Machatschkiite $Ca_6(AsO_4)(AsO_3OH)_3(PO_4,SO_4)\cdot 15H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As crusts of subparallel pseudorhombohedral crystals, $\{10\bar{1}1\}$ with minor $\{10\bar{1}2\}$, to 2 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2–3 D(meas.) = 2.5–2.6 D(calc.) = 2.594

Optical Properties: Transparent to translucent. *Color:* Colorless.
Optical Class: Uniaxial (–) or weakly biaxial (–). $\omega = 1.593(2)$ $\epsilon = 1.585(2)$

Cell Data: *Space Group: R3c.* $a = 15.127(2)$ $c = 22.471(3)$ Z = 6

X-ray Powder Pattern: Anton mine, Germany.
8.59 (10), 5.34 (8), 3.59 (8), 2.86 (8), 2.83 (8), 2.70 (8), 2.67 (8)

P_2O_5	2.6
As_2O_5	41.0
CaO	28.7
H_2O	
Total	

(1) Anton mine, Germany; by electron microprobe, average of two partial analyses; H_2O 29.2% determined on a separate sample.

Occurrence: A very rare secondary mineral in crusts on granite.

Association: Picropharmacolite, pharmacolite, cobaltian sainfeldite, gypsum.

Distribution: From the Anton mine, Heubachtal, near Schiltach, Black Forest, Germany.

Name: Honors Felix Karl Ludwig Machatschki (1895–1970), Professor of Mineralogy, University of Vienna, Vienna, Austria.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137412.

References: (1) Walenta, K. (1977) Machatschkiit, ein neues Arsenatmineral aus der Grube Anton im Heubachtal bei Schiltach (Schwarzwald, Bundesrepublik Deutschland). Tschermaks Mineral. Petrog. Mackayite $Fe^{3+}Te_2^{4+}O_5(OH)(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals, typically isolated, are short prismatic, pseudocubic or pseudododecahedral, to pyramidal, with prominent {112} and {010}, subsidiary {110}, and {012}, to 1 mm.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 4.5
D(meas.) = 4.86 D(calc.) = [5.32]

Optical Properties: Transparent. *Color:* Pale bottle-green, olive-green, brownish green, greenish black; greenish yellow to yellowish green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Pleochroism:* O = green; E = yellowish green. $\omega = 2.19(2)$ (Li) $\epsilon = 2.21(2)$

Cell Data: *Space Group:* $I4_1/acd$. $a = 11.704$ $c = 14.895$ $Z = 16$

X-ray Powder Pattern: Goldfield, Nevada, USA.
3.17 (10), 1.61 (9), 3.32 (8), 4.95 (7), 2.72 (7), 2.21 (7), 3.75 (6)

(1) Near Moctezuma, Mexico; recalculated to 100% from an original total of 99.53% after deduction of insoluble 12.69%. (2) Do.; recalculated to 100% from an original total of 98.98% after deduction of Al_2O_3 1.00%, CaO 0.32%, and insoluble 4.68%. (3) $Fe_2^{3+}Te_3^{4+}O_9 \bullet 5H_2O$. (4) $Fe^{3+}Te_2^{4+}O_5(OH)$.

Occurrence: Of rare occurrence in the oxidized zone of Au–Te deposits, an alteration product of tellurium.

Association: Tellurium, tellurite, emmonsite, rodalquilarite, poughite, cliffordite, sonoraite, pyrite, alunite, barite, quartz.

Distribution: In the USA, at the Mohawk mine, and between the Jumbo and Clermont mines, Goldfield, Esmeralda Co., Nevada; in the Toughnut-Empire mine, Tombstone, Cochise Co., Arizona; at a prospect near the Lone Pine mine, Wilcox district, Catron Co., New Mexico; from the Klondike mine, Saguache Co., Colorado. In Mexico, at the Moctezuma (Bambolla) mine and the San Miguel and La Candelaria prospects, south of Moctezuma, and from Onovas, Sonora. In the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile.

Name: For John William Mackay (1831–1902), Irish–American Comstock Lode mining magnate, in honor of his endowment of the School of Mines, University of Nevada, Reno, Nevada, USA.

Type Material: American Museum of Natural History, New York City, New York, T24594; Harvard University, Cambridge, Massachusetts, USA, 97444, 97950.

Mackinawite $(Fe, Ni)_{1+x}S$ (x = 0 to 0.11)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As well-formed thin tabular crystals, to 1 mm; massive, fine-feathery.

Physical Properties: *Cleavage:* Very good on {001}. Hardness = Soft. VHN = 63–89 (15 g load). D(meas.) = n.d. D(calc.) = 4.30

Optical Properties: Opaque. *Color:* Bronzy. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Strong. *Anisotropism:* Extreme.
R_1–R_2: (400) 17.7–25.7, (420) 17.0–28.0, (440) 16.4–30.2, (460) 16.2–32.2, (480) 16.1–34.4, (500) 16.0–36.5, (520) 16.1–38.4, (540) 16.1–40.0, (560) 16.3–41.4, (580) 16.5–42.5, (600) 16.7–43.3, (620) 17.0–43.9, (640) 17.2–44.3, (660) 17.4–44.5, (680) 17.5–44.6, (700) 17.7–44.6

Cell Data: *Space Group:* $P4/nmm$. $a = 3.6735(4)$ $c = 5.0328(7)$ $Z = 2$

X-ray Powder Pattern: Mackinaw mine, Washington, USA.
5.03 (100), 2.31 (90), 1.809 (80), 2.96 (70), 1.838 (50), 1.729 (50), 1.055 (40)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Fe	63.0	58.8	54.9	Ni	3.1	3.8	8.8
Cu		2.0	0.1	S	34.0	35.9	35.8
Co			0.4	Total	100.1	100.5	100.0

(1) Mackinaw mine, Washington, USA; by electron microprobe, corresponding to $(Fe_{1.06}Ni_{0.05})_{\Sigma=1.11}S_{1.00}$. (2) Talnakh area, Russia; by electron microprobe, corresponding to $(Fe_{0.94}Ni_{0.06}Cu_{0.03})_{\Sigma=1.03}S_{1.00}$. (3) Scotia deposit, Australia; by electron microprobe, corresponding to $(Fe_{0.88}Ni_{0.13}Co_{0.01})_{\Sigma=1.02}S_{1.00}$.

Occurrence: Formed by hydrothermal activity in mineral deposits, during serpentinization of peridotites, and in the reducing environment of river bottom muds; may be produced by magnetotactic and sulfate-reducing bacteria. Rarely in iron and carbonaceous chondrite meteorites.

Association: Chalcopyrite, cubanite, pentlandite, pyrrhotite, greigite, maucherite, troilite.

Distribution: Now known from a number of localities in addition to those listed here. In the USA, at the Mackinaw mine, Snohomish Co., Washington [TL]; in muds from the bottom of the Mystic River, Boston, Suffolk Co., Massachusetts; from the Howard Montgomery quarry, Howard Co., Maryland; in California, from the Kramer borate deposit, Boron, Kern Co. In Canada, in the Muskox intrusion, Northwest Territories, and at the Falconbridge mine, Sudbury, Ontario. From the Outokumpu mine and Hitura, Finland. At the Vena mines, near Askersund, Örebro, Sweden. In the Fiat mine, Piedmont, Italy. At Landsberg, near Obermoschel, Rhineland-Palatinate, Germany. From England, at The Rill, Kynance Cliff, The Lizard, Cornwall. On Cyprus, at Skouriotissa. In the Talnakh area, Noril'sk region, western Siberia, and at the Kovdor massif, Kola Peninsula, Russia. From Broken Hill, New South Wales, and the Scotia nickel deposit, Kalgoorlie, Western Australia.

Name: For the Mackinaw mine in Washington, USA.

Type Material: n.d.

Macphersonite $Pb_4(SO_4)(CO_3)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are commonly pseudohexagonal, thin to tabular on {010}, to 1 cm. *Twinning:* Common, lamellar and contact, composition plane {102}.

Physical Properties: *Cleavage:* On {010}, perfect. *Fracture:* Uneven. Hardness = 2.5–3 D(meas.) = 6.50–6.55 D(calc.) = 6.60–6.65 May exhibit a bright yellow fluorescence under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Colorless, white, very pale amber.
Luster: Adamantine to resinous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, moderate.
$\alpha = 1.87$ $\beta = 2.00$ $\gamma = 2.01$ 2V(meas.) = 35°–36°

Cell Data: *Space Group: Pcab.* $a = 10.383(2)$ $b = 23.050(5)$ $c = 9.242(2)$ $Z = 8$

X-ray Powder Pattern: Argentolle mine, France; may show preferred orientation.
3.234 (100), 2.654 (90), 3.274 (50), 2.598 (30), 2.310 (30), 2.182 (30), 2.033 (30)

(1) Leadhills, Scotland; by electron microprobe, average of ten analyses, CO_2 by evolved gas analysis, H_2O by TGA; corresponds to $(Pb_{4.08}Cu_{0.10}Cd_{0.07})_{\Sigma=4.25}(S_{0.90}O_4)(C_{1.09}O_3)_2(OH)_{1.58}$.
(2) Argentolle mine, France; corresponds to $Pb_{4.06}(S_{1.03}O_4)(C_{1.04}O_3)_2(OH)_{2.32}$.
(3) $Pb_4(SO_4)(CO_3)_2(OH)_2$.

Polymorphism & Series: Trimorphous with leadhillite and susannite.

Occurrence: An uncommon secondary mineral in the zone of oxidation of lead deposits.

Association: Leadhillite, susannite, cerussite, caledonite, pyromorphite, scotlandite, mattheddleite, galena, quartz

Distribution: From the Argentolle mine, near Saint-Prix, Saône-et-Loire, France. At Leadhills, Lanarkshire, Scotland. From the Red Gill mine, Caldbeck Fells, Cumbria, England. In the Churfürst Ernst mine, Bönkhausen, North Rhine-Westphalia, Germany. From Laurium, Greece, in slag. Large crystals from Tsumeb, Namibia. At the Moon Anchor mine, Maricopa Co., Arizona, USA.

Name: To honor Dr. Harry Gordon Macpherson (1925–), Keeper of Minerals, Royal Scottish Museum, Edinburgh, Scotland.

Type Material: Royal Scottish Museum, Edinburgh, Scotland, 721.34; Museum of Natural History, Geneva, Switzerland, 435/80.

Macquartite $Pb_3Cu(CrO_4)SiO_3(OH)_4 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$ (probable). Euhedral crystals, elongated along [010], to 1 mm; commonly enclosed in quartz.

Physical Properties: *Cleavage:* Good on {100}. *Fracture:* Irregular. Hardness = 3.5 D(meas.) = 5.49(7) D(calc.) = 5.58

Optical Properties: Semitransparent. *Color:* Cadmium orange. *Streak:* Pale orange. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 36°$. $\alpha = 2.28$ $\beta = 2.31$ $\gamma = 2.34$ 2V(meas.) = 85°

Cell Data: *Space Group:* $C2/m$ (probable). $a = 20.81$ $b = 5.84$ $c = 9.26$ $\beta = 91°48'$ $Z = 4$

X-ray Powder Pattern: Tiger, Arizona, USA.
3.156 (10), 4.822 (9), 4.628 (9), 3.090 (6), 2.925 (5), 2.768 (5), 3.467 (3)

Chemistry:

	(1)	(2)
SiO_2	[4.9]	6.12
CrO_3	10.5	10.19
CuO	7.8	8.11
PbO	67.6	68.24
H_2O	7.3	7.34
Total	[98.1]	100.00

(1) Tiger, Arizona, USA; Si determined by UV spectrophotometry, Cu, Pb, Cr, Zn by AA, H_2O by the Penfield method; SiO_2 reduced in proportion to ZnO deducted as willemite 2.3%. (2) $Pb_3Cu(CrO_4)SiO_3(OH)_4 \cdot 2H_2O$.

Occurrence: On museum specimens from an oxidized Pb-Zn-Cu orebody.

Association: Dioptase, quartz, willemite, wulfenite, chrysocolla, hematite, fluorite, barite.

Distribution: From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA.

Name: For the French chemist Louis Charles Henri Macquart (1745–1808), who brought to France the Russian crocoite specimens in which chromium was discovered.

Type Material: The Natural History Museum, London, England, 1980,542; University of Arizona, Tucson, Arizona; National Museum of Natural History, Washington, D.C., USA, R18726.

Madocite $Pb_{18}(Sb, As)_{15}S_{41}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Crystals are elongated and striated along [001], to 1.5 mm.

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Conchoidal. Hardness = n.d. VHN = 155 (50 g load). D(meas.) = n.d. D(calc.) = 5.98

Optical Properties: Opaque. *Color:* Gray-black. *Streak:* Gray-black, shining. *Luster:* Metallic. *Pleochroism:* Strong, from white to gray. *Anisotropism:* Strong. R_1–R_2: n.d.

Cell Data: *Space Group: Pbam* or *Pba*2. $a = 27.2$ $b = 34.1$ $c = 8.12$ $Z = 4$

X-ray Powder Pattern: Madoc, Canada.
3.396 (100), 3.355 (90), 2.720 (80), 3.67 (70), 2.925 (60), 3.87 (50), 3.110 (40)

Chemistry:

	(1)	(2)
Pb	55.0	54.5
Sb	22.8	23.1
As	3.1	2.2
S	19.9	19.3
Total	100.8	99.1

(1) Madoc, Canada; by electron microprobe, average of three analyses; corresponds to $Pb_{17.54}(Sb_{12.37}As_{2.73})_{\Sigma=15.10}S_{41.00}$. (2) Do.; by electron microprobe, corresponds to $Pb_{17.92}(Sb_{12.92}As_{2.00})_{\Sigma=14.92}S_{41.00}$.

Occurrence: In the marbles of the Precambrian Grenville Limestone, at the margin of an intrusive (Madoc, Canada); in a hydrothermal deposit in dolomitic limestones with other As–Tl minerals (Jas Roux, France).

Association: Jamesonite, boulangerite, arsnopyrite (Madoc, Canada); chabournéite, pierrotite, parapierrotite, stibnite, pyrite, sphalerite, twinnite, zinkenite, andorite, smithite, laffittite, routhierite, aktashite, wakabayashilite, realgar, orpiment (Jas Roux, France).

Distribution: From near Madoc, Huntington Township, Ontario, Canada [TL]. At the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France. From Novoye, Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan. At Boliden, Västerbotten, Sweden. From Colquiri, Bolivia.

Name: For the locality at Madoc, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 12146; National Museum of Natural History, Washington, D.C., USA, 160247.

(1) Lake Magadi, Kenya. (2) Alkali Lake Playa, Oregon, USA. (3) $NaSi_7O_{13}(OH)_3 \cdot 4H_2O$.

Occurrence: In silts of upper Pleistocene to recent age, precipitated by evaporation of saline brines (Lake Magadi, Kenya); in veins cutting playa sediments and in muds associated with alkali salts and brines (Alkali Lake Playa, Oregon, USA); in altered volcanic rocks (Trinity Co., California, USA); in marble xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in miarolitic cavities in a nepheline syenite sill (near Saint-Amable, Canada).

Association: Kenyaite, calcite (Lake Magadi, Kenya); kanemite (Lake Chad, Chad); bavenite, pectolite, apophyllite, phlogopite, quartz, thaumasite (Mont Saint-Hilaire, Canada); varennesite, natroite, eudialyte, shkatulkalite, makatite, pectolite, sphalerite, monazite-(Ce), serandite, zakharovite, lorenzenite, aegirine, tuperssuatsiaite (near Saint-Amable, Canada).

Distribution: From Lake Magadi and Lake Bogoria, Rift Valley, Kenya. In the Kanem area, Lake Chad, Chad. In the USA, on Alkali Lake Playa, Lake Co., Oregon, and about five km north of Trinity Lake, Trinity Co., California. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: For the Kenyan locality, Lake Magadi.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 121336.

Magbasite $\mathbf{KBa(Mg,Fe^{2+})_6(Al,Sc)Si_6O_{20}F_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: n.d. *Point Group:* n.d. As acicular crystals forming fibrous, fan-shaped aggregates, to 5 mm.

Physical Properties: Hardness = ∼5 D(meas.) = 3.41 D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Colorless or pinkish violet. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = colorless; Z = lilac. *Orientation:* $Z \wedge c = 10°$. $\alpha = 1.579$ $\beta = 1.609$ $\gamma = 1.615$ 2V(meas.) = 70°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: "Russia."
3.63 (100), 3.23 (100b) 3.16 (100b), 2.59 (80), 2.43 (80), 1.407 (70), 9.5 (50)

Chemistry:

	(1)
SiO_2	39.7
Al_2O_3	4.0
Sc_2O_3	2.1
FeO	8.9
MgO	21.4
CaO	1.7
BaO	14.8
K_2O	4.9
F	5.5
$-O = F_2$	2.3
Total	100.7

(1) "Russia;" corresponds to $K_{0.94}(Ba_{0.81}Ca_{0.27})_{\Sigma=1.08}(Mg_{4.81}Fe^{2+}_{1.12})_{\Sigma=5.93}(Al_{0.71}Sc_{0.28})_{\Sigma=0.99}Si_{6.00}O_{20}F_{2.62}$.

Occurrence: In hydrothermally altered dolostone invaded by alkalic ferro-hornblende-bearing granosyenite.

Association: Fluorite, barite, parisite.

Distribution: In "one of the [unspecified] Asiatic hydrothermal formations, Russia."

Name: For MAGnesium and BArium in its chemical composition.

Type Material: n.d.

References: (1) Semenov, E.I., A.P. Khomyakov, and A.V. Bykova (1965) Magbasite, a new mineral. Doklady Acad. Nauk SSSR, 163, 718–719 (in Russian). (2) (1966) Amer. Mineral., 51, 530–531 (abs. ref. 1).

Maghagendorfite $NaMn^{2+}(Mg, Fe^{3+}, Fe^{2+})_2(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Granular, massive; as laths in hagendorfite.

Physical Properties: *Cleavage:* [Good on {001}; poor on {110}] (by analogy to hagendorfite). Hardness = [∼4.5] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: [Translucent.] *Color:* [Greenish black.]
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Maghemite γ–Fe_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic, typically with a tetragonal supercell. *Point Group:* n.d. Rarely as minute octahedral crystals, or acicular overgrowths; commonly as coatings on or replacements of magnetite; massive.

Physical Properties: Hardness = 5 VHN = 920 D(meas.) = n.d. D(calc.) = 4.860 (synthetic). Strongly magnetic.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Brown, bluish black; brown to yellow in transmitted light; white to bluish gray in reflected light. *Streak:* Brown. *Optical Class:* Isotropic.
R: (400) 31.5, (420) 30.2, (440) 25.8, (460) 27.6, (480) 26.6, (500) 26.0, (520) 25.5, (540) 24.8, (560) 24.0, (580) 23.2, (600) 22.4, (620) 22.0, (640) 21.6, (660) 21.2, (680) 20.8, (700) 20.4

Cell Data: *Space Group:* $P4_132$ or $P4_332$ (synthetic), with $a = 8.3515(22)$ Z = 8 (for $Fe_{2.67}O_4$), or *Space Group:* $P4_1$ or $P4_3$ (synthetic), with $a = 8.35$ $c = 24.99$ Z = 32

X-ray Powder Pattern: Synthetic; cubic.

Chemistry:

	(1)
SiO_2	0.3
TiO_2	13.0
MnO_2	0.9
Al_2O_3	1.8
Fe_2O_3	74.6
MgO	8.4
Total	99.0

(1) Patos de Minas, Brazil; by electron microprobe, average of 28 analyses on 16 grains, total Fe as Fe_2O_3, total Mn as MnO_2; stated to correspond to $(Fe_{0.88}Mg_{0.11}Si_{0.01})_{\Sigma=1.00}(Fe_{0.96}Ti_{0.32}Mg_{0.30}Al_{0.07}[Cr_{0.03}]Mn_{0.02})_{\Sigma=1.70}O_4$.

Polymorphism & Series: Dimorphous with hematite.

Occurrence: Formed by weathering or low-temperature oxidation of spinels containing ferrous iron, commonly magnetite or titanian magnetite. A widespread yellow pigment in continental sediments, rocks, and soils.

Association: Magnetite, ilmenite, anatase, pyrite, marcasite, lepidocrocite, goethite.

Distribution: Studied material from: the Bushveld complex, Transvaal, South Africa. In the USA, at the Iron Mountain mine, near Redding, Shasta Co., California. In Canada, from the Wabush Iron Formation, Labrador City, Labrador, Newfoundland; in the Steep Rock Lake iron deposits, Ontario; at the Baffinland Iron Mines, northern Baffin Island; and elsewhere. From north of Patos de Minas, Minas Gerais, Brazil. In the Hatrurim Formation, Israel. On the Katzenbuckel, Odenwald, Baden-Württemberg, Germany. In Japan, from the Takanokura mine, Fukushima Prefecture; the Ohinata mine, Nagano Prefecture; and the Kumano mine, Yamaguchi Prefecture. Much more widespread than these localities indicate.

Name: From MAGnetite and HEMatite, in allusion to the mineral's magnetism and composition.

Type Material: n.d.

(1) Lovozero massif, Russia; corresponds to $(Na_{2.94}K_{0.25}Ca_{0.03})_{\Sigma=3.22}(Mg_{2.06}Fe^{3+}_{1.67}Fe^{2+}_{0.43}Al_{0.14}Mn_{0.13}Ti_{0.03}Li_{0.14})_{\Sigma=4.60}(Si_{7.82}Al_{0.18})_{\Sigma=8.00}O_{22}[(OH)_{0.99}F_{0.97}]_{\Sigma=1.96}$. (2) Oldonyo Dili, Tanzania; original total given as 99.69%, corresponding to $(Na_{2.37}K_{0.37}Ca_{0.35}Li_{0.01})_{\Sigma=3.10}(Mg_{2.44}Fe^{3+}_{1.05}Fe^{2+}_{0.91}Al_{0.22}Mn_{0.10}Ti_{0.06})_{\Sigma=4.78}(Si_{7.71}Al_{0.29})_{\Sigma=8.00}O_{22}[(OH)_{1.13}F_{0.70}O_{0.17}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with arfvedsonite.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) < 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) \geq 0.5$; $(Na + K)_A \geq 0.5$; $Na_B \geq 1.34$.

Occurrence: As exsolution lamellae in cummingtonite from metamorphosed iron formation; in felsic pegmatites; from sodium metasomatism (fenitization) around some carbonatites; as authigenic or diagenetic overgrowths on detrital igneous "hornblende."

Association: Aegirine, braunite, winchite, cummingtonite, albite, biotite.

Distribution: From the Norra Kärr complex, near Gränna, Sweden. In the Gardiner complex, beyond the head of the Kangerdlugssuaq Fjord, Greenland. From the Khibiny and Lovozero massifs, Kola Peninsula, Russia. In the Green River Formation, head of Avintagnia Canyon, Duchesne Co., Utah, USA. In the Wabush Iron Formation, southwestern Labrador, Newfoundland; near Perkins, and at Mont Saint-Hilaire, Quebec, Canada. From Oldonyo Dili, Tanzania. On Mbolwe Hill, Mkushi River area, Central Province, Zambia. From Ambatoharina, Madagascar. In the Kajlidongri and Tirodi mines, Madhya Pradesh, India. In the Modatamagawa mine, Noda, Iwate Prefecture, Japan. Other localities are known.

Name: For its high *magnesium* content and similarity to *arfvedsonite*.

Type Material: n.d.

(1) Tanzania; by electron microprobe, B confirmed qualitatively, Cr, Fe, Ni, Na not found.
(2) $Ca_2MgAl_2BSi_4O_{15}(OH)$.

Mineral Group: Axinite group.

Occurrence: [Typically a mineral formed during contact metamorphism and boron metasomatism.]

Association: Epidote, tremolite, calcite (London Bridge, Australia); prehnite, epidote, actinolite, vesuvianite (Luning, Nevada, USA).

Distribution: From an unrecorded locality in the Arusha district, Tanzania. At London Bridge, near Queanbeyan, New South Wales, Australia. Found near Luning, Santa Fe district, Mineral Co., Nevada, USA.

Name: For dominant *magnesium* in the composition, and its membership in the *axinite* group.

Type Material: Natural History Museum (Geological Museum), London, England, MI 34610.

(1) Vanoise massif, France; corresponds to $(Mg_{0.7}Fe^{2+}_{0.3})_{\Sigma=1.0}(Al_{1.95}Fe^{3+}_{0.05})_{\Sigma=2.00}Si_2O_6(OH)_4$.
(2) Sfinari, Crete, Greece; by XRF and AA, Fe^{2+} by oxidimetry, H_2O by the Penfield method; corresponds to $(Mg_{0.80}Fe^{2+}_{0.20})_{\Sigma=1.00}(Al_{1.98}Fe^{3+}_{0.01}Ti_{0.01})_{\Sigma=2.00}Si_{2.00}O_6(OH)_4$.

Polymorphism & Series: Forms a series with ferrocarpholite.

Occurrence: In veins and in schist, quartzite, and metabauxite formed during high-pressure, low-temperature metamorphism (Vanoise, France).

Association: Chloritoid, pyrophyllite, paragonite, muscovite, diaspore, chlorite, hematite, quartz.

Distribution: From the Vanoise massif, Savoie, France. Found near Sfinari and Sisses, on Crete, Greece.

Name: As the *magnesium* analog of *carpholite*.

Type Material: n.d.

Magnesiochloritoid $(Mg, Fe^{2+})Al_2SiO_5(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As irregular grains, to 4 mm. *Twinning:* Common on {001}, polysynthetic.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = [~6.5] (by analogy to chloritoid). D(meas.) = 3.25(2) D(calc.) = 3.343

Optical Properties: Transparent. *Color:* Pale blue-green to dark blue; in transmitted light, colorless.
Optical Class: Biaxial (+). *Pleochroism:* Very faint; light blue, gray-blue, yellowish.
$\alpha = 1.687(2)$ $\beta = 1.690(2)$ $\gamma = 1.702(2)$ 2V(meas.) = 40°–50° 2V(calc.) = 46°

Cell Data: *Space Group:* $C2/c$. $a = 9.460(1)$ $b = 5.471(1)$ $c = 18.182(2)$ $\beta = 101.4(1)°$
Z = 4

X-ray Powder Pattern: Monte Rosa massif, Italy.

(1) Monte Rosa massif, Italy; by electron microprobe, H_2O by difference; corresponds to $(Mg_{0.61}Fe^{2+}_{0.40})_{\Sigma=1.01}Al_{1.99}Si_{1.00}O_5(OH)_2$. (2) $MgAl_2SiO_5(OH)_2$.

Polymorphism & Series: Monoclinic and triclinic polytypes are known.

Mineral Group: Chloritoid group.

Occurrence: In metapelites and related rocks within high-grade blueschist rocks; stable under metamorphic conditions of near 500 °C and 18 kbar.

Association: Talc, chlorite, muscovite, quartz, kyanite, garnet, omphacite, rutile, apatite.

Distribution: In Italy, from the Monte Rosa massif, near the Ghiacciaio di Verra; in the Val d'Ayas, near the border with Switzerland; and in the Praborna mine, near St. Marcel, Val d'Aosta. From Zermatt, Valais, Switzerland. In Austria, in the Hohe Tauern Mountains.

Name: For *magnesium* in its composition and its relation to *chloritoid*.

Type Material: National School of Mines, Paris, France; Museum of Natural Science, Torino, Italy.

(1) Kalarangi mines, Orissa, India; by electron microprobe, total Fe as FeO; Fe^{2+}:Fe^{3+} recalculated for charge balance, then corresponding to $(Mg_{0.88}Fe^{2+}_{0.12})_{\Sigma=1.00}(Cr_{1.43}Al_{0.37}Fe^{3+}_{0.19})_{\Sigma=1.99}O_4$. (2) Leucite Hills, Wyoming, USA; by electron microprobe, total Fe as FeO. (3) $MgCr_2O_4$.

Polymorphism & Series: Forms two series, with chromite, and with spinel.

Mineral Group: Spinel group.

Occurrence: An accessory mineral in ultramafic rocks, as dunites, serpentinites, kimberlites, lamproites, and komatiites. More rarely as xenocrysts in lamprophyres and mid-ocean basalts. May be detrital.

Association: Olivine, augite, magnetite, plagioclase, pigeonite.

Distribution: Widespread. A few localities for analyzed material include: from near Tampadel and Groschau, Lower Silesia, Poland. From Dobřiš, and at Hamry, near Křemže, Czech Republic. At Ferdinandovo, Bulgaria. On Mt. Djeti, Togo. From Dun Mountain, New Zealand. In the Sukinda ultramafics, between Kansa to Mauabil, Orissa, India. In Canada, on Scottie Creek, about 32 km north of Ashcroft, British Columbia; from Black Lake and in the Caribou pit, Coleraine township, Quebec. In the Line Pit, Lancaster Co., Pennsylvania; from the Leucite Hills, Sweetwater Co., Wyoming, USA.

Name: For a MAGNESIum-rich *chromite*.

(1) Near Blythe, California, USA. (2) Forty Mile River, Alaska, USA; recalculated to 100% from an original total of 99.68% after deduction of remnant 1.40%; corresponds to $(Mg_{0.59}Al_{0.30}Fe^{2+}_{0.03}Co_{0.03}Cu_{0.02})_{\Sigma=0.97}(Fe^{3+}_{3.56}Al_{0.44})_{\Sigma=4.00}(SO_4)_6(OH)_2 \cdot 19.7H_2O$.
(3) $MgFe_4(SO_4)_6(OH)_2 \cdot 20H_2O$.

Mineral Group: Copiapite group.

Occurrence: An uncommon secondary mineral, typically formed by oxidation of pyrite.

Association: Pyrite, römerite, paracoquimbite, halotrichite, redingtonite.

Distribution: In the USA, from near Blythe, Riverside Co., and at the Redington mercury mine, Knoxville, Napa Co., California; from near Las Vegas, Tecolote district, San Miguel Co., New Mexico; at the Denver mine, Santa Cruz Co., and the United Verde mine, Jerome, Yavapai Co., Arizona; in Alaska, in a prospect pit along the Mosquito Fork, Forty Mile River, Eagle A-3 quadrangle. From the Prince mine, Cape Breton Island, Nova Scotia, Canada. At Falun, Kopparberg, Sweden. From the Ossling Berg, Lausitz, North Saxony, Germany.

Name: For its *magnesium* content and relation to *copiapite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 103543, 80696.

(1) Långban, Sweden. (2) Benfontein sill, South Africa; by electron microprobe, Fe^{2+}:Fe^{+3} calculated from stoichiometry; corresponds to $(Mg_{0.80}Fe^{2+}_{0.19}Mn_{0.01})_{\Sigma=1.00}(Fe^{3+}_{0.58}Ti_{0.56}Fe^{2+}_{0.56}Al_{0.27}Cr_{0.03})_{\Sigma=2.00}O_4$. (3) $MgFe_2O_4$.

Polymorphism & Series: Forms a series with magnetite.

Mineral Group: Spinel group.

Occurrence: Most commonly of fumarolic origin; also in high-grade (sanidinite facies) combustion-metamorphosed marls and burning coal heaps; in metamorphosed dolostones. An accessory mineral in some kimberlites, carbonatites, and alkali gabbros. As skeletal inclusions in glassy spherules in sediments attributed to bolide impact debris.

Association: Hematite, titanian magnetite, ferrian diopside.

Distribution: Numerous localities. In Italy, on Vesuvius and Monte Somma, Campania; on Etna, Sicily; from Stromboli and Vulcano, Lipari Islands. On Puy de la Tache, Mont Dore, Puy-de-Dôme, France. In the Hatrurim Formation, Israel. At Husereau Hill, Oka complex, Quebec, Canada. In the USA, from the Crestmore quarry, Riverside Co., California and at Magnet Cove, Hot Spring Co., Arkansas. Abundant at Långban, Värmland, Sweden. In Russia, from mines around Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains; in the Tazheran alkalic massif, west of Lake Baikal, Siberia; and in the Konder alkalic massif, Aldan Shield, Sakha. As a minor constituent of the widespread sediments marking some major geological period boundaries, as the Cretaceous-Tertiary.

Name: From the composition, with dominant MAGNESium and FERRic iron.

(1) Unteriefenbach, Austria; corresponds to $(Ca_{1.90}Na_{0.73}K_{0.35})_{\Sigma=2.98}(Mg_{3.07}Fe^{3+}_{0.86}Fe^{2+}_{0.68}Ti_{0.35}Mn_{0.02}Al_{0.02})_{\Sigma=5.00}(Si_{5.94}Al_{2.06})_{\Sigma=8.00}O_{22}(OH)_{1.60}$. (2) Březno nad Labem (Grosspriesen), Czech Republic; corresponds to $(Ca_{1.97}Na_{0.65}K_{0.24})_{\Sigma=2.86}(Mg_{3.20}Fe^{3+}_{0.86}Al_{0.54}Fe^{2+}_{0.47}Ti_{0.29})_{\Sigma=5.36}(Si_{5.92}Al_{2.08})_{\Sigma=8.00}O_{22}(OH)_{0.58}$.

Polymorphism & Series: Forms a series with hastingsite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.70$; $Fe^{3+} > Al^{vi}$; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: In alkalic basalts; in andesites, latites, tephrites, and their tuffs; in carbonatites.

Association: Olivine, plagioclase, pyroxenes.

Distribution: From Untertiefenbach, Austria. At Březno nad Labem (Grosspriesen), Czech Republic. In Germany, from the Radersberg, Eifel district. From Gillinge and Långban, Värmland, Sweden. In Russia, from the Khibiny massif, Kola Peninsula. At the Gardiner complex, beyond the head of the Kangerdlugssuaq Fjord, Greenland. From Lyndoch, Ontario, Canada. In the USA, at Iron Hill, Gunnison Co., Colorado. From the Marangudzi ring complex, Zimbabwe.

Name: For *magnesium* in its composition and relation to *hastingsite*.

Type Material: n.d.

Polymorphism & Series: 4H, 5H, 6H, 8H, 15H, 15R, 18R, 24R polytypes, polytypoids.

Occurrence: A primary mineral, or replacing spinel or magnetite, in skarns, gabbros, gneisses, "emery" or other rocks formed during medium- to high-grade metamorphism; rarely detrital.

Association: Corundum, ferroan spinel, magnetite, ilmenite, rutile, nigerite, sapphirine, sillimanite, cordierite, kyanite, garnet, quartz, chlorite, gedrite, phlogopite.

Distribution: In the Ruoutevare Fe–Ti deposit, near Kvikkjokk, Norrbotten, Sweden. At Rödstrand, Norway. From the Shoriya Mountains, western Siberia, Russia. At Cashal, near Toombeola, Co. Galway, Ireland. On Mautia Hill, Tanzania. At the Linganga deposit, Njombe district, Tanzania. From Tsaobis, Namibia. In the USA, at Whittles, Pittsylvania Co., Virginia; Peekskill, Westchester Co., New York; and Franklin, Macon Co., North Carolina. In the Romay mine, San Juan, Catamarca Province, Argentina. From the Strangways Range, Northern Territory, Australia. On the Prince Olav Coast, eastern Antarctica. More localities are known.

Name: For Professor Arvid Gustaf Högbom (1857–1940), of the University of Uppsala, Uppsala, Sweden.

Type Material: The Natural History Museum, London, England, 1923,1019.

Mineral Group: Cryptomelane group.

Occurrence: A primary mineral in contact metamorphic manganese ores, and a secondary weathering product of earlier manganese-bearing minerals.

Association: Bixbyite, braunite, piemontite, other manganese oxides.

Distribution: In India, at Kajlidongri and Sitapar, Chhindwara district, Madhya Pradesh; in the Nagpur and Balaghat districts, Maharashtra; at Banswara, Rajasthan; and elsewhere. From Sörhårrås, Ultevis, Sweden. In Norway, from Tangen, Hurdal. At Langenberg, Saxony, Germany. From Inken, Tiovine region, Morocco. In the USA, in the Artillery Mountains, Mohave Co., and in the Apache mine, Sierra Ancha district, Gila Co., Arizona.

Polymorphism & Series: Forms a series with ferrohornblende.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.50$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; 6.50 Si 7.24.

Occurrence: Common in amphibolites, schists, and pegmatitic alkalic gabbro. Also from welded tuffs, granodiorites, granites, and tonalites.

Association: Quartz, orthoclase, plagioclase, biotite, magnetite, apatite (granite).

Distribution: Very widespread. A few confirmed localities include: at Vesuvius and Monte Somma, Campania, Italy. In the granitic batholiths of the Scottish Highlands; Swiss and Italian Alps; Harz Mountains, Germany; Finland and Sweden. In the Southern California and Sierra Nevada batholiths, California, USA. Widespread in Japan.

Name: For its high *magnesium* content and from the German for *horn* and *to deceive*, in allusion to its similarity to valuable minerals in ores.

(1) Koyubi Ridge area, Sør Rondane Mountains, East Antarctica; average of 46 electron microprobe analyses, Raman spectroscopy confirms presence of OH; corresponding to $(Mg_{8.2}Fe_{1.2}Zn_{0.2})^{2+}(Al_{22.7}Fe_{0.1})^{3+}Ti^{4+}_{1.6}O_{46}(OH)_2$.

Polymorphism & Series: Part of a solid solution series between the two ideal end-members, $(Mg,Fe,Zn)^{2+}_{10}(Al,Fe)^{3+}_{22}Ti^{4+}_2O_{46}(OH)_2$ and $(Mg,Fe,Zn)^{2+}_8(Al,Fe)^{3+}_{26}O_{46}(OH)_2$.

Occurrence: The product of retrograde metamorphism in a Mg-Al-rich, Si-poor skarn developed in dolomitic impure marble.

Association: Corundum, spinel, phlogopite, clinochlore, rutile, zirconolite, polycrase-(Y).

Distribution: From the Koyubi Ridge area, Sør Rondane Mountains, Queen Maud Land, East Antarctica.

Name: Identifies a member in the *högbomit*e series with a structure based on spinel (*S*) and nolanite (*N*) modules and with $Mg^{2+} > Fe^{2+}$.

Type Material: At the National Museum of Nature and Science, Tokyo (NSM-MF15438), the Polar Science Museum, Tokyo (NIPR-0073), and the Science Museum of Niigata University, Niigata (NUMIN-NM02), Japan. Also at the Museum of Natural History, Bern, Switzerland (NMBE 41105).

(1) Shields River basin, Montana, USA; corresponds to $(Na_{1.71}Ca_{0.88}K_{0.41})_{\Sigma=3.00}(Mg_{3.24}Fe^{2+}_{1.16}Fe^{3+}_{0.45}Al_{0.26}Ti_{0.14}Mn_{0.02})_{\Sigma=5.27}(Si_{7.12}Al_{0.88})_{\Sigma=8.00}O_{22}(OH)_{1.44}$. (2) Rallier-du-Baty Peninsula, Kerguelen Island; by electron microprobe.

Polymorphism & Series: Forms a series with katophorite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $Fe^{3+} < 1.0$; $(Na + K)_A \geq 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; 6.5 Si 7.49; $Al^{vi} < 1.0$.

Occurrence: In alkalic igneous rocks, including plutonic ring complexes and dikes, and carbonatites.

Association: Arfvedsonite, aegirine, nepheline, magnetite, calcite.

Distribution: On the Rallier-du-Baty Peninsula, Kerguelen Island, in the south Indian Ocean. From the Shields River basin, Park Co., Montana, USA. At Imeria, Madagascar. In the Khibiny massif, Kola Peninsula, Russia.

Name: For *magnesium* in its composition and its relation to *katophorite*.

Type Material: n.d.

Polymorphism & Series: 6H polymorph; 24M polymorph reported.

Occurrence: An accessory mineral in high-temperature tungsten ore.

Association: Quartz, scheelite, muscovite, magnetite, rutile, nigerite, cassiterite, zircon, taaffeite.

Distribution: From the Anhua area, Hunan Province, China.

Name: To honor Peng Zhizhong, Chinese mineralogist, Wuhan Geological College, Beijing, China, who determined the crystal structure.

Type Material: [China University of Geosciences, Wuhan, China].

(1) Blue Cap mine, San Juan County, Utah, USA; average of 4 electron microprobe analyses, H_2O calculated from structure, corresponding to $Ca_{1.77}(Mg_{0.85}Zn_{0.04}Co_{0.01})(H_2O)_{15.34}(H_3O)_{0.66}(V_{10}O_{28})$.
(2) $Ca_2Mg(V_{10}O_{28}) \cdot 16H_2O$.

Mineral Group: Pascoite group.

Occurrence: Product of groundwater leaching and oxidation of vanadium oxides in a post-mining environment.

Association: Gypsum, rossite, pyrite, montroseite, martyite.

Distribution: Blue Cap and Vanadium Queen mines, near La Sal, San Juan County, Utah, USA.

Name: As the magnesium analog of *pascolite*.

Type Material: Natural History Museum of Los Angeles County, California, USA, 58610 and 58611.

(1) Kodiak Islands, Alaska, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated; corresponding to $(Na_{1.56}Ca_{0.43}K_{0.03})_{\Sigma=2.02}(Mg_{1.93}Fe^{2+}_{1.47}Fe^{3+}_{1.27}Al_{0.26}Mn_{0.05}Ti_{0.03})_{\Sigma=5.01}(Si_{7.95}Al_{0.05})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Cochabamba Province, Bolivia; H_2O calculated from stoichiometry, corresponding to $(Na_{1.38}Ca_{0.17}K_{0.13})_{\Sigma=1.68}(Mg_{3.06}Fe^{3+}_{1.66}Fe^{2+}_{0.48}Al_{0.05})_{\Sigma=5.25}(Si_{7.94}Al_{0.06})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with riebeckite.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) < 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) \geq 0.7$; $(Na + K)_A < 0.5$; $Na_B \geq 1.34$.

Occurrence: In granulites, ironstones, ferruginous metacherts, greenschist facies schists, and carbonatites.

Association: Stilpnomelane, epidote, quartz, muscovite, winchite.

Distribution: Many localities; may be in large deposits of asbestiform material. In the Ternovsk mine, Krivoy-Rog basin, Ukraine. From the Norra Kärr complex, near Gränna, Sweden. In Bolivia, around Chapare, Cochabamba Province. In South Africa, over a large area from Koegas, Cape Province, to Botswana, and to the east of Pietersburg, Transvaal. At Lusaka, Zambia. Through the Hamersley Ranges, Western Australia. At Bizan and Suberidani, Tokushima Prefecture, Japan. In the USA, at Franklin, Sussex Co., New Jersey.

Name: For its high *magnesium* content and similarity to *riebeckite*.

Type Material: n.d.

Magnesio-sadanagaite

$KCa_2[(Mg,Fe^{2+})_3(Al,Fe^{3+})_2](Si_5Al_3)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m, 2, or $2/m$. As short prismatic or granular crystals, to a few hundred microns.

Physical Properties: *Cleavage:* Perfect on {110}. *Tenacity:* [Brittle.] Hardness = ~6 D(meas.) = n.d. D(calc.) = 3.27

Optical Properties: Semitransparent. *Color:* Dark brown to black; in thin section, paler with increasing silicon content. *Streak:* Very light brown. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X' = colorless; Z' = brownish yellow. *Orientation:* $Z \wedge c = 26°$. $\alpha = 1.674(2)$ $\beta = 1.686(2)$ $\gamma = 1.699(2)$ 2V(meas.) = 90° 2V(calc.) = 88°

Cell Data: *Space Group:* $C2$, Cm, or $C2/m$. $a = 9.964(2)$ $b = 18.008(3)$ $c = 5.354(2)$ $\beta = 105.55(2)°$ Z = 2

X-ray Powder Pattern: Myojin Island, Japan; identical to sadanagaite.
3.28 (100), 8.48 (80), 3.15 (70), 2.707 (60), 2.162 (55), 2.951 (50), 2.766 (45)

Chemistry:

	(1)
SiO_2	32.1
TiO_2	3.2
Al_2O_3	22.0
FeO	13.7
MnO	0.1
MgO	8.0
CaO	12.5
Na_2O	0.7
K_2O	3.8
Total	96.1

(1) Myojin Island, Japan; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry and charge balance; corresponding to $(K_{0.75}Na_{0.22})_{\Sigma=0.97}Ca_{2.07}(Mg_{1.84}Fe^{2+}_{1.37}Al_{0.94}Fe^{3+}_{0.39}Ti_{0.38}Mn_{0.01})_{\Sigma=4.93}(Si_{4.95}Al_{3.05})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with potassic-magnesiosadanagaite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg+Fe^{2+}) > 0.5$; $Fe^{3+}/(Fe^{3+}+Al^{vi})$ 0.50; $(Na+K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca+Na)_B \geq 1.34$; $Si < 5.5$; $Ti < 0.5$.

Occurrence: In lenses and irregularly shaped nodules in crystalline limestone; metamorphism reached amphibolite facies in an Fe, Al, Ti-rich sedimentary protolith.

Association: Clinopyroxene, vesuvianite, spinel-hercynite, titanite, ilmenite, apatite, perovskite, pargasite.

Distribution: On Myojin Island, Ehime Prefecture, Japan.

Name: For *magnesium* in its composition and similarity to *sadanagaite*.

Type Material: University of Tokyo, Tokyo, Japan.

References: (1) Shimazaki, H., M. Bunno, and T. Ozawa (1984) Sadanagaite and magnesio-sadanagaite, new silica-poor members of calcic amphibole from Japan. Amer. Mineral., 69, 465–471. (1) Musgrave Ranges, Australia; Be by colorimetric methods, corresponds to $(Mg_{1.66}Fe^{2+}_{0.40})_{\Sigma=2.06}(Al_{5.95}Si_{0.02}Fe^{3+}_{0.02})_{\Sigma=5.99}Be_{0.93}O_{12}$. (2) Enderby Land, Antarctica; by electron microprobe; Be assumed from (1), total Fe as FeO, original total given as 99.62%; corresponds to $(Mg_{1.17}Fe_{0.60}Zn_{0.28})_{\Sigma=2.05}Al_{5.97}Be_{0.98}O_{12}$.

Polymorphism & Series: 9R, 18R polytypoids.

Occurrence: In a nodule, perhaps formerly a corundum crystal, in high-grade metapyroxenite, associated with metaperidotites and granulites (Musgrave Ranges, Australia); in pegmatite cutting granulite (Enderby Land, Antarctica).

Association: Spinel, sapphirine, phlogopite (Musgrave Ranges, Australia); quartz, sillimanite, garnet, biotite, surinamite, sapphirine (Enderby Land, Antarctica).

Distribution: From 16 km north-northeast of Ernabella Mission, Musgrave Ranges, South Australia. Along Casey Bay, Enderby Land, Antarctica. Found at Dove Bugt, northeast Greenland.

Name: For the Musgrave Ranges, South Australia, from where it was first recognized.

Type Material: Western Australian Museum, Perth, M.70.1991; University of Queensland, Brisbane, Australia, V014820; National Museum of Natural History, Washington, D.C., USA, 147436.

(1) Lovers Pit, Mineville, Essex Co., New York, USA. (2) Meier's Find, Western Australia; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry. (3) $Fe^{2+}Fe^{3+}_2O_4$.

Polymorphism & Series: Forms two series, with jacobsite, and with magnesioferrite.

Mineral Group: Spinel group.

Occurrence: A common accessory mineral in igneous and metamorphic rocks, in which magmatic segregation or contact metamorphism may produce economic deposits. Extensive deposits in sedimentary banded iron formations; a biogenic product; important detrital deposits.

Association: Chromite, ilmenite, ulvöspinel, rutile, apatite, silicates (igneous); pyrrhotite, pyrite, chalcopyrite, pentlandite, sphalerite, hematite, silicates (hydrothermal, metamorphic); hematite, quartz (sedimentary).

Distribution: Many localities, even for fine crystals. In Sweden, at Falun, Kiruna, Västanfors, and elsewhere. At Arendal, Norway. From Zlatoust and Magnetigorsk, Ural Mountains, Russia. In the Zillertal, Tirol, Austria. From Traversella, Piedmont, Italy. In Switzerland, at Binntal and Rimpfischwäng, Valais, and elsewhere. In the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. From Bancroft, Ontario, Canada. In the USA, around Lake Sanford, Essex Co., and in the Tilly Foster mine, Brewster, Putnam Co., New York; at Magnet Cove, Hot Spring Co., Arkansas; in the Iron Springs district, Iron Co., Utah. From the Cerro del Mercado, Durango, Mexico. At Itabira, Minas Gerais, Brazil.

Name: An ancient term, possibly an allusion to the locality, *Magnesia*, Greece.

(1) Nordfjord, Norway; by electron microprobe, Fe^{2+}:Fe^{3+} calculated; corresponding to $(Na_{1.94}Ca_{1.06})_{\Sigma=3.00}(Mg_{2.93}Al_{1.12}Fe^{3+}_{0.50}Fe^{2+}_{0.41}Ti_{0.04})_{\Sigma=5.00}(Si_{6.24}Al_{1.76})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with taramite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A \geq 0.5$; $0.67 \quad Na_B \quad 1.33$; $(Ca + Na)_B \geq 1.34$; $Si < 6.5$.

Occurrence: An unusual product of the retrograde metamorphism of eclogitic rocks.

Association: Plagioclase, clinopyroxene.

Distribution: In the Nybö eclogite pod, Nordfjord, Norway.

Name: For *magnesium* in its composition and similarity to *taramite*.

Type Material: n.d.

Magnesite $MgCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Uncommon as crystals, to 30 cm, with large $\{10\bar{1}1\}$ or $\{01\bar{1}2\}$, modified by $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, or tabular on $\{0001\}$. Typically earthy, chalky, porcelaneous, fibrous, coarse to fine granular, compact massive.

Physical Properties: *Cleavage:* On $\{10\bar{1}1\}$, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4.5 D(meas.) = 3.00(2) D(calc.) = 3.010 May exhibit pale green to pale blue fluorescence and phosphorescence under UV; triboluminescent.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale yellow, pale brown, faintly pink, lilac-rose; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Dispersion:* Very strong. *Absorption:* $O > E$, if colored.
$\omega = 1.700$ $\epsilon = 1.509$

Cell Data: *Space Group:* $R\bar{3}c$. a = 4.6632 $c = 15.015$ Z = 6

X-ray Powder Pattern: Synthetic.

(1) Brumado, Brazil; CO_2 calculated for stoichiometry; corresponds to $(Mg_{0.98}Fe_{0.01}Mn_{0.01})_{\Sigma=1.00}CO_3$. (2) $MgCO_3$.

Polymorphism & Series: Forms two series, with gaspéite and with siderite.

Mineral Group: Calcite group.

Occurrence: A primary mineral in igneous or sedimentary rocks; formed by metamorphism or alteration of serpentine and peridotite; uncommon in marine evaporites and hydrothermal veins; rare in carbonatites.

Association: Talc, antigorite, "chlorite", dolomite, calcite.

Distribution: An ore of magnesium and used to prepare refractories, with world reserves estimated at about 10 billion t. Some well-studied localites include: from Magnesia, Greece. At Baldissero Canavese, Piedmont, Italy. Large crystals from Sunk, near Trieben, Styria, and Radenthein, Carinthia, Austria. At Snarum, Norway. Fine large crystals from several mines around Brumado, Bahia, Brazil. In Canada, at the Mt. Brussilof mine, near Radium, British Columbia, and in the Del Oro deposits, Timmins, Ontario. In the USA, in a large deposit near Gabbs, Gabbs district, Nye Co., Nevada; from a number of commercial deposits in California, as in the Red Mountain district, Stanislaus and Santa Clara Co.; from southwest of Chewelah, Stevens Co., Washington. Immense deposits in the Liaoning district, Liaoning Province, China. Numerous other occurrences are known.

Name: For *magnesium* in the composition.

Magnesium-chlorophoenicite $(Mg,Mn)_3Zn_2(AsO_4)(OH,O)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, stout to acicular, usually in radial aggregates and rosettes, to 12 mm.

Physical Properties: *Cleavage:* One perfect, parallel to elongation. *Tenacity:* [Brittle] (by analogy to chlorophoenicite). Hardness = [Soft.] D(meas.) = 3.45 D(calc.) = [3.36]

Optical Properties: Translucent. *Color:* Colorless to white; colorless in thin section. *Luster:* [Vitreous.]
Optical Class: Biaxial (+). *Orientation:* Y = elongation. *Dispersion:* $r < v$, strong.
$\alpha = 1.669$ $\beta = 1.672$ $\gamma = 1.677$ 2V(meas.) = Small.

Cell Data: *Space Group:* $C2/m$. $a = 22.99(1)$ $b = 3.236(2)$ $c = 7.299(3)$ $\beta = 106.5(1)°$
Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA; nearly identical to chlorophoenicite.
2.607 (100), 3.706 (50), 3.092 (40), 2.977 (25), 6.98 (20), 6.87 (20), 1.7560 (20)

Chemistry:

	(1)
P_2O_5	0.1
As_2O_5	20.7
FeO	0.0
MnO	15.9
ZnO	37.5
MgO	10.6
CaO	0.0
H_2O	[15.2]
Total	[100.0]

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O by difference; corresponding to $(Mg_{1.39}Mn_{1.18}Zn_{0.43})_{\Sigma=3.00}Zn_{2.00}(OH)_6[As_{0.42}H_{0.5}(OH,O)_3]_2$.

Occurrence: A very rare mineral, in open veinlets cutting a metamorphosed stratiform zinc orebody.

Association: Willemite, zincite, andradite, franklinite, hodgkinsonite, barite, calcite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For its *magnesium* content and similarity to *chlorophoenicite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 92803.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 780. (2) Dunn, P.J. Magnesium-zippeite $Mg_2(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m$. As fine-grained efflorescences.

Physical Properties: Hardness = ∼2 D(meas.) = > 3.3 D(calc.) = n.d. Radioactive; fluoresces bright yellow under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Yellow-orange to orange-tan. *Optical Class:* Biaxial. *Pleochroism:* X = pale yellow; Y = yellow; Z = dark yellow. $\alpha = 1.72$ $\beta = 1.75$ $\gamma = 1.82$ 2V(meas.) = Moderate to large.

Cell Data: *Space Group:* $C2/c$ (by analogy to zippeite). $a = 8.649(1)$ $b = 14.241(2)$ $c = 17.696(2)$ $\beta = 104.11(5)°$ Z = 8

X-ray Powder Pattern: Lucky Strike No. 2 mine, Utah, USA. 3.58 (10), 7.2 (8), 3.48 (8), 3.11 (6), 2.74 (3), 2.88 (2), 2.52 (2)

Chemistry:

	(1)	(2)
SO_3	5.0	9.94
UO_3	74.6	71.06
CoO	1.4	
MgO	6.2	3.34
H_2O	10.9	15.66
Total	98.1	100.00

(1) Lucky Strike No. 2 mine, Utah, USA; by microchemical analysis; identification primarily established by correspondence of its X-ray powder pattern with that of synthetic material. (2) $Mg_2(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$.

Occurrence: A rare post-mine mineral on the walls of mine tunnels.

Association: Sodium-zippeite, gypsum, bieberite, cobaltocalcite, rabbittite (Lucky Strike No. 2 mine, Utah, USA); uranopilite, zippeite, sodium-zippeite, nickel-zippeite, johannite, cuprosklodowskite, sklodowskite, metaschoepite (Jáchymov, Czech Republic).

Distribution: From the Lucky Strike No. 2 mine, Emery Co., Utah, USA. In the Evangelista vein, Jáchymov (Joachimsthal), Czech Republic.

Name: For its content of *magnesium* and relation to *zippeite*.

Type Material: n.d.

(1) Långban, Sweden; corresponds to $Pb_{1.05}(Fe^{3+}_{7.66}Mn^{3+}_{2.56}Mn^{2+}_{0.62}Ti_{0.60}Al_{0.42}Ca_{0.06}Mg_{0.04}Cr_{0.04})_{\Sigma=12.00}O_{19}$. (2) Do.; by electron microprobe, Mn^{2+}:Mn^{3+} from charge balance; corresponds to $Pb_{1.00}(Fe^{3+}_{7.72}Mn^{3+}_{2.79}Ti_{0.60}Mn^{2+}_{0.47}Al_{0.24}Zn_{0.12}Mg_{0.03}Cr_{0.02}Ba_{0.01})_{\Sigma=12.00}O_{19}$. (3) Do.; by electron microprobe, Mn^{2+}:Mn^{3+} from charge balance; corresponds to $(Pb_{0.98}Ba_{0.02})_{\Sigma=1.00}(Fe^{3+}_{7.34}Mn^{2+}_{1.51}Ti_{1.49}Mn^{3+}_{0.87}Al_{0.38}Mg_{0.16}Sb_{0.13}Zn_{0.10}Cr_{0.02})_{\Sigma=12.00}O_{19}$.

Mineral Group: Magnetoplumbite group.

Occurrence: In skarns associated with metamorphosed Fe–Mn orebodies (Sweden).

Association: Melanotekite-kentrolite, hematite, jacobsite, hedyphane, braunite, pyrophanite, manganoan phlogopite, calcite, andradite, celsian (Sweden).

Distribution: In Sweden, from Långban; in the Harstigen mine, near Persberg; and at Jakobsberg, Värmland.

Name: For being a MAGNETic oxide of iron, manganese, and lead, *plumbum*.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 24639.

Magniotriplite $(Mg, Fe^{2+}, Mn^{2+})_2(PO_4)(F, OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals and nodular masses, to 8 cm.

Physical Properties: *Cleavage:* One direction observed under the microscope.
Fracture: Uneven. Hardness = 4 D(meas.) = 3.57 D(calc.) = 3.68

Optical Properties: Translucent. *Color:* Reddish brown, yellow. *Streak:* Pale brown.
Luster: Vitreous to resinous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = light yellow to colorless; Y = light yellow; Z = wine-yellow. *Orientation:* $Z = b$; $X \wedge a = 18°$. *Dispersion:* $r > v; r < v$. $\alpha = 1.641$–1.648 $\beta = 1.649$–1.653 $\gamma = 1.661$–1.664 2V(meas.) = 60°

Cell Data: *Space Group:* $I2/a$. $a = 12.035(5)$ $b = 6.432(4)$ $c = 9.799(2)$ $\beta = 108.12(2)°$ Z = 8

X-ray Powder Pattern: Valmy, France; close to wagnerite.
2.864 (100), 3.015 (80), 3.162 (70), 2.794 (60), 3.587 (50), 3.324 (50), 2.576 (30)

(1) Karasu pegmatite, Kyrgyzstan; SiO_2 quartz impurity, corresponds to $(Mg_{0.88}Fe_{0.74}Mn_{0.38})_{\Sigma=2.00}(PO_4)_{1.06}[F_{0.66}(OH)_{0.14}]_{\Sigma=0.80}$. (2) Valmy, France; corresponding to $(Mg_{0.89}Fe_{0.87}Mn_{0.23}Ti_{0.01})_{\Sigma=2.00}(PO_4)[F_{0.68}(OH)_{0.31}]_{\Sigma=0.99}$.

Occurrence: In zoned complex granite pegmatites.

Association: Arrojadite, triphylite, muscovite, albite, quartz (Karasu pegmatite, Kyrgyzstan); vivianite, graftonite (Valmy, France).

Distribution: From the Karasu and Kyrk-Bulak pegmatites, Turkestan Range, Kyrgyzstan. At Hålsjöberget, Värmland, Sweden. From Valmy, Albères massif, Pyrénées-Orientales, France. In the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: As the *magnesium* dominant analog of *triplite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 50653–50658.

Magnocolumbite $(Mg, Fe^{2+}, Mn^{2+})(Nb, Ta)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rough crystals, tabular to acicular, to 1.5 cm, with nine forms noted. *Twinning:* Common, with a 25° angle between extinction directions.

Physical Properties: *Cleavage:* {100} and {001}. *Fracture:* Uneven. Hardness = 6
D(meas.) = 5.17–5.25 D(calc.) = 5.23

Optical Properties: Opaque, translucent on thin edges. *Color:* Black to brownish black; brown, brownish red to reddish brown in transmitted light. *Streak:* Dark brown. *Luster:* Semimetallic.
Optical Class: Biaxial (–). *Pleochroism:* Distinct; X = brownish yellow; Z = brownish red. *Orientation:* $X = b$; $Y = a$; $Z = c$. α = 2.33–2.36 β = n.d. γ = 2.39–2.44
2V(meas.) = ∼80°

Cell Data: *Space Group:* [*Pbcn*] (by analogy to ferrocolumbite). $a = 14.17$ $b = 5.65$ $c = 5.02$ Z = 4

X-ray Powder Pattern: Kukhi-Lal deposit, Tajikistan.
2.955 (10), 1.723 (9), 1.535 (9), 1.470 (9), 1.454 (9), 1.197 (9), 1.105 (9)

Chemistry:

	(1)	(2)
WO_3	0.86	
Nb_2O_5	70.59	68.27
Ta_2O_5	10.45	16.20

Total	99.77	100.00

(1) Kukhi-Lal deposit, Tajikistan; corresponds to $(Mg_{0.71}Fe^{2+}_{0.10}Mn^{2+}_{0.10}Al_{0.07}Fe^{3+}_{0.01})_{\Sigma=0.99}(Nb_{1.69}Ti_{0.18}Ta_{0.15}W_{0.01})_{\Sigma=2.03}O_6$. (2) "Eastern Siberia, Russia"; corresponds to $(Mg_{0.80}Fe^{2+}_{0.21})_{\Sigma=1.01}(Nb_{1.70}Ta_{0.24}Ti_{0.06})_{\Sigma=2.00}O_6$.

Occurrence: In a pegmatite in partially assimilated dolomitic marbles (Kukhi-Lal deposit, Tajikistan).

Association: Ilmenorutile, cordierite, dravite, spinel, andalusite, kyanite (Kukhi-Lal deposit, Tajikistan).

Distribution: In the Kukhi-Lal deposit, Pyandzh River valley, southwestern Pamir Mountains, Tajikistan. From an undisclosed locality in "eastern Siberia", Russia.

Name: For dominant MAGNesium in the composition, and its relation to *ferrocolumbite*.

Type Material: n.d.

Magnolite $Hg_2^{1+}Te^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals bladed, showing {100} and {010}, striated on {001} ∥ [001], in parallel to subparallel groups, or acicular, elongated along [001], to 1 mm, in tufted aggregates.

Physical Properties: *Cleavage:* {001}, perfect; ⊥ {001}, good. *Tenacity:* Brittle. Hardness = "Soft". D(meas.) = n.d. D(calc.) = 8.12

Optical Properties: Transparent to opaque. *Color:* Colorless, creamy white, pale yellow-green; internally dark brown. *Streak:* Pale brown. *Luster:* Adamantine, silky in aggregates. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. $n = > 2$ α = n.d. β = n.d. γ = n.d. 2V(meas.) = ≥45°

Cell Data: *Space Group:* $Pbm2$. $a = 5.958(1)$ $b = 10.576(2)$ $c = 3.749(1)$ $Z = 2$

X-ray Powder Pattern: Colorado, USA.
3.043 (100), 3.95 (70), 5.25 (50), 2.587 (50), 1.757 (50), 3.74 (40), 1.986 (40)

Chemistry:

	(1)	(2)
TeO_2	28.9	27.67
Hg_2O	72.3	72.33
Total	101.2	100.00

(1) Keystone mine, Colorado, USA; by electron microprobe, average of five analyses, valences from crystal-structure analysis; corresponds to $Hg_{1.94}Te_{1.01}O_3$. (2) Hg_2TeO_3.

Occurrence: A late alteration product of coloradoite, formed at low temperature and oxygen fugacity, in the oxidized zone of complex polymetallic hydrothermal mineral deposits.

Association: Mercury, coloradoite, tellurite, gold, tellurium, keystoneite, "limonite", manganese oxides, quartz.

Distribution: From the Keystone and Mountain Lion mines, Magnolia district, Boulder Co., Colorado, USA.

Name: For the Magnolia district, Colorado, USA, in which the species was first noted.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 65534; Harvard University, Cambridge, Massachusetts, 112683; National Museum of Natural History, Washington, D.C., USA, 165455.

(1) Långban, Sweden; recalculated to 100% after deduction of insoluble 3.68% as barite. (2) Do.; by electron microprobe, total Mn as MnO, total Cu as CuO, H_2O by TGA; corresponds to $(Mn_{4.59}Cu_{0.19}Fe_{0.11}Ca_{0.08}Mg_{0.04})_{\Sigma=5.01}As_3O_{8.90}[(OH)_{1.10}Cl_{0.13}]_{\Sigma=1.23}$. (3) Sterling Hill, New Jersey, USA; by electron microprobe, total Mn as MnO, total Cu as CuO; with H_2O assumed for OH+Cl = 1, corresponds to $(Mn_{4.56}Cu_{0.29}Zn_{0.23}Fe_{0.04}Ca_{0.03}Mg_{0.03})_{\Sigma=5.18}$ $As_3O_{9.18}[(OH)_{0.66}Cl_{0.34}]_{\Sigma=1.00}$.

Occurrence: In a metamorphosed Fe–Mn orebody (Långban, Sweden); very rare in a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Dolomite, hausmannite, hematite, calcite, trigonite, dixenite, manganiferous serpentine (Långban, Sweden); katoptrite, sonolite, hausmannite, manganosite, magnetite (Brattfors mine, Sweden); zincite, willemite, franklinite, kraisslite (Sterling Hill, New Jersey, USA).

Distribution: From Långban, Värmland, and in the Brattfors mine, Nordmark, Värmland, Sweden. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey.

Name: For Nils Harald Magnusson (1890–1976), formerly Director, Geological Survey of Sweden, for his contributions to knowledge of the Långban mine.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; The Natural History Museum, London, England, 1963,233; Harvard University, Cambridge, Massachusetts, USA, 106140, 106337.

Mahlmoodite $Fe^{2+}Zr(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In spheroidal aggregates of radiating fibrous to lathlike crystals, to 0.15 mm.

Physical Properties: Hardness = ∼3 D(meas.) = n.d. D(calc.) = 2.877

Optical Properties: Translucent. *Color:* Cream-white.
Optical Class: Biaxial (–), sensibly uniaxial (–). *Orientation:* Positive elongation; parallel extinction. $\alpha = < 1.646$ $\beta = 1.652(2)$ $\gamma = 1.652(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 9.112(6)$ $b = 5.412(7)$ $c = 19.19(1)$ $\beta = 94.81(6)^\circ$ Z = 4

X-ray Powder Pattern: Wilson Springs mine, Arkansas, USA.
3.160 (100), 4.382 (80), 9.58 (75), 2.640 (70), 4.572 (65), 4.092 (60), 3.978 (40)

Chemistry:

	(1)	(2)
P_2O_5	36.2	34.70
SiO_2	0.3	
TiO_2	0.7

H_2O	[14.7]	17.62
Total	[100.0]	100.00

(1) Wilson Springs mine, Arkansas, USA; by electron microprobe, average of 25 analyses, total Fe as FeO, total Mn as MnO, H_2O by difference, probably reduced by loss under vacuum; excluding SiO_2 and F, corresponds to $(Fe_{0.88}Ca_{0.09}Mn_{0.04}Mg_{0.03}Na_{0.03})_{\Sigma=1.07}(Zr_{0.91}Ti_{0.03}Al_{0.02})_{\Sigma=0.96}(PO_4)_{2.01} \cdot 4H_2O$. (2) $FeZr(PO_4)_2 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in vugs in alkaline igneous rock (Wilson Springs mine, Arkansas, USA); in a mineralized fissure vein (Kerriack Cove, Cornwall, England).

Association: Kolbeckite, sodic pyroxene (Wilson Springs mine, Arkansas, USA); sphalerite, pyrite, anatase (Kerriack Cove, Cornwall, England).

Distribution: In the USA, in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas. At Kerriack Cove, near Redruth, Cornwall, England.

Name: Honors Bertha K. Mahlmood, Analytical Assistant, U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 170394.

References: (1) Milton, C., J.J. McGee, and H.T. Evans, Jr. (1993) Mahlmoodite, $FeZr(PO_4)_2 \cdot 4H_2O$, a new iron zirconium phosphate mineral from Wilson Springs, Arkansas. Amer. Total	100.68

(1) Cap Garonne mine, France; by electron microprobe; H_2O by loss on heating; corresponds to $(Na_{0.90}Ca_{0.23}K_{0.05})_{\Sigma=1.18}Cu_{2.79}(AsO_4)_{2.07}Cl_{0.81}•4.91H_2O$.

Occurrence: In the oxidized zone of an arsenic-rich copper deposit (Cap Garonne mine, France).

Association: Tennantite, covellite, geminite, pushcharovskite, quartz (Cap Garonne mine, France).

Distribution: From the Cap Garonne mine, near le Pradet, Var, and at the Salsigne mine, 15 km north of Carcassone, Aude, France. In the Falotta mine, Oberhalbstein, Graubünden, Switzerland.

Name: To honor Dr. Volker Mahnert (b. 1943), Director, Natural History Museum, Geneva, Switzerland.

Type Material: Natural History Museum, Geneva, Switzerland.

(1) Majak mine, Russia; by electron microprobe, average of two analyses; corresponding to $Pd_{0.94}Ni_{1.12}As_{1.00}$. (2) Konttijärvi intrusion, Finland; by electron microprobe, corresponding to $Pd_{1.02}Ni_{0.95}(As_{0.99}Sb_{0.01})_{\Sigma=1.00}$. (3) PdNiAs.

Occurrence: As intergrowths with other platinum-group minerals in chalcopyrite and talnakhite ores (Majak mine, Russia); in sulfide mineralization in a strongly metamorphosed layered intrusive (Konttijärvi intrusion, Finland).

Association: Chalcopyrite, talnakhite, polarite, stanopalladinite, silver, ferroplatinum, sperrylite, other platinum-group minerals (Majak mine, Russia); isomertieite, mertieite (Konttijärvi intrusion, Finland).

Distribution: In Russia, from the Majak mine, Talnakh area, Noril'sk region, western Siberia [TL]; also found at the Chiney layered intrusion, western Aldan shield, Siberia; near Nizhni Tagil, Ural Mountains; and in the Vostok deposit, Lukkulaisvaara layered intrusion, Karelia. From the Konttijärvi intrusion, northern Finland. At the Lubin and Polkovice copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland.

Name: For the Majak (Mayak) mine, Russia.

Type Material: Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Coorara meteorite; by electron microprobe, average of five analyses; original analysis Si 24.3%, Al 1.4%, Cr 0.45%, Fe 13.1%, Mg 16.6%, Ni 0.03%, Na 0.5%, here recalculated to oxides; corresponds to $(Mg_{2.98}Na_{0.10})_{\Sigma=3.08}(Fe^{2+}_{1.02}Si_{0.78}Al_{0.23}Cr_{0.03})_{\Sigma=2.06}Si_{3.00}O_{12}$. (2) Pampa del Infierno meteorite; by electron microprobe, original total given as 100.77%; corresponds to $(Mg_{2.88}Ca_{0.12})_{\Sigma=3.00}(Si_{0.78}Fe^{2+}_{0.50}Al_{0.38}Mg_{0.32})_{\Sigma=1.98}Si_{3.00}O_{12}$.

Mineral Group: Garnet group.

Occurrence: Formed from low-calcium, high-aluminum pyroxene, olivine, and shock-induced glass, by high-pressure impact metamorphism in bolides.

Association: Pyroxene, ringwoodite, olivine, kamacite, goethite, troilite.

Distribution: In the Coorara, Catherwood, Pampa del Infierno, Tenham, and Peace River chondritic meteorites.

Name: For Alan Major, who assisted A.E. Ringwood in the high-pressure synthesis of garnet from pyroxene.

Type Material: National Museum of Natural History, Washington, D.C., USA, 122379.

(1) Lake Magadi, Kenya. (2) Lovozero massif, Russia. (3) $Na_2Si_4O_8(OH)_2 \cdot 4H_2O$.

Occurrence: In cores from drill holes in a lacustrine evaporite series (Lake Magadi, Kenya); leached from natrosilite in an alkalic pegmatite in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Trona, erionite, magadiite, anorthoclase, gaylussite, organic material (Lake Magadi, Kenya); natrolite (Lovozero massif, Russia); vuonnemite, sodalite, ussingite, aegirine, steenstrupine, eudialyte, lovozerite (Mont Saint-Hilaire, Canada); varennesite, eudialyte, zakharovite,shkatulkalite, magdaiite (near Saint-Amable, Canada).

Distribution: From Lake Magadi, Rift Valley, Kenya. On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. In the Höwenegg quarry, Hegau, Baden-Württemberg, Germany. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. At Poços de Caldos, Minas Gerais, Brazil. From the Aris quarry, about 25 km south of Windhoek, Namibia.

Name: From the Masai word *emakut*, meaning *soda*, in allusion to the high sodium content of the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 122170, 122171.

Mineral Group: Benjaminite group.

Occurrence: Among other bismuth-bearing sulfosalts in a dolomite skarn (Băiţa, Romania); in a hydrothermal tungsten deposit in amphibolites and felsic gneisses, in discordant quartz veins (Felbertal mine, Austria).

Association: Chalcopyrite, hammarite, bismuthinite, krupkaite–lindströmite, tetradymite, wittichenite, paděrite, miharaite, bismuth, gold, scheelite, molybdenite, galena, sphalerite, chalcocite, diopside, chondrodite, grossular–andradite (Băiţa, Romania); galenobismutite, bismuth, hammarite, lindströmite, gold, chalcopyrite, pyrrhotite (Felbertal mine, Austria).

Distribution: In Romania, from Băiţa (Rézbánya) [TL] and at Ocna de Fier (Morávicza; Vaskő). In the Felbertal tungsten mine, Salzburg, Austria.

Name: To honor Professor Emil Makovicky (1941–), Slovak–Danish mineralogist, University of Copenhagen, Copenhagen, Denmark.

Type Material: Charles University, Prague; National Museum, Prague, Czech Republic.

Malachite $Cu_2(CO_3)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are acicular to prismatic, thick tabular, equant, with {100}, {010}, {001}, {110}, {$\overline{2}$01}, several other forms, rounded, in sprays and crude composite aggregates, to 9 cm; typically stalactitic, mammillary, botryoidal, as such, radially fibrous internally. *Twinning:* On {100}, {201}, very common as contact or penetration twins, also polysynthetic.

Physical Properties: *Cleavage:* Perfect on {$\overline{2}$01}; fair on {010}. *Fracture:* Subconchoidal to uneven. Hardness = 3.5–4 D(meas.) = 4.05(2) D(calc.) = 3.983

Optical Properties: Translucent to opaque. *Color:* Bright green, dark green, blackish green, commonly banded in masses; green to yellowish green in transmitted light. *Streak:* Pale green. *Luster:* Adamantine to vitreous; silky if fibrous; dull to earthy if massive.
Optical Class: Biaxial (–). *Pleochroism:* X = nearly colorless; Y = yellowish green; Z = deep green. *Orientation:* $Y = b$; $X \wedge c = 23.5°$. *Dispersion:* $r < v$, moderately strong. $\alpha = 1.655(3)$ $\beta = 1.875(3)$ $\gamma = 1.909(3)$ 2V(meas.) = 43(2)°

Cell Data: *Space Group:* $P2_1/a$. $a = 9.502$ $b = 11.974$ $c = 3.240$ $\beta = 98°45'$ Z = 4

X-ray Powder Pattern: Synthetic.
2.857 (100), 3.693 (85), 5.055 (75), 5.993 (55), 2.520 (55), 2.778 (45), 2.464 (35)

H_2O	8.09	8.15
Total	100.16	100.00

(1) Rio Marina, Elba, Italy. (2) $Cu_2(CO_3)(OH)_2$.

Occurrence: A common secondary mineral formed in the oxidation zone of copper deposits; locally may be an ore of copper.

Association: Azurite, cuprite, cerussite, chrysocolla, calcite. "limonite".

Distribution: Many localities; some for abundant and rich material include: from Chessy, near Lyon, Rhône, France. In Russia, large pure masses formerly from mines around Nizhni Tagil and Ekatarinburg, Ural Mountains. In Congo, in Katanga Province (Shaba Province, Zaire), from Lubumbashi, at the Musonoi mine, near Kolwezi, and elsewhere, with large crystals from the Mashamba West mine. In Namibia, from Tsumeb, and as large crystals at the Onganja mine, 60 km northeast of Windhoek. In Australia, from Broken Hill and Cobar, New South Wales, and Burra, South Australia. In the USA, from the Copper Queen, Czar, and other mines in the Warren district, Bisbee, Cochise Co. and at Morenci, Greenlee Co., Arizona; in the Fierro-Hanover district and at Santa Rita, Grant Co., New Mexico.

Name: From the Greek for *mallow*, in allusion to its green color.

(1) Malan Valley, China; by electron microprobe, corresponds to $(Cu_{0.85}Fe_{0.10}Ni_{0.03})_{\Sigma=0.98}(Pt_{1.02}Ir_{0.71}Co_{0.24}Pd_{0.02})_{\Sigma=1.99}S_{3.98}$. (2) Do.; by electron microprobe, corresponds to $(Cu_{0.93}Fe_{0.06})_{\Sigma=0.99}(Pt_{1.03}Ir_{0.66}Co_{0.20}Rh_{0.04}Ni_{0.03}Pd_{0.03})_{\Sigma=1.99}S_{4.03}$. (3) Konder massif, Russia; by electron microprobe, corresponds to $(Cu_{0.92}Fe_{0.01})_{\Sigma=0.93}(Pt_{0.90}Ir_{0.58}Rh_{0.57})_{\Sigma=2.05}S_{4.03}$.

Polymorphism & Series: Forms a series with cuproiridisite.

Mineral Group: Linnaeite group.

Occurrence: In peridotite-type platinum ores with Cu–Ni sulfides (Malan Valley, China).

Association: Pentlandite, pyrrhotite, bornite, magnetite, cooperite, sperrylite, moncheite, platinum, olivine, pyroxenes, serpentine, chlorite (Malan Valley, China); osmiridium, ferrian platinum (Shuangfeng village, China); osmium, laurite, isoferroplatinum (Konder massif, Russia).

Distribution: In China, in Hebei Province, from the Malan Valley, Zunhua Co., about 150 km east of Beijing [TL]; at Shuangfeng village, Yanshan Mountains, about 200 km northeast of Beijing; from near Damiao village and the Yixun River, about 270 km north of Beijing. In Russia, from the Konder massif, Aldan Shield, Sakha, and in the Mt. Bolshaya Varaka deposit, Imandra complex, Kola Peninsula. At the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland. In the Ojén lherzolite massif, Málaga Province, Spain. In the Baula complex, Orissa, India. From the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: Apparently for the Malan Valley, China.

Type Material: Geological Institute, Academy of Geological Sciences of China, Beijing, China.

Malayaite $CaSnSiO_5$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals wedge-shaped, up to 3 cm; massive, as a coating on cassiterite.

Physical Properties: Hardness = 3.5–4 D(meas.) = 4.3(2) D(calc.) = [4.55] Fluoresces pale to bright yellow or yellow-green under UV.

Optical Properties: Translucent. *Color:* Very pale creamy yellow to deep yellow-orange, colorless. *Luster:* Resinous.
Optical Class: Biaxial (–). α = 1.764–1.765 β = 1.783–1.786 γ = 1.798–1.801
2V(meas.) = 84°–86°

Cell Data: *Space Group:* $A2/a$. $a = 7.156(6)$ $b = 8.895(9)$ $c = 6.668(4)$ $\beta = 113.4(1)°$
Z = 4

X-ray Powder Pattern: Synthetic.
3.28 (100), 5.05 (50), 2.639 (45), 3.06 (35), 2.665 (30), 2.412 (20), 2.099 (20)

Chemistry:

	(1)	(2)
SiO_2	21.26	22.49
SnO_2	58.48	56.38
FeO		0.15
CaO	19.14	20.94
LOI	0.50	
Total	99.38	99.96

(1) Sungei Lah Valley, Malaya; corresponds to $Ca_{0.95}Sn_{1.07}Si_{0.98}O_5$. (2) Gumble, Australia; by electron microprobe, corresponding to $Ca_{1.00}Sn_{1.00}Fe_{0.01}Si_{1.00}O_5$.

Occurrence: In tin-rich contact metamorphic skarn deposits, probably a hydrothermal alteration product of cassiterite or other tin-bearing minerals.

Association: Cassiterite, quartz, calcite, wollastonite, pyroxene, garnet.

Distribution: In the Sungei Lah Valley, Chenderiang, Perak State, and other locations in Malaya, Malaysia. From Piniok, Thailand. In the Toroku and Mitate mines, Miyazaki Prefecture; the Sampo mine, Okayama Prefecture; the Hoei mine, Oita Prefecture; and the Kuga mine, Yamaguchi Prefecture, Japan. In the Kan'onsk deposit, headwaters of the Seimchan River, Yakutia, Russia. From Alpe Rosso, Val Vigezzo, Piedmont, Italy. At the Red-a-Ven Brook mine, Meldon, Devon, England. From near Gumble and Bourke, New South Wales, Australia. From the JC claims, near Dorsey Lake, Cassiar Mountains, and near Ash Mountain, McDame, British Columbia, Canada. From the Mesa Grande district, San Diego Co., California, USA.

Name: For the localities in Malaya, Malaysia.

Type Material: n.d.

Maldonite Au_2Bi

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive granular, also in thin coatings; typically seen in polished section as "decomposed" into a predominantly coarse myrmekitic intergrowth of gold and bismuth in which are wedges of maldonite, or rimming gold grains.

Physical Properties: *Cleavage:* Distinct on {001} and {110}. *Fracture:* Conchoidal. *Tenacity:* Malleable and sectile. Hardness = 1.5–2 VHN = 147–264 (100 g load). D(meas.) = 15.46 D(calc.) = 15.70

Optical Properties: Opaque. *Color:* Silver-white with pinkish tinge on fresh surface, tarnishes copper-red to black. *Luster:* Metallic.
R: (400) 48.3, (420) 49.0, (440) 50.2, (460) 51.5, (480) 53.2, (500) 54.9, (520) 56.6, (540) 58.0, (560) 59.0, (580) 59.6, (600) 59.9, (620) 60.0, (640) 60.0, (660) 60.0, (680) 60.0, (700) 60.1

Cell Data: *Space Group:* $Fd3m$. $a = 7.971$ $Z = 8$

X-ray Powder Pattern: Nuggety Reef, Australia.
2.41 (100), 1.537 (60), 2.30 (50), 1.412 (50), 2.82 (40), 1.038 (40), 1.629 (30)

Chemistry:

	(1)	(2)	(3)	(4)
Au	65.12	63.80	65.92	65.36
Bi	34.88	36.80	34.07	34.64
Total	100.00	100.60	99.99	100.00

(1) Nuggety Reef, Australia; corresponds to $Au_{1.99}Bi_{0.99}$. (2) Salsigne mine, France; by electron microprobe, corresponds to $Au_{1.94}Bi_{1.06}$. (3) Tyrnyauz deposit, Russia; by electron microprobe, corresponds to $Au_{2.02}Bi_{0.98}$. (4) Au_2Bi.

Occurrence: Formed below 373 °C, under hydrothermal conditions in gold-quartz veins and stockworks, and calc-silicate skarns.

Association: Gold, bismuth, bismuthinite, joséite, arsenopyrite, löllingite, pyrite, pyrrhotite, chalcopyrite, cubanite, scheelite, apatite, siderite, calcite, quartz.

Distribution: In Australia, in Victoria, near Maldon, from Nuggety Reef [TL], and in the Eagle Hawk mine, Union Reef; at Kingsgate and from the Lucky Draw mine, New South Wales. In the Salsigne gold deposit, 15 km north of Carcassone, Aude, and from Scoufour, Cantal, France. At the Ortosa Au–Bi–Te deposit, Asturias, Spain. From Baita ??, Romania. In the Radzimowice deposit, Kaczawa Mountains, Poland. At the Orlik deposit, near Humpolec, Czech Republic. From the Tyrnyauz W–Mo deposit, left bank of the Baksan River Valley, northern Caucasus Mountains, Russia. At Syrymbet, Kazakhstan. From Ingram, Ontario, Canada. In the USA, in Alaska, in the Shotgun deposit, about 150 km north of Dillingham, and on the Pogo claims, 145 km southeast of Fairbanks. A number of other minor occurrences are known.

Name: For the locality at Maldon, Australia.

Maleevite $BaB_2Si_2O_8$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. As equant grains to 2 mm, rarely tabular.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 7 VHN = 1018 (50 g load). D(meas.) = 3.78(1) D(calc.) = 3.79

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous, slightly greasy. Bright blue fluorescence in short-wave UV. *Optical Class:* Biaxial (-). α = 1.649(2) β = 1.656(2) γ = 1.656(2) 2V(meas) = 5(3)° 2V(calc) = 0° *Dispersion:* None. *Pleochroism*: None.

Cell Data: *Space Group:Pnma*. *a* = 8.141(2) *b* = 8.176(2) *c* = 9.038(2) Z = 4

X-ray Powder Pattern: Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan. 3.62 (100), 2.021 (70), 6.07 (60), 3.39 (60), 2.83 (50), 2.481 (40), 4.86 (30)

Chemistry:

	(1)
BaO	43.64
PbO	0.42
B_2O_3	19.92
SiO_2	34.86
Total	98.84

(1) Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan; electron microprobe analysis, corresponding to $(Ba_{0.99}Pb_{0.01})_{\Sigma=1.00}B_{1.99}Si_{2.01}O_8$.

Occurrence: In a slightly rounded block of pegmatite in syenite within a boulder in the moraine of the Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan. The Dara-i-Pioz massif at the head of the glacier contains B-rich alkaline rocks and pegmatites.

Association: Quartz, microcline, aegirine, with subordinate arfvedsonite, polylithionite, reedmergnerite, cesium-kupletskite, hyalotekite, albite.

Distribution: Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan.

Name: Honors Bulgarian mineralogist Mikhael Naidenovich Maleev (b. 1940).

Type Material: A.E. Fersman Mineralogical Museum, Moscow, Russia.

References: (1) Pautov, L.A., A.A. Agakhanov, E. Sokolova, and F.C. Mineral., 42, 107–119. (2) (2005) Amer. Mineral., 90, 272-273 (abs. ref. 1).

Malladrite Na_2SiF_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. As minute hexagonal prisms terminated by the base or a pyramid, in crusts.

Physical Properties: Hardness = n.d. D(meas.) = 2.755 D(calc.) = 2.74 Slightly soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Pale rose.
Optical Class: Uniaxial (–). $n = \sim 1.31$, birefringence weak.

Cell Data: *Space Group:* $P321$ (synthetic). $a = 8.859(2)$ $c = 5.038(2)$ Z = 3

X-ray Powder Pattern: Synthetic.
4.429 (100), 4.213 (95), 3.331 (90), 2.281 (90), 1.7962 (55), 3.056 (30), 1.6629 (20)

Chemistry: No analyses have been performed; the composition has been established through analogy to synthetic material.

Occurrence: As a volcanic sublimate.

Association: Avogadrite, hieratite, sal ammoniac, ferruccite, sassolite (Vesuvius, Italy); barberiite, sassolite (Vulcano, Italy).

Distribution: In Italy, from Vesuvius, Campania, and on Vulcano, Lipari Islands.

Name: Honors Professor Alessandro Malladra (1868–1945), Italian vulcanologist, Director, Vesuvius Observatory, Italy.

Type Material: University of Florence, Florence, Italy, 226/l.

Mallardite $Mn^{2+}SO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As masses of fibers, to 12 mm, efflorescences, and crusts.

Physical Properties: *Cleavage:* On {001}, good; on {110}, probable. Hardness = ∼2 D(meas.) = 1.846 (synthetic). D(calc.) = 1.838 Soluble in H_2O; quickly dehydrates at room temperature.

Optical Properties: Transparent to translucent. *Color:* White to pale rose; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–), may be (+). *Orientation:* $Y = b$; $Z \wedge c = 43°–44°$. $\alpha = 1.462–1.513$ $\beta = 1.465–1.533$ $\gamma = 1.474–1.540$ 2V(meas.) = Moderate to large.

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to melanterite and bieberite). $a = 14.15$ $b = 6.50$ $c = 11.06$ $\beta = 105°36'$ Z = 4

X-ray Powder Pattern: Jokoku mine, Japan.
4.92 (100), 5.49 (72), 4.88 (54), 3.79 (42), 2.758 (38), 3.26 (36), 3.13 (31)

Chemistry:

Total	100.0	100.31	100.00

(1) Lucky Boy mine, Utah, USA; corresponds to $(Mn_{0.92}Mg_{0.04}Ca_{0.04})_{\Sigma=1.00}SO_4 \cdot 6.83H_2O$.
(2) Jokoku mine, Japan; corresponds to $(Mn_{0.90}Mg_{0.11})_{\Sigma=1.01}SO_4 \cdot 6.83H_2O$. (3) $MnSO_4 \cdot 7H_2O$.

Mineral Group: Melanterite group.

Occurrence: A rare mineral formed by oxidation of Fe–Mn sulfides and carbonates under conditions of saturated relative humidity; typically post-mine, when it may be seasonal.

Association: Manganoan melanterite (Lucky Boy mine, Utah, USA); jokokuite, ilesite, rhodochrosite, manganoan calcite, kutnohorite (Jokoku mine, Japan); alabandite (Broken Hill, Australia); melanterite, chvaleticeite, epsomite, jokokuite, rozenite, ilesite, copiapite, gypsum (Chvaletice, Czech Republic).

Distribution: In the USA, from the Lucky Boy mine, Butterfield Canyon, Bingham district, Salt Lake Co., Utah; in New Mexico, in the Bayard area, Central (Bayard) district, Grant Co., and in the Lake Valley district, Sierra Co.; at the Moon Anchor mine, Cripple Creek district, Teller Co., Colorado. In the Jokoku mine, about 60 km southwest of Hakodate, Hokkaido, Japan. From Broken Hill, New South Wales, Australia. At Chvaletice, Czech Republic.

Name: To honor François Ernest Mallard (1833–1894), French crystallographer, National School of Mines, Paris, France.

Type Material: Natural History Museum, Paris, France, 96132.

Mallestigite $Pb_3Sb(SO_4)(AsO_4)(OH)_6 \cdot 3H_2O$

Crystal Data: Hexagonal. *Point Group: 6.* Crystals prismatic, elongated along [001], showing {100} and {101}, to 2 mm; also as radial aggregates to 3 mm.

Physical Properties: *Cleavage:* None observed. *Fracture:* Splintery. *Tenacity:* Brittle. VHN = 176 (10 g load). Hardness = 4 D(meas.) = n.d. D(calc.) = 4.91

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+). $\omega = 1.760(4)$ $\varepsilon = 1.801(4)$

Cell Data: *Space Group: $P6_3$.* $a = 8.938$ $c = 11.098$ Z = 2

X-ray Powder Pattern: Mallisteger Mattagskogel, Austria.
3.655 (100), 3.48 (80), 2.675 (62), 6.35 (44), 2.235 (35), 3.175 (31), 7.74 (25)

Chemistry:

	(1)
SO_3	8.64
Sb_2O_5	14.68
As_2O_5	9.71
PbO	65.67
$H_2O_{(calc)}$	[10.38]
Total	109.08

(1) Mallisteger Mattagskogel, Corinthia, Austria; average of 14 electron microprobe analyses, H_2O calculated, corresponding to $Pb_{3.06}Sb_{0.95}[(SO_4)_{1.12}(AsO_4)_{0.88}]_{\sum=2.0}(OH)_{5.99} \cdot 3.01H_2O$.

Mineral Group: The Sb analog of fleischerite.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal polymetallic base-metal deposit containing galena and tetrahedrite (Austria); in weathered metallic slag (Hartz Mountains, Germany).

Association: Anglesite, brochantite, langite, linarite, and schultenite.

Distribution: From the dumps of an ancient Cu-Pb-Zn mine near Mallisteger Mattagskogel, Corinthia, Austria; in slag, Hartz Mountains, Germany.

Name: For the town near the dumps from where the mineral was first noted.

Type Material: Not mentioned.

References: (1) Sima, I. (1998) Mallestigite, $Pb_3Sb(SO_4)(AsO_4)(OH)_6 \cdot 3H_2O$, a new mineral from a dump of a former Cu-Pb-Zn mine northwest of the Mallisteger Mattagskogel in Westkarawanken, Corinthia, Austria. Total	[100.0]	100.00

(1) Tiger, Arizona, USA; by electron microprobe, H_2O by difference; corresponds to $Pb_{5.81}Cu_{4.22}Al_{1.02}Sb_{0.94}O_2(S_{1.07}O_4)_2Cl_{3.62}(OH)_{15.58}$. (2)$Pb_6Cu_4AlSbO_2(SO_4)_2Cl_4(OH)_{16}$.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal polymetallic base-metal deposit (Tiger, Arizona, USA); in metallic slag, formed by reaction with ocean water (Laurium, Greece).

Association: Anglesite, leadhillite, caledonite, phosgenite, diaboleite, wulfenite (Tiger, Arizona, USA); cerussite, matlockite, laurionite, paralaurionite, phosgenite, fiedlerite, penfieldite, boleite, diaboleite (Laurium, Greece).

Distribution: From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA. At Laurium, Greece, in slag.

Name: For the Mammoth vein at Tiger, Arizona, from where the mineral was first noted, and the town of Mammoth, Arizona, USA, named for the mine.

Type Material: Victor Goldschmidt University, Göttingen, Germany, M5632; National Museum of Natural History, Washington, D.C., USA, 141368, 161200.

Manaksite $KNaMn^{2+}Si_4O_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As grains, to 3 mm, and aggregates, to 5 mm.

Physical Properties: *Cleavage:* {001}, perfect; {010}, less perfect. *Fracture:* Hackly to steplike. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 2.73(2) D(calc.) = 2.71

Optical Properties: Translucent to transparent. *Color:* Colorless, cream-white, pale rose. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, medium. $\alpha = 1.540(2)$ $\beta = 1.551(2)$ $\gamma = 1.557(2)$ 2V(meas.) = 73°

Cell Data: *Space Group:* $P\bar{1}$. $a = 6.993(5)$ $b = 8.219(7)$ $c = 10.007(9)$ $\alpha = 105.11(7)°$ $\beta = 100.76(6)°$ $\gamma = 114.79(6)°$ Z = 2

X-ray Powder Pattern: Lovozero massif, Russia.
3.45 (100), 3.26 (90), 3.05 (80), 6.89 (70), 2.880 (70), 2.715 (70), 2.463 (70)

Chemistry:

	(1)
SiO_2	62.0
FeO	0.8
MnO	17.2
MgO	0.3
CaO	0.2
SrO	0.2
Na_2O	8.9
K_2O	10.8
Total	100.4

(1) Lovozero massif, Russia; by electron microprobe, average of three analyses; corresponds to $K_{0.89}Na_{1.11}Mg_{0.03}Ca_{0.01}Sr_{0.01}(Mn^{2+}_{0.94}Fe_{0.03})_{\Sigma=0.97}Si_{3.99}O_{10}$.

Occurrence: In ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Nepheline, sodalite, analcime, potassic feldspar, albite, cancrisilite, arfvedsonite, aegirine, ussingite, makatite, grumantite, lomonosovite, villiaumite, additional minor minerals.

Distribution: On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For MAnganese; sodium, NAtrium; potassium, Kalium; and SIlicon in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p575/3.

Manandonite $Li_2Al_4(Si_2AlB)O_{10}(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222. As micaceous pseudohexagonal plates, fanlike lamellar aggregates, or as globules, to about 1 mm, forming crusts. *Twinning:* Commonly twinned around [001], producing six-fold sectors.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 2.5 D(meas.) = 2.76–2.89 D(calc.) = 2.79

Optical Properties: Transparent to translucent. *Color:* White as crystals; dull yellow as globules. *Luster:* Pearly on cleavages.
Optical Class: Biaxial (+) to pseudouniaxial. *Orientation:* $Z \perp \{001\}$. $\alpha = 1.604(5)$ $\beta = 1.604(5)$ $\gamma =$ n.d. 2V(meas.) = 10°–15°

Cell Data: *Space Group:* $C222_1$. $a = 5.057(4)$ $b = 8.765(7)$ $c = 13.769(9)$ Z = 2

X-ray Powder Pattern: Antandrokomby, Madagascar.
6.92 (100), 3.447 (80), 2.376 (35), 4.362 (25), 2.489 (15), 1.863 (15), 4.158 (10)

Chemistry:

Total	100.22	[100.00]	100.00

(1) Antandrokomby, Madagascar. (2) Do.; combined wet chemical analysis, plasma spectrometry, AA, and TGA, recalculated to 100.00% after deduction of FeO(OH) impurities. (3) $Li_2Al_4(Si_2AlB)O_{10}(OH)_8$.

Mineral Group: Kaolinite-serpentine group.

Occurrence: In miarolitic cavities developed in corroded differentiated quartz-microcline-tourmaline-bearing pegmatites.

Association: Elbaite, quartz, microcline, albite.

Distribution: At the Antandrokomby pegmatite, on the Manandona River, Sahatany Valley, Madagascar.

Name: For the Manandona River, nearby the type locality in Madagascar.

Type Material: n.d.

Manasseite $Mg_6Al_2(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Hexagonal crystals, to 2 cm, prismatic with hexagonal dipyramidal forms, terminated by {0001}; commonly foliated massive, intermixed with hydrotalcite. *Twinning:* On {0001}, and on a pyramid at about 30° to [0001].

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = 2 D(meas.) = 2.05(5) D(calc.) = 2.00

Optical Properties: Transparent. *Color:* White, pale blue to sky-blue, pale gray, pale yellow, pale brown, pale orange to deep red-orange, may be zoned; colorless in transmitted light. *Luster:* Waxy to pearly on the cleavage.
Optical Class: Uniaxial (–); may be biaxial due to strain. $\omega = 1.524(3)$ $\epsilon = 1.510(3)$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. $a = 6.12$ $c = 15.34$ $Z = 1$

X-ray Powder Pattern: Dypingdal quarry, Snarum, Norway. (ICDD 14-525).
7.67 (100), 1.84 (60), 2.60 (50), 2.34 (40), 2.17 (40), 2.00 (40), 1.52 (30)

Chemistry:

	(1)	(2)
Al_2O_3	16.59	16.88
Fe_2O_3	0.21	
MgO	39.38	40.04
H_2O	36.34	35.79
CO_2	7.48	7.29
Total	100.00	100.00

(1) Snarum, Norway; estimated gibbsite 6.38%. (2) $Mg_6Al_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with hydrotalcite.

Mineral Group: Manasseite group.

Occurrence: A secondary mineral in ultramafic rocks.

Association: Hydrotalcite, serpentine, dolomite.

Distribution: From Snarum, Norway. In Russia, found near Kusinsk, Southern Ural Mountains, at Asbest, Ural Mountains; on the Kola Peninsula, large crystals from the Kovdor massif, and at the Vuoriyarvi carbonatite complex. At Amity, Orange Co., New York, USA. From Mont St. Hilaire, Quebec, Canada. Fine crystals from the Jacupiranga mine, São Paulo, Brazil.

Name: Honors Ernesto Manasse (1875–1922), Italian chemist and mineralogist, Professor of Mineralogy, University of Florence, Florence, Italy, for work on pyroaurite-related minerals.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 87211.

Mandarinoite $Fe_2^{3+}(Se^{4+}O_3)_3 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are swordlike, elongated along [001], flattened on {100}, exhibiting {100}, {110}, {011}, rarely $\{\bar{1}01\}$, to 3 mm; typically in rosettes and subparallel aggregates. *Twinning:* Common as contact twins with {100}, twin and composition plane.

Physical Properties: *Cleavage:* Probable parting on {100}. Hardness = ∼2.5
D(meas.) = 2.93(3) D(calc.) = 3.04

Optical Properties: Transparent. *Color:* Pale yellowish green; nearly colorless in thin section. *Streak:* Very pale green. *Luster:* Vitreous to slightly greasy.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = pale green. *Orientation:* $X = b$; $c \wedge Z = 2(1)°$. *Dispersion:* Strong, crossed. *Absorption:* $X < Y \leq Z$. $\alpha = 1.715$ $\beta = 1.797$–1.80 $\gamma = 1.86$–1.87 2V(meas.) = 80°–85°

Cell Data: *Space Group:* $P2_1/c$. $a = 16.810(4)$ $b = 7.880(2)$ $c = 10.019(2)$ $\beta = 98.26(2)°$ Z = 4

X-ray Powder Pattern: Pacajake mine, Bolivia.
7.10 (100), 2.977 (70), 3.55 (50), 3.43 (40), 2.804 (20), 1.521 (15), 1.482 (15)

Chemistry:

	(1)	(2)
SeO_2	59.53	55.42
Fe_2O_3	28.68	26.59
H_2O	[11.79]	17.99
Total	[100.00]	100.00

(1) Pacajake mine, Bolivia; by electron microprobe, average of two analyses, Fe^{3+} confirmed by microchemical tests, H_2O by difference, with about 1/3 apparently lost to heating in the electron beam; corresponds to $Fe_{2.01}Se_{2.99}O_9 \cdot 3.65H_2O$. (2) $Fe_2(SeO_3)_3 \cdot 6H_2O$ as determined by crystal-structure analysis.

Occurrence: Probably formed by the simultaneous oxidation of penroseite and pyrite in a selenium-rich ore deposit (Pacajake mine, Bolivia).

Association: Penroseite, siderite, goethite, quartz (Pacajake mine, Bolivia); chalcomenite, kruťaite (El Dragón mine, Bolivia); chlorargyrite (De Lamar mine, Idaho, USA); poughite (El Plomo mine, Honduras).

Distribution: In Bolivia, from the Pacajake mine, Hiaco, 30 km east-northeast of Colquechaca, and at the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, Bolivia. In the USA, from the De Lamar mine, Silver City, Owyhee Co., Idaho; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., and as large crystals from the Wind Mountain mine, San Emidio district, Washoe Co., Nevada; at Darwin, Inyo Co., California. From the El Plomo mine, Ojojona district, Tegucigalpa, Honduras. In the Skouriotissa mine, Cyprus. From the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy.

Name: To honor Dr. Joseph Anthony Mandarino (1929–), American–Canadian mineralogist, Emeritus Curator of Mineralogy, Royal Ontario Museum, Toronto, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, 35273; Harvard University, Cambridge, Massachusetts, 111364, 111368D; National Museum of Natural History, Washington, D.C., USA, 142878.

Manganarsite $Mn_3^{2+}As_2^{3+}O_4(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal or pseudohexagonal. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. As platy hexagonal crystals, imperfect, to 1 mm; fine-grained, massive. *Twinning:* Lamellar, two sets at ~60°, observed optically.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = ~3 D(meas.) = 3.64 D(calc.) = 3.60

Optical Properties: Semitransparent. *Color:* Pale pinkish brown. *Streak:* Pale pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X \perp$ {0001} cleavage. *Dispersion:* $r > v$. $\alpha = 1.78$ $\beta = 1.81$ $\gamma = 1.81$ 2V(meas.) = 28°–43°

Cell Data: *Space Group:* $P\overline{3}1m$, $P31m$, $P3m1$, or $P312$. $a = 11.451(6)$ $c = 7.252(6)$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
2.662 (100), 1.845 (70), 1.652 (60), 3.62 (50), 1.531 (40), 5.74 (30), 4.49 (30)

Chemistry:

	(1)	(2)
As_2O_3	44.3	44.29
Sb_2O_3	1.3	
FeO	1.8	
MnO	43.1	47.64
MgO	1.7	
H_2O	7.7	8.07
Total	99.9	100.00

(1) Långban, Sweden; by electron microprobe, Fe^{2+} determined by microchemical tests, H_2O by TGA; corresponding to $(Mn_{2.74}Mg_{0.19}Fe_{0.11})_{\Sigma=3.04}(As_{2.02}Sb_{0.04})_{\Sigma=2.06}O_{4.21}(OH)_{3.85}$.
(2) $Mn_3As_2O_4(OH)_4$.

Occurrence: Coating armangite, and filling fractures, in a museum specimen from a metamorphosed Fe–Mn deposit.

Association: Calcite, barite, hematite, fluorite, armangite.

Distribution: From Långban, Värmland, Sweden.

Name: For MANGANese and ARSenic in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, R5795.

References: (1) Peacor, D.R., P.J. Dunn, W.B. Simmons, and F.J. Wicks (1986) Arsenites related to layer silicates: manganarsite, the arsenite analogue of manganpyrosmalite, and unnamed analogues of friedelite and schallerite from Långban, Sweden. Amer. Mineral., 71, 1517–1521.

Fe_2O_3	0.10		H_2O^+	1.26	1.58
FeO	3.27		H_2O^-	0.04	
MnO	11.66	12.46	Total	100.46	100.00

(1) Babbitt, Minnesota, USA; corresponds to $(Ca_{1.85}Mn^{2+}_{0.94}Fe^{2+}_{0.26}Mg_{0.04})_{\Sigma=3.09}(Al_{2.03}Fe^{3+}_{0.01})_{\Sigma=2.04}B_{0.99}Si_{3.98}O_{16}H_{0.83}$. (2) $Ca_2MnAl_2BSi_4O_{15}(OH)$.

Polymorphism & Series: Forms two series, with ferroaxinite, and with tinzenite.

Mineral Group: Axinite group; Ca > 1.5 per formula unit, Mn > Fe.

Occurrence: Typically a mineral formed by contact metamorphism and boron metasomatism; from a pegmatite vein cutting metamorphosed iron formation at a contact with gabbro (Minnesota, USA).

Association: Chlorite, quartz, potassic feldspar.

Distribution: A few verified localities include: in Germany, from St. Andreasberg, Harz Mountains. In Ireland, at Calliagh, eight km southwest of Monaghan, Co. Monaghan. On Monte Pu, Liguria, Italy. In the USA, from the Huachuca Mountains, Cochise Co., and at the Iron Cap Pb-Zn mine, near Aravaipa, Graham Co., Arizona; at the Consumnes Copper mine, Amador Co., and the Greystone claim, Genesee Valley, Plumas Co., California; from the Mesabi Range, St. Louis Co., Minnesota; in the McKinney mine, Mitchell Co., North Carolina. At Avondale, Delaware Co., and Cornog, Chester Co., Pennsylvania, and from Franklin, Sussex Co., New Jersey. In Canada, from Marmora Township, Ontario. At the Anawai mine, Kochi Prefecture, and the Obira mine, Bungo, Oita Prefecture, Japan.

Name: For dominant *manganese* in a mineral of the *axinite* group, named from the Greek for *axe* after their sharp crystal forms.

(1) Rudnyi Kaskad deposit, Russia. (2) $Ca_2(Mn^{2+},Fe^{2+})Fe^{3+}Si_5O_{14}(OH)$, calculated for Mn^{2+}:Fe^{2+} = 1:1.

Polymorphism & Series: Forms a series with babingtonite.

Occurrence: In thin stringers in amphibolized garnet-pyroxene-magnetite skarn associated with an iron deposit (Rudnyi Kaskad deposit, Russia); replacing hedenbergite-johannsenite skarn (Iron Cap mine, Arizona, USA).

Association: Epidote, calcite, quartz (Rudnyi Kaskad deposit, Russia); ilvaite, andradite, epidote, thaumasite, calcite, quartz, pyrite, galena, sphalerite (Iron Cap mine, Arizona, USA).

Distribution: From the Rudnyi Kaskad deposit, eastern Sayan Mountains, Siberia, Russia. In the Iron Cap Pb–Zn mine, near Aravaipa, Graham Co., Arizona, USA.

Name: For the *manganese* content and relation to *babingtonite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72039.

Manganbelyankinite $(Mn^{2+}, Ca)(Ti, Nb)_5O_{12}\cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. Massive.

Physical Properties: Hardness = [2–3] (by analogy to belyankinite). D(meas.) = 2.54 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Brownish black. *Luster:* Resinous. *Optical Class:* Biaxial (–). *Pleochroism:* Noted. α = n.d. β = n.d. γ = n.d. 2V(meas.) = 29°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Lovozero massif, Russia; after heating at 900 °C. 1.692 (4), 2.48 (3), 3.21 (2), 2.89 (2), 2.17 (1), 1.880 (1)

Chemistry:

	(1)	(2)
Nb_2O_5	7.42	7.86
SiO_2	1.51	3.34
TiO_2	44.30	44.32
ZrO_2		3.06
MnO_2	14.03	6.45
Al_2O_3		0.60
Fe_2O_3	3.77	4.12
MgO		1.10
CaO	5.77	6.00
K_2O		0.90
H_2O^+	22.36	9.09
H_2O^-		13.61
P_2O_5		0.23
Total	99.16	100.68

(1) Lovozero massif, Russia; corresponds to $(Mn, Ca)_{1.9}(Ti, Nb)_5O_{12}\cdot 9H_2O$. (2) Do.

Polymorphism & Series: Forms two series, with belyankinite, and with gerasimovskite.

Occurrence: In pegmatite.

Association: n.d.

Distribution: On Mts. Kedykverpakhk and Punkaruaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For its MANGANese content, and relation to *belyankinite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis6437.

Manganberzeliite $NaCa_2(Mn^{2+},Mg)_2(AsO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As rare trapezohedral crystals, {112}, modified by {011}, {012}, {001}, to 9 mm; typically granular or very fine-grained massive.

Physical Properties: *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 4.21–4.46 D(calc.) = 4.26

Optical Properties: Transparent to translucent. *Color:* Yellow, honey-yellow, yellowish red; colorless to orange in transmitted light. *Streak:* White to yellow-orange. *Luster:* Resinous. *Optical Class:* Isotropic. n = 1.770–1.777

Cell Data: *Space Group: Ia3d.* a = 12.500(5) Z = 8

X-ray Powder Pattern: Synthetic $NaCa_2Mn_2(AsO_4)_3$.

(1) Långban, Sweden. (2) Franklin, New Jersey, USA. (3) $NaCa_2(Mn,Mg)_2(AsO_4)_3$ with Mn:Mg = 1:1.

Polymorphism & Series: Forms a series with berzeliite.

Occurrence: In metamorphosed manganiferous skarns (Sweden); in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Hausmannite, rhodonite, tephroite, pyrochroite, bergslagite, caryinite, richterite, hedyphane, sarkinite, eveite, tilasite, barite, calcite (Långban, Sweden); sarkinite, hedyphane, schallerite, franklinite, willemite, calcite (Franklin, New Jersey, USA).

Distribution: In Sweden, from Långban, Värmland, at the Moss mine, near Nordmark, and the Sjö mine, near Grythyttan, Örebro. At Franklin, Sussex Co., New Jersey, USA. In the Gozaisho mine, Iwaki, Fukushima Prefecture, Japan.

Name: For the *manganese* dominant analogue of *berzeliite*.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 681–683. (2) Frondel, C. and J. Ito (1963) Manganberzeliite from Franklin, New Jersey. Manganese-hörnesite $(Mn^{2+},Mg)_3(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular crystals, flattened on {010}, in stellate radial aggregates, to 0.5 cm.

Physical Properties: *Cleavage:* Perfect on {010}; imperfect on {100}, {201}, {$\bar{2}$01}. Hardness = 1 D(meas.) = 2.64 (impure material). D(calc.) = 2.76

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Silky on cleavages.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 31°$. $\alpha = 1.579$ $\beta = 1.589$ $\gamma = 1.609$ 2V(meas.) = 65°–70°

Cell Data: *Space Group:* $P2_1/c$. a = 10.38(5) b = 28.09(5) c = 4.774(50) $\beta = 105°40'$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
7.01 (10), 8.19 (8), 3.02 (7), 2.41 (7), 3.25 (6), 3.09 (6), 2.88 (4)

Chemistry:

	(1)	(2)
As_2O_5	40.78	42.50
CO_2	1.35	
MnO	22.87	19.67
MgO	9.47	11.18
H_2O	25.64	26.65
Total	100.11	100.00

(1) Långban, Sweden; CO_2 and 2.17% MgO from rhodochrosite impurity; corresponds then to $(Mn_{1.65}Mg_{1.32})_{\Sigma=2.97}(AsO_4)_{2.00} \cdot 8.02H_2O$. (2) $(Mn,Mg)_3(AsO_4)_2 \cdot 8H_2O$ with Mn:Mg = 1:1.

Occurrence: In fissure veins in skarn in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Rhodochrosite, synadelphite, quartz (Långban, Sweden); adelite, alleghanyite, kraisslite, willemite (Sterling Hill, New Jersey, USA).

Distribution: From Långban, Värmland, Sweden. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For the dominant *manganese* content and its relation to *hörnesite*.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

References: (1) Gabrielson, O. (1954) Manganiferous hoernesite and manganese-hoernesite from Långban, Sweden. Arkiv. Mineral. Geol., 1(11), 333–337. (2) (1954) Amer. Mineral., 39, 159 (abs. ref. 1).

Manganese-shadlunite $(Mn, Pb, Cd)(Cu, Fe)_8S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$ (probable). As irregular grains, to 0.4 mm, and as veinlets, mostly in cubanite. *Twinning:* Polysynthetic twinning seen in polished section.

Physical Properties: Hardness = n.d. VHN = 195 (20 g load). D(meas.) = n.d. D(calc.) = 4.44

Optical Properties: Opaque. *Color:* In polished section, grayish yellow, darker than cubanite. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Weak.
R: (400) — , (420) — , (440) 21.2, (460) 22.7, (480) 24.7, (500) 26.5, (520) 27.9, (540) 29.0, (560) 29.9, (580) 30.8, (600) 31.2, (620) 32.3, (640) 32.9, (660) 33.8, (680) 34.5, (700) 34.6

Cell Data: *Space Group:* $Fm3m$ (probable). $a = 10.73$ $Z = 4$

X-ray Powder Pattern: Oktyabr mine, Russia.
3.23 (100), 1.894 (90), 1.097 (40), 3.08 (30), 2.07 (30), 3.78 (20), 2.46 (20)

Chemistry:

	(1)	(2)
Mn	4.6	3.2
Pb	4.8	8.2
Cd	1.0	1.3
Cu	31.19	29.8
Fe	27.21	26.4
S	31.46	29.4
Total	100.26	98.3

(1) Oktyabr mine, Russia; by electron microprobe, corresponds to $(Mn_{0.68}Pb_{0.19}Cd_{0.07})_{\Sigma=0.94}(Cu_{4.00}Fe_{3.97})_{\Sigma=7.97}S_{8.00}$. (2) Majak mine, Russia; by electron microprobe, corresponds to $(Mn_{0.51}Pb_{0.34}Cd_{0.10})_{\Sigma=0.95}(Fe_{4.12}Cu_{4.09})_{\Sigma=8.21}S_{8.00}$.

Mineral Group: Pentlandite group.

Occurrence: In Cu–Ni sulfide ores (Noril'sk region, Russia).

Association: Cubanite.

Distribution: In Russia, from the Talnakh area, Noril'sk region, western Siberia, in the Oktyabr [TL] and Majak mines.

Name: For its manganese content and relation to shadlunite.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Evstigneeva, T.L., A.D. Genkin, N.V. Troneva, A.A. Filimonova, and A.I. Tsepin (1973) Shadlunite, a new sulfide of copper, iron, lead, manganese, and cadmium from copper–nickel ores. Mangangordonite $(Mn^{2+},Fe^{2+})Al_2(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals nearly equant to tabular on {010}, slightly elongated along [001], to 2 mm; dominant forms include {010}, {100}, {001}, {$1\overline{1}0$}, {$0\overline{1}1$}; as fanlike to radial aggregates of bladed crystals.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 2.36(3) D(calc.) = [2.35]

Optical Properties: Transparent to translucent. *Color:* Colorless, white, may be stained yellow, tan, or brown; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Z \simeq c$. *Dispersion:* $r < v$, distinct. $\alpha = 1.556(1)$ $\beta = 1.561(2)$ $\gamma = 1.571(2)$ 2V(meas.) = 70° 2V(calc.) = 71°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.257(3)$ $b = 10.363(4)$ $c = 7.040(3)$ $\alpha = 105.44(3)°$ $\beta = 113.07(3)°$ $\gamma = 78.69(4)°$ Z = 1

X-ray Powder Pattern: Kings Mountain, North Carolina, USA.
4.77 (10), 6.39 (8), 3.18 (7), 9.96 (6), 2.86 (5), 2.59 (4), 3.90 (3)

Chemistry:

	(1)	(2)
P_2O_5	33.96	29.57
Al_2O_3	25.38	22.09
FeO	3.88	3.44
MnO	12.43	10.79
MgO	0.4	0.34
H_2O		[33.77]
Total		[100.00]

(1) Kings Mountain, North Carolina, USA; by electron microprobe, average of three partial analyses, total Fe as FeO, total Mn as MnO, H_2O rapidly lost in the electron beam. (2) Analysis (1) recalculated to 100% with H_2O from structure analysis and by analogy to gordonite; then corresponding to $(Mn_{0.73}Fe_{0.23}Mg_{0.04})_{\Sigma=1.00}Al_{2.08}(PO_4)_{2.00}(OH)_2 \cdot 8H_2O$.

Polymorphism & Series: Dimorphous with kastningite.

Occurrence: A very rare secondary mineral in complex zoned granite pegmatites.

Association: Jahnsite, beraunite, strunzite, strengite, spodumene, quartz, muscovite, fluorapatite (Foote mine, North Carolina, USA); tourmaline, siderite, muscovite, quartz (Dunton quarry, Maine, USA).

Distribution: From the Foote mine, Kings Mountain, Cleveland Co., North Carolina and the Dunton quarry, Newry, Oxford Co., Maine, USA. On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia. From Hagendorf, Bavaria, Germany.

Name: As the *manganese* analog of *gordonite*.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 54513; National Museum of Natural History, Washington, D.C., USA, 162695.

References: (1) Leavens, P.B., J.S. White, Jr., G.W. Robinson, and J.A. Nelen (1991) Mangangordonite, a new phosphate mineral from Kings Mountain, North Carolina and Newry, Maine, USA. Neues Jahrb. Manganhumite $(Mn^{2+},Mg)_7(SiO_4)_3(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Anhedral grains, to about 1 cm.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = 4 D(meas.) = 3.83(5) D(calc.) = 3.84

Optical Properties: Transparent. *Color:* Pale to deep brownish orange; very pale orange in thin section. *Luster:* Subadamantine.
Optical Class: Biaxial (+). *Dispersion:* $r > v$, perceptible. $\alpha = 1.707(3)$ $\beta = 1.712(3)$ $\gamma = 1.723(3)$ $2V(meas.) = 37(4)^\circ$

Cell Data: *Space Group: Pbnm.* $a = 4.815(1)$ $b = 10.580(2)$ $c = 21.448(5)$ $Z = 4$

X-ray Powder Pattern: Brattfors mine, Sweden.
1.777 (10), 2.500 (7), 3.371 (6), 2.628 (6), 1.525 (6), 2.752 (5), 2.813 (5b)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	29.8	26.21	CaO	0.34	0.13
TiO_2		0.17	F		1.46

MnO	57.1	69.47	$-O = F_2$		[0.61]
MgO	14.2	0.73	Total	102.42	[100.39]

(1) Brattfors mine, Sweden; by electron microprobe, average of five grains; corresponds to $(Mn^{2+}_{4.76}Mg_{2.10}Fe_{0.07}Ca_{0.07})_{\Sigma=7.00}(SiO_4)_3(OH)_2$. (2) Bald Knob, North Carolina, USA; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Mn^{2+}_{6.76}Mg_{0.12}Fe_{0.09}Ca_{0.02})_{\Sigma=6.99}Si_{3.01}O_{12}[(OH)_{1.45}F_{0.53}]_{\Sigma=1.98}$.

Mineral Group: Humite group.

Occurrence: A late-stage skarn mineral formed in recrystallized limestone banded between layers of manganese ore minerals (Brattfors mine, Sweden); in a manganese deposit metamorphosed to the amphibolite facies (Bald Knob, North Carolina, USA).

Association: Katoptrite, magnetite, manganostibite, magnussonite, tephroite, galaxite, manganosite (Brattfors mine, Sweden); sonolite, alleghanyite, rhodonite, kutnohorite, galaxite, jacobsite, kellyite, alabandite (Bald Knob, North Carolina, USA).

Distribution: In the Brattfors mine, Nordmark, and at Långban, Värmland, Sweden. In the USA, from Bald Knob, near Sparta, Alleghany Co., North Carolina, and Franklin, Sussex Co., New Jersey.

Name: For *manganese* in the composition and relation to *humite*.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; Harvard University, Cambridge, Massachusetts, 119819; National Museum of Natural History, Washington, D.C., USA, 137016, 162626.

Manganiandrosite-(Ce) $Mn^{2+}CeMn^{3+}AlMn^{2+}Si_2O_7SiO_4O(OH)$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As elongated grains to 0.1 mm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.21-4.31

Optical Properties: Transparent. *Color*: Dark brown. *Streak*: Reddish brown.
Luster: Vitreous to adamantine.
Optical Class: Biaxial (+). α > 1.74 *n*(calc.) = 1.80 2V(meas.) = 80.6(1.5)° 2V(calc.) = n.d.
Orientation: *n.d.* *Pleochroism:* Strong, *X* = light yellow, *Y* = orange-brown, *Z* = red-brown.
Dispersion: None.

Cell Data: *Space Group*: $P2_1/m$. a = 8.901(2) b = 5.738(1) c = 10.068(2) β = 113.425(3)°
Z = 2

X-ray Powder Pattern: Praborna Mn deposit, Saint-Marcel, Val d'Aosta, Italy. [calculated pattern]
2.8964 (100), 2.6225 (53), 3.5141 (41), 2.7134 (39), 2.7069 (39), 2.8690 (35), 7.8639 (28)

Chemistry:

	(1)		(1)
SiO_2	29.04	CaO	3.82
Al_2O_3	8.20	Ce_2O_3	12.22
TiO_2	1.26	La_2O_3	6.08
Fe_2O_3	2.98	Nd_2O_3	3.24
MnO	15.01	Sm_2O_3	0.18
Mn_2O_3	11.62	F	0.07
MgO	0.28	H_2O	[1.45]
SrO	1.17	Total	96.59

(1) Praborna Mn deposit, Saint-Marcel, Val d'Aosta, Italy; average of 4 electron microprobe analyses, H_2O calculated from stoichiometry; corresponding to $[Mn^{2+}_{0.60}Ca_{0.40}]_{\Sigma=1.00}[(Ce_{0.46}La_{0.23}Nd_{0.12}Sm_{0.01})_{\Sigma REE\geq 0.82}Sr_{0.07}Ca_{0.02}]_{\Sigma\geq 0.91}[Mn^{3+}_{0.63}Fe^{3+}_{0.23}Ti_{0.10}Mg_{0.04}]_{\Sigma=1.00}Al_{1.00}[Mn^{2+}_{0.96}Mn^{3+}_{0.04}]_{\Sigma=1.00}Si_2O_7SiO_4O(OH)$.

Mineral Group: Epidote group, allanite subgroup.

Occurrence: In metamorphosed (eclogite facies) lenses near Mn deposits associated with ophiolite.

Association: Tephroite, Mn-pyroxenoid, hematite, calderite; or spessartine, calderite, hematite, pyrophanite.

Distribution: From the dumps of the Praborna Mn deposit, Saint-Marcel, Val d'Aosta, Italy,

Name: The Ce analogue of manganiandrosite-(La). An epidote-group mineral in which Mn^{2+} is dominant in A1, REE are dominant in A2, Mn^{3+} in M1, Al in M2, and in which Mn^{2+} is the dominant charge-compensating (*i.e*. divalent) cation in M3.

Type Material: Mineral Museum, School of Mines, Paris, France, (73951).

Manganite $Mn^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals prismatic and striated ‖ [001], short to long, to 7.5 cm; typically terminated by {001}, {$h0l$}, may be complex. In bundles, subparallel [001], fibrous; granular, massive. *Twinning:* Contact and penetration twins on {011}; lamellar on {100}.

Physical Properties: *Cleavage:* {010}, perfect; {110} and {001}, good. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4 VHN = 630–743 (100 g load). D(meas.) = 4.29–4.34 D(calc.) = 4.38

Optical Properties: Opaque, transparent on thin edges. *Color:* Dark steel-gray to iron-black; red-brown in transmitted light; in reflected light, gray-white with brownish tint, with blood-red internal reflections. *Streak:* Reddish brown to nearly black. *Luster:* Submetallic.
Optical Class: Biaxial (+). *Pleochroism:* Faint; X = reddish brown; Z = red-brown.
Orientation: $X = a$; $Y = b$; $Z \wedge c = 0°$–$4°$. *Dispersion:* $r > v$, very strong.
Absorption: $Z > X = Y$. $\alpha = 2.25(2)$ $\beta = 2.25(2)$ $\gamma = 2.53(2)$ 2V(meas.) = Small.
Anisotropism: Weak. *Bireflectance:* Distinct; in grays.
R_1–R_2: (400) 18.0–25.1, (420) 18.0–24.8, (440) 18.0–24.5, (460) 17.9–24.1, (480) 17.8–23.7, (500) 17.6–23.2, (520) 17.3–22.7, (540) 17.0–22.2, (560) 16.8–21.6, (580) 16.5–21.2, (600) 16.3–20.8, (620) 16.1–20.6, (640) 16.0–20.3, (660) 15.8–20.1, (680) 15.7–19.9, (700) 15.7–19.7

Cell Data: *Space Group:* $B2_1/d$. $a = 8.94$ $b = 5.28$ $c = 5.74$ $\beta = 90°$ Z = 8

X-ray Powder Pattern: Ilfeld, Germany. (ICDD 8-99).
3.40 (100), 2.64 (60), 2.28 (50), 1.708 (40), 1.636 (40), 1.139 (40), 1.672 (30)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Al_2O_3	0.30	0.3		BaO	0.15		
FeO		0.5		$(Na,K)_2O$	0.22		
MnO	79.55	79.3	80.66	OH	19.59	[19.9]	19.34
$(Cu,Pb)O$	0.10			gangue	0.28		
CaO	0.10			Total	100.29	[100.0]	100.00

(1) Ilfeld, Germany; average of three analyses. (2) Do.; by electron microprobe, OH by difference. (3) MnO(OH).

Polymorphism & Series: Trimorphous with feitknechtite and groutite.

Occurrence: Formed in low-temperature hydrothermal or hot-spring manganese deposits; replacing other manganese minerals in sedimentary deposits; a component in some clay deposits and laterites.

Association: Pyrolusite, braunite, hausmannite, barite, calcite, siderite, goethite.

Distribution: Many localities, but rarely well-crystallized. Fine crystals from Ilfeld, Harz Mountains, and Ilmenau, Thuringia, Germany. In the Botallack mine, St. Just, Cornwall; from Egremont, Cumbria; and at Upton Pyne, Exeter, Devonshire, England. From Granam, near Towie, Aberdeenshire, Scotland. At Bölet, near Karlsborg, Västergötland,Sweden. In the USA, good crystals from the Negaunee and Marquette districts, Marquette Co., Michigan; in the Powell's Fort mine, near Woodstock, Shenandoah Co., Virginia; and at Lake Valley, Sierra Co., New Mexico. From the Caland mine, Atikokan, Ontario, Canada. At Kuruman, Cape Province, South Africa.

Name: For MANGANese in the composition.

Manganlotharmeyerite $Ca(Mn^{3+}, \square, Mg)_2\{AsO_4, [AsO_2(OH)_2]\}_2(OH, H_2O)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. Small tetrahedral crystals.

Physical Properties: Hardness = n.d. D(meas.) = 3.02–3.03 D(calc.) = 3.057

Optical Properties: Semitransparent. *Color:* Rose-red.
Optical Class: Isotropic. $n = 1.572$

Cell Data: *Space Group:* $P2_13$. $a = 10.014$ Z = 4

X-ray Powder Pattern: Synthetic.
3.198 (100), 2.702 (50), 3.047 (18), 1.6401 (16), 4.128 (14), 2.064 (14), 1.984 (14)

Chemistry: (1) Natural material has not been analyzed, but was determined to contain potassium and manganese; identification then depended additionally on the correspondence of the isotropic index of refraction with that of synthetic material.

Occurrence: In a cavern in lava, in thénardite and halite stalactites, formed by fumarolic action.

Association: Thénardite, halite, sylvite, aphthitalite.

Distribution: On Vesuvius, Campania, Italy.

Name: As a *manganese* compound analogous to *langbeinite*.

Type Material: University of Florence, Florence, Italy, 1975/I.

(1) Mt. Karnasurt, Lovozero massif, Russia. (2) Kola Peninsula, Russia. (3) $KNa_2Li(Mn,Fe)_2Ti_2Si_8O_{24}$ with Mn:Fe = 1:1.

Polymorphism & Series: Forms a series with neptunite.

Occurrence: A late segregation mineral found in almost all rock types, including most of the pegmatites, in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Aegirine, natrolite, analcime, lamprophyllite, murmanite, lomonosovite, eudialyte, pectolite, villiaumite, sodalite (Lovozero massif, Russia); in miarolitic cavities in a nepheline syenite sill (Saint-Amable, Canada).

Distribution: On Mt. Malyi Mannepakhk, Khibiny massif, and in the Lovozero massif, Kola Peninsula, Russia. At Point of Rocks, Colfax Co., New Mexico, USA. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. On Mt. Malosa, Zomba district, Malawi.

Name: For the preponderance of *manganese* in this chemical variant of the *neptunite* structure.

Type Material: n.d.

Manganochromite $(Mn^{2+}, Fe^{2+})(Cr^{3+}, V^{3+})_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As six-sided grains, to 10 μm.

Physical Properties: Hardness = n.d. VHN = 1000(70) (100 g load). D(meas.) = n.d. D(calc.) = 4.86–4.90

Optical Properties: Semitransparent. *Color:* Brownish gray in reflected light. *Optical Class:* Isotropic.
R: (470) 16.8, (546) 16.5, (589) 16.5, (650) 16.3

Cell Data: *Space Group:* $Fd3m$. a = 8.47 Z = 8

X-ray Powder Pattern: Nairne deposit, South Australia.
2.55 (s), 1.63 (s), 1.50 (s), 4.89 (w), 2.99 (w), 2.44 (w), 1.73 (w)

Chemistry:

	(1)	(2)
TiO_2		0.2
V_2O_3	1.7	30.5
Cr_2O_3	62.3	35.9
FeO	9.4	5.3
MnO	24.0	26.3
ZnO	1.7	0.7
Total	[99.1]	98.9

(1) Nairne deposit, South Australia; original total given as 99.0%; corresponds to $(Mn_{0.77}Fe_{0.30}Zn_{0.05})_{\Sigma=1.12}(Cr_{1.88}V_{0.04})_{\Sigma=1.92}O_4$. (2) Sätra mine, Sweden; by electron microprobe, total Fe as FeO; corresponds to $(Mn_{0.83}Fe_{0.17}Zn_{0.02})_{\Sigma=1.02}(Cr_{1.06}V_{0.92}Ti_{0.01})_{\Sigma=1.99}O_4$.

Polymorphism & Series: Forms a series with vuorelainenite.

Mineral Group: Spinel group.

Occurrence: From an extension gash vein in a metamorphosed hydrothermal pyrite deposit (Nairne deposit, South Australia); in a metamorphosed iron sulfide deposit associated with submarine felsic volcanism (Sätra mine, Sweden); in sulfide nodules in an iron meteorite (Burkhala meteorite).

Association: Pyrrhotite, rutile, diopside (Nairne deposit, South Australia); vuorelainenite, sphalerite, alabandite (Sätra mine, Sweden); troilite, daubreelite, alabandite, zinc sulfides, olivine, pyroxene (Burkhala meteorite).

Distribution: From the Nairne deposit, near Brukunga, 47 km east of Adelaide, South Australia. In the Sätra mine, Doverstorp, Bergslagen metallic province, Sweden. Noted in the Burkhala meteorite.

Name: For MANGANese in its composition, and relation to *magnesiochromite*.

Type Material: Western Australian Museum, Perth, Australia, M.65.1991.

References: (1) Graham, J. (1978) Manganochromite, palladium antimonide, and some unusual mineral associations at the Nairne pyrite deposit, South Australia. Amer. Mineral., 63, 1166–1174. Manganocolumbite $(Mn^{2+}, Fe^{2+})(Nb, Ta)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. [Crystals short prismatic or equant, also tabular; in groups of parallel or subparallel crystals; massive] (by analogy to ferrocolumbite). *Twinning:* [on {021} and {023}, may produce pseudohexagonal trillings.]

Physical Properties: *Cleavage:* [Distinct on {100}, less distinct on {010}.] *Fracture:* [Subconchoidal to uneven.] *Tenacity:* [Brittle.] Hardness = [6] D(meas.) = 5.20–6.65 D(calc.) = [5.30]

Optical Properties: Opaque, translucent through thin edges. *Color:* Black to brownish black; reddish brown in transmitted light; in reflected light, grayish white with a brownish tint, with reddish brown internal reflections. *Streak:* Dark red to black. *Luster:* Submetallic to vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; red, red-brown, and orange. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$. *Absorption:* Strong; $Z > X$. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.
R_1–R_2: n.d.

Cell Data: *Space Group: Pbcn* (synthetic). $a = 14.433(2)$ $b = 5.7637(7)$ $c = 5.0832(8)$ $Z = 4$

X-ray Powder Pattern: n.d.

Chemistry:

Na_2O		0.02	
Total	99.53	98.32	100.00

(1) Old Mike mine, South Dakota, USA. (2) Herbb #2 pegmatite, Virginia, USA; by electron microprobe, total Fe as Fe^{2+}, total Mn as MnO; corresponding to $(Mn_{0.52}Fe_{0.47})_{\Sigma=0.99}(Nb_{1.37}Ta_{0.55}Ti_{0.09}Sn_{0.01})_{\Sigma=2.02}O_6$. (3) $MnNb_2O_6$.

Polymorphism & Series: Forms two series, with ferrocolumbite, and with manganotantalite.

Occurrence: As an accessory and primary constituent of granite pegmatites; detrital in placers.

Association: [Albite, microcline, beryl, lepidolite, muscovite, tourmaline, spodumene, lithiophilite, triphylite, amblygonite, triplite, apatite, samarskite, microlite, cassiterite.]

Distribution: Analyzed material from: in the USA, the Globe and Harding pegmatites, Taos Co., New Mexico; near Cañon City, Fremont Co., Colorado; at Elk Creek, Pennington Co., and the Old Mike mine, six km north-northwest of Custer, Custer Co., South Dakota; from Mineral Hill, Delaware Co., Pennsylvania; at the Herbb #2 pegmatite, six km northeast of Flat Rock, Powhatan Co., Virginia. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada. From the Varuträsk pegmatite, 15 km north of Skellefteå, Västerbotten, and from Utö, Stockholm, Skärgård, Sweden. Around Okehampton, Devon, England. Occurs at San Piero in Campo, Elba, Italy.

Name: For its dominant MANGANese content and its relation to ferroCOLUMBITE.

(1) Uttersvik, Sweden; corresponds to $(Fe^{2+}_{3.10}Mg_{2.42}Mn_{0.96}Ca_{0.33}Fe^{3+}_{0.21}Na_{0.07}Ti_{0.01}K_{0.01})_{\Sigma=7.11}(Si_{7.80}Al_{0.16})_{\Sigma=7.96}O_{22}[(OH)_{1.99}F_{0.03}]_{\Sigma=2.02}$. (2) Haute-Maurienne, France; by electron microprobe.

Polymorphism & Series: Forms a series with tirodite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Ca + Na)_B < 1.34$; $Li < 1.0$; $Mn \geq 0.5$.

Occurrence: An uncommon mineral in metamorphosed iron-poor manganiferous rocks.

Association: Calcite, quartz, garnet.

Distribution: From Dannemora, Uppland; Uttersvik and Nävekvarn, Södermanland; in the Brunsjö mine, near Grythyttan, Örebro; and at Väster Silfberg, Värmland, Sweden. At Haute-Maurienne, Isère, France. From Guarulhos, São Paulo, Brazil. At Paddy's River mine, Australian Capital Territory, and from Broken Hill, New South Wales, Australia.

Name: For the original locality, Dannemora, Sweden.

Manganokaskasite $(Mo,Nb)S_2{\cdot}(Mn_{1-x}Al_x)(OH)_{2+x}$

Crystal Data: Hexagonal. *Point Group*: 3*m*, 32, or $\bar{3}$ 2/*m*. As lamellar or flaky, mica-like crystals flattened on [001], to 1 mm; also epitaxial and coplanar with {001} of pyrrhotite.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: Laminated. *Tenacity*: Flexible, inelastic. Hardness = ~1 D(meas.) = n.d. D(calc.) = 4.09

Optical Properties: Opaque. *Color*: Iron black; light to dark gray in reflected light. *Streak*: Black. *Luster*: Metallic. *Anisotropism:* Strong. *Pleochroism*: Strong, light yellowish to blue-gray. *Optical Class*: n.d.
R_1-R_2: (470) 10.4-25.6, (546) 10.5-25.0, (589) 10.6-24.7, (650) 10.6-24.5

Cell Data: *Space Group*: $P\bar{3}\,m1$, $P3m1$, or $P321$. [a = 3.243(3) c = 11.71(1) sulfide sub-lattice] [a = 3.118(2) c = 11.62(1) hydroxide sub-lattice] One-layer polytypes. Z = 1

X-ray Powder Pattern: Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia. 5.66 (100), 11.39 (85), 2.769 (43), 2.663 (25), 1.608 (23), 2.455 (18), 1.559 (13)

Chemistry:

	(1)		(1)
Mg	0.06	Nb	14.15
Al	3.00	Mo	20.08
Ca	0.00	W	9.12
V	0.15	S	24.84
Mn	11.44	O	13.36
Fe	2.06	H	[0.89]
		Total	99.15

(1) Mt. Kaskasnyunchorr, Russia; average of 5 electron microprobe analyses, H calculated so that all O are OH^-, OH^- confirmed by Raman spectroscopy; corresponding to $(Mo_{0.57}Nb_{0.34}W_{0.10}V_{0.01})_{\Sigma=1.02}S_2{\cdot}(Mg_{0.58}Al_{0.32}Fe_{0.06}Mn_{0.01})_{\Sigma=0.97}(OH)_{2.32}$.

Mineral Group: Valleriite group.

Polymorphism & Series: Forms a series with kaskasite.

Occurrence: Of hydrothermal origin in fenites formed by a peralkaline fluid, as a source of Nb, reacting with a xenolith of alumina-rich metamorphic rocks (metapelites) in agpaitic nepheline syenite.

Association: Orthoclase, anorthoclase, nepheline, fluorophlogopite, corundum, pyrrhotite, pyrite, rutile, monazite-(Ce), graphite, edgarite, molybdenite, tungstenite, alabandite, fluorite.

Distribution: From Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia.

Name: As the manganese analog of *kaskaite*.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 94232).

Manganokukisvumite $Na_6MnTi_4Si_8O_{28}•4H_2O$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. As sword-shaped crystals, flattened on {100}, elongate on [001] to 0.5 mm, showing {100}, {010}, and a prism; as fan-shaped to radial groups.

Physical Properties: *Cleavage:* None. *Fracture:* Splintery. *Tenacity:* Sectile and slightly flexible. Hardness = 5.5-6 D(meas.) = 2.86(1) D(calc.) = 2.88

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (-). α(calc.) = 1.657 β = 1.744(3) γ = 1.792(3) 2V(meas.) = 70° *Dispersion*: None. *Orientation: X = a*; *Y = b*; *Z = c*.

Cell Data: *Space Group: Pccn*. a = 29.05(2) b = 8.612(6) c = 5.220(4) Z = 2

X-ray Powder Pattern: Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada.
14.47 (100), 3.025 (40), 6.43 (20), 2.881 (20), 4.83 (10), 3.743 (10), 2.591 (10)

Chemistry:

	(1)		(1)
Na_2O	15.61	Al_2O_3	0.16
K_2O	0.21	Ce_2O_3	0.18
CaO	0.08	TiO_2	26.90
MgO	0.26	SiO_2	41.74
MnO	5.48	Nb_2O_5	0.68
FeO	0.57	H_2O	6.25
ZnO	0.00	Total	98.12

(1) Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada; average of 2 electron microprobe analyses, H_2O confirmed by IR and calculated; corresponding to $(Na_{5.81}K_{0.05}Ca_{0.02}Ce_{0.01})_{\Sigma=5.89}(Mn_{0.89}Fe_{0.09}Mg_{0.01}Al_{0.04})_{\Sigma=1.09}(Ti_{3.88}Nb_{0.06})_{\Sigma=3.94}Si_{8.01}O_{28}\cdot 4H_2O$.

Occurrence: A late mineral formed by hydrothermal dissolution of titanium-bearing minerals in an albite-rich syenite breccia in an intrusive alkaline complex.

Association: Aegirine, microcline, albite, annite, pyrite, pyrrhotite, natrolite, calcite (Canada); kukisvumite (Russia).

Distribution: Poudrette quarry, Mont Saint-Hilaire, Rouville County, Quebec, Canada; from Mount Kukisvumchorr, Khibiny massif, Russia.

Name: As the manganese-dominant analogue of kukisvumite.

Type Material: Canadian Museum of Nature, Ottawa, Ontario, Canada; CMNMC 83392 and CMNMC 83393.

References: (1) Gault, R.A., T.S. Ercit, J.D. Grice, and J. Van Velthuizen (2004) Manganokukisvumite, a new mineral species from Mont Saint-Hilaire, Quebec. Can. Mineral., 42, 781-785. (2) (2005) Amer. Mineral., 90, 520 (abs. ref. 1).

Manganolangbeinite $K_2Mn_2^{2+}(SO_4)_3$

Crystal Data: Cubic. *Point Group:* 23. Small tetrahedral crystals.

Physical Properties: Hardness = n.d. D(meas.) = 3.02–3.03 D(calc.) = 3.057

Optical Properties: Semitransparent. *Color:* Rose-red.
Optical Class: Isotropic. $n = 1.572$

Cell Data: *Space Group:* $P2_13$. a = 10.014 Z = 4

X-ray Powder Pattern: Synthetic.
3.198 (100), 2.702 (50), 3.047 (18), 1.6401 (16), 4.128 (14), 2.064 (14), 1.984 (14)

Chemistry: (1) Natural material has not been analyzed, but was determined to contain potassium and manganese; identification then depended additionally on the correspondence of the isotropic index of refraction with that of synthetic material.

Occurrence: In a cavern in lava, in thénardite and halite stalactites, formed by fumarolic action.

Association: Thénardite, halite, sylvite, aphthitalite.

Distribution: On Vesuvius, Campania, Italy.

Name: As a *manganese* compound analogous to *langbeinite.*

Type Material: University of Florence, Florence, Italy, 1975/I.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 435. (2) (1968) NBS Mono. 25, 6, 43.

Manganosegelerite $(Mn^{2+},Ca)(Mn^{2+},Fe^{2+},Mg)Fe^{3+}(PO_4)_2(OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Subhedral prismatic crystals, to 0.05 mm, in granular aggregates.

Physical Properties: *Cleavage:* Imperfect on {001}. Hardness = 3–4 D(meas.) = 2.76(3) D(calc.) = 2.74

Optical Properties: Transparent to translucent. *Color:* Yellow to yellow-green. *Streak:* Yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Pleochroism:* X = yellow; Z = pale yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, marked. $\alpha = 1.657(1)$ $\beta = 1.668(1)$ $\gamma = 1.691(2)$ 2V(meas.) = 75(5)° 2V(calc.) = 70°

Cell Data: *Space Group:* [*Pbca*] (by analogy to overite). $a = 14.89(1)$ $b = 18.79(1)$ $c = 7.408(5)$ Z = 8

X-ray Powder Pattern: Mt. Vasin-Myl'k, Kola Peninsula, Russia.
9.39 (10), 2.86 (9), 4.70 (5), 1.966 (5), 1.880 (5), 2.97 (4), 2.60 (4)

Chemistry:

	(1)
P_2O_5	33.21
Al_2O_3	1.48
Fe_2O_3	22.61
MnO	16.37
MgO	2.83
CaO	5.14
H_2O	[18.36]
Total	[100.00]

(1) Mt. Vasin-Myl'k, Kola Peninsula, Russia; by electron microprobe; total Fe as Fe_2O_3, total Mn as MnO, H_2O by difference, Fe^{2+}:Fe^{3+} for charge balance, $(OH)^{1-}$ and H_2O confirmed by IR; then corresponding to $(Mn_{0.61}Ca_{0.39})_{\Sigma=1.00}(Mn_{0.38}Fe^{2+}_{0.33}Mg_{0.30})_{\Sigma=1.01}(Fe^{3+}_{0.88}Al_{0.12})_{\Sigma=1.00}(PO_4)_{2.00}(OH)_{1.02}\cdot 4.04H_2O$.

Mineral Group: Overite group.

Occurrence: In fractures in granite pegmatite.

Association: Mitridatite, lun'okite, eosphorite, kingsmountite, manganoan gordonite.

Distribution: On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia.

Name: As the *manganese* analog of *segelerite*.

Type Material: Mining Institute, St. Petersburg, 1592/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Total	100.33	99.8

(1) Långban, Sweden; average of two analyses. (2) Do.; by electron microprobe.

Mineral Group: Periclase group.

Occurrence: An alteration product of rhodochrosite or other manganese minerals, formed during oxygen-deficient metamorphism of manganese-bearing deposits; in marine manganese nodules.

Association: Pyrochroite, manganite, dolomite (Långban, Sweden); pyrochroite, hausmannite, garnet, dolomite (Nordmark, Sweden); franklinite, willemite, zincite (Franklin, New Jersey, USA).

Distribution: From Långban and Nordmark, Värmland, Sweden. From Roughton Gill, Caldbeck Fells, Cumbria, England. In the USA, at Franklin, Sussex Co., New Jersey. In Japan, an ore mineral in the Noda-Tamagawa mine, Iwate Prefecture, and the Hamayokokawa mine, Nagano Prefecture; in the Manako, Oashi, Kaso, and Hikoma mines, Tochigi Prefecture; the Taguchi mine, Aichi Prefecture; the Ioi mine, Shiga Prefecture; and elsewhere. On Inylchek Ridge, Tien Shan, Kyrgyzstan. From near Tambao, Burkina Faso.

Name: As an oxide of *manganese*.

Type Material: Wroclaw University, Wroclaw, Poland, II–1810.

Manganostibite $(Mn^{2+},Fe^{2+})_7Sb^{5+}As^{5+}O_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As subhedral prismatic grains.

Physical Properties: *Fracture:* Uneven. Hardness = n.d. D(meas.) = 4.949 D(calc.) = 5.00

Optical Properties: Opaque to slightly translucent. *Color:* Coal-black; dark reddish brown in transmitted light. *Streak:* Chocolate-brown. *Luster:* Greasy.
Optical Class: Biaxial (–). *Pleochroism:* X = reddish brown; Z = nearly opaque. *Orientation:* $X = b$; $Z \wedge c$ = very large. $\alpha = 1.92(2)$ $\beta = 1.95(2)$ $\gamma = 1.96(2)$ 2V(meas.) = Very small.

Cell Data: *Space Group: Ibmm.* $a = 8.727(5)$ $b = 18.847(6)$ $c = 6.062(4)$ Z = 4

X-ray Powder Pattern: Moss mine, Sweden.
2.651 (10), 4.965 (6), 4.38 (6), 1.5418 (5), 2.180 (5), 9.313 (4), 4.694 (4)

Chemistry:

	(1)	(2)
As_2O_5	7.44	11.7
Sb_2O_5	24.09	21.8
SiO_2		3.0
FeO	5.00	1.8
MnO	55.77	61.8
MgO	3.00	2.5
CaO	4.62	
Total	99.92	102.6

(1) Moss mine, Sweden. (2) Brattfors mine, Sweden; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Mn_{6.34}Mg_{0.45}Fe_{0.19})_{\Sigma=6.98}Sb_{0.98}As_{0.74}Si_{0.36}O_{12}$.

Occurrence: In late-stage hydrothermal veins in manganese deposits in limestone.

Association: Hausmannite, sonolite, katoptrite, manganoan humite, garnet.

Distribution: In the Moss and Brattfors mines, near Nordmark, Värmland, Sweden.

Name: For MANGANese and antimony, STIBium, in the composition.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

FeO	1.17	0.04		Total	100.33	99.96	100.00

(1) Sanarka, Russia. (2) Morrua mine, Zambesia, Mozambique; by electron microprobe, corresponds to $Mn_{1.00}(Ta_{1.99}Nb_{0.01})_{\Sigma=2.00}O_6$. (3) $MnTa_2O_6$.

Polymorphism & Series: Dimorphous with manganotapiolite; forms two series, with manganocolumbite, and with ferrotantalite.

Occurrence: As an accessory and primary constituent of granite pegmatites; detrital in placers.

Association: [Albite, microcline, beryl, lepidolite, muscovite, tourmaline, spodumene, lithiophilite, triphylite, amblygonite, triplite, samarskite, apatite, microlite, cassiterite.]

Distribution: Found on the Island of Utö, Sweden. At Glenbuchat, Aberdeenshire, Scotland. From Facciatoia, Elba, Italy. In the Zambesia, Tete, and Alto Ligonha districts, Mozambique. From Bikita, Zimbabwe. At the Steinkopf, Namaqualand, South Africa. In Brazil, from Salinas, Minas Gerais, and the Alto do Giz pegmatite, near Parelhas, Rio Grande do Norte. At Stak Nala, Gilgit district, Pakistan. From Wodgina, Greenbushes, and on Mt. Holland, Western Australia. In the USA, large crystals from Amelia, Amelia Co., Virginia; at Pala, San Diego Co., California. From the Tanco pegmatite, Bernic Lake, Manitoba, Canada. A few other less-well-defined localities are known.

Name: For its dominant MANGANese content, and the Greek mythical *Tantalus*, for the difficulty in bringing the mineral into solution.

Manganotapiolite $(Mn^{2+}, Fe^{2+})(Ta, Nb)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Massive, in a zone, to 100 μ wide, in a poorly developed prismatic ferrotapiolite crystal, 1.5 mm long.

Physical Properties: Hardness = n.d. VHN = 665–752, 711 average (100 g load), probably low due to fractures. D(meas.) = n.d. D(calc.) = 7.72

Optical Properties: Opaque, translucent in very thin fragments. *Color:* Dark brown; gray in reflected light, with strong red-brown internal reflections. *Streak:* Dark brown. *Luster:* Adamantine to submetallic.
Optical Class: Uniaxial. *Pleochroism:* Strong; yellowish brown to reddish brown.
Bireflectance: Weak; light brownish gray to gray.
R_1–R_2: (470) 16.0–15.7, (546) 14.7–14.1, (589) 15.0–14.8, (650) 15.1–14.6

Cell Data: *Space Group:* $P4_2/mnm$. $a = 4.762(5)$ $c = 9.272(5)$ $Z = 2$

X-ray Powder Pattern: Eräjärvi area, Finland.
3.367 (100), 2.592 (90), 1.754 (90), 2.381 (60), 1.682 (60), 4.24 (40), 1.504 (40)

Chemistry:

	(1)
Nb_2O_5	8.5
Ta_2O_5	76.3
SnO_2	1.0
Sb_2O_3	0.1
FeO	3.2
MnO	10.2
MgO	0.0
CaO	0.4
Total	99.7

(1) Eräjärvi area, Finland; by electron microprobe, corresponds to $(Mn_{0.70}Fe_{0.22}Ca_{0.04})_{\Sigma=0.96}(Ta_{1.68}Nb_{0.31}Sn_{0.03})_{\Sigma=2.02}O_6$.

Polymorphism & Series: Dimorphous with manganotantalite; forms a series with ferrotapiolite.

Mineral Group: Ferrotapiolite group.

Occurrence: A rare accessory mineral in a lithium-rich granite pegmatite dike.

Association: Ferrotapiolite, antimony, cassiterite, microlite, albite, schorl, apatite.

Distribution: From the Viitaniemi pegmatite, Eräjärvi area, Orivesi, Finland.

Name: For its dominant MANGANese content and relation to ferroTAPIOLITE.

Type Material: Mineralogical Museum, Geological Survey of Finland, Espoo, Finland.

References: (1) Lahti, S.I., B. Johanson, and M. Virkkunen (1983) Contributions to the chemistry of tapiolite – manganotapiolite, a new mineral. Bull. Geol. Soc. Finland, 55, 101–109. Manganotychite $Na_6(Mn^{2+},Fe^{2+},Mg)_2(SO_4)(CO_3)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As irregular grains, to 1 cm, and in massive aggregates.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4 D(meas.) = 2.70(5) D(calc.) = 2.79 Weakly magnetic; slightly soluble in H_2O, forming a brown coating.

Optical Properties: Semitransparent. *Color:* Pale pink, white. *Luster:* Vitreous to dull. *Optical Class:* Isotropic. $n = 1.544(2)$

Cell Data: *Space Group:* $Fd3$. $a = 13.9951(8)$ Z = 8

X-ray Powder Pattern: Mt. Alluaiv, Kola Peninsula, Russia.
2.695 (100), 4.22 (76), 2.474 (70), 1.959 (28), 1.616 (28), 2.366 (27), 1.605 (25)

Chemistry:

	(1)	(2)
SO_3	14.13	13.71
CO_2	30.68	30.15
FeO	6.00	
MnO	15.00	24.30
MgO	1.98	
Na_2O	32.21	31.84
Total	[100.00]	100.00

(1) Mt. Alluaiv, Kola Peninsula, Russia; $(CO_3)^{2-}$ and $(SO_4)^{2-}$ confirmed by IR, recalculated to 100% from an original total of 99.34%, after deduction of CO_2 1.65%, CaO 1.49%, Na_2O 0.77% as shortite $[Na_2Ca_2(CO_3)_3]$, corresponds to $Na_{5.99}(Mn^{2+}_{1.22}Fe^{2+}_{0.48}Mg_{0.28})_{\Sigma=1.98}(SO_4)_{1.04}(CO_3)_{4.02}$.
(2) $Na_6Mn_2(SO_4)(CO_3)_4$.

Occurrence: An uncommon mineral formed in pegmatite veins in a differentiated alkalic massif (Mt. Alluaiv, Kola Peninsula, Russia).

Association: Shortite, pirssonite, sidorenkite, kogarkoite, many other species (Mt. Alluaiv, Kola Peninsula, Russia); trona, shortite, petersenite-(Y), reederite-(Y), catapleiite, analcime (Mont Saint-Hilaire, Canada).

Distribution: On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: As the *manganese* analog of *tychite*.

Type Material: Mining Institute, St. Petersburg, 2023/1; Geology Museum, Kola Branch, Academy of Sciences, Apatity; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p545/2.

Mangazeite $Al_2(SO_4)(OH)_4 \cdot 3H_2O$

Crystal Data: Triclinic. *Point Group*: 1 or $\bar{1}$. As fine acicular crystals, to 0.04 mm; in radial aggregates.

Physical Properties: *Cleavage*: None observed. *Fracture*: n.d. *Tenacity*: n.d.
Hardness = 1-2 D(meas.) = n.d. D(calc.) = 2.15

Optical Properties: Transparent. *Color*: Colorless; aggregates white with pale yellow domains.
Streak: Colorless. *Luster*: Vitreous.
Optical Class: Biaxial. α = 1.525(9) β = n.d. γ = 1.545(9) 2V = n.d.

Cell Data: *Space Group*: *P*1 or $P\bar{1}$. a = 8.286(5) b = 9.385(5) c = 11.35(1)
α = 96.1(1)° β = 98.9(1)° γ = 96.6(1)° Z = 4

X-ray Powder Pattern: Mangazeya deposit, eastern Yakutia, Russia.
4.258 (100), 7.59 (49), 4.060 (48), 7.16 (46), 3.912 (43), 8.14 (19), 4.520 (13)

Chemistry:

	(1)	(2)
Al_2O_3	36.28	37.47
SO_3	28.81	29.42
H_2O^+	34.35	33.11
Total	99.44	100.00

(1) Mangazeya deposit, West Verkhoyansk, eastern Yakutia, Russia; average of 5 wet chemical analyses, IR confirms OH, SO_4 and H_2O, corresponding to $Al_{1.99}(SO_4)_{1.01}(OH)_{3.94} \cdot 3.37H_2O$.
(2) $Al_2(SO_4)(OH)_4 \cdot 3H_2O$.

Occurrence: A secondary mineral along the margins of quartz-arsenopyrite veins in the weathering zone of an intensively sericitized and pyritized granodiorite.

Association: Gypsum, chlorite.

Distribution: Mangazeya polymetallic-silver deposit, West Verkhoyansk, eastern Yakutia (Sakha Republic), Russia.

Name: For Mangazeya Creek, eastern Yakutsk (Sakha Republic), Russia, near the first described locality.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 3291/1).

References: (1) Gamyanin, G.N., Yu.Ya. Zhdanov, N.V. Zayakina, V.V. Gamyanina, and V.S. Suknev (2006) Mangazeite, $Al_2(SO_4)(OH)_4 \cdot 3H_2O$, a new mineral. Zap. Ross. Mineral. Obshch., 135(4), 20–23 (in Russian, English abstract), Geol. Ore Deposits, 49, 514–517 (2007; in English)

Manjiroite $(Na,K)(Mn^{4+},Mn^{2+})_8O_{16}\cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Compact, massive, to 10 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. VHN = 181 average. D(meas.) = 4.29 D(calc.) = [4.45]

Optical Properties: Opaque. *Color:* Dark brownish gray; yellowish gray-white in reflected light. *Streak:* Brownish black. *Luster:* Dull.
Optical Class: Uniaxial. *Anisotropism:* Distinct; yellowish gray, gray, grayish black.
Bireflectance: Very weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I4/m$. $a = 9.916$ $c = 2.864$ Z = 1

X-ray Powder Pattern: Kohare mine, Japan.
2.406 (100), 7.017 (98), 3.136 (92), 4.941 (77), 2.160 (69), 1.839 (46), 1.548 (46)

Chemistry:

	(1)		(1)
SiO_2	0.12	MgO	0.18
MnO_2	85.79	CaO	0.22
Al_2O_3	0.62	BaO	0.16
Fe_2O_3	0.40	Na_2O	2.99
MnO	3.18	K_2O	1.39
CoO	0.00	H_2O^+	3.92
CuO	0.03	H_2O^-	0.68
ZnO	0.03	Total	99.71

(1) Kohare mine, Japan; corresponds to $(Na_{0.73}K_{0.22}Ca_{0.03}Ba_{0.01})_{\Sigma=0.99}(Mn^{4+}_{7.46}Mn^{2+}_{0.34}Al_{0.09}Fe_{0.04}Mg_{0.03})_{\Sigma=7.96}O_{16}\cdot 1.64H_2O$.

Mineral Group: Cryptomelane group.

Occurrence: In the oxidation zone of metamorphosed bedded manganese deposits.

Association: Pyrolusite, nsutite, birnessite, cryptomelane, goethite (Kohare mine, Japan); cryptomelane, pyrolusite, nsutite, romanèchite (Pilbara, Australia).

Distribution: In the Kohare, Tachikawa, Kotamagawa, Kawai, and Takinosawa mines, Iwate Prefecture, Japan. At Bollier, Mary Valley, Queensland, and the Pilbara manganese belt, Western Australia. From the Prompter mine, Tombstone, Cochise Co., Arizona, USA. Found in the Capillitas mine, Veta Balaza, Catamarca, Argentina. From Adams mine, near Kuruman, Cape Province, South Africa.

Name: Honors Dr. Manjiro Watanabe (1891–?), Emeritus Professor of Mineralogy, Tohoku University, Sendai, Japan.

Type Material: National Science Museum, Tokyo, Japan, M15748.

References: (1) Nambu, M. and K. Tanida (1967) Manjiroite, a new manganese dioxide mineral, from Kohare Mine, Iwate Prefecture, Japan. J. Japan. Assoc. Mineral. Petrol. Econ. Mannardite $BaTi_6(V^{3+},Cr^{3+})_2O_{16}\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals prismatic, bounded by {110} and {001}, may be doubly-terminated; elongated along [001], flattened on {100}, bent or twisted about [001], deeply striated ‖ elongation, to 5 mm; in fanlike aggregates.

Physical Properties: *Cleavage:* {100}, good. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–7 VHN = 609 D(meas.) = 4.12–4.43 D(calc.) = 4.28

Optical Properties: Opaque. *Color:* Jet-black; pale reddish brown in reflected light. *Streak:* White to grayish white. *Luster:* Adamantine.
Optical Class: Uniaxial (+). *Anisotropism:* Strong; light pinkish gray to dark brownish gray. *Bireflectance:* Distinct; light to dark brown.
R_1–R_2: (400) 16.5–18.0, (420) 16.3–17.6, (440) 16.0–17.2, (460) 15.7–17.0, (480) 15.5–16.9, (500) 15.4–17.0, (520) 15.2–17.2, (540) 15.1–17.4, (560) 15.0–17.7, (580) 15.0–17.9, (600) 15.0–18.1, (620) 15.0–18.3, (640) 15.0–18.4, (660) 15.0–18.5, (680) 15.1–18.6, (700) 15.1–18.6

Cell Data: *Space Group:* $I4_1/a$. $a = 14.357(2)$ $c = 5.908(1)$ $Z = 4$

X-ray Powder Pattern: Rough claims, Canada; close to redledgeite.
3.201 (100), 1.586 (80), 2.473 (70), 1.887 (70), 2.224 (50), 1.690 (50), 1.394 (40)

Chemistry:

	(1)	(2)		(1)	(2)
TiO_2	60.1	60.2	Cr_2O_3	1.9	1.9
Fe_2O_3		3.7	BaO	19.4	19.8
V_2O_3	16.3	12.2	H_2O	[2.2]	[2.2]
			Total	[99.9]	[100.0]

(1) Rough claims, Canada; by electron microprobe, H_2O calculated + Ba = 2; corresponds to $Ba_{1.02}(Ti_{6.03}V_{1.75}Cr_{0.20})_{\Sigma=7.98}O_{16}\cdot 0.98H_2O$. (2) Bathurst, Canada; by electron microprobe, H_2O calculated + Ba = 2; corresponds to $Ba_{1.04}(Ti_{6.07}V_{1.32}Fe_{0.38}Cr_{0.20})_{\Sigma=7.97}O_{16}\cdot 0.96H_2O$.

Mineral Group: Cryptomelane group.

Occurrence: In late-stage quartz-carbonate veins cutting shale and siltstone (Rough claims, Canada); in an orebody in faulted metasediments and iron formation (Bathurst, Canada); in a silver-bearing polymetallic deposit (Kantsi, China); in kimberlite (Star mine, South Africa).

Association: Barytocalcite, norsethite, sulvanite, barite, quartz (Rough claims, Canada); edingtonite, harmotome, barytocalcite, siderite, sphalerite, quartz (Bathurst, Canada).

Distribution: On the Rough claims, north of Sifton Pass, British Columbia, and in the Brunswick No. 12 orebody, Bathurst, New Brunswick, Canada. In China, from Kantsi, Sichuan Province. In the Star mine, Free State, South Africa.

Name: Honors Dr. George William Mannard (1932–1982), formerly President of Kidd Creek Mines, Ltd., Toronto, Canada, for his interest in the mineral deposits of British Columbia.

Type Material: Geological Survey of Canada, Ottawa, 64197; Royal Ontario Museum, Toronto, Canada, M40292, M40293; The Natural History Museum, London, England, 1983,68 and 1983,69; National Museum of Natural History, Washington, D.C., USA, 150275, 150337, 162567.

Mansfieldite $AlAsO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely in pseudo-octahedral crystals, to 2 mm; commonly as crusts, and porous to cellular masses with spherulitic structure.

Physical Properties: Hardness = 3.5 D(meas.) = 3.03 D(calc.) = [3.08]

Optical Properties: Semitransparent. *Color:* White to pale gray, light green to bluish green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$; strong.
$\alpha = 1.622$ $\beta = 1.624$ $\gamma = 1.642$ 2V(meas.) = $\sim 30^\circ$

Cell Data: *Space Group:* [*Pcab*] (by analogy to scorodite). $a = 10.08$ $b = 9.76$ $c = 8.72$
Z = 8

X-ray Powder Pattern: Hobart Butte, Oregon, USA.
5.45 (vvs), 4.36 (vvs), 3.09 (vs), 2.98 (s), 2.52 (s), 3.97 (ms), 1.627 (ms)

Chemistry:

As_2O_5	56.43	56.91
Sb_2O_5	0.12	
TiO_2	0.91	
Al_2O_3	23.30	25.25
Fe_2O_3	0.88	
H_2O^+	17.77	17.84
Total	[100.00]	100.00

(1) Hobart Butte, Oregon, US; recalculated to 100% after removal of quartz, kaolinite impurities 30.68%. (2) $AlAsO_4 \cdot 2H_2O$.

Polymorphism & Series: Forms a series with scorodite.

Mineral Group: Variscite group.

Occurrence: A hydrothermal product in altered and mineralized andesitic pyroclastic rocks (Hobart Butte, Oregon, USA).

Association: Kaolinite, quartz, scorodite, realgar, stibnite (Hobart Butte, Oregon, USA).

Distribution: From Hobart Butte, about 22 km south of Cottage Grove, Lane Co., Oregon, USA. Found in the Sara Alicia mine, near Alamos, Sonora, Mexico. At Neubulach, Black Forest, and Puderbach, Westerwald, Germany. Crystallized from the Cap Garonne mine, near le Pradet, Var, France. In the Penberthy Croft mine, St. Hilary, Cornwall, England. At Djebel Debar, northeast of Hammam Meskhoutine, Qacentina (Constantine), Algeria. On Mt. Cobalt, 110 km south of Cloncurry, Queensland, Australia. In the Bota-Burum uranium deposit, 15 km southwest of Alakol Lake, Chu-Ili Mountains, southwestern Balkhash district, Kazakhstan.

Name: Honors Dr. George Rogers Mansfield (1875–1947), U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106565, 117722.

(1) Ojuela mine, Mexico; Zn and Fe^{3+} by AA, Fe^{2+} by colorimetry, As by spectrophotometry, H_2O by the Penfield method; corresponding to $(Zn_{1.88}Fe^{2+}_{0.12})_{\Sigma=2.00}Fe^{3+}_{3.10}O_{2.15}(AsO_4)_{3.00} \cdot 11.61H_2O$. (2) $Zn_2Fe_3(AsO_4)_3(OH)_4 \cdot 10H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of an arsenic-rich hydrothermal polymetallic ore deposit.

Association: Scorodite, adamite, smithsonite, "limonite".

Distribution: From the Ojuela mine, Mapimí, Durango, Mexico.

Name: For the Mapimí mining district in Mexico that produced the first specimens.

Type Material: University of Pierre and Marie Curie, Paris, France.

Marcasite FeS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals typically tabular on {010}, also pyramidal, prismatic, and, rarely, capillary; curved faces common. Stalactitic, reniform, fine-granular massive; cockscomb and spearhead shapes due to twinning on {101}. *Twinning:* Common and repeated on {101}; less common on {011}. Intense twin lamellae development observed in polished section.

Physical Properties: *Cleavage:* {101}, rather distinct; {110} in traces. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 915–1099 (200 g load). D(meas.) = 4.887 D(calc.) = 4.875

Optical Properties: Opaque. *Color:* Tin-white on fresh surface, pale bronze-yellow, darkening on exposure, iridescent tarnish. *Streak:* Grayish or brownish black. *Luster:* Metallic. *Pleochroism:* [100] creamy white; [010] light yellowish white; [001] white with rose-brown tint. *Anisotropism:* Very strong, yellow through pale green to dark green.
R_1–R_2: (400) 40.4–44.5, (420) 41.9–45.4, (440) 43.4–47.3, (460) 44.3–50.1, (480) 45.2–52.8, (500) 46.3–54.8, (520) 47.7–56.1, (540) 48.9–56.3, (560) 49.5–55.9, (580) 49.6–55.2, (600) 49.5–54.8, (620) 49.2–58.4, (640) 48.7–53.8, (660) 47.9–52.9, (680) 47.2–51.9, (700) 46.6–51.2

(1) Joplin, Missouri, USA; remainder is SiO_2. (2) Jasper, Wyoming, USA. (3) FeS_2.

Polymorphism & Series: Dimorphous with pyrite.

Mineral Group: Marcasite group.

Occurrence: Typically formed under low-temperature highly acidic conditions, both in sedimentary environments (shales, limestones, and low rank coals) and in hydrothermal veins formed by ascending solutions.

Association: Pyrite, pyrrhotite, galena, sphalerite, fluorite, dolomite, calcite.

Distribution: From numerous localities world-wide. In the USA, at Joplin, Jasper Co., Missouri; Picher and Cardin, Ottawa Co., Oklahoma; and Baxter Springs and Galena, Cherokee Co., Kansas; in Wisconsin, at Mineral Point, Iowa Co., and Racine, Racine Co. In the Czech Republic, from Vintířov, Litmice, Most, Osek, and other places. In Germany, at Clausthal, in the Harz Mountains, and Freiberg and Annaberg, Saxony. In France, at Cap Blanc-Nez, Pas-de-Calais. From England, in the chalk at Kent, and between Folkestone and Dover; at Tavistock, Devon. In Mexico, in the Santa Eulalia district, Chihuahua. From Llallagua, Bolivia. In the Oppu mine, Akita Prefecture, Japan.

Name: A word of Arabic or Moorish origin, early applied to pyrite and other substances.

(1) Musonoi Extension mine, Congo; H_2O by the Penfield method., partially dehydrated material approaching a probable composition $Cu(UO_2)_3O_2(SeO_3)_2\cdot 6H_2O$. (2) $Cu(UO_2)_3O_2(SeO_3)_2\cdot 8H_2O$.

Occurrence: A rare alteration product of selenian digenite in the oxidation zone of a uranium-bearing Cu–Co hydrothermal ore deposit.

Association: Digenite, demesmaekerite, denningite, guilleminite.

Distribution: From the Musonoi Co–Cu mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Aimé Marthoz (1894–1962), former Director of the Union Minière de Haut-Katanga, Congo.

Type Material: University of Pierre and Marie Curie, Paris, 12.252; Natural History Museum, Paris; National School of Mines, Paris, France.

Margaritasite $(Cs,K,H_3O)_2(UO_2)_2(V_2O_8)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular crystals, to 3 μm, in amoeboid aggregates; typically massive.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.41 Radioactive.

Optical Properties: Translucent. *Color:* Yellow; gray in transmitted light.
Optical Class: Biaxial (–). $\alpha = [< 1.83]$ (synthetic). $\beta = 2.49(1)$ $\gamma = > 2.70$
2V(meas.) = 45.5°

Cell Data: *Space Group:* $P2_1/a$. a = 10.514(3) $b = 8.425(3)$ $c = 7.252(5)$ $\beta = 106.01°$
Z = 2

X-ray Powder Pattern: Margaritas deposit, Mexico.
6.965 (100), 3.600 (70), 3.344 (70), 3.489 (60), 3.231 (50), 3.164 (50), 3.129 (35)

Chemistry:

V_2O_5	18.1
Cs_2O	18.7
K_2O	1.73
H_2O	[2.5]
Total	[99.9]

(1) Margaritas deposit, Mexico; by electron microprobe, partial analysis, H_2O by CHN analyzer on a separate sample, recalculated assuming H_2O 2.5%; $(H_3O)^{1+}$ calculated for charge balance, then corresponding to $[Cs_{1.31}K_{0.36}(H_3O)_{0.15}]_{\Sigma=1.82}(UO_2)_{2.03}(V_2O_8)_{0.98}\cdot H_2O$.

Occurrence: As pore fillings and phenocryst casts in felsic volcanic tuffs, which have been altered by high-temperature hydrothermal fluids.

Association: Kaolinite, quartz.

Distribution: An ore at the Margaritas uranium deposit, Peña Blanca district, about 70 km north of Chihuahua City, Chihuahua, Mexico.

Name: For the Margaritas deposit, Mexico, that produced the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149090.

References: (1) Wenrich, K.J., P.J. Modreski, R.A. Zielinski, and J.L. Seeley (1982) Margaritasite: a new mineral of hydrothermal origin from the Peña Blanca uranium district, Mexico. Amer. Mineral., 67, 1273–1289.

Margarite $CaAl_2(Al_2Si_2)O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely forms distinct thin tabular crystals, with pseudohexagonal outline; commonly foliated micaceous aggregates, with lamellae to 3 cm; massive. *Twinning:* On composition plane {001}, with twin axis [310].

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Laminae brittle.
Hardness = 3.5–4.5 D(meas.) = 2.99–3.08 D(calc.) = 3.077

Optical Properties: Translucent. *Color:* Grayish, pale pink, yellow, or green; colorless in thin section. *Streak:* White. *Luster:* Pearly on cleavage, vitreous on lateral faces.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 11°$–$13°$; $Y \wedge a = 6°$–$8°$.
Dispersion: $r < v$, distinct. $\alpha = 1.630$–1.638 $\beta = 1.642$–1.648 $\gamma = 1.644$–1.650
2V(meas.) = 40°–67°

Cell Data: *Space Group:* $C2/c$. $a = 5.10$ $b = 8.83$ $c = 19.15$ $\beta = 95.5°$ Z = 4

X-ray Powder Pattern: Shin-Kiura mine, Japan.
3.180 (100), 1.908 (35), 2.517 (25), 2.508 (18), 1.903 (18), 1.466 (16), 3.123 (14)

(1) Unionville, Pennsylvania, USA; corresponds to $(Ca_{0.75}Na_{0.21}K_{0.02})_{\Sigma=0.98}(Al_{1.96}Mg_{0.07}Fe_{0.04})_{\Sigma=2.07}(Si_{2.10}Al_{1.90})_{\Sigma=4.00}O_{10}(OH)_{2.18}$. (2) Fettercairn, Scotland; by electron microprobe, H_2O by difference; corresponds to $(Ca_{0.69}Na_{0.25}K_{0.04})_{\Sigma=0.98}Al_{2.05}(Si_{2.15}Al_{1.85}Fe_{0.03})_{\Sigma=4.03}O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$ polytype.

Mineral Group: Mica group.

Occurrence: From low- to medium-grade metamorphic rocks, as in emery deposits, chlorite and mica schists, and glaucophane-bearing rocks.

Association: Corundum, diaspore, tourmaline, staurolite, glaucophane, chlorite, magnetite, spinel, andalusite, calcite, quartz.

Distribution: On Mt. Greiner, in the Zillertal, Tirol, Austria. On Mákares and Naxos Islands, Greece. From Yekaterinburg (Sverdlovsk), Ural Mountains, Russia. In the USA, from Chester, Hampden Co., Massachusetts; Cruger's Point, Peekskill, Putnam Co., New York; Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; on Corundum Hill, Chester Co., and Village Green, Delaware Co., Pennsylvania; at Bull Mountain, Patrick Co., Virginia. In California, from Meadow Valley, Plumas Co., and Hilton Gulch, Oak Ridge, Santa Clara Co. At Glen Esk and Fettercairn, Scotland. In the Shin-Kiura mine, Oita Prefecture, Japan.

Name: From the Greek for *pearl*, for its pearly luster on cleavage.

Margarosanite $Pb(Ca,Mn^{2+})_2Si_3O_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. As masses of thin plates, lamellar on {010}, closely packed together, to several cm, showing rhombic outlines resulting from the {100} and {001} cleavages.

Physical Properties: *Cleavage:* Perfect on {010}, good on {100}, fair on {001}. Hardness = 2.5–3 D(meas.) = 3.99–4.33 D(calc.) = 4.30 Blue, rarely pink to red UV fluorescence.

Optical Properties: Transparent. *Color:* Colorless to white; in thin section, colorless. *Streak:* White. *Luster:* Pearly on cleavage.
Optical Class: Biaxial (–). *Dispersion:* $r < v$, strong. $\alpha = 1.727$–1.730 $\beta = 1.771$ $\gamma = 1.795$–1.798 $2V(meas.) = 78°$

Cell Data: *Space Group:* $P\bar{1}$. $a = 6.77(1)$ $b = 9.64(1)$ $c = 6.75(1)$ $\alpha = 110°35'$ $\beta = 102°0'$ $\gamma = 88°30'$ $Z = 2$

Marialite $3NaAlSi_3O_8 \cdot NaCl$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals prismatic, typically with flat pyramidal terminations, striated ‖ [001], to 1.5 m; granular, massive.

Physical Properties: *Cleavage:* {100}, {110}, distinct. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.50–2.62 D(calc.) = [2.54] Commonly fluoresces orange to bright yellow or red under LW or SW UV or both.

Optical Properties: Transparent to opaque. *Color:* Colorless, white, grey; pink, violet, blue, yellow, brown, orange-brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous, pearly, resinous.
Optical Class: Uniaxial (–). $\omega = 1.539–1.550$ $\epsilon = 1.532–1.541$

Cell Data: *Space Group:* $I4/m$. $a = 12.060(3)$ $c = 7.572(3)$ $Z = 2$

X-ray Powder Pattern: Kenya (?).
3.45 (10), 3.05 (9), 3.80 (8), 2.68 (7), 1.907 (7), 1.363 (6), 2.29 (5)

	(1)		(1)
SiO_2	60.64	Na_2O	12.29
Al_2O_3	19.56	K_2O	0.90
FeO	0.06	Cl	3.9
MgO	0.00	SO_3	0.18
CaO	2.66	$-O = Cl_2$	0.88
		Total	99.31

(1) Kenya (?); by electron microprobe, corresponding to $3[(Na_{0.80}Ca_{0.13}K_{0.05})_{\Sigma=0.98}Al_{1.07}Si_{2.83}O_8] \cdot (NaCl)_{0.92}$.

Polymorphism & Series: Forms a series with meionite; intermediate members are $P4_2/n$.

Mineral Group: Scapolite group.

Occurrence: Typically in regionally metamorphosed rocks, especially marbles, calcareous gneisses, granulites, and greenschists. Also in skarns, some pegmatites, pneumatolytically or hydrothermally altered mafic igneous rocks, and ejected volcanic blocks.

Association: Plagioclase, garnet, pyroxenes, amphiboles, apatite, titanite, zircon.

Distribution: Most specimens are intermediate in the series, see also meionite; some localities for highly sodic materials include: at Pianura, west of Naples, Campania, Italy. From Russia, in the Slyudyanka region, near Lake Baikal, Siberia. In the USA, at Hamburg and Franklin, Sussex Co., New Jersey; at Natural Bridge, Jefferson Co., Macomb, St. Lawrence Co., and Olmsteadville, Essex Co., New York; from French Creek, Chester Co., Pennsylvania. In Canada, at Bear Lake, Pontiac Co., Quebec, and Bancroft, Ontario. From the La Panchita mine, near Ayoquezco, Oaxaca, Mexico. From Serra da Chibita, Rio Pardo, Minas Gerais, Brazil. At Tsarasaotra and Betroka, Madagascar. From Mpwapwa, Morogoro region, Dodoma, Tanzania. In the Mogok district, Myanmar (Burma).

Name: For Maria Rosa vom Rath, wife of Gerhard vom Rath, German mineralogist, who named the species.

Total	98.73

(1) Tantalum Pit, Prairie Lake intrusive complex, Ontario, Canada; average of 16 electron microprobe analyses, corresponding to $Na_{1.930}(Ca_{3.996}Mn_{0.042})_{\Sigma=4.038}(Nb_{0.967}Zr_{0.899}Ti_{0.094}Fe_{0.080}Mg_{0.028}Hf_{0.006}Ta_{0.003})_{\Sigma=2.077}(Si_{3.965}O_{14})O_{2.927}F_{1.073}$.

Occurrence: A primary mineral in phlogopite-calcite silicocarbonatite emplaced in ijolite.

Association: Calcite, phlogopite, U-rich pyrochlore, titanite.

Distribution: Tantalum Pit, south of Anomaly Lake, Prairie Lake intrusive complex, Thunder Bay district, Ontario, Canada.

Name: Honors Anthony Nicola Mariano (b. 1930) for contributions to the study of alkaline rocks and carbonatites.

Type Material: R.B. Ferguson Museum of Mineralogy, University of Manitoba, Winnipeg, Manitoba, Canada, M 7425.

(1) Moon Anchor mine, Arizona, USA; by electron microprobe, H_2O by TGA; corresponds to $Pb_{7.2}Ca_{2.2}(Al_{11.6}Si_{36.4})_{\Sigma=48.0}O_{99.6}\cdot 31.8H_2O$.

Mineral Group: Zeolite group.

Occurrence: In a hydrothermal Pb-Cu ore vein, coating and filling fractures in quartz.

Association: Cerussite, mimetite, fornacite, phoenicochroite, duftite, chrysocolla, wickenburgite, calcite, fluorite, quartz.

Distribution: From the Moon Anchor mine, near Tonopah, Maricopa Co., Arizona, USA.

Name: For Maricopa Co., Arizona, USA, where it was discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163247, 163248.

(1) Tachgagalt, Morocco. (2) Do.; recalculated to 100% after deduction of impurities.
(3) $CaMn^{4+}Mn^{2+}O_4$ (crystal-structure analysis of type material determined $CaMn_2^{3+}O_4$).

Occurrence: In hydrothermal manganese oxide deposits.

Association: Jouravskite, hausmannite, braunite, cryptomelane, pyrolusite, crednerite, dolomite, barite, calcite (Tachgagalt, Morocco); pyrolusite, cryptomelane, "opal" (Kuruman, South Africa).

Distribution: From Tachgagalt, 17 km south of Ouarzazate, Anti-Atlas Mountains, Morocco. In the Black Rock mine, near Kuruman, Cape Province, South Africa.

Name: For the first occurrence in Morocco, *Maroc* in French.

Type Material: Geological Survey, Rabat, Morocco; National School of Mines, Paris, France.

(1) Broken Hill, Australia. (2) Chuquicamata, Chile. (3) CuI.

Occurrence: A rare mineral in the oxidized zone of a metamorphosed Pb–Zn–Ag deposit (Broken Hill, Australia); in the oxidized zone of a porphyry copper deposit (Chuquicamata, Chile); in tills over a copper anomaly, introduced by brackish seawater (Löytösuo, Finland).

Association: Copper, cuprite, cerussite, malachite, Fe–Mn oxides (Broken Hill, Australia); copper, atacamite, tenorite, gypsum (Chuquicamata, Chile).

Distribution: In Australia, from Broken Hill, New South Wales, and in the Poona mine, 5 km northeast of Moonta, South Australia. At Chuquicamata, Antofagasta, Chile. In the Löytösuo area, Ylikiiminki, Finland.

Name: For Charles W. Marsh, who first noted the mineral at Broken Hill, Australia.

Marthozite $Cu(UO_2)_3O_2(Se^{4+}O_3)_2 \cdot 8H_2O$.

Crystal Data: Orthorhombic. *Point Group: mm*2. Crystals, to 4 mm, are flattened on {100}, striated parallel [001], bound by large {010}, {011}, {2$\bar{3}$0}, modified by {230}, {101}, {201}, {301}, {211}, {210}.

Physical Properties: *Cleavage:* Perfect on {100}; imperfect on {010}. Hardness = n.d. D(meas.) = 4.4 D(calc.) = 4.37 Radioactive; dehydrates at ambient temperature.

Optical Properties: Semitransparent. *Color:* Yellowish green to greenish brown. *Optical Class:* Biaxial (−). *Pleochroism:* Y = yellowish green; Z = yellowish brown. *Orientation:* $X = a$; $Y = b$; $Z = c$. α = n.d. β = 1.780–1.785 γ = 1.795–1.800 2V(meas.) = 39° 2V(calc.) = n.d.

Cell Data: *Space Group:* $P2_1bn$. a = 16.4537(10) b = 17.2229(10) c = 6.9879(4) Z = 4

X-ray Powder Pattern: Musonoi mine, Congo.
8.23 (FFF), 3.09 (FFF), 3.22 (FF), 2.900 (FF), 3.02 (F), 8.65 (mF), 4.44 (mF)

Chemistry:

	(1)	(2)
UO_3	60.5	65.82
SeO_2	23.7	17.02
CuO	4.3	6.10
H_2O	10.7	11.06
Total	99.2	100.00

(1) Musonoi Extension mine, Congo; H_2O by the Penfield method., partially dehydrated material approaching a probable composition $Cu(UO_2)_3O_2(SeO_3)_2 \cdot 6H_2O$. (2) $Cu(UO_2)_3O_2(SeO_3)_2 \cdot 8H_2O$.

Occurrence: A rare alteration product of selenian digenite in the oxidation zone of a uranium-bearing Cu–Co hydrothermal ore deposit.

Association: Digenite, demesmaekerite, denningite, guilleminite.

Distribution: From the Musonoi Co–Cu mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Aimé Marthoz (1894–1962), former Director of the Union Minière de Haut-Katanga, Congo.

Type Material: University of Pierre and Marie Curie, Paris, 12.252; Natural History Museum, Paris; National School of Mines, Paris, France.

Mineral., 39, 797–807.

Martyite $Zn_3(V_2O_7)(OH)_2 \cdot 2H_2O$

Crystal Data: Hexagonal. *Point Group*: $\bar{3}\,2/m$. As thin plates and flakes with prominent {001}, to 1mm; in mats or rosette-like clusters.

Physical Properties: *Cleavage*: Perfect on {001}, good on {110}. *Fracture*: Curved. *Tenacity*: Brittle; thin flakes slightly flexible. Hardness = 3 D(meas.) = 3.37(3) D(calc.) = 3.375

Optical Properties: Transparent. *Color*: Bright yellow-orange to red-orange. *Streak*: Pale yellow-orange. *Luster*: Adamantine.
Optical Class: Uniaxial (+). ω = 1.797(3) ε = 1.806(3)
Pleochroism: *O* = Red-orange; *E* = yellow.

Cell Data: *Space Group*: $P\bar{3}\,m1$. a = 6.0818(4) c = 7.1793(10) Z = 1

X-ray Powder Pattern: Blue Cap mine, San Juan County, Utah, USA.
7.211 (100), 2.968 (50), 2.470 (40), 2.628 (35), 1.485 (25), 4.252 (20), 2.796 (20)

Chemistry:

	(1)	(2)

CoO	2.39	
CaO	0.58	
MgO	0.03	
V_2O_5	39.47	37.89
H_2O	12.06	11.26
Total	101.46	100.00

(1) Blue Cap mine, San Juan County, Utah, USA; average of 4 electron microprobe analyses, H_2O calculated from structure, corresponding to $(Zn_{2.66}Co_{0.15}Ca_{0.05})_{\Sigma=2.86}(V_2O_7)(OH)_{1.72}\cdot 2.23H_2O$.
(2) $Zn_3(V_2O_7)(OH)_2 \cdot 2H_2O$.

Occurrence: Product of groundwater leaching and oxidation of vanadium oxides in a post-mining environment.

Association: Gypsum, rossite, pyrite, montroseite, magnesiopascoite.

Distribution: Blue Cap mine, near La Sal, San Juan County, Utah, USA.

Name: Honors Joe Marty (b. 1945) for his contributions to mineralogy.

Type Material: Natural History Museum of Los Angeles County, California, USA, 58610 and 58611.

References: (1) Kampf A.R., and I.M. Steele (2008) Martyite, a new mineral species related to volborthite: description and crystal structure. Can. Mineral., 46, 687–692. (2) (2009) Amer. Mineral., 94, 401 (abs. ref. 1).

Mascagnite $(NH_4)_2SO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rare in euhedral crystals; may be fibrous, to 5 mm; commonly in dendrites, stalactitic forms, and mealy crusts. *Twinning:* On {101}, common.

Physical Properties: *Cleavage:* {100}, good. *Fracture:* Uneven. *Tenacity:* Slightly sectile. Hardness = 2–2.5 D(meas.) = 1.768 D(calc.) = 1.769 Soluble in H_2O, taste sharp and bitter; slightly hygroscopic.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, may be tinged gray, yellowish gray, lemon-yellow; colorless in transmitted light. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, weak. $\alpha = 1.521$ $\beta = 1.523$ $\gamma = 1.539$ 2V(meas.) = 52°

Cell Data: *Space Group: Pnma* (synthetic). $a = 7.782$ $b = 5.993$ $c = 10.636$ Z = 4

X-ray Powder Pattern: Synthetic.
4.33 (100), 4.39 (65), 3.055 (55), 3.890 (35), 5.22 (30), 3.139 (30), 3.122 (25)

Chemistry: (1) Natural material has never been analyzed; identification depends on correspondence of X-ray powder pattern and optical data with that of synthetic material.

Polymorphism & Series: Forms a series with arcanite.

Occurrence: A sublimation product in fumaroles and solfataras; formed by burning coal seams.

Association: Sal ammoniac, tschermigite, sylvite, halite, sassolite, boussingaultite, gypsum, sulfur, cinnabar.

Distribution: In Italy, on Vesuvius, Campania, and Etna, Sicily. In Russia, from volcanoes on the Kamchatka Peninsula. On Nyamuragira [Nyamlagira] volcano, Kivu Province, Congo. At The Geysers, Sonoma Co., California, USA. In Germany, from the Clara mine, near Oberwolfach, Black Forest, and on the dump of the Paul-Berndt mine, Freital, Saxony. From burning coal dumps at all of the following: Commentry, Allier, France. From Bradley, Staffordshire, England. At Arniston, Midlothian, Scotland. From Kladno and Radvanice, Czech Republic. Found near Ravat, Tien-Shan Mountains, Tajikistan. From near Chervonograd, Ukraine. In the USA, from Kehley's Run mine, near Shenandoah, Schuylkill Co., and Glen Lyon, Luzerne Co., Pennsylvania; at Bitter Creek, near Wamsutter, Sweetwater Co., Wyoming.

Name: Honoring Paolo Mascagni (1755–1815), Professor of Anatomy, University of Siena, Siena, Italy, who provided the original description.

Maslovite $(Pt, Pd)(Bi, Te)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. As elongated grains, which may be rounded, to 200 μm.

Physical Properties: Hardness = n.d. VHN = 262–388 (20 g load), inversely proportional to Pd content. D(meas.) = n.d. D(calc.) = 11.51–11.74

Optical Properties: Opaque. *Color:* In polished section, pale gray with a lilac hue. *Luster:* Metallic.
R: (400) — , (420) — , (440) 55.9, (460) 55.2, (480) 55.0, (500) 55.5, (520) 56.0, (540) 56.1, (560) 55.9, (580) 55.9, (600) 56.1, (620) 56.3, (640) 56.8, (660) 57.1, (680) 57.5, (700) 58.4

Cell Data: *Space Group:* $P2_13$. $a = 6.689(7)$ $Z = 4$

X-ray Powder Pattern: Oktyabr mine, Russia.
3.01 (10), 2.71 (8), 2.02 (6), 1.788 (3), 2.36 (2), 1.852 (2), 1.286 (2)

Chemistry:

	(1)	(2)	(3)
Pt	26.6	21.0	36.69
Pd	5.6	10.6	
Pb	0.0	0.0	
Bi	53.0	49.0	39.31
Sb	1.6	1.2	
Te	15.7	19.05	24.00
Total	102.5	101.9	100.00

(1) Oktyabr mine, Russia; by electron microprobe, corresponding to $(Pt_{0.71}Pd_{0.27})_{\Sigma=0.98}(Bi_{1.31}Te_{0.64}Sb_{0.07})_{\Sigma=2.02}$. (2) Do.; corresponding to $(Pt_{0.53}Pd_{0.49})_{\Sigma=1.02}(Bi_{1.16}Te_{0.78}Sb_{0.05})_{\Sigma=1.99}$. (3) PtBiTe.

Mineral Group: Pyrite group.

Occurrence: In galena-rich portions of massive cubanite-chalcopyrite and mooihoekite ores.

Association: Altaite, sobolevskite, moncheite, michenerite, hessite, froodite, paolovite, tatyanaite, sperrylite, atokite–rustenbergite, galena, chalcopyrite, cubanite, mooihoekite.

Distribution: From the Oktyabr mine, Noril'sk region, western Siberia, Russia [TL]. At the Rustenburg mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: Honors Georgii Dmitrievich Maslov (1915–1968), geologist, one of the discoverers of the Talnakh deposits.

Type Material: Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Massicot PbO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Scaly, commonly earthy, as incrustations and massive.

Physical Properties: Hardness = 2 D(meas.) = n.d. D(calc.) = 9.640

Optical Properties: Translucent, transparent on thin edges. *Color:* Sulfur-yellow to orpiment-yellow, may have a reddish tint; in transmitted light, colorless to pale yellow. *Streak:* Yellow. *Luster:* Greasy to dull.
Optical Class: Biaxial (+). *Pleochroism:* Y = light sulfur-yellow; Z = deep yellow. *Dispersion:* Strong. $\alpha = 2.51$ $\beta = 2.61$ $\gamma = 2.71$ 2V(meas.) = $\sim 90°$

Cell Data: *Space Group: Pcam* (synthetic). $a = 5.4903(1)$ $b = 5.8920(1)$ $c = 4.7520(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.068 (100), 2.946 (24), 2.745 (23), 2.3767 (17), 1.7232 (16), 1.6401 (15), 2.0078 (13)

Chemistry: Analyses of natural material are not available; identification is through correspondence of other properties with synthetic material.

Occurrence: As an oxidation product of galena, bournonite, boulangerite, and other lead-bearing minerals.

Association: Cerussite, litharge, minium, wulfenite, antimony oxides, "limonite".

Distribution: Although widespread, typically only in minor amounts. Localities for representative material include: in Germany, from Freiberg, Saxony, at Greifenstein, Nassau, and elsewhere. In France, at Malmes, Gard; Ally, Haute-Loire; in the La Gardette mine, Bourg d'Oisans, Isère; and others. At Băiţa (Rézbánya), Romania. From Laurium, Greece, in slag. At Caracoles, Bolivia. On Popocatepetl volcano, Puebla; at Carachilas, Baja California; Tornacuxtla, Hidalgo; and many other places in Mexico. In the USA, in California, from the Cerro Gordo district, Inyo Co., and on Cucamonga Peak, San Bernardino Co.; in Arizona, from the Tonopah-Belmont mine, Osborne district, at the Moon Anchor mine, Potter-Cramer property, and the Rat Tail claim, Vulture district, Maricopa Co.; in the Flux mine, Patagonia Mountains, Santa Cruz Co.; and several other places. From Dundas, Tasmania, Australia.

Name: From early Arabic, through the Spanish *mazacote* and the French for *oxide of lead*.

Masutomilite $\mathbf{K(Li,Al,Mn^{2+})_3(Si,Al)_4O_{10}(F,OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. As the core of a sharply zoned 10 cm mica crystal; as isolated flakes in a coating on garnet.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = 2.5 D(meas.) = 2.90–2.94 D(calc.) = 2.96

Optical Properties: Transparent to translucent. *Color:* Pale purple-pink, purple; colorless to pink or purple in thin section.
Optical Class: Biaxial (–). *Pleochroism:* $X = Z$ = colorless, pale pink, pale purple; Y = purple. *Orientation:* $Y = b$; $Z \wedge a = 2°–4°$. *Dispersion:* $r > v$, very weak. *Absorption:* $Y > Z > X$. $\alpha = 1.534–1.536$ $\beta = 1.569–1.570$ $\gamma = 1.570–1.574$ 2V(meas.) = 28°–35°

Cell Data: *Space Group:* $C2$. $a = 5.262(2)$ $b = 9.102(3)$ $c = 10.094(3)$ $\beta = 100.83(2)°$ Z = [2]

X-ray Powder Pattern: Tanakamiyama, Japan.
3.32 (100), 10.10 (70), 3.35 (65), 3.09 (60), 3.64 (45), 2.589 (45), 1.989 (45)

Chemistry:

	(1)		(1)
SiO_2	46.85	Li_2O	4.45
TiO_2	0.13	Na_2O	0.54
Al_2O_3	19.81	K_2O	9.88

MgO	0.00	H_2O^-	1.36
CaO	0.00	$-O = F_2$	2.96
		Total	99.94

(1) Tanakamiyama, Japan; corresponding to $(K_{0.89}Na_{0.07}Rb_{0.07})_{\Sigma=1.03}(Li_{1.27}Al_{0.98}Mn^{2+}_{0.49}Fe^{2+}_{0.09}Fe^{3+}_{0.03})_{\Sigma=2.86}(Si_{3.32}Al_{0.68})_{\Sigma=4.00}O_{9.82}[F_{1.58}(OH)_{0.60}]_{\Sigma=2.18}$.

Polymorphism & Series: 1M, $2M_1$ polytypes.

Mineral Group: Mica group.

Occurrence: In a druse in a granite pegmatite, as the core of a crystal zoned with manganoan zinnwaldite (Tanakamiyama, Japan); as reaction rims coating spessartine-rich garnets in manganese-rich parts of a lithium pegmatite (Ctidružice, Czech Republic).

Association: Zinnwaldite, topaz, tourmaline, albite, quartz, cassiterite (Tanakamiyama, Japan); manganoan garnet, manganoan elbaite (Ctidružice, Czech Republic).

Distribution: From Tanakamiyama, Otsu, Shiga Prefecture, and Tawara, Gifu Prefecture, Japan. At Washington Pass, Okanogan Co., Washington, USA. From Ctidružice, Czech Republic.

Name: For Dr. Kazunosuke Masutomi, Japanese amateur mineralogist.

Type Material: Kanazawa University, Kanazawa; Tohoku University, Kawauchi, Japan.

References: (1) Harada, K., M. Honda, K. Nagashima, and S. Kanisawa (1977) Masutomilite, manganese analog of zinnwaldite, with special reference to masutomilite-lepidolite-zinnwaldite series. Masuyite $Pb_3U_8^{6+}O_{27}\cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$ (probable). Crystals pseudohexagonal, tabular on {001}, to 3 mm, with {100}, {010}, {110}, and {150}; scaly, in rosettes. *Twinning:* Very common on {110} or $\{1\bar{3}0\}$ as twin and composition planes, contact and repeated, individuals with ∥ {001}.

Physical Properties: *Cleavage:* {001}, perfect; {010}, good. Hardness = n.d. D(meas.) = 5.08 D(calc.) = n.d. Radioactive. Some properties may be incorrectly ascribed to this species; the chemical formula used here is from J. Protas (1959) using synthetic material, the X-ray pattern of which matched natural material in the Sorbonne collection.

Optical Properties: Transparent. *Color:* Red-orange, orange, brownish orange. *Optical Class:* Biaxial (–). *Pleochroism:* X = pale yellow; $Y = Z$ = deep golden yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, moderate. $\alpha = 1.785$ $\beta = 1.895$–1.906 $\gamma = 1.915$–1.917 2V(meas.) = 40.5°–50°

Cell Data: *Space Group: Pcna*, probable, pseudocell. $a = 13.90$–14.09 $b = 12.04$–12.31 $c = 14.20$–14.92 Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
7.08 (100), 3.52 (70), 3.12 (50), 3.56 (35), 3.48 (21), 2.008 (18), 1.95 (17b)

Chemistry:

	(1)	(2)	(3)
UO_3	70.61	75.00	72.92
PbO	24.51	18.82	21.34
H_2O	[4.88]	[6.18]	5.74
Total	[100.00]	[100.00]	100.00

(1) Shinkolobwe, Congo [type I material]; by electron microprobe, average of 11 determinations on four grains, H_2O by difference; corresponds to $Pb_{4.01}U_{9.00}O_{31}\cdot 9.87H_2O$. (2) Do. [type II material]; by electron microprobe, average of five analyses on three grains, H_2O by difference; corresponds to $Pb_{0.97}U_{3.01}O_{10}\cdot 3.94H_2O$. (2) $Pb_3U_8O_{27}\cdot 10H_2O$.

Occurrence: A secondary mineral formed in the oxidized zone of uranium-bearing deposits.

Association: Uraninite, rutherfordine, becquerelite, fourmarierite, wyartite, wölsendorfite, kasolite, metastudtite.

Distribution: From Shinkolobwe, and the Kamoto mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In the El Sharana mine, South Alligator Valley, Northern Territory, Australia. Found at the Rabéjac uranium deposit, seven km south-southwest of Lodève, Hérault, France.

Name: For Gustave Masuy (1905–1945), Belgian geologist, who studied Congolese (Zairian) minerals.

Type Material: Type material is lost; Royal Museum of Central Africa, Tervuren, Belgium has neotype material; Harvard University, Cambridge, Massachusetts, USA, 104455, although supplied as a type by Vaes, does not contain lead, found microchemically in original type material.

Mathewrogersite $Pb_7(Fe^{2+},Cu)Al_3GeSi_{12}O_{36}(OH,H_2O)_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3, $\overline{3}$, 32, $3m$, or $\overline{3}\,2/m$. As platy, six-sided crystals, to 0.3 mm, flattened on {0001}. Also as radiating groups, to < 1 mm, of intergrown blades and scales.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = ∼2 D(meas.) = 4.7 D(calc.) = 4.76

Optical Properties: Translucent. *Color:* Colorless, white, or pale greenish yellow. *Streak:* White. *Luster:* Vitreous, weakly pearly on cleavages. *Optical Class:* Uniaxial (–). $\omega = 1.810(4)$ $\epsilon = 1.745(3)$

Cell Data: *Space Group:* $R3$, $R\overline{3}$, $R32$, $R3m$, or $R\overline{3}\,2/m$. $a = 8.457(2)$ $c = 45.970(22)$ Z = 3

X-ray Powder Pattern: Tsumeb, Namibia.
3.257 (100), 15.30 (70), 2.030 (70), 7.68 (60), 2.766 (60), 1.762 (60), 4.08 (50)

Chemistry:

	(1)
SiO_2	26.2
GeO_2	3.9
Al_2O_3	5.9
FeO	1.7
CuO	0.8
PbO	57.5
MgO	0.1
H_2O	1.9
Total	98.0

(1) Tsumeb, Namibia; by electron microprobe, H_2O estimated by elemental analyzer; corresponds to $Pb_{7.08}(Fe_{0.65}Cu_{0.28}Mg_{0.07})_{\Sigma=1.00}Al_{3.18}Ge_{1.03}Si_{12}O_{41.81}H_{5.81}$.

Occurrence: In cavities of corroded Pb-Zn ores in the lower oxidation zone of a polymetallic mineral deposit.

Association: Queitite, alamosite, melanotekite, kegelite, larsenite, schaurteite, anglesite, willemite, leadhillite, mimetite.

Distribution: From Tsumeb, Namibia.

Name: To honor Mathew Rogers, the first European prospector at Tsumeb, Namibia.

Type Material: University of Stuttgart, Stuttgart, Germany, NM15; National Museum of Natural History, Washington, D.C., USA.

Mineral Group: Crichtonite group.

Occurrence: A primary mantle-derived phase found in heavy-mineral concentrates from metasomatized kimberlite (South Africa).

Association: Lindsleyite, olivine, diopside, phlogopite, Ce-bearing barite, Nb–Cr rutile, Mg–Cr spinel, ilmenite, perovskite, titanite (South Africa); yimengite (Shandong Province, China).

Distribution: From the Jagersfontein diamond mine, Free State, and the Bultfontein diamond mine and Kolonkwanen kimberlite prospect, Mackenzie's Post district, Cape Province, South Africa. From an undisclosed locality [Yimeng Mountains], Shandong Province, China.

Name: Honors Professor Frances Celia Morna Mathias (1913–), University of Cape Town, Cape Town, South Africa, for her contributions to studies of mantle-derived rocks.

Type Material: National Museum, Cape Town, South Africa; The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA.

Matildite $AgBiS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Subhedral prismatic crystals rare; massive, granular; characteristically in intimate intergrowth with galena, which may form Widmanstättenlike textures.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5 VHN = 72–85 (100 g load). D(meas.) = 6.9 D(calc.) = 6.99

Optical Properties: Opaque. *Color:* Iron-black to gray; white in polished section. *Streak:* Pale gray. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Weak. R_1–R_2: (400) 41.4–47.2, (420) 41.9–47.8, (440) 42.2–48.3, (460) 43.1–48.8, (480) 43.4–49.3, (500) 43.4–49.3, (520) 43.0–49.0, (540) 42.8–48.4, (560) 42.5–47.8, (580) 42.2–47.3, (600) 41.7–46.9, (620) 41.3–46.7, (640) 40.8–46.7, (660) 40.3–46.7, (680) 39.9–46.3, (700) 39.3–46.1

Cell Data: *Space Group:* $P\overline{3}m1$. $a = 4.0662(21)$ $c = 18.5958(17)$ $Z = 3$

X-ray Powder Pattern: Camsell River area, Canada.
2.827 (100), 3.302 (80), 1.966 (60), 2.029 (50), 6.311 (30), 1.709 (30), 3.453 (20)

Chemistry:

	(1)	(2)	(3)
Ag	28.76	27.3	28.33
Bi	54.50	56.0	54.84
S	17.24	16.9	16.83
Total	100.50	100.2	100.00

(1) Morococha, Peru; average of three analyses, after deduction of galena; corresponds to $Ag_{0.99}Bi_{0.97}S_{2.00}$. (2) Camsell River area, Canada; by electron microprobe, corresponds to $Ag_{0.96}Bi_{1.02}S_{2.00}$. (3) $AgBiS_2$.

Occurrence: Formed in hydrothermal deposits at medium to high temperatures and in pegmatites.

Association: Galena, pavonite, aikinite, bismuthinite, hessite, tetradymite, pyrite, chalcopyrite, sphalerite, arsenopyrite, tetrahedrite.

Distribution: From the Matilda mine, near Morococha, Peru [TL]. At Cerro Rico, Potosí, Bolivia. From the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. In the USA, at the Mayflower mine, Boise basin area, Ada Co., Idaho; in the Darwin mine, Inyo Co., California; in Colorado, near Lake City, Hinsdale Co., in the Revell #1 mine, north of Silver Cliff, Custer Co., at Leadville, Lake Co., and elsewhere; from the Campbell mine, Bisbee, Cochise Co., Arizona; at the Outlaw mine, Round Mountain district, Nye Co., Nevada. In Canada, in the O'Brien and other mines, Cobalt, Ontario; at Glacier Gulch, British Columbia; and along the Camsell River, about six km south of Great Bear Lake, Northwest Territories. In Germany, from Schapbach, Black Forest. At Baia Borşa, Baia Mare (Nagybánya), Romania. From Bustarviejo, near Madrid, Spain. At Panasqueira and in the Vale das Gatas tungsten mine, near Vila Real, Portugal. In southwestern Greenland, from the Ivigtut cryolite deposit. In the Kenya mine, Imtali, Zimbabwe. Also known from a few other occurrences with less-well-defined locality information.

Name: For its occurrence in the Matilda mine, Peru.

Matlockite PbFCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Tabular crystals, to 5 cm, flattened on {001}, with {110}, {011}, and {111} modifications, may be equant, rounded. In subparallel aggregates, rosettelike, radiating, hemispherical; lamellar, cleavable massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 7.12 D(calc.) = 7.16

Optical Properties: Transparent. *Color:* Colorless, pale yellow, amber-yellow, yellow-orange; colorless in transmitted light. *Luster:* Adamantine, pearly on {001}.
Optical Class: Uniaxial (–); rarely biaxial due to strain. $\omega = 2.145$ $\epsilon = 2.006$
2V(meas.) = Small.

Cell Data: *Space Group:* $P4/nmm$ (synthetic). $a = 4.1104(2)$ $c = 7.2325(5)$ $Z = 2$

X-ray Powder Pattern: Synthetic.
3.574 (100), 2.906 (45), 3.617 (40), 2.265 (40), 2.715 (35), 1.781 (25), 2.055 (20)

Chemistry:

	(1)	(2)	(3)
Pb	79.55	78.92	79.19
F	7.11	7.25	7.26
Cl	13.44	13.57	13.55
Total	100.10	[99.74]	100.00

(1) Cromford, England. (2) Tiger, Arizona, USA; original total given as 99.67%. (3) PbFCl.

Occurrence: In the oxide zone of some lead-bearing mineral deposits.

Association: Phosgenite, anglesite, cerussite, galena, sphalerite, barite, fluorite (Cromford, England); diaboleite, boleite, caledonite, leadhillite (Tiger, Arizona, USA).

Distribution: Large crystals from the Bage and Wallclose mines, about 2.5 km south of Matlock, Derbyshire, England. In slag, at Laurium, Greece. In slag, along Baratti Beach and one km north of Campiglia, Tuscany, Italy. From the Christian-Levin mine, near Essen, North Rhine-Westphalia, Germany. Fine crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co.; in the Apache mine, Gila Co.; and the Mildren mine, Cabibi district, South Comobabi Mountains, Arizona, USA. At Chancay, Peru. From Challacollo, Tarapacá, Chile. At the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa, in slag.

Name: For the first occurrence near Matlock, England.

Type Material: The Natural History Museum, London, England, 89055.

Matraite ZnS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. In pyramidal crystal aggregates consisting of oriented sceptre-shaped overgrowths of matraite and sphalerite.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 4.13

Optical Properties: Transparent. *Color:* Brownish yellow. *Luster:* Vitreous.
Anisotropism: Pronounced in some crystals.
R_1–R_2: n.d.

Cell Data: *Space Group:* $R3m$. $a = 3.8$ $c = 9.4$ $Z = 3$

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
Zn	61.70	67.10
Fe	5.10	
S	33.22	32.90
Total	100.02	100.00

(1) Matra Mountains, Hungary. (2) ZnS.

Polymorphism & Series: Trimorphous with sphalerite and wurtzite.

Occurrence: Of hydrothermal origin.

Association: Wurtzite, sphalerite, galena, chalcopyrite, pyrite.

Distribution: From an undefined locality in the Matra Mountains, Hungary. At Telluride, San Miguel Co., Colorado, USA.

Name: For the Matra Mountains locality in Hungary.

Type Material: n.d.

Mattagamite $CoTe_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As equidimensional and rarer bladelike grains isolated in altaite, and as irregular rims a few μm thick on pyrrhotite and chalcopyrite in contact with altaite. *Twinning:* In polished section twinning commonly observed perpendicular to elongation axis of the laths.

Physical Properties: Hardness = n.d. VHN = 383, 404 (25 g load). D(meas.) = n.d. D(calc.) = 8.00

Optical Properties: Opaque. *Color:* In polished section, violet. *Pleochroism:* Weak, colors from pink to cream. *Anisotropism:* Weak, pinkish violet to grayish violet.
R_1–R_2: (400) 50.2–62.2, (420) 51.0–60.3, (440) 51.8–58.4, (460) 51.0–56.6, (480) 49.9–55.6, (500) 48.7–54.7, (520) 48.2–54.2, (540) 47.9–53.9, (560) 47.8–53.9, (580) 47.7–54.0, (600) 47.8–54.3, (620) 48.0–54.7, (640) 48.3–55.2, (660) 48.6–55.6, (680) 48.9–56.3, (700) 49.1–56.9

Cell Data: *Space Group: Pnnm* (synthetic). $a = 5.3294(6)$ $b = 6.3223(8)$ $c = 3.9080(6)$ $Z = 2$

X-ray Powder Pattern: Mattagami Lake mine, Canada.
2.805 (10), 2.703 (8), 2.066 (6), 1.843 (4), 3.31 (3), 1.583 (3), 1.514 (2)

Chemistry:

	(1)	(2)
Co	10.3	18.76
Fe	6.7	
Te	82.4	81.24
Total	99.4	100.00

(1) Mattagami Lake mine, Canada; by electron microprobe, average of analyses of three grain sizes, corresponding to $(Co_{0.54}Fe_{0.37})_{\Sigma=0.91}Te_{2.00}$. (2) $CoTe_2$.

Polymorphism & Series: Forms a series with frohbergite.

Mineral Group: Marcasite group.

Occurrence: In a small telluride zone in a massive zinc-rich stratiform deposit in Archaen volcanics (Mattagami Lake mine, Canada).

Association: Frohbergite, altaite, pyrrhotite, chalcopyrite, magnetite, talc, chlorite (Mattagami Lake mine, Canada).

Distribution: From the Mattagami Lake mine, near Matagami, Quebec, Canada [TL]. At the Zhena-Tyube deposit, Kazakhstan. From Fe–Co–Au–U deposits in the the Kuusamo schist belt, northeastern Finland.

Name: For its occurrence at Mattagami Lake, Canada.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M31956.

References: $FeTe_2$, and $CoTe_2$.*ActaChem.Scand.*, 24, 1925 − −1940.

Matteuccite $NaHSO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (synthetic). *Point Group:* m. A massive component of fumarolic stalactites.

Physical Properties: Hardness = n.d. D(meas.) = 2.118 (synthetic). D(calc.) = 2.124

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Biaxial (–) (synthetic). $\alpha = 1.43$ $\beta = 1.46$ $\gamma = 1.48$ 2V(meas.) = Large.

Cell Data: *Space Group:* Aa (synthetic). $a = 8.213$ $b = 7.812$ $c = 7.805$ $\beta = 120.04°$
Z = 4

X-ray Powder Pattern: Synthetic.
3.557 (100), 3.462 (70), 3.422 (55), 5.110 (35), 3.633 (30), 2.759 (20), 3.378 (18)

Chemistry: (1) Identification depended on a single strong X-ray line at 3.47 which was interpreted as representing the two strongest lines of the synthetic compound.

Occurrence: In stalactites formed in a volcanic crater.

Association: Mercallite, ralstonite.

Distribution: From Vesuvius, Campania, Italy.

Name: Honors Vittorio Matteucci (1862–1909), Director of the Vesuvius Laboratory, Vesuvius, Italy.

Type Material: University of Florence, Florence, Italy, 1970/I.

Mattheddleite $Pb_{20}(SiO_4)_7(SO_4)_4Cl_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m$. As hexagonal prisms, up to 3 mm, forming radiating rosiform aggregates.

Physical Properties: *Cleavage:* On {0001}, or a parting. Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.96 Dull yellow fluorescence under SW UV.

Optical Properties: Transparent. *Color:* Creamy white to pinkish; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (–). $\omega = 2.017(5)$ $\epsilon = 1.999(5)$

Cell Data: *Space Group:* $P6_3/m$. $a = 9.963(5)$ $c = 7.464(5)$ Z = [0.5]

X-ray Powder Pattern: Leadhills, Scotland.
2.988 (100), 4.32 (40), 4.13 (40), 2.877 (40), 3.26 (30), 3.41 (20), 2.072 (20)

Chemistry:

	(1)	(2)
SiO_2	7.65	7.91
PbO	83.60	83.99
Cl	2.40	2.67
SO_3	6.00	6.03
$-O = Cl_2$	0.54	0.60
Total	99.11	100.00

(1) Leadhills, Scotland; by electron microprobe, average of two analyses; corresponds to $Pb_{20.28}Si_{6.90}S_{4.06}O_{44.34}Cl_{3.66}$. (2) $Pb_{20}(SiO_4)_7(SO_4)_4Cl_4$.

Occurrence: Lining cavities in quartz which contain other oxidized lead minerals.

Association: Lanarkite, cerussite, anglesite, pyromorphite, hydrocerussite, caledonite, leadhillite, susannite, macphersonite.

Distribution: From Leadhills, Lanarkshire, Scotland. In England, from the Brae Fells, Red Gill, and Roughton Gill mines, Caldbeck Fells, Cumbria. In Wales, from Dyfed, at the Esgair Hir mine, Bwlch-y-Esgair, Ceulanymaesmawr and the Darren mine, Penbont Rhydybeddau.

Name: For Matthew Forster Heddle (1828–1897), Scottish mineralogist.

Type Material: Royal Museum of Scotland, Edinburgh, Scotland, GY 721.34; The Natural History Museum, London, England, 1985,178.

Matulaite $CaAl_{18}(PO_4)_{12}(OH)_{20}\cdot 28H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rosettes of pseudohexagonal thin tabular scaly crystals, to 1 mm; botyroidal and as spherules.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Slightly flexible but not elastic. Hardness = 1 D(meas.) = 2.330 D(calc.) = [2.33]

Optical Properties: Translucent. *Color:* Colorless, white, grayish white. *Luster:* Pearly. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 8°$. *Dispersion:* $r < v$, strong. $\alpha = [1.558]$ $\beta = 1.576(2)$ $\gamma = 1.582(2)$ 2V(meas.) = ∼60°

Cell Data: *Space Group:* $P2_1/c$. a = 20.4(1) $b = 16.7(1)$ $c = 10.6(1)$ $\beta = 98.2(5)°$ Z = 2

X-ray Powder Pattern: Hellertown, Pennsylvania, USA.

(1) Hellertown, Pennsylvania, USA. (2) Do.; analysis (1) recomputed to 100% after deduction of quartz and hematite impurities, and removal of minor oxides 0.58%.
(3) $CaAl_{18}(PO_4)_{12}(OH)_{20}\cdot 28H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of phosphatic iron deposits.

Association: Beraunite, rockbridgeite, dufrénite, cacoxenite, strengite, wavellite, goethite, hematite.

Distribution: In the USA, from the Bachman iron mine, Hellertown, Northampton Co., and at General Trimble's mine, Chester Co., Pennsylvania; in the LCA pegmatite, Bessemer City, Gaston Co., North Carolina; at the Candelaria mine, Candelaria district, Mineral Co., Nevada. From the Rotläufchen iron mine, Waldgirmes, near Wetzlar, Hesse, and at Hagendorf, Bavaria, Germany.

Name: Honors Margaret Mary Matula (1925–), Allentown, Pennsylvania, USA, who supplied some of the first specimens.

Type Material: The Natural History Museum, London, England, 1984,138; National Museum of Natural History, Washington, D.C., USA, 137020.

(1) Sudbury, Canada; remainder is H_2O 0.36%, gangue 0.32%. (2) Eisleben, Germany; remainder is gangue 1.66%. (3) Elk Lake, Canada; by electron microprobe. (4) $Ni_{11}As_8$.

Occurrence: In hydrothermal veins with other nickel arsenides and sulfides.

Association: Nickeline, nickel-skutterudite, chalcopyrite (Eisleben, Germany); millerite, uvarovite, pyroxene, calcite (Orford, Canada).

Distribution: In Germany, from Eisleben, Saxony-Anhalt [TL], at Mansfeld, Thuringia, and from Bieber, near Hanau, Hesse. From Schladming, Styria, Austria. In Romania, at Bădeanca, from Băiţa, and in the East Făgăraş Mountains. In Spain, from Los Jarales, Málaga Province; and at Vimbodi, Tarragona Province. At the Littleham Cove area, Budleigh Salterton, Devon, England. From Bou Azzer, Morocco. In the Talmessi mine, near Anarak, Iran. In Canada, at several mines in the Cobalt district, and at the Moose Horn mine, Elk Lake, Timiskaming district, Ontario; in Quebec, at the Orford nickel mine, Brompton Lake, and at the Jeffrey mine, Asbestos. In the USA, at the Gem mine, northwest of Silver Cliff, Fremont Co., Colorado; in the Mohawk mine, Keweenaw Co., Michigan; and in the Mackinaw mine, Monte Cristo, Snohomish Co., Washington. Now known from a few other minor localities.

Name: To honor Wilhelm Maucher (1879–1930), metallugical chemist and mineral dealer of Munich, Germany.

Mavlyanovite Mn_5Si_3

Crystal Data: Hexagonal. *Point Group*: 6/*m* 2/*m* 2/*m*. Crystals prismatic, to 2 mm; in spherical to ovoid segregations, to 10 cm.

Physical Properties: *Cleavage*: Near perfect {0001}. *Fracture*: Conchoical. *Tenacity*: Brittle. Hardness = ~ 7 VHN = 1029-1098 (100 g load). D(meas.) = n.d. D(calc.) = 6.06

Optical Properties: Opaque. *Color*: Pale brownish-gray in reflected light. *Streak*: Dark gray. *Luster*: Metallic. *Anisotropism*: moderate; grayish-brown.
Optical Class: Uniaxial.
R_1-R_2: (470) 44.5-42.4, (546) 46.9-44.7, (589) 48.3-46.1, (650) 50.1-48.0

Cell Data: *Space Group*: *P6$_3$/mcm*. a = 6.8971(7) c = 4.8075(4) Z=2

X-ray Powder Pattern: Calculated.
2.044 (100), 1.972 (67), 2.258 (44), 1.991 (30), 2.230 (29), 1.307 (22), 1.401 (16)

Chemistry:

	(1)	(2)
Mn	70.84	76.52
Fe	6.12	
Si	22.57	23.48
Ti	0.15	
P	0.18	
Total	99.86	100.00

(1) Koshmansay river, Chatkal ridge, Uzbekistan; average of 19 electron microprobe analyses, corresponding to $(Mn_{4.66}Fe_{0.40})_{\Sigma=5.06}(Si_{2.91}Ti_{0.01}P_{0.02})_{\Sigma=2.94}$. (2) Mn_5Si_3.

Occurrence: In volcanic glass in a diamond-bearing lamproite diatreme, presumably of high temperature and pressure origin.

Association: Suessite, native iron, moissanite, diamond, an unnamed manganese silicicarbide, an unnamed manganese siliciphosphide; alabandite, khamrabaevite (as inclusions).

Distribution: Upper reaches of the Koshmansay river, Chatkal ridge, Uzbekistan.

Name: Honors Gani Arifkhanovich Mavlyanov (1910–1988) for his contributions to the geology of Uzbekistan.

Type Material: Geological Museum of the State Committee on Geology and Mineral Resources, Tashkent, Uzbekistan; Natural History Museum, London, England (catalog no. BM 2008, 31).

Mawbyite $PbFe_2^{3+}(AsO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 0.2 mm, show $\{\bar{1}01\}$, {110}, {001}, "dogtooth" to prismatic ‖ [001]; typically in hemispherical, cylindrical, and spongy sheaflike aggregates, druses, and crusts. *Twinning:* "V"-shaped, about {100}, common.

Physical Properties: *Cleavage:* On {001}, good. *Fracture:* Conchoidal. Hardness = ∼4
D(meas.) = n.d. D(calc.) = 5.365

Optical Properties: Transparent to translucent. *Color:* Pale orange, orange-brown to reddish brown. *Streak:* Yellow-orange. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* Faint; brown to reddish brown. *Orientation:* $Y = b$; $X \simeq c$. $\alpha = 1.94(2)$ $\beta = 2.00(2)$ $\gamma = 2.04(2)$ 2V(meas.) = 80(5)°

Cell Data: *Space Group:* $C2/m$. $a = 9.066(4)$ $b = 6.286(3)$ $c = 7.564(3)$
$\beta = 114.857(5)°$ Z = 2

X-ray Powder Pattern: Broken Hill, Australia.
4.647 (100), 3.245 (100), 2.724 (70), 2.546 (50), 2.860 (40), 4.458 (30), 3.136 (30)

Chemistry:

Fe_2O_3	23.66	25.33	Total	[100.00]	100.00

(1) Broken Hill, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponds to $Pb_{1.11}(Fe_{1.94}Zn_{0.07})_{\Sigma=2.01}[(As_{0.99}P_{0.01})_{\Sigma=1.00}O_4]_2(OH)_{1.79}$.
(2) $PbFe_2(AsO_4)_2(OH)_2$.

Polymorphism & Series: Dimorphous with carminite.

Mineral Group: Tsumcorite group.

Occurrence: In an arsenic-rich reaction halo in fractures and cavities in a spessartine-quartz rock in the oxidization zone of a metamorphosed stratiform Pb–Zn orebody (Broken Hill, Australia); in the oxidization zone of Ag–Pb–Cu–Bi mineralization in fluorite–barite–quartz veins (Moldava, Czech Republic).

Association: Corkite–beudantite, adamite–olivenite, duftite, bayldonite, hidalgoite, pharmacosiderite, segnitite, Fe–Mn oxides (Broken Hill, Australia); mimetite, philipsbornite, thometzekite (Moldava, Czech Republic).

Distribution: In the Kintore open cut, Broken Hill, New South Wales, Australia. From Moldava, 20 km northwest of Teplice, Czech Republic. In Germany, from the Clara mine, near Oberwolfach, the Silberbrünnle mine, near Gengenbach, and in the St. Josef mine, Schuttertal, Black Forest; from Oberwiesenthal, Saxony.

Name: To honor Sir Maurice Alan Edgar Mawby (1904–1977), Chairman of CRA, Ltd., for his contribution to the Australian mining industry and preservation of Broken Hill minerals.

Type Material: South Australian Museum, Adelaide, G16062, G16066; Museum Victoria, Melbourne, Australia, M39065, M39068, M39173, M39178.

Mawsonite $Cu_6^{1+}Fe_2^{3+}Sn^{4+}S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Typically as rounded to irregular inclusions, to 1.3 mm, exsolved from bornite.

Physical Properties: *Cleavage:* Two imperfect at right angles suggested by fractures during hardness tests. Hardness = 3.5–4 VHN = n.d. D(meas.) = n.d. D(calc.) = 4.65 Magnetic.

Optical Properties: Opaque. *Color:* In polished section, brownish orange.
Pleochroism: Strong, orange to brown with slight orange tint. *Anisotropism:* Very strong, from bright straw-yellow to bright royal blue to dark blue.
R_1–R_2: (400) 15.0–19.0, (420) 16.0–20.0, (440) 17.1–21.0, (460) 18.6–22.0, (480) 20.3–23.1, (500) 22.5–24.2, (520) 25.0–25.3, (540) 28.1–26.4, (560) 31.2–27.4, (580) 33.8–28.5, (600) 36.4–29.6, (620) 38.5–30.8, (640) 39.9–32.0, (660) 40.9–33.1, (680) 41.4–33.8, (700) 41.6–34.4

Cell Data: *Space Group:* $P\bar{4}m2$. $a = 7.603(2)$ $c = 5.358(1)$ $Z = 1$

X-ray Powder Pattern: Mt. Lyell, Tasmania, Australia.
3.09 (100), 1.895 (80), 1.618 (60), 2.680 (50), 1.063 (50), 1.232 (30), 5.37 (20)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

(1) North Lyell mine, Australia; by electron microprobe, corresponds to $Cu_{5.42}Fe_{1.74}Sn_{0.68}S_{8.00}$.
(2) Tingha, Australia; by electron microscope, corresponds to $Cu_{6.00}Fe_{1.79}Sn_{0.84}S_{8.00}$.
(3) $Cu_6Fe_2SnS_8$.

Occurrence: In massive to disseminated hydrothermal copper ores within highly altered volcanic rocks; in skarns; disseminated in altered granites; rare in copper porphyry deposits.

Association: Bornite, pyrite, chalcopyrite, chalcocite, digenite, idaite, stannite, stannoidite, pyrrhotite, pentlandite, tetrahedrite–tennantite, enargite, luzonite–famatinite, kiddcreekite, mohite, bismuth, galena, sphalerite.

Distribution: In Australia, from the North Lyell [TL] and Crown Lyell mines, Mt. Lyell district, Queenstown, Tasmania; and in New South Wales, at the Royal George mine, near Tingha, New England district [TL]. In Bolivia, from Vila Apacheta. In Peru, at the Colquijirca mine, Junín. From the New Brunswick Tin Mines deposit, New Brunswick; the Maggie porphyry copper deposit, 15 km north of Ashcroft, British Columbia; and at the Kidd Creek mine, near Timmins, Ontario, Canada. From Bisbee, Cochise Co., Arizona, USA. At Neves-Corvo, Portugal. From Chizeuil, Saône-et-Loire, France. At Tsumeb, Namibia. In the Khayragatsch and Kochbulak gold deposits, Chatkal-Kuramin Mountains, eastern Uzbekistan. At the Akenobe, Tada, and Ikuno mines, Hyogo Prefecture; the Ashio mine, Tochigi Prefecture; the Fukoku mine, Kyoto Prefecture; and the Konjo mine, Okayama Prefecture, Japan. In the Ulsan mine, Kyongsang Province, South Korea. Now known from a number of other localities.

Name: Honoring Sir Douglas Mawson (1882–1958), noted English-Australian geologist and Antarctic explorer.

Type Material: The Australian Museum, Sydney, Australia, D48487; The Natural History Museum, London, England, 1965,347; Harvard University, Cambridge, Massachusetts, USA.

(1) Squaw Creek, New Mexico, USA; by electron microprobe, average of 43 analyses, total Fe as Fe_2O_3, total Mn as Mn_2O_3, Li by ion microprobe; corresponding to $(Na_{0.59}Ca_{0.33}Li_{0.02})_{\Sigma=0.94}(Fe_{0.40}Al_{0.22}Mg_{0.20}Ti_{0.14}Mn_{0.01}Sn_{0.01}Zr_{0.01})_{\Sigma=0.99}(As_{1.01}O_4)(F_{0.72}O_{0.28})_{\Sigma=1.00}$. (2) $NaFe(AsO_4)F$.

Polymorphism & Series: Forms two series, with durangite, and with tilasite.

Occurrence: Rarely formed in miarolitic cavities in rhyolite adjacent to high-temperature veins in hydrothermal tin deposits.

Association: Squawcreekite, cassiterite, hematite, quartz, tridymite, pseudobrookite, sanidine, chernovite-(Y), gasparite-(Ce), tilasite, heulandite, stilbite, calcite.

Distribution: From the Squaw Creek tin prospect, Catron Co., and in Willow Spring Draw, Sierra Co., Taylor Creek district, New Mexico, USA.

Name: Honors Charles Henry Maxwell (1923–), geologist with the U.S. Geological Survey, who studied the Taylor Creek district.

Type Material: National Museum of Natural History, Washington, D.C., USA, 166613.

Mayenite $Ca_{12}Al_{14}O_{33}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$ (synthetic). In rounded anhedral grains, to 60 μm.

Physical Properties: Hardness = n.d. D(meas.) = 2.85 D(calc.) = [2.67] Alters immediately to hydrated calcium aluminates on exposure to H_2O.

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Isotropic. n = 1.614–1.643

Cell Data: *Space Group:* $I\bar{4}3d$ (synthetic). a = 11.97–12.02 Z = 2

X-ray Powder Pattern: Near Mayen, Germany.
2.69 (vs), 4.91 (s), 2.45 (ms), 3.00 (m), 2.19 (m), 1.95 (m), 1.66 (m)

Chemistry:

	(1)	(2)	(3)
SiO_2		0.4	
Al_2O_3	45.2	49.5	51.47
Fe_2O_3	2.0	1.5	
MnO		1.4	
CaO	45.7	47.0	48.53
LOI	2.2		
Total	95.1	99.8	100.00

(1) Near Mayen, Germany; by semiquantitative spectroscopy. (2) Hatrurim Formation, Israel; by electron microprobe, corresponding to $(Ca_{11.7}Mg_{0.5})_{\Sigma=12.2}(Al_{13.5}Fe_{0.25}Si_{0.10})_{\Sigma=13.85}O_{33}$. (3) $Ca_{12}Al_{14}O_{33}$.

Occurrence: In thermally metamorphosed limestone blocks included in volcanic rocks (near Mayen, Germany); common in high-temperature, thermally metamorphosed, impure limestones (Hatrurim Formation, Israel).

Association: Calcite, ettringite, wollastonite, larnite, brownmillerite, gehlenite, diopside, pyrrhotite, grossular, spinel, afwillite, jennite, portlandite, jasmundite (near Mayen, Germany); melilite, wollastonite, kalsilite, brownmillerite, corundum (Klöch, Austria); spurrite, larnite, grossite, brownmillerite (Hatrurim Formation, Israel).

Distribution: From the Ettringer-Bellerberg volcano, near Mayen, Eifel district, Germany. Found at Klöch, Styria, Austria. In the Hatrurim Formation, Israel. From Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia.

Name: For Mayen, Germany, near where the mineral was first described.

Type Material: Mineral Museum, University of Cologne, Cologne, Germany, M5026/86; National Museum of Natural History, Washington, D.C., USA, 120045.

Mayingite IrBiTe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Massive, in aggregates, to 0.2 mm, and in thin veinlets.

Physical Properties: *Tenacity:* Brittle. Hardness = 4 VHN = 158–241, 178 average (50 g load). D(meas.) = n.d. D(calc.) = 12.77

Optical Properties: Opaque. *Color:* Steel-black; in reflected light, bright white with a yellowish tint. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Moderate; anomalous bluish to yellowish tints.
R: (400) 47.6, (420) 49.3, (440) 49.5, (460) 49.7, (480) 49.9, (500) 50.2, (520) 50.4, (540) 50.7, (560) 51.0, (580) 51.4, (600) 51.7, (620) 51.9, (640) 52.1, (660) 52.4, (680) 52.3, (700) 52.3

Cell Data: *Space Group: Pa*3. $a = 6.502(4)$ $Z = 4$

X-ray Powder Pattern: Near Maying, China.
1.955 (100), 1.735 (80), 1.250 (80), 2.89 (70), 1.207 (70), 1.148 (70), 1.054 (70)

Chemistry:

	(1)	(2)
Ir	34.6	36.35
Pt	1.9	
Cu	0.1	
Te	24.6	24.13
Bi	38.5	39.52
Total	99.7	100.00

(1) Near Maying, China; by electron microprobe, average of 11 analyses; corresponding to $(Ir_{0.95}Pt_{0.05})_{\Sigma=1.00}Cu_{0.01}Bi_{0.97}Te_{1.02}$. (2) IrBiTe.

Occurrence: In chromite ore and placer concentrates.

Association: Platinum, iridisite, laurite, chromite, magnetite, gold, irarsite, shuanfengite.

Distribution: From near Maying, about 230 km north-northeast of Beijing, ??Hebei Province, China [TL]. [need check all Yu Zuxiang species for localities - 8 new from Yanshan Range?? including this, when done]

Name: For the locality.

Type Material: Geological Museum of China, Beijing, China.

Pb	14.12	13.90
Ag	21.60	21.70
Hg	13.58	13.45
Sb	8.07	8.16
Te	42.68	42.79
Total	100.05	100.00

(1) Findley Gulch, Saguache County, Colorado, USA; average of 20 electron microprobe analyses, corresponds to $Ag_{2.99}Hg_{1.01}Pb_{1.02}Sb_{0.99}Te_{4.99}$. (2) $Ag_3HgPbSbTe_5$.

Occurrence: A rare mineral in a hydrothermal telluride deposit.

Association: Altaite, galena, quartz.

Distribution: From Findley Gulch, Bonanza mining district, Saguache County, Colorado, USA.

Name: Honors Giuseppe Mazzetti (1942-2003), curator in chief of the Mineralogy Section, Museum of Natural History, University of Florence, Italy.

Type Material: Natural History Museum, University of Florence, Italy (2951/I) and the Mineralogical Collection, Royal Institute of Natural Sciences, Brussels, Belgium (V/876).

References: (1) Luca, B. and C. Cipriani, (2004) Mazzettiite, $Ag_3HgPbSbTe_5$, a new mineral species from Findley Gulch, Saguache county, Colorado, USA. Can. Mineral., 42(6), 1739-1743. (2) (2005) Amer. Mineral., 90, 1229 (abs. ref. 1).

Mazzite $K_2CaMg_2(Si,Al)_{36}O_{72}\cdot 28H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals are hexagonal prisms terminated by pinacoids. As radiating bundles of thin needles, up to 4 mm.

Physical Properties: Hardness = 4 D(meas.) = n.d. D(calc.) = 2.11

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White.
Optical Class: Uniaxial (–). $\omega = 1.506$ $\epsilon = 1.499$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 18.392$ $c = 7.646$ Z = [1]

X-ray Powder Pattern: Mont Sémiol, France.
3.185 (100), 2.941 (100), 3.824 (95), 3.531 (90), 9.20 (60), 6.02 (53), 4.729 (50)

Chemistry:

	(1)
SiO_2	58.10
Al_2O_3	18.14
MgO	2.92
CaO	2.75
Na_2O	0.03
K_2O	3.27
H_2O	18.42
Total	103.63

(1) Mont Sémiol, France; by electron microprobe, average of three analyses, H_2O by TGA; the high sum is thought due to loss of H_2O in the vacuum chamber during analysis; corresponds to $(K_{1.91}Na_{0.03})_{\Sigma=1.94}Ca_{1.35}Mg_{1.99}(Si_{26.53}Al_{9.77})_{\Sigma=36.30}O_{72}\cdot 28.06H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in a porphyritic olivine basalt.

Association: Phillipsite, offretite, chabazite, calcite, siderite.

Distribution: On Mont Sémiol (Mont Semiouse), near Montbrison, Loire, France.

Name: To honor Professor Fiorenzo Mazzi, mineralogist, University of Pavia, Pavia, Italy.

Type Material: University of Modena, Modena, Italy; National Museum of Natural History, Washington, D.C., USA, 128520.

References: (1) Galli, E., E. Passaglia, D. Pongiluppi, and R. Rinaldi (1974) Mazzite, a new mineral, the natural counterpart of the synthetic zeolite . Contr. Mineral. Petrol., 45, 99–105. Mbobomkulite $(Ni, Cu)Al_4[(NO_3)_2, SO_4]_2(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Pseudohexagonal crystals, to 10 μm, stacked along [001] and as rosettes, forming very fine-grained powdery nodules.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = "Very soft". D(meas.) = 2.30 D(calc.) = 2.344

Optical Properties: Semitransparent. *Color:* Pale blue; colorless in transmitted light. *Optical Class:* Biaxial. *Orientation:* $X' \wedge c \simeq 10°$. $\alpha = 1.515$ β = n.d. $\gamma = 1.585$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1$ (by analogy to chalcoalumite). $a = 10.171$ $b = 8.865$ $c = 17.145$ $\beta = 95.37°$ Z = 4

X-ray Powder Pattern: Mbobo Mkulu Cave, South Africa.
8.550 (100), 4.271 (40), 7.87 (15), 4.549 (15), 3.179 (15), 3.054 (15), 2.512 (15)

Chemistry:

	(1)
SO_3	3.81
N_2O_5	15.23
SiO_2	1.91
Al_2O_3	39.42
NiO	7.98
CuO	4.28
C	0.26
F	0.07
H_2O	27.90
$-O = F_2$	0.03
Total	100.83

(1) Mbobo Mkulu Cave, South Africa; C, N, H by gas chromatography; about 5% additional H_2O is absorbed after removal from a dessicator; after deduction of SiO_2, Al_2O_3, H_2O as allophane, corresponds to $(Ni_{0.57}Cu_{0.29})_{\Sigma=0.86}Al_{3.93}[(NO_3)_{1.50}(SO_4)_{0.25}]_{\Sigma=1.75}[(OH)_{11.45}F_{0.02}]_{\Sigma=11.47}\cdot 1.59H_2O$.

Occurrence: A rare product of oxidation and leaching of Ni–Cu from sulfides in the cave roof, reacting with aluminum from phyllosilicates and nitrate from bat guano (Mbobo Mkulu Cave, South Africa); in a sedimentary U–V deposit (Jomac mine, Utah, USA).

Association: Allophane, chalcoalumite, hydrombobomkulite (Mbobo Mkulu Cave, South Africa); oswaldpeetersite, cuprite, antlerite, goethite, lepidocrocite, hydrombobomkulite, sklodowskite, gypsum (Jomac mine, Utah, USA).

Distribution: In the Mbobo Mkulu Cave, near Ngodwana, Eastern Transvaal, South Africa. From the Jomac mine, White Canyon district, San Juan Co., Utah, USA.

Name: For the Mbobo Mkulu Cave, South Africa, the mineral's first-noted occurrence.

Type Material: Museum of the Geological Survey, Pretoria, South Africa.

References: (1) Martini, J.E.J. (1980) Mbobomkulite, hydrombobomkulite and nickelalumite, new minerals from Mbobo Mkulu Cave, eastern Transvaal. Ann. Geol. Surv. South Africa, 14(2), 1–10. (2) (1982) Amer. Mineral., 67, 415–416 (abs. ref. 1).

Mcallisterite $Mg_2B_{12}O_{14}(OH)_{12}\cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Rhombohedral crystals, to 12 mm, showing {0001}, {01$\overline{1}$2}, {10$\overline{1}$4}, imbedded in other borates and as efflorescences.

Physical Properties: *Cleavage:* Good on {0001} and {01$\overline{1}$2}. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 1.867(5) D(calc.) = 1.866 Slowly soluble in H_2O; fluoresces pale yellow under UV.

Optical Properties: Transparent. *Color:* Snow-white, white, colorless, amber with impurities; colorless in thin section.
Optical Class: Uniaxial (–). $\omega = 1.505$–1.507 $\epsilon = 1.464$–1.465

Cell Data: *Space Group:* $R\overline{3}c$. $a = 11.546(1)$ $c = 35.562(5)$ $Z = 6$

X-ray Powder Pattern: Furnace Creek district, California, USA; exhibits preferred orientation.
8.715 (100), 5.772 (50), 4.063 (50), 3.351 (50), 3.261 (50), 2.805 (50), 6.645 (35)

Chemistry:

H_2O^-		0.76	
H_2O	36.51		35.16
Total	[100.00]	99.95	100.00

(1) Furnace Creek district, California, USA; recalculated to 100% after deduction of ginorite 15.85%, insoluble [clay] 7.32%, R_2O_3 1.32%, gypsum 0.51%, total impurities estimated 25%.
(2) Tincalayu deposit, Argentina; corresponds to $(Mg_{2.01}Fe^{2+}_{0.03})_{\Sigma=2.04}B_{12}O_{14}(OH)_{12}\cdot 9.10H_2O$.
(3) $Mg_2B_{12}O_{14}(OH)_{12}\cdot 9H_2O$.

Occurrence: A secondary mineral derived from colemanite and priceite veins in altered basalt (Furnace Creek district, California, USA); a primary mineral in a metamorphosed borate playa deposit (Tincalayu deposit, Argentina); at a saline lake (China).

Association: Sassolite, ginorite, gypsum (Furnace Creek district, California, USA); starkeyite, gypsum (Sterling Hill, New Jersey, USA); rivadavite (Tincalayu deposit, Argentina); hexahydrite, hydroboracite, hungchaoite (China).

Distribution: In the USA, from the Mott colemanite prospect, Twenty Mule Team Canyon, and at the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California; from Sterling Hill, Sussex Co., New Jersey. Found about 15 km northwest of Tubutama, Sonora, Mexico. From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. On the Qinghai-Xizang Plateau, Tibet, China, not further located. From the Inder borate deposit, Kazakhstan.

Name: To honor James Franklin McAllister (1911–2000), geologist, U.S. Geological Survey, Menlo Park, California, USA, who collected the originally described material.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 109053; National Museum of Natural History, Washington, D.C., USA, 134613, 162598.

(1) McAlpine mine, California, USA; by electron microprobe, average of four analyses, H_2O by difference, presence confirmed by IR; corresponds to $(Cu_{2.79}Pb_{0.09}Ni_{0.01})_{\Sigma=2.89}(Te_{0.97}Si_{0.05})_{\Sigma=1.02}O_{5.90} \cdot 1.10H_2O$. (2) Centennial Eureka mine, Utah, USA; by electron microprobe, average of two analyses, H_2O by CHN analyzer; corresponds to $(Cu_{2.56}Zn_{0.15})_{\Sigma=2.71}(Te_{0.88}Si_{0.02}As_{0.02})_{\Sigma=0.92}O_{5.47} \cdot 1.53H_2O$. (3) $Cu_3TeO_6 \cdot H_2O$.

Occurrence: A very rare secondary mineral, formed by alteration of tellurides and tellurium-bearing sulfides.

Association: Quartz, chromian muscovite, choloalite, keystoneite, mimetite, malachite, azurite, annabergite, pyrite, acanthite, hessite, "electrum", altaite, silver, galena, pyrargyrite, sphalerite, owyheeite (McAlpine mine, California, USA); xocomecatlite, jensenite, additional uncharacterized tellurate-tellurites, hinsdalite–svanbergite, goethite (Centennial Eureka mine, Utah, USA).

Distribution: In the USA, from the McAlpine mine, Tuolumne Co., California, and at the Centennial Eureka mine, Tintic district, Juab Co., Utah.

Name: For the locality at which the mineral was originally found, the McAlpine mine, California, USA.

Type Material: The Natural History Museum, London, England, 1992,374; Canadian Geological Survey, Ottawa, Canada, 67163.

$-O = F_2$	0.9	0.85
Total	[100.0]	100.00

(1) East Kemptville mine, Nova Scotia, Canada; by electron microprobe, total Fe as FeO, confirmed by microchemical test, original anhydrous total 84.8%, normalized to 100.0% with 34% H_2O by two separate TGA-EGA determinations; then corresponding to $H_{1.02}(Fe_{2.40}Mn_{0.67})_{\Sigma=3.07}Al_{2.08}(PO_4)_{4.10}F_{1.10} \cdot 17.49H_2O$. (2) $HFe_3Al_2(PO_4)_4F \cdot 18H_2O$.

Occurrence: A very rare non-oxidized secondary mineral along joints beneath the erosional surface of a greisen-hosted stockwork tin mine.

Association: Vivianite, phosphophyllite, childrenite–eosphorite.

Distribution: From the East Kemptville tin mine, Yarmouth Co., Nova Scotia, Canada.

Name: Honors Dr. David A. McAuslan (1943–), Exploration Manager for Shell Canada Resources Ltd., developers of the East Kemptville tin mine, Canada.

Type Material: Department of Earth Sciences, Carleton University, Canada, 4427; Canadian Museum of Nature, Ottawa, Canada, 64806; National Museum of Natural History, Washington, D.C., USA, 165484.

Mcbirneyite $Cu_3(VO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As anhedral crystals, to 200 μm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.50

Optical Properties: Opaque. *Color:* Black; medium gray in reflected light.
Optical Class: [Biaxial.] *Luster:* Metallic.
R: (470) 18.5, (546) 17.5, (589) 18.7, (650) 20.6

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.3418(9)$ $b = 6.5100(8)$ $c = 5.1798(7)$ $\alpha = 88.61(1)°$ $\beta = 68.11(1)°$ $\gamma = 69.22(1)°$ Z = 1

X-ray Powder Pattern: Izalco Volcano, El Salvador.
3.12 (100), 2.82 (100), 4.01 (80), 2.641 (80), 2.428 (80), 4.25 (60), 2.572 (60)

Chemistry:

	(1)	(2)
V_2O_5	41.44	43.25
CuO	56.82	56.75
Total	98.26	100.00

(1) Izalco Volcano, El Salvador; by electron microprobe, average of six analyses of three crystals; corresponds to $Cu_{3.08}(VO_4)_{1.97}$. (2) $Cu_3(VO_4)_2$.

Occurrence: Very rare in the sulfate zone of sublimates around a fumarole in a composite volcano, likely formed between 100 °C–200 °C.

Association: Fingerite, thenardite, euchlorine.

Distribution: From fumarole "Y", Izalco Volcano, El Salvador.

Name: Honors Professor Alexander Robert McBirney (1924–), Volcanologist, University of Oregon, Corvallis, Oregon, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163183.

References: (1) Hughes, J.M., B.S. Christian, L.W. Finger, and L.L. Malinconico (1987) Mcbirneyite, $Cu_3(VO_4)_2$, a new sublimate mineral from the fumaroles of Izalco Volcano, El Salvador. J. Volcanology and Geothermal Research, 33, 183–190. (2) (1988) Amer. Mineral., 73, 1495 (abs. ref. 1).

Mcconnellite $Cu^{1+}Cr^{3+}O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As parallel intergrowths with grimaldiite in tabular rhombohedral crystals, to 1 mm; as granular aggregates of intergrown crystals.

Physical Properties: *Cleavage:* {0001}. Hardness = n.d. D(meas.) = 5.49 (synthetic). D(calc.) = 5.61

Optical Properties: Translucent in intergrowths with grimaldiite. *Color:* Deep red. *Optical Class:* Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R3m$. $a = 2.983(4)$ $c = 17.160(31)$ Z = 1

X-ray Powder Pattern: Merume River, Guyana; from a mixture with grimaldiite. 2.85 (ms), 2.462 (ms), 2.21 (vw), 1.420 (vw), 1.64 (vvw)

Chemistry:

	(1)	(2)
SiO_2	0.42	
Al_2O_3	4.3	
Fe_2O_3	0.85	
Cr_2O_3	77.3	51.51
CuO	5.5	
Cu_2O		48.49
LOI	11.5	
Total	99.9	100.00

(1) Merume River, Guyana; integrowth of 80%–86% grimaldiite, the balance mcconnellite and H_2O. (2) $CuCrO_2$.

Occurrence: In fine-grained intergrowth with other chromium oxide-hydroxide minerals in alluvial cobbles.

Association: Bracewellite, eskolaite, grimaldiite, guyanaite.

Distribution: In the basin of the Merume River, Guyana.

Name: For Dr. Richard Bradford McConnell, formerly Director, British Guyana Geological Survey.

Type Material: n.d.

Mccrillisite $NaCs(Be,Li)Zr_2(PO_4)_4 \cdot 1-2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As dipyramidal crystals, to 1.2 mm, dominated by {111}, minor {001}; crystal surfaces typically "crackled".

Physical Properties: *Fracture:* Conchoidal. Hardness = 4–4.5 D(meas.) = 3.125(5) D(calc.) = 3.30

Optical Properties: Translucent to transparent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+); some grains anomalously biaxial. $\omega = 1.634(2)$ $\epsilon = 1.645(2)$ 2V(meas.) = 5°

Cell Data: *Space Group:* $I4_1/amd$. $a = 6.573(2)$ $c = 17.28(2)$ Z = 2

X-ray Powder Pattern: Mt. Mica, Maine, USA; close to gainesite.
3.060 (100), 6.159 (90), 4.326 (80), 3.281 (80), 4.099 (40), 2.896 (30), 1.849 (30)

Chemistry:

	(1)		(1)
P_2O_5	38.3	CaO	< 0.1
SiO_2	0.1	SrO	0.2
Zr_2O	31.6	Li_2O	0.6
HfO_2	2.5	Na_2O	4.2
Al_2O_3	< 0.1	K_2O	0.3
FeO	< 0.1	Rb_2O	< 0.1
MnO	< 0.1	Cs_2O	15.3
ZnO	0.5	F	0.5
BeO	2.9	H_2O	3.0
MgO	0.1	$-O = F_2$	0.2
		Total	99.9

(1) Mt. Mica, Maine, USA; by electron and ion microprobe, average of five analyses; corresponding to $Na_{1.00}(Cs_{0.80}Li_{0.18}K_{0.05})_{\Sigma=1.03}(Be_{0.86}Li_{0.12}Mg_{0.02})_{\Sigma=1.00}(Zr_{1.90}Hf_{0.09}Zn_{0.05})_{\Sigma=2.04}P_{1.00}(O_{3.95}F_{0.05})_{\Sigma=4.00} \cdot 1.23H_2O$.

Occurrence: A rare product of late-stage hydrothermal alteration of primary zirconium-bearing minerals, in a complex granite pegmatite.

Association: Zircon, kosnarite, roscherite, moraesite, eosphorite, löllingite, uraninite, albite, quartz, manganoan almandine, muscovite, siderite, fluorapatite, elbaite, lepidolite, beryl, montebrasite, rhodochrosite, cassiterite, manganocolumbite.

Distribution: From Mt. Mica, near Paris, Oxford Co., Maine, USA.

Name: Honors the McCrillis family, principally Dean (1931–1989) and his son, Phillip, pegmatite miners from Oxford Co., Maine, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 170853.

References: (1) Foord, E.E., M.E. Brownfield, F.E. Lichte, A.M. Davis, and S.J. Sutley (1994) Mccrillisite, $NaCs(Be,Li)Zr_2(PO_4)_4 \cdot 1-2H_2O$, a new mineral species from Mount Mica, Oxford County, Maine, and new data for gainesite. Can. Mineral., 32, 839–842. Mcgillite $(Mn^{2+},Fe^{2+})_8Si_6O_{15}Cl_2(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Massive.
Twinning: Universal, repeated about monoclinic [110] and $[\bar{1}10]$, composition plane {001}, giving pseudorhombohedral symmetry.

Physical Properties: *Cleavage:* Good on {0001}; fair on $\{10\bar{1}1\}$. Hardness = [4]
VHN = 278–330 (15 g load). D(meas.) = 2.98(4) D(calc.) = 3.071

Optical Properties: Transparent to translucent. *Color:* Light to dark pink. *Luster:* Pearly on cleavage surfaces.
Optical Class: Biaxial (–); nearly uniaxial. ϵ = 1.640–1.643 ω = 1.667–1.670
2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. a = 23.312(16) b = 13.459(9) c = 7.423(7)
$\beta = 105.17(2)^\circ$ Z = [4]

X-ray Powder Pattern: Sullivan mine, Canada; nearly identical with friedelite.
2.560 (100), 7.16 (70), 2.888 (60), 3.570 (40), 2.112 (40), 1.683 (40), 11.67 (20)

Chemistry:

	(1)
SiO_2	34.54
As_2O_3	< 0.1
FeO	4.85
MnO	47.76
ZnO	< 0.1
MgO	1.62
CaO	< 0.05
Cl	6.36
H_2O	[7.16]
$-O = Cl_2$	1.44
Total	[100.85]

(1) Sullivan mine, Canada; by electron microprobe, Fe^{2+}:Fe3+ by charge balance; H_2O calculated from stoichiometry; corresponding to $(Mn^{2+}_{6.95}Fe^{2+}_{0.63}Mg_{0.42})_{\Sigma=8.00}(Si_{5.93}Fe^{3+}_{0.07})_{\Sigma=6.00}[O_{14.94}(OH)_{8.21}Cl_{1.85}]_{\Sigma=25.00}$.

Occurrence: As open-space fracture fillings in a manganese-rich section of quartzite and argillite in a metamorphosed Pb–Zn orebody (Sullivan mine, Canada).

Association: Sphalerite, boulangerite, galena, jamesonite, quartz (Sullivan mine, Canada).

Distribution: In the Sullivan mine, Kimberley, Kootenay district, British Columbia, Canada. From the Kyurazawa mine, Tochigi Prefecture, Japan.

Name: For McGill University, Montreal, Quebec, Canada.

Type Material: McGill University, Montreal, RMNS3100; Royal Ontario Museum, Toronto, Canada.

Mcgovernite

$(Mn^{2+}, Mg, Zn, Fe^{3+})_{45}$
$(As^{3+}O_3)_2(As^{5+}O_4)_5(SiO_4)_7(OH)_{42}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$ or $\bar{3}\,2/m$. Coarse cleavable, granular, massive.

Physical Properties: *Cleavage:* Perfect micaceous on {0001}. *Tenacity:* Brittle.
Hardness = 3 D(meas.) = 3.719 D(calc.) = [3.71]

Optical Properties: Semitransparent. *Color:* Deep red-brown, somewhat bronzy; deep red-brown in thin section. *Luster:* Pearly.
Optical Class: Uniaxial (+). $n = 1.761(2)$ $\omega = 1.754$ $\epsilon =$ n.d.

Cell Data: *Space Group:* $R3c$ or $R\bar{3}2/c$. a = 8.22(2) c = 203.15(10) Z = [6]

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
2.257 (100), 2.418 (80), 5.630 (70), 2.604 (50), 4.228 (40), 11.205 (30), 2.819 (30)

Chemistry:

	(1)	(2)
SiO_2	8.92	9.2
Al_2O_3		0.0
Fe_2O_3		1.7
As_2O_3	4.45	4.6
As_2O_5	12.48	12.5
FeO	1.53	
MnO	42.72	42.2
ZnO	10.22	9.3
MgO	11.27	11.5
CaO		0.0
H_2O	8.49	[8.5]
Total	100.08	[99.5]

(1) Sterling Hill, New Jersey, USA. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, H_2O from (1); corresponding to $(Mn_{26.6}Mg_{12.8}Zn_{5.1}Fe^{3+}_{0.9})_{\Sigma=45.4}(As^{3+}O_3)_{2.1}(As^{5+}O_4)_{4.9}Si_{6.9}O_{28}(OH)_{42.2}$.

Occurrence: As the principal filling of a vein in massive zinc ore in a metamorphosed stratiform Zn-Mn deposit.

Association: Franklinite, willemite, zincite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For J.J. McGovern (?–1915), of Franklin, New Jersey, USA, prominent collector of Franklin minerals.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 113888.

Mcguinnessite $(Mg,Cu)_2(CO_3)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, may be triclinic. *Point Group:* $2/m$. Crystals are fibrous, to 2 μm, aggregated into radially fibrous spherules, hemispherical or flattened.

Physical Properties: *Fracture:* Even. *Tenacity:* Brittle. Hardness = 2.5
D(meas.) = 3.02–3.22 D(calc.) = 3.076–3.234

Optical Properties: Translucent. *Color:* Pale blue-green, blue-green, white, typically color-banded. *Luster:* Vitreous to silky.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = very pale green; $Y = Z$ = pale bluish green. *Orientation:* Negative elongation; $X \wedge c = 11°$. *Absorption:* $X < Y = Z$. α = 1.596–1.607 β = 1.724–1.740 γ = 1.724–1.740 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2/a$ or $P2_1/a$. $a = 9.398(2)$ $b = 12.011(2)$ $c = 3.379(2)$ $\beta = 93.28(5)°$ Z = [4]

X-ray Powder Pattern: Red Mountain, California, USA.
6.015 (100), 3.694 (67), 2.530 (25), 2.139 (23), 5.054 (16), 2.326 (15), 3.002 (12)

Chemistry:

	(1)	(2)
CO_2	24.73	24.20
CuO	39.6	43.73
MgO	23.7	22.16
CaO	0.07	
H_2O	10.13	9.91
Total	98.23	100.00

(1) Red Mountain, California, USA; by electron microprobe, CO_2 and H_2O by TGA.
(2) $(Mg,Cu)_2(CO_3)(OH)_2$ with Mg:Cu = 1:1.

Mineral Group: Rosasite group.

Occurrence: A rare secondary mineral, typically formed in serpentinized peridotite.

Association: Vuagnatite, malachite, azurite, chrysocolla, iron oxides (Red Mountain, California, USA); coalingite, pokrovskite (Cedar Hill quarry, Pennsylvania, USA); glaukosphaerite, gaspéite, jamborite (Shinshiro, Japan).

Distribution: In the USA, from Red Mountain, 24 km southeast of Ukiah, Mendocino Co., California; occurs in the Rockville quarry, six km west of Rockville, Montgomery Co., Maryland; in the Cedar Hill quarry, Lancaster Co., Pennsylvania; at the Gabbs mine, Gabbs district, Nye Co., and from the Chalk Mountain mine and other claims in the Chalk Mountain district, Churchill Co., Nevada. In the Arroyo Puerto Nuevo, near San José de Castro, Baja California, Mexico. From the Kraubath serpentine massif, Styria, Austria. In the Arhbar (Aghbar) mine, Bou Azzer district, Morocco. Found at Shinshiro, Aichi Prefecture, Japan. In the Champion mine, Nelson, New Zealand.

Name: Honors Albert Leo McGuinness (1926–1990), amateur mineral collector and dealer, San Mateo, California, USA, for his contributions to scientific mineralogy.

Type Material: University of Pierre and Marie Curie, Paris, France; National Museum of Natural History, Washington, D.C., USA, 147169.

Mckelveyite-(Y) $Na(Ca,U)Ba_3Y(CO_3)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudorhombohedral. *Point Group:* 1. Crystals are tabular to pyramidal, with pseudorhombohedral $\{10\bar{1}2\}$, $\{10\bar{1}1\}$, $\{000\bar{1}\}$, small $\{0001\}$, may be rough, to 5 cm. *Twinning:* By three-fold rotation about pseudorhombohedral [0001] in 120° increments.

Physical Properties: Hardness = 3.5–4 D(meas.) = 3.25(5) D(calc.) = 3.37 Radioactive.

Optical Properties: Transparent to opaque. *Color:* Lime-yellow, greenish gray, reddish brown, black from contained organic material; transparent in thin section. *Luster:* Vitreous to dull. *Optical Class:* Uniaxial (–). *Pleochroism:* In greens. *Absorption:* $O > E$. $\omega = 1.644–1.66$ $\epsilon = 1.550–1.57$

Cell Data: *Space Group:* $P1$. $a = 9.170(3)$ $b = 9.169(3)$ $c = 7.075(2)$ $\alpha = 102.50(3)°$ $\beta = 115.63(3)°$ $\gamma = 59.99(3)°$ Z = 1

X-ray Powder Pattern: Sweetwater Co., Wyoming, USA.
2.942 (100), 4.47 (85), 2.648 (40), 6.40 (35), 3.32 (30), 2.040 (30), 4.15 (20)

Chemistry:

CO_2	25.7	RE_2O_3	5.7	Na_2O	3.9
UO_2	4.6	CaO	4.0	K_2O	0.1
ThO_2	0.1	SrO	1.7	H_2O	6.1
Y_2O_3	7.7	BaO	40.6	Total	[100.2]

(1) Diamond Alkali No. 3 drillhole, Wyoming, USA; by a combination of gravimetric and spectrophotometric analyses, $RE_2O_3 = La_2O_3$ 0.09%, Ce_2O_3 0.16%, Pr_2O_3 0.05%, Nd_2O_3 0.26%, Sm_2O_3 0.34%, Eu_2O_3 0.19%, Gd_2O_3 1.18%, Tb_2O_3 0.38%, Dy_2O_3 1.00%, Ho_2O_3 0.28%, Er_2O_3 0.95%, Tm_2O_3 0.12%, Yb_2O_3 0.61%, Lu_2O_3 0.08%; recalculated to 100% mckelveyite after deduction of organic 3%, acmite 2.45%, "biotite" 9.40%, quartz 3.02%; then corresponds to $(Na_{1.26}K_{0.02})_{\Sigma=1.28}(Ca_{0.71}U_{0.17})_{\Sigma=0.88}(Ba_{2.64}Sr_{0.16})_{\Sigma=2.80}(Y_{0.68}RE_{0.31})_{\Sigma=0.99}(CO_3)_{5.98} \cdot 3.22H_2O$.

Occurrence: A rare mineral formed near trona beds in the Green River Formation (Wyoming, USA); in a differentiated alkalic massif (Khibiny massif, Kola Peninsula, Russia).

Association: Ewaldite, acmite, "biotite", quartz, labuntsovite, searlesite, leucosphenite (Wyoming, USA); ewaldite, belovite-(Ce), fluorite, nenadkevichite, ancylite-(Ce), synchysite-(Ce), kukharenkoite-(Y), burbankite, calcite, barite, orthoclase (Khibiny massif, Russia); dolomite, calkinsite-(Ce), carbocernaite, khanneshite, barite (Khanneshin complex, Afghanistan).

Distribution: In the USA, in the Westvaco trona mine, the John Hay, Jr. Well No. 1, the Diamond Alkali Daco No. 3 and Reid No. 2 drillholes, the Perkins Green River No. 3 drillhole, and the Texas Gulf Sulfur mine, all near Green River, Sweetwater Co., Wyoming. At Mont Saint-Hilaire, Quebec, Canada. In Russia, large crystals in the Khibiny and Sallanlatvi massifs, and the Vuoriyarvi carbonatite complex, Kola Peninsula. From the Khanneshin carbonatite complex, Afghanistan.

Name: To honor Vincent Ellis McKelvey (1916–1985), Director of the U.S. Geological Survey, Washington, D.C., USA, for his studies of the Phosphoria Formation of Wyoming and Idaho, USA.

Type Material: The Natural History Museum, London, England, 1971,138; National Museum of Natural History, Washington, D.C., USA, 121683, 162607.

Mckinstryite $(Ag, Cu)_2S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As granular aggregates of interlocked crystals, to 3 mm.

Physical Properties: *Cleavage:* One, poorly developed. *Fracture:* Subconchoidal. Hardness = n.d. VHN = 43–45 (25 g load). D(meas.) = 6.61 D(calc.) = 6.57

Optical Properties: Opaque. *Color:* Steel-gray on fresh surface, becoming dark gray to black on long exposure; in polished section, pale grayish white. *Streak:* Dark steel-gray. *Anisotropism:* Strong, in gray, pale grayish blue, and pale tan.
R_1–R_2: (400) 34.0–40.1, (420) 34.0–39.5, (440) 33.9–39.8, (460) 33.7–37.8, (480) 32.9–36.6, (500) 31.9–35.3, (520) 31.0–34.2, (540) 30.2–33.3, (560) 29.6–32.4, (580) 29.1–31.7, (600) 28.7–31.1, (620) 28.5–30.5, (640) 28.2–30.1, (660) 27.9–29.4, (680) 27.6–28.8, (700) 27.4–28.4

Cell Data: *Space Group:* $Pnam$ or $Pna2_1$. $a = 14.043$ $b = 15.677$ $c = 7.803$ Z = 32

X-ray Powder Pattern: Foster mine, Cobalt, Canada.
2.606 (100), 2.070 (70), 3.51 (60), 3.06 (60), 2.862 (60), 1.948 (50), 2.567 (40)

Chemistry:

	(1)	(2)
Ag	60.0	60.7
Cu	24.9	24.8
S	15.1	14.8
Total	100.0	100.3

(1) Foster mine, Canada; by electron microprobe, corresponding to $(Ag_{1.18}Cu_{0.83})_{\Sigma=2.01}S_{1.00}$.
(2) Godejord, Norway; by electron microprobe, corresponding to $(Ag_{1.22}Cu_{0.84})_{\Sigma=2.06}S_{1.00}$.

Occurrence: Of hydrothermal or supergene origin; probably formed below 94.4 °C, the upper stability limit for mckinstryite.

Association: Silver, arsenopyrite, stromeyerite, actinolite, calcite (Foster mine, Canada); bornite, chalcocite, chalcopyrite, djurleite, digenite, tennantite, stromeyerite, wittichenite, bismuth, rammelsbergite, balkanite, mercurian silver, cinnabar, pyrite, calcite, barite, aragonite (Sedmochislenitsi mine, Bulgaria).

Distribution: In Canada, from the Foster mine, Coleman Township, about two km southeast of Cobalt, Ontario [TL], and from the Echo Bay mine, Great Bear Lake, Northwest Territories. In the USA, at the Colorado Central mine, Georgetown district, Clear Creek Co., and the Bulldog Mountain mine, Creede district, Mineral Co., Colorado; at Mogollon, Catron Co., New Mexico; and in the Homestake deposit, near Cooke City, Park Co., Montana. From Jalpa, Zacatecas, Mexico. At Godejord, Grong area, and in the Bleikvassli Zn–Pb–Cu deposit, Nordland, Norway. From the Vrancice deposit, near Příbram, Czech Republic. At the Sedmochislenitsi mine, Vratsa district, western part of the Stara Planina (Balkan Mountains), Bulgaria. From the Um Samiuki Zn–Cu–Pb–Ag volcanogenic deposits, Eastern Desert, Egypt. In the Tort Kudak Au–Ag deposit and the Sarbayskoye iron ore deposit, Kazakhstan. From Broken Hill, New South Wales, Australia. In the Sado mine, Niigata Prefecture; the Shakanai mine, Akita Prefecture; and the Koryu mine, Hokkaido, Japan.

Name: In honor of Hugh Exton McKinstry (1896–1961), Professor of Geology at Harvard University, Cambridge, Massachusetts, USA.

Type Material: Canadian Geological Survey, Ottawa, Canada, 12136; Harvard University, Cambridge, Massachusetts, 108804; National Museum of Natural History, Washington, D.C., USA, 120056.

Mcnearite $NaCa_5(AsO_4)(AsO_3OH)_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As bundles of fibers, to 2 mm, in radial aggregates. *Twinning:* Lamellar ‖ elongation.

Physical Properties: *Cleavage:* Perfect ‖ elongation. *Tenacity:* Very brittle. Hardness = n.d. D(meas.) = 2.60 (low due to porosity of fibrous aggregates). D(calc.) = 2.85 Fluoresces violet under LW UV.

Optical Properties: Translucent to transparent. *Color:* White; colorless in transmitted light. *Luster:* Pearly.
Optical Class: Biaxial (+). *Orientation:* $Y \wedge c = 6°–22°$; positive elongation. *Dispersion:* Moderately strong. $\alpha = 1.559$ $\beta = 1.562$ $\gamma = [1.572]$ 2V(meas.) = 60°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 13.50$ $b = 14.10$ $c = 6.95$ $\alpha = 90°$ $\beta = 92°$ $\gamma = 119°$ Z = 2

X-ray Powder Pattern: Sainte-Marie-aux-Mines, France.
12.33 (100), 3.92 (60), 3.122 (60), 6.94 (50), 2.748 (40), 4.40 (30), 3.400 (25)

Chemistry:

	(1)	(2)
As_2O_5	59.19	57.80
CaO	25.71	28.21
Na_2O	3.40	3.12
H_2O	11.32	10.87
Total	[99.62]	100.00

(1) Sainte-Marie-aux-Mines, France; by AA, original total given as 100.62%, H_2O by TGA, average of two analyses; corresponding to $H_{3.91}Na_{1.09}Ca_{4.99}(AsO_4)_{5.00} \cdot 4.32H_2O$.
(2) $NaCa_5(AsO_4)(HAsO_3OH)_4 \cdot 4H_2O$.

Occurrence: A secondary mineral in the oxidized zone of an arsenic-bearing deposit.

Association: Picropharmacolite, pharmacolite, guérinite, haidingerite.

Distribution: From Sainte-Marie-aux-Mines, Haut-Rhin, France.

Name: Honors Elizabeth McNear, mineralogist and crystallographer, University of Geneva, Geneva, Switzerland.

Type Material: Natural History Museum, Geneva, Switzerland, 435/40.

Medaite $(Mn^{2+}, Ca)_6(V^{5+}, As^{5+})Si_5O_{18}(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As elongated grains, to 1.5 mm, and as granular aggregates, to 1 cm; as oriented lamellae in tiragalloite. *Twinning:* Microscopic symmetrical twinning, the twin plane coincident with {100}.

Physical Properties: *Cleavage:* Good on {100}; a distinct parting ⊥ elongation. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.70(5) D(calc.) = 3.727

Optical Properties: Translucent in thin fragments; transparent in thin section. *Color:* Brownish red; dark orange to brownish in thin section. *Luster:* Subadamantine. *Optical Class:* Biaxial (+). *Pleochroism:* Faint, from dark to lighter orange. *Orientation:* $X = a$; $Y = b$; $Z = c$; $X \wedge \perp$ to cleavage = 3°. *Absorption:* Strong. $\alpha = 1.77(2)$ $\beta = 1.78(1)$ $\gamma = 1.80(2)$ 2V(meas.) = 71°

Cell Data: *Space Group:* $P2_1/n$. $a = 6.712(1)$ $b = 28.948(8)$ $c = 7.578(2)$ $\beta = 95.4(2)°$ Z = 4

X-ray Powder Pattern: Molinello, Italy.
3.259 (100), 3.159 (83), 3.097 (70), 2.613 (69), 2.941 (68), 3.009(47), 2.785 (47)

Chemistry:

	(1)
SiO_2	38.09
As_2O_5	2.11
V_2O_5	7.44
FeO	0.31
MnO	49.94
CaO	1.30
H_2O	[1.09]
Total	[100.28]

(1) Molinello, Italy; by electron microprobe, H_2O calculated from crystal structure; corresponds to $(Mn^{2+}_{5.77}Ca_{0.19}Fe_{0.04})_{\Sigma=6.00}(V^{5+}_{0.82}As^{5+}_{0.18})_{\Sigma=1.00}Si_5O_{18}(OH)$.

Occurrence: Formed at low temperature and low H_2O fugacity in veinlets cutting manganese ores.

Association: Tiragalloite, braunite, quartz, manganoan calcite, parsettensite, albite (Molinello mine, Italy); palenzonaite, saneroite, pyrobelonite, fianelite, parsettensite, rhodochrosite, kutahorite, aegirine, quartz (Fianel mine, Switzerland).

Distribution: From the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy. At the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: Honors Dr. Francesco Meda (1926–1977), an amateur mineralogist from Turin, Italy.

Type Material: Milan University, Milan; University of Rome, Rome, Italy; University of Oslo, Oslo, Norway.

Medenbachite $Bi_2Fe^{3+}(Cu, Fe^{2+})(O, OH)_2(AsO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As thin tabular crystals, to 2 mm, flattened on $\{\overline{1}01\}$ and elongated along [111]; forms include {001}, $\{\overline{1}01\}$, {101}, $\{\overline{1}10\}$, $\{0\overline{1}1\}$, $\{13\overline{1}\}$; typically aggregated in parallel $\{\overline{1}01\}$ growths.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4.5 VHN = 420 (25 g load). D(meas.) = n.d. D(calc.) = 5.90

Optical Properties: Transparent to translucent. *Color:* Yellow to yellow-brown. *Luster:* Vitreous to adamantine. *Optical Class:* Biaxial (–). *Orientation:* X (−14°,74°); Y (−117°,52°); Z (95°,43°) [using (ϕ,ρ)]. *Dispersion:* $r > v$. $\alpha = 2.03(2)$ $\beta = [2.09]$ $\gamma = 2.10(2)$ 2V(meas.) = 43(3)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 4.570(1)$ $b = 6.162(1)$ $c = 8.993(1)$ $\alpha = 94.56(1)°$ $\beta = 99.69(1)°$ $\gamma = 94.28(1)°$ Z = 1

X-ray Powder Pattern: Reichenbach, Germany.
3.749 (100), 3.596 (77), 2.903 (69), 8.823 (62), 3.468 (58), 2.685 (48), 5.264 (44)

Chemistry:

	(1)
As_2O_5	25.32
Bi_2O_3	53.36
Fe_2O_3	8.99
FeO	1.00
CuO	7.85
H_2O	[3.07]
Total	[99.59]

(1) Reichenbach, Germany; by electron microprobe, average of 16 analyses, Fe^{2+}:Fe^{3+} estimated from microchemical test and requirements of site occupancy, $(OH)^{1-}$ and absence of H_2O confirmed by IR and apportioned for charge balance; corresponding to $Bi_{2.04}Fe^{3+}_{1.00}(Cu_{0.88}Fe^{2+}_{0.12})_{\Sigma=1.00}O_{1.11}(AsO_4)_{1.96}(OH)_{3.03}$.

Occurrence: A very rare secondary mineral in a weathered polymetallic sulfide vein.

Association: Mixite, preisingerite, alunite, goethite, reichenbachite, malachite, quartz.

Distribution: From [the Borstein quarry,] about one km east of Reichenbach, near Bensheim, Hesse, Germany.

Name: Honors Olaf Medenbach (1949–), mineralogist, Ruhr University, Bochum, Germany.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany, 8.0.137, 8.0.376.

References: (1) Krause, W., H.-J. Bernhardt, W. Gebert, H. Graetsch, K. Belendorff, and K. Petitjean (1996) Medenbachite, $Bi_2Fe(Cu, Fe)(O, OH)_2(OH)_2(AsO_4)_2$, a new mineral species: its description and crystal structure. Amer. Mineral., 81, 505–512.

Megacyclite $Na_8KSi_9O_{18}(OH)_9 \cdot 19H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. In irregular grains, to 3 mm.

Physical Properties: *Cleavage:* Perfect {100}; less perfect {001}. *Fracture:* Steplike. Hardness = 2 D(meas.) = 1.82(5) D(calc.) = 1.87 Turns white on exposure to air.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* [White.] *Luster:* Vitreous to subvitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 30°$. *Dispersion:* $r > v$, strong.
$\alpha = 1.460(2)$ $\beta = 1.478(2)$ $\gamma = 1.481(2)$ 2V(meas.) = 43(1)° 2V(calc.) = 44°

Cell Data: *Space Group:* $P2_1/c$. $a = 24.91(5)$ $b = 11.94(1)$ $c = 14.92(2)$ $\beta = 94.47(9)°$
$Z = 4$

X-ray Powder Pattern: Khibina massif, Russia.
3.08 (100), 2.938 (70b), 4.26 (60), 2.649 (60b), 2.400 (35), 2.289 (35), 7.42 (20)

Chemistry:

	(1)
SiO_2	43.42
Na_2O	19.75
K_2O	3.62
H_2O	[33.21]
Total	[100.00]

(1) Khibina massif, Russia; by electron microprobe, average of four analyses, H_2O by difference; corresponds to $Na_{7.96}K_{0.96}Si_{9.02}O_{18}(OH)_9 \cdot 18.51H_2O$.

Occurrence: In unweathered ultra-alkalic pegmatites in an alkalic massif.

Association: Orthoclase, fenaksite, revdite, delhayelite, many other minerals.

Distribution: On Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: From the Greek for *large* and *cyclical*, with reference to the large ringlike groups of silica tetrahedra in the structure.

Type Material: Mining Institute, St. Petersburg, 2066/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p733/2.

Megawite $CaSnO_3$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. Crystals pseudo-cubic and pseudo-cuboctahedral, to 0.015 mm, as inclusions in spurrite or as rims on lakargiite. Twinning observed.

Physical Properties: *Cleavage:* Good on {110} and {001}. *Fracture:* n.d. *Tenacity:* n.d. Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.06

Optical Properties: Transparent. *Color:* Pale yellow or colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+) [Synthetic]. *n* = 1.89 *Orientation*: *X* = *b*; *Y* = *a*; *Z* = *c*.

Cell Data: *Space Group: Pbnm.* *a* = 5.555(3) *b* = 5.708(2) *c* = 7.939(5) *Z* = 4

X-ray Powder Pattern: Upper Chegem caldera, Kabardino-Balkaria, Northern Caucasus, Russia. 2.812 (100), 3.984 (52), 2.855 (43), 3.970 (19), 2.780 (19), 1.992 (13), 1.985 (13)

Al_2O_3	0.04		
Sc_2O_3	0.28		

(1) Upper Chegem caldera, Kabardino-Balkaria, Northern Caucasus, Russia; average of 9 electron microprobe analyses; corresponding to molecular ratios $(CaSnO_3)_{56}(CaZnO_3)_{31}(CaTiO_3)_7$.

Polymorphism & Series: Forms series with perovskite, $CaTiO_3$, and lakargiite, $CaZrO_3$.

Mineral Group: Perovskite group.

Occurrence: Occurs as minute inclusions in rock-forming minerals in altered ignimbrite xenoliths in a caldera. Probably formed by contact metamorphism at low pressure and >800ºC.

Association: Spurrite, reinhardbraunsite, rondorfite, wadalite, srebrodolskite, lakargiite, perovskite, kerimasite, elbrusite-(Zr), periclase, hydroxylellestadite, hydrogrossular, ettringite-group minerals, afwillite, hydrocalumite, brucite.

Distribution: Upper Chegem caldera, Kabardino-Balkaria, Northern Caucasus, Russia.

Name: Honors British crystallographer Helen Dick Megaw (1907-2002) for significant contributions to our understanding of the perovskites.

Type Material: Mineralogical Museum of Wrocław University, Poland (MMUWr II16717), and in the A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (4021/1).

Meionite $3CaAl_2Si_2O_8 \cdot CaCO_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals prismatic, typically with flat pyramidal terminations, striated ‖ [001], to 0.7 m; granular, massive.

Physical Properties: *Cleavage:* {100}, {110}, distinct. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 2.74–2.78 D(calc.) = [2.86] Commonly fluoresces orange to bright yellow or red under LW or SW UV or both.

Optical Properties: Transparent to opaque. *Color:* Colorless, white, grey; pink, violet, blue, yellow, orange-brown, brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous to pearly or resinous.
Optical Class: Uniaxial (–). $\omega = 1.590–1.600$ $\epsilon = 1.556–1.562$

Cell Data: *Space Group:* $I4/m$ (synthetic). $a = 12.179(1)$ $c = 7.571(1)$ $Z = 2$

X-ray Powder Pattern: Bolton, Massachusetts, USA. (ICDD 2-405).
3.47 (100), 3.08 (100), 2.07 (100), 2.73 (80), 1.91 (80), 1.37 (80), 3.87 (70)

Chemistry:

	(1)		(1)
SiO_2	41.38	Cl	0.18
Al_2O_3	31.59	H_2O^+	0.29
MgO	0.29	CO_2	4.35
CaO	20.72	SO_3	0.35
Na_2O	1.38	$-O = (F,Cl)_2$	0.04
K_2O	0.48	Total	100.97

(1) Vesuvius, Campania, Italy; corresponds to $(Ca_{3.39}Na_{0.41}K_{0.09}Mg_{0.07})_{\Sigma=3.96}(Si_{6.32}Al_{5.68})_{\Sigma=12.00}O_{24}[(CO_3)_{0.91}Cl_{0.05}(SO_4)_{0.04}]_{\Sigma=1.00}$.

Polymorphism & Series: Forms a series with marialite; intermediate members are $P4_2/n$.

Mineral Group: Scapolite group.

Occurrence: Typically in regionally metamorphosed rocks, especially marbles, calcareous gneisses, granulites, and greenschists. Also in skarns, some pegmatites, pneumatolytically or hydrothermally altered mafic igneous rocks, and ejected volcanic blocks.

Association: Plagioclase, garnet, pyroxenes, amphiboles, apatite, titanite, zircon.

Distribution: Most specimens are intermediate in the series, see also marialite; some localities for highly calcic material include: at Monte Somma and Vesuvius, Campania, Italy. Around the Laacher See, Eifel district, Germany. From Pargas and Pusunsaari, Finland. At Slyudyanka, near Lake Baikal, Siberia, Russia. From Gooderham, Ontario, and Grenville, Quebec, Canada. At Rossie, St. Lawrence Co., New York; Bolton, Worcester Co., Massachusetts; and Cutcane Creek, Fannin Co., Georgia, USA.

Name: From the Greek for *less*, referring to its less acute pyramidal form compared with vesuvianite.

Type Material: Natural History Museum, Paris, France, 3774.

Meixnerite $Mg_6Al_2(OH)_{18}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Tabular crystals, to 1 mm.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = ∼2 D(meas.) = 1.9(1) D(calc.) = 1.95

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (–). $\omega = 1.517$ ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 3.0463(15)$ $c = 22.93(2)$ Z = 3/8

X-ray Powder Pattern: Ybbs-Persenberg, Austria; d's calculated. (ICDD 34-478).
1.94 (100), 1.52 (75), 3.82 (72), 2.287 (70), 2.57 (64), 1.494 (57), 7.64 (55)

Chemistry:

	(1)	(2)
Al_2O_3	15.0	17.64
Fe_2O_3	0.55	
MgO	36.5	41.84
H_2O	[47.95]	40.52
Total	[100.00]	100.00

(1) Ybbs-Persenberg, Austria; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference.
(2) $Mg_6Al_2(OH)_{18}\cdot 4H_2O$.

Occurrence: A secondary mineral in serpentinite.

Association: Talc, aragonite.

Distribution: From Ybbs-Persenberg, Ispertal, Austria.

Name: To honor Professor Heinrich Hermann Meixner (1908–1981), Austrian mineralogist, University of Salzburg, Salzburg, Austria.

Type Material: University of Salzburg, Salzburg, Austria; University of Göttingen, Göttingen, Germany; The Natural History Museum, London, England, 1980,687; Harvard University, Cambridge, Massachusetts, USA, 117008.

Melanocerite-(Ce) $(Ce, Ca)_5(Si, B)_3O_{12}(OH, F)\cdot nH_2O(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal; commonly amorphous. *Point Group:* n.d. Crystals flat rhombohedral, to 2 cm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 4.13–4.29 D(calc.) = n.d.

Optical Properties: Translucent, transparent in thin fragments. *Color:* Brown, black; in thin section, bright wine-yellow. *Streak:* Light brown. *Luster:* Resinous to greasy. *Optical Class:* Uniaxial (–); commonly isotropic. $n = 1.70–1.76$; birefringence low.

Cell Data: *Space Group:* n.d. a = n.d. c = n.d. Z = n.d.

X-ray Powder Pattern: X-ray amorphous; when heated to 600 °C an apatitelike pattern results.

(1–2) Langesundsfjord, Norway. (3) Yenisei Ridge, Russia.

Occurrence: In nepheline syenite pegmatites (Langesundsfjord, Norway); in alkalic granite pegmatites (Russia).

Association: Astrophyllite, ferrian biotite, leucophanite, fluorite (Langesundsfjord, Norway); gadolinite, yttrialite, fergusonite (Russia).

Distribution: On Kjeø Island, near Barkevik, Langesundsfjord, Norway. In Russia, in Siberia, from the Burpala massif, about 120 km north of Lake Baikal, and on Yenisei Ridge.

Name: From the Greek for *black* or *dark* and *cerium* in its composition.

Melanophlogite $SiO_2 \cdot n(C, H, O, S)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m\ 2/m\ 2/m$ supercells are statistically oriented along the pseudocubic axes. As well-formed cubes, modified by {210}, to 5 mm. Most commonly as thin crusts of complexly intergrown crystals and rounded, droplike aggregates. *Twinning:* Interpenetrant twinning on {201}, probable, giving sectored and depressed cube faces.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 VHN = 649–724, 680 average (100 g load). D(meas.) = 1.99–2.11 D(calc.) = 1.98–1.99 Impurities incorporated may include CH_4, CO_2, S.

Optical Properties: Transparent to translucent. *Color:* Colorless when pure; pale yellow to deep red-brown with impurities; turbid white when weathered. *Luster:* Adamantine. *Optical Class:* Isotropic; may be weakly anisotropic. $n = 1.425$–1.457

Cell Data: *Space Group:* $P4_232$. $a = 26.82(3)$ $c = 13.37(2)$ $Z = 184$

X-ray Powder Pattern: Chvaletice, Czech Republic.
5.99 (10), 3.580 (9), 5.471 (7), 3.862 (6), 3.248 (6), 3.716 (5), 3.158 (5)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
SiO_2	92.4	94.6	96.18	O	3.40	2.6	2.24

(1) Racalmuto, Sicily, Italy. (2) Chvaletice, Czech Republic; by electron microprobe and neutron activation, corresponding to $46SiO_2 \cdot (C_{2.17}H_{17.25}O_{5.42}S_{0.09})$. (3) Mt. Hamilton, California, USA; corresponding to $46SiO_2 \cdot (C_{2.01}H_{22.69}O_{4.02})$.

Polymorphism & Series: Becomes cubic above ~40 °C.

Occurrence: A late-stage, low-temperature mineral in sulfur deposits (Racalmuto, Sicily, Italy); in low-temperature hydrothermal veins associated with metamorphosed sedimentary manganese deposits (Chvaletice, Czech Republic); in carbonate-bearing serpentinites (Fortullino, Italy; Mt. Hamilton, California, USA).

Association: Sulfur, calcite, "opal," cristobalite, quartz, dolomite, celestite, pyrite, marcasite, rhodochrosite, magnesite.

Distribution: In Italy, at Solfatara Giona, Racalmuto, and at Caltanissetta, Sicily; and from Fortullino, near Quercianella, Tuscany. In the Chvaletice deposit, Czech Republic. In the USA, at Mt. Hamilton, Santa Clara Co., California.

Name: From the Greek for *black* and *to be burned*, in allusion to the fact that some specimens of the mineral turn black when heated.

Type Material: Natural History Museum, Paris, France, 135245; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, C1279, 93011.

Melanostibite $Mn^{2+}(Sb^{5+}, Fe^{3+})O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Tiny rhombohedra, striated, in parallel growth, forming porous spongelike aggregates. *Twinning:* By rotation about [0001], common.

Physical Properties: *Cleavage:* {0001}, perfect, perhaps a parting. *Tenacity:* Brittle. Hardness = > 4 D(meas.) = 5.24, on porous fragments. D(calc.) = 5.63

Optical Properties: Opaque, transparent in thin fragments. *Color:* Coal-black; deep blood-red in transmitted light. *Streak:* Pale rouge-red to cherry-red. *Luster:* Brilliant.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.
R_1–R_2: n.d.

Cell Data: *Space Group:* $R\overline{3}$. $a = 5.226$ $c = 14.325$ Z = 6

X-ray Powder Pattern: Sjö mine, Sweden.
2.806 (10), 2.613 (8), 1.766 (8), 3.819 (6), 4.775 (5), 1.915 (5), 4.313 (4)

Chemistry:

	(1)	(2)	(3)
Sb_2O_5	42.81	41.0	42.18
Fe_2O_3	28.93	19.4	20.82
MnO	28.26	33.8	37.00
Total	[100.00]	94.2	100.00

(1) Sjö mine, Sweden; recalculated to 100% after deduction of CaO 1.97%, MgO 1.03%, H_2O 1.06% as impurities. (2) Do.; partial analysis by electron microprobe. (3) $Mn(Sb_{0.50}Fe_{0.50})_{\Sigma=1.00}O_3$.

Occurrence: A very rare mineral in fissures in banded dolomite, in a small Fe–Mn orebody in manganoan dolomite.

Association: Dolomite.

Distribution: In the Sjö mine, near Grythyttan, Örebro, Sweden.

Name: From the Greek for *black*, for its color, and antimony, STIBium, in its composition.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; The Natural History Museum, London, England, 83307; National Museum of Natural History, Washington, D.C., USA, R5766.

(1) Långban, Sweden; remainder FeO, CuO, MgO, CaO, BaO, Na_2O, K_2O, Cl, and P_2O_5. (2) Jakobsberg, Sweden; by electron microprobe, corresponds to $Pb_{2.03}(Fe^{3+}_{1.75}Al_{0.08}Ti_{0.08}Mn_{0.04}Mg_{0.02})_{\Sigma=1.97}Si_{2.00}O_9$. (3) $Pb_2Fe_2O_2Si_2O_7$.

Polymorphism & Series: Forms a series with kentrolite.

Occurrence: In a metamorphosed Fe–Mn deposit, from which over one ton was removed (Långban, Sweden); in oxidized Pb–Cu ores (Artillery Peaks, Arizona, USA).

Association: Lead, magnetite, garnet (Långban, Sweden); leadhillite, alamosite (Tsumeb, Namibia); diaboleite (Tiger, Arizona, USA); luddenite, alamosite, shattuckite, mimetite, wulfenite, cerussite, wickenburgite (Artillery Peaks, Arizona, USA).

Distribution: At Långban, Jakobsberg, and Pajsberg, Värmland, Sweden. In the Merehead quarry, Wesley mine, and at Higher Pitts Farm, Priddy, Somerset, and at Westbury-on-Trym, Avon, England. From Tsumeb, Namibia. In the USA, from Hillsboro, Sierra Co., New Mexico; in Arizona, at the Mammoth-St. Anthony mine, Tiger, Pinal Co., and from a Pb–Cu prospect near Artillery Peaks, Mohave Co.

Name: From the Greek *black* and *to melt* or *glass*, for the black bead formed under the blowpipe.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 545. (2) Gabrielson, O. (1963) The crystal structures of kentrolite and melanotekite. Arkiv Mineral. Geol. 3, 141–151. Melanothallite Cu_2OCl_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Platy or scaly, to 1 cm.

Physical Properties: *Cleavage:* One direction, perfect, probably prismatic.
Tenacity: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.08 Alters rapidly to green minerals on exposure; partly dissolved in H_2O.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black to bluish black; deep brown in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group: Fddd.* $a = 9.595(3)$ $b = 9.693(3)$ $c = 7.461(3)$ Z = 8

X-ray Powder Pattern: Tolbachik volcano, Russia.
5.041 (100), 2.518 (77), 2.947 (44), 2.422 (20), 2.176 (19), 2.816 (17), 1.928 (16)

Chemistry:

	(1)	(2)
Na	0.04	
K	0.06	
Cu	59.41	59.39
Zn	0.07	
Pb	0.01	
Li	0.04	
O	[8.55]	7.48
Cl	28.33	33.13
H_2O^+	0.05	
H_2O^-	1.75	
SO_4	1.20	
Total	[99.51]	100.00

(1) Tolbachik volcano, Russia; after deduction of excess Cu 8.63%, probably present as tenorite, O calculated from stoichiometry. (2) Cu_2OCl_2.

Occurrence: Sublimed on crater walls formed in 1868 and 1906 (Vesuvius, Italy); in volcanic fissures (Tolbachik volcano, Russia).

Association: Eriochalcite, chalcocyanite, euchlorine, dolerophanite (Vesuvius, Italy); euchlorine, chalcocyanite, dolerophanite, tenorite (Tolbachik volcano, Russia).

Distribution: On Vesuvius, Campania, Italy. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: From the Greek for *black* and *a young shoot*, for the mineral's property of turning green on exposure.

Melanovanadite $Ca(V^{5+},V^{4+})_4O_{10}\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Prismatic crystals, to 2 mm, striated and elongated along [001], with prominent but rounded prism zone, complexly terminated; in radiating aggregates and rosettes, velvety.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Brittle. Hardness = 2.5
D(meas.) = 2.55 D(calc.) = 2.53

Optical Properties: Opaque, translucent in very thin flakes. *Color:* Black; dark reddish brown in transmitted light. *Streak:* Dark reddish brown. *Luster:* Submetallic.
Optical Class: Biaxial (–). *Pleochroism:* Distinct; X = light reddish brown; $Y = Z$ = dark reddish brown. *Orientation:* $Z = b$; $Y \wedge c = 15°$. $\alpha = 1.73$ $\beta = 1.96$ $\gamma = 1.98$
2V(meas.) = Medium.

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.360(2)$ $b = 18.090(9)$ $c = 6.276(2)$ $\alpha = 110.18(4)°$ $\beta = 101.62(3)°$ $\gamma = 82.86(4)°$ Z = [2]

X-ray Powder Pattern: Minasragra, Peru.
8.40 (100), 4.208 (55), 2.974 (50), 2.473 (50), 3.109 (45), 4.120 (40), 3.182 (40)

Chemistry: Composition established by crystal-structure analysis; the mineral contains interlayer H_2O, easily displaced.

Occurrence: In altered black shale in a very rich vanadium deposit (Minasragra, Peru); in Colorado Plateau-type U–V deposits.

Association: Pascoite, pyrite, copper, gypsum, patrónite, sherwoodite (Minasragra, Peru); duttonite (Peanut mine, Colorado, USA).

Distribution: At Minasragra, 46 km from Cerro de Pasco, Peru. In the USA, in the Mesa No. 1, Mesa No. 5, and Kerr-McGee 4-1 mines, Lukachukai Mountains, Apache Co., Arizona; the Jackpile mine, Valencia Co., New Mexico; the Jo Dandy, Bitter Creek, and Peanut mines, Uravan district, Montrose Co., and the Garfield mines, Garfield Co., Colorado; and the Juniper mine, Thompsons district, Grand Co., Utah.

Name: From the Greek for *black*, for the color, and VANADium in the composition.

Type Material: Harvard University, Cambridge, Massachusetts, 90452; American Museum of Natural History, New York City, New York, 19310; National Museum of Natural History, Washington, D.C., USA, 138067, 160076.

Melanterite $Fe^{2+}SO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are rare, equant, pseudo-octahedral, to short prismatic [001], showing {120}, {001}, may be thick tabular {010}, {$10\overline{2}$}, many smaller modifying forms, to 20 cm; commonly stalactitic, in concretions and crusts, massive, pulverulent, and as efflorescences.

Physical Properties: *Cleavage:* On {001}, perfect; on {120}, distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 1.895–1.898 D(calc.) = 1.897(4) Soluble in H_2O; taste sweetish, astringent, metallic.

Optical Properties: Transparent to translucent. *Color:* Green, pale green, greenish blue, bluish green, colorless; colorless to pale green in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+) (synthetic). *Orientation:* $Y = b$; $Z \wedge c = 61°$. *Dispersion:* $r > v$, weak, inclined. $\alpha = 1.471$ $\beta = 1.478$ $\gamma = 1.486$ 2V(meas.) = 85°27′

Cell Data: *Space Group:* $P2_1/c$. $a = 14.072(10)$ $b = 6.503(7)$ $c = 11.041(10)$ $\beta = 105°34(5)'$ Z = 4

X-ray Powder Pattern: Synthetic.
4.90 (100), 3.776 (60), 4.87 (50), 3.732 (20), 3.291 (16), 4.028 (14), 5.49 (12)

Chemistry:

	(1)	(2)
SO_3	29.19	28.80
FeO	22.27	25.84
MgO	1.87	
H_2O	45.79	45.36
Total	99.12	100.00

(1) Falun, Sweden. (2) $FeSO_4 \cdot 7H_2O$.

Mineral Group: Melanterite group.

Occurrence: A post-mine product of oxidation of pyrite and marcasite ores; rarely a volcanic sublimate.

Association: Pisanite, chalcanthite, epsomite, pickeringite, halotrichite, other sulfates.

Distribution: Occurs at many localities, a few with large crystals. In Germany, from the Rammelsberg mine, near Goslar, Harz Mountains. At Falun, Sweden. From Rio Tinto, Huelva Province, Spain. At Idria, Slovenia. Large crystals on the island of Cyprus. From Cantiere Conche, Elba, Italy. At Baia Sprie (Felsőbánya), Romania. From Damar, Murgul, northeast Anatolia, Turkey. In the USA, at the Alma mine, Leona Heights, Alameda Co., and the Island Mountain mine, Trinity Co., California; from Ducktown, Polk Co., Tennessee; at Butte, Silver Bow Co., Montana; in the Lucky Boy mine, Bingham district, Salt Lake Co., Utah. At volcanoes on the Kamchatka Peninsula, Russia. From Tierra Amarilla, southeast of Copiapó, Atacama, Chile.

Name: From the Greek for *a black metallic dye*.

Meliphanite $(Ca,Na)_2Be(Si,Al)_2(O,OH,F)_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $\bar{4}$. As tablets, to 3 cm; platy, lamellar, massive.

Physical Properties: *Cleavage:* Distinct on {001}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 3.01–3.02 D(calc.) = 3.024 Strongly piezoelectric.

Optical Properties: Transparent to translucent. *Color:* Honey-yellow, citron-yellow, sulfur-yellow, flesh-red, brick-red. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.593$ $\epsilon = 1.613$

Cell Data: *Space Group:* $I\bar{4}$. $a = 10.516(2)$ $c = 9.887(2)$ Z = 8

X-ray Powder Pattern: Stokkø Island, Langesundsfjord, Norway. (ICDD 31-304).
2.75 (100), 2.96 (50), 3.59 (40), 2.346 (40), 2.342 (40), 2.316 (40), 1.978 (40)

Chemistry:

	(1)	(2)

H_2O	0.30	
$-O = (F,Cl)_2$	[2.41]	[2.29]
Total	[97.39]	[99.08]

(1) Fredriksvärn, Norway; Al_2O_3 includes Fe_2O_3, Mn_2O_3, original total given as 99.80% before F correction. (2) Arø Island, Langesundsfjord, Norway; Al_2O_3 includes Fe_2O_3, original total given as 101.37% before F correction.

Occurrence: In augite syenite (Fredriksvärn, Norway).

Association: Natrolite, mica, fluorite (Fredriksvärn, Norway).

Distribution: From near Fredriksvärn; on several of the islands in the Langesundsfjord; and at Tvedalen, near Larvik, Norway. In Russia, from the Sakhariok massif, Kola Peninsula, and at other less-well-defined localities. In the USA, in the Iron Mountain No. 2 mine, near Brown City, Sierra Co., New Mexico.

Name: From the Greek for *honey-yellow* and *to appear*, in allusion to its color.

Melkovite $H_6CaFe^{3+}(PO_4)(MoO_4)_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. Crystals are pseudohexagonal, very thin, platy, to 2 μm, in powdery aggregates in veinlets.

Physical Properties: *Cleavage:* One, perfect. *Tenacity:* Brittle. Hardness = ∼3
D(meas.) = 2.969–2.973 D(calc.) = n.d.

Optical Properties: Transparent. *Color:* Lemon-yellow, brownish yellow. *Luster:* Dull to waxy.
Optical Class: Biaxial (?), anomalous blue interference color. *Pleochroism:* Weak; colorless to light green. *Orientation:* Extinction wavy to nearly parallel ⊥ to the cleavage. $n = 1.838$

Cell Data: *Space Group:* Aa. $a = 17.46$ $b = 18.48$ $c = 10.93$ $\beta = 94.5°$ Z = 6

X-ray Powder Pattern: Shunak Mountains, Kazakhstan.
2.916 (9), 3.537 (8), 8.42 (7), 3.036 (7), 1.789 (7), 1.992 (6), 2.415 (5)

Chemistry:

	(1)	(2)

Total	100.04	100.00

(1) Shunak Mountains, Kazakhstan; by electron microprobe, total Fe as Fe_2O_3, MoO_4 and PO_4 confirmed by IR; disregarding ZrO_2, corresponds to $H_6Na_{0.18}K_{0.03}Ca_{0.92}Fe^{3+}_{0.68}(MoO_4)_{3.96}(PO_4)_{0.56} \cdot 6.2H_2O$. (2) $H_6CaFe^{3+}(PO_4)(MoO_4)_4 \cdot 6H_2O$.

Occurrence: Localized along joints in sandstone, formed by alteration of molybdenite in the oxidized zone of small molybdenite–fluorite deposits.

Association: Fluorite, molybdenite, magnetite, powellite, ferrimolybdite, iriginite, jarosite.

Distribution: In the Shunak Mountains, 60 km west of the Mointy railroad station, Kazakhstan.

Name: To honor Professor Vyacheslav Gavrilovich Melkov (1911–1991), Russian mineralogist specializing in uranium minerals, of the All-Union Research Institute of Mineral Resources, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72716; National Museum of Natural History, Washington, D.C., USA, 160237.

Mellite $Al_2[C_6(COO)_6]\cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are dipyramidal {023}, also prismatic, elongated along [001], modified by {001}, {010}, {113}, to 7.5 cm; as nodules and coatings, fine-grained massive.

Physical Properties: *Cleavage:* {023}, indistinct. *Fracture:* Conchoidal. *Tenacity:* Slightly sectile. Hardness = 2–2.5 D(meas.) = 1.64 D(calc.) = 1.65 May fluoresce pale yellow to blue under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Honey-yellow, deep red, pale shades of red, brown, gray, white; colorless to pale yellow in transmitted light. *Streak:* White. *Luster:* Resinous to vitreous.
Optical Class: Uniaxial (–), may be anomalously biaxial. *Pleochroism:* Weak; O = yellowish brown; E = yellow. *Orientation:* $X = c$. $\omega = 1.539$ $\epsilon = 1.511$ 2V(meas.) = Small.

Cell Data: *Space Group:* $I4_1/acd$. $a = 15.53(1)$ $c = 23.19(1)$ Z = 8

X-ray Powder Pattern: Artern, Germany.
7.99 (100), 4.23 (70), 5.80 (55), 5.16 (40), 3.46 (30), 3.39 (30), 2.985 (25)

Chemistry:

	(1)	(2)
C_4O_3	42.6	42.48
Al_2O_3	15.1	15.03
H_2O	[42.3]	42.49
Total	[100.0]	100.00

(1) Artern, Germany; recalculated from a partial analysis C 8.01%, Al 21.3%, corresponding to $15.7H_2O$ by difference. (2) $Al_2[C_6(COO)_6]\cdot 16H_2O$.

Occurrence: An uncommon secondary mineral in brown coal and lignite deposits, aluminum typically derived from clay.

Association: n.d.

Distribution: In Germany, from Artern, Thuringia, and near Bitterfeld, Saxony-Anhalt. At Lušice, near Bílina, Valchov, and Boskovice, Czech Republic. Large crystals from the Csordakút mine, Tatabánya, Hungary. From Malevka, Bogoroditsk district, southeast of Tula, Russia.

Name: From the Greek for *honey*, in allusion to the color.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1104–1105. (2) Giacovazzo, C., S. Menchetti, and F. (1) Stanislaus mine, California, USA; corresponding to $(Ni_{0.99}Ag_{0.02})_{\Sigma=1.01}Te_{2.00}$. (2) Strathcona mine, Canada; by electron microprobe, corresponding to $(Ni_{0.66}Pd_{0.24}Pt_{0.07})_{\Sigma=0.97}$ $(Te_{1.76}Bi_{0.24})_{\Sigma=2.00}$. (3) $NiTe_2$.

Polymorphism & Series: Forms a series with merenskyite.

Mineral Group: Melonite group.

Occurrence: With other tellurium minerals in the late stages of hydrothermal veins formed at medium to low temperatures. Also in high-temperature Ni–Cu–PGE magmatic sulfide deposits.

Association: Altaite, petzite, hessite, calaverite, coloradoite, krennerite, tellurobismuthite, montbrayite, gold, pyrite, chalcopyrite, pentlandite, pyrrhotite.

Distribution: In the USA, in California, from the Melones [TL] and Stanislaus mines, Carson Hill district, Calaveras Co., and the Jamestown mine, Tuolumne Co.; in Colorado, at the Cresson mine, Cripple Creek, Teller Co., and from a number of mines in the Magnolia district, Boulder Co.; in Arizona, from the Campbell mine, Bisbee, Cochise Co. In Ontario, Canada, from the Strathcona mine at Sudbury; in the Hemlo gold deposit, Thunder Bay district; and at the Wright-Hargreaves mine, Kirkland Lake; in Quebec, from the Robb-Montbray mine, Montbray Township. At Kalgoorlie and Kambalda, 56 km south of Kalgoorlie, Western Australia, and the Worturpa mine, Flinders Ranges, South Australia. From the Emperor mine, Vatukoula, Viti Levu, Fiji Islands. In South Africa, at Ookiep, Namaqualand. In the Omai gold deposit, Guiana. From Russia, in the Monchegorsk deposit, Kola Peninsula. At the Zhanatyube deposit, Kazakhstan. In the Yokozuru mine, north Kyushu, Japan. Many additional minor occurrences are known.

Name: For the Melones mine in California, USA, where it was discovered.

Mélonjosephite $CaFe^{2+}Fe^{3+}(PO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals tabular, showing {001}, {010}, and {100}; in fibrous masses, with fibers to 1 cm.

Physical Properties: *Cleavage:* One, longitudinal; another, transverse. *Tenacity:* Brittle. Hardness = < 5 D(meas.) = 3.65(2) D(calc.) = 3.61

Optical Properties: Semitransparent. *Color:* Dark green, nearly black. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (–). *Pleochroism:* X = deep brown with greenish tint, dark blue-green; Y = greenish brown, dark olive-brown; Z = golden yellow with greenish tint, pale brown. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* Strong. α = 1.720–1.732 β = 1.763–1.770 γ = 1.787–1.800 2V(meas.) = 80°–85°

Cell Data: *Space Group: Pbam.* $a = 9.542(1)$ $b = 10.834(1)$ $c = 6.374(1)$ Z = 4

X-ray Powder Pattern: Angarf-Sud pegmatite, Morocco.
3.049 (100), 5.42 (90), 2.710 (90), 2.624 (60), 2.912 (40), 2.187 (35), 3.185 (30)

Chemistry:

	(1)	(2)

(1) Angarf-Sud pegmatite, Morocco; Ca and Mg by AA, Na and Li by flame photometry, H_2O by the Penfield method, insoluble is quartz; corresponds to $(Ca_{0.96}Mg_{0.11}Na_{0.06}Li_{0.02})_{\Sigma=1.15}(Fe^{2+}_{0.87}Mn^{2+}_{0.02})_{\Sigma=0.89}(Fe^{3+}_{0.98}Al_{0.02})_{\Sigma=1.00}(PO_4)_{2.01}(OH)_{0.99}$. (2) $CaFe^{2+}Fe^{3+}(PO_4)_2(OH)$.

Occurrence: Replacing an alluaudite group mineral in a complex granite pegmatite (Angarf-Sud pegmatite, Morocco).

Association: Triphylite.

Distribution: From the Angarf-Sud pegmatite, Tazenakht Plain, Anti-Atlas Mountains, Morocco. At the Sandamap pegmatite, west of Usakos, Namibia.

Name: To honor Professor Joseph Mélon (1898–1991), Institute of Mineralogy, University of Liège, Liège, Belgium.

Type Material: University of Liège, Liège, Belgium, 18587; National Museum of Natural History, Washington, D.C., USA, 128338.

Sm_2O_3	0.58	H_2O	[4.25]
Gd_2O_3	0.38	-O=F	0.56
		Total	100.37

(1) Darai-Pioz alkaline massif, Tajikistan; average of 10 electron microprobe analyses, H_2O and OH calculated from structure analysis, corresponding to $Cs_{5.94}K_{2.22}[(Ce_{11.35}La_{5.86}Nd_{3.23}Pr_{1.54}Sm_{0.32}Gd_{0.20})_{\Sigma=22.50}(Ca_{4.68}Sr_{1.00})_{\Sigma=5.68}]_{\Sigma=28.18}Si_{70.12}O_{203.17}H_{45.67}F_{6.83}$.

Occurrence: In a massif composed of a variety of granitic, alkaline granitic and syenitic pegmatites, various hydrothermal rocks (albitites, fenites) and carbonatites.

Association: Pectolite, and subordinate amounts of quartz, aegirine, fluorite, sogdianite, stillwellite-(Ce), reedmergnerite, leucosphenite, aegirine, polylithionite, microcline, pyrochlore, turkestanite, hyalotecite, sokolovaite, kirchhoffite, pekovite, neptunite, zeravshanite.

Distribution: In glacial moraine, upper reaches of the Darai-Pioz River, near the junction of the Turkestan, Zeravshan, and Alai ridges, Darai-Pioz alkaline massif, Garm District, Tajikistan.

Name: Honors Dmitriy Ivanovich Mendeleev (1834-1907), the Russian chemist who among other accomplishments created the Periodic Table of Elements.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3921/1).

Cl	9.35	9.87	9.79
Total	99.75	[100.00]	100.00

(1) Mendip Hills, England; corresponds to $Pb_{3.14}Cl_2O_{2.15}$. (2) Kunibert mine, near Brilon, Germany. (3) $Pb_3O_2Cl_2$.

Occurrence: In nodules in manganese oxide ores (Somerset, England).

Association: Hydrocerussite, cerussite, malachite, pyromorphite, calcite, chloroxiphite, diaboleite, parkinsonite (Somerset, England).

Distribution: In England, from the Higher Pitts Farm, the Priddy Hill Farm, the Wesley mine, and near Churchill, Mendip Hills, and in the Merehead quarry, near Shepton Mallet, Somerset. In the Kunibert mine, near Brilon, North Rhine-Westphalia, Germany. At Långban, Värmland, Sweden. From Tarnowitz, Silesia, Poland. From Laurium, Greece, in slag. Found in the Elura Zn–Pb–Ag deposit, 43 km northeast of Cobar, New South Wales, Australia.

Name: For the occurrence in the Mendip [Myne-deepes, Old English] Hills, England.

Type Material: Swedish Academy of Sciences, Stockholm, Sweden.

CaO	2.48
Na_2O	1.25
Cl	0.26
H_2O	21.62
$-O = Cl_2$	0.06
Total	98.22

(1) Cumobabi deposit, Mexico; with $(OH)^{1-}$ calculated for charge balance, corresponds to $Na_{1.27}(Ca_{1.40}Mg_{0.27})_{\Sigma=1.67}Fe_{5.66}(PO_4)_2P_{1.02}Mo_{11.07}O_{39}[(OH)_{8.88}Cl_{0.23}]_{9.11}\cdot 33.44H_2O$.

Occurrence: In the oxidized zone of some molybdenum-bearing hydrothermal mineral deposits.

Association: Quartz, paramendozavilite (Cumobabi deposit, Mexico); molybdenite, schorl (Rustler mine, Utah, USA).

Distribution: From the Cumobabi molybdenum deposit, southwest of Cumpas, Sonora, Mexico. At the Rustler mine, Gold Hill, Tooele Co., Utah, USA. From Copaquiri, Antofagasta, Chile.

Name: To honor Heriberto Mendoza Avila (1924–), Phelps Dodge exploration geologist, who found the first specimen.

Type Material: The Natural History Museum, London, England, 1984,475.

Total	99.62	100.00

(1) "San Juan", Argentina. (2) $NaAl(SO_4)_2 \cdot 11H_2O$.

Occurrence: Rarely formed by oxidation of pyrite in reaction with clays; may occur in volcanic fumaroles.

Association: Tamarugite.

Distribution: In Argentina, from "San Juan, near Mendoza" [probably meaning Mendoza Province; the original occurrence appears lost.] At the Lanjarón mineral springs, Granada, Spain. On volcanoes on the Kamchatka Peninsula, Russia. In the USA, from Eureka, St. Louis Co., and Fulton, Calloway Co., Missouri. Other localities may afford this species, but modern confirmation is lacking.

Name: For its originally described occurrence in Mendoza Province, Argentina.

Meneghinite $Pb_{13}CuSb_7S_{24}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are slender prismatic and striated ‖ [001], to 2 cm. Also massive, fibrous to compact.

Physical Properties: *Cleavage:* Perfect but interrupted on {010}; poor on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 VHN = n.d. D(meas.) = 6.36 D(calc.) = 6.35

Optical Properties: Opaque. *Color:* Blackish lead-gray; white in polished section. *Streak:* Shining black. *Luster:* Bright metallic. *Pleochroism:* Weak. *Anisotropism:* Strong. R_1–R_2: (400) 39.6–46.6, (420) 39.0–46.0, (440) 38.5–45.4, (460) 38.2–44.9, (480) 37.8–44.4, (500) 37.5–44.0, (520) 37.2–43.6, (540) 37.0–43.4, (560) 36.9–43.2, (580) 36.7–42.8, (600) 36.3–42.2, (620) 35.9–41.6, (640) 35.4–40.9, (660) 34.9–40.1, (680) 34.4–39.4, (700) 33.7–38.7

Cell Data: *Space Group: Pbnm.* $a = 11.343$–11.369 $b = 24.028$–24.080 $c = 4.126$–4.140 $Z = 4$

X-ray Powder Pattern: Bottino, Italy.
3.274 (10), 2.922 (9), 3.740 (8), 3.489 (6), 4.13 (5), 2.741 (4), 3.080 (3)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Pb	61.52	62.44	61.51	Sb	19.53	19.47	19.46
Cu	1.20	1.52	1.45	S	17.59	17.49	17.58
				Total	99.84	100.92	100.00

(1) Bottino, Italy; by electron microprobe, corresponding to $Pb_{12.99}Cu_{0.83}Sb_{7.02}S_{24.00}$.
(2) Marmora, Canada; by electron microprobe. corresponding to $Pb_{13.26}Cu_{1.05}Sb_{7.04}S_{24.00}$.
(3) $Pb_{13}CuSb_7S_{24}$.

Occurrence: Uncommon, but widespread in hydrothermal veins, also contact metasomatic, volcanogenic sulfide, Cu–Mo porphyry, and rarely, Kuroko deposits.

Association: Galena, chalcopyrite, sphalerite, bournonite, cubanite, pyrite, pyrrhotite, boulangerite, jamesonite, franckeite, tetrahedrite, gudmundite.

Distribution: In Italy, from Bottino, about two km east of Seravezza, Tuscany [TL]. In England, at Shallowford Bridge, near South Molton, Devon, and in the Pengenna mine, St. Kew, the Pentire veins, St. Minver, and the Portquin veins, St. Endellion, Cornwall. From the Ochsenkopf, near Schwarzenberg, Saxony; at Goldkronach, in the Fichtelgebirge, Bavaria; and elsewhere in Germany. In the Maronia Cu–Mo deposit, 30 km southeast of Komotini, Greece. At Bournac, Montagne Noire, Finistère, France. From Hällefors, Sweden. At Aijala, Finland. In the Dodo mine, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains, Russia. At Pun-dung, North Korea. From Pingtoushan, Jiangxi Province, China. At Broken Hill, New South Wales, Australia. In Canada, in Ontario, at Marble Lake; in British Columbia, at the Bluebird-Mayflower mine, Trail Creek; and other localities. In the USA, at the Kalkar quarry, Santa Cruz, Santa Cruz Co., California. Many additional minor occurrences are known.

Name: Honors Professor Giuseppi Meneghini (1811–1889) of Pisa, Italy, who first observed the species.

(1) Vesuvius, Italy. (2) Do.; recalculated to 100% after deduction of misenite and thénardite estimated 6%–7% and other impurities. (3)$KHSO_4$.

Occurrence: In fumaroles.

Association: Halite, misenite, hieratite, carobbiite.

Distribution: On Vesuvius, Campania, Italy.

Name: To honor Giuseppe Mercalli (1850–1914), a Director of the Vesuvius Observatory, Italy.

Type Material: University of Florence, Florence, Italy, 1976/I.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 395. (2) Payan, F. and R. Haser (1976) On the hydrogen bonding in potassium hydrogen sulphate. Comparison with a previous crystal structure determination. Acta Cryst., 32, 1875–1879.

Mercury Hg

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Commonly as liquid spheres or globules; crystallizes in rhombohedra.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = 13.596 (liquid). D(calc.) = 14.26 (solid) Liquid above −38.9 °C; volatile; vapor highly toxic.

Optical Properties: Opaque. *Color:* Tin-white. *Luster:* Metallic, brilliant.
R_1–R_2: n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 3.463$ $c = 6.706$ $Z = 3$

X-ray Powder Pattern: n.d.

Chemistry: Composition essentially mercury, rarely with a little silver or gold.

Occurrence: In hydrothermal deposits formed at low temperature and associated with hot springs.

Association: Cinnabar, metacinnabar, calomel, terlinguaite, eglestonite, mercurian silver, mercurian gold, pyrite, dolomite, barite, quartz.

Distribution: From a number of localities, but rarely in significant amounts. In the USA, in California, especially at New Almaden, Santa Clara Co., and Mt. Diablo, Contra Costa Co.; in Texas, at Terlingua, Brewster Co. A noted locality at Almadén, Ciudad Real Province, Spain. In Serbia, on Mount Avala, near Belgrade. From Idrija (Idria), Slovenia. In Germany, at Landsberg, near Obermoschel, Rhineland-Palatinate. From Brezina, Czech Republic. In Ukraine, at Nagolnii Krjasch, Donets Basin. From Sala, Västmanland, Sweden.

Name: From the Latin *Mercurius*, the mythological messenger of the gods, in allusion to its mobility in liquid form; the chemical symbol from the Latin *hydrargyrum*, *liquid silver*.

Mereheadite $Pb_2OCl(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. As dense, fine-grained aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 4.90 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Orange.
Optical Class: Biaxial (+). $\alpha = 1.897$ $\beta = 1.911$ $\gamma = 1.932$ 2V(meas.) = 81°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Oktyabr deposit, Russia.
3.089 (9), 1.676 (6), 1.283 (6), 3.425 (5), 1.986 (4), 1.944 (4), 1.915 (3)

Chemistry:

	(1)		(1)
UO_3	76.91	CaO	4.86
As_2O_5	0.48	BaO	4.84
SiO_2	1.0	Na_2O	2.47
ZrO_2	0.45	H_2O^+	3.78
Al_2O_3	0.25	H_2O^-	0.01
Fe_2O_3	0.44	CO_2	1.80
PbO	2.29	Total	99.58

(1) Oktyabr deposit, Russia; corresponds to $(Ca_{0.37}Na_{0.31}Ba_{0.24}Pb_{0.08})_{\Sigma=1.00}O \cdot 2.1UO_3 \cdot 1.7H_2O$.

Occurrence: In the oxidation zone of a U–Mo deposit, replacing "pitchblende", and being replaced by uranophane.

Association: Uraninite, uranophane, bauranoite, calciouranoite, protasite.

Distribution: From the Oktyabr U–Mo deposit, 12 km southeast of Krasnokamensk, Strel'tsovskoye district, eastern Transbaikal, Russia.

Name: As a lower hydrate of *calciouranoite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76549, 76550.

Mereiterite $K_2Fe^{2+}(SO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are subhedral, strongly etched, to 1 cm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = 2.5–3 D(meas.) = 2.36(1) D(calc.) = 2.358 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Pale yellow. *Luster:* Vitreous to greasy. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Z \wedge c \simeq 20°$. *Dispersion:* $r > v$, very weak. $\alpha = 1.497(1)$ $\beta = 1.501(1)$ $\gamma = 1.509(1)$ 2V(meas.) = 71° 2V(calc.) = 73°

Cell Data: *Space Group:* $C2/m$. $a = 11.844(1)$ $b = 9.556(1)$ $c = 9.947(1)$ $\beta = 94.90(1)°$ Z = 4

X-ray Powder Pattern: Laurium, Greece.
3.440 (100), 3.505 (52), 3.490 (49), 3.331 (48), 4.778 (30), 2.405 (30), 3.051 (29)

Chemistry:

SO_3	40.22	40.21
FeO	17.88	18.04
K_2O	22.7	23.65
H_2O	18.0	18.10
Total	98.8	100.00

(1) Laurium, Greece; by electron microprobe, average of three crystals, total Fe as Fe^{2+}, H_2O by TGA; corresponds to $K_{1.93}Fe_{1.00}(SO_4)_{2.00} \cdot 4H_2O$. (2) $K_2Fe(SO_4)_2 \cdot 4H_2O$.

Occurrence: A rare secondary mineral imbedded in gypsum, formed by decomposition of sulfides in a hydrothermal Pb–Zn–Cu ore deposit.

Association: Gypsum, smithsonite, goethite.

Distribution: From Laurium, Greece.

Name: Honoring Dr. Kurt Helmut Mereiter (1945–), Professor of Mineralogy, Technical University of Vienna, Vienna, Austria, in recognition of his work on iron sulfates.

Type Material: University of Vienna, Vienna, Austria, 6C/18-035#1; National Museum of Natural History, Washington, D.C., USA, 170971.

Merenskyite $(Pd,Pt)(Te,Bi)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As minute grains, intimately intergrown with other Pd–Pt minerals.

Physical Properties: Hardness = ∼3.5 VHN = 82–128 (10 g load). D(meas.) = n.d. D(calc.) = 8.547

Optical Properties: Opaque. *Color:* In polished section, white. *Pleochroism:* Weak, white to grayish white in air, more distinct in oil, from white to slightly creamy to light grayish white. *Anisotropism:* Distinct to strong, from dark brown to light greenish gray.
R_1–R_2: (400) – , (420) 63.6–65.0, (440) 63.5–65.2, (460) 62.5–64.7, (480) 62.3–64.6, (500) 62.3–64.8, (520) 62.4–65.4, (540) 62.8–66.0, (560) 63.3–66.7, (580) 63.1–67.2, (600) 63.5–68.0, (620) 64.8–69.1, (640) 65.2–69.7, (660) 65.7–71.0, (680) 67.7–73.0, (700) 66.8–73.0

Cell Data: *Space Group:* $P3m1$. $a = 3.978(1)$ $c = 5.125(2)$ $Z = 1$

X-ray Powder Pattern: Merensky Reef, South Africa.
2.92 (100), 2.10 (60), 3.07 (30), 2.02 (30), 1.67 (30), 1.54 (30), 2.51 (20)

Chemistry:	(1)	(2)	(4)		(1)	(2)	(4)
Pd	25.7	13.2	29.42	Sb		0.3	
Pt	2.0	24.0		Te	56.5	61.4	70.58
Bi	15.8			Total	[100.0]	98.9	100.00

(1) Rustenburg mine, South Africa; by electron microprobe, recalculated to 100.0%; corresponds to $(Pd_{0.93}Pt_{0.04})_{\Sigma=0.97}(Te_{1.71}Bi_{0.29})_{\Sigma=2.00}$. (2) Messina, South Africa; by electron microprobe, corresponds to $(Pd_{0.50}Pt_{0.50})_{\Sigma=1.00}(Te_{1.95}Sb_{0.01})_{\Sigma=1.96}$. (3) $PdTe_2$.

Polymorphism & Series: Forms a series with melonite.

Mineral Group: Melonite group.

Occurrence: A principal Pd–Pt-bearing mineral, associated with numerous other Pt–Pd species; typically in disseminated interstitial segregations of Cu–Fe–Ni sulfides and enclosing silicates.

Association: Moncheite, melonite, kotulskite, michenerite; sperrylite, laurite, cooperite; chalcopyrite, pyrrhotite, pentlandite, pyrite; chromite, magnetite.

Distribution: Some well-studied occurreences are: in South Africa, in Transvaal, from the Rustenburg mine, in the Merensky Reef, Bushveld complex [TL]; and at Messina. In the Great Dyke, Zimbabwe. From the Gabbro Akarem intrusion, Eastern Desert, Egypt. In Canada, in Ontario, at Werner Lake; Rathbun Lake; Temagami Island in Temagami Lake; the Lac des Iles complex; in the Thierry mine, near Pickle Lake; at the Sudbury district; from the Geordie Lake intrusion, Coldwell complex; in the Wellgreen Ni–Cu–PGE deposit, Yukon Territory; and elsewhere. In the USA, from the Stillwater complex, Montana; the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; and in the Key West mine, east of Moapa, Bunkerville district, Clark Co., Nevada. From the Las Aguilas Ni–Cu deposit, San Luis Province, Argentina. In China, from Shiaonanshan, Inner Mongolia, and in the Jinchuan deposit, Gansu Province. At Kambalda, Western Australia. From the Noril'sk region, western Siberia, Russia. Numerous other localities are now known.

Name: To honor Dr. Hans Merensky (1871–1952), who was instrumental in the discovery of the "Reef" also named for him.

Type Material: n.d.

Merlinoite $(K, Ca, Na, Ba)_7Si_{23}Al_9O_{64}\cdot 23H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 4 mm, forming radiating fibrous spheroidal aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 2.14–2.27 D(calc.) = 2.19–2.23

Optical Properties: Transparent. *Color:* White.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.499$ $\beta = 1.500$ $\gamma = 1.501$ 2V(meas.) = 56°

Cell Data: *Space Group:* $Immm$; $I4/mmm$ pseudotetragonal. $a = 14.116(7)$ $b = 14.229(6)$ $c = 9.946(6)$ Z = [1]

X-ray Powder Pattern: Cupaello, Italy.
3.176 (100), 7.115 (90), 7.080 (88), 3.258 (44), 3.241 (41), 5.359 (40), 3.226 (38)

Chemistry:

	(1)
SiO_2	51.82
Al_2O_3	18.04
Fe_2O_3	0.72
CaO	3.18
BaO	2.49
Na_2O	0.65
K_2O	7.53
LOI	15.57
Total	[100.00]

(1) Cupaello, Italy; by electron microprobe, H_2O taken as loss on ignition, recalculated to 100.00%; corresponding to $(K_{4.21}Ca_{1.49}Na_{0.55}Ba_{0.43}Fe_{0.24})_{\Sigma=6.92}Si_{22.68}Al_{9.31}O_{64}\cdot 22.74H_2O$.

Mineral Group: Zeolite group.

Occurrence: A secondary mineral in veins and cavities of silica-undersaturated volcanic rocks (Cupaello, Italy); an alteration product of cataclastized pegmatitic rocks in a differentiated alkalic massif (Khibiny massif, Russia); in manganese nodules (Indian Ocean).

Association: Phillipsite, apophyllite, chabazite, calcite.

Distribution: In the Cupaello quarry, near Santa Rufina, and at Valle Beachella, Sacrofano, near Rome, Lazio, Italy. In the Höwenegg quarry, Hegau, Baden-Württemberg, and in the Ortenberg quarry, Vogelsberg, Hesse, Germany. In Russia, in the Khibiny massif, Kola Peninsula. From the Central Indian basin, Indian Ocean. In Searles Lake, San Bernardino Co., California, USA.

Name: In honor of Stefano Merlino (1938–), Professor of Crystallography, University of Pisa, Pisa, Italy.

Type Material: Municipal Museum of Natural History, Milan, 18078; University of Modena, Modena, Italy; Natural History Museum, Paris, France; National Museum of Natural History, Washington, D.C., USA, 137087.

Merrihueite $(K,Na)_2(Fe^{2+},Mg)_5Si_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: [Hexagonal] (by analogy to osumilite). *Point Group:* $6/m\ 2/m\ 2/m$. In aggregates, to 150 μm, of smaller individuals, as inclusions in enstatite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.87

Optical Properties: Semitransparent. *Color:* Greenish blue; colorless to greenish blue in thin section, with anomalous blue to purple interference colors.
Optical Class: Uniaxial or anomalously biaxial. *Pleochroism:* Colorless to greenish blue.
n = 1.559–1.592; low to moderate birefringence. 2V(meas.) = 5°–10°

Cell Data: *Space Group:* [$P6/mcc$] (by analogy to osumilite). $a = 10.16(6)$ $c = 14.32(6)$
Z = 2

X-ray Powder Pattern: Mezö-Madaras meteorite; nearly identical to osumilite.
3.73 (100), 2.774 (100), 3.23 (90), 7.13 (80), 2.92 (60), 2.530 (50), 5.03 (30)

Chemistry:

	(1)
SiO_2	61.8
Al_2O_3	0.2
FeO	23.7
MnO	0.5
MgO	4.4
CaO	0.3
Na_2O	2.0
K_2O	3.8
Total	96.7

(1) Mezö-Madaras meteorite; by electron microprobe, corresponding to $(K_{0.94}Na_{0.76}Ca_{0.06})_{\Sigma=1.76}(Fe_{3.85}Mg_{1.27}Mn_{0.08})_{\Sigma=5.20}(Si_{12.00}Al_{0.02})_{\Sigma=12.02}O_{30}$.

Mineral Group: Milarite group; K > (Na+Ca); (Fe+Mn) > Mg; Al/(Al+Si) < 0.2.

Occurrence: Rare, in a few chondules of a chondrite, as inclusions in clinopyroxenes.

Association: Clinoenstatite, fayalitic olivine, nickel-iron.

Distribution: In the Mezö-Madaras chondritic meteorite.

Name: For Craig M. Merrihue (?–1965), meteoriticist, of the Smithsonian Astrophysical Observatory, Cambridge, Massachusetts, USA.

Type Material: n.d.

References: (1) Dodd, R.T., Jr., W.R. Van Schmus, and U.B. Marvin (1965) Merrihueite, a new alkali-ferromagnesian silicate from the Mezö-Madaras chondrite. Science, 149, 972–974. (2) (1965) Amer. Mertieite-I $Pd_{11}(Sb, As)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal; possibly monoclinic, pseudohexagonal. *Point Group:* n.d.
As small grains, to 0.5 mm.

Physical Properties: Hardness = n.d. VHN = 561–593, 578 average (50 g load).
D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* In polished section, brassy yellow. *Anisotropism:* Distinct.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 15.04$ $c = 22.41$ $Z = 18$

X-ray Powder Pattern: Goodnews Bay, Alaska, USA.
2.278 (vs), 2.171 (vs), 2.232 (m), 2.017 (m), 1.918 (m), 1.861 (m), 1.572 (m)

Chemistry:

	(1)
Pd	72.9
Cu	< 1.2
Sb	15.3
As	9.2
Total	< 98.6

(1) Goodnews Bay, Alaska, USA; by electron microprobe, average of four grains; corresponding to $(Pd_{11.03}Cu_{0.30})_{\Sigma=11.33}(Sb_{2.02}As_{1.98})_{\Sigma=4.00}$.

Polymorphism & Series: Dimorphous with isomertieite.

Occurrence: As fine grains in precious metal placer concentrates, apparently derived from ultramafic source rock.

Association: Gold, chromite, laurite, mertieite-II, Pt–Ir–Os alloys.

Distribution: In the USA, from the placer dredgings at Goodnews Bay, Alaska [TL].

Name: To honor John Beaver Mertie, Jr. (1888–1980), geologist, U.S. Geological Survey, who provided the original material; "I" to distinguish its unique composition and crystallography from that of mertieite-II and isomertieite.

Type Material: National Museum of Natural History, Washington, D.C., USA, 132499.

(1) Goodnews Bay, Alaska, USA; by electron microprobe, average of four grains and five areas; corresponding to $Pd_{8.26}(Sb_{2.46}As_{0.54})_{\Sigma=3.00}$. (2) Tweefontein Farm, South Africa; by electron microprobe, corresponding to $(Pd_{7.68}Cu_{0.34})_{\Sigma=8.02}(Sb_{2.67}As_{0.30}Sn_{0.03})_{\Sigma=3.00}$. (3) Oktyabr mine, Russia; by electron microprobe, corresponding to $(Pd_{7.53}Cu_{0.42})_{\Sigma=7.95}(Sb_{2.66}As_{0.34})_{\Sigma=3.00}$.

Occurrence: As fine grains in precious metal placer concentrates, apparently derived from an ultramafic source rock (Goodnews Bay, Alaska, USA); above massive cubanite–mooihoekite ore (Oktyabr mine, Russia).

Association: Gold, sperrylite, laurite, platarsite, ruthenarsenite, mertieite-I, genkinite, Pt–Ir–Os alloys, Pt–Fe alloy, stibiopalladinite, chalcocite, bornite, heazlewoodite, galena, chalcopyrite, pentlandite, valleriite, hauchecornite, parkerite, chromite.

Distribution: In the USA, from the placers at Goodnews Bay, Alaska [TL]; at the Stillwater complex, Montana. In the Wellgreen Ni–Cu–PGE deposit, Yukon Territory, Canada. From Tweefontein Farm, 26 km from Potgietersrus, and at the Onverwacht mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. From the Oktyabr mine, Noril'sk area, western Siberia, and around Zlatoust, Ural Mountains, Russia. At Hope's Nose, Torquay, Devon, England. From the Konttijärvi intrusion, northern Finland. In Australia, at the Round Hill deposit, Moorkaie Hill, northeast of Broken Hill, New South Wales. From the Baula conplex, Orissa, India. There are additional localities known, with material close in composition, but not fully confirmed as this species.

Name: To honor John B. Mertie, Jr. (1888–1980), geologist, U.S. Geological Survey, who provided the original material; "II" to distinguish its unique composition and crystallography from that of mertieite-I and isomertieite.

Type Material: n.d.

Merwinite $Ca_3Mg(SiO_4)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are rare and inevitably pitted and rounded, to 3 mm; compact, massive. *Twinning:* Polysynthetic on {100}, twin axis [013], common.

Physical Properties: *Cleavage:* Perfect on {100}. Hardness = 6 D(meas.) = 3.15–3.32 D(calc.) = 3.33

Optical Properties: Transparent to translucent. *Color:* Colorless, white, very pale green; colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 13°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.702–1.710$ $\beta = 1.710–1.714$ $\gamma = 1.718–1.728$ 2V(meas.) = 66°–76°

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 13.254(21)$ $b = 5.293(9)$ $c = 9.328(17)$ $\beta = 91.90(15)°$ Z = 4

X-ray Powder Pattern: Synthetic.
2.672 (100), 2.749 (40), 2.213 (40), 1.909 (40), 4.63 (30), 3.310 (30), 3.128 (30)

LOI	0.94
Total	100.02

(1) Crestmore, California, USA; corresponds to $Ca_{2.98}(Mg_{0.96}Fe_{0.06})_{\Sigma=1.02}(Si_{1.98}Al_{0.04})_{\Sigma=2.02}O_8$.

Occurrence: In siliceous dolomitic limestone in contact metamorphic zones, formed at relatively elevated temperatures, locally in substantial quantities.

Association: Gehlenite, spurrite, monticellite, vesuvianite (Crestmore, California, USA); spurrite, gehlenite, spinel (Scawt Hill, Ireland).

Distribution: In the USA, at Crestmore, Riverside Co., California; at Neihart, Cascade Co., Montana; and in the Christmas Mountains, Brewster Co., Texas. From Velardeña, Durango, Mexico. In Ireland, at Scawt Hill, near Larne, Co. Antrim. From near Kilchoan, Ardnamurchan, Argyllshire, and at Camas Mòr, Isle of Muck, Scotland. Found near Anakit Creek, at the mouth of the Lower Tunguska River, central Siberia, and in the Ozerskii massif, Lake Baikal, Russia. At Iglika, Elkhovsko district, Bulgaria. In the Hatrurim Formation, Israel.

Name: For Dr. Herbert Eugene Merwin (1878–1963), American mineralogist and petrologist, Carnegie Institute, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94030; The Natural History Museum, London, England, 1923,1026.

Mesolite $Na_2Ca_2Al_6Si_9O_{30}\cdot 8H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As prismatic crystals, elongated ‖ [001], to 20 cm; commonly in hairlike tufts and aggregates of fibers; divergent, radiating compact masses; in fibrous stalactites; porcelaneous, massive. *Twinning:* Characteristically twinned on {010} or {100}.

Physical Properties: *Cleavage:* {110}, $\{\bar{1}10\}$, perfect. *Fracture:* Uneven. *Tenacity:* Brittle, but compact masses are tough. Hardness = 5 D(meas.) = 2.26 D(calc.) = 2.27 May exhibit a small pyroelectric effect; piezoelectric.

Optical Properties: Transparent to translucent, opaque. *Color:* Colorless, white, gray, yellowish; in thin section, colorless. *Luster:* Vitreous, silky when fibrous.
Optical Class: Biaxial (+). *Orientation:* $X \wedge c \simeq 8°$; $Z = b$. *Dispersion:* $r > v$, strong.
$\alpha = 1.5048$ $\beta = 1.5050$ $\gamma = 1.5053$ 2V(meas.) = ∼80°

Cell Data: *Space Group:* $Fdd2$. $a = 18.4049(8)$ $b = 56.655(6)$ $c = 6.5443(4)$ Z = 8

X-ray Powder Pattern: Harbabkhandi, Iran.
6.585 (100), 2.857 (56), 2.885 (55), 4.715 (49), 5.858 (38), 4.196 (32), 4.600 (29)

Chemistry:

	(1)
SiO_2	46.98
Al_2O_3	26.43
CaO	10.06
Na_2O	4.57
K_2O	0.05
H_2O	11.94
Total	100.03

(1) Syhadree Mountains, Bombay, India; corresponds to $(Na_{1.70}K_{0.01})_{\Sigma=1.71}Ca_{2.07}Al_{5.99}Si_{9.04}O_{30}\cdot 7.66H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities of volcanic rocks, typically basalt, also in andesites, porphyries, and hydrothermal veins.

Association: Natrolite, scolecite, other zeolites, calcite.

Distribution: Many localities, but only a few provide large crystals or rich masses. On North Mountain and Gates Mountain, and at Cape Blomiden, Nova Scotia, Canada. In the USA, on Table Mountain, Jefferson Co., Colorado; large crystals from Skookumchuck Dam, near Bucoda, Thurston Co., Washington. In Oregon, from Goble, Columbia Co.; near Dollar, and on Shotgun Creek, Linn Co.; Springfield, Lane Co.; Ritter Hot Springs, Grant Co., and elsewhere. From Puy de Marman, near Veyre, Puy-de-Dôme, France. In Iceland, from the Breiddalur-Berufjord area. On Naalsoy, Streymoy, and others of the Faeroe Islands. Exceptional crystals from the Pashan Hills and other localities around Poona, Maharashtra, India.

Name: From the Greek for *middle*, alluding to its composition intermediate between natrolite and scolecite.

Messelite $\mathbf{Ca_2(Fe^{2+},Mn^{2+})(PO_4)_2 \cdot 2H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $[\bar{1}]$ (by analogy to fairfieldite). As internally radial globular, hemispherical, or sheaflike aggregates of lamellar crystals, to 1.5 cm; may be granular.

Physical Properties: *Cleavage:* Perfect on {001}, producing curved irregular surfaces. Hardness = 3.5 D(meas.) = 3.16 D(calc.) = n.d.

Optical Properties: Translucent. *Color:* White, pale greenish white, greenish gray, pink. *Luster:* Vitreous.
Optical Class: Biaxial (+). α = 1.644–1.654 β = 1.649–1.659 γ = 1.660–1.680
2V(meas.) = 5°–30°

Cell Data: *Space Group:* $[P\bar{1}]$ (by analogy to fairfieldite). Z = n.d.

X-ray Powder Pattern: Kings Mountain, North Carolina, USA.

(1) Palermo #1 mine, New Hampshire, USA. (2) Kings Mountain, North Carolina, USA.
(3) $Ca_2(Fe,Mn)(PO_4)_2 \cdot 2H_2O$ with Fe:Mn = 1:1.

Mineral Group: Fairfieldite group.

Occurrence: Principally as a late stage hydrothermal alteration product in zoned complex granite pegmatites.

Association: Triphylite, anapaite, vivianite, ludlamite, siderite, goyazite, whitlockite, herderite, amblygonite, eosphorite, brazilianite, graftonite, fairfieldite, phosphoferrite, huréaulite.

Distribution: In Germany, from the Prinz Heinrich von Hessen and the Messel oil slate mines, Messel, Hesse; and from Hagendorf, Bavaria. In the Norrö pegmatite, on Rånö Island, Sweden. At Přibyslavice, Czech Republic. In the Salsigne mine, 15 km north of Carcassone, Aude, France. From Kustanai, Kazakhstan. In the USA, at the Foote mine, near Kings Mountain, Cleveland Co., North Carolina; from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; at the Tip Top, White Elephant, Linwood, and Bull Moose mines, near Custer, Custer Co., and the Big Chief, Ingersoll, and Dan Patch mines, near Keystone, Pennington Co., South Dakota. Large crystals from Rapid Creek, Yukon Territory, Canada. At the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil.

Name: For the locality that produced the first specimens, Messel, Germany.

Meta-aluminite $Al_2(SO_4)(OH)_4 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Microcrystalline, minute laths, aggregated into nodular to irregular masses.

Physical Properties: Hardness = "Soft". D(meas.) = 2.18 D(calc.) = 2.17

Optical Properties: Semitransparent. *Color:* White. *Luster:* Somewhat silky. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$, probable. $\alpha = 1.497(1)$ $\beta = 1.512(1)$ $\gamma = \sim 1.513$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1/m$ or $P2/m$. $a = 7.930(3)$ $b = 16.879(4)$ $c = 7.353(5)$ $\beta = 106.74(7)^\circ$ Z = 4

X-ray Powder Pattern: Fuemrole mine, Utah, USA.
4.48 (100), 8.35 (79), 4.36 (67), 6.85 (53), 3.708 (35), 3.596 (34), 3.669 (30)

Chemistry:

	(1)	(2)
SO_3	26.26	25.98
Al_2O_3	33.59	33.09
H_2O	40.15	40.93
Total	[100.00]	100.00

(1) Fuemrole mine, Utah, USA; recalculated to 100% from an original total of 100.29% after deduction of Fe_2O_3 0.53% and SiO_2 0.77%; corresponds to $Al_{2.01}(SO_4)(OH)_{4.00} \cdot 5.00H_2O$.
(2) $Al_2(SO_4)(OH)_4 \cdot 5H_2O$.

Occurrence: A rare secondary mineral formed by reaction of acid sulfate solutions from oxidizing pyrite reacting with clay minerals (Fuemrole mine, Utah, USA).

Association: Gypsum, basaluminite (Fuemrole mine, Utah, USA).

Distribution: At the Fuemrole mine, Temple Mountain, Emery Co., Utah, USA. From Newhaven, Sussex, England.

Name: The prefix, from the Greek *meta*, indicates a lower hydrate than *aluminite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 109543.

References: (1) Frondel, C. (1968) Meta-aluminite, a new mineral from Temple Mountain, Utah. Amer. Mineral., 53, 717–721. (2) Farkas, L. and P.-E. Werner (1980) Powder diffraction studies on aluminite and meta-aluminite. Zeits. Krist., 151, 141–152.

Meta-alunogen $Al_4(SO_4)_6 \cdot 27H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (synthetic). *Point Group:* n.d. Typically in fibrous tangled masses and efflorescences, or crackled massive, altered from alunogen.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.85]

Optical Properties: Semitransparent. *Color:* White, pale yellow; colorless in transmitted light. *Luster:* Waxy to pearly.
Optical Class: Biaxial (+). *Orientation:* $X \perp b$. $\alpha = 1.469$ $\beta = 1.473$ $\gamma = 1.491$
2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 12.25$ $b = 13.95$ $c = 15.95$ Z = 4

X-ray Powder Pattern: Synthetic.
4.071 (100), 12.20 (26), 6.114 (11), 3.860 (9), 4.208 (7), 3.990 (5), 3.024 (4)

Chemistry:

	(1)	(2)
SO_3	41.04	41.03
Al_2O_3	17.33	17.42
H_2O	41.44	41.55
Total	99.81	100.00

(1) Francisco de Vergara, Chile. (2) $Al_4(SO_4)_6 \cdot 27H_2O$.

Occurrence: An uncommon mineral formed by dehydration of alunogen; found in sulfate-rich hydrothermal deposits and geothermal fields.

Association: Alunogen, pickeringite, halotrichite, mirabilite, kalinite, gypsum.

Distribution: From alum mines 3.5 km south of Francisco de Vergara, Antofagasta, Chile. In Ruatapu Cave and within the Te Kopia geothermal field, Taupo Volcanic Zone, New Zealand.

Name: For *meta*, indicating a lower hydrate, and *alunogen*.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 539–540, 537–539 [alunogen, part]. (2) Náray-Szabó, I (1969) Über die hydrate des Aluminiumsulfats. Acta Chimica Academiae Scientiarum Hungaricae, 60(1–2), 27–36 (in German).

Meta-ankoleite $K_2(UO_2)_2(PO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As tabular crystals with square outline, to 1 mm; in scaly aggregates.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {010}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.54(1) Radioactive; fluoresces yellow-green under SW and LW UV.

Optical Properties: Translucent. *Color:* Yellow.
Optical Class: Uniaxial (–). *Pleochroism:* Faint; yellow. $\omega = 1.580–1.583$ ϵ = n.d.

Cell Data: *Space Group:* $P4/nmm$. $a = 6.993(10)$ $c = 8.891(5)$ $Z = 1$

X-ray Powder Pattern: Mungenyi pegmatite, Uganda.
8.92 (100), 3.73 (65), 3.25 (55), 4.93 (50), 3.49 (50), 5.47 (45), 4.32 (40)

Chemistry:

	(1)	(2)
UO_3	60.8	62.43
P_2O_5	15.5	15.49
BaO	3.2	
K_2O	8.7	10.28
H_2O	11.8	11.80
Total	100.0	100.00

(1) Mungenyi pegmatite, Uganda; recalculated to 100% after removal of albite and quartz impurities; corresponds to $(K_{1.71}Ba_{0.20})_{\Sigma=1.91}(UO_2)_{1.97}(PO_4)_{2.02} \cdot 6.06H_2O$.
(2) $K_2(UO_2)_2(PO_4)_2 \cdot 6H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral in the weathered zone of a complex granite pegmatite (Mungenyi pegmatite, Uganda) and the sericitic matrix of a quartz sandstone (Sebungwe district, Zimbabwe).

Association: Muscovite, albite, quartz, phosphuranylite, grayite, zircon (Mungenyi pegmatite, Uganda).

Distribution: From the Mungenyi pegmatite, about 65 km southwest of Mbarara, Ankole district, Uganda. In the Sebungwe district, Zimbabwe. From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. At St. Yrieux, near Limoges, Haute-Vienne, France.

Name: For the Ankole district, Uganda, from which it was first characterized.

Type Material: Geological Survey Museum; The Natural History Museum, London, England, 1966,203 and 1966,204.

References: (1) Gallagher, M.J. and D. Atkin (1966) Meta-ankoleïte, hydrated potassium uranyl phosphate. Bull. Geol. Soc. Great Britain, 25, 49–54. (2) (1967) Amer. Mineral., 52, 560 (abs. ref. 1).

Meta-autunite $Ca(UO_2)_2(PO_4)_2 \cdot 2{-}6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$ or 422. As rectangular tabular crystals, exhibiting {001}, {111}, {110}, {011}, rarely pyramidal; as foliated or scaly aggregates.

Physical Properties: *Cleavage:* Perfect on {001}; indistinct on {010}. Hardness = 2–2.5 D(meas.) = 3.35–3.55 D(calc.) = 3.31 Radioactive. Fluoresces yellowish green under UV. Dehydrates irreversibly from autunite under ambient conditions.

Optical Properties: Translucent to opaque. *Color:* Lemon-yellow to greenish yellow, yellowish green, dark green. *Luster:* Pearly to dull.
Optical Class: Uniaxial (–), anomalously biaxial (–). *Pleochroism:* X = colorless to pale yellow; $Y = Z$ = dark yellow. *Orientation:* $Z = c$. *Dispersion:* $r > v$, strong. $\omega = 1.600$–1.611 $\epsilon = 1.594$–1.598 $\alpha = 1.596$–1.604 $\beta = 1.602$–1.622 $\gamma = 1.603$–1.630 2V(meas.) = 5–20°

Cell Data: *Space Group:* $P4/nmm$ or $P4_22$. $a = 6.99$ $c = 8.46$ Z = 1

X-ray Powder Pattern: Les Oudots mine, Saône-et-Loire, France. (ICDD 39-1351).
8.46 (100), 3.620 (60), 2.115 (35), 2.615 (30), 1.601 (25), 5.39 (20), 4.233 (20)

Chemistry: (1) The mineral usually analyzed as autunite; meta-autunite I contains $6H_2O$; meta-autunite II contains $2H_2O$ and probably does not occur in nature.

Mineral Group: Meta-autunite group.

Occurrence: A secondary mineral, formed as dehydration pseudomorphs after autunite.

Association: Autunite.

Distribution: Widespread. All autunite (q.v.) localities probably contain meta-autunite.

Name: The prefix *meta* indicates the dehydration product of *autunite*.

Metaborite HBO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals show combinations of {111}, {101}, {211}, to 1 cm, occurring typically in aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 2.47 D(calc.) = 2.489 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless to pale brown. *Luster:* Vitreous. *Optical Class:* Isotropic. $n = 1.618(2)$

Cell Data: *Space Group:* $P\bar{4}3n$. $a = 8.89(1)$ $Z = 24$

X-ray Powder Pattern: Ak-saĭ, Kazakhstan.
1.938 (10), 4.53 (5), 2.835 (4), 6.60 (3), 3.71 (3), 2.388 (3), 2.102 (3)

Chemistry:

	(1)	(2)
B_2O_3	77.60	79.44
MgO	2.15	
H_2O	20.00	20.56
Total	99.75	100.00

(1) Ak-saĭ, Kazakhstan. (2) HBO_2.

Occurrence: In fine-grained halite in a salt dome (Chalkar salt dome, Kazakhstan).

Association: Halite, anhydrite, kieserite, preobrazhenskite, boracite, aksaite, ginorite, hilgardite, strontioborite, halurgite (Chalkar salt dome, Kazakhstan).

Distribution: From the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, and at the Inder borate deposit, Kazakhstan.

Name: From the Greek *meta*, as a lesser hydrate than orthoboric acid.

Type Material: Mining Institute, St. Petersburg, 1015/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69825.

(1) Russia; corresponds to $(Ca_{0.37}Na_{0.31}Ba_{0.24}Pb_{0.08})_{\Sigma=1.00}O \cdot 2.1UO_3 \cdot 1.7H_2O$.

Occurrence: In the oxidation zone of a U–Mo deposit, replacing "pitchblende", and being replaced by uranophane.

Association: Uraninite, uranophane, bauranoite, calciouranoite, protasite.

Distribution: From an undisclosed locality [Streltsovskoe U–Mo deposit, eastern Transbaikal] in Russia.

Name: As a lower hydrate of *calciouranoite.*

Type Material: n.d.

Metacinnabar HgS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Commonly massive; rarely as small (to 1 mm) tetrahedral crystals having rough faces. *Twinning:* Common on {111}, forming lamellae in polished section.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 3 VHN = n.d. D(meas.) = 7.65 D(calc.) = 7.63

Optical Properties: Opaque. *Color:* Grayish black; in polished section, grayish white. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak, rarely. *Anisotropism:* Very weak, rarely. R: (400) 28.4, (420) 27.6, (440) 26.8, (460) 26.3, (480) 25.9, (500) 25.6, (520) 25.4, (540) 25.2, (560) 25.1, (580) 25.0, (600) 24.9, (620) 24.9, (640) 24.8, (660) 24.7, (680) 24.7, (700) 24.7

Cell Data: *Space Group:* $F\overline{4}3m$. a = 5.8717(5) Z = 4

X-ray Powder Pattern: Synthetic.

Total	99.62	98.10	98.12	100.00

(1) Guadalcázar, Mexico; corresponds to $(Hg_{0.85}Zn_{0.14})_{\Sigma=0.99}(S_{0.97}Se_{0.03})_{\Sigma=1.00}$. (2) Uland area, Russia; corresponds to $(Hg_{0.69}Cd_{0.21}Zn_{0.10}Fe_{0.01})_{\Sigma=1.01}S_{1.00}$. (3) San Onofre, Mexico; corresponds to $Hg_{1.00}(S_{0.80}Se_{0.20})_{\Sigma=1.00}$. (4) HgS.

Polymorphism & Series: Trimorphous with cinnabar and hypercinnabar.

Mineral Group: Sphalerite group.

Occurrence: In mercury deposits formed under low-temperature near-surface conditions.

Association: Cinnabar, mercury, wurtzite, stibnite, marcasite, realgar, calcite, barite, "chalcedony", hydrocarbons.

Distribution: Not uncommon in mercury deposits; may be a principal ore mineral. In the USA, in California, in the Redington mine [TL] and other properties, near Knoxville, Napa Co.; at the Ryne mine, Mt. Diablo, Contra Costa Co.; from New Almaden, Santa Clara Co.; at Skaggs Springs, Sonoma Co.; from New Idria, San Benito Co.; and many other places. At Terlingua, Brewster Co., Texas; from Marysvale, Ohio district, Piute Co., Utah; and in the Reward mines, Franklin, King Co., Washington. In Canada, from Read Island, Nanaimo mining division, British Columbia. In Mexico, at San Onofre, near Plateros, Zacatecas; also from Guadalcázar, San Luis Potosí. At Idrija (Idria), Slovenia. In Italy, from Levigliani, Tuscany. In Romania, at Baia Sprie (Felsőbánya). From Almadén, Ciudad Real Province, Spain. In the Uland area, Kurai ore zone, Altai Mountains, and other deposits in Russia. At Wen-Shan-Chang, Kweichow, and elsewhere in China.

Name: From the Greek for *with*, plus *cinnabar*, in allusion to its common association.

Metadelrioite $CaSrV_2^{5+}O_6(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Intimately intergrown in parallel orientation with delrioite, in radial fibrous aggregates of tiny acicular crystals.

Physical Properties: Hardness = ∼2 D(meas.) = 4.3 D(calc.) = 4.21 Readily soluble in H_2O.

Optical Properties: Translucent. *Color:* Light yellow-green to darker green on exposed surfaces, probably the result of photoreduction of some of the vanadium. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–); properties composite with delrioite. *Pleochroism:* X = colorless; Y = pale yellow; Z = deeper yellow. *Orientation:* Z = elongation; extinction parallel. $\alpha = 1.783(3)$ $\beta = 1.834(3)$ $\gamma = 1.866(3)$ 2V(meas.) = Medium to large.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 7.343(7)$ $b = 8.382(3)$ $c = 5.117(4)$ $\alpha = 111°39(2)'$ $\beta = 90°16(5)'$ $\gamma = 102°49(4)'$ Z = 2

X-ray Powder Pattern: Jo Dandy mine, Colorado, USA.
4.94 (s), 3.46 (s), 4.73 (ms), 2.683 (ms), 2.547 (m), 2.516 (m), 1.885 (m)

Chemistry:

	(1)	(2)
V_2O_5	46.6	50.58
CaO	13.5	15.59
SrO	24.8	28.82
H_2O^+	5.7	5.01
H_2O^-	9.4	
Total	[100.0]	100.00

(1) Jo Dandy mine, Colorado, USA; an estimated 1:5 mixture with delrioite, $CaSrV_2O_6(OH)_2 \cdot 3H_2O$, recalculated to 100% after deduction of quartz 1.30%.
(2) $CaSrV_2O_6(OH)_2$.

Occurrence: An efflorescence on sandstone of the Salt Wash member of the Jurassic Morrison Formation associated with a U–V deposit.

Association: Delrioite, rossite, metarossite, quartz.

Distribution: From a dump at the Hummer portal of the Jo Dandy mine, Bull Canyon district, Paradox Valley, Montrose Co., Colorado, USA.

Name: For its relation to *delrioite* and its lesser H_2O content.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128296.

Metaheinrichite $Ba(UO_2)_2(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 4, $4/m$, or 422. As tabular {001} crystals of square or rectangular outline, exhibiting {001}, {100}, and {110}, to 2 mm; as scaly aggregates.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {010}. *Fracture:* Irregular. Hardness = 2.5 D(meas.) = 4.04 D(calc.) = 4.09 Fluoresces bright green to greenish yellow under SW and LW UV. Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow to green. *Streak:* Pale yellow to white. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–), may be anomalously biaxial (–). *Pleochroism:* O = pale yellow; E = colorless. $\omega = 1.637$–1.641 $\epsilon = 1.609(1)$ 2V(meas.) = 0°–18°

Cell Data: *Space Group:* $P4_2$, $P4_2/m$, or $P4_222$. $a = 7.07$ $c = 17.74$ Z = 2

X-ray Powder Pattern: White King mine, Oregon, USA.
8.90 (vs), 3.75 (s), 5.54 (ms), 4.42 (ms), 3.55 (ms), 3.28 (ms), 4.99 (m)

Chemistry:

	(1)	(2)
UO_3	52.5	52.03
P_2O_5	2.4	
As_2O_5	15.8	20.91
CO_2	0.6	
PbO	0.9	
CaO	0.1	
BaO	13.3	13.95
H_2O	12.2	13.11
insol.	2.4	
Total	100.2	100.00

(1) White King mine, Oregon, USA; insoluble is rhyolite tuff. (2) $Ba(UO_2)_2(AsO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral derived by the weathering of primary uranium minerals.

Association: Heinrichite, zeunerite, nováčekite, erythrite, arseniosiderite, pitticite.

Distribution: From the White King mine, about 22 km northwest of Lakeview, Lake Co., Oregon, USA. In Germany, in the Black Forest, from the Sophia mine and on the Schmiedestollen dump, near Wittichen; in the Anton mine, Heubachtal, near Schiltach; from Reinerzau and Menzenschwand; also at Sailauf, northeast of Aschaffenburg, Bavaria; in Saxony, from Schneeberg; in Rhineland-Palatinate, at Ellweiler.

Name: The prefix *meta* indicates the dehydration product of *heinrichite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115884.

References: (1) Gross, E.B., A.S. Corey, R.S. Mitchell, and K. Walenta (1958) Heinrichite and metaheinrichite, hydrated barium uranyl arsenate minerals. Amer. Mineral., 43, 1134–1143. Metahewettite $CaV_6^{5+}O_{16}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As microscopic laths or tablets, flattened on {001}, in parallel or radial fibrous masses, pulverulent, and as coatings.

Physical Properties: Hardness = Soft. D(meas.) = 2.94 D(calc.) = 3.05 Reversibly hydrates to hewettite.

Optical Properties: Semitransparent. *Color:* Deep red; in transmitted light, red to orange. *Streak:* Maroon to brownish red. *Luster:* Dull to somewhat silky.
Optical Class: Biaxial (–). *Pleochroism:* X = light yellow-orange; Y = deep red; Z = deeper red. *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.70$ $\beta = 2.10$ $\gamma = \sim 2.23$ 2V(meas.) = n.d. 2V(calc.) = 52°

Cell Data: *Space Group:* $A2/m$. $a = 12.15(1)$ $b = 3.607(3)$ $c = 18.44(1)$ $\beta = 118°2(3)'$ Z = 2

X-ray Powder Pattern: Monument No. 2 mine, Arizona, USA.
8.19 (100), 3.578 (30), 2.812 (24), 2.206 (22), 3.062 (18), 2.295 (17), 5.36 (12)

Chemistry: No analyses appear to have been made. Existence of the trihydrate has been inferred from dehydration-rehydration studies of hewettite and unit cell volume calculations.

Occurrence: As an impregnation in sandstone (Colorado Plateau-type U–V deposits).

Association: Hewettite, gypsum, selenium.

Distribution: In the USA, in the Jo Dandy and Hummer mines, Paradox Valley, Montrose Co., Colorado; from the Cactus Rat mine group, Yellow Cat district, 24 km southeast of Thompson, Grand Co., Utah; in Arizona, at the Monument No. 2 mine, Monument Valley, Apache Co.; in the Ambrosia Lakes district, McKinley Co., New Mexico; from near Post, Crook Co., Oregon; and near Cockalorum Wash, Nye Co., Nevada. In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan.

Name: For its relation to *hewettite* and its lesser H_2O content.

Type Material: Harvard University, Cambridge, Massachusetts, 93306; National Museum of Natural History, Washington, D.C., USA, 93305–93308.

Metahohmannite $Fe_2^{3+}(SO_4)_2(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Pulverulent massive.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Orange.
Optical Class: Biaxial (+). *Pleochroism:* X = pale yellow; Y = reddish yellow; Z = reddish brown. $\alpha = 1.709$ $\beta = 1.718$ $\gamma = 1.734$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Saghand, Iran; artificially dehydrated from hohmannite. (ICDD 39–379).
7.18 (100), 4.27 (71), 3.28 (71), 2.96 (71), 2.70 (71), 2.49 (71), 9.7 (57)

Chemistry:

	(1)	(2)
SO_3	39.61	40.86
Fe_2O_3	39.25	40.75
H_2O	20.29	18.39
Total	99.15	100.00

(1) Alcaparrosa, Chile. (2) $Fe_2(SO_4)_2(OH)_2 \cdot 3H_2O$.

Occurrence: Formed by the partial dehydration of hohmannite.

Association: Hohmannite.

Distribution: In Chile, in Antofagasta, from Chuquicamata, at Quetena, west of Calama, and Alcaparrosa, near Cerritos Bayos, southwest of Calama. From Saghand, Yazd, Iran. At the Redington mercury mine, Knoxville, Napa Co., California, USA.

Name: The prefix, from the Greek, *meta*, indicates a lower hydrate than *hohmannite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 99049, 99051.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 608.

Metakahlerite $Fe^{2+}(UO_2)_2(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As square tabular crystals, to 80 μm, and in scaly aggregates.

Physical Properties: *Cleavage:* Perfect on {001}; good on {010}. Hardness = n.d. D(meas.) = 3.73–3.77 (synthetic) D(calc.) = [3.83] Radioactive.

Optical Properties: Transparent. *Color:* Yellow to yellow-brown. *Luster:* Pearly on {001}. *Optical Class:* Uniaxial (–), anomalously biaxial (–). *Pleochroism:* Weak; O = pale yellow; E = colorless. $\omega = 1.642(2)$ $\epsilon = 1.608(2)$ 2V(meas.) = 0°–22°

Cell Data: *Space Group:* n.d. $a = 20.25(1)$ $c = 17.20(1)$ Z = 16

X-ray Powder Pattern: Sophia mine, Germany; indistinguishable from metakirchheimerite. 8.55 (10), 3.59 (9), 4.30 (6), 5.11 (5), 3.45 (4), 3.01 (4), 2.15 (4)

Chemistry: (1) Sophia mine, Germany; no quantitative analysis performed, the qualitatively dominant presence of Fe, As, U confirmed by microchemical analysis.

Mineral Group: Meta-autunite group.

Occurrence: A secondary mineral in the oxidized zone of U–As bearing deposits.

Association: Arseniosiderite, scorodite, löllingite, uraninite, siderite (Hüttenberg, Austria); kahlerite (Southwick Cliffs, Scotland).

Distribution: In Germany, in the Black Forest, from the Sophia and St. Joseph mines and at the Schmiedestollen, near Wittichen, and from Menzenschwand; at Ellweiler, Rhineland-Palatinate; and from Schneeberg, Saxony. From Hüttenberg, Carinthia, Austria. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. From the Krantzberg mine, 20 km west of Karibib, Namibia.

Name: The prefix *meta* indicates the dehydration product of *kahlerite*.

Type Material: n.d.

Metakirchheimerite $Co(UO_2)_2(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As square tabular crystals, to 50 μm.

Physical Properties: *Cleavage:* Perfect on {001}; good on {010}. Hardness = 2–2.5 D(meas.) = > 3.33 D(calc.) = [4.11] Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale rose to flesh-pink; colorless in transmitted light. *Luster:* Pearly on {001}.
Optical Class: Uniaxial (–), anomalously biaxial (–). ω = 1.644(2) ϵ = 1.617(2)
2V(meas.) = 0°–20°

Cell Data: *Space Group:* n.d. $a = 6.98$ $c = 16.93$ Z = [2]

X-ray Powder Pattern: Sophia mine, Germany; indistinguishable from metakahlerite.
8.78 (10), 3.57 (10), 5.08 (6), 4.30 (6), 3.01 (6), 3.42 (5), 2.52 (5)

Chemistry: (1) Sophia mine, Germany; no quantitative analysis has been performed, qualitatively major Co, U, As and minor Fe, Ni were confirmed by microchemical analysis.

Mineral Group: Meta-autunite group.

Occurrence: A very rare secondary mineral formed in the oxidized zone of a U–As deposit.

Association: Metakahlerite, nováčekite, metaheinrichite, erythrite, uraninite.

Distribution: From the dump of the Sophia mine, near Wittichen, Black Forest, Germany.

Name: The prefix *meta* indicates membership of this species in the *meta-autunite* group; the name honors Professor Franz Waldemar Kirchheimer (1911–), former Director of the Geological Survey of Baden-Württemberg, Germany.

Type Material: n.d.

Metaköttigite $(Zn, Fe^{3+}, Fe^{2+})_3(AsO_4)_2 \cdot 8(H_2O, OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1 or $\overline{1}$. Tabular crystals, very small, intergrown with köttigite. *Twinning:* Universal on $\{1\overline{1}0\}$.

Physical Properties: *Cleavage:* $\{1\overline{1}0\}$, perfect. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.03

Optical Properties: Semitransparent. *Color:* Bluish gray.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = deep blue; Y = yellow; Z = light yellow.
$\alpha = 1.648(3)$ $\beta = 1.680(1)$ $\gamma = 1.716(2)$ 2V(meas.) = 94(1)°

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. a = 7.96(2) $b = 9.44(2)$ $c = 4.72(1)$ $\alpha = 95.6(2)°$ $\beta = 97.0(2)°$ $\gamma = 107.8(2)°$ Z = 1

X-ray Powder Pattern: Ojuela mine, Mexico; very similar to symplesite.
6.91 (100), 8.90 (40), 3.93 (30), 3.00 (30), 3.11 (25), 2.83 (25), 4.99 (20)

Chemistry:

	(1)
As_2O_5	37.36
FeO	14.70
CoO	0.09
ZnO	22.50
H_2O	[25.35]
Total	[100.00]

(1) Ojuela mine, Mexico; by electron microprobe, average of two analyses, total Fe as FeO, H_2O by difference; corresponds to $(Zn_{1.72}Fe_{1.27}Co_{0.01})_{\Sigma=3.00}(AsO_4)_{2.02} \cdot 8[H_2O, (OH)]$.

Polymorphism & Series: Dimorphous with köttigite.

Occurrence: A rare secondary mineral from the oxide zone of an arsenic-rich polymetallic mineral deposit, formed by oxidation and concomitant dehydrogenization of ferroan köttigite.

Association: Köttigite, smithsonite, adamite, goethite.

Distribution: In the Ojuela mine, Mapimí, Durango, Mexico.

Name: For its dimorphous relation to *köttigite*, and by analogy to *metavivianite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160541.

References: (1) Schmetzer, K., G. Amthauer, V. Stähle, and O. Medenbach (1982) Metaköttigite, $(Zn, Fe^{3+})(Zn, Fe^{3+}, Fe^{2+})_2(AsO_4)_2 \cdot 8(H_2O, OH)$, ein neues Mineral aus Mapimi, Mexiko. Metalodèvite $Zn(UO_2)_2(AsO_4)_2 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As lamellar crystals, elongated along [100] and flattened on {001}, to 2 mm; may be in divergent radial groups.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.00 Fluoresces faint yellow-green in SW UV. Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale to bright yellow, olive-green. *Luster:* Pearly.
Optical Class: Biaxial (–). *Pleochroism:* X = light brown; $Y = Z$ = pale yellow. $\alpha = 1.615(5)$ $\beta = 1.635(2)$ $\gamma = 1.638(2)$ 2V(meas.) = 27°–37°

Cell Data: *Space Group:* $P4_2/m$. $a = 7.16$ $c = 17.20$ Z = 2

X-ray Powder Pattern: Riviéral deposit, France.
3.59 (100), 8.66 (70), 2.98 (60), 5.09 (40), 3.50 (30), 2.545 (30), 2.288 (30)

Chemistry:

	(1)	(2)
UO_3	54.44	53.80
P_2O_5	0.76	
As_2O_5	20.64	21.61
FeO	0.63	
ZnO	6.47	7.65
H_2O	17.06	16.94
Total	[100.00]	100.00

(1) Riviéral deposit, France; recalculated from an original total of 99.43% after deduction of barite 7.40%; corresponds to $(Zn_{0.84}Fe_{0.09})_{\Sigma=0.93}(UO_2)_{2.00}[(AsO_4)_{1.88}(PO_4)_{0.12}]_{\Sigma=2.00} \cdot 9.96H_2O$.
(2) $Zn(UO_2)_2(AsO_4)_2 \cdot 10H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral formed by alteration of arsenic-bearing minerals.

Association: Sphalerite, coffinite, uraninite, arsenopyrite (Riviéral deposit, France); adamite, legrandite, köttigite, scorodite, pharmacosiderite (Sterling Hill, New Jersey, USA).

Distribution: From the Riviéral uranium deposit, Saint-Martin-du-Bosc, five km southeast of Lodève, and in the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France. From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: The prefix *meta* indicates membership in the *meta-autunite* group; the name is for Lodève, France, near which the first specimens were collected.

Type Material: Atomic Energy Commission, Fontenay-aux-Roses; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 165403.

Metamunirite β–$NaV^{5+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are fibrous, needlelike, or flattened laths, with dominant {101}, unterminated, to 1 mm; in clusters of radiating needles.

Physical Properties: *Cleavage:* The fibrous character is probably due to one or more perfect cleavages. *Tenacity:* Friable. Hardness = Very soft. D(meas.) = 2.877 (synthetic). D(calc.) = 2.926 Readily soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. $\alpha = 1.780(2)$ (synthetic). $\beta = 1.800(2)$ $\gamma =$ n.d. 2V(meas.) = 30°–40°

Cell Data: *Space Group: Pnma.* $a = 14.134(7)$ $b = 3.648(2)$ $c = 5.357(2)$ Z = 4

X-ray Powder Pattern: San Miguel Co., Colorado, USA; intensities from synthetic material. 5.05 (100), 2.957 (35), 3.530 (25), 3.241 (18), 3.016 (13), 2.685 (12), 7.07 (11)

Chemistry:

	(1)	(2)
V_2O_5	75.2	74.58
Na_2O	24.8	25.42
Total	[100.0]	100.00

(1) Deremo-Snyder mine, Colorado, USA; by electron microprobe, average of 31 determinations, recalculated to 100% to account for 8–10 wt% deficiency due to epoxy mounting medium between fibers. (2) $NaVO_3$.

Occurrence: Extremely rare, in cavities in vanadium-bearing sandstone.

Association: Rossite, metarossite, pascoite, clay minerals.

Distribution: From the Burro and Deremo-Snyder mines, near Slick Rock, San Miguel Co., Colorado, USA.

Name: For its relation to *munirite*, from which it may form by dehydration.

Type Material: National Museum of Natural History, Washington, D.C., USA, 168386.

Metanováčekite $Mg(UO_2)_2(AsO_4)_2 \cdot 4-8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As rims on other minerals, to 0.5 mm; typically pseudomorphous after nováčekite crystals.

Physical Properties: *Cleavage:* Perfect on {001}; good on {010}. Hardness = 2–2.5 D(meas.) = 3.51 D(calc.) = 3.72 Radioactive. Fluoresces yellow or yellow-green under UV. Reversibly dehydrates from nováčekite under ambient conditions.

Optical Properties: Translucent. *Color:* Yellow.
Optical Class: Uniaxial (–). *Pleochroism:* O = pale yellow; E = colorless. *Absorption:* $E < O$.
$\omega = 1.632–1.637$ $\epsilon = 1.595–1.620$

Cell Data: *Space Group:* $P4/n$. $a = 7.16$ $c = 8.58$ $Z = 1$

X-ray Powder Pattern: Anton mine, Germany.
8.52 (10), 3.57 (9), 2.14 (6), 4.29 (5), 1.791 (5), 5.05 (4b), 3.02 (4)

Chemistry: (1) Anton mine, Germany; no chemical analysis has been performed; identification is from correspondence of properties with synthetic $Mg(UO_2)_2(AsO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: Typically a dehydration product of nováčekite.

Association: Nováčekite (Germany, England); bassetite, saléeite (Sue mine, Arizona, USA).

Distribution: In Germany, in the Black Forest, from the Anton mine, Heubachtal, near Schiltach; at the Michael mine, Weiler, near Lahr; and the Clara mine, near Oberwolfach; in the Weisser Hirsch mine, Schneeberg, Saxony; from Ellweiler, Rhineland-Palatinate. In West Wheal Owles, St. Just, Cornwall, England. From the Sue mine, Cherry Creek area, Gila Co., Arizona, and on Twin Mountain, Comanche Co., Oklahoma, USA.

Name: The prefix *meta* indicates the dehydration product of *nováčekite*.

Type Material: n.d.

Metarossite $CaV_2^{5+}O_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals to 0.1 mm, platy, flaky, massive; as alteration rims on and complete replacements of rossite. *Twinning:* On $\{10\overline{1}\}$ as twin plane.

Physical Properties: *Tenacity:* Friable. Hardness = Soft. D(meas.) = n.d. D(calc.) = [2.80] Soluble in H_2O; alters to rossite on exposure to dry air, which is reversible.

Optical Properties: Semitransparent. *Color:* Very light yellow to pale greenish yellow; colorless to pale yellow in transmitted light. *Luster:* Dull to pearly. *Optical Class:* Biaxial (+). *Dispersion:* Strong. $\alpha = 1.840$ $\beta = > 1.85$ $\gamma = > 1.85$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.215(5)$ $b = 7.065(5)$ $c = 7.769(5)$ $\alpha = 92°58(10)'$ $\beta = 96°39(10)'$ $\gamma = 105°47(10)'$ Z = 2

X-ray Powder Pattern: Locality unspecified [Bull Pen Canyon, Colorado, USA]. 5.9 (s), 5.1 (s), 3.05 (m)

Chemistry:

	(1)	(2)	(3)
V_2O_5	64.08	64.20	66.38
MgO	0.10	0.13	
CaO	20.04	19.60	20.47
H_2O	13.56	14.08	13.15
insol.	2.72	2.48	
Total	100.50	100.49	100.00

(1–2) Bull Pen Canyon, Colorado, USA. (3) $CaV_2O_6 \cdot 2H_2O$.

Occurrence: In veinlets in carnotite-bearing sandstone (Bull Pen Canyon, Colorado, USA).

Association: Rossite, carnotite, gypsum (Bull Pen Canyon, Colorado, USA).

Distribution: In the USA, on M.E. O'Neil's [Buckhorn] claim, Bull Pen Canyon, Slick Rock district, San Miguel Co., and in Paradox Valley, Montrose Co., Colorado; along Spring Creek, Brushy Basin, Monticello district, San Juan Co., and in the Thompsons district, Grand Co., Utah; from the Monument No. 2 mine, Apache Co., Arizona.

Name: For its relation to *rossite*, from which it may form by dehydration.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95331A, R5707A.

Metaschoderite $Al_2(PO_4)(VO_4)\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Pseudomorphous after bladed to scaly schoderite crystals or spherulitic aggregates; in microcrystalline coatings.

Physical Properties: Hardness = ∼2 D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Yellowish orange. *Optical Class:* Biaxial (+). *Orientation:* $Y \wedge c = -20°$; $Z = b$. $\alpha = 1.598$ $\beta = 1.604$ $\gamma = 1.626$ 2V(meas.) = 56° 2V(calc.) = 59°

Cell Data: *Space Group:* $P2/m$ (probable). $a = 11.4$ $b = 14.9$ $c = 9.2$ $\beta = 79°$ Z = 4

X-ray Powder Pattern: Fish Creek Range, Nevada, USA.
7.5 (100), 14.9 (60), 11.1 (40), 3.02 (20), 9.6 (15), 4.92 (10), 5.68 (8)

Chemistry: (1) No chemical analysis has been performed, the hydration state determined by DTA of schoderite.

Occurrence: Typically a dehydration product of schoderite.

Association: Schoderite, wavellite, vashegyite (Fish Creek, Nevada, USA); metahewettite, schoderite, bokite, minyulite, leucophosphite (Cockalorum Wash, Nevada, USA); hewettite, duttonite, fervanite, schoderite, straczekite (Wilson Springs mine, Arkansas, USA).

Distribution: In the USA, from the Van-Nav-Sand claim group, Fish Creek Range, 48 km south of Eureka, Eureka Co., and near Cockalorum Wash, Nye Co., Nevada; at the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas.

Name: The prefix *meta* indicates the dehydration product of *schoderite*.

Type Material: n.d.

References: (1) Hausen, D.M. (1962) Schoderite, a new phosphovanadate mineral from Nevada. Amer. Mineral., 47, 637–648.

Metaschoepite $UO_3 \cdot 1{-}2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As topotactically oriented alteration rims, threaded by minute tubes ‖ [001], on schoepite crystals.

Physical Properties: *Cleavage:* [{001}] (by analogy to schoepite and paraschoepite, with which this is an intermediate dehydration product). *Tenacity:* [Brittle.] Hardness = [∼2.5] D(meas.) = n.d. D(calc.) = [4.69–4.97] Radioactive.

Optical Properties: Semitransparent. *Color:* Bright yellow.
Optical Class: Biaxial (–) (indices given here are intermediate between schoepite and paraschoepite). *Pleochroism:* X = almost colorless; $Y = Z$ = lemon-yellow to golden yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$. α = 1.690–1.700 β = 1.714–1.750 γ = 1.735–1.770 2V(meas.) = Large.

Cell Data: *Space Group: Pbna.* $a = 13.99(4)$ $b = 16.72(5)$ $c = 14.73(4)$ Z = 32

X-ray Powder Pattern: Shinkolobwe, Congo; identical to paraschoepite.
5.09 (100), 3.45 (25), 3.39 (17), 2.890 (7), 2.48 (7b), 2.542 (6), 2.023 (5)

Chemistry: Composition intermediate between schoepite, $UO_3 \cdot 2H_2O$, and paraschoepite, $UO_3 \cdot 1{-}2H_2O$.

Occurrence: An irreversible alteration product of schoepite from the oxidized zone of uranium-bearing mineral deposits.

Association: Schoepite, paraschoepite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). Probably at many other schoepite occurrences.

Name: From the Greek *meta*, for a lower hydration state, and its relation to *schoepite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94712.

References: (1) Christ, C.L. and J.R. Clark (1960) Crystal chemical studies of some uranyl oxide hydrates [schoepite II]. Amer. Mineral., 45, 1026–1061. (2) Christ, C.L. (1965) Phase transformations and crystal chemistry of schoepite. Amer. Mineral., 50, 235–239.

Metasideronatrite $Na_2Fe^{3+}(SO_4)_2(OH)\cdot 1{-}2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rare crystals are prismatic, elongated along [001], showing {010}, {110}, {011}; typically in radiating aggregates, to 2.5 cm, and in flat mats and crusts.

Physical Properties: *Cleavage:* On {100}, {010}, perfect; on {001}, nearly perfect. *Fracture:* Fibrous. Hardness = 2.5 D(meas.) = 2.68 D(calc.) = 2.68 Reversibly alters from sideronatrite depending on relative humidity and exposure to sunlight; decomposes in boiling H_2O.

Optical Properties: Transparent. *Color:* Golden yellow, straw-yellow; yellow in transmitted light. *Luster:* Silky.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Y = pale yellow; Z = brownish yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, strong. $\alpha = 1.543$ $\beta = 1.575$ $\gamma = 1.634$ 2V(meas.) = 60°

Cell Data: *Space Group:* *Pbnm* or $Pbn2_1$. $a = 7.357(3)$ $b = 16.002(4)$ $c = 7.102(8)$ Z = 2

X-ray Powder Pattern: Chuquicamata, Chile.
3.680 (100), 8.05 (90), 6.682 (70), 2.749 (50), 2.665 (50), 3.485 (40), 3.994 (30)

Chemistry:

	(1)	(2)	(3)
SO_3	48.66	48.68	46.15
Fe_2O_3	22.90	24.27	23.01
Na_2O	17.56	18.84	17.86
K_2O	0.26		
H_2O	9.75	8.21	12.98
insol.	0.60		
Total	99.73	100.00	100.00

(1) Chuquicamata, Chile; $(OH)^{1-}$ calculated for charge balance, corresponding to $(Na_{2.02}K_{0.02})_{\Sigma=2.04}Fe_{1.02}(SO_4)_{2.17}(OH)_{0.76}\cdot 1.55H_2O$. (2) $Na_2Fe(SO_4)_2(OH)\cdot H_2O$. (3) $Na_2Fe(SO_4)_2(OH)\cdot 2H_2O$.

Occurrence: An uncommon alteration product of pyrite, typically formed in arid climates but stably formed in sea-shore environments.

Association: Sideronatrite, metavoltine, ungemachite, ferrinatrite, alunogen, natrojarosite, pickeringite, sulfur, tamarugite, aluminocopiapite, metavoltine, mendozite, kornelite, gypsum.

Distribution: From Chuquicamata and the Sierra Gorda district, southwest of Calama, Antofagasta, Chile. In the USA, in the Capitol Reef National Monument, Wayne Co., Utah; from the Yazzie No. 101 mine, near Cameron, Coconino Co., Arizona; large radiating crystals at the Hot Springs Point sulfur mine, eight km east-southeast of Crescent Valley, Eureka Co., Nevada. In the Sydney coalfield, Nova Scotia, Canada. From Trerubies Cove, near Delabole, Cornwall, and at Barton-on-Sea, Hampshire, England. From north of Ballybunion, Co. Kerry, Ireland. At the Lanjarón mineral springs, Granada, Spain. In the Grotto de Faraglione, Port di Levante, Vulcano, Lipari Islands, Italy.

Name: From the Greek *meta*, signifying a lower hydrate, and its relation to *sideronatrite*.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 603–604. (2) Finney, J.J. Metastibnite Sb_2S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous to X-rays. *Point Group:* n.d. Primarily as stains, mammilary and powdery coatings, and impregnations of siliceous sinter.

Physical Properties: Hardness = 2–3 VHN = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Translucent, transparent in thin fragments. *Color:* Red, reddish brown, purplish; in polished section, bluish white, with intense red internal reflections in oil. *Streak:* Red. *Luster:* Submetallic. *Anisotropism:* Moderate in air.
R: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)	(3)
Sb	71.50	71.58	71.69
Pb		1.82	
S	26.56	27.57	28.31
Total	98.06	100.98	100.00

(1) Copiapó, Chile; by electron microprobe, corresponds to $Sb_{2.07}S_{2.93}$. (2) Rujevac deposit, Serbia; by electron microprobe, corresponds to $(Sb_{2.02}Pb_{0.03})_{\Sigma=2.05}S_{2.95}$. (3) Sb_2S_3.

Polymorphism & Series: Dimorphous with stibnite.

Occurrence: Appears to be of primary hydrothermal origin around fumarolic centers (The Geysers, California; Steamboat Springs, Nevada, USA); and the result of oxidation of stibnite (Copiapó, Chile).

Association: Cinnabar (The Geysers, California, USA); stibnite (Copiapó, Chile; Rujevac deposit, Serbia).

Distribution: In the USA, from Steamboat Springs, Washoe Co., Nevada [TL] and at The Geysers, Sonoma Co., California. From Canada, in the Lac Nicolet mine, South Ham, Quebec. In northern Chile, at the Alacrán Ag–As–Sb mine, Pampa Larga district, Copiapó. In Bolivia, at the San José mine, Oruro. From the Rujevac Sb–Zn–Pb deposit, western Serbia. In the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia.

Name: From the Greek for *with*, plus *stibnite*, in allusion to its composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 79185.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 275. (2) Brookins, D.G. Metastudtite $UO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Fibrous, or as elongated tablets, to 3 mm; in nodules.

Physical Properties: *Tenacity:* Flexible. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.67 Radioactive.

Optical Properties: Semitransparent. *Color:* Pale yellow. *Streak:* Yellowish white. *Luster:* Silky.
Optical Class: Biaxial (+). *Orientation:* $Z = c$. $\alpha = 1.640(2)$ $\beta = 1.658(2)$ $\gamma = 1.760(2)$ 2V(meas.) = n.d. 2V(calc.) = 47.7°

Cell Data: *Space Group:* *Immm* (probable). $a = 6.51(1)$ $b = 8.78(2)$ $c = 4.21(1)$ Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
5.22 (100), 3.538 (80), 4.38 (50), 3.79 (50), 3.214 (50b), 2.756 (30), 2.669 (20)

Chemistry:

	(1)	(2)
UO_4	88.1	89.34
H_2O	∼10.	10.66
Total		100.00

(1) Shinkolobwe, Congo; by electron microprobe, H_2O by TGA, considered very approximate.
(2) $UO_4 \cdot 2H_2O$.

Occurrence: Extremely rare, on museum specimens of dolomite and uraninite, from the oxidized zone of a uranium deposit.

Association: Uraninite, uranophane, soddyite, uranopilite, fourmarierite, wölsendorfite, rutherfordine, becquerelite, masuyite, kasolite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: As a dehydration product of *studtite*.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM13748 and RGM13755.

References: (1) Deliens, M. and P. Piret (1983) Metastudtite, $UO_4 \cdot 2H_2O$, a new mineral from Shinkolobwe, Shaba, Zaire. Amer. Mineral., 68, 456–458. (2) Walenta, K. (1974) On studtite and its composition. Amer. Mineral., 59, 166–171.

Metaswitzerite $Mn_3^{2+}(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular to bladed bent crystals, pseudomorphous after switzerite, to 5 mm.

Physical Properties: *Cleavage:* Perfect on {100}; fair on {010}. Hardness = ~2.5 D(meas.) = n.d. D(calc.) = 3.18 Topotactically transforms from switzerite.

Optical Properties: Translucent. *Color:* Pale golden brown. *Luster:* Adamantine to pearly. *Optical Class:* Biaxial (–). *Pleochroism:* Pale to dark red-brown. *Dispersion:* $r < v$, distinct. $\alpha = 1.602$ $\beta = 1.628$ $\gamma = 1.632$ 2V(meas.) = 42°

Cell Data: *Space Group:* $P2/a$. $a = 17.099$ $b = 12.694$ $c = 8.282$ $\beta = 95.91°$ Z = 8

X-ray Powder Pattern: Kings Mountain, North Carolina, USA.
8.55 (100), 2.585 (60), 7.128 (40), 6.775 (40), 3.175 (40), 2.934 (40), 2.842 (40)

Chemistry:

	(1)	(2)
P_2O_5	32.94	33.26
Al_2O_3	0.27	
SiO_2	0.06	
FeO	3.60	
MnO	46.05	49.86
MgO	0.15	
CaO	0.20	
H_2O	n.d.	16.88
Total	83.27	100.00

(1) Kings Mountain, North Carolina, USA; partial analysis by electron microprobe, average of six analyses, converted to metaswitzerite in the electron beam. (2) $Mn_3(PO_4)_2 \cdot 4H_2O$.

Occurrence: Forms by irreversible dehydration of switzerite on exposure to air.

Association: Switzerite, vivianite.

Distribution: From the Foote Mine, Kings Mountain, Cleveland Co., North Carolina, USA. On Reaphook Hill, near Blinman, from the Spring Creek mine, near Wilmington, Flinders Ranges, and in the Iron Monarch quarry, Iron Knob, South Australia.

Name: Emphasizes the close chemical and structural relations to *switzerite*.

Type Material: The Natural History Museum, London, England, 1967,407; National Museum of Natural History, Washington, D.C., USA, 120230.

References: (1) White, J.S., Jr., P.B. Leavens, and P.F. Zanazzi (1986) Switzerite redefined as $Mn_3(PO_4)_2 \cdot 7H_2O$, and metaswitzerite, $Mn_3(PO_4)_2 \cdot 4H_2O$. Amer. Metatorbernite $Cu(UO_2)_2(PO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$ (with $4/m$ $2/m$ $2/m$ pseudosymmetry). Typically pseudomorphous after torbernite, as square tabular crystals, flattened on {001} and modified by {011}, in lamellar or subparallel to sheaflike aggregates, and as rosettes, to 2 cm.

Physical Properties: *Cleavage:* Perfect on {001}; indistinct on {010}. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 3.52–3.70 D(calc.) = 3.70–3.71 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale green to dark green.
Luster: Vitreous, subadamantine, pearly on {001}.
Optical Class: Uniaxial (+) or uniaxial (–); anomalously biaxial in sectors. *Pleochroism:* Weak; O = green; E = pale green to blue. *Dispersion:* $r > v$, extreme. *Absorption:* $O > E$.
ω = 1.618–1.631 ϵ = 1.622–1.628

Cell Data: *Space Group:* $P4/n$. $a = 6.969$–6.972 $c = 17.277$–17.306 Z = 2

X-ray Powder Pattern: Schneeberg, Germany.
8.71 (100), 3.678 (100), 3.480 (80), 3.232 (80), 5.44 (75), 4.93 (75), 2.931 (70)

Chemistry:

	(1)	(2)
UO_3	59.67	61.01
P_2O_5	14.00	15.14
SiO_2	0.40	
CuO	8.50	8.48
H_2O	15.00	15.37
Total	97.57	100.00

(1) Gunnislake mine, England. (2) $Cu(UO_2)_2(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: Typically a secondary mineral, a dehydration product of torbernite formed during weathering; formed directly above 75 °C.

Association: Torbernite, meta-autunite.

Distribution: Widespread; probably occurs at all localities for torbernite (q.v.). First described from Schneeberg, Saxony, Germany. Material from the Gunnislake mine, Calstock, Cornwall, England, is thought to be primary.

Name: The prefix *meta* indicates the dehydration product of *torbernite*.

Metatyuyamunite $Ca(UO_2)_2(V_2O_8)\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As bladed crystals, elongated along [010], to 3 mm; typically pulverulent, massive; always pseudomorphous after tyuyamunite.

Physical Properties: *Cleavage:* Perfect on {001}; indistinct on {010} and {100}. Hardness = ∼2 D(meas.) = 3.81–3.93 D(calc.) = 3.85 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Canary-yellow to greenish yellow, darkening on exposure to air; colorless to pale yellow in transmitted light. *Luster:* Adamantine, waxy if massive.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = colorless; Y = very pale canary-yellow; Z = pale canary-yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, weak.
α = [1.62–1.68] β = 1.835–1.842 γ = 1.865–1.899 2V(meas.) = 44°–48°

Cell Data: *Space Group: Pnam.* $a = 10.63$ $b = 8.36$ $c = 16.96$ Z = 4

X-ray Powder Pattern: Small Spot mine, Colorado, USA.
8.51 (vs), 4.22 (s), 3.26 (mb), 3.05 (mb), 5.22 (w), 3.77 (w), 2.58 (w)

Chemistry:

	(1)	(2)
UO_3	66.80	66.21
V_2O_5	18.27	21.05
V_2O_4	2.25	
CaO	6.22	6.49
H_2O	6.57	6.25
Total	100.11	100.00

(1) Small Spot mine, Colorado, USA. (2) $Ca(UO_2)_2(V_2O_8)\cdot 3H_2O$.

Occurrence: A common dehydration product of tyuyamunite in Colorado Plateau-type U–V deposits.

Association: Tyuyamunite, carnotite, volborthite, vésigniéite, autunite, malachite, gypsum.

Distribution: Occurs at all localities for tyuyamunite (q.v.). First fully characterized from the Jo Dandy mine, Montrose Co., and the Small Spot and May Day mines, Calamity Mesa, Mesa Co., Colorado, USA.

Name: The prefix *meta* indicates the dehydration product of *tyuyamunite*.

Type Material: n.d.

Metauranocircite $Ba(UO_2)_2(PO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As rectangular tabular crystals flattened on {001}, and modified by {100} and {101}, to 2 cm; in subparallel growths and fanlike aggregates. *Twinning:* Lamellar twinning ∥ {100} and {010} observed optically.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {010}. *Tenacity:* Thin plates are flexible. Hardness = 2–2.5 D(meas.) = 3.94 D(calc.) = 3.95 Radioactive. Fluorescent green under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Yellow, yellow-green. *Luster:* Waxy, pearly on {001}.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = pale canary yellow.
Orientation: $X = c$. *Dispersion:* $r > v$. $\alpha = 1.610$ $\beta = 1.621$–1.623 $\gamma = 1.622$–1.623
2V(meas.) = 0°–45°

Cell Data: *Space Group:* $P4_2/n$. $a = 6.9526(5)$ $c = 17.6342(9)$ Z = 2

X-ray Powder Pattern: Streuberg, Bergen, Germany. (ICDD 36-407).
8.82 (100), 4.410 (55), 3.723 (50), 2.708 (20), 2.205 (18), 1.4621 (18), 5.46 (15)

Chemistry:

	(1)	(2)
UO_3	56.86	56.56
P_2O_5	15.06	14.03
BaO	14.57	15.16
H_2O	13.99	14.25
Total	100.48	100.00

(1) The Falkenstein, Germany. (2) $Ba(UO_2)_2(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: Typically a secondary mineral in the oxidized zone of some uranium deposits; may be primary in low-temperature veins.

Association: Autunite, torbernite.

Distribution: In Germany, from Bergen, near the Falkenstein, Vogtland, and from Schwarzenberg and Aue, Saxony; at Wölsendorf, Bavaria; and from Menzenschwand, Black Forest. A uranium ore at Cayrou, Entraygues, Aveyron, France. From Vinaninkarena, near Antsirabe, Madagascar. At the Mounana mine, Franceville, Gabon. In the USA, in the Honeycomb Hills, Juab Co., Utah; the Wind River Basin, Fremont Co., Wyoming; and from Annie Creek, Lawrence Co., South Dakota; found near Cameron, Coconino Co., Arizona.

Name: The prefix *meta* indicates the dehydration product of *"uranocircite"*, named for its content of *uranium*, and from the Greek for *falcon*, for its occurrence at the Falkenstein, Germany.

Type Material: State Museum for Mineralogy and Geology, Dresden; Mining Academy, Freiberg, Germany.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 987–988 [uranocircite = metauranocircite]. (2) Nuffield, E.W. and I.H. Meta-uranopilite $(UO_2)_6(SO_4)(OH)_{10}\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Needlelike to lathlike crystals.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d. Radioactive; fluoresces yellowish green under UV.

Optical Properties: Semitransparent. *Color:* Grayish yellow with a brownish tint. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.72$ $\beta = 1.76$ $\gamma = 1.76$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
SO_3	4.17	4.05
UO_3	82.40	86.83
Fe_2O_3	2.03	
H_2O	9.40	9.12
Total	98.00	100.00

(1) Jáchymov, Czech Republic; Fe_2O_3 probably "limonite". (2) $(UO_2)_6(SO_4)(OH)_{10}\cdot 5H_2O$.

Occurrence: On a museum specimen from a uranium-bearing hydrothermal ore deposit [may = jáchymovite].

Association: Uranopilite.

Distribution: From Jáchymov (Joachimsthal), Czech Republic.

Name: From the Greek *meta*, for a lower hydrate, and its relation to *uranopilite*.

Type Material: National Museum, Prague, Czech Republic, listed but cannot be located.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 582–583. (2) Frondel, C. (1952) Studies of uranium minerals (X): uranopilite. Amer. Metauranospinite $Ca(UO_2)_2(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As small tabular crystals with square to rectangular outline.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 2–3. D(meas.) = n.d. D(calc.) = 3.65 Radioactive.

Optical Properties: Translucent. *Color:* Yellow. *Luster:* Pearly on {010}. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; X = colorless; Z = pale yellow. α = n.d. β = n.d. $\gamma = 1.618$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 7.14$ $c = 17.00$ Z = 2

X-ray Powder Pattern: Clara mine, Germany.
8.65 (10), 3.57 (10), 3.31 (9), 5.53 (8), 3.00 (5), 5.08 (4), 4.36 (4b)

Chemistry: (1) Identity established by microchemical analysis yielding only Ca, U, As, and coincidence with the X-ray pattern of synthetic material.

Mineral Group: Meta-autunite group.

Occurrence: A secondary mineral of the oxide zone in a hydrothermal polymetallic barite–fluorite deposit.

Association: n.d.

Distribution: From the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: The prefix *meta* indicates the dehydration product of *uranospinite*.

Type Material: n.d.

Metavandendriesscheite $PbU_7O_{22}\cdot nH_2O$ (n < 12)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* [$2/m$ $2/m$ $2/m$ or $mm2$] (by analogy to vandendriesscheite). A very fine-grained alteration product, intergrown in parallel and threaded with minute tubes, within vandendriesscheite crystals.

Physical Properties: Hardness = n.d. D(meas.) = 5.45 D(calc.) = [5.71–5.79] Alters from vandendriesscheite by dehydration.

Optical Properties: Transparent. *Color:* [Amber-yellow, yellowish orange to orange] (by analogy to vandendriesscheite).
Optical Class: Biaxial (–) (optics given here are for vandendriesscheite). *Pleochroism:* X = nearly colorless; $Y = Z$ = yellow-orange to golden yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong. $\alpha = 1.780(5)$ $\beta = 1.850(10)$ $\gamma = 1.860(10)$ 2V(meas.) = 60(2)°

Cell Data: *Space Group:* [$Pmma$, $P2_1ma$, or $Pm2a$] (by analogy to vandendriesscheite).
$a = 14.07(30)$ $b = 41.31(30)$ $c = 43.33(30)$ Z = [35]

X-ray Powder Pattern: Shinkolobwe, Congo; pattern here identical to vandendriesscheite with which it is inextricably intergrown.
7.24 (100), 3.61 (100), 3.17 (75), 1.985 (40), 3.53 (25b), 2.522 (25), 2.034 (15)

Chemistry: An analysis of pure metavandendriesscheite has not been made; its hydration is variable, less than vandendriesscheite, from which it alters by dehydration.

Occurrence: In the oxidized zone of a uranium-bearing mineral deposit.

Association: Vandendriesscheite, fourmarierite, becquerelite, metatorbernite, rutherfordine, uraninite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). Presumably other vandendriesscheite localites are likewise localities for metavandendriesscheite.

Name: As a dehydration product of *vandendriesscheite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 106523.

References: (1) Christ, C.L. and J.R. Clark (1960) Crystal chemical studies of some uranyl oxide hydrates [vandendriesscheite-II]. Amer. Mineral., 45, 1026–1061.

H_2O	[6.56]	6.55
Total	[100.00]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of five analyses, H_2O by difference; corresponds to $U(UO_2)_{3.01}(PO_4)_{1.98}(OH)_6 \cdot 2.02H_2O$. (2) $U(UO_2)_3(PO_4)_2(OH)_6 \cdot 2H_2O$.

Occurrence: A rare secondary mineral in the uraniferous zone of an altered granite pegmatite, formed by dehydration of vanmeersscheite.

Association: Vanmeersscheite, studtite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: The prefix *meta* indicates the dehydration product of *vanmeersscheite*.

Type Material: University of Liège, Liège, F360; Royal Museum of Central Africa, Tervuren, Belgium, RMG13749.

References: (1) Piret, P. and M. Deliens (1982) La vanmeersscheite $U(UO_2)_3(PO_4)_2(OH)_6 \cdot 4H_2O$, et la méta-vanmeersscheite $U(UO_2)_3(PO_4)_2(OH)_6 \cdot 2H_2O$, nouveaux minéraux. Bull. Metavanuralite $Al(UO_2)_2(V_2O_8)(OH)\cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As multiply terminated prismatic crystals, dominated by {001} and {100}, pseudomorphous after vanuralite. *Twinning:* On {001}.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d. Radioactive.

Optical Properties: Semitransparent. *Color:* Yellow to greenish yellow. *Optical Class:* Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.46(3)$ $b = 8.44(3)$ $c = 10.43(3)$ $\alpha = 75°53(20)'$ $\beta = 102°50(20)'$ $\gamma = 90°0(20)'$ Z = 2

X-ray Powder Pattern: Mounana mine, Gabon.
9.92 (FFF), 4.174 (FF), 3.153 (FF), 4.086 (F), 3.240 (F), 3.073 (F), 5.10 (mF)

(1) Mounana mine, Gabon; by colorimetric analysis, H_2O by the Penfield method.
(2) $Al(UO_2)_2(V_2O_8)(OH)\cdot 8H_2O$.

Occurrence: In the oxidized zone of a lead-bearing U–V deposit, formed as a reversible dehydration product of vanuralite.

Association: Vanuralite.

Distribution: From the Mounana uranium mine, Franceville, Gabon.

Name: The prefix *meta* indicates the dehydration product of *vanuralite*.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 165404, R16486.

Metavariscite $AlPO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As pseudo-orthorhombic crystals, composed principally of {010}, {011}, {130}, {110}; tabular on {010} and either equant or bladed by elongation along [100] or [001]; in spheroidal aggregates, granular. *Twinning:* By contact on {102}.

Physical Properties: *Cleavage:* On {010}. Hardness = 3.5 D(meas.) = 2.51–2.54 D(calc.) = 2.535

Optical Properties: Transparent to translucent. *Color:* Pale green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = colorless; $Y = Z$ = light green.
Orientation: $Y = b$. *Dispersion:* $r < v$, perceptible. $\alpha = 1.551$ $\beta = 1.558$ $\gamma = 1.582$
2V(meas.) = 55°

Cell Data: *Space Group:* $P2_1/n$. $a = 5.178(2)$ $b = 9.514(2)$ $c = 8.454(2)$ $\beta = 90.35(2)°$

(1) Utahlite Hill, Utah, USA. (2) $AlPO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with variscite.

Occurrence: Commonly a product of weathering phosphatic rocks; may form as concretions by the phosphatization of kaolin during weathering; probably a reaction product of phosphate fertilizer in acid soil.

Association: Variscite.

Distribution: In the USA, from the Edison-Bird mine, on Utahlite Hill, eight km northwest of Lucin, Box Elder Co., Utah; at Candelaria, Mineral Co., and the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada; from Twin Creek, Island Park, Fremont Co., Idaho; at the Mauldin Mountain quarry, near Mt. Ida, Montgomery Co., Arkansas. On Malpelo Island, west of Buenaventura, Colombia. From the Gunheath china clay pit, five km north-northwest of St. Austell, Cornwall, England. At Palazuelo de las Arribas, Zamora, Spain.

Name: For the dimorphous relation with *variscite*.

Type Material: The Natural History Museum, London, England, 1912,618; National Museum of Natural History, Washington, D.C., USA, 87484, 87485, 87495, 86933.

Metavauxite $Fe^{2+}Al_2(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic to acicular crystals, elongated along [001], showing {100}, {110}, {$\bar{1}$01}, {$\bar{1}$11}, {$\bar{2}$11}, to 2 cm; commonly in radiating aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.345 D(calc.) = [2.36]

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale green; colorless in thin section. *Luster:* Vitreous to silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c \simeq -17°$. $\alpha = 1.550(1)$ $\beta = 1.561(1)$ $\gamma = 1.577(1)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1/c$. $a = 10.22$ $b = 9.56$ $c = 6.94$ $\beta = 97.9°$ Z = 2

X-ray Powder Pattern: Llallagua, Bolivia.

(1) Big Chief mine, South Dakota, USA; by electron microprobe, total Fe as FeO, H_2O from ideal formula with $8H_2O$. (2) Do.; analysis (1) with Fe^{2+}:Fe^{3+} = 1.14:1.86 from Mössbauer spectroscopy.

Occurrence: A secondary mineral typically formed from oxidizing vivianite, in complex granite pegmatites; authigenic, in bogs and soils.

Association: Kryzhanovskite, triphylite (Big Chief mine, South Dakota, USA); vivianite (many authigenic occurrences).

Distribution: Likely more widespread than reported here. Confirmed localities include: in the USA, from the Big Chief mine, one km south of Glendale, Pennington Co., South Dakota; Carroll, Carroll Co., Virginia. Large crystals from the Big Fish River area, Yukon Territory, Canada. From several localities in New Zealand, as at Hunua. Along the Wannon River, Victoria, Australia. At Wheal Jane, Truro, Cornwall, England. In the Norrö pegmatite, on Rånö Island, Sweden. From the Kamysh-Burun iron deposit, near Kerch, Crimean Peninsula, Ukraine.

Name: The prefix *meta* indicates the dehydration product of *vivianite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 127100.

Metavoltine $K_2Na_6Fe^{2+}Fe_6^{3+}O_2(SO_4)_{12}\cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$ or 3. Crystals are thick hexagonal plates, to 1 mm, with large {0001}, {10$\bar{1}$0}, modified by a number of minor forms; commonly in granular to scaly aggregates and crusts.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = 2.5 D(meas.) = 2.51; 2.396 (synthetic). D(calc.) = 2.435 Partly soluble in H_2O.

Optical Properties: Translucent. *Color:* Yellowish brown, orange-brown, greenish brown. *Luster:* Resinous.
Optical Class: Uniaxial (–). *Pleochroism:* O = dark brown, brown, dark yellow, dark yellow-orange; E = pale yellow, pale greenish yellow, very pale yellow. ω = 1.588–1.595 ϵ = 1.572–1.581

Cell Data: *Space Group:* $P\bar{3}$ or $P3$. $a = 9.575(5)$ $c = 18.17(1)$ Z = 1

X-ray Powder Pattern: Madeni Zakh, Iran.

(1) La Campania, Chile. (2) Sierra Gorda [district], Chile; corresponds to $K_{1.98}Na_{6.02}(Fe^{2+}_{0.66}Cu_{0.32}Zn_{0.06})_{\Sigma=1.04}Fe^{3+}_6O_{2.04}(SO_4)_{12}\cdot 18.12H_2O$. (3) $K_2Na_6Fe^{2+}Fe^{3+}_6O_2(SO_4)_{12}\cdot 18H_2O$.

Occurrence: Typically an alteration product of pyrite in arid climates; formed as a fumarolic sublimate and solfataric precipitate; may be a post-mining product.

Association: Voltaite, botryogen, ferrinatrite, coquimbite, copiapite, sideronatrite, metasideronatrite, jarosite, alunogen, pickeringite, sulfur, gypsum.

Distribution: From near Madeni Zakh, Iran. In Italy, on Vesuvius, at the Grotta dello Zolfo, Miseno, and from Solfatara di Pozzuoli, Campi Flegrei, near Naples, Campania; in the Cetine mine, 20 km southwest of Siena, Tuscany; from the Grotto de Faraglione, Port di Levante, Vulcano, Lipari Islands. At volcanoes on the Kamchatka Peninsula, Russia. In England, from Wheal Edward, St. Just, Cornwall, and in the Brigham quarries, Cockermouth, Cumbria. On Tristan da Cunha Island, South Atlantic Ocean. From Hainaut, Belgium. At Cervenica-Dubnik, Slovakia. From Jáchymov (Joachimsthal), Czech Republic. In the USA, in the Sulfur Hole prospect, near Borate, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co., California; at Steamboat Hot Springs, Washoe Co., Nevada; from Bisbee, Cochise Co., Arizona. In Chile, in Antofagasta, at Quetena, west of Calama; Alcaparrosa, near Cerritos Bayos, and Sierra Gorda, both southwest of Calama, and at Chuquicamata. In Argentina, from the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province, and in the Capillitas mine, Catamarca Province.

Name: From the Greek for *with* and *voltaite*, as originally associated with that species.

Type Material: Institute of Mineralogy and Crystallography, University of Vienna, Vienna, Austria; Natural History Museum, Paris, France, 100.154.

Metazellerite $Ca(UO_2)(CO_3)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$ or $2/m\ 2/m\ 2/m$. A topotactic replacement of fibrous zellerite.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.414 Radioactive.

Optical Properties: Translucent. *Color:* Pale yellow. *Luster:* Chalky.
Optical Class: Biaxial (–). *Orientation:* $Z = c$. $n = 1.626$ α = n.d. β = n.d. γ = n.d.
2V(meas.) = n.d.

Cell Data: *Space Group:* $Pbn2_1$ or $Pbnm$. $a = 9.718(5)$ $b = 18.226(9)$ $c = 4.965(4)$
Z = 4

X-ray Powder Pattern: Lucky Mc mine, Wyoming, USA.
9.10 (100), 3.794 (50), 4.695 (36), 4.296 (36), 4.552 (18), 4.412 (18), 3.978 (18)

Chemistry: (1) No analysis could be performed; crystal chemical considerations indicate dehydration from $5H_2O$ in zellerite to $3H_2O$ in metazellerite.

Occurrence: A dehydration product of zellerite.

Association: Zellerite, gypsum, "limonite", iron sulfides, schoepite, meta-autunite, uranophane, voglite, "opal".

Distribution: In the USA, from the Lucky Mc mine, Wind River Basin, Fremont Co., Wyoming; in the White Canyon # 1 mine, Frey Point, San Juan Co., Colorado. At Jáchymov (Joachimsthal), Czech Republic. Other zellerite localities must also have this species.

Name: From the Greek *meta*, for a lower hydrate of *zellerite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112827.

References: (1) Coleman, R.G., D.R. Ross, and R. Meyrowitz (1966) Zellerite and metazellerite, new uranyl carbonates. Amer. Mineral., 51, 1567–1578.

(1) Schneeberg, Germany. (2) $Cu(UO_2)_2(AsO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of arsenic-bearing hydrothermal uranium deposits.

Association: Torbernite, trögerite, walpurgite, uranospinite, erythrite, mimetite, pharmacosiderite, olivenite, chalcophyllite.

Distribution: Many minor localities, but few for good specimens. Well-studied material from: in Germany, at the Weisser Hirsch mine, Neustädtel-Schneeberg, Saxony; in the Anton mine, Heubachtal, near Schiltach, Black Forest. From Wheal Gorland, Gwennap, and at Wheals Owles and Edward and the Geevor mine, St. Just, Cornwall, England. From the Cap Garonne mine, near le Pradet, Var, France. In the USA, in the Centennial Eureka mine, Tintic district, Juab Co., Utah; from the Majuba Hill mine, Antelope district, Pershing Co., Nevada; large crystals at the Grandview mine, Grand Canyon, Coconino Co., Arizona. From Talmessi, Anarak, Iran. In the Bali Lo copper prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia; at the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia; and in the South Alligator Valley, Northern Territory, Australia. Large thick crystals from the Pedra Preta mine, Brumado, Bahia, Brazil.

Name: The prefix *meta* indicates the dehydration product of *zeunerite*.

Type Material: State Museum of Mineralogy and Geology, Dresden; Mining Academy, Freiberg, Germany, 21730.

Meurigite $KFe_7^{3+}(PO_4)_5(OH)_7 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. As tabular {001} to fibrous crystals elongated along [010], typically in hemispheres and globular aggregates of radiating crystals, to 2 mm; as fibrous rosettes or drusy coatings.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = ∼3 D(meas.) = 2.96 D(calc.) = 2.86

Optical Properties: Translucent. *Color:* Yellowish brown, cream to white, canary-yellow, pale yellow to pale orange. *Streak:* Very pale yellow to cream. *Luster:* Vitreous, waxy to silky. *Optical Class:* Biaxial (+). $\alpha = 1.780(5)$ $\beta = 1.785(5)$ $\gamma = 1.800(5)$ 2V(meas.) = n.d. 2V(calc.) = 60°

Cell Data: *Space Group:* $C2$, Cm, or $C2/m$. $a = 29.52(4)$ $b = 5.249(6)$ $c = 18.26(1)$ $\beta = 109.27(7)°$ Z = 4

X-ray Powder Pattern: Santa Rita mine, New Mexico, USA.
3.216 (100), 4.84 (90), 3.116 (80), 4.32 (70), 9.41 (60), 3.470 (60), 4.25 (50)

Chemistry:

H_2O	16.2	17.74
Total	99.37	100.00

(1) Santa Rita mine, New Mexico, USA; by electron microprobe, average of five analyses, total Fe as Fe_2O_3, H_2O and CO_2 by CHN analyzer; corresponding to $(K_{0.85}Na_{0.03})_{\Sigma=0.88}(Fe_{7.01}Al_{0.16}Cu_{0.02})_{\Sigma=7.19}(PO_4)_{5.11}(CO_3)_{0.20}(OH)_{6.7} \cdot 7.25H_2O$. (2) $KFe_7(PO_4)_5(OH)_7 \cdot 8H_2O$.

Occurrence: A late-stage mineral, rare at all localities. Along fault gouge in the oxidized zone of a copper sulfide deposit (Santa Rita mine, New Mexico, USA); by alteration of triphylite in granite pegmatite (Hagendorf, Germany); in the oxidized zone of a low-temperature sediment-hosted Carlin-type hydrothermal gold deposit (Gold Quarry mine, Nevada, USA).

Association: Dufrénite, beraunite, leucophosphite, hematite (Santa Rita mine, New Mexico, USA); nontronite, rockbridgeite, apatite, vivianite, strengite, beraunite, robertsite-mitridatite, cyrilovite, laueite, stewartite (Hagendorf, Germany); fluellite, kingite, tinticite, leucophosphite, strengite/variscite, hewettite, tyuyamunite, torbernite (Gold Quarry mine, Nevada, USA); rockbridgeite, cyrilovite, leucophosphite (Wycheproof, Australia).

Distribution: In the USA, from the Santa Rita copper mine, Silver City, Grant Co., New Mexico; in the Gold Quarry mine, near Carlin, Maggie Creek district, and at the Goldstrike mine, Lynn district, Eureka Co., and from the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada. At Hagendorf and Waidhaus, Bavaria, and from Rengersdorf, Saxony, Germany. At Wycheproof, Victoria, Australia.

Name: Honors Professor John Meurig Thomas (1932–), crystal chemist, University of Cambridge, Cambridge, England.

Type Material: n.d.

Meyerhofferite $CaB_3O_3(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Rare as complex acicular to crude crystals, to ~4 cm, in fibrous divergent, radiating aggregates, commonly reticulated; may be nodular.

Physical Properties: *Cleavage:* On {010}, perfect; in traces on {100} and {1$\overline{1}$0}. Hardness = 2 D(meas.) = 2.120 D(calc.) = 2.125

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale yellow. *Luster:* Vitreous to silky.
Optical Class: Biaxial (–). *Orientation:* X (165°,62°); Y (45°30′,47°); Z (-83°,55°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r > v$. $\alpha = 1.500$ $\beta = 1.535$ $\gamma = 1.560$ 2V(meas.) = 78°

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.632(1)$ $b = 8.337(1)$ $c = 6.4748(6)$ $\alpha = 90.81(1)°$ $\beta = 101.97(1)°$ $\gamma = 86.76(1)°$ Z = 2

X-ray Powder Pattern: Mt. Blanco, California, USA. (ICDD 12-411).
8.31 (100), 6.47 (100), 4.97 (25), 4.15 (20), 3.15 (20), 3.07 (20), 2.501 (20)

H_2O		28.21
Total	100.61	100.00

(1) Mt. Blanco, California, USA. (2) $CaB_3O_3(OH)_5 \cdot H_2O$.

Occurrence: Typically a minor component of sedimentary or lake-bed borate deposits.

Association: Inyoite, colemanite, hydroboracite, ulexite.

Distribution: In the USA, from the Mt. Blanco deposit and along Gower Gulch, Furnace Creek district, Death Valley, Inyo Co., and in the Kramer borate deposit, Boron, Kern Co., California. At Mesa del Almo, 13 km southeast of Magdalena, Sonora, Mexico. In Argentina, at the Anita mine, Sijes district, and in the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province. In Turkey, from many deposits in the Bigadiç borate district, Balıkesir Province; in the Killik and Espey borate mines, near Emet, Kütahya Province. At the Inder borate deposit, Kazakhstan.

Name: Honoring Professor Wilhelm Meyerhoffer (1864–1906), German chemist, who first synthesized the compound.

Type Material: Harvard University, Cambridge, Massachusetts, 134572; National Museum of Natural History, Washington, D.C., USA, 87237, 93640.

Meymacite $WO_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous, or nearly so. *Point Group:* n.d. Powdery.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 3.94–4.10 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Yellow-brown. *Luster:* Resinous to vitreous. *Optical Class:* Isotropic. $n = > 2$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Nzombe, Congo.
3.81, diffuse.

Chemistry:

	(1)	(2)
WO_3	84.1	86.55
CaO	2.0	
$H_2O^{575^\circ}$	6.5	
$H_2O^{110^\circ}$	6.6	
H_2O		13.45
Total	99.2	100.00

(1) Nzombe, Congo. (2) $WO_3 \cdot 2H_2O$.

Occurrence: An alteration product in tungsten deposits.

Association: n.d.

Distribution: From Nzombe, Kivu Province, Congo (Zaire). At Meymac, Corrèze, France. In Italy, at Genna Gureu, near Orroli, Sardinia. From the Clara Mine, near Oberwolfach, Black Forest, Germany.

Name: Originally applied to a mineral from Meymac, France, an alteration product of scheelite, later found to be ferritungstite. The name was, however, reinstated by the IMA CNMMN for this mineral, first described from Congo (Zaire), but which also occurs at Meymac, France.

Type Material: n.d.

Mgriite Cu_3AsSe_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, presumably.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 287–379 (20 g load). D(meas.) = n.d. D(calc.) = 4.9

Optical Properties: Opaque. *Color:* Gray with a brownish tint in reflected light. *Luster:* Metallic.
R: (420) 27.1, (460) 26.7, (500) 26.4, (540) 26.9, (580) 27.0, (620) 26.8, (660) 26.4, (700) 26.0

Cell Data: *Space Group:* $Fd3m$. $a = 5.530(5)$ $Z = 1$

X-ray Powder Pattern: Erzgebirge, Germany.
3.18 (100), 1.952 (100), 1.671 (50), 1.268 (40), 1.129 (40), 0.978 (40)

Chemistry:

	(1)	(2)
Cu	37.2	37.94
Fe	1.8	
As	14.7	14.91
Se	47.2	47.15
Total	100.9	100.00

(1) Erzgebirge, Germany; by electron microprobe, average of four samples; corresponding to $(Cu_{2.92}Fe_{0.16})_{\Sigma=3.08}As_{0.98}Se_{2.96}$. (2) Cu_3AsSe_3.

Occurrence: In hydrothermal veins.

Association: Clausthalite, berzelianite, umangite, ankerite, calcite.

Distribution: From an undefined locality in the southwestern part of the Erzgebirge, Saxony, Germany.

Name: From the first letters of Moscow Geological Exploration Institute [Moskovskogo Geologro Razvedounogo Instituta (MGRI)] the laboratory in which the mineral was discovered.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Dymkov, Y.M., T.I. Loseva, E.N. Zav'yalov, B.I. Ryzhov, and L.I. Bochek (1982) Mgriite, $(Cu, Fe)_3AsSe_3$, a new mineral. Zap. Vses. Mineral. Obshch., 111, 215–219 (in Russian). (2) (1983) Amer. Mineral., 68, 280–281 (abs. ref. 1).

Miargyrite $AgSbS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly as thick crystals, to 1 cm, tabular on {001}, {100}, or $\{\bar{1}01\}$; striations ‖ [010] and $[0\bar{1}1]$; massive. *Twinning:* Polysynthetic twinning observed in polished section.

Physical Properties: *Cleavage:* Imperfect on {010}; rare on {100} and {101}. *Fracture:* Subconchoidal. Hardness = 2.5 VHN = n.d. D(meas.) = 5.25 D(calc.) = 5.29

Optical Properties: Nearly opaque; translucent in thin fragments. *Color:* Iron-black to steel-gray; in polished section, white with raspberry-red internal reflections in oil, seldom seen in air; deep cherry-red in transmitted light. *Streak:* Cherry-red. *Luster:* Metallic adamantine. *Optical Class:* Biaxial (+). *Pleochroism:* In reflected light, distinct, in whites and pale grays. $\beta = > 2.72$ (Li). *Anisotropism:* Strong.

(1) St. Andreasberg, Germany. (2) Příbram, Czech Republic. (3) $AgSbS_2$.

Polymorphism & Series: Trimorphous with cuboargyrite and baumstarkite.

Occurrence: In hydrothermal veins of low-temperature origin.

Association: Baumstarkite, proustite, pyrargyrite, polybasite, silver, galena, sphalerite, pyrite, quartz, calcite, barite.

Distribution: In small amounts in many mines, rarely a principal ore mineral. In Germany, from Braünsdorf, near Freiberg, Saxony [TL]; at St. Andreasberg and Clausthal, in the Harz Mountains; and many other localities. From Příbram and Třebsko, Czech Republic. At Baia Sprie, Romania (formerly Felsőbánya, Hungary). From Hiendelaencina, Guadalajara Province, Spain. In the Strezhen deposit, Altai Mountains, Russia. At the Rampura-Agucha deposits, Rajasthan, India. In the Ailaoshan metamorphic belt, Yunnan Province, China. From the Van Silver mine, Brandywine Creek, British Columbia, Canada. In the USA, in Idaho, from the Silver City and Flint districts, Owyhee Co.; at the Kelly, Coyote and Santa Fe mines, in the Randsburg district, San Bernardino Co., California. In Mexico, from Catorce, San Luis Potosí; and from Sombrerete and Veta Grande, Zacatecas. In Chile, from Tres Puntas, near Copiapó, and Huantajaya, Tarapacá. At Colquechaca and Cerro Rico, Potosí, and Pulcayo, Huanchaca, Bolivia. From Huancavalica and Julcani, Peru.

Name: From the Greek for *less* and *silver*, as it contains less silver than other red silver sulfosalt minerals.

Micheelsenite $(Ca,Y)_3Al(PO_3OH,CO_3)(CO_3)(OH)_6 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal (?). *Point Group:* n.d. As spherules or crusts, composed of minute matted fibers.

Physical Properties: Hardness = 5.5 D(meas.) = 2.83 D(calc.) = [2.91]

Optical Properties: Translucent. *Color:* White, pale gray, greenish; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* Negative elongation. $\alpha = 1.584$ $\beta = 1.598$ $\gamma = 1.602$
2V(meas.) = Moderate.

Cell Data: *Space Group:* n.d. $a = 7.00$–7.04 $c = 18.99$–19.07 Z = [2]

X-ray Powder Pattern: Fairfield, Utah, USA.
4.84 (100b), 2.98 (80b), 2.81 (80b), 3.09 (60b), 6.6 (40), 3.93 (30), 3.48 (30)

Chemistry:

	(1)	(2)
P_2O_5	33.8	34.75
Al_2O_3	36.3	37.45
MgO	0.2	
CaO	7.1	6.87
Na_2O	2.8	2.66
K_2O	1.7	1.73
H_2O	18.0	16.54
Total	99.9	100.00

(1) Fairfield, Utah, USA; average of two analyses, corrected by removal of wardite 5% and "davisonite" [= apatite + crandallite] 1%. (2) $(Na,K)CaAl_6(PO_4)_4(OH)_9 \cdot 3H_2O$ with Na:K = 0.7:0.3.

Occurrence: As finely banded crusts on variscite nodules (Little Green Monster mine, Utah, USA); in phosphatic laterite (Taiba mine, Senegal); as cement in weathered phosphorite (Homeland mine, Florida, USA).

Association: Wardite, apatite, crandallite (Little Green Monster mine, Utah, USA); crandallite, augelite, wavellite, turquoise (Taiba mine, Senegal); crandallite, wavellite, goethite, kaolinite, quartz (Homeland mine, Florida, USA).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah, and between Bartow and Fort Meade, as in the Homeland mine, Peace Valley, Polk Co., Florida. At the Taiba mine, Thiès district, Senegal. In Australia, from the Iron Monarch quarry, Iron Knob, South Australia, and on Christmas Island, Indian Ocean. From Kiluli, Rwanda.

Name: Honors F.T. Millis, of Lehi, Utah, USA, who collected the first specimens.

Type Material: n.d.

(1) Vermilion mine, Sudbury, Canada; by electron microprobe, corresponding to $Pd_{1.00}(Bi_{0.99}Sb_{0.01})_{\Sigma=1.00}Te_{1.00}$. (2) Kambalda, Australia; by electron microprobe, corresponding to $(Pd_{0.96}Pt_{0.02})_{\Sigma=0.98}(Bi_{0.74}Sb_{0.18})_{\Sigma=0.92}Te_{1.08}$. (3) PdBiTe.

Mineral Group: Pyrite group.

Occurrence: A principal palladium mineral in Cu–Ni sulfide deposits.

Association: Testibiopalladite, froodite, merenskyite, moncheite, kotulskite, melonite, sobolevskite, hollingworthite, sperrylite, hessite, chalcopyrite, pentlandite, cubanite, pyrrhotite.

Distribution: In Canada, in Ontario, from the Frood [TL] and other mines in the Sudbury district; at the Pipe mine, Manitoba; in the Wellgreen deposit, Yukon Territory. In the USA, from the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; and in the Stillwater complex, Montana. From the Las Aguilas deposit, San Luis Province, Argentina. In Russia, at the Oktyabr mine, Noril'sk region, western Siberia; from the Monchegorsk deposit, Kola Peninsula; in the Bissersk placers, Ural Mountains; at the Vostok deposit, Lukkulaisvaara layered intrusion, Karelia. From Hitura, Finland. At the Gabbro Akarem, Eastern Desert, Egypt. In the Ban Phuc deposit, northwest Vietnam. At Kambalda, 56 km south of Kalgoorlie, Western Australia. From the Rustenburg mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. At Danba, Sichuan Province, China. Known in trace amounts from a few other localities.

Name: In honor of Dr. Charles Edward Michener (1907–), Canadian geologist for the Canadian Nickel Company, who discovered the mineral.

Type Material: All original material consumed by analysis; redefined, Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M31189 and M29438.

Microcline $KAlSi_3O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Prismatic crystals elongated along [001] or [100], perhaps the largest of any species, to 50 m and 13,500 t. Cleavable to granular, massive. Commonly exhibits banded perthitic intergrowths from exsolution of albite. *Twinning:* Carlsbad, Baveno, and Manebach laws very common; polysynthetic twinning on the Albite and Pericline laws give an orthogonal grid pattern on (001).

Physical Properties: *Cleavage:* Perfect on {001} and {010}, intersecting at ∼90°; partings on {100}, {110}, {$\bar{1}$10}, and {$\bar{2}$01}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 2.54–2.57 D(calc.) = 2.56

Optical Properties: Transparent to translucent. *Color:* White, pale cream-yellow; red, green, blue; colorless in thin section. *Luster:* Vitreous, pearly on cleavage.
Optical Class: Biaxial (–). *Orientation:* $X \wedge \{001\} = 15°$. *Dispersion:* $r > v$, weak.
$\alpha = 1.514–1.529$ $\beta = 1.518–1.533$ $\gamma = 1.521–1.539$ 2V(meas.) = 66°–103°

Cell Data: *Space Group:* $C\bar{1}$. $a = 8.5784$ $b = 12.9600$ $c = 7.2112$ $\alpha = 90°18'$ $\beta = 115°58'$ $\gamma = 87°7.5'$ Z = 4

X-ray Powder Pattern: Vigo, Galacia, Spain. (ICDD 19-926).
4.22 (100), 3.26 (80), 3.25 (80), 3.29 (60), 3.70 (40), 3.37 (40), 3.24 (40)

Chemistry:

	(1)		(1)
SiO_2	64.46	Na_2O	0.49
Al_2O_3	18.55	K_2O	16.07
Fe_2O_3	0.14	H_2O^+	0.06
CaO	0.17	Total	99.94

(1) Norra Kärr complex, Sweden; corresponds to $(K_{0.95}Na_{0.04}Ca_{0.01})_{\Sigma=1.00}Al_{1.01}Si_{2.98}O_8$.

Polymorphism & Series: Dimorphous with orthoclase.

Mineral Group: Feldspar (alkali) group; (Si,Al) is completely ordered in low microcline.

Occurrence: Common in plutonic felsic rocks, as granites, granite pegmatites, syenites; in metamorphic rocks of the greenschist and amphibolite facies; in hydrothermal veins. A detrital component in sedimentary rocks and as authigenic overgrowths.

Association: Quartz, sodic plagioclase, muscovite, biotite, "hornblende."

Distribution: A widespread mineral. Notable occurrences include: at Fredriksvärn, Arendal, and Larvik, Norway. In the Ilmen Mountains, Ural Mountains, and on the Kola Peninsula, Russia. At St. Gotthard, Ticino, Switzerland. On Mt. Greiner, Zillertal, Tirol, Austria. At Baveno, Piedmont, Italy. In the USA, at Amelia, Amelia Co., Virginia; Haddam, Middlesex Co., Connecticut; and Magnet Cove, Hot Spring Co., Arkansas. In Colorado, in the Pikes Peak area, El Paso Co., Crystal Peak, Teller Co., with large crystals from the Devil's Hole beryl mine, Fremont Co.; in the Black Hills, Pennington and Custer Cos., South Dakota. At Bancroft, Ontario, Canada. From Klein Spitzkopje, Namibia. In Brazil, from Minas Gerais, at Fazenda do Bananal, Salinas, Urucum, and Capelinha. At Ambositra, Madagascar. From Kimpusan, Yamanshi Prefecture, and Tanakamiyama, Otsu, Shiga Prefecture, Japan. At Broken Hill, New South Wales, Australia.

Name: From the Greek for *little* and *inclined*, for the small deviation of the cleavage planes from 90°.

Microlite $(Ca, Na)_2Ta_2O_6(O, OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; metamict when uranoan. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly as euhedral to subhedral octahedra, modified by the dodecahedron, cube, and {113}, to 8 cm; also granular, massive. *Twinning:* Rare, according to the spinel law, twin plane {111}.

Physical Properties: *Cleavage:* {111}, poor. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 5.90–6.43 D(calc.) = 6.33 (for Ca:Na = 1:1). May be radioactive.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Pale yellow to brown, hyacinth-red, greenish yellow, grass-green, emerald-green; white, gray, black; colorless, yellow, brown in transmitted light, may be zoned. *Streak:* Pale yellow or brown. *Luster:* Vitreous to adamantine, resinous on fractures.
Optical Class: Isotropic. $n = 1.93$–2.02

Cell Data: *Space Group:* $Fd3m$. $a = 10.36$–10.46 $Z = 8$

X-ray Powder Pattern: Onça, Brazil.
1.568 (100), 1.838 (84), 3.00 (68), 1.193 (68), 1.000 (68), 1.354 (63), 1.163 (63)

(1) Landås, Norway. (2) Wodgina, Australia; by electron microprobe, corresponds to $(Ca_{1.52}Na_{0.12}Sn_{0.04}Mn_{0.02})_{\Sigma=1.70}(Ta_{1.92}Nb_{0.14}Ti_{0.08})_{\Sigma=2.14}O_7$.

Polymorphism & Series: Forms a series with pyrochlore.

Mineral Group: Pyrochlore group, microlite subgroup; $(Na+Ca)_A > 20\%$; $(Nb+Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: A primary mineral in lithium-bearing granite pegmatites, or replacing tantalum minerals; in miarolitic cavities in granites.

Association: Albite, lepidolite, topaz, beryl, tourmaline, spessartine, tantalite, fluorite.

Distribution: Many localities, but only a few have large crystals. Well-studied material from: in the USA, at Chesterfield, Hampshire Co., Massachusetts; Haddam and Middletown, Middlesex Co., Connecticut; from Topsham, Sagadahoc Co., and Newry, Oxford Co., Maine; large crystals from Amelia, Amelia Co., Virginia. In the Harding mine, Taos Co., New Mexico; from the Brown Derby pegmatite, Gunnison Co., Colorado; in the Tin Mountain mine, near Custer, Custer Co., South Dakota. From the Iveland district, Norway. In the Muiâne and other pegmatites, Alto Ligonha district, Mozambique. At Antandranokomby, Madagascar. From Mapembe, Mumba, and Lueshe, Kivu Province, Congo (Zaire). In Brazil, at Onça, Picuí, Paraíba; large crystals from the Virgem da Lapa pegmatite, Minas Gerais. At Wodgina and Greenbushes, Western Australia.

Name: From the Greek for *small*, for the size of crystals at the original locality.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128730.

Microsommite $(Na, Ca, K)_{7-8}(Si, Al)_{12}O_{24}(Cl, SO_4)_{2-3}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 622. As groups of minute prismatic crystals, striated ‖ their length.

Physical Properties: *Cleavage:* $\{10\bar{1}0\}$, perfect; {0001}, less distinct. Hardness = 6 D(meas.) = 2.42–2.53. D(calc.) = [2.48]

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Silky to brilliant on $\{10\bar{1}0\}$, otherwise vitreous.
Optical Class: Uniaxial (+). $\omega = 1.521$ $\epsilon = 1.529$

Cell Data: *Space Group:* $P6_322$. a = 22.08(4) c = 5.33(2) Z = 3

X-ray Powder Pattern: Monte Somma, Italy.
4.81 (100), 3.69 (100), 3.29 (100), 2.670 (80), 2.660 (80), 2.765 (60), 2.455 (60)

Chemistry:

	(1)	(2)
SiO_2	31.70	30.74
Al_2O_3	32.07	31.57
CaO	14.72	10.77
Na_2O	12.45	8.46
K_2O	4.27	8.97
Cl	6.99	7.65
SO_3		5.17
$-O = Cl_2$	1.58	1.73
Total	[100.62]	101.60

(1) Monte Somma, Italy; original total given as 100.72%; corresponds to $(Na_{4.17}Ca_{2.72}K_{0.94})_{\Sigma=7.83}(Al_{6.53}Si_{5.47})_{\Sigma=12.00}O_{23}Cl_{2.04}$. (2) Do.; corresponds to $(Na_{2.90}Ca_{2.04}K_{2.02})_{\Sigma=6.96}(Al_{6.57}Si_{5.43})_{\Sigma=12.00}O_{23}[Cl_{2.29}(SO_4)_{0.68}]_{\Sigma=2.97}$.

Mineral Group: Cancrinite group.

Occurrence: In ejected volcanic masses and in leucitites.

Association: Nepheline.

Distribution: From Monte Somma, Campania, and at Pitigliano, near Grosseto, Tuscany, Italy.

Name: From the Greek for *small*, in allusion to crystal size, and for the original locality at Monte Somma, Italy.

Type Material: Natural History Museum, Paris, France, 97397.

K_2O	10.16	10.12	H_2O	7.73	8.39
FeO	0.68		$-O = F_2$	0.10	
ZnO	0.15		Total	99.81	100.00

(1) Hilairite pegmatite, Khibiny pluton, Kola Peninsula, Russia; average of 19 electron microprobe analyses, H_2O by Penfield method, OH and H_2O confirmed by IR, corresponding to $K_{3.04}(Na_{2.07}Ca_{0.03})_{\Sigma=2.10}(Mn_{4.95}Fe_{0.13}Mg_{0.06}Ti_{0.03}Zn_{0.03})_{\Sigma=5.20}(Si_{11.94}Al_{0.06})_{\Sigma=12}[O_{27.57}(OH)_{8.26}F_{0.17}]\cdot 1.92H_2O$. (2) $K_3Na_2Mn_5Si_{12}(O,OH)_{36}\cdot 2H_2O$.

Occurrence: A late hydrothermal mineral in a hyperperalkaline pegmatite.

Association: Microcline, sodalite, cancrisilite, aegirine, calcite, natrolite, fluorite, narsarsukite, labuntsovite-Mn, mangan-neptunite, donnayite.

Distribution: Hilairite pegmatite, level +252 m, Kirovsky Mine, Mount Kukisvumchorr, Khibiny alkaline pluton, Kola Peninsula, Russia.

Name: Honors Aleksandr Fedorovich von Middendorf (1815–1894), Academician of the Imperial Russian Academy of Sciences, who carried out the first mineralogical study of the Khibiny Mountains.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, 3312/1.

References: (1) Pekov, I.V., N.V. Chukanov, V.T. Dubinchuk, and A.E. Zadov (2006) Middendorfite, $K_3Na_2Mn_5Si_{12}(O,OH)_{36}\cdot 2H_2O$, a new mineral from the Khibiny massif, Kola Peninsula. Miersite $(Ag, Cu)I$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. As tetrahedra, (+) and (–) forms of which may be balanced to give pseudo-octahedra, or, with the cube, to give pseudocubo-octahedra, to 1 mm; cube faces striated ‖ tetrahedral faces. In crystalline crusts and aggregates. *Twinning:* On {111}, may be repeated.

Physical Properties: *Cleavage:* {011}, perfect. *Fracture:* Conchoidal. *Tenacity:* Somewhat brittle. Hardness = 2.5 D(meas.) = 5.64 D(calc.) = 5.67

Optical Properties: Transparent. *Color:* Canary-yellow; in transmitted light, pale yellow. *Streak:* Canary-yellow. *Luster:* Adamantine.
Optical Class: Isotropic; slight anomalous anisotropism. $n = 2.20(2)$

Cell Data: *Space Group:* $F\overline{4}3m$. a = 6.504 Z = 4

X-ray Powder Pattern: Locality not stated [Broken Hill, Australia].
3.23 (s), 2.28 (m), 1.948 (m), 3.72 (w), 1.489 (vw), 1.320 (vw), 1.290 (vw)

Chemistry:

	(1)	(2)
Ag	38.17	45.95
Cu	5.64	
I	56.58	54.05
Total	100.39	100.00

(1) Broken Hill, Australia. (2) AgI.

Occurrence: A rare mineral in the oxidized zone of some Pb–Zn–Cu–Ag deposits, especially in arid regions.

Association: Iodargyrite, chlorargyrite, malachite, cerussite, cuprite (Broken Hill, Australia); gerhardtite, likasite (Likasi, Congo).

Distribution: From Broken Hill, New South Wales, Australia. In the USA, at the Contention mine and Joe shaft, Tombstone; in the Southwest mine, Bisbee, Cochise Co.; and from the Mildren and Steppe claim, South Comobabi Mountains, Pima Co., Arizona. In the Likasi mine, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Henry Alexander Miers (1858–1942), Professor of Mineralogy, Oxford University, Oxford, England.

Type Material: Natural History Museum, Paris, France, 112.405; The Natural History Museum, London, England, 83822.

Miharaite $PbCu_4FeBiS_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As grains, to 0.3 mm, or irregular masses; as intergrowths with other sulfides.

Physical Properties: Hardness = n.d. VHN = 190–230 (25 g load). D(meas.) = n.d. D(calc.) = 6.06

Optical Properties: Opaque. *Color:* Pale gray to grayish white in reflected light. *Luster:* Metallic. *Anisotropism:* Moderate, from grayish blue to pinkish brown or yellowish brown. *Bireflectance:* Very faint; pale gray to white.

R_1–R_2: (400) 29.2–30.8, (420) 29.7–30.8, (440) 30.6–31.4, (460) 31.2–32.0, (480) 31.3–32.0, (500) 32.1–32.8, (520) 32.2–32.9, (540) 32.2–33.0, (560) 32.1–33.0, (580) 32.2–33.5, (600) 32.2–33.9, (620) 32.3–34.3, (640) 32.4–34.9, (660) 32.4–35.1, (680) 32.8–35.7, (700) 32.8–35.8

Cell Data: *Space Group:* $Pbmn$, $Pb2m$, or $Pb2_1\ m$. $a = 10.854(4)$ $b = 11.985(4)$ $c = 3.871(1)$ $Z = 2$

X-ray Powder Pattern: Mihara mine, Japan.
3.03 (100), 3.00 (70), 1.935 (70), 2.18 (50), 3.25 (30), 3.11 (30), 2.70 (30)

Chemistry:

	(1)	(2)	(3)
Pb	22.72	23.10	22.56
Cu	28.24	27.62	27.67
Fe	6.05	6.05	6.08
Bi	22.75	23.54	22.75
S	20.60	20.66	20.94
Total	100.36	100.97	100.00

(1) Mihara mine, Japan; by electron microprobe, average of six analyses; corresponds to $Pb_{1.01}Cu_{4.09}Fe_{1.00}Bi_{1.00}S_{5.91}$. (2) Ulsan mine, Korea; by electron microprobe, average of 13 analyses on five gain; corresponds to $Pb_{1.03}Cu_{4.00}Fe_{1.00}Bi_{1.04}S_{5.94}$. (3) $PbCu_4FeBiS_6$.

Occurrence: As disseminations in a hedenbergite-garnet-epidote contact metamorphic deposit (Mihara mine, Japan); in a mineralized quartz vein through granite (Imooka mine, Japan); in a bornite vein in copper skarn ore (Ulsan mine, Korea).

Association: Wittichenite, bornite, chalcopyrite, galena.

Distribution: In Japan, in Okayama Prefecture, from the Honpi deposit, Mihara mine [TL], and the Imo-oka mine; in Hyogo Prefecture, in the Akenobe mine. In the Ulsan mine, Kyongsang Province, South Korea. At the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. From Neves-Corvo, Portugal.

Name: For the type locality at the Mihara mine, Japan.

Type Material: The Institute of Mineralogy, Petrology, and Economic Geology, Faculty of Science, Tohoku University, Sendai, Japan.

References: (1) Sugaki, A., H. Shima, and A. Kitakaze (1980) Miharaite, $Cu_4FePbBiS_6$, a new mineral from the Mihara mine, Okayama, Japan. Amer. Mineral., 65, 784–788. (2) Choi, S.G. and N. Al_2O_3	4.3	5.7	
Fe_2O_3	24.3	32.0	39.93
Mn_2O_3	0.5	0.7	
H_2O	23.0		
Total	98.9	100.0	100.00

(1) Ikushunbetsu, Japan; by electron microprobe, average of seven analyses, total Fe as Fe^{3+}, total Mn as Mn^{3+}, SO_3 by wet analysis, H_2O by moisture evolution analyzer, considered as adsorbed. (2) Analysis (1) recalculated to a H_2O−free basis, then corresponding to $(Fe_{1.56}Al_{0.44}Mn_{0.03})_{\Sigma=2.03}(SO_4)_{3.00}$. (2) $Fe_2(SO_4)_3$.

Occurrence: A sublimate around a burning coal-gas escape fracture, formed at > 300 °C.

Association: n.d.

Distribution: From Ikushunbetsu, near Mikasa, Hokkaido, Japan.

Name: For its occurrence near Mikasa, Japan.

Type Material: Hokkaido University, Sapporo, Japan.

References: (1) Miura, H., K. Niida, and T. Hirama (1994) Mikasaite, $(Fe^{3+}, Al)_2(SO_4)_3$, a new ferric sulphate mineral from Mikasa City, Hokkaido, Japan. Mineral. Mag., 58, 649–653. (2) (1995) Amer. Mineral., 80, 846 (abs. ref. 1).

Milarite **$(K, Na)Ca_2AlBe_2Si_{12}O_{30}\cdot H_2O$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Typically as well-formed hexagonal prisms, to 4 cm; as radial-fibrous aggregates and intergrowths.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.46–2.61 D(calc.) = 2.524

Optical Properties: Transparent to translucent, opaque. *Color:* Colorless, grayish, tan, pale green, yellowish green, yellow. *Luster:* Vitreous.
Optical Class: Uniaxial (–); anomalously biaxial, sectored, with a uniaxial core. $\omega = 1.532–1.551$ $\epsilon = 1.529–1.548$

Cell Data: *Space Group:* $P6/mcc$. $a = 10.340–10.410$ $c = 13.758–13.845$ Z = 2

X-ray Powder Pattern: Val Giuv, Switzerland. (ICDD 12-450).
3.307 (100), 2.880 (90), 4.160 (65), 5.21 (45), 2.743 (45), 4.495 (35), 3.776 (25)

Chemistry:

	(1)
SiO_2	71.66
Al_2O_3	4.68
BeO	5.24
CaO	11.70
Na_2O	0.46
K_2O	4.91
H_2O^+	1.02
H_2O^-	0.05
Total	99.72

(1) Val Giuv, Switzerland; corresponds to $(K_{1.04}Na_{0.15})_{\Sigma=1.19}Ca_{2.08}Al_{0.92}Be_{2.10}Si_{11.59}O_{30}\cdot 0.60H_2O$.

Mineral Group: Milarite group.

Occurrence: In alpine and low-temperature hydrothermal veins; in aplites, syenites, and granite pegmatites.

Association: Orthoclase, albite, fluorite, beryl, phenakite, bertrandite, bavenite, minasgeraisite-(Y), quartz, calcite, muscovite, chlorite.

Distribution: In the Val Giuv, Tavetsch, Graubünden, and many other localities in Switzerland. From Věžná, Maršíkov, and Radkovice, Czech Republic. In the Habachtal, at Gasteiner, Austria. From Henneberg, Thuringia, and Tittling, Bavaria, Germany. In the Cheesewring quarry, Linkinhorne, Cornwall, England. From Kent, Kazakhstan. At Yermakorskeye, Siberia, Russia. Fine crystals from Rössing, Namibia. In the USA, on Moat Mountain, North Conway, Carroll Co., New Hampshire, and in the Foote mine, Kings Mountain, Cleveland Co., North Carolina. In Canada, at Strange Lake, Quebec. From the Valencia mine, Guanajuato, Mexico. Large crystals in the José Pinto pegmatite, at Jaguaraçú, near Coronel Fabriciano, Minas Gerais, Brazil.

Name: After a spurious type locality, the Val Milà (Milar), Switzerland [originally from the nearby Val Giuv, but later found in Val Milà also].

Type Material: Federal Institute of Technology, Zurich, Switzerland, Wi8976.

Millerite NiS

ⓒ2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Typically as slender to capillary crystals, to 7 cm, elongated ‖ [0001], in radiating groups of hairlike, interwoven masses; columnar tufted coatings. Single crystals may be helically twisted about [0001] or form rings. As cleavable masses up to several cm across. *Twinning:* By pressure on $\{01\bar{1}2\}$.

Physical Properties: *Cleavage:* Perfect on $\{10\bar{1}1\}$ and $\{01\bar{1}2\}$. *Fracture:* Uneven. *Tenacity:* Brittle; capillary crystals elastic. Hardness = 3–3.5 VHN = 179 D(meas.) = 5.5 D(calc.) = 5.374

Optical Properties: Opaque. *Color:* Pale brass-yellow to bronze-yellow, tarnishes to iridescence. *Streak:* Greenish black. *Luster:* Metallic. *Pleochroism:* Weak in air, appreciably stronger in oil, pale yellow-brown to bright yellow. *Anisotropism:* Strong.
R_1–R_2: (400) 26.4–30.0, (420) 29.8–34.0, (440) 35.6–38.8, (460) 41.0–42.1, (480) 45.1–44.8, (500) 48.4–46.9, (520) 51.5–48.4, (540) 53.9–49.8, (560) 55.5–50.8, (580) 57.0–51.8, (600) 58.3–51.6, (620) 59.2–53.3, (640) 59.9–53.8, (660) 60.4–54.2, (680) 60.5–54.4, (700) 60.5–54.3

Cell Data: *Space Group:* $R\bar{3}m$. $a = 9.607$ $c = 3.143$ $Z = 9$

X-ray Powder Pattern: Canada.
2.777 (100), 1.8631 (95), 2.513 (65), 4.807 (60), 2.228 (55), 1.8178 (45), 2.946 (40)

Chemistry:

	(1)	(2)
Ni	63.68	64.67
Fe	1.03	
Co	0.21	
Cu	0.00	
S	35.47	35.33
Total	100.39	100.00

(1) Marbridge mine, Canada; by electron microprobe, corresponding to $(Ni_{0.98}Fe_{0.02})_{\Sigma=1.00}S_{1.00}$.
(2) NiS.

Occurrence: Most commonly as a low-temperature mineral, in cavities in limestones and carbonate veins and in barite; an alteration product of other nickel minerals; also in sedimentary rocks, associated with coal measures, and rarely in serpentines.

Association: Gersdorffite, polydymite, nickeline, galena, sphalerite, pyrite, chalcopyrite, pyrrhotite, pentlandite, cubanite, calcite, dolomite, siderite, barite, ankerite.

Distribution: Numerous localities world-wide. In Germany [TL], from Müsen and Wissen, and as large crystals at Ramsbeck, North Rhine-Westphalia; from Kamsdorf, Thuringia. At Kotalahti, Finland, large cleavages. From Kladno, Czech Republic. At Merthyr Tudful, Glamorgan, Wales. In the USA, from the Sterling mine, Antwerp, Jefferson Co., New York; at the Gap Nickel mine, Lancaster Co., Pennsylvania. In geodes from Keokuk, Lee Co., Iowa; St. Louis, St. Louis Co., Missouri; Esterbrook Park, Milwaukee, Waukesha Co., Wisconsin, and at Hall's Gap, Lincoln Co., Kentucky. In Canada, from Temagami, Ontario; at the Thompson mine, Thompson, Manitoba; in the Orford nickel mine, Brompton Lake, and as large cleavages from the Marbridge mine, Malartic, Quebec. At Kambalda, 56 km south of Kalgoorlie, and in the Agnew mine, Leinster, Western Australia. From the Trojan nickel mine, Bindura, Zimbabwe. On Mabilikwe Hill, Northern Transvaal, South Africa.

Name: Honors William Hallowes Miller (1801–1880), British mineralogist, Cambridge University, Cambridge, England, who first studied crystals of the mineral.

$(Na,K)CaAl_6(PO_4)_4(OH)_9 \cdot 3H_2O$ — Millisite

Crystal Data: Tetragonal (?). *Point Group:* n.d. As spherules or crusts, composed of minute matted fibers.

Physical Properties: Hardness = 5.5 D(meas.) = 2.83 D(calc.) = [2.91]

Optical Properties: Translucent. *Color:* White, pale gray, greenish; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* Negative elongation. $\alpha = 1.584$ $\beta = 1.598$ $\gamma = 1.602$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* n.d. $a = 7.00$–7.04 $c = 18.99$–19.07 Z = [2]

X-ray Powder Pattern: Fairfield, Utah, USA.
4.84 (100b), 2.98 (80b), 2.81 (80b), 3.09 (60b), 6.6 (40), 3.93 (30), 3.48 (30)

Chemistry:

	(1)	(2)
P_2O_5	33.8	34.75
Al_2O_3	36.3	37.45
MgO	0.2	
CaO	7.1	6.87
Na_2O	2.8	2.66
K_2O	1.7	1.73
H_2O	18.0	16.54
Total	99.9	100.00

(1) Fairfield, Utah, USA; average of two analyses, corrected by removal of wardite 5% and "davisonite" [= apatite + crandallite] 1%. (2) $(Na,K)CaAl_6(PO_4)_4(OH)_9 \cdot 3H_2O$ with Na:K = 0.7:0.3.

Occurrence: As finely banded crusts on variscite nodules (Little Green Monster mine, Utah, USA); in phosphatic laterite (Taiba mine, Senegal); as cement in weathered phosphorite (Homeland mine, Florida, USA).

Association: Wardite, apatite, crandallite (Little Green Monster mine, Utah, USA); crandallite, augelite, wavellite, turquoise (Taiba mine, Senegal); crandallite, wavellite, goethite, kaolinite, quartz (Homeland mine, Florida, USA).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah, and between Bartow and Fort Meade, as in the Homeland mine, Peace Valley, Polk Co., Florida. At the Taiba mine, Thiès district, Senegal. In Australia, from the Iron Monarch quarry, Iron Knob, South Australia, and on Christmas Island, Indian Ocean. From Kiluli, Rwanda.

Name: Honors F.T. Millis, of Lehi, Utah, USA, who collected the first specimens.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 941–942. (2) Owens, J.P., Z.S. Altschuler, and R. Berman (1960) Millisite in phosphorite from Homeland, Florida. Amer. Mineral., 45, 547–561.

Millosevichite $(Al, Fe^{3+})_2(SO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ (by analogy to mikasite). Tiny crystals in granular aggregates; in stalactitic porous to pumiceous masses, to 3 cm.

Physical Properties: Hardness = 1.5 D(meas.) = 1.72 D(calc.) = 2.86 Hygroscopic.

Optical Properties: Semitransparent. *Color:* Indigo, bright red, brick-red, becoming gray with hydration. *Streak:* Red. *Luster:* Vitreous.
Optical Class: Isotropic, anomalous. $n = 1.573$

Cell Data: *Space Group:* $R\overline{3}$ (synthetic). $a = 8.055$ $c = 21.191$ $Z = 6$

X-ray Powder Pattern: L'vov-Volyn' Basin, Ukraine.
3.50 (10), 5.81 (5), 2.656 (4), 4.23 (3), 2.91 (3), 2.357 (2) 2.220 (2)

Total	99.74

(1) L'vov-Volyn' Basin, Ukraine; average of two analyses, corresponding to $(Al_{1.85}Fe_{0.49})_{\Sigma=2.34}(SO_4)_3$.

Occurrence: Precipitated at high temperature from gasses originating from solfataric activity or burning coal measures.

Association: Sulfur, sal ammoniac, letovicite, alunogen, boussingaultite (Kladno, Czech Republic).

Distribution: From the Alum Grotto, Vulcano, Lipari Islands, Italy. At the Velikomostov-3 coal mine, L'vov-Volyn' Basin, Ukraine. In the Schoeller coal mine, Libušin, near Kladno, Czech Republic. From Miskolc-Lyukóbánya, Hungary. At Shamokin, near Burnside, Northumberland Co., Pennsylvania, USA.

Name: To honor Professor Federico Millosevich (1875–1942), Italian mineralogist, University of Rome, Rome, Italy.

Type Material: n.d.

(1) Předbořice, Czech Republic; average of 5 electron microprobe analyses, corresponding to $Pd_{0.98}Cu_{0.04}Ag_{0.01}Sb_{0.95}Se_{1.02}$.

Mineral Group: Ullmanite subgroup of the gersdorfite group.

Occurrence: A low-temperature mineral in fractures in selenium-rich uraninite in calcite veins.

Association: Embedded in eucairite and tiemannite, associated with bornite, selenian digenite, chrisstanleyite, fischesserite, gold, silver-rich hakite, tyrrellite, clausthalite, chaméanite, uraninite.

Distribution: In a polished section attributed to Předbořice, Czech Republic, purchased from a mineral dealer.

Name: Honors Milota Makovicky (b. 1941), Geological Institute, University of Copenhagen, for her outstanding investigations of sulfide and sulfarsenide systems with platinum-group elements.

Type Material: Department of Geography, Geology and Mineralogy, Division of Mineralogy and Material Sciences (Mineralogical Museum), Salzburg, Austria (14935).

References: (1) Paar, W.H., D. Topa, E. Makovicky, and F.J. Culetto (2005) Milotaite, PdSbSe, a new palladium mineral species from Předbořice, Czech Republic. Can. Min., 43, 689-694.

Mimetite $Pb_5(AsO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Crystals are usually prismatic to acicular ‖ [0001], to 12 cm, may be tabular, showing $\{10\bar{1}0\}$, $\{0001\}$, $\{10\bar{1}1\}$, rarely $\{11\bar{2}1\}$, $\{21\bar{3}1\}$, others; rounded, barrel-shaped, mammillary, stalactitic, granular. *Twinning:* On $\{11\bar{2}2\}$, very rare.

Physical Properties: *Cleavage:* On $\{10\bar{1}1\}$, interrupted. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 7.24 D(calc.) = 7.26 Piezoelectric; may fluoresce reddish yellow under LW or SW UV.

Optical Properties: Transparent to translucent. *Color:* Pale to bright yellow, yellowish brown, yellow-orange, white, may be colorless; colorless or pale yellow in transmitted light. *Streak:* White. *Luster:* Resinous to subadamantine.
Optical Class: Uniaxial (–), commonly anomalously biaxial (–), sectored. *Pleochroism:* Weak. *Absorption:* $O < E$. $\omega = 2.147$ $\epsilon = 2.128$

Cell Data: *Space Group:* $P6_3/m$ (synthetic). $a = 10.250(2)$ $c = 7.454(1)$ $Z = 2$

X-ray Powder Pattern: Synthetic.

(1) Phoenixville, Pennsylvania, USA. (2) $Pb_5(AsO_4)_3Cl$.

Polymorphism & Series: Dimorphous with clinomimetite.

Mineral Group: Apatite group.

Occurrence: A common secondary mineral in the oxidized zone of arsenic-bearing lead deposits.

Association: Cerussite, anglesite, smithsonite, willemite, pyromorphite, wulfenite.

Distribution: Many localities. A few for well-crystallized material include: Johanngeorgenstadt, Saxony, Germany. At Příbram, Czech Republic. In England, from a number of localities in Cornwall; fine examples from Dry Gill and other mines, Caldbeck Fells, Cumbria. From Leadhills, Lanarkshire, Scotland. Extraordinary crystals at Tsumeb, Namibia. From Gowde, Anarak district, Iran. In the USA, from Phoenixville, Chester Co., Pennsylvania; at the Mammoth-St. Anthony mine, Tiger, Pinal Co., and the Rowley mine, Maricopa Co., Arizona; from the Centennial Eureka mine, Tintic district, Juab Co., Utah. In Mexico, from Santa Eulalia and San Pedro Corallitos, Chihuahua; in the Ojuela mine, Mapimí, Durango. At Broken Hill, New South Wales; in the Mt. Bonnie mine, Grove Hill, Prices Station, Northern Territory, Australia. From Hat Yai, Thailand.

Name: From the Greek for *an imitator*, as it imitates pyromorphite.

Type Material: Mining Academy, Freiberg, Germany, 20225.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 889–895. (2) Dai, Y., J.M. Hughes, and P.B. Minamiite $(Na, Ca, K)Al_3(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Flat hexagonal plates, to 0.2 mm.

Physical Properties: Hardness = [3.5–4] (by analogy to the alunite group).
D(meas.) = n.d. D(calc.) = 2.81

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 6.981(2)$ $c = 33.490(14)$ Z = 6

X-ray Powder Pattern: Okumanza, Japan.
2.964 (100), 4.906 (80), 2.792 (80), 2.225 (65), 5.591 (60), 1.8968 (45), 1.8607 (40)

Chemistry:

	(1)
SO_3	38.09
Al_2O_3	37.74
CaO	1.94
Na_2O	3.37
K_2O	2.17
H_2O^+	12.22
rem.	4.28
Total	99.81

(1) Okumanza, Japan; remnant, all considered due to impurities, consists of P_2O_5 0.18%, V_2O_3 0.02%, SiO_2 3.58%, Fe_2O_3 0.03%, TiO_2 0.45%, H_2O^- 0.02%; corresponds then to $(Na_{0.46}Ca_{0.29}K_{0.19})_{\Sigma=0.94}Al_{3.11}(SO_4)_2(OH)_{5.70}$.

Mineral Group: Alunite group.

Occurrence: In a hydrothermally altered labradorite andesite (Okumanza, Japan); deposited from fumarolic gasses (Mt. Rainier, Washington, USA); in volcanic-hosted argillic alteration (Barton Peninsula, Antarctica).

Association: Alunite, natroalunite, huangite, quartz (Okumanza, Japan); natroalunite, woodhouseite (Mt. Rainier, Washington, USA); pyrophyllite, pyrite, sulfur, zunyite, rutile, chalcedonic silica (Barton Peninsula, Antarctica).

Distribution: From Okumanza, near the Kusatsu-Shirane volcano, Gumma Prefecture, Japan. On Mt. Rainier, Pierce Co., Washington, USA. In the Quechisla district, Bolivia. From the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. In the Fancel-Laƀuşna caldera, Gurghui Mountains, Romania. On Barton Peninsula, King George Island, Antarctica.

Name: In honor of Dr. A.E. Minami (1899–1977), who studied the hot springs around the Kusatsu-Shirane volcano, Japan.

Type Material: National Science Museum, Tokyo, Japan.

Crystal Data: Monoclinic. *Point Group:* $2/m$. As curved, sheaflike crystals, to < 5 μm, forming single and multiple rosettes, to 1 mm.

Physical Properties: *Cleavage:* Perfect on probable {100}; good on {001}. Hardness = 6–7 D(meas.) = > 4.25 D(calc.) = 4.90

Optical Properties: Translucent. *Color:* Lavender to lilac-purple, with individual rosettes having lighter-colored cores than rims; in transmitted light, colorless to pale yellow or purple. *Streak:* Light purple. *Luster:* Earthy to subvitreous.
Optical Class: Biaxial (+). *Pleochroism:* Moderate; X = colorless; Y = pale grayish yellow; Z = lavender-purple. *Dispersion:* $r > v$, very weak. $\alpha = 1.740(4)$ $\beta = 1.754(4)$ $\gamma = 1.786(4)$ 2V(meas.) = 50°–72°, average 68° 2V(calc.) = 68°

Cell Data: *Space Group:* $P2_1/a$. $a = 9.833(2)$ $b = 7.562(1)$ $c = 4.702(1)$ $\beta = 90.46(6)°$ Z = 2

X-ray Powder Pattern: José Pinto pegmatite, Brazil.

(1) José Pinto pegmatite, Brazil; by electron microprobe, ICP, and AA, after deduction of SiO_2 0.6% as mica; $RE_2O_3 = La_2O_3$ 0.25%, Ce_2O_3 0.20%, Pr_2O_3 0.13%, Nd_2O_3 0.50%, Sm_2O_3 0.26%, Eu_2O_3 0.00%, Gd_2O_3 0.32%, Tb_2O_3 0.23%, Dy_2O_3 1.26%, Ho_2O_3 0.37%, Er_2O_3 1.94%, Tm_2O_3 0.75%, Yb_2O_3 7.86%, Lu_2O_3 1.71%; corresponds to $(Ca_{0.45}Mn_{0.20}Mg_{0.08}Fe_{0.05}Zn_{0.02}Cu_{0.01})_{\Sigma=0.81}(Y_{0.72}Ca_{0.56}RE_{0.41}Bi_{0.31})_{\Sigma=2.00}(Be_{1.55}Si_{0.24}B_{0.21})_{\Sigma=2.00}(Si_{1.95}P_{0.08})_{\Sigma=2.03}O_{10}$. (2) Do.; Bi-richest portion, with $(RE_{0.86}Bi_{0.65}Ca_{0.49})_{\Sigma=2.00}$.

Mineral Group: Gadolinite group.

Occurrence: A late-stage accessory mineral in a zoned complex granite pegmatite.

Association: Milarite, muscovite, quartz, albite, orthoclase, hematite, garnet, magnetite, churchite, elbaite, anatase.

Distribution: In the José Pinto pegmatite, at Jaguaraçú, near Coronel Fabriciano, Minas Gerais, Brazil.

Name: For the state of Minas Gerais, Brazil, and *yttrium* in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 164209.

Minasragrite $V^{4+}O(SO_4)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Minute equant crystals showing {001}, {110}, {011}, {$\bar{1}$01}, {$\bar{1}$11}; in spherulites and granular masses in delicate efflorescences.

Physical Properties: Hardness = n.d. D(meas.) = 2.03(10) D(calc.) = 2.06 Easily soluble in cold H_2O.

Optical Properties: Semitransparent. *Color:* Vivid cobalt-blue to pale aquamarine-blue; blue in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = deep blue; Y = blue; Z = colorless. *Orientation:* $X = b$; $Z \wedge c$ = small. *Absorption:* $X > Y > Z$. $\alpha = 1.513(2)$ $\beta = 1.536(2)$ $\gamma = 1.545(2)$ 2V(meas.) = Medium large.

Cell Data: *Space Group:* $P2_1/a$. $a = 12.902(4)$ $b = 9.716(5)$ $c = 6.976(2)$ $\beta = 110.90(3)^\circ$ Z = 4

X-ray Powder Pattern: Minasragra, Peru.
5.135 (100), 3.907 (70), 5.431 (60), 3.826 (35), 3.658 (24), 6.049 (20), 3.509 (17)

(1) Minasragra, Peru; corresponding to $V_{1.00}O(SO_4)_{1.02}\cdot 4.89H_2O$. (2) $VO(SO_4)\cdot 5H_2O$.

Polymorphism & Series: Dimorphous with orthominasragrite.

Occurrence: An alteration product of patronite in a rich deposit of vanadian materials in fissures that cut red shales and that were probably filled by a remobilized asphaltite deposit (Minasragra, Peru); in a silicified tree, formed as an oxidation product of pyrite reacting with vanadium-rich organic material (Temple Mountain district, Utah, USA).

Association: Patronite, melanterite, morenosite, dwornikite, retgersite, szomolnokite, potassium alum, gypsum (Minasragra, Peru); orthominasragrite, pyrite, sulfur, iron sulfates (Temple Mountain district, Utah, USA).

Distribution: From Minasragra, 46 km from Cerro de Pasco, Peru. At the North Mesa mine group, Temple Mountain district, Emery County, Utah, USA.

Name: For its occurrence at Minasragra, Peru.

Type Material: National Museum of Natural History, Washington, D.C., USA, 87515.

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O by the Penfield method; corresponds to $K_{1.9}Na_{0.3}Fe_{0.1}Mg_{0.1}Mn_{0.1}Ca_{27.5}Zn_{4.8}Al_{4.4}Si_{39.4}O_{112}(OH)_{15.2}$.

Occurrence: A secondary low-temperature hydrothermal mineral formed by replacement of associated minerals in a metamorphosed stratiform zinc deposit.

Association: Microcline, wollastonite, grossular, vesuvianite, margarosanite, calcite, diopside, lead, allanite.

Distribution: At Franklin, Sussex Co., New Jersey, USA.

Name: For Mine Hill, at Franklin, New Jersey, USA, where the Franklin deposit was exposed at the surface.

Type Material: National Museum of Natural History, Washington, D.C., USA, C6411, C6412, 150332.

(1) Santa Marta, Spain. (2) $Pb_2^{2+}Pb^{4+}O_4$.

Occurrence: A rare secondary mineral in some highly oxidized lead-bearing mineral deposits; may form during mine fires.

Association: Galena, cerussite, massicot, litharge, lead, wulfenite, mimetite.

Distribution: Many localities, but only in small amounts. In Germany, at Langhecke, Hesse; Badenweiler, Baden-Württemberg; Bleialf, Eifel district; Horhausen, Rhineland-Palatinate, and many other places. At Mies (Mežica), Slovenia. From Leadhills, Lanarkshire, Scotland. At Castelberg, near St. Avold, Moselle, France. From Långban, Värmland, Sweden. At Sarrabus, Sardinia, Italy. In the Tchah Khuni and Tchah Milleh mines, near Anarak, Iran. From Tsumeb, Namibia. In the USA, in the Jay Gould mine, Alturas Co., Idaho; an important ore in the Leadville district, Lake Co., Colorado; in the Tonopah-Belmont mine, Osborne district, Maricopa Co., Arizona. From Eschuchapa, Guerrero, and other places in Mexico.

Name: From the Latin, through Spanish, for *cinnabar*, which was once adulterated with red lead oxide, now applied exclusively to that compound.

(1) Mesabi district, Minnesota, USA; corresponding to $(Fe_{2.28}Mg_{0.72}Mn_{0.01})_{\Sigma=3.01}(Si_{3.95}Al_{0.05})_{\Sigma=4.00}O_{10}(OH)_2$. (2) Emilia-San Valentin deposit, Spain; by electron microprobe, corresponding to $(Fe_{2.62}Mg_{0.28}Mn_{0.10})_{\Sigma=3.00}Si_4O_{10}(OH)_2$.

Occurrence: In banded iron formations subjected to low-grade regional metamorphism.

Association: Quartz, siderite, stilpnomelane, greenalite (Mesabi Range, Minnesota, USA).

Distribution: In the USA, in the Mesabi and Cuyuna districts, St. Louis Co., Minnesota. From a number of places in the Sokoman Iron Formation, Howells River area, Labrador, Newfoundland; and in the Blue Bell mine, Riondel, British Columbia, Canada. In the Mamatwan mine, near Kuruman, Cape Province, South Africa. In the Emilia-San Valentin Pb–Zn deposit, Sierra de Cartagena, Murcia Province, Spain. From Tynagh, near Killimor, Co. Galway, Ireland. At The Lizard, Cornwall, England. From Hagendorf, Bavaria, Germany. In the Marra Mamba and Brockman Iron Formations, Hamersley basin, and in the Weld Range, Western Australia.

Name: For the State of Minnesota, USA, from which it was first described.

Type Material: n.d.

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Mosaic rhombohedral crystals, showing only $\{10\overline{1}4\}$, to 0.5 mm, saddle-shaped and strongly twisted.

Physical Properties: *Cleavage:* On $\{10\overline{1}4\}$, prominent. Hardness = 3.5 D(meas.) = 3.45(2) D(calc.) = 3.445

Optical Properties: Semitransparent. *Color:* Milky white to colorless. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–). $\omega = 1.734$–1.750 $\epsilon = 1.542$–1.550

Cell Data: *Space Group:* $R\overline{3}$. $a = 4.8183(4)$ $c = 16.0295(10)$ Z = n.d.

X-ray Powder Pattern: Tsumeb, Namibia; similar to dolomite.
2.890 (100), 1.789 (40), 1.806 (33), 2.410 (25), 3.701 (20), 2.196 (20), 2.019 (15)

Chemistry:

	(1)	(2)
CO_2	[39.50]	39.04
FeO	1.10	
MnO	0.10	
ZnO	33.46	36.09
MgO	1.20	
CaO	24.64	24.87
Total	[100.00]	100.00

(1) Tsumeb, Namibia; recalculated from an analysis presented as carbonates, CO_2 from stoichiometry; corresponds to $Ca_{0.98}(Zn_{0.92}Mg_{0.06}Fe_{0.03})_{\Sigma=1.01}(CO_3)_2$. (2) $CaZn(CO_3)_2$.

Mineral Group: Dolomite group.

Occurrence: In a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia); from the wallrock of a carbonate-hosted Pb–Zn orebody (Navan deposit, Ireland).

Association: Dioptase, duftite, malachite, cerussite, zincian dolomite, calcite (Tsumeb, Namibia); sphalerite, pyrite, melnikovite, magnesian calcite, dolomite, calcite, quartz (Navan deposit, Ireland).

Distribution: From Tsumeb, Namibia. In the Navan Pb–Zn orebody, Co. Meath, Ireland. At the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: For the MINeralogical RECORD magazine, in recognition of that journal's contributions to a beneficial interaction between professional and amateur mineralogists.

Type Material: Institute of Mineralogy, Bari University, Bari, Italy, HO-4/81.

References: (1) Garavelli, C.G., F. Vurro, and G.C. Fioravanti (1982) Minrecordite, a new mineral from Tsumeb. Mineral. Record, 13, 131–136. (2) (1983) Amer. Mineral., 68, 281 (abs. ref. 1).

Minyulite $KAl_2(PO_4)_2(OH,F)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As radiating fibrous to prismatic crystals, elongated along [001] with {110} and {111} terminations; usually in subparallel growth or as spherules, to 15 cm.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.45 D(calc.) = 2.47

Optical Properties: Transparent. *Color:* Colorless to white, greenish yellow; colorless in transmitted light. *Luster:* Vitreous, silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.531$ $\beta = 1.534$ $\gamma = 1.538$ 2V(meas.) = Large.

Cell Data: *Space Group:* $Pba2$. $a = 9.337(5)$ $b = 9.740(5)$ $c = 5.522(3)$ Z = 2

X-ray Powder Pattern: Dandarragan, Australia. (ICDD 37–467).

(1) Minyulo Well, Australia. (2) Wait's quarry, Noarlunga, Australia; corresponds to $(K_{0.82}Ca_{0.05}Na_{0.03})_{\Sigma=0.90}(Al_{2.04}Fe_{0.08})_{\Sigma=2.12}(PO_4)_{2.00}[F_{0.55}(OH)_{0.45}]_{\Sigma=1.00}\cdot 4.00H_2O$.

Occurrence: In weathered glauconitic phosphatic ironstone (Australia).

Association: Dufrénite, apatite, fluellite, wavellite, variscite, leucophosphite.

Distribution: In Australia, from near Minyulo Well, Dandarragan, Western Australia; in Wait's quarry and Oliver's quarry, near Noarlunga, 32 km south of Adelaide; in the Moculta phosphate quarry, northeast of Angaston, and from the St. John's quarry, seven km southeast of Kapunda, Mount Lofty Ranges, South Australia; at Wolfdene, near Beenleigh, Queensland. On Elephant Island, South Shetland Islands, about 800 km southeast of Cape Horn, British Antarctic Territory, Antarctica. From the Pereta mine, Scansano, Tuscany, Italy. In Belgium, at Richelle, near Visé, and at Blaton, Hainaut. Large crystal aggregates from Pannecé, Loire-Atlantique, France. In the USA, found near Cockalorum Wash, Nye Co., and at the Willard mine, Willard district, Pershing Co., Nevada; in the Ross Hannibal mine, Lawrence Co., South Dakota; on Utahlite Hill, eight km northwest of Lucin, Box Elder Co., Utah.

Name: For Minyulo Well, Western Australia, near the source of the first specimens.

Type Material: Western Australian Museum, Perth, Australia, M68.1991, CT S2034; The Natural History Museum, London, England, 1933,84; National Museum of Natural History, Washington, D.C., USA, 96769.

Mirabilite $Na_2SO_4 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals short to long prismatic, with complex form development, also crude, to 10 cm, in interlocking masses; crystalline, granular to compact massive, commonly as efflorescences. *Twinning:* Rare on {001} or {100}.

Physical Properties: *Cleavage:* On {100}, perfect; on {010} and {001}, good to fair. *Fracture:* Conchoidal. Hardness = 1.5–2.5 D(meas.) = 1.464 D(calc.) = 1.467 Quickly dehydrates to thénardite in dry air; very soluble in H_2O, taste cool, then saline and bitter.

Optical Properties: Transparent to opaque. *Color:* Colorless to white; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 31°$. *Dispersion:* $r < v$, strong, crossed. $\alpha = 1.391$–1.394 $\beta = 1.394$–1.396 $\gamma = 1.396$–1.398 2V(meas.) = 75°56′

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 11.512(3)$ $b = 10.370(3)$ $c = 12.847(2)$ $\beta = 107.789(10)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 11-647).
5.49 (100), 3.21 (75), 3.26 (60), 3.11 (60), 4.77 (45), 3.83 (40), 2.516 (35)

Chemistry:

	(1)	(2)
SO_3	25.16	24.85
Na_2O	18.67	19.24
H_2O	55.28	55.91
Total	99.11	100.00

(1) Kirkby Thore, Westmoreland, England. (2) $Na_2SO_4 \cdot 10H_2O$.

Occurrence: Typically in salt pans, playas, and saline lakes, where deposition may be seasonal, and bedded deposits formed therefrom; rarely in caves and lava tubes; in volcanic fumaroles; a product of hydrothermal sericitic alteration; a post-mining precipitate.

Association: Gypsum, thénardite, halite, trona, glauberite, aphthitalite, blödite, epsomite.

Distribution: Only a few prominent localities are represented here. In Austria, at Hallein, Hallstatt, and Ischl. In Italy, on Vesuvius, and at Campi Flegrei, near Naples, Campania; on Vulcano, Lipari Islands. In the Salar de Pintados, near La Guaica, Atacama Desert, Tarapacá, and at Chuquicamata, Antofagasta, Chile. In the USA, at Soda Lake, San Luis Obispo Co., and in Searles Lake, San Bernardino Co., California; along Great Salt Lake, Davis Co., Utah; at Lake Lucero, west of Valmont, Doña Ana Co., New Mexico; around Downey and Union Pacific Lakes, Albany Co., Wyoming; in Mammoth Cave, southwest central Kentucky.

Name: From the Latin *sal mirable*, for *miracle salt*, expressing Glauber's surprise on its synthesis.

(1) Cape Miseno, Italy; recalculated to 100% after deduction of an unstated amount of hygroscopic H_2O. (2) $H_6K_8(SO_4)_7$.

Occurrence: Very rarely formed under fumarolic conditions.

Association: Potassium alum, alunogen, halotrichite, metavoltine, pickeringite, sulfur, tamarugite, voltaite (Cape Miseno, Italy).

Distribution: From the Grotto del Solfo fumarole, Cape Miseno, Campi Flegrei, near Naples, and on Vesuvius, Campania, Italy.

Name: For its occurrence on Cape Miseno, Italy.

Type Material: Natural History Museum, Paris, France, 100781; The Natural History Museum, London, England, 60393.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 396–397.

Miserite $\mathbf{K(Ca,Ce)_6Si_8O_{22}(OH,F)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals, unterminated, to 12 mm. Prismatic fragments are largely composed of fine fibers; in cleavable masses. *Twinning:* Lamellar.

Physical Properties: *Cleavage:* Perfect on {100}, imperfect on {010}.
Fracture: Subconchoidal to uneven. Hardness = 5.5–6 D(meas.) = 2.84–2.93
D(calc.) = 2.80

Optical Properties: Transparent to translucent. *Color:* Red-brown, raspberry-red, pink, with a lavender hue where weathered. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Z \simeq a$ on {100}; $Y \wedge c \simeq 2°$ on {100}; $Y \wedge c = 11°$ on {010}. *Dispersion:* $r > v$, weak. $\alpha = 1.576$–1.587 $\beta = 1.583$–1.589 $\gamma = 1.591$–1.594
2V(meas.) = 65°–86° 2V(calc.) = 65°–87°

Cell Data: *Space Group:* $P\bar{1}$. $a = 10.100(5)$ $b = 16.014(7)$ $c = 7.377(5)$ $\alpha = 96°25(3)'$ $\beta = 111°9(3)'$ $\gamma = 76°34(2)'$ Z = 2

X-ray Powder Pattern: Kipawa Lake, Canada.
15.42 (100), 3.14 (90), 3.18 (80), 3.17 (80), 1.667 (66), 2.377 (65), 3.106 (64)

Chemistry:

	(1)		(1)

Er_2O_3	0.31	H_2O	0.55
Tm_2O_3	0.03	Total	99.19

(1) Kipawa Lake, Canada; by electron microprobe, augmented by separate analyses for F, Cl, H_2O; corresponds to $K_{1.14}(Ca_{5.29}Y_{0.28}RE_{0.22})_{\Sigma=5.79}Si_{8.00}O_{22}[F_{1.03}(OH)_{0.28}]_{\Sigma=1.31}$.

Occurrence: In banded metamorphosed shales at the contact with a dike of nepheline syenite (Wilson Springs, Arkansas, USA); in a carbonatite vein (Kipawa Lake, Canada); in quartz-albite-aegirine veinlets and in albitites in syenites (Dara-i-Pioz massif, Tajikistan).

Association: Wollastonite, orthoclase, aegirine (Wilson Springs, Arkansas, USA); "hornblende," eudialyte, scapolite, fluorite, mosandrite (Kipawa Lake, Canada); baratovite, ekanite, titanite (Dara-i-Pioz massif, Tajikistan).

Distribution: In the USA, from the Wilson Springs (Potash Sulphur Springs) mine, between Hot Springs and Magnet Cove, Garland Co., Arkansas, and at Wausau, Marathon Co., Wisconsin. In Canada, from the [Sheffield Lake complex,] Kipawa River, Villedieu Township, and at Mont Saint-Hilaire, Quebec. From the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. In the Murun massif, southwest of Olekminsk, Yakutia, and other less-well-defined localities in Russia.

Name: For Dr. Hugh Dinsmore Miser (1884–1969), geologist with the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA.

Mitridatite $Ca_2Fe_3^{3+}O_2(PO_4)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* Rarely as thin tabular pseudorhombohedral crystals, to 2 mm, comprised of {100}, {001}, {$\bar{4}$23}; more commonly massive, as nodules, veins, and crusts.

Physical Properties: *Cleavage:* Good on {100}. *Tenacity:* Typically pulverulent, friable, gumlike. Hardness = 2.5 if compact. D(meas.) = 3.24(2) D(calc.) = 3.249

Optical Properties: Translucent to opaque. *Color:* Olive-green, greenish yellow, brownish green, brownish black, red, bronzy-red. *Streak:* Olive-green. *Luster:* Dull, earthy to resinous. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = pale greenish yellow; $Y = Z$ = deep greenish brown, red. *Absorption:* $Y = Z > X$. α = 1.762–1.785 β = n.d. γ = 1.770–1.85 2V(meas.) = 5°–10°

Cell Data: *Space Group: Aa.* a = 17.553(2) b = 19.354(3) c = 11.248(2) β = 95.84(1)° Z = 12

X-ray Powder Pattern: White Elephant mine, South Dakota, USA.
8.64 (10), 2.721 (7), 5.55 (6), 3.20 (4), 2.881 (4), 2.562 (4), 2.169 (4)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	31.5	34.41	CaO	17.4	18.13
Fe_2O_3	35.6	38.72	H_2O	12.8	8.74
Mn_2O_3	2.7		Total	100.0	100.00

(1) White Elephant mine, South Dakota, USA. (2) $Ca_2Fe_3O_2(PO_4)_3 \cdot 3H_2O$.

Occurrence: A common stain or crust on minerals near oxidizing ferrous phosphate minerals, typically triphylite or vivianite in granite pegmatite; a component of cement or fossil replacements in some ferruginous oölitic sediments; in phosphatic soils.

Association: Triphylite, vivianite, rockbridgeite, heterosite, huréaulite, fairfieldite, cyrilovite, jahnsite, collinsite, apatite, iron hydroxides.

Distribution: Probably more widespread than the literature suggests. Well-studied material occurs at: the Kamysh-Burun iron deposit and numerous other localities near Kerch, Crimean Peninsula, Ukraine. On the Taman Peninsula, and at the Voron'i massif, Kola Peninsula, Russia. In South Africa, in the Boons and West Driefontein Caves, Transvaal. In the USA, from the Tip Top, White Elephant, Bull Moose, and Linwood mines, near Custer, Custer Co., and the Gap Lode pegmatite, Pennington Co., South Dakota; in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire. At Glen Chosaidh, Loch Quoich, Inverness-shire, Scotland. In the Gunheath china clay pit, St. Austell, Cornwall, England. From Hagendorf, Bavaria, Germany. In the Mangualde pegmatite, near Mesquitela, and in the Bendada pegmatite, near Guarda, Portugal. At the Spring Creek mine, near Wilmington, South Australia. From the Rubicon and Tsaobismund pegmatites, south of Karibib, Namibia.

Name: For Mt. Mithridat [named for King Mithridates], within the city of Kerch, Ukraine, near which the first specimens were collected.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87594.

Mitscherlichite $K_2CuCl_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$ (probable). Crystals, short prismatic along [001], or pyramidal {011}, minute; in stalactitic growths.

Physical Properties: Hardness = 2.5 D(meas.) = 2.418 D(calc.) = [2.39]

Optical Properties: Transparent. *Color:* Greenish blue; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = sky-blue; E = grass-green. *Absorption:* $O > E$.
$\omega = 1.6365$ $\epsilon = 1.6148$

Cell Data: *Space Group:* $P4_2/mnm$, probable, synthetic. a = 7.477(13) $c = 7.935(19)$
Z = 2

X-ray Powder Pattern: Synthetic.
2.635 (100), 2.711 (95), 5.42 (70), 3.164 (50), 3.072 (25), 1.977 (25), 1.5814 (25)

Chemistry: Natural samples were shown to contain only K, $CuCl_2$, and H_2O; no more complete analyses of natural material appear to have been made.

Occurrence: A volcanic sublimate (Vesuvius, Italy); an alteration product of ponomarevite (Tolbachik volcano, Russia).

Association: Sylvite, metavoltine, gypsum (Vesuvius, Italy); ponomarevite, tolbachite, dolerophanite, piypite, chalcocyanite, halite, sylvite, tenorite (Tolbachik volcano, Russia).

Distribution: In the crater of Vesuvius, Campania, Italy. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Eilhardt Mitscherlich (1794–1863), German crystallographer and chemist, who first synthesized the compound.

Type Material: University of Florence, Florence, Italy, 225/l; The Natural History Museum, London, England, 1928,239.

Mixite **$BiCu_6(AsO_4)_3(OH)_6 \cdot 3H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As acicular crystals, elongated along [0001], commonly in mats, radial fibrous aggregates, or cross-fiber veinlets.

Physical Properties: Hardness = 3–4 D(meas.) = 3.79–3.83 D(calc.) = [4.04]

Optical Properties: Transparent to translucent. *Color:* Blue-green to emerald-green, pale green, white; pale green to colorless in transmitted light. *Streak:* Pale bluish green. *Luster:* Vitreous, silky in aggregates.
Optical Class: Uniaxial (+). *Pleochroism:* O = colorless; E = bright green.
Absorption: $E > O$. $\omega = 1.743–1.749$ $\epsilon = 1.810–1.830$

Cell Data: *Space Group:* $P6_3/m$. $a = 13.646(2)$ $c = 5.920(1)$ $Z = 2$

X-ray Powder Pattern: Anton mine, Germany.
12.03 (10), 2.46 (9), 3.57 (8), 2.95 (7), 2.86 (6), 2.70 (6), 2.57 (6)

(1) Jáchymov, Czech Republic. (2) Tintic district, Utah, USA. (3) $BiCu_6(AsO_4)_3(OH)_6 \cdot 3H_2O$.

Mineral Group: Mixite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of copper deposits.

Association: Bismutite, smaltite, bismuth, atelestite, erythrite, malachite, barite.

Distribution: From the Geister vein, Werner mine, Jáchymov (Joachimsthal), Czech Republic. At Wheals Owles and Edwards, St. Just, and several other mines in Cornwall, England. In Germany, in the Black Forest, at the Anton mine, Heubachtal, near Schiltach; on the Schmiedestollen dump, near Wittichen; from the Clara mine, near Oberwolfach; from Neubulach; and in the Hechtsberg quarry, near Hausach; in Hesse, at Reichenbach, near Bensheim; in Saxony, from Schneeberg, Schwarzenberg, and in the Sadisdorf copper mine, near Schmiedeberg. At the Cap Garonne mine, near le Pradet, Var, France. From the Kamariza mine, Laurium, Greece. At Tsumeb, Namibia. In the Bonanza mine, Concepción del Oro, Zacatecas, Mexico. In the USA, from the Mammoth and other mines, Tintic district, Juab Co., and at the Gold Hill mine, Tooele Co., Utah; in the Majuba Hill mine, Antelope district, Pershing Co., Nevada; from the Mammoth-St. Anthony mine, Tiger, Pinal Co., and at the Joe Shaft, Tombstone, Cochise Co., Arizona; from Granite Gap, San Simon district, Hidalgo Co., New Mexico; at the Cerro Gordo mine, Inyo Co., California. A number of other localities are known.

Name: Honors Anton Mixa, a mining official from Příbram, who found the mineral at Jáchymov, Czech Republic.

BaO	52.05	51.62
P_2O_5	24.85	23.89
F	1.99	2.13
Cl	0.06	
-O = Cl+F	0.85	-0.90
H_2O	[0.09]	.
Total	99.39	100.00

(1) Shimoharai mine, Oita Prefecture, Japan; average of 4 electron microprobe analyses, H_2O calculated for charge balance; corresponding to $(Sr_{1.366}Ca_{0.717})_{\Sigma=2.083}Ba_{2.991}P_{3.002}O_{12}(F_{0.898}OH_{0.088}Cl_{0.014})_{\Sigma=1}$. (2) $Sr_2Ba_3(PO_4)_3F$.

Mineral Group: Hedyphane subgroup of the apatite group.

Occurrence: In a metamorphosed (low grade) bedded Mn and chert deposit.

Association: Fluorapatite, namansilite, quartz.

Distribution: From the Shimoharai mine, Yayoi Udoki area, Saiki City, Oita Prefecture, Japan.

Name: Honors Michitoshi Miyahisa (1928-1983) for his contribution to the study of ore deposits on Kyushu.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSMM-41299).

References: (1) Nishio-Hamane, D., Y. Ogoshi, and T. Moctezumite $Pb(UO_2)(Te^{4+}O_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are bladelike, elongated along [010] and flattened on {201}, commonly with curved faces, to 3 mm; in subparallel radiating groups and rosettes.

Physical Properties: *Cleavage:* On {100}, perfect. Hardness = ∼3 D(meas.) = 5.73 D(calc.) = 7.256 Radioactive.

Optical Properties: Semitransparent. *Color:* Bright orange, brownish orange to dark orange. *Luster:* Dull.
Optical Class: Biaxial (–). *Orientation:* Parallel extinction. $\alpha = > 2.11$ $\beta = > 2.11$ $\gamma = > 2.11$ 2V(meas.) = 5°–10°

Cell Data: *Space Group:* $P2_1/c$. $a = 7.813(5)$ $b = 7.061(2)$ $c = 13.775(4)$ $\beta = 93.71(2)°$ Z = 4

X-ray Powder Pattern: Moctezuma mine, Mexico.
3.156 (10), 3.492 (9), 2.997 (8), 3.088 (7), 3.385 (6), 2.012 (5), 1.949 (4)

Chemistry:

	(1)	(2)
UO_3	34.20	34.53
TeO_2	40.18	38.53
PbO	25.62	26.94
Total	[100.00]	100.00

(1) Moctezuma mine, Mexico; average of two analyses originally totalling 99.42%; recalculated to 100% after deduction of WO_3 8.63% and CaO 2.09% as scheelite contaminant introduced during separation, Fe_2O_3 0.29%, insoluble 3.26%, and loss on ignition 0.05%; then corresponding to $Pb_{0.94}(UO_2)_{0.98}(TeO_3)_{2.06}$. (2) $Pb(UO_2)(TeO_3)_2$.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal Au–Te deposit.

Association: Schmitterite, burckhardtite, zemannite, emmonsite, pyrite, barite, "limonite".

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: For its occurrence in the Moctezuma mine, Mexico.

Type Material: Natural History Museum, Paris, France, 175.84; Harvard University, Cambridge, Massachusetts, 119086; National Museum of Natural History, Washington, D.C., USA, 128392, 164345, 164346.

Total	100.6

(1) Dashkesan deposit, Azerbaijan; by electron microprobe, average of 11 grains; corresponding to $(Co_{0.88}Fe_{0.12})_{\Sigma=1.00}As_{1.00}$.

Occurrence: In heavy mineral concentrates (Witwatersrand, South Africa).

Association: Nickeline, alloclasite, safflorite, glaucodot, cobaltite, pentlandite, pyrrhotite, chalcopyrite (Witwatersrand, South Africa); alloclasite, glaucodot, cobaltite, pentlandite, pyrrhotite, chalcopyrite (Dashkesan deposit, Azerbaijan).

Distribution: From the "Far East" Witwatersrand, Transvaal, South Africa [TL]. In the Dashkesan deposit, Middle Caucasus Mountains, Azerbaijan.

Name: Derivation not given; presumably named for the Modderfontein mine, South Africa.

Type Material: National Museum of Natural History, Washington, D.C., USA, 161217.

Ce_2O_3	0.28	-O = Cl	0.12
		Total	98.82

(1) Kovdor massif, Kola Peninsula, Russia; by electron microprobe analysis, IR and Mössbauer spectroscopy, and TGA; corresponding to $Na_9(Ca_{4.05}Na_{0.87}K_{0.24}Ce_{0.06}La_{0.03})_{\Sigma=5.25}Ca_{6.00}(Fe^{3+}_{1.48}Fe^{2+}_{0.58})_{\Sigma=2.06}Mn_{0.30}(Zr_{3.02}Ti_{0.09})_{\Sigma=3.11}(\square,Nb_{0.40})Si_{24.71}O_{72}(OH)_{2.86}(CO_3)_{1.03}Cl_{0.46}\bullet 0.74H_2O$.

Mineral Group: Eudialyte group, the CO_3-dominant analog of feklichevite with vacancies dominant in the *M3* structural site.

Occurrence: In a nepheline-pectolite vein within ijolite.

Association: Nepheline, pectolite, aegirine-augite, zircon, titanite, humite, andradite, scolecite, calcite.

Distribution: From the northern face of the iron-ore quarry at the 115 m horizon, Kovdor massif, Kola Peninsula, Russia.

Name: For the mountain, Mogo-Vid, near the locality from which the first specimens were collected.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, (3221/1; 3290/1).

References: (1) Chukanov, N.V., M.M. Moiseyev, R.K. Rastsvetayeva, K.A. Rozenberg, and A.E. Crystal Data: Hexagonal. *Point Group:* $6mm$. As hexagonal plates, to 5 mm, platy to elongated on $[10\bar{1}0]$, rounded; polytypes are commonly syntactically intergrown.

Physical Properties: *Cleavage:* {0001}, poor. *Fracture:* Conchoidal. Hardness = 9.5 D(meas.) = 3.1–3.29 D(calc.) = 3.21

Optical Properties: Transparent. *Color:* Green, emerald-green, blue-green, deep blue, blue-black, black; rarely pale green, yellow, or colorless; may be zoned. *Luster:* Metallic to adamantine.
Optical Class: Uniaxial (+). *Pleochroism:* Weak; O = light blue; E = deep indigo. $\omega = 2.654$ $\epsilon = 2.697$

Cell Data: *Space Group:* $P6_3mc$ (synthetic, 6H polytype). $a = 3.073$ $c = 15.08$ Z = 6

X-ray Powder Pattern: Synthetic (6H).
2.511 (100), 2.621 (40), 1.311 (40), 1.537 (35), 2.352 (20), 1.286 (15), 1.087 (15)

Chemistry:

	(1)	(2)	(3)
Si	68.54	70.01	70.05
C	31.00	29.99	29.95
Total	99.54	100.00	100.00

(1) Udachnaya kimberlite, Russia; by electron microprobe. (2) Metaxades, Greece; by electron microprobe. (3) SiC.

Polymorphism & Series: Polytypes 2H, 3C, 4H, 5H, 6H, 10R, 15R, 33R have been noted (of 74 known to exist).

Occurrence: A rare mineral: formed in an iron meteorite; as inclusions in diamond; in diamondiferous kimberlites and lamproites, and in eclogite; in volcanic breccias and rhyolite; in alluvium.

Association: Iron, diamond (Canyon Diablo); quartz, diamond (Fuxian, China); garnet, clinopyroxene, coesite, quartz, rutile, graphite, pyrrhotite, cobaltian pyrite (Udachnaya kimberlite, Russia).

Distribution: In the Canyon Diablo meteorite. From the Sevan-Amasii ophiolite, Dzoraget River, Armenia. Around Metaxades, Greece. In China, from near Fuxian, Liaoning Province, and in the Hong district, Tibet. From the Udachnaya, Mir, and Aikhal diamond mines, and elsewhere in Sakha, Russia. In the Argyle diamond mine, Kimberley district, Western Australia.

Name: For Ferdinand F. Henri Moissan (1852–1907), French chemist, who noted the species in the Canyon Diablo meteorite.

Type Material: n.d.

Moluranite $H_4U^{4+}(U^{6+}O_2)_3(MoO_4)_7 \cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. As colloform aggregates in brannerite.

Physical Properties: *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = ∼4 D(calc.) = n.d. Radioactive.

Optical Properties: Translucent. *Color:* Black, brown in thin fragments; pale gray in reflected light. *Luster:* Resinous.
Optical Class: Isotropic. n = 1.97–1.98

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Aleksandrovskii Golets deposit, Russia; heated, near U_3O_8.
4.17 (10), 1.314 (6), 1.305 (6), 3.44 (5), 2.58 (5), 2.12 (5), 2.03 (5)

U_3O_8	42.32		
H_2O	15.4	14.03	14.43
Total	99.78	99.74	100.00

(1) Aleksandrovskii Golets deposit, Russia. (2) Do.; H_2O taken as loss on ignition.
(3) $H_4U^{4+}(U^{6+}O_2)_3(MoO_4)_7 \cdot 18H_2O$.

Occurrence: In fine fissures in granulated albite, in part replacing brannerite.

Association: Brannerite, molybdenite, chalcopyrite, galena, irignite.

Distribution: From the Aleksandrovskii Golets Mo–U deposit, upper Chetkanda River, Udokan Range, Chara region, northern Transbaikal, Russia.

Name: For MOLybdenum and URANium in the composition.

Type Material: n.d.

Molybdenite MoS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$ ($2H_1$ polytype); or $3m$ (3R polytype). Crystals are commonly tabular, barrel shaped; also as slightly tapered prisms; face development poor; up to 15 cm across. Commonly shows trigonal markings on {0001} parallel to the trace of $\{10\bar{1}1\}$. Foliated, massive, or in scales.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Lamellae flexible, not elastic. Hardness = 1–1.5 VHN = n.d. D(meas.) = 4.62–4.73 D(calc.) = 4.998 Greasy feel.

Optical Properties: Nearly opaque; translucent in thin flakes; transparent in infrared light. *Color:* Lead-gray; very pale yellow to deep reddish brown in transmitted light. *Streak:* Bluish gray. *Luster:* Metallic. *Pleochroism:* Very strong. *Anisotropism:* Very strong.
R_1–R_2: (400) 21.0–55.0, (420) 22.2–54.8, (440) 23.4–54.6, (460) 24.1–53.8, (480) 23.8–52.3, (500) 22.7–49.7, (520) 21.9–47.1, (540) 21.3–45.5, (560) 20.9–44.4, (580) 20.6–44.0, (600) 20.4–44.6, (620) 20.2–45.3, (640) 20.0–45.7, (660) 20.0–45.6, (680) 19.9–45.4, (700) 19.7–44.2

Cell Data: *Space Group:* $P6_3/mmc$ ($2H_1$), with $a = 3.1604$ $c = 12.295$ Z = 2, or *Space Group:* $R3m$ (3R), with $a = 3.16$ $c = 18.33$ Z = 3

X-ray Powder Pattern: Synthetic ($2H_1$).
6.15 (100), 2.277 (45), 1.830 (25), 2.737 (16), 2.049 (14), 1.581 (12), 1.538 (12)

X-ray Powder Pattern: Con mine, Canada (3R).
6.09 (100), 2.71 (70), 1.581 (70), 1.529 (70), 2.63 (60), 2.344 (60), 2.194 (60)

Chemistry: Nearly pure MoS_2.

Polymorphism & Series: Dimorphous with jordisite; polytypes $2H_1$ and 3R are known.

Occurrence: In high-temperature hydrothermal veins. In disseminated deposits of the porphyry type, both with and without associated major copper mineralization. Also in contact metamorphic deposits in limestone with calcium silicate minerals as well as in pegmatites, granites, and aplites. Rarely in meteorites.

Association: Chalcopyrite, other copper sulfides.

Distribution: Of widespread occurrence; the most abundant molybdenum mineral. Fine crystals occur, in the USA, at the Crown Point mine, Lake Chelan, Chelan Co., Washington; and at the Frankford quarry, Philadelphia, Pennsylvania. In Canada, in the Temiskaming district, and in Aldfield Township, Quebec. In Norway, from Raade, near Moss, and at Vennesla, near Arendal. In Russia, in the Adun-Chilon Mountains, south of Nerchinsk, Transbaikal; at Miass, Ilmen Mountains, Southern Ural Mountains; and in the Slundyanogorsk deposit, Central Ural Mountains. In Germany, at Altenberg, Saxony. In Morocco, at Azegour, 80 km southwest of Marrakesh. From Kingsgate and Deepwater, New South Wales, Australia. At the Hirase mine, Gifu Prefecture, Japan. In the Wolak mine, Danyang, Chungchong Province, South Korea. The 3R polytype occurs in the Con mine, Yellowknife, Yukon Territory; and at Mont Saint-Hilaire, Quebec, Canada. From the Yamate mine, Okayama Prefecture, Japan.

Name: A word derived from the Greek *molybdos*, *lead*.

Type Material: 3R, Canadian Geological Survey, Ottawa, Canada, 12112.

Molybdite MoO_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Flat needles or thin plates, to 5 mm, elongated ‖ [001], flattened on {010}; in aggregates.

Physical Properties: *Cleavage:* {100}, perfect; {001}, distinct. *Tenacity:* Flexible. Hardness = n.d. D(meas.) = ∼4.5 (synthetic). D(calc.) = 4.72

Optical Properties: Transparent. *Color:* Light greenish yellow to nearly colorless. *Luster:* Adamantine.
Optical Class: Biaxial (+); very high birefringence. *Orientation:* $X = b$; $Y = a$; $Z = c$.
α = n.d. $\beta = > 2.0$ $\gamma = > 2.0$ 2V(meas.) = Very large.

Cell Data: *Space Group: Pbnm* (synthetic). $a = 3.954$ $b = 13.808$ $c = 3.690$ Z = 4

X-ray Powder Pattern: Krupka, Czech Republic.
3.25 (10+), 3.80 (10), 3.45 (9), 6.90 (6), 1.294 (5), 2.64 (4), 2.31 (4b)

Chemistry: (1) Krupka, Czech Republic; by semimicroanalysis, Mo = 66.2% [MoO_3 = 99.7%]; Si 0.X%; Ca 0.0X%; Al, Ag, Be, Bi, Cu, Fe, Mg, Mn, Pb, Zn traces.

Occurrence: In cavities and coating molybdenite in a weathered quartz vein near its contact with topaz-quartz greisen.

Association: Molybdenite, betpakdalite, quartz.

Distribution: Most material thought to be molybdite proves on examination to be ferrimolybdite. An authentic occurrence is at Krupka, Krušné hory Mountains, Czech Republic.

Name: As an oxide of *molybdenum*.

Type Material: Charles University, Prague, Czech Republic.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1095–1097 [molybdite = ferrimolybdite, part]. (2) Čech, F. and P. Molybdofornacite $Pb_2Cu(AsO_4,PO_4)(MoO_4,CrO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic to lathlike crystals, elongated along [010], to 1 mm. *Twinning:* Rare "butterfly" contact twins, at 120°.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3–4 D(meas.) = n.d. D(calc.) = 6.6

Optical Properties: Transparent. *Color:* Light green to olive-green. *Streak:* Pale yellow. *Luster:* Adamantine.
Optical Class: Biaxial. *Pleochroism:* Distinct; $X = Y$ = pale yellow; Z = yellow-green. *Orientation:* $Z = b$. $\alpha = 2.05(2)$ β = n.d. $\gamma = 2.15(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 8.100(5)$ $b = 5.946(3)$ $c = 17.65(1)$ $\beta = 109.17(5)°$ Z = 4

X-ray Powder Pattern: Tsumeb, Namibia.
3.32 (100), 2.979 (60), 2.845 (60), 2.753 (60), 4.84 (50), 2.353 (50), 3.41 (40)

Chemistry:

	(1)
MoO_3	14.29
CrO_3	2.15
P_2O_5	2.13
As_2O_5	12.68
CuO	9.97
PbO	56.45
H_2O	[1.16]
Total	[98.83]

(1) Tsumeb, Namibia; by electron microprobe, original total given as 98.84%, H_2O calculated from stoichiometry; corresponds to $Pb_{1.97}Cu_{0.98}(As_{0.86}P_{0.23})_{\Sigma=1.09}O_4(Mo_{0.77}Cr_{0.17})_{\Sigma=0.94}O_4(OH)$.

Occurrence: In the deep oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Dioptase, duftite, wulfenite, quartz, calcite, hematite (Tsumeb, Namibia); wulfenite, pyromorphite (Tonopah-Belmont mine, Arizona, USA); mimetite, descloizite, willemite, chrysocolla, hematite (Bullfrog #2 claim, New Mexico, USA).

Distribution: From Tsumeb, Namibia. In the USA, in Arizona, in the Tonopah-Belmont mine, Big Horn Mountains, Osborne district, Maricopa Co., and the Rawhide mine, Buckskin Mountains, Mohave Co.; at the Bullfrog #2 claim, near Silver Hill, three km northwest of Magdalena, Socorro Co., and in the Tres Hermanas Mountains, Mahoney district, Luna Co., New Mexico; at the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada. From La Cobradita, Sonora, Mexico.

Name: For its predominance of *molybdenum* and relation to *fornacite*.

Type Material: Mineralogical Institute, Ruhr-University, Bochum, Germany.

Molybdomenite $PbSe^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are typically bladed, tabular on {010}, to 2 mm, thin scaly, less commonly in needles, may be as crusts.

Physical Properties: *Cleavage:* On {001} and {$h0l$}, good. Hardness = 3.5
D(meas.) = 7.07 (synthetic). D(calc.) = 7.12

Optical Properties: Transparent to translucent. *Color:* Colorless to white, yellowish white.
Luster: Pearly, adamantine, to greasy.
Optical Class: Biaxial (–), may be (+). *Orientation:* Positive elongation, parallel extinction,
$\alpha = 2.12$ $\beta = 2.14$ $\gamma =$ n.d. 2V(meas.) = $\sim 80°$

Cell Data: *Space Group:* $P2_1/m$. $a = 6.91$ $b = 5.48$ $c = 4.51$ $\beta = 112°50'$ Z = 2

X-ray Powder Pattern: Cerro de Cacheuta, Argentina.
2.756 (10), 3.32 (9), 3.43 (7), 3.17 (7), 4.15 (6), 2.090 (6b), 2.99 (5)

Chemistry: (1) No chemical analysis has been performed; identity depends on correspondence of X-ray patterns between natural and synthetic material.

Occurrence: A rare species in the oxidized zone of selenium-bearing hydrothermal base metal deposits.

Association: Chalcomenite (Cerro de Cacheuta, Argentina); clausthalite, uraninite, calcite (Ranwick mine, Canada); chalcomenite, cobaltomenite, schmiederite, kruťaite (El Dragón mine, Bolivia).

Distribution: From Cerro de Cacheuta, Mendoza Province, Argentina. At the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, and the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, Bolivia. In the Trogtal quarry, near Lautenthal, Harz Mountains, Germany. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. At the Ranwick uranium mine, north of Sault Sainte Marie, Ontario, Canada. In the Bozo #1 mine, Skull Creek, Moffat Co., Colorado, USA.

Name: From the Greek for *lead* and *moon*, for its composition, selenium being named for the moon.

Type Material: Natural History Museum, Paris, France, 98293.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 640. (2) Mandarino, J. Molybdophyllite $Pb_2Mg_2Si_2O_7(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* Rhombohedral. In foliated aggregates of platy crystals.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Somewhat flexible in thin foliae. Hardness = 3–4 D(meas.) = 4.717 D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Pale green; colorless in thin section. *Luster:* Vitreous; pearly on {001}.
Optical Class: Uniaxial (–). $\omega = 1.815$ $\epsilon = 1.761$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Långban, Sweden.
13.8 (100), 4.60 (90), 2.67 (70), 3.80 (60), 3.04 (60), 2.95 (60), 1.762 (60)

Chemistry:

	(1)	(2)
SiO_2	18.15	18.06
Al_2O_3	0.46	
PbO	61.09	67.11
MgO	11.71	12.12
Na_2O	0.82	
K_2O	0.69	
H_2O	6.32	2.71
Total	99.24	100.00

(1) Långban, Sweden. (2) $Pb_2Mg_2Si_2O_7(OH)_2$.

Occurrence: In skarns in granular limestone or dolostone.

Association: Hausmannite, calcite, rhodonite, garnet.

Distribution: From Långban, Värmland, Sweden.

Name: From the Greek *molybdos*, for *lead*, and *phyllos*, for *leaf*, in allusion to its lead content and foliated habit.

Type Material: n.d.

References: (1) Dana, E.S. and W.E. Ford (1909) Dana's system of mineralogy, (6th edition), app. II, 70. (2) Aminoff, G. Molysite $Fe^{3+}Cl_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As coatings, massive.

Physical Properties: Hardness = Soft. D(meas.) = 2.90 (synthetic). D(calc.) = [2.91] Very deliquescent; hydrolyzed by H_2O to hydrous iron oxide.

Optical Properties: Semitransparent. *Color:* Brownish red or yellowish.
Optical Class: Uniaxial (–); very strong birefringence. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}$ (synthetic). $a = 6.065$ $c = 17.42$ Z = [6]

X-ray Powder Pattern: Synthetic.
2.68 (100), 2.08 (40), 5.9 (32), 1.75 (32), 1.63 (16), 1.67 (6), 4.79 (< 6)

Chemistry: Natural material has not been analyzed.

Occurrence: A volcanic sublimate.

Association: Tridymite, hematite, anhydrite, halite (Augustine volcano, Alaska, USA).

Distribution: In Italy, from Vesuvius, Campania; at Larderello, Val di Cecina, Tuscany; and on Vulcano, Lipari Islands. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. Found on the Augustine volcano, Augustine Island, near the Kenai Peninsula, Alaska, USA.

Name: From the Greek for *a stain*, as it stains the host rock.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 47–48. (2) Hashimoto, S., K. Forster, and S.C. Moss (1989) Structure refinement of an $FeCl_3$ crystal using a thin plate sample. J. Applied Cryst., 22, 173–180.

Momoiite $(Mn^{2+},Ca)_3(V^{3+},Al)_2Si_6O_3$

Crystal Data: Cubic. *Point Group*: $4/m\,\bar{3}\,2/m$. As granular aggregates, to 1 mm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: n.d.
Hardness = 6.5. D(meas.) = n.d. D(calc.) = 4.01

Optical Properties: Translucent. *Color*: Greenish yellow to emerald-green (less green with < V).
Streak: Dull green. *Luster*: Vitreous.
Optical Class: Isotropic. n = 1.86(1)

Cell Data: *Space Group*: $Ia\bar{3}\,d$. a = 11.9242(7) Z = 1

X-ray Powder Pattern: Kurase mine, Ehime Prefecture, Japan.
2.668 (100), 2.980 (78), 2.435 (42), 1.594 (30), 1.935 (21), 2.178 (20), 1.654 (20)

Chemistry:

	(1)	(2)
CaO	12.24	
MnO	24.74	44.04
MgO	0.28	
FeO	0.05	
Al_2O_3	5.12	
V_2O_3	21.96	18.60
SiO_2	35.02	37.35
Total	99.41	100.00

(1) Kurase mine, Ehime Prefecture, Japan; average of 10 electron microprobe analyses, corresponding to $(Mn_{1.80}Ca_{1.12}Mg_{0.12})_{\Sigma=2.96}(V_{1.51}Al_{0.52})_{\Sigma=2.03}Si_{3.00}O_{12}$. (2) $(Mn^{2+})_3(V^{3+})_2Si_6O_3$.

Mineral Group: Garnet group.

Polymorhism & Series: Solid solution with spessartine, grossular, and goldmanite.

Occurrence: Product of the metamorphism of siliceous manganese-bearing rocks.

Association: Rhodonite, calcite, tephroite, goldmanite, spessartine, vuorelainenite (Kurase mine); rhodonite, tephroite, celsian, rhodochrosite, pyrophanite (Hokkejino mine); in quartz-free assemblages with rhodonite, tephroite, rhodochrosite, spessartine, nickeline, or in quartz-bearing assemblages with rhodonite, molybdenite, rhodochrosite, spessartine, Mn-rich vanadoallanite-(La) (Fujii mine).

Distribution: In Japan, at the Kurase mine, Ehime Prefecture, the Hokkejino mine, Kyoto Prefecture, the Fujii mine, Fukui Prefecture and from the Tanohata mine, Iwate Prefecture.

Name: Honors Hitoshi Momoi (1930-2002), who first recognized $Mn_3V_2Si_3O_{12}$ molecules in garnet.

Type Material: Hokkaido University Museum, Sapporo, Japan (#Mineral-07401).

Monazite-(Ce) $(Ce, La, Nd, Th)PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic; metamict if thorium-rich. *Point Group:* $2/m$. Crystals typically tabular on {100}, may be prismatic, equant or wedge-shaped, to 27 cm; granular, massive. *Twinning:* Common, {100} as twin and composition plane, as contact twins.

Physical Properties: *Cleavage:* {100}, distinct; {010}, poor; parting on {001} or $\{\bar{1}11\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 4.98–5.43 D(calc.) = 5.26 Radioactive if thorium-rich. Dull brown cathodoluminescence. Paramagnetic.

Optical Properties: Translucent to opaque. *Color:* Reddish brown, brown, pale yellow, pink, gray; yellowish brown to yellow in transmitted light. *Luster:* Resinous, waxy, vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* Weak; in pale yellows. *Orientation:* $X = b$; $Z \wedge c$ = 2°–6°. *Dispersion:* $r < v, r > v$, weak, horizontal. *Absorption:* Distinct; $Y > X = Z$.
α = 1.770–1.793 β = 1.778–1.800 γ = 1.823–1.860 2V(meas.) = 10°–26°

Cell Data: *Space Group:* $P2_1/n$. $a = 6.7902(10)$ $b = 7.0203(6)$ $c = 6.4674(7)$ $\beta = 103.38(1)°$ Z = 4

X-ray Powder Pattern: Sri Lanka.
2.862 (100), 3.078 (80), 1.963 (50), 2.151 (40), 1.738 (40b), 3.285 (35), 1.876 (30)

Chemistry:

(1) Sri Lanka; by electron microprobe, RE_2O_3 = La_2O_3 21.7%, Ce_2O_3 28.7%, Pr_6O_{11} 1.9%, Nd_2O_3 6.0%, Sm_2O_3 0.6%, Gd_2O_3 0.09%, Dy_2O_3 0.2%, Ho_2O_3 0.05%; corresponding to $(Ce_{0.43}La_{0.33}Th_{0.11}Nd_{0.09}Ca_{0.04}Pr_{0.03}Sm_{0.01})_{\Sigma=1.04}(P_{0.94}Si_{0.02})_{\Sigma=0.96}O_4$.

Mineral Group: Monazite group.

Occurrence: An accessory mineral in granites, syenites, and their pegmatites; in carbonatites and volcanoclastic rocks; in fissure veins and high-grade metamorphic rocks; commonly detrital in river and beach sands; rarely authigenic in shales and intense weathering zones.

Association: Zircon, xenotime, titanite, thorite, allanite, columbite, wolframite (pegmatites and Alpine fissures); rhabdophane, cerianite, florencite, churchite (Mt. Weld, Australia).

Distribution: Widespread, but uncommon in fine crystals. In the Ilmen Mountains, Southern Ural Mountains, Russia, at Miass. At Arendal and many other places in Norway. In Madagascar, at Ambatofotsikely, Ampangabe, and Ampatakala. From the Kangankunde Hill carbonatite, 30 km west of Lalaka, Malawi. In the USA, large crystals from Mars Hill, Madison Co., near Double Shoals, Cleveland Co., and elsewhere in North Carolina. Fine twins from the Joaquim Felicio mine, near Buenopolis, and large crystals in the José Pinto pegmatite, at Jaguaraçú, near Coronel Fabriciano, Minas Gerais, Brazil. Good crystals from the Ishikawa district, Fukushima Prefecture, Japan. In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China, 35 million tons estimated. At the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia, 15 million tons estimated. The principal source of Ce, RE, Th, from heavy mineral sands in North and South Carolina and Florida, USA; also Australia, Sri Lanka, India, Brazil.

Name: From the Greek for *solitary*, for its initial apparent rarity, and dominant *cerium*.

Type Material: Mining Academy, Freiberg, Germany, 19539.

(1) Ebisie mine, Japan. (2) Near Kokšín, Czech Republic; by electron microprobe, analysis not given; corresponds to $(La_{0.35}Ce_{0.30}Nd_{0.21}Pr_{0.05}Gd_{0.03}Ca_{0.02}Sm_{0.02}Tb_{0.01}Tm_{0.01})_{\Sigma=1.00}PO_4$.

Mineral Group: Monazite group.

Occurrence: In fissure veins, granite and gneissic metamorphic rocks.

Association: n.d.

Distribution: From the Kounrad Massif, northern Balkhash region, Kazakhstan. At Kokšín, near Mítov, Czech Republic. From Poiana Marului, Muntele Mic Mountains, Romania. In the Gasteiner Tal, Austria. At the Ebisie mine, Wada, Gifu Prefecture, Japan. From Ratnapura, Sri Lanka. Along the Grey River, Westland, New Zealand. In Dickens Township, Nipissing district, Ontario, Canada. From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: For the member of the *monazite* group with dominant *lanthanum*.

Type Material: n.d.

Gd_2O_3	2.26
Total	99.83

(1) Pta. Glogstafel, Italy; by electron microprobe, average of three analyses; corresponding to $(Nd_{0.44}Ce_{0.29}Sm_{0.12}Pr_{0.09}La_{0.04}Gd_{0.03}Zr_{0.02})_{\Sigma=1.03}(P_{0.97}Si_{0.01})_{\Sigma=0.98}O_4$.

Mineral Group: Monazite group.

Occurrence: In fissures in aplitic veins through white-mica gneiss (Pta. Glogstafel, Italy); replacing brindleyite in bauxite (Marmara deposit, Greece); in volcanic-associated marine cherts (Kokšín, Czech Republic).

Association: Rutile, xenotime, gadolinite, bastnäsite, allanite, monazite-(Ce) (Pta. Glogstafel, Italy).

Distribution: From Pta. Glogstafel, Val Formazza, on the southeastern slope of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, Italy. In the Marmara bauxite deposit, Megora, Greece. At Kokšín, near Mítov, Czech Republic.

Name: For the member of the *monazite* group with dominant *neodymium*.

Type Material: Mineralogical Institute, University of Basel, Basel; Natural History Museum, Basel, Switzerland, 30803.

Total	100.0	100.4	100.0

(1) Monchegorsk deposit, Russia; average of microspectrographic analyses of four samples, corresponding to $(Pt_{0.60}Pd_{0.28})_{\Sigma=0.88}(Te_{1.56}Bi_{0.44})_{\Sigma=2.00}$. (2) Impala mine, Transvaal, South Africa; by electron microprobe, corresponding to $(Pt_{0.88}(Te_{1,72}Bi_{0.28})_{\Sigma=2.00}$. (3) Stillwater complex, Montana, USA; by electron microprobe, corresponding to $Pt_{0.06}(Te_{1.97}Bi_{0.03})_{\Sigma=2.00}$.

Mineral Group: Melonite group.

Occurrence: Typically in small amounts in Pt–Pd-bearing massive Cu–Ni sulfide deposits.

Association: Merenskyite, melonite, sobolevskite, michenerite, kotulskite, froodite, sperrylite, cooperite, laurite, braggite, insizwaite, gold, pyrrhotite, pentlandite, chalcopyrite, pyrite.

Distribution: In Russia, from the Monchegorsk deposit, Monche Tundra, Kola Peninsula [TL]; and at the Oktyabr mine, Noril'sk region, western Siberia. In South Africa, from several mines along the Merensky Reef, Bushveld complex, Transvaal. In the USA, at the Stillwater complex, Montana; from the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; at the Key West mine, east of Moapa, Bunkerville district, Clark Co., Nevada; and in gravels of the San Joaquin River, at Friant, Fresno Co., California. In Canada, at Sudbury, in the Strathcona and Thierry mines, near Pickle Lake, and the Lac des Iles complex, Ontario; from the Wellgreen Ni–Cu–PGE deposit, Yukon Territory. At Kambalda, 56 km south of Kalgoorlie, Western Australia. A number of additional localities are now known.

Name: For the locality at Monche Tundra in Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5966; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64852.

(1) Boqueirão pegmatite, Brazil; by electron microprobe, partial analysis. (2) $CaHPO_4$.

Occurrence: As coatings and cements resulting from guano-induced phosphatization of sedimentary rocks; a coating on phosphate minerals in granite pegmatite.

Association: Newberyite, gypsum, whitlockite, aphthitalite, syngenite (guano-related), apatite, lithiophilite, jahnsite, huréaulite, barbosalite, whitlockite (pegmatites).

Distribution: On Monito (Moneta), Mona, Los Monges, and Aruba Islands, West Indies, Caribbean Sea. From Ascension Island, South Atlantic Ocean. On Paoha Island, Mono Lake, Mono Co., California, USA. From the Boqueirão pegmatite, Parelhas, Rio Grande do Norte, Brazil. In Murra-el-elevyn Cave, Cocklebiddy, Western Australia. From the Gunong Keriang Cave and the Niah Great Cave, Sarawak, Malaysia. At the Sandamap pegmatite, west of Usakos, Namibia.

Name: For Moneta (now Monito) Island, which contains a notable occurrence.

Type Material: The Natural History Museum, London, England, 54779; National Museum of Natural History, Washington, D.C., USA, 123822, 128714.

Total	[100.75]	[100.83]

(1) Khan-Bogdinskii massif, Mongolia; by electron microprobe, original total given as 100.76%; corresponds to $(Ca_{3.01}Na_{0.31}Sr_{0.28}K_{0.14}Ba_{0.06})_{\Sigma=3.80}(Nb_{5.45}Al_{0.22}Mn_{0.22}Zn_{0.07}Mg_{0.03})_{\Sigma=5.99}Si_5O_{27.84}\cdot 5.07H_2O$. (2) Do.; original total given as 100.82%; corresponds to $(Ca_{2.87}Sr_{0.24}Na_{0.11}K_{0.11}Ba_{0.06})_{\Sigma=3.39}(Nb_{5.24}Al_{0.23}Mn_{0.16}Zn_{0.15}Mg_{0.04})_{\Sigma=5.82}Si_5O_{27.07}\cdot 6.53H_2O$.

Occurrence: In the quartz-rich core zone of an alkalic pegmatite, as a late-stage alteration product of a niobium silicate.

Association: Polylithionite, zincian montmorillonite, niobium and rare-earth silicates.

Distribution: At the Dorozhny site, northern Khan-Bogdinskii granitic massif, Gobi, Mongolia.

Name: For Mongolia, the country where the mineral was discovered.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Monimolite $(Pb, Ca)_3Sb_2O_8(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$ (probable). As octahedra with {113}, or less commonly, cube dominant, with {111} and {011}.

Physical Properties: *Cleavage:* Indistinct on {111}. *Fracture:* Small conchoidal to splintery. Hardness = 4.5–6 D(meas.) = 5.94–7.29 D(calc.) = n.d.

Optical Properties: Opaque, translucent on thin edges. *Color:* Yellow, gray-green, dark brown. *Streak:* Straw-yellow to cinnamon-brown. *Luster:* Greasy to adamantine. *Optical Class:* Isotropic; may show weak anisotropism. $n = > 2.06$

Cell Data: *Space Group:* n.d. $a = 10.47$ Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)

CaO	9.70	
Na_2O	0.54	
Total	99.84	100.24

(1) Harstigen mine, Sweden. (2) Do.; corresponds to $(Pb_{2.12}Fe_{0.66}Mn_{0.14})_{\Sigma=2.92}Sb_2O_{7.92}$.

Occurrence: In calcite veins in an iron and manganese deposit.

Association: Tephroite, calcite.

Distribution: In the Harstigen mine, near Persberg, Värmland, Sweden.

Name: From the Greek for *stable*, as it is decomposed chemically only with great difficulty.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1023. (2) Mason, B. and C.J. Vitaliano (1953) The mineralogy of the antimony oxides and antimonates. Mineral. Mag., 30, 100–112.

Monipite MoNiP

Crystal Data: Hexagonal. *Point Group*: $\bar{6}\,m2$. As an irregular 0.002 mm grain.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d.. *Tenacity*: n.d.. Hardness = n.d. D(meas.) = n.d. D(calc.) = 8.27

Optical Properties: Opaque. *Color*: n.d. *Streak*: n.d.
Luster: n.d.
Optical Class: n.d..

Cell Data: *Space Group*: $P\bar{6}\,2m$. a = 5.861 c = 3.704 Z = 3

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
Mo		51.69
Ni		31.62
P		16.69
Total		100.00

(1) Electron microprobe analyses, not given, corresponding to $(Mo_{0.84}Fe_{0.06}Co_{0.04}Rh_{0.03})_{\Sigma=0.97}(Ni_{0.89}Ru_{0.09})_{\Sigma=0.98}P$. (2) MoNiP.

Occurrence: As a single grain in the Allende meteorite, probably a secondary product of the oxidation of Mo-phosphides and/or P-rich alloys.

Association: Apatite, tugarovinite, a Ru-Mo-Ni metal grain.

Distribution: In a melilite-rich mantle of a B1 CAI (calcium aluminum rich inclusion) from the Allende meteorite.

Name: An acronym composed of the chemical symbols of the three essential components.

Type Material: National Museum of Natural History, Washington, D.C., USA, USNM 7554.

References: (1) Ma, C., J.R. Beckett, and G.R. Rossman (2009) Discovery of a new phosphide mineral, monipite (MoNiP), in an Allende type B1 CAI. 72nd Annual Meeting of the Meteoritical Society Abstracts. (2) (2010) Amer. Mineral., 95, 206 (abs. ref. 1).

Monohydrocalcite $CaCO_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Rare as aggregates of rhombohedral crystals, to 2 mm; most commonly as spheroids and crusts.

Physical Properties: Hardness = n.d. D(meas.) = 2.38 (synthetic). D(calc.) = 2.48

Optical Properties: Transparent to opaque. *Color:* Colorless to white.
Optical Class: Uniaxial (–). $\omega = 1.590–1.591$ $\epsilon = 1.545–1.546$

Cell Data: *Space Group:* $P3_121$ or $P3_221$. $a = 6.084(4)$ $c = 7.542(7)$ $Z = 3$

X-ray Powder Pattern: Lake Issyk-Kol, Kyrgyzstan.
2.17 (10), 1.926 (10), 4.49 (9), 3.15 (9), 2.90 (8), 1.770 (7), 1.746 (7)

(1) Lake Issyk-Kol, Kyrgyzstan; corresponds to $CaCO_3 \cdot 0.65H_2O$. (2) Lake Fellmongery, Australia; corresponds to $(Ca_{0.91}Mg_{0.07})_{\Sigma=0.98}CO_3 \cdot 1.15H_2O$. (3) $CaCO_3 \cdot H_2O$.

Occurrence: In lake-bed sediments and as tuffaceous deposits on lake margins, formed by precipitation at pH > 8.0 and high Mg:Ca or by biological activity; in caves, in speleothems, crusts, and "moonmilk," probably formed from an aerosol, possibly in the presence of organic matter; rarely in hydrothermal mineral deposits.

Association: Calcite, aragonite, hydromagnesite, nesquehonite.

Distribution: From Lake Issyk-Kol, Kyrgyzstan. At Lakes Maibalyk and Teke, Kazakhstan. From Lake Kivu, on the Congo (Zaire)–Rwanda border. In the Sarfartôq carbonatite complex, near Kangerdlugssuaq, Greenland. In Castleguard Cave, Columbia Icefields, Alberta, Canada. In the USA, from the Gunsight, Cottonwood, and Hidden Caves, Guadalupe Mountains, Eddy Co., New Mexico; at Sterling Hill, Ogdensburg, Sussex Co., New Jersey. From the Muckross mine, Co. Kerry, Ireland. In the Gerstenegg-Sommerloch cable tunnel, north of the Grimsel Pass, Bern, Switzerland. At the Vrančice deposit, near Příbram, and at Jáchymov (Joachimsthal), Czech Republic. From the Sedmochislenitsi deposit, western Stara Planina Mountains, Bulgaria. In the Feengrotten Cave, Thuringia, and at Ramsbeck, North Rhine-Westphalia, Germany. At Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. Around and in Lakes Fellmongery and Butler, near Robe, South Australia.

Name: For having the composition of *calcite* and the Greek for *one*, as with an additional H_2O.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72027.

(1) Highland, Montana, USA; H_2O by difference. (2) Nizhni Priamur'ya, Russia; H_2O by difference; corresponds to $(Bi_{1.16}Pb_{0.50}Ca_{0.30})_{\Sigma=1.96}Te_{1.87}O_6 \cdot nH_2O$. (3) $Bi_2TeO_6 \cdot 2H_2O$.

Occurrence: An alteration product of tetradymite.

Association: Tetradymite, bismuthinite.

Distribution: In the USA, from Highland, Silver Bow Co., and in German Gulch, Deer Lodge Co., Montana; at the Little Joe mine, Tombstone, Cochise Co., Arizona; from near Hatchita, Hidalgo Co., New Mexico. In Russia, from Nizhni Priamur'ya, otherwise not located. At Norongo, Captain's Flat, New South Wales, Australia. From Nyirjes, near Gyöngyösslymos, Mátra Mountains, Hungary.

Name: For its occurrence in Montana, USA.

Te	49.80	46.66	49.28
Total	99.99	99.76	100.00

(1) Robb-Montbray deposit, Canada; corresponds to $(Au_{1.73}Bi_{0.10}Sb_{0.06}Pb_{0.06}Ag_{0.04})_{\Sigma=1.99}Te_{3.00}$.
(2) Do.; by electron microprobe, corresponds to $(Au_{1.97}Bi_{0.13}Sb_{0.08}Pb_{0.04}Ag_{0.03})_{\Sigma=2.25}Te_{3.00}$.
(3) Au_2Te_3.

Occurrence: With other tellurides, sulfides, and gold in coarsely crystalline masses almost free from gangue (Robb-Montbray mine, Canada).

Association: Calaverite, gold, tellurobismuthite, altaite, petzite, melonite, frohbergite, chalcopyrite, pyrite, sphalerite, chalcocite, covellite, marcasite (Robb-Montbray mine, Canada).

Distribution: From the Robb-Montbray mine, Montbray Township, Quebec, Canada [TL]. At the April Fool mine, Delamar district, Lincoln Co., Nevada, USA. From the Voronezhskiy massif, 50 km south of Orel, Russia. At Enasen, Sweden. From Musariu, Romania. At Kalgoorlie, Western Australia. In the Donping gold deposit, Hebei Province, China. Several undefined localities are known.

Name: For the Robb-Montbray mine, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M15815, M19883; Harvard University, Cambridge, Massachusetts, USA, 97681, 102067.

Montebrasite $LiAl(PO_4)(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals typically equant, may be short to long prismatic, to 10 cm; as coarse cleavable or blocky to rounded nodular masses. *Twinning:* Common on $\{\overline{1}\overline{1}1\}$, producing tabular composite crystals; microscopic polysynthetic twinning on {111}.

Physical Properties: *Cleavage:* Perfect on {100}; good on {110}; distinct on $\{0\overline{1}1\}$ [morphological orientation of ref. (1)]. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.98–3.04 D(calc.) = [3.03]

Optical Properties: Translucent to transparent. *Color:* Pale brown, pink, pale yellow, gray, white, colorless; colorless in transmitted light. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (+), may be biaxial (–). *Dispersion:* $r < v$. α = 1.594–1.615 β = 1.608–1.624 γ = 1.616–1.646 2V(meas.) = 66°–101°

Cell Data: *Space Group:* $C\overline{1}$. $a = 6.713(1)$ $b = 7.708(1)$ $c = 7.0194(7)$ $\alpha = 91.31(1)°$ $\beta = 117.93(1)°$ $\gamma = 91.77(1)°$ Z = 4

X-ray Powder Pattern: Varuträsk, Sweden. (ICDD 12-448).

(1) Tanco pegmatite, Canada; corresponds to $Li_{0.93}Na_{0.01}Al_{1.01}(PO_4)_{1.01}(OH)_{0.85}F_{0.11}$.
(2) $LiAl(PO_4)(OH, F)$ with OH:F = 1:1.

Polymorphism & Series: Forms a series with amblygonite.

Mineral Group: Amblygonite group.

Occurrence: A late primary and secondary mineral in zoned granite pegmatites; may be an ore of lithium.

Association: Hydroxylapatite, spodumene, lepidolite, petalite, pollucite, tourmaline, triplite, lithiophilite, lacroixite, crandallite, muscovite, albite.

Distribution: A few localities for well-studied material include: from Montebras, Creuse, France. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. From the Tanco pegmatite, Bernic Lake, Manitoba, Canada. In the USA, at the Nevel quarry and Bell Pit, Newry, Oxford Co., and elsewhere in Maine; in the Midnight Owl pegmatite, White Picacho district, Maricopa Co., Arizona; in South Dakota, from the Peerless and Hugo mines, near Keystone, Pennington Co.; around Custer, Custer Co., at the Tip Top and Tin Mountain mines, with large masses from the Beecher lode, eight km southeast of Custer; at the Nesbit mine, Gunnison Co., Colorado; in the Stewart mine, Pala, San Diego Co., California. In Brazil, gemmy crystals from Linópolis, Galiléia; at Araçuaí, Itinga, Governador Valadares, and other places in Minas Gerais. In the Buranga pegmatite, near Gatumba, Rwanda.

Name: For the locality, Montebras, France, from which it was first described.

(1) Mont Saint-Hilaire, Canada; Y by electron microprobe, H_2O by DTA; corresponds to $K_{1.80}Na_{4.66}(Y_{1.68}Ca_{0.18}Mg_{0.06}Ba_{0.04})_{\Sigma=1.96}(Si_{15.87}Al_{0.16})_{\Sigma=16.03}O_{38}\cdot 10.02H_2O$.

Occurrence: In miarolitic cavities, metamorphosed inclusions, and rheomorphic breccias in nepheline syenite in an intrusive alkalic gabbro-syenite complex.

Association: Calcite, pectolite, microcline, albite, aegirine, arfvedsonite, phlogopite, fluorite, quartz, ekanite, sepiolite, ashcroftine, lorenzenite, narsarsukite, natrolite, harmotome, apophyllite, molybdenite, pyrite.

Distribution: At Mont Saint-Hilaire, Quebec, Canada.

Name: For the Monteregian Hills, of which Mont Saint-Hilaire is one, and *yttrium* in the composition.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 37130; National Museum of Natural History, Washington, D.C., USA, 145548.

Montesommaite $(K,Na)_9Al_9Si_{23}O_{64}\cdot 10H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $mm2$. Dipyramidal crystals, truncated by pedions, to 0.1 mm.

Physical Properties: Hardness = n.d. D(meas.) = 2.34(4) D(calc.) = 2.30

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = c$; $Y = a$ or b, $Z = a$ or b. $\alpha = 1.498(1)$ $\beta = 1.506(1)$ $\gamma = 1.507(1)$ 2V(meas.) = 35(5)° 2V(calc.) = 39°

Cell Data: *Space Group:* $Fdd2$. $a = 10.099(1)$ $b = 10.099(1)$ $c = 17.307(3)$ Z = 1

X-ray Powder Pattern: Pollena, Italy.
3.299 (100), 3.130 (100), 6.589 (75), 4.334 (43), 2.797 (30), 2.347 (22), 1.784 (22)

Chemistry:

	(1)
SiO_2	55.7
Al_2O_3	19.8
Na_2O	0.2
K_2O	16.7
H_2O	[7.6]
Total	[100.0]

(1) Pollena, Italy; by electron microprobe, H_2O by difference; corresponding to $(K_{8.6}Na_{0.2})_{\Sigma=8.8}(Si_{22.6}Al_{9.4})_{\Sigma=32.00}O_{73.9}H_{20.5}$.

Mineral Group: Zeolite group.

Occurrence: In volcanic scoria.

Association: Dolomite, calcite, chabazite, natrolite.

Distribution: From Pollena, Monte Somma, Campania, Italy.

Name: For Monte Somma, the volcano ancestral to Vesuvius, Italy, in the remnants of which the mineral occurs.

Type Material: National Museum of Natural History, Washington, D.C., USA, 165440.

ZnO	0.33
PbO	0.11
SO_3	11.17
H_2O	19.00
Total	102.27

(1) Monte Trisa, Torrebelvicino, Vicenza, Italy; average of 5 electron microprobe analyses, H_2O calculated from structure analysis, corresponding to $Cu_{5.97}Zn_{0.03}(SO_4)_{0.93}(OH)_{10.00}\cdot 2H_2O$.

Occurrence: A secondary mineral formed near oxidizing sulfide minerals.

Association: Kaolinite, galena, sphalerite, chalcopyrite, cerussite, anglesite, goethite, langite, posnjakite, linarite, redgillite.

Distribution: Mining concesson Lombardo, near the Veneziana mine, Monte Trisa, Torrebelvicino, Vicenza, Italy.

Name: For the first described locality, Monte Trisa, Italy.

Type Material: Museo di Storia Naturale e del Territorio of the University of Pisa at Calci, Pisa, Italy (catalog no. 18900).

(1) Fairfield, Utah, USA. (2) Tip Top mine, South Dakota, USA; by electron microprobe, total Mn as MnO, H_2O by difference; corresponding to $(Ca_{3.97}Mn_{0.08})_{\Sigma=4.05}Mg_{1.01}Al_{3.89}(PO_4)_6(OH)_{4.06} \cdot 12.94H_2O$. (3) $Ca_4MgAl_4(PO_4)_6(OH)_4 \cdot 12H_2O$.

Mineral Group: Montgomeryite group.

Occurrence: In sedimentary phosphatic nodules (Fairfield, Utah, USA); a late mineral in highly oxidized phosphate nodules in granite pegmatite (South Dakota, USA).

Association: Variscite, englishite, wardite, gordonite, crandallite (Fairfield, Utah, USA); mitridatite, triphylite, rockbridgeite–frondelite, whitlockite, carbonate-apatite, robertsite, fairfieldite, englishite (South Dakota, USA).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah; in South Dakota, in the Etta mine, near Keystone, Pennington Co., and at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; in the Redhouse Barite mine, Golconda district, Humboldt Co., Nevada. From the Lavra da Ilha pegmatite, in the Jequitinhonha River, three km north of Taquaral, Minas Gerais, Brazil. About 15 km northwest of Milgun Station, Western Australia; in the Iron Monarch quarry, Iron Knob, and the Moculta phosphate quarry, northeast of Angaston, South Australia. At the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda, Portugal. In Spain, from Montcada and Bruguers, Barcelona Province. At the Sandamap pegmatite, west of Usakos, Namibia.

Name: To honor Dr. Arthur Montgomery (1909–1999), American mineralogist, Professor of Geology, Lafayette College, Easton, Pennsylvania, USA, who collected the first specimens.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 95481.

(1) Crestmore, California, USA. (2) Cascade Lake, New York, USA; by electron microprobe. (3) $CaMgSiO_4$.

Polymorphism & Series: Forms a series with kirschsteinite.

Occurrence: Formed during metamorphism of siliceous dolostones; in contact metamorphic deposits between limestones and olivine gabbros; in skarns at granite-dolomitic limestone contacts; rarely in kimberlites.

Association: Gehlenite, spinel, calcite, merwinite, åkermanite, vesuvianite, apatite, cuspidine.

Distribution: Some localities for crystals or studied material follow. From Monte Somma and Vesuvius, Campania, Italy. At Camas Mòr, Isle of Muck, Scotland. From Scawt Hill, near Larne, Co. Antrim, Ireland. In the USA, at Crestmore, Riverside Co., California; on Cascade Mountain, Essex Co., New York; at Magnet Cove, Hot Spring Co., Arkansas. In Canada, at Isle Cadieux and Oka, Quebec; on Somerset Island, Northwest Territories. From Congo (Zaire), at Mt. Shaheru, Kivu Province. On Dupezeh Mountain, near Hero Town, Qala-Diza region, Iraq. In Russia, in the Kovdor massif, Kola Peninsula, and numerous other localities.

Name: For the Italian mineralogist Teodoro Monticelli (1759–1845).

Type Material: University of Naples, Naples, Italy, 22111.

Montmorillonite $(Na, Ca)_{0.3}(Al, Mg)_2Si_4O_{10}(OH)_2 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tiny scaly crystals, tabular on {001}; as lamellar or globular microcrystalline aggregates; clayey, compact, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. Hardness = 1–2 D(meas.) = 2–3 D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* White, pale pink, buff, yellow, red, green.
Luster: Dull, earthy.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless to pale brown, yellow-green; Y = dark brown to yellow-green, olive-green, pale yellow; Z = brown to olive-green, pale yellow.
Orientation: $X \simeq c$; $Y = b$; $Z \simeq a$. α = 1.492–1.503 β = 1.513–1.534 γ = 1.513–1.534
2V(meas.) = 10°–25°

Cell Data: *Space Group:* $C2/m$. $a = 5.17(2)$ $b = 8.94(2)$ $c = 9.95(6)$ β = n.d. Z = 1

X-ray Powder Pattern: Chambers, Arizona, USA; Na and glycerol saturated.

(1) Montmorillon, France; corresponds to $(Ca_{0.14}Na_{0.02})_{\Sigma=0.16}(Al_{1.68}Mg_{0.36}Fe_{0.04})_{\Sigma=2.08}(Si_{3.90}Al_{0.10})_{\Sigma=4.00}O_{10}(OH)_2 \cdot 1.02H_2O$.

Polymorphism & Series: Interstratifies with chlorite, muscovite, illite, cookeite, kaolinite.

Mineral Group: Smectite group.

Occurrence: An alteration product of volcanic tuff and ash, forming bentonite beds, and of pegmatite dikes and wall rocks bordering hydrothermal mineral deposits. Forms under alkaline conditions of poor drainage, with Mg, Ca, Na, and K remaining in the soil.

Association: Cristobalite, zeolites, biotite, quartz, orthoclase, dolomite, amphiboles, pyroxenes, olivine, calcite, gypsum, pyrite, "limonite".

Distribution: A common clay mineral, with numerous localities worldwide. From Montmorillon, Vienne, France. In the USA, material considered as standards from Bayard and Santa Rita, Grant Co., New Mexico; near Chambers, Apache Co., Arizona; at Belle Fourche, Butte Co., South Dakota; in Wyoming, on the John C. Lane tract, Upton, Weston Co., at Clay Spur, near Newcastle, Crook Co., and elsewhere. In the Itawamba mine, Itawamba Co., and in mines around Polkville, Simpson Co., Mississippi; at Strasburg, Shenandoah Co., Virginia.

Name: After the occurrence at Montmorillon, France.

(1) Bitter Creek mine, Colorado, USA; partial analysis. (2) Matchless mine, Colorado, USA. (3) VO(OH).

Occurrence: In relatively unoxidized Colorado Plateau-type U–V ores in sandstones; thought to be a primary mineral (Colorado, Utah, and Arizona, USA); in vanadiferous anthraxolite bitumen (Guangxi, China).

Association: Paramontroseite, uraninite, corvusite, hewettite, melanovanadite, pascoite, hummerite, pyrite, galena, barite, quartz.

Distribution: In the USA, at the Bitter Creek, Jo Dandy, Whitney, and Virgin mines, Uravan district, Montrose Co., and the Matchless mine, Gateway district, Mesa Co., Colorado; in the Juniper mine, near Thompson, Grand Co., the Rex No. 2 mine, Temple Mountain, and Mi Vida mine, Monticello district, Emery Co., Utah. In the Martin, Mesa 4-1/2, and Cove mines, Carrizo Mountains, and the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; in the Grants district, McKinley Co., New Mexico; and in the Runge mine, Edgemont, Fall River Co., South Dakota. At Příbram, and in the Novoveska Huta deposit, Czech Republic. In the Urcal deposit, La Rioja, and in the Huemul mine, Malargüe district, Mendoza Province, Argentina. From the Mounana uranium mine, Franceville, Gabon. In the Shanglin and Hechi bitumens, Guangxi, Zhuang Autonomous Region, China.

Name: For Montrose Co., Colorado, USA, where it was first found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106897, 106898.

Total	98.1

(1) Francon quarry, Canada; by electron microprobe, CO_2 and H_2O by TGA-EGA, $(CO_3)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR; corresponds to $(Sr_{3.78}Ca_{0.28})_{\Sigma=4.06}Al_8(CO_3)_{2.96}[(OH_{17.63}F_{8.57}]_{\Sigma=26.20}\cdot 10.52H_2O$.

Occurrence: In cavities in a silicocarbonate sill.

Association: Albite, strontiodresserite, calcite, quartz, dawsonite, ankerite, fluorite, barite, strontianite, smythite, marcasite, pyrite, halloysite, doyleite.

Distribution: From the Francon quarry, Montreal Island, Montreal, Quebec, Canada.

Name: For the Monteregian Hill, Mont Royal, prominent landmark in Montreal, Canada, from which the city's name was derived.

Type Material: Canadian Geological Survey, Ottawa, Canada, 64261–64265.

Montroydite HgO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, elongated ‖ [100], to 4 cm, or equant, with prominent {140} and a multiplicity of other forms; may have several sets of striations, bent or twisted. In aggregates, vermiform, tubular, or spherical; powdery, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Sectile; flexible but not elastic, brittle if bent on [001]. Hardness = 2.5 D(meas.) = 11.23 D(calc.) = 11.22

Optical Properties: Opaque, transparent on thin edges. *Color:* Deep red, brownish red to brown; red-orange to pale yellow in transmitted light. *Streak:* Yellow-brown. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* In thick sections, deep red-orange to yellowish brown. *Orientation:* X = a or b; Y = b or a; Z = c. $\alpha = 2.37(2)$ $\beta = 2.5$ $\gamma = 2.65(2)$ 2V(meas.) = Large.

Cell Data: *Space Group: Pnma* (synthetic). $a = 6.608$ $b = 5.518$ $c = 3.519$ Z = 4

X-ray Powder Pattern: Synthetic.

(1) Terlingua, Texas, USA; O by loss on heating. (2) Do.; O by volumetric analysis. (3) HgO.

Occurrence: In hydrothermal mercury deposits.

Association: Mercury, cinnabar, metacinnabar, calomel, eglestonite, terlinguaite, mosesite, kleinite, edgarbaileyite, gypsum, calcite, dolomite.

Distribution: In the USA, large crystals from Terlingua, Brewster Co., Texas; in California, in the Challenge deposit, near Emerald Lake, southwest of Redwood City, San Mateo Co., in the Socrates and Esperanza mines, Sonoma Co., the Kings and White mines, Parkfield district, Kings Co., the Red Elephant mine, near Lower Lake, Lake Co., and the Alpine and Clear Creek mines, New Idria district, San Benito Co.; and from the McDermitt mine, Opalite district, Humboldt Co., Nevada. Large crystals from Huahuaxtla, Guerrero, and at El Doktor, Queretaro, Mexico. From Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan.

Name: Honors Montroyd Sharp, an owner of the mercury deposit at Terlingua, Texas, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 82936; National Museum of Natural History, Washington, D.C., USA, 86637, 86638, 87483.

Mooihoekite $Cu_9Fe_9S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Grains, to 1 mm, in massive sulfides, and as intergrowths with haycockite.

Physical Properties: Hardness = n.d. VHN = 240–246 (100 g load). D(meas.) = 4.36 D(calc.) = 4.37

Optical Properties: Opaque. *Color:* Pale yellow in reflected light, tarnishes to pinkish brown and purple. *Luster:* Metallic.

R: (400) 14.3, (420) 16.7, (440) 20.0, (460) 23.9, (480) 27.5, (500) 30.6, (520) 33.2, (540) 35.2, (560) 36.7, (580) 37.8, (600) 38.8, (620) 39.4, (640) 40.0, (660) 40.2, (680) 40.3, (700) 40.4

Cell Data: *Space Group:* $P\bar{4}2m$. $a = 10.585(5)$ $c = 5.383(5)$ $Z = 1$

X-ray Powder Pattern: Mooihoek mine, South Africa.
3.06 (10), 1.881 (8), 1.593 (6), 1.081 (6), 1.219 (5), 1.870 (5), 1.321 (4)

Chemistry:

	(1)	(2)	(3)
Cu	35.91	34.08	36.02
Fe	31.88	32.47	31.66
Ni	0.26	0.24	
S	32.44	32.84	32.32
Total	100.49	99.65	100.00

(1) Bushveld complex, South Africa; by electron microprobe, average of 13 analyses; corresponding to $(Cu_{8.94}Ni_{0.07})_{\Sigma=9.01}Fe_{9.03}S_{16.00}$. (2) Minnesota, USA; by electron microprobe, average of four analyses; corresponding to $(Cu_{9.04}Ni_{0.06})_{\Sigma=9.10}Fe_{9.08}S_{16.00}$. (3) $Cu_9Fe_9S_{16}$.

Occurrence: In massive sulfide from a pipe-shaped dunite pegmatite in the Norite Zone of the Bushveld complex (Mooihoek mine, South Africa); in troctolite from the basal Duluth Gabbro complex (Minnesota, USA).

Association: Haycockite, magnetite, troilite, cuprian pentlandite, mackinawite, sphalerite, moncheite (Mooihoek Farm, South Africa); haycockite, copper, troilite, pentlandite, cubanite, magnetite (Minnesota, USA).

Distribution: In South Africa, from Transvaal, in the Mooihoek mine, Lydenburg district [TL], and from the Townlands pipe, Rustenburg. At the Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota, USA. From the Talnakh area, Noril'sk region, western Siberia, Russia. At Krzemianka, Poland. In the Malanjkhand Cu–Mo deposit, Madhya-Pradesh, India.

Name: For the locality on Mooihoek Farm, South Africa.

Type Material: Princeton University, Princeton, New Jersey; National Museum of Natural History, Washington, D.C., USA, 124965; Canadian Museum of Nature, Ottawa, 10309; Royal Ontario Museum, Toronto, Canada, M30992; Heidelberg University, Heidelberg, Germany, 2313a.

Moolooite $Cu(C_2O_4)\cdot 0.4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystallites are lathlike or prismatic, to 4 μm, in microconcretions.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.43

Optical Properties: Semitransparent. *Color:* Turquoise green, green, blue. *Luster:* Dull to waxy.
Optical Class: Biaxial. *Orientation:* $X \parallel$ elongation; $Z \perp$ elongation. $\alpha = 1.57$ $\beta = [1.77]$ $\gamma = 1.95$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 5.35$ (by analogy to synthetic $Cu(C_2O_4)\cdot 0.1H_2O$. $b = 5.63$ $c = 2.56$ Z = 1

X-ray Powder Pattern: Mooloo Station, Australia.
3.88 (100), 2.50 (30), 1.753 (30), 2.31 (25), 1.787 (25), 2.14 (20), 2.33 (18)

Chemistry:

	(1)
SiO_2	[6.35]
CuO	[46.7]
C_2O_3	42.3
H_2O	4.65
Total	[100.0]

(1) Mooloo Station, Australia; CHN analyzer gave C 14.10% and H 0.52% and a positive test for oxalate was obtained; calculating CuO for stoichiometry and assuming SiO_2 by difference, corresponds to $Cu(C_2O_4)\cdot 0.44H_2O$.

Occurrence: On an outcrop of quartz, thought to have formed by reaction between bird guano and soluble secondary copper minerals (Mooloo Station, Australia); in a mine shaft near tree roots (Sainte-Marie-aux-Mines, France).

Association: Opaline silica, sampleite, libethenite, brochantite, antlerite, atacamite, whewellite, chalcopyrite, digenite, covellite, gypsum, barite, jarosite (Mooloo Station, Australia).

Distribution: From Mooloo Station, 12 km east of the homestead, Murchison, Western Australia. At Sainte-Marie-aux-Mines, Haut-Rhin, France.

Name: For the original locality on Mooloo Station, Australia.

Type Material: Western Australian Museum, Perth, Australia, MDC6738.

References: (1) Clarke, R.M. and I.R. Williams (1986) Moolooite, a naturally occurring hydrated copper oxalate from Western Australia. Mineral. Mag., 50, 295–298. (2) (1987) Amer. Mineral., 72, 1025–1026 (abs. ref. 1).

Mooreite $Mg_9Zn_4Mn_2^{2+}(SO_4)_2(OH)_{26}\cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are flat tabular to platy $\perp$ [010], with large {010}, the edges modified by ten other forms, commonly distorted and etched, in subparallel aggregates, to 10 cm.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = 3 D(meas.) = 2.47(2) D(calc.) = 2.444

Optical Properties: Transparent. *Color:* Pale yellowish brown; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 44°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.533$ $\beta = 1.545$ $\gamma = 1.547$ 2V(meas.) = ∼50°

Cell Data: *Space Group:* $P2_1/a$. $a = 11.147(3)$ $b = 20.350(6)$ $c = 8.202(3)$ $\beta = 92.69(4)°$ Z = 2

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
5.079 (100), 10.089 (78), 2.379 (78), 1.619 (58), 3.452 (51), 1.832 (47), 2.667 (40)

Chemistry:

	(1)	(2)
SO_3	10.99	11.60
MnO	11.93	9.76
ZnO	24.58	23.99
MgO	25.38	26.75
H_2O	27.12	[27.90]
Total	[100.00]	[100.00]

(1) Sterling Hill, New Jersey, USA; average of two analyses, totalling 99.77%, recalculated to 100% after deduction of SiO_2 0.06% and $CaCO_3$ 0.89%; corresponds to $Mg_{8.61}Zn_{4.11}Mn_{2.28}(SO_4)_{1.86}(OH)_{26.28}\cdot 7.47H_2O$. (2) Do.; by electron microprobe, total Mn as MnO, H_2O by difference, $(OH)^{1-}$ calculated for charge balance, SO_3^{2-} and H_2O confirmed by IR; corresponds to $Mg_{9.10}Zn_{4.04}Mn_{1.89}(SO_4)_{1.99}(OH)_{26.08}\cdot 8.21H_2O$.

Occurrence: Rarely in cavities and veinlets in franklinite–willemite–calcite ore from a metamorphosed stratiform zinc orebody.

Association: Pyrochroite, rhodochrosite, zincite, torreyite, fluoborite, franklinite, willemite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: Honoring Dr. Gideon Emmet Moore (1842–1895), University of California, Berkeley, California, USA, American chemist, an early investigator of Franklin and Sterling Hill minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95985.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 574–575. (2) Hill, R.J. (1979) Crystal data for mooreite. Australian Mineralogist, no. 26, 126–128. (3) Hill, R.J. (1980) The structure of mooreite. Acta Cryst., 36, 1304–1311.

Moorhouseite $(Co, Ni, Mn^{2+})SO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Granular to fine-grained columnar, in crusts and efflorescences.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 1.97–2.02 D(calc.) = 2.006 (synthetic). Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Pink; pale pink in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Pale pink. *Orientation:* $Y = b$ (synthetic). *Absorption:* $X \gg Z$. $\alpha = 1.470$ $\beta = [1.496]$ $\gamma = 1.496$ 2V(meas.) = 20(10)°

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 10.032(4)$ $b = 7.233(3)$ $c = 24.261(10)$ $\beta = 98.37(3)°$ Z = 8

X-ray Powder Pattern: Magnet Cove mine, Canada.
4.39 (10), 4.01 (6), 2.91 (5), 4.13 (4), 5.45 (3), 3.58 (3), 5.84 (2)

Chemistry: (1) Magnet Cove mine, Canada; identity depends on correspondence of the X-ray powder pattern with synthetic material; analysis of an aqueous solution by X-ray spectroscopy gave Co:Ni:Mn:Cu:Fe:Zn = 100:45:21:9:6:1 or $(Co_{0.55}Ni_{0.25}Mn_{0.12}Cu_{0.05}Fe_{0.03})_{\Sigma=1.00}SO_4 \cdot 6H_2O$.

Mineral Group: Hexahydrite group.

Occurrence: As efflorescences with sulfides (probably cobaltian and nickelian pyrite) on siderite–barite matrix from a hydrothermal Pb–Zn–Cu orebody associated with a large barite deposit (Magnet Cove mine, Canada); as crusts on sandstone (near Cameron, Arizona, USA).

Association: Aplowite, siderite, barite (Magnet Cove mine, Canada); koritnignite, köttigite, picropharmacolite (Jáchymov, Czech Republic).

Distribution: From the Magnet Cove barite mine, four km southwest of Walton, Nova Scotia, Canada. In a prospect 13 km east-southeast of Gray Mountain, Cameron district, Coconino Co., Arizona, USA. From the Geschieber and Evangelista veins, Jáchymov (Joachimsthal), Czech Republic. At Fontana Rosa, Corsica, France. In Germany, on the dump of the Schmiedestollen, near Wittichen, in the Rötenback quarry, near Alpirsbach, Black Forest; at the Daniel mine, Schneeberg, Saxony.

Name: To honor Dr. Walter Wilson Moorhouse (1913–1969), Canadian Professor of Geology, University of Toronto, Toronto, Canada.

Type Material: National School of Mines, Paris, France; Canadian Geological Survey, Ottawa, Canada, 12145.

References: (1) Jambor, J.L. and R.W. Boyle (1965) Moorhouseite and aplowite, new cobalt minerals from Walton, Nova Scotia. Can. Mineral., 8, 166–171. (2) (1965) Amer. Mineral., 50, 808 (abs. ref. 1). (3) Zalkin, A., H. Ruben, and D.H. Templeton (1962) The crystal structure of cobalt sulphate hexahydrate. Acta Cryst., 15, 1219–1224.

Mopungite $NaSb^{5+}(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Pseudocubic crystals, to 0.3 mm, showing {001}, {110}, and {101}; rarely acicular; as incrustations.

Physical Properties: Hardness = 3 D(meas.) = 3.21 D(calc.) = 3.264 Soluble in hot H_2O.

Optical Properties: Transparent to translucent. *Color:* Colorless to milky white.
Luster: Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.614$ $\epsilon = 1.605$

Cell Data: *Space Group:* $P4_2/n$. $a = 7.994$ $c = 7.859$ Z = [4]

X-ray Powder Pattern: Mopung Hills, Nevada, USA.
4.581 (10), 3.985 (8), 1.205 (7), 1.629 (5), 1.325 (5), 1.265 (5), 1.192 (5)

Chemistry:

	(1)	(2)
Sb_2O_5	65.2	65.54
Na_2O	12.8	12.56
H_2O	[22.0]	21.90
Total	[100.0]	100.00

(1) Mopung Hills, Nevada, USA; by X-ray fluorescence, H_2O from analysis of synthetic material; recalculated to 100% after deduction of sulfur 11.1%. (2) $NaSb(OH)_6$.

Mineral Group: Stottite group.

Occurrence: An oxidation product of stibnite.

Association: Selenium, sulfur, stibiconite, sénarmontite, roméite, tripuhyite (Mopung Hills, Nevada, USA); cetineite, sénarmontite, brizziite, other antimony oxides (Cetine mine, Italy).

Distribution: At the Green prospect, Mopung Hills, Lake district, Churchill Co., Nevada, USA. From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: For the Mopung Hills, Nevada, USA, where it was first found.

Type Material: The Natural History Museum, London, England, 1984,477; National Museum of Natural History, Washington, D.C., USA, 161224.

References: (1) Williams, S.A. (1985) Mopungite, a new mineral from Nevada. Mineral. Record, 16, 73–74. (2) (1985) Amer. Mineral., 70, 1330 (abs. ref. 1).

Moraesite $Be_2(PO_4)(OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* As radiating tabular acicular crystals, elongated along [001], to 5 mm; dominant forms include {100}, {1$\bar{3}$0}, {130}, {1$\bar{3}$1}, {131}; aggregates may resemble cotton-balls, or in matted coatings and crusts.

Physical Properties: *Cleavage:* Perfect, two directions yielding traces parallel [100] and [001] on {100}. Hardness = n.d. D(meas.) = 1.805 D(calc.) = 1.806

Optical Properties: Translucent. *Color:* White. *Streak:* White. *Luster:* Silky. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $Y \wedge c = 11°$. $\alpha = 1.462$ $\beta = 1.482$ $\gamma = 1.490$ 2V(meas.) = 65°

Cell Data: *Space Group: Cc.* $a = 8.553(6)$ $b = 36.957(18)$ $c = 7.155(8)$ $\beta = 97.93(9)°$ Z = 12

X-ray Powder Pattern: Sapucaia mine, Brazil; nearly identical to bearsite.
7.00 (10), 3.278 (9), 4.24 (6), 3.023 (6), 2.819 (6), 6.15 (4), 2.325 (4)

Chemistry:

	(1)	(2)
P_2O_5	34.76	35.12
Al_2O_3	0.00	
Fe_2O_3	0.11	
BeO	25.28	24.76
H_2O	39.80	40.12
insol.	0.30	
Total	100.25	100.00

(1) Sapucaia mine, Brazil; iron impurity as hematite; corresponds to $Be_{2.04}(P_{0.99}O_4)(OH)\cdot 3.98H_2O$. (2) $Be_2(PO_4)(OH)\cdot 4H_2O$.

Occurrence: A rare late-stage hydrothermal mineral in complex zoned granite pegmatites.

Association: Beryl, beryllonite, hydroxylherderite, frondelite, triphylite, apatite, muscovite.

Distribution: In Brazil, from the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares; at the Mulundu and Humaita pegmatites, along the Jequitinhonha River, Itinga, and from the Almerindo pegmatite, Linópolis, Minas Gerais. At the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from Greenwood, in the Dunton quarry, Newry, and at Mt. Mica, near Paris, Oxford Co., Maine, USA. In the Viitaniemi pegmatite, near Eräjärvi, Finland. At Arnac-la-Poste, Haute-Vienne, France. From Bojeveskoje, Middle Ural Mountains, Russia. In the Londonderry quarry, 19 km south of Coolgardie, Western Australia.

Name: Honors Dr. Luciano Jacques de Moraes (1896–1968), Brazilian mineralogist and geologist.

Type Material: National Musuem, Rio de Janeiro, Brazil; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 106577.

Mordenite $(Ca, Na_2, K_2)Al_2Si_{10}O_{24}\cdot 7H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$ or $2/m\ 2/m\ 2/m$. Prismatic crystals, striated || elongation; acicular to fine fibrous, to 2.5 cm. In radiating groups or cottony aggregates; compact, porcelaneous.

Physical Properties: *Cleavage:* Perfect on {100}, distinct on {010}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 2.12–2.15 D(calc.) = 2.125

Optical Properties: Transparent to translucent. *Color:* Colorless, white, yellowish, pinkish; in thin section, colorless. *Luster:* Vitreous, pearly on {010}, silky if fibrous.
Optical Class: Biaxial (+) or (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. α = 1.472–1.483 β = 1.475–1.485 γ = 1.477–1.487 2V(meas.) = 76°–90°

Cell Data: *Space Group:* $Cmc2_1$ or $Cmcm$. a = 18.052–18.168 b = 20.404–20.527 c = 7.501–7.537 Z = [4]

X-ray Powder Pattern: Aros, Isle of Mull, Scotland.
3.483 (10), 3.222 (10), 9.10 (9), 6.61 (9), 3.999 (9), 3.393 (9), 4.525 (8)

Chemistry:

Total	99.99	99.40

(1) Challis, Idaho, USA; average of four analyses, corresponding to $(Na_{1.11}Ca_{0.48}K_{0.10}Mg_{0.08})_{\Sigma=1.77}Al_{2.16}Si_{9.80}O_{24}\cdot 5.86H_2O$. (2) Coyote, Garfield Co., Utah, USA; corresponds to $(Ca_{1.24}Na_{0.76}K_{0.02})_{\Sigma=2.02}Al_{2.02}Si_{10.04}O_{24}\cdot 6.94H_2O$.

Mineral Group: Zeolite group.

Occurrence: In veins and amygdules in various igneous rocks; a hydration product of volcanic glasses; an authigenic mineral in sediments.

Association: Zeolites, calcite, kaolinite, glauconite.

Distribution: Many localities for abundant and well-crystallized material. At Morden and along the Bay of Fundy, Nova Scotia, Canada. In the USA, from near Stevenson, Skamania Co., Washington; at Challis, Custer Co., Idaho; in Oregon, along Crooked Creek, Rome, Malheur Co., at Goble, Columbia Co., and at Cape Lookout, Tillamook Co. In Colorado, on Table Mountain, Jefferson Co. and in Wolf Creek Pass, Mineral Co.; from Crestmore, Riverside Co., California; and in Union Pass, Mohave Co., Arizona. At San Piero in Campo, Elba, Italy. In the Berufjord area, Iceland. From Cinchwad and elsewhere in the Poona district, Maharashtra, India.

Name: For the locality at Morden, Nova Scotia, Canada.

Type Material: National Museum of Natural History, Washington, D.C., USA, R4062; The Natural History Museum, London, England, 52574.

Moreauite $Al_3(UO_2)(PO_4)_3(OH)_2 \cdot 13H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular crystals flattened on {100}, may be elongated along [010], to 0.2 mm; as nodules or subparallel aggregates of tablets resembling "open books."

Physical Properties: *Cleavage:* Good on {100}, micaceous. Hardness = n.d. D(meas.) = 2.64(5) D(calc.) = 2.61 Radioactive; bright green fluorescence under SW and LW UV.

Optical Properties: Translucent to opaque. *Color:* Greenish yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \simeq c$; $X \approx a^*$. $\alpha = 1.540(3)$ $\beta = 1.552(2)$ $\gamma = 1.558(2)$ 2V(meas.) = n.d. 2V(calc.) = 70°

Cell Data: *Space Group:* $P2_1/c$. $a = 23.41(6)$ $b = 21.44(4)$ $c = 18.34(3)$ $\beta = 92.0(1)°$ Z = 16

X-ray Powder Pattern: Kobokobo pegmatite, Congo (fully hydrated). 10.80 (100), 11.69 (80), 9.13 (70), 2.931 (70), 14.02 (60), 3.043 (60), 5.43 (40)

Chemistry:

H_2O	[13.5]	[27.0]	27.90
Total	[100.0]	[100.0]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of five grains, partially dehydrated, H_2O by difference, corresponding to $Al_{3.05}(U_{1.04}O_2)(P_{0.97}O_4)_3(OH)_{1.94} \cdot 13H_2O$. (2) Do.; H_2O calculated from density, supported by TGA. (3) $Al_3(UO_2)(PO_4)_3(OH)_2 \cdot 13H_2O$.

Occurrence: A rare secondary mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Furongite, ranunculite, phosphosiderite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: Honors Professor Jules Moreau (1931–), Belgian mineralogist, Catholic University of Louvain, Louvain, Belgium.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG6601, RMG6197, RMG6203.

Morenosite $NiSO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. As indistinct crystals and fibers, in stalactites and efflorescent crusts.

Physical Properties: *Cleavage:* On {010}, distinct. *Fracture:* Conchoidal. Hardness = 2–2.5 D(meas.) = 1.953 D(calc.) = 1.959 Soluble in H_2O, metallic astringent taste; rapidly dehydrates to retgersite; weakly paramagnetic.

Optical Properties: Transparent. *Color:* Apple-green to greenish white; green in transmitted light. *Streak:* Pale green to white. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, weak.
$\alpha = 1.470$ $\beta = 1.493$ $\gamma = 1.500$ 2V(meas.) = 41°54′

Cell Data: *Space Group:* $P2_12_12_1$ (synthetic). $a = 11.746(7)$ $b = 12.003(8)$ $c = 6.751(4)$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 1-403).
4.20 (100), 5.3 (60), 2.85 (25), 3.75 (16), 3.45 (16), 2.65 (16), 4.45 (12)

Total	100.00	100.00

(1) Richelsdorf, Germany. (2) $NiSO_4 \cdot 7H_2O$.

Polymorphism & Series: Forms a series with epsomite.

Occurrence: An uncommon secondary mineral in the oxidized zone of nickel-bearing hydrothermal mineral deposits, formed from H_2O solution below 31.5 °C.

Association: Retgersite, nickelhexahydrite, annabergite, millerite.

Distribution: Not all listed localities are certainly of this species. From Cabo Ortegal, Galicia, Spain. At Jáchymov (Joachimsthal), Czech Republic. From near Plattelen, and on Mt. Pollux, both near Zermatt, Valais, Switzerland. At Sasso Moro, Val Malenco, Lombardy, Italy. In Germany, from Richelsdorf, Hesse-Nassau; in the Rammelsberg mine, near Goslar, Harz Mountains; at Ramsbeck, Sauerland, and elsewhere. In the St. Patrick's copper mine, Avoca, Co. Wicklow, Ireland. In Australia, from Kambalda, 56 km south of Kalgoorlie, and at the Mount Keith nickel deposit, 400 km north-northwest of Kalgoorlie, Western Australia. At Minasragra, 46 km from Cerro de Pasco, Peru. From a number of mines in the Sudbury district, Ontario, Canada. In the USA, from the Gap Nickel mine, Lancaster Co., Pennsylvania; in California, at the Coyote Mountain nickel prospect, Imperial Co., at the Friday Ni–Co–Cu mine, San Diego Co., and in the Island Mountain copper mine, Trinity Co.; from the Lovelock and Nickel mines, Table Mountain district, Churchill Co., Nevada.

Name: To honor Señor Antonio Moreno Ruiz (1796–1852), Spanish pharmacist and chemist, Academy of Natural Sciences, Madrid, Spain.

Morinite $NaCa_2Al_2(PO_4)_2(F,OH)_5 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular to blocky, prismatic crystals, to 1 cm; flattened on {100}, elongated along [010]; {hk0} faces striated ‖ [001]; subparallel aggregates of crystals terminated by {$\bar{1}$11}, {110} yield groups with serrated upper edges; as botryoidal crusts and radial fibrous aggregates.

Physical Properties: *Cleavage:* Perfect on {100}; imperfect on {001}. Hardness = 4–4.5 D(meas.) = 2.94–2.96 D(calc.) = 2.98

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale pink, wine-red. *Streak:* White. *Luster:* Vitreous to pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge a = 45°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.553$ $\beta = 1.565$ $\gamma = 1.567$ 2V(meas.) = 40°

Cell Data: *Space Group:* $P2_1/m$. $a = 9.454(3)$ $b = 10.692(4)$ $c = 5.444(2)$ $\beta = 105.46(2)°$ Z = 2

X-ray Powder Pattern: Hugo mine, South Dakota, USA.

(1) Montebras, France. (2) Hugo mine, South Dakota, USA; corresponds to $Na_{1.00}Ca_{1.97}Al_{2.05}(P_{0.99}O_4)_2[F_{3.52}(OH)_{1.22}]_{\Sigma=4.74} \cdot 2H_2O$.

Occurrence: An uncommon late-stage mineral in complex granite pegmatites.

Association: Montebrasite, apatite, augelite, wardite, wavellite, cassiterite.

Distribution: From Montebras, Creuse, France. On the Greifensteine, near Ehrenfriedersdorf, Saxony, and at Hagendorf, Bavaria, Germany. In the Gunheath china clay pit, St. Austell, Cornwall, England. From the Viitaniemi pegmatite, near Eräjärvi, Finland. In the USA, in the Hugo mine, 1.5 km south of Keystone, Pennington Co., South Dakota; at the Stewart mine, Pala, San Diego Co., California; from the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada. In a pegmatite nearby Broken Hill, New South Wales, and at the Mt. Cleveland tin mine, 14 km southwest of Waratah, Tasmania, Australia.

Name: Honors Mr. E.A. Morineau, Director of the tin mine, Montebras, France, who supplied the first specimens.

Polymorphism & Series: Forms a series with polkovicite.

Occurrence: In epigenetic veinlets and metasomatic replacement zones replacing sandstone and older sulfides, in brecciated sandstones underlying copper-bearing shales.

Association: Marcasite, chalcopyrite, bornite, chalcocite, tennantite, sphalerite, galena.

Distribution: From the Polkovice mine, near Legnica, Zechstein copper district, Lower Silesia, Poland [TL].

Name: To honor Josef Morozewicz (1865–1941), Professor of Mineralogy, Jagellonian University, Kraków, Poland.

Type Material: Jagellonian University, Kraków, Poland.

Mosesite $Hg_2N(Cl, SO_4, MoO_4, CO_3)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Crystals pseudo-octahedra, less commonly dodecahedra, cubo-octahedra, cubes, rarely isolated, to 2 mm, several other forms have been noted; typically in nearly spherical aggregates of crystals. *Twinning:* On {111}, common, may be repeated.

Physical Properties: *Cleavage:* {111}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 7.72 D(calc.) = 7.53

Optical Properties: Semitransparent. *Color:* Lemon-yellow, canary-yellow, sulfur-yellow, becoming light olive-green on long exposure to light; amber-orange to nearly black, rarely zoned. *Streak:* Very pale yellow. *Luster:* Adamantine.
Optical Class: Isotropic; may be weakly anisotropic. $n = 2.065(10)$

Cell Data: *Space Group:* $F\overline{4}3m$. $a = 9.524$ $Z = 8$

X-ray Powder Pattern: Huahuaxtla, Mexico.
2.74 (10), 2.86 (8), 1.68 (7), 1.44 (7), 2.18 (6), 1.61 (6), 2.38 (5)

Chemistry:

	(1)	(2)
Hg^{2+}	79.4	85.60
Hg^{1+}	3.6	
Cl	3.3	7.57
H_2O	3.2	3.84
CO_3	0.8	
SO_4	5.4	
MoO_4	2.0	
N	2.4	2.99
Total	100.1	100.00

(1) Huahuaxtla, Mexico; H_2O by the Penfield method; corresponds to $Hg_{2.20}N_{0.93}(Cl, SO_4, MoO_4, CO_3)_{0.93}\cdot 0.95H_2O$. (2) $Hg_2NCl\cdot H_2O$.

Occurrence: A rare secondary mineral formed at low temperature in hydrothermal mercury deposits.

Association: Calcite, cinnabar, metacinnabar, mercury, eglestonite, kleinite, terlinguaite, montroydite, calomel, gypsum.

Distribution: In the USA, from Terlingua, Brewster Co., Texas; in the T.S. Clack Quicksilver mine, about 37 km northeast of Lovelock, Fitting district, Mineral Co., and the McDermitt mine, Humboldt Co., Nevada; from near the Clear Creek mercury mine, New Idria district, San Benito Co., California. In Mexico, at Huahuaxtla, Guerrero, and El Doktor, Querétaro.

Name: Honors Alfred J. Moses (1859–1920), American mineralogist, Professor of Mineralogy, Columbia University, New York City, New York, USA, who described several other mercury minerals from Terlingua.

Type Material: National Museum of Natural History, Washington, D.C., USA, C87, 93292.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 89–90. (2) Switzer, G., K.J. Murata, and J.J. Fahey (1953) Re-examination of mosesite. Amer. Mineral., 38, 1225–1234.

Mottramite $PbCu(VO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, equant or dipyramidal {111}, prismatic [001] or [100], with {101}, {201}, many others, to 3 mm, in drusy crusts, botryoidal, usually granular to compact, massive.

Physical Properties: *Fracture:* Small conchoidal to uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = ∼5.9 D(calc.) = 6.187

Optical Properties: Transparent to nearly opaque. *Color:* Grass-green, olive-green, yellow-green, siskin-green, blackish brown, nearly black. *Streak:* Yellowish green. *Luster:* Greasy. *Optical Class:* Biaxial (–), rarely biaxial (+). *Pleochroism:* Weak to strong; $X = Y =$ canary-yellow to greenish yellow; $Z =$ brownish yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong; rarely $r < v$. $\alpha = 2.17(2)$ $\beta = 2.26(2)$ $\gamma = 2.32(2)$ 2V(meas.) = ∼73°

Cell Data: *Space Group: Pnma.* $a = 7.667$–7.730 $b = 6.034$–6.067 $c = 9.278$–9.332 Z = 4

X-ray Powder Pattern: Mottram St. Andrew, England; close to descloizite. 3.24 (vvs), 5.07 (vs), 2.87 (vs), 2.68 (vs), 2.66 (vs), 2.59 (vs), 1.648 (vs)

(1) Bisbee, Arizona, USA; average of three analyses. (2) $Pb(Cu, Zn)(VO_4)(OH)$ with Zn:Cu = 1:1.

Polymorphism & Series: Forms a series with descloizite.

Mineral Group: Descloizite group.

Occurrence: A secondary mineral in the oxidized zone of vanadium-bearing base metal deposits.

Association: Descloizite, duftite, mimetite, wulfenite, cerussite, azurite, dioptase.

Distribution: Many localities. From Mottram St. Andrew, Cheshire, England. In the USA, at the Mammoth-St. Anthony mine, Tiger, Pinal Co., from Bisbee, Cochise Co., at the Total Wreck mine, Pinal Co., in the Apache mine, near Globe, and from the 79 mine, near Hayden, Gila Co., Arizona; at the Mayflower mine, Socorro Peak district, Socorro Co., New Mexico; from the Whale mine, Goodsprings district, Clark Co., Nevada. At Mina Grande, Arqueros, Coquimbo, Chile. Abundant at Tsumeb and elsewhere in the Otavi district, Namibia. At Kabwe (Broken Hill), Zambia.

Name: For an occurrence in England, ore stockpiled at Mottram St. Andrew, Cheshire; likely mined from the nearby Pim Hill mine, Shrewsbury, Shropshire.

Type Material: The Natural History Museum, London, England, 52314–52315.

Motukoreaite $Na_2Mg_{38}Al_{24}(SO_4)_8(CO_3)_{13}(OH)_{108}\cdot 56H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. As tabular hexagonal crystals, showing rounded {0001} and possible {$11\overline{2}0$}, {$10\overline{1}1$}, {$10\overline{1}4$}, to 0.2 mm, forming rosettes, boxworks, and subparallel aggregates, and as a claylike cement.

Physical Properties: *Cleavage:* Good on {0001}, perhaps a parting. *Tenacity:* Sectile, flexible. Hardness = 1–1.5 D(meas.) = 1.43–1.53 D(calc.) = 1.478 Partial dehydration readily occurs.

Optical Properties: Semitransparent. *Color:* Colorless, white, pale yellow, pale yellow-green. *Luster:* Dull.
Optical Class: Uniaxial (+), nearly isotropic. n = ∼1.51, birefringence ∼0.012. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 9.172(2)$ $c = 33.51(1)$ Z = 3

X-ray Powder Pattern: Brown's Island, New Zealand; may exhibit preferred orientation. 11.32 (vvs), 5.58 (s), 4.59 (s), 3.72 (s), 2.578 (s), 2.386 (s), 2.158 (s)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	10.00	10.65	CaO	0.92

MgO	22.98	25.48			

(1) Brown's Island, New Zealand; contains estimated quartz 5%, traces of calcite and goethite; after removal of probable impurities, and with $(OH)^{1-}$ calculated for charge balance, corresponds to $(Na_{1.50}K_{0.14})_{\Sigma=1.64}Mg_{37.36}Al_{22.97}(SO_4)_{8.18}(CO_3)_{13.81}(OH)_{101.29}\cdot 58.36H_2O$. (2) $Na_2Mg_{38}Al_{24}(SO_4)_8(CO_3)_{13}(OH)_{108}\cdot 56H_2O$.

Occurrence: Relatively common in assemblages formed by reaction of basalt volcanoclastics with sea-water; in cavities in a haüyne-nephelinite.

Association: Olivine, pyroxene, calcic feldspar, magnetite, calcite, gypsum, barite, hisingerite, zeolites, "limonite", quartz (Brown's Island, New Zealand); hydrotalcite, nordstrandite, montmorillonite, phillipsite, gismondine, chabazite, calcite, apatite (Stradner Hill, Austria).

Distribution: From Brown's Island (Motukorea), Waitemata Harbour, Auckland, New Zealand. On the Island of Surtsey, and the Great Meteor and Josephine seamounts, North Atlantic, and along the mid-Atlantic Ridge. Northwest of the Emile Baudot Bank, western Mediterranean. Along the Axial Rift, Red Sea. On Stradner Kogel, south of Gleichenberg, Austria.

Name: From Motukorea, *island of cormorants*, the Maori name for Brown's Island, New Zealand.

Type Material: University of Auckland, Auckland, New Zealand; The Natural History Museum, London, England, 1977,422; National Museum of Natural History, Washington, D.C., USA, 142971.

Mounanaite $PbFe_2^{3+}(VO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals elongated along [001], flattened on {010}, to 0.3 mm; equant crystals appear pseudohexagonal; crystals are dominated by {010}, with {100}, {110}, {011}, {11$\overline{1}$}, {12$\overline{1}$}, {$\overline{1}$2$\overline{1}$}, {02$\overline{1}$}, {01$\overline{1}$}, {021}; as microcrystalline crusts. *Twinning:* Common as simple twins of two types, by rotation around [001] or on {1$\overline{1}$1}.

Physical Properties: *Cleavage:* On {001}, good. Hardness = 4.5 D(meas.) = 4.85 D(calc.) = 4.88–4.89

Optical Properties: Translucent to transparent. *Color:* Reddish brown. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; $X = Z$ = pale yellow; Y = brown. *Orientation:* $Y = b$; $X \wedge c = \sim 20°$. *Dispersion:* $r > v$, strong. α = [2.19] β = 2.25(2) γ = [2.27] 2V(meas.) = 50(10)°

Cell Data: *Space Group:* $C2/m$. a = 9.294 b = 6.164–6.166 c = 7.703–7.713 β = 115.54°−115.57° Z = 2

X-ray Powder Pattern: Mounana mine, Gabon.
4.64 (100), 3.055 (96), 3.264 (92), 7.766 (72), 2.816 (60), 2.320 (59), 4.562 (49)

(1) Kimberley, South Africa; corresponds to $(Na_{1.04}Ca_{0.99}K_{0.54}Mg_{0.02})_{\Sigma=2.59}$ $Si_{4.02}O_{9.99} \cdot 3.09H_2O$. (2) Lovozero massif, Russia; corresponds to $(Na_{1.28}Ca_{0.80}K_{0.42})_{\Sigma=2.50}$ $(Si_{3.80}Al_{0.20})_{\Sigma=4.00}O_{9.99} \cdot 2.75H_2O$.

Occurrence: In a kimberlite pipe (Kimberley, South Africa); in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Rhodesite (Kimberley, South Africa); natrolite, steenstrupine, chkalovite, neptunite, sérandite, aegirine, leucosphenite, zorite, raite, polylithionite, halite (Lovozero Massif, Russia).

Distribution: In the Bultfontein diamond mine, Kimberley, Cape Province, South Africa. On Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. In the Höwenegg quarry, Hegau, Baden-Württemberg, Germany.

Name: For Edgar Donald Mountain, Professor of Geology, Rhodes University, Grahamstown, South Africa.

Type Material: The Natural History Museum, London, England, 1957,369; National Museum of Natural History, Washington, D.C., USA, 114792.

(1) Kyzylsai deposit, Kazakhstan; original total given as 100.52%. (2) Do. (3) $UMo_5O_{17}\cdot 5H_2O$.

Occurrence: In the oxidized zone of a U–Mo deposit (Kyzylsai deposit, Kazakhstan); in a sandstone-hosted uranium deposit (Boso-Hackney prospect, Texas, USA).

Association: Uraninite, molybdenite, jordisite, ilsemannite, pyrite, umohoite, sedovite, iriginite, powellite, sodium uranospinite, uranophane, tyuyamunite, goethite, jarosite, kaolinite (Kyzylsai deposit, Kazakhstan); pyrite, marcasite, "opal," chalcedony (Boso-Hackney prospect, Texas, USA).

Distribution: From the Kyzylsai Mo–U deposit, Chu-Ili Mountains, southwestern Balkhash region, Kazakhstan. At the Boso-Hackney prospect, about 19 km southwest of Falls City, Karnes Co., Texas, USA.

Name: For MOlybdenum and URanium in the composition.

Type Material: Mining Institute, St. Petersburg, 999/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 65196, 67299; National Museum of Natural History, Washington, D.C., USA, 127972.

Moydite-(Y) $YB(CO_3)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Platy crystals, to 1 mm, with dominant {010}, {111}, minor {100}, {001}, in subparallel aggregates.

Physical Properties: *Cleavage:* Good on {010}; poor on {101}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = "Soft". D(meas.) = 3.13(3) D(calc.) = 3.01(8)

Optical Properties: Transparent. *Color:* Yellow, pale yellow, colorless in thin crystals. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, weak.
$\alpha = 1.588(2)$ $\beta = 1.681(1)$ $\gamma = 1.690(1)$ 2V(meas.) = 32(3)° 2V(calc.) = 34°

Cell Data: *Space Group: Pbca.* $a = 9.089(1)$ $b = 12.244(1)$ $c = 8.926(1)$ Z = 8

X-ray Powder Pattern: Evans-Lou quarry, Quebec, Canada.
6.106 (10), 4.501 (9), 3.179 (7), 2.818 (5), 2.525 (4), 2.749 (3), 2.203 (3)

Chemistry:

	(1)
CO_2	17.7
B_2O_3	14.4
Y_2O_3	35.0
Ce_2O_3	0.8
Nd_2O_3	1.3

Total	[100.0]

(1) Evans-Lou quarry, Quebec, Canada; by electron microprobe, average of two analyses, H_2O by difference, $(CO_3)^{2-}$, $(OH)^{1-}$ confirmed by IR; corresponds to $(Y_{0.68}Gd_{0.04}Dy_{0.04}Ca_{0.02}Nd_{0.02}Sm_{0.02}Ho_{0.02}Ce_{0.01})_{\Sigma=0.85}B_{0.84}(C_{0.84}O_3)(OH_{1.24})_4$.

Occurrence: A rare secondary mineral in quartz in a zoned granite pegmatite.

Association: Hellandite, kainosite, lokkaite, caysichite, xenotime, titanite, yttrian fluorapatite, yttrian spessartine, fergusonite, metatyuyamunite, metatorbernite, quartz.

Distribution: In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada.

Name: To honor Louis Moyd (1916–), Canadian mineralogist, Emeritus Curator, National Museum of Natural Sciences, Ottawa, Canada, for his contributions to mineralogy.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 50771, 50772; National Museum of Natural History, Washington, D.C., USA, 162936.

Mozartite $CaMnSiO_4(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222. As subhedral crystals, short prismatic, elongated ‖ [100], terminated by a bisphenoid, to 4.4 cm; commonly granular, in aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d.
D(meas.) = 3.63(4) D(calc.) = 3.68

Optical Properties: Transparent. *Color:* Reddish brown to deep red. *Streak:* Red.
Luster: Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = yellow-brown; Y = yellow; Z = red-orange. *Orientation:* Z = a. $\alpha = 1.840(5)$ $\beta = 1.855(5)$ $\gamma = 1.920(5)$ 2V(meas.) = 50(2)° 2V(calc.) = 52.8°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 5.838(1)$ $b = 7.224(1)$ $c = 8.690(1)$ Z = 4

X-ray Powder Pattern: Cerchiara mine, Italy.
2.584 (VS), 5.558 (S), 3.070 (S), 2.687 (S), 4.025 (W), 3.613 (W), 2.509 (W)

Chemistry:

	(1)
SiO_2	29.25
Al_2O_3	0.49
Mn_2O_3	38.72
MgO	0.05
CaO	27.08
F	0.00
H_2O	[4.41]
Total	[100.00]

(1) Cerchiara mine, Italy; by electron microprobe, average of 16 analyses, H_2O by difference; corresponds to $Ca_{0.98}(Mn_{1.00}Al_{0.02})_{\Sigma=1.02}Si_{0.99}O_4(OH)$.

Occurrence: In veins cutting massive braunite in ophiolitic metacherts.

Association: Pectolite, hausmannite, calcite, quartz.

Distribution: In the Cerchiara manganese mine, near Faggiona, Val di Vara, Liguria, Italy. Large crystals from the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Wolfgang Amadeus Mozart (1756–1791), discovered in the 200th year after his death.

Type Material: University of Genoa, Genoa, Italy.

Mozgovaite $PbBi_4(S,Se)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Acicular crystals, to 600 μm, in sprays.

Physical Properties: Hardness = n.d. VHN = 116 (10 g load). D(meas.) = n.d. D(calc.) = 6.26(6)

Optical Properties: Opaque. *Color:* Silvery gray; white in reflected light. *Luster:* Metallic. *Optical Class:* Biaxial. *Anisotropism:* Strong, without color effects. *Bireflectance:* Very weak. R_1–R_2: (400) —, (420) 36.4–40.3, (440) 36.0–40.1, (460) 35.8–40.2, (480) 35.7–40.3, (500) 35.7–40.3, (520) 35.4–40.6, (540) 35.3–40.6, (560) 35.1–40.6, (580) 35.0–40.6, (600) 35.0–40.3, (620) 34.9–40.1, (640) 34.8–40.1, (660) 34.9–40.1, (680) 34.8–39.8, (700) 34.7–39.6

Cell Data: *Space Group:* *Bbmm* (by analogy to synthetic $PbBi_4S_7$). $a = 13.18(6)$ $b = 37.4(2)$ $c = 4.05(3)$ Z = 6

X-ray Powder Pattern: Vulcano, Italy.
3.80 (10), 2.95 (4B), 2.34 (4B), 3.58 (3), 3.30 (3), 3.40 (2), 3.11 (2)

Chemistry:

	(1)	(2)
Pb	13.90	16.35
Cu	0.01	
Cd	0.26	
Fe	0.02	
Bi	64.79	65.94
As	0.05	
S	16.91	17.71
Total	97.57	100.00

(1) Vulcano, Italy; by electron microprobe, average of four analyses; corresponding to $(Pb_{0.87}Cd_{0.03})_{\Sigma=0.90}(Bi_{4.01}As_{0.01})_{\Sigma=4.02}(S_{6.82}Se_{0.27})_{\Sigma=7.09}$. (2) $PbBi_4S_7$.

Occurrence: Very rare, as a sublimate in a volcanic fumarole, deposited at about 600 °C.

Association: Bismuthinite, cannizzarite, lillianite, galenobismutite.

Distribution: From the Fossa crater, Vulcano, Lipari Islands, Italy [TL].

Name: In honor of Dr. Nadezhda Nikolaevna Mozgova (1931–), Russian mineralogist, Institute of Geology of Ore Deposits, Petrography, Mineralogy, and Geochemistry, Moscow, Russia, who has contributed especially to the knowledge of sulfosalt minerals.

Type Material: University of Bari, Bari, Italy, 5/nm.

Mpororoite $WAlO_3(OH)_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic (?). *Point Group:* n.d. Platy, very fine grained, powdery.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Greenish yellow.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. a = 9.40 b = 11.46 c = 8.20 $\alpha = 94°20'$ $\beta = 89°45'$ $\gamma = 95°10'$ Z = n.d.

X-ray Powder Pattern: Mpororo deposit, Uganda.
8.21 (100), 3.084 (90b), 4.09 (19), 5.69 (18), 4.20 (17), 6.18 (16), 2.357 (15)

Chemistry:

	(1)	(2)
WO_3	66.90	67.03
Al_2O_3	8.22	14.74
Fe_2O_3	9.78	
CaO	0.27	
H_2O^+	7.97	
H_2O^-	6.89	
H_2O		18.23
Total	100.03	100.00

(1) Mpororo deposit, Uganda; corresponding to $W_{1.00}(Al_{0.57}Fe^{3+}_{0.43})_{\Sigma=1.00}O_3(OH)_3 \cdot 2H_2O$.
(2) $WAlO_3(OH)_3 \cdot 2H_2O$.

Occurrence: An alteration product of primary tungsten minerals.

Association: Scheelite, ferberite, ferritungstite (Mpororo deposit, Uganda); anthoinite (Kara mine, Tasmania); scheelite, ferberite, ferritungstite, russellite, anthoinite (Kalzas Mountain, Canada).

Distribution: In the Mpororo tungsten deposit, 20 km north of Kisoro, Kigezi district, Uganda. At the Kara tungsten mine, southwest of Burnie, Tasmania, Australia. From the Flo property, Kalzas Mountain, 67 km southeast of Mayo, Yukon Territory, Canada. In the Hingston Down quarry, Calstock, Cornwall, England.

Name: For the Mpororo deposit, Uganda, where it was first found.

Type Material: n.d.

PbO		0.10	
H_2O	[5.90]	[6.00]	6.00
Total	[100.01]	[97.30]	100.00

(1) Lubietová, Slovakia; by electron microprobe, original total given as 100.00%, H_2O calculated from stoichiometry, IR confirms $(OH)^{1-}$, H_2O, $(PO_4)^{3+}$; corresponds to $Bi_{2.01}Cu_{2.96}O_{2.00}[(P_{1.01}As_{0.01})_{\Sigma=1.02}O_4]_2(OH)_2 \cdot 1.95H_2O$. (2) Reichenbach, Germany; by electron microprobe, average of 14 analyses, H_2O calculated, presence of $(OH)^{1-}$ and molecular H_2O confirmed by FTIR spectroscopy; corresponds to $Bi_{2.05}Cu_{2.99}O_{2.00}[(PO_4)_{1.95}(AsO_4)_{0.02}(VO_4)_{0.02}]_{\Sigma=1.99}(OH)_{1.98} \cdot 1.88H_2O$. (3) $Bi_2Cu_3O_2(PO_4)_2(OH)_2 \cdot 2H_2O$.

Occurrence: A rare secondary mineral formed by oxidization of polymetallic sulfides.

Association: Chalcopyrite, tetrahedrite, chalcocite, malachite, pyromorphite, pseudomalachite, libethenite, reichenbachite, beudantite, bismutite, mixite, chrysocolla.

Distribution: From L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. At Gadernheim and Reichenbach, near Bensheim, Hesse, Germany. From Sainte-Marie-aux-Mines, Haut-Rhin, France. In the Morass Creek Gorge, 15 km north of Benambra, Victoria, Australia.

Name: Honors Zdenek Mrázek (1952–1984), who collected the first specimens and recognized their unusual characteristics.

Type Material: Charles University, Prague; National Museum, Prague, Czech Republic, P1N 88529.

Mroseite $CaTe^{4+}O_2(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals may show poorly developed {100}, with elongation parallel [001], very small, commonly with a crude radiating structure; typically massive.

Physical Properties: Hardness = ∼4 D(meas.) = 4.35 D(calc.) = 4.171

Optical Properties: Semitransparent. *Color:* Colorless to white. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r \ll v$. $\alpha = 1.79$ $\beta = 1.85$ $\gamma = 1.89$ 2V(meas.) = 74°

Cell Data: *Space Group: Pbca.* $a = 6.988(15)$ $b = 11.201(10)$ $c = 10.566(10)$ Z = 8

X-ray Powder Pattern: Moctezuma mine, Mexico.
3.14 (10), 5.14 (9), 4.20 (8), 1.97 (8), 3.35 (7), 3.02 (7), 2.39 (7)

Chemistry:

	(1)	(2)
TeO_2	61.3	61.46
CO_2	16.8	16.95
CaO	22.4	21.59
Total	100.5	100.00

(1) Moctezuma mine, Mexico; by neutron activation, CO_2 by TGA; corresponds to $Ca_{1.03}Te_{0.99}O_{2.00}(C_{0.99}O_3)$. (2) $CaTeO_2(CO_3)$.

Occurrence: Very rare in a hydrothermal Au–Te deposit (Moctezuma mine, Mexico).

Association: Spiroffite, tellurium, tellurite, denningite, zemannite, quartz (Moctezuma mine, Mexico); oboyerite, choloalite, gold (Tombstone, Arizona, USA).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the Tombstone Exploration open pit, Tombstone, Cochise Co., Arizona, USA.

Name: To honor Mary Emma Mrose (1910–2003), American mineralogist, U.S. Geological Survey, Washington, D.C.

Type Material: Royal Ontario Museum, Toronto, Canada, M33757.

Muirite $\mathbf{Ba_{10}Ca_2Mn^{2+}TiSi_{10}O_{30}(OH,Cl,F)_{10}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Subhedral to euhedral crystals not uncommon, bounded principally by {100} and {001}, also {110} and {$h0l$} forms; in grains and aggregates, to 3 mm.

Physical Properties: *Cleavage:* Indistinct on {001} and {100}. Hardness = ~2.5
D(meas.) = 3.86(2) D(calc.) = 3.88

Optical Properties: Transparent to translucent. *Color:* Orange; anomalous purple-brown interference color. *Streak:* Pale orange. *Luster:* Subvitreous.
Optical Class: Uniaxial (+). *Pleochroism:* O = orange; E = colorless. $\omega = 1.697(1)$
$\epsilon = 1.704(2)$

Cell Data: *Space Group:* $P4/mmm$. $a = 14.000(3)$ $c = 5.625(2)$ Z = 1

X-ray Powder Pattern: Fresno Co., California, USA.
2.91 (100), 4.42 (75), 3.73 (60), 3.51 (60), 3.31 (60), 3.60 (50), 2.814 (40)

Chemistry:

	(1)		(1)
SiO_2	22.15	SrO	0.13
TiO_2	4.17	BaO	59.6
Al_2O_3	0.53	K_2O	0.1
FeO	0.4	F	1.4
MnO	2.04	Cl	4.5
MgO	0.11	H_2O	1.8
CaO	4.67	$-O = (F,Cl)_2$	1.6
		Total	[100.0]

(1) Fresno Co., California, USA; by D-C emission arc spectrography, K and Cl by X-ray spectroscopy, stated to be recalculated to 100.0%; corresponds to $(Ba_{9.82}K_{0.05}Sr_{0.03})_{\Sigma=9.90}Ca_{2.10}(Mn_{0.73}Fe_{0.14}Mg_{0.07})_{\Sigma=0.94}Ti_{1.32}(Si_{9.31}Al_{0.26})_{\Sigma=9.57}O_{29.52}[(OH)_{5.05}Cl_{3.21}F_{1.86}]_{\Sigma=10.12}$.

Occurrence: In sanbornite-quartz-bearing metamorphic rock (Fresno Co., California, USA).

Association: Sanbornite, verplanckite (Fresno Co., California, USA); gillespite, sanbornite, taramellite, fresnoite, pellyite, barite (Itsy Mountains, Yukon, Canada).

Distribution: On Big Creek and Rush Creek, Fresno Co., California, USA. From the Gunn claim, near Macmillan Pass, Itsy Mountains, Yukon Territory, Canada.

Name: For John Muir (1834–1914), American mountaineer, conservationist, and naturalist, whose name is intimately associated with the California Sierra Nevada.

Type Material: California Division of Mines & Geology, San Francisco, California, USA.

Mukhinite $Ca_2Al_2V^{3+}(SiO_4)(Si_2O_7)O(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Irregular, short prismatic crystals, to 2.5 mm; as grains and vuggy accumulations and segregations. *Twinning:* Simple twins on {100}.

Physical Properties: *Cleavage:* {001}, perfect; {100}, less so; (001) ∧ (100) = 64°. *Tenacity:* Brittle. Hardness = 8 VHN = 1375 average. D(meas.) = n.d. D(calc.) = [3.47]

Optical Properties: Translucent. *Color:* Black with brownish tints, reddish brown to brown; in thin section, reddish brown to olive-green. *Streak:* Light brownish gray. *Luster:* Vitreous. *Optical Class:* Biaxial (+) or (–). *Pleochroism:* Strong; X = pale olive-green; Y = pale reddish brown; Z = reddish brown. *Orientation:* $Y = b$; $Z \wedge a = 32°$. $\alpha = 1.723(2)$ $\beta = 1.733(2)$ $\gamma = 1.755(2)$ 2V(meas.) = 88°

Cell Data: *Space Group:* n.d. $a = 8.90$ $b = 5.61$ $c = 10.15$ $\beta = 115°30'$ Z = 2

X-ray Powder Pattern: Tashelginskoye deposit, Russia.
2.892 (10), 2.682 (8), 2.600 (8), 2.398 (8), 1.405 (8), 1.394 (8), 2.530 (7)

Chemistry:

	(1)
SiO_2	36.50
Al_2O_3	21.81
Fe_2O_3	1.31
V_2O_3	11.29
Cr_2O_3	0.28
MgO	trace
CaO	22.23
H_2O	1.76
S	0.98
Total	96.16

(1) Tashelginskoye deposit, Russia; corresponds to $Ca_{2.0}(Al_{2.1}V_{0.8}Fe_{0.1})_{\Sigma=3.0}Si_{3.1}O_{12}(OH)$.

Mineral Group: Epidote group.

Occurrence: In marble associated with an iron deposit (Tashelginskoye deposit, Russia); a late-stage mineral in garnet-bearing metamorphic rocks (Kuznetsk, Kazakhstan).

Association: Goldmanite, muscovite, pyrite, pyrrhotite, sphalerite, chalcopyrite (Tashelginskoye deposit, Russia); garnet, diopside, titanite, quartz, clinozoisite, galena, molybdenite (Kuznetsk, Kazakhstan).

Distribution: From the Tashelginskoye iron deposit, Shoriya Mountains, about 400 km southeast of Novosibirsk, southwestern Siberia, Russia. At Kuznetsk, Ala-Tau Range, Tien Shan, Kazakhstan. From Lewiston, Fergus Co., Montana, USA.

Name: In honor of Aleksei Stepanovich Mukhin (1910–1974), geologist with the West Siberian Geological Survey.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 71421.

References: (1) Shepel, A.V. and M.V. Karpenko (1969) Mukhinite, a new vanadium species of epidote. Doklady Acad. Nauk SSSR, 185, 1342–1345 (in Russian). (2) (1970) Amer. K_2O	0.06	
Total	100.20	100.00

(1) Isle of Mull, Scotland. (2) $Al_6Si_2O_{13}$.

Occurrence: In fused argillaceous inclusions in Tertiary eruptive rocks (Isle of Mull, Scotland); as microscopic inclusions in sillimanite in pelitic inclusions in a tonalite (Val Sissone, Italy); in a complex assemblage of emerylike rocks (Sithean Sluaigh, Scotland).

Association: Corundum (Isle of Mull, Scotland); sillimanite, kyanite (Val Sissone, Italy); corundum, magnetite, spinel, pseudobrookite, sanidine, cordierite (Sithean Sluaigh, Scotland).

Distribution: From Nuns Pass, Carsaig, and a number of other places on the Isle of Mull, also at Sithean Sluaigh, Strachur, Argyllshire, Scotland. At Tievebulliagh, Co. Antrim, Ireland. In the Bergell massif, at Val Sissone, Lombardy, Italy. At the Bellerberg, Nickenicher Sattel, and other volcanoes, Eifel district, Germany. From the Bushveld complex, at Maandagshoek, Transvaal, and in the Roberts Victor diamond mine, near Kimberley, Cape Province, South Africa. In Russia, on Buguchan Mountain and near Arkhara Station, Amur region.

Name: For its type locality on the Isle of Mull, Scotland.

Type Material: The Natural History Museum, London, England, 1925,432–437.

Mummeite $Ag_2PbCuBi_6S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As intergrowths of short columnar crystals, to 1 mm, exsolved to alternating lamellae of mummeite and plumbocuprian mummeite. *Twinning:* Along a straight composition plane parallel to elongation.

Physical Properties: Hardness = n.d. VHN = 186–220, average 203 D(meas.) = n.d. D(calc.) = 6.79–6.80

Optical Properties: Opaque. *Color:* Gray. *Luster:* Metallic.
Optical Class: Biaxial. *Anisotropism:* Pronounced, in shades of gray to brownish yellow to dark indigo. *Bireflectance:* Perceptible.
R_1–R_2: 43.3–47.5 (470), 42.8–47.0 (546), 42.5–46.4 (589), 42.2–45.7 (650)

Cell Data: *Space Group:* $C2/m$ (mummeite), with $a = 13.47(1)$ $b = 4.06(1)$ $c = 21.63(1)$ $\beta = 92.9(1)°$ Z = 2, or *Space Group:* $C2/m$ (plumbocuprian mummeite), with $a = 13.48(1)$ $b = 4.06(1)$ $c = 21.72(1)$ $\beta = 93.9(1)°$ Z = 2

X-ray Powder Pattern: Alaska mine, Colorado, USA.
2.863 (10), 2.023 (10), 3.53 (5), 3.43 (5), 1.652 (4), 1.285 (4), 5.55 (3)

Chemistry:

	(1)	(2)	(3)
Ag	11.69	10.81	10.00
Pb	12.10	14.40	9.60
Cu	2.22	4.32	2.95
Bi	56.04	52.34	58.13
S	17.30	16.99	19.32
Total	99.35	99.84	100.00

(1) Alaska mine, Colorado, USA; by electron microprobe, mummeite; corresponds to $Ag_{2.61}Pb_{1.41}Cu_{0.84}Bi_{6.46}S_{13.00}$. (2) Do.; by electron microprobe, plumbocuprian mummeite; corresponds to $Ag_{2.46}Pb_{1.71}Cu_{1.67}Bi_{6.14}S_{13.00}$. (3) $Ag_2PbCuBi_6S_{13}$.

Mineral Group: Benjaminite group.

Occurrence: In hydrothermal base-metal sulfide vein deposits.

Association: Chalcopyrite, sphalerite, pyrite, ourayite, schapbachite, heyrovskyite, quartz (Alaska mine, Colorado, USA).

Distribution: In the USA, from the Alaska mine, Poughkeepsie Gulch, near Ouray [TL] and at the Mike mine, Silverton district, San Juan Co., Colorado.

Name: To honor Dr. William Gustav Mumme (1936–), Australian mineralogist, C.S.I.R.O., Melbourne, Australia, who first studied the mineral, for his work with sulfosalts.

Type Material: University of Copenhagen, Copenhagen, Denmark; Museum of Natural History, Denver, Colorado, USA.

Munakataite $Pb_2Cu_2(Se^{4+}O_3)(SO_4)(OH)_4$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As fibrous aggregates, to 0.03 mm.

Physical Properties: *Cleavage*: Perfect {010}. *Tenacity*: Brittle. *Fracture*: None.
Hardness = < 2 D(meas.) = n.d. D(calc.) = 5.526

Optical Properties: Transparent. *Color*: Light blue. *Streak*: Bluish white.
Luster: Vitreous, pearly on cleavage surfaces. Easily mistaken visually for linarite.
Optical Class: n.d. n = 1.891 (calculated). *Pleochroism*: Weak, colorless to pale blue.

Cell Data: *Space Group*: $P2_1/m$. a = 9.766(8) b = 5.666(5) c = 9.291(10) β = 102.40(8)°
Z = 2

X-ray Powder Pattern: Kato mine, Fukuoka Prefecture, Japan.
3.18 (100), 3.14 (68), 4.77 (57), 4.86 (44), 3.53 (39), 2.72 (22), 1.813 (19)

Chemistry:

	(1)	(2)
PbO	53.71	53.62
CuO	18.33	19.11
CaO	0.04	
SO_3	9.73	9.62
SeO_2	13.19	13.32
H_2O	4.19	4.33
Total	99.19	100.00

(1) Kato mine, Fukuoka Prefecture, Japan; average of 7 EDS analyses, H_2O calculated, complex anions and OH confirmed by FT-IR, corresponding to $Pb_{2.03}(Cu_{1.94}Ca_{0.01})_{\Sigma=1.95}(Se^{4+}O_3)_{1.00}(SO_4)_{1.02}(OH)_{3.92}$. (2) $Pb_2Cu_2(Se^{4+}O_3)(SO_4)(OH)_4$.

Occurrence: A secondary mineral in the weathering zone of a polymetallic sulfide deposit.

Association: Malachite.

Distribution: Dumps of the Kato mine, Fukuoka Prefecture and at the Kisamori mine, Akita Prefecture, Japan.

Name: For the city of Munakata, where the Kato mine, source of the first specimens, is located.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSM-M28982).

References: (1) Matsubara, S., T. Mouri, R. Miyawaki, K. Yokoyama, and M. Nakahara (2008) Munakataite, a new mineral from the Kato mine, Fukuoka, Japan. J. Mineral. Petrol. Sci., 103, 327–332. (2) (2009) Amer. Mineral., 94, 1079-1080 (abs. ref. 1).

Mundite $Al(UO_2)_3(PO_4)_2(OH)_3 \cdot 5.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As tabular rectangular crystals, flattened on {010} and elongated along [001], to 0.5 mm.

Physical Properties: *Cleavage:* Perfect on {010}, {100}, {001}. Hardness = n.d. D(meas.) = > 4.05 D(calc.) = 4.295 Radioactive; fluoresces pale green in LW and SW UV.

Optical Properties: Transparent. *Color:* Golden yellow; pale yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Weak. *Orientation:* $X = b$; $Y = c$; $Z = a$. α = [1.62] $\beta = 1.682(2)$ $\gamma = 1.688(2)$ 2V(meas.) = 33°

Cell Data: *Space Group:* $Pmcn$ or $P2_1cn$. $a = 17.08(3)$ $b = 30.98(5)$ $c = 13.76$ Z = 16

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
7.80 (100), 3.37 (70), 3.87 (60), 3.06 (50), 5.74 (40), 3.00 (40), 4.23 (30)

Chemistry:

	(1)	(2)
UO_3	72.20	72.90
P_2O_5	12.55	12.06
Al_2O_3	4.45	4.33
H_2O	[10.80]	10.71
Total	[100.00]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of four analyses, H_2O by difference. (2) $Al(UO_2)_3(PO_4)_2(OH)_3 \cdot 5.5H_2O$.

Occurrence: A rare mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Phuralumite, upalite, ranunculite, threadgoldite, eylettersite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: Honors Professor Walter Mund (1892–1956), radiochemist, Catholic University of Louvain, Louvain, Belgium.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG11888.

References: (1) Deliens, M. and P. Piret (1981) Les phosphates d'uranyle et d'aluminium de Kobokobo. V. La mundite, nouveau minéral. Bull. Minéral., 104, 669–671 (in French with English abs.). (2) (1982) Amer. Mineral., 67, 624 (abs. ref. 1).

Mundrabillaite $(NH_4)_2Ca(PO_3OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. In aggregates of tiny crystals.

Physical Properties: *Tenacity:* Fragile [*sic*]. Hardness = Very soft. D(meas.) = n.d. D(calc.) = 2.09 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless. *Streak:* White. *Luster:* Dull. *Optical Class:* Biaxial (–). *Orientation:* Extinction angle +26(1)°. $\alpha = 1.522(2)$ $\beta = 1.544(2)$ $\gamma = 1.552(2)$ 2V(meas.) = n.d. 2V(calc.) = 61°

Cell Data: *Space Group:* $P2/m$, $P2$, or Pm. $a = 8.643$ $b = 8.184$ $c = 6.411$ $\beta = 98.0°$ Z = 2

X-ray Powder Pattern: Petrogale Cave, Australia.
4.279 (100), 3.106 (60), 8.60 (30), 3.687 (30), 2.873 (30), 2.728 (20), 2.116 (15)

Chemistry:

	(1)	(2)
SO_3	0.04	
P_2O_5	48.6	49.61
Fe_2O_3	0.05	
MgO	0.04	
CaO	20.4	19.60
K_2O	0.85	
$(NH_4)_2O$		18.20
H_2O		12.59
Total		100.00

(1) Petrogale Cave, Australia; by electron microprobe, average of nine partial analyses, presence of NH_4 and H_2O confirmed; formula derived by correspondence of X-ray and optical data with synthetic material. (2) $(NH_4)_2Ca(PO_3OH)_2 \cdot H_2O$.

Polymorphism & Series: Dimorphous with swaknoite.

Occurrence: Derived from bat guano and urine in caves.

Association: Biphosphammite, archerite, aphthitalite, halite, syngenite, stercorite, oxammite, weddellite, whitlockite, guanine, newberyite, calcite (Petrogale Cave, Australia); swaknoite, dittmarite, arcanite (Arnhem Cave, Namibia).

Distribution: In Petrogale Cave, near Madura, Western Australia. In Arnhem Cave, 150 km east of Windhoek, Namibia.

Name: For Mundrabilla Station, nearby the Petrogale Cave, Western Australia.

Type Material: Western Australian Museum, Perth, MDC5902.

References: (1) Bridge, P.J. and R.M. Clarke (1983) Mundrabillaite – a new cave mineral from Western Australia. Mineral. Mag., 47, 80–81. (2) (1984) Amer. Mineral., 69, 407 (abs. ref. 1).

Murataite $(Y,Na)_6(Zn,Fe^{3+})_5(Ti,Nb)_{12}O_{29}(O,F)_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As subhedral crystals, to 5 mm; granular.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–6.5 VHN = 782–870, 827 average (100 g load). D(meas.) = 4.50–4.69 D(calc.) = 4.64

Optical Properties: Opaque to translucent on thin edges. *Color:* Black; brown or yellow in transmitted light; gray in reflected light, with faint orange internal reflections. *Luster:* Submetallic.
Optical Class: Isotropic; slight anisotropism due to strain. n = 2.11–2.13 *Anisotropism:* Weak. *Bireflectance:* Slight.

(1) St. Peters Dome, Colorado, USA; by XRF, flame photometry, electron microprobe, semiquantitative spectrographic analysis, volumetric and microcoulumetric methods; after rejection of Ba 0.008%. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, Tb_2O_3 interpolated, H_2O from (1); corresponds to $(Na_{3.97}Y_{2.24}RE_{1.15}Zn_{2.81}Fe^{3+}_{1.01}Ca_{0.33}Mn_{0.21})_{\Sigma=11.72}(Ti_{9.60}Nb_{1.53}Si_{0.11}Sn_{0.04})_{\Sigma=11.28}O_{32.11}F_{7.55}(OH)_{1.23}$. (3) Burpala massif, Russia.

Occurrence: A rare accessory mineral in samples from the dump of a prospect in a pegmatite subjected to alkali metasomatism (St. Peters Dome, Colorado, USA); in pegmatite in a differentiated alkalic massif (Burpala massif, Russia).

Association: Quartz, astrophyllite, microcline, albite, riebeckite, chlorite, zircon, aegirine, anatase, rutile, thorite, pyrochlore, xenotime, genthelvite, zincian davidite (St. Peters Dome, Colorado, USA); landauite, rutile, monazite, bastnäsite, brookite (Burpala massif, Russia).

Distribution: From the St. Peters Dome area, near Pikes Peak, El Paso Co., Colorado, USA. In the Burpala massif, 120 km north of Lake Baikal, eastern Siberia.

Name: To honor Kiguma Jack Murata (1909–), geochemist, U.S. Geological Survey, Menlo Park, California, USA, for his work on rare-earth chemistry.

Type Material: National Museum of Natural History, Washington, D.C., USA, 133319–133321.

(1) Tiger, Arizona, USA; corresponds to $Pb_{0.9}Cu_{6.1}O_8$. (2) Hansonburg district, New Mexico, USA; by electron microprobe, average of two analyses. (3) Tchah Khuni mine, Iran; by electron microprobe, average of two analyses.

Occurrence: In oxidized Pb–Cu deposits.

Association: Wulfenite, fluorite, hemimorphite, willemite, descloizite, dioptase, chrysocolla, creaseyite, quartz (Tiger, Arizona, USA); plattnerite, malachite, "limonite" (Mapimí, Mexico); embolite, chrysocolla, dioptase, plattnerite, hemimorphite, iranite, boleite, diaboleite, "limonite" (Tchah Khuni mine, Iran).

Distribution: In the USA, in Arizona, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., in the Higgins mine, Bisbee, Cochise Co., from the Silver Hill mine, Pima Co., the 79 mine, Gila Co., the Tonopah-Belmont mine, Osborne district, Maricopa Co., and at the Eagle Eye mine, New Water Mountains, La Paz Co.; in the Blanchard and Mex-Tex mines, near Bingham, Hansonburg district, Socorro Co., New Mexico; and at the Blue Bell claims, near Baker, San Bernardino Co., California. From the Ojuela mine, Mapimí, Durango, and at Santa Eulalia, Chihuahua, Mexico. In the Tchah Khuni mine, near Anarak, Iran. From the Whim Creek copper mine, Pilbara district, Western Australia.

Name: In honor of Professor Joseph Murdoch (1890–1973), American mineralogist, University of California, Los Angeles, California, USA.

Type Material: n.d.

(1) Chinglusuai Valley, Russia. (2) Sengischorr cirque, Lovozero massif, Russia. (3) Ilímaussaq intrusion, Greenland; by electron microprobe, XRF, and DTA, here recalculated to oxides, $Fe^2 + :Fe^{3+} = 4:1$, H_2O estimated from oxygen difference; corresponds to $(Na_{0.88}Ca_{0.38}Fe^{2+}_{0.09}Mg_{0.03}K_{0.02})_{\Sigma=1.40}(Ti_{1.63}Nb_{0.14}Mn_{0.04}Fe^{3+}_{0.03})_{\Sigma=1.84}Si_2O_{8.63} \cdot 0.15Na_3PO_4 \cdot 1.87H_2O$.

Occurrence: In pegmatites and associated igneous rocks of alkalic complexes, as a primary magmatic mineral or altered from lomonosovite.

Association: Lomonosovite, aegirine, arfvedsonite, neptunite, microcline, albite, natrolite, analcime, nepheline, sodalite, eudialyte, lorenzenite, lamprophyllite, rinkite, ussingite.

Distribution: In Russia, from the Chinglusuai Valley, on Mts. Flora, Punkaruaiv, and Angvundaschorr, Lovozero massif, and on Mts. Rasvumchorr and Koashva, Khibiny massif, Kola Peninsula. In the Ilímaussaq intrusion, at Kvanefjeld, Steenstrups Fjeld, and Skovfjord, southern Greenland.

Name: For the Murman coast on the northern side of the Kola Peninsula, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 25852–25854, 25862, 25863.

(1) Blue Mountain, Methuen Township, Canada. (2) $KAl_2(Si_3Al)O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$, 1M, 3A polytypes; interstratifies with vermiculite, paragonite, montmorillonite.

Mineral Group: Mica group.

Occurrence: A common rock-forming mineral, in phyllites, schists, and gneisses; in granites, granite pegmatites, and aplites. Formed from other minerals under hydrothermal conditions; may be detrital or authigenic.

Association: Quartz, plagioclase, potassic feldspar, biotite, tourmaline, topaz.

Distribution: Uncommon in euhedral crystals. From Slyudyanka, near Lake Baikal, Siberia, and at Mursinka, Ural Mountains, Russia. At Kammerfors, Kragerö, and Bamble, Norway. In the USA, at Mt. Mica, near Paris, Oxford Co., and elsewhere in Maine; large crystals from Pennsbury, Chester Co., Pennsylvania; at Amelia, Amelia Co., Virginia; fine crystals from near Shelby, Cleveland Co., North Carolina; in the Black Hills, in Pennington, Lawrence, and Custer Cos., South Dakota; and from the Harding mine, Dixon, Taos Co., New Mexico. In Methuen and Calvin Townships, Ontario, Canada. In Brazil, in Minas Gerais, at Urucum, from the Taquaral mine, Itinga, and in the José Pinto pegmatite, at Jaguaraçú, near Coronel Fabriciano. Around Nellore, Andhra Pradesh, India, in commercial deposits which may contain huge crystals.

Name: From "Muscovy glass," for an occurrence in the old province of Muscovy, Russia.

Chemistry:

	(1)	(2)
SnO_2	52.2	47.2
FeO	3.3	10.6
CuO	13.5	11.4
ZnO	11.1	7.0
Ag_2O	0.1	
H_2O	[19.1]	[23.6]
Total	[99.3]	[99.8]

(1) Mushiston deposit, Tajikistan; by electron microprobe, original analysis elemental, here converted to oxides, H_2O calculated from excess O given, $(OH)^{1-}$ confirmed by IR; corresponds to $(Cu_{0.48}Zn_{0.39}Fe_{0.13})_{\Sigma=1.00}Sn_{0.98}(OH)_{6.02}$. (2) Do.; corresponds to $(Cu_{0.48}Zn_{0.39}Fe_{0.17})_{\Sigma=1.04}Sn_{1.00}(OH)_{5.95}$.

Mineral Group: Schoenfliesite group.

Occurrence: In the oxidized zone of a tin deposit, replacing stannite (Mushiston deposit, Tajikistan); from a zoned pegmatite (Etta mine, South Dakota, USA).

Association: Stannite, chalcopyrite, sphalerite, galena (Mushiston deposit, Tajikistan); cassiterite, pseudomalachite, quartz (Etta mine, South Dakota, USA).

Distribution: In the Mushiston tin deposit, Kaznok Valley, Zeravshan Mountains, Tajikistan. From the Etta mine, near Keystone, Pennington Co., South Dakota, USA.

Name: For its occurrence in the Mushiston deposit, Tajikistan.

Type Material: Mining Institute, St. Petersburg, 1999/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81069.

Muskoxite $Mg_7Fe_4^{3+}O_{13}\cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ (probable). As hexagonal crystals, to 0.25 mm, very thin on {0001}, in reticular to divergent aggregates, some intergrown to simulate larger trigonal crystals. In cross-fiber veinlets, anhedral grains; fine-grained powdery.

Physical Properties: *Cleavage:* Perfect on {0001}, micaceous. *Tenacity:* Brittle, flexible. Hardness = ∼3 D(meas.) = 3.10–3.20 D(calc.) = n.d.

Optical Properties: Translucent. *Color:* Dark reddish brown; amber-orange to deep red in transmitted light. *Streak:* Pale orange-brown. *Luster:* Vitreous.
Optical Class: Biaxial (–). n = 1.80–1.81 2V(meas.) = 10°–40°

Cell Data: *Space Group:* $R\overline{3}m$ pseudocell. a = 3.07 c = 4.6 Z = n.d.

X-ray Powder Pattern: Muskox intrusion, Canada; preferred orientation evident.
2.308 (10), 4.61 (8), 1.746 (6), 1.543 (4), 4.12 (3), 2.660 (3), 4.44 (2)

Chemistry:

	(1)	(2)
Fe_2O_3	41.1	40.86
FeO	0.0	
MgO	35.4	36.09
H_2O	23.8	23.05
CO_2	< 1.	
Total	100.3	100.00

(1) Muskox intrusion, Canada; corresponds to $Mg_{6.82}Fe^{3+}_{4.00}O_{12.82}\cdot 10.2H_2O$.
(2) $Mg_7Fe^{3+}_4O_{13}\cdot 10H_2O$.

Occurrence: In thin veinlets in serpentinite from a layered ultramafic complex.

Association: Lizardite, coalingite, Mg–Fe–Mn oxides.

Distribution: In the Muskox intrusion, Coppermine River area, Northwest Territories, Canada.

Name: For its occurrence in the Muskox intrusion, Canada.

Type Material: Canadian Geological Survey, Ottawa, 12123; Royal Ontario Museum, Toronto, Canada, M36526.

Muthmannite (Ag, Au)Te

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular crystals, typically elongated in one direction; as rims and aggregates, to 0.2 mm; in anhedral grains.

Physical Properties: *Cleavage:* One perfect, in zone of elongation. *Fracture:* Uneven. Hardness = 2.5 VHN = 172–207, 194 average (10 to 20 g load). D(meas.) = n.d. D(calc.) = 11.04

Optical Properties: Opaque. *Color:* Brassy yellow to pale bronze, pale gray on fresh fracture surface; pale gray in reflected light. *Streak:* Black to gray-black. *Luster:* Bright metallic. *Pleochroism:* Very low. *Bireflectance:* Very low.
R_1–R_2: (400) — , (420) 42.3, (440) 41.3, (460) 40.4, (480) 39.7, (500) 39.2, (520) 38.7, (540) 38.4, (560) 38.2, (580) 38.1, (600) 38.0, (620) 38.0, (640) 38.0, (660) 38.1, (680) 38.2, (700) 38.4

(1) Săcărîmb, Romania; neglecting Sb, calculated by difference, and S from stibnite impurity, then corresponds to $Ag_{1.01}Au_{0.99}Te_{2.00}$. (2) Baia-de-Arieş, Romania; by electron microprobe, corresponds to $Ag_{0.97}Au_{0.98}Cu_{0.02}Fe_{0.01}Hg_{0.01}Te_{2.04}$. (3) $AgAuTe_2$.

Occurrence: In close intergrowths with other tellurides, especially krennerite, in epithermal hydrothermal veins, and in ores enriched by secondary processes (Săcărîmb, Romania); replacing calaverite (Baia-de-Arieş, Romania).

Association: Krennerite, stibnite, hessite, nagyágite, petzite, pyrargyrite, sylvanite, calaverite, pyrite, sphalerite, altaite, tetrahedrite–tennantite, alabandite, (Săcărîmb, Romania); calaverite (Baia-de-Arieş, Romania).

Distribution: In Romania, from Săcărîmb (Nagyág) [TL] and Baia-de-Arieş (Offenbánya).

Name: To honor the chemist and crystallographer, Professor Friedrich Wilhelm Muthmann (1861–1913), Technische Hochschule, Munich, Germany.

Type Material: University of Naples Museum, Naples, Italy.

MnO	1.10	1.09	H_2O	1.83	n.d.
			$-O=F_2$	[0.50]	n.d.
			Total	98.93	99.36

(1) Inagli massif, south Yukutsk, Russia; average of 20 electron microprobe analyses, H_2O by TGA; corresponds to $Na_{2.95}K_{0.17}Ca_{0.05}Sr_{0.05}Ba_{1.29}Mn_{0.13}(Ti_{2.86}Fe_{0.08}Mg_{0.07})_{\Sigma=3.01}[(Si_{3.93}Al_{0.07})_{\Sigma=4.00}O_{14.00}]\ O_{1.94}(OH)_{1.67}F_{0.51}$. (2) Kovdor massif, Russia; average of 20 electron microprobe analyses, H_2O by TGA.

Occurrence: In peralkaline pegmatite dikes cutting alkaline ultramafic rocks.

Association: Aegirine, albite, ancylite, batisite, diopside, eckermannite, innelite, leucosphenite, lorenzenite, natrolite, neptunite, strontium apatite (Inagli); apatite, cancrinite, eudialyte-group minerals, lorenzenite, lueshite, nepheline, pectolite, pyrrhotite, thomsonite-Ca, titanite, diopside, hedenbergite, aegirine (Kovdor). In cancrinite-bearing pegmatite (Kovdor), it forms aggregates with pectolite and cancrinite, often intergrown with lorenzenite. In nepheline-bearing pegmatite (Kovdor), it forms radial aggregates of lamellar crystals with lorenzenite, titanite and eudialyte group minerals.

Distribution: From the Inagli massif, south Yukutsk and the Kovdor massif, Kola Peninsula, Russia.

Name: For its composition and relation to other *lamprophyllite*-group minerals.

Type Material: Geological Museum, Institute of Geology and Geophysics, Russian Academy of Science, Novosibirsk, Russia (XIII-274/1) and the A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia (90837 and 90843).

(1) Mt. Yukspor, Kola Peninsula, Russia; by electron microprobe, average of three analyses, recalculated to 100%, H_2O by TGA; corresponding to $Na_{0.80}(Ba_{0.95}Sr_{0.03})_{\Sigma=0.98}P_{1.05}O_4 \cdot 8.07H_2O$.
(2) $NaBaPO_4 \cdot 9H_2O$.

Occurrence: A rare late-stage hydrothermal mineral in cavities in ijolite-urtite pegmatite in a differentiated alkalic massif.

Association: Natrolite, pectolite, shcherbakovite, wadeite, eudialyte, lamprophyllite, ferrian biotite, aegirine, microcline.

Distribution: On Mt. Yukspor, Khibiny massif, Kola Peninsula, Russia.

Name: For sodium, NAtrium, BArium, and PHosphorus in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5713/2; Mining Institute, St. Petersburg, 1635/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80819.

(1) Tolbachik volcano, Russia; by electron microprobe, corresponds to $(Cu_{6.74}Zn_{0.18})_{\Sigma=6.92}(Te_{1.02}Bi_{0.02}Pb_{0.01}Fe_{0.01}V_{0.01})_{\Sigma=1.07}O_{4.10}(SO_4)_{4.98}Cl_{0.98}$. (2) $KCu_7(TeO_4)(SO_4)_5Cl$.

Polymorphism & Series: Forms a series with atlasovite.

Occurrence: A rare sublimate formed in a volcanic fumarole.

Association: Atlasovite, chalcocyanite, dolerophanite, chloroxiphite, euchlorine, piypite, atacamite, alarsite, fedotovite, lammerite, klyuchevskite, anglesite, langbeinite, hematite, tenorite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honoring Sof'ya Ivanovna Naboko (1909–), Institute of Volcanology, Petropavlovsk-Kamchatskii, Russia, Russian volcanologist who first collected the mineral.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87577.

(1) Mt. Rasvumchorr, Kola Peninsula, Russia; corresponding to $Na_{1.99}(Ca_{0.94}Sr_{0.01}Mn_{0.01})_{\Sigma=0.96}P_{1.00}O_{3.97}F_{0.97}$. (2) $Na_2Ca(PO_4)F$.

Occurrence: A rare late-stage hydrothermal mineral in ijolite-urtite pegmatite.

Association: Thermonatrite, villiaumite, aegirine, apatite, barytolamprophyllite (Khibiny massif); interstial with nepheline, potassic arfvedsonite, microcline, eudialyte and associated with sodalite, kalsilite, pectolite, lamprophyllite, lomonosovite, ershovite, loparite-(Ce), djerfisherite. (Mt. Rasvumchorr).

Distribution: On Mts. Rasvumchorr, Yukspor, and Koashva, Khibiny massif, Kola Peninsula, Russia.

Name: For sodium, NAtrium, CAlcium, and PHosphorus in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5534; Mining Institute, St. Petersburg, 1116/2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79854; The Natural History Museum, London, England, 1994,15.

Total	100.10	100.00

(1) St. Peters Dome, Colorado, USA. (2) $Al_2Si_2O_5(OH)_4$.

Polymorphism & Series: Dickite, halloysite, and kaolinite are polymorphs.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Of hydrothermal origin.

Association: Kaolinite, dickite, mica, quartz.

Distribution: Probably at many localities, but careful characterization is required for confirmation. A few verified localities include: in Germany, from Brand-Erbisdorf, near Freiberg, and Erdmannsdorf, Saxony, with large crystals from St. Andreasberg, Harz Mountains. At Lodève, Haute-Vienne, France. From Groby, Leicestershire, England. At Sidi-Amour-ben-Salem, Tunisia. From near Saint-Amable and at St. Eustache, Quebec, Canada. In the USA, at the Tracy mine, south of Negaunee, Marquette Co., Michigan; from near Texas, Cecil Co., Maryland; at St. Peters Dome, near Pikes Peak, El Paso Co., Colorado. From San Juanito, Chihuahua, Mexico. In Japan, at Yaita, Tochigi Prefecture; in the Kobayashi, Kanekura, and Yonago mines, Nagano Prefecture; and the Kasuga mine, Kagoshima Prefecture.

Name: From the French *nacre*, for *mother of pearl*, in allusion to its appearance.

Total	100.00	100.27	100.00

(1–2) Djebel Nador, Algeria. (3) $PbSbO_2Cl$.

Occurrence: As an alteration product of other antimony-bearing minerals in hydrothermal mineral deposits.

Association: Jamesonite, galena, sphalerite, bindheimite, sénarmontite, valentinite, anglesite, cerussite, smithsonite, mimetite.

Distribution: Large crystals at Djebel Nador, Qacentina (Constantine), Algeria. Fine groups in the Touissit mine, near Oujda, Morocco. In England, from the Bodannon mine and at Portquin Beach, St. Endellion; in the Trevinnick mine, St. Kew; at the Treore mine, St. Teath; and from Wheal Leigh, Pillaton, Cornwall. At Långban, Jakobsberg, and in the Harstigen mine, near Persberg, Värmland, Sweden. At the Reichensteinerberg mine, near Reichenstein, Westerwald, Germany. At the Madzharov deposit, Rhodope Mountains, Bulgaria. In the Kara Elcha mercury deposit, Turkmenistan. From the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan. At Tsumeb, Namibia.

Name: For its original occurrence at Djebel Nador, Algeria.

Nagashimalite $Ba_4(V^{3+},Ti)_4(B_2Si_8O_{27})Cl(O,OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals tabular on {001}, elongated along [010], to 15 mm, forming subparallel aggregates; striated on {001} ∥ [010].

Physical Properties: Hardness = ∼6 VHN = 606–681 (100 g load). D(meas.) = 4.08 D(calc.) = 4.14

Optical Properties: Opaque to transparent. *Color:* Greenish black. *Streak:* Green. *Luster:* Submetallic to vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = greenish yellow; Y = green; Z = greenish brown. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.750$ $\beta = 1.753$ $\gamma = 1.780$ 2V(meas.) = ∼30°

Cell Data: *Space Group: Pmmn.* a = 13.937(3) b = 12.122((3) c = 7.116(2) Z = 2

X-ray Powder Pattern: Mogurazawa mine, Japan.
3.020 (100), 3.030 (60), 2.592 (28), 3.854 (25), 2.791 (20), 3.319 (15), 3.273 (15)

Chemistry:

	(1)
SiO_2	32.37
TiO_2	2.75
B_2O_3	4.0
V_2O_3	16.65
MnO	0.48
BaO	41.36
Cl	1.73
H_2O	[0.77]
$-O = Cl_2$	0.39
Total	[99.72]

(1) Mogurazawa mine, Japan; by electron microprobe, B by wet chemical analysis, H_2O calculated to give Cl+(OH)=2; corresponds to $Ba_{4.00}(V^{3+}_{3.30}Ti_{0.51}Mn_{0.10})_{\Sigma=3.91}B_{1.71}Si_8O_{27.64}Cl_{0.72}(OH)_{1.28}$.

Occurrence: In fissures cutting massive rhodonite ore in a bedded manganese deposit.

Association: Rhodochrosite, rhodonite, barite, barian roscoelite, alabandite, digenite, bornite, tetrahedrite.

Distribution: In the Mogurazawa mine, Kiryu, Gumma Prefecture, Japan.

Name: For pioneer Japanese amateur mineralogist, Otokichi Nagashima (1890–1969).

Type Material: National Science Museum, Tokyo, Japan, M21727; National Museum of Natural History, Washington, D.C., USA, 142987.

SO_3	0.12
Total	100.15

(1) Hatrurim Formation, Israel; by electron microprobe, some MgO probably a misprint for MnO; corresponding to $(Ca_{3.78}Na_{0.06}K_{0.06})_{\Sigma=3.90}(Si_{1.58}P_{0.40})_{\Sigma=1.98}O_8$.

Polymorphism & Series: α and β polymorphic phases appear to be intergrown in the natural material.

Occurrence: In a complex assemblage of high-temperature contact metamorphosed sedimentary rocks.

Association: Gehlenite, rankinite, perovskite, titanian andradite, magnetite.

Distribution: In the Hatrurim Formation, Israel.

Name: For Guenther Nagelschmidt, chemist who first reported the synthetic compound in slags.

Type Material: n.d.

(1) Săcărîmb, Romania; corresponding to $(Te_{0.81}Au_{0.22})_{\Sigma=1.03}Pb_{1.00}(Pb_{0.60}Sb_{0.36}Fe_{0.04})_{\Sigma=1.00}S_{2.00}$. (2) Do.; by electron microprobe, average of 61 analyses on one specimen; corresponding to $(Te_{0.78}Au_{0.22})_{\Sigma=1.00}Pb_{1.00}(Pb_{0.62}Sb_{0.37})_{\Sigma=0.99}S_{2.00}$. (3) Cripple Creek, Colorado, USA; by electron microprobe, corresponding to $(Te_{0.71}Au_{0.28}Ag_{0.01})_{\Sigma=1.00}Pb_{1.00}(Pb_{0.71}Sb_{0.39})_{\Sigma=0.99}S_{2.00}$.

Occurrence: In Au–Te-bearing epithermal hydrothermal veins.

Association: Altaite, petzite, stutzite, sylvanite, tellurantimony, coloradoite, krennerite, arsenic, gold, proustite, rhodochrosite, arsenopyrite, sphalerite, tetrahedrite (Săcărîmb, Romania); calaverite, gold, tellurobismuthite, altaite, galena, pyrite (Bohuliby mine, Czech Republic).

Distribution: In Romania, from Săcărîmb (Nagyág) [TL] and Baia-de-Arieş (Offenbánya). In the Bohuliby mine, Jílové gold deposit, Czech Republic. From the Chelopech deposit, Sofia, Bulgaria. At Schellgaden, Austria. From Manka, Kazakhstan. At Zod, Armenia. In the Glen Rosa mine, Selukwe, Zimbabwe. In the USA, from Gold Hill, Boulder Co., and Cripple Creek, Teller Co., Colorado; in the Dorleska mine, Coffee Creek district, Trinity Co., California; from the Mayflower mine, Tobacco Root Mountains, Madison Co., Montana; and at the Foote mine, Kings Mountain, Cleveland Co., North Carolina. In Canada, in the Huronian mine, Moss Township, Ontario; and from the Olive Mabel claim, Gainer Creek, British Columbia. At Farallon Negro, Catamarca Province, Argentina. In the Kalgoorlie district, at Oroya, and in the Golden Mile deposit, Western Australia. From the Sylvia mine, Tararu Creek, New Zealand. In the Rendaiji mine, Shizuoka Prefecture, Japan. From the Tarua gold field, Vitu Levu, Fiji Islands.

Name: For the Săcărîmb (Nagyág), Romania locality.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are typically elongated along [001], to about 1 cm, with large {110}, {010}, {101}, smaller {120}, {$\bar{1}$01}, {111}; as fibrous masses, oriented perpendicular to bedding planes; in friable porous aggregates. *Twinning:* Common on {101} as twin and composition plane, interpenetration and contact, may be in reticulated groups.

Physical Properties: *Cleavage:* Perfect on {101}; good on {111}; fair on {100}. *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 2.21–2.238 D(calc.) = 2.16 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless, white, yellow, may be gray, reddish brown, to black from impurities; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, resinous on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 27°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.375(2)$ $\beta = 1.498$–1.503 $\gamma = 1.583$ 2V(meas.) = ∼75° 2V(calc.) = 74°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 7.525(4)$ $b = 9.72(4)$ $c = 3.53(3)$ $\beta = 93°19'$ Z = 4

X-ray Powder Pattern: Anvil Points, ten miles west of Rifle, Garfield Co., Colorado, USA. 2.97 (100), 2.60 (90), 3.08 (25), 2.217 (18), 2.032 (18), 3.48 (15), 1.900 (15)

insol.	0.82	
Total	99.83	100.00

(1) Searles Lake, California, USA. (2) $NaHCO_3$.

Occurrence: A precipitate from hot springs; as efflorescences around saline lakes and in brines; formed at a late stage in differentiated alkalic massifs; as a solid in liquid inclusions in a variety of other mineral species.

Association: Trona, thermonatrite, thénardite, halite, gaylussite, burkeite, northupite, borax.

Distribution: In a Roman conduit at Stufe de Nerone, Campi Flegrei, near Naples, and on Vesuvius, Campania, Italy. In the USA, from Searles Lake, San Bernardino Co., California; abundant in the Green River Formation, Colorado and Utah, northwestern Colorado having estimated reserves of over 30 billion tons. In the Tincalayu deposit, Salar del Hombre Muerto, Salta Province, Argentina. Along the Ilmajok River and on Mt. Alluaiv, Lovozero massif, and at Tuliylukht Bay and on Mt. Kukisvumchorr, Khibiny massif, Kola Peninsula, Russia. Around Mt. Erebus, Victoria Land, Antarctica.

Name: From the composition, NaHCO-lite.

Type Material: National School of Mines, Paris, France, 17912.

Nahpoite Na_2HPO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. As elongate grains, to 4 μm; in powdery, earthy to compact porcelaneous masses.

Physical Properties: Hardness = Very soft; 1–3 if porcelaneous. D(meas.) = n.d. D(calc.) = 2.60 Extremely soluble in H_2O.

Optical Properties: Translucent. *Color:* White; colorless in transmitted light. *Luster:* Dull. *Optical Class:* [Biaxial.] *Orientation:* Length-fast, nearly parallel extinction. *Dispersion:* $r < v$, (synthetic). $\alpha = 1.490$ $\beta =$ n.d. $\gamma = 1.505$ 2V(meas.) = 80° (synthetic).

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. $a = 5.47(1)$ $b = 6.84(1)$ $c = 5.45(1)$ $\beta = 116.33(8)°$ Z = 2

X-ray Powder Pattern: Big Fish River area, Canada.
2.803 (100), 2.720 (70), 3.84 (55), 3.97 (45), 2.868 (30), 3.41 (25), 2.650 (15)

H_2O	[6.32]	6.35
Total	[99.53]	100.00

(1) Big Fish River area, Canada; colorimetric and AA analysis, H^{1+} calculated for charge balance.
(2) Na_2HPO_4.

Occurrence: An alteration product of marićite in nodules in phosphatic ironstone (Yukon Territory, Canada); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in differentiated alkalic massifs (Kola Peninsula, Russia).

Association: Marićite (Yukon Territory, Canada); natrophosphate, villiaumite (Kola Peninsula, Russia).

Distribution: From the Big Fish River area, Yukon Territory, and at Mont Saint-Hilaire, Quebec, Canada. On Mt. Karnasurt, Lovozero massif and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: For the principal chemical components, sodium, NAtrium, Hydrogen, Phosphorus, and Oxygen.

Type Material: University of Saskatchewan, Saskatoon, Canada, 12504.

Nakauriite $Cu_8(SO_4)_4(CO_3)(OH)_6 \cdot 48H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystals are fibers, to 3 mm, in sprays and aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 2.39(2) D(calc.) = 2.35

Optical Properties: Semitransparent. *Color:* Sky-blue.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = pale greenish blue; Z = pale sky-blue to very pale blue. *Orientation:* Positive elongation, parallel extinction. *Dispersion:* $r < v$. α = 1.585–1.597 β = 1.604–1.612 γ = 1.612–1.618 2V(meas.) = 60°–70° 2V(calc.) = 65.3°

Cell Data: *Space Group:* n.d. $a = 14.585$ $b = 11.47$ $c = 16.22$ Z = 2

X-ray Powder Pattern: Nakauri, Japan.
7.31 (100), 3.652 (20), 2.367 (16), 1.9148 (16), 4.840 (14), 3.936 (14), 2.397 (14)

Chemistry:

	(1)
SO_3	16.23
CO_2	2.28
Fe_2O_3	0.06
MnO	0.09
NiO	0.88
CuO	32.12
ZnO	0.03
H_2O^+	45.31
H_2O^-	3.01
Total	[100.01]

(1) Nakauri, Japan; by AA, CO_2 by volumetric analysis; after deduction of estimated 67% chrysotile, corresponds to $(Cu_{7.77}Ni_{0.23}Mn_{0.02})_{\Sigma=8.01}(SO_4)_{3.90}(CO_3)_{1.00}(OH)_{6.23} \cdot 48.4H_2O$.
(2) Material from Gabbs, Nevada and the Cedar Hill quarry, Pennsylvania, USA, and the Hagdale quarry, Scotland, contains only traces to no detectable SO_4.

Occurrence: As fracture fillings in serpentinite (Nakauri, Japan); on chromatite from serpentinite (Hagdale quarry, Scotland).

Association: Chrysotile, magnetite, artinite, pyroaurite, brochantite, malachite (Nakauri, Japan); callaghanite, hydromagnesite (Gabbs, Nevada, USA); antigorite, magnesite, talc, quartz (Cedar Hill quarry, Pennsylvania, USA); chrysotile, theophrastite, pentlandite, heazlewoodite (Hagdale quarry, Scotland).

Distribution: From an abandoned mine at Nakauri, about 6 km southeast of Shinshiro, Aichi Prefecture, Japan. In the USA, good crystals at the Gabbs mine, Gabbs district, Nye Co., Nevada; from the Cedar Hill quarry, Lancaster Co., Pennsylvania. In the Hagdale quarry, Unst, Shetland Islands, Scotland.

Name: For the original material found at Nakauri, Japan.

Type Material: National Science Museum, Tokyo, Japan, M-24586; National Museum of Natural History, Washington, D.C., USA, 136584.

Naldrettite Pd_2Sb

Crystal Data: Orthorhombic. *Point Group*: *mm*2. As irregular grains, to 239 μm. *Twinning*: Strain-induced polysynthetic twinning observed.

Physical Properties: *Cleavage:* None. *Tenacity:* Ductile (flexibly inelastic). *Fracture:* Irregular. Hardness = 4-5 VHN =393 (50 g load). D(meas.) = n.d. D(calc.) = 10.694

Optical Properties: Opaque. *Color:* Bright creamy white in plane-polarized reflected light, no internal reflections. *Birefringence:* Weak. *Pleochroism*: None. *Anisotropism*: Distinct in shades of deep bright blue, lemon-buff, and mauve to pale pink. *Streak:* n.d. *Luster:* Metallic.
Optical Class: n.d.
R_1-R_2: (470) 49.0-50.9 $(35.9\text{-}37.6)_{oil}$, (546) 53.2-55.1 $(40.3\text{-}42.1)_{oil}$, (589) 55.4-57.5 $(42.5\text{-}44.3)_{oil}$, (650) 58.5-60.1 $(45.4\text{-}47.2)_{oil}$

Cell Data: Space Group: $Cmc2_1$. a = 3.906(1) b = 17.5551(5) c = 6.957(2) Z = 8

X-ray Powder Pattern: Mesamax Northwest deposit, Ungava region, Québec, Canada.
2.2454 (100), 0.8584 (56), 2.0567 (52), 1.2122 (50), 1.2842 (42), 2.0009 (40), 2.3029 (35)

Chemistry:

	(1)	(2)
S	0.02	
Fe	0.11	
As	0.31	
Sb	35.75	36.39
Pd	63.49	63.61
Total	99.68	100.00

(1) Mesamax Northwest deposit, Ungava region, Québec, Canada; average of 69 electron microprobe analyses, corresponds to $(Pd_{1.995}Fe_{0.007})_{\Sigma=2.002}(Sb_{0.982}As_{0.014}S_{0.002})_{\Sigma=0.998}$. (2) Pd_2Sb.

Occurrence: In drill core through the contact zone between massive and disseminated sulfide mineralization hosted by amphibolite and serpentinite replacing pyroxenite and peridotite.

Association: Clinochlore monoclinic pyrrhotite, pentlandite, chalcopyrite, galena, sphalerite, cobaltite, magnetite, sudburyite, electrum, altaite, and more rarely ungavaite, sperrylite, michenerite, petzite, hessite.

Distribution: From the Mesamax Northwest deposit, Cape Smith Fold belt, Ungava region, Québec, Canada.

Name: Honors Professor Anthony J. Naldrett (b. 1933), University of Toronto and past President of both the Mineralogical Association of Canada and the International Mineralogical Association for significant contributions to our understanding of platinum-group element (PGE) deposits.

Type Material: Natural History Museum, London, England (BM 2004,34) and the Canadian Museum of Nature, Ottawa, Canada (CNMMN 84397).

(1) Irnimi deposit, Russia; by electron microprobe, average of six analyses, original total given as 101.16%; corresponds to $(Na_{1.01}Ca_{0.02}Sr_{0.01})_{\Sigma=1.04}(Mn_{0.93}Fe_{0.05}Mg_{0.02})_{\Sigma=1.00}(Si_{1.99}Al_{0.01}Ti_{0.01})_{\Sigma=2.01}O_6$. (2) Woods mine, Australia; by electron microprobe, average of five analyses; corresponds to $Na_{0.99}(Mn_{0.99}Fe_{0.03})_{\Sigma=1.02}Si_{1.99}O_6$.

Mineral Group: Pyroxene group.

Occurrence: In low-grade metamorphosed and highly oxidized Mn, Na-rich sediments.

Association: Taikanite, pectolite, manganoan amphiboles, manganoan orthoclase, manganoan vermiculite (Irnimi deposit, Russia); pectolite, potassic feldspar, braunite, quartz (Cerchiara mine, Italy); quartz, sérandite, aegirine, kôzulite (Woods mine, Australia).

Distribution: From the Irnimi deposit, Taikan Mountains, Khabarovsk Territory, Russia. In the Cerchiara mine, near Faggiona, Val di Vara, Liguria, Italy. From Australia, in the Hoskins mine, near Grenfell, and the Woods mine, 30 km north-northeast of Tamworth, New South Wales.

Name: For sodium, NAtrium; MANganese; and SILicon in the formula.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. Rarely as platy crystals, flattened on {100}, with {101} and {111}, to 2 mm, in "bowtie" or parallel aggregates; as radiating dendritic veinlets, spheres, and as rounded masses. *Twinning:* Common on {011}, interpenetrating and polysynthetic.

Physical Properties: *Cleavage:* On {001}, good. Hardness = 4.5–5 VHN = 473 (100 and 200 g loads). D(meas.) = 6.86(3) D(calc.) = 6.91

Optical Properties: Semitransparent. *Color:* Dark olive-green to greenish black.
Streak: Pistachio-green.
Optical Class: Biaxial (–). *Pleochroism:* Slight; X = pale yellowish green; Y = pistachio-green; Z = dark green. *Orientation:* $Z = b$; $X \wedge a \simeq 12°$. *Absorption:* $Z > Y > X$. $\alpha = > 2.10$ $\beta = > 2.10$ $\gamma = > 2.10$ 2V(meas.) = Moderate for red, very small for blue.

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. $a = 11.864(8)$ $b = 3.696(4)$ $c = 7.491(5)$ $\beta = 109°42(6)'$ Z = 2

X-ray Powder Pattern: Khorixas, Namibia.
3.018 (100), 3.574 (75), 5.58 (70), 2.672 (60), 3.284 (50), 3.525 (40), 2.611 (35)

Chemistry:

	(1)	(2)	(3)
V_2O_5	14.5	13.77	14.09
Bi_2O_3	74.1	72.24	72.19
CuO		12.03	12.32
Cu_2O	11.5		
H_2O		1.51	1.40
Total	100.1	99.55	100.00

(1) Khorixas, Namibia; by electron microprobe, average of three analyses. (2) Jáchymov, Czech Republic; $(OH)^{1-}$ and $(VO_4)^{3-}$ demonstrated present by IR; corresponds to $Cu_{0.98}(BiO)_{2.01}(VO_4)_{0.98}(OH)_{1.03} \bullet 0.03H_2O$. (3) $Cu(BiO)_2(VO_4)(OH)$.

Occurrence: A secondary mineral in bismuth-bearing hydrothermal polymetallic mineral deposits and granite pegmatites.

Association: Bismuth, bismutite, wittichenite, bismite, bismutostibiconite, bismutoferrite, clinobisvanite, pucherite, beyerite, schumacherite, mixite, eulytite, chrysocolla.

Distribution: From an undefined locality [Copper Valley,] near Khorixas, Namibia. In the USA, at the Stewart and White Queen mines, Pala district, San Diego Co., in the Lodi #4 mine, Spring Creek district, Plumas Co., and at Amboy, San Bernardino Co., California; from the Mica Lode mine, Eight Mile Park, Fremont Co., Colorado. In the Evans Lou quarry, near Wakefield Lake Quebec, Canada. From Morass Creek, north of Benambra, Victoria, and at the Iron Monarch quarry, Iron Knob, South Australia. At the Eliáš mine, Jáchymov (Joachimsthal), Czech Republic. From the Hechtsberg quarry, near Hausach, Black Forest, and in the Wolfgang Maassen mine, Schneeberg, Saxony, Germany. At Buckbarrow Beck, Cumbria, England.

Name: For the Namib Desert, along the coast of Namibia.

Type Material: The University, Leeds, England; University of Helsinki, Helsinki, Finland.

Namuwite $(Zn, Cu)_4(SO_4)(OH)_6 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. In flat platy hexagonal crystals, to 60 μm, or elongated trangular needles; typically aggregated into incrustations.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = 2 D(meas.) = 2.77 D(calc.) = 2.81

Optical Properties: Semitransparent. *Color:* Pale sea-green. *Streak:* Very pale green. *Luster:* Pearly.
Optical Class: Uniaxial, very low birefringence. $n = 1.577(5)$ ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P\overline{3}$. $a = 8.330(1)$ $c = 10.540(2)$ $Z = 2$

X-ray Powder Pattern: Aberllyn mine, Wales.
10.59 (100), 2.71 (42), 2.63 (41), 4.15 (25), 1.57 (23), 2.41 (22), 1.55 (20)

Chemistry:

	(1)	(2)	(3)
SO_3	14.9	13.73	14.04
CuO	22.0	23.48	13.16
ZnO	37.8	32.28	53.02
H_2O^+	13.4		
H_2O^-	11.1		
H_2O		[21.77]	[25.03]
Total	99.2	[91.26]	[105.25]

(1) Aberllyn mine, Wales; by AA, SO_3 and H_2O by TGA; corresponds to $(Zn_{2.50}Cu_{1.49})_{\Sigma=3.99}(SO_4)(OH)_6 \cdot 4.34H_2O$. (2) Smallcleugh mine, England; by electron microprobe, H_2O calculated for stoichiometry; corresponds to $(Zn_{2.30}Cu_{1.71})_{\Sigma=4.01}(SO_4)_{0.99}(OH)_{6.04} \cdot 4H_2O$. (3) Granetal, Germany; by electron microprobe, H_2O calculated for stoichiometry; corresponds to $(Zn_{3.28}Cu_{0.83})_{\Sigma=4.11}(SO_4)_{0.88}(OH)_{6.46} \cdot 4H_2O$.

Occurrence: An uncommon secondary mineral formed in the oxidized zone of hydrothermal Cu–Zn bearing mineral deposits; may be derived from metallic slags.

Association: Hydrozincite, schulenbergite, serpierite, ktenasite, devilline, gypsum.

Distribution: In Wales, from the Aberllyn lead mine, about two km from Bettws-y-coed, Llanrwst district, Gwynedd, and at the Frongoch mine, Dyfed. In England, from the Smallcleugh mine, Nenthead, Cumbria, and in the Waterbank mine, Ecton Hill, Staffordshire. In Germany, in the Harz Mountains, from Granetal, at the Glücksrad mine, near Oberschulenberg, and in slag at the Juliushütte, Astfeld; from the Friedrichssegen mine, near Bad Ems, and at Virneberg, near Rheinbreitbach, Rhineland-Palatinate; at Stolberg, near Aachen, North Rhineland-Westphalia. In the Veneziana mine, near Torrebelvicino, Vicenta, Italy. From the Kamariza mine, and in slag, at Laurium, Greece. At Tsumeb, Namibia. From the ZCA#4 mine, Balmat, St. Lawrence Co., New York, USA.

Name: For the NAtional MUseum of Wales, Cardiff, Wales, in the collection of which the type specimen was noted.

Type Material: National Museum of Wales, Cardiff, Wales, 27.111.GR414; The Natural History Museum, London, England, 1983,341; National Museum of Natural History, Washington, D.C., USA, 150334.

Nanlingite $CaMg_4(As^{3+}O_3)_2F_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$ or $\bar{3}\ 2/m$. Crystals rarely well-formed, tabular, with {0001} and {$h0\bar{h}l$}; commonly granular, to 0.2 mm, in dendritic aggregates.

Physical Properties: *Cleavage:* One, imperfect. Hardness = 2.3 VHN = 107
D(meas.) = 3.927 D(calc.) = 3.925

Optical Properties: Transparent. *Color:* Brownish red to dark brown when oxidized; deep red in transmitted light, with anomalous red interference colors. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.82$ $\epsilon = 1.78$

Cell Data: *Space Group:* $R3m$ or $R\bar{3}m$. $a = 10.24(5)$ $c = 25.76(5)$ Z = 15

X-ray Powder Pattern: Nan Ling area, China.
2.78 (10), 8.35 (9), 1.730 (8), 1.699 (8), 2.425 (7), 1.460 (7), 1.104 (6)

Chemistry:

	(1)	(2)

F	13.64	16.56
H_2O	0.60	
$-O = F_2$	5.74	6.97
Total	100.70	100.00

(1) Nan Ling area, China; by wet chemistry supplemented by spectrographic and semiquantitative electron microprobe; when recalculated to 100%, corresponds to $(Ca_{0.96}Na_{0.27})_{\Sigma=1.23}(Mg_{2.83}Fe^{3+}_{0.41}Li_{0.37}Al_{0.09}Mn_{0.01})_{\Sigma=3.71}(AsO_3)_{2.04}F_{3.28}(OH)_{0.30}O_{0.02}$. (2) $CaMg_4(AsO_3)_2F_4$.

Occurrence: Along a contact between greisenized granite and dolomitic limestone.

Association: Fluorite, fluoborite, zinnwaldite, magnesian dolomite, arsenopyrite, pyrrhotite, gahnite, nigerite.

Distribution: From an undisclosed locality [Shizhuyuan, Guangxi Province] in the Nan Ling area, southern China.

Name: For the locality, Nan Ling area, China.

Type Material: n.d.

(1) Nanping area, China; by combined wet chemical analysis and electron microprobe, TiO_2 0.002%, CaO 0.007%; corresponds to $(Cs_{0.88}K_{0.06}Rb_{0.01})_{\Sigma=0.95}(Al_{1.64}Mg_{0.22}Fe_{0.17}Li_{0.15})_{\Sigma=2.18}(Si_{3.16}Al_{0.84})_{\Sigma=4.00}O_{9.95}[(OH)_{1.79}F_{0.26}]_{\Sigma=2.05}$.

Polymorphism & Series: $2M_1$ polytype.

Mineral Group: Mica group.

Occurrence: In veinlets in the pollucite-rich middle zone of a muscovite-albite-spodumene pegmatite.

Association: Montebrasite, quartz, apatite.

Distribution: At an undefined locality in the Nanping area, Fukien Province, China.

Name: For its occurrence in the Nanping area, China.

Type Material: Institute of Mineral Deposits, Chinese Academy of Geological Sciences; National Museum of Geology, Beijing, China.

References: (1) Yueqing Yang, Yunxiang Ni, Liben Wang, Wenying Wang, Yaping Zhang, and Chenghu Chen (1988) Nanpingite–a new cesium mineral. Yanshi Kuangwuxue Zashi, 7, 49–58 (in Chinese with English abs.). (2) (1990) Amer. Mineral., 75, 708–709 (abs. ref. 1).

Nantokite CuCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Granular, massive.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Sectile. Hardness = 2.5
D(meas.) = 3.93–4.3; 4.136 (synthetic). D(calc.) = 4.22 Alters to paratacamite on exposure.

Optical Properties: Transparent to translucent. *Color:* Colorless, white; grayish to greenish on exposure; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Isotropic; may be anomalously anisotropic. $n = 1.930(5)$ (synthetic).

Cell Data: *Space Group:* $F\overline{4}3m$. $a = 5.407$ $Z = 4$

X-ray Powder Pattern: Synthetic.
3.127 (100), 1.915 (55), 1.633 (30), 1.243 (10), 2.710 (8), 1.1054 (8), 1.354 (6)

Chemistry:

	(1)	(2)	(3)

Cl	35.52	35.82	35.81
Total	99.69	100.10	100.00

(1) Nantoko, Chile. (2) Broken Hill, Australia. (3) CuCl.

Occurrence: A secondary mineral in hydrothermal copper-bearing deposits; rarely in volcanic sublimates.

Association: Cuprite, copper, atacamite, paratacamite, claringbullite, cerussite, hematite.

Distribution: In the Carmen Bajo mine, Pintada Mountain, near Nantoko, Copiapó district, Atacama, Chile. From Broken Hill, New South Wales, and at the Wewak, Magpie, and Great Australia mines, Cloncurrie, Queensland, Australia. In the Malanjkhand copper deposit, north of Durg, Madhya Pradesh, India. From the Tolbachik volcano, Kamchatka Peninsula, Russia. At Dzhezkazgan, Kazakhstan. From the Levant mine, St. Just, Cornwall, England. Along Baratti Beach, Tuscany, Italy, in slag. In the USA, at Bisbee, Cochise County, Arizona, and in the Steeple Rock district, Grant Co., New Mexico. From the Ojuela mine, Mapimí, Durango, Mexico.

Name: For its occurrence near Nantoko, Chile.

Type Material: Mining Academy, Freiberg, Germany, 12012.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 18–19. (2) (1955) NBS Circ. 539, 4, 35–36.

Naquite FeSi

Crystal Data: Cubic. *Point Group*: 23. As irregular grains to 0.1 mm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6.5
D(meas.) = n.d. D(calc.) = 6.186

Optical Properties: Opaque. *Color*: Steel-gray. *Streak*: Grayish black. *Luster*: Metallic.
Optical Class: n.d.
R: (470) 40.6, (546) 42.23, (589) 41.6, (650) 42.5

Cell Data: *Space Group*: $P2_13$. a = 4.486(4) Z = 4

X-ray Powder Pattern: Luobusha mining district, Qusong County, Tibet, China.
2.374 (100), 5.163 (92), 1.851 (79), 1.899 (47), 1.087 (25) 1.774 (16), 1.708 (12)

Chemistry:

	(1)	(2)
Fe	65.65	66.54
Si	32.57	33.46
Al	1.78	.
Total	100.00	100.00

(1) Luobusha mining district, Qusong County, Tibet, China; average of 4 electron microprobe analyses; corresponding to $(Fe_{0.994}Al_{0.054})_{\Sigma=1.02}Si_{0.952}$. (2) FeSi.

Occurrence: In the heavy mineral fraction of a podiform chromitite deposit in the peridotite of an ophiolitic harzburgite. Likely the product of a strongly reducing environment and possibly are xenocrysts derived from a mantle source.

Association: Luobusaite.

Distribution: In a heavy mineral fraction from ore body 31, Group II of the Luobusha ("Luobusa") mining district, 200 km southeast of Lhasa, Qusong County, Shannan Prefecture, Tibet, People's Republic of China. From placers and drill-core samples from the Poltava series, Ukraine.

Name: For Naqu (Nagchu) Prefecture, Tibet, near the locality that produced the first samples.

Type Material: Geological Museum of China, Beijing, People's Republic of China (M11798).

References: (1) Li, G., N. Shi, M. Xiong, Z. Ma, W. Bai, and Q. Fang (2012) Naquite, FeSi, a new mineral species from Luobusha, Tibet, western China. Acta Geologica Sinica, 86(3), 553-538.

Fe_2O_3	6.30	5.55	H_2O	0.29	
MnO	0.47	0.20	$-O = F_2$	0.30	0.58
			Total	99.74	100.81

(1) Narssârssuk, Greenland. (2) Do.; by electron microprobe, total Fe as Fe_2O_3; corresponds to $(Na_{1.92}K_{0.01})_{\Sigma=1.93}(Ti_{0.66}Fe^{3+}_{0.27}Zr_{0.02}Mn_{0.01})_{\Sigma=0.96}(Si_{4.07}Al_{0.04})_{\Sigma=4.11}(O_{10.72}F_{0.28})_{\Sigma=11.00}$.

Occurrence: In pegmatite (Narssârssuk, Greenland); in quartz veins in syenite intruding limestone (Sweetgrass Hills, Montana, USA); in hornfels, igneous breccia, and marble xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Aegirine, microcline, albite, elpidite, epididymite, taeniolite, quartz (Narssârssuk, Greenland); aegirine, pectolite, calcite, feldspar, galena, quartz (Sweetgrass Hills, Montana, USA).

Distribution: From Narssârssuk; on the Island of Igdlutalik, in the Ilímaussaq intrusion; and in the Werner Berge complex, Greenland. On Mt. Flora, Lovozero massif, Kola Peninsula; in the Murun massif, southwest of Olekminsk, Yakutia; and other less-well-defined localities in Russia. In the Oslofjord, Norway. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From near Whitlash, Sweetgrass Hills, Sweetgrass Co., Montana; in the Diamond Jo quarry, Magnet Cove, Hot Spring Co., and from Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA. At Mont Saint-Hilaire, Quebec, Canada. From Gouré, Damagaram, Niger. In the Sirwa massif, north of Ouarzazate, Morocco.

Name: For the Greenland locality at Narssârssuk (Narsarsuk).

Type Material: University of Copenhagen, Copenhagen, Denmark.

Nasinite $Na_2B_5O_8(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Tiny crystals and microcrystalline clusters, in earthy masses.

Physical Properties: Hardness = n.d. D(meas.) = 2.2 D(calc.) = 2.134

Optical Properties: Semitransparent. *Color:* White to yellow, yellow-orange. *Optical Class:* Biaxial (–) (synthetic). *Orientation:* $Y = b$; $Z \wedge a = 6.8(1)°$ [*sic*]. $\alpha = 1.494$ $\beta = 1.512$ $\gamma = 1.524$ 2V(meas.) = 66.8(7)° 2V(calc.) = 77.4°

Cell Data: *Space Group:* $Pna2_1$ (synthetic). $a = 12.015(2)$ $b = 6.518(1)$ $c = 11.173(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
6.00 (100), 5.29 (92), 2.897 (65), 2.999 (45), 2.648 (26), 2.531 (18), 2.207 (18)

Chemistry: (1) Larderello, Italy; identity depends on the chemical analysis of a mixture with biringuccite, and the correspondence of lines in the mixture's X-ray powder pattern with those of synthetic material.

Occurrence: As scales on piping in a geothermal field.

Association: Biringuccite, thénardite, orpiment, quartz.

Distribution: From Larderello, Val di Cecina, Tuscany, Italy.

Name: To honor Rafaello Nasini (1854–1931), Italian chemist.

Type Material: University of Florence, Florence, Italy, 16803/G; National Museum of Natural History, Washington, D.C., USA, 163785.

Nasledovite $PbMn_3^{2+}Al_4O_5(CO_3)_4(SO_4)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Radial fibrous, forming oölites, to 3 mm.

Physical Properties: Hardness = 2 D(meas.) = 3.069 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Snow-white, commonly covered by dark brown to reddish material. *Luster:* Silky.
Optical Class: Biaxial (?). *Orientation:* $Z \wedge c = 2°–23°$, wavy extinction. α = n.d. β = n.d. $\gamma = 1.591$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Sardob deposit, Tajikistan.
3.261 (10), 2.028 (6), 2.019 (6), 1.462 (6), 2.853 (5), 2.983 (4), 1.749 (4)

Chemistry:

	(1)	(2)
SO_3	4.76	8.12
CO_2	19.08	17.85
Al_2O_3	20.40	20.68
Fe_2O_3	1.39	
MnO	15.46	21.58
ZnO	0.76	
PbO	24.35	22.64
MgO	3.68	
H_2O	10.12	9.13
Total	[100.00]	100.00

(1) Sardob deposit, Tajikistan; recalculated to 100% after deduction of SiO_2 1.58%, MnO_2 2.04%, and H_2O^- 0.60 % from an original total of 100.84%; then corresponds to $Pb_{1.03}(Mn_{2.05}Mg_{0.87}Zn_{0.08})_{\Sigma=3.00}(Al_{3.77}Fe_{0.17})_{\Sigma=3.94}(CO_3)_{4.08}(SO_4)_{0.56}O_{5.30}\cdot 5.27H_2O$. (2) $PbMn_3Al_4O_5(CO_3)_4(SO_4)\cdot 5H_2O$.

Occurrence: A rare fracture filling in oxidized granodiorite porphyry which also hosts polymetallic ores.

Association: Pyrolusite, iron oxide, cerussite.

Distribution: From the Sardob deposit, eastern Altyn-Topkan district, Kuramin Mountains, northern Tajikistan. [??ck not Chatkal-Kuramin Mountains, Uzbekistan??]

Name: To honor Professor Boris Nikolaevich Nasledov (1885–1942), geologist, for his investigations of the mineral resources of the Chatkal-Kuramin region, Kyrgyzstan-Uzbekistan.

Type Material: n.d.

Nasonite $Pb_6Ca_4Si_6O_{21}Cl_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m$. Rare crystals are prismatic with $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, terminated by $\{10\bar{1}1\}$; commonly granular, massive.

Physical Properties: *Cleavage:* Good on {0001}; indistinct prismatic. Hardness = 4
D(meas.) = 5.42–5.55 D(calc.) = 5.63

Optical Properties: Transparent to translucent. *Color:* White, rarely yellow or blue-green, probably as the result of impurities. *Luster:* Greasy to adamantine.
Optical Class: Uniaxial (+). $\omega = 1.913$–1.946 $\epsilon = 1.923$–1.963

Cell Data: *Space Group:* $P6_3/m$. $a = 10.08$ $c = 13.27$ $Z = 2$

X-ray Powder Pattern: Långban, Sweden. (ICDD 14-328).

(1) Franklin, New Jersey, USA. (2) Do.; by electron microprobe, original total given as 99.9%; corresponding to $Pb_{6.00}Ca_{4.42}Si_{5.64}O_{21}Cl_2$.

Occurrence: A rare mineral, formed under hydrothermal conditions, cutting franklinite-willemite ore in a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA); in calcite-filled veins in a metamorphosed Fe–Mn deposit (Långban, Sweden).

Association: Clinohedrite, barysilite, datolite, prehnite, willemite, axinite, hancockite, garnet, manganophyllite (Franklin, New Jersey, USA); manganoan diopside, manganoan aegirine, lead, apophyllite, margarosanite, thaumasite (Långban, Sweden).

Distribution: In the USA, at Franklin, Sussex Co., New Jersey, and at Crestmore, Riverside Co., California. From Långban and Jakobsberg, Värmland, Sweden.

Name: For Frank Lewis Nason (1856–1928), American geologist, Geological Survey of New Jersey, USA.

Type Material: Yale University, New Haven, Connecticut, USA, 2.4192, 2.4193.

Nastrophite $Na(Sr,Ba)PO_4 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. As cubic crystals, to 1 cm; in irregular aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼2 D(meas.) = 2.05 D(calc.) = 2.03 Partially dehydrates under ambient conditions; partially dissolves in hot H_2O.

Optical Properties: Semitransparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Isotropic. $n = 1.502(1)$

Cell Data: *Space Group:* $P2_13$. $a = 10.559(1)$ $Z = 4$

X-ray Powder Pattern: Lovozero massif, Kola Peninsula, Russia. 2.54 (10), 4.67 (9), 5.21 (8), 3.49 (5), 1.953 (5), 3.69 (4), 1.918 (4)

Chemistry:

	(1)
P_2O_5	19.04
CaO	0.41
SrO	22.19
BaO	8.17
Na_2O	8.21
K_2O	0.05
H_2O	40.52
insol.	1.64
Total	100.23

(1) Mt. Alluaiv, Kola Peninsula, Russia; K, Na, Ca by flame photometry, insoluble = aegirine, PO_4 and H_2O confirmed by IR; separate determination of H_2O on fully hydrated material gives 43.5%, then corresponding to $Na_{0.98}(Sr_{0.79}Ba_{0.20}Ca_{0.03})_{\Sigma=1.02}P_{1.00}O_4 \cdot 8.96H_2O$.

Occurrence: In pegmatitic veinlets in cancrinite and nepheline syenites.

Association: Vuonnemite, steenstrupine-(Ce), ilmajokite, mountainite (Mt. Karnasurt, Kola Peninsula, Russia); K-feldspar, sodalite, analcime, natrolite, davyne, aegirine (Mt. Alluaiv, Kola Peninsula, Russia).

Distribution: On Mts. Karnasurt and Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For sodium, NAtrium, STROntium, and PHosphorus in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5529; Mining Institute, St. Petersburg, 1194/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81405; The Natural History Museum, London, England, 1994,16.

Natalyite $Na(V^{3+},Cr^{3+})Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As grains, to 1 mm, commonly acicular to asbestiform ‖ [001], showing {110}, and {100} or {010}.

Physical Properties: *Cleavage:* {110}, distinct; parting on {001}. Hardness = ~7 VHN = 1013–1079 (50 g load). D(meas.) = n.d. D(calc.) = 3.55

Optical Properties: Translucent. *Color:* Bright green with a tinge of yellow; in transmitted light, emerald-green to yellow. *Streak:* Green. *Luster:* Vitreous to silky. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = greenish yellow to yellow; $Y = Z$ = emerald-green. $\alpha = 1.741(2)$ $\beta = 1.762(3)$ $\gamma = 1.762(3)$ 2V(meas.) = 8°–12°

Cell Data: *Space Group:* $C2/c$. $a = 9.58(1)$ $b = 8.72(1)$ $c = 5.27(1)$ $\beta = 107.16°$ Z = 4

X-ray Powder Pattern: Slyudyanka complex, Russia.
2.96 (10), 2.52 (10), 2.87 (8), 1.391 (8b), 2.46 (7), 6.24 (6), 4.36 (6)

Chemistry:

	(1)
SiO_2	53.15
TiO_2	0.11
Al_2O_3	0.75
V_2O_3	17.97
Cr_2O_3	12.23
MgO	1.28
CaO	1.78
Na_2O	12.65
Total	99.92

(1) Slyudyanka complex, Russia; by electron microprobe, average of five analyses; corresponds to $(Na_{0.92}Ca_{0.07})_{\Sigma=0.99}(V_{0.54}Cr_{0.36}Mg_{0.07}Al_{0.03})_{\Sigma=1.00}Si_{1.99}O_6$.

Mineral Group: Pyroxene group.

Occurrence: In Cr, V-rich diopside-quartz rocks that are part of a Precambrian metamorphic complex (Slyudyanka complex, Russia).

Association: Eskolaite–karelianite, uvarovite–goldmanite, chromian vanadian tourmaline, pyrite, apatite, diopside (Slyudyanka complex, Russia).

Distribution: From the Pereval marble quarry, near Slyudyanka, Lake Baikal, Siberia, Russia. On the Zaonezhki Peninsula, southern Karelia.

Name: In honor of the geologist Nataliya Vasil'evna Frolova (1907–1960), geologist, Irkutsk University, Irkutsk, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Natanite $Fe^{2+}Sn^{4+}(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals, to 3 mm, in irregular aggregates; massive.

Physical Properties: Hardness = 4.7 VHN = 315 D(meas.) = n.d. D(calc.) = 4.035

Optical Properties: Semitransparent. *Color:* Greenish brown; dark gray in reflected light.
Luster: Vitreous.
Optical Class: Isotropic. $n = 1.755$

Cell Data: *Space Group:* $Pn3m$. a = 7.69(1) Z = 4

X-ray Powder Pattern: Mushiston deposit, Tajikistan.
1.710 (10), 3.729 (9), 1.563 (7.5), 2.709 (7), 2.221 (5), 1.031 (4), 1.920 (3)

Chemistry:

	(1)	(2)
Sn	43.6	42.92
Fe	19.8	20.19
OH	36.3	36.89
Total	99.7	100.00

(1) Mushiston deposit, Tajikistan; by electron microprobe, average of three analyses; corresponding to $Fe_{0.99}Sn_{1.03}(OH)_{5.98}$. (2) $FeSn(OH)_6$.

Mineral Group: Schoenfliesite group.

Occurrence: Formed by oxidation of earlier tin sulfides in tin deposits.

Association: Stannite, vismirnovite, malachite, azurite, goethite (Mushiston deposit, Tajikistan); hocartite (Chat-Karagai deposit, Russia); nevskite, wolframite, cassiterite, laitakarite, guanajuatite (Nevskoye deposit, Russia); ilvaite, fluorite, jeanbandyite, pyrrhotite, siderite, quartz (Santa Eulalia, Mexico).

Distribution: In the Trudov tin deposit, Sarydzhaz Range, near Inyl'chek, and in the Chat-Karagai tin deposit, Tallas Alatan, Kyrgyzstan. From the Mushiston tin deposit, Kaznok Valley, Zeravshan Range, Tajikistan. In the Nevskoye W–Sn deposit, 25 km northwest of Omsukchan, Magadan region, Russia. In the El Potosi and San Antonio mines, Santa Eulalia, Chihuahua, Mexico. From Llallagua, Bolivia.

Name: Honors Professor Natan (Antolii) Il'ich Ginzburg (1917–1984), mineralogist and geologist, All-Union Research Institute of Mineral Resources, Moscow, Russia, student of oxidized tin deposits.

Type Material: Mining Institute, St. Petersburg, 1988/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81651.

TiO_2	38.93	39.62
Nb_2O_5	0.72	0.18
Ta_2O_5	0.12	
FeO	0.52	1.35
MnO	0.31	0.37
Na_2O	30.32	29.47
Total	100.69	100.13

(1) Lovozero massif, Russia; by electron microprobe, average of analyses of four grains; corresponding to $Na_{1.99}(Ti_{0.99}Mn_{0.01}Fe_{0.01}Nb_{0.01})_{\Sigma=1.02}Si_{1.01}O_5$. (2) Do.; by electron microprobe.

Polymorphism & Series: Dimorphous with paranatisite.

Occurrence: In natrolite-ussingite veins cutting alkalic rocks in a differentiated alkalic massif.

Association: Chkalovite, aegirine, vuonnemite.

Distribution: On Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: For sodium, NAtrium, TItanium, and SIlicon in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3393; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; The Natural History Museum, London, England, 1994,16.

Natrite Na_2CO_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crystals, to 1 cm; in veinlets, lenses, and dense granular masses. *Twinning:* Finely polysynthetic, probably due to a phase change.

Physical Properties: *Cleavage:* Perfect on {001}, good on {100}, {110}. Hardness = 3.5 D(meas.) = 2.54 D(calc.) = 2.55 Soluble in H_2O, yielding a strongly alkaline solution; surficially alters rapidly in air to thermonatrite.

Optical Properties: Transparent. *Color:* Colorless to pale yellow or pale rose if fresh, becoming grayish white on exposure. *Luster:* Vitreous to dull on exposure.
Optical Class: Biaxial (–). *Orientation:* $Y \simeq b$. $\alpha = 1.410(2)$ $\beta = 1.535(2)$ $\gamma = 1.543(2)$
2V(meas.) = 28°

Cell Data: *Space Group:* $C2/m$. $a = 8.905(4)$ $b = 5.237(3)$ $c = 6.045(2)$
$\beta = 101.32(1)°$ Z = 4

X-ray Powder Pattern: Mt. Karnasurt, Kola Peninsula, Russia.
2.962 (100), 2.366 (70), 2.545 (60), 2.602 (40), 2.254 (35), 2.175 (35), 2.621 (30)

Chemistry:

	(1)	(2)
CO_2	42.92	41.52
Na_2O	57.08	58.48
Total	[100.00]	100.00

(1) Mt. Karnasurt, Kola Peninsula, Russia; CO_2 by gravimetry, Na_2O by flame photometry; H_2O proven absent by IR, recalculated to 100% after deduction of H_2O 3.7% from admixed thermonatrite; corresponds then to $Na_{1.92}C_{1.02}O_3$. (2) Na_2CO_3.

Occurrence: Locally abundant in deep drillholes in pegmatites occurring in differentiated alkaline massifs (Kola Peninsula, Russia); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Thermonatrite, vinogradovite, shortite, pirssonite, gaylussite, nacaphite, natrosilite, villiaumite, neighborite, rasvumite, lomonosovite, pectolite, sodalite, fluorcaphite, many other minerals.

Distribution: In Russia, on the Kola Peninsula, on Mt. Karnasurt, Lovozero massif; in the Khibiny massif, on Mt. Rasvumchorr; near the Olenii stream; on Mt. Koashva; and on Mt. Restin'yun. At Mont Saint-Hilaire, Quebec, Canada.

Name: For sodium, *natrium*, the sole cation in the chemical formula of the mineral.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5710/1; Mining Institute, St. Petersburg, 1200/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82761.

(1) National Belle mine, Colorado, USA. (2) Matanumad, India; remnant SiO_2 0.09%, TiO_2 0.10%, MnO 0.01%, CaO 0.06%, MgO 0.01%; stated to correspond to $(Na_{0.96}K_{0.04})_{\Sigma=1.00}(Al_{2.98}Fe^{3+}_{0.02})_{\Sigma=3.00}(SO_4)_2(OH)_6$. (3) $(Na,K)Al_3(SO_4)_2(OH)_6$ with Na:K = 1:1.

Polymorphism & Series: Forms a series with alunite.

Mineral Group: Alunite group.

Occurrence: Less common than alunite, formed by solfataric or hydrothermal sulfate-bearing solutions reacting with clays, rarely with sillimanite; may be in laterites and as an authigenic sedimentary mineral.

Association: Alunite, kaolinite, halloysite, sillimanite, quartz.

Distribution: In the USA, from the National Belle mine, Red Mountain district, Ouray Co., and in the Rosita Hills, Custer Co., Colorado; at Sugarloaf Butte, near Quartzsite, La Paz Co., Arizona; in Carlsbad Cavern and Lechuguilla Cave, Eddy Co., New Mexico; on Desert Strip, Molokai, Hawaiian Islands. In the Ugusu mine and at Shirakawa, Shizuoka Prefecture, and from Sonomi, Makurazaki, Kagoshima Prefecture, Japan. In the Tatum copper deposit and Chinkuashi Cu–Au deposit, Taiwan. At Kalgoorlie and Kanowna, Western Australia; from Coober Pedy, South Australia. On Ruapahu volcano and Mount Taranaki, New Zealand. From Matanumad, 110 km northwest of Bhuj, Gujarath State, India. On the Gemsa Peninsula, Egypt. At Šaca, Košice district, Slovakia. In the Blyava deposit, Southern Ural Mountains, Russia. Found in the Hotson 6 quarry, Koenabib, west of Pofadder, Cape Province, South Africa.

Name: As the sodium, *natrium*, analog of *alunite*.

Natroapophyllite $NaCa_4Si_8O_{20}F \cdot 8H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As composite crystals, euhedral to subhedral, to 1 mm, with prismatic {100} and truncated by {111}, striated $\perp$ [001].

Physical Properties: *Cleavage:* Perfect on {001}, poor on {110}. Hardness = 4–5
D(meas.) = 2.50, including contaminants. D(calc.) = 2.30

Optical Properties: Transparent to translucent. *Color:* Colorless to white, brownish yellow to yellowish brown; colorless in thin section. *Streak:* Light gray. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (+). *Dispersion:* $r < v$. $\alpha = 1.536(2)$ $\beta = 1.538(2)$ $\gamma = 1.544(2)$
2V(meas.) = 32(1)°

Cell Data: *Space Group:* $Pnnm$ or $Pnn2$. a = 8.875(4) $b = 8.881(6)$ $c = 15.79(1)$
Z = 2

X-ray Powder Pattern: Sampo mine, Japan.
3.96 (100), 2.98 (63), 2.48 (24), 7.83 (20), 4.54 (19), 7.77 (18), 2.50 (18)

$-O = F_2$	0.96
Total	[100.00]

(1) Sampo mine, Japan; by electron microprobe, H_2O by difference; corresponds to $(Na_{0.90}K_{0.06})_{\Sigma=0.96}Ca_{4.13}Si_8O_{20.07}F_{1.09} \cdot 8.6H_2O$.

Occurrence: In skarns, banded between granite and marble, of a contact metamorphic mineral deposit.

Association: Zeophyllite, cuspidine, apophyllite, calcite, andradite, xonotlite, wollastonite, clinopyroxene, magnetite, quartz, bismuth.

Distribution: At the Sampo mine, 10 km west of Takahashi, Okayama Prefecture, Japan.

Name: For sodium, *natrium*, in the composition, and its relation to other *apophyllite* species.

Type Material: National Science Museum, Tokyo, M21067; Institute of Mining Geology, Akita University, Akita, Japan; National Museum of Natural History, Washington, D.C., USA, 136398.

Mineral Group: Pyrochlore group.

Occurrence: Replacing bismutotantalite in museum samples from a granite pegmatite.

Association: Bismutotantalite, microlite, pucherite, clinobisvanite, bismuth oxides.

Distribution: From near Koktokay, Sinkiang-Uighur Autonomous Province [Kyokfogoi, Xinjiang Uygur Autonomous Region], China.

Name: For sodium, NATRium, BISmuth, and TANTalum in the composition [deviant from IMA pyrochlore nomenclature].

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Natrochalcite $NaCu_2(SO_4)_2(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Steep pyramidal crystals, with large {111}, truncated by {001}, {110}, many smaller forms, to 1 cm; commonly cross-vein fibrous.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = 4.5 D(meas.) = 3.49(2) D(calc.) = 3.54 Slightly soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Bright emerald-green. *Streak:* Pale greenish. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = -12°$. *Dispersion:* $r < v$, strong, slightly inclined. $\alpha = 1.649$ $\beta = 1.655$ $\gamma = 1.714$ 2V(meas.) = 36°48′

Cell Data: *Space Group:* $C2/m$ (synthetic). $a = 8.809(1)$ $b = 6.187(1)$ $c = 7.509(1)$ $\beta = 118.74(1)°$ Z = 2

X-ray Powder Pattern: Chuquicamata, Chile. (ICDD 19-1189).
2.797 (10), 6.57 (8), 3.44 (8), 2.522 (8), 3.20 (7), 4.82 (6), 2.302 (6)

Chemistry:

	(1)	(2)
SO_3	42.42	43.01
CuO	42.01	42.74
Na_2O	7.98	6.99
H_2O	7.71	7.26
Total	100.12	100.00

(1) Chuquicamata, Chile. (2) $NaCu_2(SO_4)_2(OH)\cdot H_2O$.

Mineral Group: Tsumcorite group.

Occurrence: A rare mineral typically formed in an arid climate in the oxidized zone of copper deposits.

Association: Kröhnkite, antlerite, brochantite, chalcanthite, blödite, atacamite, gypsum (Chuquicamata, Chile); kröhnkite, brochantite (Capo Calamita, Italy).

Distribution: In Chile, from Chuquicamata, at the Fortuna mine, east of Baquedano, and from the Santiagina mine, Sierra Gorda, southwest of Calama, Antofagasta. At Capo Calamita, Elba, Italy.

Name: From the Latin for sodium, *natrium*, and the Greek for copper, *chalkos*, in the composition.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 97537, 97538.

Natrodufrénite $Na(Fe^{3+},Fe^{2+})(Fe^{3+},Al)_5(PO_4)_4(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $[2/m]$ (by analogy to dufrénite). As radially fibrous spherulites, to 5 mm, may be in warty nodules.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.20(5) D(calc.) = 3.23

Optical Properties: Translucent. *Color:* Greenish brown. *Streak:* Green. *Optical Class:* Biaxial (+). *Pleochroism:* X = pale yellow; Z = dark green. *Orientation:* Positive elongation. $\alpha = 1.765(5)$ (α') β = n.d. $\gamma = 1.775(5)$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $[C2/c]$ (by analogy to dufrénite). $a = 25.83(2)$ $b = 5.150(3)$ $c = 13.772(9)$ $\beta = 111°32'$ Z = 4

X-ray Powder Pattern: Rochefort-en-Terre, France; close to dufrénite. 3.152 (100), 12.04 (80), 3.400 (80), 3.204 (80), 5.040 (60), 4.124 (50), 2.989 (50)

Chemistry:

	(1)
P_2O_5	32.67
Al_2O_3	5.51
Fe_2O_3	46.21
FeO	0.42
CaO	0.14
Na_2O	2.36
H_2O^+	13.04
Total	100.35

(1) Rochefort-en-Terre, France; Na, Al, Ca by AA, P, Fe by colorimetry, H_2O by the Penfield method; thought to correspond to $[Na_{0.63}(H_2O)_{0.35}Ca_{0.02}]_{\Sigma=1.00}(Fe^{3+}_{0.67}Fe^{2+}_{0.05})_{\Sigma=0.72}(Fe^{3+}_{4.11}Al_{0.89})_{\Sigma=5.00}[(PO_4)_{3.80}(H_4O_4)_{0.20}]_{\Sigma=4.00}[(OH)_{5.56}(H_2O)_{0.44}]_{\Sigma=6.00} \cdot 2H_2O$.

Occurrence: A low-temperature secondary mineral.

Association: Cyrilovite, goethite.

Distribution: From Rochefort-en-Terre, Morbihan, France. At the Pinilla de Fermoselle pegmatite, Zamora, Spain. In Australia, at the Mt. Oxide mine, Mt. Isa district, Queensland; in the Lake Boga granite quarry, near Swan Hill, Victoria; and at Broken Hill, New South Wales. From the Lone Star copper deposit, Safford district, Graham Co., Arizona, USA.

Name: For essential sodium, *natrium*, and its relation to *dufrénite*.

Type Material: Natural History Museum, Paris, 106384, 106385; National School of Mines, Paris, France, 18329.

Polymorphism & Series: Trimorphous with nyerereite and zemkorite.

Occurrence: In a carbonatite complex, at depths below 70 m.

Association: Calcite, burbankite.

Distribution: From the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia.

Name: As the sodium, *natrium*, analog of *fairchildite*.

Type Material: n.d.

References: (1) Kapustin, Y.L. (1971) Mineralogy of carbonatites [sodium-fairchildite]. Izdat. "Nauka", Moscow, 181–183 (in Russian). (2) (1975) Amer. Mineral., 60, 488 (abs. ref. 1).

Natrojarosite $NaFe_3^{3+}(SO_4)_2(OH)_6$

ⓒ2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals, to 1 mm, are typically pseudocubic, $\{01\bar{1}2\}$, may be flattened on {0001} to give a hexagonal shape; typically in earthy crusts, pulverulent masses, and as a powder.

Physical Properties: *Cleavage:* Perfect on {0001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 3.11–3.18 D(calc.) = 3.29

Optical Properties: Transparent to translucent. *Color:* Bright yellow, golden brown, cinnamon-brown. *Luster:* Vitreous.
Optical Class: Uniaxial (–); may exhibit sectored anomalous birefringence. *Pleochroism:* O = pale yellowish; E = nearly colorless. $\omega = 1.832(5)$ $\epsilon = 1.750(5)$

Cell Data: *Space Group: R*3*m*. $a = 7.327$–7.34 $c = 16.634$–16.72 $Z = 3$

X-ray Powder Pattern: Gypsum Spring anticline, Carbon Co., Montana, USA.

(1) Kundip, Western Australia; corresponding to $(Na_{0.94}K_{0.06})_{\Sigma=1.00}Fe_3(SO_4)_2(OH)_6$. (2) Tintic Standard mine, Dividend, Utah Co., Utah, USA; by electron microprobe, H_2O by difference; corresponds to $Na_{1.09}Fe_{2.95}(SO_4)_{2.00}(OH)_{5.88}$. (3) $NaFe_3(SO_4)_2(OH)_6$.

Polymorphism & Series: Forms a series with jarosite.

Mineral Group: Alunite group.

Occurrence: Formed typically in the oxidized zone of mineral deposits by alteration of pyrite in the presence of sodium; rarely as a volcanic sublimate.

Association: Gypsum, alunite, jarosite, plumbojarosite.

Distribution: In small amounts at many localities. In the USA, on the east side of Soda Springs Valley, Mineral Co., and at Gilbert, 40 km east of Mina, Esmeralda Co., Nevada; at Cook's Peak, Luna Co., New Mexico; on the Georgia Sunset claim, about 6 km south of Kingman, Mohave Co., Arizona; in the Tintic district, Juab Co., Utah; from Palos Verdes, Los Angeles Co., California; at the Buxton mine, Lawrence Co., Kansas. Along Rapid Creek, Yukon Territory, Canada. In the San Toy mine, Santa Eulalia, Chihuahua, Mexico. From Chuquicamata, Antofagasta, Chile. In Spain, at the Rio Tinto mine, Huelva Province. From the Wanthwaite mine, St. John-in-the-Vale, Cumbria, England. On Valachov Hill, near Skřivaň, and at Jáchymov (Joachimsthal), Czech Republic. From Modum, Norway. At Pavlodar, Kazakhstan. On volcanos along the Kamchatka Peninsula, Russia. In South Australia, at Boolcoomatta, and from Kundip, Philips River goldfield, Western Australia.

Name: As the sodium, *natrium*, analog of *jarosite*.

Total	100.19

(1) Puy de Marman, France; corresponds to $(Na_{1.88}K_{0.02}Ca_{0.01})_{\Sigma=1.91}Al_{2.03}Si_{3.00}O_{10}\cdot 1.99H_2O$.

Polymorphism & Series: Dimorphous with tetranatrolite.

Mineral Group: Zeolite group.

Occurrence: In cavities in amygdaloidal basalts and related igneous rocks, one of the last minerals to form; fills seams in granite, gneiss, and syenite.

Association: Zeolites, calcite, nepheline, sodalite, quartz.

Distribution: Many localities, even for fine crystals. From the Höwenegg quarry, Hegau, Baden-Württemberg, Germany. At Puy de Marman, near Veyre, Puy-de-Dôme, France. In the Dean quarry, St. Keverne, Lizard Peninsula, Cornwall, England. At White Head, Co. Antrim, Ireland. From the Langesundsfjord and Tvedalen areas, Norway. In the Khibiny and Lovozero massifs, Kola Peninsula, Russia, large crystals. In the USA, at Bergen Hill, Hudson Co., at Prospect Park, Passaic Co., and in the Chimney Rock quarry, Bound Brook, Passaic Co., New Jersey; from north of Livingstone, Park Co., Montana; around Springfield, Lane Co., Oregon; and at the Gem mine, San Benito Co., California, USA. In Canada, huge crystals from the Johnston asbestos mine, near Thetford, and from Mont Saint-Hilaire, Quebec; in the Bay of Fundy district, Nova Scotia; and along the Ice River, British Columbia.

Name: From the Latin *natron*, for the sodium content.

Natromontebrasite $(Na, Li)Al(PO_4)(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Anhedral to rough crystals, showing {001}, {010}, {100}, {$1\overline{2}0$}, {$0\overline{2}1$}, {$\overline{1}01$}, to 15 cm; usually in cleavable masses. *Twinning:* Polysynthetic, in two directions.

Physical Properties: *Cleavage:* {001}, good; {100}, fair. *Fracture:* [Uneven to subconchoidal] (by analogy to amblygonite). *Tenacity:* [Brittle.] Hardness = 5.5 D(meas.) = 3.01–3.06 D(calc.) = n.d. Fluoresces greenish yellow-orange under SW UV, cream-white under LW UV.

Optical Properties: Translucent to opaque. *Color:* Grayish to white. *Luster:* Vitreous to greasy, chalky on weathering.
Optical Class: Biaxial (+). $\alpha = 1.594$ $\beta = 1.603$ $\gamma = 1.615$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $P\overline{1}$. a = n.d. b = n.d. c = n.d. α = n.d. β = n.d. γ = n.d. Z = n.d.

X-ray Powder Pattern: n.d.

(1) Eight Mile Park, Colorado, USA. (2) $(Na, Li)Al(PO_4)(OH, F)$ with Na:Li = 1:1 and OH:F = 1:1.

Mineral Group: Amblygonite group.

Occurrence: In granite pegmatites.

Association: Lepidolite, quartz, elbaite, mica (Eight Mile Park, Colorado, USA).

Distribution: In the USA, from Eight Mile Park, about six km northwest of Cañon City, Fremont Co., Colorado; in the Strickland quarry, Portland, Middlesex Co., Connecticut. At Jeclov, near Jihlava, Czech Republic. From the Tremearne pegmatite, Breage, Cornwall. In Brazil, large crystals from Presidente Bueno, Rio Doce Valley, Minas Gerais. At the Rusororo pegmatite, Gatumba district, Rwanda.

Name: For its content of sodium, *natrium*, and relation to *montebrasite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 86843, 87490.

Natron $Na_2CO_3 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. Granular to fine crystalline, as crusts, efflorescences, and coatings. *Twinning:* On {001}.

Physical Properties: *Cleavage:* Distinct on {001}; imperfect on {010}; in traces on {110}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1–1.5 D(meas.) = 1.478 D(calc.) = 1.458 Soluble in H_2O, alkaline taste; dehydrates rapidly in air forming thermonatrite.

Optical Properties: Semitransparent. *Color:* Colorless to white, may be yellow or gray due to impurities; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c \simeq 41°$. *Dispersion:* $r > v$, perceptible, crossed. $\alpha = 1.405(3)$ $\beta = 1.425(3)$ $\gamma = 1.440(3)$ 2V(meas.) = Large.

Cell Data: *Space Group:* Cc (synthetic). $a = 12.83(2)$ $b = 9.026(9)$ $c = 13.44(5)$ $\beta = 123.0(5)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 15-800).
3.04 (100), 3.02 (70), 2.894 (60), 5.37 (45), 3.94 (30), 3.45 (25), 4.50 (20)

(1) Hall, Austria. (2) $Na_2CO_3 \cdot 10H_2O$.

Occurrence: Formed on the margins around soda-rich lakes, or as a precipitate on lake bottoms during cold weather; as an efflorescence on lavas; rare in differentiated alkaline massifs.

Association: Thermonatrite, trona, mirabilite, gaylussite, gypsum, calcite.

Distribution: Many reported occurrences may be of thermonatrite, an easily-obtained alteration product. Confirmed occurrences include: from the Debrecen and Szeged districts, Hungary. In Austria, in the Salzburger Schacht, Untersberg; at Hall, Tirol, from Dürrnberg, near Hallein, and at Hallstatt. On Vesuvius, Campania, and Etna, Sicily, Italy. On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. In the USA, noted in the Mt. Pisgah lava tubes, Mohave Desert, San Bernardino Co., California, and in Colorado, formed around artesian wells in the San Luis Valley, Costilla Co. In Goodenough Lake, near Clinton, British Columbia, and at Mont Saint-Hilaire, Quebec, Canada. Around Lake Fellmongery, Robe, South Australia.

Name: From *nitrum*, a name from antiquity.

Natronambulite $(Na,Li)Mn_4^{2+}Si_5O_{14}(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1 or $\bar{1}$. Tabular prismatic crystals, to 6 cm; also as coarse-grained mosaic aggregates.

Physical Properties: *Cleavage:* Perfect on {100} and {001}, distinct on {010}. Hardness = 5.5–6 D(meas.) = 3.51 D(calc.) = 3.50

Optical Properties: Transparent. *Color:* Pinkish orange to pink, deep red; in thin section, very pale yellow. *Streak:* White, with slight orange tint. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Dispersion:* $r > v$, distinct. *Absorption:* $Z > Y = X$. $\alpha = 1.703$–1.706 $\beta = 1.710$–1.712 $\gamma = 1.726$–1.730 2V(meas.) = 45°–48°

Cell Data: *Space Group:* $P1$ or $P\bar{1}$. $a = 7.620$ $b = 11.762$ $c = 6.737$ $\alpha = 92.81°$ $\beta = 94.55°$ $\gamma = 106.87°$ Z = [2]

X-ray Powder Pattern: Tanohata mine, Japan.
3.559 (100), 7.13 (47), 3.078 (45), 6.70 (44), 3.348 (40), 2.506 (38), 2.972 (34)

Chemistry:

Total	99.36	100.25

(1) Tanohata mine, Japan; by electron microprobe, Li and H_2O by wet chemical analysis; corresponds to $(Na_{0.82}Li_{0.18})_{\Sigma=1.00}(Mn_{3.41}Ca_{0.37}Mg_{0.17}Fe_{0.01})_{\Sigma=3.96}Si_{5.02}O_{14.00}(OH)_{1.00}$.
(2) Kombat mine, Namibia; corresponds to $(Na_{0.61}Li_{0.40})_{\Sigma=1.01}(Mn_{3.45}Mg_{0.33}Ca_{0.31}Fe_{0.01})_{\Sigma=4.10}Si_{4.95}O_{13.99}(OH)_{1.01}$.

Polymorphism & Series: Forms a series with nambulite.

Occurrence: In banded ore of a contact metamorphosed bedded manganese deposit, and as an accessory mineral in an albite-microcline-quartz pegmatite cutting the ore (Tanohata mine, Japan).

Association: Aegirine, manganoan arfvedsonite, rhodonite, kôzulite, marsturite, sérandite, quartz, albite, microcline (Tanohata mine, Japan); gypsum, brushite, cahnite, chlorite, kentrolite, barite, calcite (Kombat mine, Namibia).

Distribution: From the Tanohata mine, Iwate Prefecture, Japan. At the Kombat mine, 49 km south of Tsumeb, Namibia.

Name: For sodium, *natrium*, in its composition, and its relation to *nambulite*.

Type Material: National Science Museum, Tokyo, Japan, M23817.

(1) Kola Peninsula, Russia. (2) $NaNbO_3$.

Polymorphism & Series: Dimorphous with isolueshite and lueshite.

Occurrence: Replacing perovskite and pyrochlore in dolomite carbonatites.

Association: Dolomite, apatite, phlogopite, perovskite, pyrochlore.

Distribution: From the Lesnaya Varaka massif, Kola Peninsula, Russia. In the Sallanlatvi massif, northern Karelia, Russia. At Gem Park, about six km east of Hillside, Fremont Co., Colorado, USA.

Name: For sodium, NATRium, and NIOBium in the composition.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, Russia, 17401.

References: (1) Bulakh, A.G., A.A. Kukharenko, Y.N. Knipovich, V.V. Kondrat'eva, K.A. Baklanova, and E.N. Baranova (1960) Some new minerals in carbonatites of the Kola Peninsula. Mat. Vses. Nauk Geol. Inst. 1960, 114–116. (2) (1962) Amer. Mineral., 47, 1483 (abs. ref. 1).

Natrophosphate $Na_7(PO_4)_2(F,Cl)\cdot 19H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rare as octahedra, dodecahedra, or tetrahedra, to 1 cm, typically rounded; in monomineralic aggregates and veinlets.

Physical Properties: *Cleavage:* On {111}, imperfect, in slightly altered specimens. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 1–2.5 D(meas.) = 1.71–1.72 D(calc.) = n.d. Fluoresces pale orange under UV, with a stronger orange cathodoluminescence; partially decomposes to a white powder on exposure to air, dissolves in H_2O.

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous to greasy, waxy to frosty on exposure.
Optical Class: Isotropic. n = 1.450–1.462

Cell Data: *Space Group: Fd3c.* a = 27.79–27.93 Z = 56

X-ray Powder Pattern: Mt. Yukspor, Kola Peninsula, Russia.
2.67 (10), 2.42 (9), 8.18 (7), 3.05 (6), 4.93 (5), 4.06 (5), 2.90 (5)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3		0.97	F	3.20	3.30
P_2O_5	21.51	18.00	Cl		1.86
CO_2	2.60		H_2O	41.30	47.04
Na_2O	32.60	29.53	$-O = (F,Cl)$	1.34	1.81
			Total	99.87	98.89

(1) Mt. Karnasurt, Kola Peninsula, Russia; with a separate DTA determination of H_2O 47.0%, and after deduction of CO_2 attributed to atmospheric contamination, then corresponds to $Na_{6.94}(PO_4)_2F_{1.11}\cdot 18.2H_2O$. (2) Aris quarry, Namibia; Na by AA, P, S, F, Cl by ion chromatograph, H_2O by Karl-Fischer titration; corresponds to $Na_{7.04}[(PO_4)_{1.87}(SO_4)_{0.09}]_{\Sigma=1.96}(F_{1.28}Cl_{0.39})_{\Sigma=1.67}\cdot 19.29H_2O$.

Occurrence: A rare mineral in ijolite-urtite pegmatite in a differentiated alkaline massif (Kola Peninsula, Russia); in sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in miarolitic cavities in phonolite (Aris quarry, Namibia).

Association: Villiaumite, aegirine, delhayelite, strontian apatite, natrolite, pectolite, albite (Mt. Yukspor, Kola Peninsula, Russia); villiaumite, nahpoite, dorfmanite, kogarkoite, sidorenkite, thermonatrite, analcime, aegirine (Mts. Alluaiv and Karnasurt, Kola Peninsula, Russia); villiaumite, ussingite, vuonnemite, lovozerite, eudialyte, steenstrupine, chkalovite, lueshite, serandite, griceite, kogarkoite (Mont Saint-Hilaire, Canada); villiaumite, aegirine, albite, eudialyte (Aris quarry, Namibia).

Distribution: On Mts. Yukspor and Koashva, Khibiny massif, and Mts. Karnasurt and Alluaiv, Lovozero massif, Kola Peninsula, Russia. From Mont Saint-Hilaire, Quebec, Canada. In the Aris quarry, about 25 km south of Windhoek, Namibia.

Name: For sodium, *natrium*, and *phosphate* in the composition.

Type Material: Vernadsky Geological Museum, Moscow, 51117; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74383.

Natrosilite $Na_2Si_2O_5$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Thick tabular pseudohexagonal crystals, to 6 cm; granular.

Physical Properties: *Cleavage:* {100}, perfect micaceous; {001}, distinct; {011}, poor. Hardness = n.d. D(meas.) = 2.48 D(calc.) = 2.51 Soluble in water.

Optical Properties: Transparent. *Color:* Colorless; anomalous blue interference colors in thin section. *Luster:* Pearly.
Optical Class: Biaxial (–). *Orientation:* $Y \wedge c = -12°$ to 2°. *Dispersion:* $r < v$. $\alpha = 1.507$. $\beta = 1.517$ $\gamma = 1.521$ 2V(meas.) = 49°–64°

Cell Data: *Space Group:* $P2_1/a$. a = 12.30(2) $b = 4.88(1)$ $c = 8.27(3)$ $\beta = 104°14'$ Z = 4

X-ray Powder Pattern: Lovozero massif, Russia.
6.06 (10), 2.98 (9), 3.97 (8), 2.435 (8), 3.64 (7), 4.17 (6), 4.28 (5)

Chemistry:

	(1)	(2)
SiO_2	66.03	65.97
Na_2O	33.96	34.03
K_2O	0.01	
H_2O^-	0.06	
Total	100.06	100.00

(1) Lovozero massif, Russia; by electron microprobe and wet chemical analysis; organic matter 0.4%. (2) $Na_2Si_2O_5$.

Occurrence: In pegmatites in nepheline syenites in differentiated alkalic massifs (Kola Peninsula, Russia); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Microcline, analcime, natrolite, lomonosovite, ussingite, vuonnemite (Lovozero massif, Russia); aenigmatite, aegirine, sodalite, cancrinite, eudialyte (Khibiny massif, Russia); revdite (Mont Saint-Hilaire, Canada).

Distribution: On Mt. Karnasurt, Lovozero massif, and in the Khibiny massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For sodium, NATRium, and SILicon in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3394; Mining Institute, St. Petersburg, 1087/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis5123, vis5147.

Natrotantite $Na_2Ta_4O_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudomonoclinic. *Point Group:* $\overline{3}$ $2/m$. Rimming crystals of simpsonite, in turn rimmed by alumotantite; intergrown with microlite.

Physical Properties: *Fracture:* Uneven. Hardness = n.d. VHN = 1270 (40 g load). D(meas.) = n.d. D(calc.) = n.d. Strong yellow-green cathodoluminescence.

Optical Properties: Transparent. *Color:* Colorless, with slight yellowish tint.
Luster: Adamantine.
Optical Class: Uniaxial. *Anisotropism:* Strong.
R_1–R_2: (486) 15.0–13.6, (589) 12.4–11.8, (656) 12.0–12.0

Cell Data: *Space Group:* $R\overline{3}c$. $a = 6.2092(1)$ $c = 36.619(1)$ Z = 6

X-ray Powder Pattern: Kola Peninsula, Russia.
3.02 (10b), 2.778 (9b), 1.556 (8), 1.548 (8), 3.06 (7), 2.474 (6b), 1.799 (6b)

Chemistry:

	(1)	(2)	(3)
Nb_2O_5	2.71	1.0	
Ta_2O_5	91.26	94.3	93.45
PbO	0.87	0.6

Na_2O	4.69	3.1	6.55
K_2O		0.06	
Total	99.61	99.4	100.00

(1) Kola Peninsula, Russia; by electron microprobe, corresponding to $(Na_{1.40}Pb_{0.04}Ca_{0.01})_{\Sigma=1.45}(Ta_{3.81}Nb_{0.19})_{\Sigma=4.00}O_{10.75}$. (2) Alto do Giz pegmatite, Brazil; by electron microprobe, corresponding to $(Na_{0.93}Ca_{0.04}Pb_{0.03}K_{0.01})_{\Sigma=1.01}(Ta_{3.93}Nb_{0.07})_{\Sigma=4.00}O_{10.54}$. (3) $Na_2Ta_4O_{11}$.

Occurrence: In albite units of granite pegmatites.

Association: Simpsonite, alumotantite, microlite, sosedkoite.

Distribution: From Mt. Vasin-Myl'k, Voroni massif, Kola Peninsula, Russia. At the Alto do Giz pegmatite, near Parelhas, Rio Grande do Norte, Brazil.

Name: For sodium, NATRium, and TANTalum in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, Russia, 5518.

Natrotitanite $(Na_{0.5}Y_{0.5})Ti(SiO_4)O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As chemically and optically distinct thin rims on prismatic crystals of (Na,Y,REE)-bearing titanite.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.833

Optical Properties: Transparent to translucent. *Color*: Milky white to yellowish grey. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (n.d.). α = 1.904(2) β = n.d. γ = 2.030(2) 2V = n.d.

Cell Data: *Space Group*: *C*2/*m*. *a* = 6.5691(2) *b* = 8.6869(3) *c* = 7.0924(2) β = 114.1269(4)° Z = 4

X-ray Powder Pattern: Verkhnee Espe REE deposit, Kazakhstan.

(1) Verkhnee Espe REE deposit, Kazakhstan; average electron microprobe analysis; corresponds to $(Na_{0.39}Ca_{0.32}Y_{0.15}Dy_{0.03}Yb_{0.03}\ Er_{0.03}Ce_{0.01}Ho_{0.01}Tm_{0.01}Gd_{0.01}Nd_{0.01})_{\Sigma=1.00}\ (Ti_{0.95}Nb_{0.02}Sn_{0.01}Fe^{3+}{}_{0.01}\ Mn_{0.01}V_{0.01})_{\Sigma=1.01}\ Si_{1.01}O_{4.00}(O_{0.83}F_{0.17})$.

Occurrence: In the wall rock zone of an alkaline granite associated with a granitic massif.

Association: Yttrium-bearing fluorite, microcline, albite, quartz, riebeckite, aegirine, biotite, astrophyllite, rutile, zircon, elpidite.

Distribution: From the Verkhnee Espe REE deposit, northern margin of the Akjailyautuas granite massif, Kazakhstan.

Name: For a *titanite* structure with Na(Y,REE)-dominant in the *Ca* site.

Type Material: Geological Scientific Museum, K.I. Satpaev Institute of Geological Sciences, Almaty, Kazakstan (3010).

Natroxalate $Na_2(C_2O_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [001], to 5 mm, showing {110}, {001}, {010}, {100}, {221}, in radiating aggregates; typically fine-grained, forming veins and nodules. *Twinning:* On {110}.

Physical Properties: *Cleavage:* On {100}, perfect; on {001} and {221}, distinct. *Fracture:* Interrupted. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.32(3) D(calc.) = 2.338 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Cream to pale yellow, with pinkish or greenish tint. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 20°$. *Dispersion:* $r < v$, moderate. $\alpha = 1.415(2)$ $\beta = 1.524(2)$ $\gamma = 1.592(2)$ 2V(meas.) = 72(1)° 2V(calc.) = 72°

Cell Data: *Space Group:* $P2_1/a$ (by analogy to synthetic). $a = 10.426(9)$ $b = 5.255(5)$ $c = 3.479(3)$ $\beta = 93.14(8)°$ Z = 2

X-ray Powder Pattern: Mt. Alluaiv, Kola Peninsula, Russia.
2.826 (100), 2.602 (56), 2.334 (33), 2.898 (27), 2.041 (14), 5.203 (13), 2.117 (13)

Chemistry:

	(1)	(2)
C_2O_3	53.70	53.75
Na_2O	46.24	46.25
Total	99.94	100.00

(1) Mt. Alluaiv, Kola Peninsula, Russia. (2) $Na_2(C_2O_4)$.

Occurrence: In a hydrothermally altered pegmatite in a differentiated alkalic massif.

Association: Aegirine, albite, elpidite, natron, nenadkevichite, taeniolite, sphalerite, pyrite, galena.

Distribution: From Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For sodium, *natrium*, in the composition, and as a naturally occurring *oxalate*.

Type Material: Mining Institute, St. Petersburg, 2080/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 1522.

Naujakasite $Na_6(Fe^{2+},Mn^{2+})Al_4Si_8O_{26}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. As aggregates of pseudohexagonal plates, to 2 cm.

Physical Properties: *Cleavage:* Perfect micaceous on {001}; {$\bar{4}$01} and {010}, distinct. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 2.615–2.622 D(calc.) = 2.661

Optical Properties: Semitransparent. *Color:* Gray to silver-white; colorless in thin section. *Luster:* Pearly on {001}.
Optical Class: Biaxial (–). α = 1.536–1.538 β = 1.548–1.551 γ = 1.555–1.557
2V(meas.) = 52°–71° 2V(calc.) = 62°–75°

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. a = 15.025(1) b = 7.991(2) c = 10.486(1) $\beta = 113°40(5)'$ Z = 2

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.
3.99 (100), 3.56 (70), 2.26 (70), 3.69 (60), 3.44 (60), 3.06 (60), 2.79 (60)

Chemistry:

	(1)	(2)
SiO_2	50.95	50.65

H_2O^-	1.02	
P_2O_5		0.07
Total	99.74	[100.00]

(1) Ilímaussaq intrusion, Greenland. (2) Tuperssuatsiait, Greenland; CaO 0.2%–0.4%, Fe^{2+}:Fe^{3+} and H_2O by TGA, recalculated to 100.00%; corresponds to $(Na_{5.67}K_{0.10})_{\Sigma=5.77}(Fe^{2+}_{0.60}Mn_{0.14}Ca_{0.06})_{\Sigma=0.80}(Al_{3.87}Fe^{3+}_{0.27})_{\Sigma=4.14}Si_{8.08}O_{26}\bullet 1.83H_2O$.

Occurrence: In an alkalic intrusion.

Association: Arfvedsonite, sodalite, steenstrupine, analcime.

Distribution: In southern Greenland, in the Ilímaussaq intrusion, at Naujakasik, at Tuperssuatsiait Bay, and on the Kvanefjeld Plateau, all around the Tunugdliarfik Fjord.

Name: For the locality of original discovery, Naujakasik, Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1933.31; National Museum of Natural History, Washington, D.C., USA, 97479.

Naumannite Ag_2Se

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* 222. Granular massive; rarely as pseudocubes and plates, to 1 cm.

Physical Properties: *Fracture:* Hackly, poor. *Tenacity:* Somewhat sectile. Hardness = 2.5 VHN = 33–84 (25 g load). D(meas.) = 7.0–8.0 D(calc.) = 8.24

Optical Properties: Opaque. *Color:* Grayish iron-black, tarnishes to iridescent brownish. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Distinct but weak, pale gray to dark gray. R_1–R_2: (400) 37.2–41.8, (420) 37.0–41.2, (440) 37.4–40.5, (460) 38.0–39.9, (480) 38.2–39.3, (500) 37.9–38.5, (520) 37.1–37.6, (540) 35.9–36.7, (560) 34.8–36.0, (580) 33.9–35.5, (600) 33.2–35.2, (620) 32.8–34.9, (640) 32.4–34.5, (660) 32.0–34.1, (680) 31.6–33.7, (700) 31.2–33.3

Cell Data: *Space Group:* $P2_12_12_1$. $a = 4.333$ $b = 7.062$ $c = 7.764$ $Z = 4$

X-ray Powder Pattern: Tilkerode, Germany.
2.67 (100), 2.57 (100), 2.24 (60), 2.006 (40), 4.15 (20), 2.42 (20), 2.11 (20)

Chemistry:

	(1)	(2)	(3)
Ag	72.3	74.8	73.21
Cu	0.1		
Se	28.0	25.0	26.79
Te	0.3		
S		1.3	
Total	100.7	101.1	100.00

(1) Tilkerode, Germany; by electron microprobe, corresponds to $(Ag_{1.95}Cu_{0.01})_{\Sigma=1.96}(Se_{1.03}Te_{0.01})_{\Sigma=1.04}$. (2) Silver City, Idaho, USA; corresponds to $Ag_{1.98}(Se_{0.90}S_{0.12})_{\Sigma=1.02}$. (3) Ag_2Se.

Occurrence: In hydrothermal veins deficient in sulfur, associated with other selenides, quartz, and carbonates.

Association: Clausthalite, aguilarite, acanthite, tiemannite, umangite, eucairite, argentian tetrahedrite, argentian gold, pyrite, chalcopyrite.

Distribution: In Germany, in the Harz Mountains, at Tilkerode [TL] and St. Andreasberg. From Săcărîmb (Nagyág), Romania. In the Předbořice deposit, Czech Republic. At Kongsberg, Norway. In the USA, from Republic, Ferry Co., and in the L-D mine, Wenatchee, Chelan Co., Washington; at the De Lamar mine, Silver City district, Owyhee Co., and from the 4th of July mine, Yankee Fork, Custer Co., Idaho; in Nevada, large crystals in the Ken Snyder mine, Gold Circle district, Elko Co., and at the Rex Grande deposit, Midas, Elko Co. From the Betty claim group, north of Divide Lake, British Columbia; and in the Kidd Creek mine, near Timmins, Ontario, Canada. At Guanajuato, Mexico. From the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, Potosí, Bolivia. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina. From the Wolumia goldfield, New South Wales, Australia. In the Emperor mine, Vatukoula, and the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. From the Hishikari and Kushikino Au–Ag deposits, Kagoshima Prefecture, and in the Sanru mine, Hokkaido, Japan. At the Axi gold deposit, Ili, Xinjiang Uygur Autonomous Region, China. A number of additional minor occurrences are known.

Name: For German mineralogist and crystallographer Carl Friedrich Naumann (1797–1873).

Navajoite $(V^{5+},Fe^{3+})_{10}O_{24}\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As fibrous cross-vein fillings, to 3 mm; as coatings around pebbles and impregnations of sandstone and shale.

Physical Properties: *Tenacity:* Sectile. Hardness = < 2 D(meas.) = 2.56 D(calc.) = 2.53

Optical Properties: Semitransparent. *Color:* Dark brown. *Streak:* Brown.
Luster: Adamantine to silky.
Optical Class: Biaxial (–) (probable). *Pleochroism:* $X = Y$ = yellowish brown; Z = dark brown.
Orientation: $Z = b$. $\alpha = 1.905(3)$ $\beta = \sim 2.02$ $\gamma = > 2.02$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. a = 34.94(2) $b = 3.597(2)$ $c = 11.79(1)$ $\beta = 95.98(6)°$
Z = [2]

X-ray Powder Pattern: Monument No. 2 mine, Arizona, USA; exhibits preferred orientation.
11.79 (100), 3.41 (20), 3.18 (8), 17.38 (7), 5.79 (6), 1.992 (4), 10.54 (3)

Chemistry:

	(1)
V_2O_5	71.68
V_2O_4	3.08
SiO_2	1.20
Fe_2O_3	3.58
CaO	0.22
H_2O	20.30
Total	100.06

(1) Monument No. 2 mine, Arizona, USA; corresponds to $(V_{9.48}Fe_{0.52})_{\Sigma=10.00}Ca_{0.05}O_{24}\cdot 12H_2O$.

Occurrence: In the highly oxidized portion of a Colorado Plateau-type U–V deposit, in a stream channel filled with conglomeratic and silty sandstone; thought to be an oxidation product of corvusite.

Association: Corvusite, tyuyamunite, rauvite, hewettite, steigerite, "limonite".

Distribution: In the Monument No. 2 mine, Monument Valley, Apache Co., Arizona, USA.

Name: For the Navajo Indians, on whose reservation the mineral was first found.

Type Material: Harvard University, Cambridge, Massachusetts, 105102; National Museum of Natural History, Washington, D.C., USA, 106900.

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. As pseudo-octahedral or pseudocubic crystals, to 3 mm, and as oblong to rounded grains. *Twinning:* Polysynthetic and interpenetrant, complex but poorly defined.

Physical Properties: *Fracture:* Uneven. Hardness = 4.5 D(meas.) = 3.03(3) D(calc.) = 3.06

Optical Properties: Transparent to opaque. *Color:* Colorless, cream, pink, red, brown, may be zoned. *Luster:* Vitreous to dull, greasy.
Optical Class: Isotropic, but with birefringence about 0.003. $n = 1.364(2)$

Cell Data: *Space Group: Pcmn.* $a = 5.363(1)$ $b = 7.676(1)$ $c = 5.503(1)$ Z = 4

X-ray Powder Pattern: South Ouray, Utah, USA.
1.918 (100), 2.71 (50), 3.83 (35), 2.30 (25), 1.556 (25), 2.23 (18), 2.20 (13)

Total	[100.37]	100.00

(1) Ural Mountains, Russia; original total given as 100.49%; corresponds to $(Na_{0.87}K_{0.02})_{\Sigma=0.89}(Mg_{0.98}Ca_{0.02})_{\Sigma=1.00}F_{2.97}$. (2) $NaMgF_3$.

Occurrence: An authigenic mineral, formed under aluminum-deficient conditions in dolomitic oil shale (South Ouray, Utah, USA); in metamorphosed tuff and clayey carbonate sediments (Ural Mountains, Russia); in miarolitic cavities in an alkalic granite (Lake Gjerdingen, Norway); in cavities in pegmatite and in hornfels in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Burbankite, nahcolite, wurtzite, barytocalcite, garrelsite, pyrite, calcite, quartz (South Ouray, Utah, USA).

Distribution: From the South Ouray and Sun Havenstrite wells, about 8 km south-southeast of South Ouray, Uintah Co., Utah, USA. At Mont Saint-Hilaire, Quebec, Canada. From near Lake Gjerdingen, Nordmarka, Norway. In the Lovozero, Khibiny, and Kovdor massifs, Kola Peninsula, the Ural Mountains, and other poorly defined localities in Russia.

Name: Honors Frank Neighbor, district geologist of Sun Oil Co., Salt Lake City, Utah, USA, for his assistance in providing samples.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115216, 162603.

Nekoite $Ca_3Si_6O_{15}\cdot 7H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1. Crystals fine, slender needles, to 5 mm, elongated ‖ [001]. *Twinning:* Repeated, lamellae ‖ {010} cleavage.

Physical Properties: *Cleavage:* Distinct on {010}. Hardness = n.d. D(meas.) = 2.21–2.24 D(calc.) = 2.21

Optical Properties: Transparent to translucent. *Color:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). $n = 1.535(2)$, very low birefringence. 2V(meas.) = ∼70°

Cell Data: *Space Group:* $P1$. $a = 7.558(3)$ $b = 9.793(5)$ $c = 7.339(5)$ $\alpha = 111.77(7)°$ $\beta = 103.50(5)°$ $\gamma = 86.53(3)°$ Z = 1

X-ray Powder Pattern: Crestmore, California, USA.
9.25 (vs), 3.36 (vsb), 2.82 (vs), 2.47 (ms), 1.83 (ms), 1.90 (mw), 1.79 (mw)

Chemistry:

	(1)	(2)	(3)
SiO_2	55.	56.17	55.05
CaO	24.	26.10	25.69
H_2O	19.6	16.83	19.26
Total	99.	99.10	100.00

(1) Crestmore, California, USA. (2) Do.; probably slightly dehydrated. (3) $Ca_3Si_6O_{15}\cdot 7H_2O$.

Occurrence: In a contact metamorphosed limestone deposit (Crestmore, California, USA).

Association: Apophyllite (Crestmore, California, USA); heulandite, apophyllite (Caxias do Sul, Brazil).

Distribution: In the USA, from Crestmore, Riverside Co., California, and at Landsman's Camp, Aravaipa district, Graham Co., Arizona. At Caxias do Sul, Rio Grande do Sul, Brazil. In the Kochbulak deposit, eastern Uzbekistan.

Name: An anagram of OKENite, for which it was originally mistaken.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95637.

(1) Khayragatsch deposit, Uzbekistan; by electron microprobe, corresponding to $(Cu_{23.97}Fe_{1.98}Zn_{0.05})_{\Sigma=26.00}(V_{1.31}Fe_{0.58})_{\Sigma=1.89}(Sn_{3.31}As_{1.39}Sb_{1.19}Se_{0.11})_{\Sigma=6.00}S_{32.11}$. (2) Bisbee, Arizona, USA; by electron microprobe, corresponding to $(Cu_{21.91}Zn_{3.95}Fe_{0.12})_{\Sigma=25.98}V_{2.12}Sn_{6.23}S_{31.66}$.

Mineral Group: Colusite group.

Occurrence: In ore aggregates within propylitic andesites and dacites (Khayragatsch deposit, Uzbekistan).

Association: Tetrahedrite–tennantite, luzonite–famatinite, pyrite, mawsonite, chalcopyrite, emplectite, laitakarite, bismuth, calcite, quartz, barite (Khayragatsch deposit, Uzbekistan).

Distribution: From the Khayragatsch gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan [TL]. In the USA, in the Campbell mine, Bisbee, Cochise Co., Arizona. At Neves-Corvo, Portugal. From the Persenk district, Rhodopes Mountains, Bulgaria.

Name: To honor Ivan Yakovlevich Nekrasov (1929–), Russian mineralogist, Institute of Experimental Mineralogy, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84283.

Total	100.00	[100.0]

(1) Franklin, New Jersey, USA; corresponds to $(Mn_{9.54}Fe_{5.51}Zn_{1.04}Mg_{0.07})_{\Sigma=16.16}$ $As_{2.92}Si_{12}O_{36.28}(OH)_{16.52}$. (2) Do.; by electron microprobe, H_2O by difference; corresponds to $(Mn_{9.27}Fe_{5.80}Zn_{0.75}Mg_{0.29}Ca_{0.17})_{\Sigma=16.28}As_{3.12}Si_{12}O_{36.39}(OH)_{17.14}$.

Polymorphism & Series: Dimorphous with schallerite.

Occurrence: In a metamorphosed stratiform zinc deposit, within pegmatitic textured masses, and as calcite-cemented fragments in a breccia probably derived from the pegmatitic material.

Association: Actinolite, calcite, willemite, tirodite, rhodonite, apatite, lennilenapeite, stilpnomelane, microcline, talc.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: In honor of Joseph A. Nelen, chemist at the Smithsonian Institution, Washington, D.C., USA.

Type Material: Harvard University, Cambridge, Massachusetts, 92791; National Museum of Natural History, Washington, D.C., USA, R7824, C6219, 145972; The Natural History Museum, London, England, 1983,237.

Neltnerite $CaMn_6^{3+}SiO_{12}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Rarely as dipyramidal crystals, to 1 mm; as small grains.

Physical Properties: *Fracture:* Subconchoidal. Hardness = 6 VHN = 1200–1220 (100 g load). D(meas.) = 4.63(5) D(calc.) = 4.65

Optical Properties: Opaque. *Color:* Black; in reflected light, gray to brownish gray. *Luster:* Submetallic. *Anisotropism:* Weak.
R_1–R_2: (470) 21.3–22.3, (546) 19.2–20.2, (589) 18.5–19.5, (650) 17.65–18.65

Cell Data: *Space Group:* $I4_1/acd$. $a = 9.464$ $c = 18.854$ $Z = 8$

X-ray Powder Pattern: Tachgagalt, Morocco.
2.728 (10), 1.672 (8.5), 1.427 (6), 1.085 (5), 1.0595 (4.5), 1.056 (4.5), 2.364 (3)

Chemistry:

	(1)
SiO_2	10.16
Fe_2O_3	1.29
Mn_2O_3	78.94
CaO	8.94
Total	99.33

(1) Tachgagalt, Morocco; by electron microprobe, average of 14 analyses; corresponds to $(Ca_{0.95}Mn^{2+}_{0.06})_{\Sigma=1.01}(Mn^{3+}_{5.89}Fe^{3+}_{0.10})_{\Sigma=5.99}Si_{1.01}O_{12}$.

Occurrence: In a vein with minerals containing manganese and calcium (Tachgagalt, Morocco).

Association: Braunite, marokite, crednerite (Tachgagalt, Morocco).

Distribution: At Tachgagalt, Anti-Atlas Mountains, Morocco. From Manganese Creek Falls, Keeweenaw Co., Michigan, USA.

Name: For Louis Neltner, pioneer student of mineral deposits of the High Atlas Mountains, Morocco.

Type Material: National School of Mines, Paris, France.

(1) Kola Peninsula, Russia. (2) Mont Saint-Hilaire, Canada; corresponds to $(Na_{0.94}K_{0.06}Ca_{0.03}Mn_{0.01})_{\Sigma=1.04}(Nb_{0.69}Ti_{0.30})_{\Sigma=0.99}Si_{2.00}O_6[O_{0.70}(OH)_{0.30}]_{\Sigma=1.00} \cdot 2H_2O$.

Occurrence: Between crystals of microcline in a natrolite-albite-rich pegmatite in nepheline syenite in a differentiated alkalic massif (Lovozero massif, Russia); in pegmatites, cavities in igneous breccia, hornfels, and marble xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Microcline (Lovozero massif, Russia); microcline, aegirine, catapleiite, ancylite, epididymite, eudialyte, sérandite, pectolite, apophyllite, monteregianite, vesuvianite, many other species (Mont Saint-Hilaire, Canada).

Distribution: On Mts. Karnasurt and Flora, in the Lovozero massif, and in the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. From Gjerdingen, near Oslo, Norway. At Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. From the Ilímaussaq intrusion and at Narssârssuk, Greenland.

Name: For Konstantin Avtonomovich Nenadkevich (1880–1963), Russian mineralogist and geochemist, A.E. Fersman Mineralogical Museum, Moscow, Russia.

(1) Geevor mine, England. (2) $(Mn,Fe)SiO_3 \cdot H_2O$ with Fe:Mn = 1:1.

Occurrence: An alteration product of manganese-bearing silicate minerals.

Association: Rhodonite, calcite, quartz.

Distribution: In Sweden, from Gestrikland; at Långban, Jakobsberg, and the Harstigen mine, near Persberg, Värmland; and in the Brunsjö mine, near Grythyttan, Örebro. In Wheal Owles, Penwith, and the Geevor mine, St. Just, Cornwall, England. In the USA, from the Aravaipa district, Graham Co., Arizona; in California, in the Charles Mountain deposit, Humboldt Co., in the Elsinor area, Riverside Co., and at the Johe Ranch mine, San Louis Obispo Co.; from the Montreal mine, Gogebic Range, Iron Co., Wisconsin; and at the Foote mine, Kings Mountain, Cleveland Co., North Carolina. From Bueycito, Oriente Province, Cuba. In Japan, from Shidara, Aichi Prefecture; in the Kawazu mine, Shidzuoka Prefecture; and at Tamaga, Iwate Prefecture. Probably additional localities are not yet recognized.

Name: From the Greek, meaning *of recent origin*, as it is an alteration product.

(1) Monte Somma, Italy; corresponds to $(Na_{0.56}K_{0.15}Ca_{0.11})_{\Sigma=0.82}Al_{0.97}Si_{1.04}O_4$.

Occurrence: Characteristic of alkalic rocks as nepheline syenites and gneisses, alkalic gabbros; in sodium-rich hypabyssal rocks, tuffs and lavas, and pegmatites; as a product of sodium metasomatism.

Association: Potassic feldspar, plagioclase, sodic pyroxenes, sodic amphiboles, leucite, olivine, augite, diopside.

Distribution: Wide-spread; only a few prominent localities can be mentioned. In Italy, at Vesuvius and Monte Somma, Campania. On the Katzenbuckel, Odenwald, Baden-Württemberg, Germany. In the Langesundsfjord area, Norway. In Portugal, from the Sierra de Monchique. Around the Tunugdliarfik Fjord and on the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion, southern Greenland. In the Lovozero massif, Kola Peninsula, Russia. From the Nyiragongo volcano, Kivu Province, Congo (Zaire). In the USA, at Litchfield, Kennebec Co., Maine; near Magnet Cove, Hot Spring Co., and on Granite Mountain, near Little Rock, Pulaski Co., Arkansas; from Iron Hill, Gunnison Co., Colorado; at Point of Rocks, Colfax Co., New Mexico. In Canada, in the Bancroft district, Ontario, especially large crystals from Davis Hill; from Mont Saint-Hilaire, Quebec.

Name: From the Greek for *cloud*, as it becomes cloudy when treated with strong acid.

Type Material: Natural History Museum, Paris, France, Haüy collection.

(1) Népoui, New Caledonia. (2) Nakety, New Caledonia. (3) $Ni_3Si_2O_5(OH)_4$.

Polymorphism & Series: Dimorphous with pecoraite; forms a series with lizardite.

Mineral Group: Kaolinite-serpentine group.

Occurrence: An alteration product of nickel-rich ultramafic rocks.

Association: Serpentine, chlorite, hydrous nickel silicates, iron oxides.

Distribution: From the Reis II mine, Népoui; near Nakety, and at Thio, New Caledonia. In the 132 North nickel mine, Widgiemooltha district, Western Australia. From Pavlos, Greece. In the Tyulenevsk Formation, Ural Mountains, Russia. At Letovice, Czech Republic. In the Kalkar quarry, Santa Cruz Co., California, USA.

Name: After the locality, Népoui, New Caledonia.

Type Material: n.d.

Neptunite $KNa_2Li(Fe^{2+},Mn^{2+},Mg)_2Ti_2Si_8O_{24}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* *m*. As prismatic crystals, to 7.5 cm, with {110} prominent, typically with square cross sections, may be curved or twisted. *Twinning:* Interpenetrant on {301}.

Physical Properties: *Cleavage:* Perfect on {110}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.19–3.23 D(calc.) = [3.24] Piezoelectric.

Optical Properties: Nearly opaque. *Color:* Black; deep red-brown in thin fragments. *Streak:* Cinnamon-brown. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = pale yellow; Y = yellow-orange; Z = red-orange to red-brown. *Orientation:* $Y = b$; $Z \wedge c = 16°–20°$. *Dispersion:* $r < v$, extreme. $\alpha = 1.692(1)$ $\beta = 1.702(1)$ $\gamma = 1.734(2)$ 2V(meas.) = ∼40°

Cell Data: *Space Group:* *Cc*. $a = 16.427(2)$ $b = 12.478(2)$ $c = 9.975(1)$ $\beta = 115.56(1)°$ Z = 4

X-ray Powder Pattern: San Benito Co., California, USA.
3.186 (100), 9.6 (60), 3.517 (45), 3.308 (35), 2.942 (32), 2.837 (32), 2.480 (32)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	52.29	54.06	CaO	0.62	
TiO_2	17.35	17.30	Li_2O	1.63	1.54
FeO	11.92	12.45	Na_2O	6.81	6.33
MnO	2.27	1.75	K_2O	5.58	4.92
MgO	1.55	1.65	Total	100.02	100.00

(1) San Benito Co., California, USA. (2) Do.; by electron microprobe, Li by wet chemical analysis; corresponds to $K_{0.95}Na_{1.85}Li_{0.92}(Fe_{1.51}Mg_{0.35}Mn_{0.20})_{\Sigma=2.06}Ti_{1.94}Si_{8.10}O_{24}$.

Polymorphism & Series: Forms a series with mangan-neptunite.

Occurrence: In natrolite veins cutting a glaucophane schist inclusion in a serpentinite body (San Benito Co., California, USA).

Association: Eudialyte, arfvedsonite, aegirine (Narssârssuk, Greenland); natrolite, benitoite, joaquinite-(Ce) (San Benito Co., California, USA); nordite-(La), lomonosovite, sodalite, ussingite (Kola Peninsula, Russia).

Distribution: From Narssârssuk, Iglunguak, and the Ilímaussaq intrusion, Greenland. In the Inagli massif, 30 km west of Aldan, Yakutia, and in the Khibiny and Lovozero massifs, Kola Peninsula, Russia. From the Khan-Bogdinskii granitic massif, Gobi, Mongolia. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. From Barnavave, near Carlingford, Co. Louth, Ireland. At Mont Saint-Hilaire, Quebec, and Seal Lake, Labrador, Newfoundland, Canada. In the USA, splendid crystals from the Gem mine and Mina Numero Uno, San Benito Co., California, and at Point of Rocks, Colfax Co., New Mexico. From near Woodsreef, New South Wales, Australia.

Name: For *Neptune*, sea-god of Roman mythology; so named because of its close association at the type occurrence with aegirine, the name of which derives from *Ægir*, the Scandinavian sea-god.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Total	99.96

(1) Neskevaara Hill, Vuoriyarvi complex, Northern Karelia, Russia; electron microprobe analysis, H_2O by TGA; corresponding to $Na_{1.22}K_{2.29}Ba_{0.26}(Fe_{0.31}Mg_{0.23}Mn_{0.09})_{\Sigma=0.63}(Ti_{2.31}Nb_{1.65})_{\Sigma=3.96}(Si_8O_{24})[O_{2.78}(OH)_{1.22}]_{\Sigma=4} \cdot 5.68H_2O$.

Mineral Group: Labuntsovite group.

Occurrence: In alkaline igneous rocks sometimes intergrown with labuntsovite-Fe or in hydrothermally altered carbonatite veins.

Association: Dolomite, calcite, phlogopite, fluorapatite, pyrite, pyrrhotite, chalcopyrite, serpentine, nenadkevichite (Neskevaara Hill); calcite, labuntsovite-Fe, donnayite-(Y), bitumen (Kirovskii mine).

Name: For the locality (Neskevaara Hill) and Fe-dominant composition of the D structural site.

Distribution: Neskevaara Hill, central part of the Vuoriyarvi alkaline complex, Northern Karelia, and the Kirovskii apatite mine, Mount Kukisvumchorr, Khibiny alkaline massif, Kola Peninsula, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 2814/1.

Total	99.76	100.00

(1) Lansford, Pennsylvania, USA; average of four analyses. (2) $Mg(HCO_3)(OH)\cdot 2H_2O$, supported by proton magnetic resonance spectroscopy, TGA, and IR.

Occurrence: Typically recently formed under near-surface conditions, as efflorescences in coal mines; in fractures in serpentinites; deposits around springs; in caves due to loss of CO_2 in waters.

Association: Lansfordite, dypingite, calcite, aragonite, artinite, hydromagnesite, brucite, pyroaurite, monohydrocalcite.

Distribution: In the USA, from Nesquehoning, near Lansford, Carbon Co., Pennsylvania; near the Robinson Gulch pegmatite, Jefferson Co., Colorado. Along Rapid Creek, Yukon Territory, Canada. In France, large crystals at a coal mine at Lamure, Isère, and from Restivalgues, near Salers, Cantal. In Austria, at Kraubath, Styria. In Italy, from near Rain, Taufers, Tirol; on Monte Ramazzo, north of Borzoli, Liguria; in the Franscia asbestos mine, Val Lanterna, Val Malenco, Lombardy; from Cogne, Val d'Aosta, Piedmont; and at Viu, near Fubina, Val di Lanzo. From the Feragen ultramafic body, Sør-Trøndelag, Norway. In Australia, from Paddy's River mine, Australian Capital Territory, and under Rainbow Falls, Sempill Creek, Barrington Tops, New South Wales. Around Mt. Erebus, Victoria Land, Antarctica. In Japan, from Yoshikawa, Aichi Prefecture, and at Shiraki, Mie Prefecture. A few other minor localities are known.

Name: For its first-noted occurrence at Nesquehoning, Pennsylvania, USA.

Type Material: Yale University, New Haven, Connecticut, USA, 3.1550, 3.1566, 3.1567.

(1) Skipton lava tube caves, Australia; H_2O by difference. (2) $Mg(PO_3OH)\bullet 3H_2O$.

Occurrence: In caves, formed directly from bat guano.

Association: Hannayite, struvite (Skipton lava tube caves, Australia); biphosphammite (Petrogale Cave, Australia); monetite, struvite (Paoha Island, California, USA).

Distribution: In the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria, and the Petrogale Cave, near Madura, Western Australia. At the Niah Great Cave, Sarawak, Malaysia. Around Mt. Erebus, Victoria Land, Antarctica. On Réunion Island, Indian Ocean. From Ascension Island, south Atlantic. In the USA, on Paoha Island, Mono Lake, Mono Co., California. From near Mejillones, Antofagasta, Chile. From Ficus and Boon's Caves, Transvaal, South Africa.

Name: To honor James Cosmo Newbery (1843–1895), geologist, Melbourne, Australia, who initially found the mineral.

Type Material: Natural History Museum, Paris, France, 99.504.

Total	102.09

(1) Gold Quarry mine, Carlin, Nevada, USA; electron microprobe analysis, H_2O calculated from structure, H_2O and OH^- confirmed by IR and structure analysis; corresponding to $(Cu^{2+}_{2.00}Zn_{0.02}V^{3+}_{0.98}Fe^{3+}_{0.01}Al_{1.15})_{\Sigma=4.16}Al_8P_{7.90}O_{32}[F_{8.37}(OH)_{1.63}]_{\Sigma=10}(H_2O)_{21.65}$.

Occurrence: A weathering-derived mineral above a low grade, disseminated gold deposit in hydrothermally altered sedimentary rocks.

Association: Intermediate members of the strengite-variscite series, fluellite, hewettite, and more rarely anatase, kazakhstanite, leucophosphite, tinticite, torbernite, tyuyamunite, wavellite.

Name: For the US state from which the first specimens were collected.

Distribution: From the open-pit Gold Quarry mine, near Carlin, Eureka County, Nevada, USA.

Type Material: Systematic Reference Series, National Mineral Collection of Canada, Geological Survey of Canada, Ottawa, Ontario, Canada; NMCC68091.

Bi	69.8
Pb	3.0
Ag	0.6
Se	24.6
S	1.6
Total	99.6

(1) Nevskoye deposit, Russia; by electron microprobe, average of four analyses; corresponding to $(Bi_{0.92}Pb_{0.04}Ag_{0.02})_{\Sigma=0.98}(Se_{0.86}S_{0.14})_{\Sigma=1.00}$.

Occurrence: In quartz-cassiterite veins.

Association: Wolframite, cassiterite, natanite, laitakarite, guanajuatite.

Distribution: From the Nevskoye W–Sn deposit, 25 km northwest of Omsukchan, Magadan region, Russia [TL].

Name: For the Nevskoye deposit in Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82673.

H_2O	[35.84]	36.17
Total	[100.00]	100.00

(1) Skipton lava tube caves, Australia; H_2O by difference. (2) $Mg(PO_3OH)\cdot 3H_2O$.

Occurrence: In caves, formed directly from bat guano.

Association: Hannayite, struvite (Skipton lava tube caves, Australia); biphosphammite (Petrogale Cave, Australia); monetite, struvite (Paoha Island, California, USA).

Distribution: In the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria, and the Petrogale Cave, near Madura, Western Australia. At the Niah Great Cave, Sarawak, Malaysia. Around Mt. Erebus, Victoria Land, Antarctica. On Réunion Island, Indian Ocean. From Ascension Island, south Atlantic. In the USA, on Paoha Island, Mono Lake, Mono Co., California. From near Mejillones, Antofagasta, Chile. From Ficus and Boon's Caves, Transvaal, South Africa.

Name: To honor James Cosmo Newbery (1843–1895), geologist, Melbourne, Australia, who initially found the mineral.

Sb		0.10	
S	15.65	16.2	16.28
Total	98.39	99.4	100.00

(1) Lime Creek deposit, Canada; corresponding to $Ag_{1.96}Cu_{6.23}Pb_{28.08}Bi_{24.42}S_{68.00}$. (2) Do.; by electron microprobe, corresponding to $Ag_{1.97}Cu_{6.14}Cd_{0.36}Pb_{24.62}Bi_{26.02}Sb_{0.11}S_{68.00}$. (3) $Ag_2Cu_6Pb_{25}Bi_{26}S_{68}$.

Occurrence: In late-forming crosscutting hydrothermal quartz veins in a quartz-molybdenite stockwork (Lime Creek deposit, Canada); in mesozonal synmetamorphic quartz veins (Johnny Lyon Hills, Arizona, USA).

Association: Pyrite, galena, sphalerite, chalcopyrite, aikinite, cosalite, tetrahedrite, nuffieldite, molybdenite (Lime Creek deposit, Canada); gold, chalcopyrite, nordströmite, quartz (Johnny Lyon Hills, Arizona, USA).

Distribution: From Patsy Creek, immediately south of the Lime Creek molybdenum deposit, Kitsault, near Alice Arm, British Columbia, Canada [TL]. In the USA, from the Johnny Lyon Hills, north of Benson, Cochise Co., Arizona; at the Alaska mine, Poughkeepsie Gulch, San Juan Co., Colorado; from the Whiskey Canyon prospect, Lewis district, Lander Co., Nevada. In the Golconda prospect, Chishawasha, near Harare, Zimbabwe. From the Vale das Gatas tungsten mine, near Vila Real, Portugal. At the Felbertal tungsten mine, Salzburg, Austria.

Name: To honor Charles Stuart Ney (1918–1975), geologist in charge of early exploration at the Lime Creek deposit.

Type Material: Canadian Geological Survey, Ottawa, Canada, 68067; National Museum of Natural History, Washington, D.C., USA, 142527.

H_2O	11.88
Total	96.00

(1) Niah Great Cave, Sarawak, Malaysia; by electron microprobe, total Mn as MnO, N, H, and P by microchemical methods; corresponding to $(NH_4)_{0.93}(Mn_{0.72}Mg_{0.20}Ca_{0.06})_{\Sigma=0.98}P_{1.00}O_{3.95} \cdot 1.23H_2O$.

Occurrence: A rare mineral, derived from the breakdown of bat guano (Niah Great Cave, Sarawak, Malaysia).

Association: Newberyite, collophane, hannayite, struvite, variscite (Niah Great Cave, Sarawak, Malaysia); newberyite, sussexite, pyrochroite (Sterling Hill, New Jersey, USA).

Distribution: From the Niah Great Cave, Sarawak, Malaysia. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. In the Taguchi mine, Shidara, Aichi Prefecture, Japan.

Name: For the place of its first-noted occurrence, the Niah Great Cave, Malaysia.

Type Material: Malaysian Geological Survey, Kuching (Sarawak), Sarawak, Malaysia; Bureau of Mineral Resources, Canberra; Government Chemical Laboratories, Perth, Australia, MDC5089.

Nickel Ni

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As euhedral cubic grains or intergrown cubes, to 0.1 mm, enclosed in heazlewoodite; also as anhedral "spiderlike" irregular masses between heazlewoodite grains; as flakes, to 0.75 mm, in a placer. *Twinning:* On {111}.

Physical Properties: *Tenacity:* Malleable. Hardness = 4.5 VHN = 172–184 (50 g load). D(meas.) = 8.90 (synthetic). D(calc.) = 8.91

Optical Properties: Opaque. *Color:* Bright silver; white in reflected light, more bluish white than heazlewoodite. *Luster:* Metallic.
R: n.d.

Cell Data: *Space Group:* $Fm3m$. a = 3.5238 Z = 4

X-ray Powder Pattern: Synthetic.
2.034 (100), 1.762 (42), 1.246 (21), 1.0624 (20), 0.7880 (15), 0.8084 (14), 1.0172 (7)

Chemistry:

Ni	> 98	96.30
Fe	trace	1.77
Co	trace	0.69
Total	> 98	98.76

(1) Bogota, New Caledonia; by electron microprobe. (2) Jerry River, New Zealand; by electron microprobe.

Occurrence: In serpentinized ultramafic rocks as a result of low-temperature hydrothermal activity.

Association: Heazlewoodite, pyrite, pyrrhotite, pentlandite, godlevskite, orcelite, millerite, nickel, copper, chalcopyrite, chalcocite, galena.

Distribution: From Bogota, near Canala, New Caledonia [TL]. In the Jerry River, in placers derived from the Red Hills Range, southern Westland, New Zealand. From Mount Clifford and Cutmore, near Agnew, Western Australia, and the Nairne pyrite deposit, South Australia. At Kaltenberg, Turtmauntal, Valais, Switzerland. In the Kauniinvaara ultramafic lens, near Lake Kauniinlampi, eastern Finland. On Grasshopper Mountain, Tulameen, British Columbia, Canada.

Name: From the German *nickel*, *demon*, from a contraction of *kupfernickel*, or *Devil's copper*, as the mineral was believed to contain copper but yielded none.

Type Material: n.d.

References: (1) Ramdohr, P. (1968) The wide-spread paragenesis of ore minerals originating during serpentinization (with some data on new and insufficiently described minerals). Geol. Rudn. Nickelaustinite $Ca(Ni,Zn)(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Crystals are flattened on {110}, elongated along [001], commonly fibrous, to 0.3 mm, in radial aggregates.

Physical Properties: *Cleavage:* On {110}, good. Hardness = 4 D(meas.) = n.d. D(calc.) = 4.27

Optical Properties: Transparent. *Color:* Yellowish green to grass-green. *Streak:* White. *Luster:* Silky to subadamantine.
Optical Class: Biaxial (+). *Orientation:* $X = c$. $\alpha = 1.770(2)$ β = n.d. $\gamma = 1.778(3)$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_12_12_1$. $a = 7.455(3)$ $b = 8.955(3)$ $c = 5.916(2)$ Z = 4

X-ray Powder Pattern: Bou Azzer, Morocco.
2.626 (10), 3.151 (9), 2.769 (9), 1.605 (9), 2.577 (8), 2.508 (8), 2.058 (7)

Chemistry:

	(1)
As_2O_5	43.70
FeO	0.10
CoO	1.22
NiO	20.40
CuO	0.06
ZnO	6.88
MgO	1.00
CaO	23.32
H_2O	[3.32]
Total	[100.00]

(1) Bou Azzer, Morocco; by electron microprobe, H_2O by difference; corresponds to $Ca_{1.01}(Ni_{0.67}Zn_{0.21}Mg_{0.06}Co_{0.04}Cu_{0.01})_{\Sigma=0.99}(As_{0.93}O_4)(OH)$.

Mineral Group: Adelite group.

Occurrence: On dolomite.

Association: Roselite, calcite, dolomite, chalcopyrite, skutterudite.

Distribution: At Bou Azzer, Anti-Atlas Mountains, Morocco.

Name: For the predominance of *nickel* in the composition and relation to *austinite*.

Type Material: National School of Mines, Paris, France.

References: (1) Cesbron, F.P., D. Ginderow, R. Giraud, P. Pelisson, and F. Nickelbischofite $NiCl_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As a 2 mm patch of crystalline material on the surface of drill core; a minor component of powdery sublimates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.932 Deliquescent; soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Green.
Optical Class: Biaxial (+) (synthetic). *Pleochroism:* Weak; X = greenish yellow; Z = green. *Orientation:* $Y = b$; $X \wedge c = 8°$. *Absorption:* $Z > X$. $\alpha = 1.590$ $\beta = 1.620$ $\gamma = 1.648$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $I2/m$ (synthetic). $a = 8.786(2)$ $b = 7.076(2)$ $c = 6.625(2)$ $\beta = 97.27(1)°$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 25-1044).
5.59 (100), 5.50 (40), 4.82 (35), 2.926 (35), 2.747 (30), 2.689 (20), 2.178 (20)

Chemistry: Natural material shown to contain nickel and chlorine, and to be identical with synthetic material by X-ray diffraction.

Occurrence: As an alteration product on the surface of drill core from an ultramafic intrusion containing low-grade nickel mineralization, formed after storage (Amos, Canada); as a volcanic sublimate (Mt. Shirane, Japan).

Association: Coalingite, paratacamite, pentlandite, awaruite, heazlewoodite (Amos, Canada); alunogen (Mt. Shirane, Japan).

Distribution: From the Dumont ultramafic intrusive, 27 km west of Amos, Quebec, Canada. On Mt. Shirane, Gumma Prefecture, Japan.

Name: As the compositional *nickel* analog of *bischofite*, with which it is, however, not isostructural.

Type Material: Canadian Geological Survey, Ottawa, Canada, 17980.

References: (1) Jambor, J.L. (1975) Secondary minerals in an ultramafic intrusion, Amos area, Quebec. Geol. Surv. Canada Paper 75-1A, 261–263. (2) Crook, W.W., III and J.L. Nickelblödite $Na_2Ni(SO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As flat crystallites, to 150 μm; with smooth forms, perhaps rounded by solution, in efflorescences.

Physical Properties: Hardness = n.d. VHN = 104–139 (5 gm load). D(meas.) = 2.43 D(calc.) = 2.432–2.455

Optical Properties: Translucent. *Color:* Pale yellowish green to pale green; in transmitted light, colorless to pale green.
Optical Class: Biaxial (–). α = 1.504–1.513 β = [1.507–1.518] γ = 1.509–1.520
2V(meas.) = 60°–70°

Cell Data: *Space Group:* $P2_1/a$ (by analogy to blödite). $a = 10.87$ $b = 8.07$ $c = 5.46$ $\beta = 100°43'$ Z = 2

X-ray Powder Pattern: Kambalda, Western Australia.
3.223 (10), 4.466 (9), 3.190 (8), 4.193 (7), 3.720 (6), 2.589 (6), 3.920 (5)

Chemistry:

	(1)	(2)
SO_3	49.00	43.41
FeO	1.03	
NiO	15.41	20.25
CuO	0.04	
MgO	1.53	
Na_2O	16.35	16.80
H_2O	[16.64]	19.54
Total	[100.00]	100.00

(1) Kambalda, Western Australia; by electron microprobe, recalculated to 100% from an elemental analysis, H_2O by difference; corresponding to $Na_{2.02}(Ni_{0.79}Mg_{0.14}Fe_{0.06})_{\Sigma=0.99}(SO_4)_{2.00} \cdot 3.17H_2O$. (2) $Na_2Ni(SO_4)_2 \cdot 4H_2O$.

Occurrence: By evaporation of fluids containing Na, Ni, and SO_4.

Association: Violarite, pyrite, siderite, halite (Kambalda, Western Australia); morenosite (Carr Boyd Rocks mine, Western Australia).

Distribution: From the Durkin nickel mine, Kambalda, 56 km south of Kalgoorlie, and in the Carr Boyd Rocks mine, Goongarrie, Western Australia.

Name: For its relation to *blödite*, with Ni > Mg.

Type Material: Western Australian Museum, Perth, Australia, M.63.1991, M.64.1991, MDC5657; The Natural History Museum, London, England, 1976,378; National Museum of Natural History, Washington, D.C., USA, 136207.

Nickel-boussingaultite $(NH_4)_2(Ni,Mg)(SO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic grains, to < 0.01 mm, in thin films.

Physical Properties: *Cleavage:* Imperfect. Hardness = 2.5 D(meas.) = n.d. D(calc.) = 1.85 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Greenish blue to emerald-green; green in transmitted light.
Optical Class: Biaxial (+). *Pleochroism:* X = pale blue; Z = yellow. *Orientation:* $X \wedge c = 0°$–$4°$. $\alpha = 1.490$ $\beta = 1.494$ $\gamma = 1.501$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/b$ (by analogy to synthetic $(NH_4)_2Ni(SO_4)_2 \cdot 6H_2O$).
$a = 9.241(2)$ $b = 12.544(15)$ $c = 6.243(5)$ $\beta = 106°58(6)'$ Z = 2

X-ray Powder Pattern: Noril'sk, Russia.
4.153 (10), 3.759 (8), 11.7 (7), 2.119 (7), 3.022 (6), 2.793 (6), 1.806 (6)

Chemistry:

	(1)
SO_3	40.20
FeO	0.37
NiO	16.84
CuO	2.74
MgO	2.30
Na_2O	0.52
$(NH_4)_2O$	[10.40]
H_2O	27.42
Total	[100.79]

(1) Noril'sk, Russia; original total given as 100.89%, $(NH_4)^{1+}$ calculated for charge balance, found present by IR; corresponds to $[(NH_4)_{1.59}Na_{0.07}]_{\Sigma=1.66}(Ni_{0.90}Mg_{0.23}Cu_{0.14}Fe_{0.02})_{\Sigma=1.29}(SO_4)_2 \cdot 6H_2O$.

Mineral Group: Picromerite group.

Occurrence: In an underground nickel ore stockpile, around and on a wooden timber, and on "limonite" (Noril'sk, Russia).

Association: Pentlandite, chalcopyrite, "limonite" (Noril'sk, Russia); wupatkiite, hydrohonessite, pickeringite (Cameron, Arizona, USA).

Distribution: From the Talnakh area, Noril'sk, western Siberia, Russia. At the Heimberg quarry, Wolfshagen, Harz Mountains, Germany. In the USA, from a prospect 13 km east-southeast of Gray Mountain, Cameron district, Coconino Co., Arizona.

Name: As the *nickel*-bearing analog of *boussingaultite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 83553.

Nickelhexahydrite $(Ni, Mg, Fe^{2+})SO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In crystalline crusts and coatings, which may be formed only during relatively dry seasons.

Physical Properties: *Cleavage:* On {010}, probable, perfect; on {100}, less perfect. Hardness = n.d. D(meas.) = 2.036 D(calc.) = 2.05 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Bluish green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Z \wedge c = 45°$. α = 1.469–1.470 β = n.d. γ = 1.493–1.494 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 9.880(3)$ $b = 7.288(2)$ $c = 24.130(3)$ $\beta = 98.32(2)°$ Z = 8

X-ray Powder Pattern: Noril'sk, Russia.
4.35 (10), 2.89 (9), 3.98 (8), 1.994 (8), 1.856 (7), 5.41 (6), 5.07 (6)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
SO_3	30.82	30.67	30.46	CuO	0.26		
Fe_2O_3	0.18			ZnO	0.00		
FeO	2.63			MgO	2.43	4.07	
MnO	0.07			CaO	0.00		
CoO	0.03	0.21		H_2O	41.05	41.96	41.12
NiO	22.57	22.69	28.42	Total	100.04	99.60	100.00

(1) Noril'sk, Russia; corresponds to $(Ni_{0.77}Mg_{0.16}Fe_{0.10})_{\Sigma=1.03}(SO_4)_{0.99} \cdot 5.84H_2O$. (2) Jáchymov, Czech Republic; corresponds to $(Ni_{0.78}Mg_{0.26}Co_{0.01})_{\Sigma=1.05}(SO_4)_{0.99} \cdot 5.99H_2O$. (3) $NiSO_4 \cdot 6H_2O$.

Polymorphism & Series: Dimorphous with retgersite.

Mineral Group: Hexahydrite group.

Occurrence: Precipitated from mine waters in the bottom of an open-pit nickel mine, and on nickel-bearing gabbro-dolerite rocks in the oxidation zone (Noril'sk region, Russia); in shear zones in talc overlying ultramafic rocks (Lahnaslampi deposit, Finland); formed from H_2O solution below 31.5 °C.

Association: Morenosite.

Distribution: From the Severnaya mine, Noril'sk, western Siberia, and in the Izumrudnye Kopi emerald mines, Asbest district, Ural Mountains, Russia. At the Lahnaslampi talc deposit, Finland. From the Riffelalp and Pollux, near Zermatt, Valais, Switzerland. At Droskovac, near Vares, Bosnia-Herzegovina. From Jáchymov (Joachimsthal), Czech Republic. At the Bauhaus mine, Richelsdorfer Mountains, Hesse, Germany. In Australia, from Noddy's Creek, Tasmania, and from Kambalda, 56 km south of Kalgoorlie, Western Australia.

Name: As the *nickel*-dominant analog of *hexahydrite*.

Type Material: Mineralogical Institute, Tomsk Polytechnical Institute, Tomsk, Russia.

Nickeline NiAs

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Commonly in granular aggregates, reniform masses with radial structure, and reticulated and arborescent growths. Rarely as distorted, horizontally striated, $\{10\bar{1}1\}$ terminated crystals, to 1.5 cm. *Twinning:* On $\{10\bar{1}1\}$ producing fourlings; possibly on $\{31\bar{4}1\}$.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–5.5 VHN = n.d. D(meas.) = 7.784 D(calc.) = 7.834

Optical Properties: Opaque. *Color:* Pale copper-red, tarnishes gray to blackish; white with strong yellowish pink hue in reflected light. *Streak:* Pale brownish black. *Luster:* Metallic. *Pleochroism:* Strong; whitish, yellow-pink to pale brownish pink. *Anisotropism:* Very strong, pale greenish yellow to slate-gray in air.
R_1–R_2: (400) 39.2–45.4, (420) 38.0–44.2, (440) 36.8–43.5, (460) 36.2–43.2, (480) 37.2–44.3, (500) 39.6–46.4, (520) 42.3–48.6, (540) 45.3–50.7, (560) 48.2–52.8, (580) 51.0–54.8, (600) 53.7–56.7, (620) 55.9–58.4, (640) 57.8–59.9, (660) 59.4–61.3, (680) 61.0–62.5, (700) 62.2–63.6

Cell Data: *Space Group:* $P6_3/mmc$. $a = 3.621(1)$ $c = 5.042(1)$ $Z = 2$

X-ray Powder Pattern: Unknown locality.
2.66 (100), 1.961 (90), 1.811 (80), 1.071 (40), 1.328 (30), 1.033 (30), 0.821 (30)

Chemistry:

	(1)	(2)
Ni	43.2	43.93
Co	0.4	
Fe	0.2	
As	55.9	56.07
Sb	0.1	
S	0.1	
Total	99.9	100.00

(1) Jáchymov, Czech Republic; by electron microprobe, corresponds to $(Ni_{0.98}Co_{0.01}Fe_{0.01})_{\Sigma=1.00}As_{1.00}$. (2) NiAs.

Mineral Group: Nickeline group.

Occurrence: A minor component of Ni–Cu ores in high-temperature hydrothermal veins; massive and in disseminations in peridotite and norite.

Association: Skutterudite–nickel-skutterudite, safflorite, rammelsbergite, gersdorffite, maucherite, breithauptite, michenerite, bismuth, bismuthinite.

Distribution: In Germany, from Eisleben and Mansfeld, Saxony-Anhalt; at St. Andreasberg, Harz Mountains; from Schneeberg, Saxony; crystallized at Richelsdorf, Hesse-Nassau. From Schladming, Austria. At Jáchymov (Joachimsthal), Czech Republic. From the Chalanches mine, near Allemont, Isère, France. In the USA, at Silver Cliff, Custer Co., and in the Gem mine, Fremont Co., Colorado. In Ontario, Canada, from the Cobalt–Gowganda and Sudbury districts, and at Silver Islet, Thunder Bay district. At Cochabamba, Bolivia. From the Aït Ahmane mine, 10 km east of Bou Azzer, Morocco. In the Talmessi mine, 35 km west of Anarak, Iran. At the Ban Phuc Ni–Cu deposit, northwestern Vietnam. Many additional occurrences have been noted.

Name: From the German *kupfernickel*, or *Devil's copper*, as the mineral was believed to contain copper but yielded none.

Nickelphosphide $(Ni, Fe)_3P$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As lathlike crystals, elongated along [0001], to 2 μm, found in perchloric acid-resistant residues.

Physical Properties: Hardness = ∼9 VHN = 2600–3500 (100 g load) (synthetic). D(meas.) = 3.167–3.171 (synthetic). D(calc.) = 3.11

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (–) (synthetic). $\omega = 2.03$ $\epsilon = 2.02$

Cell Data: *Space Group:* $P31c$ (synthetic). $a = 7.74(2)$ $c = 5.61(2)$ Z = 4

X-ray Powder Pattern: Source material not stated.
4.31 (32), 2.15 (32), 2.87 (28), 2.59 (28), 6.70 (17), 3.35 (17), 2.81 (17)

Chemistry:

	(1)	(2)
Si	57.2	60.06
N	42.8	39.94
Total	100.0	100.00

(1) Indarch meteorite; by scanning transmission electron microscope, average of eight analyses; corresponding to $Si_{2.79}N_{4.21}$. (2) Si_3N_4.

Occurrence: A very rare component of enstatite chondrite and chondrite meteorites, probably formed by exsolution during metamorphism.

Association: Diamond, kamacite, perryite, schreibersite, troilite, spinel, chromite, hibonite, rutile.

Distribution: In the Indarch enstatite chondrite meteorite, and the Inman, Adrar, and Tieschitz chondrite meteorites.

Name: Honors Alfred Otto Carl Nier (1912–1994), Professor of Chemistry at the University of Minnesota, Minneapolis, Minnesota, USA, a founder of mass spectroscopy.

Type Material: The Natural History Museum, London, England.

Nickel-skutterudite $(Ni, Co)As_{2-3}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Rare as euhedral crystals with combinations of {001}, {111}, and rarely {011}, to 2 mm; also as reticular skeletal growths, distorted aggregates and granular; {001} typically warped. *Twinning:* On {112} as sixlings; commonly complex and distorted.

Physical Properties: *Cleavage:* Distinct on {001} and {111}, in traces on {011}. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5.5–6 VHN = 642–740 (100 g load). D(meas.) = 6.5 D(calc.) = [5.07–6.90]

Optical Properties: Opaque. *Color:* Tin-white to silver-gray, may tarnish gray or iridescent; in reflected light, yellowish white, but anisotropic zones may be somewhat reddish. *Streak:* Black. *Luster:* Bright metallic on fresh surface. *Anisotropism:* Weak to distinct in some zones.

R: (400) 52.0, (420) 52.5, (440) 53.3, (460) 53.8, (480) 54.5, (500) 55.0, (520) 55.3, (540) 55.4, (560) 55.3, (580) 55.1, (600) 54.7, (620) 54.3, (640) 53.9, (660) 53.4, (680) 52.8, (700) 52.5

(1) Bullard Peak, New Mexico, USA; recalculated to 100.00% after deduction of SiO_2 4.56% and Ag 8.38%; then corresponds to $(Ni_{0.58}Co_{0.27}Fe_{0.15})_{\Sigma=1.00}As_{2.78}$. (2) Schneeberg, Germany; corresponds to $(Ni_{0.63}Co_{0.19}Fe_{0.15}Cu_{0.03})_{\Sigma=1.00}As_{2.46}$. (3) $NiAs_2$. (4) $NiAs_3$.

Polymorphism & Series: Forms a series with skutterudite.

Occurrence: In hydrothermal veins deposited at medium temperature.

Association: Arsenopyrite, silver, bismuth, calcite, siderite, barite, quartz.

Distribution: In the USA, in the Black Hawk district, on Bullard Peak, 24 km southwest of Silver City, Grant Co., from the Rose [TL] and Alhambra mines. In Canada, at the O'Brien mine and elsewhere, Cobalt, Ontario. In Germany, at Bieber and Riechelsdorf, Hesse; St. Andreasberg, Harz Mountains; and Annaberg and Schneeberg, Saxony. From Horní Slavkov (Schlaggenwald) and Jáchymov (Joachimsthal), Czech Republic. At Dobšiná (Dobschau), Slovakia. From Saint-Marie-aux-Mines, Haut-Rhin, France. In the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia.

Name: Nickel, as the nickel member of the series; skutterudite from its locality at Skutterud, Norway.

Nickel-zippeite $Ni_2(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Very fine grained, in crusts and coatings. *Twinning:* Common on $\{h0l\}$ with symmetrical extinction $Z \wedge Z' \simeq 28°$; may be polysynthetic or as fourlings, with extinction $Y \wedge Y' \simeq 74°$.

Physical Properties: *Cleavage:* Perfect to {010}; perhaps another, inclined (synthetic). Hardness = ∼2 (synthetic). D(meas.) = > 3.3 D(calc.) = n.d. Radioactive; fluoresces bright yellow under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Tan to brownish yellow, yellow-orange. *Optical Class:* Biaxial (+) (synthetic). *Pleochroism:* X = colorless to pale yellow; Y = yellow; Z = dark yellow to golden yellow. *Orientation:* $Z = c$. α = 1.73–1.74 β = 1.76–1.77 γ = 1.82–1.83 2V(meas.) = Moderate to large.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Happy Jack mine, Utah, USA; nearly identical to cobalt-zippeite. 3.45 (100), 7.10 (93), 3.10 (67), 3.56 (42), 9.63 (37), 2.481 (31), 2.644 (30)

Chemistry:

NiO	2.14	6.01
MgO	0.54	
H_2O	18.1	15.23
Total	[99.8]	100.00

(1) Happy Jack mine, Utah, USA; recalculated after deduction of SiO_2 1.23%, Al_2O_3 0.5%, TiO_2 0.08%, $(Ce,Y)_2O_3$ 0.41%; corresponds to $(Ni_{0.78}Co_{0.48}Mg_{0.36}Fe_{0.26}Mn_{0.12})_{\Sigma=2.00}$ $(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$. (2) $Ni_2(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$.

Occurrence: Typically as secondary coatings on mine walls, derived from oxidation of uranium-bearing primary Ni–Co sulfides.

Association: Cobalt-zippeite, sodium-zippeite, zippeite, johannite, uranopilite, zeunerite, schröckingerite, bayleyite, chalcanthite, antlerite, siderotil, bieberite, erythrite, epsomite, gypsum, uraninite.

Distribution: In the USA, from the Happy Jack mine, White Canyon, San Juan Co., and at Castleton, La Sal Mountains, Grand Co., Utah; in the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., Arizona. From Great Bear Lake, Northwest Territories, Canada. At Jáchymov (Joachimsthal), Czech Republic.

Name: For its dominant content of *nickel* and relation to other *zippeite* group species.

Type Material: n.d.

References: (1) Frondel, C., J. Ito, R.M. Honea, and A.M. Weeks (1976) Mineralogy of the zippeite group. Can. Mineral., 14, 429–436. (2) Haacke, D.F. and P.A. Williams (1979) The aqueous chemistry of uranium minerals. Part I. Divalent cation zippeïte. Mineral. Mag., 43, 539–541.

(1) Nickenicher Sattel volcano, Germany; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO; corresponds to $(Na_{0.81}K_{0.01})_{\Sigma=0.82}Ca_{0.27}Cu_{0.32}(Mg_{2.42}Fe_{0.38}Al_{0.12}Mn_{0.03})_{\Sigma=2.95}[(As_{1.02}P_{0.02})_{\Sigma=1.04}O_4]_3$; crystal structure determination gives $Na_{0.76}Ca_{0.41}Cu_{0.39}(Mg_{2.33}Fe_{0.52}Al_{0.12}Mn_{0.03})_{\Sigma=3.00}[(As_{0.98}P_{0.02})_{\Sigma=1.00}O_4]_3$.

Occurrence: In a cavity in volcanic scoria.

Association: Vanadinite, duhamelite.

Distribution: From the Nickenicher Sattel volcano, Eifel district, Germany.

Name: For the village of Nickenich, Germany, nearby the Nickenicher Sattel volcano.

Type Material: University of Vienna, Vienna, Austria.

(1) Laurium, Greece; by electron microprobe, average of seven analyses, H_2O by difference, 18.9% by TGA; corresponds to $Cu_{4.29}Cd_{0.96}(SO_4)_{2.01}(OH)_{6.50} \cdot 3.46H_2O$. (2) $Cu_4Cd(SO_4)_2(OH)_6 \cdot 4H_2O$.

Occurrence: Very rare in the oxidation zone of a zinc-rich hydrothermal orebody in brecciated marble, formed as an alteration product of chalcopyrite and greenockite.

Association: Gypsum, malachite, chalcanthite, brochantite, hemimorphite, hydrozincite, aurichalcite, monteponite, otavite, sphalerite, greenockite, hawleyite, pyrite, galena.

Distribution: From Laurium, Greece.

Name: To honor Dr. Gerhard Niedermayr (1941–), Curator, Natural History Museum, Vienna, Austria.

Type Material: Natural History Museum, Vienna; Institute for Mineralogy and Crystallography, Vienna University, Vienna, Austria.

Total	100.95	100.00

(1) Menzenschwand, Baden-Württemberg, Germany; average of 2 electron microprobe analyses, H_2O calculated from structure analysis, anionic groups confirmed by IR, corresponding to $(K_{0.430}\square_{0.570})(AsO_4)_{0.987}(UO_2)_{3.106}(OH)_4 \cdot 1.00H_2O$. (2) $K(UO_2)_3(AsO_4)(OH)_4 \cdot H_2O$.

Occurrence: A secondary mineral formed near oxidizing uraninite.

Association: Hematite, pyrite, schoepite, metazeunerite.

Distribution: From mine dumps near the village of Menzenschwand, Krunkelbach valley, southern Black Forest, Baden-Württemberg, Germany.

Name: Honors Niels Hendrik David Bohr (1885-1962), Danish physicist.

Type Material: Staatliches Museum für Naturkunde, Stuttgart, Germany; Laboratory of Mineralogy, University of Liège, Belgium (no. 20355).

References: (1) Walenta, K., F. Hatert, T. Theye, F. Lissner, and K. Röller (2009) Nielsbohrite, a new potassium uranyl arsenate from the uranium deposit of Menzenschwand, southern Black Forest, Germany. Eur. J. Mineral., 21, 515–520. (2) (2009) Amer. Mineral., 94, 1499 (abs. ref. 1).

Nielsenite $PdCu_3$

Crystal Data: Tetragonal. *Point Group*: 4*mm*. As droplet shaped or irregular grains, to 0.05 mm.

Physical Properties: *Cleavage*: None. *Fracture*: None. *Tenacity*: Sectile. Hardness = n.d. D(meas.) = n.d. D(calc.) = 9.53

Optical Properties: Opaque. *Color*: Steel gray; bright creamy white in reflected light.
Streak: Black. *Luster*: Metallic.
Optical Class: n.d.
R_1-R_2: (470) 57.6-47.5, (546) 60.85-50.8, (589) 62.8-53.0, (650) 66.7-57.5

Cell Data: *Space Group*: *P*4*mm* (synthetic). a = 3.7125(8) c = 25.62(1) Z = 4

X-ray Powder Pattern: Skaergaard intrusion, Kangerdlunssuaq area, East Greenland.
2.137 (100), 1.8596 (70), 1.3042 (60), 1.1181 (55), 1.8337 (40), 1.0663 (30), 0.8459 (25)

Chemistry:

	(1)	(2)

Au	3.70	
Cu	61.96	64.18
Fe	0.59	
Pb	0.17	
Total	99.36	100.00

(1) Skaergaard intrusion, East Greenland; average of 11 EDS analyses, corresponding to $(Pd_{0.862}Au_{0.058}Pt_{0.049}Fe_{0.028}Pb_{0.003})(Cu_{2.996}Fe_{0.004})_{\Sigma=3}$.
(2) $PdCu_3$.

Occurrence: As the crystallized products of immiscible melts in thoelitic gabbro and that formed at temperatures at of below 508° C, in a highly differentiated layered intrusion.

Association: Bornite-chalcocite, bornite with trace Ni-Co and Zn sulfides, skaergaardite, keithconnite, vasilite, zvyagintsevite, (Cu,Pd,Au), (Pd,Cu,Sn), (Pt,Fe,Cu,Pd) alloys, and unnamed phases Au_3Cu and PdAuCu.

Distribution: Platinova Reef, Skaergaard intrusion, Kangerdlunssuaq area, East Greenland.

Name: Honors Troels F.D. Nielsen (b. 1950), a geologist with the Geological Survey of Denmark and Greenland.

Type Material: Geologisk Museum, Copenhagen K, Denmark, 2008.1.

References: (1) Macdonald, A.M., L.J. Cabri, N.S. Rudashevsky, C.J. Stanley, V.N. Rudashevsky, and K.C. Total	100.0	100.00

(1) Indarch meteorite; by scanning transmission electron microscope, average of eight analyses; corresponding to $Si_{2.79}N_{4.21}$. (2) Si_3N_4.

Occurrence: A very rare component of enstatite chondrite and chondrite meteorites, probably formed by exsolution during metamorphism.

Association: Diamond, kamacite, perryite, schreibersite, troilite, spinel, chromite, hibonite, rutile.

Distribution: In the Indarch enstatite chondrite meteorite, and the Inman, Adrar, and Tieschitz chondrite meteorites.

Name: Honors Alfred Otto Carl Nier (1912–1994), Professor of Chemistry at the University of Minnesota, Minneapolis, Minnesota, USA, a founder of mass spectroscopy.

Type Material: The Natural History Museum, London, England.

(1) Novofrolovskoye deposit, Russia. (2) Fuka, Japan; corresponds to $Ca_{3.05}B_{5.99}O_{6.04}(OH)_{12}\cdot 1.96H_2O$. (3) $Ca_3B_6O_6(OH)_{12}\cdot 2H_2O$.

Occurrence: In a skarn formed by quartz diorite intruding limestone (Novofrolovskoye deposit, Russia); near gehlenite-spurrite skarn (Fuka, Japan).

Association: Grossular–andradite, szaibélyite, sibirskite, calciborite, dolomite, calcite (Novofrolovskoye deposit, Russia); olshanskyite, pentahydroborite, sibirskite, calcite (Fuka, Japan).

Distribution: From the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains, Russia. At Fuka, near Bicchu, Okayama Prefecture, Japan. Very large crystals from Charcas, San Luis Potosi, Mexico.

Name: Honors Roman Vladimirovich Nifontov (1901–1960), Russian geologist who studied sedimentary and placer deposits.

Type Material: Vernadsky Geological Museum, Moscow, 48611; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64942.

(1) Insizwa deposit, South Africa; by electron microprobe, corresponding to $Pt_{1.00}(Sn_{0.85}Sb_{0.12}Bi_{0.04})_{\Sigma=1.01}$. (2) Sudbury, Canada; by electron microprobe, corresponding to $(Pt_{0.98}Pd_{0.01})_{\Sigma=0.99}(Sn_{0.97}Sb_{0.03}Bi_{0.01})_{\Sigma=1.01}$. (3) PtSn.

Mineral Group: Nickeline group.

Occurrence: In late-forming hydrothermal veins.

Association: Pentlandite, chalcopyrite, bornite, parkerite, insizwaite, cubanite, pyrrhotite (Insizwa deposit, South Africa); stannopalladinite, hessite, platinum and palladium tellurides (Monchegorsk, Russia); froodite (Sudbury, Canada); leadamalgam, chromite, ilmenite, magnetite, gersdorffite, pyrite, chalcopyrite, violarite, millerite, galena, stibnite, argentian gold, sperrylite, iridosmine, platinum, merenskyite, kotulskite (Shiaonanshan, China).

Distribution: From the Insizwa Cu–Ni deposit, Waterfall Gorge, Eastern Cape, South Africa [TL]. At Monchegorsk, Kola Peninsula, and the Talnakh area, Noril'sk region, western Siberia, Russia. In China, From Shiaonanshan, Inner Mongolia. At the Szklary serpentinite massif, Poland. In the Strathcona mine, Sudbury, Ontario, Canada. From Fox Gulch, Goodnews Bay, Alaska, USA.

Name: In honor of Professor Paul Niggli (1888–1953), Swiss mineralogist, University of Zurich, Zurich, Switzerland.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162610.

(1) Bon Accord, South Africa; corresponds to $(Ni_{2.62}Mg_{1.66}Al_{0.98}Fe^{3+}_{0.36}Fe^{2+}_{0.26}Ca_{0.04}Co_{0.04})_{\Sigma=5.96}(Si_{3.01}Al_{0.99})_{\Sigma=4.00}O_{10.29}(OH)_{7.71}$.

Mineral Group: Chlorite group.

Occurrence: In a small tabular body of nickeliferous serpentinite, probably a contact deposit, along the junction of quartzite and an ultramafic intrusive; it appears to have formed at ~730 °C and < 2 kbar during thermal metamorphism, possibly of a nickel-rich meteorite.

Association: Willemseite, nickeloan talc, ferroan trevorite, bonaccordite, violarite, millerite, reevesite, goethite.

Distribution: From three km west of the Scotia talc mine, Bon Accord area, Barberton, Transvaal, South Africa.

Name: An acronym for the National Institute of Metallurgy of South Africa.

Type Material: National Museum of Natural History, Washington, D.C., USA, 132463–132465.

References: (1) Hiemstra, S.A. and S.A. De Waal (1968) Nickel minerals from Barberton. II. Nimite, a nickelian chlorite. Nat. Inst. Met. (South Africa) Res. Rep. 344, 1–10. (2) (1969) Amer. Ningyoite $(U, Ca, Ce)_2(PO_4)_2 \cdot 1{-}2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* 222 (probable). Acicular to elongated lozenge-shaped crystals, to 5 μm; may form star-shaped aggregates.

Physical Properties: *Tenacity:* Friable. Hardness = n.d. D(meas.) = > 3.30 D(calc.) = [4.70] Radioactive.

Optical Properties: Semitransparent. *Color:* Brownish green to brown. *Optical Class:* Biaxial; low birefringence. *Pleochroism:* Slight; X = pale brown. *Orientation:* Parallel extinction; positive elongation. $n = 1.60$–1.70

Cell Data: *Space Group:* $P222$ (probable). $a = 6.78(3)$ $b = 12.10(5)$ $c = 6.38(3)$ $Z = 3$

X-ray Powder Pattern: Ningyo-Toge mine, Japan.

(1) Ningyo-Toge mine, Japan; RE $\approx$ a few %, which may be in included apatite, corresponds to $Ca_{0.92}U_{0.73}Fe_{0.56}(PO_4)_2 \cdot 3.47H_2O$.

Mineral Group: Rhabdophane group.

Occurrence: The principal uranium mineral, as coatings and filling cavities in carbonaceous conglomerate (Ningyo mine, Japan); in uranium deposits in organic-rich conglomerate-sandstone-mudstone (British Columbia, Canada).

Association: Pyrite, marcasite, sphalerite, apatite, chlorite, gypsum, quartz, hypersthene, feldspar, clay minerals (Ningyo mine, Japan); saléeite, autunite, uraninite (Okanagan district, Canada).

Distribution: From the Ningyo-Toge uranium mine, Tottori Prefecture, Japan. In the Tyee and Blizzard uranium deposits, 60 and 30 km southeast of Kelowna, Okanagan district, British Columbia, Canada. From the Dzhantuar and Rudnoye uranium deposits, Auminzatau Mountains, central Kyzylkum region, Uzbekistan. At an undefined locality in the Czech Republic.

Name: For Ningyo Pass, Japan, where the mine in which the mineral was first found is located.

Type Material: The Natural History Museum, London, England, 1960,92; National Museum of Natural History, Washington, D.C., USA, 113822, 115885.

Niningerite $(Mg, Fe^{2+}, Mn)S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As grains intimately intergrown with kamacite and troilite; grains may contain oriented exsolution lamellae of troilite and minute grains of kamacite.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 3.21–3.59

Optical Properties: Opaque. *Color:* Gray in reflected light. *Luster:* Metallic.
R: n.d.

Cell Data: *Space Group:* $Fm3m$ (by analogy to synthetic). a = 5.17(2) Z = 4

X-ray Powder Pattern: Synthetic MgS.

(1) Indarch meteorite; by electron microprobe, corresponds to $(Mg_{0.56}Fe_{0.36}Mn_{0.09}Ca_{0.02}Cr_{0.02})_{\Sigma=1.05}S_{1.00}$. (2) Kota-Kota meteorite; by electron microprobe, corresponds to $(Mg_{0.66}Fe_{0.19}Mn_{0.14}Ca_{0.01})_{\Sigma=1.00}S_{1.00}$. (3) (Mg, Fe)S with Mg:Fe = 1:1.

Mineral Group: Galena group.

Occurrence: In less extensively metamorphosed enstatite chondrite meteorites.

Association: "Nickel-iron" (kamacite), troilite.

Distribution: In the Indarch [TL], St. Marks [TL], Kota-Kota [TL], Qingzhen, Yamoto 691, Yamoto 74370, South Oman, Kaidun, etc. enstatite chondrite meteorites.

Name: In honor of Harvey Harlow Nininger (1887–1986), of Sedona, Arizona, USA, for his contributions to meteoritics.

Type Material: n.d.

(1–2) Kalgoorlie, Western Australia; by electron microprobe; V and Fe valences and $(OH)^{1-}$ from crystal-structure analysis, corresponding respectively to $(V^{3+}_{6.9}Fe^{3+}_{1.6}Fe^{2+}_{0.6}Ti_{0.6}Al_{0.3})_{\Sigma=10.0}O_{14}(OH)_2$ and $(V^{3+}_{5.2}Fe^{3+}_{2.4}Fe^{2+}_{1.1}Ti_{1.1}Al_{0.2})_{\Sigma=10.0}O_{14}(OH)_2$.

Occurrence: In hydrothermal uranium deposits (Saskatchewan, Canada); in gold deposits in metamorphosed greenstones (Kalgoorlie, Western Australia).

Association: Dolomite, calcite, quartz, uraninite, pyrite, chalcopyrite, galena, ilmenite, hematite, carnotite (Saskatchewan, Canada); gold, gold tellurides, vanadian muscovite, tourmaline, tivanite, vanadian hematite, vanadian magnetite (Kalgoorlie, Western Australia).

Distribution: From Fish-Hook Bay, Lake Athabaska, and at the Ace mine, the Consolidated Nicholson Mine No. 2, and the Pitche claims, Beaverlodge Lake, Saskatchewan, Canada. From Wild Steer Canyon, Paradox Valley, Montrose Co., Colorado, and in the Campbell mine, Bisbee, Cochise Co., Arizona, USA. In several mines at Kalgoorlie, Western Australia. From the Mounana uranium mine, Franceville, Gabon.

Name: To honor Dr. Thomas Brennan Nolan (1901–1992), formerly Director of the U.S. Geological Survey, Washington, D.C., USA.

Type Material: The Natural History Museum, London, England, 1965,206; National Museum of Natural History, Washington, D.C., USA, 112965.

Ta_2O_5		[3.5]	$-O = F_2$	0.71	0.90
MnO	1.28	0.93	Total	99.94	[98.67]

(1) Oka, Canada; CaO includes some SrO, Nb_2O_5 includes some Ta_2O_5, Al_2O_3 includes some RE and Zr; corresponds to $(Ca_{6.54}Na_{0.16})_{\Sigma=6.70}(Nb_{1.06}Mg_{0.12}Mn_{0.12}Fe_{0.06}Ti_{0.02})_{\Sigma=1.38}(Si_{3.88}Al_{0.08})_{\Sigma=3.96}O_{14}[O_{3.16}F_{0.70}(OH)_{0.08}]_{\Sigma=3.94}$. (2) Do.; by electron microprobe, partial analysis; corresponds to $(Ca_{6.77}Na_{0.15})_{\Sigma=6.92}(Nb_{0.93}Mn_{0.10}Mg_{0.06}Fe_{0.05}Zr_{0.02}Ti_{0.01})_{\Sigma=1.17}Si_4O_{14}[O_{3.02}F_{0.92}]_{\Sigma=3.94}$.

Occurrence: In coarse-grained strontian carbonatite.

Association: Calcite, magnetite, apatite, diopside, biotite, pyrochlore, niobian perovskite.

Distribution: At Oka, Quebec, Canada.

Name: For NIObium and CALcium in the composition.

Type Material: n.d.

Nisbite $NiSb_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As irregular grains, to 20 μm.

Physical Properties: Hardness = n.d. VHN = 420–513, 479 average (5 g load).
D(meas.) = n.d. D(calc.) = 8.0

Optical Properties: Opaque. *Color:* White in reflected light. *Luster:* Metallic.
Pleochroism: Weak. *Anisotropism:* Weak. *Bireflectance:* Very weak.
R_1–R_2: n.d.

Cell Data: *Space Group: Pnnm* (synthetic). $a = 5.178(3)$ $b = 6.319(3)$ $c = 3.832(3)$
Z = 2

X-ray Powder Pattern: Synthetic.
2.761 (10), 2.689 (9), 2.0301 (8), 1.8427 (7), 0.9045 (7), 1.5611 (6), 1.1683 (6)

Chemistry:

	(1)	(2)
Ni	19.15	19.43
Sb	80.43	80.57
Total	99.58	100.00

(1) Trout Bay, Canada; by electron microprobe, average of four grains. (2) $NiSb_2$.

Mineral Group: Löllingite group.

Occurrence: Very rare in a high-grade base-metal sulfide deposit in altered mafic rock (Trout Bay, Canada); in Pb–Zn–Cu–Ag ore deposits remobilized by hydrothermal solutions from younger granite emplacement (Bergslagen, Sweden).

Association: Chalcopyrite, breithauptite, pyrargyrite, galena, pyrrhotite, tetrahedrite (Trout Bay, Canada); costibite, paracostibite, oenite, allargentum, bismuth, breithauptite, gudmundite, chalcopyrite, bornite, tetrahedrite, pyrrhotite, galena, sphalerite, gersdorffite, ullmannite (Bergslagen, Sweden).

Distribution: From Trout Bay, 32 km west of Red Lake, Kenora district, Ontario, Canada [TL]. At the Festivalnoe Cu–Sn mine, Magadan region, Sakha, and from Zolotaya Gora, Ural Mountains, Russia. In the Gruvåsen and Getön deposits, and at Tunaberg, Bergslagen metallic province, Sweden. From Sulitjelma, northern Norway.

Name: For the composition, NIckel and SB, from the chemical symbol for antimony, *stibium*.

Type Material: Canadian Geological Survey, Ottawa, 12162; Canadian Museum of Nature, Ottawa, Canada.

References: (1) Cabri, L.J., D.C. Harris and J.M. Stewart (1970) Paracostibite (CoSbS) and nisbite ($NiSb_2$), new minerals from the Red Lake area, Ontario, Canada. Can. Mineral., 10, 232–246. Nissonite $Cu_2Mg_2(PO_4)_2(OH)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals are tabular on {100}, elongated along [001], diamond-shaped, to 2 mm, showing {001}, {100}, {$\overline{1}$11}; more commonly in aggregates and thin crusts.

Physical Properties: *Cleavage:* {100}, fair. Hardness = 2.5 D(meas.) = 2.73(1) D(calc.) = 2.782

Optical Properties: Semitransparent. *Color:* Bluish green to deep blue, turquoise-blue. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = turquoise-blue. *Orientation:* $Z = b$; $X \wedge a = 15°$; $Y \wedge c = 6°$. *Dispersion:* $r > v$, very strong. $\alpha = 1.584(2)$ $\beta = 1.620(2)$ $\gamma = 1.621(2)$ 2V(meas.) = n.d. 2V(calc.) = 19°

Cell Data: *Space Group:* $C2/c$. $a = 22.523(5)$ $b = 5.015(2)$ $c = 10.506(3)$ $\beta = 99.62(2)°$ Z = 4

X-ray Powder Pattern: Panoche Valley, California, USA.
10.8 (100), 2.768 (100), 4.36 (70), 2.218 (65), 2.679 (60), 3.72 (55), 2.531 (55)

Chemistry:

	(1)	(2)
P_2O_5	27.1	28.98
V_2O_5	0.2	
FeO	0.04	
CuO	32.2	32.49

H_2O^+	16.8	
H_2O^-	5.6	
H_2O		22.07
insol.	1.4	
Total	99.14	100.00

(1) Panoche Valley, California, USA; insoluble is barite. (2) $Cu_2Mg_2(PO_4)_2(OH)_2 \cdot 5H_2O$.

Occurrence: A very rare mineral in a copper prospect (Panoche Valley, California, USA); in a Precambrian sedimentary iron deposit (Iron Monarch quarry, Australia).

Association: Malachite, azurite, libethenite, turquoise, chrysocolla, cuprite, barite, calcite, gypsum, riebeckite (Panoche Valley, California, USA); malachite, calcite, hematite, quartz (Iron Monarch quarry, Australia); turquoise, libethenite (Mt. Oxide, Australia).

Distribution: From a small copper prospect [Llanada copper mine, 6.5 km north-northeast of Llanada] in the Panoche Valley, San Benito Co., California, USA. At the Mt. Oxide copper mine, 150 km north of Mt. Isa, Queensland, and as fine crystals from the Iron Monarch quarry, Iron Knob, South Australia.

Name: To honor William H. Nisson (1912–1965), amateur mineralogist, mineral collector and dealer, of Petaluma, California, USA, who first noted the mineral.

Type Material: n.d.

Niter KNO_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Acicular crystals, in silky tufted to branching aggregates, may be flowerlike, to 2 cm; commonly in thin crusts, granular, earthy, mealy, massive. *Twinning:* Common on {110}, forming pseudohexagonal trillings.

Physical Properties: *Cleavage:* {011}, nearly perfect; {010}, good; {110}, imperfect. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 2.109(2) D(calc.) = 2.104 Soluble in H_2O, taste saline and cooling.

Optical Properties: Transparent. *Color:* Colorless to white, may be gray from impurities. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.332$ $\beta = 1.504$ $\gamma = 1.504$ 2V(meas.) = 7°

Cell Data: *Space Group: Pmcn.* $a = 5.414$ $b = 9.164$ $c = 6.431$ Z = 4

X-ray Powder Pattern: Synthetic.
3.78 (100), 3.73 (56), 3.033 (55), 2.647 (55), 2.661 (41), 2.192 (41), 2.763 (28)

Chemistry: (1) Identified by correspondence of optical data and X-ray powder pattern with that of synthetic material.

Occurrence: In some caves, typically formed by bacterial action on animal matter, as bat guano, or from vegetable matter, such as humus, exposed to seeping groundwater; an efflorescence on soils or cliff faces in arid regions.

Association: Nitratine, nitrocalcite, nitromagnesite, epsomite, gypsum, calcite.

Distribution: Usually in minor amounts, but may form substantial masses, into the thousands of tons, especially in some cave deposits. Typical large-scale occurrences are represented by: Pulo di Molfetta Cave, Apulia, Italy. In lava tubes 16 km east of Lava Station, Socorro Co., New Mexico, USA. In the Rusensky Lom Cave, Bulgaria. Small amounts occur in many other caves worldwide.

Name: A name from antiquity, used to distinguish potassium nitrate from sodium nitrate.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 303–305. (2) Hill, C. and P. Nitratine $NaNO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Rare as rhombohedral crystals, $\{10\overline{1}1\}$, to 3 mm; stalactitic, cottonlike, typically granular or in massive incrustations.

Physical Properties: *Cleavage:* Perfect on $\{10\overline{1}1\}$; imperfect on $\{01\overline{1}2\}$, $\{0001\}$. *Fracture:* Conchoidal. *Tenacity:* Sectile to some degree. Hardness = 1.5–2 D(meas.) = 2.24–2.29 D(calc.) = 2.25 Soluble in H_2O, taste bitter, pungent, cooling; deliquescent above ∼80% humidity.

Optical Properties: Transparent. *Color:* Colorless to white, tinged reddish brown, lemon-yellow, gray with impurities; colorless in transmitted light. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.587$ $\epsilon = 1.336$

Cell Data: *Space Group:* $R\overline{3}c$. $a = 5.070$ $c = 16.829$ Z = 6

X-ray Powder Pattern: Synthetic.
3.03 (100), 2.311 (25), 2.81 (16), 1.898 (16), 2.53 (10), 2.125 (10), 1.880 (8)

Chemistry: (1) Identified by correspondence of optical data and X-ray powder pattern with that of synthetic material.

Occurrence: Principally in bedded deposits formed in playas; in caves, deposited from seeping groundwater leaching nitrates from overlying rocks, especially in very dry and cold climates.

Association: Niter, nitrocalcite, epsomite, mirabilite, halite, gypsum.

Distribution: In Chile, in the Tarapacá district, and elsewhere along the coast, economically valuable deposits aggregating billions of tons; also at Chuquicamata, Antofagasta. Other studied occurrences include: in the Los Manos Cave, Santa Cruz Province, Argentina. In the USA, in Death Valley and along the Armagosa River, Inyo and San Bernardino Cos., California; at Niter Buttes, about 40 km southeast of Lovelock, Churchill Co., Nevada; in Plateau Canyon, 32 km east of Grand Junction, Mesa Co., Colorado; from the Organ Mountains, about 12 km east-northeast of Mesquite, Doña Ana Co., in the Jornada del Muerto lava tubes, near Socorro, Socorro Co., and other places in New Mexico; at the Wupatki fissure caves, near Flagstaff, Coconino Co., Arizona. Numerous other occurrences have been reported.

Name: For NITRogen in the composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 300–302 [soda-niter]. (2) Hill, C. and P. Nitrobarite $Ba(NO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Crystals are pseudo-octahedral, {111} and $\{\overline{1}11\}$, to 4 mm. *Twinning:* On {111}.

Physical Properties: Hardness = n.d. D(meas.) = 3.250 (synthetic). D(calc.) = 3.24 Easily soluble in H_2O; piezoelectric.

Optical Properties: Transparent. *Color:* Colorless, partially brownish black from included "wad"; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic, may be anomalously birefringent in sectors. $n = 1.5714$

Cell Data: *Space Group: Pa*3 (synthetic). $a = 8.1184$ $Z = 4$

X-ray Powder Pattern: Synthetic.
4.689 (100), 2.447 (75), 2.344 (45), 4.062 (35), 2.870 (30), 1.863 (20), 3.633 (14)

Chemistry: (1) Only a qualitative analysis of natural material was made.

Occurrence: Noted on a museum specimen, probably from a nitrate deposit.

Association: "Wad".

Distribution: From Chile, the exact locality not specified.

Name: For NITRate and BARium in the composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 305–306. (2) Hintze, C. (1930) Handbuch der Mineralogie. Nitrocalcite $Ca(NO_3)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare acicular crystals, in tufted and flowerlike aggregates, to 3 cm; more commonly as a cottony or massive efflorescence.

Physical Properties: *Cleavage:* Observed. Hardness = "Soft". D(meas.) = 1.90 (synthetic). D(calc.) = 1.91 Soluble in H_2O, taste sharp and bitter; deliquescent above about 54% relative humidity.

Optical Properties: Transparent. *Color:* Colorless to milky white; colorless in transmitted light. *Luster:* Silky.
Optical Class: Biaxial (–) (synthetic). *Orientation:* $X \perp$ cleavage. $\alpha = 1.465(3)$ $\beta = 1.498(3)$ $\gamma = 1.504(3)$ 2V(meas.) = 50(2)°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 14.8999(12)$ $b = 9.1551(5)$ $c = 6.2786(7)$ $\beta = 106.22(1)°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 24-1406).
5.14 (100), 7.72 (70), 3.580 (70), 5.42 (65), 4.36 (55), 3.121 (55), 2.810 (55)

Chemistry: (1) Identified by correspondence of optical data and X-ray powder pattern with that of synthetic material.

Occurrence: Typically formed in caves and on alkaline soils, which may be seasonal.

Association: Niter, nitromagnesite (caves); alunite, aragonite, berlinite, collophane, crandallite, francoanellite, gypsum, huntite, hydromagnesite, leucophosphite, nesquehonite, niter (Paddy's River mine, Australia).

Distribution: From the Pulo di Molfetta caves, Apulia, Italy. At Limagne, Auvergne, France. In David's and Chaos Caves, Transvaal, South Africa. From Ludwig Cave, north Namibia. In the USA, in Kartchner Caverns, near Benson, Cochise Co., Arizona. From Paddy's River mine, Australian Capital Territory. Additional localities reported earlier require modern confirmation.

Name: For NITROgen and CALCium in the composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 306–307. (2) Hill, C. and P. Nitromagnesite $Mg(NO_3)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As stalactites, flocculent to earthy efflorescences, and crusts.

Physical Properties: Hardness = n.d. D(meas.) = 1.46–1.58 D(calc.) = 1.64 Soluble in H_2O, taste bitter; hygroscopic.

Optical Properties: Transparent. *Color:* Colorless to white, may be yellow from contained bat urine. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Z = b$. *Dispersion:* $r < v$, weak. $\alpha = 1.34(1)$ $\beta = 1.506(3)$ $\gamma = 1.506(3)$ 2V(meas.) = 5°

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 6.194(2)$ $b = 12.71(3)$ $c = 6.600(2)$ $\beta = 92.99(2)°$ Z = 2

X-ray Powder Pattern: Synthetic.
3.295 (100), 2.925 (75), 4.433 (55), 5.840 (45), 4.154 (35), 3.190 (35), 2.688 (35)

Chemistry: (1) No analyses of natural material have been made. Identification depends on coincidence of properties with synthetic material.

Occurrence: A rare cave deposit in humidities up to 78%, typically formed as a leachate of bat guano; may be a component of mixed salts.

Association: Nitrocalcite.

Distribution: In the USA, from Nicojack Cave, Madison Co., Kentucky, and in a cave near Corydon, Harrison Co., Indiana. At Independence Cave, Botswana. In Namibia, from Arnhem, Gâuab, Elephant, Uisib I, and Kimberlite Caves. In the Pulo di Molfetta caves, Apulia, Italy.

Name: For NITROgen and MAGNESium in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128717.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 307. (2) Hill, C. and P. Niveolanite $NaBe(CO_3)(OH) \cdot 1\text{-}2H_2O$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. Typically as fibrous "wool-like"aggregates, to 2 cm; also as aggregates of acicular crystals with tetragonal or octagonal cross-sections, to 1 cm. Crystals elongate parallel to [100] with forms {100} and {100}.

Physical Properties: *Cleavage*: None. *Tenacity*: Brittle (acicular), flexible (fibrous). *Fracture*: Splintery. Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.82 to 2.06 (respectively for less and greater hydration, readily reversible). Weak effervescence in HCL. Readily hygroscopic.

Optical Properties: Transparent. *Color*: Colorless fibers, aggregates snow-white to pearl white. *Streak*: White. *Luster*: Silky.
Optical Class: Uniaxial (+). ω = 1.469(1) ε = 1.502(1)

Cell Data: *Space Group*: *P*4/*mcc*. a = 13.1304(19) c = 5.4189(11) Z = 8

X-ray Powder Pattern: Poudrette Quarry, Mont-Saint Hilaire, Quebec, Canada.
13.01 (100), 3.256 (95), 9.20 (62), 2.489 (60), 2.693 (44), 2.605 (37), 3.611 (34)

Chemistry:

	(1)
Na_2O	19.81
K_2O	0.07
CaO	3.88
BeO	16.65
CO_2	29.81
H_2O	26.93
Total	97.15

(1) Poudrette Quarry, Mont-Saint Hilaire, Quebec, Canada; multiple analyses by electron microprobe, ICP-OES and LOI, H_2O calculated, OH:H_2O by charge balance, OH, H_2O, CO_3 confirmed by IR; corresponding to $(Na_{0.94}Ca_{0.10})_{\Sigma=1.04}Be_{0.98}(CO_3)_{1.00}(OH)_{1.10}\cdot 1.66H_2O$.

Occurrence: A late stage mineral in cavities in the core of a hydrothermally altered peralkaline pegmatite.

Association: Albite, aegirine, natrolite, gonnardite, siderite, petersenite-(Ce), franconite, dawsonite ; more rarely analcime, quartz, eudidymite, catapleiite, gaidonnayite, monazite-(Ce), calcite, adamsite-(Y), shomiokite-(Y), galena, sphalerite, rutile.

Distribution: Poudrette Pegmatite, Poudrette Quarry, Mont-Saint Hilaire, Quebec, Canada.

Name: From the Latin *niveus*, snow white, and *lana*, wool, in allusion to the typical habit.

Type Material: A.E. Fersman Mineralogical Museum of the Russian Academy of Sciences, Moscow, 3631/1, and the Canadian Museum of Nature, Ottawa, CNMMC 86052.

Mineral., 94, 1080-1081 (abs. ref. 1).

Nobleite $CaB_6O_9(OH)_2•3H_2O$

Crystal Data: Monoclinic. *Point Group: 2/m.* Platy rhombic to pseudohexagonal crystals, flattened on {100}, elongated along [010] or [001], showing large {100}, {001}, {110}, {011}, {111}, to 3 mm; as a post-mine mammillary coating. Contact twins common on {100}.

Physical Properties: *Cleavage:* Perfect on {100}; indistinct on {001}. *Fracture:* Uneven. *Tenacity:* Sectile, flexible, inelastic. Hardness = ~3 D(meas.) = 2.09(1) D(calc.) = 2.098 Slightly to moderately soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless to white; colorless in transmitted light. *Streak:* White. *Luster:* Subvitreous, pearly on cleavages.
Optical Class: Biaxial (+). $\alpha = 1.500(3)$ $\beta = 1.520(2)$ $\gamma = 1.554(2)$ 2V(meas.) = n.d. 2V(calc.) = 76° *Orientation:* $Y = b$; $X \wedge a = 29°$; $Z \wedge c = -7°$. *Dispersion:* $r > v$, weak.

Cell Data: *Space Group:* $P2_1/a$. $a = 14.56(5)$ $b = 8.016(20)$ $c = 9.838(20)$ $\beta = 111° 45(10)'$ $Z = 4$

X-ray Powder Pattern: Near the De Bely mine, California, USA; strong preferred orientation due to platy {100} cleavage.

(1) Near the De Bely mine, California, USA; SrO and alkalies by flame photometry, H_2O by the Penfield method; corresponds to $Ca_{1.01}B_{5.84}O_9(OH)_2•3H_2O$. (2) $CaB_6O_9(OH)_2•3H_2O$.

Occurrence: Typically a recent incrustation produced by weathering of colemanite and priceite veins in altered olivine basalt and basaltic clastic rocks (near the De Bely mine, California, USA).

Association: Colemanite, meyerhofferite, gowerite, ulexite, ginorite, sassolite, gypsum, manganese oxide (near the De Bely mine, California, USA).

Distribution: In the USA, in the Furnace Creek district, Death Valley, Inyo Co., California, from one km north-northwest of the De Bely mine, and several other places; coarsely crystalline in the Corkscrew mine. From the Sijes district, Salta Province, Argentina. From drill core at Piskanja, Jarandol basin, Serbia.

Name: To honor Dr. Levi Fatzinger Noble (1882-1965), geologist with the U.S. Geological Survey, who studied the Death Valley borate deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA; 136416, 147960.

Mineral., 90, 772 (abs. ref. 2).

Nolanite $(V^{3+}, Fe^{3+}, Fe^{2+}, Ti)_{10}O_{14}(OH)_2$

Crystal Data: Hexagonal. *Point Group:* $6mm$. As euhedral hexagonal plates, to 1 mm, exhibiting {0001}, $\{10\bar{1}0\}$, and $\{10\bar{1}1\}$; as exsolution lamellae in vanadian magnetite; commonly aggregated into crusts and massive vein fillings.

Physical Properties: Hardness = ~5 VHN = 710–760, 734 average (20 g load).
D(meas.) = 4.65 D(calc.) = 4.60

Optical Properties: Opaque, slightly translucent in thin fragments. *Color:* Black; dark gray to dark grayish violet in reflected light. *Streak:* Brownish black. *Luster:* Submetallic.
Optical Class: Uniaxial. *Pleochroism:* Dark brown to deep blue. *Anisotropism:* Moderate; light to dark gray.

(1–2) Kalgoorlie, Western Australia; by electron microprobe; V and Fe valences and $(OH)^{1-}$ from crystal structure determinations, corresponding respectively to $(V^{3+}_{6.9}Fe^{3+}_{1.6}Fe^{2+}_{0.6}Ti_{0.6}Al_{0.3})_{\Sigma=10.0}O_{14}(OH)_2$ and $(V^{3+}_{5.2}Fe^{3+}_{2.4}Fe^{2+}_{1.1}Ti_{1.1}Al_{0.2})_{\Sigma=10.0}O_{14}(OH)_2$.

Occurrence: In hydrothermal uranium deposits (Saskatchewan, Canada); in gold deposits in metamorphosed greenstones (Kalgoorlie, Western Australia).

Association: Dolomite, calcite, quartz, uraninite, pyrite, chalcopyrite, galena, ilmenite, hematite, carnotite (Saskatchewan, Canada); gold, gold tellurides, vanadian muscovite, tourmaline, tivanite, vanadian hematite, vanadian magnetite (Kalgoorlie, Western Australia).

Distribution: From Fish-Hook Bay, Lake Athabaska, and at the Ace mine, the Consolidated Nicholson Mine No. 2, and the Pitche claims, Beaverlodge Lake, Saskatchewan, Canada. From Wild Steer Canyon, Paradox Valley, Montrose Co., Colorado, and in the Campbell mine, Bisbee, Cochise Co., Arizona, USA. In several mines at Kalgoorlie, Western Australia. From the Mounana uranium mine, Franceville, Gabon.

Name: To honor Dr. Thomas Brennan Nolan (1901–1992), formerly Director of the U.S. Geological Survey, Washington, D.C., USA.

Type Material: The Natural History Museum, London, England, 1965,206; National Museum of Natural History, Washington, D.C., USA, 112965.

Nontronite $(Ca_{0.5}, Na)_{0.3}Fe^{3+}_2(Si, Al)_4O_{10}(OH)_2 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely as small bladed crystals, radial or reticulated, spherulitic; commonly cryptocrystalline, claylike, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Conchoidal, splintery. Hardness = 1–2 D(meas.) = 2.2–2.3 D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent to nearly opaque. *Color:* Yellow, olive-green, green, orange, brown, may be zoned. *Luster:* Waxy, resinous, dull.
Optical Class: Biaxial (–). *Pleochroism:* X = yellowish; Y = yellow-green to dark brown; Z = olive-green to light brown. *Orientation:* $X \simeq c$; $Y = b$; $Z \simeq a$. *Absorption:* $Z > Y > X$ or $Y > Z > X$. $\alpha = 1.567$–1.600 $\beta = 1.604$–1.632 $\gamma = 1.605$–1.643 2V(meas.) = 25°–68°

Cell Data: *Space Group:* $C2/m$. $a = 5.23$–5.26 $b = 9.08$–9.12 $c = 14.8$–15.8 $\beta = \sim 90°$ Z = n.d.

X-ray Powder Pattern: Nontron, France.

(1) Nontron, France. (2) Colfax, Washington, USA; corresponds to $Ca_{0.43}(Fe^{3+}_{1.93}Mg_{0.07}Al_{0.06})_{\Sigma=2.06}(Si_{3.50}Al_{0.50})_{\Sigma=4.00}O_{10}(OH)_2 \cdot nH_2O$.

Mineral Group: Smectite group.

Occurrence: A weathering product of basalts, kimberlites, and other ultramafic igneous rocks; in poorly-drained volcanic ash soils; in some hydrothermally altered mineral deposits, midocean ridge basalts, and contact metamorphosed limestones. An authigenic mineral in recent marine sediments.

Association: Quartz, "opal," "hornblende," pyroxenes, olivine, mica, kaolinite.

Distribution: Some localities for well-characterized material include: near Saint-Pardoux, Dordogne, France. At Froland, Norway. From Vittensten, Sweden. In Russia, at Okhansk, Perm. From Geilsdorf and Wolkenstein, Saxony, Germany. At Faratsiho, Madagascar. In the Burra copper mine, South Australia, and the Tamworth copper mine, Attunga, New South Wales, Australia. In the USA, in the Spruce Pine district, Mitchell Co., North Carolina; near Colfax and Garfield, Whitman Co., Washington; from Petaluma, Sonoma Co., Crestmore, Riverside Co., and near Woody, Kern Co., California. In New Mexico, at Santa Rita, Grant Co.; from Morenci, Greenlee Co., the Globe-Miami district, Gila Co., the Twin Buttes mine, Pima Co., and at Ray, Pinal Co., Arizona. From Santa Eulalia, Chihuahua, Mexico.

Name: For the occurrence near Saint-Pardoux, Nontron Arrondissement, France.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 89645.

Norbergite $Mg_3(SiO_4)(F,OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals rare, to 2.5 cm, thick tabular, typically rounded and highly modified; granular.

Physical Properties: *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 3.177 D(calc.) = 3.186 May fluoresce canary-yellow under SW UV.

Optical Properties: Transparent to translucent. *Color:* Tan, yellow, yellow-orange, orange-brown, pink with purplish tint, white; in thin section, pale yellow to colorless. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (+). *Pleochroism:* X = pale yellow; Y = very pale yellow; Z = colorless. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, slight. $\alpha = 1.563$–1.567 $\beta = 1.567$–1.579 $\gamma = 1.590$–1.593 2V(meas.) = 44°–50°

(1) Norberg, Sweden; corresponds to $(Mg_{3.01}Fe^{2+}_{0.05}Fe^{3+}_{0.01})_{\Sigma=3.07}Si_{0.94}O_4[F_{1.45}(OH)_{0.61}]_{\Sigma=2.06}$.
(2) Franklin, New Jersey, USA; by electron microprobe, corresponds to $Mg_{2.93}Si_{1.00}O_4[F_{1.77}(OH)_{0.34}]_{\Sigma=2.11}$.

Mineral Group: Humite group.

Occurrence: In contact metamorphic zones in limestones and dolostones into which plutonic rocks or pegmatites have introduced fluorine.

Association: Dolomite, calcite, tremolite, grossular, wollastonite, forsterite, monticellite, cuspidine, fluoborite, ludwigite, fluorite, phlogopite.

Distribution: In the Östanmossa and other iron mines, Norberg, Västmanland, Sweden. At Piukkala, near Pargas, Finland. Near Loch Ness, Inverness-shire, Scotland. From the Nicoll quarry, Franklin, Sussex Co., New Jersey. Around Edenville, Orange Co., and in the Balmat mines, St. Lawrence Co., New York, USA. At Monte Somma and Nocera, Campania, Italy.

Name: From its first locality at Norberg, Sweden.

Type Material: n.d.

(1) Arø Island, Norway; remnant is B_2O_3 (?) 1.72% and ZrO_2 0.90%. (2) Jiangsu Province, China; remnant is SiO_2 0.39%, TiO_2 0.14%, Al_2O_3 0.24%, Cr_2O_3 0.01%, MnO 0.01%, BaO 0.11%, SrO 0.04%, H_2O^+ 0.38%; corresponds to $(Ca_{1.02}Fe_{0.02}Mg_{0.01})_{\Sigma=1.05}Sn_{1.06}(BO_3)_2$. (3) $CaSn(BO_3)_2$.

Occurrence: Very rare in an alkalic pegmatite (Arø Island, Norway); in a hydrothermal deposit in metasomatized marble (Arandis, Namibia); in skarns (China).

Association: Meliphanite, homilite, zircon, molybdenite, cancrinite, analcime, feldspar (Arø Island, Norway); tourmaline, cassiterite, stannite, chalcopyrite, pyrrhotite, siderite, calcite (Arandis, Namibia).

Distribution: From Arø Island, Langesundsfjord, Norway. At the Stiepelman mine, Arandis, Namibia. In the Titovskoye deposit, polar Sakha, Russia. In China, from the Damoshan deposit, Gejiu tin district, Yunnan Province, at the Dading tin-iron deposits, Guizhou Province, and in an undisclosed deposit, Wuxian Co., Jiangsu Province. On Brooks Mountain, Alaska, USA. At the MW prospect, near Smart River, Cassiar Mountains, Yukon Territory, Canada.

Name: Honors Nils Adolf Erik Nordenskiöld (1832–1901), Swedish mineralogist, geologist, and explorer.

(1) Hagendorf-Süd pegmatite, Bavaria, Germany; average of 8 electron microprobe analyses, H_2O by CHN, corresponding to $(Mn_{0.90}Ca_{0.08}Fe_{0.04}Zn_{0.01}Mg_{0.01})_{\sum=1.04}Al_{2.01}(PO_4)_2[F_{1.21}(OH)_{0.90}]_{\sum=2.11} \cdot 5.25H_2O$.

Occurrence: A late stage secondary hydrothermal mineral in altered zwieselite-triplite masses in a zoned granite pegmatite.

Association: Apatite-(CaF), sphalerite, uraninite, a columbite-tantalite phase, metastrengite, whiteite-jahnsite (inclusions).

Distribution: From the Hagendorf-Süd pegmatite, Bavaria, Germany.

Name: For *Nordgau*, the oldest name for that part of northeastern Bavaria in which Hagendorf is situated, and where mining has taken place since the 13th century.

Type Material: Museum Victoria, Melbourne, Australia (M48795; M51231).

(1) Lovozero massif, Russia. (2) Do.; corresponds to $(Na_{2.81}Mn_{0.19})_{\Sigma=3.00}(Sr_{0.54}Ca_{0.46})_{\Sigma=1.00}(La_{0.52}Ce_{0.42}Ca_{0.06})_{\Sigma=1.00}(Zn_{0.38}Mg_{0.32}Mn_{0.17}Fe_{0.13})_{\Sigma=1.00}(Si_{5.85}Fe_{0.15})_{\Sigma=6.00}O_{17.04}$. Analyses are known of material with Ce > La but with no other properties described.

Occurrence: Extremely rare in pegmatites in sodalite syenite in a differentiated alkalic massif.

Association: Sodalite, ussingite, murmanite, chkalovite, belovite, steenstrupine, lomonosovite, eudialyte, microcline, nepheline, aegirine, sphalerite, neptunite, lamprophyllite.

Distribution: In the valley of the Chinglusuai River and elsewhere in the Lovozero massif, Kola Peninsula, Russia.

Name: From the mineral's "northern origin" and *lanthanum* content.

Type Material: n.d.

Total	99.00	[100.00]	100.00

(1) Guam. (2) Mont Saint-Hilaire, Canada; by electron microprobe, H_2O by difference. (3) $Al(OH)_3$.

Polymorphism & Series: Polymorphous with bayerite, doyleite, and gibbsite.

Occurrence: Commonly in residual soils derived from limestones; in dolomitic oil shale, marine siltstone, chalk; in pegmatite, miarolitic cavities, and xenoliths in nepheline syenites.

Association: Quartz, kaolinite, diaspore, goethite (Gunong Kapor, Borneo); natrolite, tetranatrolite, analcime, sodalite, albite, microcline, dawsonite (Mont Saint-Hilaire, Canada).

Distribution: On Gunong Kapor, near Bau, western Sarawak, Borneo, Malaysia. On the Mt. Alifan-Mt. Lamlan ridge, south Guam. From Narssârssuk, Greenland. In Canada, at Mont Saint-Hilaire, and in the Francon quarry, Montreal Island, Montreal, Quebec; from the Princess sodalite mine, Bancroft, Ontario. In the Green River Formation, Rio Blanco Co., Colorado, USA. From Newhaven, East Sussex, England. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From Stradnerkogel, south of Wilhelmsdorf, Styria, Austria. At Terlan, Trentino-Alto Adige, Italy. From Ajatskoe, Kazakhstan. In the Khibiny massif, Kola Peninsula, and the Listvennoye deposit, Yenisei Ridge, Siberia, Russia. Additional localities are increasingly becoming known.

Name: For Robert A. Van Nordstrand, Sinclair Research Laboratories, Harvey, Illinois, USA, who synthesized the compound, later named for him, then transferred to the natural mineral.

Type Material: Royal Ontario Museum, Toronto, Canada, M145608; Harvard University, Cambridge, Massachusetts, 108353; National Museum of Natural History, Washington, D.C., USA, 117275, 145608.

Nordströmite $Pb_3CuBi_7(S,Se)_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibrous, to 3.5 mm.

Physical Properties: *Cleavage:* Good, parallel to crystal elongation. Hardness = 2–2.5 VHN = 130–143 (25 g load). D(meas.) = n.d. D(calc.) = 7.12

Optical Properties: Opaque, presumably. *Color:* Lead-gray; white with a gray tint in reflected light. *Anisotropism:* Dark gray to brown.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/m$. $a = 17.97(8)$ $b = 4.11(2)$ $c = 17.62(8)$ $\beta = 94.3(2)°$ $Z = 2$

X-ray Powder Pattern: Falun, Sweden.
3.066 (10), 2.242 (7), 3.583 (5), 3.882 (3b), 3.484 (3), 3.427 (3), 3.012 (3)

Chemistry:

	(1)
Pb	21.73
Cu	2.04
Bi	51.95
Se	11.16
S	10.88
Total	[97.76]

(1) Falun, Sweden; by electron microprobe, original total given as 97.75%; corresponding to $Pb_{3.06}Cu_{0.94}Bi_{7.24}(S_{9.88}Se_{4.12})_{\Sigma=14.00}$.

Occurrence: Of hydrothermal origin.

Association: Wittite, friedrichite, bismuthinite (Falun, Sweden); gold, chalcopyrite, neyite, quartz (Johnny Lyon Hills, Arizona, USA).

Distribution: From Falun, Kopparberg, Sweden [TL]. In the Johnny Lyon Hills, north of Benson, Cochise Co., Arizona, USA.

Name: To honor T. Nordström (1843–1920), Swedish mining engineer who first studied the sulfosalts from Falun.

Type Material: Royal Ontario Museum, Toronto, Canada, M12992.

References: (1) Mumme, W.G. (1980) Seleniferous lead–bismuth sulphosalts from Falun, Sweden: weibullite, wittite, and nordströmite. Amer. Mineral., 65, 789–796. (2) Mumme, W.G. H_2O^+	0.66
Total	101.15

(1) Hoskins mine, Australia; by electron microprobe, average of four analyses; H_2O by gravimetric analysis, Li by atomic emission and AA, oxidation state by titration; corresponds to $(K_{0.98}Ba_{0.01})_{\Sigma=0.99}(Mn^{3+}_{2.00}Li_{0.95}Mg_{0.02})_{\Sigma=2.97}(Si_{3.84}Al_{0.10})_{\Sigma=3.94}O_{11.66}(OH)_{0.34}$.

Mineral Group: Mica group.

Occurrence: A major to minor component of manganiferous schists, formed through metamorphism of a stratiform manganese deposit.

Association: Manganoan-alkalic amphibole, manganoan-alkalic clinopyroxene, manganoan pectolite-sérandite, braunite, calcium carbonates, barium carbonates, albite, potassic feldspar, quartz, barite.

Distribution: From the Hoskins mine, three km west of Grenfell, New South Wales, Australia.

Name: In honor of Dr. Keith Norrish of the Division of Soils, Commonwealth Scientific and Industrial Research Organization, Australia.

(1) Westvaco trona mine, Wyoming, USA; CO_2 by evolved gas analysis; after deduction of SiO_2 and Na_2O as impurities, corresponding to $(Ba_{0.99}Ca_{0.01})_{\Sigma=1.00}(Mg_{0.97}Fe_{0.03})_{\Sigma=1.00}(CO_3)_{2.01}$. (2) Tapira, Brazil; by electron microprobe, average of 15 analyses, CO_2 by difference; corresponding to $(Ba_{0.98}Ca_{0.01}Fe_{0.01})_{\Sigma=1.00}(Mg_{0.98}Fe_{0.02})_{\Sigma=1.00}(CO_3)_2$. (3) $BaMg(CO_3)_2$.

Mineral Group: Dolomite group.

Occurrence: A rare authigenic mineral in and underlying the Green River Formation; a primary mineral in carbonatites; uncommon in metamorphosed hydrothermal mineral deposits.

Association: Shortite, labuntsovite, searlesite, northupite, loughlinite, barytocalcite, witherite, pyrite, quartz (Westvaco trona mine, Wyoming, USA).

Distribution: In the USA, in the Westvaco trona mine, about 30 km west of Green River, Sweetwater Co., Wyoming; and at Iron Hill, Gunnison Co., Colorado. In Canada, on the Rough claims, north of Sifton Pass, British Columbia; at the Chipman Lake carbonatite, 350 km northeast of Thunder Bay, Ontario; and in the Jason Pb–Zn deposits, Macmillan Pass, Yukon Territory. From the Tapira carbonatite, Minas Gerais, Brazil. At the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. In the Foss deposits, Aberfeldy, Perthshire, Scotland. At Långban, Värmland, Sweden. In the Rosh Pinah Zn–Pb–Cu deposit, about 160 km southeast of Aus, Namibia.

Name: Honors Keith Norseth (1927–1991), American engineering geologist, Westvaco trona mine, Wyoming, USA, for his assistance in mineralogical studies.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137148, 162606.

References: (1) Mrose, M.E., E.C.T. Chao, J.J. Fahey, and C. Milton (1961) Norsethite, $BaMg(CO_3)_2$, a new mineral from the Green River Formation, Wyoming. Amer. Mineral., 46, 420–429. Northupite $Na_3Mg(CO_3)_2Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Octahedra, to 2 cm; globular massive.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.380–2.407 D(calc.) = 2.40 Slowly decomposes in H_2O, leaving a $MgCO_3$ residue.

Optical Properties: Transparent to translucent. *Color:* Colorless, pale green if ferroan, or due to inclusions may be pale yellow, gray, brown; colorless in transmitted light. *Luster:* Vitreous. *Optical Class:* Isotropic, may be sectorially anomalously birefringent. $n = 1.5144$; 1.550 if ferroan.

Cell Data: *Space Group:* $Fd3$. $a = 14.069(2)$ $Z = 16$

X-ray Powder Pattern: John Hay, Jr. Well No. 1, Wyoming, USA.

(1) Searles Lake, California, USA; average of two analyses. (2) John Hay, Jr. Well No. 1, Wyoming, USA. (3) $Na_3Mg(CO_3)_2Cl$.

Occurrence: An uncommon mineral, formed probably between 20° C and 50° C, as a lacustrine deposit or at depth in mud and clay; may be primary or a replacement of earlier saline minerals.

Association: Tychite, pirssonite (Searles Lake, California, USA); shortite, trona, pirssonite, gaylussite, labuntsovite, searlesite, norsethite, loughlinite, pyrite, quartz (Green River Formation, Wyoming, USA).

Distribution: In the USA, from Searles Lake, San Bernardino Co., and Borax Lake, Lake Co., California; in the John Hay, Jr. Well No. 1 and the Westvaco trona mine, about 30 km west of Green River, Sweetwater Co., Wyoming. At Lake Katwe and Lake Mahega, Uganda. In the Kanem region, near Lake Chad, Chad. From the Tuzla salt mine, Bosnia-Herzegovina. Around Mt. Erebus, Victoria Land, and on Ross Island, Ross Sea, Antarctica. From the Zabuye Salt Lake, Nagri, Tibet, China.

Name: To honor Charles H. Northup (1861–?), grocer of San Jose, California, USA, who found the first examples.

(1) Laacher See, Germany. (2) Covao, Cape Verde Islands. (3) $Na_8Al_6Si_6O_{24}(SO_4)\cdot H_2O$.

Mineral Group: Sodalite group.

Occurrence: In silica-deficient alkalic volcanic rocks, principally phonolites.

Association: Sanidine, mica, leucite, magnetite, ilmenite, titanite, zircon.

Distribution: In Germany, at the Schellkopf, near Brenk, and elsewhere around the Laacher See, Eifel district; at Dutchlingen and in the Höwenegg quarry, Hegau, Baden-Württemberg. In the Mont-Dore massif, Auvergne, and at Vinsac, Aldis, and Cournil, Cantal, France. At Wolf Rock, Cornwall, England. From Covao, Cape Verde Islands. South of the Col de Maza, Morocco. From the Black Hills, Lawrence Co., South Dakota, and in the Cripple Creek district, Teller Co., Colorado, USA. From the Lovozero massif, Kola Peninsula, Russia. On Hsi Kuang T'a Men Mountain, Chiao Ch'eng Mountains, Shansi Province, China.

Name: After Karl Wilhelm Nose (1753?–1835), German mineralogist, of Brunswick (now Lower Saxony), Germany.

(1) Schneeberg, Germany; H_2O by difference. (2) $Mg(UO_2)_2[(As,P)O_4]_2 \cdot 10H_2O$ with As:P = 1:1.

Mineral Group: Autunite group.

Occurrence: In the oxidized zone of uranium-bearing polymetallic hydrothermal mineral deposits.

Association: Zeunerite, uranophane (Schneeberg, Germany); schoepite, paraschoepite, arsenuranylite, metazeunerite, uranospinite (Cherkasar deposit, Uzbekistan); chalcopyrite, arsenopyrite, sphalerite (Wheal Owles, England).

Distribution: In Germany, from Schneeberg, Saxony; in the Black Forest, from the Schmiedestollen dump, near Wittichen, the Anton mine, Heubachtal, near Schiltach, and the Michael mine, Weiler, near Lahr; from Ellweiler, Rhineland-Palatinate. In the Rabéjac and Mas-d'Alary uranium deposits, south of Lodève, Hérault, France. At Wheals Owles and Edward, St. Just, Cornwall, England. From Needles Eye, Dalbeattie, Kirkcudbrightshire, Scotland. At the Cherkasar uranium deposit, Chaktal Mountains, Uzbekistan. Large crystals from the Pedra Preta mine, Brumado, Bahia, Brazil. In the Las Animas mine, Santa Eulalia, Chihuahua, Mexico. In the USA, from the Woodrow area, Grants district, Valencia Co., New Mexico; and in the Wichita Mountains, Comanche Co., Oklahoma; at the White King mine, Lake Co., Oregon.

Name: To honor Dr. Radim Nováček (1905–1942), Czech mineralogist, for his contributions to the mineralogy of uranium.

Type Material: Harvard University, Cambridge, Massachusetts, 103854, 103855; American Museum of Natural History, New York City, New York, 15777; National Museum of Natural History, Washington, D.C., USA, R5686.

Novákite $(Cu, Ag)_{21}As_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* 2, m, or $2/m$. As irregular aggregates, with grains to 3 cm, and as veinlets in arsenic; botryoidal.

Physical Properties: Hardness = 3–3.5 VHN = n.d. D(meas.) = n.d. D(calc.) = 8.01

Optical Properties: Opaque. *Color:* Steel-gray on fresh surface, tarnishes iridescent and then black; white with pale cream tint in reflected light. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Medium, dark blue-gray and pale brown-ocher.
R_1–R_2: (400) 43.6–49.0, (420) 45.4–50.5, (440) 47.2–52.0, (460) 48.3–53.0, (480) 49.1–53.9, (500) 49.8–54.6, (520) 50.2–55.2, (540) 50.6–55.6, (560) 50.9–56.0, (580) 51.2–56.3, (600) 51.3–56.6, (620) 51.4–56.8, (640) 51.5–56.9, (660) 51.5–57.0, (680) 51.5–57.1, (700) 51.5–57.2

Cell Data: *Space Group:* $C2$, Cm, or $C2/m$. $a = 16.269(3)$ $b = 11.711(2)$ $c = 10.007(2)$ $\beta = 112.74°$ Z = 4

X-ray Powder Pattern: Černý Důl mine, Czech Republic.
1.877 (10), 1.959 (9), 1.180 (9), 1.998 (8), 1.351 (6), 1.225 (6), 6.41 (5)

Chemistry:

	(1)
Cu	60.30
Ag	4.33
As	35.30
Total	99.93

(1) Černý Důl mine, Czech Republic; by electron microprobe, average of 10 analyses; corresponds to $(Cu_{20.14}Ag_{0.85})_{\Sigma=20.99}As_{10.00}$.

Occurrence: In hydrothermal carbonate veins up to 20 cm thick, cutting diopside hornfels lenses in pyroxene gneiss and less commonly in mica schist (Černý Důl mine, Czech Republic).

Association: Arsenic, arsenolamprite, koutekite, silver, löllingite, chalcocite, skutterudite, chalcopyrite, bornite, uraninite, calcite (Černý Důl mine, Czech Republic); algodonite, koutekeite, djurleite, domeykite (Cashin mine, Montrose Co., Colorado, USA).

Distribution: From the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic [TL]. In the Cashin mine, Montrose Co., Colorado, USA.

Name: In honor of Jiří Novák (1902–1971), Professor of Mineralogy, Charles University, Prague, Czech Republic.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 116992.

Nowackiite $Cu_6Zn_3As_4S_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. As equant crystals, to 0.3 mm. *Twinning:* On {0001}.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 4.3

Optical Properties: Opaque. *Color:* Lead-gray to black. *Luster:* Metallic.
R_1–R_2: n.d.

Cell Data: *Space Group: R*3. $a = 13.440(1)$ $c = 9.17(1)$ Z = 3

X-ray Powder Pattern: Binntal, Switzerland.
1.019 (100), 1.081 (75), 1.887 (63), 3.127 (61), 1.605 (61), 1.216 (52), 1.085 (20)

Chemistry:

	(1)	(2)	(3)
Cu	31.2	30.9	30.21
Zn	15.9	16.4	15.54
As	22.4	22.8	23.75
S	31.9	32.0	30.50
Total	101.4	102.1	100.00

(1) Binntal, Switzerland; by electron microprobe, corresponding to $Cu_{6.04}Zn_{3.01}As_{3.73}S_{12.70}$.
(2) Do.; by electron microprobe, corresponding to $Cu_{6.02}Zn_{3.11}As_{3.77}S_{12.36}$. (3) $Cu_6Zn_3As_4S_{12}$.

Occurrence: In a hydrothermal deposit in dolostone, noted for a variety of Pb–As–S minerals.

Association: Sphalerite, dolomite.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: Honors Professor Werner Nowacki (1909–1989), Swiss mineralogist, University of Berne, Switzerland.

Type Material: University of Bern, Bern, Switzerland, holotype no longer exists, L3892-65.

Nsutite $\mathbf{Mn^{4+}_{1-x}Mn^{2+}_{x}O_{2-2x}(OH)_{2x}}$ (x is small)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Massive, dense to porous, fine- to coarse-grained; crystals platy or wedgelike, to 50 μm; rarely fibrous, to 2 mm, spherulitic, radiating, colloform; commonly showing shrinkage cracks when coarse.

Physical Properties: Hardness = 8.5 to 6.5 when manganoan. VHN = 1150 to 900 when manganoan (300 g load). D(meas.) = 4.24–4.67; to 3.86 when manganoan and with increasing H_2O content. D(calc.) = 4.86

Optical Properties: Opaque. *Color:* Dark gray to black; in reflected light, white with slightly creamy hue. *Luster:* Metallic to earthy.
Optical Class: Uniaxial. *Anisotropism:* Distinct; light to dark gray. *Bireflectance:* Grayish white with a creamy tint to bluish gray-white.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 9.65$ $c = 4.43$ Z = 12

X-ray Powder Pattern: Nsuta, Ghana; identification by X-ray diffraction is essential.
3.96 (vs), 2.43 (s), 2.13 (s), 1.638 (s), 2.34 (m), 1.615 (w), 1.425 (w)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	1.17	0.46	CaO	0.08	0.72
MnO_2	90.57	93.27	Na_2O	0.06	< 0.05
Al_2O_3	0.22	0.50	K_2O	0.22	0.19
Fe_2O_3	1.07	0.49	H_2O^+	2.64	2.10
MnO	2.60	1.76	H_2O^-	0.33	0.57
NiO	0.14		C	0.03	
MgO	0.12	0.22	Total	99.25	100.28

(1) Nsuta, Ghana; corresponds to $Mn^{4+}_{0.90}Mn^{2+}_{0.03}Fe^{3+}_{0.01}[O_{1.75}(OH)_{0.25}]_{\Sigma=2.00}$. (2) Molango Piedras Negras, Mexico; corresponds to $Mn^{4+}_{0.91}Mn^{2+}_{0.02}Fe^{3+}_{0.01}Ca_{0.01}Si_{0.01}Al_{0.01}[O_{1.80}(OH)_{0.20}]_{\Sigma=2.00}$.

Occurrence: Thought to be supergene, formed under alkaline oxidizing conditions deficient in barium and potassium.

Association: Pyrolusite, cryptomelane, romanèchite, chalcophanite, other Mn oxides, rhodochrosite, quartz, goethite.

Distribution: Widespread, may be in large amounts. Well-characterized material from: Nsuta, Ghana. At Mokuta, Ivory Coast. In the Orient mine, Krugersdorp, Transvaal, and near Kuruman, Cape Province, South Africa. At Tartana, 32 km north of Drama, Macedonia. From Philipsburg, Granite Co., Montana, and the Hardshell mine, Santa Cruz Co., Arizona, USA. From Molango Piedras Negras, Hidalgo, Mexico. On Groote Eylandt, Northern Territory, Australia. In Germany, at Bülten-Adenstadt, Lower Saxony. From Bihain, near Salmchâteau, Belgium.

Name: For Nsuta, Ghana, a prominent occurrence.

Type Material: n.d.

X-ray Powder Pattern: Lime Creek deposit, Canada.
3.66 (100), 3.54 (100), 4.00 (90), 3.16 (80), 2.54 (70), 1.871 (60), 1.349 (40)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
Pb	34.12	36.63	33.77	Sb	1.33	2.15	2.18
Cu	5.81	6.41	5.52	S	17.52	16.51	17.10
Bi	42.00	37.97	42.28	Total	100.78	99.67	100.85

(1) Lime Creek deposit, Canada; by electron microprobe, corresponding to $Pb_{2.00}Cu_{1.17}(Bi_{0.58}Sb_{0.14}Pb_{0.11})_{\Sigma=0.83}Bi_{2.00}S_{7.00}$. (2) Les Houches, France; by electron microprobe, average of seven analyses; corresponding to $Pb_{2.00}Cu_{1.32}(Bi_{0.38}Pb_{0.32}Sb_{0.23})_{\Sigma=0.93}Bi_{2.00}S_{6.75}$. (3) Maleevskoe, Russia; by electron microprobe, average of ten analyses; corresponding to $Pb_{2.00}Cu_{1.13}(Bi_{0.62}Sb_{0.23}Pb_{0.11})_{\Sigma=0.96}Bi_{2.00}S_{6.91}$.

Occurrence: In vugs in a small quartz vein in the Lime Creek stock (Lime Creek deposit, Canada).

Association: Molybdenite, cosalite, aikinite, pyrite, galena, sphalerite (Lime Creek, Canada); neyite, galena, tetrahedrite, chalcopyrite, sphalerite (Alaska mine, Colorado, USA).

Distribution: In Canada, from Patsy Creek, immediately south of the Lime Creek molybdenum deposit, Kitsault, near Alice Arm, British Columbia [TL], and at Izok Lake, Northwest Territories. In the Alaska mine, Poughkeepsie Gulch, San Juan Co., Colorado, USA. From the Secu Valley, Baia Borą district, Romania. In the Spissko-Gemerske Ore Mountains, eastern Slovakia. From Les Houches, Haute-Savoie, France. At Maleevskoe, Rudnyi Altai, Russia. From Akchatau, Kara Oba, and in the Ichkeul'nes skarn copper deposit, Kazakhstan.

Name: In honor of Professor Edward Wilfrid Nuffield (1914–), Canadian mineralogist of the University of Toronto, Toronto, Canada.

Type Material: Canadian Geological Survey, Ottawa, 13448; Royal Ontario Museum, Toronto, Canada.

Chemistry:

	(1)
Cu	56.51
Fe	9.64
Ag	0.09
As	0.04
S	33.51
Total	99.79

(1) Undu mine, Fiji Islands; by electron microprobe, corresponds to $(Cu_{3.37}Fe_{0.66})_{\Sigma=4.03}S_{3.97}$.

Occurrence: A primary mineral in a Kuroko-type deposit (Undu mine, Fiji Islands); also an alteration product of primary chalcopyrite.

Association: Pyrite, covellite, chalcopyrite, bornite, sphalerite.

Distribution: From the Undu mine, Nukundamu, Vanua Levu, Fiji Islands [TL]. In the Grasberg Cu–Au deposit, Irian Jaya. From Bisbee, Cochise Co., Arizona, and at Bingham, Tooele Co., Utah, USA.

Name: For the Fijian locality at Nukundamu.

Type Material: The Natural History Museum, London, England, 1974,5, E1455; National Museum of Natural History, Washington, D.C., USA, 148128.

Nullaginite $Ni_2(CO_3)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. Fibers showing felted texture, cross-vein or in ovoid to irregular nodules, to 2 mm.

Physical Properties: Hardness = n.d. VHN = 25–45 (20 g load). D(meas.) = 3.56(4) D(calc.) = 3.66

Optical Properties: Semitransparent. *Color:* Bright green; pale green in transmitted light. *Luster:* Dull, claylike, silky in cross-vein fibers.
Optical Class: Biaxial (–). *Pleochroism:* Weak. *Orientation:* Y or $Z \simeq b$; $X \wedge c = 6°$. *Absorption:* Normal to fiber > along length of fiber. $\alpha = 1.67$ $\beta = 1.78$ $\gamma = 1.78$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. $a = 9.236(3)$ $b = 12.001(6)$ $c = 3.091(2)$ $\beta = 90.48(7)°$ Z = 4

X-ray Powder Pattern: Otway deposit, Australia.
2.579 (100), 2.557 (90), 4.619 (40), 3.660 (40), 7.30 (30b), 5.038 (30), 1.545 (30)

Chemistry:

	(1)	(2)
CO_2	[21.02]	20.82
Fe_2O_3	0.24	
Cr_2O_3	0.42	
NiO	68.67	70.66
CuO	0.11	
MgO	0.98	
H_2O	[8.56]	8.52
Total	[100.00]	100.00

(1) Otway deposit, Australia; by electron microprobe, average of five determinations, recalculated to 100% from an elemental analysis totaling 89.43% and estimated to contain pecoraite 8.6%, total thought low due to adsorbed H_2O; $(CO_3)^{2-}$ and $(OH)^{1-}$ calculated from stoichiometry; then corresponds to $(Ni_{1.93}Mg_{0.05}Cr_{0.01})_{\Sigma=1.99}(CO_3)(OH)_2$. (2) $Ni_2(CO_3)(OH)_2$.

Mineral Group: Rosasite group.

Occurrence: A rare mineral formed in the oxidation zone of nickel-rich hydrothermal ore deposits.

Association: Magnesian pecoraite, gaspéite, magnetite, "chlorite", nickeloan serpentine (Otway deposit, Australia).

Distribution: From the Otway nickel deposit, near Spinnaway, Nullagine district, and in the 132 North nickel mine, 4 km southwest of Widgiemooltha, Western Australia.

Name: For the Nullagine district, Western Australia, in which the mineral was first found.

Type Material: Western Australian Museum, Perth, Australia, M.76a.1991, M.76b.1991; The Natural History Museum, London, England, 1982,74.

References: (1) Nickel, E.H. and L.G. Berry (1981) The new mineral nullaginite and additional data on the related minerals rosasite and glaukosphaerite. Can. Mineral., 19, 315–324. (2) (1982) Amer. Mineral., 67, 857–858 (abs. ref. 1).

(1) Fuka Mine, Okayama Prefecture, Japan; average of electron microprobe analyses, anionic groups confirmed by IR spectroscopy, CO_2 and H_2O by TGA; corresponding to $Ca_{3.898}(Cu_{0.744}Mg_{0.145}Zn_{0.036})_{\Sigma=0.925}B_{3.969}O_{5.615}(OH)_{6.208}(CO_3)_{2.059}$.

Occurrence: On the wall of cavities in a vein of nifontovite or in fractures in a crystalline limestone near gehlenite-spurrite skarns. Likely formed by Cu- and Mg-bearing late hydrothermal solutions.

Association: Borcarite, nifontovite, bultfonteinite, calcite.

Distribution: In Japan, at the Fuka Mine, Okayama Prefecture.

Name: Honors Tadayuki Numano (1931-2001), Emeritus Professor, Okayama University, Japan.

Type Material: Department of Geology, National Science Museum, Tokyo, Japan, (NSM-M28813).

References: (1) Ohnishi, M., I. Kusachi, J. Yamakawa, M. Tanabe, S. Kishi, and T. Yasuda (2007) Numanoite, $Ca_4CuB_4O_6(OH)_6(CO_3)_2$, a new mineral species, the Cu analogue of borcarite from the Fuka mine, Okayama Prefecture, Japan. Can. Mineral., 45, 307-315. (2) (2007) Amer. Mineral., 92, 1778 (abs. ref. 1).

Nyböite $NaNa_2[Mg_3Al_2](Si_7Al)O_{22}(OH)_2$

(1) Nordfjord, Norway; by electron microprobe, Fe^{2+}:Fe^{3+} calculated; corresponding to $(Na_{0.72}K_{0.24})_{\Sigma=0.96}(Na_{1.67}Ca_{0.33})_{\Sigma=2.00}(Mg_{2.82}Fe^{2+}_{0.18})_{\Sigma=3.00}(Al_{1.43}Mg_{0.32}Fe^{3+}_{0.24}Ti_{0.02})_{\Sigma=2.01}(Si_{7.24}Al_{0.76})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Jianchang, China; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponding to $(Na_{0.75}K_{0.05})_{\Sigma=0.80}(Na_{1.56}Ca_{0.44})_{\Sigma=2.00}(Mg_{2.17}Fe^{2+}_{0.82}Mn_{0.01})_{\Sigma=3.00}(Al_{1.22}Mg_{0.45}Fe^{3+}_{0.33}Ti_{0.01})_{\Sigma=2.01}(Si_{7.20}Al_{0.80})_{\Sigma=8.00}O_{22}(OH)_2$.

Mineral Group: Amphibole (alkali) group: $Fe^{3+}/(Fe^{3+} + Al^{vi})$ 0.5; $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A \geq 0.5$; $Na_B \geq 1.34$; $(Ca + Na)_B \geq 1.34$; $6.5 < Si < 7.5$.

Occurrence: In a compositionally-layered eclogite that has undergone high-pressure amphibolite facies metamorphism (Nordfjord, Norway).

Association: Taramite, omphacite, jadeitic clinopyroxene, aegirine-augite, paragonite, apatite, albite, garnet, epidote, kyanite, quartz, coesite (Lanshantou, China).

Distribution: In the Nybö eclogite pod, Nordfjord, Norway. From the Dora-Maira massif, Parigi, near Martiniana Po, Piedmont, Italy. In China, near Lanshantou, Jianchang, Jiangsu Province. At Tawmaw, Myitkyina-Mogaung district, Kachin State, northern Myanmar (Burma).

Name: Apparently for the type locality, the Nybö eclogite, Nordfjord, Norway.

Type Material: n.d.

(1) Oldoinyo Lengai volcano, Tanzania. (2) Do.; by electron microprobe, CO_2 by difference. (3) $Na_2Ca(CO_3)_2$.

Polymorphism & Series: Trimorphous with natrofairchildite and zemkorite.

Occurrence: As phenocrysts in carbonate lavas, persistent due to rapid cooling.

Association: Halite, sylvite, fluorite, gregoryite, calcite.

Distribution: In Tanzania, from the Oldoinyo Lengai and Kerimasi volcanos.

Name: To honor Julius Kambarage Nyerere (1922–1999), President of Tanzania when the mineral was found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 113544, 162608.

(1) Broken Hill, New South Wales, Australia, average of 14 electron microprobe analyses; corresponding to $Cd_{2.80}Zn_{1.24}Mn_{0.53}Cu_{0.44}Al_{0.04}Ca_{0.03}Pb_{0.02}[(AsO_4)_{3.13}(PO_4)_{0.92}]_{\Sigma=4.05}\ H_{1.91} \cdot 3.79H_2O$.
(2) $Cd_3Zn_2(AsO_3OH)_2(AsO_4)_2 \cdot 4H_2O$.

Occurrence: A late-stage secondary mineral in the weathering zone of a Cd-Zn arsenate deposit.

Association: Goldquarryite, lavendulan-sampleite, scorodite-strengite, gypsum.

Distribution: Block 14 Opencut, Broken Hill, New South Wales, Australia.

Name: Honors Sir Ronald Sydney Nyholm (1917–1971), born at Broken Hill, New South Wales, and Chair and Professor of Chemistry, University College, London, from 1955–1971.

Type Material: South Australian Museum, Adelaide, South Australia (catalog no. G32511).

Odinite $(Fe^{3+}, Mg, Al, Fe^{2+})_{2.5}(Si, Al)_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or hexagonal. *Point Group:* n.d. As clay-sized crystallites within aggregates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.78]

Optical Properties: Semitransparent (?). *Color:* Green to dark green. *Streak:* Gray-green. *Luster:* Silky to earthy.
Optical Class: n.d.

Cell Data: *Space Group:* Cm (1M). $a = 5.373(3)$ $b = 9.326(7)$ $c = 7.363(6)$ $\beta = 104.0(1)°$ Z = [2], or *Space Group:* $P31m$ (1A, probable). $a = 5.366(6)$ $c = 7.161(8)$ Z = [2]

X-ray Powder Pattern: Los Islands, Guinea; mixed monoclinic and hexagonal polytypes. 7.15 (100), 3.58 (85), 1.552 (65), 4.65 (40), 2.67 (40), 2.41 (30), 4.53 (20)

Chemistry:

	(1)		(1)
SiO_2	36.0	CaO	0.13
TiO_2	0.4	Na_2O	trace
Al_2O_3	12.2	K_2O	0.35
Fe_2O_3	19.5	H_2O^+	0.91
FeO	6.21	H_2O^-	4.10
MnO	0.33	CO_2	10.05
MgO	9.7	P_2O_5	0.17
		Total	100.05

(1) Los Islands, Guinea; by a combination of wet chemical analysis and electron microprobe; after exclusion of CaO as $CaCO_3$, K_2O, and P_2O_5 as impurities, corresponds to $(Fe^{3+}_{0.78}Mg_{0.77}Al_{0.56}Fe^{2+}_{0.28}Ti_{0.02}Mn_{0.02})_{\Sigma=2.43}(Si_{1.79}Al_{0.21})_{\Sigma=2.00}O_5(OH)_{4.00}$.

Polymorphism & Series: 1M and 1A polytypes.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Formed in marine waters, a minor component of green clay infillings or replacements of microtests, bioclasts, fecal pellets, or mineral debris on shallow marine shelfs and reef lagoonal areas in tropical latitudes. Probably only present in rocks less than Quaternary in age, as susceptible to alteration to chlorite through weathering.

Association: Quartz, calcite, kaolinite, smectite, illite, chlorite.

Distribution: A minor component of sediments estimated to cover more than 100,000 km^2 of present-day sea bottom. At least eleven independent localities are noted: among these are the reef lagoon southwest of New Caledonia; in the Ogooue River prodelta, Congo Republic; the continental shelf between the Amazon and Orinoco Rivers, Brazil; the Niger River prodelta, Nigeria; off Martinique Island; Los Islands, in the mouth of the Koukoure River, Guinea.

Name: For Dr. Gilles Serge Odin, clay mineralogist of the University P. and M. Curie, Paris, France, who did the initial work on this mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 165498; The Natural History Museum, London, England, 1987,532; Museum of Natural History, Paris, 187.7; National School of Mines, Paris, France.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = n.d. VHN = 599 (100 g load). D(meas.) = n.d. D(calc.) = 7.91

Optical Properties: Opaque. *Color:* Silver-white; silver-wite in reflected light. *Streak:* Gray. *Luster:* Metallic.
Optical Class: Biaxial. *Anisotropism:* Weak to distinct; reddish brown to darker pale violet and purplish blue.
R_1–R_2: 55.5–58.2 (470), 55.6–56.8 (546), 55.5–55.8 (589), 55.5–55.0 (650)

Cell Data: *Space Group:* n.d. $a = 3.304(6)$ $b = 6.092(8)$ $c = 10.258(13)$ Z = 4

X-ray Powder Pattern: Tunaberg, Sweden.
2.63 (10), 1.942 (10), 2.53 (8), 1.1182 (8), 1.730 (4), 1.640 (4), 1.3963 (4)

Chemistry:

	(1)	(2)
Co	15.4	23.06
Ni	2.7	
Cu	0.1	
Fe	5.6	
As	26.9	29.31
Sb	47.4	47.63
S	2.0	
Total	100.1	100.00

(1) Tunaberg, Sweden; by electron microprobe, average of 21 analyses; corresponding to $(Co_{0.65}Fe_{0.24}Ni_{0.11})_{\Sigma=1.00}(Sb_{0.96}As_{0.04})_{\Sigma=1.00}(As_{0.85}S_{0.15})_{\Sigma=1.00}$. (2) CoSbAs.

Occurrence: In Cu–Co-bearing skarns.

Association: Chalcopyrite, bismuth, dyscrasite, allargentum, breithauptite, nisbite, tetrahedrite, cobaltite, gudmundite, löllingite, magnetite, galena, sphalerite, other sulfides.

Distribution: From Tunaberg, Bergslagen metallic province, Sweden [TL].

Name: In honor of Dr. Ing Soen Oen (1928–1996), Professor of Mineralogy, University of Amsterdam and Free University of Amsterdam, Amsterdam, The Netherlands, for his contributions to the geology and mineralogy of ore deposits.

Type Material: Geological Institute, University of Amsterdam, Amsterdam; Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands.

Offretite $(K_2, Ca)_{2.5}Al_5Si_{13}O_{36}\cdot 15H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. Crystals form hexagonal prisms, which may be hollow, vertically striated, to 3 mm; in hemispherical forms with radiating structure. Typically in complex overgrowths on erionite and levyne.

Physical Properties: *Cleavage:* {0001}, distinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 2.13 D(calc.) = 2.06

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.489–1.495$ $\epsilon = 1.486–1.492$

Cell Data: *Space Group:* $P\bar{6}m2$. $a = 13.291(2)$ $c = 7.582(6)$ $Z = 1$

X-ray Powder Pattern: Mont Sémiol, France; close to erionite.
11.50 (100), 2.880 (64), 4.352 (59), 3.837 (43), 5.76 (35), 3.322 (22), 6.64 (20)

Chemistry:

	(1)
SiO_2	53.0
Al_2O_3	18.1
MgO	2.0
CaO	4.1
K_2O	3.6
H_2O^+	17.7
H_2O^-	1.1
Total	99.6

(1) Mont Sémiol, France; Na_2O 0.01% by microspectrochemical analysis; corresponds to $(K_{1.1}Ca_{1.1}Mg_{0.7})_{\Sigma=2.9}Al_{5.2}Si_{12.8}O_{36}\cdot 15.2H_2O$.

Mineral Group: Zeolite group.

Occurrence: Lining cavities in basalt.

Association: Zeolites, especially erionite, levyne, celadonite, montmorillonite.

Distribution: From Mont Sémiol (Mont Simiouse), Montbrison, Loire, France. At a number of localities on the Vogelsberg, Hesse, Germany. In the USA, in Oregon, from Milwaukie, Clackamas Co., at Gordon Gulch, Owyhee Dam, Malheur Co., and Ritter Hot Springs, Grant Co.; in Washington, at Rock Island Dam, Douglas Co.; in Arizona, from Queen Creek, 10 km west of Superior, Pinal Co., and from three km south of Horseshoe Dam, Maricopa Co. From southwest of Westwold, British Columbia, Canada. There are many other occurrences, most overgrowing erionite or levyne.

Name: For Professor Albert Jules Joseph Offret (1857–?), of Lyons, France.

Total	[100.0]	100.0

(1) Sterling Hill, New Jersey, USA; by electron microprobe, average of two analyses; total Fe as Fe_2O_3, confirmed by microchemical test, total Mn as MnO, H_2O by difference. (2) Ojuela mine, Mexico; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO, H_2O by moisture evolution analysis; corresponds to $Ca_{1.86}(Zn_{0.38}Mn_{0.35})_{\Sigma=0.73}Fe_{3.80}(AsO_4)_{3.62}(OH)_{5.72} \cdot 5.64H_2O$.

Occurrence: On oxidized ore from a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA); in oxidized ore from an arsenic-rich polymetallic hydrothermal ore deposit (Ojuela mine, Mexico).

Association: Parasymplesite, köttigite, yukonite, legrandite, pharmacosiderite, willemite, franklinite, sphalerite (Sterling Hill, New Jersey, USA); villyaellenite, arseniosiderite, chalcophanite, adamite, Fe–Mn oxides (Ojuela mine, Mexico).

Distribution: From Sterling Hill, Ogdensburg, New Jersey, USA. In the Ojuela mine, Mapimí, Durango, Mexico. At the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For its occurrence at Ogdensburg, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 146880.

(1) Ohmi, Japan; corresponds to $Sr_{3.16}(Ti_{0.98}Fe^{3+}_{0.02})_{\Sigma=1.00}Si_{4.00}O_{12}[O,(OH)]\cdot 2.21H_2O$.

Occurrence: In an amphibolite-quartz-albitite dike cutting serpentinite.

Association: Magnesio-riebeckite, quartz, albite, phlogopite, benitoite, bario-orthojoaquinite, leucosphenite.

Distribution: From Ohmi, Niigata Prefecture, Japan.

Name: For the locality at Ohmi, Japan.

Type Material: n.d.

References: (1) Komatsu, M., K. Chihara, and T. Mizota (1973) A new strontium-titanium hydrous silicate mineral from Ohmi, Niigata Prefecture, central Japan. Mineral. J. (Japan), 7, 298–301. Ojuelaite $\mathbf{ZnFe_2^{3+}(AsO_4)_2(OH)_2 \cdot 4H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Acicular crystals or fibers, elongated ‖ [001], to 4 mm, commonly in divergent sprays.

Physical Properties: *Cleavage:* On {010}, observable. Hardness = 3 D(meas.) = 3.39 D(calc.) = 3.39

Optical Properties: Semitransparent. *Color:* Chartreuse to pale yellow-green. *Streak:* Pale yellow. *Luster:* Silky to vitreous.
Optical Class: Biaxial (+). *Pleochroism:* In yellows. *Orientation:* X = b; Z = c.
Absorption: $Z = X > Y$. $\alpha = 1.696$ $\beta = 1.730$ $\gamma = 1.798$ 2V(meas.) = n.d. 2V(calc.) = 73°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.237(1)$ $b = 9.662(3)$ $c = 5.562(1)$ $\beta = 94.36(1)°$ Z = 2

X-ray Powder Pattern: Ojuela mine, Mexico.
4.251 (100), 2.871 (90), 7.03 (82), 4.83 (78), 10.23 (65), 2.630 (63), 2.901 (62)

Chemistry:

	(1)	(3)
As_2O_5	40.5	40.97
Fe_2O_3	27.5	28.47
ZnO	14.6	14.51
H_2O	16.8	16.05
Total	99.4	100.00

(1) Ojuela mine, Mexico; Zn and Fe by AA, As by UV spectrophotometry, H_2O by the Penfield method; corresponds to $Zn_{1.02}Fe^{3+}_{1.96}(AsO_4)_{2.00}(OH)_{1.92} \cdot 3.37H_2O$. (2) Do.; by electron microprobe, analysis not given, stated to correspond to $(Zn_{0.77}Fe^{2+}_{0.23})_{\Sigma=1.00}$ $Fe^{3+}_{2.00}(AsO_4)_{1.94}(OH)_2 \cdot 3.75H_2O$. (3) $ZnFe_2(AsO_4)_2(OH)_2 \cdot 4H_2O$.

Mineral Group: Arthurite group.

Occurrence: A rare mineral in the oxidized zone of arsenic-rich polymetallic hydrothermal ore deposits.

Association: Paradamite, scorodite, smithsonite, "limonite" (Ojuela mine, Mexico); smithsonite, tennantite, goethite (Tsumeb, Namibia).

Distribution: In the Ojuela mine, Mapimí, Durango, and at Pitiquito, Sonora, Mexico. From Sterling Hill, Ogdensburg, New Jersey, USA. At Tsumeb, Namibia.

Name: For the Ojuela mine, Mexico, in which the first specimens were found.

Type Material: University of Pierre and Marie Curie, Paris, France; National Museum of Natural History, Washington, D.C., USA, 145679.

Okanoganite-(Y) $(Na,Ca)_3(Y,Ce)_{12}B_2Si_6O_{27}F_{14}$

Crystal Data: Hexagonal. *Point Group:* 3m. As twinned pseudotetrahedral crystals, to 4 mm, and groups of such crystals. Twinning: With twin plane (0114), producing fourlings, the (0001) face of each individual crystal forming the faces of a pseudotetrahedron.

Physical Properties: Hardness = 4 D(meas.) = 4.35(4) D(calc.) = 4.96

Optical Properties: Transparent to translucent. *Color:* Tan to pale pink; colorless in thin fragments. *Streak:* White.
Optical Class: Uniaxial (-). ω = 1.753(2) ε = 1.740(2)

Cell Data: Space Group: *R3m.* *a* = 10.7108(5) *c* = 27.0398(11) Z = 3

X-ray Powder Pattern: Golden Horn batholith, Washington, USA.

(1) Bombay, India. (2) $Ca_5Si_9O_{23}\cdot 9H_2O$.

Occurrence: Commonly in amygdules in basalts.

Association: Zeolites, apophyllite, prehnite, calcite, quartz, "chalcedony."

Distribution: From Greenland, at Qutdligssat (Kudlisat), Ritenbenk district; on Quqertarsuaq [Disko] Island, at Skarvefjeld and Blæsedal, Godhavn district; and elsewhere. On Bordoy and Streymoy, Faeroe Islands. At Scawt Hill, near Larne, Co. Antrim, Ireland. On the Isle of Mull and on Morven Peak, Grampian Highlands, Scotland. In India, in Maharashtra, from the Syhadree Mountains; the Bombay quarry, Bombay; around Poona; and in the Nasik and Kolhapur districts. At Rio Putagan, Chile. In the Noche Buena mine, Mazapil, Zacatecas, Mexico. In the USA, at Crestmore, Riverside Co., California; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; and at Skookumchuck Dam, near Bucoda, Thurston Co., Washington. In the Jeffrey mine, Asbestos, Quebec, Canada. Other localities are known.

Name: For the German naturalist Lorenz Ocken (1779–1851), of Munich, Germany, the mineral name later shortened.

H_2O	6.89
Total	100.09

(1) Kokuriki mine, Japan; by electron microprobe, H_2O by TGA, Fe^{3+} confirmed by Mössbauer spectroscopy, Mn^{2+}:Mn^{3+} calculated from stoichiometry; corresponds to $(Ca_{1.91}Na_{0.04})_{\Sigma=1.95}(Mn^{2+}_{0.69}Mg_{0.28})_{\Sigma=0.97}(Mn^{3+}_{1.13}Al_{0.47}Fe^{3+}_{0.40})_{\Sigma=2.00}Si_{3.03}[O_{9.93}(OH)_{4.07}]_{\Sigma=14.00}$.

Mineral Group: Pumpellyite group.

Occurrence: In network veinlets cutting hematite-rich ores.

Association: Hematite, quartz, piemontite, neotocite, bementite, apatite, inesite, rhodochrosite.

Distribution: From the Kokuriki mine, at Hiyoshi, about 20 km north of Kitami City, Hokkaido, Japan.

Name: For the Sea of Okhotsk, near the type locality in Japan.

Type Material: n.d.

References: (1) Togari, K. and M. Akasaka (1987) Okhotskite, a new mineral, an Mn^{3+}-dominant member of the pumpellyite group, from the Kokuriki mine, Hokkaido, Japan. Mineral. Mag., 51, 611–614. (2) (1988) Amer. Mineral., 73, 1495–1496 (abs. ref. 1).

Oldhamite (Ca, Mg)S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As single-crystal nodules, to 3 mm (Busti meteorite).

Physical Properties: *Cleavage:* On {001}. Hardness = 4 VHN = n.d. D(meas.) = 2.58 D(calc.) = 2.589

Optical Properties: Transparent. *Color:* Pale chestnut-brown, tarnishes strongly on exposure to wet air; in transmitted light, colorless to pale brown with many internal reflections.
Optical Class: Isotropic. $n = 2.137$
R: n.d.

Cell Data: *Space Group:* $Fm3m$. a = 5.6948 Z = 4

X-ray Powder Pattern: Synthetic CaS.
2.846 (100), 2.013 (70), 1.6439 (21), 1.2737 (20), 1.1627 (14), 1.4238 (10), 0.9491 (8)

Chemistry:

	(1)	(2)	(3)
Ca	53.45	51.0	55.55
Mg	1.49	0.90	
Na		0.04	
Mn		0.17	
Fe	0.32	5.50	
Cu		0.02	
S	44.74	41.6	44.45
Total	[100.00]	99.23	100.00

(1) Bustee meteorite; after deduction of other mineral impurities 7.15% and insoluble 8.46% from an original total of 97.99%, recalculated to 100.00%; then corresponds to $(Ca_{0.96}Mg_{0.04})_{\Sigma=1.00}S_{1.00}$. (2) Kota-Kota meteorite; by electron microprobe, average of 11 determinations, corresponds to $(Ca_{0.98}Fe_{0.08}Mg_{0.03})_{\Sigma=1.09}S_{1.00}$. (3) CaS.

Occurrence: Due to high melting point of 2450 °C, an early nebular condensate; may fill the latest interstices between silicates in enstatite chondrite and achondrite meteorites.

Association: Enstatite, augite, niningerite, osbornite, gypsum, calcite, troilite.

Distribution: In the Bustee [TL], Hvittis, Mayo Belwa, Indarch, Kota-Kota, Adhi-Kot, Norton County, Peña Blanca Spring, Abee, Qingzhen, etc., meteorites.

Name: Honors Thomas Oldham (1816–1878), Irish geologist, Director of the Indian Geological Survey (1850–1876).

Type Material: The Natural History Museum, London, England, 32100.

Olekminskite $(Sr, Ca, Ba)_2(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. As needlelike crystals, to 0.15 mm, hexagonal to rounded in cross section; in spherulites.

Physical Properties: *Tenacity:* Brittle. Hardness = 3 D(meas.) = 3.70(2) D(calc.) = 3.65–3.68

Optical Properties: Transparent. *Color:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.670(2)$ $\epsilon = 1.527(2)$

Cell Data: *Space Group:* [$P321$] (by analogy to paralstonite). $a = 8.66(2)$ $c = 6.08(2)$ Z = 3

X-ray Powder Pattern: Kedrovyi massif, Russia.
3.50 (100), 2.49 (90), 2.03 (90), 1.305 (70b), 1.928 (60), 1.837 (60), 1.581 (60b)

Chemistry:

	(1)
CO_2	[29.94]
La_2O_3	0.21
Ce_2O_3	0.56
CaO	6.68
SrO	49.86
BaO	11.23
Total	[98.48]

(1) Kedrovyi massif, Russia; by electron microprobe, CO_2 calculated for stoichiometry; corresponds to $Sr_{1.00}(Sr_{0.41}Ca_{0.35}Ba_{0.22}Ce_{0.01})_{\Sigma=0.99}(CO_3)_{2.00}$.

Polymorphism & Series: Forms a series with paralstonite.

Occurrence: In barytocalcite–quartz veins in intrusive breccia in an alkaline massif.

Association: Paralstonite, calcite, barite, ankerite, ancylite-(Ce), narsarsukite, sphalerite, galena.

Distribution: From the Kedrovyi massif, five km southeast of the Murun massif, Aldan Shield, Sakha, Russia.

Name: For Olekminsk, Russia, administrative center for the district in which the Kedrovyi massif is located.

Type Material: Mining Institute, St. Petersburg, 2071/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p461/1.

Olenite **$NaAl_3Al_6(BO_3)_3(Si_6O_{18})(O,OH)_4$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3*m*. As the outer zone, to 3 mm thick, of acicular crystals with elbaite cores.

Physical Properties: Hardness = [∼7] (by analogy to the tourmaline group). VHN = 676–820 (100 g load). D(meas.) = 3.010(2) D(calc.) = 3.12

Optical Properties: Transparent. *Color:* Pale pink. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* Weak; *O* = bright pink; *E* = pinkish yellow. $\omega = 1.654(2)$ $\epsilon = 1.635(2)$

Cell Data: *Space Group: R*3*m*. a = 15.803(3) *c* = 7.086(1) Z = 3

X-ray Powder Pattern: Oleny Ridge, Russia.
2.551 (100), 3.43 (80), 3.95 (70), 3.394 (70), 4.18 (40), 6.33 (30), 2.021 (30)

Chemistry:

	(1)		(1)
SiO_2	36.86	MgO	0.00
TiO_2	0.03	CaO	0.26
B_2O_3	[10.90]	Na_2O	1.60

Fe_2O_3	0.14	F	0.06
MnO	0.49	H_2O	[1.36]
ZnO	0.03	Total	[98.19]

(1) Oleny Ridge, Russia; by electron microprobe, total Fe as Fe_2O_3, B_2O_3 and H_2O calculated from stoichiometry, original total given as 98.29%; corresponds to $(Na_{0.51}Ca_{0.05}K_{0.01})_{\Sigma=0.57}(Al_{2.91}Mn_{0.07}Fe^{3+}_{0.02}Ti_{0.01})_{\Sigma=3.01}Al_6(BO_3)_3Si_6O_{18}[O_{2.53}(OH)_{1.44}F_{0.03}]_{\Sigma=4.00}$.

Mineral Group: Tourmaline group.

Occurrence: In pegmatitic veins crosscutting Precambrian metasediments.

Association: Elbaite, quartz, albite, potassic feldspar.

Distribution: On the Oleny Ridge, Voroni massif, Kola Peninsula, Russia.

Name: For the occurrence on the Oleny Ridge, Russia.

Type Material: Mining Institute, St. Petersburg, 580-8/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87568.

K_2O	0.46
Total	100.78

(1) Mt. Karnasurt, Kola Peninsula, Russia; by electron microprobe, corresponding to $Na_{1.00}(Sr_{0.47}Ba_{0.42}La_{0.03}Ca_{0.02}K_{0.02}Mn_{0.02}Ce_{0.01})_{\Sigma=0.99}P_{0.99}O_4$.

Occurrence: In nepheline syenite pegmatite in a differentiated alkalic massif.

Association: Natrosilite, analcime.

Distribution: On Mts. Karnasurt and Alluaiv, Lovozero massif, and in the Vuonnemiok River valley, Khibiny massif, Kola Peninsula, Russia.

Name: To honor Ol'ga Anisimovna Vorob'eva (1902–1974), Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia, discoverer of the rare-metal deposits in the Lovozero massif.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80179.

Total	100.25	100.00	100.00

(1) Monteagle, Ontario, Canada. (2) $Na_{0.90}Ca_{0.10}Al_{1.10}Si_{2.90}O_8$. (3) $Na_{0.70}Ca_{0.30}Al_{1.30}Si_{2.70}O_8$.

Polymorphism & Series: Low- and high-temperature structural modifications are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: Common in granite, syenite, nepheline syenite, and their pegmatites; in diorite, rhyolite, andesite. In serpentinite and gneiss; in amphibolite facies metamorphic rocks; as clastic grains in sedimentary rocks.

Association: Quartz, orthoclase, sanidine, tourmaline, corundum.

Distribution: A widespread mineral. Fine material from Danviken, near Stockholm, Sweden. At Arendal, on Tromöy Island at Alve, Tvedestrand, and elsewhere in Norway. In Sweden, at Ytterby. From Kemiö (Kimito) Island, Finland. At Silberberg, near Bodenmais, Bavaria, Germany. On Tenerife, Canary Islands. In the USA, at Fine and Macomb, St. Lawrence Co., New York; on Corundum Hill, Chester Co., and at Media, Delaware Co., Pennsylvania; near Hawk, east of Bakersville, Mitchell Co., North Carolina. At Lake Harbour, Baffin Island, Northwest Territories, Canada.

Name: From the Greek for *little* and *fracture*, for cleavages believed inferior to albite.

	(1)	(2)
As_2O_5	39.80	40.61
CuO	56.65	56.21
H_2O	3.55	3.18
Total	100.00	100.00

(1) Cornwall, England. (2) $Cu_2(AsO_4)(OH)$.

Mineral Group: Forms a series with adamite.

Occurrence: The most common secondary copper arsenate in the oxdized zone of hydrothermal copper deposits.

Association: Conichalcite, clinoclase, tyrolite, cornetite, cornwallite, metazeunerite, scorodite, pharmacosiderite, spangolite, chalcophyllite, brochantite, malachite, azurite, chrysocolla.

Distribution: Many localities. In England, from Cornwall, at the Carharrack mine, Wheals Gorland, Unity, and others in Gwennap, Linkinhorne, and elsewhere; at Alston Moor, Cumbria, and Tavistock, Devon. From the Cap Garonne mine, near le Pradet, Var, France. In the Clara Mine, near Oberwolfach, and many other places in the Black Forest, Germany. At the Kamariza mine, Laurium, Greece. From the Touissit mine, near Oujda, Morocco. Large crystals at Tsumeb, Namibia. In the USA, fine examples from the Mammoth, American Eagle, and other mines in the Tintic district, Juab Co., Utah; at the Majuba Hill mine, Antelope district, Pershing Co., Nevada. In Chile, from Chuquicamata, Antofagasta; Collahuasi, Tarapacá; and the Copiapó district, Atacama. From Ashburton Downs, Western Australia.

Name: In allusion to its common olive-green color.

FeO	0.21	
Total	99.61	100.00

(1) Ol'khon Gate Strait, Lake Baikal, Russia; by electron microprobe, average of 12 analyses, total Fe as FeO; corresponding to $(Cr_{1.12}V_{0.85}Al_{0.05}Fe_{0.01})_{\Sigma=2.03}Ti_{2.98}O_{9.00}$. (2) $(Cr, V)_2Ti_3O_9$ with Cr:V = 1:1.

Occurrence: In quartzite schists, enriched in Cr–V–Ti, interbedded with carbonate-silicate rocks.

Association: Rutile, eskolaite, karelianite, schreyerite, vuorelainenite, quartz, oligoclase, orthoclase.

Distribution: On the western shore of Lake Baikal, 4.5 km south of Ol'khon Gate Strait, Siberia, Russia.

Name: For the Ol'khonskaya series of metamorphic rocks in which the mineral occurs.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r1001.

References: (1) Koneva, A.A., L.F. Piskunova, Z.F. Ushchapovskaya, and A.A. Konev (1994) Olkhonskite $(Cr, V)_2Ti_3O_9$ – a new mineral from the Priolkhon'ye. Zap. Vses. Mineral. Olmsteadite $KFe_2^{2+}(Nb,Ta)O_2(PO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are prismatic, elongated along [010], thick tabular ‖ {100} to thin tabular ‖ {001}, to 1 mm. Forms include {001}, {100}, {111}, $\{1\bar{1}1\}$, {110}, {101}.

Physical Properties: Hardness = 4 D(meas.) = 3.31–3.36 D(calc.) = 3.41

Optical Properties: Semitransparent. *Color:* Deep brown, red-brown to black. *Streak:* Olive-green. *Luster:* Subadamantine, may be bronzy. *Optical Class:* Biaxial (+). *Pleochroism:* Marked; X = blue-green or dark blue; Y = yellow or light brown; Z = brown to dark brown. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Absorption:* $X \gg Z > Y$. $\alpha = 1.725$–1.765 $\beta = 1.755$–1.775 $\gamma = 1.815$–1.835 2V(meas.) = ∼60°

Cell Data: *Space Group:* $Pb2_1m$. $a = 7.512(1)$ $b = 10.000(3)$ $c = 6.492(2)$ Z = 1

X-ray Powder Pattern: Big Chief mine, South Dakota, USA.
6.006 (10), 3.03 (7), 3.047 (6), 2.856 (6), 7.512 (5), 6.492 (5), 4.409 (5)

Chemistry:

Total	87.3	88.2	100.00

(1) Big Chief mine, South Dakota, USA; by electron microprobe, average of five analyses, original total given as 85.0%. (2) Hesnard mine, South Dakota, USA; by electron microprobe, average of two analyses. (3) $KFe_2NbO_2(PO_4)_2 \cdot 2H_2O$.

Occurrence: A rare mineral, presumably formed by hydrothermal leaching of primary phosphates and columbite-tantalite in complex granite pegmatites.

Association: Siderite, quartz (Big Chief mine, South Dakota, USA); rockbridgeite (Hesnard mine, South Dakota, USA).

Distribution: From the Big Chief mine, one km south of Glendale; the White Cap mine, three km south of Keystone; and the Hesnard mine, three km southwest of Keystone, Pennington Co., South Dakota, USA.

Name: Honoring Milo Olmstead, Rapid City, South Dakota, USA, amateur collector of microscopic minerals, who called attention to the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135924.

Olsacherite $Pb_2(Se^{6+}O_4)(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222 or $mm2$. Sharp needlelike crystals, to 2 mm, elongated along [010], and bounded by {010}, {101}, {111}, {$1\bar{1}1$}.

Physical Properties: *Cleavage:* Good on {101}; fair on {010}. *Tenacity:* Very brittle. Hardness = 3–3.5 D(meas.) = n.d. D(calc.) = 6.55 Pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous, dull if coated.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. $\alpha = 1.935(2)$ $\beta = 1.966(2)$ $\gamma = 1.983(2)$ 2V(meas.) = 80° 2V(calc.) = 84°

Cell Data: *Space Group:* $P22_12$, $P222$, or $Pmm2$. $a = 8.42(1)$ $b = 10.96(1)$ $c = 7.00(1)$ Z = 4

X-ray Powder Pattern: Pacajake mine, Bolivia.
3.338 (100), 3.234 (100), 3.015 (100), 2.086 (70), 2.786 (60), 3.845 (50), 4.316 (40)

Chemistry:

	(1)	(2)
SO_3	14.2	12.25
SeO_3	16.2	19.43
PbO	71.2	68.32
Total	101.6	100.00

(1) Pacajake mine, Bolivia; by electron microprobe, corresponding to $Pb_{2.00}(SeO_4)_{0.80}(SO_4)_{1.12}$. (2)$Pb_2(SeO_4)(SO_4)$.

Occurrence: A rare secondary mineral in the oxidized zone of selenium-bearing hydrothermal mineral deposits.

Association: Penroseite (Pacajake mine, Bolivia); chalcomenite, ahlfeldite, lepidocrocite, goethite (El Dragón mine, Bolivia).

Distribution: From the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, and in the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, Bolivia. At Cerro de Cacheuta, Mendoza Province, Argentina. From the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy.

Name: To honor Juan Augusto Olsacher (1903–1964), Professor of Mineralogy, Córdoba University, Córdoba, Argentina, who studied Argentinian selenium-bearing minerals.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 110966.

References: (1) Hurlbut, C.S., Jr. and L.F. Aristarain (1969) Olsacherite, $Pb_2(SO_4)(SeO_4)$, a new mineral from Bolivia. Amer. Mineral., 54, 1519–1527.

(1) Titovskoye deposit, Russia; after deduction of MgO as szaibélyite, CO_2 as calcite, quartz, and "limonite", corresponds to $Ca_{3.00}B_{4.00}(OH)_{18.55}$. (2) Fuka, Japan; corresponds to $Ca_{2.89}B_{4.00}(OH)_{18}$. (3) $Ca_3B_4(OH)_{18}$.

Occurrence: In magnesian skarn (Titovskoye deposit, Russia); formed by alteration of nifontovite and some other anhydrous borate, near gehlenite-spurrite skarn (Fuka, Japan).

Association: Sakhaite, szaibélyite, calcite, "limonite", quartz (Titovskoye deposit, Russia); nifontovite, frolovite, pentahydroborite, takedaite, sibirskite, parasibirskite, borcarite, bultfonteinite, calcite (Fuka, Japan).

Distribution: From the Titovskoye boron deposit, Tas-Khayakhtakh Range, Polar Sakha, Russia. Large crystals at Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: To honor Yakov Iosifovich Ol'shanskii (1912–1958), specialist in physical geochemistry, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1493/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 71541–71544.

Na_2O	54.50	49.69
Total	99.80	100.00

(1) Mt. Rasvumchorr, Kola Peninsula, Russia; MnO and CO_2 attributed to sidorenkite impurity.
(2) $LiNa_5(PO_4)_2$.

Occurrence: An ultra-alkalic phase in nepheline syenite pegmatites in differentiated alkalic massifs.

Association: Sidorenkite, dorfmanite, nahpoite, villiaumite, shafranovskite, aegirine (Mt. Rasvumchorr, Kola Peninsula, Russia); natrite, natrosilite (Lovozero massif, Kola Peninsula, Russia).

Distribution: On Mt. Rasvumchorr, Khibiny massif, and in the Lovozero massif, Kola Peninsula, Russia.

Name: For the 1980 Summer Olympic Games, in Moscow, USSR.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5533; Mining Institute, St. Petersburg, 1208/1; I.M.G.R.E., Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80180.

Ir	0.6
Ni	0.3
Fe	0.2
Co	0.1
As	44.2
Total	98.3

(1) Danba, China; by electron microprobe, average of six analyses; corresponding to $(Os_{0.87}Ru_{0.14}Ir_{0.01})_{\Sigma=1.02}As_{2.00}$.

Polymorphism & Series: Forms a series with anduoite.

Occurrence: In a Cu–Ni sulfide deposit associated with an ultramafic body.

Association: Pyrrhotite, pentlandite, chalcopyrite, violarite, cubanite, bornite, sphalerite, galena, linnaeite, magnetite, testibiopalladite, sudburyite, michenerite, sperrylite, kotulskite, gold, argentian gold.

Distribution: From Danba, Sichuan Province, China [TL].

Name: For Omeishan, a well-known mountain in Sichuan Province, China.

Type Material: Museum of Geology, National Bureau of Geology [Beijing?], China.

References: (1) Ren Yingxin, Hu Qinde, and Xu Jingao (1978) A preliminary study on the new mineral of the platinum group – omeiite, $OsAs_2$. Acta Geol. Sinica, 52, 163–167 (in Chinese with English abs.). (2) (1979) Amer. Mineral., 64, 464 (abs. ref. 1).

Omongwaite $Na_2Ca_5(SO_4)_6{\cdot}3H_2O$

Crystal Data: Monoclinic. *Point Group*: 2. Crystals, elongated on [001], with pseudohexagonal cross-sections and sphenoidal terminations, to 0.2 mm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: n.d.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.720

Optical Properties: Transparent. *Color*: Colorless. *Streak*: n.d. *Luster*: n.d.
Optical Class: Biaxial. *n*(calc) = 1.540 2V(meas.) = n.d. 2V(calc.) = n.d. *Orientation*: $Z \sim c$.

Cell Data: *Space Group*: *C2*. $a = 12.08(3)$ $b = 6.96(1)$ $c = 6.39(2)$ $\beta = 90.2(3)°$ $Z = 1$

X-ray Powder Pattern: Omongwa pan, southwestern Kalahari, Namibia.
3.015 (100), 2.819 (100), 6.005 (75), 3.481 (50), 2.139 (<25), 1.8534 (<25), 1.7437 (<25)

Chemistry:

	(1)	(2)
SO_3	56.16	54.78
CaO	30.82	31.98
Na_2O	5.25	7.07
K_2O	3.21	
H_2O	6.25	6.17
Total	101.69	100.00

(1) Omongwa pan, southwestern Kalahari, Namibia; average of 175 electron microprobe analyses, H_2O calculated from structure analysis, H_2O and SO_4 confirmed by Raman spectroscopy, corresponding to $(Na_{1.47}K_{0.59})_{\Sigma=2.06}Ca_{4.76}S_{6.07}O_{24}{\cdot}3H_2O$. (2) $Na_2Ca_5(SO_4)_6{\cdot}3H_2O$.

Occurrence: As inclusions in gypsum in a dry lake, closed-basin evaporite deposit.

Association: Gypsum.

Distribution: From the Omongwa pan, near Aminuis, 140 km SSE of Gobabis, southwestern Kalahari, Namibia.

Name: For the locality from which the first specimens were obtained, the Omongwa pan, Namibia; "omongwa" meaning "salt" in the Otjiherero language.

Type Material: Royal Museum for Central Africa, Tervuren, Belgium (catalog no. RGM 15.908).

References: (1) Mees, F., F. Hatert, and R. Rowe (2008) Omongwaite, $Na_2Ca_5(SO_4)_6{\cdot}3H_2O$, a new mineral from recent salt lake deposits, Namibia. Mineral. Mag., 72, 1307–1318. (2) (2009) Amer. Mineral., 94, 1499-1500 (abs. ref. 1).

Omphacite $(Ca, Na)(Mg, Fe, Al)Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely in rough crystals, to 5 cm; anhedral, granular to massive. *Twinning:* Single and polysynthetic twinning on {100}, common.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ $(1\bar{1}0)$ ~87°; parting on {100}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.16–3.43 D(calc.) = [3.36]

Optical Properties: Translucent. *Color:* Green to dark green; colorless to pale green in thin section. *Luster:* Vitreous to silky.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = colorless; Y = very pale green; Z = very pale green, blue-green. *Orientation:* $Y = b$; $Z \wedge c = 36°–48°$. *Dispersion:* $r > v$, moderate. $\alpha = 1.662–1.701$ $\beta = 1.670–1.712$ $\gamma = 1.685–1.723$ 2V(meas.) = 56°–84°

Cell Data: *Space Group:* $C2/c$ or $P2/n$. $a = 9.45–9.68$ $b = 8.57–8.90$ $c = 5.23–5.28$ $\beta = 105° – 108°$ Z = 4

(1) Kupplerbrunn, Austria; corresponds to $(Ca_{0.58}Na_{0.32})_{\Sigma=0.90}(Mg_{0.61}Al_{0.31}Fe^{2+}_{0.06}Ti_{0.04}Fe^{3+}_{0.02})_{\Sigma=1.04}(Si_{1.93}Al_{0.07})_{\Sigma=2.00}O_6$. (2) Yakutia, Russia; corresponds to $(Ca_{0.46}Na_{0.42}K_{0.01})_{\Sigma=0.89}(Al_{0.58}Mg_{0.38}Fe^{3+}_{0.04}Fe^{2+}_{0.04}Ti_{0.01})_{\Sigma=1.05}(Si_{1.92}Al_{0.08})_{\Sigma=2.00}O_6$.

Polymorphism & Series: A clinopyroxene solid solution of jadeite (25%–75%), augite (25%–75%), and aegirine (0%–25%).

Mineral Group: Pyroxene group.

Occurrence: A major constituent of eclogite, commonly in kimberlite pipes; from some ophiolites and glaucophane-bearing blueschist facies rocks.

Association: Garnet, quartz, kyanite, corundum (eclogite); "hornblende," scapolite, epidote, glaucophane (blueschists).

Distribution: A widespread mineral. Some localities for studied material are: in Germany, from Hof, near Bayreuth, Bavaria. At Kupplerbrunn, Saualpe, and Gertrusk, Carinthia, Austria. From Eiksundsal, Sunmøre, Naustdal, Vanelvsdalen, and Möre, Norway. In Russia, in the Yakutia diamond pipes, as at Mir, Zagadochnaya, and Obnazhennya. From Kimberley, Cape Province, South Africa. At Shibukawa, Gumma Prefecture, and in the Ohmi district, Niigata Prefecture, Japan. In the USA, on the Tiburon Peninsula, Marin Co., and on into Sonoma Co., California.

Name: From the Greek for *unripe grape*, in allusion to its green color.

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. Needlelike crystals, elongated along [010], flattened ∥ {001}, showing {100}, {201}, {401}, and {412}, to 5 mm. *Twinning:* May be twinned on {001}.

Physical Properties: Hardness = n.d. D(meas.) = 5.3 D(calc.) = 5.49

Optical Properties: Transparent. *Color:* Colorless to white.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c \simeq 12°$; $Y \wedge a \simeq 8°$; $Z \wedge b \simeq 0°$–$14°$. α = n.d. β = 2.18–2.23 γ = 2.23–2.26 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 18.92$ $b = 4.03$ $c = 10.31$ $\alpha =\sim 90°$ $\beta =\sim 110°$ $\gamma =\sim 90°$ Z = [2]

X-ray Powder Pattern: Cetine mine, Italy.
3.190 (100), 2.677 (60), 3.041 (50), 2.822 (50), 2.598 (30), 2.544 (30), 1.807 (30)

Chemistry:

	(1)	(2)
Sb_2O_3	87.90	87.54
$SbCl_3$	12.10	12.46
H_2O	0.00	
Total	100.00	100.00

(1) Cetine mine, Italy; by TGA. (2) $Sb_8O_{11}Cl_2$.

Occurrence: An oxidation product of stibnite in an antimony deposit in highly silicified evaporites.

Association: Stibnite, stibiconite, cetineite, peretaite, klebelsbergite, quartz.

Distribution: In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: To honor Ettore Onorato (1899–1971), Italian mineralogist.

Type Material: University of Rome, Rome, Italy, 24308.

Oosterboschite $(Pd, Cu)_7Se_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* n.d. As irregular grains, to 0.4 mm. *Twinning:* Polysynthetic, two orthogonal sets of fine lamellae always observed in polished section.

Physical Properties: Hardness = 4.5–5 VHN = 340 (100 g load). D(meas.) = n.d. D(calc.) = 8.48

Optical Properties: Opaque. *Color:* In polished section, pale yellow with a cream tint. *Anisotropism:* Medium strong, in bluish gray to brownish gray.
R_1–R_2: (400) 38.4–45.1, (420) 39.9–46.5, (440) 41.4–47.9, (460) 42.8–49.2, (480) 43.9–50.3, (500) 44.9–51.2, (520) 45.6–51.7, (540) 46.0–51.8, (560) 46.0–51.6, (580) 46.1–51.3, (600) 46.3–51.2, (620) 46.7–51.4, (640) 47.2–51.6, (660) 47.7–51.8, (680) 48.2–52.0, (700) 48.6–52.2

Cell Data: *Space Group:* n.d. $a = 10.42$ $b = 10.60$ $c = 14.43$ Z = 8

X-ray Powder Pattern: Musonoi mine, Congo.
2.647 (100), 2.600 (80), 1.847 (80), 2.736 (70d), 2.244 (70d), 1.935 (70), 1.903 (70)

Chemistry:

	(1)	(2)
Pd	44.9	44.1
Cu	17.1	16.7
Se	38.8	39.2
Total	100.8	100.0

(1) Musonoi mine, Congo; by electron microprobe, corresponds to $(Pd_{4.28}Cu_{2.73})_{\Sigma=7.01}Se_{5.00}$.
(2) Do.; corresponds to $(Pd_{4.17}Cu_{2.64})_{\Sigma=6.81}Se_{5.00}$.

Occurrence: In the zone of oxidation (Musonoi mine, Congo).

Association: Verbeekite, trogtalite, selenian digenite, covellite (Musonoi mine, Congo); gold, chrisstanleyite, verbeekite (Hope's Nose, England).

Distribution: From the Musonoi Cu–Co mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire) [TL]. At the Copper Hills prospect, East Pilbara region, Western Australia. From Hope's Nose, Torquay, Devon, England.

Name: For Robert Oosterbosch (1908–), Belgian mining engineer, for many years involved in the development of the Shaba mines.

Type Material: National School of Mines, Paris, France.

Orcelite $Ni_{5-x}As_2$ (x = 0.23)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As inclusions in pentlandite and rimming maucherite, to 0.05 mm; as disseminated grains.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = 6.5 D(calc.) = 8.50

Optical Properties: Opaque. *Color:* Rose-bronze, browner than nickeline; pale orange in polished section. *Luster:* Metallic. *Pleochroism:* Low, weaker than nickeline. *Anisotropism:* Noticeable, without distinct colors. *Bireflectance:* Weak.
R: (400) 42.3, (420) 42.9, (440) 43.6, (460) 44.5, (480) 45.5, (500) 46.7, (520) 47.8, (540) 49.1, (560) 50.5, (580) 51.8, (600) 53.3, (620) 54.7, (640) 56.0, (660) 57.2, (680) 58.2, (700) 59.0

Cell Data: *Space Group:* n.d. $a = 6.815(3)$ $c = 12.498(7)$ $Z = 6$

X-ray Powder Pattern: Tiébaghi massif, New Caledonia.
1.977 (10), 1.918 (10), 2.110 (4), 1.810 (4), 1.737 (4), 1.380 (4), 1.650 (3)

Chemistry:

	(1)	(2)	(3)	(4)
Ni	57.00	64.41	64.3	65.14
Fe			0.2	
As	31.50	35.59	35.1	34.86
S	1.00		0.1	
SiO_2	4.00			
Fe_2O_3	0.85			
MgO	3.80			
H_2O	1.50			
Total	99.65	100.00	99.7	100.00

(1) Tiébaghi massif, New Caledonia; includes 9.15% antigorite as impurity. (2) Do.; analysis (1) with Ni and As recalculated to 100%. (3) Nebral, Spain; by electron microprobe. (4) $Ni_{5-x}As_2$, x = 0.23.

Occurrence: As inclusions in pentlandite in serpentinized harzburgite.

Association: Pentlandite, heazlewoodite, millerite, parkerite, maucherite, breithauptite, magnetite, nickel, copper, chalcopyrite, chalcocite, galena.

Distribution: From the Tiébaghi massif, New Caledonia [TL]. On Table Mountain and Blow-Me-Down Mountain, Newfoundland, and in the Nipissing mine, Cobalt, Ontario, Canada. In the Ronda massif, at Nebral, Málaga Province, Spain. From the Cliff region, Unst, Shetland, Scotland. In the Kauniinvaara ultramafic lens, near Lake Kauniinlampi, eastern Finland. From the Vozhmin massif, Karelia, Russia. At Polling, Salzburg, Austria. From Vourinos, Greece. At Beni Bousera, Morocco.

Name: For Professor Jean Orcel (1896–1978), French mineralogist.

Type Material: Museum of Natural History, Paris; National School of Mines, Paris, France.

Ordóñezite $ZnSb_2^{5+}O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Tetragonal pyramidal crystals, to 2 mm, showing {001}, {110}, and {011}, universally twinned, in drusy or stalactitic masses. *Twinning:* Common on {013}, repeated.

Physical Properties: *Fracture:* Conchoidal. Hardness = 6.5 D(meas.) = 6.635 D(calc.) = 6.657

Optical Properties: Semitransparent. *Color:* Very light to very dark brown, colorless to pearl-gray, light yellowish olive to dark olive. *Luster:* Adamantine.
Optical Class: Uniaxial (+). $\omega = > 2.0$ $\epsilon = > 2.0$

Cell Data: *Space Group:* $P4/mnm$. $a = 4.67(1)$ $c = 9.24(1)$ Z = 2

X-ray Powder Pattern: Santín mine, Mexico.
1.72 (100), 3.26 (90), 2.55 (80), 1.38 (60), 1.19 (60), 1.64 (50), 1.47 (50)

Chemistry:

	(1)
Sb_2O_5	80.49
SiO_2	0.00
Al_2O_3	0.00
ZnO	20.07
Total	100.56

(1) Santín mine, Mexico; corresponds to $Zn_{1.00}Sb_{2.02}O_6$.

Mineral Group: Ferrotapiolite group.

Occurrence: Deposited at a late stage with pneumatolytic tin ore in fractures in rhyolite (Santín mine, Mexico).

Association: Cassiterite, hematite, quartz, cristobalite, "hyalite", montmorillonite (Santín mine, Mexico); byströmite, chenevixite, malachite (El Antimonio, Mexico).

Distribution: At the Santín mine, about eight km from Santa Caterina, Guanajuato, and from El Antimonio, 27 km southwest of Agua Prieta, Sonora, Mexico.

Name: For Ezequiel Ordóñez (1867–1950), noted Mexican geologist, formerly Director of the Geological Institute of Mexico.

Type Material: The Natural History Museum, London, England, 1965,208; Harvard University, Cambridge, Massachusetts, 110282; National Museum of Natural History, Washington, D.C., USA, R9127.

Örebroite $Mn_3^{2+}(Sb^{5+},Fe^{3+})(SiO_4)(O,OH)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3. As fine-grained, polycrystalline intergrowths and massive.

Physical Properties: *Fracture:* Irregular. Hardness = ∼4 D(meas.) = n.d. D(calc.) = 4.77 Weakly magnetic, probably due to inclusions of magnetite.

Optical Properties: Nearly opaque. *Color:* Dark brown. *Streak:* Reddish brown.
Luster: Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.857(3)$ $\epsilon = 1.875(3)$

Cell Data: *Space Group:* $P3$ (probable). $a = 8.183(7)$ $c = 4.756(9)$ $Z = 2$

X-ray Powder Pattern: Sjö mine, Sweden.
3.096 (100), 1.778 (90), 2.334 (70), 2.838 (50), 1.550 (50), 2.680 (40), 4.08 (30)

Chemistry:

	(1)
SiO_2	15.2
WO_3	0.0
Al_2O_3	0.3
Fe_2O_3	9.2
Sb_2O_5	15.8
As_2O_5	1.6
V_2O_5	0.0
MnO	54.6
MgO	0.8
H_2O	[2.8]
Total	[100.3]

(1) Sjö mine, Sweden; by electron microprobe, H_2O by analogy to welinite; corresponds to $Mn_{3.04}(Fe^{3+}_{0.46}Sb_{0.38}Mg_{0.08}As_{0.06}Al_{0.02})_{\Sigma=1.00}Si_{1.00}[O,(OH)]_{\Sigma=\sim 7}$.

Occurrence: A fine-grained aggregate with antimonates.

Association: Calcite, hausmannite, magnetite, dolomite.

Distribution: At the Sjö mine, near Grythyttan, Örebro, Sweden.

Name: For the town of Örebro, Sweden, about 60 km southeast of the Sjö mine.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, RM 93:0255; National Museum of Natural History, Washington, D.C., USA, 163008.

References: (1) Dunn, P.J., D.R. Peacor, R.C. Erd, and R.A. Ramik (1986) Franciscanite and örebroite, two new minerals from California and Sweden, related to redefined welinite. Amer. Mineral., 71, 1522–1526.

Oregonite Ni_2FeAs_2(?)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As fine-grained pebbles, having a smooth brown crust; polygonal grains, to 0.5 mm.

Physical Properties: *Tenacity:* Ductile. Hardness = 5 VHN = n.d. D(meas.) = n.d. D(calc.) = 6.92

Optical Properties: Opaque. *Color:* In polished section, white. *Anisotropism:* Weak.
R: (400) 41.7, (420) 43.0, (440) 44.3, (460) 45.3, (480) 46.1, (500) 46.7, (520) 47.2, (540) 48.0, (560) 48.9, (580) 50.1, (600) 51.3, (620) 52.8, (640) 54.2, (660) 55.4, (680) 56.4, (700) 57.2

Cell Data: *Space Group:* n.d. $a = 6.083$ $c = 7.130$ $Z = 3$

X-ray Powder Pattern: Josephine Creek, Oregon, USA.
2.314 (vs), 2.120 (vs), 1.991 (s), 1.789 (s), 1.757 (s), 1.739 (s), 3.571 (m)

Chemistry: Composition established by X-ray fluorescence, analysis not given.

Occurrence: As water-rolled pebbles in clinochlore and serpentine (Oregon, USA).

Association: Copper, bornite, chalcopyrite, molybdenite, chromite (Oregon, USA); pyrrhotite, magnetite (Cyprus).

Distribution: From Josephine Creek, west of Kerby, Josephine Co., Oregon, USA [TL]. In the Alexo mine, near Timmins, Ontario, Canada. From near Skouriotissa, Cyprus. In the Ijim massif, west Sayan, Russia.

Name: For the state of Oregon, USA.

Type Material: n.d.

Orickite $(Na,K)_{0.4}CuFeS_2 \cdot 0.3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As grains and laths, to 150 μm.

Physical Properties: *Cleavage:* Good on {100}. *Fracture:* Conchoidal. Hardness = ~3.5 VHN = n.d. D(meas.) = n.d. D(calc.) = 4.212 Weakly magnetic.

Optical Properties: Opaque. *Color:* Brass-yellow. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak, pale yellow to slightly deeper yellow. *Anisotropism:* Strong, from grayish brown to grayish blue.
R_1–R_2: (470) 34.7, (546) 39.9, (589) 42.8, (650) 46.9

Cell Data: *Space Group:* n.d. $a = 3.695(1)$ $c = 6.16(1)$ $Z = 4$

X-ray Powder Pattern: Near Orick, California, USA.
3.08 (100), 3.20 (90), 1.85 (70), 2.84 (60), 1.73 (55), 1.583 (30), 2.20 (20)

Chemistry:

	(1)
Na	0.4
K	0.2
Cu	31.7
Fe	31.0
S	33.6
H_2O	[3.1]
Total	[100.0]

(1) Near Orick, California, USA; by electron microprobe, average of six grains, H_2O by difference (1.5% to 5.1% oxygen qualitatively determined, presumed to be in H_2O); then corresponds to $(Na_{0.03}K_{0.01})_{\Sigma=0.04}Cu_{0.95}Fe_{1.06}S_{2.00} \cdot 0.33H_2O$.

Occurrence: In an alkalic mafic diatreme, in small pegmatitic clots thought to have crystallized late in the consolidation of the Coyote Peak intrusive.

Association: Djerfisherite, rasvumite, bartonite, erdite, coyoteite, phlogopite, schorlomite, acmite, sodalite, cancrinite, pectolite, natrolite, magnetite, calcite.

Distribution: From Coyote Peak, near Orick, Humboldt Co., California, USA [TL].

Name: For the town of Orick, California, USA, near the locality.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150336.

References: (1) Erd, R.C. and G.K. Czamanske (1983) Orickite and coyoteite, two new sulfide minerals from Coyote Peak, Humboldt Co., California. Amer. Mineral., 68, 245–254.

CuO		2.09		Total	98.71	[97.63]	100.00

(1) Oriente Province, Cuba; recalculated for total Mn as Mn_2O_3. (2) Manganese Lake, Michigan, USA; average of three analyses, by electron microprobe, total Mn as Mn_2O_3, H_2O from (1). (3) $Ca_2Mn^{2+}Mn_2^{3+}Si_3O_{10}(OH)_4$ with total Mn as Mn_2O_3.

Occurrence: In manganese orebodies in latite and andesite tuffs, agglomerates, and limestones (Oriente Province, Cuba); replacing calcite in fissures and lenses in basalt (Manganese Lake, Michigan, USA).

Association: Todorokite, manganite, pyrolusite, neotocite, barite, quartz, calcite (Oriente Province, Cuba); braunite, manganite, calcite (Manganese Lake, Michigan, USA).

Distribution: In Cuba, in Oriente Province, about 10 km south of Bueycito; and near Banes, north of Antilla. In the USA, from near Manganese Lake, Copper Harbor, Keweenaw Co., Michigan. In the Wessels mine, near Kuruman, Cape Province, South Africa. In the Cerchiara mine, near Faggiona, La Spezia, Liguria, Italy.

Name: For the occurrence in Oriente Province, Cuba.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93819; The Natural History Museum, London, England, 1923,1029.

$-O = Cl_2$	3.24	3.52
Total	[101.41]	100.00

(1) Baccu Locci mine, Italy; by electron microprobe, H_2O from crystal-structure analysis, confirmed by IR; corresponds to $Pb_3(SeO_3)[Cl_{3.68}(OH)_{0.32}]_{\Sigma=4.00} \cdot H_2O$. (2) $Pb_3(SeO_3)Cl_4 \cdot H_2O$.

Occurrence: In the oxidized zone of a hydrothermal base-metal deposit, in a selenium-rich part.

Association: Chalcomenite, atacamite, pseudoboléite, chlorargyrite.

Distribution: From the Baccu Locci Pb–As mine, near Villaputzu, Sarrabus district, Sardinia, Italy.

Name: To honor Paolo Orlandi (1946–), Professor of Mineralogy, University of Pisa, Pisa, Italy, who has described a variety of new minerals from Italy.

Type Material: University of Milan, Milan, Italy.

References: (1) Campostrini, I., C.M. Gramaccioli, and F. Orlymanite $Ca_4Mn_3^{2+}Si_8O_{20}(OH)_6 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$ or 3. As fibrous crystals, with fibrils ‖ [1000], forming spheres, to 3 mm; in irregular botryoidal aggregates.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = 4–5 D(meas.) = 2.7–2.8 D(calc.) = 2.93

Optical Properties: Translucent. *Color:* Dark brown; in transmitted light, light to dark brown. *Streak:* Light brown. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = pale brown; E' = dark brown. $\omega = 1.598$ ϵ = n.d.

Cell Data: *Space Group:* $P\bar{3}$ or $P3$. $a = 9.60(2)$ $c = 35.92(10)$ Z = 5

X-ray Powder Pattern: Wessels mine, South Africa.
3.60 (100), 1.840 (90), 3.13 (80b), 7.15 (70), 4.18 (70), 2.545 (40b), 2.469 (40b)

Na_2O	0.6
H_2O	8.68
Total	100.0

(1) Wessels mine, South Africa; by electron microprobe, H_2O by the Penfield method; corresponds to $(Ca_{18.6}Mn_{13.4}Mg_{2.4}Na_{0.7}Fe_{0.5})_{\Sigma=35.6}(Si_{37.7}Al_{0.2})_{\Sigma=37.9}O_{111} \cdot 23.3H_2O$.

Occurrence: Apparently as a vein mineral in a manganese ore body.

Association: Inesite, hematite, calcite.

Distribution: In a specimen attributed to the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: In honor of Orlando Lyman (?–1986), founder of the Lyman House Memorial Museum in Hilo, Hawaii, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 166368.

References: (1) Peacor, D.R., P.J. Dunn, and J.A. Nelen (1990) Orlymanite, $Ca_4Mn_3Si_8O_{20}(OH)_6 \cdot 2H_2O$, a new mineral from South Africa: a link between gyrolite-family and conventional phyllosilicate minerals? Amer. Mineral., 75, 923–927.

Orpheite $H_6Pb_{10}Al_{20}(PO_4)_{12}(SO_4)_5(OH)_{40}\cdot 11H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As rhombohedral crystals, to 0.5 mm; as colloform crusts with radial and granular structure and replacements of pyromorphite.

Physical Properties: *Cleavage:* On {0001}, indistinct. Hardness = 3.5 VHN = 261 (50 g load). D(meas.) = 3.75(1) D(calc.) = 3.84 May fluoresce turquoise-blue.

Optical Properties: Transparent. *Color:* Colorless, gray; pale blue, pale green, yellow-green with copper impurity, may be finely zoned. *Streak:* White to pale blue. *Luster:* Vitreous, dull in aggregates.
Optical Class: Uniaxial (+); uniaxial (–) in part. $\omega = 1.682$–1.704 $\epsilon = 1.670$–1.691

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.00(2)$ $c = 16.72(2)$ $Z = 0.32$

X-ray Powder Pattern: Madjarovo deposit, Bulgaria; close to hinsdalite. (ICDD 29-756).
5.66 (100), 2.967 (97), 3.50 (67), 1.901 (33), 1.749 (26), 4.91 (22), 2.209 (22)

Al_2O_3	20.20
CuO	0.52
PbO	40.63
CaO	1.27
H_2O^+	12.30
H_2O^-	0.01
LOI	0.10
Total	100.51

(1) Madjarovo deposit, Bulgaria; estimated to contain pyromorphite about 4%; corresponds to $H_{6.00}(Pb_{9.05}Ca_{1.10})_{\Sigma=10.15}(Al_{19.75}Cu_{0.30})_{\Sigma=20.05}[(PO_4)_{12.00}(AsO_4)_{0.05}]_{\Sigma=12.05}(SO_4)_{5.15}(OH)_{39.80}\cdot 11.10H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a polymetallic deposit.

Association: Pyromorphite, anglesite, kaolinite, Fe–Mn hydroxides.

Distribution: From the Madjarovo Pb–Zn deposit, eastern Rhodopes Mountains, 60 km southeast of Haskovo, Bulgaria.

Name: For *Orpheus*, mythical singer in the Rhodopes Mountains.

Type Material: Natural History Museum, Sofia; University of Sofia, Sofia, Bulgaria, 1833.

References: (1) Kolkovski, B. (1971–1972) Orpheite, a new mineral from Madjarovo deposit, eastern Rhodopes Mountain, Bulgaria. Ann. Univ. Sofia, Fac. Geol. Geogr., 64, 107–130 (in English). (2) (1974) Mineral. Abs., 25, 240 (abs. ref. 1). (3) (1976) Amer. Mineral., 61, 176 (abs. ref. 1).

Orpiment As_2S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly in foliated columnar or fibrous aggregates, with cleavages as much as 60 cm across; may be reniform or botryoidal; also granular or powdery; rarely as prismatic crystals, to 10 cm. *Twinning:* On {100}.

Physical Properties: *Cleavage:* Perfect on {010}, imperfect on {100}; cleavage lamellae are flexible. *Tenacity:* Sectile. Hardness = 1.5–2 VHN = n.d. D(meas.) = 3.49 D(calc.) = 3.48

Optical Properties: Transparent. *Color:* Lemon-yellow to golden or brownish yellow. *Streak:* Pale lemon-yellow. *Luster:* Resinous, pearly on cleavage surface. *Optical Class:* Biaxial (–). *Pleochroism:* In reflected light, strong, white to pale gray with reddish tint; in transmitted light, Y = yellow, Z = greenish yellow. *Orientation:* $X = b$; $Z \wedge c = 2°$. *Dispersion:* $r > v$, strong. $\alpha = 2.4$ (Li). $\beta = 2.81$ (Li). $\gamma = 3.02$ (Li). 2V(meas.) = 76° *Anisotropism:* Barely observable because of strong internal reflections.

R_1–R_2: (400) 33.0–36.5, (420) 31.0–35.2, (440) 28.9–33.9, (460) 27.4–31.5, (480) 26.0–30.3, (500) 24.9–29.3, (520) 24.0–28.4, (540) 23.3–27.8, (560) 22.8–27.3, (580) 22.3–26.9, (600) 22.0–26.5, (620) 21.7–26.3, (640) 21.5–26.0, (660) 21.2–25.7, (680) 21.0–25.5, (700) 20.8–25.3

Cell Data: *Space Group:* $P2_1/n$. $a = 11.475(5)$ $b = 9.577(4)$ $c = 4.256(2)$ $\beta = 90°41(5)'$ $Z = 4$

X-ray Powder Pattern: Baia Sprie (Felsőbánya), Romania.
4.85 (100), 4.02 (50), 2.47 (40), 1.755 (40), 3.22 (30), 2.79 (30), 2.72 (30)

Chemistry: Stated to be very near As_2S_3.

Occurrence: In low-temperature hydrothermal veins, hot springs and fumaroles; also commonly as an alteration product of arsenic minerals, especially realgar.

Association: Stibnite, realgar, arsenic, calcite, barite, gypsum.

Distribution: Not uncommon in small amounts, but rare in fine specimens. In the USA, crystallized from Mercur, Tooele Co., Utah; in Nevada, at the Getchell mine, Humboldt Co.; from the White Caps mine, Manhattan, Nye Co.; with fine examples from in the Twin Creeks mine, Humboldt Co. At Tajov, Slovakia. From Křeševo, Bosnia-Herzegovina. At Alšar (Allchar), near Rošden, Macedonia. Fine crystals from the Zarshuran gold deposit, 35 km north of Takab, northwestern Iran. From Jelamerk, Turkey. In Russia, at Loukhoumi, Caucasus Mountains, and Men-Kyule, Sakha. From Racha Luyumi, Georgia. Large crystals from the Shimen mine, 33 km southeast of Shimen, Hunan Province, China. Exceptional specimens from the Quiruvilca mine, La Libertad, Peru.

Name: From the Latin *auripigmentum*, *golden paint*, in allusion to the color.

Orschallite $Ca_3(SO_3)_2(SO_4)\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Pseudocubic crystals, to 0.3 mm.

Physical Properties: *Fracture:* Irregular. Hardness = ∼4 D(meas.) = 1.90(3) D(calc.) = 1.87

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.4941(4)$ $\epsilon = 1.4960(4)$

Cell Data: *Space Group:* $R\overline{3}c$. $a = 11.350(1)$ $c = 28.321(2)$ $Z = 6$

X-ray Powder Pattern: Hannebacher Ley volcano, Germany.
5.73 (100), 8.11 (80), 2.69 (80), 3.63 (60), 3.28 (40), 2.11 (40), 4.87 (30)

Chemistry: (1) Hannebacher Ley volcano, Germany; characterized by the identity of the X-ray pattern with that of synthetic material, as well as crystal-structure analysis of the natural mineral.

Occurrence: A rare species, an intermediate stage in oxidation of sulfides to sulfates, preserved in a melilite nepheline leucitite quenched during a submarine volcanic eruption.

Association: Clinopyroxene, apatite, phillipsite, calcite.

Distribution: From the Hannebacher Ley volcano, one km east-northeast of Hannebach, Eifel, Germany.

Name: To honor P. Orschall, Cologne, Germany, who discovered the mineral.

Type Material: Institute of Mineralogy and Crystallography, University of Vienna, Vienna, Austria.

Orthobrannerite $U^{4+}U^{6+}Ti_4O_{12}(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; metamict. *Point Group:* n.d. As prismatic crystals, to 1.2 cm, showing {001}, {120}, {021}, {110}, {140}, rarely {210}, {180}, striated ‖ [001].

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. VHN = 515–532 (100–250 g load). D(meas.) = 5.46 D(calc.) = 5.46 Strongly radioactive.

Optical Properties: Semitransparent. *Color:* Black; in reflected light, grayish white with reddish brown internal reflections. *Streak:* Dark brown to black. *Luster:* Adamantine. *Optical Class:* Isotropic. $n = 2.328$
R: 15–17

Cell Data: *Space Group:* n.d. $a = 7.37$ $b = 11.67$ $c = 6.33$ Z = 2

(1) Ayrshire, Scotland.

Polymorphism & Series: Dimorphous with chamosite.

Mineral Group: Chlorite group.

Occurrence: In a lateritic clay derived from the alteration of olivine basalts (Ayrshire, Scotland).

Association: Siderite, clay minerals.

Distribution: From coalfields in Ayrshire, Scotland. At Kaňk, near Kutna Horá, Czech Republic. From Sainte-Barbe, Meurthe-et-Moselle, France. In Sweden, at Mangruvan, Örebro. From Saalfeld, Thuringia, Germany.

Name: As an ORTHOhexagonal dimorph of *chamosite*.

Type Material: n.d.

Orthochrysotile $Mg_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* n.d. Fibrous along [100]; asbestiform.

Physical Properties: *Tenacity:* Brittle, in part. Hardness = 2.5 D(meas.) = n.d. D(calc.) = [2.58]

Optical Properties: Translucent. *Color:* Yellow, white, gray, green. *Luster:* Greasy, silky in aggregates.
Optical Class: Biaxial (–). α = 1.532–1.549 β = n.d. γ = 1.545–1.556 2V(meas.) = n.d.

Cell Data: *Space Group:* *C* [*sic*]. a = 5.32 *b* = 9.17 *c* = 14.64 Z = 4

X-ray Powder Pattern: Transvaal, South Africa. (ICDD 25-645).
7.36 (100), 3.66 (80), 1.531 (65), 4.56 (50), 2.50 (50), 2.604 (40), 1.310 (40)

Chemistry: Material positively known to be this species apparently has not been analyzed.

Polymorphism & Series: Polymorphous with antigorite, clinochrysotile, lizardite, and parachrysotile; also denoted as chrysotile-2Or$_{c1}$.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Commonly intermixed with clinochrysotile in veinlets cutting serpentinite.

Association: Clinochrysotile.

Distribution: Probably not uncommon, but difficult to characterize as intermixed with the more common clinochrysotile. The structure was determined on material from Cuddapah, Andhra Pradesh, India.

Name: Refers to the mineral's ORTHOrhombic structure, with *chrysotile* from the Greek for *golden* and *fiber*.

Type Material: n.d.

Polymorphism & Series: Dimorphous with microcline; forms a series with celsian.

Mineral Group: Feldspar (alkali) group; (Al,Si) commonly only partially ordered.

Occurrence: The common feldspar of granites, granite pegmatites, and syenites. In cavities in basalts; in high-grade metamorphic rocks and as a result of potassic hydrothermal alteration; also authigenic and detrital.

Association: Albite, muscovite, biotite, "hornblende," schorl, beryl.

Distribution: Widespread. Fine examples from St. Gotthard, Ticino, and at Val Giuv, Tavetsch, Graubünden, Switzerland. In the Zillertal, Tirol, Austria. From Baveno, Piedmont, in the Pfitschtal, Trentino-Alto Adige, and at San Piero in Campo, Elba, Italy. At Epprechtstein, Bavaria, Carlsbad, Bohemia, and Manebach, Thuringia, Germany. From Cornwall, England. In Russia, from the Mursinka-Alabashka area, near Yekaterinburg (Sverdlovsk), Ural Mountains. In the USA, from Maine, at Paris and Buckfield, Oxford Co; at Cornog, Chester Co., and Blue Hill and Lieperville, Delaware Co., Pennsylvania. In California, from the Pala and Mesa Grande districts, San Diego Co.; in Colorado, on Mt. Antero, Chaffee Co.; at Crystal Pass, Goodsprings, Clark Co., Nevada. From Guanajuato, Mexico. At Tanokamiyama, Shiga Prefecture, Japan. Gem crystals from Ampandrandava, Fianarantsoa, and Itrongay, near Betroka, Madagascar.

Name: From the Greek for *straight* and *fracture*, in allusion to the cleavage angle.

Orthoericssonite $BaMn_2^{2+}Fe^{3+}OSi_2O_7(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thick plates, to 2 cm, tabular ‖ {100}, which invariably include ericssonite. *Twinning:* Rarely on {100}, observed in thin section.

Physical Properties: *Cleavage:* Perfect on {100}, fair on {011}. *Tenacity:* Brittle. Hardness = 4.5–5.5 D(meas.) = 4.21–4.22 D(calc.) = 4.27 Weakly magnetic.

Optical Properties: Translucent. *Color:* Deep reddish black; in thin section, brown to yellowish brown. *Streak:* Deep brown. *Luster:* Submetallic to pearly on the cleavage. *Optical Class:* Biaxial (+); properties indistinguishable from ericssonite. *Pleochroism:* X = pale greenish tan, yellowish brown; Y = reddish brown; Z = deep brown. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, perceptible to strong. *Absorption:* $Z > Y > X$. α = 1.802–1.807 β = 1.833–1.840 γ = 1.888–1.890 2V(meas.) = 43°–50°

Cell Data: *Space Group: Pnmn.* $a = 20.37$ $b = 7.03$ $c = 5.34$ Z = 4

X-ray Powder Pattern: Långban, Sweden.

(1) Långban, Sweden; by electron microprobe, intergrown with ericssonite, oxidation states and H_2O separately determined. (2) Hijikuzu mine, Japan. (3) $BaMn_2FeOSi_2O_7(OH)$.

Polymorphism & Series: Dimorphous with ericssonite.

Occurrence: In a fine-grained manganoan aegirine zone in well-banded tephroite-rhodonite-manganoan aegirine skarn (Långban, Sweden); in metamorphosed manganese ore (Hijikuzu mine, Japan).

Association: Ericssonite, tephroite, rhodonite, manganoan aegirine, hedyphane, andradite, hausmannite, långbanite, richterite (Långban, Sweden); jacobsite, rhodonite, aegirine, tephroite, yoshimuraite (Hijikuzu mine, Japan).

Distribution: From Långban, Värmland, Sweden. In the Hijikuzu mine, Iwate Prefecture, Japan.

Name: For its ORTHOrhombic crystallization and relation to *ericssonite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120061.

(1) San Benito Co., California, USA; by electron microprobe, average of six points on five grains, intergrown with joaquinite-(Ce) of presumably nearly identical composition; RE_2O_3 = La_2O_3 2.14%, Ce_2O_3 10.69%, Pr_2O_3 1.25%, Nd_2O_3 3.21%, Sm_2O_3 0.70%, Gd_2O_3 0.26%, Dy_2O_3 0.21%, Er_2O_3 0.00%, H_2O by difference; corresponds to $Na_{0.83}K_{0.01}Ba_{2.01}Ca_{0.05}Mg_{0.02}(Ce_{0.90}RE_{0.72}Sr_{0.42})_{\Sigma=2.04}Fe_{0.78}Ti_{2.04}Th_{0.02}Si_{8.00}O_{24.68}(OH)_{3.32}$. (2) Ilímaussaq intrusion, Greenland; RE = La 44.5%, Ce 41.6%, Pr 4.4%, and Nd 9.5%.

Polymorphism & Series: Dimorphous with joaquinite-(Ce).

Mineral Group: Joaquinite group.

Occurrence: In a natrolite vein cutting a glaucophane schist inclusion in a serpentinite body (San Benito Co., California, USA); in nepheline-sodalite syenite pegmatites (Ilímaussaq intrusion, Greenland).

Association: Joaquinite-(Ce), benitoite, neptunite, natrolite (San Benito Co., California, USA); joaquinite-(Ce), natrolite, analcime, sodalite, steenstrupine, riebeckite (Ilímaussaq intrusion, Greenland).

Distribution: At the Gem mine, San Benito Co., California, USA. In southern Greenland, in the Ilímaussaq intrusion, along the Narssaq River, near Kvanefjeld.

Name: For its ORTHOrhombic symmetry, and relation to *joaquinite*-(Ce).

Type Material: n.d.

Orthominasragrite $V^{4+}O(SO_4)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Irregular grains, to 200 μm, in crusts and efflorescences.

Physical Properties: Hardness = ∼1 D(meas.) = n.d. D(calc.) = 2.00 Readily dissolves in H_2O.

Optical Properties: Semitransparent. *Color:* Pale blue to bright blue. *Streak:* Pale blue. *Luster:* Vitreous.
Optical Class: Biaxial (+), pseudouniaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$.
$\alpha = 1.529(2)$ $\beta = 1.534(2)$ $\gamma = 1.534(2)$ 2V(meas.) = 2° 2V(calc.) = 0°

Cell Data: *Space Group:* $Pmn2_1$. $a = 7.242(1)$ $b = 9.319(2)$ $c = 6.192(1)$ Z = 2

X-ray Powder Pattern: Temple Mountain, Utah, USA.
4.70 (100b), 3.322 (50), 2.865 (40), 2.602 (30), 3.734 (20), 3.622 (20), 3.108 (20)

Chemistry:

SO_3	31.97	31.64
VO_2	33.88	32.77
H_2O	[36.30]	35.59
Total	[102.15]	100.00

(1) Temple Mountain, Utah, USA; by electron microprobe, H_2O from crystal-structure analysis; corresponds to $V_{1.01}O_{1.00}(S_{0.99}O_4)\cdot 5H_2O$. (2) $VO(SO_4)\cdot 5H_2O$.

Polymorphism & Series: Dimorphous with minasragrite.

Occurrence: In a silicified tree, formed as an oxidation product of pyrite reacting with vanadium-rich organic material.

Association: Minasragrite, pyrite, szomolnokite, kornelite, ferricopiapite, rozenite, montroseite, sulfur.

Distribution: From the [North Mesa No. 5 mine,] North Mesa mine group, Temple Mountain district, Emery County, Utah, USA.

Name: As the ORTHOrhombic polymorph of *minasragrite*.

Type Material: Canadian Museum of Nature, Ottawa, 83269; Canadian Geological Survey, Ottawa, Canada.

References: (1) Hawthorne, F.C., M. Schindler, J.D. Grice, and P. Haynes (2001) Orthominasragrite, $V^{4+}O(SO_4)(H_2O)_5$, a new mineral species from Temple Mountain, Emery County, Utah, U.S.A. Can. Mineral., 39, 1325–1331. (2) (2002) Amer. Mineral., 87, 997 (abs. ref. 1).

Orthoserpierite $Ca(Cu,Zn)_4(SO_4)_2(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Typically as platy crystals, flattened on {001}, elongated along [010], to 0.2 mm, in rosettes, fibrous masses, and crusts.

Physical Properties: *Fracture:* Splintery. Hardness = n.d. D(meas.) = 3.00(5) D(calc.) = 3.07 Fluoresces mauve under LW and SW UV.

Optical Properties: Transparent. *Color:* Sky-blue. *Streak:* Pale green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; X = colorless or very pale green; $Y = Z$ = pale green. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, medium strong. $\alpha = 1.586(2)$ $\beta = 1.645(2)$ $\gamma = 1.650(2)$ 2V(meas.) = 32(2)° 2V(calc.) = 32°

Cell Data: *Space Group:* $Pca2_1$. $a = 22.10(2)$ $b = 6.20(2)$ $c = 20.39(2)$ Z = 8

X-ray Powder Pattern: Chessy, France.
10.21 (100), 5.10 (90), 3.400 (90), 2.384 (60), 3.184 (50), 2.610 (50), 2.558 (50)

Chemistry:

	(1)	(2)
SO_3	21.20	
CuO	43.61	42.4
ZnO	7.29	7.8
CaO	9.33	7.1
H_2O	[18.57]	
Total	[100.00]	

(1) Chessy, France; by electron microprobe, H_2O by difference; $Ca_{1.08}(Cu_{3.54}Zn_{0.58})_{\Sigma=4.12}(SO_4)_{1.71}(OH)_{6.98} \cdot 3.18H_2O$. (2) Glücksrad mine, Germany; partial analysis.

Polymorphism & Series: Dimorphous with serpierite.

Occurrence: A rare secondary mineral formed in the dump from a hydrothermal copper mine (Chessy, France); precipitated from vadose waters transecting the oxidized zone of a hydrothermal copper deposit (Copper Creek district, Arizona, USA).

Association: Devilline, gypsum, calcite (Chessy, France); chrysocolla, malachite (Copper Creek district, Arizona, USA).

Distribution: From Chessy, near Lyon, Rhône, France. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. From Vezzani, Corsica, France. In the Glücksrad mine, near Oberschulenberg, Harz Mountains, Germany. From near the Childs-Aldwinkle mine, Copper Creek district, Pinal Co., Arizona, and at Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: As an ORTHOrhombic mineral related to *serpierite*.

Type Material: Natural History Museum, Geneva, Switzerland, 435/76.

References: (1) Sarp, H. (1985) Orthoserpiérite $Ca(CuZn)_4(SO_4)_2(OH)_6 \cdot 3H_2O$, un nouveau minéral de la Mine de Chessy, France, polymorphe de la serpiérite. Schweiz. Mineral. Petrog. Orthowalpurgite $Bi_4(UO_2)O_4(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are tabular on {010}, usually elongated along [100], with {010}, {001}, {104}, {100}, to 0.3 mm; in parallel or fan-shaped aggregates.

Physical Properties: *Cleavage:* Indistinct on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 4.5 VHN = 330 (25 g load). D(meas.) = n.d. D(calc.) = 6.51 Radioactive.

Optical Properties: Transparent. *Color:* Yellow. *Streak:* Pale yellow. *Luster:* Adamantine. *Optical Class:* Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.91(2)$ $\beta = 2.00(2)$ $\gamma = [2.05]$ 2V(meas.) = 70(3)°

Cell Data: *Space Group: Pbcm.* $a = 5.492(1)$ $b = 13.324(2)$ $c = 20.685(3)$ Z = 4

X-ray Powder Pattern: Schmiedestollen, Germany.
3.208 (100), 10.354 (94), 3.088 (76), 3.277 (56), 2.999 (50), 2.852 (46), 5.610 (40)

Chemistry:

	(1)	(2)
UO_3	17.86	19.28
As_2O_5	16.11	15.49
Bi_2O_3	64.21	62.80
H_2O	[2.43]	2.43
Total	[100.61]	100.00

(1) Schmiedestollen, Germany; by electron microprobe, average of eight analyses, H_2O from theory; corresponds to $Bi_{4.06}(UO_2)_{0.92}O_{3.89}(AsO_4)_{2.07} \cdot 1.99H_2O$. (2) $Bi_4(UO_2)O_4(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with walpurgite.

Occurrence: A very rare mineral, probably formed by weathering of an earlier bismuth-bearing sulfide.

Association: Preisingerite, anatase, quartz.

Distribution: On the dump of the Schmiedestollen, near Wittichen, Black Forest, Germany.

Name: As an *ortho*rhombic dimorph of *walpurgite*.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany.

References: (1) Krause, W., H. Effenberger, and F. Brandstätter (1995) Orthowalpurgite, $(UO_2)Bi_4O_4(AsO_4)_2 \cdot 2H_2O$, a new mineral from the Black Forest, Germany. Eur. J. Mineral., 7, 1313–1324. (2) (1996) Amer. Mineral., 81, 1014 (abs. ref. 1).

Osakaite $Zn_4SO_4(OH)_6 \cdot 5H_2O$

Crystal Data: Triclinic. *Point Group*: 1. As hexagonal platy crystals (0.05 mm wide and 0.01 mm thick) or as stalactitic aggregates, to 2 cm.

Physical Properties: *Cleavage*: Perfect, {001}. *Fracture*: Uneven. *Tenacity*: Flexible.
Hardness = 1 VHN = 20.3 D(meas.) = n.d. D(calc.) = 2.75
Dissolves readily in dilute hydrochloric acid.

Optical Properties: Transparent. *Color*: White or pale blue to colorless. *Streak*: White to pale blue. *Luster*: Pearly.
Optical Class: Biaxial (–). α = 1.532(2) β = 1.565(2) γ = 1.567(2) 2V(calc.) = 27.2°
Positive elongation.

Cell Data: *Space Group*: *P*1 [by analogy to the synthetic phase]. a =8.358(5) b = 8.337(4)
c = 11.027(2) α = 94.79(2)° β = 83.16(2)° γ = 119.61(4)° Z = 2

X-ray Powder Pattern: Hirao Mine, Osaka Prefecture, Japan.
10.96 (100), 2.717 (21), 1.574 (18), 3.642 (17), 5.47 (16)

Chemistry:

	(1)
ZnO	55.30
CuO	3.44
SO_3	14.66
H_2O	26.01

(1) Hirao Mine, Osaka Prefecture, Japan; ICP-AES and thermogravimetric analyses, OH^-, H_2O and SO_4 confirmed by infrared spectroscopy, corresponding to $(Zn_{3.75}Cu_{0.24})_{\Sigma=3.99}(SO_4)_{1.01}(OH)_{5.96} \cdot 4.99H_2O$.

Occurrence: A secondary mineral on mine walls and fractures produced by reaction of oxygenated groundwater with a polymetallic sulfide deposit.

Association: Hydrozincite, smithsonite, “chlorite,” and “limonite”.

Distribution: At the Hirao Mine, Osaka Prefecture, Japan.

Name: For the region (Osaka) in Japan containing the mine that produced the first specimens.

Type Material: National Science Museum, Tokyo, Japan (NSM-M28983).

References: (1) Ohnishi, M., I. Kusachi, and S. Kobayashi (2007) Osakaite, $Zn_4SO_4(OH)_6 \cdot 5H_2O$, a new mineral species from the Hirao Mine, Osaka, Japan. Can. Mineral., 45, 1511-1517. (2) (2008) Amer. Mineral., 93, 1688-1689 (abs. ref. 1).

Osarizawaite $PbCuAl_2(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\overline{3}\ 2/m$. Hexagonal crystals, flattened on {0001}, with $\{10\overline{1}1\}$, to 20 μm, which may be hollow rings due to dissolution of a central zoned phase; typically earthy, powdery.

Physical Properties: *Tenacity:* Friable. Hardness = n.d. D(meas.) = 3.89–4.037 D(calc.) = 4.167–4.20

Optical Properties: Semitransparent. *Color:* Greenish yellow; greenish yellow to yellowish green in thin section.
Optical Class: Uniaxial (+), may be biaxial. *Pleochroism:* O = dark yellow; E = pale yellowish. $\omega = 1.712(3)$ $\epsilon = 1.732(2)$ 2V(meas.) = 0°–15°

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.05$–7.075 $c = 17.23$–17.25 $Z = 3$

X-ray Powder Pattern: Osarizawa mine, Japan.
3.00 (100), 5.79 (70), 3.52 (60), 2.87 (60), 2.28 (60), 2.23 (30), 1.918 (30)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
SO_3	24.80	26.02	25.87	PbO	35.41	33.15	36.07
Al_2O_3	13.36	17.51	16.48	H_2O^+	9.20	10.42	8.73
Fe_2O_3	4.79	0.77		H_2O^-		0.09	
CuO	12.20	11.83	12.85	insol.		0.19	
ZnO	0.24			Total	[100.00]	99.98	100.00

(1) Osarizawa mine, Japan; H_2O by TGA; recalculated to 100% from an original total of 99.09% after deduction of SiO_2 2.18% as quartz, CO_2 0.45%, and H_2O^- 4.05%; then corresponds to $Pb_{1.02}(Cu_{0.99}Zn_{0.02})_{\Sigma=1.01}(Al_{1.70}Fe_{0.38})_{\Sigma=2.08}(SO_4)_2(OH)_{6.30}$. (2) Mt. Edgar Station, Australia; corresponds to $Pb_{0.91}Cu_{0.92}(Al_{2.11}Fe_{0.06})_{\Sigma=2.17}(SO_4)_{2.00}(OH)_{6.17} \bullet 0.47H_2O$. (3) $PbCuAl_2(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: An uncommon mineral in the oxidized zone of hydrothermal Pb–Zn–Cu deposits.

Association: Anglesite, beaverite, hidalgoite, duftite, bindheimite, conichalcite, olivenite, quartz, clay, goethite.

Distribution: From the Osarizawa copper mine, Kazuno, Akita Prefecture, Japan. In Australia, on the Mt. Edgar Station, 56 km east-southeast of Marble Bar, at Whim Creek, Pilbara district, and in the Teutonic Bore deposit, 300 km north of Kalgoorlie, Western Australia. At the Tui mine, Mt. Te Aroha, New Zealand. In the Ortiz mine, Capillitas, Catamarca Province, Argentina. From the Herminia mine, Sierra Gorda district, southwest of Calama, Antofagasta, and in the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. At Onovas, Sonora, Mexico. In the USA, in Arizona, from Bisbee and Tombstone, Cochise Co.; in the Omega mine, Helvetia, and at the Silver Hill mine, Waterman Mountains, Pima Co.; from the Fat Jack mine, Bradshaw Mountains, Yavapai Co.; in the Church Hills, Millard Co., Utah; at the Titusville mine, San Juan Co., and in the Silver Cliff district, Custer Co., Colorado. From Alderly Edge, Cheshire, England. At the Cap Garonne mine, near le Pradet, Var, France. In the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For its first-noted occurrence in the Osarizawa mine, Japan.

Type Material: National Science Museum, Tokyo, Japan, M-15598.

Osarsite $(Os, Ru)AsS$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As polycrystalline intergrowths, granular, to 150 μm.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 8.44

Optical Properties: Opaque. *Color:* Gray in reflected light. *Luster:* Metallic. *Anisotropism:* Weak but distinct in air.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 5.933(1)$ $b = 5.916(2)$ $c = 6.009(2)$ $\beta = 112°21(2)'$ $Z = 4$

X-ray Powder Pattern: Gold Bluff, California, USA.
3.79 (100), 1.892 (100), 1.870 (80), 2.74 (70), 2.78 (60), 2.01 (60), 1.832 (60)

Fe		2.5
Co		2.0
As	30.6	32.6
S	11.5	13.2
Total	99.9	102.14

(1) Gold Bluff, California, USA; by electron microprobe, corresponding to $(Os_{0.49}Ru_{0.47}Ni_{0.04}Ir_{0.03}Pd_{0.02})_{\Sigma=1.05}As_{1.06}S_{0.94}$. (2) Kola Peninsula, Russia; by electron microprobe, corresponding to $(Os_{0.47}Ru_{0.24}Ni_{0.13}Fe_{0.11}Co_{0.08}Ir_{0.01})_{\Sigma=1.04}As_{1.03}S_{0.97}$.

Mineral Group: Arsenopyrite group.

Occurrence: In a platinum-bearing sample of placer sand (Gold Bluff, California, USA).

Association: Irarsite, ruthenarsenite, sperrylite, iridarsenite, osmiridium, anduoite, laurite, ruarsite.

Distribution: In the USA, from Gold Bluff, Humboldt Co., California, USA [TL], and in the Salmon River placers, Goodnews Bay, Alaska. In Russia, from near Zlatoust, Ural Mountains; on the Kola Peninsula; and in the Neozhidannyy Creek placers, Tuva. From the Witwatersrand, Transvaal, South Africa. At Anduo, Tibet, China. From Vourinos, Greece.

Name: For the content of OSmium and ARSenic.

Type Material: National Museum of Natural History, Washington, D.C., USA, 123218.

Osbornite TiN

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Octahedra, to about 0.1 mm, in oldhamite; as dendritic and globular inclusions in corundum.

Physical Properties: Hardness = n.d. VHN = 1372 (20 g load). D(meas.) = n.d. D(calc.) = [5.38]

Optical Properties: Opaque. *Color:* Golden yellow. *Luster:* Metallic.
Optical Class: Isotropic.
R: (440) 20.3, (460) 25.0, (480) 31.6, (500) 38.6, (520) 45.3, (540) 45.3, (560) 55.7, (580) 60.0, (600) 63.5, (620) 66.4, (640) 68.8, (660) 70.8, (680) 72.6, (700) 74.3

Cell Data: *Space Group:* $F4/m\ \overline{3}\ 2/m$ (synthetic). $a = 4.24173(12)$ $Z = 4$

X-ray Powder Pattern: Synthetic. (ICDD 38-1420).
2.1207 (100), 2.4492 (72), 1.4997 (45), 1.2789 (19), 0.9485 (14), 1.2245 (12), 0.8658 (12)

Chemistry: (1) Bustee meteorite; qualitative presence of Ti determined colorimetrically; confirmation as TiN by behavior similar to synthetic TiN on conversion to TiO_2. (2) "Russia"; by electron microprobe, Ti ∼80%, N present, with O and C absent.

Occurrence: Embedded in oldhamite in an achondrite meteorite (Bustee meteorite); as inclusions in corundum, in weathered detritus from a pipelike body containing breccias with an alkalic ultramafic cement ("Russia").

Association: Oldhamite, diopside (Bustee meteorite); corundum, iron, perovskite, iron silicides ("Russia").

Distribution: In the Bustee meteorite. In Russia, from an undefined locality "near the junction of the Azov block with the Donbas".

Name: For George Osborn, who sent to London the meteorite in which the species was found.

Type Material: The Natural History Museum, London, England, 32100.

Oskarssonite AlF_3

Crystal Data: Hexagonal. *Point Group*: $\bar{3}\,2/m$. Forms a fine grained powder.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 3.184

Optical Properties: Translucent. *Color*: White to grayish yellow. *Streak*: n.d.
Luster: n.d.
Optical Class: Uniaxial (+). ω = 1.3765 ε = 1.3770 [Synthetic AlF_3]

Cell Data: *Space Group*: $R\bar{3}\,c$. a = 4.9817(4) c = 12.387(1) Z = 6

X-ray Powder Pattern: Eldfell volcano, Heimaey Island, Vestmannaeyjar archipelago, Iceland.
3.54 (100), 1.771 (20), 1.59 (15), 2.131 (13), 1.574 (10), 2.06 (8), 1.61(8)

Chemistry:

	(1)	(2)
Al	31.70	32.13
F	58.41	67.87
O	9.22	.
Total	99.33	100.00

(1) Eldfell volcano, Heimaey Island, Iceland; average of 5 electron microprobe analyses; corresponding to $Al(F_{2.62}(OH)_{0.49})_{\Sigma=3.11}$. (2) AlF_3.

Occurrence: As sublimate encrustations deposited at 90 °C close to the surface of fumarole vents.

Association: Anhydrite, bassanite, gypsum, jarosite, anatase, hematite, opal, ralstonite, jacobssonite, meniaylovite.

Distribution: From the Eldfell volcano, Heimaey Island, Vestmannaeyjar archipelago, Iceland; also reported from Mount Erebus, Antarctica.

Name: Honors Niels Oskarsson (b. 1944), a prominent Icelandic volcanologist, in recognition of his work on Icelandic fumaroles.

Type Material: Icelandic Institute of Natural History, Gardabaer, Iceland (NI 24489), and the mineral collection, Natural History Museum of Denmark, Copenhagen (# 2012.112, 2012.113, 2012.114).

Osmium (Os, Ir, Ru)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Rare crystals are hexagonal tabular, to 3 mm; commonly as euhedral prismatic inclusions in Pt–Fe alloys.

Physical Properties: Hardness = n.d. VHN = 1206–1246 (25 g load). D(meas.) = 22.48 D(calc.) = 22.59

Optical Properties: Opaque. *Color:* White with a bluish gray tinge in reflected light. *Pleochroism:* Noticeable. *Anisotropism:* Strong, reddish orange.

(1) Atlin, Canada; by electron microprobe. (2) Joubdo stream, Ethiopia; by electron microprobe. (3) Gusevogorskii pluton, Russia; by electron microprobe, average of four analyses.

Occurrence: With other platinum-group elements and alloys, in ultramafic rocks and placers derived therefrom.

Association: Ruthenirídosmine, iridosmine, osmiridium (Ruby Creek, Canada); bowieite, platinum, Ir–Pt alloys, laurite, silicate inclusions (Salmon River, Alaska, USA); isoferroplatinum, cuprorhodsite, malanite, cuproiridsite, iridosmine, laurite, erlichmanite, cooperite, sperrylite, chalcopyrite, bornite (Russia).

Distribution: From Ruby Creek, Atlin, British Columbia, Canada. In the USA, at Fox Gulch and the Salmon River, Goodnews Bay, Alaska. From Rio Pilpe, Colombia. In the Santiago River placers, Esmeraldas Province, Ecuador. In Russia, in the the Gusevogorskii pluton, and the Kytlym and Uktus complexes, Ural Mountains; from the Neozhidannyy Creek placers, Tuva; and in the Pustaya River placers, Kamchatka Peninsula. At the Harold's Grave and Cliff quarries, Baltasound-Haroldswick area, Unst, Shetland, Scotland. In Ethiopia, in the Joubdo stream, on the Birbir river. From the Witwatersrand, Transvaal, South Africa. At Anduo, Tibet, China. From the Sorashigawa placers, ?? Prefecture, Japan. Additional minor localities are known.

Name: From the Greek word for *odor*, in reference to the pungent and irritating odor when heated in air.

Mineral Group: Milarite group.

Occurrence: In fused xenoliths and contact metamorphic rocks.

Association: Cordierite, sodic plagioclase, sanidine, "hypersthene," tridymite, quartz, biotite, zircon, magnetite, hematite, graphite.

Distribution: Following are a few localities for material with characterized Fe^{2+}:Mg. From Tieveragh, Co. Antrim, Ireland. At Vikeså, Rogaland, Norway. From Iriki, Kagoshima Prefecture; at Haneyama, Oita Prefecture; on the Akagi volcano, Gumma Prefecture; and from Rishiri Island, Japan. On the Malyi Nepiskol volcano, Caucasus Mountains, Russia. From Reference Peak, Mt. Riiser-Larsen, and nearby, in Enderby Land, Antarctica. In the Nain complex, at Ikkinikulluit Brook, Labrador, Newfoundland, Canada.

Name: For the relation to *osumilite* and predominance of *magnesium*.

Mineral Group: Milarite group.

Occurrence: In cavities and the groundmass of rhyolite and dacite, and in high-grade contact metamorphic rocks and xenoliths.

Association: Tridymite, cristobalite, quartz, oligoclase, potassic feldspar, fayalite, "hypersthene," biotite, magnetite, zircon.

Distribution: Localities for which Fe^{2+}:Mg has been established to be of this species include: in Japan, from Sakkabira and Hayato, Kagoshima Prefecture, and from the Asama volcano, northwest of Tokyo, Yamanashi Prefecture. In the USA, at Obsidian Cliffs, Lane Co., Oregon. In the Funtanifigu quarry, Monte Arci, near Oristano, Sardinia, Italy. From the Bellerberg and Nickenicher Sattel volcanos, Eifel district, Germany.

Name: After Osumi Province, an old province in Sakkabira, on Kyushu, Japan.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 104744.

Oswaldpeetersite $(UO_2)_2CO_3(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Acicular crystals, showing {100}, {010}, {001}, heavily striated lengthwise, to 0.1 mm, in subparallel radiating groups.

Physical Properties: *Cleavage:* Parallel elongation. *Fracture:* Uneven. *Tenacity:* "Weak". Hardness = 2–3 D(meas.) = > 4.10. D(calc.) = 4.54 Radioactive.

Optical Properties: Transparent. *Color:* Canary-yellow. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = very pale yellow to colorless; Z = pale yellow. *Orientation:* $Z = a$; positive elongation. $\alpha = 1.583(2)$ $\beta = 1.669(2)$ $\gamma = 1.712(2)$ 2V(meas.) = n.d. 2V(calc.) = 67.4(2)°

Cell Data: *Space Group:* $P2_1/c$. $a = 4.1425(6)$ $b = 14.098(3)$ $c = 18.374(5)$ $\beta = 103.62(1)°$ Z = 4

X-ray Powder Pattern: Jomac mine, Utah, USA.
3.32 (100), 4.55 (96), 3.029 (85), 8.95 (65), 7.54 (63), 3.46 (62), 2.273 (62)

Chemistry:

	(1)	(2)
CO_2	[6.23]	6.23
UO_3	81.47	81.01
H_2O	12.30	12.76
Total	[100.00]	100.00

(1) Jomac mine, Utah, USA; by electron microprobe, H_2O by TGA, CO_2 by difference, presence of $(CO_3)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR; corresponds to $(UO_2)_{2.03}(CO_3)_{1.01}(OH)_{2.05} \cdot 3.85H_2O$. (2) $(UO_2)_2CO_3(OH)_2 \cdot 4H_2O$.

Occurrence: In a sedimentary Colorado-Plateau-type U–V deposit.

Association: Gypsum, cuprite, antlerite, goethite, lepidocrocite, mbobomkulite, hydrombobomkulite, sklodowskite.

Distribution: From the Jomac uranium mine, Brown's Rim, White Canyon district, San Juan Co., Utah, USA.

Name: To honor Maurice Oswald Peeters (1945–), Catholic University of Leuven, Leuven, Belgium, structural crystallographer who has done research in uranium mineralogy.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC5166.

References: (1) Vochten, R., M. Deliens, and O. Medenbach (2001) Oswaldpeetersite, $(UO_2)_2CO_3(OH)_2 \cdot 4H_2O$, a new basic uranyl carbonate mineral from the Jomac uranium mine, San Juan County, Utah, U.S.A. Can. Mineral., 39, 1685–1689. (2) (2003) Amer. Mineral., 88, 252 (abs. ref. 1).

Otavite $CdCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. Rhombohedra, $\{10\overline{1}1\}$, to 2 mm, typically in thin crusts. *Twinning:* Observed.

Physical Properties: *Cleavage:* On $\{10\overline{1}1\}$. Hardness = [3.5–4] (by analogy to the calcite group). D(meas.) = 4.96 (synthetic). D(calc.) = 5.03

Optical Properties: Semitransparent. *Color:* White, yellowish brown to reddish brown if impure; colorless in transmitted light. *Luster:* Vitreous to adamantine.
Optical Class: [Uniaxial (–).] $\omega = 1.830$ $\epsilon = 1.605$

Cell Data: *Space Group:* $R\overline{3}c$ (synthetic). $a = 4.93$ $c = 16.27$ Z = 6

X-ray Powder Pattern: Synthetic.
2.95 (100), 3.78 (80), 2.46 (35), 1.825 (35), 2.066 (25), 1.838 (25), 1.582 (16)

Chemistry:

	(1)	(2)
CO_2		29.55
CdO	70.2	43.12
ZnO		27.33
Total		100.00

(1) Tsumeb, Namibia; partial analysis, identification depending on Cd:Zn ratio and on correspondence of the X-ray powder pattern with that of synthetic material. (2) $(Cd, Zn)CO_3$ with Cd:Zn = 1:1.

Mineral Group: Calcite group.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal base-metal deposits.

Association: Smithsonite, cerussite, hydrozincite, hemimorphite, azurite, malachite, rosasite, olivenite, pyromorphite, calcite, fluorite.

Distribution: From Tsumeb, Namibia. In Russia, found in the Bilyakchan fracture system, southern Verkhoyan'ya, in the Orenburg district, Southern Ural Mountains, and at Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains. In the Montevecchio Pb–Zn mine, Sardinia, Italy. At Laurium, Greece. In the Coldstones quarry, Pateley Bridge, North Yorkshire, England. From Broken Hill, New South Wales, Australia. At the Niujiaotang zinc deposit, Duyun, Guizhou Province, China. From the Mo Ba Pb–Zn deposit, North Vietnam. In the USA, in the Blanchard mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; from Franklin, Sussex Co., New Jersey.

Name: For the Otavi district, Namibia, within which lies Tsumeb, the discovery locality.

Type Material: n.d.

PbO	35.5
Total	100.2

(1) Tsumeb, Namibia; by electron microprobe, corresponding to $Pb_{1.03}Ge_{3.99}O_9$.

Occurrence: In cavities in oxidized germanium-bearing sulfides in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Tennantite, germanite, reniérite, chalcocite, schaurteite, siderite, calcite, quartz, gypsum.

Distribution: From Tsumeb, Namibia.

Name: From *Otjisume*, the Herero name for Tsumeb, Namibia.

Type Material: University of Stuttgart, Stuttgart, Germany, NM06; National Museum of Natural History, Washington, D.C., USA, 149053.

Ottemannite Sn_2S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As small laths. *Twinning:* Commonly twinned.

Physical Properties: Hardness = ∼2 VHN = n.d. D(meas.) = 4.87 (synthetic). D(calc.) = 4.806

Optical Properties: Opaque. *Color:* In polished section, gray with orange-brown internal reflections. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Strong.
R_1–R_2: n.d.

Cell Data: *Space Group: Pnam.* a = 8.79(3) $b = 14.02(5)$ $c = 3.74(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
4.131 (100), 5.495 (75), 2.670 (45), 7.003 (40), 2.747 (35), 3.740 (35), 3.257 (30)

Chemistry: Composition determined by identity of X-ray powder pattern with synthetic material.

Occurrence: In zones of oxidation or secondary enrichment in hydrothermal tin deposits.

Association: Stannite, cassiterite, herzenbergite, berndtite.

Distribution: In Bolivia, from Cerro Rico, Potosí [TL] and at the Maria-Teresa mine, near Huari, between Oruro and Uyuni. From the Stiepelmann mine, near Arandis, Namibia.

Name: To honor Joachim Ottemann (1914–), German mineralogist, Heidelberg, Germany.

Type Material: National Museum of Natural History, Washington, D.C., USA, 114486, C5354.

quartz	1.4
Total	99.91

(1) Ottré, Belgium; corresponds to $(Mn_{0.88}Fe^{2+}_{0.55}Mg_{0.54}Fe^{3+}_{0.03})_{\Sigma=2.00}(Al_{3.93}Fe^{3+}_{0.07})_{\Sigma=4.00}$ $(Si_{1.97}Al_{0.03})_{\Sigma=2.00}O_{10.03}(OH)_{3.94}$.

Polymorphism & Series: Monoclinic and triclinic polytypes are known.

Mineral Group: Chloritoid group.

Occurrence: Formed under nonshearing stress conditions in veins and cavities within low- to medium-grade metamorphic rocks; also a medium-temperature hydrothermal alteration mineral.

Association: Dickite, kaolinite, rutile, andalusite, chlorite, pyrophyllite, davreuxite, quartz.

Distribution: In Belgium, in the Ardennes Mountains, from Ottré, Salmchâteau, and Vielsalm.

Name: For its occurrence at Ottré, Belgium.

Otwayite $Ni_2(CO_3)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Fiber bundles, to several hundred μm, in divergent interlocking sprays perpendicular to veinlet walls; as spherules, claylike coatings.

Physical Properties: Hardness = n.d. VHN = 130–360 (5 g load). D(meas.) = 3.41 D(calc.) = 3.346

Optical Properties: Opaque to translucent. *Color:* Bright green; pale green in transmitted light. *Luster:* Silky to waxy.
Optical Class: Biaxial. *Pleochroism:* Weak; deepest color $\perp$ fiber axis. *Orientation:* Parallel extinction, length-fast. $\alpha = 1.65$ β = n.d. $\gamma = 1.72$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 10.18$ $b = 27.4$ $c = 3.22$ Z = 8

X-ray Powder Pattern: Otway deposit, Western Australia.
6.84 (10), 5.67 (8), 2.737 (6), 3.022 (5), 2.529 (5), 2.24 (5), 2.370 (4)

Chemistry:

	(1)	(2)
CO_2	19.57	19.18
NiO	62.87	65.11
MgO	1.14	
H_2O	16.42	15.71
Total	100.00	100.00

(1) Otway deposit, Western Australia; by AA, colorimetry, and direct determination of C and H, recalculated to 100% from an original total of 99.01% after deduction of SiO_2 0.28% as pecoraite; then corresponding to $(Ni_{1.90}Mg_{0.06})_{\Sigma=1.96}(CO_3)_{1.01}(OH)_{1.92} \cdot 1.10H_2O$. (2) $Ni_2(CO_3)(OH)_2 \cdot H_2O$. (3) Lord Brassey mine, Tasmania, Australia; average of 14 analyses, $(CO_3)^{2-}$, $(SO_4)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR; stated to correspond to $Ni_2[(CO_3)_{0.84}(SO_4)_{0.16}]_{\Sigma=1.00}(OH)_2 \cdot 2H_2O$.

Occurrence: In veinlets in serpentinite (Otway prospect, Western Australia; Lord Brassey mine, Tasmania, Australia).

Association: Magnesite, pecoraite, gaspéite, paraotwayite, millerite, polydymite, nickeloan chrysotile, apatite (Otway deposit, Western Australia); theophrastite, hellyerite, zaratite, magnetite (Lord Brassey mine, Tasmania, Australia).

Distribution: In Australia, from the Otway nickel deposit, near Spinnaway, Nullagine district, and in the 132 North nickel mine, 4 km southwest of Widgiemooltha, Western Australia; at the Lord Brassey mine, near Heazlewood, Tasmania.

Name: To honor Charles Albert Otway (1922–), prospector of Gosnells, Western Australia, owner of the Otway prospect.

Type Material: Western Australian Museum, Perth, Australia, M.60.1991; National Museum of Natural History, Washington, D.C., USA, 142804.

(1) Old Lout mine, Colorado, USA; by electron microprobe, corresponding to $Ag_{3.02}Cu_{0.20}Pb_{3.71}Bi_{5.16}Sb_{0.04}S_{13.00}$. (2) $Ag_3Pb_4Bi_5S_{13}$.

Occurrence: In a hydrothermal sulfide vein (Old Lout mine, Colorado, USA); with topaz and fluorite in a cryolite body (Ivigtut, Greenland); with base-metal sulfides in diopside tactite (Pitiquito, Mexico).

Association: Galena, matildite (Old Lout mine, Colorado, USA); berryite, aikinite, galena, matildite, pyrite, bismuth, gold (Ivigtut, Greenland); sphalerite, galena, chalcopyrite (Pitiquito, Mexico).

Distribution: In the USA, in Colorado, near Ouray, San Juan Co., from the Old Lout mine [TL], in the Alaska mine, Poughkeepsie Gulch; in the Wombat mine, Montezuma district, Summit Co.; and from the Comstock mine, La Plata Co.; at South Mountain, Owyhee Co., Idaho. From a tungsten prospect, 40 km south of Pitiquito, Sonora, Mexico. At the Ivigtut cryolite deposit, southwestern Greenland.

Name: For Ouray, Colorado, USA, near where the mineral was first discovered.

Type Material: Royal Ontario Museum, Toronto, Canada, M4100.

MgO	0.42
H_2O	[12.80]
Total	[100.00]

(1) Shinkolobwe, Congo; by electron microprobe, average of seven analyses, H_2O by difference; corresponds to $(Co_{0.78}Mg_{0.09}Ni_{0.04})_{\Sigma=0.91}(UO_2)_{2.07}Si_{1.95}O_7 \cdot 6.30H_2O$.

Occurrence: A secondary mineral in brecciated dolostone containing uraninite.

Association: Soddyite, kasolite, schoepite, sklodowskite, torbernite, lepersonnite, bijvoetite, curite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: From the French *oursin*, meaning *sea urchin*, in allusion to the mineral's appearance.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM1321.

References: (1) Deliens, M. and P. Piret (1983) L'oursinite $(Co_{0.86}Mg_{0.10}Ni_{0.04})O \cdot 2UO_3 \cdot 2SiO_2 \cdot 6H_2O$, nouveau minéral de Shinkolobwe, Shaba, Zaïre. Bull. Minéral., 106, 305–308 (in French with English abs.). (2) (1984) Amer. Mineral., 69, 567 (abs. ref. 1).

Overite $CaMgAl(PO_4)_2(OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are platy to lathlike, flattened on {010} and elongated along [001], to 4 mm; forms include {010}, {100}, {110}, {121}, {021}. Commonly in subparallel aggregates, massive.

Physical Properties: *Cleavage:* {010}, perfect; {100}, poor. Hardness = 3.5–4
D(meas.) = 2.53 D(calc.) = 2.51

Optical Properties: Semitransparent. *Color:* Light apple-green to colorless; in transmitted light, colorless. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, weak.
$\alpha = 1.568(2)$ $\beta = 1.574(2)$ $\gamma = 1.580(2)$ 2V(meas.) = 75(10)°

Cell Data: *Space Group: Pbca.* $a = 14.723(14)$ $b = 18.746(16)$ $c = 7.107(4)$ Z = 8

X-ray Powder Pattern: Fairfield, Utah, USA. (ICDD 16-157).
2.832 (100), 9.4 (80), 5.29 (60), 2.889 (60), 3.70 (50), 1.975 (50), 3.42 (40)

(1) Fairfield, Utah, USA; by electron microprobe, H_2O separately determined.
(2) $CaMgAl(PO_4)_2(OH)\cdot 4H_2O$.

Mineral Group: Overite group.

Occurrence: In phosphate nodules (Fairfield, Utah, USA); in a complex granite pegmatite (Tanco pegmatite, Canada).

Association: Variscite, apatite (Fairfield, Utah, USA).

Distribution: Found at the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah, USA. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada.

Name: To honor Edwin J. Over (1903–1963), mineral collector, Colorado Springs, Colorado, USA, who first found the mineral.

Type Material: Harvard University, Cambridge, Massachusetts, 95482; National Museum of Natural History, Washington, D.C., USA, R7898.

(1) Poorman mine, Idaho, USA; corresponds to $Ag_{2.96}(Pb_{8.49}Cu_{0.61}Fe_{0.36})_{\Sigma=9.46}Sb_{10.85}S_{28.00}$. (2) Sheba mine, Nevada, USA; average of two analyses, corresponds to $Ag_{2.68}(Pb_{9.97}Cu_{1.15}Fe_{0.04})_{\Sigma=11.16}Sb_{11.32}S_{28.00}$. (3) Freiberg, Saxony, Germany; by electron microprobe, corresponding to $Ag_{2.94}Pb_{11.04}Sb_{11.50}S_{28.00}$. (4) $Ag_3Pb_{10}Sb_{11}S_{28}$.

Occurrence: In veins of hydrothermal origin.

Association: Galena, sphalerite, pyrite, arsenopyrite, chalcopyrite, tetrahedrite, pyrargyrite, diaphorite, miargyrite, jamesonite, boulangerite, ramdohrite, andorite, meneghinite.

Distribution: In the USA, in Idaho, from the Poorman mine, Silver City district, Owyhee Co., Idaho [TL] and at the Banner mine, Boise Co.; from the Sheba mine, Star City, and at Rochester and in the Kaiser Tunnel, Morey district, Nye Co., Nevada; from the Domingo and Garfield mines, Gunnison Co., Colorado; at the McAlpine mine, Tuolumne Co., California. From the Alma property and Rambler mine, Slocan mining division, British Columbia; and the Tintina silver mines, Yukon Territory, Canada. From Yecora, five km west of Iglesia, Sonora, Mexico. At Marmato, Colombia. From the Wongabah mine, Drake and Rivertree mining fields, New South Wales, and at the Meerschaum mine, near Omeo, Victoria, Australia. From the Rajpura Dariba polymetallic deposit, Rajasthan, India. At the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. From Kutná Hora, Czech Republic. At Bourneix, Haute-Vienne, France. From Roc-Blanc, Morocco. In the Srednegolgotaiskoe gold deposit, eastern Transbaikalia, Siberia, Russia. Known from a few other localities.

Name: For the locality in Owyhee Co., Idaho, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94054.

Oxammite $(NH_4)_2C_2O_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Rare in crystals, typically in lamellar and pulverulent masses.

Physical Properties: *Cleavage:* On {001}, distinct. Hardness = 2.5 D(meas.) = ∼1.5 D(calc.) = 1.541 Soluble in H_2O.

Optical Properties: Transparent to opaque. *Color:* Colorless to pale yellow; colorless in transmitted light.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, distinct.
$\alpha = 1.438$ $\beta = 1.547$ $\gamma = 1.595$ 2V(meas.) = 62°

Cell Data: *Space Group:* $P2_12_12$ (synthetic). $a = 8.035$ $b = 10.32$ $c = 3.801$ Z = 2

X-ray Powder Pattern: Guañape Islands, Peru.
6.37 (10), 2.88 (8), 2.68 (8), 2.60 (8), 3.83 (7), 3.08 (7), 3.28 (6)

Chemistry:

	(1)	(2)	(3)
C_2O_4	53.30	61.93	54.97
NH_4	21.95	25.39	22.53
H_2O	24.75	12.68	22.50
Total	[100.00]	100.00	100.00

(1) Guañape Islands, Peru; recalculated to 100% after deduction of organic material 5.5%.
(2) $(NH_4)_2C_2O_4 \cdot H_2O$. (3) $(NH_4)_2C_2O_4 \cdot 2H_2O$.

Occurrence: Derived from bird or bat guano; in subfossil bird eggs and on subfossil birds.

Association: Mascagnite (Guañape Islands, Peru).

Distribution: From the Guañape Islands, south of Trujillo, Peru. In Petrogale Cave, near Madura, Western Australia. On Hamar an Nafur Island, Gulf of Masirah, Oman.

Name: As an OXalate of AMMonia.

Type Material: University of Virginia, Charlottesville, Virginia, apparently lost in a fire in 1916; Yale University, New Haven, Connecticut, USA.

(1) Potosi pit, Australia; by AA, C and H by CHN analyzer, average of two analyses, O by difference; corresponds to $Ca_{1.02}Cu_{1.00}C_{8.00}H_{23.77}O_{14.23}$. (2) $CaCu(C_2H_3O_2)_4 \cdot 6H_2O$.

Occurrence: Formed in ferruginous gossan by reaction of oxidized zone metallic minerals with decaying vegetable matter provided by leaf litter and possibly mine timbers.

Association: Hoganite, linarite, malachite, azurite, cuprian smithsonite, cerussite, goethite, hematite, quartz.

Distribution: From the Potosi Ag–Pb–Zn mine, two km northeast of Broken Hill, New South Wales, Australia.

Name: To honor Frank L. Pace (1948–), Broken Hill, miner and collector of Broken Hill minerals, who first noted the mineral.

Type Material: Broken Hill Geocentre, Broken Hill; Australian Museum, Sydney; Museum of Victoria, Melbourne, Australia, M47465.

References: (1) Hibbs, D.E., U. Kolitsch, P. Leverett, J.L. Sharpe, and P.A. Williams (2002) Hoganite and paceite, two new acetate minerals from the Potosi mine, Broken Hill, Australia. Mineral. Pachnolite $NaCaAlF_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic along [001], with dominant {110}, striated ‖ {001}, and acute termination by {111}, {221}, etc., and {001}, with rhombic section, to 8 cm; cleavable to granular, stalactitic, porcelaneous massive. *Twinning:* On {100}, apparently universal, giving a grid pattern in thin section.

Physical Properties: *Cleavage:* {001}, good to indistinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.965–3.008 D(calc.) = 2.97

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 69(1)°$. *Dispersion:* $r < v$, weak; strong horizontal dispersion. $\alpha = 1.4065(1)$ $\beta = 1.4104(1)$ $\gamma = 1.4191(2)$ 2V(meas.) = 66.3°–76° ($2V_\gamma$).

Cell Data: *Space Group:* $F2/d$. a = 12.117(4) $b = 10.414(3)$ $c = 15.680(4)$ $\beta = 90.37(2)°$ Z = 16

X-ray Powder Pattern: Ivigtut, Greenland.
3.95 (100), 1.971 (90), 2.79 (70), 2.16 (50), 3.02 (20), 3.26 (10), 2.92 (10)

(1) Ivigtut, Greenland. (2) St. Peters Dome, Colorado, USA. (3) $NaCaAlF_6 \cdot H_2O$.

Polymorphism & Series: Dimorphous with thomsenolite.

Occurrence: As an alteration product of cryolite and other alkali aluminum fluorides, most commonly in pegmatites.

Association: Cryolite, thomsenolite, chiolite, elpasolite, ralstonite, sellaite, fluorite.

Distribution: In the Ivigtut cryolite deposit, southwestern Greenland. From near Lake Gjerdingen, Nordmarka, Norway. In the Hagendorf pegmatite, Bavaria, Germany. In the USA, at St. Peters Dome, near Pikes Peak, El Paso Co., and in the Goldie carbonatite, McClure Mountain-Iron Mountain, Fremont Co., Colorado; at the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada; from the Morefield pegmatite mine, Amelia, Amelia Co., Virginia. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina.

Name: From the Greek for *frost* and *stone*, in allusion to its appearance.

Type Material: n.d.

(1) Băiţa, Romania; by electron microprobe, average of six analyses on two grains; corresponds to $Ag_{1.13}Pb_{1.21}Cu_{5.55}Bi_{10.97}S_{22.00}$. (2) Ocna de Fier, Romania; by electron microprobe, average of 37 analyses; corresponds to $Ag_{0.36}Pb_{1.20}Cu_{7.11}Bi_{11.28}S_{22.05}$. (3) $AgPb_2Cu_6Bi_{11}S_{22}$.

Occurrence: Intimately intergrown with other Pb–Bi sulfosalts.

Association: Hammarite, pekoite, bismuthinite, cuprobismutite, hodrushite, chalcopyrite, grossular, andradite.

Distribution: In Romania, from Băiţa (Rézbánya) [TL], and in the Paulus mine, Ocna de Fier (Morávicza; Vaskő). At Banská Štiavnica (Schemnitz), Slovakia.

Name: Honors Dr. Karel Paděra (1923–), Czech mineralogist, Charles University, Prague, Czech Republic, who first worked on the mineral.

Type Material: Charles University, Prague, Czech Republic, 11329; National Museum of Natural History, Washington, D.C., USA, 164244.

(1) Tip Top mine, South Dakota, USA; partial analysis by electron microprobe, H_2O by TGA, Li and presence of Be confirmed by ion microprobe. (2) $Li_8(Ca_{5.5}Li_{3.6}K_{1.2}Na_{0.2})_{\Sigma=10.5}Be_{24}(PO_4)_{24}\cdot 38H_2O$.

Mineral Group: Zeolite group.

Occurrence: A rare late-stage mineral in seams in fractured beryl crystals, within the inner-intermediate zone of a complex granite pegmatite.

Association: Englishite, roscherite, eosphorite–childrenite, tiptopite, montgomeryite.

Distribution: At the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: From *Pahasapa*, the Lakota Sioux word for the Black Hills, in allusion to the type locality.

Type Material: National Museum of Natural History, Washington, D.C., USA, 159879.

(1) Near Ohngaing, Myanmar; by electron microprobe, B determined present by wet chemical analysis, IR, and crystal-structure analysis. (2) $CaZrAl_9O_{15}(BO_3)$.

Occurrence: In gem gravels.

Association: Corundum, phlogopite.

Distribution: From near Ohngaing village, Sagaing, Mogok district, Myanmar (Burma).

Name: For Arthur Charles Davy Pain (?–1971), British gem collector, who first noted the species.

Type Material: The Natural History Museum, London, England, 1954,192; National Museum of Natural History, Washington, D.C., USA, 142506.

X-ray Powder Pattern: Majak mine, Russia.
2.22 (10), 2.50 (4), 1.986 (4), 1.784 (3), 1.187 (3), 2.46 (2), 2.20 (2)

Chemistry:

	(1)
Pd	65.1
Pt	4.7
Au	1.0
Cu	0.1
Pb	4.6
Sn	13.2
As	7.2
Sb	3.0
Bi	1.0
Total	99.9

(1) Majak mine, Russia; by electron microprobe, average of four analyses; corresponds to $(Pd_{4.75}Pt_{0.19}Pb_{0.17}Au_{0.04}Cu_{0.01})_{\Sigma=5.16}(Sn_{0.86}As_{0.75}Sb_{0.19}Bi_{0.04})_{\Sigma=1.84}$.

Occurrence: Intergrown with other minerals in massive ores of cubanite, chalcopyrite and talnakhite.

Association: Pentlandite, rustenburgite–atokite, Pt–Fe alloy, polarite, sperrylite, majakite, Au–Ag–Cu alloys.

Distribution: From the Majak mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL].

Name: For the principal elements, PALladium, ARsenic and tin, STANnum.

Type Material: Geological Exploration Institute, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81391.

As_2O_5	5.14
V_2O_5	39.34
SiO_2	3.32
MnO	25.19
CaO	23.70
Na_2O	3.40
Total	100.09

(1) Molinello mine, Italy; by electron microprobe, average of three analyses, total Mn as MnO; corresponds to $Na_{0.62}Ca_{2.37}Mn_{1.99}[(V_{0.81}Si_{0.10}As_{0.08})_{\Sigma=0.99}O_4]_3$.

Occurrence: A rare mineral in narrow veinlets cutting a manganese deposit hosted within radiolarian cherts (Molinello mine, Italy).

Association: Manganoan calcite, saneroite, ganophyllite, axinite (Molinello mine, Italy); medaite, saneroite, pyrobelonite, fianelite, parsettensite, rhodochrosite, kutnohorite, aegirine, quartz (Fianel mine, Switzerland).

Distribution: From the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy. At the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: In honor of Professor Andrea Palenzona, amateur mineralogist and discoverer of the mineral.

Type Material: University of Genoa, Genoa, Italy; Royal Ontario Museum, Toronto, Canada.

SrO	12.93	11.34	Total	99.69	

(1) Palermo #1 mine, New Hampshire, USA; corresponds to $(Li_{1.74}Na_{0.28}K_{0.01})_{\Sigma=2.03}(Sr_{0.81}Ca_{0.16}Fe_{0.02}Mg_{0.02})_{\Sigma=1.01}Al_{3.93}(PO_4)_{3.92}(OH)_{3.87}$. (2) Giogo di Toirano, Italy; partial analysis by electron microprobe, total Fe as FeO.

Occurrence: A late hydrothermal product in a complex zoned granite pegmatite (Palermo #1 mine, New Hampshire, USA); near quartz veins in sandstones and conglomerates subjected to greenschist metamorphism (Giogo di Toirano, Italy).

Association: Siderite, childrenite–eosphorite, beraunite, crandallite, whitlockite, brazilianite, goyazite, apatite, quartz (Palermo #1 mine, New Hampshire, USA); lazulite, goyazite, brazilianite (Giogo di Toirano, Italy).

Distribution: In the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA. From Giogo di Toirano, near Bardineto, Liguria, Italy. In the Xiyuantou pegmatite, Nanping, Fujian Province, China.

Name: For its occurrence at the Palermo #1 mine, New Hampshire, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 101342.

Palladium Pd

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rarely as small octahedra; may be discoidal, then forming rosettes, to 3 μm; commonly in grains, which may have a radial fibrous texture.

Physical Properties: *Tenacity:* Ductile, malleable. Hardness = 4.5–5 VHN = n.d. D(meas.) = 11.9 D(calc.) = 12.04

Optical Properties: Opaque. *Color:* Whitish steel-gray. *Luster:* Metallic.
R: (400) 60.6, (420) 62.0, (440) 63.4, (460) 64.6, (480) 65.6, (500) 66.4, (520) 67.2, (540) 67.8, (560) 68.3, (580) 68.9, (600) 69.5, (620) 70.2, (640) 70.9, (660) 71.7, (680) 72.5, (700) 73.4

Cell Data: *Space Group:* $Fm3m$ (synthetic). a = 3.8898 Z = 4

X-ray Powder Pattern: Potaro River, Guyana.
2.259 (100), 1.184 (60), 1.957 (50), 1.387 (40), 1.132 (20), 0.9824 (10), 0.9019 (4b)

Chemistry:

	(1)
Pd	77.2
Hg	22.6
Total	99.8

(1) Potaro River, Guyana; by electron microprobe.

Occurrence: An oxidation product of palladium-bearing sulfides and as a primary phase in platinum deposits.

Association: Pt–Fe alloys, Pd–Hg minerals, gold, Au–Ag alloy, lead, sobolevskite.

Distribution: In Brazil [TL], in Minas Gerais, from placers in the Bom Succeso Stream, northwest of Serro; and around Itabira, as at the Cauê iron mine. In placers in the Department of Chocó, Cauca, Colombia. In Russia, from placers in the Ural Mountains. In Poland, at the Lubin copper mine, near Legnica, Zechstein copper district, and in the weathered cover of the Szklary massif. From the Transvaal, South Africa. In Guyana, in placers on the Potaro River.

Name: In honor of the discovery of the planetoid *Pallas*.

(1) Komsomol'skii mine, Russia; by electron microprobe, corresponding to $(Pd_{1.87}Ag_{0.09}Au_{0.02})_{\Sigma=1.98}As_{1.02}$. (2) Stillwater complex, Montana, USA; by electron microprobe, corresponding to $(Pd_{2.01}Cu_{0.02})_{\Sigma=2.03}(As_{0.94}Te_{0.03})_{\Sigma=0.97}$. (3) Lac des Iles complex, Canada; by electron microprobe, corresponding to $(Pd_{2.02}Pt_{0.01}Ni_{0.01})_{\Sigma=2.04}(As_{0.95}Te_{0.01})_{\Sigma=0.96}$. (4) Pd_2As.

Occurrence: As minute grains in chalcopyrite in veins along the footwall of a Cu–Ni sulfide deposit (Talnakh area, Russia); from heavy-mineral concentrates (Stillwater complex, Montana, USA).

Association: Chalcopyrite, sperrylite, gold, kotulskite (Talnakh area, Russia).

Distribution: In the Komsomol'skii mine, Oktyabr Cu–Ni deposit, Talnakh area, Noril'sk district, western Siberia, Russia [TL]. At the Elatsite porphyry copper deposit, Srednogorie zone, Bulgaria. From the Konttijarvi intrusions, northern Finland. In the USA, in the Banded and Upper Zones of the Stillwater complex, Montana. In Canada, at the Lac des Iles complex, Ontario. From Kambalda, 56 km south of Kalgoorlie, Western Australia. At the Onverwacht mine, on the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: For PALLADium and ARSENic in its chemical composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Begizov, V.D., V.I. Meschankina, and L.S. Dubakina (1974) Palladoarsenide, Pd_2As, a new natural palladium arsenide from the copper–nickel deposits of the Oktyabr deposits. Zap. Vses. S		0.31	
Total	100.01	100.63	100.00

(1) Itabira district, Brazil; by electron microprobe, corresponding to $(Pd_{15.47}Cu_{1.85}Hg_{0.24})_{\Sigma=17.56}Se_{14.44}$. (2) Cauê mine, Itabira district, Brazil; by electron microprobe, average of seven analyses; corresponding to $(Pd_{15.83}Cu_{1.47}Hg_{0.21}Pt_{0.20}Fe_{0.20}Ag_{0.09})_{\Sigma=18.00}(Se_{13.71}S_{0.29})_{\Sigma=14.00}$. (3) $Pd_{17}Se_{15}$.

Occurrence: Sparingly in residual concentrates from gold washings (Itabira district, Brazil); in specularite and magnetite (Cauê mine, Itabira district, Brazil).

Association: Arsenopalladinite, isomertieite, atheneite (Itabira district, Brazil); palladian gold, isomertieite, sudovikovite (Cauê mine, Itabira district, Brazil).

Distribution: In Brazil, in Minas Gerais, from gold placers in the Itabira district [TL], and at the Cauê iron mine; from the Serra Pelada Au–Pd–Pt deposit, Pará.

Name: For the chemical composition, PALLADium and SElenium.

Type Material: The Natural History Museum, London, England, 1977,500 and 1934,72; National Museum of Natural History, Washington, D.C., USA, 142504.

Palmierite $(K, Na)_2Pb(SO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As minute crytals, platy on {0001} with hexagonal outline, modified by $\{10\overline{1}0\}$, $\{10\overline{1}1\}$, $\{10\overline{1}2\}$, $\{10\overline{1}3\}$, $\{10\overline{1}5\}$.

Physical Properties: Hardness = n.d. D(meas.) = 4.363 (synthetic). D(calc.) = 4.33 Rapidly decomposed by H_2O, leaving a $PbSO_4$ residue.

Optical Properties: Semitransparent. *Color:* Colorless or white; colorless in transmitted light. *Luster:* Vitreous, pearly on {0001}.
Optical Class: Uniaxial (–), large birefringence. $\omega = 1.712$ $\epsilon =$ n.d.

Cell Data: *Space Group:* $R\overline{3}m$ (synthetic). $a = 5.4950(6)$ $c = 20.849(4)$ $Z = 3$

X-ray Powder Pattern: Synthetic.

Palygorskite $(Mg,Al)_2Si_4O_{10}(OH)\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are tiny laths, flattened on {100}, elongated along [001], to 1 cm. Commonly fibrous, forming tangled mats termed "mountain leather," also compact.

Physical Properties: *Cleavage:* Good on {110}. *Tenacity:* Tough. Hardness = 2–2.5 D(meas.) = > 1.0–2.6 D(calc.) = [2.35]

Optical Properties: Semitransparent. *Color:* White, grayish, yellowish, gray-green; colorless in thin section. *Luster:* Earthy to waxy.
Optical Class: Biaxial (–). *Pleochroism:* For colored varieties; X = pale yellow; $Y = Z$ = pale yellow-green. *Orientation:* $Z \wedge c$ = small. *Absorption:* $Z = Y > X$. α = 1.522–1.528 β = 1.530–1.546 γ = 1.533–1.548 2V(meas.) = 30°–61°

Cell Data: *Space Group:* $C2/m$. $a = 12.78$ $b = 17.86$ $c = 5.24$ $\beta = 95.78°$ Z = 4

X-ray Powder Pattern: Sapillo Creek, New Mexico, USA.
10.44 (100), 4.262 (22), 4.466 (20), 2.539 (20), 3.096 (16), 3.679 (15), 6.36 (13)

Chemistry:

	(1)
SiO_2	55.03
Al_2O_3	10.24
Fe_2O_3	3.53
MgO	10.49
K_2O	0.47
H_2O^+	10.13
H_2O^-	9.73
Total	99.62

(1) Attapulgus, Georgia, USA; corresponds to $(Mg_{0.99}Al_{0.68}Fe^{3+}_{0.18}Ca_{0.16}Ti_{0.04})_{\Sigma=2.05}(Si_{3.92}Al_{0.08})_{\Sigma=4.00}O_{10}(OH)\cdot 4H_2O$.

Occurrence: An alteration product of magnesium silicates in soils and sediments; in lacustrine marls, carbonate rocks, and mafic igneous rocks; in clay gouge associated with fault movement.

Association: Calcite, dolomite, talc, chlorite, quartz, "chalcedony," "opal," montmorillonite.

Distribution: Widespread; some localities for studied material include: at Palygorskaya, near the Popovka River, Perm, Russia. In the USA, at Attapulgus, Decatur Co., Georgia; near Sapillo Creek, Grant Co., New Mexico; in the Pend Oreille mine, Metaline Falls, Stevens Co., Washington; at the New Melones Dam, Calaveras Co., California; and at Gustavus, Alexander Archipelago, Alaska. In the Warren quarry, Enderby, Leicestershire, England. At Tafraout, Morocco. In the Hyderabad deposit, Andhra Pradesh, India.

Name: For the type locality, Palygorskaya, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, N824/7; Harvard University, Cambridge, Massachusetts, USA, 105018.

(1) Panasqueira, Portugal; by electron microprobe, $(OH)^{1-}$ calculated from stoichiometry; corresponds to $Ca_{0.99}(Mg_{1.02}Fe_{0.01})_{\Sigma=1.03}(PO_4)_{1.00}[(OH)_{0.71}F_{0.29}]_{\Sigma=1.00}$.

Occurrence: A rare mineral in vein selvages in a hydrothermal Sn–W deposit.

Association: Fluorapatite, wolfeite, topaz, muscovite, sphalerite, quartz, chalcopyrite, pyrrhotite, siderite, arsenopyrite, chlorite, vivianite, althausite, thadeuite.

Distribution: From the Panasqueira Sn–W deposit, Portugal.

Name: For Panasqueira, Portugal, the type locality.

Type Material: Department of Geological Sciences, University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA, 144521.

Panethite $(Na, Ca)(Mg, Fe^{2+})PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As anhedral grains, to 1 mm. *Twinning:* Simple twinning observed.

Physical Properties: Hardness = n.d. D(meas.) = 2.9–3.0 D(calc.) = [2.96]

Optical Properties: Transparent. *Color:* Pale amber.
Optical Class: Biaxial (–). $\alpha = 1.567(1)$ $\beta = 1.576(1)$ $\gamma = 1.579(1)$ 2V(meas.) = 51°

Cell Data: *Space Group:* $P2_1/n$. $a = 10.18(1)$ $b = 14.90(2)$ $c = 25.87(3)$ $\beta = 91.1°$
Z = 48

X-ray Powder Pattern: Dayton meteorite.
3.007 (10), 2.710 (7), 5.10 (6), 3.236 (5), 2.749 (5), 4.210 (4), 3.951 (4)

Total	100.5

(1) Dayton meteorite; by electron microprobe, average of six grains, total Fe as FeO, total Mn as MnO; corresponds to $(Na_{0.77}Ca_{0.14}K_{0.03})_{\Sigma=0.94}(Mg_{0.88}Fe_{0.11}Mn_{0.04})_{\Sigma=1.03}P_{0.98}O_4$.

Occurrence: A very rare mineral in phosphate nodules in an iron meteorite.

Association: Brianite, whitlockite, albite, enstatite, schreibersite, kamacite, taenite, graphite, sphalerite, troilite.

Distribution: In the Dayton very fine octahedrite meteorite.

Name: Honoring Professor Friedrich Adolf Paneth (1887–1958), Austrian chemist, Director of the Max Planck Institute for Chemistry, Mainz, Germany, for his contributions to the study of meteorites.

Type Material: National Museum of Natural History, Washington, D.C., USA, 1506.

(1) Monte Somma, Italy; alkalis determined by flame photometry. (2) $KAlSiO_4$.

Polymorphism & Series: Polymorphous with kaliophilite, kalsilite, and trikalsilite.

Occurrence: Within cavities of pyroxene-rich ejecta blocks that are part of a recent volcanoclastic deposit.

Association: Nepheline, augite, biotite.

Distribution: From Monte Somma and Vesuvius, Campania, Italy.

Name: For Dr. Achille Panunzi, Professor of Chemistry, University of Naples, Naples, Italy, who discovered the ejecta blocks in which the mineral occurs.

Type Material: University of Naples, Naples, Italy.

Paolovite Pd_2Sn

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As irregular grains embedded in other minerals. *Twinning:* Polysynthetic.

Physical Properties: Hardness = n.d. VHN = 329–378 (10 g load). D(meas.) = n.d. D(calc.) = 11.08

Optical Properties: Opaque. *Color:* Lilac-rose. *Luster:* Metallic. *Pleochroism:* Dark lilac-rose to pale rose.
R_1–R_2: (400) — , (420) 44.4–46.5, (440) 44.6–47.2, (460) 45.0–48.2, (480) 45.5–49.1, (500) 45.9–50.3, (520) 46.7–51.6, (540) 47.7–52.8, (560) 49.0–54.1, (580) 50.9–55.4, (600) 52.9–56.7, (620) 55.3–57.7, (640) 57.7–59.2, (660) 59.8–59.5, (680) 61.5–60.3, (700) 62.7–60.6

Cell Data: *Space Group: Pbnm.* $a = 8.11(1)$ $b = 5.662(6)$ $c = 4.324(2)$ $Z = 4$

X-ray Powder Pattern: Oktyabr deposit, Russia.
2.28 (100), 2.16 (70), 1.955 (50), 2.36 (40), 1.397 (40), 1.315 (40), 1.120 (40)

Chemistry:

	(1)	(2)	(3)
Pd	64.8	64.3	64.19
Pt	2.5		
Sn	35.5	35.0	35.81
Sb	0.3		
Bi	0.2		
Total	103.3	99.3	100.00

(1) Oktyabr deposit, Russia; by electron microprobe, corresponding to $(Pd_{1.98}Pt_{0.04})_{\Sigma=2.02}Sn_{0.98}$.
(2) Western Platinum mine, South Africa; by electron microprobe, corresponding to $Pd_{2.02}Sn_{0.98}$.
(3) Pd_2Sn.

Occurrence: In Cu–Ni sulfide ores; in cubanite–chalcopyrite, cubanite–talnakhite, and cubanite–mooihoekite assemblages (Oktyabr deposit, Russia).

Association: Cubanite, chalcopyrite, galena, talnakhite, mooihoekite, magnetite, sperrylite, sobolevskite, taimyrite, polarite, maslovite, atokite–rustenbergite, froodite, silver, palladium, bismuth.

Distribution: In Russia, from the Oktyabr deposit, Talnakh area, Noril'sk region, western Siberia [TL] and in the Kingash massif, eastern Sayan. At the Atok, Western Platinum, and Rustenberg mines, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. From Little Darling Creek, east of Broken Hill, New South Wales, Australia. In the Strathcona deposit, Sudbury, and the Geordie Lake intrusion, Coldwell complex, Ontario, Canada.

Name: For the chemical composition, PAlladium and *olovo*, *tin* (in Russian).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75509.

References: (1) Genkin, A.D., T.L. Evstigneeva, L.N. Vyal'sov, I.P. Laputina, and N.V. Groneva (1974) Paolovite, Pd_2Sn, a new mineral from copper–nickel sulfide ores. Geol. Rudn. Papagoite $CaCuAlSi_2O_6(OH)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Equant crystals, to 3 mm, slightly flattened on {001} with faces in the [010] zone well developed and striated. Also as sheets and rings of microcrystalline radiating aggregates enclosed in quartz crystals; in massive veneers.

Physical Properties: *Cleavage:* Distinct on {100}, noted in thin section. Hardness = 5–5.5 D(meas.) = 3.25 D(calc.) = 3.25

Optical Properties: Translucent to transparent. *Color:* Cerulean blue. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless to very pale greenish blue; Y = blue; Z = deep greenish blue. *Orientation:* $Z = b$; $X \wedge c = 44°$. *Dispersion:* $r > v$, very faint. *Absorption:* $Z > Y > X$. $\alpha = 1.607(1)$ $\beta = 1.641$ $\gamma = 1.672$ 2V(meas.) = 78(1)°

Cell Data: *Space Group:* $C2/m$. $a = 12.926(3)$ $b = 11.496(3)$ $c = 4.696(1)$ $\beta = 100.81(2)°$ Z = 4

X-ray Powder Pattern: Ajo, Arizona, USA.
2.874 (100), 4.29 (90), 2.204 (90), 3.44 (80), 2.795 (80), 6.33 (70), 4.61 (70)

Chemistry:

	(1)
SiO_2	33.60
TiO_2	0.26
Al_2O_3	15.78

MnO	0.10
CuO	23.53
MgO	0.09
CaO	17.02
H_2O^+	9.01
H_2O^-	0.04
Total	99.70

(1) Ajo, Arizona, USA; corresponds to $Ca_{1.02}Cu_{0.99}Mg_{0.01}Fe^{2+}_{0.01}Ti_{0.01}Al_{0.98}Si_{1.87}O_6(OH)_{3.04}$.

Occurrence: In narrow veinlets in altered granodiorite porphyry (Ajo, Arizona, USA); included in quartz crystals (Messina, South Africa).

Association: Aurichalcite, shattuckite, ajoite, barite (Ajo, Arizona, USA): quartz, ajoite (Messina, South Africa).

Distribution: In the New Cornelia mine, Ajo, Pima Co., Arizona, USA. In South Africa, from Messina, Transvaal. At the Sinclair mine, near Lüderitz, Namibia.

Name: For the Tohono O'odam (formerly Papago) Indians who inhabit the region around Ajo, Arizona, USA.

Type Material: n.d.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Crystals, to 0.01 mm, in radially fibrous spherules.

Physical Properties: Hardness = 1.75(5) D(meas.) = 2.0 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* White; colorless in thin section.
Optical Class: Biaxial (–). *Orientation:* Positive elongation, extinction inclined 10°–12°.
$\alpha = 1.473$ β = n.d. $\gamma = 1.502$ 2V(meas.) = 69(7)°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Gaurdak deposit, Turkmenistan.
7.90 (100), 2.64 (32), 6.20 (30), 3.32 (28), 3.90 (25), 2.68 (24), 4.04 (20)

Chemistry:

	(1)	(2)
SiO_2	0.35	
CO_2	22.42	22.56
Al_2O_3	25.88	26.13
MgO	0.16	
CaO	14.06	14.37
H_2O^+	27.37	
H_2O^-	9.36	
H_2O		36.94
Total	99.60	100.00

(1) Vodin deposit, Russia; corresponds to $(Ca_{0.98}Mg_{0.01})_{\Sigma=0.99}Al_{2.00}(CO_3)_{2.00}(OH)_{4.00} \cdot 6.0H_2O$.
(2) $CaAl_2(CO_3)_2(OH)_4 \cdot 6H_2O$.

Occurrence: In the oxidized zone of sulfur deposits, formed by decomposition of allophane (Vodin deposit, Russia; Gaurdak deposit, Turkmenistan).

Association: Gypsum, calcite, halloysite (Vodin deposit, Russia; Gaurdak deposit, Turkmenistan); allophane, scarbroite, dundasite (Hampstead Farm quarry, England).

Distribution: From the Vodin sulfur deposit, Samara district, Russia. At the Gaurdak sulfur deposit, Turkmenistan. In Hampstead Farm quarry, Chipping Sodbury, Avon, and from Boughton, near Northampton, England.

Name: From the Greek *para*, for *near*, and its relation to *alumohydrocalcite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81064.

Parabariomicrolite $BaTa_4O_{10}(OH)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. Individual crystals, to 0.1 mm, topotactically replacing microlite crystals, to 1 cm; less commonly as open-space fillings. *Twinning:* Possibly due to the topotactic replacement.

Physical Properties: *Cleavage:* {001} and {101}, good. *Tenacity:* Brittle. Hardness = 4
D(meas.) = n.d. D(calc.) = 5.97

Optical Properties: Translucent. *Color:* White to pale pink. *Streak:* White.
Luster: Vitreous to pearly.
Optical Class: Uniaxial. $\omega = > 2.0$ $\epsilon = > 2.0$

Cell Data: *Space Group:* $R\overline{3}m$, $R3m$, or $R32$. a = 7.4290(6) c = 18.505(2) Z = 3

X-ray Powder Pattern: Alto do Giz pegmatite, Brazil; after removal of lines due to microlite contaminant.
3.040 (100), 3.172 (65), 6.18 (50), 2.641 (50), 1.591 (42), 3.085 (41), 1.857 (39)

Chemistry:

	(1)	(2)
Nb_2O_5	1.5	
Ta_2O_5	80.6	81.00
PbO	0.4	
CaO	0.0	
SrO	0.8	
BaO	10.5	14.05
Na_2O	0.4	
K_2O	0.3	
H_2O		4.95
$H_2O + F$	[5.5]	
Total	[100.0]	100.00

(1) Alto do Giz pegmatite, Brazil; by electron microprobe, H_2O + F by difference; corresponding to $(Ba_{0.73}Na_{0.13}Sr_{0.08}K_{0.07}Pb_{0.02})_{\Sigma=1.03}(Ta_{3.88}Nb_{0.12})_{\Sigma=4.00}O_{10}(OH)_2 \cdot 2H_2O$.
(2) $BaTa_4O_{10}(OH)_2 \cdot 2H_2O$.

Occurrence: An alteration product of microlite crystals, in a decomposed zoned pegmatite.

Association: Microlite, simpsonite, tantalite, manganotantalite, tapiolite, natrotantite, alumotantite, stibiotantalite, beryl, spodumene, petalite.

Distribution: In the Alto do Giz pegmatite, near Parelhas, Rio Grande do Norte, Brazil.

Name: From the Greek for *near* and its relation to *bariomicrolite*.

Type Material: Royal Ontario Museum, Toronto, Canada, M22607; National Museum of Natural History, Washington, D.C., USA, 104739.

References: (1) Ercit, T.S., F.C. Hawthorne, and P. Černý (1986) Parabariomicrolite, a new species, and its structural relationship to the pyrochlore group. Can. Mineral., 24, 655–663.

Total	101.1

(1) Sterling Hill, New Jersey, USA; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by TGA-EGA; corresponds to $(Ca_{1.94}Mn_{0.06})_{\Sigma=2.00}(Mn_{0.84}Mg_{0.09}Zn_{0.04}Fe_{0.01})_{\Sigma=0.98}(As_{0.96}O_{3.90})_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with brandtite.

Mineral Group: Fairfieldite group.

Occurrence: Very rare, in a vein in primary ore from a metamorphosed stratiform zinc orebody.

Association: Sarkinite, franklinite, willemite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *brandtite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163210.

References: (1) Dunn, P.J., D.R. Peacor, S.-C Su, F.J. Wicks, and F.J. Parker (1987) Parabrandtite, the manganese analog of talmessite, from Sterling Hill, Ogdensburg, New Jersey. Neues Jahrb. Mineral., Abh., 157, 113–119. (2) (1988) Amer. Mineral., 73, 1496 (abs. ref. 1).

insol.	0.23	
Total	100.59	100.00

(1) Alcaparrosa, Chile. (2) $Fe(SO_4)(OH)\cdot 2H_2O$.

Polymorphism & Series: Dimorphous with butlerite.

Occurrence: An uncommon mineral in the oxidized zone of pyritic veins, may be formed by alteration of other sulfates.

Association: Copiapite, cuprocopiapite, butlerite, jarosite, melanterite, fibroferrite.

Distribution: From Chuquicamata, at Quetena, west of Calama, and Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta, Chile. In the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. In the USA, at the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. At Saghand, near Yazd, Iran. From the Auguste mine, Fuchsberg, near Halle, Saxony-Anhalt, Germany. At Agrokipia, Cyprus. From Iskazentgyörgy and Nyirád, Hungary.

Name: From the Greek *para*, for *near*, and its relation to *butlerite*.

Type Material: American Museum of Natural History, New York City, New York, 4629-30; Harvard University, Cambridge, Massachusetts, 94834; National Museum of Natural History, Washington, D.C., USA, 115159.

Paracelsian $BaAl_2Si_2O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals prismatic, dominated by {110} and {120}, with chisel-shaped termination by {201}, to 5 cm; confused aggregates of crystals; massive. *Twinning:* Simple twinning on {100}; lamellar on {201}.

Physical Properties: *Cleavage:* {110}, poor; (110) ∧ $(1\bar{1}0) = 87°$. *Fracture:* Subconchoidal. Hardness = ∼6 D(meas.) = 3.29–3.32 D(calc.) = 3.342

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.5702$ $\beta = 1.5824$ $\gamma = 1.5869$ 2V(meas.) = 50°35′–52°42′

Cell Data: *Space Group:* $P2_1/a$. $a = 9.065$–9.076 $b = 9.568$–9.588 $c = 8.577$–8.578 $\beta = 90.01°$–$90.21°$ Z = 4

X-ray Powder Pattern: Benallt mine, Wales.
4.00 (100), 3.80 (70), 2.99 (50), 2.73 (50), 2.56 (50), 3.59 (45), 2.37 (45)

Chemistry:

Total	99.92	100.00

(1) Benallt mine, Wales. (2) $BaAl_2Si_2O_8$.

Polymorphism & Series: Dimorphous with celsian.

Mineral Group: Feldspar group.

Occurrence: In a band through shales and sandstones, associated with a metamorphosed manganese deposit (Benallt mine, Wales).

Association: Celsian (Benallt mine, Wales).

Distribution: From Candoglia, Valle d'Ossola, Piedmont, Italy. In the Benallt mine, Rhiw, Lleyn Peninsula, Wales.

Name: A combination of the Greek *para*, for *near*, and the mineral's dimorph, *celsian*.

Type Material: n.d.

Parachrysotile $Mg_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* n.d. Fibrous along [010]; asbestiform.

Physical Properties: Hardness = 2.5 (?) D(meas.) = ~2.55 D(calc.) = [2.56]

Optical Properties: Semitransparent. *Color:* Yellow, white, gray, green [for chrysotile].
Luster: Silky in aggregates.
Optical Class: [Biaxial.] α = 1.532–1.549 [for chrysotile]. β = n.d. γ = 1.545–1.556
2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 5.3$ $b = 9.24(2)$ $c = 14.7(1)$ Z = [4]

X-ray Powder Pattern: n.d.

Chemistry: Compositional data is lacking.

Polymorphism & Series: Antigorite, clinochrysotile, lizardite, and orthochrysotile are polymorphs.

Mineral Group: Kaolinite-serpentine group.

Occurrence: A minor component of many serpentines.

Association: Clinochrysotile, orthochrysotile.

Distribution: Widespread, probably, but requires careful characterization. From the Jeffrey mine, Asbestos, Quebec, Canada. At Shabani, Zimbabwe.

Name: From the Greek *para*, for *near*, and *chrysotile* from *golden* and *fiber*.

Type Material: n.d.

References: (1) Whittaker, E.J.W. and J. Zussman (1956) The characterization of serpentine minerals by X-ray diffraction. Mineral. Mag., 31, 107–126. (2) (1957) Amer. Mineral., 42, 585 (abs. ref. 1). Paracoquimbite $Fe_2^{3+}(SO_4)_3 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Small rhombohedral crystals $\{01\overline{1}2\}$, equant pseudocubic or prismatic, with complex form development, may be sceptered on coquimbite; also granular, massive. *Twinning:* On {0001}, common.

Physical Properties: *Cleavage:* On $\{01\overline{1}2\}$ and $\{10\overline{1}4\}$, imperfect. Hardness = 2.5 D(meas.) = 2.11(1) D(calc.) = 2.115 Soluble in H_2O, taste astringent.

Optical Properties: Transparent. *Color:* Pale violet. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.550(2)$ $\epsilon = 1.555(2)$

Cell Data: *Space Group:* $R\overline{3}$. $a = 10.926(9)$ $c = 51.300(21)$ Z = 12

X-ray Powder Pattern: Calculated from the crystal structure. (ICDD 27-254). 8.88 (100), 7.62 (39), 3.367 (33), 5.465 (29), 4.605 (29), 8.55 (20), 4.713 (16)

Chemistry:

	(1)	(2)
SO_3	41.38	42.74
Al_2O_3	trace	
Fe_2O_3	29.79	28.41
H_2O	28.69	28.85
Total	99.86	100.00

(1) Tierra Amarilla, Chile. (2) $Fe_2(SO_4)_3 \cdot 9H_2O$.

Polymorphism & Series: Dimorphous with coquimbite.

Occurrence: A rare mineral formed in the oxidized zone of pyritic hydrothermal orebodies, especially in arid regions.

Association: Coquimbite, römerite, szomolnokite, quenstedtite, ferricopiapite, rozenite, voltaite.

Distribution: In Chile, from Tierra Amarilla, southeast of Copiapó, Atacama; at Chuquicamata, Alcaparrosa, near Cerritos Bayos, southwest of Calama, and Quetena, west of Calama, Antofagasta. At Myoban Spa, Oita Prefecture, Japan. From the Kamariza mine, Laurium, Greece. At Steamboat Springs, Washoe Co., Nevada, USA.

Name: From the Greek for *near* and its relation to *coquimbite*.

Type Material: n.d.

Paracostibite CoSbS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As irregular and subhedral grains, to 130 μm.

Physical Properties: Hardness = n.d. VHN = 654–763 (100 g load). D(meas.) = 6.9 D(calc.) = 6.97

Optical Properties: Opaque. *Color:* White with a faint grayish tinge. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Weak, faint pink to pale buff.
R_1–R_2: (400) 47.8–47.9, (420) 48.0–48.5, (440) 48.2–48.9, (460) 48.2–49.2, (480) 48.2–49.4, (500) 48.4–49.6, (520) 48.7–49.6, (540) 48.9–49.4, (560) 49.0–49.3, (580) 49.2–49.2, (600) 49.5–49.3, (620) 49.7–49.6, (640) 49.9–49.9, (660) 50.2–50.3, (680) 50.3–50.6, (700) 50.5–50.9

Cell Data: *Space Group: Pbca.* $a = 5.842(3)$ $b = 5.951(3)$ $c = 11.666(4)$ $Z = 8$

X-ray Powder Pattern: Trout Bay, Canada.
2.555 (10), 2.035 (8), 5.81 (8), 1.853 (8), 2.826 (7), 2.654 (7), 2.976 (4)

Chemistry:

	(1)	(2)	(3)
Co	26.4	25.0	27.70
Fe	0.4	0.4	
Ni	0.8	1.0	
Sb	56.8	57.6	57.23
As		2.1	
S	14.9	14.5	15.07
Total	99.3	100.6	100.00

(1) Trout Bay, Canada; by electron microprobe, average of five analyses; corresponds to $(Co_{0.96}Ni_{0.03}Fe_{0.02})_{\Sigma=1.01}Sb_{1.00}S_{1.00}$. (2) Wheal Cock, England; by electron microprobe; corresponds to $(Co_{0.91}Ni_{0.04}Fe_{0.01})_{\Sigma=0.96}(Sb_{1.01}As_{0.06})_{\Sigma=1.07}S_{0.97}$. (3) CoSbS.

Polymorphism & Series: Dimorphous with costibite.

Occurrence: In drill core from a massive base-metal sulfide deposit in a carbonatized chlorite-anthophyllite schist that is most likely an altered mafic rock, in a sequence of metavolcanics and metasediments (Trout Bay, Canada); in Pb–Zn–Cu–Ag ore deposits remobilized by hydrothermal solutions from younger granite emplacement (Bergslagen, Sweden).

Association: Sphalerite, chalcopyrite, galena, pyrargyrite, pyrrhotite, antimonial silver (Trout Bay, Canada); costibite, nisbite, chalcopyrite, pyrrhotite, galena, sphalerite, gersdorffite, ullmannite (Bergslagen, Sweden).

Distribution: In drill core from Trout Bay, 32 km west of Red Lake, Kenora district, Ontario, Canada [TL]. At Wheal Cock, Botallack, St. Just, Cornwall, England. In the Gruvåsen and Getön deposits, Bergslagen metallic province, Sweden.

Name: For CObalt and antimony, STIBium, in the chemical composition and probable structural relation to pararammelsbergite.

Type Material: Canadian Museum of Nature, Ottawa; Canadian Geological Survey, Ottawa, 12163; Royal Ontario Museum, Toronto, Canada.

References: (1) Cabri, L.J., D.C. Harris, and J.M. Stewart (1970) Paracostibite (CoSbS) and nisbite ($NiSb_2$), new minerals from the Red Lake Area, Ontario, Canada. Can. Mineral., 10, 232–246. Paradamite $Zn_2(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Rarely as equant crystals, striated and rounded; in sheaflike aggregates, to 1 cm.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = n.d. D(meas.) = 4.55(2) D(calc.) = 4.595

Optical Properties: Transparent. *Color:* Pale yellow. *Streak:* White. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). $\alpha = 1.726(2)$ $\beta = 1.771(2)$ $\gamma = 1.780(2)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.638(3)$ $b = 5.827(3)$ $c = 6.692(2)$ $\alpha = 103.25(4)°$ $\beta = 104.37(3)°$ $\gamma = 87.72(4)°$ Z = 2

X-ray Powder Pattern: Ojuela mine, Mexico.
6.33 (10), 3.71 (10), 2.99 (9), 2.84 (9), 2.49 (8), 3.08 (7), 2.11 (7)

Chemistry:

	(1)	(2)
As_2O_5	40.17	40.09
Fe_2O_3	0.12	
FeO	0.45	
ZnO	56.22	56.77
H_2O^+	3.44	3.14
H_2O^-	0.00	
Total	100.40	100.00

(1) Ojuela mine, Mexico. (2) $Zn_2(AsO_4)(OH)$.

Polymorphism & Series: Dimorphous with adamite.

Occurrence: A rare secondary mineral in the oxidized zone of some hydrothermal polymetallic base-metal deposits.

Association: Mimetite, adamite, ojuelaite, mapimite, "limonite" (Ojuela mine, Mexico); köttigite, adamite, smithsonite, wulfenite, chalcocite (Tsumeb, Namibia).

Distribution: From the Ojuela mine, Mapimí, Durango, Mexico. At Tsumeb, Namibia.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *adamite*.

Type Material: The Natural History Museum, London, England, 1969,184; Harvard University, Cambridge, Massachusetts, 106376; National Museum of Natural History, Washington, D.C., USA, R9492, 106378, 107443, 112518, 125506.

Paradocrasite $Sb_2(Sb, As)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. As aggregates of equant, polygonal grains and short, to 0.5 mm, stubby prisms that may be striated parallel to their length; prisms rarely curved, in nests of curved, grooved, pseudohexagonal plates. *Twinning:* Polysynthetically twinned on {010} as parallel lamellae 25 μm wide, on $\{\overline{2}01\}$ as short tapering lamellae and on $\{\overline{1}10\}$ and {001}.

Physical Properties: *Cleavage:* Parting {010} perfect, several others less perfect, paralleling the twinning composition planes. *Tenacity:* Brittle. Hardness = n.d. VHN = 118 (100 g load). D(meas.) = 6.52 D(calc.) = 6.44

Optical Properties: Opaque. *Color:* Bright white. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Distinct, from yellowish white with a slightly pinkish tint, to very pale gray in air; in oil, strong, from pale pinkish gray with a very faint blue-green tint. *Anisotropism:* Strong, in vivid pinks, pale orange, yellow, pale greenish blue and pale green.
R_1–R_2: n.d.

Cell Data: *Space Group:* $C2$. $a = 7.252(1)$ $b = 4.172(4)$ $c = 4.431(2)$ $\beta = 123°8.4(1.4)'$
Z = 1

X-ray Powder Pattern: Broken Hill, Australia.
3.06 (100), 2.09 (70), 2.21 (60), 3.72 (40), 1.730 (40), 1.521 (40), 1.392 (40)

Chemistry:

	(1)
Sb	82.9
As	18.6
Total	101.5

(1) Broken Hill, Australia; by electron microprobe, corresponding to $Sb_{2.93}Sb_{1.07}$.

Occurrence: Replacing calcite (Broken Hill, Australia).

Association: Antimonian löllingite, stibarsen, calcite (Broken Hill, Australia).

Distribution: From the Consols mine, Broken Hill, New South Wales, Australia [TL]. At Atlin, British Columbia, Canada. In Mexico, from the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora. In the Szklary serpentinite massif, southwest Poland.

Name: From the Greek for *unexpected alloy*.

Type Material: National Museum of Natural History, Washington, D.C., USA, R419.

References: (1) Leonard, B.F., C.W. Mead, and J.J. Finney (1971) Paradocrasite, $Sb_2(Sb, As)_2$, a new mineral. Amer. Mineral., 56, 1127–1146. (2) Cureton, F. (1996) Letters. Mineral. Record, 26, 70–71.

Parafransoletite $Ca_3Be_2(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Individual crystals are spearhead-shaped, flattened on {010}, elongated along [100], showing prominent {010}, {011}, {13$\overline{1}$}, {$\overline{1}$31}, {14$\overline{4}$}, to 0.4 mm. Generally as doubly-terminated crystals, sheaf- and bow-tielike, and radial aggregates. *Twinning:* Common on {010}.

Physical Properties: *Fracture:* Even to uneven. *Tenacity:* Brittle. Hardness = ~2.5 D(meas.) = 2.54(1) D(calc.) = 2.56

Optical Properties: Transparent to translucent. *Color:* Colorless, white. *Luster:* Vitreous, silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $\theta = 85°$; $\psi = -13°$; $\phi = 98°$. $\alpha = 1.562(2)$ $\beta = 1.564(2)$ $\gamma = 1.588(2)$ 2V(meas.) = n.d. 2V(calc.) = 33°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.3275(13)$ $b = 7.6959(13)$ $c = 7.0606(13)$ $\alpha = 94.903(5)°$ $\beta = 96.820(5)°$ $\gamma = 101.865(5)°$ Z = 1

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
3.032 (100), 3.619 (80), 2.595 (60), 7.52 (50), 2.334 (40), 2.485 (25), 1.870 (25)

Chemistry:

	(1)	(2)
P_2O_5	47.9	47.93
BeO	7.7	8.45
CaO	28.2	28.41
H_2O	15.1	15.21
Total	98.9	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, H_2O by Karl Fischer titration; corresponds to $Ca_{3.02}Be_{1.85}(PO_4)_{4.05}(OH)_{2.05} \cdot 4H_2O$. (2) $Ca_3Be_2(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$.

Polymorphism & Series: Dimorphous with fransoletite.

Occurrence: A rare secondary hydrothermal mineral on fracture surfaces in beryl in a complex granite pegmatite.

Association: Beryl, mitridatite, whitlockite, hurlbutite, roscherite, montgomeryite, englishite, robertsite.

Distribution: From the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *fransoletite*.

Type Material: Natural History Museum, Los Angeles, California, 35696; National Museum of Natural History, Washington, D.C., USA, 168432.

References: (1) Kampf, A.R., P.J. Dunn, and E.E. Foord (1992) Parafransoletite, a new dimorph of fransoletite from the Tip Top Pegmatite, Custer, South Dakota. Amer. Mineral., 77, 843–847. Parageorgebokiite β-$Cu_5O_2(SeO_3)_2Cl_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As slightly flattened grains.

Physical Properties: *Cleavage*: None observed. *Fracture*: n.d. *Tenacity*: Brittle.
Hardness = 3-4 D(meas.) = n.d. D(calc.) = 4.70

Optical Properties: Transparent. *Color*: Green. *Streak*: n.d.
Luster: Strongly vitreous. *Pleochroism*: $X = Y$ = grass green; Z = yellowish green.
Optical Class: Biaxial (+). $\alpha = 2.05(1)$ $\beta = 2.05(1)$ $\gamma = 2.08(1)$ 2V(meas.) $\approx 0°$
2V(calc.) = 0(5)° *Orientation*: $X = a$.

Cell Data: *Space Group*: $P2_1/c$. $a = 5.3982(5)$ $b = 8.0543(8)$ $c = 11.128(1)$
$\beta = 99.258(2)°$ $Z = 2$

X-ray Powder Pattern: Tolbachik Eruption, Kamchatka Peninsula, Russia.
3.01 (100), 3.22 (90), 2.61 (80B), 2.270 (70), 2.117 (60), 2.58 (40), 1.953 (40)

Chemistry:

	(1)
CuO	57.98
PbO	0.66
SeO_2	33.02
Cl	11.28
$-O=Cl_2$	2.55
Total	100.39

(1) Tolbachik Eruption, Kamchatka Peninsula, Russia, average of 12 electron microprobe analyses, corresponding to $Cu_{4.91}Pb_{0.02}O_{1.86}(SeO_3)_2Cl_{2.14}$.

Polymorphism & Series: Dimorphous with georgbokiite.

Occurrence: On the walls of fumaroles, crystallized at 400 to 625°.

Association: Intergrown intimately with cotunnite, ilinskite, chloromenite, burnsite, allochalcoselite; with ralstonite, tolbachite, melanothallite, chalcocyanite, euchlorine, Fe oxides, tenorite, gold, sophiite.

Distribution: Second cinder cone, North breach, Great Fissure Tolbachik Eruption, Kamchatka Peninsula, Russia.

Name: As the dimorph of the species, *georgebokiite*, named to honor Georgiĭ Borisovich Bokiĭ, (1909–2000), a corresponding member of the Russian Academy of Sciences and a prominent Russian crystal chemist.

Type Material: n.d.

(1) Pizzo Forno, Switzerland; corresponds to $(Na_{0.79}Ca_{0.09})_{\Sigma=0.88}(Al_{1.97}Mg_{0.06})_{\Sigma=2.03}(Si_{2.97}Al_{1.03})_{\Sigma=4.00}O_{10}(OH)_2$. (2) Zermatt-Saas region, Switzerland; by electron microprobe, average of four analyses, H_2O by difference; corresponding to $(Na_{0.92}K_{0.04}Ca_{0.02})_{\Sigma=0.98}(Al_{1.99}Fe_{0.03}Mg_{0.01})_{\Sigma=2.03}(Si_{2.94}Al_{1.06})_{\Sigma=4.00}O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$, 3A polytypes.

Mineral Group: Mica group.

Occurrence: Uncommon, but may be in large amounts, in low- to medium-grade metamorphic schists and phyllites, in muscovite-biotite gneisses, quartz veins, fine-grained sediments, and glaucophane-bearing rocks.

Association: Kyanite, staurolite, muscovite, quartz, glaucophane, chlorite, garnet, tourmaline, calcite, actinolite.

Distribution: A few well-studied occurrences follow. On Pizzo Forno, Ticino, and in Val Täsch, Zermatt, Valais, Switzerland. From Prägraten, Tirol, Austria. At Ochsenkopf, Schwarzenberg, Saxony, Germany. In Italy, at Borgofrance, near Ivrea, Piedmont, and in the Pfitschtal, Trentino-Alto Adige. From Miass, Ilmen Mountains, Southern Ural Mountains, Russia. In the Ivigtut cryolite deposit, southwestern Greenland. In the USA, from Corundum Hill, Chester Co., Pennsylvania; in the Leadville district, Lake Co., Colorado.

Name: From the Greek, *paragon*, for *misleading*, as it looks like talc.

(1) Mexico; by electron microprobe, corresponds to $Bi_{1.86}(Se_{2.85}S_{0.15})_{\Sigma=3.00}$. (2) Kawazu mine, Japan; by electron microprobe, corresponds to $Bi_{1.97}(Se_{2.47}Te_{0.26}S_{0.30})_{\Sigma=3.03}$.

Polymorphism & Series: Dimorphous with guanajuatite.

Mineral Group: Tetradymite group.

Occurrence: Intergrown with guanajuatite in contact metamorphic as well as in hydrothermal veins (Santa Catarina mine, Mexico).

Association: Guanajuatite, bismuthinite, ferroselite (Santa Catarina mine, Mexico).

Distribution: From Mexico, in Guanajuato, in the Santa Catarina [TL] and Leon mines. From Falun, Kopparberg, Sweden. At the Kawazu mine, Shizuoka Prefecture, Japan.

Name: From the supposed relation to guanajuatite.

Type Material: n.d.

Total	100.2	[100.0]	100.00

(1) Kabwe, Zambia. (2) Reaphook Hill, Australia; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by difference; corresponds to $(Zn_{2.26}Mg_{0.37}Fe_{0.19})_{\Sigma=2.82}(PO_4)_{2.04} \cdot 4H_2O$. (3) $Zn_3(PO_4)_2 \cdot 4H_2O$.

Polymorphism & Series: Dimorphous with hopeite.

Occurrence: A secondary mineral in the oxidized zone of some zinc-bearing hydrothermal mineral deposits.

Association: Hemimorphite, tarbuttite, hopeite, scholzite, spencerite, pyromorphite.

Distribution: From Kabwe (Broken Hill), Zambia. In the Hudson Bay mine, Salmo, and on the Oxide claim, near Ymir, British Columbia, Canada. In England, at Roughton Gill, Caldbeck Fells, Cumbria; in the Turf Pits mine, Grassington Moor, and the Cockhill mine, Bewerley, northern Yorkshire. In Germany, from the Glücksrad mine, near Oberschulenberg, Harz Mountains; from Hagendorf, Bavaria; at Richelsdorf, Hesse. Large crystals on Reaphook Hill, near Blinman, Flinders Ranges, South Australia. From an undisclosed locality in Guangdong Province, China.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *hopeite*.

Type Material: The Natural History Museum, London, England, 1907,980.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 733–734. (2) Hill, R.J. and A.R. Total	98.2	[100.0]	100.00

(1) Tombstone, Arizona, USA; traces of quartz noted as insoluble. (2) Analysis (1) recalculated to 100.0% with theoretical H_2O as determined by crystal-structure analysis; corresponding to $Pb_{1.04}Cu_{3.00}Te_{1.06}O_6(OH)_2$. (3) $PbCu_3TeO_6(OH)_2$.

Polymorphism & Series: Dimorphous with khinite.

Occurrence: A very rare secondary mineral formed under acid oxidizing conditions from gold–telluride ores in massive vein quartz.

Association: Dugganite, xocomecatlite, bromargyrite, other tellurium oxysalts.

Distribution: From the Emerald and Empire mines, Tombstone, Cochise Co., Arizona, USA.

Name: From the Greek for *near* and its dimorphous relation to *khinite*.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,543; Harvard University, Cambridge, Massachusetts, 119094; National Museum of Natural History, Washington, D.C., USA, 164352.

(1) Laurium, Greece. (2) Tiger, Arizona, USA. (3) PbCl(OH).

Polymorphism & Series: Dimorphous with laurionite.

Occurrence: A secondary mineral formed through alteration of lead-bearing slag by sea water or in hydrothermal polymetallic mineral deposits.

Association: Laurionite, penfieldite, fiedlerite, phosgenite (Laurium, Greece); leadhillite, matlockite, cerussite, hydrocerussite, diaboleite, wherryite (Tiger, Arizona, USA).

Distribution: In slag from: Laurium, Greece. Along Baratti Beach, Tuscany, Italy. From the Meadowfoot smelter, near Wanlockhead, Dumfriesshire, Scotland. At Juliushütte, Astfeld, Harz Mountains, Germany. From the Argent Pb–Ag mine, about 100 km east of Johannesburg, Transvaal, South Africa. In mineral deposits at: Wheal Rose, near Sithney, and at Daymer Bay, Padstow, Cornwall, and at the Wesley mine, near Higher Pitts, Mendip Hills, and the Merehead quarry, near Shepton Mallet, Somerset, England. Exceptional crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA. In Chile, from the San Rafael and Santa Ana mines, near Caracoles, Sierra Gorda district, Antofagasta. Large crystals from the Touissit mine, near Oujda, and from Mibladen, Morocco.

Name: From the Greek for *near*, for the dimorphous relation to *laurionite*.

Type Material: The Natural History Museum, London, England, 84034.

Paralstonite $BaCa(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. As hexagonal pyramids bounded by $\{22\overline{4}1\}$, rarely dipyramidal, striated ‖ [0001], faces divided by slightly re-entrant, irregular sutures, to 1 mm.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–4.5
D(meas.) = 3.60(2) D(calc.) = 3.62 Fluoresces pale to bright orange under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, smoky white to pale gray; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.672(3)$ $\epsilon = 1.527(3)$

Cell Data: *Space Group:* $P321$. $a = 8.692(3)$ $c = 6.148(4)$ Z = 3

X-ray Powder Pattern: Minerva No. 1 mine, Illinois, USA; essentially identical to alstonite. 3.550 (100), 2.510 (67), 2.048 (21), 6.15 (18), 1.943 (18), 1.853 (15), 4.35 (11)

Chemistry:

	(1)	(2)	
CO_2	[30.0]	[30.1]	29.59
CaO	18.8	19.42	18.86
SrO	5.2	0.50	
BaO	45.6	51.23	51.55
Total	[99.6]	[101.25]	100.00

(1) Minerva No. 1 mine, Illinois, USA; by electron microprobe, CO_2 calculated for stoichiometry; corresponds to $Ba_{0.87}Ca_{0.98}Sr_{0.15}(CO_3)_{2.00}$. (2) Kedrovyi massif, Russia; by electron microprobe, CO_2 calculated for stoichiometry; corresponds to $Ba_{0.98}Ca_{1.01}Sr_{0.01}(CO_3)_{2.00}$. (3) $BaCa(CO_3)_2$.

Polymorphism & Series: Trimorphous with alstonite and barytocalcite; forms a series with olekminskite.

Occurrence: A rare mineral in low-temperature hydrothermal Pb–Zn deposits.

Association: Calcite, alstonite, fluorite, sphalerite (Minerva No. 1 mine, Illinois, USA); olekminskite, calcite, barite, ankerite, ancylite-(Ce), narsarsukite, sphalerite, galena (Kedrovyi massif, Russia).

Distribution: From the Minerva No. 1 and Annabel Lee mines, Cave-in-Rock, Hardin Co., Illinois, USA. At the Kedrovyi massif, five km southeast of the Murun massif, Aldan Shield, Sakha, Russia.

Name: From the Greek for *near* and its morphological and chemical relation with *alstonite*.

Type Material: Canadian Geological Survey, Ottawa, 13380; Royal Ontario Museum, Toronto, Canada; National Museum of Natural History, Washington, D.C., USA, 145915.

Paramelaconite $Cu_2^{1+}Cu_2^{2+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals, to 7.5 cm, prismatic ‖ [001], showing {010} heavily striated ‖ [001], {011}, and {001}; massive.

Physical Properties: *Fracture:* Flat conchoidal. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 6.04–6.11 D(calc.) = 5.93

Optical Properties: Opaque. *Color:* Black to purplish black, pitch-black on fractures; white with pinkish brown tint in reflected light. *Streak:* Brownish black. *Luster:* Brilliant metallic to adamantine.
Optical Class: Uniaxial. *Pleochroism:* Weak. *Anisotropism:* Strong.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I4_1/amd$. $a = 5.837$ $c = 9.932$ $Z = 4$

X-ray Powder Pattern: Bisbee, Arizona, USA.
2.490 (vs), 1.575 (s), 1.251 (s), 2.050 (m), 1.449 (m), 1.430 (m), 2.888 (w)

Chemistry:

	(1)	(2)
Cu	81.80	84.12
O		15.88
Total		100.00

(1) Bisbee, Arizona, USA; by electrolytic determination of total Cu. (2) $Cu_2^{1+}Cu_2^{2+}O_3$.

Occurrence: A very rare secondary mineral in hydrothermal copper deposits.

Association: Cuprite, tenorite, connellite, malachite, goethite (Bisbee, Arizona, USA); cuprite, tenorite, chrysocolla, malachite, plancheite, dioptase, atacamite (Algomah mine, Michigan, USA).

Distribution: From the Copper Queen mine, Bisbee, Cochise Co., Arizona, and at the Algomah mine, Ontonagon Co., Michigan, USA.

Name: From the Greek for *near* and *melaconite*, which in turn was named for *black* and *dust*, now a synonym for tenorite.

Type Material: Seaman Mineral Museum, Michigan Technical University, Houghton, Michigan, 13396; American Museum of Natural History, New York City, New York, 4630; Harvard University, Cambridge, Massachusetts, 97919; National Museum of Natural History, Washington, D.C., USA, 112878; The Natural History Museum, London, England, 1967,37.

Total	100.18	100.00

(1) Cumobabi deposit, Mexico. (2) $NaAl_4Fe_7(PO_4)_5(PMo_{12}O_{40})(OH)_{16}\cdot 56H_2O$.

Occurrence: In the oxidized zone of a molybdenum-bearing pegmatitic breccia in granodiorite.

Association: Mendozavilite, biotite, kaolinite.

Distribution: From the Cumobabi molybdenum deposit, southwest of Cumpas, Sonora, Mexico.

Name: From the Greek *para*, for *near* and its chemical relation to *mendozavilite*.

Type Material: The Natural History Museum, London, England, 1984,476.

References: (1) Williams, S. A. (1986) Mendozavilite and paramendozavilite, two new minerals from Cumobabi, Sonora. Boletín de Mineralogía, 2(1), 13–19 (in English). (2) (1988) Amer. Mineral., 73, 194 (abs. ref. 1).

Paramontroseite VO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As pseudomorphs after montroseite crystals.

Physical Properties: Hardness = Soft. D(meas.) = n.d. D(calc.) = 4.09 Rapidly transforms topotactically from montroseite in air.

Optical Properties: Opaque. *Color:* Black to grayish black. *Streak:* Black.
Luster: Submetallic.
Optical Class: Biaxial.
R_1–R_2: n.d.

Cell Data: *Space Group: Pbnm.* $a = 4.905$ $b = 9.422$ $c = 2.916$ Z = 4

X-ray Powder Pattern: Bitter Creek mine, Colorado, USA. (ICDD 25-1003).
3.39 (100), 2.645 (50), 4.35 (35), 2.213 (35), 1.426 (35), 2.479 (25), 2.179 (25)

Chemistry:

	(1)	(2)
V_2O_4	72.5	66.90
SiO_2		6.12
Al_2O_3		3.00
V_2O_3	10.5	11.10
FeO	8.8	8.26
H_2O	5.0	4.82
Total	[96.8]	100.20

(1) Bitter Creek mine, Colorado, USA; partial analysis. (2) Matchless mine, Colorado, USA.

Occurrence: In relatively unoxidized Colorado Plateau-type U–V ores in sandstones, formed by dehydrogenation of montroseite (Colorado, Utah, and Arizona, USA).

Association: Montroseite, corvusite.

Distribution: All localities for montroseite are considered for paramontroseite: in the USA, in the Uravan district, from the Bitter Creek, Jo Dandy, and other mines, Montrose Co., the West Sunday mine, Big Gypsum Valley, San Miguel Co., and the Matchless mine, Gateway district, Mesa Co., Colorado; in the Juniper mine, near Thompson, Grand Co., the Rex No. 2 mine, Temple Mountain, and Mi Vida mine, Monticello district, Emery Co., Utah. In the Martin, Mesa 4-1/2, and Cove mines, Carrizo Mountains, and the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; in the Grants district, McKinley Co., New Mexico; and in the Runge mine, Edgemont, Fall River Co., South Dakota. At Příbram, and in the Novoveska Huta deposit, Czech Republic. In the Urcal deposit, La Rioja, and in the Huemul mine, Malargüe district, Mendoza Province, Argentina. From the Mounana uranium mine, Franceville, Gabon.

Name: From the Greek for *near*, for its paramorphic relation to *montroseite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106897, 106898.

References: (1) Evans, H.T., Jr. and M.E. Mrose (1955) A crystal chemical study of montroseite and paramontroseite. Amer. Mineral., 40, 861–875. (2) Weeks, A.D., E.A. Cisney, and A.N. Sherwood (1953) Montroseite, a new vanadium oxide from the Colorado Plateaus. Amer. Mineral., 38, 1235–1241.

Paranatisite $Na_2TiO(SiO_4)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As interstitial grains, to 1 mm, and aggregates, to 5 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 5 D(meas.) = 3.12(5) D(calc.) = 3.07

Optical Properties: Transparent to translucent. *Color:* Yellow, yellow-orange, orange-brown. *Streak:* White. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* Weak; $X = Y$ = brown; Z = yellow. *Orientation:* X = b; Y = a; Z = c. *Dispersion:* $r > v$, weak. $\alpha = 1.740(2)$ $\beta = 1.741(2)$ $\gamma = 1.765(2)$ 2V(meas.) = 20(1)° 2V(calc.) = 23°

Cell Data: *Space Group: Pmma.* $a = 9.827(3)$ $b = 9.167(2)$ $c = 4.799(2)$ Z = 4

X-ray Powder Pattern: Khibiny massif, Russia.
2.748 (100), 1.443 (35), 1.475 (33), 1.720 (30), 1.680 (30), 2.257 (25), 1.660 (22)

Chemistry:

	(1)
SiO_2	29.69
TiO_2	35.70
Nb_2O_5	0.14
FeO	2.61
MnO	0.39
CaO	0.05
Na_2O	28.04
F	1.0
H_2O	1.6
$-O = F_2$	0.4
Total	98.82

(1) Khibiny massif, Russia; by electron microprobe, average of three analyses, H_2O by coulometry; corresponds to $(Na_{1.83}Mn_{0.01})_{\Sigma=1.84}(Ti_{0.90}Fe_{0.07})_{\Sigma=0.97}Si[O_{5.58}(OH)_{0.36}F_{0.11}]_{\Sigma=5.04}$.

Polymorphism & Series: Dimorphous with natisite.

Occurrence: In ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Nepheline, potassic feldspar, aegirine, aenigmatite, natisite, lamprophyllite, lorenzenite, shcherbakovite, delhayelite, villiaumite, lepidomelane.

Distribution: On Mts. Yukspor and Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: From the Greek *para*, for *near*, and its relation to *natisite*.

Type Material: Mining Institute, St. Petersburg, 2055/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 545/3.

References: (1) Khomyakov, A.P., L.I. Polezhaeva, and E.V. Sokolova (1992) Paranatisite Na_2TiSiO_5 – a new mineral. Zap. Vses. Mineral. Obshch., 121(6), 133–137 (in Russian).

Paranatrolite $Na_2Al_2Si_3O_{10}•3H_2O$

Crystal Data: Monoclinic; pseudo-orthorhombic. *Point Group: m*. As radial fibrous, sheaflike, parallel columnar crystal aggregates, to 5 mm; as epitaxial overgrowths on natrolite, or crusts on other minerals; in veinlets, massive.

Physical Properties: *Cleavage:* None. *Fracture:* Conchoidal. Hardness = 5-5.5
D(meas.) = 2.21-2.29 D(calc.) = 2.20

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous.
Optical Class: Biaxial (-). α = 1.493(2) β = 1.499(2) γ = 1.505(2) 2V(meas.) = 0°-10°

Cell Data: *Space Group: Cc*. a = 18.971(4) b = 19.204(3) c = 6.5952(12) β = 91.601(18)°
Z = 8

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
2.94 (100), 5.92 (60), 4.44 (40), 4.78 (30), 6.76 (20), 3.26 (15), 3.12 (15)

Chemistry:

	(1)
SiO_2	40.18
Al_2O_3	28.36
CaO	0.30
Na_2O	15.12
K_2O	2.50
H_2O^+	13.59
Total	100.05

(1) Khibiny massif, Russia; corresponds to $(Na_{1.99}K_{0.22}Ca_{0.02})_{\Sigma=2.23}Al_{2.27}Si_{2.73}O_{10}•3.08H_2O$.
(2) Mont Saint-Hilaire, Canada; partial analysis; composition and formula based on tetranatrolite, corresponding to $(Na_{1.75}Ca_{0.10}K_{0.09})_{\Sigma=1.94}Fe_{0.01}Al_{1.95}Si_{3.02}O_{10}•2.98H_2O$.

Mineral Group: Zeolite group.

Occurrence: In miarolitic cavities and pegmatitic dikes within nepheline syenite in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in pegmatites in nepheline syenites in differentiated alkalic massifs (Kola Peninsula, Russia). Dehydrates in air to tetranatrolite.

Association: Natrolite, tetranatrolite (Mont Saint-Hilaire, Canada).

Distribution: At Mont Saint-Hilaire and from near Saint-Amable, Québec, Canada. In the Lovozero and Khibiny (e.g. Mount Kukisvumchorr) massifs, Kola Peninsula, Russia. At the Schellkopf, near Brenk, Eifel district, Germany. From Island Magee, Co. Antrim, Ireland.

Name: From the Greek *para*, for near, and its relation to natrolite.

Type Material: Royal Ontario Museum, Toronto, M35546; Canadian Museum of Nature, Ottawa, Canada, 37132.

References: (1) Chao, G.Y. (1980) Paranatrolite, a new zeolite from Mont St-Hilaire, Québec. Can. Mineral., 18, 85-88. (2) (1981) Amer. Mineral., 66, 1276-1277 (abs. ref. 1). Total	102.03	98.6	100.00

(1) Pizzo Cervandone, Italy; by electron microprobe, corresponds to $[Ca_{1.64}(Y,RE)_{0.36}]_{\Sigma=2.00}(Y,RE)_{1.00}(As_{0.96}W_{0.04})_{\Sigma=1.00}O_4[(W_{0.89}As_{0.11})_{\Sigma=1.00}O_4]_2$. (2) Fianel mine, Switzerland; by analytical electron microscope corresponds to $Ca_{2.10}Y_{0.85}(As_{1.00}O_4)[(W_{0.74}Mo_{0.28})_{\Sigma=1.02}O_4]_2$. (3) $Ca_2Y(AsO_4)(WO_4)_2$.

Occurrence: A very rare mineral found in a fissure in gneiss in an area anomalously high in arsenic (Pizzo Cervandone, Italy); as inclusions in scheelite–powellite in quartz–dolomite veinlets in dolomite breccia lenses cutting hematite–quartz-carbonate ore (Fianel mine, Switzerland).

Association: Scheelite–powellite, beryl, roméite, betafite, fluorapatite, bergslagite, barite, manganoan dolomite, quartz (Fianel mine, Switzerland).

Distribution: On the east flank of Pizzo Cervandone, Alpe Devero, Valle d'Ossola, Piedmont, Italy. At the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: Honoring Fausto Parani, amateur mineral collector of Montecrestese, Italy, who found the mineral.

Type Material: Museo di Centro Studi "P. Ginocchi", Crodo, Italy.

Crystal Data: Monoclinic. *Point Group:* n.d. Fibrous massive, parallel to sub-parallel, may be cross-vein fibrous, to 0.5 mm.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 223(22) average (20 g load). D(meas.) = 3.30 D(calc.) = 3.52

Optical Properties: Semitransparent. *Color:* Emerald-green; green in transmitted light. *Streak:* White. *Luster:* Silky.
Optical Class: Biaxial. *Pleochroism:* Weak; bluish green ∥ length; yellowish green ⊥ length. *Orientation:* Extinction parallel; length-slow. $\alpha = 1.655$ β = n.d. $\gamma = 1.705$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 7.89(1)$ $b = 2.96(1)$ $c = 13.63(3)$ $\beta = 91.1(2)°$ Z = 6

X-ray Powder Pattern: Otway prospect, Western Australia.
6.81 (10), 5.083 (8), 2.239 (8), 3.859 (5), 2.946 (4), 1.973 (3), 7.95 (2)

Chemistry:

	(1)
NiO	66.25
MgO	0.24
H_2O	17.42
CO_2	4.67
SO_3	11.80
Total	100.38

(1) Otway prospect, Western Australia; by electron microprobe, H_2O and CO_2 by CHN analyzer, $(OH)^{1-}$ calculated for charge balance; corresponds to $(Ni_{0.99}Mg_{0.01})_{\Sigma=1.00}(OH)_{1.43}(SO_4)_{0.17}(CO_3)_{0.12} \cdot 0.37H_2O$.

Occurrence: A very rare secondary mineral in veinlets in altered ore from a hydrothermal nickel deposit in a serpentinized peridotite.

Association: Millerite, polydymite, nickeloan chrysotile, dolomite, gaspéite.

Distribution: From the Otway prospect, near Spinnaway, Nullagine district, Western Australia.

Name: From the Greek for *near*, and for its similarity to *otwayite*.

Type Material: Western Australian Museum, Perth, M.71.1991; Museum Victoria, Melbourne, Australia, M36824; National Museum of Natural History, Washington, D.C., USA, 164243.

Parapierrotite $Tl(Sb,As)_5S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As terminated crystals, to 1 cm, prismatic along [001], with prominent {100}, {110}, and {100}.

Physical Properties: Hardness = 2.5–3 VHN = n.d. D(meas.) = 5.07 D(calc.) = 5.04

Optical Properties: Opaque. *Color:* Black; white with a creamy tint in reflected light, with rare red-purple internal reflections. *Luster:* Semimetallic. *Pleochroism:* Weak in air, grayish white to brownish gray in oil. *Anisotropism:* Distinct, brownish gray to bluish gray.
R_1–R_2: (400) 33.1–35.1, (420) 33.1–34.4, (440) 33.1–33.7, (460) 32.1–33.1, (480) 31.6–32.6, (500) 31.0–32.3, (520) 30.5–31.9, (540) 30.0–31.5, (560) 29.5–31.1, (580) 28.9–30.6, (600) 28.4–30.2, (620) 28.0–29.8, (640) 27.6–29.5, (660) 27.2–29.0, (680) 26.1–28.5, (700) 26.4–28.4

Cell Data: *Space Group:* $P2_1/n$. $a = 8.098(5)$ $b = 19.415(12)$ $c = 9.059(6)$ $\beta = 91.96(8)^\circ$ $Z = 4$

X-ray Powder Pattern: Alšar, Macedonia.
3.493 (100), 2.832 (100), 4.15 (90), 3.696 (90), 2.913 (90), 2.356 (90), 3.599 (70)

Chemistry:

	(1)	(2)	(3)
Tl	19.3	19.4	20.2
Sb	50.8	51.8	50.8
As	5.3	5.0	3.7
S	24.7	25.4	24.5
Total	100.1	101.6	99.2

(1–3) Alšar, Macedonia; by electron microprobe, the average corresponding to $Tl_{1.01}(Sb_{4.36}As_{0.64})_{\Sigma=5.00}S_{8.01}$.

Polymorphism & Series: Dimorphous with pierrotite.

Occurrence: Of hydrothermal origin, in cavities in realgar (Alšar, Macedonia).

Association: Realgar (Alšar, Macedonia); avicennite (Lookout Pass, Utah, USA).

Distribution: From Alšar (Allchar), near Rošden, Macedonia [TL]. At the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France. In the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. From near Lookout Pass, Tooele Co., Utah, USA.

Name: For its relation to pierrotite.

Type Material: National School of Mines, Paris, France.

Co	0.4	1.26	
Cu		0.77	
As	68.5	71.23	71.85
S	2.6	0.02	
Total	99.6	99.07	100.00

(1) Moose Horn mine, Canada; corresponds to $(Ni_{0.96}Co_{0.01})_{\Sigma=0.97}(As_{1.84}S_{0.16})_{\Sigma=2.00}$.
(2) Černý Důl mine, Czech Republic; by electron microprobe, corresponds to $(Ni_{0.92}Co_{0.04}Cu_{0.02})_{\Sigma=0.98}As_{2.00}$. (3) $NiAs_2$.

Polymorphism & Series: Trimorphous with rammelsbergite and krutovite.

Occurrence: In hydrothermal veins bearing Ni–Co sulfide mineralization.

Association: Nickeline, skutterudite, cobaltite, löllingite, gersdorffite, rammelsbergite.

Distribution: In Canada, in Ontario, from the Moose Horn mine, Elk Lake, Gowganda [TL]; at the Hudson Bay [TL] and other mines in Cobalt; and from the Keeley mine, South Lorrain Township [TL]; at the D uranium deposit, Saskatchewan; on the Camsell River, six km south of Conjurer Bay, in the Great Bear Lake silver deposits, Northwest Territories. At Franklin, Sussex Co., New Jersey, USA. From Dobšiná (Dobschau), Slovakia. At the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic. In Germany, from Bieber, near Hanau, and in the Steinbruch quarry, Keimberg, near Wolfhagen, Hesse. At the San Juan de Plan mine, Gistain, Huesca Province, Spain. In the Shorbulaksk mercury deposit, Azerbaijan. At Bou Azzer, Morocco. In the Talmessi and Meskani mines, Anarak district, Iran.

Name: For its chemical similarity to rammelsbergite.

Type Material: Royal Ontario Museum, Toronto, Canada, M12411, M11772, M14242.

Pararealgar AsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m or $2/m$. As fine powder, rarely as granular (to < 0.02 mm) aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 1–1.5 VHN = n.d. D(meas.) = 3.52(5) D(calc.) = 3.499

Optical Properties: Translucent when coarsely granular. *Color:* Bright yellow when powdery, to yellow-orange and orange-brown when granular, with internal reflections from gold to red-orange. *Streak:* Bright yellow. *Luster:* Vitreous to resinous.
Optical Class: n.d. *Pleochroism:* High. $n = > 2.02$ *Anisotropism:* Distinct.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 9.902(2)$ $b = 9.655(1)$ $c = 8.502(1)$ $\beta = 97.29(1)^\circ$
$Z = 16$

X-ray Powder Pattern: Mount Washington, Canada.
5.14 (100), 5.56 (91), 3.75 (78), 2.795 (71), 3.025 (51), 3.299 (50), 3.105 (33)

Chemistry:

	(1)	(2)
As	69.81	70.03
S	29.97	29.97
Total	99.78	100.00

(1) Mount Washington, Canada; by electron microprobe, average of two analyses. (2) AsS.

Polymorphism & Series: Trimorphous with alacránite and realgar.

Occurrence: An alteration product of realgar in stibnite-bearing quartz veins, the alteration typically a result of exposure to light.

Association: Realgar, stibnite, tetrahedrite, arsenopyrite, duranusite, arsenic, arsenolite, sulfur, lepidocrocite, pyrite.

Distribution: In Canada, in British Columbia, from Mount Washington, Comox district, on Vancouver Island [TL]; at Siwash Creek, in the Kamloops district; and from the Gray Rock property, head of Traux Creek, in the Bridge River Area, Lillooet district; from Ontario, in the Hemlo gold deposit, Thunder Bay district. From the Golconda and Getchell mines, Humboldt Co., Nevada, USA. At the Lengenbach quarry, Binntal, Valais, Switzerland. From the Geschieber vein, Jáchymov (Joachimsthal), Czech Republic. At Wittichen, Black Forest, Germany. Probably to be found at a number of other arsenic-rich localities.

Name: In allusion to its chemical identity with realgar.

Type Material: Canadian Geological Survey, Ottawa, Canada, 61566, 61567.

References: (1) Roberts, A.C., H.G. Ansell, and M. Bonardi (1980) Pararealgar, a new polymorph of AsS, from British Columbia. Can. Mineral., 18, 525–527. (2) (1981) Amer. Pararobertsite $Ca_2Mn_3^{3+}O_2(PO_4)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Platy triangular crystals, tabular on {100}, to 0.2 mm, and in subparallel aggregates.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Brittle. Hardness = Very soft. D(meas.) = 3.22(4) D(calc.) = 3.22

Optical Properties: Transparent. *Color:* Red. *Streak:* Brownish red. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; X = yellowish brown; $Y = Z$ = reddish brown. *Orientation:* $Y = b$; $Z \wedge c = 4(2)°$. *Absorption:* $Z = Y > X$. $\alpha = 1.79(1)$ $\beta = 1.81(1)$ $\gamma = 1.83(1)$ 2V(meas.) = 84(2)° 2V(calc.) = 85°

Cell Data: *Space Group:* $P2_1/c$. $a = 8.825(3)$ $b = 13.258(4)$ $c = 11.087(3)$ $\beta = 101.19(4)°$ Z = 4

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
8.69 (100), 2.772 (70), 5.66 (60), 2.884 (60), 2.611 (60), 2.163 (60), 5.44 (50)

Chemistry:

	(1)	(2)
P_2O_5	35.2	34.57
Fe_2O_3	0.1	
Mn_2O_3	38.0	38.45
CaO	18.3	18.21
H_2O	[8.4]	8.77
Total	[100.0]	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O by difference; corresponds to $Ca_{2.01}(Mn_{2.97}Fe_{0.01})_{\Sigma=2.98}O_{1.88}(PO_4)_{3.06} \cdot 2.88H_2O$.
(2) $Ca_2Mn_3O_2(PO_4)_3 \cdot 3H_2O$.

Polymorphism & Series: Dimorphous with robertsite.

Occurrence: A rare secondary mineral in a complex zoned granite pegmatite.

Association: Whitlockite, carbonate-apatite, quartz.

Distribution: In the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: From the Greek *para*, for *near*, and its relation to *robertsite*.

Type Material: Royal Ontario Museum, Toronto, Canada, M43771; National Museum of Natural History, Washington, D.C., USA, 149606.

References: (1) Roberts, A.C., B.D. Sturman, P.J. Dunn, and W.L. Roberts (1988) Pararobertsite, $Ca_2Mn_3^{3+}(PO_4)_3O_2 \cdot 3H_2O$, a new mineral species from the Tip Top pegmatite, Custer County, South Dakota, and its relationship to robertsite. Can. Mineral., 27, 451–455.

Paraschachnerite Ag_3Hg_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As crystals, to 1 cm, but typically much smaller. *Twinning:* Always twinned in a complex fashion; twin plane {110}; trillings common.

Physical Properties: Hardness = > 3.5 VHN = 79–93, average 87 (100 g load). D(meas.) = n.d. D(calc.) = 12.98

Optical Properties: Opaque. *Color:* In polished section, creamy white. *Luster:* Metallic. *Pleochroism:* Brownish rose-white to creamy white. *Anisotropism:* Distinct.
R_1–R_2: (400) 65.9–67.0, (420) 67.9–69.0, (440) 69.8–70.9, (460) 71.5–72.6, (480) 73.3–74.4, (500) 74.9–76.2, (520) 76.5–77.8, (540) 78.1–79.3, (560) 79.5–80.7, (580) 80.6–81.8, (600) 81.5–82.8, (620) 82.3–83.5, (640) 82.9–84.0, (660) 83.6–84.6, (680) 84.0–85.1, (700) 84.6–85.5

Cell Data: *Space Group:* $Cmcm$ (probable) or $Cmc2$, $Cmc2_1$. $a = 2.961$ $b = 5.13$ $c = 4.83$ $Z = 2$

X-ray Powder Pattern: Landsberg, Germany.
2.267 (10), 2.404 (6), 1.263 (6), 1.361 (5), 1.481 (4), 0.8310 (4), 2.564 (3)

Chemistry:

	(1)	(2)
Ag	43.2	44.65
Hg	56.6	55.35
Total	100.0	100.00

(1) Landsberg, Germany; by electron microprobe. (2) Ag_3Hg_2.

Occurrence: Formed in the oxidized zone by the alteration of moschellandsbergite (Landsberg, Germany); thought to be a primary mineral (Kremikovci deposit, Bulgaria).

Association: Schachnerite, mercurian silver, acanthite, cinnabar, "limonite", ankerite (Landsberg, Germany); mercurian silver, cinnabar, many secondary copper minerals (Kremikovci deposit, Bulgaria); schachnerite, sphalerite, chalcopyrite, pyrite, pyrrhotite, gudmundite, cubanite, ilmenite, galena (Sala, Sweden).

Distribution: From the Vertraun auf Gott mercury mine, at Landsberg, near Obermoschel, Rhineland-Palatinate, Germany [TL]. In the Kremikovci deposit, Sofia district, Bulgaria. From Sala, Västmanland, Sweden.

Name: For the relation to schachnerite.

Type Material: Technical University, Berlin, Germany; National Museum of Natural History, Washington, D.C., USA, 145618, 150256.

References: (1) Seeliger, E. and A. Mücke (1972) Para-schachnerite, $Ag_{1.2}Hg_{0.8}$, und Schachnerite, $Ag_{1.1}Hg_{0.9}$, von Landsberg bei Obermoschel, Pfalz. Neues Jahrb. Paraschoepite $UO_3 \cdot 1{-}2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals short prismatic to tabular on [001], to several mm, showing large {001}, {100}, and {010}, commonly terminated by numerous {*hkl*} forms.

Physical Properties: *Cleavage:* Perfect on {001}; good on {010}. *Tenacity:* Very brittle. Hardness = 2–3 D(meas.) = n.d. D(calc.) = [4.47–4.73] Radioactive.

Optical Properties: Translucent. *Color:* Yellow with a slightly greenish hue; yellow in transmitted light, showing zonation. *Streak:* Yellow.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless to pale yellow; $Y = Z$ = yellow to golden yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.700$–1.705 $\beta = 1.750$–1.760 $\gamma = 1.770$ 2V(meas.) = 40°

Cell Data: *Space Group: Pbca.* $a = 14.12(4)$ $b = 16.83(5)$ $c = 15.22(5)$ Z = 32

X-ray Powder Pattern: Shinkolobwe, Congo; identical to metaschoepite.
5.09 (100), 3.45 (25), 3.39 (17), 2.89 (7), 2.48 (7b), 2.542 (6), 1.774 (6)

Chemistry:

	(1)
UO_3	89.26
PbO	0.00
H_2O	10.73
Total	99.99

(1) Shinkolobwe, Congo; corresponds to $UO_3 \cdot 1.9H_2O$.

Occurrence: An alteration product of schoepite from the oxidized zone of uranium-bearing mineral deposits.

Association: Schoepite, becquerelite, uraninite (Shinkolobwe, Congo); schoepite, arsenuranylite, metazeunerite, uranospinite, nováčekite (Cherkasar deposit, Uzbekistan).

Distribution: At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From the Cherkasar uranium deposit, Chatkal Mountains, Uzbekistan.

Name: From the Greek for *near*, and for its relation to *schoepite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94712.

References: (1) Schoep, A. and S. Stradiot (1947) Paraschoepite and epiianthinite, two new uranium minerals from Shinkolobwe (Belgian Congo). Amer. Mineral., 32, 344–350. (2) Schoep, A. and S. CaO	12.8	14.13
H_2O	8.8	9.08
Total	99.3	100.00

(1) Hagendorf, Germany; by electron microprobe, H_2O by the Penfield method; corresponds to $(Ca_{0.92}Mn_{0.08})_{\Sigma=1.00}(Zn_{1.98}Fe_{0.03})_{\Sigma=2.01}(PO_4)_{2.02} \cdot 1.97H_2O$. (2) $CaZn_2(PO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with scholzite.

Occurrence: A secondary mineral produced by alteration of primary phosphates in complex granite pegmatites.

Association: Scholzite, vivianite, phosphophyllite, strengite (Hagendorf, Germany).

Distribution: Large crystals from Hagendorf, Bavaria, Germany. At Kabwe (Broken Hill), Zambia. On Reaphook Hill, near Blinman, Flinders Ranges, South Australia. In the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *scholzite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, B14318, B14345.

References: (1) Sturman, B.D., R.C. Rouse, and P.J. Dunn (1981) Parascholzite, a new mineral from Hagendorf, Bavaria, and its relationship to scholzite. Amer. Mineral., 66, 843–851.

Parascorodite $Fe^{3+}AsO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $\overline{6}m2$, $6mm$, $\overline{3}\ 2/m$, or $3m$. Tabular to prismatic hexagonal crystals, to 1 μm, may be fan-shaped, in crudely hemispherical aggregates. *Twinning:* Observed.

Physical Properties: *Fracture:* Earthy to conchoidal in compact masses. Hardness = Soft. D(meas.) = 3.213(3) D(calc.) = 3.212

Optical Properties: Semitransparent. *Color:* Yellowish white, greenish gray; very pale yellow to brown in transmitted light. *Streak:* Yellowish-white.
Optical Class: Uniaxial, very low birefringence. $n = > 1.72$ ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P6_3/mcm$, $P\overline{6}c2$, $P6_3cm$, $P\overline{3}c1$, or $P3c1$. $a = 8.9327(5)$ $c = 9.9391(8)$ $Z = 6$

X-ray Powder Pattern: Kaňk, Czech Republic.
4.076 (100), 2.806 (68), 3.053 (67), 4.973 (61), 2.661 (59), 2.520 (54), 4.184 (44)

Chemistry:

	(1)	(2)
SO_3	1.53

H_2O^-	1.60	
H_2O		15.61
Total	99.95	100.00

(1) Kaňk, Czech Republic; average of two analyses, corresponding to $(Fe_{0.98}Al_{0.01})_{\Sigma=0.99}[(AsO_4)_{0.88}(SO_4)_{0.04}(PO_4)_{0.03}]_{\Sigma=0.95} \cdot 2.05H_2O$. (2) $FeAsO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with scorodite.

Occurrence: A rare secondary mineral in mine dumps, presumed to be a pre-mining weathering product of arsenopyrite (Kaňk, Czech Republic).

Association: Scorodite, pitticite, bukovskýite, kaňkite, zýkaite, gypsum, jarosite, iron hydroxides (Kaňk, Czech Republic); scorodite, kaňkite, arsenic, pyrite, proustite (Svornost mine, Czech Republic).

Distribution: From the Kuntery mine, Kaňk, Kutná Hora district, and in the Svornost mine, Jáchymov (Joachimsthal), Czech Republic.

Name: From the Greek *para*, for *near*, and the dimorphic relation to *scorodite*.

Type Material: National Museum, Prague, Czech Republic, P1p 25/98.

Parasibirskite $CaH(BO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are tabular, in subparallel aggregates, to 40 μu.

Physical Properties: *Cleavage:* Perfect on {100}. Hardness = n.d. VHN = 109–155, 121 average (25 g load). D(meas.) = 2.50(1) D(calc.) = 2.54

Optical Properties: Semitransparent. *Color:* White; colorless in thin section.
Luster: "Weak", pearly.
Optical Class: Biaxial (+). $\alpha = 1.556(2)$ $\beta = 1.593(2)$ $\gamma = 1.663(2)$ 2V(meas.) = n.d. 2V(calc.) = 74.8°

Cell Data: *Space Group:* $P2_1/m$. $a = 6.722(4)$ $b = 5.437(2)$ $c = 3.555(2)$ $\beta = 93.00(5)°$ Z = 1

X-ray Powder Pattern: Fuka, Japan.
2.237 (100), 6.73 (70), 2.975 (60), 3.354 (30), 2.855(20), 1.776 (20), 4.23 (10)

Chemistry:

Total	100.13	100.00

(1) Fuka, Japan; CaO by electron microprobe, B_2O_3 by ICP, H_2O by loss on ignition and TGA; corresponding to $Ca_{0.99}H_{1.10}B_{0.97}O_3$. (2) $CaH(BO_3)$.

Polymorphism & Series: Dimorphous with sibirskite.

Occurrence: A late-stage hydrothermal alteration of takedaite in a borate-rich vein cutting limestone and gehlenite-spurrite skarn.

Association: Takedaite, frolovite, olshanskyite, sibirskite, pentahydroborite, calcite.

Distribution: From Fuka, near Bicchu, Okayama Prefecture, Japan

Name: As a polymorph of *sibirskite*.

Type Material: National Science Museum, Tokyo, Japan.

References: (1) Kusachi, I., Y. Takechi, C. Henmi, and S. Kobayashi (1998) Parasibirskite, a new mineral from Fuka, Okayama Prefecture, Japan. Mineral. Mag., 62, 521–525. (2) (1999) Amer. Mineral., 84, 686 (abs. ref. 1).

Total	99.88	100.00

(1) Darwin, California, USA; loss on ignition by TGA, taken as CO_2. (2) $Ca_5(SiO_4)_2(CO_3)$.

Polymorphism & Series: Dimorphous with spurrite.

Occurrence: The dominant phase in a sequence of thermally metamorphosed siliceous carbonate rocks of the granulite facies.

Association: Gehlenite, vesuvianite, apatite, larnite.

Distribution: From near Darwin, Inyo Co., California, USA.

Name: From the Greek *para*, for *near*, and its relation to *spurrite*.

Type Material: n.d.

References: (1) Colville, A.A. and P.A. Colville (1977) Paraspurrite, a new polymorph of spurrite from Inyo County, California. Amer. Mineral., 62, 1003–1005.

Parasterryite $Ag_4Pb_{20}(Sb_{14.5}As_{9.5})_{\Sigma=24}S_{58}$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As striated [100] acicular crystals to 4 mm. *Twinning*: Polysynthetic twins parallel elongation.

Physical Properties: *Cleavage*: Poor perpendicular to elongation. *Fracture*: Conchoidal. *Tenacity*: Brittle.
Hardness = 3-4 VHN = 196 (25 g load). D(meas.) = n.d. D(calc.) = 5.747

Optical Properties: Opaque. *Color*: Black, white in reflected light. *Streak*: Black. *Luster*: Metallic. *Pleochroism*: Weak, grayish white to white. *Anisotropism*: Distinct, gray to dark gray (with brownish and greenish tint).
Optical Class: n.d.
R_1-R_2: (470) 35.1-40.8 $(19.4\text{-}22.2)_{oil}$, (586) 33.5-39.3 $(19.3\text{-}21.7)_{oil}$, (586) 32.7-38.2 $(18.7\text{-}21.1)_{oil}$, (650) 31.4-36.5 $(17.3\text{-}19.5)_{oil}$

Cell Data: *Space Group: P*$2_1/c$. (pseudo-orthrombic) a = 8.3965(5) b = 27.9540(4) c = 43.8840(13) β = 90.061(12)° Z = 4

X-ray Powder Pattern: Pollone deposit, near Pietrasanta, Apuan Alps, Tuscany, Italy.
3.62 (100), 3.35 (95), 2.945 (85), 2.885 (80), 3.23 (65), 3.42 (45), 3.01 (45)

Chemistry:

	(1)
Cu	0.09
Ag	4.36
Hg	0.15
Pb	47.00
Sb	19.57
As	7.73
S	20.56
Total	99.46

(1) Pollone deposit, near Pietrasanta, Apuan Alps, Tuscany, Italy; average of 32 electron microprobe analyses, corresponding to $Cu_{0.13}Ag_{3.65}Hg_{0.07}Pb_{20.41}(S_{b14.49}As_{9.25})_{\Sigma=23.74}S_{57.72}$.

Occurrence: In vugs within hydrothermal barite–quartz veins embedded in barite-pyrite lenses in complexly sheared and metamorphosed sedimentary rocks.

Association: Acanthite, famatinite, geocronite-jordanite, pyrargyrite-prustite, Sb-rich rathite, sphalerite (overgrowth on sterryite), tetrahedrite, xanthoconite.

Distribution: Pollone deposit,Valdicastello Carducci, near Pietrasanta, Apuan Alps, Tuscany, Italy.

Name: For the similarity to *sterryite* with the Greek prefix *para* meaning "near".

Type Material: Natural History Museum, University of Pisa, Italy (19347), and at the Mineralogy Museum, School of Mines, Paris, France (82522).

Parasymplesite $Fe_3^{2+}(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic crystals are elongated along [001], flattened on {010}, with prominent {010}, {100}, {$\bar{2}$01}, {110}, {221}, {$\bar{5}$02}, {$\bar{4}$01}, many others, to 5 mm; usually in radiating sprays.

Physical Properties: *Cleavage:* On {010}, perfect. *Tenacity:* Flexible. Hardness = 2–3 D(meas.) = 3.07–3.12 D(calc.) = 3.10–3.13

Optical Properties: Semitransparent. *Color:* Pale blue to greenish blue, green to leek-green; in transmitted light, pale blue to colorless. *Streak:* Very pale blue or green. *Luster:* Vitreous to waxy.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = bluish green to pale blue; Y = yellowish to colorless; Z = brownish yellow to colorless. *Orientation:* $X = b$; $Z \wedge c = 29°$–$31°$. *Dispersion:* $r < v$. *Absorption:* $X > Y = Z$. $\alpha = 1.620$–1.628 $\beta = 1.648$–1.660 $\gamma = 1.685$–1.705 2V(meas.) = 86° 2V(calc.) = 85°

Cell Data: *Space Group:* $C2/m$. $a = 10.335(4)$ $b = 13.491(8)$ $c = 4.777(2)$ $\beta = 105.04(4)°$ Z = 2

(1) Kiura mine, Japan. (2) Ojuela mine, Mapimí, Mexico; by electron microprobe, partial analysis; corresponds to $(Fe_{1.68}Zn_{1.33})_{\Sigma=3.00}(AsO_4)_2 \cdot 8H_2O$. (3) $Fe_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Dimorphous with symplesite; forms a series with köttigite.

Mineral Group: Vivianite group.

Occurrence: A rare secondary mineral in the oxide zone of some arsenic-rich hydrothermal base-metal mineral deposits.

Association: Symplesite, köttigite, pharmacosiderite, scorodite, arsenopyrite, löllingite.

Distribution: From the Kiura mine, Oita Prefecture, Japan. At the Kaatiala pegmatite, Kuortane, Finland. In the Glück Auf mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. In Germany, in the Richelsdorf Mountains, Hesse; from St. Andreasberg, Harz Mountains; at the Clara mine, near Oberwolfach, and from Weiler, near Lahr, Black Forest; at Ramsbeck, North Rhein-Westphalia. From Mitterberg, Salzburg, Austria. At Laurium, Greece, in slag. From Bou Azzer, Morocco. Large crystals from the Ojuela mine, Mapimí, Durango, Mexico. At the White Elephant mine, near Pringle, Pennington Co., South Dakota, USA. In the Puttapa zinc mine, near Beltana, South Australia.

Name: From the Greek *para*, for *near*, and its dimorphous relation to *symplesite*.

Type Material: National Science Museum, Tokyo, Japan, M24052.

References: (1) Ito, T., H. Minato, and K. Sakurai (1954) Parasymplesite, a new mineral polymorphous with symplesite. Proc. Japan Acad., 30, 318–324. (2) (1955) Amer. Mineral., 40, 368 (abs. ref. 1). Paratacamite $Cu_2Cl(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. As rhombohedral crystals, with prominent $\{10\bar{1}1\}$, $\{02\bar{2}1\}$, $\{01\bar{1}2\}$, $\{0001\}$, a number of other forms; twins elongated along $[10\bar{1}1]$, to 1.5 cm; granular massive, powdery as incrustations. *Twinning:* Common on $\{10\bar{1}1\}$, may be polysynthetic.

Physical Properties: *Cleavage:* $\{10\bar{1}1\}$, good. *Fracture:* Conchoidal to uneven. Hardness = 3 D(meas.) = 3.72–3.74 D(calc.) = 3.75

Optical Properties: Translucent to nearly opaque. *Color:* Green to dark green, greenish black; in transmitted light, green. *Streak:* Green. *Luster:* Vitreous.
Optical Class: Uniaxial (+); commonly anomalously biaxial. *Dispersion:* $r > v$.
ω = 1.843–1.844 ϵ = 1.848–1.849 2V(meas.) = $\leq 50°$

Cell Data: *Space Group:* $R\bar{3}$. $a = 13.654(5)$ $c = 14.041(6)$ Z = 24

X-ray Powder Pattern: Sierra Gorda [district], Chile; almost identical to clinoatacamite. (ICDD 19-389).
5.46 (100), 2.750 (80), 2.258 (60), 1.704 (45), 1.813 (35), 2.888 (30), 4.67 (25)

Chemistry:

Cu	14.27	14.60	14.88
CuO	56.10	55.98	55.87
Cl	15.97	16.29	16.60

	(1)	(2)	(3)
H_2O^+		13.10	
H_2O^-		0.03	
H_2O	14.10		12.65
Total	100.44	[100.00]	100.00

(1) Generosa mine, Chile; same material later shown by electron microprobe to also contain Zn 2.45%. (2) Remolinos, Chile; recalculated to 100% after deduction of insoluble 0.97%. (3) $Cu_2Cl(OH)_3$.

Polymorphism & Series: Polymorphous with atacamite, botallackite, and clinoatacamite.

Occurrence: An oxidation product of other copper minerals, especially under arid, saline conditions; in fumarolic deposits; a weathering product of sulfides in subsea black smoker deposits.

Association: Clinoatacamite, caracolite, schwartzembergite, osarizawaite-beaverite, boleite (Sierra Gorda district, Chile).

Distribution: In Chile, from the Generosa and Herminia mines, Sierra Gorda district, the Queténa mine, west of Calama, and at Chuquicamata, Antofagasta; from Nantoko, Copiapó district, and Remolinos, Atacama. At the Cerro Negro volcano, Nicaragua. In the USA, at the Lost Soldier mine, Weeks, Churchill district, and at the Douglas Hill mine and Mason Pass, Yerington district, Lyon Co., Nevada; large crystals from Bisbee, Cochise Co., and in the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona. From the Botallack and other mines, St. Just, and several other places in Cornwall, England. On Vesuvius, Campania, Italy. At Laurium, Greece, in slag. In the Tchah Khuni and Kali Kafi mines, near Anarak, Iran. In Australia, from Moonta-Wallaroo, and at the Dome Rock mine, north of Mingary, South Australia; in the Nangaroo mine, Murrin-Murrin, and the Carr Boyd Rocks mine, Western Australia; and at Broken Hill, New South Wales. Along the Mid-Atlantic Ridge, in the TAG hydrothermal field. A few other localities have been confirmed.

Name: From the Greek for *near*, and for its relation to *atacamite*.

Type Material: The Natural History Museum, London, England, 86958; National Museum of Natural History, Washington, D.C., USA, 95146.

Total			100.00

(1–2) Moctezuma mine, Mexico. (3) TeO_2.

Polymorphism & Series: Dimorphous with tellurite.

Mineral Group: Rutile group.

Occurrence: As thin seams in tellurium from a hydrothermal Au–Te deposit (Moctezuma mine, Mexico).

Association: Tellurite, tellurium (Moctezuma mine, Mexico); krennerite, tellurium, rodalquilarite, emmonsite, anglesite (Tombstone, Arizona, USA).

Distribution: Type material was stated to be from Cananea, but undoubtedly originated from the nearby Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, from the Joe Shaft, Tombstone, and in the Campbell mine, Bisbee, Cochise Co., Arizona; at the Klondyke mine, Saguache Co., and the Last Chance mine, Boulder Co., Colorado; in the Silver King mine, Ward district, White Pine Co., Nevada. From the Kawazu mine, three km north of Shimoda, Shizuoka Prefecture, Japan. At Salmchâteau, near Ottré, Belgium.

Name: From the Greek for *near*, and for its relation to *tellurite*.

Type Material: Royal Ontario Museum, Toronto, Canada, M25007; National Museum of Natural History, Washington, D.C., USA, C5995, R8861.

Paraumbite $K_3Zr_2HSi_6O_{18}\cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Equant crystals, to 1 mm; massive.

Physical Properties: *Cleavage:* {010}, perfect micaceous; {100} and {110}, less perfect. *Fracture:* Uneven. Hardness = ~4.5 VHN = 280–504, 384 average. D(meas.) = 2.59 D(calc.) = 2.92

Optical Properties: Translucent to transparent. *Color:* Colorless to white, gray, pale green. *Streak:* White. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.588(2)$ $\beta = 1.601(2)$ $\gamma = 1.610(2)$ 2V(meas.) = 82°

Cell Data: *Space Group:* $P2cm$. a = 10.34–10.39 b = 13.25–13.29 c = 14.55–14.57 Z = 4

X-ray Powder Pattern: Khibiny massif, Russia.
5.95 (10b), 3.01 (9b), 6.46 (8), 3.47 (7), 2.90 (7), 2.56 (6), 4.06 (6b)

Chemistry:

	(1)
SiO_2	39.58
TiO_2	0.89
ZrO_2	27.87
HfO_2	0.32
Fe_2O_3	0.10
CaO	0.00
Na_2O	0.12
K_2O	15.39
H_2O	[15.73]
Total	[100.00]

(1) Khibiny massif, Russia; by electron microprobe, H_2O by difference; corresponds to $(K_{2.92}Na_{0.03})_{\Sigma=2.95}(Zr_{2.02}Ti_{0.10}Hf_{0.01}Fe_{0.01})_{\Sigma=2.14}Si_{5.89}O_{18}H_{0.94}\cdot 7.34H_2O$.

Occurrence: Replacing wadeite in a pegmatite in a differentiated alkalic massif (Khibiny massif, Russia); in altered pegmatite and sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Eudialyte, wadeite, gaidonnayite, natrolite, pectolite, potassic feldspar (Khibiny massif, Russia); gaidonnayite (Mont Saint-Hilaire, Canada).

Distribution: On Mt. Eveslogchorr, Khibiny massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: From the Greek *para*, for *near*, and its relation to *umbite*.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5842, 5843; Mineralogical Museum, St. Petersburg University, St. Petersburg, 17065; Mining Institute, St. Petersburg, 1630/1; Il'menskii Preserve Museum, Miass, 13095vr; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82760, vis3464, vis4544, vis4545, vis5045.

Paravauxite $Fe^{2+}Al_2(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Short prismatic [001] crystals, may be thick tabular {010}, to 3 cm; forms include {010}, {110}, {100}, {$\overline{1}$10}, {1$\overline{2}$0}, {011}, {001}, {0$\overline{1}$1}, many others. As subparallel to radial aggregates.

Physical Properties: *Cleavage:* {010}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.36 D(calc.) = [2.37]

Optical Properties: Transparent to translucent. *Color:* Pale greenish white to colorless; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (+). *Orientation:* *X* (61°,56°); *Y* (180°,55°); *Z* (-61°,54°) [using (ϕ,ρ)]. α = 1.552–1.554 β = 1.558–1.559 γ = 1.572–1.573 2V(meas.) = 72°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.233$ $b = 10.541$ $c = 6.962$ $\alpha = 106.9°$ $\beta = 110.8°$ $\gamma = 72.1°$ Z = 1

X-ray Powder Pattern: Llallagua, Bolivia.
9.82 (10), 6.38 (9), 4.20 (9), 3.18 (8), 2.85 (6), 2.58 (5), 4.91 (4)

Chemistry:

	(1)	(2)
P_2O_5	29.58	29.70
SiO_2	0.02

H_2O		33.93
Total	99.42	100.00

(1) Llallagua, Bolivia. (2) $FeAl_2(PO_4)_2(OH)_2 \cdot 8H_2O$.

Polymorphism & Series: Dimorphous with metavauxite.

Mineral Group: Paravauxite group.

Occurrence: A rare mineral in hydrothermal tin veins (Llallagua, Bolivia); in complex granite pegmatites.

Association: Vauxite, metavauxite, wavellite, sigloite, crandallite, childrenite, quartz (Llallagua, Bolivia).

Distribution: From Llallagua, Potosí, Bolivia. At the Foote mine, Kings Mountain, Cleveland Co., North Carolina; from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA. At Santa Eulalia, Chihuahua, Mexico. From Hagendorf, and in the Silbergrube quarry, near Waidhaus, Bavaria, Germany. In the Bendada pegmatite, near Guarda, Portugal. From the Leveäniemi mine, Svappavaara, near Kiruna, Sweden.

Name: From the Greek *para*, for *near*, and its chemical relation to *vauxite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112735, 136012, R5467.

Pargasite $NaCa_2[(Mg,Fe^{2+})_4Al](Si_6Al_2)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As stout prismatic crystals, to 3 cm; granular. *Twinning:* Simple or multiple twinning ∥ {100}, common.

Physical Properties: *Cleavage:* Perfect on {110}, intersecting at 56° and 124°; partings on {100}, {001}. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.04–3.17 D(calc.) = 3.209

Optical Properties: Transparent to translucent. *Color:* Bluish green, grayish black, light brown, bright green (chromian); in thin section, very light brown, bluish green. *Luster:* [Vitreous.]
Optical Class: Biaxial (+). *Pleochroism:* X = colorless, greenish yellow; Y = light brown, bluish green, green; Z = light brown, bluish green. *Orientation:* $Y = b$; $Z \wedge c \simeq 26°$. *Dispersion:* $r > v$, weak. α = 1.613–1.65 β = 1.618–1.66 γ = 1.635–1.67 2V(meas.) = 90°–120°

Cell Data: *Space Group:* $C2/m$. a = 9.910(1) b = 18.022(1) c = 5.312(1) β = 105.78(1)° Z = 2

X-ray Powder Pattern: Pargas, Finland. (ICDD 23-1406).

(1) Pargas, Finland; corresponds to $(Na_{0.69}K_{0.22})_{\Sigma=0.91}Ca_{1.88}(Mg_{4.32}Al_{0.59}Fe^{2+}_{0.19}Fe^{3+}_{0.07}Ti_{0.01})_{\Sigma=5.18}(Si_{6.76}Al_{1.24})_{\Sigma=8.00}O_{22}[F_{0.84}(OH)_{0.67}]_{\Sigma=1.51}$. (2) Sanbagawa schists, Ehime Prefecture, Japan; by electron microprobe, corresponds to $(Na_{0.93}K_{0.06})_{\Sigma=0.99}Ca_{1.70}(Mg_{2.64}Fe^{2+}_{1.52}Al_{0.72}Ti_{0.19}Fe^{3+}_{0.05}Mn_{0.02})_{\Sigma=5.14}(Si_{6.19}Al_{1.81})_{\Sigma=8.00}O_{22}(OH)_2$. (3) Merkerstein, Tanzania; original total given as 100.19%, corresponds to $(Na_{0.66}K_{0.13})_{\Sigma=0.79}Ca_{1.81}(Mg_{3.46}Al_{1.04}Fe^{2+}_{0.53}Fe^{3+}_{0.10}Cr_{0.10}Ti_{0.03}Mn_{0.02})_{\Sigma=5.28}(Si_{6.05}Al_{1.95})_{\Sigma=8.00}O_{22}(OH)_{1.69}$.

Polymorphism & Series: Forms a series with ferropargasite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.7$; Fe^{3+} Al^{vi}; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: A common component of "hornblendes" in skarns metamorphosed from siliceous limestones; schists and amphibolites; also from andesitic volcanic and altered ultramafic rocks.

Association: Diopside, phlogopite, corundum, spinel, calcite (skarn); "hypersthene," augite, plagioclase (metabasalts and andesitic volcanics).

Distribution: Many localities, but rarely in good crystals. At Parainen (Pargas), Finland. From Långban, Värmland, Sweden. On the Saualpe, Carinthia, Austria. At Vesuvius, Campania, Italy. From Franklin, Sussex Co., New Jersey, USA. At Wolfe Lake, Ontario, Canada. In Pakistan, from Aliabad, Hunza Valley.

Parisite-(Ce) **$Ca(Ce,La)_2(CO_3)_3F_2$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group: m.* Steep doubly-terminated pyramidal crystals, many forms, but oscillatory and sceptered due to intergrowths ‖ pseudo-{0001} with bastnäsite-(Ce), synchysite-(Ce), röntgenite-(Ce), cordylite, to 24 cm.

Physical Properties: *Cleavage:* On pseudo-{0001}, probably a parting. *Fracture:* Subconchoidal to splintery. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 4.33 D(calc.) = [4.38] May exhibit dark red cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Brownish yellow, orange, orange-brown, brown, wax-yellow, grayish yellow, lilac; colorless to yellow in transmitted light. *Streak:* Pale yellow. *Luster:* Vitreous to resinous, pearly on {0001} parting. *Optical Class:* Uniaxial (+). *Pleochroism:* Weak; O = pale yellow; E = golden yellow. *Absorption:* $O < E$. $\omega = 1.671$–1.676 $\epsilon = 1.771$–1.757

Cell Data: *Space Group: Cc.* $a = 12.3049$ $b = 7.1056$ $c = 28.2478$ $\beta = 98.2416°$ Z = 12

X-ray Powder Pattern: Mont Saint-Hilaire, Canada; identical with parisite-(Nd). 3.565 (100), 2.838 (100), 2.060 (80), 1.938 (60), 1.882 (50), 1.658 (50), 14.03 (40)

(1) Muzo, Colombia. (2) Do.; by electron microprobe, average of four analyses, CO_2 from ideal formula; corresponds to $Ca_{1.02}(Ce_{0.94}La_{0.50}Nd_{0.37}Pr_{0.10}Sm_{0.05})_{\Sigma=1.96}(CO_3)_3F_{1.51}$. (3) $Ca(Ce,La)_2(CO_3)_3F_2$ with Ce:La = 1:1.

Polymorphism & Series: 2M, pseudo-(3R, 4H, 6R, 8H, 10H, 14H, 16H, 18R, 25R, 30R, 36R, 42R, 48R) polytypes are known.

Occurrence: An accessory mineral in differentiated alkalic massifs, granite pegmatites, and RE-rich carbonatites.

Association: Bastnäsite, synchysite, cordylite, ancylite, calcite, fluorite, quartz.

Distribution: Many localities, most minor. Fine crystals from the Muzo district, Boyacá Province, Colombia. In the USA, in Montana, very large crystals at the Snowbird deposit and the nearby Cedar Log prospect, Mineral Co., and from Pyrites, 13 km east of Florence, Ravalli Co.; at Quincy, Norfolk Co., Massachusetts. From Mont Saint-Hilaire, Quebec, Canada. At Holmestrand, Vestfold, Norway. In the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. From Monterfano, Lombardy, Italy. Around Gallt y Wenallt, Gwynedd, Wales. In the Khibiny massif, Kola Peninsula, Russia. On Mt. Malosa, Zomba district, Malawi. At Ifasina, Torendrika, Madagascar. In the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire). At the Shirashi pegmatite, Kobe, Kyoto Prefecture, Japan. In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. At Nam Nam Xe, Vietnam.

Name: Honors J.J. Paris, Manager of the emerald mine at Muzo, Colombia.

Parisite-(Nd) $Ca(Nd,Ce)_2(CO_3)_3F_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Monoclinic.] [by analogy to parisite-Ce)]. *Point Group:* n.d. Large grains.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4–5 D(meas.) = 4.20–4.50 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Yellowish brown; pale yellowish brown in thin section. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (+). $\omega = 1.679$ $\epsilon = 1.754$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Stated to be identical to parisite-(Ce).

Chemistry: (1) Bayan Obo, China; average of two analyses, RE = Y 0.2%, La 9.6%, Ce 35.9%, Pr 7.7%, Nd 40.6%, Sm 4.5%, Eu 0.4%, Gd 1.0%, Dy 0.2%, Yb 0.1%.

Occurrence: In carbonatite-derived dolomitic marble.

Association: Calcite, aegirine, sodic amphibole, quartz.

Distribution: In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China.

Name: For its relation to *parisite*, with *neodymium* as its dominant rare-earth element.

Type Material: n.d.

Parkinsonite $(Pb, Mo)_4O_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$, $\bar{4}2m$, $4mm$, or 422. As bladed crystals, to 0.3 mm, and crystalline aggregates, embedded in other lead minerals.

Physical Properties: *Cleavage:* {001}, perfect; {100}, possible, fair. *Tenacity:* Sectile. Hardness = 2–2.5 VHN = 113–133, 122 average (50 g load). D(meas.) = 7.32 (synthetic). D(calc.) = 7.39

Optical Properties: Translucent. *Color:* Bright red, purplish red, brownish red; brownish red in transmitted light; in reflected light, gray with deep red to red-orange internal reflections. *Streak:* Scarlet to grenadine-red. *Luster:* Adamantine, pearly to resinous.
Optical Class: Uniaxial (–); anomalously biaxial. *Pleochroism:* Strong; O = brownish red; E = greenish yellow. ω = [2.58] ϵ = [2.42] 2V(meas.) = Small. *Anisotropism:* Weak to moderate. *Bireflectance:* Moderate.
R_1–R_2: (400) 22.6–21.8, (420) 22.4–21.2, (440) 22.3–20.5, (460) 22.2–19.9, (480) 21.9–19.4, (500) 21.6–18.9, (520) 21.2–18.5, (540) 20.6–18.1, (560) 20.2–17.8, (580) 19.8–17.5, (600) 19.4–17.2, (620) 19.1–17.1, (640) 18.9–17.0, (660) 18.7–16.9, (680) 18.6–16.7, (700) 18.5–16.7

Cell Data: *Space Group:* $I4/mmm$, $I\bar{4}2m$, $I\bar{4}m2$, $I4mm$, or $I422$. a = 3.9922(3) c = 22.514(3) Z = 2

X-ray Powder Pattern: Merehead quarry, England.
2.983 (100), 2.816 (78), 1.989 (75), 1.658 (51), 1.586 (33), 3.507 (32), 1.263 (24)

Chemistry:

	(1)
MoO_3	8.0
PbO	88.4
Cl	4.4
$-O = Cl_2$	1.0
Total	[99.8]

(1) Merehead quarry, England; by electron microprobe, average of six analyses, original total given as 100.8%; corresponds to $(Pb_{3.17}Mo_{0.44})_{\Sigma=3.61}O_{4.01}Cl_{0.99}$.

Occurrence: A very rare mineral in nodules in manganese oxide ores in veins, fissures, and pockets in limestone.

Association: Mendipite, chloroxiphite, diaboleite, cerussite, paralaurionite, wulfenite, calcite, manganese oxides (Merehead quarry, England).

Distribution: In the Merehead quarry, Cranmore, and from the Wesley mine, Didsbury, near Bristol, Somerset, England.

Name: For Reginald F.D. Parkinson (1928–), British mineral collector and dealer, Shepton Mallet, Somerset, England, who first found the mineral.

Type Material: The Natural History Museum, London, England, 1987,478–479.

Parnauite $Cu_9(AsO_4)_2(SO_4)(OH)_{10}\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals lathlike, elongated ‖ [001], flattened ‖ [010], to 4 mm, forming "bowties", rosettes, and fans; as scales and compact crusts.

Physical Properties: Hardness = ∼2 D(meas.) = 3.09(4) D(calc.) = [3.09]

Optical Properties: Semitransparent. *Color:* Pale blue, green, dark green, blue-green, less commonly yellow-green.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = pale green; Y = yellow-green; Z = blue-green. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Absorption:* $Z > Y > X$. $\alpha = 1.680(3)$ $\beta = 1.704(3)$ $\gamma = 1.712(3)$ $2V(meas.) = 60(5)°$

Cell Data: *Space Group:* $P2_122$ (possible). $a = 14.98(1)$ $b = 14.223(8)$ $c = 6.018(8)$ Z = [2]

X-ray Powder Pattern: Majuba Hill, Nevada, USA.
14.3 (100), 4.52 (60), 10.38 (24), 4.00 (21), 2.849 (19), 7.14 (10), 6.42 (8)

Chemistry:

	(1)	(2)
SO_3	6.33	6.45
P_2O_5	2.56	
As_2O_5	13.69	18.50
CO_2	0.7	
Al_2O_3	0.42	
CuO	58.10	57.64
H_2O	17.7	17.41
Total	99.50	100.00

(1) Majuba Hill, Nevada, USA; by electron microprobe, average of ten spots, H_2O and CO_2 by CHN analyzer; corresponds to $Cu_{8.76}Al_{0.10}[(AsO_4)_{1.43}(PO_4)_{0.43}]_{\Sigma=1.86}(SO_4)_{0.94}(CO_3)_{0.19}(OH)_{9.98}\cdot 6.81H_2O$. (2) $Cu_9(AsO_4)_2(SO_4)(OH)_{10}\cdot 7H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal Cu–Sn orebody in rhyolite porphyries and breccias (Majuba Hill, Nevada, USA).

Association: Spangolite, chalcophyllite, chenevixite, goudeyite, malachite, azurite, brochantite, chrysocolla (Majuba Hill, Nevada, USA); cyanotrichite, brochantite, lavendulan, mansfieldite–scorodite, chalcopyrite, cornubite (Cap Garonne mine, France); chrysocolla, brochantite, malachite, tyrolite, connellite (Gwaithyrafon mine, Wales).

Distribution: In the USA, fine examples from the Majuba Hill mine, Antelope district, Pershing Co., and the Burrus mine, Pyramid district, Washoe Co., Nevada; the Grandview Mine, Grand Canyon, Coconino Co., and the Harquehala mine, Yuma Co., Arizona; the Tucker's tunnel uranium deposit, near Durango, Hinsdale Co., Colorado; and at Gold Hill, Tooele Co., Utah. At the Cap Garonne mine, near le Pradet, Var, France. From Neubulach, Wittichen, and in the Clara mine, near Oberwolfach, Black Forest, Germany. At L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. In England, from Cornwall, at Wheals Gorland and Unity, Gwennap; in the Penberthy Croft mine, St. Hilary; from the South Tolcarne mine, Camborne; at the Mulberry Stockworks, Lanivet; in the Marke Valley mine, Linkinhorne. From the Gwaithyrafon mine, Cwmsymlog, Wales. At Tsumeb, Namibia.

Name: To honor John L. Parnau (1906–1990), American mineral collector of Campbell, California, USA, who contributed to knowledge of the type locality at Majuba Hill, Nevada, USA.

Type Material: University of California, Santa Barbara, California, 8090; National Museum of Natural History, Washington, D.C., USA, 144004.

(1) Parsettens Alpe, Switzerland. (2) Val Graveglia, Italy; corresponds to $(Ca_{1.17}Na_{0.25}K_{0.19})_{\Sigma=1.61}(Mn_{5.38}Al_{1.04}Mg_{0.73})_{\Sigma=7.15}Si_{8.04}O_{20}(OH)_8 \cdot 3.65H_2O$.

Occurrence: In and peripheral to manganese deposits.

Association: Tinzenite, sursassite, piemontite, rhodonite, manganoan calcite, rhodochrosite, quartz, albite, barite (Parsettens Alpe, Italy); quartz, caryopilite, ganophyllite (Val Graveglia, Italy).

Distribution: From the Parsettens Alpe, in Val d'Err, Tinzen, and at the Fianel mine, Val Ferrera, Graubünden, Switzerland. In the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy. At Watson's Beach, southeastern Otago, New Zealand. In the Kumahata mine, Shiga Prefecture, and the Noda-Tamagawa mine, Iwate Prefecture, Japan. At the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA. In the N'Chwaning mine, near Kuruman, Cape Province, South Africa.

Name: For the original locality, Parsettens Alpe, Switzerland.

Type Material: Federal Institute of Technology, Zurich, Switzerland, 194806; The Natural History Museum, London, England; Harvard University, Cambridge, Massachusetts, USA, 90497.

Parsonite $Pb_2(UO_2)(PO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals are lathlike, elongated along [001] and flattened on {010}, showing {001}, {101}, {100}. As radial-fibrous spherulites, to 3 mm; commonly as crusts and powdery aggregates.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2.5–3 D(meas.) = 5.72–5.75 D(calc.) = 6.21–6.47 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale citron-yellow, yellow, honey-brown, greenish brown, rarely pale rose; pale yellow in transmitted light. *Luster:* Subadamantine to slightly greasy.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 6°$–$36°$ or $X \wedge c = 6°$–$23°$.
Dispersion: Strong. $\alpha = 1.795$–1.875 $\beta =$ n.d. $\gamma = 1.815$–1.890 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.862$ $b = 10.425$ $c = 6.684$ $\alpha = 101°26'$ $\beta = 98°15'$ $\gamma = 86°17'$ Z = 2

X-ray Powder Pattern: Ruggles mine, New Hampshire, USA.
4.25 (10), 3.28 (8), 2.13 (6), 1.661 (6), 1.852 (5), 3.97 (4), 3.44(4)

Chemistry:

	(1)	(2)
UO_3	34.68	31.42
P_2O_5	14.46	15.59
PbO	47.43	49.03
H_2O	3.43	3.96
Total	100.00	100.00

(1) Ruggles mine, New Hampshire, USA. (2) $Pb_2(UO_2)(PO_4)_2 \cdot 2H_2O$.

Occurrence: A secondary mineral in the oxidized zone of some hydrothermal uranium deposits.

Association: Torbernite, kasolite, dewindtite (Kasolo, Congo); autunite, phosphuranylite (Ruggles mine, New Hampshire, USA); pyromorphite, torbernite, autunite (Lachaux, France).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Wölsendorf, Bavaria, Gemany. In France, at Gourniaud, Reliez, Rophin, and elsewhere around Lachaux, Puy-de-Dôme, the principal ore of uranium; at La Faye, near Grury, Saône-et-Loire. From Tragos, east of Mangualde, Portugal. At Arcu su Linnarbu, near Capoterra, Sardinia, Italy. In the Ranger mine, Jabiru, Northern Territory, Australia. In the USA, in the Ruggles mine, near Grafton, Grafton Co., New Hampshire; from the Eight Mile Park pegmatite district, Fremont Co., and on the Big Red No. 39 and 22 claims, Tomichi-Whitepine district, Gunnison Co., Colorado. A few additional localities are known.

Name: Honoring Arthur Leonard Parsons (1873–1957), Professor of Mineralogy, University of Toronto, Toronto, Canada.

Type Material: National School of Mines, Paris, France, 123.89.

MgO		0.25	CO_2		< 0.05
			Total	[99.99]	[100.08]

(1) Doğanbaba, Turkey; by electron microprobe, H_2O by difference; corresponds to $(Ca_{1.0}Na_{0.03}K_{0.01})_{\Sigma=1.04}Al_{2.1}Si_{2.2}O_8 \cdot 2.06H_2O$. (2) Denezhkin Kamen complex, Russia; original total given as 99.76%; corresponds to $(Ca_{0.96}Mg_{0.02}Na_{0.01})_{\Sigma=0.99}Al_{2.02}Si_{1.98}O_8 \cdot 2.54H_2O$.

Polymorphism & Series: Dimorphous with lawsonite.

Occurrence: In rodingite dikes within an ophiolite (Doğanbaba, Turkey); in veins cutting a gabbroic intrusive complex (Denezhkin Kamen complex, Russia).

Association: Prehnite, thomsonite, augite (Doğanbaba, Turkey); chlorite, tremolite (Denezhkin Kamen complex, Russia).

Distribution: From Belenköysirti Hill, seven km southeast of the village of Doğanbaba, Taurus Mountains, Burdur Province, Turkey. In Russia, in the Denezhkin Kamen complex, Ural Mountains.

Name: In honor of Professor Erwin Parthé, crystallographer at the University of Geneva, Geneva, Switzerland.

Type Material: Museum of Natural History, Geneva, Switzerland, 435/10; National Museum of Natural History, Washington, D.C., USA, 146562; The Natural History Museum, London, England, 1984,742.

Total	98.51

(1) Blind Spring district, California, USA; corresponds to $(Cu_{1.83}Ag_{0.24}Pb_{0.04})_{\Sigma=2.11}(Sb_{1.41}Fe_{0.15})_{\Sigma=1.56}(O,OH,H_2O)_{7.00}$.

Mineral Group: Stibiconite group.

Occurrence: An alteration product of antimony-bearing sulfides.

Association: Bindheimite, lewisite, stibiconite (Tres Alamos Wash, Arizona, USA).

Distribution: In the USA, from several mines in the Blind Spring district, Mono Co., California; at Gilbert, Gilbert district, Esmeralda Co., Nevada; and in Tres Alamos Wash, Johnny Lyon Hills, Cochise Co., Arizona. In Germany, at Müschede, near Neheim-Hüsten, Westphalia; from Imsbach and Puderbach, Rhineland-Palatinate; and in the Clara Mine, near Oberwolfach, Black Forest. At Veitsch, Styria, Austria. On Mt. Monger, near Doigs, Western Australia.

Name: For August F.W. Partz, who first recognized the mineral as a silver ore.

Type Material: Indiana University, Bloomington, Indiana, Z81; Harvard University, Cambridge, Massachusetts, USA, 80284, 83279.

CaO	1.50
Total	99.79

(1) Långban, Sweden; by electron microprobe and wet chemical analysis; corresponds to $(Mn^{2+}_{4.15}Mg_{0.75}Ca_{0.18})_{\Sigma=5.08}Sb^{5+}_{0.92}As^{5+}_{1.00}Si_{1.00}O_{12}$.

Occurrence: In a high-temperature skarn assemblage, in recrystallized manganoan carbonate ores.

Association: Långbanite, spessartine, hausmannite, berzeliite, caryinite.

Distribution: At Långban, Värmland, Sweden.

Name: For Dr. Alexander Parwel, Swedish chemist, Swedish National History Museum, Stockholm, Sweden, who has performed many analyses of Långban minerals, including this one.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, NRMS 26758; National Museum of Natural History, Washington, D.C., USA, 120065.

Pascoite $Ca_3V_{10}^{5+}O_{28}\cdot 17H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Crystals minute, lathlike with oblique terminations, in granular crusts.

Physical Properties: *Cleavage:* {010}, distinct. *Fracture:* Conchoidal. Hardness = ~2.5 D(meas.) = 2.455 D(calc.) = 2.465 Soluble in H_2O.

Optical Properties: Translucent. *Color:* Dark red-orange to yellow-orange, dirty yellow on partial dehydration. *Streak:* Cadmium-yellow. *Luster:* Vitreous to subadamantine. *Optical Class:* Biaxial (–). *Pleochroism:* X = light cadmium yellow; Y = cadmium yellow; Z = orange. *Orientation:* OAP $\perp$ {010}. *Dispersion:* Crossed, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.775(5)$ $\beta = 1.815(5)$ $\gamma = 1.825(5)$ 2V(meas.) = 50°–56°

Cell Data: *Space Group:* $C2$. $a = 16.834(3)$ $b = 10.156(2)$ $c = 10.921(2)$ $\beta = 93°8(3)'$ Z = 2

X-ray Powder Pattern: Minasragra, Peru.
5.5 (10), 4.67 (10), 5.1 (8), 7.3 (7), 3.01 (7), 8.8 (6), 4.45 (6)

Chemistry:

	(1)	(2)
V_2O_5	64.6	65.71
MoO_3	0.3	
CaO	12.6	12.16
H_2O^+	7.8

undetermined	0.9	
Total	100.0	100.00

(1) Minasragra, Peru. (2) $Ca_3V_{10}O_{28}\cdot 17H_2O$.

Occurrence: Leached out of near-surface vanadium oxides by ground waters; as efflorescences in mine tunnels.

Association: Carnotite.

Distribution: At Minasragra, 46 km from Cerro de Pasco, Peru. From the Urcal deposit, La Rioja Province, Argentina. In the USA, in Colorado, from the Hawkeye, Burro, and Deremo-Snyder mines, near Slick Rock, San Miguel Co.; in the Bitter Creek, Mill No. 1, and Peanut mines, Uravan district, Montrose Co.; at the Corvusite and La Sal No. 2 mines, Gateway district, Mesa Co.; and from the Rifle mine, Garfield Co. At the Black Ape mine, Thompsons district, Grand Co., the Crescent No. 3 claim, Crescent Creek, Garfield Co., and the Mi Vida mine, Big Indian district, San Juan Co., Utah. In Arizona, at the Monument No. 2 mine, Monument Valley; in the Mesa No. 1, No. 5, and No. 6 mines, Lukachukai Mountains, and the Zona No. 1 claim, Carrizo Mountains, Apache Co. From the Ambrosia Lakes district, McKinley Co., New Mexico.

Name: For the original locality, near Cerro de Pasco, Peru.

Type Material: Harvard University, Cambridge, Massachusetts, 101701; National Museum of Natural History, Washington, D.C., USA, 87662, 93297.

Crystal Data: Hexagonal. *Point Group*: $\bar{3}$. As elongated scalenohedral crystals to 100 μm, typically zoned with V-rich senaite.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6-6.5 VHN = 834-865, 847 average (500 g load). D(meas.) = n.d. D(calc.) = 4.315

Optical Properties: Opaque. *Color*: Dark gray to black; grayish in reflected light.
Streak: Black. *Luster*: Submetallic.
Optical Class: Biaxial (-). [by analogy to senaite]
R_1-R_2: (471.1) 18.4-18.2, (548.3) 17.9-17.7, (586.6) 17.6-17.3, (652.3) 17.0-16.8

Cell Data: *Space Group*: $R\bar{3}$. a = 10.3894(5) c = 20.8709(8) Z = 3

X-ray Powder Pattern: Molinello mine, Val Graveglia, Liguria, Italy.
3.417 (100), 2.260 (85), 2.149 (65), 2.896 (61), 1.809 (57), 2.858 (36), 2.765 (27)

Chemistry:

	(1)		(1)
Na_2O	0.35	La_2O_3	0.02
MgO	0.05	Ce_2O_3	0.03
MnO	7.70	TiO_2	32.78

PbO	8.01	V_2O_5	41.27
FeO	2.80	Total	98.64
Fe_2O_3	1.71		

(1) Molinello mine, Val Graveglia, Liguria, Italy; average of 11 electron microprobe analyses, Fe^{2+}/Fe^{3+} calculated from structure analysis; corresponding to $(Pb_{0.61}Sr_{0.39})_{\Sigma=1.00}(V^{5+}_{7.78}Ti^{4+}_{7.03}Mn^{2+}_{1.86}Fe^{2+}_{0.67}Fe^{3+}_{0.37}Zn_{0.24}Na_{0.19}U_{0.02}Mg_{0.02}\square_{2.82})_{\Sigma=21.00}O_{38}$.

Mineral Group: Crichtonite group.

Polymorphism & Series: Forms a solid solution series with senaite.

Occurrence: In micro-cavities and fractures in a piece of fossilized wood, presumably precipitated from oxidized ground water.

Association: Quartz, chalcocite, volborthite; more rarely metatyuyamunite, pyrophanite.

Distribution: From the upper part of the Molinello mine, Val Graveglia, Ne, Genoa Province, Liguria, Italy.

Name: Honors Marco Pasero (b. 1958), Professor of Mineralogy, University of Pisa, Italy, for his contributions to mineralogy and crystallography in general, and especially Italian mineralogy.

Type Material: In Italy, at the Museum of Natural History, University of Florence (# 3111/I), and in the mineralogical collections of the Natural History Museum, University of Turin (# 15900).

Patrónite $VS_4(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Massive, and as aggregates of columnar crystals.

Physical Properties: *Cleavage:* Pronounced columnar cleavage. Hardness = Very low. VHN = n.d. D(meas.) = 2.82(1) D(calc.) = 2.834

Optical Properties: Opaque. *Color:* Lead-gray on fresh surface, gray-black on old; dark gray in reflected light. *Luster:* Metallic. *Pleochroism:* Strong.
R_1–R_2: (400) 20.2–29.9, (420) 20.0–30.0, (440) 19.8–30.1, (460) 19.8–30.8, (480) 20.0–31.9, (500) 20.1–32.6, (520) 20.1–32.9, (540) 20.0–32.8, (560) 19.8–32.4, (580) 19.6–31.4, (600) 19.1–30.5, (620) 18.9–29.6, (640) 18.8–29.6, (660) 19.0–29.8, (680) 19.2–30.3, (700) 19.5–31.0

Cell Data: *Space Group:* $I2/c$. $a = 6.775(5)$ $b = 10.42(1)$ $c = 12.11(1)$ $\beta = 100.8(2.0)°$ Z = 8

X-ray Powder Pattern: Synthetic VS_4.
5.604 (100), 5.181 (65), 2.473 (30), 2.216 (30), 2.047 (25), 3.151 (20), 2.962 (20)

Chemistry: Composition established by comparison of X-ray patterns with synthetic material.

Occurrence: As interstitial filling in the core of a porous 2.5 m layer of admixed vanadium-bearing minerals. These vanadian materials are in fissures that cut red shales and that were probably filled by a remobilized asphaltite deposit.

Association: Sulfur, bravoite, pyrite, minasragrite, stanleyite, dwornikite, quartz, vanadian lignite, natural coke.

Distribution: A major ore mineral in what was the world's richest vanadium deposit, at Minasragra, 46 km from Cerro de Pasco, Peru [TL].

Name: After Antenor Rizo-Patrón (1866–1948), Peruvian metallurgist, discoverer of the Peruvian occurrence.

Type Material: n.d.

Pattersonite $PbFe_3(PO_4)_2(OH)_4[(H_2O)_{0.5}(OH)_{0.5}]_2$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As slightly elongated to rosette-like aggregates of subparallel plates, to 0.5 mm, exhibiting rough forms {110}, {001}, and {011}.

Physical Properties: *Cleavage*: One poor direction. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 4.5 VHN = 530 (25 g load). D(meas.) = > 4.04 D(calc.) = 4.17

Optical Properties: Translucent. *Color*: Dark yellow. *Streak*: Very pale yellow. *Luster*: Adamantine.
Optical Class: Biaxial (-). α = 1.86(1) β = 1.917 (calc) γ = 1.93(1) 2Vα = 50(5)°
Dispersion: Very strong, $r > v$. *Pleochroism*: Weak; *X* = nearly colorless to very pale yellow; *Y* = pale yellow to yellow; *Z* = yellow to dark yellow. *Absorption*: $Z > Y > X$.
Orientation: (polar coordinates in terms of φ and ρ based on (010) = 0°/90°), *X* (−113°/85°); *Y* (155°/70°); *Z* (−10°/21°).

Cell Data: *Space Group*: $P\bar{1}$. a = 5.309(1) b = 7.211(1) c = 7.349(1) α = 87.74(3)° β = 86.38(3)° γ = 71.40(3)° Z = 1

X-ray Powder Pattern: Vereinigung mine, Taunus, Hesse, Germany.
4.848 (100), 6.839 (64), 3.547 (57), 3.417 (52), 3.022 (51), 3.667 (47), 2.8339 (45)

Chemistry:

	(1)
PbO	33.10
Fe_2O_3	35.64
P_2O_5	20.97
H_2O	9.32
Total	98.79

(1) Vereinigung mine, Taunus, Hesse, Germany; average of 46 electron microprobe analyses, H_2O from structure determination, anionic groups confirmed by IR, corresponding to $Pb_{1.00}\ Fe_{3.02}(PO_4)_{1.98}(OH)_{5.12}(H_2O)_{0.94}$

Mineral Group: Alunite group.

Occurrence: A secondary mineral on goethite in a weathered metallic sulfide mineral vein.

Association: Kintoreite, goethite, pyromorphite.

Distribution: On the dumps of the Vereinigung mine, near Eisenbach, ~5 km north of Bad Camberg, Taunus, Hesse, Germany.

Name: Honors Arthur Lindo Patterson (1902–1966), who developed a method employing a Fourier series to generate a three-dimensional function, the now well-known "Patterson function" in crystal-structure determination.

Type Material: Natural History Museum, Vienna, Austria.

(1) Wenatchee, Washington, USA; by electron microprobe, average of five partial analyses; corresponds to $K_{2.22}Ca_{0.94}Na_{0.48}Ba_{0.09}Fe_{0.03}(Si_{16.10}Al_{4.91})_{\Sigma=21.01}O_{42} \cdot 22H_2O$. (2) Ritter, Oregon, USA; by electron microprobe, average of four partial analyses, H_2O determined separately by loss on heating as 18.5%; corresponds to $Ca_{1.85}K_{1.14}Na_{0.43}Ba_{0.05}(Si_{15.60}Al_{5.39})_{\Sigma=20.99}O_{42} \cdot 17.40H_2O$.

Mineral Group: Zeolite group.

Occurrence: In vesicles in basalt flows.

Association: Zeolites, pyrite, calcite.

Distribution: In the USA, at Rock Island Dam, on the Columbia River, Wenatchee, Douglas Co., Washington; from near Riggins, Idaho Co., Idaho; and at Three Mile Creek, near Ritter, Grant Co., Oregon. On Chase Creek, at the junction with Charcoal Creek, north of Falkland, British Columbia, Canada. Large crystals from the Giant's Causeway and Craigahulliar, Portrush, Co. Antrim, Ireland. At Kladno and Vinařice, Czech Republic. In the Höwenegg quarry, Hegau, Baden-Württemberg, and in the Ortenberg quarry, Vogelsberg, Hesse, Germany.

Name: For Linus Carl Pauling (1901–1994), Nobel Laureate, Professor of Chemistry, California Institute of Technology, Pasadena, California, USA.

Type Material: n.d.

Total	100.3	100.00

(1) Neuhilfe mine, Schneeberg, Germany; by electron microprobe, total Fe as Fe_2O_3, confirmed by microchemical tests, H_2O by TGA-EGA; corresponds to $Bi_{1.90}Fe_{1.12}(P_{0.98}O_4)(OH)_{1.99}$.
(2) $Bi_2FeO_2(PO_4)(OH)_2$.

Occurrence: A rare secondary mineral in Bi–Ni–Co ores in a hydrothermal ore deposit.

Association: Bismuth, skutterudite, pyrite, erythrite, bismutoferrite.

Distribution: From the Neuhilfe mine, Schneeberg, Saxony, Germany.

Name: To honor Dr. Paul Keller (1940–), Professor of Mineralogy, University of Stuttgart, Stuttgart, Germany, for his contributions to the mineralogy of secondary minerals from ore deposits.

Type Material: Mining Academy, Freiberg, Germany; Canadian Museum of Nature, Ottawa, Canada, 53450; National Museum of Natural History, Washington, D.C., USA, 163777.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2 or $2/m$. Crystals are tabular on {100} or {001}, to 0.5 mm, showing {100}, {001}, {011}, less commonly {$\bar{2}$01}, {110}, {111}.

Physical Properties: *Cleavage:* {100}, good. *Tenacity:* Very brittle. Hardness = ∼3
D(meas.) = 6.95(5) D(calc.) = 6.86

Optical Properties: Semitransparent. *Color:* Colorless to light orange. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (+); birefringence ∼0.110. *Orientation:* $Y = b$; $Z \wedge a = 10(1)°$. *Dispersion:* $r > v$, very strong. α = n.d. β = 1.9–2.0 γ = n.d. 2V(meas.) = 65(5)°

Cell Data: *Space Group:* $P2_1$; structure refined in $P2_1/a$. $a = 13.584(4)$ $b = 5.650(2)$ $c = 8.551(3)$ $\beta = 108.78(2)°$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
3.30 (100), 2.905 (80), 2.761 (80), 3.02 (70), 1.768 (70), 2.024 (60), 1.726 (60)

Chemistry:

	(1)	(2)
As_2O_3	30.07	30.71
PbO	69.23	69.29
Total	99.30	100.00

(1) Långban, Sweden; by electron microprobe. (2) $Pb_2As_2O_5$.

Occurrence: A very rare secondary mineral in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Hematite, magnetite, andradite, mimetite, calcite (Långban, Sweden).

Distribution: From Långban, Värmland, Sweden. At Laurium, Greece, in slag.

Name: To honor Professor Paul Brian Moore (1940–), American mineralogist and structural crystallographer, University of Chicago, Chicago, Illinois, USA, for his many contributions to mineralogy.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 252356; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 134973, 142974.

References: (1) Dunn, P.J., D.R. Peacor, and B.D. Sturman (1979) Paulmooreite, a new lead arsenite mineral from Långban, Sweden. Amer. Mineral., 64, 352–354. (2) Araki, T., P.B. Moore, and G.D. Pavonite $AgBi_3S_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tiny bladed crystals elongated parallel to [010]; typically intergrown with homologous species, and massive.

Physical Properties: *Cleavage:* Indistinct. Hardness = 2 VHN = 188 (50 g load). D(meas.) = 6.8 (synthetic). D(calc.) = [6.80]

Optical Properties: Opaque. *Color:* Lead-gray to tin-white; in polished section, white. *Luster:* Metallic. *Pleochroism:* Strong, gray-pink-white and blue-gray-white in oil. *Anisotropism:* Strong, in pale to intense blue and light tan to brown. R_1–R_2: (400) 46.3–50.7, (420) 46.1–50.5, (440) 45.9–50.3, (460) 45.6–50.0, (480) 45.3–49.8, (500) 45.0–49.5, (520) 44.5–49.0, (540) 44.0–48.4, (560) 43.4–47.8, (580) 42.9–47.3, (600) 42.5–47.0, (620) 42.2–46.7, (640) 42.0–46.4, (660) 41.9–46.2, (680) 41.7–46.0, (700) 41.6–45.8

Cell Data: *Space Group:* $C2/m$. $a = 13.35$ $b = 4.03$ $c = 16.34$ $\beta = 94.5°$ $Z = 4$

X-ray Powder Pattern: Synthetic $AgBi_3S_5$ (easily confused with benjaminite). 2.858 (100), 3.59 (90), 3.38 (80), 3.46 (40), 5.45 (35), 2.259 (35), 4.08 (30)

Chemistry:

	(1)	(2)		(1)	(2)
Ag	11.1	12.05	Bi	64.5	70.04
Cu	1.7		S	18.3	17.91
Pb	3.5		Total	99.1	100.00

(1) Porvenir mine, Bolivia; by electron microprobe, corresponding to $(Ag_{0.90}Cu_{0.23})_{\Sigma=1.13}(Bi_{2.70}Pb_{0.15})_{\Sigma=2.85}S_{5.00}$. (3) $AgBi_3S_5$.

Occurrence: In hydrothermal base-metal sulfide vein deposits.

Association: Cupropavonite, bismuthinite, chalcopyrite, aikinite, hodrušhite.

Distribution: In Bolivia, from the Porvenir [TL] and Bolivar mines, Cerro Bonete, about 75 km south-southwest of Esmoraca, Potosí. In the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. In the USA, in Colorado, in the Silver Bell mine, Red Mountain, Ouray Co.; at the Old Lout, Gladiator, and Alaska mines, Poughkeepsie Gulch, near Ouray, San Juan Co.; and at several other minor occurrences. In Nevada, at Manhattan, and from the Outlaw mine, Round Mountain district, Nye Co., and Pioche, Lincoln Co.; and in the Apache Hills mine, southeast of Hachita, Grant Co., New Mexico. In Canada, in the Keeley mine, South Lorrain Township, Ontario. From Portugal, at Panasqueira and in the Vale das Gatas tungsten mine, near Vila Real. From the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, Austria. At the Ikuno mine, Hyogo Prefecture, Japan. From the Shanhu W–Sn deposit, Guangxi Province, China.

Name: From the Latin *pavo*, *peacock*, honoring Professor Martin Alfred Peacock (1898–1950), Canadian mineralogist, University of Toronto, Toront, Canada.

Type Material: University of Toronto, Toronto, Canada; Harvard University, Cambridge, Massachusetts, USA.

Paxite $CuAs_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Massive, intergrown with novákite, koutekite, and arsenic. *Twinning:* Polysynthetic along {010}.

Physical Properties: *Cleavage:* Perfect along {010}. Hardness = 3.5–4 VHN = 146 (25 g load). D(meas.) = 5.4 D(calc.) = 5.97

Optical Properties: Opaque. *Color:* Pale steel-gray on fresh surface; in polished section, very pale gray. *Streak:* Black. *Luster:* Metallic, tarnishing black. *Anisotropism:* Very strong; in pale gray-green and dark brown with violet tint.
R_1–R_2: (400) 46.4–48.2, (420) 45.8–48.4, (440) 45.2–48.6, (460) 44.8–48.4, (480) 44.6–48.0, (500) 44.6–48.5, (520) 44.5–49.2, (540) 44.2–49.5, (560) 43.8–49.4, (580) 43.5–49.1, (600) 43.4–48.9, (620) 43.5–48.8, (640) 43.7–48.6, (660) 43.8–48.3, (680) 43.7–47.9, (700) 43.3–47.6

Cell Data: *Space Group:* $P2_1/c$. $a = 5.839(2)$ $b = 5.111(2)$ $c = 8.084(3)$ $\beta = 99.7°$ $Z = 10$

X-ray Powder Pattern: Černý Důl mine, Czech Republic.
3.144 (10), 2.616 (10), 2.495 (9), 3.604 (7), 1.795 (7), 1.687 (6), 3.295 (5)

Chemistry:

	(1)	(2)
Cu	30.35	29.77
As	69.91	70.23
Total	100.26	100.00

(1) Černý Důl mine, Czech Republic; by electron microprobe, average of 10 analyses. (2) $CuAs_2$.

Occurrence: In hydrothermal calcite veins cutting diopside hornfels lenses, in pyroxene gneisses and mica schists. Probably a late-stage reaction product formed at the expense of novákite and arsenic below 130 °C (Černý Důl mine, Czech Republic).

Association: Novákite, koutekite, arsenic, arsenolamprite, silver, löllingite, nickeline, chalcocite, skutterudite, bornite, chalcopyrite, tiemannite, clausthalite, uraninite, hematite, fluorite (Černy Důl mine, Czech Republic); lautite, kutínaite (Niederbeerbach, Germany); domeykite, algodonite, koutekite (Mohawk, Michigan, USA).

Distribution: From the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic [TL]. At Mühltal, Niederbeerbach, Odenwald, Hesse, Germany. From Mohawk, Keeweenaw Co., Michigan, USA.

Name: From the Latin *pax*, *peace*.

Type Material: Charles University, Prague, Czech Republic; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 162605.

Pašavaite $Pd_3Pb_2Te_2$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As rounded irregular grains, to 0.02 mm, included in polarite.

Physical Properties: *Cleavage*: Weak on {001}. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = 2 VHN = 233 (25 g load). D(meas.) = 9.9 D(calc.) = 10.18
Most properties determined on synthetic material.

Optical Properties: Opaque. *Color*: Gray. *Streak*: Gray; pale pink with a brownish tint in plane polarized light. *Luster*: Metallic. *Pleochroism*: Brownish to light pink. *Anisotropism:* Strong. *Optical Class*: n.d.
R_1-R_2: (470) 49.9-42.4, (546) 51.8-44.6, (589) 52.2-45.7, (650) 52.8-46.9

Cell Data: *Space Group*: *Pmmn*. *a* = 8.599(1) *b* = 5.9381(6) *c* = 6.3173(8) Z = 2

X-ray Powder Pattern: Synthetic $Pd_{2.99}Pb_{2.00}Te_{2.01}$.
3.0495 (100), 2.1637 (71), 2.5456 (63), 2.2786 (42), 1.8906 (42), 6.3152 (34), 2.4424 (34)

Chemistry:

	(1)	(2)
Pd	31.51	32.17
Pb	41.54	41.78
Bi	0.19	
Te	25.75	25.93
Total	98.99	99.88

(1) Talnakh deposit, Noril'sk-Talnakh mining camp, Russia; average of 4 electron microprobe analyses, corresponding to $Pd_{2.96}(Pb_{2.01}Bi_{0.01})Te_{2.02}$. (2) Average of 7 electron microprobe analyses of synthetic material, corresponding to $Pd_{2.99}Pb_{2.00}Te_{2.01}$.

Occurrence: Likely formed from late-stage residual liquids segregated from a Ni-Cu sulfide melt derived from a highly differentiated mafic intrusion.

Association: Polarite, sperrylite.

Distribution: Talnakh deposit, Noril'sk-Talnakh mining camp, Taimyr autonomous District, Russia.

Name: Honors Jan Pašava (b. 1957), a geologist with the Czech Geological Survey.

Type Material: Department of Mineralogy, National Museum, Prague, Czech Republic (catalog no. P1p 15/2007).

Pearceite $(Ag,Cu)_{16}As_2S_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As short, tabular pseudohexagonal prisms with bevelled edges, showing triangular striations on {001}; as rosettes of such crystals, to 3 cm.

Physical Properties: *Fracture:* Conchoidal to irregular. Hardness = 3 VHN = 130–142 (100 g load). D(meas.) = 6.15(2) D(calc.) = 6.07

Optical Properties: Opaque, translucent in very thin fragments. *Color:* Dull black; in polished section, white, with very dark red internal reflections. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Very weak in air, fair in oil. *Anisotropism:* Moderate, typically dark violet. R_1–R_2: (400) 34.8–34.3, (420) 34.2–34.2, (440) 33.4–34.1, (460) 32.5–33.8, (480) 31.5–33.2, (500) 30.6–32.8, (520) 29.8–32.5, (540) 29.3–32.3, (560) 29.0–32.0, (580) 29.0–31.7, (600) 29.1–31.2, (620) 29.1–30.7, (640) 28.9–30.2, (660) 28.6–29.8, (680) 28.0–29.3, (700) 27.4–29.1.

Cell Data: *Space Group:* $C2/m$. $a = 12.64$ $b = 7.29$ $c = 11.90$ $\beta = 90.0°$ $Z = 2$

X-ray Powder Pattern: Aspen, Colorado, USA.

(1) Molly Gibson mine, Colorado, USA; recalculated to 100% after deducting 12.81% impurities; then corresponds to $(Ag_{10.44}Cu_{4.62}Zn_{0.85})_{\Sigma=15.91}(As_{1.85}Sb_{0.05})_{\Sigma=1.90}S_{11.19}$. (2) Arqueros, Chile; corresponds to $(Ag_{12.19}Cu_{3.48}Fe_{0.22})_{\Sigma=15.89}(As_{2.01}Sb_{0.07})_{\Sigma=2.08}S_{11.02}$. (3) $Ag_{16}As_2S_{11}$.

Polymorphism & Series: Forms a series with polybasite.

Occurrence: In hydrothermal deposits formed at low to medium temperatures.

Association: Acanthite, silver, proustite, quartz, barite, calcite.

Distribution: In the USA, in Montana, large crystals from the Drumlummon mine, Marysville, Lewis and Clark Co. [TL]; at Neihart, Cascade Co.; and from about 13 km north of Niarada, in the Flathead mine, Flathead Co.; in Colorado, at the Molly Gibson mine, Aspen, Pitkin Co., and from Rico, Dolores Co.; in Utah, in the Tintic district, Juab Co., at Eureka and elsewhere; in the Lakeview district, Bonner Co., Idaho; at the Ophir mine, Comstock district, Storey Co., Nevada. In Canada, from the Morrison mine, and in the Ross mine, Holtyre, Ontario, and at the Husky mine, Yukon Territory. In Mexico, from the Veta Rica mine, Sierra Mojada, Coahuila, and as large crystals in the Reyes mine, Guanajuato. From Arqueros, Coquimbo, Chile. At Banská Štiavnica (Schemnitz), Slovakia. From the Clara mine, near Oberwolfach, Black Forest, Germany. In Spain, from Francoli, Tarragona Province. In Italy, at Boarezzo, Lombardy. In the Sark's Hope mine, Sark, Channel Islands. From Seikoshi, Shizuoka Prefecture, Japan. Additional minor localities are known.

Name: For Dr. Richard Pearce (1837–1927), Cornish–American chemist and metallurgist, Denver, Colorado, USA.

Type Material: Yale University, New Haven, Connecticut, 3.4270, 3.4292, 3.4293; The Natural History Museum, London, England, 84843.

Peatite-(Y) $Li_4Na_{12}Y_{12}(PO_4)_{12}(CO_3)_4F_8$

Crystal Data: Orthorhombic. *Point Group*: 222. As equant, well-formed, isolated or small clusters of pseudocubes to 1 mm, also as overgrowths on ramikite-(Y). Crystals display dominant {100}, {010}, and {001}, and minor {110}, {101}, and {011}; crystal faces striated parallel to the face diagonal.

Physical Properties: *Cleavage*: Very good on {100}, {010}, {001}. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = ~ 3 D(meas.) = n.d. D(calc.) = 3.62(1)

Optical Properties: Translucent. *Color*: Colorless, pale pink to purple. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (n.d.). α = n.d. β = 1.601(1) γ = n.d. 2V(meas.) = n.d. 2V(calc.) = n.d. *Pleochroism:* None. *Dispersion*: None.

Cell Data: *Space Group*: *P*222. a = 11.167(2) b = 11.164(2) c = 11.162(2) Z = 1

X-ray Powder Pattern: Poudrette pegmatite, Mont Saint-Hilaire, Canada.
2.63 (100), 2.99 (83), 4.56 (57), 3.95 (57), 3.54 (46), 2.149 (42), 2.71 (38)

(1) Poudrette pegmatite, Mont Saint-Hilaire, Canada; average of 4 electron microprobe analyses, H_2O, CO_2 and Li_2O calculated from stoichiometry and their presence confirmed by LA-ICP-MS and Raman analyses; corresponding to $Li_4Na_{12}(Y_{10.06}Na_{0.72}Ca_{0.62}Dy_{0.50}Er_{0.46}Yb_{0.28}Zr_{0.17}Ho_{0.11}Gd_{0.10}Tm_{0.04}Th_{0.04}Tb_{0.02})_{\Sigma=13.12}(PO_4)_{11.70}(CO_3)_4[F_{6.97}(OH)_{1.03}]_{\Sigma=8}$. (2) $Li_4Na_{12}Y_{12}(PO_4)_{12}(CO_3)_4F_8$.

Occurrence: A late-stage product possibly related to the in situ alteration of the pre-existing mineral assemblage present in the core of a zoned peralkaline pegmatite dike encased in a hornfels xenolith.

Association: Ramikite-(Y), albite, rhodochrosite, siderite, chabazite-Na, synchysite-(Ce), sabinaite.

Distribution: From the Poudrette pegmatite, Mont Saint-Hilaire, La Vallée-du-Richelieu, Montérégie (formerly Rouville County), Québec, Canada.

Name: Honors Cynthia Peat (1925-1999), a former X-ray technician at the Royal Ontario Museum, Toronto, Ontario, Canada, an avid mineralogist who spent decades studying and unraveling the complex mineralogy of Mont Saint-Hilaire.

Type Material: The Royal Ontario Museum, Toronto, Ontario, Canada (M53894).

Pecoraite $Ni_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. As curved plates, tubes, and spirals, to 0.4 μm; granular, to 5 mm; massive.

Physical Properties: Hardness = n.d. D(meas.) = 3.084 with absorbed H_2O. D(calc.) = [3.47]

Optical Properties: Transparent to translucent. *Color:* Bright green to blue-green. *Luster:* Vitreous.
Optical Class: Biaxial (probable). n = 1.56–1.63, with absorbed H_2O; 1.650 dried. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 5.26$ $b = 9.16$ $c = 14.7$ $\beta = 92°$ Z = [4]

X-ray Powder Pattern: Wolf Creek meteorite.
7.43 (100), 3.66 (75), 1.529 (75), 4.50 (62), 2.620 (62), 2.447 (50)

Chemistry:

	(1)
SiO_2	31.0
Al_2O_3	1.4
FeO	0.7
NiO	51.5
MgO	0.5
CaO	0.4
H_2O^+	9.7
H_2O^-	4.1
Total	99.3

(1) Wolf Creek meteorite; after deduction of H_2O^- and Ca as cassidyite ~1%, corresponds to $(Ni_{2.70}Al_{0.11}Mg_{0.05}Fe^{2+}_{0.04})_{\Sigma=2.90}Si_{2.02}O_5(OH)_4$.

Polymorphism & Series: Dimorphous with népouite.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Formed by weathering of Ni-Fe meteorite fragments in a desert environment (Wolf Creek meteorite); along shears in Archaean ultramafic rocks (Otway prospect, Western Australia); in geodes (St. Louis, Missouri, USA).

Association: Maghemite, quartz, goethite, cassidyite, reevesite (Wolf Creek meteorite); millerite, gaspéite, otwayite, nullaginite (Otway prospect, Western Australia); millerite (St. Louis, Missouri, USA).

Distribution: In the Wolf Creek meteorite. From the Otway prospect, near Spinnaway, Nullagine district, and in Rocky's Reward pit, near Agnew, Western Australia. From about 30 km west of St. Louis, St. Louis Co., Missouri, and in the Nickel mine, Riddle, Douglas Co., Oregon, USA. At Tscheremschanskoe, Ural Mountains, Russia.

Name: To honor Dr. William Thomas Pecora (1913–1972), Director of the U.S. Geological Survey, geologist and student of nickel silicate deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128111.

Pectolite $NaCa_2Si_3O_8(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals may be tabular, but also commonly acicular, to 15 cm; radiating fibrous, spheroidal, or columnar; fine-grained, massive. *Twinning:* Twin axis [010] with composition plane ~{100}, common.

Physical Properties: *Cleavage:* Perfect on {100} and {001}. *Fracture:* Uneven. *Tenacity:* Brittle; tough when compact. Hardness = 4.5–5 D(meas.) = 2.84–2.90 D(calc.) = [2.87] May be triboluminescent.

Optical Properties: Translucent to opaque. *Color:* Colorless, whitish, grayish, yellowish; in thin section, colorless. *Luster:* Silky, subvitreous.
Optical Class: Biaxial (+). *Orientation:* $X \wedge c = 10°–19°$; $Y \wedge a = 10°–16°$; $Z \wedge b = 2°$. *Dispersion:* $r > v$, weak to very strong. $\alpha = 1.592–1.610$ $\beta = 1.603–1.615$ $\gamma = 1.630–1.645$ 2V(meas.) = 50°–63°

Cell Data: *Space Group:* $P\bar{1}$. $a = 7.9882(1)$ $b = 7.03996$ $c = 7.0247(1)$ $\alpha = 90.520°$ $\beta = 95.181°$ $\gamma = 102.469°$ Z = 2

X-ray Powder Pattern: Bergen Hill, New Jersey, USA.

SiO_2	54.18
Fe_2O_3	0.18
FeO	0.42
CaO	33.36
Na_2O	8.72
K_2O	0.88
H_2O	2.74
Total	100.48

(1) Thetford mines, Quebec, Canada; corresponds to $(Na_{0.93}K_{0.06})_{\Sigma=0.99}(Ca_{1.98}Fe^{2+}_{0.02})_{\Sigma=2.00}(Si_{2.99}Fe^{3+}_{0.01})_{\Sigma=3.00}O_8(OH)_{1.01}$.

Polymorphism & Series: A M2abc polytype exists; forms a series with sérandite.

Occurrence: A primary mineral in nepheline syenites. A hydrothermal mineral in cavities in basalts and diabases; in serpentinites and peridotites; from metamorphosed high-calcium rocks.

Association: Zeolites, datolite, prehnite.

Distribution: Numerous localities. On Mt. Baldo and Mt. Monzoni, Trentino-Alto Adige, Italy. In Germany, from Niederkirchen, near Wolfstein, and Rauschermühle, Rhineland-Palatinate. In Scotland, at Lendalfoot, Ayrshire. From Zlto, Sweden. In Russia, from the Lovozero and Khibiny massifs, Kola Peninsula. In the USA, from Paterson, Passaic Co., and Bergen Hill, Hudson Co., New Jersey; at Magnet Cove, Hot Spring Co., and on Granite Mountain, near Little Rock, Pulaski Co., Arkansas. In Canada, in fine crystals from the Jeffrey mine, Asbestos, and at Mont Saint-Hilaire, Quebec. At Ahmadnagar, Maharashtra, India. From Bou Agrao, High Atlas Mountains, Morocco. At Pilansberg, Transvaal, South Africa.

Name: From the Greek for *compact*, in allusion to its resistance to pulverization.

Total	99.59

(1) Tom's quarry, Australia; Fe, Mg, Ca, Na, K by AA, H_2O by loss on ignition, original total given as 99.60%; corresponds to $(Na_{2.88}Ca_{0.30}Mg_{0.01}K_{0.01})_{\Sigma=3.20}(Al_{16.00}Fe_{0.05})_{\Sigma=16.05}(PO_4)_{9.55}(SiO_4)_{0.32}(SO_4)_{2.13}(OH)_{17.45}\cdot 20.40H_2O$.

Occurrence: A rare secondary mineral in phosphate beds in limestone.

Association: Wavellite.

Distribution: From Tom's Phosphate quarry, near Kapunda, South Australia.

Name: Honoring Mr. Vincent Peisley (1941–), Brahma Lodge, Australia, who first collected the species.

Type Material: Museum Victoria, Melbourne, Australia, M35630.

3.140 (100), 3.025 (40), 3.622 (30), 1.971 (30), 3.564 (25), 3.593 (20), 2.554 (20)

Chemistry:

	(1)
Pb	5.1
Cu	1.3
Bi	73.6
Se	7.4
S	14.3
Total	101.7

(1) Juno mine, Australia; by electron microprobe, corresponds to $Pb_{0.82}Cu_{0.68}Bi_{11.74}(S_{14.87}Se_{3.13})_{\Sigma=18.00}$

Occurrence: In magnetite pipes that cut felsic sediments and pyroclastics; the pipes are probably hydrothermal replacements associated with volcanism (Juno mine, Australia).

Association: Gladite, junoite, emplectite, magnetite, chalcopyrite (Juno mine, Australia); paděraite, hammarite, chalcopyrite, grossular, andradite (Băiţa, Romania).

Distribution: From the Juno mine, Tennant Creek, Northern Territory, Australia [TL]. Found near Narechen Basni, southern Rhodope Mountains, and at the Svishti Plaz gold deposit, Balkan Mountains, Bulgaria. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At the Funiushan copper skarn deposit, near Nanjing, Jiangsu Province, China. From Băiţa (Rézbánya), Tincova, and Sasca Montană, Romania. At the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, Austria. In the Loch Shin monzogranite, near Lairg, Scotland. At the Tanco pegmatite, Bernic Lake, Manitoba, Canada. In the USA, from the Germania Consolidated mine, Fruitland, Stevens Co., Washington; and the Comstock mine, Dos Cabezas Mountains, Cochise Co., Arizona.

Name: For the Peko mine, near the Juno mine, Tennant Creek, Australia.

Type Material: Geology Department, University of New England, Australia, R27788.

Pekovite $SrB_2Si_2O_8$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. As equant grains to 0.2 mm.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6.5-7 VHN = 953 (100 g load). D(meas.) = 3.35(2) D(calc.) = 3.36

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous, slightly greasy.
Optical Class: Biaxial (-). α = 1.597(2) β(calc) = 1.627(2) γ = 1.632(2) 2V(meas) = 43(3)° 2V(calc) = n.d. *Dispersion:* Moderate, $v > r$. *Pleochroism*: None.

Cell Data: *Space Group: Pnma*. a = 8.155(2) b = 7.919(1) c = 8.921(1) Z = 4

X-ray Powder Pattern: Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan. 3.62 (100), 3.51 (90), 2.786 (90), 3.31 (80), 1.982 (70B), 5.94 (60), 3.01 (60)

Chemistry:

	(1)
CaO	0.38
SrO	34.15
B_2O_3	23.39
SiO_2	41.56
Total	99.48

(1) Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan; electron microprobe analysis, corresponding to $(Sr_{0.97}Ca_{0.02})_{\Sigma=0.99}B_{1.97}Si_{2.02}O_8$.

Occurrence: Within a block of quartz in the moraine of the Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan. The Dara-i-Pioz massif at the head of the glacier contains B-rich alkaline rocks and pegmatites.

Association: In quartz, intergrown with pectolite, highly strontian fluorite, and aegirine.

Distribution: Dara-i-Pioz glacier, Alai mountain range, Tien Shan, northern Tajikistan.

Name: Honors Russian mineralogist Igor Viktorovich Pekov (b. 1967), an expert on the mineralogy of alkaline rocks.

Type Material: A.E. Fersman Mineralogical Museum, Moscow, Russia.

Pellouxite $\sim(Cu,Ag)_2Pb_{21}Sb_{23}S_{55}ClO$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Crystals acicular along [010] to tabular flattened on (100), to 1 mm, with lozenge-shaped cross sections.

Physical Properties: *Cleavage:* Good on $\{20\bar{1}\}$. *Tenacity:* Brittle; flexible fibers. *Fracture:* n.d. Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.97

Optical Properties: Opaque. *Color:* Black; in reflected light, red internal reflections at grain edges and defects. *Streak:* Brown. *Luster:* Metallic. *Bireflectance:* Weak, white to white-gray. *Anisotropism*: Distinct.
Optical Class: n.d.
R*(*air)-R*(*oil): (470) 38.3-23.8, (546) 37.3-22.4, (589) 36.9-21.5, (650) 35.2-19.6

Cell Data: Space Group: *C*2/*m*. a = 55.824(11) b = 4.0892(8) c = 24.128(5) β = 113.14(3)° Z = 4

X-ray Powder Pattern: Buca della Vena mine, Apuan Alps, Tuscany, Italy.
3.423 (100), 4.002 (38), 3.562 (31), 2.948 (27), 3.009 (25), 3.878 (24), 2.048 (20), 2.265 (19)

Chemistry:

	(1)	(2)
Pb	47.17	47.55
Sb	31.16	30.94
Cu	0.89	0.95
Ag	0.59	0.61
S	19.08	19.38
Cl	0.33	0.39
O	0.39	0.18
Total	99.60	100.00

(1) Buca della Vena mine, Apuan Alps, Tuscany, Italy; average of 15 electron microprobe analyses, presence of O based on structure analysis, corresponds to $(Cu_{0.64}Ag_{0.25})Pb_{10.36}Sb_{11.64}S_{27.07}Cl_{0.42}O_{1.11}$.
(2) Ideal formula corresponds to $(Cu_{1.36}Ag_{0.52})Pb_{20.88}Sb_{23.12}S_{55}ClO$.

Mineral Group: Zinkenite group.

Occurrence: Formed by high chlorinity hydrothermal fluids in cavities and vugs in calcite veins that cut a Ba-Fe deposit, as well as, the enclosing greenschist facies phyllite and dolomitic limestone.

Association: Zinkenite, boulangerite, robinsonite, tintinaite, and, rarely, scainiite and pillaite; and tetrahedrite, bournonite, sphalerite, cinnabar, galena, andorite, chalcostibite, gersdorffite.

Distribution: From the Buca della Vena mine, near Ponte Stazzemese, Apuan Alps, Tuscany, Italy.

Name: Honors Professor Alberto Pelloux (1868-1947), curator of the mineralogical Museum, University of Genoa, Italy, and past President of the "Società Geologica Italiana".

Type Material: n.a.

Total	99.98	99.41

(1) Ross River, Canada; corresponding to $Ba_{1.88}Ca_{0.94}(Fe_{1.46}Mg_{0.31}Zn_{0.11}Mn_{0.07})_{\Sigma=1.95}(Si_{5.72}Al_{0.58})_{\Sigma=6.30}O_{17}$. (2) Big Creek, California, USA; by electron microprobe, corresponding to $Ba_{1.89}Ca_{0.91}(Fe_{1.45}Mn_{0.17}Mg_{0.16}Zn_{0.02})_{\Sigma=1.80}(Si_{5.76}Al_{0.59})_{\Sigma=6.35}O_{17}$.

Occurrence: In lenses and bands of barium silicate rocks developed in metamorphic skarns near the contact with granite or granodiorite.

Association: Barite, hedenbergite, quartz, taramellite, gillespite, sanbornite, alforsite, witherite, andradite.

Distribution: From near the headwaters of the Ross and Pelly Rivers, about three km southwest of Gillespite Lake [Gunn claim, Itsy Mountains, near Macmillan Pass], Yukon Territory, Canada. From Trumbull Peak, near Incline, Mariposa Co., and at Big Creek, Fresno Co., California, USA. In the La Madrelena mine, Tres Pozos, Baja California, Mexico.

Name: For the Pelly River, Canada, near the headwaters of which it was first recognized.

Type Material: University of British Columbia, Vancouver, Canada, S-79-21844; National Museum of Natural History, Washington, D.C., USA, 148587.

Penikisite $Ba(Mg,Fe^{2+})_2Al_2(PO_4)_3(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic, or monoclinic. *Point Group:* $\overline{1}$ or 1. In crystals, in zoned intergrowth with kulanite.

Physical Properties: *Cleavage:* On {010} and {100}, fair to good. Hardness = ∼4
D(meas.) = 3.79(2) D(calc.) = 3.82

Optical Properties: Transparent to translucent. *Color:* Blue to green. *Streak:* Very pale green to white. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = grass-green; Y = blue-green; Z = pale pink. *Orientation:* $Y \wedge b = 0°$–$19°$; $Z \wedge c = -6°$. *Dispersion:* $r \gg v$, asymmetrical, suggesting a triclinic structure. *Absorption:* $X \approx Y > Z$. $\alpha = 1.684(2)$ $\beta = 1.688(2)$ $\gamma = 1.705(2)$
2V(meas.) = 56° 2V(calc.) = 52.2°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 8.999$ $b = 12.069$ $c = 4.921$ $\alpha = \sim 90°$ $\beta = 100°31'$ $\gamma = \sim 90°$ Z = 2

X-ray Powder Pattern: Cross-cut Creek, Canada; almost identical to kulanite.
3.094 (100), 2.915 (80), 2.649 (70), 8.81 (60), 3.028 (60), 2.684 (60), 4.49 (55)

Chemistry:

	(1)
P_2O_5	37.1
Al_2O_3	18.0
FeO	9.5
MnO	0.0
MgO	6.5
CaO	1.4
BaO	24.9
H_2O	3.9
Total	101.3

(1) Cross-cut Creek, Canada; by electron microprobe, total Fe as FeO; corresponds to $Ba_{0.96}(Mg_{0.95}Fe_{0.78}Ca_{0.15})_{\Sigma=1.88}Al_{2.09}(P_{1.03}O_{4.15})_3(OH)_{2.56}$.

Polymorphism & Series: Forms a series with kulanite.

Mineral Group: Bjarebyite group.

Occurrence: A very rare weathering product in fractures in sideritic iron formation.

Association: Kulanite, quartz, siderite, fluorapatite, rapidcreekite, brazilianite, arrojadite, anatase, goyazite.

Distribution: From Cross-cut Creek, Big Fish River–Blow River area, and in the Hess River area, Yukon Territory, Canada.

Name: Honoring Mr. Gunar Penikis (1936–1979), Ross River, Yukon Territory, Canada, a codiscoverer of the Rapid Creek phosphate occurrences.

Type Material: Royal Ontario Museum, Toronto, Canada, M34172.

References: (1) Mandarino, J.A., B.D. Sturman, and M.I. Corlett (1977) Penikisite, the magnesium analogue of kulanite, from Yukon Territory. Can. Mineral., 15, 393–395. (2) (1979) Amer. Mineral., 64, 657 (abs. ref. 1).

Penkvilksite $Na_4Ti_2Si_8O_{22}\cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or orthorhombic. *Point Group:* n.d. Crystal plates, to 7 μm and very thin, and microscopic radial fibrous masses, in lumps and clotted masses, to 3 cm; compact, porcelaneous.

Physical Properties: *Cleavage:* One perfect, probably basal. Hardness = 5, in aggregate. D(meas.) = 2.58(2) D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* White to pale gray, brownish, or greenish. *Luster:* Pearly or silky on fresh fracture; dull on the surface.
Optical Class: Biaxial (+). $\alpha = 1.637(2)$ $\beta = 1.640(2)$ $\gamma = 1.662(2)$ 2V(meas.) = n.d. 2V(calc.) = 42°

Cell Data: *Space Group:* n.d. $a = 7.48(5)$ $b = 8.77(5)$ c = n.d. α = n.d. β = n.d. $\gamma = 90°$ Z = n.d.

X-ray Powder Pattern: Lovozero massif, Russia.
8.2 (10), 3.37 (9), 2.84 (8), 3.32 (7), 3.10 (7), 3.07 (7), 1.713 (7)

Chemistry:

	(1)		(1)
SiO_2	54.69	CaO	1.60
TiO_2	15.91	SrO	0.01
ZrO_2	2.17	Na_2O	13.13
Al_2O_3	0.76	K_2O	0.09
Fe_2O_3	0.19	F	0.05

Ta_2O_5	0.06	H_2O^-	2.84
MnO	0.01	P_2O_5	0.02
MgO	trace	$-O = F_2$	0.02
		Total	100.02

(1) Lovozero massif, Russia; corresponds to $(Na_{3.7}Ca_{0.3})_{\Sigma=4.0}[Ti_{1.7}Zr_{0.2}(Nb,Fe,Al)_{0.1}]_{\Sigma=2.0}(Si_{7.9}Al_{0.1})_{\Sigma=8.0}O_{22}\cdot 5H_2O$.

Occurrence: In the central natrolite zone of a pegmatite in a differentiated alkalic massif (Lovozero massif, Russia); in a pegmatite vein and in a marble xenolith in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Aegirine, natrolite, mountainite, raite (Lovozero massif, Russia); microcline, aegirine, catapleiite, ancylite, nenadkevichite, pectolite, apophyllite, monteregianite, vesuvianite, tadzhikite (Mont Saint-Hilaire, Canada).

Distribution: From the Jubilee pegmatite, on Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: From the Lapp *penk*, for *curly*, and *vilkis*, for *white*, for its typical appearance.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3244, 3781; Mining Institute, St. Petersburg, 1065/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75126; National School of Mines, Paris, France; The Natural History Museum, London, England, 1994,24.

Pennantite $\mathbf{Mn_5^{2+}Al(Si_3Al)O_{10}(OH)_8}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$ or 1. As lamellar crystals and flakes, to 0.5 mm; in grains and platy aggregates, sometimes forming rosettelike clusters.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Flexible, inelastic. Hardness = 2–2.5 D(meas.) = 2.89–3.07 D(calc.) = [3.18]

Optical Properties: Translucent to nearly opaque. *Color:* Orange-brown, reddish brown, brown, dark red, dark green, black; in transmitted light, orange, pinkish, reddish orange. *Luster:* Pearly on cleavage faces.
Optical Class: Biaxial (–). *Pleochroism:* X = pinkish orange, orange-buff, reddish brown; Y = Z = orange, yellowish orange, very dark brown. *Absorption:* $Y = Z > X$. α = 1.615–1.664 β = n.d. γ = 1.622–1.673 2V(meas.) = 0° to very small.

Cell Data: *Space Group:* $C\bar{1}$ or $C1$. $a = 5.45$ $b = 9.50$ $c = 14.40$ $\alpha = 90.0°$ $\beta = 97.3°$ $\gamma = 90.0°$ Z = 2

X-ray Powder Pattern: Benallt mine, Wales.
7.1 (100), 3.57 (80), 2.43 (80), 14.3 (40), 2.70 (40), 2.03 (40), 4.75 (30)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
SiO_2	22.64	21.29	23.9	ZnO		0.97	15.9
Al_2O_3	18.60	19.07	19.1	MgO	[1.48]	0.00	3.4
Fe_2O_3	4.43	6.67	2.6	BaO	1.33	0.00	
MnO	38.93	39.82	27.4	H_2O	[9.40]	12.11	[7.7]
				Total	[96.81]	99.93	[100.0]

(1) Benallt mine, Wales; MgO and H_2O determined on an impure sample; corresponds to $(Mn^{2+}_{3.92}Al_{1.32}Fe^{3+}_{0.39}Mg_{0.26}Ba_{0.08})_{\Sigma=5.97}(Si_{2.70}Al_{1.30})_{\Sigma=4.00}O_{10}(OH)_{8.00}$. (2) Ushkatyn deposit, Kazakhstan; corresponds to $(Mn_{4.00}Al_{1.31}Fe^{3+}_{0.60}Zn_{0.09})_{\Sigma=6.00}(Si_{2.59}Al_{1.41})_{\Sigma=4.00}O_{10}[(OH)_{7.51}O_{0.49}]_{\Sigma=8.00}$. (3) Franklin, New Jersey, USA; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponds to $(Mn_{2.6}Zn_{1.3}Al_{1.3}Mg_{0.6}Fe^{3+}_{0.2})_{\Sigma=6.0}(Si_{2.7}Al_{1.3})_{\Sigma=4.0}O_{10}(OH)_8$.

Mineral Group: Chlorite group.

Occurrence: Formed during hydrothermal alteration of manganese deposits, as crusts on manganese minerals, and in veins cutting ore.

Association: Banalsite, analcime, paragonite, pyrophanite, garnet, barite, ganophyllite, kutnohorite, kellyite, willemite, prehnite, datolite, roeblingite, clinohedrite, hancockite, friedelite.

Distribution: In the Benallt mine, Rhiw, Lleyn Peninsula, Wales. From the Ushkatyn and Dzhumart deposits, Atasu district, Kazakhstan. In the Harstigen mine, near Persberg, Värmland, Sweden. At Bald Knob, near Sparta, Alleghany Co., North Carolina, and Franklin, Sussex Co., New Jersey, USA.

Name: For the Welsh mineralogist Thomas Pennant (1726–1798).

Type Material: The Natural History Museum, London, England, 1947,295–296; Harvard University, Cambridge, Massachusetts, 104705; National Museum of Natural History, Washington, D.C., USA, 105855.

Penobsquisite $Ca_2Fe^{2+}B_9O_{13}Cl(OH)_6 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Euhedral crystals, triangular in outline, tabular on {100}, elongated along [010], to 1.5 mm, showing {100}, {101}, {10$\bar{1}$}, {111}, {110}, {1$\bar{1}$0}, {$\bar{2}$1$\bar{2}$}, {$\bar{1}\bar{1}$2}.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼3
D(meas.) = 2.26(3) D(calc.) = 2.27

Optical Properties: Transparent to translucent. *Color:* Pale yellow. *Streak:* White.
Luster: Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 16.6°$. $\alpha = 1.550(2)$ $\beta = 1.554(2)$ $\gamma = 1.592(2)$ 2V(meas.) = 33(2)° 2V(calc.) = 36.6°

Cell Data: *Space Group:* $P2_1$. $a = 11.620(3)$ $b = 9.407(2)$ $c = 8.726(1)$ $\beta = 98.58(2)°$
Z = 2

X-ray Powder Pattern: Penobsquis mine, Canada.
7.29 (10), 8.65 (3), 2.113 (3), 5.32 (2), 4.50 (2), 2.958 (2), 2.744 (2)

Chemistry:

	(1)
B_2O_3	[48.50]
FeO	7.48
MnO	0.23
MgO	1.82
CaO	17.27
Cl	5.77
H_2O	[19.52]
$-O = Cl_2$	1.30
Total	[99.29]

(1) Penobsquis mine, Canada; by electron microprobe, average of three analyses, total Fe as Fe^{2+}, total Mn as Mn^{2+}, H_2O confirmed by IR, B_2O_3 and H_2O calculated from stoichiometry; corresponding to $Ca_{1.99}(Fe_{0.67}Mg_{0.29}Mn_{0.02})_{\Sigma=0.98}B_9O_{12.95}Cl_{1.05}(OH)_{5.99} \cdot 4.01H_2O$.

Occurrence: A very rare residual mineral, obtained by dissolution of halite in a drillcore through a marine evaporite series.

Association: Halite, sellaite, fluorite, boracite, hilgardite, pringleite, trembathite, brianroulstonite, hematite, malachite.

Distribution: From the Penobsquis evaporite deposit, near Sussex, New Brunswick, Canada.

Name: For the Penobsquis mine, Canada, first source of the mineral.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81524.

References: (1) Grice, J.D., R.A. Gault, and J. Van Velthuizen (1996) Penobsquisite: a new borate mineral with a complex framework structure. Can. Mineral., 34, 657–665. (2) (1997) Amer. Mineral., 82, 208 (abs. ref. 1).

Penroseite $(Ni, Co, Cu)Se_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As reniform masses with radiating columnar structure.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {011}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 VHN = 500–583 (100 g load). D(meas.) = 6.58–6.74 D(calc.) = 6.7

Optical Properties: Opaque. *Color:* Lead-gray; in polished section, creamy grayish white. *Streak:* Black. *Luster:* Metallic, tarnishes rapidly.
R: (400) 40.2, (420) 40.1, (440) 40.1, (460) 40.2, (480) 40.4, (500) 40.7, (520) 41.1, (540) 41.5, (560) 41.9, (580) 42.3, (600) 42.8, (620) 43.3, (640) 43.6, (660) 44.0, (680) 44.1, (700) 44.2

Cell Data: *Space Group:* $Pa3$. $a = 5.991$ $Z = 4$

X-ray Powder Pattern: Colquechaca, Bolivia.
2.68 (100), 2.45 (100), 1.806 (90), 1.599 (40), 3.02 (30), 1.662 (30), 1.151 (30)

Chemistry:

	(1)	(2)
Ni	22.9	12.5
Co	3.2	9.2
Cu	2.1	5.7
Se	71.7	72.3
Total	99.9	99.7

(1) Colquechaca, Bolivia; by electron microprobe, corresponds to $(Ni_{0.84}Co_{0.12}Cu_{0.07})_{\Sigma=1.03}Se_{1.97}$.
(2) Hope's Nose, England; by electron microprobe, corresponds to $(Ni_{0.46}Co_{0.34}Cu_{0.20})_{\Sigma=1.00}Se_{2.00}$.

Polymorphism & Series: Dimorphous with kullerudite.

Mineral Group: Pyrite group.

Occurrence: In hydrothermal veins.

Association: Naumannite, clausthalite, gersdorffite, tiemannite, pyrite, chalcopyrite (Pacajake mine, Bolivia); clausthalite, sederholmite, trüstedtite (Kuusamo, Finland).

Distribution: From the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, Potosí, Bolivia [TL]. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From Hope's Nose, Torquay, Devon, England. In Germany, in the Harz Mountains, at Tilkerode. At Kuusamo, northeastern Finland.

Name: In honor of Dr. Richard Alexander Fullerton Penrose, Jr. (1863–1931), American economic geologist, of Philadelphia, Pennsylvania, USA.

Type Material: The Natural History Museum, London, England, 1926,1; Harvard University, Cambridge, Massachusetts, 87472; National Museum of Natural History, Washington, D.C., USA, 95302, R7247.

Pentagonite $Ca(V^{4+}O)Si_4O_{10}\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals prismatic, to 1 mm, with dominant {110}, {201}, and $\{00\bar{1}\}$, elongated ‖ [001]; commonly as spherulitic rosettes, up to 5 mm. *Twinning:* Cyclical by reflection across {110}, common; as $(110) \wedge (1\bar{1}0) = 72.7°$, multiple twins result having pentagonal basal patterns closely simulating five-fold symmetry.

Physical Properties: *Cleavage:* Good on {010}. *Tenacity:* Brittle. Hardness = ~3–4 D(meas.) = n.d. D(calc.) = 2.33

Optical Properties: Transparent. *Color:* Greenish blue. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Pronounced; $X = Z$ = colorless; Y = blue. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, strong. $\alpha = 1.533(2)$ $\beta = 1.544(2)$ $\gamma = 1.547(2)$ 2V(meas.) = 50(2)°

Cell Data: *Space Group:* $Ccm2_1$. $a = 10.298(4)$ $b = 13.999(7)$ $c = 8.891(2)$ $Z = 4$

X-ray Powder Pattern: Owyhee Dam, Oregon, USA.
6.071 (100), 3.920 (100), 3.755 (100), 8.298 (70), 3.500 (36), 2.569 (36), 4.446 (25)

Chemistry: Semi-quantitative XRF indicates Ca:V:Si as in cavansite, and H_2O is also the same as their unit cells have the same volume.

Polymorphism & Series: Dimorphous wih cavansite.

Occurrence: In coatings on a tuff.

Association: Cavansite, heulandite, stilbite, analcime, apophyllite, calcite.

Distribution: In the USA, about three km south of Owyhee Dam, Malheur Co., Oregon.

Name: For the unusual pseudosymmetrical five-fold or *pentagonal* habit of the twinned crystals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120584, 122769.

Total	99.89	99.62	100.00

(1) Cripple Creek, Colorado, USA. (2) The Geysers, California, USA. (3) $MgSO_4 \cdot 5H_2O$.

Mineral Group: Chalcanthite group.

Occurrence: An efflorescence on shales (Grand Junction, Colorado, USA); an efflorescence on mine timbers (Virginia City, Nevada, USA); in acid sulfate soils (Basse-Casamance Valley, Senegal).

Association: Alunogen, chalcanthite.

Distribution: Modern confirmation of some localities listed would be desirable. In the USA, from Cripple Creek, Teller Co., and northwest of Grand Junction, in the West Salt Creek watershed, Mesa Co., Colorado; at The Geysers, Sonoma Co., California; from Virginia City, Comstock district, Storey Co., Nevada. At Copaquire, Tarapacá, Chile. In the Basse-Casamance Valley, Senegal.

Name: From the Greek *penta*, for *five*, alluding to the amount of water in its composition.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 492–493. (2) Baur, W.H. and J.L. Rolin (1972) Salt hydrates. IX. (1) Novofrolovskoye deposit, Russia. (2) Fuka, Japan. (3) $CaB_2O(OH)_6 \cdot 2H_2O$.

Occurrence: In boron-rich iron-ore skarns (Novofrolovskoye deposit, Russia); in a volcanogenic-sedimentary borate deposit (near the Studenitsa Cloister, Yugoslavia).

Association: Andradite–grossular, magnetite, szaibélyite (Novofrolovskoye deposit, Russia); colemanite, howlite, ulexite, studenitsite (near the Studenitsia Cloister, Yugoslavia).

Distribution: In Russia, from the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains, and at the Solongo boron deposit, Buryatia, Siberia. From the Sayak-IV boron deposit, northeast Balkhash region, Kazakhstan. Found near the Studenitsa Cloister, 280 km south of Belgrade, Yugoslavia. In Japan, at Fuka, near Bicchu, Okayama Prefecture.

Name: For the composition, originally described as a hydrated borate with five molecules of water per formula unit.

Type Material: All-Union Research Institute of Mineral Resources, Moscow, Russia.

Pentlandite $(Fe, Ni)_9S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, commonly in granular aggregates; rarely in crystals, to 10 cm, embedded in other sulfides.

Physical Properties: *Cleavage:* Parting on {111}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 VHN = 268–285 (100 g load). D(meas.) = 4.6–5.0 D(calc.) = 4.956

Optical Properties: Opaque. *Color:* Pale bronze-yellow; reddish brown when argentian. *Streak:* Pale bronze-brown. *Luster:* Metallic.
R: (400) 32.8, (420) 35.1, (440) 37.1, (460) 39.2, (480) 41.1, (500) 42.9, (520) 44.5, (540) 46.1, (560) 47.6, (580) 48.5, (600) 49.6, (620) 50.7, (640) 51.8, (660) 52.7, (680) 53.4, (700) 54.2

(1) Worthington mine, Sudbury, Canada; corresponds to $(Ni_{4.60}Fe_{4.30}Co_{0.17})_{\Sigma=9.07}S_{8.00}$. (2) Mt. Colin, Australia; by electron microprobe; corresponds to $(Ni_{4.16}Fe_{3.63}Co_{1.48})_{\Sigma=9.27}S_{8.00}$. (3) Mt. Dun area, New Zealand; by electron microprobe; corresponds to $(Fe_{5.89}Ni_{2.51}Co_{0.53})_{\Sigma=8.93}S_{8.00}$.

Polymorphism & Series: Forms a series with cobalt pentlandite.

Mineral Group: Pentlandite group.

Occurrence: Commonly intimately associated with pyrrhotite; in ultramafic rocks and perhaps derived from them by magmatic segregation; also found in mantle xenoliths and undersea "black smoker" deposits; rarely in meteorites.

Association: Pyrrhotite, troilite, chalcopyrite, cubanite, mackinawite, magnetite.

Distribution: The most important ore of nickel, occurring at many localities. From Craignure, near Inverary, Strathclyde, Scotland [TL]. At Wheals Jane and Falmouth, Kea, Cornwall, England. In Norway, from Espedalen, near Lillehammar, Opland. At Outokumpu, Vuonos, Miihkali, and Hietajärvi, in east Finland; in west Finland at the Hitura nickel deposit; and in north Finland at Rarrua. In South Africa, from the Rustenburg district, in the Merensky Reef, Bushveld complex, Transvaal. In New Zealand, in the Mount Dun area, Nelson Province. In Australia, in northwest Queensland, at Lime Creek and Mount Colin; from Coolgardie and Kambalda, 56 km south of Kalgoorlie, Western Australia; and at the Lord Brassey mine, Heazlewood, Tasmania. In the Kamishi mine, Iwate Prefecture, Japan. In Canada, from a number of mines at Sudbury, Ontario, and in the Voisey's Bay Ni–Cu–Co deposit, Labrador.

Name: To honor Joseph Barclay Pentland (1797–1873), Irish natural scientist and historian, who first noted the mineral.

Type Material: The Natural History Museum, London, England, 26622–26223.

Penzhinite $(Ag, Cu)_4Au(S, Se)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622. Intergrowths of elongate or platy grains, to 7 μm.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 8.35

Optical Properties: Opaque. *Color:* In reflected light, pale gray. *Anisotropism:* Evident; creamy yellow and greenish gray.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_322$. $a = 13.779$ $c = 16.980$ $Z = 18$

X-ray Powder Pattern: Sergeevskoye deposit, Russia.
2.59 (10), 2.71 (9), 2.14 (9), 2.11(9), 1.989 (6), 3.38 (5), 1.784 (5)

Chemistry:

	(1)
Ag	51.3
Au	24.3
Cu	3.1
Se	7.1
S	13.8
Total	99.6

(1) Sergeevskoye deposit, Russia; by electron microprobe, corresponding to $(Ag_{3.65}Cu_{0.32})_{\Sigma=3.97}Au_{0.97}(S_{3.31}Se_{0.69})_{\Sigma=4.00}$.

Occurrence: In a near-surface Au–Ag deposit.

Association: Gold, aguilarite, chalcopyrite, galena.

Distribution: From the Sergeevskoye Au–Ag deposit, 60 km northeast of Pevirechenskii, near the Penzhina River, northern Kamchatka, Russia [TL].

Name: For the Penzhina River, near the Kamchatka Peninsula, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82766.

Peprossiite-(Ce) $(Ce, La)Al_2B_3O_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. Crystals show a platy hexagonal outline, to 4 mm, in booklike aggregates or rosettes.

Physical Properties: *Cleavage:* Perfect on {0001}; distinct on $\{11\bar{2}0\}$. Hardness = ∼2 D(meas.) = 3.45(5) D(calc.) = 3.476

Optical Properties: Transparent to translucent. *Color:* Pale yellow, lemon-yellow; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.703(2)$ $\epsilon = 1.711(5)$

Cell Data: *Space Group:* $P\bar{6}2m$. $a = 4.612(1)$ $c = 9.374(3)$ Z = 1

X-ray Powder Pattern: Monte Cavalluccio, Italy.
3.67 (100), 3.04 (100), 2.458 (75), 2.308 (50), 2.020 (50), 1.953 (50), 1.855 (50)

Chemistry:

	(1)
B_2O_3	29.56
ThO_2	1.68
Al_2O_3	29.40
Ce_2O_3	18.62

Nd_2O_3	2.11
Dy_2O_3	0.06
CaO	1.34
H_2O	[0.08]
Total	[101.75]

(1) Monte Cavalluccio, Italy; by electron microprobe, B_2O_3 by ion microprobe, H_2O calculated for stoichiometry; then corresponds to $(Ce_{0.40}La_{0.32}Pr_{0.09}Ca_{0.09}Nd_{0.05}Th_{0.02})_{\Sigma=0.97}$ $Al_{2.04}B_{3.00}[O_{8.97}(OH)_{0.03}]_{\Sigma=9.00}$.

Occurrence: A very rare mineral, formed in cavities in sanidine ejecta by circulation of pneumatolytic to hydrothermal fluids, probably above 350 °C (Monte Cavalluccio, Italy).

Association: Sanidine, aegirine–augite, hellandite, zircon, titanite, magnetite (Monte Cavalluccio, Italy).

Distribution: In Italy, from Monte Cavalluccio, Campagnano, Lazio; at Cura di Vetralla and Capranico Vicano, Viterbo.

Name: To honor Giuseppe ("Pep") Rossi (1938–1989), mineralogist and crystallographer, University of Pavia, Pavia, Italy.

Type Material: University of Rome, Rome, Italy; Natural History Museum, Paris, France.

Peretaite $\mathbf{CaSb_4^{3+}O_4(SO_4)_2(OH)_2 \cdot 2H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are flattened on {100}, may be elongated along [001], bounded by {100}, {310}, {110}, {122}, {001}, {010}, {210}, {$\bar{2}$01}, {302}, {601}, to 5 mm; as divergent sprays of laths, botryoidal, massive. *Twinning:* On {100}, very common.

Physical Properties: *Cleavage:* On {100}, perfect. VHN = 170–190, 180 average (15 g load). Hardness = n.d. D(meas.) = > 3.8 D(calc.) = 4.06

Optical Properties: Transparent. *Color:* Colorless, pink to red from incrustations of valentinite. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Z = c$; $X \wedge b = \sim 28°$. $\alpha = 1.841(1)$ $\beta =$ n.d. $\gamma = 1.935(1)$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $C2/c$. $a = 24.665(4)$ $b = 5.6006(9)$ $c = 10.185(1)$ $\beta = 95.98(1)°$ Z = 4

X-ray Powder Pattern: Pereta mine, Italy; shows some preferred orientation due to {100} cleavage.
12.19 (100), 3.06 (67), 2.451 (31), 3.10 (24), 6.12 (21), 2.532 (20), 2.068 (17)

Chemistry:

SO_3	17.62	18.77
Sb_2O_3	69.09	68.33
CaO	6.44	6.57
H_2O	6.0	6.33
Total	99.15	100.00

(1) Pereta mine, Italy; CaO by AA, H_2O by TGA; corresponds to $Ca_{1.01}Sb_{4.17}O_4(SO_4)_{1.94}(OH)_{2.65} \cdot 2H_2O$. (2) $CaSb_4O_4(SO_4)_2(OH)_2 \cdot 2H_2O$.

Occurrence: Of rare occurrence, formed by the action of H_2SO_4 solutions on stibnite in the oxidized zone of a limestone-hosted hydrothermal antimony-bearing deposit.

Association: Stibnite, pyrite, kermesite, sulfur, valentinite, onoratoite, klebelsbergite, gypsum, calcite, quartz.

Distribution: In Italy, from the Pereta and Cetine mines, and at Micciano, near Larderello, Val di Cecina, Tuscany.

Name: For its occurrence at the Pereta mine, Italy.

Type Material: University of Florence, Florence, 164/I; Pisa University, Pisa, Italy; National Museum of Natural History, Washington, D.C., USA, 148481, 148482.

(1) Bell Pit, Maine, USA; by electron microprobe, average of three analyses, H_2O by difference; corresponding to $3(CaO)3.5(Al_2O_3)3(SiO_2)2(P_2O_5)18(H_2O)$.
(2) $Ca_3Al_7(SiO_4)_3(PO_4)_4(OH)_3 \cdot 16.5H_2O$. (3) Emmons mine, Maine, USA; average of 4 electron microprobe analyses, H_2O by difference, presence of Sr confirmed by EDS analysis; corresponding to $(Ca,Sr)_3Al_{7.7}Si_3P_4O_{23.5}(OH)_{14.1} \cdot 8H_2O$ or $3[(Ca,Sr)O]3.85(Al_2O_3)3(SiO_2)2(P_2O_5)15H_2O$.

Occurrence: As isolated masses in a vuggy, amblygonite-rich pegmatite (Bell Pit, Maine, USA).

Association: Siderite, wardite, amblygonite, eosphorite, sphalerite (Bell Pit, Maine, USA); fluellite, minyulite, wavellite (Tom's quarry, South Australia).

Distribution: In the USA, from Oxford Co., Maine, in the Bell Pit and Dunton mines, Newry; the Emmons quarry, Greenwood; and in the Ski Pike quarry, Cobble Hill, West Paris; at the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada. From Tom's quarry, Kapunda, and the Moculta quarry, Mount Lofty Ranges, South Australia.

Name: Honors Frank Croydon Perham (b. 1934), American geologist and pegmatite miner of West Paris, Maine, USA.

Type Material: The Natural History Museum, London, England (1976,424); National Museum of Natural History, Washington, D.C., USA, (135740, 143393).

(1) Monte Somma, Italy.

Mineral Group: Periclase group.

Occurrence: A product of the high-temperature metamorphism of magnesian limestones and dolostone.

Association: Forsterite, magnesite (Monte Somma, Italy); brucite, hydromagnesite, ellestadite (Crestmore quarry, California, USA); fluorellestadite, lime, periclase, magnesioferrite, hematite, srebrodolskite, anhydrite (Kopeysk, Russia).

Distribution: On Monte Somma, Campania, Italy. At Predazzo, Tirol, Austria. From Carlingford, Co. Louth, Ireland. At Broadford, Isle of Skye, and Camas Mòr, Isle of Muck, Scotland. From León, Spain. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From Nordmark and Långban, Värmland, Sweden. In mines around Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia. In the USA, at the Crestmore quarry, Riverside Co., California; from Tombstone, Cochise Co., Arizona; in the Gabbs mine, Gabbs district, Nye Co., Nevada. In Canada, at Oka, Quebec. From ten km west of Cowell, Eyre Peninsula, South Australia.

Name: From the Greek for *to break around*, in allusion to the perfect cubic cleavage.

Type Material: Natural History Museum, Paris, France, 96.1201.

(1) Långban, Sweden; after deduction of calcite and hausmannite, corresponds to $Pb_{1.01}Bi_{0.98}O_{3.96}Cl_{0.95}(OH)_{0.06}$.

Occurrence: In fissures in skarn in a metamorphosed Fe–Mn deposit (Långban, Sweden); in oxidized bismuth-bearing base metal deposits.

Association: Hausmannite, calcite (Långban, Sweden); galena, cerussite, plattnerite, kaolinite, muscovite, tourmaline (Glen Florrie Station, Western Australia); kettnerite, hemimorphite, embolite, fluorite, chrysocolla, quartz (Blue Bell claims, California, USA).

Distribution: From Långban, Värmland, Sweden. At Laurium, Greece, in slag. In the USA, from the Blue Bell claims, near Baker, San Bernardino Co., California; at a prospect about 13 km northeast of Benson, Cochise Co., and in the US Mine, near Wickenburg, Maricopa Co., Arizona; in a prospect on the west side of Cucomungo Wash, Tule Canyon district, Esmeralda Co., Nevada. On Glen Florrie Station, 1000 km north of Perth, Western Australia.

Name: Honors Per Adolf Geijer (1886–1976), Swedish economic geologist with the Geological Survey of Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; The Natural History Museum, London, England, 1980,106.

(1) Khibiny massif, Russia; corresponds to $K_{9.07}Na_{0.91}(Ca_{0.49}Sr_{0.46}Fe^{2+}_{0.08})_{\Sigma=1.03}(Al_{11.35}Fe^{3+}_{0.33}Mg_{0.05})_{\Sigma=11.73}Si_{24.27}O_{72.12}\cdot 15.2H_2O$.

Mineral Group: Zeolite group.

Occurrence: In nepheline-microcline and sodalite-astrophyllite veins in nepheline-feldspar and sodalite-microcline pegmatites in a differentiated alkalic massif (Khibiny massif, Russia).

Association: Pectolite, kalsilite, aegirine, wadeite, yuksporite (Khibiny massif, Russia).

Distribution: On Mts. Eveslogchorr and Yukspor, Khibiny massif, Kola Peninsula, and in the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: For LIliya ALekseevna PERekrest (1928–), Instructor in Mineralogy, Kirov Mining School, Kirovsk, Russia.

(1) Big Chief mine, South Dakota, USA; by electron microprobe, 11 points on 3 crystals, converted from elemental analysis; total Mn as MnO, total Fe reported as Fe_2O_3 then Fe^{2+}:Fe^{3+} apportioned for stoichiometry; corresponds to $(Ba_{0.89}Ca_{0.09})_{\Sigma=0.98}(Mn_{1.41}Fe^{2+}_{0.37}Mg_{0.11}Ca_{0.11})_{\Sigma=2.00}(Fe^{3+}_{1.96}Al_{0.04})_{\Sigma=2.00}(PO_4)_3(OH)_3$. (2) Spring Creek mine, Australia; by electron microprobe, total Mn as MnO; total Fe reported as Fe_2O_3 then Fe^{2+}:Fe^{3+} apportioned for stoichiometry; corresponds to $Ba_{1.09}(Mn_{1.43}Fe^{2+}_{0.38}Ca_{0.19}Mg_{0.03})_{\Sigma=2.03}(Fe^{3+}_{1.84}Al_{0.16})_{\Sigma=2.00}[(P_{0.99}As_{0.01})_{\Sigma=1.00}O_4]_3(OH)_3$.

Mineral Group: Bjarebyite group.

Occurrence: A rare secondary mineral in a complex zoned granite pegmatite (Big Chief mine, South Dakota, USA).

Association: Ludlamite, huréaulite, siderite, triphylite (Big Chief mine, South Dakota, USA); barite, copper, apatite (Spring Creek mine, Australia).

Distribution: From the Big Chief mine, one km south of Glendale, Pennington Co., South Dakota, USA. In the Spring Creek copper mine, near Wilmington, South Australia. At Hagendorf, Bavaria, Germany.

Name: Honoring Louis Perloff (1907–2004), American lawyer and collector of microscopic minerals, Tryon, North Carolina, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135925, 137015.

(1) Předbořice, Czech Republic; by electron microprobe, corresponds to $Cu_{3.01}(Sb_{0.89}As_{0.12})_{\Sigma=1.01}Se_{3.98}$. (2) Cu_3SbSe_4.

Mineral Group: Stannite group.

Occurrence: A product of epithermal hydrothermal mineralization.

Association: Berzelianite, hakite, eskebornite, umangite, naumannite, hematite, clausthalite, ferroselite, klockmannite, chalcopyrite, pyrite, gold, tetrahedrite, uraninite, goethite, calcite.

Distribution: From the Předbořice uranium deposit, near Krásna Hora, Czech Republic [TL].

Name: For François Permingeat (1917–1988), French mineralogist, University of Paul-Sabatier, Toulouse, France.

Type Material: Charles University, Prague, Czech Republic; National School of Mines, Paris, France.

Perovskite $CaTiO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. Commonly resemble distorted cubes, to 12 cm, striated ‖ [001] and [110], rarely cubo-octahedra or octahedra, with additional forms, skeletal, dendritic; reniform, granular massive. *Twinning:* 90°and 180° about [101], rarely 180° about [121], giving complex penetration twins; lamellar and sectored.

Physical Properties: *Cleavage:* {001}, imperfect. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 3.98–4.26 D(calc.) = 4.02 (synthetic).

Optical Properties: Opaque, transparent in thin fragments. *Color:* Iron-black, brown, reddish brown to yellow; colorless to dark brown in transmitted light; dark bluish gray in reflected light. *Streak:* White to grayish white. *Luster:* Adamantine to metallic; may be dull.
Optical Class: Biaxial (+); commonly isotropic. *Pleochroism:* Weak; $Z > X$. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$. $n = 2.34$–2.37 $2V(meas.) = 90°$

(1) Val d'Aosta, Italy. (2) Vogtsberg, Germany; corresponds to $(Ca_{0.61}Fe^{2+}_{0.12}Na_{0.08}RE_{0.03}K_{0.01})_{\Sigma=0.85}(Ti_{0.71}Nb_{0.29}Al_{0.02}Si_{0.01})_{\Sigma=1.03}O_3$. (3) $CaTiO_3$.

Mineral Group: Perovskite group; $Ca_A > 0.5$; $Ti_B > 0.5$.

Occurrence: An accessory mineral in alkaline mafic rocks, as nepheline syenites, kimberlites, carbonatites, commonly deuteric; in calcareous skarns. A common accessory in Ca–Al-rich inclusions in some carbonaceous chondrites.

Association: Åkermanite–gehlenite, nepheline, titanite, ilmenite, magnetite.

Distribution: Many localities. Large crystals at the Akhmatovsk mines, near Zlatoust, Ural Mountains, and from the Lovozero massif, Kola Peninsula, Russia. At Norrvik, and on Alnö Island, Sweden. From Zermatt, Valais, Switzerland. At Schelingen and Vogtsberg, Kaiserstuhl, Baden-Württemberg; Oberwiesenthal, Saxony; and in the Eifel district, Germany. In Italy, from St. Ambrogio and the Val di Susa, Piedmont, and in the Val Malenco, Lombardy. At the Jacupiranga mine, São Paulo, Brazil. Large crystals from the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. At Oka, Quebec, Canada. In the USA, from the Crestmore quarry, Riverside Co., and near the Gem mine, San Benito Co., California; in a large deposit in the Iron Hill carbonatite, Gunnison Co., Colorado; at Magnet Cove, Hot Spring Co., Arkansas.

Name: To honor Count Lev Alekseevich Perovskii (1792–1856), Russian mineralogist, of St. Petersburg, Russia.

(2) Bjørkedalen, Norway; by electron microprobe, original total given as 101.11%; $RE_2O_3 = Pr_2O_3$ 2.16%, Nd_2O_3 2.25%, Tb_2O_3 0.13%, Yb_2O_3 0.11%; corresponds to $(La_{1.51}Ce_{1.30}Ca_{0.47}RE_{0.37}Na_{0.18}Sr_{0.14}Th_{0.03})_{\Sigma=4.00}(Ti_{2.81}Fe^{2+}_{1.33}Ca_{0.36}Mn_{0.28}Mg_{0.12}Al_{0.09})_{\Sigma=4.99}Si_{4.02}O_{22}$.

Polymorphism & Series: Dimorphous with chevkinite.

Occurrence: In sands derived from weathered tuffs (Nettuno, Italy); in pockets in "hypersthene" granodiorite (Burley Farm, Virginia, USA); in syenite pegmatites (Oslo, Norway).

Association: Microcline, aegirine, loparite, pyrophanite (Oslo, Norway).

Distribution: In Italy, at Nettuno, Lazio, and on Mt. Amiata, Tuscany. In the USA, in Virginia, on the Burley Farm and at Wares Gap, Amherst Co., north of Chamblissburg, Bedford Co., and on Hat Creek and east of Roseland, Nelson Co.; in Nebraska, at Chimney Rock, Morrill Co.; from near Yucca Mountain, Nye Co., Nevada. At the Desmont mine, near Wilberforce, and west of Golden Lake, Ontario, Canada. From near Bangalore, Karnataka, and at Kanjamalaiu, near Salem, Tamil Nadu, India. At Omiya, Kyoto Prefecture, Japan. In the Orlovsk massif, Altai Mountains, and the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, Russia. From Mantyharju, Finland. At Sogndal, Bjørkedalen, and Sandefjord, near Oslo, Norway. From Bingre, Mozambique.

Name: For Carlo Perrier (1886–1948), Italian mineralogist.

Type Material: n.d.

(1) Dellen quarry, near Mendig, Eifel Mts., Rhineland-Palatinate, Germany; average of 7 electron microprobe analyses, Fe^{2+}/Fe^{3+} ratio from structure analysis; corresponding to $(La_{1.70}Ce_{1.45}Nd_{0.15}Pr_{0.06}Ca_{0.70})_{\Sigma=4.06}(Fe^{2+}_{0.53}Mn_{0.38}Mg_{0.08})_{\Sigma=0.99}(Ti_{2.44}Fe^{3+}_{0.80}Al_{0.62}Nb_{0.07})_{\Sigma=3.93}Si_{4.04}O_{22}$.

Mineral Group: Chevkinite group.

Occurrence: In miarolitic cavities in sanidinite lava rock, probably pneumatolytic.

Association: Sanidine, phlogopite, pyrophanite, zirconoiite, jakobsite, magnetite, fluorcalciopyrochlore, zircon.

Distribution: In the Dellen quarry, near Mendig, Laacher See region, Eifel Mts., Rhineland-Palatinate (Rheinland-Pfalz), Germany.

Name: For the La-dominant member of the *perrierite* structure type.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia; 4059/1.

(1) Cap Garonne mine, France; by electron microprobe, average of five analyses on two crystals; corresponds to $Hg_{5.04}Ag_{4.03}S_{3.96}(Cl_{1.55}I_{1.55}Br_{0.87})_{\Sigma=3.97}$. (2) Broken Hill, Australia; by electron microprobe, average of seven analyses; corresponding to $Hg_{5.00}Ag_{4.20}S_{5.45}(I_{1.60}Cl_{1.55}Br_{0.25})_{\Sigma=3.40}$. (3) Coppin Pool, Australia; by electron microprobe, average of 32 analyses on two specimens; corresponds to $Hg_{5.18}Ag_{4.75}S_{6.00}(Cl_{2.40}I_{1.81}Br_{0.98})_{\Sigma=5.19}$.

Occurrence: An alteration of tennantite in sandstones and conglomerates (Cap Garonne mine, France); in a quartz vein carrying oxidized galena (Coppin Pool, Australia).

Association: Mercurian and argentian tennantite, secondary copper minerals (Cap Garonne mine, France); iodargyrite, gold, kaolinite (Broken Hill, Australia); anglesite, cerussite, phosgenite, covellite, pyromorphite, cinnabar (Coppin Pool, Australia).

Distribution: From the Cap Garonne mine, near le Pradet, Var, France [TL]. At the Schöne Aussicht mine, near Dernbach, North Rhine-Westphalia, Germany. In Australia, from Broken Hill, New South Wales; at Coppin Pool, Pilbara district, and from the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia.

Name: For Professor Pierre Perroud (1943–), Voltaire College, Geneva, Switzerland, for his work on Cap Garonne mine minerals.

Type Material: Natural History Museum, Geneva, Switzerland; Government Chemical Laboratories, Perth; Museum Victoria, Melbourne, Australia.

(1) Horse Creek meteorite; by electron microprobe, corresponds to $(Ni_{7.35}Fe_{0.39})_{\Sigma=7.74}(Si_{2.28}P_{0.72})_{\Sigma=3.00}$. (2) Mt. Egerton meteorite; by electron microprobe, corresponds to $(Ni_{7.29}Fe_{1.00})_{\Sigma=8.29}(Si_{2.37}P_{0.63})_{\Sigma=3.00}$.

Occurrence: In anomalously silicon-rich mesosiderite and enstatite chondrite meteorites, probably formed by exsolution from kamacite.

Association: Kamacite, troilite, schreibersite (Horse Creek, Kota-Kota meteorites); kamacite, enstatite (South Oman meteorite).

Distribution: In the Horse Creek and Mount Egerton iron meteorites, and the Kota-Kota, South Oman, St. Marks, Norton County, Indarch, and other enstatite chondrite meteorites.

Name: For Stuart Hoffman Perry (1874–1957), American newspaperman and leading private collector of meteorites, who originally described the Horse Creek meteorite.

Type Material: National Museum of Natural History, Washington, D.C., USA.

(1) Rubicon pegmatite, Namibia; Si and Al by XRF, other elements by AA, loss on ignition taken as H_2O^+; corresponds to $Li_{0.92}Al_{0.99}Si_{3.99}O_{10}$.

Occurrence: In granite pegmatites, locally constituting an ore of lithium.

Association: Spodumene, pollucite, lepidolite, tourmaline, topaz, albite, microcline, quartz.

Distribution: On the Island of Utö, and in the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. Around San Piero in Campo, Elba, Italy. From Hirvikallio, Tammela, and Pajula, Finland. From the Rubicon pegmatite, south of Karibib, Namibia. At Bikita, Zimbabwe. In the USA, at Peru, Oxford Co., Maine; from Bolton, Worcester Co., Massachusetts; in California, on Queen and Hiriart Mountains, Pala, and in the Clark vein at Rincon, San Diego Co. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada. In Brazil, from Minas Gerais, in the Maxixe, Lavra Velha, and Lavra do Genipapo pegmatites, near Araçuaí, and in the Taquaral mine, Itinga. In the Londonderry quarry, Coolgardie, Western Australia. At Nagatareyama, Fukuoka Prefecture, Japan. Additional minor localities are known.

Name: From the Greek for *leaf*, in allusion to its perfect basal cleavage.

Type Material: Mining Academy, Freiberg, Germany, 26512.

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of five analyses, H_2O by TGA; one of the H_2O molecules is assumed to be adsorbed based on the crystal structure analysis and IR absorption studies; corresponds to $(Na_{4.69}Ca_{0.13}K_{0.05})_{\Sigma=4.87}(Zr_{2.01}Ti_{0.01})_{\Sigma=2.02}Si_6O_{18}[(OH)_{0.60}Cl_{0.48}]_{\Sigma=1.08}\cdot 3.01H_2O$.

Mineral Group: Lovozerite group.

Occurrence: In a biotite-microcline xenolith and in pegmatitic veins in a nepheline syenite in an intrusive alkalic gabbro-syenite complex.

Association: Biotite, microcline, catapleiite, apatite, zircon, natrolite, nepheline, cancrinite, eudialyte, aegirine, mosandrite, analcime, ancylite, fluorite, sodalite, låvenite, astrophyllite, pyrochlore, calcite, rhodochrosite, albite, arfvedsonite, galena, pyrrhotite.

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: In honor of Dr. Peter Tarasoff, amateur mineralogist, Dollard-des-Ormeaux, Quebec, Canada.

Type Material: Royal Ontario Museum, Toronto, M36456–M36458; Canadian Geological Survey, Ottawa; Canadian Museum of Nature, Ottawa, Canada, 43721, 43630, 43631; National Museum of Natural History, Washington, D.C., USA, 148593, 148594.

Peterbaylissite $Hg_3^{1+}(CO_3)(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$. Euhedral to subhedral crystals, to 0.2 mm, elongated parallel [001], wedgelike, may be platy; isolated and in clusters.

Physical Properties: *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = < 5
D(meas.) = n.d. D(calc.) = 7.14

Optical Properties: Opaque. *Color:* Black to dark red-brown; in polished section, gray with slight blue tinge. *Streak:* Dark brownish black. *Luster:* Submetallic to adamantine. *Optical Class:* Biaxial. *Anisotropism:* Weak, dark gray to brown. *Bireflectance:* Weak to moderate.

R_1–R_2: (400) 12.0–13.2, (420) 11.8–12.8, (440) 11.6–12.6, (460) 11.5–12.3, (480) 11.3–12.1, (500) 11.2–11.9, (520) 11.1–11.7, (540) 11.0–11.6, (560) 10.9–11.5, (580) 10.9–11.5, (600) 10.8–11.4, (620) 10.7–11.3, (640) 10.8–11.2, (660) 10.6–11.2, (680) 10.6–11.2, (700) 10.6–11.2

Cell Data: *Space Group: Pcab.* $a = 11.130(2)$ $b = 11.139(3)$ $c = 10.725(3)$ Z = 8

X-ray Powder Pattern: Clear Creek claim, California, USA.
2.648 (100), 2.969 (70), 2.786 (70), 2.419 (60), 4.84 (50), 6.35 (40), 4.95 (40)

Chemistry:

	(1)	(2)
CO_2	n.d.	6.16
Hg_2O	87.4	87.54
H_2O	n.d.	6.30
Total		100.00

(1) Clear Creek claim, California, USA; by electron microprobe, average of two analyses; $(CO_3)^{2-}$, $(OH)^{1-}$, H_2O, confirmed by IR, the chemical formula determined by crystal-structure analysis. (2) $Hg_3(CO_3)(OH)\cdot 2H_2O$.

Polymorphism & Series: Dimorphous with clearcreekite.

Occurrence: Very rare in a mercury deposit in silicate–carbonate rock, hydrothermally altered from serpentinite, probably formed as an alteration product of cinnabar.

Association: Ferroan magnesiochromite, ferroan magnesite, cinnabar, metacinnabar, mercury, quartz.

Distribution: From near the Clear Creek mercury mine, New Idria district, San Benito Co., California, USA.

Name: Honoring Dr. Peter Bayliss (1936–), Professor of Mineralogy, University of Calgary, Calgary, Canada, for his many contributions to mineralogy.

Type Material: The Natural History Museum, London, England, 1993,431 and E.1492; Canadian Geological Survey, Ottawa, Canada, 67533.

Nd_2O_3	5.82	5.20			

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of analyses on three grains, CO_2 calculated from crystal-structure analysis; corresponds to $(Na_{3.75}Ca_{0.16})_{\Sigma=3.91}(Ce_{0.96}La_{0.59}Nd_{0.23}Sr_{0.11}Pr_{0.08}Sm_{0.02}Ba_{0.01})_{\Sigma=2.00}(CO_3)_5$. (2) Mt. Koashva, Kola Peninsula, Russia; by electron microprobe, CO_2 calculated for stoichiometry; corresponds to $(Na_{3.70}Ca_{0.30})_{\Sigma=4.00}(Ce_{0.71}La_{0.48}Ca_{0.34}Sr_{0.25}Nd_{0.20}Pr_{0.06}Th_{0.02}Ba_{0.02}Sm_{0.01})_{\Sigma=2.09}(CO_3)_5$.

Occurrence: A rare component in pegmatites in nepheline–sodalite syenite near a contact with a hornfels unit, associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in the core of a large pegmatite in a differentiated alkalic massif (Mt. Koashva, Kola Peninsula, Russia).

Association: Aegirine, albite, microcline, "biotite", "chlorite", polylithionite, calcite, rhodochrosite, analcime, catapleiite, epididymite, eudialyte, serandite, fluorite, galena, sphalerite, trona, shomiokite-(Y), adamsite-(Y) (Mont Saint-Hilaire, Canada); aegirine, nacaphite, vitusite-(Ce), pectolite, thermonatrite, lomonosovite, sazykinaite-(Y) (Mt. Koashva, Kola Peninsula, Russia).

Distribution: From Mont Saint-Hilaire, Quebec, Canada. On Mt. Koashva, Khibiny massif, Kola Peninsula, Russia.

Name: To honor Dr. Ole Valdemar Petersen (1939–), Curator, Geology Museum, Copenhagen, Denmark, for his work on the mineralogy of alkaline rocks.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81511.

References: (1) Grice, J.D., J. Van Velthuizen, and R.A. Gault (1994) Petersenite-(Ce), a new mineral from Mont Saint-Hilaire, and its structural relationship to other REE carbonates. Can. Petersite-(Y) $(Ca, Y, Ce, Nd)Cu_6(PO_4)_3(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6. As prismatic crystals, showing only $\{10\bar{1}0\}$ and {0001}, to 0.1 mm, in clusters and radiating sprays, which may be nearly spherical.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.41 D(calc.) = 3.40

Optical Properties: Semitransparent. *Color:* Bright yellowish green. *Luster:* Highly vitreous on $\{10\bar{1}0\}$ to dull on {0001}.
Optical Class: Uniaxial (+). *Pleochroism:* Strong; O = light yellowish green; E = green.
Absorption: $E \gg O$. $\omega = 1.666(4)$ $\epsilon = 1.747(4)$

Cell Data: *Space Group:* $P6_3/m$ or $P6_3$. $a = 13.288(5)$ $c = 5.877(5)$ Z = 2

X-ray Powder Pattern: Laurel Hill, New Jersey, USA.
11.6 (100), 2.433 (60), 4.36 (50), 3.49 (40), 2.877 (40), 2.509 (30), 1.961 (20)

Chemistry:

	(1)
P_2O_5	23.1
Y_2O_3	2.5
La_2O_3	1.0
Ce_2O_3	2.5
Nd_2O_3	1.2
Sm_2O_3	1.2
FeO	0.8
CuO	52.1
CaO	2.4
H_2O	[13.2]
Total	[100.0]

(1) Laurel Hill, New Jersey, USA; total Fe as FeO, determined by microchemical test, H_2O by difference; corresponds to $(Ca_{0.40}Y_{0.20}Ce_{0.14}Nd_{0.12}Fe_{0.10}Sm_{0.06}La_{0.06})_{\Sigma=1.08}$ $Cu_{6.04}(PO_4)_3(OH)_{5.80} \cdot 3.39H_2O$.

Mineral Group: Mixite group.

Occurrence: A very rare secondary mineral in biotite-plagioclase hornfels near a diabase stock cutting Triassic sediments (Laurel Hill, New Jersey, USA).

Association: Chalcopyrite, malachite, chrysocolla, hematite, chlorite, "opal" (Laurel Hill, New Jersey, USA); malachite, quartz (Herrensegen mine, Germany).

Distribution: From Laurel Hill, Secaucas, Hudson Co., New Jersey, USA. In Germany, from the Herrensegen mine, near Schapbach, and the Silberbrünnle mine, near Gengenbach (Nd-rich), Black Forest. At the Sa Duchessa mine, Oridda district, Sardinia. From the Hanama quarry, Hai-Yama, Shiga Prefecture, Japan.

Name: To honor the brothers Thomas A. Peters (1947–), Curator of minerals at the Paterson Museum, Paterson, New Jersey, USA, and Joseph Peters (1951–), on the mineralogy curatorial staff of the American Museum of Natural History, New York City, New York, USA, and for *yttrium* as the dominant rare-earth element.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148973.

Petewilliamsite $(Ni,Co)_{30}(As_2O_7)_{15}$

Crystal Data: Monoclinic. *Point Group:* 2. As crudely formed equant grains, to 0.5 mm, with rounded crystal faces.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = <5 D(meas.) = n.d. D(calc.) = 4.904

Optical Properties: Translucent. *Color:* Dark violet-red to dark brownish red, dark gray in reflected light with orange to multicolored internal reflections. *Streak:* Pale reddish brown to purplish brown. *Luster:* Vitreous. Megascopically indistinguishable from brownish purple xanthiosite.
R = (470) 9.59, (546) 9.32, (589) 9.27, (650) 9.33

Cell Data: *Space Group: C2.* a = 33.256(5) b = 8.482(1) c = 14.191(2) β = 104.145(3)°
Z = 2

X-ray Powder Pattern: Johanngeorgenstadt, Saxony, Germany.
3.118 (100), 3.005 (60), 2.567 (50), 1.637 (50), 4.235 (30), 1.507(30B), 2.452 (20)

Chemistry:

	(1)	(2)
NiO	19.45	18.47
CoO	18.39	17.74
CuO	3.40	3.35
CaO	0.17	
FeO	0.04	
As_2O_5	60.32	60.45
Total	101.77	100.00

(1) Johanngeorgenstadt, Saxony, Germany; average of 3 electron microprobe analyses, corresponding to $(Ni^{2+}_{14.66}Co^{2+}_{13.82}Cu^{2+}_{2.41}Ca_{0.17}Fe^{2+}_{0.03})_{\Sigma=31.09}(As^{5+}_{1.97}O_7)_{15}$.
(2) $(Ni_{14.1}Co_{13.5}Cu_{2.4})_{\Sigma=30}(As_2O_7)_{15}$.

Occurrence: Known from one specimen; therein the product of oxidation of nickeline.

Association: Xanthiosite, aerugite, paganoite, nickeline, bismuth, bunsenite, rooseveltite, quartz.

Distribution: Johanngeorgenstadt, Saxony, Germany.

Name: Honors geochemist–crystallographer Professor Peter Allan Williams (b. 1950) of the University of Western Sydney, New South Wales, Australia.

Type Material: Systematic Reference Series of the National Mineral Collection, Geological Survey of Canada, Ottawa, Ontario (#68097), and the Natural History Museum, London, England; BM 2003, 6.

Mineral., 90, 273 (abs. ref. 1).

Petitjeanite $Bi_3O(PO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are poorly developed, tabular on {100}, elongated along [001], showing {010}, {001}, {011}, small {$\overline{1}$10}, to 0.2 mm, in spherical aggregates and crusts. *Twinning:* Common, interpenetrant, by rotation about [010].

Physical Properties: *Fracture:* Conchoidal. Hardness = 4.5 VHN = 360(30) (25 g load). D(meas.) = n.d. D(calc.) = 6.99

Optical Properties: Transparent to translucent in thin fragments. *Color:* White, pale pink, pale to dark yellow; may be dark brown to nearly black. *Streak:* White. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Dispersion:* $r > v$, distinct. $\alpha = 2.06(2)$ β = n.d. $\gamma = 2.13(2)$ $2V(meas.) = 75(5)^\circ$

Cell Data: *Space Group:* [$P\overline{1}$] (by analogy to preisingerite). $a = 9.798(3)$ $b = 7.250(3)$ $c = 6.866(2)$ $\alpha = 88.28(2)^\circ$ $\beta = 115.27(2)^\circ$ $\gamma = 110.70(3)^\circ$ Z = 2

X-ray Powder Pattern: Gadernheim, Germany; very similar to preisingerite and schumacherite.
3.188 (100), 3.135 (95), 3.247 (87), 3.026 (75), 2.953 (47), 4.437 (46), 2.165 (41)

Chemistry:

	(1)	(2)	(3)
P_2O_5	14.34	14.72	16.70
As_2O_5	2.99	2.93	
V_2O_5	0.01	0.02	
Bi_2O_3	76.04	75.26	82.24
PbO	3.39	4.88	
H_2O	[1.18]	[1.25]	1.06
Total	[97.95]	[99.06]	100.00

(1–2) Gadernheim, Germany; by electron microprobe, averages of five and eight analyses, H_2O calculated for charge balance; (1) corresponds to $(Bi_{2.86}Pb_{0.13})_{\Sigma=2.99}O_{0.85}[(PO_4)_{1.77}(AsO_4)_{0.23}]_{\Sigma=2.00}(OH)_{1.15}$. (3) $Bi_3O(PO_4)_2(OH)$.

Polymorphism & Series: Forms series with preisingerite and schumacherite.

Occurrence: A rare secondary mineral in a silicified barite vein (Gadernheim, Germany).

Association: Bismutite, mixite, reichenbachite, pyromorphite, malachite (Gadernheim, Germany).

Distribution: In Germany, from Gadernheim, and on the Hohenstein, near Reichenbach, Hesse; at the Pucher shaft, Schneeberg, Saxony. From near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně (Marienbad), Czech Republic.

Name: Honoring Klaus Petitjean, amateur mineral collector who has discovered several new species in the Reichenbach, Germany district.

Type Material: Mineralogy Institute, Ruhr University, Bochum, Germany.

References: (1) Krause, W., K. Belendorff, and H.-J. Bernhardt (1993) Petitjeanite, Bi_3O additional data for the corresponding arsenate and vanadate, preisingerite and schumacherite. Neues Jahrb. Mineral., Monatsh., 487–503. (2) (1994) Amer. Mineral., 79, 764–765 (abs. ref. 1).

Petscheckite $U^{4+}Fe^{2+}(Nb,Ta)_2O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal; metamict. *Point Group:* $\overline{3}\ 2/m$. In elongated hexagonal crystals, to 4 cm.

Physical Properties: Hardness = ∼5 D(meas.) = ∼7 D(calc.) = 7.2 Radioactive.

Optical Properties: Opaque. *Color:* Black; white with orange tinge in reflected light, with red-brown internal reflections. *Streak:* Brownish black. *Luster:* Metallic.
Optical Class: Isotropic.
R: ∼15

Cell Data: *Space Group:* $P\overline{3}1m$ for material heated to 650 °C. $a = 6.42$ $c = 4.02$ Z = 1

X-ray Powder Pattern: Berere, Madagascar; after heating at 650 °C.
4.02 (10), 3.21 (10), 2.51 (8), 1.697 (4d), 1.850 (3), 2.01 (2), 1.861 (2)

Chemistry:

Total	99.59

(1) Berere, Madagascar; ["oxy-petscheckite" with Fe^{2+} oxidized to Fe^{3+}] corresponding to $(U_{0.91}Ca_{0.05}Zr_{0.02}K_{0.01})_{\Sigma=0.99}(Fe^{3+}_{0.64}Mn^{2+}_{0.11}Al_{0.08}Fe^{2+}_{0.01})_{\Sigma=0.84}(Nb_{1.55}Ta_{0.33}Fe_{0.12})_{\Sigma=2.00}O_8$.

Occurrence: An accessory mineral in a zoned pegmatite.

Association: Magnetite, columbite, liandratite, pyrochlore, strüverite, monazite, ilmenite, garnet, tourmaline, beryl, quartz, feldspar.

Distribution: From the Antsakoa I pegmatite, near Berere, about 40 km northeast of Tsaratanana, Madagascar.

Name: Honors Eckehard Petsch, of Idar-Oberstein, Germany, who prospected extensively in Madagascar.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145619.

References: (1) Mücke, A. and H. Strunz (1978) Petscheckite and liandratite, two new pegmatite minerals from Madagascar. Amer. Mineral., 63, 941–946.

Petterdite $\mathbf{PbCr_2^{3+}(CO_3)_2(OH)_4 \cdot H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 15 μm, roughly rectangular, flattened on {010} and elongated along [001] or [100], with frayed and corroded terminations in the direction of [001]. These are loosely stacked and randomly aggregated in botryoidal, earthy to porous crusts.

Physical Properties: *Cleavage:* On {100}, fair; on {010}, possible. Hardness = ∼2 (by analogy with dundasite). D(meas.) = n.d. D(calc.) = 3.947

Optical Properties: Translucent. *Color:* Pale to deep lilac, pinkish violet, pale gray. *Streak:* Pale violet. *Luster:* Pearly to earthy.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = colorless to pale grayish pink; Z = grayish pink. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Absorption:* $X < Z$. $\alpha = 1.704(5)$ $\beta = \sim 1.802$ $\gamma = 1.842(5)$ 2V(meas.) = n.d. 2V(calc.) = ∼62°

Cell Data: *Space Group:* [*Pbnm*] (by analogy to dundasite). $a = 9.079(3)$ $b = 16.321(9)$ $c = 5.786(7)$ Z = 4

X-ray Powder Pattern: Red Lead mine, Tasmania, Australia.
7.937 (100), 3.633 (70), 4.686 (50b), 3.270 (40), 2.718 (40), 2.690 (40), 6.091 (30)

Chemistry:

	(1)	(2)
Sb_2O_5	0.67	
CO_2	18.3	17.02
Cr_2O_3	22.64	29.38
Al_2O_3	3.65	
PbO	43.33	43.15
SrO	1.40	
H_2O	[10.01]	10.45
Total	[100.00]	100.00

(1) Red Lead mine, Tasmania, Australia; by electron microprobe, total Sb as Sb_2O_5, total Cr as Cr_2O_3, CO_2 by CHN analyzer, H_2O by difference; presence of $(CO_3)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR; corresponds to $(Pb_{0.99}Sr_{0.07})_{\Sigma=1.06}(Cr_{1.52}Al_{0.36}Sb_{0.02})_{\Sigma=1.90}(CO_3)_{2.12}(OH)_{3.62} \cdot 1.02H_2O$. (2) $PbCr_2(CO_3)_2(OH)_4 \cdot H_2O$.

Occurrence: A rare secondary species probably formed by alteration of galena by Cr-bearing meteoric waters (Red Lead mine, Australia); in the oxidation zone of a hydrothermal vein cutting serpentinite (Callenberg mine, Germany).

Association: Anglesite, crocoite, "limonite" (Red Lead mine, Australia); crocoite, cerussite, bindheimite, pyromorphite, galena (Callenberg mine, Germany).

Distribution: From the Red Lead mine, Dundas, Tasmania, Australia. In the Callenberg nickel mine, near Hohenstein-Ernstthal, Saxony, Germany.

Name: Honors William Frederick Petterd (1849–1910), mineral collector who published several catalogs of Tasmanian mineral occurrences.

Type Material: Museum Victoria, Melbourne, Australia, M38601.

Petzite Ag_3AuTe_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 432. Massive, fine granular to compact and as irregular shaped blebs, to 2 mm.

Physical Properties: *Cleavage:* {001}. *Fracture:* Subconchoidal. *Tenacity:* Slightly sectile to brittle. Hardness = 2.5–3 VHN = 48 (10 g load). D(meas.) = 8.7–9.4 D(calc.) = 8.74

Optical Properties: Opaque. *Color:* Bright steel-gray to iron-gray to iron-black, commonly tarnished from bronze-yellow to sooty black; in reflected light, grayish white with a pale bluish tint. *Luster:* Metallic. *Anisotropism:* Noticeable in part.
R: (400) 45.0, (420) 43.7, (440) 42.4, (460) 41.4, (480) 40.6, (500) 39.9, (520) 39.3, (540) 38.8, (560) 38.5, (580) 38.3, (600) 38.2, (620) 38.1, (640) 38.0, (660) 37.8, (680) 37.8, (700) 37.8

Cell Data: *Space Group:* $I4_132$. $a = 10.385(4)$ $Z = 8$

X-ray Powder Pattern: Botés, Romania.
2.77 (100), 2.12 (80), 2.03 (70), 2.44 (60), 2.32 (60), 7.31 (50), 1.893 (50)

(1) Kalgoorlie, Australia. (2) Mother Lode district, California, USA. (3) Ag_3AuTe_2.

Occurrence: With other tellurides in vein-controlled gold deposits.

Association: Gold, hessite, sylvanite, krennerite, calaverite, altaite, montbrayite, melonite, frohbergite, tetradymite, rickardite, vulcanite, pyrite.

Distribution: Noted in small amounts at a number of localities other than those listed here. In Romania, from Săcărîmb (Nagyág) [TL], Botés, and Baia Sprie (Felsőbánya). At the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. From the Byn'govsk Au–Te deposit, Central Ural Mountains, Russia. In the Zhana-Tyube Au–Te deposit, northern Kazakhstan. In the USA, at Gold Hill, Boulder Co., Lake City, Hinsdale Co., and Leadville, Lake Co., Colorado; from California, in the Golden Rule and Norwegian mines, Tuttletown, and the Jamestown mine, Tuolumne Co., in the Stanislaus and Melones mines, Carson Hill district, Calaveras Co., and in other mines along the Mother Lode; from the Buster mine, Olinghouse district, Washoe Co., and elsewhere in Nevada. In Canada, at the Hollinger mine, Timmins, and the Lake Shore mine, Kirkland Lake, Ontario; in Quebec, at the Robb-Montbray mine, Montbray Township, the Noranda mine at Rouyn, the Horne mine at Noranda, and many other localities. From El Indio, east of Coquimbo, Chile. At Kalgoorlie, Western Australia. From the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. At the Bulawan deposit, Negros Occidental, Phillipines.

Name: After W. Petz, who first analyzed the mineral.

Type Material: Harvard University, Cambridge, Massachusetts, 99348; National Museum of Natural History, Washington, D.C., USA, R9556.

Pezzottaite $Cs(Be_2Li)Al_2Si_6O_{18}$

Crystal Data: Hexagonal. *Point Group*: $\bar{3}$ 2/*m*. As hexagonal tabular crystals, to 10 cm, or equant to elongated flat crystals. Well-formed crystals display dominant {001} and subordinate {100} and {101}. Also as subparallel or interpenetrant crystal aggregates.

Physical Properties: *Cleavage:* Imperfect on {001}. *Tenacity:* Brittle. *Fracture:* Conchoidal to irregular. Hardness = 8 D(meas.) = 2.97-3.14 (variable with Cs content) D(calc.) = 3.06

Optical Properties: Transparent to translucent. *Color:* Raspberry-red to pink. *Streak:* Colorless to white. *Luster:* Vitreous. Some specimens display chatoyancy.
Optical Class: Uniaxial (-). ε = 1.611 ω = 1.620 *Pleochroism:* Strong, *E* = Orange-red, *O* = Purple-violet.

Cell Data: Space Group: $R\bar{3}\,c$. a = 15.946(4) c = 27.803(8) Z = 18

X-ray Powder Pattern: Sakavalana pegmatite, Fianarantsoa province, central Madagascar. 3.271 (100), 2.871 (52), 3.027 (41), 3.019 (29), 2.215 (14), 1.636 (14), 2.229 (12), 1.749 (12)

Chemistry:

	(1)		(1)
SiO_2	54.58	Rb_2O	0.44
TiO_2	0.01	Cs_2O	18.23
Al_2O_3	16.88	Li_2O	2.12
FeO	0.02	BeO	8.14
MnO	0.02	H_2O	0.28
CaO	0.22	Total	101.54
Na_2O	0.46		
K_2O	0.14		

(1) Sakavalana pegmatite, Fianarantsoa province, central Madagascar; laser ablation ICP mass spectroscopic analysis, IR spectroscopy confirms H_2O; corresponds to $(Cs_{0.83}Rb_{0.03}Na_{0.10}K_{0.02}Ca_{0.02})_{\Sigma=1.00}(Be_{2.10}Li_{0.92})Al_{2.14}Si_{5.86}O_{18}$.

Occurrence: A late-stage hydrothermal mineral in miarolitic pockets in and near the core of a differentiated, rare-element, granitic pegmatite dike.

Association: Smoky quartz, K-feldspar (‘amazonite’), albite (‘cleavelandite’), tourmaline-group minerals, spodumene, lithian muscovite, danburite.

Distribution: From the Sakavalana pegmatite, Ampandramaika-Malakialina pegmatite district, a few kilometers northwest of Ambatovita village, Fianarantsoa province, central Madagascar. Also reported from Afghanistan and Myanmar.

Name: Honors Federico Pezzotta (b. 1965), mineralogist at the Natural History Museum, Milan, Italy, in recognition of his contributions to Madagascar mineralogy.

Type Material: National Museum of Natural History, Washington, D.C., USA; the Canadian Museum of Nature, Ottawa, Canada, and the Natural History Museum, Bern, Switzerland (NMBE-36990).

Pharmacolite $Ca(HAsO_4)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. Rarely as crystals, flattened on {010}, elongated along [001], showing {110}, {010}, {011}, {$\bar{1}$12}, several other forms. Commonly acicular, fibrous, to 1.5 cm; may be botryoidal to stalactitic.

Physical Properties: *Cleavage:* On {010}, perfect. *Fracture:* Uneven. *Tenacity:* Flexible. Hardness = 2–2.5 D(meas.) = 2.53–2.725 D(calc.) = 2.703

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale gray; colorless in transmitted light. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = -29°$. *Dispersion:* $r > v$. $\alpha = 1.583$ $\beta = 1.589$ $\gamma = 1.594$ 2V(meas.) = 79°24′

Cell Data: *Space Group:* Ia. $a = 5.9745(5)$ $b = 15.4340(15)$ $c = 6.2797(6)$ $\beta = 114°50(1)'$ Z = 4

X-ray Powder Pattern: Sainte-Marie-aux-Mines, France.
4.30 (10), 7.7 (9), 2.70 (9), 2.66 (9), 3.08 (8), 3.02 (8), 5.1 (7)

Total	100.09	100.00

(1) Sainte-Marie-aux-Mines, France. (2) $Ca(HAsO_4)\cdot 2H_2O$.

Occurrence: An uncommon secondary mineral formed by oxidation of earlier arsenic-bearing minerals.

Association: Picropharmacolite, hörnesite, haidingerite.

Distribution: In Germany, from Wittichen, Black Forest, in the Anton and Sofia mines; at St. Andreasberg, Harz Mountains; in the Rosenkrantz mine, Schneeberg, Saxony. At Nowa Ruda, Poland. Long crystals from Jáchymov (Joachimsthal), Czech Republic. At Săcărîmb, Romania. From Sainte-Marie-aux-Mines, Haut-Rhin, France. Found at Bou Azzer, Morocco. In the USA, at the Getchell mine, Potosi district, Humboldt Co., and the White Caps mine, Manhattan district, Nye Co., and the Gold Bar mine, Antelope district, Eureka Co., Nevada; at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the OK mine, San Gabriel Canyon, Los Angeles Co., California. Some additional older localities may require modern confirmation.

Name: From the Greek for *poison*, as an arsenic-containing mineral.

Pharmacosiderite $KFe_4^{3+}(AsO_4)_3(OH)_4 \cdot 6{-}7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Commonly in good crystals, dominantly cubic, striated diagonally, with minor {111}, {$\bar{1}$11}, {011}, {122}, to 2 cm. May be granular or earthy. *Twinning:* Lamellar, visible optically; rarely as twinned tetrahedra.

Physical Properties: *Cleavage:* On {001}, good to imperfect. *Fracture:* Uneven. *Tenacity:* Somewhat sectile. Hardness = 2.5 D(meas.) = 2.797 D(calc.) = 2.90 Weakly piezoelectric and pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Olive-green, grass-green, emerald-green, honey-yellow, yellowish brown, dark brown; less commonly hyacinth-red, brownish red; in transmitted light, green, yellow, pale brown, biaxially sectored. *Luster:* Adamantine to greasy.
Optical Class: Isotropic; commonly anomalously biaxial (+) or biaxial (–), with weak birefringence, perhaps showing six biaxial sectors. *Dispersion:* $r > v$ or $r < v$, strong. n = 1.687–1.704 α = 1.660–1.697 β = 1.661–1.700 γ = 1.663–1.704 2V(meas.) = Large.

Cell Data: *Space Group:* $P\bar{4}3m$. a = 7.93–7.98 Z = 1

X-ray Powder Pattern: Pednandrea mine, Cornwall, England. (ICDD 34-155).
4.61 (100), 8.0 (90), 2.408 (80), 3.259 (70), 2.822 (65), 1.7844 (65), 1.5959 (60)

Chemistry:

H_2O	18.85	17.72
Total	99.33	100.00

(1) Cornwall, England; K is exchangeable for H, Ba, Na, etc. (2) $KFe_4(AsO_4)_3(OH)_4 \cdot 6.5H_2O$

Occurrence: An oxidation product of arsenic-bearing sulfides.

Association: Scorodite, beudantite, carminite, arseniosiderite, symplesite, jarosite, "limonite".

Distribution: Many localities, in small amounts. In England, in Cornwall, from the Carharrack and Tincroft mines and Wheals Gorland and Unity, Gwennap, and a number of other localities; at many mines in Caldbeck Fells, Cumbria. From Vaulry, Haute-Vienne, and at the Cap Garonne mine, near le Pradet, Var, France. In Germany, from Dernbach and Horhausen, Rhineland-Palatinate; at the Clara mine, near Oberwolfach, and elsewhere in the Black Forest; from Schneeberg, Saxony, Germany. From Nova Bana, near Baňská Štiavnica (Schemnitz), Slovakia. In the USA, in the Mammoth mine, Tintic district, Juab Co., Utah; from the Northumberland mine, Nye Co., and as large crystals at the Majuba Hill mine, Antelope district, Pershing Co., Nevada. From Tsumeb, Namibia. At Broken Hill, New South Wales, Australia.

Name: From the Greek for *poison*, for the arsenic content, and *iron* in the composition.

(1) Sainte-Marie-aux-Mines, France; by AA, H_2O by the Penfield method.
(2) $Ca_3(AsO_4)_2 \cdot 11H_2O$.

Occurrence: A very rare post-mine low-temperature reaction product of carbonate gangue with arsenical solutions derived from arsenic (Sainte-Marie-aux-Mines, France).

Association: Picropharmacolite, pharmacolite, sainfeldite, rauenthalite, ferrarisite, löllingite, calcite, aragonite (Sainte-Marie-aux-Mines, France).

Distribution: From the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. In the Svatá Anna uranium deposit, Planá, near Mariánské Lázně (Marienbad), Czech Republic. At Schlema-Hartenstein, Saxony, and from the Bauhaus district, Richelsdorf Mountains, Hesse. In the Muckross mine, Co. Kerry, Ireland.

Name: From *Phaunoux*, the French name for the Rauenthal Valley, France, within which the mineral was first found.

Type Material: University of Torino, Torino, Italy; University of Strasbourg, Strasbourg; Natural History Museum, Paris; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 142221.

Phenakite Be_2SiO_4

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. Crystals rhombohedral, tabular to prismatic, less commonly long prismatic to acicular, to 20 cm. In columnar aggregates, as spherulites, and granular. *Twinning:* Penetration twins, by rotation about [0001].

Physical Properties: *Cleavage:* Distinct on $\{11\bar{2}0\}$, imperfect on $\{10\bar{1}1\}$.
Fracture: Conchoidal. *Tenacity:* Brittle. Hardness = 7.5–8 D(meas.) = 2.93–3.00
D(calc.) = 2.960 Bright blue cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Colorless, yellow, pink, brown; may be mottled. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.650–1.656$ $\epsilon = 1.667–1.670$

Cell Data: *Space Group:* $R\bar{3}$. $a = 12.472$ $c = 8.252$ Z = 18

X-ray Powder Pattern: Minas Gerais, Brazil.
3.119 (100), 3.66 (80), 2.518 (75), 2.358 (70), 2.187 (60), 2.079 (50), 6.24 (40)

(1) Ural Mountains, Russia. (2) Be_2SiO_4.

Occurrence: In pegmatites, greisens, and alpine and hydrothermal veins.

Association: Topaz, beryl, chrysoberyl, fluorite, muscovite, quartz.

Distribution: Numerous localities; some for fine crystals are: along the Tokovaya River, near Yekaterinburg (Sverdlovsk), Ural Mountains, and at Miass, Ilmen Mountains, Southern Ural Mountains, Russia. At several places around Kragerö, Norway. In France, in the Vosges Mountains, at Framont, Alsace. From near Reckingen, Valais, and many other places in Switzerland. At Leckbachrinne, Habachtal, Salzburg, Austria. In the USA, from near Florissant, El Paso Co., and on Mt. Antero, Chaffee Co., Colorado; on Bald Face Mountain, North Chatham, Carroll Co., New Hampshire; at Amelia, Amelia Co., Virginia. In Brazil, exceptional crystals in the São Miguel de Piracicaba pegmatite, 50 km east of Belo Horizonte, and at Catuqi, Minas Gerais; in the Socotó mine, northwest of Salvador, Bahia, and elsewhere. At Klein Spitzkopje, Namibia. From Anjanabonoina, Madagascar.

Name: From the Greek for *deceiver*, in allusion to its similarity to quartz when colorless.

Type Material: Mining Institute, St. Petersburg, Russia, 617/22.

Philipsbornite $PbAl_3(AsO_4)_2(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As pseudocubic rhombohedral crystals, with $\{10\overline{1}1\}$, $\{01\overline{1}2\}$, $\{0001\}$, to 100 μm; usually as massive to earthy crusts.

Physical Properties: *Fracture:* Conchoidal. Hardness = [∼4.5] (by analogy to hidalgoite). D(meas.) = > 4.1 D(calc.) = 4.33–4.45

Optical Properties: Translucent to transparent. *Color:* Colorless, grayish green; yellowish in transmitted light.
Optical Class: Biaxial in pseudocubic sectors, anomalously isotropic. $n = 1.790(3)$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.11$–7.17 $c = 17.05$–17.18 $Z = 3$

(1) Dundas, Tasmania; by electron microprobe, total Fe as Fe_2O_3, H_2O by LOI; corresponding to $(Pb_{0.90}Mn_{0.03})_{\Sigma=0.93}(Al_{2.76}Zn_{0.09}Cu_{0.07}Fe_{0.05})_{\Sigma=2.97}[(AsO_4)_{1.57}(CrO_4)_{0.40}(SO_4)_{0.10}]_{\Sigma=2.07}$ $H_{6.58}O_{5.72}$. (2) Tsumeb, Namibia; by electron microprobe, average of four analyses, total Fe as Fe_2O_3, H_2O by TGA. (3) $PbAl_3(AsO_4)_2(OH)_5 \cdot H_2O$.

Mineral Group: Crandallite group.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal polymetallic mineral deposits.

Association: Crocoite, hidalgoite, gorceixite (Tasmania); azurite, tsumcorite, bayldonite, malachite, hematite, quartz (Tsumeb, Namibia).

Distribution: In Australia, from the Dundas district, Tasmania, and in the Anticline and Bali Lo prospects, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. At Tsumeb, Namibia. From Cínovec (Zinnwald), and at Moldava, 20 km northwest of Teplice, Czech Republic. In Germany, from the Clara mine, near Oberwolfach, in the Michael mine, Weiler, near Lahr, and at Neubulach, Black Forest.

Name: Honors Hellmut von Philipsborn (1892–1983), Professor Emeritus of Mineralogy, University of Bonn, Bonn, Germany.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148463.

Philipsburgite $(Cu,Zn)_6(AsO_4,PO_4)_2(OH)_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [010], with prominent {100}, bounded by {010}, {001}, {111}, may be curved, with chisel-shaped terminations, to 1 mm, typically in subparallel rosettes, spherules, and crusts.

Physical Properties: Hardness = 3–4 D(meas.) = 4.07(10) D(calc.) = 4.04

Optical Properties: Transparent to translucent. *Color:* Bright emerald-green. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Moderate; X = pale green; $Y = Z$ = medium green. *Orientation:* $Z = b$; $Y \wedge c = 7°$. *Dispersion:* $r > v$, strong. *Absorption:* $Y = Z > X$.
$\alpha = 1.729(2)$ $\beta = 1.774(2)$ $\gamma = 1.775(2)$ 2V(meas.) = 16(2)° 2V(calc.) = 17°

Cell Data: *Space Group:* $P2_1/c$. $a = 12.33(8)$ $b = 9.20(4)$ $c = 10.69(3)$ $\beta = 96.92(35)°$

(1) Black Pine mine, Montana, USA; by electron microprobe, H_2O by TGA-EGA; corresponding to $(Cu_{4.30}Zn_{1.65})_{\Sigma=5.95}[(AsO_4)_{1.05}(PO_4)_{0.90}]_{\Sigma=1.95}(OH)_{6.03} \cdot 1.04H_2O$. (2) Potts Gill mine, England; by electron microprobe, partial analysis; corresponds to $(Cu_{4.92}Zn_{1.08})_{\Sigma=6.00}$ $[(AsO_4)_{1.48}(PO_4)_{0.52}]_{\Sigma=2.00}(OH)_6 \cdot H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal base-metal deposits.

Association: Bayldonite, chrysocolla, mimetite, quartz (Black Pine mine, Montana, USA); cornwallite, bayldonite, mimetite, malachite (Potts Gill mine, England).

Distribution: In the USA, from the Black Pine mine, about 14.5 km northwest of Philipsburg, Granite Co., Montana; large crystals in the Gold Hill mine, Tooele Co., and in the Centennial Eureka mine, Tintic district, Juab Co., Utah. In England, at the Potts Gill mine and the Low Pike vein, Caldbeck Fells, Cumbria; from Wheal Carpenter, Gwinear, and the Penberthy Croft mine, St. Hilary, Cornwall. At the Clara mine, near Oberwolfach, Black Forest, and from Schwarzenberg, Saxony, Germany. From Brixlegg, Tirol, Austria. In the Sa Duchessa mine, Oridda district, Sardinia, Italy. At the Christiana mine, Kamariza district, Laurium, Greece.

Name: For the town of Philipsburg, Montana, USA, near which the mineral was first found.

Type Material: Royal Ontario Museum, Toronto, Canada, M41000; National Museum of Natural History, Washington, D.C., USA, 161201.

(1) Mazé, Japan; corresponds to $(K_{0.79}Na_{0.68}Ca_{0.68}Fe_{0.08})_{\Sigma=2.23}(Si_{5.12}Al_{2.81})_{\Sigma=7.93}O_{16}\cdot 6.39H_2O$.

Mineral Group: Zeolite group.

Occurrence: Typically in cavities in basalt, of hydrothermal origin; an authigenic mineral in saline lake and hot spring deposits and calcareous deep-sea sediments.

Association: Zeolites, apophyllite, calcite, nosean, nepheline, olivine, melilite, celadonite.

Distribution: Many localities, although uncommon in large crystals. Well authenticated localities include: from Aci Castello, Sicily, and at Capo di Bove and other localities around Rome, Lazio, Italy. At Annerod, near Giessen, Hesse, and Asbach, Westerwald, Germany. Along the Giant's Causeway, Co. Antrim, Ireland. In the USA, from Oregon, at Wall Creek, near Monument, and Mount Vernon, Grant Co.; at Cape Lookout, Tillamook Co.; Spray, Wheeler Co.; and many other localities. At Mazé, Niigata Prefecture, Japan. At Richmond, Victoria, and Gads Hill, near Liena, Tasmania, Australia.

Name: For William Phillips (1775–1828), noted British mineralogist.

Philolithite

$\mathbf{Pb_{12}Mn^{2+}(Mg,Mn^{2+})_2}$
$\mathbf{(Mn^{2+},Mg)_4O_6(SO_4)(CO_3)_4Cl_4(OH)_{12}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are square tabular, {001}, {111}, modified by {110}, {112}, to 0.3 mm; may be aggregated in crusts. *Twinning:* Sectorial in four zones about [001], observed optically.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3–4
D(meas.) = n.d. D(calc.) = 5.91

Optical Properties: Semitransparent. *Color:* Pale to medium apple-green. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (+), anomalous. *Pleochroism:* Very weak; pale green to pale yellow-green. *Orientation:* $X \wedge a = 45°$. $n = > 1.92$. ω = n.d. ϵ = n.d. 2V(meas.) = 60°

Cell Data: *Space Group:* $P4_2/nnm$. a = 12.627(9) c = 12.595(9) Z = 2

X-ray Powder Pattern: Långban, Sweden.
2.975 (100), 3.99 (30), 2.752 (30), 8.95 (20), 7.30 (20), 2.473 (20), 1.716 (20)

(1) Franklin, New Jersey, USA; corresponds to $(K_{0.76}Na_{0.16}Ba_{0.05})_{\Sigma=0.97}(Mg_{2.98}Fe^{2+}_{0.01})_{\Sigma=2.99}$ $Si_{2.95}Al_{1.05}O_{10}[F_{1.30}(OH)_{0.70}]_{\Sigma=2.00}$.

Polymorphism & Series: 1M, $2M_1$, 3A polytypes; forms a series with biotite.

Mineral Group: Mica group.

Occurrence: In metamorphosed dolostones and magnesium-rich limestones; in ultramafic rocks as kimberlites, peridotites, lamproites, and serpentinites.

Association: Dolomite, calcite, diopside, tremolite, scapolite, vesuvianite, apatite, titanite, epidote, olivine, augite, magnetite.

Distribution: Some localities for well-crystallized material include: in the USA, from Antwerp and Natural Bridge, Jefferson Co., and Edwards and Pierrepont, St. Lawrence Co., New York; from Franklin, Sussex Co., New Jersey. In Canada, large crystals from the Lacey mine, Frontenac Co., and in North and South Burgess Townships, Ontario; from near Perkin's Mills, and elsewhere in Gatineau Co., Quebec. In the Slyudyanka region, near Lake Baikal, Siberia, Russia. At Ødegården, near Feset, Norway. From Campolungo, near St. Gotthard, Ticino, Switzerland. In the Val di Fassa, Trentino-Alto Adige, and on Monte Braccio, Val Malenco, Lombardy, Italy. From Saharakara and Ampandrandava, Madagascar. At Anxiety Point, Nancy Sound, New Zealand.

Name: From the Greek for *firelike*, referring to an oft-seen reddish tint.

Type Material: Mining Academy, Freiberg, Germany, 24966.

Phoenicochroite $Pb_2O(CrO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Imperfect crystals, tabular on {100} or {$\overline{2}$01}, elongated along [010] or [001], showing {010}, {100}, {110}, {$\overline{2}$01}, {$\overline{2}$11}, {310}, to 1 cm; may be in reticulated intergrowths, thin coatings, and massive.

Physical Properties: *Cleavage:* Perfect on {$\overline{2}$01}; poor on {001}, {010}, {011}. *Tenacity:* Sectile. Hardness = 2.5–3.5 D(meas.) = 7.01 D(calc.) = 7.075

Optical Properties: Translucent, transparent on thin edges. *Color:* Dark cochineal-red to hyacinth-red, lemon-yellow on exposure; red-orange, orange, yellow-orange in transmitted light. *Streak:* Brick-red to yellowish orange. *Luster:* Adamantine to resinous, glistening. *Optical Class:* Biaxial (+). *Pleochroism:* Weak. *Orientation:* $X = b$; $Y \wedge c = -2°$; $Z \wedge c = 88°$. *Dispersion:* $r > v$, , moderately strong to strong. *Absorption:* $X < Y < Z$. α = 2.34–2.38 β = 2.38–2.44 γ = 2.65 2V(meas.) = 58° 2V(calc.) = 60°

Cell Data: *Space Group:* $C2/m$. $a = 14.001(7)$ $b = 5.675(3)$ $c = 7.137(5)$ $\beta = 115.22°$ Z = 4

X-ray Powder Pattern: Beresovsk, Russia.
3.39 (10), 2.989 (10), 3.60 (7), 6.40 (4), 3.26 (4), 4.42 (3), 2.840 (3)

Chemistry:

	(1)	(2)
CrO_3	80.88	81.70
PbO	18.08	18.30
Total	98.96	100.00

(1) Potter-Kramer mine, Arizona, USA; by AA. (2) $Pb_2O(CrO_4)$.

Occurrence: A rare secondary mineral in the oxidized zone of chromium-bearing hydrothermal lead deposits.

Association: Crocoite, vauquelinite, fornacite, hemihedrite, iranite, pyromorphite, mimetite, cerussite, leadhillite, galena, calcite, fluorite, quartz.

Distribution: From the Preobrazhensky mine, Beresovsk district, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. In the Hopeful vein, near Leadhills, Lanarkshire, Scotland. At the Adelaide Proprietary mine, Dundas, Tasmania, Australia. From the Santa Ana mine, Sierra Gorda district, southwest of Calama, Antofagasta, Chile. In the USA, in Arizona, from south of Wickenburg, at the Pack Rat and Potter-Kramer claims, the Moon Anchor mine, and near the Purple Pansy mine; northeast of Wickenburg, along Amazon Wash, near its confluence with the Hassayampa River, all in Maricopa Co.; in the Florence Lead-Silver mine, Tortilla Mountains, Pinal Co. In Nevada, from about 14 km northwest of Nelson, El Dorado district, Clark Co., and at the Silver Dollar claim, north of Columbus, Candelaria Hills, Esmeralda Co. From the Seh-Changi mine, near Neyband, Khorassan, and in the Tchah Khuni mine, Anarak district, Iran. At the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa.

Name: From the Greek for *deep red* and *color*, in allusion to its typical color.

Phosgenite $Pb_2(CO_3)Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are short prismatic to prismatic [001]; rarely thick tabular {001}; commonly terminated by {001} or with large {111}, to 30 cm; granular, massive.

Physical Properties: *Cleavage:* {001} and {110}, distinct; {100}, indistinct. *Fracture:* Conchoidal. *Tenacity:* Sectile, flexible $\perp$ [001]. Hardness = 2–3, varying with direction. D(meas.) = 6.12–6.15 D(calc.) = 6.124 May fluoresce yellow under LW UV, X-rays, and electron beams.

Optical Properties: Transparent to translucent. *Color:* Pale yellow to yellowish brown, pale brown, smoky brown, smoky violet; colorless, pale rose, gray, yellowish gray, pale green; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+); anomalously biaxial. *Pleochroism:* Weak; in thick sections; O = pink; E = pale green. $\omega = 2.118$ $\epsilon = 2.145$

Cell Data: *Space Group:* $P4/mbm$. $a = 8.160(4)$ $c = 8.883(6)$ $Z = 4$

X-ray Powder Pattern: In a lead pot from Wookey Hole Cavern, England.
2.79 (vvs), 3.61 (vs), 4.40 (s), 2.56 (s), 4.04 (ms), 2.21 (m), 1.800 (m)

Chemistry:

	(1)	(2)
CO_2	8.13	8.07
PbO	81.78	81.86
Cl	12.91	13.00
$-O = Cl_2$	2.91	2.93
Total	99.91	100.00

(1) Altai district, Siberia. (2) $Pb_2(CO_3)Cl_2$.

Occurrence: Uncommon, typically formed by alteration of galena in the oxidized zone of hydrothermal lead deposits, or by reaction of sea water with other lead minerals.

Association: Cerussite, anglesite, matlockite, laurionite.

Distribution: In England, fine crystals from the Bage and other mines, near Matlock, Derbyshire, and from a number of mines in Cornwall. On Sardinia, Italy, fine crystals from Monteponi and Montevecchio, near Iglesias, and from Gibbas, near Cagliari. In slag from Laurium, Greece. At Tarnowitz, Poland. From the Syzjanov mine, Altai district, Siberia, Russia. Large fine crystals from the Touissit mine, near Oujda, Morocco. At Sidi Amor ben Salem, Tunisia. Large crystals from Tsumeb, Namibia. From Broken Hill, New South Wales, and in the Comet mine, Dundas, Tasmania, Australia. Found at Boleo, near Santa Rosalia, Baja California, Mexico. In the USA, large masses from the Terrible mine, Isle, Custer Co., Colorado; in the Mammoth mine, Tiger, Pinal Co., Arizona; at the Stevenson-Bennett mine, Organ Mountains, Doña Ana Co., New Mexico. From a number of other localities but in small amounts.

Name: From *phosgene*, $COCl_2$, composed of elements in the mineral's composition.

Phosinaite-(Ce) $Na_{13}Ca_2CeSi_4O_{12}(PO_4)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* 222. As columnar crystals, to 1 cm, with {011} predominant, and {100}, {010}, {001}; as irregular accumulations.

Physical Properties: *Cleavage:* Perfect on {001}, imperfect on {010} and {011}.
Hardness = 3.5 VHN = 207–340 D(meas.) = 2.62–3.00 D(calc.) = [3.36]

Optical Properties: Transparent. *Color:* Colorless, pale rose to brownish rose.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. α = 1.567–1.570
β = 1.569–1.572 γ = 1.570–1.573 2V(meas.) = 68°–70°

Cell Data: *Space Group:* $P2_12_12$. $a = 7.234(3)$ $b = 14.670(4)$ $c = 12.231(4)$ Z = 2

X-ray Powder Pattern: Lovozero massif, Russia.
2.74 (100), 7.44 (55), 2.566 (55), 6.92 (50), 3.51 (40), 3.62 (30), 3.94 (20)

Chemistry:

	(1)	(2)
SiO_2	18.30	23.78
RE_2O_3	13.44	13.80
Fe_2O_3		0.49
MnO	trace	1.90
CaO	12.20	5.39
Li_2O		0.24

K_2O	0.74	0.47
H_2O	6.07	4.41
P_2O_5	21.30	20.50
Total	100.15	99.76

(1) Khibiny massif, Russia. (2) Lovozero massif, Russia; spectrographic analyses show RE = Y 0.6%, La 16.8%, Ce 53.9%, Pr 4.4%, Nd 19.5%, Sm 3.0%, Eu 0.5%, Gd 0.7%, Tb 0.3%, Er 0.3%.

Occurrence: Filling interstices between large crystals of anorthoclase in alkalic pegmatites in a differentiated alkalic massif (Khibiny massif, Russia); in ussingite veinlets in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Anorthoclase, nepheline, aegirine, lomonosovite, lamprophyllite (Khibiny massif, Russia); belovite, nordite, neptunite, vuonnemite (Lovozero massif, Russia).

Distribution: On Mt. Koashva, Khibiny massif, and Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For PHOsphorus, SIlicon, and sodium, NAtrium, in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 4456; Mining Institute, St. Petersburg, 1210/1; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76195; National School of Mines, Paris, France.

Phosphammite $(NH_4)_2HPO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (synthetic). *Point Group:* $2/m$. As crystals, to 0.5 mm; typically in crusts.

Physical Properties: Hardness = n.d. D(meas.) = 1.61 D(calc.) = 1.61

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge a = 43.5°$. $\alpha = 1.508$ $\beta = 1.518$ $\gamma = 1.530$ 2V(meas.) = 80°–85° 2V(calc.) = 85°

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 8.03$ $b = 6.68$ $c = 11.02$ $\beta = 113°38'$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 29-111).
5.05 (100), 5.57 (75), 4.94 (65), 3.22 (65), 3.78 (50), 3.14 (45), 3.06 (45)

Chemistry: (1) Identification depends on the coincidence of the X-ray powder pattern and optical data with that of synthetic material.

Occurrence: Probably a crystallization product of the liquid fraction of guano.

Association: Ammonian aphthitalite, urea, weddellite (Toppin Hill Cave, Western Australia); biphosphammite (Guañape Island, Peru).

Distribution: On Guañape Island, south of Trujillo, Peru. In Toppin Hill Cave, about 320 km northeast of Kalgoorlie, Western Australia. At San Pedro, Martin Island, Mexico.

Name: As a PHOSPHate of AMMonium.

Type Material: Western Australian Museum, Perth, Australia, S4688.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 807.

Phosphoellenbergerite $Mg_{14}(PO_4)_6(PO_3OH, CO_3)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, tabular on [010] to pseudo-octahedral, with prominent {010}, {100}, {001}, {021}, many other forms, to 1 cm. May be fibrous to massive.

Physical Properties: *Cleavage:* On {010}, poor. *Fracture:* Uneven. Hardness = 4–4.5 D(meas.) = 3.10–3.29 D(calc.) = 3.32

Optical Properties: Transparent to translucent. *Color:* Pale green, olive-green, brownish green; reddish brown if oxidized. *Luster:* Vitreous to subresinous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, distinct. $\alpha = 1.663$–1.672 $\beta = 1.674$–1.680 $\gamma = 1.699$–1.700 2V(meas.) = 66°–70° 2V(calc.) = 68°

Cell Data: *Space Group: Pbna* (synthetic). $a = 9.460(2)$ $b = 10.024(3)$ $c = 8.670(2)$ Z = 4

X-ray Powder Pattern: Hagendorf, Germany; close to reddingite.
3.18 (10), 2.724 (8), 4.25 (7), 2.639 (7), 2.408 (7), 2.222 (7), 1.615 (7)

Chemistry:

	(1)	(2)
P_2O_5	34.39	34.61
FeO	37.52	26.27
MnO	13.63	25.94
CaO	1.20	
H_2O	13.32	13.18
Total	100.06	100.00

(1) Hagendorf, Germany, average of two analyses; corresponds to $(Fe^{2+}_{2.15}Mn^{2+}_{0.80}Ca_{0.10})_{\Sigma=3.05}(PO_4)_2 \cdot 3.05H_2O$. (2) $(Fe, Mn)_3(PO_4)_2 \cdot 3H_2O$ with Fe:Mn = 1:1.

Polymorphism & Series: Forms a series with reddingite.

Occurrence: An alteration product of triphylite in zoned complex granite pegmatites.

Association: Ludlamite, vivianite, huréaulite, lithiophilite, siderite.

Distribution: Large crystals from Hagendorf, Bavaria, Germany. At the Mangualde pegmatite, near Mesquitela, Portugal. In the USA, in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from the Dan Patch mine, 1.5 km west of Keystone, Pennington Co., and the Bull Moose and Tip Top mines, near Custer, Custer Co., South Dakota. At the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina.

Name: For PHOSPHOrus and iron, FERRum, in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150230.

Phosphofibrite $\mathbf{KCuFe^{3+}_{15}(PO_4)_{12}(OH)_{12}\cdot 12H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are fibrous, to 0.5 mm, in radial aggregates.

Physical Properties: *Cleavage:* One, nearly perfect, pinacoidal. Hardness = ∼4
D(meas.) = 2.90 D(calc.) = 2.94

Optical Properties: Translucent. *Color:* Yellow or yellowish green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* Y = elongation. *Dispersion:* $r \ll v$. $\alpha = 1.755(4)$ β = n.d. $\gamma = 1.790(4)$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* *Pbmn* or *Pnmn*. $a = 14.40$ $b = 18.76$ $c = 10.40$ Z = 2

X-ray Powder Pattern: Clara mine, Germany.
9.50 (100), 3.23 (60), 3.13 (60), 4.35 (50), 2.99 (50), 2.77 (50), 2.10 (50)

Chemistry:

	(1)	(2)
P_2O_5	34.0	34.07
Al_2O_3	1.5	
Fe_2O_3	46.6	47.90
CuO	2.6	3.18
K_2O	1.9	1.88
H_2O	[13.4]	12.97
Total	[100.0]	100.00

(1) Clara mine, Germany; by electron microprobe and microchemical methods, H_2O by difference; corresponding to $K_{1.00}Cu_{0.81}(Fe_{14.52}Al_{0.73})_{\Sigma=15.25}(P_{0.99}O_{3.97})_{12}(OH)_{12.36}\cdot 12.33H_2O$.
(2) $KCuFe_{15}(PO_4)_{12}(OH)_{12}\cdot 12H_2O$.

Occurrence: In a hydrothermal polymetallic barite–fluorite deposit.

Association: Beraunite, strengite, barian pharmacosiderite, quartz.

Distribution: From the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For *phospho*rus in the composition and its characteristic *fibrous* habit.

Type Material: n.d.

Phosphogartrellite $PbCuFe^{3+}(PO_4)_2(OH,H_2O)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As steeply terminated crystals, to 50 μm, in parallel growths and aggregates.

Physical Properties: Hardness = 4.5 D(meas.) = n.d. D(calc.) = 5.05

Optical Properties: Transparent in thin fragments. *Color:* Bright green. *Streak:* Yellow. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). $\alpha = 1.90(2)$ $\beta = [1.93]$ $\gamma = 2.00(2)$ 2V(meas.) = 70(5)°

Cell Data: *Space Group:* $[P\overline{1}]$ (by analogy to gartrellite). $a = 5.320(2)$ $b = 5.528(2)$ $c = 7.434(3)$ $\alpha = 67.61(3)°$ $\beta = 69.68(5)°$ $\gamma = 70.65(4)°$ Z = 1

X-ray Powder Pattern: Hohenstein, Germany.
4.360 (100), 2.885 (89), 3.250 (70), 2.868 (69), 4.720 (67), 4.502 (61), 2.459 (53)

Chemistry:

	(1)	(2)
P_2O_5	22.05	25.74

Fe_2O_3	14.14	14.48
CuO	14.41	14.42
PbO	39.02	40.46
CaO	0.20	
H_2O	[4.83]	4.90
Total	99.23	100.00

(1) Hohenstein, Germany; by electron microprobe, total Fe as Fe_2O_3, confirmed by microchemical tests, H_2O calculated from stoichiometry, presence of both $(OH)^{1-}$ and H_2O confirmed by IR; corresponds to $(Pb_{0.99}Ca_{0.02})_{\Sigma=1.01}Cu_{1.02}Fe_{1.00}[(PO_4)_{1.75}(AsO_4)_{0.23}]_{\Sigma=1.98}[(OH)_{1.12}(H_2O)_{0.96}]_{\Sigma=2.08}$. (2) $PbCuFe(PO_4)_2(OH)\bullet H_2O$.

Mineral Group: Tsumcorite group.

Occurrence: A rare secondary mineral, probably formed by oxidation of earlier sulfides in silicified barite veins.

Association: Hentschelite, pyromorphite, malachite, cuprite.

Distribution: In Germany, on the Hohenstein, near Reichenbach, and at Gadernheim, near Bensheim, Hesse.

Name: As the *phosphate* analog of *gartrellite*.

Type Material: Mineralogical Institute, Ruhr University, Bochum, Germany.

References: (1) Krause, W., K. Belendorff, H.-J. Bernhardt, and K. Petitjean (1998) Phosphogartrellite, $PbCuFe(PO_4)_2(OH)\bullet H_2O$, a new member of the tsumcorite group. Neues Jahrb. Mineral., Monatsh., 111–118. (2) (1998) Amer. Mineral., 83, 1117 (abs. ref. 1).

Phosphoinnelite $Ba_4Na_3Ti_3Si_4O_{14}(PO_4, SO_4)_2(O, F)_3$

Crystal Data: Triclinic. [*Point Group*: 1 or $\bar{1}$] (by analogy to innelite). As lath-shaped, split, and distorted crystals, to 6 mm, exhibiting prominent {010}, striations parallel to elongation; typically as bunch-, sheaf-, and rosettelike aggregates.

Physical Properties: *Cleavage*: Perfect on {010}, good on {100}. *Tenacity*: Brittle. *Fracture*: Stepped. Hardness = 4.5-5. D(meas.) = 3.82(5) D(calc.) = 3.92

Optical Properties: Transparent. *Color*: Yellow–brown, honey, occasionally brown. *Streak*: Pale yellow. *Luster*: Vitreous, greasy on broken surfaces. *Optical Class*: Biaxial (+). α = 1.730(5) β = 1.745(3) γ = 1.764(3) 2V(meas.) = ~ 90° 2V(calc) = 84° *Orientation*: $Z \wedge c \sim 5°$.

Cell Data: [*Space Group*: $P\bar{1}$ or $P1$] (by analogy to innelite). a = 5.38(2) b = 7.10(2) c = 14.76(5) α = 99.00(7)° β = 94.94(6)° γ = 90.14(8)° Z = 1

X-ray Powder Pattern: Kovdor massif, Kola Peninsula, Russia (identical to innelite). 14.5 (100), 2.683 (90), 2.133 (80), 3.455 (40), 2.810 (40), 2.059 (40), 3.382 (35)

Chemistry:

	(1)		(1)
Na_2O	6.06	SiO_2	17.83
K_2O	0.04	TiO_2	16.88
CaO	0.15	Nb_2O_5	0.74
SrO	0.99	P_2O_5	5.93
BaO	41.60	SO_3	5.29
MnO	1.07	F	0.14
Fe_2O_3	1.55	$-O=F_2$	0.06
Al_2O_3	0.27	Total	99.12

(1) Kovdor massif, Kola Peninsula, Russia; average of 14 electron microprobe analyses, absence of OH, H_2O confirmed by IR, corresponding to $(Ba_{3.59}Sr_{0.13}K_{0.01})_{\Sigma=3.73}(Na_{2.59}Mg_{0.21}Mn_{0.20}Ca_{0.04})_{\Sigma=3.04}(Ti_{2.80}Fe^{3+}_{0.26}Nb_{0.07})_{\Sigma=3.13}(Si_{3.93}Al_{0.07})_{\Sigma=4}O_{14}$ $[(P_{1.11}S_{0.87})_{\Sigma=1.98}O_{7.96}](O_{2.975}F_{0.10})_{\Sigma=3.075}$.

Polymorphism & Series: Forms a series with innelite.

Occurrence: A late stage mineral in a hydrothermally altered peralkaline pegmatite that crosscuts calcite carbonatite associated with an ultramafic alkaline pluton.

Association: Thompsonite-Ca, golyshevite, pectolite, cancrinite, pyroxene, CO_3-bearing fluorapatite.

Distribution: Kovdor massif, Kola Peninsula, Russia.

Name: For its chemical composition as the P-analog of innelite.

Type Material: A.E. Fersman Mineralogical Museum of the Russian Academy of Sciences, Moscow, 3288/1.

References: (1) Pekov, I.V., N.V. Chukanov, I.M. Kulikova, and D.I. Phosphophyllite $Zn_2(Fe^{2+},Mn^{2+})(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tend to be thick tabular on {100}, with {110}, {011}, {$\bar{1}$02}, {111}, {$\bar{3}$11}, many other forms, to 13 cm. *Twinning:* Common on {100}, as contact twins giving "fishtail" shapes and as penetration twins, may be polysynthetic; rare on {$\bar{1}$02}.

Physical Properties: *Cleavage:* On {100}, perfect; on {010}, {$\bar{1}$02}, distinct.
Tenacity: Brittle. Hardness = 3–3.5 D(meas.) = 3.08–3.13 D(calc.) = 3.12

Optical Properties: Transparent. *Color:* Pale bluish green, sea-green, colorless; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 50°$. *Dispersion:* $r > v$, perceptible.
$\alpha = 1.595–1.599$ $\beta = 1.614–1.617$ $\gamma = 1.616–1.620$ 2V(meas.) = ∼45°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.378–10.397$ $b = 5.084–5.098$ $c = 10.553–10.574$
$\beta = 121.00°–121.14(2)°$ Z = 2

X-ray Powder Pattern: Potosí, Bolivia.
4.438 (100), 8.86 (85), 3.383 (60), 2.833 (50), 2.818 (45), 2.222 (30), 1.4806 (30)

Chemistry:

	(1)	(2)
P_2O_5	32.51	32.29
FeO	12.24	16.18
MnO	4.96	0.14
ZnO	34.26	34.59
H_2O	16.52	15.99
Total	100.49	99.19

(1) Hagendorf, Germany. (2) Potosí, Bolivia; by electron microprobe, H_2O by the Penfield method.

Occurrence: Typically a secondary mineral in zoned complex granite pegmatites, an alteration product of sphalerite and Fe–Mn phosphates; in hydrothermal vein deposits.

Association: Triplite, triphylite, sphalerite, apatite, vivianite, rockbridgeite, strengite, phosphosiderite, fairfieldite (Hagendorf, Germany).

Distribution: From Hagendorf, Bavaria, Germany. At Přibyslavice, Czech Republic. From the Norrö pegmatite, on Rånö Island, Sweden. Extraordinary crystals in the Unificada mine, Cerro Rico, and from the Siglo XX mine, Llallagua, Potosí; in the Morococala mine, near Oruro, Bolivia. In the USA, at the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; at Red Hill, Rumford, and from Newry, Oxford Co., Maine. On Reaphook Hill, near Blinman, Flinders Ranges, South Australia. From Kabwe (Broken Hill), Zambia.

Name: From *phosphate* in the composition, and the Greek for *cleavage*.

Type Material: n.d.

Phosphorrösslerite $Mg(PO_3OH)\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals equant or short prismatic [100], may be skeletal; forms noted include {010}, {100}, {110}, {011}, {120}, {111}, {140}, {$\bar{1}$11}. Also in botryoids, druses, and crusts.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 1.725(4) D(calc.) = 1.741 Soluble in H_2O; alters to newberyite on exposure.

Optical Properties: Semitransparent, opaque on exposure. *Color:* Colorless, pale yellow or honey-brown when included with iron oxides or organic material, turning white on exposure. *Luster:* Vitreous, changing to dull on exposure.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 6.5°$. *Dispersion:* $r > v$. $\alpha = 1.477$ $\beta = 1.485$ $\gamma = 1.486$ 2V(meas.) = 38°10′

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 11.32(1)$ $b = 25.36(2)$ $c = 6.574(5)$ $\beta = 95°11(18)'$ Z = 8

X-ray Powder Pattern: Synthetic. (ICDD 19–761).
3.29 (100), 2.82 (100), 4.55 (90), 4.42 (90), 4.13 (90), 4.02 (90), 2.704 (90)

(1) Schellgaden, Austria. (2) $Mg(PO_3OH)\cdot 7H_2O$.

Occurrence: In cold (10 °C) wet muck in an abandoned mine.

Association: n.d.

Distribution: From the Stüblbau works, Schellgaden, Austria.

Name: As the *phosphate* analog of *rösslerite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 107177.

Phosphosiderite $Fe^{3+}PO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, tabular on {010}, to stout prismatic [001], with prominent {010}, {110}, {001}, {011}, many others, to 2.5 cm. May be radial fibrous, in botryoidal or reniform crusts and masses. *Twinning:* On {101}, common, typically as interpenetrations.

Physical Properties: *Cleavage:* {010}, good; {001}, indistinct. *Fracture:* Uneven. Hardness = 3.5–4 D(meas.) = 2.74–2.76 D(calc.) = 2.72–2.73

Optical Properties: Transparent to translucent. *Color:* Peach-blossom-red, reddish violet, reddish purple, yellow-orange, may be dark blue, moss-green to nearly colorless; in transmitted light, typically rose-red to colorless. *Luster:* Vitreous to subresinous.
Optical Class: Biaxial (–). *Pleochroism:* X = pale rose-red; Y = carmine-red; Z = colorless. *Orientation:* $Y = b$; $X \wedge c = \sim 4°$. *Dispersion:* $r > v$, very strong. α = 1.692–1.703 β = 1.725–1.728 γ = 1.738–1.739 2V(meas.) = 62°–66°

Cell Data: *Space Group:* $P2_1/n$. a = 5.329–5.330 b = 9.798–9.809 c = 8.710–8.714 β = 90.51°−90.60° Z = 4

X-ray Powder Pattern: The Kreuzberg, Germany. (ICDD 33-666).
4.689 (100), 2.787 (85), 4.363 (75), 3.610 (50), 2.572 (40), 4.912 (35), 2.013 (25)

Chemistry:

	(1)	(2)	(3)
P_2O_5	38.85	37.71	37.99
Fe_2O_3	44.30	44.38	42.73
H_2O	17.26	17.31	19.28
Total	100.41	99.40	100.00

(1) Kalterborn mine, Germany. (2) The Kreuzberg, Germany; average of two analyses.
(3) $FePO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with strengite.

Occurrence: Typically an alteration product of triphylite in zoned complex granite pegmatites; may be a component of soils; replacing bones or shells.

Association: Triphylite, barbosalite, leucophosphite, laueite, huréaulite, strengite, turquoise.

Distribution: At many localities in small amounts. In Germany, from the Kalterborn mine, near Eiserfeld, North Rhine-Westphalia; on the Kreuzberg, Pleystein; and at Hagendorf and Waidhaus, Bavaria, Germany. From the La Vilate quarry, near Chanteloube, Haute-Vienne, France. At the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda, Portugal. From the Leveäniemi mine, near Kiruna, Sweden. In the Bomi Hill Caves, Liberia. At the Ficus and West Driefontein Caves, Transvaal, South Africa. In the Alto Ligonha district, Mozambique. In the USA, from the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; at Mullica Hill, Gloucester Co., New Jersey; near Bethel Church, Pike Co., Indiana; in the Williams pegmatites, about eight km south of Rockford, Coosa Co., Alabama. Large crystals from the Bull Moose mine, five km southeast of Custer, Custer Co., South Dakota; from the Champion mine, Mono Co., and the Stewart mine, Pala, San Diego Co., California; from near Manhattan, Manhattan district, Nye Co., Nevada. At Rapid Creek, Yukon Territory, Canada. In the Sapucaia, Córrego do Urucum, and Énio pegmatite mines, around Galiléia, Minas Gerais, Brazil. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina.

Name: From *phospho*rus and the Greek for *iron* in the composition.

SiO_2	0.18		Total	100.09	100.00

(1) Smrkovec, Slavkovský Les Mountains, Czech Republic; average of 8 electron microprobe analyses, H_2O molecule confirmed by IR and amount calculated from stoichiometry; corresponds to $[(UO_2)_{0.91}Ca_{0.08}Fe_{0.07}Cu_{0.05}Pb_{0.01}]_{\Sigma=1.12}Bi_{3.91}O_{3.91}[(PO_4)_{1.50}(AsO_4)_{0.50}(SiO_4)_{0.04}(VO_4)_{0.02}]_{\Sigma=2.06}•2.00H_2O$.
(2) $(UO_2)Bi_4O_4(PO_4)_2•2H_2O$.

Polymorphism & Series: Forms a series with walpurgite.

Occurrence: A secondary mineral formed by weathering of primary bismuth and uraninite in hydrothermal quartz veins.

Association: "Apatite", atelestite, bismutoferrite, bismutite, eulytite, hechtsbergite, metatorbernite, mixite, petitjeanite, preisingerite, pucherite, retgersite, schumacherite, smrkovecite, walpurgite.

Distribution: From the dumps of an abandoned mine near Smrkovec, 10 km NNE of Mariánské Lázně, Slavkovský Les Mountains, western Bohemia, Czech Republic.

Name: Signifies the (PO_4)-dominant composition, *phospho*, and structural relationship to *walpurgite*.

Type Material: Department of Mineralogy and Petrology, National Museum, Prague, Czech Republic; P1p 10/2001.

References: (1) Sejkora, J., J. Čejka, J. Hloušek, M. Novák, and V. Šrein (2004) Phosphowalpurgite, the (PO_4)-dominant analogue of walpurgite, from Smrkovec, Slavkovský Les Mountains, Czech Republic. Can. Mineral. 42(4), 963-972. (2) (2005) Amer. Mineral., 90, 770 (abs. ref. 1).

Phosphuranylite $(H_3O)_3KCa(UO_2)_7O_4(PO_4)_4 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. In thin scales, irregular to rectangular in outline, to 2 mm. Commonly as scaly crusts, thin films, and coatings.

Physical Properties: *Cleavage:* One, perfect, ‖ flattening. Hardness = 2–2.5 D(meas.) = ∼4.1 D(calc.) = 4.575–4.631 Radioactive.

Optical Properties: Semitransparent. *Color:* Deep golden yellow, lemon-yellow, honey-yellow.
Optical Class: Biaxial (–), commonly nearly uniaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = golden yellow. *Orientation:* $Z \perp$ flattening. *Dispersion:* $r > v$, strong. *Absorption:* $X < Y = Z$; may be $X < Y < Z$. α = 1.658–1.695 β = 1.699–1.77 γ = 1.699–1.77 2V(meas.) = 0°–35°

Cell Data: *Space Group:* $Cmcm$. a = 15.779–15.899 b = 13.702–13.790 c = 17.253–17.330 Z = 4

X-ray Powder Pattern: Flat Rock mine, North Carolina, USA; nearly identical to dewindtite.

(1) Rosmaneira, Portugal; partial analysis. (2) Bois Noirs, France; by electron microprobe, H_2O by difference. (3) $(H_3O)_3KCa(UO_2)_7O_4(PO_4)_4 \cdot 8H_2O$.

Occurrence: A secondary mineral typically occurring in the weathering zone of granite pegmatites, coating cracks and fissures near altered uraninite; in paleochannels in sandstone Colorado Plateau-type U–V deposits.

Association: Uraninite, autunite, meta-autunite, uranophane, uranophane-beta, becquerelite, curite, parsonsite, torbernite, metatorbernite, saléeite, sabugalite, haiweeite, uranian "opal".

Distribution: In the USA, from the Flat Rock and Buchanan pegmatite mines, Mitchell Co., North Carolina; in the Ruggles mine, near Grafton, and the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; at Newry, Oxford Co., Maine; from Branchville, Fairfield Co., Connecticut; at the Barker (Ferguson) mine, five km southeast of Keystone, Pennington Co., South Dakota; from the DeLongchamps and Red Bluff mines, Pyramid district, Washoe Co., and several other occurrences in Nevada. In Brazil, at the Énio and Córrego do Urucum pegmatites, near Galiléia, Minas Gerais; in the Perus district, 25 km north of São Paulo. From Pamplonita, Colombia. At Peveragno, Piedmont, and Arcu su Linnarbu, near Capoterra, Cagliari, Sardinia, Italy. From the La Crouzille mine and Margnac mine, Compreignac, Haute-Vienne, and at Bois Noirs, Loire, France. From Wölsendorf, Bavaria, Germany. In Portugal, at Carrasca, Sabugal, Mangualde, and elsewhere. From Shinkolobwe, Katanga (Shaba) Province, and at the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). At Vatovory, Madagascar. In the Saddle Ridge mine, South Alligator Valley, Northern Territory, Australia. Known from a number of other minor localities.

Name: For *phosph*orus and *uranyl* uranium in the composition.

Type Material: Pennsylvania State University, State College, Pennsylvania; Yale University, New Haven, Connecticut, USA, 3249–3251.

(1) Kobokobo pegmatite, Congo; by electron microprobe, H_2O by difference. (2) $Al_2(UO_2)_3(PO_4)_2(OH)_6 \cdot 10H_2O$.

Occurrence: A rare secondary mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Meta-autunite, phosphuranylite, threadgoldite, upalite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For PHosphorus, URanium, and ALUMinum in the composition.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG6201, RMG6195, RMG6197, RMG9852.

Phurcalite $Ca_2(UO_2)_3O_2(PO_4)_2 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Platy crystals, flattened on [010] and elongated along [001], terminated by {001}, {110}, {111}, to 5 mm. Typically in radiating aggregates and thin crusts.

Physical Properties: *Cleavage:* {010}, {001}, perfect to good; {100}, good. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 VHN = 86–95, 90.5 average (5 g load). D(meas.) = 4.22(4) D(calc.) = 4.220 Radioactive; may fluoresce green under SW UV.

Optical Properties: Transparent. *Color:* Yellow. *Streak:* Pale yellow. *Luster:* Vitreous to adamantine, may be silky in aggregates.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless to pale yellow; Y = very pale yellow to pale yellow; Z = bright yellow to golden yellow. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, medium. *Absorption:* $X < Y < Z$. α = 1.670–1.680 β = 1.720–1.732 γ = 1.749–1.775 2V(meas.) = 68°–82°

Cell Data: *Space Group: Pbca.* a = 17.33–17.426 b = 15.87–16.062 c = 13.548–13.598 Z = 8

(1) Bergen, Germany; by electron microprobe, H_2O by difference. (2) Merrivale quarry, England; by electron microprobe, H_2O by TGA. (3) Perus, Brazil; by electron microprobe, average of 19 analyses, H_2O by elemental analyzer; corresponds to $(Ca_{1.97}K_{0.05})_{\Sigma=2.02}(UO_2)_{2.87}O_{1.97}[(PO_4)_{1.90}(SiO_4)_{0.04}]_{\Sigma=1.94} \cdot 7.57H_2O$. (4) $Ca_2(UO_2)_3O_2(PO_4)_2 \cdot 7H_2O$.

Occurrence: A secondary mineral in cracks and fractures in granite and granite pegmatites.

Association: Autunite, meta-autunite, uranophane, other secondary uranium minerals.

Distribution: From Bergen, Saxony; at Wittichen, Black Forest; and from Waidhaus, Bavaria. In the Merrivale quarry, Dartmoor, Devon, England. At Nisa, Portugal. From Davignac, Corrèze, France. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the USA, on the Ram claims, Pinto Mountains, Riverside Co., and at the Shale Hills, near Taft, Kern Co., California; from the Posey mine, Red Canyon, San Juan Co., and in the La Sal Mountains, Grand Co., Utah. Fine crystals from Perus, São Paulo, Brazil. At the La Gloria pegmatite, Córdoba Province, Argentina.

Name: For PHosphorus, URanium, and CALcium in the composition.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG13388; National Museum of Natural History, Washington, D.C., USA, 144187.

(1) Quetena, Chile. (2) $MgAl_2(SO_4)_4 \cdot 22H_2O$.

Polymorphism & Series: Forms a series with halotrichite.

Mineral Group: Halotrichite group.

Occurrence: A common secondary mineral formed by alteration of pyrite in aluminous rocks or in coal seams; in the oxidized zone of pyritic hydrothermal mineral deposits, typically in arid regions, typically post-mining; a fumarolic product; formed in caves.

Association: Kalinite, alunogen, epsomite, melanterite, copiapite, gypsum.

Distribution: Widespread, so only a few localities are listed. In Chile, abundant from Cerros Pintados, 80 km southeast of Iquique, Tarapacá; at Quetena, west of Calama, and Chuquicamata, Antofagasta. In the USA, in New Mexico, from near Tucumcari, Quay Co.; at The Geysers, Sonoma Co., California; from Alum Point, Salt Lake Co., Utah. In Canada, at Newport, Nova Scotia, and from the junction of the two main branches of the Smoky River, Alberta. In Germany, at Wetzelstein, near Saalfeld, and from near Lehesten, Thuringia. On Valachov Hill, near Skřivaň, Czech Republic. At Cervenica (Opálbánya), Slovakia. In Italy, from Baia di Levante, Vulcano, Lipari Islands; on Mt. Etna, Sicily; and on Elba. At volcanoes on the Kamchatka Peninsula, Russia.

Name: To honor John Pickering (1777–1846), American lawyer and philologist of Boston, Massachusetts, USA.

Total	[100.51]	100.00

(1) Leopoldshall, Germany. (2) $K_2Mg(SO_4)_2 \cdot 6H_2O$.

Mineral Group: Picromerite group.

Occurrence: Principally occurs in oceanic bedded salt deposits; a volcanic sublimate in fumaroles; in a sulfate-rich hydrothermal ore deposit.

Association: Halite, anhydrite, kainite, epsomite (oceanic salt deposits); hohmannite, metavoltine, metasideronatrite (Chuquicamata, Chile).

Distribution: From Vesuvius, Campania, Italy. In Germany, in Saxony-Anhalt, from the Leopoldshall-Stassfurt district, and at Aschersleben; large crystals from the Ellers mine, Neuhof, near Fulda, Hessen; in the Adolfsglück mine, Schwarmstedt, Lower Saxony. At Kalusz, Stebnyk, and Golyn, Ukraine. From Whitby, Yorkshire, England. At volcanoes on the Kamchatka Peninsula, Russia. From the Qarhan salt lake, Qinghai Province, China. At Chuquicamata, Antofagasta, Chile.

Name: From the Greek for *bitter* and *part*, in allusion to the magnesium in its composition.

Picropharmacolite $Ca_4Mg(AsO_4)_2(HAsO_3OH)_2 \cdot 11H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Prismatic crystals, rectangular, elongated along [001], to 1 cm; typically in radial aggregates, globular crusts, and fibrous concretions.

Physical Properties: *Cleavage:* {100}, {010}, perfect. Hardness = 1.5–2
D(meas.) = 2.62(2) D(calc.) = 2.60

Optical Properties: Semitransparent. *Color:* White; in transmitted light, colorless.
Luster: Feeble pearly to silky.
Optical Class: Biaxial (+). *Orientation:* $Z \wedge c = 8(1)°$. *Dispersion:* $r < v$, rather strong.
$\alpha = 1.557$–[1.566] $\beta = 1.566$–1.571 $\gamma = 1.577$–1.579 2V(meas.) = 50(2)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 13.547$–13.549 $b = 13.500$–13.562 $c = 6.710$–6.737
$\alpha = 99.63°-99.85°$ $\beta = 96.12°-96.41°$ $\gamma = 91.52°-91.60°$ Z = 2

X-ray Powder Pattern: Richelsdorf, Germany.
13.50 (FFF), 3.18 (F), 9.20 (mF), 3.78 (mF), 3.06 (mF), 2.92 (m), 4.84 (mf)

Chemistry:

	(1)	(2)
As_2O_5	46.93	48.88

Total	100.44	100.00

(1) Freiberg, Germany. (2) $Ca_4Mg(AsO_4)_2(HAsO_4)_2 \cdot 11H_2O$.

Occurrence: An oxidation product of arsenic-bearing sulfides in reaction with surrounding calcic rocks; a recent efflorescence in mine workings.

Association: Erythrite, pharmacolite.

Distribution: In Germany, from Richelsdorf, Hesse; at Freiberg, Marienberg, Annaberg, and Schneeberg, Saxony; fine examples in the Anton mine, Heubachtal, near Schiltach, and at Wittichen, Black Forest. At Sainte-Marie-aux-Mines, Haut-Rhin, France. From Jáchymov (Joachimsthal), Czech Republic. At the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia. In the Wanthwaite mine, St. John's in the Vale, Cumbria, England. At Silver Glen, Alva, Clackmannanshire, Scotland. From Bou Azzer, Morocco. At Matra, Corsica. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey; long fibers at the Getchell mine, Potosi district, Humboldt Co., Nevada.

Name: From the Greek for *bitter*, in allusion to its magnesium content, and its chemical similarity to *pharmacolite*.

Type Material: National School of Mines, Paris, France, 95.497.

CaO	11.86
PbO	26.34
Al_2O_3	14.04
Mn_2O_3	8.61
Fe_2O_3	8.75
SiO_2	28.90
H_2O	[1.47]
Total	99.97

(1) Nežilovo village, Jacupica Mountains, Macedonia; average of 32 electron microprobe analyses, H_2O calculated from stoichiometry and Mn^{3+} confirmed by K-edge XANES spectroscopy; corresponding to $Ca(Pb_{0.73}Ca_{0.30})(Al_{0.65}Fe^{3+}_{0.34})Al(Mn^{3+}_{0.67}Fe^{3+}_{0.33})(Si_{2.96}Al_{0.04})O_{12}(OH)$.

Mineral Group: Epidote group.

Occurrence: From the Precambrian "Mixed Series" of metamorphic and igneous rocks in the central part of the Pelagonian massif.

Association: Barite, dolomite, calcite, hematite, cymrite, Zn- and Mn-bearing phlogopite, intermediate members of epidote-(Pb)–epidote–piemontite series, hedyphane, nežilovite, rinmanite, gahnite, tilasite, rutile, Zn-rich aegirine-augite, eckermannite-ferroglaucophane, senaite, roméite, As-fluorapatite, bindheimite, mimetite, chromite, braunite.

Distribution: From near Nežilovo village, 40 km SW of Veles, Babuna river valley, Jacupica Mountains, Macedonia.

Name: As a lead (*Pb*) dominant member of the epidote group.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4193/1).

Mn_2O_3	12.33	H_2O^+	0.14
FeO	0.00	H_2O^-	0.00
MnO	1.89	Total	100.00

(1) St. Marcel, Italy; corresponds to $(Ca_{1.78}Mn^{2+}_{0.13}Na_{0.10}K_{0.03})_{\Sigma=2.04}(Al_{1.73}Mn^{3+}_{0.76}Fe^{3+}_{0.51})_{\Sigma=3.00}Si_{3.00}O_{12}[O_{0.45}(OH)_{0.08}]_{\Sigma=0.53}$.

Mineral Group: Epidote group.

Occurrence: In regionally metamorphosed rocks of the greenschist to amphibolite facies; in metasomatized manganese deposits; in low-temperature hydrothermal veins in altered rhyolites, andesites, and diorites.

Association: Epidote, tremolite, glaucophane, orthoclase, quartz, calcite.

Distribution: Many localities. In the Praborna mine, south of St. Marcel, Val d'Aosta, Piedmont, Italy. In Sweden, on Sörhårås and Rakten, Ultevis, Norrbotten, and at Jakobsberg and Långban, Värmland. At Tachgagalt, Anti-Atlas Mountains, Morocco. In the USA, at Garnet Lake and in the Agnew Meadow mine, Madera Co., and in the Braito mine, Plumas Co., California; in the Tucson Mountains, Pima Co., Arizona; at the Idarado mine, Ouray Co., Colorado; in Yuba Canyon, Peavine Mountain, Washoe Co., Nevada; and on Pine Mountain, Adams Co., Pennsylvania. In the Wessels mine, near Kuruman, Cape Province, South Africa. At the Kajlidongri mine, Jhabua district, Madhya Pradesh, India. From Otakiyama, Tokushima Prefecture, and other places in Japan. Large crystals from eight km northeast of Old Boolcoomata, South Australia.

Name: After the Piemonte (Piedmont) region in northwestern Italy.

(1) Hakone volcano, Japan; corresponds to $(Mg_{0.92}Fe^{2+}_{0.73}Ca_{0.29}Ti_{0.02}Mn_{0.02}Na_{0.02}K_{0.01})_{\Sigma=2.01}(Si_{1.94}Al_{0.06})_{\Sigma=2.00}O_6$. (2) Bushveld complex, South Africa; corresponds to $(Mg_{1.21}Fe^{2+}_{0.68}Ca_{0.06}Fe^{3+}_{0.03}Mn_{0.02}Ti_{0.01})_{\Sigma=2.01}(Si_{1.93}Al_{0.07})_{\Sigma=2.00}O_6$.

Mineral Group: Pyroxene group.

Occurrence: Common in rapidly cooled siliceous volcanic rocks. Inverted varieties with exsolved augite are found in layered mafic intrusives. From metamorphosed iron formations. Also in meteorites.

Association: Augite, olivine.

Distribution: Many localities worldwide. Studied material from: in the USA, at Pigeon Point, Cook Co., Minnesota; in the Goose Creek quarry, Leesburg, Loudoun Co., Virginia. From the Cobalt area, Ontario, Canada. In the Skaergaard intrusion, Kangerdlugssuaq Fjord, Greenland. From the Bushveld complex, Transvaal, South Africa. At the Hakone volcano, Iwate Prefecture, Japan. On the Isles of Mull and Rhum, and at Ardnamurchan, Argyllshire, Scotland. From the Vogelsberg area, Hesse, Germany.

Name: For the occurrence at Pigeon Point, Minnesota, USA.

(1) Nagybörzsöny, Hungary; by electron microprobe, average of four analyses; corresponds to $(Bi_{3.86}Pb_{0.07}Ag_{0.01})_{\Sigma=3.94}(Te_{3.02}S_{0.04})_{\Sigma=3.06}$. (2) Nagybörzsöny, Hungary; by electron microprobe, corresponds to $(Bi_{4.05}Pb_{0.02})_{\Sigma=4.07}Te_{2.93}$. (3) Bi_4Te_3.

Occurrence: Of hydrothermal origin.

Association: Hessite, joséite, bismuthinite (Nagybörzsöny, Hungary); tsumoite (Sylvanite, New Mexico, USA); argentian pentlandite, hessite, argentian tetrahedrite (Koronuda deposit, Macedonia).

Distribution: From Nagybörzsöny, Börzsöny Mountains, near Esztergom (Gran), Hungary [TL]. At Săcărîmb (Nagyág), Romania. In the Koronuda Au–Cu deposit, Macedonia. From the Bereznyakov gold deposit, Southern Ural Mountains, Russia. At Sylvanite, Hidalgo Co., New Mexico, USA. In the Corrego Criminosa gold district, Goias, Brazil. From the Huangshandong Cu–Ni deposit, Hami, Xinjiang Province, China.

Name: For the type locality, Nagybörzsöny (Deutsch-Pilsen), Hungary.

Type Material: Loránd Eötvös University, Budapest, Hungary, A-563.

Pinakiolite $(Mg, Mn^{2+})_2(Mn^{3+}, Sb^{5+})BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are typically rectangular, to 2 cm, platy on {010}, or short prismatic [001], may be bent. *Twinning:* Common on {011}, forming contact and cruciform interpenetration twins.

Physical Properties: *Cleavage:* Good on {010}. *Tenacity:* Very brittle. Hardness = 6
D(meas.) = 3.88 D(calc.) = 3.79–4.09

Optical Properties: Opaque to translucent. *Color:* Black, olive-green, yellowish brown; deep reddish brown in transmitted light. *Streak:* Brownish gray. *Luster:* Metallic, brilliant on {010}, to pearly.
Optical Class: Biaxial (–). *Pleochroism:* X = deep reddish brown; Z = reddish yellow.
Orientation: $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, moderate (?). $\alpha = 1.908(5)$
$\beta = 2.05(1)$ $\gamma = 2.06(10)$ 2V(meas.) = 32(1)°

Cell Data: *Space Group:* $C2/m$. $a = 21.773$–21.808 $b = 5.977$–6.162 $c = 5.327$–5.341
$\beta = 94.37°$–$95.83°$ Z = 8

X-ray Powder Pattern: Långban, Sweden.
2.51 (10), 2.70 (9), 5.42 (8), 1.986 (6), 2.165 (4), 1.623 (4), 1.496 (4)

MgO	29.30	32.02
CaO	1.12	
Total	[100.00]	100.88

(1) Långban, Sweden; recalculated to 100% after deduction of SiO_2 1.21%, H_2O 0.47%. (2) Do.; B_2O_3 by ICP spectroscopy, total Sb as Sb_2O_5, Mn^{2+}:Mn^{3+} calculated for charge balance; corresponds to $(Mg_{1.68}Mn^{2+}_{0.32})_{\Sigma=2.00}(Mn^{3+}_{0.60}Sb^{5+}_{0.22}Al_{0.01})_{\Sigma=0.83}BO_5$.

Occurrence: A rare mineral in banded granular dolomite in a metamorphosed Fe–Mn orebody.

Association: Hausmannite, tephroite, berzeliite, manganophyllite, dolomite, calcite.

Distribution: From Långban, Värmland, Sweden.

Name: From the Greek for *a small tablet*, in allusion to the thin tabular habit.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 531826.

Pinalite $Pb_3W^{6+}O_5Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As bladed acicular crystals, to 0.5 mm, elongated along [001], flattened on {010}, terminated by {$h0l$}; in slightly divergent sprays. *Twinning:* About [010], yielding penetration twins by rotation.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 7.78

Optical Properties: Transparent. *Color:* Bright yellow, golden, orange, pale yellow.
Luster: Adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, moderate.
$\alpha = 2.490$ $\beta = 2.495$ $\gamma = 2.505$ 2V(meas.) = 70° 2V(calc.) = 70.5°

Cell Data: *Space Group: Amam.* $a = 11.073(2)$ $b = 13.067(3)$ $c = 5.617(1)$ $Z = 4$

X-ray Powder Pattern: Mammoth-St. Anthony mine, Arizona, USA.
2.926 (10), 3.778 (9), 1.642 (5), 3.284 (4), 2.814 (4), 6.52 (3), 2.770 (3)

Chemistry:

	(1)	(2)
WO_3	23.3	24.24
PbO	70.7	70.02
Cl	7.1	7.41
$-O = Cl_2$	1.6	1.67
Total	99.5	100.00

(1) Mammoth-St. Anthony mine, Arizona, USA; by electron microprobe, corresponding to $Pb_{3.09}W_{0.98}O_{5.04}Cl_{1.95}$. (2) $Pb_3WO_5Cl_2$.

Occurrence: A late-stage secondary mineral in the oxidized zone of a base-metal deposit.

Association: Chromian leadhillite, cerussite, matlockite, diaboleite, caledonite, connellite, iranite, murdochite, fluorite, quartz.

Distribution: From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA.

Name: For Pinal Co., Arizona, USA (in turn named for the Pinal Indians), where the mineral was first noted to occur.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 53775; Harvard University, Cambridge, Massachusetts, 119858; National Museum of Natural History, Washington, D.C., USA, 165890.

Pinchite $Hg_5O_4Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As euhedral crystals, to 1 mm, blocky to tabular, may be distorted, showing {001}, {010}, {100}, and {012}.

Physical Properties: Hardness = Very soft. D(meas.) = 9.5 D(calc.) = 9.25

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black to dark brown. *Streak:* Reddish brown.
Optical Class: Biaxial; very strong birefringence. *Pleochroism:* Strong; red to black. $n = > 2.0$
2V(meas.) = n.d.

Cell Data: *Space Group: Ibam.* $a = 11.619(3)$ $b = 6.105(2)$ $c = 11.710(3)$ Z = 4

X-ray Powder Pattern: Terlingua, Texas, USA.
2.837 (100), 2.695 (80), 3.94 (60), 2.919 (50), 3.256 (35), 2.169 (20), 1.791 (15)

Chemistry:

	(1)
HgO	94.5
Cl	6.3
Br	0.2
$-O = (Cl, Br)_2$	[1.4]
Total	[99.6]

(1) Terlingua, Texas, USA; by neutron activation, corresponding to $Hg_{5.00}O_{4.00}Cl_{2.04}Br_{0.03}$.

Occurrence: A secondary mineral in a hydrothermal mercury deposit.

Association: Montroydite, terlinguaite.

Distribution: From Terlingua, Brewster Co., Texas, USA.

Name: To honor William Wallace Pinch (1940–), American mineral collector of Rochester, New York, USA, who first noted the species.

Type Material: Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada, M33258; Harvard University, Cambridge, Massachusetts, 119858; National Museum of Natural History, Washington, D.C., USA, 128440, 132391, 160256.

Pingguite $Bi_6Te_2^{4+}O_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystals, to 0.6 μm, columnar, in granular aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 5–6 VHN = 449–572, 510 average (50 g load). D(meas.) = 8.44 D(calc.) = 8.64

Optical Properties: Semitransparent. *Color:* Yellowish green. *Streak:* Pale yellow-green. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial. $n = > 2$ α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.
R: (546) 13.25

Cell Data: *Space Group:* n.d. $a = 5.689(1)$ $b = 10.791(1)$ $c = 5.308(1)$ Z = 1

X-ray Powder Pattern: Yangjiava, China.
3.146 (100), 2.841 (80), 2.694 (20), 1.695 (20), 1.956 (10), 1.631 (10), 2.651 (9)

Chemistry:

	(1)	(2)
TeO_2	20.17	18.59
Bi_2O_3	79.56	81.41
Total	99.73	100.00

(1) Yangjiava, China; by electron microprobe, average of 15 analyses; corresponds to $Bi_{5.80}Te_{2.15}O_{13.00}$. (2) $Bi_6Te_2O_{13}$.

Occurrence: In the oxidation zone of a gold deposit.

Association: Malachite, pyromorphite, bismutite, gold, "electrum", scheelite, quartz, calcite, "limonite".

Distribution: From Yangjiava, Pinggu Co., Beijing Municipality, China [TL].

Name: For its occurrence in Pinggu Co., China.

Type Material: Geological Museum of China, Beijing, China.

References: (1) Sun Zhifu, Luo Keding, Tan Falan, and Zhang Jingyi (1994) Pingguite; a new bismuth tellurite mineral. Acta Mineralogica Sinica, 14(4), 315–321 (in Chinese with English abs.). (2) (1996) Amer. Mineral., 81, 767 (abs. ref. 1). (3) (1999) Mineral. Abs., 50, 254 (abs. ref. 1).

Pinnoite $MgB_2O(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 4. Uncommon as short prismatic crystals, elongated along [001], showing {110}, {011}, {112}, {122}, to 1 mm; may be radial fibrous, typically crystalline granular.

Physical Properties: *Fracture:* Uneven. Hardness = 3.5 D(meas.) = 2.27 D(calc.) = 2.21 Soluble in boiling H_2O.

Optical Properties: Translucent. *Color:* Sulfur-yellow, straw-yellow, greenish yellow, pistachio-green; pale yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.565$ $\epsilon = 1.575$

Cell Data: *Space Group:* $P4_2$. $a = 7.6140(13)$ $c = 8.1898(8)$ Z = 4

X-ray Powder Pattern: Stassfurt, Germany. (ICDD 25-1119).
5.39 (100), 2.309 (70), 2.045 (50), 3.61 (40), 3.14 (40), 2.252 (35), 1.905 (30)

Chemistry:

Total	100.13	100.00

(1) Stassfurt, Germany; average of several analyses. (2) $MgB_2O(OH)_6$.

Occurrence: Typically in bedded marine salt deposits; an efflorescence around salt springs and lakes.

Association: Boracite, kaliborite.

Distribution: In Germany, in Saxony-Anhalt, from the Stassfurt-Leopoldshall district, at Schmidtmannshall, near Aschersleben. From the Inder borate deposit, Kazakhstan. At the Da Quidam saline lake, Qinghai-Xizang Plateau, Tibet, China. In the USA, from the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California. At Socacastro, Salta Province, Argentina.

Name: To honor Oberbergrat Pinno, Chief Councillor of Mines, Halle, Germany.

Pintadoite $Ca_2V_2^{5+}O_7 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. As crusts and stains.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d. Slowly soluble in H_2O; on evaporation yielding twinned lathlike crystals.

Optical Properties: Semitransparent. *Color:* Light to dark green.
Optical Class: n.d. ; moderate to high birefringence. *Pleochroism:* Slight; in yellow-greens.
n = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
V_2O_5	42.4	39.87
CaO	22.6	24.59
H_2O	35.0	35.54
Total	[100.0]	100.00

(1) Frisco No. 2 claim, Utah, USA; recalculated to 100% after deduction of gypsum and insoluble material. (2) $Ca_2V_2O_7 \cdot 9H_2O$.

Occurrence: As an efflorescence on sandstone in protected outcrops.

Association: Gypsum, quartz.

Distribution: In the USA, from the Frisco No. 2 and Ed Whitney claims, about 30 km north of Monticello, Pintado Canyon, San Juan Co., Utah; in the Coffins prospect, McElmo Creek area, Montezuma Co., and the Jo Dandy Hill mines, Uravan district, Montrose Co., Colorado.

Name: For Pintado Canyon, Utah, USA, where the mineral occurs.

Type Material: Harvard University, Cambridge, Massachusetts, 98962; National Museum of Natural History, Washington, D.C., USA, R5714, 93657.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1053.

UO_3	72.0	68.96
SeO_2	19.3	17.84
CaO	3.57	4.51
H_2O	8.00	8.69
Total	102.9	100.00

(1) Shinkolobwe, Congo; by electron microprobe, average of five analyses, H_2O by TGA, IR confirms the presence of $(UO_2)^{2+}$, $(SeO_3)^{2-}$, H_2O; corresponds to $Ca_{0.76}(UO_2)_{3.02}(SeO_3)_{2.09}(OH)_{3.38} \cdot 3.64H_2O$. (2) $Ca(UO_2)_3(SeO_3)_2(OH)_4 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a uranium deposit in limestone.

Association: Uraninite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Professor Paul Piret (1932–1999), crystallographer, Catholic University of Louvain, Louvain, Belgium, who described numerous new mineral species.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC 4717.

References: (1) Vochten, R., N. Blaton, O. Peeters, and M. Deliens (1996) Piretite, $Ca(UO_2)_3(SeO_3)_2(OH)_4 \cdot 4H_2O$, a new calcium uranyl selenite from Shinkolobwe, Shaba, Zaire. Can. Mineral., 34, 1315–1322. (2) (1997) Amer. Mineral., 82, 1040 (abs. ref. 1).

(2) Do.; by electron microprobe, corresponding to $(Ag_{1.96}Cu_{0.13})_{\Sigma=2.09}(Zn_{0.55}Fe_{0.46})_{\Sigma=1.01}Sn_{1.04}S_{4.00}$. (3) Ag_2ZnSnS_4.

Polymorphism & Series: Forms a series with hocartite.

Mineral Group: Stannite group.

Occurrence: As hydrothermal mineralization in veins associated with subvolcanic environments, similar to the classic Bolivian tin and silver deposits (Pirquitas deposit, Argentina).

Association: Hocartite, pyrite, marcasite, wurtzite, franckeite, miargyrite, aramayoite, chalcostibite, stannite, kesterite, rhodostannite, cassiterite (Pirquitas deposit, Argentina).

Distribution: From the Pirquitas deposit, Rinconada Department, Jujuy Province, Argentina [TL]. At the Toyoha mine, Hokkaido, Japan.

Name: For the type locality at the Pirquitas deposit in Argentina.

Type Material: National School of Mines, Paris, France.

Pirssonite $Na_2Ca(CO_3)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Hemimorphic crystals, to 2 cm, showing {010}, {110}, {111}, {131}, {311}, large $\{\bar{1}11\}$; granular, massive, may be as efflorescences.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3–3.5
D(meas.) = 2.352–2.382 D(calc.) = 2.367 Pyroelectric; soluble in H_2O, leaving $CaCO_3$.
