn, J.S. White, Jr., J.D. Grice, and P.H. Chi (1990) Lithiomarsturite, a new member of the pyroxenoid group, from North Carolina. Amer. Mineral., 75, 409–414.

Lithiophilite $Li(Mn^{2+},Fe^{2+})PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Sharply terminated crystals may show {010}, {011}, {021}, {111}, with {100}, {110}, {130}, {140}; commonly as crudely anhedral crystals and cleavages, to 1 m. *Twinning:* Rare contact twins on {130}.

Physical Properties: *Cleavage:* On {100}, perfect; on {010}, good. *Fracture:* Uneven to subconchoidal. Hardness = 4–5 D(meas.) = 3.445–3.50 D(calc.) = 3.433

Optical Properties: Transparent to translucent. *Color:* Clove-brown, yellowish brown, honey-yellow, salmon-pink, blue-gray, gray, typically surficially black from alteration; colorless to pale yellow or pink in transmitted light. *Streak:* White to grayish white. *Luster:* Vitreous to subresinous.
Optical Class: Biaxial (+). *Pleochroism:* None to weak; X = deep pink; Y = pale greenish yellow; Z = pale pink. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, strong.
$\alpha = 1.663–1.696$ $\beta = 1.667–1.700$ $\gamma = 1.674–1.702$ 2V(meas.) = 48°–70°

(1) Buckfield, Maine, USA. (2) Foote mine, North Carolina, USA; by electron microprobe, total Fe as FeO, total Mn as MnO, Li_2O by difference. (3) $Li(Mn,Fe)PO_4$ with Mn:Fe = 1:1.

Mineral Group: Forms a series with triphylite.

Occurrence: A late-stage mineral in some complex granite pegmatites; usually primary but rarely secondary.

Association: Sicklerite, purpurite, huréaulite, numerous Fe–Mn phosphates and oxides.

Distribution: In the USA, from Branchville, Fairfield Co., and in the Strickland quarry, Portland, Middlesex Co., Connecticut; at several places in Maine, as Buckfield and Norway, Oxford Co., and Poland, Androscoggin Co.; in the Custer Mountain mine, and elsewhere in Custer Co., South Dakota; good crystals from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina; in the Harding mine, Dixon, Taos Co., New Mexico; in the White Picacho district, Yavapai Co., Arizona; at several mines in the Pala district, San Diego Co., California. In Canada, from the Tanco mine, Bernic Lake, Manitoba. From the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda, Portugal. In the Viitaniemi pegmatite, near Eräjärvi, Finland. Large masses in the Blesberg mine, Noumas pegmatite, Northern Cape Province, South Africa. From Karibib, Namibia. In the Buranga pegmatite, near Gatumba, Rwanda. At Wodgina, Western Australia. Several other localities are known.

Name: For its *lithium* content and the Greek for *friend*.

Type Material: Yale University, New Haven, Connecticut, USA, 3.5641, 3.5645.

Lithiophorite $(Al,Li)Mn^{4+}O_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Very rarely in hexagonal crystals, to 1 cm; commonly scaly or very fine-grained, botryoidal, compact. *Twinning:* Sectoring observed on the basal plane of crystals may be due to twinning.

Physical Properties: *Cleavage:* {0001}, micaceous. *Tenacity:* Sectile, laminae somewhat flexible. Hardness = 2.5–3 D(meas.) = 3.14–3.37 D(calc.) = [3.30]

Optical Properties: Opaque. *Color:* Bluish black; light gray to dark brownish gray in reflected light. *Streak:* Blackish gray to greenish black. *Luster:* Dull to metallic.
Optical Class: Uniaxial. *Pleochroism:* Very strong. *Anisotropism:* Extreme; light gray to dark brown to bluish gray.

(1) Schneeberg, Germany. (2) Gloucester Farm, Postmasburg, South Africa; Mn^{4+}:Mn^{3+} assumed; corresponds to $(Al_{0.69}Li_{0.32})_{\Sigma=1.01}(Mn^{4+}_{0.66}Mn^{3+}_{0.34})_{\Sigma=1.00}O_2(OH)_2$.

Occurrence: A relatively common constituent of "wad" in the oxidized zones of hydrothermal ore deposits and sedimentary manganese deposits; in banded iron formations; from lithium-rich granite pegmatites; in some lateritic soils and bauxites.

Association: Cryptomelane, hollandite, braunite, nsutite, pyrolusite, bixbyite, gibbsite, kaolinite, hematite.

Distribution: From Schneeberg and Eibenstock, Saxony; at St. Andreasberg, Harz Mountains; from Saalfeld, Thuringia; and elsewhere in Germany. At Krosnowice (Rengersdorf), Silesia, Poland. From Salmchâteau, Belgium. At the Lecht mines, Tomintoul, Baniffshire, Scotland. In the USA, from Charlottesville, Virginia; on White Oak Mountain, Bradley Co., Tennessee; in the Artillery Mountains, Mohave Co., Arizona. In Sima Menor cave, Mt. Sarisariñama, Venezuela. On Groote Eylandt, Northern Territory, Australia. In the Sundargarh district, Orissa, India. Large crystals from Gloucester Farm, Postmasburg district, Transvaal, South Africa. At Kobokobo, Kivu Province, Congo (Zaire). Other localities are known, but some require modern confirmation.

Name: For its content of LITHIum and the Greek for *to bear*.

Lithiophosphate Li_3PO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are elongated along [010], showing prominent {110}, {101}, with {010}, {013}, {001}, to 5 cm; typically as cleavages.

Physical Properties: *Cleavage:* Perfect on {010}; distinct on {110}, may be a parting. Hardness = 4 D(meas.) = 2.46–2.478 D(calc.) = 2.479 (synthetic). Turquoise-blue cathodoluminescence. Slightly soluble in hot H_2O.

Optical Properties: Transparent in thin flakes. *Color:* Colorless, white, may be pale rose or buff. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. α = 1.550–1.553 β = 1.557–1.558 γ = 1.566–1.567 2V(meas.) = 69°– ∼80°

Cell Data: *Space Group:* $Pmn2_1$ (synthetic). $a = 6.1155$ $b = 5.2340$ $c = 4.8452$ Z = 2

(1) Mt. Okhmyl'k, Russia; after deduction of 1.04% quartz, 1.38% montebrasite, 1.33% apatite, corresponds to $Li_{3.00}(PO_4)_{1.00}$. (2) Li_3PO_4.

Occurrence: Formed by hydrothermal replacement of montebrasite in the core of a granite pegmatite in amphibolite (Mt. Okhmyl'k, Russia); in a lithium-rich granite pegmatite (Foote mine, North Carolina, USA).

Association: Montebrasite, apatite, quartz, spodumene, lepidolite, beryl, elbaite, pollucite, tantalite, cassiterite, microcline (Mt. Okhmyl'k, Russia); leucophosphite, huréaulite, switzerite, jahnsite, rockbridgeite (Tip Top mine, South Dakota, USA).

Distribution: On Mt. Okhmyl'k, Voron'i massif, Kola Peninsula, Russia. In the USA, from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina; at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. Large crystals in the Tanco pegmatite, Bernic Lake, Manitoba, Canada.

Name: For its content of *lithium* and *phosphate*.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3347; Vernadsky Geological Museum, Moscow, 48601; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 58501.

Lithiotantite $Li(Ta,Nb)_3O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In rough crystals, equant, to 0.4 mm.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 1200 (40 g load). D(meas.) = 7.0 D(calc.) = 7.08 Weak yellow-green cathodoluminescence.

Optical Properties: Transparent. *Color:* Colorless, creamy pink to brownish pink when included by cassiterite; grayish white under reflected light. *Luster:* Adamantine.
Optical Class: Biaxial; strong birefingence. *Dispersion:* Strong. $n = > 1.9$ 2V(meas.) = n.d. *Anisotropism:* Weak.
R_1–R_2: (486) 18.6–18.5, (553) 18.5–18.3, (589) 18.6–18.3, (656) 19.1–19.0

Cell Data: *Space Group:* $P2_1/c$. $a = 7.444$ $b = 5.044$ $c = 15.255$ $\beta = 107.18°$ Z = 4

X-ray Powder Pattern: "Eastern Kazakhstan".
2.96 (100), 1.722 (80), 1.451 (80), 1.772 (60b), 4.13 (5), 2.490 (5), 1.900 (5)

Chemistry:

	(1)
Nb_2O_5	24.96
Ta_2O_5	71.55
SnO_2	0.57
Li_2O	2.33
Total	99.41

(1) "Eastern Kazakhstan"; by electron microprobe, Li_2O by AA; corresponds to $Li_{0.92}(Ta_{1.90}Nb_{1.10}Sn_{0.02})_{\Sigma=3.02}O_8$.

Occurrence: In microcline-albite zones of granite pegmatites.

Association: Lepidolite, apatite, albite, thoreaulite, cassiterite, rankamaite, irtyshite ("Eastern Kazakhstan"); cassiterite, calciotantite, microlite, thoreaulite, cesplumtantite (Manono pegmatite, Congo).

Distribution: From the Ognevka tantalum deposit, Kalba Mountains, eastern Kazakhstan. In the Manono pegmatite, Katanga Province, Congo (Shaba Province, Zaire).

Name: For LITHIum and TANTalum in its composition.

Type Material: Mining Institute, St. Petersburg, 1655/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82543.

References: (1) Voloshin, A.V., Y.A. Pakhomovskii, V.I. Stepanov, and F.N. Tyusheva (1983) Lithiotantite $Li(Ta,Nb)_3O_8$ – a new mineral from granite pegmatites in Eastern Kazakhstan. Mineral. Lithosite $K_6Al_4Si_8O_{25}\cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* n.d. As irregular, typically rounded grains, to 3 mm; as granular aggregates.

Physical Properties: *Fracture:* Conchoidal. Hardness = 5.5 VHN = 412–824, 559 average (50–70 g load). D(meas.) = 2.51(1) D(calc.) = 2.54 Turns bright pink on irradiation with X-rays, which persists for at least 8 months.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = colorless; Z = bright rose. *Orientation:* $Z = b$; $Y \simeq a$; $X \simeq c$. $\alpha = 1.510(2)$ $\beta = 1.513(2)$ $\gamma = 1.527(2)$ 2V(meas.) = 47°

Cell Data: *Space Group:* n.d. $a = 15.197$ $b = 10.233$ $c = 8.435$ $\beta = 90.21°$ Z = 2

X-ray Powder Pattern: Khibiny massif, Russia.
3.07 (100), 3.46 (84), 3.26 (84), 3.16 (84), 2.10 (83), 2.82 (73), 2.05 (50)

Chemistry:

	(1)	(2)
SiO_2	50.0	49.6
Al_2O_3	20.7	20.4
K_2O	28.4	28.0
LOI	2.34	2.34
Total	101.44	100.34

(1–2) Khibiny massif, Russia; by electron microprobe, loss on ignition taken as H_2O; average corresponds to $K_{5.84}Al_{3.94}Si_{8.08}O_{25}\cdot 2.53H_2O$.

Occurrence: A secondary mineral from the weathering of ultraperalkalic pegmatite veins cutting nepheline syenites in a differentiated alkalic massif.

Association: Shafranovskite, lomonosovite, lamprophyllite, catapleiite, koashvite, zirsinalite, sodalite, aegirine, pectolite, molybdenite.

Distribution: In the Vuonnemiok River region, Khibiny massif, Kola Peninsula, Russia.

Name: From the Greek *lithos*, for *stone*, as the mineral is composed of the most abundant chemical elements of the crust of the earth.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity; Mineralogical Museum, St. Petersburg University, St. Petersburg, 17073; Mining Institute, St. Petersburg, 1633/1; A.E. Total	99.42	99.6	100.00

(1) Binntal, Switzerland. (2) Do.; by electron microprobe. (3) $Pb_9As_{13}S_{28}$.

Occurrence: Of hydrothermal origin.

Association: Pyrite, sphalerite.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: In honor of George D. Liveing (1827–1924), Professor of Chemistry, Cambridge University, Cambridge, England.

Type Material: n.d.

Livingstonite $HgSb_4S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As needles elongated [010], to 12 cm; also fibrous, massive, columnar, and in globular masses and interlaced needles. *Twinning:* Twin gliding postulated. Polysynthetic-twinninglike features noted in polished section.

Physical Properties: *Cleavage:* Perfect on {001}, poor on {010} and {100}. *Tenacity:* Flexible. Hardness = 2 VHN = 96–125 (100 g load). D(meas.) = 4.8(2); 4.88(2) (synthetic). D(calc.) = 4.98

Optical Properties: Opaque, translucent in thin fragments. *Color:* Blackish gray; in polished section, white; red in transmitted light, with deep red internal reflections. *Streak:* Red. *Luster:* Adamantine to metallic.
Optical Class: Biaxial (–). *Pleochroism:* Weak. *Orientation:* $Z = b$. $n = > 2.72$
Anisotropism: Strong.

Total	100.00	101.2	100.00

(1) Huitzuco, Mexico; recalculated after deduction of 13-16% impurities. (2) Do.; by electron microprobe. (3) $HgSb_4S_8$.

Occurrence: In low-temperature hydrothermal veins.

Association: Cinnabar, stibnite, sulfur, gypsum.

Distribution: In Mexico, from the La Cruz mine, Huitzuco, Guerrero [TL]; and at the Trinidad mine, Guadalcázar, San Luis Potosí. From the Matsuo mine, Iwate Prefecture, Japan. At Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan. From Pedrosa del Rey, León, Spain.

Name: Honors David Livingstone (1813–1873), Scottish explorer and missionary in Africa.

Lizardite $Mg_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal, pseudo-orthorhombic. *Point Group:* $3m$ (1A); $6mm$ ($2H_1$). Crystals rare, to 2 mm, as trigonal plates to truncated trigonal pyramids. Commonly as extremely fine-grained scales and massive aggregates.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Crystals are easily bent. Hardness = 2.5 D(meas.) = 2.55(3) D(calc.) = 2.57

Optical Properties: Translucent. *Color:* Green, light yellow to white; colorless to pale green in thin section. *Luster:* Waxy.
Optical Class: Uniaxial (–) to slightly biaxial (–). α = 1.538–1.554 β = 1.546–1.560 γ = 1.546–1.560 2V(meas.) = Small.

Cell Data: *Space Group:* $P31m$ (1A). $a = 5.325(5)$ $c = 7.259(7)$ Z = 2, or *Space Group:* $P6_3cm$ ($2H_1$). $a = 5.318(4)$ $c = 14.541(7)$ Z = [4]

X-ray Powder Pattern: Kennack Cove, England (1A).
7.4 (100), 2.505 (100), 4.6 (80), 3.67 (80), 2.156 (80), 1.538 (80), 1.505 (80)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	44.29	41.80	FeO		1.81
TiO_2	0.03		MgO	40.43	40.69
Al_2O_3	2.18	2.79	CaO	0.03	
Fe_2O_3	0.50		H_2O^+	12.42	[12.90]
			Total	99.88	[99.99]

(1) Kennack Cove, England; corresponds to $(Mg_{2.74}Al_{0.12}Fe^{3+}_{0.02})_{\Sigma=2.88}Si_{2.00}O_{5.13}(OH)_{3.87}$.
(2) Coli, Italy; by electron microprobe, $2H_2O$ assumed; corresponds to $(Mg_{2.82}Al_{0.09}Fe_{0.07})_{\Sigma=2.98}(Si_{1.94}Al_{0.06})_{\Sigma=2.00}O_5(OH)_4$.

Polymorphism & Series: 1A, 6A, $2H_1$ polytypes; polymorphous with antigorite, clinochrysotile, orthochrysotile, and parachrysotile; forms a series with népouite.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Typically a product of retrograde metamorphism, replacing olivine, orthopyroxene, or other minerals in ultramafic igneous rocks.

Association: Chrysotile, brucite, magnetite.

Distribution: Probably the most common serpentine mineral. A few prominent localities for well-studied material include: at Kennack Cove, The Lizard, Cornwall, England. On Unst, Shetland Islands, Scotland. From near Val Sissone, Lombardy, and Val Trebbia, Piacenza, Italy. In Japan, from Maruo Odori and Kodo, Yamaguchi Prefecture, and at Hamao, Fukuoka Prefecture. At Woodsreef, New South Wales, Australia. From the Jeffrey mine, Asbestos, Quebec, and the Cassiar mine, British Columbia, Canada. In the USA, in the Stillwater complex, Montana.

Name: For the type locality, the Lizard complex, Cornwall, England.

Type Material: The Natural History Museum, London, England, 1955,243; National Museum of Natural History, Washington, D.C., USA, 114569.

(1) Pyörönmaa pegmatite, Finland; by electron microprobe, CO_2 and H_2O by "conventional procedures," corresponds to $Ca_{0.23}RE_{3.85}(C_{1.05}O_3)_7 \cdot 3.85H_2O$. (2) Kirigo, Japan; by ICP, corresponds to $Ca_{1.03}(Y_{2.00}Gd_{0.45}Nd_{0.40}Dy_{0.35}Sm_{0.24}Er_{0.14}Eu_{0.11}Tb_{0.07}Ho_{0.06}Yb_{0.04}Pr_{0.04}Ce_{0.03}Tm_{0.02}La_{0.02}Lu_{0.01})_{\Sigma=3.98}(CO_3)_{7.00} \cdot 8.60H_2O$. (3) $CaY_4(CO_3)_7 \cdot 9H_2O$.

Occurrence: A secondary mineral formed by alteration of primary rare-earth minerals.

Association: Tengerite-(Y) (Pyörönmaa pegmatite, Finland); lanthanite, kimuraite-(Y) (Kirigo, Japan).

Distribution: From the Pyörönmaa pegmatite, Kangasala, Finland. At Ytterby, on Resarö Island, near Vaxholm, and in the Åskagen pegmatite quarry, Värmland, Sweden. In Japan, from Kirigo and Yokatake, Higashi Matsuura district, Saga Prefecture, and at Lisaka, Date district, Fukushima Prefecture. In the Evans-Lou quarry, near Hull, Quebec, Canada.

Name: To honor Professor Lauri Lokka (1885–1966), Finnish mineralogist and Chief Chemist, Geological Survey of Finland, Helsinki, Finland.

Type Material: n.d.

References: (1) Perttunen, V. (1970) Lokkaite, a new hydrous RE-carbonate from Pyörönmaa pegmatite in Kangasala, SW-Finland. Bull. Geol. Soc. Finland, 43(1), 67–72. (2) (1971) Amer. (1) Drum's Farm, Alexander Co., North Carolina, USA. (2) Cligga Head, Cornwall, England; by electron microprobe. (3) $FeAs_2$.

Polymorphism & Series: Forms a series with safflorite.

Mineral Group: Löllingite group.

Occurrence: In mesothermal deposits associated with other sulfides and with calcite gangue; also in pegmatites.

Association: Skutterudite, bismuth, nickeline, nickel-skutterudite, siderite, calcite.

Distribution: In Austria, from Lölling, near Hüttenberg, Carinthia [TL]; and at Schladming, Styria. From Reichenstein, Silesia, Poland. At St. Andreasberg, in the Harz Mountains, Germany. From Guadalcanal, in the Sierra Morena, Seville Province, Spain. In Norway, in the Langesundfjord district. In the USA, from Mt. Mica, near Paris, Oxford Co., Maine; from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in Colorado, from several mines in Gunnison Co.; large masses were found in the Ingersoll mine, near Keystone, Pennington Co., South Dakota. In Canada, from a number of mines at Cobalt, Ontario. From Broken Hill, New South Wales, Australia. Also from numerous minor localities.

Name: For the Austrian locality at Lölling.

Lomonosovite $Na_5Ti_2O_2(Si_2O_7)(PO_4)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Thin lamellar crystals, to 7 cm; also in scaly masses. *Twinning:* Around [100], composition plane {001}, simple contact to finely polysynthetic twinning.

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 2.88–3.13 D(calc.) = [3.04]

Optical Properties: Transparent in thin plates. *Color:* Cinnamon-brown, rose-violet, light yellow, black; dark brown in thin section. *Streak:* Light rose-cinnamon. *Luster:* Vitreous to adamantine on cleavages, greasy on fractures.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = yellow, pale yellow, nearly colorless; Y = brownish, yellow-orange, lilac; Z = yellowish brown, dark brown, dark blackish brown. *Orientation:* $X \wedge$ cleavage = 61°–66°; $Y \wedge$ cleavage = 59°-65°; $Z \wedge$ cleavage = 37°–41°. *Absorption:* $Z > Y > X$. α = 1.654–1.670 β = 1.736–1.750 γ = 1.764–1.778 2V(meas.) = 56°–69°

Cell Data: *Space Group:* $P\bar{1}$. $a = 5.49$ $b = 7.11$ $c = 14.50$ $\alpha = 101°$ $\beta = 96°$ $\gamma = 90°$ Z = 2

X-ray Powder Pattern: Lovozero massif, Russia.

(1) Lovozero massif, Russia. (2) Ilímaussaq intrusion, Greenland; by electron microprobe, average of six analyses; original analysis given as Si 11.19%, Ti 18.63%, Nb 0.38%, Fe 0.58%, Ca 0.40%, Na 21.99%, P 6.21%, here recalculated to oxides. (3) $Na_5Ti_2O_2(Si_2O_7)(PO_4)$.

Occurrence: In nepheline syenites and pegmatites cutting them (Lovozero massif, Russia); in lavas and gabbros near contacts with nepheline syenite (Ilímaussaq intrusion, Greenland).

Association: Nepheline, albite, pectolite, lorenzenite, ussingite, lamprophyllite, eudialyte, arfvedsonite, villiaumite, aegirine, and many other species.

Distribution: Widespread in the Lovozero massif, and on Mt. Rasvumchorr, Khibiny massif, Kola Penninsula, Russia. On the Kvanefjeld Plateau, in the Ilímaussaq intrusion, southern Greenland.

Name: For Mikhail Vasil'evich Lomonosov (1711–1765), Russian mineralogist and naturalist.

Type Material: n.d.

Londonite $(Cs, K, Rb)Al_4Be_4(B, Be)_{12}O_{28}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $[\bar{4}3m]$ (by analogy to rhodizite). As portions of Cs-rich material heterogenously distributed throughout crystals, patchy, exsolutionlike, and in veinlets; crystals may show dominant {110}, modified by {111}, {221}, {211}, rare {100}, to 7 cm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 8
D(meas.) = 3.34 D(calc.) = 3.42 [Strongly piezoelectric and pyroelectric.]

Optical Properties: Transparent to translucent. *Color:* Colorless, white, sulfur-yellow, pale yellow, pale yellow-green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.693$

Cell Data: *Space Group:* $P\bar{4}3m$. $a = 7.3205(3)$ $Z = 1$

X-ray Powder Pattern: Antandrokomby, Madagascar (very similar to rhodizite).
2.9898 (100), 2.1132 (70), 2.4410 (50), 1.7759 (40), 3.276 (35), 1.9568 (35), 2.2076 (30)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	0.07	0.45	Na_2O	0.11	0.12
B_2O_3	[47.39]	46.82	K_2O	2.21	1.79
Al_2O_3	25.10	24.41	Rb_2O	1.04	1.83
Fe_2O_3	0.06	0.12	Cs_2O	8.37	7.54
BeO	[15.49]	12.20	H_2O^+		4.10
MnO	0.05		H_2O^-		0.53
CaO	0.14		Total	[100.07]	[99.91]
Li_2O	0.04	0.00			

(1) Antandrokomby, Madagascar; by electron microprobe, average of five analyses, B_2O_3 and BeO calculated for stoichiometry; corresponds to $(Cs_{0.48}K_{0.38}Rb_{0.09}Na_{0.03}Ca_{0.02}Mn_{0.01})_{\Sigma=1.01}(Al_{3.98}Li_{0.02}Fe_{0.01})_{\Sigma=4.01}Be_{4.00}(B_{10.99}Si_{0.01}Be_{1.00})_{\Sigma=12.00}O_{28.00}$. (2) Manjaka, Madagascar; original total given as 99.92%, neglecting impurities and H_2O, corresponds to $(Cs_{0.45}K_{0.32}Rb_{0.16}Na_{0.03})_{\Sigma=0.96}Al_{4.08}Be_{4.00}(B_{11.48}Be_{0.15})_{\Sigma=11.63}O_{28.00}$.

Occurrence: An uncommon component of granite pegmatites, in the central zones and in miarolitic cavities.

Association: Rhodizite, danburite, elbaite–liddicoatite–schorl, Cs-rich beryl, spodumene, Mn-rich apatite, hambergite, microlite, manganocolumbite, manganotantalite, béhierite, hafnian zircon, albite, microcline, quartz.

Distribution: In Madagascar, from Antandrokomby, near Mt. Bity, Manandona Valley, Antsirabe district; at Antsongombato and Ampanivana, south of Mahaiza, and from Manjaka, Betafo region.

Name: To honor Dr. David London (1953–), Professor of Geology and Geophysics, University of Oklahoma, Norman, Oklahoma, USA, for his contributions to the understanding of granite pegmatites.

Type Material: Museum of Natural History, Milan, Italy, M31115; Department of Geology and Geophysics, New Orleans, USA.

Lonecreekite $(NH_4)(Fe^{3+}, Al)(SO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Xenomorphic crystals, to 0.1 mm, aggregated in sugary crusts and efflorescences.

Physical Properties: Hardness = "Very soft". D(meas.) = 1.693 D(calc.) = 1.691
Soluble in H_2O, leaving brown $Fe(OH)_3$; dehydrates to sabieite.

Optical Properties: Transparent. *Color:* Colorless to white. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.483$

Cell Data: *Space Group:* $Pa3$. $a = 12.302$ $Z = 4$

X-ray Powder Pattern: Lone Creek Fall Cave, South Africa.
4.356 (100), 7.12 (70), 3.289 (65), 4.107 (60), 5.505 (50), 5.027 (25), 1.945 (20)

Chemistry:

	(1)
SO_3	33.49
Al_2O_3	1.69
Fe_2O_3	13.04
K_2O	0.02
$(NH_4)_2O$	5.34
H_2O	45.60
insol.	0.77
Total	99.95

(1) Lone Creek Fall Cave, South Africa; corresponds to $(NH_4)_{0.99}(Fe_{0.79}Al_{0.16})_{\Sigma=0.95}(S_{1.01}O_4)_2 \cdot 12.25H_2O$.

Occurrence: A rare secondary mineral probably formed by alteration of pyrite and reaction, at pH < 1, with ammonia fumes produced as the result of decay of organic matter (*Hyrax* excreta).

Association: Clairite, sabieite, tschermigite.

Distribution: On the ceiling of Lone Creek Fall Cave, near Sabie, Eastern Transvaal, South Africa.

Name: For Lone Creek Fall Cave, South Africa, its original occurrence.

Type Material: South African Geological Survey Museum, Pretoria, South Africa, LCH002.

References: (1) Martini, J.E.J. (1983) Lonecreekite, sabieite, and clairite, new secondary ammonium ferric-iron sulphates from Lone Creek Fall Cave, near Sabie, Eastern Transvaal. Ann. Geol. Surv. S. Africa, 17, 29–34. (2) (1986) Amer. Mineral., 71, 229 (abs. ref. 1).

Lonsdaleite C

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Very fine-grained aggregates, forming cubes and cubo-octahedra, to 0.7 mm; in polycrystalline aggregates, mixed with diamond.

Physical Properties: Hardness = 3 VHN = n.d. D(meas.) = > 3.20 D(calc.) = 3.51

Optical Properties: Transparent. *Color:* Grayish in crystals; also pale yellowish or brown in broken fragments. *Luster:* Adamantine.
Optical Class: [Biaxial.] n = Slightly above 2.404. *Anisotropism:* Birefringence slight, probably due to strain.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. $a = 2.51$ $c = 4.12$ Z = 4

X-ray Powder Pattern: Cañon Diablo meteorite.
2.061 (100), 1.257 (60), 2.18 (40), 1.075 (30), 1.933 (20), 1.50 (10), 1.17 (10)

Chemistry:

	(1)
C	100.0
N	0.0
Total	100.0

(1) Cañon Diablo meteorite; by electron microprobe.

Polymorphism & Series: Polymorphous with diamond, graphite, and chaoite.

Occurrence: Discovered in the residue (ca. 200 mg) from the dissolution of 5 kg of Cañon Diablo meteorite. The mineral may be formed by impact shock, or be a product of direct crystallization in the parent body.

Association: Schreibersite, cohenite, taenite, graphite, chromite, kosmochlor, sphalerite, black diamond (Cañon Diablo); troilite, graphite, diamond, schreibersite, cohenite (Allan Hills 77283).

Distribution: In the Canyon Diablo [TL], Goalpara, and Allan Hills 77283 meteorites. From placers in northern Sakha; found in soil at the Tunguska explosion site, Federated SSR, Russia. At the Nördlinger Ries Crater, Bavaria, Germany. In the Sudbury impact structure, Ontario, Canada.

Name: To honor Professor Kathleen (Yardley) Lonsdale (1903–1971), distinguished British crystallographer, University of London, London, England.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 130245.

Loparite-(Ce) $(Ce, Na, Ca)(Ti, Nb)O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As cubic or octahedral crystals, to 2 cm, which may be highly modified; overgrowing perovskite and massive. *Twinning:* Commonly as penetration twins on {111}.

Physical Properties: *Cleavage:* Imperfect on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5–6 VHN = 734–893; 908–1422 (100 g load). D(meas.) = 4.60–4.89 D(calc.) = [4.75–4.94]

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black to grayish black; dark brown in thin section, may be zoned; light gray or white with a creamy tinge and brownish red internal reflections in reflected light. *Streak:* Cinnamon-brown to brown. *Luster:* Metallic to submetallic.
Optical Class: Isotropic, anomalously anisotropic. $n = 2.26–2.38$
R: (400) 18.8, (420) 18.2, (440) 17.8, (460) 17.3, (480) 17.0, (500) 16.8, (520) 16.6, (540) 16.4, (560) 16.3, (580) 16.1, (600) 16.1, (620) 16.0, (640) 15.9, (660) 15.9, (680) 15.9, (700) 15.8

(1) Kola Peninsula, Russia. (2) Tenerife, Canary Islands; by electron microprobe, total Fe as Fe_2O_3, original total given as 100.10%; corresponding to $(Na_{0.58}Ce_{0.17}La_{0.14}Ca_{0.07}Nd_{0.03})_{\Sigma=0.99}(Ti_{0.76}Nb_{0.19}Ta_{0.01})_{\Sigma=0.96}O_3$.

Mineral Group: Perovskite group; $Ti_B > 0.5$.

Occurrence: A primary phase in differentiated nepheline syenite massifs and alkalic pegmatites; replacing perovskite in carbonatites.

Association: Nepheline, microcline, aegirine, rare-earth-bearing apatite, arfvedsonite, perovskite, ilmenite, eudialite–eucolite, titanite, lamprophyllite.

Distribution: Widespread in the Khibiny and Lovozero massifs, Kola Peninsula; in the Yllymakh massif, Aldan; large crystals from the Burpala massif, 120 km north of Lake Baikal, eastern Siberia, Russia. From Bratthagen, Lagendalen, near Larvik and Buer, Bjørkdalen, Norway. From the Gardiner complex, Kangerdlugssuaq Fjord, eastern Greenland. On Tenerife, Canary Islands. In the Schryburt Lake carbonatite, Ontario, Canada. At Sarambi and Chiriquelo, Paraguay. From the Salitre I alkaline complex, Minas Gerais, Brazil. On Boa Vista, Cape Verde Islands.

Name: From the Russian name for the Lapps, *Lopar*, inhabitants of the Kola Peninsula, Russia, first noted place of occurrence of the mineral, and for its *cerium* content.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 21043–21045.

Lopezite $K_2Cr_2O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic (synthetic). *Point Group:* $\overline{1}$. As ball-like aggregates, to 1 mm.

Physical Properties: Hardness = 2.5 D(meas.) = 2.69 D(calc.) = 2.704 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Red-orange.
Optical Class: Biaxial (+). *Pleochroism:* X = reddish yellow; X = yellow; Z = greenish yellow.
Dispersion: $r > v$, medium. $\alpha = 1.714$ $\beta = 1.732$ $\gamma = 1.805$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P\overline{1}$ (synthetic). $a = 13.367(11)$ $b = 7.376(5)$ $c = 7.445(6)$
$\alpha = 90.75(5)°$ $\beta = 96.21(7)°$ $\gamma = 97.96(5)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 27-380).
3.298 (100), 3.472(90), 3.658 (85), 4.87 (45), 3.063 (30), 3.027 (30), 2.877 (30)

Chemistry: (1) Identification depends on microchemical tests for K and CrO_4, correspondence of optical properties, and X-ray powder pattern with the synthetic compound.

Occurrence: A rare secondary mineral in vugs in massive nitrate rock.

Association: Tarapacáite, dietzeite, ulexite (Oficina Maria Elena, Chile).

Distribution: In Chile, in Tarapacá, from Oficina Rosario, Huara, Pampa del Iquique; Oficina Maria Elena, near Tocopilla, Pampa del Tocopilla; and at Zapiga.

Name: Honoring Dr. Emiliano Lòpez Saa (1871–1959), Iquique, Chile, Chilean mining engineer and mineral collector long associated with the Chilean nitrate industry.

Type Material: National Museum of Natural History, Washington, D.C., USA, C5487.

Lorandite $TlAsS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Short prisms or tabular on {201}, pyramidal, with many forms, striated parallel to [001]; needlelike to columnar, to 5 cm; granular.

Physical Properties: *Cleavage:* Excellent on {100}, very good on {201}, good on {001}. *Tenacity:* Flexible, forming cleavage lamellae and fibers, with plastic deformation. Hardness = 2–2.5 VHN = n.d. D(meas.) = 5.53 D(calc.) = 5.53

Optical Properties: Translucent to transparent. *Color:* Cochineal-red to carmine-red surface, commonly dark lead-gray, may be coated by an ocher-yellow powder. *Streak:* Cherry-red. *Luster:* Metallic, adamantine.
Optical Class: Biaxial (+) (?). *Pleochroism:* Weak; Y = purple-red; Z = orange-red.
Orientation: X, $Y \simeq \perp$ {100}; $Z = b$. *Dispersion:* $r > v$, strong. $n = > 2.72$ (Li).
2V(meas.) = Large. *Anisotropism:* Strong.
R_1–R_2: (400) 28.8–30.6, (420) 28.7–30.7, (440) 28.6–30.8, (460) 28.4–30.9, (480) 28.2–31.2, (500) 27.8–31.1, (520) 27.5–30.6, (540) 27.0–29.8, (560) 26.4–28.8, (580) 25.8–27.7, (600) 25.0–26.7, (620) 24.4–26.0, (640) 23.9–25.5, (660) 23.5–25.0, (680) 23.2–24.7, (700) 22.9–24.5

Cell Data: *Space Group:* $P2_1/a$. $a = 12.296(9)$ $b = 11.313(5)$ $c = 6.114(1)$ $\beta = 104.21(4)^\circ$ $Z = 8$

X-ray Powder Pattern: Alšar, Macedonia.
3.59 (10), 2.88 (8), 2.97 (7), 1.867 (5), 1.484(5), 5.28 (4), 2.64 (4)

(1–2) Alšar, Macedonia. (3) Carlin mine, Nevada, USA; by electron microprobe, average of five analyses. (4) $TlAsS_2$.

Occurrence: Although rare, the most widespread thallium mineral; of hydrothermal origin, typically formed at relatively low temperatures.

Association: Stibnite, realgar, orpiment, cinnabar, vrabite, greigite, marcasite, pyrite, tetrahedrite, antimonian sphalerite, arsenic, barite.

Distribution: From Alšar (Allchar), near Rošden, Macedonia [TL]. At the Dzhizhikrut Sb–Hg deposit, Tajikistan. From the Beshtau uranium deposit, near Pyatigorsk, northern Caucasus Mountains, Russia. An ore mineral in the Lanmuchang Hg–Tl deposit, Guizhou Province, China. At the Zarshuran gold deposit, near Takab, northestern Iran. From the Lengenbach quarry, Binntal, Valais, Switzerland. In the USA, at the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; in Nevada, from the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., in the Jerritt Canyon mines, Independence Mountains district, Elko Co., and from the Getchell mine, Potosi district, Humboldt Co.; in the Mercur gold deposit, Tooele Co., Utah.

Name: For Eötvös Lorand (1848–1919), physicist of Budapest, Hungary.

(1) Narssârssuk, Greenland; traces of V, Sc, Mn. (2) Tenerife, Canary Islands; by electron microprobe. (3) $Na_2Ti_2Si_2O_9$.

Occurrence: In nepheline syenites and their associated pegmatites.

Association: Aegirine, nepheline, microcline, arfvedsonite, elpidite, loparite, eudialyte, astrophyllite, mangan-neptunite, låvenite, rinkite, apatite, titanite, ilmenite.

Distribution: From Narssârssuk and in the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. Near Mt. Karnasurt, Lovozero massif, in the Khibiny massif, and the Kondor massif, Kola Peninsula; in the Inagli, Konder, and Murun massifs, near Aldan, Yakutia, Russia. At Lågendalen, near Larvik, and on Låven Island, Langesundsfjord, Norway. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. At Point of Rocks, Colfax Co., New Mexico, and in the Diamond Jo quarry, Magnet Cove, Hot Spring Co., Arkansas, USA. On Tenerife, Canary Islands.

Name: After Johannes Theodor Lorenzen (1855–1884), Danish mineralogist interested in Greenland minerals.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1967.382; Harvard University, Cambridge, Massachusetts, USA, 87917.

Loseyite $(Mn^{2+},Zn)_7(CO_3)_2(OH)_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are lathlike, elongated along [010], to 0.5 mm, in radiating bundles and subparallel aggregates.

Physical Properties: Hardness = ∼3 D(meas.) = 3.27 D(calc.) = 3.34

Optical Properties: Transparent. *Color:* Pale blue, pale brown; colorless in transmitted light. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$. *Dispersion:* $r > v$, weak. $\alpha = 1.637$ $\beta = 1.648$ $\gamma = 1.676$ 2V(meas.) = 64°

Cell Data: *Space Group:* $A2/a$. $a = 16.408(7)$ $b = 5.540(3)$ $c = 15.150(4)$ $\beta = 95.48(3)°$ Z = 4

insol.	0.16
Total	99.38

(1) Franklin, New Jersey, USA; corresponds to $(Mn_{3.49}Zn_{2.85}Mg_{0.60}Fe_{0.06})_{\Sigma=7.00}(CO_3)_{2.02}(OH)_{10.86}$. (2) Do.; by electron microprobe, average of seven analyses, not given; stated to correspond to $(Mn_{3.48}Zn_{2.99}Mg_{0.53})_{\Sigma=7.00}(CO_3)_2(OH)_{10}$.

Occurrence: A very rare mineral occurring in veinlets in massive ore in a metamorphosed stratiform zinc orebody.

Association: Pyrochroite, sussexite, chlorophoenicite, calcite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: To honor Samuel R. Losey (1830–1904), mineral collector of Franklin, New Jersey, USA.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 89344; National Museum of Natural History, Washington, D.C., USA, 95984, 162599.

Total	[100.0]	99.7

(1) Ojuela mine, Mapimí, Mexico; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O by difference; corresponds to $Ca_{0.96}(Zn_{1.07}Mn_{0.81}Fe_{0.16})_{\Sigma=2.04}(AsO_4)_{1.89}(OH,H_2O)_2$.
(2) Do.; by electron microprobe, total Mn as Mn_2O_3, H_2O by moisture evolution analyzer.

Mineral Group: Tsumcorite group.

Occurrence: In the oxidized zone of an arsenic-rich polymetallic base-metal deposit.

Association: Adamite, cryptomelane, chalcophanite, goethite.

Distribution: From the Ojuela mine, Mapimí, Durango, Mexico.

Name: To honor Julius Lothar Meyer (1830–1895), German chemist and physician, Karlsruhe Polytechnic Institute and University of Tübingen, Germany, for his contributions to chemistry.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149482.

Total	[100.0]

(1) Goose Creek quarry, Virginia, USA; by electron microprobe, H_2O by difference; corresponds to $(Na_{0.85}K_{0.09}Ca_{0.06})_{\Sigma=1.00}(Ca_{4.31}Fe_{0.56}Mg_{0.15})_{\Sigma=5.02}Zr_{4.22}(Si_{15.44}Al_{0.32})_{\Sigma=15.76}O_{40}(OH)_{10.70}\cdot 7.92H_2O$.

Occurrence: A late-stage mineral in the alteration of diabase.

Association: Ancylite, epidote, prehnite, chlorite, actinolite, stilbite, albite, zircon, apophyllite, apatite, titanite, quartz, calcite.

Distribution: In the Goose Creek quarry, Leesburg, Loudoun Co., and the Fairfax quarry, Centreville, Fairfax Co., Virginia, USA.

Name: For the occurrence in Loudoun Co., Virginia, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149397.

References: (1) Dunn, P.J. and D. Newbury (1983) Loudounite, a new zirconium silicate from Virginia. Can. Mineral., 21, 37–40. (2) (1983) Amer. Mineral., 68, 1039 (abs. ref. 1).

Loveringite $(Ca, Ce)(Ti, Fe^{3+}, Cr, Mg)_{21}O_{38}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal; metamict in part. *Point Group:* $\overline{3}$. Commonly anhedral, to 120 μm; may be acicular; as inclusions in other minerals.

Physical Properties: Hardness = n.d. VHN = 421–464; 870–933 (100 g load).
D(meas.) = n.d. D(calc.) = 4.42

Optical Properties: Opaque. *Color:* Black; white to grayish white in reflected light.
Streak: Iron-gray. *Luster:* Metallic to submetallic.
Optical Class: Uniaxial.
R: (400) — , (420) 18.2, (440) 17.7, (460) 17.4, (480) 17.0, (500) 16.8, (520) 16.5, (540) 16.4, (560) 16.4, (580) 16.5, (600) 16.5, (620) 16.5, (640) 16.5, (660) 16.5, (680) 16.6, (700) 16.5

Cell Data: *Space Group:* $R\overline{3}$. $a = 10.337(6)$ $c = 20.677(12)$ $Z = 3$

X-ray Powder Pattern: Near Norseman, Western Australia; after heating in air at 800° C.
1.433 (100), 3.037 (93), 1.589 (92), 3.384 (87), 2.465 (72), 1.791 (71), 2.129 (68)

(1) Near Norseman, Western Australia; by electron microprobe, average of five analyses, total Fe as Fe_2O_3, total V as V_2O_5, RE_2O_3 estimated from chondrite-normalized rare earth patterns; corresponds to $[Ca_{0.72}RE_{0.33}(Y, Th, U, Pb)_{0.05}]_{\Sigma=1.10}(Ti_{12.48}Fe_{3.38}Cr_{2.24}Mg_{0.92}Zr_{0.58}Al_{0.39}V_{0.21}Mn_{0.04})_{\Sigma=20.24}O_{38}$. (2) Western Laouni massif, Algeria; by electron microprobe, total Fe as Fe_2O_3; corresponds to $[Ca_{1.13}(Ti_{14.66}Fe_{3.21}Cr_{1.02}Mg_{0.71}Al_{0.28}Mn_{0.08}Zr_{0.02})_{\Sigma=19.98}O_{38.04}]$.

Mineral Group: Crichtonite group.

Occurrence: A late-stage mineral from residual intercumulus magma in the pyroxene, olivine-chromite, or plagioclase-rich layers of mafic intrusions.

Association: Quartz, potassium feldspar, phlogopite, enstatite, baddeleyite, apatite, zircon, titanite, rutile, ilmenite, chromite (near Norseman, Australia); rutile, pseudobrookite, ilmenite, zirconolite, spinel, pargasite, phlogopite (Western Laouni massif, Algeria).

Distribution: In the Jimberlana intrusion, near Norseman, Western Australia. From St. Christophe and La Grave, near Bourg d'Oisans, Isère, France. In Austria, in the Lohning quarry, Rayris Valley. From the Koitelainen intrusion, Lappland, Finland. In the Western Laouni massif, Hoggar Mountains, Algeria.

Name: Honors Professor John Francis Lovering (1930–), Australian geochemist, University of Melbourne, Melbourne, Australia, for his work on fission-track methods in geochemistry.

Type Material: Museum Victoria, Melbourne, Australia, M34208; National Museum of Natural History, Washington, D.C., USA, 143350.

Lovozerite $Na_2Ca(Zr,Ti)Si_6(O,OH)_{18}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* 2. As pseudododecahedral crystals, to 3 mm, and spherical aggregates. In irregular but optically continuous grains, to 3 cm. *Twinning:* Polysynthetic and penetration, common.

Physical Properties: *Cleavage:* Two directions, imperfect. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 2.38–2.71 D(calc.) = 2.69

Optical Properties: Transparent to opaque. *Color:* Red-brown, dark brown, black; in thin section, yellowish pink, with altered regions dark brown. *Streak:* Brown. *Luster:* Vitreous, resinous to dull.
Optical Class: Uniaxial (–) to biaxial (–). *Pleochroism:* Weak, yellowish to pinkish. $\omega = 1.561$ $\epsilon = 1.549$ $\alpha = 1.545$ $\beta = 1.560$ $\gamma = 1.561$ 2V(meas.) = Small.

Cell Data: *Space Group:* $C2$. $a = 10.48$ $b = 10.20$ $c = 7.33$ $\beta = 92°30'$ Z = 2

X-ray Powder Pattern: Khibiny massif, Russia.
3.21 (100), 5.37 (80), 3.64 (70), 3.32 (70), 7.33 (50), 2.969 (50), 2.635 (50)

Chemistry:

(1) Lovozero massif, Russia; corresponds to $(Na_{0.87}Ca_{0.41}Mn_{0.33}K_{0.28}Mg_{0.13}Fe_{0.06})_{\Sigma=2.08}(Zr_{0.92}Ti_{0.09})_{\Sigma=1.01}(Si_{5.95}Al_{0.05})_{\Sigma=6.00}(O,OH)_{21.28}$.

Mineral Group: Lovozerite group.

Occurrence: In nepheline syenites and associated pegmatites.

Association: Potassic feldspar, nepheline, aegirine, lamprophyllite, eudialyte, murmanite (Kola Peninsula, Russia).

Distribution: In the Lovozero and Khibiny massifs, Kola Peninsula, Russia. From the Ilímaussaq southern intrusion, Greenland. At Mont Saint-Hilaire, Quebec, Canada.

Name: For the occurrence in the Lovozero massif, Kola Peninsula, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 42701.

SO_3	52.53	52.97
MgO	14.31	14.36
Na_2O	18.58	18.92
H_2O	14.80	13.75
Total	100.22	100.00

(1) Ischl, Austria. (2) $Na_{12}Mg_7(SO_4)_{13}\cdot 15H_2O$.

Occurrence: An uncommon mineral in marine salt deposits; in efflorescences and crusts in saline playa deposits; a volcanic sublimation product.

Association: Anhydrite, gypsum, vanthoffite, blödite, langbeinite, aphthitalite, epsomite, pentahydrite, hexahydrite, kieserite, mirabilite, starkeyite, thénardite.

Distribution: From Ischl, Hallstatt, and Hall, Austria. In Germany, in the Stassfurt-Aschersleben-Bernburg potash district, Saxony-Anhalt; at Merkers, Thuringia; from Hattorf, near Philippsthal, and at Neuhof-Ellers, Hesse. In playas of the La Mancha region, Spain. Found on volcanoes on the Kamchatka Peninsula, Russia. In Turkey, from the Great Konya Basin, near Çakmak, Konya Province. In the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China. In the USA, in the Carlsbad potash district, Eddy Co., New Mexico; from northwest of Grand Junction, Mesa Co., Colorado.

Name: To honor Alexander Löwe (1808–1895), Austrian chemist, Chief Assayer at the Mint, Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria, A.x.583–A.x.585.

Total	100.46	100.00

(1) Hebei Province, China; by electron microprobe, average of five analyses, ranging from $Ag_{3.08}Hg_{0.92}$ to $Ag_{2.96}Hg_{1.04}$. (2) Ag_3Hg.

Occurrence: In a placer containing gold and other elements.

Association: Gold, lead, zinc, mercurian silver, silicates.

Distribution: From a poorly specified locality in the Luan River, Hebei Province, China [TL].

Name: For the Luan [Luan He in Mandarin Chinese] River, China, in which it is found.

Type Material: The National Geological Museum, Chinese Academy of Geological Sciences, Beijing, China.

Luberoite Pt_5Se_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Granular fragments with angular edges due to cleavage, typically elongated, to 0.5 mm, or rounded due to alluvial transport; may be enclosed in platinum. *Twinning:* Commonly polysynthetic on {001}.

Physical Properties: *Cleavage:* Good on {001} Hardness = n.d. VHN = 322–620, 461 average (15 g load). D(meas.) = 10.68–12.78 D(calc.) = 13.02

Optical Properties: Opaque. *Color:* Dark bronze; white with a greenish yellow hue in reflected light. *Luster:* Metallic.
Optical Class: Biaxial. *Pleochroism:* Low. *Anisotropism:* Very high. *Bireflectance:* Very high. R_1–R_2: (400) 39.0–44.8, (420) 40.0–45.8, (440) 41.0–47.0, (460) 42.0–48.0, (480) 43.0–49.2, (500) 44.2–50.2, (520) 45.2–51.6, (540) 46.3–52.8, (560) 47.5–53.8, (580) 48.2–54.5, (600) 49.2–55.5, (620) 50.2–56.6, (640) 51.0–57.7, (660) 52.0–58.6, (680) 52.5–59.2, (700) 52.9–59.8

Cell Data: *Space Group:* $P2_1/c$. $a = 6.584(5)$ $b = 4.602(3)$ $c = 11.10(1)$ $\beta = 101.6(1)^\circ$ $Z = 2$

X-ray Powder Pattern: Mutushi, Congo.
1.875 (100B), 2.93 (80), 1.812 (70), 5.45 (60), 3.27 (60), 2.78 (60), 2.465 (60)

Chemistry:

	(1)	(2)	(3)
Pt	75.76	75.6	75.54
Pd		0.4	
Se	24.24	24.1	24.46
Total	100.00	100.1	100.00

(1) Mutushi, Congo; by electron microprobe, average of 12 analyses; corresponds to $Pt_{5.00}Se_{3.95}$. (2) Lubero, Congo; by electron microprobe, corresponds to $(Pt_{4.95}Pd_{0.05})_{\Sigma=5.00}Se_{3.90}$. (3) Pt_5Se_4.

Occurrence: In concentrates from placers derived from granodioritic source rocks.

Association: Platinum, anatase, florencite, gorceixite, kaolinite, chlorite, quartz.

Distribution: From Mutushi, Lubero district, Kivu Province, Congo (Zaire) [TL].

Name: For its occurrence in the Lubero district, Congo.

Type Material: Royal Institute of Natural Sciences, Brussels, Belgium, RC4.215.

References: (1) Jedwab, J., B. Cervelle, G. Gouet, X. Hubaut, and P. Piret (1992) The new platinum selenide luberoite Pt_5Se_4 from the Lubero region (Kivu Province, Zaire). Eur. J. Lucasite-(Ce) $(Ce, La)Ti_2(O, OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. As discrete subhedral grains, rarely showing {001} and {101}, heavily striated ‖ [010], to 1 mm; as crystalline aggregates.

Physical Properties: *Cleavage:* Good on {001}, may be a parting. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = [6] VHN = 761–900, 824 average (10 g load). D(meas.) = n.d. D(calc.) = 5.00

Optical Properties: Translucent. *Color:* Light to dark brown, chocolate-brown, or shades of gray; brown in transmitted light; gray in reflected light, with brown internal reflections. *Streak:* White. *Luster:* Resinous.
Optical Class: Biaxial. $n = > 2.0$, with very high birefringence. 2V(meas.) = High.
Anisotropism: Weak.
R: (470) 16.6, (546) 15.6, (589) 15.3, (650) 15.0

Cell Data: *Space Group:* $C2/c$ or Cc; structure refined in $I2/a$. $a = 5.178(1)$ $b = 8.756(4)$ $c = 9.768(5)$ $\beta = 93.52(4)^\circ$ Z = 4

X-ray Powder Pattern: Argyle mine, Western Australia.
3.376 (10), 3.203 (8), 2.584 (7), 3.257 (6), 1.8306 (6), 2.225 (5), 2.541 (4)

Chemistry:

	(1)
SiO_2	0.25
TiO_2	47.93
Al_2O_3	0.04
La_2O_3	13.12
Ce_2O_3	24.99
Pr_2O_3	5.50
Nd_2O_3	5.90
MgO	0.03
CaO	0.62
Total	98.38

(1) Argyle mine, Western Australia; by electron microprobe; after neglecting Ca, Mg, and SiO_2, and assuming minor H_2O accounting for low total, corresponds to $(Ce_{0.51}La_{0.27}Pr_{0.11}Nd_{0.12})_{\Sigma=1.01}$ $Ti_{2.00}(O, OH)_6$.

Polymorphism & Series: Dimorphous with aeschynite-(Ce).

Occurrence: In heavy-media concentrates from non-sandy tuff in an olivine lamproite diatreme.

Association: Calcite, dolomite, talc, titanite, manganoan ilmenite, amphibole.

Distribution: In the Argyle AK1 diamond mine, east Kimberley area, Western Australia.

Name: For Hans Lucas, Australian geologist, CRA Exploration Pty. Ltd., who noted the mineral in concentrates.

Type Material: Western Australia Museum, Perth, M.75.1991; Museum Victoria, Melbourne, Australia, M38083; The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA, 163783.

Luddenite $Pb_2Cu_2Si_5O_{14}•14H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Rare crystals tend to a platy habit with wedge-shaped terminations; microcrystalline, with individual grains to 0.01 mm, forming rosettes and fan-shaped aggregates.

Physical Properties: *Cleavage:* Parallel and normal to the plane of flattening of the microcrystals. Hardness = 4 D(meas.) = 4.45 D(calc.) = [4.98]

Optical Properties: Semitransparent. *Color:* Nickel-green. *Streak:* Slightly paler nickel green.
Optical Class: Biaxial. *Pleochroism:* $X = Y$ = yellow-green; Z = rich emerald-green. $\alpha = 1.852$ β = n.d. $\gamma = 1.867$ 2V(meas.) = $\sim 40°$

Cell Data: *Space Group:* n.d. $a = 7.85$ $b = 20.06$ $c = 14.72$ $\beta = 90.78°$ Z = [6]

X-ray Powder Pattern: Artillery Peaks area, Arizona, USA.
7.361 (10), 3.173 (10), 2.918 (8), 5.218 (7), 4.226 (5), 3.515 (5), 3.411 (5)

Chemistry:

	(1)	(2)	(3)
SiO_2	25.7	27.2	25.94
TiO_2	4.7		
CuO	13.2	14.0	13.74
PbO	35.1	37.1	38.54
H_2O	20.5	21.7	21.78
Total	99.2	[100.0]	100.00

(1) Artillery Peaks area, Arizona, USA; microchemical analysis, H_2O by Penfield method; some H_2O may be nonessential. (2) Recalculated to 100.0% after removal of TiO_2 impurity. (3) $Pb_2Cu_2Si_5O_{14}•14H_2O$.

Occurrence: In thoroughly oxidized Pb–Cu sulfide ores.

Association: Galena, chalcopyrite, fluorite, quartz, alamosite, melanotekite, cerussite, chalcocite, shattuckite, chrysocolla, wickenburgite, altered Fe-Ti oxides.

Distribution: On the dumps of a Pb–Ag–Cu prospect in the Artillery Peaks area, Mohave Co., Arizona, USA.

Name: For Raymond W. Ludden, Chief Geologist for Western Exploration, Phelps Dodge Corporation.

Type Material: The Natural History Museum, London, England, 1984,473–474.

Ludjibaite $Cu_5(PO_4)_2(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As bladed crystals, flattened on {011}, or as crestlike crystalline aggregates, to 0.3 mm. *Twinning:* On {011}.

Physical Properties: *Fracture:* Uneven. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.36

Optical Properties: Translucent to opaque. *Color:* Blue-green. *Streak:* Pale blue to white. *Luster:* Vitreous.
Optical Class: Biaxial (+) or (–). *Pleochroism:* Weak; azure-blue to pale blue. $\alpha = 1.786$ (α') β = n.d. $\gamma = 1.840$ (γ') 2V(meas.) = Large.

Cell Data: *Space Group:* $P\overline{1}$. $a = 4.446(3)$ $b = 5.871(4)$ $c = 8.680(7)$ $\alpha = 103.9(2)°$ $\beta = 90.3(2)°$ $\gamma = 93.2(2)°$ Z = 1

X-ray Powder Pattern: Ludjiba mine, Congo.
4.46 (100), 2.462 (50), 2.353 (50), 3.02 (20), 2.408 (20), 2.017 (20), 1.572 (20)

Chemistry:

	(1)	(2)
P_2O_5	24.6	24.65
CuO	69.1	69.09
H_2O	6.3	6.26
Total	100.0	100.00

(1) Ludjiba mine, Congo; by electron microprobe, H_2O by difference. (2) $Cu_5(PO_4)_2(OH)_4$.

Polymorphism & Series: Trimorphous with pseudomalachite and reichenbachite.

Occurrence: A rare mineral in the oxidized zone of some copper deposits.

Association: Pseudomalachite, libethenite (Ludjiba mine, Congo); pseudomalachite (Lubietová, Slovakia).

Distribution: From the Ludjiba mine, about 12 km southeast of Kambove, Katanga Province, Congo (Shaba Province, Zaire). At Lubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In the Käusersteimel mine, near Kausen, Siegerland, Germany.

Name: For its occurrence at Ludjiba, Congo.

Type Material: Royal Institute of Natural Sciences, Brussels, RC3514; Royal Museum of Central Africa, Tervuren, Belgium, RMG4445.

Ludlamite $(Fe^{2+}, Mg, Mn^{2+})_3(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, usually tabular {001}, showing {100}, {110}, {001}, {$\bar{1}$11}, others, to 9 cm, may be in parallel groups; granular, massive.

Physical Properties: *Cleavage:* {001}, perfect; {100}, indistinct. Hardness = 3.5
D(meas.) = 3.12–3.19 D(calc.) = 3.176

Optical Properties: Translucent. *Color:* Apple-green to bright green; nearly colorless in transmitted light. *Streak:* Pale greenish white. *Luster:* Vitreous, pearly on {001} cleavage. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -67°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.650–1.653$ $\beta = 1.669–1.675$ $\gamma = 1.688–1.697$ 2V(meas.) = 82°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.541(5)$ $b = 4.646(4)$ $c = 9.324(5)$
$\beta = 100°25.8(1.0)'$ Z = 2

X-ray Powder Pattern: Wheal Jane, England. (ICDD 17-468).

(1) Palermo #1 mine, New Hampshire, USA. (2) $Fe_3(PO_4)_2 \cdot 4H_2O$.

Occurrence: In complex granite pegmatites, a common hydrothermal alteration product of earlier phosphates, formed under reducing conditions.

Association: Phosphoferrite, triploidite, triplite, triphylite, apatite (Hagendorf, Germany); fairfieldite, vivianite, siderite, whitlockite (Palermo #1 mine, New Hampshire, USA).

Distribution: Some localities for fine crystals or large masses include: from Wheal Jane, Kea, Cornwall, England. At Hagendorf, Bavaria, Germany. From the Stari Trg mine (Trepča), Kosovo, Serbia. In the USA, at the Palermo #1 mine, North Groton, Grafton Co., New Hampshire; large crystals from the Blackbird mine, Lemhi Co., Idaho; at the Dan Patch, Ferguson, Big Chief, and other pegmatites, near Keystone, Pennington Co., South Dakota. From the Rapid Creek district, Yukon Territory, Canada. Large crystals from the San Antonio mine, Santa Eulalia district, Chihuahua, Mexico. In the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. Fine crystals from Morococala and Huanuni, Oruro, Bolivia. In the Ashio mine, Tochigi Prefecture, Japan. A number of other localities are known.

Name: To honor Henry Ludlam (1824–1880), English mineral collector, London, England.

Ludlockite $PbFe_4^{3+}As_{10}^{3+}O_{22}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Commonly as simply terminated laths, elongated along [100], and flattened on $\{0\overline{1}1\}$, less commonly prismatic with almost equant cross sections, to 4 cm; may be slightly twisted. In divergent bundles of such hairlike crystals. *Twinning:* Lamellar twinning on $\{0\overline{1}1\}$, common.

Physical Properties: *Cleavage:* Perfect micaceous on $\{0\overline{1}1\}$, perfect on {021}.
Tenacity: Very flexible and sectile. Hardness = 1.5–2 D(meas.) = 4.33–4.40 D(calc.) = 4.58

Optical Properties: Semitransparent. *Color:* Red, red-brown, orange-brown, yellow.
Streak: Pale brown. *Luster:* Subadamantine.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow; Y = deep yellow; Z = yellow-orange.
Orientation: $Z \wedge a \simeq 3°$. *Absorption:* $Z > Y > X$. $\alpha = 1.96$ $\beta = 2.055$ $\gamma = > 2.11$
2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.426(4)$ $b = 11.972(5)$ $c = 9.894(4)$ $\alpha = 113.76(3)°$ $\beta = 99.83(3)°$ $\gamma = 82.50(3)°$ Z = 2

(1) Tsumeb, Namibia; predominant Fe^{3+} confirmed by Mössbauer spectroscopy, total As as As_2O_5. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, total As as As_2O_3, both confirmed by crystal-structure analysis; corresponding to $Pb_{1.04}Fe^{3+}_{4.04}As^{3+}_{9.93}O_{22}$. (3) $PbFe_4^{3+}As_{10}^{3+}O_{22}$.

Occurrence: In sulfide ore from a complex polymetallic hydrothermal ore deposit (Tsumeb, Namibia).

Association: Zincian siderite, tennantite, chalcocite, pyrite, bornite, germanite, quartz; leiteite, reniérite, stolzite, schneiderhöhnite (Tsumeb, Namibia).

Distribution: From Tsumeb, Namibia. At Laurium, Greece, in slag. From one km north of Campiglia, Tuscany, Italy, in slag. At Zarehehuran, near Takap, Takht-e-Suleiman massif, Azerbaijan.

Name: For Fredrick LUDlow Smith III, (1939–) and Charles LOCKe Key (1935–), American mineral dealers then resident in New Jersey, USA, who supplied the first specimens for study.

Type Material: The Natural History Museum, London, England, 1969,215 and 216; Harvard University, Cambridge, Massachusetts, USA, 127927.

Ludwigite $Mg_2Fe^{3+}BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are unterminated, fibrous, curved, to 20 cm; commonly in fanlike to felted aggregates.

Physical Properties: *Tenacity:* Tough. Hardness = 5–5.5 D(meas.) = 3.80(3) D(calc.) = [3.78] Weakly ferromagnetic, probable.

Optical Properties: Opaque, translucent only in thin fragments and rims of crystals. *Color:* Pitch-black, olive-black. *Luster:* Submetallic. *Streak:* Black to greenish black. *Luster:* Silky.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = dark green; Z = dark reddish brown. *Orientation:* $Z = c$. *Dispersion:* $r \gg v$, extreme. α = 1.83–1.85 β = 1.83–1.90 γ = 1.97–2.03 2V(meas.) = Small. *Anisotropism:* Strong; yellowish brown to bluish violet gray. *Bireflectance:* Pinkish gray to dark greenish gray.

(1) Ocna de Fier, Romania; B_2O_3 by ICP, H_2O by the Penfield method; corresponds to $(Mg_{1.91}Fe^{2+}_{0.09}Mn_{0.01})_{\Sigma=1.00}(Fe^{3+}_{0.98}Al_{0.02})_{\Sigma=1.00}B_{1.00}O_5$. (2) Mg_2FeBO_5.

Polymorphism & Series: Forms a series with vonsenite.

Mineral Group: Ludwigite group.

Occurrence: Typically formed in magnesian iron skarn and contact metamorphic deposits.

Association: Magnetite, forsterite, clinohumite, vonsenite, szaibélyite.

Distribution: Numerous localities, some with large amounts. From [the Iuliana mine,] Ocna de Fier (Morávicza; Vaskő), Romania. At the Brosso mine, northwest of Ivrea, Torino, Italy. From Broadford, Isle of Skye, Inverness-shire, Scotland. In the Nordmark district, Värmland, Sweden. In Russia, at the Tazheran massif, west of Lake Baikal; large crystals from Titovskoye, Sakha. In the Gole Gohar iron deposit, Bafq district, Iran. In the USA, from the Pomeroy mine, Anaconda, Deer Lodge Co., and at Philipsburg, Granite Co., Montana; from the Crestmore quarry, Riverside Co., California; at the Mountain Lake mine, Big Cottonwood district, Salt Lake Co., Utah. In Canada, in the York River tactite zone, Bancroft, Ontario; from the Cross quarry, near Wakefield, Quebec. In the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea.

Name: Honoring Ernst Ludwig (1842–1915), Austrian Professor of Chemistry, University of Vienna, Vienna, Austria, who analyzed the original material.

(1) Lueshe, Congo; Fe_2O_3 and TiO_2 on a separate sample, SiO_2 then by difference, original total given as 100.46%; corresponding to $(Na_{0.66}Ca_{0.02})_{\Sigma=0.68}(Nb_{1.00}Ti_{0.08})_{\Sigma=1.08}O_3$. (2) $NaNbO_3$.

Polymorphism & Series: Dimorphous with isolueshite and natroniobite.

Mineral Group: Perovskite group: $Na_A > 0.5$; $Nb_B > 0.5$.

Occurrence: Incrusting a vermiculitelike mica, at the contact of cancrinite syenite with carbonatite (Lueshe, Congo); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); a common accessory mineral formed during fenetization of pyroxenite and gabbro (Gem Park, Colorado, USA); in veins cutting nepheline syenites (Ilímaussaq intrusion, Greenland).

Association: Mica (Lueshe, Congo); sodalite, ussingite, villiaumite, steenstrupine, griceite, eudialyte, lovozerite (Mont Saint-Hilaire, Canada); vermiculite, ilmenite, pyrochlore, thorianite, perovskite, fersmite, dolomite (Gem Park, Colorado, USA).

Distribution: From the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire). At Gem Park, about six km east of Hillside, Fremont Co., Colorado, USA. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. At Igdlunguaq, in the Ilímaussaq intrusion, Greenland. In Russia, from the Kovdor, Sallanlatvi, Lesnaya Varaka, and Lovozero massifs, Kola Peninsula, and unidentified carbonatites in Siberia.

Name: For the occurrence at Lueshe, Congo.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM8269; The Natural History Museum, London, England, 1960,440.

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals pseudohexagonal tabular to blocky, to 3 mm; commonly flat nodular, spherulitic, fibrous to earthy, massive. *Twinning:* Common, by rotation about $[1\bar{1}0]$.

Physical Properties: *Cleavage:* On {010}, fair. Hardness = ~2 D(meas.) = 2.05 D(calc.) = 2.204

Optical Properties: Translucent. *Color:* White to brownish white, colorless.
Luster: Vitreous.
Optical Class: Biaxial (–). α = 1.520–1.522 β = 1.54–1.541 γ = 1.545–1.549
2V(meas.) = 63° 2V(calc.) = 62°

Cell Data: *Space Group:* $P\bar{1}$. a = 6.3475(6) b = 9.8027(11) c = 6.2976(5)
α = 84.456(9)° β = 106.402(8)° γ = 96.400(9)° Z = 1

X-ray Powder Pattern: Lüneburg, Germany. (ICDD 25-1155).
4.98 (100), 4.85 (70), 2.964 (60), 2.819 (45), 3.23 (40), 2.507 (35), 3.027 (30)

Chemistry:

(1) Lüneburg, Germany. (2) Bela Stena, Serbia; corresponds to $Mg_{3.2}B_{1.8}(PO_4)_{2.1}(OH)_{5.5} \cdot 6.1H_2O$. (3) $Mg_3B_2(PO_4)_2(OH)_6 \cdot 6H_2O$.

Occurrence: In marine evaporite sequences.

Association: Boracite, gypsum (Lüneburg, Germany); colemanite, howlite, searlesite, magnesite, dolomite (Bela Stena, Serbia); halite, sylvite, polyhalite (Permian Basin, USA).

Distribution: From Lüneburg, 40 km south-southeast of Hannover, Lower Saxony, Germany. At Bela Stena, Serbia. From Kerch, Crimean Peninsula, Ukraine. At Kara-Bogaz-Gol and Uzun-Su, Turkmenistan. In the Permian Basin, around Carlsbad, Eddy Co., New Mexico and into Culbertson Co., Texas, USA. At Mejillones, Tarapaca, Chile.

Name: For its first-noted occurrence at Lüneburg, Germany.

Type Material: Wroclaw University, Wroclaw, Poland, II–5734; National Museum of Natural History, Washington, D.C., USA, 162602.

H_2O^+	11.296
Total	99.951

(1) Qingtian, China; by electron microprobe, Li by AA, H_2O by TGA; corresponds to $Li_{0.73}Al_{4.19}(Si_3Al)O_{10}(OH)_8 \cdot Al_2Si_4O_{10}(OH)_2$.

Polymorphism & Series: Regular 1:1 interstratification of cookeite and pyrophyllite.

Occurrence: Within corundum, in a hydrothermal pyrophyllite deposit in rhyolite.

Association: Corundum, diaspore, chlorite, illite, halloysite, svanbergite, zeolites, hematite.

Distribution: From Qingtian, Chekiang Province, China.

Name: From the Chinese *luni*, for the chlorite group, representing cookeite; *jian*, a connective; and *lain* for pyrophyllite.

Type Material: n.d.

Total	99.56

(1) Mt. Vasin-Myl'k, Russia; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Mn_{0.77}Ca_{0.23})_{\Sigma=1.00}(Mg_{0.35}Fe_{0.31}Mn_{0.30})_{\Sigma=0.96}Al_{1.05}(PO_4)_{1.99}(OH)_{1.10}\cdot 3.78H_2O$.

Mineral Group: Overite group.

Occurrence: In fractures and on crusts of mitridatite in granite pegmatites.

Association: Eosphorite, laueite, kingsmountite, fairfieldite, mitridatite.

Distribution: On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia.

Name: For the Lun'ok River, nearby Mt. Vasin-Myl'k, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5771; Mining Institute, St. Petersburg, 1340/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82541, 82542.

X-ray Powder Pattern: Luobusha mine, Qusong county, Tibet, China.
1.844 (100), 3.06 (80), 1.889 (60), 1.977 (40), 1.865 (40), 2.402 (25), 2.849 (20)

Chemistry:

	(1)
Si	55.24
Fe	44.40
Al	0.63
Cr	0.06
Total	100.33

(1) Luobusha mine, Qusong county, Tibet, China; average of 8 electron microprobe analyses; corresponding to $Fe_{0.83}Si_2$.

Occurrence: In the heavy mineral fraction of a podiform chromitite deposit in the peridotite of an ophiolite.

Association: Diamond, moissanite, coesite, wustite, CrC, PGEM, naquite, base metal alloys, silicates, and various native elements.

Distribution: From the Luobusha ("Luobusa") mine, 200 km southeast of Lhasa, Qusong county, Shannan Prefecture, Tibet, China.

Name: For the "Luobusa" mine, the site from which the first specimens were collected.

Type Material: Geological Museum of China, Beijing, People's Republic of China.

Luzonite Cu_3AsS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Crystals rare, to 2 mm; commonly coarse-grained, fine-grained, massive, intimately intergrown with enargite. *Twinning:* Common on {112}, also polysynthetic in polished section.

Physical Properties: *Cleavage:* Good on {101}, distinct on {100}. Hardness = 3.5 VHN = n.d. D(meas.) = 4.38 D(calc.) = 4.53

Optical Properties: Opaque. *Color:* Deep pinkish brown, similar to bornite, although darker; in polished section, pale brownish pink. *Streak:* Black. *Luster:* Metallic, dull. *Pleochroism:* Weak. *Anisotropism:* Strong, in greenish yellow and purplish.
R_1–R_2: (400) 27.2–28.7, (420) 25.6–27.6, (440) 24.1–25.6, (460) 23.6–24.7, (480) 23.4–24.5, (500) 23.7–25.2, (520) 24.1–26.4, (540) 24.3–27.1, (560) 24.9–27.7, (580) 25.6–28.5, (600) 26.5–29.1, (620) 27.3–29.6, (640) 28.1–29.9, (660) 28.6–30.1, (680) 28.7–30.0, (700) 28.7–30.0

Cell Data: *Space Group:* $I\bar{4}2m$. $a = 5.332(5)$ $c = 10.57(1)$ $Z = 2$

X-ray Powder Pattern: Mankayan, Philippines.
3.046 (10), 1.855 (9), 1.592 (7), 1.578 (6), 1.204 (6), 1.078 (6), 1.321 (5)

Chemistry:

	(1)	(2)	(3)
Cu	48.32	48.4	48.42
As	17.35	17.4	19.02
Sb	1.48	1.0	
S	32.85	32.2	32.56
Total	[100.00]	99.0	100.00

(1) Mankayan, Philippines; recalculated to 100.00% after deduction of 0.97% insol. and 0.56% pyrite. (2) Huaron, Peru; by electron microprobe. (3) Cu_3AsS_4.

Polymorphism & Series: Dimorphous with enargite; forms a series with famatinite.

Mineral Group: Stannite group.

Occurrence: In hydrothermal Cu–As–Sb-rich vein and disseminated deposits, formed at low to medium temperatures.

Association: Enargite, tetrahedrite–tennantite, colusite, stannoidite, pyrite, chalcopyrite, covellite, sphalerite, bismuthinite, silver sulfosalts, silver, gold, marcasite, alunite, barite, quartz.

Distribution: From the Lepanto mine, Mankayan, Luzon, Philippines [TL], as an ore mineral. In the Chinkuashi mine, Keelung, Taiwan. In Japan, at the Teine, Morino, and Date mines, Hokkaido; the Kasuga and Akeshi mines, Kagoshima Prefecture; and other localities. From the Sierra Famatina, La Rioja Province, Argentina. In the Julcani district, at Cerro de Pasco, and at Huaron, Peru. In the USA, in Nevada, at Goldfield, Esmeralda Co., from the Golden Chariot mine, Jamestown district, Nye Co., and in the Burrus vein, Pyramid district, Washoe Co.; from Butte, Silver Bow Co., Montana; and at Summitville, Rio Grande Co., Colorado. At the Chelopech deposit, Sofia, Bulgaria. From Calabona, Sardinia, Italy. At the Kadzaharan deposit, Armenia. From Pîrîul lui Avram, Romania. In the Lahóca Hill mine, Recsk, Mátra Mountains, Hungary. Numerous additional localities are now known.

Name: For Luzon Island in the Philippines.

As_2O_5	22.90	22.93
H_2O	14.4	14.38
Total	101.68	100.00

(1) Långban mine, Filipstad district, Värmland County, Sweden; average of 5 electron microprobe analyses, H_2O by gas chromatography, absence of CO_2 confirmed by IR spectroscopy; corresponding to $Pb_{1.97}Mn_{1.85}Mg_{0.93}Fe_{0.26}(AsO_4)_{1.96}(PO_4)_{0.09}(OH)_{3.87} \cdot 5.93H_2O$.
(2) $Pb_2Mn_2Mg(AsO_4)_2(OH)_4 \cdot 6H_2O$.

Occurrence: A last-stage hydrothermal mineral (likely below 70 ° C), in fractures and corrosion-veinlets that postdate regional metamorphism of the volcanic-hydrothermal ores and their host rocks.

Association: Calcite, antigorite, trigonite.

Distribution: From the Långban mine, Filipstad district, Värmland County, Bergslagen ore province, Sweden.

Name: From "Långbanshyttan", the old name for the mine that produced the first specimens, the mining village, and smelter that in more recent times have been known as "Långban". "Långbanshyttan" means "Långban's smelter" or "Långban's furnace."

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4032/1) and at the Swedish Museum of Natural History, Stockholm, Sweden (NRM 20100076).

Macdonaldite $BaCa_4Si_{16}O_{36}(OH)_2 \cdot 10H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Needlelike crystals show {010}, {001}, and {100}, and are elongated along [100], to 6 mm; also fibrous, in radiating aggregates, and granular.

Physical Properties: *Cleavage:* Perfect on {010}, good on {001}, poor or a fracture on {100}. Hardness = 3.5–4 D(meas.) = 2.27(2) D(calc.) = 2.27

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Satiny to vitreous.
Optical Class: Biaxial (+) or (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.518(2)$ $\beta = 1.524(2)$ $\gamma = 1.530(2)$ 2V(meas.) = 90(5)° 2V(calc.) = 90°

Cell Data: *Space Group:* $Bmmb$, $B2mb$, or $Bm2_1b$. $a = 14.06(1)$ $b = 23.52(2)$ $c = 13.08(1)$ Z = 4

X-ray Powder Pattern: Fresno Co., California, USA.
6.5 (100), 4.36 (80), 6.3 (50), 3.36 (50), 3.02 (45), 2.74 (45), 8.9 (40)

Chemistry:

	(1)
SiO_2	61.1
TiO_2	0.01
Al_2O_3	0.06
FeO	< 0.01
MnO	0.004
MgO	< 6.05
CaO	14.8
SrO	< 0.05
BaO	10.2
LOI	13.7
Total	[100.00]

(1) Fresno Co., California, USA; by D-C arc spectrography, loss on ignition taken as H_2O, stated to be recalculated to 100.00%; corresponds to $(Ba_{0.98}Sr_{0.01})_{\Sigma=0.99}(Ca_{3.90}Mg_{0.02})_{\Sigma=3.92}(Si_{15.03}Al_{0.02})_{\Sigma=15.05}O_{35.01} \cdot 11.24H_2O$.

Occurrence: As veinlets, fracture coatings, and disseminated in a sanbornite-quartz-bearing metamorphic rock.

Association: Sanbornite, quartz.

Distribution: In the Big Creek-Rush Creek area, Fresno Co., and on Trumbull Peak, near Incline, Mariposa Co., California, USA.

Name: For Gordon Andrew MacDonald (1911–1978), American vulcanologist, University of Hawaii, Honolulu, Hawaii, USA.

Type Material: California Division of Mines & Geology, San Francisco, California, USA.

References: (1) Alfors, J.T., M.C. Stinson, R.A. Matthews, and A. Pabst (1965) Seven new barium minerals from eastern Fresno County, California. Amer. Mineral., 50, 314–340.

Macedonite $PbTiO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As equant to prismatic crystals, to 0.2 mm, showing {100}, {001}, {110}, {101}, and {111}; more commonly as irregular grains.

Physical Properties: *Tenacity:* Very brittle. Hardness = 5.5–6 VHN = 477–537, 606–681 (100 g load). D(meas.) = 7.82(6) D(calc.) = 8.09

Optical Properties: Opaque; transparent in extremely thin sections. *Color:* Black with a weak brownish tint; brownish yellow with a greenish tint in thin section; grayish white in reflected light, with yellow-brown to dark brownish green internal reflections. *Luster:* Vitreous.
Optical Class: Uniaxial, sensibly isotropic. *Anisotropism:* Very weak.
R: (470) 22.5, (490) 22.2, (510) 21.8, (530) 21.2, (546) 21.0, (570) 20.9, (589) 20.8, (610) 20.6, (630) 20.4, (650) 20.2

Cell Data: *Space Group:* $[P4/nmm]$ (by analogy to synthetic material). $a = 3.89$–3.91 $c = 4.16$–4.21 Z = [1]

X-ray Powder Pattern: Crni Kamen, Macedonia.
2.843 (10), 1.603 (9), 2.728 (8), 2.284 (7), 1.954 (7), 3.836 (6), 1.370 (5)

Chemistry:

	(1)	(2)	(3)
TiO_2	25.07	24.5	26.36
Bi_2O_3	2.20		
FeO	2.69	1.0	
PbO	70.55	74.5	73.64
Total	100.51	100.0	100.00

(1) Crni Kamen, Macedonia. (2) Långban, Sweden; by electron microprobe, average of 20 analyses; total Fe as FeO; corresponding to $(Pb_{1.04}Fe_{0.04})_{\Sigma=1.08}Ti_{0.96}O_3$. (3) $PbTiO_3$.

Occurrence: As a rare accessory mineral in microcline-quartz syenite pegmatite veins cutting pyroxene amphibole schist (Crni Kamen, Macedonia); as inclusions in hematite and magnetoplumbite in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Microcline, quartz, aegirine, arfvedsonite, rutile, zircon (Crni Kamen, Macedonia); hematite, magnetoplumbite, manganoan phlogopite, calcian mimetite, manganoan kentrolite (Långban, Sweden); ganomalite, tephroite, lead, jacobsite, calcite, phlogopite, hancockite, melanotekite, hematite (Jakobsberg, Sweden).

Distribution: From Crni Kamen, near Prilep, Macedonia. At Långban and Jakobsberg, Värmland, Sweden.

Name: For Macedonia, where the mineral was discovered.

Type Material: Institute for Nuclear Raw Materials, Belgrade, Serbia (Yugoslavia); National Museum of Natural History, Washington, D.C., USA, 122391.

Macfallite $Ca_2Mn^{3+}_3(SiO_4)(Si_2O_7)(OH)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare single crystals, elongated, to 1 cm, invariably twinned; as radial and framboidal aggregates; in fine intergrowths with orientite; massive. *Twinning:* By reflection on {100}, commonly repeated.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 5–5.5 D(meas.) = 3.43(2) D(calc.) = 3.53

Optical Properties: Transparent to translucent. *Color:* Reddish brown, maroon, dull pink. *Streak:* Brown with a reddish tint. *Luster:* Silky to subadamantine. *Optical Class:* Biaxial (+) or (–). *Pleochroism:* X = colorless to yellow; Y = light brown; Z = dark brown to reddish brown. *Orientation:* $Y = b$. α = 1.773–1.775 β = 1.795 γ = 1.810–1.815 2V(meas.) = Very large.

Cell Data: *Space Group:* $P2_1/m$. a = 10.235(3) b = 6.086(6) c = 8.970(5) $\beta = 110.75(3)^\circ$ Z = 2

X-ray Powder Pattern: Manganese Lake, Michigan, USA.
2.70 (100), 4.76 (90), 1.588 (85), 3.904 (80), 3.40 (70), 2.97 (70), 2.18 (70)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	32.04	33.88	MnO	0.69	
TiO_2	trace		CuO	1.13	
Al_2O_3	3.95	1.03	MgO	0.39	0.73
Fe_2O_3	0.18		CaO	19.75	20.40
Cr_2O_3	0.03		K_2O	0.12	
Mn_2O_3	35.96	41.47	Na_2O	0.03	
V_2O_5	0.28		H_2O	5.39	[2.49]
			Total	99.94	[100.00]

(1) Manganese Lake, Michigan, USA; corresponds to $(Ca_{1.93}Mn^{2+}_{0.05})_{\Sigma=1.98}(Mn^{3+}_{2.49}Al_{0.42}Cu_{0.08}Fe^{3+}_{0.01})_{\Sigma=3.00}(Si_{2.92}V_{0.02})_{\Sigma=2.94}O_{11}[(OH)_{2.66}(H_2O)_{0.34}]_{\Sigma=3.00}$. (2) Faggiona, Italy; by electron microprobe, average of eight analyses, H_2O by difference.

Occurrence: In abundance, replacing calcite in fissures and in lenses in basalt (Manganese Lake, Michigan, USA); replacing braunite under low-temperature metamorphic conditions (Faggiona, Italy).

Association: Manganite, braunite, orientite, pyrolusite (Manganese Lake, Michigan, USA); braunite, quartz, manganoan richterite, carbonates (Faggiona, Italy).

Distribution: From near Manganese Lake, Copper Harbor, Keweenaw Co., Michigan, USA. In Italy, in the Cerchiara mine, Faggiona, La Spezia, Liguria.

Name: For Russell P. MacFall, American amateur mineralogist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135923; The Natural History Museum, London, England, 1984,139.
