Total	100.45	100.00

(1) Searles Lake, California, USA; average of two analyses. (2) $Na_2Ca(CO_3)_2 \cdot 2H_2O$.

Occurrence: A rare component of saline lake-bed sediments; in a differentiated alkalic massif.

Association: Northupite, trona, gaylussite (Borax Lake, California, USA); shortite, bradleyite, northupite, gaylussite, trona (John Hay, Jr. Well No. 1, Wyoming, USA).

Distribution: In the USA, in California, from Searles Lake, San Bernardino Co., at Borax Lake, Lake Co., in Deep Spring Lake, Inyo Co., and at Owens Lake, Mono Co.; in the John Hay, Jr. Well No. 1, about 30 km west of Green River, Sweetwater Co., Wyoming. On the Arizaro, Pastos Grandes, and Pozuelos playas, Salta Province, Argentina. From the Jequetepeque River Valley, northwest Peru. On the Otjiwalundo Salt Pan, about 400 km west-northwest of Otavi, Namibia. In the Beypazari Basin, Ankara, Turkey. On Mt. Kukisvumchorr, Khibiny massif, and Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: To honor Professor Louis Valentine Pirsson (1860–1919), American petrographer and mineralogist, Yale University, New Haven, Connecticut, USA.

Pitticite $\mathbf{Fe^{3+}_x(AsO_4)_y(SO_4)_z \cdot nH_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. Always massive, gellike, typically reniform, botryoidal, stalactitic, in thin opaline crusts, crazed and crackled when dry; earthy.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle when opaline. Hardness = 2–3 D(meas.) = 2.2–2.5 D(calc.) = n.d.

Optical Properties: Transparent to opaque. *Color:* Reddish brown, yellowish brown, brownish red to brownish black; yellow, gray to nearly white; may exhibit deep red internal reflections. *Streak:* Yellow to white. *Luster:* Waxy, vitreous, greasy, may be dull, earthy.
Optical Class: Isotropic. n = 1.616–1.66

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Amorphous to X-rays.

(1) Five localities; by wet methods, ranges. (2) Seven localities; by electron microprobe, ranges, H_2O by the Penfield method.

Occurrence: A late secondary mineral typically formed by oxidation of earlier arsenic-bearing species; may be deposited from mine and spring waters.

Association: Haidingerite, pharmacolite, pharmacosiderite, diadochite, scorodite, erythrite, melanterite, gypsum, alunite, "limonite".

Distribution: In Germany, from Freiberg, Schneeberg, Schwarzenberg, Marienberg, Johanngeorgenstadt, and other districts in Saxony; at St. Andreasberg, Harz Mountains. From Jáchymov (Joachimsthal), at Příbram, and near Kaňk, Kutná Hora district, Czech Republic. In England, in Cornwall, at Wheal Sparnon, Redruth; the Penberthy Croft mine, St. Hilary; the Botallack mine, St. Just; the Dolcoath mine, Camborne, Cornwall. In the USA, in the Tintic district, Juab Co., Utah; at the White Caps mine, Manhattan district, Nye Co., Nevada; from Sterling Hill, Ogdensburg, Sussex Co., New Jersey. At Djebel Debar, Algeria. A number of other localities are suggested for this poorly-defined species.

Name: From the Greek for *pitch*, for its typical resinous appearance.

Type Material: Mining Academy, Freiberg, Germany, 21860.

(1) New England District, Victoria, Australia, average of electron microprobe and CHN analyses, corresponding to $(Na_{0.22}H_2O_{0.44}Ca_{0.02}K_{0.003})_{\Sigma=0.683}(W_{0.82}Fe^{3+}_{0.16}Al_{0.02})_{\Sigma=1.00}[O_{2.70}(OH)_{0.30}]_{\Sigma=3.00}$.

Occurrence: Formed by weathering ferberite in hydrothermal quartz veins associated with granite by chemical reaction with acidic, oxidizing solutions containing sodium.

Association: Ferberite, quartz**,** bismuth, gold, bismuthinite, koechlinite, elsmoreite.

Distribution: From mine dumps near the main shaft of a tungsten deposit (Bass and Watson's) 6 km west of Linton (near Ballarat), New England District, Victoria, Australia.

Name: For a former village near the deposit, *Pittong* (an Australian indigenous word for *father*).

Type Material: Museum Victoria, Melbourne, Australia (M48268).

(1) Tolbachik volcano, Russia; Na_2O, K_2O by flame photometry, CuO, PbO, ZnO by AA; F by fluorine selective electrode, $(SO_4)^{2-}$ confirmed by IR, original total given as 99.94%; after deduction of CuCl as nantokite, NaCl as halite, F, H_2O, and insoluble tenorite, corresponds to $(K_{1.97}Na_{0.01}Pb_{0.01})_{\Sigma=1.99}(Cu_{2.02}Zn_{0.04})_{\Sigma=2.06}O(SO_4)_{1.98}$. (2) Vesuvius, Italy; by electron microprobe, average of four analyses. (3) $K_2Cu_2O(SO_4)_2$.

Occurrence: A rare fumarolic sublimate, formed above 500 °C.

Association: Halite, sylvite, langbeinite, tenorite, hematite, tolbachite, dolerophanite, urusovite, aphthitalite, ponomarevite, cotunnite, chalcocyanite, sofiite, euchlorine, averievite, fedotovite, alarsite, alumoklyuchevskite, nabokoite, lammerite (Tolbachik volcano, Russia); paratacamite (Vesuvius, Italy).

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. On Vesuvius, Campania, Italy,

Name: Honors Boris Ivanovich Piyp (1906–1966), Russian vulcanologist, Director of the Far Eastern Institute of Volcanology, Petropavlovsk-Kamchatskii, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 1331/1.

(1) Wolfsberg, Germany. (2) Oruro, Bolivia. (3) $Pb_5Sb_8S_{17}$.

Occurrence: In hydrothermal vein deposits.

Association: Cassiterite, franckeite, andorite, semseyite, zinkenite, twinnite, robinsonite, geocronite, boulangerite, galena, pyrite.

Distribution: In Germany, from Wolfsberg, in the Harz Mountains [TL], and Arnsberg, North Rhine-Westphalia. In France, at Leyraux, Cantal; Chazelles, Haute-Loire; Les Cougnasses and Riou Beyrou, Hautes-Alpes; and Bournac, Montagne Noire, Finistère. From Bound Cliff, St. Endellion, Cornwall, England. In the Bwlch mine, Deganwy, Gwynedd, Wales. At the Rujevac Sb–Zn–Pb deposit, western Serbia. From the Azatec deposit, Caucasus Mountains, Armenia. In the Bal'Kumeisk deposit, Sakha, Russia. At the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In Canada, from the Porter claim, Carbon Hill, Wheaton River district, Yukon Territory. From the San José mine, Oruro, Bolivia. Additional occurrences are known, either poorly located or the species not fully characterized.

Name: From the Greek for *oblique*, in reference to the crystal morphology.

(1) Mindouli, Congo. (2) $Cu_8Si_8O_{22}(OH)_4 \cdot H_2O$.

Occurrence: A rare secondary mineral in the oxidized portion of copper deposits.

Association: Chrysocolla, dioptase, malachite, conichalcite, tenorite.

Distribution: From Mindouli, Renéville, and Tshiniama, Congo Republic. In Congo (Zaire), fine material from Tantara, Mindigi, and M'sesa, near Kambove, Katanga (Shaba) Province. From Tsumeb, Guchab, and Okatumba, about 80 km east of Windhoek, Namibia. In England, at the Driggith mine, Caldbeck Fells, Cumbria; the Gunheath china clay pit, St. Austell, Cornwall; and the Engine vein, Alderley Edge, Cheshire. In the USA, in Arizona, from the Table Mountain mine, Galiuro Mountains, and the Azurite mine, Tortolita Mountains, Pinal Co.; in the Bighorn district, south of Aguila, Maricopa Co.; in the Harquehala Mountains, Yuma Co.; and elsewhere. In Michigan, from the Algomah mine, Ontonagon Co. In the Kurokawa mine, Gifu Prefecture, and the Kisanmori mine, Akita Prefecture, Japan. From La Rioja, Argentina.

Name: For a Mr. Planche, who provided the original material for characterization.

Type Material: n.d.

(1) "Gumeshevsk copper mines," Russia. (2) Mt. Ida, Arkansas, USA; by electron microprobe, total Fe as Fe_2O_3, H_2O by the Penfield method; corresponds to $(Al_{5.92}Fe_{0.08})_{\Sigma=6.00}(PO_4)_{1.92}(PO_3OH)_{2.00}(OH)_8 \cdot 4.07H_2O$. (3) $Al_6(PO_4)_2(PO_3OH)_2(OH)_8 \cdot 4H_2O$.

Polymorphism & Series: Forms a series with turquoise.

Mineral Group: Turquoise group.

Occurrence: A rare secondary mineral formed in phosphate-rich aluminous deposits.

Association: Wavellite, variscite, metavariscite (Mt. Ida, Arkansas, USA).

Distribution: From Mt. Chernovskaya, near the Chernaya River, Middle Ural Mountains, Russia. At Poniklá, Jilemnice, Czech Republic. From Bruguers, Barcelona Province, Spain. In the USA, at General Trimble's mine, Chester Co., Pennsylvania; in Arkansas, from the Mauldin Mountain quarry, near Mt. Ida, Montgomery Co., at the Coon Creek mine and Buckeye Mountain, Polk Co., and on Dug Hill, near Avant, Garland Co.; at Erin, Clay Co., Alabama; from Brewer, east of Cedartown, Polk Co., Georgia; at Cripple Creek, Teller Co., Colorado; from the Rain mine, Carlin district, Elko Co., Nevada. At Toyoda, near Kochi, Shikoku Prefecture, Japan. More localities are likely as additional turquoise group specimens are re-examined.

Name: To honor Dimitrii Ivanovich Planer (1821–1882), mineralogist and Director of the Gumeshevsk copper mines, Polevskoi, Russia, who discovered the mineral at some distance east from those mines.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 5404; National Museum of Natural History, Washington, D.C., USA, R9710.

Mineral Group: Cobaltite group.

Occurrence: In dunite pipes and replacement pegmatite deposits; in layered mafic intrusions and ophiolites; in placers.

Association: Stibiopalladinite, ruthenarsenite, mertieite-II, genkinite, Pt–Fe–Cu–Ni alloys, bornite, chromite.

Distribution: From the Onverwacht [TL], Driekop, Union, and Western Platinum mines, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. At Fox Gulch, Goodnews Bay, Alaska, USA. From Chromwerk, Kraubath ultramafic massif, Styria, Austria. At the Braganca massif, northern Portugal. In Russia, in placers on the Pustaya River, Kamchatka, and Neozhidannyy Creek, Tuva; and in the Imandra complex, Kola Peninsula. From the Munni Munni layered intrusion, Pilbara Block, Western Australia.

Name: For the composition.

(1) Chocó, Colombia; corresponds to $Pt_{0.71}Fe_{0.22}Rh_{0.02}Cu_{0.02}Ir_{0.01}Os_{0.01}Pd_{0.01}$. (2) Birbir River, Ethiopia; corresponds to $Pt_{0.56}Fe_{0.40}Rh_{0.01}Ir_{0.01}Os_{0.01}Pd_{0.01}$. (3) Nizhni Tagil, Russia; by electron microprobe, corresponds to $Pt_{0.79}Fe_{0.16}Rh_{0.02}Pd_{0.02}Cu_{0.01}$.

Occurrence: Chiefly in placer deposits, or in mafic and ultramafic igneous rocks; rarely in hydrothermal quartz veins or contact metamorphic deposits.

Association: Pt–Fe alloys, chalcopyrite, chromite, magnetite.

Distribution: From many deposits world-wide. In the Pinto River, near Papayan, in the Department of Chocó, Cauca, Colombia [TL]. In the USA, from Platinum Creek, Goodnews Bay, Alaska; in California, in a number of placers, as in Trinity Co.; and at Oroville, Butte Co. In Oregon, at Cape Blanco, Port Orford, Curry Co. In Canada, at Rivière-du-Loup and Rivière des Plantes, Beauce Co., Quebec; in British Columbia, in the Kamloops district, on the Fraser and Tranquille Rivers, and in the Similkameen district, on Granite, Cedar, and Olivine Creeks, tributaries to the Tulameen River; in Alberta, near Edmonton. In Russia, in the Ural Mountains, in a large district surrounding Nizhni Tagil; good crystals from the Konder massif, Aldan Shield, Sakha. In South Africa, at a number of deposits along the Merensky Reef of the Bushveld complex, Transvaal.

Name: From the Spanish *platina*, diminutive of *plata*, *silver*.

Plattnerite PbO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Commonly as crystals, prismatic ‖ [001], showing {010}, {011}, {110}, {131}, {001}, to 5 mm; may be nodular or botryoidal, fibrous and concentrically zoned, massive. *Twinning:* On {011}, as contact and penetration twins, rarely polysynthetic.

Physical Properties: *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 9.564 D(calc.) = 9.563

Optical Properties: Opaque to slightly translucent. *Color:* Jet-black, iron-black, brownish black; yellowish in transmitted light; gray-white in reflected light, with red-brown internal reflections. *Streak:* Chestnut-brown. *Luster:* Bright metallic to adamantine; tarnishing dull on exposure.
Optical Class: Uniaxial. *Pleochroism:* Distinct. $n = 2.30(5)$ *Anisotropism:* Noticeable; midnight-blue.
R_1–R_2: (400) 18.5–21.3, (420) 18.4–21.9, (440) 18.5–21.5, (460) 18.5–20.2, (480) 18.5–19.8, (500) 18.4–19.4, (520) 18.2–18.9, (540) 17.9–18.4, (560) 17.5–18.0, (580) 17.0–17.4, (600) 16.5–16.9, (620) 16.0–16.4, (640) 15.5–15.9, (660) 15.0–15.4, (680) 14.4–15.0, (700) 14.0–14.5

3.500 (100), 2.793 (94), 1.855 (80), 2.469 (40), 1.524 (23), 0.823 (20), 1.568 (19)

Chemistry:

	(1)
PbO_2	99.6
CuO	0.1
Total	99.7

(1) Ojuela mine, Mexico; by electron microprobe.

Polymorphism & Series: Dimorphous with scrutinyite.

Mineral Group: Rutile group.

Occurrence: In weathered hydrothermal base-metal deposits, oxidized typically in arid climates.

Association: Cerussite, smithsonite, hemimorphite, leadhillite, hydrozincite, rosasite, aurichalcite, murdochite, pyromorphite, wulfenite, calcite, quartz.

Distribution: From Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire, Scotland. In the Tchah Milleh mine, near Anarak, and the Dareh Zandjir mine, near Anjireh, Iran. From Tsumeb, Namibia. In the USA, large masses from the Coeur d'Alene district, Shoshone Co., and in the Democrat mine, Gilmore district, Lemhi Co., Idaho; from the Goodsprings district, Clark Co., and the Diamond mine, near Eureka, Eureka Co., Nevada. In the 79 mine, Gila Co., the Defiance mine, Gleeson, Cochise Co., the Glove mine, Santa Cruz Co., and elsewhere in Arizona; at the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., and Granite Gap, San Simon district, Hidalgo Co., New Mexico. From the Ojuela mine, Mapimí, Durango, and at Santa Eulalia, Chihuahua, Mexico. Other minor localities are known.

Name: To honor Carl Friedrich Plattner (1800–1858), Professor of Metallurgy and Assaying, Mining Academy, Freiberg, Germany.

Type Material: Mining Academy, Freiberg, Germany, 10045.

Plumbobetafite $(Pb, U, Ca)(Nb, Ti)_2O_6(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; may be metamict. *Point Group:* $[4/m\ \overline{3}\ 2/m]$ (by analogy to betafite). As octahedra, with curved faces, or as rounded cubic grains, to 3 mm.

Physical Properties: *Fracture:* Irregular. *Tenacity:* [Brittle.] Hardness = [~3–5.5] D(meas.) = 4.64 D(calc.) = [4.13] Radioactive.

Optical Properties: Semitransparent. *Color:* Pale yellowish, may have brownish black cores. *Luster:* Adamantine.
Optical Class: Isotropic. n = n.d.

Cell Data: *Space Group:* $[Fd3m.]$ a = 10.33(1) Z = [8]

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)		(1)	(2)
UO_3	13.73		Fe_2O_3	1.14

			Total	[99.55]	99.22

(1) Burpala massif, Russia; original total given as 99.71%, RE = La 20.6%, Ce 61.0%, Pr 4.4%, Nd 10.5%, Sm 1.0%, Gd 0.5%, Dy 0.5%, Y 1.5%; after deduction of SiO_2, corresponds to $(Pb_{0.44}U_{0.25}Ca_{0.18}Na_{0.12}RE_{0.12})_{\Sigma=1.11}(Nb_{1.12}Ti_{0.78}Fe_{0.07}Ta_{0.02})_{\Sigma=1.99}O_6[(OH)_{0.58}F_{0.42}]_{\Sigma=1.00}$.
(2) Keivy massif, Russia; by electron microprobe, corresponding to $(Pb_{2.05}Ca_{0.01})_{\Sigma=2.06}(Ti_{1.32}Nb_{0.39}W_{0.20}Sn_{0.05}Ta_{0.03}Fe_{0.01})_{\Sigma=2.00}O_6(OH)$.

Mineral Group: Pyrochlore group, betafite subgroup; $Pb_A > 20\%$; $2Ti_B \geq (Nb + Ta)_B$.

Occurrence: An accessory mineral in a pegmatitic dike in nepheline syenite (Burpala massif, Russia).

Association: Microcline, quartz, albite, aegirine, riebeckite (Burpala massif, Russia).

Distribution: In the Burpala massif, 120 km north of Lake Baikal, eastern Siberia, and from the Keivy massif, Kola Peninsula, Russia.

Name: Ostensibly for its content of lead, PLUMBum, and relation to other *betafite* members of the pyrochlore group.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Plumboferrite $\mathbf{Pb_2Fe^{3+}_{11-x}Mn^{2+}_xO_{19-2x}}$ (x = 1/3)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Thick tabular crystals, to 1 cm, with dominant $\{10\bar{1}1\}$ and {0001}, may have very complex form development; commonly cleavable massive.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = 6.5 VHN = 824–946, 882 average (100 g load). D(meas.) = 6.07 D(calc.) = 6.09–6.12

Optical Properties: Opaque. *Color:* Black; light gray in reflected light. *Streak:* Nearly black. *Luster:* Submetallic.
Optical Class: Uniaxial (–). *Bireflectance:* Weak.
R_1–R_2: (400) 27.3–29.4, (420) 26.9–28.7, (440) 26.5–28.0, (460) 26.1–27.5, (480) 25.8–26.9, (500) 25.5–26.4, (520) 25.2–25.9, (540) 24.9–25.5, (560) 24.6–25.0, (580) 24.1–24.6, (600) 23.6–24.0, (620) 23.1–23.5, (640) 22.6–23.0, (660) 22.2–22.6, (680) 21.8–22.1, (700) 21.4–21.7

Cell Data: *Space Group:* $P6_3/mmc$. $a = 5.931(1)$ $c = 23.551(2)$ Z = 2

X-ray Powder Pattern: Jakobsberg, Sweden.
2.9438 (100), 3.922 (85), 11.78 (40), 2.8132 (30), 2.6473 (30), 5.888 (25), 1.6919 (16)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2		0.10	PbO	33.03	34.18
TiO_2	0.08	0.21	MgO	0.34	0.29

MnO	1.41	1.24	insol.	0.15	
			Total	99.75	99.94

(1) Jakobsberg, Sweden. (2) Do.; by electron microprobe, average of several determinations, total Fe as Fe_2O_3, O from charge balance; corresponding to $(Pb_{2.03}Mn_{0.23}Mg_{0.10}Fe_{10.59}Ti_{0.03}Si_{0.02})_{\Sigma=13.00}O_{18.35}$.

Occurrence: In metamorphosed lead-bearing Fe–Mn orebodies.

Association: Hematite, jacobsite, magnesioferrite, lindqvistite, hedyphane, svabite, barite, hematophanite, copper, cuprite, calcite, andradite, phlogopite (Jakobsberg, Sweden).

Distribution: From Jakobsberg, Värmland, and at the Sjö mine, near Grythyttan, Örebro, Sweden.

Name: From the Latin for lead, PLUMBum, and FERROus iron in its composition.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 81:224.

Plumbogummite $PbAl_3(PO_4)_2(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Crystals hexagonal or bladed, prismatic, to 5 mm, in parallel to subparallel aggregates; microscopically radially fibrous or spherulitic; usually as crusts, botryoidal, reniform, stalactitic, globular, compact massive.

Physical Properties: *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 4.01 D(calc.) = [4.08]

Optical Properties: Transparent to translucent. *Color:* Grayish white, grayish blue, yellowish gray, yellowish brown, green, pale blue. *Streak:* White. *Luster:* Vitreous, resinous to dull. *Optical Class:* Uniaxial (+); segments of crystals may be biaxial. ω = 1.653–1.688 ϵ = 1.675–1.704

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.017(1)$ $c = 16.75(1)$ Z = 3

X-ray Powder Pattern: Ivanhoe mine, Australia.
2.969 (10), 5.71 (9), 2.220 (8), 3.51 (7), 1.905 (6), 3.44 (5), 4.93 (4)

Chemistry:

	(1)	(2)
SO_3	0.67	
P_2O_5	22.47	24.42
As_2O_5	0.04	
Al_2O_3	25.45	26.32
Fe_2O_3	0.01	
CuO	0.92	
PbO	38.90	38.41
H_2O	[11.54]	10.85
Total	[100.00]	100.00

(1) Ivanhoe mine, Australia; by electron microprobe, H_2O by difference, $(OH)^{1-}$ confirmed by IR; leading to $Pb_{1.02}Cu_{0.07}Al_{2.92}[(PO_4)_{1.85}(SO_4)_{0.05}]_{\Sigma=1.90}(OH)_{5.29} \cdot 0.73H_2O$.
(2) $PbAl_3(PO_4)_2(OH)_5 \cdot H_2O$.

Mineral Group: Crandallite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of lead deposits.

Association: Pyromorphite, mimetite, duftite, cerussite, anglesite, wulfenite.

Distribution: In France, from Huelgoat, Finistère. In England, from Roughton Gill, Red Gill, Dry Gill, and other mines, Caldbeck Fells, Cumbria; in Cornwall, from Wheal Gorland, Gwennap; at the Penberthy Croft mine, St. Hilary; in the Buttern Hill placers, Altarnum; and from Wheal Alfred, Gwinear. At Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire, Scotland. From the Horcajo mines, 35 km south of Brazatortas, Cuidad Real Province, Spain. At Moldava, 20 km northwest of Teplice, Czech Republic. In the USA, at the Canton mine, Cherokee Co., Georgia; from the Tyrone mine, Santa Rita, Grant Co., and the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; in the Hahns Peak district, Routt Co., Colorado; at the Copper Cities deposit, Gila Co., Arizona; in the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., and the San Rafael mine, Nye Co., Nevada. In Australia, from the Ivanhoe mine, Tennant Creek district, Northern Territory; in the Teutonic Bore deposit, 300 km north of Kalgoorlie, Western Australia; at Broken Hill, New South Wales. Several other minor localities are known.

Name: From the Latin for *lead* and *gum*, which it may resemble.

Type Material: Natural History Museum, Paris, France.

Plumbojarosite $Pb_{0.5}Fe_3^{3+}(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As hexagonal crystals, platy on {0001}, with $\{10\overline{1}4\}$, $\{01\overline{1}2\}$, to 0.1 mm; commonly aggregated into crusts and compact masses, pulverulent, earthy.

Physical Properties: *Cleavage:* On $\{10\overline{1}4\}$, fair. *Tenacity:* Talclike. Hardness = "Soft". D(meas.) = 3.64–3.67 D(calc.) = [3.66]

Optical Properties: Semitransparent. *Color:* Golden brown to dark brown. *Luster:* Vitreous, silky to dull.
Optical Class: Uniaxial (–). *Pleochroism:* O = yellow-brown; E = nearly colorless. $\omega = 1.875$ $\epsilon = 1.786$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.305$–7.315 $c = 33.564$–33.788 Z = 6

X-ray Powder Pattern: Cookes Peak district, New Mexico, USA.
3.066 (100), 5.933 (94), 1.829 (70), 3.114 (46), 1.976 (45), 6.232 (34), 3.657 (31)

Chemistry:

	(1)	(2)
SO_3	27.06	28.33
SiO_2	0.51	
Al_2O_3	0.10	
Fe_2O_3	42.37	42.37

Total	100.15	100.00

(1) Cookes Peak district, New Mexico, USA. (2) $Pb_{0.5}Fe_3^{3+}(SO_4)_2(OH)_6$

Mineral Group: Alunite group.

Occurrence: Formed by the reaction between galena and oxidizing pyrite in lead deposits, typically in arid regions.

Association: Jarosite, anglesite, "limonite".

Distribution: Uncommon but occurring at many localities, at some constituting an ore of lead. In the USA, from the Cookes [Cooks] Peak district, Luna Co., and many other occurrences in New Mexico; from many localities in Utah, as in the American Forks and East Tintic districts, Utah Co.; at the Boss, Kirby, Yellow Pine, and other mines, Goodsprings district, Clark Co., Nevada; from Tombstone, Cochise Co., and elsewhere in Arizona; at Leadville, Lake Co., Colorado; in the Darwin district, Inyo Co., California. In England, from the Treore mine, St. Teath, the Penberthy Croft mine, St. Hilary, and Wheal Carpenter, Gwinear, Cornwall. At Laurium, Greece. From Bolkardag, Adana Province, Turkey. At Akchagyl, Ukraine. From Tsumeb, Namibia.

Name: As the lead, *plumbum*, analog of *jarosite*.

Type Material: Yale University, New Haven, Connecticut, 3.3608, 3.6809; National Museum of Natural History, Washington, D.C., USA, 86551, R6308.

Plumbomicrolite $(Pb,Ca)_2(Ta,Nb)_2O_6(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. In octahedral or cubo-octahedral crystals, to 20 cm, and massive.

Physical Properties: *Fracture:* [Uneven] (by analogy to the pyrochlore group). *Tenacity:* [Brittle.] Hardness = 6 VHN = 610–670 (40 g load). D(meas.) = 6.5–8.2 D(calc.) = 6.70–8.73 (varying with Ta/Nb content).

Optical Properties: Opaque, translucent in thin fragments. *Color:* Yellow to orange, green to yellowish green, dark brown to black. *Luster:* Greasy.
Optical Class: Isotropic.
R: (545) 18.2

Cell Data: *Space Group:* $Fd3m$. $a = 10.56$–10.61 $Z = 8$

X-ray Powder Pattern: Kivu Province, Congo.

(1) Kivu Province, Congo; after deduction of estimated cassiterite 3% and mica 0.5%, corresponds to $(Pb_{0.74}Na_{0.13}Ca_{0.11}Cs_{0.07}Sb_{0.03}Fe_{0.03}Ba_{0.01})_{\Sigma=1.12}(Ta_{1.45}Nb_{0.53}Ti_{0.02})_{\Sigma=2.00}O_{6.04}\bullet 0.42H_2O$.
(2) Mt. Ploskaya, Kola Peninsula, Russia; corresponds to $(Pb_{1.39}Ca_{0.35}Na_{0.14})_{\Sigma=1.88}(Ta_{1.05}Nb_{0.59}Sn_{0.21}Fe^{3+}_{0.15})_{\Sigma=2.00}O_{6.11}(OH)_{0.89}$.

Mineral Group: Pyrochlore group, microlite subgroup; $Pb_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: In alluvium near lithium-rich pegmatites (Kivu Province, Congo); in microcline pegmatites in an alkalic massif (Mt. Ploskaya, Kola Peninsula, Russia).

Association: Cassiterite, manganotantalite, microlite, simpsonite, mica (Kivu Province, Congo); albite, cassiterite, galena, uranium minerals, hingganite-(Yb) (Mt. Ploskaya, Kola Peninsula, Russia).

Distribution: At an unspecified locality [Mumba district, Masisi] in Kivu Province, Congo (Zaire). From about 15 km north-northwest of Lutsiro, near the Sebeya River, western Rwanda. As large crystals on Mt. Ploskaya, Keivy massif, Kola Peninsula, Russia.

Name: For lead, PLUMBum, in its composition, and its relation to *microlite*.

Type Material: van Wambeke collection, Brussels, Belgium.

References: (1) Safiannikoff, A. and L. van Wambeke (1961) Sur un terme plombifère du groupe pyrochlore-microlite. Bull. Soc. fr. Minéral., 84, 382–384 (in French with English abs.). (2) (1962) Amer. insol.	0.78	
Total	100.40	100.00

(1) Wanlockhead, Scotland. (2) $Pb_5O(CO_3)_3(OH)_2$.

Occurrence: Rare in the oxidized zone of hydrothermal polymetallic deposits.

Association: Anglesite, linarite, galena (Tiger, Arizona, USA).

Distribution: From Wanlockhead, Dumfriesshire, Scotland. In the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA.

Name: From the Latin for *lead* and the French *nacre*, for *mother-of-pearl*, in allusion to its composition and nacreous luster.

Type Material: n.d.

Cell Data: *Space Group:* $P6_3mc$ (synthetic). $a = 4.470$ $c = 5.719$ $Z = 1$

X-ray Powder Pattern: Talnakh area, Russia.
2.30 (10), 2.23 (10), 1.207 (6), 3.20 (5), 1.302 (5), 1.760 (4), 1.602 (4)

Chemistry:

	(1)	(2)
Pd	42.35	43.51
Pb	55.12	56.49
Ag	2.07	
Cu	0.22	
Sn	0.47	
Bi	0.80	
Sb	0.08	
Total	101.11	100.00

(1) Talnakh area, Russia; by electron microprobe, average of four analyses; corresponds to $(Pd_{2.86}Ag_{0.14})_{\Sigma=3.00}(Pb_{1.91}Bi_{0.03}Sn_{0.03}Cu_{0.02}Sb_{0.01})_{\Sigma=2.00}$. (2) Pd_3Pb_2.

Occurrence: In Ni–Cu sulfide ores (Talnakh area, Russia).

Association: Cubanite, talnakhite, polarite, stannopalladinite, silver, sphalerite, galena (Talnakh area, Russia).

Distribution: From the Majak mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL]. At the Stillwater complex, Montana, USA.

Name: For the chemical composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72999.

Plumbopyrochlore $(Pb, Y, U, Ca)_{2-x}Nb_2O_6(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $[4/m\ \overline{3}\ 2/m]$ (by analogy to the pyrochlore group). As octahedral crystals, granular, and rims on columbite crystals.

Physical Properties: *Fracture:* [Uneven.] *Tenacity:* [Brittle.] Hardness = [∼5]
D(meas.) = 5.04 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Red, greenish yellow, zoned with brown cores.
Luster: [Vitreous to resinous.]
Optical Class: Isotropic. n = 2.08–2.025

Cell Data: *Space Group:* $[Fd3m.]$ a = 10.534–10.57 Z = 8

X-ray Powder Pattern: Tai-Keu deposit, Russia.
3.02 (10), 1.861 (9), 1.581 (9), 1.077 (8), 1.017 (8), 1.209 (7), 2.615 (6)

Chemistry:

	(1)	(2)		(1)	(2)
UO_3	1.82		Al_2O_3	0.64	
WO_3		0.66	RE_2O_3	4.87

SnO_2	0.61	1.80	H_2O	1.00	
			Total	99.55	99.69

(1) Tai-Keu deposit, Russia; corresponding to $(Pb_{0.80}Y_{0.24}U_{0.10}Ca_{0.09})_{\Sigma=1.23}(Nb_{1.42}Si_{0.22}Fe_{0.17}Ta_{0.07}Al_{0.05}Sn_{0.02})_{\Sigma=1.95}O_{6.18}\bullet 0.52H_2O$. (2) Keivy massif, Russia; by electron microprobe, corresponding to $(Pb_{2.08}Ca_{0.01})_{\Sigma=2.09}(Nb_{1.05}Ti_{0.68}Ta_{0.12}Sn_{0.08}Fe_{0.04}W_{0.02})_{\Sigma=1.99}O_6(OH)$.

Mineral Group: Pyrochlore group and subgroup; $Pb_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: In metasomatically altered granitic rocks (Ural Mountains, Russia).

Association: Quartz, microcline, albite, aegirine (Ural Mountains, Russia); plumbobetafite, columbite (Keivy massif, Russia).

Distribution: From the Tai-Keu RE–Nb deposit, between Vorkuta and Labytrangi, Polar Ural Mountains, and in the Keivy massif, Kola Peninsula, Russia. At Khan Bogda, Gobi Desert, Mongolia. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia. At Oka, Quebec, Canada.

Name: For lead, PLUMBum, in its composition, and its relation to *pyrochlore*.

Type Material: Vernadsky Geological Museum, Moscow, 48596; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67255, 67256.

Plumboselite $Pb_3O_2(SeO_3)$

Crystal Data: Orthorhombic. *Point Group: mm*2. In subparallel to divergent clusters of fibers elongated parallel to [001] and flattened on {010}, to 0.3 mm.

Physical Properties: *Cleavage:* None observed. *Fracture:* n.d. *Tenacity:* Brittle.
Hardness = 2-3 D(meas.) = n.d. D(calc.) = 7.814

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White.
Luster: Dull to adamantine.
Optical Class: Biaxial. *Orientation*: $X = c$. $n = 2.115$ [Gladstone-Dale relationship].

Cell Data: *Space Group: Cmc*2_1. $a = 10.5384(11)$ $b = 10.7452(13)$ $c = 5.7577(7)$ $Z = 4$

X-ray Powder Pattern: Tsumeb mine, Namibia.
3.155 (100), 1.956 (26), 2.886 (22), 1.713 (21), 2.691 (17), 1.2711 (17), 1.8864 (13)

Chemistry:

	(1)	(2)
CaO	0.09	-
PbO	84.92	85.78
SeO_2	14.95	14.22
Total	99.96	100.00

(1) Tsumeb mine, Namibia; average of 7 electron microprobe analyses, corresponding to $Pb_{2.92}Ca_{0.01}Se_{1.03}O_5$. (2) $Pb_3O_2(SeO_3)$.

Occurrence: A secondary mineral in the oxidized zone of a polymetallic sulfide deposit.

Association: Clausthalite, smithsonite, mimetite, vaterite.

Distribution: From the Tsumeb mine, Otjikoto Region, Namibia.

Name: For the mineral's essential chemical composition, *plumbo* (for lead) and *sel* (for selenite).

Type Material: Mineral Sciences Department, Natural History Museum of Los Angeles County, California, USA (63264).

References: (1) Kampf, A.R., S. J. Mills, and W.W. Pinch (2011) Plumboselite, $Pb_3O_2(SeO_3)$, a new oxidation-zone mineral from Tsumeb, Namibia. Mineralogy and Petrology, 101, 75–80.
(2) (2013) Amer. Mineral., 98, 281 (abs. ref. 1).

Plumbotellurite $PbTe^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As fine-grained aggregates in rims around and replacing altaite.

Physical Properties: Hardness = n.d. VHN = 30–42, 38 average (10 g load).
D(meas.) = 7.2 D(calc.) = 7.16

Optical Properties: Semitransparent. *Color:* Grayish yellow, gray, or pale brown; colorless in transmitted light; gray or brownish gray in reflected light. *Streak:* Yellowish gray.
Optical Class: Biaxial (+). $\alpha = 2.19$ $\beta = 2.23$ $\gamma = 2.35$ 2V(meas.) = $\sim 50°$
Anisotropism: Distinct.

Cell Data: *Space Group:* n.d. $a = 8.423$ $b = 13.739$ $c = 9.199$ Z = 12

X-ray Powder Pattern: Zhana-Tyube deposit, Kazakhstan.
3.17 (100), 3.099 (35), 3.21 (32), 2.980 (29), 2.857 (25), 2.725 (18), 2.102 (12)

Chemistry:

	(1)	(2)
SO_3	0.1	
TeO_2	42.0	41.69
SeO_2	0.1	
Bi_2O_3	0.6	
Sb_2O_3	0.1	
PbO	58.4	58.31
Total	101.3	100.00

(1) Zhana-Tyube deposit, Kazakhstan; by electron microprobe, average of three analyses; original elemental analysis here converted to oxides; corresponds to $(Pb_{1.01}Bi_{0.01})_{\Sigma=1.02}Te_{1.01}O_{2.96}$.
(2) $PbTeO_3$.

Polymorphism & Series: Dimorphous with fairbankite.

Occurrence: A secondary mineral, formed by alteration of altaite near the base of the oxidation zone of a tellurium-rich mineral deposit.

Association: Altaite.

Distribution: From the Zhana-Tyube Au–Te deposit, northern Kazakhstan.

Name: For lead, *plumbum*, and *tellurium* in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81598.

References: (1) Spiridonov, E.M. and O.I. Tananeyva (1982) Plumbotellurite, $\alpha-PbTeO_3$, a new mineral. Doklady Acad. Nauk SSSR, 262, 1231–1235 (in Russian). (2) (1982) Amer. Mineral., 67, 1075 (abs. ref. 1).

Plumbotsumite $Pb_5Si_4O_8(OH)_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* 222. As irregular to skeletal pseudohexagonal crystals, tabular on {001}, to 1 mm; rarely stacked ‖ [001] and exhibiting parallel striations; massive. *Twinning:* Microscopic lamellar twinning visible on cleavage surfaces, penetration twinning on {110} also common.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = ∼2 D(meas.) = 5.6 D(calc.) = 5.56

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Streak:* White. *Luster:* Resinous to adamantine; pearly on cleavage surfaces.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$. $\alpha = 1.922(5)$ $\beta = 1.933(4)$ $\gamma = 1.938(4)$ 2V(meas.) = 32(5)°

Cell Data: *Space Group:* $C222_1$. $a = 15.875(4)$ $b = 9.261(3)$ $c = 29.364(9)$ Z = 10

X-ray Powder Pattern: Tsumeb, Namibia.
3.65 (100b), 3.12 (80b), 14.70 (70), 2.47 (70), 7.99 (60), 1.633 (60), 1.476 (60)

Chemistry:

	(1)	(2)
SiO_2	16.5	16.62
PbO	76.7	77.15
H_2O	6.2	6.23
Total	99.4	100.00

(1) Tsumeb, Namibia; by electron microprobe, H_2O by TGA. (2) $Pb_5Si_4O_8(OH)_{10}$.

Occurrence: A secondary mineral developed in the oxidized zone above complex galena-bearing ores.

Association: Alamosite, melanotekite (Tsumeb, Namibia); wulfenite (Tiger, Arizona, USA).

Distribution: From Tsumeb, Namibia. In the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA.

Name: For lead, PLUMBum, in the mineral's composition, and the type locality, TSUMeb, Namibia.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Germany, NM10; National Museum of Natural History, Washington, D.C., USA, 148301.

Poitevinite $(Cu, Fe^{2+})SO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. Very fine-grained, vermiform to powdery.

Physical Properties: Hardness = 3–3.5 D(meas.) = 3.30 D(calc.) = 3.30

Optical Properties: Semitransparent. *Color:* Salmon-pink.
Optical Class: Biaxial. $\alpha = 1.610$ (α') $\beta =$ n.d. $\gamma = 1.636$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.12(1)$ $b = 5.160(1)$ $c = 7.535(2)$ $\alpha = 107.06(1)°$ $\beta = 107.40(1)°$ $\gamma = 92.73(1)°$ Z = 2

X-ray Powder Pattern: Avoca claim, Canada.
3.450 (100), 3.437 (83), 3.074 (79), 3.336 (49), 2.507 (48), 4.735 (46), 3.268 (30)

Chemistry:

	(1)
SO_3	44.33
FeO	18.20
CuO	21.84
ZnO	3.74
H_2O	12.07
Total	[100.18]

(1) Avoca claim, Canada; recalculated to original total of 100.18% after deduction of quartz 1.09%; corresponds to $(Cu_{0.50}Fe_{0.46}Zn_{0.08})_{\Sigma=1.04}SO_4 \cdot 1.2H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a base-metal hydrothermal mineral prospect.

Association: Quartz, gypsum, pyrite, bonattite, scorodite.

Distribution: From the Avoca claim, Hat Creek, Bonaparte River area, Lillooet district, British Columbia, Canada.

Name: To honor Dr. Theophile Eugène Poitevin (1888–1978), Canadian mineralogist, Geological Survey of Canada.

Type Material: National School of Mines, Paris, France; Canadian Geological Survey, Ottawa, 12122; Royal Ontario Museum, Toronto, Canada, M25440; National Museum of Natural History, Washington, D.C., USA, 142995.

References: (1) Jambor, J.L., G.R. Lachance, and S. Courville (1964) Poitevinite, a new mineral. Can. Mineral., 8, 109–110. (2) (1965) Amer. Mineral., 50, 263 (abs. ref. 1). (3) Giester, G., C.L. Pokrovskite $Mg_2(CO_3)(OH)_2 \cdot 0.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ (by analogy to malachite). Crystals are prismatic to acicular, to 7 mm, in sheaves; as spherulitic aggregates, may be cross-vein fibrous, asbestiform.

Physical Properties: Hardness = ∼3 D(meas.) = 2.51–2.52 D(calc.) = 2.58

Optical Properties: Semitransparent, may be opaque due to inclusions. *Color:* White with a flesh tint. *Streak:* White. *Luster:* Dull.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = 8°$; elongation, negative. $\alpha = 1.537$ $\beta = 1.619$ $\gamma = 1.619$ 2V(meas.) = 18°

Cell Data: *Space Group:* $P2_1/a$ (by analogy to malachite). $a = 9.43(1)$ $b = 12.27(1)$ $c = 3.395(3)$ $\beta = 96.60(9)°$ Z = 4

X-ray Powder Pattern: Zlatogorsk massif, Kazakhstan.
2.60 (10b), 2.17 (9), 6.10 (7), 4.70 (7), 3.73 (7), 1.661 (7b), 1.385 (5)

Chemistry:

	(1)	(2)
SiO_2	< 0.10	
CO_2	28.78	29.02
Al_2O_3	< 0.05	
Fe_2O_3	1.90	
MnO	1.02	
MgO	50.80	53.16
CaO	0.39	
BaO	0.10	
Na_2O	0.10	
K_2O	< 0.10	
H_2O^+	16.72	17.82
H_2O^-	0.44	
Total	100.50	100.00

(1) Zlatogorsk massif, Kazakhstan; $(OH)^{1-}$ and H_2O confirmed by IR, corresponds to $(Mg_{1.93}Fe_{0.04}Mn_{0.02})_{\Sigma=1.99}(CO_3)(OH)_2 \cdot 0.42H_2O$. (2) $Mg_2(CO_3)(OH)_2 \cdot 0.5H_2O$.

Occurrence: An uncommon species in ultramafic bodies of dunite or serpentinite.

Association: Dolomite, magnesite, sjögrenite (Zlatogorsk intrusion, Kazakhstan); coalingite, mcguinnessite (Cedar Hill quarry, Pennsylvania, USA).

Distribution: From a drillhole in the Zlatogorsk massif, 90 km west-southwest of Kokchetav, Kazakhstan. In the USA, at the Hunting Hill quarry, Montgomery Co., Maryland; in the Cedar Hill quarry, Lancaster Co., Pennsylvania; at the Addie quarry, Jackson Co., North Carolina; from the Gabbs mine, Gabbs district, Nye Co., Nevada; at Lytton, Sonoma Co., California.

Name: Honors Pavel Vladimirovich Pokrovskii (1912–1979), Russian mineralogist, Institute of Geology and Geochemistry, Sverdlovsk, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Ivanov, O.K., Y.A. Malinovskii, and Y.V. Mozherin (1984) Pokrovskite. $Mg_2[(CO_3)(OH)_2] \cdot 0.5H_2O$ – a new mineral from the Zlatogorskaya layered intrusive (Kazakhstan). Zap. Vses. Mineral. Obshch., 113, 90–95. (2) (1985) Amer. Mineral., 70, 217 (abs. ref. 1).

Polarite Pd_2PbBi

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As grains, to 0.3 mm.

Physical Properties: Hardness = n.d. VHN = 168–232 (50 g load). D(meas.) = n.d. D(calc.) = 12.51

Optical Properties: Opaque. *Color:* White with yellowish tint in reflected light. *Luster:* Metallic. *Anisotropism:* Slight; gray to pale brown in oil.
R: (400) — , (420) — , (440) 55.4, (460) 56.8, (480) 55.9, (500) 56.4, (520) 58.2, (540) 59.2, (560) 59.6, (580) 59.6, (600) 59.9, (620) 59.5, (640) 60.9, (660) 61.2, (680) 60.9, (700) 61.8

Cell Data: *Space Group:* $Ccm2_1$. $a = 7.191$ $b = 8.693$ $c = 10.681$ $Z = 16$

X-ray Powder Pattern: Talnakh area, Russia.
2.65 (100), 2.16 (90), 2.25 (50), 1.638 (50), 2.50 (30), 1.400 (30), 1.220 (30)

Chemistry:

	(1)	(2)	(3)	(4)
Pd	32.8	33.1	35.0	33.84
Pt			2.0	
Pb	34.0	29.0		32.94
Bi	33.4	36.4	59.4	33.22
Te			5.2	
Total	100.2	98.5	101.6	100.00

(1) Talnakh area, Russia; by electron microprobe, corresponds to $Pd_{1.95}Pb_{1.04}Bi_{1.01}$. (2) Do.; by electron microprobe, corresponds to $Pd_{1.99}Pb_{0.90}Bi_{1.11}$. (3) Union mine, South Africa; by electron microprobe, corresponds to $(Pd_{1.98}Pt_{0.06})_{\Sigma=2.04}(Bi_{1.71}Te_{0.24})_{\Sigma=1.95}$. (4) Pd_2PbBi.

Occurrence: In hydrothermal Cu–Ni–Fe sulfide veins (Talnakh area, Russia).

Association: Chalcopyrite, talnakhite, cubanite, stannopalladinite, paolovite, sobolevskite, sperrylite, cabriite, palarstanide, nickeloan platinum, sphalerite, silver (Talnakh area, Russia).

Distribution: From the Majak mine, Talnakh area, Noril'sk district, Polar Ural Mountains, western Siberia, Russia [TL]. At the Union mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. From Fox Gulch, Goodnews Bay, Alaska, USA.

Name: For its occurrence in the Polar Ural Mountains, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73002; Canadian Museum of Nature, Ottawa, Canada, 10401; National Museum of Natural History, Washington, D.C., USA, 160244.

Total	99.5

(1) Wessels mine, South Africa; by electron microprobe, H_2O by TGA; corresponds to $(Ca_{1.47}Mn_{0.53})_{\Sigma=2.00}Si_{0.99}O_{3.96} \cdot 1.04H_2O$.

Occurrence: In a pocket in massive manganese ores in a bedded manganese ore deposit.

Association: Braunite, hausmannite, henritermierite, bultfonteinite, hematite, calcite.

Distribution: In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: To honor Arie Poldervaart (1918–1964), Professor of Petrology, Columbia University, New York City, New York, USA.

Type Material: American Museum of Natural History, New York, New York, USA, T100728.

References: (1) Dai, Y., G.E. Harlow, and A.R. McGhie (1993) Poldervaartite, $Ca(Ca_{0.5}Mn_{0.5})(SiO_3OH)(OH)$, a new acid nesosilicate from the Kalahari manganese field, South Africa: crystal structure and description. Amer. Mineral., 78, 1082–1087.

Polhemusite $(Zn, Hg)S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$ or $4/m\ 2/m\ 2/m$. As stubby prisms and dipyramids, to 25 μm; as microscopic grains. *Twinning:* Knee-shaped twins with {605} as composition plane; contact twins on {*hkl*} less common; twinning on {*h*0*l*} may also be present, developing trains of prisms and discontinuous lamellae.

Physical Properties: *Cleavage:* Rare. Hardness = n.d. VHN = 262 (25 g load). D(meas.) = n.d. D(calc.) = 4.23–5.63

Optical Properties: Nearly opaque; translucent in thin section. *Color:* Black; gray in polished section, with intense red internal reflections. *Luster:* Resinous to adamantine. *Pleochroism:* Very slightly brownish gray to slightly lavender-gray. *Anisotropism:* Moderate in air, strong in oil.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P4/n$, $P4_2/n$, $P4/nbm$, $P4/nmm$, $P4_2/nnm$, or $P4_2/ncm$. $a = 8.71$ $c = 14.74$ $Z = 24 - 32(?)$

X-ray Powder Pattern: B and B deposit, Idaho, USA.

(1) B and B deposit, Idaho, USA; by electron microprobe, average analysis of 15 grains, corresponding to $(Zn_{0.87}Hg_{0.15}Fe_{0.01})_{\Sigma=1.03}S_{0.97}$.

Occurrence: As part of a replacement deposit of stibnite (B and B deposit, Idaho, USA).

Association: Stibnite, cinnabar, mercurian sphalerite, zincian metacinnabar (B and B deposit, Idaho, USA); realgar (Getchell mine, Nevada, USA).

Distribution: In the USA, from the B and B deposit, Big Creek district, Valley Co., Idaho [TL], and in the Getchell mine, Potosi district, Humboldt Co., Nevada.

Name: In honor of Clyde Polhemus Ross (1891–1965), American economic geologist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145549.

Pollucite $(Cs,Na)(AlSi_2)O_6 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Crystals rare, cubes, dodecahedra, or trapezohedra, commonly striated, up to 12 cm; as rounded grains, fine-grained, massive. Commonly heterogenous below ~200 μm, into domains enriched in (Cs,Al), (Na,Si), or (Cs,Na,Al) with exsolved quartz.

Physical Properties: *Cleavage:* In traces. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 VHN = 658–794 D(meas.) = 2.68–3.03 D(calc.) = 2.94

Optical Properties: Transparent to translucent. *Color:* Colorless, white, gray, or tinted pink, blue, violet; colorless in thin section. *Luster:* Vitreous; greasy to dull on the exterior. *Optical Class:* Isotropic; may show weak sectional birefringence. n = 1.507–1.525

Cell Data: *Space Group: Ia3d.* a = 13.682(3) Z = 16

(2) Do.; original total given as 97.06%, corresponds to $(Cs_{0.70}Na_{0.07}Rb_{0.04}Ca_{0.03})_{\Sigma=0.84}Al_{0.94}Si_{2.07}O_6 \cdot nH_2O$. (3) Do.; original total given as 97.36%, corresponds to $(Cs_{0.57}Na_{0.18}Rb_{0.04}Ca_{0.01})_{\Sigma=0.80}Al_{0.87}Si_{2.14}O_6 \cdot nH_2O$.

Polymorphism & Series: Forms a series with analcime.

Mineral Group: Zeolite group.

Occurrence: In lithium-rich granite pegmatites; may be in kiloton amounts.

Association: Quartz, spodumene, petalite, amblygonite, lepidolite, elbaite, cassiterite, columbite, apatite, eucryptite, muscovite, potassic feldspar, albite, microcline.

Distribution: In fine crystals at several places around San Piero in Campo, Elba, Italy. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. At Bikita, Zimbabwe. From Karibib, Namibia. In the USA, from a number of localities in Oxford Co., Maine; at Portland and Haddam, Middlesex Co., Connecticut; in the Tin Mountain mine, near Custer, Custer Co., South Dakota; in the Pala and Mesa Grande districts, San Diego Co., California. In large amounts in the Tanco pegmatite, Bernic Lake, Manitoba, Canada. From the Taquaral district, Itinga, Minas Gerais, Brazil. Large crystals from the Shengus, Skardu, and Gilgit districts, Pakistan. At Nilaw, Nuristan district, Laghman Province, Afghanistan. Additional minor occurrences are known.

Name: From *Pollux*, genative *Pollucis*, of classical mythology, brother of Castor, for its common association with "castorite" (petalite).

Type Material: Mining Academy, Freiberg, Germany, 27111.

(1) Beaverdell, British Colombia, Canada; corresponds to $(Ag_{14.58}Cu_{1.31})_{\Sigma=15.89}(Sb_{1.88}As_{0.19})_{\Sigma=2.07}S_{11.03}$. (2) Arizpe, Mexico; corresponds to $(Ag_{14.39}Cu_{1.85}Fe_{0.04})_{\Sigma=16.28}(Sb_{1.64}As_{0.32})_{\Sigma=1.96}S_{10.77}$.

Polymorphism & Series: Forms a series with pearceite.

Occurrence: In silver veins of low to medium temperature of formation.

Association: Pyrargyrite, tetrahedrite, stephanite, other silver sulfosalts, acanthite, gold, quartz, calcite, dolomite, barite.

Distribution: Common in small amounts, may be a major ore mineral; only rarely as fine specimens. In Germany, from the Neuer Morgenstern [TL] and other mines, Freiberg, Saxony, and at St. Andreasberg, Harz Mountains. From Banská Hodruša, near Banská Štiavnica (Schemnitz), Slovakia. At Příbram, Czech Republic. In the USA, in Colorado, from the Ouray district, Ouray Co.; the Gilman district, Eagle Co.; and the Red Mountain district, San Juan Co.; in Nevada, at Tonopah, Nye Co., Goldfield, Esmeralda Co., and in the Comstock Lode, Virginia City, Storey Co. Fine crystals from the Husky mine, Elsa, Yukon Territory, Canada. At Tres Puntas, near Copiapó, Atacama, Chile. In Mexico, at many localities, with especially fine examples from the Las Chiapas mine, Arizpe, Sonora; Fresnillo, Chihuahua; and at Guanajuato. From Sabana Grande, Honduras.

Name: From the Greek for *many* and *base*, in allusion to the many metallic bases present.

Type Material: Mining Academy, Freiberg, Germany, 6867.

(1) Maberly, Canada. (2) Santa Clara, Brazil.

Occurrence: In granite pegmatites; rarely as a detrital mineral.

Association: Gadolinite, columbite, xenotime, monazite, allanite, zircon, garnet, beryl, magnetite, fluorite.

Distribution: Less common than euxenite. Some localities for well-characterized material include: from Rasvåg, Hidra (Hitterö) Island, near Flekkefjord, and many other places in Norway. At Slättåkra, Län Jönköping, Sweden. In Lyndoch Township, and about eight km south of Maberly, Ontario, Canada. In the USA, from Zirconia, Henderson Co., North Carolina; at Marietta, Greenville Co., South Carolina; in the Overlook quarry, Day, Saratoga Co., New York; from the Trout Creek Pass pegmatite district, in Park Co., east of Buena Vista, Colorado; at the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., Texas. From Santa Clara, near Tocantins, Minas Gerais, Brazil. At Cooglegong, Western Australia. Probably from many places in Madagascar but analyses are lacking for the distinction from abundant euxenite.

Name: From the Greek for *many* and *a mixture*, in reference to the large number of chemical elements contained.

(1) Grünau mine, Germany; recalculated to 100% after deducting gersdorffite and ullmannite 5%; then corresponds to $(Ni_{2.83}Fe_{0.22}Co_{0.03})_{\Sigma=3.08}S_{3.92}$. (2) Madziwa mine, Zimbabwe; by electron microprobe, corresponds to $(Ni_{2.87}Fe_{0.17}Co_{0.04})_{\Sigma=3.08}S_{3.92}$. (3) Ni_3S_4.

Polymorphism & Series: Forms a series with linnaeite.

Mineral Group: Linnaeite group.

Occurrence: In hydrothermal veins.

Association: Chalcopyrite, pyrrhotite, pyrite, millerite, gersdorffite, ullmannite, sphalerite, galena, bismuthinite, quartz, siderite.

Distribution: In Germany, in the Grünau mine, Daaden, near Siegen [TL], and at Ramsbeck, North Rhine-Westphalia. From Saint Marina, Khaskovo district, Bulgaria. At Kunratice and Rozany, Czech Republic. From Novo-Aidyrlinsk, Southern Ural Mountains, and the Noril'sk region, western Siberia, Russia. In the USA, from Hamilton, Hancock Co., Illinois; in the Miliken (Sweetwater) mine, Reynolds Co., Missouri; and at the Copper King mine, Gold Hill district, Boulder Co., Colorado. In the Madziwa (Dry Nickel) mine, Bindura; and at Shamva, Zimbabwe. Large cystals from Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Jabal Mardah, Saudi Arabia. From Kalgoorlie, Western Australia.

Name: From the Greek for *many* and *twin*, as the mineral is observed in twinned forms.

Polyhalite $K_2Ca_2Mg(SO_4)_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudo-orthorhombic. *Point Group:* $\overline{1}$. Rare crystals, tabular {010}, or elongated along [001], to 2 mm; complex development, with 28 forms recorded; fibrous, foliated, massive. *Twinning:* Common on {010}, {100}, characteristically polysynthetic.

Physical Properties: *Cleavage:* On $\{10\overline{1}\}$, perfect; on {010}, a parting. Hardness = 3.5 D(meas.) = 2.78 D(calc.) = 2.76 Soluble in H_2O, with precipitation of gypsum and perhaps syngenite.

Optical Properties: Transparent. *Color:* Colorless, white, gray; commonly salmon-pink to brick-red from included iron oxide; colorless in transmitted light. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (–). α = 1.547–1.548 β = 1.560–1.562 γ = 1.567 2V(meas.) = 62°–70°

Cell Data: *Space Group:* $P\overline{1}$. $a = 11.689$ $b = 16.332$ $c = 7.598$ $\alpha = 91.65°$ $\beta = 90°$ $\gamma = 91.9°$ Z = 4

X-ray Powder Pattern: Netherlands. (ICDD 21-982).
3.18 (100), 2.913 (25), 2.890 (25), 2.849 (25), 2.945 (20), 6.00 (14), 2.904 (14)

Chemistry:

Total	99.63	100.00

(1) McDowell Well, Glasscock Co., Texas, USA. (2) $K_2Ca_2Mg(SO_4)_4 \cdot 2H_2O$.

Occurrence: Common in marine salt deposits, where it may constitute the major component, present in billion-ton amounts; diagenetic in playa muds, formed from gypsum in the presence of Mg–K-rich solutions; rare as a fumarolic sublimate.

Association: Halite, anhydrite, glauberite, carnallite, kieserite, langbeinite, vanthoffite.

Distribution: In Austria, from Ischl, Bad Aussée, and Altaussée, Upper Austria; at Hallstatt, Styria; and from Hall, Tirol. In Germany, from the Stassfurt-Westeregeln district, Saxony-Anhalt, and at Berchtesgaden, Bavaria. On Vesuvius, Campania, Italy. In England, in the Boulby potash mine, northwest of Whitby, Yorkshire, England. From Maman, Iran. At Tuz Goelue, Turkey. In the Nagaur-Ganganagar Basin, Rajasthan, India. From the Qarhan alt lake, Quadam Basin, Qinghai Province, China. In the USA, in the Carlsbad potash district, Eddy Co., and adjacent parts of Texas; in the Paradox Basin, Grand Co., and elsewhere in Utah.

Name: From the Greek for *many* and *salt*, in allusion to the mineral's complex composition.

Polylithionite $KLi_2AlSi_4O_{10}(F,OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Pseudohexagonal crystals, tabular ‖ {001}, to 10 cm. As irregularly shaped aggregates of fine scaly crystals.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. Hardness = 2–3 D(meas.) = 2.58–2.82 D(calc.) = 2.84 May fluoresce lemon-yellow under SW UV.

Optical Properties: Transparent. *Color:* Bright to pale pink, cream to white, colorless, pale brown to yellow-brown, bluish, greenish; in transmitted light, colorless. *Luster:* Pearly to waxy when fine-grained.
Optical Class: Biaxial (–). $\alpha = 1.53$ $\beta = 1.551$–1.556 $\gamma = 1.555$–1.559 2V(meas.) = 0°–43°

Cell Data: *Space Group:* $C2/m$. $a = 5.189$ $b = 8.974$ $c = 10.067$ $\beta = 100°27'$ Z = 2

(1) Mt. Karnasurt, Kola Peninsula, Russia; corresponds to $K_{0.95}(Li_{1.67}Na_{0.27}Ca_{0.05}Mg_{0.02}Mn_{0.01})_{\Sigma=2.02}(Al_{1.03}Fe^{3+}_{0.01})_{\Sigma=1.04}Si_{4.05}O_{10.25}[F_{0.95}(OH)_{0.91}]_{\Sigma=1.86}$. (2) Ilímaussaq intrusion, Greenland.

Mineral Group: Mica group.

Occurrence: In irregular segregations and veinlets, as a late-stage and metasomatic replacement mineral, in syenite pegmatites in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Microcline, natrolite, taeniolite, steenstrupine, aegirine, analcime, epistolite.

Distribution: On the Kangerdluarssuk Plateau and elsewhere in the Ilímaussaq intrusion, southern Greenland. In Russia, found on Mts. Karnasurt and Lepkhe-Nelm, Lovozero massif, Kola Peninsula. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. At Vøra, Sandefjord, Oslo region, Norway. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. In the USA, at Point of Rocks, Colfax Co., New Mexico. On Mt. Malosa, Zomba district, Malawi.

Name: From the Greek *poly*, for *many* or *much*, and in allusion to its high LITHIum content.

Type Material: University of Copenhagen, Copenhagen, Denmark.

		Total	100.4

(1) Lovozero massif, Russia; by electron microprobe, average of three analyses; corresponds to $(Na_{16.45}Mn_{0.43})_{\Sigma=16.88}(Ca_{2.70}Ba_{0.11}Sr_{0.05})_{\Sigma=2.86}(Mg_{0.59}Mn_{0.36}Fe_{0.05})_{\Sigma=1.00}(Ti_{2.71}Mn_{0.65}Nb_{0.37}Zr_{0.24})_{\Sigma=3.97}(Si_2O_7)_2(P_{1.00}O_4)_6O_{2.58}F_{4.89}$.

Occurrence: In ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Nepheline, sodalite, analcime, potassic feldspar, albite, arfvedsonite, aegirine, cancrisilite, ussingite, makatite, villiaumite, quadruphite, lomonosovite, sobolovite, additional minor minerals.

Distribution: On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: From the Greek *poly*, for *many*, and PHosphorus, for the multiple phosphate anions in the chemical formula.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r545/4.

Ponomarevite $K_4Cu_4OCl_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Anhedral pseudohexagonal plates, to about 0.1 mm, in nodules, skeletal forms, droplike clusters; most commonly in fine-grained incrustations, to 3 cm thick.

Physical Properties: *Cleavage:* Imperfect on {001} and {110}. *Tenacity:* Brittle. Hardness = 2.8 VHN = 66–97, 71 average (10 g load). D(meas.) = 2.78(1) D(calc.) = 2.72 Soluble in H_2O; alters to mitscherlichite on exposure.

Optical Properties: Transparent in thin fragments when fresh; becoming opaque on exposure. *Color:* Brick-red with a golden tint, dark red, black, probably due to admixed molysite; on exposure becomes grass-green by alteration to mitscherlichite. *Streak:* Red-orange. *Luster:* Vitreous, resinous to greasy in aggregates.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 30°$. $\alpha = 1.686(5)$ $\beta = 1.718(5)$ $\gamma = 1.720(5)$ 2V(meas.) = 28(5)°

Cell Data: *Space Group:* $C2/c$. $a = 14.740(3)$ $b = 14.900(3)$ $c = 8.948(2)$ $\beta = 104.9(1)°$ Z = 4

X-ray Powder Pattern: Tolbachik volcano, Russia.
2.801 (100), 7.31 (80), 2.787 (80), 6.074 (70), 2.470 (65), 3.654 (60), 3.048 (60)

Chemistry:

	(1)	(2)
CuO	38.02	40.73
ZnO	0.31	
PbO	0.03	
Na_2O	2.76	
K_2O	20.6	24.12
F	0.03

SO_3	1.25	
insol.	3.3	
Total	100.19	100.00

(1) Tolbachik volcano, Russia; Cu, Pb, Zn by AA, K, Na by flame photometry; after deduction of mitscherlichite 3.3%, SO_3 as thenardite 2.2%, insoluble and H_2O^-, corresponds to $(K_{3.53}Na_{0.49})_{\Sigma=4.02}(Cu_{3.97}Zn_{0.03})_{\Sigma=4.00}O_{1.10}Cl_{9.82}$. (2) $K_4Cu_4OCl_{10}$.

Occurrence: As a fracture filling and in fumaroles, deposited from 280–400 °C.

Association: Halite, sylvite, tenorite, tolbachite, dolerophanite, piypite, chalcocyanite, cotunnite, sofiite, klyuchevskite, kamchatkite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Vasilii Vasil'evich Ponomarev (1940–1976), Russian vulcanologist, Institute of Volcanology, Petropavlovsk-Kamchatskii, Russia, who early studied the Tolbachik volcano.

Type Material: Mining Institute, St. Petersburg, Russia, 1483/1.

Portlandite $Ca(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Hexagonal plates, to 6 cm; commonly fibrous, powdery, massive.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Sectile; cleavage flakes flexible. Hardness = 2 D(meas.) = 2.23 D(calc.) = 2.26 (synthetic). Soluble in H_2O, yielding an alkaline solution.

Optical Properties: Transparent. *Color:* Colorless, white to greenish white; colorless in transmitted light. *Luster:* Pearly on cleavages.
Optical Class: Uniaxial (–). $\omega = 1.575$ $\epsilon = 1.547$

Cell Data: *Space Group:* $P\overline{3}m1$ (synthetic). $a = 3.589(8)$ $c = 4.911(14)$ $Z = 1$

X-ray Powder Pattern: Synthetic.
2.628 (100), 4.90 (74), 1.927 (42), 1.796 (36), 3.112 (23), 1.687 (21), 1.484 (13)

Chemistry: Analyses of natural material appear not to have been made.

Occurrence: An alteration product of calcium silicates in larnite-spurrite contact metamorphic rocks (Scawt Hill, Ireland); in fumaroles (Vesuvius, Italy); as a precipitate from alkaline springs derived from ultramafic rocks (Jebel Awq, Oman); in burning coal measures (Chelyabinsk coal basin, Russia); in sedimentary deposits metamorphosed at high-temperature and low-pressure by spontaneous combustion of bitumen (Hatrurim Formation, Israel; Maqarin area, Jordan).

Association: Afwillite, calcite, larnite, spurrite (Scawt Hill, Ireland); calcite, halite (Jebel Awq, Oman); calcite, brownmillerite, hydrocalumite, mayenite, ettringite (Eifel district, Germany).

Distribution: From Scawt Hill, Larne, Co. Antrim, Ireland. On Vesuvius, Campania, Italy. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. In the Chelyabinsk coal basin, Southern Ural Mountains, Russia. From the Hatrurim Formation, Israel. In the Maqarin area, north Jordan. From Jebel Awq, Northern Oman Mountains, Oman. Large crystals and masses in the Wessels mine, near Kuruman, Cape Province, South Africa. From Cerro de la Coronita, near Cuernavaca, Morelos, Mexico.

Name: For its relation to a principal hydrolysis product of Portland cement.

Type Material: The Natural History Museum, London, England, 1933,307.

CuO	65.53	67.66	H_2O	16.70	15.32
			Total	100.25	100.00

(1) Festival deposit, Siberia, Russia; corresponds to $(Cu_{3.90}Fe^{3+}_{0.03})_{\Sigma=3.93}(S_{1.03}O_4)(OH)_6 \cdot 1.5H_2O$.
(2) $Cu_4(SO_4)(OH)_6 \cdot H_2O$.

Occurrence: A secondary mineral formed in the oxidized zone of copper-bearing hydrothermal mineral deposits, commonly of post-mine origin; may occur in slags.

Association: Brochantite, langite, devilline, serpierite, woodwardite, wroewolfeite, aurichalcite, azurite, malachite, chalcopyrite.

Distribution: Numerous minor localities. From the Nura-Taldy tungsten deposits, central Kazakhstan. In England, fine examples from Cornwall, as at the Drakewalls mine, Gunnislake, and the Fowey Consols mine, Tywardreath. Large crystals in the Penrhiw mine, Ystumtuen, Dyfed, Wales. At the Muckross mine, Co. Kerry, Ireland. In France, in the Salsigne mine, 15 km north of Carcassone, Aude. At Mitterberg, Salzburg, and Brixlegg, Tirol, Austria. From Špania Dolina (Herrengrund), Slovakia. In the USA, in the Yellow Pine mine, Crisman, Boulder Co., Colorado, and at the Majuba Hill mine, Antelope district, Pershing Co., Nevada. In Canada, from the Ives mine, near Eastman, Quebec, and in the Rocher Deboule mine, near Hazelton, British Columbia. From the Marharahara copper mine, near Woodville, New Zealand. At Tsumeb, Namibia.

Name: To honor Eugene Valdemar Posnjak (1888–1949), Geophysical Laboratory, Washington, D.C., USA, who investigated the $CuO-SO_3-H_2O$ system.

Type Material: Mining Institute, St. Petersburg, Russia, 1386/1.

H_2O	17.81
Total	100.00

(1) San Juan County, Utah, USA; average of 10 electron microprobe analyses, partially dehydrated crystals, H_2O calculated from stoichiometry; corresponding to $(Mg_{0.97}Na_{0.06}Ca_{0.04}Sr_{0.01}K_{0.01})_{\Sigma=1.09}$ $Al_{1.94}[(OH)_{1.92}(H_2O)_{0.08}]_{\Sigma=2.00}(V_{10}O_{28})\cdot 27H_2O$.

Mineral Group: Pascolite family.

Occurrence: From the oxidation of montroseite-corvusite assemblages in a moist environment in Colorado-type sandstone-hosted uranium deposits.

Association: Corvusite, montroseite.

Distribution: From the Vanadium Queen mine, La Sal Creek Canyon, and the Blue Cap mine, Lyon Canyon Creek, San Juan County, Utah, USA.

Name: Honors Jeffrey E. Post (b. 1954), Curator-in-Charge of the National Gem and Mineral Collection, U.S. National Museum of Natural History (Smithsonian Institution), for his contributions to mineralogy, crystallography and geochemistry, and particularly to the scientific understanding of manganese oxide minerals.

Type Material: Natural History Museum of Los Angeles County, Los Angeles, California, USA (# 63564 -Vanadium Queen mine, # 63563 - Blue Cap mine).

Potarite PdHg

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As small grains or nuggets, up to 1 cm, exhibiting octahedral points and having indistinct, slightly divergent columnar or fibrous structure.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 VHN = 126–137 (100 g load) on granula material. D(meas.) = 14.88 D(calc.) = 15.09

Optical Properties: Opaque. *Color:* Silver-white; in polished section, cream to creamish white. *Streak:* Silver-white. *Luster:* Metallic, bright. *Anisotropism:* Noted on inclusions in the fine-granular, apparently isotropic principal component; brown with an orange tinge.
R_1–R_2: (400) 41.6–41.6, (420) 42.5–43.5, (440) 43.8–45.2, (460) 45.7–47.0, (480) 47.8–48.8, (500) 49.4–50.4, (520) 50.9–52.0, (540) 52.2–53.2, (560) 53.4–54.4, (580) 54.4–55.4, (600) 55.4–56.4, (620) 56.3–57.3, (640) 57.2–58.4, (660) 58.2–59.5, (680) 59.2–60.7, (700) 60.2–62.1

Cell Data: *Space Group:* $P4/mmm$. $a = 3.026$ $c = 3.702$ $Z = 1$

X-ray Powder Pattern: Potaro River area, Guyana.
2.33 (100), 1.269 (70), 0.849 (50), 0.818 (50), 1.395 (40), 0.957 (20), 0.924 (20)

Chemistry:

Pd	34.5	33.2	34.66
Hg	64.3	67.0	65.34
Cu	0.5	0.1	
Total	99.3	100.3	100.00

(1) Potaro River area, Guyana; by electron microprobe. (2) Do.; by electron microprobe (2) PdHg.

Occurrence: In chromitite and dunite ultramafics; in placers for gold and diamonds.

Association: Platinum, palladium, gold, Pd–Hg compounds; pentlandite, chalcopyrite, pyrrhotite, millerite.

Distribution: In Guyana, in placers in the Kangaruma district, Potaro River area, and at Amu Creek, Essequibo River. From Morro de Pilar, and in placers in the Bom Succeso Stream, northwest of Serro, Minas Gerais, Brazil. From Fox Gulch, Goodnews Bay, Alaska, and in the Boss mine, Goodsprings district, Clark Co., Nevada, USA. In the Starchrome chromitite, Thetford Mines ophiolite, Quebec, Canada. From the Kytlym and Uktus complexes, Ural Montains, Russia. At the Herbeira ultramafic massif, Cabo Ortegal, [notinColombiaG]??, Spain. From the Brancaga massif, northern Portugal. On the Island of Zabargad (Zabirget or St. Johns), in the Red Sea, Egypt. At the Copper Hills prospect, East Pilbara region, and in the Munni Munni layered intrusive, West Pilbara region, Western Australia. From the Inazumi-yama ultramafic complex, Honshu, Japan. A few additional occurrences have been noted.

Name: For the locality on the Potaro River, Guyana.

Type Material: The Natural History Museum, London, England, 1924,192, E238; National Museum of Natural History, Washington, D.C., USA, 95350.

Potassium alum $KAl(SO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Rarely as tiny octahedra, which may be strung along fibers; stalactitic, columnar, mealy or granular, massive efflorescences. *Twinning:* Very rare on {111}.

Physical Properties: *Cleavage:* On {111}, interrupted. *Fracture:* Conchoidal.
Hardness = 2–2.5 D(meas.) = 1.757 D(calc.) = 1.754 Soluble in H_2O, taste sweetish and astringent; deliquesces at 91° C.

Optical Properties: Transparent. *Color:* Colorless, white; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Isotropic; may be weakly anomalously birefringent and sectored. $n = 1.456$

Cell Data: *Space Group:* $Pa3$. $a = 12.157(3)$ Z = 4

X-ray Powder Pattern: Synthetic.
4.293 (100), 3.250 (55), 4.053 (45), 5.44 (40), 2.789 (35), 3.039(25), 4.96 (20)

(1) Vesuvius, Italy; remnant Cr_2O_3 0.16%, Mn_2O_3 0.01%, CaO 0.36%, Cl 0.24%.
(2) $KAl(SO_4)_2 \cdot 12H_2O$.

Occurrence: Formed from argillaceous rocks or coal containing oxidizing pyrite or marcasite; may be a fumarolic or solfataric precipitate.

Association: Alunogen, pickeringite, epsomite, melanterite, gypsum, sulfur.

Distribution: In Italy, on Vesuvius, from the Grotta della Zolfo and at Cap Miseno, near Naples, Campania; in the Cetine mine, 20 km southwest of Siena, Tuscany; from the Grotte de Faraglione and along the Baia de Levante, Vulcano, Lipari Islands. In Germany, from Duttweiler, near Saarbrücken, Saarland, and at Arzberg, Fichtelgebirge, Bavaria. From Chuquicamata, Antofagasta, Chile. In the USA, in California, at the Sulfur Bank cinnabar mine, Lake Co., The Geysers, Sonoma Co., and the Nortonville coal mine, Contra Costa Co.; at Silver Peak, Esmeralda Co., Nevada; from Alum Cave Bluff, Sevier Co., Tennessee. Noted in a number of caves, as at the Mbobo Mkulu Cave, near Ngodwana, Eastern Transvaal, South Africa. In the Feengrotten, near Saalfeld, Thuringia, and the Alaunhöhle, near Dresden, Saxony, Germany.

Name: For its content of *potassium* and as an *alum*, *alumen*, Pliny, part.

Fe	2.32	2.4	2.51
Sb	10.58	10.6	10.92
S	19.80	20.4	20.14
Total	99.71	100.2	100.00

(1) Andacaba deposit, Bolivia; by electron microprobe, average of seven analyses; corresponding to $(Pb_{6.00}Ag_{0.04})_{\Sigma=6.04}Sn_{2.20}Fe_{0.94}Sb_{1.96}S_{13.91}$. (2) Herb claim, Canada; by electron microprobe, average of six analyses; corresponding to $(Pb_{5.91}Ag_{0.07}In_{0.09})_{\Sigma=6.07}Sn_{1.99}Fe_{0.95}Sb_{1.93}S_{14.07}$. (3) $Pb_6Sn_2FeSb_2S_{14}$.

Occurrence: On layered sulfide ore in a complex xenothermal-type hydrothermal tin deposit associated with subvolcanic granitic intrusive bodies (Andacaba deposit, Bolivia); in hydrothermal veins cutting rhyolite intrusions into highly kaolinized granite (Herb claim, Canada).

Association: Galena, sphalerite, semseyite, cerussite, cassiterite, quartz (Andacaba deposit, Bolivia); galena, pyrite, sphalerite, arsenopyrite, quartz (Herb claim, Canada); arsenopyrite, pyrrhotite, stannite, jamesonite, pyrite, sphalerite, kutnahorite, quartz (Hoei mine, Japan).

Distribution: In the Andacaba deposit, Potosí, Bolivia [TL]. From the Herb claim, Turnagain River area, Cassiar district, British Columbia, Canada. Large crystals from the the Hoei tin mine, Oita Prefecture, Japan.

Name: For the type locality in Potosí, Bolivia.

Type Material: Mining Academy, Freiberg, Germany, 67345.

Total	99.7	100.00

(1) Near Potts, Nevada, USA; by electron microprobe, average of three analyses, H_2O on a separate sample by the Penfield method; corresponds to $H_{1.02}Pb_{0.99}Bi_{1.00}(VO_4)_{1.99} \cdot 2H_2O$.
(2) $HPbBi(VO_4)_2 \cdot 2H_2O$.

Occurrence: Found in the oxidation zone of a tungsten-bearing tactite.

Association: Scheelite, junoite, bismutite, clinobisvanite, duhamelite, cerussite, vanadinite.

Distribution: Found at the Linka mine, Spencer Hot Springs district, Lander Co., about 30 km northwest of Potts, and northeast of Chalk Mountain, Clan Alpine Mountains, Churchill Co., Nevada, USA.

Name: For Potts, Nevada, USA, nearby the type locality.

Type Material: The Natural History Museum, London, England.

Total	98.90	99.45

(1) Oldřichov, Czech Republic; by electron microprobe, corresponding to $Pb_{1.09}Cu_{0.09}Bi_{1.90}Se_{1.93}(Te_{1.35}S_{0.64})_{\Sigma=1.99}$. (2) Otish Mountains deposit, Canada; by electron microprobe, average of six analyses; corresponding to $Pb_{0.92}Bi_{2.08}Se_{1.80}(Te_{1.85}S_{0.34})_{\Sigma=2.19}$.

Occurrence: In hydrothermal dolomite-calcite-quartz veins in the western contact of the Bor granite massif with gneisses and amphibolites, associated with a selenide-sulfide-telluride aggregate and uraninite (Oldřichov, Czech Republic); in a vein-type uranium deposit with other tellurides and selenides (Otish Mountains deposit, Canada).

Association: Selenian rucklidgeite, several incompletely characterized new species (Oldřichov, Czech Republic); součekite, wittichenite (Otish Mountains deposit, Canada).

Distribution: From Oldřichov, near Tachov, Czech Republic [TL]. In the Otish Mountains uranium deposit, Elliot Lake district, Quebec, Canada.

Name: For Professor Zdenek Pouba (1902–1971), economic geologist, Charles University, Prague, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 21241; National School of Mines, Paris, France.

Poughite $Fe_2^{3+}(Te^{4+}O_3)_2(SO_4)\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are diamond-shaped, flattened parallel to {010}, showing {010}, {101}, {011}, {120}, {100}; in small botryoidal rosettes of crystals, typically in drusy crusts.

Physical Properties: *Cleavage:* On {010}, perfect; on {101}, good. Hardness = ∼2.5 D(meas.) = 3.758 D(calc.) = 3.775

Optical Properties: Semitransparent. *Color:* Dark yellow, honey-yellow, lemon-yellow, brownish yellow, greenish yellow.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless; Y = pale greenish yellow; Z = pale yellow. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, strong. *Absorption:* $X < Y < Z$. $\alpha = 1.72(1)$ $\beta = 1.985(1)$ $\gamma = 1.990(1)$ 2V(meas.) = 15°–20°

Cell Data: *Space Group:* $P2_1nb$. $a = 9.66(2)$ $b = 14.20(2)$ $c = 7.86(2)$ Z = 4

X-ray Powder Pattern: Moctezuma mine, Mexico.
7.10 (10), 5.74 (10), 3.239 (7), 3.564 (6), 3.336 (6), 3.053 (6), 2.940 (5)

Chemistry: (1) The natural mineral was determined to be identical to the synthetic compound by correspondence of X-ray powder patterns.

Occurrence: An alteration product of pyrite in the oxidized zone of a hydrothermal Au–Te deposit (Moctezuma mine, Mexico).

Association: Pyrite, emmonsite, jarosite, "limonite", quartz (Moctezuma mine, Mexico); mandarinoite (El Plomo mine, Honduras).

Distribution: From the El Plomo mine, Ojojona district, Tegucigalpa, Honduras. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, from the Lone Pine mine, Wilcox district, Catron Co., New Mexico; in the Klondike mine, Bonanza district, Saguache Co., Colorado. From the Tambo mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. At the Kobetsuzawa gold mine, Sapporo, Hokkaido Prefecture, Japan.

Name: To honor Dr. Frederick Harvey Pough (1906–), Reno, Nevada, USA, American mineralogist and gemmologist, for his numerous contributions to these sciences.

Type Material: Natural History Museum, Paris, France, 175.77; American Museum of Natural History, New York City, New York, 16832; Harvard University, Cambridge, Massachusetts, 109696; National Museum of Natural History, Washington, D.C., USA, 128388, 164338–164340.

Povondraite $NaFe_3^{3+}Fe_6^{3+}(BO_3)_3Si_6O_{18}(O,OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$. Equant but distorted prisms, terminated by trigonal pyramids, in subparallel aggregates, to several mm.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = ~7 D(meas.) = 3.26(3) D(calc.) = 3.33

Optical Properties: Nearly opaque. *Color:* Black. *Streak:* Brown. *Luster:* Resinous, more or less splendent.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; O = yellow-brown, dark brown, brown-black; E = dark red-brown, light brown. ω = 1.800–1.820 ϵ = 1.743–1.751

Cell Data: *Space Group:* $R3m$. $a = 16.186(2)$ $c = 7.444(1)$ $Z = 3$

X-ray Powder Pattern: San Francisco mine, Bolivia.
2.63 (10), 6.63 (9), 4.05 (9), 3.05 (9), 3.61 (8), 5.13 (7), 4.71 (7)

Chemistry:

	(1)
SiO_2	30.7
TiO_2	0.0
B_2O_3	[9.0]
Al_2O_3	1.4
Fe_2O_3	45.0

FeO	1.7
MgO	6.5
K_2O	1.0
Na_2O	2.1
H_2O	[2.4]
Total	[99.8]

(1) San Francisco mine, Bolivia; by electron microprobe, Fe^{2+}:Fe^{3+} and B_2O_3 calculated from stoichiometry, H_2O from charge balance; corresponds to $(Na_{0.80}K_{0.26})_{\Sigma=1.06}(Fe^{3+}_{2.28}Mg_{0.53}Fe^{2+}_{0.27})_{\Sigma=3.08}(Fe^{3+}_{4.29}Mg_{1.36}Al_{0.32})_{\Sigma=5.97}(BO_3)_3Si_{5.96}O_{18}[(OH)_{3.12}O_{0.99}]_{\Sigma=4.00}$.

Mineral Group: Tourmaline group.

Occurrence: Very rare, in fractures and lining cavities in schist metamorphosed from sedimentary rocks.

Association: Quartz, potassic feldspar, muscovite, schorl, riebeckite, magnesite.

Distribution: In the San Francisco mine, near Villa Tunari, Alto Chapare, Cochabamba, Bolivia.

Name: For Dr. Pavel Povondra, Charles University, Prague, Czech Republic, in recognition of work on the chemistry of the tourmaline group.

Type Material: Royal Ontario Museum, Toronto, Canada, M35899; National Museum of Natural History, Washington, D.C., USA, 144478.

Powellite $CaMoO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals are dipyramidal {111}, with {011}, {112}, less commonly flat tabular to paper-thin on {001}, with many minor forms, to 8 cm; may be aggregated into crusts, pulverulent, ocherous, massive.

Physical Properties: *Cleavage:* {112}, {011}, {001}, all indistinct. *Fracture:* Uneven. Hardness = 3.5–4 D(meas.) = 4.26 D(calc.) = 4.255 Fluoresces creamy white or yellow to golden yellow under SW UV.

Optical Properties: Transparent to translucent. *Color:* Straw-yellow, greenish yellow, yellow-brown, brown, colorless, may be zoned; blue to nearly black. *Luster:* Subadamantine, resinous, pearly.
Optical Class: Uniaxial (+). *Pleochroism:* In deeply colored specimens; O = blue; E = green. $\omega = 1.974$ $\epsilon = 1.984$

Cell Data: *Space Group:* $I4_1/a$ (synthetic). $a = 5.222(1)$ $c = 11.425(3)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.10 (100), 1.929 (30), 4.76 (25), 1.588 (20), 2.61 (16), 2.86 (14), 1.848 (14)

Chemistry:

CaO	28.11	28.04
rem.	0.34	
Total	100.46	100.00

(1) Western Altai, Russia; CuO probably from malachite. (2) $CaMoO_4$.

Polymorphism & Series: Forms a series with scheelite.

Occurrence: An uncommon secondary mineral, typically formed in the oxidation zone of molybdenum-bearing hydrothermal mineral deposits, rarely in basalts, tactites, and granite pegmatites.

Association: Molybdenite, ferrimolybdite, stilbite, laumontite, apophyllite.

Distribution: In the USA, from the Peacock Lode, Seven Devils district, Adams Co., Idaho; large crystals at the Isle Royale, Calumet & Hecla, Tamarack, and other mines, Houghton Co., Michigan; in the Pine Creek tungsten mine, near Bishop, Inyo Co., California; from the Tonopah-Divide mine, Divide district, Esmeralda Co., and many other places in Nevada. At Huepac, Sonora, Mexico. In Chile, from Chuquicamata, Antofagasta; at Inca de Oro and in the Las Escobas mine, near Copiapó, Atacama. From Ultevis, Lappland, Sweden. At Traprain Law, near Haddington, East Lothian, Scotland. Extraordinary crystals from Pandulena Hill, eight km south of Nasik, Maharashtra, India. At Tsumeb, Namibia. There are a number of other older localities known, most now considered quite minor.

Name: Honors Major John Wesley Powell (1834–1902), American geologist and explorer, and Director of the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 80674.

Poyarkovite Hg_3ClO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. Granular, porous to dense, to 1 mm. *Twinning:* Frequently observed under the microscope.

Physical Properties: *Fracture:* Irregular to conchoidal. *Tenacity:* Very brittle. Hardness = 2–2.5 VHN = 173–201, 188 average (20 g load). D(meas.) = 9.80 (dense granular). D(calc.) = 9.88

Optical Properties: Translucent. *Color:* Deep raspberry-red to cherry-red, turns black on exposure; deep red or brownish red in transmitted light; white in reflected light. *Streak:* Red. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial. *Pleochroism:* Slight. $n = > 2.0$ 2V(meas.) = n.d.
Anisotropism: Strong; azure to blue.
R_1–R_2: (440) 25.0–31.0, (460) 24.5–31.0, (480) 22.5–31.0, (500) 22.5–30.0, (520) 22.2–29.2, (540) 22.0–28.4, (560) 21.6–27.2, (580) 20.9–25.5, (600) 20.0–23.5, (620) 18.5–22.1, (640) 17.0–20.7

Cell Data: *Space Group:* $C2/m$, $C2/c$, Cm, Cc, or $C2$. $a = 18.82$ $b = 9.02$ $c = 16.79$ $\beta = 112°24'$ $Z = 24$

X-ray Powder Pattern: Khaydarkan, Kyrgyzstan.
2.83 (10), 2.74 (8), 1.799 (6.5), 2.60 (6), 3.09 (5), 2.96 (4), 1.883 (4)

Chemistry:

	(1)	(2)
Hg	91.30	92.12
O	2.36	2.45
Cl	5.30	5.43
Total	98.96	100.00

(1) Khaydarkan, Kyrgyzstan; by electron microprobe, average of ten analyses; corresponds to $Hg_{3.03}Cl_{1.00}O_{0.99}$. (2) Hg_3ClO.

Occurrence: In an oxidized mercury deposit.

Association: Eglestonite, calomel, terlinguaite, montroydite, kuznetsovite, shakhovite, chursinite, corderoite, mercury, cinnabar, livingstonite.

Distribution: In the Khaydarkan mercury deposit, Fergana Valley, Alai Range, south Kyrgyzstan.

Name: Honors Vladimir Erastovich Poyarkov (1907–1975), Institute of Mineral Resources, Alma-Ata, Kyrgyzstan, investigator of mercury deposits, one of the first discoverers of the Khaydarkan deposit.

Type Material: Central Siberian Geological Museum, Siberian Division, Academy of Sciences, Novosibirsk, Russia.

Total	99.88	100.00

(1) Ashcroft, British Columbia, Canada. (2) $Ca_2Al_2Si_3O_{10}(OH)_2$.

Occurrence: A secondary or hydrothermal mineral in veins and cavities in mafic volcanic rocks; less commonly in granite gneiss or syenite; a typical product of low-grade metamorphism.

Association: Zeolites, datolite, pectolite, calcite, epidote, copper.

Distribution: Numerous localities worldwide; some for the best crystals or rich material follow. At the Cape of Good Hope, Cape Province, South Africa. From Copper Valley, Brandberg Mountains, Namibia. In France, from La Combe-de-la-Selle, near Bourg d'Oisans, Isère. From Habachtal, Salzburg, and Ankogel, Austria. At Radauthal, near Harzburg, Harz Mountains, Germany. From near Campitello, Val di Fassa, Trentino-Alto Adige, Italy. At Comperio, Graubünden, and St. Gotthard, Ticino, Switzerland. In the USA, from Paterson, Passaic Co., and Bergen Hill, Hudson Co., New Jersey; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; in the Roncari quarry, East Granby, Hartford Co., Connecticut; in the Hampden quarry, West Springfield, Hampden Co., Massachusetts. Fine crystals in the Jeffrey mine, Asbestos, Quebec, Canada. From the Khandivali quarry, Bombay, Maharashtra, India. In Copper Valley, Brandberg Mountains, Namibia. Around Coonabarabran, Warrumbungle Ranges, and in the Emu quarry, Prospect Hill, near Sydney, New South Wales, Australia. From the Rennick Glacier, North Victoria Land, Antarctica.

Name: For Colonel Hendrik von Prehn (1733–1785), who discovered the mineral.

Preisingerite $Bi_3O(AsO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are typically rounded, tabular {010}, rhomboidal in outline, displaying {100}, {$\overline{1}$11}, {$\overline{2}$10}, with several others, to 0.2 mm; generally in loose aggregates.

Physical Properties: *Cleavage:* One, indistinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4.5 D(meas.) = ∼6 D(calc.) = 7.24

Optical Properties: Translucent. *Color:* White to grayish white; colorless in transmitted light. *Streak:* White. *Luster:* Subadamantine to adamantine.
Optical Class: Biaxial (+). α = [2.130] (calculated from reflectivities). β = [2.16] γ = [2.195] 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P\overline{1}$. $a = 9.993(3)$ $b = 7.404(3)$ $c = 6.937(3)$ $\alpha = 87.82(2)°$ $\beta = 115.01(2)°$ $\gamma = 111.07(2)°$ Z = 2

X-ray Powder Pattern: San Francisco de los Andes, Argentina; very similar to petitjeanite and schumacherite.
3.281 (100), 3.263 (97), 3.194 (87), 3.091 (74), 3.016 (38), 4.524 (35), 1.967 (31)

Chemistry:

	(1)	(2)
P_2O_5	0.7	
As_2O_5	23.0	24.51
Bi_2O_3	75.8	74.53
PbO	0.5	
H_2O	1.1	0.96
Total	[101.1]	100.00

(1) San Francisco de los Andes, Argentina; by electron microprobe, elemental analysis here converted to oxides, H_2O by TGA. (2) $Bi_3O(AsO_4)_2(OH)$.

Polymorphism & Series: Forms series with petitjeanite and schumacherite.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-bearing hydrothermal mineral deposits.

Association: Rooseveltite, mixite, beudantite, bismuthite (Argentina); bismutostibiconite, atelestite, beyerite (Clara mine, Germany).

Distribution: From the San Francisco de los Andes and Cerro Negro de la Aguadita Bi–As–Cu deposits, San Juan Province, Argentina. At Tazna, Potosí, Bolivia. In Germany, from the Sauschwart mine, Schneeberg, and at Mühlleithen, Saxony; in the Black Forest, at the Clara mine, near Oberwolfach, from the Schmiedestollen, near Wittichen, in the Ödsbach Valley, near Oberkirch, and at Neubulach; from Reichenbach, near Bensheim, Hesse. In the Moldava fluorite mine, about 20 km northwest of Teplice, Krušné hory Mountains, and from near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně (Marienbad), Czech Republic. In the Mammoth mine, Tintic district, Juab Co., Utah, USA.

Name: To honor Anton Preisinger (1925–), Professor of Mineralogy, University of Technology, Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria, L7689.

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Dipyramidal crystals, {211}, with small {100}, {111}, and as anhedral grains, to 200 μm.

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = n.d. D(calc.) = 3.71 Weak orange fluorescence under SW UV; bright blue cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Pink to white. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+). $\omega = 1.790(5)$ $\epsilon = 1.86(1)$

Cell Data: *Space Group:* $I4_1/amd$. a = 6.589 (1) $c = 5.806(1)$ Z = 4

X-ray Powder Pattern: Höllkogel, Austria.
3.293 (100), 2.4636 (42), 1.6470 (33), 1.6927 (30), 2.0546 (21), 2.1777 (20), 1.7432 (9)

Chemistry:

	(1)	(2)
P_2O_5	50.02	50.72
Sc_2O_3	47.38	49.28
Y_2O_3	1.45	
Total	98.85	100.00

(1) Höllkogel, Austria; by electron microprobe, average of 50 determinations on 8 grains; corresponds to $(Sc_{0.98}Y_{0.02})_{\Sigma=1.00}P_{1.00}O_{4.00}$. (2) $ScPO_4$.

Occurrence: Rare in lazulite-quartz veins in phyllite-mica schist.

Association: Lazulite, muscovite, clinochlore, fluorapatite, rutile, chlorapatite, paragonite, augelite, wardite, hydroxylherderite, goyazite, florencite-(Ce), xenotime-(Y), corundum, bearthite.

Distribution: In Austria, from the Höllkogel, 12 km south-southwest of Mürzzuschlag, at Fürstenbauer, and additional localities near the Pretulalpe, Styria.

Name: For the Pretulalpe, Austria, on which the species was first discovered.

Type Material: Landesmuseum Joanneum, Graz; Natural History Museum, Vienna, Austria.

Priceite $Ca_2B_5O_7(OH)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are platy with a rhombic outline, to 20 μm, aggregated in books; typically cryptocrystalline, nodular to massive.

Physical Properties: *Fracture:* Conchoidal to earthy. *Tenacity:* Tough to friable. Hardness = 3–3.5, if compact. D(meas.) = 2.42 D(calc.) = 2.427

Optical Properties: Semitransparent. *Color:* White, colorless in transmitted light. *Luster:* Porcelaneous to earthy.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, rather strong. $\alpha = 1.571$–1.575 $\beta = 1.590$–1.596 $\gamma = 1.591$–1.597 2V(meas.) = 32(2)° 2V(calc.) = 42°56′

Cell Data: *Space Group:* $P2_1/c$. $a = 11.623(1)$ $b = 6.976(1)$ $c = 12.350(1)$ $\beta = 110.70(1)°$ Z = 4

X-ray Powder Pattern: Death Valley, California, USA.
10.92 (10), 3.63 (10), 5.46 (8), 3.49 (7), 2.72 (6), 2.18 (5), 4.29 (4)

Chemistry:

	(1)	(2)
B_2O_3	49.90	49.84
CaO	32.06	32.11
H_2O	18.04	18.05
Total	[100.00]	100.00

(1) Death Valley, California, USA; average of three analyses, recalculated from an original average total of 99.57%. (2) $Ca_2B_5O_7(OH)_5 \cdot H_2O$.

Occurrence: Deposited from hot spring and solfataric deposits, also a component of borate-enriched evaporites; may be derived from colemanite.

Association: Colemanite, ulexite, gypsum, aragonite, calcite.

Distribution: In the USA, from eight km north of Chetco, Curry Co., Oregon; in California, from a number of occurrences around Death Valley, as the Monte Blanco area, in Corkscrew Wash, and the Furnace Creek district, Inyo Co. From the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada. At Mesa del Almo, 13 km southeast of Magdalena, Sonora, Mexico. In Turkey, from the Sultançayir borate deposit, Bursa Province, and in several deposits in the Bigadiç borate district, Balıkesir Province. From the Inder borate deposit, Kazakhstan. At Meldon, Okehampton, Devon, England. From the Pöhla mine, Schwarzemberg, Saxony, Germany. At Radotin, Czech Republic.

Name: To honor Thomas Price (1837–?), metallurgist, San Francisco, California, USA, who provided the first chemical analyses of the species.

(1) West Kimberley area, Australia; corresponds to $(K_{0.87}Ba_{0.32}Na_{0.14})_{\Sigma=1.33}(Ti_{6.48}Fe^{3+}_{1.14}Al_{0.33})_{\Sigma=7.95}O_{16}$. (2) Do.; by electron microprobe, total Fe as Fe_2O_3; corresponding to $(K_{0.90}Ba_{0.35}Na_{0.06})_{\Sigma=1.31}(Ti_{6.68}Fe^{3+}_{1.03}Mg_{0.25}Al_{0.01})_{\Sigma=7.97}O_{16}$. (3) Kovdor massif, Russia; by electron microprobe, total Fe as Fe_2O_3; corresponds to $(Ba_{0.66}Na_{0.16}K_{0.11})_{\Sigma=0.93}(Ti_{6.05}Fe^{3+}_{1.90}Al_{0.16})_{\Sigma=8.11}O_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: In some ultrapotassic lamproites, ultramafics, and carbonatites.

Association: Leucite, potassian richterite, titanian phlogopite, jeppeite, shcherbakovite, wadeite, perovskite, apatite (West Kimberley area, Australia); potassian feldspar, phlogopite, potassian richterite, olivine, titanite, anatase, ilmenite, calcite (Corsica, France).

Distribution: From the Kimberley district, Western Australia, as in the Wolgidee Hills and the Argyle diamond mine. In the USA, from the Leucite Hills, Sweetwater Co., Wyoming; at Smoky Butte, Garfield Co., Montana; and in the Prairie Creek diatreme, near Murfreesboro, Pike Co., Arkansas. On the island of Corsica, France, near Sisco, north of Bastia. From the Sisimiut area, west Greenland. In the Kovdor and Khibiny massifs, Kola Peninsula, Russia.

Name: For Rex Tregilgas Prider (1910–), Professor of Geology, University of Western Australia, Perth, Australia, who provided the first pure sample of the species.

Type Material: University of Western Australia, Perth, Australia, 18760; The Natural History Museum, London, England.

(1) Baker mine, California, USA; average of two analyses, recalculated to 100% after deduction of insoluble 3.73%. (2) $NaCaB_5O_7(OH)_4 \cdot 3H_2O$.

Occurrence: In lake-bed deposits, the boron supplied by hydrothermal spring activity; may be an ore of boron.

Association: Kernite, colemanite, ulexite, borax.

Distribution: In the USA, in California, from the Baker, Western Borax, and Suckow mines, Kramer borate deposit, Boron, Kern Co.; in several mines around Ryan, and at the Eagle Borax Spring, Furnace Creek district, Inyo Co.; in the Sterling borax mine, Lang, Los Angeles Co.; and from the Pacific Coast Borax Co. mine, Calico Hills, north of Daggett, San Bernardino Co.; at Southard, Blaine Co., Oklahoma. From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. From one km south of Oficina Santa Luisa, Atacama, Chile. In the Günevi deposit, Bigadiç borate district, Balıkesir Province, Turkey. At the Gorleben salt dome, Lower Saxony, Germany. From the Piskanja deposit, Jarandol Basin, Serbia, Yugoslavia. In the Bakhmut depression and the Donets Basin, Ukraine.

Name: To honor Frank Holman Probert (1876–1940), Dean of the Mining College, University of California, Berkeley, California, USA, who provided the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95832–95833.

(1) Altenberg, Germany; O by difference. (2) Yenisei Ridge, Russia. (3) $CaAl_2(F,OH)_8$ with F:OH = 1:1.

Occurrence: Disseminated in fluorine-rich granites, greisens, and granite pegmatites; more rarely in base-metal deposits.

Association: Fluorite, cryolite, thomsenolite, pachnolite, gearksutite, ralstonite, weberite, jarlite, siderite, hematite, cassiterite, quartz.

Distribution: In Germany, from Altenberg, Saxony. At Horní Slavkov (Schlaggenwald), Czech Republic. From Perga, Volyn, Ukraine. In Russia, from Miass, Ilmen Mountains, Southern Ural Mountains; on the Yenisei Ridge, Siberia; and in the Zharchikhinsk molybdenum deposit, on the west side of Lake Baikal, eastern Siberia. In the Ivigtut cryolite deposit, southwestern Greenland. From Mt. Bischoff, Tasmania, Australia. In the USA, at St. Peters Dome, near Pikes Peak, El Paso Co., and in the Goldie carbonatite, McClure Mountain-Iron Mountain, Fremont Co., Colorado; in the Dugway district, Tooele Co., Utah; at the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada; from the Grand Reef mine, Aravaipa district, Graham Co., and 16 km north of Bouse, La Paz Co., Arizona; in the Morefield pegmatite mine, Amelia, Amelia Co., Virginia. In Mexico, at the Santa Rosa mine, Mazapil, Zacatecas, Mexico. From Tsumeb, Namibia.

Name: From the Greek for *mask*, the mineral's character being initially masked by pseudomorphism.

Type Material: Mining Academy, Freiberg, Germany, 12818.

(1) Tsumeb, Namibia; by electron microprobe, H_2O by TGA; corresponds to $Ca_{1.09}(Zn_{1.91}Cu_{0.08})_{\Sigma=1.99}(As_{0.98}O_{3.98})_2 \cdot 1.04H_2O$. (2) $CaZn_2(AsO_4)_2 \cdot H_2O$.

Occurrence: A rare secondary mineral in partly altered sulfide ore from a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Tennantite, chalcocite, mercurian silver, cuprite, cuprian adamite, cuprian austinite, conichalcite, stranskiite, lavendulan, köttigite, tsumcorite, koritnigite, o'danielite.

Distribution: From Tsumeb, Namibia.

Name: To honor Prosper John Williams (1910–), of Toronto, Canada, South African-Canadian mineral dealer, supplier of many Tsumeb specimens.

Type Material: Royal Ontario Museum, Toronto, Canada, M35388, M35389, M35391; The Natural History Museum, London, England, 1978,19; National Museum of Natural History, Washington, D.C., USA, 143732, 143733.

Protasite $Ba(UO_2)_3O_3(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. As thin pseudohexagonal platelets, flattened on {010}, to 0.5 mm; spherulitic, massive. *Twinning:* By 60° rotation about [010], yielding sector twinning, universal.

Physical Properties: *Cleavage:* Good on {010}. *Fracture:* Hackly. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 5.39(5) D(calc.) = 5.827(3) Radioactive.

Optical Properties: Transparent. *Color:* Bright orange. *Luster:* Subadamantine. *Optical Class:* Biaxial (–). $\alpha = 1.78$ $\beta = 1.80$–1.83 $\gamma = 1.82$–1.83 2V(meas.) = 60°–81°

Cell Data: *Space Group:* Pn. $a = 12.2949(16)$ $b = 7.2206(10)$ $c = 6.9558(8)$ $\beta = 90.401(15)°$ Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
3.14 (100), 7.06 (50), 3.58 (35), 3.11 (35), 2.496 (35), 2.395 (25), 1.976 (25)

Chemistry:

	(1)	(2)	(3)
UO_3	78.0	78.22	79.20
SiO_2		0.32	
PbO		2.63	
CaO		0.67	
BaO	15.0	9.48	14.15
K_2O		0.39	
H_2O	[7.0]	[8.29]	6.65
Total	[100.0]	[100.00]	100.00

(1) Shinkolobwe, Congo; by electron microprobe, H_2O by difference, presence confirmed by crystal-structure analysis; corresponding to $Ba_{1.08}(UO_2)_{3.00}O_3(OH)_2 \cdot 2.27H_2O$. (2) Russia; by electron microprobe, corresponding to $(Ba_{0.70}Ca_{0.13}Pb_{0.13}K_{0.04})_{\Sigma=1.00} \cdot (UO_2)_3O_3(OH)_2 \cdot 3H_2O$. (3) $Ba(UO_2)_3O_3(OH)_2 \cdot 3H_2O$.

Occurrence: In the oxidized zone of uranium-bearing mineral deposits.

Association: Uraninite, uranophane (Shinkolobwe, Congo); bauranoite, metacalciouranoite (Russia).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At an undisclosed locality [Streltsovskoe U–Mo deposit, eastern Transbaikal] in Russia.

Name: To honor Professor Jean Protas (1932–), French mineralogist, University of Nancy, Nancy, France, who first synthesized the compound, and for his work with uranium oxide minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150732.

Proudite $Cu_{0-1}Pb_{7.5}Bi_{9.3-9.7}(S,Se)_{22}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As elongate to acicular grains or irregular laths.

Physical Properties: *Cleavage:* One good cleavage parallel to grain elongation, a second at an apparent angle of 40° to the first. Hardness = n.d. VHN = 38–87 (50 g load). D(meas.) = n.d. D(calc.) = 7.08

Optical Properties: Opaque. *Color:* Silver-gray; in polished section, creamy white. *Pleochroism:* Strong, from cream-white to white. *Anisotropism:* Strong, from cream-gray to tan. R_1–R_2: n.d.

Cell Data: *Space Group:* $C2/m$. $a = 31.96(1)$ $b = 4.12(1)$ $c = 36.69(3)$ $\beta = 109.52(3)°$ $Z = 4$

X-ray Powder Pattern: Juno mine, Australia.
2.960 (100), 2.059 (86), 3.494 (65), 2.066 (60), 3.834 (48), 3.224 (48), 3.447 (42)

Chemistry:

	(1)	(2)
Cu	0.5	1.38
Pb	33.7	33.78
Bi	43.3	42.39
Se	14.0	12.02
S	9.9	10.43
Total	101.4	100.00

(1) Juno mine, Australia; by electron microprobe, average of 11 analyses; corresponds to $Cu_{0.36}Pb_{7.36}Bi_{9.38}S_{13.97}Se_{8.03}$. (2) "ideal" proudite – $Cu_{1.00}Pb_{7.50}Bi_{9.33}S_{15.00}Se_{7.00}$.

Occurrence: With large, presumably hydrothermal magnetite bodies (Juno mine, Australia).

Association: Gold, junoite, selenian heyrovskýite, krupkaite, magnetite (Juno mine, Australia).

Distribution: In Australia, from the Juno mine, Tennant Creek, Northern Territory [TL]. At Janos, Chihuahua, Mexico.

Name: Honors John S. Proud (1907–1997), a Director of the Peko-Wallsend mining company, developers of the Tennant Creek deposits.

Type Material: n.d.

References: (1) Mumme, W.G. (1976) Proudite from Tennant Creek, Northern Territory, Australia: its crystal structure and relationship to weibullite and wittite. Amer. Mineral., 61, 839–852. Proustite Ag_3AsS_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Crystals prismatic, to 8 cm; commonly rhombohedral with dominant $\{01\bar{1}2\}$ or $\{10\bar{1}1\}$; also scalenohedral with prominent $\{12\bar{3}1\}$; massive, compact. *Twinning:* On $\{10\bar{1}4\}$ to produce trillings; also common on $\{10\bar{1}1\}$ and on $\{0001\}$, $\{01\bar{1}2\}$.

Physical Properties: *Cleavage:* Distinct on $\{10\bar{1}1\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 2–2.5 VHN = 70–105 (25 g load). D(meas.) = 5.57 D(calc.) = 5.625

Optical Properties: Translucent, darkens with exposure to light. *Color:* Scarlet-vermilion. *Streak:* Vermilion. *Luster:* Adamantine.
Optical Class: Uniaxial (–). *Pleochroism:* Moderate; cochineal-red to blood-red. $\omega = 3.0877$ $\epsilon = 2.7924$ *Anisotropism:* Strong.
R_1–R_2: (400) 36.9–39.6, (420) 36.8–39.5, (440) 36.7–39.4, (460) 35.8–38.2, (480) 34.0–36.8, (500) 32.5–35.0, (520) 31.2–33.5, (540) 30.0–32.3, (560) 29.0–31.2, (580) 28.2–30.3, (600) 27.5–29.6, (620) 26.9–29.0, (640) 26.3–28.5, (660) 25.9–28.2, (680) 25.4–27.9, (700) 25.0–27.6

Cell Data: *Space Group: R3c.* $a = 10.79$ $c = 8.69$ $Z = 6$

X-ray Powder Pattern: Cobalt, Canada.
2.76 (10), 3.28 (8), 3.18 (8), 2.56 (8), 2.48 (8), 1.929 (2), 1.672 (2)

Chemistry:

	(1)	(2)	(3)

Sb	0.08	trace	
As	15.90	15.25	15.14
S	19.28	20.18	19.44
rem.	0.75	0.70	
Total	100.13	100.78	100.00

(1) Cobalt, Canada; remainder Fe 0.25%, (Co,Ni) 0.12%, insoluble 0.38%. (2) Veta Rica mine, Coahuila, Mexico; remainder is Cu. (3) Ag_3AsS_3.

Polymorphism & Series: Dimorphous with xanthoconite.

Occurrence: A late-forming mineral in hydrothermal deposits, in the oxidized and enriched zone, associated with other silver minerals and sulfides.

Association: Silver, arsenic, xanthoconite, stephanite, acanthite, tetrahedrite, chlorargyrite.

Distribution: Occurs at many localities, but rarely in fine crystals or as an important ore mineral. From Germany, in the Himmelsfürst mine, Erbisdorf, near Freiberg; and at Niederschlema, Saxony. In Romania, at Săcărîmb (Nagyág). From Jáchymov (Joachimsthal) and Příbram, Czech Republic. At Sainte-Marie-aux-Mines, Haut-Rhin, France. From Sarrabus, Sardinia, Italy. In the USA, in Colorado, at Red Mountain, San Juan Co., and at Georgetown, Clear Creek Co.; in Idaho, large masses at the Poorman mine, Silver City district, Owyhee Co.; in Nevada, in the Star mine, Cherry Creek district, White Pine Co. In Canada, from the Keeley mine, South Lorrain Township, Ontario. In Chile, at Chañarcillo, south of Copiapó, Atacama, as exceptional crystals. From Mexico, at Batopilas, Chihuahua, and Sombrerete, Zacatecas.

Name: To honor Joseph Louis Proust (1754–1826), celebrated French chemist.

Przhevalskite $Pb(UO_2)_2(PO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. Crystals are tabular, to 1 mm, in foliated aggregates.

Physical Properties: *Cleavage:* On {001}, good. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.38 Radioactive.

Optical Properties: Semitransparent. *Color:* Bright yellow with faint greenish tint. *Luster:* Adamantine, vitreous to pearly.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = pale yellow; Z = deep yellow. *Orientation:* Extinction parallel, elongation negative. $\alpha = 1.739$ $\beta = 1.749(2)$ $\gamma = 1.752(2)$ 2V(meas.) = $\sim 30°$

Cell Data: *Space Group:* n.d. $a = 7.24$ $c = 18.22$ Z = 2

X-ray Powder Pattern: Synthetic.
3.610 (10), 9.080 (9), 1.619 (6), 1.530 (6), 9.490 (5), 2.629 (5), 1.960 (5)

Chemistry:

	(1)	(2)
UO_3	46.55	56.68
P_2O_5	11.47	14.06
SiO_2	4.10	
Al_2O_3	3.48	
PbO	21.06	22.12
H_2O	6.69	7.14
Total	93.35	100.00

(1) Dzherkamar deposit, Tajikistan; SiO_2 and Al_2O_3 considered as "metahalloysite" impurity.
(2) $Pb(UO_2)_2(PO_4)_2 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a uranium deposit.

Association: Torbernite, autunite, dumontite, dewindtite, uranophane, wulfenite, hydrous Fe–Mn oxides, "metahalloysite".

Distribution: In the Dzherkamar uranium deposit, ten km southeast of Adraman, Karamazar Mountains, Tajikistan.

Name: Honoring Nikolai Mikhailovich Przheval'skii (1839–1888), Russian geographer and explorer of Central Asia.

Type Material: n.d.

References: (1) Soboleva, M.V. and I.A. Pudovkina (1957) Uranium Minerals Handbook, 408 pp, esp. 203–205 (in Russian). (2) Getseva, R.V. and K.T. Pseudoboleite $Pb_{31}Cu_{24}Cl_{62}(OH)_{48}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m\ 2/m\ 2/m$. Very rarely as single crystals, to 1 mm; commonly intergrown with and overgrown on boleite with mutually ∥ {001}.

Physical Properties: *Cleavage:* {001}, perfect; {101}, nearly perfect. Hardness = 2.5 D(meas.) = 4.85 D(calc.) = 5.07

Optical Properties: Translucent. *Color:* Indigo blue. *Luster:* Pearly on cleavages. *Optical Class:* Uniaxial (–). $\omega = 2.03$ $\epsilon = 2.00$

Cell Data: *Space Group:* $I4/mmm$. $a = 15.24(2)$ $c = 30.74(5)$ $Z = 2$

X-ray Powder Pattern: Chancay, Peru; may totally obscure the pattern of intergrown boleite. (ICDD 22-470).
4.43 (100), 3.83 (100), 2.707 (95), 2.334 (65), 2.551 (60), 2.389 (60), 1.990 (60)

Chemistry:

	(1)	(2)	(3)
AgCl	1.6		
Pb	53.5	57.7	56.37
CuO	16.5	16.9	16.75
Cl	20.2	19.8	19.29
H_2O	5.5	5.6	7.59
insol.	0.8		
Total	98.1	[100.0]	100.00

(1) Boleo, Mexico. (2) Analysis (1) corrected to 100.0% after deduction of AgCl 1.6% as boleite and insoluble 0.8%. (3) $Pb_{31}Cu_{24}Cl_{62}(OH)_{48}$.

Occurrence: A secondary mineral formed through reaction of chloride with primary sulfides in the oxidized zone of Pb–Cu deposits; in smelter slag immersed in and leached by sea water.

Association: Boleite, cumengeite, atacamite, anglesite, cerussite, phosgenite, gypsum (Boleo, Mexico).

Distribution: In Mexico, in the Amelia mine, Boleo, near Santa Rosalía, Baja California, and from an undefined locality in Sonora. In the USA, in the Mammoth-St. Anthony mine, Tiger, Pinal Co., and the Banner mine, Pima Co., Arizona. From Laurium, Greece, in slag. At Tolcarne Beach, Newquay, Cornwall, England. From Mantos Blancos, and at several mines around Caracoles, Sierra Gorda district, Antofagasta, Chile. In Peru, at Chancay.

Name: From the Greek for *false* and *boleite*, as it was mistaken for that species.

Type Material: n.d.

Pseudobrookite $(Fe^{3+}, Fe^{2+})_2(Ti, Fe^{3+})O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Commonly in short to long prismatic crystals, elongated along [010], to 7 cm, may be equant, flattened on {001}, with {*hk*0} striated ‖ [010], terminated by {0*kl*}; typically in radiating sheaves.

Physical Properties: *Cleavage:* {102}, distinct. *Fracture:* Uneven to subconchoidal. Hardness = 6 D(meas.) = 4.33–4.39 D(calc.) = 4.39

Optical Properties: Opaque, transparent in thin fragments. *Color:* Dark reddish brown, brownish black, black; in transmitted light, yellowish brown or reddish brown. *Streak:* Reddish brown to ocher-yellow. *Luster:* Metallic adamantine, may be tarnished iridescent, greasy on fractures.
Optical Class: Biaxial (+). *Pleochroism:* In browns. *Orientation:* $Y = a$; $Z = c$; $X \wedge a \simeq 26°$. *Dispersion:* $r < v$. *Absorption:* $X < Y > Z$. $\alpha = 2.35–2.38$ $\beta = 2.36–2.39$ $\gamma = 2.38–2.42$
2V(meas.) = ∼50°
R_1–R_2: (400) 22.8–24.0, (420) 21.9–23.1, (440) 21.2–22.3, (460) 20.5–21.4, (480) 19.8–20.7, (500) 19.4–20.4, (520) 19.0–19.9, (540) 18.5–19.3, (560) 18.1–18.8, (580) 17.8–18.5, (600) 17.5–18.1, (620) 17.3–17.9, (640) 17.1–17.7, (660) 17.0–17.6, (680) 16.8–17.4, (700) 16.7–17.3

Cell Data: *Space Group:* $C2$ (synthetic Fe_2TiO_5). $a = 22.23$ $b = 3.73$ $c = 9.80$ $\beta = 116.2°$ Z = 8

X-ray Powder Pattern: Synthetic Fe_2TiO_5. (ICDD 9-182).
3.483 (100), 2.748 (80), 4.902 (45), 1.54 (35), 1.862 (30), 2.402 (25), 1.971 (25)

Chemistry:

	(1)	(2)	(3)
TiO_2	41.93	38.8	33.34
Fe_2O_3	57.08	61.8	66.66
MgO	0.99	0.3	
Total	[100.00]	100.9	100.00

(1) Aranyer Berg, Romania; recalculated to 100% after deduction of SiO_2 1.29%. (2) Cuchillo, New Mexico, USA; by electron microprobe, total Fe as Fe_2O_3. (3) Fe_2TiO_5.

Occurrence: Formed by pneumatolytic processes in titanium-rich andesite, rhyolite, basalt, etc., and by reactions with xenoliths within these; commonly in lithophysae.

Association: Hematite, magnetite, bixbyite, ilmenite, enstatite-ferrosilite, tridymite, quartz, sanidine, topaz, spessartine, beryl, mica, cassiterite, apatite.

Distribution: Many of the localities following are minor; others are known. On Măgura Uroiului (Aranyer Berg), near Piski, Romania. In Germany, near Mayen, Eifel district. From Riveau Grande, Mt. Dore, Puy-de-Dôme, France. At Vesuvius, Campania, Italy. From Jumilla, Murcia Province, Spain. On Fayal and San Miguel Islands, Azores. On Kilimanjaro, Tanzania. From Réunion Island, Indian Ocean. In the USA, fine crystals from the Thomas Range, Juab Co., Utah; at Crater Lake, West Klamath Co., and Lemolo Lake, Douglas Co., Oregon; at a number of places in the Black Range, Sierra Co., New Mexico. From Cerro los Remedios, Durango, Mexico.

Name: From the Greek for *false* and *brookite*, as it was for some time thought to be that mineral.

Pseudocotunnite $K_2PbCl_4(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (probable). *Point Group:* $2/m\ 2/m\ 2/m$. Needlelike crystals, elongated ‖ [001], may be lathlike, flattened on {010} or {100}, to 5 mm; as warty aggregates, dendritic crusts.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.25 Soluble in warm H_2O.

Optical Properties: Semitransparent. *Color:* Colorless to white, yellow, greenish yellow. *Luster:* Dull.
Optical Class: Biaxial; medium strong birefringence. *Orientation:* $Z = c$. n = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* *Pnma* (synthetic). $a = 11.80(5)$ $b = 5.77(5)$ $c = 9.82(5)$ Z = 4

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)	(3)
Na	1.53		
K	17.11	18.97	18.30
Pb	43.00	47.67	48.50
Ca	2.13		
Cl	36.23	33.36	33.20
Total	100.00	[100.00]	100.00

(1) Vesuvius, Italy; SO_4 and F in traces. (2) Analysis (1) recalculated to 100% after deduction of Na and Ca as chlorides. (3) K_2PbCl_4.

Occurrence: In volcanic fumaroles.

Association: Tenorite, cotunnite.

Distribution: On Vesuvius, Campania, Italy.

Name: From the Greek for *false*, and the mineral's supposed resemblance to *cotunnite*.

Type Material: Natural History Museum, Paris, France, 108.1573.

Pseudograndreefite $Pb_6(SO_4)F_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222. Crystals are square, tabular on {010}, showing {010}, {100}, {001}, {210}, {012}, in subparallel aggregation, to 4 mm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼2.5
D(meas.) = 7.0(1) D(calc.) = 7.08 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White.
Luster: Subadamantine.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, strong.
$\alpha = 1.864(5)$ $\beta = 1.865(5)$ $\gamma = 1.873(5)$ 2V(meas.) = 30(3)° 2V(calc.) = 39°

Cell Data: *Space Group:* $F222$. $a = 8.5182(5)$ $b = 19.5736(11)$ $c = 8.4926(5)$ Z = 4

X-ray Powder Pattern: Grand Reef mine, Arizona, USA.
3.204 (100), 1.779 (70b), 2.999 (30), 2.212 (25), 1.364 (25b), 3.89 (20), 2.123 (20)

Chemistry:

	(1)	(2)
SO_3	4.7	5.24
PbO	84.9	87.57
F	13.1	12.42
$-O = F_2$	5.5	5.23
Total	97.2	100.00

(1) Grand Reef mine, Arizona, USA; by electron microprobe, H_2O shown absent by IR; corresponding to $Pb_{5.91}(S_{0.91}O_{3.29})F_{10.71}$. (2) $Pb_6(SO_4)F_{10}$.

Occurrence: In a vug isolated from acidic sulfate-rich solutions in the oxidized zone of a low-temperature Pb–Cu–Ag deposit.

Association: Grandreefite, laurelite, aravaipaite, galena, fluorite, anglesite, linarite, caledonite, quartz.

Distribution: From the Grand Reef mine, about six km northeast of Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: From the Greek for *false*, and its relation to *grandreefite*.

Type Material: Natural History Museum, Los Angeles, California, 33608; National Museum of Natural History, Washington, D.C., USA, 166056.

References: (1) Kampf, A.R., P.J. Dunn, and E.E. Foord (1989) Grandreefite, pseudograndreefite, laurelite, and aravaipaite: four new minerals from the Grand Reef mine, Graham County, Arizona. Amer. Mineral., 74, 927–933.

Pseudolaueite $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic to thick tabular pseudohexagonal crystals, with {100}, {001}, {110}, rare {011}, {$\overline{2}$01}, to 2 mm.

Physical Properties: Hardness = 3 D(meas.) = 2.463 D(calc.) = 2.51

Optical Properties: Semitransparent. *Color:* Pale yellow-orange, light to dark yellow, orange-brown.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = pale yellow; Z = yellow. *Orientation:* $Z = b$; $X \wedge c = 2°$; $Y \wedge a = 12°$. $\alpha = 1.626$ $\beta = 1.650$ $\gamma = 1.686$ 2V(meas.) = n.d. 2V(calc.) = 80°

Cell Data: *Space Group:* $P2_1/a$. $a = 9.647$ $b = 7.428$ $c = 10.194$ $\beta = 104.63°$ Z = 2

X-ray Powder Pattern: Hagendorf, Germany.
9.926 (10), 5.869 (7), 3.472 (4), 4.678 (3), 3.908 (3), 3.186 (3), 3.069 (3)

Chemistry: (1) Hagendorf, Germany; analysis not given, stated to correspond to $(Mn_{0.78}Al_{0.20}Ca_{0.02})_{\Sigma=1.00}(Fe^{3+}_{1.80}Fe^{2+}_{0.10}Mg_{0.07}Mn_{0.04})_{\Sigma=2.01}(PO_4)_2(OH)_2 \cdot 8H_2O$.

Polymorphism & Series: Trimorphous with laueite and stewartite.

Occurrence: As incrustations and replacements of stewartite crystals in a complex zoned granite pegmatite (Hagendorf, Germany).

Association: Stewartite, laueite, strunzite, triphylite, Fe–Mn oxides (Hagendorf, Germany).

Distribution: From Hagendorf, Bavaria, Germany. In Portugal, at the Mangualde pegmatite, near Mesquitela, and in the Bendada pegmatite, near Guarda. From the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; at the White Elephant mine, near Pringle, Custer Co., South Dakota, USA.

Name: From the Greek for *false* and its relation to *laueite*, as it is not that species.

Type Material: University of Chicago, Chicago, Illinois, USA, P239.

References: (1) Strunz, H. (1956) Pseudolaueit, ein neues Mineral. Naturwiss., 43, 128 (in German). (2) (1956) Amer. Mineral., 41, 815 (abs. ref. 1). (3) Baur, W.H. Pseudolyonsite $Cu_3(VO_4)_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m.* As needles to 0.5 mm or in sprays or openwork clusters to 1 mm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle, needles flexible and elastic. Hardness = 2-3 D(meas.) = n.d. D(calc.) = 4.749

Optical Properties: Translucent to opaque. *Color*: Dark red with brownish tint; gray with a weak bluish tint in reflected light, with strong red internal reflections. *Streak*: Reddish brown.
Luster: Adamantine to semi-metallic. *Anistropism*: Distinct.
Optical Class: n.d.
R_1-R_2: (470) 17.05-19.6, (546) 16.1-18.15, (589) 15.85-17.7, (650) 15.55-17.4

Cell Data: *Space Group*: $P2_1/c$. a = 6.2695(4) b = 8.0195(3) c = 6.3620(3) β = 111.96(1)°
Z = 2

X-ray Powder Pattern: Tolbachik volcano, Kamchatka Peninsula, Russia.
2.761 (100), 3.22 (87), 3.30 (79), 2.894 (74), 2.419 (67), 4.70 (60), 2.479 (59)

Chemistry:

	(1)	(2)
V_2O_5	40.37	43.25
CuO	48.83	56.75
ZnO	7.6	
MoO_3	1.89	
SiO_2	0.14	
Total	98.83	100.00

(1) Tolbachik volcano, Kamchatka Peninsula, Russia; average of 4 electron microprobe analyses; corresponding to $(Cu_{2.58}Zn_{0.44})_{\Sigma=3.02}(V_{1.88}Mo_{0.06}Si_{0.02})_{\Sigma=1.96}O_8$. (2) $Cu_3(VO_4)_2$.

Polymorphism & Series: Dimorphous with mcbirneyite and the natural analogue of synthetic monoclinic $Cu_3(VO_4)_2$.

Occurrence: Formed by late post-eruptive degassing in cavities from several centimeters to 1.5 m in size under the surface crust of volcanic cinder - typically as overgrowths on acicular piypite.

Association: Piypite, palmierite, lyonsite, hematite.

Distribution: From the Yadovitaya (''Poisonous'') fumarole, Second cone, Tolbachik volcano, Kamchatka Peninsula, Far East Asia, Russia.

Name: For its close visual (color, luster, habit) similarity to *lyonsite*.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 3879/1).

References: (1) Zelenski, M.E., N.V. Zubkova, I.V. Pekov, M. M. Boldyreva, D.Yu. Pushcharovsky, and A.N. Mineral., 97, 760-761 (abs. ref. 1).

Pseudomalachite $Cu_5(PO_4)_2(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are rare, to 6 mm, typically rough and rounded, with prominent {110}, {201}, {311}, {100}, {001}, and others. Commonly compact radiating and spherical, may be fibrous, in paintlike crusts and films, botryoidal, massive. *Twinning:* On {100}.

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* Splintery. Hardness = 4.5–5 D(meas.) = 4.15–4.35 D(calc.) = 4.34

Optical Properties: Translucent. *Color:* Dark emerald-green, dark green, blackish green, bluish green; green to bluish green in transmitted light. *Streak:* Pale green to pale bluish green. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (–), may be biaxial (+). *Pleochroism:* Weak; X = bluish green to pale green; Y = yellowish green; Z = deep bluish green to blue-green. *Orientation:* $Z = b$; X $\wedge$ c = 21°–23°. *Dispersion:* $r < v$, strong; may be $r > v$. α = 1.789–1.80 β = 1.835–1.86 γ = 1.845–1.88 2V(meas.) = 46°–50°

Cell Data: *Space Group:* $P2_1/a$. a = 17.02–17.08 b = 5.75–5.77 c = 4.47–4.50 $\beta = 90°57'–91°32'$ Z = 2

X-ray Powder Pattern: Ehl and Rheinbreitbach, Germany.
4.48 (10), 2.39 (8), 2.42 (6), 3.46 (5), 2.32 (5), 2.23 (5), 1.728 (5)

Chemistry:

	(1)	(2)
P_2O_5	23.86	24.65
FeO	0.19	
CuO	69.25	69.09
H_2O	6.76	6.26
Total	100.06	100.00

(1) Rheinbreitbach, Germany; corresponds to $(Cu_{4.98}Fe_{0.02})_{\Sigma=5.00}(PO_4)_{1.93}(OH)_{4.30}$.
(2) $Cu_5(PO_4)_2(OH)_4$.

Polymorphism & Series: Trimorphous with ludjibaite and reichenbachite.

Occurrence: A secondary mineral in the oxidized zone of hydrothermal copper deposits.

Association: Libethenite, malachite, cornetite, chrysocolla, quartz.

Distribution: Many localities, but usually in small amounts. In Germany, at Ehl, near Linz, and rich specimens from Virneberg, near Rheinbreitbach, Rhineland-Palatinate. At L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. From Nizhni Tagil and Bogoslovsk, Ural Mountains, Russia. In England, at Caldbeck Fells, Cumbria; also from a number of mines in Cornwall. From Kakanda and M'sesa, near Kambove, Katanga Province, Congo (Shaba Province, Zaire). At Mindouli, Congo Republic. From the Bwana Mkubwa, Ndola, and the Nchanga mines, Chingola, Zambia. In the USA, from the Perkiomen and Ecton mines, Montgomery Co., Pennsylvania; in the Empire-Nevada mine, Yerington district, Lyon Co., Nevada; at Lone Star mine, near Safford, Graham Co., from Harquehala, La Paz Co., and elsewhere in Arizona. At Chuquicamata, Antofagasta, Chile. Rich examples from the West Bogan mine, near Tottenham, New South Wales, and at the Burra Burra mine, Mt. Lofty Ranges, South Australia.

Name: From the Greek for *false*, as the mineral closely resembles *malachite*.

Type Material: Mining Academy, Freiberg, Germany.

Pseudorutile $Fe_2^{3+}Ti_3O_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As thin, irregular plates having fibrous texture; fine-grained, massive, replacing ilmenite crystals and grains.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = ∼3.8 D(calc.) = [4.82] Magnetic.

Optical Properties: Opaque, transparent when very thin. *Color:* Dark steel-gray on fresh fractures, light brown to black; deep red in transmitted light. *Streak:* Reddish brown. *Luster:* Submetallic to metallic.
Optical Class: Uniaxial; moderate birefringence. *Pleochroism:* Very weak; in reds. *Absorption:* $Z > X$. $n = \sim 2.62$

Cell Data: *Space Group:* $P6_322$. $a = 14.375(6)$ $c = 4.615(3)$ Z = [6]

X-ray Powder Pattern: South Neptune Island, South Australia.
1.6860 (100), 2.481 (80), 2.187 (70), 2.784 (20d), 3.897 (15d), 2.2993 (8), 1.6253 (6d)

Chemistry:

	(1)	(2)
TiO_2	58.84	60.01
Fe_2O_3	34.65	39.99
Mn_2O_3	0.60	
FeO	1.24	
H_2O^+	3.24	
Total	98.57	100.00

(1) South Neptune Island, South Australia; corresponds to $(Fe^{3+}_{1.81}Fe^{2+}_{0.07}Mn^{3+}_{0.03})_{\Sigma=1.91}$ $Ti_{3.08}O_9 \cdot 0.75H_2O$. (2) $Fe_2Ti_3O_9$.

Occurrence: An intermediate product of the weathering of ilmenite.

Association: Ilmenite, rutile, anatase, hematite, gadolinite.

Distribution: On South Neptune Island, South Australia. In the USA, around Lakehurst, Ocean Co., New Jersey. Other occurrences have been tentatively noted in ilmenite-rich beach sands.

Name: From the Greek for *false* and its relation to *rutile*.

Type Material: Museum Victoria, Melbourne, Australia, M42789.

References: (1) Teufer, G. and A.K. Temple (1966) Pseudorutile – a new mineral intermediate between ilmenite and rutile in the natural alteration of ilmenite. Nature, 211, 179–181. Pseudosinhalite $Mg_2Al_3B_2O_9(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As a topotactic replacement of sinhalite grains. *Twinning:* Polysynthetic on a very fine scale, observed optically.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.508

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$. $n = 1.72$ $\alpha = 1.691(1)$ (synthetic) $\beta = 1.713(1)$ $\gamma = 1.730(1)$ 2V(meas.) = 80°

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to synthetic). $a = 7.49(1)$ $b = 4.33(1)$ $c = 9.85(1)$ $\beta = 110.7(1)°$ Z = 2

X-ray Powder Pattern: Tayozhnoye deposit, Russia.
2.14 (100), 1.625 (100), 2.102 (60), 3.21 (40), 2.61 (40), 1.607 (40), 1.399 (40)

Chemistry:

	(1)	(2)
B_2O_3	[21.75]	22.30
Al_2O_3	46.88	48.99
FeO	1.99	
MgO	25.12	25.82
H_2O	[2.81]	2.89
Total	[98.55]	100.00

(1) Tayozhnoye deposit, Russia; by electron microprobe, average of 14 analyses; total Fe as FeO, B_2O_3 and H_2O calculated for stoichiometry; corresponds to $(Mg_{1.98}Fe_{0.09})_{\Sigma=2.07}$ $Al_{2.93}B_{2.00}O_9(OH)$. (2) $Mg_2Al_3B_2O_9(OH)$.

Occurrence: A rare mineral in a contact-metasomatic boron-rich iron deposit, a product of retrograde alteration of sinhalite in magnesium-bearing skarn.

Association: Forsterite, spinel, ludwigite, warwickite, suanite, szaibélyite, brucite, clinohumite, sinhalite, hydrotalcite.

Distribution: From the Tayozhnoye iron deposit, 550 km south of Yakutsk, Sakha, Russia.

Name: From the Greek for *false*, in recognition of its close relation to *sinhalite*.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany.

Pucherite $BiVO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, equant to tabular {001}, with curved faces and composite structure, may be acicular, to 4 mm; many forms, including {001}, {111}, {011}, {112}. As coatings of minute crystals, ocherous, massive.

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 4 D(meas.) = n.d. D(calc.) = 6.69

Optical Properties: Transparent to opaque. *Color:* Dark brownish red, reddish brown, yellowish brown; yellow-brown in transmitted light. *Streak:* Yellow. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, extreme. $\alpha = 2.41(2)$ $\beta = 2.50(2)$ $\gamma = 2.51(2)$ 2V(meas.) = 19(5)°

Cell Data: *Space Group: Pnca.* $a = 5.328(2)$ $b = 5.052(2)$ $c = 12.003(3)$ Z = 4

X-ray Powder Pattern: Schneeberg, Germany. (ICDD 12-293).
3.499 (100), 2.702 (100), 4.644 (55), 3.982 (55), 2.992 (45), 1.992 (45b), 2.133 (40)

Chemistry:

	(1)	(2)
P_2O_5	trace	
V_2O_5	27.31	28.07
Bi_2O_3	73.39	71.93
Total	100.70	100.00

(1) Schneeberg, Germany. (2) $BiVO_4$.

Polymorphism & Series: Trimorphous with clinobisvanite and dreyerite.

Occurrence: A rare alteration product of other bismuth minerals in the oxidized zone of some hydrothermal ore deposits; in zoned granite pegmatites.

Association: Bismuth, bismutite, beyerite, bismuthinite, schumacherite, clinobisvanite.

Distribution: In Germany, well-crystallized from the Pucher shaft, Wolfgang Maassen mine, and elsewhere near Schneeberg, Saxony; at Reichenbach, near Bensheim, Hesse; in the Clara Mine, near Oberwolfach, Black Forest. On Mt. Bity, at Samiresy, and Ampangabe, Madagascar. From Mutala, Mozambique. At the Golconda prospect, near Harare, Zimbabwe. In the USA, from the Harding mine, Taos Co., New Mexico; at the Stewart, Pala Chief, and other mines, Pala district, and in the Little Three mine, Ramona district, San Diego Co., California. From São José, Brejauba, and at Matto Dentro, Minas Gerais, Brazil. From near Koktokay [Kyokfogoi], Xinjiang Uygur Autonomous Region, China. In Australia, from Morass Creek, north of Benambra, Victoria; in the Londonderry quarry, southwest of Coolgardie, Western Australia.

Name: For its original occurrence at the Pucher shaft, Schneeberg, Germany.

Pumpellyite-(Fe^{2+}) $Ca_2(Fe^{2+},Fe^{3+},Mg)Al_2(SiO_4)(Si_2O_7)(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rosettes and spherulites in stringers.

Physical Properties: Hardness = [~5] (by analogy to the pumpellyite group).
D(meas.) = 3.31 D(calc.) = [3.35]

Optical Properties: Semitransparent. *Color:* [Greenish black.] *Luster:* [Vitreous.]
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow; Y = deep grass-green; Z = yellowish brown to reddish brown. *Orientation:* $Z \wedge c = 5°$. $\alpha = 1.728$ $\beta = 1.748$ $\gamma = 1.754$
2V(meas.) = $-60°$ to $30°$

Cell Data: *Space Group:* n.d. $a = 8.89(2)$ $b = 6.03(3)$ $c = 19.19(4)$ $\beta = 97°49(12)'$
Z = 4

X-ray Powder Pattern: Noril'sk, Russia.
2.91 (100), 3.79 (64), 2.75 (60), 2.22 (36), 2.66 (34), 4.76 (30), 4.43 (27)

Chemistry:

	(1)
SiO_2	34.83
TiO_2	0.10
Al_2O_3	10.10
Fe_2O_3	18.05
FeO	9.09
MnO	0.02
MgO	0.94
CaO	20.50
Na_2O	0.18
H_2O^+	5.62
Total	99.43

(1) Noril'sk, Russia; corresponds to $(Ca_{1.94}Na_{0.03}Fe^{2+}_{0.02})_{\Sigma=1.99}(Fe^{2+}_{0.65}Fe^{3+}_{0.25}Mg_{0.12})_{\Sigma=1.02}(Al_{1.06}Fe^{3+}_{0.95})_{\Sigma=2.01}Si_{3.08}O_{11}(OH)_2 \cdot 1.32H_2O$.

Polymorphism & Series: Forms two series, with julgoldite-(Fe^{2+}), and with pumpellyite-(Mg).

Mineral Group: Pumpellyite group.

Occurrence: In the contact zone around an intrusive.

Association: Prehnite, babingtonite, clinopyroxene, calcite.

Distribution: From near Noril'sk, western Siberia, Russia.

Name: For its membership in the *pumpellyite* group and dominant *ferrous iron* content.

Type Material: n.d.

Pumpellyite-(Fe^{3+})

$Ca_2(Fe^{3+}, Mg, Fe^{2+})$
$(Al, Fe^{3+})_2(SiO_4)(Si_2O_7)(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2/*m*. Fibrous.

Physical Properties: Hardness = [~5] (by analogy to the pumpellyite group).
D(meas.) = n.d. D(calc.) = [3.25]

Optical Properties: Semitransparent. *Color:* [Greenish black.] *Luster:* [Vitreous.]
Optical Class: Biaxial. α = n.d. β = 1.713 γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 8.8340$ $b = 5.9528$ $c = 19.1849$ $\beta = 97.451°$ Z = 4

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
SiO_2	35.75	36.75
TiO_2	0.12	0.05
Al_2O_3	18.70	18.81
Fe_2O_3	11.10	13.59

CaO	20.72	21.09
Na_2O	0.44	0.03
K_2O	0.06	
H_2O^+	6.63	[7.00]
Total	99.49	[100.00]

(1) Bulla, Italy; corresponds to $(Ca_{1.84}Na_{0.07}Fe^{2+}_{0.06})_{\Sigma=1.97}(Fe^{3+}_{0.48}Mg_{0.38}Fe^{2+}_{0.14})_{\Sigma=1.00}$ $(Al_{1.78}Fe^{3+}_{0.21})_{\Sigma=1.99}(Si_{2.96}Al_{0.04})_{\Sigma=3.00}O_{11}(OH)_2 \cdot 1.66H_2O$. (2) Do.; by electron microprobe, H_2O fixed at 7%.

Mineral Group: Pumpellyite group.

Occurrence: In altered porphyritic rocks.

Association: Plagioclase, hematite.

Distribution: From Bulla, Trentino-Alto Adige, Italy.

Name: For its membership in the *pumpellyite* group and dominant *ferric iron* content.

Type Material: n.d.

Pumpellyite-(Mg) $Ca_2MgAl_2(SiO_4)(Si_2O_7)(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals bladed, typically elongated along [010]; in stellate clusters, fibrous, or dense mats. *Twinning:* Common on {001} and {100}.

Physical Properties: *Cleavage:* Distinct on {001} and {100}. Hardness = 5.5
D(meas.) = 3.18(3) D(calc.) = 3.20

Optical Properties: Translucent to nearly opaque. *Color:* Green, bluish green, greenish black, brown; colorless, green, yellow, brown in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = nearly colorless to pale greenish yellow; Y = blue-green; Z = almost colorless to brownish yellow. *Orientation:* $Z \wedge c = 20°–25°$. *Dispersion:* $r < v$, strong; less commonly $r > v$. *Absorption:* $Y > Z \geq X$. $\alpha = 1.695–1.702$ $\beta = 1.703–1.709$ $\gamma = 1.717–1.722$ 2V(meas.) = 80°

Cell Data: *Space Group:* $A2/m$. $a = 8.83(1)$ $b = 5.90(1)$ $c = 19.17(2)$ $\beta = 97°7(5)'$
Z = 4

X-ray Powder Pattern: Calumet, Michigan, USA.
2.90 (100), 3.79 (50), 2.74 (50), 2.452 (40), 2.64 (30), 2.210 (30), 1.597 (30)

Chemistry:

	(1)		(1)
SiO_2	37.18	CaO	23.08
Al_2O_3	23.50	Na_2O	0.19
Fe_2O_3	5.29	K_2O	trace
FeO	2.09	H_2O^+	6.28
MnO	0.13	H_2O^-	0.06
MgO	3.18	Total	[100.98]

(1) Calumet and Hecla mine, Michigan, USA; original total given as 100.97%, corresponds to $(Ca_{1.99}Na_{0.03})_{\Sigma=2.02}(Mg_{0.38}Fe^{3+}_{0.32}Al_{0.22}Fe^{2+}_{0.14}Mn_{0.01})_{\Sigma=1.07}Al_{2.00}Si_{2.99}O_{11}(OH)_{2.43}$.

Polymorphism & Series: Forms two series, with pumpellyite-(Fe^{2+}), and with julgoldite-(Fe^{2+}).

Mineral Group: Pumpellyite group.

Occurrence: A widespread product of low-grade metamorphism of amygdaloidal basalts and diabases; in glaucophane schists and in graywackes.

Association: Chlorite, epidote, actinolite, lawsonite, glaucophane, prehnite, zeolites, quartz.

Distribution: In the USA, in Michigan, at Calumet, Houghton Co., and elsewhere on the Keweenaw Peninsula and Isle Royale; at Skaggs Springs, 24 km northwest of Healdsburg, and at Novato and Porter Creek, Sonoma Co., and elsewhere in California. From Lendalfoot, Aryshire, Scotland. At Great Penhaver Point, Roseland, and in the Penlee quarry, Newlyn, Cornwall, England. From Knipane, Iveland, Norway. In Germany, at Herbornseelbach, Hesse. At Wienern, Styria, Austria. From Obřī Důl (Riesengrund), Czech Republic. Around Tiso, Trentino-Alto Adige, Italy. In Japan, from Oonara, Sanbagawa, Gumma Prefecture, and many other localities. From New Zealand, in the Tasingatura district, South Island.

Name: For Raphael Pumpelly (1837–1923), pioneer student of the paragenesis of copper deposit minerals of the Keweenaw Peninsula, Michigan, USA, and dominant *magnesium* content.

Type Material: Harvard University, Cambridge, Massachusetts, 90919; National Museum of Natural History, Washington, D.C., USA, 95279–95281; The Natural History Museum, London, England, 1926,225–226.

Pumpellyite-(Mn^{2+})

$Ca_2(Mn^{2+},Mg)(Al,Mn^{3+},Fe)_2(SiO_4)(Si_2O_7)(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Platy crystals, to 0.1 mm, elongated along [010] and tabular on {001}; fine granular.

Physical Properties: *Cleavage:* One perfect, presumably {001}, seen in thin section. Hardness = ~5 in aggregate. D(meas.) = n.d. D(calc.) = 3.34

Optical Properties: Semitransparent. *Color:* Light grayish pink to brownish pink. *Streak:* Light grayish pink. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = pale pink; $Y = Z$ = brownish pink. $\alpha = 1.752(2)$ $\beta = 1.795(5)$ $\gamma = 1.800(5)$ 2V(meas.) = ~40°

Cell Data: *Space Group:* $A2/m$. $a = 8.923$ $b = 5.995$ $c = 19.156$ $\beta = 97°8'$ Z = 4

X-ray Powder Pattern: Ochiai mine, Japan.
2.930 (100), 2.725 (90), 4.75 (65), 3.844 (65), 2.654 (55), 2.533 (50), 2.205 (45)

Chemistry:

	(1)
SiO_2	35.66
TiO_2	0.02
Al_2O_3	13.40
Fe_2O_3	2.43
Mn_2O_3	7.74
MnO	13.41
MgO	0.89
CaO	20.69
Na_2O	0.01
H_2O	[5.75]
Total	[100.00]

(1) Ochiai mine, Japan; by electron microprobe, H_2O by difference; corresponds to $(Ca_{1.89}Mn^{2+}_{0.08})_{\Sigma=1.97}(Mn^{2+}_{0.89}Mg_{0.11})_{\Sigma=1.00}(Al_{1.34}Mn^{3+}_{0.50}Fe^{3+}_{0.16})_{\Sigma=2.00}Si_{3.03}O_{11}(OH)_2 \cdot 1.26H_2O$.

Mineral Group: Pumpellyite group.

Occurrence: In braunite ore in a syngenetic bedded manganese deposit developed in low-grade metamorphic rocks.

Association: Braunite, piemontite, clinozoisite, caryopilite, johannsenite, rhodochrosite, albite, quartz, calcite.

Distribution: In the Ochiai mine, 3.5 km west of Barazawa, Yamanashi Prefecture, Japan.

Name: For its membership in the *pumpellyite* group and dominant *manganous manganese* content.

Type Material: National Science Museum, Tokyo, Japan, M23125; National Museum of Natural History, Washington, D.C., USA, 147159, 147160.

(1) Faires tin mine, North Carolina, USA. (2) $(Mn, Fe)PO_4$ with Mn:Fe = 1:1.

Polymorphism & Series: Forms a series with heterosite.

Occurrence: Derived from oxidation and leaching of primary Mn–Fe phosphates, particularly lithiophilite, in complex granite pegmatites; rarely, formed by reaction between bat guano and Fe–Mn deposits resulting from seawater ingress.

Association: Lithiophilite, sicklerite, many secondary Fe–Mn phosphates.

Distribution: A number of minor localities. In the USA, from the Faires tin mine, Kings Mountain, Gaston Co., North Carolina; at several mines in the Pala and Rincon districts, San Diego Co., California; in the White Picacho district, Yavapai Co., Arizona; large cleavages from the Crystal Mountain district, Larimer Co., Colorado; at the Custer Mountain mine and other pegmatites in Custer Co., South Dakota; from Branchville, Fairfield Co., Connecticut; at Greenwood and Rumford, Oxford Co., Maine. From the Mangualde pegmatite, near Mesquitela, Portugal. At the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. In the Viitaniemi pegmatite, near Eräjärvi, Finland. From the La Vilate quarry, near Chanteloube, Haute-Vienne, France. At Wodgina, Western Australia. From the Karibib district, Namibia. In the Gunong Keriang Cave, Malaysia.

Name: From the Latin for *purple*, in allusion to its typical color.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93883.

(1) Cap Garonne mine, France; by electron microprobe, average of seven analyses, H_2O by TGA; corresponds to $Cu_{1.00}(As_{1.01}O_3OH)\cdot 0.98H_2O$. (2) $Cu(AsO_3OH)\cdot H_2O$.

Polymorphism & Series: Dimorphous with geminite.

Occurrence: A very rare secondary mineral from the oxidized zone of a polymetallic hydrothermal base metal deposit (Cap Garonne mine, France).

Association: Tennantite, covellite, geminite, lindackerite, yvonite, mahnertite, arsenopyrite, bismuth, chalcopyrite, quartz.

Distribution: In France, from the Cap Garonne mine, near le Pradet, Var, and at the Salsigne mine, 15 km north of Carcassone, Aude.

Name: To honor Professor Dmitry Y. Pushcharovskiy, crystallographer, Moscow State University, Moscow, Russia.

Type Material: Natural History Museum, Geneva, Switzerland.

(1) Halls Knoll gossan, Western Australia, Australia; average of 11 electron microprobe analyses, CO_2 and H_2O calculated from crystal structure analysis and confirmed by infrared spectroscopy, OH^- calculated for charge balance; corresponding to $Cr^{3+}_{8.02}Ca_{3.78}Sr_{1.08}Na_{0.11}Cu^{2+}_{0.07}Mg_{0.04}Ba_{0.02}[(SO_4)_{0.96}(SiO_4)_{0.03}]_{\Sigma=0.99}(CO_3)_{7.98}(OH)_{16.19}Cl_{0.15}\cdot 24.84H_2O$.

Occurrence: A product of the oxidation of a massive nickel sulfide deposit in komatiitic/dioritic rocks.

Association: Quartz, a near-amorphous dark green mineral.

Distribution: From the Halls Knoll gossan, Polar Bear peninsula, Southern Lake Cowan, 40 km north of Norseman, Western Australia, Australia.

Name: Honors Australian mineralogists Christine and Andrew Putnis of the Institut für Mineralogie, Universtität Münster, Germany, in recognition of their outstanding contributions to mineralogy.

Type Material: South Australian Museum, Adelaide, South Australia, (registration number G33429) and at the Canadian Museum of Nature, Ottawa, Canada (CMNMC 86133).

References: (1) Elliott, P., G. Giester, R. Rowe, and A. Pring (2014) Putnisite, $SrCa_4Cr_8^{3+}(CO_3)_8SO_4(OH)_{16}\cdot 25H_2O$, a new mineral from Western Australia: description and crystal structure. Mineral. Mag., 78(1), 131-144. (2) (2014) Amer. Mineral., 99, 1810-1811 (abs. ref. 1).

Putoranite $Cu_9(Fe,Ni)_9S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rarely as crystals; typically as small grains, to 0.1 mm, finely intergrown with mooihoekite, in aggregates. *Twinning:* Polysynthetic.

Physical Properties: Hardness = n.d. VHN = 263 (50 g load). D(meas.) = n.d. D(calc.) = 6.14

Optical Properties: Opaque. *Color:* Pale yellow in reflected light, similar to mooihoekite and chalcopyrite. *Anisotropism:* Nickelian variety distinctly anisotropic.
R: (400) — , (420) — , (440) — , (460) 24.4, (480) 25.1, (500) 30.0, (520) 31.8, (540) 38.0, (560) 40.0, (580) 41.2, (600) 41.2, (620) 40.9, (640) 41.9, (660) 41.6, (680) 41.2, (700) 41.0

Cell Data: *Space Group:* *Pn3m* (by analogy to synthetic material). $a = 5.30$ $Z = 3$

X-ray Powder Pattern: Oktyabr mine, Russia.
3.05 (10), 1.873 (9), 1.596 (6), 1.081 (5), 1.216 (3), 2.65 (2), 1.326 (2)

Chemistry:

	(1)	(2)
Cu	35.68	32.99
Fe	31.22	32.11
Ni	0.51	1.63
S	32.49	33.14
Total	99.90	99.87

(1) Oktyabr mine, Russia; by electron microprobe, average of seven samples; corresponding to $Cu_{8.87}(Fe_{8.83}Ni_{0.14})_{\Sigma=8.97}S_{16.00}$. (2) Do.; by electron microprobe, average of twelve samples, corresponding to $Cu_{8.04}(Fe_{8.90}Ni_{0.43})_{\Sigma=9.33}S_{16.00}$.

Occurrence: In massive Cu–Ni-sulfide ores (Oktyabr mine, Russia); in Cu–Ni mineralization in peridotite (Sopcha massif, Russia).

Association: Mooihoekite, talnakhite, cabriite, cubanite, pentlandite, magnetite, galena, sphalerite, platinum group minerals, silver, alabandite, valleriite, mackinawite, manganoan shadlunite, djerfisherite (Oktyabr mine, Russia).

Distribution: In Russia, from the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia [TL], and in the Sopcha massif, Monchegorsk pluton, Kola Peninsula.

Name: For Putoran Mountain, east of Noril'sk, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81312.

X-ray Powder Pattern: Rosario shaft, Capillitas mining district, Catamarca Province, Argentina. 2.943 (100), 1.805 (70), 3.074 (60), 1.962 (50), 5.896 (30), 2.083 (30), 1.725 (25), 2.343 (20)

Chemistry:

	(1)	(2)
Cu	32.71	32.48
Ag	39.83	38.71
Ge	7.62	7.89
S	20.59	20.92
Total	100.75	100.00

(1) Rosario shaft, Capillitas mining district, Catamarca Province, Argentina; average of 29 electron microprobe analyses, corresponds to $(Cu_{4.73}Ag_{3.40})_{\Sigma=8.13}Ge_{0.97}S_{5.91}$. (2) $(Cu_{4.7}Ag_{3.3})_{\Sigma=8}GeS_6$.

Occurrence: Fills cavities and vugs in bornite-chalcocite ore associated with andesitic rocks which host porphyry Cu-Au and epithermal vein-type mineral deposits.

Association: Catamarcaite, hübnerite, Ge-stannoidite, luzonite, sphalerite, tennantite, thalcusite, wittichenite, chalcocite, bornite.

Distribution: From dumps near the Rosario shaft, Capillitas mining district, Department of Andalgalá, Catamarca Province, Argentina.

Name: Honors Hubert Putz (b. 1973), who discovered the first specimens and who has made a significant contribution to the mineralogy of Ge in the Capillitas deposit.

Type Material: Division of Mineralogy, University of Salzburg, Austria (14835-14837); the Systematic References Series, National Mineral Collection of Canada, Geological Survey of Canada, Ottawa, Canada (NMCC 68096); and the Laboratory for Chemical and Mineralogical Crystallography, University of Bern, Switzerland.

Pyrargyrite Ag_3SbS_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals commonly prismatic ‖ [0001], showing hemimorphism, typically with prominent development of rhombohedra; also steep scalenohedra with $\{05\bar{5}1\}$, to 6 cm; massive, granular. *Twinning:* On $\{10\bar{1}4\}$ as twins of complex aggregates of individuals and as lamellar twins; less commonly on $\{10\bar{1}1\}$ and about $[11\bar{2}0]$; rarely on $\{01\bar{1}2\}$.

Physical Properties: *Cleavage:* Distinct on $\{10\bar{1}1\}$, very imperfect on $\{01\bar{1}2\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 2.5 VHN = n.d. D(meas.) = 5.82 D(calc.) = 5.855

Optical Properties: Translucent, darkens with exposure to light. *Color:* Deep red. *Streak:* Purplish red. *Luster:* Adamantine.
Optical Class: Uniaxial (–). *Pleochroism:* Distinct in air. $\omega = 3.084$ (Li). $\epsilon = 2.881$ (Li).
Anisotropism: Strong, in pale yellow and gray-blue.
R_1–R_2: (400) 35.0–41.0, (420) 34.8–40.8, (440) 34.6–40.6, (460) 34.0–40.2, (480) 32.8–39.5, (500) 31.0–37.4, (520) 29.6–35.4, (540) 28.2–34.0, (560) 27.2–32.7, (580) 26.4–31.7, (600) 25.6–30.9, (620) 25.0–30.2, (640) 24.4–29.6, (660) 23.8–29.0, (680) 23.4–28.5, (700) 22.9–28.1

(1) Săcărîmb (Nagyág), Romania. (2) Freiberg, Germany. (3) Ag_3SbS_3.

Polymorphism & Series: Dimorphous with pyrostilpnite.

Occurrence: Formed in hydrothermal veins as a primary late-stage, low-temperature mineral; also formed by secondary processes.

Association: Silver, acanthite, tetrahedrite, other silver sulfosalts, calcite, dolomite, quartz.

Distribution: An important ore of silver, not uncommon in oxidized silver deposits, but rarely in fine specimens. In Germany, from the Harz Mountains, at St. Andreasberg; and in the Himmelsfürst mine, Erbisdorf, near Freiberg, Saxony. From Hiendelaencina, Guadalajara Province, Spain. At Jáchymov (Joachimsthal) and from Příbram, Czech Republic. In the USA, in Nevada, at the Comstock Lode, Virginia City, Storey Co., in the Hecla Rosebud mine, Rosebud district, Pershing Co., and from the Reese River district, Lander Co.; in Idaho, in the Poorman mine, Silver City district, Owyhee Co. In Canada, from Cobalt, Ontario. In Bolivia, at Colquechaca, Potosí. From many localities in Mexico, especially at Fresnillo, Zacatecas, and Guanajuato. From Chañarcillo, south of Copiapó, Atacama, Chile. At San Cristobal, Junin, and in the San Genaro mine, Huancavelica, Peru. From Broken Hill, New South Wales, Australia.

Name: From the Greek for *fire* and *silver*, in allusion to its composition and color.

Pyrite FeS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Typically cubic, pyritohedral, octahedral, and combinations of these and other forms, to 25 cm or more. Striated conforming to pyritohedral symmetry; may be elongated to acicular. Commonly granular, globular, framboidal, stalactitic. *Twinning:* Twin axis [001] and twin plane {011}, penetration and contact twins.

Physical Properties: *Cleavage:* Indistinct on {001}; partings on {011} and {111}, indistinct. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 1505–1520 (100 g load). D(meas.) = 5.018 D(calc.) = 5.013 Paramagnetic; a semiconductor.

Optical Properties: Opaque. *Color:* Pale brass-yellow, tarnishes darker and iridescent; in polished section creamy white. *Streak:* Greenish black to brownish black. *Luster:* Metallic, splendent. *Anisotropism:* Rarely.
R: (400) 38.2, (420) 40.5, (440) 42.8, (460) 45.5, (480) 48.5, (500) 51.0, (520) 52.6, (540) 53.8, (560) 54.6, (580) 55.0, (600) 55.2, (620) 55.5, (640) 56.0, (660) 56.4, (680) 56.8, (700) 57.0

(1) Elba, Italy; remainder 0.04% SiO_2. (2) Mill Close mine, Derbyshire, England. (3) Gladhammar, Sweden. (4) FeS_2.

Polymorphism & Series: Dimorphous with marcasite; forms a series with cattierite.

Mineral Group: Pyrite group.

Occurrence: Formed under a wide variety of conditions. In hydrothermal veins as very large bodies, as magmatic segregations, as an accessory mineral in igneous rocks, in pegmatites; in contact metamorphic deposits, also in metamorphic rocks; as diagenetic replacements in sedimentary rocks.

Association: Pyrrhotite, marcasite, galena, sphalerite, arsenopyrite, chalcopyrite, many other sulfides and sulfosalts, hematite, fluorite, quartz, barite, calcite.

Distribution: The most abundant and widespread sulfide. Only a few localities for large or fine crystals can be mentioned. From Rio Marina, on Elba, and at Traversella, Piedmont, Italy. From Ambasaguas and Navajun, Logroño Province, Spain, sculptural groups of crystals. At Aktchitao, Kazakhstan. In the USA, in the Ibex mine, Leadville, Lake Co., Colorado; in Illinois, as "suns" at Sparta, Randolph Co.; very large crystals from the Santo Niño mine, near Duquesne, Santa Cruz Co., Arizona. In Pennsylvania, at the French Creek mines, Chester Co., and in the Carleton talc mine, Chester, Windsor Co., Vermont. From Butte, Silver Bow Co., Montana; at the Spruce claim, King Co., Washington; as "bars" from the Buick mine, Bixby, Iron Co., Missouri. In Peru, from many districts, with exceptional crystals from the Quiruvilca mine, La Libertad, and Huanzala, Huanaco.

Name: From the Greek for *fire*, as sparks may be struck from it.

Pyroaurite $Mg_6Fe_2^{3+}(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Thin to thick crystals, tabular {0001}, commonly overgrowing sjögrenite in parallel; in fibrous mats.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Laminae flexible, not elastic. Hardness = 2.5 D(meas.) = 2.13(1) D(calc.) = 2.102

Optical Properties: Transparent. *Color:* Pale yellow, pale brown, green, colorless; colorless in transmitted light. *Luster:* Waxy to vitreous, may be pearly.
Optical Class: Uniaxial (–); may be biaxial due to strain. *Pleochroism:* O = pale yellow, brown, pink; E = colorless. $\omega = 1.564(3)$ $\epsilon = 1.543(3)$ 2V(meas.) = Small.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 3.1094(2)$ $c = 23.4117(9)$ Z = 3/8

X-ray Powder Pattern: Canada; indistinguishable from desautelsite.

(1) Långban, Sweden; mixture of pyroaurite and sjögrenite. (2) $Mg_6Fe_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with sjögrenite.

Mineral Group: Hydrotalcite group.

Occurrence: In low-temperature hydrothermal veins; in serpentinite and ophiolites; an authigenic weathering product.

Association: Sjögrenite, calcite, magnesite, aragonite, hydromagnesite, artinite, dolomite, brucite, clinopyroxene, olivine, talc, phlogopite, spinel.

Distribution: From Långban and Nordmark, Värmland, Sweden. Occurs in the Val Malenco, Lombardy, the Val d'Astico, Vicenza, and the Val Ramazzo, Liguria, Italy. At Kraubath, Styria, Austria. From near Leslie, Aberdeenshire, Scotland. In Russia, in the Vozhmin massif, and in the Mir and other diamond-bearing kimberlite pipes, Sakha. From Yoshikawa, Aichi Prefecture, Japan. In Canada, found near Kilmar, Quebec; at Rutherglen, Nipissing, and in Langmuir Township, Ontario. In the USA, at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Hunting Hill quarry, Rockville, Montgomery Co., Maryland; in the Cedar Hill quarry, Lancaster Co., Pennsylvania; and near the Gem mine, San Benito Co., California. From Phalaborwa, Transvaal, South Africa. Several other localities are known.

Name: From the Greek for *fire* and *gold*, for the golden yellow color developed on heating.

Pyrobelonite $PbMn^{2+}(VO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals elongated prismatic to acicular along [010], prominent {101}, {111}, {212}, {210}, {013}, several others, may be curved, anhedral, to 1 cm; massive, in veinlets.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 5.82 D(calc.) = 5.79

Optical Properties: Transparent. *Color:* Fire-red to black; gray in reflected light, with red and orange internal reflections. *Streak:* Yellow-orange, reddish. *Luster:* Adamantine, may be submetallic.
Optical Class: Biaxial (–). *Pleochroism:* In shades of red-brown. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$. *Absorption:* $Y > X = Z$. $\alpha = 2.32$ $\beta = 2.36$ $\gamma = 2.37$
2V(meas.) = 29° *Anisotropism:* Strong. *Bireflectance:* Observable.

(1) Långban, Sweden; by electron microprobe, average of five analyses, total Mn as MnO.
(2) Tŷ Coch, Wales; by electron microprobe, average of five analyses, total Mn as MnO.
(3) $PbMn(VO_4)(OH)$.

Mineral Group: Descloizite group.

Occurrence: Typically in metamorphosed Fe–Mn mineral deposits.

Association: Hausmannite, manganite, pyrochroite, barite, calcite (Långban, Sweden); vanadinite, braunite, hausmannite, romanèchite, Fe–Mn oxides, barite, calcite, quartz (Tŷ Coch, Wales); medaite, palenzonaite, saneroite, fianelite, parsettensite, rhodochrosite, kutnohorite, aegirine, quartz (Fianel mine, Switzerland).

Distribution: From Långban, Värmland, Sweden. At Tŷ Coch, near South Cornelly, Glamorgan district, Wales. From the Fianel mine, Val Ferrera, Graubünden, Switzerland. In the Iron Monarch quarry, Iron Knob, South Australia. At Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *fire* and *needle*, in allusion to the color and habit.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 94381.

Pyrochlore $(Ca, Na)_2Nb_2O_6(OH, F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; typically metamict. *Point Group:* $4/m\ \overline{3}\ 2/m$. Typically octahedra, modified by {001}, {011}, {112}, {113}, to 7 cm; granular, massive. *Twinning:* On {111}, rare.

Physical Properties: *Cleavage:* {111}, may be a parting. *Fracture:* Subconchoidal to uneven, splintery. *Tenacity:* Brittle. Hardness = 5–5.5 VHN = 542–665 (100 g load). D(meas.) = 4.45 to 4.90 if uranoan. D(calc.) = 4.33 (for $CaNaNb_2O_6F$). May be radioactive.

Optical Properties: Translucent to opaque. *Color:* Black to brown, chocolate-brown, reddish brown, amber-orange, red-orange. *Streak:* Brown. *Luster:* Vitreous to resinous.
Optical Class: Isotropic, weak anomalous anisotropism. n = 1.9–2.2

(1) Oka, Canada; diopside+apatite+pyrite 0.3%, H_2O by difference; corresponds to $(Ca_{1.06}Na_{0.74}Sr_{0.03}RE_{0.06})_{\Sigma=1.89}(Nb_{1.86}Ti_{0.12}Fe^{3+}_{0.03}Zr_{0.02})_{\Sigma=2.03}O_{5.94}F_{0.91}(OH)_{0.25}$. (2) Hybla, Canada.

Polymorphism & Series: Forms a series with microlite.

Mineral Group: Pyrochlore group and subgroup; $(Na + Ca)_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: In pegmatites in nepheline syenites and other alkalic rocks; in granite pegmatites and greisens; characteristic in carbonatites; detrital.

Association: Zircon, aegirine, apatite, perovskite, columbite.

Distribution: Numerous localities. From Fredriksvärn, Larvik, and the Langesundsfjord, Norway. On Alnö Island, Sweden. From near Schelingen, Kaiserstuhl, Baden-Württemberg, and in the Eifel district, Germany. In Russia, at Miass and Vishnevogorsk, Ilmen Mountains, Southern Ural Mountains; large crystals from the Tatarkskoye deposit, Yenisei Ridge, Siberia; and in the Lovozero massif, Kola Peninsula. On San Miguel Island, Azores. From Oka, Quebec; Hybla, Ontario; and elsewhere in Canada. At Narssârssuk, Greenland. From the Mbeya carbonatite, Panda Hill, near Mbeya, Tanzania. On Rouma Isle, Los Islands, Guinea. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia.

Name: From the Greek for *fire* and *green*, to which color the mineral usually turns on ignition.

Pyrochroite $Mn^{2+}(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. Crystals commonly tabular on {0001}, rhombohedral with $\{10\overline{1}1\}$, $\{10\overline{1}2\}$; rarely prismatic along [0001], with $\{11\overline{2}0\}$, {0001}, to 1 cm; foliated, cleavable massive, to 10 cm; coarse- to fine-grained.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Flexible, in thin flakes. Hardness = 2.5 D(meas.) = 3.25(2) D(calc.) = 3.25

Optical Properties: Transparent in thin flakes, becoming opaque on exposure.
Color: Colorless, pale green, pale blue, or pink; on exposure becomes bronze-brown then black; in transmitted light, colorless, flesh-red, amethystine blue-purple; brown when altered.
Luster: Pearly on cleavages.
Optical Class: Uniaxial (–); anomalously biaxial. *Pleochroism:* O = brown; E = lighter brown.
Absorption: Strong; $O > E$. $\omega = 1.723$ $\epsilon = 1.681$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P\overline{3}m1$. $a = 3.323$–3.34 $c = 4.68$–4.738 Z = 1

X-ray Powder Pattern: Långban, Sweden.
4.6 (10), 2.48 (3), 2.76 (2), 1.542 (2) 3.09 (1), 2.41 (1), 2.04 (1)

Total	100.3	100.00

(1) Långban, Sweden. (2) $Mn(OH)_2$.

Mineral Group: Brucite group.

Occurrence: A primary mineral in some volcanogenic massive sulfide deposits; a hydration product of manganosite, in turn metamorphosed from rhodochrosite.

Association: Hausmannite, rhodochrosite, manganosite, galaxite, tephroite, alabandite, lead, barite, calcite, dolomite.

Distribution: In Sweden, from Persberg, Långban, and Nordmark, Värmland; in the Sjö mine, near Grythyttan, Örebro. From Ljubija and Prijedor, Bosnia-Herzegovina. At Gonzen, near Sarganz, Graubünden, Switzerland. From Almylak, Uzbekistan. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and in Alum Rock Park, near San Jose, Santa Clara Co., California. An ore in the Noda-Tamagawa mine, Iwate Prefecture; in the Kaso mine, Tochigi Prefecture; Hamayokokawa mine, Nagano Prefecture; the Taguchi mine, Aichi Prefecture; and the Ioi mine, Shiga Prefecture, Japan. From the N'Chwaning and Wessels mines, near Kuruman, Cape Province, South Africa. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: From the Greek for *fire* and *color*, as there is a color change on ignition.

Pyrolusite $Mn^{4+}O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Uncommon in crystals, prismatic ‖ [001], long to short, square cross-section, with fibrous texture, to 8 cm; columnar, reniform, concretionary, dendritic, granular to powdery massive. *Twinning:* Repeated on {031}, {032}, rare; may be polysynthetic.

Physical Properties: *Cleavage:* {110}, perfect. *Fracture:* Uneven. Hardness = 6–6.5, to 2 when massive. D(meas.) = 5.06(2) D(calc.) = [5.19]

Optical Properties: Opaque. *Color:* Light steel-gray, iron-gray to iron-black, may have a bluish cast when massive; in reflected light, white with creamy yellow tint. *Streak:* Black, bluish black. *Luster:* Metallic.
Optical Class: Uniaxial. *Anisotropism:* Strong; in yellows. *Bireflectance:* Weak; yellow to yellow-gray.
R_1–R_2: (400) 18.4–29.4, (420) 18.6–30.0, (440) 18.8–30.6, (460) 18.9–31.2, (480) 19.0–31.6, (500) 19.0–31.7, (520) 18.9–31.6, (540) 18.8–31.4, (560) 18.6–31.2, (580) 18.5–30.8, (600) 18.4–30.4, (620) 18.3–30.0, (640) 18.2–29.5, (660) 18.2–28.9, (680) 18.1–28.4, (700) 18.1–28.0

insol.	0.23
Total	99.95

(1) Horni Blatna, Czech Republic.

Polymorphism & Series: Trimorphous with akhtenskite and ramsdellite.

Mineral Group: Rutile group.

Occurrence: Formed under highly oxidizing conditions in manganese-bearing hydrothermal deposits and rocks; in bogs and lakes, under shallow marine conditions; commonly an alteration product of manganite.

Association: Manganite, hollandite, hausmannite, braunite, chalcophanite, goethite, hematite.

Distribution: A common manganese oxide, with many localities. Well-studied material from: in Germany, at Elgersburg, Friedrichroda, and Öhrenstock, near Ilmenau, Thuringia; at Eibenstock, Saxony; in the Lindener Mark mine, near Giessen, and at Oberrossbach, Hesse; from the Eisenkaute mine, Marienberg, Rhineland-Palatinate, long crystals, and elsewhere. In good crystals from Horni Blatna (Platten), Czech Republic. At Markhemville and Hillsboro, New Brunswick, Canada. In the USA, large deposits at Ironwood, Gogebic Co., Michigan; from Leadville, Lake Co., Colorado; at Lake Valley, Sierra Co., New Mexico; in the Artillery Mountains, Mohave Co., Arizona.

Name: From the Greek for *fire* and *to wash*, as it is used to remove tints from glass.

Pyromorphite $Pb_5(PO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Crystals short to long prismatic, may be acicular [0001], with prominent $\{10\bar{1}0\}$, $\{0001\}$, $\{10\bar{1}1\}$, $\{20\bar{2}1\}$, hoppered terminations typical, to 8 cm, rarely tabular to equant; radiating to branching groups, tapering to a point. Commonly rounded, globular, reniform, botryoidal. *Twinning:* On $\{11\bar{2}2\}$, very rare.

Physical Properties: *Cleavage:* On $\{10\bar{1}1\}$, interrupted. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 7.04 D(calc.) = 7.14 Piezoelectric if biaxial; may fluoresce yellow to orange under LW and SW UV.

Optical Properties: Transparent to translucent. *Color:* Dark grass-green, green, yellow, yellow-orange, reddish orange, yellow-brown, brown, tan, grayish, may be colorless; colorless or nearly so in transmitted light. *Streak:* White. *Luster:* Resinous to subadamantine. *Optical Class:* Uniaxial (–), may be anomalously biaxial (–), sectored. *Pleochroism:* Weak. *Absorption:* $O < E$. $\omega = 2.058$ $\epsilon = 2.048$

Cell Data: *Space Group:* $P6_3/m$ (synthetic). $a = 9.987$ $c = 7.330$ Z = 2

X-ray Powder Pattern: Synthetic.
2.985 (100), 2.959 (100), 2.885 (60), 4.132 (45), 3.271 (36), 2.063 (34), 3.377 (27)

Chemistry:

	(1)	(2)

As_2O_5	0.13	
PbO	81.33	82.28
Cl	2.71	2.61
$-O = Cl_2$	0.61	0.59
Total	99.67	100.00

(1) Wissen, Germany. (2) $Pb_5(PO_4)_3Cl$.

Mineral Group: Apatite group.

Occurrence: A secondary mineral in the oxidized zone of lead deposits; rarely a volcanic sublimate.

Association: Cerussite, anglesite, smithsonite, willemite, galena.

Distribution: Many localities, even for fine examples. A few include: in Germany, from the Friedrichssegen and other mines, near Bad Ems, Rhineland-Palatinate. At Příbram, Czech Republic. In England, from Wheal Alfred, Phillack, and elsewhere in Cornwall; at Roughton Gill, Caldbeck Fells, Cumbria. Large masses from the Horcajo mines, 35 km south of Brazatortas, Ciudad Real Province, Spain. In France, large crystals from Poullaouen, Finistère; fine groups at the Les Farges mine, Ussel, Corréze, France. From Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. In the USA, at the Wheatley mines, Phoenixville, Chester Co., Pennsylvania; large crystal groups from the Bunker Hill and other mines, Kellogg, Coeur d'Alene district, Shoshone Co., Idaho. At the Society Girl mine, Moyie, British Columbia, Canada. From San Juan Guazapares, Chihuahua, Mexico. At Broken Hill, New South Wales, and Mt. Isa, Queensland, Australia. From the Touissit mine, near Oujda, Morocco. At Kabwe (Broken Hill), Zambia.

Name: From the Greek for *fire* and *form*, as melted globules will recrystallize.

Pyrope $Mg_3Al_2(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Subhedral to euhedral crystals, showing the dodecahedron or trapezohedral forms, to 20 cm; also granular, massive.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7–7.5
D(meas.) = 3.582 D(calc.) = 3.563

Optical Properties: Transparent to translucent. *Color:* Purple-red, pinkish red, red-orange, deep red to almost black; some examples are bluish green in daylight and wine-red in artificial light; colorless to pink in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.714$

Cell Data: *Space Group: Ia3d.* $a = 11.459$ Z = 8

X-ray Powder Pattern: Synthetic.
2.562 (100), 2.865 (60), 1.5312 (50), 2.443 (40), 1.5890 (30), 2.247 (25), 2.339 (20)

Total	100.80	100.00

(1) Dora-Maira massif, Italy; by electron microprobe, corresponding to $(Mg_{2.87}Fe_{0.05}Ca_{0.02})_{\Sigma=2.94}Al_{2.01}Si_{3.02}O_{12}$. (2) $Mg_3Al_2(SiO_4)_3$.

Polymorphism & Series: Forms two series, with almandine, and with knorringite.

Mineral Group: Garnet group.

Occurrence: In ultramafic rocks, as peridotites, kimberlites, eclogites, serpentinites, and in "hornblende"-garnet-plagioclase rocks and anorthosites. Also in amphibole and biotite schists, and as a detrital mineral.

Association: Ilmenite, phlogopite, olivine, "hornblende," plagioclase, pyroxenes, diamond, kyanite, rutile, chlorite, titanite, glaucophane, omphacite.

Distribution: Widespread. The following localities have all produced substantial amounts of gem material. Around Měrunice (Meronitz), Czech Republic. Immense crystals in the Dora-Maira massif, Parigi, near Martiniana Po, Piedmont, Italy. In Germany, from Zöblitz and Greifendorf, Saxony. From South Africa, especially at the diamond mines around Kimberley, Cape Province. Along the Umba River and in the Pare Mountains, Tanzania. In the USA, at Masons' Mountain, near Cowee Creek, Macon Co., North Carolina, and from Buell Park, near Fort Defiance, Apache Co., Arizona. In Australia, 20 km from Bingara, New South Wales, and at Proston, Anakie, and Ruby Vale, Queensland. From San Martin and Quines, San Luis, Argentina. At Gravata, Pernambuco, Brazil.

Name: From the Greek for *firelike* because of its fire-red color.

(1) Pajsberg, Sweden. (2) Chvaletice, Czech Republic; by electron microprobe, total Fe as FeO. (3) $MnTiO_3$.

Polymorphism & Series: Forms a series with ilmenite.

Mineral Group: Ilmenite group.

Occurrence: Principally in metamorphosed manganese deposits; less commonly as an accessory mineral in granite, amphibolite, serpentinite; a very rare component in chondritic meteorites.

Association: Ilmenite, geikielite, hematite, spinel, gahnite, chromite, magnetite, ganophyllite, manganophyllite, hendricksite, garnet, calcite.

Distribution: At the Harstigen mine, near Persberg, Värmland, Sweden. From near Ensila, Finland. At Bratthagen, near Larvik, Norway. In the Benallt mine, Rhiw, Gwynned, Wales. At Dalroy Burn, Dalroy, Inverness-shire, Scotland. From Chvaletice, Czech Republic. From Broken Hill, New South Wales, Australia. In Japan, at the Noda-Tamagawa mine, Iwate Prefecture; the Kasama mine, Ibaragi Prefecture; the Taguchi mine, Aichi Prefecture; and others. Fine crystals from Mont Saint-Hilaire, Quebec, Canada. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at Bald Knob, near Galax, Alleghany Co., North Carolina; on Granite Mountain, near Little Rock, Pulaski Co., Arkansas. Around Manicaragua, Cuba. Additional localities are known, in small amounts.

Name: From the Greek for *fire* and *to appear*, in allusion to its red color.

Pyrophyllite $Al_2Si_4O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or triclinic. *Point Group:* $2/m$ ($2M_1$); $\bar{1}$ or 1 (1A). As lamellar crystals, to 8 cm; in compact spherulitic aggregates of needlelike radiating crystals; as fine grained foliated laminae, granular, massive.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Flexible but inelastic. Hardness = 1–2 D(meas.) = 2.65–2.90 D(calc.) = [2.81]

Optical Properties: Translucent to opaque. *Color:* White, pale blue, yellow, apple-green, grayish green, brownish green; in thin section, colorless. *Luster:* Pearly to dull. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $Y \simeq a$. *Dispersion:* $r > v$, weak. $\alpha = 1.534$–1.556 $\beta = 1.586$–1.589 $\gamma = 1.596$–1.601 2V(meas.) = 53°–62°

Cell Data: *Space Group:* $C\bar{1}$ or $C1$. $a = 5.160(2)$ $b = 8.966(3)$ $c = 9.347(6)$ $\alpha = 91.18(4)°$ $\beta = 100.46(4)°$ $\gamma = 89.64(3)°$ Z = 2

X-ray Powder Pattern: Tres Cerritos, California, USA.
3.037 (8), 4.53 (4), 8.97 (3), 2.400 (3b), 1.828 (3), 1.377 (3), 1.362 (3)

Chemistry:

	(1)
SiO_2	65.96
TiO_2	trace
Al_2O_3	28.25
Fe_2O_3	0.18
H_2O^+	5.27
H_2O^-	0.14
Total	99.80

(1) Tres Cerritos, California, USA; corresponds to $(Al_{1.97}Fe^{3+}_{0.01})_{\Sigma=1.98}(Si_{3.65}Al_{0.35})_{\Sigma=4.00}O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$, 1A polytypes.

Occurrence: Somewhat uncommon, found both in hydrothermal veins and in bedded deposits in schistose metamorphic rocks.

Association: Kyanite, andalusite, topaz, mica, quartz.

Distribution: Some localities for rich or well-crystallized material follow. In Russia, at Krassik, between Pyschminsk and Beresov, Ural Mountains. From St. Niklas, Zermatt, Valais, Switzerland. In Sweden, at Västanå, Kristianstad. From near Ottré, Ardennes Mountains, Belgium. In the USA, found near Ogilby, Imperial Co., at Tres Cerritos, Mariposa Co., and the Champion mine, White Mountains, Mono Co., California; from near Quartzsite, La Paz Co., Arizona; at Staley, Randolph Co., Glendon and Robbins, Moore Co., and Hillsborough, Orange Co., North Carolina; in the Brewer mine, Chesterfield Co., South Carolina; on Graves Mountain, Lincoln Co., Georgia. From Ibitiara, Bahia, Brazil, in large crystals. In a number of mines in Nagano Prefecture, and elsewhere in Japan.

Name: From the Greek for *fire* and *leaf*, in allusion to its tendency to exfoliate into fan shapes when heated.

Pyrosmalite-(Fe) $(Fe^{2+}, Mn^{2+})_8Si_6O_{15}(OH, Cl)_{10}$

Crystal Data: Hexagonal. *Point Group*: n.d. As subhedral to euhedral platy crystals, to 1mm; in radiating crystal aggregates.

Physical Properties: *Cleavage*: {0001}, good. Hardness = n.d. D(meas.) = n.d. D(calc.) = [3.14]

Optical Properties: Semitransparent. Color: In transmitted light, colorless.
Optical Class: Uniaxial (-). ω = 1.677(2) ε = 1.652(2)

Cell Data: Space Group: n.d. a = 13.33(3) c = 7.11(2) Z = [2]

X-ray Powder Pattern: Pegmont deposit, Australia.
2.675 (10), 7.13 (8), 3.564 (6), 2.243 (6), 1.833 (4), 1.667 (4), 1.513 (4)

Chemistry:

	(1)
SiO_2	34.17
Al_2O_3	0.00
FeO	49.54
MnO	4.36
MgO	0.64
Cl	4.00
H_2O	[8.19]
$-O = Cl_2$	0.90
Total	[100.00]

(1) Pegmont deposit, Australia; by electron microprobe, H_2O by difference; corresponds to $(Fe_{7.14}Mn_{0.64}Mg_{0.16})_{\Sigma=7.94}Si_{5.89}O_{14.42}[(OH)_{9.41}Cl_{1.17}]_{\Sigma=10.58}$.

Polymorphism & Series: Forms a series with pyrosmalite-(Mn).

Occurrence: Intergrown with sulfdes, formed during metamorphism of a stratiform Pb-Zn deposit; a retrograde reaction product derived from clinopyroxene in saline fluid inclusions in contact metamorphic rocks.

Association: Fayalite, greenalite, galena, sphalerite, clinopyroxene, hornblende, grunerite, garnet, biotite, magnetite, apatite.

Distribution: From the Pegmont lead-zinc deposit, 175 km southeast of Mt. Isa, Queensland, Australia. In Canada from the Ni-Cu-PGE deposits of Sudbury, Ontario and the PGE-Au-As deposits of the Thomson nickel belt, Manitoba. From the Banská Štiavnica district, Slovakia.

Name: For its high Fe iron content and relation to *pyrosmalite-(Mn)*; *pyrosmalite* from the Greek for *fire* and *odor*, for the odor when heated.

Type Material: n.d.

ZnO	1.94	1.92	$-O = Cl_2$	0.86	0.85
MgO	0.74	trace	Total	99.58	99.00

(1) Sterling Hill, New Jersey, USA; corresponds to $(Mn_{5.76}Fe_{1.84}Mg_{0.16}Zn_{0.24})_{\sum=8.00}Si_6O_{15}(OH, Cl)_{10}$. (2) Broken Hill, Australia; corresponds to $(Mn_{4.96}Fe_{2.56}Zn_{0.24}Ca_{0.24})_{\sum=8.00}Si_6O_{15}(OH, Cl)_{10}$.

Polymorphism & Series: Dimorphous with brokenhillite; forms a series with pyrosmalite-(Fe).

Occurrence: As veinlets in the franklinite ore of a metamorphosed stratiform zinc deposit (Sterling Hill, New Jersey, USA).

Association: Friedelite, bementite, willemite (Sterling Hill, New Jersey, USA); spessartine, manganoan tremolite, quartz (Takanosu mine, Japan); rhodonite, manganoan fayalite, bustamite, manganoan hedenbergite, galena (Broken Hill, Australia).

Distribution: At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. In the Kyurazawa mine, Ashio, Tochigi Prefecture, Japan. Large composite crystals from Broken Hill, New South Wales, Australia. Pyrosmalite series minerals (with Mn:Fe around one) occur at: Nordmark, Värmland, and Dannemora, Kopparberg, Sweden. In the Takanosu mine, Takarazawa, Tochigi Prefecture, Japan. From Nant Fracon, Wales. In the Treburland mine, Altarnun, Cornwall, England. At Port Radium, Northwest Territories, Canada. In the Lar mine, Tierra Amarilla, Copiapó, Chile.

Name: For its high manganese content and relation to *pyrosmalite-(Fe)*; *pyrosmalite* from the Greek for *fire* and *odor*, for the odor when heated.

Type Material: Harvard University, Cambridge, Massachusetts, 104214, 104215; National Museum of Natural History, Washington, D.C., USA, C6216.

S	18.11	16.8	17.76
Total	99.85	100.2	100.00

(1) St. Andreasberg, Germany. (2) Do.; by electron microprobe. (3) Ag_3SbS_3.

Polymorphism & Series: Dimorphous with pyrargyrite.

Occurrence: In low-temperature hydrothermal veins as a late-stage mineral.

Association: Pyrargyrite, stephanite, acanthite, silver, miargyrite, xanthoconite, andorite, fizelyite.

Distribution: In Germany, from St. Andreasberg, Harz Mountains [TL]. At Hiendelaencina, Guadalajara Province, Spain. In the Czech Republic, from Příbram and at Třebsko. In England, at St. Teath, Cornwall. In Australia, from Broken Hill, New South Wales; and in the Long Tunnel, at Heazlewood, Tasmania. From the Kushikino mine, Kagoshima Prefecture, Japan. In the USA, in the Silver City district, Owyhee Co., Idaho; at the Bulldog mine, Creede, Mineral Co., Colorado; and from Randsburg, San Bernardino Co., California. In Canada, at Cobalt, Ontario; in the Van silver mine, near Whistler, and at the Silvana mine, Sandon, British Columbia. In Chile, from Chañarcillo, south of Copiapó, Atacama. At Cerro Rico, Potosí, Bolivia. In small amounts from other localities.

Name: From the Greek for *fire* and *shining*, in allusion to its color and luster.

Type Material: Mining Academy, Freiberg, Germany, 6200.

Pyroxferroite $(Fe^{2+}, Mn^{2+}, Ca)SiO_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1 or $\bar{1}$. As rudimentary crystals and discrete grains.

Physical Properties: *Cleavage:* Good on {010}, poor on {001}. Hardness = n.d.
D(meas.) = 3.68–3.76 D(calc.) = 3.82–3.83

Optical Properties: Semitransparent. *Color:* Yellow; lighter yellow in thin section.
Optical Class: Biaxial (+). *Pleochroism:* Faint; pale yellow to yellow-orange.
Absorption: $X' > Z'$. α = 1.748–1.756 β = 1.750–1.758 γ = 1.767–1.768
2V(meas.) = 34°–40°

Cell Data: *Space Group:* $P1$ or $P\bar{1}$. $a = 6.6213$ $b = 7.5506$ $c = 17.3806$ $\alpha = 114.267°$
$\beta = 82.684°$ $\gamma = 94.756°$ Z = 14

X-ray Powder Pattern: Sea of Tranquillity, Moon.
2.934 (100), 2.674 (60), 3.09 (45), 4.68 (40), 2.156 (40), 2.579 (35), 1.410 (35)

Chemistry:

	(1)
SiO_2	46.8
TiO_2	0.5
Al_2O_3	0.3
FeO	44.6
MnO	0.8
MgO	0.8
CaO	6.0
Na_2O	trace
Total	99.8

(1) Sea of Tranquillity, Moon; by electron microprobe, corresponding to $(Fe^{2+}_{0.81}Ca_{0.14}Mn_{0.03}Mg_{0.03})_{\Sigma=1.01}(Si_{0.98}Ti_{0.01}Al_{0.01})_{\Sigma=1.00}O_3$.

Polymorphism & Series: Forms a series with pyroxmangite.

Occurrence: As discrete grains in microgabbros or diabase (Sea of Tranquillity, Moon).

Association: Clinopyroxene, plagioclase, ilmenite, cristobalite, tridymite, fayalite, fluorapatite, potassic feldspar (Sea of Tranquillity, Moon).

Distribution: From the Sea of Tranquillity and Oceanus Procellarum, Moon. From near Iva, Anderson Co., South Carolina, USA. From Väster Silfberg, Värmland, Sweden. At Simsiö, Lapua, Finland. In the Isanago mine, Kyoto Prefecture, Japan.

Name: From PYROXene and FERROus iron, and for its relation to *pyroxmangite*.

Type Material: Lunar Science Institute, Houston, Texas, USA.

(1) Ajiro mine, Gifu Prefecture, Japan; corresponds to $(Mn^{2+}_{0.93}Mg_{0.02}Ca_{0.01})_{\Sigma=0.96}Si_{0.96}O_3$.

Polymorphism & Series: Forms a series with pyroxferroite.

Occurrence: In regionally metamorphosed manganese ore deposits and manganiferous rocks, perhaps with lower temperature history than rhodonite-bearing rocks.

Association: Spessartine, tephroite, alleghanyite, hausmannite, pyrophanite, alabandite, rhodonite, rhodochrosite.

Distribution: Exceptional material in the Taguchi and other mines, Shidara, Aichi Prefecture; from Iwaizumi, Iwate Prefecture; and at many other places in Japan. Large crystals at Broken Hill, New South Wales, Australia. From Simsiö, Lapua, Finland. In Sweden, at Fillinge. From Glen Beag, Glenelg district, Inverness-shire, Scotland. In the USA, in Colorado, from the American tunnel, Silverton, San Juan Co., the Galena district, Hinsdale Co., and the Idarado mine, Ouray Co.

Name: A combination of PYROXene and MANGanese, in allusion to the mineral's structure and composition.

Type Material: "Type material" from Iva, South Carolina, USA, has been redefined as pyroxferroite, as Fe > Mn.

(1) Homestake mine, Lead, Lawrence Co., South Dakota, USA; corresponds to $Fe_{0.87}S_{1.00}$. (2) Kongsberg, Norway; average of two analyses, corresponds to $Fe_{0.87}S_{1.00}$. (3) Setregruben, Østfold, Norway; corresponds to $Fe_{0.92}S_{1.00}$.

Polymorphism & Series: Numerous polytypes, with 4-M, 6-M, 5-H, 7-H, and 11-H known, and a high-temperature hexagonal polymorph which may remain stable at ordinary temperatures.

Occurrence: Mainly in mafic igneous rocks, typically as magmatic segregations; also in pegmatites, and in high-temperature hydrothermal and replacement veins, and in sedimentary and metamorphic rocks; in iron meteorites.

Association: Pyrite, marcasite, chalcopyrite, pentlandite, many other sulfides, magnetite, calcite, dolomite.

Distribution: Massive material occurs at many localities. Well-crystallized from Herja (Kisbánya), Baia Mare (Nagybánya) district, Romania. From the Stari Trg mine, Trepča, Serbia. In Val Passiria, Trentino-Alto Adige, and at Bottino, near Servezza, Tuscany, Italy. In Germany, in the Harz Mountains, at St. Andreasberg. From the Bristenstock tunnel, Uri, Switzerland. In Sweden, at Falun, Kopparberg. In Russia, very large crystals at Dal'negorsk, Primorskiy Kray. Large crystals from the Morro Velho gold mine, Nova Lima, Minas Gerais, Brazil. At the Potosí and San Antonio mines, Santa Eulalia, Chihuahua, Mexico. From the Bluebell mine, Riondel, British Columbia, Canada.

Name: From the Greek for *redness*, in allusion to its color.

Qandilite $(Mg, Fe^{2+})_2(Ti, Fe^{3+}, Al)O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As octahedral crystals and granular, to 2.3 mm.

Physical Properties: *Cleavage:* {111}, perfect. *Tenacity:* Brittle. Hardness = ∼7 VHN = 960–1045, average 998 (100 g load). D(meas.) = 4.03–4.08 D(calc.) = 4.04 Strongly magnetic.

Optical Properties: Opaque. *Color:* Iron-black; light gray with a pinkish tint in reflected light. *Streak:* Black. *Luster:* Metallic.
Optical Class: Isotropic.
R: (400) 14.8, (420) 14.2, (440) 13.8, (460) 13.5, (480) 13.3, (500) 13.2, (520) 13.1, (540) 13.1, (560) 13.0, (580) 13.0, (600) 13.0, (620) 13.0, (640) 13.0, (660) 12.9, (680) 12.9, (700) 12.9

Cell Data: *Space Group:* $Fd3m$ (synthetic Mg_2TiO_4). $a = 8.4376(5)$ $Z = 8$

X-ray Powder Pattern: Dupezeh Mountain, Iraq.
2.533 (100), 1.486 (60), 1.617 (50), 2.101 (45), 2.971 (30), 1.0938 (30), 0.9704 (25)

Chemistry:

	(1)	(2)
SiO_2	0.02	
TiO_2	26.41	27.34
Al_2O_3	4.83	3.33
Fe_2O_3	28.27	27.01
Cr_2O_3		0.13
FeO	10.32	14.62
MnO	0.76	1.89
MgO	29.62	26.47
Total	100.23	100.79

(1) Dupezeh Mountain, Iraq; by electron microprobe, average of four grains, Fe^{2+} and Fe^{3+} by wet methods; corresponds to $(Mg_{1.32}Fe^{3+}_{0.41}Fe^{2+}_{0.26}Mn_{0.02})_{\Sigma=2.01}(Ti_{0.60}Fe^{3+}_{0.23}Al_{0.17})_{\Sigma=1.00}O_4$.
(2) Konder massif, Russia; by electron microprobe.

Mineral Group: Spinel group.

Occurrence: In a forsterite skarn (Dupezeh Mountain, Iraq); in a periclase-forsterite skarn (Kangerdlugssuaq, Greenland); in the contact zone of an alkaline ultramafic massif (Konder massif, Russia).

Association: Forsterite, spinel, perovskite, calcite (Dupezeh Mountain, Iraq); geikielite, spinel, periclase, forsterite (Konder massif, Russia).

Distribution: On Dupezeh Mountain, near Hero Town, Qala-Dizeh, Iraq. From near Kangerdlugssuaq, Greenland. In the Konder massif, Aldan Shield, Sakha, Russia.

Name: For the occurrence in rocks of the Qandil Group, Iraq.

Type Material: Strathclyde University, Glasgow; Royal Scottish Museum, Edinburgh, Scotland; National Science Museum, Tokyo, Japan; National School of Mines, Paris, France.

Qilianshanite $H_3Na(HCO_3)(BO_3)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Crystals are tabular to prismatic, to 2 mm, commonly in massive aggregates. *Twinning:* Polysynthetic.

Physical Properties: *Cleavage:* {100} and {010}, perfect. Hardness = ∼2
D(meas.) = 1.706 D(calc.) = 1.639 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y \wedge a = 1°$; $Z \wedge c = 9°$. *Dispersion:* $r < v$, medium. $\alpha = [1.351]$ $\beta = 1.459(2)$ $\gamma = 1.486(2)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $C2$. $a = 16.119(8)$ $b = 6.928(4)$ $c = 6.730(3)$ $\beta = 100.46(4)°$
Z = 4

X-ray Powder Pattern: Juhongtu deposit, China.
3.464 (100), 3.173 (59), 6.36 (25), 1.731 (19), 4.203 (6), 2.608 (5), 2.642 (3)

Chemistry:

	(1)	(2)
CO_2	16.99	24.20
B_2O_3	20.02	19.14
MgO	0.05	
CaO	0.22	
Na_2O	17.92	17.04
H_2O	43.11	39.62
Total	98.31	100.00

(1) Juhongtu deposit, China; corresponds to $H_{8.86}Na_{1.08}Ca_{0.01}C_{0.71}B_{1.06}O_{8.00}$.
(2) $H_3Na(HCO_3)(BO_3)\cdot 2H_2O$, confirmed by crystal-structure analysis.

Occurrence: Formed by reaction of borate-rich waters with earlier sodium carbonates in a borate deposit.

Association: Tincalconite, nahcolite, calcite, quartz.

Distribution: From the Juhongtu borate deposit, Qilian Mountains, Qinghai Province, China.

Name: For its occurrence in the Qilian Mountains, China.

Type Material: National Museum of Geology, Beijing, China.

References: (1) Luo Shiqing, Lu Jian'an, Wang Liben, and Zhu Jingqing (1993) Qilianshanite – a new boric carbonate mineral. Acta Mineral. Sinica, 13(2), 97–101 (in Chinese with English abs.). Qingheiite $Na_2(Mn^{2+}, Mg, Fe^{2+})_2(Al, Fe^{3+})(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Short prismatic to tabular anhedral grains, to 4 mm.

Physical Properties: *Cleavage:* On {010}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.3–5.6 D(meas.) = 3.718 D(calc.) = 3.61

Optical Properties: Semitransparent. *Color:* Jade-green to light yellowish green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = light yellowish green; Y = jade-green; Z = dark bluish green. *Dispersion:* $r \gg v$, strong. $\alpha = 1.678$ $\beta = 1.684$ $\gamma = 1.691$
2V(meas.) = 80°

Cell Data: *Space Group:* $P2_1/n$. $a = 11.856(3)$ $b = 12.411(3)$ $c = 6.421(1)$ $\beta = 114.45(2)°$ Z = [4]

X-ray Powder Pattern: Qinghe Co., China. (ICDD 41-1418).
2.685 (10), 3.472 (9), 2.512 (9), 6.21 (8), 2.860 (7), 1.739 (7), 3.082 (6)

Chemistry:

	(1)		(1)
P_2O_5	45.63	ZnO	0.23
TiO_2	0.05	MgO	9.75
Al_2O_3	4.53	CaO	0.93
Fe_2O_3	[2.24]	Li_2O	0.02
Cr_2O_3	0.04	Na_2O	8.73
FeO	[3.94]	K_2O	0.04
MnO	23.60	Total	[99.73]

(1) Qinghe Co., China; by electron microprobe, original total given as 99.72%, total Mn as MnO; with Fe partitioned to fill M2, corresponds to $Na_{1.31}(Mn_{1.50}Mg_{1.13}Fe^{2+}_{0.27}Ca_{0.08}Zn_{0.02})_{\Sigma=3.00}(Al_{0.42}Fe^{3+}_{0.11})_{\Sigma=0.53}(PO_4)_{3.00}$.

Occurrence: In a muscovite-rich pegmatite.

Association: Muscovite, quartz, microcline, braunite, pyrolusite.

Distribution: From an undisclosed locality in Qinghe Co., Xinjiang Uygur Autonomous Region, China.

Name: For Qinghe Co., China.

Type Material: n.d.

References: (1) Ma Zhesheng, Shi Nicheng, and Peng Zhizhong (1983) Crystal structure of a new phosphatic mineral – qingheiite. Scientia Sinica, Series B, 26, 876–884 (in English). (2) (1984) Amer. Mineral., 69, 567–568 (abs. ref. 1). (3) (1987) Mineral. Abs., 38, 349 (abs. ref. 1).

Qitianlingite $(Fe^{2+}, Mn^{2+})_2(Nb, Ta)_2W^{6+}O_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, thin tabular ∥ {001}, to 0.2 mm.

Physical Properties: *Cleavage:* {100}, distinct. Hardness = n.d. VHN = 520–580 (50 g load). D(meas.) = 6.30 D(calc.) = 6.423 Moderately magnetic.

Optical Properties: Semitransparent. *Color:* Black; yellowish white in reflected light. *Streak:* Dark brown. *Luster:* Semimetallic to metallic.
Optical Class: Biaxial. *Anisotropism:* Weak. *Bireflectance:* Weak.
R_1–R_2: 12–14

Cell Data: *Space Group: Pbcn.* $a = 23.706(7)$ $b = 5.723(2)$ $c = 5.045(3)$ Z = 4

X-ray Powder Pattern: Qitianling, China.
2.96 (10), 1.773 (8), 3.65 (7), 2.52 (7), 2.87 (6), 1.385 (6), 1.194 (6)

Chemistry:

	(1)
WO_3	32.30
Nb_2O_5	34.06
Ta_2O_5	11.73
TiO_2	1.23
SnO_2	0.36
FeO	14.64
MnO	6.01
Total	100.33

(1) Qitianling, China; by electron microprobe, corresponding to $(Fe_{1.34}Mn_{0.56})_{\Sigma=1.90}(Nb_{1.69}Ta_{0.35}Ti_{0.10}Sn_{0.02})_{\Sigma=2.16}W_{0.92}O_{10}$.

Occurrence: In a pegmatite dike in granite.

Association: Quartz, potassic feldspar, albite, muscovite, zinnwaldite, cassiterite, wolframite, "wolframoixiolite".

Distribution: From near Qitianling, Hunan Province, China.

Name: For Qitianling, China, near where the mineral was first collected.

Type Material: National Museum of Geology, Beijing, China.

Quadridavyne $(Na,K)_6Ca_2Si_6Al_6O_{24}Cl_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m$. Crystals hexagonal, prismatic, elongated along [0001], to 2 mm, showing dominant $\{10\bar{1}0\}$ and $\{0001\}$. *Twinning:* On $\{10\bar{1}0\}$, commonly observed.

Physical Properties: *Cleavage:* $\{0001\}$, perfect; $\{11\bar{2}0\}$, distinct. *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = 2.335(5) D(calc.) = 2.354

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.529(1)$ $\epsilon = 1.532(1)$

Cell Data: *Space Group:* $P6_3/m$. $a = 25.771(6)$ $c = 5.371(1)$ $Z = 4$

X-ray Powder Pattern: Ottaviano, Italy; can be distinguished from davyne only by single-crystal diffraction.
3.71 (vs), 3.31 (vs), 4.80 (s), 2.788 (s), 2.677 (m), 2.474 (m), 2.147 (m)

Chemistry:

	(1)
SiO_2	33.09
Al_2O_3	27.62
CaO	11.35
Na_2O	11.21
K_2O	5.93
Cl	12.13
SO_3	1.08
$-O = Cl_2$	2.74
Total	99.67

(1) Ottaviano, Italy; by electron microprobe, average of five analyses; corresponding to $(Na_{3.97}K_{1.38})_{\Sigma=5.35}Ca_{2.22}(Si_{6.05}Al_{5.95})_{\Sigma=12.00}O_{23.90}[Cl_{3.76}(SO_4)_{0.15}]_{\Sigma=3.91}$.

Mineral Group: Cancrinite group.

Occurrence: In volcanic ash containing metasomatized and hydrothermally altered lavas and scoriae, from the 1906 eruption of Vesuvius.

Association: n.d.

Distribution: From Ottaviano, near Naples, Campania, Italy.

Name: From the Latin *quad*, for *four*, as the mineral has four times the unit cell volume of the related mineral species *davyne*.

Type Material: University of Pisa, Pisa, Italy, 10014.

References: (1) Bonaccorsi, E., S. Merlino, P. Orlandi, M. Pasero, and G. Vezzalini (1994) Quadridavyne, $[(Na,K)_6Cl_2][Ca_2Cl_2][Si_6Al_6O_{24}]$, a new feldspathoid mineral from Vesuvius area. Eur. J. Mineral., 6, 481–487.

Quadruphite $Na_{14}CaMgTi_4(Si_2O_7)_2(PO_4)_4O_4F_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1. As flakes, flattened on {001}, to 3 mm, some epitaxially overgrown on lomonosovite and sobolovite.

Physical Properties: *Cleavage:* {001}, perfect; {110} and {100}, less perfect. *Fracture:* Steplike. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.12 D(calc.) = 3.11

Optical Properties: Translucent to transparent. *Color:* Light brown. *Luster:* Vitreous, resinous on fractures, pearly to adamantine on cleavages. *Streak:* White.
Optical Class: Biaxial (–). *Pleochroism:* Pronounced; X = colorless; $Y = Z$ = yellowish.
Dispersion: $r < v$, strong. *Absorption:* $Z \geq Y > X$. $\alpha = 1.630$ $\beta = 1.678$ $\gamma = 1.697$
2V(meas.) = 62°

Cell Data: *Space Group:* $P1$. $a = 5.415(2)$ $b = 7.081(3)$ $c = 20.34(1)$ $\alpha = 86.85(4)°$ $\beta = 94.40(4)°$ $\gamma = 89.94(3)°$ Z = 1

X-ray Powder Pattern: Lovozero massif, Russia.
2.880 (10), 2.702 (8b), 2.636 (7), 2.050 (5), 1.600 (5), 1.662 (4b), 1.713 (3)

Chemistry:

	(1)		(1)
SiO_2	16.5	CaO	5.3
TiO_2	13.7	SrO	0.4
ZrO_2	4.1	BaO	1.1

Quartz SiO_2

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 32. As enantimorphic prismatic crystals, with $\{10\bar{1}0\}$ terminated by $\{10\bar{1}1\}$ and $\{01\bar{1}1\}$, striated $\perp$ [0001]; may be morphologically complex, with over 500 forms noted, to 6 m and 36 t. Pseudocubic or dipyramidal to tapering, needlelike, with trigonal outline; may be flattened, distorted, rarely "twisted." Parallel to divergent groups; drusy, fine-grained to microcrystalline ("chalcedony"), massive. *Twinning:* Very common, penetration twins on the Dauphiné law, about [0001], and the Brazil law, with $\{11\bar{2}0\}$ as contact plane; contact twins on the Japan law, with $\{11\bar{2}2\}$ as contact plane, may be repeated; and several other laws.

Physical Properties: *Cleavage:* Rarely observable, poor on $\{10\bar{1}1\}$, $\{01\bar{1}1\}$, $\{10\bar{1}0\}$, some others; rhombohedral parting. *Fracture:* Conchoidal. *Tenacity:* Brittle, tough when massive. Hardness = 7, variable by direction and form. D(meas.) = 2.65; 2.59–2.63 when massive. D(calc.) = 2.66 Piezoelectric and pyroelectric, may be triboluminescent.

Optical Properties: Transparent to nearly opaque. *Color:* Colorless, white; from chemical or particulate inclusions, rose-pink to rose-red, yellow to yellowish brown, green, blue, bluish violet, brown to black; zoned or mottled. *Streak:* White. *Luster:* Vitreous; waxy to dull when massive.
Optical Class: Uniaxial (+). $\omega = 1.544$ $\epsilon = 1.553$

Cell Data: *Space Group:* $P3_121$ or $P3_221$. a = 4.9135(4) c = 5.4050(2) Z = 3

X-ray Powder Pattern: Synthetic.
3.342 (100), 4.257 (22), 1.8179 (14), 1.5418 (9), 2.457 (8), 2.282 (8), 1.3718 (8)

Chemistry: SiO_2 with traces of other elements.

Polymorphism & Series: Cristobalite, tridymite, coesite, and stishovite are polymorphs; stable below 573 °C.

Occurrence: In hydrothermal veins, epithermal to alpine; characteristic of granites and granite pegmatites; in sandstones and quartzites, less abundant in other rock types; in hydrothermal metal deposits. Common in carbonate rocks; a residual mineral in soils and sediments.

Association: Calcite, fluorite, feldspars, epidote, chlorite, micas, zeolites, many other species.

Distribution: Extraordinarily common. Fine specimens from many places in the Alps of Switzerland and Austria. At Carrara, Tuscany, Italy. From Bourg d'Oisans, Isère, France. At Mursinka, Ural Mountains, in the Dodo mine, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains, and elsewhere in Russia. From Sakangyi, Katha district, Myanmar (Burma). Large twins from Yamanashi Prefecture and many other places in Japan. At Tamboholehehibe and elsewhere in Madagascar. From Brazil, in large amounts from many localities in Rio Grande do Sul, Minas Gerais, Goiás, and Bahia. Around Artigas, Uruguay. At Thunder Bay, Lake Superior, Ontario, Canada. In the USA, from Mt. Ida to Hot Springs, Ouachita Mountains, Arkansas; at Middleville, Herkimer Co., New York; in North Carolina, especially in Alexander and Lincoln Cos. From the Pala and Mesa Grande districts, San Diego Co., California; the El Capitan Mountains, Lincoln Co., New Mexico; the Crystal Park area, Beaverhead Co., and Little Pipestone Creek, Jefferson Co., Montana; and in the Pikes Peak area, El Paso Co., Colorado. From Mexico, in Veracruz and Guerrero.

Name: Of obscure origin in the Middle Ages, first applied to gangue in Saxony, Germany.

Queitite $Pb_4Zn_2(SiO_4)(Si_2O_7)(SO_4)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Crystals tabular on {001} and elongated along [010], dominant forms {001}, {112}, {110}, {101}, to 1.5 cm. *Twinning:* On {100} and {001}.

Physical Properties: *Cleavage:* {010} and {001}, observed in traces. Hardness = ∼4
D(meas.) = n.d. D(calc.) = 6.07

Optical Properties: Transparent. *Color:* Pale yellow or colorless; distinct anomalous interference colors in thin section. *Streak:* White. *Luster:* Greasy.
Optical Class: Biaxial (+) (probable). *Orientation:* $X = b$; $Z \simeq a$. *Dispersion:* $r < v$, strong.
$\alpha = 1.899(4)$ $\beta = 1.901$ $\gamma = 1.903(4)$ 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P2_1$. $a = 11.362(2)$ $b = 5.266(1)$ $c = 12.655(3)$
$\beta = 108.16(2)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
3.18 (100), 1.635 (80), 1.490 (60), 1.486 (60), 3.77 (50), 3.59 (50), 2.99 (50)

Chemistry:

	(1)	(2)
SiO_2	14.33	14.52
ZnO	12.37	12.97
PbO	67.10	66.71
SO_3	6.06	6.04
Total	99.86	100.24

(1–2) Tsumeb, Namibia; by electron microprobe, with traces of Fe, Ca, Mg; the average corresponds to $Pb_{3.87}Zn_{2.01}Si_{3.10}O_{11}(S_{0.98}O_4)$.

Occurrence: On corroded sulfides in a partially oxidized lead ore from a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia); with other oxidized Pb-Cu minerals in a vug in quartz from a hydrothermal Pb-Zn-Cu ore deposit (Red Gill mine, England).

Association: Galena, sphalerite, tennantite, willemite, melanotekite, leadhillite, alamosite, larsenite, quartz (Tsumeb, Namibia); cerussite, leadhillite, susannite, caledonite, quartz (Red Gill mine, England).

Distribution: At Tsumeb, Namibia. From the Lucky Cuss mine, Tombstone, Cochise Co., Arizona, USA. In the Red Gill mine, Caldbeck Fells, Cumbria, England. From Leadhills, Lanarkshire, Scotland.

Name: For Clive Sedric Queit, mineral dealer of Tsumeb, Namibia.

Type Material: University of Stuttgart, Stuttgart, Germany, NM03; Harvard University, Cambridge, Massachusetts, 117115; National Museum of Natural History, Washington, D.C., USA, 143780, 147463.

Quenselite $PbMn^{3+}O_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, flattened on {010}, elongated ‖ [100] or [001], showing {100}, {010}, {001}, {011}, {101}, {$10\overline{3}$}, {111}; striated on {110} ‖ [100].

Physical Properties: *Cleavage:* Perfect on {001}, nearly micaceous. *Tenacity:* Flexible, in thin laminae; somewhat malleable. Hardness = 2.5 VHN = 171–268, average 221 (100 g load). D(meas.) = 6.84 D(calc.) = 7.133

Optical Properties: Opaque, translucent on thin edges. *Color:* Pitch-black; deep brown in transmitted light. *Streak:* Dark brownish gray. *Luster:* Metallic to adamantine. *Optical Class:* Biaxial (+) (?). *Orientation:* $X = b$; $Y \simeq c$. *Absorption:* $Z > X$. $n = \sim 2.30$ 2V(meas.) = n.d. *Anisotropism:* Strong.

R_1–R_2: (400) 28.1–32.6, (420) 26.7–30.9, (440) 25.3–29.2, (460) 24.0–27.7, (480) 23.0–26.3, (500) 22.1–25.1, (520) 21.4–24.2, (540) 20.8–23.4, (560) 20.4–22.8, (580) 20.0–22.2, (600) 19.7–21.8, (620) 19.5–21.5, (640) 19.4–21.3, (660) 19.2–21.0, (680) 19.2–20.9, (700) 19.2–20.9

Cell Data: *Space Group:* $P2/a$. $a = 5.61$ $b = 5.70$ $c = 9.15$ $\beta = 93.0°$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
3.04 (10), 2.72 (8), 3.68 (7), 3.60 (7), 2.95 (6), 2.44 (4), 2.08 (4)

Chemistry:

	(1)	(2)
MnO	23.44	22.80
PbO	70.21	71.74
MgO	0.30	
CaO	0.15	
Na_2O	0.28	
K_2O	0.17	
O	2.40	2.57
H_2O	3.05	2.89
Total	[100.00]	100.00

(1) Långban, Sweden; recalculated to 100% after deduction of $CaCO_3$ 1.46%, Fe_2O_3 0.28%.
(2) $PbMnO_2(OH)$.

Occurrence: In a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Calcite, barite, hausmannite, braunite (Långban, Sweden).

Distribution: From Långban, Värmland, Sweden. At Tirodi, Madhya Pradesh, India. From Luce Bay, Wigtownshire, Scotland.

Name: Honors Professor Percy Dudgeon Quensel (1881–1966), Swedish mineralogist and petrologist, Stockholm University, Stockholm, Sweden.

Type Material: n.d.

Quenstedtite $Fe_2^{3+}(SO_4)_3 \cdot 10-11H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. Tabular crystals, flattened on {010}, or short prismatic along [100], to 1 mm, which may be highly modified in the [001] and [100] zones, with about 30 forms observed; commonly in crusts and aggregates. *Twinning:* Common on {010}.

Physical Properties: *Cleavage:* Perfect on {010}; good on {100}. Hardness = 2.5 D(meas.) = 2.11–2.15 D(calc.) = 2.14 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Pale violet, reddish violet; colorless to pale rose in transmitted light.
Optical Class: Biaxial (+). *Orientation:* X (–43°,45°); Y (128°,43°); Z (–138°,88°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r < v$, strong, horizontal. $\alpha = 1.547$ $\beta = 1.566$ $\gamma = 1.594$ 2V(meas.) = 70°

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.184(5)$ $b = 23.60(2)$ $c = 6.539(5)$ $\alpha = 94.18(8)°$ $\beta = 101.73(8)°$ $\gamma = 96.27(8)°$ Z = 2

X-ray Powder Pattern: Tierra Amarilla, Chile.
4.08 (FFF), 5.78 (FF), 4.19 (FF), 3.80 (F), 5.03 (mF), 5.57 (mf), 5.34 (mf)

Chemistry:

	(1)	(2)	(3)
SO_3	39.83	41.41	40.16
Fe_2O_3	27.66	27.53	26.70
CaO	0.40		
H_2O	31.35	31.06	33.14
Total	99.24	100.00	100.00

(1) Tierra Amarilla, Chile; a separate determination by the Penfield method gave H_2O 33.4%, also crystal-structure analysis indicates 11 H_2O positions, two of which are interlayer zeolitic. (2) $Fe_2(SO_4)_3 \cdot 10H_2O$. (3) $Fe_2(SO_4)_3 \cdot 11H_2O$.

Occurrence: An uncommon mineral formed in the oxidized zone of pyrite-rich mineral deposits especially in arid regions.

Association: Coquimbite, copiapite, römerite.

Distribution: In Chile, from Tierra Amarilla, southeast of Copiapó, Atacama, and at Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta. From the Sulphur Hole prospect, near Borate, about 10 km northeast of Yermo, Calico Mountains, San Bernardino Co., California, USA. At Baňská Štiavnica (Schemnitz), Slovakia. In Germany, in the Richelsdorfer Mountains, Hesse. From the Dyakhtardakh cassiterite–sulfide deposit, northeastern Sakha, Russia.

Name: To honor Professor Friedrich August Quenstedt (1809–1889), German mineralogist and paleontologist, University of Tübingen, Tübingen, Germany.

Type Material: National School of Mines, Paris, France.

Quetzalcoatlite $\mathbf{Zn_6Cu_3(Te^{6+}O_6)_2(OH)_6 \cdot [0.24AgCl \cdot 0.30PbCl_2]}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Needlelike hexagonal crystals, to 0.4 mm, bounded by $\{10\bar{1}0\}$ and $\{0001\}$, in sprays and crystalline crusts.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, fair. *Tenacity:* Brittle. Hardness = 3
D(meas.) = 6.05(30) D(calc.) = 4.82

Optical Properties: Semitransparent. *Color:* Capri blue; green in transmitted light.
Streak: Pale blue, almost white. *Luster:* Pearly to dull.
Optical Class: Uniaxial (–). *Pleochroism:* O = blue-green; E = almost colorless. *Orientation:* Parallel extinction, length-fast. $\omega = 1.802$ $\epsilon = 1.740$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\bar{3}1m$. $a = 10.145(1)$ $c = 4.9925(9)$ Z = 1

X-ray Powder Pattern: Moctezuma mine, Mexico.
8.752 (100), 2.748 (70), 2.520 (42b), 3.531 (40), 3.273 (31), 1.766 (28), 5.054 (21)

Chemistry:

	(1)	(2)	(3)
TeO_3	33.4	31.71	31.02
CuO	20.0	20.31	21.08
ZnO	39.4	43.10	43.13
H_2O		[4.88]	4.77
Total		[100.00]	100.00

(1) Moctezuma mine, Mexico; by electron microprobe, average of 20 analyses on 3 grains, H_2O 10.1% by the Penfield method on one sample; as part of the H_2O is probably zeolitic, $(OH)^{1-}$ here calculated for charge balance; then corresponds to $Zn_{5.75}Cu_{2.98}(TeO_6)_{2.26}(OH)_{3.90}$. (2) Blue Bell claims, California, USA; average of 9 analyses on 3 grains; recalculated to 100% from an original total of 96.59% after deduction of Ag_2O 4.33%, PbO 0.83%, and Cl 2.39% as impurities in structural channels, H_2O calculated by difference, $(OH)^{1-}$ here calculated for charge balance; then corresponds to $Zn_{6.04}Cu_{2.91}(Te^{6+}O_6)_{2.05}(OH)_{5.60} \cdot 0.28H_2O$. (3) $Zn_6Cu_3(TeO_6)_2(OH)_6$.

Occurrence: A rare mineral in the oxidized zone of tellurium-bearing hydrothermal ore deposits.

Association: Hessite, galena, bornite, cerussite, azurite, chlorargyrite, teineite, quartz, barite, clay (Moctezuma mine, Mexico); khinite, dugganite, chlorargyrite, gold (Old Guard mine, Arizona, USA).

Distribution: From the Oriental (Bambollita) mine, northeast of the Moctezuma mine, Moctezuma, Sonora, Mexico. In the USA, at the Old Guard mine, Tombstone, Cochise Co., Arizona; from the Blue Bell claims, San Bernardino Co., California; and at the Centennial Eureka mine, Tintic district, Juab Co., Utah.

Name: For *Quetzalcoatl*, the Toltec and Aztec feathered serpent god of the sea, in allusion to its sea-blue color.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1986,55; National Museum of Natural History, Washington, D.C., USA, 135055.

Rabbittite $Ca_3Mg_3(UO_2)_2(CO_3)_6(OH)_4 \cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals are acicular, elongated along [001], in bundles and as an efflorescence.

Physical Properties: *Cleavage:* {001}, probable, and two prismatic. Hardness = 2.5 D(meas.) = 2.57 D(calc.) = [2.69] Radioactive; slowly soluble in H_2O; fluoresces pale cream-yellow under SW UV.

Optical Properties: Semitransparent. *Color:* Pale green, greenish yellow. *Luster:* Silky. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c \simeq 15°$. $\alpha = 1.502(5)$ $\beta = 1.508(2)$ $\gamma = 1.525(5)$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 32.6(1)$ $b = 23.8(1)$ $c = 9.45(5)$ $\beta = \sim 90°$ Z = 8

X-ray Powder Pattern: Lucky Strike No. 2 mine, Utah, USA.
8.24 (10), 7.79 (8), 4.37 (8), 4.71 (7), 5.83 (5b), 4.81 (5), 1.28 (5)

Chemistry:

	(1)	(2)
UO_3	37.4	38.51
CO_2	17.8	17.77
MgO	9.2	8.14
CaO	10.6	11.33
H_2O	24.5	24.25
insol.	0.5	
Total	100.0	100.00

(1) Lucky Strike No. 2 mine, Utah, USA; H_2O by loss on ignition less CO_2.
(2) $Ca_3Mg_3(UO_2)_2(CO_3)_6(OH)_4 \cdot 18H_2O$.

Occurrence: A rare secondary mineral, which may be of post-mine origin.

Association: Sodium-zippeite, magnesium-zippeite, fourmarierite, gypsum, bieberite, cobaltocalcite.

Distribution: From the Lucky Strike No. 2 mine, Emery Co., Utah, USA. At Jáchymov (Joachimsthal), Czech Republic.

Name: To honor John Charles Rabbitt (1907–1957), Chief, Trace Elements Section, U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, 105099; National Museum of Natural History, Washington, D.C., USA, 112741, 162619.

References: (1) Thompson, M.E., A.D. Weeks, and A.M. Sherwood (1955) Rabbittite, a new uranyl carbonate from Utah. Amer. Mineral., 40, 201–206.

Rabéjacite $Ca(UO_2)_4(SO_4)_2(OH)_6 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystals are flattened on {001}, or acicular, elongated along [001], to 0.1 mm; in rosettes, rounded nodules, and microcrystalline crusts.

Physical Properties: Hardness = 3 D(meas.) = > 4.1 D(calc.) = 4.31 Radioactive; pale yellow fluorescence under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Bright yellow, amber-yellow, brownish yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; Y = very pale yellow; Z = sulfur-yellow. *Orientation:* $X = c$; Y and $Z \perp [001]$. *Dispersion:* $r > v$, weak. $\alpha = [1.617]$ $\beta = 1.710(2)$ $\gamma = 1.758(2)$ 2V(meas.) = 68(2)°

Cell Data: *Space Group:* n.d. $a = 8.73(1)$ $b = 17.09(2)$ $c = 15.72(2)$ Z = 4

X-ray Powder Pattern: Rabéjac deposit, France.
7.90 (100), 3.49 (80), 3.38 (70), 3.98 (40), 4.17 (30), 2.844 (30b), 2.163 (15)

Chemistry:

	(1)	(2)	(3)
SO_3	10.91	10.43	10.52
UO_3	80.12	76.63	75.15
CaO	2.89	2.76	3.68
H_2O	10.18	10.18	10.65
Total	104.10	[100.00]	100.00

(1) Rabéjac deposit, France; by electron microprobe, average of 20 analyses, H_2O by chromatography; corresponds to $Ca_{0.76}(UO_2)_{4.15}(SO_4)_{2.02}(OH)_{5.78} \cdot 5.86H_2O$. (2) Analysis (1) normalized to 100.00%. (3) $Ca(UO_2)_4(SO_4)_2(OH)_6 \cdot 6H_2O$.

Occurrence: A rare secondary mineral in the oxidation zone of uranium deposits, formed by alteration of uraninite.

Association: Gypsum, johannite, uraninite.

Distribution: In France, from the Rabéjac uranium deposit, seven km south-southeast of Lodève, and at the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault. From La Creusa, near Les Marécottes, Valais, Switzerland. At Jáchymov (Joachimsthal), Czech Republic.

Name: For its first-noted occurrence in the Rabéjac deposit, France.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC 4409, RC 4410.

References: (1) Deliens, M. and P. Piret (1994) La rabejacite, $Ca(UO_2)_4(SO_4)_2(OH)_6 \cdot 6H_2O$, nouveau sulfate d'uranyle et de calcium des gîtes du Lodévois, Hérault, France. Eur. J. Mineral., 5, 873–877 (in French with English abs.). (2) (1994) Amer. Mineral., 79, 572 (abs. ref. 1).

Crystal Data: Tetragonal. *Point Group:* $4/m$, 4, $\bar{4}$, 422, $4mm$, $\bar{4}2m$, or $4/m\ 2/m\ 2/m$. Flame-like aggregates and veinlets up to 20 μm across, in rims and intergrowths with other tellurides and sulfides.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 8.89

Optical Properties: Opaque. *Color:* Rose-brown in reflected light. *Anisotropism:* Distinct. R_1–R_2: 23.7–24.3 (400), 24.7–25.2 (420), 25.6–26.1 (440), 26.6–27.1 (460), 27.6–28.2 (480), 28.6–29.2 (500), 29.6–30.1 (520), 30.3–31.0 (540), 31.1–31.8 (560), 31.8–32.4 (580), 32.4–32.9 (600), 32.7–33.3 (620), 33.0–33.5 (640), 33.2–33.6 (660), 33.2–33.6 (680), 33.2–33.6 (700)

Cell Data: *Space Group:* $P4/m$, $P4$, $P\bar{4}$, $P422$, $P4mm$, $P\bar{4}2m$, $P4/mmm$ or $P\bar{4}m2$. $a = 5.71(5)$ $c = 3.77(5)$ $Z = 1$

X-ray Powder Pattern: Champion Reef mine, India. Electron diffraction. 3.16 (100), 3.78 (60), 1.92 (50), 1.78 (50), 2.73 (40), 2.29 (40), 1.59 (40)

Chemistry:

	(1)	(2)
Pb	29.17	31.35
Te	59.80	57.92
S	0.77	
Cl	9.90	10.73
Total	99.64	100.00

(1) Champion Reef mine, India; by electron microprobe, leading to $Pb_{0.94}Te_{3.06}(Cl_{1.84}S_{0.16})_{\Sigma=2.00}$. (2) $PbTe_3Cl_2$.

Occurrence: Of primary origin, in a hydrothermal gold-quartz vein containing sulfides and tellurides.

Association: Galena, altaite, kolarite, cotunnite, volynskite, hessite, pyrrhotite, chalcopyrite, ullmannite, hawleyite, cadmian tetrahedrite, cadmian sphalerite.

Distribution: From the Champion Reef mine, Kolar Gold Fields, Karnataka, India.

Name: For B.P. Radhakrishna, Indian geologist.

Type Material: Institute of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, USSR.

References: (1) Genkin, A.D., Y.G. Safonov, V.N. Vasudev, B. Krishna Rao, V.A. Boronikhin, L.N. Vyalsov, A.I. Gorshkov, and A.V. Mineral., 71, 1545–1546 (abs. ref. 1).

Radtkeite Hg_3S_2ClI

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, $mm2$, or 222. In euhedral crystals, to 30 μm, tabular and prismatic, with well-developed prisms and pinacoids, perhaps with fluted terminations; may be hollow tubular, capped at one end, and curved; commonly granular, or as coatings.

Physical Properties: *Cleavage:* {010}, perfect; {001}, {100}, very good; {0*kl*}, {*h*0*l*}, and {*hk*0}, good (synthetic). *Fracture:* Splintery, hackly, conchoidal (synthetic). Hardness = 2–3 (synthetic). VHN = 65–75 D(meas.) = 7.0(1) (synthetic). D(calc.) = 7.05(1)

Optical Properties: Opaque to translucent. *Color:* Bright yellow-orange to dull orange; on exposure to light immediately darkens through yellow-brown to black; pale gray with yellowish tint in reflected light, with abundant canary-yellow internal reflections. *Streak:* Yellow-orange, blackening on exposure to light. *Luster:* Nearly adamantine (synthetic).
Optical Class: Biaxial (+). *Pleochroism:* Bright orange, orange with a rosy tint, or orange with a green tint. $\alpha = > 2.0$ $\beta = > 2.0$ $\gamma = > 2.0$ 2V(meas.) = $\sim 35°$

Cell Data: *Space Group:* $Fmmm$, $Fmm2$, or $F222$ (synthetic). $a = 16.92(2)$ $b = 20.25(2)$ $c = 9.110(3)$ Z = 16

X-ray Powder Pattern: McDermitt mine, Nevada, USA.
2.64 (100), 2.71 (44), 3.90 (41), 2.58 (29), 2.53 (28), 2.281 (26), 2.96 (24)

(1) McDermitt mine, Nevada, USA; by electron microprobe, average of ten analyses; corresponds to $Hg_3S_{2.10}Cl_{0.82}I_{0.96}$. (2) Hg_3S_2ClI.

Occurrence: In tuffaceous rhyolitic lake-bed sediments, formed as a reaction product between halide-bearing hydrothermal solutions and cinnabar or corderoite.

Association: Cinnabar, corderoite, quartz, gypsum.

Distribution: In the McDermitt mercury mine, Opalite district, Humboldt Co., Nevada, USA.

Name: For Arthur S. Radtke (1936–), American mineralogist and geochemist, U.S. Geological Survey, Palo Alto, California, USA.

Type Material: Mackay School of Mines, University of Nevada, Reno, Nevada; National Museum of Natural History, Washington, D.C., USA, 168450.

References: (1) McCormack, J.K., F.W. Dickson, and M.P. Leshendok (1991) Radtkeite, Hg_3S_2ClI, a new mineral from the McDermitt mercury deposit, Humboldt County, Nevada. Amer. Mineral., 76, 1715–1721.

(1) Lovozero massif, Russia.

Occurrence: On the walls of fractures filled with nepheline in alkalic pegmatite in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Nepheline, aegirine, mountainite, natrolite, zorite (Lovozero massif, Russia); aegirine, albite, nepheline, sodalite, sérandite, analcime, ancylite, epididymite, eudialyte, nenadkevichite (Mont Saint-Hilaire, Canada).

Distribution: From the Jubilee pegmatite, on Mt. Karnasurt, near the valley of the Ilmajok River, Lovozero massif, and in the Khibiny massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: In honor of the international group of scientists, captained by Thor Heyerdahl, crewing the papyrus ship *Ra* (1969–1970).

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3206, 3271; Mineralogical Museum, St. Petersburg University, St. Petersburg, 19047; Mining Institute, St. Petersburg, 1060/1–4; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74489.

TeO_2	80.91	80.05
CuO	18.03	19.95
CaO	1.06	
Total	[100.00]	100.00

(1) Lone Pine mine, New Mexico, USA; average of three analyses, each corrected to 100.00% for remnant SiO_2 as quartz; corresponds to $(Cu_{0.90}Ca_{0.08})_{\Sigma=0.98}Te_{2.01}O_5$. (2) $CuTe_2O_5$.

Occurrence: A very rare mineral, coating fractures in intensely silicified rhyolite breccia.

Association: Mackayite, quartz.

Distribution: At a prospect near the Lone Pine mine, Wilcox district, Catron Co., New Mexico, USA.

Name: To honor Robert Allen Jenkins (1944–), American geologist and mineralogist, Phelps Dodge Corporation, who found the first specimens.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,547; Harvard University, Cambridge, Massachusetts, USA, 119101.

Al_2O_3	0.04	
H_2O		22.87
Total		100.00

(1) Sunday and West Sunday mines, Colorado, USA; average of 10 electron microprobe analyses of partially dehydrated material, H_2O confirmed by structure analysis, corresponding to $(Na_{2.90}K_{0.07}Ca_{0.01}Al_{0.01})_{\Sigma=2.99}\{H_{2.98}[V_{10}O_{28}]\}\cdot 15H_2O$. (2) $Na_3\{H_3[V_{10}O_{28}]\}\cdot 15H_2O$.

Mineral Group: Pascoite group.

Occurrence: A secondary mineral as crystalline crusts on sandstone fractures in mine walls in the oxidized zone of a montroseite-corvusite assemblage.

Association: Calcite, montroseite, corvusite, hughesite, hewettite, pascoite, munirite, paramontrosite, rosasite, sherwoodite.

Distribution: From the Sunday and West Sunday mines, Slick Rock district, San Miguel County, Colorado, USA.

Name: Honors Dr. John Rakovan (b. 1964), professor, Department of Geology and Environmental Earth Science, Miami University, Oxford, Ohio, USA.

Type Material: Mineral Sciences Department, Natural History Museum of Los Angeles County, California, USA (63357, 63358).

Ralstonite $Na_xMg_xAl_{2-x}(F,OH)_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals are dominantly octahedral or cubic, less commonly cubo-octahedral, to 1 cm.

Physical Properties: *Cleavage:* {111}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 2.56–2.62 D(calc.) = 2.56

Optical Properties: Transparent to translucent. *Color:* Colorless to white, milky; may be surficially discolored yellow by iron oxides; colorless in transmitted light. *Luster:* Vitreous. *Optical Class:* Isotropic; anomalously uniaxial or biaxial, sectored. n = 1.399–1.427

Cell Data: *Space Group:* $Fd3m$. a = 9.91(4) Z = 8

X-ray Powder Pattern: Ivigtut, Greenland.
5.74 (100), 1.765 (86), 2.88 (75), 3.01 (53), 1.508 (40), 1.923 (38), 2.29 (32)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Na	4.27	9.86	5.4	Cl			0.05
K	0.12		0.02	O			[23.2]
Mg	4.39	10.28	5.6	H			[1.9]
Ca	0.03	0.95	0.02	OH	[19.46]	[4.22]	
Al	24.25	14.67	22.3	H_2O	8.43	8.65	
F	39.91	51.36	41.6	Total	[100.86]	[99.99]	[100.09]

(1) Ivigtut, Greenland; $(OH)^{1-}$ calculated for charge balance, corresponds to $Na_{0.35}Mg_{0.35}Al_{1.65}[F_{3.88}(OH)_{2.12}]_{\Sigma=6.00} \cdot 0.88H_2O$. (2) Do.; original total given as 96.29%, recalculated after deduction of mica 3.5%; original H_2O 10.30%, $(OH)^{1-}$ calculated for charge balance; then corresponds to $Na_{0.88}Mg_{0.88}Al_{1.12}[F_{5.5}(OH)_{0.5}]_{\Sigma=6.0} \cdot 0.99H_2O$. (3) Do.: by electron microprobe, H and O by difference.

Occurrence: In some granite pegmatites and greisenized zones rich in fluorine; in a hydrothermal antimony deposit in silicified limestones.

Association: Thomsenolite, cryolite, pachnolite, chiolite, elpasolite, colquiriite, gearksutite, weberite, prosopite, fluorite.

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland. In the USA, at St. Peters Dome, near Pikes Peak, El Paso Co., and in the Goldie carbonatite, McClure Mountain-Iron Mountain, Fremont Co., Colorado; in the Morefield pegmatite mine, Amelia, Amelia Co., Virginia; from the Quitman Mountains, Hudspeth Co., Texas; in the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada. From near Colquiri, Oruro, Bolivia. In the Mt. Cleveland tin mine, western Tasmania, Australia. From near Lake Gjerdingen, Nordmarka, Norway. In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. At Perga, Volyn, Ukraine. From West Kayrakty, Kazakhstan. In the Zharchikhinsk molybdenum deposit, on the west side of Lake Baikal, eastern Siberia, and at the Tolbachik fissure volcano, Kamchatk Peninsula, Russia. Several other localities are reported but are minor or require authentication.

Name: Honoring Reverend J. Grier Ralston, of Norristown, Pennsylvania, USA, who first noted the species.

Type Material: Yale University, New Haven, Connecticut, USA, 1.4437.

(1–2) Chocaya mine, Bolivia; by electron microprobe. (3) Do.; by electron microprobe, average of ten analyses. (4) $Ag_3Pb_6Sb_{11}S_{24}$.

Occurrence: Found in fine-grained quartz in a vein of hydrothermal origin (Chocaya mine, Bolivia).

Association: Pyrite, stannite, andorite, jamesonite, sphalerite, quartz (Chocaya mine, Bolivia); andorite (Bear Basin, Washington, USA).

Distribution: In Bolivia, from the Colorado Ag-Sn vein, Chocaya mine, Potosí, and from Tatasi. In the USA, at the Round Valley tungsten mine, Bishop Creek area, Inyo Co., California; and at Bear Basin, King Co., Washington.

Name: For Professor Paul Ramdohr (1890–1985), German mineralogist.

Type Material: National Museum of Natural History, Washington, D.C., USA, R6595.

Total	99.6

(1) Margnac mine, France; by electron microprobe, H_2O by TGA; corresponds to $K_{2.16}Ca_{0.87}U_{6.00}O_{20}\cdot 9.3H_2O$.

Occurrence: In the oxidation zone of uranium deposits.

Association: Calcite, uranophane, uraninite, "gummite".

Distribution: From the Margnac mine, Compreignac, Haute-Vienne, France. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). Found in the Orphan mine, Grand Canyon, Coconino Co., Arizona, USA.

Name: For Jacques Rameau (?–1960), prospector for the French Atomic Energy Commission, Paris, France, who discovered the Margnac 2 deposit.

Type Material: University of Pierre and Marie Curie, Paris; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 137454.

References: (1) Cesbron, F., W.L. Brown, P. Bariand, and J. Geffroy (1972) Rameauite and agrinierite, two new hydrated complex uranyl oxides from Margnac, France. Mineral. Mag., 38, 781–789. (2) (1973) Amer. Mineral., 58, 805 (abs. ref. 1).

(1) Poudrette pegmatite, Mont Saint-Hilaire, Canada; average of 22 electron microprobe analyses, H_2O, CO_2 and Li_2O calculated from stoichiometry and their presence confirmed by LA-ICP-MS and Raman analyses; corresponding to $Li_4(Na_{10.79}Ca_{1.21})_{\Sigma=12}(Y_{4.34}Ca_{0.99}Dy_{0.18}Er_{0.18}Yb_{0.09}La_{0.02}Ce_{0.02}Nd_{0.01})_{\Sigma=5.83}(Zr_{5.65}Hf_{0.10}Th_{0.06})_{\Sigma=5.81}[(P_{0.98}Al_{0.01})_{\Sigma=0.99}O_4]_{12}(CO_3)_4O_4[(OH)_{3.03}F_{0.97}]_{\Sigma=4}$.
(2) $Li_4Na_{12}Y_6Zr_6(PO_4)_{12}(CO_3)_4O_4(OH)_4$.

Occurrence: A late-stage product possibly related to the in situ alteration of the pre-existing mineral assemblage present in the core of a zoned peralkaline pegmatite dike encased in a hornfels xenolith.

Association: Peatite-(Y), albite, rhodochrosite, siderite, chabazite-Na, synchysite-(Ce), sabinaite.

Distribution: From the Poudrette pegmatite, Mont Saint-Hilaire, La Vallée-du-Richelieu, Montérégie (formerly Rouville County), Québec, Canada.

Name: Honors Robert A.J. Ramik (*b.*1951), an analytical technician and mineralogist in the Department of Natural History, Royal Ontario Museum, Toronto, Ontario, Canada.

Type Material: The Royal Ontario Museum, Toronto, Ontario, Canada (M53893).

Total	99.82	100.6	100.00

(1) University mine, Cobalt, Canada. (2) Coniston mines, England; by electron microprobe. (3) $NiAs_2$.

Polymorphism & Series: Trimorphous with pararammelsbergite and krutovite.

Mineral Group: Löllingite group.

Occurrence: In hydrothermal veins formed at medium temperatures with other Ni–Co minerals.

Association: Skutterudite, safflorite, löllingite, nickeline, bismuth, silver, algodonite, domeykite, uraninite.

Distribution: In Germany, at Schneeberg, Saxony [TL]; at Eisleben and Mansfeld, Saxony-Anhalt; from Bieber, near Hanau, Hesse. In the Lölling-Hüttenberg district, Carinthia, Austria. From the Polkovice copper mine, near Legnica, Zechstein copper district, Lower Silesia, Poland. In France, at Sainte-Marie-aux-Mines, Haut-Rhin. From the Coniston mines, Cumbria, England. In the Leadhills-Wanlockhead district, Dumfries, Scotland. At the Sedmochislenitsi mine, Vratsa district, western part of the Stara Planina (Balkan Mountains), Bulgaria. From Lainijaur, Västerbotten, Sweden. Large crystals at Bou Azzer, Morocco. In the USA, from the Mohawk mine, Keweenaw Co., Michigan. In Canada, at the Eldorado mine, Great Bear Lake, Northwest Territories; in various mines around Cobalt, Ontario, and other scattered localities. In the Ulsan mine, Kyongsang Province, South Korea. Known from a number of other occurrences world-wide.

Name: To honor Karl Friedrich Rammelsberg (1813–1899), mineral chemist of Berlin, Germany.

Ramsbeckite $(Cu,Zn)_{15}(SO_4)_4(OH)_{22}\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crystals are tabular with large {001}, also {210}, {110}, {100}, giving a slightly rounded rhombic outline, to 3 mm. *Twinning:* Observed, repeated, forming cylindrical aggregates.

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 3.39–3.41 D(calc.) = 3.37

Optical Properties: Transparent to translucent. *Color:* Green, blue-green. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = pale blue-green, emerald-green; $Y = Z$ = blue-green, yellow-green. *Orientation:* $Y = b$; $X \wedge c = 5°$; $Z \wedge a = 5°$. *Absorption:* $X > Y = Z$. $\alpha = 1.624$–1.669 $\beta = 1.674$–1.703 $\gamma = 1.678$–1.707 2V(meas.) = 36°–38° 2V(calc.) = 38.0°

Cell Data: *Space Group:* $P2_1/a$. $a = 16.088$–16.110 $b = 15.576$–15.602 $c = 7.102$–7.112 $\beta = 90.0°-90.27°$ Z = 2

X-ray Powder Pattern: Bastenberg mine, Ramsbeck, Germany.
7.090 (100), 3.549 (25), 1.776 (20), 3.254 (13), 4.400 (12), 3.232 (12), 3.244 (11)

Chemistry:

	(1)	(2)	(3)
SO_3	17.4	17.6	17.51
CuO	44.5	43.8	43.49
ZnO	15.8	18.1	22.25
H_2O	19.3	[20.5]	16.75
Total	97.0	[100.0]	100.00

(1) Bastenberg mine, Ramsbeck, Germany; SO_4 by photometry, CuO, ZnO by AA, H_2O by gas chromatography, $(OH)^{1-}$ computed for charge balance; corresponds to $(Cu_{10.30}Zn_{3.58})_{\Sigma=13.88}(SO_4)_{4.00}(OH)_{19.76}\cdot 9.84H_2O$. (2) Ecton mine, Pennsylvania, USA; by electron microprobe, H_2O by difference, $(OH)^{1-}$ computed for charge balance; corresponds to $(Cu_{10.03}Zn_{4.05})_{\Sigma=14.08}(SO_4)_{4.00}(OH)_{20.17}\cdot 10.64H_2O$. (3) $(Cu,Zn)_{15}(SO_4)_4(OH)_{22}\cdot 6H_2O$ with Cu:Zn = 2:1.

Occurrence: Rarely formed by supergene oxidation in dump materials and slag.

Association: Chalcopyrite, linarite, brochantite, serpierite, schulenbergite, smithsonite, hydrozincite, connellite, chalcophyllite (Germany); linarite, anglesite, pyromorphite, posnjakite, serpierite (Ecton mine, Pennsylvania, USA).

Distribution: In Germany, from the Bastenberg mine, Ramsbeck, North Rhine-Westphalia; at the Rammelsberg mine, near Goslar, the Glücksrad mine, near Oberschulenberg, the Wildemann mine, and elsewhere in the Harz Mountains; from the Friedrichssegen mine, near Bad Ems, Rhineland-Palatinate; and in the Marie mine, near Wilnsdorf, Siegerland. From the Waterbank mine, Wetton, Staffordshire, England. In Wales, at the Dylife mine, Machynlleth, Powys; in the Brynarian mine, Talybont, the Penrhiw mine, Ystumtuen, and the Frongoch mine, Dyfed. In the Veneziana mine, near Torrebelvicino, Veneto, Italy. From the Ecton mine, Audubon, Montgomery Co., Pennsylvania, USA.

Name: For Ramsbeck, Germany, near the location from which the species was first noted.

Type Material: University of Göttingen, Göttingen, Germany.

(1) Locality unknown; type material. (2) Lake Valley, New Mexico, USA.

Polymorphism & Series: Trimorphous with akhtenskite and pyrolusite.

Occurrence: A secondary mineral in manganese deposits, formed by inversion of pyrolusite or oxidative dehydrogenation of groutite.

Association: Pyrolusite, hollandite, cryptomelane, coronadite.

Distribution: Some localities for well-characterized material are: in the USA, from Lake Valley, Sierra Co., New Mexico; in the Artillery Mountains, Mohave Co., and at the Mistake mine, Yavapai Co., Arizona; from the Idarado mine, near Telluride, San Miguel Co., Colorado; in the Monroe-Tener mine, near Chisholm, St. Louis Co., Minnesota. Along the East River, Pictou Co., Nova Scotia, Canada. In Mexico, at Los Gavilanes, Baja California. In India, from Dongari Buzurg, Bhandara, Madhya Pradesh. At the Iron Monarch quarry, Iron Knob, South Australia. From the Otoshibetsu and Tanno mines, Hokkaido, and elsewhere in Japan. At Horni Blatna (Platten), Czech Republic. From Bütten-Adenstadt, Lower Saxony, and the Clara Mine, near Oberwolfach, Black Forest, Germany. At Gebel To Yu, Yoider, and Um Bogna, Egypt. From Hotazel, near Kuruman, Cape Province, South Africa.

Name: For Professor Lewis Stephen Ramsdell (1895–1975), American mineralogist, University of Michigan, Ann Arbor, Michigan, USA.

Type Material: University of Michigan, Ann Arbor, Michigan, USA.

Ranciéite $(Ca, Mn^{2+})Mn_4^{4+}O_9 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As fine lamellar to polycrystalline aggregates; in stalactites and incrustations.

Physical Properties: Hardness = n.d. D(meas.) = 3.336 D(calc.) = n.d.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black, brown, violet; brown in transmitted light. *Streak:* Pale reddish brown with a lilac to purple hue.
Luster: Bright metallic.
Optical Class: Uniaxial.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 2.83$–2.86 $c = 7.53$–7.55 Z = n.d.

X-ray Powder Pattern: Rancié, France; close to takanelite, variable with hydration.

(1) Rancié, France. (2) Oriente Province, Cuba; corresponding to $(Ca_{0.76}Mn^{2+}_{0.22})_{\Sigma=0.98}$ $Mn^{4+}_{4.14}O_9 \cdot 3.36H_2O$. (3) Sheliya deposit, Russia; by electron microprobe, Mn^{4+}:Mn^{3+}:Mn^{2+} calculated from site occupancy and charge balance considerations; corresponding to $(Ca_{0.70}Mn^{2+}_{0.22}$ $Al_{0.06}K_{0.02})_{\Sigma=1.00}(Mn^{4+}_{3.75}Mn^{3+}_{0.12}Fe^{3+}_{0.01})_{\Sigma=3.88}O_9 \cdot 3.86H_2O$.

Polymorphism & Series: Forms a series with takanelite.

Occurrence: A product of weathering or alteration of manganese deposits, commonly formed in limestone or in caves in limestone.

Association: Todorokite, calcite,"limonite".

Distribution: Some well-authenticated localities are: in France, at Rancié, near Vicdessos, Ariège; at Prader, Pyrénées-Oriental; at Montmirat, Lozève; and elsewhere. From near Newbiggin, Teesdale, Durham, England. At Barranco de Maspalomas, Grand Canary Island, Spain. In a cave at Kefali, near Itea, Greece. From Monte Gelato, near Mazzano Romano, Latium, Italy. In the Sheliya deposit, Ural Mountains, Russia. At Winterberg, Harz Mountains, Germany. From Oriente Province, Cuba. In the USA, from Batesville, Independence Co., Arkansas; in Mammoth Cave, Kentucky; at the Anson Betts mine, Plainfield, Hampshire Co., Massachusetts; in Paxton's Cave, near Bolling Springs, Alleghany Co., Virginia; at Courtland, Cochise Co., and Ajo, Pima Co., Arizona.

Name: For its first-noted occurrence at Rancié, France.

Rankachite $CaFe^{2+}V_4^{5+}W_8^{6+}O_{36}\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crusts of needlelike to lathlike crystals, elongated along [001], flattened on {100} or {010}, to 2 mm; in rosettes and subparallel to radial aggregates.

Physical Properties: *Cleavage:* One direction, good, parallel to the plane of flattening. *Fracture:* Uneven. Hardness = ∼2.5 D(meas.) = > 4.03 D(calc.) = [4.55]

Optical Properties: Opaque to translucent. *Color:* Dark brown to brownish yellow. *Streak:* Brown. *Luster:* Subadamantine to resinous, may be dull. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; $X = Y$ = yellowish brown; Z = reddish brown to opaque. *Orientation:* $X \perp$ plane of flattening; $Z = c$. *Dispersion:* $r \ll v$, strong. $\alpha = 1.770(5)$ $\beta = 1.925(5)$ $\gamma = 1.970(5)$ 2V(meas.) = 58°

Cell Data: *Space Group:* *Pmmn* (probable). $a = 8.17$ $b = 42.02$ $c = 5.45$ Z = [2]

X-ray Powder Pattern: Clara mine, Germany.
10.64 (10), 5.44 (7), 4.57 (6), 4.08 (6), 3.51 (6), 3.26 (6), 3.04 (6)

Total	98.8	100.00

(1) Clara mine, Germany; by electron microprobe, corresponding to $Ca_{1.26}Fe_{1.12}V_{3.92}W_{7.78}H_{25.04}O_{48}$. (2) $CaFeV_4W_8O_{36}\cdot 12H_2O$.

Occurrence: An alteration product of scheelite and iron sulfides in the oxidation zone of a hydrothermal base-metal deposit.

Association: Scheelite, pyrite, marcasite, quartz.

Distribution: From the mill dump of the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For the Rankach Valley, Germany, in which the Clara mine is located.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160380.

Rankamaite $(Na, K, Pb, Li)_3(Ta, Nb, Al)_{11}(O, OH)_{30}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222, $mm2$, or $2/m\ 2/m\ 2/m$. Straight to wavy fibers, aggregated into rounded grains, to 1 cm; these may be concentrically layered, in nodular masses surrounding simpsonite.

Physical Properties: Hardness = 3–4 D(meas.) = 5.5 D(calc.) = [6.02]

Optical Properties: Semitransparent. *Color:* White to cream-white, may be yellowish due to iron staining; bluish gray to brownish in thin section. *Luster:* Silky.
Optical Class: Biaxial. *Orientation:* $X \perp c$; $Z = c$. $\alpha = > 2.10$ $\beta = > 2.10$ $\gamma = > 2.10$
2V(meas.) = n.d.

Cell Data: *Space Group:* $C222$, $Cmm2$, $Cm2m$, or $Cmmm$. $a = 17.19$ $b = 17.70$ $c = 3.933$ Z = 2

X-ray Powder Pattern: Mumba district, Congo; shows some preferred orientation.

Total	99.98	98.41

(1) Mumba district, Congo; after deduction of muscovite impurity, corresponds to $(Na_{1.72}K_{0.76}Pb_{0.28}Li_{0.17})_{\Sigma=2.93}(Ta_{6.88}Nb_{3.03}Al_{1.18})_{\Sigma=11.09}[O_{26.26}(OH)_{3.74}]_{\Sigma=30.00}$. (2) [Congo]; by electron microprobe, corresponding to $(Na_{1.41}K_{1.08}Pb_{0.19})_{\Sigma=2.68}(Ta_{7.84}Nb_{2.78}Al_{1.01}Fe_{0.31})_{\Sigma=11.94}[O, (OH)]_{30}$.

Occurrence: Apparently a replacement of simpsonite, the result of intense sodium metasomatism in some Li-Ta-Nb-bearing granite pegmatites.

Association: Simpsonite, microlite, cassiterite, beryl, manganotantalite, muscovite, kaolinite (Mumba district, Congo); lithiotantite (Eastern Kazakhstan).

Distribution: In heavy-mineral concentrates from alluvial deposits in the Mumba district, Masisi, Kivu Province, Congo (Zaire). From an undisclosed locality [Kalba Mountains] in eastern Kazakhstan.

Name: To honor Professor Kalervo Rankama (1913–1995), Finnish geochemist, University of Helsinki, Helsinki, Finland.

Type Material: n.d.

Rankinite $Ca_3Si_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely as prismatic crystals, to 8 mm; as subhedral flattened or tabular grains; as elongated irregular poikiloblastic patches; massive.

Physical Properties: Hardness = 5.5 D(meas.) = 2.96–3.00 D(calc.) = 2.99–3.00

Optical Properties: Transparent to translucent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge a = 15°$. *Dispersion:* $r > v$, weak. $\alpha = 1.640–1.643$ $\beta = 1.643–1.646$ $\gamma = 1.650–1.652$ 2V(meas.) = 62°–69°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.557(1)$ $b = 8.885(3)$ $c = 7.858(1)$ $\beta = 119.586(6)°$ Z = 4

X-ray Powder Pattern: Tokatoka, New Zealand.

Total	99.7

(1) Tunguska River basin, Russia; corresponds to $Ca_{3.02}Si_{1.99}O_7$.

Polymorphism & Series: Dimorphous with kilchoanite.

Occurrence: In high-temperature calc-silicate skarns.

Association: Larnite, melilite, spurrite, kilchoanite, nagelschmidtite, gehlenite, cuspidine, monticellite, andradite, perovskite, magnetite.

Distribution: From Scawt Hill, near Larne, Co. Antrim, Ireland. Found near Kilchoan, Ardamurchan, Argyllshire, and Camas Mòr, Isle of Muck, Scotland. From Golden Gully, Tokatoka district, about 150 km north of Auckland, New Zealand. At Fuka, near Bicchu, Okayama Prefecture, Japan. In the Christmas Mountains, Brewster Co., Texas, USA. In the Hatrurim Formation, at Hatrurim and Ma'aleh Adumim, Israel. In the Lower Tunguska River basin, central Siberia, Russia.

Name: For Dr. George Atwater Rankin (1884–?), physical chemist of the Geophysical Laboratory, Washington, D.C., USA, an early student of the system lime-alumina-silica.

Type Material: The Natural History Museum, London, England, 1956,386.

Total	100.50	100.00

(1) United Verde mine, Arizona, USA. (2) $CuFe_2(SO_4)_4 \cdot 6H_2O$.

Occurrence: Very rare, formed as the result of a mine fire (United Verde mine, Arizona, USA); coating oxidizing copper-bearing pyrite (Campbell shaft, Arizona, USA).

Association: Pyrite, voltaite, römerite (Campbell shaft, Arizona, USA).

Distribution: In the USA, in Arizona, from the United Verde mine, Jerome, Yavapai Co., and in the Campbell shaft, Bisbee, Cochise Co.

Name: To honor Frederick Leslie Ransome (1868–1935), American mining geologist, U.S. Geological Survey and California Institute of Technology, Pasadena, California, USA.

Type Material: The Natural History Museum, London, England, 1985,401; Mineral Museum, University of Arizona, M50; Harvard University, Cambridge, Massachusetts, 90541; National Museum of Natural History, Washington, D.C., USA, 95955.

Total	97.9	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, H_2O by TGA; corresponds to $HAl_{1.02}(UO_2)_{1.00}(PO_4)_{0.98}(OH)_3 \cdot 4H_2O$. (2) $HAl(UO_2)PO_4(OH)_3 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the oxidized uraniferous zone of a complex granite pegmatite.

Association: Meta-autunite, phosphuranylite, phuralumite, upalite, moreauite, threadgoldite.

Distribution: From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For resemblance of the mineral's color to that of the buttercup, *ranunculus* in Latin.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG6201; National Museum of Natural History, Washington, D.C., USA, 145686.

Total	98.81	100.00

(1) Broken Hill, Australia; remnant is Fe_2O_3 and MnO. (2) $PbWO_4$.

Polymorphism & Series: Dimorphous with stolzite.

Occurrence: An uncommon secondary mineral formed in the oxidized zone of tungsten-bearing hydrothermal base metal deposits; inverts to stolzite above 410 °C.

Association: Stolzite, yttrotungstite, alumotungstite, cuprotungstite, ferritungstite.

Distribution: From the Proprietary mine, Broken Hill, and the Cordillera mine, near Tuena, New South Wales, Australia. At the Otani mine, Kyoto Prefecture, Japan. In the Kramat Pulai mine, Kinta district, Perak, Malaysia. From the Sumidoro gold placers, Municipio do Mariana, Minas Gerais, Brazil. At Gifurwe, Rwanda. In the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: To honor Charles Rasp (1846–1907), German–Australian prospector who discovered the Broken Hill deposit.

Type Material: Natural History Museum, Vienna, Austria, G6263.

X-ray Powder Pattern: Coyote Peak, California, USA.
5.513 (100), 6.98 (62), 3.403 (43), 3.492 (17), 1.778 (14), 2.935 (12), 2.905 (12)

Chemistry:

	(1)	(2)	(3)
K	16.3	15.2	15.83
Fe	45.2	46.1	45.22
S	38.0	38.5	38.95
Total	99.5	99.8	100.00

(1) Khibiny massif, Russia; by electron microprobe. (2) Coyote Peak, California, USA; by electron microprobe. (3) KFe_2S_3.

Occurrence: Typically an alteration product of pyrrhotite; in differentiated alkalic massifs (Russia); in an alkalic mafic diatreme (Coyote Peak, California, USA); in sodalite syenite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in natrocarbonate lavas (Oldoinyo Lengai volcano, Tanzania); in a contact-metamorphosed xenolith (Oslo rift, Norway).

Association: Djerfisherite, chlorbartonite, pyrrhotite, cubanite, potassic feldspar, nepheline, acmite (Russia); pyrrhotite, nepheline, acmite, analcime, alkalic feldspar (Point of Rocks, New Mexico, USA); ussingite, villiaumite, siderenkite, sodalite (Mont Saint-Hilaire, Canada).

Distribution: In Russia, on the Kola Peninsula, from Mts. Rasvumchorr [TL], Koashva, and Yukspor, and in the Kirov apatite mine, Mt. Kukisvumchorr [TL], Khibiny massif; at the Lovozero massif. From the Oslo rift, southern Norway. In the USA, at Coyote Peak, near Orick, Humboldt Co., California, and from Point of Rocks, Colfax Co., New Mexico. From Mont Saint-Hilaire, Quebec, Canada. On Oldoinyo Lengai volcano, Tanzania.

Name: For its occurrence on Mt. Rasvumchorr, Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3627; Mining Institute, St. Petersburg, 1095/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73142, 73143, 73584, 73975.

(1) Belorechenskoye deposit, Northern Caucasus, Russia; average of 12 electron microprobe analyses, H_2O by difference, presence of H_2O, PO_4, UO_2, $As^{3+}O_4$ groups confirmed by IR spectroscopy; corresponding to $(Ni_{0.76}Mg_{0.19}Co_{0.01}Zn_{0.01})_{\Sigma=0.97}U_{2.00}O_4(As_{1.86}P_{0.16})_{\Sigma=2.02}O_8 \cdot 10H_2O$. (2) $Ni(UO_2)_2(As^{3+}O_3)_2 \cdot 10H_2O$.

Mineral Group: Autunite group.

Occurrence: A secondary mineral found in small cavities and cracks in slightly oxidized uraninite-bearing dolomite veins.

Association: Dymkovite ,uraninite, nickeline, gersdorffite, goethite, "limonite", annabergite.

Distribution: From adit #1, Belorechenskoye deposit, Belaya River basin, 60 km south of Maikop, Adygea Republic, Northern Caucasus, Russia.

Name: According to the naming rules for the autunite group as the hydrated analog of *metarauchite*, $Ni(UO_2)_2(AsO_4)_2 \cdot 8H_2O$ - the root name honors Czech mineral collector Ludek Rauch (1951-1983).

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (3997/1).

(1) Sainte-Marie-aux-Mines, France; average of two analyses, H_2O by TGA; corresponds to $Ca_{2.98}(AsO_4)_{2.00} \cdot 9.9H_2O$. (2) $Ca_3(AsO_4)_2 \cdot 10H_2O$.

Occurrence: A post-mine low-temperature reaction product of carbonate gangue with arsenical solutions derived from arsenic (Sainte-Marie-aux-Mines, France).

Association: Phaunouxite, picropharmacolite, pharmacolite, sainfeldite, ferrarisite, löllingite, calcite, aragonite (Sainte-Marie-aux-Mines, France); picropharmacolite, lavendulan, cobaltian hörnesite, guérinite, roselite, gypsum (Anton mine, Germany).

Distribution: From the Gabe-Gottes mine, Sainte-Marie-aux-Mines, Haut-Rhin, and at the Salsigne mine, 15 km north of Carcassone, Aude, France. In the Svatá Anna uranium deposit, Planá, near Mariánské Lázně (Marienbad), and Jáchymov (Joachimsthal), Czech Republic. In Germany, at the Anton mine, Heubachtal, near Schiltach, and from Wittichen, Black Forest; at St. Andreasberg, Harz Mountains; in the Bauhaus district, Richelsdorf Mountains, Hesse; from Schneeberg, Saxony. In the Muckross mine, Co. Kerry, Ireland. At the Getchell mine, Potosi district, Humboldt Co., Nevada, USA.

Name: For the Rauenthal vein system, on which Sainte-Marie-aux-Mines, France, is located.

Type Material: National School of Mines, Paris, France.

(1) Temple Rock, Utah, USA; recalculated after deduction of 27.06% impurities. (2) Monument No. 2 mine, Arizona, USA. (3) $Ca(UO_2)_2V_{10}O_{28}\cdot 16H_2O$.

Occurrence: An uncommon mineral in the oxidized zones of U–V ores in Colorado Plateau-type deposits.

Association: Carnotite, corvusite, uvanite, hewettite, metatorbernite, tyuyamunite, gypsum.

Distribution: In the USA, from Temple Rock and Flat Top, Emery Co., and at the Cactus Rat mine group, Yellow Cat district, 24 km southeast of Thompson, Grand Co., Utah; in Colorado, at the Small Spot, Arrowhead, and Corvusite mines, Gateway district, Mesa Co., at the Hummer, Bitter Creek, Jo Dandy, and J.J. mines, Paradox Valley, Montrose Co.; from the Monument No. 2 mine, Monument Valley, Apache Co., and Monument No. 1 and Mitten No. 2 mines, Navajo Co., Arizona; at the Road Hog No. 3A claim, Coal Canyon, Fall River Co., South Dakota. In the Hatrurim Formation, Israel.

Name: For the chemical elements RAdium, Uranium, and Vanadium.

Type Material: Harvard University, Cambridge, Massachusetts, 134565; National Museum of Natural History, Washington, D.C., USA, 95060, R5715.

(1) Rajpura-Dariba deposit, India; by electron microprobe, average of four samples; if related to semseyite ($Pb_9Sb_8S_{21}$), corresponds to $(Ag_{1.45}Tl_{0.34}Cu_{0.02}Pb_{7.81})_{\Sigma=9.62}Sb_{7.74}S_{21.00}$; if related to boulangerite ($Pb_5Sb_4S_{11}$), corresponds to $(Ag_{0.76}Tl_{0.18}Cu_{0.01}Pb_{4.09})_{\Sigma=5.04}Sb_{4.06}S_{11.00}$.

Occurrence: In a Precambrian polymetallic massive-sulfide deposit interbedded with kyanite-graphite schists, diopside-bearing calc-silicates, and meta-cherts.

Association: Galena, meneghinite, owyheeite.

Distribution: From the Rajpura-Dariba polymetallic deposit, Udaipur district, Rajasthan, India [TL].

Name: To honor Professor Santosh K. Ray (1908–1976), Indian petrologist, President College, Calcutta, India.

Type Material: Indian Institute of Technology, Kharagpur, India; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia.

Realgar AsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, to 12 cm, and striated ‖ [001]; more commonly massive, coarse to fine granular, or as incrustations. *Twinning:* As contact twins on {100}

Physical Properties: *Cleavage:* Good on {010}; less so on {$\overline{1}$01}, {100}, {120}, and {110}. *Tenacity:* Sectile, also slightly brittle. Hardness = 1.5–2 VHN = n.d. D(meas.) = 3.56 D(calc.) = 3.59 Disintegrates on long exposure to light to a powder composed of pararealgar or arsenolite and orpiment.

Optical Properties: Transparent when fresh. *Color:* Red to yellow-orange; in polished section, pale gray, with abundant yellow to red internal reflections. *Streak:* Red-orange to red. *Luster:* Resinous to greasy.
Optical Class: Biaxial (–). *Pleochroism:* Nearly colorless to pale golden yellow. *Orientation:* $X \wedge c = -11°$. *Dispersion:* $r > v$, very strong, inclined. $\alpha = 2.538$ $\beta = 2.684$ $\gamma = 2.704$ 2V(meas.) = 40°34′ *Anisotropism:* Strong, in polished section.
R: (400) 29.9, (420) 28.6, (440) 27.4, (460) 26.3, (480) 25.2, (500) 24.2, (520) 23.3, (540) 22.4, (560) 21.7, (580) 21.1, (600) 20.6, (620) 20.3, (640) 20.0, (660) 19.7, (680) 19.5, (700) 19.3

(1) Binntal, Switzerland; remainder SiO_2. (2) AsS.

Polymorphism & Series: Trimorphous with alacránite and pararealgar.

Occurrence: Most commonly as a low-temperature hydrothermal vein mineral associated with As–Sb minerals; also as volcanic sublimations and in hot spring deposits; in carbonate and clay sedimentary rocks.

Association: Orpiment, arsenolite, other arsenic minerals, calcite, barite.

Distribution: Only localities for finely crystallized material are given. In Germany, from Schneeberg, Saxony, and at St. Andreasberg, Harz Mountains. In the Lengenbach quarry, Binntal, Valais, Switzerland. In Romania, from Baia Sprie (Felsőbánya), Cavnic (Kapnikbánya), and at Săcărîmb (Nagyág). In the Czech Republic, from Jáchymov (Joachimsthal). At Alšar (Allchar), near Rošden, Macedonia. From Men-Kyule, Sakha, Russia. At Saimoku, ?? Prefecture, Japan. In the Shimen mine, 33 km southeast of Shimen, Hunan Province, China. In the USA, fine large crystals at the Getchell mine, Potosi district, Humboldt Co., Nevada; in Tooele Co., Utah, at Mercur; in Washington, in the Monte Cristo district, Snohomish Co., and in the Royal Reward mine, in the Green River Gorge, King Co.

Name: From the Arabic *rahj al ghar* for *powder of the mine*.

Rebulite $Tl_5Sb_5As_8S_{22}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals exhibit the forms {100}, {001} and {111}; all faces in the zone [010] are striated, to 2 mm.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = 4.81 D(calc.) = 4.90

Optical Properties: Opaque. *Color:* Dark gray. *Streak:* Brownish red. *Luster:* Submetallic to metallic.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 17.441(5)$ $b = 7.363(2)$ $c = 32.052(7)$ $\beta = 105.03(7)^\circ$ Z = 4

X-ray Powder Pattern: Alšar, Macedonia.

(1) Alšar, Macedonia; by electron microprobe; corresponds to $Tl_{4.65}Sb_{5.45}As_{7.92}S_{22.00}$.
(2) $Tl_5Sb_5As_8S_{22}$.

Occurrence: In a hydrothermal As–Tl deposit.

Association: Simonite, $TlHgAsS_3$ (christite or routhierite), realgar.

Distribution: From Alšar (Allchar), near Rošden, Macedonia [TL].

Name: To honor a Slovenian geologist or mining engineer named Rebula, who discovered the mineral.

Type Material: n.d.

Rectorite $(Na, Ca)Al_4(Si, Al)_8O_{20}(OH)_4 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. As aggregates of microscopic crystals, producing foliae or matted masses resembling the "mountain leather" variety of palygorskite.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Flexible but not elastic; plastic and greasy when hydrated. Hardness = < 1 D(meas.) = n.d. D(calc.) = [2.34]

Optical Properties: Semitransparent (?). *Color:* White. *Luster:* Pearly to greasy when massive.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 5.13$ $b = 8.88$ $c = 23.85$ $\beta = 96.3°$ Z = [2]

X-ray Powder Pattern: Baluchistan Province, Pakistan, air dried sample; after heating to 600 °C, $d_{(001)}$ = 19.3 Å; after ethylene glycol treatment $d_{(001)}$ = 26.8 Å.
23.8 (100), 11.9 (65), 3.40 (16), 2.971 (16), 1.970 (12), 4.75 (10), 1.827 (4)

(1) Blue Mountain district, Arkansas, USA.

Polymorphism & Series: A 1:1 regular interstratification of a dioctahedral mica and a dioctahedral smectite.

Occurrence: In some low-temperature hydrothermal argillic alteration zones, along veins and pervasively replacing potassic feldspar. In altered bentonites; may develop from muscovite during diagenesis of shales.

Association: Quartz, cookeite, ankerite, apatite, pyrite, sphalerite, galena, rutile (Jeffrey quarry, Arkansas, USA).

Distribution: In the USA, from the Blue Mountain district, Garland Co., and in the Jeffrey quarry, North Little Rock, Pulaski Co., Arkansas; and in Buckeye Gulch, eight km from Leadville, Lake Co., Colorado. In France, from Allevard, Isère, and near Sibert, Rhône. From the Fort Sandeman district, Baluchistan Province, Pakistan. Reported from numerous other localities but the material is not as well characterized as from the foregoing.

Name: For E.W. Rector (1849–1917), lawyer of Hot Springs, Arkansas, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 80607.

Reddingite $Mn_3^{2+}(PO_4)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, usually pseudo-octahedral, to 3 mm, with prominent {111}, {212}, {221}, {010}, {223}, {122}, other minor forms; commonly granular, massive.

Physical Properties: *Cleavage:* On {010}, poor. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 3.10–3.24 D(calc.) = 3.26

Optical Properties: Transparent to translucent. *Color:* Pale rose-pink to pale brownish yellow, colorless; red to red-orange on oxidization. *Streak:* White. *Luster:* Vitreous to subresinous.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Y = pinkish brown; Z = pale yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, distinct. $\alpha = 1.643$–1.655 $\beta = 1.648$–1.662 $\gamma = 1.674$–1.683 2V(meas.) = 41°–65°

Cell Data: *Space Group: Pbna.* $a = 9.49$ $b = 10.08$ $c = 8.70$ Z = 4

X-ray Powder Pattern: Hagendorf, Germany; close to phosphoferrite.

(1) Branchville, Connecticut, USA; average of two analyses, after deduction of SiO_2 as quartz, corresponds to $(Mn_{2.68}Fe_{0.31}Ca_{0.06}Na_{0.02})_{\Sigma=3.07}(PO_4)_{2.00} \cdot 3.00H_2O$. (2) $Mn_3(PO_4)_2 \cdot 3H_2O$.

Polymorphism & Series: Forms a series with phosphoferrite.

Occurrence: A rare secondary hydrothermal alteration product in zoned complex granite pegmatites.

Association: Dickinsonite, triploidite, triplite, lithiophilite, fairfieldite, eosphorite, huréaulite, rhodochrosite.

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; in Maine, at the Bennett quarry, Buckfield, and the Emmons quarry, Greenwood, Oxford Co., and the Berry quarry, Poland, Androscoggin Co. At Hagendorf, Bavaria, Germany. Large crystals from near Galiléia, Minas Gerais, Brazil.

Name: For Redding Township, Connecticut, USA, within which the first specimens were collected, near Branchville.

Type Material: Yale University, New Haven, Connecticut, USA, 3.5850, 3.5851.

Redledgeite $BaTi_6Cr_2^{3+}O_{16}\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, or monoclinic, pseudotetragonal. *Point Group:* $4/m$ or $2/m$. As dipyramidal crystals, to 2 mm; also finely fibrous.

Physical Properties: Hardness = 6.5 D(meas.) = 3.72 D(calc.) = 4.413

Optical Properties: Opaque, transparent on thin edges or in fibrous crystals. *Color:* Black or pale green to dark yellow-green; in reflected light, may have vivid green internal reflections when iron-free. *Luster:* Adamantine.
Optical Class: Uniaxial or biaxial.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I4_1/m$, with $a = 14.320(2)$ $c = 5.893(1)$ Z = 4, or

(1) Duchesne Co., Utah, USA. (2) Dara-i-Pioz massif, Tajikistan. (3) $NaBSi_3O_8$.

Mineral Group: Feldspar group.

Occurrence: As authigenic crystals along bedding laminations, in brown dolomitic rock and black oil shale from well cuttings (Duchesne Co., Utah, USA); in a pegmatite in an alkalic massif (Dara-i-Pioz massif, Tajikistan).

Association: Eitelite, shortite, nahcolite, searlesite, leucosphenite, aegirine, analcime, magnesio-riebeckite (Duchesne Co., Utah, USA); leucosphenite, eudialyte, stillwellite, pyrochlore, microcline, aegirine, polylithionite, albite, quartz (Dara-i-Pioz massif, Tajikistan).

Distribution: In the vicinity of the Joseph Smith #1 well, near Duchesne, Duchesne Co., Utah; and at Wind Mountain, Otero Co., New Mexico, USA. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. From the Lovozero massif, Kola Peninsula, Russia.

Name: Honors Frank S. Reed (1894–?) and John L. Mergner (1894–?), petrographic technicians with the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106865.

Reevesite $Ni_6Fe_2^{3+}(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $[\bar{3}\ 2/m]$ (by analogy to pyroaurite). As hexagonal platelets, to 0.1 mm, in fine-grained aggregates.

Physical Properties: Hardness = n.d. D(meas.) = ~2.80–2.88 D(calc.) = 2.78–2.87

Optical Properties: Semitransparent. *Color:* Bright yellow, greenish yellow; golden yellow in thin section.
Optical Class: Uniaxial (–). $\omega = 1.72$–1.735 $\epsilon = 1.63$–1.65

Cell Data: *Space Group:* $R\bar{3}m$. $a = 6.15$–6.164 $c = 45.54$–45.61 $Z = 3/8$

X-ray Powder Pattern: Wolf Creek meteorite.
7.63 (100), 2.60 (81), 3.80 (73), 2.30 (61), 1.946 (48), 1.508 (34), 1.537 (33)

Chemistry:

Total			100.00

(1) Wolf Creek meteorite; by electron microprobe, partial analysis of maximally nickel-rich material; corresponds to $(Ni_{5.19}Fe^{2+}_{0.14})_{\Sigma=5.33}Fe^{3+}_{2.00}(CO_3)(OH)_{16}\cdot 4H_2O$. (2) Bon Accord, South Africa; by electron microprobe; two partial elemental analyses, here converted to oxides and averaged; corresponds to $(Ni_{5.56}Fe^{2+}_{0.28}Mg_{0.14}Co_{0.02})_{\Sigma=6.00}Fe^{3+}_{2.00}(CO_3)(OH)_{16}\cdot 4H_2O$.
(3) $Ni_6Fe_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Mineral Group: Hydrotalcite group.

Occurrence: An alteration product of a highly weathered iron-nickel meteorite (Wolf Creek meteorite); altered from violarite in nickel ore at a contact between quartzite and ultramafic rocks (Bon Accord, South Africa); on chromatite (Unst, Scotland).

Association: Goethite, nickelian maghemite, jarosite, nickel-rich serpentine, apatite, lipscombite (Wolf Creek meteorite); violarite, ferroan trevorite, willemseite, nimite, "opal", quartz (Bon Accord, South Africa); honessite, hydrohonessite, theophrastite (Unst, Scotland).

Distribution: In the Wolf Creek meteorite. Found three km west of the Scotia talc mine, Bon Accord area, Barberton, Transvaal, South Africa. In the Hagdale quarry, Unst, Shetland Islands, Scotland. From Ca' de Ladri, Emilia-Romagna, Italy. In the USA, on the Victor claim, Clear Creek, San Benito Co., California; in the Fremont district, Hidalgo and Luna Co., New Mexico; and at Barrett Camp, Dragoon Mountains, Cochise Co., Arizona. From the Otway prospect, near Spinnaway, Nullagine district, Western Australia.

Name: To honor Dr. Frank Reeves (1886–?), American geologist who discovered the Wolf Creek meteorite crater.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 119552–119554.

C	77.77	78.90
H	11.18	10.59
O	11.05	10.51
Total	100.00	100.00

(1) Near Teramo, Italy. (2) $C_{20}H_{32}O_2$ (δ-13-dihydro-*d*-pimaric acid).

Occurrence: In lignite (near Teramo, Italy); in roots of fossil spruce in a swamp (Kolbermoor, Germany).

Association: n.d.

Distribution: From Montório al Vomano, 10 km southwest of Teramo, Abruzzi, Italy. Found near Kolbermoor, Bavaria, Germany. At Krásno, Czech Republic.

Name: To honor Refik Bey (?–1865), Turkish journalist.

Reichenbachite $Cu_5(PO_4)_2(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are lancet-shaped, to 0.3 mm; may be in spherical aggregates or botryoidal crusts.

Physical Properties: *Fracture:* Irregular. Hardness = ∼3.5 D(meas.) = n.d. D(calc.) = 4.370

Optical Properties: Semitransparent. *Color:* Dark green to pale blue. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Very weak; X = bright emerald-green; Z = emerald-green. *Orientation:* $Y = b$; $Z \wedge a = 29(2)°$. *Dispersion:* $r < v$, weak. $\alpha = 1.782(2)$ $\beta = [1.833]$ $\gamma = 1.867(5)$ 2V(meas.) = 76.3(4)°

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 9.186(2)$ $b = 10.684(2)$ $c = 4.461(2)$ $\beta = 92.31(1)°$ Z = 2

X-ray Powder Pattern: Reichenbach, Germany.
4.470 (100), 2.10 (100), 3.132 (30), 3.012 (30), 2.814 (25), 2.945 (20), 2.357 (20)

Chemistry:

	(1)	(2)

H_2O	[6.09]	6.26
Total	[98.74]	100.00

(1) Reichenbach, Germany; by electron microprobe, H_2O calculated for $4(OH)^{1-}$; corresponds to $Cu_{5.07}[(P_{0.93}As_{0.06})_{\Sigma=0.99}O_4]_2(OH)_4$. (2) $Cu_5(PO_4)_2(OH)_4$.

Polymorphism & Series: Trimorphous with ludjibaite and pseudomalachite.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal copper deposits.

Association: Pseudomalachite, malachite, duftite, bayldonite, mimetite, quartz (Reichenbach, Germany).

Distribution: In Germany, from Reichenbach, and at Gadernheim, near Bensheim, Hesse. At the Old Gunnislake mine, Calstock, Cornwall, England. From L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. At the Miguel Vacas mine, Vila Viçosa, near Estremoz, Portugal. From Brown's Prospect, Rum Jungle, Alligator River district, Northern Territory, Australia. At Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). From Binghampton, Yavapai Co., Arizona, USA.

Name: For Reichenbach, Germany, the original locality.

Type Material: Natural History Museum, Mainz; Mineralogical Museum, Würzburg University, Würzburg, Germany.

Reinerite $Zn_3(As^{3+}O_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are rough, pseudohexagonal, showing {010}, {110}, {001}, and {012}, striated ‖ [001], to 4.7 cm.

Physical Properties: *Cleavage:* On {110}, {011}, {111}, good. Hardness = 5–5.5
D(meas.) = 4.270 D(calc.) = 4.283

Optical Properties: Transparent. *Color:* Light yellow-green, changing to sea-blue on exposure.
Luster: Vitreous to adamantine on fracture surfaces.
Optical Class: Biaxial (–). $\alpha = 1.749$ $\beta = 1.790$ $\gamma = 1.821$

Cell Data: *Space Group: Pbam.* $a = 6.0883(2)$ $b = 14.3941(5)$ $c = 7.8022(2)$ $Z = 4$

X-ray Powder Pattern: Tsumeb, Namibia.
3.9954 (1000), 2.6455 (290), 1.5488 (191), 3.2025 (187), 2.7826 (176), 2.6023 (145), 3.3942 (143)

Total	99.84	100.00

(1) Tsumeb, Namibia; by electron microprobe. (2) $Zn_3(As^{3+}O_3)_2$.

Occurrence: Extremely rare in a deep oxidation zone in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Chalcocite, bornite, willemite, smithsonite, hydrozincite, hemimorphite, adamite, olivenite, gebhardite.

Distribution: From Tsumeb, Namibia.

Name: To honor Willy Reiner (1895–1965), Senior Chemist, Tsumeb Corporation, Tsumeb, Namibia, who analyzed this material.

Type Material: n.d.

References: (1) Geier, B.H. and K. Weber (1958) Reinerit $Zn_3[AsO_3]_2$, ein neues Mineral der Tsumeb Mine Südwestafrika. Neues Jahrb. Mineral., Monatsh., 160–167 (in German). (2) (1959) Amer. Reinhardbraunsite $Ca_5(SiO_4)_2(OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Anhedral to subhedral grains, up to 3 mm. *Twinning:* Single and multiple twinning on {001}, noted only in minute recrystallized grains.

Physical Properties: *Cleavage:* Distinct on {001}. *Fracture:* Conchoidal. Hardness = 5–6 D(meas.) = 2.85(2) D(calc.) = 2.885

Optical Properties: Transparent to translucent. *Color:* Light pink; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 18(1)°$. *Dispersion:* $r > v$, distinct.
$\alpha = 1.606(2)$ $\beta = 1.617(2)$ $\gamma = 1.620(2)$ 2V(meas.) = 44°–50°

Cell Data: *Space Group:* $P2_1/a$. $a = 11.458(2)$ $b = 5.052(1)$ $c = 8.840(2)$ $\beta = 108.91(1)°$ Z = 2

X-ray Powder Pattern: Bellerberg volcano, Germany.
1.902 (100), 3.035 (80), 2.903 (75), 3.322 (50), 2.941 (50), 1.894 (50), 1.658 (45)

Chemistry:

	(1)
SiO_2	26.97
CaO	65.68
F	4.24
H_2O	[2.66]
P_2O_5	0.69
$-O = F_2$	1.78
Total	[98.46]

(1) Bellerberg volcano, Germany; by electron microprobe, H_2O calculated from stoichiometry, original total given as 98.65%; corresponds to $Ca_{5.10}(Si_{1.96}P_{0.04})_{\Sigma=2.00}O_8[(OH)_{1.24}F_{0.97}]_{\Sigma=2.21}$.

Occurrence: In contact metamorphosed and metasomatized calcium-rich xenoliths in scoria.

Association: Ellestadite, cuspidine, gehlenite, brownmillerite, mayenite, periclase.

Distribution: From the Ettringer Bellerberg volcano, near Mayen, Eifel district, Germany.

Name: For Dr. Reinhard Brauns (1861–1937), Professor of Mineralogy at the University of Bonn, Bonn, Germany.

Type Material: Mineralogical-Petrological Institute, University of Bonn, Bonn, Germany.

(1) Mt. Koashva, Kola Peninsula, Russia; by electron microprobe, average of 11 analyses, CO_2 calculated for stoichiometry; corresponds to $Na_{2.87}(La_{0.80}Ce_{0.68}Ca_{0.61}Na_{0.46}Sr_{0.18}Nd_{0.09}K_{0.08}Pr_{0.04}Th_{0.03}Sm_{0.01}Ba_{0.01})_{\Sigma=2.99}(CO_3)_5$.

Occurrence: Of late hydrothermal origin, very rare in a small pegmatite in a differentiated alkalic massif.

Association: Cancrisilite, microcline, sodalite, villiaumite, natrolite, pectolite, lomonosovite, barytolamprophyllite, catapleiite, natron, thermonatrite, sazykinaite-(Y), niobian rinkite, vitusite-(Ce), fluorcaphite.

Distribution: From Mt. Koashva, Khibiny massif, Kola Peninsula, Russia.

Name: For its relation to *rémondite*-(Ce), and the predominance of *lanthanum* over other rare-earth elements in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Pekov, I.V., N.V. Chukanov, N.N. Kononkova, A.E. Zadov, and Y.V. Reniérite $(Cu, Zn)_{11}Fe_4(Ge, As)_2S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $\bar{4}2m$. As rare equant crystals, to 3 mm; disseminated granular aggregates, irregular patches, and as regular lamellae replacing germanite grains. *Twinning:* Polysynthetic.

Physical Properties: Hardness = 3.5 VHN = 340–363, 351 average (25 g load). D(meas.) = 4.38 D(calc.) = 4.40 Magnetic.

Optical Properties: Opaque. *Color:* Bronze; in polished section, orange-brown. *Luster:* Metallic. *Pleochroism:* Orange to brown or bronze with violet tint. *Anisotropism:* Strong, yellow to reddish orange.
R_1–R_2: (400) 19.6–20.3, (420) 19.1–19.8, (440) 18.7–19.3, (460) 18.7–19.0, (480) 19.8–19.4, (500) 21.9–20.8, (520) 24.5–23.0, (540) 27.1–25.3, (560) 29.6–27.5, (580) 31.2–29.4, (600) 32.6–30.9, (620) 33.8–32.1, (640) 34.7–33.1, (660) 35.3–33.7, (680) 35.6–34.2, (700) 36.0–34.6

Cell Data: *Space Group:* $P\bar{4}2c$. $a = 10.6226(5)$ $c = 10.5506(8)$ $Z = 2$

X-ray Powder Pattern: Kipushi, Congo.
3.06 (100), 1.87 (80), 1.595 (60), 2.65 (30), 1.214 (30), 4.31 (20), 1.083 (20)

Chemistry:

	(1)	(2)		(1)	(2)
Cu	41.63	41.6	Ge	7.75	7.3
Fe	13.73	13.0	Ga		0.5
Zn	3.53	2.7	As	0.87	2.0

			Total	99.02	99.7

(1) Kipushi, Congo; corresponds to $(Cu_{10.67}Zn_{0.88})_{\Sigma=11.55}Fe_{4.00}(Ge_{1.74}As_{0.19})_{\Sigma=1.93}S_{16.00}$.
(2) Tsumeb, Namibia; by electron microprobe, corresponds to $(Cu_{10.30}Zn_{0.65})_{\Sigma=10.95}$ $Fe_{3.66}(Ge_{1.58}As_{0.42}Ga_{0.11})_{\Sigma=2.11}S_{16.00}$.

Occurrence: Rare in some Ge-bearing hydrothermal polymetallic deposits.

Association: Germanite, tennantite, enargite, digenite, bornite, chalcopyrite, sphalerite.

Distribution: From the Prince-Léopold mine, Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire) [TL]. At M'Passa, 150 km west of Brazzaville, Niari Province, Congo Republic. From Tsumeb, Namibia. At Kabwe (Broken Hill), Zambia. In Bulgaria, in the Chelopech deposit, Sofia, and at the Radka deposit, Pazardzhik. From Akhtala, Armenia. At the San Giovanni mine, Iglesiente, Sardinia, Italy. In the Repparfjord copper deposit, Finnmark, Norway. At Vaygach, Arkhangel'sk; the Urup deposit, Caucasus Mountains, and other less-well-defined localities in Russia. In Japan, at the Shakanai and Furutobe mines, Akita Prefecture. From the Rajpura-Dariba polymetallic deposit, Udaipur district, Rajasthan, India. In the Ruby Creek deposit, southern Brooks Range, Alaska; and at the Inexco #1 mine, Jamestown, Boulder Co., Colorado, USA. From Pinar del Rio, Cuba.

Name: For Armand Marie Vincent Joseph Reniér (1876–1951), Belgian geologist and Director of the Belgian Geological Survey.

Type Material: National School of Mines, Paris, France.

Reppiaite $Mn_5^{2+}(VO_4)_2(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As striated irregular grains, flattened on {100}, to 300 μm; in fine-grained aggregates.

Physical Properties: Hardness = ∼3 VHN = 90–110, 100 average (15 g load).
D(meas.) = 3.92 D(calc.) = 3.91

Optical Properties: Transparent. *Color:* Red-orange. *Streak:* Yellow-orange.
Luster: Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Very weak; yellow-orange to deep orange. *Dispersion:* Medium. $\alpha = 1.803(2)$ (α') β = n.d. $\gamma = 1.810(5)$ (γ') 2V(meas.) = Large.

Cell Data: *Space Group:* $C2/m$. $a = 9.614(4)$ $b = 9.561(3)$ $c = 5.396(3)$ $\beta = 98.39(1)°$
Z = 2

X-ray Powder Pattern: Gambatesa mine, Italy.
2.680 (VS), 4.76 (S), 3.00 (M), 2.656 (M), 2.155 (M), 1.565 (M), 1.510 (M)

Chemistry:

As_2O_5	6.87	
V_2O_5	25.79	31.77
MnO	61.17	61.94
H_2O	[6.17]	6.29
Total	[100.00]	100.00

(1) Gambatesa mine, Italy; by electron microprobe, average of ten analyses from two samples, total Mn as MnO, H_2O by difference; corresponding to $Mn_{5.01}[(V_{0.82}As_{0.18})_{\Sigma=1.00}O_4]_2(OH)_{3.98}$.
(2) $Mn_5(VO_4)_2(OH)_4$.

Occurrence: A rare mineral, deposited from V–As-bearing hydrothermal solutions in fractures cutting manganiferous cherts.

Association: Hausmannite, tephroite, Mn–Ca carbonates.

Distribution: From the Gambatesa mine, near Reppia, Val Graveglia, Liguria, Italy.

Name: For Reppia, Italy, a village near the locality where the mineral was first found.

Type Material: University of Genoa, Genoa, Italy.

References: (1) Basso, R., G. Lucchetti, L. Zefiro, and A. Palenzona (1992) Reppiaite, $Mn_5(OH)_4(VO_4)_2$, a new mineral from Val Graveglia (Northern Appenines, Italy). Zeits. Krist., 201, 223–234. (2) (1993) Amer. Mineral., 78, 452 (abs. ref. 1).

Retgersite $NiSO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 422. Rare in crude single crystals, to 3 mm; as fibers, elongated along [001], may be twisted spire- and hornlike, and in veinlets; most commonly as efflorescences.

Physical Properties: *Cleavage:* On {001}, perfect; on {110}, in traces, microscopically observed. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.04 D(calc.) = 2.075 Soluble in H_2O, taste slightly bitter and metallic.

Optical Properties: Semitransparent. *Color:* Deep emerald-green tinged with blue; pale green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.510–1.511$ $\epsilon = 1.486$

Cell Data: *Space Group:* $P4_12_12$. $a = 6.783(1)$ $c = 18.288(2)$ $Z = 4$

X-ray Powder Pattern: Synthetic.

(1) Cottonwood Canyon, Nevada, USA; H_2O by difference. (2) Jáchymov, Czech Republic; H_2O by TGA, corresponds to $(Ni_{1.01}Mg_{0.04}Ca_{0.02})_{\Sigma=1.07}S_{0.99}O_4 \cdot 5.99H_2O$. (3) $NiSO_4 \cdot 6H_2O$.

Polymorphism & Series: Dimorphous with nickelhexahydrite.

Occurrence: An uncommon secondary mineral in the oxidization zone of nickel-bearing hydrothermal mineral deposits, formed from H_2O solution between 31.5 °C and 53.5 °C.

Association: Nickeline, gersdorffite, nickelian pyrite, morenosite, chalcanthite, annabergite.

Distribution: Crystallized from Minasragra, 46 km from Cerro de Pasco, Peru. In the USA, in Cottonwood Canyon, at the Nickel and Lovelock mines, Table Mountain district, Churchill Co., Nevada; from the Gap Nickel mine, Lancaster Co., Pennsylvania; at Mine La Motte, Fredericktown, Madison Co., Missouri. From Key Lake, Saskatchewan, Canada. In Germany, at Lichtenberg, near Bayreuth, Bavaria; at Lobenstein, Thuringia; and from Antweiler, Eifel; in the Rammelsberg mine, near Goslar, Harz Mountains. From "Menimuir Burn", near Cassencarie, Kirkcudbrightshire, Scotland. At the Newdigate colliery, near Bedworth, southwest of Nuneaton, Warwickshire, England. From the 132 North nickel mine, 4 km southwest of Widgiemooltha, and at Kambalda, 56 km south of Kalgoorlie, Western Australia. In the Allarechensk deposit, Kola Peninsula, and from the Noril'sk region, western Siberia, Russia. At Chelmiec, Poland. From Jáchymov (Joachimsthal), and near Smrkovec, about 10 km north-northeast of Mariánské Lázně (Marienbad), Czech Republic.

Name: To honor Jan Willem Retgers (1856–1896), Dutch physical chemist and chemical crystallographer, who studied the crystallography of many synthetic compounds.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 100822.

Revdite $Na_{16}Si_{16}O_{27}(OH)_{26}\cdot 28H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Crystals prismatic, with sharply pointed terminations, to 2 mm; as spherical fibrous aggregates and irregular rounded masses.

Physical Properties: *Cleavage:* Perfect on {100}, less perfect on {010}. *Tenacity:* Fibers are flexible. Hardness = ∼2 D(meas.) = 1.94 D(calc.) = 1.93 Dissolves slowly in water at room temperature, giving an alkaline reaction.

Optical Properties: Transparent. *Color:* Colorless to white. *Luster:* Vitreous to pearly, silky.
Optical Class: Biaxial (–). *Orientation:* $Y \wedge c = 0°$–$10°$. $\alpha = 1.469(2)$ $\beta = 1.482(2)$ $\gamma = 1.490(2)$ 2V(meas.) = 75° 2V(calc.) = 75.6°

Cell Data: *Space Group:* $C2$. $a = 5.383(4)$ $b = 9.972(9)$ $c = 6.907(4)$ $\beta = 96.78(1)°$ Z = 2

X-ray Powder Pattern: Lovozero massif, Russia.
4.46 (100), 13.37 (76), 3.34 (71), 2.501 (48), 3.79 (42), 2.879 (38), 2.230 (24)

Chemistry:

	(1)	(2)
SiO_2	45.21	43.78
Na_2O	22.25	22.58
K_2O	0.08	
H_2O	32.50	33.64
Total	100.04	100.00

(1) Lovozero massif, Russia. (2) $Na_{16}Si_{16}O_{27}(OH)_{26}\cdot 28H_2O$.

Occurrence: In ussingite veinlets cutting nepheline syenites in a differentiated alkalic massif (Lovozero massif, Russia); in sodalite xenoliths in syenite in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Ussingite (Lovozero massif, Russia); ussingite, villiaumite, kogarkoite, lovozerite, eudialyte (Mont Saint-Hilaire, Canada).

Distribution: From Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Revda, a town near Mt. Karnasurt, on which the mineral occurs.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5531; Mining Institute, St. Petersburg, 1204/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81394.

Reyerite $(Na,K)_2Ca_{14}Al_2Si_{22}O_{58}(OH)_8 \cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. In radiating aggregates of thin hexagonal plates. Massive, and intergrown with chlorite.

Physical Properties: *Cleavage:* Perfect on {0001}, micaceous. Hardness = 3.5–4.5 D(meas.) = 2.51–2.58 D(calc.) = 2.59

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale green with chlorite inclusions. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.563–1.568$ $\epsilon = 1.558–1.563$

Cell Data: *Space Group:* $P\bar{3}$. $a = 9.767$ $c = 19.067$ Z = 1

X-ray Powder Pattern: Niaqornat, Greenland; can resemble gyrolite or truscottite.
3.17 (vs), 2.855 (s), 2.659 (s), 1.846 (s), 4.23 (ms), 3.52 (m), 3.035 (m)

Chemistry:

	(1)	(2)	(3)
SiO_2	53.2	54.7	53.4
Al_2O_3	3.8	4.4	4.7
CaO	32.3	31.6	31.8
Na_2O	2.3	3.5	1.5
K_2O	1.6	2.2	5.2
H_2O	6.0	[3.6]	[3.4]
Total	99.2	[100.0]	[100.0]

(1) Niaqornat, Greenland. (2) Do.; by electron microprobe, H_2O by difference; corresponds to $(Na_{2.7}K_{1.1})_{\Sigma=3.8}Ca_{13.6}Al_{2.1}Si_{21.9}O_{60}(OH)_{4.6} \cdot 5H_2O$. (3) Rawlings quarry, Virginia, USA; by electron microprobe, H_2O by difference; corresponds to $(K_{1.1}Na_{2.7})_{\Sigma=3.8}Ca_{13.9}Al_{2.3}Si_{21.7}O_{60}(OH)_{5.2} \cdot 5H_2O$.

Occurrence: In tuff (Niaqornat, Greenland); in basalt, within the contact aureole of a volcanic plug (Isle of Mull, Scotland); in a low-grade regionally metamorphosed diabase dike (Rawlings quarry, Virginia, USA).

Association: Calcite, chlorite, gyrolite, analcime, pectolite, thomsonite, natrolite.

Distribution: In Greenland, at Niaqornat (Niakornak). In Scotland, at 'S Airde Beinn, five km west of Tobermory, Isle of Mull, and at Allt Coir' a' Ghobhainn, near Drynoch, Isle of Skye. In the USA, in the Rawlings quarry, south of McKenney, Brunswick Co., Virginia.

Name: For Professor Eduard Reyer (1849–1914), geologist of Vienna, Austria.

Type Material: University of Copenhagen, Copenhagen, Denmark.

References: (1) Dana, E.S. and W.E. Ford (1909) Dana's system of mineralogy, (6th edition), app. II, 88. (2) Chalmers, R.A., V.C. Farmer, R.I. Harker, S. Kelly, and H.F.W. Taylor (1964) Reyerite. Rhabdophane-(Ce) $(Ce,La)PO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As stalactitic, globular, or botryoidal incrustations with internally radial fibrous structure.

Physical Properties: *Fracture:* Uneven to conchoidal. Hardness = 3–3.5
D(meas.) = 3.77–4.01 D(calc.) = 4.19 (synthetic $CePO_4 \cdot H_2O$).

Optical Properties: Translucent. *Color:* Brown, pale pink, yellowish white, creamy, may be pale green. *Luster:* Greasy to dull.
Optical Class: Uniaxial (+). *Pleochroism:* O = colorless; E = brownish. *Orientation:* Positive elongation. $\omega = 1.654–1.700$ $\epsilon = 1.703–1.744$

Cell Data: *Space Group:* $P6_222$. $a = 7.055(5)$ $c = 6.439(3)$ $Z = 3$

X-ray Powder Pattern: Clara mine, Germany.
3.03 (10), 6.09 (9), 2.83 (9), 4.41 (8), 3.51 (7), 2.16 (6), 1.865 (6)

Chemistry:

	(1)	(2)
P_2O_5	24.64	28.04
SiO_2	3.76	
$(Al,Fe)_2O_3$	1.93	
$(Ce,Y)_2O_3$	61.69	
Ce_2O_3		64.84
H_2O	7.50	7.12
Total	99.52	100.00

(1) Cornwall, England. (2) $CePO_4 \cdot H_2O$.

Occurrence: A very rare mineral in some hydrothermal ore deposits.

Association: Sphalerite (Fowey Consols mine, England); barite, fluorite, chalcopyrite, tetrahedrite (Clara mine, Germany).

Distribution: In England, from an unknown locality Cornwall. In Germany, at the Clara mine, near Oberwolfach, Black Forest; from Waldstein, Fichtelgebirge, Bavaria; at the Krufter Ofen volcano, Eifel district. In the Ilímaussaq intrusion, Greenland. At Mont Saint-Hilaire and from near Saint-Amable, Quebec, Canada. At Iron Hill, Powderhorn district, Gunnison Co., Colorado, and in the Majuba Hill mine, Antelope district, Pershing Co., Nevada, USA. From the Lovozero and Kovdor massifs, Kola Peninsula, and at the Kiya alkalic massif, Yenisei Ridge, Siberia, Russia. In the Sumi region, Ukraine. From Karonge, Burundi.

Name: From the Greek for *a rod* and *to appear*, for the characteristic bands due to cerium in its emission spectrum, and the dominant rare earth, *cerium*.

Type Material: The Natural History Museum, London, England, Ludlam collection.

Rhabdophane-(La) $(La, Ce)PO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Radiating and fanlike aggregates of fine fibrous crystals, to 0.05 mm; may be in druses.

Physical Properties: *Fracture:* Subconchoidal. Hardness = 3–3.5 D(meas.) = 4.4 D(calc.) = 4.3

Optical Properties: Semitransparent. *Color:* Pale pink, yellowish to dark brown.
Luster: Greasy to silky.
Optical Class: Uniaxial (+). $\omega = 1.692$ $\epsilon = 1.732$

Cell Data: *Space Group:* $[P6_222]$ [by analogy to rhabdophane-(Ce)]. $a = 7.03(1)$ $c = 6.41(1)$ Z = 3

X-ray Powder Pattern: Kazakhstan (?).
1.86 (7), 3.03(6), 2.85 (4), 2.157 (4b), 2.133 (4b), 1.76 (2), 1.68 (2)

Total	99.87

(1) Kazakhstan (?); RE by XRF; Y = 0.5%, La = 49%, Ce = 8.4%, Pr = 14.6%, Nd = 3.3%, Sm = 12.5%, Eu = 1.3%, Gd = 4.2%, Tb = 0.4%, Dy = 2.2%, Ho = 0.2%, Er = 1.3%, Tm = 0.2Yb = 1.7

Occurrence: A secondary mineral in faults cutting weathered sediments, probably derived from a porphyritic granite.

Association: Clay minerals, "opal".

Distribution: From an undisclosed locality, probably in Kazakhstan. On Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At the Silberbrünnle mine, near Gengenbach, Black Forest, Germany. From Gakara, Burundi.

Name: For its dominant rare earth, *lanthanum*, and relation to *rhabdophane*-(Ce).

Type Material: n.d.

References: (1) Dumler, F.L., K.P. Skornyakova, and G.G. Shul'ga (1969) Lanthanum rhabdophane in the weathered mantle on limestones – a new type of rare earth mineralization. Zap. Vses. Mineral. Obshch., 98, 593–600 (in Russian).

(1) Kimberley, South Africa, average of two analyses. (2) Do.; by electron microprobe, H_2O by difference. (3) $KHCa_2Si_8O_{19}\cdot 5H_2O$.

Occurrence: In a kimberlite pipe (Kimberley, South Africa); in a magadiite deposit localized in altered silicic lavas (Trinity Co., California, USA).

Association: Mountainite (Kimberley, South Africa); magadiite, montmorillonite (Trinity Co., California, USA).

Distribution: In South Africa, at the Bultfontein diamond mine, Kimberley, Cape Province. From near Redding, Trinity Co., California, USA. On the Zeilberg, near Maroldsweisach, Bavaria, Germany. From San Venanzo, near Terni, Lazio, Italy.

Name: For Cecil John Rhodes (1853–1902), British founder of the DeBeers Mining Company, also for Rhodes University, Grahamstown, South Africa, where the mineral was examined.

Type Material: The Natural History Museum, London, England, 1957,18; National Museum of Natural History, Washington, D.C., USA, 114793.

Rhodium (Rh, Pt)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$ (synthetic). As subhedral grains, to 200 μm.

Physical Properties: Hardness = n.d. VHN = 136–194, 165 average (30 g load). D(meas.) = n.d. D(calc.) = [16.5]

Optical Properties: Opaque. *Color:* In polished section, bright white. *Luster:* Metallic. R: (470) 75.2, (546) 72.6, (589) 73.3, (650) 75.7

Cell Data: *Space Group:* $Fm3m$ (synthetic). a = 3.856(1) Z = 4

X-ray Powder Pattern: Stillwater complex, Montana, USA. 0.7874 (100), 0.8623 (80), 0.8847 (70), 2.227 (60), 1.362 (50), 1.162 (50), 1.927 (30)

Chemistry:

	(1)
Pt	59.6
Rh	41.7
Total	101.3

(1) Stillwater complex, Montana, USA; by electron microprobe, corresponding to $Rh_{0.57}Pt_{0.43}$.

Occurrence: A single grain was found in heavy mineral concentrates (Stillwater complex, Montana, USA).

Association: Platinum, Pt–Fe alloy, gold, moncheite, kotulskite, merenskyite, cooperite, braggite, vysotskite, sperrylite, pyrite, chalcopyrite, pyrrhotite, chromite, magnetite, marcasite, violarite, graphite (Stillwater complex, Montana, USA).

Distribution: In the USA, from the Stillwater complex, Montana [TL], and at Fox Gulch, Goodnews Bay, Alaska.

Name: From the Greek *rhodon*, *rose*.

Type Material: Royal Ontario Museum, Toronto, Canada, M33257.

Rhodizite $(K, Cs)Al_4Be_4(B, Be)_{12}O_{28}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Typically as well-formed dodecahedra and tetrahedra, to 3.5 cm, modified by {001} and {$\overline{1}$11}. *Twinning:* On {111}, uncommon.

Physical Properties: *Cleavage:* {111} and {$\overline{1}$11}, indistinct. *Fracture:* Conchoidal. Hardness = 8–8.5 D(meas.) = 3.22–3.44 D(calc.) = 3.2–3.62 Strongly piezoelectric and pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless to white, may have a pale gray or pale yellow tinge; in transmitted light, colorless. *Luster:* Vitreous to slightly adamantine.
Optical Class: Isotropic, may display zoned anomalous birefringence. $n = 1.693(1)$

Cell Data: *Space Group:* $P\overline{4}3m$. a = 7.317–7.319 Z = 1

X-ray Powder Pattern: Manjaka, Madagascar; very similar to londonite.
2.983 (100), 2.440 (51), 3.274 (48), 2.111 (37), 1.775 (25), 1.956 (22), 2.205 (21)

(1) Ambatofinandrahana, Madagascar; B_2O_3 by ICP, SiO_2 6.23% assumed as quartz; calculated neglecting impurities, corresponds to $(K_{0.46}Cs_{0.36}Rb_{0.06}Na_{0.02}Li_{0.02})_{\Sigma=0.92}Al_{3.99}Be_{4.00}(B_{11.35}Be_{0.55})_{\Sigma=11.90}O_{28.00}$. (2) Andasy, Madagascar; by electron microprobe, average of seven analyses, B_2O_3 and BeO calculated for stoichiometry; corresponds to $(K_{0.82}Cs_{0.09}Rb_{0.04}Na_{0.05}Li_{0.02}Ca_{0.01})_{\Sigma=1.03}(Al_{3.99}Si_{0.01})_{\Sigma=4.00}Be_{4.00}(B_{10.99}Be_{1.00})_{\Sigma=11.99}O_{28.00}$.

Occurrence: A rare late-stage accessory mineral in alkali-rich granite pegmatites.

Association: Londonite, elbaite, spodumene, beryl, béhierite, albite, microcline, quartz.

Distribution: Found near Sarapulka and Shaitanka, Mursinka district, Ural Mountains, Russia. In Madagascar, from Antandrokomby, near Mt. Bity, at Andasy, Besesitra, and Ifsina, Manandona Valley, Antsirabe district; from Fiakarandava, south of the Manandona Valley; from the Ambatofinandrahana district, in the Ankarata Mountains; at Antsongombato, 25 km southwest of Mahaiza, Betafo district; from Ampanivana, 15 km south of Antsongombato; at Ampakita and Sahanivotry, in the Sahatany Valley; and from Ambalalehifotsy. In England, from Meldon and Okehampton, Devon. In the USA, found in the Animikie Red Ace pegmatite, near Pine River, Florence Co., Wisconsin.

Name: From the Greek for *rose-colored*, for the rose-red color the mineral imparts to the blowpipe flame.

Rhodochrosite $Mn^{2+}CO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Crystals are rhombohedra $\{10\bar{1}1\}$ or scalenohedra $\{21\bar{3}1\}$, to 12 cm, modified by $\{0001\}$, $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, with several other forms, may be rounded or saddle-shaped. Commonly in bladed aggregates, columnar, stalactitic, botryoidal, compact granular, massive. *Twinning:* On $\{10\bar{1}2\}$, contact and lamellar, then flattened.

Physical Properties: *Cleavage:* $\{10\bar{1}1\}$, perfect; $\{01\bar{1}2\}$, a parting. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 3.70 D(calc.) = 3.70

Optical Properties: Transparent to translucent. *Color:* Pink, rose-red, cherry-red, yellow, yellowish gray, cinnamon-brown, may be banded; pale rose to colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, pearly in aggregates.
Optical Class: Uniaxial (–). *Pleochroism:* Faint. *Absorption:* $O > E$. $\omega = 1.810$ $\epsilon = 1.597$

Cell Data: *Space Group:* $R\bar{3}c$ (synthetic). $a = 4.777$ $c = 15.67$ Z = 6

X-ray Powder Pattern: Synthetic.
2.84 (100), 3.66 (35), 1.763 (35), 1.770 (30), 2.172 (25), 2.000 (25), 2.39 (20)

Chemistry:

	(1)	(2)
CO_2	38.26	38.29
FeO	0.77	
MnO	60.87	61.71
MgO	trace	
CaO	0.51	
Total	100.41	100.00

(1) Ljubija district, Bosnia-Herzegovina. (2) $MnCO_3$.

Polymorphism & Series: Forms two series, with calcite and with siderite.

Mineral Group: Calcite group.

Occurrence: A primary mineral in low- to moderate-temperature hydrothermal veins; in metamorphic deposits; common in carbonatites; authigenic and secondary in sediments; uncommon in granite pegmatites.

Association: Calcite, siderite, dolomite, fluorite, barite, quartz, pyrite, tetrahedrite, sphalerite, hübnerite (hydrothermal); rhodonite, garnet, alabandite, hausmannite (metamorphic).

Distribution: Numerous localities; only a few for fine specimens are listed. From Cavnic (Kapnikbánya) and Herja (Kisbánya), Baia Mare (Nagybánya) district, Romania. In the Wolf mine, near Herdorf, Westphalia, Germany. In Russia, from the Vuoriyarvi carbonatite complex and the Kovdor massif, Kola Peninsula. Large twinned crystals at Mont Saint-Hilaire, Quebec, Canada. In the USA, from the Emma mine, Butte, Silver Bow Co., Montana; in Colorado, at many localities, as fine large crystals in the Home Sweet Home mine, Alma, Park Co., from the Climax mine, Lake Co., in the Sunnyside mine, near Silverton, San Juan Co., and the Mountain Monarch mine, Ouray Co. In Mexico, from Cananea, Sonora, and Santa Eulalia, Chihuahua. Large crystals from the Huallapón mine, Pasto Bueno, Ancash Department, and in the Uchuc-Chacua deposit, Cajatambo Province, Peru. In Province, Peru. A large deposit of ornamental banded material at the Capillitas mine, San Luis, Catamarca Province, Argentina. Exceptional crystals from the Hotazel and N'Chwaning mines, near Kuruman, Cape Province, South Africa. From the Inakuraishi and Yakumo mines, Hokkaido, Japan.

Name: From the Greek *rhodon*, for *rose*, and *chrosis*, for *coloring*.

Rhodonite $(Mn^{2+}, Fe^{2+}, Mg, Ca)SiO_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals rough, with rounded edges, typically tabular and elongated ‖ [001], to 20 cm; commonly massive, cleavable to compact. *Twinning:* Lamellar, with {010} as composition plane.

Physical Properties: *Cleavage:* Perfect on {110} and $\{1\bar{1}0\}$, $(110) \wedge (1\bar{1}0) = 92.5°$; good on {001}. *Fracture:* Conchoidal to uneven. Hardness = 5.5–6.5 D(meas.) = 3.57–3.76 D(calc.) = 3.726

Optical Properties: Transparent to translucent. *Color:* Rose-pink to brownish red, gray, or yellow, exterior commonly black from manganese oxides; in thin section, colorless to faint pink. *Streak:* White. *Luster:* Vitreous, somewhat pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = yellowish red; Y = pinkish red; Z = pale yellowish red. *Orientation:* $X \wedge a \simeq 5°$; $Y \wedge b \simeq 20°$; $Z \wedge c \simeq 25°$. *Dispersion:* $r < v$. $\alpha = 1.711$–1.734 $\beta = 1.716$–1.739 $\gamma = 1.724$–1.748 2V(meas.) = 63°–87°

Cell Data: *Space Group:* $C\bar{1}$. $a = 9.758$ $b = 10.499$ $c = 12.205$ $\alpha = 108.58°$ $\beta = 102.92°$ $\gamma = 82.52°$ Z = 20

X-ray Powder Pattern: Franklin, New Jersey, USA. (ICDD 13-138).
2.772 (100), 2.980 (65), 2.924 (65), 3.14 (30), 3.34 (25), 3.10 (25), 2.651 (18)

Chemistry:

	(1)
SiO_2	45.46
Al_2O_3	0.27
Fe_2O_3	0.00
FeO	0.96
MnO	50.54
ZnO	trace

(1) Chikla, Bhandara district, Maharashtra, India; corresponds to $(Mn^{2+}_{0.93}Ca_{0.05}Fe^{2+}_{0.02}Mg_{0.02})_{\Sigma=1.02}(Si_{0.99}Al_{0.01})_{\Sigma=1.00}O_3$.

Occurrence: In manganese-bearing deposits formed by hydrothermal, contact and regional metamorphic, and sedimentary processes.

Association: Calcite, willemite, franklinite (Franklin, New Jersey, USA); calcite, alleghanyite, tephroite, galaxite, grunerite, magnetite (Bald Knob, North Carolina, USA).

Distribution: A few localities for studied or fine material are: from around Yekaterinburg (Sverdlovsk), Ural Mountains, Russia. In the Harstigen mine, near Persberg, and at Långban, Värmland, Sweden. In the Meldon quarry, Okehampton, Devon, England. In Romania, at Băiţa (Rézbánya) and Cavnic (Kapnik). From near Viu and St. Marcel, Val d'Aosta, Italy. At Broken Hill, New South Wales, Australia, as gem crystals. In the Noda-Tamagawa mine, Iwate Prefecture, and many other places in Japan. In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at Bald Knob, near Sparta, Alleghany Co., North Carolina; from Butte, Silver Bow Co., Montana. At Morro da Mina, Conselheiro Lafaiete, Minas Gerais, Brazil, as gem crystals. In the Chiurucu mine, Huanaco, Peru.

Name: From the Greek for *rose*, in reference to the mineral's color.

Rhodostannite $Cu_2FeSn_3S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Very fine-grained massive, slightly porous.

Physical Properties: Hardness = n.d. VHN = 243–266 (100 g load). D(meas.) = n.d. D(calc.) = 4.79

Optical Properties: Opaque. *Color:* Reddish. *Luster:* Metallic. *Anisotropism:* Distinct, from bluish gray to dark brown.

R_1–R_2: (400) 29.1–30.4, (420) 28.7–29.9, (440) 28.3–29.4, (460) 28.2–29.3, (480) 28.2–29.4, (500) 28.3–29.8, (520) 28.5–30.2, (540) 28.8–30.4, (560) 28.9–30.6, (580) 28.9–30.8, (600) 28.9–30.8, (620) 28.9–30.8, (640) 28.8–30.7, (660) 28.8–30.7, (680) 28.7–30.5, (700) 28.6–30.3

Cell Data: *Space Group:* $I4_1/a$ (synthetic). $a = 7.305(2)$ $c = 10.330(5)$ $Z = 2$

X-ray Powder Pattern: Vila Apacheta, Bolivia.
3.12 (100), 5.93 (60), 2.58 (50), 6.09 (40), 1.819 (30), 1.837 (20), 3.64 (16)

Chemistry:

	(1)	(2)	(3)
Cu	16.0	15.9	15.97
Fe	6.8	6.5	7.02
Sn	45.5	45.4	44.76
S	31.3	32.8	32.25
Total	99.6	100.6	100.00

(1) Vila Apacheta, Bolivia; by electron microprobe, corresponding to $Cu_{2.03}Fe_{0.98}Sn_{3.10}S_{7.89}$.
(2) Do.; by electron microprobe, corresponding to $Cu_{1.98}Fe_{0.92}Sn_{3.02}S_{8.08}$. (3) $Cu_2FeSn_3S_8$.

Occurrence: An alteration product of stannite (Vila Apacheta, Bolivia).

Association: Stannite, pyrite (Vila Apacheta, Bolivia).

Distribution: At Vila Apacheta, Bolivia [TL]. From the Pirquitas deposit, Rinconada Department, Jujuy Province, Argentina. In the Dean mine, southeast of Battle Mountain, Lander Co., Nevada, and in the Campbell mine, Bisbee, Cochise Co., Arizona, USA.

Name: From the Greek for *rose*, in allusion to its color, and for its affinity to stannite.

Type Material: n.d.

References: (1) Springer, G. (1968) Electronprobe analyses of stannite and related tin minerals. Mineral. Mag., 36, 1045–1051. (2) (1969) Amer. Mineral., 54, 1218 (abs. ref. 1). (3) Wang, N. Total	100.31	100.00

(1) Ural Mountains, Russia; by electron microprobe; corresponds to $Pb_{1.95}(Rh_{3.06}Ir_{0.01}Pt_{0.01})_{\Sigma=3.08}S_{1.97}$. (2) $Pb_2Rh_3S_2$.

Occurrence: In a platinum nugget in a placer probably derived from the nearby Omutninskii gabbro-pyroxenite-dunite massif.

Association: Platinum, tulameenite, iridium–osmium, laurite, chromite.

Distribution: From the Omutninskaya platinum-bearing placer, Omutnaya River, 20 km south of Polevskoi, Sysert' district, Ural Mountains, Russia [TL].

Name: For rhodium and lead, *plumbum*, in the composition.

Type Material: Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Rhomboclase $H_5Fe^{3+}O_2(SO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thin tabular crystals, {001}, {010}, {100}, {111}, {011}, with other modifying forms noted, giving a rhombic outline, to 2 cm; may be radially bladed in stalactites.

Physical Properties: *Cleavage:* Perfect on {001}, good on {110}. *Fracture:* Conchoidal to fibrous. *Tenacity:* Cleavage folia are flexible. Hardness = 2 D(meas.) = 2.23 D(calc.) = 2.210 Slowly soluble in H_2O.

Optical Properties: Transparent. *Color:* White, gray, pale yellow, may be pale green or pale blue if impure; colorless in transmitted light. *Luster:* Subvitreous to pearly.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.534$ $\beta = 1.553$–1.555 $\gamma = 1.634$–1.638 $2V(meas.) = 27°$

Cell Data: *Space Group: Pnma.* $a = 9.724(4)$ $b = 18.333(9)$ $c = 5.421(4)$ $Z = 4$

X-ray Powder Pattern: Cerro de Pasco, Peru.
9.18 (> 100), 3.29 (18), 4.05 (15), 3.33 (15), 3.11 (11), 3.05 (10), 4.75 (7)

(1) Szomolnok, Slovakia; remnant is $MgO+Na_2O$, H_2O stated determined by difference. (2) Cerro de Pasco, Peru, H_2O by TGA. (3) $H_5FeO_2(SO_4)_2 \cdot 2H_2O$.

Occurrence: An uncommon secondary mineral formed by alteration of pyrite, especially in an arid climate; typically of post-mining origin.

Association: Szomolnokite, copiapite, römerite, voltaite, epsomite, halotrichite, melanterite, chalcanthite, pyrite.

Distribution: From Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia. At Lesenceistvánd, Hungary. In the Nikitovka mercury deposit, Gorlovka, Ukraine. At the Esperanza mine, Cerro de Pasco, Peru. In Chile, from Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta. Large crystals in the Socavon mine, Oruro, Bolivia. In the USA, from the Copper Queen mine, Bisbee, Cochise Co., and in the Magma mine, Superior district, Pinal Co., Arizona.

Name: From the Greek for *rhomb*, for the typical rhombic crystal outline, and for *to break*, for its perfect cleavage.

(1) Scharnhausen, Germany; corresponds to $(Ca_{1.78}Na_{0.18}K_{0.11})_{\Sigma=2.07}(Mg_{2.52}Fe^{2+}_{1.28}Fe^{3+}_{1.17}Ti_{0.96})_{\Sigma=5.93}(Si_{3.27}Al_{2.72}Fe^{3+}_{0.01})_{\Sigma=6.00}O_{20}$. (2) Kalaheo, Hawaii, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry, original total given as 98.12%; corresponds to $(Ca_{1.16}Na_{0.77}K_{0.01})_{\Sigma=1.94}(Mg_{3.78}Fe^{3+}_{1.65}Ti_{0.56}Fe^{2+}_{0.04}Mn_{0.03})_{\Sigma=6.06}(Si_{4.01}Al_{1.94}Fe^{3+}_{0.05})_{\Sigma=6.00}O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: In silica-undersaturated, alkalic, mafic to intermediate igneous rocks, as a primary mineral or an alteration product of amphiboles. Also developed at the contact of alkalic basalt and limestone.

Association: Titanian augite, kaersutite, alkalic feldspar, diopside, forsterite, spinel, perovskite, titanian magnetite, magnesioferrite.

Distribution: In Germany, in the Rhön Mountains, at Scharnhausen, near Stuttgart, Hesse; from Eichersattel, Sattelberg, and other volcanic cones in the Eifel district; at the Löbauer Berg, Saxony, and other places. From Skåne, Sweden. In France, from Puy de Saint-Sandoux, Auvergne; south of Bort-les-Orgues, Puy-de-Dôme; and at Monistrol-d'Allier, Haute Loire. From Hobbs Land, Greenland. In New Zealand, at Dunedin volcano, Otago Harbour, South Island. On Hut Point Peninsula, Ross Island, Antarctica. At Dogo, Oki Islands, Japan. Found near Study Butte, Brewster Co., Texas, and north of Kalaheo, Kauai, Hawaii, USA.

Name: For the Rhön district, Germany, from where it was first identified.

Type Material: n.d.

MgO	5.2
CaO	0.2
F	0.0
H_2O	[4.9]
Total	[100.0]

(1) Kombat mine, Namibia; by electron microprobe, H_2O by difference; corresponds to $(Mn^{2+}_{4.30}Mg_{0.60}Fe_{0.02}Ca_{0.02})_{\Sigma=4.94}Si_{1.90}O_{10}H_{2.54}$.

Polymorphism & Series: Dimorphous with alleghanyite.

Mineral Group: Leucophoenicite group.

Occurrence: In mineralogically distinct layers, in tectonically transported and boudinaged manganese-rich lenses within dolostones, apparently formed under prograde metamorphic conditions.

Association: Alleghanyite, manganoan calcite, pyrochroite, chlorite, galaxite, jacobsite.

Distribution: In the Kombat mine, 49 km south of Tsumeb, Namibia.

Name: To honor Dr. Paul H. Ribbe, Virginia Polytechnic Institute, Blacksburg, Virginia, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163208.

(1) Richelle, Belgium. (2) Analysis (1) recalculated to 100%, with $(OH)^{1-}$ by analogy to the lipscombite structure. (3) $(Ca_{1.3}Fe^{2+}_{0.7})_{\Sigma=2.0}(Fe^{3+}_{3.3}Al_{0.7})_{\Sigma=4.0}(PO_4)_{4.0}(OH)_{2.0}$.

Occurrence: Presumably as a secondary mineral in phosphatic sedimentary rocks.

Association: Halloysite, allophane, koninckite (Richelle, Belgium).

Distribution: From Richelle, near Visé, Belgium. In the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada, USA.

Name: For the locality where first found, Richelle, Belgium.

Type Material: University of Liège, Liège, Belgium, 9361 and 9375.

(1) Richelsdorf Mountains, Germany; by electron microprobe, H_2O by difference. (2) Triembach-au-Val, France; by electron microprobe, H_2O by difference. (3) $Ca_2Cu_5Sb(AsO_4)_4Cl(OH)_6 \cdot 6H_2O$.

Occurrence: In cavities in sandstone in the Kupferschiefer (Richelsdorf Mountains, Germany).

Association: Duftite, tyrolite, azurite, tetrahedrite–tennantite, calcite (Richelsdorf Mountains, Germany); tetrahedrite–tennantite, galena, brochantite, devilline, harmotome, calcite (Samson mine, Germany); erythrite, chalcophyllite, cornwallite, strashimirite, tetrahedrite–tennantite, barite (Triembach-au-Val, France).

Distribution: In Germany, from Iba, near Richelsdorf, Richelsdorf Mountains, and Reichenbach, near Bensheim, Hesse; at the Sauberg mine, Ehrenfriedersdorf, Saxony; in the Samson mine, St. Andreasberg, and on the dumps of the Glücksrad mine, Oberschulenberg, Harz Mountains; in the Alte Buntekuh mine, near Niederschelden, and at Ramsbeck, North Rhine-Westphalia; in the Clara mine, near Oberwolfach, Black Forest. From Triembach-au-Val, Haut-Rhin, France. Large crystals at the Burrus mine, Pyramid district, Washoe Co., Nevada, USA.

Name: For its first observed occurrence in the Richelsdorf Mountains, Germany.

Type Material: Göttingen University, Göttingen, Germany; National Museum of Natural History, Washington, D.C., USA, 150229.

Richetite $PbU_4^{6+}O_{13}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudohexagonal. *Point Group:* 1 or $\overline{1}$. As platy crystals, flattened on {001}, bounded by {010}, {110}, and {1$\overline{1}$0}, to 0.1 mm, in lamellar aggregates ∥ {001}, on needles of uranophane. *Twinning:* Common on a plane or planes in the [001] zone, to give pseudohexagonal outlines.

Physical Properties: *Cleavage:* {001}, perfect; another ⊥ to first. Hardness = n.d. VHN = 113 D(meas.) = n.d. D(calc.) = 6.02 Radioactive.

Optical Properties: Opaque to translucent. *Color:* Black; brown in transmitted light. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = pale brown to colorless; $Y = Z$ = dull brown. *Orientation:* $X = c^*$; $Y \wedge [110] = 85°$; $Z \wedge [110] = 5°$. $\alpha = \sim 1.9$ $\beta = \sim 2.0$ $\gamma = \sim 2.0$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. $a = 20.81(2)$ $b = 12.06(2)$ $c = 16.30(2)$ $\alpha = 103.8(2)°$ $\beta = 115.1(2)°$ $\gamma = 90.4(2)°$ Z = 9

X-ray Powder Pattern: Shinkolobwe, Congo.
3.122 (100), 7.12 (80), 3.55 (60), 3.47 (60), 2.486 (40), 1.961 (40), 2.008 (30)

Chemistry:

	(1)	(2)
UO_3	78.28	79.48
PbO	16.38	15.51
H_2O	[5.34]	5.01
Total	[100.00]	100.00

(1) Shinkolobwe, Congo; by electron microprobe, average of eight analyses, H_2O by difference; corresponding to $Pb_{1.07}U_{3.98}O_{13}\cdot 4.31H_2O$. (2) $PbU_4^{6+}O_{13}\cdot 4H_2O$.

Occurrence: A very rare secondary mineral in the oxidized zone of a hydrothermal uranium deposit (Shinkolobwe, Congo).

Association: Uraninite, uranophane, becquerelite, masuyite, torbernite, kasolite, rutherfordine, wölsendorfite (Shinkolobwe, Congo); metazeunerite, nováčekite, zeunerite, antlerite, langite (Jáchymov, Czech Republic).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Jáchymov (Joachimsthal), Czech Republic.

Name: To honor Emile Richet (1884–1939), Belgian geologist, formerly Chief Geologist, Union Minière du Haut-Katanga.

Type Material: University of Liège, Liège, Belgium, 1712.

(1) Libby, Lincoln Co., Montana, USA; corresponds to $(Na_{1.39}Ca_{0.92}K_{0.32})_{\Sigma=2.63}(Mg_{4.57}Fe^{3+}_{0.50}Fe^{2+}_{0.10}Al_{0.04}Ti_{0.03}Ni_{0.02}Mn_{0.01})_{\Sigma=5.27}(Si_{7.92}Al_{0.08})_{\Sigma=8.00}O_{22}[(OH)_{0.81}F_{0.57}]_{\Sigma=1.38}$. (2) Mayo Belwa meteorite; by electron microprobe, average of three analyses; corresponds to $(Na_{1.93}Ca_{1.00}K_{0.08})_{\Sigma=3.01}(Mg_{5.01}Al_{0.03}Ti_{0.02})_{\Sigma=5.06}Si_{8.03}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with ferrorichterite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A \geq 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; $Si \geq 7.5$.

Occurrence: Commonly in contact metamorphosed limestones; in alkalic igneous rocks and carbonatites. Also in meteorites.

Association: Leucite, diopside, forsterite, calcite, apatite, natrolite, phlogopite, cristobalite, enstatite, plagioclase.

Distribution: A few historic localities or sources for good specimen material include: at Långban and Pajsberg, Värmland, Sweden. In the Praborna mine, near St. Marcel, Val d'Aosta, Italy. At the Kangerdlugssuaq Fjord, Greenland. In the Murun massif, southwest of Olekminsk, Yakutia, Russia. In the USA, at Iron Hill, Gunnison Co., Colorado and the Leucite Hills, Sweetwater Co., Wyoming. In Canada, from Gooderham, Wilberforce; on Tory Hill, Bancroft; and at Essenville, Ontario; from near Gatineau Park, Quebec. At the Jacupiranga mine, São Paulo, Brazil. In the Noda-Tamagawa mine, Iwate Prefecture, and the Taguchi mine, Aichi Prefecture, Japan. At Imerina, Madagascar.

Name: For Professor Theodor Richter (1824–1898), German mineralogist.

Type Material: Mining Academy, Freiberg, Germany, 28854.

Rickardite $Cu_{3-x}Te_2$ (x = 0 to 0.36)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$ Massive, very fine grained, somewhat porous; may be botryoidal.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 VHN = 72–85 (50 g load). D(meas.) = 7.54 D(calc.) = 7.467

Optical Properties: Opaque. *Color:* Purple-red on fresh surface, tarnishes rapidly. *Luster:* Metallic. *Pleochroism:* Strong; carmine to violet-gray. *Anisotropism:* Strong; exceptional, in fiery orange colors.
R_1–R_2: (400) 28.3–37.2, (420) 26.1–35.5, (440) 23.5–33.2, (460) 20.8–30.5, (480) 17.8–27.5, (500) 15.1–24.8, (520) 12.8–22.3, (540) 11.5–20.3, (560) 11.8–18.9, (580) 14.5–18.2, (600) 19.6–18.4, (620) 26.0–19.4, (640) 32.7–21.0, (660) 38.6–23.3, (680) 43.9–26.0, (700) 48.1–28.6

Cell Data: *Space Group: Pmmn* (synthetic). $a = 3.9727(4)$ $b = 4.0020(5)$ $c = 6.1066(3)$ Z = 2

X-ray Powder Pattern: Good Hope Mine, Colorado, USA.
2.07 (100), 3.36 (60), 2.55 (40), 1.988 (40), 1.158 (30), 2.82 (20), 1.706 (20)

Chemistry:

	(1)	(2)
Cu	40.74	40.0
Te	59.21	60.9
Total	99.95	100.9

(1) Good Hope mine, Colorado, USA; corresponds to $Cu_{2.76}Te_{2.00}$. (2) Do.; by electron microprobe, corresponds to $Cu_{2.64}Te_{2.00}$.

Occurrence: A late-stage mineral of low-temperature hydrothermal origin in some Te-bearing mineral deposits.

Association: Vulcanite, tellurium, cameronite, petzite, sylvanite, berthierite, pyrite, arsenopyrite, bornite.

Distribution: In the USA, in Colorado, at the Good Hope mine, Vulcan, Gunnison Co. [TL]; also at the Empress Josephine mine, Bonanza district, Saguache Co., at Buckeye Gulch, Lake Co., and elsewhere; in Arizona, from the Junction and Campbell mines, Bisbee, and the Little Joe shaft, Tombstone, Cochise Co. In the Horne mine, Noranda, Quebec, Canada. From the San Miguel prospect, 10 km southwest of Moctezuma, Sonora, Mexico. At the Lomo Hierro silver deposit, western Cuba. From the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. In Japan, from the Teine mine, Hokkaido, and the Kawazu mine, Shizuoka Prefecture. From Kalgoorlie, Western Australia. In South Africa, at Ookiep, Namaqualand. From the Byn'govsk Au–Te deposit, Ural Mountains, and the Koshmansaisk deposits, Chatkal Ridge, in the basin of the Arbulak River, Russia. At Zlata Bana, Slanske vrchy Mountains, Czech Republic. Other occurrences are known.

Name: In honor of Thomas Arthur Rickard (1864–1953), mining engineer and Editor of the Engineering and Mining Journal, New York and London.

Type Material: National Museum of Natural History, Washington, D.C., USA, 114590.

Rickturnerite $Pb_7O_4[Mg(OH)_4](OH)Cl_3$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As mats, to 16 mm, of flattened fibrous crystals.

Physical Properties: *Cleavage*: Indistinct. *Fracture*: Splintery. *Tenacity*: Brittle.
Hardness = ~ 3 VHN = 140 (100 g load). D(meas.) = n.d. D(calc.) = 6.886

Optical Properties: Translucent. *Color*: Pale emerald green, gray in reflected light with abundant greenish gray internal reflections. *Streak*: White. *Luster*: Vitreous.
Optical Class: n.d. n = 1.38 [calculated]
R_1-R_2: (470) 14.9-15.7, (546) 13.8-14.4, (589) 13.6-14.2, (650) 13.4-14

Cell Data: *Space Group*: *Pnma*. a = 5.8034(5) b = 11.3574(9) c = 12.9393(16) Z = 8

X-ray Powder Pattern: Torr Works (Merehead) quarry, England.
6.474 (100), 3.233 (73), 2.867 (57), 5.636 (44), 3.112 (31), 2.635 (25), 4.287 (20)

Chemistry:

$-O=Cl_2$	1.50	1.39
Total	97.02	100.00

(1) Torr Works (Merehead) quarry, England; electron microprobe analyses, H_2O calculated from structure analysis; corresponding to $Pb_{7.16}Mg_{0.81}Cu_{0.03}Cl_{3.40}H_{4.60}O_{8.60}\cdot 1.15H_2O$.
(2) $Pb_7O_4[Mg(OH)_4](OH)Cl_3$.

Occurrence: Part of an assemblage of lead oxychloride minerals that occur in cavities in manganese oxide pods in limestone.

Association: Mereheadite, cerussite, calcite, aragonite, mimetite, hydrocerussite, "plumbonacrite," manganite, pyrolusite, and an uncharacterized lead oxychloride.

Distribution: From the Torr Works (Merehead) quarry, near the village of Cranmore, England.

Name: Honors Rick Turner, geologist and mineral collector, who collected the first specimens.

Type Material: Natural History Museum, London, England (BM 2008,100).

(1) Dales Gorge Iron Formation, Western Australia; by electron microprobe, corresponds to $(Na_{2.00}Ca_{0.02}K_{0.01})_{\Sigma=2.03}(Fe^{2+}_{2.26}Mg_{0.66}Ti_{0.06})_{\Sigma=2.98}Fe^{3+}_{1.95}(Si_{7.98}Al_{0.02})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Pikes Peak area, Colorado, USA; corresponds to $(Na_{2.02}K_{0.29}Ca_{0.01})_{\Sigma=2.32}(Fe^{2+}_{2.30}Li_{0.33}Mn_{0.18}Al_{0.10}Ti_{0.02}Mg_{0.01})_{\Sigma=2.94}Fe^{3+}_{2.02}(Si_{7.75}Al_{0.25})_{\Sigma=8.00}O_{22}[F_{1.25}(OH)_{0.89}]_{\Sigma=2.14}$.

Polymorphism & Series: Forms a series with magnesioriebeckite.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) \geq 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) \geq 0.7$; $(Na + K)_A < 0.5$; $Na_B \geq 1.34$.

Occurrence: In alkalic granites and syenites; rarer in felsic volcanics and granite pegmatites; in some schists. In iron formations as asbestiform "crocidolite."

Association: Aegirine, nepheline, albite, arfvedsonite (igneous); tremolite, ferro-actinolite (metamorphic); grunerite, magnetite, hematite, stilpnomelane, ankerite, siderite, calcite, "chalcedony," quartz (iron formations).

Distribution: Numerous localities. On Socotra Island, Indian Ocean. In South Africa, north from Koegas, Cape Province, and east of Pietersburg, Transvaal. Exceptional crystals from Sultan Hamud, Kenya. In the USA, at Quincy, Norfolk Co., Massachusetts; at St. Peters Dome, near Pikes Peak, El Paso Co., Colorado; from Washington Pass, Okanogan Co., Washington. In Canada, at the Red Wine complex, Labrador, Newfoundland; and at Mont Saint-Hilaire, Quebec. Around Chapare, Cochabamba, Bolivia. At Wittenoom and elsewhere in the Hamersley Ranges, Western Australia.

Name: To honor Emil Riebeck (1853–1885), German explorer.

(1) Rio Blanco Co., Colorado, USA. (2) $(Cr, Al)_6SiO_{11} \cdot 5H_2O$ with Cr:Al = 3.5:2.5.

Occurrence: On the outer surface and in shallow recesses of a petrified log in sandstone.

Association: Carnotite, organic matter.

Distribution: From the Riland uranium claim, about 21 km east-northeast of Meeker, Rio Blanco Co., Colorado, USA.

Name: For James L. Riland, newspaper publisher from Meeker, Colorado, USA, owner of the mining claims on which the mineral was discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 96808.

Total	100.70

(1) Zheleznyi iron mine, Russia; by electron microprobe, average of two analyses, total Mn as MnO, H_2O by the Penfield method; corresponds to $(Mg_{5.05}Mn_{0.17})_{\Sigma=5.22}(Ba_{0.85}Sr_{0.13}Ca_{0.01})_{\Sigma=0.99}(P_{0.98}O_4)_4 \cdot 7.45H_2O$.

Occurrence: In cavities in dolomitic carbonatites cutting jacupirangite and forsterite-magnetite iron ores in a differentiated alkalic massif.

Association: Collinsite, bobierrite, carbonate-fluorapatite, strontiowhitlockite, pyrite.

Distribution: From the Zheleznyi iron mine, Kovdor massif, Kola Peninsula, Russia.

Name: Honoring Professor Ol'ga Mikhailonova Rimskaya-Korsakova [RIMskaya-KORsakova, OLGa] (1914–1987), mineralogist, St. Petersburg University, St. Petersburg, Russia, who researched the Kovdor massif.

Type Material: St. Petersburg University, St. Petersburg; Mining Institute, St. Petersburg, Russia, 2035/1.

Ringwoodite $(Mg, Fe^{2+})_2SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. As rounded grains, to 100 μm, or massive.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.90

Optical Properties: Semitransparent. *Color:* Purple, bluish to smoky gray, colorless. *Optical Class:* Isotropic. $n = 1.768(3)$

Cell Data: *Space Group: Ia3d.* $a = 8.113$–8.127 Z = 8

X-ray Powder Pattern: Tenham meteorite.
2.447 (100), 1.434 (60), 2.028 (40), 2.872 (20), 1.560 (20), 1.0559 (10), 0.8283 (10)

Chemistry:

	(1)	(2)
SiO_2	38.9	38.42
TiO_2		0.05
FeO	23.4	22.98
MnO		0.30
MgO	37.0	37.86
CaO		0.05
Total	99.3	[99.66]

(1) Tenham meteorite; by electron microprobe, corresponding to $(Mg_{1.48}Fe^{2+}_{0.52})_{\Sigma=2.00}SiO_4$.
(2) Pampa del Infierno meteorite; by electron microprobe, Al_2O_3, Cr_2O_3, NiO, Na_2O, K_2O all $< 0.01\%$, original total given as 99.64%; corresponds to $(Mg_{1.48}Fe^{2+}_{0.52})_{\Sigma=2.00}SiO_4$.

Polymorphism & Series: Trimorphous with forsterite and wadsleyite.

Occurrence: In veinlets cutting the matrix of meteorites and replacing olivine; probably produced during shock metamorphism.

Association: Majorite, magnesian silicate glass.

Distribution: In the Tenham, Pampa del Infierno, Catherwood, and Coorara chondrite meteorites.

Name: For Professor Alfred Edward Ringwood (1930–1993), noted geochemist of the Australian National University, Canberra, Australia.

Type Material: The Natural History Museum, London, England, 1935,792.

References: (1) Binns, R.A., R.J. Davis, and S.J.B. Reed (1969) Ringwoodite, natural $(Mg, Fe)_2SiO_4$ spinel in the Tenham meteorite. Nature, 221, 943–944. (2) (1969) Amer. Rinmanite $Zn_2Sb_2Mg_2Fe_4^{3+}O_{14}(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Crystals very rare, showing $\{11\overline{2}0\}$ and $\{01\overline{1}2\}$; commonly granular, massive.

Physical Properties: *Cleavage:* $\{11\overline{2}0\}$, good. *Fracture:* Splintery or conchoidal. Hardness = 3 D(meas.) = 2.347 D(calc.) = [2.37] Astringent taste.

Optical Properties: Semitransparent. *Color:* Colorless, rose-red, violet, yellow, becoming brown on exposure; colorless to yellowish in transmitted light. *Luster:* Adamantine, commonly silky.
Optical Class: Uniaxial (+). $\omega = 1.5886$ $\epsilon = 1.5894$

Cell Data: *Space Group:* $R\overline{3}c$. $a = 11.98$ $c = 13.84$ Z = 6

X-ray Powder Pattern: Vesuvius, Italy. (ICDD 20-925).
2.509 (100), 6.0 (55), 2.593 (45), 5.75 (40), 2.811 (35), 2.653 (35), 3.46 (30)

Chemistry:

	(1)	(2)
Na	5.61	5.62
K	28.90	28.69
Fe	13.94	13.66
Cl	51.87	52.03
Br	0.04	
Total	100.36	100.00

(1) Wolkramshausen, Germany; average of two analyses. (2) $K_3NaFeCl_6$.

Occurrence: A secondary mineral in marine saline evaporite deposits; as a volcanic sublimate.

Association: Halite, sylvite, kieserite, carnallite, langbeinite, anhydrite.

Distribution: In Germany, in Lower Saxony, at Wolkramshausen, near Nordhausen; from mines around Diekholzen and Salzdetfurth, near Hildesheim; at Wathlingen-Hänigsen, near Celle; and other mines around Hamelyn and Hannover. On Vesuvius, Campania, Italy. From Aislaby, near Whitby, Yorkshire, England. In the Gaudark salt deposit, Gissar Mountains, Uzbekistan. In salt beds under the Kansk-Taseev depression, Siberia, Russia.

Name: To honor Friedrich Wilhelm Berthold Rinne (1863–1933), German crystallographer and petrographer, University of Kiel, Kiel, Germany.

Type Material: n.d.

Riomarinaite $Bi(OH)SO_4 \cdot H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As acicular crystals elongated on [001], to 60 μm, as hollow masses and botryoidal crusts to several millimeters; rarely as globular aggregates composed of tufts and spherulites.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle.
Hardness = 2-3 D(meas.) = n.d. D(calc.) = 4.80(3)

Optical Properties: Transparent. *Color*: Whitish-beige to light gray. *Streak*: White to light gray. *Luster*: Vitreous.
Optical Class: n.d.

Cell Data: *Space Group: P*$2_1/n$. a = 6.0118(3) b = 13.3355(6) c = 6.4854(4) Z = 4
(for synthetic $Bi(OH)SO_4 \cdot H_2O$)

X-ray Powder Pattern: Falcacci stope, Rio Marina iron mine, Elba, Tuscany, Italy.
4.2598 (100), 5.4530 (42), 3.3350 (42), 5.1152 (37), 3.1127 (36), 5.1926 (32), 2.9151 (22)

Chemistry:

	(1)
Bi_2O_3	68.86
SO_3	24.28
H_2O	6.86
Total	100.00

(1) Falcacci stope, Rio Marina iron mine, Elba, Tuscany, Italy; wet chemical analysis, H_2O by difference; corresponding to $Bi_{1.02}H_{2.64}S_{1.05}O_6$.

Occurrence: A weathering product from the decomposition of bismuthinite and cosalite.

Association: Bismoclite, bismutite, cannonite, anglesite, hydroniumjarosite, plumbojarosite.

Distribution: Falcacci stope, Rio Marina iron mine, east coast of Elba Island, Tuscany, Italy.

Name: For the mine that produced the first specimens.

Type Material: Bavarian State Collection for Mineralogy, Munich, Germany (MSM 27074).

References: (1) Rögner, P. (2005) Riomarinaite, a new bismuth mineral from Falcacci stope, Rio Marina, Elba (Italy). Der Aufschluss, 56, 53-60 (in German with English abstract).

Rittmannite

$(Mn^{2+}, Ca)Mn^{2+}(Fe^{2+}, Mn^{2+}, Mg)_2$
$(Al, Fe^{3+})_2(PO_4)_4(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, flattened on {001}, pseudohexagonal, to 1 mm, in subparallel aggregates.

Physical Properties: *Cleavage:* On {001}, indistinct. Hardness = 3.5 D(meas.) = 2.81(1) D(calc.) = 2.83

Optical Properties: Transparent. *Color:* Very pale yellow to lemon-yellow, brownish yellow. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 7°$. $\alpha = 1.622$ $\beta = [1.626]$ $\gamma = [1.654]$ 2V(meas.) = 43(2)°

Cell Data: *Space Group:* $[P2/a]$ (by analogy to the whiteite group). $a = 15.01(4)$ $b = 6.89(3)$ $c = 10.16(3)$ $\beta = 112.82(25)°$ Z = 2

X-ray Powder Pattern: Mangualde pegmatite, Portugal.
9.38 (s), 2.802 (s), 4.69 (ms), 5.66 (m), 4.93 (m), 4.85 (m), 3.530 (m)

Chemistry:

	(1)
P_2O_5	35.9
Al_2O_3	11.3
Fe_2O_3	2.6
FeO	10.4
MnO	18.9
MgO	1.5
CaO	3.3
H_2O	[19.7]
Total	[103.6]

(1) Mangualde pegmatite, Portugal; by electron microprobe, average of two analyses, Fe^{2+}:Fe^{3+} from stoichiometry, total Mn as MnO, H_2O calculated; corresponds to $(Mn_{0.54}Ca_{0.47})_{\Sigma=1.01}$ $Mn_{1.01}(Fe^{2+}_{1.15}Mn_{0.56}Mg_{0.29})_{\Sigma=2.00}(Al_{1.75}Fe^{3+}_{0.25})_{\Sigma=2.00}(PO_4)_4(OH)_{2.02} \cdot 8H_2O$.

Mineral Group: Whiteite group.

Occurrence: A very rare mineral in phosphatic nodules in zoned granite pegmatite veins (Mangualde pegmatite, Portugal).

Association: Kryzhanovskite, frondelite, huréaulite, orthoclase (Mangualde pegmatite, Portugal).

Distribution: From the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda, Portugal.

Name: To honor Professor Alfred Rittmann (1893–1980), German petrologist and volcanologist, University of Catania, Catania, Italy.

Type Material: Natural History Museum, Pisa, 4760/89; Civic Museum of Natural History, Milan, Italy.

References: (1) Marzoni Fecia di Cossato, Y., P. Orlandi, and G. Vezzalini (1989) Rittmannite, a new mineral species of the whiteite group from the Mangualde granitic pegmatite, Portugal. Can. Mineral., 27, 447–449. (2) (1990) Amer. Mineral., 75, 932–933 (abs. ref. 1).

Rivadavite $Na_6Mg[B_6O_7(OH)_6]_4 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, elongated along [010], and flattened on {100}, showing large {100} modified by $\{\bar{1}02\}$, {012}, $\{\bar{1}12\}$, to 3 mm, in subparallel massive aggregates.

Physical Properties: *Cleavage:* Perfect on {100}, $\{\bar{1}02\}$; poor on {010}. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 1.905(2) D(calc.) = 1.91 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless, white *Luster:* Vitreous, silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -32°$. *Dispersion:* $r > v$.
$\alpha = 1.470(1)$ $\beta = 1.481(1)$ $\gamma = 1.497(1)$ 2V(meas.) = 80°

Cell Data: *Space Group:* $P2_1/m$. $a = 15.870$ $b = 8.010$ $c = 22.256$ $\beta = 116°26'$ Z = 1

X-ray Powder Pattern: Tincalayu deposit, Argentina.
14.2 (100), 7.59 (100), 2.950 (65), 3.246 (64), 6.23 (51), 4.740 (51), 5.340 (49)

Chemistry:

	(1)	(2)
B_2O_3	58.2	57.30
FeO	0.05	
MgO	2.70	2.76
Na_2O	12.7	12.76

H_2O^+	25.3	
H_2O^-	1.4	
H_2O		27.18
Total	100.38	100.00

(1) Tincalayu deposit, Argentina; corresponds to $Na_{5.90}Mg_{0.94}[B_{6.01}O_7(OH)_6]_4 \cdot 10.7H_2O$.
(2) $Na_6Mg[B_6O_7(OH)_6]_4 \cdot 10H_2O$.

Occurrence: In sedimentary borate deposits; deposited from borate-rich hot springs.

Association: Borax, tincalconite (Tincalayu deposit, Argentina).

Distribution: From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. In the USA, from the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California. At the Tülüovasıdeposit, Bigadiç borate district, Balıkesir Province, Turkey.

Name: In honor of Bernardino Rivadavia (1780–1845), first President of the Argentine Republic.

Type Material: Harvard University, Cambridge, Massachusetts, 109055; National Museum of Natural History, Washington, D.C., USA, 137290, 137295.

References: (1) Hurlbut, C.S., Jr. and L.F. Aristarain (1967) Rivadavite, $Na_6MgB_{24}O_{40} \cdot 22H_2O$, a new borate from Argentina. Amer. Mineral., 52, 326–335. (2) Dal Negro, A. and L. Ungaretti (1973) Crystal structure of rivadavite. Naturwiss., 69(7), 350.

Total	[100.0]	100.00

(1) Crestmore, California, USA; recalculated to 100.0% after deduction of CaO in calcite and P_2O_5 and SO_4 in apatite. (2) $Ca_5Si_6O_{16}(OH)_2 \cdot 2H_2O$.

Occurrence: As intimate intergrowths with apatite, in veinlets cutting contact metamorphosed limestone (Crestmore, California, USA).

Association: Apatite, vesuvianite, diopside, calcite, wollastonite (Crestmore, California, USA).

Distribution: From Crestmore, Riverside Co., California, USA. At Ballycraigy, near Larne, Co. Antrim, Ireland. In the Hatrurim Formation, Israel.

Name: For the first-noted occurrence in Riverside Co., California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93416.

Roaldite Fe_4N

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$ (synthetic Fe_4N is $\overline{4}3m$). As planar foils, to 2 μm thick but many mm long, forming bursts embedded in kamacite.

Physical Properties: *Tenacity:* Ductile. Hardness = n.d. VHN = 600–900 (estimated). D(meas.) = n.d. D(calc.) = 7.21 (synthetic).

Optical Properties: Opaque. *Color:* White in reflected light.
Optical Class: Isotropic.
R: n.d.

Cell Data: *Space Group:* $Pm3m$ (synthetic Fe_4N is $P\overline{4}3m$). $a = 3.79(4)$ $Z = 1$

X-ray Powder Pattern: Synthetic Fe_4N.
2.191 (100), 1.144 (85), 1.897 (75), 1.342 (65), 0.949 (45), 1.095 (40), 2.684 (20)

Chemistry:

	(1)	(2)
Fe	89.8	88.6
Co	n.d.	0.53
Ni	5.58	6.35
N	6.3	7.6
Total	101.68	103.08

(1) Jerslev meteorite; by electron microprobe, trace Co assumed; corresponds to $(Fe_{3.76}Ni_{0.22}Co_{0.02})_{\Sigma=4.00}N$. (2) Youndegin meteorite; by electron microprobe, corresponds to $(Fe_{3.72}Ni_{0.26}Co_{0.02})_{\Sigma=4.00}N$.

Occurrence: A rare accessory mineral in iron-nickel meteorites, probably formed by diffusion of nitrogen.

Association: Kamacite, cohenite, schreibersite, carlsbergite, daubreelite.

Distribution: In the Jerslev, Youndegin, and Canyon Diablo iron meteorites.

Name: Honors Roald Norbach Nielsen (1928–), Danish electron microprobe analyst, of the Department of Metallurgy, Danish Technical Institute, Lyngby, Denmark.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1977,540.

References: (1) Buchwald, V.F. and H.P. Nielsen (1981) Roaldite, a new nitride in iron meteorites. Lunar and Planetary Science, 12, 112–114. (2) (1981) Amer. Mineral., 66, 1100 (abs. ref. 1). Robertsite $Ca_2Mn_3^{3+}O_2(PO_4)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Platy to wedge-shaped, pseudorhombohedral to barrel-shaped crystals, to 5 mm, showing {100}, {001}, {031}; fibrous, in botryoidal to feathery aggregates. *Twinning:* By rotation $\perp$ {100}, common.

Physical Properties: *Cleavage:* On {100}, good. Hardness = 3.5 D(meas.) = 3.13–3.17 D(calc.) = 3.22

Optical Properties: Semitransparent. *Color:* Black, deep red, bronzy; dark reddish brown to deep blood-red in thin slivers. *Streak:* Chocolate-brown. *Luster:* Vitreous to resinous or waxy, silky in fibrous material.
Optical Class: Biaxial (–). *Pleochroism:* X = pale reddish pink; $Y = Z$ = deep reddish brown. *Orientation:* $X \simeq \perp$ {100}. *Absorption:* $Y = Z \gg X$. $\alpha = 1.775(5)$ $\beta = 1.82(1)$ $\gamma = 1.82(1)$ 2V(meas.) = $\sim 8°$

Cell Data: *Space Group:* $A2/a$. $a = 17.36(2)$ $b = 19.53(5)$ $c = 11.30(3)$ $\beta = 96.0°$ Z = 12

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
8.63(10), 2.749 (6), 5.61 (5), 1.623 (5), 3.27 (4), 2.590 (4), 2.876 (3)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	35.6	34.57	CaO	17.9	18.21
Fe_2O_3	0.9		H_2O	8.1	8.77
Mn_2O_3	38.1	38.45	Total	100.6	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O by the Penfield method on a separate sample; corresponds to $Ca_{1.93}(Mn_{2.92}Fe_{0.07})_{\Sigma=2.99}O_{1.84}(PO_4)_{3.04} \cdot 2.72H_2O$. (2) $Ca_2Mn_3O_2(PO_4)_3 \cdot 3H_2O$.

Polymorphism & Series: Dimorphous with pararobertsite.

Occurrence: A late secondary mineral in complex zoned granite pegmatites; in a phosphate deposit in limestone, derived from bat guano.

Association: Rockbridgeite, ferrisicklerite, leucophosphite, jahnsite, montgomeryite, collinsite, huréaulite (Tip Top mine, South Dakota, USA); carbonate-fluorapatite, calcite, dolomite, quartz, clay minerals (Khoa Rang Kai, Thailand).

Distribution: In the USA, from the Tip Top mine, 8.5 km southwest of Custer, and the White Elephant mine, near Pringle, Custer Co., and the Gap Lode pegmatite, Pennington Co., South Dakota; in the White Picacho district, Yavapai Co., Arizona; at the Stewart mine, Pala, San Diego Co., California; in the Emmons quarry, Greenwood, Oxford Co., Maine. At Hagendorf, Bavaria, Germany. From Jebilet, Morocco. At the Rubicon pegmatite, south of Karibib, Namibia. In the Khoa Rang Kai phosphate deposit, near Chiang Mai, northwestern Thailand.

Name: To honor Professor Willard Lincoln Roberts (1923–1987), mineralogist, South Dakota School of Mines and Technology, Rapid City, South Dakota, USA, researcher of Black Hills minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 127151.

Robinsonite $Pb_4Sb_6S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are slender, prismatic and striated ‖ [001], to 5 mm; fibrous to compact, intergrown with other sulfosalts; massive.

Physical Properties: *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 2.5–3 VHN = n.d. D(meas.) = 5.64–5.75 D(calc.) = 5.743

Optical Properties: Opaque. *Color:* Bluish lead-gray. *Luster:* Metallic. *Anisotropism:* Strong; in blue-gray, cream-white, and brown-gray. R_1–R_2: n.d.

Cell Data: *Space Group:* $I2/m$. $a = 23.642(4)$ $b = 3.9761(6)$ $c = 24.420(4)$ $\beta = 93.808(3)^\circ$ Z = 4

X-ray Powder Pattern: Red Bird mine, Nevada, USA.
3.39 (100), 4.04 (80), 3.92 (80), 3.03 (80), 2.75 (80), 2.67 (80), 3.79 (60)

Chemistry:

	(1)	(2)	(3)
Pb	42.6	41.76	41.94
Fe		0.01	
Cu		0.01	
Ag		0.01

Bi		0.02	
S	20.9	21.36	21.09
Total	99.0	[99.22]	100.00

(1) Red Bird mine, Nevada, USA; by electron microprobe, corresponding to $Pb_{4.10}Sb_{5.82}S_{13.00}$. (2) Malé Železné deposit, Slovakia; by electron microprobe, average of six analyses, original total given as 99.23%; corresponding to $Pb_{3.93}Sb_{5.77}S_{13.00}$. [??saved this spot for the chem analysis in 2004 ref??] (3) $Pb_4Sb_6S_{13}$.

Occurrence: A primary hydrothermal mineral with other lead sulfosalts.

Association: Zinkenite, boulangerite, semseyite, plagionite, stibnite, sphalerite, galena, pyrite, quartz, calcite.

Distribution: In the USA, in Nevada, from the Red Bird mercury mine, about 37 road km east of Lovelock, Antelope district, Pershing Co. [TL], and in the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co.; at the Cleary prospect, Fairbanks district, Alaska. From Madoc, Ontario, and in the Dodger tungsten mine, Salmo, British Columbia, Canada. At Vall de Ribes, eastern Pyrenees, Spain. Large crystals from the Malé Železné and Däbrava deposits, Low Tatra Mountains, Slovakia. At the Rujevac Sb–Zn–Pb deposit, western Serbia. From Săsar, Hondol, Romania. In the Bwlch mine, Deganwy, Gwynedd, Wales. At the Pitone quarry, near Seravezza, Tuscany, Italy. Several additional localities are known.

Name: To honor Dr. Stephen Clive Robinson (1911–1981), Geological Survey of Canada, who first synthesized the mineral at Queen's University, Kingston, Ontario, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 12132; National Museum of Natural History, Washington, D.C., USA, 106568.

Rockbridgeite $(Fe^{2+},Mn^{2+})Fe_4^{3+}(PO_4)_3(OH)_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Euhedral crystals rare; typically fibrous, elongated along [001], compact radiating, to 3 cm, in crusts, botryoidal and drusy masses.

Physical Properties: *Cleavage:* {100}, excellent; {010}, good; {001}, fair. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4.5 D(meas.) = 3.45 D(calc.) = 3.60

Optical Properties: Semitransparent. *Color:* Dark green, olive-green, greenish black, black, commonly color-banded; may be bronze-brown, reddish brown when oxidized. *Luster:* Vitreous to dull.
Optical Class: Biaxial (+). *Pleochroism:* X = pale brown to pale yellow-brown; Y = bluish green; Z = dark bluish green. *Dispersion:* $r < v$, rarely $r > v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.873$–1.875 $\beta = 1.880$ $\gamma = 1.895$–1.897 2V(meas.) = Moderate.

Cell Data: *Space Group: Bbmm.* a = 13.783(12) $b = 16.805(9)$ $c = 5.172(4)$ Z = 4

X-ray Powder Pattern: Irish Creek, Rockbridge Co., Virginia, USA.
3.196 (10), 4.842 (5), 3.573 (5), 2.409 (5), 1.5890 (5), 6.87 (4), 4.630 (4)

H_2O	8.53	6.94
insol.	0.12	
Total	99.88	100.00

(1) Rockbridge Co., Virginia, USA. (2) $(Fe^{2+},Mn^{2+})Fe_4^{3+}(PO_4)_3(OH)_5$ with Fe^{2+}:Mn^{2+} = 1:1.

Polymorphism & Series: Forms a series with frondelite.

Occurrence: In "limonite" iron ore deposits; an alteration product of primary phosphates in complex granite pegmatites.

Association: Triphylite, huréaulite, barbosalite, roscherite, "limonite".

Distribution: Widespread; may be locally abundant. In the USA, in Virginia, on South Mountain, southeast of Midvale, Rockbridge Co.; at the Palermo #1 and Fletcher mines, North Groton, Grafton Co., New Hampshire; in the Tip Top, Bull Moose, and other mines, near Custer, Custer Co., and at the Big Chief, Etta, and other mines, near Keystone, Pennington Co., South Dakota. From the Énio pegmatite mine, northeast of Galiléia, and near São Jose da Safira, Agua Boa, Minas Gerais, Brazil. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. At Sabugal, Mangualde, Bendada, and Moreira, Portugal. From the La Vilate quarry, near Chanteloube, Haute-Vienne, France. In Germany, at Hagendorf, and on the Kreuzberg, Pleystein, Bavaria; and from Ullersreuth, Saxony. In the Moculta phosphate quarry, northeast of Angaston, South Australia. From the Sandamap pegmatite, west of Usakos, Namibia. In the Pearl mine, Miami, Zimbabwe. At Tazenakht, Morocco.

Name: For the occurrence in Rockbridge Co., Virginia, USA, taken as the type locality.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 80600.

Rodalquilarite $H_3Fe_2^{3+}(Te^{4+}O_3)_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Stout crystals, to 2.5 cm; commonly in crusts.

Physical Properties: *Cleavage:* One, good. *Tenacity:* Very brittle. Hardness = 2–3
D(meas.) = 4.97–5.15 D(calc.) = 5.08–5.14

Optical Properties: Semitransparent. *Color:* Grass-green, emerald-green, oil-green, pistachio-green, yellow-green; green in transmitted light. *Streak:* Greenish yellow.
Luster: Greasy.
Optical Class: Biaxial (–). $n = \sim 2.2$ α = n.d. β = n.d. γ = n.d. 2V(meas.) = 38(5)°

Cell Data: *Space Group:* $P\overline{1}$. a = 8.89–9.00 b = 5.08–5.10 c = 6.63–6.64
$\alpha = 103°10'–103°22'$ $\beta = 106°38'–107°05'$ $\gamma = 77°52'–78°4'$ Z = 1

X-ray Powder Pattern: Rodalquilar, Spain.
4.24 (FFF), 2.62 (FF), 3.31 (F), 2.17 (F), 2.85 (mF), 2.97 (m), 1.873 (mf)

Chemistry:

	(1)	(2)	(3)
TeO_2	72.85	73.36	74.88
Fe_2O_3	18.45	18.59	18.73
Cl	4.80	3.98	4.16
H_2O	4.50	3.34	3.17
insol.	0.35		
$-O = Cl_2$	1.08	0.90	0.94
Total	99.87	98.37	100.00

(1) Rodalquilar, Spain; by microanalysis, corresponds to $H_{3.07}Fe_{2.00}(TeO_3)_{3.95}Cl_{1.17} \bullet 1.25H_2O$.
(2) Tombstone, Arizona, USA; by microanalysis. (3) $H_3Fe_2(TeO_3)_4Cl$.

Occurrence: A rare secondary mineral formed in the zone of oxidation of tellurium-bearing precious metal deposits.

Association: Emmonsite, gold, alunite, jarosite, quartz (Rodalquilar, Spain); tellurium, mackayite, emmonsite (near El Indio, Chile); emmonsite, sonoraite (Joe mine, Arizona, USA).

Distribution: From the Rodalquilar gold deposit, Almería Province, Spain. In the Wendy open pit, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. At the Joe and Grand Central mines, Tombstone, Cochise Co., Arizona, USA.

Name: For its first-noted occurrence at Rodalquilar, Spain.

Type Material: Natural History Museum, Paris; National School of Mines, Paris, France.

Rodolicoite $Fe^{3+}PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. In microcrystalline nodules, intimately mixed with grattarolaite, as crystallites to < 1000 Å.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.04

Optical Properties: Opaque. *Color:* Reddish brown. *Streak:* Brown. *Luster:* Greasy. *Optical Class:* Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P3_121$ (synthetic). $a = 5.048(3)$ $c = 11.215(8)$ Z = 3

X-ray Powder Pattern: Synthetic.
3.445 (100), 4.360 (19), 2.362 (14), 1.8846 (12), 2.180 (10), 1.4214 (10)

Chemistry: (1) Due to the tiny particle sizes (average about 260 Å) only bulk composition of the mixture could be determined; this is compatible with a composition of $Fe_{1.04}P_{0.96}O_{4.00}$; the identity of the mineral rests also on its X-ray powder pattern compared to synthetic material.

Occurrence: Very rare, in microcrystalline nodules in lignite beds which appear to have naturally burned.

Association: Grattarolaite, heterosite.

Distribution: From the Castelnuovo mine, Santa Barbara lignite district, 30 km southeast of Florence, Florence, Italy.

Name: Honoring Francesco Rodolico (1905–1988), Professor of Mineralogy, Florence University, Florence, Italy.

Type Material: Museum of Natural History, Florence University, Florence, Italy, 2087/RI.

References: (1) Cipriani, C., M. Mellini, G. Pratesi, and C. Viti (1997) Rodolicoite and grattarolaite, two new phosphate minerals from Santa Barbara mine, Italy. Eur. J. Mineral., 9, 1101–1106. (1–2) Franklin, New Jersey, USA. (3) Långban, Sweden; by electron microprobe, H_2O calculated from stoichiometry. (4) $Pb_2Ca_6MnSi_6O_{18}(SO_4)_2(OH)_2 \cdot 4H_2O$.

Occurrence: As nodular masses in calcium silicate lenses containing abundant garnet (Franklin, New Jersey, USA); as fracture fillings in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Garnet, titanite, zircon, phlogopite, axinite, willemite, datolite, barite, calcite, arsenopyrite, sphalerite, rhodonite, rhodochrosite.

Distribution: From Franklin, Sussex Co., New Jersey, USA. At Långban, Värmland, Sweden.

Name: For Colonel Washington Augustus Roebling (1837–1926), of Trenton, New Jersey, USA, distinguished American civil engineer, mineral collector, and benefactor of American geological sciences.

Type Material: National Museum of Natural History, Washington, D.C., USA, R8824, 124351; The Natural History Museum, London, England, 1925,69.

Roedderite $(Na,K)_2(Mg,Fe^{2+})_5Si_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. Platy to short prismatic hexagonal crystals, exhibiting dominant $\{10\bar{1}0\}$ and $\{0001\}$ with $\{11\bar{2}0\}$, $\{10\bar{1}2\}$, and $\{10\bar{1}4\}$, to 2 mm.

Physical Properties: Hardness = n.d. D(meas.) = ~2.6 D(calc.) = 2.63

Optical Properties: Transparent to translucent. *Color:* Colorless, yellowish to reddish brown. *Luster:* Vitreous.
Optical Class: Uniaxial (+) to slightly biaxial. ω = 1.537–1.543 ϵ = 1.536–1.547
2V(meas.) = 2°–5°

Cell Data: *Space Group:* $P\bar{6}2c$. a = 10.139(3) c = 14.269(4) Z = 2

X-ray Powder Pattern: Indarch meteorite; essentially identical with eifelite.
3.570 (100), 3.239 (77), 2.922 (67), 3.747 (66), 7.15 (64), 2.772 (44), 5.540 (36)

Chemistry:

	(1)	(2)
SiO_2	71.32	71.0

Na_2O	5.29	4.0
Total	99.86	100.2

(1) Bellerberg volcano, Germany; by electron microprobe, corresponds to $(Na_{1.72}K_{0.89})_{\Sigma=2.61}(Mg_{4.48}Fe_{0.07}Al_{0.06}Mn_{0.04}Ti_{0.01})_{\Sigma=4.66}(Si_{11.99}Al_{0.01})_{\Sigma=12.00}O_{30}$. (2) Indarch meteorite; by electron microprobe, average of six analyses; corresponds to $(Na_{1.30}K_{0.69})_{\Sigma=1.99}(Mg_{4.86}Fe_{0.27})_{\Sigma=5.13}(Si_{11.88}Al_{0.07})_{\Sigma=11.95}O_{30}$.

Polymorphism & Series: Forms a series with eifelite.

Mineral Group: Milarite group.

Occurrence: In vesicles in contact metamorphosed basement gneiss xenoliths in leucite tephrite (Bellerberg volcano, Germany); an accessory mineral in an enstatite chondrite (Indarch meteorite).

Association: Hematite, tridymite, sanidine, spinel, pyroxene, quartz, sillimanite (Bellerberg volcano, Germany); enstatite, clinoenstatite, troilite, nickel-iron, schreibersite, plagioclase, carbon, tridymite, oldhamite, glass (Indarch meteorite).

Distribution: In the Indarch, Witchita County, and Canyon Diablo meteorites. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany.

Name: For Dr. Edwin Woods Roedder (1919–), mineralogist, U.S. Geological Survey, who noted the synthetic compound.

Type Material: n.d.

(1) Alpe Rosso, Italy; by electron microprobe, H_2O by difference.
(2) $Ca_2BeAl_2Si_4O_{13}(OH)_2 \cdot 2.5H_2O$.

Occurrence: Coating fractures in a sodic feldspar dike which cuts gneiss (Alpe Rosso, Italy).

Association: Thomsonite (Alpe Rosso, Italy); bertrandite, chrysoberyl, scheelite, molybdenite (Pizzo Marcio, Italy).

Distribution: At Alpe Rosso and Pizzo Marcio, Val Vigezzo, Piedmont, Italy.

Name: For Aldo G. Roggiani, Italian teacher of natural sciences, who first found the mineral.

Type Material: University of Modena, Modena, Italy; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 122280.

Rohaite $TlCu_5SbS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222, $mm2$, or $2/m\ 2/m\ 2/m$. Rarely as euhedral and subhedral crystals, to 0.5 mm; in patchy aggregates.

Physical Properties: *Tenacity:* Malleable. Hardness = n.d. VHN = 94 (25 g load). D(meas.) = n.d. D(calc.) = 7.752

Optical Properties: Opaque. *Color:* In reflected light, yellowish cream to dull bluish gray. *Luster:* Metallic. *Pleochroism:* Distinct to strong. *Anisotropism:* Very strong, from yellowish cream to black, with dark red-purple colors present near extinction.
R_1–R_2: (400) — , (420) 31.6–36.4, (440) 30.7–36.6, (460) 30.0–36.7, (480) 29.2–36.5, (500) 28.4–36.1, (520) 27.9–36.0, (540) 27.0–35.4, (560) 26.6–35.2, (580) 26.5–35.0, (600) 26.3–34.6, (620) 26.1–34.4, (640) 25.6–34.0, (660) 25.4–33.9, (680) 24.8–33.7, (700) 24.4–33.7

Cell Data: *Space Group:* $P222$, $Pmm2$, or $Pmmm$. $a = 7.602(2)$ $b = 3.801(2)$ $c = 20.986(8)$ $Z = 2$

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.
3.078 (100), 2.393 (100), 3.800 (90), 1.902 (90), 2.623 (50), 2.605 (50), 2.577 (50)

Chemistry:

	(1)	(2)	(3)
Tl	26.6	27.7	28.87
Cu	18.6	17.8	17.20

Sb	41.0	43.5	44.87
S	9.3	9.6	9.06
Total	97.8	100.5	100.00

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, average of seven grains; corresponding to $Tl_{0.97}(Cu_{4.79}Fe_{0.07})_{\Sigma=4.86}Pb_{0.04}Sb_{1.13}S_{2.15}$. (2) Do.; by electron microprobe, average of eightgrains, corresponding to $Tl_{0.97}(Cu_{4.89}Fe_{0.06})_{\Sigma=4.95}Pb_{0.04}Sb_{1.05}S_{2.14}$.
(3) $TlCu_5SbS_2$.

Occurrence: In veins cutting an alkalic intrusive.

Association: Chalcocite, löllingite, cuprite, antimonian silver, analcime, sodalite.

Distribution: From the Ilímaussaq intrusion, southern Greenland [TL].

Name: In honor of Professor John ROse-HAnsen (1937–), Danish mineralogist, University of Copenhagen, Denmark.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1979,1211.

Rokühnite $Fe^{2+}Cl_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. Rarely in thin plates, dominated by {110}, with a number of other forms, to 300 μm; the plates are commonly composed of fibers. *Twinning:* On $\{\overline{2}01\}$, contact twins.

Physical Properties: *Cleavage:* Very good on {110}; good on {010}. *Tenacity:* Fibers are quite flexible. Hardness = n.d. D(meas.) = 2.35 D(calc.) = 2.35 Soluble in H_2O, hydrating topotactically and oxidizing rapidly on exposure to air.

Optical Properties: Semitransparent. *Color:* Light green, turning brown on oxidation; colorless in transmitted light.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = -49°$. *Dispersion:* $r \leq v$.
$\alpha = 1.605(2)$ $\beta = 1.633(1)$ $\gamma = 1.703(2)$ 2V(meas.) = 64(2)°

Cell Data: *Space Group:* $C2/m$, $C2$, or Cm. $a = 7.396(1)$ $b = 8.458(2)$ $c = 3.638(1)$ $\beta = 97.68(2)°$ Z = 2

X-ray Powder Pattern: Germany.

(1) Germany; analysis of a mixture, interpreted as: carnallite 8.89%, rinneite 18.47%, halite 23.55%, tachyhydrite 1.02%, and rokühnite 48.14%, of composition $(Fe_{0.88}Mg_{0.12})_{\Sigma=1.00}Cl_2 \cdot 1.95H_2O$. (2) Do.; carnallite 18.76%, rinneite 9.93%, halite 26.04%, and rokühnite 44.17%, of composition $(Fe_{0.94}Mg_{0.06})_{\Sigma=1.00}Cl_{1.98} \cdot 2.02H_2O$.

Occurrence: A secondary mineral in fissures in earlier potassium-rich salt beds.

Association: Carnallite, rinneite, halite, tachyhydrite, sylvite, langbeinite.

Distribution: In the Salzdetfurth potash mine, Hamelyn, and the Siegfried-Giesen and Hope potash mines, Sarstedt, Zechstein basin, south of Hannover, Lower Saxony, Germany.

Name: To honor Professor Dr. Robert Kühn (1911–), German mineralogist, Kaliforschungs-Institut der Kali und Salz AG, Hannover, Germany.

Type Material: Mineralogical Institute, University of Hannover, Hannover; Institute for Sedimentology, University of Heidelberg, Heidelberg, Germany.

(1) Santiaguillo, Bolivia. (2) San Francisco de los Andes, Argentina; by electron microprobe. (3) $BiAsO_4$.

Polymorphism & Series: Dimorphous with tetrarooseveltite.

Mineral Group: Monazite group.

Occurrence: Vey rare in cassiterite veinlets in rhyolite-dacite lava flows (Santiaguillo, Bolivia); in the oxidized zone of a breccia pipe (San Francisco de los Andes, Argentina).

Association: Cassiterite (Santiaguillo, Bolivia); preisingerite, bismutite, mixite, zavaritskite, wulfenite (Moldava, Czech Republic); conichalcite, mixite (Uzbekistan).

Distribution: At Santiaguillo, west of Maragua, Potosí, Bolivia. From the San Francisco de los Andes and Cerro Negro de la Aguadita mines, San Juan Province, Argentina. In the Moldava fluorite mine, about 20 km northwest of Teplice, Krušné hory Mountains, Czech Republic. In the Ödsbach Valley, near Oberkirch, at the Clara mine, near Oberwolfach, and on the Schmiedestollen dump, Black Forest, Germany. From an undefined locality in the Chatkal Mountains, Uzbekistan.

Name: Honors Franklin Delano Roosevelt (1882–1945), 32nd President of the USA.

Type Material: Harvard University, Cambridge, Massachusetts, 101938; National Museum of Natural History, Washington, D.C., USA, 115317.

Romanèchite $(Ba, H_2O)_2(Mn^{4+}, Mn^{3+})_5O_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Euhedral crystals very rare, flat, ridged, to 200 μm; acicular to fibrous, divergent; commonly reniform, botryoidal, stalactitic, colloform banded; very fine-grained massive.

Physical Properties: Hardness = 5–6 VHN = 514–715 (100 g load). D(meas.) = 4.70–4.74 D(calc.) = [4.90]

Optical Properties: Opaque. *Color:* Iron-black, dark steel-gray; gray-white in reflected light. *Streak:* Black, brownish black. *Luster:* Submetallic; dull when massive.
Optical Class: Biaxial. *Anisotropism:* Strong. *Bireflectance:* Strong; gray to white.

(1) Romanèche, France. (2) Schneeberg, Germany. (3) Do.; by electron microprobe, analysis not given, H_2O by the Penfield method; corresponds to $(Ba_{0.66}Ca_{0.03}Na_{0.01})_{\Sigma=0.70}[(Mn^{4+}, Mn^{3+})_{4.83}Si_{0.06}Mg_{0.02}Al_{0.01}(W, Cu, Zn, Ni, Co)_{0.08}]_{\Sigma=5.00}O_{10} \bullet 1.2H_2O$.

Occurrence: A product of weathering of manganese-bearing oxides, carbonates, silicates; in sedimentary deposits; as replacement deposits in limestones and dolostones; a principal component of "psilomelane" and "desert varnish" (manganese oxide-rich coatings formed on rocks in arid regions); in some plume agates.

Association: Pyrolusite, hausmannite, chalcophanite, braunite, goethite, calcite, quartz.

Distribution: While of common occurrence, characterization by X-ray, chemical analysis, or both, is necessary. Authenticated from: Romanèche, Saône-et-Loire, France. In Germany, well-crystallized from Schneeberg, Saxony, and at the Clara Mine, near Oberwolfach, Black Forest. From the Restormel mine, Lostwithiel, Cornwall, England. In the USA, at Austinville, Wyeth Co., Virginia; from Sodaville, Mineral Co., Nevada; at the Hoggett mines, Hidalgo Co., New Mexico; at the Tolbard mine, Paymaster district, Imperial Co., California. In the Talmantes mine, near Parral, Chihuahua, Mexico. From Pilbara, Western Australia.

Name: For the occurrence at Romanèche, France.

Type Material: The Natural History Museum, London, England, 69160.

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. In massive crusts.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [6.40]

Optical Properties: Semitransparent. *Color:* Black.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $P4/mmm$ (synthetic). $a = 3.802$ $c = 4.836$ Z = 2

X-ray Powder Pattern: Boundary Falls, Canada.
2.98 (10), 1.601 (9), 1.799 (7), 2.679 (6), 1.491 (6b)

Chemistry: (1) Boundary Falls, Canada; X-ray spectrographic analysis detected only tin and a trace of iron.

Occurrence: As an alteration product on tin pannikins immersed in a river (Boundary Falls, Canada); replacing herzenbergite replacing cassiterite (Maria-Teresa mine, Bolivia); on tin ingots from the cargo of a ship wrecked in a Red Sea cove (Sharm Abhur, Saudi Arabia).

Association: Hydroromarchite (Boundary Falls, Canada); abhurite, kutnohorite, aragonite (Sharm Abhur, Saudi Arabia).

Distribution: At Boundary Falls, Winnipeg River, Ontario, Canada, where tin pannikins had been dropped by a voyageur between 1801 and 1821. From the Maria-Teresa mine, near Huari, between Oruro and Uyuni, Bolivia. In a cove of the Red Sea known as Sharm Abhur, about 30 km north of Jiddah, Saudi Arabia.

Name: For the Royal Ontario Museum ARCHeology Department.

Type Material: Royal Ontario Museum, Toronto, Canada, M28744.

(1) St. Marcel, Italy. (2) Långban, Sweden; after deduction of remnant 0.52%. (3) $Ca_2Sb_2O_7$.

Occurrence: A secondary mineral in some manganese-bearing hydrothermal mineral deposits which commonly have undergone metamorphism.

Mineral Group: Stibiconite group.

Association: Epidote, manganese oxides (St. Marcel, Italy); yeatmanite, sarkinite, willemite, diopside, andradite (Franklin, New Jersey, USA).

Distribution: In the Praborna mine, south of St. Marcel, Val d'Aosta, Piedmont, Italy. At the Radstädter Tauern-Pass, Salzburg, Austria. From Långban and Jakobsberg, Värmland, Sweden. In the USA, at Franklin, Sussex Co., New Jersey; from the Green prospect, Mopung Hills, Lake district, Churchill Co., Nevada. At the Tripuhy cinnabar mine, Ouro Prêto, Minas Gerais, Brazil. From the Tai Lee mine, Siput Utara, Perak, Malaysia. A few other localities are reported, but require modern authentication.

Name: To honor Jean Baptiste Louis Romé de l'Isle (1736–1790), early French crystallographer.

Type Material: Natural History Museum, Paris, France, 41.151 and 41.152.

(1) Tierra Amarilla, Chile; corresponds to $Fe^{2+}_{0.97}Fe^{3+}_{2.02}(SO_4)_{3.98} \cdot 13.81H_2O$.
(2) $Fe^{2+}Fe^{3+}_2(SO_4)_4 \cdot 14H_2O$.

Occurrence: As an early alteration product of oxidizing pyrite or pyrrhotite; uncommonly a volcanic sublimate.

Association: Copiapite, melanterite, voltaite, halotrichite, szomolnokite, kornelite, rozenite, siderotil, alunite.

Distribution: In Germany, from the Rammelsberg mine, near Goslar, Harz Mountains; at Pfaffenreuth, near Waldsassen, Bavaria. At the Tmavýdůl coal mine, near Rtyně, and from Příbram, Czech Republic. In the Kamariza mine, Laurium, Greece. At Nagybörzsöny and Lesenceistvánd, Hungary. In Russia, in the Blyava sulfate deposits, Southern Ural Mountains, and on volcanoes on the Kamchatka Peninsula. From Madeni Zakh, Iran. In Chile, at Tierra Amarilla, southeast of Copiapó, Atacama; from Quetena, west of Calama, Alcaparrosa, near Cerritos Bayos, southwest of Calama, and Chuquicamata, Antofagasta. In the USA, at the United Verde mine, Jerome, Yavapai Co., and the Copper Queen mine, Bisbee, Cochise Co., Arizona; at the Island Mountain mine, Trinity Co., and the Leviathan mine, Alpine Co., California; in the Dexter mine group, Calf Mesa, San Rafael district, Emery Co., Utah. From Mt. Isa, Queensland, Australia. At Navarana Fjord, northeastern Freuchen Land, Greenland. Some additional minor localities are known.

Name: Honors Friedrich Adolph Römer (1809–1869), German geologist, Director of the School of Mines, Clausthal, Germany.

Röntgenite-(Ce) $Ca_2(Ce,La)_3(CO_3)_5F_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. Crystals are hexagonal, with $\{10\bar{1}1\}$, $\{01\bar{1}2\}$, $\{11\bar{2}0\}$, small (0001), striated horizontally, to 3 mm; commonly in syntaxic intergrowth with bastnäsite-(Ce), synchysite-(Ce), parisite-(Ce), cordylite-(Ce). *Twinning:* On (0001), twin and composition plane, rare.

Physical Properties: *Fracture:* Subconchoidal. Hardness = 4.5 (by analogy to related rare-earth carbonates). D(meas.) = n.d. D(calc.) = 4.19

Optical Properties: Transparent to translucent. *Color:* Wax-yellow, brown, green; pale yellow to colorless in transmitted light.
Optical Class: Uniaxial (+). $\omega = 1.658–1.662$ $\epsilon = 1.756$

Cell Data: *Space Group:* $R3$. $a = 7.13(3)$ $c = 69.4(2)$ $Z = 9$

X-ray Powder Pattern: n.d.

Chemistry: (1) Chemical composition has been inferred by interpolation in the bastnäsite–synchysite series.

Occurrence: A rare late-stage hydrothermal mineral in granite pegmatite (Narssârssuk, Greenland); in alkaline orthoclase pegmatite (Mianning deposit, China).

Association: Bastnäsite-(Ce), parisite-(Ce), synchysite-(Ce) as syntactic intergrowths.

Distribution: From Narssârssuk, Greenland. In the Mianning rare-earth deposit, Sichuan Province, China. At an undefined locality in the Chatkal Range, Tien-Shan Mountains, Uzbekistan. From Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Wilhelm Conrad Röntgen (1845–1923), German physicist, discoverer of X-rays, as the species was noted and confirmed by use of X-rays only.

Type Material: Harvard University, Cambridge, Massachusetts, 84233; National Museum of Natural History, Washington, D.C., USA, R2609, R2613, R2615.

Crystal Data: Monoclinic. *Point Group:* $2/m$. Microcrystalline, to < 5 μm; in thin botryoidal crusts, and replacing emplectite crystals.

Physical Properties: *Fracture:* Conchoidal to irregular. *Tenacity:* Brittle. Hardness = 4–4.5 VHN = 513 (25 g load). D(meas.) = 6.86–7.01 D(calc.) = 7.21

Optical Properties: Semitransparent. *Color:* White to pale gray, pale green, yellow.
Luster: Adamantine.
Optical Class: Biaxial (+). $\alpha = 2.09(4)$ $\beta =$ n.d. $\gamma = 2.27(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 6.879(1)$ $b = 7.159(1)$ $c = 6.732(1)$ $\beta = 104.84(1)°$ Z = 4

X-ray Powder Pattern: Argentina.
3.15 (100), 2.97 (80), 3.33 (61), 2.98 (37), 4.82 (36), 2.70 (36), 2.50 (26)

Bi_2O_3	67.2	67.9	66.97
Total	100.4	100.9	100.00

(1) Santiaguillo, Bolivia. (2) San Francisco de los Andes, Argentina; by electron microprobe. (3) $BiAsO_4$.

Polymorphism & Series: Dimorphous with tetrarooseveltite.

Mineral Group: Monazite group.

Occurrence: Vey rare in cassiterite veinlets in rhyolite-dacite lava flows (Santiaguillo, Bolivia); in the oxidized zone of a breccia pipe (San Francisco de los Andes, Argentina).

Association: Cassiterite (Santiaguillo, Bolivia); preisingerite, bismutite, mixite, zavaritskite, wulfenite (Moldava, Czech Republic); conichalcite, mixite (Uzbekistan).

Distribution: At Santiaguillo, west of Maragua, Potosí, Bolivia. From the San Francisco de los Andes and Cerro Negro de la Aguadita mines, San Juan Province, Argentina. At Moldava, about 20 km northwest of Teplice, Czech Republic. In the Ödsbach Valley, near Oberkirch, at the Clara mine, near Oberwolfach, and on the Schmiedestollen dump, Black Forest, Germany. From an undefined locality in the Chatkal Mountains, Uzbekistan.

Name: Honors Franklin Delano Roosevelt (1882–1945), 32nd President of the USA.

Type Material: Harvard University, Cambridge, Massachusetts, 101938; National Museum of Natural History, Washington, D.C., USA, 115317.

Roquesite $CuInS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Typically as inclusions in other sulfides, to 0.3 mm. *Twinning:* Polysynthetic.

Physical Properties: Hardness = n.d. VHN = 259–274 (25 g load). D(meas.) = n.d. D(calc.) = [4.78]

Optical Properties: Opaque. *Color:* In polished section, gray with a slight bluish tint. *Luster:* Metallic. *Anisotropism:* Very weak.
R_1–R_2: (400) 25.8–25.0, (420) 25.3–24.8, (440) 24.5–24.5, (460) 23.8–23.9, (480) 23.2–23.4, (500) 22.7–22.9, (520) 22.3–22.6, (540) 22.1–22.4, (560) 21.9–22.3, (580) 21.8–22.2, (600) 21.8–22.2, (620) 21.8–22.2, (640) 21.7–22.2, (660) 21.8–22.2, (680) 21.9–22.3, (700) 22.1–22.5

Cell Data: *Space Group:* $I\bar{4}2d$ (by analogy to chalcopyrite group). $a = 5.51$ $c = 11.05$ Z = 4

X-ray Powder Pattern: Charrier, France.
3.19 (vvs), 1.95 (vs), 1.66 (s), 2.76 (mw), 1.268 (vw), 1.127 (vvw), 3.08 (f)

Chemistry:

	(1)	(2)	(3)
Cu	26.8	28.4	26.20
Fe		0.6	
In	47.8	45.9	47.35
S	27.3	26.2	26.45
Total	101.9	101.1	100.00

(1) Charrier, France; by electron microprobe, corresponds to $Cu_{0.99}In_{0.98}S_{2.00}$. (2) Geevor mine, England; by electron microprobe, corresponds to $Cu_{1.09}Fe_{0.03}In_{0.98}S_{2.00}$. (3) $CuInS_2$.

Mineral Group: Chalcopyrite group.

Occurrence: In association with copper sulfides in high-temperature Sn–W–Bi–Mo hydrothermal veins in highly metamorphosed rocks (Charrier, France); a late-stage mineral in a skarn Fe–W ore pipe (Ulsan mine, South Korea); in magnetite-bearing massive chalcopyrite ore (Akenobe mine, Japan).

Association: Chalcopyrite, bornite, cubanite, covellite, sphalerite, tetrahedrite, emplectite, wittichenite, stannoidite, pyrite, löllingite, arsenopyrite, bismuth, cassiterite, ferberite, magnetite.

Distribution: In France, from Charrier, Allier [TL]; in Lautaret Pass, Hautes-Alpes; at La Telhaie, Morbihan; and from Vaultry, Haute-Vienne. In the Geevor mine, St. Just, Cornwall, England. At Listulli, Telemark, and Långban, Värmland, Sweden. From the Radka deposit, Pazardzhik, Bulgaria. At Cínovec (Zinnwald), Czech Republic From Syrymbet, Kazakhstan. In the Akenobe and Ikuno mines, Hyogo Prefecture, Japan. In the Ulsan mine, Kyongsang Province, South Korea. At the Tosham tin prospect, Bhiwani district, Haryana, India. In Canada, from Mount Pleasant, New Brunswick. At the Sure Fire mine, Pyramid district, Washoe Co., Nevada, USA. Found in the Mangabeira tin deposit, Goiás, Brazil. Additional localities are now known.

Name: Honors Professor Maurice Roques (1911–), French geologist, University of Clermont-Ferrand, Clermont-Ferrand, France.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1965,302.

Rorisite CaFCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals rounded, tabular, flattened on {001}, showing {111}, {110}, rarely {100}, to 1 mm.

Physical Properties: *Cleavage:* {110}, perfect; {001}, excellent. *Fracture:* Conchoidal. *Tenacity:* Brittle, thin fragments slightly elastic. Hardness = 2 D(meas.) = 2.78(1) D(calc.) = 2.94 Hygroscopic, soluble in H_2O, altering to $CaCl_2$ and CaF_2; weak violet fluorescence under LW UV.

Optical Properties: Transparent, becoming turbid on exposure to moist air. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.668(2)$ $\epsilon = 1.635(2)$

Cell Data: *Space Group:* $[P4/nmm]$ (by analogy to matlockite). $a = 3.890(1)$ $c = 6.810(1)$ Z = 2

X-ray Powder Pattern: Kopeysk, Russia.
2.557 (100), 6.81 (45), 2.267 (35), 2.138 (32), 1.560 (32), 3.396 (30), 1.363 (25)

Mg	3.63	
Ca	38.94	42.40
F	23.29	20.10
Cl	34.24	37.50
Total	100.10	100.00

(1) Kopeysk, Russia; corresponds to $(Ca_{0.89}Mg_{0.13})_{\Sigma=1.02}F_{1.00}(Cl_{0.88}F_{0.12})_{\Sigma=1.00}$. (2) CaFCl.

Occurrence: Within carbonized wood in burnt coal dumps.

Association: Fluorite, periclase, troilite.

Distribution: From Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia.

Name: From the Latin for *dew*, in allusion to the transparent drops that cover the mineral in moist air.

Type Material: Mining Institute, St. Petersburg, 2073; Il'menskii Preserve Museum, Miass, 5880; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r460/1.

2.600 (100), 6.05 (90), 5.07 (90), 3.69 (90), 2.962 (70), 2.534 (50), 2.144 (50)

Chemistry:

	(1)	(2)
CO_2	19.54	19.74
CuO	47.53	35.68
ZnO	24.60	36.50
H_2O	8.33	8.08
Total	[100.00]	100.00

(1) Sardinia; recalculated to 100% from an original total of 100.37% after deduction of MgO 0.15%, Fe_2O_3 0.39%, insoluble 0.33%. (2) $(Cu, Zn)_2(CO_3)(OH)_2$ with Cu:Zn = 1:1.

Mineral Group: Rosasite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of Cu–Zn-bearing deposits, typically formed by zinc-bearing solutions on primary copper minerals; may be of post-mine origin.

Association: Malachite, aurichalcite, smithsonite, cerussite, hydrozincite, hemimorphite.

Distribution: From the Rosas mine, Sulcis, Sardinia, Italy. At a number of places in England, as Caldbeck Fells, Cumbria, and mines in Cornwall. Fine examples from Tsumeb, Namibia. In the USA, from the Kelly mine, Magdalena, Socorro Co., New Mexico; fine specimens from the Silver Bill mine, Gleeson, and at Bisbee, Cochise Co., in the 79 mine, Gila Co., and a number of other places in Arizona; from the Mohawk mine, San Bernardino Co., California; at Leadville, Lake Co., Colorado; from Majuba Hill, Pershing Co., Nevada; in the Hidden Treasure mine, Ophir district, Tooele Co., Utah. Abundant specimens from the Ojuela mine, Mapimí, Durango, Mexico. In small amounts from additional localities.

Name: For its occurrence in the Rosas mine, Sardinia, Italy.

Type Material: Natural History Museum, Paris, France, 109.327, 109.328, 139.61.

(1) Greifensteine, Germany; BeO originally determined as Al_2O_3. (2) Sapucaia mine, Brazil. (3) Gunnislake Clitters mine, England; BeO may include some Al_2O_3; corresponds to $Ca_{1.20}(Fe_{2.64}Mn_{0.04})_{\Sigma=2.68}Be_{2.51}(PO_4)_3(OH)_3 \cdot 2.58H_2O$.

Occurrence: In cavities in granite or complex zoned granite pegmatites.

Association: Morinite, lacroixite, eosphorite, apatite, tourmaline (Greifensteine, Germany); frondelite, faheyite, beryl, muscovite, quartz (Sapucaia mine, Brazil).

Distribution: On the Greifensteine, near Ehrenfriedersdorf, Saxony, Germany. In the Gunnislake Clitters mine, Calstock, Cornwall, England. In Brazil, from the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and in the Énio pegmatite mine, northeast of Galiléia, Minas Gerais. In the USA, at the Davis mine, North Groton, Grafton Co., New Hampshire; from the Dunton quarry, Newry and the Black Mountain quarry, Rumford, Oxford Co., and elsewhere in Maine; at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Foote mine, Kings Mountain, Cleveland Co., North Carolina.

Name: Honoring Walter Roscher, mineral collector, Ehrenfriedersdorf, Germany.

(1) Stuckslager mine, California, USA.

Polymorphism & Series: Forms a series with muscovite; 1M polytype.

Mineral Group: Mica group.

Occurrence: An early-stage gangue mineral in low-temperature epithermal Au-Ag-Te deposits; from the oxidized portions of low-temperature sedimentary U-V ores.

Association: Quartz, pyrite, carbonates, fluorite, gold (Au-Ag-Te mineral association); corvusite, hewettite, carnotite, tyuyamunite (U-V mineral association).

Distribution: In the USA, from the Stuckslager mine, Lotus, El Dorado Co., California; in Colorado, from Cripple Creek, Teller Co., La Plata district, La Plata Co., Magnolia district, Boulder Co., the Gateway district, Mesa Co., in the Uravan and Paradox, Bull Canyon, and Slick Rock districts, in Montrose, San Miguel, and Dolores Cos. From the Spotted Horse mine, Maiden, Fergus Co., Montana; the Baker, Mammoth, and North Pole mines, Baker Co., Oregon; in the Monument No. 2 mine, Apache Co., and Monument No. 1 and Mitten No. 2 mines, Navajo Co., Arizona; from the Goldstrike mine, Lynn district, Eureka Co., Nevada. At the Yamato mine, Amamioshima Island, Kagoshima Prefecture, Japan. From Kalgoorlie, Western Australia and Radium Hill, Olary, South Australia. In the Emperor mine, Vatukoula, Viti Levu, Fiji Islands. At Horní Kalná, Czech Republic. From the Mounana mine, Gabon.

Name: For British scientist Henry Enfield Roscoe (1833–1915), of Manchester, England, who first prepared pure vanadium.

Roselite $Ca_2(Co,Mg)(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [100], showing {011}, {$\bar{1}$11}, {010}, {110}, to 1.3 cm; commonly in spherical aggregates and druses. *Twinning:* Very common on {100} with {100} as composition plane, contact twins and fourlings.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = 3.5 D(meas.) = 3.46–3.74 D(calc.) = 3.65

Optical Properties: Transparent to translucent. *Color:* Pale rose-pink to dark rose-pink; rose-pink in transmitted light, may be color zoned. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = pale rose-pink to dark rose-pink; Y = paler rose-pink; Z = palest rose-pink. *Orientation:* $X = b$ to $X \wedge c \sim 0°$–$4°$; $Y = b$ to $Y \wedge c = 12°$–$20°$; $Z \wedge c$ –70° to 91°. *Dispersion:* $r < v$, weak to strong. $\alpha = 1.694$–1.725 $\beta = 1.704$–1.730 $\gamma = 1.719$–1.735 2V(meas.) = 60°–75°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.801(1)$ $b = 12.898(3)$ $c = 5.617(1)$ $\beta = 107.42(2)°$ Z = 2

X-ray Powder Pattern: Schneeberg, Germany.
2.993 (100), 3.222 (75), 3.354 (60), 2.763 (50), 3.395 (35), 6.444 (20), 5.089 (20)

Chemistry:

	(1)	(2)
As_2O_5	49.96	52.76
CoO	12.45	8.60
MgO	4.67	4.63
CaO	23.72	25.74
H_2O	9.69	8.27
Total	100.49	100.00

(1) Schneeberg, Germany. (2) $Ca_2(Co,Mg)(AsO_4)_2 \cdot 2H_2O$ with Co:Mg = 1:1.

Polymorphism & Series: Dimorphous with roselite-beta; forms a series with wendwilsonite.

Mineral Group: Roselite group.

Occurrence: A rare secondary mineral in cobalt-bearing hydrothermal mineral deposits.

Association: Talmessite (Bou Azzer, Morocco).

Distribution: In Germany, from the Rappold and Daniel mines, Schneeberg, Saxony; at the Friedrich Christian mine, Wildschapbachtal, and the Anton mine, Heubachtal, near Schiltach, Black Forest. From Bou Azzer, Morocco. In the Talmessi mine, 35 km west of Anarak, Iran. From Huercal Overa, Almería Province, and at Molvizar, Granada Province, Spain.

Name: To honor Gustav Rose (1798–1873), Professor of Mineralogy, University of Berlin, Berlin, Germany.

H_2O	8.41	7.96
Total	100.31	100.00

(1) Schneeberg, Germany. (2) $Ca_2Co(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with roselite.

Mineral Group: Fairfieldite group.

Occurrence: A rare secondary mineral in cobalt-bearing hydrothermal mineral deposits.

Association: Roselite, calcite, pyrite, quartz (Schneeberg, Germany); erythrite, arthurite, conichalcite, chenevixite, scorodite, cobaltaustinite, heterogenite (Dome Rock mine, Australia).

Distribution: From Schneeberg, Saxony, and at the Bauhaus district, Richelsdorf Mountains, Hesse, Germany. At Bou Azzer, Morocco. From Tsumeb, Namibia. In the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia. From the San Jose del Carmen mine, Copiapó, Atacama, Chile.

Name: As a monoclinic dimorph of *roselite*.

Type Material: The Natural History Museum, London, England, 1956,196; Harvard University, Cambridge, Massachusetts, USA, 105301.

Rosemaryite $(Na, Ca, Mn^{2+})(Mn^{2+}, Fe^{2+})(Fe^{3+}, Fe^{2+}, Mg)Al(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Granular, massive, to 1 cm.

Physical Properties: *Cleavage:* Observed. Hardness = [> 4] (by analogy to ferrowyllieite). D(meas.) = n.d. D(calc.) = [3.63]

Optical Properties: Semitransparent. *Color:* Dark green, deep brown to reddish brown. *Luster:* Resinous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = pale brownish yellow; Z = pale greenish yellow. $\alpha = 1.723(2)$ $\beta = 1.742(2)$ $\gamma = 1.758(2)$ 2V(meas.) = –80°

Cell Data: *Space Group:* $P2_1/n$. a = 11.977(2) $b = 12.388(2)$ $c = 6.320(1)$ $\beta = 114°27(1)'$ Z = 4

X-ray Powder Pattern: Buranga, Rwanda.
3.024 (100), 2.693 (100), 2.726 (85), 3.487 (70), 2.842 (60), 2.062 (55), 5.451 (50)

(1) Rock Ridge pegmatite, South Dakota, USA; corresponds to $(Na_{0.47}Ca_{0.04})_{\Sigma=0.51}(Mn^{2+}_{0.20}Ca_{0.15}Na_{0.15})_{\Sigma=0.50}(Mn^{2+}_{0.69}Fe^{2+}_{0.31})_{\Sigma=1.00}(Fe^{3+}_{0.45}Mg_{0.06}Zn_{0.02}Li_{0.01})_{\Sigma=0.54}(Al_{0.63}Fe^{3+}_{0.37})_{\Sigma=1.00}(PO_4)_{3.00}$. (2) Buranga, Rwanda; corresponds to $(Na_{0.59}Ca_{0.02})_{\Sigma=0.61}(Mn^{2+}_{0.42}Ca_{0.08})_{\Sigma=0.50}(Mn^{2+}_{0.95}Fe^{2+}_{0.05})_{\Sigma=1.00}(Fe^{3+}_{0.82}Fe^{2+}_{0.10}Mg_{0.08})_{\Sigma=1.00}(Al_{0.78}Fe^{3+}_{0.22})_{\Sigma=1.00}(PO_4)_{3.00}$.

Polymorphism & Series: Forms two series, with ferrowyllieite, and with wyllieite; $Mn^{2+} > Fe^{2+}$ in M(1); Fe^{3+} dominant in M(2a).

Occurrence: In zoned complex granite pegmatites.

Association: Trolleite, alluaudite, montebrasite, scorzalite, strengite (Buranga, Rwanda).

Distribution: From the Rock Ridge pegmatite, near Custer, Custer Co., South Dakota, USA. At the Buranga pegmatite, near Gatumba, Rwanda.

Name: To honor Mrs. F. Rosemary Wyllie, wife of Professor Peter J. Wyllie, namesake of wyllieite, q.v.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162559.

Rosenbergite $AlF_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As slender tetragonal prismatic crystals, elongate along [001], to 0.25 mm, in radiating tufts.

Physical Properties: *Cleavage:* {001}, good. Hardness = n.d. VHN = 92–113, 103 average (15 g load). D(meas.) = 2.10(1) D(calc.) = 2.111

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.427$ $\epsilon = 1.403$

Cell Data: *Space Group:* $P4/n$. $a = 7.715(1)$ $c = 3.648(1)$ $Z = 2$

X-ray Powder Pattern: Cetine mine, Italy.
5.47 (100), 1.725 (85), 1.775 (78), 2.439 (72), 2.027 (70), 1.306 (70), 1.388 (65)

Chemistry:

	(1)
Al	19.94
F	41.05
H_2O	[39.01]
Total	[100.00]

(1) Cetine mine, Italy; by electron microprobe, H_2O by difference; corresponds to $Al_{1.02}F_{2.98} \cdot 2.99H_2O$.

Occurrence: Very rare in cavities in a silicified limestone from an antimony deposit in highly silicified evaporites (Cetine mine, Italy); in volcanic sublimates (Mt. Erebus, Antarctica).

Association: Gypsum, fluorite, elpasolite, ralstonite, onoratoite (Cetine mine, Italy).

Distribution: In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. On Mt. Erebus, Antarctica.

Name: Honors Professor Philip E. Rosenberg, Washington State University, Pullman, Washington, USA, who first noted the mineral in Antarctica.

Type Material: University of Florence, Florence, Italy, 1934/RI.

References: (1) Olmi, F., C. Sabelli, and R. Trosti-Ferroni (1993) Rosenbergite, $AlF[F_{0.5}(H_2O)_{0.5}]_4 \cdot H_2O$, a new mineral from the Cetine mine (Tuscany, Italy): description and crystal structure. Eur. J. Mineral., 5, 1167–1174. (2) (1994) Amer. Mineral., 79, 765 (abs. ref. 1).

(1) Langesundsfjord, Norway; corresponds to $(Ca_{1.71}Na_{1.23}Mn_{0.08}RE_{0.01})_{\Sigma=3.03}(Zr_{0.63}Ti_{0.33}Fe^{3+}_{0.05})_{\Sigma=1.01}Si_{2.01}O_8F_{1.18}$.

Occurrence: In some nepheline syenites and related pegmatites.

Association: Aegirine, natrolite, sodalite, zircon, låvenite, rinkite, eudialyte, leucophanite (Langesundsfjord, Norway).

Distribution: From Lille Arø Island and Skudesundskjaer, near Brevik, Langesundsfjord, and Bratthagen, north of Larvik, Norway. In the Norra Kärr complex, near Gränna, Sweden. From the Los Islands, Guinea. In the USA, from Red Hill, Moultonborough, Carroll Co., New Hampshire. At Mont Saint-Hilaire, Quebec, Canada. In Russia, from the Lovozero and Khibiny massifs, Kola Peninsula, and at Zaangar'ya, Yenisei Ridge, Siberia. In the Ilímaussaq intrusion, southern Greenland.

Name: For Professor Carl Harry F. Rosenbusch (1836–1914), German geologist and mineralogist, Heidelberg, Germany.

(1) Russian River, California, USA; by D-C arc emission spectroscopy, recalculated to 100.00% from an original total of 96.86%. (2) $Ca_3Si_3O_8(OH)_2$.

Occurrence: In veins in brecciated, fine-grained, garnet- and diopside-bearing metasediments (Russian River, California, USA).

Association: Pectolite, xonotlite, datolite (Russian River, California, USA); prehnite, gyrolite, okenite, apophyllite (Durham, North Carolina, USA); prehnite, xonotlite, pectolite (Staré Ransko, Czech Republic).

Distribution: In the USA, from the Russian River, in Mendocino Co., about eight km north of Cloverdale, California, and in the Durham quarry, near Durham, Wake Co., North Carolina. From Engyouji, Kochi Prefecture, Japan. At Wairere, south of Te Kuiti, New Zealand. From Staré Ransko, Czech Republic. In Russia, from Asbest, Ural Mountains.

Name: For Leo Rosenhahn (1906–1991), amateur mineralogist of San Anselmo, California, USA, who discovered the mineral.

Type Material: California Division of Mines & Geology, San Francisco, California; National Museum of Natural History, Washington, D.C., USA, 120124, 134562; The Natural History Museum, London, England, 1976,392–393.

(1) Cetine mine, Italy; by electron microprobe, average of three analyses; corresponding to $Pb_{1.01}Sb_{2.00}O_6$. (2) $PbSb_2O_6$.

Occurrence: From an antimony deposit in highly silicified evaporites (Cetine mine, Italy).

Association: Valentinite, tripuhyite, bindheimite (Cetine mine, Italy).

Distribution: From the Cetine mine, 20 km southwest of Siena, and the Tafone mine, Grosseto, Tuscany, Italy.

Name: For the village of Rosia, near the Cetine mine, Italy.

Type Material: University of Genoa, Genoa, Italy.

References: (1) Basso, R., G. Lucchetti, L. Zefiro, and A. Palenzona (1996) Rosiaite, $PbSb_2O_6$, a new mineral from the Cetine mine, Siena, Italy. Eur. J. Mineral., 8, 487–492. (2) (1997) Amer. Mineral., 82, 208–209 (abs. ref. 1).

Rosickýite S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As equidimensional crystals; thick to very thin tabular on {010}, elongated along [010], to 1 mm; short prismatic on {110}, rarely acicular [001]; also dipyramidal with {111} and {$\overline{1}$11}; as crystalline efflorescences. *Twinning:* On {101}, the twinning lamellae parallel to the edge [010].

Physical Properties: Hardness = Low. VHN = n.d. D(meas.) = n.d. D(calc.) = 2.02–2.03

Optical Properties: Transparent to translucent. *Color:* Colorless to pale yellow with a greenish tinge. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = 1.25°$. *Dispersion:* Strong. α = High. β = High. γ = High. 2V(meas.) = Large.

Cell Data: *Space Group:* $P2/c$. $a = 8.476(2)$ $b = 13.088(3)$ $c = 9.270(2)$ $\beta = 124.92(2)°$ Z = 32

X-ray Powder Pattern: La Presta mine, Switzerland.
4.37 (100), 3.75 (100), 3.66 (80), 3.18 (80), 3.06 (60), 3.48 (40), 2.485 (40)

Chemistry: (1) La Presta mine, Switzerland; pure elemental sulfur by gas chromatography, enriched in ^{32}S, evidence of microbial activity.

Polymorphism & Series: Dimorphous with sulfur, to which it changes in time at room temperature.

Occurrence: In hollow "limonite" nodules in a thin clay stratum (Havírna, Czech Republic); in fumaroles (Vulcano, Italy); an alteration product of pyrite-rich asphalt (La Presta mine, Switzerland); formed from gypsum and stabilized due to microbial activity (Death Valley, California, USA).

Association: Pyrite, gypsum, rozenite, sulfur, calcite, "limonite", asphalt (La Presta mine, Switzerland).

Distribution: In the Czech Republic, from Havírna, near Letovice [TL], and at Visky. Well-crystallized in the La Presta asphalt mine, near Travers, Neuchâtel, Switzerland. From St. Andreasberg, Harz Mountains, and at Ronneburg, Thuringia, Germany. On Vulcano, Lipari Islands, Italy. In the USA, from Point Rincon, Ventura Co., and in the salt pan of Death Valley, California.

Name: Honors Professor Vojtěch Rosický (1880–1942), former Director of the Mineralogical and Petrological Institute of Masaryk University, Brno, Czech Republic.

Type Material: Moravian Museum, Brno, Czech Republic, A6111.

Rosièresite $Pb_xCu_yAl_z(PO_4)_m \cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous (?). *Point Group:* n.d. Stalactitic, to 4 cm, concentric, massive.

Physical Properties: Hardness = n.d. D(meas.) = 2.2 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Greenish yellow, yellow, light brown.
Luster: Opaline.
Optical Class: Isotropic. $n = \sim 1.50$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

(1) Rosières mine, France.

Occurrence: As post-mining incrustations.

Association: Tetrahedrite, cuprite, chrysocolla, malachite, azurite.

Distribution: From the Rosières copper mine, about one km east of Carmaux, Tarn, France.

Name: For the mineral's first occurrence at the Rosières mine, France.

Rossite $CaV_2^{5+}O_6 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. In small glassy lumps surrounded by alteration rims of metarossite.

Physical Properties: *Cleavage:* One direction, prominent. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 2.45 D(calc.) = 2.42 Slowly soluble in H_2O; transforms to metarossite in open air in a few weeks time, which is reversible.

Optical Properties: Transparent. *Color:* Pale yellow; yellow in transmitted light. *Luster:* Vitreous to somewhat pearly.
Optical Class: Biaxial (–) (recrystallized). *Orientation:* $Y \wedge b \simeq 45°$; $Z \simeq c$. *Dispersion:* Very strong. $\alpha = 1.710$ $\beta = 1.770$ $\gamma = 1.840$ 2V(meas.) = 60(15)°

Cell Data: *Space Group:* $P\overline{1}$ (recrystallized). $a = 8.552(2)$ $b = 8.576(2)$ $c = 7.028(2)$ $\alpha = 101.50(2)°$ $\beta = 114.96(2)°$ $\gamma = 103.39(2)°$ Z = 2

X-ray Powder Pattern: Yellow Cat Wash, Utah, USA; rehydrated from metarossite. 3.860 (100), 6.636 (95), 7.260 (90), 3.432 (60), 3.033 (55), 3.000 (50), 3.934 (25)

(1) Bull Pen Canyon, Colorado, USA; corresponds to $Ca_{1.01}V_{1.98}O_6 \cdot 3.85H_2O$.
(2) $CaV_2O_6 \cdot 4H_2O$.

Occurrence: In veinlets in carnotite-bearing sandstone (Bull Pen Canyon, Colorado, USA).

Association: Metarossite, carnotite, gypsum (Bull Pen Canyon, Colorado, USA); huemulite, hummerite, thenardite, gypsum, epsomite (Malargüe district, Argentina).

Distribution: In the USA, on M.E. O'Neil's [Buckhorn] claim, Bull Pen Canyon, and at the Burro and Deremo-Snyder mines, Slick Rock district, San Miguel Co., Colorado; at Yellow Cat Wash, Thompsons district, Grand Co., Utah; and from the Mesa No. 1 mine, Lukachukai Mountains, Arizona. In the Malargüe district, Mendoza Province, Argentina.

Name: To honor Dr. Clarence Samuel Ross (1880–1975), American geologist and mineralogist, U.S. Geological Survey, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95331, R5707 (all type material has altered to metarossite).

Rösslerite $MgHAsO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare in small crystals, short prismatic; may be hairlike, to 4 cm, in radiating groups, and fine-grained crusts.

Physical Properties: *Cleavage:* {111}, imperfect. Hardness = 2–3 D(meas.) = 1.943 (synthetic). D(calc.) = 1.948 (synthetic). Dehydrates in air to brassite.

Optical Properties: Transparent. *Color:* Colorless to white, may be faintly tinted pink; colorless in transmitted light. *Luster:* Vitreous to dull.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge c = 14°$. $\alpha = 1.525(5)$ $\beta = 1.53(1)$ $\gamma = 1.550(5)$ 2V(meas.) = Small.

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 6.6918(5)$ $b = 25.744(2)$ $c = 11.538(1)$ $\beta = 95.15(1)°$ Z = 8

X-ray Powder Pattern: Synthetic.
4.08 (100), 6.43 (89), 4.49 (89), 4.67 (82), 4.29 (79), 12.90 (59), 2.863 (53)

(1) Bieber, Germany. (2) $MgHAsO_4 \cdot 7H_2O$.

Occurrence: A secondary mineral in the oxidized zone of arsenic-bearing ore deposits.

Association: Pharmacolite, haidingerite, picropharmacolite, erythrite.

Distribution: In Germany, from Bieber, near Hanau, and from the Bauhaus district, Richelsdorf Mountains, Hesse; in the Sophia mine, near Wittichen, from the Anton mine, Heubachtal, near Schiltach, and in the Wolfgang mine, near Alpirsbach, Black Forest; at St. Andreasberg, Harz Mountains. Long fibers from Jáchymov (Joachimsthal), Czech Republic. At the White Caps mine, Manhattan district, Nye Co., Nevada, USA.

Name: Honoring Karl Rössler, Hanau, Germany.

Rostite $Al(SO_4)(OH,F)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As flattened rhomboidal tablets, to 0.5 mm, in nodular aggregates and masses.

Physical Properties: Hardness = "Soft". D(meas.) = 1.892 D(calc.) = 1.92–1.96

Optical Properties: Semitransparent. *Color:* Chalky white.
Optical Class: Biaxial (+) or (–). *Orientation:* Y bisects the acute angle of the tablets; $Z \perp$ flattening. $\alpha = 1.440$–1.462 $\beta = 1.460$–1.470 $\gamma = 1.483$–1.487 2V(meas.) = 68°

Cell Data: *Space Group: Pcab.* $a = 11.169$–11.187 $b = 13.039$–13.060 $c = 10.871$–10.893 Z = 8

(1) Libušín, Czech Republic. (2) Do.; original total given as 100.09%; after deduction of gypsum and tschermigite, stated to correspond to $(Al_{1.06}Fe^{3+}_{0.02})_{\Sigma=1.08}(SO_4)_{0.99}[(OH)_{0.64}F_{0.62}]_{\Sigma=1.26}\cdot 5H_2O$. (3) $Al(SO_4)(OH,F)\cdot 5H_2O$ with OH:F = 1:1.

Polymorphism & Series: Dimorphous with jurbanite.

Occurrence: In burning waste heaps at a coal mine, formed by decomposition of aluminum-bearing rocks by gasses containing SO_2 and fluorine (Libušín, Czech Republic).

Association: Tschermigite, alunogen, copiapite (Libušín, Czech Republic).

Distribution: From the Nejedlý I (Schoeller) coal mine, Libušín, near Kladno, Czech Republic. At the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: Honoring Professor Rudolph Rost (1902–?), Czech mineralogist, Charles University, Prague, Czech Republic, who first characterized the mineral.

Type Material: National Museum, Prague, Czech Republic, 29742.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 601 ["lapparentite" of Rost = rostite]. (2) Čech, F. Rouaite $Cu_2(NO_3)(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Crystals flattened on {001}, may be elongated along [010] or equant, showing {001}, {100}, {101}, {110}, {011}, to 0.1 mm, isolated or in aggregates. *Twinning:* Rare on {001}.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.38(2) D(calc.) = 3.39

Optical Properties: Transparent. *Color:* Dark green, bluish green to emerald-green. *Streak:* Green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = dark blue-green; Y = blue-green; Z = pale green to colorless. *Orientation:* $Y = b$; $Z = c$; $X \wedge a = 5°$. *Dispersion:* $r < v$, strong. $\alpha = 1.700(2)$ $\beta = 1.715(2)$ $\gamma = 1.738(2)$ 2V(meas.) = 81.2° 2V(calc.) = 79(1)°

Cell Data: *Space Group:* $P2_1$. $a = 5.596(2)$ $b = 6.079(2)$ $c = 6.925(3)$ $\beta = 94.67(2)°$ Z = 2

X-ray Powder Pattern: Roua mines, France.
6.91 (100), 3.457 (90), 2.669 (80), 2.462 (80), 2.250 (50), 2.078 (50), 2.154 (40)

Chemistry:

	(1)	(2)
N_2O_5	21.64	22.49
CuO	65.5	66.26
H_2O	11.9	11.25
Total	99.04	100.00

(1) Roua mines, France; by electron microprobe, N_2O_5 and H_2O by CHN analyzer; corresponds to $Cu_{1.99}(NO_3)_{0.97}(OH)_{3.19}$. (2) $Cu_2(NO_3)(OH)_3$.

Polymorphism & Series: Dimorphous with gerhardtite.

Occurrence: Rare in cavities in cuprite from a hydrothermal copper deposit, the nitrate perhaps supplied from guano or organic matter in host-rock pelites (Roua mines, France).

Association: Cuprite, copper, silver, algodonite, domeykite, connellite, olivenite, malachite, theoparacelsite, gerhardtite (Roua mines, France).

Distribution: From the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For the Roua copper mines, France, from which the mineral was first described.

Type Material: Natural History Museum, Geneva, Switzerland.

(1) Shinkolobwe, Congo; by electron microprobe, H_2O determined on a separate sample.
(2) $Cu_2(UO_2)_3(CO_3)_2O_2(OH)_2 \cdot 4H_2O$.

Occurrence: A rare mineral in the zone of oxidation of copper-bearing uranium deposits, formed by alteration of uraninite.

Association: Vandenbrandeite, soddyite, becquerelite, cuprosklodowskite, uranophane, heterogenite, uraninite (Shinkolobwe, Congo).

Distribution: From Shinkolobwe, near Kolwezi, at the Musonoi mine, and in the Kamoto mine, Katanga Province, Congo (Shaba Province, Zaire). In the Komsomol ore field, eastern Siberia, Russia.

Name: Honors Marcel Edouard Roubault (1905–1974), Professor of Geology, University of Nancy, Nancy, France.

Type Material: National School of Mines, Paris, France.

(1) Jas Roux, France; by electron microprobe, corresponding to $Tl_{0.98}(Cu_{0.60}Ag_{0.35})_{\Sigma=0.95}(Hg_{1.70}Zn_{0.30})_{\Sigma=2.00}(As_{1.73}Sb_{0.21})_{\Sigma=1.94}S_{6.00}$. (2) Do.; by electron microprobe, corresponding to $Tl_{0.95}(Cu_{0.59}Ag_{0.38})_{\Sigma=0.97}(Hg_{1.68}Zn_{0.32})_{\Sigma=2.00}(As_{1.73}Sb_{0.23})_{\Sigma=1.96}S_{6.00}$. (3) $TlCuHg_2As_2S_6$.

Occurrence: In hydrothermal deposits in dolostone (Jas Roux, France).

Association: Realgar, stibnite, pierrotite, sphalerite, pyrite, smithite (Jas Roux, France); pyrite, stibnite, realgar, cinnabar, parapierrotite, molybdenite, sphalerite, tetrahedrite–tennantite (Hemlo deposit, Canada).

Distribution: From the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France [TL]. At the Vorontsovskoye gold deposit, Serov district, Northern Ural Mountains, Russia. In the Hemlo gold deposit, Thunder Bay district, Ontario, Canada.

Name: For Pierre Routhier (1916–), Professor of Economic Geology, University of Paris, Paris, France.

Type Material: National School of Mines, Paris, France.

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of three analyses, total Fe as FeO, total Mn as MnO, CO_2 calculated from stoichiometry, confirmed by IR; corresponds to $Na_{2.96}(Ca_{1.66}Mn_{0.34}Fe_{0.02})_{\Sigma=2.02}(CO_3)_3F_{1.06}$. (2) Mt. Alluaiv, Kola Peninsula, Russia; by electron microprobe, total Fe as FeO, total Mn as MnO, corresponds to $Na_{3.08}(Ca_{1.36}Mn_{0.44}Fe_{0.06}Y_{0.03}Dy_{0.02})_{\Sigma=1.91}(CO_3)_{3.02}F_{0.99}$. (3) $Na_3Ca_2(CO_3)_3F$.

Occurrence: In a sodalite xenolith in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in a differentiated alkalic massif (Lovozero massif, Kola Peninsula, Russia).

Association: Kupletskite, villiaumite, aegirine, microcline, cancrinite, analcime, shortite, vuonnemite, cryolite, kogarkoite (Mont Saint-Hilaire, Canada); manganotychite, mineevite, nahcolite, trona, pirssonite, sidorenkite, rhodochrosite (Lovozero massif, Kola Peninsula, Russia).

Distribution: From Mont Saint-Hilaire, Quebec, Canada. On Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: For Rouville Co., within which the Mont Saint-Hilaire, Canada, locality is located.

Type Material: Canadian Museum of Nature, Ottawa, 54542; Royal Ontario Museum, Toronto, Canada, M44157, M44233.

Rowlandite-(Y) $Y_4Fe^{2+}Si_4O_{14}F_2(?)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic; commonly metamict. *Point Group:* 1 or $\bar{1}$. As small irregular masses.

Physical Properties: Hardness = 5.5–6.5 D(meas.) = 4.39 when metamict; 4.55 when heated at 900 °C for one hour; 4.85 when crystalline. D(calc.) = [4.33]

Optical Properties: Transparent in thin fragments. *Color:* Pale dull green, grayish white; alters to brick-red material. *Luster:* Vitreous; waxy when altered.
Optical Class: Biaxial (+); isotropic when metamict. $n = 1.704$, metamict; 1.76 when heated at 900 °C for one hour. $\alpha = 1.763$ $\beta =$ n.d. $\gamma = 1.769$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P1$ or $P\bar{1}$. $a = 6.59$ $b = 8.65$ $c = 5.53$ $\alpha = 99°2'$ $\beta = 104°8'$ $\gamma = 91°28'$ Z = 1

X-ray Powder Pattern: Baringer Hill, Texas, USA; pattern from metamict material heated one hour in nitrogen at 900 °C; matches crystalline material.
3.06 (100), 4.87 (60), 3.51 (55), 3.59 (50), 2.076 (45), 1.720 (40), 2.608 (35)

Chemistry:

	(1)	(2)
SiO_2	25.98	30.59
UO_2	0.40	
Y_2O_3	61.91	57.47
FeO	4.69	9.14
CaO	0.19	
F		4.84
LOI	2.01	
$-O = F_2$		2.04
Total		100.00

(1) Baringer Hill, Texas, USA; partial analysis. (2) $Y_4FeSi_4O_{14}F_2$.

Occurrence: In some rare-earth-rich pegmatites.

Association: Gadolinite, yttrialite (Baringer Hill, Texas, USA).

Distribution: In the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., and from Clear Creek, Burnet Co., Texas, USA. In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada. From an unspecified locality in Kazakhstan.

Name: For Henry Augustus Rowland (1848–1901), American physicist and spectroscopist, of Johns Hopkins University, Baltimore, Maryland, USA, student of the spectra of the rare earth elements, and for its *yttrium* content.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 134649.

Roxbyite Cu_9S_5

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$, m, or 2. As single crystals, to 0.01 mm, epitaxially intergrown with djurleite; in powdery mixtures with djurleite.

Physical Properties: *Cleavage:* Poor on {100}. Hardness = n.d. VHN = 83 (50 g load). D(meas.) = n.d. D(calc.) = 5.49

Optical Properties: Opaque. *Color:* Blue-black; in reflected light, white to off-white with a blue tinge. *Anisotropism:* Very weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. $a = 53.79$ $b = 30.90$ $c = 13.36$ $\beta = 90.0°$ Z = 512

X-ray Powder Pattern: Olympic Dam, Australia.
1.933 (100), 2.375 (90), 1.857 (80), 2.86 (70), 2.630 (50), 1.673 (25), 1.626 (20)

Chemistry:

	(1)	(2)	(3)
Cu	77.25	79.47	78.10
Fe	0.77	0.07	
S	22.19	21.94	21.90
Total	100.21	101.48	100.00

(1) Olympic Dam, Australia; by electron microprobe, corresponding to $(Cu_{8.80}Fe_{0.10})_{\Sigma=8.90}S_{5.00}$. (2) Do.; by electron microprobe, corresponding to $Cu_{9.15}S_{5.00}$. (3) Cu_9S_5.

Occurrence: A low-temperature alteration product of djurleite, in a complex polymetallic hydrothermal deposit (Olympic Dam, Australia); in a porphyry copper deposit (El Teniente mine, Chile).

Association: Djurleite, bornite, pyrite, chalcopyrite, hematite (Olympic Dam, Australia); djurleite (El Teniente mine, Chile).

Distribution: From the Olympic Dam Cu–Au–U deposit, Roxby Downs Station, near Woomera, South Australia [TL]. In the El Teniente mine, 67 km west of Rancagua, O'Higgins Province, Chile.

Name: For its occurrence at Roxby Downs, South Australia.

Type Material: Museum Victoria, Melbourne, Australia, M37924; The Natural History Museum, London, England, 1988,28.

References: (1) Mumme, W.G., G.J. Sparrow, and G.S. Walker (1988) Roxbyite, a new copper sulphide mineral from the Olympic Dam deposit, Roxby Downs, South Australia. Mineral. Mag., 52, 323-330. (2) (1989) Amer. Mineral., 74, 947 (abs. ref. 1).

Rozenite $Fe^{2+}SO_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As cottonball-like concretions and nodules; most commonly as powdery efflorescences or coatings on melanterite.

Physical Properties: Hardness = [2–3] (by analogy to rozenite group members). D(meas.) = 2.293 (synthetic). D(calc.) = 2.29 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless, white, pale green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.527$ $\beta = 1.536$ $\gamma = 1.541$–1.543 (γ') 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 5.979(4)$ $b = 13.648(4)$ $c = 7.977(3)$ $\beta = 90°26(10)'$ Z = 4

X-ray Powder Pattern: Manitoba, Canada.
4.47 (10), 5.46 (9), 4.47 (7), 3.40 (6), 6.85 (5), 3.22 (5), 2.953 (5)

Chemistry:

	(1)	(2)	(3)
SO_3	36.29	35.91	35.75
Fe_2O_3		0.80	
FeO	31.13	30.65	32.08
MnO	0.06		
MgO	0.97		
H_2O	32.98	31.90	32.17
Total	[101.43]	99.26	100.00

(1) Staszic mine, Poland; original total given as 100.43%, corresponds to $Fe_{1.01}S_{0.99}O_4 \cdot 3.97H_2O$. (2) Manitoba, Canada; corresponds to $Fe_{0.98}S_{1.02}O_4 \cdot 4.02H_2O$. (3) $FeSO_4 \cdot 4H_2O$.

Mineral Group: Rozenite group.

Occurrence: An uncommon secondary mineral, formed at or below 21 °C and under low humidity directly from copper-free melanterite, in turn an alteration product of pyrite or marcasite; commonly a post-mining product, in lake-bed sediments, or coal seams.

Association: Melanterite, epsomite, jarosite, gypsum, sulfur, pyrite, marcasite, "limonite".

Distribution: In Poland, from Mt. Ornak, Tatra Mountains, and in the Staszic pyrite mine, Rudki. From the Voras Mountains, 17 km north-northwest of Ardéa, Greece. At Alšar (Allchar), near Rošden, Macedonia. In the Cetine mine, near Rosia, Tuscany, Italy. From Bleiberg, Carinthia, Austria. At Ramsbeck, North Rhine-Westphalia, Germany. In England, from the Oughterside coal mine, near Aspatria, Cumbria. In Scotland, at Slateford, near Edinburgh, from the West Mains coal mine, West Calder; and in the Howcommon limestone mine, Kilmarnock. In Canada, in Twp. 24, R28, west of 1st meridian, Manitoba; at the Spatsum claim, south of Ashcroft Manor, British Columbia; in the Dundas quarry, Dundas, Ontario. In the USA, from Bisbee, Cochise Co., Arizona; in the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; at the Goldstrike mine, Lynn district, Humboldt Co., and other localities in Nevada. At Navarana fjord, Freuchen Land, Greenland. From Paddy's River mine, Australian Capital Territory. Additional localities are known.

Name: To honor Zygmunt Rozen (1874–1936), mineralogist and petrographer, Academy of Mining and Metallurgy, Kraców, Poland.

Type Material: Academy of Mining and Metallurgy, Kraców, Poland.

Ruarsite RuAsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. As irregular grains or as aggregates, to 100–150 μm, having rough textured surfaces.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. VHN = 893 (50 g load) low % Os grains; 734 (50 g load) for 14% Os. D(meas.) = n.d. D(calc.) = 7.08

Optical Properties: Opaque. *Color:* Lead-gray to dark lead-gray; grayish white in polished section. *Streak:* Grayish black. *Luster:* Metallic. *Pleochroism:* Pale yellowish white to pale grayish yellow-white. *Anisotropism:* Distinct, bluish gray to light reddish.
R_1–R_2: (480) 43.4, (546) 44.1, (589) 43.8, (656) 45.1

Cell Data: *Space Group:* n.d. $a = 5.931$ $b = 5.915$ $c = 6.003$ $\beta = 112°27'$ $Z = 4$

X-ray Powder Pattern: Anduo, Tibet, China.
2.77 (100), 1.870 (90), 1.695 (90), 1.890 (70), 1.660 (60), 3.79 (50), 1.580 (50)

Chemistry:

	(1)	(2)
Ru	42.45	48.58
Os	5.94	
Ir	1.67	
Pt	0.07	
Cu	0.00	
As	36.25	36.01
Sb	0.00	
S	14.08	15.41
Total	100.36	100.00

(1) Anduo, Tibet, China; by electron microprobe, average of eight analyses of seven grains; corresponding to $(Ru_{0.91}Os_{0.05}Ir_{0.02})_{\Sigma=0.98}As_{1.05}S_{0.94}$. (2) RuAsS.

Mineral Group: Arsenopyrite group.

Occurrence: In heavy mineral concentrates and in chromium ore derived from an Alpine-type ultramafic (Anduo, Tibet, China).

Association: Iridosmine, rutheniridosmine, ruthenosmiridium, Pt–Ir alloy, Ru–Fe alloy, osmium, sperrylite, laurite, chromian spinel, pyrite, pyrrhotite, löllingite, magnetite, chalcopyrite, molybdenite, galena, millerite (Anduo, Tibet, China).

Distribution: From the Anduo chromite deposit, northern Tibet, China [TL]. At the Neozhidannyy Creek placers, Tuva, Russia. In the Kapitanov chromite deposit, near Zvenyhorodka, Ukraine. From the Kraubath ultramafic massif, Styria, Austria. At the Kelly Lake Ni–Cu sulfide deposit, Sudbury, Ontario, Canada.

Name: For the chemical composition RUthenium, ARsenic, and Sulfur.

Type Material: Museum of Geology, (Beijing?), China.

Rucklidgeite $(Bi, Pb)_3Te_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As foliated aggregates, to 13 mm, and as smaller grains.

Physical Properties: *Cleavage:* Perfect on {0001}; "average" on rhombohedron. *Tenacity:* Flexible; brittle. Hardness = n.d. VHN = 51.6–62.9 (10 g load). D(meas.) = 7.739 D(calc.) = 8.06

Optical Properties: Opaque. *Color:* Silver-white; in polished section, white with very weak rose tint. *Streak:* Lead-gray. *Luster:* Metallic. *Pleochroism:* Very weak in air, noticeable in oil. *Anisotropism:* Distinct, reddish brown to bluish gray.
R_1–R_2: (400) 62.9–62.1, (420) 62.9–62.0, (440) 63.0–61.8, (460) 63.2–61.8, (480) 63.7–61.8, (500) 64.4–61.9, (520) 65.0–62.0, (540) 65.3–62.1, (560) 65.5–62.2, (580) 65.8–62.2, (600) 66.1–62.3, (620) 66.4–62.4, (640) 66.5–62.6, (660) 66.6–62.8, (680) 66.7–63.0, (700) 66.6–63.2

Cell Data: *Space Group:* $R\overline{3}m$. $a = 4.422$ $c = 41.49$ $Z = 3$

X-ray Powder Pattern: Kochkar deposit, Russia.
3.22 (100), 2.34 (90), 1.473 (60), 1.976 (50), 2.21 (40), 1.822 (40), 1.607 (40)

Chemistry:

	(1)	(2)		(1)	(2)
Bi	37.4	38.1	Sb	1.0	2.9
Pb	15.4	13.6	Te	43.9	44.2
Ag	1.2	1.1	Total	98.9	99.9

(1) Kochkar deposit, Russia; by electron microprobe, corresponding to $(Bi_{2.08}Pb_{0.88}Ag_{0.13})_{\Sigma=3.09}Te_{4.00}$. (2) Zod deposit, Armenia; by electron microprobe, corresponding to $(Bi_{2.11}Pb_{0.78}Ag_{0.12}Sb_{0.10})_{\Sigma=3.11}Te_{4.00}$.

Occurrence: Of hydrothermal origin.

Association: Gold, arsenopyrite, boulangerite, dolomite (Kochkar deposit, Russia); tellurobismuthite, volynskite, calaverite, hessite (Ashley deposit, Canada); altaite, galena, volynskite, hessite, melonite, chalcopyrite, michenerite, hawleyite (Kambalda, Australia).

Distribution: In Russia, from the Kochkar gold deposit, Plast, Southern Ural Mountains [TL]; at the Alekseevskoye mine, Sutam district, Stanovoi Range, southeast Yakutia; in the Mount General'skaya massif, Kola Peninsula. From the Zod gold deposit, 14 km east of Vardenis, Armenia [TL]. In the Aidarly porphyry copper deposit, Kazakhstan. At Oldřichov, near Tachov, Czech Republic. From the Dragset deposit, south Trondelag, Norway. In the USA, at the Campbell mine, Bisbee, Cochise Co., Arizona; from the Hesperus mine, La Plata Co., Colorado; in the Olinghouse mine, Olinghouse district, Washoe Co., Nevada. In Canada, from the Ashley deposit, Bannockburn Township, Ontario; in the Robb-Montbray mine, Montbray Township, Quebec; at the ABO prospect, Harrison Hot Springs, British Columbia. From the Lunnon Shoot, Kambalda, 56 km south of Kalgoorlie, Western Australia, and at Crown Reef, Norseman, Western Australia. From the Yanahara mine, Okayama Prefecture, Japan. In the Bulawan Au–Ag–Te deposit, Negros Occidental, Phillipines.

Name: Honors Dr. John Christopher Rucklidge (1938–), Canadian mineralogist, University of Toronto, Toronto, Canada, who first noted a mineral of analogous composition in the Robb-Montbray deposit, Ontario, Canada.

Type Material: Vernadsky Geological Museum, Moscow, 50743; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 83005, 87446, vis 245, vis247.

Rudenkoite $Sr_3Al_{3.5}Si_{3.5}O_{10}(OH_{7.5},O_{0.5})Cl_2•H_2O$

Crystal Data: Monoclinic. *Point Group: m*, 2 or 2/*m*. As spheroidal aggregates of radiating fibers, to 7 mm, elongated on [100].

Physical Properties: *Cleavage:* None. *Fracture:* n.d. *Tenacity*: Flexible. Hardness = 1.5 (for aggregates). D(meas.) = 3.17(1) D(calc.) = 3.18

Optical Properties: Translucent. *Color:* White. *Luster:* n.d.
Optical Class: Biaxial (+). α = 1.639(2) β = 1.648(2) γ = 1.665(2) 2V(meas.) = 75(10)°
2V(calc.) = 72.71° *Dispersion:* Average, $r > v$. *Orientation:* $X = a$. *Pleochroism*: None.

Cell Data: *Space Group: P2/m*, *P*2, or *Pm*. a = 5.893(5) b = 7.262(5) c = 10.288(8)
β = 97.23(3)° Z = 1

X-ray Powder Pattern: Emel'dzhaksky deposit, Aldan province, southern Yakutsk, Russia.
10.13 (100), 2.96 (100), 2.90 (100), 2.505 (100), 3.23 (80), 2.182 (80), 1.855 (70)

Chemistry:

	(1)
CaO	0.86
SrO	34.61
BaO	0.54
Al_2O_3	21.01
SiO_2	24.73
Cl	9.06
H_2O	10.10
-O = Cl	2.04
Total	98.87

(1) Emel'dzhaksky deposit, Aldan province, southern Yakutsk, Russia; electron microprobe analysis, H_2O by Penfield method, OH^- and H_2O confirmed by IR; corresponding to $(Sr_{2.83}Ba_{0.33}Ca_{0.13})_{\Sigma=2.99}(Al_{3.49}Si_{3.48})_{\Sigma=6.97}O_{10.16}(OH)_{7.88}Cl_{2.16}•0.8H_2O$.

Occurrence: Formed in the last stages of (metasomatic) prehnitization, in garnet-wollastonite metamorphic rock (skarn) at the contact between pegmatite and calcite marble.

Association: Prehnite, calcite, spinel, diopside, fluorapatite.

Distribution: At the Emel'dzhaksky phlogopite deposit, Aldan province, Aldan Shield, southern Yakutsk, Russia.

Name: Honors Professor Sergey Alexandrovich Rudenko (1917-1992), a specialist in minerals of alkaline pegmatites, St. Petersburg (Leningrad) Mining Institute, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 3121/1.

(1) Potash Corporation of America mine, Penobsquis, Canada; by electron microprobe, average of two analyses, H_2O by difference; corresponds to $Ca_{9.27}B_{26.51}O_{34.97}Cl_{3.50}(OH)_{24.63}\cdot 11.90H_2O$. (2) $Ca_9B_{26}O_{34}Cl_4(OH)_{24}\cdot 13H_2O$.

Polymorphism & Series: Dimorphous with pringleite.

Occurrence: Very rare, in an evaporite deposit.

Association: Halite, pringleite, hilgardite-1A, sylvite, anhydrite, quartz, clays.

Distribution: From the Potash Corporation of America mine, Penobsquis evaporite deposit, near Sussex, New Brunswick, Canada.

Name: To honor Dr. Arie A. Ruitenberg (1929–), geologist, Geological Surveys Branch, New Brunswick Department of Natural Resources, Sussex, Canada, for his contributions to the mineral industry in New Brunswick.

Type Material: Geological Survey of Canada, Ottawa, 66920; Canadian Museum of Nature, Ottawa, Canada, 82047.

Ruizite $Ca_2Mn_2^{3+}Si_4O_{11}(OH)_4 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Euhedral prismatic crystals, to 1 mm, elongated ‖ [010] and somewhat flattened on {100}; as spherules of radial acicular crystals. *Twinning:* Common on {100}, always involving only two individuals.

Physical Properties: Hardness = ∼5 D(meas.) = 2.9(1) D(calc.) = 2.997

Optical Properties: Translucent. *Color:* Orange, inclining to brown. *Streak:* Pale apricot. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 44°$. *Dispersion:* $r > v$, strong, inclined. *Absorption:* $Y > Z \gg X$. $\alpha = 1.663$ $\beta = 1.715$ $\gamma = 1.734$ 2V(meas.) = 60.2° 2V(calc.) = 60.7°

Cell Data: *Space Group:* $C2/m$. $a = 11.95$–11.976 $b = 6.17$–6.175 $c = 9.03$–9.064 $\beta = 91.375°$ Z = 4

X-ray Powder Pattern: Christmas, Arizona, USA.
11.95 (100), 4.19 (70), 3.12 (60), 5.09 (50), 3.64 (40), 2.951 (40), 2.591 (40)

Chemistry:

	(1)	(2)
SiO_2	39.14	41.26
Mn_2O_3	23.42	27.11
CaO	20.57	19.26
H_2O	16.0	12.37
Total	99.13	100.00

(1) Christmas, Arizona, USA; SiO_2 by solvent extraction, Mn and Ca by AA, H_2O by the Penfield method. (2) $Ca_2Mn_2Si_4O_{11}(OH)_4 \cdot 2H_2O$.

Occurrence: In veinlets and on fracture surfaces in metalimestones, formed during cooling of a high-temperature calc-silicate assemblage under oxidizing conditions (Christmas, Arizona, USA).

Association: Apophyllite, kinoite, junitoite, wollastonite, grossular, diopside, vesuvianite, calcite, chalcopyrite, bornite, sphalerite, smectite (Christmas, Arizona, USA); apophyllite, pectolite, datolite, inesite, orientite, quartz (Wessels mine, South Africa).

Distribution: In the Christmas copper mine, Christmas, Gila Co., Arizona, USA. From the N'Chwaning and Wessels mines, near Kuruman, Cape Province, South Africa.

Name: For Joe Ana Ruiz, of Mammoth, Arizona, USA, collector of microscopic minerals, who discovered the mineral.

Type Material: University of Arizona, Tucson, Arizona; Harvard University, Cambridge, Massachusetts, 119096; National Museum of Natural History, Washington, D.C., USA, 136689; The Natural History Museum, London, England, 1980,534.

Rumseyite $[Pb_2OF]Cl$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As aggregates of minute tabular to prismatic crystals with pyramidal terminations.

Physical Properties: *Cleavage*: Perfect on {100}. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = ~ 3 VHN = 140 (100 g load). D(meas.) = n.d. D(calc.) = 7.72

Optical Properties: Translucent. *Color*: Pale orange-brown, gray in reflected light with abundant pale-yellow internal reflections. *Streak*: White. *Luster*: Vitreous.
Optical Class: n.d. n = 2.15 [calculated]
R: (470) 14.6, (546) 13.6, (589) 13.4, (650) 13.2

Cell Data: *Space Group*: *I*4/*mmm*. a = 4.065(1) c = 12.631(7) Z = 2

X-ray Powder Pattern: Torr Works (Merehead) quarry, England.
2.923 (100), 2.875 (68), 3.848 (41), 6.306 (17), 1.680 (14), 2.110 (12), 2.049 (10)

Chemistry:

	(1)	(2)
PbO	90.63	92.07
F	3.53	3.92
Cl	7.15	7.31
$-O=(F+Cl)_2$	3.23	3.30
Total	99.08	100.00

(1) Torr Works (Merehead) quarry, England; average of 25 electron microprobe analyses, O calculated by difference, absence of OH^- determined by structure analysis; corresponding to $Pb_{2.039}O_{1.00}F_{0.992}Cl_{1.001}$. (2) $[Pb_2OF]Cl$.

Occurrence: Part of an assemblage of lead oxychloride minerals that occur in cavities in manganese oxide pods in limestone.

Association: Calcite, cerussite, diaboleite, hydrocerussite, pyrolusite, manganite.

Distribution: From the Torr Works (Merehead) quarry, near the village of Cranmore, Somerset, England.

Name: Honors Michael Scott (Mike) Rumsey (b. 1980), Curator and Collections Manager, the Natural History Museum, London, England.

Type Material: Natural History Museum, London, England (BM 1970,110).

(1) Upper Chegem caldera, near Mt. Lakargi, Northern Caucasus, Russia; average of 45 electron microprobe analyses, H_2O calculated for charge balance, corresponding to $Ca_{9.99}Si_{6.01}O_{21}(Cl_{1.86}OH_{0.14})$.

Occurrence: In a thermally altered (sanidinite facies) carbonate-silicate xenolith about 10 m in size enclosed in ignimbrite.

Association: Wadalite, wollastonite, trabzonite, rankinite, larnite.

Distribution: Upper Chegem caldera, near Mt. Lakargi, Kabardino-Balkaria, Northern Caucasus, Russia.

Name: Honors Vladimir L. Rusinov (1935-2007), a Russian petrologist who studied the thermodynamics of non-equilibrium mineral systems.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (4022/1).

(1) Castle-an-Dinas mine, England. (2) Flo property, Canada; by electron microprobe, total Fe as Fe_2O_3; corresponding to $(Bi_{1.59}Pb_{0.05})_{\Sigma=1.64}(W_{0.85}Fe_{0.15})_{\Sigma=1.00}O_6$. (3) Bi_2WO_6.

Occurrence: An alteration product of earlier bismuth minerals in Sn–W-bearing high-temperature hydrothermal mineral deposits, greisens, or granite pegmatites.

Association: Bismuth, bismuthinite, bismite, wolframite, ferberite, scheelite, ferritungstite, anthoinite, mpororoite, koechlinite, cassiterite, topaz, muscovite, tourmaline, quartz.

Distribution: In England, at the Castle-an-Dinas mine, St. Columb Major, and the Hingston Down quarry, Calstock, Cornwall; and from Buckbarrow Beck, Corney Fell, Cumbria. In Germany, at the Himmelsfürst mine, Erbisdorf, near Freiberg, and at Altenberg, Saxony, and in the Clara Mine, near Oberwolfach, Black Forest. From Krupka, Krušné hory Mountains, Czech Republic. In Canada, on the Nug-4 claim, Nahani River area, Northwest Territories, and the Flo property, Kalzas Mountain, 67 km southeast of Mayo, Yukon Territory. At Sylvanite, Hidalgo Co., New Mexico, USA. From near Poona, Western Australia. At Bugaya, Uganda. In the Kara-Oba Mo–W deposit, the Bom-Gorkhon deposit, and the Spokoynoye deposit, Kazakhstan.

Name: To honor Sir Arthur Edward Ian Montagu Russell (1878–1964), British mineralogist and mineral collector, of Swallowfield Park, Berkshire, England.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1934,615.

Rustenburgite $(Pt,Pd)_3Sn$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As grains, rarely showing {001}, to 100 μm, and as droplike inclusions.

Physical Properties: Hardness = n.d. VHN = 365 (25 g load). D(meas.) = n.d. D(calc.) = 15.08

Optical Properties: Opaque. *Color:* In polished section, pale cream. *Luster:* Metallic. *Anisotropism:* Slight, due to strain.
R_1–R_2: (480) 56.2, (546) 59.8, (589) 60.4, (656) 61.65

Cell Data: *Space Group:* $Fm3m$ (probable) or $Pm3m$. a = 3.991 Z = 4

X-ray Powder Pattern: Merensky Reef, South Africa.
2.295 (100), 1.202 (100), 1.408 (90), 0.9153 (90), 0.8145 (90), 1.992 (80), 0.8922 (80)

Chemistry:

	(1)
Pt	53.44
Pd	28.28
Sn	17.70
Total	99.42

(1) Merensky Reef, South Africa; by electron microprobe, corresponding to $(Pt_{1.52}Pd_{1.48})_{\Sigma=3.00}Sn_{0.83}$.

Polymorphism & Series: Forms a series with atokite.

Occurrence: As very sparse grains in concentrates (Merensky Reef, South Africa).

Association: Atokite, unspecified platinum tellurides (Merensky Reef, South Africa); moncheite, pyrrhotite, pentlandite (Stillwater complex, Montana, USA).

Distribution: In the Rustenburg [TL], Atok, and Onverwacht mines, on the Merensky Reef, Bushveld complex, Transvaal, South Africa. From the Upper Banded Zone of the Stillwater complex, Montana, USA. In Russia, at Noril'sk, western Siberia; from the Ioko-Dovyren ultramafic pluton, northern Baikal district, eastern Siberia.

Name: For its occurrence in the Rustenburg mine, South Africa.

Type Material: n.d.

References: (1) Mihálik, S.A., S.A. Hiemstra, and J.P.R. de Villiers (1975) Rustenburgite and atokite, two new platinum-group minerals from the Merensky Reef, Bushveld Igneous Complex. Can. Mineral., 13, 146–150. (2) (1976) Amer. Mineral., 61, 340 (abs. ref. 1).

Rustumite $Ca_{10}(SiO_4)(Si_2O_7)_2Cl_2(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals crudely tabular on {100}, to 1 cm. *Twinning:* Lamellar on {100}, twin axis [001], common.

Physical Properties: *Cleavage:* Poor on {100}, very poor on {010} and {001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.94]

Optical Properties: Translucent. *Color:* Colorless. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 4°–6°$. $\alpha = 1.640$ β = n.d. $\gamma = 1.651$ 2V(meas.) = 80°

Cell Data: *Space Group:* $C2/c$. $a = 7.62(5)$ $b = 18.55(5)$ $c = 15.51(5)$ $\beta = 104°20(10)'$ $Z = 4$

X-ray Powder Pattern: Kilchoan, Scotland.
3.03 (s1), 2.89 (s2), 3.19 (s3), 2.52 (ms), 1.907 (ms), 1.752 (ms), 2.75 (m)

Chemistry:

	(1)	(2)
SiO_2	33.8	32.16
CaO	61.6	60.03
Cl		7.59
H_2O		1.93
$-O = Cl_2$		1.71
Total	95.4	100.00

(1) Kilchoan, Scotland; by electron microprobe, partial analysis; contains less than 0.2% Fe_2O_3, Al_2O_3, MgO, no CO_2; Cl not determined (later inferred during crystal structure determination, and independently confirmed). (2) $Ca_{10}(SiO_4)(Si_2O_7)_2Cl_2(OH)_2$.

Occurrence: In limestones between two ring dikes, formed during a metamorphic period in which H_2O:CO_2 in the vapor phase was relatively high (Kilchoan, Scotland).

Association: Åkermanite, merwinite, larnite, spurrite, rankinite, kilchoanite (Kilchoan, Scotland).

Distribution: In Scotland, from near Kilchoan, Ardnamurchan, Argyllshire. From Carlingford, Co. Louth, Ireland. In the Igeltjärn mine, near Persberg, Värmland, Sweden. From the Güneyce-İkizdere area, Trabzon Province, Turkey. In the La Negra mine, Maconi, Querétaro, Mexico.

Name: For Rustum Roy (1924–), experimental petrologist and materials scientist, Pennsylvania State University, University Park, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119428, 119429.

Ruthenarsenite (Ru, Ni)As

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As irregular inclusions, to 100 μm, in a matrix of rutheniridosmine.

Physical Properties: Hardness = n.d. VHN = 743–933 (100 g load). D(meas.) = n.d. D(calc.) = 10.0 for $Ru_{0.89}Ni_{0.11}As$.

Optical Properties: Opaque. *Color:* In polished section, pale orange-brown to brownish gray. *Pleochroism:* Distinct. *Anisotropism:* Strong, orange-brown to pale steel-gray.
R_1–R_2: (470) 46.1–48.8, (546) 47.5–49.5, (589) 49.3–50.9, (650) 51.1–52.4

Cell Data: *Space Group: Pnma* (synthetic RuAs). $a = 5.628$ $b = 3.239$ $c = 6.184$
$Z = 4$

X-ray Powder Pattern: Papua New Guinea.
2.061 (100), 2.696 (70), 2.124 (50), 1.780 (40), 1.750 (40), 1.343 (40), 1.302 (40)

Chemistry:

	(1)	(2)
Ru	44.6	29.1
Ir	4.0	
Os	2.1	
Pt		1.5
Rh	2.3	27.4
Pd	1.8	0.59
Ni	4.4	0.69

Sb		1.4
Total	98.6	101.78

(1) Papua New Guinea; by electron microprobe, corresponding to $(Ru_{0.79}Ni_{0.13}Ir_{0.04}Rh_{0.04}Pd_{0.03}Os_{0.02})_{\Sigma=1.05}As_{0.95}$. (2) Onverwacht mine, South Africa; by electron microprobe, corresponding to $(Ru_{0.51}Rh_{0.47}Ni_{0.02}Pt_{0.01}Pd_{0.01})_{\Sigma=1.02}(As_{0.96}Sb_{0.02})_{\Sigma=0.98}$.

Occurrence: As inclusions in Os–Ir–Ru alloys (Papua New Guinea), and in Alpine-type ultramafics.

Association: Rutheniridosmine, irarsite, iridarsenite.

Distribution: From an unspecified locality [probably the Waria River, Bowutu Mountains, or the Yodda Goldfield] in Papua New Guinea [TL]. At Anduo, Tibet, China. In the Onverwacht mine, on the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: For RUTHENium and ARSENic in the composition.

Type Material: Canadian Museum of Nature, Ottawa, Canada.

(1) Rio Pilpe, Guapi Co., Colombia; by electron microprobe, corresponds to (2)

Occurrence: In placer sands, generally derived from ultramafic rocks.

Association: Other Os–Ir–Ru alloys, sperrylite, hollingworthite, iridarsenite, ruthenarsenite, michenerite, laurite, geversite, moncheite, chromite. ??

Distribution: In Canada, from several properties around Atlin, and from the Spruce Creek and Tulameen River areas, British Columbia. Around Zlatoust, Ural Mountains; in the Konder massif, Aldan Shield, Sakha; and from several other less well-defined localities, Russia. From Vourinos, Greece. In South Africa, on the Witwatersrand. From the Heazlewood and Adamsfield districts, Tasmania, Australia. At Ironstone Creek, Parapara, New Zealand. In the Massif du Sud, New Caledonia. From an unspecified locality in Papua New Guinea. ?? all suspect ??

Name: For RUTHENium, IRIDium, and OSMium in the composition; the name applied to hexagonal alloys with Ir dominant.

Type Material: n.d.

(1) Uryu River, Japan; by electron microprobe, corresponding to $(Ru_{0.74}Ir_{0.09}Rh_{0.08}Pt_{0.05}Os_{0.03}Pd_{0.01})_{\Sigma=1.00}$.

Occurrence: In a platinum grain (Uryu River, Japan).

Association: Platinum, other PGE minerals.

Distribution: In gravels of the Uryu River, near Horokanai, Hokkaido, Japan [TL]. In Russia, from Nizhni Tagil, Ural Mountains, and in a placer on the Upper Miass River, Southern Ural Mountains. In the Waiau River, western Southland, New Zealand. From the Kraubath ultramafic massif, Styria, Austria. In the USA, in the Yuba River, Nevada Co., California; at Tennessee Pass, Josephine Co, Oregon. In concentrates from the Wellgreen Cu–Ni–Pt–Pd deposit, Yukon Territory, Canada. At Rio Pilpe, Guapi Co., Colombia. Additional poorly specified localities are recorded.

Name: From the Latin *Ruthenia*, for *Ukraine* or *Russia*, as the element was found associated with platinum in the Ural Mountain placers, Russia; the name applied to hexagonal alloys with dominant Ru.

Type Material: University of Kagoshima, Kagoshima, Japan.

References: (1) Urashima, Y., T. Wakabayashi, T. Masaki, and Y. Terasaki (1974) Ruthenium, a new mineral from Horokanai, Hokkaido, Japan. Mineral. J. (Japan), 7, 438–444. (2) (1976) Amer. Rutherfordine $U^{6+}O_2(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are lathlike, elongated along [001], with large {100}, {010}, {001}, to 3 mm; commonly radiating, fibrous, matted, in pulverulent, earthy to very fine-grained dense masses.

Physical Properties: *Cleavage:* On {010}, perfect; on {001}, less perfect. Hardness = n.d. D(meas.) = 5.7 D(calc.) = 5.682 Radioactive.

Optical Properties: Semitransparent. *Color:* Pale yellow, straw-yellow, greenish yellow, orange, amber-brown, may be zoned. *Luster:* Dull to earthy, silky if fibrous. *Optical Class:* Biaxial (+). *Pleochroism:* Slight; X = colorless; Y = pale yellow; Z = pale greenish yellow. *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.715$–1.723 $\beta = 1.728$–1.730 $\gamma = 1.755$–1.795 2V(meas.) = Large. 2V(calc.) = 53°

Cell Data: *Space Group:* $Imm2$. $a = 4.840(1)$ $b = 9.273(2)$ $c = 4.298(1)$ Z = 2

X-ray Powder Pattern: Uluguru Mountains, Tanzania.
4.61 (100), 4.30 (70), 3.23 (40), 3.92 (30), 2.64 (25), 2.309 (20), 2.062 (20)

Chemistry:

	(1)	(2)	(3)
CO_2	13.1	13.6	13.33
UO_3	86.7	86.6	86.67
H_2O^+	0.2		
Total	[100.0]	100.2	100.00

(1) Uluguru Mountains, Tanzania; recalculated to 100% from an original total of 100.3%, after deduction of Pb and Ca as kasolite and uranophane, and remaining FeO and CaO as impurities. (2) Katanga Province, Congo. (3) $UO_2(CO_3)$.

Occurrence: A secondary mineral formed as a weathering product of uraninite.

Association: Uraninite, becquerelite, masuyite, schoepite, kasolite, curite, boltwoodite, vandendriesscheite, billietite, metatorbernite, fourmarierite, studtite, sklodowskite.

Distribution: From the Uluguru Mountains, Morogoro district, Tanzania. At Shinkolobwe, from Kalongwe, and in the Musonoi mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, from Beryl Mountain, Acworth, Sullivan Co., and in the Palermo mine, near North Groton, Grafton Co., New Hampshire; at Newry, Oxford Co., Maine. In Utah, from the Delta mine, Emery Co., and in the "C" group of claims and the Jomac mine, White Canyon district, San Juan Co.; from the Lucky Mc No. 20 mine, Wind River Basin, Fremont Co., Wyoming; near McCoy, Eagle Co., and in the Maybell area, Moffat Co., Colorado; from the Apex uranium mine, Reese River district, Lander Co., Nevada. In England, at Loe Warren zawn, 0.75 km west of Botallack, St. Just, and in the South Terras mine, St. Stephen-in-Brannel, Cornwall. At the Les Mares and Rabéjac uranium deposits, south of Lodève, Hérault, France. From the Krunkelbachtal mine, near Menzenschwand, Black Forest, Germany. In Australia, from the Nabarlek uranium deposit, Northern Territory, and at the Coppertop mine, Peake and Denison Ranges, South Australia.

Name: Honors Professor Ernest Rutherford (1871–1937), New Zealand–English atomic physicist.

Type Material: Natural History Museum, Paris, 109.1083; National Museum of Natural History, Washington, D.C., USA, 93291.

Rutile TiO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals prismatic, elongated and striated ‖ [001], to 25 cm, showing {110}, {010}, terminated by {101} or {111}, many others; equant, rarely dipyramidal; massive. *Twinning:* On {011}, common, or {031}, geniculated, reticulated; as contact twins with two, six, or eight individuals, cyclic, polysynthetic.

Physical Properties: *Cleavage:* {110}, good; {100}, moderate; {111}, in traces. *Fracture:* Conchoidal, subconchoidal, uneven. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 894–974 (100 g load). D(meas.) = 4.23(2), increasing with Nb–Ta content. D(calc.) = 4.25 Photosensitive.

Optical Properties: Opaque, transparent in thin fragments. *Color:* Reddish brown, red, pale yellow, pale blue, violet, rarely grass-green; black if high in Nb–Ta; red to brownish red, pale yellow in transmitted light, deep brown to green with high Nb–Ta; in reflected light, gray with bluish tint, with white, yellow, or red internal reflections. *Streak:* Pale brown, yellowish brown; gray, greenish black with high Nb–Ta. *Luster:* Adamantine to submetallic. *Optical Class:* Uniaxial (+). *Pleochroism:* Distinct; red, brown, yellow, green. *Dispersion:* Strong. *Absorption:* $E > O$. $\omega = 2.605$–2.613 $\epsilon = 2.899$–2.901 *Anisotropism:* Strong. R_1–R_2: (400) 23.7–27.0, (420) 23.2–26.5, (440) 22.7–26.0, (460) 22.2–25.5, (480) 21.7–25.1, (500) 21.3–24.7, (520) 20.9–24.3, (540) 20.6–24.0, (560) 20.2–23.6, (580) 20.0–23.4, (600) 19.7–23.1, (620) 19.5–22.9, (640) 19.2–22.8, (660) 19.1–22.6, (680) 19.0–22.5, (700) 18.9–22.5

Cell Data: *Space Group:* $P4_2/mnm$ (synthetic). $a = 4.5937$ $c = 2.9587$ Z = 2

X-ray Powder Pattern: Synthetic.
3.247 (100), 1.6874 (60), 2.487 (50), 2.188 (25), 1.6237 (20), 1.3598 (20), 1.3465 (12)

Chemistry:

	(1)
TiO_2	97.46
Fe_2O_3	2.62
Total	100.08

(1) Graves Mountain, Georgia, USA.

Polymorphism & Series: Trimorphous with anatase and brookite.

Mineral Group: Rutile group.

Occurrence: A common high-temperature, high-pressure accessory mineral in igneous rocks, anorthosite, and granite pegmatite; in hydrothermally-altered rocks; in gneiss, schist, contact metamorphosed limestone; in clays, shales; a common detrital mineral.

Association: Anatase, brookite, hematite, ilmenite, apatite, adularia, albite, titanite, chlorite, pyrophyllite, calcite, quartz.

Distribution: Many localities; a few for fine crystals include: in Switzerland, at Cavradi, Tavetsch, Graübunden, and Lodrino, Tessin. From the Pfitschtal, Trentino-Alto Adige, Italy. On the Saualpe, and at Herzogberg, near Modriach, Styria, Austria. From Kassoi Brod, Ural Mountains, Russia. In the USA, at Magnet Cove, Hot Spring Co., Arkansas; on Graves Mountain, Washington, Lincoln Co., Georgia; at Stony Point, Alexander Co., North Carolina; from Parkesburg and elsewhere, Chester Co., Pennsylvania; in the Champion mine, White Mountains, Mono Co., California. In Brazil, large crystals from Conquista, and at Ibitiara, Bahia. At the Giftkuppe mine, Omaruru, Namibia.

Name: From the Latin *rutilus*, for *red*, a common color of the mineral.

Rynersonite $Ca(Ta,Nb)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 0.5 mm, elongated along [100] and flattened on {010}, in fibrous, felted aggregates, to several cm.

Physical Properties: *Fracture:* Uneven. Hardness = ∼4.5 D(meas.) = 6.402 D(calc.) = 6.39–7.20

Optical Properties: Transparent. *Color:* Pale creamy white to pale reddish pink; pale yellowish brown to dark brown. *Streak:* White. *Luster:* Dull, earthy in aggregates. *Optical Class:* Biaxial (+); birefringence ∼0.14. *Pleochroism:* $X = Y$ = straw-yellow; Z = light straw-yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = > 2.05$ $\beta = > 2.05$ $\gamma = > 2.05$ 2V(meas.) = Moderate.

Cell Data: *Space Group: Pmnb.* $a = 7.505(1)$ $b = 11.063(2)$ $c = 5.370(1)$ Z = 4

X-ray Powder Pattern: San Diego mine, California, USA.
3.038 (100), 4.835 (90), 2.964 (90), 3.754 (70), 2.683 (50), 2.359 (50), 2.767 (35)

Chemistry:

	(1)	(2)
Nb_2O_5	14.2	10.23
Ta_2O_5	66.6	74.6
SiO_2	3.0	1.01
Sb_2O_3	0.5	0.07
Bi_2O_3	0.1	0.43
FeO	0.4	1.43
MnO	0.1	0.35
CaO	13.0	8.50
Total	97.9	96.62

(1) San Diego mine, California, USA; by electron microprobe, total Fe as FeO; corresponds to $Ca_{1.11}(Ta_{1.44}Nb_{0.51})_{\Sigma=1.95}O_6$. (2) Wampewo pegmatite, Uganda; by electron microprobe, total Fe as FeO; corresponds to $(Ca_{0.75}Fe_{0.10}Mn_{0.02})_{\Sigma=0.87}(Ta_{1.67}Nb_{0.38})_{\Sigma=2.05}O_6$.

Occurrence: A rare alteration product of earlier Nb–Ta minerals in some granite pegmatites.

Association: Fersmite, stibiotantalite, cassiterite, microlite, beyerite, tourmaline, albite, quartz (San Diego Co., California, USA); microlite, wodginite, zircon, lepidolite, quartz (Wampewo pegmatite, Uganda).

Distribution: In the USA, from the Himalaya and San Diego mines, Mesa Grande district, San Diego Co., California; at the Brown Derby No. 1 pegmatite, Quartz Creek district, Gunnison Co., Colorado. In the Wampewo pegmatite, Gamba Hill, near Kampala, southwest Uganda.

Name: To honor Frederick James Rynerson (1882–1960), and his two sons, Buel Frederick Rynerson (1905–) and Eugene Bonfoey Rynerson (1910–), long-time pegmatite miners in San Diego Co., California, USA.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1977,144; National Museum of Natural History, Washington, D.C., USA, 135832, 135833, 136719, 149524.

Sabatierite Cu_6TlSe_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As radiating polycrystalline aggregates, to 0.05 mm.

Physical Properties: Hardness = n.d. VHN = 54 (15 g load). D(meas.) = n.d. D(calc.) = 6.78

Optical Properties: Opaque. *Color:* In polished section, bluish gray with slight cream tint. *Luster:* Metallic. *Pleochroism:* Distinct, in pale brown to pale blue. *Anisotropism:* Strong, with undulatory extinction, colors in pale gray-blue to dark yellow-brown.
R_1–R_2: (400) —, (420) 31.0–33.2, (440) 30.9–34.3, (460) 30.6–33.8, (480) 30.1–33.0, (500) 29.5–32.2, (520) 28.7–31.5, (540) 27.9–30.6, (560) 27.0–29.6, (580) 26.1–28.4, (600) 25.3–27.2, (620) 24.5–26.0, (640) 23.8–24.8, (660) 23.0–23.8, (680) 22.2–22.7, (700) 21.3–21.6

Cell Data: *Space Group:* n.d. $a = 3.986(4)$ $b = 5.624(4)$ $c = 9.778(8)$ $Z = 1$

X-ray Powder Pattern: Bukov deposit, Czech Republic.
3.089 (100), 2.706 (70), 1.991 (70), 2.445 (60), 1.847 (60), 3.987 (50), 2.525 (50)

Chemistry:

	(1)	(2)
Cu	42.71	42.29
Tl	22.44	22.67
Se	34.57	35.04
Total	99.72	100.00

(1) Bukov deposit, Czech Republic; by electron microprobe, average of five analyses, corresponding to $Cu_{6.06}Tl_{0.99}Se_{3.95}$. (2) Cu_6TlSe_4.

Occurrence: In calcite veins.

Association: Crookesite, berzelianite, umangite, bukovite.

Distribution: In the Bukov deposit, Rožná district, Czech Republic [TL].

Name: To honor Germain Sabatier (1923–), former Director of Research, C.N.R.S., Orléans, France.

Type Material: National School of Mines, Paris, France.

Sabelliite $Cu_2Zn(AsO_4, SbO_4)(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystals are tabular on {001}, showing only {001} with a characteristic coinlike circular outline, to 200 μm; usually in aggregates of crystals.

Physical Properties: *Tenacity:* Brittle. Hardness = ∼4.5 VHN = 322–469, 386 average (15 g load). D(meas.) = n.d. D(calc.) = 4.65

Optical Properties: Transparent. *Color:* Emerald-green. *Streak:* Pale green.
Luster: Adamantine.
Optical Class: Uniaxial (–). $\omega = 1.802(2)$ $\epsilon = 1.797(2)$

Cell Data: *Space Group:* $P\overline{3}$. $a = 8.197(2)$ $c = 7.312(1)$ $Z = 3$

X-ray Powder Pattern: Is Murvonis mine, Sardinia, Italy.
2.522 (100), 1.550 (100), 1.805 (92), 2.166 (88), 1.513 (85), 4.11 (55), 3.66 (52)

Chemistry:

	(1)
As_2O_5	23.07
Sb_2O_5	6.59
SiO_2	0.71
CuO	43.56
ZnO	19.48
H_2O	[6.05]
Total	[99.46]

(1) Is Murvonis mine, Sardinia, Italy; by electron microprobe, average of 20 spots on four crystals, H_2O calculated from direct determination of O content, structural H_2O absent by IR; corresponds to $Cu_{2.19}Zn_{0.96}(As_{0.80}Sb_{0.16}Si_{0.05})_{\Sigma=1.01}O_{4.31}(OH)_{2.69}$.

Occurrence: A rare mineral in the oxidized zone of a hydrothermal copper deposit, formed by weathering of sulfides and sulfosalts.

Association: Theisite, malachite, azurite, tetrahedrite.

Distribution: From the Is Murvonis mine, Domusnovas, Iglesias district, Sardinia, Italy.

Name: To honor Dr. Cesare Sabelli (1934–), Consiglio Nazionale della Ricerche, Florence, Italy, who has worked with the copper-bearing alteration minerals of Sardinia, Italy.

Type Material: Museum of Natural History, University of Florence, Florence, Italy, 2053/RI.

Sabieite $(NH_4)Fe^{3+}(SO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Thin platelets, hexagonal, to 10 μm, constituting a powder.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [2.36] Slowly soluble in H_2O.

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* [$P321$] (by analogy to synthetic). $a = 4.822$ $c = 8.1696$ Z = 1

X-ray Powder Pattern: Lone Creek Fall Cave, South Africa.
8.19 (100), 2.409 (30), 3.72 (20), 1.392 (20), 1.556 (15), 2.910 (10), 2.718 (10)

Chemistry:

	(1)	(2)
SO_3	61.80	60.19
Al_2O_3	0.68	
Fe_2O_3	28.64	30.02
K_2O	0.70	
$(NH_4)_2O$	8.18	9.79
Total	100.80	[100.00]

(1) Lone Creek Fall Cave, South Africa; recalculated to 100% from an original total of 100.80% after deduction of 12.77% insoluble; then corresponds to $[(NH_4)_{0.84}K_{0.04}]_{\Sigma=0.88}(Fe_{0.94}Al_{0.04})_{\Sigma=0.98}(S_{1.02}O_4)_2$. (2) $(NH_4)Fe(SO_4)_2$.

Occurrence: Formed by dehydration of lonecreekite.

Association: Lonecreekite, tschermigite.

Distribution: On the ceiling of Lone Creek Fall Cave, near Sabie, Eastern Transvaal, South Africa.

Name: For its occurrence near Sabie, South Africa.

Type Material: South African Geological Survey Museum, Pretoria, South Africa.

References: (1) Martini, J.E.J. (1983) Lonecreekite, sabieite, and clairite, new secondary ammonium ferric-iron sulphates from Lone Creek Fall Cave, near Sabie, Eastern Transvaal. Ann. Geol. Surv. S. Africa, 17, 29–34. (2) (1986) Amer. Mineral., 71, 229 (abs. ref. 1).

Sabinaite $Na_4Zr_2TiO_4(CO_3)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Flaky to blocky crystals, {001}, {010}, {100}, {110}, to 0.4 mm, with irregular pseudohexagonal outlines, in compact chalky aggregates and powdery coatings.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {100}. Hardness = n.d. D(meas.) = 3.36 D(calc.) = 3.44–3.48

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous, silky in aggregates *Optical Class:* Biaxial (–) or (+). *Orientation:* $Y = b$; $X \wedge c = 13°$. *Dispersion:* $r > v$, moderate. $\alpha = 1.72$–1.74 $\beta = 1.79$–1.80 $\gamma = 1.85$–[1.90] 2V(meas.) = 82°–85°

Cell Data: *Space Group:* $C2/c$. $a = 10.196(1)$ $b = 6.616(1)$ $c = 17.958(3)$ $\beta = 94.14(1)°$ Z = 4

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
8.96 (100), 3.251 (50), 2.990 (50), 2.017 (45), 2.239 (40), 1.795 (35), 4.48 (25)

Chemistry:

	(1)	(2)	(3)
CO_2	27.1	[27.56]	28.11
TiO_2	12.0	10.91	12.75
ZrO_2	39.1	40.64	39.35
HfO_2	0.47	0.45	
CaO	0.2	0.02	
Na_2O	20.7	19.53	19.79
Total	99.57	[99.11]	100.00

(1) Francon quarry, Canada; by electron microprobe, TiO_2, ZrO_2, HfO_2 by neutron activation, CO_2 determined by wet methods and confirmed by IR; corresponds to $(Na_{4.18}Ca_{0.02})_{\Sigma=4.20}(Zr_{1.99}Hf_{0.01})_{\Sigma=2.00}Ti_{0.94}O_{4.14}(CO_3)_{3.86}$. (2) Mont Saint-Hilaire, Canada; by electron microprobe, average of five analyses of one crystal, CO_2 calculated for stoichiometry; corresponds to $Na_{4.02}(Zr_{1.99}Hf_{0.01})_{\Sigma=2.00}(Ti_{0.87}Zr_{0.12})_{\Sigma=0.99}O_4(CO_3)_4$. (3) $Na_4Zr_2TiO_4(CO_3)_4$.

Occurrence: A rare mineral in vugs in a silicocarbonatite sill (Francon quarry, Canada); in cavities in sodalite syenite associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Calcite, dawsonite, weloganite, cryolite, pyrite, galena, barite, ilmenorutile, ankerite, siderite, quartz (Francon quarry, Canada); albite, microcline, dawsonite, analcime, sodalite, pectolite, dolomite, aegirine (Mont Saint-Hilaire, Canada).

Distribution: From the Francon quarry, Montreal Island, Montreal, and at Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Ann Phyllis Sabina Stenson (1930–), mineralogist, Geological Survey of Canada, who collected sufficient of the mineral to allow its characterization.

Type Material: National School of Mines, Paris, France; Canadian Geological Survey, Ottawa, 61017–61024; Royal Ontario Museum, Toronto, Canada, M35902; National Museum of Natural History, Washington, D.C., USA, 145916.

Sabugalite $HAl(UO_2)_4(PO_4)_4 \cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Crystals, to 1 mm, very thin on {001}, square to lathlike outlines, typically warped, in composite subparallel growths; typically in thick crusts.

Physical Properties: *Cleavage:* On {001}, perfect. *Tenacity:* Somewhat flexible. Hardness = 2.5 D(meas.) = ∼3.20 D(calc.) = 3.150 Radioactive; fluoresces bright lemon-yellow under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Bright yellow to lemon-yellow. *Luster:* Weakly vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = pale yellow. *Orientation:* Z = elongation. α = 1.564–1.565 β = 1.581–1.583 γ = 1.582–1.584 2V(meas.) = Moderately large, may be 0°.

Cell Data: *Space Group:* $C2/m$ (synthetic). a = 19.426 b = 9.483 c = 9.850 β = 96.161° Z = 2

X-ray Powder Pattern: Sabugal, Portugal.
9.69 (10), 4.86 (9), 3.47 (8), 2.188 (6), 4.39 (4), 2.452 (2), 2.389 (2)

				Total	99.88	[100.00]	100.00

(1) Quarta Feira mine, Portugal; corresponds to $H_{1.00}Al_{0.94}(UO_2)_{4.12}(PO_4)_{4.08} \cdot 15.96H_2O$. (2) Kariz, Portugal; H_2O by difference; corresponds to $H_{1.00}Al_{1.12}(UO_2)_{4.08}[(PO_4)_{3.56}(AsO_4)_{0.42}]_{\Sigma=3.98} \cdot 15.96H_2O$. (3) $HAl(UO_2)_4(PO_4)_4 \cdot 16H_2O$.

Mineral Group: Autunite group.

Occurrence: A secondary mineral formed in the oxidized zone of uranium veins.

Association: Meta-autunite, saléeite, phosphuranylite.

Distribution: In Portugal, in Beira Alta, from the Quarta Feira and Coitos mines, Sabugal Co.; at Kariz, Minho Province; and elsewhere. From the Pedro Alvaro and Cuidad Rodrigo vanadium mines, Salamanca Province, Spain. In the Margnac mine, Compreignac, and the La Crouzille mine, Haute-Vienne, France. At Arcu su Linnarbu, near Capoterra, Sardinia, Italy. In the USA, from the Black Water mine, Black Mesa Basin, Apache Co., and at the Huskon and Arrowhead claims, Huskon district, near Cameron, Coconino Co., Arizona; in the Union Carbide mine, Maybell district, Moffat Co., at the Pitch mine, Marshall Pass district, Saguache Co., and the High Park claims, Teller Co., Colorado; from the Happy Jack mine, White Canyon, San Juan Co., Utah; at the Lucky Mc No. 20 mine, the Blue Buck claim and Blarco group, Fremont Co., the Poison Creek claim, Crook Co., and the Del Linch claim, Johnson Co., Wyoming. In the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. From the El Sharana mine, South Alligator Valley, Northern Territory, Australia.

Name: For Sabugal Co., Portugal, in which the mineral was first found.

Type Material: The Natural History Museum, London, England, 1958,733; Harvard University, Cambridge, Massachusetts, 102192, 102193; National Museum of Natural History, Washington, D.C., USA, 106335–106337.

Sacrofanite

$(Na, Ca, K)_9(Si, Al)_{12}O_{24}$
$[(OH)_2, (SO_4), (CO_3), Cl_2]_3 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6mm$, $\bar{6}m2$, or $6/m\ 2/m\ 2/m$. As hexagonal prisms, flattened on {0001}, to 2 cm.

Physical Properties: *Cleavage:* Perfect on {0001}, $\{01\bar{1}0\}$. Hardness = 5.5–6
D(meas.) = 2.423(5) D(calc.) = 2.446

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Pearly.
Optical Class: Uniaxial (–). $\omega = 1.505(1)$ $\epsilon = 1.486(1)$

Cell Data: *Space Group:* $P6_3mc$, $P\bar{6}2c$, or $P6_3/mmc$. $a = 12.865(4)$ $c = 74.240(10)$
Z = 14

X-ray Powder Pattern: Sabatini Mountains, Italy.
3.73 (100), 3.483 (43), 2.648 (30), 3.685 (26), 3.74 (25), 2.149 (18), 11.12 (12)

Chemistry:

	(1)
SiO_2	33.06
Al_2O_3	24.94
Fe_2O_3	0.35
CaO	8.76
Na_2O	16.50
K_2O	5.56
Cl	0.59
H_2O^+	2.47
SO_3	7.77
CO_2	1.00
$-O = Cl_2$	0.13
Total	[100.87]

(1) Sabatini Mountains, Italy; by XRF, Na by AA, Ca and H by microanalyser, H_2O by TGA, original total given as 99.87%; corresponds to $(Na_{6.25}Ca_{1.83}K_{1.39})_{\Sigma=9.47}(Si_{6.26}Al_{5.74})_{\Sigma=12.00}O_{24}[(OH)_{2.69}(SO_4)_{1.14}(CO_3)_{0.27}Cl_{0.20}]_{\Sigma=4.30} \cdot 0.27H_2O$.

Mineral Group: Cancrinite group.

Occurrence: As crystals lining a cavity in an ejected block of volcanic rock.

Association: Sanidine, andradite, fassaite, leucite, haüyne.

Distribution: From Valle Biachella, 3.2 km north-northwest of Sacrofano, in the Sacrofano caldera, Lazio, Italy.

Name: For the type locality in the Sacrofano volcanic area, Italy.

Type Material: University of Rome, Rome, Italy, 24332; Natural History Museum, Paris, France.

References: (1) Burragato, F., G.C. Parodi, and P.F. Zanazzi (1980) Sacrofanite – a new mineral of the cancrinite group. Neues Jahrb. Mineral., Abh., 140, 102–110. (2) (1981) Amer. Mineral., 66, 1100 (abs. ref. 1).

Sadanagaite

$KCa_2[(Fe^{2+}, Mg)_3(Al, Fe^{3+})_2](Si_5Al_3)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m, 2, or $2/m$. Prismatic crystals, to 1 mm; as polycrystalline aggregates.

Physical Properties: *Cleavage:* Perfect on {110}. *Tenacity:* [Brittle.] Hardness = ~6 D(meas.) = n.d. D(calc.) = 3.30

Optical Properties: Semitransparent. *Color:* Dark brown to black; in thin section, paler with greater silicon content. *Streak:* Very light brown. *Luster:* Vitreous.
Optical Class: Biaxial (+) or (–). *Pleochroism:* Strong; X = pale brown, grayish, or greenish yellow; Y = yellowish orange to light olive-brown; Z = greenish brown, light olive-brown to dark yellowish orange. *Orientation:* $Z \wedge c = 28°$. $\alpha = 1.673(2)$ $\beta = 1.684(2)$ $\gamma = 1.697(2)$ 2V(meas.) = 70°–90° 2V(calc.) = 86°

Cell Data: *Space Group:* $C2$, Cm, or $C2/m$. $a = 9.922(10)$ $b = 18.03(2)$ $c = 5.352(9)$ $\beta = 105.30(10)°$ Z = 2

X-ray Powder Pattern: [Myojin Island, Japan; identical to magnesio-sadanagaite.]
3.28 (100), 8.48 (80), 3.15 (70), 2.707 (60), 2.162 (55), 2.951 (50), 2.766 (45)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	29.9	34.4	MgO	6.1	6.11
TiO_2	4.3	3.15	CaO	11.9	11.9
Al_2O_3	22.6	18.4	Na_2O	0.6	0.73
FeO	17.4	18.4	K_2O	3.7	4.21
MnO	0.3	0.24	Total	96.8	97.5

(1) Yuge Island, Japan; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(K_{0.74}Na_{0.17})_{\Sigma=0.91}Ca_{1.99}(Fe^{2+}_{1.63}Mg_{1.41}Al_{0.81}Fe^{3+}_{0.63}Ti_{0.50})_{\Sigma=4.98}(Si_{4.66}Al_{3.34})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Nogo-Hakusan area, Japan; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(K_{0.84}Na_{0.22})_{\Sigma=1.06}Ca_{1.99}(Fe^{2+}_{2.17}Mg_{1.42}Al_{0.74}Ti_{0.37}Fe^{3+}_{0.23}Mn_{0.03})_{\Sigma=4.96}(Si_{5.36}Al_{2.64})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesio-sadanagaite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+})$ 0.5; $Fe^{3+}/(Fe^{3+} + Al^{vi})$ 0.50; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 5.5$; $Ti < 0.5$.

Occurrence: By contact metamorphism, producing banded skarns, under amphibolite to pyroxene hornfels facies conditions; from eclogites.

Association: Vesuvianite, hercynite, sphene, ilmenite, apatite (Yuge Island, Japan); biotite, orthoclase, subsilicic ferroan pargasite (Nogo-Hakusan area, Japan).

Distribution: On Yuge Island, Ehime Prefecture, and in the Nogo-Hakusan area, Fukui Prefecture, Japan. At the Botallack mine, St. Just, Cornwall, England. In the Oetztal, Austria.

Name: To honor Professor Ryoichi Sadanaga of the Mineralogical Institute, University of Tokyo, Tokyo, Japan.

Type Material: University of Tokyo, Tokyo; National Science Museum, Tokyo, Japan, M23378.

Saddlebackite $Pb_2Bi_2Te_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic [010], also with prominent {101} and {310}, to 0.1 mm; commonly massive with a radiated fibrous structure, finely zoned with other arsenides. *Twinning:* As fivelings with {011} as twin plane; also forming cruciform penetration twins, as with arsenopyrite, with twin plane {101}.

Physical Properties: *Cleavage:* Distinct on {100}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 VHN = 792–882 (100 g load). D(meas.) = 7.2 D(calc.) = 7.471

Optical Properties: Opaque. *Color:* Tin-white, readily tarnishes to dark gray; in polished section, white. *Streak:* Grayish black. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Strong.
R_1–R_2: (400) 55.8–52.6, (420) 55.8–53.0, (440) 55.8–53.4, (460) 55.6–53.8, (480) 55.2–54.1, (500) 54.7–54.3, (520) 54.2–54.4, (540) 53.5–54.5, (560) 52.8–54.5, (580) 52.2–54.5, (600) 51.8–54.4, (620) 51.3–54.3, (640) 51.0–54.2, (660) 50.7–54.1, (680) 50.5–53.9, (700) 50.3–53.8

Cell Data: *Space Group: Pnnm.* $a = 5.173$ $b = 5.954$ $c = 2.999$ $Z = 2$

X-ray Powder Pattern: Cobalt, Canada. (ICDD 23-88).
2.379 (100), 2.572 (80), 2.597 (55), 1.862 (45), 1.849 (20), 1.650 (20), 1.636 (20)

Chemistry:

As	70.36	69.3	71.77
S	0.90	2.6	
Total	99.97	100.0	100.00

(1) Schneeberg, Germany; corresponds to $(Co_{0.65}Fe_{0.35}Cu_{0.02})_{\Sigma=1.02}(As_{1.94}S_{0.06})_{\Sigma=2.00}$.
(2) Locality not specified; by electron microprobe, corresponds to $(Co_{0.70}Fe_{0.25}Ni_{0.01})_{\Sigma=0.96}$ $(As_{1.84}S_{0.16})_{\Sigma=2.00}$. (3) $CoAs_2$.

Polymorphism & Series: Dimorphous with clinosafflorite; forms a series with löllingite.

Mineral Group: Löllingite group.

Occurrence: In hydrothermal Co–Ni veins formed at medium temperature and pressure.

Association: Skutterudite, rammelsbergite, nickeline, silver, bismuth, löllingite.

Distribution: In Sweden, from Nordmark, Värmland [TL]; and at Tunaberg, Södermanland. In Germany, from Schneeberg and Annaberg, Saxony; at Bieber and Mackenheim, Hesse; from St. Andreasberg, Harz Mountains; and at Wittichen, Black Forest. From Burguillos de Cerro, Badajoz Province, Spain. In the Tynebottom mine, Garrigill, near Alston, Cumbria, England. At Sarrabus and Gonnosfanadiga, Sardinia, Italy. From Bou Azzer, Morocco. At the Talmessi and Meskani deposits, Anarak, Iran. In the USA, from the Quartzburg district, Grant Co., Oregon. At Cobalt and South Lorrain Township, Ontario; and from Great Bear Lake, Saskatchewan, Canada. In Australia, at Broken Hill, New South Wales. A number of other less prominent localities are known.

Name: From German *Safflor or Zaffer*, for *safflower*, in allusion to its use as a cobalt-blue pigment.

Type Material: Mining Academy, Freiberg, Germany, 3863.

Sahamalite-(Ce) $(Mg, Fe^{2+})(Ce, La, Nd)_2(CO_3)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic euhedral crystals, to 0.2 mm, flattened on $\{\overline{2}01\}$, complexly developed with {110}, {120}, {010}, $\{\overline{1}31\}$, {011}, {012}, $\{\overline{1}42\}$, in subparallel radiating aggregates.

Physical Properties: *Cleavage:* Poor on {010}; traces on $\{\overline{2}01\}$. Hardness = n.d.
D(meas.) = 4.30 D(calc.) = 4.30

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 29°$. *Dispersion:* $r < v$, perceptible.
$\alpha = 1.679(2)$ $\beta = 1.776(2)$ $\gamma = 1.807(2)$ 2V(meas.) = 57° 2V(calc.) = 57°

Cell Data: *Space Group:* $P2_1/a$. $a = 5.894(1)$ $b = 16.116(3)$ $c = 4.612(1)$
$\beta = 106.54(1)°$ Z = 2

X-ray Powder Pattern: Mountain Pass, California, USA.
3.90 (10), 3.65 (10), 2.87 (10), 5.33 (7), 4.26 (7), 3.03 (7), 2.12 (7b)

Chemistry:

	(1)
CO_2	31.7
Ce_2O_3	31.4
$(La, Nd)_2O_3$	[27.8]
FeO	2.0
MgO	6.1
insol.	0.5
Total	[99.5]

(1) Mountain Pass, California, USA; $(La, Nd)_2O_3$ calculated as the difference from R_2O_3 less Fe_2O_3 and CeO_2; R_2O_3 determined by spectrographic analysis as La_2O_3 17.4%, Nd_2O_3 7.3%, Pr_2O_3 2.3%, Sm_2O_3 0.7%, total 27.7%; corresponds to $(Mg_{0.85}Fe_{0.15})_{\Sigma=1.00}[Ce_{1.06}(La, Nd)_{0.93}]_{\Sigma=1.99}(CO_3)_{4.00}$.

Occurrence: A rare accessory mineral in a rare-earth-bearing barite-dolomite carbonatite (Mountain Pass, California, USA).

Association: Parisite, bastnäsite, barite, dolomite, ankerite, quartz, hematite (Mountain Pass, California, USA); dorrite, esseneite, titanian andradite, magnetite–magnesioferrite–spinel, plagioclase, gehlenite–åkermanite, wollastonite, ulvöspinel, nepheline, apatite (Durham Ranch, Wyoming, USA); synchysite, monazite, strontianite, quartz (Kangankunde, Malawi).

Distribution: In the USA, from Mountain Pass, San Bernardino Co., California, and on the Durham Ranch, Powder River Basin, 13 km northeast of Reno Junction and 25 km south of Gillette, Campbell Co., Wyoming. At Kangankunde, Malawi.

Name: Honors Professor Thure Georg Sahama (1910–1983), Finnish geochemist and petrologist, University of Helsinki, Helsinki, Finland, who studied abundances of rare-earth elements.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106901.

Total	100.03	99.5	100.00

(1) Långban, Sweden, average of two analyses; after deduction of Ca and CO_2 as calcite, corresponds to $Pb_{13.70}O_{8.85}(AsO_4)_{1.95}Cl_{3.92}$. (2) Do.; by electron microprobe. (3) $Pb_{14}O_9(AsO_4)_2Cl_4$.

Occurrence: In a metamorphosed Fe–Mn orebody (Långban, Sweden); in layered hausmannite-barite ore (Kombat mine, Namibia).

Association: Hausmannite, manganhumite, forsterite, dolomite (Långban, Sweden); copper, jacobsite, hausmannite, barite (Kombat mine, Namibia).

Distribution: From Långban, Värmland, Sweden. At the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: To honor Dr. Carl Sahlin (1861–1943), General Manager of the iron works at Laxå, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; National Museum of Natural History, Washington, D.C., USA, B13892.

Sakhaite $Ca_{12}Mg_4(BO_3)_7(CO_3)_4Cl(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, in veinlets.

Physical Properties: Hardness = 5 D(meas.) = 2.78–2.83 D(calc.) = 2.79

Optical Properties: Transparent. *Color:* Gray to grayish white; colorless in transmitted light.
Luster: Vitreous to slightly greasy.
Optical Class: Isotropic. $n = 1.638$–1.641

Cell Data: *Space Group:* $Fd3m$. a = 14.685(3) Z = 4

X-ray Powder Pattern: Titovskoye deposit, Russia.
2.58 (100), 2.108 (56), 5.16 (22), 1.827 (21), 1.951 (14), 2.81 (13), 1.491 (12)

Chemistry:

	(1)	(2)		(1)	(2)
CO_2	14.33	13.36	MgO	12.54	12.24
SiO_2	0.25		CaO	50.18	51.09
B_2O_3	17.65	18.50	F	0.00	
Al_2O_3	0.24		Cl	2.63	2.68
Fe_2O_3	0.00		H_2O	2.75	2.74
FeO	0.31		$-O = (F, Cl)_2$	0.58	0.61
			Total	100.30	100.00

(1) Titovskoye deposit, Russia; CO_2 and BO_3 confirmed by IR; with $(OH)^{1-}$ calculated for charge balance, corresponds to $Ca_{11.71}Mg_{4.07}Fe_{0.06}Al_{0.06}Si_{0.05}(BO_3)_{6.64}(CO_3)_{4.26}Cl_{0.97}(OH)_{2.65} \cdot 0.68H_2O$.
(2) $Ca_{12}Mg_4(BO_3)_7(CO_3)_4Cl(OH)_2 \cdot H_2O$.

Occurrence: In lenses replacing marble at the contact of a granitic massif with dolostone (Titovskoye deposit, Russia).

Association: Kotoite, clinohumite, forsterite, suanite, spinel, ludwigite, borcarite, szaibélyite, sphalerite (Titovskoye deposit, Russia); szaibélyite, kotoite, fluoborite, stannian ludwigite, forsterite (Daiy Mountain, China).

Distribution: From the Titovskoye boron deposit, Tas-Khayakhtakh Mountains, Sakha, and at the Solongo boron deposit, Buryatia, Russia. In the Sayak-IV boron deposit, northeast Balkhash region, Kazakhstan. From Daiy Mountain, Qiliping, Hunan Province, China. At Fuka, near Bicchu, Okayama Prefecture, Japan. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia.

Name: From *Sakha*, the Yakutian word for Yakutia [now Sakha].

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67237.

Sakharovaite $Pb_4Fe(Bi,Sb)_6S_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (?) [by analogy to jamesonite]. *Point Group:* n.d. As radiating aggregates of fine capillary crystals, to 1 cm.

Physical Properties: *Cleavage:* Perfect in one direction. Hardness = Low. VHN = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Lead-gray; in polished section, pure white. *Luster:* Metallic. *Pleochroism:* Birefringent. *Anisotropism:* Strong; reddish internal reflections seen only in oil.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Ustarasai deposit, Uzbekistan.
3.412 (100), 2.721 (60), 2.031 (60b), 3.093 (40), 2.811 (40), 2.299 (40), 2.244 (40)

Chemistry:

	(1)
Pb	32.25
Fe	1.39
Cu	0.30
Bi	30.50
Sb	16.50
S	17.62
insol.	1.59
Total	100.15

(1) Ustarasai deposit, Uzbekistan; by analogy to jamesonite, corresponds to $Pb_{3.97}Fe_{0.63}Cu_{0.12}(Bi_{3.72}Sb_{3.45})_{\Sigma=7.17}S_{14.00}$.

Occurrence: In carbonate veinlets cutting arsenopyrite ore (Ustarasai deposit, Uzbekistan); as inclusions in and myrmeketic intergrowths with tetrahedrite (Rudňay, Slovakia).

Association: Antimony, realgar, cinnabar (Ustarasai deposit, Uzbekistan); tetrahedrite (Rudňay, Slovakia).

Distribution: From the Ustarasai bismuth deposit, near Brichmulla village, Pskem Range, southern Tien Shan, northeastern Uzbekistan [TL]. Found at Rudňay, Spišsko-Gemerské Rudohorie Mountains, Slovakia. In the Dachang district, Guangxi Autonomous Region, China.

Name: In honor of Professor Marina Sergeevna Sakharova (1917–), Soviet mineralogist specializing in gold and silver deposits, Moscow University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72022.

Sakuraiite $(Cu, Zn, In, Fe, Sn)S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 432, $\overline{4}3m$, or $4/m\ \overline{3}\ 2/m$. Forms in exsolution texture with stannite, to 0.5 mm.

Physical Properties: Hardness = 4 VHN = 243–282, 265 average (100 g load).
D(meas.) = n.d. D(calc.) = 4.45

Optical Properties: Opaque. *Color:* Greenish steel-gray; in polished section, purplish olive-gray with a red tint. *Streak:* Lead-gray with olive tint. *Luster:* Metallic. *Anisotropism:* Nearly isotropic.
R_1–R_2: (400) 22.5, (420) 22.5, (440) 22.5, (460) 22.6, (480) 22.6, (500) 22.6, (520) 22.6, (540) 22.7, (560) 22.6, (580) 22.5, (600) 22.5, (620) 22.6, (640) 22.6, (660) 22.6, (680) 22.6, (700) 22.4

Cell Data: *Space Group:* $P432$, $P\overline{4}3m$, or $Pm3m$. $a = 5.4563(24)$ $Z = 1$

X-ray Powder Pattern: Ikuno mine, Japan.
3.15 (100), 1.927 (40), 1.650 (20), 2.73 (10), 5.47 (6), 3.85 (6), 2.44 (6)

Chemistry:

Sn	4	7.2	4.9
S	30	29.1	29.0
Total	100.5	99.3	99.9

(1) Ikuno mine, Japan; by electron microprobe, corresponding to $(Cu_{1.41}Zn_{0.92}In_{0.86}Fe_{0.38}Sn_{0.14}Ag_{0.14})_{\Sigma=3.85}S_{4.00}$. (2) Do.; by electron microprobe, corresponds to $(Cu_{1.36}Zn_{0.92}In_{0.84}Fe_{0.54}Sn_{0.27}Cd_{0.02}Ag_{0.01})_{\Sigma=3.96}S_{4.00}$. (3) Do.; by electron microprobe, corresponds to $(Cu_{1.32}Zn_{1.22}In_{0.92}Fe_{0.36}Sn_{0.18}Cd_{0.03})_{\Sigma=4.03}S_{4.00}$.

Occurrence: In a banded hydrothermal vein.

Association: Stannite, sphalerite, chalcopyrite, cassiterite, matildite, cobaltian arsenopyrite, quartz, calcite.

Distribution: From the Ikuno mine, Hyogo Prefecture, Japan [TL].

Name: Honors Dr. Kin-ichi Sakurai (1912–1993), Japanese mineral collector.

Type Material: National Science Museum, Tokyo, Japan, M15843; National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 108788; National Museum of Natural History, Washington, D.C., USA, 120592.

Sal ammoniac NH_4Cl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals show {112}, {113}, {011}, rarely {001}; commonly with stepped or curved faces, skeletal or dendritic, to 5 cm; stalactitic, or in crusts, fibrous, earthy. *Twinning:* On {111}, may be cyclic.

Physical Properties: *Cleavage:* {111}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Between brittle and sectile; very plastic. Hardness = 1–2 D(meas.) = 1.532 D(calc.) = 1.535 Soluble in H_2O; stinging salty taste.

Optical Properties: Transparent. *Color:* Colorless, white, pale gray, may be pale yellow to brown if impure; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic; may be weakly anisotropic. $n = 1.639(1)$

Cell Data: *Space Group:* $Pm3m$ (synthetic). $a = 3.8756$ $Z = 1$

X-ray Powder Pattern: Synthetic.
2.740 (100), 3.87 (25), 1.582 (25), 1.939 (8), 1.733 (6), 1.370 (6), 1.225 (6)

Chemistry: Identification relies on correspondence of properties with synthetic material.

Occurrence: A sublimation product around volcanic fumaroles; in burning coal seams and waste piles; in guano deposits. The ammonia usually is derived from organic matter.

Association: Sulfur (fumaroles); realgar, orpiment, sulfur, mascagnite, tschermigite (burning coal).

Distribution: Fumarolic on: Vesuvius, Campania; Etna, Sicily; Stromboli and Vulcano, Lipari Islands, Italy. From Mount Pelée, Martinique, West Indies. At Hekla, Iceland. On Parícutin, Michoacán, Mexico. At Kilauea, Hawaii, USA. From the Kukhi-Malik area, near Rarat, Tajikistan. With burning coal at: Duttweiler, near Saarbrücken, Saarland, Germany. At Saint-Etienne, Loire, France. From Newcastle, Northumberland, England. On Mt. Pyramide, Spitsbergen, Norway. In the USA, at the Hope Ranch, Santa Barbara Co., California. In guano on: Cincha and Guañape Islands, Peru. At [??ck-a Province??] Tarapacá, Chile.

Name: From the Greek, *sal ammoniac*, applied in antiquity to the synthetic compound.

Saléeite $Mg(UO_2)_2(PO_4)_2 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Crystals are square plates, composite, flattened on {001}, with {001}, {100}, {120}, {012} (pseudotetragonal indices), to 2.5 cm; commonly in subparallel lamellar aggregates.

Physical Properties: *Cleavage:* On {001}, perfect; on {010}, {110}, indistinct (pseudotetragonal indices). Hardness = 2–3 D(meas.) = 3.27 D(calc.) = 3.21 Radioactive; fluoresces bright lemon-yellow under LW UV, pale yellow under SW UV.

Optical Properties: Transparent to opaque. *Color:* Lemon-yellow, straw-yellow, greenish yellow. *Luster:* Adamantine to waxy.
Optical Class: Biaxial (–), typically nearly uniaxial (–), sectored. *Pleochroism:* X = colorless; Z = pale greenish yellow. *Dispersion:* $r > v$, marked. α = 1.554–1.559 β = 1.570–1.582 γ = 1.571–1.585 2V(meas.) = 0°–61°

Cell Data: *Space Group:* $P2_1/c$. a = 6.951(3) b = 19.947(8) c = 9.896(4) β = 135.17(2)° Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
9.97 (10), 3.48 (8), 4.94 (7), 4.45 (4), 2.20 (3), 1.739 (3), 6.54 (2)

	(1)	(2)		(1)	(2)
UO_3	61.72	61.23	MgO	4.43	4.31
P_2O_5	14.87	15.19	H_2O	19.39	19.27
			Total	100.41	100.00

(1) Cunha Baixa mine, Portugal; corresponds to $Mg_{1.03}(UO_2)_{2.02}(PO_4)_{1.96} \cdot 10.05H_2O$.
(2) $Mg(UO_2)_2(PO_4)_2 \cdot 10H_2O$.

Mineral Group: Autunite group.

Occurrence: In the oxidized zone of uranium-bearing polymetallic hydrothermal and sedimentary mineral deposits.

Association: Torbernite, autunite, zeunerite, bassetite, dewindtite, sabugalite, phosphuranylite, dumontite.

Distribution: Many localities. A few for good examples or studied material include: from Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Schneeberg, Saxony, Germany. In Spain, from the Caridid mine, Villavieja de Yeltes, Salamanca Province. From the Cunha Baixa and Quarta Feira mines, Sabugal, Portugal. From Arcu su Linnarbu, near Capoterra, Sardinia, Italy. In England, in Cornwall, from the South Terras mine, St. Stephen-in-Brannel; in Wheals Edward and Owles, St. Just; from Wheal Basset, Illogan; and at Roughton Great Consols, St. Clether. In the Plessis deposit, near Mortagne, Deux-Sèvres, France. In Australia, large crystals from the Ranger mine, Jabiru, and at Rum Jungle, Alligator River district, Northern Territory; in the Lake Boga granite quarry, near Swan Hill, and at Wycheproof, Victoria. From the Énio pegmatite mine, and at the Córrego do Urucum pegmatite, near Galiléia, Minas Gerais, Brazil. In the USA, from the Sue mine, Cherry Creek area, Gila Co., Arizona; on the High Park claims, Teller Co., Colorado.

Name: In honor of Achille Salée (1883–1932), Professor of Geology, Catholic University of Louvain, Louvain, Belgium.

Type Material: Catholic University of Louvain, Louvain, Belgium, K1812.

X-ray Powder Pattern: Horoman massif, Samani-cho, Samani-gun, Hokkaido, Japan.
3.118 (100), 1.844 (50), 1.595 (45), 1.873 (25), 3.050 (20), 5.88 (15), 2.703 (5)

Chemistry:

	(1)
Cu	16.90
Fe	34.60
Ni	15.48
Co	0.16
S	32.87
Total	100.01

(1) Horoman massif, Samani-cho, Samani-gun, Hokkaido, Japan; average of 10 electron microprobe analyses, corresponding to $Cu_{2.08}(Fe_{4.84}Ni_{2.06}Co_{0.02})_{\Sigma=6.92}S_8$.

Occurrence: Filling space between silicate minerals in lherzolites of a peridotite massif.

Association: Horomanite and sugakiite as intergrowths; bornite, talnakhite, copper, troilite, heazlewoodite, pentlandite, magnetite, olivine, clino- and orthopyroxenes.

Distribution: Horoman peridotite massif, Samani-cho, Samani-gun, Hokkaido, Japan.

Name: For the region of Japan (*Samani*-cho) from which the first specimens were collected.

Type Material: Tohoku University Museum, Japan.

(1) Miass, Russia. (2) Kawabe, Japan; by ICP, corresponds to $A_{0.99}B_{1.01}O_4$.

Occurrence: An accessory mineral in RE-rich granite pegmatites, common but not abundant; rarely as a detrital mineral.

Association: Columbite, zircon, monazite, uraninite, aeschynite, magnetite, albite, topaz, beryl, garnet, muscovite, biotite.

Distribution: A few localities for analyzed material include: at Miass, Ilmen Mountains, Southern Ural Mountains, Russia. From the Ånneröd, Iveland, and Setesdal districts, Norway. In the USA, at Glastonbury, Hartford Co., Connecticut; in the Mitchell pegmatite, Bedford Co., Virginia; around Spruce Pine, Mitchell Co., North Carolina; near Nuevo, Riverside Co., California; at the Addey claims, along Texas Creek, Fremont Co., Colorado; and in the New Year's Eve mine, Sierrita Mountains, Pima Co., Arizona. At Divina de Uba, near Belo Horizonte, Minas Gerais, Brazil. In Madagascar, from Ambatofotsikely, Antsirabe, Ampangabé, and elsewhere. At Kivu, Kivu Province, Congo (Zaire). In Japan, especially in the Ishikawa district, Fukushima Prefecture. Many other localities are known.

Name: To honor Colonel Vasilii Evgrafovich von Samarskii-Bykhovets (1803–1870), Chief of Staff of the Russian Corps of Mining Engineers.

Samfowlerite $Ca_{14}Mn_3Zn_2(Be,Zn)_2Be_6(SiO_4)_6(Si_2O_7)_4(OH,F)_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, to 0.05 mm, and in groups.

Physical Properties: Hardness = <3. D(meas.) = 3.28(5) D(calc.) = 3.29–3.31 Weakly fluoresces red under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $X \wedge a = 44°$; $Z \wedge c = 29°$. $\alpha = 1.674(3)$ $\beta = 1.680(3)$ $\gamma = 1.681(3)$ 2V(meas.) = 29.0(1)°

Cell Data: *Space Group:* $P2_1/c$. $a = 9.068(2)$ $b = 17.992(2)$ $c = 14.586(2)$ $\beta = 104.86(1)°$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
2.863 (100), 2.653 (50), 2.388 (50), 2.771 (40), 2.272 (30), 1.832 (30), 2.329 (20)

Chemistry:

	(1)
SiO_2	36.9
MnO	9.3
ZnO	9.5
BeO	5.6
MgO	0.2
CaO	34.1
F	1.0
H_2O	[3.8]
$-O = F_2$	0.4
Total	[100.0]

(1) Franklin, New Jersey, USA; by electron microprobe, Be and F by ion microprobe, H_2O by difference; crystal structure analysis indicates that Be is lower and H_2O is higher than reported; corresponding to $(Ca_{13.9}Mg_{0.1})_{\Sigma=14.0}Mn_{3.0}Zn_{2.6}Be_{5.1}Si_{14.0}O_{56.5}H_{9.6}F_{1.2}$.

Occurrence: In vugs in granular willemite-franklinite-andradite ore from a metamorphosed stratiform Zn–Mn deposit.

Association: Andradite-grossular, cahnite, clinochlore, leucophoenicite, johnbaumite, barite, franklinite, willemite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For Samuel Fowler, M.D. (1779–1844), who early encouraged study of the Franklin deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, M04254.

Total	100.00	100.00

(1) Chuquicamata, Chile; recalculated to 100% after deduction of insoluble 1.48%; corresponds to $(Na_{0.88}K_{0.27})_{\Sigma=1.15}(Ca_{0.91}Mg_{0.10})_{\Sigma=1.01}Cu_{4.83}(PO_4)_{3.94}Cl_{0.98} \cdot 4.71H_2O$.
(2) $NaCaCu_5(PO_4)_4Cl \cdot 5H_2O$.

Occurrence: A rare mineral in the oxidized zone of copper deposits in arid climates; in caves, derived from copper sulfides in the cave walls and phosphate from bat guano.

Association: Atacamite, libethenite, pseudomalachite, torbernite, chrysocolla, gypsum, calcite, jarosite.

Distribution: In Chile, in Antofagasta, from Chuquicamata; at the Fortuna mine, east of Baquedano; as large crystals from Mantos Blancos; at the Santa Catalina mine, Sierra Gorda district; and from the El Guanaco mine, near Taltal. In Australia, from the Lake Boga granite quarry, near Swan Hill, Victoria, at the Spring Creek mine, near Wilmington, South Australia, from Mooloo Station, 12 km east of the homestead, Murchison, and in the Jingemia Cave, 6 km northwest of Watheroo, Western Australia. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. In the Mbobo Mkulu Cave, near Ngodwana, eastern Transvaal, South Africa.

Name: In honor of Mat Sample, Mine Superintendent, Chuquicamata, Chile.

Type Material: Harvard University, Cambridge, Massachusetts, 95023, 95024; National Museum of Natural History, Washington, D.C., USA, 137298.

Samsonite $Ag_4MnSb_2S_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic and striated ‖ [001], to 3 cm, in radiating groups.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 VHN = 187–212 (100 g load). D(meas.) = 5.51 D(calc.) = 5.50

Optical Properties: Nearly opaque; translucent in thin fragments. *Color:* Steel-black, deep red to brown in transmitted light; in polished section, bluish white with deep red internal reflections. *Streak:* Dark red. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Weak. R_1–R_2: (400) 33.8–38.5, (420) 33.6–34.9, (440) 33.2–34.5, (460) 32.6–33.8, (480) 31.6–33.0, (500) 30.6–32.2, (520) 29.6–31.1, (540) 28.8–30.0, (560) 28.1–29.0, (580) 27.5–28.1, (600) 26.8–27.5, (620) 26.3–26.9, (640) 25.9–26.5, (660) 25.4–26.1, (680) 25.1–25.8, (700) 24.8–25.6

Cell Data: *Space Group:* $P2_1/n$. $a = 10.362(4)$ $b = 8.101(3)$ $c = 6.647(3)$ $\beta = 92°38(4)'$ Z = 2

X-ray Powder Pattern: St. Andreasberg, Germany. (ICDD 11-74).
3.20 (100), 3.01 (90), 2.59 (60), 2.86 (50), 2.43 (50), 2.51 (40), 6.4 (30)

Chemistry:

	(1)	(2)
Ag	45.95	46.78
Mn	5.86	5.96
Cu	0.18	
Fe	0.22	
Sb	26.33	26.40
S	20.55	20.86
rem.	0.87	
Total	99.96	100.00

(1) St. Andreasberg, Germany; remainder is $CaCO_3$ 0.41%, $MgCO_3$ 0.46%, original total given as 99.86%; corresponds to $Ag_{3.99}Mn_{1.00}Fe_{0.04}Cu_{0.03}Sb_{2.02}S_{6.00}$. (2) $Ag_4MnSb_2S_6$.

Occurrence: Very rare in a hydrothermal vein (St. Andreasberg, Germany).

Association: Pyrargyrite, galena, dyscrasite, tetrahedrite, pyrolusite, quartz, calcite, apophyllite (St. Andreasberg, Germany).

Distribution: From the Samson vein, St. Andreasberg, Harz Mountains, Germany [TL]. At the Garpenberg Norra mine, Dalarna, Sweden. From the Brady Lake property of the Silver Miller mine, near Cobalt, Ontario, Canada.

Name: For the occurrence in the Samson vein, St. Andreasberg, Germany.

Type Material: n.d.

CaO	28.30	28.41	Total	100.53	100.29

(1) Palermo #1 mine, New Hampshire, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Ba_{0.21}Ca_{0.10}Sr_{0.07})_{\Sigma=0.38}Ca_{8.00}(Fe_{2.52}Mn_{1.63}Na_{0.11}Mg_{0.04})_{\Sigma=4.30}Al_{1.52}(PO_4)_{9.76}(OH)_{5.35}$. (2) Buranga pegmatite, Rwanda; corresponds to $(Ba_{0.24}Ca_{0.21})_{\Sigma=0.45}Ca_{8.00}(Mn_{2.04}Fe^{2+}_{1.78}Li_{0.46}Na_{0.18}Mg_{0.03})_{\Sigma=4.49}(Al_{1.97}Fe^{3+}_{0.02})_{\Sigma=1.99}(PO_4)_{10.00}(OH)_{2.00}\bullet 0.68H_2O$.

Occurrence: A secondary mineral in complex zoned granite pegmatites.

Association: Childrenite, hydroxylapatite, arrojadite, whitlockite, carbonate-apatite, laueite, Fe–Mn oxides (Palermo #1 mine, New Hampshire, USA); trolleite, bertossaite, scorzalite, apatite, burangaite, gatumbaite (Buranga pegmatite, Rwanda).

Distribution: From the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA. In the Buranga pegmatite, near Gatumba, Rwanda.

Name: Honoring Peter B. Samuelson (1941–), Rumney, New Hampshire, USA, for his efforts in field collecting of pegmatite minerals.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 128071.

Saneroite $\mathbf{Na_2(Mn^{2+},Mn^{3+})_{10}(Si_{11},V^{5+})O_{34}(OH)_4}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Tabular crystals, rarely prismatic to stocky, to 1 cm, in compact aggregates. *Twinning:* Present.

Physical Properties: *Cleavage:* Perfect in two perpendicular directions. Hardness = n.d. D(meas.) = 3.47 D(calc.) = 3.51

Optical Properties: Transparent to translucent. *Color:* Bright orange. *Luster:* Resinous to greasy.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = deep orange; Y = lemon-yellow; Z = yellow-orange. $\alpha = 1.715–1.725$ $\beta = 1.740–1.745$ $\gamma = 1.745–1.750$ 2V(meas.) = 40°–48°

Cell Data: *Space Group:* $P\bar{1}$. $a = 9.741(5)$ $b = 9.974(7)$ $c = 9.108(5)$ $\alpha = 92.70(4)°$ $\beta = 117.11(4)°$ $\gamma = 105.30(4)°$ Z = 1

X-ray Powder Pattern: Val Graveglia, Italy.
3.06 (s), 2.83 (s), 2.70 (s), 3.01 (m), 2.98 (m), 2.62 (m), 2.20 (m)

Chemistry:

	(1)
SiO_2	39.33
Fe_2O_3	0.36
As_2O_5	0.29
V_2O_5	6.60
MnO	40.13
CaO	0.25
Na_2O	4.53
H_2O^+	5.00
Total	96.49

(1) Val Graveglia, Italy; by electron microprobe, average of data collected on two zones of differing color, H_2O by TGA, valences from crystal structure analysis; corresponds to $Na_{2.40}(Mn^{2+}_{9.32}Fe^{3+}_{0.07}Ca_{0.07})_{\Sigma=9.46}(Si_{10.77}V^{5+}_{1.19}As^{5+}_{0.04})_{\Sigma=12.00}O_{35.30}\bullet 4.57H_2O$.

Occurrence: In veins in manganese ores associated with low-grade prehnite-pumpellyite facies metamorphic recrystallization of siliceous-hematitic sediments (Val Graveglia, Italy).

Association: Quartz, barite, caryopilite, ganophyllite (Val Graveglia, Italy); medaite, palenzonaite, pyrobelonite, fianelite, parsettensite, rhodochrosite, kutahorite, aegirine, quartz (Fianel mine, Switzerland).

Distribution: In Italy, at the Gambatesa and Molinello manganese mines, near Chiavari, Val Graveglia, Liguria, Italy. From the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: For Edoardo Sanero, formerly Professor of Mineralogy at the University of Genoa, Genoa, Italy.

Type Material: University of Genoa, Genoa; Municipal Museum of Natural History, Genoa, Italy.

Sanidine $(K,Na)(Al,Si)_4O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly tabular on {010}, with a square cross section, to 50 cm. Acicular in spherulites. *Twinning:* Carlsbad twins are common, Baveno and Manebach twins rarer.

Physical Properties: *Cleavage:* Perfect on {001}, distinct on {010}; parting on {100}. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 2.56–2.62 D(calc.) = [2.56]

Optical Properties: Transparent. *Color:* Colorless to white; colorless in thin section. *Streak:* White. *Luster:* Vitreous, pearly on cleavage.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c \simeq -20°$ (low); $Z = b$; $Y \wedge c \simeq -21°$ (high). *Dispersion:* $r < v$ or $r > v$, weak. $\alpha = 1.518$–1.524 $\beta = 1.522$–1.529 $\gamma = 1.522$–1.530 2V(meas.) = 18°–42° (low); 15°–63° (high)

Cell Data: *Space Group:* $C2/m$ (high). $a = 8.603(2)$ $b = 13.036(4)$ $c = 7.174(2)$ $\beta = 116.03(2)°$ Z = 4

X-ray Powder Pattern: Locality unknown.
3.326 (100), 3.284 (60), 3.788 (57), 4.235 (53), 3.225 (52), 2.584 (35), 3.458 (31)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	64.79	67.27	Na_2O		6.45
Al_2O_3	18.50	18.35	K_2O	16.79	7.05
$FeO + Fe_2O_3$		0.92	H_2O^+		0.08
CaO		0.15	H_2O^-		0.08
			Total	100.08	100.35

(1) Buck claims, Bernic Lake, Canada; by electron microprobe, average of analyses on six crystals; corresponds to $K_{0.99}Al_{1.01}Si_{3.00}O_8$. (2) Mitchell Mesa rhyolite, Texas, USA; corresponds to $(Na_{0.56}K_{0.40}Ca_{0.01})_{\Sigma=0.97}(Al_{0.97}Fe^{3+}_{0.03})_{\Sigma=1.00}Si_{3.01}O_8$.

Polymorphism & Series: High sanidine forms a series with high albite.

Mineral Group: Feldspar (alkali) group; (Al,Si) completely disordered.

Occurrence: Most common in felsic volcanic and hypabyssal rocks as rhyolites, phonolites, trachytes; as spherulites in volcanic glass. Also from ultrapotassic mafic, high-temperature contact metamorphic (sanidinite facies), and hydrothermally altered rocks. From eclogite nodules in kimberlite.

Association: Quartz, sodic plagioclase, muscovite, biotite, "hornblende," magnetite.

Distribution: Not uncommon, but rare in crystals of any size. In Germany, from Drachenfels, Siebengebirge, Rhine; and at Hohenfels, Mendig, Mayen, and elsewhere around the Laacher See, Eifel district. In France, at Mt. Dore, Auvergne, and Puy Gros du Laney, Puy-de-Dôme. From Vesuvius and Monte Somma, Campania, and Monte Cimine, Lazio, Italy. At Daichi, Wakayama Prefecture, Japan. From Kanchin-do, Meisem-gun, northeast Korea. In the USA, at Tooele, Tooele Co., Utah; Cottonwood Canyon, Peloncillo Mountains, Cochise Co., Arizona; as large crystals in Rabb Canyon and near the crest of the Black Range, Grant Co., New Mexico. From Bernic Lake, Manitoba, and Mont Saint-Hilaire, Quebec, Canada. In the Sierra de San Francisco, Durango, Mexico.

Name: From the Greek for *tablet* or *board*, in allusion to the mineral's common habit.

Sanjuanite $Al_2(PO_4)(SO_4)(OH)\cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic (?). *Point Group:* n.d. Microscopic laths, parallel to divergent, fibrous, in chalklike aggregates.

Physical Properties: *Fracture:* Uneven to earthy. Hardness = 3 D(meas.) = 1.94 D(calc.) = 1.96

Optical Properties: Semitransparent. *Color:* White; colorless in transmitted light. *Luster:* Dull to silky.
Optical Class: Biaxial. *Orientation:* Positive elongation, extinction ∼25°–30°. $\alpha = 1.484$ (α') ⊥ length. β = n.d. $\gamma = 1.499$ (γ') ∥ length. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 11.314(11)$ $b = 9.018(9)$ $c = 7.376(7)$ $\alpha = 93°4.17(6.01)'$ $\beta = 95°46.49(4.17)'$ $\gamma = 105°39.77(4.42)'$ Z = 2

X-ray Powder Pattern: Sierra Chica de Zonda, Argentina.
10.77 (100), 4.13 (55), 5.28 (38), 4.32 (36), 3.450 (35), 8.66 (30), 4.27 (30)

Al_2O_3	23.48	24.04
Fe_2O_3	1.72	
H_2O	40.20	40.35
Total	100.41	100.00

(1) Sierra Chica de Zonda, Argentina; corresponds to $Al_{2.00}Fe_{0.10}(PO_4)_{1.00}(SO_4)_{1.01}(OH)\cdot 8.71H_2O$. (2) $Al_2(PO_4)(SO_4)(OH)\cdot 9H_2O$.

Occurrence: In mineralized joint fractures cutting slate.

Association: Gypsum, natrojarosite, iron oxides.

Distribution: On a ridge of the eastern slope of Sierra Chica de Zonda, about 45 km south-southwest from San Juan, San Juan Province, Argentina.

Name: For San Juan Province, Argentina, in which the mineral was first found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149522.

Sanmartinite $(Zn, Fe^{2+})WO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare as crystals, to 60 μm, tabular on {001}, with {001}, {010}, {110}, {112}, {102}; typically in reticulated aggregates and fine-grained massive.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = n.d. D(meas.) = 6.70 D(calc.) = 7.87 (synthetic $ZnWO_4$).

Optical Properties: Translucent. *Color:* Reddish brown, with dark red internal reflections, dark brown to brownish black if massive. *Luster:* Resinous.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 4.702$ $b = 5.726$ $c = 4.948$ $\beta = 90°28'$ Z = 2

X-ray Powder Pattern: Synthetic $ZnWO_4$.
2.931 (100), 2.908 (90), 3.73 (40), 4.69 (35), 3.62 (35), 2.472 (35), 2.464 (35)

Chemistry:

	(1)	(2)	(3)

FeO	7.24	4.67	
MnO	1.73	0.22	
ZnO	18.18	23.00	25.98
CaO	1.48		
insol.	0.24		
Total	[101.49]	101.30	100.00

(1) Los Cerrillos, Argentina; original total given as 101.25%; corresponds to $(Zn_{0.68}Fe_{0.31}Ca_{0.08}Mn_{0.07})_{\Sigma=1.14}(W_{0.95}O_4)$. (2) Do.; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Zn_{0.81}Fe_{0.18})_{\Sigma=0.99}WO_4$. (3) $ZnWO_4$.

Occurrence: A rare alteration product of scheelite in a quartz vein between granite and granite pegmatite intruding Precambrian crystalline schists.

Association: Willemite, scheelite, tourmaline, quartz.

Distribution: From Los Cerrillos, seven km southwest of San Martín, San Luis Province, Argentina.

Name: For its occurrence near San Martín, Argentina.

Type Material: The Natural History Museum, London, England, 1978,353; Academy of Natural Sciences, Philadelphia, 25575; Harvard University, Cambridge, Massachusetts, 134566; National Museum of Natural History, Washington, D.C., USA, 105681, 137479.

Santaclaraite $CaMn_4^{2+}Si_5O_{14}(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Rarely as thick prismatic crystals, to 1 cm. As radiating lamellar aggregates of thin prismatic to tabular subhedral crystals, flattened on {100}. In rough spherules, also as cross-vein prismatic to nearly fibrous crystals. *Twinning:* On {100}.

Physical Properties: *Cleavage:* Good on {100} and {010}. Hardness = 6.5
D(meas.) = 3.31 D(calc.) = 3.379

Optical Properties: Transparent. *Color:* Pale pink or moderate reddish orange. *Streak:* Pale pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* In thick sections, weak; X = very pale red; Y = pale red; Z = pale reddish brown. *Orientation:* $Z \wedge c = -2°$; $X \wedge b = -21°$ in {100} sections; $Y \wedge a = -14.5°$ in {010} sections; $Z \wedge c = 16°$. *Absorption:* $Y > Z > X$. $\alpha = 1.681(2)$ $\beta = 1.696(2)$ $\gamma = 1.708(2)$ 2V(meas.) = 81(1)°

Cell Data: *Space Group:* $P\bar{1}$. $a = 9.738(2)$ $b = 9.970(1)$ $c = 7.603(1)$ $\alpha = 109.77(1)°$ $\beta = 93.95(1)°$ $\gamma = 104.97(2)°$ Z = 2

X-ray Powder Pattern: Santa Clara Co., California, USA.
7.04 (100), 3.003 (84), 3.152 (80), 7.69 (63), 3.847 (57), 3.524 (39), 4.797 (38)

Chemistry:

	(1)
SiO_2	44.74
Al_2O_3	0.12
FeO	0.09
MnO	41.26
CoO	0.06
NiO	0.06
MgO	0.31
CaO	7.24
Na_2O	0.12
H_2O	5.28
Total	99.28

(1) Santa Clara Co., California, USA; H_2O by microcoulometric methods; corresponds to $(Ca_{0.87}Na_{0.03})_{\Sigma=0.90}(Mn^{2+}_{3.94}Mg_{0.05}Fe^{2+}_{0.01}Ni_{0.01}Co_{0.01})_{\Sigma=4.02}(Si_{5.04}Al_{0.02})_{\Sigma=5.06}O_{14.03}(OH)_{1.97} \cdot H_2O$.

Occurrence: As cross-fiber veins and irregular masses in manganese-oxide-stained chert and quartz.

Association: Calcite, quartz, barite, harmotome, chalcopyrite, copper, howieite, kutnohorite, rhodochrosite, braunite.

Distribution: From an unspecified manganese mine in the Diablo Range, Santa Clara Co., and the Buckeye mine, Stanislaus Co., California, USA.

Name: For the occurrence in Santa Clara Co., California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA.

rem.	2.1	
Total	96.2	[100.1]

(1) Grants district, New Mexico, USA; remnant includes CuO 0.5%, CoO 0.1%, NiO 0.1%, UO_3 0.3%, SiO_2 + insoluble 0.8%, [cuprosklodowskite], CO_3 0.3% [limestone]. (2) Do.; by electron microprobe, Mn^{2+}:Mn^4 from (1); corresponds to $(Na_{1.44}Ca_{0.83}Sr_{0.73})_{\Sigma=3.00}(Mn^{2+}_{1.37}Mg_{0.20}Al_{0.19}Fe^{3+}_{0.12})_{\Sigma=1.88}(Mn^{4+}_{1.70}Mn^{2+}_{0.30})_{\Sigma=2.00}[(VO_4)_{3.59}(AsO_4)_{0.25}]_{\Sigma=3.84}[(OH), O]_{4.53} \cdot 2.10H_2O$.

Occurrence: Rarely incrusting fractures in limestone (Grants district, New Mexico, USA) and in sandstone (Monument No. 1 mine, Arizona, USA) in Colorado Plateau-type U–V deposits.

Association: Calcite, cuprosklodowskite (Grants district, New Mexico, USA); carnotite (Monument No. 1 mine, Arizona, USA).

Distribution: In the USA, from an unnamed uranium prospect about 20 km north of Grants, McKinley Co., New Mexico; at the Monument No. 1 mine, Monument Valley, Navajo Co., Arizona.

Name: For the Atchison, Topeka, and Santa Fe Railroad, on whose property the mineral was first found to occur, for their pioneering work in developing the uranium resources of the district.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115882, 121957.

Santanaite $9PbO \cdot 2PbO_2 \cdot CrO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622. Platy hexagonal crystals, flattened on {0001}, to 0.5 mm, in aggregates.

Physical Properties: *Cleavage:* {0001} and $\{11\bar{2}0\}$, very good; $\{10\bar{1}0\}$, rare. Hardness = ∼4 D(meas.) = n.d. D(calc.) = 9.155

Optical Properties: Semitransparent. *Color:* Straw-yellow; gray-brown in reflected light, with light yellow internal reflections. *Luster:* Adamantine.
Optical Class: Uniaxial (–). $\omega = 2.32$ $\epsilon = 2.12$

Cell Data: *Space Group:* $P6_322$. a = 9.03(1) $c = 39.84(8)$ Z = 6

X-ray Powder Pattern: Santa Ana mine, Chile.
3.539 (10), 2.606 (8), 2.080 (5), 1.701 (5), 2.948 (4), 2.846 (4), 2.243 (4)

Chemistry:

	(1)	(2)
Pb	88.0	88.10
Cr	1.9	2.01
O	[10.1]	9.89
Total	[100.0]	100.00

(1) Santa Ana mine, Chile; by electron microprobe, O by difference. (2) $Pb_{11}CrO_{16}$.

Occurrence: An alteration product of galena with other chromium-bearing minerals in an oxidized hydrothermal lead deposit.

Association: Galena, phoenicochroite, chromatian wulfenite, diaboleite, quartz.

Distribution: At the Santa Ana mine, near Caracoles, Sierra Gorda district, Antofagasta, Chile.

Name: For the occurrence at the Santa Ana mine, Chile.

Type Material: n.d.

Santarosaite CuB_2O_4

Crystal Data: Tetragonal. *Point Group*: $\bar{4}\,2m$. As globules of leaf-like crystals, to 0.06 mm.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 3.96

Optical Properties: Translucent. *Color*: Vivid blue. *Streak*: Pale blue.
Luster: Vitreous.
Optical Class: n.d. n = 1.75 (calculated from reflectance data).

Cell Data: *Space Group*: $I\bar{4}\,2d$. a = 11.517(8) c = 5.632(6) Z = 12

X-ray Powder Pattern: Santa Rosa mine, Northern Chile.
3.797 (100), 3.638 (47), 2.775 (35), 2.572 (26), 2.501 (26), 1.822 (21), 1.793 (20)

Chemistry:

	(1)	(2)
CuO	43.24	53.33
PbO	4.48	
CaO	0.97	
B_2O_3	45.44	46.67
Total	94.13	100.00

(1) Santa Rosa mine, Northern Chile; average of 17 electron microprobe and EELS analyses, BO_4 and absence of other anionic groups confirmed by IR and Raman spectroscopy, corresponding to $(Cu_{0.86}Pb_{0.03}Ca_{0.03})B_{2.06}O_4$. (2) CuB_2O_4.

Occurrence: In the oxidation zone of a hydrothermal polymetallic vein deposit.

Association: Atacamite, malachite, wulfenite, anhydrite.

Distribution: Santa Rosa mine, 15 km SE of Iquique, Atacama desert, Northern Chile.

Name: Named for the mine that produced the first specimens.

Type Material: Mineralogical Museum, University of Hamburg, Germany.

References: (1) Schlüter, J., D. Pohl, and U. Golla-Schindler (2008) Santarosaite, CuB_2O_4, a new mineral with disordered structure from the Santa Rosa mine, Atacama desert, Chile. Neues Jahrb. Mineral. Abh., 185, 27–32. (2) (2009) Amer. Mineral., 94, 402-403 (abs. ref. 1).

Santite $KB_5O_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Anhedral crystals, to 0.06 mm, typically in aggregates; as an efflorescent crust.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.74 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.422(2)$ $\beta = 1.435(2)$ $\gamma = 1.480(1)$ 2V(meas.) = 70°

Cell Data: *Space Group:* $Aba2$. $a = 11.10(2)$ $b = 11.18(2)$ $c = 9.08(2)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.36 (100), 3.52 (84), 5.60 (71), 2.767 (50), 2.181 (21), 3.28 (18), 5.93 (15)

Chemistry: (1) Larderello, Italy; partial analysis of a mixture was estimated to contain larderellite 66%, santite 25%, sassolite 9%; identification depends on agreement of optics, X-ray powder pattern, and unit cell size with synthetic material.

Occurrence: Very rare, formed in fumaroles, probably a product of reaction between potassium-rich solutions and larderellite (Larderello, Italy); as a deposit around a thermal spring (Eagle Borax Spring, California, USA).

Association: Larderellite, sassolite (Larderello, Italy); aristarainite, hydroboracite, kaliborite, mcallisterite, pinnoite, rivadavite (Eagle Borax Spring, California, USA).

Distribution: From Larderello, Val di Cecina, Tuscany, Italy. In the USA, at the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California.

Name: Honors Giorgio Santi (1746–1822), Italian chemist and Director, Museum of Natural History, University of Pisa, Pisa, Italy.

Type Material: Mineralogical Museum, University of Pisa, Pisa, Italy.

Saponite $(Ca_{0.5}, Na)_{0.3}(Mg, Fe^{2+})_3(Si, Al)_4O_{10}(OH)_2 \cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals minute, pseudohexagonal, tabular ‖ {001}; bladed, fibrous, flaky, or subparallel aggregates; nodular, fine-grained, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Plastic when hydrated, brittle when dry. Hardness = < 1–2 D(meas.) = 2.24–2.30 D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* White, yellow, gray, blue, green, reddish, brown. *Luster:* Greasy.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless, light yellow to green-brown; Y = Z = colorless, greenish brown to dark brown. *Orientation:* $X \perp \{001\}$; $Z \parallel$ elongation. *Absorption:* $Y \simeq Z > X$. $\alpha = 1.48$–1.54 $\beta = 1.50$–1.58 $\gamma = 1.50$–1.58 2V(meas.) = 0°–40°

Cell Data: *Space Group:* n.d. $a = 5.3$ $b = 9.14$ $c = 16.9$ $\beta = \sim 97°$ Z = n.d.

X-ray Powder Pattern: Synthetic $Na_{0.33}Mg_{3.00}(Si_{0.67}Al_{3.67})_{\Sigma=4.00}O_{10}(OH)_2$, glycolated; very close to stevensite.

(1) Čáslav, Czech Republic; corresponds to $(Ca_{0.16}Mg_{0.05}Na_{0.04}K_{0.03})_{\Sigma=0.28}(Mg_{2.37}Fe^{2+}_{0.32}Fe^{3+}_{0.21}Al_{0.10})_{\Sigma=3.00}(Si_{3.16}Al_{0.84})_{\Sigma=4.00}O_{10}(OH)_2 \cdot 0.98H_2O$. (2) Ballarat, California, USA; by XRF, Na by AA, H_2O by TGA; corresponds to $(Ca_{0.19}Na_{0.16}K_{0.02})_{\Sigma=0.37}(Mg_{2.61}Al_{0.15}Fe^{2+}_{0.06})_{\Sigma=2.82}(Si_{3.77}Al_{0.23})_{\Sigma=4.00}O_{10}(OH)_2 \cdot nH_2O$.

Mineral Group: Smectite group.

Occurrence: Hydrothermally deposited in mineralized veins and in vesicles in basalt. Formed in fissures cutting calc-silicates, iron-rich skarns, amphibolites, and serpentinites.

Association: Celadonite, chlorite, copper, epidote, orthoclase, dolomite, calcite, quartz.

Distribution: Many localities; a few for well-studied material follow. At The Lizard, Cornwall, England. From Allt Ribhein, Fiskavaig Bay, Isle of Skye, Scotland. At Svärdsjö, Kopparberg, Sweden. From Čáslav, Czech Republic. In Poland, at Frankenstein, Silesia. At Krugersdorp, Transvaal, South Africa. In the USA, in the Kearsarge and Ahmeek mines, Keweenaw Peninsula, Houghton Co., Michigan; between Pigeon Point and Fond du Lac, north shore of Lake Superior, Cook Co., Minnesota; from near Milford, Beaver Co., Utah; at Ballarat, Inyo Co., California; in the Toughnut mine, Tombstone, Cochise Co., Arizona. From Thunder Bay, Ontario, Canada.

Name: From the Latin for *soap*, which it resembles.

Type Material: Mining Academy, Freiberg, Germany, 44591.

Sapphirine $(Al,Mg)_8(Al,Si)_6O_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or triclinic. *Point Group:* $2/m$ or $\bar{1}$. Crystals indistinct, tabular on {010}, to 3 cm. Commonly as disseminated grains or aggregates. *Twinning:* Repeated on {010}; uncommon.

Physical Properties: *Cleavage:* Fair on {010}, poor on {001}, {100}. *Fracture:* Subconchoidal. Hardness = 7.5 D(meas.) = 3.40–3.58 D(calc.) = 3.486

Optical Properties: Transparent to translucent. *Color:* Light to dark blue or green, white, gray, pale red, yellow; in thin section, colorless to blue or pink. *Luster:* Vitreous. *Optical Class:* Biaxial (+) or (–). *Pleochroism:* X = colorless, pale reddish, yellowish green, pale yellow; Y = sky-blue, lavender-blue, bluish green; Z = blue, sapphire-blue, dark blue. *Orientation:* $Y = b$; $Z \wedge c = 6°$–$9°$. *Dispersion:* $r < v$, moderate to very strong. $\alpha = 1.701$–1.726 $\beta = 1.703$–1.728 $\gamma = 1.705$–1.734 2V(meas.) = 47°–114°

Cell Data: *Space Group:* $P2_1/a$ (2M) $a = 11.266(12)$ $b = 14.401(7)$ $c = 9.929(10)$ $\beta = 125.46(5)°$ Z = 4, or *Space Group:* $P\bar{1}$ (1A) $a = 9.97(1)$ $b = 10.34(1)$ $c = 8.62(1)$ $\alpha = 107.4(1)°$ $\beta = 95.2(1)°$ $\gamma = 123.8(1)°$ Z = 4

X-ray Powder Pattern: Fiskenæsset, Greenland; closely resembles surinamite. 2.447 (100), 2.015 (90), 2.990 (65), 1.4353 (65), 1.4192 (65), 2.023 (60), 2.844 (50)

Chemistry:

	(1)
SiO_2	12.83
Al_2O_3	65.29
Fe_2O_3	0.93
FeO	0.65
MgO	19.78
LOI	0.31
Total	99.79

(1) Fiskenæsset, Greenland; corresponds to $(Al_{4.43}Mg_{3.42}Fe^{3+}_{0.08}Fe^{2+}_{0.06})_{\Sigma=7.99}$ $(Al_{4.51}Si_{1.49})_{\Sigma=6.00}O_{20}$.

Polymorphism & Series: 1A, 2A, 2M, 3A, 4M, 5A polytypes.

Occurrence: In high-temperature metamorphic rocks or xenoliths with abundant aluminum and magnesium and low silicon. May occur as a primary magmatic mineral in subsilicic rocks.

Association: Sillimanite, kyanite, cordierite, kornerupine, corundum, surinamite, phlogopite, chrysoberyl, pyroxenes, spinel, garnet, calcite, quartz.

Distribution: Only a few localities are given, which have provided especially large or fine crystals, or rich material. Around Fiskenæsset, Greenland. In the USA, in the Cortland complex, Westchester Co., New York. In Canada, at Wilson Lake, Labrador, Newfoundland. At Sakena, Vorokafotra, Bekily, Anjamiary, and Betroka, Madagascar. Large crystals from Blinkwater, near Messina, Transvaal, South Africa. In Tanzania, at Mautia Hill. From Waldheim, Saxony, Germany. At Naxos, Greece. From Finero, Val Viggezo, Piedmont, Italy. In the Harts Range, Northern Territory, Australia. From the Napier complex, Casey Bay, Enderby Land, Antarctica.

Name: For its typical *sapphire*-blue color.

Sarabauite $CaSb_{10}O_{10}S_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular and prismatic ‖ [010], to 1 mm.

Physical Properties: *Tenacity:* Somewhat sectile. Hardness = n.d. VHN = 272 (20 g load). D(meas.) = 4.8 D(calc.) = 4.99

Optical Properties: Translucent. *Color:* Carmine-red; gray-white in polished section with remarkable reddish orange internal reflections. *Streak:* Orange. *Luster:* Resinous. *Optical Class:* Biaxial (–) (synthetic). *Pleochroism:* Discernible in reflected light, from brownish to purplish tint; in transmitted light, reddish yellow ‖ Y; brownish red ‖ Z'. 2V(meas.) = ∼90° R_1–R_2: (486) 20.1–25.8, (546) 19.7–24.7, (589) 19.1–23.5, (656) 14.0–20.0

Cell Data: *Space Group:* $C2/c$. $a = 25.37(2)$ $b = 5.654(1)$ $c = 16.87(1)$ $\beta = 117.58(4)°$ Z = 4

X-ray Powder Pattern: Sarabau mine, Malaysia.
3.215 (100), 2.817 (88), 3.466 (78), 3.182 (60), 3.164 (50), 4.227 (42), 2.583 (40)

Chemistry:

	(1)	(2)
Ca	2.43	2.49
Sb	74.89	75.62
S	11.91	11.95
O	9.61	9.94
Total	98.84	100.00

(1) Sarabau mine, Malaysia; by electron microprobe, corresponds to $Ca_{0.99}Sb_{10.00}O_{9.76}S_{6.04}$.
(2) $CaSb_{10}O_{10}S_6$.

Occurrence: In hydrothermal mineral deposits, deposited at high temperature.

Association: Stibnite, sénarmontite, wollastonite, calcite, quartz (Sarabau mine, Malaysia).

Distribution: From the Sarabau mine [TL] and the Lucky Hill mine, Bau district, about 40 km southwest of Kuching, Sarawak, Malaysia.

Name: For its occurrence in the Sarabau mine, Malaysia.

Type Material: National Science Museum, Tokyo, Japan, MA7055; The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA, 146210.

(1) Monte Somma, Italy; by electron microprobe. (2) Anguillara Sabazia, Italy; by electron microprobe. (3) $NaCa_6Al_4Si_6O_{24}F$.

Occurrence: In contact metamorphosed limestone-bearing volcanic ejecta.

Association: Augite, gehlenite, garnet (Monte Somma, Italy); augite, haüyne, fluorite (Anguillara Sabazia, Italy).

Distribution: In Italy, at Monte Somma and Vesuvius, Campania, and Anguillara Sabazia, Lazio.

Name: From the Greek for *flesh*, alluding to the color.

Type Material: The Natural History Museum, London, England, 1960,629.

Sarcopside $(Fe^{2+}, Mn^{2+}, Mg)_3(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibrous, to 1 mm, more commonly platy or lamellar, in veinlets in oriented intergrowth with graftonite or triphylite. *Twinning:* Polysynthetic on {001}, common.

Physical Properties: *Cleavage:* {100}, {001}, good; {010}, poor. *Fracture:* Splintery to fibrous. Hardness = 4 D(meas.) = 3.79 D(calc.) = 3.80; 3.94

Optical Properties: Translucent. *Color:* Pink, brown to gray, colorless. *Luster:* Silky to waxy.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 45°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.670–1.676$ $\beta = 1.728–1.730$ $\gamma = 1.730–1.734$ 2V(meas.) = 26°–28°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.437(22)$ $b = 4.768(9)$ $c = 6.026(8)$ $\beta = 90.00(15)°$ Z = 2

X-ray Powder Pattern: East Alstead, New Hampshire, USA.
3.03 (100), 3.54 (80), 6.06 (50), 2.819 (50), 3.95 (40), 4.37 (30), 2.558 (30)

Chemistry:

	(1)
P_2O_5	39.8
FeO	50.2
MnO	6.9
MgO	3.5
Total	100.4

(1) East Alstead, New Hampshire, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponding to $(Fe_{2.42}Mn_{0.34}Mg_{0.30})_{\Sigma=3.06}(PO_4)_{1.94}$. (2) Bull Moose mine, South Dakota, USA; by electron microprobe, analysis not given; stated to correspond to $(Fe_{2.34}Mn_{0.63}Mg_{0.03})_{\Sigma=3.00}(PO_4)_2$.

Occurrence: Formed along with graftonite, probably by exsolution from triphylite, in complex zoned granite pegmatites.

Association: Graftonite, vivianite, huréaulite, triphylite.

Distribution: From Góry Sowie (Michelsdorf), in the Eulengebirge, Silesia, Poland. At Otov and Domažlice, Czech Republic. From the Norrö pegmatite, on Rånö Island, and in the Berg quarry, near Sollefteå, Västerbotten, Sweden. At Hagendorf, Bavaria, Germany. In the USA, in New Hampshire, at the Gingrass Farm, near Deering, Hillsboro Co., in the G.E. Smith mine, Newport, Sullivan Co., and from the DeMott and French King No. 2 mines, East Alstead, Cheshire Co.; in South Dakota, at the Bull Moose and Victory mines, and the Lofton prospect, near Custer, Custer Co. From the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. In the Tsaobismund pegmatite, 60 km south of Karibib, Namibia.

Name: From the Greek for *flesh* and *view*, in allusion to its supposed flesh-red color [due to intimate intergrowth with graftonite].

Type Material: Wroclaw University, Wroclaw, Poland, IV-4247.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 858–859. Sarkinite $Mn_2^{2+}(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals typically thick tabular {100}, elongated, to 4 mm, short prismatic, or tabular along [010]. May be crudely spherical, granular massive.

Physical Properties: *Cleavage:* On {100}, distinct. *Fracture:* Subconchoidal to uneven. Hardness = 4–5 D(meas.) = 4.08–4.18 D(calc.) = 4.20

Optical Properties: Semitransparent. *Color:* Flesh-red to dark blood-red, rose-red, orange, orange-brown, brown, reddish yellow to yellow; pale rose to yellow in transmitted light. *Streak:* Rose-red to yellow. *Luster:* Greasy.
Optical Class: Biaxial (–). *Pleochroism:* Weak. *Orientation:* $Y = b$; $X \wedge c = -54°$. *Dispersion:* $r < v$. *Absorption:* $X > Z > Y$. $\alpha = 1.790–1.793$ $\beta = 1.794–1.807$ $\gamma = 1.798–1.809$ 2V(meas.) = 83°

Cell Data: *Space Group:* $P2_1/a$. $a = 12.779(2)$ $b = 13.596(2)$ $c = 10.208(2)$ $\beta = 108°53'$ Z = 16

X-ray Powder Pattern: Pajsberg [Harstigen mine, near Persberg], Sweden.
3.18 (10), 3.04 (10), 3.29 (9), 3.48 (8), 2.90 (7), 2.65 (6), 6.0 (3)

CuO		0.01		insol.	0.38		
				Total	100.37	[99.92]	100.00

(1) Pajsberg [Harstigen mine, near Persberg], Sweden. (2) Långban, Sweden; by electron microprobe, total Mn as MnO, original total given as 99.93%; corresponds to $(Mn_{1.93}Ca_{0.01}Mg_{0.01})_{\Sigma=1.95}(AsO_4)_{1.02}(OH)$. (3) $Mn_2(AsO_4)(OH)$.

Polymorphism & Series: Dimorphous with eveite.

Occurrence: Rare in metamorphosed Fe–Mn orebodies (Sweden); in manganese-rich lenses in quartzitic chlorite schists probably of marine origin (Ködnitz Valley, Austria); in metamorphosed stratiform zinc orebodies (New Jersey, USA).

Association: Lead, bementite, brandtite, calcite, barite (Harstigen mine, Sweden); katoptrite, magnetite, jacobsite, tephroite (Sjö mine, Sweden); tephroite, pyroxmangite, rhodonite, spessartine, rhodochrosite, tiragalloite (Ködnitz Valley, Austria); grischunite, brandtite, manganoan berzeliite, tilasite, rhodochrosite, braunite (Falotta mine, Switzerland); eveite, adamite, willemite, allactite, brandtite, parabrandtite, kraisslite, copper, euchroite, serpierite, rhodochrosite, barite, manganese oxides (Sterling Hill, New Jersey, USA).

Distribution: In Sweden, from the Harstigen mine, near Persberg, at the Brattfors mine, and from Långban, Värmland; in the Sjö mine, near Grythyttan, Örebro. In the Ködnitz Valley, Tirol, Austria. At the Falotta mine, Oberhalbstein, Graubünden, Switzerland. From Sterling Hill, Ogdensburg, and at Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *made of flesh*, an allusion to the blood-red color and greasy luster.

Sarmientite $Fe_2^{3+}(AsO_4)(SO_4)(OH)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, prismatic [001] and flattened on {010}, showing {010}, {110}, {011}, to 20 μm, aggregated into nodular masses.

Physical Properties: Hardness = n.d. D(meas.) = 2.58 D(calc.) = 2.58

Optical Properties: Semitransparent. *Color:* Pale yellow-orange.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 12°$. $\alpha = 1.628$ $\beta = 1.635$ $\gamma = 1.698$ 2V(meas.) = n.d. 2V(calc.) = 38°

Cell Data: *Space Group:* $P2_1/c$. $a = 6.55$ $b = 18.55$ $c = 9.70$ $\beta = 97°39'$ Z = 4

X-ray Powder Pattern: Santa Elena mine, Argentina.
9.29 (100), 4.64 (90), 4.26 (80), 3.06 (70), 2.60 (48), 3.43 (40), 4.87 (38)

Chemistry:

	(1)	(2)
SO_3	18.28	17.64
As_2O_5	22.68	25.33
Fe_2O_3	36.57	35.19
CaO	0.27	
H_2O	22.86	21.84
Total	100.66	100.00

(1) Santa Elena mine, Argentina. (2) $Fe_2(AsO_4)(SO_4)(OH)\cdot 5H_2O$.

Occurrence: A rare mineral in oxidized pyritic veins in diabase.

Association: Fibroferrite, copiapite, botryogen, szomolnokite, zincian melanterite, slavíkite, epsomite, gypsum.

Distribution: From the Santa Elena mine, Quebrada de La Alcaparrosa, between San Juan and Calingasta, San Juan Province, Argentina.

Name: To honor Domingo Faustino Sarmiento (1811-1888), former President of Argentina.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1013–1014. (2) de Abeledo, M.E.J. and M.A.R. de Benyacar (1968) New data on sarmientite. Amer. Mineral., 53, 2077–2082.

Sarrabusite $Pb_5CuCl_4(SeO_3)_4$

Crystal Data: Monoclinic. *Point Group*: *m* or 2/*m*. As spherical aggregates (<100 mm) of tabular crystals (<10 mm).

Physical Properties: *Cleavage*: Distinct. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.011

Optical Properties: Translucent. *Color*: Lemon-yellow. *Streak*: White. *Luster*: Vitreous. *Optical Class*: n.d.

Cell Data: *Space Group*: *Cc* or *C*2/*c*. a = 24.917(3) b = 5.506(1) c = 14.242(2) β = 101.77(1)° Z = 4

X-ray Powder Pattern: Baccu Locci mine, near Villaputzu, Sardinia, Italy. 3.034 (100), 3.685 (60), 2.728 (38), 2.043 (28), 3.314 (20), 2.079 (18), 2.106 (15)

Chemistry:

	(1)	(2)
PbO	61.26	63.80
SO_2	0.14	
CdO	1.44	
CuO	4.29	4.55
SeO_2	24.84	25.37
Cl	8.41	8.11
$- O = Cl_2$	1.90	1.83
Total	98.48	100.00

(1) Baccu Locci mine, near Villaputzu, Sardinia, Italy; average of 7 electron microprobe analyses, corresponding to $(Pb_{4.83}Cd_{0.20})_{\Sigma=5.03}Cu_{0.95}(Se_{3.94}S_{0.04})_{\Sigma=3.98}O_{11.83}Cl_{4.17}$. (2) $Pb_5CuCl_4(SeO_3)_4$.

Occurrence: A secondary mineral in a hydrothermal lead arsenic mineral deposit.

Association: Orlandiite, chalcomenite, anglesite.

Distribution: From the Baccu Locci mine, near Villaputzu, Sardinia, Italy.

Name: For *Sarrabus*, the region in Sardinia, from which the first specimens were obtained.

Type Material: Department of Structural Chemistry and Inorganic Stereochemistry, University of Milan, Italy (2010-02).

References: (1) Gemmi, M., I. Campostrini, F. Demartin, T. Gorelik, and C.M. Gramaccioli (2012) Structure of the new mineral sarrabusite, $Pb_5CuCl_4(SeO_3)_4$, solved by manual electron-diffraction tomography. Acta Cryst., B68, 15-23. (2) (2012) Amer. Mineral., 97, 1265 (abs. ref. 1).

Sartorite $PbAs_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Prismatic, deeply striated ‖ [010] with rounded cavernous crystal terminations, to 10 cm; parallel and subparallel groupings common due in part to twinning. *Twinning:* Commonly repeated on {100} to produce lamination of crystals; lamellae seen in polished section may be bent.

Physical Properties: *Cleavage:* Fair on {100}. *Fracture:* Conchoidal. *Tenacity:* Extremely brittle. Hardness = 3 VHN = 196 D(meas.) = 5.10 D(calc.) = [5.13]

Optical Properties: Opaque. *Color:* Dark lead-gray; in polished section, pure white, rarely with deep red internal reflections. *Streak:* Chocolate-brown. *Luster:* Metallic. *Pleochroism:* Rarely visible, only in oil. *Anisotropism:* Weak.
R_1–R_2: (400) 37.5–40.4, (420) 37.1–40.0, (440) 36.7–39.6, (460) 36.1–39.2, (480) 35.7–38.8, (500) 35.1–38.3, (520) 34.5–37.8, (540) 33.9–37.2, (560) 33.3–36.6, (580) 32.6–35.9, (600) 31.9–35.2, (620) 31.1–34.4, (640) 30.4–33.4, (660) 29.8–32.6, (680) 29.1–32.0, (700) 28.6–31.5

Cell Data: *Space Group:* $P2_1/n$ (pseudocell; supercells exist). $a = 19.62$ $b = 7.89$ $c = 4.19$ $\beta = 90°$ Z = 4

X-ray Powder Pattern: Binntal, Switzerland.
3.49 (100), 2.76 (90), 2.96 (80), 2.33 (60), 3.87 (50), 2.64 (50), 4.15 (40)

Chemistry:

	(1)	(2)
Pb	43.63	42.70
As	30.46	30.87
S	25.51	26.43
Total	99.60	100.00

(1) Binntal, Switzerland; average of three analyses. (2) $PbAs_2S_4$.

Occurrence: In a hydrothermal deposit in dolostone (Binntal, Switzerland).

Association: Tennantite, pyrite, dufrénoysite, rathite, realgar (Binntal, Switzerland).

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL]. In the Pitone marble quarry, near Seravezza, Tuscany, Italy. At the Zuni mine, San Juan Co., Colorado, USA. From the Julcani district, Peru.

Name: Honors Professor Wolfgang Sartorius von Waltershausen (1809–1876), University of Göttingen, Göttingen, Germany, who first announced the species.

Type Material: n.d.

(1–2) [Sary-Arka, Kazakhstan]; average of two spectrographic determinations of RE_2O_3 = Y_2O_3 53.5%; La_2O_5 5.35%, Ce_2O_3 7.95%, Nd_2O_3 14.6%, Sm_2O_3 0.00%, Gd_2O_3 4.76%, Tb_2O_3 0.52%, Dy_2O_3 0.81%, Ho_2O_3 1.34%, Er_2O_3 4.23%, Tm_2O_3 0.52%, Yb_2O_3 5.35%, Lu_2O_3 1.15%; after deduction of Fe_2O_3, the average corresponds to $Al_5(Ca_{0.96}Y_{0.40}RE_{0.36}Th_{0.28})_{\Sigma=2.00}[(SiO_4)_{2.16}(PO_4)_{1.52}(SO_4)_{0.32}]_{\Sigma=4.00}(OH)_{6.6} \cdot 5.6H_2O$.

Occurrence: In Devonian propylitized felsic effusives and in altered granitic rocks associated with quartzites.

Association: Mica, alunite, andalusite, huttonite, barite, molybdenite, pyrite, hematite, hydrous iron oxides.

Distribution: From the Akkuduk rare-metal deposit, near the Mointy railway station,central Kazakhstan.

Name: From *Saryarka*, Kazakh name for the steppes area of central Kazakhstan, and for its high *yttrium* content.

Type Material: Mining Institute, St. Petersburg, 978/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72018, 72019.

Sasaite $(Al, Fe^{3+})_6(PO_4, SO_4)_5(OH)_3 \cdot 35{-}36H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Crystals with rhombic outline, {110}, small {100}, {010}, to 20 μm, stacked in twisted vermiform aggregates; in veinlets, nodules, and efflorescences.

Physical Properties: *Cleavage:* On {001}, perfect. *Tenacity:* Chalky. Hardness = Soft. D(meas.) = 1.75 D(calc.) = 1.78 H_2O content variable with humidity.

Optical Properties: Transparent. *Color:* White; colorless in transmitted light. *Optical Class:* Biaxial (–). *Orientation:* $X \simeq c$; $Y \simeq b$; $Z \simeq a$. $\alpha = 1.465(1)$ $\beta = 1.473(1)$ $\gamma = 1.477(1)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 10.75$ $b = 15.02$ $c = 46.03$ Z = 6

X-ray Powder Pattern: West Driefontein Cave, South Africa; fully hydrated. 11.52 (100), 2.901 (42), 6.99 (23), 7.51 (22), 6.30 (21), 4.214 (18), 3.262 (18)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	2.77	3.72	CaO	0.12	0.08

CuO		0.38	insol.	0.07	
			Total	99.44	[100.00]

(1) West Driefontein Cave, South Africa; corresponds to $(Al_{5.77}Fe_{0.18}Ca_{0.03}Mg_{0.02})_{\Sigma=6.00}[(PO_4)_{4.62}(SO_4)_{0.47}]_{\Sigma=5.09}(OH)_{3.13} \cdot 35.79H_2O$. (2) Cheshunt, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference, $(OH)^{1-}$ for charge balance; corresponds to $(Al_{5.97}Fe_{0.02}Ca_{0.01})_{\Sigma=6.00}[(PO_4)_{4.72}(SO_4)_{0.47}]_{\Sigma=5.19}(OH)_{2.89} \cdot 17.33H_2O$.

Occurrence: Rarely formed from acidic phosphate-sulfate-rich solutions derived from bat guano reacting with clay minerals in cave soil (West Driefontein Cave, South Africa; Skipton lava tube caves, Australia); in veinlets in slate (Cheshunt, Australia).

Association: Variscite, strengite, phosphosiderite, leucophosphite, apatite.

Distribution: In West Driefontein Cave, Carlstonville, west Transvaal, South Africa. In Australia, in the Skipton lava tube caves, 40 km southwest of Ballarat, and near Cheshunt, Victoria. At Rapid Creek, Yukon Territory, Canada. In the Feengrotten (Cave), near Saalfeld, Thuringia, Germany.

Name: For the South African Speleological Association (SASA), whose members collected the first specimens.

Type Material: Geological Survey, Pretoria, South Africa; National Museum of Natural History, Washington, D.C., USA, 146835.

Sassolite H_3BO_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. As scaly pseudohexagonal crystals, flattened on {001}, showing prominent {001}, additional minor complex forms, to 5 mm; may be stalactitic. *Twinning:* Around [001] as twin axis, common.

Physical Properties: *Cleavage:* Perfect on {001}, micaceous. *Tenacity:* Flexible. Hardness = 1 D(meas.) = 1.46–1.50 D(calc.) = 1.562 Soluble in H_2O, taste acid, slightly saline and bitter.

Optical Properties: Transparent. *Color:* White to gray, may be pale yellow from included sulfur or pale brown from included iron oxides; colorless in transmitted light. *Luster:* Pearly. *Optical Class:* Biaxial (–). *Orientation:* X almost $\perp$ {001}; OAP nearly $\parallel$ b and $\perp$ {001}. $\alpha = 1.337$–1.347 $\beta = 1.456$–1.457 $\gamma = 1.459$–1.468 2V(meas.) = 14°–17°

Cell Data: *Space Group:* $P1$ (synthetic). $a = 7.0187(14)$ $b = 7.035(2)$ $c = 6.3472(12)$ $\alpha = 92.49(12)°$ $\beta = 101°46(2)°$ $\gamma = 119.76(2)°$ Z = 4

X-ray Powder Pattern: Furnace Creek district, California, USA.
3.18 (10), 6.02 (1), 1.590 (1), 5.89 (< 1), 4.59 (< 1), 4.20 (< 1), 4.04 (< 1)

Chemistry:

	(1)	(2)
B_2O_3	57.19	56.30
H_2O	[42.81]	43.70
Total	[100.00]	100.00

(1) Furnace Creek district, California, USA; H_2O by difference. (2) H_3BO_3.

Occurrence: An evaporite or sublimate around hot spring lagoons and volcanic fumaroles; in bedded sedimentary borate deposits.

Association: Larderellite, santite, ginorite, probertite, searlesite, mirabilite, hieratite, glauberite, sulfur, realgar, sal ammoniac, alums.

Distribution: In Italy, from Tuscany, around the lagoons at Sasso, eight km from Castelnuovo, Val di Cecina, also at Larderello and other reduction works nearby; from Campi Flegrei, near Naples, and on Vesuvius, Campania; on Vulcano, Lipari Islands. In the USA, in California, from the Kramer borate deposit, Boron, Kern Co., in Death Valley, near the head of Furnace Creek, and in the Upper Biddy mine, near Ryan, Inyo Co., and at The Geysers, Sonoma Co.; from Norris geyser basin, Yellowstone National Park, Wyoming; at Steamboat Hot Springs, Steamboat Springs district, Washoe Co., Nevada. At the Copahue geothermal field, Neuquén Province, Argentina. In Japan, on Showa-shinzan, in the dome of Usu volcano, Hokkaido; at the Asamayama volcano, Nagano Prefecture; from the Iwodake volcano, Kagoshima Prefecture; at the Yunotani geothermal field, in the Aso caldera, Kyushu. From the Bezymyanni volcano, Kamchatka Peninsula, Russia.

Name: For its initially-noted occurrence at Sasso, Italy.

H_2O^+	22.80		
H_2O^-	4.10		
H_2O			29.00
Total	98.55		100.00

(1) Kara-Tau Mountains, Kazakhstan; spectrographic analysis shows Zn 0.5%, Cu 0.2%, Ni 0.1%, Cr 0.03%, Ba 0.01%. (2) Do.; partial reanalysis. (3) $Al_{12}V_2^{4+}V_6^{5+}O_{37}\cdot 30H_2O$.

Occurrence: In the oxidation zone of a vanadiferous clay-anthraxolite horizon.

Association: Steigerite, vanalite, hewettite, delvauxite, gypsum.

Distribution: In the Kurumsak and Balasauskandyk vanadium deposits, northwest Kara-Tau Mountains, southern Kazakhstan. northwestern Kara-Tau Mountains, Kazakhstan.

Name: Honors Kanysh Imantaevich Satpaev (1899–1964), Kazakhstani geologist, Institute of Geosciences, Alma-Ata, Kazakhstan.

Type Material: Mning Institute, St. Petersburg, 1251/1; Vernadsky Geological Museum, Moscow, 49850; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 62760.

(1) Friedensville, Pennsylvania, USA. (2) Coon Hollow mine, Arkansas, USA.

Mineral Group: Smectite group.

Occurrence: Fills vugs and seams in oxidized zinc and copper deposits; may be redeposited at the water table.

Association: Hemimorphite, smithsonite, chrysocolla, coronadite, iron oxides.

Distribution: In the USA, from the Ueberroth mine, Saucon Valley, near Friedensville, Lehigh Co., Pennsylvania; the Coon Hollow mine, north of Zinc, Boone Co., Arkansas; and the Liberty mine, Meekers Grove, Lafayette Co., Wisconsin. In Arizona, at Castle Dome, Globe-Miami district, and the 79 mine, Gila Co., and from the Magma mine, Superior, Pinal Co.; and in Colorado, from the New Discovery and Yankee Doodle mines, Leadville, Lake Co. At Moresnet, Liège, Belgium. From the Lovozero massif, Kola Peninsula, and a number of other poorly defined Russian localities.

Name: For its occurrence in the Saucon Valley, Pennsylvania, USA.

Sayrite $Pb_2(UO_2)_5O_6(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As isolated prismatic crystals, to 0.6 mm, elongated along [010], showing $\{\bar{1}02\}$, {001}, {100}, terminated by {110}.

Physical Properties: *Cleavage:* $\{\bar{1}02\}$, distinct. Hardness = n.d. VHN = 150
D(meas.) = n.d. D(calc.) = 6.76 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Yellow-orange to red-orange.
Luster: Vitreous to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* Pale yellow to amber-yellow. *Orientation:* $X \simeq c$; $Y = b$; $Z \simeq a$. α = n.d. $\beta = \sim 1.94$ $\gamma = \sim 1.95$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1/c$. $a = 10.704(3)$ $b = 6.960(2)$ $c = 14.533(3)$
$\beta = 116.81(2)^\circ$ Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
3.113 (100), 3.512 (90), 7.01 (80), 3.052 (70), 5.63 (50), 1.955 (50), 1.916 (50)

Chemistry:

	(1)	(2)
UO_3	73.58	72.72
PbO	21.82	22.70
H_2O	[4.60]	4.58
Total	[100.00]	100.00

(1) Shinkolobwe, Congo; by electron microprobe, average of ten analyses; corresponding to $1.91PbO \cdot 5.03(UO_3) \cdot 4.99H_2O$. (2) $Pb_2(UO_2)_5O_6(OH)_2 \cdot 4H_2O$.

Occurrence: An alteration product of uraninite in the oxidized zone of a uranium orebody.

Association: Uraninite, becquerelite, uranophane, richetite, masuyite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Dr. David Sayre (1924–), American crystallographer, State University of New York, Stony Brook, New York, USA.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM13944.

References: (1) Piret, P., M. Deliens, J. Piret-Meunier, and G. Germain (1983) La sayrite, $Pb_2[(UO_2)_5O_6(OH)_2] \cdot 4H_2O$, nouveau minéral; propriétés et structure cristalline. Bull. Minéral., 106, 299–304 (in French with English abs.). (2) (1984) Amer. Mineral., 69, 568 (abs. ref. 1).

MnO	0.06		Total	99.56	100.00

(1) Lovozero massif, Russia; RE = La 21.1%–22.2%, Ce 54.0%–56.0%, Pr 5.2%–5.5%, Nd 15.7%–16.8%, Sm 1.1%–1.4%, Eu 0.1%–0.2%, Gd 0.4%. (2) $Na_2CeSi_6O_{14}(OH)\cdot 5.5H_2O$.

Occurrence: As disseminations in natrolite and rims around altered steenstrupine in an alkalic pegmatite in a differentiated alkalic massif (Lovozero massif, Russia); in sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Natrolite, steenstrupine, neptunite (Lovozero massif, Russia); vuonnemite, sérandite, ussingite, sodalite, eudialyte (Mont Saint-Hilaire, Canada).

Distribution: In the Jubilee pegmatite, on Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Academician Nikolai Petrovich Sazhin (1898–1969), a founder of the Soviet rare-earth industry, Mendeleeev Chemical Technology Institute, Moscow, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3386; Mining Institute, St. Petersburg, 1082/1; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Sborgite $NaB_5O_6(OH)_4 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ (synthetic). As euhedral to anhedral crystals, to 1 mm, in sugary-textured to fine-grained aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 1.713 (synthetic). D(calc.) = 1.711 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* [White.]
Optical Class: Biaxial (+). $\alpha = 1.432$–1.435 β = n.d. $\gamma = 1.450$–1.488 2V(meas.) = Small.

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 11.189(8)$ $b = 16.474(14)$ $c = 13.576(9)$ $\beta = 112°50(2)'$ Z = 8

X-ray Powder Pattern: Furnace Creek district, California, USA.
4.60 (10), 3.30 (8), 3.20 (7), 3.74 (5), 3.18 (5), 4.29 (3), 3.56 (3)

Chemistry: (1) Identification depends on identity of X-ray powder pattern and optical data with synthetic material.

Occurrence: Formed in pipes at a reduction works for borates from hot spring lagoons, between 32° C and 60° C (Larderello, Italy); deposited in an arid climate in surficial debris above weathering borate-bearing veins and in beds of saline tuffaceous siltstone (Furnace Creek district, California, USA).

Association: Borax, thénardite (Larderello, Italy); halite, thénardite (Furnace Creek district, California, USA).

Distribution: From Larderello, Val di Cecina, Tuscany, Italy. At several localities in the Furnace Creek district, Death Valley, Inyo Co., California, USA.

Name: Honors Professor Umberto Sborgi (1883–1955), Italian chemist, University of Milan, Milan, Italy, a worker in the system Na_2O–B_2O_3–H_2O.

Type Material: University of Florence, Florence, Italy, 16801/702.

Scacchite $MnCl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As incrustations on rock, intermixed with other salts.

Physical Properties: *Cleavage:* {0001}, perfect, inferred from crystal structure. Hardness = Soft. D(meas.) = 2.98 D(calc.) = 3.04 Deliquescent; soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless when fresh, turning rose-red, then brown on exposure.
Optical Class: Uniaxial (–). $\epsilon = 1.708$ $\alpha = 1.622$

Cell Data: *Space Group:* $R\overline{3}m$ (synthetic). $a = 3.711(2)$ $c = 17.59(7)$ $Z = 3$

X-ray Powder Pattern: Synthetic.
5.85 (100), 2.592 (80), 3.161 (25), 1.8529 (25), 1.8118 (25), 1.7663 (13), 1.977 (11)

Chemistry: Analyses are lacking.

Occurrence: A product of fumarolic activity.

Association: Halite, sylvite, other chlorides.

Distribution: On Vesuvius, Campania, Italy.

Name: To honor Professor Arcangelo Scacchi (1810–1893), Italian mineralogist, University of Naples, Naples, Italy.

Scainiite $Pb_{14}Sb_{30}O_5S_{54}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As crystals, to 1 cm.

Physical Properties: Hardness = Low. VHN = 142–151, 148 average (100 g load). D(meas.) = n.d. D(calc.) = 13.52

Optical Properties: Opaque. *Color:* In polished section, gray. *Luster:* Metallic. *Anisotropism:* Very weak.
R_1–R_2: (400) 59.7–60.6, (420) 61.4–62.8, (440) 63.3–65.0, (460) 65.0–66.6, (480) 66.8–68.4, (500) 68.7–70.1, (520) 70.5–71.7, (540) 72.1–73.4, (560) 73.6–74.9, (580) 74.9–76.1, (600) 76.1–77.2, (620) 77.2–78.2, (640) 78.1–79.0, (660) 79.1–79.8, (680) 79.8–80.5, (700) 80.5–81.1

Cell Data: *Space Group:* $P6_3/mmc$. $a = 2.978$ $c = 4.842$ $Z = 2$

X-ray Powder Pattern: Landsberg, Germany.
2.273 (100), 0.8595 (60), 2.420 (50), 1.268 (50), 0.9538 (50), 1.489 (40), 0.9373 (40)

Chemistry:

	(1)	(2)
Ag	37.8	39.66
Hg	61.6	60.34
Total	99.4	100.00

(1) Landsberg, Germany; by electron microprobe, corresponding to $Ag_{1.07}Hg_{0.93}$; microprobe analyses give low totals because of high absorption; results cluster about $Ag_{1.12}Hg_{0.98}$.
(2) $Ag_{1.10}Hg_{0.90}$.

Occurrence: In the zone of oxidation, formed by the alteration of moschellandsbergite.

Association: Paraschachnerite, mercurian silver, acanthite, cinnabar, ankerite, "limonite" (Landsberg, Germany); paraschachnerite, mercurian silver, sphalerite, pyrite (Sala, Sweden).

Distribution: From the Vertrauen auf Gott mercury mine, Landsberg, near Obermoschel, Rhineland-Palatinate, Germany [TL]. At Sala, Västmanland, Sweden.

Name: Honors Professor Doris Schachner-Korn (1904–1989), ore mineralogist, Institute for Mineralogy and Ore Deposits, Rhine Westphalian Technical School, Aachen, Germany.

Type Material: Technical University, Berlin, Germany; National Museum of Natural History, Washington, D.C., USA, 145618, 150256.

(1) Scarborough, England; corresponding to $Al_{5.0}(CO_3)(OH)_{12.9}\cdot 5.2H_2O$.
(2) $Al_5(CO_3)(OH)_{13}\cdot 5H_2O$.

Occurrence: In vertical fissures in sandstone (Scarborough, England); authigenic, probably formed by dessication of near-shore bottom sediments of a hypersaline lake (Muskiki Lake, Canada).

Association: Hydroscarbroite, gibbsite, kaolinite, calcite, quartz (Scarborough, England); illite, kaolinite, smectite, "chlorite", huntite, feldspar, quartz (Muskiki Lake, Canada).

Distribution: In England, from South Bay, near Scarborough, North Yorkshire, and at Weston Favell, Northampton. From near Nikšić, Yugoslavia. In Canada, from Muskiki Lake, Saskatchewan.

Name: For its first-noted occurrence near Scarborough [contracted to Scarbro, the common local pronunciation], England.

Type Material: The Natural History Museum, London, England, 1984,898.

(1) Crestmore, California, USA; total Fe as Fe_2O_3. (2) Ballycraigy, Ireland; remainder is trivalent metal oxides. (3) $Ca_7Si_6O_{18}(CO_3)\cdot 2H_2O$.

Occurrence: A late-stage hydrothermal mineral veining skarns formed from contact metamorphism of limestone.

Association: Melilite, spurrite, tobermorite, thomsonite, larnite, grossular, bultfonteinite, calcite, analcime, foshagite, hillebrandite.

Distribution: At Scawt Hill and Ballycraigy, near Larne, Co. Antrim, Ireland. On the Zeilberg, near Maroldsweisach, Bavaria, Germany. In the USA, at Crestmore, Riverside Co., California, and near Neihart, Cascade Co., Montana. From Kushiro, Hiroshima Prefecture, and in the Mihara mine and at Fuka, near Bicchu, Okayama Prefecture, Japan. From near Rehia, Tokatoka district, about 150 km north of Auckland, New Zealand.

Name: For the locality where first found, Scawt Hill, Ireland.

Type Material: The Natural History Museum, London, England, 1956,384.

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As crystals up to 1 cm in length, but most much smaller.

Physical Properties: Hardness = Low. VHN = n.d. D(meas.) = n.d. D(calc.) = 13.52

Optical Properties: Opaque. *Color:* In polished section, gray. *Luster:* Metallic. *Anisotropism:* Very weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. $a = 2.978$ $c = 4.842$ Z = 2

X-ray Powder Pattern: Landsberg, Germany.
2.273 (100), 0.8595 (60), 2.420 (50), 1.268 (50), 0.9538 (50), 1.489 (40), 0.9373 (40)

Chemistry: Microprobe analyses give low totals because of high absorption; results cluster about $Ag_{1.12}Hg_{0.98}$.

Occurrence: Found in the zone of oxidation, formed by the alteration of moschellandsbergite.

Association: Paraschachnerite, mercurian silver, acanthite, cinnabar, ankerite, "limonite" (Landsberg, Germany); paraschachnerite, mercurian silver, sphalerite, pyrite (Sala, Sweden).

Distribution: In the Vertraun Gott mercury mine at Landsberg, near Obermoschel, Rhineland-Palatinate, Germany. At Sala, Västmanland, Sweden.

Name: For Professor Doris Schachner, ore mineralogist, Institute for Mineralogy and Ore Deposits, Rhine Westphalian Technical School, Aachen, Germany.

Type Material: Technical University, Berlin, Germany; National Museum of Natural History, Washington, D.C., USA, 150256.

FeO	17.58	19.77
ZnO	1.10	
Total	96.35	100.00

(1) Buca della Vena mine, Italy; by electron microprobe, total Fe as FeO, Sb as Sb_2O_3, As as As_2O_3; corresponds to $(Fe_{0.88}Zn_{0.05})_{\Sigma=0.93}(Sb_{1.69}As_{0.36})_{\Sigma=2.05}O_4$. (2) $FeSb_2O_4$.

Occurrence: In oxidized antimony-bearing hydrothermal mineral deposits.

Association: Kermesite, valentinite, sénarmontite, stibnite, calcite (Pernek, Slovakia); apuanite, versiliaite, derbylite, bournonite, pyrite, sphalerite (Buca della Vena mine, Italy).

Distribution: From Pernek, near Pezinok, Slovakia. In the Buca della Vena iron mine, north of Stazzema, Apuan Alps, Tuscany, Italy. From Canada, in the Lac Nicolet mine, South Ham, Quebec.

Name: To honor Professor Ferenc Schafarzik (1854–1927), Hungarian mineralogist, of the Polytechnic, Budapest, Hungary.

Type Material: University of Vienna, Vienna, Austria.

Schairerite $Na_{21}(SO_4)_7F_6Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Steep trigonal rhombohedra $\{03\bar{3}2\}$, modified by $\{10\bar{1}0\}$, $\{10\bar{1}1\}$, $\{01\bar{1}2\}$, $\{0001\}$, to 2 mm; may form polycrystals with galeite.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 2.612–2.616 D(calc.) = 2.619 Slowly soluble in H_2O.

Optical Properties: Transparent to translucent with clay inclusions. *Color:* Colorless; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.440$ $\epsilon = 1.445$

Cell Data: *Space Group:* $P31m$. $a = 12.197(4)$ $c = 19.259(11)$ $Z = 3$

X-ray Powder Pattern: Searles Lake, California, USA.

(1) Franklin, New Jersey, USA; by electron microprobe, As_2O_3 by wet chemical analysis, H_2O by the Penfield method. (2) Ködnitz Valley, Austria; by electron microprobe, average of 13 analyses; H_2O calculated from stoichiometry; original total given as 99.83%. (3) $Mn_{16}As_3Si_{12}O_{36}(OH)_{17}$.

Polymorphism & Series: Dimorphous with nelenite.

Occurrence: In banded willemite-franklinite ore or rhodonite, from a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA); in manganese-rich lenses in quartzitic chlorite schists probably of marine origin (Ködnitz Valley, Austria).

Association: Willemite, franklinite, calcite, rhodonite (Franklin, New Jersey, USA); tephroite, pyroxmangite, rhodonite, spessartine, rhodochrosite (Ködnitz Valley, Austria).

Distribution: From Franklin, Sussex Co., New Jersey, USA. In the Ködnitz Valley, Tirol, Austria.

Name: For Dr. Waldemar Theodore Schaller (1882–1967), mineralogist, U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, 87106; National Museum of Natural History, Washington, D.C., USA, R6610.

Scheelite $CaWO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals are typically pseudo-octahedral {011} or {112}, with modifying forms {001}, {013}, {121}, several others, to 32 cm; commonly granular, massive. *Twinning:* {110}, common, penetration and contact twins, composition plane {110} or {001}.

Physical Properties: *Cleavage:* On {101}, distinct; on {112}, interrupted; on {001}, indistinct. Hardness = 4.5–5 D(meas.) = 6.10(2) D(calc.) = 6.09 Bright bluish white cathodoluminescence and fluorescence under SW UV and X-rays.

Optical Properties: Transparent to opaque; transparent in transmitted light. *Color:* Colorless, white, gray, brown, pale yellow, yellow-orange, pale shades of orange, red, green; may be compositionally color zoned. *Streak:* White. *Luster:* Vitreous to adamantine.
Optical Class: Uniaxial (+). $\epsilon = 1.935$–1.938 $\omega = 1.918$–1.921

Cell Data: *Space Group:* $I4_1/a$ (synthetic). $a = 5.2429(3)$ $c = 11.3737(6)$ $Z = 4$

X-ray Powder Pattern: Kernville, California, USA.
3.10 (100), 4.76 (55), 3.072 (30), 1.928 (30), 1.592 (30), 2.622 (25), 2.296 (20)

Total	99.73	100.00

(1) Schwarzenberg, Germany. (2) $CaWO_4$.

Polymorphism & Series: Forms a series with powellite.

Occurrence: Typically a component of contact-metamorphic tactite; in high-temperature hydrothermal veins and greisen; less common in granite pegmatites and medium-temperature hydrothermal veins; alluvial.

Association: Cassiterite, wolframite, topaz, fluorite, apatite, tourmaline, quartz (greisen); grossular–andradite, diopside, vesuvianite, tremolite (tactite).

Distribution: An important ore of tungsten, with many localities. Some for fine and large crystals include: from Sweden, at the Bispberg iron mine, near Säter, Dalarne. In Germany, from Altenberg and Schwarzenberg, Saxony. At Cínovec (Zinnwald) and Horní Slavkov (Schlaggenwald), Czech Republic. From Traversella, Piedmont, Italy. At Tenkergin, Chukotka, Siberia, Russia. In the Natas mine, about 80 km south of Windhoek, Namibia. Large crystals from the Tae wha mine, Chungju, North Chungchong Province, South Korea. At Pia Oac, Tonkin, North Vietnam. In China, from near Pingwu, Xuebao Ding Mountains, Sichuan Province, China. A large deposit in the Flat River Valley, Northwest Territories, Canada. In the USA, in Arizona, large crystals from the Cohen mine, Dragoon Mountains, Cochise Co.; commercially mined at the Pine Creek mine, near Bishop, Inyo Co., California. At Mitopilas, Sonora, Mexico. In the Morro Velho gold mine, Nova Lima, Minas Gerais, Brazil.

Name: Honors Karl Wilhelm Scheele (1742–1786), who determined the mineral contained tungsten.

Crystal Data: Orthorhombic (synthetic). *Point Group:* $2/m\ 2/m\ 2/m$. Small indistinct flat crystals.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.83 Soluble in H_2O, forming a struvite residue.

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Biaxial (+) (synthetic). *Orientation:* $Z = a$; OAP = {001}. $\alpha = 1.508(2)$ $\beta = 1.515(2)$ $\gamma = 1.523(2)$ 2V(meas.) = ~90° 2V(calc.) = 86°

Cell Data: *Space Group:* *Pbca* (probable; synthetic). $a = 11.47$ $b = 23.63$ $c = 8.62$ $Z = 8$

X-ray Powder Pattern: Synthetic.
5.94 (100), 2.97 (43), 5.21 (37), 2.80 (29), 3.02 (22), 3.46 (21), 4.31 (19)

Total	100.00	100.00

(1) Skipton lava tube caves, Australia. (2) $(NH_4)_2Mg(PO_3OH)_2 \cdot 4H_2O$.

Occurrence: Rarely formed in drier portions of bat guano, by the reaction of NH_4 from guano with Mg in surrounding rocks.

Association: Struvite, newberyite (Skipton lava tube caves, Australia).

Distribution: In the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria, Australia. From Chaos Cave, Transvaal, South Africa.

Name: To honor Professor Arnulf Schertel (1841–1902), mineralogist, Freiberg Mining Academy, Freiberg, Germany.

Schiavinatoite $(Nb, Ta)BO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As portions of prismatic tetragonal dipyramidal crystals, intergrown with béhierite, to 2 cm.

Physical Properties: Hardness = ∼8 D(meas.) = n.d. D(calc.) = 6.548

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $n = 2.30(5)$, birefringent. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $I4_1/amd$. $a = 6.219(5)$ $c = 5.487(5)$ Z = 4

X-ray Powder Pattern: Antsongombato, Madagascar; calculated pattern, very close to béhierite.
4.115 (100), 3.110 (84), 2.328 (49), 1.598 (42), 2.481 (36), 1.939 (29), 1.646 (25)

Chemistry:

	(1)	(2)
B_2O_3	[16.60]	16.44
Nb_2O_5	33.08	31.38
Ta_2O_5	50.37	52.18
Total	[100.05]	100.00

(1) Antsongombato, Madagascar; by electron microprobe, average of 16 analyses, B_2O_3 calculated from stoichiometry; corresponds to $(Nb_{0.52}Ta_{0.48})_{\Sigma=1.00}BO_4$. (2) $(Nb, Ta)BO_4$ with Nb:Ta = 1:1.

Occurrence: Very rare in miarolitic cavities in a pegmatite dike.

Association: Béhierite, rhodizite, elbaite–liddicoatite, spodumene, pollucite, danburite, apatite, quartz, feldspar.

Distribution: From Antsongombato, south of Betafo, Madagascar.

Name: To honor Professor Guiseppe Schiavinato (1915–1996), Italian mineralogist, who supported the advancement of mineralogy in Italy.

Type Material: City Museum of Natural History, Milan, Italy, M31137.

Schieffelinite $\mathbf{Pb(Te^{6+}O_4, SO_4)\cdot H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are very rare, flattened on {010}, modified by {001}, {320}, {133}; typically platy or scaly, to 1 mm, in random aggregates.

Physical Properties: *Cleavage:* On {010}, easy. Hardness = 2 D(meas.) = 4.98(12) D(calc.) = 5.15

Optical Properties: Transparent to translucent. *Color:* Colorless, milky white. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, weak.
$\alpha = 1.897$ $\beta = 1.940$ $\gamma = 1.942$ 2V(meas.) = 24°

Cell Data: *Space Group: Cmcm.* $a = 9.67$ $b = 19.56$ $c = 10.47$ Z = 16

X-ray Powder Pattern: Joe shaft, Tombstone, Arizona, USA.
9.778 (10), 3.426 (6), 3.250 (6b), 3.560 (5b), 3.338 (5), 3.033 (5), 2.934 (5)

Chemistry:

	(1)
SO_3	6.8
TeO_3	28.6
PbO	58.2
H_2O	4.7
Total	98.3

(1) Joe shaft, Tombstone, Arizona, USA; average of two analyses, H_2O by the Penfield method; corresponds to $Pb_{1.05}(Te_{0.66}S_{0.34})_{\Sigma=1.00}O_4 \cdot 1.06H_2O$.

Occurrence: In the oxidized zone of tellurium-bearing hydrothermal precious metal deposits.

Association: Rodalquilarite, girdite, bromargyrite, gold, pyrite, empressite, goethite, quartz.

Distribution: On the dumps of the Joe shaft and at the Grand Central mine, Tombstone, Cochise Co., Arizona, USA.

Name: To honor Edward Schieffelin (1847–1897), a discoverer of the mines at Tombstone, Arizona, USA.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,539; University of Arizona Mineral Museum, Tucson, Arizona; National Museum of Natural History, Washington, D.C., USA, R18474.

Schirmerite $Ag_3Pb_3Bi_9S_{18}$ to $Ag_3Pb_6Bi_7S_{18}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As lath-shaped grains, to several mm; also massive and fine-granular.

Physical Properties: *Cleavage:* Noticeable along grain length; transverse and longitudinal partings. Hardness = ∼2 VHN = 150–206 D(meas.) = n.d. D(calc.) = 7.58

Optical Properties: Opaque. *Color:* Lead-gray to iron-black; in polished section, white. *Luster:* Metallic. *Pleochroism:* Weak in air, weak to distinct in oil. *Anisotropism:* Weak in air, distinct to strong in oil, in gray to black.

R_1–R_2: (400) 42.6–46.6, (420) 43.0–47.3, (440) 43.4–48.0, (460) 43.6–48.2, (480) 43.5–48.2, (500) 43.2–48.0, (520) 42.9–47.7, (540) 42.4–47.2, (560) 42.0–46.7, (580) 41.7–46.2, (600) 41.4–46.0, (620) 41.2–45.7, (640) 41.1–45.6, (660) 41.0–45.5, (680) 40.9–45.3, (700) 40.9–45.1

Cell Data: *Space Group:* $Bbmm$, $Bb2_1m$, or $Bbm2$. $a = 13.448(2)$ $b = 44.386(1)$ $c = 4.022(12)$ $Z = 8$

X-ray Powder Pattern: Treasure Vault mine, Colorado, USA.
2.035 (100), 3.207 (90), 2.923 (90), 2.878 (70), 2.873 (70), 2.786 (70), 2.382 (70)

Chemistry:

Total	100.8	100.00	100.00

(1) Treasure Vault mine, Colorado, USA; by electron microprobe. (2) $Ag_3Pb_3Bi_9S_{18}$. (3) $Ag_3Pb_6Bi_7S_{18}$.

Occurrence: Disseminated through quartz.

Association: Galena, matildite, hessite, aikinite, clausthalite, bismuthinite, lillianite.

Distribution: In the USA, in Colorado, from several mines on the Treasure Vault and parallel lodes, Geneva district [TL], Clear Creek, Park, and Summit Cos.; in the Lake City district, Hinsdale Co.; from Darwin, Inyo Co., California. In Scotland, from Corrie Buie, Meal nan Oighreag, Perthshire. At the Monteneme W–Sn deposit, Galice?? which Prov. or delete??, Spain. In the Toroiaga mine, Baia Borşa district, Romania. From the Zambarak Pb–Zn deposit, eastern Karamazar, Tajikistan. At the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In China, at the Shanhu W–Sn deposit, Guangxi Zhuangzu Autonomous Region, and in the Huangshaping Pb–Zn deposit, Guiyang, Hunan Province. Additional localities are known, but the species may be confused with other homologous sulfosalts.

Name: In honor of Dr. J.F.L. Schirmer, former Superintendent of the U.S. Mint, Denver, Colorado, USA.

(1) Emma Luisa mine, Chile; by electron microprobe, H_2O by difference, $(OH)^{1-}$ calculated for charge balance; corresponds to $[(H_3O)_{0.54}Ca_{0.26}Na_{0.07}Cu_{0.06}K_{0.05}Sr_{0.01}Ba_{0.01}]_{\Sigma=1.00}(Al_{2.97}Fe_{0.03})_{\Sigma=3.00}[(SO_4)_{1.53}(AsO_4)_{0.49}]_{\Sigma=2.02}(OH)_{6.19}$.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral in the oxidized zone of a copper-bearing gold deposit.

Association: Ceruleite, chenevixite, olivenite, alumopharmacosiderite, mansfieldite, barite, quartz, goethite.

Distribution: From the Emma Luisa gold mine, Guanaco district, about 100 km east-northeast of Taltal, Antofagasta, Chile.

Name: To honor Professor Emeritus Karl Schlossmacher (1887–1980), Institute for Mineralogy and Petrography, Johannes Gutenberg University, Mainz, Germany, Honorary President of the German Gemmological Society.

Type Material: University of Heidelberg, Heidelberg, Germany, 10'11'13.

PbO	51.25	50.76
H_2O	[3.08]	4.10
Total	[100.00]	100.00

(1) Cóndor mine, Argentina; partial elemental analysis here recalculated to oxides assuming Se^{4+}:Se^{6+} = 1:1; corresponds to $Pb_{2.00}Cu_{2.00}(SeO_3)_{1.01}(SeO_4)_{1.01}(OH)_{3.99}$.
(2) $Pb_2Cu_2(SeO_3)(SeO_4)(OH)_4$.

Occurrence: A rare secondary mineral in the oxidized zone of selenium-bearing hydrothermal base metal deposits.

Association: Chalcomenite, molybdomenite, umangite, clausthalite (Cóndor mine, Argentina).

Distribution: From the Cóndor mine, Los Llantenes district, Sierra de Cacheuta, La Rioja Province, Argentina. In the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, Bolivia. In Wales, from the Llechwedd Helyg mine, Tir-y-Mynach, and at the Nantycagl (Eaglebrook) mine, Ceulanymaesmawr, Dyfed; in the Dyfngwm mine, Penegoes, Powis; from Machen. In the Greystone quarry, Levant, Cornwall, England. From the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy. In the Tonopah-Belmont mine, Osborne district, Maricopa Co., Arizona, USA.

Name: To honor Oscar Schmieder (1891–1980), German geographer, a Director of the Museum of Mineralogy and Geology, National University, Córdoba, Argentina.

Type Material: The Natural History Museum, London, England, 1962,217; National Museum of Natural History, Washington, D.C., USA, 160487.

Schmitterite $(UO_2)Te^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Individual crystals are bladelike, elongated along [100] and flattened on [010], in rosettes, to 2 mm, and in scales and tufts; may be aggregated into nodules and crusts.

Physical Properties: *Cleavage:* On {100}. *Tenacity:* Plastic. Hardness = ∼1
D(meas.) = 6.878 (synthetic). D(calc.) = 6.916 Radioactive.

Optical Properties: Semitransparent. *Color:* Colorless, pale straw-yellow, pale yellow.
Luster: Pearly.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. α = n.d. $\beta = 2.05$ $\gamma = > 2.11$
2V(meas.) = ∼75°

Cell Data: *Space Group:* $P2_1ab$ (synthetic). $a = 7.860(4)$ $b = 10.089(2)$ $c = 5.363(2)$
Z = 4

X-ray Powder Pattern: Synthetic.
3.682 (10), 5.35 (9), 3.099 (9), 4.73 (8), 3.170 (8), 1.971 (7), 1.549 (6)

Chemistry: (1) Identification depends on coincidence of the X-ray powder pattern with synthetic material, and the presence of uranium and tellurium.

Occurrence: In the oxidized zone of a hydrothermal Au–Te deposit (Moctezuma mine, Mexico); in the oxidized zone of a uranium deposit (Shinkolobwe, Congo).

Association: Emmonsite, mackayite, cuzticite, eztlite, "limonite" (Moctezuma mine, Mexico); uraninite, siegenite, vaesite (Shinkolobwe, Congo).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, and at the San Miguel prospect, 10 km northwest of the Moctezuma mine, Sonora, Mexico. From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Eduardo Schmitter Villada (1904–1982), Professor of Mineralogy and Petrology, National University of Mexico, Mexico City, Mexico.

Type Material: Mexican Institute of Geology, National University of Mexico, Mexico City, Mexico; Natural History Museum, Paris, France, 175.80; National Museum of Natural History, Washington, D.C., USA, 120247, 122475, 164351.

(1) Fish Creek Range, Nevada, USA; original total given as 100.27%, corresponds to $Al_{1.92}(PO_4)_{1.00}(VO_4)_{1.10}\bullet 7.94H_2O$. (2) Wilson Springs mine, Arkansas, USA; by electron microprobe, H_2O by difference. (3) $Al_2(PO_4)(VO_4)\bullet 8H_2O$.

Occurrence: A rare mineral formed from amorphous phosphatic gels or by crystallization from meteoric solution in fractures in phosphatic chert (Fish Creek Range, Nevada, USA).

Association: Vashegyite, wavellite (Fish Creek Range, Nevada, USA); metahewettite, metaschoderite, bokite, minyulite, leucophosphite (Cockalorum Wash, Nevada, USA); hewettite, duttonite, fervanite, metaschoderite, straczekite, apatite, quartz (Wilson Springs mine, Arkansas, USA).

Distribution: In the USA, from the Van-Nav-Sand claim group, Fish Creek Range, about 48 km south of Eureka, Eureka Co., and near Cockalorum Wash, Nye Co., Nevada; in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas.

Name: To honor William Paul Schoder (1900–1977), research chemist, Union Carbide Corporation, for his work on the metallurgy of vanadium.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145791, 144479.

Schneiderhöhnite $Fe^{2+}Fe_3^{3+}As_5^{3+}O_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As flattened curved crystals, to 3 cm; also spindle-shaped, in aggregates.

Physical Properties: *Cleavage:* {100}, perfect; two others observed. Hardness = ∼3
D(meas.) = 4.3 D(calc.) = 4.40

Optical Properties: Opaque, transparent in thin flakes. *Color:* Dark brown, nearly black; yellow-brown to yellow-orange; in reflected light, red-brown with brownish red internal reflections. *Streak:* Coffee-brown. *Luster:* Metallic to adamantine.
Optical Class: Biaxial (+). *Pleochroism:* Red-brown to pale yellow. *Absorption:* $X > Y < Z$.
$\alpha = > 2.11$ $\beta =$ n.d. $\gamma = < 2.13$ 2V(meas.) = n.d. *Anisotropism:* Weak; greenish to brownish.

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.924(2)$ $b = 10.016(3)$ $c = 9.103(3)$ $\alpha = 59.91(2)°$
$\beta = 112.41(2)°$ $\gamma = 81.69(2)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
7.25 (10), 3.583 (10), 2.891 (10), 2.598 (10), 2.399 (9), 3.320 (8), 2.255 (8)

Chemistry:

	(1)	(2)
As	47.03	46.48
Fe	27.90	27.72
Zn	0.93	
Ge	0.37	
O	[23.77]	25.80
Total	[100.00]	100.00

(1) Tsumeb, Namibia; by electron microprobe, average of three analyses, O by difference.
(2) $Fe^{2+}Fe_3^{3+}As_5O_{13}$.

Occurrence: A rare secondary mineral in an oxidation zone in a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Zincian stottite, chalcocite, tennantite, leiteite (Tsumeb, Namibia); löllingite, karibibite, eosphorite, arseniosiderite, scorodite, quartz (Bou Azzer, Morocco).

Distribution: From Tsumeb, Namibia. At Bou Azzer, Morocco. From the Córrego do Urucum pegmatite, near Galiléia, Minas Gerais, Brazil. At the Veta Negra mine, Pampa Larga district, Tierra Amarilla, southeast of Copiapó, Chile. In the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA. At the Belaj-Gora pegmatite in Kazakhstan.

Name: To honor Hans Schneiderhöhn (1887–1962), Professor of Mineralogy, University of Freiburg, Freiburg im Breisgau, Germany.

Type Material: Royal Ontario Museum, Toronto, Canada, M33238; Harvard University, Cambridge, Massachusetts, USA, 111932.

(1) Brooks Range, Alaska; averages of varying numbers of determinations on the same sample; calculated to be a mixture of maghemite 57.38%, goethite 17.45%, hulsite 4.33%, fluorite 0.60%, and schoenfliesite 19.51%. (2) Schoenfliesite from (1) recalculated to 100%. (3) Pitkäranta district, Russia; by electron microprobe, average of 7 points; corresponds to $(Mg_{0.94}Mn_{0.13})_{\Sigma=0.1.07}Sn_{0.97}(OH)_{6.00}$. (4) $MgSn(OH)_6$.

Mineral Group: Schoenfliesite group.

Occurrence: A late-stage hydrothermal alteration product of hulsite in a boron-metasomatized limestone near the contact with a granite intrusive (Brooks Range, Alaska, USA); a late-stage low-temperature mineral in serpentinized dolostone associated with W, Sr, B, Be-bearing skarns (Pitkäranta district, Russia).

Association: Hulsite, goethite, maghemite (Brooks Range, Alaska, USA); cassiterite, berborite, calcite, fluorite, dolomite, magnetite, chondrodite, diopside (Pitkäranta district, Russia).

Distribution: On the northwest flank of Brooks Mountain, Seward Peninsula, Alaska, USA. From the Pitkäranta district, Lake Ladoga, Karelia, Russia. At the Damoshan deposit, Gejiu tin district, Yunnan Province, China. From Sungai Gow, Pahang, Malaysia.

Name: To honor Arthur Moritz Schoenflies (1853–1928), Professor of Mathematics, University of Frankfurt-am-Main, Frankfurt, Germany, for his derivation of the 230 space groups.

Type Material: n.d.

Schoepite $(UO_2)_4O(OH)_6 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Commonly in crystals, tabular ∥ {001}, equant, may be short prismatic along {001}, to 1.5 mm; highly developed, with over 20 forms noted; rarely in microcrystalline aggregates.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 4.8–4.96 D(calc.) = 4.87 Radioactive; fluoresces green under UV.

Optical Properties: Transparent. *Color:* Sulfur-yellow to citron-yellow; brownish yellow to amber-yellow, as a surficial alteration towards metaschoepite and paraschoepite; yellow in transmitted light. *Streak:* Yellow. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = almost colorless; $Y = Z$ = lemon-yellow to golden yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong. $\alpha = 1.690(3)$ $\beta = 1.714(3)$ $\gamma = 1.735(3)$ 2V(meas.) = 75°–85°

Cell Data: *Space Group:* $P2_1ca$. $a = 14.337(3)$ $b = 16.813(5)$ $c = 14.731(4)$ Z = 8

Chemistry:

	(1)	(2)
UO_3	87.73	87.59
H_2O	12.32	12.41
Total		100.00

(1) Shaba Province, Congo; UO_3 average of four partial determinations, H_2O average of two partial determinations. (2) $(UO_2)_4O(OH)_6 \cdot 6H_2O$.

Occurrence: A rare alteration product of uraninite in hydrothermal uranium deposits; may form directly from ianthinite.

Association: Uraninite, becquerelite, billietite, vandendriesscheite, fourmarierite, ianthinite, curite, soddyite, rutherfordine, uranophane (Shinkolobwe, Congo); paraschoepite, arsenuranylite, metazeunerite, uranospinite, nováčekite (Cherkasar deposit, Uzbekistan).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the USA, at Beryl Mountain, Acworth, Sullivan Co., and in the Ruggles mine, Grafton, and the Palermo mine, near North Groton, Grafton Co., New Hampshire; in Utah, at the Consolidated mine, Green Vein Mesa, Emery Co., the Happy Jack mine, White Canyon, and the Frey No. 4 mine, Red Canyon, San Juan Co., and the Oyler Tunnel claim, near Fruita, Wayne Co.; at the Lookout No. 22 claim, Marshall Pass district, Saguache Co., Colorado; from the Monument No. 2 mine, Apache Co., the Abe Lincoln mine, northeast of Wickenburg, Yavapai Co., and the Black Point-Murphy mine, near Cameron, Coconino Co., Arizona; from Paguate, Valencia Co., New Mexico; in the Lucky Mc mine, Gas Hills district, Fremont Co., Wyoming. From Wölsendorf, Bavaria, Germany. In the Margnac mine, Compreignac, Haute-Vienne, and at the Mas-d'Alary and Rabéjac uranium deposits, south of Lodève, Hérault, France. In Japan, at Akura, Okayama Prefecture, and in the Tarumi mine, Kagoshima Prefecture. From the Cherkasar uranium deposit, Chaktal Mountains, Uzbekistan. Several additional localities are known.

Name: Honors Alfred Schoep (1881–1966), Professor of Mineralogy, University of Ghent, Ghent, Belgium, for his contributions to uranium mineralogy.

Type Material: Royal Ontario Museum, Toronto, Canada, M13072.

(1) Norton County meteorite; by electron microprobe, average values; corresponds to $Na_{0.31}Cr_{0.98}S_{2.00} \cdot 1.20H_2O$. (2) Synthetic schöllhornite; by electron microprobe, corresponds to $Na_{0.31}Cr_{0.99}S_{2.00} \cdot 1.10H_2O$. (3) $Na_{0.3}CrS_2 \cdot H_2O$.

Occurrence: In an enstatite achondrite meteorite with other chromium-rich minerals, probably formed by terrestrial weathering of caswellsilverite.

Association: Caswellsilverite, daubréelite, titanoan troilite, ferromagnesian alabandite, oldhamite, kamacite, perryite.

Distribution: Found in the Norton County enstatite achondrite meteorite [TL].

Name: Honors Professor Robert Schöllhorn, Inorganic Chemical Institute, Münster University, Münster, Germany.

Type Material: Institute of Meteoritics and Department of Geology, University of New Mexico, Albuquerque, New Mexico, USA.

(1) Hagendorf, Germany; corresponds to $Ca_{1.00}(Zn_{1.72}Mg_{0.09}Mn_{0.08}Fe_{0.02})_{\Sigma=1.91}(PO_4)_{1.99} \cdot 2.26H_2O$. (2) $CaZn_2(PO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with parascholzite.

Occurrence: May be a primary mineral, but more commonly a secondary mineral in Zn phosphate-bearing granite pegmatites and sediments.

Association: Parascholzite, sphalerite, triplite (Hagendorf, Germany); parahopeite, collinsite (Reaphook Hill, Australia); tarbuttite (Kabwe, Zambia).

Distribution: From Hagendorf, Bavaria, Germany. At Otov, near Domažlice, Czech Republic. In the Baccu Locci mine, Cagliari, Sardinia, Italy. From Richelle, near Visé, Belgium. At Kabwe (Broken Hill), Zambia. In Australia, fine examples on Reaphook Hill, near Blinman, Flinders Ranges, South Australia; from Broken Hill, New South Wales. In the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Snowstorm mine, North Battle Mountain district, Lander Co., Nevada, USA. In China, at an undefined locality in Guangdong Province.

Name: Honoring Dr. Adolph Scholz (1894–1950), chemist and mineral collector, Regensburg, Germany.

Type Material: The Natural History Museum, London, England, 1961,14; Harvard University, Cambridge, Massachusetts, 102210; National Museum of Natural History, Washington, D.C., USA, 106411.

(1) Palermo #1 mine, New Hampshire, USA; by electron microprobe, total Fe as FeO, H_2O from theory. (2) $Fe_2^{2+}ZnMn^{2+}Fe^{3+}(PO_4)_3(OH)_2 \cdot 9H_2O$.

Occurrence: A rare late-stage low-temperature hydrothermal alteration and weathering product formed from earlier more reduced phases.

Association: Mitridatite, laueite, strunzite, whitmoreite, siderite, ludlamite, messelite, vivianite, whitlockite, hydroxylapatite, childrenite, jahnsite, arrojadite, Fe–Mn oxyhydroxides (Palermo #1 mine, New Hampshire, USA).

Distribution: From the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, and at Newry, Oxford Co., Maine, USA. At Hagendorf, Bavaria, Germany.

Name: To honor Richard Schooner (1925–), Woodstock, Connecticut, USA, student and collector of New England minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135934, 137019.

(1) St. Andreasberg, Germany; by electron microprobe, B_2O_3 calculated from stoichiometry, Fe^{2+}:Fe^{3+} from Mössbauer spectroscopy; stated to correspond to $(Na_{0.88}Ca_{0.11}K_{0.01})_{\Sigma=1.00}(Fe^{2+}_{1.64}Al_{0.44}Fe^{3+}_{0.42}Mg_{0.11}Ca_{0.07}[Li_{0.07}]Ti_{0.07}Mn_{0.02})_{\Sigma=2.84}(Al_{5.61}Fe^{2+}_{0.39})_{\Sigma=6.00}(BO_3)_3Si_6O_{18}[(OH)_{3.70}O_{0.30}]_{\Sigma=4.00}$.

Polymorphism & Series: Forms a series with dravite.

Mineral Group: Tourmaline group.

Occurrence: In granites and granite pegmatites, high-temperature hydrothermal veins, and some metamorphic rocks; also detrital.

Association: Quartz, albite, microcline, orthoclase, epidote, garnet, muscovite, topaz, cassiterite, scheelite, fluorite, beryl.

Distribution: Many localities, but few for fine crystals. From Sonnenberg, near St. Andreasberg, Harz Mountains, Germany. At Bovey Tracey, Devon, England. From San Piero in Campo, Elba, Italy. Around Alabashka and Mursinka, Ural Mountains, Russia. In the USA, from Haddam, Middlesex Co., Connecticut; at Pierrepont and elsewhere in St. Lawrence Co., New York; from Stony Point, Alexander Co., and near Statesville, Iredell Co., North Carolina; in the Little Three mine, Ramona, San Diego Co., California. At Santa Cruz, Sonora, Mexico. Around Bom Jesus de Lapa and Mendes Pimental, Minas Gerais, Brazil. At Anibib and Farm Etemba, Namibia. From the Nuristan district, Laghman Province, Afghanistan.

Name: From the Old German *Schürl*, of uncertain derivation, perhaps meaning *impurities*.

(1) Magnet Cove, Arkansas, USA. (2) Fanshan complex, China; corresponds approximately to $(Ca_{2.80}Fe^{2+}_{0.18}Mg_{0.15}Na_{0.03}Mn_{0.02}K_{0.01})_{\Sigma=3.19}(Ti^{4+}_{0.69}Fe^{3+}_{0.66}Al_{0.46})_{\Sigma=1.81}(Si_{2.24}Fe^{3+}_{0.46}Ti^{4+}_{0.30})_{\Sigma=3.00}O_{12}$.

Polymorphism & Series: Forms a series with andradite.

Mineral Group: Garnet group.

Occurrence: In carbonatites, syenites, and phonolites; also in skarns.

Association: Leucite, brookite, nepheline, potassic feldspar (Magnet Cove, Arkansas, USA).

Distribution: From Magnet Cove, Hot Spring Co., Arkansas, and near the Gem mine, San Benito Co., California, USA. In the Jacupiranga mine, São Paulo, Brazil. At Camphouse, Ardnamurchan, Argyllshire, Scotland. On Alnö Island, Sweden. From Iivaara, Kuusamo, Finland. In the Tokatoka district, about 150 km north of Auckland, New Zealand. From Fuka, near Bicchu, Okayama Prefecture, Japan. At Morotu, Sakhalin, Russia. In the Fanshan ultramafic complex, Hebei Province, China.

Name: For its resemblance to schorl.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128705.

Schreibersite $(Fe, Ni)_3P$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\overline{4}$. Rarely in crystals, rounded, may be hoppered; commonly in plates or tablets, or rods and needles, embedded in or along grain boundaries of kamacite in iron meteorites.

Physical Properties: *Cleavage:* Perfect on {001}; another, prismatic, on {010} or {110}, imperfect. *Tenacity:* Very brittle. Hardness = 6.5–7 D(meas.) = 7.0–7.3 D(calc.) = 7.12–7.44 Strongly magnetic.

Optical Properties: Opaque. *Color:* Silver-white to tin-white, tarnishing brass-yellow or brown. *Luster:* Brilliant metallic.
Optical Class: Uniaxial.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I\overline{4}$. $a = 9.013$–9.106 $c = 4.424$–4.464 $Z = 8$

X-ray Powder Pattern: Synthetic Fe_3P.
2.20 (100), 1.978 (100), 2.03 (80), 1.115 (80), 1.281 (65), 1.127 (65), 1.762 (55)

Chemistry:

	(1)	(2)	(3)	(4)
Fe	41.54	66.92	81.7	84.40
Co	0.80	0.62		
Ni	42.61	18.16		
P	15.05	14.88	18.1	15.60
Total	100.00	100.58	99.8	100.00

(1–2) Beaconsfield meteorite. (3) Red Sea; average of four analyses. (4) Fe_3P.

Occurrence: In nearly all iron meteorites, but lacking in those which are nickel deficient; rare in stony meteorites. Terrestrial occurrences are in reduced differentiated lenses in basalt (Disko Island, Greenland); as a hydrothermal metasomatic replacement of mineralized wood at a depth of 1400 m (Red Sea).

Association: Kamacite, tetrataenite (meteorites); iron, cohenite, troilite, wüstite (Disko Island, Greenland).

Distribution: Common in iron meteorites, as Magura, Bohumilitz, Beaconsfield, Canyon Diablo, Coahuila, many others. In Greenland, on Disko Island, near Kitdlît. At an unspecified location in the Red Sea.

Name: To honor Karl Franz Anton von Schreibers (1775–1852), of Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria (Magura meteorite).

(1) Lasamba Hill, Kenya; by electron microprobe, average of six analyses, total Fe as FeO; corresponds to $(V_{1.86}Cr_{0.12}Al_{0.02})_{\Sigma=2.00}Ti_3O_9$. (2) Sätra, Sweden; by electron microprobe, average of four analyses, total Fe as FeO; corresponds to $(V_{1.8}Cr_{0.2})_{\Sigma=2.0}Ti_3O_9$. (3) $V_2Ti_3O_9$.

Polymorphism & Series: Dimorphous with kyzylkumite.

Occurrence: In quartz-biotite-sillimanite-diopside-epidote gneiss in contact with quartzite, formed above 600 °C and 5 kbar (Lasamba Hill, Kenya); in quartzitic schists (Ol'khon Gate Straits, Lake Baikal, Russia).

Association: Vanadian rutile, kornerupine, kyanite, sillimanite, muscovite, apatite, tourmaline, graphite, pyrrhotite, chalcopyrite, pentlandite (Lasamba Hill, Kenya); rutile, eskolaite, karelianite, vuorelainenite, olkhonskite (Ol'khon Gate Straits, Lake Baikal, Russia).

Distribution: From six km southeast of Lasamba Hill, Kwale district, south of Voi, Kenya. At Komolo, Tanzania. In Sweden, from the Sätra mine, Doverstorp, Bergslagen metallic province. Found 4.5 km south of the Ol'khon Gate Strait, on the western shore of Lake Baikal, Siberia, Russia.

Name: To honor Dr. Werner Schreyer (1930–), Professor of Mineralogy, Ruhr University, Bochum, Germany.

Type Material: University of Heidelberg, Heidelberg, Germany; National Museum of Natural History, Washington, D.C., USA, 136230.

(1) Wamsutter, Wyoming, USA; insoluble SiO_2 0.08%, R_2O_3 0.95%; corresponds to $Na_{1.06}Ca_{2.92}(UO_2)_{0.98}(CO_3)_{2.91}(SO_4)_{1.03}F_{1.02} \cdot 10.10H_2O$. (2) $NaCa_3(UO_2)(CO_3)_3(SO_4)F \cdot 10H_2O$.

Occurrence: An uncommon alteration product of uraninite in the oxidized zone of uranium deposits; may be of post-mine origin.

Association: Gypsum, andersonite, bayleyite, swartzite, albrechtschraufite, liebigite, uraninite, dolomite.

Distribution: May be an ore of uranium. From the Evangelista vein, Jáchymov (Joachimsthal), and the Rozna uranium deposit, Czech Republic. On the Radhausberg, near Bad Gastein, Austria. At the Geevor mine, St. Just, Cornwall, England. In the Gerstenegg-Sommerloch cable tunnel, north of the Grimsel Pass, Bern, Switzerland. In the USA, from Lost Creek, about 60 km north-northwest of Wamsutter, Sweetwater Co., Wyoming; in Arizona, in the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., and the Jack Daniels No. 1 and Foley Bros. No. 5 mines, Cameron area, Coconino Co.; large crystals in the Grants district, McKinley Co., New Mexico. In Utah, from the Shinarump No. 1 and 3 mines, Seven Mile Canyon, on the Crabapple claim, Green River district, near Moab, from the McCoy group, and at the Parco No. 25 mine, Yellow Cat group, Thompsons district, Grand Co., at the Hideout mine, White Canyon district, San Juan Co., and elsewhere; in the Troublesome Formation, Middle Park, Grand Co., and at a number of other places in Colorado. Large crystals from the Soberanía mine, 15 km east of Mendoza, Mendoza Province, and elsewhere in Argentina. A number of additional localities are more poorly characterized.

Name: To honor Julius Schröckinger von Neudenberg (1813–1882), Austrian geologist who originally found the mineral at Jáchymov, Czech Republic.

Type Material: Natural History Museum, Vienna, Austria, A.a.6740.

(1) Mounana mine, Gabon; by microchemical analysis, H_2O by TGA. (2) $FeVO_4 \cdot H_2O$.

Occurrence: At the base of the oxidized zone of a uranium deposit (Mounana mine, Gabon); in a hydrothermal gold deposit (Gold Quarry mine, Nevada, USA).

Association: Fervanite, goethite (Mounana mine, Gabon); kazakhstanite, fervanite, tyuyamunite (Gold Quarry mine, Nevada, USA).

Distribution: From the Mounana uranium mine, Franceville, Gabon. In the USA, at the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada.

Name: To honor Henri-Jean Schubnel (1935–), mineralogist and gemologist, Bureau de Recherches Géologiques et Minières, Paris, France.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1970,149; National Museum of Natural History, Washington, D.C., USA, 137457.

Schuetteite $Hg_3O_2(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Very rare microcrystals, hexagonal plates or prisms; typically as thin earthy films.

Physical Properties: Hardness = ∼3 D(meas.) = 8.18 D(calc.) = 8.36

Optical Properties: Semitransparent. *Color:* Canary-yellow, greenish yellow, yellowish orange.
Optical Class: Uniaxial (–), moderate to high birefringence. *Pleochroism:* Slight; O = greenish yellow; E = yellow-orange. $\omega = > 2.10$ $\epsilon = > 2.10$

Cell Data: *Space Group:* n.d. $a = 7.07(1)$ $c = 10.05(1)$ Z = 3

X-ray Powder Pattern: Synthetic.
2.91 (100), 3.34 (70), 2.60 (55), 1.933 (25), 5.19 (20), 1.556 (18), 2.30 (16)

Chemistry:

	(1)	(2)
SO_3	12.3	10.97
HgO	87.7	89.03
Total	[100.0]	100.00

(1) Oceanic mine, California, USA; recalculated to 100.0% after deduction of opal as SiO_2 12.74%, other impurities 2.10%, and H_2O 3.73% [by difference]; identification depends primarily on the correspondence of an X-ray powder pattern with synthetic material. (2) $Hg_3O_2(SO_4)$.

Occurrence: A recently formed secondary mineral in opalite [chalcedonic] mercury deposits, typically formed on cinnabar exposed to sunlight.

Association: Cinnabar.

Distribution: In the USA, in California, from a calcined dump at the Oceanic mine, San Luis Obispo Co., at the Mt. Diablo mine, Contra Costa Co., in the Sulphur Bank mine, Lake Co., and near the Clear Creek mercury mine, New Idria district, San Benito Co. In Nevada, from the B & B mine, east slope of the White Mountains, Fish Lake Valley district, Esmeralda Co., at the Silver Cloud mine, north of Battle Mountain, Ivanhoe district, Lander Co., from the Red Bird mercury mine, Antelope Springs district, and the Goldbanks mercury mine, Goldbanks district, Pershing Co.; at the Opalite mine, Malheur Co., Oregon.

Name: Honors Curt Nicolaus Schuette (1895–1975), American mining engineer and geologist, who studied many mercury deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 117725.

(1) [Kasompi mine,] Congo; by electron microprobe, CO_2 by chromatography, CO_2+H_2O by TGA; corresponds to $Pb_{1.04}Cu_{0.96}(Nd_{0.32}Gd_{0.14}Sm_{0.13}Y_{0.12}Dy_{0.11}Eu_{0.09}La_{0.04}Pr_{0.04})_{\Sigma=0.99}(CO_3)_{3.01}(OH)_{0.95}\cdot 0.85H_2O$. (2) Do.; by electron microprobe, average of five analyses, CO_2 and H_2O calculated for stoichiometry, original total given as 98.91%; corresponds to $Pb_{1.05}Cu_{0.92}(Nd_{0.24}Gd_{0.18}Y_{0.16}Dy_{0.13}Sm_{0.12}Eu_{0.06}La_{0.04}Pr_{0.03}Er_{0.03}Tb_{0.02}Yb_{0.01})_{\Sigma=1.02}(CO_3)_3(OH)\cdot H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal base metal deposits.

Association: Gysinite-(Nd), malachite, cerussite, wulfenite, kasolite, schoepite, uranophane, curite, françoisite-(Nd), kamotoite-(Y), astrocyanite-(Ce), masuyite, uraninite.

Distribution: From the Kasompi, Menda, and Kamoto East mines, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Hendrik Jan Schuiling (1892–1966), Chief Geologist, Union Minière du Haut-Katanga, Congo.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG11.418.

Schulenbergite $(Cu, Zn)_7(SO_4)_2(OH)_{10} \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ or 3. Crystals are hexagonal or rhombic, very thin tabular, to 4 mm, in spherules, sheaves, and rosettes.

Physical Properties: *Cleavage:* Perfect on {0001}; poor on $\{11\overline{2}0\}$. Hardness = ∼2
D(meas.) = 3.28–3.42 D(calc.) = 3.38–3.45

Optical Properties: Transparent. *Color:* Pale blue-green, emerald-green. *Streak:* Blue-green, pale green. *Luster:* Vitreous, pearly on {0001}.
Optical Class: Uniaxial (–). *Pleochroism:* Faint to strong; O = colorless, emerald-green to green; E = colorless to pale green. $\omega = 1.640–1.707$ $\epsilon = 1.623–1.666$

Cell Data: *Space Group:* $P\overline{3}$ or $P3$. $a = 8.211–8.249$ $c = 7.106–7.183$ Z = 1

X-ray Powder Pattern: [Glücksrad mine,] Germany.
7.186 (100), 2.700 (80), 2.527 (80), 3.581 (40), 3.209 (30), 2.157 (30), 1.559 (30)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	17.4	15.13	CuO	36.7	53.18
CO_2	0.8		ZnO	28.1	11.39
CoO		0.84	H_2O	17.4	[18.68]
NiO		0.78	Total	100.4	[100.00]

(1) [Glücksrad mine,] Germany; CO_2 by gas chromatograph, H_2O by TGA; corresponds to $(Cu_{4.00}Zn_{3.00})_{\Sigma=7.00}[(SO_4)_{1.89}(CO_3)_{0.16})]_{\Sigma=2.05}(OH)_{9.90} \cdot 3.43H_2O$. (2) Cap Garonne mine, France; by electron microprobe, average of nine analyses, H_2O by difference; corresponds to $(Cu_{5.77}Zn_{1.21}Ni_{0.10}Co_{0.09})_{\Sigma=7.17}(SO_4)_{1.63}(OH)_{11.08} \cdot 3.40H_2O$.

Occurrence: A rare secondary mineral formed in the oxidized zone of Cu–Zn-bearing hydrothermal mineral deposits, commonly post-mine; in Cu–Zn slags.

Association: Namuwite, brochantite, posnjakite, ktenasite, serpierite, linarite, malachite, cerussite, hemimorphite, smithsonite, gypsum, chalcopyrite, sphalerite, quartz.

Distribution: In Germany, in the Harz Mountains, from dumps at the Glücksrad mine, near Oberschulenberg, and in slag at the Ochsenhütte, Granetal, and at Juliushütte, Astfeld, near Goslar; from the Marie mine, southeast of Wilnsdorf, near Siegen, and in the Wilder Mann mine, near Müsen, Siegerland; from the Bastenberg mine, near Ramsbeck, North Rhine-Westphalia; in the Richelsdorfer Mountains, Hesse; on dumps of the Friedrichssegen mine, near Bad Ems, at the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate, and elsewhere. From the Cap Garonne mine, near le Pradet, Var, France. In England, from the Smallcleugh mine, Nenthead, Cumbria; large crystals in the Waterbank mine, Ecton Hill, Staffordshire, at the Prince of Wales mine, Calstock, and in the Penberthy Croft mine, St. Hilary, Cornwall. In Wales, from the Dyfngwm mine, Penegoes, Powis; in Dyfed, at the Penrhiw mine, Ystumtuen, from the Ystrad Einion mine, at the Nantycagl (Eaglebrook) mine, Ceulanymaesmawr, and in the Frongoch mine. From the Kamariza mine, and in slag, at Laurium, Greece. At Broken Hill, New South Wales, Australia.

Name: For its occurrence at the Glücksrad mine, near Oberschulenberg, Germany.

Type Material: Institute of Crystallography and Petrography, University of Hannover, Hannover, Germany; National School of Mines, Paris, France.

Schulténite $Pb(AsO_3OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* Crystals are flattened {010}, with large {010} striated ‖ [001], {130}, {140}, {111}, {121}, {001}, {011}, many other forms, rarely to 17.5 cm. *Twinning:* Rare "fishtail" twins according to an unknown law.

Physical Properties: *Cleavage:* On {010}, good. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 5.943–6.07 D(calc.) = 6.079 May fluoresce dull yellow under LW UV.

Optical Properties: Transparent. *Color:* Colorless to white; in transmitted light, colorless. *Streak:* White. *Luster:* Vitreous to nearly adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = -24°$; $Z \wedge c = 66°$. *Dispersion:* Strong. $\alpha = [1.890]$ $\beta = 1.910$ $\gamma = 1.976$ 2V(meas.) = 58°14′

Cell Data: *Space Group: Pa.* $a = 5.946(6)$ $b = 6.783(6)$ $c = 4.873(5)$ $\beta = 95.53(6)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
3.35 (vvs), 3.13 (vs), 1.950 (vsb), 1.778 (sb), 2.19 (ms), 1.683 (ms), 1.546 (ms)

Chemistry:

	(1)	(2)
As_2O_5	32.18	33.11
PbO	63.97	64.30
H_2O	2.88	2.59
Total	99.03	100.00

(1) Tsumeb, Namibia. (2) $Pb(AsO_3OH)$.

Occurrence: A rare secondary mineral in the oxidized zone of Pb–As-rich hydrothermal deposits.

Association: Anglesite, bayldonite, cuprian adamite, keyite, olivenite, duftite, carminite, beudantite, scorodite, stranskiite, pharmacosiderite, mimetite, cerussite, tennantite, galena, arsenopyrite.

Distribution: From Tsumeb, Namibia. On a ridge between Granite Lake and Gifford Lake, 13 km east of North Bend, King Co., Washington, USA. In the Deer Hills vein, Caldbeck Fells, Cumbria, England. In Germany, from the Michael mine, Weiler, near Lahr, and on the Geiges mine dump, near Schramberg, Black Forest; at St. Andreasberg, Harz Mountains; from Ramsbeck, North Rhein-Westphalia. At Grabanz, near Finkenstein, Austria.

Name: Honoring Professor August Benjamin Friherre af Schultén (1856–1912), chemist, University of Helsinki, Helsinki, Finland, who studied synthetic arsenates.

Type Material: The Natural History Museum, London, England, 1926,205; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 106356.

Schumacherite $Bi_3O(VO_4, AsO_4, PO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are tabular ∥ {010}, with $\{\overline{1}10\}$, and $\{10\overline{1}\}$, to 0.1 mm, in crusts.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼3 D(meas.) = n.d. D(calc.) = 6.90

Optical Properties: Translucent. *Color:* Yellow, yellow-brown, red-brown. *Luster:* Adamantine. *Optical Class:* Biaxial (+), probable. *Orientation:* $X' \wedge c \simeq 22°$; OAP $\simeq \{11\overline{1}\}$. $\alpha = > 2.20(2)$ β = n.d. $\gamma = 2.42(2)$ 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.05(3)$ $b = 7.46(3)$ $c = 6.90(3)$ $\alpha = 87.7(3)°$ $\beta = 115.3(3)°$ $\gamma = 111.5(3)°$ Z = 2

X-ray Powder Pattern: Schneeberg, Germany; very similar to preisingerite and petitjeanite. 3.28 (10), 3.19 (8), 3.09 (8), 4.57 (6), 1.976 (5), 6.21 (4), 4.13 (4)

Chemistry:

	(1)
P_2O_5	3.6
As_2O_5	5.8
V_2O_5	10.9
Bi_2O_3	79.0
H_2O	[1.0]
Total	[100.3]

(1) Schneeberg, Germany; by electron microprobe, H_2O calculated; corresponds to $Bi_{3.03}O_{0.97}[(V_{0.54}As_{0.22}P_{0.22})_{\Sigma=0.98}O_4]_2(OH)_{1.00}$.

Polymorphism & Series: Forms series with petitjeanite and preisingerite.

Occurrence: Very rare, in the oxidized zone of Bi-rich hydrothermal deposits.

Association: Pucherite, namibite, quartz (Schneeberg, Germany); bismutite, bismutoferrite, bismutostibiconite, koechlinite, namibite (Lodi #4 mine, California, USA); beyerite, namibite (Mica Lode mine, Colorado, USA); mrázekite, pucherite (Morass Creek, Australia).

Distribution: From the Pucher shaft, Wolfgang Maassen mine, and on the Sauschwart mine dump, Schneeberg, Saxony, Germany. In the USA, at the Lodi #4 mine, Spring Creek district, Plumas Co., California; from the Mica Lode mine, Eight Mile Park, Fremont Co., Colorado; from Manhattan, Nye Co., Nevada. At Morass Creek, north of Benambra, Victoria, Australia.

Name: To honor Professor Friedrich Schumacher (1884–1975), Universities of Freiberg and Bonn, Germany.

Type Material: University of Stuttgart, Stuttgart, Germany; National Museum of Natural History, Washington, D.C., USA, 149596.

(1) Pyhäsalmi mine, Finland; Fe and S by ICP, CO_2 by gas analyzer, H_2O by TGA. (2) Analysis (1) after deduction of CO_2 and adsorbed H_2O^-, recalculated to 100.0%; corresponds to $Fe_{16}O_{16}(OH)_{9.6}(SO_4)_{3.2}\cdot 10H_2O$. (3) $Fe_{16}O_{16}(SO_4)_2(OH)_{12}\cdot 10H_2O$.

Occurrence: A secondary mineral precipitated by waters of pH 3–4.5 and high in iron sulfate content from the surface oxidation of metal sulfides.

Association: Goethite, jarosite, natrojarosite, ferrihydrite, sulfides.

Distribution: From the Pyhäsalmi mine, Oulu, Finland. At over 40 unspecified localities in Europe, North America, and Australia.

Name: For Udo Schwertmann (1927–), Professor of Soil Science, Technical University of Munich, Munich, Germany, who has worked on poorly crystalline products of weathering.

Type Material: Museum of Natural History, University of Helsinki, Helsinki, Finland, B8659.

References: (1) Bigham, J.M., L. Carlson, and E. Murad (1994) Schwertmannite, a new iron oxyhydroxysulphate from Pyhäsalmi, Finland, and other localities. Mineral. Mag., 58, 641–648. (2) (1995) Amer. Mineral., 80, 847 (abs. ref. 1).

(1) Löhley quarry, Eifel region, Rheinland-Pfalz, Germany; average of 5 electron microprobe analyses, Fe^{3+}:Fe^{2+} calculated from X-ray emission spectra; corresponding to $(Ba_{1.68}Sr_{0.18}K_{0.11}Na_{1.05}Ca_{0.43}Mn_{0.47}Mg_{0.88}Fe^{2+}_{0.44}Fe^{3+}_{1.02}Ti_{1.28}Nb_{0.17}Al_{0.24})_{\Sigma=7.95}Si_{3.98}O_{16.98}F_{1.02}$.

Occurrence: A late pneumatolitic mineral in miarolitic cavities in alkaline basalt.

Association: Nepheline, leucite, augite, phlogopite, magnetite, titanite, fresnoite, barytolamprophyllite, fluorapatite, perovskite, pyrochlore.

Distribution: At the Löhley quarry, Eifel volcanic region, near Üdersdorf, Rheinland-Pfalz (Rhineland-Palatinate), Germany.

Name: Honors Willi Schüller (b 1953), prominent mineral collector, specialist in the mineralogy of Eifel, and collector of the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia; 3995/2 and 3995/1.

Sclarite $(Zn, Mg, Mn^{2+})_4Zn_3(CO_3)_2(OH)_{10}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 0.2 mm, platy on {001}, elongated along [010], in roughly spherulitic aggregates.

Physical Properties: *Tenacity:* Moderately brittle. Hardness = 3–4 D(meas.) = 3.51(5) D(calc.) = 3.547

Optical Properties: Transparent to translucent. *Color:* Colorless to grayish white. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 49°$. *Dispersion:* $r \gg v$, strong.
$\alpha = 1.648(1)$ $\beta = 1.664(1)$ $\gamma = 1.702(2)$ 2V(meas.) = 63.4(6)° 2V(calc.) = 67°

Cell Data: *Space Group:* $A2/a$. $a = 16.110(7)$ $b = 5.432(1)$ $c = 15.041(10)$ $\beta = 95.490(4)°$ Z = 4

X-ray Powder Pattern: Franklin, New Jersey, USA.
7.50 (10), 3.63 (5), 2.621 (5), 3.75 (4), 3.53 (4), 2.500 (4), 2.281 (3)

Chemistry:

	(1)
CO_2	[12.67]
FeO	0.1
MnO	4.2
ZnO	62.0
MgO	6.7
H_2O	[12.97]
Total	[98.64]

(1) Franklin, New Jersey, USA; by electron microprobe, total Mn as MnO, CO_2 and H_2O calculated from crystal-structure analysis; corresponds to $(Zn_{2.39}Mg_{1.18}Mn_{0.42})_{\Sigma=3.99}Zn_{3.00}(CO_3)_2(OH)_{10}$.

Occurrence: Very rare on a museum specimen, in a veinlet possibly of hydrothermal origin, from a metamorphosed stratiform zinc orebody.

Association: Gageite, leucophoenicite, chlorophoenicite, rhodochrosite, willemite, zincite, franklinite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: To honor Professor Charles Bertram Sclar (1925–2001), Geology Department, Lehigh University, Bethlehem, Pennsylvania, USA, who long studied the genesis of the Franklin deposit.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 53777; National Museum of Natural History, Washington, D.C., USA, B13671.

Scolecite $CaAl_2Si_3O_{10}\cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* m. Crystals are slender prismatic, may be square in cross section, elongated and striated ‖ [001], to 30 cm. Characteristically in radiating sprays, fibrous masses; nodular, massive. *Twinning:* On {100}, twin axis [001], common, as contact or penetration twins.

Physical Properties: *Cleavage:* {110} and $\{1\bar{1}0\}$, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.25–2.29 D(calc.) = 2.275 Pyroelectric; piezoelectric; may fluoresce yellow to brown under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in thin section. *Luster:* Vitreous, silky when fibrous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 15°–18°$; $Y \wedge a = -14°$ to $-17°$. *Dispersion:* $r < v$, strong. $\alpha = 1.507–1.513$ $\beta = 1.516–1.520$ $\gamma = 1.517–1.521$ 2V(meas.) = 36°–56°

Cell Data: *Space Group:* Cc. $a = 18.508(5)$ $b = 18.981(5)$ $c = 6.527(2)$ $\beta = 90.64(1)°$ Z = 8

X-ray Powder Pattern: Near Surat Thani, Thailand.
5.848 (100), 2.882 (100), 6.590 (90), 4.387 (90), 2.851 (70), 4.722 (60), 2.929 (60)

Chemistry:

	(1)
SiO_2	45.16
Al_2O_3	25.90
CaO	14.86
Na_2O	0.16
K_2O	0.06
H_2O	13.66
Total	99.80

(1) Syhadree Mountains, Bombay, India; corresponds to $(Ca_{1.05}Na_{0.02})_{\Sigma=1.07}$ $Al_{2.00}Si_{2.97}O_{10}\cdot 2.99H_2O$.

Mineral Group: Zeolite group.

Occurrence: Primarily in cavities in basalts; in gneisses and amphibolites, and in laccoliths and dikes derived from syenitic and gabbroic magmas.

Association: Zeolites, prehnite, calcite.

Distribution: Many localities for good crystals are known; exceptional crystals from the Teigarhorn, Berufjord, Iceland. At Ben More, Isle of Mull, and Talisker Bay, Isle of Skye, Scotland. From Pflüglhof, Malta Valley, Carinthia, Austria. In Switzerland, from the Shattig Wichel, Fallital-Giuv area, Graübunden. Exceptional crystals in the Poona, Nasik, and Bombay districts, Maharashtra, India. In the USA, on the south fork of the Toutle River, Cowlitz Co., in the Pioneer quarry, Bremerton, Kitsap Co., and other localities in Washington. At Charcas, San Luis Potosí, Mexico. Large crystals from near Bento Gonçalves, Rio Grande do Sul, Brazil.

Name: From the Greek for *worm*, alluding to its curling action when heated.

Scorodite $Fe^{3+}AsO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals pyramidal {111}, tabular [001], or prismatic [010], with large {111}, {101}, {201}, {001}, many other modifying forms, to 5 cm. Commonly as crystalline crusts; may be porous, sinterlike, earthy, massive.

Physical Properties: *Cleavage:* {201}, imperfect; {001}, {100}, in traces.
Fracture: Subconchoidal. Hardness = 3.5–4 D(meas.) = 3.27 D(calc.) = 3.276

Optical Properties: Semitransparent. *Color:* Pale leek-green, grayish green, liver-brown, pale blue, violet, yellow, pale grayish, colorless; may be blue-green in daylight but bluish purple to grayish blue in incandescent light; in transmitted light, colorless to pale shades of green or brown. *Luster:* Vitreous to subadamantine, subresinous.
Optical Class: Biaxial (+). *Pleochroism:* Typically faint; blue-violet to blue-green. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > X = Y$. $\alpha = 1.741$–1.784 $\beta = 1.744$–1.805 $\gamma = 1.768$–1.820 2V(meas.) = 40°–∼75°

Cell Data: *Space Group: Pcab.* $a = 8.937$–8.953 $b = 10.278$–10.325 $c = 9.996$–10.038
Z = 8

X-ray Powder Pattern: Bhilivara [Bhilwara] district, Rajasthan, India.
4.50 (100), 5.65(80), 3.20 (80), 3.07 (60), 3.01 (60), 2.601 (60), 5.05 (40)

H_2O	15.61	15.61
Total	100.00	100.00

(1) Kiura mine, Japan. (2) $FeAsO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with parascorodite; forms a series with mansfieldite.

Mineral Group: Variscite group.

Occurrence: A secondary mineral formed by oxidation of As-bearing sulfides.

Association: Pharmacosiderite, beudantite, carminite, dussertite, arseniosiderite, adamite, austinite, vivianite, iron oxides.

Distribution: Numerous occurrences, typically in small amounts; some localities for well-crystallized material are: in Germany, from Schwarzenberg, Saxony, and in the Clara mine, near Oberwolfach, Black Forest. At Horní Slavkov (Schlaggenwald), Czech Republic. From Lölling, Carinthia, Austria. Found at a number of places in Gwennap, Calstock, and elsewhere in Cornwall, England. Occurs at Djebel Debar, Qacentina (Constantine), Algeria. Very large crystals from Tsumeb, Namibia. Large crystals from Antonio Pereira, Minas Gerais, Brazil. In Mexico, large crystals from the El Cobre mine, Aranzazú, Concepción del Oro, Zacatecas, and in the Ojuela mine, Mapimí, Durango. In the USA, in Utah, an ore mineral at Gold Hill, Tooele Co., and in the Tintic district, Juab Co.; and from the Majuba Hill mine, Antelope district, Pershing Co., Nevada. At the Kiura mine, Oita Prefecture, Japan, large crystals. From Broken Hill, New South Wales, Australia.

Name: From the Greek for *garlic*, in allusion to its odor when heated.

Type Material: Mining Academy, Freiberg, Germany, 21245.

Fe_2O_3	0.54		MgO	4.23	6.34			

(1) Corrego Frio mine, Brazil; corresponds to $(Fe^{2+}_{0.66}Mg_{0.34}Zn_{0.01})_{\Sigma=1.01}(Al_{1.93}Fe^{3+}_{0.02})_{\Sigma=1.95}(PO_4)_{1.94}(OH)_{2.08}$. (2) $(Fe,Mg)Al_2(PO_4)_2(OH)_2$ with Fe:Mg = 1:1.

Polymorphism & Series: Forms a series with lazulite.

Mineral Group: Lazulite group.

Occurrence: Typically a secondary mineral in complex zoned granite pegmatites; may occur in kyanite-rich quartzite.

Association: Souzalite, triphylite, wyllieite, trolleite, apatite, lacroixite, berlinite, tourmaline, muscovite, feldspar, quartz.

Distribution: From the Corrego Frio pegmatite mine, Divino das Laranjeiras, near Linópolis, Minas Gerais, Brazil. In the USA, at the Victory mine, four km northeast of Custer, Custer Co., and the White Cap mine, three km south of Keystone, Pennington Co., South Dakota; in the Palermo #1 mine, near North Groton, Grafton Co., and the G.E. Smith mine, Newport, New Hampshire; at the Champion mine, Mono Co., California; from McIntyre Creek, about four km west of Glendevey, Larimer Co., Colorado. In the Buranga and Rusororo pegmatites, Gatumba district, Rwanda. At Jebilet, Morocco. From Hålsjöberget, Värmland, and in the Norrö pegmatite, on Rånö Island, Sweden. At Hagendorf, Bavaria, Germany. Other localities are reported, but chemical analyses would be desirable.

Name: To honor Dr. Evaristo Pena Scorza (1899–?), Chief Mineralogist, Mineral Survey of Brazil, Rio de Janeiro, Brazil.

Type Material: The Natural History Museum, London, England, 1965,207; Harvard University, Cambridge, Massachusetts, 100679; National Museum of Natural History, Washington, D.C., USA, C5862.

Scotlandite $PbS^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [001], spear- or chisel-shaped, with {021}, {031}, {100}, {010}, rare {011}, {032}, to 3 mm, in radial and fanlike aggregates.

Physical Properties: *Cleavage:* Perfect on {100}; good on {010}. Hardness = ∼2 D(meas.) = 6.37(2) D(calc.) = 6.396–6.44 May fluoresce yellow under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, grayish white, brown, pale yellow if included with pyromorphite. *Luster:* Adamantine to resinous, pearly on cleavages. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge a = 15°$–$20°$; $Z \wedge a = 4°$. *Dispersion:* $r \ll v$, strong. $\alpha = 1.95$–2.035 $\beta = 2.00$–2.040 $\gamma = 2.085$–2.10 2V(meas.) = ∼35° 2V(calc.) = 37°40′

Cell Data: *Space Group:* $P2_1/m$. $a = 4.505(2)$ $b = 5.333(2)$ $c = 6.405(2)$ $\beta = 106.24(3)°$ Z = 2

X-ray Powder Pattern: Leadhills, Scotland.
3.99 (10), 3.25 (8), 3.38 (7), 2.66 (7), 2.56 (5), 2.24 (5), 2.01 (5)

Chemistry:

	(1)	(2)	(3)
SO_2	19.88	17.89	22.30
PbO	77.85	79.03	77.70
Total	97.73	96.92	100.00

(1) Leadhills, Scotland; by electron microprobe, sulfite confirmed by IR and secondary ion mass spectrometry; corresponds to $Pb_{1.06}S_{0.94}O_{2.94}$. (2) Argentolle mine, France; by electron microprobe, corresponds to $Pb_{1.16}S_{0.91}O_3$. (3) $PbSO_3$.

Occurrence: A very rare secondary mineral, formed in the oxidized zone of hydrothermal lead deposits.

Association: Pyromorphite, anglesite, lanarkite, leadhillite, susannite, barite (Leadhills, Scotland); leadhillite, susannite, macphersonite, cerussite, pyromorphite, galena, quartz (Argentolle mine, France); mattheddleite, lanarkite, leadhillite, caledonite, galena (Roughton Gill, England).

Distribution: Found on a museum specimen labelled as coming from the Susanna mine, Leadhills, Lanarkshire, Scotland. At Roughton Gill, Caldbeck Fells, Cumbria, England. From the Argentolle mine, near Saint-Prix, Saône-et-Loire, France. In the Haus Baden mine, near Badenweiler, Black Forest, Germany. At Tsumeb, Namibia.

Name: For Scotland, within which the first specimen was found.

Type Material: University of Salzburg, Salzburg, Austria; University of Stuttgart, Stuttgart, Germany, NM13; Royal Scottish Museum, Edinburgh, Scotland; The Natural History Museum, London, England, 1982,451; Royal Ontario Museum, Toronto, Canada, M39907.

Scrutinyite α–PbO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 30 μm.

Physical Properties: *Cleavage:* [{100}, perfect; {010}, imperfect] (forms by analogy to columbite). Hardness = n.d. D(meas.) = n.d. D(calc.) = 9.867

Optical Properties: Translucent in thin flakes. *Color:* Dark reddish brown, clove-brown, red on thin edges; in reflected light, gray-white with reddish brown internal reflections. *Streak:* Dark brown. *Luster:* Submetallic.
Optical Class: Biaxial. *Anisotropism:* Weak; pale blue. *Bireflectance:* Very weak; gray-white to bluish gray.
R_1–R_2: (546) 17.9–18.8, (589) 17.0–17.9

Cell Data: *Space Group: Pbcn.* $a = 4.971(2)$ $b = 5.956(2)$ $c = 5.438(2)$ $Z = 4$

X-ray Powder Pattern: Sunshine #1 mine, New Mexico, USA.
3.117 (100), 1.840 (80), 2.722 (50), 1.527 (50), 3.816 (40), 1.635 (40), 3.497 (30)

Chemistry: (1) Sunshine #1 mine, New Mexico, USA; by electron microprobe, average of ten analyses gave PbO 98.2%; the remainder is probably $(OH)^{1-}$ to balance Pb^{2+} replacing Pb^{4+} in the structure.

Polymorphism & Series: Dimorphous with plattnerite.

Occurrence: In the oxidized zone of hydrothermal lead-bearing ore deposits.

Association: Murdochite, plattnerite, fluorite, quartz (Sunshine #1 mine, New Mexico, USA); plattnerite, rosasite, "limonite" (Mapimí, Mexico).

Distribution: In the Sunshine #1 and Mex-Tex mines, near Bingham, Hansonburg district, Socorro Co., New Mexico, and at the Grand Deposit mine, Muncy Creek district, White Pine Co., Nevada, USA. From the Ojuela mine, Mapimí, Durango, Mexico.

Name: From *scrutiny*, in allusion to the close examination necessary to recognize and characterize the species.

Type Material: National Museum of Natural History, Washington, D.C., USA, 165479.

References: (1) Taggart, J.E., Jr., E.E. Foord, A. Rosenzweig, and T. Hanson (1988) Scrutinyite, natural occurrences of αPbO_2 from Bingham, New Mexico, U.S.A., and Mapimi, Mexico. Can. Seamanite $Mn_3^{2+}B(PO_4)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Acicular, elongated along [001], showing {110} and {111}, to 1 cm.

Physical Properties: *Cleavage:* On {001}, distinct. *Tenacity:* Brittle. Hardness = 4
D(meas.) = 3.08–3.128 D(calc.) = 3.132

Optical Properties: Transparent. *Color:* Pale yellow to wine-yellow, pale pink; colorless in transmitted light.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$. $\alpha = 1.640(3)$ $\beta = 1.663(3)$ $\gamma = 1.665(3)$ 2V(meas.) = 40°

Cell Data: *Space Group:* *Pbnm*. $a = 7.811(5)$ $b = 15.114(10)$ $c = 6.691(5)$ Z = 4

X-ray Powder Pattern: Chicagoan mine, Michigan, USA.
6.917 (10), 2.843 (8), 3.777 (7), 2.502 (7), 7.551 (6), 4.204 (6), 3.467 (6)

Chemistry:

	(1)	(2)
P_2O_5	15.94	19.05
B_2O_3	9.94	9.34
FeO	0.11	
MnO	56.42	57.11
(Mg, Ca)O	1.33	
H_2O	14.57	14.50
Total	98.31	100.00

(1) Chicagoan mine, Michigan, USA; average of four analyses. (2) $Mn_3B(PO_4)(OH)_6$.

Occurrence: In fractures cutting siliceous rock.

Association: Sussexite, calcite, manganese oxide.

Distribution: In the Chicagoan mine, near Iron River, Iron Co., Michigan, USA.

Name: To honor Professor Arthur Edmund Seaman (1858–1937), American mineralogist, Michigan College of Mining and Technology, Houghton, Michigan, USA, who first noted the mineral.

Type Material: Michigan Technical University, Houghton, Michigan; National Museum of Natural History, Washington, D.C., USA, 96282.

Searlesite $NaBSi_2O_5(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Flat crystals, to 17 cm, occur along bedding planes. Commonly as spherulitic aggregates of radiating acicular to prismatic crystals; as massive granular aggregates.

Physical Properties: *Cleavage:* Perfect on {100}; imperfect on $\{\bar{1}02\}$, {010}. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.44–2.46 D(calc.) = 2.46 Piezoelectric; may fluoresce green under SW UV.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous, slightly pearly on cleavage surfaces.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 34°$. $\alpha = 1.515$ $\beta = 1.533$ $\gamma = 1.535$ 2V(meas.) = 55°

Cell Data: *Space Group:* $P2_1$. $a = 7.9814(12)$ $b = 7.0657(8)$ $c = 4.9054(4)$ $\beta = 93.95(1)°$ Z = 2

X-ray Powder Pattern: Green River Formation, Wyoming, USA.
8.01 (100), 4.06 (50), 3.48 (40), 3.24 (40), 4.31 (30), 3.54 (30), 3.21 (30)

Chemistry:

	(1)	(2)
SiO_2	58.88	58.91
B_2O_3	16.95	17.07
Al_2O_3	0.04	
Fe_2O_3	0.04	
MgO	0.03	
Na_2O	15.31	15.19
H_2O^+	8.90	8.83
Total	100.15	100.00

(1) Green River Formation, Wyoming, USA. (2) $NaBSi_2O_5(OH)_2$.

Occurrence: Commonly interbedded with oil shales or marls (Green River Formation, USA); in boron-bearing evaporite deposits (California, USA); rarely in vugs in phonolite (Point of Rocks, New Mexico, USA).

Association: Shortite, trona, pyrite (Green River Formation, USA); "opal" (Cave Springs Wash, Nevada, USA).

Distribution: In the USA, at Searles Lake, San Bernardino Co., in the Kramer borate deposit, Kern Co., and at Lake Tecopa, Inyo Co., California; widespread in the Green River Formation of Utah and Wyoming; from Cave Springs Wash, Silver Peak Range, Esmeralda Co., Nevada; and at Point of Rocks, Colfax Co., New Mexico. In Canada, at Mont Saint-Hilaire, Quebec. From Kremna, near Tito Uzice; Lopare; and near Bela Stena, Yugoslavia.

Name: Honors John W. Searles, who put down the deep well from which type material was extracted.

Type Material: Harvard University, Cambridge, Massachusetts, 81274; National Museum of Natural History, Washington, D.C., USA, R6457, 93270, 94734, 96080, 124352.

Sederholmite β–NiSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As grains in clausthalite.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 7.06

Optical Properties: Opaque. *Color:* In polished section, yellow to orange-yellow. *Optical Class:* Uniaxial. *Pleochroism:* Distinct, in shades of yellow. *Anisotropism:* Strong to distinct, in pinkish to greenish colors.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. $a = 3.624$ $c = 5.288$ $Z = 2$

X-ray Powder Pattern: Kuusamo, Finland.
2.70 (100), 2.015 (80), 1.806 (60), 1.535 (40), 1.50 (40), 1.348 (30), 1.155 (30)

Chemistry:

	(1)	(2)
Ni	36.8	42.65
Co	1.9	
Se	61.3	57.35
Total	100.0	100.00

(1) Kuusamo, Finland; by X-ray fluorescence. (2) NiSe.

Mineral Group: Nickeline group.

Occurrence: In calcite veins, in sills of albite diabase in schist, associated with low-grade uranium mineralization.

Association: Wilkmanite, penroseite, clausthalite, calcite.

Distribution: From Kuusamo, northeastern Finland [TL].

Name: In honor of Jakob Johannes Sederholm (1863–1934), former Director of the Geological Survey of Finland.

Type Material: n.d.

References: (1) Vuorelainen, Y., A. Huhma, and A. Häkli (1964) Sederholmite, wilkmanite, kullerudite, mäkinenite, and trüstedtite, five new nickel selenide minerals. Compt. Rendus Soc. Géol. Finlande, 36, 113–125. (2) (1965) Amer. Mineral., 50, 519–520 (abs. ref. 1).

Sedovite $U^{4+}(MoO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Acicular crystals, to 0.5 mm, radiating, fibrous, powdery, in thin crusts and imbedded in gypsum.

Physical Properties: *Cleavage:* One, ‖ elongation. Hardness = n.d. D(meas.) = 4.2 D(calc.) = n.d. Radioactive.

Optical Properties: Translucent, nearly opaque. *Color:* Brown to reddish brown; gray with brownish tint in reflected light, with bright red internal reflections.
Optical Class: Biaxial. *Pleochroism:* Slight; $X = Y$ = pale reddish brown; Z = reddish brown. *Orientation:* $Y \wedge$ elongation = 38°; positive elongation. $\alpha = > 1.789$ $\beta = > 1.789$ $\gamma = > 1.789$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 3.36(6)$ $b = 11.08(3)$ $c = 6.42(5)$ Z = n.d.

X-ray Powder Pattern: Kyzylsai deposit, Kazakhstan.
3.193 (10), 11.04 (9), 3.370 (9), 3.064 (9), 5.530 (8), 3.702 (8), 2.775 (6)

Chemistry:

	(1)	(2)
SO_3	41.51	
MoO_3	5.50	51.60
UO_3	0.00	
SiO_2	0.60	
UO_2	4.16	48.40
Fe_2O_3	0.17	
CaO	27.89	
H_2O	19.72	
Total	99.55	100.00

(1) Kyzylsai deposit, Kazakhstan; deducting SO_3, CaO, H_2O as gypsum and 20% of MoO_3 as due to molybdenite, the remainder corresponds to $U_{1.00}(MoO_4)_{2.00}$. (2) $U(MoO_4)_2$.

Occurrence: A rare secondary mineral formed in the oxidized zone of a U–Mo deposit.

Association: Uraninite, gypsum, iriginite, calcurmolite, mourite, autunite, phosphuranylite, wulfenite, powellite, molybdenite, barite.

Distribution: From the Kyzylsai Mo–U deposit, Chu-Ili Mountains, southwestern Balkhash region, Kazakhstan.

Name: To honor Georgii Yakovlevich Sedov (1877–1914), Russian Arctic explorer.

Type Material: Mining Institute, St. Petersburg, 1000/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67300, 72032.

References: (1) Skvortsova, K.V. and G.A. Sidorenko (1965) Sedovite – a new supergene mineral of uranium and molybdenum. Zap. Vses. Mineral. Obshch., 94, 548–554 (in Russian). (2) (1966) Amer. Mineral., 51, 530 (abs. ref. 1).

Seeligerite $Pb_3O(IO_3)Cl_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222. Crystals are thin square platelets, to 1 mm.

Physical Properties: *Cleavage:* Good on {001}, {110}; poor on {100}, {010}. Hardness = n.d. D(meas.) = 6.83 (synthetic). D(calc.) = 7.052

Optical Properties: Semitransparent. *Color:* Bright yellow. *Optical Class:* Biaxial (–). *Dispersion:* $r > v$. $\alpha = 2.12$ $\beta = \sim 2.32$ $\gamma = \sim 2.32$ 2V(meas.) = 4°

Cell Data: *Space Group:* $C222_1$. a = 7.964(3) $b = 7.964(3)$ $c = 27.288(7)$ Z = 8

X-ray Powder Pattern: Synthetic. 3.219 (10), 3.649 (9), 2.785 (8), 1.991 (8), 1.693 (8), 1.619 (8), 2.816 (7)

Chemistry: (1) Santa Ana mine, Chile; no analysis could be performed due to admixtures; identification depends on coincidence of the X-ray powder pattern with that of synthetic material.

Occurrence: A rare secondary mineral formed in the oxidized zone of hydrothermal polymetallic mineral deposits.

Association: Boleite, paralaurionite, schwartzembergite (Santa Ana mine, Chile).

Distribution: From the Santa Ana, Casucha, and San Francisco (Beatriz) mines, near Caracoles, Sierra Gorda district, Antofagasta, Chile.

Name: To honor Erich Seeliger, Professor of Mineralogy, Technical University, Berlin, Germany.

Type Material: Type material is missing from the Technical University, Berlin, Germany.

Seelite $\mathbf{Mg(UO_2)_2(As^{3+}O_3)_{2-x}(As^{5+}O_4)_x \cdot 7H_2O}$ **(x**= 0.6)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are tabular, flattened on {100} or {001}, or elongated [010], showing {100}, {001}, {010}, {011}, {$01\overline{1}$}, to 1 mm; typically in spherules, rosettes, and divergent needles.

Physical Properties: *Fracture:* Irregular. Hardness = ∼3 D(meas.) = 3.70 D(calc.) = 3.60–3.71 Radioactive.

Optical Properties: Semitransparent. *Color:* Canary-yellow, apple-green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; $X = Y$ = yellow; Z = colorless. *Orientation:* $Z \wedge c = 5(1)°$. *Dispersion:* $r \gg v$, inclined. α = 1.602–1.610 β = 1.730–1.737 γ = 1.740–1.753 2V(meas.) = 30°–41° 2V(calc.) = 34°–37.5°

Cell Data: *Space Group:* $C2/m$. a = 18.194–18.207 b = 7.062–7.071 c = 6.661–6.670 β = 99.65°−99.70° Z = 2

X-ray Powder Pattern: Rabéjac deposit, France.
9.02 (100), 4.48 (80), 3.01 (60), 2.849 (60), 3.28 (50), 4.90 (40), 4.00 (40)

Chemistry:

	(1)	(2)
UO_3	62.43	62.75
As_2O_5	6.67	25.52
As_2O_3	13.41	
MgO	4.09	4.39
H_2O	13.40	[7.34]
Total	[100.00]	[100.00]

(1) Rabéjac deposit, France; by electron microprobe, original total 104.03%, As^{3+}:As^{5+} from crystal-structure analysis, H_2O by CHN analyzer; corresponds to $Mg_{0.97}(UO_2)_{2.08}(As^{3+}O_3)_{1.30}(As^{5+}O_4)_{0.56} \cdot 7.08H_2O$. (2) Talmessi mine, Iran; by electron microprobe, H_2O by difference, corresponds to $Mg_{1.00}(UO_2)_{2.01}(AsO_4)_{2.03} \cdot 4H_2O$.

Occurrence: A rare mineral in the oxidation zone of uranium-bearing hydrothermal deposits.

Association: Annabergite, talmessite, zaratite, uranospinite (Talmessi mine, Iran); zeunerite (Rabéjac deposit, France).

Distribution: In the Talmessi mine, 35 km west of Anarak, Iran. From the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France.

Name: To honor Paul Seel (1904–1982) and Hilde Seel (1902–1987), American collectors of microscopic minerals, Philadelphia, Pennsylvania, USA.

Type Material: Royal Institute of Natural Sciences, Brussels, Belgium, RC4191; University of Pierre and Marie Curie, Paris, France.

References: (1) Bariand, P., B. Bachet, C. Brassy, O. Medenbach, M. Deliens, and P. Piret (1993) Seelite, a new uranium mineral from the Talmessi mine, Iran, and Rabejac, France. Mineral. Total	92.1	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, total Fe as Fe_2O_3, H_2O by loss on ignition; corresponds to $Ca_{1.04}Mg_{1.00}(Fe_{0.89}Al_{0.05})_{\Sigma=0.94}(PO_4)_{2.00}(OH)_{0.89}\cdot 3.84H_2O$.
(2) $CaMgFe(PO_4)_2(OH)\cdot 4H_2O$.

Mineral Group: Overite group.

Occurrence: A rare alteration product of triphylite in zoned complex granite pegmatites.

Association: Ferrisicklerite-rockbridgeite, collinsite, hydroxylapatite, robertsite (Tip Top mine, South Dakota, USA).

Distribution: From the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA. On Milgun Station, Western Australia. In the Mangualde pegmatite, near Mesquitela, and at Belmonte, south of Guarda, Portugal. From Hagendorf, Bavaria, Germany.

Name: Honoring Curt George Segeler (1901–1989), American engineer and amateur mineralogist, Brooklyn, New York, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 127154.

References: (1) Moore, P.B. (1974) I. Jahnsite, segelerite, and robertsite, three new transition metal phosphate species. II. Redefinition of overite, an isotype of segelerite. III. Total	99.96	100.00

(1) Broken Hill, Australia; by electron microprobe, average of ten analyses, total Fe as Fe_2O_3, H_2O by CHN analyzer; corresponds to $(Pb_{1.05}Ba_{0.03})_{\Sigma=1.08}(Fe_{2.76}Zn_{0.22}Al_{0.17}Cu_{0.01})_{\Sigma=3.16}[(AsO_4)_{1.85}(PO_4)_{0.05}(SO_4)_{0.04}]_{\Sigma=1.94}(OH, H_2O)_{6.24}$. (2) $HPbFe_3(AsO_4)_2(OH)_6$.

Occurrence: Of rare occurrence in the oxidized zone of a Pb–Zn orebody (Broken Hill, Australia); in a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Beudantite–corkite, adamite–olivenite, duftite, bayldonite, carminite, mimetite, hidalgoite, pharmacosiderite, mawbyite, agardite-(Y), spessartine, quartz, coronadite, goethite (Broken Hill, Australia); olivenite, duftite (Tsumeb, Namibia).

Distribution: In Australia, from Broken Hill, New South Wales, and at Coppin Pool, about 41 km east-southeast of Mt. Tom Price, Western Australia. Large crystals from Tsumeb, Namibia. In the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA. From the Penberthy Croft mine, St. Hilary, Cornwall, England.

Name: Honoring Dr. E. Ralph Segnit (1923–1999), mineralogist and petrologist, University of Adelaide, Adelaide, Australia, for his contributions to Australian mineralogy.

Type Material: Museum Victoria, Melbourne, Australia, M30044.

References: (1) Birch, W.D., A. Pring, and B.M. Gatehouse (1992) Segnitite, $PbFe_3H(AsO_4)_2(OH)_6$, a new mineral in the lusungite group from Broken Hill, New South Wales, Australia. Amer. Mineral., 77, 656–659.

Seidozerite $(Na,Ca)_2(Zr,Ti,Mn)_2Si_2O_7(O,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. As radiating crystals, elongated along [010], to 5 cm, showing {001}, {100}, {010}, {011}, {111}, and {203}.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle. Hardness = 4–5
D(meas.) = 3.472 D(calc.) = 3.87

Optical Properties: Opaque, translucent in thin fragments. *Color:* Brownish red to reddish yellow; red where translucent. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Intense; X = dark red; Y = red; Z = light yellow. *Orientation:* $X = b$; $Z = a$; $Y \wedge c = 13°$. *Dispersion:* $r > v$, strong. *Absorption:* $X > Y > Z$.
$\alpha = 1.725$ $\beta = 1.758$ $\gamma = 1.830$ 2V(meas.) = 68°

Cell Data: *Space Group:* $P2/c$ or Pc. $a = 5.53(3)$ $b = 7.10(4)$ $c = 18.30(10)$
$\beta = 102°43'$ Z = 4

X-ray Powder Pattern: Lovozero massif, Russia.
2.97 (10), 2.87 (7), 1.830 (7), 2.58 (4), 1.633 (4), 2.43 (3), 2.25 (3)

Chemistry:

	(1)		(1)
SiO_2	31.40	MnO	4.22
TiO_2	13.16	MgO	1.79
ZrO_2	23.14	CaO	2.80
Al_2O_3	1.38	Na_2O	14.55
Fe_2O_3	2.85	F	3.56
Nb_2O_5	0.60	H_2O	0.60
FeO	1.06	$-O = F_2$	1.49
		Total	99.62

(1) Lovozero massif, Russia; corresponds to $(Na_{1.79}Ca_{0.19})_{\Sigma=1.98}(Zr_{0.72}Ti_{0.63}Mn_{0.23}Mg_{0.17}Fe^{3+}_{0.13}Al_{0.10}Fe^{2+}_{0.06}Nb_{0.02})_{\Sigma=2.06}Si_{2.00}O_7(O_{1.28}F_{0.72})_{\Sigma=2.00}$.

Occurrence: In thin veins in nepheline syenite pegmatites in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Microcline, aegirine, nepheline, apatite, pyrochlore, magnetite, ilmenite, titanian låvenite, eudialyte (Lovozero massif, Russia).

Distribution: In Russia, in the Lovozero massif, near the Muruai and Uel'kuai Rivers, Seidozero region, Kola Peninsula, and in the Burpala massif, 120 km north of Lake Baikal, eastern Siberia. From Val Giuv, Graübunden, Switzerland.

Name: For the Lake Seidozero region, Kola Peninsula, Russia, near which the mineral occurs.

Type Material: Vernadsky Geological Museum, 45148; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 59965, vis4318, vis4319.

Seifertite SiO_2

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m* or *mm*2. As lamellae to 0.2 mm.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 4.294

Optical Properties: Transparent. *Color*: n.d. *Streak*: n.d. *Luster*: n.d.
Optical Class: n.d.

Cell Data: *Space Group*: *Pbcn* or *Pb*2*n*. a = 4.097(1) b = 5.0462(9) c = 4.4946(8) Z = 4

X-ray Powder Pattern: Shergotty meteorite. (Quickly amorphizes under electron, laser or ion beams) 2.596 (100), 3.181 (72), 1.938 (64), 1.4199 (44), 1.514 (31), 1.970 (25), 1.288 (19)

Chemistry: Electron-microprobe analyses with a defocused beam showed almost pure SiO_2 with minor concentrations in Na_2O (0.2 to 0.50 wt.%) and Al_2O_3 (0.8 to 1.60 wt.%).

Occurrence: Formed by shock-induced solid-state transformation (> 35 GPa) of either tridymite or cristobalite in basaltic achondrite meteorites, presumably of Martian origin.

Association: Stishovite, silica glass, unnamed monoclinic silica polymorph.

Distribution: In the Martian meteorite Shergotty that fell on August 25, 1865 in Bihar State, India and the Zagami meteorite that fell in Katsina Province**,** Nigeria on October 3, 1962.

Name: Honors Friedrich A. Seifert (b. 1941), founding Director of the Bayerisches Geoinstitut, Universität Bayreuth, Germany, for his important contributions to high-pressure geoscience.

Type Material: Museum of the Geological Survey in Calcutta, India.

X-ray Powder Pattern: Seinäjoki deposit, Finland.
2.81 (100), 2.59 (90), 2.03 (80), 1.790 (60), 1.212 (5), 1.174 (30), 1.626 (20)

Chemistry:

	(1)
Fe	15.4
Ni	4.0
Co	0.6
Sb	73.5
As	6.9
Te	1.2
Total	101.6

(1) Seinäjoki deposit, Finland; by electron microprobe, average of six analyses; corresponding to $(Fe_{0.78}Ni_{0.19}Co_{0.03})_{\Sigma=1.00}(Sb_{1.71}As_{0.26}Te_{0.03})_{\Sigma=2.00}$.

Mineral Group: Löllingite group.

Occurrence: In an antimony deposit, replacing antimony (Seinäjoki deposit, Finland).

Association: Antimony, antimonian westerveldite, breithauptite, altaite (Seinäjoki deposit, Finland).

Distribution: From the Seinäjoki antimony deposit, Vaasa, Finland [TL]. In the Ilímaussaq intrusion, southern Greenland. At Zolotaya Gora, Ural Mountains, Russia.

Name: For the occurrence at Seinäjoki, Finland.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Sekaninaite $(Fe^{2+},Mg)_2Al_4Si_5O_{18}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As poorly developed crystals, to 70 cm. *Twinning:* Commonly twinned on {110} and {310}, simulating hexagonal symmetry.

Physical Properties: *Cleavage:* {100}, imperfect; parting on {001}. Hardness = 7–7.5 D(meas.) = 2.76–2.77 D(calc.) = 2.78

Optical Properties: Transparent to translucent. *Color:* Blue to blue-violet.
Luster: Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = blue; Z = pale blue. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, moderate. *Absorption:* $Y > Z > X$. $\alpha = 1.561$ $\beta = 1.572$ $\gamma = 1.576$ 2V(meas.) = 66°

Cell Data: *Space Group: Cccm.* $a = 17.230(5)$ $b = 9.835(3)$ $c = 9.314(3)$ Z = 4

X-ray Powder Pattern: Dolní Bory, Czech Republic.
8.583 (100), 3.386 (100), 3.376 (100), 4.081 (83), 3.076 (74), 3.143 (64), 3.043 (57)

Chemistry:

	(1)
SiO_2	45.10
TiO_2	0.04
Al_2O_3	30.63
Fe_2O_3	0.91
FeO	17.85
MnO	0.92
MgO	1.69
CaO	0.39
Na_2O	0.68
K_2O	0.03
H_2O^+	1.84
H_2O^-	0.12
Total	100.20

(1) Dolní Bory, Czech Republic; corresponding to $(Fe^{2+}_{1.63}Mg_{0.28}Na_{0.14}Mn_{0.09}Ca_{0.05})_{\Sigma=2.19}(Al_{3.94}Fe^{3+}_{0.08})_{\Sigma=4.02}Si_{4.93}O_{18}\cdot 0.67H_2O$.

Polymorphism & Series: Forms a series with cordierite.

Occurrence: In the albite zone of pegmatites in granulites and gneisses (Dolní Bory, Czech Republic); in bauxitic lithomarge intensely altered by a diabase plug (Brockley, Ireland).

Association: Albite, quartz (Dolní Bory, Czech Republic).

Distribution: From Dolní Bory, near Velké Meziříčí, Czech Republic. At Brockley, Rathlin Island, Co. Antrim, Ireland. From Gåsborn, Bergslagen, Sweden. At Filone Rosina, Elba, Italy. In Japan, from Kitasugama, Fukushima Prefecture; Sasago and Doshi, Yamanashi Prefecture; Ide, Kyoto Prefecture; Ishii, Yamaguchi Prefecture; and in the Hanoka mine, Kagoshima Prefecture.

Name: For Professor Josef Sekanina (1901–), Czech mineralogist who first discovered the mineral.

Type Material: Moravian Museum, Brno, Czech Republic, A6108.

References: (1) Stanek, J. and J. Miskovsky (1975) Sekaninaite, a new mineral of the cordierite series, from Dolni Bory, Czechoslovakia. Scr. Fac. Sci. Nat. Ujep Brun., Geol. 1(5), 21–30. Selenium Se

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Forms acicular crystals, to 2 cm, commonly hollow and tubular; as sheetlike clusters and felted masses; also as glassy droplets.

Physical Properties: *Cleavage:* Good on $\{01\bar{1}2\}$. *Tenacity:* Flexible. Hardness = 2 VHN = n.d. D(meas.) = 4.80 D(calc.) = 4.809

Optical Properties: Opaque, transparent in very thin fragments. *Color:* Gray to purple-gray, red in transmitted light; in polished section, white in air, darker white to grayish brown in oil. *Streak:* Red. *Luster:* Metallic.
Optical Class: Uniaxial (+). *Pleochroism:* Distinct, cream-white toward brown. $\omega = 3.0$ $\epsilon = 4.04$ *Anisotropism:* Very strong.
R_1–R_2: (400) 29.9–50.9, (420) 28.3–48.6, (440) 27.0–46.5, (460) 26.1–44.6, (480) 25.5–43.1, (500) 25.5–42.3, (520) 25.9–41.6, (540) 26.8–41.4, (560) 27.9–41.3, (580) 28.8–41.0, (600) 29.8–40.4, (620) 30.1–39.7, (640) 29.9–38.7, (660) 28.8–37.6, (680) 27.9–37.0, (700) 27.5–36.8

Cell Data: *Space Group:* $P3_121$ or $P3_221$. $a = 4.3662$ $c = 4.9536$ $Z = 3$

X-ray Powder Pattern: Synthetic.
3.00 (100), 3.78 (55), 2.072 (35), 1.998(20), 1.766 (20), 2.184 (16), 1.650 (10)

Chemistry: Very pure selenium, with a trace of S.

Occurrence: Formed at relatively low temperatures by sublimation of fumarolic vapors, and from oxidation of selenium-bearing organic compounds in sandstone U–V deposits; from burning coal and pyritic ores.

Association: Pyrite, ferroselite, zippeite, metatyuyamunite, metarossite, montroseite, corvusite.

Distribution: In the USA, from the United Verde mine, Jerome, Yavapai Co., Arizona; at a number of localities in U–V deposits of the Colorado Plateau, as in the Peanut mine, Bull Canyon, Uravan district, Montrose Co., Colorado, and the Parco No. 23 mine, Thompsons district, Grand Co., Utah. From the Road Hog No. 1A mine, Black Hills, Fall River Co., South Dakota; in the Mopung Hills, Churchill Co., and the Gold Quarry mine, near Carlin, Eureka Co., Nevada; in uranium mines around Grants, McKinley Co., New Mexico; from Darwin, Inyo Co., California. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. From the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, Potosí, Bolivia. On Vesuvius, Campania, Italy. In the Czech Republic, at Kladno. In Russia, from the Kul'Yurt Tau pyrite deposit, and in the Zhivetski horizon, Tuva. From the Yutangba district, near Enshi, Hubei Province, China.

Name: From the Greek, *selene*, *the moon*, in allusion to its similarity to tellurium, named for *the earth*, Latin *tellus*.

Mineral Group: Member of the pearceite-polybasite group.

Occurrence: In silicious veins through rhyolite porphyry altered at shallow depth by heated brines.

Association: Naumannite, covellite, pyrite, calcite.

Distribution: In a museum sample collected at the De Lamar Mine, Owyhee County, Idaho, USA.

Name: The selenium dominant analogue of *polybasite*.

Type Material: Mineral Collection, Natural History Museum, University of Florence, Italy (2453/I).

(1) Rudnaya Sopka deposit, Russia; by electron microprobe, corresponding to $Ag_{5.00}Sb_{1.00}(Se_{3.56}S_{0.44})_{\Sigma=4.00}$.

Occurrence: In quartz and orthoclase-quartz veins with other silver minerals in a volcanogenic Au–Ag deposit.

Association: Miaragyrite, clausthalite, Au–Ag alloy, pyrargyrite, acanthite, clausthalite, naumannite, argyrodite, tetrahedrite–tennantite, pyrite, sphalerite, chalcopyrite, orthoclase, quartz.

Distribution: From the Rudnaya Sopka Au–Ag deposit, central Chukotka Peninsula, Russia [TL].

Name: For selenium in the composition, and similarity to stephanite.

Type Material: Central Institute for Geological Exploration for Base and Precious Metals, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82774.

References: (1) Botova, M.M., S.M. Sandomirskaya, and N.G. Tschuvikina (1985) Selenostephanite $Ag_5Sb(Se,S)_4$ – a new mineral. Zap. Vses. Mineral. Obshch., 114, 627–630 (in Russian). Zn	0.27			S	21.73	20.6	21.77
				Total	99.12	99.4	100.00

(1) Binntal, Switzerland; corresponds to $Pb_{0.99}Cu_{0.91}(As_{1.00}Sb_{0.02})_{\Sigma=1.02}S_{3.00}$. (2) Do.; by electron microprobe, corresponds to $Pb_{1.09}Cu_{1.12}(As_{0.84}Sb_{0.06})_{\Sigma=0.90}S_{3.00}$. (3) $PbCuAsS_3$.

Polymorphism & Series: Forms a series with bournonite.

Occurrence: In cavities in dolostone (Binntal, Switzerland).

Association: Tennantite, sphalerite, pyrite, dufrénoysite, rathite, baumhauerite (Binntal, Switzerland); tennantite, jordanite, dufrénoysite (Bleikvassli deposit, Norway).

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL]. At Mooseck, near Golling, Salzburg, Austria. From Sulitjelma and in the Bleikvassli Zn–Pb–Cu deposit, northern Norway. At the Aghios Philippos Pb–Zn deposit, near Kirki, Greece. In the USA, from Bingham, Tooele Co., Utah; at Butte, Silver Bow Co., Montana; and in the Balmat-Edwards mine, Balmat, St. Lawrence Co., New York. From the Whisky Creek group of mines, near Woodcock, British Columbia, and in the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. At the Noche Buena mine, Mazapil, Zacatecas, Mexico. From Cerro de Pasco, Peru. In the Desierto mine, near Iquique, Tarapacá, Chile. From Tsumeb, Namibia. At the Pb–Zn deposit, Yanbian, Sichuan Province, China. From Broken Hill, New South Wales, Australia. A few additional localities are known.

Name: Honors Gustav Seligmann (1849–1920), a mineral collector of Koblenz, Germany.

Type Material: Museum of Natural History, Fribourg, Switzerland, B618.

Sellaite MgF_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Short prismatic crystals, to 5 cm, with prominent {010}, {011}, {110}, may be flattened, pyramidal; fibrous, radial, spherulitic, in aggregates. *Twinning:* On {011}.

Physical Properties: *Cleavage:* Perfect on {010} and {110}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 3.15 D(calc.) = 3.08 Very slightly soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.378$ $\epsilon = 1.390$

Cell Data: *Space Group:* $P4_2/mnm$ (synthetic). $a = 4.6213(1)$ $c = 3.0519(1)$ Z = 2

X-ray Powder Pattern: Synthetic.
3.275 (100), 2.231 (95), 1.711 (75), 2.067 (35), 1.375 (35), 1.635 (30), 2.545 (20)

Chemistry:

	(1)	(2)
Mg	38.37	39.01
F	[61.63]	60.99
Total	[100.00]	100.00

(1) Gebroulaz glacier, France; F by difference. (2) MgF_2.

Occurrence: In a bituminous dolomite-anhydrite rock (Gebroulaz glacier, France); in evaporites (Bleicherode, Germany); in volcanic ejecta and fumarolic deposits (Vesuvius, Italy); in marble (Carrara, Italy); in a metamorphic magnesite deposit (Brumado mine, Brazil); in an alkalic granite (Lake Gjerdingen, Norway).

Association: Fluorite, sulfur, celestine, anhydrite, gypsum, magnesite, quartz.

Distribution: In France, in the moraine of the Gebroulaz glacier, near Moûtiers, Savoy, and in the Font Sante mine, Estrel, Var. In Germany, from Bleicherode, Harz, in the Clara mine, near Oberwolfach, Black Forest, and at Emmelberg, Eifel district. In Italy, from Carrara, Tuscany; on Vesuvius, Campania, and on Mt. Etna, Sicily. From near Lake Gjerdingen, Nordmarka, Norway. Large crystals in the Brumado mine, Bahia, Brazil. At the Huanzala mine, Huanuco, Peru. In the Rico-Argentine mine group, Rico district, Dolores Co., Colorado, USA. A few other localities have been reported but modern verification is desirable.

Name: Honors Quintino Sella (1827–1884), Italian mining engineer and mineralogist.

MgO	0.15	$-O = F_2$	0.16
		Total	99.29

(1) Wycheproof, Australia; by electron microprobe, average of nine analyses, Rb and Be by ICP, H_2O determined by CHN analyzer; corresponds to $Na_{1.00}(K_{0.92}Na_{0.06}Cs_{0.03}Rb_{0.02})_{\Sigma=1.03}(Be_{0.40}Al_{0.14}Ca_{0.12}Mn_{0.10}Fe_{0.05}Mg_{0.03}Sr_{0.01}Ba_{0.01})_{\Sigma=0.86}(Zr_{1.89}Hf_{0.04})_{\Sigma=1.93}[(P_{1.00}Si_{0.02})_{\Sigma=1.02}O_{3.95}]_4F_{0.13} \cdot 2.07H_2O$.

Occurrence: Very rare, a cavity filling in veins, formed under reducing conditions during late-stage cooling in granite pegmatite.

Association: Wardite, eosphorite, montmorillonite, "limonite".

Distribution: In a quarry 0.5 km east of Wycheproof, Victoria, Australia.

Name: To honor Alfred Richard Cecil Selwyn (1824–1902), founding Director of the Geological Survey of Victoria, Australia, and later, the Geological Survey of Canada.

Type Material: Museum Victoria, Melbourne, Australia, M42492, M42590.

Semenovite-(Ce) $(Na,Ca)_9(Ce,La)_2(Fe^{2+},Mn)(Si,Be)_{20}(O,OH,F)_{48}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$.
As pseudotetragonal dipyramidal crystals, to 1 cm, and coarsely crystalline aggregates.
Twinning: Multiple interpenetration twinning on {110} with composition plane {120}, produces a pseudotetragonal habit; viewed in thin section, two sets of parallel twin boundaries produce rhombic-shaped intersections.

Physical Properties: *Fracture:* Uneven. Hardness = 3.5–4 D(meas.) = 3.140(2) D(calc.) = 3.17

Optical Properties: Transparent, to translucent when altered. *Color:* Brown or orange-brown to grey or reddish brown when altered; colorless to greyish brown in thin section.
Luster: Vitreous, to dull when altered.
Optical Class: Uniaxial (–) to biaxial (–). *Orientation:* $X = c$. $\alpha = 1.595(2)$ $\beta = 1.614(2)$ $\gamma = 1.614(2)$ $2V(meas.) = 55°$

Cell Data: *Space Group: Pmnn.* $a = 13.879(5)$ $b = 13.835(5)$ $c = 9.942(6)$ $Z = 2$

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, wet chemical analysis, spectrography, AA, and TGA; $RE_2O_3 = Nd_2O_3$ 2.2%, Gd_2O_3 0.6%, $(Sm,Eu)_2O_3$ 0.3%; corresponds to $(Na_{6.74}Ca_{2.04}K_{0.04})_{\Sigma=8.82}(La_{0.80}Ce_{0.74}Y_{0.32}RE_{0.44})_{\Sigma=2.30}(Mn_{0.48}Fe^{2+}_{0.21}Zn_{0.12}Pb_{0.04})_{\Sigma=0.85}Fe^{3+}_{0.57}(Si_{13.55}Be_{6.24}Al_{0.26})_{\Sigma=20.05}[O_{40.40}F_{4.51}(OH)_{4.04}]_{\Sigma=48.95}$. (2) Do.; by electron microprobe, partial analysis, average of analysis in (1) and two additional analyses; Ce > La indicated. (3) Analysis calculated from stoichiometry of the crystal structure.

Occurrence: A late-stage hydrothermal mineral developed in cavities within albitite veins cutting alkalic igneous rocks.

Association: Epididymite, eudidymite, "lithium-mica," albite.

Distribution: North of the westernmost end of Lake Taseq, in the Ilímaussaq intrusion, southern Greenland.

Name: Honors Professor E.I. Semenov, Russian mineralogist, Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia.

Type Material: University of Copenhagen, Copenhagen, Denmark; National Museum of Natural History, Washington, D.C., USA, 145810.

(1) Herja, Romania; corresponds to $(Pb_{8.55}Ag_{0.18}Cu_{0.06})_{\Sigma=8.79}Sb_{7.62}S_{21.00}$. (2) Chichibu mine, Japan; by electron microprobe, average of 23 analyses; corresponds to $(Pb_{8.52}Sn_{0.05}Cd_{0.03}Ag_{0.02}Cu_{0.01}Zn_{0.01}Fe_{0.01}Mn_{0.01})_{\Sigma=8.66}(Sb_{7.77}Bi_{0.02})_{\Sigma=7.79}S_{21.00}$. (3) $Pb_9Sb_8S_{21}$.

Occurrence: In hydrothermal veins formed at medium temperature.

Association: Sorbyite, jamesonite, bournonite, zinkenite, guettardite, jordanite, diaphorite, sphalerite, galena, pyrite, chalcopyrite, tetrahedrite, bournonite, arsenopyrite, siderite.

Distribution: In Romania, from Baia Sprie (Felsőbánya) [TL], at Herja (Kisbánya), in the Baia Mare (Nagybánya) district, and from Rodna. In Germany, at Wolfsberg, Harz Mountains, and from the Caspari mine, Arnsberg, North Rhine-Westphalia. From the Les Anglais mine, Massaic, Cantal; Montlucan and Bournac, Montagne Noire, Finistère; Saint-Pons, Alpes-de-Haute-Provence; and elsewhere in France. In Scotland, at the Louisa mine, Glendinning, Eskdale, Dumfries. In Bolivia, at the San José mine, Oruro. From Herminia, in the Julcani district, Peru. At the Brobdignag prospect, near Silverton, San Juan Co., the Argentine Pass area, Clear Creek Co., and near the Maid of Orleans mine, Montezuma district, Summit Co., Colorado, USA. From near Madoc, Ontario, Canada. In the Chichibu mine, Saitama Prefecture, Japan. In small amounts from other occurrences.

Name: In honor of Andor von Semsey (1833–1923), a Hungarian nobleman much interested in minerals.

(1) Curralinho, Brazil. (2) Dattas, Brazil; by electron microprobe, average of four analyses, total Fe as Fe_2O_3, total Mn as MnO; corresponding to $(Pb_{0.76}Sr_{0.20}La_{0.08}Ce_{0.07}Ba_{0.04})_{\Sigma=1.15}$ $(Ti_{12.89}Fe^{3+}_{5.99}Mn_{0.88}Y_{0.59}Zn_{0.12}Mg_{0.07}Nb_{0.03}Cr_{0.02}Th_{0.02})_{\Sigma=20.61}O_{38}$.

Mineral Group: Crichtonite group.

Occurrence: In granite or syenite pegmatites; in a hydrothermal deposit; a detrital mineral.

Association: Ilmenite, rutile, magnetite, hematite.

Distribution: In Brazil, from a number of occurrences in the Diamantina district, as at Datas; Curralinho; Santa Quitéria; Imbiruçu; Vargeas; Rio Cipó; Riacho das Varas; and elsewhere in Minas Gerais [some may be crichtonite]. From Wannigletscher, Binntal, and near Collonges, Valais, Switzerland. On Pizzo Cervandone, Alpe Devero, Val d'Aosta, and at Cuneo, Piedmont, Italy. At Alinci and Nezilovo, Macedonia. From near Tvedalen, Norway. In the Mangruvan Fe–Mn deposit, near Guldsmedshyttan, Örebro, Sweden. In the USA, from St. Peters Dome, near Pikes Peak, El Paso Co., Colorado. At Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Joachim Candido de Costa Sena (1852–1919), Professor of Mineralogy, School of Mines, Ouro Preto, Brazil.

Type Material: The Natural History Museum, London, England, 83656, 86037; National Museum of Natural History, Washington, D.C., USA, R7241.

Sénarmontite Sb_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly as octahedra, to 3 cm, which may be modified by the cube or dodecahedron; in crusts, granular massive.

Physical Properties: *Cleavage:* {111}, interrupted. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 5.50 D(calc.) = 5.584

Optical Properties: Transparent to translucent. *Color:* Colorless, grayish white; colorless in transmitted light. *Streak:* White. *Luster:* Resinous to subadamantine.
Optical Class: Isotropic; strong anomalous anisotropism, zoned or sectored. $n = 2.087$

Cell Data: *Space Group:* $Fd3m$ (synthetic). $a = 11.1519(2)$ $Z = 16$

X-ray Powder Pattern: Synthetic.
3.218 (100), 1.972 (42), 2.788 (40), 1.681 (35), 6.44 (12), 1.279 (12), 2.559 (11)

Chemistry: Modern analyses are unavailable.

Polymorphism & Series: Dimorphous with valentinite.

Occurrence: Formed by oxidation of antimony, stibnite, and other antimony minerals in hydrothermal antimony-bearing deposits.

Association: Valentinite, kermesite, stibiconite, cetineite, mopungite, sulfur.

Distribution: In large crystals at Sensa (Haminate mine), Aïn-el-Bebbouch, Qacentina (Constantine), Algeria. From the Globe and Phoenix mine, Kwekwe (Que Que), Zimbabwe. At Pernek, near Pezinok, and Dubrava, Slovakia. From Arnsberg, Westphalia, and St. Ulrich, Black Forest, Germany. At Anzat-le-Luguet, Puy-de-Dôme, France. In several mines around St. Endellion and elsewhere in Cornwall, England. From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. In Canada, from the Lac Nicolet mine, South Ham, Quebec; at Red Lake, Ontario; and in Lake George antimony deposit, 40 km west of Fredricton, New Brunswick. In the Green prospect, Mopung Hills, Churchill Co., Nevada, USA. A few other localities are known.

Name: To honor Henri Hureau de Sénarmont (1808–1862), French physicist and mineralogist, School of Mines, Paris, France, who first noted the species.

Senegalite $Al_2(PO_4)(OH)_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals, to 1.5 mm, are flattened on [010], showing large {001}, {010}, {101}, {111}, small {100}, {011}, {021}.

Physical Properties: *Cleavage:* On {010}, poor. Hardness = 5.5 D(meas.) = 2.552(7) D(calc.) = 2.551

Optical Properties: Transparent. *Color:* Colorless to pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, weak.
$\alpha = 1.562(2)$ $\beta = 1.566(2)$ $\gamma = 1.587(2)$ 2V(meas.) = 53(4)° 2V(calc.) = 48°

Cell Data: *Space Group:* $P2_1nb$. $a = 7.675(4)$ $b = 9.711(4)$ $c = 7.635(4)$ Z = 4

X-ray Powder Pattern: Kouroudiako deposit, Senegal.
3.834 (10), 2.990 (9), 3.610 (8), 2.348 (8), 5.41 (7), 2.070 (7), 1.929 (7)

Chemistry:

	(1)	(2)
P_2O_5	31.83	32.56
Al_2O_3	46.23	46.78
Fe_2O_3	0.28	
H_2O	21.00	20.66
Total	99.34	100.00

(1) Kouroudiako deposit, Senegal; by electron microprobe, total Fe as Fe_2O_3, H_2O by TGA, $(OH)^{1-}$ and H_2O confirmed by IR; corresponds to $Al_{1.98}(PO_4)_{0.98}(OH)_{3.08} \cdot H_2O$.
(2) $Al_2(PO_4)(OH)_3 \cdot H_2O$.

Occurrence: In the oxidized zone of a magnetite iron ore deposit.

Association: Turquoise, augelite, wavellite, crandallite.

Distribution: From the Kouroudiako iron deposit, Falémé river basin, Senegal.

Name: For Senegal, the country in which it was first found to occur.

Type Material: National School of Mines, Paris, France.

Sengierite $Cu_2(UO_2)_2(V_2O_8)(OH)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are six-sided thin plates, flattened on {001}, to 2 mm, showing {001}, {110}, {100}, {201}, {111}; as flaky coatings.

Physical Properties: *Cleavage:* On {001}, perfect. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 4.05 D(calc.) = 4.10 Radioactive.

Optical Properties: Transparent. *Color:* Yellowish green to greenish yellow. *Streak:* Pale green. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = bluish green to colorless; Y = olive-green to greenish yellow; Z = yellowish green to colorless. *Orientation:* $Y = b$; $X \wedge c = 13°40'$. *Dispersion:* $r < v$, strong. *Absorption:* $Z = Y > X$. α = 1.76–1.77 β = 1.92–1.94 γ = 1.94–1.97 2V(meas.) = 37°–39°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.599(5)$ $b = 8.093(4)$ $c = 10.085(9)$ $\beta = 103.42(6)°$ Z = 2

X-ray Powder Pattern: Luiswishi mine, Congo.
9.82 (vvs), 4.91 (vs), 3.735 (s), 3.197 (s), 3.179 (s), 3.144 (s), 3.094 (s)

Chemistry:

	(1)	(2)
UO_3	47.45	55.05
V_2O_5	15.96	17.50
$(Fe, Al)_2O_3$	1.43	
CuO	14.82	15.31
H_2O	15.77	12.14
Total	95.43	100.00

(1) Luiswishi mine, Congo. (2) $Cu_2(UO_2)_2(V_2O_8)(OH)_2 \cdot 6H_2O$.

Occurrence: A rare secondary mineral, deposited from solutions derived from primary uraninite.

Association: Volborthite, vandenbrandeite, malachite, chrysocolla, cobalt oxides (Luiswishi mine, Congo); chalcocite, covellite, malachite, tyuyamunite, chlorargyrite (Cole shaft, Arizona, USA).

Distribution: From the Luiswishi copper mine, Lubumbashi; at Shinkolobwe and in the Ruiwe, Musonoi, and Mutoshi mines, Katanga Province, Congo (Shaba Province, Zaire). From the Cole shaft, Bisbee, Cochise Co., Arizona, and the Section 33 mine, Grants district, McKinley Co., New Mexico, USA. In the Malargüe district, Mendoza Province, Argentina. At the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. From the Argana Bigoudine area, Amelal, Morocco.

Name: To honor Edgard Sengier (1879–1963), Director, Union Minière du Haut Katanga, principal mining company in the former Belgian Congo.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 103963.

Sepiolite $Mg_4Si_6O_{15}(OH)_2 \cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$, possible. Compact nodular, earthy, clayey, massive. Rarely fine fibrous along [001], to 2 cm.

Physical Properties: Hardness = 2–2.5 D(meas.) = > 2; dry porous masses float on water. D(calc.) = [2.26]

Optical Properties: Opaque or nearly so. *Color:* Grayish white, white, white with a yellowish or reddish tinge; bluish green. *Luster:* Dull.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless to very pale yellow; $Y = Z$ = golden yellow. α = 1.515–1.520 β = n.d. γ = 1.525–1.529 2V(meas.) = 0°–50°

Cell Data: *Space Group:* *Pncn* or *Pnan*, possible. $a = 5.21$ $b = 26.73$ $c = 13.50$
Z = 4

X-ray Powder Pattern: Eskişehir, Turkey.
12.8 (100), 2.58 (45), 4.53 (35), 4.29 (35), 3.35 (30vb), 3.77 (20), 2.26 (16b)

Chemistry:

	(1)	(2)
SiO_2	52.50	55.65
Al_2O_3	0.60	
Fe_2O_3	2.99	
FeO	0.70	
MgO	21.31	24.89
CaO	0.47	
H_2O^+	21.27	19.46
Total	99.84	100.00

(1) Ampandrandava, Madagascar. (2) $Mg_4Si_6O_{15}(OH)_2 \cdot 6H_2O$.

Occurrence: A sedimentary clay mineral; also in serpentine.

Association: "Opal," dolomite.

Distribution: Known from many localities, but not in large amounts. A few localities affording good material include: from antiquity, at Eskişehir, Turkey. From Vallecas, near Madrid, and Cabañas, near Toledo, Spain. At Nugssuaq, western Greenland. In the USA, from Middletown, Delaware Co., Pennsylvania; at Gouverneur, St. Lawrence Co., New York; in Little Cottonwood Canyon, Salt Lake Co., Utah; from Crestmore, Riverside Co., California; on the southern High Plains, from Amarillo, Texas to Hobbs, New Mexico; at Ash Meadows, Nye Co., Nevada. From Cerro Mercado, Durango, Mexico. From near Lake Amboseli, Kenya. At Lake Natron, Tanzania. From Ampandrandava, Madagascar. At Kuzuu, Tochigi Prefecture, Japan.

Name: From the Greek for *cuttle-fish*, the bone of which resembles the mineral in being light and porous.

Sérandite $Na(Mn^{2+},Ca)_2Si_3O_8(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Prismatic to acicular crystals, elongated along [010]; bladed, blocky, or tabular crystals, flattened on {100}, to 20 cm. As radiating crystal aggregates; massive. *Twinning:* Around [010], with composition plane {100}; less commonly contact twinned by reflection on {110}.

Physical Properties: *Cleavage:* Perfect on {001}, {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 3.34 D(calc.) = 3.42

Optical Properties: Transparent to translucent. *Color:* Rose-red, orange, salmon-pink, light pink, colorless, brown, black; colorless in thin section. *Streak:* White. *Luster:* Vitreous to greasy; fibrous aggregates are dull to silky.
Optical Class: Biaxial (+). *Dispersion:* $r < v$, moderate. $\alpha = 1.668$ $\beta = 1.671$ $\gamma = 1.703$ 2V(meas.) = 39° 2V(calc.) = 39°

Cell Data: *Space Group:* $P\bar{1}$. $a = 7.683(1)$ $b = 6.889(1)$ $c = 6.747(1)$ $\alpha = 90.53(5)°$ $\beta = 94.12(2)°$ $\gamma = 102.75(2)°$ Z = 2

X-ray Powder Pattern: Mont Saint-Hilaire, Canada. (ICDD 25-723).
2.983 (100), 3.158 (90), 2.838 (65), 2.192 (60), 2.495 (45), 2.602 (35), 7.51 (25)

MnO	28.99	37.33	H_2O^-	0.11	
MgO	0.06	0.13	H_2O		[1.27]
			Total	[100.26]	[100.00]

(1) Rouma Isle, Guinea; original total given as 100.46%. (2) Tanohata mine, Japan; by electron microprobe, H_2O by difference; corresponds to $Na_{1.00}(Mn^{2+}_{1.88}Ca_{0.17}Mg_{0.01})_{\Sigma=2.06}Si_{2.97}O_8(OH)$.

Polymorphism & Series: Forms a series with pectolite.

Occurrence: In sodalite xenoliths and pegmatites cutting syenites and nepheline syenites in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in vugs in phonolite (Point of Rocks, New Mexico, USA); in a contact metamorphosed terrigenous volcanogenic manganese deposit (Tumannoe deposit, Russia).

Association: Sodalite, nepheline, aegirine, astrophyllite, arfvedsonite, eudialyte, leucophanite, analcime, villiaumite, fluorite (Rouma Isle, Guinea); analcime, aegirine, mangan-neptunite, microcline (Mont Saint-Hilaire, Canada).

Distribution: From Rouma Isle, Los Islands, Guinea. In the USA, at Point of Rocks, Colfax Co., New Mexico; from the Gem mine, San Benito Co., California; on Granite Mountain, near Little Rock, Pulaski Co., Arkansas. Large crystals from Mont Saint-Hilaire, and from near Saint-Amable, Quebec, Canada. In the Tanohata mine, Iwate Prefecture, Japan. At the Tumannoe deposit, Bol'shoi Santar Island, Okhotsk Sea, and on Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: Honors J.M. Sérand, who aided the collection of type material.

Type Material: National Museum of Natural History, Washington, D.C., USA, 96515.

Serendibite $Ca_2(Mg,Al)_6(Si,Al,B)_6O_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Rarely in small tabular crystals; as anhedral grains, to 2 cm, and aggregates. *Twinning:* Polysynthetic on $\{0\bar{1}1\}$, common.

Physical Properties: *Cleavage:* Good on {010}, {001}; (010) ∧ (001) ∼66°. Hardness = 6.5–7 D(meas.) = 3.42–3.52 D(calc.) = 3.47

Optical Properties: Transparent. *Color:* Grayish blue-green to deep blue, green, or brown; in transmitted light, nearly colorless to pale yellow-green or blue. *Luster:* Vitreous. *Optical Class:* Biaxial (+) or (–). *Pleochroism:* Strong; X = pale yellow, yellow-green to blue-green; Y = almost colorless, pale yellow, blue, blue-green; Z = light to dark blue. *Orientation:* $Z \wedge c = 26°–40°$. *Dispersion:* $r > v$, strong to extremely strong; may produce abnormal interference colors. α = 1.700–1.738 β = 1.703–1.741 γ = 1.706–1.743 2V(meas.) = 78°–90°

Cell Data: *Space Group:* $P\bar{1}$. $a = 10.019$ $b = 10.393$ $c = 8.630$ $\alpha = 106.36°$ $\beta = 96.06°$ $\gamma = 124.36°$ Z = 2

X-ray Powder Pattern: Melville Peninsula, Canada.
2.846 (100), 2.595 (80), 2.461 (80), 2.038 (70), 2.032 (70), 2.018 (50), 3.320 (40)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

(1) Gangapitiya, Sri Lanka; B_2O_3 by difference; corresponds to $(Ca_{1.89}Na_{0.12}K_{0.02})_{\Sigma=2.03}(Al_{2.92}Mg_{2.69}Fe^{2+}_{0.42})_{\Sigma=6.03}(Si_{3.04}Al_{1.57}B_{1.39})_{\Sigma=6.00}O_{20}$. (2) Tayozhnoye deposit, Russia; by electron microprobe, B by ion microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry, original total given as 100.07%; corresponds to $(Ca_{1.99}Na_{0.01})_{\Sigma=2.00}(Al_{3.00}Mg_{2.40}Fe^{3+}_{0.34}Fe^{2+}_{0.24}Ti_{0.01}Mn_{0.01})_{\Sigma=6.00}(Si_{2.66}Al_{1.75}B_{1.59})_{\Sigma=6.00}O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: In skarns, affected by boron metasomatism, along the contact between carbonate rocks and granite, tonalite, or granulite.

Association: Diopside, spinel, phlogopite, scapolite, calcite, tremolite, apatite, grandidierite, sinhalite, hyalophane, uvite, pargasite, clinozoisite, forsterite, warwickite, graphite.

Distribution: At Gangapitiya, near Ambakotte, Sri Lanka. In the USA, from near Johnsburg, Warren Co., Amity, near Warwick, Orange Co., and Russell, St. Lawrence Co., New York; and in the New City quarry, three km south of Riverside, Riverside Co., California, USA. On the Melville Peninsula, Northwest Territories, Canada. In Russia, in the Tayozhnoye iron deposit, 550 km south of Yakutsk, Yakutia. From the Handeni district, Tanzania. At Ianapera and Ihosy, Madagascar.

Name: From the old Arabic name, *Serendib*, for Sri Lanka (Ceylon).

Type Material: n.d.

Total	99.71	100.00

(1) Malyi Mukulan deposit, Russia; $(CO_3)^{2-}$, $(HCO_3)^{1-}$, $(OH)^{1-}$ confirmed by IR, chrysocolla impurity estimated about 1.3%. (2) $Ca_2Mg_{11}(CO_3)_9(HCO_3)_4(OH)_4 \cdot 6H_2O$.

Occurrence: A weathering product of pyroxene–garnet skarn.

Association: Huntite, chrysocolla, chalcanthite, brochantite, malachite, gypsum, epsomite, "limonite".

Distribution: From the Malyi Mukulan tin deposit, Tyrnyauz district, Baksan River Valley, northern Caucasus Mountains, Russia.

Name: To honor Professor Yevgenii Mikhailovich Sergeev (1924–1997), geological engineer, Moscow University, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1262/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80181, 82947.

Serpierite $Ca(Cu,Zn)_4(SO_4)_2(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are lathlike, elongated along [010], flattened on {100}, with $\{10\overline{1}\}$, $\{31\overline{1}\}$, $\{\overline{3}11\}$, other minor forms, to 5 mm, in tufted aggregates and botryoidal fibrous masses.

Physical Properties: *Cleavage:* Perfect on {100}. Hardness = n.d. D(meas.) = 3.07 D(calc.) = 3.08

Optical Properties: Transparent. *Color:* Sky-blue; greenish blue in transmitted light. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Pleochroism:* X = nearly colorless, pale green; Y = bluish green; Z = deep greenish blue, blue-green. *Orientation:* $Y = b$; $X \wedge a = 24°$, $Z \simeq c$. *Dispersion:* $r > v$, strong. $\alpha = 1.584(3)$ $\beta = 1.642(3)$ $\gamma = 1.647(3)$ 2V(meas.) = 35(2)° 2V(calc.) = 37°

Cell Data: *Space Group:* $C2/c$. $a = 22.186(2)$ $b = 6.250(2)$ $c = 21.853(2)$ $\beta = 113.36(1)°$ Z = 8

X-ray Powder Pattern: Laurium, Greece; similar to devilline.
10.22 (vs), 5.09 (s), 3.386 (s), 2.708 (ms), 2.650 (ms), 2.440 (ms), 4.744 (m)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	24.29	24.78	CaO	8.00	8.68
CuO	36.12	24.62	H_2O	16.75	16.73
ZnO	13.95	25.19	Total	99.11	100.00

(1) Laurium, Greece; corresponds to $Ca_{0.93}(Cu_{2.96}Zn_{1.12})_{\Sigma=4.08}(SO_4)_{1.98}(OH)_{6.06} \cdot 3.03H_2O$.
(2) $Ca(Cu,Zn)_4(SO_4)_2(OH)_6 \cdot 3H_2O$ with Cu:Zn = 1:1.

Polymorphism & Series: Dimorphous with orthoserpierite.

Occurrence: A secondary mineral in the oxidized zone of hydrothermal Cu–Zn-bearing hydrothermal mineral deposits; commonly a post-mine product.

Association: Smithsonite, devilline, posnjakite, ktenasite, linarite, langite, brochantite, wroewolfeite, namuwite, schulenbergite, hydrozincite, malachite, gypsum.

Distribution: From the Kamariza mine, Laurium, Greece. On Ross Island, Lough Leane, Co. Kerry, Ireland. In England, in the Waterbank mine, Ecton, Staffordshire; from the Potts Gill and other mines, Caldbeck Fells, Cumbria; at the Smallcleugh mine, Nenthead, Northumberland. From the West Blackcraig mine, near Newton Stewart, Kirkcudbrightshire, Scotland. At the Friedrichssegen mine, near Bad Ems, Rhineland-Palatinate, Germany. Rich masses from the Prince Leopold mine, Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). At Tsumeb, Namibia. In the USA, in Colorado, large crystals from the Bulldog Mountain mine, Creede district, Mineral Co., at the Titusville mine, San Juan Co., and a number of other places; from the Bay Horse mine, Challis, Custer Co., Idaho; in the Linchburg mine, nine km south of Magdalena, Socorro Co., New Mexico. From the Otoño mine, Caborca, Sonora, Mexico. At Broken Hill, New South Wales, Australia. A number of additional minor localities are now known.

Name: Honors Giovanni Battista Serpieri (1832–1897), Italian engineer, who helped to reopen the ancient mines at Laurium, Greece.

Type Material: Natural History Museum, Paris, France, 73.38, 78.226.

Shabaite-(Nd) $Ca(Nd,Y,Sm)_2(UO_2)(CO_3)_4(OH)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m or 2. Crystals are rounded micaceous plates, flattened on {010} and elongated along [100], in rosettes, to 5 mm. *Twinning:* On {001}.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 2.5 D(meas.) = 3.13(10) D(calc.) = 3.23 Radioactive.

Optical Properties: Translucent to opaque. *Color:* Pale greenish yellow, pale green; very pale yellow in transmitted light. *Luster:* Pearly.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge a = 3°–4°$. $\alpha = 1.534(2)$ $\beta = [1.590(4)]$ $\gamma = 1.600(2)$ 2V(meas.) = 44°

Cell Data: *Space Group:* $P2/m$, Pm, or $P2$. $a = 9.208(5)$ $b = 32.09(3)$ $c = 8.335(4)$ $\beta = 90.3(1)°$ Z = 5

X-ray Powder Pattern: Kamoto-East mine, Congo.
15.9 (100), 7.31 (70), 4.17 (70), 3.072 (60b), 4.58 (50), 4.01 (30), 9.20 (20)

(1) Kamoto-East mine, Congo; by electron microprobe, average of ten analyses, CO_2, H_2O by gas chromatography; corresponds to $Ca_{1.01}(Nd_{0.76}Y_{0.42}Sm_{0.30}Dy_{0.14}Pr_{0.14}La_{0.08}Ce_{0.04})_{\Sigma=1.88}(UO_2)_{1.00}(CO_3)_{4.08}(OH)_{1.50} \cdot 5.57H_2O$.

Occurrence: A very rare secondary mineral in the oxidized zone of a uranium-bearing Cu–Co deposit.

Association: Uraninite, uranophane, kamotoite-(Y), astrocyanite-(Ce), françoisite-(Nd), schuilingite-(Nd), masuyite.

Distribution: From the Kamoto-East Cu–Co mine, five km west of Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: For Shaba, a former name of Katanga Province, Congo.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC3511.

(1) Korshunovskoye deposit, Russia; $(BO_3)^{3-}$, $(OH)^{1-}$, H_2O confirmed by IR; corresponds to $Mg_{5.05}(BO_3)_{0.94}[Cl_{1.49}(OH)_{0.79}]_{\Sigma=2.28}(OH)_5 \cdot 3.90H_2O$.

Occurrence: As veinlets in a brecciated dolomitic marble in a skarn magnetite deposit.

Association: Dolomite, korshunovskite, ekaterinite, dashkovaite, iowaite, halite.

Distribution: From the Korshunovskoye iron–boron skarn deposit, Irkutsk district, Siberia, Russia.

Name: Honors Leonid Ivanovich Shabynin (1909–), Russian geologist, specialist in skarn deposits, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1225/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80672; National Museum of Natural History, Washington, D.C., USA, 160483.

X-ray Powder Pattern: Majak mine, Russia.
3.29 (10), 1.925 (9), 3.84 (4), 2.11 (4), 5.42 (3), 3.16 (2), 1.666 (2)

Chemistry:

	(1)
Cu	27.5
Fe	24.1
Pb	16.6
Cd	3.9
S	27.4
Total	99.5

(1) Majak mine, Russia; by electron microprobe, corresponding to $(Pb_{0.75}Cd_{0.32})_{\Sigma=1.07}(Fe_{4.04}Cu_{4.05})_{\Sigma=8.09}S_{8.00}$.

Mineral Group: Pentlandite group.

Occurrence: As tiny grains and veinlets cutting Cu–Ni sulfide ores.

Association: Manganese-shadlunite, cubanite, talnakhite.

Distribution: In Russia, from the Majak [TL] and Oktyabr mines, Talnakh area, Noril'sk region, western Siberia, and at the Ust'-Khann'ya intrusive, lower Khann'ya River, Vilyui River basin, eastern Siberia. In the USA, in the Minnamax Cu–Ni sulfide deposit, Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota, and from the Cove mine, McCoy district, Lander Co. Nevada.

Name: In honor of Soviet mineralogist Tat'yana Nikolaevna Shadlun (1912–1996), researcher on ore minerals, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75510.

Total	99.27

(1) Kola Peninsula, Russia; corresponds to $(Na_{3.63}K_{1.82}Mn^{2+}_{0.29}Ca_{0.12})_{\Sigma=5.86}(Mn^{2+}_{1.95}Fe^{2+}_{0.93}Mg_{0.09}Ti_{0.02}Fe^{3+}_{0.01})_{\Sigma=3.00}(Si_{8.68}Fe^{3+}_{0.24}Al_{0.01})_{\Sigma=8.93}O_{24}\cdot 5.96H_2O$.

Occurrence: Produced by late-stage crystallization of alkalic nepheline syenite magmas in pegmatites in differentiated alkalic massifs.

Association: Thermonatrite, natrophosphate, nacaphite, olympite, sidorenkite, aegirine, villiaumite, phosinaite, rasvumite.

Distribution: On Mts. Rasvumchorr, Niorkpakhk, Koashkar, and Koashva, Khibiny massif, and at the Jubilee pegmatite, Mt. Karnasurt, and several other localities in the Lovozero massif, Kola Peninsula, Russia.

Name: Honors Professor Ilarion Ilarionovich Shafranovskii (1907–1994), mineralogist and crystallographer at the Mining Institute, St. Petersburg, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5713/1; Mining Institute, St. Petersburg, 1202/1; Vernasdsky Geological Institute, 57772; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81593.

Shakhovite $Hg_4^{1+}Sb^{5+}O_3(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m. Platy crystals, to about 2 mm, slightly elongated.

Physical Properties: *Cleavage:* In two directions, parallel elongation. *Tenacity:* Brittle. Hardness = 3–3.5 VHN = 285–362, 317 average (20 g load). D(meas.) = 8.34–8.51, 8.38 average. D(calc.) = 8.60

Optical Properties: Semitransparent. *Color:* Bright lettuce-green, olive-green, yellowish green, darkening on exposure; grayish white in reflected light. *Streak:* Yellowish white. *Luster:* Adamantine.
Optical Class: Biaxial; high birefringence. *Pleochroism:* Weak; olive-green to colorless.
$\alpha = > 2.03$ $\beta = > 2.03$ $\gamma = > 2.03$ 2V(meas.) = n.d.
R_1–R_2: (434) 24.5–19.0, (460) 22.5–17.6, (486) 21.5–16.4, (500) 21.5–16.2, (546) 20.2–15.8, (590) 20.3–15.6, (656) 18.2–13.4

Cell Data: *Space Group:* Im. $a = 4.871(1)$ $b = 15.098(3)$ $c = 5.433(1)$ $\beta = 98.86(2)^\circ$
$Z = 2$

X-ray Powder Pattern: Kelyana mine, Russia.
3.88 (10), 3.33 (8), 2.69 (6), 2.63 (5), 2.552 (5), 1.931 (3.5), 3.47 (3b)

Chemistry:

	(1)	(2)	(3)	(4)
Hg	77.25	77.57	77.3	78.42
Sb	11.53	11.93	12.1	11.90
O	9.88	9.67		9.38
H				0.30
Total	98.66	99.17		100.00

(1) Kelyana mine, Russia; by electron microprobe, Hg average of 24 analyses, Sb average of 13 analyses, O average of five analyses; Cu, As, Cl, S absent; corresponding to $Hg_{4.03}Sb_{1.00}O_{6.47}$. (2) Khaydarkan, Kyrgyzstan; by electron microprobe, Hg average of 15 analyses, Sb average of 10 analyses, O average of seven analyses; corresponding to $Hg_{4.09}Sb_{1.04}O_{6.38}$. (3) Landsberg, Germany; by electron microprobe, presence of $(OH)^{1-}$ confirmed by IR. (4) $Hg_4SbO_3(OH)_3$.

Occurrence: A late-stage secondary mineral in the oxidation zone of cinnabar-stibnite ore (Kelyana mine, Russia); in the oxidation zone of cinnabar-livingstonite ore (Khaydarkan, Kyrgyzstan); in oxidized Hg–Sb-bearing tetrahedrite ore (Landsberg, Germany).

Association: Calomel, eglestonite, mercury, montroydite, terlinguaite, corderoite, kelyanite, kuznetsovite, antimony oxides (Kelyana mine, Russia); calomel, cinnabar, mercury, malachite, goethite (Landsberg, Germany).

Distribution: In the Kelyana Sb–Hg mine, North Muya Mountains, Buryatia, Transbaikal, Siberia, Russia. From the Khaydarkan deposit, Fergana Valley, Alai Range, south Kyrgyzstan. At Landsberg, near Obermoschel, and Stahlberg, Rhineland-Palatinate, Germany.

Name: To honor Feliks Nikolaevich Shakhov (1894–1971), Head of the Division of Geochemistry of the Russian Academy of Sciences, Novosibirsk, Russia.

Type Material: Central Siberian Geological Museum, Siberian Division, Academy of Sciences, Novosibirsk, BII-30/1; Mining Institute, St. Petersburg, 1212/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81603.

Total	[100.28]	100.00

(1) Isua Belt, Greenland; by electron microprobe, original total given as 100.29%; corresponds to $Pb_{1.91}Fe_{0.05}Mn_{0.01}Ni_{3.10}Co_{0.02}S_{1.91}$. (2) $Pb_2Ni_3S_2$.

Occurrence: In serpentine (Trial Harbour, Australia and Isua Belt, Greenland); in segregations in an iron-rich lens in basalt (Kitdlît, Greenland).

Association: Heazlewoodite, pentlandite, sphalerite, chromite, magnetite (Trial Harbour, Australia); galena, altaite, lead, iron, troilite (Kitdlît, Greenland); heazlewoodite, pentlandite (Isua Belt, Greenland).

Distribution: In Australia, from Trial Harbour, Tasmania [TL], and at Nullagine, Western Australia. From near Kitdlît, Disko Island, and in the Isua Belt, about 150 km northeast of Godthåb, western Greenland. In the Jeffrey mine, Asbestos, Quebec, Canada. From the Itoigawa district, Niigata Prefecture, Japan.

Name: To honor the Scottish petrologist, Professor Samuel James Shand (1882–1957), of Columbia University, New York, USA.

Type Material: n.d.

Shannonite $Pb_2O(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Anhedral to platy crystals, to 400 μm, aggregated into porcelaneous crusts.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–3.5
D(meas.) = n.d. D(calc.) = 7.31–7.59

Optical Properties: Opaque. *Color:* White; white in reflected light, due to white internal reflections. *Streak:* White. *Luster:* Waxy.
Optical Class: Biaxial. n = [2.09] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_12_12_1$ (synthetic). $a = 9.014(1)$ $b = 9.315(1)$ $c = 5.1465(7)$
Z = 4

X-ray Powder Pattern: Grand Reef mine, Arizona, USA.
3.215 (100), 3.181 (90), 4.02 (40), 2.858 (40), 2.564 (35), 6.49 (30), 4.14 (30)

Chemistry:

	(1)	(2)
CO_2	9.70	8.97
PbO	89.9	91.03
Total	99.6	100.00

(1) Grand Reef mine, Arizona, USA; by electron microprobe, CO_2 by CHN analyzer; corresponding to $Pb_{1.91}O(C_{1.05}O_3)$. (2) $Pb_2O(CO_3)$.

Occurrence: A rare secondary mineral formed in the oxidation zone, probably by acidic groundwater reacting with cerussite, in a lead ore deposit (Grand Reef mine, Arizona, USA).

Association: Cerussite, litharge, massicot, minium, hydrocerussite, fluorite, plumbojarosite, hematite, manganese oxides, quartz, muscovite (Grand Reef mine, Arizona, USA).

Distribution: From the Grand Reef mine, about six km northeast of Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: Honors David Michael Shannon (1942–2003?2002??ck??), mineral dealer and collector, Mesa, Arizona, USA, who provided the original material.

Type Material: Canadian Geological Survey, Ottawa, Canada, 67216; The Natural History Museum, London, England, 1993,487.

Sharpite $Ca(UO_2)_6(CO_3)_5(OH)_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Very fine needlelike crystals, to 5 mm, in subparallel aggregates, typically flat radial fibrous; may be in crusts.

Physical Properties: Hardness = 2.5–3 D(meas.) = > 4.45 D(calc.) = 4.61 Radioactive.

Optical Properties: Semitransparent. *Color:* Greenish yellow, olive-green, pale green, pale gray; pale yellow in transmited light.
Optical Class: Biaxial (+). *Pleochroism:* Slight; $X = Y$ = pale brown, very pale yellow-green; Z = pale yellow-green. *Orientation:* $Y \perp$ laths; $Z \parallel$ elongation; positive elongation, parallel extinction. $\alpha = 1.632–1.638$ $\beta =$ close to α $\gamma = 1.720–1.722$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 21.99(2)$ $b = 15.63(2)$ $c = 4.487(4)$ Z = 2

X-ray Powder Pattern: Shinkolobwe, Congo.
4.497 (100), 3.910 (48), 7.82 (40), 5.34 (35), 2.996 (33), 11.02 (30), 6.37 (28)

Chemistry:

	(1)	(2)
UO_3	81.04	80.33
CO_2	10.30	10.30
CaO	2.70	2.62
H_2O	6.81	6.75
Total	100.85	100.00

(1) Shinkolobwe, Congo; contained insoluble cobalt oxide 1.6%; $(CO_3)^{2-}$, H_2O confirmed by IR, TGA; corresponds to $Ca_{1.02}(UO_2)_{6.01}(CO_3)_{4.96}(OH)_{4.14} \cdot 5.95H_2O$. (2) $Ca(UO_2)_6(CO_3)_5(OH)_4 \cdot 6H_2O$.

Occurrence: A very rare secondary mineral formed in the oxide zone of hydrothermal uranium deposits.

Association: Uranophane, becquerelite, schoepite, curite, masuyite, vandenbrandeite, ianthinite, uraninite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In France, at Kruth, Haut-Rhin, and in the Brugeaud mine, near Bessines, Haute-Vienne.

Name: To honor Major Robert Richard Sharp (1881–1956), English engineer and prospector who discovered the Shinkolobwe deposit, Congo.

Type Material: University of Liège, Liège, Belgium, 6280, 16905.

Shattuckite $Cu_5(SiO_3)_4(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely as well-formed prismatic crystals elongated on {001}, to 2 mm. Typically forms aggregates of spherulitic masses composed of acicular crystals.

Physical Properties: *Cleavage:* {010} and {100}, perfect. Hardness = ~3.5
D(meas.) = 4.11 D(calc.) = 4.128

Optical Properties: Semitransparent. *Color:* Deep to medium blue. *Luster:* Silky. *Optical Class:* Biaxial (+). *Pleochroism:* X = very pale blue; Y = pale blue; Z = deep blue. *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.753(3)$ $\beta = 1.782(3)$ $\gamma = 1.815(3)$
2V(meas.) = n.d. 2V(calc.) = 88°

Cell Data: *Space Group: Pcab.* $a = 9.885(1)$ $b = 19.832(2)$ $c = 5.3825(8)$ $Z = 4$

X-ray Powder Pattern: Ajo, Arizona, USA.
4.42 (100), 4.96 (90), 3.50 (80), 3.30 (80), 2.745 (70), 1.627 (70), 2.400 (60)

Chemistry:

	(1)	(2)	(3)
SiO_2	36.68	37.2	36.63
FeO	0.19		
MnO	0.03	1.6	
CuO	60.41	59.0	60.62
MgO	0.02	0.17	
CaO	0.01		
H_2O^+	2.66	[2.03]	2.75
Total	[100.00]	[100.00]	100.00

(1) Ajo, Arizona, USA; recalculated to 100.00% after deduction of 0.58% quartz; corresponds to $Cu_{5.02}(SiO_3)_{4.01}(OH)_{1.94}$. (2) Mili, Evvia Island, Greece; by electron microprobe, H_2O by difference; corresponding to $(Cu_{4.80}Mn_{0.15}Mg_{0.03})_{\Sigma=4.98}(SiO_3)_{4.01}(OH)_2$. (3) $Cu_5(SiO_3)_4(OH)_2$.

Occurrence: A secondary mineral in oxidized copper deposits.

Association: Chrysocolla, ajoite, malachite, quartz, hematite.

Distribution: In the USA, in Arizona, in the Shattuck mine, Bisbee, Cochise Co., the New Cornelia mine, Ajo, Pima Co., the San Manuel and Mammoth-St. Anthony mines, Tiger, Pinal Co., the Clifton-Morenci district, Greenlee Co., and at several localities south of Wickenburg, Maricopa Co.; in the Santa Fe district, Mineral Co., Nevada; from the Buckhorn mine, Red Cloud district, Lincoln Co., New Mexico. From Munihuaza, near Alamos, Sonora, Mexico. At Tsumeb, Namibia. From Tantara and M'Sesa, near Kambove, Katanga Province, Congo (Shaba Province, Zaire). At Mili, Evvia Island, and Apikia, Andros Island, Cyclades Islands, Greece.

Name: For the type locality, the Shattuck mine, Bisbee, Arizona, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R4871–R4874, 87447, 93891, 95727.

Shcherbakovite $K_2NaTi^{4+}{}_2O(OH)[Si_4O_{12}]$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. Crystals are long prismatic, to 6 cm; terminated crystals are uncommon.

Physical Properties: *Cleavage:* Two directions, observed microscopically, may be parting. *Tenacity:* Brittle. *Fracture:* Uneven. Hardness = 6.5 VHN = 731-845 D(meas.) = 2.968 D(calc.) = 3.194

Optical Properties: Opaque, translucent on thin edges. *Color:* Dark brown to blue-green. *Luster:* Vitreous, greasy on fracture surfaces.
Optical Class: Biaxial (-). *Pleochroism:* Distinct; *X* = pale yellow; *Y* = yellow; *Z* = brownish yellow. *Dispersion: r* < *v*, strong. *Absorption: Z* > *Y* ≥ *X*. α = 1.707 β = 1.745 γ = 1.776 2V(meas.) = 82°

Cell Data: Space Group: *Imma*. *a* = 8.1538(4) *b* = 10.5569(5) *c* = 13.9882(6) Z = 4

X-ray Powder Pattern: Wolgidee Hills, Western Australia; nearly identical to batisite. 2.911 (100), 3.201 (80), 3.399 (75), 2.634 (70), 2.191 (60), 2.102 (60), 1.680 (60)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	40.61	40.57	MnO	0.04	
TiO_2	17.91	18.87	$(Nb,Ta)_2O_5$	10.44	10.49
ZrO_2	1.23		MgO	0.26	
Na_2O	5.82	5.59	CaO	0.82	0.20
K_2O	12.29	13.22	BaO	6.22	6.07

Al_2O_3	0.76		H_2O^+	0.54	
Fe_2O_3	1.80	1.05	H_2O^-	0.10	
FeO	0.47		Total	99.61	97.63

(1) Khibiny massif, Russia; corresponds to $(K_{1.23}Na_{1.10}Ba_{0.24}Ca_{0.08}Mg_{0.04})_{\Sigma=2.69}(Ti_{1.31}Nb_{0.44}Fe_{0.17}Zr_{0.06})_{\Sigma=1.98}Si_{3.96}[O_{13.6}(OH)_{0.4}]_{\Sigma=14.00}$. (2) Mount Rasvumchorr, Khibiny massif, Russia; electron microprobe analysis, H_2O from crystal structure analysis, Mn, Mg, Al, Ta, Sr, F, Cl not detected, corresponds to $(K_{0.66}Ba_{0.23}Na_{0.07}Ca_{0.02})_{\Sigma=0.98}K_{1.00}Na_{1.00}(Ti_{1.40}Nb_{0.47}Fe_{0.08}Zr_{0.04})_{\Sigma=1.99}(O_{1.52}OH_{0.48})_{\Sigma=2.00}[Si_4O_{12}]$.

Polymorphism & Series: Forms a series with batisite.

Occurrence: Very rare, in pegmatite in a differentiated alkalic massif as a hydrothermal pectolite–natrolite vein cutting leucite-normative kalsilite–nepheline rischorrite (Khibiny massif, Russia); in lamproite (Leucite Hills, Wyoming, USA).

Association: Natrolite, manganoan pectolite, albite, potassic feldspar, astrophyllite, strontian fluorapatite, titanite (Khibiny massif, Russia); priderite, jeppeite, wadeite, perovskite, phlogopite, richterite (Wolgidee Hills, Western Australia).

Distribution: From Mts. Rasvumchorr and Yukspor, Khibiny massif, Kola Peninsula, Russia. In the Wolgidee Hills, West Kimberley district, Western Australia. From Emmons Mesa, Zirkel Mesa, and Black Butte, Leucite Hills, Sweetwater Co., Wyoming, USA.

Name: For Academician Demitrii Ivanovich Shcherbakov (1893-1966), Russian mineralogist and geochemist, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; 57256.

Shcherbinaite V_2O_5

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Acicular crystals, to 1 cm, may be lathlike, elongated along [001] and flattened on [100], in finely fibrous aggregates. *Twinning:* By rotation about [100], with {031} composition plane probable, as simple and geniculated contact twins.

Physical Properties: *Cleavage:* {010} and {001}, perfect. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.38 D(calc.) = [3.37]

Optical Properties: Translucent. *Color:* Yellow-green, golden yellow; straw-yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial. *Orientation:* X or $Y = c$. $n = 2.42$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $Pnmm$. $a = 4.364(8)$ $b = 11.50(2)$ $c = 3.561(4)$ Z = 2

X-ray Powder Pattern: Bezymianny volcano, Russia.
4.339 (100), 2.883 (50), 4.067 (28), 3.411 (28), 2.176 (24), 5.726 (22), 2.760 (22)

Chemistry:

	(1)	(2)
V_2O_5	39.	97.55
Na_2O	3.9	
LOI	12.5	
insol.	42.	
Total	97.4	97.55

(1) Bezymianny volcano, Russia; acid insoluble = SiO_2 24%, Fe_2O_3 3.3%, CaO 7%, Mg and Al $> 1\%$. (2) Izalco volcano, El Salvador; by electron microprobe, maximum of 15 analyses, with no elements other than V detected.

Occurrence: Deposited from fumarolic gasses, rich in halogens, at 500–550 °C, on the walls of volcanic fissures (Bezymianny volcano, Russia); in vanadium-bearing sublimates in fumaroles on a basaltic volcanic cone (Izalco volcano, El Salvador).

Association: Bannermanite, stoiberite, ziesite, fingerite, chalcocyanite, chalcanthite (Izalco volcano, El Salvador).

Distribution: From the Bezymyanniy volcano and the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. In El Salvador, on the Izalco volcano.

Name: Honors Vladimira Vital'evich Shcherbina (1907–1978), Russian geochemist of the Vernadsky Institute of Geochemistry and Analytical Chemistry, Academy of Sciences, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis6272.

F	16.17	16.85
H_2O	5.61	5.33
$-O = F_2$	6.81	7.09
Total	[99.14]	100.00

(1) Mont Saint-Hilaire, Canada; by electron microprobe, average of three analyses, H_2O by TGA, CO_2 calculated from structure analysis, $(CO_3)^{2-}$ and H_2O confirmed by IR; corresponds to $Na_{1.01}(Ca_{2.97}Sr_{0.01})_{\Sigma=2.98}(CO_3)_2[F_{2.90}(OH)_{0.07}]_{\Sigma=2.97} \cdot H_2O$. (2) $NaCa_3(CO_3)_2F_3 \cdot H_2O$.

Occurrence: A very rare late-stage hydrothermal mineral in a marble xenolith in nepheline syenite associated with an intrusive alkalic gabbro-syenite complex.

Association: Shortite, pectolite, microcline, polylithionite, arfvedsonite, molybdenite.

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Professor George M. Sheldrick (1942–), Institute for Organic Chemistry, University of Göttingen, Göttingen, Germany, author of widely-used crystal structural refinement computer programs.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81530, 81537–81539.

CaO	13.7	12.22
H_2O	24.0	24.43
Total	[100.0]	100.00

(1) Peanut mine, Colorado, USA; total V and V_2O_4 determined directly, V_2O_5 by difference, recalculated to 100% after deduction of insoluble 3.8%; corresponds to $(Ca_{8.7}Mg_{0.5})_{\Sigma=9.2}Al_{2.0}Fe^{3+}_{0.4}V^{4+}_{4.0}V^{5+}_{23.6}O_{80} \cdot 56H_2O$. (2) $Ca_9Al_2V^{4+}_4V^{5+}_{24}O_{80} \cdot 56H_2O$.

Occurrence: An oxidation product of lower valent vanadium minerals, on fracture surfaces and replacing fossil wood in Colorado Plateau-type U–V deposits; likely widely distributed.

Association: Selenium, metatyuyamunite, melanovanadite (Colorado Plateau, USA); pascoite, pyrite, copper, gypsum, patrónite, melanovanadite (Minasragra, Peru).

Distribution: In the USA, in Colorado, from the Peanut and Jo Dandy mines, Bull Canyon district, Uravan district, Montrose Co., at the Fall Creek mine, Placerville, San Miguel Co., and the Matchless mine, Calamity Mesa, Mesa Co.; on Wilson Mesa, Grand Co., Utah; in the Shadyside mine, east Carrizo Mountains, San Juan Co., New Mexico; and in the Joleo mine, Apache Co., Arizona. From Minasragra, 46 km from Cerro de Pasco, Peru.

Name: To honor Alexander M. Sherwood (1888–?), American analytical chemist, U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115883, 121951.

(1) Ioi mine,Japan; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO, H_2O by TGA-EGA. (2) Iron Monarch quarry, Australia; by electron microprobe, average of two analyses, total Fe as Fe_2O_3, total Mn as MnO, H_2O by difference. (3) $NaMn_6Al_3(SO_4)_2(OH)_{18}\cdot 12H_2O$.

Occurrence: A rare secondary mineral in metamorphosed manganese ore deposits.

Association: Rhodochrosite, sonolite, manganosite, pyrochroite, jacobsite, hausmannite, galaxite (Ioi mine, Japan); rhodochrosite, leucophoenicite, gageite, caryopilite (Wessels mine, South Africa); arsenoclasite, gatehouseite, hematite, hausmannite, manganoan ferroan calcite, barite, gypsum (Iron Monarch quarry, Australia).

Distribution: From the Ioi mine, about 25 km east of Kyoto, Shiga Prefecture, Japan. In South Africa, at the N'Chwaning mine, and large crystals from the Wessels mine, near Kuruman, Cape Province. In the Iron Monarch quarry, Iron Knob, South Australia. Large crystals from the Bengal Cannon mine, Iron Co., Michigan, USA.

Name: For Shiga Prefecture, Japan, within which the original locality, the Ioi mine, is located.

Type Material: National Museum of Natural History, Washington, D.C., USA, 122089.

X-ray Powder Pattern: Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.
13.33 (100), 6.67 (76), 2.945 (62), 3.068 (57), 6.47 (55), 3.469 (45), 3.042 (45)

Chemistry:

	(1)
Na_2O	0.68
K_2O	11.03
CaO	13.70
SiO_2	59.86
H_2O	[14.73]
Total	100.00

(1) Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia; average of 7 electron microprobe analyses, H_2O by difference, OH/H_2O calculated for charge balance; corresponding to $(K_{0.96}Na_{0.09})_{\Sigma=1.05}Ca_{1.00}Si_{4.07}O_{9.932}(OH)_{0.68}\cdot 3H_2O$.

Occurrence: A late-stage hydrothermal mineral along fractures in a high-potassium peralkaline pegmatite in urtite rocks near the contact with nepheline-apatite rock.

Association: Cryptophyllite.

Distribution: At the Central mine, Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: Honors geologist, Valeriy Georgievich Shlykov (1941-2007), Moscow State University, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3753/1).

(1) Mt. Alluaiv, Kola Peninsula, Russia; H_2O by coulometry, original total given as 99.10%; corresponds to $(Na_{2.93}Ca_{0.01})_{\Sigma=2.94}(Y_{0.79}Dy_{0.11}Gd_{0.04}Er_{0.03}Ho_{0.01}Tb_{0.01})_{\Sigma=0.99}(C_{1.06}O_3)_3 \cdot 3.26H_2O$. (2) Mont Saint-Hilaire, Canada; by electron microprobe, CO_2, H_2O calculated from stoichiometry; corresponds to $(Na_{2.97}(Y_{0.67}Nd_{0.07}Dy_{0.06}Ce_{0.04}Er_{0.04}Yb_{0.03}Sm_{0.02}Gd_{0.02}Ho_{0.02}La_{0.01}Tb_{0.01}Pr_{0.01}Tm_{0.01}Lu_{0.01})_{\Sigma=1.02}(CO_3)_3 \cdot 3H_2O$. (3) $Na_3Y(CO_3)_3 \cdot 3H_2O$.

Occurrence: In interstices and as large segregations in potassic feldspar in pegmatites (Mt. Alluaiv, Kola Peninsula, Russia); associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Albite, cancrinite, aegirine, elpidite, natron, natroxalate, kogarkoite, villiaumite, neighborite, trona, sidorenkite, siderite, sphalerite (Mt. Alluaiv, Kola Peninsula, Russia); microcline, albite, aegirine, analcime, rhodochrosite, eudialyte, catapleiite, sphalerite, petersenite-(Ce) (Mont Saint-Hilaire, Canada).

Distribution: From Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For the Shomiok River, in the Lovozero massif, flowing near Mt. Alluaiv, where the mineral was first found.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r545/1; The Natural History Museum, London, England, 1994,030.

Shortite $Na_2Ca_2(CO_3)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are typically wedge-shaped, tabular to short prismatic on [100], to 3 cm, showing (100), $(\bar{1}00)$, (011), $(0\bar{1}1)$, $(00\bar{1})$, with {011} striated by $\{00\bar{1}\} \parallel [100]$.

Physical Properties: *Cleavage:* Distinct on {010}. *Fracture:* Conchoidal. Hardness = 3–4.5 D(meas.) = 2.629 D(calc.) = 2.620 Slowly decomposes in H_2O, with $CaCO_3$ residue; strongly pyroelectric; pale amber fluorescence under SW UV.

Optical Properties: Transparent. *Color:* Colorless, pale yellow, dark yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, moderate.
$\alpha = 1.531$–1.532 $\beta = 1.555$–1.556 $\gamma = 1.570$ 2V(meas.) = 69.0(5)° 2V(calc.) = 73.9°–75°

Cell Data: *Space Group:* $Amm2$. $a = 4.947(1)$ $b = 11.032(2)$ $c = 7.108(1)$ Z = 2

X-ray Powder Pattern: John Hay, Jr. Well No. 1, Wyoming, USA.
2.562 (100), 5.515 (71), 4.957 (71), 2.179 (71), 1.996 (60), 5.985 (50), 3.818 (50)

(1) John Hay, Jr. Well No. 1, Wyoming, USA. (2) Upper Canada mine, Canada; by electron microprobe, CO_2 by difference. (3) $Na_2Ca_2(CO_3)_3$.

Occurrence: In saline dolomitic marl (Green River Formation, Wyoming and Utah, USA); in kimberlite dikes (Upper Canada mine, Canada); in carbonatite (Vuoriyarvi massif, Kola Peninsula, Russia); in differentiated alkalic massifs (Kovdor and Khibiny massifs, Kola Peninsula, Russia); associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Trona, nahcolite, pyrite (Green River Formation, Wyoming and Utah, USA); phlogopite, magnetite, apatite, perovskite, calcite, olivine (Upper Canada mine, Canada); barentsite, villiaumite, natrite, natrolite, albite (Khibiny massif, Kola Peninsula, Russia).

Distribution: In the USA, from the Green River Formation, Wyoming and Utah, with indicated reserves of billions of tons; found in the John Hay, Jr. Well No. 1, about 30 km west Green River, Sweetwater Co., Wyoming; and in the Uintah Basin, northeastern Utah. In Canada, in the Upper Canada gold mine, Kirkland Lake district, Ontario, and at Mont Saint-Hilaire, Quebec. In Russia, on the Kola Peninsula, in the Vuoriyarvi carbonatite complex, from the Kovdor massif, and on Mt. Restin'yun, Khibiny massif; from the Udachnaya pipe, Daldyn kimberlite field, Sakha.

Name: To honor Dr. Maxwell Naylor Short (1889–1952), Professor of Mineralogy, University of Arizona, Tucson, Arizona, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 98093.

(1) Saranovskii mine, Russia; corresponding to $(Ca_{1.91}K_{0.03}Na_{0.02})_{\Sigma=1.96}(Mg_{0.64}Al_{0.25}Fe_{0.10})_{\Sigma=0.99}(Cr_{1.30}Al_{0.69}Ti_{0.04})_{\Sigma=2.03}(Si_{2.67}Al_{0.30})_{\Sigma=2.97}O_{11}(OH)_{2.00} \cdot 0.99H_2O$.

Mineral Group: Pumpellyite group.

Occurrence: On the walls of fractures in chromitite.

Association: Uvarovite, chlorite, titanite.

Distribution: From the Biserskoye deposit and Saranovskii chromium mine, five km north of the Laki railway station, Gorozavod district, Northern Ural Mountains, Russia.

Name: For Vadim Prokof'evich Shuiskii (1936–), petrologist of the Ural Scientific Center, Yekaterinburg (Sverdlovsk), Russia.

Type Material: Ural Geological Museum, Mining Institute, Yekaterinburg (Sverdlovsk); Mining Institute, St. Petersburg, 1227/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81684.

References: (1) Ivanov, O.K., V.A. Arkhangel'skaya, L.O. Miroshnikova, and T.A. Shilova (1981) Shuiskite, the chromium analog of pumpellyite, from the Bisersk deposit, Urals. Zap. Vses. Mineral. Obshch., 110, 508–512 (in Russian). (2) (1982) Amer. Mineral., 67, 860 (abs. ref. 1).

Sibirskite $CaH(BO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rhombic to prismatic crystals, to 1.5 mm, and as irregular grains, in aggregates. *Twinning:* On {100}, polysynthetic.

Physical Properties: Hardness = n.d. VHN = 298–383, 339 average (25 g load).
D(meas.) = 2.58 D(calc.) = 2.59

Optical Properties: Semitransparent. *Color:* Colorless, white, pale gray; colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* OAP $\simeq$ {100}. α = 1.554–1.555 β = 1.638–1.643 γ = 1.652–1.658 2V(meas.) = 43° 2V(calc.) = 42.6°

Cell Data: *Space Group:* $P2_1/a$. a = 8.643(6) b = 9.523(2) c = 3.567(3) β = 119.23(3)° Z = 4

(1) Fuka, Japan; by electron microprobe, B_2O_3 by wet chemistry, H_2O by LOI; corresponds to $Ca_{1.00}H_{1.07}B_{0.97}O_3$. (2) $CaH(BO_3)$.

Polymorphism & Series: Dimorphous with parasibirskite.

Occurrence: In veinlets and aggregates in skarns.

Association: Calcite, "chlorite", pyrite, garnet, vesuvianite, datolite, tourmaline, axinite (Yuliya Svintsovaya deposit, Russia); takedaite, nifontovite, olshanskyite, pentahydroborite, frolovite, parasibirskite, uralborite, borcarite, fluorite, calcite (Fuka, Japan).

Distribution: In Russia, from the Yuliya Svintsovaya Pb–Zn deposit, 20 km east-northeast of the Son railway station, Khakassia district, Siberia; at the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains; and on the Chersk and Selenyakhsk Ridges, Transbaikal. From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For its first-noted occurrence in Siberia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64709.

(1) Pala, California, USA. (2) Stewart mine, California, USA; by electron microprobe, total Fe as Fe_2O_3, total Mn as MnO, $(Li,H)_2O$ by difference; corresponds to $(Li_{0.94}Na_{0.01})_{\Sigma=0.95}(Mn^{2+}_{0.80}Fe^{3+}_{0.15})_{\Sigma=0.95}(PO_4)_{1.00}$.

Polymorphism & Series: Forms a series with ferrisicklerite.

Occurrence: Formed by late hydrothermal alteration or weathering of triphylite-lithiophilite in complex zoned granite pegmatites.

Association: Huréaulite, stewartite, jahnsite, phosphosiderite (Pala, California, USA).

Distribution: In the USA, in the Vanderburg mine, Hiriart Mountain, and the Stewart mine, Pala district, San Diego Co., California; from the White Picacho district, Yavapai Co., Arizona; in the Custer Mountain mine, 2.5 km east-southeast of Custer, Custer Co., South Dakota. From the Tanco pegmatite, Bernic Lake, Manitoba, Canada. At Tammela, and in the Viitaniemi pegmatite, near Eräjärvi, Finland. From Varuträsk, at the Norrö pegmatite, on Rånö Island, and on Utö Island, Sweden. From Sidi-bou-Othmane, Morocco. Occurs at Wodgina, Western Australia. Probably present in many other pegmatites; chemical analyses are desirable for certainty that the material fits the present definition.

Name: Honoring the Sickler family, mineral collectors, formerly of Pala, California, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 101195; National Museum of Natural History, Washington, D.C., USA, 93653.

Siderite $Fe^{2+}CO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\,2/m$. Commonly crystallized, typically rhombohedral $\{10\bar{1}1\}$ to steep scalenohedral $\{21\bar{3}1\}$, prismatic $\{10\bar{1}0\}$, $\{0001\}$, with additional minor forms, to 25 cm; fibrous, stalactitic, spherulitic, cleavable, fine-grained massive. *Twinning:* Uncommon on $\{01\bar{1}2\}$, lamellar; rare on $\{0001\}$.

Physical Properties: *Cleavage:* Perfect on $\{10\bar{1}1\}$. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 3.75–4.25 D(meas.) = 3.96(1) D(calc.) = 3.932

Optical Properties: Translucent. *Color:* Yellowish brown, brown; white, ash-gray, yellowish gray, pale green; colorless, yellow, yellow-brown in transmitted light. *Streak:* White. *Luster:* Vitreous, may be pearly or silky.
Optical Class: Uniaxial (–). *Dispersion:* Strong. $\omega = 1.875$ $\epsilon = 1.633$

Cell Data: *Space Group:* $R\bar{3}c$. $a = 4.6916$–4.6935 $c = 15.3796$–15.3860 Z = 6

(1) Camborne, England. (2) $FeCO_3$.

Polymorphism & Series: Forms three series, with magnesite, with rhodochrosite, and with smithsonite.

Mineral Group: Calcite group.

Occurrence: A common component of bedded sedimentary iron ores and metamorphic iron formations; in hydrothermal metallic veins; rarely in granite and nepheline syenite pegmatites; in carbonatites; authigenic, and in concretions.

Association: Quartz, barite, fluorite, pyrite.

Distribution: Many noted localities worldwide, including: in Germany, from Freiberg and Neudorf, Harz Mountains, and in the Siegerland district, Westphalia. In Austria, on the Erzberg, near Eisenerz, Styria, and Hüttenberg-Lölling, Carinthia. From Allevard, Isère, France. In England, from many mines in Cornwall, as at the Great Onslow Consols mine, St. Breward, Wheal Maudlin, Lanlivrey, Dolcoath mine, Camborne; from the Virtuous Lady mine, Tavistock, Devon. At Panasqueira, Portugal. From Ivigtut, Greenland. Very large crystals at Mont Saint-Hilaire, Quebec, Canada. In the USA, from Bisbee, Cochise Co., and in the Antler mine, Mohave Co., Arizona; at Leadville, Lake Co., Colorado. From Mosojllacta, Colavi, Bolivia, large crystals. In Brazil, in the Morro Velho gold mine, Nova Lima, Minas Gerais, and at Pedreira Ataleia, Governador Valadares.

Name: From the Greek *sideros*, for *iron* in the composition.

Sideronatrite $Na_2Fe^{3+}(SO_4)_2(OH)\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely in good crystals, lathlike to acicular, to 3 cm; commonly fibrous, earthy, pulverulent, in efflorescences and crusts, nodular, massive.

Physical Properties: *Cleavage:* On {010}, perfect; on {100}, fair. *Tenacity:* Slightly flexible. Hardness = 1.5–2.5 D(meas.) = 2.22–2.35 D(calc.) = 2.276 Soluble in boiling H_2O, with separation of Fe_2O_3; reversibly dehydrates to metasideronatrite depending on relative humidity and exposure to sunlight.

Optical Properties: Semitransparent. *Color:* Lemon-yellow, straw-yellow, pale orange, yellow-brown; in transmitted light, nearly colorless to pale yellow. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = nearly colorless; Y = very pale amber-yellow; Z = pale amber-yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, strong. $\alpha = 1.508(3)$ $\beta = 1.525(3)$ $\gamma = 1.586(3)$ 2V(meas.) = n.d. 2V(calc.) = 58(5)°

Cell Data: *Space Group:* *Pbnm*; may be *Pnn*2 or *Pnnm* if OD structure. $a = 7.27(2)$ $b = 20.50(3)$ $c = 7.15(2)$ Z = 4

X-ray Powder Pattern: Sierra Gorda [district], Chile.
10.15 (FFF), 3.01 (FF), 3.38 (F), 2.68 (F), 6.78 (mF), 3.58 (mF), 5.00 (f)

Chemistry:

	(1)	(2)
SO_3	42.98	43.87
Fe_2O_3	22.40	21.88
Na_2O	17.00	16.98
H_2O	17.75	17.27
Total	100.13	100.00

(1) Sierra Gorda [district], Chile; corresponds to $Na_{1.96}Fe_{1.00}(SO_4)_{1.92}(OH)_{1.12}\cdot 2.96H_2O$.
(2) $Na_2Fe(SO_4)_2(OH)\cdot 3H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized zone of iron-rich deposits in very arid climates, may be post-mine; also formed by alteration of pyrite by saline water in metallic veins, coal measures, and in a sea-spray environment.

Association: Metasideronatrite, ferrinatrite, copiapite, voltaite, melanterite, halotrichite, uklonskovite, jurbanite, jarosite, pyrite, marcasite.

Distribution: In Chile, from the San Simon mine, Huantajaya, Tarapacá; in the Compania mine, Sierra Gorda district, southwest of Calama, and at Chuquicamata, Antofagasta. From Potosí, Bolivia. At the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province, Argentina. On the Urus Plateau, Cheleken Peninsula, Caspian Sea, Turkmenistan. From north of Ballybunion, Co. Kerry, Ireland. At Barton-on-Sea, Hampshire, on Trerubies Cliff, near Delabole, Cornwall, and in the Rising Sun colliery, Backworth, Northumberland, England. From Winterslag and Eisden, Belgium. In the Polish Turoszow brown coal mine, Turoszow, Poland. From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. At the New Milo mine, Wadnaminga, South Australia. Large crystals in the Hot Springs Point sulfur mine, Crescent Valley, Eureka Co., Nevada, USA. A few additional localities are known.

Name: From the Greek for iron, *sideros* and sodium, *natrium*, in its chemical composition.

(1) Pikes Peak, Colorado, USA; loss on ignition taken as H_2O. (2) Brooks Mountain [*sic*], Alaska, USA; corresponds to $(K_{0.93}Na_{0.09}Rb_{0.01})_{\Sigma=1.03}Fe^{2+}_{2.02}(Al_{0.47}Li_{0.33}Mn_{0.07}Mg_{0.03})_{\Sigma=0.90}(Si_{2.97}Al_{1.03})_{\Sigma=4.00}O_{10}(F,OH)_2$.

Polymorphism & Series: 1M polytype.

Mineral Group: Mica group.

Occurrence: In pegmatites in nepheline syenite; in greisens in granite and aplite.

Association: Microcline, astrophyllite (Pikes Peak, Colorado, USA).

Distribution: On Pikes Peak, El Paso Co., Colorado, and in the Brooks Range, Alaska, USA. At Mont Saint-Hilaire, Quebec, Canada. From Altenberg, Saxony, Germany. In the Reschen Pass, Trentino-Alto Adige, Italy. At Badzhala, Ural Mountains, Russia. From Newcastle, Co. Down, Ireland. Probably additional localities exist.

Name: From the Greek for *iron* and *leaf*, for its composition and habit.

Total	[100.00]	100.00

(1) Yerington, Nevada, USA; SO_3 by difference; corresponds to $(Fe_{0.55}Cu_{0.44}Co_{0.01})_{\Sigma=1.00}$ $SO_4 \cdot 5H_2O$. (2) $FeSO_4 \cdot 5H_2O$; some copper is required to stabilize the structure.

Mineral Group: Chalcanthite group.

Occurrence: Forms by dehydration of cuprian melanterite.

Association: Melanterite.

Distribution: Originally incompletely described from Idrija (Idria), Slovenia, where it may or may not occur. Some authenticated localities include: in the USA, in Nevada, from the Yerington district, Lyon Co., at the Watt mine, Reese River district, Lander Co., and from Steamboat Springs, Steamboat Springs district, Washoe Co.; at Bingham Canyon, Salt Lake Co., Utah; from the Mt. Diablo mercury mine, Contra Costa Co., California; in the Campbell shaft, Bisbee, Cochise Co., Arizona; at Ducktown, Polk Co., Tennessee. In the Capillitas mine, Catamarca Province, Argentina. At Grandola, near Lisbon, Portugal. In the Clara mine, near Oberwolfach, Black Forest, Germany. From Les Vallettes, Valais, Switzerland.

Name: From the Greek for iron, *sideros*, and for fiber, *tilos*, for its composition and structure.

Sidorenkite $Na_3Mn^{2+}(PO_4)(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$ or 2. Crystals, elongated along [001], are boxlike, showing {100}, {010}, rarely {001}, to 3 cm; granular.

Physical Properties: *Cleavage:* On {100} and {010}, perfect; on {001}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = ∼2 D(meas.) = 2.90–3.03 D(calc.) = 2.98 Strongly electromagnetic.

Optical Properties: Transparent. *Color:* Colorless, pale rose-red to pale pink, with surficial brownish or yellowish tint. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.521(2)$ $\beta = 1.563(2)$ $\gamma = 1.585(2)$ 2V(meas.) = 68° 2V(calc.) = 70°

Cell Data: *Space Group:* $P2_1/m$ or $P2_1$. a = 8.997(4) $b = 6.741(2)$ $c = 5.163(2)$ $\beta = 90.16(4)°$ Z = 2

X-ray Powder Pattern: Mt. Alluaiv, Kola Peninsula, Russia.
3.36 (100), 8.97 (20), 1.682 (20), 2.69 (15), 2.99 (12), 2.243 (12), 2.58 (8)

Chemistry:

	(1)	(2)
P_2O_5	25.77	25.45
CO_2	15.71	15.78
FeO	0.49	
MnO	22.40	25.44
MgO	0.00	
CaO	2.20	
Na_2O	32.36	33.33
K_2O	0.44	
Total	99.37	100.00

(1) Mt. Alluaiv, Kola Peninsula, Russia; corresponds to $(Na_{2.93}K_{0.03})_{\Sigma=2.96}(Mn_{0.89}Ca_{0.11}Fe_{0.02})_{\Sigma=1.02}(PO_4)_{1.02}(CO_3)_{1.00}$. (2) $Na_3Mn(PO_4)(CO_3)$.

Occurrence: A rare low-temperature hydrothermal mineral, formed very late in the crystallization of hyperagpaitic pegmatites in a differentiated alkalic massif (Mt. Alluaiv, Kola Peninsula, Russia); in sodalite syenite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Villiaumite, kogarkoite, thermonatrite, aegirine (Mt. Alluaiv, Kola Peninsula, Russia); rasvumite, ussingite, villiaumite (Mont Saint-Hilaire, Canada).

Distribution: From Mt. Alluaiv, Lovozero massif, and in the Khibiny massif, Kola Peninsula, Russia. On Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Academician Aleksandr Vasil'evich Sidorenko (1917–1982), noted Russian geologist, a founder of the Kola Branch of the Russian Academy of Sciences.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5198; Mining Institute, St. Petersburg, 1110/1–2; Vernadsky Geological Museum, Moscow, 51718; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79775.

Sidpietersite $Pb_4(S_2O_3)O_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Euhedral to subhedral crystals, to 0.3 mm, are bladed, elongated along [01$\overline{1}$], platy on {001}, showing {001}, {100}, {01$\overline{1}$}, in radiating aggregates; more typically in warty nodular to earthy masses.

Physical Properties: *Cleavage:* Perpendicular to [01$\overline{1}$]. *Fracture:* Uneven. *Tenacity:* Sectile. Hardness = 1–2 D(meas.) = n.d. D(calc.) = 6.765

Optical Properties: Transparent to opaque. *Color:* Colorless, white, cream-beige. *Streak:* White to cream-white. *Luster:* Vitreous to pearly. *Optical Class:* [Biaxial.] *Pleochroism:* Slight. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.455(2)$ $b = 6.496(2)$ $c = 11.207(4)$ $\alpha = 114.33(2)°$ $\beta = 89.65(2)°$ $\gamma = 88.68(2)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
10.13 (100), 3.414 (100), 3.198 (80), 5.93 (50), 2.622 (40), 4.401 (35), 2.889 (35)

Chemistry:

	(1)	(2)
SO_3	7.58	7.95
S	3.04	3.18
PbO	89.55	88.66
H_2O	[1.79]	1.79
$-O = S$	1.51	1.58
Total	[100.45]	100.00

(1) Tsumeb, Namibia; by electron microprobe, $(S_2O_3)^{2-}$ and $(OH)^{1-}$ confirmed by IR and crystal-structure analysis; after partitioning S 6.07% as S^{6+}:S^{2-} = 1:1 and calculating $(OH)^{1-}$ for stoichiometry, corresponds to $Pb_{4.09}(S^{6+}_{0.97}S^{2-}_{0.97}O_{2.90})O_{2.09}(OH)_{2.03}$.

Occurrence: A very rare late-stage alteration product of galena in the oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Smithsonite, zincite, greenockite, galena, sphalerite, quartz.

Distribution: From Tsumeb, Namibia.

Name: To honor Sidney Pieters (1920–2003), Windhoek, Namibia, prominent dealer in Tsumeb minerals.

Type Material: The Natural History Museum, London, England, 1998,36; Canadian Geological Survey, Ottawa, Canada, 68076.

Sidwillite $MoO_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are pseudohexagonal, flattened on {010}, with {101}, {103}, {$\bar{1}$01}, {111}, and {11$\bar{1}$}, to 0.2 mm.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 2.5 D(meas.) = 3.12 D(calc.) = 3.11

Optical Properties: Semitransparent. *Color:* Canary-yellow. *Streak:* Pale yellow. *Luster:* Resinous to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = colorless; $Y = Z$ = yellow. *Orientation:* $X = b$; $Z \wedge a = 47°$. $\alpha = 1.70(1)$ $\beta = 2.21(2)$ $\gamma = 2.38(2)$ 2V(meas.) = n.d. 2V(calc.) = 48°

Cell Data: *Space Group:* $P2_1/n$. $a = 10.618(5)$ $b = 13.825(7)$ $c = 10.482(5)$ $\beta = 91.61(4)°$ Z = 16

X-ray Powder Pattern: Lake Como, Colorado, USA.
3.322 (100), 3.248 (93), 6.94 (84), 3.680 (58), 3.79 (53), 2.656 (51), 2.620 (41)

Chemistry:

	(1)	(2)
MoO_3	78.60	79.98
Fe_2O_3	trace	
H_2O	[21.40]	20.02
Total	[100.00]	100.00

(1) Lake Como, Colorado, USA; by electron microprobe, average of 15 analyses, H_2O by difference. (2) $MoO_3 \cdot 2H_2O$.

Occurrence: An oxidation product of jordisite in a quartz vein.

Association: Jordisite, quartz.

Distribution: From near Lake Como, Hinsdale Co., Colorado, USA.

Name: To honor Dr. Sidney Arthur Williams (1933–), American mineralogist and petrologist of Douglas, Arizona, USA, for his contributions to the mineralogy of oxidation zones of ore deposits.

Type Material: National School of Mines, Paris, France.

Total	100.67	100.41	100.1	100.00

(1) Littfeld, Germany; corresponds to $(Co_{1.33}Ni_{1.60}Fe_{0.03})_{\Sigma=2.96}S_{4.00}$. (2) Mine la Motte, Missouri, USA; corresponds to $(Co_{1.04}Ni_{1.61}Fe_{0.17}Cu_{0.15})_{\Sigma=2.97}S_{4.00}$. (3) Schönbrunn deposit, near Ölsnitz, [Vogtland=Saxony or Thuringia ck??, not in Rand-McNally, mindat.org??] Germany; by electron microprobe, corresponds to $(Co_{0.71}Ni_{2.14}Fe_{0.15})_{\Sigma=3.00}S_{4.00}$. (4) $CoNi_2S_4$.

Mineral Group: Linnaeite group.

Occurrence: In hydrothermal veins with other Cu–Ni–Fe sulfides.

Association: Chalcopyrite, pyrrhotite, galena, sphalerite, pyrite, millerite, gersdorffite, ullmannite.

Distribution: In Germany, from the Siegen district, North Rhine-Westphalia [TL], as at Müsen and Littfeld. From near Brestovsko, central Bosnian Mountains, Serbia. At Kladno, Czech Republic. From Blackcraig, Kirkcudbrightshire, Scotland. In the USA, in the Mine la Motte, Madison Co.; fine crystals from the Buick mine, Bixby, Iron Co., and in the Miliken (Sweetwater) mine, Reynolds Co., Missouri. In Canada, from the Langis mine, Cobalt-Gowganda area, Ontario. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From Kilembe, Uganda. In the Kamaishi mine, Iwate Prefecture, and the Yokozuru mine, north Kyushu, Japan. From Kalgoorlie, Western Australia. Known from many other minor localities.

Name: For the occurrence in the Siegen district, Germany.

Type Material: n.d.

Sieleckiite **$Cu_3Al_4(PO_4)_2(OH)_{12}\cdot 2H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Crystals, to 100 μm, in smooth spherical aggregates, to 0.5 mm, with a finely fibrous radiating structure.

Physical Properties: *Fracture:* Subconchoidal. Hardness = ∼3 D(meas.) = 3.02(2) D(calc.) = 2.94

Optical Properties: Translucent. *Color:* Deep sky-blue to Royal blue. *Streak:* Pale blue. *Luster:* Pearly.
Optical Class: Biaxial. *Pleochroism:* Weak; colorless to very pale blue. *Orientation:* Length-slow. $\alpha = 1.63$ $\beta =$ n.d. $\gamma = 1.66$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.41(8)$ $b = 7.56(5)$ $c = 5.95(6)$ $\alpha = 90.25(12)°$ $\beta = 91.27(12)°$ $\gamma = 104.02(7)°$ Z = 1

X-ray Powder Pattern: Mt. Oxide, Australia.
5.036 (100), 3.852 (100), 9.120 (50), 2.827 (50), 2.460 (50), 3.276 (30), 2.570 (20)

Chemistry:

	(1)	(2)
P_2O_5	19.42	19.48
CO_2	1.6	
Al_2O_3	26.57	27.99
CuO	32.39	32.75
H_2O	18.1	19.78
Total	98.1	100.00

(1) Mt. Oxide, Australia; by electron microprobe, H_2O by CHN analyzer; corresponds to $Cu_{3.11}Al_{3.98}(PO_4)_{2.09}(OH)_{12}\cdot 1.7H_2O$. (2) $Cu_3Al_4(PO_4)_2(OH)_{12}\cdot 2H_2O$.

Occurrence: A rare secondary mineral found in a fracture in a boulder from the oxidized zone of a copper deposit.

Association: Variscite, turquoise, libethenite, pseudomalachite.

Distribution: From the Mt. Oxide copper mine, 150 km north of Mt. Isa, Queensland, Australia.

Name: To honor Robert Sielecki (1958–), Australian geologist, who collected the first specimens.

Type Material: Museum Victoria, Melbourne, M38238, M38538; South Australian Museum, Adelaide, Australia, G14180.

Sigismundite

$\mathbf{Na_3(Ba,K,Pb)(Ca,Sr)(Fe^{2+},Mg,Mn^{2+})_{14}Al(PO_4)_{12}(OH)_2}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Imperfect and shattered elongated crystals, to 1 cm, in massive lumps.

Physical Properties: *Cleavage:* Two, imperfect, at ∼110°. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.544

Optical Properties: Translucent. *Color:* Grayish green; greenish yellow in transmitted light. *Streak:* White. *Luster:* Greasy.
Optical Class: Biaxial. *Orientation:* Extinction ∼25° to elongation. $n = 1.65(1)$
2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$. $a = 16.406(5)$ $b = 9.945(3)$ $c = 24.470(5)$
$\beta = 105.73(2)°$ Z = 4

X-ray Powder Pattern: Near Madésimo, Italy.
3.010 (100), 3.178 (51), 2.678 (42), 2.523 (27), 2.805 (25), 4.519 (23), 2.775 (21)

Chemistry:

	(1)		(1)
P_2O_5	40.50	CaO	2.09
SiO_2	0.02	SrO	1.09
Al_2O_3	2.45	BaO	5.68
FeO	27.64	Na_2O	4.44
MnO	0.70	K_2O	0.26
PbO	0.76	H_2O	[0.86]
MgO	10.85	Total	[97.34]

(1) Near Madésimo, Italy; average of ten analyses, total Fe as FeO, total Mn as MnO, H_2O from crystal-structure analysis; corresponds to $Na_{3.02}(Ba_{0.78}K_{0.12}Pb_{0.07}Sr_{0.02})_{\Sigma=0.99}(Ca_{0.79}Sr_{0.20})_{\Sigma=0.99}(Fe_{8.12}Mg_{5.68}Mn_{0.21})_{\Sigma=14.01}Al_{1.01}(PO_4)_{12}(OH)_2$.

Occurrence: A very rare mineral in phengitic quartzite, formed probably by metamorphism of phosphatic organic matter.

Association: Quartz, apatite, iron carbonates, potassic feldspar, rutile, schorl, barite, celestine, lazulite, woodhouseite, crandallite, kaolinite, mitridatite, diaspore, svanbergite, vanadinite, albite, iron oxides.

Distribution: From near Madésimo, Spluga Valley, Lombardy, Italy.

Name: In honor of Pietro Sigismund (1874–1962), mineral collector specializing in minerals from Val Malenco, Italy.

Type Material: Civic Museum of Natural History, Morbegno, Italy.

(1) Trinity Center, California, USA. (2) $3SiO_2 \cdot H_2O$.

Occurrence: Formed by the leaching of sodium from magadiite by near-surface water.

Association: Magadiite.

Distribution: About 10 km east of Trinity Center, Trinity Co., California, USA.

Name: For the SILica and water of HYDRation in its composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 125042.

References: (1) Gude, A.J., 3rd and R.A. Sheppard (1972) Silhydrite, $3SiO_2 \cdot H_2O$, a new mineral from Trinity County, California. Amer. Mineral., 57, 1053–1065.

Silinaite $NaLiSi_2O_5 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular to prismatic, to 2 mm; in fibrous clusters; earthy to chalky massive. *Twinning:* About [110], with composition plane {001}.

Physical Properties: *Cleavage:* {001}, perfect; {010}, good; {110}, distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼4.5 D(meas.) = 2.24(1) D(calc.) = 2.23

Optical Properties: Transparent to translucent, opaque. *Color:* Colorless to white. *Streak:* White. *Luster:* Vitreous to earthy. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = 16°$. *Dispersion:* $r > v$, strong, inclined. $\alpha = 1.515(1)$ $\beta = 1.516(1)$ $\gamma = 1.518(1)$ 2V(meas.) = 64(1)° 2V(calc.) = 71°

Cell Data: *Space Group:* $A2/n$. $a = 5.061(1)$ $b = 8.334(2)$ $c = 14.383(3)$ $\beta = 96.67(2)°$ Z = 4

X-ray Powder Pattern: Mont Saint-Hilaire, Canada. 7.14 (100), 4.14 (100), 2.847 (100), 4.24 (80), 4.02 (80), 2.698 (50), 1.610 (40)

Chemistry:

	(1)
SiO_2	58.54
Al_2O_3	0.01
CaO	0.14
Li_2O	[7.28]
Na_2O	14.96
H_2O	[17.56]
Total	[98.49]

(1) Mont Saint-Hilaire, Canada; by electron microprobe, Li_2O and H_2O calculated from stoichiometry of crystal structure; corresponds to $(Na_{0.99}Ca_{0.01})_{\Sigma=1.00}LiSi_{2.00}O_5 \cdot 2H_2O$.

Occurrence: In sodalite syenite xenoliths in nepheline syenite in an intrusive alkalic gabbro-syenite complex.

Association: Ussingite, terskite-(Ce), sérandite, vuonnemite, halite, villiaumite, thermonatrite, aegirine.

Distribution: At Mont Saint-Hilaire, Quebec, Canada.

Name: For SIlicon, LIthium, and sodium, NAtrium, in the composition.

Type Material: Canadian Museum of Nature, Ottawa, 56467, 56468; Royal Ontario Museum, Toronto, Canada, M44516, M44517.

Sillénite $Bi_{12}SiO_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* 23. Crystals are cubes, up to 5 mm; fine-grained granular to massive.

Physical Properties: *Tenacity:* Waxy in part. Hardness = Soft. VHN = 345–386 (50 g load). D(meas.) = 9.16 D(calc.) = 9.18

Optical Properties: Translucent. *Color:* Olive-green, gray-green, yellow-green, yellow, reddish brown; in transmitted light, deep golden brown to yellow. *Streak:* Light yellowish to brownish white. *Luster:* Adamantine.
Optical Class: Isotropic. $n = > 2.50$

Cell Data: *Space Group: I*23. $a = 10.110(2)$ $Z = 2$

X-ray Powder Pattern: Durango, Mexico.
3.216 (10), 1.743 (9), 2.730 (8), 2.939 (7), 1.651 (6), 1.499 (6), 1.216 (5)

Chemistry:

	(1)	(2)
SiO_2	2.22	1.85
Bi_2O_3	97.74	96.48
Total	99.96	98.33

(1) Fuka, Japan; corresponds to $Bi_{11.93}Si_{1.05}O_{20}$. (2) Do.; by electron microprobe, corresponds to $Bi_{12.13}Si_{0.90}O_{20}$.

Occurrence: A secondary mineral formed by the oxidation of bismuth-bearing minerals (Durango, Mexico); in a hydrothermal vein in skarns (Fuka, Japan).

Association: Bismutite (Durango, Mexico); shattuckite, ajoite, duhamelite (Munihuaza, Mexico); calcite (Fuka, Japan).

Distribution: In Mexico, from an unspecified locality in Durango, and at Munihuaza, near Alamos, Sonora. In the Monapo pegmatite, Mocambique district, Mozambique. From Fujikawachi, Oita Prefecture; Fuka, near Bicchu, Okayama Prefecture; and Ishikawa, Fukushima Prefecture, Japan. In the Czech Republic, from near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně.

Name: In honor of Dr. Lars Gunnar Sillén (1916–), Swedish chemist of Stockholm, Sweden.

Type Material: Harvard University, Cambridge, Massachusetts, 83256; National Museum of Natural History, Washington, D.C., USA, C1926.

Sillimanite Al_2SiO_5

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, may be acicular, with square cross sections, rounded and striated, poorly terminated, to 2 cm; as fibrous mats; rarely radiating.

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Uneven. *Tenacity:* Tough in aggregate. Hardness = 6.5–7.5 D(meas.) = 3.23–3.24 D(calc.) = [3.24]

Optical Properties: Transparent to translucent. *Color:* Colorless or white to gray, also brown, yellow, yellow-green, gray-green, blue-green, blue; colorless in thin section. *Streak:* White. *Luster:* Vitreous to subadamantine.
Optical Class: Biaxial (+). *Pleochroism:* If colored, X = pale brown or pale yellow; Y = brown or green; Z = dark brown or blue. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, strong. $\alpha = 1.653–1.661$ $\beta = 1.657–1.662$ $\gamma = 1.672–1.683$ 2V(meas.) = 21°–30°

Cell Data: *Space Group: Pbnm.* a = 7.4883(7) b = 7.6808(7) c = 5.7774(5) Z = 4

X-ray Powder Pattern: Custer, Custer Co., South Dakota, USA.
3.42 (100), 3.37 (65), 2.204 (60), 2.541 (40), 2.679 (30), 2.111 (20), 5.36 (16)

Chemistry:

	(1)
SiO_2	37.08
Al_2O_3	63.11
Fe_2O_3	0.09
Total	100.28

(1) Delaware Co., Pennsylvania, USA; corresponds to $Al_{2.00}Si_{1.00}O_5$.

Polymorphism & Series: Trimorphous with kyanite and andalusite.

Occurrence: In high-grade metamorphic schists, gneisses, and hornfels; more rarely in pegmatites. Also as a detrital mineral.

Association: Andalusite, kyanite, potassic feldspar, almandine, cordierite, biotite, quartz.

Distribution: Of widespread occurrence, but fine examples are uncommon. From the Lisens Alp, Selraintal, Tirol, Austria. At Maršová (Marschendorf), Czech Republic. From Bodenmais, Bavaria, Germany. At Pontgibaud, Auvergne, France. In the USA, from Chester, near Saybrook, Middlesex Co., and near Norwich, New London Co., Connecticut; from Chester, Delaware Co., Pennsylvania; at Monroe, Orange Co., New York. In the Okkampitiya, Ratnapura, Deniyaya, and Balangoda districts, Sri Lanka, as gem crystals. At Christmas Point, Enderby Land, Antarctica.

Name: For Professor Benjamin Silliman (1779–1864), Professor of Chemistry and Mineralogy, Yale University, New Haven, Connecticut, USA.

Silver Ag

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals commonly cubic, octahedral, or dodecahedral, to 2 cm; in parallel groups; more commonly as elongated, wiry, arborescent, or reticulated forms. Massive, in scales, sheets, and as coatings. *Twinning:* On {111} as simple pairs and repeated in aggregates radiating along [111] axes.

Physical Properties: *Fracture:* Hackly. *Tenacity:* Ductile, malleable. Hardness = 2.5–3 VHN = 60–65 (100 g load). D(meas.) = 10.1–11.1 (10.5 when pure). D(calc.) = 10.497

Optical Properties: Opaque. *Color:* Silver-white, tarnishes gray to black; in polished section, brilliant silver-white. *Streak:* Silver-white. *Luster:* Metallic.
R: (400) 83.4, (420) 84.5, (440) 86.0, (460) 87.7, (480) 89.1, (500) 90.5, (520) 91.8, (540) 93.0, (560) 93.5, (580) 93.7, (600) 94.0, (620) 94.4, (640) 94.7, (660) 95.2, (680) 95.6, (700) 96.0

(1) Kongsberg, Norway.

Polymorphism & Series: Forms a series with gold; the cubic form is 3C; hexagonal stacking polytypes 2H and 4H are known.

Occurrence: A primary hydrothermal mineral, also formed by secondary processes, especially in the oxidized portions of mineral deposits.

Association: Acanthite, chlorargyrite, embolite, silver sulfosalts, gold, copper.

Distribution: Numerous localities even for fine specimens. Well-crystallized examples from: in Germany, near Freiberg and Marienberg, Saxony, and at St. Andreasberg, Harz Mountains. Exceptionally developed at Kongsberg, Norway. From Příbram and Jáchymov (Joachimsthal), Czech Republic. In Italy, from Monte Narba, Sarrabus, Sardinia. In the USA, on the Keweenaw Peninsula, Houghton and Keweenaw Cos., Michigan; at Aspen, Pitkin Co., and from Creede, Mineral Co., Colorado; and in Arizona, in the Silver King mine, Pinal Co. In Canada, in large amounts from Cobalt; and in the Thunder Bay district, at Silver Islet, on the north shore of Lake Superior, Ontario. Important production from Mexico, in many states; finely crystallized from Batopilas, Chihuahua; masses over 1500 kg from Arizonac, Sonora. At Chañarcillo, south of Copiapó, Atacama, Chile. In Australia, at Broken Hill, New South Wales.

Name: From an Old English word for the metal *soelfer*, related to the German *silber* and the Dutch *zilver*; the chemical symbol from the Latin *argentum*.

CaO	0.00	0.08
Li_2O	5.45	5.35
Total	99.84	101.01

(1) Radionovskoye pegmatite field, Ukraine; corresponds to $Li_{1.00}(Mg_{1.09}Fe^{3+}_{0.57}Mn^{3+}_{0.34})_{\Sigma=2.00}(P_{1.01}O_4)_2$. (2) Do.; corresponds to $Li_{0.98}(Mg_{0.85}Fe^{3+}_{0.60}Mn^{3+}_{0.52})_{\Sigma=1.97}(P_{1.00}O_4)_2$.

Occurrence: At the contact of a rare-earth-bearing granite pegmatite and phlogopitized ultramafic tremolite rock.

Association: Muscovite, quartz, oligoclase, albite, phlogopite, tourmaline, apatite.

Distribution: In the Radionovskoye pegmatite field, middle Berda River, Zaporozhe district, Ukraine.

Name: For the city of Simferopol, Crimea, Ukraine, where the mineral was studied.

Type Material: n.d.

References: (1) Yakubovich, O.V., V.V. Bairakov, and M.A. Simonov (1989) Crystal structure of simferite $Li(Mg, Fe^{3+}, Mn^{3+})_2[PO_4]_2$. Doklady Acad. Nauk SSSR, 307, 1119–1122 (in Russian). (1) Richelsdorf, Germany; by electron microprobe, average of several determinations; H_2O by Karl Fischer titration, presence established by IR. (2) $Zn_5Cl_2(OH)_8 \cdot H_2O$.

Occurrence: A rare secondary mineral formed by weathering of zinc-bearing slag.

Association: Wülfingite, hydrocerussite, diaboleite, zincite, hydrozincite, zinc.

Distribution: On slag heaps from the foundry at Richelsdorf, Hesse, Germany.

Name: Honors Werner Simon and Kurt Kolle, mineral collectors of Cornberg, near Richelsdorf, Germany.

Type Material: Göttingen University, Göttingen; Heidelberg University, Heidelberg, Germany.

References: (1) Schmetzer, K., G. Schnorrer-Köhler, and O. (1) Alšar, Macedonia; by electron microprobe, corresponds to $Tl_{0.90}Hg_{0.91}(As_{2.63}Sb_{0.11})_{\Sigma=2.74}S_{6.00}$. (2) $TlHgAs_3S_6$.

Occurrence: As inclusions in rebulite.

Association: Rebulite, christite or routhierite, parapierrotite.

Distribution: From Alšar (Allchar), near Rošden, Macedonia [TL].

Name: Apparently to honor Simon Engel, son of Peter Engel, Swiss crystallographer, the principal describer.

Type Material: Natural History Museum, Bern, Switzerland, B2920.

References: (1) Engel, P., W. Nowacki, T. Balić-Žunić, and S. Šćavnićar (1982) The crystal structure of simonite, $TlHgAs_3S_6$. Zeits. Krist., 161, 159–166. (2) (1984) Amer. Mineral., 69, 211 (abs. ref. 1).

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Crystals are hexagonal, commonly flattened on {0001}, or prismatic, may be in parallel, to 1 mm.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = ~1.5 D(meas.) = 3.292 D(calc.) = 3.341

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.657(1)$ $\epsilon = 1.700(1)$

Cell Data: *Space Group:* $R\bar{3}m$. $a = 6.334(2)$ $c = 23.58(1)$ $Z = 3$

X-ray Powder Pattern: Richelsdorf, Germany.
7.87 (100), 2.672 (60), 2.725 (50), 3.58 (40), 3.16 (40), 2.372 (40), 5.33 (30)

Chemistry:

	(1)	(2)
FeO	1.25	
ZnO	73.63	71.40
Cl	11.73	12.44
H_2O	16.21	18.96
$-O = Cl_2$	2.65	2.80
Total	100.17	100.00

(1) Richelsdorf, Germany; by electron microprobe, average of several determinations; H_2O by Karl Fischer titration, presence established by IR. (2) $Zn_5(OH)_8Cl_2 \cdot H_2O$.

Occurrence: A rare secondary mineral formed by weathering of zinc-bearing slag.

Association: Wülfingite, hydrocerussite, diaboleite, zincite, hydrozincite, zinc.

Distribution: On slag heaps from the foundry at Richelsdorf, Hesse, Germany.

Name: Honors Werner Simon and Kurt Kolle, mineral collectors of Cornberg, near Richelsdorf, Germany.

Type Material: Göttingen University, Göttingen; Heidelberg University, Heidelberg, Germany.

References: (1) Schmetzer, K., G. Schnorrer-Köhler, and O. Medenbach (1985) Wülfingite, ϵ–$Zn(OH)_2$, and simonkolleite, $Zn_5(OH)_8Cl_2 \cdot H_2O$, two new minerals from Richelsdorf, Hesse, F.R.G. Simplotite $CaV_4^{4+}O_9 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$, m, or 2. Radiating books of pseudotetragonal plates, showing {101}, to 1 mm; in micaceous plates and hemispherical aggregates.

Physical Properties: *Cleavage:* {010}, perfect, micaceous. Hardness = ∼1
D(meas.) = 2.64(2) D(calc.) = 2.65

Optical Properties: Semitransparent. *Color:* Black, greenish black; yellow-green in thin flakes. *Streak:* Brownish black. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = yellow; $Y = Z$ = green. *Orientation:* $X = b$; $Z \wedge c \simeq -58°$. *Dispersion:* $r > v$, weak, crossed. $\alpha = 1.705(2)$ $\beta = 1.767(2)$ $\gamma = 1.769(2)$
2V(meas.) = ∼25°; after several years dehydration $\alpha = 1.730(5)$ $\beta = 1.781(3)$ $\gamma = 1.807(3)$
2V(meas.) = 40°

Cell Data: *Space Group:* $A2/m$, Am, or $A2$. $a = 8.39(3)$ $b = 17.02(5)$ $c = 8.37(3)$
$\beta = 90°25(5)'$ Z = 4

X-ray Powder Pattern: Colorado Plateau, USA; strong preferred orientation.
8.51 (100), 2.62 (25), 3.14 (18), 4.26 (9), 2.84 (9), 3.42 (6), 2.52 (5)

Chemistry:

	(1)	(2)
V_2O_4	69.0	69.42
V_2O_5	0.5	
CaO	11.8	11.73
H_2O^+	4.0	
H_2O^-	14.7	
H_2O		18.85
Total	[100.0]	100.00

(1) Peanut mine, Colorado, USA; total V and V^{4+} determined directly, V^{5+} by difference, recalculated to 100% after deduction of insoluble 0.5%, mainly SiO_2. (2) $CaV_4O_9 \cdot 5H_2O$.

Occurrence: A secondary mineral on fracture surfaces and replacing fossil wood in Colorado Plateau-type U–V deposits.

Association: Montroseite, duttonite, melanovanadite, selenium, uraninite, coffinite, vanadiferous silicates.

Distribution: In the USA, in Colorado, from the Peanut mine, Bull Canyon, in the J.J. and Hummer mines, Paradox Valley, and at the Shattuck-Denn mine, Club Mesa, Uravan district, Montrose Co., and on the Sundown claim, Gypsum Valley, and the Burro mine, Slick Rock district, San Miguel Co.; from the Vanadium Queen mine, La Sal Creek, San Juan Co., Utah.

Name: For John Richard Simplot (1909–), Boise, Idaho, of the J.R. Simplot Mining Co., which owned the Peanut mine.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115881.

References: (1) Thompson, M.E., C.H. Roach, and R. Meyrowitz (1958) Simplotite, a new quadrivalent vanadium mineral from the Colorado Plateau. Amer. Mineral., 43, 16–24.

Simpsonite $Al_4(Ta,Nb)_3O_{13}(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. Euhedral to subhedral crystals, tabular to short prismatic, with $\{10\bar{1}0\}$ and {0001}, and rarely a few other forms, striated ‖ [0001], to 2.4 cm; commonly in subparallel groups.

Physical Properties: *Fracture:* Conchoidal. Hardness = 7.5 D(meas.) = 6.68–6.82 D(calc.) = [6.82–6.86] Blue-white cathodoluminescence and fluorescence in SW UV, rarely fluoresces yellow.

Optical Properties: Semitransparent. *Color:* White to cream, yellow to yellow-brown when altered; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (–). $\omega = 2.045(5)$ $\epsilon = 2.025(5)$

Cell Data: *Space Group:* $P3$. $a = 7.385$–7.387 $c = 4.515$–4.516 $Z = 1$

X-ray Powder Pattern: Alto do Giz pegmatite, Brazil.
1.651 (100), 2.859 (67), 3.69 (62), 2.131 (59), 1.395 (54), 2.417 (40), 2.609 (37)

Chemistry:

Total	99.96	100.2	99.5

(1) Alto do Giz pegmatite, Brazil. (2) Do.; by electron microprobe, H_2O calculated for O:OH = 13:1; corresponding to $Al_{3.93}Ta_{3.04}O_{13}(OH)$. (3) Mumba, Congo; by electron microprobe, H_2O calculated for O:OH = 13:1, corresponding to $Al_{3.97}Sn_{0.05}(Ta_{2.44}Nb_{0.54})_{\Sigma=2.98}O_{13}(OH)$.

Occurrence: An uncommon accessory mineral in some tantalum-rich granite pegmatites.

Association: Tantalite, manganotantalite, microlite, tapiolite, beryl, spodumene, montebrasite, pollucite, petalite, eucryptite, tourmaline, muscovite, quartz.

Distribution: From Tabba Tabba, Western Australia. At the Alto do Giz pegmatite, near Parelhas, and the Onça mine, about 25 km distant, Rio Grande do Norte, Brazil. In the Al Hayat and Mdara mines, Bikita, and at the Benson No. 3 pegmatite, Mtoko, Zimbabwe. In Congo (Zaire), from Mumba, near Lake Kivu, Kivu Province, and in the Manono pegmatite, Katanga (Shaba) Province. At the Leshaia pegmatite, Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. In Canada, from the Tanco pegmatite, Bernic Lake, Manitoba.

Name: To honor Dr. Edward Sydney Simpson (1875–1939), Western Australian government mineralogist and mineral analyst.

Type Material: Western Australian Museum, Perth, MDC1006, MDC1007; The Natural History Museum, London, England, 1938,122.

Sincosite $\mathbf{CaV_2^{4+}(PO_4)_2(OH)_4 \cdot 3H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Thin tabular, square to rectangular crystals, with {001}, {010}, and {110}, striated on {001} ‖ [100] and [110], to 1 cm, may be composite; in rosettes, crudely radial and in scaly aggregates; botryoidal to nodular massive. *Twinning:* On {110}, rare.

Physical Properties: *Cleavage:* Perfect on {001}; good on {110}; poor on {010}. *Tenacity:* Brittle. Hardness = Soft. D(meas.) = ∼2.84–2.98 D(calc.) = 2.970

Optical Properties: Translucent to transparent in small grains. *Color:* Leek-green, olive-green, pale green, blue-green, brownish green; in transmitted light, light green, olive-green, brownish green, yellowish green, bluish green, typically zoned parallel {001}. *Streak:* Green. *Luster:* Vitreous, submetallic if partially dehydrated.
Optical Class: Uniaxial (–), partially biaxial (–) if dehydrated. *Pleochroism:* Strong; $O = Z =$ gray-green; $E = X =$ nearly colorless to pale yellow. *Dispersion:* $r > v$, faint. $\omega = \sim 1.680$ $\epsilon = \sim 1.655$ $\alpha = 1.670$–1.675 $\beta = 1.690$ $\gamma = 1.693$–1.694 2V(meas.) = 10°–83°

Cell Data: *Space Group:* $P4_2/n$. a = 8.895–9.08 $c = 12.727$–12.86 Z = [4]

X-ray Powder Pattern: Black Hills, South Dakota, USA.
6.35 (100), 3.190 (80), 3.511 (60), 2.682 (50), 2.907 (40), 2.100 (40), 3.841 (25)

Chemistry:

(1) Sincos, Peru. (2) Black Hills, South Dakota, USA; by electron microprobe, average of three analyses, total V as V_2O_4, H_2O by difference. (3) $CaV_2(PO_4)_2(OH)_4 \cdot 3H_2O$.

Occurrence: In veinlets in black carbonaceous shale (Sincos, Peru).

Association: Gypsum (Sincos, Peru); minyulite (Ross Hannibal mine, South Dakota, USA).

Distribution: From Sincos, Junin Province, Peru. In the USA, large crystals in the Ross Hannibal mine, about four km southwest of Lead, Lawrence Co., South Dakota; from Bloomington, Bear Lake Co., and in the Enoch Valley phosphate mine, Soda Springs, Caribou Co., Idaho; in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas; from the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada. At an unspecified locality in Kazakhstan.

Name: For its originally noted occurrence near Sincos, Peru.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 99139, 101699; National Museum of Natural History, Washington, D.C., USA, 95096.

(1) Sri Lanka; corresponds to $Mg_{1.02}(Al_{1.03}Fe^{3+}_{0.03})_{\Sigma=1.06}B_{0.89}O_{3.94}$. (2) Do.; by electron microprobe, average of ten analyses, total Fe as FeO, B_2O_3 calculated from stoichiometry; corresponds to $(Mg_{0.91}Fe^{2+}_{0.04}Al_{0.04})_{\Sigma=0.99}Al_{1.00}BO_4$. (3) $MgAlBO_4$.

Occurrence: A rare accessory mineral formed in boron-rich skarns at the contact of limestones with granite or gneiss.

Association: Spinel, serendibite, ludwigite, warwickite.

Distribution: From Sri Lanka, in gem gravels, in the Ratnapura district, at Nivitigala, Balangoda, Nirialla; around Elahera and Eheliyagoda; and elsewhere. From Mogok, Myanmar, in gem gravels. In the USA, at Johnsburg, Warren Co., New York, and in the Bodnar quarry, near Hamburg, Sussex Co., New Jersey. Found near Bancroft, Ontario, Canada. From the Kwakonje area, Handeni district, Tanzania. In the Tayozhnoye iron deposit, 550 km south of Yakutsk, and the Taiga boron–iron deposit, Sakha, Russia. From the Huayuangou boron deposit, Liaoning Province, China.

Name: From *Sinhala*, the Sanskrit name for Ceylon.

Type Material: The Natural History Museum, London, England, 1952,36–1952,37 and other earlier museum specimens.

(1) Barker mine, South Dakota, USA; corresponds to $(Mn_{0.71}Ca_{0.24}Fe_{0.15}Mg_{0.02}Na_{0.01})_{\Sigma=1.13}(Al_{0.74}Fe^{3+}_{0.26})_{\Sigma=1.00}(PO_3OH)_{2.00}(OH)_{1.26}\cdot 6.35H_2O$. (2) Do.; by electron microprobe, total Fe as FeO, total Mn as MnO, H_2O by the Penfield method, normalized to 100.0% with H_2O as determined, from an original total of 106.5%, thought high due to loss of H_2O in the electron beam; then corresponds to $(Mn_{0.64}Fe_{0.38}Mg_{0.02})_{\Sigma=1.04}Al_{1.00}(PO_3OH)_{2.08}[(OH)_{0.44}F_{0.42}]_{\Sigma=0.86}\cdot 5.56H_2O$. (3) $MnAl(PO_3OH)_2(OH)\cdot 6H_2O$.

Occurrence: A late-stage hydrothermal alteration product of triphylite in complex zoned granite pegmatites.

Association: Vivianite, huréaulite, carbonate-apatite, strengite, barbosalite, fluellite (Barker pegmatite, South Dakota, USA).

Distribution: In the USA, from the Barker (Ferguson) mine, five km southeast of Keystone, Pennington Co., South Dakota; and in the Palermo #3 mine, near North Groton, Grafton Co., New Hampshire.

Name: To honor Dr. John Sinkankas (1915–2002), American author and bibliographer on mineralogical and gemological subjects.

Type Material: The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA, 149597.

References: (1) Peacor, D.R., P.J. Dunn, W.L. Roberts, T.J. Campbell, and W.B. Simmons (1984) Sinkankasite, a new phosphate from the Barker pegmatite, South Dakota. Amer. Mineral., 69, 380–382. As	29.2	29.7	30.91
S	29.8	28.7	29.77
Total	100.3	97.5	100.00

(1) Binntal, Switzerland; by electron microprobe, corresponding to $Cu_{6.29}As_{3.77}S_{9.00}$. (2) Do.; by electron microprobe, corresponding to $Cu_{6.19}As_{3.99}S_{9.00}$. (3) $Cu_6As_4S_9$.

Occurrence: On sulfides in crystalline dolostone.

Association: Tennantite, galena, sphalerite.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: Honors Rudolph von Sinner (1890–1960), President of the Commission of the Natural History Museum, Bern, Switzerland.

Type Material: Mineralogical-Petrographical Institute, University of Bern, Bern, Switzerland, L2120-62; University of Copenhagen, Copenhagen, Denmark.

Sinoite Si_2N_2O

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Rarely in lathlike crystals, to 200 μm, and in granular aggregates.

Physical Properties: Hardness = n.d. D(meas.) = 2.80–2.85 D(calc.) = 2.84 Bright greenish yellow cathodoluminescence.

Optical Properties: Transparent. *Color:* Colorless in thin section; light gray in reflected light.
Optical Class: Biaxial (–) (probable). *Orientation:* $Z = c$. $\alpha = 1.740$ β = n.d. , close to γ. $\gamma = 1.855$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $Cmc2_1$ (synthetic). $a = 8.843(5)$ $b = 5.473(5)$ $c = 4.835(5)$ Z = 4

X-ray Powder Pattern: Synthetic.
4.43 (10), 3.36 (10), 4.66 (8), 2.61 (5), 2.42 (5), 2.39 (4), 4.13 (3)

Chemistry:

Si	56.6	56.7	56.07
N	31.5	31.7	27.96
O	13.1	13.0	15.97
Total	101.2	101.4	100.00

(1) Jajh deh Kot Lalu meteorite; by electron microprobe, average of several hundred determinations; corresponds to $Si_{2.00}N_{2.23}O_{0.81}$. (2) Hvittis meteorite; by electron microprobe. (3) Si_2N_2O.

Occurrence: A rare mineral embedded in enstatite in chondritic meteorites.

Association: Enstatite, nickel-iron, plagioclase, troilite, pigeonite, daubreelite, oldhamite, ferroan alabandite, graphite, tridymite (Jajh deh Kot Lalu meteorite).

Distribution: In the Jajh deh Kot Lalu, Hvittis, Ufana, Yilmia, and Pillistfer enstatite chondrite meteorites.

Name: For SIlicon, Nitrogen, and Oxygen in the composition.

Type Material: American Museum of Natural History, New York, New York, USA, 3954.

Sitinakite $KNa_2Ti_4Si_2O_{13}(OH)\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals equant to stubby prismatic, to 4 mm; in aggregates.

Physical Properties: *Cleavage:* {100} and {001}, perfect. Hardness = 4.5
D(meas.) = 2.86(6) D(calc.) = 2.89

Optical Properties: Semitransparent. *Color:* Colorless, light brown, pale rose.
Streak: White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.780(3)$ $\epsilon = 1.988(3)$

Cell Data: *Space Group:* $P4_2/mcm$. $a = 7.819(2)$ $c = 12.099(4)$ $Z = 2$

X-ray Powder Pattern: Khibiny massif, Russia.
7.84 (100), 6.02 (100), 3.25 (80), 2.003 (70), 2.608 (60), 3.36 (50), 2.805 (50)

Chemistry:

	(1)		(1)
SiO_2	17.80	CaO	0.05
TiO_2	46.68	SrO	0.96
ZrO_2	0.08	BaO	0.58
Ce_2O_3	0.12	Na_2O	10.79
Fe_2O_3	0.16	K_2O	4.93
Nb_2O_5	5.05	H_2O	11.7
Ta_2O_5	0.05	Total	98.95

(1) Khibiny massif, Russia; by electron microprobe, average of three analyses, H_2O by TGA; corresponds to $K_{0.68}Na_{2.28}Sr_{0.06}Ba_{0.02}Ca_{0.01}(Ti_{3.82}Nb_{0.25}Fe_{0.01})_{\Sigma=4.08}Si_{1.94}O_{13}[(OH)_{0.54}O_{0.46}]_{\Sigma=1.00}\cdot 3.98H_2O$.

Occurrence: In hydrothermally altered portions of alkalic pegmatites in a differentiated alkalic massif.

Association: Nepheline, natrolite, aegirine, microcline, apatite, vinogradovite.

Distribution: On Mts. Kukisvumchorr and Yukspor, Khibiny massif, Kola Peninsula, Russia.

Name: For SIlicon; TItanium; sodium, NAtrium; and potassium, Kalium, in its composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, ining Institute, St. Petersburg, Russia, 2021/1; The Natural History Museum, London, England, 1994,31.

Sjögrenite $Mg_6Fe^{3+}_2(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As broad basal plates bounded by rough pyramid and prism faces; commonly intergrown with pyroaurite.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Laminae flexible, not elastic. Hardness = 2.5 D(meas.) = 2.11(3) D(calc.) = 2.11

Optical Properties: Transparent to nearly opaque. *Color:* Cream-white, pale yellow, orange, pale brown, nearly colorless; colorless in transmitted light. *Luster:* Waxy to vitreous, pearly on cleavages.
Optical Class: Uniaxial (–). *Pleochroism:* O = pale yellow to brown; E = colorless.
$\omega = 1.573(3)$ $\epsilon = 1.550(3)$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 3.113(3)$ $c = 15.61(1)$ Z = 1/4

X-ray Powder Pattern: Långban, Sweden.
7.78 (10), 3.90 (6), 2.54 (5), 2.21 (5), 1.87 (5), 2.65 (4), 2.39 (3)

(1) Långban, Sweden; mixture of pyroaurite and sjögrenite. (2) Zlatogor intrusive, Kazakhstan; by electron microprobe, five partial elemental analyses, here converted to oxides. (3) $Mg_6Fe_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with pyroaurite.

Mineral Group: Manasseite group.

Occurrence: In low-temperature hydrothermal veins in a metamorphosed Fe–Mn orebody (Långban, Sweden); in a vein in serpentinized dunite (Zlatogor intrusive, Kazakhstan); in a vein in a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Pyroaurite, calcite (Långban, Sweden); pokrovskite, magnesite (Zlatogor intrusive, Kazakhstan); pyroaurite, willemite, chlorophoenicite, barite, sphalerite (Sterling Hill, New Jersey, USA).

Distribution: From Långban and Nordmark, Värmland, Sweden. In the Phlogopite mine, Kovdor massif, Kola Peninsula, Russia. From the Zlatogor layered intrusive, northern Kazakhstan. Found at Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For Stens Anders Hjalmar Sjögren (1856–1922), Swedish mineralogist, Professor of Mineralogy, University of Stockholm, Stockholm, Sweden.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 83907.

Skinnerite Cu_3SbS_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As irregular grains, to 0.1 mm. *Twinning:* Microscopic to submicroscopic about {001}.

Physical Properties: Hardness = n.d. VHN = 148–166 (50 g load). D(meas.) = n.d. D(calc.) = 5.10

Optical Properties: Opaque, transparent in very thin sections. *Color:* In polished section, pale bluish gray, with deep red internal reflections; very deep red in transmitted light. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Distinct; pale purple to grayish yellow. R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 7.814(1)$ $b = 10.242(1)$ $c = 13.273(1)$ $\beta = 90.29(1)^\circ$ Z = 8

X-ray Powder Pattern: Synthetic.
2.830 (100), 2.628 (90), 2.619 (90), 3.911 (80), 3.208 (70), 3.192 (70), 3.048 (70)

Chemistry:

	(1)	(2)
Cu	46.08	46.66
Ag	2.01	
Sb	29.06	29.80
S	22.79	23.54
Total	99.94	100.00

(1) Ilímaussaq intrusion, Greenland; by electron microprobe, average of 15 analyses; corresponding to $Cu_{3.06}Ag_{0.08}Sb_{1.01}S_{3.00}$. (2) Cu_3SbS_3.

Occurrence: In a complex of analcime-natrolite veins cutting naujaites (Ilímaussaq intrusion, Greenland).

Association: Sénarmontite, valentinite, tetrahedrite, antimony, chalcostibite, löllingite, galena, natrolite, analcime, ussingite, sodalite, feldspars, acmite, arfvedsonite, steenstrupine-(Ce) (Ilímaussaq intrusion, Greenland).

Distribution: From the Ilímaussaq intrusion, southern Greenland [TL]. In the Clara mine, near Oberwolfach, Black Forest, Germany. At Košice, Czech Republic. From near Belmont, Belmont district, Nye Co., Nevada, USA.

Name: In honor of Professor Brian John Skinner (1928–), Australian-American economic geologist, Yale University, New Haven, Connecticut, USA.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1979.1121; Mineralogical-Petrographical Institute, University of Bern, Bern, Switzerland.

(1) Otish Mountains deposit, Canada; by electron microprobe, average of six analyses; corresponding to $(Bi_{2.07}Cu_{0.02}Pb_{0.01})_{\Sigma=2.10}Se_{2.02}(Te_{0.87}S_{0.13})_{\Sigma=1.00}$. (2) Bi_2Se_2Te.

Mineral Group: Tetradymite group.

Occurrence: In a vein-type uranium deposit with other tellurides and selenides.

Association: Watkinsonite, součekite, clausthalite, chalcopyrite, Au–Ag alloy.

Distribution: From the Otish Mountains uranium deposit, Quebec, Canada [TL].

Name: To honor Professor George Skippen (1936–), Canadian geologist, Carleton University, Ottawa, Canada.

Type Material: n.d.

Total	99.40	100.00

(1) Shinkolobwe, Congo. (2) $(H_3O)_2Mg(UO_2)_2(SiO_4)_2 \cdot 2H_2O$.

Occurrence: A rare secondary mineral formed by the action of silica-bearing waters on uraninite or earlier-formed secondary uranium minerals.

Association: Kasolite, soddyite, torbernite, uranophane, uranophane-beta, nováčekite, metazeunerite, curite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the USA, from the Grants district, McKinley Co., New Mexico; at the Oyler Tunnel claim, near Fruita, Wayne Co., and from the Honeycomb Hills, Juab Co., Utah; in the New Haven mine, Crook Co., Wyoming; and in the Ross-Adams mine, Bokan Mountain, Prince of Wales Island, Alaska. From the Santo Domingo mine, Santa Eulalia, Chihuahua, Mexico. In the Pedra Preta mine, Brumado district, Bahia, Brazil. In the Nabarlek and Koongara uranium deposits and at Rum Jungle, Northern Territory, Australia. In the Rabéjac uranium deposit, seven km south-southwest of Lodève, Hérault, France.

Name: For Marie Sklodowska-Curie (1867–1934), Polish-French physicist and chemist, pioneer worker on radioactivity.

Type Material: n.d.

Total	99.69	100.00

1) Skorpion mine, Lüderitz district, Karas region, south-western Namibia; average of 17 electron microprobe analyses, anionic groups confirmed by IR, H_2O and CO_2 calculated, corresponding to $Ca_{3.05}Zn_{1.96}(PO_4)_{1.99}(CO_3)_{1.00}(OH)_{2.06} \cdot 0.98H_2O$. (2) $Ca_3Zn_2(PO_4)_2CO_3(OH)_2 \cdot H_2O$.

Occurrence: A secondary mineral in an oxidized non-sulfide zinc deposit formed by weathering of sediment- and volcanic-hosted disseminated sulfide minerals.

Association: Tarbuttite, hydrozincite, gypsum.

Distribution: Skorpion zinc mine, Lüderitz district, Karas region, south-western Namibia.

Name: For the locality that produced the first specimens.

Type Material: Mineralogical Institute, University of Bochum, Germany, IMA 2005-010.

Skutterudite $CoAs_{2-3}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Crystals are cubes, octahedra, dodecahedra, to 9 cm; rarely prismatic; in skeletal growth forms, distorted aggregates; also massive, granular and dense. *Twinning:* On {112} as sixlings and complex shapes; also reported on {011}.

Physical Properties: *Cleavage:* Distinct on {001} and {111}; in traces on {011}. *Fracture:* Conchoidal to uneven. Hardness = 5.5–6 VHN = 606–824; 810–915 (100 g load). D(meas.) = 6.5 D(calc.) = 6.821

Optical Properties: Opaque. *Color:* Tin-white to silver-gray, tarnishes gray or iridescent; in polished section, gray, creamy or golden white. *Streak:* Black. *Luster:* Metallic.
R: (400) 55.3, (420) 56.0, (440) 56.4, (460) 56.6, (480) 56.4, (500) 56.1, (520) 55.7, (540) 55.3, (560) 55.0, (580) 54.7, (600) 54.4, (620) 54.1, (640) 53.8, (660) 53.5, (680) 53.1, (700) 52.7

Cell Data: *Space Group:* $Im3$. $a = 8.195(3)$ $Z = 8$

X-ray Powder Pattern: Synthetic $CoAs_3$.

(1) Skutterud, Norway; recalculated after deduction of SiO_2 5.63%; corresponding to $(Co_{0.87}Fe_{0.13})_{\Sigma=1.00}(As_{2.65}S_{0.08})_{\Sigma=2.73}$. (2) Cobalt, Canada; by electron microprobe, corresponding to $(Co_{0.83}Fe_{0.09}Ni_{0.08})_{\Sigma=1.00}(As_{2.60}S_{0.17})_{\Sigma=2.77}$. (3) $CoAs_2$. (4) $CoAs_3$.

Polymorphism & Series: Forms a series with nickel-skutterudite.

Occurrence: Typically in medium- to high-temperature hydrothermal veins with other Ni–Co sulfide minerals.

Association: Nickeline, cobaltite, arsenopyrite, silver, silver sulfosalts, bismuth, calcite, siderite, barite, quartz.

Distribution: From many localities as an accessory mineral, only rarely as an important ore or in fine specimens. In Norway, from Skutterud, Modum [TL]. At Schneeberg, Annaberg, and Freiberg, Saxony, Germany. From Austria, at Lölling, Carinthia. In Spain, in the valley of Gistain, Huesca Province. From France, at Riomanou, Hautes-Pyrénées, and on Mount Chalanches, Isère. At Talnotry, Kirkcudbrightshire, Scotland. From a number of mines in Cornwall, England. At Khovu-Akay, Tuva, Russia. Well-crystallized from the Aghbar (Arhbar) and Irhtem (Ightem) mines, Bou Azzer district, Morocco. In the USA, in Connecticut, at Chatham, Middlesex Co.; and from Mine la Motte, Madison Co., Missouri. In Canada, in large amounts at Cobalt; in South Lorrain Township; at Sudbury; and Gowganda, Ontario.

Name: For the Norwegian locality at Skutterud.

Type Material: Mining Academy, Freiberg, Germany, 3910.

(1) Quebrada de La Alcaparrosa, Argentina. (2) $NaMg_2Fe_5(SO_4)_7(OH)_6 \cdot 33H_2O$.

Occurrence: An uncommon secondary oxidation product of pyrite in shales and slates.

Association: Halotrichite, pickeringite, fibroferrite, copiapite, melanterite, epsomite, jarosite, gypsum.

Distribution: In the Czech Republic, on Valachov Hill, near Skřivaň; from Troja, near Prague; and at Mandát. From Medzev, 26 km west of Košice, Slovakia. At Rudabánya, Hungary. From Pöham, near Radstadt, Austria. At Franquenies, Belgium. From Le Kaymar, Aveyron, France. At Wiescoszowice, Poland. In the Servette mine, Saint Marcel, Val d'Aosta, Piedmont, Italy. From the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. At Alum Cave Bluff, Sevier Co., Tennessee, USA.

Name: In honor of František Slavík (1876–1957), Professor of Mineralogy, Charles University, Prague, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 8877.

Slawsonite $(Sr,Ca)Al_2Si_2O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular crystals, elongated along [110], with {110} and {001}, to 7 cm; in radial aggregates.

Physical Properties: *Cleavage:* Good on {001}, fair to good on {100}.
Fracture: Subconchoidal. Hardness = 5.5–6.5 D(meas.) = 3.05(1) D(calc.) = 3.044
May fluoresce intense pinkish red-purple under SW UV.

Optical Properties: Semitransparent. *Color:* Light gray to colorless; colorless in thin section.
Streak: White.
Optical Class: Biaxial (–). *Orientation:* $Y \wedge c = 5°$–$11°$. *Dispersion:* $r < v$, medium, or $r > v$, very weak. $\alpha = 1.570$–1.573 $\beta = 1.581$–1.582 $\gamma = 1.585$–1.586 2V(meas.) = 55°–82°

Cell Data: *Space Group:* $P2_1/a$. $a = 8.888(2)$ $b = 9.344(2)$ $c = 8.326(3)$ $\beta = 90.33(2)°$
Z = [4]

(1) Wallowa Mountains, Oregon, USA; corresponds to $(Sr_{0.82}Ca_{0.13}Mg_{0.02})_{\Sigma=0.97}(Al_{1.84}Fe^{3+}_{0.05})_{\Sigma=1.89}(Si_{2.06}Ti_{0.01})_{\Sigma=2.07}O_8$. (2) Rendai, Japan; by electron microprobe, corresponds to $(Sr_{0.98}Ca_{0.02})_{\Sigma=1.00}Al_{1.93}Si_{2.04}O_8$.

Mineral Group: Feldspar group.

Occurrence: In pectolite veinlets in metamorphosed xenoliths (Rendai, Japan); in a xenolith in ultramafic rock (Sarusaka, Japan).

Association: Calcite, phlogopite, albite, pyrite (Wallowa Mountains, Oregon, USA); celsian, cymrite, xonotlite, prehnite, grossular, diopside (Sarusaka, Japan).

Distribution: From the Wallowa Mountains, Wallowa Co., Oregon, USA. In Japan, in Kochi Prefecture, from Sarusaka, Kamagi; Rendai, Kochi City; and Miyanotani, Hidaka.

Name: For Professor Chester Baker Slawson (1898–1964), mineralogist at the University of Michigan, Ann Arbor, Michigan, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 122831–122833.

(1) Binntal, Switzerland. (2) $AgAsS_2$.

Polymorphism & Series: Dimorphous with trechmannite.

Occurrence: Of hydrothermal origin with other Ag–As sulfides.

Association: Sphalerite, pyrite, realgar, orpiment, hutchinsonite, sartorite, rathite (Binntal, Switzerland); chabournéite, pierrotite, parapierrotite, stibnite, pyrite, sphalerite, twinnite, zinkenite, madocite, andorite, laffittite, routhierite, aktashite, wakabayashilite, realgar, orpiment (Jas Roux, France); proustite, gersdorffite, argentian miargyrite (Silvermines, Ireland).

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL]. At the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France. From Wiesloch, Black Forest, Germany. At Silvermines, Co. Tipperary, Ireland.

Name: In honor of George Frederick Herbert Smith (1872–1953), crystallographer of the British Museum (Natural History), London, England.

Type Material: n.d.

Smithsonite $ZnCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. Uncommon as crystals, to 10 cm, rhombohedral $\{10\bar{1}1\}$ and scalenohedral $\{21\bar{3}1\}$, with $\{10\bar{1}0\}$, $\{0001\}$, additional modifying forms, with curved faces; typically botryoidal, reniform, spherulitic; stalactitic, and as cave pearls; earthy, friable, granular to porous or compact massive.

Physical Properties: *Cleavage:* On $\{10\bar{1}1\}$, nearly perfect. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 4.43(1) D(calc.) = 4.43 May fluoresce pale green or pale blue under UV.

Optical Properties: Translucent to transparent. *Color:* White, pale gray, dark gray, pale brown, brown, more rarely pale shades of red, pink, orange, yellow, green, apple-green, emerald-green, blue, bluish gray; colorless to faintly tinted in transmitted light. *Streak:* White. *Luster:* Vitreous, may be pearly.
Optical Class: Uniaxial (–). $\omega = 1.842–1.850$ $\epsilon = 1.619–1.623$

Cell Data: *Space Group:* $R\bar{3}c$. $a = 4.6526(7)$ $c = 15.0257(22)$ $Z = 6$

X-ray Powder Pattern: Kabwe, Zambia.
2.760 (100), 3.55 (50), 1.703 (45), 2.327 (25), 1.946 (25), 2.110 (18), 1.515 (14)

Chemistry:

	(1)	(2)
CO_2	35.25	35.10
ZnO	64.55	64.90
MgO	0.04	
CaO	0.35	
insol.	0.07	
Total	100.26	100.00

(1) Aachen district, Germany. (2) $ZnCO_3$.

Polymorphism & Series: Forms two series, with rhodochrosite and with siderite.

Mineral Group: Calcite group.

Occurrence: A secondary mineral formed in the oxidized zone of zinc-bearing deposits and replacing adjacent carbonate rocks, where it may constitute an ore.

Association: Hemimorphite, willemite, hydrozincite, cerussite, malachite, azurite, aurichalcite, anglesite.

Distribution: Many localities, even for fine specimens, including: abundant at Laurium, Greece. In major ore deposits at Tarnowitz and Beuthen, Poland. From Moresnet, Belgium. At Altenberg, near Aachen, North Rhine-Westphalia, Germany. Good crystals from Chessy, near Lyon, Rhône, France. At Bleiberg, Carinthia, Austria. From Iglesias, Sardinia, Italy. Large crystals at Kabwe (Broken Hill), Zambia. Abundant in fine specimens with large crystals, from Tsumeb, Namibia. In the USA, at Friedensville, Lehigh Co., Pennsylvania; in the Joplin district, Jasper Co., Missouri; from the Rush Creek district, Marion Co., Arkansas; an ore at Leadville, Lake Co., Colorado; in the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona; fine examples from the Kelly mine, Magdalena, Socorro Co., New Mexico. In Mexico, abundant at Santa Eulalia, Chihuahua, and from Choix, Sinaloa. At Trang da, Tonkin, North Vietnam. From Broken Hill, New South Wales, Australia.

Name: To honor James Lewis (Macie) Smithson (1754–1829), British chemist and mineralogist, whose bequest founded the Smithsonian Institution, Washington, D.C., USA.

Total	99.7	100.87

(1) [Khovu-Aksy deposit, Russia or Bou Azzer, Morocco]; IR confirms $(AsO_4)^{3-}$, H_2O, and lack of $(OH)^{1-}$; with $(OH)^{1-}$ for charge balance, corresponds to $(Co_{1.21}Ni_{1.08}Mg_{0.87}Ca_{0.74})_{\Sigma=3.90}(Fe_{1.67}Al_{0.33})_{\Sigma=2.00}(AsO_4)_{4.11}(OH)_{1.47} \cdot 11H_2O$. (2) Mt. Cobalt, Australia; Fe^{3+} confirmed by Mössbauer spectra, H_2O by a microgravimetric technique; with $(OH)^{1-}$ for charge balance, corresponds to $(Co_{2.02}Ca_{0.93}Mg_{0.33}Ni_{0.06})_{\Sigma=3.34}(Fe_{1.53}Al_{0.47})_{\Sigma=2.00}(AsO_4)_{3.89}(OH)_{1.01} \cdot 11H_2O$.

Occurrence: An oxidation product of Ni–Co arsenides.

Association: Erythrite, pharmacolite, quartz.

Distribution: From the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, Russia. At the Bastnäs mine, near Riddarhyttan, Västmanland, Sweden. From Bou Azzer, Morocco. On Mt. Cobalt, 110 km south of Cloncurry, Queensland, and in the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia. At the Sara Alicia mine, near Alamos, Sonora, Mexico. From Schneeberg, Saxony, Germany. At the Muckross mine, Co. Kerry, Ireland.

Name: To honor Professor Nikolai Alekseevich Smol'yaninov (1885–1957), Russian mineralogist, Moscow University, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1286/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64823.

Total	[99.77]	100.00

(1) Smrkovec, Czech Republic; by electron microprobe, average of five analyses, H_2O calculated for stoichiometry; corresponds to $Bi_{2.01}O_{1.00}[(PO_4)_{0.98}(AsO_4)_{0.01}]_{\Sigma=0.99}(OH)_{1.00}$.
(2) $Bi_2O(PO_4)(OH)$.

Occurrence: A rare secondary mineral formed by weathering, found in old mine dumps at an Ag–Bi–As–U deposit.

Association: Quartz, atelestite, bismutite, bismutoferrite, eulytite, metatorbernite, petitjeanite, preisingerite, pucherite, retgersite, sillénite.

Distribution: From near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně (Marienbad), Czech Republic.

Name: For its first-noted occurrence near Smrkovec, Czech Republic.

Type Material: National Museum, Prague, Czech Republic, P1N84596.

(1) Bloomington, Indiana, USA; by electron microprobe, average of seven analyses; corresponds to $(Fe_{3.20}Ni_{0.06})_{\Sigma=3.26}S_{4.00}$. (2) Landsberg, Germany; by electron microprobe, corresponds to $Fe_{3.21}S_{4.00}$. (3) Fe_3S_4.

Occurrence: Formed as a low-temperature oxidation product of the strongly magnetic monoclinic phase of pyrrhotite, as inclusions in calcite crystals in quartz geodes; also in hydrothermal veins.

Association: Pyrite, greigite, mackinawite, pyrrhotite, marcasite, magnetite, sphalerite, galena, chalcopyrite, calcite.

Distribution: In the USA, in Monroe Co., Indiana, from a road cut about 3 km north of Bloomington [TL], and near Unionville; at the Kramer borate deposit, Boron, Kern Co., California; and from near Helena, Lewis and Clark Co., Montana. In Canada, from the Silverfields mine, at Cobalt, and the Nicopor mine, north of Schreiber, Ontario; in the Bird River mines, Lac du Bonnet area, Manitoba; and elsewhere. In Ukraine, from the Kimmerian sedimentary iron ores of the Kerch Peninsula. In the Kamaishi mine, Iwate Prefecture, Japan. In the Lengenbach quarry, Binntal, Valais, and Trimbach, near Olten, Switzerland. In Germany, from Hartenstein, Saxony; in the Clara mine, near Oberwolfach, Black Forest; and at Landsberg, near Obermoschel, Rhineland-Palatinate. From the Ceragiola quarry, near Seravezza, Tuscany, Italy. At Wadi Kamal, Saudi Arabia.

Name: Honors Professor Charles Henry Smyth, Jr. (1866–1937), economic geologist and petrologist, Princeton University, Princeton, New Jersey, USA.

Polymorphism & Series: Forms a series with kotulskite.

Mineral Group: Nickeline group.

Occurrence: In massive and disseminated Cu–Ni–PGE minerals; in copper deposits in organic-rich limestones; along grain boundaries in silicates in layered intrusives.

Association: Paolovite, sperrylite, altaite, taimyrite, silver, polarite, talnakhite, chalcopyrite, cubanite, mooihoekite, troilite, pyrrhotite, galena (Oktyabr mine, Russia); platinian gold, palladium (Lubin mine, Poland).

Distribution: In Russia, from the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia [TL]; in the Federov Pansky layered mafic intrusion, Kola Peninsula; at the Vostok deposit, Lukkulaisvaara layered intrusion, and the Burakovsky complex, Karelia; in the Kingash massif, eastern Sayan. From the Keivitsansarvi Ni–Cu–PGE deposit, Keivitsa intrusion, northern Finland. In the Lubin and Polkovice copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland. From the Onverwacht mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. At the Wellgreen Ni–Cu–PGE deposit, Yukon Territory; from Blue Lake, Quebec; in footwall and deposits of the Sudbury igneous complex, Ontario, Canada. From the Bacuri complex, Amapá, Brazil. Additional localities are now known.

Name: Honors Petr Grigorevich Sobolevski (1781–1841), Russian metallurgist, who studied the platinum deposits of the Ural Mountains.

Type Material: Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Total	99.82

(1) Mont Saint-Hilaire, Canada; by electron microprobe, corresponds to $Na_{7.50}Fe_{0.05}Al_{5.93}Si_{6.07}O_{23.83}[Cl_{1.99}(SO_4)_{0.01}]_{\Sigma=2.00}$.

Mineral Group: Sodalite group.

Occurrence: Formed in nepheline syenites, phonolites, and related rock types. In metasomatized calcareous rocks, and in cavities in ejected volcanic blocks.

Association: Nepheline, cancrinite, titanian andradite, aegirine, microcline, sanidine, albite, calcite, fluorite, ankerite, barite.

Distribution: Widespread; some prominent localities include: on the Kangerdluarssuk Plateau and around the Tunugdliarfik Fjord, in the Ilímaussaq intrusion, southern Greenland. From the Langesundsfjord, Norway. In the Khibiny and Lovozero massifs, Kola Peninsula, Russia. From Monte Somma and Vesuvius, Campania, Italy. At the Bellerberg volcano, two km north of Mayen, and elsewhere in the Eifel district, Germany. From Litchfield, Kennebec Co., Maine, and at Magnet Cove, Hot Spring Co., Arkansas, USA. In Canada, from Bancroft, Ontario; at Mont Saint-Hilaire, Quebec; and along the Ice River, at Kicking Horse Pass, British Columbia. From Cerro Sapo, Cochabamba, Bolivia.

Name: In allusion to its *sodium* content.

(1) Kasolo, Congo. (2) $(UO_2)_2SiO_4 \cdot 2H_2O$.

Occurrence: A secondary mineral formed by oxidation of uraninite.

Association: Kasolite, sklodowskite, uranophane, torbernite, curite.

Distribution: From Kasolo, Swambo, and in the Musonoi mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). At the Norrabees pegmatite, Namaqualand, Cape Province, South Africa. In the Krunkelbachtal mine, near Menzenschwand, Black Forest, Germany. In the USA, in the Ruggles pegmatite, Grafton, Grafton Co., New Hampshire; at the Steel City mine, Yavapai Co., Arizona; from the Jackpile mine, Laguna, Valencia Co., New Mexico; in the Lucky Mc mine, Fremont Co., Wyoming; from the Honeycomb Hills, Juab Co., Utah; and at the Lookout No. 22 claim, Marshall Pass, Saguache Co., Colorado. On Mt. Painter, Flinders Ranges, South Australia, and from South Alligator Valley, Northern Territory, Australia.

Name: For Frederick Soddy (1877–1956), British radiochemist.

Type Material: Natural History Museum, Paris, France, 122.122/3

Sodium alum $NaAl(SO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As octahedral crystals, to 1 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼3 D(meas.) = 1.64 (synthetic). D(calc.) = 1.670 (synthetic). Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Isotropic. $n = 1.4388$

Cell Data: *Space Group:* $Pa3$. $a = 12.214(1)$ $Z = 4$

X-ray Powder Pattern: Synthetic.
4.314 (100), 2.962 (35), 3.526 (14), 7.05(7), 1.9077 (7), 3.263 (6), 2.493 (6)

Chemistry: (1) There are apparently no analyses of natural material.

Occurrence: A sublimate on burning coal heaps (Bátonyterenye, Hungary); a recent precipitate (Recsk mine, Hungary).

Association: Blödite, kröhnkite (Recsk mine, Hungary).

Distribution: Earlier reported localities require confirmation by modern methods. Recently identified in Hungary, from the Recsk copper mine, Mátra Mountains, and at Bátonyterenye.

Name: For its *sodium* content, and as a hydrated aluminum sulfate.

Type Material: n.d.

Sodium betpakdalite $(Na, Ca)_3Fe_2^{3+}Mo_6^{6+}As_2^{5+}O_{28}\cdot 15H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals are pseudohexagonal, very thin, platy, to several μm; as powdery aggregates, crusts, and films.

Physical Properties: Hardness = n.d. D(meas.) = 2.02 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Lemon-yellow. *Luster:* Dull in aggregates. *Optical Class:* Biaxial. *Pleochroism:* Distinct; X = pale yellow; Z = yellow. *Orientation:* $Z \wedge$ elongation = 38°. *Absorption:* $Z > X$. $\alpha = 1.792$ β = n.d. $\gamma = 1.810$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: [Kyzylsai deposit, Kazakhstan].
8.73 (10), 3.629 (9), 1.836 (8), 3.243 (7), 2.940 (7), 2.752 (7), 2.071 (7)

MgO	0.22
CaO	4.23
Na_2O	3.14
K_2O	0.20
H_2O^+	16.65
Total	[100.44]

(1) [Kyzylsai deposit, Kazakhstan]; original total given as 100.48%, H_2O confirmed by IR; corresponds to $(Na_{1.71}Ca_{1.28})_{\Sigma=2.99}Fe^{3+}_{2.05}Mo^{6+}_{5.90}As^{5+}_{2.05}O_{28}\cdot 15.27H_2O$.

Occurrence: A rare secondary mineral formed in the oxidation zone of a Mo–U deposit.

Association: Natrojarosite, goethite, arsenian pyrite, calcite.

Distribution: From an unspecified locality [Kyzylsai deposit, Chu-Ili Mountains, southwestern Balkhash Lake region, Kazakhstan].

Name: For a *sodium*-bearing mineral showing some relation to *betpakdalite*.

Type Material: Mining Institute, St. Petersburg, 1883/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74275, 74276.

MgO	0.00
CaO	4.35
Na_2O	4.21
K_2O	3.10
H_2O	8.70
LOI	14.23
Total	[109.41]

(1) Kyzylsai district, Kazakhstan; contained quartz and calcite, original total given as 100.71%; after subtracting impurities, corresponds to $(H_3O)(Na_{0.7}K_{0.3})_{\Sigma=1.0}(UO_2)(SiO_4) \cdot H_2O$.

Occurrence: A minor secondary mineral formed from subalkaline groundwater in the near-surface parts of uranium deposits in arid regions.

Association: Kaolinite, calcite, feldspar, quartz, gypsum, Fe-Mn oxides and hydroxides.

Distribution: Found at an unnamed uranium deposit, Kyzylsai district, Chu-Ili Mountains, Balkhash Lake region, Kazakhstan.

Name: For *sodium* in its composition and its relation to *boltwoodite*.

Type Material: n.d.

References: (1) Chernikov, A.A., D.P. Shashkin, and I.N. Gavrilova (1975) Sodium boltwoodite. Doklady Acad. Nauk SSSR, 221, 195–197 (in Russian). (2) (1976) Amer. H_2O^+	4.05		
H_2O^-	9.02		
H_2O		14.84	15.66
Total	100.91	99.08	100.00

(1) Kuruk deposit, Tajikistan; after deduction of impurities, stated to correspond to $(Na, Ca)_{\Sigma=2.04}(UO_2)_{1.91}(PO_4)_{2.00} \cdot 6.66H_2O$. (2) Do.; corresponds to $(Na, Ca)_{\Sigma=2.12}(UO_2)_{2.1}(PO_4)_{2.00} \cdot 7.9H_2O$. (3) $Na_2(UO_2)_2(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Autunite group.

Occurrence: In the oxidized zone of a uranium deposit in a granodiorite massif.

Association: Schoepite, gypsum, kaolinite, "limonite".

Distribution: Found in the Kuruk uranium deposit, 15 km northeast of Khodzhent, Samgar Steppe, northern Tajikistan.

Name: The prefix *meta* indicates the dehydration product of *"sodium autunite"*, the transitory sodium analog of *meta-autunite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67809–67812.

Sodium pharmacosiderite $(Na,K)_2Fe_4^{3+}(AsO_4)_3(OH)_5 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Cubic crystals, to 1 mm, in aggregates.

Physical Properties: *Cleavage:* On {001}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 2.79(4) D(calc.) = 2.90 for $Na_2Fe_4(AsO_4)_3(OH)_5 \cdot 7H_2O$.

Optical Properties: Transparent to translucent. *Color:* Pale green to dull orange; pale green to colorless in thin section. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.705(4)$

Cell Data: *Space Group:* $[P\bar{4}3m]$ (by analogy to pharmacosiderite). $a = 8.012(1)$ $Z = 1$

X-ray Powder Pattern: Marda, Australia.
7.99 (100), 3.27 (80), 2.831 (60), 2.416 (60), 4.61 (50), 2.532 (50), 4.00 (40)

Chemistry:

	(1)
As_2O_5	36.7
Fe_2O_3	35.5
Na_2O	5.8
K_2O	2.7
H_2O	19.3
Total	[100.0]

(1) Marda, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by the Penfield method; normalized to 100.0% from an original total of 106.2%, keeping H_2O constant; then corresponding to $(Na_{1.68}K_{0.52})_{\Sigma=2.20}Fe_{4.00}(AsO_4)_{2.87}(OH)_{5.59} \cdot 6.84H_2O$.

Occurrence: Initially found on a museum specimen, presumably an alteration product of arsenopyrite (Marda, Australia).

Association: Pharmacosiderite, scorodite, arseniosiderite, "jarosite", arsenopyrite, quartz (Marda, Australia).

Distribution: In Australia, from Marda, Western Australia, and at Mafeking, Victoria. From the Gold Hill mine, Tooele Co., Utah, USA.

Name: In allusion to *sodium* in the composition and its relation to *pharmacosiderite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 146392.

References: (1) Peacor, D.R. and P.J. Dunn (1985) Sodium-pharmacosiderite, a new analog of pharmacosiderite from Australia and new occurrences of barium-pharmacosiderite [= barian pharmacosiderite]. Sodium uranospinite $(Na_2, Ca)(UO_2)_2(AsO_4)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Imperfect lathlike to fibrous elongated crystals, to 2 cm, in divergent or irregular aggregates, and as incrustations.

Physical Properties: *Cleavage:* On {001}, perfect; on {010}, distinct. Hardness = 2.5 D(meas.) = 3.846 D(calc.) = [3.66] Fluoresces bright yellowish green under UV. Radioactive.

Optical Properties: Semitransparent. *Color:* Yellow-green, lemon-yellow, straw-yellow. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Uniaxial (–), commonly anomalously biaxial (–). *Pleochroism:* Faint; X = colorless; $Y = Z$ = yellow. $\omega = 1.612$ $\epsilon = 1.585$ 2V(meas.) = Small.

Cell Data: *Space Group:* $[P4/nmm]$ (by analogy to meta-autunite). $a = 7.12$ $c = 8.61$ Z = 1

X-ray Powder Pattern: Bota-Burum deposit, Kazakhstan.
8.48 (10), 3.68 (10), 3.292 (9), 1.837 (9), 1.987 (8), 1.634 (8), 5.45 (7)

Chemistry:

	(1)
UO_3	58.29
P_2O_5	1.65
As_2O_5	20.84
SiO_2	2.39
Al_2O_3	0.91
Fe_2O_3	0.57
MgO	trace
CaO	1.87
Na_2O	3.91
K_2O	0.00
H_2O^+	3.49
H_2O^-	6.00
Total	99.92

(1) Bota-Burum deposit, Kazakhstan; neglecting Si, Al, Fe as impurities, corresponds to $(Na_{1.26}Ca_{0.34})_{\Sigma=1.60}(UO_2)_{2.04}[(AsO_4)_{1.82}(PO_4)_{0.22}]_{\Sigma=2.04} \cdot 5.27H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: In the oxidized zone of a uranium–sulfide deposit in felsite porphyry and sodium-bearing tuffaceous breccias (Bota-Burum deposit, Kazakhstan).

Association: Realgar, orpiment, scorodite, mansfieldite, trögerite, arseniosiderite, metatorbernite, metazeunerite, uranophane, uraninite, arsenopyrite, pyrite, galena (Bota-Burum deposit, Kazakhstan).

Distribution: In the Bota-Burum uranium deposit, 15 km southwest of Alakol Lake, Chu-Ili Mountains, southwestern Balkhash district, Kazakhstan. At the Buhlskopf mine, near Ellweiler, Rhineland-Palatinate, Germany. On the Clyde Long property, Elk Park, San Juan Co., Colorado, USA.

Name: For its dominant *sodium* content and relation to *uranospinite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72124–74126.

References: (1) Kopchenova, E.V. and K.V. Skvortsova (1957) Sodium uranospinite. Doklady Acad. Nauk SSSR, 114, 634–636 (in Russian). (2) (1958) Amer. Mineral., 43, 383–384 (abs. ref. 1). (3) Pekov, I.V. (1998) Minerals first discovered on the territory of the former Soviet Union, 191.

Sodium-zippeite $Na_4(UO_2)_6(SO_4)_3(OH)_{10}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Rare in crystals, to 100 μm, rhomboidal to slightly elongated plates, extremely thin, may be petallike, lathlike, spindle-shaped, in vermiform aggregates; as cross-fiber veinlets, warty crusts, very fine-grained powdery to massive; commonly in efflorescences. *Twinning:* Common on {*h*0*l*}, contact twins, with another law, polysynthetic.

Physical Properties: *Cleavage:* Perfect on {010}; perhaps another perpendicular. Hardness = ∼2 D(meas.) = > 3.3 D(calc.) = n.d. Radioactive; fluoresces bright yellow under SW and LW UV.

Optical Properties: Semitransparent. *Color:* Yellow, lemon-yellow, yellow-orange. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless to pale yellow; Z = dark yellow to golden yellow. *Orientation:* $X \perp$ plane of flattening; $Z = c$. α = 1.630–1.637 β = 1.685–1.689 γ = 1.732–1.739 2V(meas.) = Moderate to large.

Cell Data: *Space Group:* n.d. $a = 8.82$ $b = 17.12$ $c = 7.32$ Z = n.d.

X-ray Powder Pattern: Synthetic.
7.34 (100), 3.663 (54), 3.490 (44), 3.153 (35), 2.858 (15), 3.754 (14), 2.118 (11)

Chemistry:

	(1)	(2)
SO_3	10.43	10.71
UO_3	75.86	76.53
Na_2O	5.25	5.53
K_2O	0.47	
H_2O	7.99	7.23
Total	[100.00]	100.00

(1) Delta mine, Utah, USA; recalculated to 100% after deduction of gypsum 0.1% and insoluble $SiO_2 + Al_2O_3 + Fe_2O_3$ 4.39%. (2) $Na_4(UO_2)_6(SO_4)_3(OH)_{10}\cdot 4H_2O$.

Occurrence: A secondary alteration product of uraninite and base-metal sulfides in the oxidized zone of uranium-rich deposits, typically in sandstone-type uranium deposits; of post-mine origin, where the sodium may be supplied by percolating saline water.

Association: Andersonite, uranopilite, johannite, schröckingerite, uranopilite, other "zippeite-group" minerals.

Distribution: In the USA, in Utah, from the Happy Jack mine, White Canyon, and the W.N. mine, Deer Flat, San Juan Co.; in the Delta and Lucky Strike No. 2 mines, San Rafael district, and at the Sodaroll mine, Green River district, Emery Co.; from the Parco No. 23 mine, Thompsons district, Grand Co.; at the Atomic King mine, Cane Springs, Moab Co.; in the Oyler mine, Henry Mountains district, Wayne Co.; in Arizona, from the Sue mine, Cherry Creek district, Gila Co., and in the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co.; at the Jackpile mine, Grants district, Socorro Co., New Mexico. From Jáchymov (Joachimsthal), Czech Republic. In the Geevor mine, St. Just, Cornwall, England.

Name: For its content of *sodium* and relation to the other *zippeite* group species.

Type Material: n.d.

References: (1) Frondel, C., J. Ito, R.M. Honea, and A.M. Weeks (1976) Mineralogy of the zippeite group. Can. Mineral., 14, 429–436.

(1) Dara-i-Pioz massif, Tajikistan; corresponding to $(K_{1.05}Na_{0.95})_{\Sigma=2.00}(Li_{2.55}Al_{0.15})_{\Sigma=2.70}(Zr_{0.8}Fe^{3+}_{0.6}Ti_{0.4}Fe^{2+}_{0.2})_{\Sigma=2.0}Si_{12}O_{30}$.

Mineral Group: Milarite group.

Occurrence: In a pegmatite vein with a composition about that of an alkalic granite.

Association: Thorite, stillwellite, pyrochlore, tienshanite, thorite, cesium kupletskite, microcline, quartz, aegirine (Dara-i-Pioz massif, Tajikistan); aegirine, polylithionite (Washington Pass, Washington, USA).

Distribution: From the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. In the Wessels mine, near Kuruman, Cape Province, South Africa. At Washington Pass, Okanogan Co., Washington, USA.

Name: For *Sogdiana*, an ancient Central Asian state.

Type Material: Mineralogy Museum, St. Petersburg University, St. Petersburg, 16246; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72028, 74962, vis3595.

Söhngeite $Ga(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. In crystalline twinned groups and aggregates, to 1 cm; very rarely as single crystals. *Twinning:* As trillings of composite flattened and curved crystals, interpenetrant at right angles, according to an unknown law.

Physical Properties: Hardness = 4–4.5 D(meas.) = 3.84 D(calc.) = 3.847

Optical Properties: Semitransparent. *Color:* White, pale yellow, pale brown, pale greenish yellow.
Optical Class: Isotropic. $n = 1.736$

Cell Data: *Space Group:* $Pmn2_1$. $a = 7.4865$ $b = 7.4379$ $c = 7.4963$ Z = [8]

X-ray Powder Pattern: Tsumeb, Namibia.
3.74 (10), 1.669 (7), 2.63 (6), 1.525 (6), 1.867 (4), 2.15 (3.5), 2.36 (3)

Chemistry:

	(1)	(2)
SiO_2	1.8	
Al_2O_3	4.7	
Ga_2O_3	66.8	77.62
Fe_2O_3	2.3	
H_2O^+	19.6	
H_2O^-	4.2	
H_2O		22.38
Total	99.4	100.00

(1) Tsumeb, Namibia. (2) $Ga(OH)_3$.

Occurrence: An alteration product of gallite-bearing germanite in an oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Germanite, gallite.

Distribution: From Tsumeb, Namibia.

Name: Honors Dr. A.P.G. Söhnge, formerly Chief Geologist, Tsumeb Corporation, Tsumeb, Namibia.

Type Material: n.d.

Solongoite $Ca_2B_3O_4Cl(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Subhedral crystals, tabular, vertically striated, to 0.2 mm.

Physical Properties: *Cleavage:* One, imperfect, parallel elongation. Hardness = 3.5 D(meas.) = 2.514 D(calc.) = 2.58

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Z \wedge c = 25°$, positive elongation. *Dispersion:* $r > v$, very weak. $\alpha = 1.510(1)$ $\beta = 1.510(1)$ $\gamma = 1.545(1)$ 2V(meas.) = Very small.

Cell Data: *Space Group:* $P2_1/b$. $a = 7.975(2)$ $b = 12.571(5)$ $c = 7.237(2)$ $\beta = 86.14(3)°$ Z = 4

X-ray Powder Pattern: Solongo deposit, Russia.
2.196 (10), 7.84 (9), 1.734 (9), 2.61 (8), 2.54 (8), 1.911 (8), 2.74 (7)

Chemistry:

	(1)	(2)

Total	99.86	100.00

(1) Solongo deposit, Russia; H_2O absent by IR; corresponds to $(Ca_{1.92}Mg_{0.03})_{\Sigma=1.95}$ $B_{3.02}O_4Cl_{0.58}(OH)_{4.66}$. (2) $Ca_2B_3O_4Cl(OH)_4$.

Occurrence: From a drillhole into a contact metamorphic boron deposit at a depth of 400 m.

Association: Szaibélyite, andradite–grossular, kurchatovite, calcite, "chlorite", vesuvianite, svabite, magnetite, hematite, sphalerite, quartz.

Distribution: From the Solongo boron deposit, Buryatia, Russia.

Name: For the Solongo (Buryat for *rainbow*, for the variety of boron minerals contained) deposit, Russia, from which it was first noted.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74785.

Sonolite $Mn_9^{2+}(SiO_4)_4(OH,F)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic to anhedral, to 2.5 cm; granular. *Twinning:* Singular or lamellar on {101}, common.

Physical Properties: Hardness = 5.5 D(meas.) = 3.82–4.00 D(calc.) = 3.97

Optical Properties: Transparent. *Color:* Brown, dark brown, reddish brown to reddish orange; colorless in thin section. *Luster:* Dull to vitreous.
Optical Class: Biaxial (–). *Orientation:* $X \wedge \{001\} = 9°–10°$. *Dispersion:* $r > v$. $\alpha = 1.763$ $\beta = 1.779$ $\gamma = 1.793$ 2V(meas.) = 75.5°–82°

Cell Data: *Space Group:* $P2_1/b$. $a = 4.872(5)$ $b = 10.669(12)$ $c = 14.287(7)$ $\alpha = 100.30(10)°$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
2.869 (10), 1.743 (10), 2.651 (7), 2.608 (7), 2.699 (5.5), 2.458 (5), 2.504 (4.5)

(1) Hanawa mine, Japan; corresponds to $(Mn_{7.80}Mg_{1.05}Fe_{0.16}Ca_{0.16})_{\Sigma=9.17}(Si_{3.45}Al_{0.62}Ti_{0.01})_{\Sigma=4.08}O_{15.91}[(OH)_{1.95}F_{0.14}]_{\Sigma=2.09}$.

Polymorphism & Series: Dimorphous with jerrygibbsite.

Mineral Group: Humite group.

Occurrence: In metamorphosed manganese-rich deposits.

Association: Rhodochrosite, galaxite, pyrochroite (Japan); franklinite, willemite, zincite, manganosite, chlorite, calcite, tephroite (Franklin, New Jersey, USA).

Distribution: In the Sono mine, Kyoto Prefecture; the Hanawa mine, Iwate Prefecture; the Hokkejino mine, Kyoto Prefecture; the Kuratomi mine, Oita Prefecture; and a number of other places in Japan. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and at Bald Knob, near Sparta, Alleghany Co., North Carolina. From Bonneval-sur-Arc, Savoie, France. In Kyrgyzstan, on Inyl'chek Ridge, Tien Shan.

Name: For the Sono mine, Japan, where it was originally found.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 114576.

Sonoraite $Fe^{3+}Te^{4+}O_3(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Bladelike crystals, to 2 mm, flattened on {100}, in subparallel sheaves and rosettes.

Physical Properties: Hardness = ∼3 D(meas.) = 3.95(1) D(calc.) = 4.18

Optical Properties: Transparent. *Color:* Dark yellowish green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). $\alpha = 2.018(3)$ $\beta = 2.023(3)$ $\gamma = 2.025(3)$ 2V(meas.) = 20°–25°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.984(2)$ $b = 10.268(1)$ $c = 7.917(2)$ $\beta = 108.49(2)°$ Z = 8

X-ray Powder Pattern: Moctezuma mine, Mexico.
10.4 (10), 4.66 (8), 3.110 (8), 3.290 (7), 3.66 (6), 5.18 (5), 3.035 (5)

Chemistry:

	(1)	(2)
TeO_2	52.5	59.90
Fe_2O_3	27.9	29.96
H_2O	18.2	10.14
Total	98.6	100.00

(1) Moctezuma mine, Mexico; H_2O taken as loss on ignition. (2) $FeTeO_3(OH)\cdot H_2O$.

Occurrence: A very rare mineral in the oxide zone of a hydrothermal Au–Te ore deposit (Moctezuma mine, Mexico).

Association: Emmonsite, anglesite, "limonite", quartz (Moctezuma mine, Mexico); emmonsite (Mohawk mine, Nevada, USA); rodalquilarite, emmonsite, jarosite, limonite (Tombstone, Arizona, USA).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, in the Mohawk mine, Goldfield, Esmeralda Co., Nevada; from the Joe shaft, near Tombstone, Cochise Co., Arizona; in the Wilcox district, Catron Co., New Mexico; in Colorado, at the Good Hope mine, Vulcan district, Gunnison Co., and the Hoosier mine, Cripple Creek district, Teller Co.

Name: For the state of Sonora, Mexico, in which the mineral was first found.

Type Material: The Natural History Museum, London, England, 1967,390; National Museum of Natural History, Washington, D.C., USA, 119271, 164343, 164344.

Ni	0.03		
Bi	0.17	0.5	
Te	41.32	39.7	40.47
Total	100.29	100.3	100.00

(1) Monchegorsk deposits, Russia; by electron microprobe, corresponding to $(Ag_{3.78}Fe_{0.18}Cu_{0.02}Ni_{0.01})_{\Sigma=3.99}Pd_{2.96}(Te_{4.04}Bi_{0.01})_{\Sigma=4.05}$. (2) Lac des Iles complex, Canada; by electron microprobe, average of three analyses; corresponding to $Ag_{4.00}Pd_{3.05}(Te_{3.92}Bi_{0.03})_{\Sigma=3.95}$.
(3) $Ag_4Pd_3Te_4$.

Occurrence: In veinlets cutting chalcopyrite (Monchegorsk deposits, Russia).

Association: Merenskyite, kotulskite, chalcopyrite, mackinawite (Monchegorsk deposits, Russia).

Distribution: From the Monchegorsk group of Cu–Ni deposits, in the Sopcha massif, Monchegorsk pluton, Kola Peninsula, Russia [TL]. In Canada, in Ontario, in the Roby zone, Lac des Iles complex; at the Levack West mine, Sudbury; at the Geordie Lake intrusion, Coldwell complex. From the Santo Tomas II porphyry copper deposit, Benguet, Philippines.

Name: For the type locality, Sopcha Mountain, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, Russia, 5709/1.

References: (1) Orsoev, D.A., S.A. Rezhenova, and A.N. Bodanova (1982) Sopcheite, $Ag_4Pd_3Te_4$, a new mineral from copper–nickel ores of the Monchegorsk pluton. Zap. Vses. Mineral. Sofiite $Zn_2(Se^{4+}O_3)Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are thin platy to micalike, pseudohexagonal, may be elongated along [001], with {010}, {100}, to 5 mm. *Twinning:* On {100}, contact, to give "swallow-tail" forms.

Physical Properties: *Cleavage:* On {010}, perfect; on {201}, less perfect. *Tenacity:* Brittle. Hardness = n.d. VHN = 38–61, average 49 (10 g load). D(meas.) = n.d. D(calc.) = 3.64(1) Soluble with difficulty in H_2O.

Optical Properties: Transparent. *Color:* Colorless, becomes sky-blue on long exposure to air. *Streak:* White. *Luster:* Vitreous to greasy or silky.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.709(3)$ $\beta = 1.726(2)$ $\gamma = 1.750(2)$ 2V(meas.) = n.d. 2V(calc.) = 91°

Cell Data: *Space Group: Pccn.* $a = 10.251(4)$ $b = 15.223(2)$ $c = 7.666(5)$ $Z = 8$

X-ray Powder Pattern: Tolbachik volcano, Russia; preferred orientation due to {010} cleavage.
7.61 (100), 3.807 (23), 2.918 (12), 3.055 (8), 3.237 (6), 2.538 (6), 2.727 (4)

Chemistry:

	(1)	(2)
SeO_2	34.48	33.76
CuO	0.19	
ZnO	47.83	49.53
PbO	0.35	
Cl	22.26	21.58
$-O = Cl_2$	5.02	4.87
Total	100.09	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, average of 38 analyses; corresponds to $(Zn_{1.92}Cu_{0.01}Pb_{0.01})_{\Sigma=1.94}(Se_{1.02}O_{2.94})Cl_{2.06}$. (2) $Zn_2(SeO_3)Cl_2$.

Occurrence: In fractures in volcanic fumaroles, formed at 180 °C–230 °C.

Association: Tenorite, cotunnite, piypite, ponomarevite, chalcocyanite, chloromenite, burnsite, ilinskite, georgbokiite, dolerophanite, halite, sylvite, gold.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: To honor Sof'ya Ivanovna Naboko (1909–), Institute of Volcanology, Petropavlovsk-Kamchatskii, Russia, leading investigator of the Kamchatka volcanoes.

Type Material: Mining Institute, St. Petersburg, Russia, 1550/1.

Sorbyite $Pb_{19}(Sb, As)_{20}S_{49}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are equant to thin tabular, elongated [010], and commonly heavily striated ‖ [010], to 1 mm. *Twinning:* Irregular lamellae seen in polished section.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. VHN = 175 (50 g load). D(meas.) = n.d. D(calc.) = 5.52

Optical Properties: Opaque. *Color:* Lead-gray; in polished section, white. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Strong. *Anisotropism:* Strong.
R_1–R_2: n.d.

Cell Data: *Space Group:* $C2/m$. $a = 45.15$ $b = 8.28$ $c = 26.53$ $\beta = 113.4°$ Z = 4

X-ray Powder Pattern: Madoc, Canada.
3.44 (100), 3.38 (90), 4.13 (60), 2.96 (60), 2.099 (50), 4.02 (40), 3.04 (40)

Chemistry:

	(1)	(2)
Pb	46.6	46.9
Cu	1.2	
Ag	0.17	
Sb	26.3	25.8
As	3.5	5.7
S	20.7	22.1
Total	98.47	100.5

(1) Madoc, Canada; by electron microprobe, corresponds to $(Pb_{17.07}Cu_{1.43}Ag_{0.15})_{\Sigma=18.65}(Sb_{16.40}As_{3.55})_{\Sigma=19.95}S_{49.00}$. (3) Novoye, Kyrgyzstan; by electron microprobe; corresponds to $(Pb_{16.09}(Sb_{15.07}As_{5.41})_{\Sigma=20.48}S_{49.00}$.

Occurrence: Of hydrothermal origin, in a deposit in marble (Madoc, Canada); in a hydrothermal deposit in limestone, replacing pyrite and sphalerite, with other Pb–As–Sb sulfides (Novoye, Kyrgyzstan).

Association: Boulangerite, jamesonite, antimonian baumhauerite, zinkenite, semseyite, geocronite, robinsonite (Madoc, Canada); sphalerite, pyrite, galena, playfairite, twinnite, guettardite, baumhauerite, realgar, orpiment, cinnabar, fluorite, quartz (Novoye, Kyrgyzstan).

Distribution: In Canada, from near Madoc, Ontario [TL]. In the USA, from the Northern Belle and Lucky Strike mines, Candelaria district, Mineral Co., Nevada. From Novoye, Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan.

Name: To honor Henry Clifton Sorby (1826–1908), English chemist and the founder of metallography.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, 35802.

(1) Nákâlâq, Greenland. (2) Kvanefjeld, Greenland. (3) $Na_4SnBe_2Si_6O_{18}\cdot 2H_2O$.

Occurrence: On the floor of miarolitic cavities in hydrothermal veins cutting coarse-grained nepheline syenites.

Association: Analcime, microcline, neptunite, sodalite, aegirine, arfvedsonite, beryllite, chkalovite, apatite, sphalerite.

Distribution: Found at Nákâlâq and Kvanefjeld, in the Ilímaussaq intrusion, southern Greenland.

Name: For Professor Henning Sørensen, Danish mineralogist and petrographer, University of Copenhagen, Copenhagen, Denmark.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1965.222; The Natural History Museum, London, England.

X-ray Powder Pattern: Baimka placer, Russia.
2.970 (10), 2.094 (9), 2.112 (8), 1.487 (5), 1.218 (5), 1.212 (5), 1.333 (4)

Chemistry:

	(1)	(2)
Cu	35.33	35.99
Fe	1.18	trace
Sn	58.18	56.12
Sb	4.77	7.89
Total	99.46	[100.00]

(1) Baimka placer, Russia; by electron microprobe, average of nine analyses; corresponding to $(Cu_{1.00}Fe_{0.04})_{\Sigma=1.04}(Sn_{0.89}Sb_{0.07})_{\Sigma=0.96}$. (2) Rio Tamaná, Colombia; by electron microprobe, average of nine analyses, recalculated to 100% from an original total of 92.75%; corresponding to $Cu_{1.05}(Sn_{0.88}Sb_{0.12})_{\Sigma=1.00}$.

Occurrence: Very rare, in a gold-PGE placer probably derived from Alaskan-type complexes, formed under low-sulfur reducing conditions (Baimka placer, Russia); in concentrates from precious metal placers (Rio Tamaná, Colombia); in sediments (Mid-Atlantic Ridge).

Association: Tin, stistaite, herzenbergite, cassiterite, lead (Baimka placer, Russia); tin, stistaite (Rio Tamaná, Colombia).

Distribution: From the Baimka gold-PGE placer deposit, in the Bol'shoy Anyuy River area, western Chukotka, Russian Far East, Russia [TL]. In the Rio Tamaná, the Department of Chocó, Cauca, Colombia. From the Mir zone, Mid-Atlantic Ridge (26°N).

Name: To honor George Soros (1930–), American financier, for his support of science in the former Russian republics.

Type Material: St. Petersburg Mining University, St. Petersburg, Russia, 2083/1.

S	8.83	9.25	7.83
Total	99.50	99.33	100.21

(1) Oldřichov, Czech Republic; by electron microprobe, corresponds to $Pb_{1.05}Cu_{0.99}Bi_{0.97}(S_{1.77}Se_{1.19}Te_{0.04})_{\Sigma=3.00}$. (2) Do.; by electron microprobe; corresponds to $Pb_{0.99}Cu_{0.98}Bi_{0.98}(S_{1.82}Se_{1.16}Te_{0.02})_{\Sigma=3.00}$. (3) Otish Mountains deposit, Canada; by electron microprobe, average of seven analyses; corresponds to $Pb_{1.00}Cu_{1.03}Bi_{1.04}(S_{1.60}Se_{1.35}Te_{0.05})_{\Sigma=3.00}$.

Occurrence: In hydrothermal quartz-carbonate veins (Oldřichov, Czech Republic); in a vein-type uranium deposit with other tellurides and selenides (Otish Mountains deposit, Canada).

Association: Poubaite, galena, clausthalite, selenian–sulfurian rucklidgeite, uraninite (Oldřichov, Czech Republic); watkinsonite, poubaite, wittichenite (Otish Mountains deposit, Canada).

Distribution: From Oldřichov, near Tachov, Czech Republic [TL]. At the Beregove and Muzhieve deposits, Ukraine. In the Otish Mountains uranium deposit, Quebec, Canada.

Name: In honor of Frantisek Souček (1911–1989), Department of Mineralogy, Charles University, Prague, Czech Republic, and a devoted mineral collector.

Type Material: Charles University, Prague, Czech Republic, 21241; National School of Mines, Paris, France.

(1) Corrego Frio mine, Brazil; corresponding to $(Mg_{1.78}Fe^{2+}_{1.19}Mn_{0.03})_{\Sigma=3.00}(Al_{3.82}Fe^{3+}_{0.25})_{\Sigma=4.07}(PO_4)_{3.96}(OH)_{6.33} \cdot 1.82H_2O$.

Polymorphism & Series: Forms a series with gormanite.

Occurrence: A rare hydrothermal alteration product of scorzalite in complex zoned granite pegmatites, in sedimentary phosphate nodules, and in a high-pressure kyanite deposit.

Association: Scorzalite.

Distribution: From the Corrego Frio pegmatite mine, Divino das Laranjeiras, near Linópolis, Minas Gerais, Brazil. Along Rapid Creek, Yukon Territory, Canada. In the Bell Pit, Newry, Oxford Co., Maine, USA.

Name: To honor Dr. Antonio José Alves de Souza (1896–1961), Director, Mineral Survey of Brazil, Rio de Janeiro, Brazil.

Type Material: Royal Ontario Museum, Toronto, Canada, M34010; Harvard University, Cambridge, Massachusetts, 100680; National Museum of Natural History, Washington, D.C., USA, C5863, 159981, 160114.

Total	99.33	[100.03]	100.00

(1) Capo di Bove, Italy; material probably dried at 100° before analysis thereby driving off some H_2O. (2) Gold Hill, Utah, USA; recalculated to the same total after insoluble impurities (taken as diopside, garnet, and wollastonite) 12.58% and H_2O^- 10.36% deducted from original total of 100.03%. (3) $MgSiO_2(OH)_2 \cdot H_2O$.

Occurrence: In leucite-bearing lava (Capo di Bove, Italy); in amygdular diabase (Sasbach, Germany); replacing tactite minerals near gold ore shoots (Gold Hill, Utah, USA).

Association: Wollastonite, diopside, garnet.

Distribution: At Capo di Bove, near Rome, Lazio, Italy. At Sasbach, Baden-Württemberg, Germany. In the Cane Springs, Alvarado, and Midas mines, near Gold Hill, Tooele Co., Utah, and in the Livingston quarry, Palos Verdes Hills, Los Angeles Co., California, USA.

Name: For Lavino Spada de Medici (1801–1863), Italian political figure interested in mineralogy.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 682. (2) Schaller, W.T. and T.B. Nolan (1931) An occurrence of spadaite at Gold Hill, Utah. Amer. Mineral., 16, 231–236.

Spangolite $Cu_6Al(SO_4)Cl(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals equant, flattened, or elongated along [0001], to 2 cm, with prominent $\{000\overline{1}\}$, equally developed $\{10\overline{1}0\}$, $\{01\overline{1}0\}$, $\{10\overline{1}1\}$, $\{01\overline{1}1\}$, deeply striated parallel $\{0001\}$, with additional $\{h0\overline{h}l\}$ forms, small $\{0001\}$, in parallel aggregates; may exhibit hemimorphic pyramidal development; cleavable massive. *Twinning:* On $\{0001\}$, the acute forms about opposite antilogous poles joined to give an hourglasslike shape.

Physical Properties: *Cleavage:* On $\{0001\}$, perfect; distinct on $\{10\overline{1}1\}$, $\{01\overline{1}1\}$. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2 on $\{0001\}$, 3 on inclined faces. D(meas.) = 3.135–3.141 D(calc.) = 3.14 Pyroelectric.

Optical Properties: Transparent. *Color:* Dark green, emerald-green, bluish green; pale green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* Weak; O = green; E = bluish green. ω = 1.680–1.687 ϵ = 1.627–1.641

Cell Data: *Space Group:* $P31c$. a = 8.245–8.278 c = 14.32–14.54 Z = 2

X-ray Powder Pattern: Tintic district, Utah, USA. 7.07 (10), 3.59 (8), 2.54 (7), 1.80 (7), 1.98 (6), 2.36 (5), 2.66 (4)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	10.11	10.03	H_2O	20.41	20.32
Al_2O_3	6.60	6.39	$-O=Cl_2$	0.92	1.00
CuO	59.51	59.82	Total	99.82	100.00
Cl	4.11	4.44			

(1) Region of Tombstone, Arizona, USA; average of four analyses, three partial; corresponds to $Cu_{5.97}Al_{1.04}(SO_4)_{1.00}Cl_{0.92}(OH)_{12.14}\cdot 2.97H_2O$. (2) $Cu_6Al(SO_4)Cl(OH)_{12}\cdot 3H_2O$.

Occurrence: A rare secondary mineral in the oxidization zone of hydrothermal copper deposits.

Association: Cuprite, connellite, brochantite, chalcophyllite, cyanotrichite, linarite, caledonite, clinoclase, azurite, malachite, aurichalcite, chrysocolla.

Distribution: Found in many localities in minor amounts. In the USA, in Arizona, the original specimen found "within a radius of 200 miles of Tombstone" [almost certainly from Bisbee]; large crystals in the Copper Queen, Czar, and Southwest mines, Bisbee; in the Maid of Sunshine mine, Courtland, Turquoise district, Cochise Co.; at Metcalf, Clifton-Morenci district, Greenlee Co.; from the Mex-Tex, Blanchard, and Portales mines, near Bingham, Hansonburg district, Socorro Co., and elsewhere in New Mexico; at the Grand Central mine, Tintic district, Juab Co., Utah; in the Majuba Hill mine, Antelope district, Pershing Co., and elsewhere in Nevada. From Wheal Gorland, Gwennap, and the West Caradon mine, St. Cleer, Cornwall, England. At Trébas, Tarn, and Fontana Rossa, Corsica, France. From the Arenas mine, south of Iglesias, Sardinia, Italy. In the Kamariza mine, Laurium, Greece. From Brixlegg, Tirol, Austria. At the Kabasaka and Nyukaku mines, Kyogo Prefecture, Japan. Additional localities are known.

Name: Honors Norman Spang (1842–1922), Etna, Pennsylvania, USA, American mineral collector, who provided the original specimen.

Type Material: The Natural History Museum, London, England, 74198; Yale University, New Haven, Connecticut, 3.3482; National Museum of Natural History, Washington, D.C., USA, 83512.

Spencerite $Zn_4(PO_4)_2(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals elongated along [001], tabular on {100}, bluntly terminated or lancelike, with many other forms, to 2 cm. Typically with a columnar to platy structure, stalactitic, massive. *Twinning:* Polysynthetic, twin plane and composition plane {100}.

Physical Properties: *Cleavage:* On {100}, perfect; on {010}, good; on {001}, distinct. Hardness = ∼3 D(meas.) = 3.123–3.145 D(calc.) = 3.282

Optical Properties: Transparent to translucent. *Color:* White, pale green; colorless in transmitted light. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \simeq a$. *Dispersion:* $r > v$, moderate.
$\alpha = 1.586$ $\beta = 1.602$ $\gamma = 1.606$ 2V(meas.) = 49°

Cell Data: *Space Group:* $P2/c$. $a = 10.448(3)$ $b = 5.282(1)$ $c = 11.208(3)$ $\beta = 116°44(2)'$ Z = 2

X-ray Powder Pattern: Hudson Bay mine, Canada. (ICDD 35-631).
9.34 (100), 3.491 (50), 2.3292 (25), 4.590 (19), 3.861 (7), 3.4211 (6), 3.1055 (6)

Chemistry:

	(1)	(2)
P_2O_5	26.13	26.31
ZnO	60.39	60.34
H_2O	13.44	13.35
Total	99.96	100.00

(1) Hudson Bay mine, Canada. (2) $Zn_4(PO_4)_2(OH)_2 \cdot 3H_2O$.

Occurrence: A rare secondary mineral in some zinc-bearing hydrothermal deposits.

Association: Hemimorphite, hopeite, smithsonite, cerussite.

Distribution: Found in the Hudson Bay mine, about eight km southeast of Salmo, near Nelson, Kootenay district, British Columbia, Canada. At Kabwe (Broken Hill), Zambia. In the Turf Pits mine, Grassington Moor, Yorkshire, England.

Name: To honor Leonard James Spencer (1870–1959), British mineralogist, formerly Keeper of Minerals, British Museum (Natural History), London, England.

Type Material: Royal Ontario Museum, Toronto, Canada, M9602, M9610, M9691, M9726; The Natural History Museum, London, England; Natural History Museum, Paris, France, 120.22; Harvard University, Cambridge, Massachusetts, 98956; National Museum of Natural History, Washington, D.C., USA, 121566.

Sperrylite $PtAs_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Commonly well crystallized as cubes and cubo-octahedrons, to 5 cm; may be highly modified with rounded edges and corners; as intergrowths with Pt–Fe alloys.

Physical Properties: *Cleavage:* Indistinct on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6–7 VHN = 960–1277 ⊥ (100); 960–1277 ⊥ (111) (100 g load). D(meas.) = 10.58 D(calc.) = 10.78

Optical Properties: Opaque. *Color:* Tin-white. *Streak:* Black. *Luster:* Metallic. R: (400) 53.6, (420) 53.6, (440) 53.9, (460) 53.9, (480) 53.9, (500) 53.9, (520) 54.0, (540) 53.9, (560) 53.8, (580) 53.7, (600) 53.5, (620) 53.1, (640) 52.7, (660) 52.3, (680) 51.9, (700) 51.4

Cell Data: *Space Group: Pa*3. $a = 5.967$ $Z = 4$

X-ray Powder Pattern: Vermilion mine, Sudbury, Canada.
1.801 (100), 0.777 (90), 1.148 (70), 2.98 (60), 0.798 (60), 2.11 (50), 3.43 (40)

Chemistry:

	(1)	(2)		(1)	(2)
Pt	56.8	56.56	As	42.8	43.44
Sb	0.08		Total	99.68	100.00

(1) Vermilion mine, Sudbury, Canada; by electron microprobe, corresponding to $Pt_{1.01}As_{1.96}$.
(2) $PtAs_2$.

Mineral Group: Pyrite group.

Occurrence: The most widespread platinum mineral, occurring in every type of deposit.

Association: Pyrrhotite, pentlandite, chalcopyrite, violarite, cubanite, bornite, sphalerite, galena, linnaeite, magnetite, testibiopalladite, sudburyite, omeiite, gold, argentian gold (Danba, China); leadamalgam, chromite, ilmenite, magnetite, gersdorffite, pyrite, chalcopyrite, violarite, millerite, galena, stibnite, argentian gold, niggliite, iridosmine, platinum, merenskyite, kotulskite (Shiaonanshan, China); also cooperite, laurite.

Distribution: In Canada, at the Vermilion [TL], Victoria, and Frood mines, Algoma district, near Sudbury, Ontario. In the USA, at the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming; in the Key West mine, east of Moapa, Bunkerville district, Clark Co., Nevada; and from the Stillwater complex, Montana. In the Bushveld complex, on the Merensky reef, Transvaal, South Africa, fine crystals from the Tweefontein Farm, near Potgietersrus; also at the Atok, Onverwacht, and Rustenburg mines. From Antamponbato, Madagascar. In China, from Danba, Sichuan Province; and Shiaonanshan, Inner Mongolia. In Australia, at several deposits east of Broken Hill, New South Wales, and at Kambalda, 56 km south of Kalgoorlie, Western Australia. In Russia, large crystals from the Talnakh area, Noril'sk region, and at Nikolaevsky, Amur, Siberia; in the Konder massif, Aldan Shield, Sakha; and elsewhere. In Finland, at Rometölväs Hill, in the Koillismaa complex; from the Hitura Cu–Ni deposit; and in the Siikakama intrusion.

Name: Honors Francis Lewis Sperry (1861–1906), chemist of Sudbury, Ontario, Canada, who first found the mineral.

Type Material: Royal Ontario Museum, Toronto, Canada; Yale University, New Haven, Connecticut, USA, 1.2950, 1.5895.

Spertiniite $Cu(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Flat tabular to lathlike crystals, to 10 μm, in radial and botryoidal aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = Soft. D(meas.) = 3.93(2) D(calc.) = 3.94 Synthetic material decomposes in hot H_2O.

Optical Properties: Transparent. *Color:* Blue to blue-green. *Luster:* Vitreous. *Optical Class:* Biaxial. *Pleochroism:* Strong; X = colorless; Z = dark blue. *Orientation:* Extinction parallel; elongation positive. $\alpha = 1.720(2)$ β = n.d. $\gamma = > 1.800(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $Cmc2_1$. $a = 2.951(1)$ $b = 10.592(3)$ $c = 5.257(3)$ Z = 4

X-ray Powder Pattern: Jeffrey mine, Canada.
2.63 (100), 3.73 (90), 5.29 (80), 2.266 (70), 1.718 (70), 2.50 (60), 2.361 (50)

Chemistry:

	(1)	(2)
Cu	66.9	65.14
Cl	0.1	
OH		34.86
Total		100.00

(1) Jeffrey mine, Canada; by electron microprobe. (2) $Cu(OH)_2$.

Occurrence: A very rare mineral, altering from chalcocite in alkaline groundwater, in a rodingite dike near the contact with a serpentinized dunite (Jeffrey mine, Quebec, Canada).

Association: Chalcocite, atacamite, copper, diopside, grossular, vesuvianite (Jeffrey mine, Quebec, Canada).

Distribution: In Canada, in Quebec, from the Jeffrey mine, Asbestos, and at Mont Saint-Hilaire. In the USA, at Ely, White Pine Co., Nevada, and from Bisbee, Cochise Co., Arizona. At Dzhezkazgan, Kazakhstan. In Germany, from Juliüshutte, Astfeld, Harz Mountains, in slag. At Tsumeb, Namibia.

Name: Honors Francesco Spertini (1937–), Chief Geologist, Jeffrey mine, Asbestos, Canada, who submitted the first sample.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 44696–44699; Harvard University, Cambridge, Massachusetts, USA, 126504.

Spessartine $Mn_3^{2+}Al_2(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Commonly as euhedral crystals, dodecahedra or trapezohedra, or in combination with other cubic forms, to 10 cm. Fine or coarse granular, compact, massive.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 7–7.5 D(meas.) = 4.190 D(calc.) = 4.179

Optical Properties: Transparent to translucent. *Color:* Red, reddish orange, yellow, yellowish brown, reddish brown, brown, black; pale pink to pale brown in thin section, may be sectored. *Streak:* White. *Luster:* Vitreous.
Optical Class: Isotropic; may show weak anisotropism. *Dispersion:* Weak. $n = 1.800$

Cell Data: *Space Group: Ia3d.* a = 11.621 Z = 8

X-ray Powder Pattern: Synthetic.
2.60 (100), 1.557 (40), 1.614 (30), 2.91 (25), 1.886 (20), 1.681 (20), 2.37 (16)

H_2O	0.86	
Total	99.77	100.00

(1) Kinko mine, Yamaguchi Prefecture, Japan; corresponds to $(Mn_{2.82}Ca_{0.09})_{\Sigma=2.91}$ $Al_{1.92}(Si_{2.86}Al_{0.14})_{\Sigma=3.00}O_{12}$. (2) $Mn_3Al_2(SiO_4)_3$.

Polymorphism & Series: Forms a series with almandine.

Mineral Group: Garnet group.

Occurrence: Common in granite pegmatites, granites, and rhyolites. Formed in some skarns and metasomatic manganese-rich rocks adjacent to igneous intrusions or in regionally metasomatized areas.

Association: Quartz, potassic feldspar, tourmaline, rhodonite, pyroxmangite, tephroite, alleghanyite, galaxite, muscovite, topaz, apatite, beryl, albite, bixbyite, pseudobrookite.

Distribution: While a less-common garnet, nevertheless many localities. From Aschaffenburg, Spessart Mountains, Bavaria, Germany. On Seriphos, Cyclades Islands, Greece. In the USA, in Leiper's quarry, Avondale, Delaware Co., Pennsylvania; the Rutherford mine, Amelia, Amelia Co., Virginia; in the Ramona and Pala districts, San Diego Co., California; from the Thomas Range, Juab Co., Utah; at Ely, White Pine Co., Nevada; from near Nathrop, Chaffee Co., Colorado. In Brazil, from Nangue and Urucum, Minas Gerais, and at Carnaúba, near Picui, Rio Grande do Norte. From Marienflüss, Namibia. At Tsilaizina and Anjanabonoina, Madagascar. In the Gilgit district, and at Dusso, Baltistan, Pakistan. From Broken Hill, New South Wales, Australia. At Wada-toge Pass, Nagano Prefecture, Japan.

Name: For the locality near Spessart, Germany.

Sphaerobismoite Bi_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. Crystals tabular, to 20 μm, may show a tetragonal outline, in spherulitic aggregates.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4 D(meas.) = n.d. D(calc.) = 7.17

Optical Properties: Semitransparent. *Color:* Green, pale yellow, or gray. *Streak:* White. *Luster:* Adamantine to dull.
Optical Class: Uniaxial (+). $\omega = 2.13(2)$ $\epsilon = 2.18(2)$

Cell Data: *Space Group:* n.d. $a = 8.08(2)$ $c = 6.46(2)$ $Z = 4$

X-ray Powder Pattern: Black Forest, Germany.
3.16 (100), 5.73 (70), 1.902 (60), 3.44 (50), 2.02 (50)

Chemistry:

	(1)
Bi_2O_3	98.40

Total	100.18

(1) Black Forest, Germany; by electron microprobe, corresponding to $(Bi_{1.92}As_{0.08})_{\Sigma=2.00}O_3$.

Polymorphism & Series: Dimorphous with bismite.

Occurrence: An oxidation product of wittichenite and emplectite.

Association: Bismutite, mixite, malachite, barite, quartz, "limonite".

Distribution: From Neubulach, and at Schmiedestollen-Holde, near Wittichen, Black Forest, Germany.

Name: In allusion to the spherical aggregates, and *bismuth* in its composition.

Type Material: n.d.

References: (1) Walenta, K. (1995) Sphaerobismoite, a new mineral of the composition Bi_2O_3 from the Black Forest. Aufschluss, 46, 245–248 (in German). (2) (1996) Amer. Mineral., 81, 1514–1515 (abs. ref. 1).

Sphalerite (Zn, Fe)S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals tetrahedral, dodecahedral, typically complex and distorted, curved and conical faces common, to 30 cm. Also fibrous, botryoidal, stalactitic, cleavable, coarse to fine granular, massive. *Twinning:* Twin axis [111], twin plane {111}, simple contact twins or complex lamellar forms.

Physical Properties: *Cleavage:* Perfect on {011}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 VHN = 208–224 (100 g load). D(meas.) = 3.9–4.1 D(calc.) = 4.096 Pyroelectric, may be triboluminescent, fluorescent.

Optical Properties: Transparent to translucent, opaque when iron-rich. *Color:* Highly variable, ranging from colorless to dark brown, gray, black, commonly brown, yellow, red, green. *Streak:* Pale brown to pale yellow and white. *Luster:* Resinous to adamantine.
Optical Class: Isotropic. $n = 2.369$ (Na) (ZnS). *Anisotropism:* May show strain-induced birefringence.
R: (400) 19.6, (420) 19.0, (440) 18.3, (460) 17.9, (480) 17.5, (500) 17.2, (520) 16.9, (540) 16.7, (560) 16.5, (580) 16.4, (600) 16.3, (620) 16.2, (640) 16.1, (660) 16.0, (680) 15.9, (700) 15.8

Cell Data: *Space Group:* $F\bar{4}3m$. a = 5.4060 Z = 4

X-ray Powder Pattern: Synthetic ZnS.
3.123 (100), 1.912 (51), 1.561 (30), 2.705 (10), 1.240 (9), 1.1034 (9), 1.351 (6)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
Zn	66.98	44.67	67.10	Mn		2.66	
Fe	0.15	18.25		S	32.78	33.57	32.90
Cd		0.28		Total	99.91	99.43	100.00

(1) Sonora, Mexico; corresponds to $Zn_{1.00}S_{1.00}$. (2) St. Christoph mine, Isère, France; corresponds to $(Zn_{0.65}Fe_{0.31}Mn_{0.05})_{\Sigma=1.01}S_{1.00}$. (3) ZnS.

Polymorphism & Series: Trimorphous with matraite and wurtzite.

Mineral Group: Sphalerite group.

Occurrence: Formed under a wide range of low- to high-temperature hydrothermal conditions; in coal, limestone, and other sedimentary deposits.

Association: Galena, chalcopyrite, marcasite, pyrite, fluorite, barite, quartz, many other hydrothermal minerals.

Distribution: The most important ore of zinc. Only a few localities for the finest crystallized examples can be given. In Germany, from Freiberg, Saxony, and Neudorf, Harz Mountains. Colorless crystals in the Lengenbach quarry, Binntal, Valais, Switzerland. At Horní Slavkov (Schlaggenwald) and Příbram, Czech Republic. From Rodna, Romania. Transparent crystals in the Aliva mine, Picos de Europa Mountains, Cantabria [Santander] Province, Spain. In England, from Alston Moor, Cumbria. At Dal'negorsk, Primorskiy Kray, Russia. From Watson Lake, Yukon Territory, Canada. In the USA, in the Tri-State district of the Mississippi Valley; near Baxter Springs, Cherokee Co., Kansas; Joplin, Jasper Co., Missouri and Picher, Ottawa Co., Oklahoma. From the Elmwood mine, near Carthage, Smith Co., Tennessee; in the Eagle mine, Gilman district, Eagle Co., Colorado. In Mexico, from Santa Eulalia and Naica, Chihuahua, and Cananea, Sonora. At Huaron, Casapalca, and Huancavelica, Peru.

Name: From the Greek for *treacherous*, the mineral sometimes being mistaken for galena, but yielding no lead.

MgO	0.30
CaO	0.50
K_2O	4.45
$(NH_4)_2O$	3.27
H_2O^+	13.79
H_2O^-	5.84
Total	[100.00]

(1) Elephant Island; by X-ray fluorescence, presence of NH_4 confirmed by IR, recalculated after deduction of SiO_2 9.93%, TiO_2 0.91%, with $(OH)^{1-}$ calculated for charge balance; then corresponding to $[(NH_4)_{0.55}K_{0.41}Ca_{0.04}Mg_{0.03}]_{\Sigma=1.03}(Fe^{3+}_{1.65}Al_{0.80})_{\Sigma=2.45}(PO4)_{2.00}(OH)_{2.45}\cdot 2.12H_2O$.

Occurrence: Formed by interaction of phosphate solutions derived from guano with micaceous and chloritic minerals in soil under a penguin rookery.

Association: Micas, chlorites.

Distribution: On Elephant Island, South Shetland Islands, about 800 km southeast of Cape Horn, British Antarctic Territory, Antarctica.

Name: For *Sphenisciformes*, the Latin order name for penguins.

Type Material: Macaulay Institute for Soil Research, Aberdeen, Scotland; The Natural History Museum, London, England.

Sphaerocobaltite $CoCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Crystals uncommon, rhombohedral $\{10\overline{1}1\}$, flat discoidal {0001}, modified by $\{10\overline{1}0\}$, to 5 mm; commonly compact radiated, concentric, spherical, massive, and in crusts. *Twinning:* Observed.

Physical Properties: *Cleavage:* [On $\{10\overline{1}1\}$] (by analogy to the calcite group). Hardness = 4 D(meas.) = 4.13 D(calc.) = 4.214

Optical Properties: Translucent. *Color:* Deep rose-red, red, may be surficially altered to gray, brown, or velvet-black. *Streak:* Peach-blossom-red. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = red-violet; E = rose-red. $\omega = 1.855(5)$ $\epsilon = 1.60(1)$

Cell Data: *Space Group:* $R\overline{3}c$. $a = 4.659$ $c = 14.957$ Z = 6

X-ray Powder Pattern: Synthetic.
2.743 (100), 3.551 (40), 1.702 (30), 1.697 (25), 2.330 (20), 2.112 (20), 1.948 (20)

Chemistry:

	(1)	(2)
CO_2	36.36	37.00
CoO	61.75	63.00
CaO	1.89	
Total	[100.00]	100.00

(1) Schneeberg, Germany; recalculated to 100% from an original total of 99.94% after deduction of Fe_2O_3 3.41%, H_2O 1.22%. (2) $CoCO_3$.

Mineral Group: Calcite group.

Occurrence: A rare accessory mineral in hydrothermal cobalt-bearing mineral deposits.

Association: Roselite, erythrite, annabergite (Schneeberg, Germany); cobaltian calcite, cobaltian dolomite (Congo).

Distribution: From Schneeberg, Saxony, Germany. At Libiola, near Casarza, and in the Valle del Neva, Liguria, Italy. From Zemo-Svanetia, Georgia. Found in a number of mines in Katanga Province, Congo (Shaba Province, Zaire), including Kambove; in the Musonoi and Kamoto mines, near Kolwezi; from Kabolela; Mupine; at the Kirilabomwe mine; from Konkola; very large crystals from the Kakanda mine. At the Aghbar (Arhbar) mine, Bou Azzer district, Morocco. In the Cameron area, Coconino Co., Arizona, USA. From Boleo, Baja California, Mexico. At the Mt. Cobalt mine, 140 km south of Cloncurry, Queensland, Australia.

Name: From the Greek for *sphere* and *cobalt* in its composition.

Type Material: Mining Academy, Freiberg, Germany, 15177.

Spinel $MgAl_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly as octahedra, to 30 cm, may show dodecahedron or cube faces, rarely as dodecahedra; coarse granular, rounded, massive. *Twinning:* On {111} as both twin and composition plane, the spinel law, penetration or contact, may be repeated as sixlings.

Physical Properties: *Cleavage:* Parting on {111}. *Fracture:* Conchoidal, uneven to splintery. *Tenacity:* Brittle. Hardness = 7.5–8 D(meas.) = 3.6–4.1, increasing with Fe and Zn content. D(calc.) = 3.578

Optical Properties: Transparent to nearly opaque. *Color:* Colorless, brown, black; red, orange, yellow, green, blue, indigo, violet. *Streak:* White. *Luster:* Vitreous, splendent to dull. *Optical Class:* Isotropic. $n = 1.719$

Cell Data: *Space Group:* $Fd3m$ (synthetic). $a = 8.0898(9)$ $Z = 8$

X-ray Powder Pattern: Synthetic.

(1) "South East Asia"; corresponds to $Mg_{1.00}(Al_{1.97}Mg_{0.02}Fe_{0.01}Zn_{0.01})_{\Sigma=2.01}O_4$. (2) Kaveltorp, Sweden; corresponds to $(Mg_{0.57}Zn_{0.33}Fe^{2+}_{0.07}Mn^{2+}_{0.02}Ca_{0.01})_{\Sigma=1.00}(Al_{1.84}Fe^{3+}_{0.14}Si_{0.02})_{\Sigma=2.00}O_4$. (3) $MgAl_2O_4$.

Polymorphism & Series: Forms three series, with magnesiochromite, with gahnite, and with hercynite.

Mineral Group: Spinel group.

Occurrence: A common mineral, formed at high-temperatures as an accessory in igneous rocks, principally basalts, kimberlites, peridotites, and in xenoliths; in regionally metamorphosed aluminum-rich schists; in regionally and contact metamorphosed limestones; a detrital mineral.

Association: Forsterite, chondrodite, scapolite, phlogopite, corundum, sillimanite, andalusite.

Distribution: Many localities. Some for good specimens include: gem crystals from around Mogok, Myanmar (Burma). In Sri Lanka, in the Ratnapura and Elahera districts, and elsewhere. In the USA, at many places from Amity and Edenville, Orange Co., New York to Andover, Allegany Co., New Jersey; fine crystals from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey. From near Midland, and at the Crestmore quarry, Riverside Co., California. In Canada, at Burgess, Ontario, and Wakefield, Quebec. In the Eifel district, and at Bodenmais, Bavaria, Germany. On Monte Somma and Vesuvius, Campania, Italy. From Andrahomana, Ambinda, Besakoa, and many other places in Madagascar. Large crystals from the Emeldjak and Katalakhu deposits, in the Aldan Shield, Sakha, Russia. At Gorondarinskoye, Pamir Mountains, Tajikistan.

Name: Perhaps from the Latin *spinella*, for *little thorn*, in allusion to the spine-shaped octahedral crystals.

(1–2) Yarrow and Spionkop Creeks, Canada; by electron microprobe. (3) Eretria, Greece; by electron microprobe. (4) $Cu_{39}S_{28}$.

Occurrence: As weathering-produced lamellar replacements of anilite and djurleite in stratabound red-bed copper deposits (Spionkop Creek, Canada); in a serpentine-hosted magnetite-chromite deposit (Eretria, Greece).

Association: Anilite, djurleite, yarrowite, tennantite (Yarrow and Spionkop Creeks, Canada); geerite, chalcopyrite, cobalt pentlandite, magnetite, chromite, andradite, chlorite, diopside (Eretria, Greece).

Distribution: From the Upper Grinnell Formation, Spionkop Creek and Yarrow Creek areas of southwestern Alberta, Canada [TL]. In the USA, at the Campbell mine, Bisbee, Cochise Co., Arizona; in the Lone Tree mine, Buffalo Mountain district, Humboldt Co., Nevada; from Dekalb Township, St. Lawrence Co., New York; and at Washington Pass, Okanogan Co., Washington. From near Eretria, Greece. At Schulenberg, near Clausthal, Harz Mountains, and in the Clara mine, near Oberwolfach, Black Forest, Germany. From the Lubin and Rudna copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland. In the West Carbery district, Co. Cork, Ireland.

Name: For the locality at Spionkop Creek, Canada.

Type Material: Canadian Geological Survey, Ottawa; Queen's University, Kingston, Ontario, Canada; Harvard University, Cambridge, Massachusetts, 122290; National Museum of Natural History, Washington, D.C., USA, 149430, 149431.

Spiroffite $(Mn^{2+},Zn)_2Te_3^{4+}O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Anhedral crystals, to 1 cm, commonly cleavable massive.

Physical Properties: *Cleavage:* Observed in at least two directions. *Fracture:* Conchoidal. Hardness = ∼3.5 D(meas.) = 5.01(2) D(calc.) = 5.059

Optical Properties: Transparent to translucent. *Color:* Purple, red, pale pink. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (+). $\alpha = 1.85(1)$ $\beta = 1.91(1)$ $\gamma = [2.20]$ 2V(meas.) = 55(5)°

Cell Data: *Space Group:* $C2/c$. $a = 12.870(2)$ $b = 5.3813(5)$ $c = 11.888(2)$ $\beta = 98.22(1)°$ Z = 4

X-ray Powder Pattern: Moctezuma mine, Mexico.
4.98 (vs), 3.00 (vs), 4.06 (s), 3.31 (s), 2.77 (w), 2.69 (w), 2.60 (w)

Chemistry:

	(1)
TeO_2	76.29
MnO	14.20
ZnO	9.36
CaO	0.15
Total	[100.00]

(1) Moctezuma mine, Mexico; recalculated to 100% from an original total of 100.06% after deduction of H_2O 0.03%, insoluble 0.22%, remnant = Bi_2O_3 0.08%, Sb_2O_3 0.02%, Al_2O_3 0.02%, PbO 0.05%, CdO 0.07%, CoO 0.02%, MgO 0.02%; corresponds to $(Mn_{1.26}Zn_{0.72}Ca_{0.02})_{\Sigma=2.00}Te_{3.01}O_{8.02}$.

Occurrence: Very rare in the oxidized zone of an Au–Te deposit (Moctezuma mine, Mexico); very rare in intensely silicified pyritic shales (Joe mine, Arizona, USA).

Association: Tellurium, tellurite, paratellurite, denningite, mroseite, zemannite (Moctezuma mine, Mexico).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. Large crystals at the Joe mine, Tombstone, Cochise Co., Arizona, USA. From the Kawazu mine, Shizuoka Prefecture, Japan.

Name: To honor Professor Kiril Spiroff (1901–1981), Bulgarian–American mineralogist, Michigan College of Mining and Technology, Houghton, Michigan, USA.

Type Material: Natural History Museum, Paris, France, 175.79; Royal Ontario Museum, Toronto, Canada, M24879; Harvard University, Cambridge, Massachusetts, USA, 108109.

References: (1) Mandarino, J.A., S.J. Williams, and R.S. Mitchell (1963) Spiroffite, a new tellurite mineral from Moctezuma, Sonora, Mexico. Mineral. Soc. Amer. Special Paper 1, 305–309. (2) Cooper, M.A. and F.C. Hawthorne (1996) The crystal structure of spiroffite. Can. Mineral., 34, 821–826.

SiO_2	63.60
Al_2O_3	27.48
Fe_2O_3	0.04
MnO	0.14
MgO	< 0.02
CaO	< 0.02
Li_2O	7.79
Na_2O	0.22
H_2O^+	0.17
Total	99.44

(1) Pala, California, USA; corresponds to $(Li_{0.98}Na_{0.01})_{\Sigma=0.99}Al_{1.00}(Si_{1.99}Al_{0.01})_{\Sigma=2.00}O_6$.

Mineral Group: Pyroxene group.

Occurrence: A common constituent of lithium-rich granite pegmatites; in aplites and gneisses.

Association: Quartz, albite, petalite, eucryptite, lepidolite, beryl.

Distribution: From Utö, Södermanland, and in the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. In Finland, from near Kuortane, and in the Tammela district. In the USA, giant crystals in the Etta mine, near Keystone, Pennington Co., and elsewhere in the Black Hills, South Dakota; at Hiddenite, Alexander Co. and in the Foote mine, Kings Mountain, Cleveland Co., North Carolina; from the Pala district, San Diego Co., California; and in the Harding mine, Dixon, Taos Co., New Mexico. From the Tanco mine, Bernic Lake, Manitoba, Canada. At the Urupuca mine, Itambacari, and at Resplendor, Minas Gerais, Brazil. From Mawi and Kantiva, Nuristan district, Laghman Province, Afghanistan. At Maharitra, Mt. Bity, and at Anjanabonoina, Madagascar. From Bikita, Zimbabwe. Many other minor localities are known.

Name: From the Greek for *ash-colored*, in allusion to its color.

(1) Velardeña, Mexico; corresponds to $(Ca_{4.95}Mg_{0.02}Na_{0.01})_{\Sigma=4.98}(Si_{2.00}Al_{0.03}Fe^{3+}_{0.01})_{\Sigma=2.04}O_8(C_{0.98}O_3)$.

Polymorphism & Series: Dimorphous with paraspurrite.

Occurrence: A product of high-temperature thermal metamorphism along the contact between carbonate rock and mafic magma.

Association: Gehlenite, merwinite, tilleyite, hillebrandite, scawtite, kilchoanite, rankinite, larnite, foshagite, wollastonite.

Distribution: From the Santa Juana mine, Velardeña, Durango, and in the Encantada district, Coahuila, Mexico. In the USA, at Crestmore, Riverside Co., California; in the Tres Hermanas district, Luna Co., New Mexico; and from the Little Belt Mountains, Lewis and Clark and Meagher Co., Montana. In Ireland, from Scawt Hill, near Larne, and at Carneal, Co. Antrim, and at Carlingford, Co. Louth. From Camas Mòr, Isle of Muck, and at Camphouse, Ardnamurchan, Argyllshire, Scotland. At Golden Gully, Tokatoka district, about 150 km north of Auckland, New Zealand. From the Güneyce-İkizdere area, Trabzon Province, Turkey. In the Hatrurim Formation, Israel. At Kushiro and Hirata, Hiroshima Prefecture, and at Fuka, near Bicchu, Okayama Prefecture, Japan. Found near Anakit Creek, at the mouth of the Lower Tunguska River, central Siberia, and elsewhere in Russia.

Name: For Josiah Edward Spurr (1870–1950), American geologist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 86532; The Natural History Museum, London, England, 1923,1032.

CaO	41.69	41.26
Total	100.28	100.00

(1) Kopeysk, Russia; corresponds to $Ca_{2.01}(Fe^{3+}_{1.91}Mg_{0.08}Mn_{0.03})_{\Sigma=2.02}O_5$. (2) $Ca_2Fe^{3+}_2O_5$.

Occurrence: Formed from calcined ankerite in petrified wood baked by burning coal heaps (Kopeysk, Russia); in leucite tephrite lava at contacts between lava and calcium-rich xenoliths (Bellerberg volcano, Germany).

Association: Portlandite, fluorellestadite, lime, periclase, spurrite, larnite, magnesioferrite, hematite, anhydrite (Kopeysk, Russia); sanidine, clinopyroxene, pyrrhotite, thompsonite, ettringite, willhendersonite, gismondine, jasmundite, mayenite, bellbergite, calcic olivine, portlandite (Bellerberg volcano, Germany).

Distribution: From mines around Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany.

Name: Honors Dr. Boris Ivanovich Srebrodol'skii (1927–), Russian-Ukrainian mineralogist, Institute of Geology and Geochemistry, Lvov, Ukraine.

Type Material: Mining Institute, St. Petersburg, 1943/1; Il'menskii Preserve Museum, Miass; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84277, vis6221.

Srilankite $(Ti, Zr)O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As idiomorphic inclusions, less than 1 mm, intergrown with associated minerals.

Physical Properties: *Cleavage:* One direction, poor. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼6.5 VHN = 900–1000 D(meas.) = ∼4.6 D(calc.) = 4.77 Commonly radioactive.

Optical Properties: Opaque, translucent in thin fragments. *Color:* Black, brownish black; dark blue in transmitted light; gray-white in reflected light. *Luster:* Submetallic to adamantine. *Optical Class:* Biaxial (–); high birefringence. n = [2.38] 2V(meas.) = 16(1)° *Anisotropism:* Observed.
R_1–R_2: (480) 19.4–18.6, (546) 18.4–16.0, (589) 18.5–16.4, (649) 18.7–17.0

Cell Data: *Space Group: Pbcn.* a = 4.706(5) b = 5.553(5) c = 5.024(4) Z = 4

X-ray Powder Pattern: Rakwana, Sri Lanka.
2.92 (100), 1.516 (35), 1.721 (30), 3.61 (25), 1.692 (25), 1.864 (15), 1.793 (15)

Chemistry:

	(1)
TiO_2	56.30
$(Zr, Hf)O_2$	43.97
Total	100.27

(1) Rakwana, Sri Lanka; by electron microprobe, average of 50 analyses of four grains, UO_2 0.15(5)% in three grains; corresponds to $[Ti_{0.66}(Zr, Hf)_{0.34}]_{\Sigma=1.00}O_2$.

Occurrence: In pebbles found in concentrates from a placer gemstone mine.

Association: Zirconolite, baddeleyite, geikielite, spinel, perovskite.

Distribution: From Rakwana, Sri Lanka.

Name: For Sri Lanka, the country where the mineral was first collected.

Type Material: National Museum of Natural History, Washington, D.C., USA, 165370.

Staněkite $\mathbf{Fe^{3+}(Mn, Fe^{2+}, Mg)O(PO_4)}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. May be anhedral, showing rough {120} faces, elongated along [001], to 2 cm, in subparallel aggregates; granular.

Physical Properties: *Cleavage:* Parting ⊥ [001]. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = 4–5 D(meas.) = 3.80 D(calc.) = 4.09

Optical Properties: Nearly opaque. *Color:* Black; pale gray in reflected light, with reddish yellow to brownish red internal reflections. *Streak:* Dark brown. *Luster:* Weakly submetallic. *Optical Class:* Biaxial. *Pleochroism:* Weak. *Anisotropism:* Distinct, pale brownish gray. *Bireflectance:* Weak.

Cell Data: *Space Group:* $P2_1/a$. $a = 11.844(3)$ $b = 12.662(3)$ $c = 9.989(3)$ $\beta = 105.93(2)°$ Z = 16

X-ray Powder Pattern: Clementine II pegmatite, Namibia.
2.971 (100), 2.810 (85), 2.857 (58), 3.259 (50), 3.412 (38), 5.54 (37), 3.621 (35)

Chemistry:

	(1)
P_2O_5	31.16
TiO_2	0.02
Al_2O_3	0.01
Fe_2O_3	41.56
FeO	1.56
MnO	23.12
ZnO	0.22
MgO	0.50
CaO	0.13
Na_2O	0.13
K_2O	0.05
Total	[98.46]

(1) Clementine II pegmatite, Namibia; by electron microprobe, original total given as 98.42%, FeO:Fe_2O_3 by Mössbauer spectroscopy; corresponds to $Fe^{3+}_{1.00}(Mn_{0.73}Fe^{3+}_{0.16}Fe^{2+}_{0.05}Mg_{0.03}Na_{0.01})_{\Sigma=0.98}O(P_{0.98}O_4)$.

Occurrence: An uncommon alteration product of earlier phosphates in zoned complex granite pegmatites.

Association: Eosphorite, arrojadite, kryzhanovskite, ferrisicklerite, alluaudite, quartz (Clementine II pegmatite, Namibia); ferrisicklerite, heterosite (Albères, France).

Distribution: In Namibia, near Karibib, from the Clementine II pegmatite, Okatjimukuju Farm, and at the Helikon pegmatite; from the Cameroon pegmatite, Usakos. In the Albères massif, Pyrénées-Orientales, France. From Cap Creus, east of Figueras, Gerona Province, Spain.

Name: To honor Professor Josef Staněk (1928–), Masarykov University, Brno, Czech Republic, specialist in pegmatite phosphate mineralogy.

Type Material: University of Stuttgart, Stuttgart, Germany; National School of Mines, Paris, France, 45634.

References: (1) Keller, P., F. Fontan, F. Velasco Roldan, and J.C. Melgarejo (1997) Staněkite, $Fe^{3+}(Mn, Fe^{2+}, Mg)(PO_4)O$: a new phosphate mineral in pegmatites at Karibib (Namibia) and French Pyrénées (France). Eur. J. Mineral., 9, 475–482. (2) (1998) Amer. Mineral., 83, 187 (abs. ref. 1).

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. As subhedral to irregular grains, to 1 mm, in veinlets and rimming olivine.

Physical Properties: Hardness = 4.5–5 D(meas.) = 3.15(1) D(calc.) = 3.15

Optical Properties: Transparent. *Color:* Reddish to amber, pale bluish if weathered; colorless in transmitted light.
Optical Class: Biaxial (+). α = 1.594–1.619 β = [1.596]–1.622 γ = 1.604–1.631
2V(meas.) = 50°–60°

Cell Data: *Space Group:* $P2/c$ or Pc. a = 17.16(3) b = 10.00(2) c = 22.88(4)
$\beta = 100°15(10)'$ Z = 8

X-ray Powder Pattern: Estherville meteorite.
2.817 (10), 3.747 (8), 2.505 (8), 3.845 (6), 8.31 (5), 6.01 (5), 1.870 (4)

Chemistry:

	(1)
P_2O_5	46.6
FeO	13.8
MnO	1.4
MgO	12.9
CaO	24.6
Total	99.3

(1) Estherville meteorite; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponding to $Ca_{4.02}(Mg_{2.91}Fe_{1.74}Mn_{0.18})_{\Sigma=4.83}(PO_4)_6$.

Occurrence: A rare component of some meteorites.

Association: Olivine, whitlockite, farringtonite, troilite.

Distribution: In the Estherville mesosiderite meteorite, and the pallasite meteorites Albin, Finmarken, Imilac, Newport, Mount Vernon, Santa Rosalia, and Zaisho.

Name: To honor Stanley Field (1875–1964), former Chairman of the Board of Trustees of the Field Museum of Natural History, Chicago, Illinois, USA, during whose tenure the Museum's meteorite collection reached major proportions.

Type Material: Masses of the Estherville meteorite are at: The Natural History Museum, London, England; Natural History Museum, Paris, France; Natural History Museum, Vienna, Austria; Field Museum of Natural History, Chicago, Illinois; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA.

Stanleyite $V^{4+}O(SO_4)\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, possibly monoclinic or triclinic. *Point Group:* n.d. As aggregates of minute plates, to 1.5 mm, which may be in parallel to subparallel stacks, and as efflorescences.

Physical Properties: Hardness = 1–1.5 D(meas.) = 1.95 D(calc.) = 2.01 Easily soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Aquamarine-blue to deep cobalt-blue.
Streak: White.
Optical Class: Biaxial (+). *Pleochroism:* Moderate; $X = Y$ = blue; Z = very pale blue to colorless. *Orientation:* Extinction at up to 15° to the length. *Absorption:* $X = Y > Z$.
$\alpha = 1.505$ $\beta = 1.519$ $\gamma = 1.533$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. $a = 12.12$ $b = 9.71$ $c = 14.92$ $Z = 8$

X-ray Powder Pattern: Minasragra, Peru; shows some preferred orientation.
4.20 (100), 4.98 (90), 4.69 (80), 4.41 (60), 3.81 (60), 3.73 (60), 3.09 (20)

Chemistry:

	(1)	(2)

V_2O_4	30.6	30.60
H_2O	38.0	39.87
rem.	1.8	
Total	99.4	100.00

(1) Minasragra, Peru; by electron microprobe, average of nine analyses, SO_3 and H_2O by TGA, remnant = SiO_2 0.3%, TiO_2 0.1%, Al_2O_3 0.2%, FeO 0.2%, NiO 0.3%, MgO 0.1%, CaO 0.1%, K_2O 0.4%, Cl 0.1%; corresponds to $V_{1.01}O_{1.01}S_{0.99}O_{3.99}\cdot 5.78H_2O$. (2) $VO(SO_4)\cdot 6H_2O$.

Occurrence: Initially found on a museum specimen of patronite from a rich vanadium deposit.

Association: Patronite, pyrite, potassium alum, quartz.

Distribution: From Minasragra, 46 km from Cerro de Pasco, Peru.

Name: To honor Henry Morton Stanley (1841–1904), noted Welsh–American journalist-explorer.

Type Material: Royal Scottish Museum, Edinburgh, Scotland, 1922.11.6; National Museum of Natural History, Washington, D.C., USA, 160386.

Stannite Cu_2FeSnS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Rarely as crystals, to 6 cm, with a pseudo-octahedral habit due to twinning; also massive, granular, and disseminated. *Twinning:* As penetration twins on {102} and with [112] as twin axis and {112} as composition plane. Polysynthetic lamellae seen in polished section.

Physical Properties: *Cleavage:* Indistinct on {110} and {001}. *Fracture:* Uneven. Hardness = 4 VHN = 216–265 (25 g load). D(meas.) = 4.3–4.5 D(calc.) = 4.490

Optical Properties: Opaque. *Color:* Steel-gray to iron-black, may tarnish blue; in polished section gray with olive-green tinge. *Streak:* Blackish. *Luster:* Metallic. *Pleochroism:* Indistinct in air, distinct in oil. *Anisotropism:* Distinct; violet and slate-green.
R_1–R_2: (400) 21.4–22.2, (420) 22.1–23.4, (440) 23.5–24.7, (460) 24.9–26.0, (480) 26.2–27.0, (500) 27.1–27.8, (520) 27.7–28.3, (540) 27.8–28.4, (560) 27.6–28.3, (580) 27.3–28.0, (600) 27.0–27.6, (620) 26.7–27.3, (640) 26.6–27.1, (660) 26.5–27.0, (680) 26.5–27.0, (700) 26.7–27.1

(1) Chocaya, Bolivia; corresponds to $Cu_{2.04}Fe_{1.11}Sn_{1.02}S_{4.00}$. (2) Oruro, Bolivia; by electron microprobe, corresponding to $Cu_{2.01}(Fe_{0.84}Zn_{0.14})_{\Sigma=0.98}Sn_{1.01}S_{4.00}$. (3) Cu_2FeSnS_4.

Polymorphism & Series: Dimorphous with ferrokesterite.

Mineral Group: Stannite group.

Occurrence: In tin-bearing vein deposits of hydrothermal origin.

Association: Chalcopyrite, sphalerite, tetrahedrite, arsenopyrite, pyrite, cassiterite, wolframite.

Distribution: In Cornwall, England, from Wheal Rock, near St. Agnes [TL], and at a number of other mines, where it may constitute an ore mineral. In the Czech Republic, from Cínovec (Zinnwald). In Australia, at Broken Hill, New South Wales, and from Zeehan, Tasmania. In Bolivia, in the Itos and San José mines, Oruro; at Llallagua, Chocaya, and Cerro Rico, Potosí; and from Uncia. In the USA, at the Peerless and Etta mines, near Keystone, Pennington Co., South Dakota. From the Brunswick tin mines, 56 km southwest of Fredericton, New Brunswick, Canada. As large crystals from the Yaogangxian mine, 45 km northeast of Yizhang, Hunan Province, China. Noted in small amounts from a number of other localities world-wide.

Name: From the Latin *stannum*, *tin*.

H_2O			0.61
Total	102.10	96.97	98.49

(1) Near Sukula, Finland; by electron microprobe, total Sn as SnO_2. (2) Do.; analysis (1) with total Sn as SnO. (3) Do.; analysis (1) with Sn^{2+}, Sn^{4+} and $(OH)^{1-}$ calculated to fill all sites; then corresponding to $(Sn^{2+}_{1.69}Fe^{2+}_{0.18}Mn^{2+}_{0.13})_{\Sigma=2.00}(Ta_{1.21}Sn^{4+}_{0.36}Nb_{0.35}Ti_{0.08})_{\Sigma=2.00}[O_{6.57}(OH)_{0.43}]_{\Sigma=7.00}$.

Mineral Group: Pyrochlore group, microlite subgroup; $Sn_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: A very rare mineral, replacing ferrowodginite inclusions in tantalian cassiterite, in a museum specimen from a granite pegmatite.

Association: Ferrowodginite, tantalian cassiterite, bismuth.

Distribution: From near Sukula, Tammela, Finland, the exact locality now lost.

Name: For tin, STANNum, in the composition, and membership in the *microlite* subgroup of the pyrochlore group.

Type Material: n.d.

(1) Noril'sk region (?), USSR; by electron microprobe, ranges of analyses. (2) Monchegorsk, USSR; by electron microprobe, average of analyses.

Occurrence: In sulfide Cu-Ni ores (Noril'sk region (?), USSR).

Association: Chalcopyrite, Pt–Fe alloy (Noril'sk region (?), USSR); niggliite, hessite, tellurides of Pt and Pd (Monchegorsk, USSR).

Distribution: Originally described from a locality thought to be in the Noril'sk region, and since described from the Taimyr mine, Talnakh area, of that region in western Siberia; the species later redefined from Monchegorsk, Kola Peninsula; also at the Ugol'nri Ruch' placer, all in the USSR.

Name: For the composition.

Type Material: n.d.

(1) Alta mine, California, USA; by electron microprobe and gravimetric methods, total Fe as FeO; corresponds to $(Mg_{0.86}Fe_{0.12})_{\Sigma=0.98}(SO_4)_{1.02} \cdot 4.00H_2O$. (2) $MgSO_4 \cdot 4H_2O$.

Mineral Group: Rozenite group.

Occurrence: An uncommon secondary mineral formed in the presence of iron sulfides; as efflorescences from evaporation of surface and ground waters.

Association: Pyrite, marcasite (Starkey mine, Missouri, USA); konyaite, blödite, gypsum, halite (Great Konya Basin, Turkey); szomolnokite, gunningite (Goldstrike mine, Nevada, USA).

Distribution: In the USA, from the Starkey mine, Madison Co., Missouri; at the Alta troilite mine, Del Norte Co., California; in the Green River Formation, northern Piceance Creek Basin, Garfield and Rio Blanco Cos., and at Garden Park, Fremont Co., Colorado; from the Goldstrike mine, Lynn district, Eureka Co., Nevada; near the Fuemerol mine area, Emery Co., Utah. In the Hansa I mine, Empelde, and the Niedersachsen mine, near Wathlingen, Lower Saxony, Germany. In the Nižná Mysl'a mine, Vel'ky Milic massif, Slovakia. Long fibers from Felsőpetény, also at Rudabánya, Szarvaskő, and Radostyán, Hungary. From the Cantiere Macei, Capo Calamita, Elba, Italy. In Turkey, in the Great Konya Basin, near Çakmak, Konya Province.

Name: For its originally-noted occurrence at the Starkey mine, Missouri, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 105610.

Staurolite $(Fe^{2+}, Mg)_2Al_9(Si, Al)_4O_{20}(O, OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Commonly in prismatic crystals exhibiting {110}, {010}, {001}, and {101}, typically rough, to 12 cm. *Twinning:* Commonly as 60° twins with {231} as twin plane, may be cyclic; less commonly as 90° cruciform twins with {031} as twin plane.

Physical Properties: *Cleavage:* Distinct on {010}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 7–7.5 D(meas.) = 3.74–3.83 D(calc.) = 3.686

Optical Properties: Transparent to opaque. *Color:* Dark reddish brown to blackish brown, yellowish brown, rarely blue; pale golden yellow in thin section. *Streak:* White to grayish. *Luster:* Subvitreous to resinous.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Y = pale yellow; Z = golden yellow. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, weak. *Absorption:* $Z > Y > X$.
$\alpha = 1.736–1.747$ $\beta = 1.742–1.753$ $\gamma = 1.748–1.761$ 2V(meas.) = 80°–90°

Cell Data: *Space Group:* $C2/m$. $a = 7.863–7.871$ $b = 16.534–16.613$ $c = 5.632–5.663$ $\beta = 90.00°–90.45°$ Z = 2

X-ray Powder Pattern: Pizzo Forno, Switzerland. (ICDD 15-397).
3.012 (100), 2.693 (100), 2.372 (80), 3.559 (60), 2.400 (60), 1.515 (60), 1.511 (60)

		Total	[99.55]

(1) Black Mountain, Grafton Co., New Hampshire, USA; by electron and ion microprobe, average of 23 analyses, H_2O determined on a separate sample; corresponds to $(Fe^{2+}_{1.43}Li_{0.20}Mg_{0.13}Mn_{0.03}Zn_{0.02})_{\Sigma=1.81}(Al_{8.64}Fe^{3+}_{0.04}Ti_{0.03})_{\Sigma=8.71}(Si_{3.85}Al_{0.15})_{\Sigma=4.00}O_{24}H_{2.08}$.

Occurrence: Common in pelitic schists, gneisses, and argillaceous rocks regionally metamorphosed to amphibolite grade; also a detrital mineral.

Association: Almandine, sillimanite, kyanite, tourmaline, muscovite, quartz, chloritoid.

Distribution: Widespread, with fine crystals from, for example: at Pizzo Forno and Alpe Piona, Ticino, Switzerland. On Mt. Greiner, Zillertal, Tirol, Austria. From the Keivy massif, Kola Peninsula, Russia. Large twins, in the old Provinces of Finistère and Morbihan, in "Brittany," France. From Fanzeres, Portugal. In the USA, at Franconia, Grafton Co., New Hampshire; Chesterfield, Hampshire Co., Massachusetts; near Blue Ridge, Fannin Co., Georgia; near Picures, Taos Co., New Mexico. In Brazil, in Minas Gerais, from Rubellita and Ardenella; Agua Quente, Rio Pardo de Minas; and Fazenda Graniais.

Name: Derived from the Greek for a *cross*, describing the common twins.

(1) Poudrette quarry, Mont Saint-Hilaire, Québec, Canada; average of 14 electron microprobe analyses, B and H_2O calculated and their presence confirmed by crystal structure refinement and Raman spectroscopy; corresponding to $Na_{0.97}(Mn_{1.75}Fe_{0.05}Ca_{0.01})_{\Sigma=1.81}(Si_{3.07}S_{0.02})_{\Sigma=3.09}BO_9(OH)_2$.
(2) $NaMn_2[Si_3BO_9](OH)_2$.

Occurrence: Precipitated in vugs in altered sodalite syenite by late-stage aqueous fluids, presumably highly alkaline due to the presence of natrite.

Association: Microcline, analcime, nepheline, aegirine, pyrrhotite, sodalite, eudialyte-group minerals, natron, catapleiite.

Distribution: From the Poudrette quarry, Mont Saint-Hilaire, La Vallée-du-Richelieu, Montérégie (formerly Rouville County), Québec, Canada.

Name: Honors Anthony Hosford Steede (b. 1940) in recognition of his contributions to the understanding of the mineralogy of Mont Saint-Hilaire.

Type Material: Department of Natural History, Royal Ontario Museum, Toronto, Ontario, Canada (M56489).

References: (1) Haring, M.M.M. and A.M. McDonald (2014) Steedeite, $NaMn_2[Si_3BO_9](OH)_2$: Characterization, crystal-structure determination, and origin. Can. Mineral., 52, 47-60. (2) (2014) Amer. Mineral., 99, 2442-2443 (abs. ref. 1).

Steenstrupine-(Ce)

$Na_{14}Ce_6Mn^{2+}Mn^{3+}Fe_2^{3+}(Zr,Th)(Si_6O_{18})_2(PO_4)_7(OH)_2 \cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal; commonly metamict. *Point Group:* $\bar{3}\,2/m$. Rhombohedral crystals, rounded and rough, to 10 cm; massive.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4–5 D(meas.) = 3.38–3.47. D(calc.) = [3.63] Radioactive.

Optical Properties: Opaque. *Color:* Brownish red to black. *Streak:* Brownish, nearly white. *Luster:* Dull.
Optical Class: Uniaxial (–). *Pleochroism:* Weak, in brown and yellow tints. $\omega = 1.665–1.667$ $\epsilon = 1.662–1.663$

Cell Data: *Space Group:* $R\bar{3}m$. $a = 10.460(4)$ $c = 45.479(15)$ $Z = 3$

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.

(1) Julianehåb, Greenland. (2) $Na_{14}Ce_6Mn^{2+}Mn^{3+}Fe_2^{3+}Zr(Si_6O_{18})_2(PO_4)_7(OH)_2 \cdot 3H_2O$.

Occurrence: In ultra-agpaitic pegmatites of nepheline-sodalite syenites and syenites.

Association: Lepidolite, aegirine, murmanite, ussingite, natrolite, nordite, nepheline, sodalite.

Distribution: From the Kangerdluarssuk Plateau and elsewhere in the Ilímaussaq intrusion, southern Greenland. In the Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Knud Johannes Vogelius Steenstrup (1842–1913), Danish geologist of Copenhagen, Denmark.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1881.1070.

Steigerite $AlVO_4 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or 2. Cryptocrystalline fibrous, may be flat platy {010}, to < 1 μm; gumlike to compact massive, typically as coatings.

Physical Properties: *Cleavage:* Perfect on {010}; fair on {100} and {100}.
Tenacity: Pulverulent. Hardness = 2.5–3 D(meas.) = 2.52–2.58 D(calc.) = 2.58

Optical Properties: Semitransparent. *Color:* Canary-yellow, greenish yellow, olive-green.
Luster: Waxy in compact aggregates.
Optical Class: Biaxial (+). α = 1.720–1.730 β = 1.730–1.734 γ = 1.748–1.752
2V(meas.) = n.d.

(1) Gypsum Valley, Colorado, USA. (2) Kara-Tau Mountains, Kazakhstan. (3) $Al(VO_4) \cdot 3H_2O$.

Occurrence: In U–V deposits impregnating sandstone (Gypsum Valley, Colorado, USA); a weathering product in vanadium-rich schists (Kara-Tau Mountains, Kazakhstan).

Association: Fervanite, corvusite, gypsum (Gypsum Valley, Colorado, USA); navajoite, tyuyamunite, rauvite, hewettite (Monument No. 2 mine, Arizona, USA); vanalite, hewettite, delvauxite, satpaevite, gypsum, vashegyite, variscite, halloysite, alunite (Kara-Tau Mountains, Kazakhstan).

Distribution: In the USA, from the Sullivan Brothers and adjacent Ponto No. 3 claims, Gypsum Valley, San Miguel Co.; in the Fox mine, Atkinson Mesa, Uravan district, Montrose Co., Colorado; on the Cactus Rat claims, Thompsons district, Grand Co., Utah; at the Monument No. 2 mine, Monument Valley, Apache Co., Arizona. In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan.

Name: Honoring Dr. George Steiger (1869–1944), Chief Chemist, U.S. Geological Survey, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, C5108.

Steklite $KAl(SO_4)_2$

Crystal Data: Hexagonal. *Point Group*: 32. As hexagonal or irregularly shaped crystals, platy on (001), to 1 mm. Crystals often split and combined in open aggregates or thin crusts.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle. *Fracture:* n.d.
Hardness = 2.5 D(meas.) = n.d. D(calc.) = 2.797

Optical Properties: Transparent. *Color:* Colorless, white to grayish-white in aggregates.
Streak: White. *Luster:* Vitreous.
Optical Class: Uniaxial (-). ω = 1.546(2) ε = 1.533(3) *Pleochroism:* None.

Cell Data: Space Group: *P*321. a = 4.7281(3) c = 7.9936(5) Z = 1

X-ray Powder Pattern: Tolbachik volcano, Kamchatka, Russia.
3.649 (100), 2.861 (51), 8.02 (34), 2.364 (25), 2.660 (19), 2.267 (14), 1.822 (12), 4.085 (11)

Chemistry:

	(1)
Na_2O	0.09
K_2O	18.12
CaO	0.08
MnO	0.03
Fe_2O_3	2.02
Al_2O_3	18.18
SO_3	61.80
Total	100.37

(1) Tolbachik volcano, Kamchatka, Russia; average of 5 electron microprobe analyses, corresponds to $(K_{0.997}Na_{0.008}Ca_{0.004})_{\Sigma=1.009}(Al_{0.925}\ Fe^{3+}_{0.066}Mg_{0.003}Mn_{0.001})_{\Sigma=0\ 995}S_{2.001}O_8$.

Occurrence: A volcanic sublimate formed at 150-170 °C as part of sulfate crusts around an active fumarole. Also described as a sublimate near burning coal deposits.

Association: Alumoklyuchevskite, langbeinite, euchlorine, fedotovite, chalcocyanite, hematite, kamchatkite, atlasovite, melanothallite, tenorite, avdoninite, belloite, ziesite, Cu-lyonsite (Tolbackhik, Russia).

Distribution: From the Second scoria cone of the Northern Breakthrough of the Great Tolbachik Fissure Eruption (1975–1976), Tolbachik volcano, Kamchatka, and the dumps of coal mine N 47 near Kopeisk, South Urals, Russia. At Showashinzan volcano, Hokkaido, Japan. From Izalco volcano, El Salvador and Santiaguit volcano, Guatemala. From burning anthracite coal deposits Eastern Pennsylvania, USA.

Name: From the Russian word *стекло* (*steklo*) for *glass* as an allusion to the visual appearance of aggregates of the mineral formed around vents of a burning coal heap (coal mine N 47 near Kopeisk, South Urals, Russia).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; 4109/1.

Al_2O_3	14.21	BaO	0.02
Fe_2O_3	0.17	Na_2O	0.19
MnO	trace	K_2O	0.23
MgO	0.04	H_2O	17.79
CaO	7.45	Total	99.30

(1) Villanova Monteleone, Sardinia, Italy; corresponds to $(Ca_{0.94}Na_{0.04}K_{0.04}Mg_{0.01})_{\Sigma=1.03}(Al_{1.98}Fe_{0.02})_{\Sigma=2.00}Si_{7.00}O_{18}\cdot 7.02H_2O$.

Mineral Group: Zeolite group.

Occurrence: Lines cavities and fracture surfaces in volcanic rocks altered by hydrothermal solutions.

Association: Zeolites, prehnite, tridymite.

Distribution: Increasingly recognized from localities worldwide; only a few of the best confirmed of these can be given. On Copper Island, Komandorskiye (Commander) Islands, Bering Sea, and at Klichka, Chita region, Siberia, Russia. Fine examples in the Sarbayskaya quarry, near Rudniy, Kazakhstan. From Villanova Monteleone, Alghero, Sardinia, Italy. At Kongsberg, Norway. In the USA, at Ritter Hot Springs, Grant Co., Oregon; on Hook Mountain, Rockland Co., New York; and at Fanwood, Somerset Co., New Jersey. In Australia, large crystals from around Gunnedah, New South Wales, and at Harcourt, Dookie, and Corop, Victoria. Exceptional examples from Cinchwad, Poona, and in the Nasik district, Maharashtra, India.

Name: For Georg Wilhelm Steller (1709–1746), discoverer of the Komandorskiye (Commander) Islands, Russia.

Type Material: The Natural History Museum, London, England, 1934,650.

Stenhuggarite $CaFe^{3+}Sb^{3+}As_2^{3+}O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As equant pseudo-octahedral crystals, to 3 mm, showing {100}, {211}, and {301}.

Physical Properties: *Fracture:* Conchoidal. Hardness = > 4 D(meas.) = 4.63(5) D(calc.) = 4.56

Optical Properties: Transparent to translucent. *Color:* Bright reddish orange. *Streak:* Bright yellow.
Optical Class: Uniaxial, nearly isotropic. *Absorption:* Strong. $n = > 2.0$, low birefringence.

Cell Data: *Space Group:* $I4_1/amd$. $a = 16.144(3)$ $c = 10.706(2)$ $Z = 16$

X-ray Powder Pattern: Långban, Sweden.
2.985 (10), 1.8450 (4), 2.548 (3.5), 1.5440 (3.5), 5.92 (3), 1.1963 (2.5), 8.00 (2)

Chemistry:

	(1)
As	31.3
Sb	24.5
Fe	11.0
Ca	8.1
O	[25.1]
Total	[100.0]

(1) Långban, Sweden; by electron microprobe, O by difference; corresponds to $Ca_{1.00}Fe_{0.98}Sb_{1.00}As_{2.06}O_{7.76}$.

Occurrence: Very rare in hematite ore from a metamorphosed Fe–Mn orebody.

Association: Hematite.

Distribution: From Långban, Värmland, Sweden.

Name: From the Swedish for *stonemason*, in honor of Dr. Brian Harold Mason (1917–), U.S. National Museum, Washington, D.C., USA, for his contributions to the mineralogy of the Långban deposit.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; The Natural History Museum, London, England, 1969,117; National Museum of Natural History, Washington, D.C., USA, 120066.

(1) Ivigtut, Greenland; estimated to contain jarlite 3%. (2) $(Sr, Ba, Na)_2Al(CO_3)F_5$.

Occurrence: A rare mineral in the contact zone between siderite–cryolite and fluorite-rich rocks.

Association: Jarlite, weberite, jørgensonite, thomsenolite, gearksutite, topaz, muscovite, barite, pyrite, siderite, quartz.

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland.

Name: Honors Nicholaus Stenonis (Steno) (1638–1686), Danish scientist, who determined the constancy of interfacial angles of crystals.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1965.16–1965.22, 1981.1016–1981.1018, 1981.1021, 1981.1060. Natural History Museum, Paris, France,; The Natural History Museum, London, England, 1966,536.

(1) Copiapó, Chile; traces of As and Cu. (2) Cornwall, England; trace of Fe. (3) Ag_5SbS_4.

Occurrence: A late-stage mineral in hydrothermal silver deposits.

Association: Proustite, acanthite, silver, tetrahedrite, galena, sphalerite, pyrite.

Distribution: From many silver mining localities, typically in small amounts, and only rarely in fine specimens. In Germany, at Freiberg [TL], Schneeberg, and Marienberg, Saxony; and as exceptional crystals from St. Andreasberg, Harz Mountains. In Slovakia, at Banská Hodruša and from Banská Štiavnica (Schemnitz). In the Czech Republic, at Jáchymov (Joachimsthal), Příbram, and Třebsko. In Italy, fine twins from Monte Narba, near Sarrabus, Sardinia. In England, as twinned crystals from Wheal Boys, St. Endellion, Cornwall. At Espedalen, Norway. From Azegour, Morocco. At Altyn-Topkan, Tadjikistan. In Canada, in the Cobalt district, Ontario; at United Keno Hill Mines, and fine examples from the Husky mine, Elsa, Yukon Territory. In the USA, in Nevada, as an important ore mineral in the Comstock Lode, Virginia City, Storey Co. In Mexico, large crystals from Arizpe, Sonora; at Guanajuato; from Fresnillo, Zacatecas. At Chañarcillo, south of Copiapó, Atacama, Chile. In Bolivia, from Colquechaca, Potosí. At San Cristobal, Peru. From Broken Hill, New South Wales, Australia.

Name: In honor of the Archduke Victor Stephan (1817–1867), former Mining Director of Austria.

Total	[100.0]	100.00

(1) Sterling Hill, New Jersey, USA; by electron microprobe, total Mn as MnO, H_2O by difference.
(2) $Mn_3(AsO_4)_2 \cdot 4H_2O$.

Occurrence: A very rare mineral in seams in franklinite ore from a metamorphosed stratiform zinc orebody.

Association: Franklinite, sphalerite, löllingite, calcite.

Distribution: From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: For the Sterling Hill mine, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 147269.

Sternbergite $AgFe_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are thin pseudohexagonal basal plates, to 0.6 cm, striated on {001} ‖ [100], also ‖ [010]; forming rosettes and fanlike aggregates. *Twinning:* On {130}, lamellar.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Thin lamellae are flexible, foil-like. Hardness = 1–1.5 VHN = 31–44 (50 g load). D(meas.) = 4.101–4.215 D(calc.) = 4.275

Optical Properties: Opaque. *Color:* Pinchbeck-brown, may tarnish blue-violet on selected faces; in reflected light, pale brown. *Streak:* Black. *Luster:* Metallic, brilliant on {001}. *Pleochroism:* Distinct, in browns. *Anisotropism:* Strong; bluish and reddish to lilac, reddish brown to pale green with purplish pink shades.

R_1–R_2: (400) 18.2–30.1, (420) 19.0–31.0, (440) 19.8–32.0, (460) 20.6–33.1, (480) 21.6–34.0, (500) 22.4–34.9, (520) 23.2–35.7, (540) 23.9–36.4, (560) 24.5–37.0, (580) 25.2–37.5, (600) 26.0–38.0, (620) 26.7–38.2, (640) 27.3–38.3, (660) 27.7–38.2, (680) 28.0–38.1, (700) 28.1–37.9

(1) Jáchymov, Czech Republic. (2) $AgFe_2S_3$.

Polymorphism & Series: Dimorphous with argentopyrite.

Occurrence: In hydrothermal veins with other silver sulfosalt minerals and in Co–Ni–Ag sulfide assemblages.

Association: Stephanite, acanthite, proustite, pyrargyrite, argentopyrite, xanthoconite, pyrite, galena, sphalerite, dolomite, calcite, quartz.

Distribution: In the Czech Republic, from Jáchymov (Joachimsthal) [TL], at Příbram, and in the Krušné hory Mountains, at Měděnec. In Germany, from Johanngeorgenstadt, Freiberg, Marienberg, and Schneeberg, Saxony, and at St. Andreasberg, Harz Mountains. From the Ruen Pb–Zn deposit, Osogovo region, Bulgaria. At Hiendelaencina, Guadalajara Province, Spain. From the Akersberg mine, Oslo, Norway. In the USA, in Arizona, in the Leroy mine, Dos Cabezas Mountains, Cochise Co. At the Highland Bell mine, Beaverdell, British Columbia, Canada. From the Kamikita mine, Aomori Prefecture, Japan.

Name: To honor Caspar Maria Sternberg (1761–1838), Czech botanist, of the National Museum in Prague, Czech Republic.

Type Material: National Museum, Prague, Czech Republic.

Stetefeldtite $Ag_2Sb_2(O,OH)_7(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Powdery, massive.

Physical Properties: Hardness = 3.5–4.5 D(meas.) = 4.6 D(calc.) = [4.58]

Optical Properties: Semitransparent. *Color:* Yellow, black to brown when admixed with impurities; pale yellow in transmitted light. *Streak:* Pale yellow, shining.
Optical Class: Isotropic. $n = 1.95$

Cell Data: *Space Group:* $Fd3m$. a = 10.46 Z = 8

X-ray Powder Pattern: Belmont, Nevada, USA.
3.02 (100), 2.61 (70), 1.85 (70), 1.58 (70), 1.20 (50), 0.884 (50), 1.17 (40)

Chemistry:

	(1)
Sb_2O_4	43.77
Ag	23.74
Cu	12.78
Fe	1.82
S	4.7
H_2O	7.9
Total	94.71

(1) Belmont, Nevada, USA; average of two analyses; assuming Cu, Fe, and S are contained in admixed chalcocite and pyrite, then corresponds to $Ag_{1.1}Sb_{1.4}(O,OH,H_2O)_{6.3}$.

Mineral Group: Stibiconite group.

Occurrence: Apparently an alteration product in the oxidized zone of some hydrothermal Ag–Sb-bearing mineral deposits, where it may constitute an ore of silver.

Association: Chalcocite, pyrite, quartz (Belmont, Nevada, USA).

Distribution: In the USA, in Nevada, in the Empire and Philadelphia districts, Belmont, 80 km northeast of Tonopah, Nye Co., and in the Black Warrior mine, near Silver Peak, Esmeralda Co.; in Arizona, at the Snyder Hill mine, Tucson Mountains, Pima Co., in the Johnny Lyon Hills, Cochise Co., and from the Red Cloud mine, Silver District, La Paz Co.

Name: To honor Carl August Stetefeldt (1838–1896), German-American mining engineer and metallurgist.

Type Material: Location of original type material is unknown; restudied on Harvard University, Cambridge, Massachusetts, 80285; National Museum of Natural History, Washington, D.C., USA, 104763.

Stevensite $(Ca_{0.5}, Na)_{0.3}Mg_3Si_4O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: [Monoclinic] (by analogy to the smectite group). *Point Group:* n.d. Aggregates of plates, to 1 μm; massive.

Physical Properties: Hardness = 2.5 D(meas.) = 2.15–2.56 D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* Pink, buff, amber, white, gray, brown. *Luster:* Dull to resinous.
Optical Class: n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Springfield, New Jersey, USA; very close to saponite.
12.5–13.0 (10), 2.55 (10), 4.54 (6), 1.520 (4), 3.17–3.20 (3), 26.5 (2)

(1) Springfield, New Jersey, USA. (2) Prócida Island, Italy; by electron microprobe, H_2O by difference; corresponds to $(Na_{0.09}Ca_{0.06}K_{0.02})_{\Sigma=0.17}(Mg_{2.77}Fe^{3+}_{0.08})_{\Sigma=2.85}Si_4O_{10}(OH)_2$.
(3) $(Ca/2)_{0.3}Mg_3Si_4O_{10}(OH)_2$.

Mineral Group: Smectite group.

Occurrence: In cavities in basalt, formed by late-stage hydrothermal replacement of pectolite. A hydrothermal alteration product of igneous rocks, as dunite and tuff. May form authigenically, interstratified with other species.

Association: Quartz, talc, pectolite.

Distribution: In the USA, in New Jersey, from Bergen Hill, Hudson Co., Springfield, Essex Co., Paterson, Passaic Co., and elsewhere; at Mine Creek, Bakersville, Mitchell Co., North Carolina. On Prócida Island, Italy. From Corstorphine Hill, Edinburgh, Scotland. In the Ohiri mine, Yamagata Prefecture, and the Akatani mine, Niigata Prefecture, Japan. Probably occurs at additional localities but modern confirmation required.

Name: For E.A. Stevens, founder, Stevens Institute of Technology, Hoboken, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R4719.

Stewartite $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As acicular to thin tabular bladed crystals, with inclined terminations, to 4 mm, in bundles and tufts.

Physical Properties: Hardness = n.d. D(meas.) = 2.94 D(calc.) = 2.48

Optical Properties: Semitransparent. *Color:* Lemon-yellow, yellow to brownish yellow. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless; Y = pale yellow; Z = yellow. *Orientation:* Extinction inclined on all crystal edges. *Dispersion:* $r < v$, strong. $\alpha = 1.63$ $\beta = 1.658$ $\gamma = 1.66$ 2V(meas.) = Large.

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.398(2)$ $b = 10.672(3)$ $c = 7.223(3)$ $\alpha = 90.10(3)^\circ$ $\beta = 109.10(2)^\circ$ $\gamma = 71.83(2)^\circ$ Z = 2

X-ray Powder Pattern: Stewart mine, California, USA.
10.04 (10), 6.73 (7), 5.035 (5), 3.925 (5), 3.03 (4), 2.60 (4), 2.489 (4)

Chemistry: (1) No analysis has been made; composition established as a polymorph of laueite.

Polymorphism & Series: Trimorphous with laueite and pseudolaueite.

Occurrence: A rare oxidation product formed by the leaching of primary phosphates in complex zoned granite pegmatites.

Association: Lithiophilite, triphylite, huréaulite, strunzite, laueite, pseudolaueite, eosphorite, rockbridgeite, strengite, diadochite, phosphosiderite, Fe–Mn oxides.

Distribution: In the USA, at the Stewart mine, Pala, San Diego Co., California; in the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; at Newry, Oxford Co., Maine; from the Hesnard mine, three km southwest of Keystone, Pennington Co., and the Linwood, Tip Top, and White Elephant mines, near Custer, Custer Co., South Dakota; in the White Picacho district, Maricopa and Yavapai Cos., Arizona. At the Boqueirão pegmatite, three km southeast of Parelhas, Rio Grande do Norte, Brazil. In the Okatjimukuju pegmatite, near Karibib, Namibia. From Vilate, near Chanteloube, Haute-Vienne, France. At Sabugal, in the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda, Portugal. From Hagendorf, Bavaria, Germany. Other localities will undoubtedly be noted.

Name: For its originally noted occurrence at the Stewart mine, Pala, California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93656.

(1) Varuträsk, Sweden. (2) SbAs.

Mineral Group: Arsenic group.

Occurrence: Most commonly in hydrothermal veins, but also in pegmatites.

Association: Arsenic, arsenolite, antimony, kermesite, stibnite, stibiconite, cervantite, sphalerite, siderite, calcite, quartz.

Distribution: From the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden [TL]. At Marienberg, Saxony, and from St. Andreasberg, Harz Mountains, Germany. In France, in the Chalanches mine, near Allemont, Isère. At Cavnic (Kapnikbánya) and Baia Mare (Nagybánya), Romania. In the Czech Republic, from Příbram. At Hüttenberg, Carinthia, Austria. From Valtellina, Italy. In the USA, in the Ophir mine, Comstock Lode, Virginia City, Storey Co., Nevada. In Canada, at Atlin, Alder Island, and in the Engineer mine, Tagish Lake, British Columbia; from Bernic Lake, Manitoba. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. From Broken Hill, New South Wales, Australia. A few additional localities are known.

Name: For the composition, intermediate between antimony, STIBium, and ARSENic.

Stibiconite $Sb^{3+}Sb_2^{5+}O_6(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, botryoidal, as incrustations, may be concentrically zoned, to several cm thick; typically powdery, compact.

Physical Properties: Hardness = 5.5–7, when compact. D(meas.) = 3.3–5.5
D(calc.) = n.d.

Optical Properties: Transparent to translucent. *Color:* Pale yellow to yellowish white, reddish white, orange; gray, brown, black when impure. *Luster:* Pearly, opaline, glassy to earthy.
Optical Class: Isotropic. n = 1.621–2.047, often in admixtures.

Cell Data: *Space Group: Fd3m.* a = 10.255–10.282 Z = 8

X-ray Powder Pattern: Locality not stated.

(1) Yucunani mine, Tejocotes, Oaxaca, Mexico; Sb^{3+}:Sb^{5+} calculated from stoichiometry; corresponds to $(Sb^{3+}_{0.52}Ca_{0.16})_{\Sigma=0.68}Sb^{5+}_{2.19}O_6(OH)_{0.83}$. (2) $Sb^{3+}Sb^{5+}_2O_6(OH)$.

Mineral Group: Stibiconite group.

Occurrence: A secondary mineral in hydrothermal mineral deposits, formed by the oxidation of other antimony-bearing minerals, commonly stibnite, which it may entirely replace.

Association: Cervantite, valentinite, kermesite, antimony, stibnite.

Distribution: Probably very common, but modern confirmation is required for many earlier localities. From Losacio, Zamora Province, Spain. At Ramsbeck, North Rhein-Westphalia, and in the Clara Mine, near Oberwolfach, Black Forest, Germany. At Szalonack, Hungary. An important ore from Catorce and Tierras Prietas, San Luis Potosi, and at El Antimonio, Sonora, Mexico. In Canada, in the Lac Nicolet mine, South Ham Township, Wolfe Co., Quebec. In the USA, at the Black Warrior mine, near Unionville, Pershing Co., Nevada; from Antimony, Garfield Co., Utah; in the Stanley stibnite mine, Shoshone Co., Idaho; along Erskine Creek, Kern Co., California. In Kyrgyzstan, in the Kadamdzhai antimony deposit.

Name: From the Latin for antimony, STIBIum, and the Greek for *powder* or *dust*, a common habit.

Type Material: Neither an analysis nor a type locality was given on introduction of the name by Beudant in 1832.

Stibiobetafite $(Ca, Sb^{3+})_2(Ti, Nb, Ta)_2(O, OH)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; may be metamict. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rare rounded octahedra with small cube modifications, to 8 mm; commonly anhedral, granular, in veinlets and aggregates.

Physical Properties: *Fracture:* [Conchoidal to uneven] (by analogy to betafite).
Tenacity: Brittle. Hardness = ∼5 D(meas.) = 5.30 (on impure material). D(calc.) = 5.19

Optical Properties: Semitransparent. *Color:* Dark brown to brown-black; brown in transmitted light; medium gray in reflected light. *Streak:* Pale brown to cream.
Luster: Vitreous.
Optical Class: Isotropic. $n = > 1.78$

Cell Data: *Space Group:* $Fd3m$. a = 10.351 Z = 8

X-ray Powder Pattern: Věžná, Czech Republic; after heating at 700 °C for one hour.
2.988 (10), 1.829 (6), 1.561 (5), 2.581 (4), 5.94 (3), 1.495 (3), 1.187 (3)

MnO	0.6	$-O = F_2$	0.06
		Total	100.65

(1) Věžná, Czech Republic; by electron and ion microprobe on a selected grain; total Sb as Sb_2O_3, Fe as FeO, Mn as MnO, Sn as SnO; corresponds to $(Ca_{1.11}Sb^{3+}_{0.69}Sn_{0.09}Fe_{0.04}Mn_{0.04}Na_{0.04})_{\Sigma=2.01}(Ti_{0.89}Nb_{0.70}Ta_{0.38}Al_{0.04})_{\Sigma=2.01}O_6[O_{0.76}(OH)_{0.21}F_{0.03}]_{\Sigma=1.00}$.

Mineral Group: Pyrochlore group, betafite subgroup; $Sb_A > 20\%$; $2Ti_B \geq (Nb + Ta)_B$.

Occurrence: As replacement masses and in veinlets, in a granite pegmatite in a serpentinite.

Association: Columbite, niobian rutile, antimony, stokesite, cassiterite, zircon, albite.

Distribution: From Věžná, Czech Republic.

Name: From the Latin for antimony, STIBium, in its composition, and as a member of the *betafite* subgroup of the pyrochlore group.

Type Material: University of Manitoba, Winnipeg, M5233; Royal Ontario Museum, Toronto, Canada, M35630.

Stibiocolumbite $Sb(Nb, Ta)O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals prismatic ‖ [010]; {001} and {101} striated ‖ [010]. *Twinning:* About [010] with composition plane {001}, commonly an irregular junction, or polysynthetic.

Physical Properties: *Cleavage:* {001}, distinct; {100}, indistinct. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 5.68 (synthetic $SbNbO_4$). D(calc.) = [5.72] Strongly pyroelectric.

Optical Properties: Semitransparent. *Color:* Dark brown to light yellowish brown; reddish yellow, reddish brown, greenish yellow; in transmitted light, pale yellow-brown to brown, may be zoned. *Streak:* Pale yellow to yellow-brown. *Luster:* Resinous to adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, strong.
$\alpha = 2.398$ $\beta = 2.419$ $\gamma = 2.459$ 2V(meas.) = n.d. 2V(calc.) = 73°25′

Cell Data: *Space Group:* $Pc2_1n$ (synthetic $SbNbO_4$). $a = 4.929$ $b = 11.797$ $c = 5.559$ Z = 4

X-ray Powder Pattern: Synthetic $SbNbO_4$; nearly identical to stibiocolumbite.
3.125 (100), 2.947 (28), 1.735 (21), 3.517 (18), 1.891 (12), 2.779 (10), 2.023 (10)

(1) Mesa Grande district, California, USA. (2) Pamir Mountains, Tajikistan; by electron microprobe, corresponding to $(Sb_{0.93}Pb_{0.05})_{\Sigma=0.98}(Nb_{0.69}W_{0.16}Ta_{0.12}Sn_{0.02})_{\Sigma=0.99}O_4$.
(3) $SbNbO_4$.

Mineral Group: Forms a series with stibiotantalite. [As stibiocolumbite was originally defined from its analysis only, some properties given here are likely for stibiotantalite].

Occurrence: A rare accessory mineral in complex granite pegmatites.

Association: Tourmaline, beryl, lepidolite (Mesa Grande district, California, USA).

Distribution: From the Mesa Grande district, San Diego Co., California, USA. At Emd, Mattertal, Valais, Switzerland. From an undisclosed locality in the Pamir Mountains, Tajikistan.

Name: From the Latin for antimony, STIBium, in its composition, and relation to *columbite*.

Type Material: The type crystal was totally consumed during analysis before realization it was of a new species.

Stibiocolusite $Cu_{13}V_4(Sb,Sn,As)_3S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $6mm$, or $\overline{6}m2$. As hexagonal thin to thick tabular crystals, to 200 μm; as inclusions in chromite, massive sulfides, and silicates; as inclusions in Pt–Fe alloys. *Twinning:* Ubiquitous.

Physical Properties: Hardness = n.d. VHN = 610(7) (100 g load). D(meas.) = n.d. D(calc.) = 10.8

Optical Properties: Opaque. *Color:* In polished section, yellowish white. *Pleochroism:* Weak; pale yellow to yellowish white, also faint greenish, pinkish, or lavender. *Anisotropism:* Distinct; colors may be lacking but some grains are purplish gray to greenish gray.

R_1–R_2: (400) 41.8–42.3, (420) 43.3–44.7, (440) 44.9–46.8, (460) 46.8–49.0, (480) 48.6–50.7, (500) 50.2–52.3, (520) 51.7–53.6, (540) 53.0–54.8, (560) 54.1–55.6, (580) 55.2–56.4, (600) 56.3–57.0, (620) 57.3–57.6, (640) 58.3–58.0, (660) 59.1–58.3, (680) 60.1–58.6, (700) 61.0–59.0

Cell Data: *Space Group:* $P6_3/mmc$, $P6_3mc$, or $P\overline{6}2c$. $a = 7.598(2)$ $c = 28.112(9)$ $Z = 12$

(1) Tweefontein Farm, South Africa; by electron microprobe, corresponding to $(Pd_{4.87}Cu_{0.19}Sn_{0.01})_{\Sigma=5.07}(Sb_{1.91}As_{0.02})_{\Sigma=1.93}$. (2) Goodnews Bay, Alaska, USA; by electron microprobe, average of analyses of seven grains; corresponding to $(Pd_{4.83}Cu_{0.23})_{\Sigma=5.06}Sb_{1.94}$. (3) Pd_5Sb_2.

Occurrence: An uncommon constituent of PGE deposits in layered intrusives and ophiolites, nevertheless a major carrier of palladium; in placers.

Association: Braggite, cooperite, mertieite-II, sperrylite, Pt–Fe–Cu–Ni alloys, genkinite, platarsite, chromite, chalcopyrite, pentlandite, pyrrhotite, geversite, gold, violarite.

Distribution: In Transvaal, South Africa, from Tweefontein Farm, Potgietersrus district [TL], and from the Elephant Winze, near Rietfontein; at the Onverwacht and Driekop mines, all on the Merensky Reef, Bushveld complex. In Russia, from the Morozova mine, Noril'sk region, western Siberia; at Zlatoust, Ural Mountains; from the Pustaya River placers, Kamchatka. At Tilkerode, Harz Mountains, Germany. In the Pirogues River, New Caledonia. In the USA, at Goodnews Bay, Alaska. From the Lac des Iles complex, Ontario, Canada. In the Department of Chocó, Cauca, Colombia. At Kambalda, 56 km south of Kalgoorlie, Western Australia. From the Santo Tomas II porphyry copper deposit, Benguet, Philippines. A number of other localities are known.

Name: For the composition.

Nb_2O_5	17.54
Ta_2O_5	52.65
Sb_2O_3	19.24
CaO	6.78
Na_2O	2.58
Total	[98.79]

(1) Varuträsk pegmatite, Sweden; by electron microprobe, total Sb as Sb_2O_3, original total given as 98.80%; corresponds to $(Sb_{0.71}Ca_{0.65}Na_{0.45})_{\Sigma=1.81}(Ta_{1.29}Nb_{0.71})_{\Sigma=2.00}O_7$. (2) Odd West pegmatite, Canada; analysis not given, corresponds to $(Ca_{0.71}Sb_{0.46}Na_{0.22}Fe_{0.04}Sn_{0.03})_{\Sigma=1.46}(Ta, Nb)_2O_7$.

Mineral Group: Pyrochlore group, microlite subgroup; $Sb_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: A very rare mineral, replacing stibiotantalite, in the lithium-rich albite unit of a complex granite pegmatite (Varuträsk pegmatite, Sweden).

Association: Stibiotantalite, antimony, allemontite, lithiophilite, alkalic beryl, cassiterite, columbite–tantalite, microlite (Varuträsk pegmatite, Sweden); cassiterite (Odd West pegmatite, Canada).

Distribution: In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. In the Odd West pegmatite, southeastern Manitoba, Canada.

Name: From the Latin for antimony, STIBIum, in its composition, and membership in the *microlite* subgroup of the pyrochlore group.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 600200; University of Manitoba, Winnipeg, Canada, M6134.

Association: Braggite, cooperite, mertieite-II, sperrylite, Pt–Fe–Cu–Ni alloys, genkinite, platarsite, chromite, chalcopyrite, pentlandite, pyrrhotite, geversite, gold, violarite.

Distribution: In the USA, at Goodnews Bay, Alaska. In Transvaal, South Africa, from Tweefontein Farm, Potgietersrust district, and from the Elephant Winze, near Rietfontein; at the Onverwacht and Driekop mines. From the Department of Chocó, Cauca, Colombia. In the USSR, from the Morozova mine, Noril'sk region, western Siberia, and at Zlatoust, Ural Mountains. From the Lac des Iles Complex, Ontario, Canada.

Name: For the composition.

Type Material: British Museum (Natural History), London, England, 1930,950-2; Royal Ontario Museum, Toronto, Canada, M34229; National Museum of Natural History, Washington, D.C., USA, 135408; all probably topotypic.

Stibiotantalite $Sb(Ta,Nb)O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals prismatic ‖ [010], flattened ‖ to [001], may be equant, to 12 cm; {001} and {101} striated ‖ [010]. *Twinning:* About [010] with composition plane {001}; polysynthetic.

Physical Properties: *Cleavage:* {001}, distinct; {100} indistinct. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 7.53 (synthetic $SbTaO_4$). D(calc.) = [7.58] Strongly pyroelectric.

Optical Properties: Semitransparent. *Color:* Dark brown to light yellowish brown; reddish yellow, reddish brown, greenish yellow; in transmitted light, pale yellow-brown to brown, may be zoned. *Streak:* Pale yellow to yellow-brown. *Luster:* Resinous to adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, strong.
$\alpha = 2.374$ $\beta = 2.404$ $\gamma = 2.457$ 2V(meas.) = n.d. 2V(calc.) = $75°5'$

Cell Data: *Space Group:* $Pc2_1n$ (synthetic $SbTaO_4$). $a = 4.911$ $b = 11.814$ $c = 5.535$
Z = 4

X-ray Powder Pattern: Synthetic $SbTaO_4$; nearly identical to stibiotantalite.
3.121 (100), 3.506 (38), 2.950 (34), 2.687 (22), 2.692 (21), 1.735 (19), 1.888 (17)

Total	100.02	98.9	100.00

(1) Greenbushes, Western Australia. (2) Mesa Grande district, California, USA; by electron microprobe, corresponding to $Sb_{1.00}(Ta_{0.71}Nb_{0.30})_{\Sigma=1.01}O_4$. (3) $SbTaO_4$.

Mineral Group: Forms a series with stibiocolumbite.

Occurrence: An uncommon accessory mineral in complex granite pegmatites.

Association: Tantalite (Greenbushes, Western Australia); antimony, allemontite, microlite, stibiomicrolite, lithiophilite, alkalic beryl, cassiterite, columbite–tantalite (Varuträsk, Sweden).

Distribution: From the Greenbushes tin placers, Wodgina district, Western Australia. Large crystals at the Muiâne and other mines, Alto Ligonha, Mozambique. From the Benson mine, Mtoko, Zimbabwe. In the USA, from Topsham, Sagadahoc Co., Maine; in California, in San Diego Co., fine crystals from the Himalaya mine, Mesa Grande district; at the Katerina, Stewart, and Vandenburg mines, Pala district; and in the Little Three mine, Ramona district; in the Brown Derby pegmatite, Gunnison Co., Colorado. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. From the Voronya massif, Kola Peninsula, Russia. Found near Stak Nala, Gilgit district, Pakistan.

Name: From the Latin for antimony, STIBIum, in the composition, and relation to *tantalite*.

Type Material: Western Australian Museum, Perth, Astralia, MDC550; Harvard University, Cambridge, Massachusetts, USA, 111954.

Stibivanite $Sb_2^{3+}V^{4+}O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic or orthorhombic. *Point Group:* $2/m$; $2/m$ $2/m$ $2/m$ or $mm2$. Lathlike fibrous crystals, to 3 mm, may be cylindrical, in incrustations of radiating aggregates.

Physical Properties: *Tenacity:* Flexible and elastic. Hardness = ∼4 VHN = 148–256, 232 average (50 g load). D(meas.) = n.d. D(calc.) = 5.26–5.267

Optical Properties: Translucent. *Color:* Bright yellow-green; light to dark gray in reflected light, with green to yellowish internal reflections. *Streak:* White. *Luster:* Adamantine. *Optical Class:* Biaxial (–) or (+). *Pleochroism:* Strong; X = emerald-green with olive tint; Y = emerald-green; Z = olive-green. *Orientation:* $X = b$; $Z \wedge c \simeq 0°$ [2M]; $X = a$; $Y = b$; $Z = c$ [2O]. *Dispersion:* $r \gg v$, very strong. $\alpha = > 1.87$ β = n.d. $\gamma = < 1.89$ 2V(meas.) = 85(1)° *Anisotropism:* Moderate.

Cell Data: *Space Group:* $P2/c$ (2M), with $a = 17.989(6)$ $b = 4.792(1)$ $c = 5.500(2)$ $\beta = 95.15(3)°$ Z = 4, or *Space Group:* $Pmcn$ or $P2_1cn$ (2O), with $a = 17.916(3)$ $b = 4.790(1)$ $c = 5.509(1)$ Z = 4

X-ray Powder Pattern: Lake George deposit, Canada (2M).
2.996 (10), 3.502 (7), 3.173 (7), 4.646 (6), 2.114 (4), 1.870 (4), 1.787 (4)

Chemistry:

	(1)	(2)
VO_2	22.01	22.15
Sb_2O_3	79.31	77.85
Total	101.32	100.00

(1) Lake George deposit, Canada; by electron microprobe, Sb^{3+} and V^{4+} confirmed by crystal-structure analysis, H_2O and $(OH)^{1-}$ absent by IR; corresponds to $Sb^{3+}_{2.01}V^{4+}_{0.98}O_5$.
(2) Sb_2VO_5.

Polymorphism & Series: 2M and 2O polytypes.

Occurrence: In late veins in a hydrothermal antimony deposit (Lake George deposit, Canada); in a metasomatized hydrothermal iron deposit (Buca della Vena mine, Italy).

Association: Antimony, stibnite, sénarmontite, pyrite, arsenopyrite, sphalerite, quartz (Lake George deposit, Canada); anatase, apuanite, barite, beryl, derbylite, dolomite, hematite, magnetite, pyrite, tourmaline, versiliaite (Buca della Vena mine, Italy).

Distribution: From the Lake George antimony deposit, 40 km west of Fredricton, New Brunswick, Canada. In the Buca della Vena mine, northeast of Stazzema, Apuan Alps, Tuscany, Italy.

Name: From the Latin for antimony, STIBIum, and VANadium in the composition.

Type Material: Canadian Geological Survey, Ottawa, 61523–61525; National Museum of Natural Science, Ottawa, 44654–44658; Royal Ontario Museum, Toronto, Canada, M36642; The Natural History Museum, London, England, 1984,369–370; Harvard University, Cambridge, Massachusetts, 117335; National Museum of Natural History, Washington, D.C., USA, 148697; University of Pisa, Pisa, Italy, 4880 (2O polytype).

Stibnite Sb_2S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Slender to stout, complexly terminated crystals, elongated along [001], to 0.65 m; bent crystals not uncommon, rarely twisted. In radiating and confused groups of acicular crystals; also columnar, granular, or very fine masses. *Twinning:* Rare; twin planes {130}, {120}, and perhaps {310}.

Physical Properties: *Cleavage:* Perfect and easy on {010}; imperfect on {100} and {110}. *Fracture:* Subconchoidal. *Tenacity:* Highly flexible but not elastic; slightly sectile. Hardness = 2 VHN = 71–86, {010} section (100 g load). D(meas.) = 4.63 D(calc.) = 4.625

Optical Properties: Opaque. *Color:* Lead-gray, tarnishing blackish or iridescent; in polished section, white. *Streak:* Lead-gray. *Luster:* Metallic, splendent on cleavage surfaces. *Anisotropism:* Strong.

R_1–R_2: (400) 31.1–53,3, (420) 30.8–53.2, (440) 30.6–53.0, (460) 30.7–52.8, (480) 31.0–52.2, (500) 31.2–51.1, (520) 31.4–49.7, (540) 31.2–48.5, (560) 30.8–47.2, (580) 30.3–45.8, (600) 29.7–44.5, (620) 29.3–43.5, (640) 29.2–42.6, (660) 29.4–41.8, (680) 29.6–41.1, (700) 29.4–40.3

Total	99.87	100.00

(1) Wolfsberg, Germany. (2) Sb_2S_3.

Polymorphism & Series: Dimorphous with metastibnite.

Mineral Group: Forms a series with bismuthinite.

Occurrence: Of hydrothermal origin, formed in veins through a wide range of temperatures.

Association: Realgar, orpiment, cinnabar, galena, lead sulfantimonides, pyrite, marcasite, arsenopyrite, cervantite, stibiconite, calcite, ankerite, barite, chalcedonic quartz.

Distribution: The most important ore of antimony, although large deposits are rare. The following localities have produced outstanding crystallized material. In the USA, at the White Caps mine, Manhattan district, Nye Co., and the Murray mine, Independence Mountains district, Elko Co., Nevada. From the San José and other mines, Oruro, Bolivia. In Germany, at Wolfsberg, Harz Mountains, and near Arnsberg, North Rhine-Westphalia. At Kremnica (Kremnitz) and Banská Štiavnica (Schemnitz), Slovakia. From Příbram, Czech Republic. At Baia Sprie (Felsőbánya) and Herja (Kisbánya), Baia Mare (Nagybánya) district, Romania. In France, at Massaic, Cantal; and at La Lucette, Mayenne. At the Kusa mine, near Bau, Sarawak, Malaysia. From Thames, New Zealand. At Bahar-Lou, near Hamadan, Iran. From Kadamzhay, Kyrgyzstan. Magnificent groups of crystals in the Ichinokawa mine, near Saijo, Ehime Prefecture (Iyo Province), Japan. In China, from the Xikuangshan mine, northeast of Lengshuijiang, Hunan Province, economically very important; fine crystals from the [?? verify in MR as spelling seems off, not in mindat.org ?? and Lushi is a Co.??] Lijai Valligy mine, Lushi, Henan Province.

Name: From the Greek *stibi*, then Latin *stibium*, an old name for the mineral.

Fe_2O_3	4.18	
Cr_2O_3	14.15	23.24
MgO	37.72	36.98
H_2O	34.14	33.05
CO_2	7.15	6.73
Total	[100.00]	100.00

(1) Dundas, Tasmania, Australia; probably intermixed with barbertonite, original total given as 99.27%, recalculated to 100% after deduction of SiO_2 2.09%, FeO 0.28% as chromite.
(2) $Mg_6Cr_2(CO_3)(OH)_{16}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with barbertonite.

Mineral Group: Hydrotalcite group.

Occurrence: An alteration product of chromite in serpentinite.

Association: Barbertonite, chromite, antigorite.

Distribution: From Stichtite Hill, near the Adelaide mine, Dundas, Tasmania, Australia. In the Kaapsehoop asbestos mine, Kaapse Hoop, and the New Amianthus asbestos mine, Stolzburg, Barberton district, Transvaal, and several other places in South Africa. On the Darwendale Farm, Darwendale, Zimbabwe. At Bou Offroich, near Bou Azzer, Morocco. In Scotland, at Cunningsburgh, Shetland Islands. From Långban, Värmland, Sweden. In Russia, from near Tyungur, Kaznakhty Range, and in the Terektinskogo Range, Altai Mountains. In Canada, from Langmuir Township, Ontario, and in the Megantic mine, Black Lake, Quebec. From Campo Formosa, Bahia, Brazil. In the Keonjhar district, Orissa, India.

Name: To honor Robert C. Sticht (1857–1922), formerly General Manager of the Mount Lyell Mining and Railway Company, Tasmania, Australia.

Type Material: National School of Mines, Paris, France.

Stilbite **$NaCa_2Al_5Si_{13}O_{36}\cdot 14H_2O$**

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals typically thin tabular, flattened on [010], to 14 cm; in fasicled, sheaflike, or globular aggregates. *Twinning:* Ubiquitous on {001}, cruciform and penetration twins.

Physical Properties: *Cleavage:* {010}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.19(1) D(calc.) = 2.23

Optical Properties: Transparent to translucent. *Color:* White, yellowish, gray, pink, reddish, orange, light brown to dark brown; colorless in thin section. *Streak:* White. *Luster:* Vitreous, pearly on cleavage.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge c = 5°$. *Dispersion:* $r < v$.
$\alpha = 1.484–1.500$ $\beta = 1.492–1.507$ $\gamma = 1.494–1.513$ 2V(meas.) = 30°–49°

Cell Data: *Space Group:* $F2/m$. $a = 13.595–13.657$ $b = 18.197–18.309$ $c = 17.775–17.842$ $\beta = 90.05°–90.91°$ Z = [4]

X-ray Powder Pattern: Montresta, Sardinia, Italy.
9.13 (100), 4.065 (58), 3.028 (36), 2.780 (21), 4.679 (16), 4.627 (15), 3.199 (13)

Chemistry:

	(1)
SiO_2	52.70
Al_2O_3	17.71
CaO	7.76
Na_2O	2.39
K_2O	1.09
H_2O^+	16.32
H_2O^-	2.08
Total	100.05

(1) Pedemonte, Bellinzona, Tessin, Switzerland; corresponds to $(Na_{1.12}K_{0.34})_{\Sigma=1.46}Ca_{2.02}Al_{5.08}Si_{12.82}O_{36}\cdot 13.24H_2O$.

Mineral Group: Zeolite group.

Occurrence: A low-temperature hydrothermal mineral, in amygdules and cavities in basalts, andesites, and various metamorphic rocks. Formed in hot springs deposits, and as a cementing agent in some sandstones and conglomerates.

Association: Zeolites, prehnite, calcite, quartz.

Distribution: A common zeolite, with many occurrences of large and fine crystals. In Iceland, at the Helgustadir mine, Reydarfjord, and the Teigarhorn, Berufjord. On several of the Faeroe Islands. In the Glasgow district, Dumbartonshire, Scotland. At Strzegom (Striegau), Poland. In the USA, at Great Notch and Paterson, Passaic Co., New Jersey; on the south fork of the Toutle River, Cowlitz Co., and at Skookumchuck Dam, near Bucoda, Thurston Co., Washington; from Goble, Columbia Co., and near Dollar, Lynn Co., Oregon. Along the Bay of Fundy, Nova Scotia, Canada. From Guanajuato, Mexico. At Rio das Antas, Bento Gonçalves, Rio Grande do Sul, Brazil. From around Gunnedah and Tambar Springs, New South Wales, and Arkaroola, South Australia. Exceptional crystals from the Bombay, Poona, and Nasik districts, Maharashtra, India.

Name: From the Greek for *luster*, in reference to its pearly luster.

Type Material: Natural History Museum, Paris, France, Haüy 4059.

(1) Stillwater complex, Montana, USA; by electron microprobe; corresponds to $Pd_{7.87}As_{3.00}$. (2) Siikakämä intrusion, Finland; by electron microprobe, average of three grains, original total given as 100.58%; corresponds to $(Pd_{7.97}Pt_{0.02})_{\Sigma=7.99}(As_{2.98}S_{0.01})_{\Sigma=2.99}$. (3) Pd_8As_3.

Occurrence: In layered ultramafic igneous bodies.

Association: Gold, palladoarsenide, sperrylite, braggite, hollingworthite, chalcopyrite, digenite, pentlandite, pyrrhotite.

Distribution: From the Banded and Upper zones of the Stillwater complex, Montana, USA [TL]. In the Roby zone, Lac des Iles complex, Ontario, Canada. At the Siikakämä intrusion, about 50 km southeast of Rovaniemi, northern Finland. From the Lukkulaisvaara layered intrusion, Karelia, Russia.

Name: For the Stillwater mafic complex, Montana, USA.

Type Material: Royal Ontario Museum, Toronto, Canada, M33559; The Natural History Museum, London, England, 1979,129; National Museum of Natural History, Washington, D.C., USA, 132500.

(1) Mary Kathleen mine, Australia; recalculated to 100.00% after removal of very small amounts of uraninite and apatite determined by separate analysis. (2) Vico volcano, near Vetralla, Italy; by electron microprobe, B_2O_3 calculated from stoichiometry, original total given as 99.23%; corresponds to $(Ce_{0.50}La_{0.31}Nd_{0.08}Th_{0.05}Pr_{0.03}Ca_{0.02}Sm_{0.01})_{\Sigma=1.00}B_{1.02}Si_{0.97}O_5$.

Occurrence: Locally abundant as a metasomatic replacement of metamorphosed calcareous sediments (Mary Kathleen mine, Australia); in alkalic pegmatites in syenite in an alkalic massif (Dara-i-Pioz massif, Tajikistan).

Association: Allanite, garnet, uraninite (Mary Kathleen mine, Australia); calcite, monazite, bastnäsite, thorite, uranothorite, thorianite (Desmont mine, Canada); pyrochlore, tienshanite, sogdianite, thorite, cesium kupletskite, reedmergnerite, steacyite, pectolite, quartz (Dara-i-Pioz massif, Tajikistan).

Distribution: In the Mary Kathleen mine, about 55 km east of Mt. Isa, Queensland, Australia. At the Desmont mine, near Wilberforce, Ontario, and at Mont Saint-Hilaire, Quebec, Canada. From Mineville, Essex Co., New York, USA. Large crystals in the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. From the Inagli massif, 30 km west of Aldan, Yakutia, Russia. Found around the Langesundsfjord, Norway. In the Ilímaussaq intrusion, southern Greenland. At Bassano Romano and on the Vico volcano, near Vetralla, Lazio, Italy.

Name: For Dr. Frank Leslie Stillwell (1888–1963), Australian ore mineralogist, and its predominant *cerium* content.

Type Material: National Museum of Natural History, Washington, D.C., USA, 113038.

(1) Zuckmantel, Poland. (2) Western Otago, New Zealand.

Occurrence: In banded iron formations and enclosing slates and schists. In metamorphic rocks of the blueschist and greenschist facies, and in some metamorphosed massive sulfide deposits.

Association: Quartz, siderite, apatite, hematite, minnesotaite, greenalite, chamosite, grunerite (iron formations); magnetite, chlorite, quartz, pyrrhotite, chalcopyrite (massive sulfides); quartz, glaucophane, manganoan garnet, albite, epidote, actinolite, chlorite (greenschists).

Distribution: From Obergrund, near Zuckmantel, Silesia, Poland. At Beroun na Morave, Czech Republic. From Prägraten, Tirol, Austria. In Sweden, at the Brunsjö mine, near Grythyttan, Örebro. From Mullion Island, The Lizrd, Cornwall, England. In the USA, at the Sterling mine, Antwerp, Jefferson Co., New York; from Franklin, Sussex Co., New Jersey; in the Laytonville quarry, Mendocino Co., and a number of other places in California; at Bald Knob, near Sparta, Alleghany Co., North Carolina; in the Animikian Iron Formations of Minnesota. From Poplar Creek, British Columbia, Canada. At the Great Cobar mine, New South Wales, and in the Hamersley Ranges, Western Australia. From French Ridge and Queenstown, West Otago, New Zealand.

Name: From the Greek for *shining* and *black*, in allusion to its luster and color.

Type Material: Wroclaw University, Wroclaw, Poland, II–11434, II–11437.

Stishovite SiO_2

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As aggregates of submicron-size crystals.

Physical Properties: Hardness = n.d. VHN = 2080 ∥ [001]; 1700 ⊥ [001] (100 g load, synthetic). D(meas.) = 4.35 (synthetic). D(calc.) = 4.29 Resonance at –191.3 ppm by ^{29}Si magic-angle spinning nuclear magnetic resonance spectroscopy.

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (+). $\omega = 1.799–1.800$ $\epsilon = 1.826–1.845$

Cell Data: *Space Group:* $P4_2/mnm$ (synthetic). $a = 4.1772(7)$ $c = 2.6651(4)$ $Z = 2$

X-ray Powder Pattern: Meteor Crater, Arizona, USA.
2.959 (100), 1.530 (50), 1.981 (35), 1.235 (25), 2.246 (18), 1.478 (18), 1.870 (13)

Chemistry: Qualitative spectrographic analysis of the mineral from Meteor Crater, Arizona, USA indicates essentially pure SiO_2.

Polymorphism & Series: Quartz, tridymite, cristobalite, and coesite are polymorphs.

Mineral Group: Rutile group.

Occurrence: At sites of meteorite impact, formed by shock metamorphism of quartz at temperatures ≥ 1200 °C and pressures ∼100 kbar; then metastable, alters to glass or cristobalite at ≥ 300 °C.

Association: Coesite, quartz, silica glass.

Distribution: From Meteor Crater, Coconino Co., Arizona, and at the Cretaceous-Tertiary boundary, Raton, Colfax Co., New Mexico, USA. In Germany, at the Nördlinger Ries crater, Bavaria. From the Vredefort Ring crater, Orange Free State, South Africa. At the Ternovska crater, Krivoi Rog, Ukraine. From the Lonar Lake crater, Maharashtra, India.

Name: In honor of the Russian crystallographer Sergei Mikhailovich Stishov, who, with S.V. Popova, first synthesized the compound.

Type Material: n.d.

X-ray Powder Pattern: Elkiaidai River, Uzbekistan.
3.09 (10), 2.19(10), 1.374 (8), 1.253(7), 1.022 (6), 1.779 (4), 1.537 (4)

Chemistry:

	(1)	(2)	(3)	
Sn	56.9	55.55	56.38	49.36
Cu		0.12		
Sb	43.1	44.33	44.13	50.64
Total	100.0	[100.00]	100.51	100.00

(1) Elkiaidai River, Uzbekistan; by electron microprobe; corresponds to $Sn_{1.15}Sb_{0.85}$. (2) Rio Tamaná, Colombia; by electron microprobe, recalculated to 100% from an original total of 93.84%; corresponds to $Sn_{1.12}Sb_{0.87}$. (3) Baimka placer, Russia; by electron microprobe, corresponds to $Sn_{1.13}Sb_{0.87}$. (4) SnSb.

Occurrence: In concentrates from placer deposits from a region of Silurian shaly-sandy sediments (Elkiaidai River, Uzbekistan); in concentrates from precious metal placers (Rio Tamaná, Colombia).

Association: Tin, zircon, "leucoxene", rutile, apatite, barite, celestine, scheelite, cinnabar (Elkiaidai River, Uzbekistan); tin, sorosite, herzenbergite, cassiterite, lead (Baimka placer, Russia)

Distribution: From the Elkiaidai River, eastern margin of the Northern Nuratau Range, western Uzbekistan [TL]. At the Baimka gold-PGE placer, western Chukotka, Russian Far East, Russia. In the Rio Tamaná, the Department of Chocó, Cauca, Colombia.

Name: For the composition, from Greek STIbium, *antimony*, and STAnnum, *tin*.

Type Material: n.d.

	(1)	(2)
V_2O_5	30.3	31.38
CrO_3	1.0	
CuO	68.1	68.62
Total	99.4	100.00

(1) Izalco volcano, El Salvador; by electron microprobe, average of 20 analyses of 10 crystals, total V as V_2O_5, Cr as Cr_2O_3; corresponding to $Cu_{4.98}(V_{1.94}Cr_{0.06})_{\Sigma=2.00}O_{10}$. (2) $Cu_5V_2O_{10}$.

Occurrence: A very rare mineral, deposited in vanadium-bearing sublimates in fumaroles on a basaltic volcanic cone.

Association: Shcherbinaite, ziesite, fingerite, bannermanite, chalcocyanite, chalcanthite.

Distribution: On Izalco volcano, El Salvador.

Name: To honor Dr. Richard Edwin Stoiber (1911–2001), Emeritus Professor of Geology, Dartmouth College, Hanover, New Hampshire, USA, who has studied Central American volcanoes and their mineralogy.

Type Material: Department of Earth Sciences, Dartmouth College, Hanover, New Hampshire; National Museum of Natural History, Washington, D.C., USA, 144942.

(1) Roscommon Cliff, England. (2) Do.; by electron microprobe, H_2O by difference; corresponding to $Ca_{0.97}Sn_{1.00}Si_{3.01}O_9 \cdot 2.03H_2O$. (3) Corrégo do Urucum, Brazil; by electron microprobe, H_2O by difference; corresponding to $Ca_{1.00}Sn_{1.00}Si_{3.00}O_9 \cdot 2.0H_2O$.

Occurrence: On axinite (Roscommon Cliff, England); in miarolitic cavities in a quartz-albite pegmatite (Věžná, Czech Republic).

Association: Axinite, cassiterite (Roscommon Cliff, England); albite, titanite, beryl, microlite, quartz (Corrégo do Urucum, Brazil).

Distribution: On Roscommon Cliff, St. Just, and in the Halvosso quarry, Longdowns, Cornwall, England. From Ctidružice and Věžná, Czech Republic. In the Pitkäranta district, Lake Lagoda, Karelia. Large spherical masses of crystals from Corrégo do Urucum, near Galiléia, Minas Gerais, Brazil. In the USA, in the Himalaya mine, Mesa Grande district, San Diego Co., California. From the Iwaguro Sekizai quarry, Tahara, Gifu Prefecture, Japan.

Name: For Sir George Gabriel Stokes (1819–1903), Professor of Mathematics, Cambridge University, Cambridge, England.

Type Material: Mineralogical Museum, Cambridge University, Cambridge, England.

Stolzite $PbWO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. Crystals are commonly dipyramidal {111}, {101}, with {011}, {112}, {001}, complex development with over 30 other forms recorded; may be flat tabular {001}, {101}, to 6 cm.

Physical Properties: *Cleavage:* Imperfect on {001}; indistinct on {011}. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 8.34 D(calc.) = 8.408 May fluoresce bright red to red-orange under LW UV and lemon-yellow under SW UV.

Optical Properties: Translucent, transparent in thin pieces. *Color:* Reddish brown, brown, yellowish gray, smoky gray, straw-yellow, lemon-yellow; may be green, orange, red. *Streak:* White. *Luster:* Resinous, subadamantine.
Optical Class: Uniaxial (–). $\omega = 2.27$ $\epsilon = 2.18$–2.19

Cell Data: *Space Group:* $I4_1/a$ (synthetic). $a = 5.4695(3)$ $c = 12.0432(3)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.25 (100), 2.024 (35), 1.6606 (35), 2.732 (30), 3.01 (20), 1.7820 (20), 1.931 (16)

Chemistry:

	(1)	(2)
WO_3	51.34	50.95
MnO	0.78	
PbO	47.44	49.05
Total	99.56	100.00

(1) Broken Hill, Australia. (2) $PbWO_4$.

Polymorphism & Series: Dimorphous with raspite.

Occurrence: An uncommon mineral in the oxidized zone of hydrothermal tungsten-bearing lead deposits.

Association: Raspite, cerussite, anglesite, pyromorphite, mimetite.

Distribution: At many localities in small amounts. From Cínovec (Zinnwald), Czech Republic. At Bleiberg, Carinthia, Austria. Large crystals in the Sainte-Lucie mine, Saint-Léger de Peyre, Lozère, France. From La Tala, Salamanca Province, Spain. At several mines in Caldbeck Fells, Cumbria, England. Fine examples from Broken Hill, New South Wales, Australia. At Yaogangxian, Hunan Province, China. From the Kramat Pulai mine, Kinta district, Perak, Malaysia. In the Sumidoro gold placers, Minas Gerais, Brazil. At Diko Ajuba, Nigeria. From Djebel Aouam, Morocco. Large crystals from Tsumeb, Namibia. In the USA, in Arizona, at the Reef mine, Huachuca Mountains, the Primos mine, Little Dragoon Mountains, and the Cohen mine, Dragoon Mountains, Cochise Co.; large crystals at the Fat Jack mine, Bradshaw Mountains, Yavapai Co.; from the Thompson mine, Darwin district, Inyo Co., California; in the Emma mine, Little Cottonwood Canyon district, Salt Lake Co., Utah; at the Black Pine mine, Phillipsburg, Granite Co., Montana.

Name: To honor Dr. Joseph Alexis Stolz (1803–1896), Teplice, Czech Republic, who provided the first specimen.

Type Material: Mining Academy, Freiberg, Germany, 17596.

Stottite $\mathbf{Fe^{2+}Ge^{4+}(OH)_6}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m$. Crystals are tetragonal dipyramidal, pseudo-octahedral, with dominant {111}, modified by {100}, {110}, {101}, {102}, {001}, and others, to 1 cm.

Physical Properties: *Cleavage:* {100}, {010}, good; {001}, poor. Hardness = 4.5
D(meas.) = 3.596 D(calc.) = [3.54]

Optical Properties: Transparent to translucent. *Color:* Brown, green, orange, red; in transmitted light, orange-brown, may be zoned with light olive-gray to nearly colorless centers. *Streak:* Grayish white. *Luster:* Resinous to adamantine, greasy on cleavages.
Optical Class: Uniaxial (–); anomalously biaxial. *Dispersion:* $r > v$. $\omega = 1.737$–1.738 $\epsilon = 1.728$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P4_2/n$. $a = 7.594(4)$ $c = 7.488(6)$ $Z = 4$

X-ray Powder Pattern: Tsumeb, Namibia.
3.767 (vs), 2.655 (s), 1.687 (ms), 2.171 (m), 1.886 (m), 1.672 (m), 1.538 (m)

Chemistry:

H_2O	21.84	23.45
Total	100.08	100.00

(1) Tsumeb, Namibia; corresponds to $(Fe^{2+}_{1.15}Mg_{0.03}Mn_{0.03}Ca_{0.01})_{\Sigma=1.22}Ge^{4+}_{0.95}(OH)_6$.
(2) $FeGe(OH)_6$.

Mineral Group: Stottite group.

Occurrence: A rare secondary mineral formed in an oxidized zone of a germanium-rich dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Tennantite, germanite, reniérite, chalcocite, leiteite, schneiderhöhnite, brunogeierite, siderite.

Distribution: From Tsumeb, Namibia.

Name: To honor Charles E. Stott (1896–1978), geologist and formerly General Director of the Tsumeb mine, Tsumeb, Namibia.

Type Material: Technical University, Berlin, Germany; National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, USA, 111460.

Straczekite $\mathbf{(Ca,K,Ba)(V^{5+},V^{4+})_8O_{20}\cdot 3H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. Lathlike fibers, elongated along [010], to 0.5 mm, in radiating groups and foliated masses. *Twinning:* On {00*l*}, possible, observed by X-ray diffraction.

Physical Properties: *Cleavage:* {100}, perfect. Hardness = Very soft. D(meas.) = 3.09–3.29 D(calc.) = 3.21

Optical Properties: Opaque, thin flakes are translucent. *Color:* Greenish black; yellowish green in transmitted light. *Streak:* Greenish black. *Luster:* Greasy.
Optical Class: Biaxial (–) (probable). *Pleochroism:* Slight; apple-green to olive-green.
Orientation: Extinction parallel to length. n = [1.99] (by the rule of Gladstone and Dale).
2V(meas.) = Large.

Cell Data: *Space Group:* $C2/m$, $C2$, or Cm. $a = 11.679(2)$ $b = 3.6608(4)$ $c = 10.636(2)$ $\beta = 100.53(4)^\circ$ Z = [1]

X-ray Powder Pattern: Wilson Springs, Arkansas, USA.
3.486 (100), 10.449 (50), 1.8306 (50), 1.9437 (15), 3.255 (10), 2.492 (10), 1.8030 (10)

(1) Wilson Springs, Arkansas, USA; corresponds to $(Ca_{0.39}K_{0.33}Ba_{0.31}Na_{0.11})_{\Sigma=1.14}(V^{5+}_{6.31}V^{4+}_{1.59}Fe^{3+}_{0.10})_{\Sigma=8.00}O_{20.02}\cdot 2.9H_2O$. (2) Monument No. 2 mine, Arizona, USA; analysis not given, corresponds to $(Ca_{0.58}K_{0.11}Na_{0.06}Fe_{0.04})_{\Sigma=0.79}(V_{7.87}Fe_{0.13})_{\Sigma=8.00}O_{20}\cdot 3.17H_2O$.

Occurrence: An uncommon secondary mineral, in seams in argillaceous gangue, in vanadium-rich alkalic igneous and metamorphosed sedimentary rocks (Wilson Springs, Arkansas, USA).

Association: Hewettite, duttonite, fervanite, schoderite, metaschoderite (Wilson Springs, Arkansas, USA).

Distribution: In the USA, in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas, and from the Monument No. 2 mine, Monument Valley, Apache Co., Arizona.

Name: To honor John A. Straczek, Chief Geologist, Union Carbide Corporation.

Type Material: n.d.

Strashimirite $Cu_8(AsO_4)_4(OH)_4 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. Thin tabular, elongated to fibrous crystals, to 4 mm, typically in radiating spherulitic aggregates, to 1 cm, and in crusts.

Physical Properties: *Cleavage:* May exhibit parting $\perp$ elongation. Hardness = n.d. D(meas.) = n.d. D(calc.) = [3.67]

Optical Properties: Semitransparent. *Color:* White to pale green. *Luster:* Pearly to greasy. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; Y = very pale yellowish green; Z = yellowish green. *Orientation:* $Z \wedge$ elongation $\simeq 5°$. $\alpha = 1.726(1)$ $\beta =$ n.d. $\gamma = 1.747(2)$ 2V(meas.) = 70°

Cell Data: *Space Group:* $P2/m$, Pm, or $P2$. $a = 9.70$ $b = 18.90$ $c = 9.127$ $\beta = 97°15'$ Z = 3

X-ray Powder Pattern: Zapachitsa deposit, Bulgaria.
18.74 (10), 2.86 (10), 8.97 (9), 3.13 (9), 9.46 (8), 4.79 (8), 4.21 (8)

Chemistry:

	(1)	(2)
As_2O_5	38.3	37.61
CuO	49.8	52.07
ZnO	2.0	
H_2O	[9.9]	10.32
Total	[100.0]	100.00

(1) Zapachitsa deposit, Bulgaria; H_2O by difference, corresponds to $(Cu_{7.70}Zn_{0.30})_{\Sigma=8.00}(AsO_4)_{4.08}(OH)_{3.52} \cdot 5H_2O$. (2) $Cu_8(AsO_4)_4(OH)_4 \cdot 5H_2O$.

Occurrence: A secondary mineral in the oxidation zone of Cu–As-bearing mineral deposits.

Association: Tyrolite, cornwallite, clinoclase, euchroite, olivenite, parnauite, goudeyite, arthurite, metazeunerite, chalcophyllite, cyanotrichite, scorodite, pharmacosiderite, brochantite, azurite, malachite, chrysocolla.

Distribution: At the Zapachitsa copper deposit, Ismerez, Stara-Planina, Bulgaria. From Novoveská Huta, Czech Republic. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland. In Germany, from Kamsdorf and Saalfeld, Thuringia; at the Clara mine, near Oberwolfach, Black Forest; in the Richelsdorf Mountains, Hesse; and elsewhere. From the Cap Garonne mine, near le Pradet, Var, and Triembach-au-Val, Haut-Rhin, France. At Wheals Gorland and Unity, Gwennap, Cornwall, England. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. In the USA, in Nevada, at the Majuba Hill mine, Antelope district, Pershing Co., in the Nickel mine, Table Mountain district, Churchill Co., from the San Rafael mine, Lodi district, Nye Co., and the Burrus mine, Pyramid district, Washoe Co.; from Gold Hill, Tooele Co., and in the Centennial Eureka mine, Tintic district, Juab Co., Utah.

Name: To honor Strashimir Dimitrov, Bulgarian petrographer.

Type Material: Natural History Museum, Sofia; University of Sofia, Sofia, Bulgaria.

(1) Basaral, Kazakhstan; CaO due to calcite impurity; corresponds to $Na_{2.28}(UO_2)_{1.84}(V_2O_8)\cdot 3.85H_2O$. (2) Do.; original LOI given as 12.50%, partitioned as H_2O 10.27%, CO_2 1.15%, reduction of U^{6+} and V^{5+} 1.08%, then deducting SiO_2, Al_2O_3, CaO, K_2O as due to calcite and clay impurities, corresponds to $Na_{2.00}(UO_2)_{2.00}(V_2O_8)\cdot 5.70H_2O$. (3) $Na_2(UO_2)_2(V_2O_8)\cdot 6H_2O$.

Occurrence: Along seams and fractures in carbonaceous-siliceous shales.

Association: Calcite, quartz, iron hydroxides, clay minerals.

Distribution: From Basaral, ten km north of the Bota-Burum uranium deposit, Chi-Ili Mountains, Kazakhstan. In the Kendyktas Mountains, Kyzylkum district, Uzbekistan.

Name: To honor Professor Mikhail Fedorovich Strelkin (1905–1965), Russian mineralogist, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia, who studied uranium ores.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74783, 74784.

Strengite $Fe^{3+}PO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are variable in habit, may be dominated by {111}, lathlike along [001], or elongated along [100] or [010], to 5 cm, with many forms. Generally radial fibrous, as botryoidal or spherical aggregates and crusts. *Twinning:* Rarely on {201}.

Physical Properties: *Cleavage:* On {010}, good; on {001}, poor. Hardness = 3.5 D(meas.) = 2.84–2.87 D(calc.) = 2.84

Optical Properties: Transparent to translucent. *Color:* Purple, violet, pink, peach-blossom-red, carmine, greenish white; may be nearly colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$, strong. $\alpha = 1.697$–1.708 $\beta = 1.708$–1.719 $\gamma = 1.741$–1.745 2V(meas.) = Moderate to small.

Cell Data: *Space Group: Pcab.* $a = 10.122(1)$ $b = 9.886(1)$ $c = 8.7233(7)$ Z = 8

X-ray Powder Pattern: The Kreuzberg, Germany. (ICDD 33–667).
3.114 (100), 4.383 (85), 5.509 (60), 2.546 (50), 3.996 (45), 3.002 (45), 2.949 (45)

Chemistry:

	(1)	(2)
P_2O_5	38.24	37.99
Fe_2O_3	43.40	42.73
H_2O	18.89	19.28
Total	100.53	100.00

(1) Pleystein, Germany. (2) $FePO_4 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with phosphosiderite, forms a series with variscite.

Mineral Group: Variscite group.

Occurrence: A late secondary mineral in complex granite pegmatites; in "limonite" iron ores and gossans; with magnetite iron ores; rarely a cave mineral.

Association: Beraunite, huréaulite, dufrénite, bermanite, stewartite, cacoxenite, rockbridgeite, vivianite, apatite, leucophosphite, phosphosiderite.

Distribution: In Germany, in the Eleonore and Rotläufchen iron mines, near Giessen, Hesse; at Hagendorf, and on the Kreuzberg, Pleystein, Bavaria. At Cyrilov, Czech Republic. In Sweden, from the Leveäniemi mine, Svappavaara, and in the Kiruna iron mines. At Iglesias, Sardinia, Italy. From the Mangualde pegmatite, near Mesquitela, Portugal. In the Bomi Hill Caves, Liberia. In the USA, from the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; at Midvale, Rockbridge Co., Virginia; large crystals from Indian Mountain, Cherokee Co., Alabama; at Three Oak Gap and the Coon Creek mine, Polk Co., Arkansas; in the Wood mine, Cooke Co., Tennessee; from the Bull Moose mine, five km southeast of Custer, Custer Co., South Dakota; at Pala, San Diego Co., California. In the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. At the Iron Monarch quarry, Iron Knob, South Australia. A number of other minor localities are known.

Name: To honor Johan August Streng (1830–1897), German mineralogist, University of Giessen, Giessen, Germany.

Type Material: Wroclaw University, Wroclaw, Poland, II–18166.

Stringhamite $CaCuSiO_4 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals well-formed, but smaller than 0.1 mm, dominated by {011} and {101}; also as botryoidal fracture fillings. *Twinning:* Common, perhaps pervasive, on an undetermined law.

Physical Properties: Hardness = n.d. D(meas.) = 3.16–3.18 D(calc.) = 3.67

Optical Properties: Transparent to translucent. *Color:* Deep azure.
Optical Class: Biaxial (+). *Pleochroism:* X = light blue-gray; Y = light blue; Z = dark blue.
Orientation: $X = b$; $Y \wedge c = 2.5°$. $\alpha = 1.709$ $\beta = 1.717$ $\gamma = 1.729$ 2V(meas.) = n.d.
2V(calc.) = 80°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.030(2)$ $b = 16.135(3)$ $c = 5.343(1)$
$\beta = 102.96(1)°$ Z = 4

X-ray Powder Pattern: Bawana mine, Utah, USA.
2.768 (100), 2.523 (40), 3.236 (39), 8.049 (35), 3.928 (34), 1.614 (23), 4.884 (21)

Chemistry:

	(1)	(2)
SiO_2	26.95	28.11
Al_2O_3	0.07	
FeO	0.77	
CuO	33.41	37.22
MgO	0.01	
CaO	25.40	26.24

Total	[100.00]	100.00

(1) Bawana mine, Utah, USA; by electron microprobe, H_2O by difference. (2) $CaCuSiO_4 \cdot H_2O$.

Occurrence: A retrograde reaction product between copper-bearing solutions and diopside in diopside-magnetite tactites (Bawana mine, Utah, USA).

Association: Thaumasite, tenorite, kinoite, calcite (Bawana mine, Utah, USA); kinoite, apophyllite (Christmas, Arizona, USA).

Distribution: In the USA, in the Bawana mine, about six km northwest of Milford, Beaver Co., Utah; at Crestmore, Riverside Co., California; and from the Christmas copper mine, Gila Co., Arizona. In the El Bronce mine, Tierra Amarilla, Copiapó, Chile.

Name: In honor of Bronson Ferrin Stringham (1907–1968), Professor of Mineralogy, University of Utah, Salt Lake City, Utah, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128031; The Natural History Museum, London, England, 1976,421.

Total	100.33	99.50	100.00

(1) Foster mine, Cobalt, Canada. (2) Guarisamey, Mexico; average of three analyses. (3) AgCuS.

Occurrence: In hydrothermal veins, formed most commonly by secondary processes, although it also forms as a primary mineral.

Association: Freibergite, bornite, chalcopyrite, galena, other sulfides.

Distribution: An accessory mineral in a number of deposits, although only rarely in good crystals. From Zmeyewskaja-Goro, near Zmeinogorsk (Schlangenberg), Altai Mountains, Siberia, Russia [TL]. In Kazakhstan, at Dzhezkazgan. From Godejord, Norway. At Rudelstadt and Kupferberg, Silesia, Poland. From Příbram and Vrančice, Czech Republic. In Australia, at Mt. Lyell, Tasmania, and from Broken Hill, New South Wales. In Chile, at Santiago, at San Lorenzo in Aconcagua, and at Copiapó and Tarapacá. In the USA, in Arizona, an important ore mineral at the Silver King and Magma mines, Superior, Pinal Co. In Colorado, at many mines in the state; crystallized from the Red Mountain district, San Juan Co.; the American Sisters mine, Clear Creek Co., and elsewhere. From Butte, Silver Bow Co., Montana. In Canada, from Cobalt and Gowganda, Timiskaming district, Ontario; and at the Silver King mine, south of Nelson, British Columbia.

Name: In honor of Professor Friedrich Stromeyer (1776–1835), chemist and mineralogist, University of Göttingen, Göttingen, Germany, who first analyzed the mineral.

Stronalsite $Na_2SrAl_4Si_4O_{16}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. In short prisms, to 1 mm, forming blocky aggregates.

Physical Properties: *Cleavage:* Rectangular parting suspected. Hardness = 6.5
D(meas.) = 2.95 D(calc.) = 2.95

Optical Properties: Semitransparent. *Color:* White; in thin section, colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.563(2)$ $\beta = [1.564]$ $\gamma = 1.574(2)$ 2V(meas.) = 32°

Cell Data: *Space Group:* *Ibam* or *Iba*2. $a = 8.415(4)$ $b = 9.901(4)$ $c = 16.729(9)$
Z = 4

X-ray Powder Pattern: Rendai, Japan; very similar to banalsite.
3.204 (100), 3.502 (80), 2.881 (70), 3.183 (50), 2.067 (50), 3.765 (40), 3.069 (40)

Chemistry:

	(1)	(2)
SiO_2	39.09	38.87
Al_2O_3	32.70	32.30
CaO	0.17	0.41
SrO	15.71	17.11
BaO	2.29	0.80
Na_2O	9.98	10.12
Total	[99.94]	99.61

(1) Rendai, Japan; by electron microprobe, average of five analyses, original total given as 99.91%; corresponds to $Na_{1.99}(Sr_{0.94}Ba_{0.09}Ca_{0.02})_{\Sigma=1.05}Al_{3.95}Si_{4.01}O_{16}$. (2) Mt. Ohsa, Japan; by electron microprobe; corresponds to $Na_{2.02}(Sr_{1.03}Ca_{0.05}Ba_{0.03})_{\Sigma=1.11}Al_{3.92}Si_{4.00}O_{16}$.

Mineral Group: Feldspar group.

Occurrence: A secondary alteration mineral in veins cutting mafic metatuff xenoliths (Rendai, Japan); in veinlets and grains in jadeitic aggregates within serpentinite (Mt. Ohsa, Japan).

Association: Pectolite, slawsonite, albite, calcite, aragonite, natrolite, thomsonite, prehnite, datolite, rosenhahnite, vuagnatite.

Distribution: From a quarry near Rendai, Kochi City, Kochi Prefecture, and on Mt. Ohsa, Okayama Prefecture, Japan.

Name: For STRONtium and ALuminum in its composition.

Type Material: National Science Museum, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 160484.

References: (1) Hori, H., I. Nakai, K. Nagashima, S. Matsubara, and A. Kato (1987) Stronalsite, $SrNa_2Al_4Si_4O_{16}$, a new mineral from Rendai, Kochi City, Japan. Mineral. J. (Japan), 13, 368–375. (2) (1988) Amer. Mineral., 73, 195 (abs. ref. 1).

Strontianite $SrCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals typically short to long prismatic, may be acicular, elongated along [001], pseudohexagonal, to 8 cm; columnar, fibrous, rounded, granular, powdery, massive. *Twinning:* On {110}, contact or less commonly penetration twins, repeated to give trillings, fourlings; may be polysynthetic.

Physical Properties: *Cleavage:* On {110}, nearly perfect; on {021}, poor; on {010}, interrupted. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 3.76(2) D(calc.) = 3.780 May be thermoluminescent; fluorescent under UV, cathodoluminescent under X-rays and electron beams.

Optical Properties: Transparent to translucent. *Color:* Colorless, gray, pale yellow, pale green, yellowish brown, pale red, may be longitudinally zoned; colorless in transmitted light. *Luster:* Vitreous, resinous on breaks.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, weak.
$\alpha = 1.517$ $\beta = 1.663$ $\gamma = 1.667$ 2V(meas.) = n.d. 2V(calc.) = 7°07′

Cell Data: *Space Group: Pmcn.* $a = 5.1059(7)$ $b = 8.4207(13)$ $c = 6.0319(11)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.535 (100), 3.450 (70), 2.0526 (50), 2.458 (40), 1.9053 (35), 2.481 (34), 2.4511 (33)

Chemistry:

	(1)	(2)
CO_2	30.35	29.81
CaO	2.70	
SrO	66.31	70.19
BaO	0.17	
Total	99.53	100.00

(1) Strontian, Scotland. (2) $SrCO_3$.

Mineral Group: Aragonite group.

Occurrence: An uncommon low-temperature hydrothermal mineral formed in veins in limestone, marl, and chalk; in geodes and concretions; rarely occurs in hydrothermal metallic veins; common in carbonatites.

Association: Barite, calcite, celestine, harmotome, sulfur.

Distribution: Dozens of known localities, nearly all in minor amounts. From Strontian, Argyll, Scotland. In Germany, from Clausthal and Bad Grund, Harz Mountains; at Bräunsdorf, near Freiberg, Saxony; in the Lützow mine, Könitz, Thuringia; commercial deposits at Drensteinfurt, near Hamm, Westphalia; in the Dreislar mine, near Medebach, with fine crystals from Aschberg, Beckum, North Rhine-Westphalia. In Austria, large crystals from Oberdorf, Styria, and at Leogang, Salzburg; from Brixlegg, Tirol. From Nepean Township, Ontario, Canada. In the USA, from the Strontium Hills, 16 km north of Barstow, San Bernardino Co., California; in the Homestake mine, Lead, Lawrence Co., South Dakota; in Illinois, at a number of mines around Rosiclare, as the Minerva #1 mine, Cave-in-Rock, Hardin Co., Illinois; in the Winfield quarry, Union Co., Pennsylvania. From the Sierra Mojada district, Coahuila, Mexico. In the Kovdor, Sallanlatvi, and Vouriyärvi carbonatites, and the Khibiny and Lovozero massifs, Kola Peninsula, Russia.

Name: For Strontian, Scotland, source of the first specimens.

Strontiochevkinite $(Sr, La, Ce, Ca)_4(Fe^{2+}, Fe^{3+})(Ti, Zr)_4Si_4O_{22}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rounded grains, up to 1.5 mm. *Twinning:* Thick parallel or interpenetrating twins seen in polished section.

Physical Properties: Hardness = ∼5 D(meas.) = n.d. D(calc.) = 5.44

Optical Properties: Opaque. *Color:* Flesh-pink; dark gray in reflected light, may show deep red internal reflections. *Luster:* Submetallic. *Anisotropism:* Strong, in shades of gray.

Cell Data: *Space Group:* $P2_1/a$. $a = 13.56$ $b = 5.70$ $c = 11.10$ $\beta = 100.32°$ $Z = 2$

X-ray Powder Pattern: Near Sarambi, Paraguay.
3.01 (100), 1.97 (75), 2.19 (70), 2.51 (40), 2.73 (30), 2.85 (25), 3.21 (10)

Chemistry:

	(1)		(1)
SiO_2	20.45	Cr_2O_3	0.04
TiO_2	23.16	FeO	6.02
ZrO_2	10.30	MnO	0.08
Al_2O_3	0.11	CaO	2.05
Y_2O_3	0.05	SrO	19.60
La_2O_3	9.18	BaO	0.38
Ce_2O_3	9.35	Na_2O	0.02
RE_2O_3	0.05	Total	100.84

(1) Near Sarambi, Paraguay; UO_2, ThO_2, Nb_2O_5, PbO, MgO, K_2O, all $< 0.01\%$; corresponds to $(Sr_{2.17}Ce_{0.66}La_{0.65}Ca_{0.42}Ba_{0.03}Na_{0.01})_{\Sigma=3.94}(Fe^{2+}_{0.96}Mn_{0.01})_{\Sigma=0.97}(Ti_{3.26}Zr_{0.96}Al_{0.03}Cr_{0.01})_{\Sigma=4.26}Si_{3.91}O_{22}$.

Occurrence: In the more mafic bands of fenite dikes formed radially around carbonatite plugs.

Association: Sanidine, aegirine, nepheline, hematite, zeolites, strontian loparite, lamprophyllite.

Distribution: In the Sarambi carbonatite complex, about 27 km northeast of Sarambi, Paraguay.

Name: For the *strontium* content and relation to *chevkinite*.

Type Material: The Natural History Museum, London, England, 1984,482; National Museum of Natural History, Washington, D.C., USA, 161154.

Strontiodresserite $(Sr, Ca)Al_2(CO_3)_2(OH)_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As lathlike crystals, to 0.2 mm, typically in radially divergent aggregates forming atoll-shaped rings or smooth spheres.

Physical Properties: Hardness = n.d. D(meas.) = 2.71 D(calc.) = 2.73

Optical Properties: Transparent to translucent. *Color:* White. *Luster:* Vitreous to silky. *Optical Class:* Biaxial (–). *Orientation:* $Y \parallel$ elongation; $X \perp$ elongation and in the plane of flattening. $\alpha = 1.510(4)$ $\beta = 1.583(2)$ $\gamma = [1.595(4)]$ 2V(meas.) = 42.5(1)°

Cell Data: *Space Group:* [*Pbnm*] (by analogy to dundasite). $a = 9.168(4)$ $b = 16.037(6)$ $c = 5.598(3)$ Z = 4

X-ray Powder Pattern: Francon quarry, Canada.
7.97 (10), 3.021 (8), 6.04 (7), 2.648 (6), 2.052 (6), 1.738 (6), 4.41 (5)

Chemistry:

	(1)
Al_2O_3	29.13
CaO	2.78
SrO	24.36
Total	

(1) Francon quarry, Canada; by electron microprobe, averages of three partial analyses; presence of H_2O and $(OH)^{1-}$ confirmed by IR; corresponds to $(Sr, Ca)_{1.00}Al_{2.00}(CO_3)_2(OH)_4 \cdot H_2O$.

Occurrence: As a rare crystalline coating in vugs in a silicocarbonatite sill.

Association: Quartz, weloganite, dawsonite, montroyalite.

Distribution: From the Francon quarry, Montreal Island, Montreal, Quebec, Canada.

Name: As the *strontium* analog of *dresserite*.

Type Material: Canadian Geological Survey, Ottawa, 13704; Royal Ontario Museum, Toronto, Canada, M34626, M34627.

Strontiofluorite SrF_2

Crystal Data: Isometric. *Point Group:* 4/*m* $\bar{3}$ 2/*m*. As cubo-octahedral crystals to 0.3 mm, as spherical grains to1 mm, or as fine-grained compact massive aggregates; as pseudomorphs after prismatic lamprophyllite.

Physical Properties: *Cleavage:* Perfect {111}. *Fracture:* Stepped. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 4.05 D(calc.) = 4.11

Optical Properties: Translucent. *Color:* Pale gray; colorless in transmitted light. *Streak:* White. *Luster:* Greasy.
Optical Class: Isotropic. n = 1.438(2)

Cell Data: *Space Group: Fm*$\bar{3}$ *m*. *a* = 5.713(8) *Z* = 4

X-ray Powder Pattern: Khibiny massif, Kola Peninsula, Russia.
3.324 (100), 2.029 (90), 1.731 (60), 1.172 (50), 1.317 (30), 2.886 (20), 1.434 (20)

Chemistry:

	(1)
Na	1.79
Ca	9.57
Sr	42.81
Ba	7.06
La	2.14
Ce	2.78
Nd	0.64
F	33.15
Total	99.94

(1) Mt. Koashva, Khibiy massif, Kola Peninsula, Russia; average of several electron microprobe analyses; corresponding to $(Sr_{0.56}Ca_{0.27}Na_{0.09}Ba_{0.06}Ce_{0.02}La_{0.02}Nd_{0.01})_{\Sigma=1.03}F_2$.

Mineral Group: Fluorite group.

Occurrence: In lenses of sodalite-microcline-aegirine rock within an apatite-rich urtite; produced by intense alteration of primary Sr-bearing minerals by F-rich hydrothermal fluids in a peralkaline parageneses.

Association: Astrophyllite, burbankite, chlorobartonite, fluorite, fluorapatite, polezhaevite-(Ce).

Distribution: Mt. Koashva and Mt. Kitchepakhk, Khibiny alkaline massif, Kola Peninsula, Russia.

Name: As a Sr-dominant analogue of fluorite.

Type Material: Mineralogical Museum, St. Petersburg State University, Russia; Geological and Mineralogical Museum of the Geological Institute, Kola Science Center, Russian Academy of Sciences, Apatity, Russia (6455).

References: (1) Yakovenchuk, V.N., G.Y. Ivanyuk, Y.A. Pakhomovsky, E.A. Selivanova, J.A. Korchak, and A.P. Strontioginorite $SrCaB_{14}O_{20}(OH)_6 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As thick tabular {010} crystals, prismatic along [001], to 3 mm, with dominant {110}, {010}, {111}, and six other forms. *Twinning:* On (010) twin plane with $[\bar{1}01]$ twin axis.

Physical Properties: *Cleavage:* On {010}, perfect; on {001}, very good. *Tenacity:* Easily deformed. Hardness = 2–3 D(meas.) = 2.25(1) D(calc.) = 2.265

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Silky.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 38°–42°$; $Z \wedge [\bar{1}01] = –49°$ to $–54°$.
$\alpha = 1.512–1.515$ $\beta = 1.524–1.526$ $\gamma = 1.573–1.577$ 2V(meas.) = 49°–53°

Cell Data: *Space Group:* $P2_1/a$. $a = 12.817(8)$ $b = 14.448(8)$ $c = 12.783(8)$
$\beta = 101°25(5)'$ Z = 4

X-ray Powder Pattern: Königshall-Hindenburg mine, Germany.
7.25 (vs), 2.10 (s), 5.40 (m), 3.92 (m), 3.34 (m), 1.19 (m), 4.75 (mw)

Chemistry: (1) Stoichiometry established by analogy to ginorite, and validated by close similarity of X-ray powder patterns, optical properties and densities; formula from crystal structure analysis; SrO 10%–20% by X-ray fluorescence analysis, corresponding to as much as $Sr(Ca_{0.66}Sr_{0.34})_{\Sigma=1.00}B_{14}O_{20}(OH)_6 \cdot 5H_2O$.

Occurrence: A rare insoluble residue in salt beds (Königshall-Hindenburg mine, Germany).

Association: Halite, anhydrite (Königshall-Hindenburg mine, Germany).

Distribution: From the Königshall-Hindenburg potash mine, Reyershausen, near Göttingen, Lower Saxony, Germany. At the Inder borate deposit, Kazakhstan. From the Furnace Creek district, Death Valley, Inyo Co., California, USA. In the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina.

Name: As the *strontium* analog of *ginorite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 114168.

References: (1) Braitsch, O. (1959) Über Strontioginorit, eine neue Ginorit-Varietät aus dem Zechsteinsalz. Beitr. Mineral. u. Petrog., 6, 366–370 (in German). (2) (1960) Amer. Strontiojoaquinite $Sr_2Ba_2(Na,Fe^{2+})_2Ti_2Si_8O_{24}(O,OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* 2, m, or $2/m$. Crystals pseudotetragonal, steeply dipyramidal, to 0.5 mm, overgrown on joaquinite-(Ce) cores.

Physical Properties: *Cleavage:* Good on {001}. Hardness = 5.5 D(meas.) = n.d. D(calc.) = 3.68

Optical Properties: Semitransparent. *Color:* Green, yellow-green, yellow-brown. *Optical Class:* Biaxial (+). *Pleochroism:* Weak; $X = Y$ = colorless; Z = yellow. *Orientation:* $Y = b$; $Z = c$; $X \wedge a = 19°$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > X = Y$. $\alpha = 1.710(2)$ $\beta = 1.718(2)$ $\gamma = 1.780(3)$ 2V(meas.) = 35°–45°

Cell Data: *Space Group:* $P2$, Pm, or $P2/m$. $a = 10.516(6)$ $b = 9.764(5)$ $c = 11.87(1)$ $\beta = 109°17(4)'$ Z = 2

X-ray Powder Pattern: San Benito Co., California, USA.
2.801 (100), 2.967 (72), 3.011 (48), 2.923 (45), 2.611 (42), 4.47 (40), 2.432 (40)

Total	[99.89]

(1) Mina Numero Uno, California, USA; by electron microprobe, Li, RE, and H_2O determined using ion microprobe; $RE_2O_3 = Y_2O_3$ 0.00%, La_2O_3 0.14%, Ce_2O_3 0.003%, Pr_2O_3 0.003%, Nd_2O_3 0.05%, Sm_2O_3 0.00%, Gd_2O_3 0.00%, Dy_2O_3 0.00%, original total given as 99.85%; corresponds to $(Sr_{2.00}Ba_{0.04})_{\Sigma=2.04}Ba_{2.00}(Na_{1.14}Fe_{0.72}Li_{0.06})_{\Sigma=1.92}Ti_{2.00}Si_8O_{24}[(OH)_{1.36}O_{0.64}]_{\Sigma=2.00} \cdot 0.81H_2O$.

Polymorphism & Series: Dimorphous with strontio-orthojoaquinite.

Mineral Group: Joaquinite group.

Occurrence: In a metamorphosed and metasomatized basalt lens in serpentinite (Mina Numero Uno, California, USA); in veins cutting metagraywacke (prospect, San Benito Co., California, USA).

Association: Joaquinite-(Ce), neptunite, natrolite, albite, actinolite, crossite, benitoite, analcime.

Distribution: From Mina Numero Uno, south side of Clear Creek; at the Gem mine; and at a prospect about three km southwest of San Benito Mountain, San Benito Co., California, USA.

Name: For its *strontium* content and its relation to *joaquinite* in contrast to strontio-orthojoaquinite.

Type Material: University of California, Santa Barbara, California; Harvard University, Cambridge, Massachusetts, 119526; National Museum of Natural History, Washington, D.C., USA, 149429.

SrO	13.45
H_2O	[1.72]
Total	[99.38]

(1) Val Graveglia, Italy; by electron microprobe, Mn^{2+}:Mn^{3+} calculated from stoichiometry, H_2O calculated to give one H per formula unit; corresponds to $(Ca_{0.79}Mn^{2+}_{0.21})_{\Sigma=1.00}(Sr_{0.68}Ca_{0.31})_{\Sigma=0.99}(Al_{1.81}Mn^{3+}_{0.86}Fe^{3+}_{0.32})_{\Sigma=2.99}Si_{3.00}O_{12}(OH)$.

Mineral Group: Epidote group.

Occurrence: As veinlets in a low-temperature metamorphosed manganese ore deposit (Val Graveglia, Italy).

Association: Calcite, rhodonite, rhodochrosite, ganophyllite, braunite, quartz (Val Graveglia, Italy); xonotolite, vuagnatite (Wessels mine, South Africa).

Distribution: From the Molinello and Cassagna manganese mines, near Chiavari, Val Graveglia, Liguria, Italy. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: From its *strontium* content and similarity to *piemontite*.

Type Material: University of Florence, Florence, Italy, 1266/l.

References: (1) Bonazzi, P., S. Menchetti, and A. Palenzona (1990) Strontiopiemontite, a new member of the epidote group, from Val Graveglia, Liguria, Italy. Eur. J. Mineral., 2, 519–523. (2) (1991) Amer. Mineral., 76, 668 (abs. ref. 1).

H_2O	0.5	0.61
Total	99.9	100.00

(1) Kovdor massif, Kola Peninsula, Russia; by electron microprobe, H_2O by microcoulometric methods, PO_3OH confirmed by IR; corresponds to $(Sr_{6.96}Ca_{1.38}Mg_{0.60}Ba_{0.21}Mn_{0.04}Fe_{0.04})_{\Sigma=9.23}$ $Mg_{1.00}(PO_4)_6(P_{0.96}O_3OH_{0.78})$. (2) $Sr_9Mg(PO_4)_6(PO_3OH)$.

Occurrence: Very rare, in cavities in a dolomite carbonatite vein cutting pyroxenites in an alkalic massif.

Association: Strontian collinsite, bobierrite, carbonate-fluorapatite, rimkorolgite, pyrite, dolomite, unnamed Sr–Mg phosphate.

Distribution: From the Zheleznyi iron ore deposit, Kovdor alkalic massif, Kola Peninsula, Russia.

Name: As the *strontium* analog of *whitlockite*.

Type Material: Mining Institute, St. Petersburg, 2022/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, r558.

Strontium-apatite $(Sr,Ca)_5(PO_4)_3(OH,F)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6. As poorly-formed prismatic crystals, exhibiting $\{10\overline{1}0\}$, $\{10\overline{1}1\}$, $\{0001\}$, to 4 cm.

Physical Properties: *Cleavage:* Imperfect on $\{10\overline{1}0\}$. Hardness = 5 D(meas.) = 3.84 D(calc.) = 3.95

Optical Properties: Transparent. *Color:* Colorless, pale green to yellowish green.
Luster: Vitreous, greasy on fracture surfaces.
Optical Class: Uniaxial (–). $\omega = 1.651$ $\epsilon = 1.637$

Cell Data: *Space Group:* $P6_3/m$ or $P6_3$. $a = 9.565(8)$ $c = 7.115(3)$ Z = 2

X-ray Powder Pattern: Inagli massif, Russia.
2.89 (10), 3.167 (7), 2.78 (7), 2.005 (7), 1.909 (7), 1.467 (6), 2.32 (5)

Chemistry:

	(1)		(1)

Mineral Group: Apatite group.

Occurrence: In alkalic pegmatite veins in a zoned ultramafic intrusion (Inagli massif, Russia).

Association: Batisite, innelite, lorenzenite, eudialyte, aegirine, eckermannite, microcline, magnesioarfvedsonite, albite (Inagli massif, Russia).

Distribution: In Russia, from the Inagli massif, 30 km west of Aldan, Sakha, and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula.

Name: As a *strontium*-dominant member of the *apatite* group; see fluorapatite.

Type Material: Vernadsky Geological Museum, Moscow, 48010; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 63197, 66210.

Strunzite $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$. Crystals are flattened on {100}, typically needlelike to hairlike, to 2 cm; in radiating sprays, tufts, and coatings. *Twinning:* On $\{1\overline{2}0\}$, common.

Physical Properties: Hardness = n.d. D(meas.) = 2.52(5) D(calc.) = 2.49

Optical Properties: Semitransparent. *Color:* White, pale yellow, straw-yellow, brownish yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Faint; X = nearly colorless; Y = yellow-brown; Z = darker yellow-brown. *Orientation:* $Z \wedge c = 10°–19°$. *Absorption:* $Z > X = Y$. $\alpha = 1.619–1.625$ $\beta = 1.640–1.670$ $\gamma = 1.696–1.720$ 2V(meas.) = Medium. 2V(calc.) = 56°–93°

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.228(5)$ $b = 9.837(5)$ $c = 7.284(5)$ $\alpha = 90.17(5)°$ $\beta = 98.44(5)°$ $\gamma = 117.44(5)°$ Z = 2

X-ray Powder Pattern: Hagendorf, Germany; nearly identical to ferrostrunzite.
9.02 (10), 5.32 (8), 4.35 (6), 4.27 (6), 3.29 (6), 3.23 (6), 4.50 (5)

Chemistry:

	(1)	(2)
P_2O_5	33.0	28.46
Fe_2O_3	36.0	32.02
MnO	9.1	14.23
H_2O^+	22.5	25.29
Total	100.6	100.00

(1) Hagendorf, Germany. (2) $Mn^{2+}Fe_2^{3+}(PO_4)_2(OH)_2 \cdot 6H_2O$.

Occurrence: A secondary mineral, typically altered from triphylite, in zoned complex granite pegmatites.

Association: Triphylite, laueite, rockbridgeite, many other Mn–Fe phosphates.

Distribution: From Hagendorf, Waidhaus, and Hühnerkobel, near Zwiesel, Bavaria, Germany. At Blaton, Belgium. In Portugal, from Sabugal, in the Mangualde pegmatite, near Mesquitela, and the Bendada pegmatite, near Guarda. In the Gravel Hill mine, Perranzabuloe, Cornwall, England. At the Norrö pegmatite, on Rånö Island, and from near Kapelludden, Utö Island, Sweden. From Morašice, Czech Republic. In the USA, from the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., the G.E. Smith mine, Newport, Sullivan Co., and the Fitzgibbon mine, Alstead, Cheshire Co., New Hampshire; in Maine, at the Red Hill quarry, Rumford, and the BB quarry, Norway, Oxford Co., and elsewhere; in the Big Chief mine, one km south of Glendale, and the Hesnard and Etta mines, near Keystone, Pennington Co., from the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Foote mine, Kings Mountain, Cleveland Co., North Carolina. At several mines around Linópolis, Minas Gerais, Brazil.

Name: To honor Dr. Hugo Strunz (1910–), Professor of Mineralogy, Technical University, Berlin, Germany, for his work on pegmatite phosphate minerals, especially those of Hagendorf, Germany.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 106288–106301.

Strüverite $(Ti, Ta, Fe^{2+})O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As dipyramidal, prismatic crystals, to several cm, with striated prism faces. *Twinning:* Common on {101}.

Physical Properties: *Cleavage:* {110}, distinct. *Fracture:* Conchoidal. Hardness = 6–6.5 VHN = 911–998 D(meas.) = 4.2–5.8 D(calc.) = [5.68–5.77]

Optical Properties: Opaque, translucent through thin edges. *Color:* Black; red or reddish brown in transmitted light; light gray in reflected light. *Streak:* Grayish black. *Luster:* Adamantine, resinous.
Optical Class: Uniaxial (+). *Pleochroism:* Strong; E = brown; O = dark bluish green or greenish blue. *Absorption:* $E > O$. $n = > 2.6$ *Anisotropism:* Strong. *Bireflectance:* Weak. R_1–R_2: n.d.

Cell Data: *Space Group:* $P4_2/mnm$. a = 4.62–4.64 c = 2.98–3.00 Z = 2

X-ray Powder Pattern: Altai Mountains, Mongolia; almost identical to ilmenorutile.
3.25 (10), 1.699 (10), 2.495 (9), 1.641 (7), 1.375 (7), 1.183 (7), 1.054 (7)

Chemistry:

	(1)	(2)
Nb_2O_5	6.5	9.30
Ta_2O_5	35.5	33.12
SiO_2		0.41
TiO_2	47.8	47.0
SnO_2	0.3	
Al_2O_3		0.60
FeO	9.2	9.70
MnO	0.1	0.09
MgO		0.03
CaO		0.05
Total	99.4	100.30

(1) Craveggia, Italy; by electron microprobe, total Fe as FeO, total Mn as MnO. (2) Altai Mountains, Mongolia; corresponds to $(Ti_{0.63}Ta_{0.16}Fe_{0.15}Nb_{0.07})_{\Sigma=1.01}O_2$.

Polymorphism & Series: Forms a series with ilmenorutile; Ta:Nb > 1.

Occurrence: A late primary mineral in granite pegmatites; rarely detrital.

Association: Columbite, ilmenite, beryl, cassiterite, zircon, monazite, albite, microcline.

Distribution: From Craveggia, Val Vigezzo, Piedmont, Italy. At Věžná, near Rožná, and Písek, Czech Republic. In the Etta mine, near Keystone, Pennington Co., South Dakota, USA. At Tongafeno, Fefana, Mananjary, Ampangabé, and elsewhere in Madagascar. From near Salak North, Kuala Kangsar, Perak, Malaya. At Globe Hill, Western Australia. Other localities are reported, either undefined, or the material requiring modern confirmation.

Name: Honors Professor Giovanni Strüver (1842–1915), mineralogist, University of Rome, Rome, Italy.

Type Material: The Natural History Museum, London, England, 1906,123; Natural History Museum, Paris, France, 108.371.

Struvite-(K) $KMgPO_4 \cdot 6H_2O$

Crystal Data: Orthorhombic. *Point Group*: *mm*2. As acicular prismatic crystals, to 0.7 mm; elongated on [010] with wedge-shaped terminations, displaying {001}, {010}, {101}, {012}, {110}, {111}, $\{01\bar{2}\}$. *Twinning:* Contact twins on (101) common.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: n.d. Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.864

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Biaxial (+). α = 1.490(2) β = 1.493(2) γ = n.d. $2V_Z$ = large (> 70°). *Dispersion*: $r < v$, weak. *Orientation*: (OAP) $\perp$ [010]; β parallel a.

Cell Data: *Space Group*: $Pmn2_1$ (by analogy to struvite). a = 6.903(3) b = 6.174(2) c = 11.146(3) Z = 2

X-ray Powder Pattern: Lengenbach, Binntal, Switzerland.
4.255 (100), 3.271 (90), 4.136 (80), 2.650 (70), 2.905 (70), 2.699 (50), 1.9541 (50)

Chemistry: Lengenbach, Binntal, Switzerland; Qualitative EDS analyses confirmed major K, Mg, P, and traces of Sb, Fe, and Cu. Structure refinement confirmed the pure K end-member.

Occurrence: Of either late hydrothermal or secondary origin (Switzerland); an alteration product of animal bones and circulating fluids (Austria).

Association: Rathite, dolomite (Switzerland); newberyite (Austria).

Distribution: Lengenbach, Binntal, Switzerland; Rossblei, Schladminger Tauern, Styria, Austria.

Name: As the potassium equivalent of struvite.

Type Material: Natural History Museum, Basel, Switzerland, S176.

Struvite $(NH_4)Mg(PO_4)\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals are equant, wedgelike, short prismatic, or tabular, hemimorphic, with large {011}, {100}, {001}, {101}, {$\overline{1}$01}, {102}, several other forms, to 3 cm. *Twinning:* On {001} as twin and composition plane, with deep re-entrants.

Physical Properties: *Cleavage:* {001}, good; {010}, poor. *Fracture:* Subconchoidal to uneven. Hardness = 2 D(meas.) = 1.711 D(calc.) = 1.706 Slightly soluble in H_2O, dehydrates in dry, warm air. Pyroelectric and piezoelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless, may be tinted yellow or brown from impurities, and becomes surficially white on dehydration; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, strong.
$\alpha = 1.495$ $\beta = 1.496$ $\gamma = 1.504$ 2V(meas.) = 37°22′

Cell Data: *Space Group:* $Pmn2_1$ (synthetic). $a = 6.955(1)$ $b = 6.142(1)$ $c = 11.218(2)$
Z = 2

X-ray Powder Pattern: Synthetic.
4.257 (100), 5.601 (60), 2.919 (55), 2.690 (50), 2.660 (45), 5.905 (40), 4.139 (40)

Chemistry:

Total	100.00	100.00

(1) Skipton lava tube caves, Australia. (2) $(NH_4)Mg(PO_4)\cdot 6H_2O$.

Occurrence: In peaty earth intermixed with cattle dung (Hamburg, Germany); typically formed in bird or bat guano in caves and surface deposits.

Association: Newberyite, hannayite, brushite, stercorite.

Distribution: Found under St. Nikolai Church, Hamburg, Germany. From an archaeological excavation at High Street and Fishamble Street, Dublin, Ireland. At the Limfjord, Denmark. In the Niah Great Cave, Sarawak, Malaysia. From Saldanha Bay, Cape Province, and Ficus and Boon's Caves, Transvaal, South Africa. On Ichaboe Island, northwest of Lüderitz, Namibia. From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana. On Réunion Island, Indian Ocean; the Bounty Islands, South Pacific Ocean; King Georges Island, Maritime Antarctic. In the Skipton lava tube caves, 40 km south of Ballarat, Victoria, Australia. In the USA, on Paoha Island, Mono Lake, Mono Co., California.

Name: To honor Heinrich Christoph Gottfried Struve (1772–1851), German mineral collector, serving as Russian Consul at Hamburg, Germany when the mineral was discovered.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 715–717. (2) Ferraris, G., H. Fuess, and W. Studenitsite $NaCa_2B_9O_{14}(OH)_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As flattened wedge-shaped crystals, to 5 mm, dominated by {001}, {011}, {111}, with poorly developed {100}, {110}, {012}, in aggregates.

Physical Properties: *Tenacity:* "Fragile". Hardness = 5.5–6 VHN = 527–550
D(meas.) = 2.29 D(calc.) = 2.34

Optical Properties: Translucent to transparent in thin pieces. *Color:* Colorless, pale gray, yellowish gray. *Streak:* White.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z = a$; $Y \wedge c = 10°$. *Dispersion:* $r > v$, medium. $\alpha = 1.532(2)$ $\beta = 1.538(2)$ $\gamma = 1.564(2)$ 2V(meas.) = 54(2)°

Cell Data: *Space Group:* $P2_1/c$. $a = 11.4994(8)$ $b = 12.5878(9)$ $c = 10.5297(7)$
$\beta = 99.423(6)°$ Z = 4

X-ray Powder Pattern: Piskaya deposit, Yugoslavia.
3.04 (100), 3.35 (89), 5.41 (66), 3.27 (59), 2.210 (59), 5.20 (57), 4.20 (56)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	0.09		CaO	20.84	21.22
CO_2	0.00		SrO	0.09	
B_2O_3	59.64	59.28	Na_2O	5.96	5.86
Al_2O_3	0.05		K_2O	0.08	
Fe_2O_3	0.05		H_2O^+	13.64	
MnO	0.01		H_2O^-	0.00	
MgO	0.02		H_2O		13.64
			Total	100.47	100.00

(1) Piskaya deposit, Yugoslavia; $(OH)^{1-}$ and H_2O confirmed by IR.
(2) $NaCa_2B_9O_{14}(OH)_4 \cdot 2H_2O$.

Occurrence: As lenses in clay and carbonate-bearing volcanogenic-sedimentary borate deposits.

Association: Colemanite, howlite, ulexite, pentahydroborite.

Distribution: From the Piskaya deposit, Yarondolskii Basin, on the Ibar River, 280 km south of Belgrade, Yugoslavia.

Name: For the Studenitsa Cloister near the first occurrence.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Malinko, S.V., S. Anichich, D. Yoksimovich, A.E. Lisitsyn, G.I. Dorokhova, M.A. Yamnova, V.V. Vlasov, and A.A. Studtite $UO_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$, m, or 2. Needlelike crystals, elongated along [001], to 1 mm, in radial fibrous aggregates and crusts.

Physical Properties: *Tenacity:* Flexible. Hardness = Soft. D(meas.) = 3.58 (synthetic). D(calc.) = 3.64 Radioactive.

Optical Properties: Translucent to transparent. *Color:* Yellow to pale yellow; nearly colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* Z = elongation. α = 1.537–1.551 β = 1.555–1.686 γ = 1.680–1.690 2V(meas.) = Small.

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. a = 11.85(2) b = 6.80(1) c = 4.25(1) $\beta = 93°51(20)'$ Z = 2

X-ray Powder Pattern: Menzenschwand, Germany.
5.93 (10), 3.40 (8), 2.96 (6), 2.23 (6), 2.02 (5), 1.970 (5b), 4.27 (4)

Chemistry: Qualitative microchemical and electron microprobe analyses typically show major U with traces of Pb, H_2O, CO_3 attributed to impurities. Characterization of naturally-occurring material thus rests on equivalence of the X-ray pattern and optical properties with the synthetic compound, and chemical behavior as a peroxide.

Occurrence: A very rare mineral in the oxidized zone of some uranium-bearing mineral deposits.

Association: Uranophane, rutherfordine, lepersonnite (Shinkolobwe, Congo); billietite, uranophane, rutherfordine, barite, quartz, hematite, "limonite" (Menzenschwand, Germany); tengchongite, calcurmolite, kivuite (Tengchong Co., China).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Menzenschwand, Black Forest, Germany. From Mitterberg, Salzburg, Austria. In France, at Davignac, Corrèze, and from the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault. In Tengchong Co., and at Tongbiguan village, Yingjiang Co., Yunnan Province, China.

Name: To honor Franz Edward Studt, geologist, who published a geological map of Shaba (Katanga) Province in 1913.

Type Material: n.d.

Stumpflite $Pt(Sb, Bi)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Massive grains, to a few tenths of a mm, intergrown with geversite.

Physical Properties: Hardness = n.d. VHN = 385 (50 g load). D(meas.) = n.d. D(calc.) = 13.52

Optical Properties: Opaque. *Color:* In polished section, cream. *Luster:* Metallic. *Pleochroism:* Perceptible. *Anisotropism:* Strong, in brownish yellow.

R_1–R_2: (400) —, (420) 45.9–49.3, (440) 49.1–52.2, (460) 52.0–54.7, (480) 54.6–57.3, (500) 56.6–59.5, (520) 58.2–61.5, (540) 59.3–63.0, (560) 60.2–64.5, (580) 61.1–65.7, (600) 62.1–66.7, (620) 62.9–67.6, (640) 63.7–68.5, (660) 64.5–69.3, (680) 65.0–70.0, (700) 65.1–70.7

Cell Data: *Space Group:* $P6_3/mmc$ (probable). $a = 4.175(2)$ $c = 5.504(2)$ $Z = 2$

X-ray Powder Pattern: Driekop mine, South Africa.
3.027 (10), 2.192 (10), 2.088 (8), 3.618 (6), 1.512 (5), 1.720 (4), 1.224 (4)

Chemistry:

	(1)
Pt	57.0
Sb	26.1
Bi	16.3
Total	99.4

(1) Driekop mine, South Africa; by electron microprobe, corresponding to $Pt_{1.00}(Sb_{0.73}Bi_{0.27})_{\Sigma=1.00}$.

Mineral Group: Nickeline group.

Occurrence: In platinum concentrates from an ultramafic pipe deposit (Driekop mine, South Africa).

Association: Geversite, Pt–Fe alloys (Driekop mine, South Africa).

Distribution: From the Driekop mine, on the Merensky Reef, Bushveld complex, Transvaal, South Africa [TL]. From near Nizhni Tagil, Ural Mountains, Russia. In the Kelvon Grove prospect, near Fifield, New South Wales, Australia.

Name: Honors Professor Eugen Friedrich Stumpfl (1931–), University of Hamburg, Hamburg, Germany, who first described the mineral.

Type Material: Bureau de Recherches Géologiques et Minières (B.R.G.M.), Orléans; National School of Mines, Paris, France.

References: (1) Johan, Z. and P. Picot (1972) La stumpflite, Pt(Sb, Bi), un nouveau minéral. Bull. Soc. fr. Minéral., 95, 610–613 (in French with English abs.). (2) (1974) Amer. Sturmanite $\mathbf{Ca_6(Fe^{3+}, Al, Mn^{2+})_2(SO_4)_2[B(OH)_4](OH)_{12}\cdot 25H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As dipyramidal tabular to elongated hexagonal crystals, to 40 cm, showing $\{10\bar{1}0\}$, $\{10\bar{1}4\}$, $\{11\bar{2}4\}$, typically in groups, may be in stacked parallel aggregates. *Twinning:* Probably twinned (by analogy to ettringite).

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, perfect. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 1.847 D(calc.) = 1.855

Optical Properties: Transparent to translucent. *Color:* Bright yellow. *Streak:* Pale yellow, greenish yellow, brownish orange if altered. *Luster:* Vitreous, slightly greasy on fracture surfaces.
Optical Class: Uniaxial (+) or (–). *Pleochroism:* Weak; O = pale green; E = pale yellowish green. *Absorption:* $O < E$. $\omega = 1.499$–1.500 $\epsilon = 1.497$–1.505

Cell Data: *Space Group:* $[P31c]$ (by analogy to ettringite). $a = 11.16(3)$ $c = 21.79(9)$ Z = 2

X-ray Powder Pattern: Kuruman district, South Africa.
9.67 (100), 5.58 (70), 3.89 (70), 2.582 (60), 2.774 (50), 2.215 (50), 2.161 (40)

Chemistry:

	(1)
SO_3	14.2
B_2O_3	3.2
Al_2O_3	1.13
Fe_2O_3	8.84
MnO	1.30
CaO	25.6
H_2O	46.7
Total	101.0

(1) Kuruman district, South Africa; by AA, B_2O_3 spectrophotometrically, H_2O by the Penfield method; corresponds to $Ca_{6.0}(Fe^{3+}_{1.5}Al_{0.3}Mn^{2+}_{0.2})_{\Sigma=2.0}(SO_4)_{2.3}[B(OH)_4]_{1.2}(OH)_{12.0}\cdot 25.7H_2O$.

Mineral Group: Ettringite group.

Occurrence: An uncommon secondary mineral in cavities in metamorphosed bedded manganese deposits.

Association: Barite, manganite, hausmannite, hematite.

Distribution: From the Kuruman district, with large crystals in the Wessels and N'Chwaning II mines, Cape Province, South Africa.

Name: Honors Bozidar Darko Sturman (1937–), Canadian mineralogist, Royal Ontario Museum, Toronto, Ontario, Canada.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148261.

References: (1) Peacor, D.R., P.J. Dunn, and M. Duggan (1983) Sturmanite, a ferric iron, boron analogue of ettringite. Can. Mineral., 21, 705–709. (2) (1988) Amer. Mineral., 73, 195 (abs. ref. 1).

Stützite $\mathbf{Ag_{5-x}Te_3}$ (x = 0.24 to 0.36)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. The only crystal known is the type, 2 cm, hexagonal, equant, and highly modified, with 14 forms; commonly massive, compact, granular.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 3.5 VHN = 73–90 (25 g load). D(meas.) = 8.00 D(calc.) = 8.18

Optical Properties: Opaque. *Color:* Dark lead-gray, tarnishes rapidly to a dark bronze to iridescence; in polished section, pale gray. *Luster:* Metallic. *Anisotropism:* Moderate, in gray reddish brown-blue.
R_1–R_2: (400) 41.2–42.9, (420) 41.2–42.5, (440) 41.2–42.0, (460) 41.2–41.6, (480) 41.2–41.3, (500) 41.1–41.1, (520) 41.0–40.8, (540) 40.8–40.4, (560) 40.7–40.0, (580) 40.6–39.5, (600) 40.6–39.0, (620) 40.6–38.7, (640) 40.7–38.3, (660) 40.8–37.9, (680) 40.9–37.4, (700) 41.1–37.0

Cell Data: *Space Group:* $C6/mmm$. $a = 13.38$ $c = 8.45$ $Z = 7$

X-ray Powder Pattern: May Day mine, Colorado, USA.
2.16 (100b), 2.55 (80b), 3.03 (70), 2.62 (70), 3.56 (60), 3.52 (60), 2.11 (60)

Chemistry:

	(1)	(2)	(3)
Ag	57.1	59.8	58.49
Cu		0.1	
Te	42.6	39.2	41.51
Total	99.7	99.1	100.00

(1) Red Cloud mine, Colorado, USA; by electron microprobe, corresponding to $Ag_{4.76}Te_{3.00}$.
(2) Bisbee, Arizona, USA; by electron microprobe, correspnding to $(Ag_{5.41}Cu_{0.02})_{\Sigma=5.43}Te_{3.00}$.
(3) Ag_5Te_3.

Occurrence: As replacement masses in hydrothermal deposits associated with other tellurides and sulfides.

Association: Sylvanite, hessite, altaite, petzite, empressite, tellurium, gold, galena, sphalerite, colusite, tetrahedrite–tennantite, pyrite.

Distribution: A museum specimen, probably from Săcărîmb (Nagyág), Romania [TL]. At Kremnica (Kremnitz) and Byšta, Slovakia. From Glava, Värmland, Sweden. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. On Temagami Island, Lake Temagami, Ontario; and at Lindquist Lake, Quebec, Canada. In the USA, in Colorado, at the May Day mine, La Plata district, La Plata Co.; from the Golden Fleece mines, Lake City, Hinsdale Co.; at the Empress Josephine mine, Bonanza district, Saguache Co.; from Buckeye Gulch, near Leadville, Lake Co.; and at the Red Cloud and other mines, Jamestown and Gold Hill districts, Boulder Co. In the Mayflower mine, Tobacco Root Mountains, Madison Co., Montana; from the Campbell mine, Bisbee, Cochise Co., Arizona. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the Kawazu mine, Shizuoka Prefecture, Japan.

Name: To honor Andreas Xavier Stütz (1747–1806), mineralogist of Vienna, Austria.

Type Material: Vienna University, Vienna, Austria, 5808; Harvard University, Cambridge, Massachusetts, USA, 108098.

Suanite $Mg_2B_2O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As aggregates of slender prismatic to fibrous crystals, elongated along [010].

Physical Properties: *Cleavage:* In one direction ∥ [010], perfect. Hardness = 5.5
D(meas.) = 2.91 D(calc.) = 2.91

Optical Properties: Translucent. *Color:* White, pale gray; colorless in transmitted light.
Luster: Silky to pearly.
Optical Class: Biaxial (–). *Orientation:* $X = b$. *Dispersion:* $r > v$, weak. $\alpha = 1.596$
$\beta = 1.639$ $\gamma = 1.670$ 2V(meas.) = 70°

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 12.303(4)$ $b = 3.1228(9)$ $c = 9.917(4)$
$\beta = 104.26(3)°$ Z = 4

X-ray Powder Pattern: Hol Kol mine, North Korea.
2.557 (100), 2.010 (60), 2.823 (50), 1.916 (30), 4.47 (25), 1.562 (21), 2.983 (18)

Chemistry:

	(1)	(2)
SiO_2	0.80	
B_2O_3	42.28	46.34
$(Al + Fe)_2O_3$	0.63	
MgO	50.64	53.66
CaO	1.52	
H_2O^+	3.87	
H_2O^-	0.19	
Total	99.93	100.00

(1) Hol Kol mine, North Korea; after deduction of szaibélite, corresponds to $Mg_{1.96}B_2O_5$.
(2) $Mg_2B_2O_5$.

Occurrence: In a contact metasomatic hydrothermal boron deposit in diopside–clinohumite–dolomite–calcite skarn (Hol Kol mine, North Korea).

Association: Kotoite, sakhaite, ludwigite, szaibélyite, clinohumite, forsterite, apatite, spinel, calcite.

Distribution: From the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. At the Zhuanmiao and Houxianyu boron deposits, Liaoning Province, China. In Russia, in Sakha, from the Titovskoye boron–iron deposit, Tas-Khayakhtakh Mountains, in the Taiga boron–iron deposit, and from the Tayozhnoye iron deposit, 550 km south of Yakutsk. From Băiţa (Rézbánya), Băişoara, Cacova Ierii, Gilău Mountains, and elsewhere in Romania. At Kami-neichi, Miyako, Iwate Prefecture, Japan.

Name: For Suan Co., the North Korean region from which the first specimens were collected.

Type Material: n.d.

References: (1) Watanabe, T. (1953) Suanite, a new magnesium borate mineral from Hol Kol, Suan, North Korea. Mineral. J. (Japan), 1, 54–62. (2) (1955) Amer. Mineral., 40, 941 (abs. ref. 1). Ni	7.6	3.2	
Sb	55.5	51.3	53.3
Bi	0.77	4.5	
As	0.71	0.5	< 0.01
Te	0.79	0.1	
Total	101.47	100.4	99.3

(1) Copper Cliff South mine, Sudbury, Canada; by electron microprobe, corresponding to $(Pd_{0.71}Ni_{0.27})_{\Sigma=0.98}(Sb_{0.96}Bi_{0.01}As_{0.02}Te_{0.01})_{\Sigma=1.00}$. (2) Do.; by electron microprobe corresponding to $(Pd_{0.85}Ni_{0.12})_{\Sigma=0.97}(Sb_{0.93}Bi_{0.05}As_{0.02})_{\Sigma=1.00}$. (3) Witwatersrand, South Africa; by electron microprobe, corresponding to $Pd_{0.99}Sb_{1.01}$.

Mineral Group: Nickeline group.

Occurrence: As tiny inclusions, commonly in cobaltite or maucherite, in mechanical concentrates of platinum-group minerals (Sudbury, Canada).

Association: Cobaltite, maucherite, gersdorffite, breithauptite, chalcopyrite, nickeline, galena (Sudbury, Canada); pyrrhotite, pentlandite, chalcopyrite, violarite, cubanite, bornite, sphalerite, galena, linnaeite, magnetite, testibiopalladite, sperrylite, omeiite, gold (Danba, China).

Distribution: In Canada, from the Copper Cliff South [TL] and Frood mines, Sudbury, Ontario; and in the Wellgreen Cu–Ni–Pt–Pd deposit, Yukon Territory. At Danba, Sichuan Province, China. From the Baula complex, Orissa, India. From Kambalda, 56 km south of Kalgoorlie, Western Australia. In the Onverwacht and Tweefontein pipes, on the Merensky Reef, Bushveldt complex, and from the Witwatersrand, Transvaal, South Africa.

Name: For the localities at Sudbury, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M32841.

X-ray Powder Pattern: Negaunee, Michigan, USA.
2.501 (100), 4.52 (85), 14.2 (80), 4.74 (80), 3.55 (65), 1.511 (60), 2.409 (50)

Chemistry:

	(1)		(1)
SiO_2	32.81	MnO	0.29
TiO_2	0.18	MgO	13.54
Al_2O_3	35.71	CaO	0.03
Fe_2O_3	2.66	K_2O	0.03
FeO	1.07	H_2O	12.95
		Total	99.27

(1) Ottré, Belgium; by XRF, Fe^{2+}:Fe^{3+} determined separately, H_2O by titration with Karl Fischer reagent; corresponds to $(Mg_{1.85}Fe^{2+}_{0.08}Mn_{0.02})_{\Sigma=1.95}(Al_{2.86}Fe^{3+}_{0.18}Ti_{0.01})_{\Sigma=3.05}$ $Si_{3.00}Al_{1.00}O_{10}(OH)_{7.91}$.

Mineral Group: Chlorite group.

Occurrence: Disseminated in hematite ore, probably of hydrothermal origin (Negaunee, Michigan, USA); an authigenic mineral in aeolian sandstones (Kesselberg, Germany); in low-grade metamorphic assemblages (Ottré, Belgium).

Association: Hematite (Negaunee, Michigan, USA); quartz, carpholite, manganoan garnet, hematite (Biesenrode, Germany); pyrophyllite, diaspore, mica, böhmite (Itaya, Japan).

Distribution: From Lützelbach, near Plochingen, Baden-Württemberg; in the Kesselberg area, Black Forest; and from near Biesenrode, Harz Mountains, Germany. At Ottré, near Salmchâteau, Ardennes Mountains, Belgium. From Beresov, Ural Mountains, Russia. In the USA, from the Tracy mine, Negaunee, Marquette Co., Michigan. Around the Cigar Lake uranium deposit, Athabasca basin, Saskatchewan, Canada. From the Hanaoka and Kamakita mines, Aomori Prefecture; the Ehara mine, Mitsuishi, and at Itaya, Hyogo Prefecture; in the Furutobe mine, Akita Prefecture; the Kamagamine mine, Hiroshima Prefecture; the Shinyo mine, Nagano Prefecture, and elsewhere in Japan.

Name: For Professor Toshio Sudo (1911–), University of Tokyo, Tokyo, Japan.

Type Material: n.d.

Suessite $(Fe, Ni)_3Si$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As anhedral interstitial vein fillings, to about 150 μm long; as cubic crystals, skeletal, to 0.3 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 7.08 Strongly ferromagnetic.

Optical Properties: Opaque. *Color:* Cream-white in reflected light.
Optical Class: Isotropic.
R: (470) 48.5, (546) 51.6, (589) 53.5, (650) 50.0

Cell Data: *Space Group:* $Im3m$. $a = 2.841(2)$ $Z = [0.5]$

X-ray Powder Pattern: North Haig meteorite.
2.005 (10), 1.160 (3), 1.42 (1)

Chemistry:

	(1)	(2)
Fe	84.7	83.1
Cr	0.10	0.04
Co	0.21	0.27
Ni	1.6	4.5
Si	15.3	13.7
P	0.06	0.17
Total	101.97	101.78

(1) North Haig meteorite; by electron microprobe, corresponds to $(Fe_{2.78}Ni_{0.05}Co_{0.01})_{\Sigma=2.84}(Si, P)_{1.00}$. (2) Do.; by electron microprobe, corresponds to $(Fe_{2.98}Ni_{0.15}Co_{0.01})_{\Sigma=3.14}(Si, P)_{1.00}$.

Occurrence: In a highly reduced brecciated meteorite (North Haig meteorite); in amygdaloidal basaltic porphyrite (Chatkal Range, Russia).

Association: Olivine, pigeonite, kamacite, troilite, carbonaceous material (North Haig meteorite); khamrabaevite (Chatkal Range, Russia).

Distribution: In the North Haig olivine-pigeonite achondrite (ureilite) meteorite. From the Ir-Tash stream basin, Arashan Mountains, Chatkal Range, Uzbekistan.

Name: To honor Dr. Hans E. Suess (1909–1993), Austrian-American geochemist, Professor of Chemistry, University of California at San Diego, La Jolla, California, USA, for his work in cosmochemistry and meteoritics.

Type Material: Institute of Meteoritics, University of New Mexico, Albuquerque, New Mexico, USA.

Sugakiite $Cu(Fe, Ni)_8S_8$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. As irregular grains, to 0.1 mm; as lamellae.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = n.d. VHN = 145 (50 g load). D(meas.) = n.d. D(calc.) = 4.71

Optical Properties: Opaque. *Color*: Reddish yellow; creamy white with reddish tint in reflected light. *Streak*: n.d. *Luster*: Metallic. Tarnishes brownish gray on exposure to air.
Optical Class: n.d. *Anisotropism:* Weak, dark to light gray.
R_1-R_2: (436) 25.6–31.9, (497) 29.9–36.1, (543) 33.2-39.1, (586) 36.1–41.5, (648) 39.3–44.3

Cell Data: *Space Group*: $P4_2/mnm$. $a = 10.566(5)$ $c = 9.749(8)$ $Z = 4$

X-ray Powder Pattern: Horoman massif, Samanicho, Samani-gun, Hokkaido, Japan.
2.072 (100), 1.793 (85), 1.804 (83), 3.061 (74), 1.954 (42), 1.962 (38), 2.641 (33)

Chemistry:

	(1)
Cu	6.99
Fe	43.27
Ni	16.10
Co	0.17
S	33.04
Total	99.57

(1) Horoman massif, Hokkaido, Japan; average of 8 electron microprobe analyses, corresponding to $Cu_{0.85}(Fe_{6.01}Ni_{2.13}Co_{0.02})_{\Sigma=8.16}S_{7.99}$.

Occurrence: An intergranular exsolved phase in sulfide aggregates in lherzolite in a peridotite massif.

Association: Bornite, talnakhite, copper, $(Fe,Ni,Co,Cu)_9S_8$, $Cu_2(Fe,Ni)_7S_8$.

Distribution: Horoman peridotite massif, Samanicho, Samani-gun, Hokkaido, Japan.

Name: Honors emeritus professor Asahiko Sugaki (b 1923), Tohoku University, Sendai, Japan, for his studies on sulfide phase equilibria.

Type Material: Tohoku University Museum, Sendai, Japan.

References: (1) Kitakaze, A. (2008) Sugakiite, $Cu(Fe,Ni)_8S_8$, A new mineral species from Hokkaido, Japan. Can. Mineral., 46, 263–267. (2) (2008) Amer. Mineral., 93, 1944 (abs. ref. 1).

Sugilite $KNa_2(Fe^{3+},Mn^{3+},Al)_2Li_3Si_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals prismatic, to 2 cm, rare. Commonly in interlocking aggregates of subhedral grains, compact to massive.

Physical Properties: *Cleavage:* {0001}, poor. Hardness = 5.5–6.5 D(meas.) = 2.74–2.79 D(calc.) = 2.80

Optical Properties: Transparent to translucent. *Color:* Light brownish yellow to bright magenta; nearly colorless in thin section. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* Weak. ω = 1.595–1.611 ϵ = 1.590–1.607

Cell Data: *Space Group:* $P6/mcc$. $a = 10.007$ $c = 14.000$ Z = 2

X-ray Powder Pattern: Iwagi Islet, Japan; similar to sogdianite.
4.32 (100), 3.19 (80), 4.06 (55), 2.876 (50b), 3.50 (25), 2.499 (18), 6.98 (13)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	71.38	72.38	CaO	0.00	
TiO_2	0.51	0.00	Li_2O	3.14	[4.5]

Mn_2O_3		0.89	H_2O^+	0.81	
FeO	0.19		H_2O^-	0.12	
			Total	[100.01]	[99.63]

(1) Iwagi Islet, Japan; by XRF and spectrographic methods, recalculated after deduction of admixed pectolite; corresponds to $(K_{0.81}Na_{0.19})_{\Sigma=1.00}[(H_2O)_{0.91}Na_{0.64}]_{\Sigma=1.55}(Fe^{3+}_{1.32}Na_{0.59}Ti_{0.06}Fe^{2+}_{0.03})_{\Sigma=2.00}(Li_{2.12}Al_{0.59}Fe^{3+}_{0.29})_{\Sigma=3.00}Si_{12}O_{30}$. (2) Wessels mine, South Africa; by electron microprobe, Li_2O from stoichiometry; corresponding to $K_{1.00}Na_{1.82}(Al_{1.16}Fe^{3+}_{0.70}Mn^{3+}_{0.12})_{\Sigma=1.98}Li_{3.02}Si_{12}O_{30}$.

Mineral Group: Milarite group.

Occurrence: In an aegirine-bearing syenite stock in biotite granite (Iwagi Islet, Japan); in bedded manganese deposits (near Kuruman, South Africa).

Association: Albite, aegirine, pectolite, titanite, allanite, andradite, zircon, apatite (Iwagi Islet, Japan).

Distribution: On Iwagi Islet, Ehime Prefecture, Japan. In the Wessels and N'Chwaning mines, near Kuruman, Cape Province, South Africa. At Mont Saint-Hilaire, Quebec, Canada. In the Cerchiara mine, near Faggiona, Liguria, Italy. From an undetermined locality in Madhya Pradesh, India. In the Woods mine, 30 km north-northeast of Tamworth, New South Wales, Australia.

Name: For Professor Ken-ichi Sugi (1901–1948), Japanese petrologist, who discovered the mineral.

Type Material: Yamaguchi University, Yamaguchi; Sakurai Museum, Tokyo; National Science Museum, Tokyo, Japan; The Natural History Museum, London, England, 1975,342; National Museum of Natural History, Washington, D.C., USA, 133982.

(1) Westeregeln, Germany. (2) $Mg_3B_2(SO_4)(OH)_9F$.

Occurrence: An uncommon mineral in marine salt deposits.

Association: Carnallite, anhydrite, boracite, celestine, kieserite (Westeregeln, Germany); polyhalite, kaliborite, aphthitalite, carnallite, preobrazhenskite (Inder deposit, Kazakhstan).

Distribution: In Germany, from near Westeregeln, Saxony-Anhalt, and at the Wittmar potash mine, Asse, southwest of Braunschweig, Lower Saxony. At Forden, near Scarborough, Yorkshire, England. From the Inder borate deposit, Kazakhstan.

Name: In allusion to *sulfur* and *boron* in the composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 387–388. (2) Giese, R.F., Jr., and G. Penna (1983) The crystal structure of sulfoborite, $Mg_3SO_4(B(OH)_4)_2(OH)F$. Amer. Mineral., 68, 255–261.

Sulphohalite $Na_6(SO_4)_2FCl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Octahedral, dodecahedral, cubic, or in combinations thereof, to 3 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼3.5 D(meas.) = 2.489–2.500 D(calc.) = 2.505 Slowly soluble in H_2O, with a mildly saline taste.

Optical Properties: Transparent. *Color:* Colorless, pale greenish yellow or gray; colorless in transmitted light. *Luster:* Vitreous to greasy.
Optical Class: Isotropic. $n = 1.455(1)$

Cell Data: *Space Group:* $Fm3m$. a = 10.068(3) Z = 4

X-ray Powder Pattern: Searles Lake, California, USA.

(1) Searles Lake, California, USA. (2) $Na_6(SO_4)_2FCl$.

Occurrence: In evaporite deposits (Searles Lake, California, USA; Otjiwalundo salt pan, Namibia); a volcanic sublimate (Kamchatka Peninsula, Russia).

Association: Hanksite, halite (Searles Lake, California, USA); trona, thénardite, pirssonite (Otjiwalundo salt pan, Namibia).

Distribution: In the USA, from Searles Lake, San Bernardino Co., California. In the Otjiwalundo salt pan, about 400 km west-northwest of Otavi, Namibia. From volcanoes on the Kamchatka Peninsula, Russia.

Name: In allusion to *sulfur* and sodium chloride, (*halite*), in the composition, neglecting fluorine, the presence of which was unnoticed in the original analysis of type material.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 548–549. (2) Pabst, A., D.L. Sawyer, and G. Sulphotsumoite Bi_3Te_2S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. As a rim, to 1 mm, around tsumoite; massive and as aggregates.

Physical Properties: *Cleavage:* Very perfect in one direction. *Tenacity:* Brittle. Hardness = Very soft. VHN = 64–66 (5 g load). D(meas.) = n.d. D(calc.) = 8.13

Optical Properties: Opaque. *Color:* Grayish white. *Luster:* Metallic.

R_1–R_2: (400) — , (420) 51.8–53.8, (440) 51.8–54.1, (460) 52.0–54.7, (480) 52.3–55.3, (500) 52.7–56.0, (520) 53.2–56.7, (540) 53.6–57.3, (560) 53.8–57.8, (580) 53.9–58.0, (600) 53.8–58.0, (620) 53.7–58.0, (640) 53.6–58.0, (660) 53.6–57.9, (680) 53.6–57.9, (700) 53.6–57.8

Cell Data: *Space Group:* $P\overline{3}m1$. $a = 4.316$ $c = 23.43$ $Z = 2$

X-ray Powder Pattern: Burgagylkan deposit or Egerlyakh deposit, Russia. 3.16 (100), 2.32 (60), 2.16 (50), 1.779 (40) 1.367 (40), 4.67 (30), 1.960 (30)

S	3.2	3.4	3.51
Total	100.8	99.7	100.00

(1) Burgagylkan deposit or Egerlyakh deposit, Russia; by electron microprobe, corresponding to $Bi_{3.08}Te_{1.94}(S_{0.92}Se_{0.06})_{\Sigma=0.98}$. (2) Do.; by electron microprobe, corresponding to $Bi_{2.97}Te_{2.06}S_{0.97}$. (3) Bi_3Te_2S.

Occurrence: Of hydrothermal origin, with other bismuth tellurides.

Association: Tsumoite, joséite-B.

Distribution: In Russia, from the Burgagylkan Au–Ag deposit, upper Chelomzha River, Magadan district [TL], and the Egerlyakh deposit, Indigirka River basin, northeastern Sakha [TL]. At the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the Pogo Au–As–Bi–Te deposit, 145 km east of Fairbanks, Alaska, USA.

Name: In allusion to the chemical relation to tsumoite.

Type Material: Mining Institute, St. Petersburg, 1369/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87246.

References: (1) Zav'yalov, E.N. and V.D. Begizov (1982) Sulphotsumoite, Bi_3Te_2S, a new bismuth mineral. Zap. Vses. Mineral. Obshch., 111, 316–320 (in Russian). (2) (1983) Amer. Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals dipyramidal on {111}, thick tabular and disphenoidal, to 20 cm; also massive, reniform, and forming stalactites; as a powder. *Twinning:* On {101}, {011}, {110}, rare.

Physical Properties: *Cleavage:* Imperfect on {001}, {110}, {111}; parting on {111}. *Fracture:* Conchoidal to uneven. *Tenacity:* Rather brittle to somewhat sectile. Hardness = 1.5–2.5 VHN = n.d. D(meas.) = 2.07 D(calc.) = 2.076

Optical Properties: Transparent to translucent. *Color:* Sulfur-yellow to honey-yellow, yellowish brown, greenish, reddish or yellowish gray; may be black from included organic matter. *Streak:* White. *Luster:* Resinous to greasy.

Optical Class: Biaxial positive (+). *Pleochroism:* Distinct. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$. $\alpha = 1.9579$ (Na). $\beta = 2.0377$ (Na). $\gamma = 2.2452$ (Na). 2V(meas.) = 68°58′ 2V(calc.) = n.d.

R_1–R_2: n.d.

Cell Data: *Space Group: Fddd.* $a = 10.468$ $b = 12.870$ $c = 24.49$ Z = 128

X-ray Powder Pattern: Synthetic.
3.90 (100), 3.24 (60), 5.75 (50), 7.76 (40), 3.48 (40), 3.12 (40), 2.12 (40)

Chemistry: Sulfur, sometimes with Se and Te.

Polymorphism & Series: Dimorphous with rosickýite.

Occurrence: A sublimation product at volcanic fumaroles; a product of the activity of biological micro-organisms; as a result of low oxidation potential and highly acidic chemical reactions in mineral deposits; formed by the decomposition of sulfides, especially pyrite, during mine fires; found in sedimentary rocks.

Association: Gypsum, anhydrite, halite, aragonite, calcite, celestine.

Distribution: In the USA, large deposits occur in salt domes, as in Louisiana, especially in the area of Lake Charles, Chalcasieu Parish, and in Texas near Freeport, Brazoria Co. At Sulfur Mountain, in Yellowstone Park, Wyoming. In California, at the Sulfur Bank mercury mine, on Clear Creek, Lake Co. Crystals from quarries at Maybee and Scofield, Monroe Co., Michigan. On Sicily, at Cianciana, Agrigento, and Racalmuto, the source of exceptionally large and fine crystals; from many other places in Italy, notably at Solfatara di Pozzuoli, near Naples; at Perticara, near Rimini, Marche; and at Carrara, Tuscany. Large crystals from Spain, at Conil, near Cádiz, Cádiz Province. In Baja California, Mexico, at San Felipe. Numerous other localities are known, the occurrence often inconspicuous.

Name: From the Latin *sulfur*.

Total	99.27	100.3	100.00

(1) Burra-Burra, South Australia; average of two analyses, remainder $(Fe, Al)_2O_3$ 1.04% and gangue 6.45%; corresponds to $Cu_{3.06}V_{0.97}S_{4.00}$. (2) Mercur, Utah, USA; by electron microprobe, corresponds to $Cu_{3.03}V_{1.05}S_{4.00}$. (3) Cu_3VS_4.

Polymorphism & Series: Forms a series with arsenosulvanite.

Occurrence: In hydrothermal copper deposits which contain vanadium as a primary sulfide.

Association: Chalcopyrite, chalcocite, digenite, covellite, chrysocolla, malachite, azurite, atacamite, vésigniéite, mottramite, gypsum (Burra-Burra, Australia); yushkinite, cadmian sphalerite, fluorite (Pay-Khoy, Russia).

Distribution: From the Edelweiss mine, Burra district, South Australia [TL]. At Tsumeb, Namibia. From Kipushi, Katanga Province, Congo (Shaba Province, Zaire). At the Oyu Tolgoi porphyry Cu–Au deposit, Gobi Desert, Mongolia. In the USA, in the Thorpe Hills, and near Mercur, Tooele Co., Utah; in the Redhouse Barite mine, near Golconda, Humboldt Co., Nevada. On the Rough claims, north of Sifton Pass, British Columbia, Canada. At Pay-Khoy, in the middle stream of the Silova-Yakha River, Russia. From the Ceragiola quarry, near Carrara, Tuscany, Italy. At Bor, Serbia. In the Assarel and Medet deposits, Bulgaria. From Ponte Castiola, Corsica, France. On Koksín Hill, near Mítov, Czech Republic.

Name: For the composition: SULfur and VANadium.

Type Material: Natural History Museum, Paris, France, 101.112, 101.370.

X-ray Powder Pattern: Långban, Sweden.
2.981 (10), 2.737 (8), 3.101 (6), 3.044 (6), 6.10 (3), 3.744 (3), 3.914 (2)

Chemistry:

	(1)	(2)
FeO	0.5	
PbO	93.1	94.30
Cl	3.0	3.00
SO_3	3.5	3.38
$-O = Cl_2$	0.7	0.68
Total	99.4	100.00

(1) Långban, Sweden; by electron microprobe, corresponding to $(Pb_{9.65}Fe_{0.15})_{\Sigma=9.80}(SO_4)O_{7.8}Cl_{1.95}$. (2) $Pb_{10}O_8(SO_4)Cl_2$.

Occurrence: On fracture surfaces in a museum specimen of manganese ore from a metamorphosed Fe–Mn orebody.

Association: Blixite, braunite, hausmannite, manganoan biotite, calcite.

Distribution: From Långban, Värmland, Sweden.

Name: To honor Nils Sundius (1886–1976), Swedish mineralogist, who made numerous contributions to Långban mineralogy.

Type Material: The Natural History Museum, London, England, 1980,580; Royal Ontario Museum, Toronto, Canada, M36619; Harvard University, 117086; National Museum of Natural History, Washington, D.C., USA, 134984.

(1) Suolun, China. (2) Kulaski, Bosnia-Herzegovina. (3) $Ca_2Si_2O_5(OH)_2 \cdot H_2O$.

Occurrence: In veins cutting harzburgites in an ultramafic intrusive (Suolun, China); as a precipitate from an alkaline spring in a fault zone in basalts overlying an ultramafic intrusive (Al Khawd, Oman).

Association: Tobermorite.

Distribution: From Suolun, Inner Mongolia, China. At Kulaski, near Doboj, Bosnia-Herzegovina. From Al Khawd, near Masqat, Oman.

Name: For the original locality, Suolun, China.

Type Material: n.d.

Surinamite $(Mg, Fe^{2+})_3Al_4BeSi_3O_{16}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As small crystals, platy ∥ {010}, to 0.2 mm.

Physical Properties: *Cleavage:* One well-developed ⊥ {010}. Hardness = n.d.
D(meas.) = > 3.3 D(calc.) = 3.58

Optical Properties: Transparent. *Color:* Dark blue, blue-green.
Optical Class: Biaxial (–). *Pleochroism:* Y = violet; ∥ to cleavage = bright blue-green; ⊥ to cleavage = very light greenish brown to colorless. *Orientation:* $Y = b$. *Dispersion:* Very strong.
$\alpha = 1.738$ $\beta = 1.743$ $\gamma = 1.746$ 2V(meas.) = 67°–68°

Cell Data: *Space Group:* $P2/n$. $a = 9.916(1)$ $b = 11.384(1)$ $c = 9.631(1)$
$\beta = 109.30(1)°$ Z = 4

X-ray Powder Pattern: Bakhuis Mountains, Surinam; closely resembles sapphirine.
2.435 (100), 1.99 (100), 1.420 (80), 7.05 (60), 2.91 (60), 1.432 (60), 1.411 (60)

Chemistry:

	(1)	(2)
SiO_2	33.1	32.3
TiO_2	0.05	
Al_2O_3	34.9	34.3
FeO	12.25	10.8
MnO	1.05	0.7
ZnO	0.05	
BeO	n.d.	[4.5]
MgO	16.45	17.3
CaO	0.05	0.0
F	0.05	
Total	[97.95]	[99.9]

(1) Bakhuis Mountains, Surinam; by electron microprobe, original total given as 97.85%; BeO ∼4% inferred from later analyses. (2) Chimwala area, Zambia; BeO assumed, then corresponding to $(Mg_{2.39}Fe_{0.55}Mn_{0.06})_{\Sigma=3.00}(Al_{3.74}Fe_{0.28})_{\Sigma=4.02}Be_{1.00}Si_{2.99}O_{16}$.

Occurrence: In mylonitic mesoperthite gneiss, probably formed during high-pressure granulite facies metamorphism of aluminous rocks (Bakhuis Mountains, Surinam); in sillimanite-rich segregations in pegmatites (Casey Bay, Antarctica); as pseudomorphs after cordierite (Chimwala area, Zambia).

Association: Biotite, kyanite, sillimanite, spinel (Bakhuis Mountains, Surinam); quartz, sillimanite, sapphirine, taaffeite (Casey Bay, Antarctica); cordierite (Chimwala area, Zambia).

Distribution: From the Bakhuis Mountains, Surinam. In the Woolanga Bore area, Strangways Range, Northern Territory, Australia. From Casey Bay, Enderby Land, Antarctica. In the Chimwala area, Eastern Province, Zambia.

Name: For Surinam, the country of first occurrence.

Type Material: Geological & Mining Service, Paramaribo, Surinam, EW 1115.

Surite

$(Pb,Ca)_{2-3}(CO_3)_{1.5-2}(OH,F)_{0.5-1}\cdot (Al,Fe^{3+})_2(Si,Al)_4O_{10}(OH)_2\cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2 (possible). As aggregates of tabular lath-shaped crystals, to ~5 μm.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 2–3 D(meas.) = 4.0 D(calc.) = [4.00]

Optical Properties: Semitransparent. *Color:* White to pale green; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial. $\alpha = 1.693(2)$ β = n.d. $\gamma = 1.738(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1$ (possible). $a = 5.22$ $b = 8.97$ $c = 16.3$ $\beta = 96.1°$ Z = 2

X-ray Powder Pattern: Cruz del Sur mine, Argentina; basal spacing does not expand with ethylene glycol treatment.
4.05 (100), 5.4 (71), 16.2 (68), 3.24 (60), 2.313 (50), 2.700 (35), 4.48 (20)

Chemistry:

	(1)
SiO_2	23.58
Al_2O_3	11.27
Fe_2O_3	0.41
CuO	0.07
PbO	45.32
MgO	1.29
CaO	4.75
Na_2O	0.77
H_2O	3.72
CO_2	9.45
Total	100.63

(1) Cruz del Sur mine, Argentina; corresponds to $(Pb_{1.84}Ca_{0.77}Na_{0.23}Cu_{0.01})_{\Sigma=2.85}(CO_3)_{1.95}(OH)_{0.59}\cdot(Al_{1.58}Mg_{0.29}Fe^{3+}_{0.05})_{\Sigma=1.92}(Si_{3.57}Al_{0.43})_{\Sigma=4.00}O_{10}(OH)_2\cdot 0.58H_2O$.

Occurrence: As fissure fillings in the oxidized zone of a Pb-Zn deposit.

Association: Kaolinite, cerussite, quartz.

Distribution: In the Cruz del Sur mine, 42 km east-southeast of Los Menucos, Rio Negro Province, Argentina.

Name: For the type locality, the Cruz del Sur mine, Argentina.

Type Material: Institute of Earth Science, Waseda University, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 147202.

(1) Val d'Err, Switzerland. (2) Plymouth deposit, Canada. (3) $Mn_2Al_3(SiO_4)(Si_2O_7)(OH)_3$.

Occurrence: As vein fillings in manganese deposits in low-grade metasediments.

Association: Braunite, barite, calcite, quartz.

Distribution: From the Val d'Err, Oberhalbstein, Graubünden, Switzerland. In the Plymouth deposit, near Woodstock, New Brunswick, Canada. From the Palos Verdes Hills, Los Angeles Co., California, USA. In the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy. On Andros Island, Cyclades Islands, Greece.

Name: From the Roman name for Oberhalbstein, *Sursass*, Switzerland.

Type Material: Federal Institute of Technology, Zurich, Switzerland, 194807; The Natural History Museum, London, England.

Susannite $Pb_4(SO_4)(CO_3)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. As equant to acute rhombohedral crystals, modified by a prism and basal pinacoid, to 8 cm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.52

Optical Properties: Translucent. *Color:* Colorless, white, pale green, pale yellow, brown. *Optical Class:* Uniaxial, may be anomalously biaxial. ω = n.d. ϵ = n.d. 2V(meas.) = 0°–3°

Cell Data: *Space Group:* $P3$. $a = 9.0718(7)$ $c = 11.570(1)$ Z = 3

X-ray Powder Pattern: Susanna mine, Scotland; nearly identical to leadhillite, from which it may be distinguished by presence of the (101) diffraction peak at 6.5 (1).
3.571 (vs), 2.937 (s), 2.622 (s), 4.538 (ms), 2.113 (ms), 2.316 (m), 2.066 (m)

Chemistry: (1) Composition established by crystal-structure analysis.

Polymorphism & Series: Trimorphous with leadhillite and macphersonite.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal lead-bearing deposits, formed at temperatures above 80 °C.

Association: Leadhillite, macphersonite, lanarkite, caledonite, cerussite (Leadhills, Scotland).

Distribution: From the Susanna mine, Leadhills, Lanarkshire, Scotland. At Caldbeck Fells, Cumbria, England. In Wales, in Dyfed, from the Esgair Hir mine, Bwlch-y-Esgair, Ceulanymaesmawr; in the Bwlch Glas mine; at the Llechweddhelyg mine, Tir-y-Mynach; from the Hendrefelen mine, Ysbyty Ystwyth; and at the Frongoch mine. In Germany, in the Richelsdorfer Mountains, Hesse; from Virneberg, near Rheinbreitbach, Rhineland-Palatinate; at Ramsbeck, North Rhine-Westphalia, Wilnsdorf. Siegerland; and in the Clara mine, near Oberwolfach, Black Forest. In the USA, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, and at the Ecton mine, Audubon, Montgomery Co., Pennsylvania. From Iporanga, Sao Paulo, Brazil. Very large crystals at Tsumeb, Namibia.

Name: For its first-noted occurrence in the Susanna mine, Leadhills, Scotland.

(1) Franklin, New Jersey, USA; recalculated to 100% after deduction of willemite 4.5%.
(2) N'chwaning II mine, South Africa; by electron microprobe, analysis not given; stated to correspond to $(Mn_{0.95}Mg_{0.05})_{\Sigma=1.00}BO_2(OH)$. (3) $MnBO_2(OH)$.

Polymorphism & Series: Forms a series with szaibélyite.

Occurrence: A rare hydrothermal mineral typically in veinlets in boron-bearing metamorphosed Mn–Fe–Zn deposits.

Association: Pyrochroite, rhodochrosite, wiserite, hausmannite, sonolite, alabandite, seamanite, tephroite, alleghanyite, willemite, leucophoenicite, hauckite.

Distribution: In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at the Chicagon and Bengal mines, Iron Co., Michigan; in the Mountain Lake mine, Big Cottonwood district, Salt Lake Co., Utah. Large crystals from the N'chwaning II and Hotazel mines, near Kuruman, Cape Province, South Africa. At the Gonzen iron–manganese mine, near Sargans, St. Gallen Canton, Switzerland. In the Kurihara mine, Mie Prefecture, the Yaei mine, Shiga Prefecture, the Hokkoji mine, Tochigi Prefecture, the Matsuo mine, Kochi Prefecture, and a number of other localities in Japan.

Name: For Sussex Co., New Jersey, USA, within which the first specimens were collected.

Type Material: Yale University, New Haven, Connecticut, 3.1072; National Museum of Natural History, Washington, D.C., USA, 124356.

Suzukiite $BaV^{4+}Si_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As tiny flakes forming aggregates around other minerals.

Physical Properties: *Cleavage:* {010}, perfect; {100} and {001}, distinct. Hardness = 4–4.5 D(meas.) = 4.0 D(calc.) = 4.03

Optical Properties: Semitransparent. *Color:* Bright green. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = pale green; Y = light yellow-green; Z = bluish green. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$, very strong. *Absorption:* $Z > Y > X$. $\alpha = 1.730(5)$ $\beta = [1.739]$ $\gamma = 1.748(5)$ 2V(meas.) = ∼90°

Cell Data: *Space Group:* $Amam$ or $Ama2$. $a = 7.089(2)$ $b = 15.261(2)$ $c = 5.364(1)$ Z = 2

X-ray Powder Pattern: Mogurazawa mine, Japan.
7.63 (100), 3.818 (60), 3.353 (60), 2.394 (35), 3.276 (25), 2.653 (18), 1.526 (16)

Chemistry:

	(1)
SiO_2	33.59
TiO_2	0.20
VO_2	23.56
SrO	3.21
BaO	38.38
Total	98.94

(1) Mogurazawa mine, Japan; by electron microprobe, corresponding to $(Ba_{0.89}Sr_{0.11})_{\Sigma=1.00}(V^{4+}_{1.01}Ti_{0.01})_{\Sigma=1.02}Si_{1.98}O_7$.

Occurrence: In massive rhodonite-rhodochrosite ores of a bedded manganese deposit, formed in very weakly metamorphosed Triassic cherts.

Association: Quartz, barite, alabandite, nagashimalite, rhodonite, rhodochrosite, barian roscoelite.

Distribution: In the Mogurazawa mine, Gumma Prefecture, Japan.

Name: For Dr. Jun Suzuki (1896–1970), petrologist and mineralogist, Professor at Hokkaido University, Sapporo, Japan.

Type Material: National Science Museum, Tokyo, Japan, M-21385.

(1) Jakobsberg, Sweden. (2) $Ca_5(AsO_4)_3(F,OH)$ with F:OH = 1:1.

Mineral Group: Apatite group.

Occurrence: A rare accessory mineral in calcsilicate skarns.

Association: Manganoan diopside, brandtite, sarkinite, garnet (Harstigen mine, Sweden); hausmannite (Jakobsberg, Sweden); manganoan diopside, tilasite, manganberzeliite, bergslagite, hematite, calcite, barite (Långban, Sweden).

Distribution: In Sweden, found in the Harstigen mine, near Persberg, at Jakobsberg, and at Långban, Värmland; from Kesebol, Dalsland; in the Ultevis district, Jokkmokk, Swedish Lappland. In the Clara Mine, near Oberwolfach, Black Forest, Germany.

Name: Honors Anton Svab (1703–1768), Swedish mining official.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 113494.

(1) Near Hawthorne, Nevada, USA. (2) Champion mine, California, USA; by electron microprobe, H_2O by difference; corresponding to $(Sr_{0.94}Ca_{0.08}Ba_{0.01})_{\Sigma=1.03}Al_{2.96}(PO_4)_{1.12}(SO_4)_{0.91}(OH)_6$. (3) $SrAl_3(PO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: In aluminous medium-grade metamorphic deposits; from bauxite deposits; a product of sulphatic argillic wall-rock alteration in hydrothermal vein and disseminated ore deposits, replacing apatite.

Association: Pyrophyllite, kyanite, andalusite, lazulite, augelite, alunite, kaolinite, quartz.

Distribution: From Hålsjöberg (Horrsjöberg), Värmland, and at the Västanå mine, near Näsum, Skåne, Sweden. In the Novodmitrievsk Pb–Zn deposit, Donets Basin, Ukraine. From Wheal Coates, St. Agnes, Cornwall, England. In France, at Chizeuil, near Chalmoux, Saône-et-Loire. From Andorinha-Cantahede, Portugal. In the Radjou iron deposit, Syria. From the Sallanlatvi carbonatite, Kola Peninsula, and in the Shakhtam deposit, not otherwise located in the Transbaikal, and at a number of less-well-defined localities in Russia. In the USA, in the Dover andalusite mine, about 20 km northeast of Hawthorne, Mineral Co., Nevada; at Ogilby, Imperial Co., and at the Champion mine, White Mountains, Mono Co., California; from Summitville, Rio Grande Co., and several other minor occurrences in Colorado; at Tyrone, Grant Co., New Mexico. In the Rio São Jose, near Paraguaçu, Bahia, Brazil. From La Granja, Peru. At La Escondida, about 150 km south-southeast of Antofagasta, Chile. Additional occurrences have been reported, but require modern confirmation or better location.

Name: Honoring Lars Fredrik Svanberg (1805–1878), Swedish chemist, Professor of Mineralogy, University of Uppsala, Uppsala, Sweden.

(1) Buer syenite pegmatite, Larvik plutonic complex, Oslo Region, Norway; electron microprobe analysis, Fe^{2+}/Fe^{3+} ratio calculated from structure refinement and Mössbauer spectroscopic data, H_2O calculated from structure analysis and OH confirmed by IR, corresponding to $(Ca_{0.95}Na_{0.12}K_{0.14})_{\Sigma=1.21}Fe^{2+}_{5.65}Fe^{3+}_{0.93}Mn_{0.25}Mg_{0.18})_{\Sigma=7.01}(Ti_{1.86}Nb_{0.06}Zr_{0.05}Fe^{3+}_{0.03})_{\Sigma=2}(Si_{7.91}Al_{0.09})_{\Sigma=8}O_{34.61}H_{12.34}F_{0.17}$. (2) $Ca(Fe_6^{2+}Fe^{3+})Ti_2(Si_4O_{12})_2O_2(OH)_5(H_2O)_4$.

Mineral Group: Astrophyllite group.

Occurrence: A late forming mineral in cavities in syenite pegmatite in an alkaline plutonic complex.

Association: Microcline, magnesiokatophorite, aenigmatite, aegirine, albite, calcite, fluorapatite, molybdenite, galena, a hochelagaite-like mineral.

Distribution: Buer syenite pegmatite, Larvik plutonic complex, Vesterøya peninsula, Sandefjord, Oslo Region, Norway.

Name: Honors Svein Arne Berge (b. 1949), the Norwegian amateur mineralogist who observed and collected the first specimens.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Science, Moscow, Russia (3966) and the Natural History Museum, Section of Geology, University of Oslo, Norway (42259 and 42260).

(1) Autana Cave, Venezuela; K_2O by flame photometry, $(NH_4)_2O$ by distillation, and C, H, N, S by gas chromatography, insoluble is quartz; corresponds to $K_{1.07}Al_{7.07}(NO_3)_{3.28}(SO_4)_{0.32}(PO_4)_{0.02}Cl_{2.32}(OH)_{15.96}\cdot 7.77H_2O$. (2) $KAl_7(NO_3)_4Cl_2(OH)_{16}\cdot 8H_2O$.

Occurrence: As crusts and efflorescences precipitated from solutions trickling onto cave roofs and walls.

Association: Quartz.

Distribution: From the Autana Cave, Amazonas Territory, Venezuela. On a rock overhang at an unspecified locality in the northeastern San Joaquin Valley, California, USA.

Name: From the first letters of the Sociedad Venezolana de Espeleología, whose members collected the original material studied.

Type Material: University of Central Venezuela, Caracas, Venezuela; The Natural History Museum, London, England, 1985,348; National Museum of Natural History, Washington, D.C., USA, 162532.

Svyazhinite $(Mg, Mn^{2+})(Al, Fe^{3+})(SO_4)_2F \cdot 14H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As tabular crystals, elongated along $\{0\overline{1}4\}$, with wedgelike terminations, to 0.5 mm, showing dominant forms $\{0\overline{1}4\}$, $\{4\overline{1}0\}$, {110}, {210}, six other forms; forms nodular aggregates, which may be hollow. *Twinning:* On $\{0\overline{1}4\}$.

Physical Properties: *Cleavage:* {010}. Hardness = 2 D(meas.) = 1.67 D(calc.) = 1.69 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Yellow; colorless in transmitted light.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y \wedge c \simeq 40°$; $Z \wedge a \simeq 25°$. $\alpha = 1.423(2)$ $\beta = 1.439(2)$ $\gamma = 1.444(2)$ 2V(meas.) = Small. 2V(calc.) = 57°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 6.217$ $b = 13.306$ $c = 6.255$ $\alpha = 90.09°$ $\beta = 93.50°$ $\gamma = 82.05°$ Z = 1

X-ray Powder Pattern: Ilmen Mountains, Russia.
4.91 (10), 5.68 (7), 4.40 (5), 4.15 (5), 2.824 (5), 2.84 (4.5), 3.39 (4)

Chemistry:

	(1)
SO_3	29.37
Al_2O_3	8.65
Fe_2O_3	1.90
MnO	3.07
MgO	4.18
CaO	0.38
F	3.42
Cl	0.17
H_2O	49.40
$-O = (F, Cl)_2$	1.48
Total	99.06

(1) Ilmen Mountains, Russia; by laser microprobe, corresponds to $(Mg_{0.57}Mn_{0.24}Ca_{0.04})_{\Sigma=0.85}(Al_{0.93}Fe_{0.13})_{\Sigma=1.06}(SO_4)_{2.00}(F_{0.98}Cl_{0.03})_{\Sigma=1.01} \cdot 14.96H_2O$.

Occurrence: A weathering product in fractures cutting pyrite–fluorite-bearing pyroxene–amphibole fenites.

Association: Gypsum, pickeringite, melanterite, copiapite, epsomite, jarosite, pyrite, fluorite.

Distribution: From near Miass, Ilmen Mountains, Southern Ural Mountains, Russia.

Name: Honors Nikolai Vasil'evich Svyazhin (1927–1967), Russian mineralogist, Ural Mining Institute, Sverdlovsk, Russia.

Type Material: Sverdlovsk Mining Institute, Sverdlovsk; Il'menskii Preserve Museum, Miass, iz4524; Mining Institute, St. Petersburg, 1509/1; Vernadsky Geological Museum, Moscow, 53493; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82772.

Swaknoite $(NH_4)_2Ca(PO_3OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystals are needlelike, elongate along [001], with {110}, {100}, {111}, {001}, to 1 mm, in rosettes; as coatings.

Physical Properties: *Tenacity:* Brittle. Hardness = Soft. D(meas.) = 1.91 D(calc.) = 1.89 Soluble on H_2O.

Optical Properties: Semitransparent. *Color:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.506$ $\beta = 1.510$ $\gamma = 1.512$ 2V(meas.) = 65(10)° 2V(calc.) = 70°

Cell Data: *Space Group:* n.d. $a = 20.959$ $b = 7.403$ $c = 6.478$ Z = 4

X-ray Powder Pattern: Arnhem Cave, Namibia.
6.99 (100), 3.705 (89), 10.5 (57), 3.177 (55), 3.651 (39), 4.739 (36), 5.24 (21)

Chemistry:

	(1)	(2)
P_2O_5	48.93	49.61
CaO	21.46	19.60
$(NH_4)_2O$	16.06	18.20
H_2O	12.78	12.59
Total	99.23	100.00

(1) Arnhem Cave, Namibia; by electron microprobe, NH_4 and H_2O by CHN analyzer; corresponds to $(NH_4)_{1.78}Ca_{1.10}(PO_3OH)_{1.99} \cdot 1.05H_2O$. (2) $(NH_4)_2Ca(PO_3OH)_2 \cdot H_2O$.

Polymorphism & Series: Dimorphous with mundrabillaite.

Occurrence: Formed from bat guano and urine by reaction with cave walls.

Association: Mundrabillaite, dittmarite, arcanite, dolomite.

Distribution: Found in Arnhem Cave, 150 km east of Windhoek, Namibia.

Name: From Suid Wes Africa Karst Navorsing Organisasie (SWAKNO), a speleological exploration organization, the members of which noted the species.

Type Material: State Museum, Windhoek, Namibia; Transvaal Museum, Pretoria, South Africa.

References: (1) Martini, J.E.J. (1991) Swaknoite [$Ca(NH_4)_2 \cdot (HPO_4)_2 \cdot H_2O$, orthorhombic]: a new mineral from Arnhem cave, Namibia. Bull. South African Speleological Assoc., 32, 72–74. (2) (1993) Amer. Mineral., 78, 1110 (abs. ref. 1).

Swamboite $U^{6+}H_6(UO_2)_6(SiO_4)_6 \cdot 30H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular crystals elongated ‖ [010], to ~1 mm, showing {001} and $\{\bar{2}01\}$; in nodular fibrous aggregates.

Physical Properties: *Cleavage:* $\{\bar{2}01\}$, good. Hardness = n.d. D(meas.) = 4.0 D(calc.) = 4.064 Radioactive.

Optical Properties: Transparent. *Color:* Deep to very pale yellow; in transmitted light, colorless to yellow.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = light yellow. *Orientation:* $X \simeq a$; $Y \simeq b$; $Z \wedge c = 13°$. *Dispersion:* $r > v$, strong. $\alpha = 1.640$ $\beta = 1.661$ $\gamma = 1.663$ 2V(meas.) = 30° 2V(calc.) = 34°

Cell Data: *Space Group:* $P2_1/a$. $a = 17.64(3)$ $b = 21.00(5)$ $c = 20.12(4)$ $\beta = 103.4(2)°$ Z = 18

X-ray Powder Pattern: Swambo, Congo.
8.67 (100), 4.75 (80), 4.32 (80), 3.51 (60), 2.979 (60b), 5.85 (50), 4.49 (50)

Chemistry:

	(1)	(2)
SiO_2	12.73	13.42
UO_3	67.43	74.51
H_2O^+	19.93	12.07
Total	100.09	100.00

(1) Swambo, Congo; by electron microprobe, average of six analyses, H_2O by TGA.
(2) $UH_6(UO_2)_6(SiO_4)_6 \cdot 30H_2O$.

Occurrence: A secondary mineral formed during the weathering of uranium deposits.

Association: Soddyite, gypsum, curite (Swambo, Congo).

Distribution: From the uranium deposit of Swambo, about 36 km west of Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). In the USA, at the Jomac mine, White Canyon district, San Juan Co., Utah.

Name: For the occurrence at Swambo, Congo (Zaire).

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM13690.

References: (1) Deliens, M. and P. Piret (1981) La swamboïte, nouveau silicate d'uranium hydraté du Shaba, Zaïre. Can. Mineral., 19, 553–557 (in French with English abs.). (2) (1983) Amer. Mineral., 68, 1250 (abs. ref. 1).

Swartzite $CaMg(UO_2)(CO_3)_3 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, to about 0.3 mm, prismatic along [001], in efflorescent crusts.

Physical Properties: Hardness = n.d. D(meas.) = 2.3 D(calc.) = 2.32 Radioactive; soluble in H_2O; fluoresces bright yellow-green under SW UV.

Optical Properties: Transparent. *Color:* Green; turns dull pale yellow on dehydration. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = yellow. *Dispersion:* $r > v$. $\alpha = 1.465$ $\beta = 1.51$ $\gamma = 1.540$ 2V(meas.) = n.d. 2V(calc.) = 40°

Cell Data: *Space Group:* $P2_1/m$ (synthetic). $a = 11.080(2)$ $b = 14.634(2)$ $c = 6.439(1)$ $\beta = 99.43(1)°$ Z = 2

X-ray Powder Pattern: Hillside mine, Arizona, USA.
8.76 (10), 5.50 (10), 7.31 (9), 4.82 (8), 2.91 (8), 2.06 (8), 1.707 (8)

Chemistry:

	(1)	(2)
UO_3	38.85	39.15
CO_2	17.92	18.07
MgO	5.47	5.52
CaO	7.32	7.67
Na_2O	0.26	
K_2O	0.49	
H_2O	29.69	29.59
Total	[100.00]	100.00

(1) Hillside mine, Arizona, USA; recalculated to 100% after deduction of gypsum 4.38% and insoluble 0.30%. (2) $CaMg(UO_2)(CO_3)_3 \cdot 12H_2O$.

Occurrence: A secondary mineral in oxidized portions of a polymetallic sulfide deposit, the source of uranium undetermined.

Association: Gypsum, schröckingerite, andersonite, bayleyite (Hillside mine, Arizona, USA).

Distribution: In the USA, from the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., Arizona; in Colorado, in the Rifle mine, Garfield Co., and the Schwartzwalder mine, Jefferson Co.; at the Coral prospect, Elk Ridge, San Juan Co., Utah.

Name: Honors Charles K. Swartz (1861–1949), Professor of Geology and Mineralogy, Johns Hopkins University, Baltimore, Maryland, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106107, 106108.

Swedenborgite $NaBe_4SbO_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6mm$. Short prismatic crystals, $\{10\bar{1}0\}$, $\{10\bar{1}1\}$, and {0001} prominent, to 8 mm, may be morphologically hemihedral. *Twinning:* Observed.

Physical Properties: *Cleavage:* {0001}, distinct. *Fracture:* Subconchoidal. Hardness = ∼8 D(meas.) = 4.285 D(calc.) = 4.28

Optical Properties: Transparent. *Color:* Colorless, pale wine-yellow to honey-yellow; colorless in transmitted light.
Optical Class: Uniaxial (–). *Dispersion:* Strong. $\omega = 1.7724$ $\epsilon = 1.7700$

Cell Data: *Space Group:* $P6_3mc$. $a = 5.442$ $c = 8.848$ $Z = 2$

X-ray Powder Pattern: Långban, Sweden.
4.20 (10), 2.72 (9), 2.51 (9), 2.32 (9), 3.22 (8), 4.70 (7), 4.40 (7)

Chemistry:

	(1)	(2)
Sb_2O_5	54.17	55.25
BeO	34.72	34.17
MgO	0.52	
CaO	0.94	
Na_2O	8.50	10.58
K_2O	0.21	
H_2O	0.39	
P_2O_5	0.23	
Total	99.68	100.00

(1) Långban, Sweden; average of three partial analyses. (2) $NaBe_4SbO_7$.

Occurrence: In skarn from a metamorphosed Fe–Mn orebody.

Association: Bromellite, richterite, manganoan biotite, calcite, hematite.

Distribution: From Långban, Värmland, Sweden.

Name: Honors Emanuel Swedenborg (1688–1772), Swedish philosopher and theologian.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; The Natural History Museum, London, England, 1924,560.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 1027–1029. (2) Pauling, L., H.P. Klug, and A.N. Sweetite $Zn(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 422. Dipyramidal crystals, to 1 mm, showing possible {112}; rare {001}, may be tabular.

Physical Properties: Hardness = n.d. D(meas.) = ∼3.33 D(calc.) = 3.41

Optical Properties: Translucent to transparent. *Color:* Colorless to whitish.
Optical Class: Uniaxial (–). $\omega = 1.635$ $\epsilon = 1.628$

Cell Data: *Space Group:* $P4_12_12$ or $P4_32_12$ (probable). $a = 8.222(5)$ $c = 14.34(1)$
Z = 20

X-ray Powder Pattern: Near Ashover, England.
2.922 (100), 3.572 (60), 4.53 (37), 1.764 (24), 2.708 (18), 2.257 (17), 1.560 (14)

Chemistry:

	(1)	(2)	(3)
ZnO	84.3	87.33	81.88
PbO		0.35	
CdO		0.11	
CaO		0.29	
H_2O	17.0	[17.0]	18.12
Total	101.3	[105.08]	100.00

(1) Near Ashover, England; by AA, H_2O by CHN analyzer; high total thought due to ZnO in the core of the analyzed crystal. (2) Do.; by electron microprobe, H_2O from (1), high total thought due to dehydration in the electron beam; corresponds to $Zn_{1.26}Ca_{0.01}[O_{0.55}(OH)_{1.45}]_{\Sigma=2.00}$. (3) $Zn(OH)_2$.

Polymorphism & Series: Trimorphous with ashoverite and wülfingite.

Occurrence: In an oxidized vein in limestone.

Association: Galena, ashoverite, wülfingite, anglesite, cerussite, hydrocerussite, litharge, fluorite, palygorskite, calcite.

Distribution: From a limestone quarry 200–300 m northwest of Milltown, near Ashover, Derbyshire, England.

Name: To honor Jessie May Sweet (1901–1979), Curator of the mineral collections of the British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 1982,4.

References: (1) Clark, A.M., E.E. Fejer, A.G. Couper, and G.C. Jones (1984) Sweetite, a new mineral from Derbyshire. Mineral. Mag., 48, 267–269. (2) (1985) Amer. Mineral., 70, 438 (abs. ref. 1). Swinefordite $\mathbf{Li_{0.5}(Al,Li,Mg)_2(Si,Al)_4O_{10}(OH,F)_2 \cdot nH_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Resembles petroleum jelly when hydrated; on dehydration, becomes fibrous, in thin ribbons, folded and twisted, and in curled sheets.

Physical Properties: *Tenacity:* Tough; greasy when hydrated. Hardness = ∼1 D(meas.) = n.d. D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* Greenish yellow to light olive when hydrated; light greenish gray to grayish olive after dehydration. *Streak:* White. *Luster:* Glistening when hydrated; dull when partially dehydrated.
Optical Class: Biaxial (–). *Pleochroism:* Y = almost colorless; Z = pale yellow-brown. *Orientation:* $X \simeq c$; $Y = a$. α = [1.492] β = 1.524(2) γ = 1.526(2) 2V(meas.) = 29°–45° 2V(calc.) = 37°

Cell Data: *Space Group:* $C2/m$. a = 5.2 b = 9.0 c = 13.0 β = n.d. Z = n.d.

X-ray Powder Pattern: Kings Mountain, North Carolina, USA; partly hydrated. (ICDD 29-809).
12.96 (vvs), 4.53 (vs), 1.508 (vs), 3.09 (s), 2.62 (m), 1.713 (m), 1.304 (m)

Chemistry:

	(1)
SiO_2	54.1
Al_2O_3	13.1
Fe_2O_3	1.9
MgO	6.8
CaO	0.8
Li_2O	4.7
Na_2O	0.63
H_2O	15.6
F	1.49
$-O = F_2$	[0.63]
Total	[98.49]

(1) Kings Mountain, North Carolina, USA; original total given as 99.12%, corresponding to $(Li_{0.38}Na_{0.08}Ca_{0.06}Mg_{0.02})_{\Sigma=0.54}(Li_{0.93}Al_{0.80}Mg_{0.68}Fe^{3+}_{0.10})_{\Sigma=2.51}(Si_{3.74}Al_{0.26})_{\Sigma=4.00}O_{10}[(OH)_{1.68}F_{0.32}]_{\Sigma=2.00} \cdot 2H_2O$.

Mineral Group: Smectite group.

Occurrence: Deposited from ground water, as coatings on the walls of fracture zones and fissures, or replacing spodumene, in a Li-Sn-rich pegmatite.

Association: Spodumene, switzerite, vivianite, quartz, albite, apatite.

Distribution: From the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA.

Name: For Dr. Ada Swineford (1917–1993), clay mineralogist and Professor of Geology at Western Washington State College, Bellingham, Washington, USA.

Type Material: National School of Mines, Paris, France; Department of Geology, East Carolina University, Greenville, North Carolina; University of Delaware, Newark, Delaware; Harvard University, Cambridge, Massachusetts, 125477; National Museum of Natural History, Washington, D.C., USA, 126826, 131848, 144722.

Switzerite $\mathbf{(Mn^{2+},Fe^{2+})_3(PO_4)_2 \cdot 7H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Thin crystals, tabular on {001}, or bladed by elongation along [100], to 5 mm.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle, somewhat flexible. Hardness = Soft. D(meas.) = 2.535 D(calc.) = 2.562 Rapidly and irreversibly topotactically transforms in air to metaswitzerite.

Optical Properties: Transparent to translucent. *Color:* Pink, becoming yellowish or brownish on dehydration. *Luster:* Vitreous, pearly on {001}.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \perp \{001\}$. $\alpha = 1.560(1)$ $\beta = 1.574(1)$ $\gamma = 1.580(1)$ 2V(meas.) = 70° 2V(calc.) = 66°

Cell Data: *Space Group:* $P2_1/a$. $a = 8.528(4)$ $b = 13.166(5)$ $c = 11.812(4)$ $\beta = 110.05(3)°$ Z = 4

X-ray Powder Pattern: Foote mine, North Carolina, USA.
11.12 (100), 3.37 (90), 8.47 (50), 2.137 (50), 2.353 (40), 2.94 (30), 1.612 (30)

Chemistry:

	(1)
P_2O_5	32.94
SiO_2	0.06
Al_2O_3	0.27
FeO	3.60
MnO	46.05
MgO	0.15
CaO	0.20
H_2O	n.d.
Total	83.27

(1) Foote mine, North Carolina, USA; by electron microprobe, total Fe as FeO, total Mn as MnO; due to loss of H_2O in electron beam, all elements are high, H_2O in formula from crystal-structure analysis; corresponds to $(Mn_{2.79}Fe_{0.21})_{\Sigma=3.00}(PO_4)_2 \cdot 7H_2O$.

Occurrence: In complex zoned granite pegmatites.

Association: Metaswitzerite, vivianite (Foote mine, North Carolina, USA) huréaulite (Tip Top mine, South Dakota, USA); triplite, bermanite, phosphosiderite, leucophosphite, strengite, phosphosiderite, paulkerrite (7U7 Ranch, Arizona, USA); scholzite, parahopeite, phosphophyllite rockbridgeite; (Reaphook Hill, Australia).

Distribution: In the USA, from the Foote mine, Kings Mountain, Cleveland Co., North Carolina; at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the 7U7 Ranch, 40 km west of Hillside, Bagdad district, Yavapai Co., Arizona; in the Emmons quarry, Greenwood, and the Bell Pit, Newry, Oxford Co., Maine. From the Tanco pegmatite, Bernic Lake, Manitoba, Canada. At Hagendorf, Bavaria, Germany. In the Mangualde pegmatite, near Mesquitela, Portugal. From near Eräjärvi, Finland. At Reaphook Hill, near Blinman, Flinders Ranges, and in the Iron Monarch quarry, Iron Knob, South Australia.

Name: To honor Dr. George Shirly Switzer (1915–), Chairman Emeritus, Department of Mineral Sciences, United States National Museum, Smithsonian Institution, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120871.

Sylvanite $(Au, Ag)_2Te_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 1 cm, short prismatic [001] or [010], thick tabular on {100} and {010}; may be skeletal, bladed, imperfectly columnar, granular. *Twinning:* Common on {100} as contact, lamellar, or penetration twins, resembling cuneiform characters.

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 1.5–2 VHN = 154–172 (100 g load). D(meas.) = 8.16 D(calc.) = 8.161

Optical Properties: Opaque. *Color:* Steel-gray to silver-white inclining to yellow; in polished section, creamy white. *Streak:* Steel-gray to silver-white. *Luster:* Metallic, brilliant. *Pleochroism:* Strong; cream-white to leather-brown. *Anisotropism:* Very strong; in grayish brown, grayish white, and yellowish and bluish tints.

R_1–R_2: (400) 43.2–53.6, (420) 45.4–55.9, (440) 47.7–57.9, (460) 49.7–59.6, (480) 50.9–60.8, (500) 51.8–61.8, (520) 52.3–62.6, (540) 52.5–62.9, (560) 52.5–63.0, (580) 52.5–63.0, (600) 52.6–62.9, (620) 52.8–62.7, (640) 53.0–62.4, (660) 53.3–62.2, (680) 53.6–62.2, (700) 54.1–62.4

Cell Data: *Space Group:* $P2/c$. $a = 8.95(1)$ $b = 4.478(5)$ $c = 14.62(2)$ $\beta = 145.35(5)^\circ$ Z = 2

X-ray Powder Pattern: Fiji Islands.
3.05 (100), 2.15 (50), 2.25 (30), 1.989 (30), 2.98 (20), 1.797 (20), 1.523 (20)

Chemistry:

	(1)	(2)	(3)
Au	25.45	29.85	24.19
Ag	13.94	9.18	13.22
Cu		0.15	

	(1)	(2)	(3)
Ni		0.10	
Te	60.61	60.45	62.59
Total	100.00	99.73	100.00

(1) Cripple Creek, Colorado, USA. (2) Kalgoorlie, Australia. (3) $(Au, Ag)_2Te_4$ with Au:Ag = 1:1.

Occurrence: Most commonly in low-temperature hydrothermal veins; also in medium- and high-temperature deposits, typically among the last minerals formed.

Association: Gold, calaverite, krennerite, altaite, hessite, petzite, acanthite, pyrite, galena, sphalerite, chalcopyrite, quartz, "chalcedony", fluorite.

Distribution: A mineral present in minor amounts in many Au–Ag deposits, but only rarely in rich specimens or of economic importance. In Romania, from Baia-de-Arieş (Offenbánya) [TL], Săcărîmb (Nagyág) [TL], and Facebánya. At Glava, Värmland, Sweden. In the Bereznyakov gold deposit and the Yaman-Kasy Cu–Zn–pyrite deposits, Southern Ural Mountains, Russia. In Canada, from the Dome mine, Porcupine, Ontario. In the USA, in California, at the Melones and Stanislaus mines, Carson Hill district, Calaveras Co.; in Colorado, in abundance at Cripple Creek, Teller Co., and important in the Magnolia, Gold Hill, and Sunshine districts, Boulder Co., and elsewhere; in the Cornucopia district, Baker Co., Oregon; from the Mayflower mine, Tobacco Root Mountains, Madison Co., and the at Gies mine, Judith Mountains, Fergus Co., Montana. From the San Francisco mine, 145 km north of Hermosillo, Sonora, Mexico. At the El Indio mine, east of La Serena, Coquimbo, Chile. From Kalgoorlie, Western Australia. In the Bulawan deposit, Negros Occidental, Phillipines. At the Arakara goldfields, Guyana. From the Emperor mine, Vatukoulu, and in the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands.

Name: From TranSYLVANia, Romania where it was first found, and in allusion to the element tellurium (*sylvanium*, a name early proposed for the element), which the mineral contains.

Sylvite **KCl**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As cubes, cubo-octahedra, and octahedra, to 15 cm; may be columnar, in crusts, coarse granular to compact, massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle, ductile under low strain. Hardness = 2 D(meas.) = 1.993(5) D(calc.) = 1.987 Soluble in H_2O; salty taste, with bitter overtones.

Optical Properties: Transparent. *Color:* Colorless to white, pale gray, pale blue; yellowish red to red when included with hematite; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic; anomalously weakly anisotropic when strained. $n = 1.4903$

Cell Data: *Space Group:* $Fm3m$ (synthetic). $a = 6.2931$ $Z = 4$

X-ray Powder Pattern: Synthetic.
3.146 (100), 2.224 (59), 1.816 (23), 1.407 (20), 1.284 (13), 1.573 (8), 1.0490 (6)

Chemistry: Typically nearly pure KCl.

Occurrence: In sedimentary basins, forming thick bedded deposits with halite; as a sublimate in volcanic fumaroles; in nitrate beds and cave deposits; a product of burning coal; may be included in other minerals as a product of intermediate-grade metamorphism.

Association: Halite, kieserite, kainite, carnallite, polyhalite, gypsum, anhydrite.

Distribution: On Vesuvius, Campania, Italy. At Hallein, Salzburg, Austria. In Germany, from Westeregeln and Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt, and at Bernburg, Lower Saxony. At Aislaby, near Whitby, Yorkshire, England. From Kalusz, Ukraine. In the Verkhnekamsk sylvite deposit, Solikamsk-Berezniki region, Ural Mountains, Russia. In the USA, in the Permian salt basin of southeastern New Mexico, in the Carlsbad potash district, Eddy Co. with large crystals in the Potash Corporation of America mine, and adjacent parts of Texas. From the Smoky Hills, Peace River area, Alberta, Canada. Other minor localities are known.

Name: From the alchemical *Sal digestivus Sylvii* or *Salt of Sylvius*, the digestive salt of François Sylvius de le Boë (1614–1672), Dutch physician and chemist of Leiden, Netherlands.

Symesite $Pb_{10}(SO_4)O_7Cl_4(H_2O)$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As blocky crystal 'blebs', to 2 mm; as crystalline aggregates to 1 cm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: Uneven.
Tenacity: n.d. Hardness = 4 D(meas.) = 7.3(2) D(calc.) = 7.23

Optical Properties: Translucent. *Color*: Pink; gray in reflected light. *Streak*: White.
Luster: Vitreous.
Orientation: n.d. *Anistropism:* Weak.
Optical Class: n.d. n = > 2
R_1-R_2: (400) 17.20-17.95, (420) 16.50-17.40, (440) 15.90-16.90, (460) 15.50-16.50, (470) 15.20-16.30, (480) 15.10-16.10, (500) 14.90-15.80, (520) 14.50-15.50, (540) 14.30-15.30, (546) 14.20-15.30, (560) 14.10-15.20, (580) 14.00-15.00, (589) 13.90-15.00, (600) 13.90-14.90, (620) 13.80-14.80, (640) 13.80-14.80, (650) 13.70-14.70, (660) 13.70-14.70, (680) 13.60-14.65, (700) 13.60-14.60

Cell Data: *Space Group*: $B\bar{1}$. a = 19.727(2) b = 8.796(1) c = 13.631(2) α = 82.21(1)° β= 78.08(1)° γ= 100.04(1)° Z = 4

X-ray Powder Pattern: Merehead Quarry, Somerset, England.
2.911 (100), 3.286 (90), 2.955 (90), 2.793 (80), 6.573 (40), 3.768 (40), 3.805 (30)

Chemistry:

	(1)	(2)
PbO	90.66	91.48
SO_3	3.15	3.28
Cl	5.83	5.81
H_2O	-	0.74
-O=Cl	1.32	1.31
Total	98.32	100.00

(1) Merehead Quarry, Somerset, England; average of 17 electron microprobe analyses, H_2O from stoichiometry, corresponding to $(Na_{0.99}Sr_{0.03}K_{0.01})_{\Sigma=1.03}Ca_{2.01}Be_{2.99}Si_{3.98}O_{13}(OH)\cdot 2H_2O$.

Occurrence: A secondary low-temperature mineral formed from metalliferous brines moving along fractures through Mn and Fe-oxide mineral deposits in limestone.

Association: Cerussite, hydrocerussite, paralaurionite, blixite, chloroxiphite, pyrolusite, coronadite, hematite, parkinsonite, mereheadite.

Distribution: Merehead Quarry, near Cranmore, Somerset, England.

Name: Honors Robert Symes (1937–) of the Department of Mineralogy, the Natural History Museum (London, England), in recognition of his many contributions to the mineralogy of the ore deposits of South-West England.

Type Material: Natural History Museum, London, England (Specimen BM1998,37).

Symplesite $Fe_3^{2+}(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals elongated along [001], may be flattened $\{1\overline{1}0\}$, to 2 cm; in fibrous, radially spherical aggregates. *Twinning:* On $\{1\overline{1}0\}$; translation gliding observed.

Physical Properties: *Cleavage:* On {110}, perfect. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 2.96–3.01 D(calc.) = 3.02

Optical Properties: Transparent, becoming translucent on oxidation. *Color:* Leek-green, pale green; dark green, greenish black to dark Indigo-blue on oxidation. *Streak:* Pale bluish. *Luster:* Vitreous to oily, pearly on cleavages.
Optical Class: Biaxial (–). *Pleochroism:* X = deep blue; Y = nearly colorless; Z = yellowish. *Orientation:* $X \perp \{1\overline{1}0\}$; $Z \wedge c = 31.5°$, increasing to 50° on oxidation. *Dispersion:* $r > v$, strong. $\alpha = 1.635(5)$ $\beta = 1.668(3)$ $\gamma = 1.702(3)$ 2V(meas.) = 86.5°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.86$–7.86 $b = 9.35$–9.41 $c = 4.72$–4.75 $\alpha = 93.7°-99.9°$ $\beta = 97.4°-98.1°$ $\gamma = 106°-106.5°$ Z = 1

X-ray Powder Pattern: Baia Sprie, Romania; very similar to metaköttigite.
6.785 (100), 7.499 (16), 8.971 (15), 4.007 (8), 3.743 (8), 5.027 (7), 4.069 (7)

Chemistry:

	(1)	(2)
As_2O_5	34.73	38.99
FeO	37.84	36.56
H_2O	[27.43]	24.45
Total	[100.00]	100.00

(1) Hüttenberg, Austria; recalculated after deduction of quartz 7.7%, H_2O by difference.
(2) $Fe_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Dimorphous with parasymplesite.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-rich hydrothermal mineral deposits.

Association: Pharmacosiderite, scorodite, erythrite, roselite, annabergite, parasymplesite, "limonite".

Distribution: In Germany, from the Tännig, near Lobenstein, Thuringia, and at Neustädtel-Schneeberg, Saxony. From Baia Sprie (Felsőbánya), Romania. At Pisek, Czech Republic. From Hüttenberg and Lölling, Carinthia, Austria. From Laurium, Greece, in slag. In Italy, at Pizzo Cipolla, near Mandanici, Sicily. In the Wanthwaite mine, St. John's in the Vale, Cumbria, England. At Bou Azzer, Morocco. Large crystals from the Ojuela mine, Mapimí, Durango, Mexico. In the USA, in the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; at the Getchell mine, about 32 km northeast of Golconda, Humboldt Co., Nevada; in the Custer Mountain quarry, Custer, Custer Co., North Dakota. In Australia, from the O'Donoghue Castle copper mine, 10 km west of Wooltana, Flinders Ranges, South Australia, and at the Magnet mine, Dundas, Tasmania.

Name: From the Greek for *with* and *to be associated*, in allusion to the other rare arsenates accompanying it in the original occurrence.

Type Material: Mining Academy, Freiberg, Germany, 21034.

Synadelphite $(Mn^{2+}, Mg, Ca, Pb)_9(As^{3+}O_3)(As^{5+}O_4)_2(OH)_9 \cdot 2H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are short tabular to prismatic [001], with {110} striated ‖ [001], {011}, {121}, {010}, to 3 mm; in reniform crusts. *Twinning:* Observed optically.

Physical Properties: *Cleavage:* On {010}, imperfect. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.57–3.79 D(calc.) = 3.57 Oxidizes readily on exposure to air.

Optical Properties: Transparent if colorless, grading from translucent to opaque. *Color:* Colorless internally, externally garnet-red, red-brown, dark brown, nearly black; in transmitted light, colorless to pink, pale brown, may be sectored as well as zoned. *Luster:* Vitreous, adamantine to submetallic. *Optical Class:* Biaxial (+). *Pleochroism:* X = colorless to light brown; Y = colorless to brown; Z = light brown to dark red-brown. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$. $\alpha = 1.750$–1.87 $\beta = 1.751$–1.88 $\gamma = 1.761$–1.93 2V(meas.) = 37°–40° 2V(calc.) = 35°15′–67°37′

Cell Data: *Space Group: Pnma.* $a = 10.754(11)$ $b = 18.865(17)$ $c = 9.884(14)$ Z = 4

X-ray Powder Pattern: Nordmark, Sweden.
8.72 (10), 2.636 (9), 9.36 (7), 2.091 (7), 1.5996 (7), 5.27 (5), 3.080 (5)

Chemistry:

	(1)	(2)		(1)	(2)
As_2O_5	32.43	21.20	CaO	0.28	
As_2O_3	n.d.	9.12	H_2O	11.33	10.80
FeO	0.17		insol.	0.19	
MnO	56.43	58.88	Total	100.83	100.00

(1) Långban, Sweden. (2) $Mn_9(As^{3+}O_3)(As^{5+}O_4)_2(OH)_9 \cdot 2H_2O$.

Occurrence: A rare low-temperature hydrothermal mineral cutting hausmannite ores in dolomitic marble (Moss mine, Sweden).

Association: Pyrochroite, manganite, jacobsite, allactite, calcite (Moss mine, Sweden); manganon biotite, allactite, hausmannite (Långban, Sweden); kraisslite, allactite (Sterling Hill, New Jersey, USA).

Distribution: Found in the Moss mine, Nordmark, and at Långban, Värmland, Sweden. From Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: From the Greek for *with* and *brother*, as it is commonly associated with several other chemically similar minerals.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 780–782, 919–920 [hemafibrite = synadelphite]. (2) Moore, P.B. Synchysite-(Ce) $Ca(Ce,La)(CO_3)_2F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crystals are commonly acute pyramidal [using pseudohexagonal indices] $\{10\bar{1}0\}$ to tabular and striated $\parallel \{0001\}$, but oscillatory and sceptered due to syntactic intergrowths $\parallel \{0001\}$ with bastnäsite-(Ce), parisite-(Ce), röntgenite-(Ce), cordylite, to 6 cm. *Twinning:* On $\{0001\}$, may be lamellar.

Physical Properties: *Fracture:* Subconchoidal to splintery. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.90 D(calc.) = 3.88

Optical Properties: Translucent. *Color:* Wax-yellow, brown, grayish yellow; colorless to pale yellow in transmitted light. *Luster:* Vitreous to subadamantine, may be greasy. *Optical Class:* Uniaxial (+). *Pleochroism:* Weak. *Absorption:* $O < E$. $\omega = 1.674$ $\epsilon = 1.770$

Cell Data: *Space Group:* $C2/c$. $a = 12.329(2)$ $b = 7.110(1)$ $c = 18.741(2)$ $\beta = 102.68(1)^\circ$ Z = 12

X-ray Powder Pattern: Predazzo, Italy.
3.55 (100), 2.80 (100), 9.1 (60), 4.53 (50), 2.06 (50), 1.934 (50), 3.32 (40)

Chemistry:

	(1)		(1)		(1)
CO_2	[27.95]	Ce_2O_3	22.34	Gd_2O_3	1.27
SiO_2	0.14	Pr_2O_3	2.27	CaO	18.14

La_2O_3	9.96	Sm_2O_3	1.79	$-O = F_2$	2.41
				Total	[100.36]

(1) Trimouns talc deposit, France; by electron microprobe, average of ten points, CO_2 and F calculated from stoichiometry; corresponds to $Ca_{1.02}(Ce_{0.43}La_{0.24}Nd_{0.19}Pr_{0.05}Sm_{0.03}Gd_{0.02}Y_{0.01})_{\Sigma=0.97}(CO_3)_2F$. (2) Mont Saint-Hilaire, Canada; analysis not given, stated to correspond to $Ca_{0.94}(Ce_{0.62}La_{0.32}Y_{0.02}Th_{0.01}Eu_{0.01})_{\Sigma=0.98}(CO_3)_2F_{0.64}$.

Occurrence: An uncommon hydrothermal accessory mineral in granites and alkalic syenites.

Association: Astrophyllite, catapleiite, neptunite, epididymite, elpidite, cordylite, fluorite, rhodochrosite, polylithionite, aegirine, microcline, albite (Narssârssuk, Greenland); ewaldite, belovite-(Ce), fluorite, nenadkevichite, ancylite-(Ce), kukharenkoite-(Ce), mckelveyite-(Y), burbankite, calcite, barite, orthoclase (Khibiny massif, Russia).

Distribution: In Greenland, very large crystals from Narssârssuk, and in the Ilímaussaq intrusion. At Holmestrand, Norway. In the Valle de Arán, Lerida Province, Spain. In Italy, from Predazzo, Trentino-Alto Adige, and on the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont. In Switzerland, from Piz Blas, Val Nalps, and at La Bianca, Val Casatscha, Grisons; on the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais; with many other minor occurrences. In the Kaiserer and Lohningbruch quarries, Rauris Valley, Salzburg, Austria. In the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. In Russia, rock-forming in the Khibiny massif, Kola Peninsula. From the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire). In Canada, from Mont Saint-Hilaire and at Saint-Amable, Quebec. From Mt. Weld, 34 km south of Laverton, Western Australia. Increasingly recognized from additional localities.

Name: From the Greek for *confounding*, as originally thought to be parisite, and dominant *cerium*.

Type Material: University of Copenhagen, Copenhagen, Denmark.

(1) Holičky deposit, Czech Republic; by electron microprobe, CO_3 by difference, determined present by IR; corresponds to $(Ca_{1.03}U_{0.01})_{\Sigma=1.04}(Nd_{0.33}Y_{0.25}Gd_{0.14}Sm_{0.13}Eu_{0.04}Dy_{0.04}Pr_{0.03}La_{0.02}Ce_{0.01}Ho_{0.01})_{\Sigma=1.00}(CO_3)_{1.94}F_{1.13}$. (2) Grebnik deposit, Yugoslavia; by electron microprobe, average of three analyses, CO_2 calculated by difference; corresponds to $Ca_{1.10}(Nd_{0.34}La_{0.27}Y_{0.12}Pr_{0.10}Sm_{0.08}Gd_{0.05}Ce_{0.04}Dy_{0.02})_{\Sigma=1.02}(CO_3)_{1.90}F_{0.90}$.

Occurrence: An authigenic minerals in cement in sandstone (Holičky deposit, Czech Republic); filling cavities in the base of a bauxite deposit in contact with limestone (Grebnik deposit, Yugoslavia).

Association: Florencite-(La), sphalerite, manganoan siderite, pyrite, kaolinite, quartz (Holičky deposit, Czech Republic).

Distribution: From the Holičky deposit, near Česká Lípa, Czech Republic. In the Grebnik bauxite deposit, Serbia, Yugoslavia. At the Pyörönmaa pegmatite, Kangasala, Finland.

Name: For its relation to *synchysite*-(Ce) and dominant *neodymium*.

Type Material: Charles University, Prague, Czech Republic, 21242, National Museum of Natural History, Washington, D.C., USA, 161213.

Synchysite-(Y) $Ca(Y,Ce)(CO_3)_2F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crystals exhibit [using pseudohexagonal indices] $\{11\bar{2}1\}$ and $\{0001\}$, with smaller $\{10\bar{1}0\}$, $\{02\bar{2}1\}$, $\{33\bar{6}5\}$, $\{5.5.\bar{10}.3\}$, to 0.2 mm; typically in very fine-grained aggregates.

Physical Properties: Hardness = ∼4.5 D(meas.) = 3.9 D(calc.) = [3.88]

Optical Properties: Transparent to translucent. *Color:* Red-brown, pale yellow, pale pink, colorless. *Luster:* Greasy.
Optical Class: Uniaxial (+). $\omega = 1.643$–1.645 $\epsilon = 1.73$–1.74

Cell Data: *Space Group:* $C2/c$. $a = 12.039(3)$ $b = 6.950(1)$ $c = 18.436(6)$ $\beta = 102.45(2)^\circ$ Z = 12

X-ray Powder Pattern: Cotopaxi, Colorado, USA.
1.89 (10), 2.00 (9), 1.83 (9), 1.37 (9), 2.75 (8), 3.47 (7), 1.26 (7)

(1) Near Cotopaxi, Colorado, USA; RE_2O_3 by difference, after deduction of kainosite 10.8% and Fe_2O_3 1%, corresponds to $Ca_{1.0}(Y_{0.6}RE_{0.4})_{\Sigma=1.0}(CO_3)_{2.0}F_{0.9}$. (2) $Ca(Y,Ce)(CO_3)_2F$ with Y:Ce = 1:1.

Occurrence: A rare hydrothermal accessory mineral in alkalic granites and granite pegmatites.

Association: Kainosite, bastnäsite, xenotime, hematite, quartz (Dover, New Jersey, USA).

Distribution: In the USA, from the Scrub Oaks iron mine, Mine Hill, 4 km west of Dover, Morris Co., New Jersey; at the Henry pegmatite, near Cotopaxi, Fremont Co., and the Big Bertha and White Cloud pegmatites, South Platte district, Jefferson Co., Colorado; from Rib Mountain, Marathon Co., Wisconsin. In the Evans-Lou quarry, near Wakefield, Quebec, Canada. Around Gallt y Wenallt, Gwynedd, Wales. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland. At Bad Grund, Harz Mountains, Germany. Crystallized in the Bantyshevo salt stock, Dnieper-Donets Basin, Ukraine. From the Jabal Sa'id pegmatite, central Saudi Arabia. At Xiaocaidan, Qinghai Province, China.

Name: For its relation to *synchysite*-(Ce) and dominant *yttrium*.

Type Material: n.d.

Syngenite $K_2Ca(SO_4)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, tabular on {100} to prismatic along [001], with many forms recorded, to 14 cm; forms lamellar aggregates and crystalline crusts. *Twinning:* Contact twins on {100} common.

Physical Properties: *Cleavage:* On {110} and {100}, perfect; on {010}, distinct. *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 2.579–2.603 D(calc.) = 2.575 Soluble in H_2O, with separation of gypsum.

Optical Properties: Transparent to translucent. *Color:* Colorless, milky white, faintly yellow due to inclusions; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = -2°17'$. *Dispersion:* $r < v$, very strong.
$\alpha = 1.501$ $\beta = 1.517$ $\gamma = 1.518$ 2V(meas.) = 28°

Cell Data: *Space Group:* $P2_1/m$. $a = 9.77$ $b = 7.15$ $c = 6.25$ $\beta = 104.0°$ Z = 2

X-ray Powder Pattern: Synthetic.
2.855 (100), 3.165 (75), 5.71 (55), 2.741 (55), 2.827 (50), 9.49 (40), 4.624 (40)

Total	100.49	100.00

(1) Kalush, Ukraine; corresponds to $K_{1.97}Ca_{1.00}(SO_4)_{2.03} \cdot 1.07H_2O$. (2) $K_2Ca(SO_4)_2 \cdot H_2O$.

Occurrence: An uncommon diagenetic component of marine salt deposits; a volcanic sublimate or pneumatolytic reaction product; a hydrothermal vein filling in a geothermal field; derived from bat guano in caves.

Association: Halite, arcanite (salt deposits); biphosphammite, aphthitalite, monetite, whitlockite, uricite, brushite, gypsum (caves).

Distribution: In Ukraine, large crystals from the Kalush salt deposit (Kalusz, Poland), and at Stebnyk. In Germany, from Thuringia, in the Glückauf mine, near Sondershausen, from Bischofferode, and at Volkenroda-Pöther, near Mühlhausen; from the Stassfurt salt district, Saxony-Anhalt; in the Sigmundshall mine, Bokeloh, and at the Kalkberg, near Lüneburg, Lower Saxony. On Vesuvius, Campania, and in the Cesano geothermal field, Latium, Italy. From Haleakala volcano, Maui, Hawaii, USA. In Murra-el-elevyn, Dingo Dongo, and Petrogale Caves, Western Australia. From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana. On volcanoes on the Kamchatka Peninsula, Russia. Around Mt. Erebus, Victoria Land, Antarctica. From the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China.

Name: From the Greek for *related*, for the chemical resemblance to polyhalite.

(1) Schmidtmannshall, Germany. (2) $MgBO_2(OH)$.

Polymorphism & Series: Polytypes -O and -M are known; forms a series with sussexite.

Occurrence: Uncommon in marine evaporite deposits; in boron-bearing contact metasomatized dolomitic marbles and skarns, and metamorphosed banded iron formation.

Association: Ludwigite, hulsite, magnetite, fluoborite, vonsenite, sinhalite, nordenskiöldine, warwickite, brucite, aragonite, brugnatellite, clinohumite, dolomite (skarns); boracite, sylvite, halite, kainite (marine salt deposits).

Distribution: Numerous localities worldwide, typically in small amounts. In Romania, from Băiţa (Rézbánya) and at Ocna de Fier (Morávicza; Vaskő). In Germany, in the Stassfurt salt district, Saxony-Anhalt; from Pöhla, Erzgebirge, and at Vienenburg, north of Bad Harzburg. At Broadford, Isle of Skye, Inverness-shire, Scotland. In the Brosso mine, northwest of Ivrea, Torino, Italy. From Norberg, Västmanland, Sweden. In the USA, from Bolinas Bay, Marin Co., California; near Blind Mountain, west of Pinoche, Lincoln Co., and east of the Ludwig gypsum mine, Lyon Co., Nevada. In Canada, from the Potash Corporation of America mine, Penobsquis evaporite deposit, and the Salt Springs evaporite deposit, near Sussex, New Brunswick; near Bancroft, Ontario, and elsewhere. In the St. Dizier tin–boron deposit, 20 km northwest of Zeehan, Tasmania, Australia. From the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. At Irazuyama, Ehime Prefecture, Japan. In the Taiga boron–iron deposit, and the Tayozhnoye iron deposit, 550 km south of Yakutsk, Sakha, Russia. In economic amounts in the Inder boron deposit, Kazakhstan. Mined for boron at Fengchen and elsewhere in Liaoning Province, China. Millions of tons are in the Gole Gohar iron deposit, Bafq district, Iran.

Name: Honors István Ádám Rudolf Szaibély (1777–1855), Rézbánya, Hungary [now Băiţa, Romania], mine surveyor, who collected the first specimens.

Type Material: Loránd Eötvös University, Budapest, Hungary, E555.

Total	99.19	100.00

(1) Jardinera No. 1 mine, Chile; by electron microprobe, average of 20 analyses; H_2O by LOI, MoO_4^{2-} and OH^- confirmed by IR; corresponds to $Cu_{2.97}Al_{0.01}(MoO_4)_{0.99}(OH)_{4.09}$.
(2) $Cu_3(MoO_4)(OH)_4$.

Occurrence: A uncommon secondary mineral in the oxidized zone of a copper–molybdenum deposit in granite.

Association: Powellite, chrysocolla, brochantite, lindgrenite, gold, molybdenite, chalcopyrite, chalcocite, hematite, barite, quartz.

Distribution: From the Jardinera No. 1 mine, five km east of Inca de Oro, Atacama, Chile.

Name: Honors husband and wife Marissa Szenics (1950–) and Terry Szenics (1947–), mineral collectors and dealers who found the first specimens.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 133734, 133735, 133738, 133739.

(1) Smolník, Slovakia. (2) $FeSO_4 \cdot H_2O$.

Mineral Group: Kieserite group.

Occurrence: An uncommon secondary mineral formed in pyrite-rich oxidized sulfide deposits, typically under highly acid and arid conditions.

Association: Rhomboclase, halotrichite, fibroferrite, römerite, copiapite, voltaite, pyrite.

Distribution: Widespread in small amounts. Several localities for studied material include: from Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia. On Valachov Hill, near Skřivaň, and at Kladno, Czech Republic. From the Staszic mine, Rudki, Poland. In the Clara mine, near Oberwolfach, Black Forest, Germany. From the Crumlin colliery, Ebbw Vale, Gwent, Wales. At Quetena, west of Calama, and Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta, Chile. From the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. In the USA, from the Tintic Standard mine, near Dividend, East Tintic district, Utah Co., Utah; at Bisbee, Cochise Co. and in the Magma mine, Pinal Co., Arizona; from the Goldstrike mine, Lynn district, Eureka Co., Nevada; at the Island Mountain mine, Trinity Co., California. From Saghand, Yazd, Iran.

Name: For the first recognized occurrence at Szomolnok, Hungary (now Smolník, Slovakia).

Type Material: The type specimens were destroyed in 1956 at the Natural History Museum, Budapest, Hungary.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 479–480. (2) Pistorius, C.W.F.T. Szymańskiite $(H_3O)_8^{1+}Hg_{16}^{1+}(Ni,Mg)_6(CO_3)_{12}(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6. As sprays of euhedral to subhedral prismatic crystals, elongated along [0001], with dominant $\{10\overline{1}0\}$ striated ‖ [0001], and minor {0001}, to 0.4 mm.

Physical Properties: *Cleavage:* $\{10\overline{1}0\}$, poor. *Fracture:* Irregular to conchoidal. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.86 Slowly darkens on exposure to light.

Optical Properties: Transparent. *Color:* Blue-gray to blue-green, darkening to black on exposure to air. *Streak:* Pale blue. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = yellowish green; E = bluish green.
Absorption: $O < E$. $\omega = 1.795(3)$ $\epsilon = 1.786(3)$

Cell Data: *Space Group:* $P6_3$. $a = 17.3984(7)$ $c = 6.0078(4)$ $Z = 1$

X-ray Powder Pattern: Clear Creek claim, California, USA.
14.9 (100), 5.60 (100), 3.299 (80), 2.704 (60), 2.665 (60), 3.201 (50), 2.476 (50)

Chemistry:

	(1)	(2)
NiO	7.9	6.59
Hg_2O	75.8	72.14
MgO	2.0	1.67
CO_2		11.42
H_2O		8.18
Total		100.00

(1) Clear Creek claim, California; by electron microprobe, average of three analyses, values high due to volatilization; IR confirms presence of CO_3^{2-}, $(OH)^{1-}$, H_2O. (2) Do.; with H_2O and CO_2^{2-} determined by crystal-structure analysis, corresponds to $(H_3O)_8Hg_{16}(Ni_{4.08}Mg_{1.92})_{\Sigma=6.00}(CO_3)_{12}(OH)_{12}\cdot 3H_2O$.

Occurrence: A very rare secondary mineral in the oxidized zone of a mercury–nickel-bearing sulfide deposit in silicate–carbonate rock hydrothermally altered from serpentinite.

Association: Cinnabar, montroydite, mercury, edgarbaileyite, millerite, cinnabar, quartz.

Distribution: From the Clear Creek claim, near the Clear Creek mercury mine, New Idria district, San Benito Co., California, USA.

Name: Honors Dr. Jan T. Szymański (1938–), X-ray crystallographer, Canadian Centre for Mineral and Energy Technology (CANMET), Ottawa, Canada.

Type Material: Canadian Geological Survey, Ottawa, Canada, 65743.

References: (1) Roberts, A.C., T.S. Ercit, R.C. Erd, and R.L. Oscarson (1990) Szymańskiite, $Hg_{16}^{1+}(Ni,Mg)_6(CO_3)_{12}(OH)_{12}(H_3O)_8^{1+}\cdot 3H_2O$, a new mineral species from the Clear Creek claim, San Benito County, California. Can. Tacharanite $Ca_{12}Al_2Si_{18}O_{51}\cdot 18H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. As aggregates of fibers, to several μm, in bundles or spherulites; porcelaneous cryptocrystalline masses.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Tough. Hardness = n.d. D(meas.) = 2.33–2.36 D(calc.) = [2.28]

Optical Properties: Semitransparent. *Color:* Milky white. *Luster:* Vitreous to dull. *Optical Class:* [Biaxial.] n = 1.518–1.537 2V(meas.) = n.d.

Cell Data: *Space Group:* A-centered monoclinic pseudocell. $a = 17.07$ $b = 3.65$ $c = 27.9$ $\beta = 114.1°$ Z = 1

X-ray Powder Pattern: Bramburg, Germany.
12.7 (vvs), 3.048 (vs), 2.775 (s), 1.822 (s), 5.19 (ms), 2.888 (ms), 2.853 (ms)

Chemistry:

	(1)	(2)
SiO_2	41.8	48.3
Al_2O_3	5.6	4.5
Fe_2O_3	0.3	0.0
MgO	3.2	0.4
CaO	33.6	30.8
Na_2O	0.6	0.5
K_2O	0.1	0.6
H_2O	15.2	14.9
Total	100.4	[100.0]

(1) Portree, Scotland. (2) Bramburg, Germany; H_2O by TGA, recalculated to 100.0%; corresponds to $(Ca_{12.2}Na_{0.4}Mg_{0.4}K_{0.3})_{\Sigma=13.3}Al_{2.0}Si_{17.9}O_{51}\cdot 18.4H_2O$.

Occurrence: In amygdules and fractures in metabasalts and basaltic breccias; in hydrothermally altered quartzite inclusions in basalt (Bramburg, Germany).

Association: Tobermorite, gyrolite, mesolite, thomsonite, xonotlite, calcite, saponite (Portree, Scotland); scawtite (Huntley, Scotland).

Distribution: In Scotland, from north of Portree, Isle of Skye; on the Isle of Mull; and in the Binbill quarry, Cairnie, Huntley, Aberdeenshire. From Carneal, Co. Antrim, Ireland. At Bramburg, near Göttingen, Lower Saxony, and at Arensberg, near Zilsdorf, Eifel district, Germany. At Espalion, Aveyron, France. Along the Olbirella, near Tiglieto, Liguria, Italy. From Australia, on Tasmania, in the Marrawah-Redpa area and Brittons Swamp; on Gads Hill, Mersey-Forth River valleys; and at Liawenee, Great Lake. From Noaki, near Yaizu, Shuzuoka Prefecture, Japan.

Name: From the Gaelic *tacharan* for *changeling*, as the mineral converts to others on exposure to air.

Type Material: The Natural History Museum, London, England, 1961,163; National School of Mines, Paris, France.

Tachyhydrite $CaMg_2Cl_6 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. In rounded masses.

Physical Properties: *Cleavage:* $\{10\overline{1}1\}$, perfect. Hardness = 2 D(meas.) = 1.667 D(calc.) = 1.673 Very deliquescent; tastes sharp and bitter.

Optical Properties: Transparent. *Color:* Wax-yellow to honey-yellow, may be colorless; colorless to pale yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.520$ $\epsilon = 1.512$

Cell Data: *Space Group:* $R\overline{3}$ (synthetic). $a = 10.136(1)$ $c = 17.318(2)$ Z = 3

X-ray Powder Pattern: Synthetic.
2.884 (100), 5.77 (35), 2.609 (25), 1.443 (25), 1.983 (20), 5.07 (12), 3.097 (10)

Chemistry:

	(1)	(2)	(3)
Mg	9.97	9.71	9.39
Ca	7.16	7.72	7.74

H_2O	42.50	42.20	41.77
Total	100.48	100.52	100.00

(1) Stassfurt, Germany; average of two analyses. (2) Krügershall, Germany.
(3) $CaMg_2Cl_6 \cdot 12H_2O$.

Occurrence: A rare mineral in bedded salt deposits of oceanic origin.

Association: Kainite, carnallite, sylvite, halite, kieserite, bischofite, anhydrite.

Distribution: In Germany, from Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt, at Krügershall-Teutschenthal, near Halle, and from Vienenburg, Lower Saxony. In the Santa Rosa de Lima and Taquari Basins, Sergipe, Brazil, with reserves estimated at 4 billion t. On the Khorat Plateau, Thailand, also massive reserves.

Name: From the Greek for *quick* and *water*, remarking on its deliquescence.

Taenite γ–(Fe, Ni)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As small plates and grains, fine scales, and large ellipsoidal masses, to 40 kg (terrestrial); in intergrowths with, or narrow selvages around, kamacite in meteorites.

Physical Properties: *Tenacity:* Malleable, flexible. Hardness = 5–5.5 VHN = n.d. D(meas.) = 7.8–8.22 D(calc.) = 8.29 (ordered). Strongly magnetic.

Optical Properties: Opaque. *Color:* Silver-white to grayish white. *Luster:* Metallic.
R: n.d.

Cell Data: *Space Group:* $Fm3m$. a = 7.146 Z = 32

X-ray Powder Pattern: Linville ataxite meteorite - ordered structure.
3.340 (100), 2.879 (80), 2.526 (80), 4.239 (60), 2.279 (10), 2.187 (10), 2.070 (10)

Chemistry:

	(1)	(2)	(3)
Fe	68.13	74.78	25.24
Ni	30.85	24.32	74.17
Co	0.69	0.33	0.46
Cu	0.33		
P			0.04
S			0.09
C		0.50	
Total	100.00	99.93	100.00

(1) Cañon Diablo meteorite. (2) Welland meteorite. (3) Josephine Co., Oregon, USA (terrestrial).

Occurrence: In massive serpentine bodies, as particles in placer sands, and as loose, detached masses which give few clues as to their ultimate origin, which was most likely hydrothermal, igneous, or metamorphic. Important in meteorites.

Association: Kamacite, graphite, cohenite, moissanite, schreibersite, troilite, daubréelite, oldhamite, other meteorite minerals.

Distribution: From Gorge River, South Island, New Zealand [TL]. In the USA, in Josephine and Jackson Cos., Oregon; and in California, near South Fork, Smith River, Del Norte Co. In Canada, on the Fraser River, Lillooet district, British Columbia. Taenite is found in all octahedrite meteorites which exhibit Widmannstätten structures as well as in some nickel-rich ataxites.

Name: From the Greek for *band* or *strip*, in allusion to its platy structure.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 117–119 ["nickel-iron"]. (2) Ramsden, A.R. and E.N. MnO	19.42		Na_2O	0.18	0.06
PbO		2.10	K_2O		0.01
			Total	99.58	99.94

(1) Irnimi deposit, Russia; by electron microprobe, average of three analyses; corresponds to $Ba_{1.03}(Sr_{2.78}Ca_{0.07}Na_{0.05}Mg_{0.03})_{\Sigma=2.93}Mn_{2.34}Si_{3.86}O_{14}$. (2) Wessels mine, South Africa; by electron microprobe, corresponds to $(Ba_{0.93}Pb_{0.07})_{\Sigma=1.00}(Sr_{1.84}Ca_{0.04}Na_{0.02})_{\Sigma=1.90}Mn^{3+}_{1.96}(Si_{4.07}Al_{0.01})_{\Sigma=4.08}O_{14}$.

Occurrence: In hydrothermal manganese ores related to alkalic dikes intruding limestones and siliceous rocks (Irnimi deposit, Russia); in a bedded manganese deposit (Wessels mine, South Africa).

Association: Braunite, namansilite, strakhovite (Irnimi deposit, Russia); sérandite, pectolite, braunite, sugilite, hennomartinite, kornite (Wessels mine, South Africa).

Distribution: From the Irnimi manganese deposit, Taikan Mountains, Khabarovsk Territory, Russia. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For the occurrence in the Taikan Mountains, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84394.

Taimyrite $(Pd, Cu, Pt)_3Sn$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As rounded grains, to 3 mm, and as veinlets; in zoned aggregates with other species. *Twinning:* Most grains show polysynthetic twinning.

Physical Properties: Hardness = n.d. VHN = 480(25) (50 g load). D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Bronze-gray; pale gray with a rose tint in reflected light. *Luster:* Metallic. *Pleochroism:* Distinct; from pale gray with a rose tint to a creamy tint. *Anisotropism:* Colors from dark gray with a blue tint to yellowish gray.
R_1–R_2: (400) 33.0–37.1, (430) 37.8–41.2, (460) 39.6–42.3, (490) 42.3–45.2, (520) 44.0–47.8, (550) 45.5–49.6, (580) 47.4–51.6, (610) 49.7–54.0, (640) 51.4–56.5, (670) 53.0–59.2, (700) 54.0–61.9

Cell Data: *Space Group:* n.d. a = 16.11(2) or 12.57(2) b = 11.27(1) or 13.40(2) c = 8.64(1) or 17.09(2) Z = n.d.

X-ray Powder Pattern: Majak mine, Russia.
2.155 (100), 2.29 (55), 2.365 (40), 1.44 (40)

Chemistry:

	(1)	(2)
Pd	46.9	46.02
Cu	10.3	11.85
Pt	15.4	14.44
Sn	23.8	24.77
Pb	0.0	1.01
Sb	2.5	1.86
Total	98.9	99.95

(1) Majak mine, Russia; by electron microprobe, corresponds to $(Pd_{1.95}Cu_{0.72}Pt_{0.35})_{\Sigma=3.02}(Sn_{0.89}Sb_{0.09})_{\Sigma=0.98}$. (2) Oktyabr mine, Russia; by electron microprobe, corresponding to $(Pd_{1.88}Cu_{0.81}Pt_{0.32})_{\Sigma=3.01}(Sn_{0.90}Sb_{0.07}Pb_{0.02})_{\Sigma=0.99}$.

Occurrence: As grains and veinlets near the contact between sulfide and rock-forming minerals in gabbro-diabase; in massive sulfide ores.

Association: Au–Ag alloys, polarite, sperrylite, froodite, sobolevskite, atokite, rustenburgite, tatyanite, mooihoekite, talnakhite, chalcopyrite, pentlandite, cubanite, pyrrhotite, galena, sphalerite (Talnakh area, Russia).

Distribution: In Russia, from the Majak [TL] and Oktyabr mines, Talnakh area, Noril'sk region, Taimyr Peninsula, western Siberia. In the Loolekop carbonatite, Phalaborwa, Transvaal, South Africa.

Name: For the type locality on the Taimyr Peninsula, Russia.

Type Material: Mineralogical Museum of the Moscow Geological Prospecting Institute; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81390.

Taeniolite $KLiMg_2Si_4O_{10}F_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular crystals, pseudohexagonal, to 3.5 cm; as individual scales or lamellar, also in cryptocrystalline aggregates. *Twinning:* Penetration trillings rare.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Foliae flexible, somewhat elastic. Hardness = 2.5–3.5 D(meas.) = 2.83–2.90 D(calc.) = 2.80

Optical Properties: Transparent. *Color:* Colorless, brown to greenish brown, typically concentrically zoned. *Luster:* Vitreous, silky.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless to pale greenish brown; $Y = Z$ = yellowish to reddish brown. *Absorption:* $Y = Z > X$. α = 1.522–1.541 β = 1.553–1.570 γ = 1.553–1.570 2V(meas.) = 0°–5°

Cell Data: *Space Group:* $C2/m$. a = 5.254(2) b = 9.110(4) c = 10.187(2) β = 99.85(4)° Z = 2

X-ray Powder Pattern: Magnet Cove, Arkansas, USA; 1M.

(1) Narssârssuk, Greenland. (2) Lovozero massif, Russia. (3) Coyote Peak, California, USA; by electron microprobe, H_2O calculated to give (F+OH) = 2; corresponding to $(K_{1.01}Na_{0.04})_{\Sigma=1.05}Li_{0.68}(Mg_{1.92}Fe^{2+}_{0.20}Ti_{0.06}Al_{0.01}Mn_{0.01})_{\Sigma=2.20}(Si_{3.76}Al_{0.24})_{\Sigma=4.00}O_{10}[F_{1.40}(OH)_{0.60}]_{\Sigma=2.00}$.

Polymorphism & Series: 1M, $2M_1$, 3A polytypes.

Mineral Group: Mica group.

Occurrence: A late-stage mineral in nepheline syenite pegmatites.

Association: Quartz, dickite (Narssârssuk, Greenland); natrolite, apatite, neptunite, polylithionite, manganoan pectolite (Lovozero massif, Russia); natrolite, pectolite, aegirine, barytolamprophyllite, rasvumite (Coyote Peak, California, USA).

Distribution: From Narssârssuk, Greenland. In the Lovozero and Khibiny massifs, Kola Peninsula, and at several poorly defined localities around Lake Baikal, Siberia, Russia. In the USA, at Magnet Cove, Hot Spring Co., Arkansas, and Coyote Peak, near Orick, Humboldt Co., California. From Mont Saint-Hilaire, Quebec, Canada.

Name: From the Greek for *ribbon* in reference to the mineral's tabular crystals.

Type Material: University of Copenhagen, Copenhagen, Denmark.

			Total	100.22	100.75

(1) Nomura mine, Japan; after subtraction of impurity SiO_2, Al_2O_3, Fe_2O_3, H_2O^- and part of H_2O^+ as halloysite, goethite, and quartz, corresponds to $(Mn^{2+}_{0.89}Ca_{0.23}Mg_{0.03})_{\Sigma=1.15}Mn^{4+}_{3.94}O_9 \cdot 1.3H_2O$. (2) Janggun mine, South Korea; by electron microprobe, Mn and H_2O by wet methods; corresponds to $(Mn^{2+}_{0.68}Ca_{0.32}Mg_{0.09}K_{0.04})_{\Sigma=1.13}Mn^{4+}_{3.96}O_9 \cdot 2.97H_2O$.

Polymorphism & Series: Forms a series with ranciéite.

Occurrence: Formed in the oxide zone of a bedded manganese deposit in metamorphosed cherts (Nomura mine, Japan); a secondary mineral derived from alteration of rhodochrosite in a manganese deposit (Janggun mine, South Korea).

Association: Braunite, todorokite, halloysite, goethite, quartz (Nomura mine, Japan); nsutite, pyrolusite (Janggun mine, South Korea).

Distribution: In the Nomura mine, Ehime Prefecture, Japan. From the Janggun mine, Bonghwa district, South Korea. At the Anson Betts mine, Plainfield, Hampshire Co., Massachusetts, and from Marfa, Presidio Co., Texas, USA.

Name: To honor Dr. Katsutoshi Takane (1899–1945), Professor of Mineralogy, Tohoku University, Sendai, Japan.

Type Material: Tohoku University, Sendai, Japan.

B_2O_3	28.41	29.27
CaO	71.13	70.73
LOI	0.14	
Total	99.68	100.00

(1) Fuka, Japan; corresponds to $Ca_{3.05}B_{1.96}O_6$. (2) $Ca_3B_2O_6$.

Occurrence: A rare mineral probably formed by boron-rich fluids reacting between crystalline limestone and gehlenite-spurrite skarns.

Association: Frolovite, nifontovite, olshanskyite, pentahydroborite, sibirskite, calcite.

Distribution: From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: Honors Professor Hiroshi Takeda (1934–), mineralogist, University of Tokyo, Tokyo, Japan.

Type Material: National Science Museum, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 165482.

References: (1) Kusachi, I., C. Henmi, and S. Kobayashi (1995) Takedaite, a new mineral from Fuka, Okayama Prefecture, Japan. Mineral. Mag., 59, 549–552. (2) (1996) Amer. Mineral., 81, 518 (abs. ref. 1).

Takéuchiite $(Mn^{2+},Mg)_2Mn^{3+}BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As acicular crystals, to 1 cm, with rhomboidal cross section ⊥ to the dominant form {320}.

Physical Properties: *Fracture:* Uneven. Hardness = ∼6 D(meas.) = n.d. D(calc.) = 3.93

Optical Properties: Opaque. *Color:* Black. *Streak:* Brown. *Luster:* Metallic.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group: Pnnm.* a = 27.585(4) b = 12.561(3) c = 6.027(2) Z = 24

X-ray Powder Pattern: Långban, Sweden.
1.511 (100), 2.60 (90), 5.20 (85), 2.035 (80), 2.73 (70), 2.209 (70), 3.02 (65)

Chemistry:

	(1)
B_2O_3	17.10
Mn_2O_3	35.56
Fe_2O_3	7.43
MnO	8.99
MgO	30.84
TiO_2	0.50
Total	100.42

(1) Långban, Sweden; by electron microprobe, average of 12 analyses of 4 specimens; total Fe as Fe_2O_3, Mn^{3+}:Mn^{2+} derived from crystal-structure analysis; corresponds to $(Mn^{2+}_{1.56}Mg_{0.26}Fe^{3+}_{0.19}Ti^{4+}_{0.01})_{\Sigma=2.02}Mn^{3+}_{0.92}BO_5$.

Occurrence: Very rare in museum specimens from a metamorphosed Fe–Mn orebody.

Association: Dolomite, calcite.

Distribution: From Långban, Värmland, Sweden.

Name: Honors Professor Yoshio Takéuchi (1924–), University of Tokyo, Tokyo, Japan, who predicted the existence of the species and its crystal structure.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; National Museum of Natural History, Washington, D.C., USA, 138548.

(1) Takovo, Serbia; quartz 10.17%, goethite 2%, and calcite 0.8% considered as impurities. (2) Agnew, Australia; after deduction of SiO_2 impurity, corresponds to $(Ni_{4.94}Fe_{0.13}Mg_{0.10}Ca_{0.02}Al_{2.81})_{\Sigma=8.00}(OH)_{14.42}(CO_3)_{2.27}\cdot 5.42H_2O$. (3) $Ni_6Al_2(OH)_{16}CO_3\cdot 4H_2O$.

Mineral Group: Hydrotalcite group.

Occurrence: In a karstitic bauxite at the contact of limestone and metamorphosed serpentinite (Takovo, Serbia); an alteration product of nickel sulfides (Western Australia).

Association: Gibbsite, allophane (Takovo, Serbia); glaukosphaerite, népouite, gaspéite, paratacamite, nickeloan magnesite, gypsum, (Kambalda, Australia).

Distribution: From Takovo, Serbia. In the Blangvette West mine, Le Thoronet, Var, France. On Mueo, New Caledonia. In Western Australia, at the Carr Boyd Rocks nickel mine; the Agnew nickel deposit, north of Kalgoorlie; from Kambalda, 56 km south of Kalgoorlie; and the Dordie North nickel deposit. In the USA, at Wells Canyon, Oquirrh Mountains, Utah Co., Utah, and at the Alpine mine, Clear Creek, San Benito Co., California.

Name: For Takovo, Serbia, from which it was first described.

Type Material: National Museum of Natural History, Washington, D.C., USA, 136981.

(1) Parma district, Apennines, Italy; corresponds to $(Mg_{2.94}Fe^{2+}_{0.09}Ca_{0.03})_{\Sigma=3.06}(Si_{3.84}Al_{0.12})_{\Sigma=4.00}O_{10}(OH)_{2.14}$. (2) Malangen, Norway; corresponds to $(Mg_{2.91}Fe^{2+}_{0.07})_{\Sigma=2.98}(Si_{3.94}Al_{0.07})_{\Sigma=4.01}O_{10}(OH)_{2.08}$. (3) $Mg_3Si_4O_{10}(OH)_2$.

Polymorphism & Series: 1A, $2M_1$ polytypes.

Occurrence: In talc-rich schists or steatite through hydrothermal alteration of mafic rocks (steatitization) subsequent to serpentinization during greenschist facies metamorphism. Also formed by thermal low-temperature metamorphism of siliceous dolostones.

Association: Actinolite, tremolite, chlorite, pyroxene, vermiculite, serpentine, anthophyllite, dolomite, calcite.

Distribution: Of widespread occurrence. Some localities for good crystals or pure material include: on Mt. Greiner, Zillertal, Tirol, Austria. At Zermatt, Valais, and St. Gotthard, Ticino, Switzerland. From the Pfitschtal, Trentino-Alto Adige, Italy. At the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. From Goepfersgruen, Bavaria, Germany. At Snarum, Norway. In the Onotosk deposit, Irkutsk, Siberia, Russia. In the USA, near Fowler, St. Lawrence Co., New York; Delta, York Co., Pennsylvania; Smithfield, Providence Co., Rhode Island; Rochester, Windsor Co., Vermont; Holly Springs, Cherokee Co., Georgia; near San Andreas, Calaveras Co., California.

Name: Probably from the Arabic *talq*.

Total	95.4	100.00

(1) Talmessi mine, Iran; Ba and excess Ca [as carbonate?] probably impurities; after removal stated to correspond to $Ca_{2.00}(Mg_{0.97}Ni_{0.06})_{\Sigma=1.03}(AsO_4)_{2.06} \cdot 1.84H_2O$.
(2) $Ca_2Mg(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Forms a series with gaitite.

Mineral Group: Fairfieldite group.

Occurrence: A rare secondary species formed typically in the oxidized zone of some hydrothermal mineral deposits, an alteration product of realgar, orpiment, or Cu–Ni arsenides.

Association: Gaitite, erythrite, annabergite, picropharmacolite, pharmacolite, austinite, fluorite, barite, aragonite, calcite, dolomite.

Distribution: From the Talmessi mine, 35 km west of Anarak, Iran. In the Arhbar (Aghbar) and Aït Ahmane mines, Bou Azzer district, Morocco. From Tsumeb, Namibia. In the USA, at the Gold Hill mine, Tooele Co., Utah: in a cave in Peach Springs Canyon, Mohave Co., Arizona. From Gomez Palacio, Durango, Mexico. At Cross Creek, near Savona, British Columbia, Canada. From Lucéram, Alpes-Maritimes, France. At Stelzing, Austria. In Russia, from the Khovu-Aksy Ni–Co deposit, Tuva, Siberia, and several other undefined localities.

Name: For the Talmessi mine, Iran, in which the mineral was first found.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England.

Talnakhite $Cu_9(Fe,Ni)_8S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As narrow laths, to 2 mm; typically in massive intergrowths with other Cu–Fe sulfides.

Physical Properties: Hardness = n.d. VHN = 261–277 (50 g load). D(meas.) = 4.29 D(calc.) = 4.36

Optical Properties: Opaque. *Color:* Chalcopyrite-yellow, tarnishes rapidly to hues of pink and brown.
R: (400) —, (420) —, (440) —, (460) 22.4, (480) 24.7, (500) 30.0, (520) 32.7, (540) 35.4, (560) 37.5, (580) 38.8, (600) 39.8, (620) 39.6, (640) 40.8, (660) 41.1, (680) 41.8, (700) 41.6

Cell Data: *Space Group:* $I\bar{4}3m$ (probable). $a = 10.59(1)$ $Z = 2$

X-ray Powder Pattern: Talnakh area, Russia.
3.06 (100), 1.873 (90), 1.599 (70), 1.079 (60), 2.64 (50), 1.213 (50), 1.019 (50)

Chemistry:

	(1)	(2)
Cu	37.15	36.8
Fe	29.1	29.8
Ni	0.75	0.7
S	33.31	34.0
Total	100.31	101.3

(1) Talnakh area, Russia; by electron microprobe, average of five analyses; corresponds to $Cu_{9.00}(Fe_{8.03}Ni_{0.20})_{\Sigma=8.20}S_{16.00}$. (2) Noril'sk, Russia; by electron microprobe, corresponds to $Cu_{8.74}(Fe_{8.05}Ni_{0.16})_{\Sigma=8.21}S_{16.00}$.

Occurrence: In concentrations of up to 70% in zones to 12 m thick, in hydrothermal ores (Talnakh area, Russia); in the layered ultramafic Stillwater complex (Nye, Montana, USA); a component of undersea black smokers.

Association: Chalcopyrite, cubanite, djerfisherite, pentlandite, valleriite or mackinawite, magnetite, Ag–Au alloy, Pd–Pb alloy (Talnakh area, Russia).

Distribution: In Russia, from the Norilsk-I [TL] and Talnakh deposits [TL], Talnakh area, Noril'sk region, western Siberia. At Strachimir, Bulgaria. From the Filizchai deposit, Azerbaijan. In the Axial Rift Valley, Red Sea. At Nye, Stillwater Co., Montana, USA. In the Horoman peridotite, Hokkaido, Japan. From the Zhilingtou Au–Ag deposit, Zhejiang Province, China.

Name: For the Talnakh area, Russia, where it occurs.

Type Material: Mining Institute, St. Petersburg, 103a/1–5; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69836–69839; Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada, M29419; National Museum of Natural History, Washington, D.C., USA, 121944.

Tamarugite $NaAl(SO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular {010} or short prismatic [001] crystals, with a multiplicity of additional forms, to 1 mm; may be fibrous or fine granular. *Twinning:* Reportedly polysynthetic.

Physical Properties: *Cleavage:* {010}, perfect. Hardness = ∼3 D(meas.) = 2.06(1) D(calc.) = 2.066 Soluble in H_2O, sweet astringent taste.

Optical Properties: Transparent. *Color:* Colorless; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 4°–5°$. $\alpha = 1.484(1)$ $\beta = 1.486(1)$ $\gamma = 1.497(1)$ 2V(meas.) = ∼60°

Cell Data: *Space Group:* $P2_1/a$. $a = 7.353(2)$ $b = 25.225(5)$ $c = 6.097(2)$ $\beta = 95.2(1)°$ $Z = 4$

X-ray Powder Pattern: Cerro Pintados, Chile.
4.223 (100), 4.207 (80), 3.647 (59), 3.964 (32), 2.899 (23), 3.153 (21), 12.54 (16)

Chemistry:

	(1)	(2)
SO_3	45.66	45.72
Al_2O_3	14.48	14.56
CaO	0.20	
Na_2O	9.04	8.85
Cl	0.12

Total	[100.33]	100.00

(1) Cerro Pintados, Chile; original total 100.36% (2) $NaAl(SO_4)_2 \cdot 6H_2O$.

Occurrence: A secondary mineral in oxidized sulfide-bearing alkali-rich aluminous rocks, with sodium supplied from hydrothermal solutions or sea-spray; as efflorescences in active geothermal systems; may be formed by reaction between acid sulfate solutions or fumarolic gas and wall rock.

Association: Pickeringite, coquimbite, quenstedtite, sideronatrite, mendozite, kröhnkite, halite, alunogen, meta-alunogen, potassium alum, epsomite, halotrichite, halite, gypsum, anhydrite.

Distribution: In Chile, from Cerro Pintados, 80 km southeast of Iquique, Tarapacá; in Antofagasta, at the Compania mine, eight km south of Sierra Gorda; from Alcaparrosa, near Cerritos Bayos, southwest of Calama; at Chuquicamata, and Quetena, west of Calama; in Atacama, at Tierra Amarilla, southeast of Copiapó. In Italy, in the Alum Cave, Vulcano, Lipari Islands; at the Furtei gold mine, Sardinia; from the Cetine mine, near Rosia, Tuscany, and at the Grotta dello Zolfo, Cape Miseno, Campania. In the Skouriotissa mine, Cyprus. At Compton Chine, Isle of Wight. From Saghand, Yazd, Iran. At the Myoban hot spring, Beppu, Oita Prefecture, Japan. From Anglesea, Victoria, Australia. In the Te Kopia geothermal area, New Zealand. On St. Bartholomew Island, West Indies. In the USA, near Eureka, St. Louis Co., and at Fulton, Calloway Co., Missouri. A number of other occurrences are known.

Name: For the originally-noted occurrence at Cerro Pintados, in the Tamarugal Pampa, Chile.

Tancoite $HNa_2LiAl(PO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, typically equant to tabular {010}, elongated along [001], with {001}, {010} {100}, {021}, {111}, to 1 mm, and in subparallel [001] druses.

Physical Properties: *Cleavage:* On {010} and {100}, fair. *Fracture:* Conchoidal.
Hardness = 4–4.5 D(meas.) = 2.752 D(calc.) = 2.724

Optical Properties: Transparent. *Color:* Colorless to pale pink; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = z$; $Z =$ a. *Dispersion:* $r < v$, weak.
$\alpha = 1.541(2)$ $\beta = 1.563(2)$ $\gamma = 1.564(2)$ 2V(meas.) = 23(2)° 2V(calc.) = 24°

Cell Data: *Space Group: Pbcb.* $a = 6.948(2)$ $b = 14.089(4)$ $c = 14.065(3)$ Z = 8

X-ray Powder Pattern: Tanco mine, Canada.
4.672 (100), 3.150 (100), 3.413 (90), 2.479 (90), 1.760 (40), 1.438 (40), 1.429 (40)

(1) Iwaizawa mine, Japan; by electron microprobe, total Fe as Fe_2O_3, H_2O calculated to give (O+OH) = 44; corresponds to $(Na_{0.96}Ca_{0.01})_{\Sigma=0.97}(Mn^{2+}_{7.20}Mg_{2.58}Fe^{3+}_{1.33}Al_{0.41}Ti_{0.16})_{\Sigma=11.68}Si_{12.00}[O_{29.98}(OH)_{14.02}]_{\Sigma=44.00}$. (2) Taneyama mine, Japan; corresponds to $(Na_{0.91}Ca_{0.16}K_{0.04})_{\Sigma=1.11}(Mn^{2+}_{5.78}Fe^{2+}_{2.85}Fe^{3+}_{1.87}Mg_{1.07}Al_{0.26})_{\Sigma=11.83}(Si_{11.55}Al_{0.44}Ti_{0.01})_{\Sigma=12.00}[O_{30.63}(OH)_{13.37}]_{\Sigma=44.00}$.

Occurrence: In cracks in ferruginous chert, mafic rocks, and limestone subjected to blueschist facies metamorphism (Taneyama mine, Japan); in bedded manganese ores in weakly metamorphosed chert and greenstone of the prehnite-pumpellyite metagraywacke facies (Iwaizawa mine, Japan).

Association: Quartz, hematite, chamosite (Taneyama mine, Japan); caryopilite, bannisterite, braunite, rhodochrosite, calcite, albite, cinnabar, pyrite (Iwaizawa mine, Japan).

Distribution: In the Taneyama mine, Kumamoto Prefecture, and the Iwaizawa mine, near Agano, Saitama Prefecture, Japan. From Brezovia, Yugoslavia. In the USA, from Ward Creek, near Cazadero, and along the Russian River, Sonoma Co., and Pacheco Pass, Santa Clara Co., California.

Name: For the Taneyama mine, Japan, where the mineral was first noted.

Type Material: Department of Geology, Kyushu University, Hakozaki; Sakurai Museum, Tokyo; National Science Museum, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 142945.

Fe_2O_3	0.10				

(1) Tyuya-Muyun, Kyrgyzstan. (2) $CaCu(VO_4)(OH)$.

Polymorphism & Series: Forms a series with conichalcite.

Mineral Group: Adelite group.

Occurrence: A rare secondary mineral in vanadium-bearing mineral deposits in sandstone.

Association: Calcite, barite, malachite (Tyuya-Muyun, Kyrgyzstan); rhodonite, quartz, pyrobelonite, chalcocite, neotocite, copper (Molinello mine, Italy); malachite, chrysocolla, tyuyamunite, chalcopyrite, pyrite, "limonite" (Garnet Ridge, Arizona, USA).

Distribution: From the Tyuya-Muyun Cave, Fergana Valley, Alai Range, Kyrgyzstan. Well-crystallized at the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy. In the USA, from near Uranium, Roc Creek, Paradox Valley, at the Pluto mine, Bull Canyon, Uravan district, Montrose Co., and in the Shirley May mine, Garo district, Park Co., Colorado; from the Richardson district, Moab Valley, Grand Co., and in the Whirlwind mine, Monument Valley, San Juan Co., Utah; in Arizona, from Monument Valley, on Garnet Ridge, Apache Co., and at the Monument No. 1 mine, Navajo Co., and in the Copper Queen mine, New Water Mountains, Yuma Co.; from the Mammoth copper mine, Grindstone Creek, Glenn Co., California. At Menzies Bay, Vancouver Island, British Columbia, Canada. From the west side of Lake Torrens, Stuart Shelf, South Australia. From Luiswishi, Katanga Province, Congo (Shaba Province, Zaire). Large crystals from the Lueca vanadium mines, Angola. A few other minor localities are known, some requiring modern confirmation.

Name: For its initially noted occurrence in the Tange Gorge, Fergana Valley, Alai Range, Kyrgyzstan.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, m6065, m6066, m6068.

(1) Raposa pegmatite, Brazil; by electron microprobe, corresponding to $(Ca_{0.47}Y_{0.17}Ce_{0.10}RE_{0.14}Th_{0.10}U_{0.01})_{\Sigma=0.99}(Ta_{0.75}Ti_{0.62}Nb_{0.60}Fe_{0.05})_{\Sigma=2.02}O_6$.

Polymorphism & Series: Forms a series with aeschynite-(Y).

Occurrence: In a pegmatite.

Association: Quartz, microcline, biotite, columbite, beryl.

Distribution: In the Raposa pegmatite, near São José do Sabugí, Paraíba, Brazil.

Name: For an *aeschynite* with TANTALum greater than titanium in the composition and with *yttrium* as the dominant rare-earth element.

Type Material: Department of Geosciences, University of Brasilia, Brasilia, Brazil, NT-52; Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands, NT-52.

References: (1) Adusumilli, M.S., C. Kieft, and E.A.J. Burke (1974) Tantal-aeschynite, a new mineral of the aeschynite group from the Borborema region, north-eastern Brazil. Mineral. Mag., 39, 571–576. (2) (1974) Amer. Mineral., 59, 1331–1332 (abs. ref. 1).

(1) Cooglegong, Australia. (2) Woodstock, Australia.

Occurrence: A detrital mineral in tin placers (Western Australia); in a granite pegmatite (Craveggia, Italy).

Association: Strüverite, columbite, ilmenite, tourmaline, spessartine, beryl, allanite, monazite, xenotime (Craveggia, Italy).

Distribution: From Eleys, 16 km south of Cooglegong, and at Woodstock, Pilbara district, Western Australia. From Piano del Lavonchio, near Craveggia, Val Vigezzo, Piedmont, Italy. At Ituri, Haut-Congo Province, Congo (Haut-Zaire Province, Zaire).

Name: For its relation to *euxenite*, with TANTalum greater than niobium.

Type Material: Western Australian Museum, Perth, Australia, S392A; Natural History Museum, Paris, France, 128.223; The Natural History Museum, London, England, 1928,340–341.

(1) Candoglia, Italy; B and Cl are known to be essential to the structure. (2) Långban, Sweden; by electron and ion microprobe, Al_2O_3 0.10%; corresponds to $(Ba_{3.43}Pb_{0.59})_{\Sigma=4.02}(Fe^{3+}_{3.92}Ca_{0.04}Mn_{0.04})_{\Sigma=4.00}B_{2.24}Si_{7.82}O_{29}Cl_{0.48}$.

Polymorphism & Series: Forms a series with titantaramellite.

Occurrence: In metamorphic rocks rich in barium silicates, in contact with granitic rocks (Candoglia, Italy); in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Calcite, diopside, actinolite, celsian, magnetite, chalcopyrite, pyrite (Candoglia, Italy); quartz, calcite, hematite, barylite, barite, manganoan pectolite, potassic feldspar, manganoan garnet, melanotekite, barian hedyphane, rhodonite, manganoan aegirine (Långban, Sweden).

Distribution: From Candoglia, Valle de Toce, Piedmont, Italy. At Långban, Värmland, Sweden.

Name: For Torquato Taramelli (1845–1922), Italian geologist.

Type Material: Natural History Museum, Paris, France, 109.1005.

(3) Bancroft, Canada; corresponds to $(Na_{1.40}Ca_{1.18}K_{0.38})_{\Sigma=2.96}(Fe^{2+}_{2.43}Fe^{3+}_{1.31}Mg_{0.89}Ti_{0.19}Mn_{0.18}Al_{0.04})_{\Sigma=5.04}(Si_{6.18}Al_{1.82})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesiotaramite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Na + K)_A \geq 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; $Si < 6.5$.

Occurrence: In sodium-metasomatized alkalic gneisses and nepheline syenite dikes; in eclogite metamorphosed to the amphibolite facies.

Association: Nepheline, aegirine, oligoclase, microcline, nyböite.

Distribution: From the Vali-Tarama Valley, near Mariupol (Zhdanov), Ukraine. From near Miass, Ilmen Mountains, Southern Ural Mountains, Russia. In China, near Lanshantou, Jianchang, Jiangsu Province. At the Mbozi syenite gabbro complex, 80 km southwest of Mbeya, Tanzania. From the Darkainle complex, Borama district, northwest Hargeisa, Somali Republic. In Canada, in the York River area, Bancroft, Ontario.

Name: For the type locality, the Vali-Tarama Valley, Ukraine.

Type Material: National Museum of Natural History, Washington, D.C., USA, R3259, 95477.

(1) Onino-Iwaya Cave, Japan; by gravimetry and flame photometry; corresponds to $H_{7.09}K_{1.97}(Al,Fe)_{4.98}(PO_4)_8 \cdot 19.7H_2O$. (2) Castellana Cave, Italy. (3) $K_3Al_5(PO_4)_2(PO_3OH)_6 \cdot 18H_2O$.

Occurrence: Formed from phosphatic solutions derived from bird or bat guano reacting with clays or aluminous rocks under perenially damp conditions; the most common phosphate mineral in caves.

Association: Vashegyite, leucophosphite, minyulite, francoanellite, brushite, ardealite, strengite, variscite, vivianite.

Distribution: From the Sugarloaves, near New Plymouth, Taranaki Peninsula, New Zealand. On Réunion Island, Indian Ocean; Island Leones, Patagonia, Argentina; King George Island, Maritime Antarctic. In Australia, in the Russenden Cave, Queensland; the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria; in caves at Mimegarra, Western Australia; and the Jenolan Caves, New South Wales. In the Yangsue Posayen Cave, 20 km south of Guilin, Guangxi Province, China. From the Niah Great Cave, Sarawak, Malaysia. In the Onino-Iwaya Cave, Hiroshima Prefecture, Japan. From the Tour Combes Cave, near Oran, Algeria. In Etienne's Cave, and well-crystallized in Christmas Cave, Transvaal, South Africa. From the Bacho Kuo Cave, Bulgaria. In the Minerva Grotto, Fauzan, Hérault, France. In Italy, in the Castellana Cave, south of Bari, Puglia; on Monte Alburno, near Controne, Salerno. In the USA, in the Pig Hole Cave, Giles Co., Virginia; and the Low Water Bridge Cave, Greene Co., Missouri. Additional localities are known.

Name: For its first recognized occurrence on the Taranaki Peninsula, New Zealand.

Tarapacáite K_2CrO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely as thick tabular {001} crystals; typically disseminated granular. *Twinning:* As pseudohexagonal trillings on {011}.

Physical Properties: *Cleavage:* On {010} and {100}, distinct. Hardness = n.d. D(meas.) = 2.74 (synthetic). D(calc.) = 2.735 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Bright canary-yellow.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, weak.
$\alpha = 1.687$ $\beta = 1.722$ $\gamma = 1.731$ 2V(meas.) = 52°

Cell Data: *Space Group:* *Pnam* (synthetic). $a = 7.662(1)$ $b = 10.391(1)$ $c = 5.919(1)$
Z = 4

X-ray Powder Pattern: Synthetic.
3.078 (100), 2.988 (75), 2.960 (40), 2.479 (25), 2.286 (25), 2.599 (22), 2.570 (21)

Chemistry: (1) Analyses of natural material are lacking; identification depends on coincidence of optical and X-ray data with synthetic material.

Occurrence: A minor accessory mineral in nitrate deposits.

Association: Lopezite, dietzeite.

Distribution: In Chile, in nitrate caliche deposits throughout the Atacama Desert, as at the Oficina Maria Elena, near Tocopilla, Antofagasta, and Zapiga, Tarapacá.

Name: For its first noted occurrence in the Tocopilla Pampa, 170 km north of Antofagasta, Tarapacá, Chile.

Tarbagataite $(K,\square)_2(Ca,Na)(Fe^{2+},Mn)_7Ti_2(Si_4O_{12})_2O_2(OH)_4(OH,F)$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As lamellar intergrowths with astrophyllite to 0.2 mm.

Physical Properties: *Cleavage*: Perfect on {001}, moderate on {010}. *Fracture*: n.d. *Tenacity*: Elastic. Hardness = 3 D(meas.) = n.d. D(calc.) = 3.263

Optical Properties: Transparent. *Color*: Brown to pale golden brown. *Streak*: Colorless to pale yellow. *Luster*: Vitreous to pearly.
Optical Class: Biaxial (+). α = 1.710(3) β = 1.715(3) γ = 1.745(3) 2V(meas.) = 37(3)° 2V(calc.) = 45° *Pleochroism*: *X* = yellow-brown, *Y* = orange-red, *Z* = yellow-orange.
Absorption: *X* < *Z* < *Y*. *Orientation*:

	a	*b*	*c*
X	89.5°	165.6°	58.5°
Y	94.8°	95.4°	147.0°
Z	4.8°	103.3°	98.9°

Cell Data: *Space Group*: $P\bar{1}$. *a* = 5.3868(6) *b* = 11.9141(6) *c* = 11.7171(2) α = 112.978(2)° β = 94.641(2)° γ = 103.189(2)° Z = 1

X-ray Powder Pattern: Verkhnee Espe deposit, Tarbagatai mountain range, Kazakhstan.
3.258 (100), 4.095 (80), 2.858 (80), 2.761 (70), 3.497 (50), 2.560 (50), 3.735 (30)

Chemistry:

(1) Verkhnee Espe deposit, Tarbagatai mountain range, Kazakhstan; average of multiple electron microprobe analyses, H_2O calculated from structure analysis; corresponding to $(K_{0.76}Rb_{0.18}Na_{0.12}Cs_{0.04}\square_{0.90})_{\Sigma=2}(Ca_{0.62}Na_{0.38})_{\Sigma=1}(Fe^{2+}_{3.51}Mn_{2.94}Mg_{0.28}Zr_{0.02}Zn_{0.02}\square_{0.23})_{\Sigma=7}(Ti_{1.57}Nb_{0.30}Sn_{0.11}Zr_{0.02})_{\Sigma=2}(Si_{8.09}Al_{0.03})_{\Sigma=8.12}O_{30.65}H_{4.65}F_{0.35}$.

Mineral Group: Astrophyllite group.

Occurrence: In pegmatite veins and fenite associated with alkaline granitic massifs.

Association: Astrophyllite, microcline, albite, quartz, aegirine, kupletskite, zircon, thorite, xenotime, fergusonite, fersmite, euxenite-(Y), ilmenite, columbite-(Mn), zinc pyrophanite, keiviite, thalenite-(Y), cappelenite-(Y), eudialyte, jinshajiangite, milarite, helvite, bertrandite, bavenite.

Distribution: From the Verkhnee Espe deposit, northern part of the Tarbagatai mountain range, Akjailyautas Mountains, Kazakhstan.

Name: For the Tarbagatai mountain range where the Verkhnee Espe deposit that produced the first specimens is located.

Type Material: Geological Museum, Satpaev Institute of Geological Sciences, Almaty, Kazakhstan (# 3009/2010).

Tarbuttite $Zn_2(PO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudocubic. *Point Group:* $\overline{1}$. Crystals typically equant to short prismatic, complex, with many forms, to 2 cm; in sheaflike or saddle-shaped aggregates; as crusts.

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* Uneven. Hardness = 3.5–4 D(meas.) = 4.19 D(calc.) = 4.21

Optical Properties: Transparent to translucent. *Color:* Colorless, pale yellow, may be brown, red, or green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* X (7°,58°); Y (159°,25°); Z (−86°,80°) [using (ϕ,ρ)]. *Dispersion:* Strong. $\alpha = 1.659$–1.660 $\beta = 1.683$–1.705 $\gamma = 1.702$–1.713 2V(meas.) = 50°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.499$ $b = 5.654$ $c = 6.465$ $\alpha = 102°51'$ $\beta = 102°46'$ $\gamma = 86°50'$ Z = 2

X-ray Powder Pattern: Kabwe, Zambia. (ICDD 36-410).

(1) Kabwe, Zambia; corresponds to $Zn_{1.98}(PO_4)_{0.99}(OH)_{1.02}$. (2) Reaphook Hill, Australia; by electron microprobe, average of ten analyses; corresponds to $Zn_{1.96}(PO_4)_{0.96}(OH)_{0.70}$. (3) $Zn_2(PO_4)(OH)$.

Occurrence: An uncommon secondary mineral in the oxidized zone of zinc-bearing deposits.

Association: Hopeite, hemimorphite, smithsonite, parahopeite, hydrozincite, scholzite, cerussite, pyromorphite, descloizite, vanadinite, "limonite".

Distribution: From Kabwe (Broken Hill), Zambia. In the Lueca vanadium mines, Angola. From the Kef Semmah mine, near Sétif, Algeria. In Australia, on Reaphook Hill, near Blinman, Flinders Ranges, South Australia; at Broken Hill, New South Wales. In the Hudson Bay mine, Salmo, British Columbia, Canada. At an undefined locality in Guangdong Province, China.

Name: Honoring Percy Coventry Tarbutt, Director of the Broken Hill Exploration Company, who early provided material for characterization.

Type Material: n.d.

Tarkianite $(Cu,Fe)(Re,Mo)_4S_8$

Crystal Data: Isometric. *Point Group:* $\bar{4}$ 3m. As equant grains to 0.5 mm.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5-6 VHN = 537–584 (15 g load). D(meas.) = n.d. D(calc.) = 7.30

Optical Properties: Opaque. *Color:* Black; light gray in reflected light in air, brownish gray in oil. *Streak:* Black. *Luster:* Metallic.
Optical Class: Isotropic.
R_{air}-R_{oil}: (470) 38.02- 20.91, (546) 38.87- 21.76, (589) 39.18- 21.84, (650) 39.30- 22.12

Cell Data: *Space Group: $F\bar{4}3m$.* a = 9.563(1) Z = 4

X-ray Powder Pattern: Hitura mine, Nivala, west-central Finland.
5.531 (100), 2.885 (90), 2.389 (90), 1.841 (90), 1.690 (80), 2.194 (70), 1.952 (60)

Chemistry:

	(1)
Fe	0.59
Ni	0.09
Co	0.08
Cu	5.48
Mo	12.32
Re	53.61
Os	0.84
S	26.77
Total	99.78

(1) Hitura mine, Nivala, west-central Finland; average of 34 electron microprobe analyses, corresponding to $(Cu_{0.83}Fe_{0.10}Ni_{0.02}Co_{0.01})_{\Sigma=0.96}(Re_{2.79}Mo_{1.22}Os_{0.04})_{\Sigma=4.03}S_{8.01}$.

Occurrence: In a heavy mineral concentrate derived from a serpentinized, disseminated sulfide and PGM-bearing, ultramafic intrusion.

Association: Pentlandite, chromite, pyrrhotite, valleriite, chalcopyrite, cubanite, mackinawite, sperrylite, michenerite, irarsite, froodite, hollingworthite.

Distribution: From the Hitura mine, 13 km south of Nivala, west-central Finland and the Stillwater complex, Montana, USA. Other reported occurrences are the Coldwell complex, Ontario, Canada; the Lukkulaisvaara complex, Karelia, and Monchegorsk, Kola Peninsula, Russia; Ekojoki, Finland, and two localities in Sweden.

Name: Honors Prof. Mahmud Tarkian (b. 1941) of the University of Hamburg, Germany, who earlier described an occurrence of the mineral.

Type Material: Finnish Museum of Natural History, Geological Museum, University of Helsinki, Finland; C4001.

References: (1) Kojonen, K.K., A.C. Roberts, O.-P. Isomäki, V.F. Knauf, B. Johanson, and L. Pakkanen (2004) Tarkianite, $(Cu,Fe)(Re,Mo)_4S_8$, a new mineral species from the Hitura mine, Nivala, Finland. Can. Mineral., 42, 539–544. (2) (2005) Amer. Mineral., 90, 273 (abs. ref. 1).

Tassieite $(Na,\square)Ca_2(Mg,Fe^{2+},Fe^{3+})_2(Fe^{3+},Mg)_2(Fe^{2+},Mg)_2(PO_4)_6\cdot 2H_2O$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As platy grains with irregular outline, to 1 mm.

Physical Properties: *Cleavage*: Perfect to good on {100} and on a second direction at 60° to the first. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.45

Optical Properties: Transparent. *Color*: Dark green. *Streak*: Light green. *Luster*: Vitreous. *Optical Class:* Biaxial (+). α = 1.712(2) β = 1.713(2) γ = 1.722(2) 2V(meas.) = 46(1)° 2V(calc.) = 37° *Dispersion*: Very weak. *Pleochroism*: Strong; *X* = dark blue, *Y* = blue, *Z* = light brown. *Absorption*: *X* > *Y* >> *Z*.

Cell Data: *Space Group*: *Pbca*. *a* = 12.4588(14) *b* = 11.5974(13) *c* = 12.7506(15) Z = 4

X-ray Powder Pattern: Stornes Peninsula, Larsemann Hills, Prydz Bay, East Antarctica.

Fe_2O_3	[11.63]	H_2O	[3.78]
Na_2O	1.96	Total	100.34

(1) Stornes Peninsula, Larsemann Hills, Prydz Bay, East Antarctica; average of electron microprobe analyses, Fe^{2+}: Fe^{3+} and H_2O calculated from stoichiometry; corresponding to $Na_{0.60}Ca_{1.96}Mg_{2.59}Mn_{0.05}Fe^{2+}_{1.98}Fe^{3+}_{1.39}Y_{0.02}Yb_{0.01}S_{0.01}P_{5.98}O_{24}\cdot 2H_2O$.

Mineral Group: Wicksite group, with Mg-dominant in the M1 structural site.

Occurrence: A late-stage, low-temperature mineral formed by hydrothermal alteration of stornesite-(Y), wagnerite and fluorapatite in the core of a fluorapatite nodule in regionally metamorphosed and fractured gneissic rocks.

Association: Stornesite-(Y), wagnerite, fluorapatite, xenotime-(Y), mélonjosephite, monazite-(Ce).

Distribution: From between Johnston Fjord and Tassie Tarn, Stornes Peninsula, Larsemann Hills, Prydz Bay, East Antarctica.

Name: For a lake, Tassie Tarn, near the site from which the first specimens were collected.

Type Material: National Museum of Natural History, Washington, D.C., USA, (NMNH 174436).

Total	[99.22]	100.00

(1) Chelkar salt dome, Kazakhstan; original total given as 99.61%, stated to correspond to $Ca_{6.14}Mg_{1.60}(K, Na)_{0.26}(SO_4)_2(CO_3)_2Cl_4(OH)_4 \cdot 7H_2O$. (2) $Ca_6Mg_2(SO_4)_2(CO_3)_2Cl_4(OH)_4 \cdot 7H_2O$.

Occurrence: A rare secondary mineral found in drill core in a marine salt deposit.

Association: Anhydrite, halite, bischofite, magnesite, hilgardite.

Distribution: From the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan.

Name: Honors Professor Vitalii Borisovich Tatarskii (1907–1993), mineralogist, St. Petersburg University, St. Petersburg, Russia.

Type Material: Mining Institute, St. Petersburg, 948/1-2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79820.

(2) Do.; original total given as 99.18%; corresponds to $(Sr_{0.70}Na_{0.10}Ce_{0.05}Ca_{0.03}La_{0.02}Nd_{0.01}K_{0.01})_{\Sigma=0.92}Ti_{1.00}O_3$. (3) $SrTiO_3$.

Mineral Group: Perovskite group.

Occurrence: In aegirine-kalsilite rock in an alkalic massif (Murun massif, Russia); in a rheomorphic fenite dike in a carbonatite complex (Sarambi, Paraguay).

Association: Aegirine, kalsilite, potassic feldspar, titanite, magnetite, lamprophyllite, barium lamprophyllite, wadeite, batisite, anatase (Murun massif, Russia).

Distribution: From the Murun massif, southwest of Olekminsk, Sakha, Russia. In the Sarambi carbonatite complex, about 27 km northeast of Sarambi, Paraguay.

Name: To honor Academician Lev Vladimirovich Tauson (1917–1989), Russian geochemist, Director of the Geochemical Institute, Irkutsk, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Tavorite $LiFe^{3+}(PO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals, {100}, {010}, {001}, to 5 mm; commonly very fine-grained, massive, in veinlets, disseminated, and thin films.

Physical Properties: Hardness = n.d. D(meas.) = 3.32 D(calc.) = 3.33

Optical Properties: Semitransparent. *Color:* Greenish yellow, grass-green, bright apple-green. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* $X = Y$ = yellow-green; Z = colorless. *Orientation:* $X \wedge a \simeq 15°$; $Y \wedge b \simeq 0°$; $Z \wedge c \simeq 38°$. *Dispersion:* $r > v$, strong. $\alpha = 1.795(5)$ $\beta = 1.81(1)$ $\gamma = 1.86(1)$ 2V(meas.) = 50(2)° 2V(calc.) = 59°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.340(2)$ $b = 7.283(2)$ $c = 5.110(2)$ $\alpha = 109.29(2)°$ $\beta = 97.86(3)°$ $\gamma = 106.32(3)°$ Z = 2

X-ray Powder Pattern: Sapucaia mine, Brazil.
3.045 (10), 3.285(9), 4.99 (5), 2.474 (4), 4.68 (3), 1.662 (3b), 3.95 (2)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	39.78	40.61	Li_2O	7.64	8.55
Fe_2O_3	42.57	45.69	H_2O^+	5.76	5.15
FeO	2.39		H_2O^-	0.40	
MnO	1.47		Total	100.01	100.00

(1) Sapucaia mine, Brazil; corresponds to $(Li_{0.90}Fe^{2+}_{0.06}Mn^{2+}_{0.04})_{\Sigma=1.00}Fe^{3+}_{0.94}(PO_4)_{0.99}(OH)_{1.13}$.
(2) $LiFe(PO_4)(OH)$.

Mineral Group: Amblygonite group.

Occurrence: A secondary oxidation product of earlier phosphates in complex zoned granite pegmatites.

Association: Barbosalite, heterosite, ferrisicklerite, triphylite, huréaulite, rockbridgeite, jahnsite, vivianite.

Distribution: In Brazil, in the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and the Énio pegmatite mine, northeast of Galiléia, Minas Gerais; from near Pedra Lavrda, Paraíba. In the USA, in the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; in South Dakota, from the Custer Mountain, Hot Shot, Elkhorn, Bull Moose, Hesnard, Linwood, and White Elephant mines; good crystals from the Tip Top mine, 8.5 km southwest of Custer, Custer Co. At Hagendorf, Bavaria, Germany. In the Buranga pegmatite, Gatumba district, Rwanda. In Namibia, from the Tsaobismund pegmatite, 60 km south of Karibib, and at the Sandamap pegmatite, west of Usakos. From Jebilet, Morocco. In the Mangualde pegmatite, near Mesquitela, Portugal. Undoubtedly to be recognized at additional localities.

Name: To honor Dr. Elysiario Tavora (1911–), Professor of Mineralogy, University of Brazil, Rio de Janeiro, Brazil.

Type Material: National Museum, Rio de Janeiro, Brazil; The Natural History Museum, London, England, 1965,209; Harvard University, Cambridge, Massachusetts, 107298 and 107299; National Museum of Natural History, Washington, D.C., USA, 106842.

Tazheranite $(Zr, Ti, Ca)O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$, $\bar{4}3m$, or 432. Anhedral crystals, thick tabular, may be rounded, to 1.5 mm, and as irregular grains.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7.5
D(meas.) = 5.01(2) D(calc.) = [5.03]

Optical Properties: Semitransparent. *Color:* Yellowish orange to reddish orange, rarely cherry-red, then zoned, brownish green; in thin section, pale yellow, zoned with a reddish tint.
Luster: Adamantine to greasy on fractures.
Optical Class: Isotropic; may exhibit weak to strong anisotropism, centrally zoned. $n = 2.25(2)$

Cell Data: *Space Group:* $Fm3m$, $F\bar{4}3c$, or $F432$. $a = 5.108(1)$ $Z = 4$

X-ray Powder Pattern: Tazheran massif, Russia.
2.94 (10), 1.804 (10), 1.539 (10), 2.55 (6), 1.171 (5), 1.044 (5), 0.9828 (5)

Chemistry:

	(1)
SiO_2	0.63
TiO_2	2.42
ZrO_2	67.67
Ti_2O_3	11.65
Al_2O_3	4.61
Fe_2O_3	0.92
MgO	2.38
CaO	9.97
Total	100.25

(1) Tazheran massif, Russia; after deduction of spinel 5.41% and forsterite 1.48%, corresponds to $(Zr_{0.59}Ca_{0.19}Ti^{3+}_{0.18}Ti^{4+}_{0.03}Al_{0.02}Fe_{0.02})_{\Sigma=1.03}O_{1.74}$.

Occurrence: In calciphyres banding periclase-brucite marble xenoliths in an alkalic massif (Tazheran massif, Russia).

Association: Spinel, forsterite, åkermanite–gehlenite, clinohumite, ludwigite, azoproite, magnesioferrite, calzirtite, baddeleyite, geikielite, perovskite, rutile, zircon, dolomite, calcite (Tazheran massif, Russia).

Distribution: In the Tazheran alkalic massif, west of Lake Baikal, eastern Siberia, Russia. On Alnö Island, Sweden. From the Jacupiranga carbonatite, São Paulo, Brazil.

Name: For the Tazheran massif, Russia, where it was first noted.

Type Material: Mining Institute, St. Petersburg, 1094/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72602, vis5748; National Museum of Natural History, Washington, D.C., USA, 145796.

Teallite $PbSnS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals thin tabular on {001} with nearly square section, to 1 cm; lateral faces striated ‖ their intersection with {001}, and with striations on {001} ‖ [110]. More commonly as massive aggregates of thin, graphitelike folia having irregular edges; warped or bent crystals typical. *Twinning:* Seen only in polished section.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Flexible, somewhat malleable. Hardness = 1.5 VHN = n.d. D(meas.) = 6.36 D(calc.) = 6.567

Optical Properties: Opaque. *Color:* Grayish black, may tarnish dull or iridescent; in polished section, white with slight yellow tint. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak; in white with pale golden tint, and pure white. *Anisotropism:* Distinct to rather high.
R_1–R_2: (400) 39.8–43.7, (420) 40.4–44.0, (440) 41.0–44.3, (460) 41.6–44.4, (480) 42.0–44.5, (500) 42.3–44.4, (520) 42.5–44.3, (540) 42.5–44.1, (560) 42.4–43.8, (580) 42.2–43.5, (600) 41.8–43.1, (620) 41.5–42.6, (640) 41.0–42.2, (660) 40.5–41.7, (680) 40.0–41.3, (700) 39.6–40.9

Cell Data: *Space Group: Pbnm.* $a = 4.266(3)$ $b = 11.419(7)$ $c = 4.090(2)$ Z = 2

X-ray Powder Pattern: Montserrat, Bolivia.
2.84 (100), 3.41 (60), 1.419 (50), 3.27 (40), 2.33 (40), 2.03 (40), 1.090 (40)

Chemistry:

	(1)	(2)
Pb	52.09	53.13
Fe	0.17	
Sn	30.55	30.43
S	16.91	16.44
Total	[99.72]	100.00

(1) Santa Rosa mine, Bolivia; recalculated after deduction of Zn 1.08% as ZnS. (2) $PbSnS_2$.

Occurrence: A hydrothermal mineral in tin veins; may be an important ore mineral.

Association: Cassiterite, stannite, franckeite, cylindrite, galena, sphalerite, wurtzite, pyrite.

Distribution: Found in many Bolivian tin veins, including those of the Santa Rosa [TL], Ichucollo, and El Salvador mines, Montserrat, and the Porvenir mine, Huanuni, Oruro; Mount Cerillos, near Carguaicollo, in the Cordillera de los Frailes, Potosí; the Lipey Huaico mine, Ocuri; the San Alfredo mine, Colquiri; and the Aliada mine, Colquechaca. In the Ivigtut cryolite deposit, southwestern Greenland. At Radvanice, near Trutnov, Czech Republic. From Sinantscha, Sichota-Alin, and Smirnowsk, Transbaikal, Russia. At the Wallah Wallah mine, Rye Park, New South Wales, Australia. From the Toyoha mine, Hokkaido, Japan. In the Changpo deposit, Dachang district, Guangxi Province, China.

Name: To honor Jethro Justinian Harris Teall (1849–1924), Director of the Geological Survey of Great Britain and Ireland.

Type Material: n.d.

Teepleite $Na_2B(OH)_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are tabular on {001}, in rounded lenslike shapes composed of {001} and {101}, to 5 cm; commonly forms aggregates of rosettes.

Physical Properties: *Fracture:* Irregular to subconchoidal. *Tenacity:* Very brittle. Hardness = 3–3.5 D(meas.) = 2.076 D(calc.) = 2.070 (synthetic). Soluble in H_2O; alters to tincalconite on exposure.

Optical Properties: Transparent. *Color:* Colorless to white, pale buff due to organic inclusions; colorless in transmitted light. *Luster:* Vitreous to greasy, dulled on exposure to air. *Optical Class:* Uniaxial (–). $\omega = 1.519$ $\epsilon = 1.503$

Cell Data: *Space Group:* $P4/nmm$. $a = 7.260(2)$ $c = 4.847(2)$ $Z = 2$

X-ray Powder Pattern: Synthetic.
2.697 (10), 2.015 (9), 2.90 (8), 1.659 (8), 2.264 (7), 1.815 (7), 1.709 (7)

Total	99.83	100.00

(1) Borax Lake, California, USA; after deduction of Ca as calcite and remaining CO_2 as trona, corresponds to $Na_{2.00}B_{1.00}(OH)_{3.69}Cl_{1.03}$. (2) $Na_2B(OH)_4Cl$.

Occurrence: Formed by reaction of boron-rich brines with halite in an extremely desiccated lake (Borax Lake, California, USA).

Association: Halite, trona, burkeite, hanksite.

Distribution: In the USA, in California, from Borax Lake, Lake Co., and in large crystals at Searles Lake, San Bernardino Co.

Name: Honors John Edgar Teeple (1874–1931), for his work on the chemistry of Searles Lake, California, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 95832; National Museum of Natural History, Washington, D.C., USA, 97449.

Teineite **$CuTe^{4+}O_3 \cdot 2H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Crystals are prismatic along [001], may be flattened on {010}, may be rough due to alteration; exhibiting forms {010}, {110}, {011}, rare {073}, to 2 cm; commonly as crusts and aggregates.

Physical Properties: *Cleavage:* On {010}, good; on {001} and {100}, poor.
Tenacity: Brittle. Hardness = 2.5 D(meas.) = 3.80 D(calc.) = 3.86

Optical Properties: Semitransparent. *Color:* Cerulean blue, Cobalt blue, bluish gray; in transmitted light, bright blue to greenish blue. *Streak:* Pale blue.
Optical Class: Biaxial (–). *Pleochroism:* X = greenish blue; Y = blue; Z = Indigo blue.
Orientation: $X = a$; $Y = b$; $Z = c$. *Absorption:* $Z > Y > X$. $\alpha = 1.767$ $\beta = 1.782$ $\gamma = 1.791$
2V(meas.) = 36°

Cell Data: *Space Group:* $P2_12_12_1$ (synthetic). $a = 6.634(4)$ $b = 9.597(5)$ $c = 7.428(4)$
Z = 4

X-ray Powder Pattern: Teine mine, Japan.
3.45 (10), 5.45 (9b), 3.06 (8), 2.94 (7), 2.880 (7), 2.392 (7), 5.87 (6)

Chemistry:

	(1)	(2)
SO_3	6.96	
TeO_3	50.63	58.00
CuO	29.54	28.91
H_2O	12.87	13.09
Total	[100.00]	100.00

(1) Teine mine, Japan; recalculated to 100% from an original total of 100.9% after deducting insoluble 6.1%. (2) $CuTeO_3 \cdot 2H_2O$.

Occurrence: A rare secondary mineral formed by oxidation of copper- and tellurium-bearing sulfides.

Association: Tellurite, tellurium, pyrite, tetrahedrite, sphalerite, azurite, malachite, quartz, barite (Teine mine, Japan); hessite, galena, bornite, cerussite, azurite, chlorargyrite, quetzalcoatlite, quartz, barite, clay (Moctezuma mine, Mexico); cuprite, malachite, graemite (Cole shaft, Arizona, USA).

Distribution: In Japan, from the Teine mine, Sapporo, Hokkaido, and in the Kawazu mine, three km north of Shimoda, Shizuoka Prefecture. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, in Arizona, large crystals from the Cole shaft and in the Shattuck mine, Bisbee, Warren district, Cochise Co., and in the Dome Rock Mountains, La Paz Co.; from the Lone Pine mine, Wilcox district, Catron Co., New Mexico. At Salmchâteau, near Ottré, Belgium. From Åmotsdal, Norway. At the Aginsk gold telluride deposit, Kamchatka, Far Eastern Region, Russia.

Name: For the Teine mine, Japan, in which specimens were first found.

Type Material: University of Hokkaido, Sapporo, Japan; Harvard University, Cambridge, Massachusetts, USA, 94749.

X-ray Powder Pattern: Oktyabr mine, Russia.
2.42 (10), 2.10 (5), 3.05 (4), 2.74 (3), 1.475 (3), 2.22 (2), 1.822 (2)

Chemistry:

	(1)	(2)
Pd	39.0	42.73
Ag	30.8	29.82
Pb	6.7	0.46
Bi	3.7	1.46
Te	19.8	26.32
Se	0.6	
Total	100.6	100.79

(1) Oktyabr mine, Russia; by electron microprobe, average of analyses of nine samples; corresponding to $(Pd_{1.72}Ag_{1.34})_{\Sigma=3.06}(Te_{0.73}Pb_{0.15}Bi_{0.08}Se_{0.04})_{\Sigma=1.00}$. (2) Nadezhda deposit, Russia; by electron microprobe, average of 41 analyses; corresponding to $(Pd_{1.86}Ag_{1.28})_{\Sigma=3.14}$ $(Te_{0.96}Bi_{0.03}Pb_{0.01})_{\Sigma=1.00}$.

Occurrence: In metasomatically altered Cu–Ni sulfide ores (Talnakh area, Russia); in the layered ultramafic Stillwater complex (Nye, Montana, USA).

Association: Chalcopyrite, bornite, millerite, braggite, silver, kotulskite, clausthalite (Talnakh area, Russia).

Distribution: In Russia, from the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia [TL], and in the Nadezhda deposit, Lukkulaisvaara layered intrusion, Karelia. From Nye, Stillwater Co., Montana, USA.

Name: For the constituent chemical elements, TELlurium, ARGentum *silver*, and PALladium.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76575.

(1) Mattagami mine, Canada; by electron microprobe, average of analyses of eight grains; corresponds to $Sb_{1.91}Te_{3.00}$. (2) Kobetsuzawa mine, Japan; by electron microprobe, corresponding to $(Sb_{1.96}Pb_{0.04})_{\Sigma=2.00}Te_{3.00}$. (3) Sb_2Te_3.

Polymorphism & Series: Forms a series with tellurobismuthite.

Mineral Group: Tetradymite group.

Occurrence: In a zinc-rich stratiform massive sulfide deposit of volcanogenic origin in Archean volcanics (Mattagami Lake mine, Canada).

Association: Altaite, pyrrhotite, chalcopyrite (Mattagami Lake mine, Canada); altaite, tellurium (Kobetsuzawa mine, Japan).

Distribution: In Canada, from the Mattagami Lake mine, about 8 km southwest of the town of Matagami, Quebec [TL]. At the Smuggler, Little Johnny, Washburn, and other mines, Boulder Co., Colorado, USA. From the Kobetsuzawa mine, near Sapporo, Hokkaido, Japan. In the Danba district, Sichuan Province, China. At Kalgoorlie, Western Australia. In Romania, from Săcărîmb (Nagyág), Stănija, and Măgura-Hondol. At Kremnica (Kremnitz), Slovakia. From Enasen, ??ck, Sweden.

Name: For the composition.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M31957.

(1) Good Hope mine, Colorado, USA. (2) TeO_2.

Polymorphism & Series: Dimorphous with paratellurite.

Occurrence: An alteration product of tellurium and tellurides in the oxide zone of some hydrothermal mineral deposits.

Association: Tellurium, tetradymite, nagyagite, many secondary tellurates.

Distribution: In Romania, in Transylvania, from Faţa Băii (Faczebaja), Zalatna, and Săcărîmb (Nagyág). In Kazakhstan, from the Zavodinskii mine, near Ziryanovskii, Altai Mountains. In Japan, from the Teine mine, northwest of Sapporo, Hokkaido, and the Kawazu and Susaki mines, Shizuoka Prefecture. In the USA, in Colorado, from Cripple Creek, Teller Co., in the Good Hope mine, Gunnison Co., and the Keystone, Smuggler, and John Jay mines, Central district, Boulder Co.; from the Goldfield-Belmont, Clermont, and Mohawk mines, Goldfield district, Esmeralda Co., Nevada. Large crystals from the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: For its composition as a TELLURium dioxide.

(1) Gunnison Co., Colorado, USA.

Occurrence: In hydrothermal veins; may be of both primary and secondary origin; a sublimate in volcanic fumaroles.

Association: Gold, sylvanite, empressite, altaite, pyrite, galena, alabandite, barite, quartz, carbonates.

Distribution: In Romania, from Faţa Băii (Zlatna, Faczebaj) [TL] and Baia-de-Arieş (Offenbánya). At the Fossa volcano, Vulcano, Lipari Islands, Italy. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. Large cleavages at the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the USA, from many localities in Colorado, including Cripple Creek, Teller Co.; in the Magnolia, Gold Hill, Ballarat, and Central districts, Boulder Co.; and at the Vulcan mine, Gunnison Co.; in Nevada, at the Mohawk and Clermont mines, Goldfield district, Humboldt Co., and from Delamar, Lincoln Co. At the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. From the El Indio mine, east of La Serena, Coquimbo, Chile. At Kalgoorlie, Western Australia. In the Teine mine, northwest of Sapporo, Hokkaido, and in the Kawazu mine, near Sizewka, Shizuoka Prefecture, Japan. From the Emperor mine, Vatukoula, Viti Levu, Fiji Islands. At the Guilaizhuang gold deposit, Shandong Province, and in the Dashuigou tellurium deposit, Sichuan Province, China. Additional minor localities are known.

Name: Latin name for *the earth*, *tellus*.

(1) Tellurium mine, Virginia, USA. (2) Oya mine, Japan. (3) Bi_2Te_3.

Polymorphism & Series: Forms a series with tellurantimony.

Mineral Group: Tetradymite group.

Occurrence: Typically formed in hydrothermal gold-quartz veins of low sulfur content.

Association: Gold, bismuth, gold tellurides, tetradymite, altaite, chalcopyrite, pyrrhotite.

Distribution: In the USA, from Field's vein, Dahlonega, Lumpkin Co., Georgia [TL]; in the Tellurium mine, Fluvanna Co., Virginia; in New Mexico, from the Little Mildred mine, near Hachita, Grant Co.; at the Campbell mine, Bisbee, Cochise Co., Arizona; in Colorado, from near Whitehorn, Fremont Co. and at the Little Gerald and Hamilton mines, Sierra Blanca, Huerfano, Costilla, and Alamosa Cos. In Canada, a number of minor occurrences, as at the Hunter mine, Khutze Inlet, near Swanson Bay; from the Lucky Jim mine, Quadra Island, and at the Ashloo mine, near Squamish, Howe Sound, British Columbia; from the Robb-Montbray mine, Montbray Township, and at the Horne mine, Noranda, Quebec. From the Uzelga copper deposit, Ural Mountains, Russia. At the Zhanatyube deposit, Kazakhstan. In Japan, in the Oya mine, Miyagi Prefecture; the Ojiri mine, Iwate Prefecture; the Suwa mine, Ibaragi Prefecture; and the Kiura mine, Oita Prefecture. At the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. From the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. At the Bulawan deposit, Negros Occidental, Phillipines. In Sweden, at Boliden, Västerbotten. In Wales, from the Clogau-St. Davids mine, Mangtall Mountains, Dollgelly, and the Vigra mine, Llanaker, Merionshire.

Name: For the composition.

Occurrence: Cogenetic with moderately high-temperature invasive chalcopyrite magma (Temagami Mine, Canada).

Association: Merenskyite, hessite, chalcopyrite, stützite.

Distribution: In Canada, in Ontario, from the Temagami Cu–Ni mine, Temagami Island, Lake Temagami, Nipissing district [TL] and from a prospect near Rathbun Lake. In the USA, from the Stillwater complex, Montana; and the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming.

Name: For the Temagami mine in Canada, where the mineral was first found.

Type Material: Royal Ontario Museum, Toronto, Canada, M32528.

			Total	99.44	100.00

(1) Tongbiguan village, China; IR confirmed the presence of $(MoO_4)^{2-}$, $(UO_2)^{2-}$, H_2O, and lack of $(OH)^{1-}$; after deduction of impurities, corresponds to $Ca_{0.96}O_5(UO_2)_{6.18}(MoO_4)_{1.89} \cdot 11.88H_2O$.
(2) $CaO_5(UO_2)_6(MoO_4)_2 \cdot 12H_2O$.

Occurrence: In the oxidized portions of a uranium deposit in migmatite and gneiss.

Association: Studtite, calcurmolite.

Distribution: From Tongbiguan village, Tengchong Co., Yunnan Province, China.

Name: For Tengchong Co., China, where the first specimens were found.

Type Material: Beijing Uranium Geology Research Institute, Beijing, China.

(1) Ytterby, Sweden; by X-ray fluorescence analysis, CO_2 calculated for charge balance, H_2O calculated by difference, CaO attributed to impurities; corresponds to $(Y_{1.14}Gd_{0.16}Dy_{0.16}Nd_{0.15}Sm_{0.12}Ce_{0.04}Er_{0.04}Tb_{0.02}Pr_{0.02}Yb_{0.02}Ho_{0.02}Tm_{0.01}La_{0.01})_{\Sigma=1.91}(CO_3)_{2.95} \cdot nH_2O$. (2) Iisaka, Japan; by ICP-AES analysis, CaO attributed to impurities; corresponds to $(Y_{1.70}Dy_{0.04}Er_{0.03}Yb_{0.02}Gd_{0.02}Nd_{0.01}Ho_{0.01}Sm_{0.01})_{\Sigma=1.84}C_{3.03}O_9 \cdot 3.07H_2O$.

Occurrence: An alteration coating on yttrium-bearing minerals.

Association: Gadolinite-(Y), lokkaite-(Y), kimuraite-(Y), bastnäsite-(Ce), lanthanite, synchysite, calcite, quartz.

Distribution: In Sweden, from Ytterby, on Resarö Island, near Vaxholm, and at Åskagen, Värmland. From Rosås, Norway. At the Pyörönmaa pegmatite, Kangasala, and Lövböle, Kemiö, Finland. From Iisaka and Suishoyama, Fukushima Prefecture, Japan. In the Evans-Lou pegmatite, 32 km north of Hull, Quebec, Canada. In the USA, from the Baringer Hill pegmatite, 26 km west of Burnet, and the Rode Ranch pegmatite, near Bluffton, Llano Co., and from the Clear Creek pegmatite, Burnet Co. Texas. Additionally reported localities require modern confirmation.

Name: To honor C. Tenger, Swedish chemist who studied the mineral.

Type Material: National Science Museum, Tokyo, Japan, M25981; National Museum of Natural History, Washington, D.C., USA, R13924.

Tennantite $(Cu, Ag, Zn, Fe)_{12}As_4S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals are tetrahedral, as large as 20 cm; may be as groups of parallel crystals; commonly massive, coarse or fine granular to compact. *Twinning:* Twin axis [111], twin plane {111}, as contact and penetration twins, commonly repeated.

Physical Properties: *Fracture:* Subconchoidal to uneven. *Tenacity:* Somewhat brittle. Hardness = 3–4.5 VHN = 294–380 (100 g load). D(meas.) = 4.62 D(calc.) = 4.61

Optical Properties: Opaque, except in very thin fragments. *Color:* Flint-gray to iron-black, cherry-red in transmitted light; in polished section, gray inclining to black to brown to cherry-red (high As and low Fe). *Luster:* Metallic, commonly splendent.
Optical Class: Isotropic. $n = > 2.72$ (Li).

R: (400) 31.5, (420) 31.4, (440) 31.4, (460) 31.2, (480) 31.0, (500) 30.8, (520) 30.6, (540) 30.2, (560) 29.7, (580) 29.0, (600) 28.3, (620) 27.7, (640) 27.1, (660) 26.6, (680) 26.2, (700) 25.9

Cell Data: *Space Group:* $I\bar{4}3m$. $a = 10.19$ $Z = 2$

X-ray Powder Pattern: Binntal, Switzerland.

(1) Molly Gibson mine, Colorado, USA; corresponds to $(Cu_{9.36}Ag_{2.11}Zn_{1.75}Fe_{0.12}Pb_{0.07})_{\Sigma=13.41}(As_{3.82}Sb_{0.02})_{\Sigma=3.84}S_{13.00}$. (2) San Lorenzo mine, Santiago, Chile; corresponds to $(Cu_{10.17}Zn_{1.43}Fe_{0.41}Ag_{0.01})_{\Sigma=12.02}(As_{2.58}Sb_{1.37})_{\Sigma=3.95}S_{13.00}$. (3) $Cu_{12}As_4S_{13}$.

Polymorphism & Series: Forms a series with tetrahedrite.

Mineral Group: Tetrahedrite group.

Occurrence: In hydrothermal veins and contact metamorphic deposits.

Association: Cu–Pb–Zn–Ag sulfides and sulfosalts, pyrite, calcite, dolomite, siderite, barite, fluorite, quartz.

Distribution: From numerous localities; rarer than tetrahedrite. In England, in Cornwall [TL], from a number of mines in Gwennap, Gwinear, Illogan, St. Just, and elsewhere. An ore mineral in the Gortdrum mine, near Tipperary, Co. Tipperary, Ireland. In Germany, from Freiberg, Saxony. In Poland, at Kupferberg-Rudelstadt, Silesia. In Switzerland, from the Lengenbach quarry, Binntal, Valais. At Dzhezkazgan, Kazakhstan. In the USA, in Colorado, from many localities, including the Freeland mine, Idaho Springs, Clear Creek Co.; in the Central City district, Gilpin Co.; at the Molly Gibson and other mines, Aspen, Pitkin Co.; in the Red Mountain district, San Juan Co.; from the Champion Lode, Geneva, Georgetown district, Clear Creek Co.; at Butte, Silver Bow Co., Montana. From Concepción del Oro, Zacatecas, Mexico. At Morococha and Quiruvilca, Peru. From the El Teniente mine, 67 km west of Rancagua, O'Higgins Province, Chile. At Yaogonxian, Hunan Province, China. From Tsumeb, Namibia, remarkable large crystals.

Tenorite CuO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Lathlike crystals, flattened on [100], elongated along [011], to 2 mm; curved, scaly, dendritic; commonly pulverulent, earthy, massive. *Twinning:* On {011}, contact plane, common, forming stellate groups; lamellar.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle; flexible and elastic in thin scales. Hardness = 3.5 VHN = 190–300 (100 g load). D(meas.) = 6.45 (synthetic). D(calc.) = 6.515(2)

Optical Properties: Opaque, transparent only in the thinnest scales. *Color:* Steel-gray, iron-gray, black; brown in transmitted light; light gray with golden tint in reflected light. *Luster:* Metallic.
Optical Class: Biaxial. *Pleochroism:* Distinct; light to dark brown. *Orientation:* $Y = b$; $Z \simeq c$. 2V(meas.) = Large. *Anisotropism:* Strong; blue to gray. *Bireflectance:* Strong.
R_1–R_2: (400) 22.8–29.6, (420) 21.9–30.0, (440) 21.0–30.4, (460) 20.4–30.6, (480) 20.1–30.8, (500) 19.8–30.7, (520) 19.7–30.4, (540) 19.6–30.2, (560) 19.5–29.8, (580) 19.5–29.6, (600) 19.4–29.4, (620) 19.4–29.2, (640) 19.4–29.1, (660) 19.4–28.8, (680) 19.3–28.6, (700) 19.3–28.2

Cell Data: *Space Group:* $C2/c$. $a = 4.6837(5)$ $b = 3.4226(5)$ $c = 5.1288(6)$ $\beta = 99.54(1)^\circ$ Z = 4

X-ray Powder Pattern: Synthetic.
2.523 (100), 2.323 (96), 2.530 (49), 2.312 (30), 1.866 (25), 1.505 (20), 1.375 (19)

Chemistry: Nearly pure CuO; modern analyses are not available.

Occurrence: Commonly in the oxidized zone of hydrothermal copper deposits; a volcanic sublimate.

Association: Cuprite, copper, chrysocolla, malachite, azurite, Fe–Mn oxides (hydrothermal); copper chlorides, alkali chlorides, cotunnite (volcanic).

Distribution: Many localities, but few for well-crystallized or pure material. From Vesuvius, Campania, and Etna, Sicily, Italy. In England, at a number of mines in Gwennap, Redruth, St. Just, and elsewhere in Cornwall. At Leadhills, Lanarkshire, Scotland. From Rio Tinto, Huelva Province, Spain. In Germany, at Siegen, Westphalia; from Daaden, Rhineland-Palatinate; and at Neubulach, Black Forest. At Jáchymov (Joachimsthal), Czech Republic. In Russia, from Bogoslovsk and Nizhni Tagil, Ural Mountains, and at the Tolbachik fissure volcano, Kamchatka Peninsula. In the USA, from Copper Harbor, Keweenaw Co., Michigan; at Darwin, Inyo Co., California; an ore at Bisbee, Cochise Co., Arizona. From Chuquicamata, Antofagasta, Chile. At Tsumeb, Namibia.

Name: To honor Professor Michele Tenore (1781–1861), Italian botanist, University of Naples, Naples, Italy.

Tephroite $Mn_2^{2+}SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals typically short, prismatic, to 4 cm, or anhedral, equidimensional. Commonly in disseminated grains, compact, or massive. *Twinning:* {011}, not common.

Physical Properties: *Cleavage:* {010}, distinct; {001}, imperfect. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 3.87–4.12 D(calc.) = 4.15

Optical Properties: Transparent to translucent. *Color:* Olive-green, bluish green, gray, flesh-red, reddish brown; pale green in thin section, may be colorless. *Streak:* Pale gray. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (–). *Pleochroism:* None or weak; X = brownish red; Y = reddish; Z = greenish blue. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.770$–1.788 $\beta = 1.807$–1.810 $\gamma = 1.817$–1.825 2V(meas.) = 60°–70°

Cell Data: *Space Group: Pbnm.* $a = 4.86$–4.90 $b = 10.59$–10.62 $c = 6.22$–6.25 Z = 4

Chemistry:

	(1)	(2)
SiO_2	29.27	29.75
FeO	1.20	
MnO	65.23	70.25
MgO	1.98	
CaO	2.32	
Total	100.00	100.00

(1) Benallt mine, Wales; corresponds to $(Mn^{2+}_{1.84}Mg_{0.10}Ca_{0.08}Fe^{2+}_{0.03})_{\Sigma=2.05}Si_{0.97}O_4$. (2) Mn_2SiO_4.

Polymorphism & Series: Forms two series, with fayalite, and with forsterite.

Mineral Group: Olivine group.

Occurrence: In Fe–Mn ore deposits, related skarns, and metamorphosed manganese-rich sediments.

Association: Zincite, willemite, franklinite, rhodonite, jacobsite, diopside, gageite, bustamite, manganocalcite, glaucochroite, calcite, banalsite, alleghanyite.

Distribution: In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at Bald Knob, near Sparta, Alleghany Co., North Carolina; and in the Sunnyside mine, San Juan Co., Colorado. From Buritirama, Piaui, Brazil. In the Harstigen mine, near Persberg; at Långban, Värmland; and in the Sjö mine, near Grythyttan, Örebro, Sweden. From the Benallt mine, near Rhiw, Lleyn Peninsula, Gwennyd, Wales. In the Meldon quarry, Okehampton, Devon, and the Treburland mine, Altarnun, Cornwall, England. At Val Malenco, Lombardy, Italy. From Bonneval-sur-Arc, Haute-Maurienne, Isère, France. Large crystals from the Wessels mine, near Kuruman, Cape Province, South Africa. In the Kaso mine, Totigi Prefecture, and the Noda-Tamagawa mine, Iwate Prefecture, Japan. From Broken Hill and Tamworth, New South Wales, Australia. On the Clark Peninsula, Wilkes Land, Antarctica.

Name: From the Greek for *ash-colored.*

(1–2) Terlingua, Texas, USA; each value is an average of several analyses. (3) Hg_2OCl.

Occurrence: A rare secondary mineral in hydrothermal mercury deposits.

Association: Cinnabar, metacinnabar, eglestonite, kleinite, montroydite, calomel, mercury.

Distribution: In the USA, from Terlingua, Brewster Co., Texas; in the McDermitt mercury mine, Opalite district, and from the Cahill mine, Poverty Peak district, Humboldt Co., Nevada; at the Kings mine, Parkfield district, Kings Co., and the Nepper and Clear Creek mines, New Idria district, San Benito Co., California. In Mexico, from Huahuaxtla, Guerrero; Pedernales, Chihuahua; and Guadalćazar, San Luis Potosi. At Landsberg, near Obermoschel, Rhineland-Palatinate, Germany. From Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan. A few other minor or poorly-defined localities are known.

Name: For its occurrence at Terlingua, Texas, USA.

Type Material: n.d.

MgO	0.2	0.59	
H_2O		[21.81]	19.60
Total		[100.00]	100.00

(1) Foote mine, North Carolina, USA; by electron microprobe, original analysis given as elements, here converted to oxides, total Mn as MnO, total Fe as Fe_2O_3, H_2O by difference; corresponding to $(Mn^{2+}_{0.94}Fe^{3+}_{0.04}Ca_{0.01}Mg_{0.01})_{\Sigma=1.00}(Sn^{4+}_{0.98}Si_{0.01}Al_{0.01})_{\Sigma=1.00}(OH)_6$. (2) Långban, Sweden; by electron microprobe, total Mn as MnO. (3) $MnSn(OH)_6$.

Polymorphism & Series: Dimorphous with wickmanite.

Mineral Group: Stottite group.

Occurrence: As a very rare late-formed mineral in fractures in lithium-rich pegmatite (Foote mine, North Carolina, USA); on a museum specimen from a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Bavenite, eakerite, siderite–rhodochrosite, albite, quartz (Foote mine, North Carolina, USA); magnetite, barite (Långban, Sweden).

Distribution: In the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA. At Långban, Värmland, Sweden.

Name: As the TETRAgonal dimorph of *wickmanite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120239, 121265.

Terskite $Na_4ZrSi_6O_{15}(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* $mm2$. Crystals platy, to 3.5 mm.

Physical Properties: Hardness = ∼5 VHN = 426–519 (40 g load). D(meas.) = 2.71 D(calc.) = 2.74 Fluoresces bright green or very pale yellow under SW UV.

Optical Properties: Semitransparent. *Color:* Pale lilac; nearly colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, weak. $\alpha = 1.576(2)$ $\beta = 1.582(2)$ $\gamma = 1.584(2)$ 2V(meas.) = 53°

Cell Data: *Space Group:* $Pnc2$. $a = 14.195(8)$ $b = 14.750(5)$ $c = 7.511(2)$ Z = 4

X-ray Powder Pattern: Mt. Alluaiv, Russia.
3.324 (100), 3.299 (100), 3.257 (100), 3.186 (80), 2.615 (70), 3.126 (60), 2.565 (60)

Chemistry:

	(1)
SiO_2	56.3
ZrO_2	17.8
MnO	0.4
Na_2O	19.0
LOI	6.37
Total	99.87

(1) Mt. Alluaiv, Russia; by electron microprobe, average of analyses on three grains, loss on ignition taken as H_2O; corresponds to $(Na_{3.97}Mn_{0.04})_{\Sigma=4.01}Zr_{0.94}Si_{6.06}O_{16.02} \cdot 2.29H_2O$.

Occurrence: In veins in pegmatites in alkalic massifs.

Association: Potassic feldspar, sodalite, davyne, arfvedsonite, aegirine, eudialyte (Mt. Alluaiv, Russia); villiaumite, ussingite, gmelinite, tetranatrolite, epistolite, eudialyte, polylithionite, albite (Mont Saint-Hilaire, Canada); eudialyte, microcline, zakharovite, aegirine, nenadkevichite, mangan-neptunite, shkatulkaite (Saint-Amable, Canada).

Distribution: On Mts. Alluaiv and Karnasurt, Lovozero massif, and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia. In the Ilímaussaq intrusion, southern Greenland. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: For the Tersk shore of the White Sea, southeastern Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5778/1; Mineralogical Museum, St. Petersburg University, St. Petersburg, 17090; Mining Institute, St. Petersburg, 1034/1; Vernadsky Geological Museum, Moscow, 57773; A.E. H_2O^+	25.57	
H_2O^-	2.82	
H_2O		28.32
Total	[100.00]	100.00

(1) Loma Blanca deposit, Argentina; recalculated to 100% from an original total of 99.94% after deduction of SiO_2 0.29%; then corresponds to $Ca_{3.98}Mg_{1.00}As_{1.99}B_{12}O_{22}(OH)_{12}\cdot 14H_2O$.
(2) $Ca_4MgAs_2B_{12}O_{22}(OH)_{12}\cdot 14H_2O$.

Occurrence: In lacustrine borate deposits, typically associated with volcanic hot springs and diagensis of playa sediments.

Association: Inyoite, calcite, ulexite, aragonite, realgar, montmorillonite (Loma Blanca deposit, Argentina); colemanite, meyerhofferite, ulexite (Emet deposits, Turkey).

Distribution: From the Loma Blanca borate deposit, eight km southwest of Coranzulí, Jujuy Province, Argentina. At the Hisarcık borate mine, near Emet, Kütahya Province. Turkey.

Name: Honors Mario E. Teruggi, Professor of Sedimentology and Petrology, National University, Plata, Argentina.

Type Material: Harvard University, Cambridge, Massachusetts, 109056; National Museum of Natural History, Washington, D.C., USA, 145925.

Total	100	100	99.7

(1) Locality "Y", China; by electron microprobe, corresponding to $(Pd_{0.89}Ni_{0.06})_{\Sigma=0.95}(Sb_{0.63}Bi_{0.34})_{\Sigma=0.97}Te_{1.03}$. (2) Do.; by electron microprobe, corresponding to $Pd_{0.91}(Sb_{0.65}Bi_{0.30})_{\Sigma=0.95}Te_{1.05}$. (3) Kambalda, Western Australia; by electron microprobe, corresponding to $(Pd_{0.97}Pt_{0.01}Ni_{0.01}Ag_{0.01})_{\Sigma=1.00}(Sb_{0.63}Bi_{0.33})_{\Sigma=0.96}Te_{1.04}$.

Mineral Group: Pyrite group.

Occurrence: In a Cu–Ni sulfide deposit in a serpentine body intruded into a Permian formation of metamorphic rocks (Locality "Y", China); in Cu–Ni sulfide deposits in clinopyroxenite intruding sandy shales and volcanics (Locality "W", China).

Association: Michenerite, gersdorffite, cobaltite, pyrrhotite, chalcopyrite, pentlandite (Locality"Y", China); pyrrhotite, pentlandite, chalcopyrite, violarite, cubanite, bornite, sphalerite, galena, linnaeite, magnetite, sudburyite, sperrylite, omeiite, gold (Danba, China).

Distribution: From Locality "Y" (a code name), in southwestern China [TL]; also at the "W" deposit, in northeastern China [TL]. From Danba, Sichuan Province, China. At Kambalda, 56 km south of Kalgoorlie, Western Australia. From the Nausahi complex, Orissa, India. In the Uitkomst complex, Eastern Transvaal, South Africa. From the Wellgreen Cu–Ni–Pt–Pd deposit, Yukon Territory, Canada.

Name: For TEllurium, antimony (STIBium), and PALLADium in the composition.

(1) Ciclova, Romania. (2) Near Bradshaw City, Yavapai Co., Arizona, USA. (3) Žubkov, Slovakia; by electron microprobe. (4) Bi_2Te_2S.

Mineral Group: Tetradymite group.

Occurrence: In hydrothermal gold-quartz veins of medium to high temperature of formation; also in contact metamorphic deposits.

Association: Tellurium, tellurobismuthite, gold, silver, bismuth, hessite, petzite, calaverite, matildite, altaite, pyrite, pyrrhotite, galena, sphalerite, arsenopyrite, chalcopyrite, quartz.

Distribution: In small amounts at numerous localities world-wide; the following are only a sampling. In Slovakia, from Žubkov (Schubkau) [TL], as fine twinned crystals. In Romania, from Băiţa (Rezbánya), also Ciclova, Moraviţa (Moravicza), and Oraviţa (Oravicza). In Norway, from Narverud and Seljord. Rich at Boliden, Västerbotten, Sweden. In the USA, from Trail Creek, Blaine Co., Idaho; in New Mexico, in the Sylvanite district, Hidalgo Co.; and in Virginia, at the Whitehall mines, Spotsylvania Co. In Canada, from many localities, as near Liddle Creek, West Kootenay, and at the White Elephant mine, near Vernon, British Columbia; from Red Lake at Bigstone Bay, Lake of the Woods, Ontario; in Quebec, at the McWatters mine, Rouyn Township, and in the Eureka mine, Abitibi Co. The principal ore mineral, in large crystals, from the Dashuigou tellurium deposit, Sichuan Province, China.

Name: From the Greek for *fourfold* and *twin*, an allusion to the twin crystals.

Tetraferroplatinum ≈PtFe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As tiny grains typically embedded in other Pt–Fe alloys.

Physical Properties: Hardness = n.d. VHN = 306–401. D(meas.) = n.d. D(calc.) = [15.7] Ferromagnetic.

Optical Properties: Opaque. *Color:* White in reflected light. *Luster:* Metallic. *Anisotropism:* Weak, in oil.
R: (400) – , (420) 58.5, (440) 59.9, (460) 61.4, (480) 61.9, (500) 62.7, (520) 63.7, (540) 64.2, (560) 64.5, (580) 64.8, (600) 65.0, (620) 64.8, (640) 64.8, (660) 64.6, (680) 64.9, (700) 65.2

Cell Data: *Space Group:* n.d. $a = 3.850(5)$ $c = 3.693(6)$ Z = [2]

X-ray Powder Pattern: Mooihoek mine, South Africa.
2.191 (100), 1.920 (70b), 1.342 (60b), 1.152 (50b), 1.099 (30b), 2.721 (20), 1.709 (20)

Chemistry:

	(1)	(2)	(3)
Pt	78.0	77.0	77.74
Rh		0.8	
Ir	0.32		
Fe	14.9	22.0	22.26
Cu	6.1		
Ni	0.50		
Sb	0.40		
Total	100.22	100.6	100.00

(1) Mooihoek mine, South Africa; by electron microprobe, corresponding to $(Pt_{1.03}Ir_{0.01})_{\Sigma=1.04}(Fe_{0.69}Cu_{0.24}Ni_{0.02}Sb_{0.01})_{\Sigma=0.96}$. (2) Sorashigawa placers, Japan; by electron microprobe, corresponding to $Pt_{0.50}Rh_{<0.01}Fe_{0.50}$. (3) PtFe.

Occurrence: In a hortonolite dunite (Mooihoek, South Africa); in Uralian ultramafics and placers derived therefrom.

Association: Geversite, irarsite, majakite, sperrylite, stannopalladinite, plumbopalladinite, chalcopyrite, pentlandite, chromite, galena, magnetite.

Distribution: In South Africa, from the Mooihoek [TL] and Onverwacht mines, in the Merensky Reef, Bushveld complex, Transvaal. At the Taimyr and Noril'sk-I mines, Noril'sk region, western Siberia; from the Ioko-Dovyren massif, Baikal region, southern Siberia; at the Kytlym and Uktus complexes, and in placers around Nizhni Tagil, Ural Mountains; and at the Konder massif, Aldan Shield, Sakha Russia. From Yubdo, Ethiopia. At the Herbeira ultramafic massif, Cabo Ortegal, [notinColombiaG]??, Spain. In the Pirogues River, New Zealand. From the Sorashigawa placers, ??Prefecture, Japan. In Canada, in the Tulameen and Similkameen Rivers, British Columbia, and in concentrates from the Wellgreen Cu–Ni–Pt–Pd deposit, Yukon Territory. At Nye, Stillwater Co., Montana, USA.

Name: For crystallization in the TETRAgonal system, and iron, FERRum, and PLATINUM in its composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 136552.

Tetrahedrite $(Cu, Fe, Ag, Zn)_{12}Sb_4S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Crystals are tetrahedral, to 15 cm; common as groups of parallel crystals; massive, coarse or fine and granular to compact. *Twinning:* On {111} around [111] as twin axis; contact and penetration twins, commonly repeated.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Somewhat brittle.
Hardness = 3–4.5 VHN = 312–351 (100 g load). D(meas.) = 4.97 D(calc.) = 4.99

Optical Properties: Opaque, except in very thin fragments. *Color:* Flint-gray to iron-black to dull black, cherry-red in transmitted light; in polished section, gray inclining to olive-brown. *Streak:* Black to brown. *Luster:* Metallic, commonly splendent.
Optical Class: Isotropic. $n = > 2.72$ (Li).

R: (400) 32.1, (420) 31.8, (440) 31.7, (460) 31.7, (480) 31.8, (500) 32.0, (520) 32.2, (540) 32.4, (560) 32.4, (580) 32.3, (600) 32.0, (620) 31.5, (640) 31.0, (660) 30.6, (680) 30.2, (700) 29.8

Cell Data: *Space Group:* $I\bar{4}3m$. $a = 10.23$–10.55 $Z = 2$

X-ray Powder Pattern: Neuglück mine, Wittichen, Black Forest, Germany.
3.00 (100), 1.831 (60), 1.563 (30), 2.61 (20), 1.056 (20), 3.69 (10), 2.46 (10)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
Cu	45.39	37.7	45.77	Fe	1.32	5.5	
Ag		0.4		Sb	28.85	29.3	29.22
Pb	0.11			As	trace	0.8	
Zn		1.8		S	24.48	24.9	25.01
				Total	100.15	100.4	100.00

(1) Bourg d'Oisans, France. (2) Val del Frigido, Tuscany, Italy; by electron microprobe.
(3) $Cu_{12}Sb_4S_{13}$.

Polymorphism & Series: Forms a series with tennantite and freibergite.

Mineral Group: Tetrahedrite group.

Occurrence: Typically in hydrothermal veins or contact metamorphic deposits of low to medium temperature of formation.

Association: Chalcopyrite, galena, sphalerite, pyrite, bornite, acanthite, calcite, dolomite, siderite, barite, fluorite, quartz.

Distribution: One of the most common of the sulfosalts. Only a few localities which have produced well-crystallized material can be mentioned. In Germany, from Freiberg, Saxony, and in the Harz Mountains, at Clausthal and Horhausen. From near Brixlegg, Tirol, Austria. At Botés, near Zlatna, and Cavnic (Kapnikbánya), Romania. In France, at Irazein, Ariège, France, a few exceptionally large crystals, and from Sainte-Marie-aux-Mines, Haut-Rhin. In Cornwall, England, at the Herodsfoot mine. In Algeria, from near Tenés and Mouzaía. In Bolivia, at the San José mine, Oruro. In Peru, from Casapalca, Junin, in the Huallanca and Quiruvilca districts, and at many other places. From the Noche Buena mine, Mazapil, and at the El Cobre mine, Concepción del Oro, Zacatecas, Mexico. In the USA, in the Daly-Judge and other mines, Park City district, Summit Co., Utah. From the Nanisivik mine, Baffin Island, Nunavut, Canada.

Name: In allusion to the tetrahedral crystal shape.

Tetrarooseveltite β–$Bi(AsO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As indistinct crystals, to 50 μm, in powdery aggregates.

Physical Properties: Hardness = 2.5 D(meas.) = n.d. D(calc.) = 7.64

Optical Properties: Semitransparent. *Color:* White to pale yellowish. *Luster:* Earthy. *Optical Class:* Uniaxial (+). $n = 2.20(5)$

Cell Data: *Space Group:* $I4_1/a$ (synthetic). $a = 5.085(5)$ $c = 11.69(2)$ $Z = 4$

X-ray Powder Pattern: Moldava fluorite mine, Czech Republic.
3.066 (100), 1.933 (55), 1.551 (17), 2.546 (12), 4.660 (11), 1.797 (11), 1.581 (10)

Chemistry:

	(1)	(2)
P_2O_5	0.02	
As_2O_5	33.02	33.03
Bi_2O_3	66.96	66.97
Total	100.00	100.00

(1) Moldava fluorite mine, Czech Republic; average of six analyses. (2) $Bi(AsO_4)$.

Polymorphism & Series: Dimorphous with rooseveltite.

Occurrence: A rare secondary mineral in vugs in an oxidized fluorite–barite–quartz vein.

Association: Bayldonite, malachite, mimetite, fluorite, quartz.

Distribution: In the Moldava fluorite mine, about 20 km northwest of Teplice, Krušné hory Mountains, Czech Republic.

Name: As the *tetra*gonal dimorph of *rooseveltite*.

Type Material: Národní Museum, Prague, Czech Republic, P1N 84 563.

References: (1) Sejkora, J. and T. Řídkošil (1994) Tetrarooseveltite, β–$Bi(AsO_4)$, a new mineral species from Moldava deposit, the Krušné hory Mts., northwestern Bohemia, Czech Republic. Tetrataenite FeNi

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Irregular crystals, to 100 μm, as grains and in rims around taenite.

Physical Properties: Hardness = n.d. VHN = 170–200 (25 g load). D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Creamy in reflected light. *Luster:* Metallic. *Anisotropism:* Distinct on well-polished surfaces, bluish green to brownish orange.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P4/mmm$. a = 2.533(2) c = 3.582(2) Z = 1

X-ray Powder Pattern: Linville Ni-rich ataxite meteorite.
3.40 (100), 2.879 (80), 2.526 (80), 4.239 (60), 2.279 (10), 2.187 (10), 2.070 (10)

Chemistry:

	(1)	(2)
Fe	49.00	48.75
Ni	51.00	51.25
Cu	0.20	
Co	0.08	
P	< 0.01	
Total	100.28	100.00

(1) By electron microprobe, average of analyses from 18 meteorites. (2) FeNi.

Occurrence: In slowly cooled meteorites, by the ordering of Fe and Ni atoms in taenite. It is most abundant in mesosiderites and chondrites.

Association: Kamacite, troilite, taenite.

Distribution: Widely distributed in chondrite, mesosiderite, iron, and pallas types of meteorites.

Name: In allusion to the symmetry of the mineral, and the genetic link to taenite.

Type Material: National Museum of Natural History, Washington, D.C., USA, meteorite collection 1025.

References: (1) Ramsden, A.R. and E.N. Cameron (1966) Kamacite and taenite superstructures and a metastable tetragonal phase in iron meteorites. Amer. Mineral., 51, 37–55. Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m$ (probable). Pyramidal pseudo-octahedral crystals, with prominent {112}, {001}, and {100}, pseudocubic to rhombic; in globular, rough masses, to 1 mm.

Physical Properties: Hardness = n.d. D(meas.) = 3.65 D(calc.) = 3.79

Optical Properties: Transparent to translucent. *Color:* Honey-yellow, brownish orange, bright yellow.
Optical Class: Uniaxial (–). $\omega = 1.724$ $\epsilon = 1.720$

Cell Data: *Space Group:* $P4_2/n$. $a = 7.787(1)$ $c = 7.797(1)$ Z = [4]

X-ray Powder Pattern: Foote mine, North Carolina, USA.
3.939 (100), 2.7698 (90), 1.7604 (50), 1.6050 (40), 4.518 (30), 3.880 (30), 2.2637 (25)

Chemistry:

	(1)	(2)	(3)
WO_3		6.52	
SiO_2	0.9		
SnO_2	45.7	45.02	54.67
Al_2O_3	0.4		
Fe_2O_3	1.3		
MnO	25.2	25.90	25.73
CaO	0.3	0.16	
MgO	0.2	0.59	
H_2O		[21.81]	19.60
Total		[100.00]	100.00

(1) Foote mine, North Carolina, USA; by electron microprobe, original analysis given as elements, here converted to oxides, total Mn as MnO, total Fe as Fe_2O_3, H_2O by difference; corresponding to $(Mn^{2+}_{0.94}Fe^{3+}_{0.04}Ca_{0.01}Mg_{0.01})_{\Sigma=1.00}(Sn^{4+}_{0.98}Si_{0.01}Al_{0.01})_{\Sigma=1.00}(OH)_6$. (2) Långban, Sweden; by electron microprobe, total Mn as MnO. (3) $MnSn(OH)_6$.

Polymorphism & Series: Dimorphous with wickmanite.

Mineral Group: Stottite group.

Occurrence: As a very rare late-formed mineral in fractures in lithium-rich pegmatite (Foote mine, North Carolina, USA); on a museum specimen from a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Bavenite, eakerite, siderite–rhodochrosite, albite, quartz (Foote mine, North Carolina, USA); magnetite, barite (Långban, Sweden).

Distribution: In the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA. At Långban, Värmland, Sweden.

Name: As the TETRAgonal dimorph of *wickmanite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120239, 121265.

References: (1) White, J.S., Jr. and J.A. Nelen (1973) Tetrawickmanite, tetragonal $MnSn(OH)_6$, a new mineral from North Carolina, and the stottite group. Mineral. Record, 4, 24–30. (2) (1973) Amer. Thadeuite $(Ca, Mn^{2+})(Mg, Fe^{2+}, Mn^{2+})_3(PO_4)_2(OH, F)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Cleavable massive, to ∼1 cm, also granular.

Physical Properties: *Cleavage:* On {010}, very good; another perpendicular. Hardness = < 4 D(meas.) = 3.25(1) D(calc.) = 3.21

Optical Properties: Translucent. *Color:* Yellow-orange. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = [1.568]$ $\beta = 1.597(2)$ $\gamma = 1.600(2)$ 2V(meas.) = 33(2)°

Cell Data: *Space Group:* $C222_1$. $a = 6.412(3)$ $b = 13.563(8)$ $c = 8.545(5)$ Z = 4

X-ray Powder Pattern: Panasqueira, Portugal.
3.38 (100), 3.00 (31), 2.793 (31), 2.626 (23), 2.185 (18), 3.61 (16), 1.696 (11)

Chemistry:

	(1)
P_2O_5	38.7
FeO	11.3
MnO	5.6
MgO	24.3
CaO	14.7
F	2.4
OH	[7.1]
$-O = (F_2, OH)$	[4.3]
Total	[99.8]

(1) Panasqueira, Portugal; by electron microprobe, average of three analyses, total Fe as FeO, total Mn as MnO; $(OH)^{1-}$ calculated for P:(OH+F) = 1:1; corresponds to $(Ca_{0.96}Mn_{0.04})_{\Sigma=1.00}(Mg_{2.21}Fe_{0.57}Mn_{0.25})_{\Sigma=3.03}(PO_4)_{2.00}[(OH)_{1.53}F_{0.46}]_{\Sigma=1.99}$.

Occurrence: A very rare primary mineral in the margins of hydrothermal veins, formed between 230°–360° C and 100–1000 bars.

Association: Fluorapatite, wolfeite, topaz, muscovite, sphalerite, quartz, chalcopyrite, pyrrhotite, siderite, arsenopyrite, chlorite, vivianite, althausite, panasqueiraite.

Distribution: In the Panasqueira Sn–W deposit, Portugal.

Name: Honoring Professor Décio Thadeu, Technical University, Lisbon, Portugal, for his studies on Portuguese ore deposits.

Type Material: Department of Geology and Mineralogy, University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA, 143141.

Thalcusite $Tl_2Cu_3FeS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$, $4mm$, 422, or $4/m\ 2/m\ 2/m$. As bladed crystals, to 1 mm; most commonly as grains.

Physical Properties: *Cleavage:* Parallel to grain elongation. *Tenacity:* Brittle. Hardness = n.d. VHN = 82–92, 88 average (10 g load). D(meas.) = 6.15 (synthetic). D(calc.) = 6.54

Optical Properties: Opaque. *Color:* Bronzy-black; in reflected light, rose-gray to pale lilac. *Luster:* Metallic. *Pleochroism:* Weak; pale gray with brownish lilac tint to dark gray. *Anisotropism:* Moderate; pale yellowish to very dark gray.
R_1–R_2: (400) — , (420) — , (440) 29.3–30.7, (460) 30.4–31.3, (480) 29.6–30.1, (500) 29.8–30.8, (520) 29.7–30.8, (540) 28.4–29.9, (560) 27.9–29.8, (580) 27.9–30.3, (600) 28.4–30.3, (620) 29.2–32.1, (640) 29.7–33.0, (660) 30.6–33.7, (680) 30.7–34.5, (700) 31.7–35.9

Cell Data: *Space Group:* $I\bar{4}md$, $I\bar{4}2m$, $I4mm$, $I422$, or $I4/mmm$. a = 3.882(5) c = 13.25(2) Z = 1

X-ray Powder Pattern: Majak mine, Russia.
2.91 (100), 2.53 (100), 3.73 (80), 1.941 (50), 1.717 (50), 3.31 (40), 2.18 (40)

Chemistry:

	(1)	(2)	(3)		(1)	(2)	(3)
K		2.30	0.02	Ag			0.02
Tl	52.2	42.34	51.07	Sb		0.23	0.03

Fe	9.1	7.43	7.59	S	16.3	18.17	16.74
				Total	100.2	97.97	100.38

(1) Majak mine, Russia; by electron microprobe, corresponding to $Tl_{2.01}Cu_{2.79}Fe_{1.28}S_{4.00}$. (2) Murun massif, Russia; by electron microprobe, corresponding to $(Tl_{0.94}K_{0.42})_{\Sigma=1.36}$ $Cu_{3.00}Fe_{0.94}S_{4.00}$. (3) Ilímaussaq intrusion, Greenland; by electron microprobe, original total given as 100.37%; corresponding to $Tl_{1.91}Cu_{3.01}Fe_{1.04}S_{4.00}$.

Occurrence: In base-metal sulfide deposits and hyperalkalic massifs.

Association: Platinum and palladium minerals, altaite, galena, sphalerite, djerfisherite, pentlandite, cubanite, chalcopyrite (Majak mine, Russia); chalcopyrite, chalcocite, bornite, idaite (Murun massif, Russia); gudmundite, cuprostibite, djerfisherite, galena, troilite (Ilímaussaq intrusion, Greenland).

Distribution: In Russia, from the Majak mine, Talnakh area, Noril'sk region, western Siberia [TL]; and at the Murun massif, southwest of Olekminsk, Sakha. From Kangerdluarssuk Fjord and at Nakkaalaaq Mountain, southern Greenland. In the Rajpura-Dariba polymetallic deposit, Rajasthan, India. From Mont Saint-Hilaire, Quebec, Canada.

Name: For the constituents THALlium; CUprum, *copper*; and Sulfur.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 77165.

Thalénite-(Y) $Y_3Si_3O_{10}(F,OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic; commonly metamict. *Point Group:* $2/m$. As tabular prismatic crystals, to 20 cm; commonly lamellar; as irregular segregations and embedded in fluorite.

Physical Properties: *Fracture:* Conchoidal, uneven to splintery. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 4.16–4.41 D(calc.) = 4.29

Optical Properties: Transparent to opaque. *Color:* Black, brown, greenish, pink; in thin section, colorless. *Luster:* Greasy.
Optical Class: Biaxial (–). n = ~1.73–1.76 when metamict. α = 1.716–1.731 β = 1.716–1.739 γ = 1.729–1.746 2V(meas.) = 68°–79°

Cell Data: *Space Group:* $P2_1/n$. a = 7.318(2) b = 11.134(3) c = 10.379(3) β = 97.24(2)° Z = 4

X-ray Powder Pattern: Kingman, Arizona, USA.
3.104 (vs), 2.808 (m+), 5.52 (m), 3.79 (m), 3.276 (m), 3.159 (m), 3.453 (mw)

(1) Österby, Sweden. (2) Kola Peninsula, Russia; by X-ray spectroscopy, $RE_2O_3 = Gd_2O_3$ 0.24%, Dy_2O_3 1.77%, Ho_2O_3 0.22%, Er_2O_3 2.92%, Tm_2O_3 0.26%, Yb_2O_3 2.40%, Lu_2O_3 0.19%; corresponds to $[Y_{2.70}Er_{0.08}Yb_{0.07}Dy_{0.05}(Lu,Gd,Tm,Ho)_{0.03}]_{\Sigma=2.93}Si_{3.06}O_{10}[F_{0.97}(OH)_{0.03}]_{\Sigma=1.00}$.

Occurrence: In granite pegmatites.

Association: Fluocerite, fergusonite, gadolinite, zircon, magnetite, allanite, fluorite, quartz, microcline.

Distribution: In Sweden, from Österby, Dalekarlien, and at Åskagen, Torsbacken, and Forskeelbach, Värmland. In Norway, from Hundholmen, Tysfjord, and Kragerö, Nordland; Högetveit, Evje; and Rossås, Setesdal. In the Pyörönmaa pegmatite, Kangasala, Finland. From the Keivy massif, Kola Peninsula, Russia. In the USA, in the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., Texas; in the Snowflake feldspar mine, Teller Co., and the White Cloud pegmatite, South Platte district, Jefferson Co., Colorado; and on the Guy Hazen claims, seven km south of Kingman, Mohave Co., Arizona. From Suishoyama and Iizaka, Fukushima Prefecture, and at Nosen, Yamanashi Prefecture, Japan.

Name: For Professor Tobias Robert Thalén (1827–1905), Swedish physicist, and its high *yttrium* content.

Type Material: n.d.

Cl	0.84	1.01
Total	100.51	98.03

(1) Oktyabr mine, Russia; by electron microprobe, average of 15 grains of 2 samples; corresponding to $(Tl_{5.58}K_{0.03})_{\Sigma=5.61}(Fe_{17.96}Ni_{5.99}Cu_{0.93})_{\Sigma=24.88}S_{26.39}Cl_{0.81}$. (2) Do.; by electron microprobe, the border zone of a zoned grain; corresponding to $(Tl_{4.15}K_{1.52})_{\Sigma=5.67}(Fe_{18.01}Ni_{5.51}Cu_{1.07})_{\Sigma=24.59}S_{26.33}Cl_{0.92}$.

Occurrence: In pentlandite-galena-chalcopyrite ores, localized at the contact of chalcopyrite and galena and included in pentlandite.

Association: Pentlandite, galena, chalcopyrite.

Distribution: From the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL].

Name: For the principal constituents, THALlium, FErrum for *iron*, NI for *nickel*, and Sulfur.

Type Material: Mining Institute, St. Petersburg, Russia, 1128/1.

Thaumasite $Ca_3Si(SO_4)(CO_3)(OH)_6 \cdot 12H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 6. Crystals prismatic, to 5 cm; typically acicular, radiating; powdery, compact, massive.

Physical Properties: *Cleavage:* Traces observed. *Fracture:* Subconchoidal.
Tenacity: Brittle. Hardness = 3.5 D(meas.) = 1.877 D(calc.) = [1.90]

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale yellow.
Luster: Vitreous to dull, greasy, silky.
Optical Class: Uniaxial (–). ω = 1.498–1.507 ϵ = 1.458–1.470

Cell Data: *Space Group:* $P6_3$. a = 11.030(7) c = 10.396(6) Z = 2

X-ray Powder Pattern: Ballyalton, Ireland.
9.56 (100), 5.51 (40), 3.41 (20), 3.78 (16), 3.18 (16), 2.713 (14), 2.155 (13b)

Chemistry:

	(1)	(2)
SiO_2	10.00	10.20
Al_2O_3	0.08	
Fe_2O_3	0.14	
MgO	0.50

CO_2	6.73	6.99
SO_3	12.61	12.80
Total	100.05	100.41

(1) Hatrurim, Israel; corresponds to $(Ca_{2.96}Mg_{0.08})_{\Sigma=3.04}Si_{1.01}(SO_4)_{0.96}(CO_3)_{0.93}(OH)_{6.00} \cdot 12.3H_2O$. (2) N'Chwaning mine, South Africa; by AA, CO_3 volumetrically, H_2O by TGA; corresponds to $Ca_{3.10}Si_{1.06}(SO_4)_{1.00}(CO_3)_{0.99}(OH)_{6.37} \cdot 11.60H_2O$.

Occurrence: A very late-stage mineral in some sulfide ore deposits. In contact metamorphic zones and from the reaction of geothermal waters or seawaters with basalts and tuffs.

Association: Zeolites, apophyllite, analcime, calcite, gypsum, pyrite.

Distribution: In the Bjelke mine, near Åreskuta, and at Kjölland, Jämtland, and at Långban, Värmland, Sweden. From Sulitjelma, Norway. At Ballyalton, Co. Down, Ireland. From the Bellerberg volcano and at the Schellkopf, Eifel district; and on the Zeilberg, near Maroldsweisach, Bavaria, Germany. At Klöch, Styria, Austria. In the Hatrurim Formation, Israel. Large crystals from the Wessels and N'Chwaning mines, Kuruman, Cape Province, South Africa. In the USA, at Paterson and Great Notch, Passaic Co., New Jersey; in the Goose Creek quarry, Leesburg, Loudoun Co., and the Fairfax quarry, Centreville, Fairfax Co., Virginia; from Crestmore, Riverside Co., California. From Concepción del Oro, Zacatecas, Mexico. In the Basalt quarry, Prospect, New South Wales, Australia. A number of other occurrences are known.

Name: From the Greek *to be surprised*, because of its remarkable composition, without parallel at the time of its discovery.

Type Material: Wroclaw University, Wroclaw, Poland, II–18500.

Theisite $Cu_5Zn_5(AsO_4,SbO_4)_2(OH)_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (probable), pseudohexagonal. *Point Group:* n.d. Crystal cleavage plates are usually curved or crumpled, to 2 mm; may be micaceous, lamellar, in spherical aggregates and crusts.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Sectile. Hardness = 1.5 D(meas.) = 4.3 D(calc.) = 4.45

Optical Properties: Semitransparent. *Color:* Greenish blue, turquoise-blue, pale turquoise-green, pale emerald-green; pale blue-green in transmitted light. *Streak:* White. *Luster:* Pearly on cleavages.
Optical Class: Biaxial (–), nearly uniaxial (–). $\alpha = 1.755$ $\beta = 1.785$ $\gamma = 1.785$
2V(meas.) = ≈0°

Cell Data: *Space Group:* n.d. $a = 8.220$–8.225 $b = 7.123$ $c = 14.934$–15.019 Z = 2

X-ray Powder Pattern: Near Durango, Colorado, USA.
3.741 (10), 14.97 (9), 2.534 (9), 7.483 (5), 1.830 (5), 1.533 (5), 4.112 (4)

Chemistry:

	(1)	(2)	(3)

Total	99.0		

(1) Near Durango, Colorado, USA; H_2O on a separate sample; corresponds to $Cu_{4.9}Zn_{4.7}Ca_{0.1}[(As_{0.74}Sb_{0.26})_{\Sigma=1.0}O_4]_2(OH)_{13.6}$. (2) Sa Duchessa mine, Italy; by electron microprobe, average of 11 analyses, $(OH)^{1-}$ calculated for charge balance; corresponds to $Cu_{5.0}Zn_{5.2}[(As_{0.7}Sb_{0.3})_{\Sigma=1.0}O_4]_2(OH)_{14.4}$. (3) Forno, Italy; by electron microprobe, average of 13 analyses, $(OH)^{1-}$ calculated for charge balance; corresponds to $Cu_{4.9}Zn_{4.9}[(As_{0.65}Sb_{0.35})_{\Sigma=1.0}O_4]_2(OH)_{13.6}$.

Occurrence: A rare secondary mineral in thin seams cutting other oxidized minerals (near Durango, Colorado, USA); in dolomitized marble (Forno, Italy).

Association: Cuprite, malachite, azurite, kolwezite, partzite, parnauite, anglesite, cerussite, tenorite, adamite, hemimorphite, chrysocolla, zeunerite, duftite (near Durango, Colorado, USA); azurite, chrysocolla (Sa Duchessa mine, Italy); cinnabar, tetrahedrite, azurite, malachite, fluorite (Forno, Italy).

Distribution: From the Tucker's tunnel uranium deposit, near Durango, Hinsdale Co., Colorado, USA. At the Tynagh mine, near Loughrea, Co. Galway, Ireland. In Germany, from the Glücksrad mine, Oberschulenberg, Harz Mountains; in the Richelsdorf Mountains, Hesse; at the Clara mine, near Oberwolfach, Black Forest. From near Padern, Pyrénées-Orientales, France. In Italy, at the Sa Duchessa mine, Oridda district, and the Is Murvonis mine, Domusnovas, Sardinia; at Canale Fondone, near Forno, Piedmont. From Brixlegg, Tirol, Austria.

Name: To honor Dr. Nicholas J. Theis, who provided the first specimens.

Type Material: The Natural History Museum, London, England, 1984,478.

References: (1) Williams, S.A. (1982) Theisite, a new mineral from Colorado. Mineral. Mag., 46, 49–50. (2) (1983) Amer. Mineral., 68, 282 (abs. ref. 1). (3) Bonazzi, P. and F. Thénardite Na_2SO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals dipyramidal {111}, or tabular {010} with large {101}, rarely prismatic along [100], to 20 cm; as pulverulent crusts and efflorescences. *Twinning:* On {110}, commonly forming cruciform groups; as crude butterflylike twins on {011}.

Physical Properties: *Cleavage:* On {010}, perfect; on {101}, fair; on {100}, interrupted. *Fracture:* Uneven to hackly. *Tenacity:* Somewhat brittle. Hardness = 2.5–3 D(meas.) = 2.664 D(calc.) = 2.66 Soluble in H_2O, taste slightly saline.

Optical Properties: Transparent to translucent. *Color:* Colorless; grayish white, pale yellow, yellow-brown, reddish due to inclusions; colorless in transmitted light. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, weak.
$\alpha = 1.464$–1.471 $\beta = 1.473$–1.477 $\gamma = 1.481$–1.485 2V(meas.) = 82°35′

Cell Data: *Space Group:* $Fddd$. $a = 9.829(1)$ $b = 12.302(2)$ $c = 5.868(1)$ Z = 8

X-ray Powder Pattern: Synthetic.
2.783 (100), 4.66 (73), 3.178 (51), 2.646 (48), 3.075 (47), 1.864 (31), 2.329 (21)

Chemistry:

	(1)	(2)
SO_3	54.34	56.37
CaO	2.66	
Na_2O	41.91	43.63
H_2O	0.93	
Total	99.84	100.00

(1) Aguas Blancas, Chile. (2) Na_2SO_4.

Occurrence: Typically in lacustrine (salt and soda lake) evaporite deposits in arid regions, also as crusts and efflorescences, which may be ephemeral, in a wide range of geologic environments; as precipitates around fumaroles.

Association: Mirabilite, blödite, glauberite, epsomite, gypsum, natron, halite.

Distribution: Numerous minor occurrences; rarely in thick beds or as large crystals. From the Espartinas salt lake, near Aranjuez, Madrid Province, Spain. On Vesuvius, Campania, and Etna, Sicily, Italy. From Natron Lakes, northwest of Cairo, Egypt. At Etosha Pan, Namibia. In Chile, from Salar de San Sebastian and as large crystals at Salar de Pintados, near La Guaica, Tarapacá; from Aguas Blancas, near Copiapó, Atacama. In the USA, in California, large crystals from Searles Lake, San Bernardino Co., at Soda Lake, Carrizo Plain, San Luis Obispo Co., and from Bertram Siding, near the Salton Sea, Imperial Co.; at a large deposit five km southwest of Camp Verde, Yavapai Co., Arizona; in Kilauea Crater, Mauna Loa volcano, Hawaii. From the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China.

Name: Honors Professor Louis Jacques Thénard (1777–1857), French chemist, University of Pierre and Marie Curie, Paris, France.

Type Material: Natural History Museum, Paris, France, 26.252.

Name: For Theophrastus, (ca. 371 BC–ca. 287 BC), the first Greek mineralogist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148460.

References: (1) Marcopoulos, T. and M. Economou (1981) Theophrastite, $Ni(OH)_2$, a new mineral from northern Greece. Amer. Mineral., 66, 1020–1021. (2) Livingstone, A. and D. Bish (1982) On the new mineral theophrastite, a nickel hydroxide, from Unst, Shetland, Scotland. Mineral. Mag., 46, 1–5.

Therasiaite $(NH_4)_3KNa_2Fe^{2+}Fe^{3+}(SO_4)_3Cl_5$

Crystal Data: Monoclinic. *Point Group*: *m*. Displaying forms {012},{210},{101},{$\bar{1}$ 01} and {010}, crystals are well-formed equant to short prismatic, to 0.1 mm.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: n.d. Hardness = 1.5-2 D(meas.) = 2.41(1) D(calc.) = 2.397

Optical Properties: Translucent. *Color*: Brown to dark brown. *Streak*: Brown. *Luster*: Vitreous. *Optical Class*: Biaxial (-). α =1.585(3) β = 1.615(3) γ = 1.630(3)

Cell Data: *Space Group*: *Cc*. *a* = 18.284(4) *b* = 12.073(2) *c* = 9.535(2) Z = 4

X-ray Powder Pattern: La Fossa crater, Vulcano, Aeolian Islands, Sicily, Italy.
2.812 (100), 2.664 (77), 3.297 (28), 3.208 (14), 3.008 (12), 2.942 (11), 7.36 (8)

Chemistry:

	(1)	(2)
$(NH_4)_2O$	[9.64]	10.91
K_2O	8.61	6.58
Na_2O	8.72	8.65
FeO	[8.75]	10.03
Fe_2O_3	[9.72]	11.15
MnO	1.21	
Al_2O_3	0.87	
SO_3	32.93	33.53
Cl	24.70	24.74
–O=Cl	5.58	5.59
Total	99.57	100.00

(1) La Fossa crater, Vulcano, Sicily, Italy; average of 12 electron microprobe analyses, $(NH_4)_2O$ calculated from stoichiometry and confirmed by IR spectroscopy, Fe^{2+}/Fe^{3+} calculated from structure analysis; corresponding to $(NH_4)_{2.68}K_{1.32}Na_{2.04}Fe_{1.76}Al_{0.12}Mn_{0.12}S_{2.98}O_{11.95}Cl_{5.05}$.
(2) $(NH_4)_3KNa_2Fe^{2+}Fe^{3+}(SO_4)_3Cl_5$.

Occurrence: A sublimate on pyroclastic breccia in a medium temperature (~250ºC) intracrater active volcanic fumarole.

Association: Salammoniac, kremersite, adranosite.

Distribution: (Fumarole FA) at La Fossa crater, Vulcano, Aeolian Islands, Sicily, Italy.

Name: For the type locality, *Therasia*, one of the ancient names for Vulcano island (from the Greek for "warm earth").

Type Material: In the Reference Collection, Department of Chemistry, University of Milan, Italy (specimen number 2013-01).

References: (1) Demartin, F., C. Castellano, and I. Campostrini (2014) Therasiaite, $(NH_4)_3KNa_2Fe^{2+}Fe^{3+}(SO_4)_3Cl_5$, a new sulfate chloride from La Fossa Crater, Vulcano, Aeolian islands, Italy. Mineral. Mag., 78(1), 203-213. (2) (2014) Amer. Mineral., 99, 1811 (abs. ref. 1).

Thérèsemagnanite $(Co, Zn)_6(SO_4)(OH, Cl)_{10} \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Crystals are very thin, tabular on {0001}, aggregated in radial spherules, to 0.2 mm.

Physical Properties: *Cleavage:* Perfect on {0001}. *Fracture:* Irregular. *Tenacity:* "Fragile". Hardness = "Very soft". D(meas.) = 2.52(2) D(calc.) = 2.48

Optical Properties: Transparent. *Color:* Pink to pale pink. *Streak:* Pale pink.
Luster: Pearly.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; O = pink; E = pale pink. $\omega = 1.568(2)$
$\epsilon = 1.542(2)$

Cell Data: *Space Group:* n.d. $a = 8.363(8)$ $c = 26.18(7)$ $Z = 3$

X-ray Powder Pattern: Cap Garonne mine, France.
13.1 (100), 2.527 (90), 2.681 (40), 3.523 (30), 6.552 (25), 4.177 (25), 2.736 (25)

Chemistry:

	(1)
SO_3	10.54
CoO	32.95
NiO	3.18
CuO	0.16
ZnO	20.42
Cl	5.65
H_2O	28.40
$-O = Cl_2$	1.28
Total	100.02

(1) Cap Garonne mine, France; by electron microprobe, average of five analyses, H_2O by CHN analyzer; corresponds to $(Co_{3.47}Zn_{1.98}Ni_{0.34}Cu_{0.02})_{\Sigma=5.81}(SO_4)_{1.04}[(OH)_{8.29}Cl_{1.25}]_{\Sigma=9.54} \cdot 8.3H_2O$.

Occurrence: A secondary mineral in the oxidized portions of a polymetallic sulfide deposit.

Association: Anglesite, antlerite, cobaltoan-nickeloan ktenasite, cerussite, brochantite, covellite, tennantite, gersdorffite, guarinoite, rutile, quartz.

Distribution: From the Cap Garonne mine, near le Pradet, Var, France.

Name: To honor Thérèse Magnan (1918–), Toulon, France, former mathematics teacher, and President of the Association of Friends of the Mine of Cap Garonne.

Type Material: Mineralogy Department, Natural History Museum, Geneva, Switzerland, 435/86.

Thermessaite $K_2[AlF_3|SO_4]$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As sharp prismatic crystals, to 0.25 mm, that display {110}, {100}, {111}.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = 2.77(2) D(calc.) = 2.790

Optical Properties: Translucent. *Color*: Colorless to white. *Streak*: White. *Luster*: Vitreous. *Optical Class*: n.d. $n \sim 1.445$

Cell Data: *Space Group*: *Pbcn*. $a = 10.810(2)$ $b = 8.336(2)$ $c = 6.822(1)$ $Z = 4$

X-ray Powder Pattern: La Fossa crater, Vulcano, Aeolian Islands, Italy.
2.983 (100), 2.702 (82), 6.631 (70), 1.712 (58), 2.208 (30), 3.317 (28), 5.429 (14)

Chemistry:

	(1)	(2)
K_2O	36.19	36.48
Al_2O_3	20.42	19.74
SO_3	28.74	31.01
F	22.89	22.07
-O=F	9.64	9.30
Total	98.60	100.00

(1) La Fossa crater, Vulcano, Aeolian Islands, Italy; average of 7 electron microprobe analyses, corresponding to $K_{2.02}[Al_{1.05}F_{3.17}S_{0.94}O_{3.83}]$.
(2) $K_2[AlF_3|SO_4]$.

Occurrence: In altered pyroclastic breccias in an active fumarole (300-350° C).

Association: Alunite, sassolite, anhydrite, metavoltine.

Distribution: La Fossa crater, Vulcano, Aeolian Islands, Sicily, Italy.

Name: For *Thermessa* (warm island), an ancient Greek name for the island of Vulcano.

Type Material: Reference Collection, Dipartimento di Chimica Strutturale e Stereochimica Inorganica of Università degli Studi, Milan, Italy, 2007-2.

References: (1) Demartin, F., C.M. Grammaccioli, I. Campostrini, and P. Orlandi (2008) Thermessaite, $K_2[AlF_3|SO_4]$, a new ino-aluminofluoride–sulfate from La Fossa crater, Vulcano, Aeolian Islands, Italy. Can. Mineral., 46, 693–700. (2) (2009) Amer. Mineral., 94, 404- 405 (abs. ref. 1).

Thermonatrite $Na_2CO_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Very rare in acicular crystals; typically as powdery crusts and efflorescences.

Physical Properties: *Cleavage:* On {100}, difficult. *Tenacity:* Somewhat sectile. Hardness = 1–1.5 D(meas.) = 2.255 (synthetic). D(calc.) = 2.262 Soluble in H_2O, alkaline taste; dehydrates readily.

Optical Properties: Transparent. *Color:* Colorless to white, gray, pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, weak.
$\alpha = 1.420$ $\beta = 1.506$ $\gamma = 1.524$ 2V(meas.) = 48°

Cell Data: *Space Group:* $P2_1bc$ (synthetic). $a = 6.472(2)$ $b = 10.724(3)$ $c = 5.259(2)$
Z = 4

X-ray Powder Pattern: Synthetic.
2.768 (100), 2.372 (60), 2.753 (55), 2.678 (55), 2.684 (50), 2.475 (30), 2.010 (25)

Chemistry: (1) Identification depends on coincidence of X-ray powder pattern and optical properties with synthetic material.

Occurrence: Typically on soils and deposited from saline lakes; uncommon in volcanic fumaroles; in hydrothermal veins related to carbonatites.

Association: Trona, natron, halite.

Distribution: In minor amounts in deserts worldwide. On Vesuvius, Campania, Italy. In Russia, from the Kola Peninsula, on Mts. Rasvumchorr and Kukisvumchorr, and in the Vuonnemiok River valley, Khibiny massif; at Mt. Alluaiv, Lovozero massif; and in the Kovdor massif. From the Ilímaussaq intrusion, Greenland. At Mont Saint-Hilaire, Quebec, Canada. In the USA, crystallized from Borax Lake, Lake Co., and at Deep Spring Lake, Inyo Co., California; at Point of Rocks, east of Springer, Colfax Co., New Mexico. In the Lake Bogoria basin, Rift Valley, Kenya. Around Mt. Erebus, Victoria Land, Antarctica.

Name: From the Greek for *heat* and *natron*, as the dehydration product from heating natron.
