(1–2) Higher Pitts Farm, England; H_2O by loss on ignition. (3) $Pb_3CuO_2Cl_2(OH)_2$.

Occurrence: A secondary mineral associated with lead- and copper-bearing pods in Mn–Fe deposits developed along fissures in dolomitic conglomerate and limestone.

Association: Mendipite, diabolite, parkinsonite, wulfenite, cerussite, hydrocerussite.

Distribution: In England, at the Higher Pitts Farm, near Priddy, and in the Merehead quarry, near Shepton Mallet, Mendip Hills, Somerset.

Name: From the Greek for *green* and *blade* or *straight sword*, for the typical crystal habit.

Type Material: The Natural History Museum, London, England, 1923,712–717.

(1) Moctezuma mine, Mexico; average of four analyses, H_2O by the Penfield method, apparently adsorbed; corresponds to $Cu_{2.75}Pb_{2.94}(Te_{1.05}O_{3.05})_6 \cdot 3.75H_2O$. (2) Do.; by electron microprobe, corresponds to $Pb_{2.65}(Cu_{2.81}Sb^{5+}_{0.13}Zn_{0.09})_{\Sigma=3.03}(Te_{1.02}O_{3.00})_6Cl_{0.92}$. (3) $PbCu(TeO_3)_2$.

Occurrence: With other tellurites and tellurates in the oxidized portions of base and precious metal deposits.

Association: Emmonsite, rodalquilarite, cerussite, jarosite, "opal" (Tombstone, Arizona, USA).

Distribution: From the Oriental (Bambollita) mine, northeast of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. On the dumps between the Joe and Grand Central shafts, Tombstone, Cochise Co., Arizona, and at the McAlpine mine, Tuolumne Co., California, USA. From an unidentified locality in Saudi Arabia.

Name: From the Nahua language *choloa*, for *evasive*, the mineral having been undetected for many years.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,548.

(1) Hangelby, Finland; corresponds to $(Mg_{5.13}Fe^{2+}_{0.04}Al_{0.02}Mn_{0.01})_{\Sigma=5.20}Si_{1.95}O_8[F_{1.21}(OH)_{0.56}O_{0.23}]_{\Sigma=2.00}$. (2) Kafveltorp, Sweden; corresponds to $(Mg_{4.74}Fe^{2+}_{0.30}Mn_{0.07}Al_{0.05}Fe^{3+}_{0.03}Ti_{0.01})_{\Sigma=5.20}Si_{1.92}O_8[F_{1.34}(OH)_{0.48}O_{0.18}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with alleghanyite.

Mineral Group: Humite group.

Occurrence: In contact metamorphic zones, in limestones and dolostones, associated with felsic to alkalic plutonic rocks, especially with Fe-B-F metasomatism; in a carbonatite.

Association: Phlogopite, spinel, magnetite, grossular, wollastonite, forsterite, monticellite, cuspidine, diopside, calcite.

Distribution: From Pargas, Hangelby, and Sibbo, Finland. At Kafveltorp, near Kopparberg, Sweden. From Monte Somma and Vesuvius, Campania, Italy. At Le Chipal, Vosges, France. From Bhandara, Maharashtra, India. In the USA, fine crystals from the Tilly Foster mine, Brewster, Putnam Co., and Amity, Orange Co., New York; at Franklin and Sparta, Sussex Co., New Jersey; Johnson Camp, Cochise Co., and the Lakeshore mine, Pinal Co., Arizona; and Crestmore, Riverside Co., California. From Bancroft, Ontario, Canada. In the Loolekop carbonatite, Transvaal, South Africa. A few other localities are known.

Name: From the Greek meaning *grain*, alluding to its occurrence in isolated grains.

Cu	0.18	2.05	
Se	36.39	38.50	37.12
Total	99.30	101.16	100.00

(1) Hope's Nose, England; by electron microprobe, average of 26 analyses; corresponding to $(Ag_{2.01}Cu_{0.02})_{\Sigma=2.03}Pd_{3.02}Se_{3.95}$. (2) Copper Hills prospect, Australia; by electron microprobe, corresponding to $(Ag_{1.86}Cu_{0.27}Hg_{0.02})_{\Sigma=2.15}(Pd_{2.77}Pt_{0.03})_{\Sigma=2.80}Se_{4.06}$. (3) $Ag_2Pd_3Se_4$.

Occurrence: In gold-bearing calcite veins in limestone (Hope's Nose, England); in a carbonate matrix (Tilkerode, Germany); in malachite nodules (Copper Hills prospect, Australia).

Association: Gold, fischesserite, clausthalite, tiemannite, eucairite, verbeekite, umangite, cerussite, bromian chlorargyrite (Hope's Nose, England); clausthalite, tischendorfite, tiemannite, stibiopalladinite, gold (Tilkerode, Germany); oosterboschite, naumannite, berzelianite, umangite, tiemannite, chalcomenite, malachite, quartz (Copper Hills prospect, Australia).

Distribution: From Hope's Nose, Torquay, Devon, England [TL]. At Tilkerode, Harz Mountains, Germany. In the Copper Hills prospect, East Pilbara region, Western Australia.

Name: In honor of Dr. Chris J. Stanley (1954–), The Natural History Museum, London, England, for his contributions to ore mineralogy.

Type Material: Institute for Mineralogy, Salzburg University, Salzburg, Austria, II/A 1070; The Natural History Museum, London, England, 1997,59, E1527, E1534, E1537, E1538.

Chromatite $CaCrO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Rarely as tetragonal dipyramidal crystals, short to prismatic; typically as grains, to 0.1 mm; as earthy flecks, crusts, nodules, veins, and films.

Physical Properties: *Cleavage:* One prismatic, poor. *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.142 (synthetic). Soluble in H_2O.

Optical Properties: Transparent. *Color:* Bright citron-yellow; yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Dispersion:* Strong. $\omega = 1.81$–1.85 $\epsilon = 1.84$–1.88

Cell Data: *Space Group:* $I4_1/amd$ (synthetic). $a = 7.26(1)$ $c = 6.26(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.62 (100), 2.679 (55), 1.8510 (45), 2.880 (16), 2.375 (16), 1.8100 (16), 1.4999 (14)

Total	98.6	100.00

(1) Hatrurim Formation, Israel; by AA, K, Na by flame photometry. (2) $CaCrO_4$.

Occurrence: Formed in an arid climate along fractures in limestones and marls by ascending ground water, the chromium derived from underlying bituminous phosphatic marls.

Association: Gypsum, calcite, aragonite, vaterite, portlandite.

Distribution: From Ma'aleh Adumim, along the Jerusalem-Jericho highway, and in the Hatrurim Formation, Israel.

Name: As a *chromate*.

Type Material: Geological Survey of Israel, Jerusalem, Israel, SG232, SG236, SG261, SG571.

Chrombismite $Bi_{16}CrO_{27}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals octahedral, modified by the cube or dodecahedron, to 1.6 cm; commonly fine granular, compact, massive. *Twinning:* On {111} as both twin and composition plane, the spinel law.

Physical Properties: *Cleavage:* Parting may develop along {111}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5 VHN = 1278–1456 (100 g load). D(meas.) = 4.5–4.8 D(calc.) = [5.12] Some samples are weakly magnetic.

Optical Properties: Translucent to opaque. *Color:* Black to brownish black; brown to brownish black on thin edges in transmitted light; in reflected light, gray-white with a brownish tint and brownish red internal reflections. *Streak:* Brown. *Luster:* Metallic to submetallic. *Optical Class:* Isotropic. $n = 2.08$–2.16

(1) Bushveld complex, South Africa; by electron microprobe, Fe_2O_3 calculated from stoichiometry; corresponds to $(Fe^{2+}_{0.74}Mg_{0.27})_{\Sigma=1.01}(Cr_{1.42}Al_{0.40}Fe^{3+}_{0.15}Ti_{0.01}V_{0.01})_{\Sigma=1.99}O_4$.
(2) Great Dyke, Zimbabwe; by electron microprobe, Fe_2O_3 calculated from stoichiometry; corresponds to $(Fe^{2+}_{0.54}Mg_{0.45}Mn_{0.01})_{\Sigma=1.00}(Cr_{1.47}Al_{0.48}Fe^{3+}_{0.03}Ti_{0.01})_{\Sigma=1.99}O_4$. (3) $FeCr_2O_4$.

Polymorphism & Series: Forms series with magnesiochromite and hercynite.

Mineral Group: Spinel group.

Occurrence: A cumulus mineral in ultramafic portions of layered mafic igneous rocks; an accessory mineral in alpine-type peridotites; also detrital. Common in all meteorites, except carbonaceous chondrites, and in lunar mare basalts.

Association: Olivine, enstatite, plagioclase, serpentine, magnetite, ilmenite, pyrrhotite, pentlandite, ulvöspinel.

Distribution: Widespread. From Gassin, Var, France. Large crystals from Hangha, Sierra Leone. At Tiebaghi, New Caledonia. As economic deposits in: the Bushveld complex, Transvaal, South Africa. From the Great Dyke, Zimbabwe. From many localities in Turkey. At Saranay and elsewhere in the Ural Mountains, Russia. From the Moa district, northern Cuba, may be crystallized. On Luzon, Philippines. From the Stillwater complex, Montana, USA.

Name: For its CHROMium content.

Chromdravite $NaMg_3(Cr^{3+},Fe^{3+})_6(BO_3)_3Si_6O_{18}(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3*m*. In pyramidal acicular crystals, to 0.1 mm.

Physical Properties: Hardness = [∼7] (by analogy to the tourmaline group).
D(meas.) = 3.40(1) D(calc.) = [3.39]

Optical Properties: Semitransparent. *Color:* Dark green to nearly black.
Optical Class: Uniaxial (–). *Pleochroism: O* = dark green; *E* = yellow-green.
Absorption: O > *E*. $\omega = 1.778(5)$ $\epsilon = 1.772(5)$

Cell Data: *Space Group: R*3*m*. $a = 16.11$ $c = 7.27$ Z = [3]

X-ray Powder Pattern: Velikaya Guba deposit, Karelia.
2.62 (100), 3.58 (75), 3.04 (75), 6.57 (50), 4.05 (50), 2.079 (50), 4.31 (40)

LOI	4.43
Total	[100.00]

(1) Velikaya Guba deposit, Karelia; recalculated to 100.00% after correction for 6.5% chromian phengite; corresponds to $(Na_{0.97}Ca_{0.03})_{\Sigma=1.00}(Mg_{2.57}V_{0.22}Al_{0.16}Mn_{0.03}Ti_{0.02})_{\Sigma=3.00}(Cr^{3+}_{4.71}Fe^{3+}_{1.08}Al_{0.21})_{\Sigma=6.00}[(B_{0.97}Al_{0.03})_{\Sigma=1.00}O_3]_3(Si_{5.81}Al_{0.19})_{\Sigma=6.00}O_{18}[(OH)_{3.77}O_{0.23}]_{\Sigma=4.00}$.

Mineral Group: Tourmaline group.

Occurrence: In micaceous metasomatic clay-carbonate rocks.

Association: Chromian phengite, taeniolite, vanadian muscovite, quartz, dolomite.

Distribution: From the Velikaya Guba uranium deposit, Zaonezhskii Peninsula, southern Karelia.

Name: For CHROMium in the composition and similarity to *dravite*.

Type Material: Mining Institute, St. Petersburg, Russia, 1239/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82811.

(1) Sichuan Province, China.

Occurrence: In heavy sands derived from the contact metamorphic zone between a siliceous marble and ultramafic rock (Sichuan Province, China); in a kimberlite pipe (Liaoning Province, China); in podiform chromitites (Luobusha ophiolite, China); in ultramafic dike rocks (Gavasai ore field, Russia); in kimberlite (Sakha, Russia); in serpentinite in dunite–peridotite (Far East, Russia).

Association: Pyrrhotite, pentlandite, chalcopyrite, platinum group minerals, danbaite (Sichuan Province, China); cohenite, moissanite, ilmenite, titanite (Gavasai ore field, Russia).

Distribution: In China, from an unspecified locality [Danba] in Sichuan Province [TL]; in "kimberlite pipe 50", Liaoning Province; in sea-floor muds from near the island of Diaoyudao, a few km northeast of Taiwan, at about 1500 m depth; and in the Luobusha ophiolite, 200 km southeast of Lhasa, Tibet. In Russia, from the Gavasai ore field, location not further given; in unspecified kimberlite pipes in Sakha; and at an unspecified locality in the "Soviet Far East".

Name: From the Greek *chroma*, *color*, as all chromium compounds are colored.

Type Material: n.d.

(1) Bird Nest drift, Otto Mountain, near Baker, California, USA; average of 4 electron microprobe analyses, H_2O calculated, low analytical total ascribed to beam damage; corresponding to $Pb_{9.65}Te_6O_{19.96}(OH)_{14.04}(CrO_4)_{0.67}(H_2O)_{6.32}$. (2) $Pb_{10}Te_6O_{20}(OH)_{14}(CrO_4)(H_2O)_{5.}$

Occurrence: A secondary mineral in the oxidized zone of a telluride and galena deposit.

Association: Chalcopyrite, chrysocolla, galena, goethite, hematite, khinite, pyrite, wulfenite.

Distribution: From the Bird Nest drift, southwest flank of Otto Mountain, 0.4 miles northwest of the Aga mine, near Baker, California, USA.

Name: As the chromate analog of *schieffelinite*.

Type Material: Natural History Museum of Los Angeles County, Los Angeles, California, USA (63511).

References: (1) Kampf, A.R., S.J. Mills, R.M. Housley, M.S. Rumsey, and J. Spratt (2012) Lead-tellurium oxysalts from Otto Mountain near Baker, California: VII. Chromschieffelinite, $Pb_{10}Te_6O_{20}(OH)_{14}(CrO_4)(H_2O)_5$, the chromate analog of schieffelinite. Amer. Mineral., 97, 212-219.

Chrysoberyl $BeAl_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are tabular on {001} or short prismatic along [100], to 22 cm; prominently striated on {001} ∥ [100]. *Twinning:* Common on {130}, producing either flattened heart-shaped or pseudohexagonal multiple contact and penetration twins.

Physical Properties: *Cleavage:* Distinct on {110}, imperfect on {010}, poor on {001}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 8.5 D(meas.) = 3.75(1) D(calc.) = 3.69

Optical Properties: Transparent to translucent, may be opaque and chatoyant with oriented inclusions. *Color:* Various shades of green, yellow, brownish to greenish black, may be raspberry-red under incandescent light when chromian; colorless, pale shades of yellow, green, or red in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = red; Y = yellow-orange; Z = emerald-green. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.746$ $\beta = 1.748$ $\gamma = 1.756$ 2V(meas.) = 70°

Cell Data: *Space Group: Pbnm.* $a = 4.428(1)$ $b = 9.415(3)$ $c = 5.481(2)$ Z = 4

X-ray Powder Pattern: Near Golden, Colorado, USA. (ICDD 11-448).
3.24 (100), 2.091 (90), 1.619 (80), 4.01 (50), 2.563 (50), 2.265 (45), 2.081 (45)

Chemistry:

	(1)	(2)
TiO_2	0.55	
Al_2O_3	76.34	80.30
FeO	3.60	
BeO	19.15	19.70
LOI	0.30	
Total	99.94	100.00

(1) Near Golden, Colorado, USA. (2) $BeAl_2O_4$.

Occurrence: Characteristic of some granite pegmatites associated with high-grade mica schists or reaction zones in ultramafic rocks; also detrital in placers.

Association: Quartz, muscovite, albite, beryl, columbite, tourmaline, topaz, kyanite, staurolite (granite pegmatites); phenakite, apatite, tourmaline, fluorite (reaction zone pegmatites).

Distribution: Widespread, however fine crystals are uncommon. Notable localities include: from many places in Brazil, with exceptional crystals from Tancredo, Itaguaçu, and Colatina, Espirito Santo; from Faria Lemos, Santa Luzia de Carangola, and Americana, Teófilo Otoni, Minas Gerais; at Campo Formoso, Teixeira de Freitas, and Cachoeira, Bahia. From Maršíkov, Czech Republic. At the Izumrudnye mines, Tokovaya River, near Yekaterinburg (Sverdlovsk), and Mursinka, Ural Mountains, Russia. From Miakanjovato, near Lake Alaotra, northeast of Ambatosoratra, Madagascar. Near Masvingo (Ft. Victoria), Zimbabwe. Abundant in gem gravel placers in the Ratnapura district, Sri Lanka. In the USA, from near Golden, Jefferson Co., Colorado; in Maine, at Topsham, Sagadahoc Co., from Paris, Norway, and Hartford, Oxford Co., and elsewhere.

Name: From the Greek for *golden*, in allusion to the mineral's color, and *beryl*.

Chrysocolla $(Cu, Al)_2H_2Si_2O_5(OH)_4 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic (?). *Point Group:* n.d. Crystals acicular, to 5 mm, in radiating clusters; fine fibrous, botryoidal, earthy; commonly cryptocrystalline, opaline, or enamel-like.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle to somewhat sectile. Hardness = ∼2–4 D(meas.) = 1.93–2.4 D(calc.) = n.d.

Optical Properties: Translucent to opaque. *Color:* Blue, blue-green, or green; brown to black when impure. *Streak:* White when pure. *Luster:* Vitreous, porcelaneous, earthy. *Optical Class:* Biaxial (–). $\alpha = 1.575$–1.585 $\beta = 1.597$ $\gamma = 1.598$–1.635 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 5.72$–5.92 $b = 17.7$–18.0 $c = 8.00$–8.28 Z = n.d.

X-ray Powder Pattern: Locality unknown. (ICDD 27-188).

(1) Mednorudyansk, Russia. (2) Kamoya, Congo.

Occurrence: In the oxidized portions of many copper deposits.

Association: Malachite, tenorite, halloysite, nontronite.

Distribution: A few localities for rich or commercial material include: from Nizhni Tagil, Ural Mountains, Russia. At Lubietová, near Banská Bystrica (Libethen, near Neusohl), Slovakia. In the Timna (King Solomon's) mine, Israel. From the Star of the Congo mine, Lubumbashi, and at Likasi and Kakanda, Katanga Province, Congo (Shaba Province, Zaire). In the USA, in Arizona, constitutes parts of large orebodies, as in the Globe-Miami district, Gila Co., Morenci, Greenlee Co., San Manuel and Ray mines, Pinal Co.; in New Mexico, at Santa Rita, Grant Co.; from Utah, in the Tintic district, Juab Co. At Cananea, Sonora, Mexico. In Chile, in the Chuquicamata and Exotica deposits; around Copiapó and Coquimbo. From the Chillagoe district, Queensland, Australia.

Name: From the Greek for *gold* and *glue*, for a substance used in the soldering of gold, including chrysocolla as well as other blue and green minerals.

Chudobaite $(Mg,Zn)_5(AsO_4)_2(AsO_3OH)_2 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals equant, to 5 mm, showing prominent {100}, {010}, {001}, with half-a-dozen additional modifying forms.

Physical Properties: *Cleavage:* On {010}, very good; {100}, good. Hardness = 2.5–3 D(meas.) = 2.94 D(calc.) = [2.93]

Optical Properties: Transparent. *Color:* Rose, white, colorless. *Luster:* Good [*sic*]. *Optical Class:* Biaxial (–). *Orientation:* $Z \wedge c = -24°$ on {010}; $Z \wedge c = 11°$ on {100}. $\alpha = 1.583$ $\beta = \sim 1.608$ $\gamma = 1.633$ 2V(meas.) = 79°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.944(1)$ $b = 10.691(1)$ $c = 6.770(1)$ $\alpha = 80.97(1)°$ $\beta = 84.20(1)°$ $\gamma = 81.85(1)°$ Z = 1

(1) Tsumeb, Namibia. (2) $(Mg,Zn)_5(AsO_4)_2(AsO_3OH)_2 \cdot 10H_2O$ with Mg:Zn = 3.4:1.6.

Occurrence: In a deep oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Conichalcite, cuprian adamite, zincian olivenite, ferrilotharmeyerite, chalcocite.

Distribution: From Tsumeb, Namibia.

Name: To honor Dr. Karl Franz Chudoba (1898–1976), Professor of Mineralogy, University of Bonn, Bonn, Germany.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 162628.

Chukanovite $Fe_2(CO_3)(OH)_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Acicular to fibrous, elongated on [001], to 0.5 mm and 2–3 μm thick; often as spherulites (rarely to 1 mm). Typically as botryoidal crusts of spherulitic clusters and parallel- or radial-columnar aggregates, to 1 mm thick.

Physical Properties: *Cleavage*: Perfect, probably on $\{0\bar{2}\ 1\}$. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 3.5-4 D(meas.) = n.d. D(calc.) = 3.60

Optical Properties: Transparent. *Color*: Pale-green, colorless; aggregates brownish-green. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (–). α = 1.673(3) β = 1.770(5) γ = 1.780(5) 2V(meas.) = 10(5)°

Cell Data: *Space Group*: $P2_1/a$. a = 12.396(1) b = 9.407(1) c = 3.2152(3) β = 97.78° Z = 1

X-ray Powder Pattern: Dronino iron meteorite, Russia.
2.645 (100), 3.73 (80), 5.15 (60), 6.14 (40), 2.361 (40), 2.171 (40)

Chemistry:

	(1)
MgO	0.1
FeO	68.8
NiO	0.6
CO_2	19.8
H_2O	10.9
Total	100.2

(1) Dronino iron meteorite, Russia; electron microprobe analysis, H_2O by modified Penfield method, CO_2 by selective sorption, corresponding to $(Fe^{2+}_{1.97}Ni_{0.02}Mg_{0.01})_{\Sigma=2.00}(CO_3)_{0.93}(OH)_{2.14}\cdot 0.18\ H_2O$.

Occurrence: In a terrestrially altered meteorite fragment.

Association: Kamacite, taenite, chromite, troilite, goethite, akaganeite, hematite, hibbingite, reevesite, honessite, undetermined Fe-Ni sulfides.

Distribution: In cavities in the Dronino ataxite iron meteorite, collected near Dronino, Kasimov district, Ryazan' Oblast, 350 km southeast of Moscow, Russia.

Name: Honors Nikita V. Chukanov (b. 1953), Russian physicist and mineralogist.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Pekovi, I.V., N. Perchiazzi, S. Merlino, V.N. Kalachev, M. Merlini, and A.E. Zadov (2007) Chukanovite, $Fe_2(CO_3)(OH)_2$, a new mineral from the weathered iron meteorite Dronino. Eur. J. Mineral., 19, 891–898. (2) (2008) Amer. Mineral., 93, 1687 (abs. ref. 1).

Chukhrovite-(Ce) $Ca_3(Ce,Y)Al_2(SO_4)F_{13}\cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Octahedral crystals, to 1.5 mm.

Physical Properties: *Cleavage:* [On {111}, distinct.] [by analogy to chukhrovite-(Y)]. *Fracture:* [Irregular.] *Tenacity:* [Brittle.] Hardness = [∼3] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* [Colorless.]
Optical Class: Isotropic. $n = 1.443(2)$

Cell Data: *Space Group:* $Fd3$. $a = 16.74(4)$ $Z = 8$

X-ray Powder Pattern: Clara mine, Germany.
9.75 (10), 5.93 (8), 3.22 (7), 2.56 (6), 2.17 (6), 4.20 (5), 2.24 (5)

Chemistry: (1) Clara mine, Germany; by electron microprobe, Ce determined as the dominant rare-earth element, with Y absent. (2) Yaroslavsk deposit, Russia; $RE_2O_3 = Y_2O_3$ 20.7%, La_2O_3 8.9%, Ce_2O_3 27.1%, Pr_2O_3 6.3%, Nd_2O_3 14.8%, Sm_2O_3 7.0%, Gd_2O_3 6.6%, Dy_2O_3 4.0%, Er_2O_3 2.2%, Yb_2O_3 1.4%; identity established by X-ray powder pattern and physical properties.

Occurrence: In a hydrothermal barite–fluorite vein deposit (Clara mine, Germany); from the oxidized zone of a banded sellaite–tourmaline–fluorite deposit (Yaroslavsk deposit, Russia).

Association: Fluorite, jarosite, pyrite, sulfur (Clara mine, Germany); sellaite, gearksutite, yaroslavite (Yaroslavsk deposit, Russia).

Distribution: From the Clara mine, near Oberwolfach, Black Forest, Germany. At the Yaroslavsk tin deposit, 50 km south of Lake Khanka, Primorskiy Kray, Siberia, Russia.

Name: For its relation to *chukhrovite*-(Y) and content of *cerium* as the dominant rare-earth element.

Type Material: n.d.

Chukhrovite-(Y) $Ca_3(Y,Ce)Al_2(SO_4)F_{13}\cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Crystals show varying degrees of dominance of {100} and {111}, to 1 cm.

Physical Properties: *Cleavage:* On {111}, distinct. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 2.274–2.398 D(calc.) = [2.16]

Optical Properties: Transparent to opaque. *Color:* Colorless, white, rarely with a lilac tint. *Luster:* Vitreous to pearly, greasy on fracture surfaces.
Optical Class: Isotropic, anomalously birefringent. n = 1.42–1.44

Cell Data: *Space Group:* $Fd3$. a = 16.80(0.5) Z = 8

X-ray Powder Pattern: Kara-Oba deposit, Kazakhstan.
2.193 (10), 1.834 (10), 3.261 (9), 2.572 (9), 2.843 (8), 1.684 (8), 1.512 (8)

(1) Kara-Oba deposit, Kazakhstan; $RE_2O_3 = Y_2O_3$ [40.9%], La_2O_3 5%, Ce_2O_3 15%, Pr_2O_3 4%, Nd_2O_3 12%, Sm_2O_3 7.2%, Eu_2O_3 0.2%, Gd_2O_3 6.5%, Tb_2O_3 0.9%, Dy_2O_3 4.1%, Ho_2O_3 0.8%, Er_2O_3 1.7%, Tm_2O_3 0.3%, Yb_2O_3 1.2%, Lu_2O_3 0.2% by X-ray spectroscopy; corresponds to $Ca_{3.03}(Y,Ce)_{0.95}Al_{1.62}(SO_4)_{1.00}[F_{11.46}(OH)_{0.40}]_{\Sigma=11.86}\cdot 9.55H_2O$.

Occurrence: In the oxidation zone of a Mo–W deposit.

Association: Halloysite, gearksutite, fluorite, creedite, anglesite, "limonite".

Distribution: From the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan.

Name: Honors Fedor Vasil'evich Chukhrov (1908–1988), Russian mineralogist, Director, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia, and *yttrium*, the dominant rare-earth element.

Type Material: Vernadsky State Geological Museum, 46354; Russian Research Institute of Mineral Resources; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61518, 61519; National Museum of Natural History, Washington, D.C., USA, 144183.

Churchite-(Y) $YPO_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. Crystals rare, to 6 mm, columnar to acicular, in flat radial aggregates; typically as crusts and coatings.

Physical Properties: *Cleavage:* On {001}, perfect; on {010} and {100}, less perfect. *Fracture:* Conchoidal. Hardness = 3 D(meas.) = 3.26 D(calc.) = [3.11]

Optical Properties: Transparent. *Color:* Colorless to snow-white; smoke-gray, with flesh-red tints; colorless in transmitted light. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (+). *Orientation:* $X = a$; $Z \wedge c = 28°–35°$. *Dispersion:* Small to marked. $\alpha = 1.605–1.623$ $\beta = 1.600–1.631$ $\gamma = 1.645–1.657$ 2V(meas.) = Small to medium.

Cell Data: *Space Group:* $A2/a$ or Aa. $a = 5.59$ $b = 15.08$ $c = 6.17$ $\beta = 115.3°$ Z = 4

X-ray Powder Pattern: Cornwall, England.
4.21 (vvs), 7.50 (vs), 3.02 (vs), 2.82 (ms), 4.70 (m), 3.74 (m), 2.62 (m)

Chemistry:

	(1)	(2)	(3)

Total	99.78	100.24	100.00

(1) Cornwall, England; corresponds to $[Y_{0.74}(La,Nd)_{0.11}Er_{0.07}Ce_{0.02}]_{\Sigma=0.94}PO_4 \cdot 2.02H_2O$.
(2) Auerbach, Germany. (3) $YPO_4 \cdot 2H_2O$.

Occurrence: Locally abundant; typically derived from meteoric waters, with yttrium weathered or biochemically leached from trace amounts in surrounding rocks or soil, deposited on colloidal Fe–Mn oxides; less commonly a secondary mineral in hydrothermal mineral deposits.

Association: Florencite, rhabdophane, wavellite, crandallite, turquoise, variscite, cacoxenite, beraunite, dufrénite, goyazite, gorceixite, crandallite, monazite, apatite, todorokite, lithiophorite, hematite, "limonite", clay minerals.

Distribution: In England, from Cornwall, at the Tretoil mine, Lanivet, near Bodmin, and at Wheal Pendarves, Camborne. In Germany, in the Nitzlbuch and Leonie mines, near Auerbach, Bavaria; at Rengersdorf, Saxony; from Reichenbach, near Bensheim, Hesse. At Jáchymov (Joachimsthal), Czech Republic. In the USA, in the Kelly Bank mine, east of Vesuvius, Rockbridge Co., and at the Burley pegmatite, Amherst Co., Virginia; from Girard, Burke Co., Georgia; on Indian Mountain, Cherokee Co., Alabama; found about one km south of Sausalito, Marin Co., California. In the José Pinto pegmatite, at Jaguaraçu, near Coronel Fabriciano, Minas Gerais, Brazil. From the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia. At Chutukou, Yenisei Ridge, Taimyr Peninsula, Russia. Several other poorly-defined occurrences are known; probably more await recognition.

Name: To honor Arthur Herbert Church (1834–1915), English chemist, who originally analyzed and described the mineral.

Type Material: The Natural History Museum, London, England, 40636.

Chursinite $Hg^{1+}Hg^{2+}(AsO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In grains, to 0.2 mm.

Physical Properties: *Cleavage:* One, parallel to elongation. *Tenacity:* Brittle. Hardness = ∼3 VHN = 198–245, 219 average. D(meas.) = n.d. D(calc.) = 9.06 (synthetic).

Optical Properties: Transparent in thin fragments. *Color:* Yellow-brown to orange-brown; in reflected light, gray with bluish tint, tarnishes to a bluish to bluish white film. *Streak:* Grayish yellow. *Luster:* Adamantine, nearly.
Optical Class: Biaxial. *Pleochroism:* Pale brownish yellow to light brown. *Orientation:* Straight. $n = > 2.0$ *Anisotropism:* Dark brown to blue-gray.
R_1–R_2: (460) 18.5–22.8, (546) 16.1–20.4, (590) 15.8–19.7, (656) 14.5–18.5

Cell Data: *Space Group:* $P2_1/c$. $a = 8.71(2)$ $b = 5.08(2)$ $c = 15.66(2)$ $\beta = 128.27(11)^\circ$ $Z = 2$

X-ray Powder Pattern: Khaydarkan deposit, Kyrgyzstan.
3.05 (10), 2.89 (7.5), 2.84 (7), 2.49 (5), 2.16 (5b), 1.911 (5), 1.883 (5)

Chemistry:

	(1)	(2)
As	9.74	13.87
Hg	81.28	74.28
O	9.57	11.85
Total	100.59	100.00

(1) Khaydarkan deposit, Kyrgyzstan; by electron microprobe, average of six analyses; stated to correspond to $Hg_{2.71}As_{0.87}O_{4.00}$. (2) $Hg^{1+}Hg^{2+}(AsO_4)$.

Occurrence: In the oxidized zone of a Sb–As–Hg deposit.

Association: Calomel, eglestonite, terlinguaite, corderoite, montroydite, kuznetsovite, shakhovite, poyarkovite, mercury.

Distribution: From the Khaydarkan deposit, Fergana Valley, Alai Range, Kyrgyzstan.

Name: In honor of the Russian theater and film actress Lyudmila Alekseevna Chursina (1941–).

Type Material: Institute of Geology and Geophysics, Siberian Division, Academy of Sciences, Novosibirsk, XI-41/1; Mining Institute, St. Petersburg, Russia, 1678/1.

References: (1) Vasil'ev, V.I., Y.G. Lavrent'ev, and N.A. Pal'chik (1984) Chursinite, $(Hg_2)_3(AsO_4)_3$, a new natural mercury arsenate. Zap. Vses. Mineral. Obshch., 113, 341–347 (in Russian). Chvaleticeite $(Mn^{2+},Mg)SO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (by analogy to hexahydrite). *Point Group:* $2/m$. As efflorescences and coatings, granular, to 0.05 mm.

Physical Properties: Hardness = 1.5 D(meas.) = 1.84 D(calc.) = 1.84 Dehydrates readily in air; easily soluble in H_2O.

Optical Properties: Translucent to transparent. *Color:* White, pale pink, yellowish green; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial. $\alpha = 1.457$ (α') $\beta =$ n.d. $\gamma = 1.506$ (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$ (by analogy to hexahydrite). $a = 10.05(2)$ $b = 7.24(2)$ $c = 24.3(1)$ $\beta = 98.0(2)^\circ$ Z = 8

X-ray Powder Pattern: Chvaletice, Czech Republic.
4.91 (10), 5.45 (8), 4.47 (8), 3.98 (8), 3.25 (8), 3.42 (7), 2.967 (7)

Chemistry:

	(1)
SO_3	31.48
Al_2O_3	trace
Fe_2O_3	0.10
FeO	trace
MnO	15.81
MgO	6.41

insol.	0.36
Total	99.81

(1) Chvaletice, Czech Republic; Ca, Fe, K, and Na by AA, H_2O by the Penfield method; corresponds to $(Mn_{0.57}Mg_{0.40})_{\Sigma=0.97}SO_4 \cdot 6.39H_2O$.

Mineral Group: Hexahydrite group.

Occurrence: Formed in the oxidation zone of a pyrite–manganese silicate deposit (Chvaletice, Czech Republic).

Association: Melanterite, magnesian–manganoan melanterite, epsomite, magnesian–ferroan mallardite, magnesian jokokuite, magnesian ilesite, rozenite, copiapite, gypsum (Chvaletice, Czech Republic); apjohnite, copiapite, epsomite, gypsum (Jáchymov, Czech Republic).

Distribution: In the Czech Republic, from Chvaletice, and at Jáchymov (Joachimsthal).

Name: For the locality where the first specimens were collected, Chvaletice, Czech Republic.

Type Material: Geological Survey, Prague, Czech Republic.

Chvilevaite $Na(Cu, Fe, Zn)_2S_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Tabular, equant, and prismatic grains, up to 0.5 mm, intergrown with other sulfides.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Brittle. Hardness = n.d. VHN = 110–153, 135 average (20 g load). D(meas.) = n.d. D(calc.) = 3.94

Optical Properties: Opaque. *Color:* Bronze, tarnishing to a sooty black coating; in reflected light, orange, changing to rosy purple with time. *Luster:* Metallic. *Pleochroism:* Distinct, from pale orange to dark gray with a lilac tint. *Anisotropism:* Strong, from black to white.
R_1–R_2: (400) — , (420) 17.9–17.9, (440) 17.7–18.0, (460) 17.5–18.4, (480) 17.4–19.0, (500) 17.3–19.7, (520) 17.4–20.7, (540) 17.5–21.6, (560) 17.7–22.5, (580) 17.8–23.3, (600) 18.0–24.0, (620) 18.2–24.8, (640) 18.5–25.6, (660) 18.8–26.2, (680) 19.1–26.8, (700) 19.4–27.4

Cell Data: *Space Group:* $P3m1$. $a = 3.873(1)$ $c = 6.848$ $Z = 1$

X-ray Powder Pattern: Akatui deposit, Russia.
3.02 (100), 2.40 (100), 1.945 (100), 3.40 (90), 1.870 (90), 6.85 (60)

Chemistry:

	(1)
Na	10.93
Cu	38.63
Fe	11.64
Zn	6.72
Ca	0.26
Mn	0.06
As	0.55
S	30.83
Total	99.62

(1) Akatui deposit, Russia; by electron microprobe, corresponding to $(Na_{1.01}Ca_{0.01})_{\Sigma=1.02}(Cu_{1.28}Fe_{0.44}Zn_{0.22}As_{0.01})_{\Sigma=1.95}S_{2.03}$.

Occurrence: Of hydrothermal origin.

Association: Sphalerite, covellite, chalcocite, galena, pyrite, boulangerite, arsenopyrite, carbonates, quartz.

Distribution: From the Akatui Pb–Zn deposit, Akatui, eastern Transbaikal, Russia [TL].

Name: For Tat'yana Nikiforovna Chvileva (1925–), economic mineralogist, Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 88050.

Cianciulliite $Mn^{2+}(Mg,Mn^{2+})_2Zn_2(OH)_{10}\cdot 2{-}4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, lathlike, tabular on {100}, many faces curved, to 0.6 mm.

Physical Properties: *Cleavage:* Perfect on {100}. *Tenacity:* Laminae flexible, not elastic. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 2.87 for $2H_2O$; 3.15 for $4H_2O$.

Optical Properties: Opaque in all but one direction, ⊥ {100}, then transparent only in thinnest fragments. *Color:* Dark brown to reddish brown; dark red-brown in transmitted light; gray in reflected light, with red-orange internal reflections. *Luster:* Adamantine to vitreous; dull to pearly on cleavage.
Optical Class: Biaxial. n = 1.76–1.92 *Anisotropism:* Very weak. *Bireflectance:* Very weak. R_1–R_2: (400) 9.52–9.72, (420) 9.13–9.30, (440) 8.85–8.97, (460) 8.65–8.74, (480) 8.44–8.56, (500) 8.34–8.44, (520) 8.23–8.35, (540) 8.09–8.25, (560) 8.06–8.21, (580) 8.01–8.20, (600) 7.98–8.18, (620) 7.96–8.18, (640) 7.98–8.18, (660) 7.98–8.18, (680) 7.93–8.15, (700) 7.90–8.14

Cell Data: *Space Group:* $C2/m$. a = 15.405(3) b = 6.344(1) c = 5.562(2) β = 101.23(2)° Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
7.61 (10), 2.745 (6), 3.96 (5), 2.997 (4), 3.45 (3), 2.673 (3), 5.47 (2)

Chemistry:

	(1)	(2)	(3)
MnO	27.8	29.70	27.56
ZnO	31.1	33.36	30.97
MgO	9.2	9.86	9.15
H_2O	[31.9]	27.08	32.32
Total	[100.0]	[100.00]	[100.00]

(1) Franklin, New Jersey, USA; by electron microprobe, Mn^{2+} from crystal-structure analysis, H_2O by difference. (2) Do.; metal ratios from (1), calculated for $2H_2O$. (3) Do.; metal ratios from (1), calculated for $4H_2O$.

Occurrence: A very rare mineral on a museum specimen, typical of material from secondary veins in a metamorphosed stratiform zinc orebody.

Association: Willemite, zincite, cahnite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: In honor of John Cianciulli, of Sussex, New Jersey, USA, for his assistance to mineralogists studying Franklin-Sterling Hill minerals.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 56469; National Museum of Natural History, Washington, D.C., USA, M03074.

Cinnabar HgS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Rhombohedral crystals, to 10 cm; thick tabular {0001}; stout to slender prismatic ‖ [10$\bar{1}$0]. Also as incrustations, granular, and massive. *Twinning:* Twin plane {0001}, twin axis [0001], to form simple contact twins.

Physical Properties: *Cleavage:* {10$\bar{1}$0}, perfect. *Fracture:* Subconchoidal, uneven. *Tenacity:* Slightly sectile. Hardness = 2–2.5 VHN = 82–156 (10 g load). D(meas.) = 8.176 D(calc.) = 8.20

Optical Properties: Transparent in thin pieces. *Color:* Cochineal-red, towards brownish red and lead-gray. *Streak:* Scarlet. *Luster:* Adamantine, inclining to metallic when dark; dull in friable material.
Optical Class: Uniaxial (+). $\omega = 2.905$ (598.5). $\epsilon = 3.256$ (598.5). *Anisotropism:* High.
R_1–R_2: (400) 30.0–33.5, (420) 28.8–32.1, (440) 27.4–30.9, (460) 26.4–29.9, (480) 25.7–29.5, (500) 25.2–29.4, (520) 24.6–29.4, (540) 24.2–29.1, (560) 23.9–28.6, (580) 23.7–27.9, (600) 23.4–27.3, (620) 23.0–26.8, (640) 22.6–26.3, (660) 22.4–26.0, (680) 22.1–25.7, (700) 21.9–25.5

Cell Data: *Space Group:* $P3_121$ or $P3_221$. a = 4.145(2) c = 9.496(2) Z = 3

X-ray Powder Pattern: Almadén, Spain.
2.85 (10), 3.34 (9), 1.672 (6), 2.06 (5), 1.969 (5), 1.725 (5), 1.339 (5)

Chemistry: Essentially pure HgS.

Polymorphism & Series: Trimorphous with metacinnabar and hypercinnabar.

Occurrence: Formed from low-temperature hydrothermal solutions in veins, and in sedimentary, igneous, and metamorphic host rocks.

Association: Mercury, realgar, pyrite, marcasite, stibnite, "opal", "chalcedony", barite, dolomite, calcite.

Distribution: The most common ore of mercury world-wide, so only a few localities for exceptionally abundant or well-crystallized material can be mentioned. In the USA, in California, notably at New Almaden, Santa Clara Co. and New Idria, San Benito Co.; in Texas, at Terlingua, Brewster Co.; in Nevada, at the Cahill mine, Poverty Peak district, Humboldt Co., and near Lovelock, Pershing Co. At Charcas, San Luis Potosí, Mexico. In Spain, from Almadén, Ciudad Real Province, and Mieres, Asturias. At Hydercahn, in the Fergana basin, Kazakhstan. From Tongrin, Wanshanchang, and elsewhere in Guizhou Province, and in exceptional twinned crystals from the Tsar Tien mine, Hunan Province, China. As fine crystals at Mount Avala, near Belgrade, Serbia. From Idrija (Idria), Slovenia.

Name: From the Medieval Latin *cinnabaris*, traceable to the Persian *zinjifrah*, apparently meaning *dragon's blood*, for the red color.

Clairite $(NH_4)_2Fe^{3+}_3(SO_4)_4(OH)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As powdery aggregates of pseudohexagonal plates, to 50 μm.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. D(meas.) = 2.31 D(calc.) = 2.32 Slowly soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Yellow.
Optical Class: Biaxial. *Pleochroism:* X = pale yellow; Z' = dark yellow. *Orientation:* $X = c$.
$\alpha = 1.595$ β = n.d. $\gamma = 1.607$ 2V(meas.) = n.d.

Cell Data: *Space Group:* [$P\overline{1}$ or $P1$] (by analogy to metavoltine). $a = 9.368$ $b = 9.150$ $c = 52.610$ $\alpha = 88.15°$ $\beta = 90°$ $\gamma = 118.36°$ Z = 8

X-ray Powder Pattern: Lone Creek Fall Cave, South Africa.
17.5 (100), 8.78 (100), 3.279 (25), 8.23 (20), 3.424 (20), 3.041 (20), 4.743 (15)

Chemistry:

	(1)	(2)
SO_3	43.86	46.21
Al_2O_3	0.10	
Fe_2O_3	31.42	34.57
Mn_2O_3	1.23	
Na_2O	0.35	
K_2O	0.03	
$(NH_4)_2O$	6.97	7.52
H_2O	10.85	11.70
insol.	4.41	
Total	99.22	100.00

(1) Lone Creek Fall Cave, South Africa; Na and K by flame photometry, insoluble is quartz; corresponding to $[(NH_4)_{1.95}Na_{0.08}]_{\Sigma=2.03}(Fe_{2.87}Mn_{0.11}Al_{0.02})_{\Sigma=3.00}(SO_4)_4(OH)_{3.03} \cdot 2.88H_2O$.
(2) $(NH_4)_2Fe_3(SO_4)_4(OH)_3 \cdot 3H_2O$.

Occurrence: A rare secondary mineral formed by alteration of pyrite to ferric sulfate, and reaction, at pH ~2, with ammonia produced as the result of decay of organic matter (*Hyrax* excreta).

Association: Lonecreekite, sabieite, tschermigite.

Distribution: On the ceiling of Lone Creek Fall Cave, near Sabie, Eastern Transvaal, South Africa.

Name: Honors Claire Zingg Martini (1936–), wife of the author of the type description, who assisted her husband in cave exploration and mineral collecting.

Type Material: Museum of the Geological Survey, Pretoria, South Africa.

References: (1) Martini, J.E.J. (1983) Lonecreekite, sabieite, and clairite, new secondary ammonium ferric-iron sulphates from Lone Creek Fall Cave, near Sabie, Eastern Transvaal. Ann. Geol. Surv. S. Africa, 17, 29–34. (2) (1986) Amer. Mineral., 71, 229 (abs. ref. 1).

Claraite $(Cu, Zn)_3(CO_3)(OH)_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudohexagonal. *Point Group:* $\overline{1}$ or 1. As crusts and spherules composed of divergent tabular to pseudorhombohedral crystals, to 0.5 mm.

Physical Properties: *Cleavage:* On pseudo-$\{10\overline{1}0\}$, perfect. Hardness = ∼2
D(meas.) = 3.35(5) D(calc.) = 3.34

Optical Properties: Semitransparent. *Color:* Bluish green. *Luster:* Vitreous.
Optical Class: Uniaxial (–), may be weakly biaxial (–). *Pleochroism:* O = pale green to bluish green; E = colorless to pale green. *Dispersion:* $r \gg v$. $\omega = 1.751(2)$ $\epsilon = 1.645(2)$
2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 14.28$ $b = 8.03$ $c = 7.27$ $\alpha = 79.16°$ $\beta = 107.90°$ $\gamma = 99.68°$ Z = 4

X-ray Powder Pattern: Clara mine, Germany.
13.47 (10), 7.84 (9), 3.65 (8), 5.17 (6), 2.96 (6), 3.24 (5), 2.72 (4)

Chemistry:

	(1)
CO_2	11.6
MnO	1.2
CuO	52.2
ZnO	8.0
H_2O	[27.0]
Total	[100.00]

(1) Clara mine, Germany; by electron microprobe, average of two analyses, H_2O by difference; corresponding to $(Cu_{2.56}Zn_{0.38}Mn_{0.06})_{\Sigma=3.00}(CO_3)_{1.03}(OH)_{3.94} \cdot 3.85H_2O$.

Occurrence: A rare secondary mineral in oxidized Cu–Zn deposits.

Association: Malachite, azurite, olivenite, barite, fluorite, quartz (Clara mine, Germany); malachite, devilline, gypsum (Rudabánya, Hungary).

Distribution: From the Clara mine, near Oberwolfach, Black Forest, Germany. At Rudabánya, Hungary.

Name: For the Clara mine, Germany, where the first specimens were collected.

Type Material: University of Stuttgart, Stuttgart, Germany; National Museum of Natural History, Washington, D.C., USA, 148464.

Claringbullite $Cu_4Cl(OH)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As micaceous or platy crystals, to 1 cm, flattened on {1000}; in groups of divergent plates.

Physical Properties: *Cleavage:* Perfect on {0001}; distinct on $\{10\bar{1}0\}$ and $\{11\bar{2}0\}$.
Hardness = Soft. D(meas.) = 3.9 D(calc.) = 3.99

Optical Properties: Transparent to translucent. *Color:* Blue; pale blue in transmitted light.
Luster: Pearly.
Optical Class: Uniaxial (–). $\omega = 1.782$ $\epsilon = [1.780]$

Cell Data: *Space Group:* $P6_3/mmc$. a = 6.6733(5) $c = 9.185(1)$ Z = 2

X-ray Powder Pattern: Nchanga mine, Zambia or Kambove, Congo.
5.75 (vvs), 2.700 (vvs), 2.445 (vs), 4.89 (s), 4.58 (s), 2.889 (ms), 1.797 (ms)

Chemistry:

	(1)	(2)	(3)
CuO	78.18	74.42	77.85
Cl	8.55	8.30	8.68
H_2O	[15.14]	[19.03]	15.43

$-O = Cl_2$	1.93	1.87	1.96
Total	[100.00]	[100.00]	100.00

(1) Nchanga mine, Zambia; by electron microprobe, H_2O by difference, presence confirmed by elemental analyzer. (2) Kambove, Congo; by electron microprobe, H_2O by difference, presence confirmed by elemental analyzer; the mean of five analyses from both localities above corresponds to $Cu_{8.00}(SO_4)_{0.01}Cl_{1.99}(OH)_{14.00} \cdot 0.68H_2O$. (3) $Cu_4Cl(OH)_7$.

Occurrence: In oxidized copper ore or slag, produced under chlorine-rich conditions.

Association: Cuprite, malachite, quartz, brochantite, nantokite, paratacamite, connellite, spangolite.

Distribution: In the Nchanga mine, Chingola, Zambia. From the M'sesa mine, Kambove, Katanga Province, Congo (Shaba Province, Zaire). In the USA, from the Cole and Southwest mines, Bisbee, Cochise Co., Arizona. In the Malanjkhand copper deposit, north of Durg, Madhya Pradesh, India. At the Great Australia mine, near Cloncurry, Queensland, Australia.

Name: Honors Gordon Frank Claringbull (1911–1990), formerly Keeper of Mineralogy and Director of the British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 1976,109; University of Pierre and Marie Curie, Paris; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 145660.

Clarkeite $(Na, Ca, Pb)(UO_2)O(OH)\cdot 0{-}1H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As dense microcrystalline replacements of uraninite, which may be mineralogically zoned.

Physical Properties: *Fracture:* Conchoidal to splintery. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 6.29–6.39 D(calc.) = 6.74 Radioactive.

Optical Properties: Opaque, transparent in thin grains. *Color:* Dark brown, mahogany-brown, chocolate-brown, or reddish orange; reddish brown to orange-brown or orange in transmitted light. *Streak:* Yellowish brown. *Luster:* Slightly waxy.
Optical Class: Biaxial (–). *Pleochroism:* Weak; in darker oranges. *Dispersion:* $r < v$, weak.
$\alpha = 1.997$ $\beta = 2.098$ $\gamma = 2.108$ 2V(meas.) = 30°–50°

Cell Data: *Space Group:* $R\overline{3}m$. a = 3.954(1) c = 17.660(3) Z = 3

X-ray Powder Pattern: Fanny Gouge mine, North Carolina, USA.

(1) Spruce Pine, North Carolina, USA. (2) Ajmer district, India. (3) Fanny Gouge mine, North Carolina, USA; by electron microprobe, H_2O by difference; corresponds to $(Na_{0.73}Pb_{0.06}K_{0.03}Ca_{0.02}Y_{0.02}Sr_{0.01}Th_{0.01})_{\Sigma=0.88}(UO_2)_{0.94}O_{0.92}(OH)_{1.08}\cdot 0.07H_2O$.

Occurrence: Replacing uraninite, as a late-stage hydrothermal alteration product.

Association: Uraninite, uranophane, wölsendorfite, fourmarierite, vandendriesscheite, becquerelite, curite, "gummite", quartz.

Distribution: In the USA, in the Spruce Pine district, from the Deer Park and other mines, Mitchell Co., and the Fanny Gouge mine, Yancey Co., North Carolina. In India, from the Ajmer district, Rajputana.

Name: Honors Frank Wigglesworth Clarke (1847–1931), prominent American geochemist of the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 96510, R6607.

Claudetite As_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, thin tabular on {010}, with {111} and {$\bar{1}$11}, and cleavages, to 5 cm; also as crusts. *Twinning:* Commonly as penetration or contact twins on {100}.

Physical Properties: *Cleavage:* Perfect micaceous cleavage on {010}. *Fracture:* Splintery. *Tenacity:* Very flexible; deforms plastically. Hardness = 2.5 D(meas.) = 4.14–4.15 D(calc.) = 4.186

Optical Properties: Transparent. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous; pearly on cleavage surfaces.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c \simeq 84°$; $Z \wedge c \simeq 6°$. *Dispersion:* $r < v$, strong. $\alpha = 1.871(5)$ $\beta = 1.92(2)$ $\gamma = 2.01(1)$ 2V(meas.) = 58°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 5.25(1)$ $b = 12.99(1)$ $c = 4.53(1)$ $\beta = 93°53(20)'$ Z = 4

X-ray Powder Pattern: San Domingo mines, Portugal.
3.245 (100), 3.454 (50), 2.771 (35), 4.924 (25), 2.264 (25), 3.356 (20), 3.328 (18)

Chemistry:

	(1)	(2)
As	75.99	75.74
O	[23.84]	24.26
insol.	0.17	
Total	[100.00]	100.00

(1) Smolník, Slovakia; average of two analyses, O by difference. (2) As_2O_3.

Polymorphism & Series: Dimorphous with arsenolite.

Occurrence: A secondary oxidation product derived from realgar, arsenopyrite, or other arsenic-bearing minerals. Also produced as a sublimate during mine fires.

Association: Arsenolite, realgar, orpiment, sulfur.

Distribution: From the San Domingo mines, Algarve, Portugal. At Calañas, Andalusia; large cleavages from Rio Tinto, Huelva, Spain. In the Lasalle mine, Decazeville, Aveyron, France. From Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia, as a sublimation product. At Trebsko, Czech Republic. In Germany, found at St. Andreasberg, Harz Mountains. At Tsumeb, Namibia. In the USA, at the United Verde mine, Jerome, Yavapai Co., Arizona, and in the Tintic Standard mine, near Dividend, East Tintic district, Utah Co., Utah, both from mine fires; and in a sulfur prospect about 10 km north of the 4 S Ranch, Imperial Co., California.

Name: Honors Frederick Claudet, the French chemist who first described naturally occurring material.

Co	1.10	
Se	27.99	27.66
Total	99.94	100.00

(1) Clausthal, Germany. (2) PbSe.

Polymorphism & Series: Forms a series with galena.

Occurrence: Associated in low-sulfur hydrothermal deposits with other selenides, also in mercury deposits. Probably of secondary origin in some deposits.

Association: Tiemannite, klockmannite, berzelianite, umangite, gold, stibiopalladinite, uraninite.

Distribution: Perhaps the most common selenide. In Germany, from the Charlotte mine, Clausthal, 13 km south-southwest of Goslar [TL], Tilkerode, Lerbach, and Zorge, in the Harz Mountains, and at Schneeberg, Saxony. At Skrikerum, Sweden. From Hope's Nose, Torquay, Devon, England. In the Czech Republic, at Bukov, near Tisnova; in the Petrovice uranium deposit, near Ždăr; and the Předbořice uranium deposit, near Krásna Hora. In the USA, in the Blue Range Wilderness Area, Greenlee Co., Arizona; and at the Essex mine, Darwin, Inyo Co., California. In the Goldfields district, Saskatchewan; in the Kidd Creek mine, near Timmins, and the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. In Argentina, from the Sierra de Umango; in the Santa Brigida mine; at Tuminico, Sierra de Cacho; and from Los Llantenes, La Rioja Province, and from Cerro de Cacheuta, Mendoza Province. At the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, Potosí, Bolivia. From El Sharana, Northern Territory, Australia. At Tsumeb, Namibia. Other minor occurrences are known.

Name: For the locality at Clausthal, Germany.

Clearcreekite $Hg_3^{1+}(CO_3)(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular subhedral crystals, showing {001} and {010}, to 0.17 mm.

Physical Properties: *Cleavage:* Good on {001}. *Tenacity:* Brittle. Hardness = "Soft", probable. D(meas.) = n.d. D(calc.) = 6.96

Optical Properties: Transparent. *Color:* Pale greenish yellow. *Streak:* Pale greenish yellow. *Luster:* Vitreous.
Optical Class: Biaxial. n = [2.06–2.12]. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 6.760(4)$ $b = 9.580(4)$ $c = 10.931(4)$ $\beta = 105.53(5)^\circ$ Z = 4

X-ray Powder Pattern: Clear Creek claim, California, USA.
2.831 (100), 2.767 (100), 4.62 (90), 7.09 (70), 5.32 (40), 2.391 (40), 5.40 (30)

Chemistry:

	(1)	(2)
CO_2	n.d.	6.16
Hg_2O	84.65	87.54
H_2O	n.d.	6.30
Total		100.00

(1) Clear Creek claim, California, USA; by electron microprobe, presence of $(CO_3)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR, overall composition determined by crystal-structure analysis; corresponds to $Hg_{2.92}(CO_3)_{1.01}(OH)_{0.90}\cdot 2.07H_2O$. (2) $Hg_3(CO_3)(OH)\cdot 2H_2O$.

Polymorphism & Series: Dimorphous with peterbaylissite.

Occurrence: Very rare, probably formed as an alteration product of cinnabar.

Association: Edoylerite, cinnabar.

Distribution: From the Clear Creek claim, near the Clear Creek mercury mine, New Idria district, San Benito Co., California, USA.

Name: For the Clear Creek mine, California, USA.

Type Material: Canadian Geological Survey, Ottawa, Canada, 68074.

References: (1) Roberts, A.C., L.A. Groat, M. Raudsepp, T.S. Ercit, R.C. Erd, E.A. Moffatt, and J.A.R. Sterling (2001) Clearcreekite, a new polymorph of $Hg_3^{1+}(CO_3)(OH)\cdot 2H_2O$, from the Clear Creek claim, San Benito Co., California. Can. Mineral., 39, 779–784.

Clerite $Mn(Sb, As)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As irregular equant grains, to 0.2 mm, in aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = n.d. VHN = 224–262, 252 average (15 g load). D(meas.) = n.d. D(calc.) = 4.48

Optical Properties: Opaque. *Color:* Black; pale gray with pink-yellow tint in reflected light. *Luster:* Submetallic. *Anisotropism:* Strong; yellow-brown. *Bireflectance:* Distinct. R_1–R_2: (400) — , (420) 24.8–35.6, (440) 24.5–35.2, (460) 24.1–34.7, (480) 23.9–35.2, (500) 23.8–35.5, (520) 23.7–35.5, (540) 23.8–36.0, (560) 24.1–36.4, (580) 24.6–36.7, (600) 25.2–37.1, (620) 25.4–37.0, (640) 25.6–36.8, (660) 25.7–36.4, (680) 25.8–36.1, (700) 25.8–35.6

Cell Data: *Space Group: Pnam* (by analogy to berthierite). $a = 11.47(2)$ $b = 14.36(3)$ $c = 3.81(1)$ $Z = 4$

X-ray Powder Pattern: Vorontsovskoye deposit, Russia.
2.65 (100), 3.69 (90), 2.90 (80), 3.23 (70), 1.813 (50), 4.46 (40), 2.18 (40)

Chemistry:

	(1)
Mn	13.1
As	4.4
Sb	51.2
S	30.8
Total	99.5

(1) Vorontsovskoye deposit, Russia; by electron microprobe, average of five analyses; corresponding to $Mn_{1.00}(Sb_{1.75}As_{0.25})_{\Sigma=2.00}S_{4.00}$.

Occurrence: In a hydrothermal gold deposit in limestone.

Association: Realgar, pyrite, alabandite, sphalerite, aktashite, routhierite, zinkenite, chalcostibite, orpiment, stibnite, cinnabar, tetrahedrite–tennantite, gold, greigite.

Distribution: From the Vorontsovskoye gold deposit, Serov district, Northern Ural Mountains, Russia [TL].

Name: To honor Onisima Yegorovicha Klera (1845–1920), Russian geologist, President of the Ural Society of Natural Sciences Amateurs, Ykaterinberg (Sverdlovsk), Russia.

Type Material: Ural Geological Museum, Mining Institute, Yekaterinburg (Sverdlovsk), Russia.

Cliffordite $(UO_2)Te_3^{4+}O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As octahedra, to 0.2 mm, in crusts.

Physical Properties: Hardness = 4 D(meas.) = 6.57 (synthetic). D(calc.) = 6.77 Radioactive.

Optical Properties: Semitransparent. *Color:* Bright sulfur-yellow. *Luster:* Adamantine. *Optical Class:* Isotropic. $n = 2.25(2)$ (synthetic).

Cell Data: *Space Group:* $Pa3$. a = 11.37–11.47 Z = 8

X-ray Powder Pattern: San Miguel prospect, Mexico.
3.273 (10), 2.844 (8), 2.007 (8), 2.755 (7), 1.712 (7), 4.63 (6), 4.02 (6)

Chemistry:

	(1)	(2)
U	24.	31.12
Te	54.	50.05
O		18.83
Total		100.00

(1) San Miguel prospect, Mexico; by electron microprobe. (2) $(UO_2)Te_3O_7$.

Occurrence: As rare incrustations along fractures in the oxidized zone of hydrothermal Au–Ag telluride deposits.

Association: Mackayite, barite, quartz, "limonite" (San Miguel prospect, Mexico); tellurium, paratellurite, quartz (Moctezuma mine, Mexico).

Distribution: From the San Miguel prospect, and 10 km southeast at the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: Honors Professor Clifford Frondel (1907–2002), Harvard University, Cambridge, Massachusetts, USA, for his contributions to uranium mineralogy.

Type Material: Natural History Museum, Paris, France, 175.83, 180.61; Harvard University, Cambridge, Massachusetts, 119079; National Museum of Natural History, Washington, D.C., USA, 120246, 164341, 164342.

Clinoatacamite $Cu_2Cl(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudorhombohedral. *Point Group:* $2/m$. As complex intergrowths of crystals and twinned grains, to 1 mm; as powdery aggregates. *Twinning:* Very common on {100}.

Physical Properties: *Cleavage:* Perfect on {012}. *Fracture:* Even. *Tenacity:* Brittle. Hardness = 3 D(meas.) = n.d. D(calc.) = 3.77

Optical Properties: Transparent to translucent. *Color:* Green to dark greenish black, rarely greenish blue. *Luster:* Adamantine to vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y \wedge a = 10°$. *Dispersion:* $r \gg v$, strong.
α = n.d. β = n.d. γ = n.d. 2V(meas.) = 75(5)° 2V(calc.) = 69(3)°

Cell Data: *Space Group:* $P2_1/n$. $a = 6.157(2)$ $b = 6.814(3)$ $c = 9.105(5)$ $\beta = 99.65(4)°$
Z = 4

X-ray Powder Pattern: Chuquicamata, Chile; nearly identical to paratacamite.
5.47 (100), 2.742 (70), 2.767 (60), 2.266 (60), 2.243 (50), 1.704 (50), 2.887 (40)

Chemistry:

	(1)	(2)
CuO	74.7	74.49
Cl	16.5	16.60
H_2O	[13.5]	12.65
$-O = Cl_2$	3.7	3.74
Total	[101.0]	100.00

(1) Chuquicamata, Chile; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $Cu_{1.96}Cl_{0.97}O_{3.03}H_{3.11}$. (2) $Cu_2Cl(OH)_3$.

Polymorphism & Series: Polymorphous with atacamite, botallackite, and paratacamite.

Occurrence: An oxidation product of other copper minerals.

Association: Atacamite, paratacamite, gypsum, alunite (Chuquicamata, Chile); atacamite, zincian paratacamite, caracolite, schwartzembergite, osarizawaite-beaverite, boleite (Sierra Gorda district, Chile).

Distribution: In Chile, from Chuquicamata, and in the Sierra Gorda district, southwest of Calama, Antofagasta; at Remolinos, Atacama. From Calumet, Keweenaw Co., Michigan, and Mason Pass, near Yerington, Lyon Co., Nevada, USA. At Wallaces Gully, Mount Painter, and Wallaroo, South Australia. From the Castletown mine, Lochgilphead, Scotland.

Name: As the monoclinic polymorph of *atacamite*.

Type Material: Royal Ontario Museum, Toronto, Canada, M32176.

Clinobarylite $BaBe_2Si_2O_7$

Crystal Data: Orthorhombic. *Point Group: mm*2. As radial aggregates of platy to prismatic crystals elongated on [001], to 20 mm. Typically flattened on {100} or less commonly on {010}.

Observed forms are {100}, {010}, {201}, and {$\bar{2}$ 01}, with less common {610}, {101}, and {$\bar{1}$ 01}. Twinning on a microscopic scale noted.

Physical Properties: *Cleavage:* Perfect on {100} and less perfect on {001} and {101}. *Fracture:* n.d. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 3.97(7) D(calc.) = 4.01

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (-). α = 1.695(5) β = 1.702(5) γ = 1.708(8) 2V(calc.) = 85(5)º *Orientation*: $X = b$, $Y = c$.

Cell Data: Space Group: $Pmn2_1$. a = 11.650(10) b = 4.922(4) c = 4.674(4) Z = 2

X-ray Powder Pattern: Mount Yukspor, Khibiny massif, Kola Peninsula, Russia. 2.458 (100), 2.929 (58), 3.388 (56), 2.336 (31), 2.986 (28), 3.042 (26), 2.077 (23)

Chemistry:

	(1)
BaO	47.66
SiO_2	36.38
BeO	14.90
Total	98.94

(1) Mount Yukspor, Khibiny massif, Kola Peninsula, Russia; average of 4 electron microprobe analyses, Be by AA, corresponding to $Ba_{1.03}Be_{1.97}Si_{2.00}O_{7.00}$.

Polymorphism & Series: Dimorphous with barylite.

Occurrence: In pegmatite veins in an alkaline igneous complex.

Association: Natrolite, aegirine, microcline, catapleiite, fluorapatite, titanite, fluorite, galenite, sphalerite, strontianite, annite, astrophyllite, lorenzenite, labuntsovite-Mn, kuzmenkoite-Mn, cerite-(Ce), edingtonite, ilmenite, calcite.

Distribution: Mount Yukspor, southern Khibiny alkaline massif, Kola Peninsula, Russia.

Name: Reflects the relationship to *barylite* and non-orthogonal appearance of its crystals which were originally incorrectly determined to be monoclinc.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 2819/1.

BeO	55(5)	58.13
H_2O	41.0	41.87
Total		100.00

(1) Malyshev deposit, Russia; Be by laser spectral analysis, H_2O by coulometric analysis.
(2) $Be(OH)_2$.

Polymorphism & Series: Polymorphous with behoite.

Occurrence: In hydrothermally altered zones in desilicated pegmatites.

Association: Bavenite, bityite, phillipsite, analcime, albite.

Distribution: From the Malyshev deposit, Asbest district, near Yekaterinburg (Sverdlovsk), Ural Mountains, Russia.

Name: For its monoclinic symmetry and relation to *behoite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Clinobisvanite $BiVO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely in platy to pyramidal crystals, to 1 mm; as globular aggregates and coatings. *Twinning:* May exhibit multiple twinning on {101}, composition plane {010}, giving reticulated groups.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = Very soft.
D(meas.) = n.d. D(calc.) = 6.949

Optical Properties: Transparent in thin flakes. *Color:* Yellow, pale orange, yellow-orange, deep reddish orange. *Luster:* Earthy to subvitreous.
Optical Class: Biaxial. $n = [2.63]$

Cell Data: *Space Group:* $I2/a$ (synthetic). $a = 5.195$ $b = 11.701$ $c = 5.092$ $\beta = 90.38°$
$Z = 4$

X-ray Powder Pattern: Synthetic.
3.095 (100), 3.082 (95), 3.120 (30), 4.749 (25), 4.670 (25), 2.924(25), 1.717 (18)

CaO		0.9	
Total	98.85	99.9	100.00

(1) Yinnietharra Station, Western Australia. (2) White Queen mine, California, USA; by electron microprobe, corresponding to $Bi_{1.01}V_{0.97}O_4$. (3) $BiVO_4$.

Polymorphism & Series: Trimorphous with dreyerite and pucherite.

Occurrence: An accessory mineral in pegmatites, as an oxidization product of other bismuth minerals.

Association: Pucherite, bismite, bismutite, bismuth, vanadinite, beyerite, namibite, scheelite.

Distribution: In Western Australia, from five km south of Pyramid Hill, Yinnietharra Station; in the Londonderry quarry, 19 km south of Coolgardie; at Menzies; from Wodgina; on the Champion lease, Westonia; from about three km north-northwest of Corinthia; and east-southeast of Try Again Bore, Yandil Station; from South Australia, at Lively's Find gold mine, Arkaroola. From Mutala, Mozambique. At the Rubicon pegmatite, south of Karibib, and from near Khorixas, Namibia. In the USA, in the Jensen quarry, Riverside Co.; at the Lodi #4 mine, Spring Creek district, Plumas Co., and from the White Queen and Elizabeth "R" mines, Pala, San Diego Co., California; near the Comstock mine, Dos Cabezas Mountains, Cochise Co., Arizona; from the Linka mine, Spencer Hot Springs district, Lander Co., about 30 km northwest of Potts, Nevada. At the La Juana mine, Córdoba Province, Argentina. In China, from near Koktokay [Kyokfogoi], Xinjiang Uygur Autonomous Region. In an undisclosed gold deposit, Ural Mountains, Russia. At Reichenbach, near Bensheim, Hesse, Germany.

Name: For the mineral's *monoclinic* crystal system, and BISmuth and VANadium in its composition.

Type Material: Western Australian Museum, Perth, Australia, MDC5144; National Museum of Natural History, Washington, D.C., USA, 127456.

Clinochalcomenite $CuSe^{4+}O_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic along and striated ‖ [001], to 0.6 mm; {110} and {011} dominant, {210}, {100}, {010}, {001} and {101} observed. Also as crusts and patchy coatings on chalcomenite.

Physical Properties: *Cleavage:* Perfect on {110}. *Tenacity:* Brittle. Hardness = 2
D(meas.) = 3.28 D(calc.) = 3.42

Optical Properties: Transparent. *Color:* Blue-green to pale green, may be black from included umangite; pale blue-green in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Y$ = colorless; Z = blue-green. *Orientation:* $Y = b$; $X \wedge a = 3°$; $Z \wedge c = 10°$. *Dispersion:* $r < v$. $\alpha = 1.675$ $\beta = 1.723$ $\gamma = 1.765$
2V(meas.) = 78°

Cell Data: *Space Group:* $P2_1/n$. $a = 8.177$ $b = 8.611$ $c = 6.290$ $\beta = 97°16'$ Z = 4

X-ray Powder Pattern: Gansu Province, China.
5.89 (10), 3.66 (9), 2.926 (8), 4.06 (7), 2.694 (7), 2.482 (7), 1.818 (7)

Chemistry:

	(1)	(2)
SeO_2	53.27	48.98
CuO	37.15	35.11
H_2O		15.91
Total		100.00

(1) Gansu Province, China; by electron microprobe, here converted to oxides, $2H_2O$ by analogy to ahlfeldite and cobaltomenite. (2) $CuSeO_3 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with chalcomenite.

Occurrence: A very rare secondary mineral in the oxidized zone of a uranium deposit in brecciated carbonaceous slate (China); in a hydrothermal selenium vein deposit (El Dragón mine, Bolivia).

Association: Volborthite, chalcomenite, umangite, malachite (China); chalcomenite, cobaltomenite, alunite (El Dragón mine, Bolivia).

Distribution: From an undisclosed locality in Gansu Province, China. At the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, Bolivia.

Name: As the monoclinic dimorph of *chalcomenite*.

Type Material: n.d.

References: (1) Luo Keding, Wei Jun, Zhang Jingyi, and Gu Qifang (1980) Clinochalcomenite, a new mineral of selenite. Kexue Tongbao, 25, 85–89 (in Chinese), 427–433 (in English).

Clinochlore $(Mg, Fe^{2+})_5Al(Si_3Al)O_{10}(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. In thin to thick pseudohexagonal crystals, with tapering pyramidal faces, to 10 cm. Commonly foliated, fibrous, granular, earthy, massive. *Twinning:* Twin plane {001}; twin axis [310], composition plane {001}.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Laminae flexible, inelastic. Hardness = 2–2.5 D(meas.) = 2.60–3.02 D(calc.) = 2.628

Optical Properties: Transparent to translucent. *Color:* Grass-green, olive-green, yellowish, white; pink, rose-red; colorless to pale green or yellow in thin section. *Streak:* Greenish white to white. *Luster:* Pearly, greasy, dull.
Optical Class: Biaxial (+) or (–). *Pleochroism:* Distinct; X = light yellow-green to light blue-green; $Y = Z$ = light greenish yellow to light blue-green. *Orientation:* $Y = b$; $Z \wedge c = 2°$–$9°$. *Dispersion:* $r < v$. *Absorption:* $Y \simeq Z > X$ or $Z \simeq Y > Z$. $\alpha = 1.571$–1.588 $\beta = 1.571$–1.588 $\gamma = 1.576$–1.597 2V(meas.) = 0°–50°

Cell Data: *Space Group:* $C2/m$. $a = 5.350(3)$ $b = 9.267(5)$ $c = 14.27(1)$ $\beta = 96.35(5)°$ Z = 2

X-ray Powder Pattern: Synthetic (IIb structure); berthierine plus clinochlore easily mistaken for chamosite.
3.57 (100), 2.540 (100), 2.008 (100), 1.539 (100), 14.1 (80), 7.14 (80), 4.76 (80)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	33.83	32.12	MgO	34.94	35.36
Al_2O_3	12.95	9.50	CaO		1.24
Fe_2O_3	2.25		H_2O^+	13.11	10.25

FeO	3.02	1.98	Total	100.10	100.37

(1) Zillertal, Austria; corresponds to $(Mg_{4.94}Fe^{2+}_{0.24})_{\Sigma=5.18}(Al_{0.65}Fe^{3+}_{0.16})_{\Sigma=0.81}(Si_{3.21}Al_{0.79})_{\Sigma=4.00}O_{10}(OH)_8$. (2) Deer Park, Wyoming, USA; corresponds to $(Mg_{5.05}Fe^{2+}_{0.16}Ca_{0.13})_{\Sigma=5.34}(Cr_{0.60}Al_{0.15}Fe^{3+}_{0.15})_{\Sigma=0.90}(Si_{3.08}Al_{0.92})_{\Sigma=4.00}O_{10}(OH)_8$.

Polymorphism & Series: Forms a series with chamosite; stacking disorder is common.

Mineral Group: Chlorite group.

Occurrence: A hydrothermal alteration product of amphiboles, pyroxenes, biotite. In chlorite schists, serpentinites, marbles, calc-silicate rocks, amphibolites, less commonly in ultramafic rocks. In ore veins; a detrital component of sediments.

Association: Serpentine, calcite, dolomite, actinolite, biotite, olivine, plagioclase, talc, chromite, uvarovite.

Distribution: Some localities for well-crystallized material are: in the USA, in the Emery mine, Chester, Hampden Co., Massachusetts; at Texas, Lancaster Co., and West Chester, Chester Co., Pennsylvania; in the Tilly Foster mine, Brewster, Putnam Co., New York. In the Zillertal, Tirol, Austria. From the Pfitschtal, Trentino-Alto Adige; Val Malenco, Lombardy; and at Ala, Piedmont, Italy. At Rimpfischwänge, near Zermatt, Valais, Switzerland. From Ojén, Málaga Province, Spain. On Unst, Shetland Islands, Scotland. In the Kop Krom [chrome mine], Kop Mountains, near Aşkale, Turkey. In Russia, in the Ural Mountains, at Akhmatovsk, Berbliouchka, and Hardadinsk; and at Miass, Ilmen Mountains, Southern Ural Mountains.

Name: For its inclined optic axes and the Greek *chloros*, for green, its common color.

Clinochrysotile $Mg_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or triclinic. *Point Group:* n.d. Asbestiform, fibrous along [100], curled to cylindrical; also bladed, massive.

Physical Properties: Hardness = 2.5 D(meas.) = 2.53(1) D(calc.) = 2.61

Optical Properties: Semitransparent. *Color:* White, pale green to dark green. *Luster:* Silky in fibrous aggregates.
Optical Class: Biaxial (–). $\alpha = 1.569(2)$ $\beta = [1.569]$ $\gamma = 1.570(2)$ 2V(meas.) = ∼42°

Cell Data: *Space Group:* n.d. $a = 5.3129(9)$ $b = 9.120(3)$ $c = 14.637(2)$ $\beta = 93°9.8(6)'$
Z = 4

X-ray Powder Pattern: Butler Estate chrome mine, California, USA.
7.31 (100), 3.65 (70), 4.57 (50), 1.535 (50), 2.270 (30), 2.205 (30), 2.092 (30)

			Total	100.23	100.00

(1) Joe No. 5 pit, California, USA. (2) $Mg_3Si_2O_5(OH)_4$.

Polymorphism & Series: Polymorphous with antigorite, orthochrysotile, lizardite, and parachrysotile; may also be termed chrysotile-$2M_{c1}$.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Intermixed with orthochrysotile in veinlets cutting serpentinite.

Association: Orthochrysotile, lizardite, corundum.

Distribution: Undoubtedly of common occurrence in asbestos deposits, but requires careful characterization for confirmation, which has been accomplished at only a few localities, such as: in the USA, from the Butler Estate chrome mine, Fresno Co., and the Joe No. 5 pit, New Idria, San Benito Co., California; in the Belvidere Mountain quarries, Lowell, Orleans Co., Vermont; and from the Salt River Canyon, near Globe, Gila Co., Arizona. At Thetford Mines, Quebec, Canada. From Quilla, Charsadda Tehsil, Pakistan. In Australia, from Woodsreef, New South Wales.

Name: Chrysotile from the Greek for *golden* and *fiber*; *clino* in reference to the mineral's crystallization in inclined axis crystal systems.

Type Material: n.d.

Clinoclase $Cu_3(AsO_4)(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare in crystals, typically needlelike, to 9 mm, elongated along [010], tabular on {001}, may be pseudorhombohedral, with prominent {100}, {001}, smaller {110}, and additional forms; as rosettes and radial fibrous spherical aggregates, to 5 cm; in crusts and coatings.

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 4.38 D(calc.) = 4.42

Optical Properties: Transparent to translucent. *Color:* Dark greenish blue to greenish black; in transmitted light, blue-green. *Streak:* Bluish green. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (–). *Pleochroism:* X = pale blue-green; Y = pale blue-green; Z = Benzol-green. *Orientation:* $Y = b$; $Z \simeq a$. *Dispersion:* $r < v$, very strong. $\alpha = 1.756$ $\beta = 1.874$ $\gamma = 1.896$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P2_1/a$. $a = 12.33$–12.38 $b = 6.42$–6.46 $c = 7.21$–7.26 $\beta = 99°22'$–$99°51'$ $Z = 4$

X-ray Powder Pattern: Cornwall, England and the Tintic district, Utah, USA. 3.55 (10), 3.13 (8), 10.4 (6), 2.30 (5), 2.05 (5), 2.88 (4), 2.53 (4)

Chemistry:

	(1)	(2)
P_2O_5	1.50	
As_2O_5	27.08	30.20
Fe_2O_3	0.49	
CuO	62.80	62.70
H_2O	7.57	7.10
Total	99.44	100.00

(1) Cornwall, England; corresponding to $(Cu_{2.97}Fe^{3+}_{0.02})_{\Sigma=2.99}(As_{0.89}P_{0.08})_{\Sigma=0.97}O_4(OH)_{3.16}$.
(2) $Cu_3(AsO_4)(OH)_3$.

Polymorphism & Series: Dimorphous with gilmarite.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-rich hydrothermal base-metal deposits.

Association: Olivenite, cornwallite, cornubite, conichalcite.

Distribution: In England, from Cornwall, at Wheals Gorland and Unity, the Ting Tang and St. Day United mines, and others, Gwennap, in the Providence mine, Lelant, at Wheal Hazard, St. Just; from the Bedford United mines, near Tavistock, Devon. At Sainte-Marie-aux-Mines, Haut-Rhin, and the Cap Garonne mine, near le Pradet, Var, France. From the Altväter samt Eschig mine, near Sayda, Saxony; in the Neues Jahr mine, near Freudenstadt, and the Clara mine, near Oberwolfach, Black Forest, Germany. At the Santa Lucia mine, near Muravera, Sardinia, Italy. From Novoveská Huta, Slovakia. In the Mammoth and other mines, Tintic district, Juab Co., and the Gold Hill mine, Tooele Co., Utah; fine examples from the Majuba Hill mine, Antelope district, Pershing Co., Nevada, USA. From San Francisco de los Andes, San Juan Province, Argentina. At the Lantaro mine, near Copiapó, Atacama, Chile. In the Hillside quarry, near Stavoren, Transvaal, South Africa. From the Kitabira mine, Yamaguchi Prefecture, Japan. At the Dome Rock copper mine, about 40 km northwest of Mingary, and Moonta, South Australia. Many other minor localities are known.

Name: From the Greek for *to incline* and *to break*, remarking the oblique basal cleavage.

Clinoenstatite $Mg_2Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, to 2 mm; lamellar, fibrous, or massive; as stellate clusters. *Twinning:* Polysynthetic on {100}.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ (1$\bar{1}$0) ∼91°. *Tenacity:* [Brittle] (by analogy to enstatite). Hardness = [5–6] D(meas.) = n.d. D(calc.) = 3.210

Optical Properties: Semitransparent. *Color:* [White to brown; colorless in thin section.] *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = 20°–22°$. $\alpha = 1.651$ $\beta = 1.654$ $\gamma = 1.660$ 2V(meas.) = 53.5°

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 9.6065$ $b = 8.8146$ $c = 5.1688$ $\beta = 108.335°$ Z = 4

X-ray Powder Pattern: Synthetic.
2.873 (100), 2.976 (75), 3.17 (30), 2.452 (30), 2.115 (30), 3.28 (25), 2.518 (18)

Chemistry:

	(1)
SiO_2	57.36
TiO_2	0.00
Al_2O_3	0.11
Cr_2O_3	0.28
FeO	6.32
MnO	0.09
MgO	34.97
CaO	0.26
Na_2O	0.00
Total	99.39

(1) Ogasawara Islands, Japan; by electron microprobe, corresponds to $(Mg_{1.81}Fe_{0.18}Ca_{0.01}Cr_{0.01})_{\Sigma=2.01}(Si_{1.99}Al_{0.01})_{\Sigma=2.00}O_6$.

Polymorphism & Series: Dimorphous with enstatite; forms a series with clinoferrosilite.

Mineral Group: Pyroxene group.

Occurrence: As phenocrysts, likely inverted from "protoenstatite," in high-magnesium nonfeldspathic andesites. Exsolved in diopside in ultramafic rocks and in enstatite in high-grade metamorphic hornfelses. An essential constituent of chondrite and achondrite meteorites, likely formed by stress.

Association: Diopside, enstatite, chromite, "hypersthene," glass.

Distribution: From Cape Vogel, Papua New Guinea, and on the inner slope of the Mariana trench. At Chichijima and Mukojima, Ogasawara (Bonin) Islands, Japan. From Népoui, New Caledonia. In the USA, from the Mt. Stuart batholith, central Cascade Mountains, Washington.

Name: For its monoclinic crystal system and chemical identity to *enstatite*.

Type Material: n.d.

Clinoferrosilite $(Fe^{2+},Mg)_2Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular crystals lacking terminal faces. *Twinning:* On {100}.

Physical Properties: *Cleavage:* [Good on {110}, (110) ∧ $(1\bar{1}0)$ ∼87°] (by analogy to ferrosilite). Hardness = [5–6] D(meas.) = n.d. D(calc.) = 4.068

Optical Properties: Semitransparent. *Color:* Colorless with slight amber tint. *Optical Class:* Biaxial (+). *Orientation:* $Z \wedge c = 31°$. $\alpha = 1.764(2)$ (synthetic $Fe_2Si_2O_6$). $\beta = 1.767(2)$ $\gamma = 1.792(2)$ 2V(meas.) = 25(5)°

Cell Data: *Space Group:* $P2_1/c$ (synthetic $Fe_2Si_2O_6$). $a = 9.7085$ $b = 9.0872$ $c = 5.2284$ $\beta = 108.432°$ Z = 4

X-ray Powder Pattern: Synthetic $Fe_2Si_2O_6$.
3.035 (100), 2.603 (63), 2.909 (55), 2.408 (53), 2.161 (51), 4.605 (49), 3.234 (40)

Chemistry: (1) Material from Lake Naivasha, Kenya, approximates $(Fe_{1.90}Mn_{0.10})_{\Sigma=2.00}Si_2O_6$, with Mg, Al, Ca, Ti, V, Cr, Co, and Ni absent.

Polymorphism & Series: Dimorphous with ferrosilite; forms a series with clinoenstatite.

Mineral Group: Pyroxene group.

Occurrence: As acicular crystals in lithophysae in obsidian (Lake Naivasha, Kenya).

Association: Anorthoclase, magnetite, cristobalite, fayalite, biotite (Lake Naivasha, Kenya).

Distribution: From near Lake Naivasha, Rift Valley, Kenya. In the USA, from the Coso Mountains, Inyo Co., California; and at Obsidian Cliffs, Yellowstone National Park, Wyoming. From Hrafntinnuhryggur, Iceland.

Name: For its monoclinic crystal system and chemical identity with *ferrosilite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 102793.

Clinohedrite $CaZnSiO_4 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. Crystals typically prismatic or tabular, to 4 mm; may be wedge-shaped reflecting the domatic class in which the species crystallizes.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 5.5 D(meas.) = 3.28–3.335 D(calc.) = [3.32] Strongly pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Amethystine, colorless to white. *Luster:* Brilliant, glassy; pearly on {010}.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $Y \wedge c = 28°$. $\alpha = 1.662$ $\beta = 1.667$ $\gamma = 1.669$ 2V(meas.) = Large.

Cell Data: *Space Group:* Cc. $a = 5.090$–5.131 $b = 15.829$–15.928 $c = 5.386$–5.422 $\beta = 103.39°-103.43°$ Z = 4

X-ray Powder Pattern: Franklin, New Jersey, USA. (ICDD 17-214).
2.76 (100), 3.23 (70), 2.50 (60), 7.81 (50), 3.97 (50), 2.36 (50), 2.47 (40)

Chemistry:

	(1)	(2)	(3)
SiO_2	27.22	26.73	27.87
$(Fe, Al)_2O_3$	0.28	0.37	
MnO	0.50	1.11	
ZnO	37.44	37.13	37.76
MgO	0.07		
CaO	26.25	26.25	26.01
H_2O^+	8.56	8.09	8.36
Total	100.32	99.68	100.00

(1) Franklin, New Jersey, USA; average of two analyses. (2) Do. (3) $CaZnSiO_4 \cdot H_2O$.

Occurrence: In a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Hancockite, nasonite, glaucochroite, roeblingite, calcite, willemite, axinite, larsenite, hodgkinsonite, franklinite (Franklin, New Jersey, USA); stringhamite, kinoite, apophyllite (Christmas mine, Arizona, USA).

Distribution: From Franklin, Sussex Co., New Jersey; in the Christmas mine, Gila Co., Arizona, USA.

Name: From the Greek *klino*, for *incline*, and *hedra*, for *face*, for the inclined facial character of the crystal morphology.

Type Material: Yale University, New Haven, Connecticut, 2.4855; Harvard University, Cambridge, Massachusetts, USA, 131872.

Clinoholmquistite $\mathbf{Li_2[(Mg,Fe^{2+})_3Al_2]Si_8O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As elongated prismatic crystals.

Physical Properties: *Cleavage:* [Perfect on {110}, intersecting at ∼56° and ∼124°; partings on {100}, {001}.] *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = 3.00 D(calc.) = [3.07]

Optical Properties: [Transparent to translucent.] *Color:* [Blue.] *Luster:* [Vitreous.] *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z = c$; $X \wedge a = 15°–16°$. $\alpha = 1.610$ $\beta = 1.627$ $\gamma = 1.633$ 2V(meas.) = 55°–61°

Cell Data: *Space Group:* $P2/m$. $a = 9.80(2)$ $b = 17.83(3)$ $c = 5.30(1)$ $\beta = 109°06'$ Z = 2

X-ray Powder Pattern: Tastyg deposit, Russia.
7.93 (100), 2.985 (100), 2.70 (100), 4.40 (90), 1.371 (90), 1.614 (80), 1.571 (70)

Chemistry:

	(1)		(1)
SiO_2	57.68	CaO	[1.80]
TiO_2	0.00	Li_2O	3.37
Al_2O_3	13.52	Na_2O	1.74
Fe_2O_3	0.44	K_2O	0.28
FeO	5.87	F	1.70
MnO	0.45	H_2O^+	1.67
MgO	9.37	$-O = F_2$	0.71
		Total	[97.18]

(1) Tastyg deposit, Russia; recalculated to remove calcite contamination; corresponds to $(Li_{1.79}Ca_{0.21})_{\Sigma=2.00}(Mg_{1.93}Fe^{2+}_{0.68}Al_{0.21}Li_{0.08}Fe^{3+}_{0.05}Mn_{0.05})_{\Sigma=3.00}Al_{2.00}Si_8O_{22}(OH)_2$.

Polymorphism & Series: Dimorphous with holmquistite; forms a series with magnesio-clinoholmquistite and ferro-clinoholmquistite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: 0.1 $Mg/(Mg + Fe^{2+})$ 0.89; $(Ca + Na)_B < 1.34$; $Li \geq 1.0$.

Occurrence: Partly replaced by holmquistite.

Association: Holmquistite, calcite.

Distribution: From the Tastyg spodumene deposit, Tuva, Siberia, Russia.

Name: In allusion to its similarity to *holmquistite* and its monoclinic structure.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 67493.

References: (1) Ginzburg, I.V. (1965) Holmquistite and its structural variety clinoholmquistite. Trudy Mineral. Muzeya Akad. Nauk SSSR, 16, 73–89 (in Russian). (2) (1967) Amer. Clinohumite $(Mg,Fe^{2+})_9(SiO_4)_4(F,OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals complex, highly modified, to 2 cm; massive. *Twinning:* Common on {100}, simple, lamellar.

Physical Properties: *Cleavage:* {100}, poor. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 3.17–3.35 D(calc.) = 3.279

Optical Properties: Transparent to translucent. *Color:* White, yellow to brown with increasing Ti; in thin section, colorless, pale yellow to golden yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Pleochroism:* X = golden yellow, yellow-brown, deep reddish yellow; Y = pale yellow, yellow-orange, light yellow; Z = pale yellow, yellow-orange, colorless. *Orientation:* $Z = b$; $X \wedge c = 9°–15°$. *Dispersion:* $r > v$, strong. $\alpha = 1.628–1.638$ $\beta = 1.641–1.654$ $\gamma = 1.662–1.674$ 2V(meas.) = 73°–76°

Cell Data: *Space Group:* $P2_1/c$. $a = 13.68$ $b = 4.75$ $c = 10.27$ $\beta = 100°50'$ Z = 2

X-ray Powder Pattern: Hämeenkylä, Finland. (ICDD 14-692).
1.738 (100), 5.02 (70), 3.70 (70), 2.76 (70), 2.54 (70), 2.51 (70), 2.26 (70)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	36.53	35.90	MgO	54.16	44.16
TiO_2	0.26	5.59	CaO		0.01
Al_2O_3	0.22		F	2.74	0.00
Fe_2O_3	0.56		H_2O^+	1.52	2.64
FeO	5.04	11.21	H_2O^-	0.04	
MnO	0.34	0.50	$-O = F_2$	1.15	
			Total	100.26	100.01

(1) Hämeenkylä, Finland; corresponds to $(Mg_{8.42}Fe^{2+}_{0.50}Mn^{2+}_{0.06}Ti_{0.02})_{\Sigma=9.00}(SiO_4)_4[F_{1.04}(OH)_{0.93}O_{0.03}]_{\Sigma=2.00}$. (2) Franscia, Italy; corresponds to $(Mg_{7.33}Fe^{2+}_{1.04}Ti_{0.47}Mn^{2+}_{0.05})_{\Sigma=8.89}(SiO_4)_4[(OH)_{1.04}O_{0.96}]_{\Sigma=2.00}$.

Mineral Group: Humite group.

Occurrence: In contact metamorphic zones in dolostones and metasomatized limestones adjacent to felsic plutonic rocks; in serpentine and talc schists; in a carbonatite.

Association: Grossular, wollastonite, forsterite, monticellite, cuspidine, fluoborite, ludwigite, dolomite, calcite, talc, biotite, spinel, vesuvianite, sanidine, meionite, nepheline.

Distribution: At Monte Somma and Vesuvius, Campania, and Franscia, Val Malenco, Lombardy, Italy. From Hämeenkylä and Ojamo, Lohja, Finland. At Broadford, Isle of Skye, Scotland. From Llanos de Juanar, Málaga Province, Spain. At the Kangerdlugssuaq Fjord, Greenland. Found near Lake Baikal, eastern Siberia, Russia. Large crystals from Kuche-Lal, Pamir Mountains, Tajikistan. In the USA, at the Tilly Foster iron mine, Brewster, Putnam Co., New York; at Buell Park, near Fort Defiance, Apache Co., Arizona; Crestmore, Riverside Co., and the Twin Lakes region, Fresno Co., California. At Cargill Lake, Ontario, Canada. In the Jacupiranga mine, São Paulo, Brazil.

Name: For its monoclinic crystal system and relation to *humite*.

Type Material: Natural History Museum, Paris, France, 106.395–106.556; National Museum of Natural History, Washington, D.C., USA, 94997.

Total	[100.0]	100.00

(1) Sayak-IV deposit, Kazakhstan; average of three analyses, B_2O_3 by difference; corresponds to $Ca_{1.00}(Mg_{0.94}Fe_{0.17}Mn_{0.02})_{\Sigma=1.13}B_{1.95}O_5$. (2) $CaMgB_2O_5$.

Polymorphism & Series: Dimorphous with kurchatovite.

Occurrence: A replacement of kurchatovite in boron-bearing rocks.

Association: Kurchatovite, suanite, ludwigite, szaibélyite, sakhaite, clinohumite, svabite, sphalerite (Solongo deposit, Russia).

Distribution: From the Sayak-IV boron deposit, northeast Balkhash region, Kazakhstan. In Russia, at the Solongo boron deposit, Buryatia; from the Titovskoye boron deposit, Tas-Khayakhtakh Mountains, Sakha; in the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains.

Name: As the monoclinic dimorph of *kurchatovite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82777.

Clinometaborite β-HBO_2

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As prismatic crystals comprised of fibrous individuals and most likely pseudomorphic, in aggregates to 2 mm.

Physical Properties: *Cleavage*: One perfect set. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.049

Optical Properties: Translucent. *Color*: Colorless (chalky white after exposure to open air and it's transformation into orthoboric acid). *Streak*: n.d. *Luster*: Vitreous. *Optical Class: B*iaxial (–). α = 1.434 β = 1.570 γ = 1.588 (for synthetic material)

Cell Data: *Space Group*: $P2_1/a$. a = 7.127(2) b = 8.842(3) c = 6.773(2) β = 93.21(1)° Z = 12

X-ray Powder Pattern: La Fossa crater, Vulcano Island, Aeolian archipelago, Sicily, Italy. 3.078 (100), 4.193 (20), 6.773 (15), 2.550 (10), 3.224 (8), 2.702 (8), 2.518 (7)

Chemistry:
(1) La Fossa crater, Vulcano Island, Aeolian archipelago, Sicily, Italy; electron microprobe analyses did not detect any elements of atomic number greater than 11, BO_2^- confirmed by IR spectroscopy. Species identify based on XRD pattern and crystal structure refinement.

Occurrence: Found as a sublimate in an active fumarole (~250 °C) in a volcanic crater.

Association: Metaborite, sassolite, adranosite.

Distribution: La Fossa crater, Vulcano Island, Aeolian archipelago, Sicily, Italy.

Name: Named for its mono*clinic* symmetry and compositional identity with *metaborite*.

Type Material: Reference Collection, Department of Inorganic Structural and Stereochemistry, University of Milan, Italy (2010–03).

References: (1) Demartin, F., C.M. Gramaccioli, and I. Campostrini (2011) Clinometaborite, natural β-metaboric acid, from La Fossa crater, Vulcano, Aeolian Islands, Italy. Canadian Mineralogist, 49, 1273-1279. (2) (2014) Amer. Mineral., 99, 870 (abs. ref. 1).

Clinomimetite $Pb_5(AsO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As six-sided, barrel-shaped or spindlelike, short to long prismatic crystals, elongated ‖ [001], to 9 mm.

Physical Properties: Hardness = 4 D(meas.) = 7.36(1) D(calc.) = 7.37

Optical Properties: Transparent to translucent. *Color:* Greenish yellow, pale greenish yellow, wax-yellow, white.
Optical Class: Biaxial (–). *Orientation:* $X = c$; Y or $Z \wedge b \simeq 30°$ (probable). $\alpha = [2.129]$ $\beta = [2.144]$ $\gamma = [2.144]$ 2V(meas.) = 8(3)°

Cell Data: *Space Group:* $P2_1/b$. $a = 10.189(3)$ $b = 20.372(8)$ $c = 7.46(1)$ $\beta = 119.88(3)°$ Z = 2

X-ray Powder Pattern: Johanngeorgenstadt, Germany.
3.048 (100), 3.008 (70), 2.947 (70), 2.106 (60), 3.342 (50), 1.961 (50), 1.903 (50)

Chemistry:

	(1)	(2)
SO_3	0.15	
P_2O_5	0.33	
As_2O_5	22.05	23.17
SiO_2	0.14

CaO	0.00	
Cl	2.58	2.38
$-O = Cl_2$	[0.58]	0.54
Total	[99.28]	100.00

(1) Johanngeorgenstadt, Germany; by electron microprobe, corresponds to $Pb_{5.00}[(As_{0.97}P_{0.02}Si_{0.01}S_{0.01})_{\Sigma=1.01}O_{3.98}]_3Cl_{1.09}$. (2) $Pb_5(AsO_4)_3Cl$.

Polymorphism & Series: Dimorphous with mimetite.

Mineral Group: Apatite group.

Occurrence: A rare secondary mineral in the oxidized zone of some base-metal deposits.

Association: Romanéchite, hematite (Johanngeorgenstadt, Germany).

Distribution: In Germany, from Johanngeorgenstadt, Saxony, and at Horhausen, Harz Mountains. From Eureka, Juab Co., Utah, USA.

Name: For its *monoclinic* structure and relation to *mimetite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, B13647.

References: (1) Dai, Y. (1993) Clinomimetite – the history and substantiation of the natural monoclinic dimorph of mimetite. Mineral. Record, 24, 307–310. (2) (1994) Amer. Clinophosinaite $Na_3Ca(SiO_3)(PO_4)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Habit not described.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4 D(meas.) = 2.85–2.88 D(calc.) = [2.84]

Optical Properties: Semitransparent. *Color:* Pale lilac. *Luster:* Vitreous. *Optical Class:* Biaxial (+). α = 1.556–1.557 β = 1.559–1.561 γ = 1.563–1.567 2V(meas.) = 75°–80°

Cell Data: *Space Group:* $P2/c$. a = 7.303(2) b = 12.201(5) c = 14.715(4) $\beta = 91°56'$ Z = 8

X-ray Powder Pattern: Mt. Koashva, Russia.
2.724 (100), 2.639 (57), 2.550 (50), 2.031 (50), 1.823 (47), 1.838 (35), 3.97 (12)

Chemistry:

	(1)	(2)	(3)
SiO_2	20.1	20.1	21.45
Ce_2O_3	0.18	0.44	
MnO	0.60	0.54	
CaO	15.65	16.45	20.02
SrO	3.08	1.91	
Na_2O	32.55	32.7	33.19
K_2O	0.09	0.05	
P_2O_5	25.35	25.5	25.34
LOI	1.08	2.55	
Total	98.68	100.24	100.00

(1) Mt. Koashva, Russia; by electron microprobe, contains traces of Ti, Zr, Al, Fe, Mg, Ba, loss on ignition may be H_2O; corresponds to $(Na_{3.04}K_{0.01})_{\Sigma=3.05}(Ca_{0.81}Sr_{0.09}Mn_{0.02})_{\Sigma=0.92}Si_{0.97}P_{1.03}O_{6.95}$. (2) Mt. Yukspor, Russia; by electron microprobe, impurities as in (1), corresponds to $Na_{3.04}(Ca_{0.85}Sr_{0.05}Mn_{0.02})_{\Sigma=0.92}Si_{0.96}P_{1.04}O_{6.97}$. (3) $Na_3CaPSiO_7$.

Occurrence: Apparently as an alteration product of eudialyte in alkalic pegmatites in a differentiated alkalic massif.

Association: Zirsinalite, eudialyte.

Distribution: In Russia, on Mts. Yukspor and Koashva, Khibiny massif, Kola Peninsula.

Name: For its monoclinic crystallography and chemical similarity to *phosinaite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81592.

References: (1) Khomyakov, A.P., D.Y. Pushcharovskii, and J.G. Ronsbo (1981) Clinophosinaite, $Na_3CaPSiO_7$, a new mineral. Zap. Vses. Mineral. Obshch., 110, 351–355 (in Russian). (2) (1982) Amer. Clinoptilolite $(Na, K, Ca)_{2-3}Al_3(Al, Si)_2Si_{13}O_{36}\cdot 12H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Platy crystals, to 1 cm, showing {010}, {001}, {101}, {20$\bar{1}$}; commonly fine-grained, massive.

Physical Properties: *Cleavage:* {010}, perfect. Hardness = 3.5–4 D(meas.) = 2.16(2) D(calc.) = 2.146

Optical Properties: Transparent to translucent. *Color:* Colorless to white; colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–) or (+). *Orientation:* $Y = b$; $Z \wedge a = 30°–45°$. *Dispersion:* $r < v$, strong. $\alpha = 1.476–1.488$ $\beta = 1.479$ $\gamma = 1.479–1.489$ 2V(meas.) = 32°–48°

Cell Data: *Space Group:* $C2/m$. $a = 17.633(8)$ $b = 17.941(8)$ $c = 7.400(4)$ $\beta = 116.39°$ Z = 2

X-ray Powder Pattern: Agoura, California, USA.
8.92 (100), 2.974 (80), 3.897 (57), 3.964 (55), 2.728 (33), 3.419 (16), 3.119 (15)

Chemistry:

	(1)	(2)
SiO_2	69.93	68.44
Al_2O_3	11.89	11.86
Fe_2O_3	0.02	
MgO	0.47	0.12
CaO	1.07	3.26
Na_2O	2.96	1.51
K_2O	3.47	2.14
H_2O	[10.19]	[12.67]
Total	[100.00]	[100.00]

(1) Agoura, California, USA; H_2O by difference, corresponds to $(Na_{1.22}K_{0.94}Ca_{0.24}Mg_{0.15})_{\Sigma=2.55}Al_{2.99}Si_{15.01}O_{36}\cdot 11.6H_2O$. (2) Richardson Ranch, Oregon, USA; by electron microprobe, after removal of 0.46% FeO as impurity, H_2O by difference; corresponds to $(Ca_{0.78}Na_{0.65}K_{0.60}Mg_{0.04})_{\Sigma=2.07}Al_{3.10}Si_{14.91}O_{36}\cdot 11.5H_2O$.

Mineral Group: Zeolite group.

Occurrence: Formed by devitrification of volcanic glass, and in cavities in rhyolites and andesites.

Association: Zeolites, montmorillonite, hectorite, thenardite, halite, gaylussite, celadonite, quartz, "opal," calcite.

Distribution: Abundant in the western USA, as in Wyoming, at Mt. Hoodoo, Park Co.; in California, from near Agoura, Los Angeles Co., at Owens Lake, Inyo Co., and 10 km west of Hector, San Bernardino Co.; in Arizona, from northwest of Bowie, Cochise Co., and near Wikieup, Mohave Co.; in the Cuchillo deposit, near Winston, Sierra Co., New Mexico. In Oregon, large crystals from Agate Beach, Lincoln Co., Succor Creek, Malheur Co., and at Richardson Ranch, near Bend, Jefferson Co. At Kamloops Lake, near Kamloops, British Columbia, Canada. From near Kapfenberg, Styria, Austria. On the Vogelsberg, Hesse, Germany. From Val di Fassa and Alpe di Siusi, Trentino-Alto Adige, Italy.

Name: For its inclined optics and relation to *ptilolite* [mordenite].

Type Material: The Natural History Museum, London, England, 1939,314.

Total	99.2	100.0

(1) Nord mine, Sweden; by electron microprobe, corresponding to $(Co_{0.98}Ni_{0.02}Fe_{0.01})_{\Sigma=1.01}(As_{1.96}S_{0.04})_{\Sigma=2.00}$. (2) Bou Azzer, Morocco; by electron microprobe, corresponding to $(Co_{0.89}Fe_{0.15})_{\Sigma=1.04}(As_{1.85}S_{0.15})_{\Sigma=2.00}$. (3) Cobalt, Canada; by electron microprobe, analyses of three samples, not given, stated to correspond to $(Co_{0.76}Fe_{0.14}Ni_{0.10})_{\Sigma=1.00}As_{2.00}$; $(Co_{0.73}Fe_{0.26}Ni_{0.01})_{\Sigma=1.00}As_{2.00}$; and $(Co_{0.70}Fe_{0.21}Ni_{0.09})_{\Sigma=1.00}As_{2.00}$.

Polymorphism & Series: Dimorphous with safflorite.

Mineral Group: Arsenopyrite group.

Occurrence: In hydrothermal Co–Ni sulfide ores, typically silver-bearing.

Association: Skutterudite, cattierite, cobaltite, siegenite, bismuth, silver, molybdenite, dolomite, barite.

Distribution: From Cobalt, Ontario, Canada [TL]. At the London mine, National district, Humboldt Co., Nevada, USA. In the Aghbar (Arhbar) mine, Bou Azzer district, Morocco. At the Nord mine, Nordmark district, and from near Filipstad, Värmland, Sweden. In Germany, in the Richelsdorf Mountains, Hesse. At the Alva silver mine, Ochil Hills, central Scotland.

Name: In reference to the monoclinic symmetry of this saffloritelike species.

Type Material: Department of Geological Sciences, Queen's University, Kingston, Ontario, Canada.

References: (1) Radcliffe, D. and L.G. Berry (1971) Clinosafflorite: a monoclinic polymorph of safflorite. Can. Mineral., 10, 877–881. (2) (1972) Amer. Mineral., 57, 1552 (abs. ref. 1). Clinotyrolite $Ca_2Cu_9(AsO_4,SO_4)_4(OH)_{10}\cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m or $2/m$. Crystals, flattened parallel to {001}, elongated along [100], in radiated and foliated aggregates, to 3 mm.

Physical Properties: Hardness = n.d. D(meas.) = 3.22 D(calc.) = 3.21

Optical Properties: Semitransparent. *Color:* Emerald-green. *Luster:* Pearly or silky. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \wedge a = 3°$–$4°$. $\alpha = 1.666$ $\beta = 1.686$ $\gamma = 1.694$ 2V(meas.) = 65°–66°

Cell Data: *Space Group:* Pa or $P2/a$. $a = 10.513$ $b = 5.56$ $c = 27.61$ $\beta = 94.0°$ Z = 2

X-ray Powder Pattern: Dongchuan mine, China.
2.960 (10), 2.673 (10), 4.81 (9), 4.400 (8), 1.748 (8), 3.670 (7), 3.500 (7)

Chemistry:

	(1)
SO_3	1.28
As_2O_5	28.09
CuO	46.04
CaO	7.24
H_2O	17.63
Total	100.28

(1) Dongchuan mine, China; corresponds to $Ca_{2.01}Cu_{9.01}[(AsO_4)_{3.81}(SO_4)_{0.25}]_{\Sigma=4.06}(OH)_{9.87}\cdot 10.32H_2O$.

Occurrence: In the oxidized zone of a copper mine (Dongchuan mine, China).

Association: Tyrolite (Dongchuan mine, China); tennantite, parnauite (Tynagh mine, Ireland); cuprite, posnjakite, gilmarite, langite, connellite, brochantite, malachite, vésigniéite, cornubite, olivenite, trippkeite, domeykite, djurleite (Roua mines, France).

Distribution: From the Dongchuan copper mine, Yunnan Province, China. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. From the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. At Richelsdorf, Hesse, Germany. In the Lovelock mine, Table Mountain district, Churchill Co., Nevada, USA.

Name: For its *monoclinic* crystal system and similarity to *tyrolite*.

Type Material: n.d.

References: (1) Ma Zhesheng, Qian Rongyao, and Peng Zhizhong (1980) Clinotyrolite – a new mineral of the hydrous copper arsenate discovered in Dongchuan, Yunnan. Acta Geol. Sinica, 54, 134–143 (in Chinese with English abs.). (2) (1980) Mineral. Abs., 31, 495 (abs. ref. 1).

Clinoungemachite $K_3Na_8Fe^{3+}(SO_4)_6(NO_3)_2 \cdot 6H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$ (?). As minute thick tabular pseudorhombohedral crystals, visibly indistinguishable from ungemachite; forms include {001}, {100}, $\{\bar{1}02\}$, {111}, twenty others.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Transparent. *Color:* Colorless to pale yellow. *Luster:* Vitreous. *Optical Class:* Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. a = n.d. b = n.d. c = n.d. $\beta = 110°40'$ Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: (1) No analysis was made, presumed to be the same as ungemachite.

Occurrence: Very rarely formed by the oxidation of pyrite in an arid climate, in veins and cavities in other massive iron sulfates.

Association: Ungemachite, jarosite, sideronatrite, metasideronatrite, metavoltine, fibroferrite.

Distribution: From Chuquicamata, Antofagasta, Chile.

Name: As the probable monoclinic dimorph of *ungemachite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA.

Clinozoisite $Ca_2Al_3(SiO_4)(Si_2O_7)O(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, typically elongated and striated ‖ [010]; commonly coarse to fine granular; also fibrous. *Twinning:* Lamellar on {100}, uncommon.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 3.21–3.38 D(calc.) = 3.364

Optical Properties: Transparent to translucent. *Color:* Colorless, pale yellow, pink, red, gray, green; colorless in thin section.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge a = 0°$–$7°$. *Dispersion:* $r < v$.
$\alpha = 1.670$–1.718 $\beta = 1.670$–1.725 $\gamma = 1.690$–1.734 2V(meas.) = 14°–90°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.879(5)$ $b = 5.583(5)$ $c = 10.155(6)$
$\beta = 115.50(5)°$ Z = 2

X-ray Powder Pattern: Vernirovice, Czech Republic. (ICDD 21-128).
2.89 (100), 2.79 (90), 2.59 (70), 2.68 (60), 2.67 (60), 2.40 (60), 2.29 (60)

(1) Kälviä, Finland; corresponds to $(Ca_{1.86}Fe^{2+}_{0.11}Mg_{0.08})_{\Sigma=2.05}(Al_{2.78}Fe^{3+}_{0.04})_{\Sigma=2.82}Si_{3.10}O_{12.5}$.
(2) Camaderry Mountain, Ireland; corresponds to $(Ca_{1.96}Fe^{2+}_{0.02})_{\Sigma=1.98}(Al_{2.79}Fe^{3+}_{0.27})_{\Sigma=3.06}(Si_{2.92}Al_{0.08})_{\Sigma=3.00}O_{12.5}(OH)_{0.94}$.

Polymorphism & Series: Dimorphous with zoisite.

Mineral Group: Epidote group.

Occurrence: Typically in low- to medium-grade regionally metamorphosed igneous and sedimentary rocks, as well as in contact metamorphosed calcium-rich sediments; an alteration product of plagioclase feldspars (saussuritization).

Association: Amphiboles, plagioclase, quartz.

Distribution: A widespread mineral. Typical occurrences for good crystals include: at the Goslarwand, near Prägraten, Tirol, Austria. From Vernirovice, Czech Republic. At Kälviä, Finland. From Arendal, Norway. At Camaderry Mountain, Co. Wicklow, Ireland. From Amborompotsy, Madagascar. At Sittampundi, Madras, India. In the USA, from the Belvidere Mountain quarries, Lowell, Orleans Co., Vermont; in northern Spade Spring Canyon, Los Angeles Co., California; in the Nightingale district, Pershing Co., Nevada. In Mexico, from the Juarez district, Baja California, and at Alamos, Sonora. In Canada, from Timmins, Ontario.

Name: For its monoclinic crystallography and relation to *zoisite*.

Type Material: n.d.

Polymorphism & Series: 1M polytype; $2M_1$ and 3A polytypes rare.

Mineral Group: Mica group.

Occurrence: In chlorite schists; in metasomatically altered limestones; in siliceous skarns near contact metamorphic zones.

Association: Talc, spinel, grossular, vesuvianite, clinopyroxene, monticellite, chondrodite, phlogopite, chlorite, quartz, calcite, dolomite.

Distribution: In the USA, around Amity, Edenville, and Warwick, Orange Co., New York; from Crestmore, Riverside Co., California; near Ludwig, Lyon Co., Nevada; at Sulzer, Prince of Wales Island, Alaska. On Mt. Monzoni and at Mts. Castone and Adamello, Trentino-Alto Adige, Italy. In the Pargas district, Finland. From the Akhmatovsk mine, near Zlatoust, Ural Mountains, Russia. In the Chichibu mine, Saitama Prefecture, Japan. On the Ertsberg, Irian Jaya.

Name: For De Witt Clinton (1769–1828), American statesman.

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. In irregular platelets, to 0.2 mm, and equant grains, intergrown with hydrotalcite–pyroaurite or brucite; also as fibers, to 5 mm. *Twinning:* By reflection across {0001}, common.

Physical Properties: *Cleavage:* {0001}, perfect; another at 45°. Hardness = 1–2
D(meas.) = 2.32–2.42 D(calc.) = 2.26

Optical Properties: Translucent. *Color:* Deep reddish brown, brown, straw-yellow; golden brown in transmitted light. *Luster:* Resinous.
Optical Class: Uniaxial (–); may be anomalously biaxial. *Pleochroism:* Marked; O = golden brown, dark brown; E = colorless. *Absorption:* $O > E$. ω = 1.588–1.606; 1.620–1.634
ϵ = 1.560–1.575; 1.585–1.590 2V(meas.) = 5°–20°

Cell Data: *Space Group:* $R\bar{3}m$. $a = 3.12$ $c = 37.4$ Z = 0.5

X-ray Powder Pattern: Near Coalinga, California, USA.
2.34 (10), 4.20 (8), 6.05 (5), 1.558 (5), 13.4 (4b), 2.67 (3), 1.884 (3)

Total	[100.2]	100.05	[99.1]

(1) Near Coalinga, California, USA; original total given as 100.7%, after deduction of SiO_2 as chrysotile and Ca as calcite, corresponds to $Mg_{10.08}Fe^{3+}_{2.08}C_{0.92}H_{27.85}O_{29}$. (2) Do.; corresponds to $Mg_{10.16}Fe^{3+}_{2.06}C_{0.81}H_{28.28}O_{29}$. (3) Muskox intrusion, Canada; after corrections for total loss on ignition 33.4%, partially attributed to introduced density liquids; corresponds to $Mg_{9.4}Mn_{0.2}Fe^{2+}_{0.1}Fe^{3+}_{2.3}(CO_3)_{0.32}(OH)_{25.66}\cdot 2.88H_2O$.

Occurrence: Developed from iron-rich brucite in the surface weathering zone of a serpentinite (near Coalinga, California, USA); formed (after collection) in thin veinlets in serpentinite from a layered ultramafic complex (Muskox intrusive, Canada).

Association: Lizardite, antigorite, chrysotile, hydrotalcite–pyroaurite, artinite, hydromagnesite, brucite, magnetite, chromite, uvarovite, calcite (near Coalinga, California, USA).

Distribution: In the USA, from about 55 km northwest of Coalinga, Fresno Co., California; from the Rockville quarry, Rockville, Montgomery Co., Maryland; in the Cedar Hill quarry, Lancaster Co., Pennsylvania. In the Muskox intrusion, Coppermine River area, Northwest Territories, Canada. At Hagdale, Unst, Shetland Islands, Scotland. From Montjovet, Piedmont, Italy. In Russia, in the Lower Tagil massif, Ural Mountains. Found at Mashiki, Kumamoto Prefecture, Japan. At Woodsreef, Barraba, New South Wales, Australia.

Name: For Coalinga, California, USA, near the original occurrence.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119335.

Cobaltaustinite $Ca(Co,Cu)(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Orthorhombic] (by analogy to the adelite group). *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, to 25 μm, in botryoidal microcrystalline aggregates and coatings.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ~4.5
D(meas.) = n.d. D(calc.) = 4.24

Optical Properties: Semitransparent. *Color:* Dull green; yellowish green in transmitted light.
Streak: Pale green.
Optical Class: Biaxial (+). α = 1.777(3) (α'). β = n.d. γ = 1.802(3) (γ').
2V(meas.) = Large.

Cell Data: *Space Group:* $P2_12_12_1$. $a = 7.498(7)$ $b = 9.006(7)$ $c = 5.920(3)$ Z = 4

X-ray Powder Pattern: Dome Rock mine, Australia.
3.159 (10), 1.609 (10), 2.633 (8), 2.600 (8), 4.13 (7), 2.801 (5b), 2.532 (4)

(1) Dome Rock mine, Australia; by electron microprobe, H_2O by CHN analyzer; corresponds to $Ca_{1.02}(Co_{0.87}Cu_{0.08})_{\Sigma=0.95}(As_{1.01}P_{0.01}S_{0.01})_{\Sigma=1.03}O_{4.05}(OH)_{1.01}$.

Polymorphism & Series: Forms a series with conichalcite.

Mineral Group: Adelite group.

Occurrence: A rare secondary mineral in the oxidized zone of a copper deposit, an alteration product of arsenides.

Association: Erythrite, roselite-beta, arthurite, conichalcite, chenevixite, scorodite, heterogenite.

Distribution: From the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia.

Name: For its content of *cobalt* and similarity to *austinite*.

Type Material: Western Australian Museum, Perth, M.73.1991; Museum Victoria, Melbourne, Australia, M32479.

Cobaltite CoAsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $mm2$. Commonly as pseudocubic or pseudopyritohedral crystals, or combinations having striated faces as with pyrite, to as large as 8 cm, also as pseudo-octahedra; granular massive. *Twinning:* About [111] as a pseudocubic three-fold axis, with {011} and {111} of the pseudocubic habit as twin planes, rare. Twin lamellae are commonly observed in polished section, which may exhibit a flamelike texture.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5 VHN = 1095–1346 D(meas.) = 6.33 D(calc.) = 6.328

Optical Properties: Opaque. *Color:* Silver-white. *Streak:* Grayish black. *Pleochroism:* Very weak, on grain boundaries.
R: (400) 48.2, (420) 48.0, (440) 47.7, (460) 47.8, (480) 48.2, (500) 48.9, (520) 49.6, (540) 50.4, (560) 51.2, (580) 51.9, (600) 52.6, (620) 53.1, (640) 53.5, (660) 53.7, (680) 53.8, (700) 53.8

Cell Data: *Space Group:* $Pca2_1$. $a = 5.5833(7)$ $b = 5.5892(6)$ $c = 5.5812(8)$ $Z = 4$

X-ray Powder Pattern: Cobalt, Canada.
2.49 (100), 1.680 (100), 2.27 (90), 2.77 (80), 1.490 (80), 1.073 (80), 1.973 (60)

	(1)	(2)	(3)
Co	28.64	33.2	35.53
Fe	4.11	2.8	
Ni	3.06	0.6	
As	44.77	43.4	45.15
S	19.34	20.6	19.32
Total	99.92	100.6	100.00

(1) Cobalt, Canada; corresponds to $(Co_{0.80}Fe_{0.12}Ni_{0.09})_{\Sigma=1.01}As_{0.99}S_{1.00}$. (2) Tunaberg, Sweden; by electron microprobe, corresponds to $(Co_{0.88}Fe_{0.08}Ni_{0.02})_{\Sigma=0.98}As_{0.90}S_{1.00}$. (3) CoAsS.

Mineral Group: Cobaltite group.

Occurrence: In high-temperature hydrothermal deposits, as disseminations, and as veins in contact metamorphosed rocks.

Association: Magnetite, sphalerite, chalcopyrite, skutterudite, allanite, zoisite, scapolite, titanite, calcite (Tunaberg, Sweden); numerous other Co–Ni sulfides and arsenides.

Distribution: In Sweden, fine crystals from Tunaberg, Södermanland; Riddarhyttan and Håkansboda, Västmanland; and at the Vena mines, near Askersund, Örebro. From Skutterud, Modum, Norway. At Bieber, near Hanau, Hesse, Germany. From Crown's Engine House, Wheal Cock, and the Botallack mine, St. Just, Cornwall, England. Good crystals from Espanola, and at mines in the Cobalt and Sudbury districts, Ontario; from Great Bear Lake, Northest Territories, Canada. In Australia, at Broken Hill and Torrington, New South Wales; Bimbowrie, South Australia; and at Mt. Cobalt and Cloncurry, Queensland. From the Aït Ahmane mine, Bou Azzer, Morocco. Many more minor localities are known.

Name: In allusion to the elemental composition.

Cobaltkoritnigite $(Co, Zn)(AsO_3OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic (synthetic, and by analogy to koritnigite). *Point Group:* $\overline{1}$. Crystals tabular, to 15 μm.

Physical Properties: *Cleavage:* {010}, perfect; {100}, good. Hardness = [2]
D(meas.) = n.d. D(calc.) = [3.46]

Optical Properties: Transparent. *Color:* Deep violet, deep rose-red, *Streak:* White.
Luster: Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = deep violet; Y = reddish violet; Z = bluish violet. *Orientation:* $X \wedge b < 3°$; $Y \wedge a = 12.5(1.0)°$. $\alpha = 1.646(2)$ $\beta = 1.668(2)$ $\gamma = 1.705(5)$ $2V(meas.) = 78(2)°$

Cell Data: *Space Group:* $[P\overline{1}]$ (by analogy to koritnigite). $a = 7.95$ $b = 15.83$ $c = 6.67$ $\alpha = 90.9°$ $\beta = 96.6°$ $\gamma = 90.0°$ Z = 8

X-ray Powder Pattern: Saxony, Germany; very close to koritnigite.
7.94 (100), 3.14 (70), 3.82 (50), 3.25 (40), 3.23 (40), 2.461 (40), 2.688 (30)

Chemistry:

	(1)	(2)
As_2O_5	54.63	54.14
FeO	0.45	0.48
CoO	20.55	23.46
NiO	0.25	0.37
CuO	0.50	0.41
ZnO	11.73	9.09
H_2O	[12.46]	[12.46]
Total	[100.57]	[100.41]

(1) Saxony, Germany; by electron microprobe, total Fe as FeO, H_2O calculated from stoichiometry; corresponds to $(Co_{0.59}Zn_{0.31}Cu_{0.02}Fe_{0.01}Ni_{0.01})_{\Sigma=0.94}(As_{1.03}O_3OH)\cdot H_2O$. (2) Do.; corresponds to $(Co_{0.68}Zn_{0.24}Cu_{0.02}Fe_{0.01}Ni_{0.01})_{\Sigma=0.96}(As_{1.03}O_3OH)\cdot H_2O$.

Occurrence: A weathering product of glaucodot (Saxony, Germany); altering from cobaltite (Bauhaus district, Germany).

Association: Erythrite–köttigite, sphaerocobaltite, pitticite, glaucodot, löllingite–safflorite, arsenopyrite, quartz (Saxony, Germany); erythrite, cobaltite, calcite, barite, quartz (Bauhaus district, Germany).

Distribution: In Germany, found on an old specimen from the Erzgebirge, Saxony, probably from the Schwarzenberg district, and at Frohnau, near Annaberg; in the Bauhaus district, Richelsdorf Mountains, Hesse; from the Sophia mine, near Wittichen, in the Rötenbach quarry, near Alpirsbach and in the Anton mine, Heubachtal, near Schiltach, Black Forest. From Jáchymov (Joachimsthal), Czech Republic.

Name: For its relation to *koritnigite* and high *cobalt* content.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148979.

Cobaltomenite $CoSe^{4+}O_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals exhibit {001}, {100}, {010}, and less prominent {101}, to 1 mm; typically as spherical aggregates or crusts.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 3.42 D(calc.) = 3.422 (synthetic).

Optical Properties: Transparent to translucent. *Color:* Rose-red, peach-blossom-pink to brownish pink, pale brown to yellowish brown with increasing nickel content. *Luster:* Vitreous. *Optical Class:* Biaxial (–) (synthetic). *Pleochroism:* X = pale pink; Y = pink; Z = red. *Orientation:* $Z \wedge c = 13°$. *Dispersion:* $r < v$. *Absorption:* $Z > Y > X$. $\alpha = 1.681$ $\beta = 1.728$ $\gamma = 1.769$ 2V(meas.) = 83°

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 6.496(1)$ $b = 8.809(2)$ $c = 7.619(2)$ $\beta = 98.87(1)°$ Z = 4

X-ray Powder Pattern: Synthetic; close to ahlfeldite.
5.70 (100), 3.46 (70), 3.017 (55), 3.80 (50), 2.738 (45), 2.378 (40), 1.734 (35)

Chemistry: (1) Composition established by concurrence of properties with those of synthetic material.

Polymorphism & Series: Forms a series with ahlfeldite.

Occurrence: A secondary mineral in the oxidation zone of hydrothermal selenium-sulfide-bearing vein deposits.

Association: Chalcomenite, molybdomenite (Cerro de Cacheuta, Argentina); chalcomenite, clinochalcomenite, lepidocrocite, gypsum (El Dragón mine, Bolivia).

Distribution: From Cerro de Cacheuta, Mendoza Province, Argentina. At the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí, and in the Pacajake mine, Hiaco, 30 km east-northeast of Colquechaca, Potosí, Bolivia. From the Musonoi and Kambove West mines, Shaba Province, Congo (Zaire). In the USA, at the A.E.C. No. 8 mine, Temple Mountain, Emery Co., and at the Parco mine group, Thompson district, Grand Co., Utah.

Name: For the content of *cobalt* and the Greek for *moon*.

Cobalt pentlandite $(Co, Ni, Fe)_9S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As exsolved lamellae, granular and as separate crystals, to 4 mm.

Physical Properties: *Cleavage:* {100}. Hardness = n.d. VHN = 278–332 (100 g load). D(meas.) = n.d. D(calc.) = 5.22

Optical Properties: Opaque. *Color:* In polished section, slightly lighter bronze-yellow than pentlandite. *Luster:* Metallic.
R: (400) 36.9, (420) 41.9, (440) 45.9, (460) 49.2, (480) 51.7, (500) 53.8, (520) 55.6, (540) 57.0, (560) 58.2, (580) 59.2, (600) 60.0, (620) 60.5, (640) 61.0, (660) 61.2, (680) 61.4, (700) 61.5

Cell Data: *Space Group: Fm3m.* a = 9.973 Z = 4

X-ray Powder Pattern: Outokumpu mine, Finland.
3.008 (100), 1.763 (100), 1.918 (80), 5.75 (60), 2.878 (60), 1.018 (60), 2.288 (50)

Chemistry:

Total	100.00	98.7	100.8	100.00

(1) Varislahti deposit, Finland; corresponding to $(Co_{6.86}Fe_{1.52}Ni_{1.27})_{\Sigma=9.65}S_{8.00}$. (2) Langis mine, Canada; by electron microprobe, corresponding to $(Co_{6.88}Ni_{1.33})_{\Sigma=8.21}S_{8.00}$. (3) Amianthus mine, South Africa; by electron microprobe, corresponding to $(Co_{4.58}Ni_{3.70}Fe_{0.89})_{\Sigma=9.17}S_{8.00}$. (4) Co_9S_8.

Polymorphism & Series: Forms a series with pentlandite.

Mineral Group: Pentlandite group.

Occurrence: With other sulfides and arsenides in hydrothermal deposits.

Association: Pyrite, marcasite, pyrrhotite, troilite, chalcopyrite, cubanite, bornite, chalcocite, digenite, linnaeite, siegenite, parkerite, bravoite, langisite, magnetite.

Distribution: In Finland, from the Varislahti [TL], Kuusjärvi, and Savonranta pyrrhotite deposits and in the Outokumpu mine, northern Karelia, Finland. At Långban, Värmland, Sweden. From Vîlsan, Romania. In the Erglodd mine, ??, Wales. [??D8,ckMinWales??] From near Eretria, Othris Mountains, and near Perivoli, Pindos Mountains, Greece. In Canada, at the Langis mine, Casey Township, Cobalt-Gowganda area, Ontario, and the Vauze mine, north of Noranda, Quebec. From the Salamanca mine, Mendoza Province, Argentina. In the Amianthus mine, Kaapsche Hoop, Barberton, and the Loolekop carbonatite, Phalaborwa, Transvaal, South Africa. At the Talmessi mine, near Anarak, Iran. From the Mundonguara deposit, Chimoio district, Mozambique. In Japan, at the Shimokaua mine, Hokkaido, and the Kamaishi mine, Iwate Prefecture. On the Mid-Atlantic Ridge at 14°45'N.

Name: For the cobalt content and the relation with pentlandite.

Type Material: n.d.

Cobalt-zippeite $Co_2(UO_2)_6(SO_4)_3(OH)_{10}\cdot 16H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. As minute tabular {010} grains and petallike aggregates. *Twinning:* Simple and polysynthetic twins common in synthetic material.

Physical Properties: *Cleavage:* On {010}, perfect (synthetic). Hardness = ∼2 (synthetic). D(meas.) = > 3.3 D(calc.) = n.d. Radioactive.

Optical Properties: Semitransparent. *Color:* Tan to brownish yellow, yellow-orange. *Optical Class:* Biaxial (–) (synthetic). *Pleochroism:* X = colorless; Y = pale yellow; Z = yellow. *Orientation:* $Z = c$. $\alpha = 1.747$ $\beta = 1.779$ $\gamma = 1.84$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Synthetic, nearly identical to nickel-zippeite.
7.21 (100), 3.59 (46), 3.12 (28), 3.47 (22), 1.963 (12), 2.491 (11), 2.653 (10)

Chemistry:

	(1)	(2)

Total	99.95	99.82

(1) Bon Accord, South Africa; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Co_{0.50}Ni_{0.22}Fe^{2+}_{0.22}Mg_{0.05}Mn_{0.03}Zn_{0.02})_{\Sigma=1.04}(Cr_{1.43}Al_{0.38}Fe^{3+}_{0.11}Ti_{0.03})_{\Sigma=1.95}O_4$.
(2) Bo Phloi, Thailand; by electron microprobe, total Fe as FeO; corresponds to $(Co_{0.52}Mg_{0.26}Fe^{2+}_{0.23})_{\Sigma=1.01}(Al_{1.70}Cr_{0.27}Ti_{0.02})_{\Sigma=1.99}O_4$.

Mineral Group: Spinel group.

Occurrence: Replacing chromite in a small tabular nickel deposit at the contact between quartzite and serpentinized ultramafics; it appears to have formed at ∼730 °C and < 2 kbar during thermal metamorphism, possibly of a nickel-rich meteorite (Bon Accord, South Africa); an inclusion in corundum from alkalic basalts (Bo Phloi, Thailand).

Association: Trevorite, nichromite, liebenbergite, bunsenite (Bon Accord, South Africa); corundum, albite (Bo Phloi, Thailand).

Distribution: In the Bon Accord deposit, Barberton, Transvaal, South Africa. From Bo Phloi, 40 km north of Kanchanaburi, Thailand.

Name: For a *chromite* with essential cobalt, Co.

Type Material: n.d.

(1) Rindsberg mine, Germany; CuO, CaO, MgO, SiO_2 considered to be impurities. (2) Do. (3) General Trimble's mine, Pennsylvania, USA.

Mineral Group: Turquoise group.

Occurrence: In brown iron ore (Rindsberg mine, Germany).

Association: Wavellite, variscite, matulaite, gibbsite, cacoxenite, goethite, "limonite" (General Trimble's mine, Pennsylvania, USA); bermanite, purpurite (Kobokobo pegmatite, Congo).

Distribution: May occur at the following localities: the Rindsberg mine, near Katzenelnbogen, Rhineland-Palatinate, Germany. From the Phoenix United mines, Linkinhorne, Cornwall, England. In General Trimble's mine, East Whiteland, Chester Co., Pennsylvania, USA. At the Cruziero mine, Paoiá district, Minas Gerais, Brazil. From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: From the Greek for *blue* and *milk*, for its typical color.

Type Material: Type material cannot be located. All specimens thought to be this species examined by (2) Foord and Taggart proved to be cuprian planerite.

(1) Roberts Victor mine, South Africa; by electron microprobe, average of four analyses.

Polymorphism & Series: Quartz, tridymite, cristobalite, and stishovite are polymorphs.

Occurrence: Formed at pressures in excess of 20 kbar, as fine-grained intergrowths with quartz and silica glass in impact metamorphosed rocks and tektites. A primary phase in grospydite (kyanite-garnet-clinopyroxene) xenoliths in kimberlite, and intergrown with quartz as inclusions in garnet and clinopyroxene within eclogites of high-grade metamorphic terranes.

Association: Quartz, stishovite, silica glass, kyanite, omphacite, garnet, sanidine, muscovite, talc, rutile, dolomite.

Distribution: From Meteor Crater, Coconino Co., Arizona, USA. At the Nördlinger Ries crater, Bavaria, Germany. In the Kara structure, Pay-Khoy, Russia. In Italy, in the Dora-Maira massif, Parigi, near Martiniana Po, Piedmont. From Grytting, Selje district, Norway. In the Wabar craters, Rub' al Khali, Saudi Arabia. At Dabie Mountain, west of Qianshan, Anhwei Province, China. In the Roberts Victor diamond mine, near Kimberley, Cape Province, and near Boshoff, Orange Free State, South Africa.

Name: For Loring Coes, Jr. (1915–), American chemist, who synthesized the material prior to the discovery of a natural occurrence.

Type Material: n.d.

Coffinite $U(SiO_4)_{1-x}(OH)_{4x}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal; may be metamict. *Point Group:* $4/m\ 2/m\ 2/m$. As crystals, rarely > 20 μm, and in colloform to botryoidal incrustations, radially fibrous. Commonly pulverulent, in aggregates of extremely fine crystallites, or massive.

Physical Properties: *Fracture:* Irregular to subconchoidal, earthy. *Tenacity:* Brittle or friable. Hardness = 5–6 D(meas.) = 5.1 D(calc.) = n.d. Radioactive.

Optical Properties: Opaque, transparent on very thin edges. *Color:* Black from included organic matter; pale brown to dark brown in thin section. *Luster:* Dull to adamantine. *Optical Class:* Isotropic due to fine grain size; uniaxial (+) or (–). *Pleochroism:* Moderate; pale yellow-brown ∥ length, medium brown ⊥ length. $n = 1.73$–1.75

Cell Data: *Space Group:* $I4_1/amd$ (synthetic $USiO_4$). $a = 6.979$ $c = 6.252$ Z = 4

X-ray Powder Pattern: Synthetic $USiO_4$; natural material gives broad peaks or may be metamict.

(1) La Sal No. 2 mine, Colorado, USA; H_2O from loss on ignition, contains admixed clay minerals, vanadates, organic matter, etc. (2) $USiO_4$. (3) $USiO_4 \cdot 2H_2O$.

Occurrence: In Colorado Plateau-type black unoxidized U–V deposits, replacing organic material in sandstone; in other sedimentary and hydrothermal vein uranium deposits.

Association: Uraninite, thorite, pyrite, marcasite, roscoelite, clay minerals, amorphous organic matter.

Distribution: Numerous minor occurrences; those mentioned are for well-crystallized or studied material. In the USA, in the La Sal No. 2 mine, Beaver Mesa, Gateway district, Mesa Co., and in the Peanut mine, Montrose Co., Colorado; around the Jackpile and Crownpoint mines, Valencia Co., New Mexico; in the Mi Vida, Homestake, and other mines, San Juan Co., Utah. From Wölsendorf, Bavaria; at Niederramstadt, near Schneeberg, Johanngeorgenstadt, and Niederpfannenstiel, Saxony, Germany. At Hüttenberg, Carinthia, Austria. From Jáchymov (Joachimsthal) and Příbram, Czech Republic. In the Geevor mine, St. Just, the South Terras mine, St. Stephen-in-Brannel, and the Roskrow United mine, Ponsansooth, Cornwall, England.

Name: Honoring Reuben Clare Coffin (1886–1972), Tulsa, Oklahoma, USA, pioneer geologist in the study of uranium deposits of the Colorado Plateau.

Type Material: The Natural History Museum, London, England, 1956,201; National Museum of Natural History, Washington, D.C., USA, 112646.

Cohenite $(Fe, Ni, Co)_3C$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As imperfect platy to needlelike crystals; also rimming or in eutectic dendritic intergrowths with iron.

Physical Properties: *Cleavage:* {100}, {010}, and {001}. *Tenacity:* Very brittle. Hardness = 5.5–6 D(meas.) = 7.20–7.65 D(calc.) = 7.68 (synthetic Fe_3C). Strongly magnetic.

Optical Properties: Opaque. *Color:* Tin-white; oxidizes to light bronze then golden yellow. *Luster:* Metallic.
Optical Class: Biaxial.
R_1–R_2: (400) 51.8–54.7, (420) 52.6–55.2, (440) 53.2–55.7, (460) 53.8–56.2, (480) 54.4–56.7, (500) 55.0–57.1, (520) 55.6–57.7, (540) 56.2–58.2, (560) 56.8–58.8, (580) 57.4–59.3, (600) 58.0–60.0, (620) 58.7–60.6, (640) 59.3–61.3, (660) 60.0–62.0, (680) 60.8–62.8, (700) 61.6–63.6

(1) Magura meteorite. (2) Kitdlît dike, Disko Island, Greenland; by electron microprobe, C by difference. (3) Fe_3C.

Occurrence: In iron meteorites. Also in terrestrial iron, in mafic volcanic rocks chemically reduced from assimilation of graphite.

Association: Iron, schreibersite, troilite, wüstite.

Distribution: Common in iron meteorites. In Greenland, at Niaqornat (Niakornak) and on Disko Island, near Uivfaq and Kitdlît. At Bühl, near Weimar, Hesse, Germany. From Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, and in the Ijim massif, western Sayan Mountains, Tuva, Russia. In the Burobaiskii massif, eastern Kazakhstan.

Name: Honors Emil Wilhelm Cohen (1842–1905), Professor of Mineralogy, University of Greifswald, Greifswald, Germany.

Colemanite $Ca_2B_6O_{11}\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As equant to short prismatic crystals, with large {110} and multiple terminating forms, to 30 cm; pseudorhombohedral with large {110} and $\{\overline{3}01\}$; pseudo-octahedral with large $\{\overline{2}21\}$ and {011}; nearly 50 forms measured; cleavable massive, granular, most commonly nodular.

Physical Properties: *Cleavage:* On {010}, perfect; on {001}, distinct. *Fracture:* Uneven to subconchoidal. Hardness = 4.5 D(meas.) = 2.423(5) D(calc.) = 2.42 Bright pale yellow fluorescence, may phosphoresce pale green; pyroelectric and piezoelectric at very low temperature.

Optical Properties: Transparent to translucent. *Color:* Colorless, milky white, pale yellow, gray; colorless in transmitted light. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = -6°$; $Z \wedge c = 84°$. *Dispersion:* $r > v$, weak. $\alpha = 1.586$ $\beta = 1.592$ $\gamma = 1.614$ 2V(meas.) = 56°

Cell Data: *Space Group:* $P2_1/a$. $a = 8.712(2)$ $b = 11.247(3)$ $c = 6.091(1)$ $\beta = 110.12(2)°$ Z = 2

X-ray Powder Pattern: Twenty Mule Team Canyon, Death Valley, California, USA.

Total	99.98	100.00

(1) Death Valley, California, USA. (2) $Ca_2B_6O_{11}\cdot 5H_2O$.

Occurrence: A common constituent in borate deposits formed in arid alkaline lacustrine environments, deficient in sodium and carbonate, typically under warm conditions.

Association: Howlite, ulexite, searlesite, priceite, nobleite, ginorite, gowerite, lüneburgite, kernite, gypsum, calcite, celestine.

Distribution: An important component of sedimentary borate deposits worldwide. In the USA, in California, from Death Valley, near Ryan, Furnace Creek district, in the Thompson mine and the Boraxo mine, fine crystals; at Borate, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co.; from Boron, Kern Co.; at the Anniversary mine, Muddy Mountains district, Clark Co., Nevada. From the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada. Large deposits at El Torreon and La Tinaja del Oso, near Magdalena, Sonora, Mexico. In Argentina, on the Salinas Grandes Playa, and at the Loma Blanca deposit, eight km southwest of Coranzulí, Jujuy Province; from the Sijes district, Salta Province. In the Inder borate deposit, Kazakhstan. Near Bela Stena, Jarandol Basin, Serbia, Yugoslavia. From a lake on West Samos Island, Greece. Extensive deposits with about one billion tons reserves in Turkey, as in the Bigadiç borate district, Balıkesir Province, large crystals; from the Kestelek borax deposit, Eskiçehir Province; at the Emet borate deposits, Kütahya Province; large crystals from Mustafakemalpasa, Bursa Province.

Name: Honors William Tell Coleman (1824–1893), pioneer developer of the borax industry in California, USA.

Collinsite $Ca_2(Mg,Fe^{2+})(PO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As bladed to prismatic crystals, to 2 cm; fibrous, as globular crystal aggregates; in concentrically layered botryoidal masses.

Physical Properties: *Cleavage:* Fair on {001} and {010}. *Tenacity:* Brittle. Hardness = 3.5–5 D(meas.) = 2.93–2.95 D(calc.) = 2.955

Optical Properties: Translucent. *Color:* Brown, chocolate-black, light brown, yellowish white, white, colorless, pale blue if zincian; in thin section, colorless. *Streak:* White. *Luster:* Subvitreous, silky if fibrous.
Optical Class: Biaxial (+). $\alpha = 1.632(3)$ $\beta = 1.642(3)$ $\gamma = 1.657(3)$ 2V(meas.) = ∼80°

Cell Data: *Space Group:* $P\overline{1}$. $a = 5.734(1)$ $b = 6.780(1)$ $c = 5.441(1)$ $\alpha = 97.29°$ $\beta = 108.56°$ $\gamma = 107.28°$ Z = 1

(1) François Lake, Canada; corresponds to $Ca_{1.92}(Mg_{0.78}Fe_{0.34})_{\Sigma=1.12}(PO_4)_{1.95} \cdot 1.81H_2O$.
(2) Milgun Station, Australia; SiO_2 as quartz impurity.

Mineral Group: Fairfieldite group.

Occurrence: A secondary weathering product typically incrusting other minerals.

Association: Carbonatian fluorapatite, bitumen (Lake François, Canada); parahopeite, scholzite, cryptomelane, Fe–Mn oxides (Reaphook Hill, Australia); bobierrite, kovdorskite, dolomite (Kovdor massif, Russia).

Distribution: From François Lake, south of Babine Lake, Coast district, British Columbia, and as large crystals from the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In the USA, at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; in the Foote mine, near Kings Mountain, Cleveland Co., North Carolina. On Milgun Station, Western Australia, and a zincian variety from Reaphook Hill, near Blinman, Flinders Ranges, South Australia. In the Kovdor massif, Kola Peninsula, Russia.

Name: Honoring William Henry Collins (1878–1937), formerly Director of the Geological Survey of Canada.

Type Material: n.d.

Te	39.38	38.7	38.88
Total	100.33	99.7	100.00

(1) Kalgoorlie, Australia; corresponding to $Hg_{0.98}Te_{1.00}$. (2) Do.; by electron microprobe, corresponding to $Hg_{1.00}Te_{1.00}$. (4) HgTe.

Occurrence: In hydrothermal tellurium-bearing precious metal veins.

Mineral Group: Sphalerite group.

Association: Altaite, calaverite, krennerite, petzite, gold, pyrite, chalcopyrite, sphalerite, galena, pyrrhotite, tetrahedrite–tennantite.

Distribution: In the USA, in Colorado, at the Good Hope mine, Vulcan, Gunnison Co.; in the La Plata district, La Plata Co.; and at the Keystone, Mountain Lion, Smuggler, and Ellen mines, Boulder Co. [TL]; from the Cresson mine, Cripple Creek district, Teller Co.; in California, at the Norwegian mine, near Tuttletown, and the Jamestown mine, Tuolumne Co.; in Nevada, at the Twin Creeks and Getchell mines, Potosi district, Humboldt Co.; from the Outlaw mine, Round Mountain district, Nye Co.; and at the Gus Schave property, Olinhouse district, Washoe Co.; from the Mayflower mine, Tobacco Root Mountains, Madison Co., Montana. In Canada, at a number of mines in the Kirkland Lake district, in the Hemlo gold deposit, Thunder Bay district, and at Hollinger in the Porcupine district, Ontario; also found at the Ardeen mine and the Robb-Montbray mine, Quebec. From the Jeronimo gold deposit, near Potrerillos, Atacama, Chile. In the Uzel'ginsk deposit and the Yaman-Kasy Cu–Zn–pyrite deposits, Southern Ural Mountains, Russia. From Săcărîmb, Romania. At the Zarshuran gold deposit, 35 km north of Takab, northwestern Iran. From Kalgoorlie, Western Australia. In the Emperor mine, Vatukoula, and in the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. At the Bulawan deposit, Negros Occidental, Phillipines. From the Guilaizhuang gold deposit, Shandong Province, China. In the Commoner mine, 50 km west-southwest of Kadoma, Zimbabwe. Additional localities are known.

Name: For the Keystone and Mountain Lion mines, Magnolia, Magnolia district, and Smuggler mine, Ballerat district, Boulder Co., type localities in Colorado, USA.

Type Material: n.d.

(2) Do.; by electron microprobe, corresponds to $(Cu_{25.31}Zn_{0.15})_{\Sigma=25.46}V_{1.92}(As_{3.14}Sn_{2.38}Sb_{0.77}Fe_{0.24})_{\Sigma=6.53}S_{32.00}$. (3) Lorano, Italy; by electron microprobe, corresponds to $Cu_{25.93}V_{2.13}(As_{5.97}Sb_{0.38}Te_{0.33}Ge_{0.28}Sn_{0.07})_{\Sigma=7.03}S_{32.00}$.

Mineral Group: Colusite group.

Occurrence: Widespread in small amounts with other sulfides and sulfosalts, typically in hydrothermal vein and disseminated copper deposits.

Association: Pyrite, tetrahedrite–tennantite, enargite, luzonite, stannoidite, goldfieldite, germanite, reniérite, bornite, chalcocite, covellite, chalcopyrite, sphalerite, galena.

Distribution: In the USA, in Montana, from the Leonard mine [TL] and other mines, Butte, Silver Bow Co.; in Arizona, from the Magma mine, Superior, Pinal Co., and the Campbell mine, Bisbee, Cochise Co.; from Red Mountain Pass, San Juan, Ouray Co., and in the Buffalo Boy mine, near Silverton, San Juan Co., Colorado. In the Kidd Creek mine, near Timmins, Ontario, Canada. From Chuquicamata, Antofagasta, Chile. At Cerro de Pasco, Peru. From Lorano, 5 km from Carrara, and in the Costa and Pitone quarries, near Seravezza, 20 km southwest of Carrara, from the La Facciata quarry, Carrara, Tuscany, Italy. At Chizeuil, Saône-et-Loire, France. From Bor, Serbia. In the Medet and Assarel deposits, and at the Chelopech deposit, Sofia, Bulgaria. In the Gay Cu–Zn deposit, Southern Ural Mountains, Russia. From the Grasberg Cu–Au deposit, Irian Jaya. At the Shin-Ohtoyo Cu–Ag deposit, Harukayama district, Hokkaido, Japan. Numerous minor localities are now known.

Name: For the Colusa claim, Butte, Montana, USA, near which it occurs in the Leonard mine.

Type Material: n.d.

Comancheite $Hg_{13}(Cl,Br)_8O_9$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. Rarely as sprays of acicular crystals, elongated ‖ [001], up to 80 μm, and as anhedral masses.

Physical Properties: *Cleavage:* Fair on {001} and {110}. *Tenacity:* Brittle. Hardness = 2 D(meas.) = 7.7(4) D(calc.) = 8.0

Optical Properties: Transparent to translucent. *Color:* Red-orange to yellow in crystals; red when massive. *Streak:* Yellow-orange. *Luster:* Vitreous in crystals; resinous when massive. *Optical Class:* Biaxial. *Orientation:* Extinction parallel; length-fast. *Absorption:* Strong. n = 1.78–1.79 2V(meas.) = n.d.

Cell Data: *Space Group:* $Pnnm$ or $Pnn2$. a = 18.41(1) b = 21.64(1) c = 6.677(2) Z = 4

X-ray Powder Pattern: Terlingua, Texas, USA.
2.669 (10), 2.878 (8), 5.68 (7), 5.42 (6), 2.710 (5), 2.457 (5), 1.415 (5)

Chemistry:

$-O = (Cl,Br)_2$	2.0
Total	101.7

(1) Terlingua, Texas, USA; by electron microprobe, corresponding to $Hg_{13}(Cl_{4.51}Br_{3.50})_{\Sigma=8.01}O_{9.07}$.

Occurrence: A secondary mineral in an oxidized mercury deposit.

Association: Calcite, goethite, hematite, quartz.

Distribution: From the Mariposa mine, Terlingua, Brewster Co., Texas, USA.

Name: For the Comanche Indians, the first miners of the mercury deposits in which this mineral occurs.

Type Material: Canadian Geological Survey, Ottawa, Canada, 14608; National Museum of Natural History, Washington, D.C., USA, 150760.

(1) Mt. Shaheru, Congo. (2) Oldoinyo Lengai volcano, Tanzania; by electron microprobe.
(3) $Na_2Ca_2Si_3O_9$.

Occurrence: In nephelinite (Mt. Shaheru, Congo); in nephelinite and ash ejecta (Oldoinyo Lengai volcano, Tanzania).

Association: Götzenite (Mt. Shaheru, Congo); wollastonite, clinopyroxene, nepheline, melilite, titanian garnet, titanian magnetite (Oldoinyo Lengai, Tanzania).

Distribution: On Mt. Shaheru, the extinct southern cone of Mt. Nyiragongo, Kivu Province, Congo (Zaire). From the Oldoinyo Lengai volcano, Tanzania.

Name: To honor Arthur Delmar Combe, Geological Survey of Uganda.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM8037; National Museum of Natural History, Washington, D.C., USA, 142981; The Natural History Museum, London, England, 1957,705.

Comblainite $Ni_6Co_2^{3+}(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ $2/m$, $3m$, 32, $\overline{3}$, or 3. As cryptocrystalline crusts.

Physical Properties: Hardness = [∼2] D(meas.) = 3.05(2) D(calc.) = 3.16–3.31

Optical Properties: Semitransparent. *Color:* Turquoise-blue; yellow-green in transmitted light.
Optical Class: Uniaxial (–). $\omega = 1.690(2)$ (ω') $\epsilon = 1.684(2)$ (ϵ')

Cell Data: *Space Group:* $R\overline{3}m$, $R3m$, $R32$, $R\overline{3}$, or $R3$. $a = 3.038$ $c = 22.79$ Z = [3/8]

X-ray Powder Pattern: Shinkolobwe, Congo; very close to takovite.
7.64 (100), 2.567 (70), 3.808 (50), 2.278 (50), 1.934 (40), 1.489 (30), 1.519 (20)

Chemistry:

Total	[99.64]	[96.42]

(1) Shinkolobwe, Congo; Ni^{2+} and Co^{3+} valences by ESCA spectra; MgO, P_2O_5, and H_2O calculated from UO_3, known to be present as "metasaleeite" $[Mg(UO_2)_2(PO_4)_2\cdot 8H_2O]$; corresponding to $Ni^{2+}_{6.10}Co^{3+}_{2.90}(CO_3)_{1.32}(OH)_{18.27}\cdot 6.7H_2O$. (2) Do.; corresponding to $Ni^{2+}_{6.11}Co^{3+}_{2.89}(CO_3)_{1.02}(OH)_{18.84}\cdot 9.92H_2O$.

Mineral Group: Hydrotalcite group.

Occurrence: An alteration product of nickel and cobalt sulfides in the oxidized zone of a uranium deposit.

Association: Uraninite, "metasaleeite", uranophane, becquerelite, curite, rutherfordine, heterogenite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: For Gordon Comblain (1920–), Royal Museum of Central Africa, Tervuren, Belgium, who discovered the mineral.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM2224; National Museum of Natural History, Washington, D.C., USA, 147188.

Compreignacite $K_2(UO_2)_6O_4(OH)_6 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As tabular crystals, to several tenths of one mm, flattened on [001], with large {001} and {010}, modified by {130}, {102}, {110}, {104}, and {118}; as intergrowths of crystals and spherules. *Twinning:* Commonly on {110}, as simple contact or multiple cyclic twins.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 5.03(5) D(calc.) = 5.13(5)

Optical Properties: Transparent to translucent. *Color:* Bright yellow to golden yellow. *Streak:* Pale yellow.
Optical Class: Biaxial (–). *Pleochroism:* Intense; X = colorless; $Y = Z$ = yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = [< 1.790]$ $\beta = 1.798$ $\gamma = 1.802$ 2V(meas.) = 10°–15°

Cell Data: *Space Group:* $Pnmn$ or $Pn2_1n$. $a = 7.16(2)$ $b = 12.16(5)$ $c = 14.88(5)$ Z = 2

X-ray Powder Pattern: Margnac mine, France.
7.40 (FFF), 3.53 (FF), 3.19 (FF), 3.70 (F), 3.58 (F), 3.34 (F), 2.554 (F)

Chemistry:

	(1)	(2)
UO_3	88.8	85.44
K_2O	5.4	4.69
H_2O	[9.9]	9.87
Total	[104.1]	100.00

(1) Margnac mine, France; by electron microprobe, original analysis U 82.0%, K 4.5% after heating material to 450 °C; here converted to oxides, H_2O from theoretical analysis.
(2) $K_2(UO_2)_6O_4(OH)_6 \cdot 8H_2O$.

Occurrence: As a very rare oxidation product of "pitchblende" in uranium deposits.

Association: Uraninite, cuprosklodowskite, uranophane, zeunerite, schoepite, brochantite, connellite, cerian agardite (Margnac mine, France); cuprosklodowskite, uranophane, brochantite, connellite, calcite, chalcopyrite, siderite, uraninite, potassian feldspar (Wheal Edward, Cornwall, England).

Distribution: In France, from the Margnac mine, Compreignac, Haute-Vienne. From Wheal Owles and Wheal Edward, St. Just, Cornwall, England. From Jáchymov (Joachimsthal), Czech Republic. In the Val Masino, Lombardy, Italy. At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From White Canyon, near Moab, Grand Co., Utah; in the Marshall Pass district, Saguache Co., Colorado; at the Palermo mine, near North Groton, Grafton Co., New Hampshire, USA.

Name: For Compreignac, the village near the Margnac mine, France.

Type Material: University of Pierre and Marie Curie, Paris; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 165183.

Congolite $(Fe^{2+}, Mg)_3B_7O_{13}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As grains, to 0.2 mm.

Physical Properties: Hardness = 7 D(meas.) = 3.58 D(calc.) = [3.52]

Optical Properties: Transparent. *Color:* Pink.
Optical Class: Uniaxial (–). $\omega = 1.755(5)$ $\epsilon = 1.731(2)$

Cell Data: *Space Group:* $R3c$. a = 8.6225(15) $c = 21.054(5)$ Z = 6

X-ray Powder Pattern: Brazzaville, Congo.
2.725 (100), 3.05 (80), 2.061 (75), 2.058 (75), 1.838 (70), 1.834 (70), 2.158 (60)

Chemistry:

	(1)
B_2O_3	[56.42]
FeO	25.54
MnO	0.26
MgO	13.52
Cl	7.83
$-O = Cl_2$	1.77
Total	[101.80]

(1) Penobsquis mine, Canada; by electron microprobe, B_2O_3 calculated for stoichiometry; corresponds to $(Fe_{1.55}Mg_{1.45})_{\Sigma=3.00}B_7O_{13}Cl_{0.95}$.

Polymorphism & Series: Dimorphous with ericaite.

Occurrence: Part of insoluble residue from a drill core into sedimentary evaporites (Brazzaville, Congo); in a marine evaporite deposit (Penobsquis mine, Canada).

Association: Anhydrite, halite (Brazzaville, Congo).

Distribution: From Brazzaville, Congo. In the Penobsquis evaporite deposit, near Sussex, New Brunswick, Canada. At Bischofferode, Thuringia, Germany.

Name: For Congo, the country in which the first specimens were collected.

Type Material: n.d.

Conichalcite $CaCu(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Rarely as euhedral crystals, equant to short prismatic along [010], to 3 mm, terminated by many forms, both left- and right-handed; typically in radial fibrous aggregates, as botryoidal to reniform crusts, massive. *Twinning:* Rare on {001}.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5
D(meas.) = 4.33 D(calc.) = 4.29

Optical Properties: Subtranslucent. *Color:* Grass-green to yellowish green, pistachio-green, emerald-green; in transmitted light, pale green to yellowish green, commonly zoned.
Streak: Green. *Luster:* Vitreous to somewhat greasy.
Optical Class: Biaxial (+), may be biaxial (–), commonly zoned. *Pleochroism:* X = colorless to green; Y = pale greenish to yellow-green; Z = pale bluish to blue-green. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong, to $r < v$, moderate. $\alpha = 1.778$–1.800 $\beta = 1.795$–1.831 $\gamma = 1.801$–1.846 2V(meas.) = 0°–90°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 7.38$–7.40 $b = 9.21$–9.24 $c = 5.82$–5.84 Z = 4

X-ray Powder Pattern: Higgins mine, Bisbee, Arizona, USA.

(1) Hinojosa de Córdoba, Spain. (2) Higgins mine, Bisbee, Arizona, USA; by electron microprobe, H_2O by difference. (3) $CaCu(AsO_4)(OH)$.

Polymorphism & Series: Forms three series; with austinite, with cobaltaustinite, and with tangeite.

Mineral Group: Adelite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of copper deposits, typically an alteration product of enargite.

Association: Austinite, olivenite, clinoclase, libethenite, chenevixite, brochantite, malachite, azurite, jarosite, "limonite".

Distribution: Many minor occurrences. Some providing good specimens include: from Hinojosa de Córdoba, Andalusia, Spain. In England, at Wheal Kendall, St. Hilary, and the Hingston Down quarry, Calstock, Cornwall; from Caldbeck Fells, Cumbria. In the USA, at the American Eagle and a number of other mines in the Tintic district, Juab Co., and in the Gold Hill mine, Tooele Co., Utah; from Bisbee, Cochise Co., Arizona; in the Bristol mine, Lincoln Co., and the Empire-Nevada mine, Yerington, Lyon Co., Nevada. From the Ojuela mine, Mapimí, Durango, Mexico. At Collahuasi, Tarapacá, Chile. From the Guchab mine, near Otavi, and at Tsumeb, Namibia.

Name: From the Greek for *lime* and *copper*, as both elements are essential to the composition.

Type Material: Mining Academy, Freiberg, Germany, 21297.

(1) Grand Central mine, Tintic, Utah, USA; corresponds to $Cu_{36.00}[(SO_4)_{1.87}(NO_3)_{0.22}]_{\Sigma=2.07}Cl_{7.76}(OH)_{60.28}\cdot 6.26H_2O$. (2) Czar mine, Bisbee, Arizona, USA; corresponds to $Cu_{36.00}[(SO_4)_{1.54}(NO_3)_{0.52}]_{\Sigma=2.06}Cl_{7.51}(OH)_{60.89}\cdot 6.66H_2O$. (3) Toughnut mine, Tombstone, Arizona, USA; crystal structure analysis yields $Cu_{36.0}[(SO_4)_{1.6}(NO_3)_{0.4}]_{\Sigma=2.0}Cl_{7.8}(OH)_{60.6}\cdot 6.7H_2O$. (4) $Cu_{36}(SO_4)_2Cl_6(OH)_{62}\cdot 12H_2O$.

Polymorphism & Series: Forms a series with buttgenbachite.

Occurrence: An uncommon secondary mineral in the oxidized portions of copper deposits.

Association: Cuprite, spangolite, atacamite, botallackite, langite, malachite, azurite.

Distribution: In England, in the Wheals Gorland, Unity, Edward, the Botallack mine, and others in St. Just, and several other mines in Cornwall. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. In the Britannia mine, Snowdonia, Wales. At the Cap Garonne mine, near le Pradet, Var, France. In the Sa Duchessa mine, Oridda district, Sardinia, Italy. From Laurium, Greece, in slag. At Fontana Rossa, Corsica, France. From Weibing, Salzburg, Austria. In the Clara mine, Black Forest, Germany. In the USA, in Arizona, from several mines at Bisbee and in the Toughnut mine, Tombstone, Cochise Co.; in Utah, from the Grand Central mine, Tintic district, Juab Co. and the Gold Hill mine, Tooele Co. At Spring Creek and the Ediacara mine, Flinders Ranges, South Australia, and at Broken Hill, New South Wales, Australia. In the Marharahara mine, near Woodville, New Zealand. Increasingly recognized from other minor localities.

Name: Honors Arthur Connell (1794–1863), Scottish chemist who first examined the mineral.

Mineral Group: Chlorite group.

Occurrence: A late-stage hydrothermal alteration product of lithium-bearing minerals in pegmatites; a primary hydrothermal vein mineral.

Association: Lepidolite, spodumene, tourmaline, petalite, quartz, albite, microcline.

Distribution: Good examples from: in the USA, at Hebron, Mt. Mica, near Paris, and Buckfield, Oxford Co., Maine; in the Pala and Rincon districts, San Diego Co., California; from the Jeffrey quarry, North Little Rock, Pulaski Co., Arkansas. At Waitabit Creek, northwest of Donald, British Columbia, Canada. From Ogofau, Carmarthenshire, England. At Radkovice and Dobrá Voda, Czech Republic. In the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten, Sweden. From Lipovka, Ural Mountains, Russia. In the Muiâne pegmatite, Alto Ligonha district, Mozambique. At Londonderry, Western Australia. Many additional localities are known.

Polymorphism & Series: Dimorphous with braggite.

Occurrence: A significant platinum ore mineral, found in ultramafics, gabbros, dunites, chromitites, typically layered; in massive chalcopyrite–pyrrhotite orebodies; in alluvial placers.

Association: Braggite, vysotskite, sperrylite, moncheite, platarsite, laurite, malanite, hollingsworthite, platinum, Pt–Fe alloys and many other PGM species, chalcopyrite, bornite, cubanite, pentlandite, pyrrhotite, pyrite, chromite.

Distribution: In South Africa, from the Rustenburg [TL] and Potgietersrus districts, and various other localities along the Merensky Reef of the Bushveld complex, Transvaal. In the Freetown complex, Sierra Leone. From the Stillwater complex, Montana; at the junction of the Trinity and Klamath Rivers, Humboldt Co., and from the Merced River at Snelling and Cressy, Merced Co., California, USA. In Canada, in the Lac des Iles complex, Ontario, and the Tulameen district, British Columbia. In Russia, in the Severnyi mine, Noril'sk region, western Siberia; at the Konder massif, Aldan Shield, Sakha; in the Gusevogorskii magnetite deposits, Ural Mountains; and the Baimka placer, Chukotka, Far Eastern Region. At Round Hill, near Orepuki, New Zealand. A number of additional localities are known, generally in small amounts or in placers of uncertain origin.

Name: Honors Richard A. Cooper (1890–1972), South African metallurgist, Johannesburg, South Africa, who first described the mineral.

Type Material: The Natural History Museum, London, England, 1932,1301; Harvard University, Cambridge, Massachusetts, USA, 101935.

(1) Glandore mines, Ireland. (2) Dernbach, Germany; Pb, Cu, and Fe by AA, P and As by neutron activation, SO_4 by ESCA, H_2O by the phosphoric acid method; corresponding to $Pb_{0.98}Cu_{0.05}Fe_{2.99}(PO_4)_{1.00}(AsO_4)_{0.02}(SO_4)_{0.98}(OH)_{6.04}$. (3) $PbFe_3(PO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral formed at low temperatures or by weathering in oxidized hydrothermal base-metal deposits.

Association: Pyromorphite, malachite, plumbojarosite, "limonite", quartz.

Distribution: Widespread in small amounts. From the Glandore iron mines, Co. Cork, Ireland. In England, large crystals at the Mexico mine, Caldbeck Fells, Cumbria; in Cornwall, from the Penberthy Croft mine, St. Hilary, at Wheal Unity, Gwennap, and the Gravel Hill mine, Perranzabuloe. In Germany, from Dernbach, near Montabaur, Hesse, and in the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate. At Richelle, near Visé, Belgium. From Maikain, Kazakhstan. In the USA, at the Silver Queen mine, Galena, Lawrence Co., South Dakota; in the Wild Bill, Harrington-Hickory, and other mines, Beaver Co., and the Gold Hill and Honerine mines, Tooele Co., Utah; at the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico. From Santa Eulalia, Chihuahua, Mexico. At the Osarizawa mine, Akita prefecture, Japan. From Aggeneys, Northern Cape Province, South Africa. At Tsumeb, Namibia. In the Woodcutters Pb–Zn mine, Northern Territory, Australia. A number of other localities are known.

Name: For its first-noted occurrence, in Co. Cork, Ireland.

(1) Capo d'Arco, Elba, Italy. (2) $Fe^{2+}Fe^{3+}_4(SO_4)_6(OH)_2 \cdot 20H_2O$.

Mineral Group: Copiapite group.

Occurrence: A secondary mineral formed typically by the weathering and oxidation of pyrite in a wide range of rock types, preserved in arid climates; rarely associated with fumarolic action.

Association: Melanterite, alunogen, fibroferrite, halotrichite, botryogen, butlerite, amarantite.

Distribution: One of the most common ferric sulfates. In small amounts from many localities, with well studied material from: in Chile, at Tierra Amarilla, southeast of Copiapó, Atacama; from Alcaparrosa, near Cerritos Bayos, southwest of Calama, and at Chuquicamata, Antofagasta. In the USA, in California, from Coso Hot Springs, Inyo Co., Sulphur Bank, Lake Co., the Alma mine, Leona Heights, Alameda Co., and elsewhere; from the Comstock Lode, Virginia City, Storey Co., Nevada; in the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah; in Arizona, at Bisbee, Cochise Co., and from the United Verde mine, Jerome, Yavapai Co. At the Rammelsberg mine, near Goslar, Harz Mountains, Germany. In Italy, at Capo Calamita and Capo d'Arco, Elba; in Alum Cave, Vulcano, Lipari Islands. From volcanoes on the Kamchatka Peninsula, Russia.

Name: For the city of Copiapó, Chile, near which specimens were first collected.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 99059.

Copper Cu

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As cubes, dodecahedra, and as tetrahexahedra; rarely as octahedra and complex combinations. Commonly flattened on {111}, elongated along [001]. Also as irregular distortions, in twisted, wirelike shapes; filiform, arborescent, massive; as a coarse powder. Masses weighing hundreds of tons have been found; crystals up to 15 cm. *Twinning:* On {111} to produce simple contact and penetration twins and cyclic groups.

Physical Properties: *Fracture:* Hackly. *Tenacity:* Highly malleable and ductile. Hardness = 2.5–3 VHN = 77–99 (100 g load). D(meas.) = 8.95 D(calc.) = 8.93

Optical Properties: Opaque. *Color:* Pale rose on fresh surface, quickly darkens to copper-red, then metallic, shining; in reflected light, pale rose. *Luster:* Metallic.
R: (400) 45.0, (420) 47.9, (440) 51.3, (460) 54.4, (480) 56.9, (500) 58.9, (520) 60.5, (540) 63.0, (560) 70.5, (580) 86.1, (600) 95.9, (620) 98.4, (640) 98.7, (660) 98.7, (680) 98.7, (700) 98.7

Cell Data: *Space Group:* $Fm3m$. a = 3.615 Z = 4

X-ray Powder Pattern: Synthetic.
2.088 (100), 1.808 (46), 1.278 (20), 1.0900 (17), 0.8293 (9), 0.8083 (8), 1.0436 (5)

Chemistry: Copper, typically with only small amounts of other metals.

Occurrence: Commonly associated with porous zones in mafic extrusive rocks, less commonly in sandstones and shales, where the copper was probably of hydrothermal origin, precipitated as the result of oxidizing conditions; in the oxidized zone of large, disseminated copper deposits as a result of secondary processes. A rare mineral in some meteorites.

Association: Silver, chalcocite, bornite, cuprite, malachite, azurite, tenorite, iron oxides, many other minerals.

Distribution: Occurs in many districts world-wide. In the USA, as remarkably large masses and excellent, large crystals in deposits of the Keweenaw Peninsula, Keweenaw and Houghton Cos., Michigan; in several porphyry copper deposits in Arizona including those at the New Cornelia mine, Ajo, Pima Co.; the Copper Queen and other mines at Bisbee, Cochise Co.; and at Ray, Gila Co.; similarly in the Chino mine at Santa Rita, Grant Co., New Mexico. In Namibia, at the Onganja mine, 60 km northeast of Windhoek, and at Tsumeb. In large crystals from the Turinsk copper mine, Bogoslovsk, Ural Mountains, Russia. In Germany, at Rheinbreitbach, North Rhine-Westphalia, and the Friedrichssegen mine, near Bad Ems, Rhineland-Palatinate. In fine specimens from many mines in Cornwall, England. In Australia, at Broken Hill, New South Wales. In Chile, at Andacolla, near Coquimbo. From Bolivia, at Corocoro.

Name: From the Latin *cuprum*, in turn from the Greek *kyprios*, *Cyprus*, from which island the metal was early produced.

Coquandite $Sb_6^{3+}O_8(SO_4)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals lamellar, elongated along [001], very thin tabular on {010}, to 0.1 mm, showing {010}, {001}, {$2\overline{1}0$}, and {$1.\overline{12}.0$}. Fibrous, in feathery spheroidal aggregates; in thin crusts, powdery, massive. *Twinning:* On {010} as twin plane, polysynthetic.

Physical Properties: *Tenacity:* Flexible. Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.78

Optical Properties: Transparent to translucent. *Color:* Colorless, white. *Streak:* White. *Luster:* Adamantine to pearly.
Optical Class: Biaxial (+); low birefringence. *Orientation:* $Z \simeq c$; OAP ∥ [001]; parallel extinction ∥ {010}; length-slow. $n = 2.08(5)$. $2V(meas.) = \gg 60°$

Cell Data: *Space Group:* $P\overline{1}$. $a = 11.434$–11.449 $b = 29.77$–29.846 $c = 11.314$–11.337 $\alpha = 91.07°-91.16°$ $\beta = 118.88°-119.24°$ $\gamma = 92.49°-92.82°$ Z = 12

X-ray Powder Pattern: Pereta mine, Italy.
3.092 (100), 3.304 (93), 6.81 (67), 14.84 (50), 9.27 (41), 3.200 (39), 8.01 (34)

(1) Pereta mine, Italy; by electron microprobe, average of 10 analyses on three grains. (2) Cetine mine, Italy; by electron microprobe, average of four analyses on two grains. (3) Lucky Knock mine, Washington, USA; by electron microprobe, average of eight analyses on seven grains, H_2O by elemental analyzer, confirmed by IR. (4) Average of (1–3); corresponding to $Sb_{5.98}Ca_{0.01}Na_{0.01}O_{7.96}(SO_4)_{1.02}\cdot 0.78H_2O$.

Occurrence: Probably produced by action of H_2SO_4 on stibnite, in a stibnite vein in silicified limestone (Pereta mine, Italy).

Association: Klebelsbergite, peretaite, valentinite, sénarmontite, stibiconite, stibnite, sulfur, gypsum, quartz.

Distribution: From the Cetine mine, 20 km southwest of Siena, and the Pereta mine, Scansano, Tuscany, Italy. In the Lucky Knock mine, Tonasket, Okanogan Co., Washington, USA.

Name: For Henri-Jean-Baptiste Coquand (1813–1881), Professor of Geology and Mineralogy, University of Marseilles, Marseilles, France, for his early work on the antimony deposits of Tuscany, Italy.

Type Material: University of Florence, Florence, 1761/RI; University of Pisa, Pisa, Italy, 8800; National Museum of Natural History, Washington, D.C., USA.

Coquimbite $Fe_2^{3+}(SO_4)_3 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As short prismatic to pyramidal crystals, dominated by $\{10\overline{1}0\}$, $\{11\overline{2}0\}$, $\{10\overline{1}1\}$, $\{0001\}$, to 2 cm; massive, granular.

Physical Properties: *Cleavage:* Imperfect on $\{10\overline{1}1\}$; difficult on $\{10\overline{1}0\}$. Hardness = 2.5 D(meas.) = 2.11(1) D(calc.) = [2.12] Soluble in H_2O, astringent taste; effloresces in dry air.

Optical Properties: Transparent. *Color:* Pale violet to amethystine, rarely pale yellow or pale green. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.536$–1.539 $\epsilon = 1.548$–1.572

Cell Data: *Space Group:* $P\overline{3}1c$. $a = 10.922(9)$ $c = 17.084(14)$ $Z = 4$

X-ray Powder Pattern: Smolník, Slovakia. (ICDD 6–40).

(1) Tierra Amarilla, Chile. (2) $Fe_2(SO_4)_3 \cdot 9H_2O$.

Polymorphism & Series: Dimorphous with paracoquimbite.

Occurrence: Typically a secondary mineral in the oxidized portions of weathering iron sulfide deposits in arid regions; rarely associated with fumarolic activity.

Association: Copiapite, paracoquimbite, voltaite, szomolnokite, römerite.

Distribution: Abundant at numerous localities in Chile: from Tierra Amarilla, southeast of Copiapó, Atacama; at Quetena, west of Calama, from Chuquicamata, and at Alcaparrosa, near Cerritos Bayos, southwest of Calama, Antofagasta. In the USA, in Arizona, at Bisbee, Cochise Co., and from the United Verde mine, Jerome, Yavapai Co.; near Borate, San Bernardino Co., California; fine examples from the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. Large crystals from Zalamea la Real, Huelva Province, Spain. From Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia. In Alum Cave, Vulcano, Lipari Islands, Italy. At volcanoes on the Kamchatka Peninsula, Russia.

Name: For the Coquimbo region, Chile.

Type Material: Mining Academy, Freiberg, Germany, 18558.

Corderoite $Hg_3S_2(Cl,Br)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Rare as cubic crystals, to 2 mm; as rims and replacements of cinnabar.

Physical Properties: Hardness = ∼3 VHN = 28–61 (25 g load) (synthetic).
D(meas.) = 6.74 (synthetic). D(calc.) = 6.845

Optical Properties: Transparent. *Color:* Pale orange-pink to salmon-pink; on exposure to light, rapidly darkening to pale gray, then black.
Optical Class: Isotropic. $n = > 2.5$
R: 16.7 (470), 15.5 (546), 15.1 (589), 15.1 (650)

Cell Data: *Space Group:* $I2_13$. $a = 8.940(5)$ Z = 4

X-ray Powder Pattern: Synthetic $Hg_3S_2Cl_2$.
3.62 (100), 2.57 (70), 1.749 (60), 2.81 (50), 2.38 (40), 2.10 (40), 6.23 (30)

(1) Arzak deposit, Russia; by electron microprobe, average of four grains; corresponds to $Hg_{3.00}S_{1.96}Cl_{1.95}$. (2) Kadyrel deposit, Russia; by electron microprobe, corresponds to $Hg_{3.00}S_{1.96}(Cl_{1.90}Br_{0.12})_{\Sigma=2.02}$. (2) $Hg_3S_2Cl_2$.

Polymorphism & Series: Dimorphous with lavrentievite.

Occurrence: In lake-bed sediments and underlying silicified rhyolite tuffs, possibly of low-temperature secondary origin (McDermitt mine, Nevada, USA); in an oxidized hydrothermal deposit (Arzak deposit, Russia).

Association: Cinnabar, kleinite, kenhsuite, radtkeite, montmorillonite, quartz, cristobalite, orthoclase, plagioclase (McDermitt mine, Nevada, USA); cinnabar, calomel, eglestonite, arzakite, lavrentievite, kuznetsovite, mercury, quartz, kaolinite (Arzak deposit, Russia).

Distribution: In the USA, in Nevada, from the McDermitt mercury mine, Opalite district, Humboldt Co. [TL]; at the Paradise Peak mine, Fairplay district, Nye Co.; and in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co. From the Arzak and Kadyrel mercury deposits, Tuva, Siberia, Russia. In the Khaydarkan mercury deposit, Fergana Valley, Alai Range, Kyrgyzstan. At Landsberg, near Obermoschel, and from Königsberg, near Wolfstein, Rhineland-Palatinate, Germany.

Name: For its occurrence in the McDermitt (formerly Cordero) mine, USA.

Type Material: Stanford University, Palo Alto, California; National Museum of Natural History, Washington, D.C., USA, 133354.

(1) White Well, Western Australia; corresponds to $(Mg_{1.91}Fe^{2+}_{0.08}Na_{0.05}Ca_{0.02}K_{0.02}Mn_{0.01})_{\Sigma=2.09}Al_{3.95}Si_{5.02}O_{18}$. (2) Smith Ridge, Boehls Butte quadrangle, Idaho, USA; corresponds to $(Mg_{1.81}Fe^{2+}_{0.18}K_{0.04}Ca_{0.03}Mn_{0.01})_{\Sigma=2.07}Al_{3.99}Si_{4.98}O_{18}$.

Polymorphism & Series: Dimorphous with indialite; forms a series with sekaninaite.

Occurrence: In thermally metamorphosed argillaceous sediments and high-grade regionally metamorphosed schists, gneisses, and granulites; in mafic igneous rocks and granites; detrital.

Association: Sillimanite, potassic feldspar, muscovite, biotite, corundum, spinel, garnet, andalusite.

Distribution: Widely distributed; some localities for abundant material are: at Bodenmais, Bavaria, Germany. From Orijärvi and Leppävirta, Finland. In Norway, at Kragerö, near Tvedestrand, and Akland, Söndeled, near Risör. In the Mt. Bity district, south of Antsirabe, Madagascar. On the Treasure Casket claims, Fungure Reserve, Zimbabwe. Found around Namib, Namibia. Crystals from the gem gravels of Sri Lanka. Around Tiruchchirappalli and Coimbatore, Tamil Nadu, India. In the Harts Range, Northern Territory, Australia. In the USA, at Richmond, Cheshire Co., New Hampshire; and at Haddam, Middlesex Co., Connecticut. Fine crystals from Thompson, Manitoba, Canada.

(1) Narssârssuk, Greenland; by electron microprobe, CO_2 by difference; corresponds to $(Na_{1.08}Ca_{0.14})_{\Sigma=1.22}(Ba_{1.03}Sr_{0.10})_{\Sigma=1.13}(Ce_{0.96}La_{0.64}Nd_{0.20}Pr_{0.08})_{\Sigma=1.88}(CO_3)_{4.10}F_{1.35}$. (2) Saint-Amable, Canada; by electron microprobe, CO_2 and F calculated from stoichiometry; corresponds to $(Na_{0.92}Ca_{0.04})_{\Sigma=0.96}(Ba_{0.98}Sr_{0.05})_{\Sigma=1.03}(Ce_{1.05}La_{0.65}Nd_{0.21}Pr_{0.06}Sm_{0.01})_{\Sigma=1.98}(CO_3)_4F$.

Occurrence: Rare in an alkali pegmatite (Narssârssuk, Greenland); a late-stage mineral in miarolitic vugs and fractures (Saint-Amable, Canada); in pegmatite dikes associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Aegirine, ancylite-(Ce), synchysite-(Ce), parisite-(Ce), neptunite (Narssârssuk, Greenland); analcime, aegirine, albite, pyrophanite (Mont Saint-Hilaire, Canada); parisite, cebaite-(Ce), barite (Bayan Obo deposit, China); vaterite, alstonite, ancylite-(Ce), kukharenkoite-(Ce), mckelveyite-(Y), fluorapatite, barite (Vuoriyarvi complex, Russia).

Distribution: From Narssârssuk, Greenland. In Canada, large crystals at Mont Saint-Hilaire, and from near Saint-Amable, Quebec. In the Khibiny massif, the Vuoriyarvi carbonatite complex, and the Lesnaya Varaka carbonatite, Kola Peninsula, Russia. From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China.

Name: From the Greek for *club*, in allusion to its typical clublike crytal habit.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Crystal Data: Hexagonal. *Point Group:* $3m$. As pseudocubic rhombohedral crystals, to 2 mm, with prominent $\{10\bar{1}1\}$; usually in crusts, massive.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = 3.5–4.5 D(meas.) = 4.295 D(calc.) = [4.31]

Optical Properties: Transparent. *Color:* Brown to light yellowish brown, pale yellow, yellowish green to dark green. *Luster:* Vitreous to resinous.
Optical Class: Uniaxial (–); commonly anomalous biaxial, birefringence weak, showing lamellar structure. n = 1.93–1.96

Cell Data: *Space Group:* $R3m$. a = 7.280 (1) c = 16.821 (1) Z = 3

X-ray Powder Pattern: Glandore mines, Ireland. (ICDD 17-471).
3.03 (100), 5.86 (65), 2.237 (55), 3.61 (35), 2.793 (35), 1.482 (35), 2.508 (30)

(1) Glandore mines, Ireland. (2) Dernbach, Germany; Pb, Cu, and Fe by AA, P and As by neutron activation, SO_4 by ESCA, H_2O by the phosphoric acid method; corresponding to $Pb_{0.98}Cu_{0.05}Fe_{2.99}(PO_4)_{1.00}(AsO_4)_{0.02}(SO_4)_{0.98}(OH)_{6.04}$. (3) $PbFe_3(PO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral formed at low temperatures or by weathering in oxidized hydrothermal base-metal deposits.

Association: Pyromorphite, malachite, plumbojarosite, "limonite", quartz.

Distribution: Widespread in small amounts. From the Glandore iron mines, Co. Cork, Ireland. In England, large crystals at the Mexico mine, Caldbeck Fells, Cumbria; in Cornwall, from the Penberthy Croft mine, St. Hilary, at Wheal Unity, Gwennap, and the Gravel Hill mine, Perranzabuloe. In Germany, from Dernbach, near Montabaur, Hesse, and in the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate. At Richelle, near Visé, Belgium. From Maikain, Kazakhstan. In the USA, at the Silver Queen mine, Galena, Lawrence Co., South Dakota; in the Wild Bill, Harrington-Hickory, and other mines, Beaver Co., and the Gold Hill and Honerine mines, Tooele Co., Utah; at the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico. From Santa Eulalia, Chihuahua, Mexico. At the Osarizawa mine, Akita prefecture, Japan. From Aggeneys, Northern Cape Province, South Africa. At Tsumeb, Namibia. In the Woodcutters Pb–Zn mine, Northern Territory, Australia. A number of other localities are known.

Name: For its first-noted occurrence, in Co. Cork, Ireland.

Cornetite $Cu_3(PO_4)(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, short prismatic on [001], {210} rounded, also showing large {021}, {221}, with a number of other forms known, to 1 cm; as flat radial aggregates and crusts. *Twinning:* On {*h*0*l*}.

Physical Properties: Hardness = ∼4.5 D(meas.) = 4.10 D(calc.) = 4.14

Optical Properties: Transparent to translucent. *Color:* Deep blue, peacock-blue, pale blue to greenish blue; in transmitted light, greenish blue, may be zoned. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, strong.
$\alpha = 1.744$–1.765 $\beta = 1.81$–1.832 $\gamma = 1.82$–1.848 2V(meas.) = 24°–33° 2V(calc.) = 23°45′

Cell Data: *Space Group: Pbca.* $a = 10.854(1)$ $b = 14.053(3)$ $c = 7.086(2)$ $Z = 8$

X-ray Powder Pattern: Bwana Mkubwa, Zambia.
3.04 (10), 4.29 (9), 3.17 (8), 3.68 (7), 2.06 (7), 5.07 (6), 5.48 (5)

Chemistry:

	(1)	(2)
P_2O_5	19.81	21.08
CuO	70.78	70.89
H_2O	9.41	8.03
Total	[100.00]	100.00

(1) Bwana Mkubwa, Zambia; recalculated after deduction of Fe_2O_3 0.53% and insoluble 4.03%.
(2) $Cu_3(PO_4)(OH)_3$.

Occurrence: A rare secondary mineral in the oxidized zone of some hydrothermal copper deposits.

Association: Copper, brochantite, pseudomalachite, libethenite, malachite, atacamite, chrysocolla, heterogenite.

Distribution: From the Star of the Congo mine, near Lubumbashi, and at the Kalabi and Lukini mines, Katanga Province, Congo (Shaba Province, Zaire). From the Bwana Mkubwa mine, Ndola, and Kansanshi, Zambia. At the Alaska, Mangula, and Molly mines, Lomagundi district, Zimbabwe. In the USA, in the Blue Jay and Empire-Nevada mines, Yerington district, Lyon Co., Nevada; at Tyrone, Santa Rita, Grant Co., New Mexico; on Saginaw Hill, Pima Co., Arizona. From Cerro Verde, Sonora, Mexico. In Chile, at Chuquicamata, Antofagasta; the Manto Ruso mine, about 85 km north of Copiapó, Atacama; and the Brillador mine, La Serena, near Coquimbo. From the Blockade mine, 60 km east of Mount Isa, and at Ravenswood, Queensland, Australia.

Name: To honor Jules Cornet (1865–1929), Belgian geologist.

Type Material: University of Liège, Liège, Belgium, 9.130 and 9.133.

(1) Wheal Carpenter, Cornwall, England; by microchemical methods, H_2O by difference; corresponds to $Cu_{4.8}(AsO_4)_{1.95}(OH)_{3.6}$. (2) Reichenbach, Germany; by electron microprobe, total Fe as Fe_2O_3, H_2O calculated from charge balance, original total given as 96.64%; corresponds to $Cu_{5.03}[(As_{0.95}Si_{0.02}P_{0.01}Fe^{3+}_{0.01}Al_{0.01})_{\Sigma=1.00}O_4]_2(OH)_4$. (3) $Cu_5(AsO_4)_2(OH)_4$.

Polymorphism & Series: Dimorphous with cornwallite.

Occurrence: A rare secondary mineral in oxidized copper deposits.

Association: Cornwallite, chalcophyllite, olivenite, liroconite, chenevixite, clinoclase, pseudomalachite, bayldonite, parnauite, tyrolite, azurite, malachite, cuprite, chrysocolla, quartz.

Distribution: In England, from Cornwall, at Wheal Carpenter, Gwinear; Wheals Gorland, Unity, and Muttrell, Gwennap; Wheal Phoenix, Linkinhorne; and a number of other mines; in the Bedford United mines, Tavistock, Devon; from the Potts Gill mine, Caldbeck Fells, Cumbria. At Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. In Germany, at Neubulach and the Clara mine, near Oberwolfach, Black Forest; and from Reichenbach, near Bensheim, Hesse. From the Cap Garonne mine, near le Pradet, Var, and the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. At L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. In the USA, in the Centennial Eureka mine, Tintic district, Juab Co., and Gold Hill, Tooele Co., Utah; at the Majuba Hill mine, Antelope district, Pershing Co., Nevada; from near the Humboldt and Marshall mines, Santa Cruz Co., Arizona; at Sylvanite, Hidalgo Co., and in the Buckhorn mine, Red Cloud district, Lincoln Co., New Mexico. From Mindigi, Katanga Province, Congo (Shaba Province, Zaire).

Name: From *Cornubia*, the Latin name for Cornwall, source of the first specimens.

Type Material: The Natural History Museum, London, England, 1964R,8650.

Coronadite $Pb(Mn^{4+},Mn^{2+})_8O_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As fibrous botryoidal aggregates, banded with other manganese oxides; as microscopic curved lamellae; laminated, granular, massive.

Physical Properties: Hardness = 4.5–5 D(meas.) = 5.246–5.505 D(calc.) = [5.45]

Optical Properties: Opaque. *Color:* Dark gray to black; white in reflected light.
Streak: Brownish black. *Luster:* Dull to submetallic.
Optical Class: Biaxial. *Pleochroism:* Strong; dark brown to gray. *Anisotropism:* Strong.

Cell Data: *Space Group:* $I2/m$. $a = 9.938(1)$ $b = 2.8678(5)$ $c = 9.834(2)$ $\beta = 90.39(2)^\circ$
$Z = 1$

X-ray Powder Pattern: Coronado vein, Arizona, USA; easily mistaken for hollandite.
3.104 (100), 3.466 (60), 1.542 (50), 2.400 (40), 2.205 (40), 2.155 (20), 1.836 (20)

Chemistry:

	(1)	(2)		(1)	(2)

			Total	[100.00]	98.46

(1) Coronado vein, Arizona, USA; recalculated to 100% after removal of insolubles and alkalies 7.67%. (2) Bou Tazalt, Morocco. (3) Do.; by electron microprobe, analysis not given, but stated to correspond to $Pb_{1.06}Ba_{0.10}Mn_{7.7}V_{0.20}Al_{0.08}O_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: A primary mineral in hydrothermal veins or from hot springs; of secondary origin in oxidized zones above manganese-bearing rocks; also in bedded sedimentary deposits.

Association: Hollandite, pyrolusite, other manganese oxides.

Distribution: Widespread; a few localities for pure or well-characterized material include: in the USA, in Arizona, from the Coronado vein, Clifton-Morenci district, Greenlee Co.; the Magma mine, Superior, Pinal Co.; from the Artillery Mountains, Mohave Co., and elsewhere. In New Mexico, from the Luis Lopez district, Socorro Co. From the Philipsburg district, Granite Co., Montana. In Mexico, from the Talamantes district, Chihuahua, and in the Ojuela mine, Mapimí, Durango. At many places in the Ouarzazate and Oujda districts, and elsewhere in Morocco. From the Almalyskoye Pb–Zn deposit, Kurgashikan, Uzbekistan. In the Dry Gill mine, Caldbeck Fells, Cumbria, England. In France, from the Richesse mine, near Bourgeten-Huile, Savoy. At Dongari Buzurg, Bhandara, Madhya Pradesh, and Kodur, Andhra Pradesh, India. From Broken Hill, New South Wales, and in the Puttapa zinc mine, near Beltana, South Australia. At Tsumeb, Namibia.

Name: Honors the first Spanish explorer of the American southwest, Francisco Vasquez de Coronado (ca. 1500–1554).

Type Material: National Museum of Natural History, Washington, D.C., USA, R2012, 86040.

			Total	99.7	[100.]

(1) Sparta, Tennessee, USA; total Fe as Fe_2O_3, traces of Zr, V, and Cu determined spectrographically. (2) Do.; recalculated to 100% after removal of impurities.

Polymorphism & Series: A 1:1 mixed-layer interstratification of trioctahedral chlorite with either a trioctahedral vermiculite or a trioctahedral smectite.

Occurrence: From diverse sedimentary environments, which produced clastic, carbonate, volcanoclastic, or evaporite rocks. Also a hydrothermal alteration product, may be formed under retrograde diagenetic conditions; in soils.

Association: Illite, chlorite, laumontite, gypsum, anhydrite, quartz, dolomite.

Distribution: Probably fairly widely distributed; a few localities with material known to meet the definition are: from Zaiserweiher, three km from Maulbronn, Baden-Württemberg, and at the Hünstollen, near Holserode, Lower Saxony, Germany. At Wilkesley, near Audlem, Cheshire, and elsewhere in England. From Hillhouse quarry, Ayrshire, Scotland. In the USA, from Juniper Canyon, Moffat Co., Colorado; in the Wellington Formation, in Lyon Co., Kansas; in the County rock quarry, Sparta, White Co., Tennessee; and from a number of localities in west-central Montana, as between Bowman's Corner and Wolf Creek, Lewis and Clark Co. From Packwood, Western Australia. From the Yamanaka area, Shimane Prefecture, and in the Yoshino mine, Yamagata Prefecture, Japan.

Name: For Professor Carl Wilhelm Correns (1893–1980), Director of the Sedimentary Petrography Institute, Göttingen University, Göttingen, Germany.

Type Material: National Museum of Natural History, Washington, D.C., USA, 107373, 162265.

Corundum Al_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. Crystals hexagonal, prismatic or steeply dipyramidal, tabular, rhombohedral, rarely acicular, typically rough, to 1 m; sectorially striated on {0001} ‖ {10$\overline{1}$1}. Also granular, massive. *Twinning:* Common lamellar ‖ {10$\overline{1}$1}, may be an exsolution phenomenon. Contact or penetration twins on {0001} or {10$\overline{1}$1}, rare.

Physical Properties: *Cleavage:* Partings on {0001} and {10$\overline{1}$1}, from exsolved böhmite. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle, tough when compact. Hardness = 9 D(meas.) = 3.98–4.10 D(calc.) = 3.997 May fluoresce or phosphoresce under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, gray, brown; pink to pigeon-blood-red, orange, yellow, green, blue to cornflower blue, violet; may be color zoned, asteriated; colorless, pale bluish or reddish in transmitted light. *Streak:* White. *Luster:* Adamantine to vitreous; pearly on partings.
Optical Class: Uniaxial (–); commonly anomalously biaxial. *Pleochroism:* Weak; stronger when colored, O = pale to deep blue, E = blue-green to yellow-green, or O = deep purple, E = pale yellow. *Absorption:* $O > E$. $\omega = 1.767–1.772$ $\epsilon = 1.759–1.763$ 2V(meas.) = $\leq 58°$

Cell Data: *Space Group:* $R\overline{3}c$ (synthetic). $a = 4.7540(5)$ $c = 12.9820(6)$ Z = 6

X-ray Powder Pattern: Synthetic. (ICDD 42-1468).
2.085 (100), 2.551 (97), 1.6014 (82), 3.48 (70), 1.3738 (45), 2.379 (42), 1.7398 (42)

Chemistry: Nearly pure Al_2O_3, with traces of Fe, Ti, and Cr.

Mineral Group: Hematite group.

Occurrence: Characteristic of Al-rich, Si-poor geological environments; in syenite and monzonite, and some quartz-free pegmatites; primary or a reaction product in eclogitic xenoliths in kimberlites. In regional or contact, high-grade metamorphic aluminous rocks, and some advanced argillic and potassic hydrothermal alteration assemblages; detrital in placers.

Association: Andesine, oligoclase, nepheline, scapolite (syenites); spinel, rutile, chondrodite, "hornblende", phlogopite, calcite (metamorphosed limestones); kyanite, sillimanite, dumortierite, chlorite (schists); pyrope-rich garnet, spinel, phlogopite, omphacitic clinopyroxene, kyanite, rutile, graphite, diamond (eclogitic xenoliths).

Distribution: Numerous localities. In the USA, from Chester, Hampden Co., Massachusetts; the Cortland district, Westchester Co., New York; at Franklin, Sussex Co., New Jersey; large crystals from Hogback Mountain, Jackson Co., and Buck Creek, Clay Co., North Carolina; and from the Laurel Creek mine, Rabun Co., Georgia. At Bancroft and Haliburton, Ontario, Canada. On Naxos and Samos Islands, Greece. Large crystals from around the Soutpansberg, Transvaal, South Africa. Red gems from: the Mogok district, Myanmar (Burma). In the Ratnapura district, Sri Lanka. Around Mysore, India. In the Jegdalek marble, near Sorobi, Laghman Province, Afghanistan. At Merkestein, near Longido, and the Morogoro district, Tanzania. From Ampanihy, Madagascar. Blue, green, and yellow gems from: Chanthaburi and Trat, Thailand. Around Bottambang and Pailin, Cambodia. From the Zanskar district, Kashmir, India. In the Umba Valley, Tanzania. From around Andranondambo and Antsiermene, Madagascar. At Anakie, Queensland, Australia. From Yogo Gulch, 25 km southwest of Utica, Fergus Co., Montana, USA.

Name: Probably from the Sanskrit *kurivinda*, for *ruby*, through the Tamil *kurundam*.

Corvusite $(Na, Ca, K)_x(V^{5+}, V^{4+}, Fe^{2+})_8O_{20}\cdot 4H_2O$ (x = 0.8 to 1.2)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals are lathlike, elongated ‖ [010] and flattened on {100}, to 0.2 μm; commonly massive, may display shrinkage cracks from loss of H_2O.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3
D(meas.) = 2.82 D(calc.) = 3.02

Optical Properties: Opaque, transparent in very thin lamellae. *Color:* Purplish blue-black to greenish black; olive-green to greenish yellow in thin fragments. *Streak:* Purplish blue-black. *Luster:* "Lusterous". n = [2.05] (rule of Gladstone and Dale).
Optical Class: Biaxial.
R_1–R_2: (400) 10.3–20.7, (420) 9.8–19.8, (440) 9.3–18.9, (460) 9.0–18.0, (480) 8.7–17.3, (500) 8.5–16.6, (520) 8.4–16.0, (540) 8.2–15.6, (560) 8.2–15.1, (580) 8.1–14.7, (600) 8.0–14.3, (620) 8.0–14.0, (640) 8.0–13.7, (660) 8.0–13.5, (680) 8.0–13.4, (700) 8.0–13.3

Cell Data: *Space Group:* $C2/m$. a = 11.706(4) b = 3.644(1) c = 11.11(1) β = 103.46(7)° Z = [1]

X-ray Powder Pattern: Jack claim, Utah, USA; very close to fernandinite.
10.82 (100), 3.464 (18), 3.590 (6), 1.819 (6), 1.934 (4), 2.595 (3), 3.255 (2)

Chemistry:

	(1)	(2)		(1)	(2)

(1) Jack claim, Utah, USA; corresponds to $(Na_{0.40}Ca_{0.32}K_{0.20}Fe_{0.20}Mg_{0.06})_{\Sigma=1.18}(V_{7.56}Fe_{0.44})_{\Sigma=8.00}O_{20}\cdot 5.96H_2O$ (2) Do.; by electron microprobe, average of two analyses, all V as V_2O_5, H_2O by difference; assuming Al as an impurity, V^{5+}:V^{4+} from crystal-structure analysis, corresponds to $(Na_{0.73}Ca_{0.26}K_{0.08})_{\Sigma=1.07}(V^{5+}_{7.47}Fe^{2+}_{0.40}V^{4+}_{0.14})_{\Sigma=8.01}O_{20}\cdot 5.85H_2O$.

Occurrence: In roll-front uranium deposits in sandstone.

Association: Carnotite, fervanite, roscoelite, gypsum.

Distribution: In the USA, in Utah, from the Jack claim, La Sal Mountains, Grand Co., 16 km west of Gateway, Colorado, and in the Flat Top mine, Emery Co.; at the Ponto No. 3 claim, Gypsum Valley, San Miguel Co., and the Hummer mine, Paradox Valley, Montrose Co., Colorado. In Arizona, from the Monument No. 2 mine, Monument Valley, and in the Lukachukai Mountains, Apache Co., and in the Monument No. 1 and Mitten No. 2 mines, Monument Valley, Navajo Co.; probably widespread in carnotite deposits of the Colorado Plateau. In the Mounana uranium mine, Franceville, Gabon. From Balasauskandyk, northwestern Kara-Tau Mountains, Kazakhstan.

Name: From the Latin word for *raven*, in allusion to the similarity of the mineral's color to that of a raven.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 96806.

Cosalite $Pb_2Bi_2S_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Prismatic crystals elongated ‖ [001], to 8 cm; flexible capillary fibers; commonly massive in aggregates of radiating prismatic, fibrous, or feathery forms.

Physical Properties: *Cleavage:* Very rare. *Fracture:* Uneven. *Tenacity:* Fibers are flexible. Hardness = 2.5–3 VHN = n.d. D(meas.) = 6.86–6.99 D(calc.) = 7.12

Optical Properties: Opaque. *Color:* Lead-gray to steel-gray to silver-white; in polished section, white, with only a trace of cream. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Weak, but distinct in oil.
R_1–R_2: (400) 48.2–51.4, (420) 47.0–50.3, (440) 45.9–49.5, (460) 44.9–48.7, (480) 43.9–47.9, (500) 43.0–47.1, (520) 42.2–46.4, (540) 41.6–45.9, (560) 41.1–45.5, (580) 40.8–45.3, (600) 40.5–45.2, (620) 40.4–45.2, (640) 40.2–45.2, (660) 40.1–45.2, (680) 40.1–45.2, (700) 40.0–45.1

Cell Data: *Space Group: Pbnm.* $a = 19.09$ $b = 23.87$ $c = 4.055$ $Z = 8$

X-ray Powder Pattern: Hagidaira mine, Gumma Prefecture, Japan.
3.44 (100), 2.81 (30), 3.37 (23), 2.96 (22), 1.911 (17), 2.13 (15), 3.72 (14)

(1) McElroy Township, Canada; corresponds to $Pb_{1.80}Cu_{0.31}Bi_{1.96}S_{5.00}$. (2) Ocna de Fier, Romania; corresponds to $Pb_{1.78}Cu_{0.40}Fe_{0.04}Bi_{1.79}S_{5.00}$. (3) $Pb_2Bi_2S_5$.

Occurrence: In hydrothermal deposits formed at medium temperatures but also found in contact metasomatic replacements, and epithermal replacements, as well as in pegmatites.

Association: Sphalerite, chalcopyrite, pyrite, skutterudite, cobaltite, bornite, enargite, stromeyerite, bismuth, bismuthinite, calcite, tremolite, diopside, epidote, quartz.

Distribution: From numerous localities world-wide. From the Nuestra Señora mine, Cosalá, Sinaloa, Mexico [TL]. In the USA, at Deer Park, Stevens Co., Washington; in Colorado, in the Red Mountain district, San Juan Co.; in Arizona, at the Magma mine, Superior, Pinal Co., and from Landsman Camp, Gila Co.; at Darwin, Inyo Co., California. In Canada, in Ontario, at Boston Creek, McElroy Township, and at Cobalt; long crystals in the Caribou mine, Wells, British Columbia. From Hůrky, Czech Republic. In Sweden, at the Bjelkes mine, Nordmark, and Boliden, Västerbotten. Large crystals from Kara Oba, Kazakhstan. At the Carrock Fell mine, Caldbeck Fells, Cumbria, England. From Băiţa (Rézbánya) and Ocna de Fier (Morávicza; Vaskő), Romania. In the New England Range, New South Wales, Australia. From Amparindravato, Madagascar.

Name: For the locality at Cosalá, Mexico.

Type Material: n.d.

Nd_2O_3	13.3	Total	[101.5]

(1) Alum Cave Bluff, Tennessee, USA; by electron microprobe, C_2O_3 and H_2O calculated from stoichiometry, original total given as 100.0%; corresponding to $(Ce_{1.06}Nd_{0.56}La_{0.20}Pr_{0.09}Sm_{0.04}Eu_{0.03}Gd_{0.01}Y_{0.01})_{\Sigma=2.00}(SO_4)_2(C_2O_4)\cdot 8H_2O$.

Occurrence: Formed by weathering of pyritiferous phyllite with evaporation of the resulting sulfate-rich solutions in soil, the rare earths probably derived from monazite and xenotime.

Association: Epsomite, apjohnite.

Distribution: From Alum Cave Bluff, Great Smoky Mountains National Park, Tennessee, USA.

Name: Honors Dr. T. Dennis Coskren (1942–), geologist and geochemist, Columbia, Maryland, USA, who studied the minerals of Alum Cave Bluff, Tennessee, USA.

Type Material: University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA.

(1) Consols mine, Australia; by electron microprobe, average of three grains, corresponding to $(Co_{0.96}Fe_{0.02}Ni_{0.01})_{\Sigma=0.99}(Sb_{0.99}As_{0.01})_{\Sigma=1.00}S_{1.00}$. (2) Getön deposit, Sweden; by electron microprobe; corresponding to $(Co_{0.95}Ni_{0.09}Fe_{0.03})_{\Sigma=1.07}(Sb_{1.02}As_{0.01})_{\Sigma=1.03}S_{1.00}$. (3) CoSbS.

Polymorphism & Series: Dimorphous with paracostibite.

Mineral Group: Löllingite group.

Occurrence: Intimately intergrown with other hydrothermal sulfides (Broken Hill, Australia); in Pb–Zn–Cu–Ag ore deposits remobilized by hydrothermal solutions from later granite emplacement (Bergslagen, Sweden).

Association: Löllingite, willyamite, dyscrasite, ullmannite, pyrargyrite (Broken Hill, Australia); nisbite, paracostibite, chalcopyrite, bismuth, pyrrhotite, galena, sphalerite, gersdorffite, ullmannite (Bergslagen, Sweden).

Distribution: In Australia, at the Consols mine, Broken Hill, New South Wales [TL]. From the Gruvåsen and Getön deposits, Bergslagen metallic province, Sweden. At Sulitjelma, northern Norway.

Name: For CObalt and *antimony*, STIBium, in its composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, R849A.

Cotunnite $PbCl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As prismatic crystals, elongated along [001] and flattened on {010}, to about 2 mm; as scepter-shaped or skeletal crystals; doubly-terminated crystals may exhibit unequally developed equivalent faces; in aggregates of radiating sprays. Also granular, as crusts or pseudomorphs, and massive.

Physical Properties: *Cleavage:* Perfect on {010}. *Fracture:* Subconchoidal. *Tenacity:* Slightly sectile. Hardness = 2.5 D(meas.) = 5.80 (synthetic). D(calc.) = [5.91] Somewhat soluble in H_2O.

Optical Properties: Transparent to opaque. *Color:* Colorless to white, pale green, pale yellow; colorless in thin section. *Luster:* Adamantine, silky to pearly. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 2.199$ $\beta = 2.217$ $\gamma = 2.260$ 2V(meas.) = n.d. 2V(calc.) = $67°12'$

Cell Data: *Space Group:* *Pnam* (synthetic). $a = 7.6222(5)$ $b = 9.0448(7)$ $c = 4.5348(4)$ Z = 4

X-ray Powder Pattern: Synthetic.

(1) Tolbachik volcano, Russia. (2) Kolar Gold Fields, India; by electron microprobe. (3) $PbCl_2$.

Occurrence: A volcanic sublimate or as an alteration of galena in saline environments. Also as an alteration product on leaden archeological objects or slag immersed in seawater.

Association: Galena, cerussite, anglesite, matlockite (Caracoles, Chile); tenorite, ponomarevite, sofiite, burnsite, ilinskite, georgbokite, chloromenite, halite, sylvite, gold (Tolbachik volcano, Russia).

Distribution: In Italy, on Vesuvius, Campania; in the Niccioleta mine, 40 km southwest of Siena, and along Baratti Beach, Tuscany, in slag. In Germany, from the Christian-Levin mine, near Essen, North Rhine-Westphalia, and at Richelsdorf, Hesse, in slag. At Laurium, Greece, in slag. From Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire, Scotland. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. From the Kolar Gold Fields, Karnataka, India. In Chile, from near Caracoles, Sierra Gorda district, Antofagasta, and at Challacollo, Tarapacá. From the La Pamapa district, Pallasca Province, Peru. In the USA, from the Grand Gulch mine, Grand Wash Cliffs, Bentley district, Mohave Co., Arizona; at Bonanza, Saguache Co., Colorado; from Tintic, Juab Co., Utah; in the Loudville mine, Southampton, Hampshire Co., Massachusetts; at the Minnamax Cu–Ni sulfide deposit, Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota.

Name: Honors Domenico Cotugno (Cotunnius) (1736–1822), Italian physician and Professor of Anatomy, University of Naples, Naples, Italy.

Coulsonite $Fe^{2+}V_2^{3+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As subhedral crystals, less than 1 mm; and as exsolution lamellae along {111} in magnetite.

Physical Properties: *Tenacity:* Brittle. Hardness = 4.5–5 D(meas.) = 5.17–5.20 D(calc.) = 5.15

Optical Properties: Opaque. *Color:* Bluish gray; light gray in reflected light. *Streak:* Dark brown to black. *Luster:* Metallic.
Optical Class: Isotropic; locally slightly anisotropic.
R: 23.5

Cell Data: *Space Group: Fd3m.* a = 8.297(2) Z = 8

X-ray Powder Pattern: Buena Vista Hills, Nevada, USA.
2.50 (100), 1.466 (95), 1.597 (91), 2.07 (78), 2.93 (58), 4.79 (35), 1.693 (28)

Total	99.68	98.1	100.00

(1) Buena Vista Hills, Nevada, USA; corresponds to $Fe^{2+}_{1.00}(V^{3+}_{1.07}Fe^{3+}_{0.01})_{\Sigma=1.08}O_{4.24}$.
(2) Kalgoorlie, Australia; by electron microprobe, average of three analyses; original analysis Fe 25.7%, Ti 3.17%, Cr 0.08%, V 40.5%, here converted to oxides; corresponding to $Fe^{2+}_{1.03}(V^{3+}_{1.84}Ti_{0.13})_{\Sigma=1.97}O_{4.02}$. (3) $Fe^{2+}V^{3+}_2O_4$.

Mineral Group: Spinel group.

Occurrence: In veinlets of magnetite, with silicate minerals, cutting metamorphosed andesite (Buena Vista Hills, Nevada, USA); exsolved from magnetite in a mantle xenolith in basalt (Panzhihua, China).

Association: Magnetite, scapolite, apatite, titanite, chlorite, "hornblende", muscovite (Buena Vista Hills, Nevada, USA).

Distribution: From the Buena Vista Hills, 32 km southeast of Lovelock, Mineral Basin district, Pershing Co., Nevada, USA. At Kalgoorlie, Western Australia. In India, at Dublahera, Singhbum, Bihar. Found at Panzhihua, Sichuan Province, China.

Name: For Dr. Arthur Lennox Coulson (1898–?), geologist of the Indian Geological Survey.

Type Material: n.d.

References: (1) Radtke, A.S. (1962) Coulsonite, FeV_2O_4, a spinel-type mineral from Lovelock, Nevada. Amer. Mineral., 47, 1284–1291. (2) Palache, C., H. Berman, and C. Covellite CuS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Forms hexagonal plates as large as 10 cm, flattened on {0001}, which may exhibit hexagonal striae; as rosettes of nearly parallel plates; commonly massive and foliated.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Flexible in thin leaves. Hardness = 1.5–2 VHN = 128–138 (100 g load). D(meas.) = 4.6–4.76 D(calc.) = 4.602

Optical Properties: Opaque. *Color:* Indigo-blue or darker, commonly highly iridescent, brass-yellow to deep red. *Streak:* Lead-gray, shining. *Luster:* Submetallic, inclining to resinous, somewhat pearly on cleavage; subresinous to dull when massive.
Optical Class: Uniaxial (+). *Pleochroism:* Marked, deep blue to pale blue. *Dispersion:* Strong.
$\omega = 1.45$ (589). $\epsilon = 2.62$ (589). *Anisotropism:* Strong.
R_1–R_2: (400) 14.5–32.0, (420) 14.7–31.5, (440) 14.3–30.3, (460) 13.3–29.0, (480) 11.7–27.6, (500) 10.1–26.2, (520) 8.5–24.7, (540) 6.9–23.4, (560) 5.5–22.1, (580) 4.2–21.1, (600) 3.3–21.1, (620) 3.3–21.6, (640) 4.9–22.3, (660) 9.8–22.7, (680) 16.4–22.6, (700) 24.9–22.4

insol.	0.11		
Total	100.18	99.19	100.00

(1) Butte, Montana, USA. (2) Bor, Serbia. (3) CuS.

Occurrence: Most commonly of secondary origin in the zone of oxidation in sulfide copper deposits. Rarely of primary hydrothermal origin. Widespread in most copper deposits; common as an iridescent tarnish on other sulfides.

Association: Chalcopyrite, chalcocite, djurleite, bornite, enargite, pyrite, other sulfides.

Distribution: Numerous localities, but with only a few producing rich material. In Italy, from Vesuvius, Campania [TL] and as large crystals from the Calabona mine, Alghero, Sardinia. At Bor, Serbia. From Leogang, Salzburg, Austria. At Dillenburg, Hesse, and Sangerhausen, Saxony, Germany. From Kedabek, Caucasus Mountains, Russia. In the Bou-Skour mine, Bou Azzer district, Morocco. In the USA, from Butte, Silver Bow Co., Montana, as fine crystals in the primary ore; at Kennicott, Alaska; from Summitville, Rio Grande Co., Colorado; in the La Sal district, San Juan Co., Utah; a widespread but minor constituent of the ores in most porphyry copper mines in Arizona. In the Sierra de Famatina, La Rioja Province, Argentina.

Name: To honor Niccolò Covelli (1790–1829), discoverer of Vesuvian covellite.

Type Material: Mineral Museum, University of Naples, Naples, Italy, 12338.

H_2O	22.8	21.0
Total	103.41	109.34

(1) Goble, Oregon, USA; by electron microprobe, H_2O by weight loss to 600 °C; corresponds to $(Ca_{0.96}Na_{0.10})_{\Sigma=1.06}Al_{2.00}Si_{2.99}O_{10}\cdot 5.6H_2O$. (2) Superior, Arizona, USA; by electron microprobe; H_2O by weight loss to 600 °C; corresponds to $(Ca_{1.04}Na_{0.10}K_{0.01})_{\Sigma=1.15}Al_{1.96}Si_{2.98}O_{10}\cdot 5.0H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in basalts and scoria, typically the only zeolite within a single vesicle.

Association: Zeolites, apophyllite.

Distribution: In the USA, at Goble, Columbia Co., at Beech Creek, Grant Co., and at Spray, Wheeler Co., Oregon; on Capitol Peak, Thurston Co., Washington; from eight km south of Superior, Pinal Co., Arizona; and at Table Mountain, Jefferson Co., Colorado. In Canada, at Monte Lake, British Columbia. From Dunseverick, Ballyclare, and elsewhere in Co. Antrim, Ireland. At Kingsburgh, Isle of Skye, Scotland. In Mjoädalsá Canyon, near Hvammur, Iceland. From Dalsnipa, on Sandoy and Satan, on Streymoy, Faeroe Islands. At Kuniga, Oki Islands, Japan. From Flinders and Jindivick, Victoria, Australia. A number of other localities are known.

Name: To honor John Cowles (1907–1985), amateur mineralogist of Rainier, Oregon, USA.

Na	5.99	5.94
Fe	44.0	43.31
S	41.3	41.44
H_2O	[8.71]	9.31
Total	[100.00]	100.00

(1) Coyote Peak, California, USA; by electron microprobe, average of five grains, H_2O by difference, on independent proof of the presence of oxygen; corresponds to $Na_{1.01}Fe_{3.06}S_{5.00} \cdot 1.88H_2O$. (2) $NaFe_3S_5 \cdot 2H_2O$.

Occurrence: With rare iron sulfides in small pegmatitic clots thought to have crystallized late in the consolidation of the Coyote Peak intrusive, an alkalic mafic diatreme.

Association: Pyrrhotite, djerfisherite, rasvumite, bartonite, erdite, phlogopite, schorlomite, acmite, sodalite, cancrinite, pectolite, natrolite, magnetite, calcite.

Distribution: From Coyote Peak, near Orick, Humboldt Co., California, USA [TL].

Name: For Coyote Peak, California, a local prominence on which the mineral was found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150335.

References: (1) Erd, R.C. and G.K. Czamanske (1983) Orickite and coyoteite, two new sulfides from Coyote Peak, Humboldt Co., California. Amer. Mineral., 68, 245–254.

(1) Brooklyn mine, Utah, USA; after deduction of insolubles 35.13% as quartz, barite and sulfides. (2) Alto Benedito pegmatite, Brazil; Ca:Sr = 0.56:0.44. (3) $CaAl_3(PO_4)(PO_3OH)(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: In weathered phosphatic aluminous sedimentary rocks and carbonatites. In phosphate-rich nodules; from complex granite pegmatites; in amphibolite-grade metaquartzites. An authigenic mineral in anoxic marine sediments or in clay-rich sediment beneath a tropical swamp.

Association: Fluorapatite, hydroxylherderite, quartz.

Distribution: In the USA, in Utah, from the Brooklyn mine, near Silver City, Tintic district, Juab Co., at the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, and from Amatrice Hill, about 40 km northwest of Fairfield, Utah Co.; in the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; from near Gore, Frederick Co., Virginia; on Dug Hill, near Avant, Garland Co., Arkansas; in several rock formations in central and northern Florida; from the Everly and Hugo mines, Pennington Co., and in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. In the Alto Benedito pegmatite, 15 km west of Picuí, Paraíba, Brazil. At Blaton, Belgium. From Ronneburg, Thuringia, Germany. In Wheal Jane, Kea, Cornwall, England. At Fort Lismeenagh, Shenagolden, Co. Limerick, Ireland. From the Kovdor massif, Kola Peninsula, Russia. In Australia, in the Iron Monarch quarry, Iron Knob; the Moculta phosphate quarry, northeast of Angaston; and at the Mt. Weld carbonatite, 35 km south of Laverton, South Australia. In the Buranga pegmatite, near Gatumba, Rwanda.

Name: Honors Milan L. Crandall, Jr., mining engineer, of Provo, Utah, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R5641.

Crystal Data: Monoclinic. *Point Group:* 2. Irregular anhedral grains, to 1 mm.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3 D(meas.) = 3.05 D(calc.) = 3.08 Bright greenish yellow fluorescence under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X \simeq c$; $Y \simeq a$; $Z \simeq b$. $\alpha = 1.520(2)$ $\beta = 1.564(2)$ $\gamma = 1.565(2)$ 2V(meas.) = 20(1)° 2V(calc.) = 17°

Cell Data: *Space Group:* $P2_1$. $a = 9.187(3)$ $b = 6.707(2)$ $c = 5.279(1)$ $\beta = 89.98(3)°$ Z = 2

X-ray Powder Pattern: Khibiny massif, Russia.
2.708 (100), 2.172 (100), 2.648 (90), 1.891 (80), 1.415 (70), 1.129 (60), 1.106 (60)

Chemistry:

	(1)	(2)
P_2O_5	23.64	22.78
CO_2	[14.47]	14.12
CaO	1.45	
SrO	27.42	33.26
Na_2O	31.83	29.84
K_2O	0.22	
Total	[99.03]	100.00

(1) Khibiny massif, Russia; by electron microprobe, average of two analyses, CO_2 from X-ray structural data; corresponding to $Na_{3.03}(Sr_{0.81}Na_{0.10}Ca_{0.08}K_{0.01})_{\Sigma=1.00}(P_{1.01}O_4)(C_{1.00}O_3)$.
(2) $Na_3Sr(PO_4)(CO_3)$.

Occurrence: A hydrothermal mineral in ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Pectolite, astrophyllite, barytolamprophyllite, shcherbakovite, vuonnemite, kazakovite, ershovite, chkalovite, natrite, villiaumite, rasvumite, potassian feldspar, nepheline, sodalite, aegirine.

Distribution: From Mt. Koashva, Khibiny massif, Kola Peninsula, Russia.

Name: To honor Adair Crawford (1748–1795), Scottish physician and Professor of Chemistry, discoverer of strontium salts.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p1346/1.

References: (1) Khomyakov, A.P., L.I. Polezhaeva, and E.V. Sokolova (1994) Crawfordite $Na_3Sr(PO_4)(CO_3)$: a new mineral from the bradleyite group. Zap. Vses. Mineral. Obshch., 123(3), 41–49 (in Russian with English abs.). (2) (1995) Amer. Mineral., 80, 1328 (abs. ref. 1).

Creaseyite $Pb_2Cu_2Fe_2^{3+}Si_5O_{17}\cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* [$2/m$ $2/m$ $2/m$ or $mm2$.] Fibrous crystals, elongated along [001] and flattened on {010}, to 0.5 mm. As densely packed spherules of crystals; in masses of matted and tangled fibers.

Physical Properties: *Cleavage:* Poor on {010}. Hardness = 2.5 for spherules, greater for crystals. D(meas.) = 4.1(1) D(calc.) = 4.01

Optical Properties: Transparent to translucent. *Color:* Pale green to yellow-green; yellow in thin section. *Streak:* Light green.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow-green; Y = green; Z = yellow-green. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Absorption:* $Z = X > Y$. $\alpha = 1.737(2)$ $\beta = 1.747(2)$ $\gamma = 1.768(2)$ 2V(meas.) = 69° 2V(calc.) = 70°

Cell Data: *Space Group:* *mmmCb* [diffraction symbol]. a = 12.483–12.497 b = 21.375–21.395 c = 7.283 Z = 4

X-ray Powder Pattern: Tiger, Arizona, USA.
10.726 (100), 6.024 (50), 4.067 (50), 3.555 (50b), 3.013 (50), 2.982 (50), 2.696 (50)

Chemistry:

	(1)	(2)
SiO_2	25.5	25.59
Fe_2O_3	12.3	13.61
Al_2O_3	2.1	
CuO	13.5	13.56

Total	100.4	100.00

(1) Tiger, Arizona, USA; average of several microchemical analyses, corresponding to $Pb_{1.98}(Cu_{2.02}Zn_{0.18})_{\Sigma=2.20}(Fe^{3+}_{1.85}Al_{0.05})_{\Sigma=1.90}Si_{5.08}O_{17.18}\cdot 5.85H_2O$. (2) $Pb_2Cu_2Fe_2Si_5O_{17}\cdot 6H_2O$.

Occurrence: In the oxidized zone of a base-metal deposit, in andesite breccia loosely cemented with iron oxides and wulfenite (Tiger, Arizona, USA).

Association: Mimetite, dioptase, fluorite, willemite, wulfenite, descloizite, murdochite (Tiger, Arizona, USA); ajoite, fluorite (Potter-Cramer property, Arizona, USA).

Distribution: In the USA, in Arizona, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., at the Potter-Cramer property and Tonopah-Belmont mine, near Wickenburg, Maricopa Co., from near Artillery Peak, Mohave Co., and in the the Copper Point prospect, Amole district, Pima Co.; from near Gold Point, Esmeralda Co., Nevada. In Mexico, at Caborca and Munihuaza, near Alamos, Sonora. In the Cruz del Sur mine, Rio Negro Province, Argentina.

Name: To honor Dr. Saville Cyrus Creasey (1917–), economic geologist, U.S. Geological Survey, expert on Arizona mineral deposits.

Type Material: The Natural History Museum, London, England, 1976,412; University of Arizona, Tucson, Arizona; Harvard University, Cambridge, Massachusetts, 117000; National Museum of Natural History, Washington, D.C., USA, 147661.

Crednerite $CuMnO_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As striated single plates, to 6 cm, fanlike radiating aggregates, or hemispherical masses of plates; also as coatings, and massive. *Twinning:* Mosaic and polysynthetic intergrowths are probably caused by twinning, producing pseudohexagonal individuals by rotation $\perp$ $(41\overline{1})$.

Physical Properties: *Cleavage:* Perfect parallel to plate surfaces, {001}; also {100}, perfect, $\{\overline{1}11\}$, prominent, {111} and {212}, poor. *Tenacity:* Brittle. Hardness = 4 VHN = 231–297 (100 g load). D(meas.) = 4.98–5.34 D(calc.) = [5.46]

Optical Properties: Opaque. *Color:* Bright gray to iron-black; cream-white in reflected light. *Streak:* Soot-black, with a brownish tint. *Luster:* Metallic.
Optical Class: Biaxial. *Anisotropism:* Strong. *Bireflectance:* Strong; pale yellow to brownish gray.
R_1–R_2: (400) 28.3–28.6, (420) 27.4–30.1, (440) 26.5–31.6, (460) 25.8–32.9, (480) 25.1–33.7, (500) 24.5–34.0, (520) 24.1–34.3, (540) 23.8–34.2, (560) 23.5–34.1, (580) 23.3–33.7, (600) 23.1–33.1, (620) 22.9–32.6, (640) 22.7–32.0, (660) 22.5–31.2, (680) 22.4–30.5, (700) 22.2–29.9

Cell Data: *Space Group:* $C2/m$. $a = 5.58(1)$ $b = 2.877(5)$ $c = 5.875(1)$ $\beta = 104.0(1)^\circ$ $Z = 2$

X-ray Powder Pattern: Higher Pitts Farm, Somerset, England.
2.71 (10), 2.43 (10), 2.85 (6), 2.24 (5b), 1.613 (4), 1.560 (4), 1.764 (3)

Chemistry:

	(1)	(2)	(3)
MnO	48.0	48.2	47.14
CuO	52.2	52.5	52.86
Total	100.2	100.7	100.00

(1) Friedrichroda, Germany; by electron microprobe. (2) Idikel, Morocco; by electron microprobe. (3) $CuMnO_2$.

Occurrence: A low-temperature secondary mineral, perhaps indicating a reducing chemical environment.

Association: Psilomelane, hausmannite, malachite, volborthite, barite, calcite, "wad" (Friedrichroda, Germany); cerussite, hydrocerussite, malachite, mendipite, "wad" (Mendip Hills, England).

Distribution: From Friedrichroda, Thuringia, Germany. In England, from the Merehead quarry, near Shepton Mallet, and Higher Pitts Farm, near Priddy, Mendip Hills, Somerset. At Långban and Jakobsberg, Värmland, Sweden. From Idikel and Tachgagalt, 17 km south of Ouarzazate, Anti-Atlas Mountains, Morocco. At Tsumeb, and in the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. In the USA, from Bisbee, Cochise Co., Arizona; at Calistoga, Napa Co., California; and in the Crescent mine, Crescent Lake, Clallam Co., Washington. From 29 km north of Cleve, Eyre Peninsula, South Australia.

Name: Honors Karl F.H. Credner (1809–1876), German mining geologist and mineralogist.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 722–723. (2) McAndrew, J. (1956) Crystallography and composition of crednerite. Amer. Creedite $Ca_3Al_2(SO_4)(F,OH)_{10}\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are prismatic [001], bladelike to acicular, typically with {110}, {111}, {$\overline{1}$11}, {001}, several other minor forms noted, to 8 cm; radiating, drusy to granular aggregates.

Physical Properties: *Cleavage:* {100}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 2.713–2.730 D(calc.) = 2.739

Optical Properties: Transparent to translucent. *Color:* Colorless to white, purple; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 42.5°$. *Dispersion:* $r > v$, strong.
$\alpha = 1.461(1)$ $\beta = 1.478(1)$ $\gamma = 1.485(1)$ 2V(meas.) = 64°22′ 2V(calc.) = 65°

Cell Data: *Space Group:* $C2/c$. $a = 13.936(1)$ $b = 8.606(1)$ $c = 9.985(1)$ $\beta = 94.39(1)°$
Z = 4

X-ray Powder Pattern: Wagon Wheel Gap, Colorado, USA.
3.48 (10), 7.3 (9), 6.9 (9), 3.92 (9), 2.161 (9), 5.79 (8), 3.07 (8)

Chemistry:

	(1)
SO_4	19.10
Al_2O_3	21.42
CaO	35.18
F	30.30
H_2O	10.72
$-O = F_2$	17.28
Total	99.44

(1) Wagon Wheel Gap, Colorado, USA; H_2O by the Penfield method, corresponds to $Ca_{2.99}Al_{2.19}(SO_4)_{1.00}[F_{8.02}(OH)_{2.00}]_{\Sigma=10.02}\cdot 2.06H_2O$.

Occurrence: Uncommon in fluorite-rich hydrothermal mineral deposits.

Association: Fluorite, barite, kaolinite (Wagon Wheel Gap, Colorado, USA).

Distribution: In the USA, from Wagon Wheel Gap, near Creede, Mineral Co., Colorado; in the Liberty and Hall mines and at Granite, near Tonopah, Nye Co., Nevada; in Arizona, at the Grand Reef mine, Graham Co.; from the Thompson and Defiance mines, Darwin district, Inyo Co., California. In Mexico, large crystals from the Potosí and other mines, Santa Eulalia district, Chihuahua. Exceptional crystals from Colquiri, La Paz, Bolivia. In the Dzhaambai deposit, eastern Pamir Mountains, Tajikistan. Fine examples from Aktshatau, 40 km south of Dzhezkazgan, Kazakhstan. Several other minor localities are known.

Name: For the occurrence near Creede, Colorado, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 81273; National Museum of Natural History, Washington, D.C., USA, 93117, C1034.

Crerarite $(Pt,Pb)Bi_3(S,Se)_{4-x}$ (x ~0.7)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Anhedral grains, to 120 μm.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = ~3.5 (softer than chalcopyrite). D(meas.) = n.d. D(calc.) = 7.75

Optical Properties: Opaque. *Color:* Pale gray in reflected light, with a slight bluish tint in oil. *Luster:* Metallic.

R: (400) 53.7, (420) 53.8, (440) 53.1, (460) 52.4, (480) 51.6, (500) 50.8, (520) 50.5, (540) 49.9, (560) 49.7, (580) 49.4, (600) 49.4, (620) 49.1, (640) 48.9, (660) 48.7, (680) 48.5, (700) 48.5

Total	[101.09]

(1) Lac Sheen, Canada; by electron microprobe, average of analyses of three grains, original total given as 101.11%; corresponding to $Pt_{0.51}Pb_{0.65}Fe_{0.01}Cu_{0.01}Bi_{3.02}(S_{3.18}Se_{0.11})_{\Sigma=3.29}$.

Occurrence: In an amphibolite boulder, perhaps glacially transported, containing sulfides.

Association: Chalcopyrite, pentlandite, pyrrhotite, sphalerite, galena, michenerite, actinolite, chlorite, quartz.

Distribution: From an erratic boulder found on the north shore of Lac Sheen, near Belleterre, Quebec, Canada [TL].

Name: Honors Professor David Crerar (1945–1994), economic geologist, Princeton University, Princeton, New Jersey, USA.

Type Material: Mineralogical Museum, Bayerische Julius-Maximilians University, Würzburg, Germany, M2897 a/b; Royal Ontario Museum, Toronto, Canada, M46005–46007.

(1) "Dauphiné region", France; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from crystal-structure analysis; corresponds to $[Sr_{0.71}(RE, Pb)_{0.19}]_{\Sigma=0.90}[Ti_{13.43}Fe_{6.71}Mn_{0.69}(V, Cr)_{0.17}]_{\Sigma=21.00}O_{38}$. (2) Selva, Switzerland; by electron microprobe, remnant CoO, NiO, CuO, Fe^{2+}:Fe^{3+} determined separately; corresponding to $[Sr_{0.65}Ba_{0.15}(RE, Ca, U)_{0.15}Pb_{0.14}]_{\Sigma=1.09}[Ti_{14.06}Fe^{2+}_{3.13}Fe^{3+}_{2.56}(Y, Zn, Mn, Sc, V, Al, RE)_{1.30}]_{\Sigma=21.05}O_{38}$.

Mineral Group: Crichtonite group.

Occurrence: In alpine-type fissure veins.

Association: Quartz, chlorite.

Distribution: From St. Christophe, Bourg d'Oisans, Isère, France. At Selva, Tavetsch, Graubünden and Wannigletscher, Binntal, Valais, Switzerland. In Russia, from the Khibiny massif, Kola Peninsula. At Fazenda Guariba, 40 km south of Diamantina, Minas Gerais, Brazil.

Name: For Sir Alexander A. Crichton (1763–1856), Scottish physician and mineral collector, once physician to the Russian Czar Alexander I.

Type Material: The Natural History Museum, London, England, 1926,1191.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 534 [crichtonite = ilmenite, in error]. (2) Hey, M.H., P.G. Embrey, and E.E. (1) Hemlo deposit, Canada; by electron microprobe, average of analyses of five samples; corresponds to $Tl_{0.92}Ag_{1.99}Au_{2.93}Sb_{9.87}S_{10.29}$. (2) Viges deposit, France; by electron microprobe, average of twelve analyses; corresponds to $Tl_{0.61}Ag_{2.10}Au_{3.15}Sb_{10.18}S_{9.96}$. (3) $TlAg_2Au_3Sb_{10}S_{10}$.

Occurrence: A primary hydrothermal mineral in a complex gold deposits.

Association: Aurostibite, gold, antimony, chalcostibite, parapierrotite, stibnite, tetrahedrite, molybdenite, zinkenite, pyrite, quartz (Hemlo deposit, Canada); gold, aurostibite (Viges deposit, France).

Distribution: From the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. In the Viges Au–Sb deposit, Creuse, France.

Name: To honor Dr. Alan John Criddle (1944–2002), English mineralogist of the British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 1987,351 and E.1230; Canadian Geological Survey, Ottawa, 65186; Royal Ontario Museum, Toronto, Canada.

Cristobalite SiO_2

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal, pseudocubic. *Point Group:* 422. As pseudo-octahedral crystals, to 4 mm, with {110} and {331}, rarely pseudocubic. Commonly dendritic to skeletal; as spherulites to several cm; fibrous or microcrystalline ("opal"), massive. *Twinning:* On {111}, common, interpenetrant, polysynthetic, repeated.

Physical Properties: *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 2.32–2.36 D(calc.) = 2.33

Optical Properties: Transparent. *Color:* Colorless, white, milky white to yellowish; in transmitted light, colorless. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.487$ $\epsilon = 1.484$

Cell Data: *Space Group:* $P4_12_12$. $a = 4.9709(1)$ $c = 6.9278(2)$ $Z = 4$

X-ray Powder Pattern: Synthetic.
4.05 (100), 2.485 (20), 2.841 (13), 3.135 (11), 1.870 (7), 2.465 (5), 2.118 (5)

Chemistry:

	(1)
SiO_2	[99.13]
TiO_2	0.38
Al_2O_3	0.18
FeO	0.09
MnO	< 0.02
MgO	< 0.03
CaO	< 0.02
Na_2O	0.05
K_2O	0.17
P_2O_5	< 0.03
Total	[100.00]

(1) Mare Imbrium, Moon; by electron microprobe, SiO_2 by difference.

Polymorphism & Series: Quartz, tridymite, coesite, and stishovite are polymorphs; inverts from high- or β-cristobalite at 268 °C or below.

Occurrence: In vesicles and lithophysae; a late-crystallizing phase in basaltic to rhyolitic volcanic rocks; from acid-sulfate-type hydrothermal alteration of volcanic rocks; precipitated by hot springs. By contact metamorphism of sandstone; developed during diagenesis, recrystallized from siliceous sedimentary rocks.

Association: Tridymite, quartz, sanidine, anorthoclase, fayalite, magnetite, kaolinite, alunite, "opal."

Distribution: On Cerro San Cristóbal, near Pachuca, Hidalgo, and in the Santín mine, Santa Caterina, Guanajuato, Mexico. In the USA, at Glass Mountain, Little Lake, and Sugarloaf Mountain, near Coso Hot Springs, Inyo Co., California; near Crater Lake, Klamath Co., Oregon; widespread in the San Juan Mountains, San Juan Co., Colorado. At Mayen and Mendig, Eifel district, Germany. From Sárospatak, Hungary. In the Ellora Caves, Maharashtra, India. From the Tokatoka district, about 150 km north of Auckland, New Zealand. In Japan, at Goroyama, Nagano Prefecture; Futo, Shizuoka Prefecture; and many other places.

Name: For the first-noted occurrence at Cerro San Cristóbal, Mexico.

Crocoite $PbCrO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic to acicular crystals with nearly square outline, elongated and striated [001], to 15 cm.; short prismatic to pseudo-octahedral, may be highly modified, terminations are commonly hollow or incomplete. Typically in radial sprays to randomly intergrown aggregates.

Physical Properties: *Cleavage:* Distinct on {110}; indistinct on {001} and {100}. *Fracture:* Small conchoidal to uneven. *Tenacity:* Sectile. Hardness = 2.5–3 D(meas.) = 6.0–6.1 D(calc.) = [6.10]

Optical Properties: Transparent to translucent. *Color:* Hyacinth-red, red-orange, orange; red-orange in transmitted light. *Streak:* Yellow-orange. *Luster:* Adamantine. *Optical Class:* Biaxial (+). *Pleochroism:* Weak; $X = Y$ = red-orange; Z = blood-red. *Orientation:* $Y = b$; $Z \wedge c = 5.5°$. *Dispersion:* $r > v$, very strong, inclined. $\alpha = 2.29(2)$ $\beta = 2.36(2)$ $\gamma = 2.66(2)$ $2V(meas.) = 54°$

Cell Data: *Space Group:* $P2_1/n$. $a = 7.120$ $b = 7.421$ $c = 6.800$ $\beta = 102°20'$ $Z = 4$

X-ray Powder Pattern: Beresovsk, Russia.
3.277 (10), 3.475 (8), 3.030 (6), 4.374 (5), 2.254 (5), 4.950 (3), 1.846 (3)

Chemistry:

	(1)	(2)
CrO_3	30.35	30.94
SiO_2	1.10	
PbO	68.35	69.06
Total	99.80	100.00

(1) Nontron, France. (2) $PbCrO_4$.

Occurrence: An uncommon secondary mineral in the oxidized portions of lead deposits associated with chromium-bearing rocks; may be of post-mine formation.

Association: Phoenicochroite, vauquelinite, embreyite, pyromorphite, dundasite, vanadinite, descloizite, wulfenite, cerussite, anglesite, quartz, "limonite".

Distribution: From the Tsvetnoi mine, Mt. Uspenskaya, the Preobrazhensky mine, and other mines, Beresovsk district, and on Mt. Tochil'naya, Middle Ural Mountains, near Yekaterinburg (Sverdlovsk), Russia. At Băiţa (Rézbánya), Romania. In Germany, fine examples from Obercallenberg, near Glauchau, Saxony. In the Hopeful vein, Leadhills, Lanarkshire, Scotland. From the Greystone quarry, Lezant, Cornwall, England. At the Cantonniers mine, Nontron, Dordogne, France. From Howard's Luck mine, Umtali, and at a number of other minor occurrences in Zimbabwe. From the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa. In Australia, as exceptional specimens and an ore of lead in the Dundas district, at the Adelaide, West Comet, and other mines, also from the Heazlewood, Whyte River, and Magnet mines, Tasmania; from the Happy Jack mine, Comet Vale, and several other places in Western Australia; at the Wadnaminga gold mines, near Olary, South Australia. From Labo, Luzon, Philippines. At Goyabeira, near Congonhas do Campo, Minas Gerais, Brazil. In the USA, from Darwin, Inyo Co., California; at the Moon Anchor, Potter-Kramer, Pack Rat, and other mines south of Wickenburg, Maricopa Co., Arizona.

Name: From the Greek for *saffron*, an allusion to the distinctive red-orange color.

Type Material: Natural History Museum, Paris, France.

Cronstedtite $Fe_2^{2+}Fe^{3+}(SiFe^{3+})O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, monoclinic, or hexagonal. *Point Group:* See polytypes. As hexagonal prisms, tapering toward one end and vertically striated. In divergent fibrous groups; cylindroidal, reniform, massive. *Twinning:* Twin axis [001]; interpenetrating trigonal pyramids produce six-rayed composite crystals.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Thin laminae are elastic. Hardness = 3.5 D(meas.) = 3.34–3.35 D(calc.) = n.d.

Optical Properties: Nearly opaque. *Color:* Coal-black to brownish black; thin laminae emerald-green by transmitted light, brown to yellow-brown on edges. *Streak:* Dark olive-green. *Luster:* Brilliant.
Optical Class: Biaxial; pseudo-uniaxial (–). *Pleochroism:* In browns and blacks. ω = 1.72–1.80 2V(meas.) = n.d.

Cell Data: *Space Group:* $P1$. $a = 5.472(8)$ $b = 9.467(19)$ $c = 14.241(39)$ $\alpha = 90.015(20)^\circ$ $\beta = 90.042(18)^\circ$ $\gamma = 89.952(15)^\circ$ Z = 4

X-ray Powder Pattern: Wheal Jane, Cornwall, England. (ICDD 17-470).
7.09 (100), 3.54 (85), 2.722 (50), 2.439 (40), 1.586 (40), 2.305 (16), 1.680 (16)

Chemistry:

	(1)	(2)
SiO_2	16.42	15.04
Al_2O_3	0.90	
Fe_2O_3	29.72	39.97
FeO	41.86	35.97
CaO	1.32	
H_2O	10.17	9.02
Total	100.39	100.00

(1) Herja, Romania. (2) $Fe_2^{2+}Fe^{3+}(SiFe^{3+})O_5(OH)_4$.

Polymorphism & Series: Stacking polytypes have space groups:
$P1$, Cc, Cm, $P31m$, $P6_3cm$, $P6_3$, $P3_1$, $P31c$, and $R3$.

Mineral Group: Kaolinite-serpentine group.

Occurrence: A low-temperature hydrothermal product in ore veins.

Association: Siderite, pyrite, sphalerite, clinochlore, quartz.

Distribution: At Příbram, Kutná Hora, Chvaletice, Chynava, and other places in the Czech Republic. Exceptional groups from Herja (Kisbánya), Romania. From Hagental, Harz Mountains, Germany. In the Salsigne gold mine, 15 km north of Carcassone, Aude, France. In England, from Wheal Jane, Kea; at Wheal Maudlin, Lanlivery; and in the Penlee quarry, Newlyn, Cornwall. In the USA, at Long Hill, Fairfield Co., Connecticut; in the Cornucopia mine, Nye Co., Nevada. From Santa Eulalia, Chihuahua, Mexico. At Conghonas do Campo, Minas Gerais, Brazil. From Llallagua, Bolivia. Additional minor occurrences are known.

Name: To honor the Swedish mineralogist and chemist, Axel Fredrik Cronstedt (1722–1765).

Cronusite $Ca_{0.2}CrS_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. As anhedral grains, to 1 mm, in enstatite.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Uneven. Hardness = 1.5 VHN = 82–109, 98 average (10 g load). D(meas.) = 2.51(3) D(calc.) = 2.55(1)

Optical Properties: Opaque. *Color:* Coal-black; gray in reflected light. *Streak:* Black. *Luster:* Submetallic. *Pleochroism:* In shades of gray. *Anisotropism:* Strong; in shades of gray. *Bireflectance:* Strong.
R_1–R_2: (400) — , (420) — , (440) 14.2–15.4, (460) 14.5–15.8, (480) 14.7–16.4, (500) 15.0–16.8, (520) 15.4–17.2, (540) 15.7–17.6, (560) 15.9–17.9, (580) 16.2–18.2, (600) 16.4–18.4, (620) 16.5–18.5, (640) 16.6–18.6, (660) 16.6–18.6, (680) 16.7–18.6, (700) 16.8–18.7

Cell Data: *Space Group:* $R\overline{3}m$, $R3m$, or $R32$. $a = 3.326$ $c = 33.29$ $Z = 3$

X-ray Powder Pattern: Norton County meteorite.
11.1 (100), 5.56 (10), 2.719 (5), 3.700 (4), 2.464 (4), 2.180 (4)

Chemistry:

	(1)
Na	0.0
K	0.6
Ca	4.2
Cr	33.7
S	39.1
O	21.
H	[2.65]
Total	[101.25]

(1) Norton County; by electron microprobe, average of six analyses, H calculated for oxygen content; corresponds to $(Ca_{0.17}K_{0.02})_{\Sigma=0.19}Cr_{1.04}S_{1.96} \cdot 2.14H_2O$.

Occurrence: In an enstatite achondrite meteorite, formed by teresstrial weathering of caswellsilverite.

Association: Enstatite, ferroan alabandite, troilite, daubréelite, iron hydroxides.

Distribution: Found in the Norton County enstatite achondrite meteorite [TL].

Name: For *Cronus*, a Titan in Greek mythology, son of Uranus and Gaea, in allusion to a mixed meteoritic-terrestrial origin of the mineral.

Type Material: n.d.

Se	30.86	33.27	32.43	32.73
Total	99.08	100.00	100.41	100.00

(1) Skrikerum, Sweden; corresponds to $Cu_{7.50}Tl_{0.82}Ag_{0.48}Fe_{0.07}Se_{4.00}$. (2) Do.; corresponds to $Cu_{6.89}Tl_{0.86}Ag_{0.13}Fe_{0.11}Se_{4.00}$. (3) Bukov, Czech Republic; by electron microprobe, leading to $Cu_{7.07}Tl_{0.98}Ag_{0.01}Se_{3.94}$. (4) Tuminico, Argentina; by electron microprobe, analysis not given, corresponds to $Cu_{7.00}Tl_{0.97}Se_{4.04}$. (5) Cu_7TlSe_4.

Occurrence: Of hydrothermal origin, with other selenides.

Association: Umangite, berzelianite, eucairite, klockmannite, clausthalite, sabatierite, selenian linnaeite, calcite, quartz.

Distribution: From Skrikerum, near Tryserum, Kalmar, Sweden [TL]. At Tilkerode, Harz Mountains, Germany. From Bukov, near Tisnova, and in the Petrovice uranium deposit, near Ždár, Czech Republic. In the Pinky Fault uranium deposit, near Lake Athabasca, Saskatchewan, Canada. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: In honor of William Crookes (1832–1919), English chemist who discovered thallium.

Cryolite Na_3AlF_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 3 cm, are pseudocubic or short prismatic along [001], striated on {110} ∥ [$1\bar{1}1$], [$1\bar{1}\bar{1}$], and [$1\bar{1}0$]; typically massive or coarsely granular. *Twinning:* Common, according to one or more of 13 distinct twin laws, producing penetration, repeated, or polysynthetic twins.

Physical Properties: *Cleavage:* Partings on {001} and {110}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.97 D(calc.) = 2.973(2) Weakly thermoluminescent; may fluoresce intense yellow under SW UV, with yellow phosphorescence, pale yellow fluorescence under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale brown, pink, smoky to black; colorless in thin section. *Streak:* White. *Luster:* Vitreous to greasy or waxy, pearly on {001}.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = -44°$. *Dispersion:* $r < v$. $\alpha = 1.338$ $\beta = 1.338$ $\gamma = 1.339$ 2V(meas.) = 43°

Cell Data: *Space Group:* $P2_1/n$. $a = 5.4024(2)$ $b = 5.5959(2)$ $c = 7.7564(3)$ $\beta = 90.278(1)°$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 25-772).
2.748 (100), 1.943 (95), 3.886 (65), 4.54 (55), 4.44 (40), 1.571 (35), 2.337 (30)

Chemistry:

	(1)	(2)
Na	32.41	32.85
Al	13.01	12.85
F	54.28	54.30
Total	99.70	100.00

(1) Ivigtut, Greenland. (2) Na_3AlF_6.

Occurrence: A late-stage mineral in some granite pegmatites; in tin-bearing alkalic granites; a vapor-phase mineral along fractures and in the groundmass of some fluorine-rich, topaz-bearing rhyolites; in pods in a carbonatite vein cutting fenitized biotite gneiss. Also as a rare authigenic component of the marlstones and shales of the Green River Formation.

Association: Pachnolite, thomsenolite, gearksutite, cryolithionite, weberite, jarlite, prosopite, chiolite, microcline, quartz, fluorite, siderite, topaz (Ivigtut, Greenland); sodalite, villiaumite, eudialyte, lovozerite, natrolite, chabazite, aegirine (Mont St. Hilaire, Canada).

Distribution: Formerly in a large deposit at Ivigtut, southwestern Greenland. In the USA, from St. Peters Dome, near Pikes Peak, El Paso Co., in the Goldie carbonatite, Fremont Co., and the Green River Formation, Colorado; in the Round Top intrusion, Sierra Blanca Peaks, Hudspeth Co., Texas; from the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada; in the Morefield pegmatite, Amelia, Amelia Co., Virginia. From the Francon quarry, Montreal Island, Montreal, at Mont Saint-Hilaire, and from near Saint-Amable, Quebec, Canada. From Miass, Ilmen Mountains, Southern Ural Mountains, the Khibiny massif, Kola Peninsula, and elsewhere in Russia. In the Madeira and Agua Boa granites, Pitinga region, Amazonas, Brazil. Several other minor occurrences are known.

Name: From the Greek for *ice* and *stone*, alluding to its appearance.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Cryolithionite $Na_3Li_3Al_2F_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As dodecahedra, to 17 cm, which may show {112}; commonly as coarse granular aggregates.

Physical Properties: *Cleavage:* Distinct on {011}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 2.771–2.774 D(calc.) = 2.771

Optical Properties: Transparent; often cloudy from inclusions. *Color:* Colorless to white; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic. n = 1.3393–1.3395

Cell Data: *Space Group: Ia3d.* a = 12.122(2) Z = 8

X-ray Powder Pattern: Synthetic.
4.28 (100), 3.029 (55), 1.966 (55), 2.213 (50), 2.711 (35), 2.376 (35), 1.619 (30)

LOI	0.36	
Total	99.79	100.00

(1) Ivigtut, Greenland. (2) $Na_3Li_3Al_2F_{12}$.

Occurrence: In some granite pegmatites.

Association: Cryolite, quartz, fluorite, siderite (Ivigtut, Greenland); cryolite, chiolite, pachnolite, thomsenolite, ralstonite, prosopite (Miass, Russia).

Distribution: In the Ivigtut cryolite deposit, southwestern Greenland. From near Miass, Ilmen Mountains, Southern Ural Mountains, Russia. At the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada, USA.

Name: For its similarity to CRYOlite and high LITHIum content.

Type Material: University of Copenhagen, Copenhagen, Denmark; National Museum of Natural History, Washington, D.C., USA, 106833.

Cryptohalite $(NH_4)_2SiF_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As crusts of interpenetrating tabular crystals, to 1 mm; in aggregates, which may be mammillary, columnar, globular, or arborescent.

Physical Properties: *Cleavage:* Perfect on {111}. Hardness = 2.5 D(meas.) = 2.004 D(calc.) = 2.029 Soluble in H_2O, saline taste.

Optical Properties: Transparent. *Color:* Colorless, white to gray; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.369(1)$

Cell Data: *Space Group:* $Fm3m$. a = 8.392 Z = 4

X-ray Powder Pattern: Synthetic.

(1) Barari, India. (2) $(NH_4)_2SiF_6$.

Polymorphism & Series: Dimorphous with bararite, the lower-temperature form.

Occurrence: A volcanic sublimate, or formed from fires in burning coal seams.

Association: Sal ammoniac, bararite, sulfur, selenium.

Distribution: From Vesuvius, Campania, Italy. In the Clara mine, near Wolfach, Black Forest, Germany. At Libusín, Kladno basin, Czech Republic. In the Bararee mine, Barari, Jharia district, West Bengal, India. From Kehley's Run mine, near Shenandoah, Schuylkill Co., and at Glen Lyon, Luzerne Co., Pennsylvania, USA.

Name: From the Greek for *concealed* and *salt*, for being admixed with sal ammoniac.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 104–105. (2) Vainshtein, B.K. and M.M. Cryptomelane $\mathbf{K_{1-1.5}(Mn^{4+},Mn^{3+})_8O_{16}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely in subhedral crystals, to 2 mm; commonly as compact fine-grained masses, banded colloform, botryoidal, or radial fibrous aggregates, all in the same specimen; massive cleavable. *Twinning:* Typically on (010) and $(10\bar{1})$, producing a pseudotetragonal unit cell.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5, compact. D(meas.) = 4.17–4.41 D(calc.) = [4.44]

Optical Properties: Opaque. *Color:* Steel-gray to bluish gray when fresh; tarnishes to dull grayish black; light tan or gray in reflected light. *Streak:* Brownish black. *Luster:* Metallic to dull.
Optical Class: Isotropic, nearly.
R: n.d.

Cell Data: *Space Group:* $I2/m$. $a = 9.956(3)$ $b = 2.8705(9)$ $c = 9.706(4)$ $\beta = 90.95(3)^\circ$

(1) Tombstone, Arizona, USA; Mn^{4+} from "available O". (2) Philipsburg, Montana, USA; Mn^{4+} from "available O". (3) Chindwara, India; by electron microprobe, Mn^{4+}:Mn^{3+} from charge balance, original total given as 99.18%; corresponding to $(K_{0.94}Na_{0.25}Sr_{0.13}Ba_{0.10}Mg_{0.03})_{\Sigma=1.45}(Mn^{4+}_{6.33}Mn^{3+}_{1.20}Fe^{3+}_{0.30}Al_{0.15})_{\Sigma=7.98}(O,OH)_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: Widespread in oxidized manganese deposits as open-space fillings or replacing primary manganese-bearing minerals; commonly replaced by other secondary manganese minerals.

Association: Pyrolusite, nsutite, braunite, chalcophanite, manganite, other manganese oxides.

Distribution: Some localities for well-studied and pure material include: in the USA, from the Oregon-Prompter mine, Tombstone, Cochise Co., in the Hardshell and Mowry mines, Santa Cruz Co., and the Artillery Mountains, Mohave Co., Arizona; at Lake Valley, Sierra Co., New Mexico; from the Silver Cliff district, Custer Co., Colorado; at Philipsburg, Granite Co., Montana. From Urucum, Mato Grosso, Brazil. In Oriente Province, Cuba. From Nsuta, Ghana. At Sitapar, Chindwara district, Central Provinces, India. On Groote Eylandt, Northern Territory, Australia.

Name: From the Greek for *hidden* and *black*, alluding to the mineral's obscure identity as one of several black mineral species in "psilomelane", the collective term for hard manganese oxides.

Type Material: n.d.

Cryptophyllite $K_2Ca[Si_4O_{10}]\cdot 5H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As distorted and/or split platelets to 0.2 mm or as rosette-like intergrowths with shlykovite to 1 mm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.185

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Biaxial (+). α = 1.520(2) β = 1.523(2) γ = 1.527(2) 2V(meas.) > 70° 2V(calc.) = 82° *Orientation*: $X = c$.

Cell Data: *Space Group*: $P2_1/n$. a = 6.4934(14) b = 6.9919(5), c = 32.087(3) β = 94.680(12)° Z = 4

X-ray Powder Pattern: Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia. 16.01 (100), 2.903 (84), 6.24 (48), 2.995 (47), 3.197 (27), 7.98 (24), 3.228 (22)

Chemistry:

	(1)
Na_2O	1.12
K_2O	17.73
CaO	11.59
Al_2O_3	0.08
SiO_2	50.24
H_2O	[19.24]
Total	100.00

(1) Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia; average of 4 electron microprobe analyses, H_2O by difference, OH/H_2O calculated for charge balance; corresponding to $(K_{1.80}Na_{0.17})_{\Sigma=1.97}Ca_{0.99}Al_{0.01}Si_{3.99}O_{9.94}(OH)_{0.06}\cdot 5H_2O$.

Occurrence: A late-stage hydrothermal mineral along fractures in a high-potassium peralkaline pegmatite in urtite rocks near the contact with nepheline-apatite rock.

Association: Shlykovite.

Distribution: At the Central mine, Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia.

Name: Derived from the Greek words "κρυπτοζ"- *concealed* (*crypto*) and "φυλλον" - *leaf* as an allusion to its occurrence in intimate intergrowths with visually indistinguishable shlykovite and to its layered structure.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3753/2).

Al_2O_3	10.4	10.90
CuO	32.0	34.00
H_2O^+	20.8	20.53
Total	[100.0]	100.00

(1) Clara mine, Germany; H_2O by TGA, after deduction of quartz and barite 9.9%, corresponds to $Cu_{5.62}Al_{2.85}Sb_{3.18}O_{18}\cdot 16.14H_2O$. (2) $Cu_6Al_3Sb_3^{5+}O_{18}\cdot 16H_2O$.

Occurrence: A secondary mineral from oxidation of a hydrothermal polymetallic barite–fluorite deposit.

Association: Cornwallite, arsenogoyazite, goethite, barite, fluorite, quartz.

Distribution: In the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: From the chemical symbols of the mineral's major components, copper (CUprum), ALuminum, and antimony (STIBium).

Type Material: Institute for Mineralogy and Petrography, University of Stuttgart, Stuttgart, Germany.

S	34.37	35.30	35.43
Total	99.84	99.96	100.00

(1) Barracanao, Cuba. (2) Prince William Sound, Alaska, USA. (3) $CuFe_2S_3$.

Polymorphism & Series: Dimorphous with isocubanite.

Occurrence: In hydrothermal deposits formed at relatively high temperature, in pyrrhotite–pentlandite ores in which it commonly occurs as intimate oriented intergrowths with chalcopyrite. Cubanite may exsolve from chalcopyrite below about 200 °C–210 °C. A rare constituent of some carbonaceous chondrite meteorites.

Association: Chalcopyrite, pyrite, pyrrhotite, pentlandite, sphalerite.

Distribution: Numerous localities; may be an important ore mineral. From Barracanao, Cuba [TL]. In the USA, at Fierro, Grant Co., New Mexico; at the Christmas mine, Gila Co., Arizona; from Prince William Sound, Alaska. In the Strathcona mine, Sudbury, Ontario; as exceptional crystals from Chibougamau, Quebec, Canada. In Sweden, at Tunaberg, Södermanland; from Kaveltorp, near Ljusnarsberg, Örebro; at Kalkugnstorp, 70 km west of Stockholm. From Virtasalm, Finland. At Traversella, Piedmont, Italy. In Brazil, in the Morro Velho gold mine, Nova Lima, Minas Gerais. At Broken Hill, New South Wales, Australia. From the Noril'sk region, western Siberia, Russia. In the Orgueil and Alais carbonaceous chondrite meteorites.

Name: For its occurrence in Cuba.

Type Material: Mining Academy, Freiberg, Germany, 5467.

(1–2) Boleo, Mexico. (3) $Pb_{21}Cu_{20}Cl_{42}(OH)_{40}$.

Occurrence: A secondary mineral formed through reaction of chloride ions with primary sulfides in the oxidized zone of some Pb–Cu deposits; in smelter slag immersed in and leached by sea water.

Association: Boleite, pseudoboleite, atacamite, anglesite, cerussite, phosgenite, gypsum (Boleo, Mexico).

Distribution: In Mexico, exceptional crystals and groups from the Amelia mine, Boleo, near Santa Rosalía, Baja California. From Laurium, Greece, in slag. Along Baratti Beach, Tuscany, Italy, in slag. In England, in Cornwall, from Tolcarne Beach, Great Western Beach, and Watergate Bay, Newquay; Newporth Beach, Falmouth; in the Porthilly mine, St. Minver; at Daymer Bay, near Polzeath; Trerubies Cove, near Delabole; Gunver Head, near Padstow Consols; and Loe Warren zawn, 0.75 km west of Botallack, St. Just. In Germany, from the Christian-Levin mine, near Essen, North Rhine-Westphalia. In Australia, at the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia, and at Broken Hill, New South Wales.

Name: For Edouard Cumenge (1828–1902), French mining engineer at Boleo, Mexico, who found the first specimens.

Type Material: n.d.

Cummingtonite $(Mg,Fe^{2+})_2(Mg,Fe^{2+})_5Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed, columnar, or fibrous crystals and fibrous aggregates, to 20 cm. *Twinning:* Simple or multiple twinning ∥ {100}.

Physical Properties: *Cleavage:* Good on {110}, intersecting at 54° and 126°. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.1–3.6 D(calc.) = 3.3

Optical Properties: Transparent to translucent. *Color:* Dark green, brown, gray, beige; colorless to pale green in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* With increasing Fe content, weak; $X = Y =$ colorless; $Z =$ pale green. *Orientation:* $Y = b$; $Z \wedge c = -21°$ to $-16°$; $X \wedge a = -9°$ to $-3°$. *Dispersion:* $r < v$, weak. $\alpha = 1.632$–1.663 $\beta = 1.638$–1.677 $\gamma = 1.655$–1.697 2V(meas.) = 70°–90°

Cell Data: *Space Group:* $C2/m$. a = 9.516(5) $b = 18.139(10)$ $c = 5.311$ $\beta = 102.1°$ Z = 2

X-ray Powder Pattern: Labrador City, Canada.
8.30 (100b), 3.06 (90), 3.26 (80), 2.754 (70), 1.403 (60), 9.12 (50), 2.623 (50)

(1) Geodh Dubh, Scotland; corresponds to $(Mg_{4.44}Fe^{2+}_{2.02}Al_{0.21}Ca_{0.20}Na_{0.18}Fe^{3+}_{0.09}Ti_{0.03}Mn_{0.03})_{\Sigma=7.20}(Si_{7.36}Al_{0.64})_{\Sigma=8.00}O_{22}(OH)_{2.05}$. (2) Orfordville Formation, Mt. Cube quadrangle, Vermont, USA; by electron microprobe, corresponds to $(Mg_{3.77}Fe^{2+}_{3.11}Al_{0.08}Ca_{0.06}Na_{0.04}Mn_{0.02})_{\Sigma=7.08}(Si_{7.80}Al_{0.20})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesio-cummingtonite and grunerite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: 0.3 $Mg/(Mg + Fe^{2+})$ 0.69; $(Ca + Na)_B < 1.34$; Li < 1.0; Mn < 0.5.

Occurrence: Commonly in medium-grade regionally metamorphosed rocks; characteristic of metamorphosed iron formations; a late-stage mineral in some gabbros and norites; rarely in silicic volcanic rocks.

Association: "Hornblende," anthophyllite, actinolite, ferro-actinolite, tremolite, arfvedsonite, magnesio-arfvedsonite, gedrite, glaucophane, quartz, garnet.

Distribution: Well-characterized material from: in the USA, at Cummington, Hampshire Co., Massachusetts; the Homestake mine, Lead, Pennington Co., South Dakota; in the Jackson County Iron Formation, Wisconsin. In the Wabush Iron Formation, Labrador City, Labrador, Newfoundland, Canada. From the Miyamori district, Iwate Prefecture, and the Hitachi mine, Ibaragi Prefecture, Japan. In the Garabal Hill-Glen Fyne complex, Scotland. At Teisko, Finland. From Nordmark, Värmland, Sweden.

Name: For the occurrence at Cummington, Massachusetts, USA.

(1) Listvenitovii stream, USSR; by electron microprobe, ranges of analyses on nine grains, corresponding to (Cu, Zn)Al.

Occurrence: In black slick washed from greenish gray cover weathering from serpentine.

Association: Khatyrkite, two unnamed zinc aluminides.

Distribution: Near the Listvenitovii stream, Khatirskii ultramafic zone of the Koryak–Kamchata fold area, Koryak Mountains, USSR.

Name: For the composition.

Type Material: Mining Museum, Leningrad Mining Institute, Leningrad, USSR.

Cuprite $Cu_2^{1+}O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As cubic, octahedral, and dodecahedral crystals, to 14 cm, which may be highly modified; as hairlike capillary forms, with square section, reticulated, tufted and matted; also earthy, compact granular, massive.

Physical Properties: *Cleavage:* {111}, interrupted; {001}, rare. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 3.5–4 VHN = 183–222 (100 g load). D(meas.) = 6.14 D(calc.) = 6.15

Optical Properties: Transparent to translucent. *Color:* Cochineal-red, ruby-red, purplish red, to nearly black; in transmitted light, cochineal-red or red in thick sections; yellow-orange, yellow, lemon-yellow in progressively thinner sections; in reflected light, gray blue, commonly with many red internal reflections. *Streak:* Brownish red, shining. *Luster:* Adamantine to submetallic, earthy.
Optical Class: Isotropic, anomalously anisotropic. *Pleochroism:* Anomalous, common.

Cell Data: *Space Group:* $Pn3m$ (synthetic). a = 4.2685(1) Z = 2

X-ray Powder Pattern: Synthetic.
2.465 (100), 2.135 (37), 1.510 (27), 1.287 (17), 3.020 (9), 1.233 (4), 0.9795 (4)

Chemistry: No modern analyses are available.

Occurrence: A common mineral in the oxidized portions of many copper deposits.

Association: Copper, tenorite, malachite, azurite, calcite, brochantite, antlerite, atacamite, chrysocolla, iron oxides, clay minerals.

Distribution: A few localities for fine specimens include: at Bogoslovsk, Nizhni Tagil, and Yekaterinburg (Sverdlovsk), Ural Mountains, Russia. At Dzhezkazgan, Kazakhstan. In England, fine crystals from many mines in Cornwall. At Rheinbreitbach, North Rhine-Westphalia, Germany. In Namibia, large crystals from the Onganja mine, 60 km northeast of Windhoek, and at Tsumeb. At Likasi, Ruwe, and the Mashamba West mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, in Arizona, large crystals from Bisbee, Cochise Co., at Ray, Pinal Co., Globe, Gila Co., and elsewhere; from Santa Rita, Grant Co., New Mexico. From Boleo, Baja California, Mexico. At Chuquicamata, Antofagasta, Chile. In Australia, from Broken Hill and Cobar, New South Wales; at Burra-Burra and Moonta, South Australia; large crystals in the Red Dome mine, Chilliago, Queensland.

Name: From the Latin *cuprum*, for its copper content.

(1) Hall's Valley, Colorado, USA; analysis by Hillebrand (in 1884), who assumed the sample to contain chalcopyrite 6.97% after deducting gangue 4.43%; sulfur content "calculated for the analysis"; then corresponds to $Cu_{9.69}Ag_{0.32}Zn_{0.06}Bi_{11.23}S_{24.00}$. (2) Ohio district, Utah, USA; by electron microprobe, corresponds to $Cu_{9.77}Ag_{0.45}Pb_{0.17}Mn_{0.10}(Bi_{12.55}Sb_{0.03})_{\Sigma=12.58}(S_{23.72}Se_{0.26}Te_{0.02})_{\Sigma=24.00}$. (3) $Cu_8AgBi_{13}S_{24}$.

Occurrence: Rare, of hydrothermal origin with other sulfides and sulfosalts.

Association: Emplectite, aikinite, wittichenite, benjaminite, berryite, cupropavonite, paděraite, hodrushite, wolframite, bismuthinite.

Distribution: In the USA, in Colorado, from the Missouri mine, Hall's Valley, Park Co. [TL], and at Silver Cliff, Custer Co.; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; and from the Tunnel Extension 2 mine, Marysvale, Ohio district, Piute Co., Utah. From Krupka, Czech Republic. At Băiţa (Rézbánya) and in the Paulus mine, Ocna de Fier (Morávicza; Vaskő), Romania. From Baicolliou, Switzerland.

Name: For copper, CUPRum, and BISMUTh in the composition.

Type Material: Harvard University, Cambridge, Massachusetts, 94989; National Museum of Natural History, Washington, D.C., USA, 92902.

(1) Chuquicamata, Chile. (2) $CuFe_4(SO_4)_6(OH)_2 \cdot 20H_2O$.

Mineral Group: Copiapite group.

Occurrence: A rare secondary mineral probably formed by reaction between copiapite and copper sulfate-bearing solutions, preserved in arid climates.

Association: Copiapite, parabutlerite, chalcanthite, jarosite.

Distribution: In Chile, from Chuquicamata and at Quetena, west of Calama, Antofagasta.

Name: As the *cuprian* member of the *copiapite* group.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 99048, 99060.

Total	100.9	100.00

(1) Kamchatka, Russia; by electron microprobe, corresponding to $(Cu_{0.61}Fe_{0.30}Ni_{0.02})_{\Sigma=0.93}(Ir_{1.33}Pt_{0.28}Rh_{0.31})_{\Sigma=1.92}S_{4.00}$. (2) $CuIr_2S_4$.

Polymorphism & Series: Forms two series, with cuprorhodsite and with malanite.

Mineral Group: Linnaeite group.

Occurrence: In alluvial deposits.

Association: Isoferroplatinum, cuprorhodsite, malanite, osmium, iridosmine, platinum, laurite, erlichmanite, cherepanovite, kashinite, rhodian pentlandite, irarsite, cooperite, sperrylite, chalcopyrite, bornite.

Distribution: In Russia, from the Kondor [TL] and Chad massifs, Khabarovsk Territory; at Inagli, Aldan Shield; on Mt. Filipp, Kamchatka; and in the Ray-Iz ophiolite complex, Polar Ural Mountains. From Chromwerk, Kraubath massif, Styria, Austria. At Finero, [prov??in D8??], Italy. From Goodnews Bay, Alaska, USA.

Name: For copper, CUPRum, IRIDium, and Sulfur in the chemical composition.

Type Material: Mining Institute, St. Petersburg, Russia, 1686/1.

Total	100.07

(1) Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia; average of 202 electron microprobe analyses; corresponding to $(Cu_{0.98}Fe_{0.02}Zn_{0.01})_{\Sigma=1.01}(Cr_{1.65}V_{0.34}As_{0.01})_{\Sigma=2.00}S_{3.99}$.

Mineral Group: Thiospinel group.

Occurrence: As disseminated inclusions in quartz from Cr-V-bearing quartz-diopside granulite facies metamorphic rocks.

Association: Cr-V-tremolite and mica, calcite, Cr-V spinels, V-titanite, pyrite, plagioclase, a mineral of the natalyite-kosmochlor series, goldmanite-uvarovite, dravite-chromdravite, karelianite-eskolaite.

Distribution: In the Sludyanka complex, South Baikal region, Russia.

Name: For its essential copper content and structural identity with *kalininite*, $ZnCr_2S_4$.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3886/1-3).

(1) Băița Bihor, Romania; average of 5 electron microprobe analyses, corresponding to $Cu_{7.79}Ag_{2.40}Pb_{2.95}Bi_{18.55}(S_{35.37}Se_{0.25}Te_{0.39})_{\Sigma=36.00}$.
(2) $Cu_8Pb_4Ag_2Bi_{18}S_{36}$.

Occurrence: As exsolution lamellae or discrete grains associated with sulfosalts in contact metamorphic rocks (skarns) around granite and in scheelite-bearing quartz veins in felsic gneisses and amphibolites.

Association: Aikinite-friedrichite, hodrušite, paděraite, kupčikite, emplectite, wittichenite, tetradymite, chalcopyrite, dolomite (Romania); aikinite-krupkaite, hodrušite, cuprobismutite, kupčikite, wittichenite, native bismuth, chalcopyrite, pyrrhotite, quartz (Austria).

Distribution: Băița Bihor, Apuseni Mts, Romania; Felbertal scheelite deposit, Hohe Tauern, Austria.

Name: For its essential copper content and relationship to makovickyite.

Type Material: Division of Mineralogy, University of Salzburg, Austria, 14943 and 14944.

References: (1) Topa, D. and W.H. Paar (2007) Cupromakovickyite, $Cu_8Pb_4Ag_2Bi_{18}S_{36}$, a new mineral species of the pavonite homologous series. Can. Mineral., 46, 503-514. (2) (2008) Amer. Mineral., 93, 1942 (abs. ref. 1).

Cupromolybdite $Cu_3O(MoO_4)_2$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/m 2/*m*. As well-formed, stout prismatic to acicular crystals to 0.2 mm; also in radiating aggregates.

Physical Properties: *Cleavage*: Distinct. *Fracture*: Uneven to splintery. *Tenacity*: Brittle. Hardness = ~ 3 D(meas.) = n.d. D(calc.) = 4.512 VHN = 189 (50 g load).

Optical Properties: Translucent. *Color*: Honey-yellow or dark brown (prismatic crystals) to bright yellow (acicular), gray with a bluish tint in reflected light with orange-red or orange-brown internal reflections. *Streak*: Yellow to light brown. *Luster*: Adamantine. *Anisotropism*: Distinct. *Optical Class*: n.d.

(1) Second Scoria Cone, Tolbachik volcano, Russia; average of 7 electron microprobe analyses; corresponding to $(Cu_{2.83}Zn_{0.03}Fe_{0.01})_{\Sigma=2.87}(Mo_{1.98}S_{0.05}V_{0.02})_{\Sigma=2.05}O_9$ (prismatic crystals). (2) Second Scoria Cone, Tolbachik volcano, Russia; average of 7 electron microprobe analyses; corresponding to $(Cu_{2.46}Zn_{0.54}Fe_{0.01})_{\Sigma=3.01}(Mo_{1.81}S_{0.14}V_{0.05})_{\Sigma=2.00}O_9$ (acicular variety). (3) $Cu_3O(MoO_4)_2$.

Occurrence: A fumarolic mineral formed during post-volcanic degassing.

Association: Piypite, fedotovite, vergasovite, hematite, magnetite, aphthitalite, langbeinite, palmierite, As-bearing orthoclase, lammerite, klyuchevskite, alumoklyuchevskite, euchlorine, lyonsite, pseudo-lyonsite, averievite, rutile, gold.

Distribution: From the Yadovitaya (poisonous) fumarole, Second Scoria Cone, Tolbachik volcano, Kamchatka Peninsula, Russia.

Name: For its chemical composition. The name also reflects the stoichiometric relationship with cuprotungstite, $Cu_3(OH)_2(WO_4)_2$.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4072/1).

Sb	0.1	0.3		
S	18.0	17.6	18.10	17.74
Total	99.9	100.1	99.34	100.00

(1–2) Alaska mine, Colorado, USA; by electron microprobe, the average corresponding to $Ag_{0.97}Pb_{1.17}Cu_{1.74}Bi_{4.88}S_{10.00}$. (3) Hall's Valley, Colorado, USA; by electron microprobe, corresponding to $Ag_{1.15}Pb_{0.65}Cu_{2.02}Bi_{5.03}S_{10.00}$. (4) $AgPbCu_2Bi_5S_{10}$.

Occurrence: In zoned mesothermal base- and precious-metal veins.

Association: Pavonite, gustavite, cuprobismutite, berryite.

Distribution: In the USA, in Colorado, from the Alaska mine, Poughkeepsie Gulch, near Ouray, San Juan Co. [TL], and at the Missouri mine, Hall's Valley, Park Co.; in the Campbell mine, Bisbee, Cochise Co., Arizona; and from the April Fool mine, Delamar district, Lincoln Co., Nevada. At Stănija and Băiţa (Rézbánya), Romania. In the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, Austria. From Saxony, Germany, otherwise undefined.

Name: For its copper, *cuprum*, content, and to stress a similarity with pavonite.

Type Material: University of Pennsylvania, Philadelphia, Pennsylvania, USA, 1124, ("alaskaite").

(1) Far Eastern Region, Russia; by electron microprobe, corresponding to $(Cu_{0.51}Fe_{0.41})_{\Sigma=0.92}(Rh_{1.66}Ir_{0.23}Pt_{0.15})_{\Sigma=2.04}S_{4.00}$. (2) $CuRh_2S_4$.

Polymorphism & Series: Forms a series with cuproiridsite.

Mineral Group: Linnaeite group.

Occurrence: In alluvial placers.

Association: Isoferroplatinum, cuproiridsite, malanite, osmium, iridosmine, laurite, erlichmanite, cooperite, sperrylite, chalcopyrite, bornite (Chad massif, Russia).

Distribution: In Russia, from the Gusevogorskii massif, Ural Mountains [TL], and in the Far Eastern Region, from the Chad massif, Khabarovsk Territory, on Mt. Filipp, Kamchatka, and in the Baimka placers, Chukota. At Chromwerk, Kraubath massif, Styria, Austria.

Name: For copper, CUPRum, RHODium, and Sulfur in the chemical composition.

Type Material: Mining Institute, St. Petersburg, Russia, 1685/1.

(1) Vesuvius, Italy; sample contaminated with 13% quartz. (2) $CaCuSi_4O_{10}$.

Occurrence: Intimately mixed with quartz (Vesuvius, Italy); in a mudstone xenolith ejected from a scoria cone (Sattelberg volcanic cone, Germany).

Association: Quartz.

Distribution: In Italy, on Vesuvius, Campania. From Wheal Edward, Cornwall, England. At Summit Rock, near Diamond Lake, Douglas Co., Oregon, USA. From the Sattelberg volcanic cone, near Brenk, Eifel district, Germany. At Messina, Transvaal, South Africa.

Name: For a high copper content and presumed similarity to *rivaite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 135505.

(1) Shaba Province, Congo; Fe_2O_3 trace. (2) Jáchymov, Czech Republic; Fe_2O_3, PbO, and CaO in traces. (3) $(H_3O)_2Cu(UO_2)_2(SiO_4)_2 \cdot 2H_2O$.

Occurrence: A secondary mineral formed by alteration of earlier uranium minerals, both *in situ* and after transport of solutions.

Association: Becquerelite, brochantite, uranophane, kasolite, vandenbrandeite, liebigite, uranophane-beta, compreignacite.

Distribution: In Congo (Zaire), from Katanga (Shaba) Province, at Kambove and Kalongwe, with exceptional specimens from Shinkolobwe and the Musonoi mine, Kolwezi. From Jáchymov (Joachimsthal), Czech Republic. At Johanngeorgenstadt, Saxony, Germany. From West Wheal Owles and the Geevor mine, St. Just, Cornwall, England. In the Rabéjac uranium deposit, seven km south-southwest of Lodève, Hérault, France. In the USA, in New Mexico, from the Sanostee area, San Juan Co., in the Woodrow mine, Laguna district, Valencia Co., and in the Grants district, McKinley Co.; in Utah, in the Frey No. 4 mine, Frey Canyon, the Posey mine, Red Canyon, and the Happy Jack mine, White Canyon, San Juan Co.; in California, on the Ram claims, Pinto Mountains, Riverside Co. In Canada, from the Nicholson mine, Lake Athabasca, Saskatchewan. At Kenzan, Okayama Prefecture, Japan.

Name: A name supplied by Buttgenbach while introducing Vaes' paper, in the mistaken belief that it was the copper analog of *sklodowskite*.

Type Material: University of Liège, Liège, Belgium, 16.655.

(1) Baie Verte, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} calculated to satisfy the spinel structure; corresponding to $(Cu_{0.80}Mg_{0.10}Fe^{2+}_{0.05}Co_{0.02}Zn_{0.02}Mn_{0.01})_{\Sigma=1.00}(Fe^{3+}_{1.89}Al_{0.11})_{\Sigma=2.00}O_4$.

Mineral Group: Spinel group.

Occurrence: In highly oxidized material, once spontaneously ignited, in an ore dump.

Association: Pyrite, chalcopyrite, sphalerite, pyrrhotite, hematite.

Distribution: On the property of Consolidated Rambler Mines Limited, near Baie Verte, Newfoundland, Canada.

Name: For the mineral's copper, CUPRum, content and having the *spinel* structure.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128673.

References: (1) Nickel, E.H. (1973) The new mineral cuprospinel ($CuFe_2O_4$) and other spinels from an oxidized ore dump at Baie Verte, Newfoundland. Can. Mineral., 11, 1003–1007. (2) (1974) Amer. Mineral., 59, 381 (abs. ref. 1).

Cuprostibite Cu_2Sb

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As fine-grained aggregates, to 1.5 mm in diameter. *Twinning:* Platy [*sic*].

Physical Properties: *Cleavage:* One direction. *Fracture:* Uneven. Hardness = n.d. VHN = 216–249 (50 g load). D(meas.) = n.d. D(calc.) = 8.42

Optical Properties: Opaque. *Color:* Steel-gray, red-violet tint on fresh fracture; in reflected light, rose-violet. *Luster:* Metallic. *Pleochroism:* Creamy white to dark rose-violet. *Anisotropism:* Strong.
R_1–R_2: (400) 51.1–58.6, (420) 52.5–58.5, (440) 52.2–56.9, (460) 50.0–54.9, (480) 47.4–52.6, (500) 45.5–50.3, (520) 42.2–47.6, (540) 37.8–45.0, (560) 35.4–42.5, (580) 35.7–41.7, (600) 39.6–43.0, (620) 45.4–45.9, (640) 50.7–49.3, (660) 55.9–52.0, (680) 59.7–54.3, (700) 62.6–55.7

Cell Data: *Space Group:* $P4/nmm$. $a = 3.990$ $c = 6.09$ $Z = 2$

X-ray Powder Pattern: Mt. Nákâlâq, Greenland.
2.07 (100), 2.56 (50), 2.82 (40), 1.993 (40), 1.167 (40), 1.424 (30), 3.33 (20)

Chemistry:

	(1)	(2)	(3)	(4)
Cu	53.3	50.4	52.0	51.07
Tl	3.5			
Ag	0.1			
Sb	42.0	48.9	48.4	48.93
S	1.1			
Total	100.0	99.3	100.4	100.00

(1) Mt. Nákâlâq, Greenland; by electron microprobe, average of three analyses; corresponds to $Cu_{2.00}(Sb_{0.82}S_{0.08}Tl_{0.04})_{\Sigma=0.94}$. (2) Långban, Sweden; by electron microprobe, average of three analyses; corresponds to $Cu_{2.00}Sb_{1.01}$. (3) Kangerdluarssuk Plateau, Greenland; by electron microprobe, corresponds to $Cu_{2.00}Sb_{0.97}$. (4) Cu_2Sb.

Occurrence: As fine-grained aggregates in a vein of ussingite cutting sodalite syenite (Ilímaussaq intrusion, Greenland); in sulfide veins in metamorphic siliceous dolostone (Långsjön, Sweden).

Association: Löllingite, antimonian silver, chalcopyrite, chalcothallite (Ilímaussaq intrusion, Greenland); chalcocite, bismuth (Långban, Sweden); sphalerite, galena, dyscrasite, gudmundite, breithauptite, antimony (Långsjön, Sweden).

Distribution: In southern Greenland, from Mt. Nákâlâq [TL], northwest of Taseq Lake, and at other localities in the Ilímaussaq intrusion. From Långsjön, at Långban, and in the Getberg mine, near Långban, Värmland, Sweden. From Franklin, Sussex Co., New Jersey, USA.

Name: For copper, CUPRum, and antimony, STIBium, in the composition.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Total	99.60	[100.00]	100.00

(1) Peralillo, Chile. (2) Cordillera mine, Australia; partial analysis by electron microprobe, H_2O by difference; then corresponds to $(Cu_{2.98}Pb_{0,02})_{\Sigma=2.00}(WO_4)_{2.00}(OH)_{1.96}$. (3) $Cu_3(WO_4)_2(OH)_2$.

Occurrence: A rare secondary mineral typically replacing scheelite.

Association: Scheelite, stolzite, raspite.

Distribution: From La Paz, Baja California, Mexico. In the USA, on the Gold Cliff claims, Cave Creek, Maricopa Co., Arizona; in the Green Monster mine, near White River, Kern Co., California; from the South Peacock mine, Seven Devils district, Adams Co., Idaho. At the Llamuco copper mine, east of Salamanca, Coquimbo, Chile. In England, at Buckbarrow Beck, Corney Fell, Cumbria; in Cornwall, from Wheal Gorland, Gwennap; at the Gunnislake mine, Calstock; in the Gunheath china clay pit, St. Austell. From the Clara mine, near Oberwolfach, Black Forest, Germany. At Natas, Namibia. In the Cordillera mine, near Tuena, New South Wales, Australia. Numerous other localities have been reported but require modern confirmation.

Name: For copper, *cuprum* and *tungsten* in the composition.

Type Material: Natural History Museum, Paris, France, 69.47.

Curetonite **$Ba(Al,Ti)(PO_4)(OH,O)F$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly euhedral, to 3 mm, may be elongated along [001], showing {100}, {010}, {001}, {011}, and $\{\overline{2}01\}$; may be wedgelike. *Twinning:* Polysynthetic, common on {100}, producing broad lamellae with imperfect composition planes.

Physical Properties: *Cleavage:* On {011}, good; a parting on {010}. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 4.42(5) D(calc.) = 4.31

Optical Properties: Semitransparent. *Color:* Bright yellow-green to nickel-green; colorless in thin section. *Streak:* White.
Optical Class: Biaxial (+). *Pleochroism:* In patchy yellows. *Orientation:* $X = b$; $Z \wedge c = 30°$. *Dispersion:* $r < v$, weak, strongly inclined. *Absorption:* $X \gg Y = Z$. $\alpha = 1.676$ $\beta = 1.680$ $\gamma = 1.693$ 2V(meas.) = 60° 2V(calc.) = 58.4°

Cell Data: *Space Group:* $P2_1/n$. $a = 6.977(2)$ $b = 12.564(4)$ $c = 5.223(1)$ $\beta = 102.15(2)°$ Z = 4

X-ray Powder Pattern: Near Golconda, Nevada, USA.
3.230 (10), 3.286 (8), 2.991 (6), 2.816 (6), 4.290 (5), 2.848 (5), 3.568 (4)

(1) Near Golconda, Nevada, USA; by electron microprobe, Ti and V by wet methods, H_2O by the Penfield method. (2) Do.; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Ba_{1.02}Mg_{0.02})_{\Sigma=1.04}(Al_{0.79}Ti_{0.16})_{\Sigma=0.95}[(P_{0.98}V_{0.03})_{\Sigma=1.01}O_4][(OH)_{0.85}O_{0.11}]_{\Sigma=0.96}F_{1.04}$.

Occurrence: A rare mineral, in veins cutting a replacement barite deposit.

Association: Orthoclase, barite, variscite, montgomeryite, englishite, sulvanite, hisingerite, "opal".

Distribution: In the Redhouse Barite mine, near Golconda, Potosi district, Humboldt Co., Nevada, USA.

Name: In honor of Forrest Ellsworth Cureton II (1932–), mineral dealer and collector, Tucson, Arizona, USA, and Michael Edward Cureton (1960–), mineral collector, Stockton, California, USA, who first found the mineral.

Type Material: The Natural History Museum, London, England, 1979,205; Harvard University, Cambridge, Massachusetts, 119100; National Museum of Natural History, Washington, D.C., USA, 145621.

BaO	0.84		
H_2O	8.30	10.00	8.44
Total	99.95	100.00	100.00

(1) Mounana mine, Gabon; by gravimetric and photometric methods, H_2O by the Penfield method; corresponds to $(Pb_{0.97}Ba_{0.06})_{\Sigma=1.03}(UO_2)_2(V_{2.04}O_8)\cdot 4.94H_2O$. (2) Abertamy mine, Czech Republic; by electron microprobe, H_2O by microchemical methods.
(3) $Pb(UO_2)_2(V_2O_8)\cdot 5H_2O$.

Polymorphism & Series: Forms a series with francevillite.

Occurrence: In the oxidized zone of a Pb-bearing U–V deposit (Mounana mine, Gabon).

Association: Francevillite, duttonite, vanuralite, chervetite, mottramite, carnotite, dewindtite, torbernite, uranopilite, johannite, kasolite (Mounana mine, Gabon); sphalerite, galena, uraninite, quartz (Abertamy mine, Czech Republic); mottramite, metatorbernite, zeunerite (Jáchymov, Czech Republic).

Distribution: From the Mounana uranium mine, Franceville, Gabon. In the Abertamy uranium mine, near Jáchymov, and in the Geister vein, Jáchymov (Joachimsthal), Czech Republic. From Akashat, Iraq.

Name: To honor Professor Hubert Curien (1924–), French mineralogist and crystallographer, Laboratory of Mineralogy and Crystallography, University of Pierre and Marie Curie (Sorbonne), Paris, France.

Type Material: University of Pierre and Marie Curie, Paris; National School of Mines, Paris, France.

Total	[99.22]	100.17	100.00

(1) Congo; average of three analyses, original total given as 99.92%. (2) Do.
(3) $Pb_3(UO_2)_8O_8(OH)_6 \cdot 3H_2O$.

Occurrence: A secondary mineral commonly formed through alteration of uraninite.

Association: Fourmarierite, vandendriesscheite, schoepite, soddyite, kasolite, dewindtite, torbernite, rutherfordine, sklodowskite.

Distribution: At Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). From La Crouzille, Puy-de-Dôme, France. At Menzenschwand, Black Forest, and Wölsendorf, Bavaria, Germany. In the El Dorado mine, Great Bear Lake, Northwest Territories; from the Elliot Lake district and at Villeneuve, Quebec; and elsewhere in Canada. In Australia, in the Nabarlek, Jabiru, and Koongarra deposits, Northern Territory. From Malakialina, Madagascar.

Name: To honor French physicist Pierre Curie (1856–1906), student of radioactivity.

Type Material: Natural History Museum, Paris, France, 121.248; The Natural History Museum, London, England, 1924,337.

(1) Monte Somma, Italy; remainder is trivalent oxides. (2) Franklin, New Jersey, USA. (3) $Ca_4Si_2O_7F_2$.

Occurrence: In tuff ejecta (Monte Somma, Italy); in contact metamorphosed limestone (Franklin, New Jersey, USA); in melilite skarn (Dupezeh Mountain, Iraq).

Association: Augite, "hornblende," diopside, grossular, biotite, phlogopite, monticellite, wollastonite, calcite, spinel, magnetite, perovskite.

Distribution: At Monte Somma and Vesuvius, Campania, and in the Alban Hills, as at Ariccia, Lazio, Italy. From Carlingford, Co. Louth, Ireland. At Broadford and Camas Malag, Isle of Skye, and Camas Mór, Isle of Muck, Scotland. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. In the USA, at Franklin, Sussex Co., New Jersey; in the Alder district, Custer Co., Idaho; at Crestmore, Riverside Co., California; on Cascade Mountain, Adirondack Mountains, Essex Co., New York. On Dupezeh Mountain, near Hero Town, Qala-Diza region, Iraq. In the Hatrurim Formation, Israel. From Fuka, near Bicchu, and in the Sampo and Mihara mines, Kawakami, Okayama Prefecture, Japan.

Name: From the Greek *cuspis*, for a *spear*, the characteristic shape of the twinned crystals.

H_2O	13.6	13.88
Total	100.2	100.00

(1) Moctezuma mine, Mexico; average of three analyses, total Mn as Mn^{3+}, H_2O by the Penfield method on a separate sample. (2) $Fe_2TeO_6 \cdot 3H_2O$.

Occurrence: Very rare in oxidized ore in a matrix of intensely silicified and brecciated rhyolite vitrophyre cemented by drusy quartz and carrying pyrite and tellurides.

Association: Eztlite, emmonsite, schmitterite, kuranakhite, pyrite.

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: From the Nahua language for *something yellow*, in allusion to the color.

Type Material: The Natural History Museum, London, England, 1984,467.

References: (1) Willams, S.A. (1982) Cuzticite and eztlite, two new tellurium minerals from Moctezuma, Mexico. Mineral. Mag., 46, 257–259. (2) (1983) Amer. Mineral., 68, 471 (abs. ref. 1).

Cyanochroite $K_2Cu(SO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Small euhedral crystals are tabular on {001}; typically forms crystalline crusts intermixed with other soluble compounds.

Physical Properties: *Cleavage:* On $\{\bar{2}01\}$, perfect. Hardness = n.d. D(meas.) = 2.22 D(calc.) = [2.23] Soluble in H_2O.

Optical Properties: Transparent. *Color:* Greenish blue. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = 18°33'$. *Dispersion:* $r < v$, strong. $\alpha = 1.484$–1.485 $\beta = 1.486$–1.488 $\gamma = 1.502$ 2V(meas.) = $45°32'$–$46°32'$

Cell Data: *Space Group:* $P2_1/c$. $a = 6.159$ $b = 12.131$ $c = 9.086$ $\beta = 104°27'$ $Z = 2$

X-ray Powder Pattern: Synthetic.
3.673 (100), 4.179 (90), 4.057 (79), 2.975 (65), 2.377 (45), 2.816 (42), 2.993 (39)

Chemistry: (1) Analyses of natural material have not been made; identification depends on correspondence of other properties with those of synthetic material.

Mineral Group: Picromerite group.

Occurrence: A rare product of fumarolic action (Vesuvius, Italy).

Association: n.d.

Distribution: From Vesuvius, Campania, Italy. At Laurium, Greece, in slag.

Name: From the Greek for *blue* and *color*, in reference to its appearance in white light.

Type Material: Natural History Museum, Paris, France, 175.358.

Cyanophillite $Cu_5Al_2Sb_3^{3+}O_{12}(OH)\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As coatings and as spherulitic aggregates of tabular crystals, with dominant {001} and bounded by {hk0}, to 20 μm.

Physical Properties: *Cleavage:* {001}, perfect; another, {100} or {010}, good to very good. Hardness = ∼2 D(meas.) = 3.10(10) D(calc.) = 3.12

Optical Properties: Semitransparent. *Color:* Greenish blue, turquoise-blue; colorless in transmitted light. *Luster:* Pearly to silky.
Optical Class: Biaxial (–). *Orientation:* $X = c$. $\alpha = 1.640(2)$ $\beta = 1.664(2)$ $\gamma = 1.675(2)$
2V(meas.) = n.d. 2V(calc.) = 67°

Cell Data: *Space Group: Pmmb.* $a = 11.82$ $b = 10.80$ $c = 9.64$ Z = 1

X-ray Powder Pattern: Clara mine, Germany.
4.84(10), 9.67 (6), 2.59 (6), 2.44 (5), 4.59 (4), 4.46 (4), 1.917 (4)

Chemistry:

	(1)	(2)
Al_2O_3	8.5	8.77
Sb_2O_3	37.4	37.63
CuO	34.4	34.22
H_2O	19.8	19.38
Total	100.1	100.00

(1) Clara mine, Germany; by AA, Al_2O_3 and Sb_2O_5 average of two analyses, H_2O from weight loss at 200 °C; corresponds to $Cu_{10.11}Al_{3.90}Sb_{6.00}O_{24.96}\cdot 25.74H_2O$.
(2) $Cu_5Al_2Sb_3O_{12}(OH)\cdot 12H_2O$.

Occurrence: A secondary mineral associated with copper mineralization in a hydrothermal polymetallic barite–fluorite deposit.

Association: Chalcophyllite, chrysocolla, brochantite, tripuhyite, quartz, barite.

Distribution: In the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: From the Greek for *blue* and *a leaf*, in allusion to the color and habit.

Type Material: Institute of Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany.

Cyanotrichite $Cu_4Al_2(SO_4)(OH)_{12}\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Crystals are acicular [001], to 3 cm; may be cottonball-like, commonly in radially fibrous and plushlike tufted aggregates forming incrustations.

Physical Properties: Hardness = n.d. D(meas.) = 2.74–2.95 D(calc.) = 2.88

Optical Properties: Transparent to translucent. *Color:* Sky-blue to azure-blue. *Streak:* Pale blue. *Luster:* Silky.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Y = pale blue; Z = bright blue. *Orientation:* $X \perp$ elongation; $Z = c$. α = 1.588–1.591 β = 1.617–1.620 γ = 1.654–1.655 2V(meas.) = 82°

Cell Data: *Space Group:* n.d. $a = 10.16$ $b = 12.61$ $c = 2.90$ Z = 1

X-ray Powder Pattern: Grandview mine, Arizona, USA. (ICDD 11–131).
10.2 (100), 3.88 (90), 5.26 (80), 5.47 (50), 3.04 (40), 3.38 (35), 2.392 (35)

Chemistry:

	(1)	(2)
SO_3	12.19	12.43
Al_2O_3	15.59	15.82
Fe_2O_3	0.43	
CuO	47.50	49.38
CaO	0.11	
H_2O	23.20	22.37
insol.	1.46	
Total	100.48	100.00

(1) Grandview mine, Arizona, USA. (2) $Cu_4Al_2(SO_4)(OH)_{12}\cdot 2H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized portions of copper sulfide deposits.

Association: Brochantite, spangolite, chalcophyllite, olivenite, tyrolite, parnauite, azurite, malachite.

Distribution: From Moldova Nouă (Moldova), Romania. At the Cap Garonne mine, near le Pradet, Var, France. In England, from Wheal Gorland, St. Day, the Phoenix United mine, Linkinhorne, at Lanivet, and elsewhere in Cornwall; in the Old Potts Gill mine, Caldbeck Fells, Cumbria. At the Sa Duchessa mine, Sardinia, Italy. From Laurium, Greece. At the Mednorudyanskoye copper deposit, near Nizhni Tagil, Ural Mountains, Russia. From Akchagyl, Kazakhstan. From the Springbok mine, Namaqualand, South Africa. In the USA, in Arizona, exceptional specimens from the Grandview (Last Chance) mine, Grand Canyon National Park, Coconino Co.; at the Maid of Sunshine mine, Courtland, and Bisbee, Cochise Co.; from Morenci, Greenlee Co.; at Jerome, Yavapai Co. Large sprays from the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; in the American Eagle mine, Tintic district, Juab Co., Utah; at Majuba Hill, Pershing Co., and elsewhere in Nevada; fine examples from the Peacock mine, near Leadore, Lemhi Co., Idaho. At Mina la Vieja, near Potrerillos, Atacama, Chile. Other minor localities have been noted.

Name: From the Greek for *blue* and *hair*, in allusion to the typical color and habit.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 578–579.

Cylindrite $Pb_3Sn_4FeSb_2S_{14}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. In concentric spherical or tubular shells and aggregates, up to 5 cm across and 2–3 cm in length, rarely terminated; also massive.

Physical Properties: *Cleavage:* {100}, excellent. *Tenacity:* Slightly malleable. Hardness = 2.5 VHN = 54–93 (100 g load). D(meas.) = 5.42–5.49 D(calc.) = 5.443

Optical Properties: Opaque. *Color:* In reflected light, galena-white. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Weak in air, stronger in oil. *Anisotropism:* Distinct, gray to pale yellowish or brownish gray.
R_1–R_2: (400) 34.5–40.3, (420) 34.3–40.1, (440) 34.1–40.1, (460) 33.6–39.8, (480) 33.1–39.4, (500) 32.5–38.9, (520) 31.8–38.3, (540) 31.2–37.8, (560) 30.7–37.2, (580) 30.3–36.7, (600) 29.9–36.3, (620) 29.6–35.9, (640) 29.3–35.5, (660) 28.9–35.1, (680) 28.6–34.7, (700) 28.4–34.4

Cell Data: *Space Group:* Two subcells are recognized, both $P\overline{1}$: the first (pseudotetragonal) has $a = 11.733(5)$ $b = 5.790(8)$ $c = 5.810(5)$ $\alpha = 90.00(0.20)°$ $\beta = 92.38(0.20)°$ $\gamma = 93.87(0.20)°$ Z = 2 and the second (pseudohexagonal) has $a = 11.709(5)$ $b = 3.670(8)$ $c = 6.320(5)$ $\alpha = 90.00(0.20)°$ $\beta = 92.58(0.20)°$ $\gamma = 90.85(0.20)°$ Z = 2

X-ray Powder Pattern: Poopó, Bolivia.
3.85 (100), 2.885 (100), 3.9 (90), 3.06 (65), 2.849 (65), 2.044 (65), 2.026 (65)

Chemistry:

	(1)	(2)	(3)	(4)
Pb	34.91	35.5	33.72	33.70
Sn	25.38	26.8	27.37	25.74
Fe	2.79	2.7	2.70	3.03
Ag	0.39	0.5

Total	99.97	100.8	100.15	100.00

(1) Poopó, Bolivia; average of two analyses; corresponds to $Pb_{3.17}Sn_{4.02}Fe_{0.94}Ag_{0.07}Sb_{1.95}S_{14.00}$. (2) Do.; by electron microprobe; corresponds to $Pb_{3.30}Sn_{4.35}Fe_{0.93}Ag_{0.09}Sb_{1.90}S_{14.00}$. (3) Do.; by electron microprobe; corresponds to $Pb_{2.96}Sn_{4.19}Fe_{0.88}Sb_{1.75}S_{14.00}$. (4) $Pb_3Sn_4FeSb_2S_{14}$ [average from structure, not charge balanced; see ref. 3].

Occurrence: In tin-bearing hydrothermal veins.

Association: Franckeite, stannite, incaite, potosiite, teallite, jamesonite, boulangerite, cassiterite, galena, pyrite, sphalerite.

Distribution: In Bolivia, with fine examples from Poopó, in the Santa Cruz [TL] and Trinacria mines; at the Porvenir and Maria Francisca mines, Huanuni; from the Nueva Virginia vein, Colquechaca; and from the Purisima vein, all in Oruro; also from Llallagua, Potosí. In the Smirnovsk deposit, Transbaikalia, Russia.

Name: In allusion to its typical cylindrical habit.

Type Material: Mining Academy, Freiberg, Germany; The Natural History Museum, London, England, 84255.

Cymrite $BaAl_2Si_2(O,OH)_8 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* 2. As thin pseudohexagonal platelets and prisms, to 7 mm; also fibrous.

Physical Properties: *Cleavage:* Perfect on {001}, imperfect on {110}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = 3.413(5) D(calc.) = 3.447 Greenish white fluorescence under UV.

Optical Properties: Translucent. *Color:* Colorless when pure; commonly dark green or brown due to inclusions of alteration products. *Luster:* Vitreous to satiny.
Optical Class: Biaxial (–); pseudouniaxial. $\alpha = 1.611$ $\beta = 1.619$ $\gamma = 1.621$
2V(meas.) = 0°–5°

Cell Data: *Space Group:* $P2_1$. $a = 5.324$–5.334 $b = 36.6$ $c = 7.662$–7.705 $\beta = 90°$
Z = [8]

X-ray Powder Pattern: Brooks Range, Alaska, USA.
2.96 (100), 3.96 (90), 2.67 (70), 7.71 (50), 2.24 (40), 2.21 (40), 1.850 (40)

(1) Benallt mine, Wales. (2) Pacheco Pass, California, USA; by electron microprobe, theoretical H_2O added. (3) $BaAl_2Si_2O_8 \cdot H_2O$.

Occurrence: In veinlets cutting hydrothermal manganese silicate ore (Benallt mine, Wales); in a copper-bearing deposit in dolostones and siderites (Ruby Creek, Alaska, USA); in jadeite graywacke near the contact of an ultramafic rock and the Franciscan Formation (San Benito Co., California, USA); a product of high-pressure metamorphism of manganese-rich rocks (Andros Island, Greece).

Association: Ganophyllite (Benallt mine, Wales); calcite, albite, lawsonite (San Benito Co., California, USA); hyalotekite, banalsite, hyalophane, hedyphane, manganoan biotite (Långban, Sweden).

Distribution: In the Benallt mine, Rhiw, Lleyn Peninsula, Wales. From Långban, Värmland, Sweden. In the USA, from Ruby Creek, Brooks Range, Alaska, and near Pacheco Pass, San Benito Co., California. On Andros Island, Cyclades Islands, Greece. From the Lianyuan-Shaoyang area, Hunan Province, China. In the Shiramaru mine, Tokyo Prefecture, Japan. At Northwest Nelson, South Island, New Zealand. In the Saureisk deposit, Polar Ural Mountains, and near Lake Baikal, eastern Siberia, Russia. From the Black Rock and Hotazel mines, near Kuruman, Cape Province, South Africa. A number of other occurrences are known.

Name: From *Cymru*, the Welsh name for *Wales*, the locality of discovery.

Type Material: The Natural History Museum, London, England, 1944,36 and 1944,48.

(1) Sapucaia mine, Brazil; corresponds to $(Na_{0.74}Mn_{0.07}K_{0.06}Ca_{0.01})_{\Sigma=0.88}(Fe^{3+}_{2.93}Al_{0.13})_{\Sigma=3.06}(PO_4)_2(OH)_{3.84} \cdot 2H_2O$. (2) Near Torre Argentina, Sardinia, Italy; by electron microprobe, H_2O by TGA; corresponds to $(Na_{0.92}Ca_{0.06})_{\Sigma=0.98}Fe^{3+}_{2.98}(PO_4)_{2.03}(OH)_{4.00} \cdot 2.00H_2O$.
(3) $NaFe_3(PO_4)_2(OH)_4 \cdot 2H_2O$.

Occurrence: A rare accessory mineral in some oxidizing phosphate-bearing granite pegmatites and iron deposits.

Association: Dufrénite, frondelite, phosphosiderite, leucophosphite, whitlockite, kingsmountite, triphylite, rockbridgeite, strengite, phosphosiderite, jahnsite, montgomeryite, millisite, wardite, apatite, wavellite.

Distribution: From the Cyrilov pegmatite, Velké Meźiříči, Czech Republic. In the Gunheath china clay pit, St. Austell, Cornwall, England. At Rochefort-en-Terre, Bretagne, France. In Portugal, from the Vermilhas pegmatite, Vouzela; the Mangualde pegmatite, near Mesquitela; and the Bendada pegmatite, near Guarda. At Hagendorf, Bavaria, Germany. Between Torre Argentina and Punta Capuzzo, Bosa region, Sardinia, Italy. In the Kabingo pegmatites, Rwanda. From Kokpatas and Djargantan, central Kyzylkum region, Uzbekistan. At the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and in the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. In Australia, on Milgun Station, Western Australia; in the Iron Monarch quarry, Iron Knob, at the Moculta phosphate quarry, northeast of Angaston, and in the Fairview quarry, near Robertstown, South Australia; at Wycheproof, and in the Lake Boga granite quarry, near Swan Hill, Victoria. In the USA, from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, and in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota.

Name: For its occurrence in the Cyrilov pegmatite, Czech Republic.

Type Material: National Museum of Natural History, Washington, D.C., USA, 107425.

(1) Elba, Italy; by electron microprobe, H_2O by difference; corresponds to $(Ca_{3.52}K_{0.73}Na_{0.70}Cs_{0.24}Sr_{0.04})_{\Sigma=5.23}Al_{10.10}Si_{37.86}O_{96}\cdot nH_2O$. (2) Hatsuneura, Ogasawara Islands, Japan.

Mineral Group: Zeolite group.

Occurrence: Of hydrothermal origin in basalt, quartz veins, and pegmatites; in hydrothermally altered pumiceous tuffaceous sediments.

Association: Mordenite, heulandite, ferrierite.

Distribution: From San Piero in Campo, Elba, and on the Alpe di Siusi, Trentino-Alto Adige, Italy. From near Zvezdel, Rhodope Mountains, Bulgaria. In Japan, at Hatsuneura, Ogasawara Islands; Hokiya-dake, Nagano Prefecture; and in the Onoyama mine, Kagoshima Prefecture. In the USA, from Altoona, Wahkiakum Co., Washington; at Cape Lookout, Tillamook Co., and Agate Beach, Lincoln Co., Oregon; and in the Lower Geyser basin, Yellowstone National Park, Wyoming. A number of other localities are known.

Name: For Antonio D'Achiardi (1839–1902), Italian mineralogist, whose son described the mineral.

Type Material: Natural History Museum, Paris, France, 109.1084; National Museum of Natural History, Washington, D.C., USA, 123998.

(1) Madoc, Canada; by electron microprobe, corresponds to $Pb_{20.9}(Sb_{21.2}As_{1.2})_{\Sigma=22.4}S_{55.0}Cl_{0.5}$. (2) Wolfsberg, Germany; by electron microprobe, corresponds to $Pb_{21.0}Sb_{22.6}S_{55.0}Cl_{0.6}$. (3) Saint-Pons, France; by electron microprobe; corresponds to $Pb_{21.0}Sb_{23.0}S_{55.0}Cl_{1.0}$. (4) $Pb_{21}Sb_{23}S_{55}Cl$.

Occurrence: In hydrothermal veins with other sulfides and lead sulfosalt minerals.

Association: Jamesonite (Northwest Territories and Ontario, Canada); robinsonite (Pershing Co., Nevada, USA); bournonite, boulangerite, zinkenite, chalcostibite (Saint-Pons, France).

Distribution: In Canada, in the Brock zone of the Giant property, Yellowknife, Northwest Territories [TL]; and from Madoc, Ontario [TL]. In the USA, at the Red Bird mercury mine, Rye Patch district, Pershing Co., Nevada [TL]. In Germany, in the Harz Mountains, from Wolfsberg [TL], St. Andreasberg, and Harzburg. In France, at Saint-Pons, Alpes-de-Haute-Provence.

Name: To honor the Canadian mineralogist, Alexander Stewart Dadson (1906–1958), active in development of the Yellowknife gold deposits.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M30905; National School of Mines, Paris, France; The Natural History Museum, London, England, 1972,11; National Museum of Natural History, Washington, D.C., USA, 123240.

Daliranite $PbHgAs_2S_6$

Crystal Data: Monoclinic. *Point Group*: n.d. As matted nests of acicular fibers < 0.2 mm long and < 0.003 mm in diameter, elongated along [010].

Physical Properties: *Cleavage*: none discernable. *Fracture*: n.d.
Tenacity: Brittle, flexible. Hardness = < 2 D(meas.) = n.d. D(calc.) = 5.93

Optical Properties: Transparent. *Color*: Vibrant orange-red; gray in reflected light, orange-red internal reflections. *Streak*: Pale orange-red. *Luster*: Adamantine.
Optical Class: n.d.
R: (470) 32.9, (546) 30.5, (589) 34.0, (650) 39.5

Cell Data: *Space Group*: *P2*, *Pm* or *P2/m*. a = 19.113(5) b = 4.233(2) c = 22.958(8)
β = 114.78(5)° Z = 8

X-ray Powder Pattern: Zarshouran Au-As deposit, northwest Iran.
2.722 (100), 8.67 (80), 4.65 (50), 3.40 (50), 2.894 (50), 2.187 (50), 3.87 (40)

Chemistry:

	(1)	(2)
Pb	23.26	27.63
Hg	24.77	26.75
Tl	0.19	
As	18.75	19.98
S	22.48	25.65
Total	89.44	100.01

(1) Zarshouran Au-As deposit, northwest Iran, average of 8 electron microprobe analyses, corresponding to $Pb_{0.95}Tl_{0.01}Hg_{1.04}As_{2.10}S_{5.91}$. (2) $PbHgAs_2S_6$.

Occurrence: A late-stage hydrothermal mineral formed by reaction with orpiment in a Carlin-type, sediment-hosted disseminated Au-As deposit.

Association: Orpiment, quartz, rarely with galkhaite, hutchinsonite and cinnabar.

Distribution: Zarshouran Au-As deposit, 42 km north of the town of Takab, West Azarbaijan Province, northwest Iran.

Name: Honors Dr. Farahnaz Daliran (b. 1953), mineralogist and economic geologist at the University of Karlsruhe, Germany, for her research on ore deposits in Iran.

Type Material: Mineralogical Museum, Department of Materials Engineering and Physics (Mineralogy), University of Salzburg, Austria (sample nos. 14947/14948); the South Australian Museum, Adelaide, Australia (catalog no. G29976).

FeO		0.28	H_2O	0.64	
MnO		0.02	P_2O_5		0.04
			Total	100.91	99.94

(1) Ascension Island; corresponds to $(K_{1.79}Na_{0.32})_{\Sigma=2.11}Zr_{1.01}Si_{5.95}O_{15}$. (2) Dalsfjorden, Norway; by electron microprobe, average of ten analyses; corresponds to $(K_{1.90}Fe_{0.02}Mg_{0.02}Na_{0.01})_{\Sigma=1.95}(Zr_{0.90}Ti_{0.09}Al_{0.01})_{\Sigma=1.00}Si_{6.01}O_{15}$.

Occurrence: A rare accessory in ejected blocks of alkalic granite in trachytic and basaltic tuffs (Ascension Island); in syenite (Serra de Agua de Pau, Azores); in lamproite (Cancarix, Spain).

Association: Quartz, aegirine, arfvedsonite, aenigmatite (Ascension Island); sanidine, arfvedsonite, quartz, aegirine, fayalite, astrophyllite, pyrrhotite (Serra de Agua de Pau, Azores); pyrophanite, elpidite, monazite, janhaugite, kupletskite (Gjerdingen, Norway).

Distribution: On Green Mountain and Middleton Peak, Ascension Island, southern Atlantic Ocean. From Serra de Agua de Pau, São Miguel, Azores. Near Cancarix, Albacete Province, Spain. At Dalsfjorden, Sunnfjord, and Gjerdingen, near Oslo, Norway. In the Straumsvola complex, Dronning Maud Land, Antarctica. From the Murun massif, southwest of Olekminsk, and other less-well-defined localities in the Aldan Shield, Yakutia, Russia.

Name: For Reginald Aldworth Daly (1871–1957), Professor of Geology, Harvard University, Cambridge, Massachusetts, USA.

Type Material: The Natural History Museum, London, England, 64685; National Museum of Natural History, Washington, D.C., USA, 113106.

	(1)	(2)
Pb	87.04	87.45
O	[5.08]	5.07
Cl	7.29	7.48
Total	[99.41]	100.00

(1) Kombat mine, Namibia; by electron microprobe, average of four analyses; corresponds to $Pb_{4.02}O_{3.03}Cl_{1.97}$. (2) $Pb_4O_3Cl_2$.

Occurrence: From a late-stage vein cutting a banded manganese ore lens in Cu–Pb–Ag ores formed by hydrothermal and metasomatic replacement of dolostones (Kombat mine, Namibia).

Association: Jacobsite, hausmannite, hematophanite, defernite, crednerite, asisite, andradite, vesuvianite, copper, calcite, barite (Kombat mine, Namibia).

Distribution: From the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. At Laurium, Greece, in slag. Found in the Elura Zn–Pb–Ag deposit, 43 km northeast of Cobar, New South Wales, Australia.

Name: For the Damara dolostone sequence, which hosts the Kombat deposit.

Type Material: The Natural History Museum, London, England, 1988,256–257; Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany.

Danalite $Fe_4^{2+}Be_3(SiO_4)_3S$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As octahedral and dodecahedral crystals, to 10 cm; as irregular segregations.

Physical Properties: *Cleavage:* Poor on {111}, {1$\bar{1}$1}. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 3.28–3.46 D(calc.) = 3.36

Optical Properties: Semitransparent. *Color:* Yellow, pink, reddish brown, red; in thin section, colorless to pink. *Luster:* Vitreous or greasy.
Optical Class: Isotropic. n = 1.747–1.771

Cell Data: *Space Group:* $P\bar{4}3n$. a = 8.20–8.23 Z = 2

X-ray Powder Pattern: Needlepoint Mountain, Canada.
3.35 (100), 1.932 (70), 1.012 (60), 2.193 (50), 1.118 (50), 1.043 (50), 3.68 (40)

Chemistry:

(1) Redruth, England; corresponds to $(Fe^{2+}_{2.96}Mn^{2+}_{0.92}Zn_{0.34})_{\Sigma=4.22}Be_{3.32}Si_{2.78}O_{12}S$. (2) Imalka, Russia; corresponds to $(Fe^{2+}_{2.28}Mn^{2+}_{1.00}Zn_{0.19})_{\Sigma=3.47}Be_{3.48}Si_{3.02}O_{12}S$. (3) Bartlett, New Hampshire, USA; by electron microprobe, BeO calculated from stoichiometry. (4) $Fe_4Be_3(SiO_4)_3S$.

Polymorphism & Series: Forms two series, with genthelvite, and with helvite.

Occurrence: In granites, granite pegmatites, zones of contact metamorphism, skarns, and gneisses.

Association: Magnetite, garnet, fluorite (skarn); albite, cassiterite, pyrite, muscovite (tin-bearing pegmatites); arsenopyrite, quartz, chlorite (hydrothermal deposits).

Distribution: In the USA, at Rockport and Gloucester, Essex Co., Massachusetts; on Moat Mountain, Conway, Carroll Co., New Hampshire; at Iron Mountain, Sierra Co., New Mexico; and from the Black Hills, south of Jerome, Yavapai Co., Arizona. From Needlepoint Mountain, McDame area, British Columbia, and on Walrus Island, James Bay, Quebec, Canada. In Sweden, from Yxsjö, Örebro. At Redruth, St. Just, Lanlivery, Falmouth, and Lanivet, Cornwall, England. In Russia, from Imalka, Transbaikal, and other less-well-defined localities. From the Kara mine, Tasmania, and on Mt. Francisco, Ribawa area, Western Australia. In the Mihara mine, Hiroshima Prefecture, Japan.

Name: To honor James Dwight Dana (1813–1895), American geologist and mineralogist, Yale University, New Haven, Connecticut, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 85384; National Museum of Natural History, Washington, D.C., USA, 124353; The Natural History Museum, London, England, 1976,422.

Danbaite $CuZn_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* n.d. Botryoidal and spherulitic aggregates, to 0.2 mm, as rims around chromium.

Physical Properties: Hardness = 4.2 VHN = 234–288 (20 g load). D(meas.) = n.d. D(calc.) = 7.36

Optical Properties: Opaque. *Color:* Silver-white to grayish white; white with a milky blue tint in reflected light, slightly yellowish compared to chromium. *Luster:* Strong metallic.
R: (470) [71.0], (546) 68.5, (589) 67.9, (650) [66.7]

Cell Data: *Space Group:* n.d. $a = 7.7615$ $Z = 12$

X-ray Powder Pattern: Danba, China.
2.0803 (10), 2.3552 (5), 2.1574 (4), 1.3732 (4), 1.5901 (3), 1.2256 (3), 1.2154 (3)

Chemistry:

	(1)	(2)	(3)
Cu	33.12	32.52	32.70
Zn	66.70	67.47	67.30
Total	99.82	99.99	100.00

(1) Danba, China; by electron microprobe, corresponding to $Cu_{1.00}Zn_{1.96}$. (2) Do.; corresponding to $Cu_{1.00}Zn_{2.02}$. (3) $CuZn_2$.

Occurrence: In a platinum-bearing Cu–Ni deposit in a highly altered ultramafic intrusion.

Association: Chromium, pyrrhotite, pentlandite, chalcopyrite, violarite, cubanite, bornite, sphalerite, galena, linnaeite, magnetite, testibiopalladite, sudburyite, sperrylite, omeiite, gold.

Distribution: From Danba, Sichuan Province, China [TL].

Name: For the locality at Danba in China.

Type Material: n.d.

Danburite $CaB_2(SiO_4)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, rhomboidal to square in cross section, to 50 cm; also as disseminated masses.

Physical Properties: *Cleavage:* Indistinct on {001}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 7–7.25 D(meas.) = 2.93–3.02 D(calc.) = 2.99

Optical Properties: Transparent to translucent. *Color:* Colorless, white, wine-yellow, yellowish brown, greenish; colorless in thin section. *Streak:* White. *Luster:* Vitreous to greasy. *Optical Class:* Biaxial (–). *Dispersion:* $r < v$, strong. $\alpha = 1.627$–1.633 $\beta = 1.630$–1.636 $\gamma = 1.633$–1.639 2V(meas.) = $\sim 90°$

Cell Data: *Space Group: Pnam.* $a = 8.038(3)$ $b = 8.752(5)$ $c = 7.730(3)$ $Z = 4$

X-ray Powder Pattern: Maglovec Hill, Prešov, Slovakia.
3.57 (100), 2.961 (80), 2.743 (65), 2.655 (55), 2.729 (40), 1.435 (40), 3.65 (35)

Chemistry:

	(1)
SiO_2	49.18
B_2O_3	27.65
Al_2O_3	0.42
FeO	0.26
MnO	0.02
MgO	0.11
CaO	22.10
SrO	0.03
Na_2O	0.07
H_2O	0.24
Total	100.08

(1) Maglovec Hill, Prešov, Slovakia; corresponds to $(Ca_{0.97}Na_{0.01}Mg_{0.01}Fe_{0.01})_{\Sigma=1.00}(B_{1.95}Al_{0.02})_{\Sigma=1.97}Si_{2.01}O_{8.00}$.

Occurrence: In granite and metamorphosed carbonate rocks associated with hydrothermal activity; in evaporites.

Association: Titanite, axinite, tourmaline, mica, quartz, grossular, albite, fluorite, apophyllite, stilbite, datolite, bakerite, dolomite, calcite, anhydrite, gypsum.

Distribution: In the USA, at Danbury, Fairfield Co., Connecticut; and at Russell, St. Lawrence Co., New York. In Mexico, large crystals from Charcas, San Luis Potosí; and in the La Verde mine, near La Huerta, Baja California. From Alto Chapare, Cochabamba, Bolivia. In Switzerland, on the Piz Valatscha, Mt. Scopi, south of Disentis, Graubünden. In Madagascar, very large crystals from Anjanabonoina; at Maharitra, Mt. Bity; at Imalo, near Mania, south of the Betafo district; and at Sahasonjo, northeast of Andina. In Russia, from Alabashka, near Mursinka, Ural Mountains; large crystals from Vostochnaïa, Siberia, and at Dal'negorsk, Primorskiy Kray; numerous other minor occurrences. From the Mogok district, Myanmar (Burma). In Japan, from the Obira mine, Bungo, Oita Prefecture, and at Toroku, Miyazaki Prefecture.

Name: For the locality at Danbury, Connecticut, USA.

Danielsite $(Cu, Ag)_{14}HgS_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic (?). *Point Group:* n.d. As ragged polycrystalline masses of grains, up to 20 μm, in anglesite.

Physical Properties: *Tenacity:* Brittle. Hardness = 2–2.5 VHN = 38 (10 g load). D(meas.) = n.d. D(calc.) = 6.541

Optical Properties: Opaque. *Color:* Gray in polished section. *Anisotropism:* Moderate, in shades of gray. *Bireflectance:* Weak.
R_1–R_2: (470) 32–34, (546) 30–31, (589) 28–30, (650) 27–29

Cell Data: *Space Group:* n.d. $a = 9.644$ $b = 9.180$ $c = 18.156$ $Z = 4$

X-ray Powder Pattern: Coppin Pool, Western Australia.
2.622 (10), 1.959 (6), 1.875 (6), 2.392 (5), 2.831 (3), 4.44 (2), 3.648 (2)

Chemistry:

	(1)
Cu	33.9
Ag	36.5
Hg	12.3
S	16.1
Total	98.8

(1) Coppin Pool, Australia; by electron microprobe, average of four analyses; corresponds to $(Cu_{8.54}Ag_{5.43})_{\Sigma=13.97}Hg_{0.98}S_{8.05}$.

Occurrence: In a gossan pod in a quartz vein, as a weathering product derived from other sulfides.

Association: Anglesite, covellite, stromeyerite, chalcocite, cinnabar, other secondary lead and copper minerals.

Distribution: From near Coppin Pool, about 41 km east-southeast of Mount Tom Price, Western Australia.

Name: For Dr. John L. Daniels (1931–), Geoscan Pty. Ltd., who collected the material in which the species was found.

Type Material: Western Australian Museum, Perth; Museum Victoria, Melbourne, Australia.

Dannemorite $Mn_2(Fe^{2+},Mg)_5Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, fibrous, to 1 cm; columnar or asbestiform.

Physical Properties: *Cleavage:* Perfect on {110}, with intersections at ∼55° and ∼125°. *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = 3.50 D(calc.) = [3.35]

Optical Properties: Transparent to translucent. *Color:* Yellowish brown, greenish gray, colorless. *Luster:* Silky to vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = red-violet; Y = pale violet; Z = blue. *Orientation:* $Y = b$; $Z \wedge c = 15°$. *Dispersion:* $r < v$. $\alpha = 1.666$ $\beta = 1.682$ $\gamma = 1.698$ 2V(meas.) = 88°

Cell Data: *Space Group:* $C2/m$. a = 9.561 (ICDD 23-302). $b = 18.28$ $c = 5.348$ $\beta = 102.09°$ Z = 2

X-ray Powder Pattern: Väster Silfberg, Sweden. (ICDD 23-302).
8.40 (100), 3.08 (60), 3.28 (20), 2.764 (18), 4.70 (12), 2.637 (10), 2.201 (10)

Chemistry:

	(1)	(2)
SiO_2	50.74	51.6
TiO_2	0.06	0.13
Al_2O_3	0.88	0.65
Fe_2O_3	1.80

Total	99.87	97.5

(1) Uttersvik, Sweden; corresponds to $(Fe^{2+}_{3.10}Mg_{2.42}Mn_{0.96}Ca_{0.33}Fe^{3+}_{0.21}Na_{0.07}Ti_{0.01}K_{0.01})_{\Sigma=7.11}(Si_{7.80}Al_{0.16})_{\Sigma=7.96}O_{22}[(OH)_{1.99}F_{0.03}]_{\Sigma=2.02}$. (2) Haute-Maurienne, France; by electron microprobe.

Polymorphism & Series: Forms a series with tirodite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Ca + Na)_B < 1.34$; $Li < 1.0$; $Mn \geq 0.5$.

Occurrence: An uncommon mineral in metamorphosed iron-poor manganiferous rocks.

Association: Calcite, quartz, garnet.

Distribution: From Dannemora, Uppland; Uttersvik and Nävekvarn, Södermanland; in the Brunsjö mine, near Grythyttan, Örebro; and at Väster Silfberg, Värmland, Sweden. At Haute-Maurienne, Isère, France. From Guarulhos, São Paulo, Brazil. At Paddy's River mine, Australian Capital Territory, and from Broken Hill, New South Wales, Australia.

Name: For the original locality, Dannemora, Sweden.

D'ansite $Na_{21}Mg(SO_4)_{10}Cl_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As tetrahedral {211} crystals, modified by {$2\bar{1}1$} and {110}. *Twinning:* Polysynthetic twinning observed.

Physical Properties: Hardness = 2.5–3 D(meas.) = 2.63–2.655 D(calc.) = 2.60 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Colorless, yellow, pale brown.
Optical Class: Isotropic. $n = 1.488–1.489$

Cell Data: *Space Group:* $I\bar{4}3m$. $a = 15.95$ $Z = 4$

X-ray Powder Pattern: Synthetic. (ICDD 41-1473).
3.396 (100), 2.815 (100), 3.123 (60), 2.584 (40), 4.257 (30), 3.982 (30), 2.518 (25)

Chemistry:

K		
Cl	7.47	6.76
Total	100.11	100.00

(1) Jianghan Plain, China; corresponding to $Na_{21.25}Mg_{1.02}Cl_{3.35}(SO_4)_{10.00}$.
(2) $Na_{21}Mg(SO_4)_{10}Cl_3$.

Occurrence: A component of marine evaporite deposits.

Association: Vanthoffite, thénardite, blödite.

Distribution: In large amounts in the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China. From several locations in the Zechstein Basin, Germany, as in the Unstrut and the northern Harz districts.

Name: Honors Professor Jean D'Ans (1881–1969), German mineralogist, student of salt deposit chemistry, Technical University, Berlin, Germany.

Type Material: n.d.

References: (1) Autenrieth, H. and G. Braune (1958) Ein neues Salzmineral, seine Eigenschaften, sein Auftreten und seine Existenzbedingungen im System der Salze ozeanischer Salzablagerungen. Daomanite $CuPtAsS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As tabular crystals, to 0.3 mm across, with prominent {010}, {100}, {001}, {011}, commonly with curved faces. *Twinning:* On {010}, forming "elbow twins", which may be multiple.

Physical Properties: *Cleavage:* Perfect on {010}, distinct on {100}, {001}, less distinct on {110}. *Fracture:* Steplike or uneven. *Tenacity:* Brittle. Hardness = n.d. VHN = 169–175 (10 to 20 g load). D(meas.) = n.d. D(calc.) = 7.57

Optical Properties: Opaque. *Color:* Steel-gray with yellow tint; in polished section, pale greenish yellow. *Luster:* Metallic. *Pleochroism:* Distinct; yellowish with green tint. *Anisotropism:* Strong. *Bireflectance:* Distinct.
R_1–R_2: (400) 37.0–44.0, (420) 37.9–44.6, (440) 39.1–45.0, (460) 40.4–45.3, (480) 41.5–45.5, (500) 42.2–45.6, (520) 42.8–38.6, (540) 42.9–45.3, (560) 42.8–45.2, (580) 42.4–45.0, (600) 41.8–44.8, (620) 41.2–44.7, (640) 40.6–44.5, (660) 40.1–44.4, (680) 39.8–44.0, (700) 39.7–43.7

Cell Data: *Space Group:* $Amam$, $Amam$, or $Ama2_1$. $a = 5.852$ $b = 15.876$ $c = 3.756$
$Z = 4$

X-ray Powder Pattern: Yanshan Mountains, China.
2.93 (10), 3.29 (6), 7.95 (5), 1.63 (5), 1.006 (5), 0.9299 (5), 2.72 (4)

Total	100.02	100.38	100.00

(1) China; by electron microprobe, corresponds to $Cu_{0.97}Pt_{1.00}As_{0.96}S_{2.00}$. (2) Do.; by electron microprobe, corresponds to $Cu_{0.96}Pt_{1.01}As_{0.92}S_{2.00}$. (3) Do.; by electron microprobe, average of three analyses, not given, stated to correspond to $Cu_{0.96}(Pt_{0.96}Rh_{0.01})_{\Sigma=0.97}As_{1.08}S_{2.00}$. (4) $CuPtAsS_2$.

Occurrence: A replacement of bornite in contact metasomatic platinum-bearing Co–Cu sulfide mineralization in peridotite-pyroxenite at the contact with anorthosite or granite-gneiss.

Association: Bornite, chalcopyrite, carrolite, pyrite, tetrahedrite, galena, molybdenite; minor sperrylite, cooperite, moncheite, cobaltian malanite, yixunite, damiaoite.

Distribution: In China, from Sandao and Tiema villages [TL] and near Damiao village and the Yixun River, about 270 km north of Beijing, Yanshan Mounains, Hebei Province.

Name: From the last syllables of its two Chinese localities, SanDAO and TieMA villages.

Type Material: n.d.

(1) Bayan Obo deposit, China; CO_2 and H_2O by gas chromatography, original total given as 99.20%; $RE_2O_3 = Pr_6O_{11}$ 0.70%, Nd_2O_3 1.59%, Sm_2O_3 0.106%, Eu_2O_3 0.02%, Gd_2O_3 0.12%, Tb_4O_7 0.05%, Dy_2O_3 0.03%, Ho_2O_3 0.03%, Er_2O_3 0.01%, Tm_2O_3 0.01%, Yb_2O_3 0.02%, Lu_2O_3 0.01%; corresponds to $(Sr_{1.52}Ca_{0.67}Ba_{0.63}Mg_{0.11}Na_{0.03})_{\Sigma=2.96}(Ce_{0.37}La_{0.29}RE_{0.10}Al_{0.02}Fe^{3+}_{0.02})_{\Sigma=0.80}(PO_4)_{1.00}(CO_3)_{2.23}[(OH)_{0.46}F_{0.26}]_{\Sigma=0.72}$. (2) Nkombwa Hill, Zambia; by electron microprobe, average of ten partial analyses; $RE_2O_3 = Pr_2O_3$ 0.83%, Nd_2O_3 1.71%, Sm_2O_3 < 0.42%, Gd_2O_3 < 0.40%; corresponds to $(Sr_{2.69}Ba_{0.20}Ca_{0.11})_{\Sigma=3.00}(Ce_{0.50}La_{0.42}RE_{0.10})_{\Sigma=1.02}(PO_4)_{0.99}(CO_3)_{3-x}[(OH), F]_x$.

Occurrence: In rare-earth-bearing carbonatite-derived biotite dolomite at the footwall of an iron orebody (Bayan Obo deposit, China); in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in altered magnesiocarbonatite (Nkombwa Hill, Zambia).

Association: Benstonite, huntite, strontianite, pyrite, phlogopite, monazite (Bayan Obo deposit, China); albite, ancylite, pyrite, anatase, chlorite (Mont Saint-Hilaire, Canada); dolomite, monazite, isokite, apatite, strontianite, quartz (Nkombwa Hill, Zambia).

Distribution: In the western Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. From Mont Saint-Hilaire, Quebec, Canada. At the Nkombwa Hill carbonatite, Zambia.

Name: For Mt. Daqingshan, near the Bayan Obo deposit, China.

Type Material: n.d.

Total	99.45

(1) Dara-i-Pioz massif, Tajikistan; corresponds to $K_{1.23}(Na_{1.08}Li_{0.58}Ca_{0.11})_{\Sigma=1.77}Li_{0.73}(Mn_{1.31}Zn_{1.10})_{\Sigma=2.41}(Zr_{0.46}Fe_{0.26}Nb_{0.07})_{\Sigma=0.79}Si_{12}[O,(OH)]_{30}$.

Mineral Group: Milarite group.

Occurrence: In an alkalic massif.

Association: Aegirine, quartz, sogdianite, eudialyte, manganoan pectolite, polylithionite.

Distribution: In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan.

Name: For the occurrence in the Dara-i-Pioz massif, Tajikistan.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76078.

Darapskite $Na_3(NO_3)(SO_4)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular to prismatic crystals, elongated on [001] or [010], flattened on {100}, to 10 cm; less commonly as thick tabular {100} crystals with square to slightly rectangular outlines; rarely stalactitic, as flowstone, or in "flowers"; commonly in granular aggregates mixed with other saline minerals. *Twinning:* With composition plane {100}; may be polysynthetic.

Physical Properties: *Cleavage:* On {010} and {100}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.201(5) D(calc.) = 2.202 Soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 12°–13°$. *Dispersion:* $r > v$, strong. $\alpha = 1.388–1.391$ $\beta = 1.479–1.481$ $\gamma = 1.486$ 2V(meas.) = 27(1)° 2V(calc.) = 26°–33°35′

Cell Data: *Space Group:* $P2_1/m$. $a = 10.564(2)$ $b = 6.913(1)$ $c = 5.1890(9)$ $\beta = 102°47.8(0.8)'$ Z = 2

X-ray Powder Pattern: Oficina Alemania, Chile.
10.29 (100), 3.456 (35), 2.865 (35), 2.594 (30), 4.13 (25), 3.522 (25), 3.266 (18)

Chemistry:

	(1)	(2)
SO_3	32.88	32.67
N_2O_5	22.26	22.04
Na_2O	38.27	37.94
H_2O	7.30	7.35
Total	100.71	100.00

(1) Oficina Lautaro, Chile. (2) $Na_3(NO_3)(SO_4)\cdot H_2O$.

Occurrence: Widespread in commercial nitrate deposits, filling veins and cavities in cemented regolith, in an arid region (Chile); in saline arid soil (Death Valley, California, USA; Antarctica); a component of "flowers" and other cave incrustations, the nitrate probably supplied from urine and guano.

Association: Nitratine, niter, blödite, mirabilite, epsomite, halite, anhydrite.

Distribution: In Chile, in Antofagasta, from Oficina Lautaro, Pampa del Toro, Taltal district, in thick veins from Chuquicamata, and widespread in other nitrate deposits, such as those around Oficinas Alemania, María Elena, Victoria, Santa Lucia, and others; at Zapiga, Tarapacá. In Antarctica, around Mt. Erebus and in the Wright Valley, Victoria Land; in the McMurdo region. In the USA, from the Mineral Mountain mine, south of Stein's Pass, Peloncillo Mountains, Greenlee Co., Arizona; in California, in Death Valley, Inyo Co., as deposits in soil and in caves in the Funeral Mountains; in Flower Cave, southern Big Bend National Park, Texas.

Name: Honors Ludwig Darapsky (1857–1916), German–Chilean chemist and mineralogist, Santiago, Chile.

Dashkovaite $Mg(HCO_3)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibrous, to 3 mm, in porous aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Sectile. Hardness = 1 D(meas.) = n.d. D(calc.) = 1.74

Optical Properties: Semitransparent. *Color:* White, colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* X = elongation. $\alpha = 1.465(3)$ $\beta = 1.486(3)$ $\gamma = 1.516(3)$ 2V(meas.) = n.d. 2V(calc.) = 81(5)°

Cell Data: *Space Group:* $[P2_1/c]$ (by analogy to synthetic). $a = 8.64(1)$ $b = 7.15(1)$ $c = 9.38(1)$ $\beta = 98.0(1)°$ Z = 4

X-ray Powder Pattern: Korshunovskoye deposit, Russia.
3.40 (10), 4.90 (9), 4.64 (8), 3.68 (8), 4.30 (7), 5.45 (4), 4.56 (4)

Chemistry:

	(1)	(2)
C	16.2	13.17
Mn	0.2	
Mg	16.4	13.33
H	3.9	3.32
O	[63.3]	70.18
Total	[100.0]	100.00

(1) Korshunovskoye deposit, Russia; by electron microprobe, average of two analyses, C and H by high-temperature sorption in oxygen, O by difference; corresponding to $(Mg_{1.00}Mn_{0.01})_{\Sigma=1.01}(H_{1.00}C_{1.00}O_{3.00})_2 \cdot 1.87H_2O$. (2) $Mg(HCO_3)_2 \cdot 2H_2O$.

Occurrence: Rare, in hydrothermal veinlets in serpentine in dolomite marble.

Association: Shabynite, iowaite, ekaterinite, korshunovskite, halite, hydromagnesite.

Distribution: From the Korshunovskoye iron–boron skarn deposit, Irkutsk district, Siberia, Russia.

Name: To honor Ekaterina Romanova Dashkova (1744–1810), Director of the St. Petersburg Academy of Sciences and President of the Russian Academy of Sciences.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81597.

References: (1) Chukanov, N.V., D.I. Belakovskiy, S.V. Malinko, and N.I. Organova (2000) Dashkovaite $Mg(HCO_3)_2 \cdot 2H_2O$ – a new formate mineral. Zap. Vses. Mineral. Obshch., 129(6), 49–53 (in Russian with English abs.). (2) (2001) Amer. Mineral., 86, 1534 (abs. ref. 1).

Datolite $CaBSiO_4(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals typically short prismatic, with prominent {110}, {011}, or tabular on {010}, to 12 cm. Botryoidal or globular, having columnar structure; granular to compact; cryptocrystalline.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.96–3.00 D(calc.) = [3.00] Commonly fluoresces blue under SW UV.

Optical Properties: Transparent to translucent, rarely opaque. *Color:* Colorless or white, commonly with a greenish tinge; may be grayish, yellow, green, red, pink; in thin section, colorless. *Luster:* Vitreous, rarely subresinous on fracture surface.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = -1°$ to $-4°$. *Dispersion:* $r > v$, weak. $\alpha = 1.622–1.626$ $\beta = 1.649–1.654$ $\gamma = 1.666–1.670$ 2V(meas.) = 72°–75°

Cell Data: *Space Group:* $P2_1/c$. $a = 4.832(4)$ $b = 7.608(4)$ $c = 9.636(8)$ $\beta = 90.40(7)°$ $Z = 4$

X-ray Powder Pattern: St. Andreasberg, Germany. (ICDD 11-70).
3.11 (100), 2.855 (65), 2.189 (60), 3.76 (45), 1.875 (40), 1.644 (40), 2.986 (35)

Chemistry:

	(1)
SiO_2	38.00
B_2O_3	19.38
Al_2O_3	0.65
Fe_2O_3	0.28
MnO	0.39
MgO	0.09
CaO	35.39
H_2O^+	5.71
H_2O^-	0.26
Total	100.15

(1) Silver Harbour, Lake Superior, Ontario, Canada; corresponds to $(Ca_{1.02}Mg_{0.02}Mn_{0.01})_{\Sigma=1.05}B_{0.90}(Si_{1.03}Al_{0.02})_{\Sigma=1.05}O_{4.05}(OH)_{0.95}$.

Mineral Group: Gadolinite group.

Occurrence: A secondary mineral in mafic igneous rocks; in geodes in tuffs; in skarns in limestones; in serpentinites and "hornblende" schists; from some ore veins.

Association: Calcite, prehnite, zeolites, danburite, axinite, garnet.

Distribution: Widespread; some localities for fine specimens are: in Norway, from Arendal, and north of Hardangerfjiord. At St. Andreasberg, Harz Mountains, Germany. In Italy, from Serra dei Zanchetti, near Bologna, Emilia-Romagna, and from Alpe di Siusi, Trentino-Alto Adige. From the Kratzenberg, Habachtal, Austria. In Japan, from the Iwato copper mine, Miyazaki Prefecture. As exceptional crystals from Dal'negorsk, Primorskiy Kray, Russia. In the USA, large crystals from the Lane quarry, Westfield, Hampden Co., Massachusetts; in the Roncari quarry, East Granby, Hartford Co., Connecticut; from Bergen Hill, Hudson Co., Great Notch, Essex Co., and at Paterson and Prospect Park, Passaic Co., New Jersey; in the Goose Creek quarry, near Leesburg, Loudoun Co., Virginia. Very large crystals from Charcas, San Luis Potosí, Mexico.

Name: From the Greek *to divide*, in reference to the granular structure of a massive variety.

Fe_2O_3	0.72	
Bi_2O_3	89.60	92.74
Cl	7.50	7.06
H_2O	3.84	1.79
$-O = Cl_2$	1.69	1.59
Total	99.97	100.00

(1) Tazna, Bolivia. (2) $BiO(OH, Cl)$ with OH:Cl = 1:1.

Occurrence: A secondary mineral formed by alteration of bismuth or bismuthinite, intermixed with "clay" (Tazna, Bolivia).

Association: Kaolinite (?).

Distribution: From the Constancia mine, Tazna, Bolivia.

Name: For Gabriel Auguste Daubrée (1814–1896), French mineralogist and geologist.

Type Material: National Museum of Natural History, Paris, France, 94.247.

Daubréelite $Fe^{2+}Cr_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, scaly to platy, as exsolution lamellae parallel to {0001} of troilite, and as discrete grains to 500 μm across in kamacite.

Physical Properties: *Cleavage:* Distinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5 VHN = 260–303 (100 g load). D(meas.) = 3.81 D(calc.) = 3.842

Optical Properties: Opaque. *Color:* Black. *Streak:* Brown. *Luster:* Metallic, brilliant. R: (400) 33.3, (420) 33.2, (440) 33.1, (460) 33.0, (480) 33.1, (500) 33.1, (520) 33.1, (540) 33.0, (560) 33.0, (580) 32.9, (600) 32.8, (620) 32.7, (640) 32.4, (660) 32.3, (680) 32.1, (700) 31.9

Cell Data: *Space Group: Fd3m.* a = 9.966 Z = 8

X-ray Powder Pattern: Synthetic.
3.01 (10), 1.77 (10), 3.53 (8), 2.50 (8), 1.92 (8), 1.30 (8), 1.25 (8)

Chemistry:

	(1)	(2)	(3)
Fe	20.10	16.7	19.38
Mn		2.8	
Mg		0.06	
Cr	35.91	34.9	36.10
Ti		0.10	
S	42.69	44.3	44.52
Total	98.70	98.86	100.00

(1) Coahuila meteorite; average of three analyses, corresponding to $Fe_{1.08}Cr_{2.08}S_{4.00}$.
(2) Blithfield meteorite; by electron microprobe, average of 15 analyses; corresponding to $(Fe_{0.87}Mn_{0.15}Mg_{0.01})_{\Sigma=1.03}(Cr_{1.94}Ti_{0.01})_{\Sigma=1.95}S_{4.00}$. (3) $FeCr_2S_4$.

Mineral Group: Linnaeite group.

Occurrence: In small amounts in many meteorites.

Association: Troilite, kamacite, orthoenstatite, plagioclase, alabandite, graphite, schreibersite.

Distribution: In iron meteorites, such as the Coahuila [TL], North Chile, and Scottsville hexahedrites, and the Cosby's Creek, Toluca, Cranbourne, and Mundrabilla octahedrites. In stony meteorites, including the Bustee, Mayo Belwa, Norton County, and Cumberland Falls achondrites, the Hvittis and Blythfield enstatite chondrites, and Odessa olivine-bronzite chondrite. Now found in many additional meteorites.

Name: For Professor Gabriel Auguste Daubrée (1814–1896), of Paris, France, French meteorite researcher.

Type Material: n.d. [??first from the Bolson de Mapimi iron meteorite - where is it?? = Coahuila now, ck??]

(1) Murun massif, Russia; by electron microprobe, average of four analyses; corresponds to $K_{1.98}Ti_{1.01}Si_{6.01}O_{15.03}$. (2) Smoky Butte, Montana, USA; by electron microprobe. (3) $K_2TiSi_6O_{15}$.

Occurrence: In contact metamorphic rocks in an alkalic massif (Murun massif, Russia); of magmatic origin, lining vugs in lamproites (Smoky Butte, Montana, USA).

Association: Aegirine, pectolite, titanite, quartz, potassic feldspar, calcite (Murun massif, Russia); phlogopite, diopside, leucite, analcime, olivine, pseudobrookite, potassian richterite, Ca-Sr carbonates, priderite, barite (Smoky Butte, Montana, USA).

Distribution: From near the Davan Stream, in the Murun massif, southwest of Olekminsk, Yakutia, Russia. At Smoky Butte, Garfield Co., Montana, USA.

Name: For the Davan Stream, in the Murun massif, Russia.

Type Material: Geological Museum, Yakutsk Scientific Center, Academy of Sciences, Yakutsk, mk-124; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82768.

Davidite-(Ce) $(Ce, La)(Y, U, Fe^{2+})(Ti, Fe^{3+})_{20}(O, OH)_{38}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal; metamict. *Point Group:* [3 or $\overline{3}$] [by analogy to davidite-(La)]. In elongated masses, to 20 cm, with rough semi-linear outlines.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* [Brittle.] Hardness = 6 D(meas.) = 4.29 D(calc.) = n.d. Radioactive.

Optical Properties: Opaque, translucent in very thin fragments. *Color:* Black, brownish on oxidized surfaces; clove-brown in transmitted light; gray in reflected light. *Streak:* Black to very dark gray. *Luster:* Vitreous.
Optical Class: Isotropic. n = n.d.
R: n.d.

Cell Data: *Space Group:* [$R\overline{3}$.] a = n.d. c = n.d. Z = n.d.

X-ray Powder Pattern: Tuftane, Norway; after heating at 1030 °C for one hour.

Mineral Group: Crichtonite group.

Occurrence: In a pegmatite dike, rich in rare-earth minerals, in granite.

Association: Ilmenite, rutile, gadolinite, euxenite, thortveitite, xenotime, allanite, zircon.

Distribution: From Tuftane, Iveland, Norway.

Name: For its relation to *davidite* and dominant *cerium* content.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway.

Mineral Group: Crichtonite group.

Occurrence: A primary mineral in high-temperature hydrothermal veins; in norite and anorthosite; in alkalic rocks and also granite pegmatites and carbonatites.

Association: Rutile, titanite, magnetite, ilmenite, apatite, tourmaline, epidote, albite, calcite.

Distribution: In Australia, in the Olary district, at Radium Hill, Crocker's Well, and Billeroo Station, South Australia, and from Thackeringa, Broken Hill, New South Wales. In the Vishnevy Mountains, Southern Ural Mountains, Russia. At Bek-tau Alta, Kazakhstan, From Iveland, Norway. At Björko, Västervik district, Sweden. At Villanueva del Fresno, Spain. In Mozambique, very large crystals from Mavusi, Tete district; at Matema and Campangula. In the Kirumba massif, Kivu Province, Congo (Zaire). In the USA, from the Quijotoa Mountains, Pima Co., Arizona. At the Faraday mine, Bancroft, Ontario, and elsewhere in Canada. A few other localities are known.

Name: For Professor Tannatt William Edgeworth David (1858–1934), Australian geologist, University of Sydney, Sydney, Australia.

(1) Glen Davis, New South Wales, Australia; original total given as 100.25%.
(2) $NaAl(CO_3)(OH)_2$.

Occurrence: Coating vug walls and fractures in hydrothermally altered feldspathic dikes and hornfels associated with nepheline syenite (Mont Saint-Bruno, Canada); authigenic in alkaline shales and coal-bearing rocks (Green River Formation, USA; Sydney Basin, Australia); in saline soils on nepheline syenite tuffs (Olduvai Gorge, Tanzania).

Association: Fluorite, calcite, dolomite, aragonite, pyrite, quartz (Quebec, Canada); analcime, dolomite, quartz, calcite, pyrite, albite, cryolite, halite, fluorite (Green River Formation, USA).

Distribution: In Canada, in Quebec, from Mont Royal, on the campus of McGill University, and in the Francon quarry, Montreal Island, Montreal; on Mont Saint-Bruno and as large crystals at Mont Saint-Hilaire; from near Saint-Amable; at Bancroft, Ontario. Abundant in the Green River Formation, Colorado and Wyoming, USA. At Pian Castagnaio and Santa Fiora, near Mt. Amiata, Siena, Tuscany; on Monte Tondo, Terlano, Bolzano, Italy. In the Simplon Tunnel, Valais, Switzerland. At Komana, Drin Valley, Albania. From Lahóca Hill, Recsk, Mátra Mountains, Hungary. In the Khibiny massif, Kola Peninsula, Russia. From near Lake Natron, in the Olduvai Gorge area, Tanzania. From east of Tenès, Algeria. In the Sydney Coal Basin, as at Glen Davis and Muswellbrook, New South Wales, Australia. Additional localities are known.

Name: Honors John William Dawson (1820–1899), Canadian geologist and Principal of McGill University, Montreal, Canada.

Type Material: McGill University, Montreal, Canada, RMF2381A.

Deanesmithite $Hg_2^{1+}Hg_3^{2+}Cr^{6+}O_5S_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As bladed to tabular {100} crystals, dominated by {100}, with minor {320}, {001}, {$\overline{5}$10}, {01$\overline{1}$}, and a dozen other forms, to 0.5 mm; striations on {100} ‖ [001]; typically in radiating clusters and fan-shaped aggregates. *Twinning:* Indicated in reflected light.

Physical Properties: *Cleavage:* Good on {$\overline{1}$10}; fair on {001}. *Fracture:* Irregular to subconchoidal. *Tenacity:* Brittle to friable. Hardness = < 5 D(meas.) = n.d. D(calc.) = 8.06

Optical Properties: Transparent. *Color:* Red-orange; dark bluish gray to pale gray with bright yellow-orange internal reflections in reflected light. *Streak:* Less intense red-orange. *Luster:* Adamantine.
Optical Class: Biaxial. *Pleochroism:* Weak; yellow-orange to dark reddish orange.
Bireflectance: Weak.
R_1–R_2: (400) 24.8–23.1, (420) 25.2–23.1, (440) 24.8–23.15, (460) 23.8–23.3, (480) 22.9–23.6, (500) 22.1–23.8, (520) 21.3–23.5, (540) 20.5–22.9, (560) 20.1–22.05, (580) 20.0–21.7, (600) 20.0–21.55, (620) 19.9–21.3, (640) 19.7–21.0, (660) 19.6–20.8, (680) 19.4–20.45, (700) 19.25–20.3

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.1287(8)$ $b = 9.4916(7)$ $c = 6.8940(4)$
$\alpha = 100.356(6)°$ $\beta = 110.163(7)°$ $\gamma = 82.981(8)°$ Z = 2

X-ray Powder Pattern: Clear Creek claim, California, USA.
3.008 (100), 5.72 (90), 3.373 (60), 2.425 (60), 2.864 (50b), 2.774 (50), 2.536 (50)

Chemistry:

	(1)	(2)
CrO_3	8.6	8.34
HgO	[54.4]	54.19
Hg_2O	[34.9]	34.79
S	5.3	5.35
−O = S	2.6	2.67
Total	[100.6]	100.00

(1) Clear Creek claim, California, USA; by electron microprobe, average of six analyses; after recalculation with Hg_2O and HgO in the ratio 2:3, confirmed by crystal-structure analysis, corresponds to $Hg^{1+}_{1.98}Hg^{2+}_{2.97}Cr^{6+}_{1.02}O_{5.05}S_{1.95}$. (2) $Hg_2^{1+}Hg_3^{2+}CrO_5S_2$.

Occurrence: Very rare in a mercury deposit in silicate–carbonate rock hydrothermally altered from serpentinite.

Association: Cinnabar, edoylerite.

Distribution: From the Clear Creek claim, near the Clear Creek mercury mine, New Idria district, San Benito Co., California, USA.

Name: Honors Professor Deane Kingsley Smith, Jr. (1930–2001), Pennsylvania State University, University Park, Pennsylvania, USA, for his contributions to structural and experimental mineralogy.

Type Material: Canadian Geological Survey, Ottawa, Canada, 65026, 66152.

Decrespignyite-(Y) $Y_4Cu(CO_3)_4Cl(OH)_5 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, 2, or m. Rarely as thin pseudohexagonal crystals, to 50 μm, commonly curved; in stellate rosettes and as massive crusts and coatings.

Physical Properties: Hardness = ∼4 D(meas.) = 3.64(2) D(calc.) = [3.92]

Optical Properties: Transparent. *Color:* Deep Royal blue to turquoise-blue; very pale blue in transmitted light. *Streak:* Pale blue. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–). *Pleochroism:* Medium strong; X = very pale blue; $Y = Z$ = greenish blue. *Absorption:* $Z \simeq Y \gg X$. $\alpha = 1.604(4)$ $\beta = \simeq 1.638$ $\gamma = 1.638(3)$ 2V(meas.) = Very small.

Cell Data: *Space Group:* $P2/m$, $P2$, or Pm. $a = 8.899(6)$ $b = 22.77(2)$ $c = 8.589(6)$ $\beta = 120.06(5)°$ Z = 4

X-ray Powder Pattern: Paratoo mine, Australia.
6.241 (100), 7.086 (50), 3.530 (40), 22.8 (30), 7.463 (30), 4.216 (30), 3.336 (30)

Chemistry:

	(1)		(1)
CO_2	19.8	Ho_2O_3	2.6
Y_2O_3	42.2	Er_2O_3	2.5
La_2O_3	0.3	CuO	10.9
Pr_2O_3	0.1	CaO	0.5
Nd_2O_3	1.3	Cl	3.0
Sm_2O_3	1.0	H_2O	10.8
Gd_2O_3	4.8	$-O = Cl_2$	0.7
Tb_2O_3	0.4	Total	103.2
Dy_2O_3	3.7		

(1) Paratoo mine, Australia; by electron microprobe, average of seven analyses, CO_2 and H_2O by CHN analyzer, presence of CO_3^{2-} and H_2O confirmed by IR; corresponds to $(Y_{3.32}Gd_{0.24}Dy_{0.18}Ho_{0.11}Er_{0.12}Ca_{0.08}Nd_{0.07}Sm_{0.05}Tb_{0.02}La_{0.02})_{\Sigma=4.22}Cu_{1.22}(CO_3)_{4.00}Cl_{0.75}(OH)_{6.27} \cdot 2.20H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a copper deposit, the source of rare-earths enigmatic, perhaps from surrounding sediments.

Association: Caysichite-(Y), donnayite-(Y), kamphaugite-(Y), malachite, nontronite, calcite, gypsum, "limonite".

Distribution: From the Paratoo copper mine, 30 km southwest of Yunta, Olary district, South Australia.

Name: Honors Robert James Champion de Crespigny (1950–), Chairman of Normandy Mining Limited and Chairman of the South Australian Museum, for his contributions to Australian education.

Type Material: South Australian Museum, Adelaide, Australia, G25453–G25455.

H_2O	4.25	[4.25]	[4.25]	4.19
Total	100.48	[99.46]	[96.36]	100.00

(1) Laytonville district, California, USA. (2) Do.; by electron microprobe. (3) Ambin massif, Italy; by electron microprobe; H_2O and Fe^{2+}:Fe^{3+} in (2–3) assumed same as (1). (4) $Fe^{2+}_6Fe^{3+}_3Si_6O_{20}(OH)_5$.

Occurrence: In meta-ironstones and Cu-Fe sulfide deposits, in blueschist facies metasediments formed at high pressure and low temperature.

Association: Howieite, zussmanite, stilpnomelane, spessartine, riebeckite, quartz, aegirine, grunerite, aragonite, manganoan siderite, ferroan kutnohorite (Laytonville district, California, USA).

Distribution: In the USA, in California, in the Laytonville quarry, at Covelo, and at Burn's Flats, Mendocino Co.; at Ward Creek, Cazadero, Sonoma Co.; and at Panoche Pass, San Benito Co.; in Oregon, at Wild Horse Lookout, Curry Co., and in the Powers quarry, Coos Co. From Salbertrand, Viafiorcia, and Beth-Ghinivert, Piedmont, Italy. At Termignon, Haute-Savoie, France. From Sifnos, Greece. At Süpüren-Karaalan, Eskişehir Province, Turkey. From the Diahöt Valley, and at Ouegoa Koumec, New Caledonia. A few other occurrences are known.

Name: To honor Professor William Alexander Deer (1910–), mineralogist-petrologist, Cambridge University, Cambridge, England.

Type Material: National Museum of Natural History, Washington, D.C., USA, 109455; The Natural History Museum, London, England, 1964,543.

Defernite $\mathbf{Ca_6(CO_3)_{2-x}(SiO_4)_x(OH)_7(Cl,OH)_{1-2x}}$ (x 0.5)

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As anhedral platy crystals, to 2 cm, flattened on {010}; in fan-shaped forms.

Physical Properties: *Cleavage:* Perfect on {010}; distinct on {100}. *Fracture:* Conchoidal to splintery. Hardness = n.d. D(meas.) = 2.34–2.5 D(calc.) = 2.31–2.42

Optical Properties: Transparent. *Color:* Colorless to deep red or rose-brown. *Streak:* Pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = ocher-brown; Y = brownish orange to ocher-brown; Z = colorless to yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, weak. $\alpha = 1.544(2)$ $\beta = 1.580(2)$ $\gamma = 1.584(2)$ 2V(meas.) = 38(2)°

Cell Data: *Space Group: Pnam.* $a = 17.82$–17.86 $b = 22.62$–22.78 $c = 3.63$–3.66 Z = 8

X-ray Powder Pattern: Güneyce-İkizdere, Turkey.
11.37 (100), 2.899 (50), 3.045 (40), 8.29 (35), 2.418 (35), 1.962 (35), 5.68 (30)

Chemistry:

	(1)	(2)
SiO_2	1.2	3.6
FeO		0.1
MnO		1.2
MgO		0.1
CaO	62.9	65.0
Cl	3.3	3.5
H_2O^+	[19.94]	11.47
CO_2	13.4	16.3
$-O = Cl_2$	0.74	0.8
Total	[100.00]	100.5

(1) Güneyce-İkizdere, Turkey; by electron microprobe, average of 18 analyses on three samples, H_2O by difference; corresponds to $Ca_{6.00}(CO_3)_{1.62}(SiO_4)_{0.1}(OH)_{7.82}Cl_{0.50} \bullet 2.00H_2O$ (with zeolitic H_2O). (2) Kombat mine, Namibia; preferred values obtained from analysis by AA, electron microprobe, Heraeus CHN analyzer, and the Penfield method; corresponds to $(Ca_{5.90}Mn_{0.09}Mg_{0.01})_{\Sigma=6.00}(CO_3)_{1.88}(SiO_4)_{0.30}(OH)_{6.48}Cl_{0.50}$.

Occurrence: In skarn at a granite-limestone contact (Güneyce-İkizdere, Turkey); throughout a body of unbanded, granular massive hausmannite (Kombat mine, Namibia).

Association: Vesuvianite, wollastonite, andradite, diopside, calcite, rustumite, spurrite, hillebrandite (Güneyce-İkizdere, Turkey); hausmannite, hillebrandite, brucite, crednerite, barite, calcite, vesuvianite, jacobsite, hematite, copper (Kombat mine, Namibia).

Distribution: From the Güneyce-İkizdere area, Trabzon Province, Turkey. In the Kombat mine, 49 km south of Tsumeb, Namibia.

Name: For Jacques Deferne, Curator of Mineralogy, Museum of Natural History, Geneva, Switzerland.

Type Material: Museum of Natural History, Geneva, Switzerland, 435/30; National Museum of Natural History, Washington, D.C., USA, 163241.

(1) Yekaterinburg, Russia; remnant is Al_2O_3. (2) Bisbee, Arizona, USA; average of two analyses, remnant is hematite. (3) $CuFeO_2$.

Occurrence: Principally as a secondary mineral near the base of the oxidized zone of copper deposits; less commonly a primary mineral.

Association: Cuprite, copper, tenorite, malachite, hematite, kaolinite.

Distribution: In the Mednorudyanskoye copper deposit, Nizhni Tagil, near Yekaterinburg (Sverdlovsk), Ural Mountains, and elsewhere in Russia. From the Cartagenera mine, near Pedroso, Sevilla, Spain. In the Tolvaddon mine, Marazion, Cornwall, England. In Germany, from Pfaffenreuth and Waldsassen, Bavaria; in the Clara mine, near Oberwolfach, Black Forest. At Tary-Ekan, Karamazan, Tajikistan. From Mina Remolinos Nuevo, Atacama, Chile. At the Ojuela mine, Mapimí, Durango, Mexico. In the USA, good crystals from Bisbee, Cochise Co., and in the United Verde mine, Jerome, Yavapai Co., Arizona; from the Alpha mine, Kimberly, White Pine Co., and Eureka, Eureka Co., Nevada; from the Pope-Shenon copper mine near Salmon, Lemhi Co., Idaho; in the Kirwin mineralized area, Park Co., Wyoming. From Akjoujt, Mauritania. In the Malanjkhand copper deposit, north of Durg, Madhya Pradesh, India. A few other less-well-defined localities are known.

Name: For the French mineralogist and crystallographer, Gabriel Delafosse (1796–1878).

Type Material: National School of Mines, Paris, France.

(1) Mt. Shaheru, Congo; total Fe as Fe_2O_3; corrected for nepheline 2%.

Occurrence: In a kalsilite-bearing melilite-nepheline lava (Mt. Shaheru, Congo).

Association: Kalsilite, nepheline, götzenite, combeite, kirschsteinite (Mt. Shaheru, Congo); fenaksite, eudialyte, lomonosovite (Khibiny massif, Russia).

Distribution: On Mt. Shaheru, the extinct southern cone of Mt. Nyiragongo, Kivu Province, Congo (Zaire). On Mts. Rasvumchorr and Yukspor, Khibiny massif, Kola Penninsula, Russia.

Name: Honoring Fernard Delhaye (1880–1946), Belgian geologist, a pioneer in the geological exploration of the northern Kivu region of Congo (Zaire).

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM8037.

Deliensite $Fe^{2+}(UO_2)_2(SO_4)_2(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As crystals, elongated along [001], tabular on {100}, to 0.35 mm; typically in spherical aggregates and in crusts. *Twinning:* Observed on {010}, yielding a parting.

Physical Properties: *Cleavage:* On {100}, perfect; on {010}, a parting. *Tenacity:* "Weak". Hardness = 2 D(meas.) = 3.268(7) D(calc.) = 3.31 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale yellow to pale gray. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, weak.
$\alpha = [1.432]$ $\beta = 1.470(2)$ $\gamma = 1.492(2)$ 2V(meas.) = 73(2)°

Cell Data: *Space Group:* $Pnnm$ or $Pnn2$. $a = 15.908(5)$ $b = 16.274(3)$ $c = 6.903(1)$
Z = 4

X-ray Powder Pattern: Mas-d'Alary deposit, France.
5.90 (100), 7.95 (81), 3.94 (71), 2.597 (70), 3.45 (67), 3.166 (50), 2.895 (41)

Chemistry:

	(1)	(2)
SO_3	17.37	18.28
UO_3	67.63	65.29
FeO	7.42	8.20
H_2O	8.63	8.23
Total	101.05	100.00

(1) Mas-d'Alary deposit, France; by electron microprobe, average of five analyses, H_2O by TGA; corresponds to $Fe_{0.91}(UO_2)_{2.08}(SO_4)_{1.95}(OH)_{2.08} \cdot 3.18H_2O$. (2) $Fe(UO_2)_2(SO_4)_2(OH)_2 \cdot 3H_2O$.

Occurrence: A rare mineral in the oxidized portions of a uranium deposit.

Association: Uraninite, gypsum, pyrite.

Distribution: From the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France.

Name: Honors Dr. Michel Deliens (1939–), Belgian mineralogist of the Royal Belgian Institute of Natural Sciences, Brussels, Belgium, for his contributions to uranium mineralogy.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC4718.

References: (1) Vochten, R., N. Blaton, and O. Peeters (1997) Deliensite, $Fe(UO_2)_2(SO_4)_2(OH)_2 \cdot 3H_2O$, a new ferrous uranyl sulfate hydroxyl hydrate from Mas d'Alary, Lodève, Hérault, France. Can. Mineral., 35, 1021–1025. (2) (1998) Amer. Mineral., 83, 653 (abs. ref. 1).

Delindeite $(Na,K)_3(Ba,Ca)_4(Ti,Fe,Al)_6Si_8O_{26}(OH)_{14}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As lath-shaped crystals or flakes, forming compact spherulitic aggregates, to 1 mm. *Twinning:* Submicroscopic on {100}, common.

Physical Properties: *Cleavage:* {001}, good. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.3(1) D(calc.) = 3.70(1)

Optical Properties: Translucent. *Color:* Pale pinkish gray. *Luster:* Resinous, pearly. *Optical Class:* Biaxial (+). $\alpha = 1.790(5)$ $\beta = 1.825(5)$ $\gamma = [1.982]$ 2V(meas.) = Moderate. 2V(calc.) = 54°

Cell Data: *Space Group:* $C2/m$ or subgroup. $a = 21.617(13)$ $b = 6.816(5)$ $c = 5.383(3)$ $\beta = 94.03(5)°$ Z = 1

X-ray Powder Pattern: Diamond Jo quarry, Arkansas, USA.
10.80 (100), 2.888 (31), 3.083 (28), 3.54 (24), 2.806 (20), 2.262 (18), 2.753 (16)

Chemistry:

	(1)
SiO_2	27.10
TiO_2	23.02
Al_2O_3	1.10
Fe_2O_3	2.54
MgO	0.00
CaO	0.61
BaO	33.05
Na_2O	3.79
K_2O	1.47
H_2O	[7.32]
Total	[100.00]

(1) Diamond Jo quarry, Arkansas, USA; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponds to $(Na_{2.16}K_{0.55})_{\Sigma=2.71}(Ba_{3.80}Ca_{0.19})_{\Sigma=3.99}(Ti_{5.08}Fe_{0.56}Al_{0.34})_{\Sigma=5.98}(Si_{7.96}Al_{0.04})_{\Sigma=8.00}[O_{32.83}(H_2O)_{7.17}]_{\Sigma=40.00}$.

Occurrence: In vugs and miarolitic cavities, as a weathering product of titaniferous nepheline syenite.

Association: Pectolite, barite, labuntsovite, lourenswalsite, pyroxene, titanite, sphalerite, potassic feldspar.

Distribution: Found in the Diamond Jo quarry, Magnet Cove, Hot Spring Co., Arkansas, USA.

Name: In honor of amateur mineralogist Henry deLinde of Mabelvale, Arkansas, USA, owner of the Diamond Jo quarry.

Type Material: n.d.

References: (1) Appleman, D.E., H.T. Evans, Jr., G.L. Nord, E.J. Dwornik, and C. Milton (1987) Delindeite and lourenswalsite, two new titanosilicates from the Magnet Cove region, Arkansas. Mineral. Mag., 51, 417–425. (2) (1988) Amer. Mineral., 73, 1493–1494 (abs. ref. 1).

Dellaite $Ca_6Si_3O_{11}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals are bladed, in thin veinlets and patches, to 2 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.975

Optical Properties: Semitransparent (?). *Color:* [White (?).]
Optical Class: Biaxial (–) (synthetic). $\alpha = 1.650$ $\beta = 1.661$ $\gamma = 1.664$ 2V(meas.) = $< 30°$

Cell Data: *Space Group:* $P\overline{1}$ (synthetic). $a = 6.815$ $b = 6.934$ $c = 12.882$ $\alpha = 90.67°$ $\beta = 97.70°$ $\gamma = 98.14°$ Z = 2

X-ray Powder Pattern: Synthetic. (ICDD 29-376).
2.821 (100), 2.551 (80), 2.806 (70), 3.059 (50), 2.856 (50), 2.982 (45), 2.730 (45)

Chemistry: No chemical analysis appears to have been published.

Occurrence: In late-stage, fracture-controlled replacement veins cutting thermally metamorphosed limestones.

Association: Calcite, spurrite, kilchoanite, foshagite, tilleyite.

Distribution: From near Kilchoan, Ardnamurchan, Argyllshire, Scotland.

Name: To honor Della Martin Roy (1926–), Pennsylvania State University, University Park, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119426.

References: (1) Agrell, S.O. (1965) Polythermal metamorphism of limestones at Kilchoan, Ardnamurchan. Mineral. Mag., 34, 1–15. (2) (1965) Amer. Mineral., 50, 2104–2105 (abs. ref. 1).

Deloneite-(Ce) $NaCa_2SrCe(PO_4)_3F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. Granular, to 1.5 mm.

Physical Properties: *Cleavage:* On $\{10\overline{1}0\}$ and $\{0001\}$. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.92(5) D(calc.) = 3.95

Optical Properties: Transparent. *Color:* Bright yellow. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.682(2)$ $\epsilon = 1.660(2)$

Cell Data: *Space Group:* $P3$. $a = 9.51(1)$ $c = 7.01(1)$ Z = 2

X-ray Powder Pattern: Mt. Koashva, Kola Peninsula, Russia.
2.84 (100b), 3.12 (40), 2.753 (40), 3.51 (30), 1.967 (30), 1.870 (30), 2.288 (20)

Chemistry:

	(1)		(1)
P_2O_5	30.71	CaO	14.77
SiO_2	0.74	SrO	18.19
ThO_2	0.02	BaO	0.10
Y_2O_3	0.02	Na_2O	4.45
La_2O_3	8.12	K_2O	0.07
Ce_2O_3	13.15	F	2.03
Pr_2O_3	1.13	H_2O	[0.38]
Nd_2O_3	3.81	$-O = F_2$	0.85
Sm_2O_3	0.34	Total	97.18

(1) Mt. Koashva, Kola Peninsula, Russia; by electron microprobe, corresponds to $(Na_{0.96}K_{0.01})_{\Sigma=0.97}Ca_{1.77}Sr_{1.18}(Ce_{0.54}La_{0.34}Nd_{0.15}Pr_{0.04}Sm_{0.02})_{\Sigma=1.09}[(P_{0.97}Si_{0.03})_{\Sigma=1.00}O_4]_3[F_{0.72}(OH)_{0.28}]_{\Sigma=1.00}$.

Occurrence: In the natrolite core of a pegmatite in a differentiated alkalic massif.

Association: Fluorcaphite, belovite-(Ce), lomonosovite, sitinakite, fluorite.

Distribution: From Mt. Koashva, Khibiny massif, Kola Peninsula, Russia.

Name: To honor Boris Nikolaevich Delone (1890–1980), crystallographer and mathematician, Mathematics Institute, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

References: (1) Khomyakov, A.P., D.V. Lisitsin, I.M. Kulikova, and R.K. Rastsvetaeva (1996) Deloneite-(Ce) $NaCa_2SrCe(PO_4)_3F$ – a new mineral with a belovite-like structure. Zap. Vses. Mineral. Deloryite $Cu_4(UO_2)(MoO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, tabular on {010}, elongated along [001], with arcuate terminations, to 3 mm; typically in rosettes of subparallel individuals.

Physical Properties: *Cleavage:* Perfect on {010} and {100}; good on {001}. *Fracture:* Conchoidal. Hardness = 4 D(meas.) = 4.9(1) D(calc.) = 4.78 Radioactive.

Optical Properties: Transparent to nearly opaque. *Color:* Dark green to black; yellow-green in transmitted light. *Streak:* Green. *Luster:* Vitreous to greasy. *Optical Class:* Biaxial (+). *Orientation:* $Z = b$; $X \wedge c = 21.9°$; $Y \wedge a = 36.2°$. *Dispersion:* $r > v$, strong. $\alpha = 1.90(3)$ $\beta = 1.93(3)$ $\gamma = 1.96(3)$ 2V(meas.) = 90° 2V(calc.) = 91.3(1)°

Cell Data: *Space Group:* $C2/m$. $a = 19.94(1)$ $b = 6.116(2)$ $c = 5.520(3)$ $\beta = 104.18(5)°$ Z = 2

X-ray Powder Pattern: Cap Garonne mine, France.
4.100 (100), 3.734 (90), 4.815 (80), 2.482 (60), 4.425 (40), 4.276 (40), 3.254 (40)

Chemistry:

	(1)	(2)
MoO_3	29.16	30.43
SO_3	0.27	
UO_3	31.78	30.23
Al_2O_3	0.10	
CuO	33.36	33.63
H_2O	5.8	5.71
Total	100.47	100.00

(1) Cap Garonne mine, France; by electron microprobe, average of three analyses, H_2O by TGA, $(MoO_4)^{2-}$ and $(OH)^{1-}$ shown present by IR; corresponds to $Cu_{3.96}(UO_2)_{1.05}Al_{0.02}(MoO_4)_{1.91}(SO_4)_{0.03}(OH)_{6.08}O_{0.06}$. (2) $Cu_4(UO_2)(MoO_4)_2(OH)_6$.

Occurrence: Very rare in the oxidized portion of a uranium deposit in sandstone.

Association: Metazeunerite, atacamite, paratacamite, malachite, barite.

Distribution: From the Cap Garonne mine, near le Pradet, Var, France.

Name: Honors Jean Claude Delory (1953–), French mineral collector and land surveyor, Toulon, France, who collected the first specimens.

Type Material: Natural History Museum, Geneva, Switzerland, 435/82.

References: (1) Sarp H. and P.J. Chiappero (1992) Deloryite, $Cu_4(UO_2)(MoO_4)_2(OH)_6$, a new mineral from the Cap Garonne mine near Le Pradet, Var, France. Neues Jahrb. Mineral., Monatsh., 58–64. Delrioite $CaSrV_2^{5+}O_6(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m or $2/m$. As radial aggregates of tiny acicular crystals, intimately intergrown in parallel orientation with metadelrioite. *Twinning:* On {100}, not uncommon.

Physical Properties: Hardness = ∼2 D(meas.) = 3.1(1) D(calc.) = 3.16 Readily soluble in H_2O; reversibly dehydrated.

Optical Properties: Translucent. *Color:* Pale yellow-green to darker green on exposed surfaces, probably the result of photoreduction of some of the vanadium. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–); properties composite with metadelrioite. *Pleochroism:* X = colorless; Y = pale yellow; Z = deeper yellow. *Orientation:* Z = elongation; extinction parallel. $\alpha = 1.783(3)$ $\beta = 1.834(3)$ $\gamma = 1.866(3)$ 2V(meas.) = Medium to large.

Cell Data: *Space Group:* Ia or $I2/a$. $a = 17.170(3)$ $b = 7.081(1)$ $c = 14.644(4)$ $\beta = 102°29(1)'$ Z = 8

X-ray Powder Pattern: Jo Dandy mine, Colorado, USA.
6.52 (vs), 3.54 (s), 4.39 (ms), 3.26 (ms), 2.794 (ms), 2.174 (m), 4.19 (w)

Chemistry:

	(1)	(2)
V_2O_5	46.6	43.97
CaO	13.5	13.56
SrO	24.8	25.05
H_2O^+	5.7	17.42
H_2O^-	9.4	
Total	[100.0]	100.00

(1) Jo Dandy mine, Colorado, USA; an estimated 5:1 mixture with metadelrioite, $CaSrV_2O_6(OH)_2$, recalculated to 100% after deduction of quartz 1.30%.
(2) $CaSrV_2O_6(OH)_2 \cdot 3H_2O$.

Occurrence: An efflorescence on sandstone of the Salt Wash member of the Jurassic Morrison Formation associated with a U–V deposit.

Association: Metadelrioite, rossite, metarossite, quartz.

Distribution: From a dump at the Hummer portal of the Jo Dandy mine, Bull Canyon district, Paradox Valley, Montrose Co., Colorado, USA.

Name: For Mexican mineralogist Andrés Manuel del Rio (1764–1849), who first discovered vanadium in North America.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128296.

Total	99.41	99.55

(1) Berneau, Belgium; corresponds to $(Ca,Mg)_{1.00}(Fe^{3+},Al)_{4.10}(PO_4,SO_4,CO_3)_{2.74}(OH)_8 \cdot 5.71H_2O$. (2) Leoben, Austria; corresponds to $(Ca,Mg)_{1.00}(Fe^{3+},Al)_{4.10}(PO_4,SO_4,CO_3)_{2.18}(OH)_8 \cdot 4.72H_2O$.

Occurrence: In gossan (Nenačovice, Czech Republic).

Association: Diadochite, vivianite, pitticite, melanterite, "limonite".

Distribution: From Berneau, Richelle, and Argenteau, all near Visé, Belgium. At Tollinggraben, Leoben, Styria, Austria. From Nenačovice and Trubín, Czech Republic. At Železník (Vashegy), Slovakia. From Fouchères, Aube, France. In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan. From the St. John's quarry, near Kapunda, Mount Lofty Ranges, South Australia. Possibly from a number of other places, but modern confirmation is required.

Name: In honor of J.S.P.J. Delvaux de Feuffe (1782–1863), Belgian chemist, who first analyzed the mineral.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. H_2O	4.2	4.15
Total	100.3	100.00

(1) Musonoi mine, Congo; H_2O by the Penfield method; corresponds to $Pb_{1.87}Cu_{4.93}(UO_2)_{2.08}(SeO_3)_6(OH)_{6.04} \cdot 2H_2O$. (2) $Pb_2Cu_5(UO_2)_2(SeO_3)_6(OH)_6 \cdot 2H_2O$.

Occurrence: Rare in the lower oxidized portions of a selenium-bearing Cu–Co deposit.

Association: Cuprosklodowskite, kasolite, guilleminite, derriksite, chalcomenite, malachite, selenian digenite.

Distribution: From the Musonoi Co–Cu mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Gaston Demesmaeker (1911–), Belgian mining geologist, Director, Geological Department, Union Minière du Haut Katanga.

Type Material: University of Pierre and Marie Curie, Paris, 9.097; Natural History Museum, Paris, 181.36; National School of Mines, Paris, France; The Natural History Museum, London, England, 1969,46.

Demicheleite-(I) BiSI

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. Crystals, acicular to stout prismatic, to 0.25 mm; with forms {110} and {111} by analogy to demicheleite-(Br).

Physical Properties: *Cleavage*: None observed. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 6.411

Optical Properties: Translucent. *Color*: Dark red to black. *Streak*: Brown. *Luster*: Submetallic. *Optical Class*: n.d.

Cell Data: *Space Group*: *Pnam*. *a* = 8.4501(7) *b* = 10.1470(9) *c* = 4.1389(4) Z = 4

X-ray Powder Pattern: La Fossa crater, Vulcano Island, Sicily, Italy. 6.490 (100), 4.346 (94), 3.896 (90), 2.709 (60), 2.161 (38), 3.243 (22), 2.999 (22)

Chemistry:

	(1)	(2)
Bi	58.32	56.80
S	9.43	8.71
I	23.69	34.49
Br	5.66	
Cl	1.01	
Total	98.11	100.00

(1) La Fossa crater, Vulcano Island, Sicily, Italy; electron microprobe analysis, corresponding to $Bi_{0.97}S_{1.03}(I_{0.65}Br_{0.25}Cl_{0.10})_{\Sigma=1.00}$. (2) BiSI.

Occurrence: A product of fumarolic alteration of pyroclastic breccia.

Association: Demicheleite-(Br), bismoclite, bismuthinite, aiolosite, godovikovite, panichiite, brontesite, adranosite.

Distribution: La Fossa crater, Vulcano Island, Aeolian archipelago, Sicily, Italy.

Name: Honors Vincenzo de Michele (b. 1936), former curator of the Natural History Museum, Milan, Italy, and for its chemical composition.

Type Material: Department of Structural Chemistry and Inorganic Stereochemistry, University of Milan, Italy (reference collection 2009-02).

References: (1) Demartin, F., C.M. Gramaccioli, and I. Campostrini (2010) Demicheleite-(I), BiSI, a new mineral from La Fossa Crater, Vulcano, Aeolian Islands, Italy. Mineral. Mag., 74, 141–145. (2) (2010) Amer. Mineral., 95, 1596 (abs. ref. 1).

Denisovite $(K,Na)Ca_2Si_3O_8(F,OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. As acicular crystals, in parallel columnar aggregates, to 15 cm.

Physical Properties: *Cleavage:* Cleavage or parting observed ⊥ elongation of crystals. *Fracture:* Splintery. *Tenacity:* Brittle. Hardness = 4–5 D(meas.) = 2.76 D(calc.) = 2.81

Optical Properties: Semitransparent. *Color:* Light gray to greenish gray; colorless to faint yellow in thin section. *Luster:* Pearly to silky.
Optical Class: Biaxial (+). α = 1.565–1.569 β = 1.566–1.570 γ = 1.574–1.578
2V(meas.) = 20°–30°

Cell Data: *Space Group:* n.d. $a = 30.92(7)$ $b = 7.20(3)$ $c = 18.27(5)$ $\beta = 95°$ Z = 20

X-ray Powder Pattern: Khibiny massif, Russia.
3.32 (100), 2.75 (100), 3.24 (90), 3.03 (90), 3.65 (80), 3.08 (80), 2.79 (80)

Chemistry:

			Total	99.44	[97.88]

(1) Khibiny massif, Russia; after deduction of small amounts of contaminant minerals, corresponds to $(K_{0.68}Na_{0.32})_{\Sigma=1.00}(Ca_{1.95}Mn_{0.04}Sr_{0.01})_{\Sigma=2.00}Si_{3.00}O_8[F_{0.54}(OH)_{0.46}]_{\Sigma=1.00}$.
(2) Murun massif, Russia; by electron microprobe, average of 11 grains, original total given as 98.88%; corresponds to $(K_{0.69}Na_{0.26}Mn_{0.05}Fe_{0.02}Mg_{0.01})_{\Sigma=1.03}(Ca_{1.97}Sr_{0.02}Mn_{0.01})_{\Sigma=2.00}(Si_{2.94}Al_{0.05})_{\Sigma=2.99}O_8F_{0.56}$.

Occurrence: In nepheline syenite in a differentiated alkalic massif (Khibiny massif, Russia).

Association: Nepheline, potassic feldspar, aegirine, fluorite, apatite, biotite, yuksporite (Khibiny massif, Russia): aegirine, kalsilite, feldspar (Murun massif, Russia).

Distribution: On Mts. Eveslogchorr and Yukspor, Khibiny massif, Kola Peninsula, and in the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: Honors Aleksander Petrovich Denisov (1918–1972), Russian specialist in X-ray investigations of minerals, of the Kola Scientific Center, Ruisia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5774/1–2; Mining Institute, St. Petersburg, 1295/1–2; Il'menskii Preserve Museum, Miass, 5392; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82762, vis4773; The Natural History Museum, London, England, 1994,7.

Denningite $(Ca, Mn^{2+})(Mn^{2+}, Zn)(Te_2^{4+}O_5)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Rare as octagonal thin platy crystals, flattened on {001}, with {001}, {110}, and {100}, to 4 mm; most commonly in cleavable masses.

Physical Properties: *Cleavage:* Perfect on {001}. *Fracture:* Conchoidal. Hardness = 4
D(meas.) = 5.05(5) D(calc.) = 5.07

Optical Properties: Translucent to transparent. *Color:* Pale green to pale gray, may be colorless; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+), may be biaxial. $\omega = 1.89(1)$ $\epsilon = 2.00(1)$ 2V(meas.) = 0°–15°

Cell Data: *Space Group:* $P4_2/nbc$. $a = 8.82(5)$ $c = 13.04(5)$ Z = 4

X-ray Powder Pattern: Moctezuma mine, Mexico.
4.42 (vs), 3.38 (s+), 3.12 (s), 2.62 (s), 2.03 (s), 1.53 (ms), 6.26 (m)

Chemistry:

	(1)
TeO_2	82.34
MnO	10.28
ZnO	2.63
CaO	4.23
H_2O	0.03
excess O	0.09

rem.	0.27
Total	99.90

(1) Moctezuma mine, Mexico; Mg determined spectrographically, after deduction of minor components corresponds to $(Ca_{0.60}Mn_{0.40})_{\Sigma=1.00}(Mn_{0.72}Zn_{0.24}Mg_{0.04})_{\Sigma=1.00}(Te_2O_5)_{2.01}$.

Occurrence: In a hydrothermal Au–Te deposit.

Association: Tellurium, tellurite, paratellurite, spiroffite, zemannite.

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: To honor Reynolds McConnell Denning (1916–1967), Professor of Mineralogy, University of Michigan, Ann Arbor, Michigan, USA.

Type Material: Natural History Museum, Paris, 175.81; National School of Mines, Paris, France; Royal Ontario Museum, Toronto, Canada, M25000–M25005.

Derbylite $(Ti, Fe^{3+}, Fe^{2+})_7Sb^{3+}O_{13}(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, to 2 mm, elongate along [001], showing many forms, mostly $\{hk0\}$; in small grains. *Twinning:* On {011} or $\{\overline{1}53\}$, commonly as cruciform twins and trillings.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = 5 VHN = 1033–1121 (100 g load). D(meas.) = 4.53–4.62 D(calc.) = [4.50]

Optical Properties: Opaque, translucent in small grains. *Color:* Pitch-black; dark brown when translucent; in reflected light, gray with bluish green internal reflections. *Luster:* Resinous to metallic.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 2.45$ $\beta = 2.45$ $\gamma = 2.51$
2V(meas.) = $\sim 0°$
R_1–R_2: (400) 22.1–23.6, (420) 21.3–22.8, (440) 20.5–22.0, (460) 19.8–21.2, (480) 19.2–20.4, (500) 18.8–19.9, (520) 18.4–19.6, (540) 18.1–19.3, (560) 17.8–19.0, (580) 17.6–18.7, (600) 17.4–18.5, (620) 17.3–18.4, (640) 17.1–18.2, (660) 16.9–18.0, (680) 16.8–17.8, (700) 16.7–17.7

Cell Data: *Space Group:* $P2_1/m$. $a = 7.156$–7.160 $b = 14.347$–14.354 $c = 4.970$–4.980 $\beta = 104.61°$–$104.69°$ Z = 2

X-ray Powder Pattern: Buca della Vena mine, Italy.
2.853 (100), 2.674 (73), 3.186 (43), 3.118 (33), 2.479 (23), 2.393 (23), 3.997 (18)

Chemistry:

	(1)	(2)
TiO_2	36.6	40.20
Al_2O_3	3.8	
Fe_2O_3	36.0	31.83
Cr_2O_3	0.3	
Sb_2O_3	21.5	19.80
FeO		4.44
H_2O	[1.3]	[1.24]
Total	[99.5]	[97.51]

(1) Tripuhy, Brazil; by electron microprobe, H_2O calculated for one (OH). (2) Buca della Vena mine, Italy; by electron microprobe, Ti by AA, Fe^{2+}:Fe^{3+} separately determined, H_2O calculated for one (OH); corresponds to $(Ti_{3.66}Fe^{3+}_{2.90}Fe^{2+}_{0.45})_{\Sigma=7.01}Sb^{3+}_{0.99}O_{13.11}(OH)$.

Occurrence: In cinnabar-bearing placer gravels (Tripuhy, Brazil); in microcrystalline barite and in cavities within metasomatically mineralized dolostones (Buca della Vena mine, Italy).

Association: Roméite, tripuhyite, monazite, xenotime, zircon, rutile, hematite, muscovite (Tripuhy, Brazil); pyrite, sphalerite, bournonite, schafarzikite, versiliaite, apuanite, dolomite, barite (Buca della Vena mine, Italy).

Distribution: From around Tripuhy, near Ouro Preto, Minas Gerais, Brazil. In the Buca della Vena iron mine, north of Stazzema, Apuan Alps, Tuscany, Italy.

Name: For the American geologist Orville Adelbert Derby (1851–1915), at one time Director of the Brazilian Geological Survey.

Type Material: The Natural History Museum, London, England, 80143.

Derriksite $Cu_4(UO_2)(Se^{4+}O_3)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As well-formed wedgelike crystals, elongated along [001], flattened on {100}, to 0.7 mm, exhibiting {010}, {100}, {110}, and {121}; typically forms incrustations.

Physical Properties: *Cleavage:* On {010}, very good. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.61 Radioactive.

Optical Properties: Semitransparent. *Color:* Dark green to bottle-green. *Optical Class:* Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.77$ $\beta = [1.85]$ (β') $\gamma = [1.89]$ (γ') 2V(meas.) = 68(19)°

Cell Data: *Space Group:* $Pn2_1m$. $a = 5.570(2)$ $b = 19.088(8)$ $c = 5.965(2)$ Z = 2

X-ray Powder Pattern: Musonoi mine, Congo.
4.78 (FFF), 4.072 (FF), 3.748 (FF), 4.352 (F), 3.218 (F), 5.35 (mF), 4.197 (mF)

Chemistry:

	(1)	(2)
SeO_2	24.87	25.21
UO_3	32.67	32.50
CuO	35.67	36.15
H_2O	8.10	6.14
Total	101.31	100.00

(1) Musonoi mine, Congo; by electron microprobe, H_2O partially adsorbed.
(2) $Cu_4(UO_2)(SeO_3)_2(OH)_6$ confirmed by crystal-structure analysis.

Occurrence: Very rare in the oxidized portions of a selenium-bearing Cu–Co deposit.

Association: Selenian digenite, chalcomenite, demesmaekerite, malachite.

Distribution: From the Musonoi Cu–Co mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Jean Marie François Joseph Derriks (1912–1993), Belgian geologist who studied the Shinkolobwe uranium deposit.

Type Material: University of Pierre and Marie Curie, Paris, 204, 12.251; Natural History Museum, Paris, 181.35; National School of Mines, Paris, France, 9.104.

$H_2O + CO_2$	[41.08]	38.15	39.43
Total	[100.00]	99.11	100.00

(1) Cedar Hill quarry, Pennsylvania, USA; by electron microprobe, CO_2 confirmed by effervescence in HCl; total Mn as Mn_2O_3, $H_2O + CO_2$ by difference. (2) Shiraki, Japan; by AA. (3) $Mg_6Mn_2^{3+}(CO_3)(OH)_{16}\cdot 4H_2O$.

Mineral Group: Hydrotalcite group.

Occurrence: Abundantly, in fractures in serpentinite breccia, with other secondary magnesium minerals, the last mineral to form (California, USA); in ultramafics in faults in sediments (Shiraki, Japan).

Association: Brucite, artinite (California, USA); aragonite, hydrotalcite, rhodochrosite, manganese oxides (Shiraki, Japan).

Distribution: In the USA, from the Cedar Hill quarry, Lancaster Co., Pennsylvania, and at the Coalinga asbestos mine and the Herman Akers prospect, New Idria district, San Benito Co., California. In Japan, from Shiraki, Mie Prefecture, and Konomori, Kochi Prefecture.

Name: To honor Paul Ernest Desautels (1920–1991), Curator of Mineralogy, National Museum of Natural History (Smithsonian Institution), Washington, D.C., USA.

Type Material: Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 120219.

Descloizite $PbZn(VO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, equant or pyramidal {111}, prismatic [001] or [100], or tabular {100}, with {101}, {201}, many others, rarely skeletal, to 5 cm, commonly in drusy crusts, stalactitic or botryoidal, coarsely fibrous, granular to compact, massive.

Physical Properties: *Fracture:* Small conchoidal to uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = ∼6.2 D(calc.) = 6.202

Optical Properties: Transparent to nearly opaque. *Color:* Brownish red, red-orange, reddish brown to blackish brown, nearly black. *Streak:* Orange to brownish red. *Luster:* Greasy. *Optical Class:* Biaxial (–), rarely biaxial (+). *Pleochroism:* Weak to strong; $X = Y =$ canary-yellow to greenish yellow; $Z =$ brownish yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong; rarely $r < v$. $\alpha = 2.185(10)$ $\beta = 2.265(10)$ $\gamma = 2.35(10)$ 2V(meas.) = ∼90°

Cell Data: *Space Group: Pnma.* $a = 7.593$ $b = 6.057$ $c = 9.416$ Z = 4

X-ray Powder Pattern: Venus mine, [El Guaico district, Córdoba Province,] Argentina; close to mottramite.
3.23 (vvs), 5.12 (vs), 2.90 (vs), 2.69 (vsb), 2.62 (vsb), 1.652 (vs), 4.25 (s)

(1) Abenab, Namibia. (2) $Pb(Zn, Cu)(VO_4)(OH)$ with Zn:Cu = 1:1.

Polymorphism & Series: Forms a series with mottramite.

Mineral Group: Descloizite group.

Occurrence: A secondary mineral in the oxidized zone of vanadium-bearing base metal deposits; rarely an ore of vanadium.

Association: Mottramite, vanadinite, pyromorphite, mimetite, wulfenite, cerussite.

Distribution: Many localities. From "Sierra de Córdoba," Córdoba Province, Argentina. At Los Lamentos and Santa Eulalia, Chihuahua, Mexico. In the USA, in the Mammoth-St. Anthony mine, Tiger, Pinal Co., and from Bisbee, Cochise Co., Arizona; in the Caballo Mountains district, Sierra Co., and several mines around Georgetown, Grant Co., New Mexico; from the Chalk Mountain mine, Churchill Co., Nevada. Large crystals from an economic deposit at Berg Aukas, near Grootfontein; at Abenab; from Tsumeb; and elsewhere in the Otavi district, Namibia. At Kabwe (Broken Hill), Zambia. From M'fouti and Ruwe, Congo Republic. In the Gowde mine, Great Salt Desert, Iran. At Obir, Carinthia, Austria. From Mežica (Mies), Slovenia. In the Prequica mine, Cobral d'Adrea, Portugal.

Name: To honor Alfred Lewis Oliver Legrand Des Cloizeaux (1817–1897), Professor of Mineralogy, University of Paris, Paris, France, who first described the mineral.

Despujolsite $Ca_3Mn^{4+}(SO_4)_2(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. As hexagonal prisms, to 0.5 mm, displaying dominant $\{10\bar{1}0\}$, modified by $\{10\bar{1}2\}$ and $\{0001\}$.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5
D(meas.) = 2.46(2) D(calc.) = 2.54

Optical Properties: Transparent to translucent. *Color:* Lemon-yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). *Pleochroism:* Weak; O = pale yellow; E = yellow. $\omega = 1.656(2)$ $\epsilon = 1.682(2)$

Cell Data: *Space Group:* $P\bar{6}2c$. $a = 8.56(2)$ $c = 10.76(4)$ $Z = 2$

X-ray Powder Pattern: Tachgagalt, Morocco.
3.34 (FFF), 4.26 (FF), 2.129 (FF), 7.40 (F), 2.570 (F), 2.025 (F), 3.49 (mF)

Chemistry: (1) Tachgagalt, Morocco; electron microprobe analysis confirmed dominant components Ca, Mn and S and the ratio of Ca:Mn = 3.10:1; chemical formula supported by crystal-structure analysis and analogy to schaurteite.

Occurrence: In a hydrothermal manganese deposit.

Association: Gaudefroyite.

Distribution: From Tachgagalt, 17 km south of Ouarzazate, Anti-Atlas Mountains, Morocco.

Name: Honors Pierre Despujols (1888–?), founder of the Moroccan Geologic Survey.

Type Material: National School of Mines, Paris, France.

References: (1) Gaudefroy, C., M.-M. Granger, F. Permingeat, and J. Protas (1968) La despujolsite, une nouvelle espèce minérale. Bull. Minéral., 91, 43–50 (in French with English abs.). (2) (1969) Amer. Mineral., 54, 326 (abs. ref. 1).

Dessauite $(Sr,Pb)(Y,U)(Ti,Fe^{3+})_{20}O_{38}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* 4*mm*. Crystals tabular on {001}, exhibiting square or octagonal outline with vicinal forms, rarely showing pyramidal hemihedralism, to 4 cm; in subparallel aggregates; massive.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 5.42 D(calc.) = 5.48

Optical Properties: Transparent to translucent. *Color:* Deep blue; pale blue in transmitted light. *Streak:* Pale blue. *Luster:* Adamantine, pearly on cleavages.
Optical Class: Uniaxial (–). *Absorption:* $O > E$, in thick fragments. $\omega = 1.98(1)$ $\epsilon = 1.85(1)$

Cell Data: *Space Group:* *P*4*mm*. $a = 5.880(1)$ $c = 5.500(2)$ $Z = 1$

X-ray Powder Pattern: Tiger, Arizona, USA.
5.51 (10), 2.283 (10), 3.305 (9), 2.580 (9), 1.755 (9), 1.537 (9), 2.929 (8)

Chemistry:

	(1)	(2)	(3)

insol.		0.19	
$-O = Cl_2$	2.46	2.57	2.59
Total	99.56	99.76	100.00

(1) Mendip Hills, England; corresponding to $Pb_{2.10}Cu_{1.06}Cl_{2.00}(OH)_{4.44}$. (2) Tiger, Arizona, USA; corresponding to $Pb_{1.98}Cu_{0.98}Cl_{1.98}(OH)_{4.01}$. (3) $Pb_2CuCl_2(OH)_4$.

Occurrence: In oxidized manganese ores (Mendip Hills, England); a secondary mineral in deeply oxidized Pb–Cu ores (Tiger, Arizona, USA); in slag exposed to seawater.

Association: Chloroxiphite, hydrocerussite, mendipite, cerussite (Mendip Hills, England); boleite, wherryite, hydrocerussite, leadhillite, phosgenite, caledonite, atacamite, paratacamite, cerussite (Tiger, Arizona, USA).

Distribution: In England, at the Higher Pitts Farm, Mendip Hills, and the Merehead quarry, near Shepton Mallet, Somerset; at Padstow Consols, Padstow, Cornwall. In Germany, from the Christian-Levin mine, near Essen, North Rhine-Westphalia, and from Richelsdorf, Hesse, in slag. Along Baratti Beach, Tuscany, Italy, in slag. At Laurium, Greece, in slag. In the USA, exceptional crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co., and from the Rowley mine, Maricopa Co., Arizona. In Iran, in the Tchah Khuni and other mines in the Anarak district; the Seh-Changi mine, near Neyband, Khorassan; and at Abdol Abad, Tabas. From Moolyella, and at the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. In the Santa Ana mine, near Caracoles, Sierra Gorda district, Antofagasta, Chile. Found at an undefined locality in the Kopet-Dag Range, Cheleken Peninsula, Russia.

Name: From the Greek for *separate from*, and the related mineral *boleite*.

Type Material: The Natural History Museum, London, England, 1923,521; National Museum of Natural History, Washington, D.C., USA, 94813.

Devilline **$CaCu_4(SO_4)_2(OH)_6 \cdot 3H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As pseudohexagonal crystals, platy on {001}, striated ‖ [010], typically in rosettes, to 1 cm; in crusts. *Twinning:* On {010}.

Physical Properties: *Cleavage:* On {001}, perfect; on {110}, {101}, {$10\overline{1}$}, distinct. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 3.13, on impure material. D(calc.) = 3.084 Soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Blue-green, dark emerald-green, verdigris-green; green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous, may be pearly on {001}.
Optical Class: Biaxial (–). *Pleochroism:* X = pale green; Y = bluish green; Z = dark green. *Orientation:* $Z = b$; $X \simeq c$. *Dispersion:* $r < v$, marked. $\alpha = 1.585(3)$ $\beta = 1.649(3)$ $\gamma = 1.660(3)$ 2V(meas.) = 39°

Cell Data: *Space Group:* $P2_1/c$. $a = 20.870(2)$ $b = 6.135(2)$ $c = 22.191(3)$ $\beta = 102°44(1)'$ Z = 8

X-ray Powder Pattern: Špania Dolina, Slovakia (similar to serpierite).
10.22 (100), 5.099 (93), 3.392 (67), 2.098 (37), 3.209 (35), 3.745 (34), 3.185 (33)

Chemistry:

	(1)	(2)
SO_3	24.41	24.92
SiO_2	2.11	
CuO	48.39	49.52
CaO	8.32	8.73
H_2O	16.22	16.83
Total	99.45	100.00

(1) Špania Dolina, Slovakia; after deduction of SiO_2 as quartz, corresponds to $Ca_{0.98}Cu_{4.02}(SO_4)_{2.02}(OH)_{5.96} \cdot 2.97H_2O$. (2) $CaCu_4(SO_4)_2(OH)_6 \cdot 3H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized portions of copper sulfide deposits; may be of post-mining origin in dumps and on timbers.

Association: Langite, antlerite, brochantite, posnjakite, linarite, malachite, azurite, gypsum.

Distribution: In England, from Cornwall, at several mines around St. Just, St. Hilary, and Gwinear; at Wheal Friendship, Mary Tavy, Devon; from Caldbeck Fells, Cumbria. Fine examples at Špania Dolina (Herrengrund) and Piesky, Slovakia. In Germany, from Bad Ems, Rhineland-Palatinate, and at Sailauf, northeast of Aschaffenburg, Bavaria. In Italy, in the Monte Rosso gypsum cave; from the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia. At Tsumeb, Namibia. From the Kabasaka and Nyukaku mines, Hyogo Prefecture, Japan. At the Tui mine, Mt. Te Aroha, New Zealand. In the USA, from the Ecton mine, Montgomery Co., Pennsylvania; at Sterling Hill, Ogdensburg, New Jersey; from Majuba Hill, Pershing Co., and at several other minor localities in Nevada; in the Trixie mine, Tintic district, Juab Co., Utah; in Arizona, from the Grandview mine, Grand Canyon, Coconino Co., in the Mammoth mine, Tiger, Pinal Co., at Ajo, Pima Co., and elsewhere.

Name: Honors Henri Etienne Sainte-Claire Deville (1818–1881), French chemist.

Type Material: n.d.

Dewindtite $H_2Pb_3(UO_2)_6O_4(PO_4)_4 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are rectangular tablets, flattened along and striated ‖ [001], to 3 mm; more usually pulverulent, fine-grained to compact massive.

Physical Properties: *Cleavage:* {100}, perfect. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 5.03 D(calc.) = 5.12 Radioactive. Fluoresces green under UV.

Optical Properties: Semitransparent. *Color:* Canary-yellow, may exhibit a greenish tint. *Streak:* Pale yellow.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; $Y = Z$ = golden yellow. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$. $\alpha = 1.760$–1.762 $\beta = 1.767$–1.768 $\gamma = 1.768$–1.770 2V(meas.) = Moderate to large.

Cell Data: *Space Group: Bmmb.* $a = 16.031(6)$ $b = 17.264(6)$ $c = 13.605(2)$ Z = 4

X-ray Powder Pattern: Shinkolobwe, Congo; nearly identical to phosphuranylite.
8.01 (10), 5.89 (10), 2.88 (9), 4.00 (7), 3.14 (7), 3.40 (5), 3.07 (5)

Chemistry:

H_2O	6.71	7.93	8.06
insol.	0.40		
Total	99.70	97.72	100.00

(1) Shinkolobwe, Congo; loss on ignition taken as H_2O. (2) Do.; corresponding to $Pb_{3.31}(UO_2)_{5.69}(PO_4)_{4.24}O_4 \cdot 13.07H_2O$. (3) $H_2Pb_3(UO_2)_6O_4(PO_4)_4 \cdot 12H_2O$.

Occurrence: A rare secondary mineral formed by alteration of uraninite or earlier-formed secondary uranium minerals.

Association: Torbernite, parsonsite, dumontite, uraninite (Shinkolobwe, Congo); bergenite, torbernite, autunite, "uranocircite", barian uranophane (The Streuberg, Germany); uranosphaerite, wölsendorfite, uraninite (Kerségalec-en-Lignol, France).

Distribution: From Shinkolobwe and Swambo, Katanga Province, Congo (Shaba Province, Zaire). At Wölsendorf, Bavaria, and on the Streuberg, near Bergen, and at Schneeberg, Saxony, Germany. From La Faye, near Grury, Saône-et-Loire, and at Kerségalec-en-Lignol, Morbihan, France. From Jáchymov (Joachimsthal), Czech Republic. At Urgeiriça, Portugal. In the Takwa and Lac Indicateur areas, Quebec, Canada. From the Ranger mine, Jabiru, Northern Territory, Australia.

Name: Honoring Dr. Jean Dewindt, Belgian geologist.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM6433; Natural History Museum, Paris, France, 122.106.

Occurrence: In oxidized manganese ores (Mendip Hills, England); a secondary mineral in deeply oxidized Pb–Cu ores (Tiger, Arizona, USA); in slag exposed to seawater.

Association: Chloroxiphite, hydrocerussite, mendipite, cerussite (Mendip Hills, England); boleite, wherryite, hydrocerussite, leadhillite, phosgenite, caledonite, atacamite, paratacamite, cerussite (Tiger, Arizona, USA).

Distribution: In England, at the Higher Pitts Farm, Mendip Hills, and the Merehead quarry, near Shepton Mallet, Somerset; at Padstow Consols, Padstow, Cornwall. In Germany, from the Christian-Levin mine, near Essen, North Rhine-Westphalia, and from Richelsdorf, Hesse, in slag. Along Baratti Beach, Tuscany, Italy, in slag. At Laurium, Greece, in slag. In the USA, exceptional crystals from the Mammoth-St. Anthony mine, Tiger, Pinal Co., and from the Rowley mine, Maricopa Co., Arizona. In Iran, in the Tchah Khuni and other mines in the Anarak district; the Seh-Changi mine, near Neyband, Khorassan; and at Abdol Abad, Tabas. From Moolyella, and at the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. In the Santa Ana mine, Caracoles, Sierra Gorda district, Chile. Found at an undefined locality in the Kopet-Dag Range, Cheleken Peninsula, Russia.

Name: From the Greek for *separate from*, and the related mineral *boleite*.

Type Material: The Natural History Museum, London, England, 1923,521; National Museum of Natural History, Washington, D.C., USA, 94813.

Diadochite $Fe_2^{3+}(PO_4)(SO_4)(OH)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic; may be amorphous. *Point Group:* 1 or $\overline{1}$. Rarely microcrystalline, as six-sided platy crystals, in nodular, reniform, botryoidal, stalactitic, colloform aggregates; commonly amorphous, glassy, earthy.

Physical Properties: *Fracture:* Earthy to uneven, conchoidal. *Tenacity:* Pulverulent to brittle. Hardness = 3–4 or less. D(meas.) = 2.0–2.4 D(calc.) = [2.32]

Optical Properties: Semitransparent. *Color:* Yellow, brownish yellow, brown; reddish brown, greenish yellow, pale green, pale yellow; in transmitted light, pale yellow to yellowish brown. *Optical Class:* Biaxial (+), isotropic when glassy. *Dispersion:* $r > v$, strong. n = 1.60–1.61 [isotropic] $\alpha = 1.615$ β = 1.618–1.638 γ = 1.665–1.670 2V(meas.) = Small.

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. a = 9.585(1) b = 10.235(1) c = 7.335(1) $\alpha = 81°46(1)'$ $\beta = 107°57(1)'$ $\gamma = 121°10(1)'$ Z = 2

X-ray Powder Pattern: Haut-le-Wastia, Belgium; commonly X-ray amorphous.

(1) Arnsbach, Germany. (2) Haut-le-Wastia, Belgium; H_2O by the Penfield method.
(3) $Fe_2(PO_4)(SO_4)(OH)\cdot 5H_2O$.

Occurrence: A secondary mineral in gossans and some coal deposits, formed by sulfate-rich solutions acting on earlier phosphates, may be post-mine; in cave deposits, the phosphate derived from guano; widespread in secondary phosphate assemblages in granite pegmatites.

Association: Delvauxite, vashegyite, pitticite, melanterite, vivianite, wavellite, leucophosphite, phosphosiderite, ferrostrunzite, beraunite, mitridatite, rockbridgeite, jahnsite, roscherite, "limonite".

Distribution: From Arnsbach, near Gräfenthal, and in the Garnsdorf mine and the Feengrotten (Cave), Saalfeld, Thuringia, Germany. At Visé, Védrin, and Haut-le-Wastia, Belgium. From Hředl, Nučic, Litošice, Vysocany, and Chvaletice, Czech Republic. At Peychagnard, Isère, France. In Slovakia, from Železník (Vashegy). At Leoben, Austria. In the USA, from near Bethel Church, Pike Co., Indiana; at a coal mine in Jackson Township, Coshocton Co., and in Monday Creek Township, Perry Co., Ohio; from the Coon Creek mine, near Shady, Polk Co., Arkansas; in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from Gringo Gulch, Santa Cruz Co., Arizona. At Rapid Creek, Yukon Territory, Canada. A few additional localities are reported.

Name: From the Greek for *a successor*, as it typically is formed from earlier phosphates.

Type Material: Mining Academy, Freiberg, Germany, 20765.

Diamond C

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$, possibly $\overline{4}3m$. Most commonly octahedral, crystals to 10 cm or more, also dodecahedral, tetrahedral, and cubic. Curved and striated faces common; spherical, with internal radial structure. *Twinning:* Contact twins with {111} as twin plane; typically flattened on {111}; as penetration twins, may be repeated.

Physical Properties: *Cleavage:* {111}, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 10 VHN = n.d. D(meas.) = 3.511 D(calc.) = 3.515 Fluorescent and phosphorescent; triboelectric; the highest thermal conductivity of any known substance.

Optical Properties: Transparent to translucent. *Color:* Colorless, pale yellow to deep yellow, brown, white, blue-white; less commonly in oranges, pinks, greens, blues, reds, gray to black. *Luster:* Adamantine to greasy.
Optical Class: Isotropic. *Dispersion:* Strong. n = 2.4354 (486), 2.4175 (589), 2.4076 (687). *Anisotropism:* Birefringent where strained.
R: n.d.

Cell Data: *Space Group:* $Fd3m$. a = 3.5595 Z = 8

X-ray Powder Pattern: Synthetic.
2.06 (100), 1.261 (25), 1.0754 (16), 0.8182 (16), 0.8916 (8)

Chemistry: Nearly pure carbon.

Polymorphism & Series: Chaoite, graphite, and lonsdaleite are polymorphs.

Occurrence: Primarily formed in pipes, less commonly in dikes, of deep-seated, igneous origin, composed of kimberlite or lamproite, and in alluvial deposits formed by their weathering. In carbonaceous achondrite and iron meteorites; may be formed by impact.

Association: Forsterite, phlogopite, pyrope, diopside, ilmenite (kimberlite pipes); ilmenite, garnet, rutile, brookite, anatase, hematite, magnetite, tourmaline, gold, zircon, topaz (placers).

Distribution: Numerous occurrences world-wide, but only a few are of economic importance. Formerly important deposits were in India, in the Golconda region, and near Nágpur and Bundelkhand. From the area around Diamantina, Minas Gerais, and other states in Brazil. In South Africa, formerly obtained from the Orange and Vaal Rivers; still from along the coast north into Namibia, with offshore reserves estimated at 3 Bct. Important current alluvial production from Lunda Norte Province, Angola; southeastern Sierra Leone; also from Bakwanga and Tchikapa, Kasai Province, Congo (Zaire). From South Africa, in several pipes around Kimberley, at the Finsch mine, near Postmasburg, Cape Province; from the Premier mine, near Pretoria, and the Venetia mine, Transvaal; about 150 diamondiferous pipes have been mined. From the Jwaneng and Orapa pipes, Botswana. In Russia, in Sakha, from the Mir (Peace), Udatchnaya (Success), Zarnitsa (Thunderflash), Aikhal (Glory), and Jubileynaya (Jubilee) pipes. In China, from pipes at the Wafangdian and Binhai mine, Liaoning Province; at Changma, near Mengyin, Shandong Province. Prolific production from the Argyle pipe, Kimberley, Western Australia. At the Ekati and Diavik mines, Lac de Gras region, Northwest Territories, Canada.

Name: A corruption of the Greek for *invincible*.

Type Material: Natural History Museum, Paris, France, Haüy 6599.

(1) Diaoyudao Island, China; by electron microprobe, average of 13 analyses; corresponds to $(Na_{0.87}K_{0.02}Mg_{0.02}Ca_{0.01})_{\Sigma=0.92}(Al_{10.84}Cr_{0.15}Si_{0.02})_{\Sigma=11.01}O_{17}$. (2) $NaAl_{11}O_{17}$.

Occurrence: In the heavy-mineral (S.G. > 2.8) fraction of the surface layer of sea-floor muds at about 1500 m water depth.

Association: Chromium inclusions; other heavy minerals include "hornblende", epidote, dolomite, muscovite, chlorite, biotite.

Distribution: In the Okinawa Trough, near Diaoyudao Island, a few km northeast of Taiwan.

Name: For Diaoyudao Island, near which it occurs.

Type Material: Museum of Geology, Beijing, China.

(1) Příbram, Czech Republic; corresponds to $Pb_{1.80}Ag_{2.76}Fe_{0.15}Cu_{0.15}Sb_{2.76}S_{8.00}$. (2) Santa Maria de Catorze, Mexico; by electron microprobe, corresponding to $Pb_{1.97}Ag_{3.22}Sb_{3.35}S_{8.00}$. (3) $Pb_2Ag_3Sb_3S_8$.

Occurrence: In hydrothermal veins with other sulfides formed at medium temperatures.

Association: Galena, sphalerite, miargyrite, pyrargyrite, pyrite, siderite, quartz.

Distribution: In the Czech Republic, from Příbram [TL] and Kutná Hora. In Germany, in Saxony, at Bräunsdorf, near Freiberg [TL], in the Neues Hoffnung Gottes mine; at Freiberg; and in the Alte Hoffnung Gottes mine, Voigtsberg. [??ck if Saxony??] From Baia Sprie (Felsőbánya) and Baia Mare (Nagybánya), Romania. From Fournial, Cantal, and Pontgibaud, Puy-de-Dôme, France. In the Mangazeika and Bulatsk Pb–Zn deposits, northeastern Sakha, Russia. In the USA, from the Lake Chelan district, Chelan Co., Washington; the Wood River deposits, Mineral Hill district, Blaine Co., Idaho; and near Morey, Nye Co., Nevada. At Santa Maria de Catorze, San Luis Potosí, Mexico. From Zancudo, Colombia. At Machacamarca and Cerro Rico, Potosí, Bolivia. From the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. Known from a number of other localities.

Name: From the Greek for *difference*, as being distinct from freieslebenite.

			Total	100.03	100.00

(1) Kossoi Brod, Russia. (2) AlO(OH).

Polymorphism & Series: Dimorphous with böhmite.

Occurrence: Typically a final product of diagenesis in bauxite deposits formed by the tropical weathering of alumino-silicate rocks; from hydrothermal alteration of aluminous minerals; a hydrothermal mineral in some alkalic pegmatites.

Association: Corundum, magnetite, margarite, chloritoid, spinel, chlorite, gibbsite, böhmite, sillimanite, lepidocrocite, hematite, kaolinite, halloysite.

Distribution: Many localities; some prominent ones include: near Kossoi Brod village, about 37 km south of Yekaterinburg (Sverdlovsk), and Kyshtym, Ural Mountains, Russia. From Banská Belá (Dilln), near Banská Štiavnica (Schemnitz), Slovakia. At Jordansmühl, Silesia, Poland. From Campolungo, Tessin, Switzerland. At Gumuch-dagh, near Ephesus, and in large crystals from between Aydin and Mugla, Turkey. From Sivec, near Prilep, Macedonia. On the islands of Naxos and Samos, Greece. From Lohatlha, 30 km north of Postmasburg, Cape Province, South Africa. In the USA, at Chester, Hampden Co., Massachusetts; on Corundum Hill, Newlin, Chester Co., Pennsylvania; at Culsagee, Macon Co., North Carolina; at Swiss, Gasconade Co., Missouri. From the Rosita Hills, Custer Co., Colorado; and at the Champion mine, White Mountains, Mono Co., California.

Name: From the Greek for *to scatter*, in allusion to its decrepitation under the blowpipe.

Type Material: Natural History Museum, Paris, France.

Dickinsonite $KNa_4Ca(Mn^{2+},Fe^{2+})_{14}Al(PO_4)_{12}(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are minute, tabular {100}, commonly pseudorhombohedral, {011}, {$11\bar{1}$}, and many {$h0l$} forms; striated on {100} giving a triangular pattern; curved, lamellar, radiated, stellated; foliated, micaceous, to several cm; disseminated scaly massive.

Physical Properties: *Cleavage:* On {100}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 3.34–3.41 D(calc.) = 3.426

Optical Properties: Transparent to translucent. *Color:* Oil-green to olive-green, pale to dark grass-green, yellowish green to brownish green; green in transmitted light. *Streak:* White, nearly. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* X = pale olive-green; Y = paler olive-green; Z = very pale yellowish green. *Orientation:* $X = b$; $Y \wedge c \simeq 15°$. *Dispersion:* $r > v$, moderate to strong. $\alpha = 1.648–1.658$ $\beta = 1.655–1.662$ $\gamma = 1.662–1.671$ $2V(meas.) = \leq 90°$

(1) Branchville, Connecticut, USA. (2) Do.; by electron microprobe, total Fe as FeO, total Mn as MnO, Li_2O and H_2O from (1); corresponds to $K_{0.49}Li_{0.24}Na_{5.33}Ca_{0.87}(Mn^{2+}_{9.55}Fe^{2+}_{3.92})_{\Sigma=13.47}Al_{0.83}(PO_4)_{11.78}(OH)_{3.88}$. (3) $KNa_4Ca(Mn,Fe)_{14}Al(PO_4)_{12}(OH)_2$ with Mn:Fe = 1:1.

Polymorphism & Series: Forms a series with arrojadite.

Occurrence: A high-temperature (≈ 800 °C) primary mineral in granite pegmatites.

Association: Eosphorite, triploidite, lithiophilite, rhodochrosite, reddingite, fairfieldite (Branchville, Connecticut, USA).

Distribution: In the USA, from Branchville, Fairfield Co., and in the Strickland quarry, Portland, Middlesex Co., Connecticut; in Maine, from Auburn and Poland, Androscoggin Co., and at Hebron, Greenwood, and Newry, Oxford Co.; from the White Picacho district, Maricopa and Yavapai Cos., Arizona; in the Nickel Plate mine, near Keystone, Pennington Co., South Dakota. At the Buranga pegmatite, near Gatumba, Rwanda.

Name: In honor of the Reverend John William Dickinson (1835–1899), Redding, Connecticut, USA, an early collector of Branchville minerals.

Type Material: Yale University, New Haven, Connecticut, Brush 3090; Harvard University, Cambridge, Massachusetts, 110679, 103812; National Museum of Natural History, Washington, D.C., USA, 80561.

Dickite $Al_2Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. As pseudohexagonal crystals, to 2 mm, which may be elongated along [100]. As aggregates of platelets resembling books; commonly as compact masses of microscopic crystals.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Flexible but inelastic. Hardness = 2–2.5 D(meas.) = 2.60 D(calc.) = [2.62]

Optical Properties: Transparent. *Color:* White, but will assume coloration from included impurities. *Luster:* Satiny.
Optical Class: Biaxial (+). *Orientation:* $X \wedge c = 8°–14°$; $Y \wedge a = 14°–20°$. *Dispersion:* $r > v$.
$\alpha = 1.560–1.564$ $\beta = 1.561–1.566$ $\gamma = 1.566–1.570$ 2V(meas.) = 50°–80°

Cell Data: *Space Group:* Cc. $a = 5.150(1)$ $b = 8.940(1)$ $c = 14.424(2)$ $\beta = 96°44(1)'$
Z = 4

X-ray Powder Pattern: Schuylkill, Pennsylvania, USA. (ICDD 10-446).
7.15 (100), 3.580 (100), 2.326 (90), 4.124 (70), 3.799 (60), 2.510 (50), 1.975 (50)

Chemistry:

	(1)	(2)		(1)	(2)

			Total	100.02	99.66

(1) Anglesey, Wales. (2) Pine Knot colliery, Pennsylvania, USA; corresponds to $Al_{2.02}Si_{1.99}O_5(OH)_{4.00}$.

Polymorphism & Series: Halloysite, kaolinite, and nacrite are polymorphs.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Commonly of hydrothermal origin along veins derived in part from the alteration of aluminosilicate minerals; also as an authigenic sedimentary mineral.

Association: Quartz, "chalcedony."

Distribution: Widespread; some localities for studied materials follow: at Amlwch and the Pant-y-Gaseg quarry, Trwynbychan, Anglesey, Wales. From Mád, Hungary. In the Iza Cave, Mt. Rodna, Romania. From Mas D'Alary, Lodève, Hérault, France. At Postmasburg and Barkly East, Cape Province, and in the Middelburg district, Transvaal, South Africa. In the USA, on Red Mountain, near Ouray, San Juan Co., Colorado; in the Mineral Mountain area, near St. George, Washington Co., Utah; the Pine Knot colliery, Schuylkill, Schuylkill Co., Pennsylvania; and on Bruin Creek, Elliott Co., Kentucky. At San Juanito and Cusihuiriáchic, Chihuahua, Mexico.

Name: For Allan Brugh Dick (1833–1926), Scottish metallurgical chemist, who first described the species.

Type Material: n.d.

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are minute, tabular {100}, commonly pseudorhombohedral, {011}, {11$\bar{1}$}, and many {$h0l$} forms; striated on {100} giving a triangular pattern; curved, lamellar, radiated, stellated; foliated, micaceous, to several cm; disseminated scaly massive.

Physical Properties: *Cleavage:* On {100}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 3.34–3.41 D(calc.) = 3.426

Optical Properties: Transparent to translucent. *Color:* Oil-green to olive-green, light to dark grass-green, yellowish green to brownish green; green in transmitted light. *Streak:* White, nearly. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* X = pale olive-green; Y = paler olive-green; Z = very pale yellowish green. *Orientation:* $X = b$; $Y \wedge c \simeq 15°$. *Dispersion:* $r > v$, moderate to strong. $\alpha = 1.648$–1.658 $\beta = 1.655$–1.662 $\gamma = 1.662$–1.671 2V(meas.) = $\leq 90°$

Cell Data: *Space Group:* $A2/a$. $a = 24.940(6)$ $b = 10.131(4)$ $c = 16.722(2)$ $\beta = 105.60(2)°$ Z = 4

X-ray Powder Pattern: Branchville, Connecticut, USA; close to arrojadite. (ICDD 24-66). 3.04 (100), 2.717 (80), 3.22 (60), 2.85 (45), 5.93 (40), 2.770 (40), 2.554 (35)

(1) Branchville, Connecticut, USA. (2) Do.; by electron microprobe, total Fe as FeO, total Mn as MnO, Li_2O and H_2O from (1); corresponds to $K_{0.49}Li_{0.24}Na_{5.33}Ca_{0.87}(Mn^{2+}_{9.55}Fe^{2+}_{3.92})_{\Sigma=13.47}Al_{0.83}(PO_4)_{11.78}(OH)_{3.88}$. (3) $KNa_4Ca(Mn,Fe)_{14}Al(PO_4)_{12}(OH)_2$ with Mn:Fe = 1:1.

Polymorphism & Series: Forms a series with arrojadite.

Occurrence: A high-temperature ($\approx$ 800 °C) primary mineral in granite pegmatites.

Association: Eosphorite, triploidite, lithiophilite, rhodochrosite, reddingite, fairfieldite (Branchville, Connecticut, USA).

Distribution: In the USA, from Branchville, Fairfield Co., and in the Strickland quarry, Portland, Middlesex Co., Connecticut; in Maine, from Auburn and Poland, Androscoggin Co., and at Hebron, Greenwood, and Newry, Oxford Co.; from the White Picacho district, Maricopa and Yavapai Cos., Arizona; in the Nickel Plate mine, near Keystone, Pennington Co., South Dakota. At the Buranga pegmatite, near Gatumba, Rwanda.

Name: In honor of the Reverend John William Dickinson (1835–1899), Redding, Connecticut, USA, an early collector of Branchville minerals.

Type Material: Yale University, New Haven, Connecticut, Brush 3090; Harvard University, Cambridge, Massachusetts, 110679, 103812; National Museum of Natural History, Washington, D.C., USA, 80561.

Chemistry:

	(1)	(2)
V_2O_5	73.92	52.22
FeO	0.46	
MgO	15.38	11.57
H_2O		36.21
Total		100.00

(1) Firefly-Pigmay mine, Utah, USA; by electron microprobe, total Fe as FeO, highly volatilized in the electron beam due to rapid dehydration; atomic ratios correspond to $(Mg_{0.95}Fe_{0.02})_{\Sigma=0.97}(V_{2.01}O_6)\cdot nH_2O$. (2) $Mg(V_2O_6)\cdot 7H_2O$ as established by crystal-structure analysis.

Occurrence: In the oxidized zone of a sandstone U–V deposit.

Association: Pascoite, sherwoodite, selenium.

Distribution: From the Firefly-Pigmay U–V mine, 16 km east of La Sal, San Juan Co., Utah, USA.

Name: To honor Richard Wyatt?? Thomssen (1933–), American economic geologist and collector of microscopic mineral specimens, Dayton, Nevada, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, ??.

H_2O	[2.34]
Total	100.97

(1) Wessels Mine, Northern Cape Province, Republic of South Africa; average of 5 electron microprobe analyses, H_2O calculated from stoichiometry; corresponding to $Na_{2.00}Ca_{1.00}Cu_{1.98}Fe_{0.04}Si_{7.99}O_{20}•H_2O$.

Occurrence: In a hydrothermally altered manganese deposit.

Association: Wesselite, aegirine, Cu-rich pectolite, sugilite, quartz, and undifferentiated Fe-Mn oxides, as well as scottyite, lavinskyite, richterite.

Distribution: From the central-eastern ore-body, Wessels Mine, Kalahari manganese fields, Northern Cape Province, Republic of South Africa.

Name: Honors Professor Diego Gatta (b. 1974), Department of Earth Sciences, University of Milan, Italy, for his contributions in the areas of crystal structures and crystal chemistry of zeolites and related silicates with cage structures.

Type Material: Museum of Natural History, London, England, (BM 2012,2).

Total	99.50	100.00

(1) Atacama Desert, Chile. (2) $Ca_2(IO_3)_2(CrO_4)\cdot H_2O$; crystal-structure analysis confirms one H_2O molecule as an essential chemical component.

Occurrence: In nitrate deposits in an arid region.

Association: Lopezite, tarapacáite, ulexite (Oficina Maria Elena, Chile).

Distribution: In Chile, from the Atacama Desert, as in the Taltal district, from near the Oficina Louisa and Oficina Chacabuco; at Pampa Pique III, about one km north of Oficina Lautaro, and near Oficina Maria Elena, near Tocopilla, Antofagasta; from near Zapiga, Tarapacá.

Name: Honors August Dietze (?–1893?), German chemist who first described this mineral.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 318–319. (2) Burns, P.C. and F.C. Hawthorne (1993) The crystal structure of dietzeite, $Ca_2H_2O(IO_3)_2(CrO_4)$, a heteropolyhedral framework mineral. Can. Mineral., 31, 313–319.

Total	99.96	100.4	100.00

(1) Jerome, Arizona, USA. (2) Seathwaite Tarn, England; by electron microprobe. (3) Cu_9S_5.

Occurrence: In hydrothermal copper deposits of primary and secondary origin. Formed under a wide range of conditions; reported from mafic intrusives, as a volcanic exhalation product, and in pegmatites.

Association: Chalcocite, djurleite, bornite, chalcopyrite, other copper minerals, pyrite.

Distribution: From Sangerhausen, Thuringia, Germany [TL]. In the Botallack mine, St. Just, Cornwall, and from Seathwaite Tarn, near Coniston, Cumbria, England. At Listulli, Norway. From Kiruna, Sweden. In the USA, crystallized at Butte, Silver Bow Co., Montana; in Arizona, from the United Verde mine, Jerome, Yavapai Co., the Magma mine, Superior, Pinal Co., and at Bisbee, Cochise Co. Abundant at Kennicott, Alaska. From Cananea, Sonora, Mexico. In Namibia, at Tsumeb. At Dongxiang, Jiangxi Province, China. Probably not yet recognized at many other localities.

Name: From the Greek for *two kinds* or *sexes*, in reference to the presumed presence of both cuprous and cupric ions.

Dimorphite As_4S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Dipyramidal by development of {111}; {101} and {110} are also well developed. Commonly in groups of tiny individuals.

Physical Properties: *Tenacity:* Brittle. Hardness = 1.5 VHN = n.d. D(meas.) = 3.58 D(calc.) = 3.60 Burns without residue.

Optical Properties: Transparent. *Color:* Yellow-orange. *Luster:* Adamantine.
R_1–R_2: n.d.

Cell Data: *Space Group: Pnma.* $a = 11.24$ $b = 9.90$ $c = 6.56$ Z = 4

X-ray Powder Pattern: Solfatara, Italy.
4.89 (100), 2.14 (50), 1.620 (50), 3.91 (40), 5.64 (30), 3.07 (25), 2.94 (25)

Chemistry:

	(1)	(2)
As	75.45	75.70
S	24.55	24.30
Total	100.00	100.00

(1) Solfatara, Italy. (2) As_4S_3.

Occurrence: Deposited at a fumerolic vent at temperatures of about 70 °C–80 °C (Solfatara, Italy); formed in an ore deposit under secondary conditions (Chile).

Association: Realgar, sal ammoniac, sulfur, various sulfates (Solfatara, Italy); orpiment (Chile).

Distribution: In Italy, in Campania, from Solfatara di Pozzuoli, Campi Flegri, near Naples [TL], and on Vesuvius. In the Alacrán Ag–As–Sb mine, Pampa Larga district, Copiapó, Chile.

Name: From the Greek for *two* and *form*, in reference to the two forms in which the species was thought to occur.

Type Material: Natural History Museum, Paris, 50.588, 99.492; The Natural History Museum, London, England, 1937,1432.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 197–198. (2) Clark, A.H. (1972) Mineralogy of the Alacrán deposit, Pampa Larga, Chile. Dinite $C_{20}H_{36}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Massive.

Physical Properties: *Tenacity:* Very brittle. Hardness = n.d. D(meas.) = 1.01(1) D(calc.) = 1.02 Fuses at 34(1) °C.

Optical Properties: Transparent. *Color:* Pale yellow. *Luster:* "Icy". *Optical Class:* Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_12_12_1$. $a = 12.356(4)$ $b = 12.762(4)$ $c = 11.427(3)$ Z = [1]

X-ray Powder Pattern: Castelnuovo di Garfagnana, Italy. 5.53 (vs), 5.06 (vs), 7.00 (s), 8.92 (ms), 8.32 (ms), 4.02 (ms), 3.870 (m)

Chemistry:

	(1)	(2)
C	86.77	86.88
H	13.44	13.12
Total	100.21	100.00

(1) Castelnuovo di Garfagnana, Italy. (2) $C_{20}H_{36}$.

Occurrence: In bituminous fossil wood in unconsolidated river sediment.

Distribution: From Castelnuovo di Garfagnana, Serchio Valley, Tuscany, Italy.

Name: Honors Professor Olinto Dini (1802–1866), Italian physicist, University of Pisa, Pisa, Italy, who discovered the first specimens.

Type Material: University of Pisa, Pisa, Italy, 8875.

References: (1) Franzini, L., M. Pasero, and N. Perchiazzi (1991) Re-discovery and re-definition of dinite, $C_{20}H_{36}$, a forgotten organic mineral from Garfagnana, northern Tuscany, Italy. Eur. J. Mineral., 3, 855–861. (2) (1992) Amer. Mineral., 77, 674 (abs. ref. 1).

Diomignite $Li_2B_4O_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4mm$. As pseudocubic crystals, to 30 μm, bounded by {111} and {100}; also anhedral.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.437

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (–). $n = \sim 1.6$ $\omega = 1.612(2)$ (synthetic) $\epsilon = 1.554(2)$

Cell Data: *Space Group:* $I4_1cd$. $a = 9.470(4)$ $c = 10.279(5)$ $Z = 8$

X-ray Powder Pattern: Tanco pegmatite, Canada.
4.07 (100), 2.662 (60), 3.495 (50), 2.587 (40), 2.045 (40), 3.908 (20), 2.240 (20)

Chemistry: Analyses by electron microprobe indicate all elements are atomic weight < 11; identification is by inference of other properties to synthetic $Li_2B_4O_7$.

Occurrence: Abundant in fluid inclusions in spodumene crystallized from a late-stage hydrothermal fluid in a granite pegmatite.

Association: Albite, cookeite, quartz, pollucite–analcime, microlite, all as daughter species in fluid inclusions.

Distribution: From the Tanco pegmatite, Bernic Lake, Manitoba, Canada.

Name: From the Greek meaning *divine mix*, in allusion to its likely pronounced fluxing effects.

Type Material: American Museum of Natural History, New York, New York, 98089; National Museum of Natural History, Washington, D.C., USA, 164236.

References: (1) London, D., M.E. Zolensky, and E. Roedder (1987) Diomignite: natural $Li_2B_4O_7$ from the Tanco pegmatite, Bernic Lake, Manitoba. Can. Mineral., 25, 173–180.

Diopside $CaMgSi_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals with nearly square cross sections, to 50 cm; granular, columnar, lamellar massive. *Twinning:* Simple or multiple twins on {100} or {010}, common.

Physical Properties: *Cleavage:* Distinct on {110}, (110) $\wedge$ $(1\bar{1}0)$ ~87°; partings on {100} and probably {010}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6.5 D(meas.) = 3.22–3.38 D(calc.) = 3.278

Optical Properties: Transparent to opaque. *Color:* Colorless, white, yellow, pale to dark green, black; colorless in thin section. *Streak:* White, gray, gray-green. *Luster:* Vitreous or dull.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -38°$ on (010); $X \wedge a = -22°$. *Dispersion:* $r > v$, weak to moderate. $\alpha = 1.664$ $\beta = 1.672$ $\gamma = 1.694$ 2V(meas.) = 59°

Cell Data: *Space Group:* $C2/c$. $a = 9.746$ $b = 8.899$ $c = 5.251$ $\beta = 105.63°$ Z = 4

X-ray Powder Pattern: Schwartzenstein, Austria. (ICDD 11-654).
2.991 (100), 2.528 (40), 2.893 (30), 2.518 (30), 3.23 (25), 2.952 (25), 1.625 (25)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
SiO_2	54.66	54.09	FeO	0.07	1.47	K_2O		0.15

Cr_2O_3		2.03	Na_2O		1.37	Total	100.35	100.64

(1) Juva, Finland; corresponds to $Ca_{1.00}(Mg_{1.01}Fe^{3+}_{0.02})_{\Sigma=1.03}Si_{1.98}O_6$. (2) Dutoitspan mine, Kimberley, Cape Province, South Africa; corresponds to $(Ca_{0.82}Na_{0.05}Fe^{2+}_{0.04}Mg_{0.04}K_{0.01})_{\Sigma=0.96}(Mg_{0.88}Cr_{0.06}Al_{0.03}Fe^{3+}_{0.02}Ti_{0.01})_{\Sigma=1.00}(Si_{1.96}Al_{0.04})_{\Sigma=2.00}O_6$.

Polymorphism & Series: Forms two series, with hedenbergite, and with johannsenite.

Mineral Group: Pyroxene group.

Occurrence: Typical of metamorphosed siliceous Ca, Mg-rich rocks of the pyroxene-hornfels or epidote-amphibolite facies; common in skarns, Ca, Mg-rich gneisses and schists, and some kimberlites and peridotites. Less common in alkalic olivine basalts and andesites.

Association: Calcite, forsterite, chondrodite, monticellite, clinohumite, scapolite, wollastonite, grossular, vesuvianite, tremolite, quartz.

Distribution: Selected localities for fine crystals follow: at Schwarzenstein, Zillertal, and near Prägraten, Tirol, Austria. From Ala, Piedmont, and St. Marcel, Val d'Aosta, Italy. At Otokumpu, Finland. In Russia, at the Akhmatovsk deposit, near Zlatoust, Ural Mountains; large crystals in the Inagli massif, 30 km west of Aldan, Yakutia; and along the Slyudyanka River, near Lake Baikal, Siberia. In Canada, many localities; in Ontario, at Bird's Creek, Eganville, Dog's Lake, Littlefield, and Burgess; in Quebec, at Wakefield, Brompton Lake, near Magog, and in the Jeffrey mine, Asbestos. In the USA, at DeKalb, St. Lawrence Co., Natural Bridge, Jefferson Co., Sing Sing, near Ossining, Westchester Co., New York; and at Ducktown, Polk Co., Tennessee. At Ampandrandava and Andranodambo, Taolañaro (Fort Dauphin), Madagascar. Large gemmy crystals from the Kunlun Mountains, Sinkiang Uighur Autonomous Region, China. From Tange-Achin, Kandahar Province, Afghanistan. Found near Jaipur, Rajasthan, India. At Khapalu and Chamachu, Pakistan.

Name: From the Greek for *double* and *appearance*, apparently for two possible orientations of the prism zone.

Dioptase $CuSiO_2(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Commonly in prismatic to rhombohedral crystals, terminated by $\{02\overline{2}1\}$, to 5 cm. As indistinct crystalline aggregates and massive.

Physical Properties: *Cleavage:* Perfect on $\{10\overline{1}1\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.28–3.35 D(calc.) = [3.30] Pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Emerald-green, blue-green. *Streak:* Green. *Luster:* Vitreous.
Optical Class: Uniaxial (+), with three or six sectors in basal section. $\omega = 1.652–1.658$ $\epsilon = 1.704–1.710$

Cell Data: *Space Group:* $R\overline{3}$. $a = 14.566$ $c = 7.778$ Z = 18

X-ray Powder Pattern: Tsumeb, Namibia. (ICDD 33-487).
2.600 (100), 2.443 (60), 7.29 (50), 4.07 (30), 4.90 (25), 2.714 (20), 2.117 (20)

Chemistry:

	(1)	(2)
SiO_2	38.93	38.11
CuO	49.51	50.46
H_2O	11.27	11.43
Total	99.71	100.00

(1) Unknown locality. (2) $CuSiO_2(OH)_2$.

Occurrence: In the oxidized zone of some copper deposits.

Association: Chrysocolla, malachite, mimetite, wulfenite, cerussite, hemimorphite, fluorite, quartz.

Distribution: From Altyn-Tyube, 50 km east of Karaganda, Kirghiz Steppe, Kazakhstan. At Băiţa (Rézbánya), Romania. In the USA, in Arizona, at the Mammoth-St. Anthony mine, Tiger, at Ray, and in the Table Mountain mine, Galiuro Mountains, Pinal Co., and from the Harquehala mine, Harquehala Mountains, Yuma Co.; in California, from the Blue Bell claims, near Baker, San Bernardino Co. At Chiviquin, Córdoba Province, Argentina. In Chile, from the Mina La Verde, Copiapó. Fine crystals from around Renéville, Mindouli, and Pimbi, Congo Republic. At Tantara and the Mashamba West mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). As splendid large crystals from Tsumeb, Guchab, and the Omaue deposit, Kaokoveld, Namibia. From Mavoyo, Angola. In Zimbabwe, at several mines in the Lomagundi district, the Inez mine, Hartley district, and the Midway mine, Fort Victoria. Many other minor localities are known.

Name: From the Greek for *through* and *to see*, as the cleavage directions may be seen on looking through the crystal.

Type Material: Natural History Museum, Paris, France, Haüy 4969.

Dissakisite-(Ce) $Ca(Ce,La)MgAl_2(SiO_4)(Si_2O_7)O(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely crystallized; as anhedral grains, up to 0.6 mm.

Physical Properties: Hardness = n.d. D(meas.) = 3.75(15) D(calc.) = 3.97–4.02

Optical Properties: Transparent. *Color:* Pale yellow-brown in thin section.
Luster: Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = pale brown; $Y = Z$ = light yellow-brown.
Orientation: $Y = b$; $Z \wedge a = 23.7°$. *Dispersion:* $r < v$, medium. *Absorption:* $Y = Z > X$.
$\alpha = 1.735(3)$ $\beta = 1.741(3)$ $\gamma = 1.758(3)$ 2V(meas.) = 64.2(3)° 2V(calc.) = 62°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.905(1)$ $b = 5.684(1)$ $c = 10.113(1)$
$\beta = 114.62(2)°$ Z = 2

X-ray Powder Pattern: Balchen Mountain, Antarctica.

(1) Balchen Mountain, Antarctica; by electron microprobe, H_2O calculated, $RE_2O_3 = La_2O_3$ 9.80%, Nd_2O_3 2.08%, Pr_2O_3 0.86%, Sm_2O_3 0.13%, $Eu_2O_3 < 0.10\%$, $Gd_2O_3 < 0.10\%$, $Dy_2O_3 < 0.05\%$, $Er_2O_3 < 0.05\%$; corresponds to $Ca_{1.08}(Ce_{0.57}RE_{0.45})_{\Sigma=1.02}(Mg_{0.93}Fe_{0.14})_{\Sigma=1.07}(Al_{1.91}Ti_{0.06})_{\Sigma=1.97}Si_3O_{12.25}[(OH)_{0.69}F_{0.06}]_{\Sigma=0.75}$. (2) Östanmossa mine, Sweden; corresponds to $Ca_{1.00}(Ce_{0.42}RE_{0.55})_{\Sigma=0.97}(Al_{1.16}Mg_{1.08}Fe^{3+}_{0.43}Fe^{2+}_{0.43}Mn_{0.02})_{\Sigma=3.12}Si_{1.03}O_{12}[(OH)_{1.16}F_{0.27}]_{\Sigma=1.43}$.

Mineral Group: Epidote group.

Occurrence: Formed in marble, under amphibolite-facies metamorphism, at about 600 °C and 7 kbar (Balchen Mountain, Antarctica).

Association: Calcite, dolomite, forsterite, clinohumite, phlogopite, chlorite, ilmenite-geikelite, spinel, zircon, pyrrhotite (Balchen Mountain, Antarctica).

Distribution: On Balchen Mountain, Sør Rondane Mountains, east Antarctica. From the Östanmossa mine, Norberg, Sweden. At the Fedorovskoye deposit, Yakutia, Russia. From Outokumpu, Finland. Well crystallized from Luzenac, Ariège, France. In the Donghai district, Kiangsu Province, China.

Name: From the Greek for *twice over*, for a magnesium analog of allanite being described twice.

Type Material: National Museum of Natural History, Washington, D.C., USA, 168421.

References: (1) Grew, E.S., E.J. Essene, D.R. Peacor, S.-C. Su, and M. Asami (1991) Dissakisite-(Ce), a new member of the epidote group and the Mg analogue of allanite-(Ce), from Antarctica. Amer. Total	99.34	100.00

(1) Ceragiola area, near Seravezza, Apuan Alps, Italy; electron microprobe analysis; corresponding to $Pb_{10.87}(Sb_{12.86}As_{0.26})_{\Sigma=13.13}S_{30.56}Cl_{0.04}$. (2) $Pb_{11}Sb_{13}S_{31}$.

Occurrence: In pockets with high sulfur fugacity during hydrothermal alteration of marble.

Association: Boulangerite, calcite, sphalerite.

Distribution: From a marble quarry in the Ceragiola area, near Seravezza, Apuan Alps, Italy.

Name: For the relationship to *dadsonite* and the presence of the *disulfide* ion in the crystal structure.

Type Material: Museum of Natural History, University of Pisa, Italy (# 19442).

Dixenite $Cu^{1+}Mn^{2+}_{14}Fe^{3+}(As^{3+}O_3)_5(As^{5+}O_4)(SiO_4)_2(OH)_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3. In aggregates of thin flakes; massive.

Physical Properties: *Cleavage:* Perfect, basal micaceous. Hardness = 3–4 D(meas.) = 4.36 D(calc.) = 4.375

Optical Properties: Translucent. *Color:* Deep red-brown to nearly black; intense red in thin sheets. *Luster:* Metallic to resinous.
Optical Class: Uniaxial (+). $n = 1.96(2)$

Cell Data: *Space Group: R*3. $a = 8.233(4)$ $c = 37.499(1)$ Z = 3

X-ray Powder Pattern: Långban, Sweden. (ICDD 19-426).
2.92 (100), 4.10 (90), 2.37 (80), 2.40 (55), 3.90 (50), 2.83 (50), 3.31 (45)

Chemistry:

	(1)
SiO_2	5.31
Fe_2O_3	3.75
Mn_2O_3	8.05
As_2O_3	32.16
MnO	43.35
CuO	3.49
MgO	0.32
CaO	0.39
Na_2O	0.13
K_2O	0.14
H_2O	2.80
P_2O_5	0.02
Total	99.91

(1) Långban, Sweden; cationic charges from structural study; corresponds to $Cu^{1+}_{0.85}(Mn^{2+}_{13.58}Mn^{3+}_{0.22}Mg_{0.15})_{\Sigma=13.95}Fe^{3+}_{0.91}As^{3+}_{4.99}As^{5+}_{1.30}Si_{1.71}O_{27}(OH)_6$.

Occurrence: In a metamorphosed Fe–Mn orebody in serpentine.

Association: Hematite, adelite, lead, domeykite, magnussonite.

Distribution: At Långban, Värmland, Sweden.

Name: From the Greek *di*, for *two*, and *xenos*, for *stranger*, in reference to the then unique association of silica and arsenious oxide in the mineral.

Type Material: n.d.

Djerfisherite $K_6(Fe,Cu,Ni)_{25}S_{26}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As rounded grains, to 0.4 mm in diameter.

Physical Properties: Hardness = < 3.5 VHN = 172 D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color:* Greenish yellow, close to khaki, to olive-drab.
Luster: Submetallic.
R: (400) 17.5, (420) 18.3, (440) 19.1, (460) 20.0, (480) 20.8, (500) 21.6, (520) 22.3, (540) 22.9, (560) 23.5, (580) 24.0, (600) 24.5, (620) 24.9, (640) 25.2, (660) 25.5, (680) 25.8, (700) 25.9

Cell Data: *Space Group:* $Pm3m$. $a = 10.465(1)$ $Z = 2$

X-ray Powder Pattern: Kota Kota meteorite.
1.828 (100), 2.985 (70), 2.372 (60), 10.34 (50), 5.97 (50), 3.118 (50), 3.269 (40)

Chemistry:

	(1)	(2)
K	8.7	9.00
Na	0.3	0.76
Fe	50.7	45.4
Cu	4.2	8.37
Ni	0.8	1.41
Mg		< 0.05
S	33.8	33.8
Cl	1.0	1.26
Total	99.5	100.00

(1) St. Marks meteorite; by electron microprobe, average of 12 grains; corresponds to $(K_{5.49}Na_{0.32})_{\Sigma=5.81}(Fe_{22.39}Cu_{1.63}Ni_{0.34})_{\Sigma=24.36}S_{26.00}Cl_{0.70}$. (2) Coyote Peak, California, USA; by electron microprobe, corresponds to $(K_{5.68}Na_{0.82})_{\Sigma=6.50}(Fe_{20.05}Cu_{3.25}Ni_{0.59})_{\Sigma=23.89}S_{26.00}Cl_{0.88}$.

Occurrence: In meteorites, in hydrothermal Cu–Ni sulfide ores, in skarns, in pegmatites, in kimberlites, and alkalic mafics.

Association: "Nickel-iron" (kamacite), troilite, schreibersite, clinoenstatite, tridymite, cristobalite, daubréelite, graphite, roedderite, alabandite (Kota Kota meteorite); talnakhite, pentlandite, chalcopyrite, magnetite, valleriite, sphalerite, platinum minerals (Talnakh area, Russia).

Distribution: Found in the Kota Kota [TL] and St. Marks [TL] enstatite chondrites, the Pena Blañca Spring [ck Springs??] achondrite, also the Toluca and Cape York octahedrite iron meteorites. In the USA, at Coyote Peak, near Orick, Humboldt Co., California. In Russia, in the Talnakh area, Noril'sk region, western Siberia; Udachnaya and other kimberlite pipes, Sakhan; the Inagli complex, Aldan Shield; the Lovozero, Khibiny, and Kovdor massifs, and the Salmagorskii ring igneous complex, Kola Peninsula. On Dupezeh Mountain, near Hero Town, Qala-Dizeh region, northeastern Iraq. From the Ilímaussaq intrusion, southern Greenland. At Kushiro, Hiroshima Prefecture, Japan.

Name: To honor Professor Daniel Jerome Fisher (1896–1988), American mineralogist, University of Chicago, Chicago, USA.

Type Material: n.d. [??where are Kota Kota and St. Marks meteorites??]

Djurleite $Cu_{31}S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are short, prismatic and thick tabular, as large as 1.5 cm; massive compact. *Twinning:* Common by rotation of 60° around [100].

Physical Properties: Hardness = 2.5–3 VHN = 65–85 (100 g load). D(meas.) = n.d. D(calc.) = 5.749

Optical Properties: Opaque. *Color:* Black; gray in reflected light. *Luster:* Metallic. *Anisotropism:* Weak.
R_1–R_2: (400) 36.1–37.3, (420) 36.2–37.1, (440) 36.0–36.8, (460) 35.7–36.4, (480) 35.1–35.7, (500) 34.2–34.8, (520) 33.1–33.9, (540) 32.1–33.0, (560) 31.0–32.1, (580) 30.0–31.3, (600) 29.0–30.6, (620) 28.1–29.9, (640) 27.4–29.3, (660) 26.6–28.8, (680) 25.9–28.4, (700) 25.3–28.0

Cell Data: *Space Group:* $P2_1/n$. $a = 26.897(6)$ $b = 15.745(3)$ $c = 13.565(2)$ $\beta = 90.13(3)°$ Z = 8

X-ray Powder Pattern: Butte, Montana, USA (close to chalcocite).
1.871 (100), 2.387 (90), 1.964 (90), 1.957 (90), 3.386 (50), 3.282 (30), 3.192 (30)

Chemistry:

	(1)	(2)
Cu	78.6	79.34
Ag	0.1	
Fe	0.1	
S	20.2	20.66
Total	99.0	100.00

(1) Seathwaite Tarn, England; by electron microprobe. (2) $Cu_{31}S_{16}$.

Occurrence: With other secondary copper sulfides in enriched zones.

Association: Digenite, bornite, chalcocite, chalcopyrite, anilite, pyrite.

Distribution: In Mexico, in Chihuahua, from Barranca de Cobre [TL] and at the Salvadora mine, Milpillas. In the USA, in many of the porphyry copper deposits of the Western Cordillera including Butte, Silver Bow Co., Montana; from Bisbee, Cochise Co., Globe-Miami, Gila Co., and the Magma mine, Superior, Pinal Co., Arizona; in large isolated crystals from the Gem mine, San Benito Co., California. In Peru, from Morococha. At Tsumeb, Namibia. In the Philippine Islands, at Bagacay, Samar Island. In Japan, from the Ani, Osarizawa, and other mines, Akita Prefecture, and elsewhere. At the Mt. Gunson mine, South Australia. In England, from Seathwaite Tarn, near Coniston, Cumbria; at Wheal Owles and the Dean quarry, Cornwall; in the Merehead and Cannington Park quarries, Somerset; and at Gipsy Lane, Leicester. From Bandaksli, Norway. A relatively common mineral, now identified at a number of other localities.

Name: For Dr. Seved Djurle (1918–), Swedish chemist, who first synthesized the compound later found in nature.

Type Material: Royal Ontario Museum, Toronto, Canada, M25369; National Museum of Natural History, Washington, D.C., USA, 92349.

Dmisteinbergite $CaAl_2Si_2O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals tabular, crudely hexagonal, to 0.7 mm.

Physical Properties: *Cleavage:* {0001}, perfect. Hardness = 6 D(meas.) = n.d. D(calc.) = 2.747

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Uniaxial (+). $\omega = 1.575$ $\epsilon = 1.580$

Cell Data: *Space Group:* $P6/mmm$. a = 5.122(5) $c = 14.781(5)$ Z = 2

X-ray Powder Pattern: Chelyabinsk coal basin, Russia.
3.73 (100), 2.57 (80), 2.85 (70), 1.847 (70), 4.48 (60), 3.83 (60)

Chemistry:

	(1)
SiO_2	43.89
Al_2O_3	35.39
MgO	0.01
CaO	19.29
Na_2O	0.32
K_2O	0.03
Total	98.93

(1) Chelyabinsk coal basin, Russia; by electron microprobe, average of four analyses; corresponds to $(Ca_{0.96}Na_{0.03})_{\Sigma=0.99}Al_{1.95}Si_{2.05}O_8$.

Polymorphism & Series: Trimorphous with anorthite and svyatoslavite.

Mineral Group: Feldspar group.

Occurrence: On fracture surfaces in blocks from burned coal dumps.

Association: Cordierite, mullite, anorthite, wollastonite, tridymite, fayalite, fassaite, norbergite-chondrodite, graphite, iron sulfides.

Distribution: From Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia.

Name: For Dmitrii Sergeevich Steinberg (1910–), noted petrologist, Institute of Geology and Geochemistry, Yekaterinberg, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Dolerophanite $Cu_2O(SO_4)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals elongated along [010], flattened on $\{\overline{1}01\}$ and striated ‖ [010], with complex development of over 20 forms, to 1 mm.

Physical Properties: *Cleavage:* Perfect on $\{\overline{1}01\}$. Hardness = 3 D(meas.) = 4.17 D(calc.) = [4.16] Soluble in H_2O, leaving a residue.

Optical Properties: Translucent to opaque. *Color:* Chestnut-brown to dark brown and nearly black; yellow-brown in transmitted light. *Streak:* Yellowish brown.
Optical Class: Biaxial (+). *Pleochroism:* X = deep brown; Y = brownish yellow; Z = lemon-yellow. *Orientation:* $Y = b$; $Z \wedge c = -10°$. *Dispersion:* $r > v$, very strong, crossed. $\alpha = 1.715$ $\beta = 1.820$ $\gamma = 1.880$ 2V(meas.) = 85°

Cell Data: *Space Group:* $C2/m$ (synthetic). $a = 9.370(1)$ $b = 6.319(1)$ $c = 7.639(1)$ $\beta = 122.34(1)°$ Z = 4

X-ray Powder Pattern: Vesuvius, Italy.
3.623 (100), 6.443 (50), 2.615 (42), 2.256 (30), 2.776 (21), 2.546 (18), 2.028 (13)

Chemistry:

	(1)	(2)
SO_3	33.94	33.48
CuO	66.06	66.52
Total	[100.00]	100.00

(1) Vesuvius, Italy; recalculated to 100% from an original total of 98.69%; corresponds to $Cu_{1.98}O_{0.98}(SO_4)_{1.01}$. (2) $Cu_2O(SO_4)$.

Occurrence: A rare volcanic sublimate.

Association: Chalcocyanite, euchlorine, eriochalcite (Vesuvius, Italy); chalcocyanite, euchlorine, eriochalcite, vergasovaite, fedotovite, melanothallite, piypite, ponomarevite, cotunnite, sofiite, halite, sylvite, tenorite, cuprian anglesite, gold (Tolbachik volcano, Russia).

Distribution: On Vesuvius, Campania, Italy. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: From the Greek for *fallacious* and *to appear*, in allusion to a physical appearance nonsuggestive of the composition.

Type Material: Natural History Museum, Paris, France, 71.124.

Total	102.9

(1) Östanmossa mine, Sweden; by electron microprobe, H_2O from Geijer (1927); corresponds to $(Ca_{0.91}Ce_{0.45}La_{0.20}Nd_{0.20}Pr_{0.09}Sm_{0.08}Gd_{0.06})_{\Sigma=1.99}(Mg_{1.81}Fe_{0.25})_{\Sigma=2.06}Al_{0.97}Si_3O_{10.99}[(OH)_{1.25}F_{0.88}]_{\Sigma=1.13}$.

Mineral Group: Epidote group.

Occurrence: In tactite replacement deposits developed during metamorphism of dolomitic limestone.

Association: Tremolite, norbergite, magnetite, dolomite, calcite.

Distribution: In the Östanmossa mine, Norberg, Västmanland, Sweden.

Name: Honors Professor Wayne A. Dollase, University of California, Los Angeles, California, USA, for his crystal chemical research on minerals of the epidote group, and its *cerium* content.

Type Material: National Museum of Natural History, Washington, D.C., USA, R6505.

Dolomite $CaMg(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystals typically combinations of $\{10\overline{1}1\}$ and $\{11\overline{2}0\}$, tabular on $\{0001\}$, many minor forms, may exhibit curved faces, to 20 cm; saddle-shaped aggregates, columnar, stalactitic, granular, massive. *Twinning:* With $\{0001\}$, $\{10\overline{1}0\}$, or $\{11\overline{2}0\}$ as twin plane, common as simple contact twins and in combinations; lamellar on $\{02\overline{2}1\}$.

Physical Properties: *Cleavage:* On $\{10\overline{1}1\}$, perfect; on $\{02\overline{2}1\}$, a parting. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.86 D(calc.) = [2.876] May fluoresce white to pink under UV; triboluminescent.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, yellow, brown, pale pink; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to pearly. *Optical Class:* Uniaxial (–), anomalously biaxial. *Dispersion:* Very strong. $\omega = 1.679$ $\epsilon = 1.500$ 2V(meas.) = Small.

Cell Data: *Space Group:* $R\overline{3}$. $a = 4.812(1)$ $c = 16.020(3)$ Z = 3

X-ray Powder Pattern: Haley, Ontario, Canada.
2.886 (100), 2.192 (30), 1.783 (30), 1.804 (20), 2.015 (15), 1.389 (15), 2.670 (10)

Chemistry:

	(1)	(2)		(1)	(2)
CO_2	47.22	47.73	MgO	21.12	21.86
SiO_2	0.12		CaO	31.27	30.41
FeO	0.22		H_2O	0.02	
MnO			Total	99.97	100.00

(1) Haley, Ontario, Canada. (2) $CaMg(CO_3)_2$.

Polymorphism & Series: Forms two series, with ankerite and with kutnohorite.

Mineral Group: Dolomite group.

Occurrence: Formed by diagenesis or hydrothermal metasomatism of limestone; a primary phase in hypersaline sedimentary environments; a major component of some contact metamorphic rocks and marbles; a gangue in hydrothermal veins; in carbonatites and ultramafic rocks.

Association: Fluorite, barite, calcite, siderite, quartz, metal sulfides (hydrothermal); calcite, celestine, gypsum, quartz (sedimentary); talc, serpentine, magnesite, calcite, magnetite, diopside, tremolite, forsterite, wollastonite (metamorphic); calcite, ankerite, siderite, apatite (carbonatites).

Distribution: A major rock-forming mineral, abundant worldwide with numerous commercial uses. Some localities for fine examples include: in Italy, from Traversella and Brosso, Piedmont. Exceptional crystals from Eugui, Navarra Province, Spain. At Trieben and Hall, Tirol, Austria. From Freiberg and Schneeberg, Saxony, Germany. At Lengenbach, Binntal, Switzerland. From Trepča, Serbia, Yugoslavia. At Frizington, Cumbria, England. In the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. Fine crystals from Brumado, Bahia, and in the Morro Velho gold mine, Nova Lima, Minas Gerais, Brazil. At Naica, Chihuahua, Mexico. In the USA, in New York, from Lockport, Niagara Co., eastward to Walworth, Wayne Co.; at Stony Point, Alexander Co., North Carolina; in the Mississippi Valley region, in the Tri-State district, at Joplin, Jasper Co., Missouri; Galena, Cherokee Co., Kansas; and Picher, Ottawa Co., Oklahoma.

Name: Honors Dieudonne (Déodat) Sylvain Guy Tancrède de Gratet de Dolomieu (1750–1801), French geologist and naturalist, who contributed to early descriptions of the species in dolostone.

Doloresite $H_8V_6^{4+}O_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very rarely in crystals, to 0.1 mm; commonly massive, as veinlets, in radiating bands having botryoidal surfaces, or bladed; almost always intimately intermixed with other vanadium oxide minerals, especially montroseite–paramontroseite. *Twinning:* Lamellar, on {100}, nearly universal.

Physical Properties: *Cleavage:* "Flaky". *Fracture:* "Fibrous". Hardness = n.d. D(meas.) = 3.27–3.33 D(calc.) = 3.41

Optical Properties: Opaque, transparent only in thin fragments. *Color:* Chocolate-brown when pure, commonly nearly black, typically with a dark bronzy tarnish; in transmitted light, reddish brown to reddish yellow; in reflected light, gray with color variation along the crystals. *Streak:* Greenish black. *Luster:* Submetallic; sometimes satinlike on cleavage surfaces. *Optical Class:* Biaxial; optical data not determinable, presumably due to lamellar submicroscopic twinning. *Orientation:* Extinction parallel. $n = \sim 1.90$ 2V(meas.) = n.d. *Anisotropism:* Strong.

Cell Data: *Space Group:* $C2/m$. $a = 19.64(6)$ $b = 2.99(1)$ $c = 4.83(2)$ $\beta = 103°55(5)'$ $Z = 1$

X-ray Powder Pattern: Monument No. 2 mine, Arizona, USA.
4.70 (100), 3.83 (50), 2.45 (50), 3.16 (42), 1.933 (25), 1.799 (21), 2.98 (15)

(1) La Sal No. 2 mine, Colorado, USA; estimated about 50% montroseite–paramontroseite.
(2) $H_8V_6O_{16}$.

Occurrence: In relatively unoxidized uranium-vanadium ores; from the cores of black, concretionary masses high in uranium and vanadium, surrounded by tyuyamunite-bearing sandstone (La Sal No. 2 mine, Colorado, USA).

Association: Coffinite, uraninite, clausthalite, montroseite, paramontroseite, vanadium oxides.

Distribution: In the USA, in Colorado, from the La Sal No. 2 mine, Lumsden Canyon, Gateway district, and in the Matchless, Arrowhead, Corvusite, Black Mama, and Lumsden No. 2 mines, Mesa Co.; from the Golden Cycle, J.J., and Peanut mines, Montrose Co. From the Mi Vida mine, San Juan Co., Utah; at a prospect in Valencia Co., New Mexico; in the Monument No. 2 mine, Apache Co., Arizona; and from Carlile, Crook Co., Wyoming. At the Puttapa zinc mine, near Beltana, South Australia. In the Urcal deposit, La Rioja Province, Argentina.

Name: For the Dolores River, southwestern Colorado, USA.

Type Material: n.d.

Domeykite Cu_3As

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. Reniform, botryoidal; massive.

Physical Properties: *Fracture:* Uneven. Hardness = 3–3.5 VHN = 213–235; 124–140 ("domeykite-beta") (100 g load). D(meas.) = 7.2–7.9 D(calc.) = 7.92

Optical Properties: Opaque. *Color:* Tin-white to steel-gray, tarnishes pale yellow, then pale brown, and finally to iridescence. *Luster:* Metallic.
R: (400) 41.1, (420) 41.4, (440) 41.7, (460) 43.1, (480) 45.2, (500) 47.5, (520) 49.3, (540) 50.7, (560) 52.2, (580) 53.6, (600) 54.5, (620) 54.9, (640) 54.8, (660) 54.6, (680) 54.4, (700) 54.6

(1) Mohawk mine, Michigan, USA. (2) Wasserfall, France; by electron microprobe. (3) Cu_3As.

Occurrence: Of hydrothermal origin.

Association: Copper (typically arsenian), silver, algodonite.

Distribution: In Chile, from the Algodones silver mine, near Coquimbo [TL] and at San Antonio and Chañarcillo, near Copiapó, Atacama. From Corocoro, Bolivia. At Cerro de Paracatas, Tlachapa, Guerrero, Mexico. In the USA, from the Mohawk and Ahmeek mines, Keweenaw Co., and in the Sheldon-Columbia mine, Portage Lake, Houghton Co., Michigan; at the Cashin mine, Montrose Co., Colorado; from Franklin, Sussex Co., New Jersey. In Canada, on Michipicoten Island and at the Silver Islet mine, Thunder Bay, Lake Superior, Ontario; in the East Arm area, Great Slave Lake, Northwest Territories. From Långban and at the Harstigen mine, Värmland, Sweden. From Wasserfall, about 20 km northwest of Belfort, Haute-Saône, and at the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. From Zwickau, Saxony, and at Sailauf, northeast of Aschaffenburg, Bavaria, Germany. In the Condurrow mine, near Helstone, Cambourne, and at Wheal Druid, Redruth, Cornwall, England. In the Talmessi mine, 35 km west of Anarak, Iran. Several other occurrences are known.

Name: Honors Professor Ignacio Domeyko [born Ignacy Domejko] (1802–1889), Polish–Chilean mineralogist, University of Chile, Santiago, Chile.

(1) Utrennyaia shaft, Donets Basin, Ukraine. (2) Uralskaya vein, Donets Basin, Ukraine. (3) $Al_{4.33}(Si_3Al)O_{10}(OH)_8$.

Polymorphism & Series: 1a-2 polytype.

Mineral Group: Chlorite group.

Occurrence: In the lode walls and crushed zones in ore veins and as coatings on slickensides of coals. In soils and sediments in very aluminum-rich environments.

Association: n.d.

Distribution: From a number of places in the Donets Basin, as at Nagol'no Tarasovka, Ukraine. On Novaya Zemlya, Arctic Ocean. From Kesselberg, Black Forest, Germany. At Saint-Paul-de-Fenouillet, Pyrénées-Orientales, France. From Namivu, Alto Ligonha district, Mozambique. At Szabo Bluff, Scott Glacier, Antarctica.

Name: For occurrences in the DONets BASin, Ukraine.

Type Material: n.d.

X-ray Powder Pattern: Alšar, Macedonia.
3.112 (100), 5.974 (87), 3.666 (34), 1.991 (29), 1.833 (23), 2.988 (22), 2.577 (21)

Chemistry:

	(1)
SO_3	26.52
As_2O_5	1.19
Fe_2O_3	39.54
K_2O	1.23
Tl_2O	24.28
H_2O	[7.59]
Total	[100.35]

(1) Alšar, Macedonia; by electron microprobe, average of seven analyses with lowest Fe/(Tl + K) ratios, H_2O calculated by analogy to jarosite; after deduction of excess Fe and As, corresponds to $(Tl_{0.81}K_{0.19})_{\Sigma=1.00}Fe_3(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: In oxidized portions of a Tl-bearing hydrothermal sulfide-sulfosalt deposit.

Association: Amorphous Fe–Mn arsenate-sulfate, gypsum, bassanite, rösslerite, pharmacosiderite, melanterite, barite.

Distribution: From Alšar (Allchar), near Rošden, Macedonia.

Name: From the French *doré*, *golden yellow*, and the famous mining locality, Alšar (Allchar), Macedonia.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1993.7.

References: (1) Balić Žunić, T., Y. Moëlo, Ž. Lončar, and H. Micheelsen (1994) Dorallcharite, $Tl_{0.8}K_{0.2}Fe_3(SO_4)_2(OH)_6$, a new member of the jarosite-alunite family. Eur. J. Mineral., 6, 255–263. (2) (1995) Amer. Mineral., 80, 184–185 (abs. ref. 1).

Dorfmanite $Na_2(PO_3OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Powdery aggregates and incrustations, with individual particles up to 15 μm.

Physical Properties: Hardness = 1–1.5 in aggregates. D(meas.) = 1.98–2.00 D(calc.) = 2.06 Very soluble in H_2O.

Optical Properties: Semitransparent. *Color:* White. *Luster:* Vitreous to earthy. *Optical Class:* Biaxial (+). *Orientation:* $Z \parallel$ elongation. *Dispersion:* $r > v$, weak. $\alpha = 1.454$ $\beta = 1.461$ $\gamma = 1.471$ 2V(meas.) = 65°

Cell Data: *Space Group:* n.d. (synthetic). $a = 10.34$ $b = 16.82$ $c = 6.601$ Z = 8

X-ray Powder Pattern: Kola Peninsula, Russia.
3.35 (100), 3.25 (81), 4.64 (75), 2.869 (75), 2.260 (75), 5.28 (56), 2.928 (56)

Chemistry:

	(1)	(2)	(3)
P_2O_5	39.49	40.83	39.88
Na_2O	34.84	33.80	34.82
K_2O	trace	0.00	
F	0.00	0.00	
H_2O	25.44	25.60	25.30
Total	99.77	100.23	100.00

(1) Mt. Koashva, Russia; corresponds to $Na_{2.02}H_{0.98}PO_4 \cdot 2.04H_2O$. (2) Kola Peninsula, Russia; corresponds to $Na_{1.89}H_{1.11}PO_4 \cdot 1.97H_2O$. (3) $Na_2(PO_3OH) \cdot 2H_2O$.

Occurrence: Noted in drill cores into alkalic pegmatites in differentiated alkalic massifs, as an alteration product of lomonosovite and nacaphite (Kola Peninsula, Russia); in sodalite xenoliths associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Lomonosovite, olympite, villiaumite (Kola Peninsula, Russia); sodalite, villiaumite, eudialyte, lovozerite, ussingite (Mont Saint-Hilaire, Canada).

Distribution: In Russia, on the Kola Peninsula, from Mts. Yukspor, Kukisvumchorr, Koashva, and Rasvumchorr in the Khibiny massif, and on Mts. Karnasurt and Alluaiv in the Lovozero massif. At Mont Saint-Hilaire, Quebec, and in the Tanco pegmatite, Bernic Lake, Manitoba, Canada.

Name: To honor Moisei Davidovich Dorfman (1908–), Russian mineralogist, A.E. Fersman Mineralogical Museum, Moscow, Russia, investigator of Khibiny minerals.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Dorrite $\mathbf{Ca_2Mg_2Fe_4^{3+}Al_4Si_2O_{20}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudomonoclinic by twinning. *Point Group:* $\overline{1}$ or 1. As anhedral to prismatic grains, to 0.1 mm; some grains exhibit hopper and skeletal crystal habit. *Twinning:* Twinned by two-fold rotation about the pseudomonoclinic [010] axis.

Physical Properties: *Cleavage:* Good on {010} and {001}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = n.d. D(calc.) = 3.959

Optical Properties: Nearly opaque. *Color:* Dark red-brown to dark brown. *Streak:* Gray. *Luster:* Submetallic.
Optical Class: Biaxial. *Pleochroism:* In ultrathinned sections, very strong; X = red-orange-brown; Y = yellowish brown; Z = greenish brown. *Absorption:* Extreme. $\alpha = 1.82(1)$ $\beta = 1.84(1)$ $\gamma = 1.86(1)$ 2V(meas.) = 90°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.505(3)$ $b = 10.897(3)$ $c = 9.019(1)$ $\alpha = 106.26(2)°$ $\beta = 95.16(2)°$ $\gamma = 124.75(2)°$ Z = 2

X-ray Powder Pattern: Durham ranch, Wyoming, USA.
2.971 (100), 2.558 (80), 2.515 (80), 2.125 (60), 1.511 (30), 1.482 (30), 8.1 (20)

Chemistry:

	(1)	(2)
SiO_2	11.16	14.37
TiO_2	0.56	
Al_2O_3	24.85	24.39
Fe_2O_3	41.65	38.19

CaO	13.63	13.41
Na_2O	0.02	
K_2O	0.02	
Total	100.47	100.00

(1) Durham ranch, Wyoming, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponding to $(Ca_{1.99}Na_{0.01})_{\Sigma=2.00}(Mg_{1.19}Fe^{2+}_{0.33}Fe^{3+}_{0.29}Ca_{0.10}Ti_{0.06}Mn_{0.02}Cr_{0.01})_{\Sigma=2.00}Fe^{3+}_{4.00}Al_{4.00}(Si_{1.60}Al_{0.20}Fe^{3+}_{0.20})_{\Sigma=2.00}O_{20}$. (2) $Ca_2Mg_2Fe_4Al_4Si_2O_{20}$.

Mineral Group: Aenigmatite group.

Occurrence: A product of oxidizing, high-temperature, low-pressure metamorphism of alkalic rocks, in a pyrometamorphic zone in sediments.

Association: Esseneite, titanian andradite, magnetite-magnesioferrite-spinel, plagioclase, gehlenite-åkermanite, wollastonite, ulvöspinel, nepheline, apatite, ferroan sahamalite.

Distribution: From the Durham ranch, Powder River basin, 13 km northeast of Reno Junction and 25 km south of Gillette, Campbell Co., Wyoming, USA.

Name: To honor Dr. John A. Dorr, Jr., Professor of Geology, University of Michigan, Ann Arbor, Michigan, USA, in recognition of his regional geologic research in Wyoming.

Type Material: University of Michigan, Ann Arbor, Michigan; National Museum of Natural History, Washington, D.C., USA, 163357.

Douglasite $K_2Fe^{2+}Cl_4 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (synthetic). *Point Group:* $2/m$. As coarse granular masses.

Physical Properties: Hardness = n.d. D(meas.) = 2.16 D(calc.) = [2.04]

Optical Properties: Semitransparent. *Color:* Pale green, yellow-green, brownish red on exposure. *Luster:* Vitreous.
Optical Class: Uniaxial (+), or nearly so. $\omega = 1.488(3)$ $\epsilon = 1.500(3)$ 2V(meas.) = 5(5)°

Cell Data: *Space Group:* n.d. $a = 11.80$ $b = 16.27$ $c = 8.225$ $\beta = 104.89°$ Z = [6]

X-ray Powder Pattern: Westeregeln, Germany. (ICDD 41-1358).
3.081 (100), 3.665 (78), 4.032 (62), 4.157 (59), 2.9678 (53), 5.065 (47), 2.3700 (41)

Chemistry: No analysis is available; identification depends on correspondence of other properties with the synthetic compound.

Occurrence: In a halite–potash deposit.

Association: Carnallite, sylvite, halite.

Distribution: From the Douglashall mine, near Westeregeln, northwest of Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt, Germany.

Name: For the locality, Douglashall, Germany, at which it occurs.

Type Material: The Natural History Museum, London, England, 1965,450.

Downeyite SeO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As acute needlelike crystals, up to 2 cm in length, elongated along [001]; also as radiating sprays. *Twinning:* Contact twinning reported.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.165 Extremely hygroscopic; readily soluble in cold H_2O.

Optical Properties: Transparent. *Color:* Colorless; red from inclusions of amorphous selenium or yellowish from sulfur. *Luster:* Adamantine.
Optical Class: Uniaxial (+); determination of indices hindered by reaction with the immersion media. *Orientation:* Extinction parallel. $n = > 1.80$, moderate birefringence.

Cell Data: *Space Group:* $P4_2/mbc$ (synthetic). $a = 8.3622(7)$ $c = 5.0612(5)$ Z = 8

X-ray Powder Pattern: Synthetic.
3.008 (100), 3.742 (60), 4.180 (55), 3.227 (55), 2.531 (25), 1.933 (18), 1.883 (14)

Chemistry: Electron microprobe analyses found only selenium; identity with synthetic SeO_2 established by correspondence of other properties.

Occurrence: As a rare sublimation product of gases escaping through vents in actively burning culm banks in anthracite coal deposits; forms at about 200 °C near the vents.

Association: Selenium, rosickýite, mascagnite.

Distribution: In the USA, from coal waste piles at Glen Lyon, Luzerne Co., Williamstown, Dauphin Co., Forestville, Schuylkill Co., and Burnside, Northumberland Co., Pennsylvania.

Name: For Wayne F. Downey, Jr., of Harrisburg, Pennsylvania, USA, who first collected the mineral.

Type Material: n.d.

Doyleite $Al(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ (probable) or 1. As rosettes of crystals, to 0.6 mm, tabular on {010}, showing forms {101}, {10$\overline{1}$}, and less commonly {100} and {001}, rectangular or square in outline; also finely granular and as porcelaneous coatings.

Physical Properties: *Cleavage:* {010}, perfect; {100}, fair. *Tenacity:* Flexible. Hardness = 2.5–3 D(meas.) = 2.48(1) D(calc.) = 2.482

Optical Properties: Transparent to opaque. *Color:* Colorless, white, creamy, bluish white. *Streak:* White. *Luster:* Vitreous to pearly if colorless; otherwise dull. *Optical Class:* Biaxial (+). *Orientation:* X (90°,41°); Y (240°,53°); Z (343°,74°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r > v$, moderately strong. $\alpha = 1.545(1)$ $\beta = 1.553(1)$ $\gamma = 1.566(1)$ 2V(meas.) = 77° 2V(calc.) = 76.8°

Cell Data: *Space Group:* $P\overline{1}$ (probable), or $P1$. $a = 5.002(1)$ $b = 5.175(1)$ $c = 4.980(2)$ $\alpha = 97.50(1)°$ $\beta = 118.60(1)°$ $\gamma = 104.74(1)°$ Z = 2

X-ray Powder Pattern: Mont Saint-Hilaire, Canada; minor preferred orientation. 4.794 (100), 2.360 (40), 1.972 (30), 1.857 (30), 1.842 (30), 4.296 (20), 4.182 (20)

Chemistry:

	(1)	(2)	(3)	(4)
SiO_2		0.03	3.22	
Al_2O_3	65.2	63.7	59.6	65.36
FeO		0.14	0.08	
MgO			0.96	
CaO	0.48		0.23	
Na_2O		0.09	0.35	
H_2O	35.76	35.76	[35.56]	34.64
Total	101.44	99.72	[100.00]	100.00

(1) Mont Saint-Hilaire, Canada; H_2O by TGA, $(OH)^{1-}$ confirmed by IR. (2) Do.; by electron microprobe, H_2O from (1). (3) Francon quarry, Canada; by electron microprobe, average of four analyses, H_2O by difference. (4) $Al(OH)_3$.

Polymorphism & Series: Polymorphous with bayerite, gibbsite, and nordstrandite.

Occurrence: A late-stage hydrothermal mineral lining vugs in veins in nepheline syenite associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in vugs within silicocarbonatite sills intruding limestones (Francon quarry, Canada); in miarolitic cavities in a nepheline syenite sill (near Saint-Amable, Canada).

Association: Calcite, albite, pyrite (Mont Saint-Hilaire, Canada); weloganite, calcite, quartz, albite, pyrite, cryolite, strontianite, dresserite, dawsonite, fluorite, analcime (Francon quarry, Canada); microcline, eudialyte, yofortierite, astrophyllite, serandite, aegirine (near Saint-Amable, Canada).

Distribution: Found at Mont Saint-Hilaire, in the Francon quarry, Montreal Island, Montreal, and near Saint-Amable, Quebec, Canada.

Name: Honors Canadian physician E.J. Doyle, of Ottawa, Canada, who found the mineral at Mont Saint-Hilaire, Canada.

Type Material: Canadian Museum of Nature, Ottawa, 48932; Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M41025; National Museum of Natural History, Washington, D.C., USA, 162728.

References: (1) Chao, G.Y., J. Baker, A.P. Sabina, and A.C. Roberts (1985) Doyleite, a new polymorph of $Al(OH)_3$, and its relationship to bayerite, gibbsite and nordstrandite. Can. Mineral., 23, 21–28. (2) (1986) Amer. Mineral., 71, 845 (abs. ref. 1).

Dravite $NaMg_3Al_6(BO_3)_3Si_6O_{18}(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals equant or short to long prismatic, with dominant pyramid faces, to 20 cm. Striated ‖ [0001], cross sections typically triangular with curved convex sides. Commonly radiating, granular, and massive. *Twinning:* Rare, on $\{10\bar{1}1\}$ and $\{40\bar{4}1\}$.

Physical Properties: *Cleavage:* $\{11\bar{2}0\}$, $\{10\bar{1}1\}$, very poor. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 7 D(meas.) = 3.03–3.18 D(calc.) = 3.038 Pyroelectric and piezoelectric; may weakly fluoresce under SW UV.

Optical Properties: Transparent to translucent. *Color:* Brown to black, red, yellow, blue, green, colorless, white; colorless to yellow in thin section. *Streak:* Light brown, white. *Luster:* Vitreous to resinous.
Optical Class: Uniaxial (–). *Pleochroism:* Very strong; O = pale yellow; E = colorless, yellowish, greenish, brownish. *Absorption:* $O > E$. ω = 1.634–1.661 ϵ = 1.612–1.632

Cell Data: *Space Group: R3m.* a = 15.94–15.98 c = 7.19–7.23 Z = 3

X-ray Powder Pattern: Dobrawa, Slovenia.
2.576 (100), 3.99 (85), 2.961 (85), 4.22 (65), 3.48 (60), 2.040 (45), 1.920 (35)

Chemistry:

	(1)		(1)
SiO_2	36.52	MgO	11.25
TiO_2	0.17	CaO	0.42
B_2O_3	10.32	Na_2O	2.34
Al_2O_3	33.41	K_2O	0.57
FeO	0.30	F	0.12
MnO	0.57	H_2O^+	3.76
		Total	99.75

(1) Dobrawa, Slovenia; corresponds to $(Na_{0.73}K_{0.12}Ca_{0.07})_{\Sigma=0.92}(Mg_{2.70}Al_{0.35}Mn_{0.08}Fe^{2+}_{0.04}Ti_{0.02})_{\Sigma=3.19}Al_{6.00}(B_{0.96}O_3)_3Si_{5.88}O_{18}[(OH)_{3.70}O_{0.20}F_{0.10}]_{\Sigma=4.00}$.

Polymorphism & Series: Forms two series, with schorl, and with elbaite.

Mineral Group: Tourmaline group.

Occurrence: Commonly in metamorphosed limestones or mafic igneous rocks with metasomatically introduced boron; rarely in pegmatites; as authigenic overgrowths in sedimentary rocks.

Association: Quartz, calcite, dolomite, epidote, microcline, albite, muscovite, fluorite, titanite.

Distribution: Found around Dravograd (Unterdrauberg), Slovenia. From Beura, Val d'Ossola, Piedmont, Italy. At Arendal and Snarum, Norway. From Outokumpu, and Kaavi, Kuopio, Finland. In the USA, fine crystals from Gouverneur, Pierrepont, and Macomb, St. Lawrence Co., New York; at Franklin and Hamburg, Sussex Co., New Jersey; and Newry, Oxford Co., Maine. In Canada, in Hull Township, Quebec; at Wilberforce, Ontario; and many other places. From Brumado, Bahia, Brazil. Large crystals from Yinnietharra, 800 km north of Perth, Western Australia. At Osarara, Narok district, Kenya. From Gujarkot, Nepal. Increasingly distinguished from other tourmaline group members.

Name: For the district along the Drava (Drave) River in Austria and Slovenia.

Type Material: National Museum of Natural History, Washington, D.C., USA, R18133, R17274.

Total	101.3	99.1	100.00

(1–2) Hirschhorn, Germany; by electron microprobe; the average corresponding to $(Bi_{0.96}Ca_{0.05})_{\Sigma=1.01}VO_4$. (3) $BiVO_4$.

Polymorphism & Series: Trimorphous with clinobisvanite and pucherite.

Occurrence: In rhyolitic tuffs, intercalated with carbonaceous matter and silicified wood.

Association: Bismite, mixite, carnotite, silver, chlorargyrite, kaolinite, hematite, goethite, barite, quartz.

Distribution: From Hirschhorn, near Kaiserlautern, Rhineland-Palatinate, Germany.

Name: In honor of Gerhard Dreyer, Assistant Professor, Johannes Gutenberg University, Mainz, Germany, who found the mineral.

Type Material: Johannes Gutenberg University, Mainz, Germany; National Museum of Natural History, Washington, D.C., USA, 159922.

References: (1) Dreyer, G. and E. Tillmanns (1981) Dreyerit: ein natürliches, tetragonales Wismutvanadat von Hirschhorn/Pfalz. Neues Jahrb. Mineral., Monatsh., 151–154 (in German with English abs.). Drugmanite $HPb_2(Fe^{3+}, Al)(PO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Pseudorhombohedral crystals, to 0.2 mm, with prominent {001}, also {110}, flattened on [001], elongated along [010], in aggregates.

Physical Properties: Hardness = < 6 D(meas.) = > 4.1 D(calc.) = 5.55

Optical Properties: Transparent. *Color:* Pale yellow to colorless; in transmitted light, colorless with anomalous interference colors. *Streak:* White. *Luster:* Adamantine. *Optical Class:* Biaxial (–). *Orientation:* OAP = (010); $X \simeq \perp$ (001). *Dispersion:* $r < v$, strong. $n = [1.87]$ $\alpha = > 1.74$ $\beta = > 1.74$ $\gamma = > 1.74$; γ–$\beta = 0.020(2)$ in (001) section. 2V(meas.) = 33(2)°

Cell Data: *Space Group:* $P2_1/a$. $a = 11.111(5)$ $b = 7.986(5)$ $c = 4.643(3)$ $\beta = 90.41(3)°$ Z = 2

X-ray Powder Pattern: Richelle, Belgium.
3.752 (10), 4.63 (9), 2.912 (9), 3.350 (8), 3.247 (8), 2.714 (7b), 2.391 (6)

Chemistry:

	(1)	(2)
P_2O_5	20.37	20.85
Al_2O_3	1.61	3.74
Fe_2O_3	8.85	5.87
PbO	64.37	65.57
H_2O	[3.87]	3.97
Total	[99.07]	100.00

(1) Richelle, Belgium; by electron microprobe, average of eight analyses; total Fe as Fe_2O_3, H_2O calculated for 10 O^{2-}; corresponds to $HPb_2(Fe_{0.78}Al_{0.22})_{\Sigma=1.00}(PO_4)_2(OH)_2$.
(2) $HPb_2(Fe, Al)(PO_4)_2(OH)_2$ with Fe:Al = 1:1.

Occurrence: Very rare, formed at low temperatures in vugs in mineralized limestones, an oxidation product of disseminated sulfides.

Association: Anglesite, corkite, pyromorphite, phosphosiderite.

Distribution: From Richelle, near Visé, Belgium.

Name: To honor Dr. Julien Drugman (1875–1950), Belgian mineralogist.

Type Material: Belgian Royal Institute of Natural Sciences, Brussels, RC5210; University of Liège, Liège, Belgium, 19347.

Drysdallite $Mo(Se,S)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$ most probably. Steep pyramidal crystals, to 0.5 mm, embedded in other minerals; massive.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Pliable, difficult to pulverize. Hardness = Very soft. VHN = 46–58 (7.6 g load). D(meas.) = n.d. D(calc.) = 6.248

Optical Properties: Opaque. *Color:* Grayish black with a brownish tint. *Streak:* Brownish black. *Luster:* Metallic. *Pleochroism:* Strong, white to very pale gray, to pinkish gray. *Anisotropism:* Very strong, with colors from pale bluish gray to purplish brown.
R_1–R_2: (400) 17.0–38.0, (420) 18.2–37.8, (440) 19.4–37.6, (460) 20.4–37.6, (480) 21.4–37.5, (500) 21.8–37.5, (520) 21.8–37.4, (540) 21.6–37.1, (560) 21.4–36.7, (580) 21.1–36.0, (600) 20.8–35.5, (620) 20.6–35.1, (640) 20.5–35.0, (660) 20.4–35.0, (680) 20.4–35.2, (700) 20.4–35.6

Cell Data: *Space Group:* $P6_3/mmc$ (synthetic). $a = 3.287(1)$ $c = 12.925(2)$ $Z = 2$

X-ray Powder Pattern: Kapijimpanga deposit, Zambia.
2.373 (100), 6.46 (75), 2.845 (55), 1.913 (55), 1.643 (40), 1.615 (40), 2.153 (25)

Total	99.10	100.00

(1) Kapijimpanga deposit, Zambia; by electron microprobe, corresponds to $Mo_{0.85}(Se_{1.76}S_{0.24})_{\Sigma=2.00}$, with spectrographic traces of Si, Mg, Al, Pb, Fe, Bi, Ca, Cu, Ni, and Ti, belonging mostly to impurities. (2) $MoSe_2$.

Occurrence: In the oxidation zone of a uranium deposit in a talc schist.

Association: Uraninite, apatite, masuyite, secondary uranium minerals.

Distribution: From the Kapijimpanga uranium deposit, 16 km southeast of Solwezi, Northwestern Province, Zambia [TL].

Name: To honor Dr. A.R. Drysdall (1933–), Director, Geological Survey of Zambia.

Type Material: Charles University, Prague, Czech Republic, 17348; National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 145627.

Dufrénite $Ca_{0.5}Fe^{2+}Fe^{3+}_5(PO_4)_4(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals rare, rounded, tabular, to 1 mm; in sheaflike or subparallel aggregates. Usually radial fibrous, botryoidal masses or crusts.

Physical Properties: *Cleavage:* One, perfect; another, less perfect, both ∥ fiber elongation; a third ⊥ first two, in traces. *Tenacity:* Brittle. Hardness = 3.5–4.5 D(meas.) = 3.1–3.34 D(calc.) = [3.41]

Optical Properties: Translucent to almost opaque. *Color:* Greenish black, dark green, olive-green when fresh, olive-brown to reddish brown when oxidized, typically concentrically banded; in transmitted light, bluish green, reddish brown, yellow. *Luster:* Vitreous to silky. *Optical Class:* Biaxial (+). *Pleochroism:* X = deep blue, bluish green, pale yellow-brown, pale brown; Y = buff, pale yellow-brown to brown, deep blue; Z = deep red-brown, olive-brown, dark brown, greenish blue. *Dispersion:* $r < v$, commonly, or $r > v$; both extreme. *Absorption:* $Z > Y > X$; may be $Z > X > Y$. α = 1.810–1.842 β = 1.813–1.850 γ = 1.855–1.925 2V(meas.) = Small to very small.

Cell Data: *Space Group:* $C2/c$. $a = 25.84(2)$ $b = 5.126(3)$ $c = 13.78(1)$ $\beta = 111.20(6)°$ Z = 2

X-ray Powder Pattern: Cornwall, England; close to natrodufrénite.
3.151 (10), 12.00 (9), 5.002 (9), 3.393 (7), 2.860 (6), 4.410 (5), 2.101 (5)

(1–2) Wheal Phoenix, Cornwall, England. (3) $Ca_{0.5}Fe^{2+}Fe^{3+}_5(PO_4)_4(OH)_6 \cdot 2H_2O$.

Occurrence: A secondary mineral formed principally in iron ore deposits.

Association: Goethite, beraunite, quartz.

Distribution: In Germany, from Hirschberg, Ullersreuth, and Lobenstein, Thuringia; at Hauptmannsgrün, near Reichenbach, Saxony; in the Rotläufchen mine, Waldgirmes, near Giessen, Hesse; at Hagendorf, Bavaria. From the West Phoenix United mines, Linkinhorne, and in the Gunheath china clay pit, St. Austell, Cornwall, England. From the Mangualde pegmatite, near Mesquitela, Portugal. In the USA, at Rock Run, Cherokee Co., Alabama; in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; at the Sequoia Pit, Iron Point district, Humboldt Co., and in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada; in the Santa Rita mine, Grant Co., New Mexico. From Dandarragan, Western Australia. In the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 kilometers west of Córdoba, Córdoba Province, Argentina. There are probably additional localities, but requiring confirmation.

Name: To honor Professor Ours Pierre Armand Petit-Dufrénoy (1792–1857), French mineralogist, National School of Mines, Paris, France.

Type Material: University of Chicago, Chicago, Illinois, 1247; Harvard University, Cambridge, Massachusetts, USA, 97427.

Total	100.86	100.00

(1) Binntal, Switzerland. (2) $Pb_2As_2S_5$.

Occurrence: An uncommon mineral of medium- to low-temperature hydrothermal origin.

Association: Chalcopyrite, sphalerite, realgar, orpiment, tetrahedrite.

Distribution: In Switzerland, from Binntal, Valais, in the Lengenbach quarry [TL], and at Recki Bach. From the Bleikvassli Zn–Pb–Cu deposit, Nordland, Norway. At Wheal Boys, St. Endellion, Cornwall, England. In the USA, from the Silver Star claims, near Fruitland, Stevens Co., Washington, and at the Zuni mine, San Juan Co., Colorado. From the Hemlo gold deposit, Thunder Bay district, Ontario, Canada.

(1–2) Tsumeb, Namibia. (3) $PbCu(AsO_4)(OH)$.

Mineral Group: Adelite group.

Occurrence: An uncommon mineral in the oxidized zone of some hydrothermal base-metal deposits.

Association: Olivenite, mottramite, azurite, malachite, wulfenite, calcite (Tsumeb, Namibia); bayldonite, beudantite, mimetite, cerussite (Cap Garonne mine, France).

Distribution: Many minor localities. Abundant at Tsumeb, Namibia, rarely in large crystals. From Fitula and Mufulira, Zambia. At the Touissit mine, near Oujda, Morocco. From the Cap Garonne mine, near le Pradet, Var, France. In the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate, Germany. From Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. In England, at Brandy Gill, Caldbeck Fells, Cumbria, and in the Penberthy Croft mine, St. Hilary, Cornwall. From the Ojuela mine, Mapimí, Durango, Mexico. In the USA, from the Mohawk mine, Clark Mountains, San Bernardino Co., and at the Belmont mine, Cerro Gordo, Inyo Co., California; in the Black Pine mine, Philipsburg, Granite Co., Montana; at Granite Gap, Hidalgo Co., New Mexico. In Australia, large crystals in the Mt. Bonnie mine, Grove Hill, Prices Station, Northern Territory; from Broken Hill, New South Wales; and in the Puttapa zinc mine, near Beltana, and the Mt. Malvern mine, near Clarendon, South Australia.

Name: In honor of G. Duft, General Manager of the mine at Tsumeb, Namibia.

Type Material: n.d.

Total	[100.0]	100.00

(1) Tombstone, Arizona, USA; average of four analyses for Pb, Zn, Cu, three for Te, and two for As, H_2O by the Penfield method; recalculated to 100% after deduction of insoluble 3.63% average.
(2) $Pb_3Zn_3(TeO_6)(AsO_4)(OH)_3$.

Occurrence: An alteration product of khinite and parakhinite, formed under acid oxidizing conditions from gold-telluride ores in massive vein quartz (Tombstone, Arizona, USA).

Association: Khinite, parakhinite, bromargyrite, chlorargyrite, cerussite, emmonsite, other tellurium oxysalts (Tombstone, Arizona, USA).

Distribution: In the USA, from the Emerald and Old Guard mines, and the Joe shaft, Tombstone, Cochise Co., Arizona; at the Centennial Eureka mine, Tintic district, Juab Co., Utah. From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: To honor Marjorie Duggan (1927–), American analytical chemist, who first analyzed Te^{6+} from nature.

Type Material: The Natural History Museum, London, England, 1980,544; Harvard University, Cambridge, Massachusetts, 119093; National Museum of Natural History, Washington, D.C., USA, 162207.

Total	99.12	99.1	100.00

(1) Shinkolobwe, Congo. (2) Do.; UO_3 and P_2O_5 average of two analyses, PbO and H_2O average of three analyses. (3) $Pb_2(UO_2)_3O_2(PO_4)_2 \cdot 5H_2O$.

Occurrence: In pockets of torbernite in the oxidized zone of a uranium deposit (Shinkolobwe, Congo).

Association: Torbernite (Shinkolobwe, Congo); uranophane, kasolite, autunite (near Nogales, Arizona, USA); kasolite (Goodsprings, Nevada, USA).

Distribution: From Shinkolobwe, Katanga (Shaba) Province, and at the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). In the USA, at the White Oak property, near Nogales, Santa Cruz Co., Arizona; in the Green Monster and Desert Valley mines, Goodsprings district, Clark Co., Nevada. From the South Alligator Valley, and in the Ranger mine, Jabiru, Northern Territory, Australia.

Name: Honoring André Hubert Dumont (1809–1857), Belgian geologist.

Type Material: Natural History Museum, Paris, France, 125.11.

Dumortierite $Al_7(BO_3)(SiO_4)_3O_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As fibrous or columnar crystals, having generally poor face development, to 6 cm; as coarsely crystalline to intimate parallel aggregates of needles; massive. *Twinning:* Common on {110}, which may produce trillings.

Physical Properties: *Cleavage:* Distinct on {100}, poor on {110}; parting on {001}. Hardness = 7–8.5 D(meas.) = 3.21–3.41 D(calc.) = 3.45

Optical Properties: Transparent to translucent. *Color:* Bright smalt-blue to greenish blue, violet, red-violet, purple, brown. *Luster:* Vitreous to dull.
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = deep blue or violet; Y = yellow to red-violet or nearly colorless; Z = colorless or very pale blue. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong. α = 1.659–1.686 β = 1.684–1.722 γ = 1.686–1.723 2V(meas.) = 13°–55°

Cell Data: *Space Group: Pmcn.* a = 11.828(1) b = 20.243(3) c = 4.7001(5) Z = 4

X-ray Powder Pattern: Sri Lanka.
5.85 (s), 2.09 (ms), 5.06 (m), 3.43 (m), 3.22 (m), 2.91 (mb), 4.26 (mw)

Chemistry:

(1) Dehesa, California, USA; by electron microprobe, B_2O_3 and H_2O inferred from structure determination. (2) $Al_7(BO_3)(SiO_4)_3O_3$.

Occurrence: In aluminum-rich regionally metamorphosed rocks, disseminated and in veinlets cutting schists; also in pegmatitic veins.

Association: Quartz, cordierite, kyanite, andalusite, sillimanite, muscovite, rutile.

Distribution: In France, from near Beaunan and at Chaponost, near Lyon, Rhône. At Wolfshau, near Schmiedeberg, Silesia, Poland. From Kaňk, near Kutná Hora, Czech Republic. In the USA, from the Champion mine, near Oreana, Sacramento district, Humboldt Co., Nevada, once mined commercially; at Clip, near Yuma, and Quartzsite, La Paz Co., Arizona; Petaca, Rio Arriba Co., New Mexico; in California, from near Dehesa, San Diego Co., and from near Ogilby, Imperial Co. In Canada, from Ashby Township, Addington Co., Ontario. From the Erongo Mountains, Namibia. On Madagascar, many places for fine examples, as at Soavina, north of Atofinandrahana; Saharina; Ambatolahinanahary; Ambositra; and Riamfotsy. In India, at Mogra, Bhandara district, Maharashtra. Many other minor localities are known.

Name: For Eugène Dumortier (1802–1873?), French paleontologist, of Lyons, France.

(1) Dundas, Tasmania, Australia. (2) $PbAl_2(CO_3)_2(OH)_4 \cdot H_2O$.

Occurrence: Uncommon in the oxidized zone of lead-bearing deposits.

Association: Cerussite, plattnerite, azurite, malachite, pyromorphite, mimetite, beudantite, duftite, crocoite, gibbsite, allophane, "limonite".

Distribution: In Australia, from near Dundas, Tasmania, notably at the Adelaide Proprietary mine, and at the Hercules mine, Mt. Read. In the Tui mine, Mt. Te Aroha, New Zealand. In Wales, from the Welsh Foxdale mine and others, near Trefriw, Gwynedd. At the Clements mine, near Maam, Co. Galway, Ireland. In England, from the Mill Close mine, Wensley, Derbyshire; at Wheals Rose and Penrose, Sithney, in the Trevinnick mine, St. Kew, and others in Cornwall; from the Brandehow mine, Derwentwater, and the Wanthwaite mine, St. John's in the Vale, Cumbria. In the Bad Ems district, Rhineland-Palatinate, and at Bad Harzburg and elsewhere, Harz, Germany. At Guttaring, and Pleschutz, near Hirt, Carinthia, Austria. In Italy, on Sardinia, from the Punta Sa Torre mine, the Seddas Moddizis mine, and the San Giovanni mine, near Gonessa, Iglesias. In the Kamariza mine, Laurium, Greece. Long crystals from the Cap Garonne mine, near le Pradet, Var, France. At the Touissit mine, Oujda, Morocco. From Tsumeb, Namibia. In the USA, in New Mexico, from the South Juanita, Tip Top, and Kelly mines, near Magdalena, Socorro Co.; in the Success mine, Schell Creek Range, White Pine Co., Nevada; at the Noble mine, Ogdensburg, Sussex Co., New Jersey.

Name: For the occurrence at Dundas, Tasmania, Australia.

Durangite $NaAl(AsO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically in euhedral crystals, to 1 cm, slightly elongated along [001], with dominant {110}, {$\bar{1}$11}, and {010}, {100}, {021}, faces commonly rough; in stacked aggregates.

Physical Properties: *Cleavage:* On {110}, distinct. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 3.90–4.07 D(calc.) = 3.92

Optical Properties: Transparent to opaque. *Color:* Pale to dark red-orange, deep red, orange, orange-brown, pale yellow; in transmitted light, color zoned from varying contents of Fe and Mn. *Streak:* Cream-yellow to pale yellow. *Luster:* Vitreous, usually dull.
Optical Class: Biaxial (–). *Pleochroism:* X = yellow-orange; Y = pale yellow-orange; Z = nearly colorless. *Orientation:* $Z = b$; $X \wedge c = -25°$. *Dispersion:* $r < v$, less commonly $r > v$, weak to moderate. *Absorption:* $X > Y > Z$. $\alpha = 1.597–1.634$ $\beta = 1.636–1.673$ $\gamma = 1.647–1.685$ 2V(meas.) = 45°; 68°–85° 2V(calc.) = 55°–81°

(1) Barranca tin mine, Durango, Mexico. (2) Boiler Peak, New Mexico, USA; by ICPA and emission spectroscopy, F by ion chromatography, H_2O by Karl Fischer method, after deduction of SiO_2 3.21%; then corresponds to $(Na_{0.93}Li_{0.07})_{\Sigma=1.00}(Al_{0.89}Fe_{0.07}Mn_{0.06})_{\Sigma=1.02}(As_{0.99}O_4)[F_{0.90}(OH)_{0.07}]_{\Sigma=0.97}$. (3) $NaAl(AsO_4)F$.

Polymorphism & Series: Forms two series, with maxwellite and with tilasite.

Occurrence: In veins in alkalic rhyolite and tin placers derived therefrom; in pegmatite dikes in granite.

Association: Cassiterite, hematite, topaz, ilmenite, tantalite, wickmanite, beudantite, mimetite, fluorite, tridymite, cristobalite, quartz, amblygonite, "chalcedony", zeolites, clay minerals.

Distribution: From the Barranca tin mine, about 30 km northeast of Coneto de Comonfort, Durango, Mexico. Found near Lake Ramsey, New Ross, Nova Scotia, Canada. In the USA, in tin prospects near Boiler Peak, in the Black Range, Sierra Co., New Mexico; and in the Thomas Range, Juab Co., Utah. From the Cheesewring quarry, Linkinhorne, Cornwall, England.

Name: For the original occurrence in Durango, Mexico.

Type Material: Yale University, New Haven, Connecticut, USA, 3.586, 3.3036, 3.3037.

Total	100.21	100.00

(1) Djebel Debar, Algeria. (2) $BaFe_3(AsO_4)_2(OH)_5$.

Mineral Group: Crandallite group.

Occurrence: In the oxidized zone of some base-metal deposits, typically an alteration product of arsenopyrite.

Association: Beudantite, carminite, scorodite, arseniosiderite, stibiconite, goethite, quartz.

Distribution: From Djebel Debar, northeast of Hammam Meskhoutine, Qacentina (Constantine), Algeria. At the Senator mine, 20 km south-southwest of Kutahya, Turkey. In the Ojuela mine, Mapimí, Durango, Mexico. From Tecoma, Elko Co., Nevada, USA. In Germany, on Mt. Borstein, near Reichenbach, Hesse; in the Black Forest, at the Clara mine, near Oberwolfach, the Anton mine, Heubachtal, near Schiltach, and Freudenstadt, near Wittichen; at Schneeberg, Saxony.

Name: Honors Desiré Dussert (1872–?), French mining engineer who worked in Algeria.

H_2O	18.8	17.84
Total	[100.0]	100.00

(1) Peanut mine, Colorado, USA; by spectrophotometry, H_2O by CHN analyzer; recalculated to 100% after deduction of 4.2% insoluble selenium and quartz. (2) $VO(OH)_2$.

Occurrence: A secondary mineral formed by the low-temperature hydrothermal alteration of vanadium-bearing minerals.

Association: Melanovanadite, lenoblite, selenium, simplotite, montroseite, paramontroseite, uraninite, coffinite (Peanut mine, Colorado, USA); hewettite, fervanite, schoderite, metaschoderite, straczekite (Wilson Springs, Arkansas, USA).

Distribution: In the USA, found at the Peanut mine, Bull Canyon area, Uravan district, Montrose Co., and at the Sundown claim, Gypsum Valley, Slick Rock district, San Miguel Co., Colorado; in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas. From the Urcal deposit, La Rioja, Argentina. At the Mounana uranium mine, Franceville, Gabon.

Name: Honors Captain Clarence Edward Dutton (1841–1912), American geologist with the U.S. Geological Survey, an early worker on the Colorado Plateau.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 134144.

(1) Minasragra, Peru; by X-ray fluorescence, average of four partial analyses; corresponds to $(Ni_{0.80}Fe_{0.20})_{\Sigma=1.00}(SO_4)_2 \cdot H_2O$.

Mineral Group: Kieserite group.

Occurrence: In a vanadium sulfide deposit, probably by oxidation of associated bravoite.

Association: Patronite, sulfur, retgersite, szomolnokite, "bitumen".

Distribution: At Minasragra, 46 km from Cerro de Pasco, Peru.

Name: Honors Edward J. Dwornik (1920–), Lunar geologist and mineralogist, U.S. Geological Survey, Washington, D.C., USA, who studied several vanadium deposits.

Type Material: George Washington University, Washington, D.C., USA.

Total	100.00	100.00

(1) Belorechenskoye deposit, Northern Caucasus, Russia; average of 12 electron microprobe analyses, H_2O by difference, presence of H_2O, PO_4, UO_2, $As^{3+}O_4$ groups confirmed by IR spectroscopy; corresponding to $(Ni_{0.69}Mg_{0.26}Fe_{0.03}Zn_{0.03})_{\Sigma=1.01}U_{1.97}(As^{3+}_{1.88}P_{0.08})_{\Sigma=1.96}O_{9.94} \cdot 7.06H_2O$.
(2) $Ni(UO_2)_2(As^{3+}O_3)_2 \cdot 7H_2O$.

Mineral Group: Autunite group.

Occurrence: A secondary mineral found in small cavities and cracks in slightly oxidized uraninite-bearing dolomite veins.

Association: Rauchite, uraninite, nickeline, gersdorffite, limonite, annabergite.

Distribution: From adit #1, Belorechenskoye deposit, Belaya River basin, 60 km south of Maikop city, Adygea Republic, Northern Caucasus, Russia.

Name: Honors Russian mineralogist, Yuriy Maksimovich Dymkov (b. 1926), a specialist in the mineralogy and geology of uranium deposits.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (4065/1).

Dypingite $Mg_5(CO_3)_4(OH)_2 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (?). *Point Group:* n.d. As reniform, botryoidal, oolitic, or globular aggregates of radially-divergent acicular to flaky crystals, to 0.5 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.15 Fluoresces pale blue under SW and LW UV; some material also displays green phosphorescence.

Optical Properties: Semitransparent. *Color:* Snow-white to gray; colorless in transmitted light. *Luster:* Pearly.
Optical Class: Biaxial (+) or (–). *Orientation:* Elongated ∥ *Y*. α = 1.508–1.515 β = 1.510–1.521 γ = 1.516–1.522 2V(meas.) = n.d. 2V(calc.) = 44.5°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Dypingdal, Norway.
10.6 (100), 5.86 (90), 6.34 (60), 2.53 (50), 2.17 (50), 3.16 (40), 3.07 (40)

H_2O^+		20.90	
H_2O^-		6.39	
H_2O	22.7		22.26
insol.	2.0		
Total	99.5	99.94	100.00

(1) Dypingdal, Norway; total Fe by spectrophotometry, here given as Fe_2O_3, Mg by EDTA, Ca by AA, $(OH)^{1-}$, H_2O, and $(CO_3)^{2-}$ confirmed by IR; corresponds to $Mg_{4.60}(CO_3)_{4.00}(OH)_{1.20} \cdot 4.92H_2O$. (2) Yoshikawa, Japan; after deduction of SiO_2 due to chrysotile impurity, corresponds to $Mg_{5.09}(CO_3)_{4.04}(OH)_{2.10} \cdot 7.76H_2O$. (3) $Mg_5(CO_3)_4(OH)_2 \cdot 5H_2O$.

Occurrence: Coats fractures and exposed surfaces in serpentine; may be of recent formation on dump materials.

Association: Hydrotalcite, magnesite (Norway); brucite, brugnatellite, pyroaurite, artinite, hydromagnesite, nesquehonite (Yoshikawa, Japan).

Distribution: From Dypingdal, near Snarum, Modum, Norway. At Hagdale, Unst, Shetland Islands, Scotland. From Kraubath, Styria, Austria. In Japan, at Yoshikawa, Aichi Prefecture; Mashiki, Kumamoto Prefecture; and Naradani, Gifu Prefecture. In the Vestford Hills, east Antarctica. From the Rapid Creek–Big Fish River area, Yukon Territory, Canada. In the USA, at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; from Robinson Gulch, Jefferson Co., Colorado; found at the Akers prospect, about six km south of Idria, San Benito Co., California.

Name: For the first-noted occurrence at Dypingdal, Norway.

Type Material: Mineralogical-Geological Museum, University of Oslo, Oslo, Norway, 21886, 21887.

Dyscrasite Ag_3Sb

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Pyramidal crystals, to 5 cm, also cylindrical, prismatic to platy, striated; granular, foliated or massive. *Twinning:* On {110}, giving pseudohexagonal forms and V-shapes.

Physical Properties: *Cleavage:* Distinct on {001} and {011}; imperfect on {110}. *Fracture:* Uneven. *Tenacity:* Sectile, but brittle. Hardness = 3.5–4 VHN = 153–179 (100 g load). D(meas.) = 9.712 D(calc.) = 9.720

Optical Properties: Opaque. *Color:* Silver-white, tarnishing to lead-gray, pale yellow, or black. *Streak:* Silver-white. *Luster:* Metallic. *Pleochroism:* Very weak. *Anisotropism:* Weak. R_1–R_2: (400) 57.0–57.7, (420) 57.7–59.0, (440) 58.3–60.1, (460) 59.1–61.2, (480) 59.6–61.7, (500) 59.9–62.1, (520) 60.0–62.4, (540) 60.1–62.7, (560) 60.0–62.9, (580) 59.8–63.0, (600) 59.6–63.0, (620) 59.5–63.0, (640) 59.4–63.1, (660) 59.3–63.0, (680) 59.3–63.1, (700) 59.6–63.4

Cell Data: *Space Group:* $Pmm2$. $a = 3.008$ $b = 4.828$ $c = 5.214$ $Z = 1$

X-ray Powder Pattern: St. Andreasberg, Germany.
2.29 (100), 2.42 (40), 1.370 (40), 2.61 (30), 1.771 (30), 1.506 (30), 1.278 (30)

Chemistry:

	(1)	(2)	(3)
Ag	75.41	73.1	72.66
Sb	24.37	26.1	27.34
Total	99.78	99.2	100.00

(1) St. Andreasberg, Germany; average of seven analyses. (2) Do.; by electron microprobe. (3) Ag_3Sb.

Occurrence: In hydrothermal veins with other silver minerals as both a primary and secondary mineral.

Association: Silver, pyrargyrite, acanthite, stromeyerite, tetrahedrite, allemontite, galena, calcite, barite.

Distribution: In Germany, in the Black Forest, from Wenzelgang, near Wolfach [TL] and Wittichen; at St. Andreasberg, Harz Mountains. In France, from Wasserfall, about 20 km northwest of Belfort, Haute-Saône; and at Sainte-Marie-aux-Mines, Haut-Rhin. From Hiendelaencina, Guadalajara Province, Spain. At Příbram, Czech Republic. From Långsjön, Sweden. At Kongsberg and Sulitjelma, Norway. Large masses in the Consols mine, Broken Hill, New South Wales, Australia. From Chañarcillo, south of Copiapó, Atacama, Chile. At Colquechaca, Bolivia. From the Highbridge mine, Belmont district, Nye Co., Nevada, USA. In Canada, at Cobalt, Ontario, in a number of mines; and in the Tanco pegmatite, Bernic Lake, Manitoba. From the Ilímaussaq intrusion, southern Greenland. In the Yuzhnyi tin deposit, Tetukhe region, southern Maritime Territory, Russia. From the Aktepe Ag–As deposits, near Tashkent, Uzbekistan. At the Shkol'noe deposit, Kurama Ridge, Tadjikistan. From the Rampura Agucha Zn–Pb–Ag deposit, Rajasthan, India.

Name: From the Greek for *a bad alloy*.

Dzhalindite $In(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Massive.

Physical Properties: Hardness = n.d. D(meas.) = 4.38 (synthetic). D(calc.) = 4.344

Optical Properties: Semitransparent. *Color:* Yellow-brown; light yellow in transmitted light; dark gray in reflected light.
Optical Class: Isotropic. $n = 1.725(2)$

Cell Data: *Space Group:* $Im3$ (synthetic). $a = 7.9743(6)$ $Z = 8$

X-ray Powder Pattern: Dzhalinda deposit, Russia.
3.96 (10), 2.80 (9), 1.778 (9), 1.624 (7), 2.290 (6), 1.324 (6), 4.36 (5)

Chemistry:

	(1)	(2)	(3)
In	63.06	61.59	69.24
Sn		7.36

Total			100.00

(1) Dzhalinda deposit, Russia; by electron microprobe, average of 67 analyses. (2) Mount Pleasant, Canada; by electron microprobe, average of three analyses. (3) $In(OH)_3$.

Occurrence: Probably of secondary origin from its occurrence along fractures through primary hydrothermal minerals associated with brecciated felsic volcanic rocks (Dzhalinda deposit, Russia); in sulfides hosted in greisenized granite (Mangabeira, Brazil).

Association: Indite, cassiterite, quartz (Dzhalinda deposit, Russia); sphalerite, galena, chalcopyrite, stannite, calcite, quartz (Mount Pleasant, Canada); roquesite, sphalerite, chalcopyrite, digenite, arsenopyrite, cassiterite, scorodite (Mangabeira, Brazil).

Distribution: In the Dzhalinda tin deposit, Little Khingan Ridge, Far Eastern Region, Russia. From Mount Pleasant, New Brunswick, Canada. In the USA, at the Flambeau mine, southwest of Ladysmith, Rusk Co., Wisconsin. Found in the Mangabeira tin deposit, Goiás, Brazil.

Name: For the occurrence in the Dzhalinda tin deposit, Russia.

Type Material: Mining Institute, St. Petersburg, 106a/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 65279.

Fe	26.70	26.13
Cu	0.45	
Co	0.01	
Se	73.32	73.87
Total	100.07	100.00

(1) Seluchekinskoye deposit, Kazakhstan; by electron microprobe, average of six analyses; corresponds to $Fe_{1.02}Se_{1.94}$. (2) $FeSe_2$.

Polymorphism & Series: Dimorphous with ferroselite.

Mineral Group: Pyrite group.

Occurrence: In Se–U ores in quartz-sandstone (Seluchekinskoye deposit, Kazakhstan); in a massive sulfide deposit (Zapadno-Ozernoe deposit, Russia).

Association: Ferroselite, goethite (Seluchekinskoye deposit, Kazakhstan); pyrite, galena, tetrahedrite, metacinnabar, tiemannite, sulfur, gold, selenium (Zapadno-Ozernoe deposit, Russia).

Distribution: From the Seluchekinskoye deposit, near the middle Ili River, southeastern Kazakhstan [TL]. At the Zapadno-Ozernoe Cu–Zn deposit, Southern Ural Mountains, Russia.

Name: For the Dzharkenskaya depression, within which the Seluchekinskoye deposit occurs.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84060.

Eakerite $Ca_2Sn^{4+}Al_2Si_6O_{18}(OH)_2 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, up to 5 mm, prism zone striated ‖ [001]. Forms are {111}, {210}, {410}, {201}, {$\bar{2}$01}, {001}, and {100}. As minute lathlike inclusions along {110} in andradite.

Physical Properties: *Fracture:* Conchoidal. Hardness = 5.5 D(meas.) = 2.93(1) D(calc.) = 2.931

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = 23.5°$ *Dispersion:* $r > v$, marked. $\alpha = 1.584$ $\beta = 1.586$ $\gamma = 1.600$ 2V(meas.) = ∼35°

Cell Data: *Space Group:* $P2_1/a$. $a = 15.829(7)$ $b = 7.721(3)$ $c = 7.438(3)$ $\beta = 101°34(3)'$ Z = 2

X-ray Powder Pattern: Kings Mountain, North Carolina, USA.
4.812 (100), 5.257 (90), 7.31 (80), 3.021 (80), 3.353 (60), 6.905 (50), 5.944 (50)

Chemistry:

	(1)
SiO_2	46.75
SnO_2	18.59
Al_2O_3	14.07
CaO	14.2
H_2O	6.7
Total	100.3

(1) Kings Mountain, North Carolina, USA; by microchemical analysis, corresponds to $Ca_{1.96}Sn^{4+}_{0.95}Al_{2.12}Si_{6.03}H_{5.77}O_{22}$.

Occurrence: Probably of hydrothermal origin, in a seam in spodumene-bearing pegmatite (Foote mine, North Carolina, USA); as exsolved inclusions in stanniferous andradite (Kitel'skoye deposit, Karelia).

Association: Tetrawickmanite, bavenite, quartz, albite (Foote mine, North Carolina, USA); andradite (Kitel'skoye deposit, Karelia).

Distribution: In the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA. From the Kitel'skoye tin skarn deposit, north of Lake Lagoda, Karelia.

Name: In honor of Jack Eaker, mineral collector of Kings Mountain, North Carolina, USA, who discovered the mineral.

Type Material: The Natural History Museum, London, England, 1968,204; National Museum of Natural History, Washington, D.C., USA, 120301, 121143.

Total	[100.0]	[100.0]

(1) Foote mine, North Carolina, USA; by electron microprobe, Fe confirmed as dominantly Fe^{3+} by microchemical tests and stoichiometry, H_2O by difference; corresponds to $(Mn^{2+}_{0.55}Fe^{2+}_{0.30}Mg_{0.09}Ca_{0.05})_{\Sigma=0.99}(Fe^{3+}_{2.00}Al_{0.01})_{\Sigma=2.01}(PO_4)_{2.00}(OH)_{2.01} \cdot 4.75H_2O$. (2) Hagendorf, Germany; by electron microprobe, corresponds to $(Mn^{2+}_{0.47}Mg_{0.26}Fe^{2+}_{0.16}Zn_{0.02})_{\Sigma=0.91}(Fe^{3+}_{1.97}Al_{0.03})_{\Sigma=2.00}(PO_4)_{2.00}(OH)_{1.82} \cdot 4.66H_2O$.

Mineral Group: Arthurite group.

Occurrence: A very late-stage secondary mineral in a lithium-rich granite pegmatite (Foote mine, North Carolina, USA).

Association: Jahnsite, laueite, mitridatite, rockbridgeite, manganese oxide, quartz (Foote mine, North Carolina, USA); rockbridgeite–frondelite (Hagendorf, Germany).

Distribution: In the USA, from the Foote mine, Kings Mountain, Cleveland Co., and at the LCA pegmatite, Bessemer City, Gaston Co., North Carolina; in Maine, in the Emmons quarry, Greenwood, and at the Dunton quarry, Newry, Oxford Co. From Hagendorf, Bavaria, Germany. At Dolní Bori, near Velké Meziříčí, Czech Republic.

Name: To honor Earl V. Shannon (1895–1981), American mineralogist and chemist, U.S. National Museum, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150168, R12832.

Ecandrewsite $(Zn, Fe^{2+}, Mn^{2+})TiO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As tabular crystals and grains, to 250 μm.

Physical Properties: Hardness = n.d. VHN = 500–600 (100 g load). D(meas.) = n.d. D(calc.) = 4.98–4.99

Optical Properties: Opaque to translucent. *Color:* Dark brown to black; deep orange-brown in transmitted light; grayish white with a pinkish tint in reflected light. *Streak:* Dark brown to black. *Luster:* Submetallic.
Optical Class: Uniaxial (+). *Pleochroism:* Weak. *Anisotropism:* Strong; greenish gray to dark brownish gray.
R_1–R_2: (470) 17.2–19.9, (546) 17.2–19.7, (589) 17.0–19.6, (650) 16.8–19.2

Cell Data: *Space Group:* $R\overline{3}$. $a = 5.090(1)$ $c = 14.036(2)$ Z = 6

X-ray Powder Pattern: San Valentin mine, Spain.
2.73 (10), 2.53 (9), 1.71 (7), 2.23 (6), 1.87 (4), 3.69 (2), 1.502 (2)

Chemistry:

	(1)	(2)
TiO_2	50.12	52.45
FeO	11.37	12.05
MnO	7.64	6.15
ZnO	30.42	29.35
Total	99.55	100.00

(1) Melbourne Rockwell mine, Australia; by electron microprobe, total Fe as FeO; corresponds to $(Zn_{0.59}Fe_{0.24}Mn_{0.17})_{\Sigma=1.00}Ti_{0.99}O_3$. (2) San Valentin mine, Spain; by electron microprobe, total Fe as FeO; corresponds to $(Zn_{0.56}Fe_{0.26}Mn_{0.13})_{\Sigma=0.95}Ti_{1.02}O_3$.

Polymorphism & Series: Forms a series with ilmenite.

Mineral Group: Ilmenite group.

Occurrence: In quartz-rich metasediments of the amphibolite-granulite facies (Melbourne Rockwell mine, Australia); in a kyanite-bearing pelitic schist (Death Valley, California, USA).

Association: Almandine-spessartine, ferroan gahnite, rutile (Melbourne Rockwell mine, Australia); zincian ilmenite (San Valentin mine, Spain); almandine, kyanite, zincian ilmenite, monazite, muscovite, quartz, chlorite, zircon, titanite (Death Valley, California, USA).

Distribution: From the Melbourne Rockwell mine, Little Broken Hill, and the North mine, Broken Hill, New South Wales, Australia. In Spain, at the San Valentin mine, La Unión district, Sierra de Cartegena, Murcia Province. In the Black Mountains, Death Valley, Inyo Co., California, USA. From Fuzhou, Fujian Province, China.

Name: Honors Ernest Clayton Andrews (1870–1948), New South Wales government geologist, who mapped the Broken Hill region.

Type Material: Museum Victoria, Melbourne, Australia, M35700; Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands.

References: (1) Birch, W.D., E.A.J. Burke, V.J. Cl	8.00	8.61
$-O = Cl_2$	1.81	1.94
Total	100.24	100.00

(1) Långban, Sweden. (2) $Pb_6As_2O_7Cl_4$.

Occurrence: A rare mineral in metamorphosed Fe–Mn orebodies (Sweden).

Association: Heliophyllite, finnemanite, freedite, lead, copper, manganoan calcite, andradite, magnetite (Långban, Sweden).

Distribution: In Sweden, from Långban, in the Harstigen mine, near Persberg, and at Jakobsberg, Värmland. From Laurium, Greece, in slag.

Name: From the Greek for *unusual*, in allusion to the composition.

(1) Tawmaw, Myanmar; corresponds to $(Na_{2.43}Ca_{0.20}K_{0.19})_{\Sigma=2.82}(Mg_{3.73}Al_{0.86}Fe^{3+}_{0.24}Fe^{2+}_{0.15})_{\Sigma=4.98}(Si_{7.91}Al_{0.09})_{\Sigma=8.00}O_{22}(OH)_{1.98}$. (2) Norra Kärr complex, Sweden; corresponds to $(Na_{2.66}K_{0.42}Ca_{0.05})_{\Sigma=3.13}(Mg_{1.91}Fe^{3+}_{0.85}Li_{0.65}Fe^{2+}_{0.32}Zn_{0.06}Mn_{0.04}Ti_{0.04})_{\Sigma=3.87}Al_{1.02}Si_{8.02}O_{22}[F_{1.19}(OH)_{0.47}]_{\Sigma=1.66}$.

Polymorphism & Series: Forms a series with ferro-eckermannite.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) < 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) < 0.5$; $(Na + K)_A \geq 0.5$; $Na_B \geq 1.34$.

Occurrence: In alkalic plutonic igneous rocks; rarely in alkalic volcanics and nepheline-bearing pegmatites.

Association: Nepheline, albite, aegirine, katophorite.

Distribution: From the Norra Kärr complex, near Gränna, Sweden. At Tawmaw, Myitkyina-Mogaung district, Kachin State, northern Myanmar (Burma). In the Noda-Tamagawa mine, Iwate Prefecture, Japan. In the Snowy Range mine, Camp Albion, Boulder Co., Colorado, USA.

Name: To honor Professor Claes Walther Harry von Eckermann (1886–1969), Swedish petrologist, Stockholm, Sweden.

Type Material: The Natural History Museum, London, England, 1949,151.

(1) Binntal, Switzerland; by electron microprobe, average of three analyses; corresponds to $Pb_{1.00}Tl_{1.03}As_{2.99}S_{5.98}$. (2) Do.; by electron microprobe, original total given as 100.02%; corresponds to $Pb_{0.94}Tl_{1.00}(As_{2.98}Sb_{0.09})_{\Sigma=3.07}S_{6.06}$. (3) $PbTlAs_3S_6$.

Occurrence: In a hydrothermal deposit in dolostone.

Association: Baumhauerite, realgar, orpiment, hutchinsonite, hatchite, wallisite, lorandite, sartorite, jentschite, erniggliite, stalderite, bernardite.

Distribution: From the Lengenbach quarry, Binntal, Valais, Switzerland [TL].

Name: Honors Dr. Andreas Edenharter (1933–), University of Göttingen, Göttingen, Germany, who had previously synthesized the compound.

Type Material: Natural History Museum, Basel, Switzerland, L 18,393.

Edenite $\mathbf{NaCa_2(Mg, Fe^{2+})_5(Si_7Al)O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly as well-formed prismatic crystals, to 2.5 cm; fibrous; as reaction rims on pyroxenes. *Twinning:* Simple or multiple twinning $\parallel$ {100}.

Physical Properties: *Cleavage:* Good on {110}, intersecting at 56° and 124°; partings on {100}, {001}. *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = 3.05–3.37 D(calc.) = 3.06

Optical Properties: Semitransparent. *Color:* White, gray, pale green; color zoning is commonly seen in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* [Distinct, in greens, blue-greens, and yellow-browns.] *Orientation:* $Y = b$; $Z \wedge c = 18°$–$34°$. *Dispersion:* $r > v$, weak. *Absorption:* $Z > Y > X$.
$\alpha = 1.622$–1.665 $\beta = 1.632$–1.678 $\gamma = 1.641$–1.684 2V(meas.) = 50°–82°

Cell Data: *Space Group:* $C2/m$. $a = 9.837(4)$ $b = 17.954(6)$ $c = 5.307(2)$ $\beta = 105.18(2)°$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA. (ICDD 23-1405).
3.120 (100), 8.43 (80), 3.267 (40), 2.699 (20), 2.800 (18), 3.377 (12), 9.01 (10)

(1) Kotaki, Japan; corresponds to $(Na_{0.70}K_{0.02})_{\Sigma=0.72}(Ca_{1.54}Fe^{2+}_{0.22}Na_{0.22}Mn_{0.02})_{\Sigma=2.00}(Mg_{4.05}Al_{0.57}Fe^{2+}_{0.20}Fe^{3+}_{0.17}Ti_{0.01})_{\Sigma=5.00}(Si_{7.13}Al_{0.87})_{\Sigma=8.00}O_{22}(OH)_{1.63}$. (2) Franklin Marble, Orange Co., New York, USA; by electron microprobe, F by wet chemical analysis; corresponds to $(Na_{0.63}K_{0.10})_{\Sigma=0.73}(Ca_{1.99}Mn_{0.01})_{\Sigma=2.00}(Mg_{4.58}Al_{0.18}Fe^{2+}_{0.15}Ti_{0.05})_{\Sigma=4.96}(Si_{7.05}Al_{0.95})_{\Sigma=8.00}O_{22}[(OH)_{1.18}F_{0.82}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with ferro-edenite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; 6.75 Si 7.25.

Occurrence: In intermediate plutonic igneous and medium-grade metamorphic rocks, as amphibolites and marbles.

Association: Titanite, mica, chondrodite (Edenville, New York, USA).

Distribution: In the USA, perhaps from Edenville, Orange Co., New York, and Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey. At Tory Hill, near Bancroft, and at Wilberforce, Ontario, Canada. From Kotaki, Niigata Prefecture, Japan.

Name: For the locality at Edenville, New York, USA, although it is not certain to occur there.

Edgarbaileyite $Hg_6^{1+}Si_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. As sheaves of ill-formed platy crystals, with dominant {100}, to 200 μm. Also as cryptocrystalline nodular masses, which may be hollow. *Twinning:* Polysynthetic on {100}.

Physical Properties: *Fracture:* Irregular to subconchoidal. *Tenacity:* Brittle. Hardness = 4 VHN = 153–217, 192 average (100 g load). D(meas.) = 9.4(3) D(calc.) = 9.11 Photosensitive, darkening on exposure to UV, IR, X-rays, and visible light.

Optical Properties: Translucent. *Color:* Lemon-yellow to orange-yellow when fresh; dark olive-green, through lighter yellowish green, to dark green-brown on exposed surface; in reflected light, gray to slightly lighter gray, with pale lemon-yellow internal reflections; lemon-yellow in transmitted light. *Streak:* Pale yellowish green. *Luster:* Vitreous, resinous when nodular. *Optical Class:* Biaxial. *Pleochroism:* Weak. *Absorption:* Strong. α = [2.10] β = n.d. γ = [2.58] 2V(meas.) = n.d.
R: (400) 16.7, (420) 17.1, (440) 17.0, (460) 16.4, (480) 15.8, (500) 15.3, (520) 14.9, (540) 14.6, (560) 14.3, (580) 14.2, (600) 14.0, (620) 14.0, (640) 13.8, (660) 13.8, (680) 13.7, (700) 13.6

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. $a = 11.755(3)$ $b = 7.678(2)$ $c = 5.991(2)$ $\beta = 111.73(3)^\circ$ Z = 2

X-ray Powder Pattern: Terlingua, Texas, USA.
3.160 (100), 2.715 (63), 1.872 (36), 2.952 (34), 3.027 (27), 2.321 (24), 6.28 (20)

Chemistry:

	(1)	(2)	(3)
SiO_2	8.6	7.9	8.76
Hg_2O	89.6	91.0	91.24
Total	98.2	[98.9]	100.00

(1) Socrates mine, California, USA; by electron microprobe, average of five analyses.
(2) Terlingua, Texas, USA; by electron microprobe, average of three analyses, originally given as Si 3.7%, Hg 87.5%, here recalculated to oxides. (3) $Hg_6Si_2O_7$.

Occurrence: A secondary mineral, probably resulting from reaction between mercury and quartz under unknown conditions.

Association: Mercury, cinnabar, montroydite, terlinguaite, eglestonite, calcite, quartz, barite.

Distribution: In the Socrates mercury mine, Sonoma Co., and near the Clear Creek mercury mine, New Idria district, San Benito Co., California; at Terlingua, Brewster Co., Texas, USA. From the San Luis mine, Huahuaxtla, Guerrero, Mexico.

Name: For Dr. Edgar Herbert Bailey (1914–1983), distinguished geologist and mercury specialist with the U.S. Geological Survey.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 65531; The Natural History Museum, London, England, 1906,190.

Edingtonite $BaAl_2Si_3O_{10}\cdot 4H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222, $\bar{4}2m$ pseudotetragonal. Prismatic crystals exhibit pseudotetragonal pyramid or sphenoid forms, to 10 cm; also massive. *Twinning:* On {110} and about [001].

Physical Properties: *Cleavage:* {110}, perfect. Hardness = 4–4.5 D(meas.) = 2.73–2.78 D(calc.) = 2.75–2.80 Pyroelectric and piezoelectric.

Optical Properties: Transparent to translucent. *Color:* White, grayish, pink; colorless in thin section. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, strong.
$\alpha = 1.535–1.541$ $\beta = 1.542–1.553$ $\gamma = 1.545–1.557$ 2V(meas.) = 54°–62°

Cell Data: *Space Group:* $P2_12_12$; $P\bar{4}2_1m$ pseudotetragonal. $a = 9.550(10)$ $b = 9.665(10)$ $c = 6.523(5)$ Z = 2

X-ray Powder Pattern: Kilpatrick, Scotland. (ICDD 25-61).
3.576 (100), 6.51 (80), 2.741 (75), 5.38 (60), 4.79 (50), 4.69 (50), 2.589 (45)

Chemistry:

	(1)	(2)
SiO_2	35.14	36.3
Al_2O_3	20.12	20.6
BaO	31.18	28.6
K_2O		0.32
H_2O	13.16	12.8
Total	99.60	98.62

(1) Bölet mine, Sweden; corresponds to $Ba_{1.03}Al_{2.01}Si_{2.98}O_{10.00}\cdot 3.72H_2O$. (2) Ice River, Canada; by electron microprobe, H_2O by TGA; corresponds to $(Ba_{0.96}K_{0.04})_{\Sigma=1.00}$ $Al_{2.08}Si_{3.12}O_{10.00}\cdot 4.00H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in mafic igneous rocks and nepheline syenites; in carbonatites; in hydrothermal veins.

Association: Thomsonite, analcime, natrolite, harmotome, brewsterite, prehnite, calcite.

Distribution: At several quarries in the Kilpatrick Hills, Dumbartonshire, Scotland. From Disgwylfa Hill, Shropshire, England. Large crystals from the Bölet mine, Västergötland, Sweden. At Staré Ransko, Czech Republic. In the Podol'skoye and other deposits, Southern Ural Mountains, and in the Khibiny massif, Kola Peninsula, Russia. Along Ash Creek, in Mendocino Co. near the Sonoma Co. line, California, USA. In the Brunswick No. 12 mine, near Bathurst, New Brunswick; along the Ice River valley, 25 km south of Field, British Columbia; and at Mont Saint-Hilaire, Quebec, Canada. In the Jacupiranga mine, São Paulo, Brazil.

Name: For James Edington (1787–1844), mineral collector of Glasgow, Scotland, the discoverer of the mineral.

Edoylerite $Hg_3^{2+}Cr^{6+}O_4S_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular to prismatic crystals, elongated along [101], showing {010}, {$\bar{1}$11}, {001}, {101}, to 0.5 mm; typically in stellate aggregates.

Physical Properties: *Cleavage:* On {010}, good; on {101}, fair. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 7.11 Photosensitive, turning olive-green after several months exposure.

Optical Properties: Transparent to opaque. *Color:* Canary yellow to orangeish yellow; pale gray to bluish gray in reflected light with brilliant pale yellow internal reflections. *Streak:* Yellow. *Luster:* Adamantine.
Optical Class: Biaxial. *Pleochroism:* Weak; $X = Y$ = lemon-yellow; Z = darker lemon-yellow. *Orientation:* $Z = [101]$; positive elongation. *Absorption:* $Z > X = Y$. *Bireflectance:* Weak.
R_1–R_2: (400) 17.5–16.8, (420) 18.0–18.0, (440) 18.2–19.1, (460) 17.9–19.2, (480) 17.3–18.95, (500) 17.0–18.5, (520) 17.1–19.5, (540) 17.0–19.8, (560) 16.8–19.6, (580) 16.6–19.55, (600) 16.3–19.5, (620) 16.2–19.3, (640) 16.1–19.2, (660) 15.95–19.1, (680) 15.8–19.1, (700) 15.7–18.9

H_2O_{calc}	16.14	16.14
Total	99.32	100.00

(1) Block 14 Opencut, Broken Hill, New South Wales, Australia; average of 10 electron microprobe analyses, H_2O calculated from structure analysis, OH and SO_4 confirmed by IR, corresponding to $Cu_{2.77}Cd_{1.98}Zn_{0.22}Fe_{0.01}(SO_4)_{2.00}(OH)_{5.95} \cdot 4.06H_2O$. (2) $Cu_3Cd_2(SO_4)_2(OH)_6 \cdot 4H_2O$.

Occurrence: A secondary mineral in the oxidized portion of a Ag-Pb-Zn metal deposit.

Association: Niedermayrite, christelite.

Distribution: Block 14 Opencut, Broken Hill, New South Wales, Australia.

Name: Honors Dr. Austin Burton Edwards (1909–1960), mineralogist and petrologist in the Mineragraphic Section of the Council for Scientific and Industrial Research CSIRO), Melbourne, Australia, for his contributions to the study of Australian ore deposits such as Broken Hill.

Type Material: South Australian Museum, Adelaide, South Australia (catalog no. G32703).

References: (1) Elliott, P., J. Brugger, and T. Caradoc-Davies (2010) Description and crystal structure of a new mineral, edwardsite, $Cu_3Cd_2(SO_4)_2(OH)_6 \cdot 4H_2O$, from Broken Hill, New South Wales, Australia. Mineral. Mag., 74, 39–54. (2) (2010) Amer. Mineral., 95, 1597-1598 (abs. ref. 1).

Efremovite $(NH_4)_2Mg_2(SO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. As equant grains, to 0.015 mm; typically as crusts.

Physical Properties: *Fracture:* Uneven. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 2.52
Readily hygroscopic, altering to boussingaultite.

Optical Properties: Transparent to nearly opaque. *Color:* White, gray; colorless to pale brown in transmitted light. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.550(1)$

Cell Data: *Space Group:* $P2_13$. $a = 9.99(1)$ Z = 4

X-ray Powder Pattern: Chelyabinsk coal basin, Russia.
3.15 (10), 4.07 (7), 4.33 (6), 2.668 (4), 5.76 (3.5), 3.00 (3.5), 1.620 (2.5)

Chemistry:

	(1)
SO_3	38.37
FeO	0.72
MnO	0.25
MgO	11.47
CaO	0.35
Na_2O	0.13
K_2O	0.50
$(NH_4)_2O$	8.31
insol.	39.97
Total	100.07

(1) Chelyabinsk coal basin, Russia; K by flame photometry, insoluble is organic matter and quartz; corresponds to $[(NH_4)_{2.00}K_{0.06}Na_{0.02}]_{\Sigma=2.08}(Mg_{1.79}Fe_{0.06}Ca_{0.04}Mn_{0.02})_{\Sigma=1.91}(SO_4)_{3.00}$.

Occurrence: As crusts on burning coal mine dumps, formed by the reaction of combustion gases with carbonate rocks.

Association: Sulfur, kladnoite, mascagnite, boussingaultite.

Distribution: From near Kopeysk, in the Chelyabinsk coal basin, Southern Ural Mountains, Russia. At the Scholler mine, near Kladno, Czech Republic.

Name: Honors Dr. Ivan Antonovich Yefremov (1907–1972), Russian geologist and science fiction writer.

Type Material: Il'menskii Preserve Museum, Miass, 5895; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Eggletonite $(Na,K,Ca)_2(Mn,Fe)_8(Si,Al)_{12}O_{29}(OH)_7 \cdot 11H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. Crystals display a pseudohexagonal cross section, elongated along [100], with {011} and {001} common. As clusters of divergent sprays of radiating acicular prisms, to 2 cm. *Twinning:* On {001}.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Very brittle. Hardness = 3–4 D(meas.) = 2.76 D(calc.) = 2.76

Optical Properties: Semitransparent. *Color:* Dark to golden brown, red-brown. *Streak:* Light brown. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Very weak; X = pale brown to colorless; $Y = Z$ = pale yellow-brown. *Orientation:* $Z = b$; $X \simeq c'$; $Y \simeq a$. *Dispersion:* $r < v$, weak. *Absorption:* $Z \simeq Y > X$. $\alpha = 1.566(2)$ $\beta = 1.606(2)$ $\gamma = 1.606(2)$ 2V(meas.) = 9(3)°

Cell Data: *Space Group:* $I2/a$ or Ia. $a = 5.554$ $b = 13.72$ $c = 25.00$ $\beta = 93.95°$ Z = 2

X-ray Powder Pattern: Big Rock quarry, Arkansas, USA.
12.4 (100), 3.13 (30), 2.691 (25), 2.600 (20), 2.462 (20), 3.45 (15), 2.854 (15)

Chemistry:

K_2O	1.3
H_2O	[11.4]
Total	[100.0]

(1) Big Rock quarry, Arkansas, USA; by electron microprobe, H_2O by difference; corresponds to $(Na_{0.82}K_{0.40}Ca_{0.39})_{\Sigma=1.61}(Mn_{6.61}Fe_{0.61}Al_{0.56}Mg_{0.16}Zn_{0.08})_{\Sigma=8.02}(Si_{10.33}Al_{1.67})_{\Sigma=12.00}[O_{28.92}(OH)_{3.08}]_{\Sigma=32.00}(OH)_{4.00} \cdot 10.66H_2O$.

Occurrence: In miarolitic pockets in nepheline syenite pegmatite.

Association: Albite, natrolite, apophyllite pyrophanite, kupletskite.

Distribution: In the Big Rock quarry, Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA.

Name: To honor Dr. Richard A. Eggleton, Australian National University, Canberra, Australia.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137143.

References: (1) Peacor, D.R., P.J. Dunn, and W.B. Simmons (1984) Eggletonite, the Na analogue of ganophyllite. Mineral. Mag., 48, 93–96. (2) (1985) Amer. Mineral., 70, 436 (abs. ref. 1).

Eglestonite $Hg_6^{1+}HCl_3O_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As dodecahedra, octahedra, or cubes, complexly modified by {112}, {116}, {223}, {123}, many others; may be acicular to filiform by elongation on [001]. Commonly as granular aggregates or massive crusts and films.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 8.309–8.45 D(calc.) = 8.652

Optical Properties: Translucent. *Color:* Yellow, yellow-orange, light brownish yellow to dark brown or black with exposure to light; yellowish brown to brown in transmitted light. *Streak:* Yellow or greenish yellow, rapidly becoming black. *Luster:* Brilliant adamantine to resinous.
Optical Class: Isotropic, occasionally weakly anisotropic. $n = 2.49(2)$

Cell Data: *Space Group: Ia3d.* $a = 16.036$ Z = 16

X-ray Powder Pattern: Terlingua, Texas, USA.
3.273 (100), 1.890 (57), 2.536 (47), 4.009 (36), 1.709 (14), 2.315 (11), 1.336 (9)

Chemistry:

	(1)	(2)	(3)
Hg	89.00	89.90	89.62
O	1.79		1.79
Cl	8.22	7.79	7.92
Br		0.13	
H_2O			0.67
Total	99.01		100.00

(1) Terlingua, Texas, USA; average of three analyses. (2) Arzak deposit, Russia; by electron microprobe, average of five analyses. (3) $Hg_6HCl_3O_2$.

Polymorphism & Series: Forms a series with kadyrelite.

Occurrence: An oxidation product of other mercury minerals in mercury deposits.

Association: Calomel, mercury, terlinguaite, montroydite, calcite (Terlingua, Texas, USA); cinnabar, mercury, calomel (San Mateo Co., California, USA); lavrentievite, calomel, mercury, kadyrelite (Kadyrel deposit, Russia).

Distribution: In the USA, at Terlingua, Brewster Co., Texas; around Crawford and Jackfork, Pike Co., Arkansas; in the McDermitt and Cordero mercury mines, Opalite district, and at the Cahill mine, Poverty Peak district, Humboldt Co., Nevada; from the Denio district, Harney Co., Oregon. In California, near the New Idria mine, San Benito Co.; in the Challenge deposit, near Emerald Lake, southwest of Redwood City, San Mateo Co.; in the Kings mine, Parkfield district, Kings Co.; and at the Socrates mine, Sonoma Co. At Huahuaxtla, Guerrero, and Guadalćazar, San Luis Potosi, Mexico. From South Africa, in the Monarch cinnabar mine, Transvaal. At Landsberg, near Obermoschel, Rhineland-Palatinate, Germany. In Russia, from Siberia, in the Arzak and Kadyrel deposits, Tuva, and the Kelyan Sb–Hg deposit, Buryatia; in the Aktash mercury deposit, Kosh-Agach district, Kurai Range, Altai Mountains. From Khaydarkan, Fergana Valley, Alai Range, Kyrgyzstan. In the Ruziobnok deposit, central Tajikistan. Several other localities are known.

Name: Honors Thomas Egleston (1832–1900), Professor of Mineralogy and Metallurgy, Columbia University, New York City, New York, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R1325.

Ehrleite $Ca_2ZnBe(PO_4)_2(PO_3OH)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Thick tabular crystals, showing {100}, {010}, and {001}, to 2 mm. *Twinning:* Contact twins, by reflection on {001}, universal.

Physical Properties: *Cleavage:* Parting on {001}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = ~3.5 D(meas.) = 2.64(2) D(calc.) = [2.66]

Optical Properties: Transparent. *Color:* Milky white to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c^*$; $Y \wedge b = 18°$; $Z \wedge a = 9°$. $\alpha = 1.556(2)$ $\beta = 1.560(1)$ $\gamma = 1.580(1)$ 2V(meas.) = 62° 2V(calc.) = 49°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.130(4)$ $b = 7.430(4)$ $c = 12.479(9)$ $\alpha = 94.31(5)°$ $\beta = 102.07(4)°$ $\gamma = 82.65(4)°$ Z = 2

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
3.161 (10), 12.41 (7), 2.723 (6), 6.95 (5), 4.31 (4), 6.58 (3), 3.014 (3)

Chemistry:

	(1)	(2)
P_2O_5	40.5	41.54
ZnO	14.8	15.88
BeO	7.9	4.88
CaO	20.9	21.88
H_2O	[15.9]	15.82
Total	[100.0]	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, Be by ion microprobe, thought to be in excess, H_2O by difference, presence of H confirmed by ion probe; corresponds to $Ca_{1.96}Zn_{0.96}Be_{1.66}O_{0.58}(PO_4)_2(PO_3OH)\cdot 4.08H_2O$. (2) $Ca_2ZnBe(PO_4)_2(PO_3OH)\cdot 4H_2O$ as determined from crystal-structure analysis.

Occurrence: A very rare mineral with other secondary phosphates, in the outer to intermediate zone of a complex granite pegmatite.

Association: Apatite, mitridatite, roscherite, hydroxyl-herderite, goyazite–crandallite, parascholzite, manganese oxides, beryl, quartz.

Distribution: In the USA, found in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota.

Name: In honor of Howard Ehrle, Miles City, Montana, USA, who discovered the mineral.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 49289; South Dakota School of Mines and Technology, Rapid City, South Dakota, 2958; National Museum of Natural History, Washington, D.C., USA, 160381.

Eifelite $KNa_3Mg_4Si_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals platy to prismatic, to 1 mm, with dominant $\{10\bar{1}0\}$ and $\{0001\}$, and $\{11\bar{2}0\}$ and $\{10\bar{1}2\}$; in druses.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.67

Optical Properties: Transparent. *Color:* Colorless to faintly yellow or green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.5430–1.5445$ $\epsilon = 1.5443–1.5458$

Cell Data: *Space Group:* $P6/mcc$. $a = 10.155$ $c = 14.223(6)$ $Z = 2$

X-ray Powder Pattern: Bellerberg volcano, Germany; essentially identical with roedderite. 3.26 (10), 3.75 (9), 4.43 (6), 7.07 (5), 5.11 (5), 4.14 (5), 2.91 (5)

Na_2O	6.48
K_2O	4.18
Total	100.24

(1) Bellerberg volcano, Germany; by electron microprobe, microchemical analysis showed Li_2O 0.1%; corresponding to $(Na_{2.12}K_{0.90})_{\Sigma=3.02}(Mg_{4.08}Al_{0.14}Fe_{0.07}Mn_{0.07}Zn_{0.04}Cr_{0.01}Ti_{0.01}Cu_{0.01})_{\Sigma=4.43}(Si_{11.98}Al_{0.02})_{\Sigma=12.00}O_{30}$.

Polymorphism & Series: Forms a series with roedderite.

Mineral Group: Milarite group.

Occurrence: In vesicles in contact metamorphosed basement gneiss xenoliths in leucite tephrite.

Association: Tridymite, hematite, pseudobrookite, pyroxene, amphibole, quartz, sanidine.

Distribution: From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany.

Name: For the locality in the Eifel district, Rhineland-Palatinate, Germany.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany; National Museum of Natural History, Washington, D.C., USA, 162496.

Total	100.56	100.00

(1) Khibiny massif, Russia; corresponds to $Na_{2.03}(Mg_{0.61}Fe_{0.30}Mn_{0.06})_{\Sigma=0.97}(CO_3)_{2.00}$.
(2) $Na_2Mg(CO_3)_2$.

Occurrence: An authigenic mineral in dolomitic shale and bituminous marlstone (Utah, USA); from an alkaline igneous pluton (Khibiny massif, Russia).

Association: Reedmergnerite, leucosphenite, searlesite, crocidolite, shortite (Kermit Poulson No. 1 well, Utah, USA); trona, nahcolite, shortite, northupite (Mapco Shrine Hospital #1 well, Utah, USA).

Distribution: In the USA, in Utah, from drill core in the Green River Formation, in Duchesne Co., at the Kermit Poulson No. 1 well and abundant in large crystals in the Mapco Shrine Hospital #1 well; in the South Ouray well, Uintah Co. From the Vuonnemiok River Valley, Khibiny massif, Kola Peninsula, Russia.

Name: Honors Wilhelm Hermann Julius Eitel (1891–1979), Director of the Institute of Silicate Research, University of Toledo, Toledo, Ohio, USA, who synthesized the compound.

Type Material: n.d.

(1) Eheliyagoda district, Sri Lanka. (2) Tombstone Mountains, Canada; by electron microprobe, heated specimen; separate wet chemical analysis gives F 3.4% and H_2O 7.8%; corresponds to $(Ca_{1.91}Fe_{0.06}Mn_{0.03})_{\Sigma=2.00}(Th_{0.90}U_{0.05})_{\Sigma=0.95}Si_8O_{20}$. (3) $Ca_2ThSi_8O_{20}$.

Occurrence: Detrital (Sri Lanka); in a glacial erratic syenitic boulder (Tombstone Mountains, Canada); in volcanic ejecta (Case Collina, Italy).

Association: Fluorite, garnet, quartz, microcline, clinopyroxene, apatite, sodic plagioclase, hematite, thorogummite, zircon, titanite (Tombstone Mountains, Canada); quartz, feldspar, pyroxene (Case Collina, Italy).

Distribution: From the Eheliyagoda and Okkampitiya districts, near Ratnapura, Sri Lanka. In the Tombstone Mountains, Yukon Territory, Canada. At Case Collina, Pitigliano, near Grosetto, Tuscany, and on the Vico volcano, near Vetralla, Lazio, Italy. From the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: In honor of the mineral's discoverer, F.L.D. Ekanayake, of Colombo, Sri Lanka.

Ekaterinite $Ca_2B_4O_7(Cl,OH)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6 (?). As foliated hexagonal crystals, to 1 mm; massive in veinlets and crusts.

Physical Properties: *Cleavage:* On {0001}, distinct, foliated. Hardness = 1–1.5 D(meas.) = 2.440(5) D(calc.) = [2.17] Hygroscopic with swelling, soluble in H_2O; luminesces and phosphoresces blue at 77 °K and 300 °K.

Optical Properties: Transparent to translucent. *Color:* White, may have a pale rose tint. *Luster:* Pearly.
Optical Class: Biaxial (–). $\alpha = 1.574(1)$ $\beta =$ n.d. $\gamma = 1.577(1)$ 2V(meas.) = Very small.

Cell Data: *Space Group:* $P6$ (?). $a = 11.86$ $c = 23.88$ Z = [6]

X-ray Powder Pattern: Korshunovskoye deposit, Russia.
2.31 (100), 1.916 (100), 2.047 (99), 2.09 (98), 1.281 (97), 2.51 (93), 1.166 (87)

Chemistry:

	(1)		(1)
B_2O_3	38.47	K_2O	0.16
SiO_2	0.04	F	0.00
Fe_2O_3	0.04	Cl	11.07

MgO	0.11	H_2O^-	7.62
CaO	30.67	$-O = (F,Cl)_2$	2.50
Na_2O	0.08	Total	99.93

(1) Korshunovskoye deposit, Russia; H_2O and borate anion confirmed by IR; corresponds to $Ca_{2.00}B_{4.04}O_7[Cl_{1.14}(OH)_{0.86}]_{\Sigma=2.00} \cdot 2.38H_2O$.

Occurrence: In calcite and calcite–anhydrite veins associated with a mineralized skarn.

Association: Halite, calcite, szaibélyite, korshunovskite, shabynite, iowaite, dashkovaite, siderite, hydromagnesite, quartz.

Distribution: From drill cores in the Korshunovskoye iron–boron skarn deposit, Irkutsk district, Siberia, Russia.

Name: Honors Dr. Yekaterina Vladimirovna Rozhkova (1898–1979), Russian mineralogist, Research Institute of Mineral Resources, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1224/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80173; National Museum of Natural History, Washington, D.C., USA, 160242, 160482.

Ekplexite $(Nb,Mo)S_2{\cdot}(Mg_{1-x}Al_x)(OH)_{2+x}$

Crystal Data: Hexagonal. *Point Group*: 3*m*, 32, or $\bar{3}$ 2/*m*. As isolated lenticular nests, to 1 mm; as near-parallel, radiating or chaotic aggregates of mica-like, corrugated flakes, to 0.1 mm; or as flakes epitaxially growing on Ti-bearing pyrrhotite, to 0.7 mm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: Laminated. *Tenacity*: Flexible, inelastic. VHN = 64 (5 g load). Hardness = ~1 D(meas.) = n.d. D(calc.) = 3.63

Optical Properties: Opaque. *Color*: Iron black; light to dark gray in reflected light. *Streak*: Black. *Luster*: Metallic. *Anisotropism:* Strong. *Pleochroism*: Strong, light to dark gray. *Optical Class*: n.d.
R_1-R_2: (470) 8.7-18.9, (546) 8.7-19.4, (589) 8.8-19.0, (650) 8.6-18.2

Cell Data: *Space Group*: $P\bar{3}\,m1$, $P3m1$, or $P321$. [a = 3.262(2) c = 11.44(2) sulfide sub-lattice] [a = 3.066(2) c = 11.52(2) hydroxide sub-lattice] One-layer polytypes. Z = 1

X-ray Powder Pattern: Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia. 11.40 (100), 5.65 (56), 2.812 (21), 1.622 (11), 2.647 (9), 2.248 (4), 1.573 (4)

		Total	99.09

(1) Mt. Kaskasnyunchorr, Russia; average of 5 electron microprobe analyses, H calculated so that all O are OH^-, OH^- confirmed by Raman spectroscopy; corresponding to $(Nb_{0.45}Mo_{0.38}W_{0.10}V_{0.04})_{\Sigma=0.97}S_2{\cdot}(Mg_{0.60}Al_{0.37}Fe_{0.02})_{\Sigma=0.99}(OH)_{2.36}$.

Mineral Group: Valleriite group.

Occurrence: Of hydrothermal origin in fenites formed by a peralkaline fluid, as a source of Nb, reacting with a large xenolith of alumina-rich metamorphic rocks (metapelites) in agpaitic nepheline syenite.

Association: Orthoclase, anorthoclase, nepheline, fluorophlogopite, corundum, pyrrhotite, pyrite, rutile, monazite-(Ce), graphite, edgarite, molybdenite, tungstenite, alabandite.

Distribution: From Mt. Kaskasnyunchorr, Khibiny alkaline complex, Kola Peninsula, Russia.

Name: After the Greek word έκπληξη meaning "surprise", for its exotic combination of major chemical constituents.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 93628).

Elbaite $\mathbf{Na(Al,Li)_3Al_6(BO_3)_3Si_6O_{18}(OH)_4}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals prismatic to acicular, with prominent trigonal prism and pyramid, to 1.6 m, commonly hemimorphic, striated ‖ [0001]. Also radial, fibrous, and massive. *Twinning:* Rare, on $\{10\bar{1}1\}$ or $\{40\bar{4}1\}$.

Physical Properties: *Cleavage:* $\{11\bar{2}0\}$, $\{10\bar{1}1\}$, very poor. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 7 D(meas.) = 2.90–3.10 D(calc.) = 3.069 Pyroelectric and piezoelectric.

Optical Properties: Transparent to translucent. *Color:* Green, blue, red, orange, yellow, colorless, zoning common parallel to trigonal outline; colorless in thin section. *Luster:* Vitreous to resinous.
Optical Class: Uniaxial (–); under strain may show slight biaxiality. *Pleochroism:* O = pink, pale green, pale to deep blue; E = colorless, yellow, olive-green, purplish. *Absorption:* $O > E$.
ω = 1.633–1.651 ϵ = 1.615–1.630

Cell Data: *Space Group:* $R3m$. a = 15.80–15.93 c = 7.09–7.13 Z = 3

(1) Elba, Italy; corresponds to $(Na_{0.74}Ca_{0.01})_{\Sigma=0.75}(Al_{2.11}Li_{1.05}Fe^{2+}_{0.01}Mn_{0.01})_{\Sigma=3.18}$ $Al_{6.00}(B_{0.93}O_3)_3Si_{5.94}O_{18}[(OH)_{3.63}O_{0.32}F_{0.05}]_{\Sigma=4.00}$.

Polymorphism & Series: Forms a series with dravite.

Mineral Group: Tourmaline group.

Occurrence: In granites, granite pegmatites, and some metamorphic rocks; in high-temperature hydrothermal veins; detrital in sediments.

Association: Quartz, albite, lepidolite, microcline, garnet, muscovite, beryl, apatite, spodumene.

Distribution: Many localities; some for exceptional specimens follow. In Italy, around San Piero in Campo, Elba. In the Yekaterinburg (Sverdlovsk) district, Ural Mountains, Russia. From Korgal and Mawi, Laghman Province, Afghanistan. In Pakistan, from around Gilgit and Stak Nala. At Ampantsikahitra, Anjanabonoina, Antandrokomby, Maharitra on Mt. Bity, and elsewhere on Madagascar. In the Alto Ligonha district, Mozambique. At Karibib and Usakos, Namibia. In the USA, from Mt. Mica, near Paris, Newry, and elsewhere in Oxford Co., Maine; at Haddam, Middlesex Co., Connecticut; and from the Pala and Mesa Grande districts, San Diego Co., California. In Brazil, from a large district around Araçuaí-Itinga-Salinas, and the Itatiaia district, Governador Valadares, Minas Gerais; at São José da Batalha, Paraíba.

Name: From the occurrence on the Island of Elba, Italy.

(1) Carlin mine, Nevada, USA; by electron microprobe, average of five grains. (2) Tl_3AsS_3.

Occurrence: In a hydrothermal gold deposit, in mineralized, argillaceous, carbonaceous dolostone beds.

Association: Gold, pyrite, christite, lorandite, getchellite, realgar, arsenic, carlinite, hydrocarbons.

Distribution: In the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., Nevada, USA.

Name: Honors Dr. Albert J. Ellis (1929–), New Zealand geochemist, Chemistry Division, Department of Scientific and Industrial Research, New Zealand.

Type Material: Department of Geology, Stanford University, Palo Alto, California, USA, Epithermal Minerals Collection.

References: (1) Dickson, F.W., A.S. Radtke, and J.A. Peterson (1979) Ellisite, Tl_3AsS_3, a new mineral from the Carlin gold deposit, Nevada, and associated sulfide and sulfosalt minerals. Amer. Elpasolite K_2NaAlF_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As octahedra, trapezohedral or tetrahexahedral crystals, to 0.5 mm; in granular aggregates, massive.

Physical Properties: *Fracture:* Uneven. Hardness = 2.5 D(meas.) = 2.98(1) D(calc.) = 3.01

Optical Properties: Transparent to translucent. *Color:* Colorless. *Luster:* Weakly vitreous to slightly greasy.
Optical Class: Isotropic. $n = 1.376(2)$

Cell Data: *Space Group:* $Fm3m$. a = 8.116(2) Z = 4

X-ray Powder Pattern: Pikes Peak, Colorado, USA.
2.863 (10), 2.024 (10), 2.336 (8), 1.428 (6), 0.795 (6), 0.905 (5), 1.650 (4)

Chemistry:

	(1)	(2)	(3)
Na	9.90	7.96	9.50
K	28.94	30.82	32.29
Mg	0.22	0.03	
Ca	0.72	0.08	
Al	11.32	10.04	11.14
F	[47.90]	49.69	47.07
Total	[99.00]	98.62	100.00

(1) Pikes Peak, Colorado, USA; F calculated for charge balance; corresponds to $K_{1.79}Na_{1.07}Ca_{0.04}Al_{1.02}F_{6.11}$. (2) Cetine mine, Italy, by electron microprobe, corresponds to $K_{2.12}Na_{0.93}Al_{1.00}F_{7.03}$. (3) K_2NaAlF_6.

Occurrence: Replacing fluorine-bearing minerals in a quartz-microcline pegmatite (Pikes Peak, Colorado, USA); on vein quartz in a hydrothermal antimony deposit in silicified limestone (Cetine mine, Italy).

Association: Cryolite, pachnolite, thomsenolite, prosopite, gearksutite (Pikes Peak, Colorado, USA); cryolite, chiolite, pachnolite, thomsenolite, ralstonite (Amelia, Virginia, USA); ralstonite, rosenbergite, gypsum, fluorite, quartz (Cetine mine, Italy).

Distribution: In the USA, from the Cincinnati mine, St. Peters Dome, near Pikes Peak, El Paso Co., Colorado; from the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada; and in the Morefield pegmatite mine, Amelia, Amelia Co., Virginia. From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy. In the Ivigtut cryolite deposit, southwestern Greenland.

Name: For El Paso County, Colorado, USA, where the mineral was found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162621, 83302.

Elpidite $Na_2ZrSi_6O_{15}\cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals prismatic, elongated ‖ [001], to 30 cm, striated ‖ [010]. In fan-shaped aggregates, columnar, fine fibrous, massive. *Twinning:* Noted.

Physical Properties: *Cleavage:* Perfect on {110}. *Fracture:* Splintery. Hardness = 5 D(meas.) = 2.52–2.62 D(calc.) = 2.59

Optical Properties: Opaque to translucent and transparent. *Color:* White, colorless, yellowish, pale to bright orange, brownish yellow, brownish, beige, green, brick-red from inclusions. *Luster:* Silky, vitreous to waxy or dull.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$.
$\alpha = 1.556$–1.563 $\beta = 1.565$–1.569 $\gamma = 1.574$–1.577 2V(meas.) = 76°–89°

Cell Data: *Space Group: Pbcm.* $a = 7.14(2)$ $b = 14.68(1)$ $c = 14.65(1)$ Z = 4

X-ray Powder Pattern: Narssârssuk, Greenland.

Total	100.53	99.83	100.00

(1) Narssârssuk, Greenland. (2) Lovozero massif, Russia. (3) $Na_2ZrSi_6O_{15}\cdot 3H_2O$

Occurrence: In albitized nepheline syenite and associated pegmatites, aegirine-rich granite, and fenites, in a differentiated alkalic massif (Lovozero massif, Russia).

Association: Albite, quartz, aegirine, epididymite, labuntsovite (Lovozero massif, Russia).

Distribution: At Narssârssuk and in the Ilímaussaq intrusion, southern Greenland. In Russia, from the Lovozero and Khibiny massifs, Kola Peninsula; in the Ulan-Erge massif, southeastern Tuva; and in the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia. In large crystals from Tarbagatai, eastern Kazakhstan. In the Khan-Bogdinskii granite massif, Gobi, Mongolia. At Gjerdingen, near Oslo, Norway. On Rockall Island, North Atlantic. In Canada, at Mont Saint-Hilaire and near Saint-Amable, Quebec, and in the Strange Lake complex, southeast of Lac Brisson, Quebec and Labrador, Newfoundland. From Washington Pass, Okanogan Co., Washington, USA.

Name: From the Greek *hope*, named in anticipation of discovery of other interesting minerals.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Elyite $Pb_4CuO_2(SO_4)(OH)_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular prismatic to fibrous crystals, elongated along [001], to 1 mm, platy on {100} with minor modifying forms; typically in radiating sprays, tufts, or matted. *Twinning:* Common by reflection across {100}.

Physical Properties: *Cleavage:* On {100}, good. *Tenacity:* Sectile. Hardness = 2
D(meas.) = ∼6 D(calc.) = 6.232

Optical Properties: Transparent. *Color:* Violet. *Streak:* Pale violet to white.
Luster: Silky.
Optical Class: Biaxial (–). *Pleochroism:* Deep to pale purple. *Orientation:* $Y = b$; $X \wedge c = 45°$.
Dispersion: Noticeable. *Absorption:* $Z > Y > X$. $\alpha = 1.990(1)$ $\beta = 1.993(1)$ $\gamma = 1.994(1)$
2V(meas.) = 66°

Cell Data: *Space Group:* $P2_1/c$. $a = 14.233(2)$ $b = 11.532(1)$ $c = 14.611(2)$
$\beta = 100.45(1)°$ Z = 8

X-ray Powder Pattern: Silver King mine, Nevada, USA.
7.00 (100), 7.19 (99), 2.995 (73), 2.884 (37), 3.136 (32), 3.341 (31), 3.047 (30)

Chemistry:

	(1)	(2)	(3)
SO_3	7.10	7.70	7.24
CuO	7.98	6.71	7.19
PbO	81.65	80.36	80.69
H_2O	6.1	[5.23]	4.88
Total	102.83	[100.00]	100.00

(1) Silver King mine, Nevada, USA; by electron microprobe, H_2O determined by TGA; corresponds to $Pb_{4.00}Cu_{1.10}O_{2.00}(SO_4)_{0.97}(OH)_{4.25} \cdot 1.57H_2O$. (2) Mizuhiki mine, Japan; by electron microprobe, H_2O by difference; corresponds to $Pb_{4.00}Cu_{0.94}O_{2.00}(SO_4)_{1.07}(OH)_{3.74} \cdot 1.32H_2O$.
(3) $Pb_4CuO_2(SO_4)(OH)_4 \cdot H_2O$.

Occurrence: Rare in the oxidized zone of base metal sulfides; may be formed in dumps and common in slags.

Association: Galena, langite, serpierite, cerussite, anglesite, litharge, minium.

Distribution: From the Silver King mine, Ward, White Pine Co., Nevada, USA. In Germany, at the Clara mine, near Oberwolfach, from the Altemann rock, at the Freiamt mine, northeast of Freiburg, and from Badenweiler, Black Forest; in the Churfürst mine, Bönkhausen, Sauerland, North Rhine-Westphalia. At the Mizuhiki mine, Fukushima Prefecture, Japan. From Tsumeb, Namibia. At the Red Gill mine, Caldbeck Fells, Cumbria, England. From Leadhills, Lanarkshire, Scotland. In the Esgair Hir mine, Bwlch-y-Esgair, Ceulanymaesmawr, and at the Frongoch mine, Dyfed, Wales. A number of occurrences noted in slags have been omitted.

Name: Honors John H. Ely, nineteenth century frontiersman and promoter of an early mining company in Nevada, USA.

Type Material: The Natural History Museum, London, England, 1972,193.

Embreyite $Pb_5(PO_4)_2(CrO_4)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudorhombohedral. *Point Group:* $2/m$ (probable). Minute tabular crystals, pseudorhombohedral, with apparent $\{10\bar{1}1\}$ and $\{0001\}$, in drusy botryoidal crusts. *Twinning:* Multiple twinning and 60° sector zoning observed optically.

Physical Properties: *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 6.45(12) D(calc.) = 6.41

Optical Properties: Translucent to transparent. *Color:* Dull orange, red-violet, dark red, reddish brown; orange in thin section. *Streak:* Yellow. *Luster:* Vitreous, resinous, dull. *Optical Class:* Biaxial (–). *Pleochroism:* X = honey-yellow; $Y = Z$ = amber. *Orientation:* $Y = b$. *Dispersion:* Low. $\alpha = 2.20(4)$ $\beta = 2.36(4)$ $\gamma = 2.36(4)$ 2V(meas.) = 0°–11°

Cell Data: *Space Group:* $[A2/m]$ (probable; by analogy to cassedanneite). $a = 7.135(3)$ $b = 5.636(3)$ $c = 9.599(3)$ $\beta = 115.15(2)°$ Z = 1

X-ray Powder Pattern: Beresovsk, Russia.
3.167 (100), 4.751 (60), 2.818 (60), 1.917 (45), 3.563 (32), 2.213 (32), 2.187 (31)

Chemistry:

	(1)	(2)
CrO_3	13.46	13.55
P_2O_5	9.13	9.62
Fe_2O_3	0.02	
CuO	1.71	
ZnO	0.04	
PbO	74.73	75.61
H_2O	0.91	1.22
Total	[100.00]	100.00

(1) Beresovsk, Russia; by electron microprobe and AA, average of five analyses, H_2O by TGA; corresponds to $Pb_{4.97}(PO_4)_{1.91}(CrO_4)_{2.00} \cdot 0.75H_2O$. (2) $Pb_5(PO_4)_2(CrO_4)_2 \cdot H_2O$.

Occurrence: On museum samples from the oxidized zone of gold-bearing quartz veins (Beresovsk, Russia).

Association: Crocoite, phoenicochroite, vauquelinite, cassedanneite, cerussite (Beresovsk, Russia); crocoite, vauquelinite, fornacite, pyromorphite, mimetite, cerussite (Callenberg mine, Germany).

Distribution: From the Beresovsk gold deposit, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. At the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, South Africa. In the Callenberg mine, near Hohenstein-Ernstthal, Saxony, Germany.

Name: To honor Peter Godwin Embrey (1929–), English mineralogist, British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 39316.

MgO	0.10
CaO	0.00
Li_2O	2.78
Na_2O	11.98
K_2O	0.00
Total	99.76

(1) Island of Igdlutalik, Greenland; by electron microprobe, Li by flame photometry; corresponds to $Na_{3.96}Li_{1.91}(Fe^{3+}_{1.56}Al_{0.27}Ti_{0.07}Mg_{0.03}Zr_{0.01})_{\Sigma=1.94}Si_{12.05}O_{30}$.

Mineral Group: Milarite group.

Occurrence: A minor constituent of a peralkalic trachyte dike, in flow-banded aegirine-albite-rich layers.

Association: Albite, aegirine, quartz, riebeckite, micas, zircon, pectolite, apatite, calcite, titanian narsarsukite, zincian nordite, thorite, opaque oxides.

Distribution: On the Island of Igdlutalik, Julianehåb district, Greenland.

Name: To honor Dr. Charles Henry Emeleus, University of Durham, Durham, England.

Type Material: University of Copenhagen, Copenhagen, Denmark; Department of Geology, Edinburgh University, Edinburgh, Scotland; The Natural History Museum, London, England, 1987,118; National Museum of Natural History, Washington, D.C., USA, 146464.

(1) Cripple Creek, Colorado, USA; corresponds to $(Fe_{1.91}Al_{0.08})_{\Sigma=1.99}Te_{3.01}O_{9.00} \cdot 1.78H_2O$.
(2) $Fe_2Te_3O_9 \cdot 2H_2O$.

Occurrence: An alteration product formed from earlier tellurium minerals in the oxide zone of some hydrothermal precious metal deposits.

Association: Tellurium, tellurite, rodalquilarite, mackayite, sonoraite, cuzticite, eztlite, gold, pyrite.

Distribution: In the USA, from the W.P.H., Moose, and Deadwood mines, Cripple Creek, Teller Co., Colorado; in the Toughnut-Empire mine and between the Joe and Grand Central mines, Tombstone, Cochise Co., Arizona; from the Wilcox district, Catron Co., and the Sylvanite district, Hidalgo Co., New Mexico; at the Mohawk mine, Goldfield, Esmeralda Co., Nevada; from the Clinton mine, Lawrence Co., South Dakota. In the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. At the El Plomo mine, Tegucigalpa, Honduras. In the Wendy open pit, Tambo, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. From the Zod gold deposit, 14 km east of Vardenis, Armenia.

Name: To honor Samuel Franklin Emmons (1841–1911), American economic geologist, U.S. Geological Survey.

Type Material: Yale University, New Haven, Connecticut, 5.6300; Harvard University, Cambridge, Massachusetts, USA, 97503.

(1) Tannenbaum mine, Germany; average of two analyses. (2) Sadisdorf, Germany; by electron microprobe. (3) $CuBiS_2$.

Occurrence: In hydrothermal veins with other sulfides and sulfosalts formed at medium temperatures.

Association: Chalcopyrite, pyrite, sphalerite, molybdenite, quartz, fluorite (Horní Slavkov, Czech Republic); tetrahedrite–tennantite, luzonite–famatinite, pyrite, mawsonite, nekrasovite, chalcopyrite, laitakarite, bismuth, calcite, quartz, barite (Khayragatsch deposit, Uzbekistan).

Distribution: In Germany, in Saxony, sharp crystals from Johanngeorgenstadt [TL]; in the Tannenbaum mine, near Schwarzenberg; from Schneeberg, Annaberg, the Sadisdorf copper mine, near Schmiedeberg, and other localities; from Wittichen, Black Forest. In the Czech Republic, at Krupka, Horní Slavkov (Schlaggenwald), and Cínovec (Zinnwald). In Norway, at the Åmdal copper mines, Telemark. In Scotland, from Corrie Buie, Meal nan Oighreag, Perthshire. In the Khayragatsch gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. From Japan, in the Akenobe mine, Hyogo Prefecture, the Hade mine, Okayama Prefecture, and the Shin-Ohtoyo deposit, Hokkaido. In Mexico, from the El Cobre mine, Concepción del Oro, Zacatecas. At Bisbee, Cochise Co., Arizona, USA. In Chile, from Cerro Blanco, near Copiapó, Atacama, and in the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo. Chile. In the Jules Verne mine, Salta Province, Argentina. Additional minor occurrences are known.

Name: From the Greek for *interwoven* or *entwined*; in reference to its sometimes intimate association with quartz.

Empressite AgTe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As compact, granular masses; crystals rare, to 400 μm.

Physical Properties: *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5 VHN = 108–133; 142 (25 g load). D(meas.) = 7.61(1) D(calc.) = 7.59

Optical Properties: Opaque. *Color:* Pale bronze; grayish white in reflected light. *Streak:* Gray-black to black. *Luster:* Metallic. *Pleochroism:* Very strong, in gray to creamy white. *Anisotropism:* Strong, gray to yellowish white to grayish blue. *Bireflectance:* Strong. R_1–R_2: (400) 36.6–42.8, (420) 37.1–44.2, (440) 37.5–45.8, (460) 37.8–47.8, (480) 38.1–49.6, (500) 38.7–51.0, (520) 39.3–51.9, (540) 39.8–52.6, (560) 40.0–52.8, (580) 40.0–52.8, (600) 40.0–52.9, (620) 39.9–53.1, (640) 39.8–53.5, (660) 39.7–53.8, (680) 39.5–53.9, (700) 39.4–54.0

(1) Empress Josephine mine, Colorado, USA; average of two analyses, corresponding to $Ag_{0.98}Te_{1.00}$. (2) Do.; by electron microprobe, corresponding to $Ag_{0.95}Te_{1.00}$. (3) Do.; by electron microprobe, corresponding to $Ag_{0.97}Te_{1.00}$. (4) AgTe.

Occurrence: In low-temperature gold-poor hydrothermal vein deposits.

Association: Tellurium, sylvanite, petzite, hessite, rickardite, altaite, galena (Empress Josephine mine, Colorado, USA); pyrite, rodalquilarite (Tombstone, Arizona, USA); gold, tellurium, hessite, petzite, rickardite (Pitman, Canada).

Distribution: In the USA, in Colorado, from the Empress Josephine mine, Kerber Creek district [TL], and the Klondike mine, Finley Gulch, both in Saguache Co.; the May Day mine, La Plata Co.; and the Red Cloud, Rex, and other mines, Boulder Co.; from Tombstone, Cochise Co., Arizona. In Canada, from the Grotto group of pits, near Pitman, British Columbia, and the Quetico intrusions, northwestern Ontario. At Kalgoorlie, Western Australia. From the Emperor mine, Vatukoula, Viti Levu, Fiji Islands. At the Kawazu mine, Shizuoka Prefecture, Japan. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At Sulitjelma, Norway. From the Huangshaping Pb–Zn deposit, Guiyang, Hunan Province, China.

Name: For the Empress Josephine mine, Colorado, USA.

Enargite Cu_3AsS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Tabular on {001}; also prismatic by elongation of [001]; crystals up to 15 cm. Prism zone typically deeply striated ‖ [001]. *Twinning:* Twin plane {320} common, rarely as interpenetrating pseudohexagonal trillings.

Physical Properties: *Cleavage:* Perfect on {110}, distinct on {100} and {010}, indistinct on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3 VHN = n.d. D(meas.) = 4.45 D(calc.) = 4.40

Optical Properties: Opaque. *Color:* Grayish black to iron-black; in polished section, gray to pale pink-brown, deep red internal reflections may be observed. *Streak:* Grayish black. *Luster:* Metallic to dull. *Pleochroism:* Weak. *Anisotropism:* Very strong, dark violet-red or olive-green tones.
R_1–R_2: (400) 24.8–26.2, (420) 26.6–26.0, (440) 26.5–25.6, (460) 26.5–25.9, (480) 26.2–25.8, (500) 25.6–25.6, (520) 24.9–25.3, (540) 24.4–25.2, (560) 24.0–25.2, (580) 23.8–25.4, (600) 23.8–25.9, (620) 24.1–26.5, (640) 24.6–26.9, (660) 25.2–26.9, (680) 25.6–26.8, (700) 25.7–26.7

(1) Cerro Blanco, Chile. (2) Bor, Serbia; by electron microprobe. (3) Cu_3AsS_4.

Polymorphism & Series: Dimorphous with luzonite.

Occurrence: In hydrothermal vein deposits formed at medium temperatures. Also as a late-stage mineral in low-temperature deposits.

Association: Pyrite, sphalerite, galena, bornite, tetrahedrite–tennantite, chalcocite, covellite, barite, quartz.

Distribution: A widespread mineral, may be an important ore of copper, but not commonly well-crystallized. Only a few localities can be mentioned. In Peru, from Morococha [TL] and Cerro de Pasco, with exceptional crystals from the Mina Luz Angelica, Quiruvilca. In Argentina, in the Sierra de Famatina, La Rioja Province. In the Philippine Islands, at Mancayan, Luzon. From the Chinkuashi mine, Keelung, Taiwan. At Kaize-mura, Nagano Prefecture, and in the Teine mine, Hokkaido, Japan. In the USA, in splendent crystals from Butte, Silver Bow Co., Montana; in Utah, in the Tintic district, Juab Co.; in Colorado, in fine specimens from a number of mines in the Red Mountain district, San Juan Co. In Austria, at Matzenköpfl, Brixlegg, Tirol. From Bor, Serbia. In Italy, on Sardinia, at Alghero and Calabona. At Tsumeb, Namibia.

Name: From the Greek for *distinct*, in allusion to its cleavage.

Type Material: Mining Academy, Freiberg, Germany, 6929.

(1) Little Green Monster mine, Utah, USA; by electron microprobe, H_2O by the Penfield method, average of three analyses; corresponds to $K_{3.01}Na_{1.83}(Ca_{9.79}Mg_{0.09})_{\Sigma=9.88}Al_{14.94}(PO_4)_{20.77}(OH)_{7.11} \cdot 26.14H_2O$. (2) Tip Top mine, South Dakota, USA; by electron microprobe, H_2O from stoichiometry. (3) $K_3Na_2Ca_{10}Al_{15}(PO_4)_{21}(OH)_7 \cdot 26H_2O$.

Occurrence: In variscite nodules (Little Green Monster mine, Utah, USA); in a complex granite pegmatite (Tip Top mine, South Dakota, USA).

Association: Variscite, montgomeryite, wardite, millisite, crandallite (Little Green Monster mine, Utah, USA); montgomeryite, eosphorite–childrenite, tiptopite, roscherite, pahasapaite, parafransoletite, robertsite, mitridatite, whitlockite (Tip Top mine, South Dakota, USA).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah; in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; at the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., the Miekle mine, Lynn district, Elko Co., and the Redhouse barite mine, Potosi disict, Humboldt Co., Nevada.

(1) Maliba Matso, Lesotho; corresponds to $(Mg_{1.77}Fe^{2+}_{0.11}Al_{0.04}Ca_{0.02}Na_{0.02}Fe^{3+}_{0.02})_{\Sigma=1.98}Si_{2.00}O_6$.

Polymorphism & Series: Dimorphous with clinoenstatite; forms a series with ferrosilite.

Mineral Group: Pyroxene group.

Occurrence: In pyroxenites, peridotites, and dunites; in ultramafic inclusions in alkalic olivine basalts and kimberlite; in mafic volcanics, rarely in felsic volcanics. Characteristic of charnockites and the granulite metamorphic facies, in regionally metamorphosed rocks and metagabbros. Common in chondrite, achondrite, and stony-iron meteorites.

Association: Olivine, phlogopite, clinopyroxene, diopside, spinel, pyrope.

Distribution: Prominent localities for well-studied material include: from Ždár (Zdjarberg), Czech Republic. At Ødegården and Kjörrestad, Bamble, Norway. From The Lizard, Cornwall, England. At Dawros, Co. Connaught, Ireland. From Kupferberg, Bavaria, and the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. At Kraubath, Styria, Austria. Fine crystals from Mbeya, Tanzania. At Liahobong, Lesotho. In the USA, at Webster, Jackson Co., and on Corundum Hill, Macon Co., North Carolina; at Wood's chrome mine and Texas, Lancaster Co., and elsewhere in Pennsylvania. Gem material from Embilipituya, Sri Lanka.

Name: From the Greek for *opponent*, in allusion to its refractory nature under the blowpipe.

Eosphorite $Mn^{2+}Al(PO_4)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$; pseudo $2/m$ $2/m$ $2/m$. Typically as crystals, short to long prismatic on [001], to 20 cm; in planar radial or spherical radiating groups, with wedge-shaped terminations; globular, rarely massive. *Twinning:* May show twinning on {100} and {001}, observed optically, to give pseudo-orthorhombic symmetry; perhaps due to oxidation.

Physical Properties: *Cleavage:* {100}, poor. *Fracture:* Subconchoidal to uneven. Hardness = 5 D(meas.) = 3.06–3.08 D(calc.) = 3.04

Optical Properties: Transparent to translucent. *Color:* Pink to rose-red, commonly brown to black when oxidized. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (–). *Pleochroism:* X = yellow; Y = pink; Z = pale pink to colorless. *Orientation:* $X = b$; $Y = a$; $Z = c$; $Y \wedge c = 4°$–$8°$ in optically twinned individuals. *Dispersion:* $r < v$, strong, for near end-member composition. $\alpha = 1.628$–1.644 $\beta = 1.648$–1.673 $\gamma = 1.657$–1.679 2V(meas.) = $45°$–$50°$ in optically twinned crystals.

Cell Data: *Space Group:* $P2_1/m$. $a = 10.455(1)$ $b = 13.501(2)$ $c = 6.928(1)$ $\beta = 90.0°$ Z = 8

(1) Buckfield, Oxford Co., Maine, USA. (2) $MnAl(PO_4)(OH)_2 \cdot H_2O$.

Polymorphism & Series: Forms a series with childrenite.

Occurrence: Typically a secondary mineral in some phosphate-bearing granite pegmatites.

Association: Rhodochrosite, lithiophilite, triploidite, dickinsonite (Branchville, Connecticut, USA); albite, cookeite, apatite, beryllonite, hydroxyl-herderite, tourmaline (Newry, Maine, USA).

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; at a number of places around Newry, in the Red Hill and Black Mountain quarries, Rumford, Oxford Co., and elsewhere in Maine; in the Hugo mine, 1.5 km south of Keystone, Pennington Co., South Dakota; from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina; in the White Picacho district, Maricopa and Yavapai Cos., Arizona. At Hagendorf, Bavaria, and on the Greifensteine, near Ehrenfriedersdorf, Saxony, Germany. In the Viitaniemi pegmatite, Eräjärvi, Finland. In Brazil, large crystals from the Lavra da Ilha pegmatite, in the Jequitinhonha River, three km north of Taquaral; in the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares; at the João Modesto dos Santos mine, and from a number of other mines around Linópolis and Mendes Pimental, Minas Gerais, Brazil. From Wycheproof, Victoria, Australia.

Name: From the Greek for *dawn-bearing*, in allusion to the pink color.

Type Material: Yale University, New Haven, Connecticut, USA, 3.3231, 3.5847.

(1) Gumuch-dagh, Turkey; Li perhaps analyzed as Na and K. (2) Postmasburg district, South Africa. (3) $NaLiAl_2(Al_2Si_2)O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$, 1M polytypes.

Mineral Group: Mica group.

Occurrence: In an emery deposit (Gumuch-dagh, Turkey); a minor constituent in manganese oxide ore (Postmasburg district, South Africa).

Association: Corundum, magnetite (Gumuch-dagh, Turkey); diaspore, braunite, bixbyite (Postmasburg district, South Africa).

Distribution: Some material from the original locality at Gumuch-dagh, near Ephesus, Turkey was later determined to be a mixture, but has not been reexamined by modern methods. From Lohatla, Postmasburg district, Transvaal, and in the Wessels mine, near Kuruman, Cape Province, South Africa. In the Ilímaussaq intrusion, southern Greenland.

Name: For Ephesus, Turkey, near where it may occur.

Epididymite $NaBeSi_3O_7(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As pseudohexagonal crystals, tabular on {001}, also elongated along [010], to 6 cm. Micaceous, spherulitic, fine to coarse granular, porcelaneous massive. *Twinning:* On {001}, common, simple and polysynthetic; also as trillings.

Physical Properties: *Cleavage:* Perfect on {001}, distinct on {100}. *Fracture:* Uneven to conchoidal when massive. Hardness = 5.5 D(meas.) = 2.55–2.61 D(calc.) = 2.56

Optical Properties: Transparent to translucent. *Color:* Colorless, white, also tinted violet, blue, or yellow when finely crystalline. *Luster:* Pearly on cleavages, vitreous on fractures. *Optical Class:* Biaxial (+) or (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, distinct, crossed. $\alpha = 1.536$–1.544 $\beta = 1.51$–1.544 $\gamma = 1.542$–1.546 2V(meas.) = 16°–32° 2V(calc.) = 26°

Cell Data: *Space Group: Pnma.* $a = 12.74(1)$ $b = 13.63(1)$ $c = 7.33(1)$ Z = 8

X-ray Powder Pattern: Narssârssuk, Greenland.

(1) Narssârssuk, Greenland. (2) Mt. Karnasurt, Russia. (3) $NaBeSi_3O_7(OH)$.

Polymorphism & Series: Dimorphous with eudidymite.

Occurrence: A late-stage mineral in nepheline syenite pegmatites.

Association: Albite, aegirine, eudialyte, elpidite, neptunite, tugtupite, leucophanite, natrolite, analcime.

Distribution: At Narssârssuk and in the Ilímaussaq intrusion, southern Greenland. On Arø Island, in the Langesundsfjord, and in the Vevja quarry, Tvedalen, Norway. On the Kola Peninsula, in the Lovozero massif, on Mts. Karnasurt and Alluaiv, and at Kuivchorr, and in the Khibiny massif; from the Murun massif, southwest of Olekminsk, Yakutia, Russia. At Věžná, Czech Republic. From Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada. In the USA, near Quincy, Norfolk Co., Massachusetts. Large crystals on Mt. Malosa, Zomba district, Malawi.

Name: The prefix *epi* from the Greek for *near*, referring to the dimorphous relation with *eudidymite*.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Total	100.04

(1) Nagakawara deposit, Ananai mine, Kochi Prefecture, Japan; average of 41 electron microprobe analyses, H_2O calculated, corresponding to $(Ca_{1.10}Sr_{0.90})_{\Sigma=2.00}(Al_{1.92}Fe^{3+}_{0.87}Mn^{3+}_{0.20})_{\Sigma=2.99}Si_{3.01}O_{12}(OH)$.

Mineral Group: Epidote group, clinozoizite subgroup.

Occurrence: A late-stage hydrothermal vein mineral in a tinzenite deposit in metachert (Nagakawara deposit) and in piemontite breccias (Hohnomori deposit).

Association: Calcite, tinzenite, piemontite-(Sr).

Distribution: Nagakawara and Hohnomori deposits, Ananai mine, Kochi Prefecture, Japan.

Name: For its chemical composition as a member of the epidote group.

Type Material: Hokkaido University museum, Sapporo, Japan (Mineral-07400).

(1) Westfield, Hampden Co., Massachusetts, USA; corresponds to $(Ca_{1.99}Fe^{2+}_{0.03})_{\Sigma=2.02}Al_{1.94}Fe^{3+}_{1.04}(Si_{2.94}Al_{0.06})_{\Sigma=3.00}O_{12}(OH)_{1.06}$.

Polymorphism & Series: Forms a series with clinozoisite.

Mineral Group: Epidote group.

Occurrence: Characteristic of several facies of regionally metamorphosed rocks and some contaminated felsic igneous rocks; in contact zones between igneous and calcareous sedimentary rocks; from alteration of plagioclase (saussuritization).

Association: Zeolites, amphiboles, plagioclase feldspars, quartz, actinolite, calcite (greenschist facies); amphiboles, vesuvianite, scapolite, talc, wollastonite, pyroxenes, garnet (epidote-hornfels facies); pumpellyite, glaucophane, lawsonite, riebeckite, garnet, omphacite (blueschist facies).

Distribution: A few notable occurrences follow for this widespread mineral. From Bourg d'Oisans, Isère, France. At Arendal, Norway. From Traversella, Piedmont, Italy. Exceptional crystals from the Knappenwand, Untersulzbachtal, Salzburg, Austria. In the USA, fine crystals from around Sulzer, Prince of Wales Island, Alaska; on Garnet Hill, Calaveras Co., California; at the Calumet mine, Chaffee Co., Colorado; in the Seven Devils district, Adams Co., Idaho; and from the Julie claim, Pamlico district, Mineral Co., Nevada. In Mexico, at San Quentin, Baja California. From Naukluft Farm, Rehoboth, Namibia. In Pakistan, exceptional crystals from Tormiq.

Name: From the Greek for *increase*, the base of the prism with one longer side.

Type Material: Natural History Museum, Paris, France.

(1) Fossarfell, Iceland; corresponds to $(Ca_{0.90}Na_{0.27}K_{0.01})_{\Sigma=1.18}Al_{2.12}Si_{5.89}O_{16}\cdot 5.20H_2O$.

Polymorphism & Series: Dimorphous with goosecreekite.

Mineral Group: Zeolite group.

Occurrence: In cavities in basalts and gneisses.

Association: Zeolites, quartz.

Distribution: While relatively rare, many localities are known. Exceptional crystals from around the Berufjord, Iceland. Found near San Piero in Campo, Elba, Italy. At Giebelsbach, near Fiesch, Valais, Switzerland. In Japan, at Kuroiwa, Niigata Prefecture; Yugawara, Kanagawa Prefecture; and elsewhere. Large crystals from Nasik and Khandivali quarry, Bombay, Maharashtra, India. In the USA, large crystals from Kosmos, near Morton, Lewis Co., Washington; at Goble, Columbia Co., Oregon.

Name: From the Greek, *epi* for *near*, and the quite similar mineral *stilbite*.

(1) Julianehåb district, Greenland; material partly altered. (2) Lovozero massif, Russia. (3) Ilímaussaq alkaline complex, South Greenland; electron microprobe analysis, H_2O calculated from structure analysis; K and P considered contaminants; corresponding to $(Na_{3.79}Ca_{0.27}Mn_{0.04})_{\Sigma=4.06}(Nb_{1.92}Ti_{1.04}Fe^{3+}_{0.04})_{\Sigma=3.00}(Si_2O_7)_2O_2(OH_{1.44}F_{0.56})(H_2O)_4$.

Occurrence: A low temperature mineral in alkalic pegmatites, albitites, sodalite xenoliths, and hydrothermal veins.

Association: Aegirine, albite, murmanite, sphalerite, manganoan pectolite, neptunite, steenstrupine, sodalite, eudialyte, nenadkevichite.

Distribution: At a number of localities in the Ilímaussaq alkaline complex intrusion, southern Greenland. From the Lovozero massif, Kola Peninsula, Russia. At Mont Saint-Hilaire and near Saint-Amable, Quebec, Canada.

Name: From the Greek for *letter*, in allusion to the flat rectangular crystal habit and white color.

Type Material: University of Copenhagen, Copenhagen, Denmark, 319, 320.

Total	100.10	100.00

(1) Ashcroft, Canada. (2) $MgSO_4 \cdot 7H_2O$.

Polymorphism & Series: Forms two series, with goslarite and with morenosite.

Occurrence: As efflorescences on the walls of mines, caves, and outcrops of sulfide-bearing magnesian rocks; a product of evaporation at mineral springs and saline lakes; a hydration product of kieserite and langbeinite; rarely a fumarolic sublimate.

Association: Melanterite, gypsum, halotrichite, pickeringite, alunogen, rozenite (efflorescences); mirabilite (lacustrine evaporites).

Distribution: Widespread and common; a few varied localities include: from Epsom, Surrey, England. At Sedlitz and Saidschitz, Czech Republic. From Špania Dolina (Herrengrund), Slovakia. On Vesuvius, Campania, Italy. At volcanoes on the Kamchatka Peninsula, Russia. In the USA, large masses in Mammoth Cave, Kentucky; at the Mt. Princeton hot spring, Chalk Creek, Chaffee Co., Colorado; at Leona Heights, Alameda Co., California; very large crystals from salt lakes on Kruger Mountain, near Oroville, Okanogan Co., Washington; in Idaho, at the Buckhorn mine, Lemhi Co. and the Claytonia mine, Owyhee Co. From Ashcroft, British Columbia, and in the Dundas quarry, Dundas, Ontario, Canada.

Name: For the occurrence at Epsom, England.

Erdite $NaFeS_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In fine granular, impure masses of minute fibers; single, fine-bladed crystals, to 1 mm in length.

Physical Properties: *Cleavage:* Good on {110}. Hardness = Very soft. VHN = 22–67, 39 average (15 g load). D(meas.) = 2.2, 2.30 (magnetite-contaminated). D(calc.) = 2.216

Optical Properties: Opaque, transmits light in very fine fibers. *Color:* Copper-red to bronze on fresh surface, may be chatoyant, tarnishes rapidly. *Streak:* Black. *Pleochroism:* Extreme: brilliant reddish orange through greenish grays and pinkish grays to dark gray with a barely perceptible bluish or greenish tint. *Anisotropism:* Strong.
R_1–R_2: (400) 10.2–23.8, (420) 9.8–28.8, (440) 10.1–27.3, (460) 10.9–20.8, (480) 11.3–15.6, (500) 11.3–16.6, (520) 11.0–23.3, (540) 10.6–25.7, (560) 10.3–25.7, (580) 10.0–31.6, (600) 9.8–36.6, (620) 9.7–43.1, (640) 9.8–46.9, (660) 10.0–44.3, (680) 10.6–39.3, (700) 11.0–35.3

Cell Data: *Space Group:* $C2/c$. $a = 10.677$–10.693 $b = 9.083$–9.115 $c = 5.499$–5.507 $\beta = 92°10(2)'$–$92°23(4)'$ $Z = 4$

X-ray Powder Pattern: Coyote Peak, California, USA.
6.935 (100), 5.342 (71), 4.556 (41), 3.467 (28), 2.310 (23), 2.902 (15), 3.317 (12)

Chemistry:

	(1)	(2)	(3)
Na	14.1	11.2	12.84
K		0.12	
Fe	36.0	34.9	31.20
S	40.5	37.6	35.82
O	[9.4]	[16.2]	17.88
H			[2.26]
Total	[100.0]	[100.02]	100.00

(1) Coyote Peak, California, USA; by electron microprobe, oxygen by difference; corresponds to $Na_{0.96}Fe_{1.01}S_{1.96} \cdot 0.82H_2O$, presence of H_20 confirmed by evolution, with $2H_2O$ established by crystal structure analysis. (2) Lovozero massif, Russia; by electron microprobe, average of ten analyses, oxygen by difference; corresponds to $(Na_{0.81}K_{0.01})_{\Sigma=0.82}Fe_{1.04}S_{1.96} \cdot 1.50H_2O$. (3) $NaFeS_2 \cdot 2H_2O$.

Occurrence: Found in abundance, typically associated with other sulfides and fine grained magnetite, in discrete, late segregations within an alkalic mafic diatreme (Coyote Peak, California, USA); in pegmatites in nepheline syenite (Lovozero massif, Russia).

Association: Pyrrhotite, magnetite, rasvumite, djerfisherite, bartonite (Coyote Peak, California, USA); pyrite, murmanite (Lovozero massif, Russia).

Distribution: At Coyote Peak, near Orick, Humboldt Co., California, USA [TL]. From Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia. In Canada, at Mont Saint-Hilaire and near Saint-Amable, Quebec.

Name: For Dr. Richard Clarkson Erd (1924–), American mineralogist with the U.S. Geological Survey, who first synthesized the compound.

Type Material: n.d.

Ericaite $(Fe^{2+}, Mg)_3B_7O_{13}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $mm2$. As pseudocubic crystals, dominated by {100} and modified by {111}, to 2.2 cm.

Physical Properties: Hardness = [7–7.5] (by analogy to boracite). D(meas.) = 3.17–3.22 D(calc.) = 3.58

Optical Properties: Semitransparent. *Color:* Pale green to raspberry-red, red-violet, brownish violet, brown, black, may be zoned.
Optical Class: Biaxial (–). $\alpha = 1.731$ $\beta = 1.755$ $\gamma = 1.755$ 2V(meas.) = Small.

Cell Data: *Space Group:* $Pca2_1$. $a = 8.58$ $b = 8.65$ $c = 12.17$ Z = 4

X-ray Powder Pattern: Thuringia, Germany. (ICDD 29–697, may be congolite).
3.043 (100), 2.056 (70), 2.720 (60), 2.152 (45), 3.51 (40), 1.834 (40), 1.2411 (30)

Chemistry:

	(1)	(2)	(3)

Total			100.00

(1) Bischofferode, Germany; partial analysis. (2) Thuringia, Germany; partial analysis, corresponds to $(Fe_{2.25}Mg_{0.57}Mn_{0.14})_{\Sigma=2.96}B_7O_{13}Cl$. (3) $(Fe, Mg)_3B_7O_{13}Cl$ with Fe:Mg = 1:1. (4) Boulby mine, England; by AA, analysis not given, stated to correspond to $(Fe_{2.18}Mg_{0.71}Mn_{0.11})_{\Sigma=3.00}B_7O_{13}Cl$.

Polymorphism & Series: Dimorphous with congolite; forms a series with boracite.

Occurrence: An uncommon constituent of marine evaporite deposits.

Association: Halite, sylvite, anhydrite, kieserite (Germany); danburite, boracite (Alto Chapare, Bolivia).

Distribution: In Germany, from Wathlingen-Hänigsen, Lower Saxony; at Bischofferode and Sondershausen, Thuringia. Large crystals in the Boulby potash mine, northwest of Whitby, Yorkshire, England. From Alto Chapare, Cochabamba, Bolivia. In the Louann Salt Formation, Clarke Co., Alabama, USA.

Name: For the typical purple color, characteristic of the heather genus *Erica*.

Type Material: n.d.

Ericssonite $BaMn_2^{2+}Fe^{3+}OSi_2O_7(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As thick plates, tabular ∥ {100}, intimately intergrown with orthoericssonite, to 2 cm.

Physical Properties: *Cleavage:* Perfect on {100}, fair on {011}. *Tenacity:* Very brittle. Hardness = 4.5 D(meas.) = 4.21 D(calc.) = 4.38 Weakly magnetic.

Optical Properties: Translucent. *Color:* Deep reddish black; in thin section, brown to yellowish brown. *Streak:* Rich brown.
Optical Class: Biaxial (+); properties indistinguishable from orthoericssonite. *Pleochroism:* X = pale greenish tan; Y = red-brown; Z = deep brown. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, perceptible. *Absorption:* $Z > Y > X$. $\alpha = 1.807(5)$ $\beta = 1.833(5)$ $\gamma = 1.89(1)$ 2V(meas.) = 43°

Cell Data: *Space Group:* $C2/m$. $a = 20.46$ $b = 7.03$ $c = 5.34$ $\beta = 95°30'$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
3.510 (100), 10.12 (60), 2.780 (60), 1.752 (60), 1.597 (60), 5.08 (50), 3.398 (50)

Chemistry:

Total	93.64	100.00

(1) Långban, Sweden; by electron microprobe, intergrown with orthoericssonite, oxidation states and H_2O separately determined. (2) $BaMn_2FeOSi_2O_7(OH)$.

Polymorphism & Series: Dimorphous with orthoericssonite.

Occurrence: A rare mineral, embedded in a fine-grained manganoan aegirine zone in well-banded tephroite-rhodonite-manganoan aegirine skarn, in a metamorphosed Fe–Mn orebody.

Association: Orthoericssonite, tephroite, rhodonite, manganoan aegirine, hedyphane, andradite, hausmannite, långbanite, richterite.

Distribution: From Långban, Värmland, Sweden.

Name: In honor of John E. Ericsson (1803–1889), Swedish-American inventor and designer of the iron-clad ship "Monitor," who was born at Långban, Sweden.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120061; The Natural History Museum, London, England, 1987,118.

(1) Wiluy River, Sakha-Yakutia Republic, Russia; average of 8 electron microprobe analyses, corresponding to $(Ca_{2.98}Y_{0.01}Mg_{0.01})_{\Sigma=3.00}(Sc_{0.82}Ti^{4+}_{0.44}Fe^{3+}_{0.30}Zr_{0.21}Mg_{0.10}Al_{0.09}Cr^{3+}_{0.08}Fe^{2+}_{0.05}V^{3+}_{0.01})_{\Sigma=2.01}(Si_{2.48}Al_{0.30}Fe^{3+}_{0.22})_{\Sigma=3.00}O_{12}$.

Mineral Group: Garnet group.

Polymorhpism & Series: Continuous solid solution series with andradite, uvarovite, goldmanite.

Occurrence: An accessory mineral in metasomatic rodingite-like rocks; it forms regular growth zones and irregular spots in complex garnet crystals.

Association: Grossular, vesuvianite, serpentine, melilite-group minerals, kimzeyite.

Distribution: Wiluy River, Sakha-Yakutia Republic, Russia.

Name: For the Eringa River, the tributary of the Wiluy River directly across from where the first specimens were collected.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3837/1).

(1) Quetena, Chile. (2) $CuCl_2 \cdot 2H_2O$.

Occurrence: As an encrustation around fumaroles (Vesuvius, Italy); a product of weathering in a copper sulfide deposit in an arid climate (Quetena, Chile).

Association: Melanothallite, euchlorine, chalcocyanite, dolerophanite (Vesuvius, Italy); atacamite, bandylite (Quetena, Chile); euchlorine, chalcocyanite, dolerophanite, melanothallite, tenorite, tolbachite (Tolbachik volcano, Russia).

Distribution: On Vesuvius, Campania, Italy. From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. At Quetena, west of Calama, Antofagasta, Chile. From near Hawthorne, Mineral Co., Nevada, USA. At the Mt. Gunson copper mine, Stuart Shelf, and Moonta, South Australia.

Name: From the Greek for *wool* and *copper*, for the form of aggregates at Vesuvius, Italy.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 97927.

(1) Durkee, Oregon, USA; corresponds to $(Ca_{0.75}K_{0.52}Mg_{0.40}Na_{0.34})_{\Sigma=2.01}Al_{4.40}Si_{14.10}O_{36}\cdot 14.00H_2O$. (2) Tecopa, California, USA; remainder is TiO_2 0.09%, MnO 0.03%, P_2O_5 0.02%; corresponds to $(Na_{0.99}K_{0.60}Mg_{0.38}Ca_{0.16})_{\Sigma=2.13}Fe_{0.25}Al_{3.54}Si_{13.71}O_{36}\cdot 11.34H_2O$.

Mineral Group: Zeolite group.

Occurrence: In basalts; in altered rhyolitic tuffs and lake-bed sediments formed by alteration of vitric ash fallen into the lakes.

Association: Zeolites, "opal," quartz, celadonite, montmorillonite, dolomite, calcite.

Distribution: Some localities for relatively pure material are: in the USA, at Tecopa, Inyo Co., California; in Nevada, at Pine Valley, Eureka Co., Eastgate, Churchill Co., Jersey Valley, Pershing Co., and Reese River, Lander Co.; in Oregon, at Cape Lookout, Tillamook Co., Agate Beach, Lincoln Co., and Durkee, Baker Co. From the Parkgate quarry, Templepatrick, Co. Antrim, Ireland. At Hvalstod and in the Berufjord area, Iceland. At Moeraki, Otago, South Island, New Zealand. From Mazé, Niigata Prefecture, Japan. Many other localities are known.

Name: For the Greek word for *wool*, recalling its common appearance.

Type Material: Harvard University, Cambridge, Massachusetts, 86532; National Museum of Natural History, Washington, D.C., USA, R4066, 133333.

		Total	99.60

(1) Harhada mine, China; by colorimetric microanalysis, corresponds to $(Fe^{2+}_{3.33}Fe^{3+}_{0.36}Mg_{0.22}Mn_{0.07})_{\Sigma=3.98}(Fe^{3+}_{1.89}V_{0.11})_{\Sigma=2.00}(Si_{5.79}Fe^{3+}_{0.14}Ti_{0.04}Al_{0.03})_{\Sigma=6.00}O_{15}[O,(OH)]_8$.

Occurrence: As coatings along fault surfaces cutting a low-grade metamorphosed volcanic-sedimentary iron formation; presumably formed in a high-pressure, low-temperature environment.

Association: Minnesotaite, stilpnomelane, quartz, magnetite, siderite, albite, deerite.

Distribution: In the Harhada iron mine, along the Jining-Erlian railway, Inner Mongolia, China.

Name: Presumably for the town of Erlian, China.

Type Material: n.d.

(1) MacIntosh mine, California, USA; by electron microprobe, corresponding to $(Os_{0.89}Rh_{0.09}Ir_{0.04}Pd_{0.01}Ru_{0.01})_{\Sigma=1.04}S_{1.96}$. (2) Western Ethiopia; by electron microprobe, corresponding to $(Os_{0.84}Ir_{0.05}Rh_{0.13}Ru_{0.01}Pd_{0.01})_{\Sigma=1.04}S_{1.96}$. (3) OsS_2.

Polymorphism & Series: Forms a series with laurite.

Mineral Group: Pyrite group.

Occurrence: Typically in PGM placers, likely derived from chromitites associated with ophiolites and other Alaskan-type ultramafic complexes.

Association: Pt–Fe alloy, platinum, osmium, laurite, hollingworthite, irarsite, many other PGM alloys and sulfides.

Distribution: In the USA, in California, from a placer at the MacIntosh mine, Willow Creek, Trinity River, Humboldt Co. [TL], and in gravels from the American River, Sacramento Co.; in the Salmon River placers, Goodnews Bay, Alaska. From placers on the Tulameen River, British Columbia, Canada. In the Ural Mountain placers, Siberia, and in the Konder massif, Aldan Shield, Sakha, Russia. In a platinum metal nugget from Joubdo stream, Birbir River, Ethiopia. From placers at Guma Water, Sierra Leone. At Tiébaghi, New Caledonia. From Maud Creek, Howard River, New Zealand. In the Merensky Reef, Bushveld complex, Transvaal, South Africa. At Rio Pilpe, Colombia. In placers from the Santiago River, Esmeraldas Province, Ecuador. There are numerous other trace occurrences.

Name: For Jozef Erlichman (1935–), American electron probe analyst, Planetary Branch, NASA-Ames Research Branch, who analyzed a number of new minerals.

Type Material: Stanford University, Palo Alto, California, USA, 51965; National Museum of Natural History, Washington, D.C., USA123914.

(1) Near Siberia, Western Australia; by electron microprobe, average of two analyses; H_2O calculated from stoichiometry; corresponds to $(Ni_{0.87}Mn_{0.04}Mg_{0.03}Co_{0.02})_{\Sigma=0.96}Mn_3O_7 \cdot 3H_2O$. (2) Kamennyy Kobchik deposit, Russia; by electron microprobe, average of two analyses, H_2O by difference; after correction for cerianite and hollandite as impurities, corresponds to $(Ni_{0.74}Cu_{0.14}Co_{0.06})_{\Sigma=0.94}Mn_{3.06}O_{7.09} \cdot 5.55H_2O$. (3) $NiMn_3^{4+}O_7 \cdot 3H_2O$.

Occurrence: In an intensely laterized ultramafic intrusion (Siberia, Western Australia); in the weathering zone of ultramafic rocks (Kamennyy Kobchik deposit, Russia).

Association: Chalcedonic quartz, magnesite, serpentine, nimite, nontronite, goethite, nickel-rich clay minerals (Siberia, Western Australia); asbolane, lithiophorite, hollandite, cerianite (Kamennyy Kobchik deposit, Russia).

Distribution: In the SM7 open pit, near Siberia, 60 km north of Kalgoorlie, Western Australia. From the Kamennyy Kobchik deposit, Kempirsay massif, Southern Ural Mountains, Russia.

Name: In honor of Dr. Ernest Henry Nickel (1925–), Canadian-Australian mineralogist with the C.S.I.R.O., Perth, Australia.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81510.

(1) $Mg(CH_3SO_3)_2 \cdot 12H_2O$; the composition of natural material confirmed by ion chromatography and Raman spectroscopy.

Occurrence: As solid inclusions in an ice core (from a depth of 576.5 m), presumably formed by the fixation of CH_3SO_3H on alkaline particles of marine or continental origin during long-range aerosol transport to the polar region.

Association: Gypsum, ice.

Distribution: Beneath the Dome Fuji station, East Antarctica, near the summit of the eastern Dronning Maud Land plateau.

Name: Honors Ernst A.J. Burke (b. 1943), Vrije Universiteit Amsterdam, Netherlands, for his contributions to the mineralogy of opaque minerals and Raman spectrometry of fluid inclusions.

Type Material: In a cold room (at -50° C), Institute of Low Temperature Science, Hokkaido University, Sapporo, Japan (81,616).

Total	99.81	100.00

(1) Schneeberg, Germany. (2) $Co_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Forms two series, with annabergite, and with hörnesite.

Mineral Group: Vivianite group.

Occurrence: A secondary mineral in the oxide zone of some Co–Ni–As-bearing mineral deposits.

Association: Cobaltite, skutterudite, symplesite, roselite-beta, scorodite, pharmacosiderite, adamite, morenosite, retgersite, malachite.

Distribution: Many localities, but few of importance. In France, at Chalanches, near Allemont, Isère. In Germany, fine examples with large crystals from Schneeberg, Saxony, at Wittichen, Black Forest, from Richelsdorf, Hesse, and elsewhere. At Jáchymov (Joachimsthal), Czech Republic. In the Botallack mine, St. Just, and from a number of other places in Cornwall, England. At the Aghbar (Arhbar), Irhtem (Ightem), and other mines in the Bou Azzer district, Morocco, large crystals. From Cobalt, Ontario, Canada. In the USA, at the Blackbird mine, Lemhi Co., Idaho. From the Sara Alicia mine, near Alamos, Sonora, Mexico. In Australia, from Mt. Cobalt, 110 km south of Cloncurry, Queensland, and at the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia.

Name: From the Greek for *red*, for its characteristic deep crimson color.

Erythrosiderite $K_2Fe^{3+}Cl_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As tabular pyramidal crystals, flattened on {100}, showing {100}, {210}, {201}, {101}, {011}, {010}, to 0.03 mm.

Physical Properties: *Cleavage:* Perfect on {210} and {011}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.364 Easily soluble in H_2O; very deliquescent.

Optical Properties: Translucent. *Color:* Ruby-red to red and brownish red; brownish red to yellowish in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, strong.
$\alpha = 1.715$ $\beta = 1.75$ $\gamma = 1.79$–1.80 2V(meas.) = 62°

Cell Data: *Space Group: Pnma.* $a = 13.75$ $b = 9.924$ $c = 6.93$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.782 (100), 5.566 (40), 2.427 (40), 5.68 (35), 2.440 (25), 2.993 (19), 2.841 (16)

Chemistry:

	(1)	(2)
K	24.21	23.74
Fe	16.81	16.96
Cl	53.30	53.83
H_2O	[5.68]	5.47
Total	[100.00]	100.00

(1) Vesuvius, Italy; H_2O by difference. (2) $K_2FeCl_5 \cdot H_2O$.

Occurrence: As sublimates around fumaroles (Vesuvius, Italy); rimming rinneite in bedded salt deposits (Stassfurt, Germany; Kansk-Taseev depression, Russia).

Association: Kremersite, molysite, hematite (Vesuvius, Italy); rinneite (Stassfurt, Germany; Kansk-Taseev depression, Russia).

Distribution: On Vesuvius, Campania, Italy. In Germany, at Stassfurt, 34 km south of Magdeburg, Saxony-Anhalt. From Aislaby, near Whitby, Yorkshire, England. In the Kansk-Taseev depression, Siberia, and at the Kliuchevsky volcano, Kamchatka Peninsula, Russia.

Name: From the Greek for *red* and *iron*, in allusion to its color and composition.

Eskebornite $CuFeSe_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $\bar{4}2m$. Crystals thick tabular, to 1 mm; massive, typically intergrown with other selenides.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = 3–3.5 VHN = 155–252, 204 average (15 g load). D(meas.) = 5.35 D(calc.) = 5.44 Distinctly magnetic.

Optical Properties: Opaque. *Color:* Brass-yellow, tarnishes dark brown to black; in reflected light, brown-yellow or cream-yellow, may show an orange tint. *Luster:* Metallic. *Pleochroism:* Weak, creamy yellow to yellowish brown. *Anisotropism:* Marked, yellowish to tan. R_1–R_2: (400) 22.0–24.5, (420) 24.8–27.9, (440) 26.5–30.1, (460) 27.8–31.8, (480) 28.7–33.1, (500) 29.5–34.2, (520) 30.4–35.0, (540) 31.1–35.6, (560) 31.6–36.0, (580) 32.0–36.2, (600) 32.6–36.4, (620) 33.0–36.6, (640) 33.3–37.0, (660) 33.7–37.5, (680) 33.8–38.1, (700) 34.0–38.7

Cell Data: *Space Group:* $P\bar{4}2c$. a = 5.518(4) c = 11.048(6) Z = 4

(1) Martin Lake, Canada; by electron microprobe, average of several analyses; corresponding to $Cu_{1.06}Fe_{1.01}Se_{2.00}$. (2) Petrovice, Czech Republic; by electron microprobe, average of 18 analyses; corresponding to $Cu_{1.01}Fe_{1.04}Se_{2.00}$. (3) $CuFeSe_2$.

Polymorphism & Series: Forms a series with chalcopyrite.

Mineral Group: Chalcopyrite group.

Occurrence: In low-temperature hydrothermal vein deposits.

Association: Chalcopyrite, clausthalite, tiemannite, berzelianite, naumannite, umangite, geffroyite, chaméanite, uraninite, ankerite, dolomite.

Distribution: From the Eskeborn adit, Tilkerode, Harz Mountains, Germany [TL]. At the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France. In the Czech Republic, from Bukov, near Tisnova; in the Petrovice uranium deposit, near Ždár; and the Předbořice uranium deposit, near Krásna Hora; at Slavkovice; and on Koksín Hill, near Mitov. In Argentina, at Cerro de Cacheuta, Mendoza Province; from Sierra de Umango, and at Tuminico, Sierra de Cacho, La Rioja Province. From Martin Lake and the Eagle Group, Lake Athabasca area, Saskatchewan, Canada.

Name: For the Eskeborn adit, Tilkerode, Germany, where first discovered.

Type Material: The Natural History Museum, London, England, 1948,325; Harvard University, Cambridge, Massachusetts, USA, 98902.

Eskimoite $Ag_7Pb_{10}Bi_{15}S_{36}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. As lamellar grains, the average size of which is 0.5 mm. *Twinning:* On {010}, twin lamellae ∥ [001] may be present.

Physical Properties: Hardness = n.d. VHN = 162–223, 191 average (50 g load).
D(meas.) = n.d. D(calc.) = 7.12

Optical Properties: Opaque. *Color:* In polished section, galena-white. *Pleochroism:* Absent in air, absent to weak in oil. *Anisotropism:* Distinct to strong, pale gray to steel bluish black.
R_1–R_2: n.d.

Cell Data: *Space Group:* $B2/m$ or Bm. $a = 13.459$ $b = 30.194$ $c = 4.100$ $\beta = 93.35°$
$Z = 1$

X-ray Powder Pattern: Ivigtut, Greenland.
3.36 (100), 2.87 (60), 2.96 (50), 2.05 (50), 1.754 (50), 2.08 (40), 1.667 (40)

Chemistry:

	(1)	(2)	(3)
Ag	9.64	9.68	10.61
Pb	30.42	28.80	29.12
Cu	0.21	0.30	
Bi	44.79	46.70	44.05
S	16.40	16.17	16.22
Total	101.46	101.65	100.00

(1) Ivigtut, Greenland; by electron microprobe, average of 9 grains; corresponds to $Ag_{6.29}Cu_{0.23}Pb_{10.33}Bi_{15.09}S_{36.00}$. (2) Ivigtut, Greenland; by electron microprobe, average of 15 grains; corresponds to $Ag_{6.41}Cu_{0.34}Pb_{9.92}Bi_{15.95}S_{36.00}$. (3) $Ag_7Pb_{10}Bi_{15}S_{36}$.

Occurrence: In a cryolite deposit (Ivigtut, Greenland).

Association: Berryite, aikinite, galena (Ivigtut, Greenland); pyrite, enargite (Flathead mine, Montana, USA).

Distribution: From the Ivigtut cryolite deposit, southwestern Greenland [TL]. In the USA, from about 13 km north of Niarada, in the Flathead mine, Flathead Co., Montana, and at Manhattan, Nye Co., Nevada. In the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. From the La Roche-Balue quarry, west of Nantes, Loire Atlantique, France. At Monteneme W–Sn deposit, Galicia?? [=Gallaecia= La Coruña, Lugo, Orense, Pontevedra Provinces = which??], Spain. From Rauriser Goldberg, Salzburg, Austria.

Name: For the Eskimos, early settlers of Greenland.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1973,156.

X-ray Powder Pattern: Outokumpu, Finland.
1.6746 (100), 2.665 (97), 3.630 (96), 2.479 (94), 1.8146 (58), 2.174 (48), 1.4331 (47)

Chemistry:

	(1)
SiO_2	0.20
Al_2O_3	0.19
Fe_2O_3	0.55
Cr_2O_3	94.13
V_2O_3	4.58
MnO	0.03
MgO	0.03
H_2O	0.10
Total	99.81

(1) Outokumpu, Finland; corresponds to $(Cr_{1.90}V_{0.09}Fe_{0.01})_{\Sigma=2.00}O_3$.

Mineral Group: Hematite group.

Occurrence: In chromium-rich tremolite skarns, metaquartzites, and chlorite veins (Outokumpu, Finland); on greywacke pebbles in a glacial boulder clay deposit (Callowhill Upper, Ireland); as pebbles in streams (Merume River, Guyana); a very rare component in chondrite meteorites.

Association: Guyanaite, pyrrhotite, pentlandite, chalcopyrite, pyrite, chromian tremolite, uvarovite, chromium tourmaline, calcite, talc, quartz (Outokumpu, Finland); guyanaite, bracewellite, grimaldiite, mcconnellite, chromian gahnite, pyrophyllite, quartz (Merume River, Guyana).

Distribution: From Outokumpu, Finland. In Russia, at Nizhni Tagil, Ural Mountains, and on the western shore of Lake Baikal, 4.5 km south of Olkhon Gate Strait, Siberia. Found near Dukou, Szechwan Province, China. At Callowhill Upper, near Newtown Mt. Kennedy, Co. Wicklow, Ireland. From the Chapada Diamantina, Bahia, Brazil. Along the Merume River and its tributaries, Mazaruni district, Guyana.

Name: Honors Professor Pentti Eelis Eskola (1883–1964), of the University of Helsinki, Helsinki, Finland.

Type Material: n.d.

Total	99.36

(1) Durham ranch, Wyoming, USA; by electron microprobe, average of 43 analyses on several grains, Fe^{2+}:Fe^{3+} calculated from normalized formula; corresponds to $(Ca_{1.01}Na_{0.01})_{\Sigma=1.02}(Fe^{3+}_{0.72}Mg_{0.16}Al_{0.04}Ti_{0.03}Fe^{2+}_{0.02})_{\Sigma=0.97}(Si_{1.19}Al_{0.81})_{\Sigma=2.00}O_6$.

Mineral Group: Pyroxene group.

Occurrence: A high-temperature, low-pressure, oxidized and quenched crystallization product derived from fused sediments contiguous to naturally combusted coal seams.

Association: Anorthite, melilite, magnetite-hercynite, glass.

Distribution: At Durham ranch, in the Powder River basin, 13 km northeast of Reno Junction and 25 km south of Gillette, Campbell Co., Wyoming, USA.

Name: For Dr. Eric J. Essene, Professor at the University of Michigan, Ann Arbor, Michigan, USA, and discoverer of the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163357.

References: (1) Cosca, M.A. and D.R. Peacor (1987) Chemistry and structure of esseneite ($CaFe^{3+}AlSiO_6$), a new pyroxene produced by pyrometamorphism. Amer. Mineral., 72, 148–156.

Ettringite $Ca_6Al_2(SO_4)_3(OH)_{12}\cdot 26H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals prismatic and striated along [0001], to 20 cm, commonly unterminated, rarely dipyramidal $\{10\bar{1}2\}$; fibrous to cottonlike.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, perfect. Hardness = 2–2.5 D(meas.) = 1.77 D(calc.) = 1.77 Partially soluble in H_2O; partially dehydrates on exposure, becoming opaque.

Optical Properties: Transparent to opaque. *Color:* Colorless, pale yellow, milky white; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (–), changing to uniaxial (+) on dehydration. $\omega = 1.464$ $\epsilon = 1.458$

Cell Data: *Space Group:* $P31c$. $a = 11.23$ $c = 21.44$ $Z = 2$

X-ray Powder Pattern: Synthetic.

(1) Scawt Hill, Ireland. (2) $Ca_6Al_2(SO_4)_3(OH)_{12}\cdot 26H_2O$.

Mineral Group: Ettringite group.

Occurrence: In metamorphosed limestone near igneous contacts or in xenoliths; as weathering crusts on larnite rocks (Hatrurim Formation, Israel).

Association: Portlandite, afwillite, hydrocalumite (Scawt Hill, Ireland); afwillite, hydrocalumite, mayenite, gypsum (Hatrurim Formation, Israel).

Distribution: In Germany, from the Ettringer-Bellerberg volcano, near Mayen, and Schellkopf near Brenk, Eifel district; in the Zeilberg quarry, Maroldsweisach, Bavaria. At Boisséjour, near Clermont-Ferrand, Puy-de-Dôme, France. From Scawt Hill, near Larne, Co. Antrim, Ireland. In the Hatrurim Formation, Israel. As large crystals from the N'Chwaning mine, Kuruman district, Cape Province, South Africa. In the USA, at the Crestmore quarry, Riverside Co., California; in the Lucky Cuss mine, Tombstone, Cochise Co., Arizona.

Name: For the occurrence near Ettringen, Germany.

Total	100.04	101.0	100.00

(1) Argentina. (2) Hope's Nose, England; by electron microprobe. (3) CuAgSe.

Occurrence: Widely distributed in selenium deposits of hydrothermal origin; locally abundant with other selenides.

Association: Berzelianite, weissite, crookesite, clausthalite, umangite, klockmannite, tiemannite, chalcomenite, malachite, calcite.

Distribution: In Sweden, at the Skrikerum copper mine near Tryserum, Kalmar [TL]. From the Frederik VII's mine, near Julianehåb, southern Greenland. In Germany, in the Harz Mountains, from the Trogtal quarry, near Lautenthal, and at Lerbach. From Kletno, Poland. In the Czech Republic, at Bukov, near Tisnova; in the Petrovice uranium deposit, near Ždăr; the Předbořice uranium deposit, near Krásna Hora; from Lasovice, and at Jáchymov (Joachimsthal). In the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France. From Hope's Nose, Torquay, Devon, England. In Canada, in the Martin Lake mine near Lake Athabasca, Saskatchewan, and in the Kidd Creek mine, near Timmins, Ontario. In the Cougar mine, Slick Rock district, San Miguel Co., Colorado, USA. In Argentina, from Sierra de Umango; in the Santa Brigida mine; and at Tuminico, Sierra de Cacho, La Rioja Province. From Aguas Blancas, near Copiapó, Antofagasta, Chile. At Kalgoorlie, Western Australia. A few additional minor localities are known.

Name: From the Greek for *opportunity*, because it was discovered shortly after discovery of the element selenium.

Euchlorine $KNaCu_3O(SO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, tabular on {001}, with rectangular outline, to 2 mm; typically as an incrustation.

Physical Properties: *Cleavage:* In two directions. Hardness = n.d. D(meas.) = 3.27 D(calc.) = 3.28 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Emerald-green; emerald-green in transmitted light.
Optical Class: Biaxial (+). *Pleochroism:* X = pale grass-green; Y = grass-green; Z = bright yellow-green. $\alpha = 1.580$ $\beta = 1.605$ $\gamma = 1.644$ 2V(meas.) = Moderately large.

Cell Data: *Space Group:* $C2/a$. $a = 18.41(5)$ $b = 9.43(3)$ $c = 14.21(5)$ $\beta = 113.7(3)°$ Z = 8

X-ray Powder Pattern: Vesuvius, Italy.
8.44 (100), 2.816 (47), 2.544 (45), 2.843 (40), 2.852 (37), 3.475 (30), 3.237 (25)

Total	[100.00]	100.00

(1) Vesuvius, Italy; by electron microprobe, average of seven analyses, recalculated to 100% from an original total of 101.86%, $(SO_4)^{2-}$ shown present by IR; corresponds to $K_{1.01}Na_{1.18}Mg_{0.02}Ca_{0.01}Cu_{3.15}O_{1.27}(SO_4)_3$. (2) $KNaCu_3O(SO_4)_3$.

Occurrence: A rare sublimate around volcanic fumaroles.

Association: Dolerophanite, eriochalcite, chalcocyanite, melanothallite (Vesuvius, Italy); stoiberite, fingerite, ziesite, thénardite, mcbirneyite (Izalco volcano, El Salvador); eriochalcite, melanothallite, fedotovite, vergasovaite, chalcocyanite, dolerophanite, tenorite, cuprian anglesite, gold (Tolbachik volcano, Russia).

Distribution: From Vesuvius, Campania, Italy. On the Izalco volcano, El Salvador. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia,

Name: From the Greek for *pale green*, in allusion to the typical color.

H_2O^-	3.12	
Total	98.92	100.00

(1) Lubietová, Slovakia. (2) $Cu_2(AsO_4)(OH)\cdot 3H_2O$.

Occurrence: A very rare mineral in the oxidized zone of some copper-bearing hydrothermal mineral deposits.

Association: Olivenite (Lubietová, Slovakia); strashimirite, olivenite, azurite, malachite (Zapachitsa deposit, Bulgaria).

Distribution: From L'ubietová, near Baňská Bystrica (Libethen, near Neusohl), Slovakia. At Laurium, Greece, in slag. From the Zapachitsa copper deposit, Ismerez, Stara-Planina, Bulgaria. In the USA, at the Black Pine mine, Philipsburg, Granite Co., and along Cramer Creek, Missoula Co., Montana; in the Monte Cristo mine, Weden Creek, Snohomish Co., Washington; at Sterling Hill, Ogdensburg, Sussex Co., New Jersey.

Name: From the Greek for *beautiful color.*

Type Material: Mining Academy, Freiberg, Germany, 21335.

(1) Ottré, Belgium; recalculated to 100.00% after deduction of 3.5% quartz; corresponds to $Be_{1.00}Al_{0.95}Si_{1.00}O_4(OH)_{1.01}$. (2) Santo do Encoberto, Brazil; by electron microprobe; corresponds to $(Be_{0.99}Fe_{0.01}Na_{0.01})_{\Sigma=1.01}Al_{1.00}Si_{1.01}O_4(OH)_{0.96}$.

Occurrence: The product of decomposition of beryl in pegmatites, and in low-temperature alpine veins.

Association: Feldspar, quartz, topaz, beryl, mica, calcite, ankerite, chlorite.

Distribution: Fine crystals occur from: the Sanarka River, Orenburg district, and the Kamenka River, Southern Ural Mountains, Russia. At Epprechtstein, Bavaria, Germany. In the Muiâne pegmatite, Alto Ligonha district, Mozambique. Found near Mikese Station, Morogoro district, Tanzania. From Karoi, Miami district, Zimbabwe. In Brazil, in Minas Gerais, around Villa Rica, Boa Vista, Santa do Encoberto, Dom Bosco, Ouro Prêto; Mãe dos Homens, in Capelinha; and many other localities. Large crystals from the Gachalá mine, Las Cruces, near Chivor, Colombia. A number of other minor localities are known.

Name: From the Greek for *easily* and *fracture* regarding its perfect cleavage.

Type Material: Natural History Museum, Paris, France, Haüy 3303.

(1) Bikita, Zimbabwe. (2) Kings Mountain, North Carolina, USA. (3) $LiAlSiO_4$.

Occurrence: In lithium-rich pegmatites.

Association: Albite, spodumene, petalite, amblygonite, lepidolite, quartz.

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; Center Strafford, Strafford Co., New Hampshire; in the Harding pegmatite, Dixon, Taos Co., New Mexico; in the Midnight Owl pegmatite, Maricopa Co., Arizona; and in the Foote mine, Kings Mountain, Cleveland Co., North Carolina. From the Tanco pegmatite, Bernic Lake, Manitoba, and near Nakina, Ontario, Canada. In Zimbabwe, large amounts at Bikita, with many other minor localities. From the Haapaluoma quarry, near Peräseinäjoki, Finland.

Name: From the Greek for *well* and *concealed*, in reference to its occurrence as intimate intergrowths with albite.

Type Material: Yale University, New Haven, Connecticut, USA, 2.4206, 2.4208, 2.4209.

(1) Kipawa Lake, Canada; corresponds to $Na_{3.85}(Ca_{1.65}RE_{0.19}K_{0.17})_{\Sigma=2.01}(Fe^{2+}_{0.32}Mn^{2+}_{0.18}Nb_{0.06}Mg_{0.03})_{\Sigma=0.59}(Zr_{0.91}Al_{0.08}Ti_{0.04}Fe^{3+}_{0.01})_{\Sigma=1.04}Si_{8.02}O_{22}[(OH)_{1.73}Cl_{0.39}]_{\Sigma=2.12}$. (2) Khibiny massif, Russia; corresponds to $Na_{4.29}(Ca_{1.88}K_{0.28}RE_{0.02})_{\Sigma=2.18}(Fe^{2+}_{0.70}Mn^{2+}_{0.08}Mg_{0.06}Nb_{0.01})_{\Sigma=0.85}(Zr_{0.98}Fe^{3+}_{0.13}Ti_{0.05}Al_{0.01})_{\Sigma=1.17}Si_{7.90}O_{22}[(OH)_{1.12}Cl_{0.43}]_{\Sigma=1.55}$.

Occurrence: In nepheline syenites, alkalic granites, and associated pegmatites; may be a major constituent, of both magmatic and late-stage pneumatolytic origin.

Association: Microcline, nepheline, aegirine, lamprophyllite, lorenzenite, murmanite, arfvedsonite, sodalite, aenigmatite, rinkite, låvenite, titanite, titanian magnetite.

Distribution: Numerous localities, a number affording fine crystals. In Greenland, on the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion, at Narssârssuk, and elsewhere. Around the Langesundsfjord, Norway. In Russia, from the Lovozero and Khibiny massifs, Kola Peninsula; at Barynga Ridge, Taimyr; in the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia. In the USA, from Magnet Cove, Hot Spring Co., Arkansas; at Point of Rocks, Colfax Co., and in a large deposit at Pajarito Mountain, Otero Co., New Mexico. In Canada, from Seal Lake and the Red Wine complex, Labrador, Newfoundland; in the Sheffield Lake complex, Kipawa River, Villedieu Township, and from Mont Saint-Hilaire and near Saint-Amable, Quebec. From Tenerife, Canary Islands.

Name: From the Greek for *easily* and *dissolved*, in allusion to its ready dissolution in acids.

Eudidymite $NaBeSi_3O_7(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals tabular on {001}, to 5 cm, commonly twinned, intergrown in fanlike aggregates. Spherulitic, micaceous, coarse and fine granular, massive. *Twinning:* On {001}, simple twins, common, may be polysynthetic.

Physical Properties: *Cleavage:* Perfect on {001}, imperfect on $\{\bar{5}51\}$. *Fracture:* Uneven to conchoidal. Hardness = 6 D(meas.) = 2.55 D(calc.) = [2.57]

Optical Properties: Transparent to translucent. *Color:* White or colorless, also grayish blue, blue, violet, yellow; colorless in thin section. *Luster:* Vitreous, pearly on cleavage. *Optical Class:* Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = -58.5°$. *Dispersion:* $r > v$, distinct. $\alpha = 1.545$ $\beta = 1.546$ $\gamma = 1.549$–1.551 2V(meas.) = 25°–30°

Cell Data: *Space Group:* $C2/c$. $a = 12.63(1)$ $b = 7.38(1)$ $c = 14.02(1)$ $\beta = 103°43(5)'$ Z = 8

X-ray Powder Pattern: Langesundsfjord, Norway.
3.163 (10), 3.398 (8), 3.074 (8), 6.35 (6), 2.999 (6), 2.848 (6), 3.687 (5)

Total	100.42	99.26	100.00

(1) Langesundsfjord, Norway. (2) Mt. Alluaiv, Russia. (3) $NaBeSi_3O_7(OH)$.

Polymorphism & Series: Dimorphous with epididymite.

Occurrence: A late-stage mineral in alkalic nepheline syenite pegmatites.

Association: Albite, neptunite, aegirine, elpidite, natrolite, analcime, fluorite, quartz.

Distribution: On Arø Island, in the Langesundsfjord, Norway. In the Ilímaussaq intrusion, southern Greenland. At Meldon, Okehampton, Devon, England. From Věžná, Czech Republic. On Mt. Alluaiv, Lovozero massif, and Mt. Yukspor, Khibiny massif, Kola Peninsula; in the Burpala massif, 120 km north of Lake Baikal, eastern Siberia; and other less-well-defined localities in Russia. From Seal Lake, Labrador, Newfoundland, and at Mont Saint-Hilaire, Quebec, Canada. Large crystals on Mt. Malosa, Zomba district, Malawi.

Name: From the Greek for *well* and *twinned*, in allusion to its common occurrence in twins.

Eugenite $Ag_{11}Hg_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. Granular, up to 4 mm.

Physical Properties: Hardness = n.d. VHN = 85–106, 92 average (15 g load).
D(meas.) = 10.75(3) D(calc.) = 10.45

Optical Properties: Opaque. *Color:* [Black]; white with faint yellow tinge in reflected light.
Luster: Metallic.
Optical Class: Isotropic.
R: (546) 80.1, (589) 82.7, (656) 85.6

Cell Data: *Space Group:* $I4\overline{3}m$. $a = 10.02(2)$ $Z = 4$

X-ray Powder Pattern: Lubin mine, Poland.
2.37 (10), 2.10 (8), 0.950 (8), 0.925 (8), 1.457 (7), 1.240 (7), 1.193 (6)

Chemistry:

	(1)	(2)
Hg	25.50	25.27
Ag	74.00	74.73
S	0.15	
Total	99.70	100.00

(1) Lubin mine, Poland; by electron microprobe, corresponds to $Ag_{11.00}Hg_{2.10}$. (2) $Ag_{11}Hg_2$.

Occurrence: In low-grade copper sulfide ore in black shale and carbonate rocks (Lubin mine, Poland); in cuprite (Bisbee, Arizona, USA).

Association: Chalcocite, covellite, tennantite, hematite, calcite, ankerite, gypsum (Lubin mine, Poland).

Distribution: In Poland, from the Lubin [TL] and Sieroszowice copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland. In the USA, in the Southwest mine, Bisbee, Cochise Co., Arizona.

Name: To honor Professor Eugen Friedrich Stumpfl (1935–), Austrian mineralogist, Mining University, Leoben, Austria, for his studies of noble metal compounds.

Type Material: Institute of Geology and Mineral Deposit, Cracow, Poland.

References: (1) Kucha, H. (1986) Eugenite, $Ag_{11}Hg_2$ – a new mineral from Zechstein copper deposits in Poland. Mineral. Polonica, 17(2), 3–10. (2) Piestrzyński, A. and W. Tylka (1992) Silver amalgams from the Sieroszowice copper mine, Lubin-Sieroszowice district, SW Poland. Mineral. Polonica, 23(1), 17–24. (3) (1995) Amer. Mineral., 80, 845–846 (abs. refs. 1–2).

Eugsterite $Na_4Ca(SO_4)_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (?). *Point Group:* n.d. As clusters of thin fibers, to 40 μm.

Physical Properties: Hardness = "Low". D(meas.) = < 2.5 D(calc.) = n.d. Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Biaxial. *Orientation:* $Z = b$; $Y \wedge c = 27°$. $\alpha = \sim 1.492$ β = n.d. $\gamma = \sim 1.496$
2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. a = n.d. b = n.d. c = n.d. $\beta = 116°$ Z = n.d.

X-ray Powder Pattern: Synthetic.
3.428 (100), 5.50 (64), 1.7126 (61), 2.746 (46), 9.20 (39), 4.50 (33), 3.454 (32)

Chemistry: (1) Qualitative electron microprobe analysis confirms Na, Ca, and S as the major chemical components; identification depends on correspondence of other properties with those of synthetic material.

Occurrence: As evaporative crusts in carbonate-poor soil, playa sediment and around an active boron-rich spring.

Association: Thénardite, halite, blödite, gypsum, glauberite, nesquehonite, admontite.

Distribution: From northeast of Karapinar, between Konya and Ereğli, Great Konya Basin, Konya Province, Turkey. Along the shore of Lake Victoria, at Sindo and Luanda, and at Kalacha, Turkana district, Kenya. From Schildmauer, near Admont, Styria, Austria. In the USA, from the Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California. On the Río Grande and Rincón playas, Jujuy Province, Argentina.

Name: Honors Professor Hans Peter Eugster (1927–1985), Swiss–American mineralogist, Johns Hopkins University, Baltimore, Maryland, USA, who studied the mineralogy of saline lakes.

Type Material: National Museum of Geology and Mineralogy, Leiden, The Netherlands.

References: (1) Vergouwen, L. (1981) Eugsterite, a new salt mineral. Amer. Mineral., 66, 632–636.

Eulytite $Bi_4(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As tetrahedral crystals, to 2 mm, showing {100}, {110}, {111}, and {211}. *Twinning:* Interpenetrant, may be multiple.

Physical Properties: *Cleavage:* Very imperfect on {110}. *Fracture:* Uneven. *Tenacity:* Rather brittle. Hardness = 4.5 D(meas.) = 6.62–6.76 D(calc.) = [6.76]

Optical Properties: Transparent to opaque. *Color:* Dark brown, yellowish gray, grayish white, straw-yellow, colorless; colorless to pale brown in thin section. *Streak:* White or yellowish gray. *Luster:* Resinous or adamantine.
Optical Class: Isotropic; anomalously biaxial (–). $n = 2.05$

Cell Data: *Space Group:* $I\bar{4}3d$. $a = 10.29$ Z = [4]

X-ray Powder Pattern: Synthetic.
3.20 (100), 2.70 (100), 4.13 (80), 2.070 (70), 1.990 (70), 1.664 (70), 1.584 (70)

Chemistry:

	(1)	(2)
SiO_2	16.52	16.21
Bi_2O_3	82.23	83.79
rem.	1.15	
Total	99.90	100.00

(1) Schneeberg, Germany; remainder is Fe_2O_3 and P_2O_5. (2) $Bi_4(SiO_4)_3$.

Occurrence: In bismuth-rich hydrothermal veins.

Association: Bismuth, quartz.

Distribution: In Germany, from Schneeberg and Johanngeorgenstadt, Saxony; at Hechtsberg, near Hausach, and in the Clara Mine, near Oberwolfach, Black Forest. From Dognecea (Dognaczka), Romania. At Lanlivery, Cornwall, England. From the Southwick cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. In Canada, from the Evans-Lou quarry, near Wakefield Lake, Quebec.

Name: From the Greek for *good* and *dissolved*, in reference to its low point of fusion.

Type Material: Mining Academy, Freiberg, Germany, 23972.

References: (1) Dana, E.S. (1892) Dana's system of mineralogy, (6th edition), 436.

Eurekadumpite $(Cu,Zn)_{16}(TeO_3)_2(AsO_4)_3Cl(OH)_{18}\cdot 7H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*, *m*, or 2. As micaceous crystals (< 1 μm) with either round or hexagonal outlines, to 0.5 mm, as spherulites and rosettes to 1 mm.

Physical Properties: *Cleavage*: Perfect on {010}. *Fracture*: n.d. *Tenacity*: Flexible. Hardness = 2.5-3 D(meas.) = 3.76(2) D(calc.) = 3.826

Optical Properties: Transparent. *Color*: Deep blue-green or turquoise. *Streak*: Light turquoise. *Luster*: Pearly flakes, silky aggregates.
Optical Class: Biaxial (-). $\alpha = 1.69(1)$ $\beta = \gamma = 1.775(5)$ $2V(meas.) = 10(5)^{o}$ 2V(calc.) = n.d.
Pleochorism: Strong, *Y* = *Z* = deep blue-green, *X* = light turquoise. *Absorption*: *Y* = *Z* > *X*.
Orientation: *X* = *b*.

Cell Data: *Space Group*: *P*2/*m*, *P*2, or *Pm*. $a = 8.28(3)$ $b = 18.97(2)$ $c = 7.38(2)$ $\beta = 121.3(6)°$ $Z = 1$

X-ray Powder Pattern: Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.
18.92 (100), 2.524 (41), 3.777 (24), 1.558 (22), 9.45 (19), 2.692 (15), 4.111 (13)

Chemistry:

	(1)
FeO	0.04
CuO	36.07
ZnO	20.92
TeO_2	14.02
As_2O_5	14.97
Cl	1.45
H_2O	13.1
$-O = Cl_2$	0.33
Total	100.24

(1) Centennial Eureka mine, Tintic district, Utah, USA; average of 14 electron microprobe analyses, H_2O by Alimarin method, IR spectroscopy confirms TeO_3, AsO_4 and OH; corresponding to $(Cu_{10.32}Zn_{5.85}Fe_{0.01})_{\Sigma=16.18}(TeO_3)_2(AsO_4)_{2.97}[Cl_{0.93}(OH)_{0.07}](OH)_{18.45}\cdot 7.29H_2O$.

Occurrence: In the oxidation zone of quartz-sulfide ores containing tellurides (mostly hessite) in small cavities and in fractures in quartz.

Association: Mcalpineite, malachite, Zn-bearing olivenite, goethite, unspecified Mn oxides.

Distribution: From old dumps of the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: Reflects the fact that the first samples were found on the *dumps* of the Centennial *Eureka* mine. The mineral name is also related to the Greek word *eureka* -"*I have found it*" – in a *dump*—an allusion to the important role old mine dumps have played in the discovery of new minerals.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (3962/1), at the National Museum of Natural History, Washington, D.C. (174877), and the American Museum of Natural History, New York, New York (112206), USA.

Euxenite-(Y) $(Y, Ca, Ce, U, Th)(Nb, Ta, Ti)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; typically metamict. *Point Group:* $2/m\ 2/m\ 2/m$. As stout prismatic crystals, to 10 cm, may be flattened ‖ [100] or [010]; commonly in parallel, subparallel, or radiating aggregates; compact massive. *Twinning:* Common on {201}; rare on {101} or {013}.

Physical Properties: *Fracture:* Conchoidal to subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–6.5 VHN = 633–692 (50 g load). D(meas.) = 5.3–5.9 D(calc.) = [5.16] Radioactive.

Optical Properties: Opaque, translucent on thin edges. *Color:* Black, brownish black, greenish black; brown to yellow-brown in transmitted light. *Streak:* Yellowish, grayish, or reddish brown. *Luster:* Brilliant submetallic, waxy to resinous on fractures.
Optical Class: Isotropic. $n = 2.06$–2.24
R_1–R_2: (470) 13.7–15.6, (546) 13.0–15.6, (589) 12.5–15.0, (650) 12.4–15.0

Cell Data: *Space Group: Pcmn* (synthetic $YNbTiO_6$). $a = 5.5528(6)$ $b = 14.6432(20)$ $c = 5.1953(7)$ $Z = 4$

X-ray Powder Pattern: Risør, Norway; after heating at 1200 °C.
2.99 (100), 3.66 (40), 2.95 (40), 2.60 (30), 1.830 (30), 1.727 (30), 2.78 (25)

ZrO_2	0.04	FeO	0.77	Total	100.24

(1) Lyndoch Township, Ontario, Canada.

Occurrence: From granite pegmatites; as a component of detrital black sands.

Association: Albite, microcline, biotite, muscovite, ilmenite, monazite, xenotime, zircon, beryl, magnetite, garnet, allanite, gadolinite, aeschynite-(Y), thorite, uraninite, betafite, columbite.

Distribution: Numerous localities worldwide. In Norway, from Jölster, Söndfjord; at Alve, on Tromö Island; on Hidra (Hitterö) Island, near Flekkefjord; at many other places between Tvedestrand and Arendal, and in Iveland and Evje Parishes, Sätersdal. In Sweden, in the Ruoutevare Fe–Ti deposit, near Kvikkjokk, Norrbotten; at Ytterby, on Resarö Island, near Vaxholm; and elsewhere. From Huntila, Pitkäranta district, Lake Ladoga, Karelia, Russia. In Madagascar, large crystals from Vohimasina; Ambatofotsikely; Ankazobe, near Ambohitantely; Ambolotara; Ranomafana; and elsewhere. In Brazil, from Santa Clara, Pomba, and Espirito Santo, Minas Gerais. In Canada, from Lyndoch, Sabine, and Mattawan Townships, and elsewhere in Ontario; also in Quebec. In the USA, from the Rutherford pegmatite, Amelia Co., the Nanco pegmatite, Bedford Co., and others in Virginia; from Morton, Delaware Co., Pennsylvania; at Encampment, Carbon Co., Wyoming; from Guffey, Park Co., near Bergen Park, Jefferson Co., and the Colorado feldspar pegmatite, Fremont Co., Colorado.

Name: From the Greek for *hospitable*, in allusion to the wide variety of rare elements in its composition.

Evansite $Al_3(PO_4)(OH)_6 \cdot 6H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. Commonly as reniform or botryoidal coatings; spherulitic or stalactitic, to 0.6 m, may show a concentric structure.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = 3–4 D(meas.) = 2.0(2) D(calc.) = n.d. May fluoresce bright green under SW and LW UV, probably due to minor uranium content.

Optical Properties: Transparent to translucent. *Color:* Colorless to milky white, may be tinted blue, green, or yellow; reddish brown to brown with included iron oxides; colorless to brown in transmitted light. *Streak:* White or slightly tinted. *Luster:* Vitreous to resinous or waxy. *Optical Class:* Isotropic; may show birefringence up to 0.02. n = 1.445–1.485

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Amorphous to X-rays.

(1) Mt. Železník, Czech Republic. (2) Zeehan district, Tasmania, Australia.
(3) $Al_3(PO_4)(OH)_6 \cdot 6H_2O$.

Occurrence: In a graphite deposit (Gross-Tresny, Czech Republic); in graphitic gneiss (Vatoinandry district, Madagascar); in coal seams (Alabama, USA); a coating in caves, the phosphate derived from guano.

Association: Variscite, allophane, "limonite".

Distribution: In Slovakia, from Železník (Vashegy). At Gross-Tresny; Litošice; and Nižná-Slaná, Czech Republic. In Romania, from Alsô-Sajô; Roşia Montană (Verespatak); and Baia-de-Arieş (Offenbánya). From Epernay, Marne, France. In Spain, at Campo Lameiro; Teis, near Vigo; and several other places in Pontevedra Province; from santa Cruz de Olarde, Barcelona Province. At Richelle, near Visé, Belgium. In England, from Yoredale Rocks, near Macclesfield, Cheshire. In the Vatoinandry district, Madagascar. From the Berlin and other caves, Transvaal, South Africa. In the Zeehan and Dundas districts, Tasmania, Australia. In the USA, at Columbiana and Coalville, Shelby Co., Alabama; in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas; and from Goldburg, Custer Co., Idaho. At Cueva de Cunday, Colombia, in a cave. From the Cueva de Urtany and Cueva de Aguapiras Caves, Venezuela.

Name: In honor of Brooke Evans (1797–1862), English mining geologist, Birmingham, England, who provided the first specimens.

Type Material: Narodni Museum, Prague, Czech Republic, 1935-26572; Harvard University, Cambridge, Massachusetts, USA, 110880.

Eveite $Mn_2^{2+}(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals thick tabular on {100}, with {100}, {010}, {110}, {210}, {011}; usually composite, nearly parallel, warped, barrel-shaped, sheaflike, to 2 mm.

Physical Properties: *Cleavage:* On {101}, fair. Hardness = < 4 D(meas.) = 3.67 D(calc.) = [3.75]

Optical Properties: Semitransparent. *Color:* Bright green, apple-green to pale green, pale yellow. *Streak:* White.
Optical Class: Biaxial (+). *Pleochroism:* $X = Z$ = green; Y = yellow. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$, medium. $\alpha = 1.700(5)$ $\beta = 1.715(5)$ $\gamma = 1.732(10)$ 2V(meas.) = 65(5)°

Cell Data: *Space Group:* *Pnnm*. $a = 8.57(1)$ $b = 8.77(1)$ $c = 6.27(1)$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
4.39 (10), 3.058 (9), 5.09 (8), 6.10 (7), 2.528 (6), 2.797 (5), 3.14 (4)

Chemistry:

	(1)	(2)	(3)
As_2O_5	43.1	42.89	43.24
FeO		0.01	
MnO	48.8	50.29	53.37
CuO		0.01	
ZnO		0.01	
MgO		1.14	
CaO	1.3	0.50	
H_2O	n.d.	[3.36]	3.39
Total		[98.21]	100.00

(1) Långban, Sweden; by electron microprobe, total Mn as MnO, total As as As_2O_5. (2) Do.; by electron microprobe, average of two analyses, total Mn as MnO, total As as As_2O_5; corresponds to $(Mn_{1.90}Mg_{0.08}Ca_{0.02})_{\Sigma=2.00}(AsO_4)_{1.00}(OH)$. (3) $Mn_2(AsO_4)(OH)$.

Polymorphism & Series: Dimorphous with sarkinite.

Occurrence: Very rare, in fissures in a metamorphosed Fe–Mn orebody (Långban, Sweden); in a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Akrochordite, manganoan hörnesite, hausmannite, carbonates, Fe–Mn oxides (Långban, Sweden); willemite, sarkinite (Sterling Hill, New Jersey, USA).

Distribution: From Långban, Värmland, Sweden. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: Named for the biblical *Eve*, in contrast to adamite, with which it is isostructural.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 390274; The Natural History Museum, London, England; Harvard University, Cambridge, Massachusetts, 108971; National Museum of Natural History, Washington, D.C., USA, 120062, 162614A.

Evenkite $C_{24}H_{50}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$ (probable). As pseudohexagonal crystals, tabular on {001}, to 3 cm. *Twinning:* Polysynthetic twinning observed.

Physical Properties: *Cleavage:* On {001}, good, micaceous. *Tenacity:* Waxlike. Hardness = 1 D(meas.) = 0.920 D(calc.) = [0.926]

Optical Properties: Transparent. *Color:* Colorless or pale yellow. *Luster:* Waxy. *Optical Class:* Biaxial (+). $\alpha = \leq 1.504$ $\beta = \leq 1.504$ $\gamma = \simeq 1.553$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1/a$ (probable). $a = 7.52$ $b = 4.98$ $c = 32.50$ $\beta = \sim 90°$ Z = 2 (by analogy to *n*-tetracosane).

X-ray Powder Pattern: Evenkia district, Russia. (ICDD 28-2004). 4.18 (100), 3.74 (90), 2.25 (80), 2.52 (70), 2.12 (60), 1.751 (60), 3.02 (50)

Chemistry:

	(1)	(2)
C	85.43	85.63
H	14.99	14.37
Total	100.42	100.00

(1) Evenkia district, Russia; M.P. 49 °C–51 °C. (2) $C_{24}H_{50}$; M.P. 50.7 °C– 50.8 °C.

Occurrence: In mineralized cavities, now quartz geodes, in welded tuff.

Association: Quartz, chalcedony, pyrite, pyrrhotite, sphalerite, galena, chalcopyrite, calcite.

Distribution: From the Khavokiperskiye Rocks deposit, 40 km below Tura, Lower Tunguska River, Evenkia district, Siberia, Russia.

Name: For the occurrence in the Evenkia district, Siberia, Russia.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, Russia, 924-1/1–924-1/3.

Eylettersite $(Th,Pb)_{1-x}Al_3(PO_4,SiO_4)_2(OH)_6(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. In pulverulent nodules.

Physical Properties: Hardness = n.d. D(meas.) = 3.38–3.44 D(calc.) = 3.44–3.50
Radioactive; fluoresces greenish yellow in SW UV, weak cream-brown in LW UV.

Optical Properties: Semitransparent. *Color:* White to cream-white; colorless in transmitted light.
Optical Class: Uniaxial (–), probable; sensibly isotropic, with very low birefringence.
n = 1.615–1.66

Cell Data: *Space Group:* $R\overline{3}m$. a = 6.98–6.99 c = 16.66–16.70 Z = [3]

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
2.95 (100), 3.51 (60), 5.70 (55), 2.187 (40), 1.899 (30), 1.748 (20), 2.848 (15)

Chemistry:

	(1)	(2)
UO_3	2.09	2.42
SiO_2	1.56	1.03
ThO_2	19.18	20.72
CO_2	0.21	0.10
P_2O_5	18.38	19.98
Al_2O_3	37.13	35.98
PbO	4.80	3.21
CaO	0.11	0.26
SrO	0.11	0.21
BaO	1.51	1.96
H_2O	15.18	14.51
Total	100.26	100.38

(1) Kobokobo pegmatite, Congo; adjusted to original total after deduction of "autunite 1.8%–1.9%, fluorapatite 0.9%, limonite 0.1%"; stated then to correspond to $(Th_{0.36}Pb_{0.11}Ba_{0.05}U_{0.04}Ca_{0.01}Sr_{0.01}H_{0.17})_{\Sigma=0.75}Al_{3.58}[(PO_4)_{1.27}(SiO_4)_{0.13}(CO_3)_{0.02}(H_4O_4)_{0.58}]_{\Sigma=2.00}(OH)_{6.10}$.
(2) Do.; adjusted to original total after deduction of "autunite 1.3%, fluorapatite 0.4%"; stated then to correspond to $(Th_{0.39}Pb_{0.07}Ba_{0.06}U_{0.04}Ca_{0.02}Sr_{0.01}H_{0.17})_{\Sigma=0.76}Al_{3.50}[(PO_4)_{1.39}(SiO_4)_{0.09}(CO_3)_{0.01}(H_4O_4)_{0.51}]_{\Sigma=2.00}(OH)_{6.09}$.

Mineral Group: Crandallite group.

Occurrence: An alteration product of thorian crandallite in a phosphate-rich granite pegmatite.

Association: Autunite, phosphuranylite, fluorapatite, "limonite", feldspar, "cyrtolite".

Distribution: In the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For the wife of the discoverer, Mme. Van Wambeke.

Type Material: Euratom, Ispra, Italy; National Museum of Natural History, Washington, D.C., USA, 136443.

References: (1) Van Wambeke, L. (1972) Eylettersite, un nouveau phosphate de thorium appartenant à la série de la crandallite. Bull. Soc. fr. Minéral., 95, 98–105 (in French with English abs.). (2) (1974) Amer. Mineral., 59, 208 (abs. ref. 1).

Ezcurrite $Na_4B_{10}O_{17}\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As bladed to fibrous prismatic crystals, moderately striated and elongated along [001], may be bent, to 7.5 cm; as intergrown cleavable masses.

Physical Properties: *Cleavage:* {110}, excellent; {010}, good; {100}, {$\overline{1}\overline{2}6$}, fair; {$1\overline{1}0$}, {$\overline{1}01$}, poor. *Tenacity:* Brittle. Hardness = 3 (‖ {001}), 3.5 (⊥ {001}). D(meas.) = 2.053 D(calc.) = 2.049 Soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous to satiny. *Optical Class:* Biaxial (–). *Orientation:* X (177°,86°); Y (–90°,47°); Z (82°,43°) [using (ϕ,ρ)]. *Dispersion:* $r > v$. $\alpha = 1.468(1)$ $\beta = 1.507(1)$ $\gamma = 1.529(1)$ 2V(meas.) = 73.5°

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.598(2)$ $b = 9.570(2)$ $c = 6.576(2)$ $\alpha = 102°45(3)'$ $\beta = 107°30(3)'$ $\gamma = 71°31(3)'$ Z = 1

X-ray Powder Pattern: Tincalayu deposit, Argentina.
6.936 (100), 3.074 (38), 4.494 (29), 3.135 (19), 2.780 (19), 2.039 (10), 3.302 (8)

Chemistry:

	(1)	(2)
B_2O_3	59.4	58.20
Na_2O	19.8	21.08
K_2O	0.18	
H_2O^+	20.4	20.72
Total	99.78	100.00

(1) Tincalayu deposit, Argentina; $(OH)^{1-}$ and H_2O confirmed by DTA; corresponds to $Na_{3.98}B_{10.54}O_{17}\cdot 7H_2O$. (2) $Na_4B_{10}O_{17}\cdot 7H_2O$.

Occurrence: Probably formed from solutions derived from dehydration of borax in a discordant deposit in folded playa siltstones and sandstones.

Association: Borax, kernite, halite.

Distribution: From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina.

Name: Honors Juan Manuel de Ezcurra (1900–1970), Manager of the Compania Productora de Boratos, S.A., owner of the Tincalayu deposit, Argentina.

Type Material: National Museum of Natural History, Washington, D.C., USA, 123927.

PbO	25.5	24.61
H_2O	12.3	12.91
Total	97.5	100.00

(1) Moctezuma mine, Mexico; H_2O by the Penfield method, low analytical total likely caused by insoluble lost following acid digestion. (2) $Pb_2Fe_6(Te^{4+}O_3)_3(Te^{6+}O_6)(OH)_{10}\cdot 8H_2O$.

Occurrence: Very rare in oxidized ore in a matrix of intensely silicified and brecciated rhyolite vitrophyre cemented by drusy quartz and carrying pyrite and tellurides.

Association: Cuzticite, emmonsite, schmitterite, kuranakhite, pyrite.

Distribution: From Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: From the Nahua language for *blood*, in allusion to the color.

Type Material: The Natural History Museum, London, England, 1984,468.

References: (1) Williams, S.A. (1982) Cuzticite and eztlite, two new tellurium minerals from Moctezuma, Mexico. Mineral. Mag., 46, 257–259. (2) (1983) Amer. Mineral., 68, 471 (abs. ref. 1).

Fabianite $CaB_3O_5(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic, to 2.5 cm, showing {100}, {120}, {110}, {320}, {011}, and {021}.

Physical Properties: *Cleavage:* On {110}. Hardness = 6 D(meas.) = 2.77–2.796 D(calc.) = 2.788 Slightly soluble in H_2O; fluoresces brownish yellow under UV.

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $X \wedge a = 22(2)°$; $Z \wedge c = -45(2)°$.
Dispersion: $r < v$, weak. $\alpha = 1.608–1.612$ $\beta = 1.636–1.637$ $\gamma = 1.650–1.653$
2V(meas.) = 65°

Cell Data: *Space Group:* $P2_1/a$. $a = 6.593(1)$ $b = 10.488(2)$ $c = 6.365(1)$
$\beta = 113.38(2)°$ Z = 4

X-ray Powder Pattern: Rehden, Germany.
3.269 (100), 2.920 (87), 3.032 (83), 2.025 (56), 3.962 (54), 2.074 (54), 2.620 (48)

Chemistry:

	(1)	(2)
SO_3	2.2	
B_2O_3	57.9	61.61
Fe_2O_3	0.6	
CaO	32.1	33.08
H_2O	5.2	5.31
Total	98.0	100.00

(1) Rehden, Germany; includes impurities of $CaSO_4$ and Fe_2O_3. (2) $CaB_3O_5(OH)$.

Occurrence: In a marine evaporite deposit.

Association: Halite, anhydrite, howlite, szaibélyite.

Distribution: From drill core at Rehden, near Diepholz, Lower Saxony, Germany.

Name: Honors Hans-Joachim Fabian, German geologist.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160098.

Fabriesite $Na_3Al_3Si_3O_{12}\cdot 2H_2O$

Crystal Data: Orthorhombic. *Point Group*: n.d. Pseudomorphous after jadeite, as skeletal crystals, to 20 mm, and rarely as pseudo prismatic crystals.

Physical Properties: *Cleavage*: n.d. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = ~5-5.5 D(meas.) = n.d. D(calc.) = 2.386

Optical Properties: Transparent. *Color*: White to yellow, colorless in thin section. *Streak*: White. *Luster*: Vitreous to greasy. *Optical Class*: Biaxial (–). α = 1.503 β = 1.506 γ = 1.508 2V(calc.) = 78° [synthetic nepheline hydrate I]

Cell Data: *Space Group*: $Pna2_1$. a = 16.426 b = 15.014 c = 5.223 Z = 4 [synthetic orthorhombic $Na_3Al_3Si_3O_{12}\cdot 2H_2O$]

X-ray Powder Pattern: Calculated pattern. [identifiable only by a combination of scanning electron microscopy, electron microprobe analyses and electron backscatter diffraction] 3.41 (100), 4.41 (77), 2.97 (70), 2.61 (40), 8.21 (36), 7.51 (32), 2.45 (29)

Chemistry:

(1) Tawmaw-Hpakant Jade Tract, Myanmar; average of 10 electron microprobe analyses, H_2O by difference; corresponding to $(Na_{2.94}Ca_{0.03}K_{0.01}Mg_{0.01})_{\Sigma=2.99}Al_{3.00}Si_{3.00}O_{12}\cdot 2H_{1.99}O$.

Occurrence: In serpentinized peridotite and related to the hydration of trinepheline during the late stage of metamorphism along veins in a jadeite deposit.

Association: Nepheline, trinepheline, more rarely with albite, banalsite, stronalsite.

Distribution: From the Tawmaw-Hpakant Jade Tract, Hpakant Township, Mohnyin District, Kachin State, Myanmar.

Name: Honors Jacques Fabriés (1932-2000), professor of Mineralogy, National Natural History Museum, Paris, France, where he served as chair of Mineralogy from 1969 until 1998, and was the Museum director (1990-1994).

Type Material: National Museum of Natural History, Paris, France (MNHN 212.001).

References: (1) Ferraris, C., G.C. Parodi, S. Pont, B. Rondeau, and J-P. Lorand (2014) Trinepheline and fabriesite: two new mineral species from the jadeite deposit of Tawmaw (Myanmar). European Journal of Mineralogy, 26(2), 257-265. (2) (2014) Amer. Mineral., 99, 1808-1809 (abs. ref. 1).

Faheyite $(Mn^{2+},Mg)Fe_2^{3+}Be_2(PO_4)_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622 (probable). As needlelike crystals, showing $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, $\{0001\}$, and several $\{h0\bar{i}l\}$ forms; more generally fibrous, to 1 mm, elongated along [0001], in flat rosettes and botryoidal masses; in mats.

Physical Properties: *Cleavage:* One, ‖ [0001], perfect. Hardness = n.d. D(meas.) = 2.660 D(calc.) = 2.670

Optical Properties: Semitransparent. *Color:* White, bluish white to brownish white. *Optical Class:* Uniaxial (+). $\omega = 1.631$ $\epsilon = 1.652$

Cell Data: *Space Group:* $P6_222$, $P6_422$, $6mm$, 622, $\bar{6}m2$, or $6/mmm$. a = 9.42(2) $c = 15.98(3)$ Z = 3

X-ray Powder Pattern: Sapucaia mine, Brazil.

(1) Sapucaia mine, Brazil; Na and K by flame photometry, recalculated after deduction of insoluble quartz and muscovite 9.44%; then corresponding to $(Mn_{0.61}Mg_{0.21}Na_{0.20})_{\Sigma=1.02}(Fe_{1.95}Al_{0.01})_{\Sigma=1.96}Be_{2.11}(PO_4)_{3.90} \cdot 6.01H_2O$.

Occurrence: A rare late-stage secondary mineral in a complex granite pegmatite (Sapucaia mine, Brazil).

Association: Quartz, muscovite, variscite, frondelite (Sapucaia mine, Brazil); strengite (Roosevelt mine, South Dakota, USA).

Distribution: From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. In the USA, at the Roosevelt mine, near Custer, Custer Co., South Dakota. From the Noumas mine, Blesberg, Cape Province, South Africa.

Name: Honoring Joseph John Fahey (1901–1980), American analytical chemist, U.S. Geological Survey, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112653.

Fahleite $\mathbf{Zn_5CaFe_2^{3+}(AsO_4)_6 \cdot 14H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, probable. *Point Group:* n.d. Crystals are curved and twisted, in fibrous bundles, to about 1.5 cm; in minute spherical aggregates.

Physical Properties: *Cleavage:* One, perfect, ⊥ fiber length. *Tenacity:* Sectile, flexible. Hardness = Very soft. D(meas.) = n.d. D(calc.) = [3.08]

Optical Properties: Transparent. *Color:* Straw-yellow to gray, bright green; colorless in transmitted light. *Luster:* Silky or pearly.
Optical Class: Biaxial (+). *Orientation:* Z = length, parallel extinction, positive elongation.
$\alpha = 1.628(1)$ $\beta = 1.631(1)$ $\gamma = 1.656(1)$ 2V(meas.) = n.d. 2V(calc.) = 39°

Cell Data: *Space Group:* n.d. $a = 6.60$ $b = 11.6$ $c = 22.$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia; all lines very broad.
22. (10), 11. (10), 3.2 (8), 2.9 (5), 1.65 (2)

Chemistry:

	(1)	(2)
As_2O_5	43.6	44.08

CaO	4.0	3.58
H_2O	15.5	16.12
Total	100.0	100.00

(1) Tsumeb, Namibia; by electron microprobe, average of five analyses; total Fe as Fe_2O_3, total Mn as MnO, H_2O by difference, confirmed by IR; corresponds to $Zn_{5.02}Ca_{1.11}Mn_{0.11}Fe_{1.99}(AsO_4)_{5.91} \cdot 13.42H_2O$. (2) $Zn_5CaFe_2(AsO_4)_6 \cdot 14H_2O$.

Occurrence: On oxidized tennantite–chalcocite ore from a deep oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Lavendulan, cuprian adamite, conichalcite, tsumcorite, tennantite, chalcocite, quartz, calcite, gypsum.

Distribution: From Tsumeb, Namibia.

Name: In honor of Rolf Fahle (1943–), Munich, Germany, mineral dealer specializing in Tsumeb minerals, who supplied the specimen from which the species was described.

Type Material: Mineralogical Institute, Ruhr University, Bochum, Germany.

References: (1) Medenbach, O., K. Schmetzer, and K. Abraham (1988) Fahleite from Tsumeb/Namibia, a new mineral belonging to the smolianinovite group. Neues Jahrb. Mineral., Monatsh., 167–171. (2) (1989) Amer. Mineral., 74, 501–502 (abs. ref. 1).

Fairbankite $PbTe^{4+}O_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Crystals nearly equant, to 0.5 mm; typically as thin crusts.

Physical Properties: *Tenacity:* Brittle. Hardness = 2 D(meas.) = n.d. D(calc.) = 7.45

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Resinous to adamantine. *Optical Class:* Biaxial (–) or (+). *Dispersion:* Weak. $\alpha = 2.29$ $\beta = 2.31$ $\gamma = 2.33$ 2V(meas.) = 86° 2V(calc.) = 90°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 7.81$ $b = 7.11$ $c = 6.96$ $\alpha = 117°12'$ $\beta = 93°47'$ $\gamma = 93°24'$ Z = 4

X-ray Powder Pattern: Grand Central mine, Arizona, USA.
3.265 (10), 3.148 (6), 3.098 (6), 2.828 (6), 3.020 (5), 2.516 (5), 2.076 (3)

Chemistry:

	(1)	(2)
TeO_2	41.70	41.69
PbO	58.30	58.31
Total	[100.00]	100.00

(1) Grand Central mine, Arizona, USA; recalculated to 100% from an original total of 100.3%, after deduction of $PbCO_3$ 13.0% due to cerussite impurity. (2) $PbTeO_3$.

Polymorphism & Series: Dimorphous with plumbotellurite.

Occurrence: Very rare on the mine dump from a hydrothermal Au–Te-bearing ore deposit.

Association: Oboyerite, cerussite, "opal".

Distribution: From the Grand Central mine, Tombstone, Cochise Co., Arizona, USA.

Name: Honors Nathaniel Kellogg Fairbank (1829–1903), who organized the company that developed the Grand Central lode, Tombstone, Arizona, USA.

Type Material: Natural History Museum, Paris; The Natural History Museum, London, England, 1980,540; National Museum of Natural History, Washington, D.C., USA, 160238.

References: (1) Williams, S.A. (1979) Girdite, oboyerite, fairbankite, and winstanleyite, four new tellurium minerals from Tombstone, Arizona. Mineral. Mag., 43, 453–457. (2) (1980) Amer. Mineral., 65, 809 (abs. ref. 1).

Fairchildite $K_2Ca(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As microscopic hexagonal plates, flattened on {0001}; typically in dense stony aggregates.

Physical Properties: *Cleavage:* On {0001}, good. Hardness = n.d. D(meas.) = 2.45 D(calc.) = 2.45 Slowly hygroscopic in air, altering to bütschliite, which may then leach to calcite.

Optical Properties: Transparent. *Color:* Colorless; light gray to bluish gray in aggregates. *Optical Class:* Uniaxial (–). $\omega = 1.533$ $\epsilon = 1.498$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 5.294(1)$ $c = 13.355(2)$ $Z = 2$

X-ray Powder Pattern: Synthetic.
3.192 (100), 2.646 (70), 2.699 (30), 2.168 (20), 2.225 (16), 6.67 (14), 2.039 (14)

Chemistry: (1) Analyses of nearly pure natural material apparently do not exist; identification depends on coincidence of other properties with those of synthetic material.

Polymorphism & Series: Dimorphous with bütschliite.

Occurrence: Formed from fused wood ash in partially burned trees.

Association: Bütschliite, calcite.

Distribution: In the USA, many occurrences in forests from trees struck by lightning. Some studied are: from the Grand Canyon National Park, Coconino Co., Arizona; in the Kaniksu National Forest, near Coolin, Bonner Co., Idaho. From near Eganville and Deseronto, Ontario, Canada.

Name: Honors John Gifford Fairchild (1882–1965), analytical chemist, U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 105675, 105676, 162622.

(1) Branchville, Connecticut, USA. (2) Buckfield, Maine, USA. (3) $Ca_2(Mn,Fe)(PO_4)_2 \cdot 2H_2O$ with Mn:Fe = 1:1.

Mineral Group: Fairfieldite group.

Occurrence: An accessory mineral in granite pegmatites.

Association: Apatite, strunzite, diadochite, dickinsonite, stewartite, rockbridgeite, mitridatite, eosphorite, a host of other Fe–Mn phosphates, jahnsite, rhodochrosite, quartz, muscovite.

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; in Maine, in Oxford Co., as large crystals at the Bennett quarry, Buckfield, in the Nevel quarry and elsewhere around Newry, from the Emmons quarry, Greenwood, and from the Berry quarry, Poland, Androscoggin Co.; fine examples from the Foote mine, Kings Mountain, Cleveland Co., North Carolina; in the Tip Top mine, 8.5 km southwest of Custer, and the Bull Moose mine, five km southeast of Custer, Custer Co., South Dakota; from the White Picacho district, Maricopa and Yavapai Cos., Arizona. At Hagendorf, and Hühnerkobel, near Zwiesel, Bavaria, Germany. From the Mangualde pegmatite, near Mesquitela, Portugal. In the Cerdanya basin, east to southwest of Bellver, Lerida Province, Spain. From the Voron'i massif, Kola Peninsula, Russia.

Name: For Fairfield Co., Connecticut, USA, within which is Branchville, the original locality.

Type Material: Yale University, New Haven, Connecticut, USA, 3.3118, 3.3123.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 720–722. (2) Frondel, C. Total	100.24

(1) Dara-i-Pioz glacier, Tien-Shan Mountains, Tajikistan; average of 20 electron microprobe and ICP-OES analyses, corresponding to $(K_{1.97}Ba_{0.04}Rb_{0.03})_{\Sigma=2.05}Li_{6.00}(Na_{0.86}\square_{0.14})_{\Sigma=1.00}$ $(Ca_{6.16}Na_{0.67}Sr_{0.17})_{\Sigma=7.00}(Ti_{4.00}Nb_{0.02})_{\Sigma=4.02}Si_{24.01}O_{66}(F_{1.63}O_{0.37})_{\Sigma=2}$.

Occurrence: In a quartz-pectolite boulder in the moraine of a glacier eroding an alkaline massif.

Association: Baratovite, fluorite, quartz, pectolite, aegirine, luorite, polylithionite, neptunite, hyalotekite, sokolovaite, senkevichite, Ti-rich mica.

Distribution: In moraine of the Dara-i-Pioz glacier, Alai ridge, Tien-Shan Mountains, Tajikistan.

Name: Honors Faiziev Abdulkhak Radzhabovitch (b 1938), professor and member-correspondent of the Academy of Sciences, Republic of Tajikistan.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow.

Falcondoite $(Ni, Mg)_4Si_6O_{15}(OH)_2 \cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* n.d. As slightly schistose, friable masses of minute fibrous particles, less than 10 μm in length.

Physical Properties: *Tenacity:* Friable. Hardness = 2–3 D(meas.) = 1.9(1) D(calc.) = 2.54

Optical Properties: Transparent to translucent. *Color:* Whitish green. *Optical Class:* Biaxial. $n = < 1.55$; birefringence ~0.01–0.02. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 13.5$ $b = 26.9$ $c = 5.24$ Z = 4

X-ray Powder Pattern: Near Bonao, Dominican Republic.
12.2 (100), 2.58 (35), 3.33 (30), 2.62 (30), 2.44 (30), 3.19 (25), 2.39 (20)

Chemistry:

	(1)	(2)
SiO_2	45.93	49.2
Al_2O_3	0.39	
Cr_2O_3	0.45	
FeO	1.99	< 0.03
NiO	26.7	23.6
MgO	8.46	9.26
LOI	15.0	[18.0]
Total	98.92	[100.0]

(1) Near Bonao, Dominican Republic; corresponds to $(Ni_{2.66}Mg_{1.55}Fe_{0.22}Al_{0.06}Cr_{0.04})_{\Sigma=4.53}Si_{5.71}O_{16} \cdot 6.22H_2O$. (2) Do.; average of five analyses by electron microprobe and other methods; loss on ignition by difference, taken as H_2O; corresponds to $(Ni_{2.32}Mg_{1.68})_{\Sigma=4.00}Si_6O_{16} \cdot 7.30H_2O$.

Occurrence: In garnierite veins which cut an extensive laterite, associated with a serpentinized harzburgite massif (near Bonao, Dominican Republic).

Association: Sepiolite, talc, quartz (near Bonao, Dominican Republic).

Distribution: From near Bonao, Dominican Republic. In the USA, from near Glamis, Imperial Co., California.

Name: For the familiar name "Falcondo" of the company operating the mine in the Dominican Republic where the mineral was first found.

Type Material: Royal Ontario Museum, Toronto, Canada, M34324.

Famatinite Cu_3SbS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Massive, granular; reniform; as crusts of tiny crystals. *Twinning:* Polysynthetic, very commonly seen in polished section.

Physical Properties: *Cleavage:* {101}, good; {100}, distinct. *Fracture:* Uneven, conchoidal. *Tenacity:* Brittle. Hardness = 3.5 VHN = n.d. D(meas.) = 4.635 D(calc.) = 4.66

Optical Properties: Opaque. *Color:* Deep pinkish brown; in polished section, pale brownish pink. *Streak:* Black. *Luster:* Dull metallic. *Pleochroism:* Weak, pale orange, pink-violet. *Anisotropism:* Strong, greenish yellow and purplish red.
R_1–R_2: (400) 24.4–30.0, (420) 24.2–25.5, (440) 24.0–25.0, (460) 23.8–24.1, (480) 23.1–23.4, (500) 22.7–23.1, (520) 22.9–23.6, (540) 23.8–25.0, (560) 24.3–26.0, (580) 24.5–26.5, (600) 24.8–27.0, (620) 25.4–27.5, (640) 26.0–28.1, (660) 26.8–28.6, (680) 27.3–29.0, (700) 27.5–29.4

(1) Goldfield, Nevada, USA. (2) Sierra Famatina, Argentina. (3) Cu_3SbS_4.

Polymorphism & Series: Forms a series with luzonite.

Mineral Group: Stannite group.

Occurrence: In copper deposits formed at low to medium temperatures.

Association: Pyrite, enargite, tetrahedrite–tennantite, chalcopyrite, covellite, sphalerite, bismuthinite, silver, gold, marcasite, quartz, barite.

Distribution: From the Sierra de Famatina, La Rioja Province, Argentina [TL]. In the USA, at Goldfield, Esmeralda Co., Nevada; and in Arizona, from Tombstone and the Campbell mine, Bisbee, Cochise Co.; from the Magma mine, Superior, Pinal Co. Also at Butte, Silver Bow Co., Montana; Red Mountain, Ouray Co., Colorado; and Darwin, Inyo Co., California. In Mexico, at Cananea, Sonora. From Cerro de Pasco and Morococha, Peru. Well-crystallized in the Chinkuashi mine, Keelung, Taiwan. At Isk Amellal, Morocco. In minor amounts from many other localities.

Name: For the locality, Sierra de Famatina, Argentina.

Fangite Tl_3AsS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Irregular to subhedral grains, to 0.9 mm.

Physical Properties: Hardness = 2–2.5 VHN = 60–63, 61 average (100 g load) (synthetic). D(meas.) = n.d. D(calc.) = 6.185

Optical Properties: Translucent. *Color:* Deep red to maroon, tarnishing to darker colors; blue-gray in reflected light, with abundant red internal reflections. *Luster:* Vitreous, tarnishing to metallic.
Optical Class: Biaxial. *Bireflectance:* Very low.
R_1–R_2: (400) 29.1–30.2, (420) 28.5–29.5, (440) 27.6–28.7, (460) 26.8–27.8, (480) 26.0–26.8, (500) 25.2–25.9, (520) 24.5–25.0, (540) 23.8–24.2, (560) 23.3–23.6, (580) 22.8–23.1, (600) 22.3–22.7, (620) 22.0–22.3, (640) 21.7–22.0, (660) 21.5–21.8, (680) 21.3–21.6, (700) 21.1–21.5

Cell Data: *Space Group: Pnma.* $a = 8.894(8)$ $b = 10.855(9)$ $c = 9.079(9)$ $Z = 4$.

X-ray Powder Pattern: Mercur deposit, Utah, USA.
2.813 (vs), 3.99 (s), 2.264 (ms), 4.14 (m), 3.80 (m), 3.47 (m), 3.35 (m)

Tl	75.7	75.11
As	9.16	9.18
S	15.6	15.71
Total	100.4	100.00

(1) Mercur deposit, Utah, USA; by electron microprobe, average of analyses on two grains;
(2) Tl_3AsS_4.

Occurrence: In a sediment-hosted disseminated gold deposit, in sulfide-rich carbonaceous ore, probably formed by alteration of Tl-As-rich sulfosalts or sulfides.

Association: Pyrite, realgar, orpiment, calcite.

Distribution: From the Mercur gold deposit, southern Oquirrh Mountains, about 56 km southwest of Salt Lake City, Tooele Co., USA [TL].

Name: In honor of Dr. Jen-Ho Fang (1929–), crystal chemist, University of Alabama, Tuscaloosa, Alabama, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 17071.

Farringtonite $Mg_3(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Subhedral to euhedral grains, to 2 mm, and as rims on olivine.

Physical Properties: *Cleavage:* {100} and {010}, fair to good. Hardness = n.d. D(meas.) = ∼2.80 D(calc.) = 2.76

Optical Properties: Transparent to opaque. *Color:* Colorless, white, yellow, dark amber. *Optical Class:* Biaxial (+). *Orientation:* $Z \wedge c = 16°–17°$. $\alpha = 1.540(2)$ $\beta = 1.544(2)$ $\gamma = 1.559(2)$ 2V(meas.) = 47°–55°

Cell Data: *Space Group:* $P2_1/a$. a = 8.79(1) $b = 8.22(2)$ $c = 5.07(1)$ $\beta = 120.5(5)°$ Z = 2

X-ray Powder Pattern: Springwater meteorite.
3.443 (100), 3.85 (67), 2.411 (48), 4.09 (40), 4.34 (38), 3.65 (37), 2.122 (33)

Chemistry:

	(1)	(2)	(3)
P_2O_5	53.2	53.9	54.00

MgO	43.1	44.9	46.00
CaO	0.07	0.08	
Total	100.8	101.8	100.00

(1) Springwater meteorite; by electron microprobe, average of six grains, total Fe and Mn as FeO and MnO; corresponding to $(Mg_{2.84}Fe_{0.15}Mn_{0.01})_{\Sigma=3.00}(PO_4)_2$. (2) Krasnojarsk meteorite; by electron microprobe, average of six grains, total Fe and Mn as FeO and MnO; corresponding to $(Mg_{2.92}Fe_{0.10}Mn_{0.01})_{\Sigma=3.03}(PO_4)_2$. (3) $Mg_3(PO_4)_2$.

Occurrence: A rare component in pallasite meteorites, rimming and cementing olivine nodules.

Association: Olivine, stanfieldite, troilite, schreibersite, kamacite.

Distribution: In the Springwater, Krasnojarsk, Zaisho, Imilac, and Port Orford pallasite meteorites.

Name: To honor Dr. Oliver Cummings Farrington (1864–1933), Curator of Geology, Field Museum of Natural History, Chicago, Illinois, USA, an authority on meteorites.

Type Material: The Natural History Museum, London, England, 1960,150 and 1960,151.

References: (1) DuFresne, E.R. and S.K. Roy (1961) A new phosphate mineral from the Springwater pallasite. Geochim. Cosmochim. Acta, 24, 198–205. (2) (1961) Amer. Mineral., 46, 1513 (abs. ref. 1). Fassinaite $Pb_2^{2+}(S_2O_3)(CO_3)$

Crystal Data: Orthorhombic. *Point Group:* 2/*m* 2/*m* 2/*m*. Crystals prismatic {101}, to 0.4 mm, with flat chisel-shaped {*hk*0} terminations. As radiating aggregates of acicular crystals. Easily mistaken for anglesite, except for less-steep terminations on anglesite.

Physical Properties: *Cleavage:* None. *Fracture:* Irregular. *Tenacity:* Brittle.
Hardness = 1.5-2 D(meas.) = n.d. D(calc.) = 6.084

Optical Properties: Transparent. *Color:* Colorless; intense internal reflections. *Streak:* White. *Luster:* Vitreous to adamantine.
Optical Class: n.d. *n* = 2.13 *Birefringence:* Very high.

Cell Data: *Space Group: Pnma*. a = 16.320(2) b = 8.7616(6) c = 4.5809(7) *Z* = 4

X-ray Powder Pattern: Trentini mine, Veneto, Italy.
3.108 (100), 2.986 (82), 3.504 (75), 4.080 (62), 2.736 (60), 4.381 (59), 2.952 (49)

Chemistry:

	(1)	(2)
PbO	77.1(4)	76.11
SO_3	12.0(1)	
S^{2-}	4.83(1)	
SO		16.39
CO_2	7.60(4)	7.50
$-O = S^{2-}$	2.41(2)	
Total	99.2	100.00

(1) Trentini mine, Veneto, Italy; average of 11 electron microprobe analyses, thiosulphate and carbonate groups confirmed by Raman spectra, CO_2 calculated for stoichiometry, S^{6+}:S^{2-} ratio (1:1) on structural considerations; corresponding to $Pb_{2.01}(S_{1.82}O_3)(CO_3)$. (2) $Pb_2^{2+}(S^{6+}S^{2-}O_3)(CO_3)$.

Occurrence: A secondary mineral in the weathering zone of a polymetallic hydrothermal deposit.

Association: Galena, quartz, anglesite (Trentini mine, Italy); galena, cerussite, anglesite, sulfur, phosgenite (Erasmus adit, Austria).

Distribution: From the Trentini mine, Mount Naro, Vicenza Province, Veneto, Italy; from the Erasmus adit, Schwarzleo District, Leogang, Salzburg, Austria, and the Friedrich-Christian mine, Schapbach, Black Forest, Baden-Württemberg, Germany.

Name: Honors Bruno Fassina (b. 1943), an Italian mineral collector who found the first samples at the Trentini mine.

Type Material: Museum of Mineralogy, Department of Geosciences, University of Padova, Italy (MMP M10008); Natural History Museum, Vienna, Austria (N9055 and N 9056).

CaO	4.79	4.93
Na_2O	5.09	3.02
K_2O		0.16
H_2O	27.02	[26.54]
Total	99.83	[100.00]

(1) Kaiserstuhl, Germany. (2) San Bernardino Co., California, USA; by electron microprobe, average of 15 analyses, H_2O by difference, corresponding to $(Na_{0.52}Ca_{0.47}Mg_{0.10}K_{0.02})_{\Sigma=1.11}$ $Al_{1.78}Si_{4.24}O_{12}\cdot 16H_2O$.

Mineral Group: Zeolite group.

Occurrence: Rare, in vesicles of basalts, phonolites, and tuffs; formed by palagonization or authigenically.

Association: Zeolites, olivine, augite, nepheline.

Distribution: In Germany, from Sasbach, Kaiserstuhl, and elsewhere in Baden-Württemberg; from the Pflasterkaute, near Eisenach, Thuringia; at Annerod, near Giessen, and at a number of localities around the Vogelsberg volcano, Hesse. From Aci Reale and Aci Castello, Sicily, Italy. On the Cima Dome, near Valley Wells, San Bernardino Co., California, and at several localities on Oahu, Hawaii, USA. From Davis Hill and Khartoum, Ontario; at Laurel, Hincks Bridge, and Notre-Dame-de-la-Salette, and at the Daisy Mica mine, Ottawa Co., Quebec, Canada. A few other localities are known.

Name: Honoring Barthélemy Faujas de Saint Fond (1741–1819), French mineralogist and vulcanologist.

Faustite $(Zn, Cu)Al_6(PO_4)_4(OH)_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $[\overline{1}]$ (by analogy to turquoise). Fine-grained massive, as veinlets, to 8 mm thick, and as nuggets and nodules.

Physical Properties: *Fracture:* Small conchoidal to smooth. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 2.92, corrected for admixed montmorillonite. D(calc.) = [2.88]

Optical Properties: Opaque, translucent on thin edges. *Color:* Apple-green; in transmitted light, brown with a greenish cast. *Streak:* White to pale yellow-green. *Luster:* Waxy to dull. *Optical Class:* [Biaxial (+)] (by analogy to turquoise); birefringence medium. $n = 1.613$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $[P\overline{1}]$ (by analogy to turquoise). $a = 7.44$ $b = 9.89$ $c = 7.67$ $\alpha = 107°43'$ $\beta = 115°39'$ $\gamma = 69°39'$ Z = 1

X-ray Powder Pattern: Copper King mine, Nevada, USA; nearly identical to turquoise. 3.68 (10), 2.89 (8), 6.70 (7), 6.14 (7), 2.05 (7), 3.44 (6), 3.28 (6)

Chemistry:

	(1)	(2)
P_2O_5	34.83	34.11
Al_2O_3	35.31	36.74
Fe_2O_3	1.73	
CuO	1.61	4.78
ZnO	7.74	4.89
H_2O^+	18.78	19.48
Total	[100.00]	100.00

(1) Copper King mine, Nevada, USA; after deduction of montmorillonite ∼20%; stated to then correspond to $(Zn_{0.8}Cu_{0.2})_{\Sigma=1.0}Al_6(PO_4)_4(OH)_8 \cdot 4.5H_2O$. (2) $(Zn, Cu)Al_6(PO_4)_4(OH)_8 \cdot 4H_2O$ with Zn:Cu = 1:1.

Mineral Group: Turquoise group.

Occurrence: In argillized shales associated with copper mineralization (Copper King mine, Nevada, USA).

Association: Montmorillonite, apatite, chrysocolla, azurite, malachite, cuprite, kaolinite, quartz, alunite (Copper King mine, Nevada, USA).

Distribution: In the USA, from the Copper King mine, about 16 km northwest of Carlin, Maggie Creek district, Eureka Co., and the Rain mine, Carlin district, Elko Co., Nevada; at the Bingham mine, Salt Lake Co., Utah. In the Iron Monarch quarry, Iron Knob, South Australia. At the Phoenix United mines, Linkinhorne, Cornwall, England. In the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate, and at Rengersdorf, Lausitz, Saxony, Germany.

Name: To honor Dr. George Tobias Faust (1908–1985), mineralogist and geologist, U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, 106377; National Museum of Natural History, Washington, D.C., USA, 106879, 113171.

References: (1) Erd, R.C., M.D. Foster, and P.D. Proctor (1953) Faustite, a new mineral, the zinc analogue of turquois. Amer. Mineral., 38, 964–972.

Fayalite $Fe_2^{2+}SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are thick to thin, tabular ∥ {100}, typically with wedge-shaped terminations, producing eight-sided cross sections. Commonly granular, compact, or massive. *Twinning:* On {100}; also on {031}, as trillings.

Physical Properties: *Cleavage:* {010}, {100}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 4.392 D(calc.) = [4.40]

Optical Properties: Transparent. *Color:* Greenish yellow, yellow-brown, brown; pale yellow to amber in thin section. *Streak:* White. *Luster:* Vitreous to resinous on fractures. *Optical Class:* Biaxial (–). *Pleochroism:* Faint; $X = Z$ = pale yellow; Y = yellow-orange, reddish brown. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, weak. $\alpha = 1.827$ $\beta = 1.869$ $\gamma = 1.879$ 2V(meas.) = 48°

Cell Data: *Space Group: Pbnm* (synthetic). $a = 4.8211$ $b = 10.4779$ $c = 6.0889$ Z = 4

X-ray Powder Pattern: Rockport, Massachusetts, USA. (ICDD 20-1139).
2.501 (100), 2.828 (90), 1.777 (90), 3.55 (80), 2.565 (70), 1.523 (70), 1.516 (70)

Chemistry:

	(1)
SiO_2	29.83
FeO	69.48
MnO	0.28
H_2O^+	0.34
H_2O^-	0.04
Total	99.97

(1) Brocken massif, Germany; corresponds to $(Fe^{2+}_{1.97}Mn^{2+}_{0.01})_{\Sigma=1.98}Si_{1.01}O_4$.

Polymorphism & Series: Forms two series, with forsterite, and with tephroite.

Mineral Group: Olivine group.

Occurrence: In ultramafic volcanic and plutonic rocks, less commonly in felsic plutonic rocks; rarely in granite pegmatite; in lithophysae in obsidian. In metamorphosed iron-rich sediments and impure carbonate rocks.

Association: Augite, plagioclase, microcline, quartz, apatite, magnetite, ilmenite, spinel, hedenbergite, arfvedsonite, amphiboles, almandine, tridymite, grunerite.

Distribution: Among the occurrences of relatively pure material are: in the USA, in the St. Peters Dome area, near Pikes Peak, El Paso Co., Colorado; at Obsidian Cliff, Yellowstone National Park, Wyoming; from Coso Hot Springs, Inyo Co., California; at Rockport, Essex Co., Massachusetts; from Monroe, Orange Co., New York; in the Iron Hill mine, Cumberland, Providence Co., Rhode Island. In the Blue Bell mine, Riondel, British Columbia, Canada. From the Brocken massif, Harz Mountains, Germany. At Raftsund, Norway. In the Skaergaard and Ilímaussaq intrusions, Greenland. On Red Rock Ridge, Nevy Fjord, Palmer Peninsula, Antarctica.

Name: After Faial (Fayal) Island in the Azores, thought to occur in a local volcanic rock, but probably obtained from slag carried as ship's ballast.

(1) Turii Peninsula, Russia; corresponding to $K_{1.08}Ca_{4.08}Na_{3.72}(Si_{15.20}Al_{0.80})_{\Sigma=16.00}O_{36.20}(OH)_{3.80} \cdot 6H_2O$.

Occurrence: In fine veinlets in fenitized sandstone (Turii Peninsula, Russia).

Association: Narsarsukite, quartz, apophyllite (Turii Peninsula, Russia).

Distribution: On the Turii Peninsula, Kola Peninsula, and in the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: For Evgraf Stepanovich Fedorov (1853–1919), eminent Russian crystallographer, Mining Institute, St. Petersburg, Russia.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 1505/2–3; Geology Museum, Kola Branch, Academy of Sciences, Apatity, 1873; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73038–73040, 73371, 73772, vis5121.

Fedorovskite $Ca_2(Mg, Mn^{2+})_2B_4O_7(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As prismatic crystals, sometimes with rhombic outlines, to 1 cm; commonly in fibrous aggregates. *Twinning:* Polysynthetic, with {100} as composition plane.

Physical Properties: *Cleavage:* On {100}, perfect. Hardness = 4.5 D(meas.) = 2.65 D(calc.) = 2.60

Optical Properties: Semitransparent. *Color:* Brown. *Optical Class:* Biaxial (–). *Pleochroism:* X = colorless to pale yellow; Z = yellow to bright yellow. *Orientation:* $X = c$; $Z = a$. *Dispersion:* $r < v$, very strong. α = 1.619–1.623 β = 1.627–1.632 γ = 1.629–1.634 2V(meas.) = 48°

Cell Data: *Space Group: Pbam.* $a = 8.96(2)$ $b = 13.15(2)$ $c = 8.15(1)$ Z = [4]

X-ray Powder Pattern: Solongo deposit, Russia.
3.92 (10), 2.59 (10), 3.02 (7), 2.119 (7), 1.693 (7), 1.632 (7), 2.28 (6)

Total		100.00

(1) Solongo deposit, Russia; partial elemental analysis, here converted to oxides; corresponds to $Ca_2(Mg_{1.3}Mn_{0.7})_{\Sigma=2.0}B_4O_7(OH)_6$. (2) $Ca_2(Mg, Mn)_2B_4O_7(OH)_6$ with Mg:Mn = 1:1.

Polymorphism & Series: Forms a series with roweite.

Occurrence: In veinlets in a skarn-type boron deposit.

Association: Sakhaite, frolovite, uralborite, szaibélyite, datolite.

Distribution: From the Solongo boron deposit, Buryatia, Transbaikal region, Russia.

Name: Honors Nikolai Mikhailovich Fedorovskii (1886–1956), eminent crystallographer and founder of the Russian Research Institute of Mineral Resources, Moscow, Russia.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 1223/1; Il'menskii Preserve Museum, Miass, 4239; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76926, 77482, 77659.

Fedotovite $K_2Cu_3O(SO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crusts of imperfect pseudohexagonal crystals, flaky to platy on {100}, to 5 mm.

Physical Properties: *Cleavage:* On {100}, perfect. Hardness = 2.5 D(meas.) = 3.205(3) D(calc.) = 3.09 Unstable in air.

Optical Properties: Transparent. *Color:* Emerald-green to grass-green. *Streak:* Pale grass-green. *Luster:* Vitreous to silky.
Optical Class: Biaxial (+). *Pleochroism:* X = greenish blue; $Y = Z$ = yellow-green.
Orientation: $Z = b$; $Y \wedge c \simeq 0°$. *Absorption:* $Z > Y$. $\alpha = 1.577$ $\beta = 1.594$ $\gamma = 1.633$
2V(meas.) = n.d. 2V(calc.) = 68°

Cell Data: *Space Group:* $C2/c$. $a = 19.037(6)$ $b = 9.479(2)$ $c = 14.231(5)$
$\beta = 111.04(3)°$ Z = 8

X-ray Powder Pattern: Tolbachik volcano, Russia.

(1) Tolbachik volcano, Russia; presence of $(SO_4)^{2-}$ and absence of $(OH)^{1-}$ and H_2O confirmed by IR; corresponds to $(K_{1.65}Na_{0.28})_{\Sigma=1.93}(Cu_{2.85}Zn_{0.02}Pb_{0.01})_{\Sigma=2.88}O_{0.80}(SO_4)_{3.05}$.
(2) $K_2Cu_3O(SO_4)_3$.

Occurrence: As sublimates around volcanic fumaroles.

Association: Dolerophanite, chalcocyanite, tolbachite, piypite, melanothallite, tenorite, vergasovaite, euchlorine, alarsite, klyuchevskite, lammerite, nabokoite, atlasovite, langbeinite, hematite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Sergei Aleksandrovich Fedotov (1931–), volcanologist and seismologist, Director of the Institute of Volcanology, Petropavlovsk-Kamchatkskii, Russia.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, Russia, 1890/1.

(1) Tsumeb, Namibia; by electron microprobe, average of seven analyses, total Fe as FeO, H_2O by difference; with $(OH)^{1-}$ supplied for charge balance, corresponds to $Pb_{2.09}(Zn_{0.68}Fe^{2+}_{0.18})_{\Sigma=0.86}[(AsO_4)_{1.46}(SO_4)_{0.50}]_{\Sigma=1.96}(OH)_{0.52}\bullet 0.62H_2O$.

Mineral Group: Brackebuschite group.

Occurrence: A very rare secondary mineral, in a cavity in chalcocite, from an oxidized zone in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Goethite, anglesite, wulfenite, chalcocite, arsendescloizite, gypsum.

Distribution: From Tsumeb, Namibia.

Name: To honor Dr. Mark N. Feinglos (1948–), American medical researcher and mineral collector specializing in Tsumeb minerals, Durham, North Carolina, USA, who first noted the mineral.

Type Material: The Natural History Museum, London, England, 1984,943; Harvard University, Cambridge, Massachusetts, USA, 95.66.

(1) Noda-Tamagawa mine, Japan. (2) MnO(OH).

Polymorphism & Series: Trimorphous with manganite and groutite.

Occurrence: In a mixture with hausmannite, formed by supergene oxidation of and replacing earlier pyrochroite.

Association: Pyrochroite, hausmannite.

Distribution: From Franklin, Sussex Co., New Jersey, USA. In Japan, in the Noda-Tamagawa and Tanohata mines, Iwate Prefecture; the Hamayokokawa mine, Nagano Prefecture; the Taguchi mine, Aichi Prefecture; and the Ioi mine, Shiga Prefecture. At Långban and Pajsberg, Värmland, Sweden.

Name: To honor Dr. Walter Feitknecht (1899–?), Swiss Professor of Chemistry, University of Berne, Berne, Switzerland, who synthesized the compound.

Type Material: n.d.

(1) Felbertal mine, Austria; by electron microprobe, average of fifteen analyses, original total given as 100.36% or 100.4%; corresponds to $Cu_{2.02}Ag_{0.37}(Pb_{5.20}Cd_{0.14})_{\Sigma=5.34}Bi_{8.33}(S_{18.88}Te_{0.06})_{\Sigma=18.94}$. (2) Funiushan deposit, China; by electron microprobe, corresponds to $Cu_{2.19}Ag_{0.70}Pb_{4.64}(Bi_{8.41}Sb_{0.01})_{\Sigma=8.42}(S_{18.31}Se_{0.62}Te_{0.13})_{\Sigma=19.06}$. (3) $Cu_2Pb_6Bi_8S_{19}$.

Occurrence: In a hydrothermal tungsten deposit in amphibolites and felsic gneisses, in discordant quartz veins (Felbertal mine, Austria); in a copper deposit in skarn, developed at the contact between a granodiorite complex with quartz sandstone and slate hornfels (Funiushan deposit, China).

Association: Cosalite, lillianite, bismuthinite–aikinite species, cannizzarite, junoite, pavonite series species, bismuth, chalcopyrite (Felbertal mine, Austria); aikinite, friedrichite, berryite, wittichenite, pekoite, benjaminite, tetradymite, galena, chalcopyrite, andradite (Funiushan deposit, China).

Distribution: From the Felbertal tungsten mine, Salzburg, Austria [TL]. At the Funiushan copper skarn deposit, 26 km east of Nanjing, Jiangsu Province, China.

Name: For the valley of Felbertal, Austria, in which the mineral was found.

Type Material: University of Copenhagen, Copenhagen, Denmark; Mineralogical Institute, University of Salzburg, Salzburg, Austria, 14493, 14494; The Natural History Museum, London, England, 1999,174.

(1) Khibiny massif, Russia.

Occurrence: In pegmatites associated with an ijolite-urtite intrusion in a differentiated alkalic massif.

Association: Albite, nepheline, "aegirine-augite," delhayelite, eudialyte.

Distribution: On Mts. Rasvumchorr and Yukspor, Khibiny massif, Kola Peninsula, Russia.

Name: For *Fe, Na, K, Si* in the composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 1780; Vernadsky Geological Museum, Moscow, 46626; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61123, 61124, 62013.

Ferberite $Fe^{2+}WO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As wedge-shaped crystals, typically flattened {100} and elongated along [010] or, less commonly, along [001], to 15 cm; faces striated ‖ [001] or [010]; in groups of bladed crystals; massive. *Twinning:* Contact twins with composition plane {100} or {023}, or more rarely {001}; also interpenetrant or lamellar.

Physical Properties: *Cleavage:* {010}, perfect; {100} and {102}, partings. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 7.58 D(calc.) = 7.60 Slightly magnetic.

Optical Properties: Nearly to entirely opaque. *Color:* Black; dark brown in transmitted light. *Streak:* Brownish black to black. *Luster:* Submetallic to metallic adamantine.
Optical Class: Biaxial (+). α = n.d. β = ∼2.40 γ = n.d. 2V(meas.) = 66°
Anisotropism: Distinct. *Bireflectance:* Weak.
R_1–R_2: (400) 16.5–19.5, (420) 16.4–19.2, (440) 16.3–18.9, (460) 16.2–18.7, (480) 15.9–18.5, (500) 16.0–18.7, (520) 16.0–18.7, (540) 16.0–18.7, (560) 16.0–18.7, (580) 15.8–18.6, (600) 15.8–18.6, (620) 15.7–18.6, (640) 15.6–18.5, (660) 15.5–18.3, (680) 15.4–18.1, (700) 15.5–18.0

Cell Data: *Space Group:* $P2/c$. $a = 4.72$ $b = 5.70$ $c = 4.96$ $\beta = 90°$ Z = 2

X-ray Powder Pattern: Tirpersdorf, near Oelsnitz, Saxony, Germany.
2.940 (10), 4.69 (8), 3.75 (6), 2.476 (6), 2.470 (6), 3.65 (5), 2.195 (5)

MnO	0.19	
Total	99.77	100.00

(1) Kurasawa, Yamanashi Prefecture, Japan. (2) $FeWO_4$.

Polymorphism & Series: Forms a series with hübnerite.

Occurrence: In high-temperature hydrothermal veins, greisens, and granitic pegmatites; also residual in alluvial and eluvial deposits.

Association: Scheelite, topaz, fluorite, marcasite, pyrite, hematite, feldspar.

Distribution: Numerous minor localities; material approaching end-member composition is uncommon. From near Aquilas, Sierra de Almagrera, Almería Province, Spain. At Panasqueira, Portugal. From around Calstock and elsewhere in Cornwall, England. Large crystals at Pechtelsgrün and Zinnwald, Saxony, Germany. From Chanteloube, near Limoges, Haute-Vienne, France. In the USA, an ore mineral, well-crystallized, from a number of mines in the Boulder Co. tungsten district, Colorado; on Corral Creek, near Soldier Mountain, Camas Co., Idaho; in the Elizabethtown district, Colfax Co., New Mexico; at the Monarch tungsten mine, Ubehebe district, Inyo Co., California. From Mundo Nuovo and Junin, Peru. In the Quechisla district and elsewhere in Potosí, Bolivia. Large crystals from Kirwa, Kigezi, Uganda. At Gejui, Hunan Province, China. At the Tae wha mine, Chungju, North Chungchong Province, South Korea.

Name: Honors Moritz Rudolph Ferber (1805–1875), amateur mineralogist, Gera, Germany.

Fe	12.60
Cr	87.58
Total	100.18

(1) Efim area, Russia; by electron microprobe, corresponding to $Cr_{3.0}Fe_{1-x}$, with x = 0.6.

Occurrence: In quartz veins within brecciated amphibolites and schist.

Association: Iron, copper, bismuth, gold, chromferide, graphite, cohenite, halite, sylvite, marialite, quartz.

Distribution: From a gold deposit in the Efim area, Kumak district, 110 km east of Orsk, Southern Ural Mountains, Russia [TL].

Name: For the chemical composition, FERrum, *iron*, and CHROMium.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Fergusonite-(Ce) $(Ce, La, Y)NbO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Tetragonal.] *Point Group:* [$4/m$] [by analogy to fergusonite-(Y)]. As prismatic dipyramidal crystals, to 1 mm, and as irregular poikioblasts, to 1 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = [5.5–6.5] VHN = 720–800 D(meas.) = 5.45–5.48 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark red to black; reddish in transmitted light. *Luster:* Adamantine.
Optical Class: Uniaxial (–). $\omega = 2.30$ $\epsilon = 2.20$

Cell Data: *Space Group:* [$I4_1/a$.] $a = 5.17$ $c = 5.30$ Z = [2]

X-ray Powder Pattern: Novopoltavskii massif, Russia.
3.1 (10), 1.882 (9), 1.631 (5), 1.566 (4), 2.60 (3), 3.5 (2), 2.76 (2)

Chemistry:

	(1)
U_3O_8	1.11
Nb_2O_5	42.01
Ta_2O_5	1.00
TiO_2	0.05
ThO_2	0.88
RE_2O_3	52.26
Fe_2O_3	0.13
CaO	0.81
H_2O	1.79
Total	[100.04]

(1) Novopoltavskii massif, Russia; original total given as 99.94%; RE = La 12%, Ce 34%, Pr 4%, Nd 21%, Sm 3%, Eu 0.5%, Gd 5%, Tb 0.2%, Dy 1.7%, Ho 0.3%, Er 2%, Tm 0.1%, Yb 1.6%, Y 11.6%; corresponds to $[(Ce, La, Y)_{0.96}Ca_{0.04}Th_{0.01}]_{\Sigma=1.01}(Nb_{0.98}Ta_{0.02})_{\Sigma=1.00}O_{4.00} \bullet 0.30H_2O$.

Polymorphism & Series: Dimorphous with fergusonite-beta-(Ce).

Occurrence: In a carbonatite (Novopoltavsk massif, Russia); in magnesium-rich skarn of the outer granite contact zone of a carbonatite-derived dolomitic marble (Bayan Obo, China).

Association: Magnetite, phlogopite, graphite, chlorite, quartz, pyrite, columbite, allanite, bastnäsite, parisite, apatite, uranpyrochlore, aeschynite, fersmite, monazite, calcite, dolomite (Novopoltavsk massif, Russia).

Distribution: In the Chernigovskaya zone, Novopoltavskii massif, Azov Sea area, Ukraine. From the eastern Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. On Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA.

Name: For its relation to *fergusonite-(Y)*, and its dominant *cerium* content.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79595.

Fergusonite-(Nd) $(Nd, Ce)(Nb, Ti)O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Tetragonal]; typically metamict. *Point Group:* [4/*m*] [by analogy to fergusonite-(Y)]. As granular to equant grains.

Physical Properties: Hardness = [5.5–6.5] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark brown. *Luster:* Adamantine. *Optical Class:* [Isotropic when metamict.] n = n.d.

Cell Data: *Space Group:* [$I4_1/a$.] a = n.d. c = n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: (1) Bayan Obo, China; analysis not published; RE_2O_3 47.54%, with empirical formula $(Nd_{0.33}Ce_{0.14}Fe_{0.10}Gd_{0.05}Pr_{0.04}Dy_{0.03}Y_{0.03}La_{0.02}Eu_{0.01}Tb_{0.01}Er_{0.01}Th_{0.01}U_{0.01}Mn_{0.01})_{\Sigma=0.80}(Nb_{0.83}Ti_{0.17})_{\Sigma=1.00}O_{3.64}$.

Polymorphism & Series: Dimorphous with fergusonite-beta-(Nd).

Occurrence: In veinlets in a carbonatite-derived dolomitic marble.

Association: Aegirine, fergusonite-beta-(Nd).

Distribution: From the central Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China.

Name: For its relation to *fergusonite-(Y)*, and its dominant *neodymium* content.

Type Material: n.d.

References: (1) Peishan Zhang and Kejie Tao (1987) Characteristics of the fergusonite- and aeschynite-group minerals in China. Zhongguo Xitu Xuebao, 5, 1–7 (in Chinese with English abs.). (2) (1989) Amer. Mineral., 74, 946–947 (abs. ref. 1).

Fergusonite-(Y) $YNbO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal; typically metamict. *Point Group:* $4/m$. As prismatic to acicular dipyramidal crystals, to 20 cm; granular, massive.

Physical Properties: *Cleavage:* {111}, poor. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–6.5 D(meas.) = 5.6–5.8 D(calc.) = [5.65]

Optical Properties: Opaque, transparent on thin edges. *Color:* Gray, yellow, brown, brownish black when altered; light brown to dark brown in transmitted light. *Streak:* Brown, yellow-brown, greenish gray. *Luster:* Dull; vitreous to submetallic on fractures.
Optical Class: Isotropic; rarely uniaxial. $n = 2.05$–2.19

Cell Data: *Space Group:* $I4_1/a$. $a = 5.15$ $c = 10.89$ Z = 4

X-ray Powder Pattern: Madawaska, Canada; after heating at 1200 °C.
3.12 (100), 2.96 (90), 1.901 (50), 2.74 (40), 1.855 (30), 3.01 (20), 2.64 (20)

(1) Near Cape Farewell, Greenland. (2) $YNbO_4$.

Polymorphism & Series: Dimorphous with fergusonite-beta-(Y); forms a series with formanite-(Y).

Occurrence: Typical of rare-earth-bearing granite pegmatites; in placers.

Association: Monazite, gadolinite, thalenite, euxenite, allanite, zircon, biotite, magnetite.

Distribution: Widespread, but in small amounts. On Qeqertaussaq [Kikertaursuk] Island, Julienhåb district, Greenland. In Norway, many localities in the Evje-Iveland district; from Arendal; at Berg, near Råde; from Hundholmen; and from near Risör. In Sweden, at Ytterby, on Resarö Island, near Vaxholm, and Kårarfvet, near Falun. In Finland, from Laurinmäki. From the Blum mine, Ilmen Mountains, Southern Ural Mountains, Russia. In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. In Madagascar, from Ambatofotsikely, Ranomafana, Fiadanana, and elsewhere. In the USA, from the Baringer Hill pegmatite, 26 km west of Burnet, Llano Co., Texas; in the Champion and Rutherford pegmatite deposits, Amelia Co., and at Little Friar Mountain, Amherst Co., Virginia; at Spruce Pine, Mitchell Co., North Carolina; from Storeville, Anderson Co., South Carolina; at Rockport, Cape Ann, Essex Co., Massachusetts. At Madawaska, Ontario, Canada. From Hakatamura, Iyo Prefecture, and at Naegi, Mino Prefecture, Japan.

Name: Honors Robert Ferguson (1767–1840), landowner, politician, and mineral collector, of Raith, near Kirkaldy, Scotland, and for its predominant *yttrium* content.

Type Material: n.d.

Fermorite $(Ca,Sr)_5(PO_4,AsO_4)_3(F,OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crudely prismatic, massive, granular.

Physical Properties: *Fracture:* Uneven. Hardness = 5 D(meas.) = 3.518 D(calc.) = [3.41]

Optical Properties: Translucent. *Color:* Pale pinkish white to white. *Streak:* White. *Luster:* Greasy.
Optical Class: Uniaxial (–). $n = \sim 1.66$

Cell Data: *Space Group:* $P2_1/m$, pseudo-$P6_3/m$. $a = 9.55$ $c = 6.98$ Z = 2

X-ray Powder Pattern: Sitapar, India.
2.86 (10), 2.75 (6), 3.49 (5), 1.971 (4), 1.867 (4), 3.95 (3), 3.12 (3)

Chemistry:

insol.	0.08
$-O = F_2$	0.35
Total	100.17

(1) Sitapar, India; F determination probably low; corresponds to $(Ca_{4.46}Sr_{0.54})_{\Sigma=5.00}[(PO_4)_{1.60}(AsO_4)_{1.24}]_{\Sigma=2.84}(F,OH)$. (2) Do.; by electron microprobe, corresponds to $(Ca_{4.20}Sr_{0.80})_{\Sigma=5.00}[(PO_4)_{1.45}(AsO_4)_{1.48}]_{\Sigma=2.93}[(OH)_{0.66}(F_{0.34}]_{\Sigma=1.00}$.

Mineral Group: Apatite group.

Occurrence: A rare mineral in veinlets through a manganese deposit.

Association: Braunite, hollandite, pyrolusite.

Distribution: From Sitapar, Chhindwara district, Madhya Pradesh, India.

Name: Honors Dr. Lewis Leigh Fermor (1880–1954), former Director of the Geological Survey of India.

Type Material: National Museum of Natural History, Washington, D.C., USA, 94809.

Fernandinite $\mathbf{Ca(V^{5+},V^{4+},Fe^{2+})_8O_{20}\cdot 4H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals are platy, rectangular, to 10 μm; fibrous, cryptocrystalline, porous massive.

Physical Properties: Hardness = Soft. D(meas.) = 2.78(5) D(calc.) = 3.07 Somewhat soluble in cold H_2O, giving a yellow solution.

Optical Properties: Opaque to translucent. *Color:* Dull green; light green, dark olive-green, brownish green in transmitted light. *Luster:* Submetallic.
Optical Class: Biaxial; strong birefringence. $n = 2.05$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. $a = 11.680(1)$ $b = 3.6537(4)$ $c = 11.023(2)$ $\beta = 105.00(2)^\circ$ Z = [1]

X-ray Powder Pattern: Minasragra, Peru; very close to corvusite.
10.68 (100), 3.483 (26), 1.836 (8), 2.826 (7), 1.949 (6), 3.545 (4), 2.549 (4)

Total	[100.0]	[100.0]

(1) Minasragra, Peru; by electron microprobe, average of five analyses, all V as V_2O_5, H_2O by difference; assuming Si and Al as impurities, V^{5+}:V^{4+} from crystal-structure analysis, corresponds to $(Ca_{0.86}K_{0.04})_{\Sigma=0.90}(V^{5+}_{6.48}V^{4+}_{1.39}Fe^{2+}_{0.05}Ti_{0.02})_{\Sigma=7.94}O_{20}\cdot 2.5H_2O$. (2) Do.; by electron microprobe, average of 10 analyses, all V as V_2O_5, H_2O by difference; V^{5+}:V^{4+} from crystal-structure analysis, corresponds to $(Ca_{0.92}K_{0.04}Na_{0.01})_{\Sigma=0.97}(V^{5+}_{6.73}V^{4+}_{0.88}Fe^{2+}_{0.34}Ti_{0.05})_{\Sigma=8.00}O_{20}\cdot 4.5H_2O$.

Occurrence: In a rich vanadium deposit in fissures that cut red shales and that were probably filled by a remobilized asphaltite deposit.

Association: Hewettite, quartz.

Distribution: From Minasragra, 46 km from Cerro de Pasco, Peru. In the USA, at the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; from the Cactus Rat mine group, Yellow Cat district, 24 km southeast of Thompson, Grand Co., Utah; in the Spring Creek Mesa area, Uravan district, Montrose Co., Colorado.

Name: For Eulagio E. Fernandini, formerly an owner of the Minasragra, Peru deposit.

Type Material: Harvard University, Cambridge, Massachusetts, 101718; National Museum of Natural History, Washington, D.C., USA, 87661, R5706.

Feroxyhyte δ–$Fe^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Acicular, minute, possibly comprised of rolled thin plates; in aggregates with clay particles.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.20 Transforms in air to goethite.

Optical Properties: [Opaque.] *Color:* Brown, yellow-brown.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* n.d. $a = 2.93$ $c = 4.60$ Z = 1

X-ray Powder Pattern: Locality not stated; may be confused with vernadite.
2.54 (10), 1.47 (8), 2.23 (5), 1.69 (3)

Chemistry: Natural material appears not to have been analyzed; confirmation is from the correspondence of X-ray powder pattern and other physical properties with synthetic material.

Polymorphism & Series: Trimorphous with goethite and lepidocrocite.

Occurrence: In sea-floor Fe–Mn concretions. As cement and coatings on clasts in chemically reduced, poorly drained soils and sediments, formed by the rapid oxidation of ferrous compounds.

Association: Lepidocrocite, goethite.

Distribution: In soils around Kolomyya, Carpathian Mountains, Ukraine. Also near Moscow, Ryazan, and Smolensk, Russia. On the floors of the Pacific Ocean, at depths of 4800 m, and the Baltic, White, and Kara Seas. Found in the Koktenkol deposit, central Kazakhstan. In Holocene sediments near Parainen and Somero, Finland. From Laurium, Greece, in slag.

Name: For the principal components, iron (FERrum), OXYgen, and HYdroxyl, in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Ferrarisite $Ca_5(AsO_4)_2(AsO_3OH)_2 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals, flattened on {110}, slightly elongated along [$\overline{1}$10], with pseudohexagonal outline, to 300 μm.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = n.d. D(meas.) = 2.63 D(calc.) = 2.594 Dehydrates in dry air.

Optical Properties: Transparent. *Color:* Colorless, white on dehydration. *Optical Class:* Biaxial (+). *Orientation:* X $\wedge$ c = 17°; Z $\perp$ {110}. *Dispersion:* Strong. $\alpha = 1.562(2)$ $\beta = 1.572(2)$ $\gamma = 1.585(2)$ 2V(meas.) = ∼90° 2V(calc.) = 83°

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.294(4)$ $b = 6.722(3)$ $c = 11.198(5)$ $\alpha = 106.16(4)°$ $\beta = 92.94(4)°$ $\gamma = 99.20(4)°$ Z = 1

X-ray Powder Pattern: Sainte-Marie-aux-Mines, France.
10.81 (10), 2.831 (9), 3.170 (8), 4.07 (4), 3.573 (4), 6.34 (3), 5.36 (3)

Chemistry:

	(1)	(2)
As_2O_5	49.3	49.95
MgO	0.52	
CaO	30.6	30.47
H_2O	19.4	19.58
Total	99.8	100.00

(1) Sainte-Marie-aux-Mines, France; by AA, MgO considered as admixed picropharmacolite, H_2O average of two determinations, one by the Penfield method 18.1%, another by TGA 20.7%; corresponds to $Ca_{5.00}(AsO_4)_2(AsO_3OH)_2 \cdot 9.85H_2O$. (2) $Ca_5(AsO_4)_2(AsO_3OH)_2 \cdot 9H_2O$.

Polymorphism & Series: Dimorphous with guérinite.

Occurrence: A post-mine low-temperature reaction product of carbonate gangue with arsenical solutions derived from arsenic (Sainte-Marie-aux-Mines, France).

Association: Picropharmacolite, pharmacolite, sainfeldite, rauenthalite, phaunouxite, calcite, löllingite (Sainte-Marie-aux-Mines, France).

Distribution: From the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, and at Duranus, Alpes-Maritimes, France. In Germany, in the Anton mine, Heubachtal, near Schiltach, Wittichen, Black Forest, in the Bauhaus district, Richelsdorf Mountains, Hesse, and at Ramsbeck, North Rhein-Westphalia.

Name: To honor Professor Giovanni Ferraris (1937–), Institute of Mineralogy, Crystallography and Geochemistry, University of Turin, Turin, Italy, who worked on crystal structures of several arsenate minerals from Sainte-Marie-aux-Mines, France.

Type Material: National School of Mines, Paris, France; Institute of Mineralogy and Crystallography, University of Stuttgart, Stuttgart, Germany; National Museum of Natural History, Washington, D.C., USA, 146899.

Ferricopiapite $\mathbf{Fe^{3+}_{2/3}Fe^{3+}_4(SO_4)_6(OH)_2 \cdot 20H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. [As pseudo-orthorhombic plates, tabular on {010}, multiply modified, typically in scaly or granular pulverulent aggregates.] (by analogy to copiapite group members).

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = ∼2 D(meas.) = 2.14 D(calc.) = 2.14 Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Yellow, yellow-orange.
Optical Class: Biaxial (+). *Pleochroism:* In shades of yellow. *Orientation:* $X \simeq b$.
Dispersion: $r > v$. $\alpha = 1.496$–1.530 $\beta = 1.531$–1.550 $\gamma = 1.579$–1.592 2V(meas.) = 69°–80°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.394(5)$ $b = 18.36(2)$ $c = 7.324(8)$ $\alpha = 93.8(1)°$ $\beta = 102.2(1)°$ $\gamma = 98.9(1)°$ Z = 1

X-ray Powder Pattern: Challant-St. Anselme mine, Italy.
9.06 (100), 5.58 (80), 3.58 (78), 18.4 (70), 6.04 (70), 3.53 (67), 4.03 (48)

Chemistry:

	(1)	(2)
SO_3	38.82	39.01
Fe_2O_3	30.29	30.26
H_2O	31.07	30.73
Total	100.18	100.00

(1) Challant-St. Anselme mine, Italy. (2) $Fe^{3+}_{2/3}Fe^{3+}_4(SO_4)_6(OH)_2 \cdot 20H_2O$.

Mineral Group: Copiapite group.

Occurrence: A secondary mineral formed typically by the weathering and oxidation of iron sulfide in a wide range of rock types, preserved in arid climates.

Association: Pyrite.

Distribution: Studied material from: in Chile, in Atacama, at Tierra Amarilla, southeast of Copiapó; in Antofagasta, from Alcaparrosa, near Cerritos Bayos and in the Sierra Gorda district, both southwest of Calama. In the Capillitas mine, Catamarca Province, Argentina. Along Cache Creek, British Columbia, Canada. In the USA, in the Campbell mine, Bisbee, Cochise Co., Arizona; at Coso Hot Springs, Inyo Co., California; in the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. At the Challant-St. Anselme mine, Ayas Valley, Val d'Aosta, Piedmont, Italy.

Name: For the *ferric* iron member of the *copiapite* group.

Type Material: National Museum of Natural History, Washington, D.C., USA, 80516.

			Total	[100.00]	100.12

(1) Kamloops Lake, Canada; by electron microprobe, H_2O by difference; corresponding to $(Na_{0.78}K_{0.18})_{\Sigma=0.96}(Mg_{0.82}Ca_{0.04}Ba_{0.04}Sr_{0.02})_{\Sigma=0.92}(Si_{15.11}Al_{2.90})_{\Sigma=18.01}O_{36}\cdot 9H_2O$.
(2) Itomuka mine, Japan; by electron microprobe, H_2O by Penfield method, corresponding to $(K_{0.78}Na_{0.66})_{\Sigma=1.44}Mg_{0.54}(Si_{15.48}Al_{2.52})_{\Sigma=18.00}O_{36}\cdot 9.41H_2O$.

Mineral Group: Zeolite group.

Occurrence: In seams and vesicles in deeply weathered basalts, flow breccias, and andesites; in tuffaceous sediments.

Association: Zeolites, plagioclase, "hypersthene," augite, montmorillonite, "chalcedony," calcite.

Distribution: In Canada, in British Columbia, at Kamloops Lake, near Kamloops, and at Monte Lake and Pinaus Lake, near Westwold. In the USA, from Altoona, Wahkiakum Co., Washington; near Agoura, Los Angeles Co., and on Silver Mountain, southwest of Markleeville, Alpine Co., California. From Albero Basso and Val Timonchio, Vicenza, and near Monastir, Cagliari, Sardinia, Italy. At Weitendorf, near Wildon, Styria, Austria. From Reichweiler, Rhineland-Palatinate, Germany. On Phillip Island, Victoria, and at Unanderra, New South Wales, Australia. In the Itomuka mine, Hokkaido, and at Tadumi, Fukushima Prefecture, Japan. A number of other occurrences are known.

Name: For Dr. Walter Frederick Ferrier (1865–1950), geologist and mining engineer with the Canadian Geological Survey.

Type Material: McGill University, Montreal, Canada, RMF3099.

Ferrihydrite $5Fe_2O_3 \cdot 9H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As poorly crystalline spheres, to 50 μm, in globular aggregates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: [Opaque.] *Color:* Yellow-brown to dark brown.
Optical Class: Uniaxial. ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* n.d. $a = 5.08$ $c = 9.4$ Z = [1]

X-ray Powder Pattern: Synthetic.
2.50 (100), 2.21 (80), 1.96 (80), 1.48 (80), 1.51 (70), 1.72 (50)

Chemistry: Natural material appears not to have been analyzed; confirmation is from the correspondence of X-ray powder pattern and other physical properties with synthetic material. Most ferrihydrites contain appreciable silica, chemically adsorbed.

Occurrence: Widespread in the soluble fraction of soils and weathered rock. In precipitates around cold and hot springs, especially those supporting iron-metabolizing bacteria; in acid mine effluent.

Association: Goethite, lepidocrocite, hematite, manganese oxides.

Distribution: Widespread. Well-characterized from: the Ridder (Leninogorsk) and Belousovsk Pb–Zn mines, Rudnyi Altai, Kazakhstan. At Joensuu, Pohjiskarjala, and elsewhere in Finland. From Killiechronan, southwest of Salen, Isle of Mull, Scotland. In the Clara mine, near Oberwolfach, Black Forest, Germany. In the USA, at Mineral Hill, Delaware Co., Pennsylvania; at Hot Springs, Garland Co., Arkansas; and in the Niagara basin of Lake Ontario.

Name: For FERRIc iron in its composition, and a HYDRated mineral.

Type Material: Vernadsky Geological Musem, Moscow, 51508; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 76642.

(1) Tsumeb, Namibia; by electron microprobe, H_2O by CHN analyzer; corresponds to $(Ca_{0.92}Pb_{0.05})_{\Sigma=0.97}(Fe_{0.87}Zn_{0.81}Cu_{0.34}Al_{0.01})_{\Sigma=2.03}(AsO_4)_2(OH, H_2O)_2$. (2) Do.; by electron microprobe, average of 20 analyses, total Fe as Fe_2O_3, H_2O calculated from theory; corresponds to $Ca_{1.02}(Fe_{0.93}Zn_{1.04})_{\Sigma=1.97}(AsO_4)_{2.02}[(H_2O)_{1.08}(OH)_{0.90}]_{\Sigma=1.98}$.

Mineral Group: Tsumcorite group.

Occurrence: Very rare, on museum specimens from a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Conichalcite, scorodite, schneiderhöhnite, beudantite, tennantite, calcite.

Distribution: From Tsumeb, Namibia.

Name: As the *ferric* iron analog of *lotharmeyerite*.

Type Material: Canadian Geological Survey, Ottawa, Canada, NMC 64573; Museum Victoria, Melbourne, Australia, M38092.

(1) Santa Rita Mountains, Pima Co., Arizona, USA; average of two analyses, recalculated to 100% after deduction of insoluble 2.66%; corresponds to $Fe_{1.94}(MoO_4)_{3.00} \cdot 6.84H_2O$.
(2) Huanglongpu deposit, China; corresponds to $Fe_{1.68}Si_{0.23}(Mo_{1.07}O_4)_{3.00} \cdot 8.22H_2O$.
(3) $Fe_2(MoO_4)_3 \cdot 8H_2O$.

Occurrence: An uncommon secondary mineral in the oxidized portions of hydrothermal vein and porphyry-type molybdenum-bearing deposits.

Association: Molybdenite, pyrite, chalcopyrite.

Distribution: Widely distributed, but commonly in small amounts. Studied material from the Alekseevskii mine, Khakassia district, Siberia, Russia. At Vielsalm, Belgium. In the USA, abundant in the Climax mine, Lake Co., Colorado; in Sulfur Gulch, Questa, Taos Co., New Mexico; from Mineral Park, Mohave Co., Arizona; in the Little Cottonwood district, Salt Lake Co., Utah. From the Kingsgate district and elsewhere, New South Wales, Australia. In the Huanglongpu deposit, Jinduicheng, Shaanxi Province, China.

Name: For the essential chemical components, FERRIc iron and MOLYBDate anionic group.

Type Material: n.d.

Ferrinatrite $Na_3Fe^{3+}(SO_4)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystals with hexagonal outline, short prismatic along [0001] to fibrous, $\{10\overline{1}0\}$, $\{11\overline{2}0\}$, with several terminating forms, to several mm; in stellate aggregates; cryptocrystalline to cleavable massive.

Physical Properties: *Cleavage:* On $\{10\overline{1}0\}$, perfect; on $\{11\overline{2}0\}$, less perfect.
Fracture: Splintery. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.55–2.61 D(calc.) = 2.55
Alters to sideronatrite in moist air.

Optical Properties: Transparent. *Color:* Colorless, grayish white, pale green, bluish green; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.556–1.558$ $\epsilon = 1.610–1.613$

Cell Data: *Space Group:* $P\overline{3}$. $a = 15.566(5)$ $c = 8.69(1)$ $Z = 6$

X-ray Powder Pattern: Cetine mine, Italy.
7.78 (100), 2.909 (87), 3.430 (66), 2.938 (57), 2.827 (57), 3.297 (53), 4.39 (51)

Chemistry:

	(1)	(2)
SO_3	50.50	51.42
Fe_2O_3	18.02	17.10
Na_2O	19.10	19.91
H_2O	12.45	11.57
Total	100.07	100.00

(1) Sierra Gorda, Chile; total originally given as 100.11%. (2) $Na_3Fe(SO_4)_3 \cdot 3H_2O$.

Occurrence: An oxidation product of iron sulfides, typically in arid regions; rarely fumarolic.

Association: Metavoltine, copiapite, coquimbite, sideronatrite, tamarugite, quenstedtite, römerite (Chile); gypsum, sideronatrite, metavoltine, tamarugite, uklonskovite, jurbanite, rostite (Cetine mine, Italy).

Distribution: From various localities in the Atacama Desert, Chile, as at Mina la Compania, near Sierra Gorda, Atacama; at Alcaparrosa, near Cerritos Bayos, southwest of Calama, from Quetena, west of Calama, and at Chuquicamata, Antofagasta. From Vesuvius, Campania, and at the Cetine mine, near Rosia, Tuscany, Italy. In the Escuhu Formation, Teruel Province, and at the Lanjarón mineral springs, Granada Province, Spain.

Name: For the essential chemical components, FERRIc iron and sodium, NATRium.

Type Material: n.d.

Ferripyrophyllite $Fe_2^{3+}Si_4O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: [Monoclinic] (by analogy to pyrophyllite). *Point Group:* [2/*m*.] Fine-scaly, granular, compact.

Physical Properties: *Tenacity:* Waxy. Hardness = 1.5–2 D(meas.) = 2.97–3.01 D(calc.) = [3.05]

Optical Properties: Semitransparent. *Color:* Brownish yellow. *Optical Class:* Biaxial. *Pleochroism:* $X = Y$ = greenish; Z = bright yellow. α = 1.650–1.660 β = 1.676–1.678 γ = 1.686–1.688 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. $a = 5.26$ $b = 9.10$ $c = 19.1$ $\beta = 95°30'$ Z = [4]

X-ray Powder Pattern: The Strassenschacht, Germany.
4.54 (10), 9.6 (8), 1.518 (8), 3.17 (7), 2.62 (4), 2.47 (4), 1.725 (3)

Chemistry: (1) The Strassenschacht, Germany; by electron microprobe, analysis not given, stated to correspond to $Fe^{3+}_{1.96}Mg_{0.11}Ca_{0.05}(Si_{3.80}Al_{0.13}Fe^{3+}_{0.07})_{\Sigma=4.00}O_{10}(OH)_2 \bullet H_2O$. (2) Mt. Tologay, Kazakhstan; by electron microprobe, analysis not given, stated to correspond to $Fe^{3+}_{1.97}Ca_{0.18}(Na,K)_{0.03}Mg_{0.02}(Si_{3.74}Al_{0.23})_{\Sigma=3.97}O_{10}(OH)_2 \bullet 1.5H_2O$.

Polymorphism & Series: [Isostructural with the 2M modification of pyrophyllite.]

Occurrence: Found on museum specimens.

Association: n.d.

Distribution: From the Strassenschacht hematite deposit, south of Eibenstock, Saxony, Germany. At the Tulagai Pb–Cu deposit, near Akchatau, Kazakhstan.

Name: Presumably for its FERRIc iron content and relation to *pyrophyllite*.

Type Material: Moscow University, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79071, vis5430, 5431.

Ferrisicklerite $Li(Fe^{3+}, Mn^{2+})PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rare crystals, to 1 mm, in spherical or radial aggregates; usually massive, may be monocrystalline, in nodules, and as rims around crystals and masses of triphylite-lithiophilite.

Physical Properties: *Cleavage:* {010}, perfect; {100}, good. Hardness = ∼4
D(meas.) = 3.2–3.4 D(calc.) = 3.257

Optical Properties: Subtranslucent to opaque. *Color:* Colorless, yellowish brown to dark chocolate-brown. *Streak:* Pale yellowish brown, brown, reddish brown.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Pleochroism:* Faint; X = golden yellow to yellow-orange; Z = pale yellow to golden yellow. $\alpha = 1.790(5)$ $\beta = 1.805(5)$
$\gamma = 1.820(5)$ 2V(meas.) = ∼85°

Cell Data: *Space Group: Pmnb.* $a = 5.918(3)$ $b = 10.037(6)$ $c = 4.799(3)$ Z = 4

X-ray Powder Pattern: Sidi Bou Othmane, Morocco.
2.959 (100), 5.01 (70), 4.33 (40), 2.49 (35), 3.49 (30), 3.82 (20), 2.444 (15)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
P_2O_5	44.80	43.73	47.03	CaO	1.36	0.62	0.10
SiO_2		0.12	0.16	Li_2O	3.72	3.95	[1.20]
Fe_2O_3	27.20	32.22	44.76	Na_2O	0.81	0.40	0.01
Mn_2O_3	0.00			H_2O^+	0.51	1.48	n.d.
FeO	0.59	0.34		H_2O^-	0.51	0.63	
MnO	19.13	15.66	1.97	insol.	1.66		
MgO	0.11	0.96	3.57	Total	100.40	100.11	[98.80]

(1) Varuträsk, Sweden. (2) Sidi Bou Othmane, Morocco; corresponds to $(Li_{0.40}Na_{0.02}Fe_{0.01})_{\Sigma=0.43}(Fe^{3+}_{0.61}Mn^{2+}_{0.34}Mg_{0.04}Ca_{0.01})_{\Sigma=1.00}[(PO_4)_{0.94}(OH)_{0.06}]_{\Sigma=1.00}$. (3) Angarf-Sud pegmatite, Morocco; by electron microprobe, Li_2O calculated for charge balance; corresponds to $Li_{0.12}(Fe^{3+}_{0.84}Mg_{0.13}Mn^{2+}_{0.04})_{\Sigma=1.01}(PO_4)$.

Polymorphism & Series: Forms a series with sicklerite.

Occurrence: Formed by late hydrothermal alteration or weathering of triphylite-lithiophilite in complex zoned granite pegmatites.

Association: Triphylite-lithiophilite, heterosite, alluaudite, phosphosiderite, cyrilovite.

Distribution: In Sweden, from the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten; at the Norrö pegmatite, on Rånö Island, and on Utö Island. At Tammela, Finland. From Hühnerkobel, near Zwiesel, and crystallized from Hagendorf, Bavaria, Germany. From pegmatites around Sidi Bou Othmane, Jebilet, and the Angarf-Sud pegmatite, Tazenakht Plain, Anti-Atlas Mountains, Morocco. At the Souchon pegmatite, Lamativi, and Portree mine, Odzi, Zimbabwe. In the Buranga pegmatite, Gatumba district, Rwanda. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. In the USA, from Strafford and Rochester, Strafford Co., and in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from Newry and Paris, Oxford Co., Maine; in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina. Probably present at many other pegmatites.

Name: For its dominant *ferric* iron content and relation to *sicklerite*.

Type Material: n.d.

Ferristrunzite $Fe^{3+}Fe^{3+}_2(PO_4)_2(OH)_3 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$ or 1. Crystals are acicular, rounded and elongated ‖ [001], in subparallel, radial, and matted aggregates, to 3 mm. *Twinning:* On {110}.

Physical Properties: *Cleavage:* One, probable, parallel *X*-*Z* OAP. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.38–2.50 D(calc.) = 2.55

Optical Properties: Semitransparent. *Color:* Light brownish yellow to pale orange. *Streak:* Very pale yellow.
Optical Class: Biaxial (+). *Pleochroism:* X = greenish yellow; Z = brownish yellow. *Orientation:* $Z \wedge c \simeq 17°$. *Dispersion:* Strong. *Absorption:* $Z > X$. $\alpha = 1.664(4)$ $\beta = [1.698]$ $\gamma = 1.757(5)$ 2V(meas.) = 77(10)°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.01(2)$ $b = 9.73(2)$ $c = 7.334(8)$ $\alpha = 90.50(12)°$ $\beta = 96.99(10)°$ $\gamma = 116.43(10)°$ Z = 2

X-ray Powder Pattern: Blaton, Belgium.
5.34 (100), 8.87 (80), 3.267 (40), 4.20 (30), 3.442 (30), 3.387 (30), 4.48 (20)

Chemistry:

	(1)	(2)
P_2O_5	28.2	28.47
Fe_2O_3	46.3	48.04
H_2O	26.0	23.49
Total	100.5	100.00

(1) Blaton, Belgium; by electron microprobe, total Fe as Fe_2O_3, confirmed by microchemical tests, H_2O by TGA-EGA; corresponds to $Fe^{3+}_{0.92}Fe^{3+}_{2.00}(PO_4)_2(OH)_{2.52} \cdot 5H_2O$.
(2) $Fe_3(PO_4)_2(OH)_3 \cdot 5H_2O$.

Occurrence: A rare secondary mineral in argillaceous and clastic sediments, probably as an oxidation product of strunzite (Blaton, Belgium).

Association: Beraunite, crandallite, diadochite, allophane–evansite, strengite, phosphosiderite, cacoxenite (Blaton, Belgium).

Distribution: From near Blaton, Belgium. In Germany, at Aprath, near Wuppertal, North Rhine-Westphalia; in the Silbergrube quarry, near Waidhaus, Bavaria; from Ventorp, near Arnsberg, North Rhein-Westphalia.

Name: For *ferric* iron in the composition and its relation to *strunzite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162499.

References: (1) Peacor, D.R., P.J. Dunn, W.B. Simmons, and R.A. Ramik (1987) Ferristrunzite, a new member of the strunzite group, from Blaton, Belgium. Neues Jahrb. Mineral., Monatsh., 433–440. Ferrisurite

$\mathbf{(Pb,Ca)_{2-3}(CO_3)_{1.5-2}(OH,F)_{0.5-1}\cdot (Fe^{3+},Al)_2Si_4O_{10}(OH)_2\cdot nH_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* 2 or $2/m$. As crystals, flattened on {010}, tapering to fibrous, elongated ‖ [100]; in compact radial aggregates, to 2 mm.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Very flexible.
Hardness = 2–2.5 D(meas.) = 4.0(1) D(calc.) = 3.89

Optical Properties: Transparent to translucent. *Color:* Forest-green to light yellow-green. *Streak:* Greenish yellow to olive-green. *Luster:* Silky.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow; Y = brown; Z = light green. *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.757(3)$ $\beta = 1.763(3)$ $\gamma = 1.773(3)$ 2V(meas.) = n.d. 2V(calc.) = 76°

Cell Data: *Space Group:* $P2_1$ or $P2_1/m$. $a = 5.241(1)$ $b = 9.076(5)$ $c = 16.23(1)$ $\beta = 90.03(7)°$ Z = 2

X-ray Powder Pattern: Shirley Ann claim, California, USA.
4.53 (100), 3.240 (90), 2.612 (80), 2.272 (50), 16.1 (40), 3.727 (35), 5.40 (25), 1.715 (25)

Chemistry:

	(1)		(1)
SiO_2	26.6	BaO	0.1
Al_2O_3	3.2	Na_2O	0.3
Fe_2O_3	10.5	F	0.8
FeO	0.8	H_2O	3.5
PbO	42.7	CO_2	8.2
MgO	0.2	$-O=F_2$	0.3
CaO	3.4	Total	100.0

(1) Shirley Ann claim, California, USA; by electron microprobe, FeO by potentiometric titration, Fe^{2+}:Fe^{3+} by wet chemical analysis, CO_2 by coulometric titration, H_2O by Karl Fischer titration; corresponding to $(Pb_{1.73}Ca_{0.55}Na_{0.09}Ba_{0.01})_{\Sigma=2.38}(CO_3)_{1.68}[(OH)_{0.51}F_{0.38}]_{\Sigma=0.89}\cdot(Fe^{3+}_{1.19}Al_{0.57}Fe^{2+}_{0.10}Mg_{0.05})_{\Sigma=1.91}Si_4O_{10}(OH)_2\cdot 0.50H_2O$.

Occurrence: In an oxidized lead deposit in contact metamorphosed impure limestone, as an oxidation product of silicates proximate to galena.

Association: Galena, pyrite, chalcopyrite, covellite, chalcocite, quartz, calcite, hematite, cerussite, mimetite, wulfenite, malachite.

Distribution: At the Shirley Ann claim, Ubehebe district, west of Death Valley, Inyo Co., California, USA.

Name: For a predominance of Fe^{3+} over Al and its relation to *surite*.

Type Material: Natural History Museum of Los Angeles Co., Los Angeles, California; National Museum of Natural History, Washington, D.C., USA, 170288.

References: (1) Kampf, A.R., L.L. Jackson, G.B. Sidder, E.E. Foord, and P.M. Adams (1992) Ferrisurite, the Fe^{3+} analogue of surite, from Inyo County, California. Amer. Mineral., 77, 1107–1111.

K_2O		2.16
H_2O		[8.45]
LOI	7.52	
Total	[100.00]	[99.20]

(1) Nevada Scheelite mine, Nevada, USA; recalculated to 100% after removal of SiO_2 6.56% as quartz. (2) Kalzas Mountain, Yukon Territory, Canada; by electron microprobe, H_2O calculated from crystal-structure analysis; corresponding to $[(H_2O)_{0.59}Ca_{0.06}Na_{0.02}]_{\Sigma=0.67}(W_{1.46}Fe^{3+}_{0.54})_{\Sigma=2.00}[O_{4.70}(OH)_{1.30}]_{\Sigma=6.00}[(H_2O)_{0.80}K_{0.20}]_{\Sigma=1.00}$.

Occurrence: An alteration coating on, or replacing, primary tungsten minerals, as a product of weathering.

Association: Wolframite, ferberite, scheelite, alumotungstite, russellite, anthoinite, mpororoite, jarosite.

Distribution: In the USA, at the Germania tungsten mine, Deer Trail district, Fruitland, Stevens Co., Washington, and the Nevada Scheelite mine, near Rawhide, Leonard district, Mineral Co., Nevada. From the Flo property, Kalzas Mountain, 67 km southeast of Mayo, Yukon Territory, Canada. In the Borrllealha tungsten mine, Minho, Portugal. In France, at La Bertrande, Haute-Vienne, and Meymac, Corrèze. From the Grancarica scheelite deposit, southwest of Velingrad, Bulgaria. In the Hingston Downs quarry, Calstock, Cornwall, England. At the Namulilo mine, Uganda. From Nyakabingu and Gifurwe, Rwanda. Found in the Nita mine, Yaku Island, Kagoshima Prefecture, Japan. From Aktchatau, Kazakhstan.

Name: For FERRIc iron and TUNGsten in its composition.

Type Material: Harvard University, Cambridge, Massachusetts, 101796; National Museum of Natural History, Washington, D.C., USA, 86985.

Ferro-actinolite $\mathbf{Ca_2(Fe^{2+},Mg)_5Si_8O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. [As bladed or columnar crystals; also radiating fibrous; granular, massive.] *Twinning:* Simple or lamellar twinning ∥ {100}.

Physical Properties: *Cleavage:* Perfect on {110}, intersecting at 56° and 124°; parting on {100}. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.24–3.48 D(calc.) = [3.34]

Optical Properties: Transparent to translucent. *Color:* Dark green; in thin section, yellow-green or blue-green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Moderate to strong, in yellows and greens.
Orientation: $Y = b$; $Z \wedge c = 12.5°$–$17°$. *Dispersion:* $r > v$, weak. *Absorption:* $Z > Y \geq X$.
$\alpha = 1.646$–1.686 $\beta = 1.656$–1.696 $\gamma = 1.666$–1.704 2V(meas.) = 71°–81°

Cell Data: *Space Group:* $C2/m$. $a = 9.891(1)$ $b = 18.200(1)$ $c = 5.305(1)$
$\beta = 104.64(1)°$ Z = 2

X-ray Powder Pattern: Prieska, South Africa. (ICDD 23-118).
8.58 (100), 2.728 (40), 3.157 (35), 2.033 (30), 2.546 (25), 4.57 (20), 2.613 (18)

(1) Cumberland, Rhode Island, USA; corresponds to $(Ca_{1.74}Mn_{0.17}Na_{0.10}K_{0.03})_{\Sigma=2.04}(Fe^{2+}_{2.53}Mg_{1.94}Fe^{3+}_{0.31}Mn_{0.14}Al_{0.08})_{\Sigma=5.00}(Si_{7.72}Al_{0.28})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Jackson County Iron Formation, Wisconsin, USA; by electron microprobe, corresponds to $(Ca_{1.86}Na_{0.03}K_{0.02})_{\Sigma=1.91}(Fe^{2+}_{3.98}Mg_{1.08}Fe^{3+}_{0.06}Ti_{0.01}Mn_{0.01}Al_{0.01})_{\Sigma=5.15}(Si_{7.87}Al_{0.13})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with tremolite and actinolite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.50$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si \geq 7.5$.

Occurrence: In iron-rich greenschist and blueschist facies metamorphic rocks; in metamorphosed iron formations; as part of a vein assemblage cutting Ca-Fe-Si tactites.

Association: Hedenbergite (replacement), andradite, ilvaite (contact metamorphic); cummingtonite, quartz, magnetite, riebeckite, biotite, hematite (iron formations).

Distribution: Probably widespread, but many locality references lack qualifying chemical analyses. In the USA, in the Jackson County Iron Formation, Wisconsin, and at Cumberland, Providence Co., Rhode Island. From Black Perry Mountain, New South Wales, Australia. At Prieska, Cape Province, South Africa.

Name: For *ferrous* iron in its composition and similarity to *actinolite*.

Type Material: n.d.

Ferroalluaudite $NaCaFe^{2+}(Fe^{3+},Mn^{2+},Fe^{2+})_2(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very fine-grained, massive.

Physical Properties: Hardness = [5] D(meas.) = n.d. D(calc.) = [3.67]

Optical Properties: Semitransparent. *Color:* Blue-green.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = dull green to pale blue; $Y = Z$ = bright green with a bluish tinge. *Dispersion:* $r < v$, strong. $n = 1.775(5)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $[C2/c]$ (by analogy to alluaudite). $a = 11.898(2)$ $b = 12.541(2)$ $c = 6.434(1)$ $\beta = 114°6(1)'$ Z = 4

X-ray Powder Pattern: Helen Beryl mine, Custer, South Dakota, USA. (ICDD 39-377).

(1) Pleasant Valley pegmatite, South Dakota, USA; P_2O_5 by difference; corresponds to $Na_{0.24}(Na_{0.83}Ca_{0.13}Mn^{2+}_{0.04})_{\Sigma=1.00}(Fe^{2+}_{0.54}Mn^{2+}_{0.46})_{\Sigma=1.00}(Fe^{3+}_{1.69}Mg_{0.24}Fe^{2+}_{0.06}Li_{0.01})_{\Sigma=2.00}(PO_4)_3$.
(2) Angarf-Sud pegmatite, Morocco; recalculated after deduction of barbosalite 10%; corresponds to $Na_{0.52}(Na_{0.51}Ca_{0.43}Mn^{2+}_{0.06})_{\Sigma=1.00}(Fe^{2+}_{0.72}Mn^{2+}_{0.28})_{\Sigma=1.00}(Fe^{3+}_{1.37}Mg_{0.39}Fe^{2+}_{0.23}Al_{0.01})_{\Sigma=2.00}(PO_4)_3$.

Polymorphism & Series: Forms a series with alluaudite.

Mineral Group: Alluaudite group.

Occurrence: From zoned granite pegmatites; in phosphatic nodules.

Association: Triphylite, barbosalite, ferrisicklerite, apatite.

Distribution: From the Pleasant Valley pegmatite and the Helen Beryl mine, near Custer, Custer Co., South Dakota, USA. At Rapid Creek, Yukon Territory, Canada. In the Angarf-Sud pegmatite, Tazenakht Plain, Anti-Atlas Mountains, Morocco. From the Norrö pegmatite, on Rånö Island, Sweden. At Kiluli, Rwanda.

Name: For its dominant content of *ferrous* iron and relation to *alluaudite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162558.

Ferroaxinite $Ca_2Fe^{2+}Al_2BSi_4O_{15}(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals typically flattened, axe-head-shaped, to 20 cm; granular, massive.

Physical Properties: *Cleavage:* Good on {100}, poor on {001}, {110}, and {011}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 3.25–3.28 D(calc.) = [3.33]

Optical Properties: Transparent to translucent. *Color:* Clove-brown, brown, plum-blue, pearl-gray; colorless to pale brown or blue in thin section. *Luster:* Vitreous. *Optical Class:* Biaxial (–). α = 1.674–1.682 β = 1.682–1.690 γ = 1.685–1.693 2V(meas.) = 65°–75°

(1) Durango, Mexico. (2) Rosebery district, Tasmania, Australia; by electron microprobe, B_2O_3 interpolated from end members, H_2O calculated from stoichiometry. (3) $Ca_2FeAl_2BSi_4O_{15}(OH)$.

Polymorphism & Series: Forms a series with manganaxinite.

Mineral Group: Axinite group; Ca > 1.5 per formula unit, Fe > Mn.

Occurrence: In low- to high-grade regionally metamorphosed rocks, in contact metamorphosed rocks, and in pegmatites.

Association: Prehnite, andradite, hedenbergite, zoisite, actinolite, datolite, tourmaline, vesuvianite, calcite, albite, quartz.

Distribution: Many localities, even for fine crystals. On Roscommon Cliff and in the Botallack mine, St. Just, Cornwall, England. From Bourg d'Oisans, Isère, France. In the Maderantal, Uri, Switzerland. Extraordinary crystals from the Puiva deposit, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains; at Zlatoust, Ural Mountains; and elsewhere in Russia. At Skardu, Pakistan. In the Obira mine, Bungo, Oita Prefecture; the Toroku mine, Miyazaki Prefecture; and elsewhere in Japan. In the USA, from Coarse Gold, Madera Co., near Yreka, Siskiyou Co., and New Melones Lake, Calaveras Co., California; and from Elkhorn, Jefferson Co., Montana. In Canada, found near Hope, British Columbia, and in the Moneta mine, Timmins, Ontario. From Trinidad, Baja California, Mexico. At Vitoria da Conquista, Bahia, Brazil.

Name: From the Greek for *axe*, referring to the common crystal shape, and for dominant FERROan iron, in a mineral of the *axinite* group.

Ferro-barroisite $[NaCa][(Fe^{2+},Mg)_3Al_2](Si_7Al)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic; also as rims and cores of mixed amphibole crystals.

Physical Properties: *Cleavage:* [Perfect on {110}, intersecting at ∼56° and ∼124°; partings on {100}, {001}.] *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Deep bluish green to blue in thin section.
Luster: [Vitreous.]
Optical Class: [Biaxial.] *Pleochroism:* Strong in blues and bluish green. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* [$C2/m$.] a = n.d. b = n.d. c = n.d. β = n.d. Z = n.d.

X-ray Powder Pattern: n.d.

(1) Klamath Mountains, California, USA; by electron microprobe, Fe^{2+}:Fe^{3+} from stoichiometry and charge balance; corresponding to $(Na_{1.19}Ca_{0.87}K_{0.10})_{\Sigma=2.16}(Fe^{2+}_{1.69}Mg_{1.53}Mn_{0.03})_{\Sigma=3.25}(Fe^{3+}_{1.00}Al_{0.73}Ti_{0.02})_{\Sigma=1.75}(Si_{7.20}Al_{0.80})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Cauro-Bastelica, Corsica; by electron microprobe. (3) Iskou ring complex, Niger; by electron microprobe.

Polymorphism & Series: Forms a series with barroisite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg+Fe^{2+}) < 0.5$; $(Na+K)_A < 0.5$; $0.67 \; Na_B \;\; 1.33$; $(Ca+Na)_B \geq 1.34$; $Si < 7.5$.

Occurrence: A primary mineral in some alkalic granites and syenite ring complexes; from blueschist facies metavolcanic rocks.

Association: Crossite (metavolcanic).

Distribution: On Condrey Mountain, Klamath Mountains, Del Norte Co., California, USA. From Cauro-Bastelica, Corsica. In the Iskou ring complex, Aïr, Niger.

Name: For *ferroan* iron in its composition and similarity to *barroisite*.

Type Material: n.d.

(1) West of Tomata, Celebes, Indonesia; after deduction of CaO 0.13%, Na_2O 0.14%, K_2O 0.09%, SO_3 0.12%; corresponds to $(Fe^{2+}_{0.81}Mg_{0.20}Mn_{0.01})_{\Sigma=1.02}(Al_{1.87}Fe^{3+}_{0.08}Ti_{0.01})_{\Sigma=1.96}Si_{2.03}O_{9.87}H_{3.64}$.
(2) Haute-Ubaye district, France; after deduction of Na_2O 0.23% and K_2O 0.45% as mica; corresponds to $(Fe^{2+}_{0.53}Mg_{0.36}Mn_{0.01})_{\Sigma=0.90}(Al_{1.95}Fe^{3+}_{0.06})_{\Sigma=2.01}Si_{2.01}O_6(OH)_4$.

Polymorphism & Series: Forms two series, with carpholite, and with magnesiocarpholite.

Occurrence: In quartz veins in blueschists of low metamorphic grade, formed from felsic tuffs at about 250 °C and 3 kbar.

Association: Quartz, glaucophane, lawsonite, pumpellyite, jadeite, stilpnomelane.

Distribution: At several localities west of Tomata, Celebes, Indonesia. In the Diahot region, New Caledonia. From Italy, at Colle Ciarbonet, Piedmont. From the Vanoise massif, Savoie, and Pic du Pelvat, Haute-Ubaye district, Alpes-de-Haute Provence, France. At Ruwi, Oman.

Name: The FERROus iron analogue of *carpholite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106754.

Ferrochiavennite $Ca_{1-2}FeSi_5Be_2O_{13}(OH)_2 \cdot 2H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As spherules to ~2 mm; crystals, to 0.2 mm, are platy on {001} and spear-shaped along [100].

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = ~3
D(meas.) = 2.67(2) D(calc.) = 2.709

Optical Properties: Translucent. *Color*: Beige to pale-yellow, pale-green. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (+). α = 1.583(1) β = 1.589(1) γ = 1.602(1) 2V(meas.) = 62(4)° 2V(calc.) = 69° *Orientation*: $X \approx a$, $Y \approx c$, $Z \approx b$.

Cell Data: *Space Group*: $P2_1/c$. a = 8.7499(5) b = 4.9160 (3) c = 31.431(2) β = 90.1574(9)° Z = 4

X-ray Powder Pattern: Blåfjell, Langangen, Telemark, Norway.
15.555 (100), 3.251 (66), 2.884 (64), 3.909 (60), 3.938 (36), 3.820 (30), 4.104 (29)

Chemistry:

(1) Blåfjell, Norway; average of 10 electron microprobe analyses, H_2O and BeO calculated from structure analysis; corresponding to $(Ca_{1.73}Na_{0.13})_{\Sigma=1.86}(Fe_{0.41}Mn_{0.31}Mg_{0.02})_{\Sigma=0.74}(Si_{4.22}Al_{0.50}Be_{2.28})_{\Sigma=7.00}O_{13}(OH)_2 \cdot 2H_2O$. (2) AS Granit larvikite quarry, Norway; average of 7 electron microprobe analyses, H_2O and BeO calculated from structure analysis; corresponding to $(Ca_{1.25}Na_{0.19}Mn_{0.08})_{\Sigma=1.52}(Fe_{0.79}Mn_{0.21})_{\Sigma=1.00}(Si_{4.42}Al_{0.31}Be_{2.27})_{\Sigma=7.00}O_{13}(OH)_2 \cdot 2H_2O$

Occurrence: A late hydrothermal stage mineral in alkaline syenite pegmatite.

Association: Albite, magnetite, fayalite, with minor amounts of zircon, nepheline, analcime, pyrite, hambergite (Blåfjell); tvedalite, apophyllite-(KF), natrolite, gonnardite, chiavennite, epididymite, behoite, calcite, chlorite, aegirine, catapleiite, gaidonnayite, neotocite, fluorite, molybdenite (AS Granit quarry).

Distribution: From Norway at Blåfjell, Langangen, Telemark, and the AS Granit larvikite quarry, Tvedalen, Vestfold.

Name: As the iron (*ferro*) analog of *chiavennite*.

Type Material: Canadian Museum of Nature, Ottawa, Canada (CMNMC 86554), and the Department of Geology, Natural History Museum, University of Oslo, Norway (# 42108).

Ferrocolumbite $(Fe^{2+}, Mn^{2+})(Nb, Ta)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals short prismatic or equant, also flat tabular, to 0.75 m. In groups of parallel or subparallel crystals, to 18 t; massive. *Twinning:* Common as heart-shaped contact and penetration twins, on {021} and {023}, may produce pseudohexagonal trillings. More rarely on {051} and {15•1•0}.

Physical Properties: *Cleavage:* Distinct on {100}, less distinct on {010}. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 6 VHN = 652–739 (100 g load). D(meas.) = 5.20–6.65 D(calc.) = [5.43] Paramagnetic.

Optical Properties: Opaque, translucent through thin edges. *Color:* Black to brownish black; reddish brown in transmitted light; in reflected light, grayish white with a brownish tint and reddish internal reflections. *Streak:* Black to dark brown. *Luster:* Submetallic to vitreous, commonly tarnished iridescent.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$.
Absorption: Strong; $Z > X$. α = n.d. β = 2.29–2.40 γ = n.d. 2V(meas.) = n.d.

(1) Ånneröd, Norway. (2) Kings Mountain, North Carolina, USA; by electron microprobe, corresponds to $(Fe_{0.68}Mn_{0.28}Ti_{0.06}Sn_{0.01}W_{0.01})_{\Sigma=1.04}(Nb_{1.50}Ta_{0.50})_{\Sigma=2.00}O_6$. (3) $FeNb_2O_6$.

Polymorphism & Series: Forms two series, with ferrotantalite and with manganocolumbite.

Occurrence: An accessory constituent of granite pegmatites; rarely in carbonatites; a detrital mineral in placer deposits.

Association: Albite, microcline, beryl, lepidolite, muscovite, tourmaline, spodumene, lithiophilite, triphylite, amblygonite, triplite, apatite, samarskite, microlite, cassiterite.

Distribution: In the USA, in Connecticut, at Middletown, Portland, and Haddam, Middlesex Co.; large masses from the Beecher Lode, eight km southeast of Custer, Custer Co., and around Keystone, Pennington Co., South Dakota; in the Spruce Pine district, Mitchell Co., and the Foote mine, Kings Mountain, Cleveland Co., North Carolina. At Ånneröd, Tveit, and elsewhere in Norway. In Russia, from Miass, Ilmen Mountains, Southern Ural Mountains. At Craveggia, Val Vigezzo, Piedmont, Italy. Large crystals from Ambatofotsikely and Antsirabe, Madagascar. At Greens Well, Wodgina, Greenbushes, and elsewhere in Western Australia. In the Ishikawa district, Fukushima Prefecture, Japan.

Name: For iron (FERRum), and COLUMBia, for *America*, source of the first specimens.

(1) La Tabatière, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} from stoichiometry and charge balance; corresponds to $(Na_{0.55}K_{0.11})_{\Sigma=0.66}(Ca_{1.66}Mn_{0.15}Fe^{2+}_{0.14}Na_{0.05})_{\Sigma=2.00}(Fe^{2+}_{3.47}Mg_{1.38}Ti_{0.15})_{\Sigma=5.00}(Si_{7.09}Al_{0.91})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Tibchi ring complex, Nigeria; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from charge balance; corresponds to $(Na_{0.42}K_{0.18})_{\Sigma=0.60}(Ca_{1.85}Fe^{2+}_{0.15})_{\Sigma=2.00}(Fe^{2+}_{4.15}Mg_{0.36}Al_{0.18}Fe^{3+}_{0.14}Mn_{0.14}Ti_{0.03})_{\Sigma=5.00}(Si_{7.01}Al_{0.99})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with edenite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; 6.75 Si 7.25.

Occurrence: An early or deuteric phase replacing pyroxene in syenitic ring complexes; from medium-grade metamorphic amphibolites and gneisses; from plutonic igneous rocks.

Association: Pyroxene, ferro-actinolite, monazite, magnetite, fluorite (Tibchi ring complex, Nigeria).

Distribution: From the Baie-des-Moutons complex, La Tabatière, Quebec, Canada. At the Tibchi ring complex, Nigeria. Undoubtedly occurs at other localities but qualifying analyses appear lacking.

Name: For its high *ferrous* iron content and relation to *edenite*.

Type Material: n.d.

(1) Mt. Yakushi, Japan; adjusted for removal of estimated 6% chamosite contamination, original total given as 99.92%; corresponds to $(Fe^{2+}_{4.40}Na_{0.33}Mn_{0.31}Mg_{0.01}K_{0.01})_{\Sigma=5.06}(Al_{1.68}Fe^{3+}_{0.35}Ti_{0.06})_{\Sigma=2.09}(Si_{6.03}Al_{1.97})_{\Sigma=8.00}O_{22}[(OH)_{2.15}F_{0.06}]_{\Sigma=2.21}$. (2) Kawai mine, Japan; by electron microprobe.

Polymorphism & Series: Forms a series with magnesio-gedrite and gedrite.

Mineral Group: Amphibole (Fe–Mn–Mg) group; $Mg/(Mg + Fe^{2+}) < 0.10$; $(Ca + Na)_B < 1.34$; Li < 1.0; Si < 7.0.

Occurrence: In contact metamorphosed pelitic rocks.

Association: Chamosite, chlorite, andalusite, cordierite, garnet, muscovite, biotite, spinel, quartz, labradorite, magnetite, graphite.

Distribution: On Mt. Yakushi, Miyamori district, Kitakami Mountainland, Iwate Prefecture, and in the Kawai mine, Ena, Gifu Prefecture, Japan. From Fiskenæsset, Greenland. At Turbeoshov, Shuyeverskoya, Karelia. From Spitzenberg, Harz Mountains, Germany.

Name: For *ferrous* iron in its composition and similarity to *gedrite*.

Type Material: n.d.

(1) Calabria, Italy; by electron microprobe, Fe^{2+}:Fe^{3+} from Mössbauer spectroscopy, original total given as 97.56%; corresponding to $(Na_{1.75}Ca_{0.15})_{\Sigma=1.90}(Fe^{2+}_{1.94}Al_{1.83}Mg_{1.03}Fe^{3+}_{0.31}Ti_{0.01}Mn_{0.01})_{\Sigma=5.13}(Si_{7.94}Al_{0.06})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Bouehndep, New Caledonia; by electron microprobe, FeO determined by wet chemical analysis, corresponding to $(Na_{1.91}Ca_{0.14})_{\Sigma=2.05}(Fe^{2+}_{2.17}Mg_{0.84})_{\Sigma=3.01}(Al_{1.51}Fe^{3+}_{0.44}Mn_{0.01})_{\Sigma=1.96}(Si_{7.79}Al_{0.21})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with glaucophane.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) \geq 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) < 0.3$; $(Na + K)_A < 0.5$; $Na_B \geq 1.34$.

Occurrence: In metamorphic rocks of the high-pressure, low-temperature blueschist facies, commonly derived from either siliceous sedimentary, alkalic basaltic, or felsic volcanic predecessors.

Association: Paragonite, lawsonite, albite, spessartine, almandine, epidote, omphacite.

Distribution: Widespread. Representative occurrences include: from Bouehndep, and near Ouégoa, New Caledonia. At Champ de Praz, Val d'Aosta, Italy. From near Menai Bridge, Anglesey, Wales. In Scotland, from near Heriot. On the Ile de Groix, Bay of Biscay, off Morbihan, France.

Name: For its high *ferrous* iron content and similarity to *glaucophane*.

Type Material: n.d.

Ferrohexahydrite $Fe^{2+}SO_4 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (by analogy to other group members). *Point Group:* $2/m$. Stalactites and veinlets, fibrous to capillary crystals, to 6 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.934 (Hygroscopic; soluble in H_2O.)

Optical Properties: Transparent. *Color:* Bluish green, colorless.
Optical Class: Biaxial (–) (by analogy to other group members). $\alpha = 1.468(2)$ β = n.d. $\gamma = 1.498(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$ (ICDD 15-393, by analogy to synthetic $MgSO_4 \cdot 6H_2O$).
$a = 10.08$ $b = 7.28$ $c = 24.59$ $\beta = 98°22'$ Z = 8

X-ray Powder Pattern: Northeastern Tatarstan, Russia.
4.43 (10), 2.97 (7), 2.93 (7), 4.89 (6), 2.03 (6), 1.881 (6), 1.862 (6)

Chemistry: (1) Sofiya mine, Ukraine; described with Fe:Mg from 42.28 to 3.54.
(2) Northeastern Tatarstan, Russia; microchemical analysis confirms ferrous iron and absence of Mg or Zn.

Mineral Group: Hexahydrite group.

Occurrence: In oxidized ore-bearing sandstone (Sofiya mine, Ukraine); a dehydration product of melanterite in drill cores (northeastern Tatarstan, Russia).

Association: Melanterite (northeastern Tatarstan, Russia).

Distribution: From the Sofiya mine, Nikitovka mercury deposit, Gorlovka, Ukraine. At Olkusz, northwest of Krakow, Poland. From an unspecified locality in northeastern Tatarstan, Russia. At Jáchymov (Joachimsthal), Czech Republic. In Italy, on Vesuvius, Campania, and from the Conchea mine, near Rio Marina, Elba. Found along Contrary Creek, Louisa Co., Virginia, USA.

Name: As a ferrous iron sulfate with six essential water molecules per formula unit.

Type Material: n.d.

Ferrohornblende $Ca_2[(Fe^{2+},Mg)_4Al](Si_7Al)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As prismatic crystals, to 10 cm, and as rims on pyroxenes. *Twinning:* [Simple or lamellar twinning ∥ {100}.]

Physical Properties: *Cleavage:* Perfect on {110}, with intersections at 56° and 124°; may show partings on {100}, {010}. *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = 3.12–3.30 D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Green, greenish brown. *Luster:* [Vitreous.] *Optical Class:* Biaxial (–). *Pleochroism:* X = light brown, greenish yellow; Y = light green, olive-green; Z = dark green, bluish green. *Orientation:* $Y = b$, $Z \wedge c \simeq 18°$. α = 1.641–1.704 β = 1.657–1.718 γ = 1.662–1.727 2V(meas.) = 57°–79°

Cell Data: *Space Group:* [$C2/m$.] a = n.d. b = n.d. c = n.d. β = n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

MnO	0.75	0.48	H_2O^-	0.00	
			Total	100.13	99.13

(1) Centennial mine, Broken Hill, New South Wales, Australia; corresponds to $(Ca_{1.65}Na_{0.39}K_{0.08})_{\Sigma=2.12}(Fe^{2+}_{2.43}Mg_{2.00}Al_{0.72}Ti_{0.14}Mn_{0.09}Fe^{3+}_{0.05})_{\Sigma=5.43}(Si_{6.81}Al_{1.19})_{\Sigma=8.00}O_{22}[(OH)_{1.50}O_{0.50}]_{\Sigma=2.00}$. (2) Mayurbhanj district, Orissa, India; corresponds to $(Ca_{1.60}Na_{0.34}K_{0.19})_{\Sigma=2.13}(Fe^{2+}_{3.51}Fe^{3+}_{0.86}Ti_{0.40}Al_{0.34}Mg_{0.10}Mn_{0.06})_{\Sigma=5.27}(Si_{6.93}Al_{1.07})_{\Sigma=8.00}O_{22}(OH)_{0.81}$.

Polymorphism & Series: Forms a series with magnesiohornblende.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.50$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; 6.50 Si 7.24.

Occurrence: From granites, granodiorites, and metabasalts; common in amphibolites and schists. As reaction rims on ferroan hedenbergite.

Association: Hedenbergite (granite); biotite, epidote, albite, quartz (amphibolite).

Distribution: Very widespread, but many locality references lack qualifying chemical analyses. A few historic localities for well-crystallized material include: at Monte Somma and Vesuvius, Campania, Italy. From Pargas, Finland. At Kragerö, Arendal, and around the Langesundsfjord, Norway. From Bílina and Schima, Czech Republic. In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; from Edwards, Pierrepont, and Gouverneur, St. Lawrence Co., New York. From Bancroft, Pakenham, and Eganville, Ontario, Canada. From Broken Hill, New South Wales, Australia.

Name: For its *ferrous* iron content and from the German for *horn* and *to deceive*, in allusion to its similarity to valuable minerals in ores.

Ferroindialite $(Fe^{2+},Mg)_2Al_4Si_5O_{18}$

Crystal Data: Hexagonal. *Point Group*: 6/*m* 2/*m* 2/m. As hexagonal prismatic or tabular crystals, to 1.5 mm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle.
Hardness = 7 D(meas.) = 2.66(1) D(calc.) = 2.667

Optical Properties: Transparent. *Color*: Brownish purple to gray with a violet-blue tint.
Streak: White. *Luster*: Vitreous. *Pleochroism*: Weak, *X* = colorless, *Z* = pale violet.
Dispersion: r < *v*, weak.
Optical Class: Biaxial (–) [anomalous]. α = 1.539(2) β = 1.552(2) γ = 1.554(2)
2V(meas.) = 30(10)°

Cell Data: *Space Group*: *P*6/*mcc*. *a* = 9.8759(3) *c* = 9.3102(3) Z = 2

X-ray Powder Pattern: Bellerberg Mountain, Eifel region, Germany.
8.59 (100), 3.390 (35), 3.055 (31), 4.094 (27), 3.147 (19), 2.657 (12), 1.695 (9)

Chemistry:

	(1)
Na_2O	0.14
K_2O	0.46
MgO	4.95
MnO	1.13
FeO	12.66
Fe_2O_3	2.64
Al_2O_3	30.45
SiO_2	47.22
Total	99.65

(1) Bellerberg Mountain, Eifel region, Germany; average of 5 electron microprobe analyses, Fe^{2+} and Fe^{3+} calculated from structure refinement, absence of OH^- and H_2O confirmed by IR spectroscopy; corresponding to $(K_{0.06}Na_{0.03})(Fe^{2+}_{1.12}Mg_{0.78}Mn_{0.10})_{\Sigma=2.00}(Al_{3.79}Fe^{3+}_{0.21})_{\Sigma=4.00}Si_{4.98}O_{18}$.

Mineral Group: Beryl group.

Occurrence: In a metamorphosed pelitic xenolith in alkaline basalt.

Association: Sillimanite, sanidine, phlogopite, enstatite-ferrosilite, wagnerite, fluorapatite, tridymite, zircon, high-Mg almandine.

Distribution: From the Caspar quarry, Bellerberg Mountain, near Mayen, Eifel region, Rheinland-Pfalz, Germany.

Name: As the iron-dominant (*ferro*) analog of *indialite*.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4400/1).

References: (1) Chukanov, N.V., S.M. Aksenov, I.V. Pekov, B. Ternes, W. Schüller, D.I. Belakovskiy, K.V. Van, and G. Total	[99.95]

(1) Koraput, India; original total given as 99.98%; corresponds to $(Na_{0.40}K_{0.26})_{\Sigma=0.66}Ca_{1.84}(Fe^{2+}_{2.51}Mg_{1.00}Ti_{0.73}Al_{0.48}Fe^{3+}_{0.42})_{\Sigma=5.14}(Si_{5.74}Al_{2.26})_{\Sigma=8.00}O_{22}[(OH)_{1.30}O_{0.70}]_{\Sigma=2.00}$.

Polymorphism & Series: Forms a series with kaersutite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.50$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; Si < 6.5; Ti ≥ 0.5.

Occurrence: From syenites, camptonites, and essexites.

Association: Alkalic feldspar, oligoclase, biotite, ilmenite-magnetite.

Distribution: From Koraput, Orissa, India.

Name: For its high *ferrous* iron composition and similarity to *kaersutite*.

Type Material: n.d.

Ferrokesterite $Cu_2(Fe,Zn)SnS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $\overline{4}$. Massive, granular, to 0.5 mm.

Physical Properties: *Cleavage:* Distinct on {110}; a parting on {001}. Hardness = ∼4 VHN = 228–255, 238 average (100 g load). D(meas.) = n.d. D(calc.) = 4.490

Optical Properties: Opaque. *Color:* Steel-gray; medium gray in reflected light. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Weak; in shades of gray. *Bireflectance:* Weak. R_1–R_2: 23.9–26.8 (470), 26.0–27.0 (546), 26.4–27.3 (589), 26.0–26.8 (650)

Cell Data: *Space Group:* $I\overline{4}$ (by analogy to kesterite). $a = 5.433(36)$ $c = 10.883(89)$ $Z = 2$

X-ray Powder Pattern: Cligga mine, England.
3.13 (10), 1.919 (6), 1.110 (4), 2.712 (3), 1.242 (3), 1.045 (3), 0.9182 (3)

Chemistry:

	(1)
Cu	29.5
Zn	5.0
Cd	0.1
Fe	8.7
Mn	0.1
Sn	27.4
S	30.1
Total	100.9

(1) Cligga mine, England; by electron microprobe, corresponding to $Cu_{1.99}(Fe_{0.67}Zn_{0.33})_{\Sigma=1.00}Sn_{0.99}S_{4.02}$.

Polymorphism & Series: Dimorphous with stannite.

Occurrence: In greisen-bordered sulfide veins in granite.

Association: Arsenopyrite, cassiterite, chalcopyrite, sphalerite, chalcocite, quartz.

Distribution: From the Cligga mine, Perranzabuloe, Cornwall, England [TL].

Name: For its content of iron, *ferrum*, and relation to kesterite.

Type Material: Canadian Geological Survey, Ottawa, Canada, 14747, 65048; The Natural History Museum, London, England, 1984,844.

Total	99.21	100.00

(1) Northern Pekul'nei River, Russia; by electron microprobe, average of six analyses; corresponds to $(Pt_{2.02}Ir_{0.01})_{\Sigma=2.03}Fe_{0.98}(Ni_{0.96}Cu_{0.03})_{\Sigma=0.99}$. (2) Pt_2FeNi.

Polymorphism & Series: Forms a series with tulameenite.

Occurrence: In the heavy fraction of Quaternary alluvial deposits associated with ultramafics from an ophiolite belt (Northern Pekul'nei River, Russia);

Association: Isoferroplatinum, tetraferroplatinum, rutheniridosmine, laurite, irarsite, cooperite, sperrylite, hollingworthite, cherepanovite, chromite, olivine (Northern Pekul'nei River, Russia).

Distribution: From the placer of the Northern Pekul'nei River, Pekul'nei Range, eastern Chukot Peninsula, Russia [TL]. In the Naran massif, western Mongolia. At Goodnews Bay, Alaska, USA.

Name: For iron, FERRum, NICKEL, and PLATINUM in the composition.

Type Material: Mining Institute, St. Petersburg, Russia, 1306/1.

References: (1) Rudashevskiy, N.S., A.G. Mochalov, Y.P. Men'shikov, and N.I. Shumskaya (1983) Ferronickelplatinum, Pt_2FeNi, a new mineral species. Zap. Vses. Mineral. 			Total	99.83	100.3

(1) Egbe district, Nigeria; corresponds to $(Fe^{2+}_{0.39}Zn_{0.38}Mg_{0.33}Fe^{3+}_{0.09}Pb_{0.04}Mn_{0.01})_{\Sigma=1.24}(Sn_{1.77}Zn_{0.21}Ti_{0.02})_{\Sigma=2.00}(Al_{10.52}Fe^{3+}_{1.48})_{\Sigma=12.00}[O_{22.16}(OH)_{1.84}]_{\Sigma=24.00}$. (2) Caramos mine, Portugal; by wet chemical, X-ray fluorescence, colorimetric, and spectrographic methods, total Fe as FeO, H_2O by LOI at 1000 °C.

Polymorphism & Series: 6H and 24R polytypes are known.

Occurrence: In quartz-sillimanite rocks closely associated with tin-bearing granite pegmatites (Egbe district, Nigeria); in riebeckite gneiss (La Guia, Spain).

Association: Quartz, sillimanite, andalusite, muscovite, garnet, cassiterite, gahnite, chrysoberyl, columbite, apatite (Egbe district, Nigeria); quartz, albite, microcline, riebeckite, ferrian biotite, aegirine, zircon, fluorite (La Guia, Spain).

Distribution: From several occurrences in the Egbe district, Kabba Province, Nigeria. At the Caramos mine, Lixa, and other places between Felgueiras and Amarante, Portugal. From La Guia, Vigo, Pontevedra Province, Spain. In Sweden, at Falun. In the Rosendal pegmatite, Kemiö (Kimito) Island, Finland. From an undefined locality in Siberia, Russia. At Shizhuyuan, Guangxi Province, China. From the upper Candeias area, Rondônia, and elsewhere in the Araguarí-Amaparí region, Amapá Territory, Brazil. In the Omaruru River tin deposits, Namibia.

Name: For Nigeria, the country where it was first found.

Type Material: n.d.

References: (1) Jacobson, R. and J.S. Webb (1947) The occurrence of nigerite, a new tin mineral in quartz-sillimanite-rocks from Nigeria. Mineral. Mag., 28, 118–128. (2) Bannister, F.A., M.H. SnO_2	21.27
Al_2O_3	52.63
FeO	13.91
MnO	0.33
ZnO	8.12
CaO	1.06
H_2O	[1.79]
Total	[100.00]

(1) Mt. Garnet, Australia; by electron microprobe, here computed from average of two elemental analyses, total Fe as FeO, H_2O by difference; corresponds to $(Fe_{2.66}Zn_{1.42}Mn_{0.06})_{\Sigma=4.14}Sn_{2.01}Ca_{0.28}(Al_{14.69}Si_{0.21}Fe_{0.10})_{\Sigma=15.00}O_{30}(OH)_2$.

Polymorphism & Series: 6H and 24R polytypes are known.

Occurrence: In quartz-sillimanite rocks closely associated with tin-bearing granite pegmatites (Egbe district, Nigeria); in tin-bearing skarns (Mt. Garnet, Australia).

Association: Gahnite (Egbe district, Nigeria); magnetite, fluorite, biotite, gahnite, corundum, cassiterite (Mt. Garnet, Australia).

Distribution: Distinction of the 24R from the 6H polytype requires that the unit cell be determined, which has been accomplished for the following localities: from the Egbe district, Kabba Province, Nigeria. At the Mt. Garnet tin deposits, Queensland, Australia. In the Geco Cu–Zn deposit, Manitouwadge district, 80 km north-northeast of Lake Superior, Ontario, Canada.

Name: As the 24R polytype of *nigerite*-6H.

Type Material: Royal Ontario Museum, Toronto, Canada, M24546; National Museum of Natural History, Washington, D.C., USA, 146963.

; nigerite-6T = ferronigerite-2N1S; nigerite-24R = ferronigerite-6N6S; [full list given under högbohmite];

Ferropargasite $\mathbf{NaCa_2[(Fe^{2+},Mg)_4Al](Si_6Al_2)O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As homoaxial intergrowths with grunerite. *Twinning:* [Simple or multiple twinning ∥ {100}.]

Physical Properties: *Cleavage:* [Perfect on {110}, with intersections at ∼56° and ∼124°; partings on {100}, {001}.] *Tenacity:* [Brittle.] Hardness = 5–6 D(meas.) = n.d. D(calc.) = 3.44 (synthetic ferro-pargasite).

Optical Properties: Semitransparent. *Color:* Bluish green in thin section.
Luster: [Vitreous.]
Optical Class: Biaxial (–). *Pleochroism:* Moderate. $\alpha = 1.700$ $\beta = 1.713$ $\gamma = 1.718$
2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. $a = 9.953(5)$ (synthetic ferro-pargasite). $b = 18.152(3)$ $c = 5.330(2)$ $\beta = 105.3(1)°$ Z = 2

X-ray Powder Pattern: Synthetic ferro-pargasite.
8.50 (100), 3.15 (80), 2.718 (60), 2.607 (40), 2.57 (35), 3.40 (25), 2.36 (25)

Chemistry:

	(1)
SiO_2	38.65
Al_2O_3	16.50
FeO	27.75
MnO	0.39
MgO	2.03
CaO	10.30
Na_2O	1.80
K_2O	0.50
Total	97.92

(1) Flowerdale, Scotland; by electron microprobe, corresponds to $(Na_{0.55}K_{0.10})_{\Sigma=0.65}Ca_{1.73}(Fe^{2+}_{3.65}Mg_{0.48}Mn_{0.05})_{\Sigma=4.18}Al_{1.13}(Si_{6.07}Al_{1.93})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with pargasite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.3$; Fe^{3+} Al^{vi}; $(Na + K)_A \geq 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: In an amphibolite facies metamorphosed banded iron formation.

Association: Grunerite, almandine, biotite, ferroan clinochlore, magnetite, quartz.

Distribution: From Flowerdale, near Gairloch, Scotland.

Name: For its high *ferrous* iron content and relation to *pargasite*.

Type Material: n.d.

Ferro-richterite $\mathbf{Na[NaCa](Fe^{2+},Mg)_5Si_8O_{22}(OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals prismatic; in reticulated masses; as overgrowths on clinopyroxene. *Twinning:* [Simple or multiple twinning ∥ {100}.]

Physical Properties: *Cleavage:* [Perfect on {110}, intersecting at ∼56° and ∼124°; partings on {100}, {001}.] *Fracture:* [Uneven.] *Tenacity:* [Brittle.] Hardness = 5–6 D(meas.) = n.d. D(calc.) = 3.46 (synthetic ferro-richterite).

Optical Properties: Semitransparent. *Color:* Brown to green. *Streak:* [White.] *Luster:* [Vitreous.]
Optical Class: Biaxial (–). *Pleochroism:* Strong; X = yellow; Y = blue-black; Z = dark blue-green. *Orientation:* $Y = b$. *Dispersion:* $r < v$. $\alpha = 1.688$ $\beta = 1.699$ $\gamma = 1.704$ 2V(meas.) = 35°

Cell Data: *Space Group:* $[C2/m.]$ a = 9.982(7) (synthetic ferro-richterite). $b = 18.223(6)$ $c = 5.298(5)$ $\beta = 103°44(7)'$ Z = 2

X-ray Powder Pattern: Synthetic ferro-richterite.
8.58 (100), 2.739 (70), 3.18 (65), 2.540 (50), 3.43 (35), 2.615 (35), 3.32 (25)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	48.85	51.15	MnO	1.31	1.84
TiO_2	1.02	1.33	MgO	4.20	8.08
Al_2O_3	2.39	1.35	CaO	6.10	5.04
Fe_2O_3		0.82	Na_2O	4.37	6.62
Cr_2O_3	0.04		K_2O	1.24	1.10
FeO	30.19	20.98	Total	[99.71]	98.31

(1) Baie-des-Moutons, Quebec, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry, original total given as 99.68%, corresponding to $(Na_{0.59}K_{0.25})_{\Sigma=0.84}(Ca_{1.02}Na_{0.73}Mn_{0.17}Fe^{2+}_{0.08})_{\Sigma=2.00}(Fe^{2+}_{3.85}Mg_{0.98}Ti_{0.12}Al_{0.05})_{\Sigma=5.00}(Si_{7.61}Al_{0.39})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Kangerdlugssuaq Fjord, Greenland; by electron microprobe, Fe^{2+}:Fe3+ calculated; corresponding to $(Na_{0.77}K_{0.21})_{\Sigma=0.98}(Ca_{1.82}Na_{0.18})_{\Sigma=2.00}(Fe^{2+}_{2.67}Mg_{1.83}Mn_{0.24}Ti_{0.15}Fe^{3+}_{0.09}Al_{0.02})_{\Sigma=5.00}(Si_{7.78}Al_{0.22})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with richterite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Na + K)_A \geq 0.5$; 0.67 Na_B 1.33; $(Ca + Na)_B \geq 1.34$; $Si \geq 7.5$.

Occurrence: A rare accessory mineral in sodium-rich syenites and their volcanic equivalents; replacing ferromagnesian minerals in granite.

Association: Feldspar, pyroxenes, zircon, fayalite, ferro-actinolite.

Distribution: From the Baie-des-Moutons complex, La Tabatière, Quebec, Canada. At the Kangerdlugssuaq Fjord, Greenland. From the Tibchi ring complex, Nigeria.

Name: For the *ferrous* iron in its composition and similarity to *richterite*.

Type Material: n.d.

Ferroselite $FeSe_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As slender prismatic crystals, to 1 mm, striated on {110} parallel to [001], with rhombic cross sections; fine-grained massive. *Twinning:* As stellate and cruciform twins; twin lamellae noted in polished section.

Physical Properties: *Tenacity:* Very brittle. Hardness = 6–6.5 VHN = 858–933, 897 average (25 g load). D(meas.) = 7.20 D(calc.) = 7.139 Becomes magnetic on heating.

Optical Properties: Opaque. *Color:* Steel-gray to tin-white with a rose tint, also brass-yellow, tarnishes to a brassy tone; in polished section, white with a gray-brown hue. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Distinct. *Anisotropism:* Strong, from greenish gray to lilac-gray. R_1–R_2: (400) 42.3–44.1, (420) 42.5–44.3, (440) 43.0–44.5, (460) 43.5–45.1, (480) 43.9–45.9, (500) 44.4–47.0, (520) 44.9–48.2, (540) 45.3–49.5, (560) 46.0–50.9, (580) 46.8–52.3, (600) 47.6–53.7, (620) 48.2–54.9, (640) 48.7–55.9, (660) 49.1–56.3, (680) 49.3–56.5, (700) 49.5–56.7

Cell Data: *Space Group: Pnnm.* $a = 4.8007$ $b = 5.776$ $c = 3.5850$ $Z = 2$

X-ray Powder Pattern: Powder River basin, Wyoming, USA (nearly identical to rammelsbergite).
2.568 (100), 2.474 (100), 1.885 (70), 2.871 (50), 1.695 (40), 2.400 (35), 1.541 (35)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Fe	27.87	26.4	26.13	Cu		0.2

				Total	[100.00]	100.7	100.00

(1) Ust'-Uyuk V–Se–U deposit, Russia; recalculated to 100% after deduction of 4% insoluble; corresponds to $Fe_{1.09}Se_{2.00}$. (2) Trogtal quarry, Germany; by electron microprobe, corresponds to $(Fe_{1.01}Cu_{0.01})_{\Sigma=1.02}Se_{2.00}$. (3) $FeSe_2$.

Polymorphism & Series: Dimorphous with dzharkenite.

Mineral Group: Marcasite group.

Occurrence: In red-bed deposits of the Colorado Plateau type, peripheral to pyrite and uranium concentrations (Utah, USA); in U–V ores in sandstone, with coalified wood (Colorado, USA); with other sulfides and selenides cementing sandstones and pelites (Tuva, Russia).

Association: Uraninite, pyrite, marcasite, chalcopyrite, sphalerite, selenium, clausthalite, cadmoselite, bornite, cobaltomenite, laumontite, barite.

Distribution: In Russia, from the Ust'-Uyuk V–Se–U deposit, Tuva, Siberia [TL]; and in the Zapadno-Ozernogo Cu–Zn deposit, Southern Ural Mountains. From the Seluchekinskoye deposit, Kazakhstan. In Finland, at Kuusamo. In the Czech Republic, at the Petrovice uranium deposit, near Ždăr, and the Předbořice uranium deposit, near Krásna Hora. In the Trogtal quarry, near Lautenthal, Harz Mountains, Germany. In the USA, at several localities in Utah, on the Colorado Plateau, including the A.E.C. no. 8 mine, Temple Mountain, Emery Co. and the Repete mine, San Juan Co.; in Wyoming, from sandstones of the Powder River basin; from the Kermac Sec. 10 mine, McKinley Co., New Mexico; in the Mitten #2 mine, Navajo Co., Arizona; and from a number of mines in the Uravan district, Montrose Co., Colorado. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: For iron, FERrum, and SELenium in the composition.

Type Material: Mining Museum, St. Petersburg Mining Institute, St. Petersburg, 46-2/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69853.

(1) Bauchi, Nigeria; corresponds to $(Fe^{2+}_{1.60}Mg_{0.21}Ca_{0.08}Mn_{0.04}Fe^{3+}_{0.02}Na_{0.01})_{\Sigma=1.96}(Si_{1.90}Al_{0.10})_{\Sigma=2.00}O_6$.

Polymorphism & Series: Dimorphous with clinoferrosilite; forms a series with enstatite.

Mineral Group: Pyroxene group.

Occurrence: In medium- to high-grade metamorphosed iron formations.

Association: Magnetite, hematite, ferroan diopside, quartz, almandine.

Distribution: From Bauchi, Nigeria. At Tiris, Mauritania. From Oribi Gorge, Marble Delta, Natal, South Africa. In the USA, in Montana, around Copper Mountain and Carmichael Creek, in the Tobacco Root Mountains; in the Ruby Creek area, in the Gravelly Range, Madison Co.; also the Carter Creek area, in the Ruby Mountains, Beaverhead and Madison Cos.; and in Utah, at Hanksville, Wayne Co. On Arcedeckne Island, District of Franklin, Arctic Canada.

Name: For FERROus iron and SILicon in the composition; originally a "normative" mineral in rocks.

References: (1) Deer, W.A., R.A. Howie, and J. Zussman (1978) Rock-forming minerals, (2nd edition), v. 2A, single-chain silicates, 20–161. (2) Turnock, A.C., D.H. Lindsley, and J.E. Ferroskutterudite $(Fe, Co)(As, S)_3$

Crystal Data: Isometric. *Point Group*: 4/*m* $\bar{3}$ 2/*m*. As grains, 30-100 μm.

Physical Properties: *Cleavage*: Perfect, probably on {0$\bar{2}$ 1}. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = n.d. VHN = 700–1050 (50 g load). D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Opaque. *Color*: Tin white. *Streak*: n.d. *Luster*: Metallic.
Optical Class: Isotropic. Indistinguishable from skutterudite.
R_{air}: (400) 57.2, (420) 57.6, (440) 58.0, (460) 58.2, (470) 58.2, (480) 58.2, (500) 58.0, (520) 57.6, (540) 57.3, (546) 57.2, (560) 56.9, (580) 56.4, (589) 56.2, (600) 56.0, (620) 55.5, (640) 55.2, (650) 54.9, (660) 54.7, (680) 54.3, (700) 53.8

Cell Data: *Space Group*: *Im*3*m*. *a* = 8.17(1) Z = 8

X-ray Powder Pattern: Noril'sk ore field, Russia.
2.858 (100), 2.182 (90), 1.829 (70), 1.602 (70), 1.402 (60), 1.667 (50)

Chemistry:

	(1)
Ni	0.05
Co	8.38
Fe	12.09
As	78.01
S	1.34
Total	99.87

(1) Noril'sk ore field, Russia; average of 4 electron microprobe analyses, corresponding to $(Fe_{0.600}Co_{0.394}Ni_{0.002})_{\Sigma=0.996}(As_{2.888}S_{0.116})_{\Sigma=3.004}$.

Occurrence: In hydrothermal dolomite-calcite veins and apophyllite-anhydrite-carbonate veins in a magmatic hydrothermal Co-Ni antimonide-arsenide deposit.

Association: Wurtzite, sphalerite, galena, chalcopyrite, pyrrhotite, cubanite, chalcocite.

Distribution: From the Noril'sk ore field, Russia.

Name: For the high iron content and relation to *skutterudite*.

Type Material: A. E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (no. 3440/1).

References: (1) Spiridonov, E.M., Yu.D. Gritsenko, and I.M. Kulikova (2007) Ferroskutterudite (Fe,Co)As_3: A new mineral species from the dolomite-calcite veins of the Noril'sk Ore Field. Doklady Earth Sciences, 417, 1278–1280. (2) (2008) Amer. Mineral., 93, 1687-1688 (abs. ref. 1).

Ferrostrunzite $Fe^{2+}Fe^{3+}_2(PO_4)_2(OH)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$ or 1. Crystals are prismatic, flattened ∥ {100}, elongated along [001], to 6 mm, commonly fibrous in divergent aggregates. *Twinning:* By reflection across {110}.

Physical Properties: *Cleavage:* One nearly ∥ to elongation; one ≃ ⊥ optic normal; one ⊥ *Bxa*. *Fracture:* Very brittle. Hardness = ∼4 D(meas.) = 2.50 D(calc.) = 2.57

Optical Properties: Semitransparent. *Color:* Pale brown, colorless, white, straw-yellow, bright orange. *Streak:* Pale brown. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Faint; *X* = yellow-green; *Z* = orange. *Orientation:* $Z \wedge c \simeq 3°–8°$. *Dispersion:* Moderate, asymmetric. *Absorption:* Minimum ∥ *Z*. $\alpha = 1.628(2)$ $\beta = [1.682]$ $\gamma = 1.723(4)$ 2V(meas.) = 80(5)°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.17–10.23$ $b = 9.77–9.78$ $c = 7.37–7.40$ $\alpha = 88.63°–89.65°$ $\beta = 97.60°–98.28°$ $\gamma = 117.26°–117.60°$ Z = 2

X-ray Powder Pattern: Mullica Hill, New Jersey, USA; nearly identical to strunzite.
5.29 (100), 8.94 (80), 3.277 (40), 4.47 (30), 3.452 (30), 3.213 (30), 4.33 (20)

Chemistry:

	(1)	(2)	(3)

H_2O	[27.1]	27.5	25.24
Total	[100.0]	100.7	100.00

(1) Mullica Hill, New Jersey, USA; by electron microprobe, H_2O by difference, Fe^{2+}:Fe^{3+} estimated at 1:2 from microchemical tests and the known isostructural strunzite formula; corresponds to $Fe^{2+}_{0.98}Fe^{3+}_{1.96}(PO_4)_2(OH)_{1.84} \cdot 6.68H_2O$. (2) Bethel Church, Indiana, USA; by electron microprobe, H_2O by TGA; assuming Fe^{2+}:Fe^{3+} = 1:2, then corresponds to $Fe^{2+}_{0.95}Fe^{3+}_{1.9}(PO_4)_2(OH)_{1.84} \cdot 6H_2O$. (3) $Fe^{2+}Fe^{3+}_2(PO_4)_2(OH)_2 \cdot 6H_2O$.

Occurrence: Replacing a belemnite (Mullica Hill, New Jersey, USA); a secondary mineral in weathered phosphatic black shale beds (Bethel Church, Indiana, USA).

Association: Rockbridgeite, phosphosiderite (Mullica Hill, New Jersey, USA); vivianite, aluminian strengite, diadochite, leucophosphite, beraunite, fluorapatite (Bethel Church, Indiana, USA); beraunite, cacoxenite (Arnsberg, Germany).

Distribution: In the USA, along Raccoon Creek, near Mullica Hill, Gloucester Co., New Jersey; near Bethel Church, Pike Co., Indiana; in the Dunton quarry, Newry, Oxford Co., Maine; from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire. In the Gravel Hill mine, Perranzabuloe, Cornwall, England. At Arnsberg, North Rhein-Westphalia, and Althütte and Waidhaus, Bavaria, Germany. Along Dry Weather road, Glenhope, New Zealand.

Name: For its dominant content of *ferrous* iron and relation to *strunzite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149594.

(1) Xianghualing ore field, Hunan Province, People's Republic of China, average of 23 electron microprobe analyses, BeO calculated from stoichiometry; corresponds to $Be(Fe_{1.39}Mg_{0.97}Zn_{0.42}Mn_{0.17}Sn_{0.03})_{\Sigma=2.98}Al_{7.99}O_{16}$.

Mineral Group: Taaffeite group.

Occurrence: In a contact metamorphic skarn zone.

Association: Fe^{2+}-rich magnesiotaaffeite-2*N′*2*S*, ferronigerite-2*N*1*S*, cassiterite, liberite, pyrite, sphalerite, pyrrhotite, galena, spinel, phlogopite.

Distribution: Xianghualing Sn-polymetallic ore field, Linwu County, Hunan Province, People's Republic of China.

Name: Identifies a member in the *taaffeite* group with a structure based on spinel (*S*) and nolanite (*N*) modules and with $Fe^{2+} > Mg^{2+}$.

Type Material: Museum of the Institute of Geology and Geophysics, Chinese Academy of Sciences, Beijing, People's Republic of China (KDX017).

Pehrmanite $(Fe^{2+}, Zn, Mg)_2Al_6BeO_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ $2/m$. Tabular hexagonal crystals, to 250 μm, subhedral; as oriented overgrowths on nigerite.

Physical Properties: *Tenacity:* Very brittle. Hardness = 8–8.5 VHN = 1700 (100 g load). D(meas.) = n.d. D(calc.) = 4.07

Optical Properties: Semitransparent. *Color:* Light green; gray in reflected light.
Luster: Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* Weak to distinct; O = pale greenish; E = pale grayish brown. *Orientation:* Elongation positive. n = [1.79] *Anisotropism:* Very weak.
R: (470) 8.34, (546) 8.11, (589) 8.01, (650) 7.86

Total	100.00

(1) Rosendal pegmatite, Finland; by electron microprobe, average of two analyses; total Fe as FeO, BeO by difference, B shown present by ion microprobe; corresponds to $(Fe_{1.54}Zn_{0.30}Mg_{0.22}Mn_{0.02})_{\Sigma=2.08}Al_{5.99}Be_{0.93}O_{12}$.

Occurrence: In the wall zone of a granite pegmatite in "hornblende" gabbro.

Association: Quartz, plagioclase, sillimanite, muscovite, spessartine-almandine, chlorite, biotite, epidote, allanite, nigerite, calcite.

Distribution: In the Rosendal pegmatite, Kemiö (Kimito) Island, southwestern Finland.

Name: To honor Gunnar Pehrman (1895-?), Emeritus Professor of Mineralogy and Geology, Åbo University, Turku, Finland, for his work on the Kemiö pegmatites.

Type Material: Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands, HL-6, HL-12.

Ferrotantalite $(Fe^{2+}, Mn^{2+})(Ta, Nb)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m2/m2/m$. Commonly as exsolution intergrowths with ferrotapiolite.

Physical Properties: *Cleavage:* {100}, distinct; {010}, less distinct. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 6.65–7.95 D(calc.) = n.d. Paramagnetic.

Optical Properties: Opaque, translucent in thin edges. *Color:* Iron-black; reddish brown in transmitted light; gray in reflected light with red to reddish brown internal reflections. *Streak:* Black. *Luster:* Submetallic to vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$. *Absorption:* Strong; $Z > X$. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.
R_1–R_2: n.d.

Cell Data: *Space Group:* [*Pbcn*](by analogy to ferrocolumbite). a = n.d. b = n.d. c = n.d. Z = [4]

X-ray Powder Pattern: n.d.

(1) Spittal a.d. Drau, Austria; by electron microprobe, total Fe as FeO; corresponds to $(Fe_{0.78}Mn_{0.20})_{\Sigma=0.98}Ti_{0.03}(Ta_{1.11}Nb_{0.87})_{\Sigma=1.98}O_6$. (2) $FeTa_2O_6$.

Polymorphism & Series: Dimorphous with ferrotapiolite; forms two series, with manganotantalite and with ferrocolumbite.

Occurrence: As an accessory and primary constituent of granite pegmatites.

Association: Ferrotapiolite.

Distribution: Material analyzed by microprobe from: Moss, Norway. At Spittal an der Drau, Austria. From Nyanga, Uganda. At Muhembe, Rwanda. At Upper Bear Gulch, Lawrence Co., South Dakota, USA. In the Yellowknife district, Northwest Territories, Canada.

Name: For its dominant content of FERROus iron, and the Greek mythical *Tantalus*, for the difficulty in bringing the mineral into solution.

Ferrotapiolite $(Fe^{2+}, Mn^{2+})(Ta, Nb)_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m2/m2/m$. Crystals usually well developed, short prismatic or equant, with several forms. *Twinning:* Common on {013}, then distorted along $[0\bar{3}1]$; rarely on {101}.

Physical Properties: *Fracture:* Uneven to subconchoidal. Hardness = n.d. VHN = 885–974 (100 g load). D(meas.) = 7.90(5) D(calc.) = 8.17–8.21

Optical Properties: Opaque, transparent on thin edges. *Color:* Black, may be brownish black on the surface; yellowish to reddish brown in transmitted light. *Streak:* Brown to brownish black. *Luster:* Subadamantine to submetallic, brilliant.
Optical Class: Uniaxial (+). *Pleochroism:* Strong; O = pale yellowish or reddish brown.

(1) Skogböle, Finland; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Fe_{0.68}Mn_{0.30})_{\Sigma=0.98}(Ta_{1.94}Nb_{0.05}Ti_{0.02})_{\Sigma=2.01}O_6$.

Polymorphism & Series: Forms a series with manganotapiolite.

Mineral Group: Ferrotapiolite group.

Occurrence: An accessory mineral in zoned granite pegmatites; detrital in placers.

Association: Albite, muscovite, tourmaline, beryl, spodumene, columbite–tantalite, wodginite, cassiterite, triplite, triphylite.

Distribution: Well-characterized material from: in Finland, in the Eräjärvi area, Orivesi; at Sukula and Härkäsaari, Tammela; at Skogböle and the Rosendal pegmatite, Kemiö (Kimito) Island. From Maršíkov, Czech Republic. At Olgiasca, Lombardy, Italy. In France, from Chanteloube, Haute-Vienne. Occurs at Angarf-Nord and elsewhere in the Anti-Atlas Mountains, Morocco. From Greenbushes, Strelley, and Tabba Tabba, Pilbara, Western Australia. In the USA, from Topsham, Sagadahoc Co. and Paris, Oxford Co., Maine; in the Old Mike mine, six km north-northwest of Custer, Custer Co., South Dakota; at Rockford, Coosa Co., Alabama.

Name: For its dominant FERROus iron content and for *Tapio*, ancient Finnish god of the forest, as the mineral was first found in Finland.

(1) Oktyabr'skiy mine, Norilsk district, Krasnoyarskiy Kray, Russia; average of 9 electron microprobe analyses, Fe^{2+}/Fe^{3+} calculated for charge balance, H calculated as if present only as OH, presence of OH and absence of H_2O confirmed by IR spectroscopy; corresponding to $(Fe_{5.98}Cu_{0.015}Ni_{0.005})_{\Sigma=6.00}S_6(Fe^{2+}_{4.89}Mg_{0.01})_{\Sigma=4.90}(OH)_{9.80}Fe^{3+}_{0.09}(OH)_{0.27}$.

Occurrence: Of low-temperature hydrothermal origin coating cavities in pentlandite-mooihoekite-cubanite ore with minor magnetite and chalcopyrite.

Association: Ferrovalleriite, magnetite, an Fe-rich chlorite-type phyllosilicate.

Distribution: From Shaft no 1, Oktyabr'skiy mine, Oktyabr'skoye Cu-Ni-PGM deposit, Talnakh, Norilsk district, Krasnoyarskiy Kray, Siberia, Russia.

Name: As the structural analogue (based on chemical, X-ray, and IR data similarities) of *tochilinite* with essential *ferrous iron*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (4058/1).

(2) Lake's Grave, Australia; corresponds to $(Ca_{1.92}Na_{0.27}K_{0.20})_{\Sigma=2.39}(Fe^{2+}_{2.86}Mg_{0.87}Fe^{3+}_{0.49}Al_{0.53}Ti_{0.15}Mn_{0.04})_{\Sigma=4.94}(Si_{6.24}Al_{1.76})_{\Sigma=8.00}O_{21.75}[(OH)_{1.81}F_{0.44}]_{\Sigma=2.25}$.

Polymorphism & Series: Forms a series with tschermakite.

Mineral Group: Amphibole (calcic) group: $Mg/(Mg + Fe^{2+}) < 0.5$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; $Si < 6.25$; $Ti < 0.5$.

Occurrence: A product of medium- to high-pressure metamorphism of highly aluminous rocks, producing schists, gneisses, or amphibolites; from differentiated mafic plutonic igneous rocks.

Association: Almandine, chlorite, biotite, muscovite, quartz, anorthite, apatite (metamorphic).

Distribution: From Emeryville, St. Lawrence Co., New York, USA. At Lake's Grave, Broken Hill, New South Wales, Australia.

Name: For *ferrous* iron in its composition and relation to *tschermakite*.

Type Material: n.d.

(1) Oktyabr'skiy mine, Norilsk district, Krasnoyarskiy Kray, Russia; average of 6 electron microprobe analyses, Fe^{2+}/Fe^{3+} calculated for charge balance, H calculated as if present only as OH, presence of OH and absence of H_2O confirmed by IR spectroscopy; corresponding to $(Fe_{1.09}Cu_{0.91})_{\Sigma=2.00}S_2 \cdot (Fe^{2+}_{1.34}Fe^{3+}_{0.12}Al_{0.01})_{\Sigma=1.47}(OH)_{3.07}$.

Mineral Group: Valleriite group.

Occurrence: Of low-temperature hydrothermal origin coating cavities in pentlandite-mooihoekite-cubanite ore with minor magnetite and chalcopyrite.

Association: Ferrotochilinite, magnetite, an Fe-rich chlorite-type phyllosilicate, hibbingite, rhodochrosite.

Distribution: From several Cu-Ni-PGM deposits of the Norilsk region, including at the Oktyabr'skiy mine, Talnakh, Krasnoyarskiy Kray, Siberia, Russia.

Name: As the structural analogue (based on chemical, X-ray, and IR data similarities) of *valleriite* with essential *ferrous iron*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Ferrowodginite $Fe^{2+}Sn^{4+}Ta_2O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As lathlike to irregular inclusions, to 0.3 mm, in tantalian cassiterite. *Twinning:* Polysynthetic on {100}.

Physical Properties: *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 5.5
D(meas.) = n.d. D(calc.) = 7.02

Optical Properties: Transparent to translucent. *Color:* Dark brown to black. *Streak:* Dark brown. *Luster:* Vitreous.
Optical Class: Biaxial. $\alpha = > 2.0$ $\beta = > 2.0$ $\gamma = > 2.0$ 2V(meas.) = n.d.
Anisotropism: Noted.

Cell Data: *Space Group: C*2/*c*. $a = 9.415(7)$ $b = 11.442(6)$ $c = 5.103(4)$ $\beta = 90.8(1)°$
Z = 4

X-ray Powder Pattern: Near Sukula, Finland.
2.97 (100), 4.16 (50), 2.493 (40), 2.55 (30), 1.455 (30), 3.64 (20), 2.86 (20)

Chemistry:

	(1)	(2)
Nb_2O_5	14.8	
TiO_2	4.3	
SnO_2	10.1	22.68
Fe_2O_3	1.9	
Ta_2O_5	56.3	66.51
FeO	9.3	10.81
MnO	2.8	
Total	[99.5]	100.00

(1) Near Sukula, Finland; by electron microprobe, average of two analyses, original total given as 99.4%; Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Fe^{2+}_{0.76}Mn_{0.23})_{\Sigma=0.99}(Sn_{0.40}Ti_{0.32}Ta_{0.15}Fe^{3+}_{0.14})_{\Sigma=1.01}(Ta_{1.34}Nb_{0.66})_{\Sigma=2.00}O_8$. (2) $FeSnTa_2O_8$.

Mineral Group: Wodginite group: $Fe^{2+} > 0.5$; $Ti_B \leq 0.5$; $Fe^{3+}_B \leq 0.25$.

Occurrence: In museum specimens from a granite pegmatite.

Association: Tantalian cassiterite, tapiolite, bismuth, stannomicrolite.

Distribution: Near Sukula, Tammela, Finland, the exact locality now lost.

Name: For its content of FERROus iron and its relation to *wodginite*.

Type Material: R.B Ferguson Museum of Mineralogy, University of Manitoba, Winnipeg, Canada.

References: (1) Ercit, T.S., P. Černý, and F.C. Hawthorne (1992) The wodginite group. III. Classification and new species. Can. Mineral., 30, 633–638. (2) (1993) Amer. Mineral., 78, 848 (abs. ref. 1).

(1) Victory mine, South Dakota, USA; H_2O by calorimetry, corresponds to $(Na_{1.25}Mn^{2+}_{0.30}Ca_{0.22}Fe^{2+}_{0.01})_{\Sigma=1.78}Fe^{2+}_{1.00}(Fe^{2+}_{0.96}Li_{0.03}Mg_{0.01})_{\Sigma=1.00}(Al_{0.75}Mg_{0.23}Fe^{3+}_{0.02})_{\Sigma=1.00}(PO_4)_3$. (2) G.E. Smith mine, New Hampshire, USA; corresponds to $(Na_{1.07}Mn^{2+}_{0.43}Ca_{0.08})_{\Sigma=1.58}(Fe^{2+}_{0.84}Mn^{2+}_{0.16})_{\Sigma=1.00}(Fe^{2+}_{0.48}Mg_{0.48}Li_{0.03})_{\Sigma=0.99}(Al_{0.65}Fe^{3+}_{0.28}Mg_{0.07})_{\Sigma=1.00}(PO_4)_3$.

Polymorphism & Series: Forms two series, with wyllieite, and with rosemaryite; $Fe^{2+} > Mn^{2+}$ in M(1); Fe^{2+} dominant in M(2a).

Occurrence: A primary phosphate in zoned granite pegmatites.

Association: Arrojadite, muscovite, schorl, plagioclase, quartz (Victory mine, South Dakota, USA).

Distribution: In the USA, from the Victory mine, four km northeast of Custer, Custer Co., South Dakota, and at the G.E. Smith mine, Newport, Sullivan Co., New Hampshire.

Name: As a mineral with dominant *ferrous* iron, and its relation to *wyllieite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 126318, 137244, 162555, 162556.

Ferruccite $NaBF_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m2/m2/m$. As minute tabular crystals.

Physical Properties: *Cleavage:* {100}, {010}, and {001}. Hardness = ∼3
D(meas.) = 2.496 D(calc.) = 2.5075 (synthetic). Soluble in H_2O, bitter and acid taste.

Optical Properties: Translucent. *Color:* Colorless to white; colorless in transmitted light.
Optical Class: Biaxial (+) (synthetic). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.301$
$\beta = [1.3012]$ $\gamma = 1.3068$ 2V(meas.) = 11°25′

Cell Data: *Space Group: Cmcm*(synthetic). $a = 6.8368(9)$ $b = 6.2619(7)$ $c = 6.7916(4)$
Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 11-671).
3.39 (100), 3.41 (85), 2.31 (40), 2.84 (25), 3.82 (20), 2.14 (20), 2.03 (20)

Chemistry: Analyses of relatively pure material are not available.

Occurrence: As a fumarolic sublimate.

Association: Sassolite, fluorborates, and fluorsilicates.

Distribution: From Vesuvius, Campania, and on Vucano, Aeolian Islands, Italy. At volcanoes on the Kamchatka Peninsula, Russia.

Name: Honors Professor Ferruccio Zambonini (1880–1932), Italian mineralogist, student of fumarolic minerals.

Type Material: University of Florence, Florence, Italy, 1974/l; National School of Mines, Paris, France; The Natural History Museum, London, England, 1933,419.

Fersmanite $\mathbf{(Ca,Na)_4(Ti,Nb)_2Si_2O_{11}(F,OH)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudotetragonal. *Point Group:* $\overline{1}$ or 1. Crystals commonly distorted, flattened, pseudotetragonal, to 2 cm. *Twinning:* Possibly on {001}.

Physical Properties: *Fracture:* Uneven. Hardness = 5–5.5 D(meas.) = 3.44–3.46 D(calc.) = [3.43]

Optical Properties: Transparent to translucent. *Color:* Dark brown to golden yellow. *Streak:* White with pale brownish tint. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.873$–1.886 $\beta = 1.930$ $\gamma = 1.914$–1.939 2V(meas.) = 0°–7°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 7.210(1)$ $b = 7.213(2)$ $c = 20.451(3)$ $\alpha = 95.15(3)°$ $\beta = 95.60(2)°$ $\gamma = 89.04(5)°$ Z = [8]

X-ray Powder Pattern: Khibiny massif, Russia.
3.058 (100), 2.815 (60), 1.518 (55), 1.801 (50), 1.687 (45), 1.552 (40), 2.530 (35)

Chemistry:

	(1)
SiO_2	22.46
TiO_2	17.08
Nb_2O_5	21.79
CaO	28.80
Na_2O	6.92
F	4.23
$-O = F_2$	1.78
Total	99.50

(1) Khibiny massif, Russia; by electron microprobe, average of several analyses, H_2O in empirical analysis to sum to 13 cations; corresponds to $(Ca_{2.82}Na_{1.21})_{\Sigma=4.03}(Ti_{1.18}Nb_{0.86})_{\Sigma=2.04}Si_2O_{10.89}[F_{1.15}(OH)_{0.96}]_{\Sigma=2.11}$.

Occurrence: In aegirine-rich nepheline pegmatites in a differentiated alkalic massif (Khibiny massif, Russia).

Association: Feldspar, pectolite, apatite, aegirine, lamprophyllite, rinkite, sulfides.

Distribution: On Mt. Eveslogchorr, Khibiny massif, Kola Peninsula, Russia. From Üdersdorf, Eifel district, Germany.

Name: For Academician Aleksandr Evgen'evich Fersman (1883–1945), eminent Russian mineralogist, geochemist, and gemologist.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 33193, 33194.

Fersmite $(Ca, Ce, Na)(Nb, Ta, Ti)_2(O, OH, F)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; commonly metamict. *Point Group:* $2/m2/m2/m$. As rough prismatic crystals, slightly elongated along [001], tabular on {010} or {100} and striated parallel to [001]; also acicular, to 15 mm; in intergrowths with columbite and pyrochlore.

Physical Properties: *Cleavage:* {100}, parting. *Fracture:* Subconchoidal. *Tenacity:* Extremely brittle. Hardness = 4–4.5 VHN = 572–593 D(meas.) = 4.69–4.80 D(calc.) = 4.78 Fluoresces yellow-green to bluish green under SW and LW UV; light blue cathodoluminescence.

Optical Properties: Opaque, translucent through thin edges. *Color:* Black, dark brown, lemon-yellow to yellow-brown; dark honey-yellow in thin section. *Streak:* Grayish brown. *Luster:* Resinous to subvitreous, submetallic.
Optical Class: Biaxial (+). *Pleochroism:* Moderate to weak; $X = Y$ = pale greenish yellow to colorless; Z = dark greenish yellow to olive-yellow. $\alpha = 2.07$ $\beta = [2.08]$ $\gamma = 2.19$ 2V(meas.) = 20°–25°

Cell Data: *Space Group: Pcan* (synthetic $CaNb_2O_6$). $a = 5.752(4)$ $b = 14.926(4)$ $c = 5.204(4)$ Z = 4

X-ray Powder Pattern: Ravalli Co., Montana, USA.
3.049 (100), 3.762 (21), 1.527 (15), 2.493 (14), 1.183 (13), 1.211 (11), 1.967 (10)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

Ce_2O_3		0.5	CaO	14.49	16.4			

(1) Vishnevy Mountains, Russia; $RE_2O_3 = Ce_2O_3$ 80%, Y_2O_3 10%, ThO_2 10%. (2) Orcesco, Italy; by electron microprobe, corresponds to $Ca_{1.01}(Nb_{1.72}Ta_{0.26}Ti_{0.02})_{\Sigma=2.00}O_6$.

Occurrence: A rare accessory mineral in nepheline syenites and carbonatites. In miarolitic cavities in an albitized pegmatite dike.

Association: Columbite, pyrochlore, plagioclase, microcline, biotite, apatite, "hornblende", titanite, muscovite, zircon, xenotime (Vishnevy Mountains, Russia); columbite, monazite, ancylite, barite, quartz, apatite (Ravalli Co., Montana, USA).

Distribution: Near Lake Buldym, Vishnevy-Ilmen Mountains, Southern Ural Mountains, Russia. On Alpe Rosso, near Orcesco, Val Vigezzo, Piedmont, Italy. In the USA, from the Dark Star claim, 8 km south of Alta, Ravalli Co., Montana; in the Gem Park ultramafic complex, about six km east of Hillside, Fremont Co., Colorado; from the Mesa Grande and Ramona districts, San Diego Co., California; at the Foote mine, Kings Mountain, Cleveland Co., North Carolina; Granite Mountain, near Little Rock, Pulaski Co., Arkansas. In Canada, at Mt. Brussilof, British Columbia, and at the Huron claim, Greer Lake district, Manitoba. From the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire). A few other localities are reported.

Name: For Academician Aleksandr Evgen'evich Fersman (1883–1945), eminent Russian mineralogist, geochemist, and gemologist.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 44383, 44384.

(1) Gypsum Valley, Colorado, USA; recalculated to 100% after deduction of gypsum 7.34%, insoluble 9.40%. (2) $Fe_4V_4O_{16}\cdot 5H_2O$.

Occurrence: As an impregnation in sandstone (Colorado Plateau-type U–V deposits).

Association: Hewettite, metahewettite, carnotite, steigerite, tyuyamunite, gypsum, other vanadium oxides (Colorado Plateau deposits); hewettite, duttonite, schoderite, metaschoderite, straczekite (Wilson Springs, Arkansas, USA).

Distribution: In the USA, from an unspecified locality in Gypsum Valley [later noted from the Tiny mine], San Miguel Co., on Polar Mesa, Gateway district, La Sal Mountains, Grand Co., at the Hummer mine, Bull Canyon area, Paradox Valley, and from the Fox mine, Uravan district, Montrose Co., Colorado; in the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada; and in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas. At the Mounana uranium mine, Gabon.

Name: Named for its content of FERric iron and VANadium.

Type Material: Harvard University, Cambridge, Massachusetts, 91457; National Museum of Natural History, Washington, D.C., USA, 96420, 96421, 97874.

Fetiasite $(Fe^{2+}, Fe^{3+}, Ti)_3O_2(As_2^{3+}O_5)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are tabular on {100}, elongated along [010] or [001], showing {100}, {011}, {001}, to 2 cm; in radial to globular aggregates.

Physical Properties: *Cleavage:* {100}, perfect. *Fracture:* Uneven to conchoidal. Hardness = ∼5 VHN = 438–490 (50 g load). D(meas.) = 4.6(1) on altered material. D(calc.) = 4.74–4.80

Optical Properties: Opaque. *Color:* Brown to black, red-brown when altered; creamy white in reflected light. *Luster:* Metallic to semimetallic.
Optical Class: Biaxial. *Anisotropism:* Noted.
R_1–R_2: (470) 15.4–16.0, (546) 15.3–15.8, (589) 14.8–15.2, (650) 14.2–15.0

Cell Data: *Space Group:* $P2_1/m$. $a = 10.595$–10.616 $b = 3.242$–3.252 $c = 8.931$–8.945 $\beta = 108.89°$–$108.95°$ $Z = 2$

X-ray Powder Pattern: Pizzo Cervandone, Italy.
2.749 (100), 2.811 (94), 2.391 (85), 2.985 (67), 1.779 (48), 1.709 (35), 1.754 (32)

Chemistry:

	(1)	(2)
TiO_2	10.09	11.17
Fe_2O_3	17.13	17.93
As_2O_3	46.95	46.76
FeO	23.12	24.23
MnO	1.25	0.89
Total	98.54	100.98

(1) Pizzo Cervandone, Italy; by electron microprobe, average of seven analyses; Fe^{2+}:Fe^{3+} from crystal-structure analysis, total Mn as MnO, As^{3+} confirmed by IR; corresponding to $(Fe^{2+}_{1.38}Fe^{3+}_{0.92}Ti_{0.54}Mn_{0.08})_{\Sigma=2.92}O_2(As_2O_5)$. (2) Binntal, Switzerland; by electron microprobe, average of ten analyses; corresponding to $(Fe^{2+}_{1.40}Fe^{3+}_{0.93}Ti_{0.58}Mn_{0.05})_{\Sigma=2.96}O_2(As_2O_5)$.

Occurrence: Deposited from arsenic-bearing solutions in Alpine fissures in gneisses of the upper greenschist to lower amphibolite facies.

Association: Asbecasite, cafarsite, cervandonite, anatase, chlorite, feldspar, mica, quartz.

Distribution: On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, Italy. At Gorb, Binntal, Valais, Switzerland.

Name: For *Fe, Ti, As* in its composition.

Type Material: Natural History Museum, Basel; Mineralogical Institute, University of Basel, Switzerland.

References: (1) Graeser, S., H. Schwander, F. Demartin, C.M. Gramaccioli, T. Pilati, and E. Reusser (1994) Fetiasite $(Fe^{2+}, Fe^{3+}, Ti)_3O_2[As_2O_5]$, a new arsenite mineral: its description and structure determination. Amer. Mineral., 79, 996–1002.

Fettelite $Ag_{24}HgAs_5S_{20}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. Hexagonal tablets and flakes, to 0.2 mm, in subparallel aggregates, rosettelike groups, and clusters.

Physical Properties: *Cleavage:* Perfect on {0001}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3.75 VHN = 138–174, 158 average (20 g load). D(meas.) = n.d. D(calc.) = 6.29

Optical Properties: Opaque. *Color:* Dark violet to scarlet, wine-red in thin fragments; in reflected light, gray with a greenish tint, with strong red internal reflections. *Streak:* Dark vermillion. *Luster:* Submetallic to adamantine.
Optical Class: Biaxial. *Anisotropism:* Weak; bright greenish gray to dark bluish gray.
Bireflectance: Weak.
R_1–R_2: (400) — , (420) 30.7–31.3, (440) 30.7–31.3, (460) 30.5–31.1, (480) 30.0–30.8, (500) 29.4–30.3, (520) 28.6–29.8, (540) 27.6–29.2, (560) 27.1–28.6, (580) 26.0–27.6, (600) 25.7–27.1, (620) 25.0–26.3, (640) 24.3–25.4, (660) 23.6–24.5, (680) 23.0–23.8, (700) 22.5–23.3

Cell Data: *Space Group:* $P\overline{3}m1$, $P\overline{3}1m$, $P3m1$, $P31m$, $P321$, or $P312$. $a = 15.00$ $c = 15.46$ $Z = 3$

X-ray Powder Pattern: Niederbeerbach mine, Germany.
3.091 (10), 1.878 (8), 3.175 (6), 2.998 (4), 2.755 (3), 3.243 (2), 2.497 (2)

Chemistry:

	(1)	(2)
Tl	0.13	
Hg	5.21	5.27
Ag	67.55	68.03
Pb	0.07	
Cu	0.07	
Fe	0.04	
As	9.80	9.85
Sb	0.23	
S	16.79	16.85
Total	99.88	100.00

(1) Niederbeerbach mine, Germany; by electron microprobe, average of 28 analyses on five crystals; corresponds to $Ag_{24.00}Hg_{1.00}Cu_{0.04}Fe_{0.03}Tl_{0.02}Pb_{0.01}As_{5.01}S_{20.07}$. (2) $Ag_{24}HgAs_5S_{20}$.

Occurrence: A rare mineral in low-temperature hydrothermal prehnite–calcite–quartz veins.

Association: Proustite, pearceite, xanthoconite, safflorite.

Distribution: From the Niederbeerbach mine, 10 km south of Darmstadt, Odenwald, Hesse, Germany [TL].

Name: To honor M. Fettel, who first noted the mineral.

Type Material: Institute of Mineralogy, University of Heidelberg, Heidelberg, Germany.

References: (1) Wang, N. and A. Paniagua (1996) Fettelite a new Hg-sulfosalt mineral from Odenwald. Neues Jahrb. Mineral., Monatsh., 313–320. (2) (1997) Amer. Mineral., 82, 621 (abs. ref. 1).

Fianelite $\mathbf{Mn_2^{2+}V^{5+}(V^{5+},As^{5+})O_7 \cdot 2H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals, platy, prominent {010}, with {100}, {001}, {041}(?), intergrown and striated ‖ [100], to 0.2 mm; in rosettes and polycrystalline crusts.

Physical Properties: *Cleavage:* Parallel {001}(?) and {100}(?), good. Hardness = ∼3 VHN = 84–89, average 86.5 (15 g load). D(meas.) = 3.21(1) D(calc.) = 3.217(2)

Optical Properties: Transparent. *Color:* Red-orange. *Streak:* Orange. *Luster:* Vitreous. *Optical Class:* Biaxial. *Pleochroism:* Strong; yellow to red on {010} (?). $n = 1.82(2)$ 2V(meas.) = $< 10°$

Cell Data: *Space Group:* $P2_1/n$. $a = 7.809(2)$ $b = 14.554(4)$ $c = 6.705(4)$ $\beta = 93.27(3)°$ Z = 4

X-ray Powder Pattern: Fianel mine, Switzerland.
3.039 (100), 5.32 (80), 2.721 (60), 1.593 (60), 3.436 (50), 3.259 (50), 2.573 (50)

Chemistry:

	(1)
As_2O_5	13.57
V_2O_5	38.23
SiO_2	0.12
MnO	37.49
H_2O	[9.64]
Total	[99.05]

(1) Fianel mine, Switzerland; by electron microprobe, average of eight analyses on three grains, total Mn as MnO, H_2O calculated from crystal-structure analysis; corresponds to $Mn_{1.98}(V_{1.57}As_{0.44}Si_{0.01})_{\Sigma=2.02}O_7 \cdot 2H_2O$.

Occurrence: In fractures crosscutting veinlets in metamorphosed Fe–Mn ores.

Association: Medaite, palenzonaite, saneroite, pyrobelonite, parsettensite, rhodochrosite, kutnohorite, aegirine, quartz.

Distribution: From the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: For its occurrence in the Fianel mine, Switzerland.

Type Material: Natural History Museum, Basel, Switzerland.

References: (1) Brugger, J. and P. Berlepsch (1996) Description and crystal structure of fianelite, $Mn_2V(V,As)O_7 \cdot 2H_2O$, a new mineral from Fianel, Val Ferrera, Graubünden, Switzerland. Amer. Mineral., 81, 1270–1276.

Fibroferrite $Fe^{3+}(SO_4)(OH)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Acicular crystals, elongated along {001}, to 5 mm; typically as mammillary aggregates, mats, and incrustations. *Twinning:* Repeated contact twins on {110}, yielding trillings.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = ∼2.5 D(meas.) = 1.84–2.09 D(calc.) = 1.996 Soluble in H_2O.

Optical Properties: Translucent. *Color:* Pale yellow, straw-yellow, yellowish green, greenish gray, nearly white; colorless to pale yellow in transmitted light. *Luster:* Pearly, silky in aggregates.
Optical Class: Biaxial (+), anomalous. *Pleochroism:* Colorless to pale amber-yellow.
Orientation: $Z = c$. α = 1.518–1.533 (variable with H_2O content) β = 1.518–1.535 γ = 1.561–1.575 2V(meas.) = ∼0°

Cell Data: *Space Group:* $R\overline{3}$. $a = 24.176$ $c = 7.656$ Z = 18

X-ray Powder Pattern: Cetine mine, Italy.
12.10 (100), 4.57 (53), 6.98 (42), 4.07 (35), 3.346 (33), 2.784 (30), 2.989 (25)

Chemistry:

	(1)	(2)
SO_3	30.73	30.91
Fe_2O_3	30.80	30.83
H_2O	38.21	38.26
Total	99.74	100.00

(1) Saint-Félix de Paillères, France. (2) $Fe(SO_4)(OH)\cdot 5H_2O$.

Occurrence: An uncommon dehydration product of melanterite in oxidized portions of rocks and sediments containing iron sulfide, most stable in arid regions; rarely a volcanic sublimate.

Association: Melanterite, amarantite, hohmannite, krausite, coquimbite, parabutlerite, butlerite, copiapite, epsomite, gypsum, pyrite.

Distribution: Worldwide localities are too numerous to list. Studied material from: in Chile, at Tierra Amarilla, near Coquimbó, Atacama; from Quetena, west of Calama, and at Chuquicamata, Antofagasta. Thick beds in the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. In the USA, in California, from Borate, about 10 km northeast of Yermo, Calico Hills, San Bernardino Co., at Island Mountain, Trinity Co., and in the Redington mine, Knoxville, Napa Co.; from the Shattuck mine, Bisbee, Cochise Co., Arizona; in Nevada, at the Cordero mine, Poalit district, Humboldt Co., in the Commonwealth mine, Galena district, Washoe Co., and elsewhere in Nevada; long crystals in the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah. In Canada, from Quatsino, British Columbia, and in the Sydney coal field, Cape Breton, Nova Scotia. From Saint-Félix de Paillères, Gard, France. In the Cae Coch mine, Trefriw, Gwynedd, Wales. At Skouriotissa, Cyprus. In Italy, on Capo Calamita and La Vigneria, Elba, and in the Cetine mine, near Rosia, Tuscany. At Laurium, Greece. On Valachov Hill, near Skřivaň, Czech Republic. From Špania Dolina (Herrengrund), Slovakia. At volcanoes on the Kamchatka Peninsula, Russia. From Yetar Spring, near Chidlows, Western Australia.

Name: For the *fibrous* habit and essential *ferric* iron.

(1) Laurium, Greece; by electron microprobe, average of five points, H determined by elemental microanalyzer. (2) $Pb_3Cl_4F(OH)\cdot H_2O$.

Polymorphism & Series: 2M and 1A polytypes are known.

Occurrence: Produced by reaction of halide-bearing seawater and metal-bearing slag.

Association: Penfieldite, laurionite, phosgenite, cotunnite (Laurium, Greece). penfieldite, cotunnite (Baratti Beach, Italy).

Distribution: In slag from: Laurium, Greece. Along Baratti Beach, Tuscany, Italy. In South Africa, at the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal.

Name: Honors Karl Gustav Fiedler (1791–1853), Saxon Commissioner of Mines.

Type Material: Museum of Natural History, University of Pisa, Pisa, Italy.

ZnO		1.9 – 2.1
MgO	12.4	7.8 – 8.0
Total	99.4	

(1) Långban, Sweden; by electron microprobe, average of five analyses, total Fe as Fe^{3+}, total Mn as MnO; corresponding to $(Mn_{2.48}Mg_{1.48})_{\Sigma=3.96}Fe_{0.90}Sb^{5+}_{1.02}Al_{0.06}Si_{0.02}O_8$. (2) Jakobsberg, Sweden; by electron microprobe, ranges of seven analyses on two grains, total Fe as FeO, Mn^{2+}:Mn^{3+} from charge balance; the average corresponding to $Mn^{2+}_{2.56}Mg_{0.94}Sb^{5+}_{0.80}Fe^{3+}_{0.82}Mn^{3+}_{0.70}Zn_{0.12}Al_{0.02}Ti_{0.02}Si_{0.02}O_8$.

Occurrence: In metamorphosed Fe–Mn orebodies.

Association: Jacobsite, ingersonite, calcite, antimony (Långban, Sweden); hausmannite, forsterite, phlogopite, calcite, copper, hedyphane, svabite (Jakobsberg, Sweden).

Distribution: From Långban and Jakobsberg, Värmland, Sweden.

Name: For the town of Filipstad, Sweden, which is near the Långban mine.

Type Material: The Natural History Museum, London, England, 1986,410, E1177; National Museum of Natural History, Washington, D.C., USA, 163012.

Fillowite $Na_2Ca(Mn^{2+},Fe^{2+})_7(PO_4)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Rarely as tiny rhombohedral crystals, showing $\{01\overline{1}2\}$, $\{0001\}$; usually in granular aggregates.

Physical Properties: *Cleavage:* $\{0001\}$, nearly perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.43 D(calc.) = 3.55

Optical Properties: Transparent to translucent. *Color:* Wax-yellow, pale yellow, greenish yellow, reddish brown, colorless; colorless to yellow in transmitted light. *Streak:* White. *Luster:* Subresinous to greasy.
Optical Class: Uniaxial (+), anomalously biaxial. *Dispersion:* $r < v$, strong. $\omega = 1.672(3)$ $\epsilon = 1.676(3)$ 2V(meas.) = 30°

Cell Data: *Space Group:* $R\overline{3}$. $a = 15.282(2)$ $c = 43.507(3)$ Z = 18

X-ray Powder Pattern: Branchville, Connecticut, USA.
2.814 (100), 3.017 (70), 3.640 (60), 2.552 (60), 3.789 (40), 1.888 (40), 11.44 (35)

Total	100.27	100.69	100.00

(1) Branchville, Connecticut, USA; average of two analyses, insoluble is quartz. (2) Do.; insoluble is quartz. (3) $Na_2Ca(Mn,Fe)_7(PO_4)_6$ with Mn:Fe = 1:1.

Occurrence: A primary accessory mineral in a zoned granite pegmatite (Branchville, Connecticut, USA).

Association: Triploidite, fairfieldite, reddingite (Branchville, Connecticut, USA).

Distribution: In the USA, from Branchville, Fairfield Co., Connecticut; in the White Picacho district, Maricopa and Yavapai Cos., Arizona; at the Animike Red Ace pegmatite, Florence Co., Wisconsin. From Buranga, Kiluli, and Rusororo, Rwanda. At Kabira, Uganda.

Name: In honor of Abijah N. Fillow (1822–1895), Branchville, Connecticut, USA, who early supplied minerals from his quarry at the locality.

Type Material: Yale University, New Haven, Connecticut, 3.3094, 3.3096; Harvard University, Cambridge, Massachusetts, USA, 96840.

Fingerite $Cu_{11}O_2(VO_4)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As crystals, to 150 μm, may be subhedral or anhedral; equant or platelike. *Twinning:* As contact and multiple twins, by rotation about [010].

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.776

Optical Properties: Opaque. *Color:* Black; medium gray in reflected light. *Streak:* Dark reddish brown. *Luster:* Metallic.
Optical Class: Biaxial.

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.1576(6)$ $b = 8.2691(5)$ $c = 8.0437(7)$
$\alpha = 107.144(5)°$ $\beta = 91.389(7)°$ $\gamma = 106.441(5)°$ Z = 1

X-ray Powder Pattern: Izalco volcano, El Salvador.
6.48 (100), 3.042 (80), 2.822 (70), 2.025 (70), 3.894 (60), 3.617 (60), 3.293 (60d)

Chemistry:

	(1)	(2)	(3)
V_2O_5	39.65	39.67	38.41
CuO	59.3	59.53	61.59
Total	98.95	99.20	100.00

(1) Izalco volcano, El Salvador; by electron microprobe, average of seven analyses. (2) Do.; by electron microprobe, averages of 15 analyses of three crystals; corresponds to $Cu_{10.6}O_{1.3}(VO_4)_{6.2}$. (3) $Cu_{11}O_2(VO_4)_6$.

Occurrence: A rare component of vanadium-bearing sublimates in fumaroles on a basaltic volcanic cone, formed between 100 °C and 200 °C.

Association: Thenardite, euchlorine, stoiberite, shcherbinaite, ziesite, bannermanite, chalcocyanite, chalcanthite.

Distribution: On the Izalco volcano, El Salvador.

Name: In honor of Dr. Larry W. Finger (1940–), American mineralogist, Carnegie Institution, Washington, D.C., USA.

Type Material: Carnegie Institution, Washington, D.C.; National Museum of Natural History, Washington, D.C., USA, 160387.

Se	24.4	22.8	22.8	23.27
Total	99.3	98.9	99.4	100.00

(1) Předbořice, Czech Republic; by electron microprobe, corresponding to $Ag_{2.85}Au_{0.90}Se_{2.00}$. (2) Do.; corresponding to $Ag_{3.12}Cu_{0.03}Au_{0.96}Se_{2.00}$. (3) Hope's Nose, England; by electron microprobe, corresponding to $Ag_{3.35}Cu_{0.10}Au_{0.82}Se_{2.00}$. (4) Ag_3AuSe_2.

Occurrence: In carbonate veins in epithermal precious metal deposits (Předbořice, Czech Republic).

Association: Naumannite, clausthalite, permingeatite, gold, calcite, quartz (Předbořice, Czech Republic).

Distribution: From the Předbořice uranium deposit, near Krásna Hora, Czech Republic [TL]. At Hope's Nose, Torquay, Devon, England. From the Kidd Creek mine, near Timmins, Ontario, Canada. In the USA, from the De Lamar mine, Silver City district, Owyhee Co., Idaho; in the Ken Snyder, Bonberger, and Eastern Star mines, Gold Circle district, Elko Co., Nevada. At Flamenco, Atacama, Chile.

Name: For Raymond Fischesser (1911–1991), French mineralogist and crystallographer, Director of the National School of Mines, Paris, France.

Type Material: National School of Mines, Paris, France.

(1) San Francisco Peaks, Arizona, USA; corresponding to $C_{10.0}H_{20.7}O_{2.5}$. (2) $C_{10}H_{20}O_2 \cdot H_2O$.

Occurrence: Lining cracks in decomposing buried pine logs.

Association: n.d.

Distribution: At the base of the San Francisco Peaks, north of Flagstaff, Coconino Co., Arizona, USA.

Name: For Flagstaff, Arizona, USA, near the type locality.

Type Material: n.d.

(1) Tsumeb, Namibia; corresponds to $Pb_{2.84}(Ge_{0.93}Ga_{0.09})_{\Sigma=1.02}(SO_4)_{1.88}(OH)_{5.91} \cdot 3.47H_2O$.
(2) $Pb_3Ge(SO_4)_2(OH)_6 \cdot 3H_2O$.

Occurrence: Very rare in an oxidized portion of a dolostone-hosted hydrothermal germanium-bearing polymetallic ore deposit.

Association: Cerussite, anglesite, melanotekite, kegelite, alamosite, mimetite, tennantite, plumbojarosite, itoite.

Distribution: From Tsumeb, Namibia.

Name: Honors Dr. Michael Fleischer (1908–1998), mineralogist and geochemist, U.S. Geological Survey, Washington, D.C., USA.

Type Material: National School of Mines, Paris, France; Technical University, Berlin, Germany, 57/1405; Harvard University, Cambridge, Massachusetts, 111461; National Museum of Natural History, Washington, D.C., USA, 115310, 162620.

Fletcherite $Cu(Ni,Co)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As anhedral crystals, to 200 μm, typically imbedded in other sulfides.

Physical Properties: Hardness = n.d. VHN = 446–464 (25 g load). D(meas.) = n.d. D(calc.) = 4.76

Optical Properties: Opaque. *Color:* Steel-gray; in polished section, creamy white. *Luster:* Metallic.
R: (420) 36.4, (460) 40.9, (500) 42.5, (546) 43.4, (589) 45.3, (640) 43.8

Cell Data: *Space Group:* $Fd3m$ (by analogy to other thiospinels). $a = 9.520$ $Z = 8$

X-ray Powder Pattern: Fletcher mine, Missouri, USA.
1.68 (vs), 1.83 (s), 2.87 (m), 2.39 (m), 1.37 (m), 1.24 (m), 1.19 (m)

(1) Fletcher mine, Missouri, USA; by electron microprobe, corresponds to $Cu_{0.95}Fe_{0.05}(Ni_{1.36}Co_{0.71})_{\Sigma=2.07}S_{4.00}$. (2) Do.; corresponds to $Cu_{0.78}Fe_{0.01}(Ni_{1.98}Co_{0.54})_{\Sigma=1.99}S_{4.00}$.
(3) Kalgoorlie, Australia; by electron microprobe, corresponds to $Cu_{1.27}Fe_{0.20}Ni_{1.27}Co_{0.14}S_{4.00}$.
(4) $Cu(Ni,Co)_2S_4$ with Ni:Co = 1:1.

Mineral Group: Linnaeite group.

Occurrence: Disseminated in copper sulfides, in copper-rich pods replacing dolostone (Fletcher mine, Missouri, USA); in black slates (Kalgoorlie, Australia).

Association: Vaesite, pyrite, covellite, chalcopyrite, bornite, digenite (Fletcher mine, Missouri, USA); pyrrhotite (Kalgoorlie, Australia).

Distribution: In the USA, from the Fletcher mine, Reynolds Co., Missouri [TL], and at the New Rambler Cu–Ni mine, Medicine Bow Mountains, east of Encampment, Albany Co., Wyoming. From Băiţa (Rézbánya), Romania. In Australia, at Rum Jungle, Alligator River district, Northern Territory, and from Kalgoorlie, Western Australia.

Name: For the Fletcher mine in Missouri, USA.

Type Material: The Natural History Museum, London, England; Royal Ontario Museum, Toronto, Canada, M35070; National Museum of Natural History, Washington, D.C., USA, 137072.

Flinkite $Mn_2^{2+}Mn^{3+}(AsO_4)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Rarely as individual crystals, to 3 mm, bladed, thin tabular {001}, elongated along [010], showing forms {001}, {010}, {110}, {101}, {111}; typically rounded in the zone [100], with {001} striated ‖ [100]. Commonly as rosettes or featherlike aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.87 D(calc.) = 3.73

Optical Properties: Transparent. *Color:* Greenish brown, dark green, dark yellow-brown; brownish yellowish green in transmitted light. *Luster:* Vitreous, resinous to somewhat greasy. *Optical Class:* Biaxial (+). *Pleochroism:* X = pale brownish green; Y = yellow-green; Z = orange-brown. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, weak. $\alpha = 1.783(3)$ $\beta = 1.801(3)$ $\gamma = 1.834(3)$ 2V(meas.) = Large.

Cell Data: *Space Group: Pnma.* $a = 9.55$ $b = 13.11$ $c = 5.25$ Z = 4

X-ray Powder Pattern: Harstigen mine, Sweden.
4.733 (100), 4.386 (100b), 2.662 (100), 3.179 (80), 3.815 (30), 2.506 (30), 1.538 (20)

Total	101.1	[100.0]	100.00

(1) Harstigen mine, Sweden; corresponds to $(Mn^{2+}_{1.85}Mg_{0.15}Ca_{0.03})_{\Sigma=2.03}[Mn^{3+}_{0.93}(Fe, Al)_{0.08}]_{\Sigma=1.01}[(As_{0.94}Sb_{0.05})_{\Sigma=0.99}O_4](OH)_{4.01}$. (2) Franklin, New Jersey, USA; by electron microprobe, total Fe as Fe_2O_3, Mn^{2+}:Mn^{3+} from stoichiometry, H_2O by difference. (3) $Mn_2^{2+}Mn^{3+}(AsO_4)(OH)_4$.

Occurrence: Very rare, in veinlets in magnetite ore (Harstigen mine, Sweden); in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Sarkinite, brandtite, caryopilite, nadorite, lead, manganoan calcite, barite (Harstigen mine, Sweden); cahnite, jarosewichite, franklinite, hausmannite, andradite (Franklin, New Jersey, USA).

Distribution: From the Harstigen mine, near Persberg, and at Långban, Värmland, Sweden. At Franklin, Sussex Co., New Jersey, USA.

Name: To honor Gustav Flink (1849–1931), Swedish mineralogist and collector.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Florencite-(Ce) $(Ce, La)Al_3(PO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. As pseudocubic rhombohedra, $\{01\bar{1}1\}$, may be modified by $\{10\bar{1}0\}$, $\{02\bar{2}1\}$, $\{0001\}$, to 2 cm.

Physical Properties: *Cleavage:* Good on $\{0001\}$; interrupted on $\{11\bar{2}0\}$. *Fracture:* Splintery to subconchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.45–3.54
D(calc.) = 3.47–3.69

Optical Properties: Transparent to translucent. *Color:* Pale yellow to butterscotch-yellow, red-orange, pink, pale brown, colorless to gray; colorless to pale yellow in thin section, may be zoned. *Luster:* Greasy to resinous.
Optical Class: Uniaxial (+). $\omega = 1.680$–1.702 $\epsilon = 1.705$–1.715

Cell Data: *Space Group:* $R\bar{3}m$. $a = 6.972(2)$ $c = 16.261(6)$ $Z = 3$

X-ray Powder Pattern: Matta dos Creoulos, Brazil; near florencite-(La) and -(Nd). (ICDD 8-143).
2.93 (100b), 5.63 (90), 2.16 (80), 1.885 (80), 3.48 (70), 2.21 (70), 1.741 (70)

(1) Mackenzie Mountains, Canada; by electron microprobe, average of ten partial analyses; corresponding to $(Ce_{0.56}La_{0.28}Nd_{0.12}Sm_{0.04}Ca_{0.04})_{\Sigma=1.04}Al_{3.00}(PO_4)_{1.99}(OH)_6$. (2) Kangankunde Hill, Malawi. (3) $CeAl_3(PO_4)_2(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: As a weathering product, typically of apatite, in highly argillized igneous rocks, bauxite, saprolite, carbonatites; authigenic in shales and sandstones; formed by the interaction of guano-reacted waters with gabbroic rock.

Association: Kaolinite, muscovite, alunite, siderite, quartz (sedimentary rocks); monazite, bastnäsite, apatite, ankerite, strontianite, barite, sphalerite, quartz (carbonatites).

Distribution: Many localities, but chemical analysis is required to determine which florencite species is present. Characterized material from Brazil, at Tripuhy, near Ouro Preto; from Matta dos Creoulos, and Lavra da Tejucana, near Diamantina, Minas Gerais; large crystals at Brumado, Bahia, Brazil. From the Backbone Ranges, Mackenzie Mountains, Northwest Territories, Canada. At Salmchâteau, Belgium. From the Corris area, Gwynedd, Wales. At the La Vanguardia kaolin deposit, near Combarbalá, Illapel region, Chile. On Middleton's Ridge, Ascension Island. At Klein Spitzkopje, Namibia. On Kangankunde Hill, Malawi. From Mt. Weld, 35 km south of Laverton, Western Australia. Most likely widespread in minor amounts in marine sediments.

Name: Honors Dr. William Florence (1864–1942), Brazilian mineralogist who made an early analysis, and for the dominant rare earth element, *cerium*.

Type Material: National Museum of Natural History, Washington, D.C., USA, R5209.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 838–839. (2) McKie, D. (1962) Goyazite and florencite from two African carbonatites. (1) Shituru deposit, Congo; by electron microprobe, corresponding to $(La_{0.61}Ce_{0.34}Gd_{0.03}Nd_{0.02})_{\Sigma=1.00}Al_3(PO_4)_2(OH)_6$. (2) Bohemia, Czech Republic; by electron microprobe, original total given as 100.00%; corresponding to $(La_{0.36}Sr_{0.18}Pr_{0.14}Nd_{0.12}Ca_{0.12}Ce_{0.02}Ba_{0.02}Gd_{0.01})_{\Sigma=1.00}(Al_{3.16}Fe_{0.01})_{\Sigma=3.17}[(PO_4)_{1.94}(SO_4)_{0.04}]_{\Sigma=1.98}(OH)_{5.99}$.

Mineral Group: Crandallite group.

Occurrence: A secondary mineral in weathered metamorphosed corrensitic siltstone (Shituru deposit, Congo); an authigenic mineral in sandstone.

Association: Synchysite-(Nd), manganoan siderite, sphalerite, kaolinite, "chalcedony".

Distribution: From the Shituru copper deposit, Likasi, Katanga Province, Congo (Shaba Province, Zaire). At the Bangombé natural fission reactor, Gabon. In the Hamr, Stráž, and Holičky deposits, Czech Republic.

Name: For a *florencite* with *lanthanum* as the dominant rare earth element.

Type Material: n.d.

Florencite-(Nd) $(Nd, Ce)Al_3(PO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As pulverulent aggregates.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.70

Optical Properties: Translucent. *Color:* Moderate brown. *Luster:* Earthy.
Optical Class: [Uniaxial.] ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R\overline{3}m$. $a = 6.992(1)$ $c = 16.454(7)$ Z = 3

X-ray Powder Pattern: Near Sausalito, California, USA; near florencite-(Ce) and -(La).
2.948 (100), 5.693 (93), 3.497 (90), 1.748 (63), 2.189 (50), 1.895 (50), 1.286 (27)

Chemistry: (1) Sausalito, California, USA; semiquantitative spectrographic analysis confirms Nd > Ce+La and Ba 7%.

Mineral Group: Crandallite group.

Occurrence: Lining surfaces of fractures in a weathered chert layer in shale.

Association: Churchite-(Y), todorokite, lithiophorite, hematite.

Distribution: From about one km south of Sausalito, Marin Co., California, USA.

Name: For a *florencite* with *neodymium* as the dominant rare earth element.

Type Material: U.S. Geological Survey, Reston, Virginia, USA.

(1) Svodovyi site, Maldynyrd Ridge, Russia; average of 5 electron microprobe analyses, H_2O by TGA; corresponding to $(Sm_{0.37}Nd_{0.28}Gd_{0.07}Ce_{0.06}Pr_{0.01}Sr_{0.09}Ca_{0.07})_{\Sigma=0.95}Al_{2.97}(P_{1.92}S_{0.13})_{\Sigma=2.05}O_{14}H_{5.98}$.
(2) Same as above; average of 3 electron microprobe analyses; corresponding to $(Sm_{0.37}Nd_{0.32}Ce_{0.10}Gd_{0.07}Pr_{0.03}La_{0.02}Eu_{0.01}Sr_{0.04}Ca_{0.03})_{\Sigma=0.99}Al_{3.02}(P_{1.90}S_{0.05}Si_{0.01})_{\Sigma=1.96}O_{14}H_{6.15}$.

Mineral Group: Plumbogummite group of the alunite supergroup.

Occurrence: In quartz veins cutting quartz meta-conglomerate beds near contacts with Al-enriched metasomatites.

Association: Florencite-(Ce), xenotime-(Y), quartz, dravite.

Distribution: Svodovyi site, Maldynyrd Ridge, Subpolar Urals, Russia.

Name: As the Sm-dominant example of the *florencite* structure.

Type Material: Natural Science Museum, Ilmen State Reserve, Miass, Russia.

Florensovite $Cu(Cr,Sb)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Grains, to 0.8 mm, slaglike; as overgrowths on eskolaite–karelianite.

Physical Properties: *Tenacity:* Brittle. Hardness = 5 VHN = 477–541, 511 average (50 g load). D(meas.) = n.d. D(calc.) = 4.28 Strongly magnetic.

Optical Properties: Opaque. *Color:* Black; pale creamy in reflected light.
Luster: Adamantine to metallic luster.
Optical Class: Isotropic.
R: (400) — , (420) — , (440) 23.2, (460) 24.5, (480) 25.7, (500) 26.4, (520) 26.5, (540) 26.5, (560) 26.8, (580) 27.0, (600) 27.4, (620) 27.5, (640) 27.1, (660) 26.6, (680) 26.3, (700) 26.2

Cell Data: *Space Group:* $Fd3m$ (by analogy to $CuCr_2S_4$). $a = 10.005(6)$ $Z = 8$

X-ray Powder Pattern: Slyudyanka complex, Russia.
3.01 (10), 1.768 (10), 2.50 (8), 1.923 (8), 1.021 (8), 1.302 (6), 3.53 (5)

Chemistry:

	(1)
Cu	18.80
Zn	0.75
Cr	24.24
Sb	19.17
V	0.02
S	38.45
Total	100.43

(1) Slyudyanka complex, Russia; by electron microprobe, corresponding to $(Cu_{0.97}Zn_{0.04})_{\Sigma=1.01}(Cr_{1.53}Sb_{0.52})_{\Sigma=2.05}S_{3.94}$.

Mineral Group: Linnaeite group.

Occurrence: Found in a granulite complex, in Cr- and V-rich metasediments.

Association: Cuprian kalininite, uvarovite–goldmanite, karelianite–eskolaite, pyrite, ilmenite, pyrrhotite, magnesiochromite, chalcopyrite, franklinite, barite, apatite, zircon, tremolite, diopside, calcite, quartz.

Distribution: From the Pereval marble quarry, near Slyudyanka, Sayan Mountains, south of Lake Baikal, Siberia, Russia [TL].

Name: To honor Nikolai Aleksandrovich Florensov (1909–1986), Ukrainian geologist, Director of the Institute of the Earth's Crust, Irkutsk, Russia.

Type Material: Central Siberian Geological Museum, Novosibirsk; Mining Institute, St. Petersburg, Russia, 2077/1–2.

References: (1) Reznitskii, L.Z., E.V. Sklyarov, L.F. Piskunova, and Z.F. Ushchapovskaya (1989) Florensovite $Cu(Cr_{1.5}Sb_{0.5})S_4$ – a new sulfospinel from Pribaikalya. Zap. Vses. Mineral. Obshch., 118(1), 57–65. (2) (1990) Amer. Mineral., 75, 1209–1210 (abs. ref. 1).

Fluckite **$CaMn^{2+}(AsO_3OH)_2 \cdot 2H_2O$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Prismatic crystals, to 1.5 mm, elongated along [100] or [010], flattened on {100} or {110}, terminated by large {$2\overline{3}1$}, {$2\overline{3}3$}, with a number of other forms present. Typically radiating to spherulitic.

Physical Properties: *Cleavage:* On {010}, perfect; on {100}, easy; on {$\overline{1}01$}, imperfect and difficult. Hardness = 3.5–4 VHN = 170 (50 g load). D(meas.) = 3.05(2) D(calc.) = 3.11

Optical Properties: Semitransparent. *Color:* Colorless, very pale pink to dark pink with increasing cobalt content.
Optical Class: Biaxial (+), probable. $\alpha = 1.618$ $\beta = 1.627$ $\gamma = 1.642$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.459(2)$ $b = 7.613(1)$ $c = 6.968(1)$ $\alpha = 82.21(1)°$ $\beta = 98.25(1)°$ $\gamma = 95.86(2)°$ Z = 2

X-ray Powder Pattern: Gabe-Gottes mine, France.
7.512 (100), 3.266 (91), 3.528 (90), 2.975 (81), 2.688 (61), 3.767 (56), 8.323 (44)

Total	99.99	100.00

(1) Gabe-Gottes mine, France; by AA, H_2O by the Penfield method; corresponds to $Ca_{0.95}Mn_{0.99}(AsO_3OH)_{2.02} \cdot 2H_2O$. (2) $CaMn(AsO_3OH)_2 \cdot 2H_2O$.

Occurrence: A post-mine low-temperature reaction product of carbonate gangue with arsenical solutions derived from arsenic (Gabe-Gottes mine, France).

Association: Arsenic, tennantite, skutterudite, sainfeldite, pharmacolite, villyaellenite, picropharmacolite, calcite, dolomite, ankerite, quartz (Gabe-Gottes mine, France).

Distribution: From the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut Rhin, France. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: In honor of Pierre Fluck, mineralogist, Louis Pasteur University, Strasbourg, France, who found the first specimen.

Type Material: Mineralogical Museum, Sainte-Marie-aux-Mines; National School of Mines, Paris, France; The Natural History Museum, London, England, 1979,341.

Fluellite $Al_2(PO_4)F_2(OH)\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Dipyramidal crystals, dominant {111}, with {001}, {011}, to 7 mm, commonly in aggregates; powdery, massive.

Physical Properties: *Cleavage:* On {001} and {111}, both indistinct. Hardness = 3 D(meas.) = 2.14–2.18 D(calc.) = 2.16 May fluoresce creamy white under LW UV.

Optical Properties: Transparent. *Color:* Colorless to white, may be pale yellow; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, perceptible to strong. $\alpha = 1.473$–1.490 $\beta = 1.490$–1.496 $\gamma = 1.509$–1.511 2V(meas.) = Very large.

Cell Data: *Space Group: Fddd.* $a = 8.546(8)$ $b = 11.222(5)$ $c = 21.158(5)$ Z = 8

X-ray Powder Pattern: Stenna Gwynn mine, Cornwall, England. (ICDD 19-38).
6.48 (100), 3.24 (70), 3.09 (60), 2.667 (60), 4.96 (50), 2.868 (50), 2.763 (50)

Total	[99.98]	100.00

(1) Kazakhstan; average of two analyses, $(OH)^{1-}$ calculated for charge balance.
(2) $Al_2(PO_4)F_2(OH)\cdot 7H_2O$.

Occurrence: A rare secondary mineral, formed by weathering of earlier phosphates in some complex granite pegmatites.

Association: Fluorapatite, wavellite, phosphosiderite, strengite, aldermanite, cacoxenite, variscite, turquoise, fluorite, quartz.

Distribution: In England, in Cornwall, from the Stenna Gwynn mine, St. Stephen-in-Brannel, and at the Goonvean china clay pit, St. Austell. In Germany, in Bavaria, on the Kreuzberg, Pleystein, and as large crystals at Hagendorf. At Lázně Kynzvart, near Mariánské Lázně (Königswart, near Marienbad), Czech Republic. From Argenteau, Visé, Belgium. At the Pereta mine, Scansano, Tuscany, Italy. In the USA, from the Carolina pyrophyllite mine, Staley, Randolph Co., North Carolina; in the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., and at the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada; from the Tuscarora mine, near Randolph, Rich Co., Utah. At the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. In Australia, from Wolfdene, near Beenleigh, Queensland; at Phosphate Hill, near Mansfield, Victoria; in South Australia, in the Moculta phosphate quarry, northeast of Angaston, and from St. John's and Tom's quarries, near Kapunda. At an undefined locality in Kazakhstan. A few other localities are now known.

Name: From the Latin *fluate alumine*, for its *fluorine* and *aluminum* content, phosphorus having been overlooked in early analyses.

Type Material: National Museum of Natural History, Washington, D.C., USA, C1028.

Fluoborite $Mg_3(BO_3)(F,OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As acicular to prismatic crystals with pyramidal terminations, which may be poorly formed, to 2 cm; in fanlike or stellate aggregates.

Physical Properties: *Cleavage:* On {0001}, good. Hardness = ∼3.5 D(meas.) = 2.98 D(calc.) = [2.92] Strong cream-white fluorescence under SW UV.

Optical Properties: Translucent to transparent. *Color:* Colorless to white; colorless in transmitted light.
Optical Class: Uniaxial (–). ω = 1.510–1.530 (smaller values for F-rich compositions).
ϵ = 1.486–1.507

Cell Data: *Space Group:* $P6_3/m$. $a = 8.8612(12)$ $c = 3.1021(6)$ Z = 3

X-ray Powder Pattern: Crestmore quarry, California, USA.
2.424 (s), 4.462 (ms), 2.143 (ms), 2.129 (ms), 7.72 (m), 2.575 (m), 1.815 (m)

(1) Huerta del Vinagre mine, Spain; by electron microprobe, corresponding to $Mg_{3.02}(BO_3)_{0.98}(F_{2.29}OH_{0.71})_{\Sigma=3.00}$.

Occurrence: A rare hydrothermal mineral in skarns developed in metamorphosed boron-rich magnesian rocks.

Association: Ludwigite, chondrodite, magnetite, calcite (Tallgruvan, Sweden); mooreite, willemite, fluorite, hydrozincite, pyrochroite, zincite, rhodochrosite (Sterling Hill, New Jersey, USA).

Distribution: From Tallgruvan, east of Kallmora, Norberg, Sweden. In the USA, around Edenville and Amity, Orange Co., New York; in New Jersey, from Sterling Hill, Ogdensburg, in the Limecrest quarry, Sparta, and at the Edison quarry, Rudeville, Sussex Co.; from near Blind Mountain, Bristol district, Lincoln Co., Nevada; in the Crestmore quarry, Riverside Co., California. Large crystals from the Cardiff mine and several roadcuts in the vicinity of Wilberforce, Ontario, Canada. At Broadford, Skye, Inverness-shire, Scotland. Abundant at the St. Dizier tin deposit, 20 km northwest of Zeehan, Tasmania, Australia. At the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. From the Palabora mine, Transvaal, South Africa.

Name: For the essential chemical components, FLUOrine and BORon.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Fluocerite-(La) $(La, Ce)F_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}2/m$(synthetic LaF_3). As platy to tabular crystals, to 7 cm.

Physical Properties: *Cleavage:* "Dipyramidal", imperfect. *Fracture:* Conchoidal. *Tenacity:* [Brittle] [by analogy to fluocerite-(Ce)]. Hardness = [4–5] VHN = 390 D(meas.) = 5.93 D(calc.) = 5.94 (synthetic LaF_3).

Optical Properties: Semitransparent. *Color:* Pale greenish yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.609$ $\epsilon = 1.603$

Cell Data: *Space Group:* $P\overline{3}c1$(synthetic LaF_3). $a = 7.1871(4)$ $c = 7.3501(5)$ Z = 6

X-ray Powder Pattern: Zhanuzak area, Kazakhstan.
3.19 (10), 1.048 (7), 2.07 (6), 2.01 (6), 1.796 (5.5), 3.60 (4), 1.736 (4)

		Total	99.47

(1) Zhanuzak area, Kazakhstan; spectrographic analysis showed Si 0.2%, Al 0.05%, P 0.05%, Mn 0.005%; corresponds to $(La_{0.50}Ce_{0.39}Pr_{0.04}Nd_{0.04}Ca_{0.02}Th_{0.01})_{\Sigma=1.00}F_{2.55}O_{0.22}$.

Occurrence: In hydrothermal quartz veins in granite.

Association: Quartz.

Distribution: From the Zhanuzak area, Kent massif, Karaganda region, central Kazakhstan.

Name: As the *lanthanum* analog of *fluocerite-(Ce)*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 68285, vus1051, vis1053.

Fluorapatite $Ca_5(PO_4)_3F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal or monoclinic. *Point Group:* $6/m$ or $2/m$. As prismatic hexagonal crystals, elongated on [0001], dominated by $\{10\bar{1}0\}$ and $\{10\bar{1}1\}$, to 2 m; as complex tabular to discoidal crystals flattened on {0001}, typically with many forms; granular, globular to reniform, nodular, massive. *Twinning:* Rare as contact twins on $\{11\bar{2}1\}$ or $\{10\bar{1}3\}$.

Physical Properties: *Cleavage:* Poor on {0001} and $\{10\bar{1}0\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 5 D(meas.) = 3.1–3.25 D(calc.) = 3.18 May be cathodoluminescent, phosphorescent, or fluorescent in UV.

Optical Properties: Transparent to translucent. *Color:* Sea-green, violet, purple, blue, pink, yellow, brown, white, colorless, may be zoned; colorless or faintly tinted in thin section. *Streak:* White. *Luster:* Vitreous to subresinous.
Optical Class: Uniaxial (–). *Pleochroism:* Weak to strong if colored. *Absorption:* $E > O$.
$\omega = 1.631–1.650$ $\epsilon = 1.627–1.646$

Cell Data: *Space Group:* $P6_3/m$. $a = 9.3973$ $c = 6.8782$ Z = 2, or *Space Group:* $P2_1/b$. $a = 9.4877$ $b = 18.9628$ $c = 6.8224$ $\beta = 119.97°$ Z = 6

X-ray Powder Pattern: Synthetic.
2.800 (100), 2.702 (60), 2.772 (55), 3.442 (40), 2.624 (30), 1.837 (30), 1.937 (25)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
P_2O_5	42.01	42.22	CaO	55.52	55.60	$-O = F_2$	1.63	1.59
RE_2O_3	0.28		F	3.89	3.67	Total	100.07	100.00

(1) Gloserheia pegmatite, Froland, Norway; $RE_2O_3 = Y_2O_3$ 0.10%, Nd_2O_3 0.06%, Gd_2O_3 0.06%, Yb_2O_3 0.06%; corresponds to $Ca_{5.00}(PO_4)_{2.99}F_{1.03}$. (2) $Ca_5(PO_4)_3F$.

Mineral Group: Apatite group; F > Cl or OH.

Occurrence: The most common rock-forming phosphate mineral. Accessory in most igneous rocks, important in syenites, alkaline rocks, carbonatites, granite pegmatites. Common in marbles and skarns, Ca-rich regional metamorphic rocks, Alpine-type fissures, and hydrothermal tin veins. An essential component of sedimentary phosphorites, common as a detrital or diagenetic component in oolitic ironstones and phosphatic carbonate rocks and shales. Residual in laterites.

Association: Diopside, forsterite, scapolite, phlogopite, chondrodite, calcite, magnetite.

Distribution: A few of the many localities for fine crystals include: at Ehrenfriedersdorf, Saxony, Germany. From Untersulzbachtal, Salzburg, Austria. At Panasqueira, Portugal. From near Pech, Kunar Province, Afghanistan. At Chumar Bakhoor, Nagar, Gilgit district, Pakistan. In Brazil, at the Morro Velho gold mine, Nova Lima, Minas Gerais. From Llallagua, Potosí, Bolivia. At Cerro de Mercado, Durango, Mexico. From the Pulsifer quarry, Mt. Apatite, Auburn, Androscoggin Co., Maine, USA. In Canada, large crystals from southeastern Ontario, as in Renfrew Co., and in adjoining southwestern Quebec, as in Ottawa Co., etc. An important ore in carbonatites; in Russia, in the Khibiny and Kovdor massifs, Kola Peninsula; from the Slyudyanka region, Lake Baikal, eastern Siberia. At Phalaborwa, Transvaal, South Africa. From the Jacupiranga mine, São Paulo, and at Tapira, Minas Gerais, Brazil. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia.

Name: For dominant *fluorine* and membership in the *apatite* group, the group name from the Greek for *to deceive*, for the ease with which specimens were confused with other minerals.

(1) Phoenix mine, Keweenaw Co., Michigan, USA; corresponding to $(K_{0.85}Na_{0.16})_{\Sigma=1.01}Ca_{4.05}(Si_{7.83}Al_{0.07})_{\Sigma=7.90}O_{20}F_{1.05}\cdot 8.1H_2O$. (2) $KCa_4Si_8O_{20}F\cdot 8H_2O$.

Polymorphism & Series: Forms a series with hydroxyapophyllite.

Occurrence: A secondary mineral in amygdules or druses in basalts; in cavities in granite; in tactite and other metamorphic rocks; a late-stage hydrothermal mineral in some mineral deposits.

Association: Zeolites, datolite, pectolite, calcite, quartz.

Distribution: Many localities worldwide, but distinction from hydroxyapophyllite requires chemical analysis. Fine specimens with large crystals from the Teigarhorn, Berufjord, Iceland. On the Alpe di Siusi, Trentino-Alto Adige, Italy. At St. Andreasberg, Harz Mountains, Germany. From Korsnäs, Finland. Exceptional groups from India, in the Poona, Nasik, and Bombay districts, Maharashtra. At Shauguang, Guangdong, China. In the USA, from French Creek, Chester Co., and Cornwall, Lebanon Co., Pennsylvania; at Paterson, Passaic Co., and at Bergen Hill, Hudson Co., New Jersey; from the Fairfax quarry, Centreville, Fairfax Co., Virginia. Very large crystals from near Bento Gonçalves, Rio Grande do Sul, Brazil.

Name: For the preponderance of *fluorine* in the composition, and *apophyllite*, from the Greek for *away from* and *leaf*, in allusion to its manner of exfoliating on heating.

Total	[99.34]

(1) Kopeysk, Russia; after correction for impurities, MgO, Al_2O_3, 4% CaO, Fe_2O_3, Na_2O, and H_2O^+, original total given as 99.24%; corresponds to $(Ca_{9.96}Mn_{0.04})_{\Sigma=10.00}[(SO_4)_{2.84}(SiO_4)_{2.80}(PO_4)_{0.20}(CO_3)_{0.16}]_{\Sigma=6.00}F_{2.08}$.

Polymorphism & Series: Forms a series with hydroxylellestadite.

Occurrence: Formed in burned fragments of petrified wood in coal dumps (Kopeysk, Russia).

Association: Lime, periclase, magnesioferrite, hematite, srebrodolskite, anhydrite.

Distribution: From mines around Kopeysk, Chelyabinsk coal basin, Southern Ural Mountains, Russia. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. At Crestmore, Riverside Co., California, and Franklin, Sussex Co., New Jersey, USA.

Name: For *fluorine* in the chemical composition and analogy to *ellestadite*.

Type Material: Mining Institute, St. Petersburg, 711/1; Il'menskii Preserve Museum, Miass, 5900; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Fluorite CaF_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. Cubes, octahedra, rarely dodecahedra, or combinations, with many other forms; rounded or stepped, to 2 m; nodular, botryoidal, rarely columnar or fibrous; granular, massive. *Twinning:* Common on {111}, interpenetrant, flattened.

Physical Properties: *Cleavage:* {111}, perfect; on {011}, parting, poor. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 4 VHN = 174–181 {100}, 174–203 {111} (100 g load). D(meas.) = 3.175–3.184; to 3.56 if high in rare-earth elements. D(calc.) = 3.180 Fluoresces blue, violet, green, yellow, red under UV; may be phosphorescent, thermoluminescent, or triboluminescent.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, purple, blue, green, yellow, orange; red, pink, brown, bluish black; commonly zoned; in transmitted light, colorless, may be colored in thick sections. *Streak:* White. *Luster:* Vitreous; dull when massive. *Optical Class:* Isotropic; weak anomalous anisotropism. $n = 1.433$–1.448

Cell Data: *Space Group:* $Fm3m$. a = 5.4626 Z = 4

X-ray Powder Pattern: Synthetic.
1.931 (100), 3.153 (94), 1.647 (35), 1.1150 (16), 1.366 (12), 1.253 (10), 0.8637 (9)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	0.05		F	48.29	48.67

Ca	51.24	51.33	Total	99.83	100.00

(1) Corvara, Trentino-Alto Adige, Italy. (2) CaF_2.

Occurrence: An accessory mineral in granite, granite pegmatites, syenites; around fumaroles; in carbonatites and alkaline intrusives. Economic deposits in low- to high-temperature hydrothermal veins and stratabound deposits; a cement in sandstones.

Association: Quartz, dolomite, calcite, barite, celestine, sulfides, cassiterite, topaz, wolframite, scheelite, apatite.

Distribution: Notable occurrences include: in England, from many localities in Cornwall; in Durham, as at Weardale; from Castleton, Derbyshire. In France, at Bex, Var; Le Beix, Puy de Dôme; and on Mont Blanc, near Chamonix, Haute-Savoie. On the Göscheneralp, Uri, Switzerland. From Wölsendorf, Bavaria, and in the Clara Mine, near Oberwolfach, Black Forest, Germany. Around Berbes, Asturias Province, Spain. At the Nikolaev mine, Dal'negorsk, Russia. From Kara Oba, Kazakhstan. At Xianghuapu, Hunan Province, China. In Mexico, from Naica, Chihuahua; Musquiz, Coahuila; and the Ojuela mine, Mapimí, Durango. In the USA, from Macomb, St. Lawrence Co., and Penfield, Monroe Co., New York; at Clay Center, Ottawa Co., Ohio; from Rosiclare and Cave-in-Rock, Hardin Co., Illinois; at the Elmwood mine, Smith Co., Tennessee; in the Sunnyside mine, San Juan Co., Colorado; from the Pine Canyon deposit, Burro Mountains, Grant Co., New Mexico. In Canada, from Madoc, Ontario, and in the Rock Candy mine, near Grand Forks, British Columbia. From Huanzala, Huanuco, Peru. At Okorusu, Namibia. In Pakistan, at Nagar, near Karimabad, Gilgit district.

Name: From the Latin *to flow*, in allusion to its low melting point.

Fluornatromicrolite $(Na,Ca,Bi)_2Ta_2O_6F$

Crystal Data: Cubic. *Point Group*: 4/*m* $\bar{3}$ 2/*m*. As regular to flattened octahedral crystals, to 6 mm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 5 D(meas.) = 6.49(6) D(calc.) = 6.568

Optical Properties: Transparent. *Color*: Green. *Streak*: White. *Luster*: Adamantine. *Optical Class*: Isotropic. *n* = 2.11(2)

Cell Data: *Space Group*: *Fd3m.* *a* = 10.4451(2) *Z* = 8

X-ray Powder Pattern: Alto Quixaba pegmatite, Frei Martinho, Paraíba, Brazil. 3.015 (100), 1.846 (59), 1.574 (47), 3.14 (33), 6.023 (31), 2.610 (27), 1.198 (23)

Chemistry:

	(1)
Na_2O	6.39
CaO	6.96
Bi_2O_3	6.71
Ta_2O_5	76.81
F	3.63
$-O = F_2$	1.53
Total	98.97

(1) Alto Quixaba pegmatite, Frei Martinho, Paraíba, Brazil; average of 17 electron microprobe analyses, IR spectroscopy confirms absence of H_2O and OH; corresponding to $(Na_{1.10}Ca_{0.64}Bi_{0.15})_{\Sigma=1.89}Ta_{2.00}O_{5.91}F_{1.02}$.

Mineral Group: Pyrochlore supergroup, microlite group.

Occurrence: In a granitic pegmatite.

Association: Perthitic microcline, albite, amblygonite, muscovite, quartz, elbaite, tantalite-(Fe), tantalite-(Mn), beryl.

Distribution: From the Alto Quixaba pegmatite, Frei Martinho municipality, Paraíba State, northeastern Brazil. Similar material from the Altai Mounains, Russia and the Borborema pegmatitic province, northeastern Brazil.

Name: As a member of the *microlite* group with dominant fluorine (*fluor*) at an anion site and sodium (*natro*) in the *A* structural site.

Type Material: Mineralogical Collection of the Bergakademie, Freiberg (77975), and in the Mineralogical Collection, Martin-Luther University, Institute for Geological Science, Halle (010356), Germany.

Total	99.73

(1) Dealul Uroi, Apuseni Mountains, Hunedoara county, Romania; average of electron microprobe analyses, absence of OH confirmed by IR spectroscopy; corresponding to $(Na_{0.50}K_{0.22}Ca_{0.17})_{\Sigma=0.89}$ $Ca_{2.00}(Mg_{4.03}Fe^{3+}_{0.70}Al_{0.13}Ti_{0.13})_{\Sigma=4.99}(Si_{5.89}Al_{2.11})_{\Sigma=8.00}O_{22.00}F_{2.00}$.

Mineral Group: Amphibole group, calcium amphibole subgroup.

Occurrence: In small cavities in an altered hematite-rich xenolith in trachyandesite.

Association: Titaniferous hematite, augite, phlogopite, enstatite, feldspar, tridymite, titanite, fluorapatite, ilmenite, pseudobrookite.

Distribution: From an abandoned quarry at Dealul Uroi, 10 km east of Deva, Apuseni Mountains, Hunedoara county, Romania.

Name: Signifies an amphibole in the compositional range of *magnesio-hastingsite* with F > Cl, OH.

Type Material: Department of Mineralogy, Landesmuseum Joanneum, Graz, Styria, Austria (83854-83855).

References: (1) Bojar, H-P. and F. Walter (2006) Fluoro-magnesiohastingsite from Dealul Uroi (Hunedoara county, Romania): Mineral data and crystal structure of a new amphibole end-member. Eur. J. Mineral. 118, 503-508. (2) (2007) Amer. Mineral., 92, 703-704 (abs. ref. 1).

Fluoro-potassichastingsite $KCa_2(Fe^{2+}_4Fe^{3+})Si_6Al_2O_{22}F_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Crystals, prismatic; in compact aggregates to 1 cm.

Physical Properties: *Cleavage*: Perfect on {110}, intersecting at 56°. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6 D(meas.) = n.d. D(calc.) = 3.14

Optical Properties: Transparent. *Color*: Black, green on thin edges. *Streak*: Greenish gray. *Luster*: Vitreous.
Optical Class: Biaxial (-). $\alpha = 1.668(2)$ $\beta = 1.688(2)$ $\gamma = 1.698(2)$ 2V(meas.) = 40–70° 2V(calc.) = 70° *Pleochroism*: *X* = bluish green; *Y* = greenish to brownish green; *Z* = blue to light blue. *Dispersion*: *r* < *v*, weak. *Orientation*: *Y* = *b*; *Z* ^ *c* ≈ 23°.

Cell Data: *Space Group*: *C*2/*m*. *a* = 9.9480(3) *b* = 18.1777(6) *c* = 5.3302(2) $\beta = 105.140(1)°$ *Z* = 2

(1) Greenwood (Patterson) iron mine, Orange County, New York; average of 12 electron microprobe analyses, Fe_2O_3 and FeO by Mössbauer spectroscopy, H_2O by hydrogen extraction; using H_2O from stoichiometry, corresponding to $(K_{0.59}Na_{0.25})_{\Sigma=0.84}(Ca_{1.87}Na_{0.13})_{\Sigma=2.00}(Fe^{2+}_{2.60}Mg_{1.56}Fe^{3+}_{0.53}Al_{0.26}Mn_{0.03}Ti_{0.01})_{\Sigma=4.99}(Si_{6.36}Al_{1.64})_{\Sigma=8.00}O_{22.68}O_3[F_{1.11}(OH)_{0.73}Cl_{0.16}]_{\Sigma=2.00}$.

Mineral Group: Amphibole group.

Occurrence: A product of potassium-halogen metasomatism of a hastingsite and diopside-bearing rock.

Association: Magnetite, diopside, enstatite, pyrrhotite, chalcopyrite, pyrite, phlogopite.

Distribution: Greenwood (Patterson) iron mine, Harriman State Park, near Tuxedo, Orange County, New York, USA.

Name: For its composition and relationship to hastingsite.

Type Material: New York State Museum, Albany, New York, USA (catalog no. 21205).

References: (1) Lupulescu, M.V., J. Rakovan, D.M. Dyar, G.W. Robinson, and J.M. Hughes (2009) Fluoro-potassichastingsite from the Greenwood mine, Orange County, New York: a new end-member calcic amphibole. Can. Mineral., 47, 909–916. (2) (2010) Amer. Mineral., 95, 205 (abs. ref. 1).

Fluoro-potassic-pargasite $KCa_2(Mg_4Al)(Si_6Al_2)O_{22}F_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Crystals prismatic to 2 cm.

Physical Properties: *Cleavage*: Perfect on {110}. *Fracture*: Splintery. *Tenacity*: Brittle. Hardness = 6.5 D(meas.) = 3.46 D(calc.) = 3.151

Optical Properties: Transparent. *Color*: Brownish black. *Streak*: Pale gray. *Luster*: Vitreous. *Optical Class*: Biaxial (+). α = 1.638(2) β = 1.641(2) γ = 1.653(2) 2V(meas.) = 49.6(4)° 2V(calc.) = 53.4° *Orientation*: $X \wedge a$ = 46.9° (in β obtuse), $Y \parallel b$, $Z \wedge c$ = 31.4° (in β acute). *Pleochroism:* X = colorless to very pale gray, Y = very pale gray, Z = colorless.

Cell Data: *Space Group*: *C*2/*m*. a = 9.911(3) b = 17.972(3) c = 5.322(2) β = 105.55(2)° Z = 2

X-ray Powder Pattern: Tranomaro area, Fort Dauphin region, Madagascar.
3.133 (100), 3.270 (55), 2.809 (47), 8.413 (45), 2.698 (39), 3.374 (31), 2.934 (29)

Total	99.99

(1) Tranomaro area, Fort Dauphin region, Madagascar; average of 10 electron microprobe analyses, FeO:Fe_2O_3 calculated from structure analysis, H_2O calculated from stoichiometry; corresponding to $(K_{0.69}Na_{0.28}Ca_{0.04})_{\Sigma=1.01}Ca_{2.00}(Mg_{3.64}Fe^{2+}_{0.24}Mn_{0.01}Al_{0.79}Fe^{3+}_{0.27}Ti_{0.05})_{\Sigma=5.00}(Si_{5.80}Al_{2.20})_{\Sigma=8.00}O_{22}[F_{1.26}(OH)_{0.74}]_{\Sigma=2.00}$.

Mineral Group: Amphibole group, calcium amphibole subgroup.

Occurrence: Part of a single crystal attributed to a skarn deposit.

Association: Diopside, phlogopite, apatite, calcite, anhydrite, titanite.

Distribution: From a skarn in the Tranomaro area, Fort Dauphin region, Madagascar.

Name: Signifies an amphibole in the compositional range of *pargasite* with F > OH, Cl and K dominant in the A structural site.

Type Material: Mineral Museum, Department of Earth Science, University of Pavia, Italy (2009-02).

Total	102.14	100.00

(1) Bellerberg volcano, near Ettringen, East Eifel volcanic area, Germany; average of 11 electron microprobe analysis, H_2O from structure refinement, corresponding to $K_{2.96}Ca_{2.04}Na_{1.02}Mg_{0.01}[Al_{8.03}Si_{7.97}O_{31.97}]\cdot 11.72H_2O$. (2) $K_3Ca_2Na\,[Al_8Si_8O_{32}]\cdot 12H_2O$.

Group: Zeolite group.

Occurrence: In late-stage, low-temperature mineral in small cavities of a pyrometamorphically modified limestone xenolith in leucite-tephritic lava.

Association: Tobermorite, thaumasite.

Distribution: Bellerberg volcano, near Ettringen, East Eifel volcanic area, Germany.

Name: Honors the German mineralogist and crystallographer Otto Wilhelm Flörke (b. 1926) for his investigations on silica polymorphs.

Type Material: Natural History Museum, Vienna, Austria, (2009-IV-a).

References: (1) Lengauer, C.L., U. Kolitsch, and E. Tillmanns (2009) Flörkeite, $K_3Ca_2Na[Al_8Si_8O_{32}]\cdot 12H_2O$, a new phillipsite-type zeolite from the Bellerberg, East Eifel volcanic area, Germany. Eur. J. Mineral., 21, 901–913. (2) (2010) Amer. Mineral., 95, 1123 (abs. ref. 1).

Foggite $CaAl(PO_4)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thin prismatic crystals, tabular {010}, slightly elongated [001], to 0.4 mm; in fanlike and radial aggregates.

Physical Properties: *Cleavage:* {010}, perfect; {100}, good. Hardness = ∼4
D(meas.) = 2.78(1) D(calc.) = 2.77

Optical Properties: Semitransparent. *Color:* Colorless to snow-white.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.610(2)$ $\beta = 1.610(2)$ $\gamma = 1.611(2)$ 2V(meas.) = 40°–45°

Total		100.00

(1) Palermo #1 mine, New Hampshire, USA; by electron microprobe.
(2) $CaAl(PO_4)(OH)_2 \cdot H_2O$.

Occurrence: A secondary mineral, probably formed at < 300 °C, in complex granite pegmatites.

Association: Carbonate-apatite, childrenite, whitlockite, montebrasite, siderite, quartz.

Distribution: From the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA. On Milgun Station, Western Australia.

Name: To honor Forrest F. Fogg (1920–), mineral collector of Penacook, New Hampshire, USA, who provided the first material.

Type Material: National Museum of Natural History, Washington, D.C., USA, 128068.

References: (1) Moore, P.B., A.J. Irving, and A.R. Total	[99.19]

(1) "Southern California," USA; by electron microprobe, average of 10 analyses; Ti, Cu, K, F not detected, B_2O_3, Li_2O, and H_2O from stoichiometry to fill their respective sites; corresponds to $Na_{0.25}(Fe_{1.60}Al_{0.89}Mn_{0.24}Li_{0.22}Mg_{0.05})_{\Sigma=3.00}Al_{6.00}(BO_3)_3Si_{6.01}O_{18}(OH)_4$.

Mineral Group: Tourmaline group.

Occurrence: Probably in granite pegmatites.

Association: The original specimens are loose crystals without matrix.

Distribution: Found as museum specimens designated only as from "southern California," USA. [White Queen mine, Pala district, San Diego Co., California, USA.] At the Kazionnitsa mine, Alabashka, Ural Mountains, Russia.

Name: To honor Franklin F. Foit, Jr. (1942–), of Washington State University, Pullman, Washington, USA, for his work on tourmaline group minerals.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81512.

PbO	6.0	0.5	
Total	100.2	100.2	100.00

(1) Lutsiro, Rwanda; by electron microprobe, total Sn as SnO; corresponding to $(Sn_{0.87}Pb_{0.13})_{\Sigma=1.00}(Nb_{1.40}Ta_{0.60})_{\Sigma=2.00}O_6$. (2) Kubitaka, Congo; by electron microprobe, Sn^{2+}:Sn^{4+} calculated from stoichiometry; corresponding to $(Sn^{2+}_{0.97}Sb_{0.01}Pb_{0.01})_{\Sigma=0.99}(Nb_{1.04}Ta_{0.93}Sn^{4+}_{0.03})_{\Sigma=2.00}O_6$. (3) $Sn(Nb,Ta)_2O_6$ with Nb:Ta = 1:1.

Mineral Group: Forms a series with thoreaulite.

Occurrence: A very rare mineral, in an alluvial pebble originating from a highly differentiated granite pegmatite, formed under reducing conditions deficient in Fe, Mn, Na, Ca, and F (Lutsiro, Rwanda).

Association: Ferrocolumbite, cassiterite, stannoan plumbomicrolite, ixiolite (Lutsiro, Rwanda).

Distribution: From about 15 km north-northwest of Lutsiro, near the Sebeya River, western Rwanda. At Kubitaka, near Punia, Kivu Province, Congo (Zaire).

Name: To honor Dr. Eugene Edward Foord (1946–1998), American mineralogist with the U.S. Geological Survey, Denver, Colorado, USA, student of granite pegmatites.

Type Material: Catholic University of Louvain, Louvain, Belgium, P1284.

(3) $YTaO_4$.

Polymorphism & Series: Dimorphous with yttrotantalite-(Y); forms a series with fergusonite-(Y).

Occurrence: In granites and albitized, RE-rich pegmatitic veins; a detrital mineral in placers.

Association: Cassiterite, monazite, euxenite, gadolinite (Cooglegong, Western Australia).

Distribution: Found at Cooglegong, Pilbara district, and in the Marble Bar district, Western Australia. In Russia, found at an undisclosed location in Siberia. Occurs at an undisclosed locality in Jiangxi Province, China.

Name: Honors Francis Gloster Forman (1904–1980), government geologist of Western Australia.

Type Material: Western Australian Museum, Perth, Australia, S381.

(1) Russia; by electron microprobe and gas chromatography of combustion products, average of twelve analyses, H calculated for charge balance, O calculated for the ideal formula; corresponds to $(Ca_{0.88}Na_{0.01}H_{0.23})_{\Sigma=1.12}(HCO_2)_2$. (2) $Ca(HCO_2)_2$.

Occurrence: Rare in hydrothermal veinlets cutting kurchatovite-sakhaite ore (Solongo deposit, Russia); in a veinlet in skarnitized marble (Novofrolovskoye deposit, Russia).

Association: Calcite, lizardite, frolovite, pentahydroborite, hexahydroborite, vimsite (Solongo deposit, Russia); calcite, vesuvianite, pentahydroborite, frolovite, calciborite, uralborite, johnbaumite (Novofrolovskoye deposit, Russia).

Distribution: In Russia, from the Solongo boron deposit, Buryatia, and the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains.

Name: Alludes to the composition, a calcium formate.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Djoué, Congo Republic. (2) Renéville, Congo Republic. (2) $Pb_2Cu(AsO_4)(CrO_4)(OH)$.

Occurrence: A rare mineral in the oxidized zones of some hydrothermal base-metal deposits.

Association: Dioptase, wulfenite, hemihedrite, phoenicochroite, duftite, mimetite, shattuckite, chrysocolla, hemimorphite, willemite, fluorite.

Distribution: From Djoué and Renéville, Congo Republic. In South Africa, at the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal. From the Seh Changi mine, near Neybaud, Khorassan, and at Sebarz, Iran. In the USA, in Arizona, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., at the Tonopah-Belmont mine, Osborne district, Maricopa Co., from the Lone Star mine, near Copperopolis, Yavapai Co., at the 79 mine, Gila Co., from the Shattuck mine, Bisbee, Warren district, Cochise Co., from the Eagle Eye mine, New Water Mountains, La Paz Co., and at several other localities; from the Blue Bell mine, near Baker, San Bernardino Co., California; at Socorro Peak, Socorro Co., New Mexico; from the Killie mine, Spruce Mountain district, Elko Co., and in the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada. At the Union mine, Taltal, Antofagasta, Chile. In the Teutonic Bore deposit, 300 km north of Kalgoorlie, and at Whim Creek, east of Roeburne, Western Australia.

Name: In honor of Lucien Louis Forneau (1867–1930), Colonial Governor of the French Congo.

Type Material: n.d.

Forsterite Mg_2SiO_4

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. In euhedral or subhedral crystals, typically thick, with striations ‖ elongation, with wedge-shaped terminations, to 17 cm. Commonly granular or compact massive. *Twinning:* On {100}, {011}, {012}.

Physical Properties: *Cleavage:* {010}, {100}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7 D(meas.) = 3.275 D(calc.) = 3.271

Optical Properties: Transparent to translucent. *Color:* Green, yellowish, lemon-yellow, white, grayish, blue-gray; colorless in thin section. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$. $\alpha = 1.635$ $\beta = 1.651$ $\gamma = 1.670$ 2V(meas.) = 82°

Cell Data: *Space Group: Pbnm* (synthetic). $a = 4.7540$ $b = 10.1971$ $c = 5.9806$ Z = 4

X-ray Powder Pattern: Ojamo, Finland. (ICDD 7-74).
2.458 (100), 3.883 (70), 2.512 (70), 2.768 (60), 5.10 (50), 2.269 (40), 2.250 (30)

Chemistry:

	(1)
SiO_2	41.72
FeO	1.11
MgO	57.83
Total	100.66

(1) Mogok district, Myanmar; corresponds to $(Mg_{2.02}Fe^{2+}_{0.02})_{\Sigma=2.04}Si_{0.98}O_4$.

Polymorphism & Series: Trimorphous with ringwoodite and wadsleyite; forms two series, with fayalite, and with tephroite.

Mineral Group: Olivine group.

Occurrence: In mafic and ultramafic igneous rocks and thermally metamorphosed impure dolomitic limestones.

Association: Enstatite, plagioclase, phlogopite, magnetite, chromite, antigorite, dolomite, brucite, diopside, corundum, amphiboles, calcite, spinel, augite.

Distribution: Localities for near end member material or good crystals include: at Monte Somma and Vesuvius, Campania, Italy. From Ojamo, Lohja, Finland. At Møre og Ramsdel, Norway. Large crystals from the Kovdor massif, Kola Peninsula, and at Zlatoust and Mt. Itkul, Ural Mountains, Russia. In the Eifel district, Germany, at Forstberg. In the USA, in Arizona, on Peridot Mesa, four km southwest of San Carlos, Gila Co., and at Buell Park, Apache Co. In the Mogok district and at Pyaung Gaung, Myanmar (Burma). Exceptional gemmy crystals from Sapat, 24 km northeast of Naran, Northwest Frontier Province, Pakistan. At Kingiti, Mpapwa, Tanzania. Large gem crystals from the Island of Zabargad (Zabirget or St. Johns), in the Red Sea, Egypt.

Name: After Adolarius Jacob Forster (1739–1806), English mineral collector and dealer.

(1) Cap Garonne mine, France; average of 6 electron microprobe analyses, presence of H_2O and OH^- confirmed by Raman spectroscopy, H_2O by difference; corresponding to $Cu_{1.94}(Al_{1.96}Fe^{3+}_{0.04})_{\Sigma=2.00}(As_{0.84}S_{0.09}Si_{0.04})_{\Sigma=0.97}O_{10}H_{5.19}$. (2) $Cu_2Al_2(AsO_4)(OH,O,H_2O)_6$.

Occurrence: A secondary mineral in the oxidation zone of a hydrothermal sulfide deposit presumably formed under acidic conditions.

Association: Bariopharmacoalumite, cyanotrichite, parnauite, chalcophyllite, mansfieldite (Cap Garonne mine); chalcophyllite, mansfieldite, olivenite, goethite (Salsigne mine).

Distribution: From the Annex S chamber and pillar 44b, Cap Garonne mine, Var, Provence-Alpes-Côte d'Azur and at the Salsigne gold mine, Aude, Languedoc-Roussillon, France.

Name: Honors Jean-Paul Forêt (b. 1943), a retired engineer of the French Ministry of Equipment, and a co-founder of the Musée de la Mine de Cap Garonne.

Type Material: Natural History Museum of Los Angeles County, California, USA (# 63573, 63574, 63575, 63576, 63577); the Museum Victoria, Melbourne, Australia (M51746); and Muséum National d'Histoire Naturelle, Paris, France (# 211.58).

(1) Crestmore, California, USA. (2) $Ca_4Si_3O_9(OH)_2$.

Occurrence: In thin veins in thermally altered limestone (Crestmore, California, USA; Kilchoan, Scotland) or melilite skarn (Dupezeh Mountain, Iraq).

Association: Hillebrandite, calcite, vesuvianite, garnet, thaumasite (Crestmore, California, USA); merwinite, larnite, kilchoanite (Kilchoan, Scotland); perovskite, grossular, schorlomite, monticellite, wollastonite, phlogopite, spinel, cuspidine, baddeleyite, baghdadite, pyrrhotite, djerfisherite, valleriite (Dupezeh Mountain, Iraq).

Distribution: In the USA, at Crestmore, Riverside Co., California. From near Kilchoan, Ardnamurchan, Argyllshire, Scotland. On Dupezeh Mountain, near Hero Town, Qala-Diza region, Iraq. From the Hatrurim Formation, Israel. At Kushiro, Hiroshima Prefecture, and in the Akagané mine, Iwate Prefecture, Japan. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For William Frederick Foshag (1894–1956), Curator of the Smithsonian mineral collections, Washington, D.C., USA, who studied Crestmore minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95229.

Total	[100.00]	100.00

(1) Shinkolobwe, Congo; recalculated to 100% after deduction of SiO_2 2.07%.
(2) $Pb(UO_2)_4O_3(OH)_4 \cdot 4H_2O$.

Occurrence: A rare secondary mineral formed as an alteration product of uraninite in the oxide zone of uranium deposits; a common component of "gummite" replacing uraninite; may replace fossil wood.

Association: Uraninite, ianthinite, schoepite, becquerelite, billietite, dewindtite, phosphuranylite, vandendriesscheite, rutherfordine, torbernite, kasolite, curite, goethite.

Distribution: Relatively abundant from Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Morogoro, Uluguru Mountains, Tanzania. From Wölsendorf and Hagendorf, Bavaria, Germany. At Tvedestrand and Krøderen, Norway. From Great Bear Lake, Northwest Territories, and in the Lac Indicateur area, Quebec, Canada. In the USA, from the Palermo mine, near North Groton, Grafton Co., New Hampshire; at Newry, Oxford Co., Maine; in Liepers quarry, Swarthmore, Delaware Co., Pennsylvania; from Spruce Pine, Mitchell Co., North Carolina. In the Monument No. 2 mine, Monument Valley, Apache Co., Arizona; at the Lucky Strike No. 2 mine, San Rafael Swell, Emery Co., Utah; and at Mica Lake, Hahns Peak, Routt Co., and elsewhere in Colorado.

Name: Honors Paul Fourmarier (1877–1970), Belgian geologist, Professor of Geology, University of Liège, Liège, Belgium.

Type Material: University of Liège, Liège, Belgium, 16871 and 16872; Natural History Museum, Paris, France, 124-181.

Fraipontite $(Zn, Al)_3(Si, Al)_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Fibrous to porcelaneous massive.

Physical Properties: Hardness = 3.5–4 D(meas.) = 3.08–3.10 D(calc.) = 3.44–3.54

Optical Properties: Opaque to translucent. *Color:* Yellowish white to bluish. *Streak:* White to pale green. *Luster:* Silky.
Optical Class: Biaxial (–). $n = 1.61–1.62$ 2V(meas.) = 15°–20°

Cell Data: *Space Group:* n.d. $a = 5.372$ $b = 9.246$ $c = 7.273$ $\beta = 103°33'$ Z = 2

X-ray Powder Pattern: Vieille-Montagne, Belgium.
7.03 (100), 3.53 (70), 2.650 (40), 2.490 (30), 2.385 (30), 1.540 (30), 4.60 (20)

Chemistry:

	(1)	(2)	(3)
SiO_2	20.86	24.8	32.78
Al_2O_3	16.62	17.3	21.71

Total	100.22	[101.39]	[100.00]

(1) Vieille-Montagne, Belgium; corresponds to $(Zn_{2.29}Al_{0.66}Cu_{0.03}Mg_{0.01})_{\Sigma=2.99}(Si_{1.37}Al_{0.63})_{\Sigma=2.00}O_5(OH)_{4.01}$. (2) Silver Bill mine, Arizona, USA; by electron microprobe, H_2O by loss on ignition; corresponds to $(Zn_{1.84}Al_{0.77}Cu_{0.24})_{\Sigma=2.85}(Si_{1.51}Al_{0.49})_{\Sigma=2.00}O_5(OH)_4$. (3) Mohawk mine, California, USA; H_2O by difference, corresponds to $(Al_{1.18}Cu_{0.69}Zn_{0.58})_{\Sigma=2.45}(Si_{1.79}Al_{0.21})_{\Sigma=2.00}O_5(OH)_4$.

Mineral Group: Kaolinite-serpentine group.

Occurrence: In oxidized zinc-bearing mineral deposits.

Association: Smithsonite (Vieille-Montagne, Belgium); gebhardite, willemite, cerussite (Tsumeb, Namibia); sauconite (Silver Bill mine, Arizona, USA).

Distribution: Original locality not known with certainty, but thought to be one of the mines of Vieille-Montagne (Altenberg), near Moresnet, Belgium. From Tsumeb, Namibia. At Laurium, Greece. From the Copperthwaite vein, Swaledale, North Yorkshire, England. In the USA, in the Silver Bill mine, Gleeson, Cochise Co., Arizona; the Blanchard mine, Socorro Co., New Mexico; and the Mohawk mine, San Bernardino Co., California. From the Ojuela mine, Mapimí, Durango, Mexico.

Name: To honor Julien Jean Joseph Fraipont (1857–1910), and Charles Fraipont, of Liège, Belgium, both geologists and paleontologists.

Type Material: University of Liège, Liège, Belgium, 13727.

Francevillite $(Ba,Pb)(UO_2)_2(V_2O_8)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Commonly as crystals, dominantly {111}, rare {100}, {010}, a few other forms, to 8 mm, in aggregates and crusts. Also massive, in veinlets and as impregnations.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = 3 D(meas.) = 4.55 D(calc.) = [4.56] Radioactive.

Optical Properties: Semitransparent. *Color:* Lemon-yellow, yellow-orange, orange, greenish yellow; green, brown.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; $Y = Z$ = yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.750(5)$ $\beta = 1.910(5)$ $\gamma = 1.945(5)$ 2V(meas.) = n.d. 2V(calc.) = 46(2)°

Cell Data: *Space Group:* $Pcan$. $a = 10.419(1)$ $b = 8.510(1)$ $c = 16.763(2)$ Z = 4

X-ray Powder Pattern: Mounana mine, Gabon.
8.30 (10), 2.98 (8), 4.17 (6), 2.57 (6), 2.10 (5), 3.27 (4), 2.01 (4)

Chemistry:

	(1)
UO_3	56.70
V_2O_5	18.56
PbO	2.05
BaO	13.90
H_2O	8.85
Total	100.06

(1) Mounana mine, Gabon; corresponds to $(Ba_{0.92}Pb_{0.09})_{\Sigma=1.01}(UO_2)_{2.00}(V_2O_8)_{1.03}\cdot 4.96H_2O$.

Polymorphism & Series: Forms a series with curienite.

Occurrence: In the oxidized zone of a Pb-bearing U–V deposit (Mounana mine, Gabon).

Association: Curienite, duttonite, vanuralite, chervetite, mottramite, carnotite, dewindtite, torbernite, uranopilite, johannite, kasolite (Mounana mine, Gabon).

Distribution: Exceptional crystals from the Mounana uranium mine, Franceville, Gabon. At Kambove and in the Musonoi mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). On the southwest edge of the Chimeja Range, about four km north of Lubimbi Spring, Zimbabwe. From Bertholène and Lussagues, Aveyron, and Saint-Pierre, Cantal, France. In Germany, on the Donnersberg, near Imsbach, Rhineland-Palatinate; in the Black Forest, at Nussbach, near Triberg, and from the Clara mine, near Oberwolfach. In the South Terras mine, St. Stephen-in-Brannel, Cornwall, England. At the Tyuya-Muyun Cave, Fergana Valley, Alai Range, Kyrgyzstan. From the Otish Mountains, Quebec, Canada. In the USA, at Jim Thorpe, Carbon Co., Pennsylvania.

Name: For its original occurrence near Franceville, Gabon.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1958,597.

Franciscanite $\mathbf{Mn_3^{2+}V_{1-x}^{5+}(SiO_4)(O,OH)_3}$ (x = 0.5)

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3. As irregular grains to 1.0 mm.

Physical Properties: *Fracture:* Uneven. Hardness = ∼4 D(meas.) = 4.1(3) D(calc.) = 3.97 May be weakly magnetic, possibly resulting from tiny opaque inclusions.

Optical Properties: Transparent. *Color:* Cherry-red when fresh, darkening to brownish red with exposure. *Streak:* Brownish red. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Pleochroism:* Strong; O = wine-red; E = dark red to nearly black. *Absorption:* Intense; $E > O$. $\omega = 1.856(3)$ $\epsilon = 1.882(3)$

Cell Data: *Space Group:* $P3$. $a = 8.1518(3)$ $c = 4.8091(2)$ Z = 2

X-ray Powder Pattern: Pennsylvania mine, California, USA.
2.331 (100), 3.105 (90), 2.844 (90), 1.785 (70), 1.538 (50), 2.668 (40), 3.97 (30)

Total	[100.2]

(1) Pennsylvania mine, California, USA; by electron microprobe, H_2O by analogy to welinite; corresponds to $Mn_{2.98}V_{0.49}(SiO_4)(O,OH)_{\sim 3}$.

Occurrence: As sparse, irregular segregations within a sheared sonolite-bearing assemblage in chert.

Association: Sonolite, hausmannite, braunite, gageite.

Distribution: From the Pennsylvania mine, San Antonio Valley, Santa Clara Co., California, USA.

Name: For the Franciscan complex of California, USA, where it was found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 163041.

References: (1) Dunn, P.J., D.R. Peacor, R.C. Erd, and R.A. Ramik (1986) Franciscanite and örebroite, two new minerals from California and Sweden, related to redefined welinite. Amer. Francisite $Cu_3BiO_2(Se^{4+}O_3)_2Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As bladed crystals, elongated along [010], with dominant forms {100}, {011}, and {101}, to 0.25 mm; in divergent sprays. *Twinning:* Contact twins on {100}.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3–4 D(meas.) = n.d. D(calc.) = 5.42

Optical Properties: Semitransparent. *Color:* Bright apple-green. *Streak:* Pale apple-green. *Luster:* Adamantine.
Optical Class: [Biaxial.] *Pleochroism:* Distinct, from pale green to bright green ∥ [010].
Orientation: Length-slow. $\alpha = > 1.79$ $\beta = > 1.79$ $\gamma = > 1.79$ 2V(meas.) = n.d.

Cell Data: *Space Group: Pmmn.* $a = 6.354(1)$ $b = 9.630(1)$ $c = 7.220(2)$ $Z = 2$

X-ray Powder Pattern: Iron Monarch quarry, Australia.
3.39 (100), 2.866 (80), 2.652 (70), 5.31 (60), 2.491 (60), 1.588 (60), 1.695 (35)

Chemistry:

	(1)	(2)
SeO_2	27.23	30.78
Bi_2O_3	35.75	32.31
CuO	32.62	33.10
Cl	4.11	4.92
$-O = Cl_2$	0.93	1.11
Total	98.78	100.00

(1) Iron Monarch quarry, Australia; by electron microprobe, average of seven analyses, absence of $(OH)^{1-}$ and H_2O and presence of $(SeO_3)^{2-}$ confirmed by IR; corresponds to $Cu_{3.10}Bi_{1.16}O_{2.12}(Se_{0.93}O_3)_2Cl_{0.88}$. (2) $Cu_3BiO_2(SeO_3)_2Cl$.

Occurrence: A rare secondary mineral in an oxidized barite lens in Precambrian sedimentary iron formation.

Association: Chorargyrite, muscovite, naumannite, bismuth, djurleite, Cu–Bi–Ag selenides, barite.

Distribution: From the Iron Monarch quarry, Iron Knob, South Australia. At the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy.

Name: Honors Glyn Francis (1939–), Quality Control Officer at the Iron Monarch quarry, Australia, who collected the first specimen.

Type Material: South Australian Museum, Adelaide, G16415; The Museum of Victoria, Melbourne, Australia, M39650.

Franckeite $\mathbf{(Pb, Sn^{2+})_6Fe^{2+}Sn_2^{4+}Sb_2^{3+}S_{14}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Thin crystals, tabular on {010}; elongated ‖ [100], to 6 cm, striated on {010}, may be warped or bent; typically in spherical, rosette- or cauliflowerlike aggregates of thin plates; commonly massive, radiated, or foliated. *Twinning:* Complex twinning has been observed.

Physical Properties: *Cleavage:* {010}, perfect. *Tenacity:* Flexible, inelastic; slightly malleable. Hardness = 2.5–3. VHN = n.d. D(meas.) = 5.88–5.92 D(calc.) = 5.88

Optical Properties: Opaque. *Color:* Grayish black. *Streak:* Grayish black. *Luster:* Metallic. *Anisotropism:* Weak.

				Total	98.87	100.19	100.00

(1) Chocaya, Bolivia. (2) Poopó, Bolivia. (3) $Pb_5FeSn_3Sb_2S_{14}$.

Occurrence: In hydrothermal Ag–Sn deposits (Bolivia); in a limestone contact metamorphic deposit (Kalkar quarry, California, USA).

Association: Cylindrite, teallite, plagionite, zinkenite, cassiterite, wurtzite, pyrrhotite, marcasite, arsenopyrite, galena, pyrite, sphalerite, siderite (Bolivia); cassiterite, galena, stannite, teallite, cylindrite (Russia).

Distribution: In Bolivia, from Chocaya [TL], Poopó, Oruro, Llallagua, Huanuni, Colquechaca, and Cerro Rico, Potosí. At the Pirquitas mine, Jujuy Province, Argentina. In the Thompson mine, Darwin district, Inyo Co., and the Kalkar quarry, Santa Cruz, Santa Cruz Co., California, USA. From near the headwaters of the east branch of the Coal River, Yukon Territory, Canada. At Vens Haut, Cantal, France. In the Sinantscha zinc deposit, Sichota-Alin, and from Smirnowsk, Transbaikalia, Russia. At the Changpo-Tongkeng tin deposit, Dachang district, Guangxi Autonomous Region, China. From the Hoei tin mine, Oita Prefecture, Japan. At the Renison Bell mine, Tasmania, and the Wallah Wallah mine, Rye Park, New South Wales, Australia.

Name: For the mining engineers Carl and Ernest Francke.

(1) Castellana Cave, Italy; average of two analyses totaling 99.64% and 99.42%, recalculated to 100%; K, Na, and Fe by flame photometry, H_2O by the Penfield method; corresponds to $H_6(K_{2.6}Na_{0.4})_{\Sigma=3.0}(Al_{4.55}Fe_{0.45})_{\Sigma=5.00}(PO_4)_8 \cdot 13H_2O$. (2) $K_3Al_5(PO_4)_2(PO_3OH)_6 \cdot 12H_2O$.

Occurrence: An alteration product probably formed by reaction between bat guano and clay minerals (Castellana Cave, Italy); in soils developed on granite debris and bat guano mixtures, by reaction of phosphate-rich sea mist with clay minerals (Farallon Islands, USA).

Association: Taranakite (Castellana Cave, Italy); taranakite, hydroxylapatite, brushite (Little Swallow Cave, Italy); alunite, aragonite, berlinite, collophane, crandallite, gypsum, huntite, hydromagnesite, leucophosphite, nesquehonite, niter, nitrocalcite (Paddy's River mine, Australia).

Distribution: In Italy, in Puglia, from the Castellana Cave, about 40 km southeast of Bari, and in the Little Swallow Cave, near Polignaro a mare. In Australia, at the Paddy's River mine, Australian Capital Territory. Above Rabbit Cave, Farallon Islands, about 48 km west of San Francisco Co., California, USA.

Name: Honoring Franco Anelli, formerly Professor of Geography, University of Bari, Bari, Italy, who found the Castellana caves.

Type Material: Mineralogical Museum, University of Bari, Bari, Italy; National School of Mines, Paris, France.

(1) Kamoto-East mine, Congo; by electron microprobe, H_2O by gas chromatography; average of ten analyses, recalculated to 100% from original total of 97.13%; corresponds to $(Nd_{0.18}Y_{0.09}Sm_{0.06}Ce_{0.04}Pr_{0.04}La_{0.03}Dy_{0.03})_{\Sigma=0.47}(UO_2)_{3.15}O(PO_4)_{1.92}(OH)\cdot 6.34H_2O$. (2) Bangombé, Gabon; by electron microprobe, H_2O by difference; corresponds to $(Nd_{0.28}Ce_{0.28}Pb_{0.15}Pr_{0.08}La_{0.08}Sm_{0.05}Al_{0.05}Dy_{0.03})_{\Sigma=1.00}(UO_2)_{3.11}O(PO_4)_{1.92}(OH)\cdot 6H_2O$.

Occurrence: A rare alteration product of uraninite in a sedimentary Cu–Co deposit (Kamoto-East mine, Congo).

Association: Uraninite, schoepite, uranophane, curite, schuilingite-(Nd), kamotoite-(Y), astrocyanite-(Ce), masuyite (Kamoto-East mine, Congo).

Distribution: From the Kamoto-East Cu–Co mine, five km east of Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). At the Bangombé natural fission reactor, Gabon.

Name: To honor Dr. Armand François (1922–), former Director of Geology for Gécamine (the national mining company), and for its dominant *neodymium* content.

Type Material: Royal Institute of Natural Sciences, Brussels, Belgium, RC3512.

(1) Francon quarry, Canada; by electron microprobe, H_2O by difference, originally given as 13.0%; using H_2O 21%–22% as confirmed by mass spectrometry, corresponds to $(Na_{1.82}Ca_{0.08})_{\Sigma=1.90}(Nb_{3.76}Si_{0.17}Ti_{0.08})_{\Sigma=4.01}O_{11}\cdot 9H_2O$. (2) Vishnevogorsk complex, Russia; by electron microprobe, average of three analyses, H_2O taken as LOI; corresponds to $(Na_{2.03}Ca_{0.09})_{\Sigma=2.12}(Nb_{3.92}Si_{0.10})_{\Sigma=4.02}O_{11}\cdot 9.6H_2O$. (3) $Na_2Nb_4O_{11}\cdot 9H_2O$.

Occurrence: In vugs of a dawsonite-bearing sill in a limestone deposit (Francon quarry, Canada); in cavities in altered pegmatite dikes, hornfels, sodalite syenite, or miarolitic cavities, associated with an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Hochelagaite, weloganite, calcite, quartz (Francon quarry, Canada); burbankite, muscovite, albite, microcline, chlorite, calcite, strontianite, natrolite (Vishnevogorsk complex, Russia).

Distribution: In the Francon quarry, Montreal Island, Montreal, at Mont Saint-Hilaire, and near Saint-Amable, Quebec, Canada. In the Vishnevogorsk alkalic complex, Vishnevy-Ilmen Mountains, Southern Ural Mountains, Russia.

Name: For the Francon quarry, Montreal, Canada, where it was first found.

Type Material: Geological Survey of Canada, Ottawa, 62094, 63748–63750; Royal Ontario Museum, Toronto, Canada, M39041.

Total	99.63

(1) Carlin mine, Nevada, USA; by electron microprobe, average of three analyses; corresponds to $Ba_{1.00}F_{2.00}$.

Occurrence: Of hydrothermal origin, encased in quartz veinlets cutting a gold deposit in silicified carbonaceous arsenic-rich limestone.

Association: Quartz.

Distribution: From the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., Nevada, USA.

Name: To honor Dr. Frank Wilson Dickson (1922–), Professor of Geochemistry, Stanford University, Palo Alto, California, USA, for his work on low-temperature ore deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 133958.

CuO	45.20	45.10
H_2O	[5.05]	5.11
Total	[99.02]	100.00

(1) Centennial Eureka mine, Utah, USA; by electron microprobe, average of five analyses, H_2O calculated, presence of $(OH)^{1-}$ confirmed by IR and crystal-structure analysis; corresponds to $Cu_{2.03}(Te_{0.99}O_4)(OH)_2$. (2) $Cu_2(TeO_4)(OH)_2$.

Occurrence: A very rare secondary mineral formed by the oxidization of primary Cu–Te-bearing sulfides.

Association: Mcalpineite, hematite, acanthite, chrysocolla, connellite, enargite, hinsdalite–svanbergite, pyrite, quartz.

Distribution: From the dumps of the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: Honors Frank Christopher Hawthorne (1946–), Professor of Crystallography and Mineralogy, University of Manitoba, Winnipeg, Canada, who has determined the crystal structures of many copper minerals.

Type Material: Canadian Geological Survey, Ottawa, Canada, 67263.

Total	[100.0]	100.0

(1) Franklin, New Jersey, USA; by electron microprobe, Fe_2O_3 shown present by microchemical tests, Mn^{2+}:Mn^{3+} from crystal structure, H_2O by difference; corresponds to $Ca_2(Fe^{3+}_{0.76}Al_{0.24})_{\Sigma=1.00}(Mn^{3+}_{0.97}Mg_{0.03})_{\Sigma=1.00}(Mn^{2+}_{0.54}Mg_{0.28}Zn_{0.18})_{\Sigma=2.00}Zn_2Si_2O_{10}(OH)_8$.
(2) Do; H_2O by TGA, corresponds to $Ca_{1.88}(Fe^{3+}_{0.97}Al_{0.06})_{\Sigma=1.03}Mn^{3+}_{1.12}Mn^{2+}_{2.24}Mg_{0.12}Zn_{2.47}Si_{2.08}O_{10.22}(OH)_{7.78}$.

Occurrence: A late-stage mineral in vugs in a metamorphosed stratiform zinc deposit.

Association: Willemite, clinohedrite, hodgkinsonite, hetaerolite, franklinite, barite, rhodonite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: After Franklin Furnace, the former name for Franklin, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, C6309, R19144.

(1) New Jersey, USA; total Fe as Fe^{3+}. (2) Do.; by electron microprobe, average of five analyses, total Fe as Fe_2O_3. (3) Långban, Sweden; by electron microprobe, average of four analyses, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Zn_{0.88}Fe^{2+}_{0.12})_{\Sigma=1.00}(Fe^{3+}_{1.90}Al_{0.06}Mn^{2+}_{0.02}Ti_{0.02})_{\Sigma=2.00}O_4$.

Mineral Group: Spinel group.

Occurrence: In beds and veins formed by high-temperature metamorphism of Fe, Zn, Mn-rich marine carbonate sediments. As a minor mineral in some manganese and iron deposits.

Association: Zincite, willemite, calcite, andradite, manganosite, rhodochrosite, gahnite, magnetite, rhodonite, hausmannite, hetaerolite, jacobsite, braunite, sarkinite, berzeliite, hematite.

Distribution: From Franklin and at Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. Found at Långban, Värmland, Sweden. Occurs at Hraničná, Czech Republic. In Kazakhstan, from Nayzatas, Dzhumart, and in the Ushkatyn deposits, Atasui area. At the Pereval marble quarry, near Slyudyanka, Sayan Mountains, south of Lake Baikal, Siberia, Russia. From the Koduru manganese mine, Srikakulam district, Andhra Pradesh, India. At the Bonnie prospect, near Mukinbudin, Western Australia.

Name: Named for Franklin Furnace (now Franklin), New Jersey, USA; and in honor of the American statesman, philosopher and inventor Benjamin Franklin (1706–1790).

(1) Franklin, New Jersey, USA.; by electron microprobe, H_2O by difference, corresponding to $(K_{2.6}Na_{1.1})_{\Sigma=3.7}(Mn_{26.1}Mg_{13.2}Zn_{6.0}Fe^{3+}_{2.7})_{\Sigma=48.0}(Si_{60.8}Al_{5.8}Fe^{3+}_{5.4})_{\Sigma=72.0}[O_{163.2}(OH)_{52.8}]_{\Sigma=216.0}\cdot nH_2O$.

Polymorphism & Series: Forms a series with lennilenapeite.

Occurrence: In a veinlet crosscutting a breccia of calcite, aegirine, and serpentine in a metamorphosed stratiform zinc deposit.

Association: Friedelite, nelenite, rhodonite, tirodite.

Distribution: At Franklin, Sussex Co., New Jersey, USA.

Name: From the locality Franklin, New Jersey, USA, and the Greek for *friend*, for the association of elements characteristic of Franklin.

Type Material: National Museum of Natural History, Washington, D.C., USA, 167390.

References: (1) Dunn, P.J., D.R. Peacor, and S.-C. Su (1992) Franklinphilite, the manganese analog of stilpnomelane, from Franklin, New Jersey. Mineral. Record, 23, 465–468. (2) (1993) Amer. Mineral., 78, 672–673 (abs. ref. 1).

Fransoletite $Ca_3Be_2(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are arrow-head-shaped, curved, composed of mosaiced aggregates of minute crystallites, to 3 mm. Elongated along [101], tabular on {010}, forms are {100}, {011}, {010}.

Physical Properties: *Cleavage:* {010}, imperfect. *Fracture:* Irregular. Hardness = ∼3
D(meas.) = 2.56(3) D(calc.) = 2.53

Optical Properties: Transparent to translucent. *Color:* Colorless to slightly whitish.
Streak: White. *Luster:* Subvitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 14°$. $\alpha = 1.560(2)$ $\beta = 1.566(2)$
$\gamma = 1.586(2)$ 2V(meas.) = 25° 2V(calc.) = 25°

Cell Data: *Space Group:* $P2_1/a$. $a = 7.3482(13)$ $b = 15.0522(28)$ $c = 7.0685(13)$
$\beta = 96.519(6)°$ Z = 2

X-ray Powder Pattern: Tip Top mine, South Dakota, USA.
3.044 (100), 3.47 (90), 3.32 (70), 2.317 (50), 7.52 (40), 2.597 (40), 6.55 (30)

Chemistry:

	(1)	(2)
P_2O_5	47.3	47.93
MnO	0.3	
BeO	9.3	8.45
CaO	28.8	28.41
H_2O	[14.3]	15.21
Total	[100.0]	100.00

(1) Tip Top mine, South Dakota, USA; by electron microprobe, Be by AA, H_2O by difference; corresponds to $(Ca_{3.08}Mn_{0.02})_{\Sigma=3.10}Be_{2.23}(PO_4)_2(PO_3OH)_2 \cdot 3.76H_2O$.
(2) $Ca_3Be_2(PO_4)_2(PO_3OH)_2 \cdot 4H_2O$.

Polymorphism & Series: Dimorphous with parafransoletite.

Occurrence: Formed by late-stage hydrothermal alteration of beryl and other phosphates in a zoned granite pegmatite.

Association: Beryl, tiptopite, whitlockite, carbonate-apatite, montgomeryite, hurlbutite, englishite, roscherite, quartz.

Distribution: From the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota, USA.

Name: To honor Dr. André-Mathieu Fransolet (1947-), Professor of Mineralogy, University of Liège, Liège, Belgium, for his work with primary phosphate minerals.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149607.

(1) Pitigliano, Italy; by a variety of techniques including AA and XRF, recalculated to 100%; corresponding to $(Na_{4.31}Ca_{2.50}Mg_{0.04}Fe_{0.01})_{\Sigma=6.86}(Si_{6.26}Al_{5.74})_{\Sigma=12.00}O_{24}[(SO_4)_{1.54}(OH)_{0.70}(CO_3)_{0.41}Cl_{0.12}]_{\Sigma=2.77} \cdot 0.86H_2O$. (2) Ariccia, Italy; methods as for (1), corresponding to $(Na_{4.16}Ca_{2.18}Mg_{0.08}Fe_{0.01})_{\Sigma=6.43}(Si_{6.22}Al_{5.78})_{\Sigma=12.00}O_{24}[(SO_4)_{1.50}(OH)_{0.64}(CO_3)_{0.53}Cl_{0.04}]_{\Sigma=2.71} \cdot 0.79H_2O$.

Mineral Group: Cancrinite group.

Occurrence: In ejected metasomatized pumice blocks, thought to be the product of a syntectic process between a trachytic magma and carbonate rocks at the volcanic vent.

Association: Diopside, vesuvianite, afghanite, liottite (Pitigliano, Italy); calcite, leucite (Ariccia, Italy).

Distribution: In Italy, in the Pitigliano quarry, near Grosseto, Tuscany; and at Sacrofano and Ariccia, near Rome, Lazio.

Name: For Marco Franzini, Professor of Mineralogy, University of Pisa, Pisa, Italy.

Type Material: University of Pisa, Pisa, 3208; University of Modena, Modena, Italy.

Freboldite CoSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Massive; as embedded grains.

Physical Properties: Hardness = < 6, much softer than trogtalite and hastite.
VHN = n.d. D(meas.) = n.d. D(calc.) = 7.70

Optical Properties: Opaque. *Color:* Similar to nickeline, but more intense violet in oil.
Anisotropism: Less anisotropic than nickeline.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. a = 3.61 $c = 5.28$ Z = 2

X-ray Powder Pattern: Steinbruch, Germany.
2.05 (100), 1.066 (100), 0.963 (100), 2.4 (50), 1.71 (50), 1.08 (50), 0.992 (50)

Chemistry: Composition established by analogy to synthetic material.

Mineral Group: Nickeline group.

Occurrence: In dolostone veinlets (Steinbruch, Germany).

Association: Clausthalite, nickeline, guanajuatite, hastite, trogtalite, bornhardtite, chalcopyrite, millerite, sphalerite, hematite.

Distribution: In Germany, in the Harz Mountains, from the Trogtal quarry, Steinbruch [TL], and at Rote Berg, St. Andreasberg; also from Hartenstein, Saxony. In the Pinky Fault uranium deposit, Saskatchewan, Canada. At Temple Mountain, Emery Co., Utah, USA.

Name: In honor of Professor Georg Frebold (1891–?) of Hannover, Germany.

Type Material: n.d.

References: (1) Ramdohr, P. and Schmitt, M. (1955) Vier neue natüraliche kobaltselenide von Steinbruch Trogtal bei Lautenthal im Harz. Neues Jahrb. Mineral., Monatsh., 133–142 (in German). Fredrikssonite $Mg_2(Mn^{3+},Fe^{3+})BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, prismatic and striated along [001], sharp to rounded, to 2.0 mm, with diamond-shaped cross-sections; in parallel to randomly oriented aggregates.

Physical Properties: *Cleavage:* One, poor, and a second, very poor. *Fracture:* Irregular to uneven. *Tenacity:* Brittle. Hardness = ∼6 D(meas.) = 3.84(5) D(calc.) = 3.80

Optical Properties: Nearly opaque to translucent. *Color:* Medium reddish brown. *Streak:* Pale brown to yellow. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Pleochroism:* Pronounced; X = golden brown; Z = dark reddish brown to black. *Orientation:* Z = elongation of cleavage fragments = c (by analogy to ludwigite). *Dispersion:* $r > v$, strong. *Absorption:* $Z > X$. $\alpha = 1.82(2)$ $\beta = < 1.86$ $\gamma = \sim 1.99$ $2V(meas.) = > 60°$

Cell Data: *Space Group: Pbam.* $a = 9.198(2)$ $b = 12.528(3)$ $c = 2.965(1)$ $Z = 4$

X-ray Powder Pattern: Långban, Sweden.
2.590 (100), 2.486 (90), 5.16 (80), 2.013 (50), 1.513 (40), 2.201 (30), 1.570 (30)

Chemistry:

	(1)
B_2O_3	[17.9]
Al_2O_3	1.9
Fe_2O_3	5.4
Mn_2O_3	35.5
MnO	0.0
MgO	40.3
Total	[101.0]

(1) Långban, Sweden; by electron microprobe, B_2O_3 calculated from stoichiometry and by analogy to orthopinakiolite; corresponds to $Mg_{1.93}(Mn^{3+}_{0.87}Fe^{3+}_{0.13}Al_{0.07})_{\Sigma=1.07}B_{0.99}O_{5.05}$.

Polymorphism & Series: Polymorphous with orthopinakiolite, pinakiolite, takéuchiite.

Mineral Group: Ludwigite group.

Occurrence: From a metamorphosed Fe–Mn orebody.

Association: Hausmannite, manganoan calcite, brucite, adelite, dolomite–kutnohorite, clinohumite, jacobsite.

Distribution: From Långban, Värmland, Sweden.

Name: Honors Dr. Kurt A. Fredriksson (1926–), Swedish–American geochemist and meteoriticist, Smithsonian Institution, Washington, D.C., USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 149811, 150341.

Freedite $Pb_8Cu^{1+}(As^{3+}O_3)_2O_3Cl_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. As composite crystals in slightly radial aggregates.

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 7.0(5) D(calc.) = 7.43

Optical Properties: Transparent to translucent. *Color:* Bright greenish yellow. *Streak:* Yellow. *Luster:* Greasy to vitreous. *Optical Class:* Biaxial. *Pleochroism:* Weak to none. $\alpha = > 1.90$ $\beta = > 1.90$ $\gamma = > 1.90$ 2V(meas.) = n.d.

Cell Data: *Space Group: C*2/*m*. $a = 13.578(2)$ $b = 20.099(3)$ $c = 7.465(1)$ $\beta = 105.73(1)°$ Z = 4

X-ray Powder Pattern: Långban, Sweden. 2.949 (10), 2.830 (8), 2.734 (8), 3.832 (5), 2.096 (5), 6.51 (4), 3.581 (4)

Chemistry:

	(1)	(2)
As_2O_3	9.2	9.02
FeO	0.4	
PbO	80.2	81.45
CuO	4.9	3.26
Cl	8.0	8.09
$-O = Cl_2$	1.8	1.82
Total	100.9	100.00

(1) Långban, Sweden; by electron microprobe, total Cu as CuO, total Fe as FeO, total As as As_2O_3; neglecting $H_2O + CO_2$ 0.2% by TGA-EGA-mass spectrometer, corresponds to $Pb_{29.4}Cu^{2+}_{5.1}Fe^{2+}_{0.5}As^{3+}_{7.6}Cl_{18.4}O_{37.1}$. (2) $Pb_8Cu(AsO_3)_2O_3Cl_5$.

Occurrence: An uncommon mineral in andradite–magnetite ore from a metamorphosed Fe–Mn orebody.

Association: Ecdemite, lead, copper, finnemanite, calcite, andradite, magnetite.

Distribution: At Långban, Värmland, Sweden.

Name: Honors Dr. Robert L. Freed, American mineralogist, of Trinity University, San Antonio, Texas, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160353 and 160354.

References: (1) Dunn, P.J. and R.C. Rouse (1985) Freedite and thorikosite from Långban, Sweden, and Laurion, Greece: two new species related to the synthetic bismuth oxyhalides. Amer. Zn	0.6	6.1	S	21.8	19.9
Hg		0.1	Total	100.5	100.1

(1) Mt. Isa, Australia; by electron microprobe, corresponding to $(Ag_{6.37}Cu_{3.72}Fe_{1.41}Zn_{0.18})_{\Sigma=11.68}(Sb_{3.95}As_{0.13})_{\Sigma=4.08}S_{13.00}$. (2) Knappenstube mine, Austria; by electron microprobe, average of analyses on 14 samples; corresponding to $(Ag_{9.50}Zn_{1.95}Cu_{1.06}Fe_{0.08}Hg_{0.01})_{\Sigma=12.60}(Sb_{3.61}As_{0.17}Bi_{0.01})_{\Sigma=3.79}S_{13.00}$.

Polymorphism & Series: Forms a series with tetrahedrite and argentotennantite.

Mineral Group: Tetrahedrite group.

Occurrence: In hydrothermal deposits.

Association: A wide variety of sulfides and sulfosalts, as for tetrahedrite.

Distribution: In Germany, in Saxony, from the Freiberg district [TL], as in the Himmelsfürst mine, Erbisdorf, near Freiberg. From Kutná Hora and the Zlate Hore district, Czech Republic. In Austria, from the Knappenstube mine, Hochtor, Salzburg. From Yukhondzha, Sakha, Russia. At Slädekärr and in the Vena mines, near Askersund, Örebro, Sweden. From the Bleikvassli Zn–Pb–Cu deposit, Nordland, Norway. In Scotland, at Tyndrum, Perthshire. In the Hi-Ho mine, Cobalt-Gowganda region, Ontario; and the Keno Hill-Galena Hill area, Yukon Territory, Canada. Large crystals from the San José mine, Oruro, Bolivia. In Japan, in the Inakuraishi, Koryu, and Sanru mines, Hokkaido. In Australia, at Mt. Isa and the Cannington Ag–Pb–Zn deposit, Queensland; and in the Meerschaum mine, north of Omeo, Victoria. Additional localities are known.

Name: For the long-known occurrence of silver-rich tetrahedrite at Freiberg, Germany.

(1) Hiendelaencina, Spain; corresponds to $Ag_{1.14}Pb_{0.84}Sb_{1.20}S_{3.00}$. (2) Příbram, Czech Republic; corresponds to $Ag_{1.12}Pb_{0.78}Fe_{0.06}Sb_{1.16}S_{3.00}$. (3) $AgPbSbS_3$.

Occurrence: Of hydrothermal origin.

Association: Acanthite, pyrargyrite, silver, andorite, galena, siderite.

Distribution: In Germany, in Saxony, from the Himmelsfürst mine, Erbisdorf [TL] and Braünsdorf, both near Freiberg, and at Marienberg. From Příbram, Czech Republic. As fine crystals from Hiendelaencina, Guadalajara Province, Spain. In the Les Farges mine, near Ussel, Corrèze; Pontgibaud, Puy-de-Dôme; and Vialas, Lozère, France. From Dossena, Lombardy, Italy. At Hällefors, Bergslagen metallic province, Sweden. In the USA, from the Eagle mine, Gilman district, Eagle Co., Colorado, and the Castle Dome Mountains, Yuma Co., Arizona. In Canada, at Cobalt, Ontario, and at the Weber prospect of Mount Nansen Mines, Yukon Territory. From Oruro, Bolivia.

Name: Honoring Johann Karl Freiesleben (1774–1846), Mining Commissioner of Saxony, Germany, who first described the mineral.

Fresnoite $Ba_2TiOSi_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* 4*mm*. As subhedral to euhedral tetragonal crystals, slightly elongated along [001], bounded principally by {110} and {001}, to 2.1 cm.

Physical Properties: *Cleavage:* Fair on {001}. Hardness = 3–4 D(meas.) = 4.43(2) D(calc.) = 4.45 Fluoresces pale yellow under SW UV.

Optical Properties: Transparent to translucent. *Color:* Lemon-yellow to canary-yellow, butterscotch-yellow to salmon-pink; yellow to colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* O = colorless; E = yellow, with anomalous blue interference colors. $\omega = 1.775(3)$ $\epsilon = 1.765$

Cell Data: *Space Group: P4bm*. $a = 8.518(2)$ $c = 5.211(1)$ $Z = 2$

X-ray Powder Pattern: Synthetic.
3.077 (100), 3.301 (45), 2.697 (25), 3.816 (20), 2.607 (20), 2.151 (20), 1.874 (20)

(1–2) Rush Creek area, California, USA; by D-C arc spectrography, recalculated to 100%.
(3) $Ba_2TiOSi_2O_7$.

Occurrence: Disseminated in gneissic metamorphic rocks composed mainly of sanbornite and quartz (Rush Creek, California, USA).

Association: Quartz, sanbornite, celsian, taramellite, diopside, pyrrhotite (Rush Creek, California, USA); bario-orthojoaquinite, benitoite, baotite, natrolite (Esquire mine No. 1, California, USA); gillespite, sanbornite, taramellite, pellyite, muirite, barite (Gunn claim, Canada).

Distribution: In the USA, in California, from the Rush Creek area and at the Esquire No. 1 mine, Big Creek, Fresno Co.; at the Gem mine, and in the Clear Creek district, at the Victor mine, and large crystals in the Junilla mine, San Benito Co.; on Trumbull Peak, near Incline, Mariposa Co. From the Gunn claim, Itsy Mountains, near Macmillan Pass, Yukon Territory, Canada. At Graulai and Üdersdorf, Eifel district, Germany.

Name: For the original localities in Fresno Co., California, USA.

Type Material: California Division of Mines & Geology, San Francisco, California, USA.

Freudenbergite $Na_2(Ti, Fe^{3+})_8O_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m, m$,or 2. As irregularly shaped grains, to 0.15 mm.

Physical Properties: *Cleavage:* {001}, and another prismatic, good. Hardness = < 5 D(meas.) = 3.956 D(calc.) = 3.97

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black; deep brown to light yellowish brown in transmitted light with yellow-brown internal reflections. *Streak:* Pale yellow-brown.
Optical Class: Biaxial (+), near uniaxial. *Pleochroism:* Deep brown to pale yellow-brown. n = ∼2.37–2.42 (Li). 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m, Cm$,or $C2$. $a = 12.305(5)$ $b = 3.822(2)$ $c = 6.500(3)$ $\beta = 107.30(3)°$ Z = 4

X-ray Powder Pattern: Michelsberg, Germany.
3.63 (100), 1.911 (90), 3.10 (80), 3.02 (80), 2.731 (80), 2.069 (80), 1.596 (80)

(1) Michelsberg, Germany; by electron microprobe, total Fe as Fe_2O_3; corresponds to $(Na_{1.98}K_{0.01})_{\Sigma=1.99}(Ti_{6.22}Fe_{1.59}Nb_{0.07}Mn_{0.01})_{\Sigma=7.89}O_{16}$. (2) Do.; by electron microprobe, total Fe as Fe_2O_3.

Occurrence: A late-stage mineral in an apatite-bearing alkali syenite.

Association: Hematite, högbomite, diopside, apatite, ilmenite, titanite, biotite, sanidine.

Distribution: Found at Michelsberg, on the Katzenbuckel, Odenwald, Baden-Württemberg, Germany.

Name: For Professor Wilhelm Freudenberg (1881–?), who studied Katzenbuckel rocks.

Type Material: n.d.

Friedelite $\mathbf{Mn_8^{2+}Si_6O_{15}(OH,Cl)_{10}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As pseudohexagonal tablets, may be hemimorphic, to 1 cm; more rarely as slender needles or as fibrous or lamellar aggregates; stalactitic, massive, cryptocrystalline. *Twinning:* Universal, repeated about [110] and $[\bar{1}10]$, composition plane {001}, giving pseudorhombohedral symmetry.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = 4–5 D(meas.) = 3.04–3.06 D(calc.) = 3.066

Optical Properties: Translucent to transparent. *Color:* Pale pink, brownish red, dark red, brown. *Streak:* Pale rose. *Luster:* Vitreous, pearly on basal plane.
Optical Class: Biaxial; sensibly uniaxial (–). ω = 1.654–1.656 ϵ = 1.620–1.625 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/m$. a = 23.33(5) b = 13.396(8) c = 7.447(4) $\beta = 105.08(8)^\circ$ Z = [4]

X-ray Powder Pattern: Franklin, New Jersey, USA; nearly identical with mcgillite. 2.56 (100), 7.17 (90), 3.60 (70), 2.88 (60), 1.676 (60), 2.115 (40), 2.408 (30)

Chemistry:

Total	99.94	99.55	[100.0]

(1–2) Franklin, New Jersey, USA. (3) Sterling Hill, New Jersey, USA; by electron microprobe, H_2O by difference; corresponding to $(Mn^{2+}_{7.01}Fe_{0.49}Mg_{0.36}Zn_{0.13}Ca_{0.02})_{\Sigma=8.01}Si_{5.92}O_{15}[(OH)_{10.15}Cl_{0.84}]_{\Sigma=10.99}$.

Occurrence: In metamorphosed Mn-Fe deposits.

Association: Rhodochrosite, alabandite (Adervielle, France); franklinite, willemite, calcite, rhodochrosite, barite, chlorite, sphalerite (Franklin, New Jersey, USA); calcite, kutnohorite, andradite, hausmannite (Kuruman, South Africa).

Distribution: In France, at Adervielle, Louron Valley, Hautes-Pyrénées, and Costabonne, Pyrénées-Orientales. From the Harstigen mine, near Persberg, Värmland, and in the Sjö mine, near Grythyttan, Örebro, Sweden. In the Ködnitz Valley, Tirol, Austria. At Dshumart and Kamya, Atasui region, Kazakhstan. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, and the Sunnyside mine, Silverton district, San Juan Co., Colorado. From the Wessels and N'Chwaning mines, near Kuruman, Cape Province, South Africa. At Broken Hill, New South Wales, Australia.

Name: For the noted French chemist and mineralogist, Charles Friedel (1832–1899).

Friedrichbeckeite $K(\square_{0.5}Na_{0.5})_2Mg_2Be_3[Si_{12}O_{30}]$

Crystal Data: Hexagonal. *Point Group*: 6/*m* 2/*m* 2/*m*. Crystals, thin tabular, flattened on {0001}, to 0.6 mm, exhibiting forms {0 0 0 1}, {1 0 $\bar{1}$ 0}, {1 1 $\bar{2}$ 0}.

Physical Properties: *Cleavage*: None. *Fracture*: Irregular. *Tenacity*: Brittle. Hardness = 6 D(meas.) = n.d. D(calc.) = 2.686

Optical Properties: Transparent to translucent. *Color*: Colorless to pale yellow. *Streak*: Colorless to pale cream. *Luster*: Vitreous. *Pleochroism:* Distinct; *O* = yellow; *E* = light blue. Anomalous extinction, slight biaxiality and zoning sometimes observed. *Optical Class*: Uniaxial (+). ω = 1.552(2) ε = 1.561(2)

Cell Data: *Space Group*: *P*6/*mcc*. a = 9.970(1) c = 14.130(3) Z = 2

X-ray Powder Pattern: Bellerberg volcano, East Eifel volcanic area, Germany. 3.180 (100), 2.885 (70), 4.993 (30), 4.081 (30), 3.690 (30), 4.321 (25), 3.525 (25)

Chemistry:

	(1)	(2)
Na_2O	2.73	3.19
K_2O	4.16	4.86
BeO	4.67	5.16
CaO	0.04

TiO_2	0.02	
Total	100.33	100.00

(1) Bellerberg volcano, East Eifel volcanic area, Germany; average of 15 electron microprobe analyses, Be determined by laser-ablation ICP-MS, absence of OH and H_2O confirmed by Micro-Raman spectroscopy, corresponding to $K_{0.87}Na_{0.86}(Mg_{1.57}Mn_{0.28}Fe_{0.24})_{\Sigma=2.09}(Be_{1.83}Mg_{1.17})_{\Sigma=3.00}[Si_{12}O_{30}]$. (2) $K(\square_{0.5}Na_{0.5})_2Mg_2Be_3[Si_{12}O_{30}]$.

Mineral Group: Milarite-osumilite group.

Occurrence: In vesicles in pyrometamorphically metasomatized silicate-rich xenoliths in leucite-tephrite volcanic rock.

Association: Tridymite, augite, magnesiohornblende, enstatite, almandine-spessartine garnet, fluorapatite, biotite, braunite, hematite, roedderite.

Distribution: Bellerberg volcano, southeast of Ettringen, East Eifel volcanic area, Germany.

Name: Honors Austrian mineralogist and petrographer Friedrich Johann Karl Becke (1855–1931), best known for developing the Becke-line method for determining indices of refraction.

Type Material: Natural History Museum, Vienna, Austria (catalog no. 2009-IV-a).

References: (1) Lengauer, C.L., N. Hrauda, U. Kolitsch, R. Krickl, and E. Mineral. Petrol., 96, 221–232. (2) (2009) Amer. Mineral., 94, 1497 (abs. ref. 1).

Friedrichite $Pb_5Cu_5Bi_7S_{18}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As isolated columnar crystals, to 1.5 mm, or as granular aggregates.

Physical Properties: Hardness = n.d. VHN = 224 (50 g load). D(meas.) = 6.98 D(calc.) = 7.06

Optical Properties: Opaque. *Color:* In polished section, creamy yellowish white in air, more pinkish in oil. *Luster:* Metallic. *Anisotropism:* Strong in oil, distinct in air.
R_1–R_2: (470) 41.0–46.7, (546) 40.1–46.2, (589) 39.9–45.8, (650) 39.9–45.6

Cell Data: *Space Group:* $Pb2_1m$. $a = 33.84(6)$ $b = 11.65(07)$ $c = 4.010(3)$ $Z = 2$

X-ray Powder Pattern: Salzburg, Austria.
3.644 (100), 3.584 (100), 3.161 (100), 2.850 (80), 4.05 (40), 2.577 (40), 1.979 (40)

Chemistry:

	(1)	(2)	(3)
Pb	29.7	28.0	30.53
Cu	9.1	10.2	9.36
Bi	44.2	44.7	43.10
S	17.2	17.2	17.01
Total	100.2	100.1	100.00

(1) Salzburg, Austria; by electron microprobe, average of six analyses; corresponding to $Pb_{4.81}Cu_{4.80}Bi_{7.10}S_{18.00}$. (2) Do.; by electron microprobe, average of 12 analyses; corresponding to $Pb_{4.54}Cu_{5.39}Bi_{7.17}S_{18.00}$. (3) $Pb_5Cu_5Bi_7S_{18}$.

Occurrence: As aggregates of granular crystals, in boulders of vein quartz which occur in the scree of a landslip (Salzburg, Austria); in magnesian and calcic skarn deposits (Apuseni Mountains, Romania).

Association: Chalcopyrite, covellite, cerussite, chlorite, mica, quartz (Salzburg, Austria); cuprobismutite, cupropavonite (Apuseni Mountains, Romania).

Distribution: Near the emerald beryl deposit in the "Sedl" region, east of the Habachtal, Salzburg, Austria [TL]. In Romania, from the Antoniu, Blidar, and Secundar deposits, Apuseni Mountains, Băiţa (Rézbánya), and in the Baia Borşa area, Baia Mare (Nagybánya). From Les Houches, Haute-Savoie, France. At the Paliopyrgos area, northern Greece. In the USA, from the Fremont mine, Apache Hills, east of Hachita, Grant Co., New Mexico; near Panguitch, Garfield Co., Utah; on the northeast flank of the Johnny Lyon Hills, Cochise Co., Arizona; and at the Silver Bismuth claim, near the Outlaw mine, Round Mountain district, Nye Co., Nevada. In the Julcani district, Peru. From the Shin-Ohtoyo deposit, Harukayama district, Hokkaido, Japan. In the Funiushan copper skarn deposit, near Nanjing, Jiangsu Province, China. At Inkur, Transbaikal, Russia.

Name: To honor Professor Dr.-Ing Otmar Michael Friedrich (1902–1991), Austrian geologist of the Mining University, Leoben, Styria, Austria.

Type Material: Institute of Mineralogy, University of Salzburg, Salzburg, Austria; Joanneum Provincial Museum, Graz, Styria, Austria; Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada; The Natural History Museum, London, England, 1982,574; Harvard University, Cambridge, Massachusetts, 117007; National Museum of Natural History, Washington, D.C., USA, 144072, 144185.

Fritzscheite $Mn^{2+}(UO_2)_2[(PO_4),(VO_4)]_2 \cdot 10H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Tetragonal] (by analogy to the autunite group). *Point Group:* n.d. Rectangular platy crystals, may overgrow or border autunite or torbernite.

Physical Properties: *Cleavage:* Basal, perfect; prismatic, distinct. Hardness = 2.25–3 D(meas.) = 3.504 (may be low). D(calc.) = n.d. Radioactive.

Optical Properties: Translucent to opaque. *Color:* Reddish brown to hyacinth-red. *Streak:* Reddish brown to hyacinth-red. *Luster:* Vitreous to pearly. *Optical Class:* [Uniaxial] (by analogy to the autunite group). ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry: (1) Germany; qualitative chemical tests indicate the mineral to be a manganese uranium phosphate-vanadate hydrate.

Mineral Group: Autunite group.

Occurrence: In a hematite deposit (Nove Hamry, Czech Republic).

Association: Autunite, torbernite.

Distribution: In Germany, from the Georg Wagsfort mine, Johanngeorgenstadt, and at Schneeberg, Saxony. From Nove Hamry, near Nejdek (Neuhammer, near Neudeck), Czech Republic.

Name: To honor Professor Carl Julius Fritzsche (1808–1871), German chemist.

Type Material: Natural History Museum, Vienna, Austria, Aa 5699.

Fe	18.1	18.3	17.94
Te	82.7	82.5	82.06
Total	100.8	100.8	100.00

(1) Robb-Montbray mine, Canada; by electron microprobe. (2) Noranda, Canada; by electron microprobe. (3) $FeTe_2$.

Polymorphism & Series: Forms a series with mattagamite.

Mineral Group: Marcasite group.

Occurrence: In hydrothermal ore deposits, rimming chalcopyrite grains, and as inclusions in gold, petzite, or chalcopyrite.

Association: Chalcopyrite, altaite, gold, melonite, petzite, montbrayite, sylvanite, tellurobismuthite, pyrite, sphalerite, marcasite, chalcocite, covellite.

Distribution: In Canada, from the Robb-Montbray [TL] and Noranda mines, Quebec; and at Lindquist Lake, British Columbia. From Gold Hill, north of San Simon, Cochise Co., Arizona, USA. At Bodennec, Finistère, France. From Faţa Băii (Facebánya) and Săcărîmb (Nagyág), Romania. At Jabal Sayid, Saudi Arabia. In the Kobetsuzawa gold mine, near Sapporo, Hokkaido, Japan. From the North Kalgurli mine, Kalgoorlie, and at Kambalda, Western Australia.

Name: Honors Dr. Max Hans Frohberg (1901–1970), Canadian mining geologist, Toronto, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M31173.

Frolovite $CaB_2(OH)_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As veinlets and dense aggregates of grains, to 0.15 mm.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 VHN = 151–181, 168 average (25 g load). D(meas.) = 2.14–2.22 D(calc.) = 2.259 Violet cathodoluminescence.

Optical Properties: Opaque, translucent through thin edges. *Color:* White, with a grayish tint; colorless in transmitted light. *Luster:* Vitreous to dull.
Optical Class: Biaxial (+). $\alpha = 1.572$ $\beta = 1.573$ $\gamma = 1.586$ 2V(meas.) = ∼75°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.774(2)$ $b = 5.680(1)$ $c = 8.136(2)$ $\alpha = 113.15(1)°$ $\beta = 101.67(2)°$ $\gamma = 107.87(2)°$ Z = 2

X-ray Powder Pattern: Novofrolovskoye deposit, Russia.
6.08 (10), 3.858 (9), 3.471 (8), 2.357 (8), 2.522 (7), 2.330 (7), 2.65 (6)

Chemistry:

	(1)	(2)	(3)
SO_3	1.78		
SiO_2	0.57		
B_2O_3	34.20	34.57	35.20
Fe_2O_3	0.10		
MgO	0.72		
CaO	28.70	27.67	28.36
H_2O^+		35.57	
H_2O^-		2.06	
H_2O	32.96		36.44
Total	99.03	99.87	100.00

(1) Novofrolovskoye deposit, Russia; estimated gypsum 3% impurity. (2) Fuka, Japan; corresponds to $Ca_{1.00}B_{2.01}(OH)_{8.03}$. (3) $CaB_2(OH)_8$.

Occurrence: A rare alteration product of hydrothermal boron minerals in skarn deposits.

Association: Calciborite, calcite, gypsum, garnet, magnetite (Novofrolovskoye deposit, Russia); olshanskyite, parasibirskite, sibirskite, takedaite, pentahydroborite, nifontovite, calcite (Fuka, Japan).

Distribution: In Russia, from the Novofrolovskoye copper deposit, near Krasnoturinsk, Turinsk district, Northern Ural Mountains, and in the Solongo boron deposit, Buryatia. At the Sayak-IV boron deposit, northeast Balkhash region, Kazakhstan. From Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For the first-noted occurrence in the NovoFROLOVskoye deposit, Russia.

Type Material: Institute of Mining-Chemical Stock, Moscow, Russia, 1317a.

Frondelite $(Mn^{2+},Fe^{2+})Fe_4^{3+}(PO_4)_3(OH)_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Rarely as euhedral crystals, showing {100}, {010}, {110}, {101}; typically fibrous, to 8 cm, elongated along [001], radiating, in crusts, botryoidal and drusy masses.

Physical Properties: *Cleavage:* {100}, excellent; {010}, good; {001}, fair. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5 D(meas.) = 3.453 D(calc.) = [3.35]

Optical Properties: Subtranslucent. *Color:* Dark brown, ocher-yellow, red-brown, orange, greenish brown; commonly zoned lengthwise. *Luster:* Vitreous to dull.
Optical Class: Biaxial (–). *Pleochroism:* X = pale yellow-brown; $Y = Z$ = orange-brown. *Orientation:* $X = c$. *Dispersion:* $r > v$. *Absorption:* $Z > Y > X$. $\alpha = 1.860$ $\beta = 1.880$ $\gamma = 1.893$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* $B22_12$. $a = 13.810(1)$ $b = 17.968(3)$ $c = 5.182(1)$ Z = 4

X-ray Powder Pattern: Sapucaia mine, Brazil. (ICDD 35-625).
3.191 (100), 3.381 (85), 3.615 (40), 3.445 (25), 3.046 (20), 1.5953 (19), 6.91 (17)

Chemistry:

insol.	0.32	
Total	100.09	100.00

(1) Sapucaia mine, Brazil; corresponds to $(Mn^{2+}_{0.70}Na_{0.20}Mg_{0.03}K_{0.02})_{\Sigma=0.95}(Fe^{3+}_{3.94}Mn^{3+}_{0.16}Al_{0.16})_{\Sigma=4.26}(PO_4)_{2.84}(OH)_{5.38}$. (2) $(Mn^{2+},Fe^{2+})Fe_4^{3+}(PO_4)_3(OH)_5$ with Mn^{2+}:Fe^{2+} = 1:1.

Polymorphism & Series: Forms a series with rockbridgeite.

Occurrence: An alteration product of primary phosphates in complex granite pegmatites.

Association: Triphylite, vivianite, heterosite–purpurite, cyrilovite, phosphosiderite, leucophosphite (Sapucaia mine, Brazil).

Distribution: From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. At the Fletcher mine, near North Groton, Grafton Co., New Hampshire, and in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., USA. From Hagendorf, Bavaria, Germany. At the Buranga pegmatite, near Gatumba, Rwanda. From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: To honor Dr. Clifford Frondel (1907–2002), American mineralogist, Professor of Mineralogy, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 100808; National Museum of Natural History, Washington, D.C., USA, 105946.

Froodite $PdBi_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As flat cleavage fragments, to 4 mm, and rounded grains. *Twinning:* May be present.

Physical Properties: *Cleavage:* Perfect on {100}, less perfect on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5 VHN = 84 (25 g load). D(meas.) = 12.5–12.6, 11.5 (synthetic). D(calc.) = [11.42]

Optical Properties: Opaque. *Color:* Gray; creamy white in reflected light. *Streak:* Black. *Luster:* Metallic, splendent, tarnishes quickly. *Anisotropism:* Evident, in pale and dark grays. R_1–R_2: (400) — , (420) 50.7–52.9, (440) 51.9–54.3, (460) 53.1–55.5, (480) 54.3–56.4, (500) 55.2–57.2, (520) 55.7–57.8, (540) 56.1–58.4, (560) 56.5–59.0, (580) 56.9–59.6, (600) 57.4–60.2, (620) 57.7–60.7, (640) 58.0–61.1, (660) 58.5–61.4, (680) 58.8–62.0, (700) 59.3–63.0

Cell Data: *Space Group:* $C2/m$. $a = 12.74$ $b = 4.29$ $c = 5.71$ $\beta = 102°27'$ $Z = [4]$

X-ray Powder Pattern: Frood mine, Canada.
2.77 (100), 1.556 (80), 2.97 (70), 2.48 (70), 2.21 (70), 1.637 (60), 1.419 (60)

Chemistry:

	(1)	(2)	(3)
Pd	20.3	19.3	20.29
Bi	79.7	81.5	79.71
Te		0.39	
Total	100.0	101.19	100.00

(1) Frood mine, Canada; by electron microprobe, corresponding to $Pd_{1.00}Bi_{2.00}$. (2) Oktyabr mine, Russia; by electron microprobe, corresponding to $Pd_{0.95}(Bi_{2.03}Te_{0.02})_{\Sigma=2.05}$. (3) $PdBi_2$.

Occurrence: In mill concentrates of As–Pb–Cu-rich ores (Frood mine, Canada); in Pd–Pt-bearing layered or pipelike ultramafic intrusives.

Association: Chalcopyrite, cubanite, pyrite, pentlandite, altaite, hessite, galena, bismuth, pyrrhotite, tsumoite, parkerite, sudburyite, michenerite, sperrylite, insizwaite, niggliite, cabriite, mooihoekite.

Distribution: In Canada, from Sudbury, in the Frood [TL], Creighton, Coleman, and Strathcona mines, Ontario; and at the Pipe mine, Manitoba. In the USA, from Fox Gulch, Goodnews Bay, Alaska, and in the Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota. In Russia, at the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia; from the Karik'yavr Cu–Ni deposit, Kola Peninsula; and in the Kingash massif, eastern Sayan. From the Koillismaa complex, northeast Finland. In the Merensky Reef, Bushveld complex, Transvaal, South Africa. In Australia, at Mulga Springs, northeast of Broken Hill, New South Wales.

Name: For the Frood mine in Canada, from where it was first noted.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada, M29438; Harvard University, Cambridge, Massachusetts, USA, 108371.

Fuenzalidaite $K_6(Na,K)_{10}Mg_{10}(SO_4)_{12}(IO_3)_{12}\cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\ 2/m$. As thin pseudorhombohedral platy {0001} crystals with hexagonal outline, modified by $\{10\bar{1}2\}$, to < 200 μm; as blebs and flattened micaceous aggregates.

Physical Properties: *Cleavage:* On $\{11\bar{2}0\}$, likely, visible on SEM images. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = n.d. D(calc.) = 3.284 Slowly soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless to bright yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.622(5)$ $\epsilon = 1.615(5)$

Cell Data: *Space Group:* $P\bar{3}c1$. $a = 9.4643(4)$ $c = 27.336(6)$ $Z = 1$

X-ray Powder Pattern: Near Oficina Santa Luisa, Chile.
3.927 (100), 13.67 (50), 3.023 (41), 7.05 (40), 2.681 (33), 3.515 (24), 2.327 (21)

Chemistry:

	(1)
SO_3	20.9
SeO_3	0.1
CrO_3	0.2
I_2O_5	49.3
MgO	10.0
Na_2O	5.2
K_2O	5.9
H_2O	n.d.
Total	91.6

(1) Near Oficina Santa Luisa, Chile; by electron microprobe, amounts thought low due to decay in electron beam, H_2O confirmed by crystal-structure analysis; corresponds to $K_{5.7}Na_{7.6}Mg_{11.3}[(SO_4)_{11.9}(CrO_4)_{0.1}]_{\Sigma=12.0}(IO_3)_{13.4}\cdot 12H_2O$.

Polymorphism & Series: Forms a series with carlosruizite.

Occurrence: A rare constituent of nitrate ores.

Association: Nitratine, halite, probertite, darapskite.

Distribution: From one km south of Oficina Santa Luisa, Antofagasta, Chile.

Name: Honors Humberto Fuenzalida P. (1904–1966), first Director of the Chilean School of Geology, University of Chile, Santiago, Chile.

Type Material: n.d.

References: (1) Konnert, J.A., H.T. Evans, Jr., J.J. McGee, and G.E. Ericksen (1994) Mineralogical studies of the nitrate deposits of Chile: VII. Two new saline minerals with the composition $K_6(Na,K)_4Na_6Mg_{10}(XO_4)_{12}(IO_3)_{12}\cdot 12H_2O$: fuenzalidaite (X = S) and carlosruizite (X = Se). Amer. Mineral., 79, 1003–1008.

Na_2O	0.17	0.05	Total	99.66	[99.48]

(1) Fuka, Japan; corresponding to $(Ca_{3.97}Na_{0.02}Mg_{0.01}Fe_{0.01})_{\Sigma=4.01}(Si_{1.98}Al_{0.04})_{\Sigma=2.02}O_{6.03}(CO_3)_{0.96}[(OH)_{2.02}F_{0.07}]_{\Sigma=2.09}$. (2) Mihara, Japan; original total given as 99.38%, corresponding to $(Ca_{4.03}Fe_{0.01}Na_{0.01})_{\Sigma=4.05}(Si_{1.99}Al_{0.02})_{\Sigma=2.01}O_{6.08}(CO_3)_{0.96}[(OH)_{1.95}F_{0.09}]_{\Sigma=2.04}$.

Occurrence: A retrograde mineral and alteration product in skarns formed from metasomatism of limestone.

Association: Cuspidine, xonotlite, calcite, spurrite, hillebrandite, scawtite, foshagite, wollastonite, fluorite, gehlenite, perovskite, grossular, hydrogrossular, vesuvianite, monticellite.

Distribution: In Japan, at Fuka, near Bicchu, and Mihara, Okayama Prefecture, and at Kushiro, Hiroshima Prefecture.

Name: For the locality where it was first discovered, Fuka, Japan.

Type Material: Department of Earth Sciences, Okayama University, Okayama, ONM-02; National Science Museum, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 136583.

Fukuchilite $(Cu, Fe)S_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $[2/m\ \overline{3}]$. In a uniform, nearly eutecticlike intergrowth with pyrite and covellite, with grains < 1 μm.

Physical Properties: Hardness = ∼4. VHN = n.d. D(meas.) = 4.86 D(calc.) = 4.90

Optical Properties: Opaque. *Color:* Dark brownish gray; in polished section, pinkish brown, very similar to bornite. *Luster:* Submetallic.
R: n.d.

Cell Data: *Space Group:* $Pa3$ (by analogy to other pyrite group members). $a = 5.58$ $Z = 4$

X-ray Powder Pattern: Hanawa mine, Japan.
2.789 (vs), 3.21 (s), 1.685 (s), 2.281 (m), 2.497 (w), 1.971 (w), 1.545 (w)

Chemistry:

	(1)	(2)
Cu	37.9 – 40.6	37.90
Fe	10.5 – 12.9	11.10
S	49.2 – 53.3	51.00
Total		100.00

(1) Hanawa mine, Japan; by X-ray fluorescence, range of analyses. (2) $(Cu, Fe)S_2$ with Cu:Fe = 3:1.

Mineral Group: Pyrite group.

Occurrence: In an ore body of gypsum–anhydrite, in interstices of small masses consisting of barite, covellite, and pyrite.

Association: Pyrite, covellite, barite, gypsum.

Distribution: From the Hanawa mine, Akita Prefecture, Japan.

Name: Honors Nobuyo Fukuchi (1877–1934), Japanese mineralogist and geologist, who studied many Japanese Kuroko-type deposits.

Type Material: National Science Museum, Tokyo, Japan, M15937; National Museum of Natural History, Washington, D.C., USA, 135971.

References: (1) Kajiwara, Y. (1969) Fukuchilite, Cu_3FeS_8, a new mineral from the Hanawa mine, Akita Prefecture, Japan. Mineral. J. (Japan), 5, 399–416. (2) (1970) Amer. Fülöppite $Pb_3Sb_8S_{15}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals short prismatic [201], to 3 mm, and pyramidal; striated on {100} ∥ [$0\bar{1}0$] and on {$\bar{1}12$} ∥ [110]; curved crystals common.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5
VHN = 140–157 (100 g load). D(meas.) = 5.22 D(calc.) = 5.19

Optical Properties: Opaque. *Color:* Lead-gray; may tarnish steel-blue or bronzy white in polished section. *Streak:* Reddish gray. *Luster:* Metallic. *Anisotropism:* May be weak in bluish gray, moderate in blue-green to red-brown.
R_1–R_2: (400) 37.8–45.9, (420) 37.6–45.7, (440) 37.3–45.2, (460) 37.1–44.6, (480) 37.0–44.0, (500) 36.7–43.4, (520) 36.3–42.6, (540) 36.1–42.0, (560) 35.9–41.3, (580) 35.4–40.5, (600) 34.6–39.3, (620) 33.6–38.1, (640) 32.5–36.9, (660) 31.6–35.9, (680) 30.8–35.1, 700) 30.1–34.4

Cell Data: *Space Group:* $C2/c$. $a = 13.441$ $b = 11.726$ $c = 16.930$ $\beta = 94.71(8)°$
Z = 4

X-ray Powder Pattern: Baia Mare, Romania.
3.89 (100), 3.20 (90), 2.919 (80), 2.822 (80), 3.23 (70), 2.749 (70), 6.25 (50)

Chemistry:

	(1)	(2)	(3)
Pb	28.29	30.6	29.93
Sb	47.50	47.0	46.91
S	24.10	23.1	23.16
rem.	0.19		
Total	100.08	100.7	100.00

(1) Baia Mare, Romania; remainder is SiO_2, corresponds to $Pb_{2.95}Sb_{7.90}S_{15.00}$. (2) Skalnoye deposit, Kazakhstan; [??by electron microprobe??,] corresponds to $Pb_{3.01}Sb_{8.02}S_{15.00}$.
(3) $Pb_3Sb_8S_{15}$.

Occurrence: Of hydrothermal origin.

Association: Zinkenite, semseyite, fizélyite, andorite, freieslebenite, geocronite, boulangerite, jamesonite, cinnabar, sphalerite, marcasite, quartz, dolomite.

Distribution: In Romania, in the Baia Mare (Nagybánya) district, from the Dealul Crucii (Kereszthegy) [TL] and Herja mines. At Wet Swine Gill, Caldbeck Fells, Cumbria, England. In France, from Auliac, Cantal; Bodennec and Bournac, Montagne Noire, [Hérault??not=??so double check both Bodennec and Bournac localities??] Finistère. From the North Altyntopkan Pb–Zn skarn deposit, northwestern Karamazar, Tajikistan. At the Skalnoye Hg–Sb deposit, central Kazakhstan. In the Lake George antimony deposit, 40 km west of Fredricton, New Brunswick, Canada.

Name: For Dr. Béla Fülöpp (1863–1938), mineral collector of Hungary.

Type Material: The Natural History Museum, London, England, 1929,248.

Furongite $Al_2(UO_2)(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As tabular crystals, to 0.5 mm, in rosettes, and dense cryptocrystalline aggregates.

Physical Properties: *Cleavage:* On $\{\overline{1}11\}$ and $\{1\overline{1}1\}$, very perfect. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.82–3.0 D(calc.) = 2.92 Radioactive; strong pale yellowish green fluorescence under UV.

Optical Properties: Translucent. *Color:* Bright to pale yellow, lemon-yellow; pale yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Observed, in yellows. *Orientation:* $Z \wedge \{\overline{1}11\} \simeq 38°$.
$\alpha = 1.538–1.549$ $\beta = 1.558–1.567$ $\gamma = 1.566–1.575$ 2V(meas.) = 65°–80° 2V(calc.) = 64°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 19.227–19.271$ $b = 14.094–14.173$
$c = 12.102–12.136$ $\alpha = 67.21°–67.62°$ $\beta = 115.45°–115.64°$ $\gamma = 94.51°–94.58°$ Z = 4

X-ray Powder Pattern: Hunan Province, China.

(1) Hunan Province, China. (2) Kobokobo pegmatite, Congo; by electron microprobe, H_2O by TGA. (3) $Al_2(UO_2)(PO_4)_2(OH)_2 \cdot 8H_2O$.

Occurrence: In the oxidation zone of a uranium deposit (Hunan Province, China); in a complex granite pegmatite (Kobokobo pegmatite, Congo).

Association: Variscite, evansite, autunite, halloysite, "opal", "limonite" (Hunan Province, China); moreauite (Kobokobo pegmatite, Congo).

Distribution: From an undefined locality in western Hunan Province, China. At the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: From a poetic name for Hunan Province, China.

Type Material: n.d.

Furutobeite $(Cu, Ag)_6PbS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* m, 2, or $2/m$. Granular, to 300 μm).

Physical Properties: Hardness = n.d. VHN = 100–108 (25 g load). D(meas.) = n.d. D(calc.) = 6.74

Optical Properties: Opaque. *Color:* Gray, with a creamy yellow tint in reflected light. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Moderate, from pale yellow to dark brown. R_1–R_2: (400) 35.7–34.2, (420) 35.2–34.3, (440) 35.0–34.5, (460) 34.7–34.9, (480) 34.5–35.3, (500) 34.4–35.6, (520) 34.4–35.9, (540) 34.6–36.2, (560) 34.7–36.3, (580) 34.8–36.4, (600) 34.9–36.4, (620) 34.9–36.3, (640) 34.9–36.3, (660) 34.8–36.2, (680) 34.5–36.1, (700) 34.3–36.0

Cell Data: *Space Group:* Cm, $C2$, or $C2/m$. a = 20.025(13) b = 3.963(2) c = 9.705(4) $\beta = 101.57(4)°$ Z = 4

X-ray Powder Pattern: Furutobe mine, Japan.
2.50 (100), 2.95 (90), 2.55 (70), 3.43 (50), 2.61 (50), 2.14 (40), 2.09 (40)

Chemistry:

	(1)	(2)	(3)
Cu	40.4	42.4	41.75
Ag	15.7	13.9	14.17
Pb	26.6	27.6	27.23
S	16.8	16.0	16.85
Total	99.5	99.9	100.00

(1) Furutobe mine, Japan; by electron microprobe, average of seven analyses; corresponds to $(Cu_{4.85}Ag_{1.11})_{\Sigma=5.96}Pb_{0.98}S_{4.00}$. (2) Tsumeb, Namibia; by electron microprobe, corresponds to $(Cu_{5.35}Ag_{1.03})_{\Sigma=6.38}Pb_{1.07}S_{4.00}$. (3) $(Cu, Ag)_6PbS_4$ with Cu:Ag = 5:1.

Occurrence: In veinlets of stromeyerite that cut bornite in the Kuroko zone of a stratabound, Kuroko-type, massive sulfide deposit (Furutobe mine, Japan).

Association: Stromeyerite, bornite, galena, sphalerite, tennantite, digenite, argentian gold.

Distribution: In Japan, in Akita Prefecture, in the Daikokuzawa-Higashi deposit of the Furutobe mine [TL], and the No. 11 deposit of the Shakanai mine, near Ohdate City. At Tsumeb, Namibia. In the Erasmus mine, Leogang, Salzburg, Austria.

Name: For the type locality at the Furutobe mine, Japan.

Type Material: Institute of Mineralogy, Petrology and Economic Geology, Faculty of Science, Tohoku University, Sendai, Japan.

FeO	18.47	17.15
PbO	50.09	53.27
H_2O	1.21	2.15
Total	98.31	100.00

(1) Långban, Sweden; corresponds to $(Pb_{0.90}Fe_{0.07})_{\Sigma=0.97}Fe_{0.97}(AsO_4)(OH)_{0.55}O_{0.12}$.
(2) $PbFe(AsO_4)(OH)$.

Mineral Group: Adelite group.

Occurrence: In a metamorphosed Fe–Mn orebody.

Association: Roméite, nadorite, finnemanite, calcite, barite.

Distribution: From Långban, Värmland, Sweden.

Name: To honor Dr. Olof Erik Gabrielson (1912–), mineralogist, Swedish Museum of Natural History, Stockholm, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, NRMS 254857; National Museum of Natural History, Washington, D.C., USA, 120063, 162613.

Gadolinite-(Ce) $(Ce, La, Nd, Y)_2Fe^{2+}Be_2Si_2O_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Metamict; monoclinic after recrystallization. *Point Group:* $2/m$. As irregular highly-fractured masses, to 2 cm.

Physical Properties: *Fracture:* Conchoidal. Hardness = [6.5–7] (by analogy to the gadolinite group). D(meas.) = 4.20 D(calc.) = 4.90

Optical Properties: Translucent. *Color:* Black; in thin section, olive-green.
Luster: Vitreous.
Optical Class: Isotropic. $n = 1.78$

Cell Data: *Space Group:* $P2/c$ after recrystallization by heating at 700 °C. $a = 4.82(2)$ $b = 7.58(2)$ $c = 10.01(3)$ $\beta = 90°28(16)'$ Z = [2]

X-ray Powder Pattern: Buer, Norway; hydrothermally recrystallized at 700 °C and 2 kb for 48 hours. (ICDD 29-1409).
2.88 (100), 4.81 (90), 2.60 (80), 2.59 (80), 3.18 (70), 3.00 (70), 3.59 (60)

Chemistry:

	(1)		(1)
SiO_2	23.17	FeO	10.03
TiO_2	0.14	MnO	1.33

Ce_2O_3	21.25	K_2O	0.53
RE_2O_3	12.05	Total	[101.81]

(1) Buer, Norway; by a combination of wet chemical analysis, electron microprobe, and emission spectroscopy; $RE_2O_3 = Pr_2O_3$ 2.95%, Nd_2O_3 4.36%, Sm_2O_3 0.39%, Eu_2O_3 0.07%, Gd_2O_3 0.92%, Tb_2O_3 0.29%, Dy_2O_3 1.01%, Ho_2O_3 0.39%, Er_2O_3 0.76%, Tm_2O_3 0.13%, Yb_2O_3 0.65%, Lu_2O_3 0.13%; corresponds to $(Ce_{0.68}La_{0.45}Y_{0.32}RE_{0.71})_{\Sigma=2.16}(Fe^{2+}_{0.74}Mn_{0.10}Mg_{0.04}Ti_{0.01})_{\Sigma=0.89}(Be_{1.86}B_{0.08}Al_{0.01})_{\Sigma=1.95}Si_{2.04}O_{10}$.

Mineral Group: Gadolinite group.

Occurrence: In syenite pegmatite veins along a contact between basalt and monzonite.

Association: Aegirine, pyrochlore, zircon, apatite, titanite, pyrophanite, magnetite, loparite, chevkinite, biotite, microcline, helvite, molybdenite, albite, apophyllite, quartz, calcite.

Distribution: From a dump at Buer, nine km southeast of Skien, Bjørkedalen region, and in the Bakken quarry, Tvedalen, Norway.

Name: For its *cerium* content and relation to *gadolinite*-(Y).

Type Material: n.d.

References: (1) Segalstad, T.V. and A.O. Larsen (1978) Gadolinite-(Ce) from Skien, southwestern Oslo region, Norway. Amer. Mineral., 63, 188–195.

Gadolinite-(Y) $Y_2Fe^{2+}Be_2Si_2O_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic; commonly metamict. *Point Group:* $2/m$. Crystals rough; typically prismatic, terminated by {001}, {111}, {221}, and many other forms, to 25 cm; commonly massive.

Physical Properties: *Fracture:* Conchoidal or splintery. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 4.36–4.77 non-metamict. D(calc.) = 4.41

Optical Properties: Opaque, nearly transparent in thin fragments. *Color:* Black, greenish black, brown; grass-green to olive-green in thin fragments. *Streak:* Greenish gray. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (+); isotropic when metamict. *Orientation:* $Z \wedge c = 10°$.
Dispersion: $r < v$, strong. $\alpha = 1.77–1.78$ $\beta =$ n.d. $\gamma = 1.78–1.82$ 2V(meas.) = 85°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.000(2)$ $b = 7.565(2)$ $c = 4.768(1)$ $\beta = 90.31(2)°$ Z = 2

X-ray Powder Pattern: Synthetic.
2.818 (100), 2.816 (100), 4.735 (80), 2.932 (70), 2.558 (60), 2.539 (55), 3.118 (50)

(1) Ytterby, Sweden. (2) Douglas Co., Colorado, USA. (3) Near Yokkaichi, Mie Prefecture, Japan; by electron microprobe, $RE_2O_3 = Pr_2O_3$ [1.2%], Nd_2O_3 4.55%, Sm_2O_3 2.82%, Eu_2O_3 [0.6%], Gd_2O_3 2.93%, Tb_2O_3 [1.1%], Dy_2O_3 4.06%, Ho_2O_3 1.98%, Er_2O_3 1.54%, Tm_2O_3 [0.2%], Yb_2O_3 0.58%, Lu_2O_3 trace, BeO and H_2O from stoichiometry; corresponding to $(Y_{1.30}RE_{0.70})_{\Sigma=2.00}Fe^{2+}_{0.86}Be_{2.00}Si_{2.00}[O_{9.72}(OH)_{0.28}]_{\Sigma=10.00}$.

Mineral Group: Gadolinite group.

Occurrence: In granite and alkalic granite pegmatites.

Association: Allanite, fluorite, fergusonite, yttrialite, chevkinite, zircon.

Distribution: Numerous localities worldwide: in Sweden, from Ytterby, on Resarö Island, near Waxholm, and at Kolsva, Västmanland. On Hitterö Island, Flekkefjord; at Slobrekka and Dauren, Iveland; and elsewhere in Norway. From Piz Blas, Val Nalps, also Piz Rondadura and Pizza Rotondo, Val Bedretto, Ticino, Switzerland. In Austria, at Böckstein, near Badgastein, Salzburg. In the USA, in the Clear Creek pegmatite, Burnet Co., and the Baringer Hill pegmatite, 26 km west of Burnet, and at Rode Ranch, near Bluffton, Llano Co., Texas; in Arizona, near Hackberry, Mohave Co.; on Devil's Head Mountain, Douglas Co., and near Lake George, Park Co., Colorado. In Canada, from Loughborough Township, Frontenac Co., Ontario.

Name: For the Finnish chemist, Johan Gadolin (1760–1852), who discovered yttrium.

Gagarinite-(Y) $NaCaY(F,Cl)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. As long- and short-prismatic hexagonal crystals, showing the forms $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, $\{0001\}$, and less well-developed rhombohedral faces, to several cm. Commonly as irregular grains and granular aggregates.

Physical Properties: *Cleavage:* One direction, prismatic, distinct. *Tenacity:* Brittle. Hardness = 4.5 VHN = 367–372 D(meas.) = 4.11–4.29 D(calc.) = [4.27] Decomposed by H_2O, most Na going into solution; weakly magnetic.

Optical Properties: Transparent to translucent. *Color:* Pinkish or rosy, yellow, yellowish white or creamy, colorless; in transmitted light, colorless. *Streak:* White. *Luster:* Vitreous to dull.
Optical Class: Uniaxial (+); may be anomalously biaxial. $\omega = 1.472$–1.475 $\epsilon = 1.490$–1.493 2V(meas.) = $\leq 20°$

Cell Data: *Space Group:* $P6_3/m$. $a = 5.987(2)$ $c = 3.5413(7)$ $Z = 1$

X-ray Powder Pattern: Verkhne-Espe massif, Kazakhstan.
1.717 (10b), 2.086 (9), 3.00 (5), 2.92 (5), 5.24 (3), 1.129 (3), 2.28 (2)

(3) Katugino massif, Kazakhstan; analysis not given, stated to correspond to $Na_{0.6}(Ca_{0.95}Y_{0.72}Dy_{0.10}Gd_{0.09}Er_{0.04}Ho_{0.03}Sm_{0.03}Yb_{0.01}Nd_{0.01}Tb_{0.01}Ce_{0.01})_{\Sigma=2.00}F_{5.41}$.

Occurrence: As disseminations, segregations, and in veins and miarolitic cavities within Na-metasomatized alkalic granites and quartz-syenites.

Association: Riebeckite, pyrochlore, zircon, bastnäsite, tengerite, synchysite, yttrofluorite, elpidite (Verkhne-Espe massif, Kazakhstan); riebeckite, aegirine, zircon, fergusonite, polylithionite, siderite, sphalerite, fluorite (Erzin massif, Russia).

Distribution: From the Bol'shoi and Malyi stocks, Verkhne-Espe alkaline massif, Tarbagatai Range, and the Katugino massif, Irkutsk region, Kazakhstan. In Russia, found in the Erzin alkaline massif, southeastern Tuva, and other undefined localities in eastern Siberia. Occurs in the vicinity of Lake Gjerdingen, Nordmarka, Norway. In the USA, found at Washington Pass, Okanogan Co., Washington.

Name: In honor of the first cosmonaut, Yuri Alekseevich Gagarin (1934–1968).

Type Material: Vernadsky Geological Museum, Moscow, 47307; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 62341–62343.

Gageite $(Mn^{2+}, Mg, Zn)_{42}Si_{16}O_{54}(OH)_{40}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudotetragonal, or triclinic. *Point Group:* $2/m$ or $\overline{1}$. Minute laths or saddlelike crystals grouped radially, in bundles, or as matted fibers.

Physical Properties: *Cleavage:* {110}, pronounced. Hardness = 3 D(meas.) = 3.46–3.584 D(calc.) = 3.599

Optical Properties: Transparent to translucent. *Color:* Colorless, pale pink, pale brown. *Luster:* Highly vitreous.
Optical Class: Biaxial (–). *Orientation:* $Z \parallel$ fiber length. *Dispersion:* $r < v$, extreme.
$\alpha = 1.723(3)$ $\beta = 1.734(3)$ $\gamma = 1.736(3)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2/n$. $a = 19.42$ $b = 19.42$ $c = 9.84$ $\beta = 89.5°$ Z = [1], or *Space Group:* $P\overline{1}$. $a = 14.17$ $b = 14.07$ $c = 9.84$ $\alpha = 76.5°$ $\beta = 76.6°$ $\gamma = 86.9°$ Z = [1]

X-ray Powder Pattern: Franklin, New Jersey, USA.
6.87 (100), 2.758 (80), 2.707 (80), 3.44 (60), 3.25 (60), 2.556 (60), 1.6742 (60)

Chemistry:

	(1)	(2)	(3)

(1) Franklin, New Jersey, USA; H_2O by difference. (2) Do. (3) Do.; by electron microprobe, average of seven analyses, H_2O by difference; corresponds to $(Mn_{28.95}Mg_{11.32}Zn_{2.13}Ca_{0.14}Fe_{0.11})_{\Sigma=42.65}Si_{16}O_{54.53}(OH)_{40.23}$.

Polymorphism & Series: 2M, 1A polytypes.

Occurrence: A late-stage low- to medium-temperature mineral, implanted on other species in fissures and solution cavities, in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Zincite, willemite, pyrochroite, leucophoenicite, calcite, chlorophoenicite (Franklin, New Jersey, USA); leucophoenicite, hausmannite, rhodochrosite, manganoan calcite (near Kuruman, South Africa).

Distribution: In the USA, at Franklin, Sussex Co., New Jersey, and in the Pennsylvania mine, San Antonio Valley, Santa Clara Co., California. In the Wessels and N'Chwaning II mines, near Kuruman, Cape Province, South Africa.

Name: For Robert B. Gage, of Trenton, New Jersey, USA, who analyzed the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, R6444, 86845.

Gahnite $ZnAl_2O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. Typically octahedra, rarely as dodecahedra, may be modified by {100} or {011}, to 12 cm; also as exsolution lamellae in other minerals; granular, massive. *Twinning:* On {111} as both twin and composition plane, common.

Physical Properties: *Cleavage:* Parting {111}, indistinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 7.5–8 D(meas.) = 4.38–4.60 D(calc.) = 4.607

Optical Properties: Translucent to nearly opaque. *Color:* Dark green, bluish green, blue to indigo, yellow to brown; in transmitted light, pale green; in reflected light, bluish green to green internal reflections. *Streak:* Gray. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 1.79$–1.80

Cell Data: *Space Group:* $Fd3m$(synthetic). a = 8.0872(1) Z = 8

X-ray Powder Pattern: Synthetic.

(1) Desolation Row pluton, Victoria Range, New Zealand; by electron microprobe, total Fe as FeO; corresponding to $(Zn_{0.75}Fe_{0.19}Mg_{0.03}Mn_{0.02})_{\Sigma=0.99}(Al_{2.01}Si_{0.01})_{\Sigma=2.02}O_4$. (2) Geco mine, Canada; by electron microprobe, average of six points, total Fe as FeO; corresponding to $(Zn_{0.41}Mg_{0.30}Fe_{0.28}Mn_{0.01})_{\Sigma=1.00}Al_{1.99}O_{32}$. (3) $ZnAl_2O_4$.

Polymorphism & Series: Forms two series, with spinel, and with hercynite.

Mineral Group: Spinel group.

Occurrence: An accessory mineral in granites and granite pegmatites; in medium- to high-grade metamorphic rocks and metamorphosed base-metal sulfide deposits; in diasporites, formed by the low-grade metamorphism of bauxites; a detrital mineral in placers.

Association: Rhodonite, franklinite, calcite, andradite, willemite (Franklin, New Jersey, USA); corundum, pyrrhotite, högbomite, nigerite, phlogopite, staurolite, cordierite, pyrite, chalcopyrite (Geco mine, Canada).

Distribution: Many localities, but most with small crystals. Abundant at Falun, Sweden. From the Silberberg mine, near Bodenmais, Bavaria, Germany. At Tiriolo, near Catanzaro, Calabria, Italy. In the USA, large crystals from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at the Mineral Hill and Patapsco mines, Carroll Co., Maryland; in the Deake and Chalk Mountain mines, Mitchell Co., North Carolina; in the Cotopaxi mine, Fremont Co., Colorado. In Canada, found at the Geco mine, Manitouwadge, Ontario; in Hudson township, Quebec; and elsewhere. In Brazil, from the Alto do Giz pegmatite, near Parelhas, Rio Grande do Norte. At Ambatofotsikely, Madagascar. From Otjiwarango, Namibia. At Jemaa, Nigeria. From Broken Hill, New South Wales; at Wodgina and Greenbushes, Western Australia. In New Zealand, occurs in the Victoria Range, Nelson.

Name: For the Swedish chemist and mineralogist, Johan Gottlieb Gahn (1745–1818), who discovered the mineral.

Gaidonnayite $Na_2ZrSi_3O_9 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals well-formed, slightly bladed, flattened on {010}, and elongated and heavily striated along [100], to 6 mm. *Twinning:* Common about [012] with irregular composition plane.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = 2.67(1) D(calc.) = 2.70 Commonly fluoresces bright green fluorescence under SW and LW UV.

Optical Properties: Transparent to opaque. *Color:* Colorless, white, beige, light brown, pale yellowish green. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = b$; $Z = c$. α = 1.573–1.575 β = 1.590–1.592 γ = 1.599–1.605 2V(meas.) = 53°–59° 2V(calc.) = 55°–62°

Cell Data: *Space Group:* $P2_1nb$. $a = 11.740(3)$ $b = 12.820(3)$ $c = 6.691(1)$ Z = 4

X-ray Powder Pattern: Mont Saint-Hilaire, Canada; very similar to georgechaoite.
3.124 (100), 5.93 (80), 5.84 (80), 3.094 (80), 5.63 (50), 2.931 (40), 1.637 (40)

(1) Mont Saint-Hilaire, Canada, by electron microprobe, H_2O by TGA; corresponding to $(Na_{1.72}K_{0.19})_{\Sigma=1.91}Zr_{1.00}Nb_{0.09}Ti_{0.02}Si_{2.88}O_9 \cdot 2.10H_2O$. (2) Narssârssuk, Greenland; by electron microprobe, H_2O by difference; corresponding to $(Na_{1.19}K_{0.58}Ca_{0.05})_{\Sigma=1.82}Zr_{0.95}Nb_{0.04}Ti_{0.03}Si_{3.00}O_9 \cdot nH_2O$.

Polymorphism & Series: Dimorphous with catapleiite.

Occurrence: In miarolitic cavities in nepheline syenite and altered pegmatite dikes in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada); in augite syenite (Narssârssuk, Greenland).

Association: Siderite, analcime, hilairite, aegirine, calcite, albite, catapleiite, zircon, pyrochlore, ancylite, burbankite (Mont Saint-Hilaire, Canada); vlasovite, gittinsite, apophyllite (Kipawa River, Canada); natrolite, aegirine, albite, siderite (Narssârssuk, Greenland).

Distribution: In Canada, from Mont Saint-Hilaire, near Saint-Amable, and in the Sheffield Lake complex, Kipawa River, Villedieu Township, Quebec. From Granite Mountain, near Little Rock, Pulaski Co., Arkansas, USA. In Greenland, at Narssârssuk. From the Lovozero and Khibiny massifs, Kola Peninsula, Russia. At Poços de Caldas, Minas Gerais, Brazil.

Name: For Professor Gabrielle Donnay (1920–1987), mineralogist of McGill University, Montreal, Quebec, Canada.

Type Material: Canadian Museum of Nature, Ottawa, T73/2-1, T73/2-2; Royal Ontario Museum, Toronto, Canada, 34803.

(1) Tsumeb, Namibia; by electron microprobe, H_2O by DTA-TGA; corresponds to $Ca_{1.98}(Zn_{0.86}Mg_{0.14}Fe_{0.01}Mn_{0.01})_{\Sigma=1.02}(AsO_4)_2•2H_2O$. (2) $Ca_2Zn(AsO_4)_2•2H_2O$.

Polymorphism & Series: Dimorphous with zincroselite; forms a series with talmessite.

Mineral Group: Fairfieldite group.

Occurrence: A very rare mineral from a deep oxidized zone in a dolostone-hosted, hydrothermal, polymetallic ore deposit.

Association: Talmessite, prosperite, adamite, conichalcite, austinite, barite, quartz, chalcocite.

Distribution: From Tsumeb, Namibia.

Name: In honor of Dr. Robert Irwin Gait (1938–), South African-Canadian Curator of Mineralogy, Royal Ontario Museum, Toronto, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M35388; National Museum of Natural History, Washington, D.C., USA, 144799.

(1) Bald Knob, North Carolina, USA; total Fe as FeO. (2) Do.; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(Mn^{2+}_{0.95}Mg_{0.04}Zn_{0.01})_{\Sigma=1.00}(Al_{1.90}Fe^{3+}_{0.10})_{\Sigma=2.00}O_4$. (3) Bonneval-sur-Arc, France; by electron microprobe, total Fe as Fe_2O_3; corresponds to $(Mn^{2+}_{0.92}Mg_{0.08})_{\Sigma=1.00}(Al_{1.70}Fe^{3+}_{0.20}Mn^{3+}_{0.09}Si_{0.01})_{\Sigma=2.00}O_4$.

Mineral Group: Spinel group.

Occurrence: In carbonate-rich, silica-undersaturated parts of metamorphosed manganese deposits.

Association: Alleghanyite, rhodonite, sonolite, spessartine, tephroite, kutnohorite, manganhumite, jacobsite, kellyite, alabandite (Bald Knob, North Carolina, USA); katoptrite, magnetite, manganostibite, magnussonite, tephroite, manganhumite, manganosite (Brattfors mine, Sweden).

Distribution: Occurs near Bald Knob, Alleghany Co., North Carolina, USA. In the Brattfors and Jakobsberg mines, Värmland, Sweden. In France, found near Bonneval-sur-Arc, Haute-Savoie. In Japan, found at the Noda-Tamagawa mine and Hijikuzu, Iwate Prefecture; the Oashi mine, Tochigi Prefecture; the Taguchi mine, Aichi Prefecture; the Ioi mine, Shiga Prefecture; and the Fukumaki mine, Yamaguchi Prefecture.

Name: For Galax, Virginia, USA, close to Bald Knob, North Carolina, and for the plant, *galax*, after which the town is named.

Type Material: n.d.

Galeite $Na_{15}(SO_4)_5F_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As tabular to barrel-shaped crystals composed of {0001}, {$11\bar{2}0$}, {$11\bar{2}1$}, to 1 mm; typically as nodular aggregates. May form syntactic overgrowths and intergrowths with schairerite.

Physical Properties: Hardness = n.d. D(meas.) = 2.605 D(calc.) = 2.596

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Uniaxial (+). $\omega = 1.447(2)$ $\epsilon = 1.449(2)$

Cell Data: *Space Group:* $P31m$. $a = 12.197(4)$ $c = 13.955(10)$ Z = 3

X-ray Powder Pattern: Searles Lake, California, USA.
2.79 (10), 3.52 (8), 3.68 (7), 2.55 (7), 2.97 (6), 1.758 (6), 3.04 (4)

Chemistry:

	(1)	(2)
SO_4	51.2	51.28
Na	36.4	36.82
F	8.1	8.11
Cl	3.79	3.79
Total	99.49	100.00

(1) Searles Lake, California, USA; by electron microprobe. (2) $Na_{15}(SO_4)_5F_4Cl$.

Occurrence: In a playa lake deposit.

Association: Schairerite, gaylussite, northupite, pirssonite, tychite, trona, hanksite, calcite.

Distribution: From Searles Lake, San Bernardino Co., California, USA.

Name: Honors Dr. William Alexander Gale (1898–1985), Director of Research of the American Potash and Chemical Corporation.

Type Material: National Museum of Natural History, Washington, D.C., USA, 107385.

References: (1) Pabst, A., D.L. Sawyer, and G. Switzer (1963) Galeite and related phases in the system Na_2SO_4−NaF−NaCl. Amer. Mineral., 48, 485–510. (2) Brown, F.H. and A. Galena PbS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Most commonly cubic, crystals to a meter on an edge are known; more rarely cubo-octahedral or octahedral. May be tabular on {001}; also forms reticulated masses and skeletal crystals. As cleavable masses, coarse to very fine granular; fibrous, plumose. *Twinning:* Twin plane {111}, as both contact and penetration twins; twin plane {114}, lamellar.

Physical Properties: *Cleavage:* Perfect on {001}; parting or cleavage on {111}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 2.5–2.75 VHN = 79–104 (100 g load). D(meas.) = 7.58 D(calc.) = 7.57

Optical Properties: Opaque. *Color:* Lead-gray; in polished section, white. *Streak:* Lead-gray. *Luster:* Metallic.

Total	99.88	99.4	100.00

(1) Katanga Province, Congo (Shaba Province, Zaire); Cu assumed present in covellite and S equivalent deducted. (2) Barrow mine, Newlands, Cumbria, England; by electron microprobe. (3) PbS.

Polymorphism & Series: Forms a series with clausthalite.

Occurrence: In many different types of environments. In hydrothermal veins, formed under a wide range of temperatures; in contact metamorphic deposits, in pegmatites, rarely; limestones and dolostones are common host rocks.

Association: Sphalerite, marcasite, pyrite, chalcopyrite, tetrahedrite, silver minerals, siderite, calcite, dolomite, barite, quartz, many other hydrothermal minerals.

Distribution: The most important ore mineral of lead; only a few deposits of note can be mentioned. In the USA, in Idaho, in the Coeur d'Alene district, Shoshone Co.; in Colorado, at Leadville, Lake Co., and from Breckenridge, Summit Co. In the Mississippi Valley region, in the Tri-State district, at Joplin, Jasper Co., Missouri; Galena, Cherokee Co., Kansas; and Picher, Ottawa Co., Oklahoma. At the Miliken (Sweetwater) mine, Reynolds Co., Missouri, and other mines north along the Viburnum Trend district, brilliant crystals. From Příbram, Czech Republic. At Freiberg, Saxony; from near Bad Ems, Hesse; and at St. Andreasberg, Neudorf, and Clausthal, in the Harz Mountains, Germany. In France, from Pontgibaud, Puy-de-Dôme. In England, at Alston Moor, Cumbria. In Scotland, at Wanlockhead, Dumfries. In Ireland, from the Mogul mine, Silvermines, Co. Tipperary. At Naica and Santa Eulalia, Chihuahua, Mexico.

Name: A Latin word *galena*, given to lead ore or the dross from melted lead.

Galenobismutite $PbBi_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals lathlike, elongated [001], flattened {100}, may be needlelike [001], and as very thin plates, to 1 cm. Commonly crystalline, massive, indistinctly columnar to fibrous.

Physical Properties: *Cleavage:* Good on {110}. *Tenacity:* Flexible. Hardness = 2.5–3.5 VHN = 142–194 (100 g load). D(meas.) = 7.04 D(calc.) = 7.195

Optical Properties: Opaque. *Color:* Pale gray to tin-white or lead-gray, may tarnish yellow or iridescent. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Strong.
R_1–R_2: (400) 48.0–51.1, (420) 47.9–51.1, (440) 47.8–51.1, (460) 47.7–51.0, (480) 47.5–50.8, (500) 47.1–50.5, (520) 46.6–49.8, (540) 45.9–48.8, (560) 45.3–48.2, (580) 44.8–47.7, (600) 44.6–47.2, (620) 44.4–46.8, (640) 44.4–46.7, (660) 44.4–46.7, (680) 44.5–46.8, (700) 44.7–47.1

(1) Nordmark, Sweden. (2) $PbBi_2S_4$.

Occurrence: Of hydrothermal origin.

Association: Galena, bismuth, cosalite, aikinite, tellurobismuthite, joséite, tetradymite, tetrahedrite, gold, pyrite, quartz.

Distribution: In Sweden, from the Ko mine, Nordmark, Värmland [TL]; at Gladhammar and Falun, Kopparberg. From Oberpinzgau, Salzburg, Austria. At Pechtelsgrön, Saxony, Germany. From the Măgura mine, Baia Borşa district, Romania. In the Gupworthy mine, Brendon Hills, Somerset, and at Wheal Penrose, Sithney, Cornwall, England. At Corrie Buie, Meal nan Oighreag, Perthshire, Scotland. From Kingsgate, New South Wales; and at Mt. Farrell, Tasmania, Australia. At Chenzhou, Hunan Province, China. In the USA, in the Belzazzar mine, Quartzburg district, Boise Co., Idaho; and in the Hatfield mine, Okanogan Co., and the Germania mine, Fruitland, Stevens Co., Washington. From the Cariboo mine, Barkerville, Cariboo district, British Columbia; in the Siscoe mine, Gowganda, Ontario; and at Dublin Gulch, Yukon Territory, Canada. At Cerro Bonete, Bolivia. Known from a number of other minor occurrences.

Name: In allusion to *galena* and *bismuth* in its composition.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 3987.

Galileiite $Na(Fe^{2+},Mn^{2+})_4(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. In anhedral grains, to 30 μm.

Physical Properties: *Tenacity:* Sectile. Hardness = $\leq$4 D(meas.) = n.d. D(calc.) = [4.07]

Optical Properties: Transparent. *Color:* Colorless to very pale amber. *Optical Class:* Uniaxial (+). $\omega = 1.72(3)$ $\epsilon = 1.75(5)$

Cell Data: *Space Group:* $[R\overline{3}]$ (by analogy to chladniite and johnsomervilleite). $a = 14.98$ $c = 41.66$ Z = 36

X-ray Powder Pattern: Grant meteorite.
2.71 (100), 3.01 (90), 4.13 (80), 3.47 (50), 3.21 (50), 2.93 (50), 2.85 (50)

Chemistry:

	(1)	(2)
P_2O_5	40.2	40.08
Cr_2O_3	0.07	
FeO	49.0	54.09
MnO	3.98	
Na_2O	5.87	5.83
K_2O	0.04	
Total	99.16	100.00

(1) Grant meteorite; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $Na_{1.01}(Fe_{3.63}Mn_{0.30})_{\Sigma=3.93}(P_{1.01}O_4)_3$. (2) $NaFe_4(PO_4)_3$.

Occurrence: Very rare, as inclusions within troilite nodules in type IIIAB iron meteorites.

Association: Ca-free sarcopside or graftonite, chromite, troilite.

Distribution: In the Grant, El Ampal, Mount Edith, Chupaderos, and Bella Roca meteorites.

Name: To honor Galileo Galilei (1564–1642), Italian astronomer and poet.

Type Material: Field Museum, Chicago, Illinois, Me1959; National Museum of Natural History, Washington, D.C., USA.

(1) Khaydarkan, Kyrgyzstan; by electron microprobe, corresponds to $(Cs_{0.43}Tl_{0.07})_{\Sigma=0.50}(Hg_{4.45}Cu_{0.92}Zn_{0.42})_{\Sigma=5.77}(As_{3.34}Sb_{0.42})_{\Sigma=3.76}S_{12.00}$. (2) Getchell mine, Nevada, USA; by electron microprobe, corresponds to $(Cs_{0.67}Tl_{0.21})_{\Sigma=0.88}(Hg_{4.42}Cu_{0.88}Zn_{0.48})_{\Sigma=5.78}(As_{3.55}Sb_{0.04})_{\Sigma=3.59}S_{12.00}$.

Occurrence: In hydrothermal Hg–Au deposits.

Association: Pyrite, stibnite, cinnabar, metacinnabar, aktashite, enargite, wakabayashilite, orpiment, realgar, getchellite, calcite, fluorite, quartz (Russia); pyrite, realgar, stibnite, orpiment, getchellite, fluorite, quartz (Getchell mine, Nevada, USA).

Distribution: From the Gal-Khaya mercury deposit, Sakha, Russia [TL]. In Kyrgyzstan, at Khaydarkan [TL] and in the Chauvai Sb–Hg deposit, both in the Fergana Valley, Alai Range. In the USA, in Nevada, large crystals from the Getchell mine, Potosi district, Humboldt Co.; at the Carlin mine, 50 km northwest of Elko, and the Goldstrike and Rodeo mines, Lynn district, Eureka Co.; in the Jerritt Canyon mine, Independence Mountains district, Elko Co. From the Hemlo gold deposit, Thunder Bay district, Ontario, Canada.

Name: For the Gal-Khaya deposit, Russia.

Type Material: Mining Institute, St. Petersburg, 1052/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73879, 73880.

(1) Tsumeb, Namibia; by electron microprobe, recalculated to 100.0% after deduction of impurity phases. (2) Do.; by electron microprobe. (3) Kipshi, Congo. (4) $CuGaS_2$.

Mineral Group: Chalcopyrite group.

Occurrence: In base-metal vein deposits with relatively high gallium content.

Association: Reniérite, germanite, bornite, chalcocite, digenite, pyrite, sphalerite, galena, tetrahedrite.

Distribution: From Tsumeb, Namibia [TL]. In Congo (Zaire), at Kipushi, 28 km southwest of Lubumbashi, Katanga (Shaba) Province. From the Radka deposit, Pazardzhik, and the Chelopech deposit, Sofia, Bulgaria. In Cuba, in northwestern Pinar del Rio Province. From Yauricocha, Peru.

Name: For the mineral's gallium content.

Type Material: Berlin Technical University, Berlin, Germany, 86/67, 87/564, 396.

(1) Tsumeb, Namibia; by electron microprobe, average of six analyses, total Fe as Fe_2O_3, H_2O calculated from stoichiometry; corresponds to $Pb_{1.04}(Ga_{1.49}Fe^{3+}_{0.82}Al_{0.62}Zn_{0.10}Ge_{0.02})_{\Sigma=3.05}[(AsO_4)_{1.14}(SO_4)_{0.86}]_{\Sigma=2.00}(OH)_{5.94}$. (2) $PbGa_3(AsO_4,SO_4)_2(OH)_6$ with AsO_4:SO_4 = 1:1.

Mineral Group: Beudantite group.

Occurrence: A rare secondary mineral in vugs in oxidized ore from a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Stolzite, mercurian silver, otjisumeite, gallian beudantite, gallian hidalgoite, scorodite, hematite, goethite, reniérite, gallite, gallian tennantite, chalcocite.

Distribution: From Tsumeb, Namibia.

Name: For its predominant *gallium* content as a member of the *beudantite* group.

Type Material: Canadian Museum of Nature, Ottawa, 81518; Canadian Geological Survey, Ottawa, Canada.

Galuskinite $Ca_7(SiO_4)_3(CO_3)$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As veins of highly fractured grains, to 0.5 mm. Simple and polysynthetic twinning on (001).

Physical Properties: *Cleavage:* {001}, {100}, {010}; imperfect. *Parting:* Perfect on (001). *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = ~5 VHN = 440 (20 g. load). D(meas.) = n.d. D(calc.) = 3.096

Optical Properties: Transparent. *Color:* Colorless, white, pale gray. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). α = 1.660(3) β = 1.669(3) γ = 1.676(3) 2V(meas.) = 60(5)° 2V(calc.) = 82.4° *Orientation:* $X \parallel b$, $Z \wedge a \approx 25°$, $Y \wedge c \approx 25°$ or $X \parallel b$, $Z \wedge c \approx 25°$, $Y \wedge a \approx 25°$.

Cell Data: *Space Group:* $P2_1/c$. a = 18.7872(5) b = 6.7244(2) c = 10.4673(2) β = 90.788(10)° Z = 4

X-ray Powder Pattern: Birkhin complex, Baikal area, Eastern Siberia, Russia.
2.7032 (100), 2.6706 (100), 2.7338 (98), 2.7030 (85), 2.6166 (82), 2.7141 (78), 3.0323 (59)

Chemistry:

	(1)	(2)
Na_2O	0.43	
CaO	62.61	63.63
SiO_2	28.85	29.22
P_2O_5	0.20	
SO_3	0.05	
CO_2	7.08	7.14
Total	99.22	100.00

(1) Birkhin complex, Baikal area, Eastern Siberia, Russia; electron microprobe analysis, CO_2 from structure analysis, Raman spectroscopy confirmed the presence of CO_3^{2-}, corresponding to $(Ca_{6.936}Na_{0.086})_{\Sigma=7.022}(Si_{2.983}P_{0.018}S_{0.004})_{\Sigma=3.005}O_{12}(CO_3)$. (2) $Ca_7(SiO_4)_3(CO_3)$.

Occurrence: A retrograde product of skarn alteration found in sanidinite facies contact-metamorphosed silicate carbonate xenoliths intruded by gabbroid rocks (Birkhin complex).

Association: Pavlovskyite, dellaite, larnite, bredigite, gehlenite, cuspidine, hydroxylellestadite.

Distribution: At the Birkhin complex, Baikal area, Olkhon region, Eastern Siberia, Russia.

Name: Honors Russian mineralogists Irina Olegovna Galuskina (b. 1961) and Evgeny Vadimovich Galuskin (b. 1960), Faculty of Earth Sciences, University of Silesia, Poland.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia; 4050/1 and the Natural History Museum, Bern, Switzerland; NMBE-40811.

Mineral., 98, 1631 (abs. ref. 1).

Gamagarite $Ba_2(Fe^{3+},Mn^{3+})(VO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Needlelike crystals, elongated along [010], to more than 1 cm, and as prisms, flattened on [001]; as anhedral grains.

Physical Properties: *Cleavage:* {001} and {100}, distinct; $\{\bar{1}01\}$ difficult, indices probable. Hardness = 4.5–5 D(meas.) = 4.62–4.68 D(calc.) = [4.72] Moderately magnetic.

Optical Properties: Transparent in thin fragments. *Color:* Dark brown to almost black. *Streak:* Reddish brown. *Luster:* Adamantine.
Optical Class: Biaxial (+). *Pleochroism:* X = red-brown; Y = very deep red-brown; Z = light salmon-buff. *Orientation:* $Y = b$; $X \wedge c = 39°–43°$. *Dispersion:* $r < v$, fairly strong. *Absorption:* Y > X > Z. $\alpha = 2.016(10)$ $\beta = 2.040(10)$ $\gamma = 2.130(10)$ 2V(meas.) = 46°–62°

Cell Data: *Space Group:* $P2_1/m$. $a = 9.121–9.15$ $b = 6.142–6.17$ $c = 7.838–7.88$ $\beta = 112.7°–112.88°$ Z = 2

X-ray Powder Pattern: Gloucester Farm, South Africa.
3.309 (100), 3.051 (80), 2.805 (80), 2.349 (50), 4.969 (10), 4.627 (10), 3.711 (10)

Chemistry:

	(1)	(2)	(3)
As_2O_5			3.47
V_2O_5	31.9	31.9	29.07

H_2O^+	1.06	[1.91]	[1.58]
Total	99.3	[101.9]	[100.00]

(1) Gloucester Farm, South Africa; recalculated from original analysis. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O calculated for charge balance; corresponds to $Ba_{1.99}(Fe^{3+}_{0.58}Mn^{3+}_{0.41}Al_{0.09})_{\Sigma=1.08}(VO_4)_2(OH)_{1.22}$. (3) Molinello mine, Italy; by electron microprobe, total Fe as Fe_2O_3, total Mn as Mn_2O_3, H_2O calculated from crystal-structure analysis; corresponding to $(Ba_{1.80}Sr_{0.20})_{\Sigma=2.00}(Fe^{3+}_{0.56}Mn^{3+}_{0.44})_{\Sigma=1.00}[(VO_4)_{1.83}(AsO_4)_{0.17}]_{\Sigma=2.00}(OH)_{1.00}$.

Mineral Group: Brackebuschite group.

Occurrence: Very rare, in banded manganese ore replacing shale (Gloucester Farm, South Africa); in veinlets cutting manganese ore (Molinello mine, Italy).

Association: Bixbyite, hematite, ephesite, diaspore, amesite (Gloucester Farm, South Africa); braunite, saneroite, bementite, caryopilite, calcite, quartz (Molinello mine, Italy).

Distribution: Along Gamagara Ridge, on Gloucester Farm, about 27 km north of Postmasburg, Cape Province, South Africa. In the Molinello manganese mine, near Chiavari, Val Graveglia, Liguria, Italy.

Name: For the original occurrence on Gamagara Ridge, South Africa.

Type Material: The Natural History Museum, London, England, 1958,553; National Museum of Natural History, Washington, D.C., USA, 105142.

Gananite BiF_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\overline{4}3m$. In irregular aggregates, to 0.15 mm.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = n.d.
VHN = 135–153 D(meas.) = n.d. D(calc.) = 8.928

Optical Properties: Translucent. *Color:* Brown to black, greenish black; gray in reflected light. *Streak:* Dark gray. *Luster:* Resinous to semimetallic.
Optical Class: Isotropic.
R: (407) 11.08, (435) 12.31, (546) 12.73, (591) 12.92, (621) 12.96, (647) 13.27

Cell Data: *Space Group:* $P\overline{4}3m$(synthetic, ICDD 11-10). $a = 5.825(1)$ $Z = 4$

X-ray Powder Pattern: Ganan area, China.
3.37 (100), 2.057 (90), 1.756 (80), 2.91 (70), 2.272 (50), 1.334 (50), 1.188 (50)

Chemistry:

	(1)	(2)
Bi	78.98	78.57
F	20.40	21.43
Total	99.38	100.00

(1) Ganan area, China; by electron microprobe, corresponding to $Bi_{1.00}F_{2.84}$. (2) BiF_3.

Occurrence: In wolframite-bearing quartz veins.

Association: Bismuth, bismuthinite, pyrite, chalcopyrite.

Distribution: In the Ganan area, Laikeng district, southern Jiangxi Province, China.

Name: Presumably for its occurrence in the Ganan area, China.

Type Material: National Museum of Geology, Beijing, China.

Ganomalite $Pb_9Ca_5Mn^{2+}Si_9O_{33}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* 3. As simple hexagonal prisms, tabular on {0001}, typically in subparallel groupings.

Physical Properties: *Cleavage:* $\{10\bar{1}0\}$ and {0001}, distinct. *Fracture:* Uneven. *Tenacity:* Very brittle. Hardness = 3 D(meas.) = 5.7 D(calc.) = [5.69]

Optical Properties: Semitransparent. *Color:* Colorless to gray. *Luster:* Resinous to vitreous.
Optical Class: Uniaxial (+). $\omega = 1.910$ $\epsilon = 1.945$

Cell Data: *Space Group:* $P3$. $a = 9.82$ $c = 10.13$ Z = 1

X-ray Powder Pattern: Jakobsberg, Sweden.
3.06 (10), 3.53 (9), 3.38 (8), 2.71 (8), 4.92 (7), 4.43 (7), 1.985 (7)

Chemistry:

	(1)	(2)	(3)
SiO_2	19.8	19.7	18.64
MnO	2.1	2.3	2.44
PbO	66.5	67.4	69.25
CaO	11.5	10.9	9.67
Total	99.9	100.3	100.00

(1) Franklin, New Jersey, USA; by electron microprobe. (2) Jakobsberg, Sweden; by electron microprobe. (3) $Pb_9Ca_5MnSi_9O_{33}$.

Occurrence: In skarn assemblages (Jakobsberg, Sweden); in manganese ores in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Tephroite, lead, jacobsite, calcite, phlogopite, macedonite (Jakobsberg, Sweden); clinohedrite, willemite, andradite, franklinite (Franklin, New Jersey, USA).

Distribution: At Långban, in the Harstigen mine, near Persberg, and at Jakobsberg, Värmland, Sweden. From Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *luster*, in allusion to its appearance.

(1) Pajsberg, Sweden. (2) Do.; by electron microprobe, H_2O by difference. (3) Franklin, New Jersey, USA; by electron microprobe, average of 10 analyses, H_2O by difference.

Occurrence: In manganese-rich portions of metamorphosed Zn-Mn mineral deposits.

Association: Calcite, rhodonite, caryopilite, barite, lead, garnet, manganoan biotite, pyrophanite (Harstigen mine, Sweden); rhodonite, willemite, bustamite, axinite, clinohedrite, datolite, roeblingite, charlesite (Franklin, New Jersey, USA); parsettensite, caryopilite (Molinello mine, Italy).

Distribution: In Sweden, from the Harstigen mine, near Persberg, and at Långban, Värmland; and in the Sjö mine, near Grythyttan, Örebro. At the Benallt and Nant mines, Rhiw, Lleyn Peninsula, Wales. From the Molinello and Gambatesa manganese mines, near Chiavari, Val Graveglia, Liguria, Italy. In the USA, in the Maple-Hovey deposits, west of Bridgewater, Aroostook Co., Maine, and at Franklin, Sussex Co., New Jersey. From Mont Saint-Hilaire, Quebec, Canada. In the Ananai mine, Nagaoka, Kochi Prefecture; the Noda-Tamagawa mine, Iwate Prefecture; the Kumahata mine, Shiga Prefecture; and the Osu and Yonoyama mines, Kita, Ehime Prefecture, Japan. From Broken Hill, New South Wales, Australia.

Name: From the Greek for *luster* and *leaf*, for the high luster on cleavages.

Gaotaiite Ir_3Te_8

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As subhedral grains, in aggregates to 0.2 mm; massive, in veinlets.

Physical Properties: *Tenacity:* Brittle. Hardness = 3 VHN = 94–177, 117 average (20 g load). D(meas.) = n.d. D(calc.) = 10.00

Optical Properties: Opaque. *Color:* Steel-black; in reflected light, bright white with a bluish tint. *Streak:* Black. *Luster:* Metallic.
Optical Class: Isotropic. *Anisotropism:* May be weak; bluish or yellowish.
R: (400) 45.9, (420) 46.8, (440) 46.7, (460) 46.6, (480) 46.5, (500) 46.4, (520) 46.3, (540) 46.3, (560) 46.3, (580) 46.3, (600) 46.2, (620) 46.1, (640) 46.0, (660) 45.5, (680) 45.3, (700) 45.2

Cell Data: *Space Group:* $Pa3$. $a = 6.413(4)$ $Z = 1$

X-ray Powder Pattern: Near Gaotai village, China.
1.93 (100), 1.132 (90), 1.235 (80), 1.040 (80), 0.9780 (80), 2.86 (70), 2.60 (60)

Chemistry:

	(1)	(2)
Ir	35.6	36.10
Pt	0.1	
Cu	0.2	
Te	62.8	63.90
S	0.2	
Total	98.9	100.00

(1) Near Gaotai village, China; by electron microprobe, average of nine analyses; corresponds to $(Ir_{2.96}Cu_{0.05}Pt_{0.01})_{\Sigma=3.02}(Te_{7.88}S_{0.10})_{\Sigma=7.98}$. (2) Ir_3Te_8.

Occurrence: In crushed chromite ores and placer concentrates.

Association: Iridium, osmium, osmiridium, ferrian platinum, isoferroplatinum, iridisite, erlichmanite, laurite, irarsite, shuangfengite, chengdeite, inaglyite, chromite, magnetite, gold.

Distribution: From near Gaotai village, about 200 km north-northeast of Beijing, Hebei Province, China [TL].

Name: For Gaotai village, China, near which the mineral was found.

Type Material: Geological Museum of China, Beijing, China.

Total	[99.56]		100.00

(1) Uintah Co., Utah, USA; contains visible impurities, original total given as 100.1%, H_2O by loss on ignition, remainder is trivalent oxides. (2) Do.; by electron microprobe, partial analyses on pure material, Na by AA. (3) $Ba_3NaSi_2B_7O_{16}(OH)_4$.

Occurrence: Of authigenic origin, in dolomitic shale in drill core from the Green River Formation (Uintah Co., Utah, USA).

Association: Nahcolite, shortite, searlesite, wurtzite (Uintah Co., Utah, USA).

Distribution: In the USA, from several drill holes in Uintah Co., Utah; in the Kramer borate deposit, Kern Co., and at Searles Lake, San Bernardino Co., California.

Name: For Professor Robert Minard Garrels (1916–1988), American geochemist and educator.

Type Material: n.d.

References: (1) Milton, C., J.M. Axelrod, and F.S. Grimaldi (1955) New mineral, garrelsite $(Ba_{.65}Ca_{.29}Mg_{.06})_4H_6Si_2B_6O_{20}$, from the Green River Formation, Utah. Bull. Geol. Soc. Garronite $Na_2Ca_5Al_{12}Si_{20}O_{64}\cdot 27H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal; possibly orthorhombic, pseudotetragonal. *Point Group:* $\bar{4}2m$. As radiating crystal aggregates completely filling amygdules, characteristically radially jointed; rare single crystals, to 4 mm, are dipyramidal. *Twinning:* Observed optically at a very fine scale; may be a domain structure.

Physical Properties: *Cleavage:* Two at 90°, prismatic. Hardness = 4.5–5
D(meas.) = 2.13–2.17 D(calc.) = 2.201

Optical Properties: Transparent. *Color:* [Colorless to white, yellowish, grayish.]
Luster: Vitreous to greasy.
Optical Class: Uniaxial (+) or (–) to biaxial; may be zoned, changing optical properties from the core to the extremities. $\omega = 1.500–1.515$ $\epsilon = 1.502–1.512$

Cell Data: *Space Group:* $I\bar{4}m2$. $a = 9.9266(2)$ $c = 10.3031(3)$ Z = [0.5]

X-ray Powder Pattern: Co. Down, Ireland.
4.12 (100), 3.14 (100), 2.66 (100), 7.15 (80), 4.95 (80), 4.07 (60), 3.22 (60)

Total	100.17	100.79

(1) Glenariff, Ireland; corresponds to $(Na_{2.52}K_{0.30})_{\Sigma=2.82}Ca_{5.08}Al_{12.70}Si_{19.24}O_{64}\cdot 27.64H_2O$.
(2) Skessa, Reydarfjord, Iceland; corresponds to $(Na_{2.52}K_{0.08})_{\Sigma=2.60}(Ca_{4.86}Ba_{0.02})_{\Sigma=4.88}$ $Al_{12.10}Si_{19.84}O_{64}\cdot 27.46H_2O$.

Mineral Group: Zeolite group.

Occurrence: As amygdule fillings in silica-undersaturated olivine basalt flows (Co. Antrim, Ireland); in lavas rich in phenocrysts of bytownite and in non-porphyritic olivine basalt flows (Iceland); in diabase porphyry (Angara River, Russia).

Association: Zeolites.

Distribution: In Ireland, from the Glenariff Valley, Co. Antrim, and at a number of other localities towards Belfast. At The Storr, Isle of Skye, Scotland. In Iceland, at numerous localities between Berufjord and Seydisfjord. In Russia, near Nevon, on the Angara River, 50 km below the Ilim River, Siberia. At Gignat, Puy-de-Dôme, France. In the Höwenegg quarry, Hegau, Baden-Württemberg, Germany. From San Giorgio di Perlena, Vicenza, Italy. On Table Mountain, Jefferson Co., Colorado, and from Goble, Columbia Co., Oregon, USA. At Davis Hill, Ontario, and around Laurel and at Mont Saint-Hilaire, Quebec, Canada. A few other localities are known.

Name: For the Garron Plateau area, Co. Antrim, Ireland.

Type Material: n.d.

Gartrellite **$PbCu(Fe^{3+},Cu)(AsO_4)_2(OH,H_2O)_2$**

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Nearly cryptocrystalline, with platy crystallites to 10 μm, tabular on {111}, {010}, {112}, additional minor forms; in aggregates, fine-grained coatings and powdery incrustations. *Twinning:* Common, by reflection on {$1\bar{1}0$}.

Physical Properties: *Cleavage:* Perfect on {111}. *Tenacity:* Friable. Hardness = 4.5
D(meas.) = n.d. D(calc.) = 5.38–5.43

Optical Properties: Transparent. *Color:* Bright yellow, greenish yellow, green, brown; pale yellow in transmitted light. *Streak:* Bright yellow. *Luster:* Chalky.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = Y = pale yellow; Z = yellow. *Orientation:* X (45°,-22°); Y (48°,130°); Z (76°,-127°) [with a (90°,90°) and b (90°,0°) using (ϕ,ρ)].
$\alpha = 1.94(1)$ $\beta = [1.98]$ $\gamma = 2.06(2)$ 2V(meas.) = 78(4)°

Cell Data: *Space Group:* $P\bar{1}$. $a = 5.431$–5.460 $b = 5.628$–5.653 $c = 7.565$–7.589
$\alpha = 67.52°-67.77°$ $\beta = 69.27°-69.57°$ $\gamma = 70.04°-70.31°$ Z = 1

X-ray Powder Pattern: Anticline prospect, Australia.
2.962 (100), 3.203 (97), 4.612 (70), 3.339 (70), 2.915 (70), 2.522 (64), 4.847 (54)

Chemistry:

	(1)	(2)		(1)	(2)

Fe_2O_3	10.33	7.74	H_2O	[4.47]	n.d.
			Total	[100.46]	95.41

(1) Anticline prospect, Australia; by electron microscope, average of 15 analyses, original total given as 100.47%, total Fe as Fe_2O_3, confirmed by IR and Mössbauer spectroscopy, H_2O calculated from theory; corresponds to $Pb_{1.04}Cu_{1.00}(Fe_{0.82}Cu_{0.12}Zn_{0.02}Al_{0.01})_{\Sigma=0.97}[(AsO_4)_{1.83}(SO_4)_{0.13}]_{\Sigma=1.96}[(OH)_{1.10}(H_2O)_{1.03}]_{\Sigma=2.13}$. (2) Broken Hill, Australia; by electron microprobe, average of two analyses; corresponds to $Pb_{1.07}Cu_{1.00}(Fe_{0.60}Al_{0.25}Cu_{0.05}Zn_{0.02})_{\Sigma=0.92}[(AsO_4)_{1.75}(SO_4)_{0.06}]_{\Sigma=1.81}[(OH),H_2O]_2$.

Mineral Group: Tsumcorite group.

Occurrence: A rare mineral in an oxidized mineralized shear zone cutting graywackes and shales (Anticline prospect, Australia); on fine-grained quartz-spessartine rocks (Broken Hill, Australia).

Association: Secondary copper minerals, quartz, clay minerals, iron oxides (Anticline prospect, Australia); hidalgoite–beudantite, quartz, spessartine (Broken Hill, Australia); mimetite, duftite, beudantite, bayldonite, quartz (Tsumeb, Namibia).

Distribution: From the Anticline and Bali Lo copper prospects, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia, and in the Kintore open cut, Broken Hill, New South Wales, Australia. At Reichenbach, near Bensheim, Hesse, and in the Clara Mine, near Oberwolfach, Black Forest, Germany. From Tsumeb, Namibia. In the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: Honoring Blair J. Gartrell (1950–1994), Australian mineral collector of Beverley, Australia, who found the mineral.

Type Material: Western Australian Museum, Perth, M.61.1991; Museum Victoria, Melbourne, Australia, M39278.

References: (1) Nickel, E.H., B.W. Robinson, Ô. Fitz Gerald, and W.D. Birch (1989) Gartrellite, a new secondary arsenate mineral from Ashburton Downs, W.A. and Broken Hill, N.S.W. Australian Mineral., 4(3), 83–89. (2) (1990) Amer. Mineral., 75, 932 (abs. ref. 1).

H_2O	11.0
Total	99.4

(1) Rapid Creek, Canada; by electron microprobe, Fe^{2+} by KCr_2O_7 titration, Fe^{3+} by difference, total Mn as MnO, H_2O by DTA/TGA; corresponds to $(Mg_{1.45}Fe^{3+}_{1.39}Mn_{0.14}Al_{0.01}Fe^{2+}_{0.01})_{\Sigma=3.00}(PO_4)_{1.99}(OH)_{1.43}\cdot 1.52H_2O$.

Polymorphism & Series: Forms a series with kryzhanovskite.

Occurrence: A rare low-temperature mineral in fractures in a sedimentary iron formation.

Association: Kryzhanovskite, ludlamite, arrojadite, vivianite, metavivianite, souzalite, quartz.

Distribution: From the east side of Rapid Creek, about one km north of the junction with Lake Creek, Yukon Territory, Canada.

Name: Honors H. Gary Ansell (1943–), Associate Curator, Canadian National Mineral Collection, Geological Survey of Canada, Ottawa, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M37306.

Total	99.52	100.00

(1) Pizzo Cervandone, Italy; by electron microprobe, average of nine analyses; corresponding to $(Ce_{0.47}La_{0.20}Nd_{0.18}Ca_{0.07}Pr_{0.06}Th_{0.02})_{\Sigma=1.00}(As_{0.94}Si_{0.03}S_{0.03})_{\Sigma=1.00}O_4$. (2) $CeAsO_4$.

Mineral Group: Monazite group.

Occurrence: In fissures, replacing synchysite, formed by amphibolite-grade metamorphism of metasedimentary rocks (Pizzo Cervandone, Italy).

Association: Synchysite-(Ce), chernovite, cafarsite, rutile, anatase, magnetite, hematite (Pizzo Cervandone, Italy).

Distribution: On the southeastern slope of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, Italy. At the Squaw Creek tin prospect, Catron Co., and on the Beryllium Virgin claim, Paramount Canyon, Sierra Co., New Mexico, USA.

Name: To honor Giovanni Gaspari, mineral collector of Crodo, Italy, who first found the mineral, and for its dominant *cerium* content.

Type Material: Natural History Museum, Basel, 30653; Mineralogical Institute, Basel University, Basel, Switzerland.

References: (1) Graeser, S. and H. Schwander (1987) Gasparite-(Ce) and monazite-(Nd): two new minerals to the monazite group from the Alps. Schweiz. Mineral. Petrog. Mitt., 67, 103-113. (2) (1988) Amer. Mineral., 73, 1494–1495 (abs. ref. 1).

FeO	5.7	0.1		insol.	1.8		
NiO	35.0	55.5	36.79	Total	102.7	[95.3]	100.00

(1) Gaspé Peninsula, Canada; CO_2 by ignition and absorption; after removal of MgO and SiO_2 from serpentine, corresponds to $(Ni_{0.49}Mg_{0.43}Fe_{0.08})_{\Sigma=1.00}CO_3$. (2) Otway prospect, Western Australia; by electron microprobe, here converted to oxides from an original elemental analysis totalling 94.8%, CO_2 calculated for charge balance. (3) $(Ni, Mg)CO_3$ with Ni:Mg = 1:1.

Polymorphism & Series: Forms a series with magnesite.

Mineral Group: Calcite group.

Occurrence: An uncommon secondary mineral in a Ni-sulfide-bearing vein in metamorphosed siliceous dolostone (Gaspé Peninsula, Canada); possibly from alteration of a nickel-rich meteorite (Bon Accord, South Africa).

Association: Millerite, nickeline, annabergite, gersdorffite, polydymite, heazlewoodite, magnesite, spinel, dolomite (Gaspé Peninsula, Canada); pecoraite, magnesite, siderite, chrysotile, antigorite, magnetite, millerite, polydymite (Otway prospect, Western Australia); glaukosphaerite, mcguinnessite, jamborite (Shinshiro, Japan); liebenbergite, trevorite, nickeloan ludwigite, bunsenite, violarite, millerite, nimite (Bon Accord, South Africa).

Distribution: Found in a prospect pit near Mount Albert, Gaspé Peninsula, Quebec, Canada. In Western Australia, from the Otway nickel prospect, near Spinnaway, Nullagine district; in the Otter Shoot gossan, Kambalda, 56 km south of Kalgoorlie; at the Rocky's Reward pit, near Agnew; from the 132 North nickel mine, Widgiemooltha district. Found at Shinshiro, Aichi Prefecture, Japan. In South Africa, on Mabilikwe Hill, Pafuri; from three km west of the Scotia Talc mine, Bon Accord, Barberton district, Transvaal. In the San Benedetto mine, Iglesias district, Sardinia, Italy.

Name: For the original locality on the Gaspé Peninsula, Canada.

Type Material: University of British Columbia, Vancouver, Canada, S-75-4222; National Museum of Natural History, Washington, D.C., USA, 119544.

(1) Iron Monarch quarry, Australia; by electron microprobe, total Mn as MnO, total Fe as FeO, H_2O calculated for 4(OH); corresponds to $Mn_{5.09}Fe_{0.01}Al_{0.01}[(P_{0.87}As_{0.08}V_{0.01})_{\Sigma=0.96}O_4]_2(OH)_4$. (2) Do.; corresponds to $Mn_{4.74}Al_{0.03}[(P_{0.87}As_{0.08}S_{0.01})_{\Sigma=0.96}O_4]_2(OH)_4$. (3) $Mn_5(PO_4)_2(OH)_4$.

Occurrence: As a secondary mineral in cavities in a sedimentary Fe–Mn deposit, probably formed by reaction of phosphorus-rich fluids with hausmannite at low temperature.

Association: Arsenoclasite, shigaite, hematite, hausmannite, triploidite, barite, manganoan ferroan calcite.

Distribution: From the Iron Monarch quarry, Iron Knob, South Australia.

Name: Honoring Dr. Bryan Michael Kenneth Cummings Gatehouse (1932–), crystal chemist, Monash University, Melbourne, Australia.

Type Material: South Australian Museum, Adelaide, G17655; Museum Victoria, Melbourne, Australia, M41982, M42467.

(1) Buranga pegmatite, Rwanda; $(OH)^{1-}$ and H_2O confirmed by IR, corresponds to $(Ca_{1.06}Na_{0.04}Mn^{2+}_{0.02})_{\Sigma=1.12}(Al_{1.89}Fe^{3+}_{0.10})_{\Sigma=1.99}(PO_4)_2(OH)_{2.14} \cdot 0.96H_2O$. (2) Mt. Perry, Australia; by electron microprobe, H_2O by difference; corresponds to $Ca_{0.98}Al_{2.00}(PO_4)_{2.00}(OH)_2 \cdot H_2O$. (3) $CaAl_2(PO_4)_2(OH)_2 \cdot H_2O$.

Occurrence: From the phosphate assemblage in a complex granite pegmatite (Buranga pegmatite, Rwanda; Hålsjöberg, Sweden.); in andesites altered hydrothermally through hydrogen metasomatism (Mt. Perry, Australia).

Association: Trolleite, scorzalite, apatite, bjarebyite, burangaite (Buranga pegmatite, Rwanda); trolleite, augelite, andalusite, rutile, topaz, quartz (Mt. Perry, Australia).

Distribution: In the Buranga pegmatite, near Gatumba, Rwanda. On Mt. Perry, 75 km southwest of Bundaberg, Queensland, Australia. At Hålsjöberg, Värmland, Sweden.

Name: For its occurrence near Gatumba, Rwanda.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG10560; National Museum of Natural History, Washington, D.C., USA, 142982.

Gaudefroyite $Ca_4Mn^{3+}_{3-x}(BO_3)_3(CO_3)(O,OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6 or $6m$. Crystals are stubby dipyramidal $\{11\overline{2}0\}$, or prismatic $\{01\overline{1}0\}$ with prominent pyramidal terminations, to 5 cm; typically as stepwise tapered crystals in divergent aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6 VHN = 840 D(meas.) = 3.35–3.50 D(calc.) = 3.44–3.53

Optical Properties: Opaque, transparent in thin slivers. *Color:* Black; in reflected light, gray with strong yellow-orange to reddish internal reflections. *Luster:* Vitreous to dull. *Optical Class:* Uniaxial (+). *Pleochroism:* Strong; O = pale yellowish brown; E = red-orange. $\omega = 1.81(1)$ $\epsilon = 2.02(1)$ *Anisotropism:* Strong, in pale gray.

R_1–R_2: (400) 11.2–15.4, (420) 10.8–14.8, (440) 10.4–14.2, (460) 10.1–13.8, (480) 9.9–13.4, (500) 9.7–13.1, (520) 9.6–12.8, (540) 9.6–12.6, (560) 9.5–12.3, (580) 9.5–12.2, (600) 9.4–12.1, (620) 9.4–12.0, (640) 9.3–11.9, (660) 9.3–11.8, (680) 9.3–11.7, (700) 9.3–11.7

(1) Tachgagalt, Morocco; H_2O by the Penfield method, includes pyrolusite estimated at 5.4%; corresponds to $Ca_{4.00}Mn_{2.83}(BO_3)_{3.09}(CO_3)_{0.95}[O_{2.78}(OH)_{0.22}]_{\Sigma=3.00}$. (2) Wessels mine, South Africa; by electron microprobe, corresponding to $Ca_4Mn_{2.86}(BO_3)_3(CO_3)[O_{2.59}(OH)_{0.41}]_{\Sigma=3.00}$.

Occurrence: An uncommon hydrothermal mineral in manganese deposits.

Association: Marokite, braunite, hausmannite, crednerite, pyrolusite, calcite, quartz, brucite (Tachgagalt, Morocco); barite, calcite, hydrogrossular, manganite, bixbyite, braunite, hausmannite, hematite (Kuruman district, South Africa).

Distribution: From Tachgagalt, 17 km south-southwest of Ouarzazate, Anti-Atlas Mountains, Morocco. At the Wessels and N'Chwaning mines, near Kuruman, Cape Province, South Africa.

Name: Honors Abbé Christophe Gaudefroy (1888–1971), French mineralogist who worked in Morocco.

Type Material: Geological Survey of Morocco, Rabat, Morocco; Natural History Museum, Paris, 165.34; National School of Mines, Paris, France.

(1) Taboos-nor salt lake, Mongolia. (2) $Na_2Ca(CO_3)_2 \cdot 5H_2O$.

Occurrence: Typically in evaporites or shales from alkali lakes; rarely in veinlets cutting alkalic igneous rocks.

Association: Shortite, northupite, pirssonite, trona (Green River Formation, Wyoming, USA); thermonatrite, shortite, villiaumite, ferrian "biotite", pectolite, potassian feldspar, aegirine (Khibiny massif, Russia).

Distribution: From Lagunillas, 80 km southeast of Mérida, Venezuela. In the USA, in California, at Mono Lake, Mono Co., Borax Lake, Lake Co., Deep Spring Lake, Inyo Co., China Lake, Kern Co., and Searles Lake, San Bernardino Co.; in the Green River Formation, Sweetwater Co., Wyoming; at several localities in the Carson Desert, near Ragtown, Nevada. Large crystals from Lake Amboseli, Kenya. At Lake Eyasi, Tanzania. On Zoutpan Farm, 40 km northwest of Pretoria, Transvaal, South Africa. At the Taboos-nor salt lake, eastern Gobi Desert, Mongolia. From the Olenii Ruchei area, Khibiny massif, Kola Peninsula, Russia. Around Mt. Erebus, Victoria Land, Antarctica.

Name: Honors Joseph Louis Gay-Lussac (1778–1850), noted French chemist and physicist.

Gearksutite $CaAl(OH)F_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, probable. *Point Group:* n.d. As extremely minute fibers, which, under the SEM, are seen to be lath-shaped crystals; these form chalklike nodular masses and powders.

Physical Properties: Hardness = 2, in aggregates. D(meas.) = 2.72–2.768 D(calc.) = n.d. Compact, massive material fluoresces dark violet to bluish gray; powdery material fluoresces yellowish brown.

Optical Properties: Opaque; fine fibers are transparent. *Color:* White, pale rose; in transmitted light, colorless. *Luster:* Dull.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge$ elongation = large. $\alpha = 1.448(3)$ $\beta = 1.454(3)$ $\gamma = 1.456(3)$ 2V(meas.) = Moderate.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Ivigtut, Greenland.

(1) Wagon Wheel Gap, Colorado, USA. (2) Hot Springs, Virginia, USA. (3) $CaAl(OH)F_4 \cdot H_2O$.

Occurrence: In granite and granite pegmatites; may be formed by low-temperature hydrothermal alteration of aluminous rocks by fluorine-bearing hot springs.

Association: Cryolite, thomsenolite, sellaite, pachnolite, ralstonite, weberite, fluorite.

Distribution: Occurs in the Ivigtut cryolite deposit, southwestern Greenland. In Norway, found near Lake Gjerdingen, Nordmarka. Found at Miass, Ilmen Mountains, Southern Ural Mountains; in the Karasug barite–fluorite deposit, 15 km north of Karasug, western Tannu-Ola Mountains, Siberia; in the Zharchikhinsk molybdenum deposit, on the west side of Lake Baikal, eastern Siberia; in the Voznesensk fluorite deposit, Primorskiy Territory; and other less-well-defined localities in Russia. From Aktchatau and Baynazar, Kazakhstan. Occurs on Vulcano, Lipari Islands, Italy. At Salzburg, and near Hall, Tirol, Austria. In the USA, found between Hot Springs and Warm Springs, Bath Co., Virginia; at the Chancellor mine, Boulder Co., St. Peters Dome, near Pikes Peak, El Paso Co., and the Wagon Wheel Gap fluorite mine, Mineral Co., Colorado; in the Grand Reef mine, Graham Co., Arizona; at the Hall mine, near Tonopah, San Antone district, Nye Co., Nevada; and in the Quitman Mountains, Hudspeth Co., Texas. From Colquiri, Oruro, Bolivia. Found at the Mt. Cleveland tin mine, 14 km southwest of Waratah, Tasmania, and from Gingin, Western Australia. Several other localities are known.

Name: From the Greek *ge* for *Earth*, in allusion to the earthy appearance of the mineral, and *arksutite* (= chiolite), originally thought to be a mineral that gearksutite closely resembled in composition.

Type Material: University of Copenhagen, Copenhagen, Denmark.

(1) Tsumeb, Namibia; by electron microprobe, As^{3+} valence determined by microchemical analysis; corresponds to $Pb_{7.99}As^{3+}_{3.99}Cl_{5.96}O_{11}$.

Occurrence: On a specimen of highly oxidized ore from the lower oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Reinerite, mimetite, smithsonite, willemite, hematite, fraipontite, quartz.

Distribution: From Tsumeb, Namibia.

Name: To honor Dr. Georg Gebhard (1945–), German chemist, mineral collector, and authority on rare minerals, who supplied the specimen.

Type Material: National School of Mines, Paris, France; National Museum of Natural History, Washington, D.C., USA, 147360.

(1) Grafton, Maine, USA; corresponds to $(Fe^{2+}_{3.00}Mg_{2.34}Al_{1.23}Na_{0.46}Fe^{3+}_{0.10}Ti_{0.03}Mn_{0.02}Ca_{0.01}K_{0.01})_{\Sigma=7.20}(Si_{5.99}Al_{2.01})_{\Sigma=8.00}O_{22}(OH)_{2.70}$. (2) Tallan Lake sill, Peterborough Co., Ontario, Canada; by electron microprobe, original total given as 97.07%; corresponding to $(Mg_{3.31}Fe^{2+}_{2.12}Al_{0.82}Na_{0.57}Fe^{3+}_{0.37}Mn_{0.06}Ti_{0.06})_{\Sigma=7.31}(Si_{6.37}Al_{1.63})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with magnesio-gedrite and ferro-gedrite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: 0.1 $Mg/(Mg + Fe^{2+})$ 0.89; $(Ca + Na)_B < 1.34$; Li < 1.0; Si < 7.0; $Al^{iv} > 0.99$.

Occurrence: Widespread in medium- to high-grade metamorphic rocks; in metasomatized contact metamorphic rocks.

Association: Garnet, cordierite, "hornblende," anthophyllite, cummingtonite, sapphirine, sillimanite, kyanite, quartz, staurolite, biotite.

Distribution: From Gèdre, Héas Valley, Haut Pyrénées, France. At Strathy, Sutherlandshire, and Glen Urquhart, Inverness-shire, Scotland. From Snarum, Bjordammen, and Bamble, Norway. At Schisshyttan, near Väster Silfberg, Värmland, Sweden. From Shuyeverskoya, Karelia. In the USA, at Haddam, Middlesex Co., Connecticut; Grafton, Oxford Co., Maine; Masons' Mountain, Macon Co., North Carolina; and Powder Mill Point, Berkeley, Alameda Co., California. At Budsbrook, Western Australia. In the Wakamatsu mine, Tottori Prefecture, and at Iratsuyama, Ehime Prefecture, Japan.

Name: For the occurrence near Gèdre, France.

(1) DeKalb Township, New York, USA; by electron microprobe, corresponding to $Cu_{7.22}S_{5.00}$. (2) Do.; by electron microprobe, corresponding to $Cu_{7.46}S_{5.00}$; (1) and (2) represent the range of 27 analyses. (3) Eretria, Greece; by electron microprobe, corresponding to $(Cu_{9.34}Zn_{0.11}Fe_{0.05})_{\Sigma=9.50}S_{5.00}$. (4) Cu_8S_5.

Occurrence: Replacing sphalerite along cleavage traces (DeKalb Township, New York, USA); in a serpentine-hosted magnetite–chromite deposit (Eretria, Greece).

Association: Spionkopite, sphalerite, tetrahedrite, chalcopyrite, malachite, azurite, brochantite, chrysocolla, cervantite, stibiconite, hemimorphite, calcite (DeKalb Township, New York, USA); spionkopite, chalcopyrite, cobalt pentlandite, magnetite, chromite, andradite, chlorite, diopside (Eretria, Greece).

Distribution: In the USA, from DeKalb Township, St. Lawrence Co., New York [TL], and at Cuchillo, Winston district, Sierra Co., New Mexico. From near Eretria, Othris Mountains, Greece. In the Lubin and Rudna copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland. At the Clara mine, near Oberwolfach, Black Forest, Germany. In southwestern Co. Cork, Ireland. From the Lorena gold deposit, near Cloncurry, Queensland, Australia.

Name: To honor the collector of the original specimens, Adam Geer (1895–1973), of Utica, New York, USA.

Type Material: New York State Museum, Albany, New York; The Natural History Museum, London, England, 1986,482; Queen's University, Kingston, Ontario, Canada; National Museum of Natural History, Washington, D.C., USA, 144186.

Geffroyite $(Cu, Fe, Ag)_9(Se, S)_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly in a micro-myrmekitic intergrowth, to 0.7 mm, with clausthalite and eskebornite.

Physical Properties: Hardness = n.d. VHN = 67.5–72.4 (15 g load). D(meas.) = n.d. D(calc.) = 5.39

Optical Properties: Opaque. *Color:* Brown with a creamy tint in reflected light. *Luster:* Metallic.
R: (400) — , (420) 19.0, (440) 21.4, (460) 23.5, (480) 25.5, (500) 27.5, (520) 29.1, (540) 30.1, (560) 31.7, (580) 32.7, (600) 33.6, (620) 34.4, (640) 35.1, (660) 35.8, (680) 36.3, (700) 36.9

Cell Data: *Space Group:* $Fm3m$. a = 10.889 Z = 4

X-ray Powder Pattern: Chaméane mine, France.
1.925 (100), 3.282 (90), 3.145 (90), 2.094 (60), 1.112 (60), 1.660 (50), 2.436 (40)

Chemistry:

	(1)	(2)
Cu	28.57	28.81
Fe	19.01	19.38
Ag	7.05	5.16
Se	34.42	35.76
S	10.06	9.87
Total	99.11	98.98

(1) Chaméane mine, France; by electron microprobe, corresponds to $(Cu_{4.80}Fe_{3.63}Ag_{0.70})_{\Sigma=9.13}(Se_{4.65}S_{3.35})_{\Sigma=8.00}$. (2) Do.; by electron microprobe, corresponds to $(Cu_{4.77}Fe_{3.65}Ag_{0.50})_{\Sigma=8.90}(Se_{4.76}S_{3.24})_{\Sigma=8.00}$.

Mineral Group: Pentlandite group.

Occurrence: As late-stage deposits in veins cutting granite (Chaméane mine, France).

Association: Eskebornite, clausthalite, chaméanite, ankerite (Chaméane mine, France).

Distribution: From the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France [TL]. In the San Miguel prospect, 10 km northwest of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico.

Name: To honor Jacques Geffroy (1918–1993), metallurgist for the French Atomic Energy Commission.

Type Material: National School of Mines, Paris, France.

(1) Val di Fassa, Italy. (2) Carneal, Ireland; by electron microprobe. (3) $Ca_2Al(AlSi)O_7$.

Polymorphism & Series: Forms a series with åkermanite.

Mineral Group: Melilite group.

Occurrence: In contact metamorphosed impure limestones; in calcium-rich ultramafic volcanic rocks.

Association: Dolomite, calcite, augite, olivine, nepheline, leucite, merwinite, spurrite, diopside, ferroan spinel, phlogopite, pyrope, grossular, antigorite, pyroxenes, apatite, vesuvianite.

Distribution: Occurrences are typically of intermediate series members. Relatively pure examples have been found at: Mt. Monzoni, Val di Fassa, and Canzòcoli, Val di Fiemme, Trentino-Alto Adige, Italy. On Scawt Hill, near Larne, and at Carneal, Co. Antrim, Ireland. At Camas Mòr, Isle of Muck, and Camphouse, Ardnamurchan, Argyllshire, Scotland. From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. In the USA, at Crestmore, Riverside Co., California; from the Tres Hermanas district, Luna Co., New Mexico; and at Iron Hill, Gunnison Co., Colorado. From the Terneras mine, Velardeña, Durango, Mexico.

Name: After the German chemist, Adolf Ferdinand Gehlen (1775–1815).

Geigerite $Mn_5^{2+}(AsO_4)_2(AsO_3OH)_2 \cdot 10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Subhedral crystals, to 0.5 mm, platy on {010}, striated ‖ [001]; in fibrous to fine-grained aggregates.

Physical Properties: *Cleavage:* Perfect on {010}. *Tenacity:* Extremely brittle. Hardness = ∼3 VHN = 105 (20 g load). D(meas.) = 3.05(10) D(calc.) = 3.00

Optical Properties: Transparent to translucent. *Color:* Pale rose-red to colorless. *Streak:* White. *Luster:* Vitreous to pearly. *Optical Class:* Biaxial (–). *Pleochroism:* Very weak; colorless to rose-red in thick sections. *Orientation:* $X \simeq b$; $Y \simeq a$; $Z \simeq c$; $Z \wedge c = 15°$ on {010}; $Z \wedge c = 6°$ on {100}; X almost $\perp$ {010}. *Absorption:* $Z > Y \simeq X$. $\alpha = 1.601(2)$ $\beta = 1.630(2)$ $\gamma = 1.660(2)$ 2V(meas.) = Large. 2V(calc.) = 89°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.944(1)$ $b = 10.691(1)$ $c = 6.770(1)$ $\alpha = 80.97(1)°$ $\beta = 84.20(1)°$ $\gamma = 81.85(1)°$ Z = 1

X-ray Powder Pattern: Falotta mine, Switzerland.
10.45 (100), 3.051 (24), 3.507 (21), 3.340 (20), 3.011 (17), 2.786 (14), 7.85 (13)

Chemistry:

	(1)	(2)
As_2O_5	50.12	45.40
MnO	39.71	35.03
CaO	0.12	
H_2O	[10.05]	19.57
Total	[100.00]	100.00

(1) Falotta mine, Switzerland; by electron microprobe, average of five analyses; H_2O by difference.
(2) $Mn_5(AsO_4)_2(AsO_3OH)_2 \cdot 10H_2O$.

Occurrence: In cavities in radiolarites, formed by metamorphism of manganese oxide ores.

Association: Brandtite, sarkinite, grischunite, bergslagite, manganberzeliite, tilasite.

Distribution: At the Falotta mine, Oberhalbstein, Graubünden, Switzerland.

Name: In honor of Dr. Thomas Geiger (1886–1976), Wiesendangen, Switzerland, who studied Falotta manganese ores.

Type Material: Natural History Museum, Basel, 30804; Basel University, Basel, Switzerland.

(1) Sri Lanka. (2) Bergell zone, Switzerland/Italy; by electron microprobe; Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponding to $Mg_{0.60}Fe^{2+}_{0.35}Mn_{0.03}Fe^{3+}_{0.03}Ti_{0.98}Si_{0.01}O_3$. (3) $MgTiO_3$.

Polymorphism & Series: Forms a series with ilmenite.

Mineral Group: Ilmenite group.

Occurrence: Forms during contact metamorphism of impure magnesian limestones. Also in carbonatites, kimberlites, serpentinized ultramafic rocks, and in gem-bearing placer deposits.

Association: Rutile, spinel, clinohumite, perovskite, diopside, serpentine, forsterite, brucite, hydrotalcite, chlorite, calcite.

Distribution: From the Rakwana and Balangoda districts, Sri Lanka. At Baltistan, Kashmir, Pakistan. In the USA, from the Crestmore quarry, Riverside Co. and in the Santa Lucia Mountains, Monterey Co., California; large crystals in Skeleton Canyon, Cochise Co., Arizona. At the Maxwell quarry, near Wakefield, Quebec, Canada. From the Fiskenæsset complex, western Greenland. In the Bergell contact aureole, Central Alps, Switzerland/Italy. From the Naataniemi serpentinite massif, Kuhmo greenstone belt, Finland. In Russia, on Mount Jemorakly-Tube, North Caucasus Mountains; in the Camel Mountains, Southern Ural Mountains; in the Tazheran alkalic massif, west of Lake Baikal, Siberia. At Kimberley, Cape Province, South Africa. From north of the Mahogany mine, Hartley district, Zimbabwe. Several other localities are known.

Name: In honor of Sir Archibald Geikie (1835–1924), Scottish geologist and Director-General of the Geological Survey of Great Britain.

Type Material: The Natural History Museum, London, England, 69078–69079.

Geminite $Cu(AsO_3OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As euhedral crystals, tabular on {001}, slightly elongated along [100], with {001}, {100}, {010}, and {*hk*0} forms, to 0.3 mm, usually in aggregates. *Twinning:* On {001}, polysynthetic, universal.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 3.70(2) D(calc.) = [3.63]

Optical Properties: Transparent. *Color:* Light green to sea-green. *Streak:* Very pale green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Weak; $X = Y$ = colorless; Z = pale green to pale gray. *Orientation:* $X' \wedge c \simeq 90°$; $Y' \wedge a = 17°$–$18.5°$; $Z' \wedge b = 13°$. *Dispersion:* $r > v$, weak. $\alpha = 1.656(2)$ $\beta = 1.692(2)$ $\gamma = 1.770(5)$ 2V(meas.) = 75(5)° 2V(calc.) = 71°

Cell Data: *Space Group:* $C\overline{1}$. $a = 9.841(2)$ $b = 10.818(2)$ $c = 15.733(3)$ $\alpha = 95.71(2)°$ $\beta = 90.94(2)°$ $\gamma = 103.11(2)°$ Z = 16

X-ray Powder Pattern: Cap Garonne mine, France.
7.83 (100), 3.260 (70), 3.070 (70), 3.925 (60), 2.611 (50), 3.107 (40), 2.825 (40)

Chemistry:

	(1)	(2)
As_2O_5	52.4	51.89
CuO	36.5	35.91
H_2O	11.0	12.20
Total	99.9	100.00

(1) Cap Garonne mine, France; by AA, H_2O by TGA; corresponds to $Cu_{1.04}(As_{1.03}O_3OH)\cdot H_2O$.
(2) $Cu(AsO_3OH)\cdot H_2O$.

Polymorphism & Series: Dimorphous with pushcharovskite.

Occurrence: From an arsenic-bearing oxidized Pb–Cu deposit (Cap Garonne mine, France); on specimens from mine dumps at a gold-bearing arsenic sulfide deposit (Salsigne mine, France).

Association: Tennantite, covellite, chalcanthite, lavendulan, pushcharovskite, antlerite, brochantite, quartz (Cap Garonne mine, France); lindackerite, yvonite, arsenopyrite, bismuth, chalcopyrite, pushcharovskite (Salsigne mine, France).

Distribution: In France, from the Cap Garonne mine, near le Pradet, Var, and in the Salsigne mine, 15 km north of Carcassone, Aude. At Jáchymov (Joachimsthal), Czech Republic. From Hartenstein, Saxony, Germany.

Name: From the Latin *gemini*, for *twins*, as the mineral is extensively twinned.

Type Material: Natural History Museum, Geneva, Switzerland, 435/80.

	(1)	(2)
Pt	44.4	41.86
Pd	9.0	7.01
Rh	6.6	8.23
Ni	2.0	3.41
Cu	0.25	
Sb	35.8	38.96
Bi	1.7	
As	0.89	
Total	100.64	99.47

(1) Onverwacht mine, South Africa; by electron microprobe, corresponds to $(Pt_{2.17}Pd_{0.81}Rh_{0.61}Ni_{0.32}Cu_{0.04})_{\Sigma=3.95}(Sb_{2.81}As_{0.11}Bi_{0.08})_{\Sigma=3.00}$. (2) Shetland Islands, Scotland; by electron microprobe, corresponds to $(Pt_{2.04}Rh_{0.76}Pd_{0.62}Ni_{0.55})_{\Sigma=3.97}Sb_{3.03}$.

Occurrence: In ultramafics or ophiolites mineralized with Pt–Fe–Cu–Ni, and placers derived from them.

Association: Sperrylite, platarsite, ruthenarsenite, stibiopalladinite, mertieite-II, Pt–Fe alloy, chromite (Onverwacht mine, South Africa); osmium, Pt–Pd–Cu alloy, hollingworthite, irarsite, laurite, ruthenian pentlandite, chromite (Shetland Islands, Scotland).

Distribution: In South Africa, in the Merensky Reef, Bushveld complex, Transvaal, at the Onverwacht [TL] and Driekop mines. From the Joubdo stream, Birbir River, Ethiopia. On Unst and Fetlar, Shetland Islands, Scotland. From Fox Gulch, Goodnews Bay, Alaska, USA.

Name: For Dr. Alexandr D. Genkin (1919–), Russian mineralogist specializing in platinum group elements.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, N79000; Canadian Museum of Nature, Ottawa; Royal Ontario Museum, Toronto, Canada, M34861; National Museum of Natural History, Washington, D.C., USA, 136485.

Genthelvite $Zn_4Be_3(SiO_4)_3S$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As tetrahedra and tristetrahedra, to 5 cm. Also as irregular segregations, to 25 cm.

Physical Properties: *Cleavage:* Poor on {111}, {1$\bar{1}$1}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 3.44–3.70 D(calc.) = 3.70 May fluoresce intense green under LW and SW UV, then phosphorescent.

Optical Properties: Transparent. *Color:* Red, pink, yellow, pale green, emerald-green; colorless or pink in thin section. *Luster:* Vitreous.
Optical Class: Isotropic. n = 1.738–1.752

Cell Data: *Space Group:* $P\bar{4}3n$. a = 8.10–8.15 Z = 2

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
3.320 (100), 1.916 (80), 2.168 (70), 2.567 (65), 1.657 (65), 1.483 (50), 1.435 (50)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)
SiO_2	30.26	30.70	CuO	0.30		LOI	0.21	
Al_2O_3		0.18	ZnO	46.20	40.56	$-O = S$	2.78	2.74
FeO	6.81	11.73	BeO	12.70	12.39	Total	100.41	100.04
MnO	1.22	1.72	S	5.49	5.50			

(1) St. Peters Dome, Colorado, USA; average of two analyses, corresponds to $(Zn_{3.31}Fe^{2+}_{0.56}Mn_{0.10}Cu_{0.02})_{\Sigma=3.99}Be_{2.91}Si_{2.97}O_{11.72}S_{1.00}$. (2) Jos, Nigeria; corresponds to $(Zn_{2.93}Fe^{2+}_{0.96}Mn_{0.14})_{\Sigma=4.03}Be_{2.92}(Si_{3.02}Al_{0.04})_{\Sigma=3.06}O_{11.99}S_{1.01}$.

Polymorphism & Series: Forms two series, with danalite, and with helvite.

Occurrence: In miarolitic cavities in granite pegmatites; in alkaline granites and syenites, greisens, and skarns.

Association: Phenakite, bertrandite, hambergite, siderite, sphalerite, willemite, gahnite, topaz, zircon, quartz, microcline, zeolites.

Distribution: From West Cheyenne Cañon, near St. Peters Dome, El Paso Co., Colorado, and Cumberland, Providence Co., Rhode Island, USA. Large crystals from Mont Saint-Hilaire, Quebec, Canada. At Lågendalen, Tvedalen, Brevik, and on Låven Island, in the Langesundsfjord area, Norway. At the Treburland mine, Altarnun, Cornwall, England. From Coire an Lochain, Cairngorm Mountains, Banffshire, Scotland. In the Jos-Bukuru complex, Nigeria. From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. In the Ilímaussaq intrusion and the Motzfeldt centre, Greenland. From Russia, in the Lovozero and Khibiny massifs, Kola Peninsula. At Titkäranta, Karelia.

Name: The prefix for Frederick August Ludwig Karl Wilhelm Genth (1820–1893), German-American mineralogist, who described a zinc-rich *helvite* (danalite), later renamed genthelvite.

Type Material: Pennsylvania State University, University Park, Pennsylvania; National Museum of Natural History, Washington, D.C., USA, 127180; The Natural History Museum, London, England, 1976,427.

Geocronite $Pb_{14}(Sb, As)_6S_{23}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals rare, but may be to 8 cm, from several localities; tabular on {001}. Massive, as rounded and irregular grains; earthy. *Twinning:* Common on {001}; lamellar.

Physical Properties: *Cleavage:* Distinct on {011}. *Fracture:* Uneven. Hardness = 2.5 VHN = 144–160 (100 g load). D(meas.) = 6.46 D(calc.) = 6.44

Optical Properties: Opaque. *Color:* Pale lead-gray to pale gray; in polished section, pure white. *Streak:* Pale lead-gray to grayish blue. *Luster:* Metallic. *Pleochroism:* Weak. *Anisotropism:* Moderate.
R_1–R_2: (400) 40.5–45.3, (420) 40.4–45.0, (440) 40.0–44.4, (460) 39.7–43.9, (480) 39.5–43.6, (500) 39.3–43.2, (520) 39.1–42.8, (540) 38.8–42.3, (560) 38.6–41.9, (580) 38.3–41.5, (600) 38.0–41.1, (620) 37.7–40.6, (640) 37.2–40.1, (660) 36.5–39.4, (680) 35.9–38.8, (700) 35.1–38.2

Cell Data: *Space Group:* $P2_1/m$. $a = 8.963(2)$ $b = 31.93(2)$ $c = 8.500(2)$ $\beta = 118.02(1)^\circ$ $Z = 2$

X-ray Powder Pattern: Park City, Utah, USA.
3.54 (100), 3.06 (90), 2.89 (90), 3.39 (80), 3.18 (86), 2.98 (70), 3.71 (60)

Chemistry:

	(1)	(2)	(3)

Sb	9.27	11.48	8.64
As	4.54	3.65	5.32
S	17.13	17.45	17.44
Total	99.84	100.10	100.00

(1) Sala, Sweden; corresponds to $Pb_{14.32}(Sb_{3.28}As_{2.61})_{\Sigma=5.89}S_{23.00}$. (2) Silver King mine, Park City, Utah, USA; corresponds to $Pb_{13.77}(Sb_{3.98}As_{2.06})_{\Sigma=6.04}S_{23.00}$. (3) $Pb_{14}(Sb, As)_6S_{23}$ with Sb:As = 1:1.

Polymorphism & Series: Forms a series with jordanite.

Occurrence: In hydrothermal veins with sulfides and other sulfosalt minerals.

Association: Galena, pyrite, tetrahedrite, barite, fluorite, quartz.

Distribution: Only some of the best authenticated localities are mentioned here. In Sweden, from Sala, Västmanland [TL??only, not Falun=DS8??ck Swedish book??], and Falun, Kopparberg [??TL??MRM??]. In Ireland, in the Kilbricken mine, Co. Clare, and at Silvermines, Co. Tipperary. From the Treore mine, St. Treath [Teath in Criddle??ck], Cornwall, England. At Bournac, Montagne Noire, Finistère, France. From the Bayerland mine, Oberpfalz??, Germany. In Italy, at Pietrasanta, Val de Castello [Pollone mine, Valdicastello Carducci??], Tuscany. From Uzunzhal, Kazakhstan. At Smirnovsk, Transbaikal??, Siberia, Russia. From the Xanda mine, Virgem da Lapa, Minas Gerais, Brazil. In the Noche Buena mine, Mazapil, Zacatecas, Mexico. In the USA, in Utah, in the Silver King mine, Park City district, Summit Co.; and in the Tintic district, Juab Co.; in California, at Darwin, Inyo Co.; at the Inexco #1 mine, Jamestown, Boulder Co., Colorado. From the Hemlo gold deposit, Thunder Bay district, Ontario, Canada.

Name: From the Greek for *Earth* and *Saturn*, the alchemistic name for lead.

Georgbarsanovite $Na_{12}(Mn, Sr, REE)_3Ca_6Fe^{2+}{}_3Zr_3NbSi_{25}O_{76}Cl_2 \cdot H_2O$

Crystal Data: Hexagonal. *Point Group*: 3*m*. As 1-2 cm thick, branching veinlets with either gradational or sharp contacts with eudialyte.

Physical Properties: *Cleavage*: None observed. *Fracture*: Uneven to conchoidal. *Tenacity*: Brittle. Hardness = 5 D(meas.) = 3.05(2) D(calc.) = 3.11

Optical Properties: Transparent to translucent. *Color*: Yellow-green. *Streak*: White. *Luster*: Vitreous.
Optical Class: Uniaxial (–) [some grains show anomalous biaxial character, 2V = 10-15°].
ω = 1.639(2) (bottle green) ε = 1.631(2) (pale yellow)

Cell Data: *Space Group*: *R*3*m*. a = 14.274(2) c = 30.02(1) Z = 3

X-ray Powder Pattern: Kola Peninsula, Russia.
3.202 (100), 2.975 (98), 2.857 (94), 3.155 (71), 4.304 (62), 6.42 (54), 2.591 (54)

Chemistry:

		Total	99.97

(1) Kola Peninsula, Russia; electron microprobe analysis, IR spectroscopy confirms the presence of (OH), H_2O and minor CO_2, corresponding to $(Na_{11.73}K_{0.24})_{\Sigma=11.97}(Mn_{1.19}Sr_{0.71}REE_{0.63}Ca_{0.30}Y_{0.13}Ba_{0.03})_{\Sigma=2.99}Ca_6(Fe^{2+}{}_{2.55}Zr_{0.23}Ti_{0.05}Hf_{0.04})_{\Sigma=2.87}Zr_3Nb_{0.92}Si_{25.25}O_{76.48}Cl_{1.11}F_{0.61}\cdot 0.88H_2O$.

Mineral Group: Eudialyte subgroup of the eudialyte group.

Occurrence: A late stage reaction product in nepheline-feldspar pegmatite associated with an alkaline massif.

Association: Eudialyte.

Distribution: In boulders, upper reaches of the Petreliusa River valley, Khibiny alkaline massif, Kola Peninsula, Russia.

Name: Honors prominent Russian mineralogist Georgiy Pavlovich Barsanov (1907-1991).

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (catalog no. 61504).

CuO	58.17	58.96
ZnO	0.22	
Cl	10.96	10.51
$-O = Cl_2$	2.47	2.37
Total	99.97	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, average of 13 analyses; corresponds to $(Cu_{4.92}Zn_{0.02})_{\Sigma=4.94}O_{1.91}(SeO_3)_{2.01}Cl_{2.08}$. (2) $Cu_5O_2(SeO_3)_2Cl_2$.

Occurrence: A rare fumarolic sublimate.

Association: Burnsite, chloromenite, sofiite, ilinskite, cotunnite, halite, moissanite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: To honor Professor Georgiy Borisovich Bokii (1909–2001), Institute of Geology of Ore Deposits, Moscow, Russia, for his work in mineralogy and crystal chemistry.

Type Material: Mineralogy Museum, St. Petersburg University; Mining Institute, St. Petersburg, Russia.

Georgechaoite $KNaZrSi_3O_9 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As well-formed single and twinned hemimorphic crystals, to 1 mm; forms include {010}, {011}, {100}, {$\bar{1}$00}, {$\bar{1}$01}, {101}, and {120}. *Twinning:* Common, by interpenetration of individuals related by a half-turn about [023]; the [100] axes of twinned crystals are parallel, with [010] of one 14° from [001] of the other.

Physical Properties: *Fracture:* Conchoidal. Hardness = 5 D(meas.) = 2.70(2) D(calc.) = 2.689

Optical Properties: Semitransparent. *Color:* Colorless to white. *Optical Class:* Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. $\alpha = 1.578(1)$ $\beta = 1.597(1)$ $\gamma = 1.606(1)$ 2V(meas.) = 67° 2V(calc.) = 68°

Cell Data: *Space Group:* $P2_1nb$. $a = 11.836(4)$ $b = 12.940(6)$ $c = 6.735(4)$ Z = 4

X-ray Powder Pattern: Wind Mountain, New Mexico, USA; very similar to gaidonnayite. 3.12 (100), 6.46 (73), 5.95 (70), 5.67 (52), 5.83 (32), 2.829 (22), 2.201 (21)

Chemistry:

	(1)	(2)
SiO_2	43.18	43.16
TiO_2	0.11	
ZrO_2	29.03	29.51
FeO	0.15	
Na_2O	7.54	7.42
K_2O	10.75	11.28
H_2O	[9.21]	8.63
Total	[99.97]	100.00

(1) Wind Mountain, New Mexico, USA; by electron microprobe, average of several analyses, H_2O estimated by analogy to gaidonnayite. (2) $NaKZrSi_3O_9 \cdot 2H_2O$.

Occurrence: In miarolitic cavities in analcime-bearing nepheline syenite (Wind Mountain, New Mexico, USA); in a carbonatite, in dolomitic veinlets cutting metasomatically altered pyroxenites, apparently altering from catapleiite (Vuoriyarvi complex, Russia).

Association: Microcline, nepheline, aegirine, catapleiite, monazite, chlorite (Wind Mountain, New Mexico, USA); dolomite, strontianite, phlogopite, barite, komkovite, pyrite (Vuoriyarvi complex, Russia).

Distribution: On Wind Mountain, Otero Co., New Mexico, USA. In the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. From Poços de Caldas, Minas Gerais, Brazil.

Name: Honors Professor George Y. Chao, of Carleton University, Toronto, Canada, for his studies of zirconium silicates.

Type Material: National Museum of Natural History, Washington, D.C., USA, 161902.

Georgeericksenite $Na_6CaMg(IO_3)_6(CrO_4)_2 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As acicular to prismatic [001] crystals, slightly flattened on {110}, to 0.2 mm, with dominant forms {110}, {100}, {$\overline{2}$33}; in nodular aggregates.

Physical Properties: *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = n.d. D(calc.) = 3.035 Readily soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Bright lemon-yellow to pale yellow. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* Slight; X = very pale yellow; Z = distinct yellow-green. *Orientation:* $Z \simeq c$. $\alpha = 1.647(2)$ $\beta = 1.674(2)$ $\gamma = 1.704(2)$ 2V(meas.) = n.d. 2V(calc.) = 88.4°

Cell Data: *Space Group:* $C2/c$. $a = 23.645(2)$ $b = 10.918(1)$ $c = 15.768(1)$ $\beta = 114.42(6)°$ Z = 4

X-ray Powder Pattern: Oficina Chacabuco, Chile.
10.69 (100), 3.121 (80), 3.051 (80), 3.590 (70), 6.36 (50), 5.65 (50), 4.36 (40)

Chemistry: (1) Oficina Chacabuco, Chile; major elemental components and anion groups confirmed by qualitative electron microprobe and IR; by crystal-structure analysis, corresponds to $Na_{6.00}Ca_{1.00}Mg_{1.00}(IO_3)_{6.00}[(Cr_{0.84}S_{0.16})_{\Sigma=1.00}O_4]_2 \cdot 12H_2O$.

Occurrence: On a museum specimen from a nitrate deposit.

Association: Halite, nitratine, niter.

Distribution: From Oficina Chacabuco, Taltal district, Antofagasta, Chile.

Name: Honors George E. Ericksen (1920–1996), research geologist, U.S. Geological Survey, Reston, Virginia, USA, who studied Chilean nitrate deposits.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 82914.

(1) Carr Boyd Rocks mine, Australia; IR confirms OH^{1-} and H_2O; recalculated after deduction of chalconatronite 12.35% from an original analysis totalling 100.5%; then corresponds to $(Cu_{5.01}Zn_{0.05})_{\Sigma=5.06}(CO_3)_3(OH)_{4.12} \cdot 6.3H_2O$. (2) $Cu_5(CO_3)_3(OH)_4 \cdot 6H_2O$.

Occurrence: A rare secondary mineral in oxidized portions of a Ni–Cu sulfide deposit.

Association: Malachite, chalconatronite, nickelian magnesite, gypsum.

Distribution: From the Carr Boyd Rocks nickel mine, Yerilla district, 80 km north-northeast of Kalgoorlie, Western Australia.

Name: Honors George Herbert Payne (1912–1989), Chief of the Mineral Division, Government Chemical Laboratories, Perth, Western Australia.

Type Material: Western Australian Museum, Perth, Australia, 5775; National Science Museum, Tokyo, Japan; The Natural History Museum, London, England, 1979,323; National Museum of Natural History, Washington, D.C., USA.

Georgiadèsite $Pb_8(AsO_4)_2OCl_7(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are pseudohexagonal tablets, showing {100}, {001}, {110}, and several other modifying forms, with multiple individuals typically grown in parallel, to 5 mm.

Physical Properties: Hardness = 3.5 D(meas.) = 6.3(3) D(calc.) = 6.39

Optical Properties: Semitransparent. *Color:* White or brownish yellow; colorless in transmitted light. *Luster:* Resinous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z = c$. *Dispersion:* $r < v$, strong. $\alpha = 2.17$ $\beta = 2.17$ $\gamma = 2.18$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $P2_1/c$. $a = 13.803(10)$ $b = 7.910(2)$ $c = 10.812(4)$ $\beta = 102.68(3)°$ Z = 1

X-ray Powder Pattern: Laurium, Greece.
3.096 (10), 3.955 (5), 3.164 (5), 6.33 (3), 5.30 (3), 4.031 (3), 3.773 (3)

(1) Laurium, Greece; recalculated from original analyses, O^{2-} calculated for charge balance; corresponds to $Pb_{7.65}(AsO_4)_{2.35}O_{0.3}Cl_{7.65}$. (2) Do.; by electron microprobe, O^{2-} calculated for charge balance; corresponds to $Pb_{7.85}(AsO_4)_{2.1}O_{1.25}Cl_{6.9}$. (3) $Pb_8(AsO_4)_2OCl_7(OH)$.

Occurrence: Formed by the action of seawater on lead-bearing slag (Laurium, Greece).

Association: Laurionite, fiedlerite, matlockite, phosgenite, nealite (Laurium, Greece).

Distribution: At Laurium, Greece, in slag.

Name: In honor of Mr. Georgiadès, a Director of the mines at Laurium Greece.

Type Material: National School of Mines, Paris, France; American Museum of Natural History, New York City, New York, 28427; National Museum of Natural History, Washington, D.C., USA, 137839, 145938.

(1) Mt. Punkaruaiv, Russia; original total given as 100.11%; corresponds to $(Mn_{0.84}Ca_{0.18})_{\Sigma=1.02}(Nb_{2.50}Ti_{2.50})_{\Sigma=5.00}O_{12.27}\cdot 9.09H_2O$. (2) Mt. Karnasurt, Russia. (3) Ilímaussaq intrusion, Greenland; partial analysis.

Polymorphism & Series: Forms a series with manganbelyankinite.

Occurrence: As a secondary mineral formed by the late-stage hydrothermal alteration of Nb–Ti minerals (possibly epistolite) within ussingite-bearing pegmatites, associated with alkaline intrusions.

Association: Ussingite, epistolite, steenstrupine, neptunite (Lovozero massif, Russia); albite, analcime, aegirine, natrolite, tetranatrolite, chkalovite, lithian mica, epistolite, niobophyllite, monazite, rhabdophane, tugtupite, nenadkevichite, beryllite (Ilímaussaq intrusion, Greenland).

Distribution: Found on Mts. Punkaruaiv, Karnasurt, Nepkhe, and Alluaiv, in the Lovozero massif, Kola Peninsula, Russia. In Greenland, occurs at Nákâlâq, in the Ilímaussaq intrusion.

Name: Honors Vasily Ivanovich Gerasimovskii (1911–1979), Russian mineralogist and geochemist, discoverer of many new minerals from the Lovozero massif.

Type Material: Vernadsky Geological Museum, Moscow, 46315; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 62290.

(1) Tsumeb, Namibia; by electron microprobe, total Fe as Fe_2O_3, H_2O by TGA on a separate sample; corresponds to $(Zn_{0.83}Fe_{0.49}Al_{1.60})_{\Sigma=2.92}[(As_{0.97}Mo_{0.03})_{\Sigma=1.00}O_4](OH)_{4.30}$. (2) Do.; corresponds to $(Zn_{0.85}Fe_{0.44}Al_{1.86})_{\Sigma=3.15}[(As_{0.97}Mo_{0.03})_{\Sigma=1.00}O_4](OH)_{4.43}$. (3) $(Zn_{0.85}Fe^{2+}_{0.15})_{\Sigma=1.00}(Al_{1.70}Fe^{3+}_{0.30})_{\Sigma=2.00}(AsO_4)(OH)_5$.

Occurrence: A very rare secondary mineral from the deep oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Powellite, betpakdalite, scorodite, wilhelmkleinite, adamite, hematite, kaolinite, quartz.

Distribution: From Tsumeb, Namibia.

Name: To honor Dr. Gerd Tremmel (1940–), of Overath-Steinbrück, Germany, who submitted the mineral for identification.

Type Material: Mineralogical-Petrographical Institute, University of Heidelberg, Heidelberg, Germany; National Museum of Natural History, Washington, D.C., USA, 162488.

(1) United Verde mine, Arizona, USA. (2) $Cu_2(NO_3)(OH)_3$.

Polymorphism & Series: Dimorphous with rouaite.

Occurrence: A rare secondary mineral in oxidized portions of copper deposits.

Association: Cuprite, malachite, atacamite, miersite, brochantite, pseudomalachite, buttgenbachite, likasite, connellite, claringbullite.

Distribution: In the USA, in Arizona, from the United Verde mine, Jerome, Yavapai Co.; in the Daisy shaft, Mineral Hill mine, Pima district, Pima Co.; and at Chase Creek Canyon, Greenlee Co. Large crystals from Likasi, and at Kalabi, near Likasi, Katanga Province, Congo [Shaba Province, Zaire]. From Dzhezkazgan, Kazakhstan. At Ramsbeck, Westphalia, Germany. From the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France. At the Great Australia and Monakoff mines, near Cloncurry, Queensland, Australia.

Name: Honors Charles Frederic Gerhardt (1816–1856), American chemist who first prepared the artificial compound.

Type Material: Yale University, New Haven, Connecticut, USA, 3.3269.

(3) $Cu^{1+}_8Cu^{2+}_5Fe^{3+}_2Ge^{4+}_2S_{16}$; Mo-, V-, and W-rich varities are known.

Mineral Group: Colusite group.

Occurrence: In primary Cu–Pb–Zn ores in a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Reniérite, pyrite, tennantite, enargite, galena, sphalerite, digenite, bornite, chalcopyrite.

Distribution: From Tsumeb, Namibia [TL]. At M'Passa, 150 km west of Brazzaville, Congo Republic. From Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). In the USA, at the Inexco #1 mine, Jamestown, Boulder Co., Colorado; and in the Ruby Creek deposit, Brooks Range, near Bornite, Alaska. In Cuba, from Pinar del Rio Province. In Bulgaria, at the Radka deposit, Pazardzhik. From Dastakert, Armenia. At Bor, Serbia. From the Bancairoun mine, Alpes-Maritimes, France. At Weisloch, ??, Germany. In Russia, from Vaygach, Arkhangel'sk, and in the Noril'sk region, western Siberia; at the Vaigach and Sibai deposits, Ural Mountains. In the Shakanai mine, Akita Prefecture, Japan.

Name: For the *germanium* content of the mineral.

Type Material: The Natural History Museum, London, England, 1922,1180.

Gersdorffite NiAsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. Crystals are octahedral, typically modified by the cube, to 4 cm, or pyritohedral, may be striated as is pyrite; commonly internally zoned.

Physical Properties: *Cleavage:* Perfect on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5 VHN = 657–767 (100 g load). D(meas.) = 5.9 D(calc.) = 5.966

Optical Properties: Opaque. *Color:* Silver-white to steel-gray; may tarnish gray or grayish black; in polished section, white. *Streak:* Grayish black. *Luster:* Metallic.
R: (400) 50.2, (420) 49.7, (440) 49.1, (460) 48.6, (480) 47.7, (500) 47.0, (520) 46.2, (540) 45.7, (560) 45.3, (580) 45.1, (600) 45.0, (620) 45.1, (640) 45.3, (660) 45.5, (680) 45.9, (700) 46.3

Cell Data: *Space Group: Pa*3. $a = 5.60$–5.72, 5.594 (synthetic). Z = 4

X-ray Powder Pattern: Synthetic.
2.545 (100), 2.325 (90), 1.716 (80), 2.848 (60), 2.013 (35), 1.521 (35), 1.096 (20)

Total	[100.00]	100.9	100.00

(1) Rhodesia; recalculated to 100% after deduction of gangue; corresponds to $Ni_{1.01}(As_{1.05}Sb_{0.02})_{\Sigma=1.07}S_{1.00}$. (2) Cochabamba, Bolivia; by electron microprobe, corresponds to $(Ni_{1.03}Fe_{0.01})_{\Sigma=1.04}(As_{1.00}Sb_{0.02})_{\Sigma=1.02}S_{1.00}$. (3) NiAsS.

Polymorphism & Series: Modifications -Pa3, -$P2_13$, and -$Pca2_1$ are known.

Mineral Group: Cobaltite group.

Occurrence: In hydrothermal vein deposits formed at medium temperatures.

Association: Nickeline, nickel-skutterudite, cobaltite, ullmannite, maucherite, löllingite, platinum-group minerals, millerite, pyrite, marcasite, chalcopyrite.

Distribution: A number of new localities have been recognized in recent years, only a few of which can be listed. In Austria, from Schladming, 64 km southeast of Salzburg, Styria [TL], and at Olsa, Freisach, Carinthia. In Germany, at Müsen, Wissen, and Ramsbeck, North Rhine-Westphalia; from Lobenstein, Thuringia; at Bad Ems and Dillenburg, Hesse; and from the Rammelsberg mine, near Goslar, and at Wolfsberg, Harz Mountains. From Dobšiná (Dobschau), Slovakia. In the Craignure mine, Inverary, Strathclyde region, Scotland. At Silvermines, Co. Tipperary, Ireland. In the USA, large crystals from the Snowbird mine, Mineral Co., Montana. In Canada, in several mines at Sudbury and Cobalt, Ontario. At Cochabamba, Bolivia. In the Aït Ahmane mine, 10 km east of Bou Azzer, Morocco, as fine crystals. From the Mt. Ogilvie and Nichol Nob mines, Flinders Ranges, South Australia.

Name: To honor Johann von Gersdorff (1781–1849), owner of the nickel mine at Schladming, Austria.

Gerstleyite $Na_2(Sb, As)_8S_{13}\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* As spherules with a fibrous to platy structure, to 2.5 cm; also as fine granular aggregates and groups of small thick plates.

Physical Properties: *Cleavage:* Perfect on {010} and {100}; poor on {001}. Hardness = 2.5 VHN = n.d. D(meas.) = 3.62 D(calc.) = 3.723

Optical Properties: Transparent. *Color:* Cinnabar-red. *Streak:* Bright cinnabar-red; powder darkens on exposure. *Luster:* Weakly adamantine.
Optical Class: [Biaxial.] *Pleochroism:* Weak; X = salmon-red; $Y = Z$ = deep blood-red.
$n = > 2.01$
R_1–R_2: n.d.

Cell Data: *Space Group: Cm.* $a = 9.911(8)$ $b = 23.05(2)$ $c = 7.097(8)$ $\beta = 127.85(7)^\circ$
$Z = 2$

X-ray Powder Pattern: Baker mine, California, USA.
11.85 (100), 3.05 (90), 5.64 (70), 4.03 (70), 2.81 (50), 2.739 (40), 1.934 (40)

(1) Baker mine, California, USA. (2) Analysis (1) recalculated to 100% after deduction of gangue 8%, corresponds to $(Na_{2.87}Li_{0.31})_{\Sigma=3.18}(Sb_{6.06}As_{1.52})_{\Sigma=7.58}S_{13.00}\cdot 4.68H_2O$.
(3) $Na_2(Sb, As)_8S_{13}\cdot 2H_2O$ with Sb:As = 4:1.

Occurrence: A low-temperature mineral found embedded in massive borates and clay.

Association: Borax, probertite, tincalconite, realgar, stibnite.

Distribution: In the USA, from the Baker mine, Kramer borate deposit, Boron, Kern Co., California [TL].

Name: Honors James Mack Gerstley (1907–), President of the Pacific Coast Borax Company.

Type Material: Harvard University, Cambridge, Massachusetts, 111307; National Museum of Natural History, Washington, D.C., USA, 106916.

Gerstmannite $(Mg, Mn^{2+})_2Zn(SiO_4)(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As mats and sprays of bunched prismatic crystals, to 1 cm; as single crystals typically bounded by {100}, {010}, {110}, lacking terminations.

Physical Properties: *Cleavage:* Good on {010}. Hardness = 4.5 D(meas.) = 3.68(2) D(calc.) = 3.66

Optical Properties: Translucent to opaque. *Color:* White to very pale pink. *Streak:* White. *Luster:* Vitreous to subadamantine, silky when matted.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.665(2)$ $\beta = 1.675(2)$ $\gamma = 1.678(2)$ 2V(meas.) = 50°–60°

Cell Data: *Space Group: Bbcm*. $a = 8.185(7)$ $b = 18.65(2)$ $c = 6.256(6)$ Z = 8

X-ray Powder Pattern: Sterling Hill, New Jersey, USA.
2.598 (100), 9.326 (85), 3.418 (80), 2.758 (75), 2.332 (75), 2.983 (60), 4.806 (50)

Getchellite $AsSbS_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As subhedral crystals, to 2 cm, commonly bent; massive.

Physical Properties: *Cleavage:* Perfect micaceous on {001}, yielding flexible, inelastic lamellae. *Fracture:* Splintery. *Tenacity:* Flexible to some degree, but inelastic. Hardness = 1.5–2 VHN = n.d. D(meas.) = 3.92 D(calc.) = 3.98 (synthetic).

Optical Properties: Transparent. *Color:* Dark blood-red, tarnishes to green to purple iridescence. *Streak:* Red-orange. *Luster:* Pearly to vitreous on cleavage surfaces, otherwise resinous.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $Y \wedge a = 15(5)°$; $Y \wedge c = 101(5)°$. *Dispersion:* $r > v$, strong, crossed. $\alpha = > 2.72$ (Li). $2V(meas.) = < 46°$ *Anisotropism:* Weak.
R_1–R_2: (400) 34.8–37.9, (420) 34.2–37.4, (440) 33.6–36.9, (460) 32.7–36.0, (480) 31.8–34.8, (500) 30.7–33.5, (520) 29.5–31.9, (540) 28.1–30.6, (560) 27.0–29.4, (580) 26.2–28.6, (600) 25.7–28.0, (620) 25.2–27.4, (640) 24.9–27.0, (660) 24.5–26.8, (680) 24.2–26.5, (700) 23.8–26.1

S	32.82	34.30	32.84
Total	99.95	102.60	100.00

(1) Getchell mine, Nevada, USA; average of several analyses. (2) Zarehshuran, Iran. (3) $AsSbS_3$.

Occurrence: In an epithermal gold deposit formed in a narrow, steeply-dipping fault zone cutting interbedded Paleozoic (?) shales, argillites, and limestones, near a granodiorite intrusive (Getchell mine, Nevada, USA).

Association: Orpiment, realgar, stibnite, cinnabar, galkhaite, laffittite, chabournéite, christite, lorandite, marcasite, quartz, barite, fluorite, calcite.

Distribution: In the USA, in Nevada, from the Getchell mine, about 32 km northeast of Golconda, Potosi district, Humboldt Co. [TL], and in the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co. At the Zarehshuran gold deposit, 35 km north of Takab, northwestern Iran. From the Gal-Khaya deposit, Sakha, Russia. At Khaydarkan and in the Chauvai Sb–Hg deposit, Fergana Valley, Alai Range, Kyrgyzstan. From the Toya mine, Abuta, Hokkaido, Japan.

Name: For the Getchell mine, Nevada, USA, where it was discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 118159, 118160.

Total	96.5	98.4	100.00

(1) Driekop mine, South Africa; by electron microprobe, corresponds to $Pt_{1.00}Sb_{1.84}$.
(2) Onverwacht mine, South Africa; by electron microprobe, corresponds to $Pt_{1.00}(Sb_{1.66}Bi_{0.29}As_{0.04})_{\Sigma=1.99}$ (3) $PtSb_2$.

Mineral Group: Pyrite group.

Occurrence: In concentrates of platinum minerals derived from Pt–Fe–Ni–Cu deposits in ultramafic rocks (Driekop mine, South Africa).

Association: Platinum, gold, hollingworthite, sperrylite, stibiopalladinite, chalcopyrite, pyrrhotite (Driekop mine, South Africa); vozhminite, heazlewoodite, tučekite, magnetite, copper (Vozhmin massif, Russia).

Distribution: In South Africa, in the Merensky Reef, Bushveld complex, Transvaal, in the Driekop [TL] and Onverwacht mines. In Russia, from the Morozova and Oktyabr mines, Talnakh area, Noril'sk region, western Siberia, and in the Vozhmin massif, Segezha district, central Karelia. At the Kelvon Grove prospect, near Fifield, New South Wales, Australia. From the Baula complex, Orissa, India. At Fox Gulch, Goodnews Bay, Alaska, USA. In the Wellgreen Ni–Cu–PGM deposit, Yukon Territory, Canada.

Name: In honor of Professor Traugott Wilhelm Gevers (1900–1991), University of the Witswatersrand, Johannesburg, South Africa, eminent South African geologist.

Type Material: National School of Mines, Paris, France.

Total	95.2	100.00

(1) Mariposa mine, Texas, USA; by separate microchemical analyses on several samples, corresponding to $Hg_{4.1}(SO_4)_{0.9}N_{2.0}$. (2) $Hg_4(SO_4)N_2$.

Occurrence: A rare secondary mineral coating fracture surfaces in oxidized portions of a hydrothermal mercury deposit, the nitrogen likely derived from decaying organic matter (Mariposa mine, Texas, USA); in a mercury deposit in silicate–carbonate rock hydrothermally altered from serpentinite (Clear Creek claim, California, USA).

Association: Cinnabar, terlinguaite, montroydite, mercury, calomel, hematite, calcite (Mariposa mine, Texas, USA).

Distribution: In the USA, from the Perry pit, Mariposa mine, Terlingua district, Brewster Co., Texas; on the Clear Creek claim, near the Clear Creek mercury mine, New Idria district, San Benito Co., California.

Name: Honors Professor Vincent Paul Gianella (1886–1983), Head of the Department of Geology, MacKay School of Mines, University of Nevada, Reno, Nevada, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 124993; National Museum of Natural History, Washington, D.C., USA, 142886, 142887.

(1) Klein-Tresny, Moravia. (2) $Al(OH)_3$.

Polymorphism & Series: Polymorphous with bayerite, doyleite, and nordstrandite.

Occurrence: A typical product of weathering of aluminous minerals, common in lateritic soils and bauxite. Also formed in low-temperature hydrothermal and metamorphic environments, replacing aluminous minerals.

Association: Diaspore, böhmite, corundum, kaolinite, goethite.

Distribution: Widespread, particularly in bauxite deposits. Some prominent localities are: in the USA, at Richmond, Berkshire Co., Massachusetts; Unionville, Chester Co., Pennsylvania; large crystals from the Champion mine, White Mountains, Mono Co., California; from Toomsboro, Wilkinson Co., Georgia; at Tar Branch, near Winston-Salem, Forsyth Co., North Carolina. Around Saramenha, Ouro Prêto, Minas Gerais, Brazil. From Paramaribo, Surinam. On Eikaholmen and Lille-Arø Islands, Langesundsfjord, and at Tredalen, near Larvik, Norway. Large crystals from Schischimskaya, near Zlatoust, Ural Mountains, Russia. On the Vogelsberg, Hesse, and on the Katzenbuckel, Baden-Württemberg, Germany. In India, many localities, as at Kodikanal, Madras, and Talevadi, near Bombay, Maharashtra. From Dundas, Tasmania, Australia.

Name: Honors Colonel George Gibbs (1776–1833), a prominent mineral collector of New Haven, Connecticut, USA.

Type Material: n.d.

Giessenite $\mathbf{Pb_{28}Cu_2^{1+}(Bi,Sb)_{19}S_{57}}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As fine needles, to 1.5 mm. *Twinning:* Intimately on {100}.

Physical Properties: Hardness = ∼2.5 VHN = 65 D(meas.) = n.d. D(calc.) = 7.45

Optical Properties: Opaque. *Color:* Grayish black. *Streak:* Grayish black. *Luster:* Metallic. R_1–R_2: n.d.

Cell Data: *Space Group:* $P2_1/n$. $a = 34.51(3)$ $b = 38.18(5)$ $c = 4.080(8)$ $\beta = 90.33(5)°$ $Z = 2$

X-ray Powder Pattern: Bjørkåsen, Norway.
2.0271 (100), 3.436 (90), 3.404 (90), 2.1514 (90), 2.9061 (70), 2.8867 (70), 2.8413 (70)

Chemistry:

	(1)	(2)	(3)
Pb	47.5	48.3	48.9
Cu	1.2	0.7	0.88
Ag			0.14
Fe			0.09
Bi	29.8	31.7	31.2
Sb	4.2	3.5	3.1
S	16.5	[16.0]	16.4
Total	99.2	[100.2]	[100.71]

(1) Binntal, Switzerland; by electron microprobe, average of three analyses; corresponds to $Pb_{25.88}Cu_{2.13}(Bi_{16.10}Sb_{3.89})_{\Sigma=19.99}S_{58.08}$. (2) Bjørkåsen, Norway; by electron microprobe, average of three analyses, S assumed; corresponds to $Pb_{26.36}Cu_{1.24}(Bi_{17.15}Sb_{3.25})_{\Sigma=20.40}S_{56.41}$. (3) Do.; by electron microprobe, average of eight analyses, original total given as 100.8%; corresponds to $Pb_{26.50}(Cu_{1.55}Fe_{0.18}Ag_{0.15})_{\Sigma=1.88}(Bi_{16.76}Sb_{2.86})_{\Sigma=19.62}S_{57.42}$.

Polymorphism & Series: Forms a series with izoklakeite.

Occurrence: Of hydrothermal origin, with other sulfides.

Association: Galena, pyrite, pyrrhotite, sphalerite, tennantite, seligmannite, geocronite, quartz, dolomite.

Distribution: In Switzerland, from Turtschi, between Giessen and Binn, about 2 km from the Lengenbach quarry, Binntal, Valais [TL]; and at Lake Zervreila, Vals, Graubünden. From the Bjørkåsen sulfide deposit, Otoften, Norway. At the Vena mines, near Askersund, Örebro, Sweden. In the Otome mine, Yamanashi Prefecture, Japan.

Name: For Giessen, a village nearby the Binntal, Switzerland.

Type Material: Natural History Museum, Basel, Switzerland, SG393.

Gilalite $Cu_5Si_6O_{17}\cdot 7H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, probable. *Point Group:* n.d. As spherules of radial fibers, to 0.3 mm.

Physical Properties: *Tenacity:* Waxy or gummy. Hardness = 2 D(meas.) = 2.72(5) D(calc.) = [2.54]

Optical Properties: Transparent or translucent. *Color:* Chrysocolla-green, inclining to pale blue-green. *Luster:* Nonmetallic.
Optical Class: Biaxial (–). *Pleochroism:* Weak in drab grayish green. *Orientation:* Blades extinguish up to 8° from Z ∥ length. *Absorption:* $Z > X = Y$. $\alpha = 1.560$ $\beta = 1.635$ $\gamma = 1.635$ 2V(meas.) = Very small.

Cell Data: *Space Group:* n.d. $a = 13.38$ $b = 19.16$ $c = 9.026$ $\beta = \sim 90°$ Z = [4]

X-ray Powder Pattern: Christmas, Arizona, USA.
13.4 (100), 7.786 (50), 4.790 (40), 3.897 (40), 10.97 (30), 6.684 (30), 3.315 (30)

Chemistry:

	(1)	(2)
SiO_2	41.5	40.77
MnO	0.5	
CuO	36.2	44.97
MgO	2.3	
CaO	3.8	
H_2O	14.6	14.26
Total	98.9	100.00

(1) Christmas, Arizona, USA; average of two closely agreeing analyses. (2) $Cu_5Si_6O_{17}\cdot 7H_2O$.

Occurrence: A retrograde metamorphic or mesogene mineral formed at the expense of a prograde calc-silicate and sulfide assemblage; in tactites, commonly incrusting fractures; also filling cracks or interstices in diopside grains (Christmas, Arizona, USA).

Association: Kinoite, apachite, stringhamite, junitoite, clinohedrite, xonotlite, diopside, apophyllite, calcite, tobermorite (Christmas, Arizona, USA).

Distribution: From the Christmas copper mine, Gila Co., and the Lonestar [ckname??] deposit, near Safford, Graham Co., Arizona, USA.

Name: For Gila Co., Arizona, USA, where it was found.

Type Material: The Natural History Museum, London, England, 1980,533; University of Arizona, Tucson, Arizona; National Museum of Natural History, Washington, D.C., USA, 150201.

Gillespite $BaFe^{2+}Si_4O_{10}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As crystalline masses, to 2 cm, and embedded grains.

Physical Properties: *Cleavage:* Very good on {001}, poor on {100}; very poor on {110}. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 3.390–3.402 D(calc.) = 3.404

Optical Properties: Translucent. *Color:* Deep red, rose-red. *Streak:* Pink.
Luster: Vitreous.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; O = colorless; E = red. $\omega = 1.619–1.621$
$\epsilon = 1.618–1.620$

Cell Data: *Space Group:* $P4/ncc$. a = 7.5164(6) $c = 16.0768(10)$ Z = 4

X-ray Powder Pattern: Dry Delta, Alaska, and near Incline, California, USA. (ICDD 3-402).
3.39 (100), 4.41 (70), 3.22 (70), 3.09 (50), 2.65 (5), 2.39 (50), 8.02 (40)

Chemistry:

	(1)	(2)
SiO_2	50.08	51.63
TiO_2	0.00	
Al_2O_3	0.34	
Fe_2O_3	0.56	
Mn_2O_3	0.14	
FeO	14.60	15.43
BaO	31.02	32.94
LOI	0.82	
insol.	2.20	
Total	99.76	100.00

(1) Dry Delta, Alaska, USA; nearly pure material, corrected for assumed oxidation of FeO to Fe_2O_3, loss on ignition taken as H_2O. (2) $BaFeSi_4O_{10}$.

Occurrence: In a glacial moraine (Dry Delta, Alaska, USA); probably from a contact metamorphic zone (Trumbull Peak, California, USA).

Association: Celsian, hedenbergite, quartz (Dry Delta, Alaska, USA); sanbornite, celsian, diopside, tourmaline, quartz, pyrrhotite (Trumbull Peak, California, USA); pellyite, sanbornite, taramellite, fresnoite, muirite, barite (Itsy Mountains, Canada).

Distribution: In the USA, near the head of Dry Delta, Alaska Range, Alaska; from Trumbull Peak, near Incline, Mariposa Co., and on the Esquire No. 7 claim, Big Creek, Fresno Co., California. On the Gunn claim, in the Itsy Mountains, near Macmillan Pass, Yukon Territory, Canada. In the La Madrelena mine, Tres Pozos, Baja California, Mexico.

Name: For Frank Gillespie, of Richardson, Alaska, USA, who discovered the first specimen.

Type Material: Harvard University, Cambridge, Massachusetts, 90622; National Museum of Natural History, Washington, D.C., USA, 94347.

Gillulyite $Tl_2(As,Sb)_8S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely as prismatic crystals, to 2 mm, showing {110}, {010}, and {011}; in cleavable masses.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 2–2.5 VHN = 87–132, 108 average (25 g load). D(meas.) = 4.02 D(calc.) = 4.14

Optical Properties: Opaque, translucent in thin fragments. *Color:* Deep red to maroon, tarnishing to darker red or blue; pale gray in reflected light, with abundant deep red internal reflections. *Streak:* Bright brick-red. *Luster:* Vitreous to metallic if tarnished.
Optical Class: Biaxial. *Anisotropism:* Distinct. *Bireflectance:* Weak to moderate in oil; pale rose to dusky rose.
R_1–R_2: (400) 29.8–32.0, (420) 29.3–31.8, (440) 28.6–31.6, (460) 27.8–31.0, (480) 27.3–30.6, (500) 27.0–30.4, (520) 26.1–29.6, (540) 25.1–28.9, (560) 23.6–27.5, (580) 23.1–26.9, (600) 22.6–26.2, (620) 22.2–25.8, (640) 21.9–25.4, (660) 21.6–25.2, (680) 21.4–24.9, (700) 21.2–24.8

Cell Data: *Space Group:* $P2/n$. $a = 9.584(3)$ $b = 5.679(2)$ $c = 21.501(6)$ $\beta = 10.07(2)^\circ$ $Z = 2$

X-ray Powder Pattern: Mercur deposit, Utah, USA.
3.077 (100), 2.814 (100), 3.63 (90), 2.502 (70), 1.766 (70), 4.14 (60), 3.87 (60)

Chemistry:

	(1)
Tl	28.4
As	39.3
Sb	2.2
S	28.7
Total	98.6

(1) Mercur deposit, Utah, USA; by electron microprobe, average of five analyses; corresponding to $Tl_{2.02}As_{7.62}Sb_{0.26})_{\Sigma=7.88}S_{13.00}$.

Occurrence: In a sediment-hosted disseminated gold deposit, in organic-rich unoxidized carbonates.

Association: Orpiment, realgar, lorandite, raguinite, pyrite, barite, calcite.

Distribution: From the Mercur gold deposit, southern Oquirrh Mountains, about 56 km southwest of Salt Lake City, Tooele Co., USA [TL].

Name: To honor James C. Guilluly (1896–1980), U.S. Geological Survey, who worked in the area of the Mercur deposit.

Type Material: Royal Ontario Museum, Toronto, Canada; Harvard University, Cambridge, Massachusetts, 130781; National Museum of Natural History, Washington, D.C., USA, 170773.

Gilmarite $Cu_3(AsO_4)(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. Lozenge-shaped crystals, elongated along [101] or [100], flattened on {010}, also showing {100}, {101}, {001}, to 0.1 mm; typically in rosettes.

Physical Properties: *Cleavage:* Good on {010}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = ∼3 D(meas.) = 4.2(1) D(calc.) = 4.21

Optical Properties: Transparent. *Color:* Blue-green. *Streak:* Blue-green. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; $X = Y$ = light green; Z = green. *Orientation:* On {010}, $X \wedge c = 33°$ and $Y \wedge a = 37.1°$; on {001}, $Y \wedge a = 34.3°$ and $Z \wedge b = 30.1°$; on {101}, $Z \wedge b = 44°$ and $Y' \wedge [101] = 36.5°$. *Dispersion:* $r > v$, weak. $\alpha = 1.760(5)$ $\beta = 1.80(1)$ $\gamma = 1.83(1)$ 2V(meas.) = 77(4)° 2V(calc.) = 80(1)°

Cell Data: *Space Group:* $P1$. $a = 5.445(4)$ $b = 5.873(3)$ $c = 5.104(3)$ $\alpha = 114.95(3)°$ $\beta = 93.05(5)°$ $\gamma = 91.92(4)°$ Z = 1

X-ray Powder Pattern: Roua mines, France.
4.613 (100), 3.390 (60), 4.580 (50), 2.713 (40), 2.543 (40), 2.445 (30), 3.654 (20)

Chemistry:

	(1)	(2)
As_2O_5	29.64	30.20
CuO	63.0	62.70
H_2O	[7.36]	7.10
Total	[100.00]	100.00

(1) Roua mines, France; by electron microprobe, average of five analyses, H_2O by difference; corresponds to $Cu_{3.00}(As_{0.98}O_4)(OH)_{3.10}$. (2) $Cu_3(AsO_4)(OH)_3$.

Polymorphism & Series: Dimorphous with clinoclase.

Occurrence: A rare secondary mineral associated with other copper arsenates and copper arsenides in the oxidized zone.

Association: Cuprite, posnjakite, langite, clinotyrolite, connellite, brochantite, malachite, vésigniéite, cornubite, olivenite, trippkeite, domeykite, djurleite.

Distribution: From the Roua copper mines, about 50 km north of Nice, Alpes Maritimes, France.

Name: To honor Gilbert Mari (1944–), mineralogist, University of Nice-Sophia Antipolis, Nice, France, who collected the samples in which the mineral was found.

Type Material: Natural History Musem, Geneva, Switzerland, 477.006.

(1) Sandamap pegmatite, Namibia; by electron microprobe, total Fe as Fe_2O_3, H_2O by TGA.
(2) $Fe^{2+}Fe_4^{3+}(PO_4)_4(OH)_2 \cdot 2H_2O$.

Occurrence: A secondary mineral in a complex granite pegmatite.

Association: Triphylite, barbosalite, huréaulite, leucophosphite, phosphosiderite, mélonjosephite, tavorite, whitlockite, monetite.

Distribution: At the Sandamap pegmatite, west of Usakos, Namibia.

Name: To honor Adelheid (Gini) Keller (1940–), wife of Paul Keller.

Type Material: University of Stuttgart, Stuttgart, Germany, NM01.

References: (1) Keller, P. (1980) Giniit, $Fe^{2+}Fe_4^{3+}[(H_2O)_2|(OH)_2|(PO_4)_4]$, ein neues Mineral aus dem Pegmatit von Sandamab [*sic*] bei Usakos, Namibia. Neues Jahrb. Total	100.00	100.34	100.00

(1) Sasso Pisano, Italy. (2) Death Valley, California, USA; corresponds to $(Ca_{1.94}Sr_{0.08})_{\Sigma=2.02}$ $14.02O_{20}(OH)_{6.10} \cdot 4.90H_2O$. (2) $Ca_2B_{14}O_{20}(OH)_6 \cdot 5H_2O$.

Occurrence: As efflorescences on weathered basalt associated with colemanite-bearing limestone (Death Valley, California, USA); in veins in sandstone (Sasso Pisano, Italy).

Association: Calcite (Sasso Pisano, Italy); mirabilite, gypsum, anhydrite (Windsor, Canada); sassolite, colemanite, mcallisterite (Death Valley, California, USA); kieserite, anhydrite, preobrazhenskite, boracite, aksaite, halurgite, strontioborite, metaborite (Ak-saĭ, Kazakhstan).

Distribution: From Sasso Pisano, eight km south of Lardarello, Tuscany, Italy. In the Clinton quarry, Windsor, Nova Scotia, Canada. At the Mott colemanite prospect and on the Hard Scramble claim, Furnace Creek district, Death Valley, Inyo Co., California, USA. In the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. From the Chalkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan.

Name: Honors Prince Piero Ginori Conti (1865–1939), Florence, Italy, for his contributions to the Tuscan borax industry.

Type Material: n.d.

Giorgiosite $Mg_5(CO_3)_4(OH)_2 \cdot 5–6H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Fibrous, spherulitic, admixed with other species in powdery crusts.

Physical Properties: Hardness = n.d. D(meas.) = 2.155–2.185 (synthetic). D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* White. *Luster:* Silky.
Optical Class: Biaxial. *Orientation:* Positive elongation, parallel extinction. n = 1.48–1.51
α = 1.498 (synthetic). β = n.d. γ = 1.513 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Thíra Island, Greece.
3.40 (100), 3.29 (70), 2.92 (60), 4.44 (40), 3.97 (40), 2.46 (40), 5.80 (30)

Chemistry: (1) Identification is by near correspondence between the X-ray patterns of natural and synthetic material.

Occurrence: A rare incrustation on recent lava (Thíra Island, Greece); a weathering product in fractures in sideritic iron formation (Big Fish River-Rapid Creek area, Canada).

Association: Sodium chloride, sodium sulfate, magnesium carbonate (Thíra Island, Greece); aragonite, kulanite (Big Fish River-Rapid Creek area, Canada).

Distribution: From Alphroëssa, Thíra (Santorini) Island, Cyclades, Greece. In the Big Fish River-Rapid Creek area, Yukon Territory, Canada.

Name: For Giorgios, a cone formed during the volcanic eruption of 1866 on Thíra Island.

Type Material: Natural History Museum, Paris, France.

Mineral Group: Tetrahedrite group.

Occurrence: A rare late-stage mineral with other selenides and sulfides in uranium deposits.

Association: Geffroyite, chaméanite, ankerite (Chaméane mine, France); berzelianite, clausthalite (Niederschlema-Alberoda deposit, Germany).

Distribution: From the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France [TL]. In the Niederschlema-Alberoda uranium deposit, Saxony, Germany.

Name: To honor Roger Giraud (1936–), French electron microprobe analyst, B.R.G.M.–C.N.R.S., Orléans, France.

Type Material: National School of Mines, Paris, France.

insol.	0.7	
Total	99.0	100.00

(1) Grand Central mine, Arizona, USA; H_2O by the Penfield method on a separate sample; corresponds to $H_{2.3}Pb_{2.8}(Te^{4+}O_3)_{1.0}(Te^{6+}O_6)_{1.0}$. (2) $H_2Pb_3(Te^{4+}O_3)(Te^{6+}O_6)$.

Occurrence: Very rare, coating fractures in oxidized tellurite and tellurate ores.

Association: Chlorargyrite, quartz.

Distribution: From the dumps of the Grand Central mine, Tombstone, Cochise Co., Arizona, USA.

Name: Honors Richard Gird (1836–1910), mining engineer and assayer, a discoverer of the Tombstone district, Arizona, USA.

Type Material: Natural History Museum, Paris, France; The Natural History Museum, London, England, 1980,539.

(1) Kovdor massif, Russia; by electron microprobe, H_2O by coulometry and TGA, CO_2 by difference between total weight loss and H_2O; corresponds to $Na_{1.05}Ca_{1.95}(Mg_{3.00}Fe^{3+}_{0.11}Mn_{0.01})_{\Sigma=3.12}(PO_4)_2[PO_2(OH)_2](CO_3)_{1.10} \cdot 4.53H_2O$.
(2)$NaCa_2Mg_3(PO_4)_2[PO_2(OH)_2](CO_3)(OH)_2 \cdot 4H_2O$.

Occurrence: A low-temperature hydrothermal mineral filling solution cavities in dolomite carbonatite in a differentiated alkaline massif.

Association: Bobierrite, pyrite, dolomite.

Distribution: From the Zheleznyi iron mine, Kovdor massif, Kola Peninsula, Russia.

Name: For Lake Girvas, northwest of the Kovdor massif, Kola Peninsula, Russia.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5948; Mining Institute, St. Petersburg, 2025/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87981.

(1) Capo di Bove, Italy; corresponds to $(Ca_{1.78}K_{0.44})_{\Sigma=2.22}Al_{3.95}Si_{4.03}O_{16}\cdot 8.24H_2O$.
(2) Eyrarfjäll, Reydarfjord, Iceland; corresponds to $(Ca_{1.59}Na_{0.30}K_{0.02})_{\Sigma=1.91}$ $Al_{3.63}Si_{4.40}O_{16}\cdot 8.34H_2O$. (3) $Ca_2Al_4Si_4O_{16}\cdot 9H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in nepheline and olivine basalt and leucite tephrite.

Association: Zeolites, calcite, chlorite, quartz.

Distribution: At Capo di Bove and elsewhere around Rome, Lazio, Italy. In Germany, from the Hohenberg, near Bühne, Westphalia; on the Frauenberg, near Fulda, Hesse; at the Schlauroth, Görlitz, Saxony; on the Arensberg, near Zilsdorf; and from the Schellkopf, near Brenk, and elsewhere in the Eifel district. From near Zálezly (Salesel), Czech Republic. Found near the Gorner glacier, near Zermatt, Valais, Switzerland. In Ireland, at many localities in Co. Antrim, as in the Bruslee quarry, Ballyclare. On Iceland, many localities around Reydarfjord, Fáskrúdsfjord, and Fagridalur. At Round Top volcano, Oahu, and Alexander Dam, Kauai, Hawaii, USA. From Concepción del Oro, Zacatecas, Mexico. A number of other localities are known.

Name: For Professor Carlo Giuseppe Gismondi (1762–1824), Italian mineralogist, Rome, Italy, who first examined the mineral.

Gittinsite $CaZrSi_2O_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. As radiating sheaves of crystals and fibrous masses, with individual fibers to about 0.3 mm. In fine intergrowths with vlasovite and apophyllite.

Physical Properties: Hardness = 3.5–4 D(meas.) = n.d. D(calc.) = 3.624

Optical Properties: Translucent. *Color:* Chalky white; colorless in thin section.
Luster: Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = 5°–10°$; Y and $Z \simeq \perp$ to elongation.
$\alpha = 1.720(2)$ $\beta = 1.736(2)$ $\gamma = 1.738(2)$ 2V(meas.) = 20°–40°

Cell Data: *Space Group:* $C2$. $a = 6.852(2)$ $b = 8.659(1)$ $c = 4.686(2)$ $\beta = 101.69(2)°$
Z = 2

X-ray Powder Pattern: Kipawa River, Canada.
3.155 (100), 3.232 (80), 3.026 (80), 2.660 (80), 1.677 (70), 5.32 (60), 2.226 (50)

Chemistry:

	(1)
SiO_2	40.8
ZrO_2	40.3
CaO	18.4
Total	99.5

(1) Kipawa River, Canada; by electron microprobe, corresponding to $Ca_{0.98}Zr_{0.98}Si_{2.03}O_7$.

Occurrence: In eudialyte-rich pegmatitic lenses in a regionally metamorphosed agpaitic syenite complex (Kipawa River, Canada); an alteration product of eudialyte in syenite, quartz syenite, and alkalic granite (Pajarito Mountain, New Mexico, USA).

Association: Apophyllite, vlasovite, eudialyte, fluorite, graphite, calcite, apatite, "opal" (Kipawa River, Canada); eudialyte, zircon, chlorite (Pajarito Mountain, New Mexico, USA).

Distribution: From the [Sheffield Lake complex,] Kipawa River, Villedieu Township, Quebec, and in the Strange Lake complex, southeast of Lac Brisson, Quebec and Labrador, Newfoundland, Canada. On Pajarito Mountain, Mescalero Indian Reservation, Otero Co., New Mexico, USA.

Name: For Professor John Gittins, Canadian petrologist, University of Toronto, Toronto, Ontario, Canada.

Type Material: Canadian Geological Survey, Ottawa, 19558; University of Toronto, Toronto; Royal Ontario Museum, Toronto, Canada, M37321; Harvard University, Cambridge, Massachusetts, 117030, 117031; National Museum of Natural History, Washington, D.C., USA, 147002.

Gjerdingenite-Ca $K_2Ca(Nb_3Ti)Si_8O_{24}(OH)O_3 \cdot 6H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Crystals, to 2 mm, are poorly formed and divergent, with indistinct terminations. They are elongate on [010], and their major forms are probably pinacoids {100} and {001}. As massive granular pseudomorphs of vuonnemite, to 1 cm.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 5
D(meas.) = 2.79(1) D(calc.) = 2.775

Optical Properties: Transparent to translucent. *Color*: White, pinkish brown. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial (+). α = 1.680(1) β = 1.682(2) γ = 1.762(3) 2V(meas.) = 25(10)° 2V(calc.) = 19° *Orientation*: *Y* = *b*. *Pleochroism:* Weak; *X* = *Z* = colorless, *Y* = pale yellowish. *Dispersion*: None.

Cell Data: *Space Group*: *C*2/*m*. *a* = 14.6365(6) *b* = 14.2059(5) *c* = 7.8919(4)
β = 117.467(5)° *Z* = 2

X-ray Powder Pattern: Mount Karnasurt, Lovozero massif, Kola Peninsula, Russia.
7.100 (100), 6.999 (88), 4.985 (78), 3.167 (46), 3.246 (43), 3.252 (42), 6.476 (38)

Chemistry:

	(1)	(2)		(1)	(2)

(1) Mount Karnasurt, Lovozero massif, Kola Peninsula, Russia; average of 8 electron microprobe analyses, H_2O by TGA; corresponding to $(K_{0.93}Na_{0.45}Sr_{0.41}Ca_{0.15}Ba_{0.08})_{\sum=2.02}(Ca_{0.62}Mn_{0.14}Fe_{0.03}Zn_{0.01})_{\sum=0.80}(Nb_{2.51}Ti_{1.52})_{\sum=4.03}(Si_{7.97}Al_{0.03})_{\sum=8}O_{24}[O_{2.86}(OH)_{1.14}]_{\sum=4} \cdot 5.67H_2O$.
(2) $K_2Ca(Nb_3Ti)Si_8O_{24}(OH)O_3 \cdot 6H_2O$.

Mineral Group: Labuntsovite group, kuzmenkoite subgroup.

Occurrence: As alteration of vuonnemite formed in hydrothermal assemblages of peralkaline pegmatites related to agpaitic feldspathoidal syenites.

Association: Microcline, natrolite, aegirine, organovaite-Mn, organovaite-Zn, beryllite, epididymite, altered steenstrupine-(Ce), ranciéite (pseudomorph after sérandite), yakhontovite; or komarovite, organovaite-Mn, strontiopyrochlore.

Distribution: Pegmatite #61 at Mount Karnasurt, Lovozero massif, Kola Peninsula, Russia.

Name: Signifies the structural analog of *gjerdingenite*-Mn with dominant *Ca* in the *D* structural site.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (92111).

			Total	100.98	100.00

(1) Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada; average of 9 electron microprobe analyses, H_2O by TGA; corresponding to $(K_{0.98}Na_{0.62}Ca_{0.37}Ba_{0.07})_{\sum=2.04}(Na_{0.90}Ca_{0.04}Mn_{0.04}Zn_{0.02})_{\sum=1.00}(Nb_{2.43}Ti_{1.49}Fe^{3+}_{0.09})_{\sum=4.01}(Si_{7.95}Al_{0.05})_{\sum=8}O_{24}[(OH)_{2.09}O_{1.91}]_{\sum=4} \cdot 5.32H_2O$.
(2) $K_2Na(Nb_3Ti)Si_8O_{24}(OH)_2O_2 \cdot 5H_2O$.

Mineral Group: Labuntsovite group, kuzmenkoite subgroup.

Occurrence: As alteration of vuonnemite formed in hydrothermal assemblages of peralkaline pegmatites related to agpaitic feldspathoidal syenites.

Association: Microcline, albite, aegirine, analcime, a eudialyte-group mineral, natrolite, epistolite, polylithionite, steacyite, thorite, ekanite, brockite, fluorapatite, yofortierite, calcite, hemimorphite, sauconite (?), earthy Mn oxides.

Distribution: From the East Hill suite, De-Mix quarry (now part of the Poudrette quarry), Mont Saint-Hilaire, Quebec, Canada.

Name: Signifies the structural analog of *gjerdingenite*-Fe with dominant *Na* in the *D* structural site.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia (92112) and Canadian Museum of Nature, Ottawa, Canada (CMNMC 85457).

Total	99.69	99.5	100.00

(1) Gladhammar, Sweden; corresponding to $Pb_{0.96}Cu_{1.00}Fe_{0.05}Bi_{4.97}S_{9.00}$. (2) Felbertal, Austria; by electron microprobe, corresponding to $Pb_{1.02}Cu_{0.99}Bi_{4.98}S_{9.00}$. (3) $PbCuBi_5S_9$.

Occurrence: Of hydrothermal origin.

Association: Bismuthinite-aikinite, galenobismutite, makovickyite, nuffieldite, berryite, galena, quartz.

Distribution: From Gladhammar, Kalmar, Sweden [TL]. At Bleka, Telemark, Norway. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At Krupka, Czech Republic. In Romania, from Ocna de Fier (Morávicza; Vaskő); at Baia Borşa, Baia Mare (Nagybánya); and Băiţa (Rézbánya). From Narechenski Basni, southern Rhodope Mountains, Bulgaria. In the Loch Shin monzogranite, near Lairg, Scotland. From the Felbertal tungsten mine, Salzburg, and in the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, Austria. In the Beregovo district, near Mukachevo, Ukraine. From the Tanco deposit, Bernic Lake, Manitoba, Canada. In the Comstock mine, Dos Cabezas, Cochise Co., Arizona, USA.

Name: For the original locality, Gladhammar, Sweden.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Glauberite $Na_2Ca(SO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals, to 10 cm, tabular on {001}, prismatic along [$\bar{1}$01] with dominant {111} or along [001] with dominant {110}, or dipyramidal with dominant {111}, {110}; {001} and {111} may be striated ‖ mutual intersections, yielding steplike terminations.

Physical Properties: *Cleavage:* {001}, perfect; {110}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 2.75–2.85 D(calc.) = 2.78 Slightly saline taste; powdery surface alteration in humid environments, leaching Na_2SO_4 and leaving gypsum.

Optical Properties: Transparent to translucent. *Color:* Gray or pale yellow, colorless. *Streak:* White. *Luster:* Vitreous to waxy, pearly on {001} cleavage surfaces. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $Y \wedge c = 12°$. *Dispersion:* $r > v$, strong, horizontal. $\alpha = 1.515$ $\beta = 1.535$ $\gamma = 1.536$ 2V(meas.) = 7°

Cell Data: *Space Group:* $C2/c$. $a = 10.129(2)$ $b = 8.306(2)$ $c = 8.533(2)$ $\beta = 112.19(1)°$ Z = 4

X-ray Powder Pattern: Synthetic.
3.126 (100), 3.110 (80), 3.175 (75), 2.808 (65), 2.677 (60), 1.975 (60), 2.861 (50)

Chemistry:

	(1)	(2)
SO_4	57.29	57.56
CaO	21.04	20.16
Na_2O	21.27	22.28
Total	99.60	100.00

(1) Berchtesgaden, Bavaria, Germany. (2) $Na_2Ca(SO_4)_2$.

Occurrence: A common constituent of continental and marine evaporite deposits; as sublimates around fumaroles; in mineral-filled cavities in basaltic lava; in nitrate deposits in arid climates.

Association: Halite, polyhalite, anhydrite, gypsum, thénardite, mirabilite (evaporites); thénardite, sassolite (fumaroles); thénardite, blödite (nitrate deposits).

Distribution: Many localities, most minor. In Spain, from Villarrubia de Santiago, near Ocaña, Toledo Province, and elsewhere. At Douglashall, near Westeregeln, Saxony-Anhalt, Germany. From Hallstatt, Austria. At Varangéville, near Nancy, Meurthe-et-Moselle, France. Found at many places in the Taltal nitrate district, Antofagasta, Chile. In the USA, from Searles Lake, San Bernardino Co., Borax Lake, Lake Co., and the Salton Sea, Imperial Co., California; in the Permian salt deposits of Ector and Upton Cos., Texas and Eddy Co., New Mexico; near Camp Verde, Yavapai Co., Arizona; from the Great Salt Lake, Davis Co., Utah. At Gypsumville, Manitoba, Canada. From Lake Gillies, Lochiel, South Australia. On Vulcano, Lipari Islands, Italy. In the Grillid volcanic cave, Surtsey Island, Iceland.

Name: In allusion to Glauber's Salt (Na_2SO_4), the synthetic equivalent of the dominant chemical component, named for Johann Rudolf Glauber (1604–1668), German alchemist.

Type Material: Natural History Museum, Paris, France, 23.400–23.402.

Glaucocerinite $(Zn, Cu)_{10}Al_6(SO_4)_3(OH)_{32}\cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal (?). *Point Group:* n.d. As banded botryoidal crusts, to 3 mm thick, with divergent fibrous to platy internal structure.

Physical Properties: *Tenacity:* Waxlike. Hardness = 1 D(meas.) = 2.4(2) D(calc.) = 2.33

Optical Properties: Semitransparent. *Color:* Sky-blue to bluish green, grading to pale blue, color-banded. *Luster:* Waxy.
Optical Class: Uniaxial, anomalously biaxial (–). *Orientation:* Positive elongation parallel fibers. $n = 1.542$ $\alpha = 1.540(2)$ $\beta = 1.554(2)$ $\gamma = 1.562(2)$ 2V(meas.) = 60°

Cell Data: *Space Group:* n.d. $a = 3.070(8)$ $c = 32.65(1)$ Z = n.d.

X-ray Powder Pattern: Laurium, Greece.
10.9 (100), 5.45 (90), 3.63 (80), 2.62 (60), 2.46 (60), 2.231 (50), 1.981 (50)

Chemistry:

	(1)
SO_3	11.8
Al_2O_3	15.4
CuO	11.6
ZnO	28.7
Cl	0.0
H_2O	30.9
Total	98.4

(1) Laurium, Greece, low analytical total probably due to experimental error in H_2O determination by CHN analyzer; corresponds to $(Zn_{7.03}Cu_{2.91})_{\Sigma=9.94}Al_{6.02}(SO_4)_{2.94}(OH)_{32.06}\cdot 18.18H_2O$.

Occurrence: A rare secondary mineral on museum specimens from a Cu–Zn sulfide deposit.

Association: Smithsonite, adamite, ktenasite, serpierite, malachite, azurite, gypsum, pyrite, galena, sphalerite, fluorite, calcite, "limonite".

Distribution: From Laurium, Greece.

Name: From the Greek for *bluish green* and *waxlike*.

Type Material: University of Vienna, Vienna, C11.130; Natural History Museum, Vienna, Austria, G1378, G1379.

Glaucochroite $CaMn^{2+}SiO_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals commonly long prismatic, to 1 cm, typically unterminated, alone or in columnar aggregates; forms include {100}, {010}, {110}, {120}, {103}, {021}, {111}, {121}. Coarse-grained cleavable, fine-grained massive. *Twinning:* Penetration and contact twins, rarely triplets at about 60°, with {011} as twin plane.

Physical Properties: *Cleavage:* Very poor on {001}. *Fracture:* Conchoidal. Hardness = ~6 D(meas.) = 3.407 D(calc.) = 3.465

Optical Properties: Semitransparent. *Color:* Bluish green; small crystals white or pinkish; may be brown when massive, perhaps due to manganese oxides. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Dispersion:* $r > v$, marked. $\alpha = 1.682–1.686$ $\beta = 1.716–1.722$ $\gamma = 1.729–[1.735]$ $2V(meas.) = 60°51'$

Cell Data: *Space Group: Pbnm.* $a = 4.92(3)$ $b = 11.19(2)$ $c = 6.51(2)$ $Z = 4$

X-ray Powder Pattern: Franklin, New Jersey, USA. (ICDD 14-376).
1.85 (100), 2.69 (80), 2.63 (80), 3.69 (60), 2.96 (60), 1.13 (50), 1.11 (50)

Chemistry:

	(1)	(2)
SiO_2	31.48	32.2
FeO	trace	
MnO	38.00	37.5
ZnO		0.8
PbO	1.74	
MgO		0.2
CaO	28.95	29.5
Total	100.17	100.2

(1) Franklin, New Jersey, USA; neglecting PbO, corresponds to $Ca_{0.99}Mn_{1.02}Si_{1.00}O_4$. (2) Do.; by electron microprobe, corresponds to $(Ca_{0.98}Zn_{0.02}Mg_{0.01})_{\Sigma=1.01}Mn_{0.99}Si_{1.00}O_4$.

Occurrence: In a metamorphosed stratiform zinc deposit (Franklin, New Jersey, USA); in skarn at the contact between diabase and marble (Anakit Creek, Russia); in calc-silicate rocks with manganese ores (Kuruman, South Africa).

Association: Nasonite, willemite, andradite, hardystonite, tephroite, clinohedrite, esperite, leucophoenicite, hodgkinsonite, diopside, cuspidine, calcite, franklinite, zincite (Franklin, New Jersey, USA).

Distribution: At Franklin, Sussex Co., New Jersey, USA. From near Anakit Creek, at the mouth of the Lower Tunguska River, central Siberia, Russia. In the Wessels mine, near Kuruman, Cape Province, South Africa. From the Kombat mine, 49 km south of Tsumeb, Namibia.

Name: From the Greek for *blue green* and *color*, in allusion to its color.

Type Material: Yale University, New Haven, Connecticut, USA, 2.4359, 2.4360.

(1) Håkansböda, Sweden. (2) $(Co, Fe)AsS$ with Co:Fe = 2:1.

Polymorphism & Series: Dimorphous with alloclasite.

Mineral Group: Arsenopyrite group.

Occurrence: In deep-seated deposits of high-temperature hydrothermal origin.

Association: Cobaltite, pyrite, chalcopyrite.

Distribution: From Huasco, Tarapacá, Chile [TL]. In the USA, at the Standard Consolidated mine, Sumpter, Grant Co., Oregon, and at Franconia, Grafton Co., New Hampshire. From the Cobalt-Gowganda district, Ontario, Canada. In Sweden, at Håkansboda, Västmanland, as large twinned and untwinned crystals; also at Tunaberg, Södermanland. From Skutterud, Norway. At Oraviţa (Oravicza), Banat, Romania. From Gosenbach, North Rhine-Westphalia, Germany. In the Tynebottom mine, Garrigill, near Alston, Cumbria, England. From Tsumeb, Namibia. Numerous minor occurrences are known.

Name: From the Greek for *blue*, in reference to its use in the dark blue glass called smalt.

(1) Whare Flat, Otago, New Zealand; corresponds to $(K_{0.60}Ca_{0.06}Na_{0.02})_{\Sigma=0.68}(Fe^{3+}_{1.27}Mg_{0.44}Fe^{2+}_{0.21}Al_{0.11})_{\Sigma=2.03}(Si_{3.82}Al_{0.18})_{\Sigma=4.00}O_{10}(OH)_2$. (2) Makhtesh Ramon, Israel; corresponds to $(K_{0.76}Ca_{0.04}Na_{0.03})_{\Sigma=0.83}(Fe^{3+}_{1.33}Mg_{0.54}Fe^{2+}_{0.13}Al_{0.06})_{\Sigma=2.06}(Si_{3.64}Al_{0.36})_{\Sigma=4.00}O_{10}(OH)_2$.

Polymorphism & Series: 1M polytype.

Mineral Group: Mica group.

Occurrence: Altered from detrital biotite or other parent materials, by marine diagenesis in shallow water under reducing conditions; especially in loosely consolidated sandstone (greensand), and impure limestone and siltstone.

Association: Quartz, feldspars, glaucophane, dolomite, siderite, calcite, ankerite, pyrite, "limonite".

Distribution: Worldwide in marine sediments. A few localities for studied material are: on the Otago Peninsula, New Zealand. From the Flinders Ranges and Yorke Peninsula, South Australia. Around Sandwich and Folkestone, Kent, and Hollybush Hill, Worcester, England. At Villers-sur-Mer, Calvados, France. From Verona, Vicenza, Italy. At a number of localities in Israel. From the N'Chwaning mine, near Kuruman, Cape Province, South Africa. In the USA, particularly widespread in Alabama; from Burnet Co., Texas; both on and offshore in several of the coastal counties of California; from Baker Co., Oregon; in the Black Hills of South Dakota.

Name: From the Greek *glaucos*, for *bluish green*.

(1) Tiburon Peninsula, California, USA; corresponds to $(Na_{1.96}Ca_{0.04})_{\Sigma=2.00}(Mg_{2.39}Al_{1.82}Fe^{2+}_{0.61}Fe^{3+}_{0.18})_{\Sigma=5.00}Si_8O_{22}(OH)_2$. (2) Kodiak Islands, Alaska, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated; corresponds to $(Na_{1.90}Ca_{0.09}K_{0.02})_{\Sigma=2.01}(Al_{1.82}Mg_{1.74}Fe^{2+}_{1.20}Fe^{3+}_{0.18}Mn_{0.03}Ti_{0.02}Cr_{0.01})_{\Sigma=5.00}(Si_{7.83}Al_{0.17})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with ferroglaucophane.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) < 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) < 0.3$; $(Na + K)_A < 0.5$; $Na_B \geq 1.34$.

Occurrence: Characteristic of the blueschist facies, in former subduction zones in mountain belts; in the greenschist facies and in eclogites that have undergone retrograde metamorphism.

Association: Crossite, chlorite, epidote, pumpellyite, lawsonite, omphacite, jadeite, actinolite, barroisite, cummingtonite, aragonite.

Distribution: Widespread in some mountain belts. On Syra Island, Cyclades Islands, Greece. At numerous sites in the California Coast Ranges, as on the Tiburon Peninsula and at Vonsen Ranch, Marin Co., at Glaucophane Ridge, Panoche Valley, San Benito Co., and near Valley Ford, Sonoma Co.; in the Kodiak Islands, Alaska, USA. At St. Marcel, Val d'Aosta, and Piollore (Biella), Piedmont, Italy. On Anglesey, Wales. In Japan, at Ubuzan, Aichi Prefecture, and Otakiyama, Tokushima Prefecture.

Name: From the Greek for *bluish green* and *to appear*.

Glaukosphaerite $(Cu,Ni)_2(CO_3)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* n.d. As divergent fibrous to concentrically zoned spherules, to 3 mm; in plumose aggregates, rarely as felted masses of parallel fibers.

Physical Properties: *Cleavage:* One ‖ [001]. *Tenacity:* Brittle. Hardness = 3–4
D(meas.) = 3.78–3.96 D(calc.) = 3.78–4.03

Optical Properties: Semitransparent. *Color:* Deep malachite-green to apple-green.
Streak: Pale green. *Luster:* Subvitreous to dull, silky if fibrous.
Optical Class: Biaxial (–). *Pleochroism:* X = deep malachite-green; $Y = Z$ = apple-green.
Orientation: $X \wedge c = 7°$. $\alpha = 1.69$–1.71 $\beta = 1.83$–1.85 $\gamma = 1.83$–1.85 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. $a = 9.36(3)$ $b = 11.92(3)$ $c = 3.08(1)$ $\beta = 91.1(0.04)°$
Z = 4

X-ray Powder Pattern: Kambalda, Western Australia.
2.591 (100b), 3.690 (80), 2.952 (70), 2.484 (70b), 2.931 (60), 5.048 (50), 2.517 (50)

Chemistry:

	(1)	(2)		(1)	(2)
CO_2	21.70	20.15	CoO	0.07	
SiO_2	< 0.01		MgO	1.23

NiO	25.22	23.92	Total	100.13	99.22

(1) Kambalda, Western Australia; corresponds to $(Cu_{1.08}Ni_{0.70}Mg_{0.06})_{\Sigma=1.84}(CO_3)_{1.02}(OH)_{1.94}$.
(2) Kasompi, Congo; neglecting impurities, corresponds to $(Cu_{1.23}Ni_{0.71})_{\Sigma=1.94}(CO_3)_{1.02}(OH)_{2.04}$.

Mineral Group: Rosasite group.

Occurrence: A rare secondary mineral in the oxidized portions of Cu–Ni sulfide deposits.

Association: Nickeloan malachite, azurite, paratacamite, brochantite, chalconatronite, takovite, georgeite, carrboydite, gaspéite, népouite, nickeloan chrysotile, nickeloan celadonite, gypsum, epsomite, nickeloan magnesite, goethite, quartz.

Distribution: In Australia, from around Kambalda, at the Hampton East Location 48, three km north of the Durkin shaft, from three km southeast at Widgiemooltha, and 11 km southeast of Widgiemooltha, at the Dordie North nickel prospect, in the 132 North nickel mine, four km southwest of Widgiemooltha, and in the Otter Shoot gossan; in the Discovery gossan, eleven km south of Windarra; from the Carr Boyd Rocks nickel mine, Yerilla district, 80 km north-northeast of Kalgoorlie, in the Scotia nickel mine, Kalgoorlie, and at the Jan nickel deposit, St. Ives, all in Western Australia. From Shinshiro, Aichi Prefecture, Japan. At Kasompi, Katanga Province, Congo (Shaba Province, Zaire). In the Key West mine, east of Moapa, Bunkerville district, Clark Co., Nevada, USA. At the Kamariza mine, Laurium, Greece.

Name: From the Greek for *bluish green* and *spherical*, the typical color and habit.

Type Material: Western Australian Museum, Perth, MDC5309; National School of Mines, Paris, France; The Natural History Museum, London, England, 1975,419; National Museum of Natural History, Washington, D.C., USA, 131889.

(1) Boevskoye deposit, Russia; corresponds to $Ca_{0.86}Be_{3.94}[(PO_4)_{1.79}(CO_3)_{0.15}(AlO_4)_{0.06}]_{\Sigma=2.00}(OH)_{3.63} \cdot 0.80H_2O$. (2) Do.; Fe_2O_3 considered to be "limonite"; corresponds to $Ca_{0.84}Be_{4.28}[(PO_4)_{1.76}(CO_3)_{0.18}(SiO_4)_{0.06}]_{\Sigma=2.00}[(OH)_{4.34}F_{0.02}]_{\Sigma=4.36} \cdot 0.62H_2O$.
(3) $CaBe_4(PO_4)_2(OH)_4 \cdot 0.5H_2O$.

Occurrence: As segregations in mica-fluorite greisen in illite rocks (Boevskoye deposit, Russia).

Association: Moraesite, fluorite, rutile, "limonite", quartz, mica-clay minerals (Boevskoye deposit, Russia); mitridatite, moraesite, siderite, tourmaline, albite (Paris, Maine, USA).

Distribution: In Russia, from the Boevskoye phenakite-beryl deposit, 35 km southwest of Kamensk-Ural'skii, Ural Mountains. In the Mt. Mica quarry, Paris, Oxford Co., Maine, USA.

Name: From the Latin *glucinium*, *beryllium*, for its content of that element.

Type Material: Il'menskii Preserve Museum, Miass, 11344vr; Mining Institute, St. Petersburg, 118/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 65901, 65902.

Glushinskite $Mg(C_2O_4)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As granular, distorted pyramidal crystals, to 5 μm, with curved and striated faces; in platy aggregates.

Physical Properties: Hardness = 2 D(meas.) = 1.85 D(calc.) = n.d. Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Creamy white, colorless.
Luster: Subadamantine.
Optical Class: Biaxial (–). $\alpha = 1.365$ $\beta = 1.530$ $\gamma = 1.595$ 2V(meas.) = 58(1)°

Cell Data: *Space Group:* $C2/c$ (synthetic β form). $a = 12.675$ $b = 5.406$ $c = 9.984$ $\beta = 129.45°$ Z = 4

X-ray Powder Pattern: Mill of Johnston, Scotland.
4.89 (100), 3.179 (70), 2.039 (60), 2.379 (50), 1.861 (50), 3.340 (40), 2.541 (40)

Chemistry: (1) Mill of Johnston, Scotland; identity of natural material confirmed by agreement with the X-ray pattern and IR spectrum of the synthetic compound.

Polymorphism & Series: Both α and β forms are known.

Occurrence: As veinlets in brown coal seams impregnated with natural acetic acid (Chai-Tumus deposit, Russia); formed by reaction between Mg-rich minerals and oxalic acid secreted by incrusting lichen, *Lecanora atra* (Mill of Johnston, Scotland); in desert plants (Lake Huleh basin, Israel).

Association: Whewellite, weddellite, calcite, dolomite, stepanovite, zhemchuzhnikovite (Chai-Tumus deposit, Russia); whewellite, chrysotile, quartz (Mill of Johnston, Scotland).

Distribution: Likely more common than known localities suggest. From the Chai-Tumus coal deposit, 200 km up from the Lena River estuary, Bulun district, polar Sakha, Russia. In Scotland, near Mill of Johnston, six km west-southwest of Insch, Kincardineshire, and on the Island of Rhum, Inner Hebrides. In the Lake Huleh basin, Jordan Rift Valley, Israel (α form). From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana.

Name: To honor Petr Ivanovich Glushinskii (1908–), coal geologist, Institute of Arctic and Antarctic Geology, St. Petersburg, Russia.

Type Material: Royal Scottish Museum, Edinburgh, Scotland; The Natural History Museum, London, England.

H_2O	20.00	20.40
Total	100.00	100.00

(1) Montecchio Maggiore, Italy; by electron microprobe, corresponds to $(Na_{1.16}Ca_{0.26}Sr_{0.03}K_{0.01})_{\Sigma=1.46}Al_{1.88}Si_{4.16}O_{12}\cdot 5.54H_2O$. (2) South quarry, White Head, Co. Antrim, Ireland; by electron microprobe, corresponds to $(Na_{0.71}Ca_{0.64}Sr_{0.03}K_{0.01})_{\Sigma=1.39}Al_{2.10}Si_{3.92}O_{12}\cdot 5.73H_2O$.

Mineral Group: Zeolite group.

Occurrence: Formed from sodium-rich fluids, in basalts and related igneous rocks, also pegmatites.

Association: Zeolites, calcite, aragonite, quartz.

Distribution: Widespread in small amounts. A few localities for well studied material follow. From Montecchio Maggiore, Vicenza, Italy. At Glenarm and elsewhere in Co. Antrim, Ireland. On the Isle of Skye, Scotland. At Pyrgos, Cyprus. In the USA, from Bergen Hill, Hudson Co., and Great Notch, Paterson, and Prospect Park, Passaic Co., New Jersey; at Springfield, Lane Co., Oregon. On Pinnacle Rock, Five Islands, and Two Islands, Nova Scotia, Canada. In the Ilímaussaq intrusion, southern Greenland. At Sarbay-Sokolov, Kazakhstan. Large crystals from Bekiady, Madagascar. From around Flinders, Victoria, Australia.

Godlevskite $(Ni, Fe)_9S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* 222. As aggregates and single grains, to 1 mm; in fine disseminations. *Twinning:* Common and complex, ⊥ (101), may result in geniculated forms.

Physical Properties: Hardness = n.d. VHN = 383–415 (40–50 g load). D(meas.) = n.d. D(calc.) = 5.273

Optical Properties: Opaque. *Color:* In polished section, pale yellow. *Luster:* Metallic. *Pleochroism:* Weak, pale cream to pinkish cream. *Anisotropism:* Strong, from bluish to reddish. R_1–R_2: (400) 25.7–27.1, (420) 30.3–32.1, (440) 35.7–37.9, (460) 40.6–42.6, (480) 44.5–46.5, (500) 47.4–49.1, (520) 49.7–50.9, (540) 51.3–52.2, (560) 52.5–53.0, (580) 53.6–53.8, (600) 54.6–54.4, (620) 55.4–55.0, (640) 56.1–55.6, (660) 57.0–56.2, (680) 57.8–56.8, (700) 58.4–57.4

Cell Data: *Space Group: C*222. $a = 9.3359(7)$ $b = 11.2185(10)$ $c = 9.4300(6)$ $Z = 4$

X-ray Powder Pattern: Zapolyarnyi mine, Russia.
2.85 (100), 1.803 (90), 1.795 (80), 1.654 (80), 3.28 (50), 2.10 (50), 2.33 (40)

Chemistry:

	(1)	(2)	(3)	(4)
Ni	61.5	64.45	68.2	67.31
Fe	3.0	2.08		
Co	0.6	0.19		
S	35.0	32.85	32.7	32.69
Total	100.1	99.57	100.9	100.00

(1) Zapolyarnyi mine, Russia; by electron microprobe, corresponding to $(Ni_{7.68}Fe_{0.39}Co_{0.08})_{\Sigma=8.15}S_{8.00}$. (2) Do.; by electron microprobe, corresponding to $(Ni_{8.58}Fe_{0.29}Co_{0.02})_{\Sigma=8.89}S_{8.00}$. (3) Barberton district, South Africa; by electron microprobe, corresponding to $Ni_{9.12}S_{8.00}$. (4) Ni_9S_8.

Occurrence: In hydrothermal veins, or in peridotite with other nickel sulfides.

Association: Millerite, heazlewoodite, pentlandite, pyrrhotite, pyrite, bornite, chalcopyrite, magnetite.

Distribution: In Russia, from the Talnakh area, Noril'sk region, western Siberia, in the Zapolyarnyi [TL], Mayak, and other mines; at the Bazhenovo ultramafic massif, Middle Ural Mountains. From the Swat Valley, northwestern Pakistan. At the Amianthus mine, Kaapsche Hoop, Barberton, Transvaal, South Africa. From Bou Azzer, Morocco. At Fiskenæsset, Greenland. In Canada, in the Texmont mine, about 50 km south of Timmins, Ontario, and at the Orford nickel mine, Brompton Lake, Quebec. From near Moapa, Clark Co., Nevada, USA. At Mount Clifford, 54 km north-northwest of Leonora, Western Australia. Several other less-well-defined occurrences are known.

Name: In honor of Mikhail Nikolaevich Godlevskii (1902–1984), Russian economic geologist, Central Institute of Geological Exploration for Base and Precious Metals, Moscow, Russia.

Type Material: Institute of Geology; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 73000.

Goethite α–$Fe^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m2/m2/m$. As prismatic crystals, striated ‖ [001], to 45 cm, or tabular on {010}. More commonly as aggregates of capillary to acicular crystals, in divergent sprays, or reniform, botryoidal, or stalactitic masses with concentric or radial fibrous internal structure; nearly cryptocrystalline in "limonite".

Physical Properties: *Cleavage:* {010}, perfect; {100}, less perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 VHN = 667 (100 g load). D(meas.) = 4.28(1) D(calc.) = 4.18

Optical Properties: Opaque, transparent on thin edges. *Color:* Blackish brown; yellowish to reddish brown in massive aggregates, may be banded; shades of yellow in thin section; gray with bluish tint in reflected light, with yellow, red, brown internal reflections. *Streak:* Brownish yellow, yellow-orange, ocher-yellow. *Luster:* Imperfect adamantine metallic to dull earthy; silky when fibrous.
Optical Class: Biaxial (–); uniaxial (–) for red light. *Pleochroism:* Strong; X = yellow to colorless; Y = yellow-brown, reddish orange; Z = yellow-orange, deep reddish orange. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, extreme. *Absorption:* $Z > Y > X$. α = 2.260–2.275 β = 2.393–2.409 γ = 2.398–2.515 2V(meas.) = 0°–27° *Anisotropism:* Distinct; in bluish grays. Cell Data: *Space Group: Pbnm.* $a = 4.608$ $b = 9.956$ $c = 3.0215$ Z = 4

X-ray Powder Pattern: Hindlow quarry, Derbyshire, England.
4.183 (100), 2.450 (50), 2.693 (35), 1.7192 (20), 2.190 (18), 2.253 (14), 4.98 (12)

Chemistry:

	(1)	(2)
SiO_2	0.36	
Fe_2O_3	89.65	89.86
H_2O	10.19	10.14
Total	100.20	100.00

(1) El Paso Co., Colorado, USA. (2) FeO(OH).

Polymorphism & Series: Trimorphous with feroxyhyte and lepidocrocite.

Occurrence: A common weathering product derived from numerous iron-bearing minerals in oxygenated environments; an important component of ore in weathered iron deposits. Also a primary precipitate in hydrothermal, marine, and bog environments upon oxidation of reduced iron-bearing waters.

Association: Lepidocrocite, hematite, pyrite, siderite, pyrolusite, manganite, many other iron- and manganese-bearing species.

Distribution: Widespread; some localities for good crystals include: from Siegen, North Rhine-Westphalia, and near Giessen, Hesse, Germany. At Příbram, Czech Republic. Exceptional crystals from the Restormel mine, Lanlivery; the Botallack mine, St. Just; and elsewhere in Cornwall, England. From Chaillac, Indre-et-Loire, France. In the USA, from the Pikes Peak district and Florissant, El Paso Co., Colorado; an ore mineral in the Lake Superior district, as at the Jackson mine, Negaunee, and the Superior mine, Marquette, Marquette Co., Michigan.

Name: Honors the German poet, dramatist, and philosopher, Johann Wolfgang von Goethe (1749–1832).

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 680–687. (2) Deer, W.A., R.A. Howie, and J. Gold Au

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As octahedra, dodecahedra, and cubes, typically crude or rounded, to about 5 cm; also elongated ‖ [111]. In twinned and parallel crystal groups; reticulated, dendritic, arborescent, platy, filiform, spongy; massive, and in rounded nuggets; scales and flakes. *Twinning:* Common on {111}; repeated to form reticulated and dendritic aggregates.

Physical Properties: *Fracture:* Hackly. *Tenacity:* Very malleable and ductile. Hardness = 2.5–3 VHN = 30–34, 44-58 (argentian) (10 g load). D(meas.) = 19.3 D(calc.) = 19.302

Optical Properties: Opaque in all but thinnest foils. *Color:* Gold-yellow with a reddish tint when pure, silver-white to copper-red when impure; blue and green in transmitted light. *Luster:* Metallic.
R: (400) 36.8, (420) 36.8, (440) 36.4, (460) 36.1, (480) 36.7, (500) 45.3, (520) 62.5, (540) 75.0, (560) 82.2, (580) 86.8, (600) 89.7, (620) 91.9, (640) 93.3, (660) 94.1, (680) 94.8, (700) 95.3

Cell Data: *Space Group: Fm3m.* a = 4.0786 Z = 4

X-ray Powder Pattern: Synthetic.
2.355 (100), 2.039 (52), 1.230 (36), 1.442 (32), 0.9357 (23), 0.8325 (23), 0.9120 (22)

Chemistry:

	(1)		(1)
Au	99.6	Ag	0.1
Cu	0.1	Total	99.8

(1) Porthcurnick Beach, Cornwall, England; by electron microprobe. Commonly contains Ag, Cu, Fe; rarely Pb, Ti, Sb, Hg, V, Bi, Mn, As, Sn, Zn, Pd, Pt, Cd, many other elements.

Polymorphism & Series: Forms a series with silver.

Occurrence: Widespread in very small quantities in rocks of many kinds throughout the world, and in sea water. In veins of epithermal origin, typically in quartz with pyrite and other sulfides, and with tellurides; in pegmatites; in contact metamorphic deposits. Common in placers.

Association: Pyrite, chalcopyrite, arsenopyrite, pyrrhotite, sylvanite, krennerite, calaverite, altaite, tetradymite, scheelite, ankerite, tourmaline, quartz.

Distribution: Many localities for fine specimens. In Russia, in Siberia, along the eastern slope of the Ural Mountains; important localities near Yekaterinburg (Sverdlovsk), as at Beresovsk; in the Miass district; large crystal groups from along the Lena River, Sakha. Sharply crystallized from Romania, at Roşia Montană (Verespatak) and Săcărîmb (Nagyág). In Australia, many occurrences, as at Bendigo, Ballarat, and Matlock, Victoria; along the Palmer River and at Gympie, Queensland; from Kalgoorlie, Western Australia, with gold telluride ores, also very large alluvial nuggets. At the Porgera mine, Mt. Kare, Papua New Guinea. The world's most important gold district is the Witwatersrand, Transvaal, South Africa, which, however, only rarely produces crystalline material. In Canada, especially in Ontario, in the Porcupine and Hemlo districts. In the USA, in California, in the Mother Lode belt of the Sierra Nevada, with fine examples from both lode and placer deposits. In South Dakota, from the Homestake mine at Lead, Lawrence Co.; in Colorado, wire and leaf gold from Breckenridge, Summit Co.; in Lake Co., at Leadville; in Alaska, in lode mines in the Juneau district and placers along the Yukon River. Near Santa Elena, in the Grand Savannah River region, Venezuela, a placer producing exceptional skeletal crystals. A bonanza gold rush occurred at Serra Pelada, Pará, Brazil.

Name: An Old English word for the metal; perhaps related to the Sanskrit *jval*; chemical symbol from the Latin *aurum*, *shining dawn*.

				Total	100.21	99.9	99.7

(1) Yelshishche [Elshitsa] deposit, Bulgaria; by electron microprobe, corresponds to $Cu_{10.92}(Te_{3.23}As_{1.13}Sb_{0.03})_{\Sigma=4.39}S_{12.75}$. (2) Goldfield, Nevada, USA; by electron microprobe, corresponds to $(Cu_{11.12}Ag_{0.09}Zn_{0.05}Fe_{0.03})_{\Sigma=11.29}(Te_{1.81}As_{1.13}Sb_{0.93})_{\Sigma=3.87}S_{13.84}$. (3) Tramway mine, Montana, USA; by electron microprobe, corresponds to $Cu_{11.85}(Te_{2.28}As_{1.53}Sb_{0.93})_{\Sigma=4.74}S_{12.41}$.

Mineral Group: Tetrahedrite group.

Occurrence: In epithermal gold-bearing veins; less commonly in porphyry copper and volcanogenic massive sulfide deposits.

Association: Marcasite, famatinite, tennantite, hessite, petzite, sylvanite, altaite, chalcostibite, emplectite, gold, kuramite, bismuthinite, pyrite, sphalerite.

Distribution: In the USA, in Nevada, from Goldfield, Esmeralda Co., in the Mohawk [TL] and Claremont mines; at the Tramway mine, Butte, Silver Bow Co., Montana; in the Campbell mine, Bisbee, Cochise Co., Arizona; and at the Sweethome mine, Lake City, Hinsdale Co., Colorado. From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. In the Bittibulakhsk Cu–As deposit, Lesser Caucasus Mountains, Russia. In the Elshitsa massive sulfide deposit, Srena Gora district, and the Assarel porphyry copper deposit, Bulgaria. At Kremnica (Kremnitz), Slovakia. From the Kawazu mine, Shizuoka Prefecture, and in the Iriki mine, Kagoshima Prefecture, Japan. At Ufuo, Left April River area, Papua New Guinea. From the Marian gold deposit, Luzon, Philippines. In the Peak Hill Au–Cu deposit, New South Wales, Australia.

Name: After the type locality, Goldfield, Nevada, USA.

Type Material: n.d.

Goldichite $KFe^{3+}(SO_4)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As singly- or doubly-terminated lathlike crystals, to 4 mm, flattened on {100} and elongated along [001], with dominant {011}, {100}, and {110}; the latter two may be striated ∥ [001]; in parallel and radiating clusters, aggregated into incrustations.

Physical Properties: *Cleavage:* On {100}, perfect. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 2.43 D(calc.) = 2.461 Slightly soluble in cold H_2O; soluble in hot H_2O with hydrolysis.

Optical Properties: Transparent. *Color:* Pale yellowish green, with a lavender tint under artificial light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless; Y = colorless to very pale yellow; Z = very pale yellow. *Orientation:* $X = b$; $Y \simeq a$; $Z \wedge c = 9°–11°$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.582–1.584$ $\beta = 1.602(2)$ $\gamma = 1.629–1.639$ 2V(meas.) = n.d. 2V(calc.) = 75°–82°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.387(6)$ $b = 10.486(6)$ $c = 9.086(5)$ $\beta = 101.68(7)°$ Z = 4

X-ray Powder Pattern: Dexter No. 7 mine, Utah, USA.
3.068 (10), 7.35 (9), 10.29 (8), 6.85 (7), 4.00 (6), 3.403 (6), 2.656 (6)

Chemistry:

	(1)	(2)		(1)	(2)

(1) Dexter No. 7 mine, Utah, USA; Al_2O_3 from alunogen impurity. (2) $KFe(SO_4)_2 \cdot 4H_2O$.

Occurrence: Cementing fragments in slope debris from an oxidizing pyritiferous Colorado Plateau-type uranium deposit (Dexter No. 7 mine, Utah, USA); coating mine walls in an argillized sulfur deposit formed by underground fumarole activity (Santa Bárbara mine, Argentina).

Association: Alunogen, coquimbite, copiapite, halotrichite (Dexter No. 7 mine, Utah, USA); metavoltine, hexahydrite, ferrinatrite, krausite, halotrichite, voltaite, sulfur, sideronatrite, alunogen, halite (Santa Bárbara mine, Argentina).

Distribution: From the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah, USA. At the Santa Bárbara sulfur mine, El Palmar district, Jujuy Province, Argentina. From the Lanjarón mineral springs, Granada Province, Spain. On the island of Saba, Netherland Antilles.

Name: Honors Dr. Samuel Stephen Goldich (1909–2000), American mineralogist, petrologist, and analytical isotope chemist, Professor of Geology, University of Minnesota, Minneapolis, Minnesota, USA, who analyzed the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106903.

Goldmanite $\mathbf{Ca_3(V^{3+}, Al, Fe^{3+})_2(SiO_4)_3}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As dodecahedra, to 0.1 mm; in anhedral grains.

Physical Properties: Hardness = 7 D(meas.) = 3.74–3.77 D(calc.) = 3.765

Optical Properties: Transparent. *Color:* Dark green to brownish green, commonly sector zoned; green to brown in thin section.
Optical Class: Isotropic to weakly anisotropic. $n = 1.821(1)$

Cell Data: *Space Group:* $Ia3d$. $a = 12.06$ Z = 8

X-ray Powder Pattern: Sandy mine, New Mexico, USA.
2.688 (100), 3.005 (65), 1.607 (49), 2.453 (38), 1.951 (22), 1.667 (18), 2.357 (16)

Chemistry:

	(1)	(2)
SiO_2	36.6	35.58
Al_2O_3	4.9	
Fe_2O_3	5.4	0.24
V_2O_3	18.3	28.66
Cr_2O_3		0.88
MnO	0.3	
MgO	0.7	
CaO	33.3	33.06
Total	99.5	98.42

(1) Sandy mine, New Mexico, USA; corresponds to $(Ca_{2.91}Mg_{0.08}Mn_{0.02})_{\Sigma=3.01}(V_{1.20}Al_{0.47}Fe_{0.33})_{\Sigma=2.00}Si_{2.99}O_{12}$. (2) North Sea; by electron microprobe, corresponds to $Ca_{2.98}(V_{1.94}Cr_{0.06}Fe^{3+}_{0.01})_{\Sigma=2.01}Si_{3.00}O_{12}$.

Mineral Group: Garnet group.

Occurrence: In a small metamorphosed U–V deposit in sandstone, embedded in vanadium-rich clays and calcite (Sandy mine, New Mexico, USA); in calcareous metapelites and tungsten-bearing skarns (Coat-an-Noz, France); detrital.

Association: Quartz, calcite, diopside, vesuvianite, wollastonite, epidote, grossular-andradite, biotite, spinel, plagioclase, pyrrhotite, roscoelite, montmorillonite (Sandy mine, New Mexico, USA); plagioclase, titanite, clinopyroxene, actinolite, chlorite, pyrite, arsenopyrite (Coat-an-Noz, France); rhodonite, braunite (Yamoto mine, Japan).

Distribution: In the Sandy mine, near Laguna, Valencia Co., New Mexico, USA. From Coat-an-Noz, Côtes-du-Nord, France. In a deep well in the United Kingdom sector of the North Sea. From Tetetice, Klatovy, Czech Republic. At Ishimskaya Luka, northern Kazakhstan. From the Slyudyanka complex, Sayan Mountains, near Lake Baikal, Siberia, Russia. In the Yamoto mine, Kagoshima Prefecture, Japan.

Name: For Dr. Marcus Isaac Goldman (1881–1965), American sedimentary petrologist, U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121717, 121953.

La_2O_3	0.15	Total	100.20
Ce_2O_3	0.29		

(1) Kovdor massif, Kola Peninsula, Russia; by electron microprobe analysis, IR and Mössbauer spectroscopy, and TGA; corresponding to $(Na_{9.02}Ca_{0.43}K_{0.30})_{\Sigma=9.75}(Ca_{5.92}Ce_{0.05}La_{0.03})_{\Sigma=6.00}(Fe^{3+}_{1.69}Fe^{2+}_{0.50}Mn_{0.29})_{\Sigma=2.48}Zr_{2.97}(Si_{0.66}Nb_{0.60}Al_{0.08})_{\Sigma=1.34}Si_{24}O_{72}(OH)_{2.37}(CO_3)_{1.05}Cl_{0.21} \cdot 1.01H_2O$.

Mineral Group: Eudialyte group, the CO_3-dominant analog of feklichevite with Si > Nb in the M3 structural site.

Occurrence: In a calcium-rich peralkaline pegmatite.

Association: Cancrinite, aegirine-augite, hedenbergite, orthoclase, pectolite, thomsonite-Ca, tacharanite, calcite.

Distribution: From the northern face of the Mica quarry, pegmatite no. 10, Kovdor massif, Kola Peninsula, Russia.

Name: Honors crystallographer Vladimir Mikhailovich Golyshev (1943-2000), Mordvinian State University, Saransk, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, (3220/1).

CaO	6.95	3.61	6.94
Na_2O	8.69	13.16	7.66
H_2O	[13.00]	11.74	15.60
Total	[100.00]	99.61	100.00

(1) Chaux de Bergonne, France; by electron microprobe, H_2O by difference; corresponding to $Na_{2.22}Ca_{0.98}Al_{4.32}Si_{5.71}O_{20}\cdot 5.70H_2O$. (2) Aci Trezza, Sicily, Italy; corresponds to $Na_{3.5}Ca_{0.5}Al_{4.5}Si_{5.9}O_{20.8}\cdot 5.35H_2O$. (3) $Na_2CaAl_4Si_6O_{20}\cdot 7H_2O$.

Mineral Group: Zeolite group.

Occurrence: In cavities in basalt, leucite tephrite, and altered skarn.

Association: Zeolites, calcite.

Distribution: Well characterized material from: in France, at Chaux de Bergonne, Gignat, Puy de Dôme. In Italy, from Capo di Bove, near Rome, Lazio; and at Aci Castello, Aci Trezza, Osilo, and other places on Sardinia. From Arendal, Tvedalen, at Brevik and elsewhere around the Langesundsfjord, Norway. At Klöch, Styria, Austria. From the Schellkopf, near Brenk, Eifel district, and in the Höwenegg quarry, Hegau, Baden-Württemberg, Germany. From Allt Ribhein, Fiskavaig Bay, Isle of Skye, Scotland. In the USA, at Crestmore, Riverside Co., California, and around Honolulu, Oahu, Hawaii. At Mazé, Niigata Prefecture, Japan. A number of other localities are known.

Name: For Ferdinand Gonnard, French mineralogist, Lyons, France, who first noted the mineral.

Type Material: The Natural History Museum, London, England, 1930,166.

Gonyerite $(Mn^{2+},Mg)_5Fe^{3+}(Si_3Fe^{3+})O_{10}(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* n.d. In rounded, radial aggregates of lath- and plate-shaped crystals, to several mm; as tiny rosettes of intergrown pseudohexagonal plates.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Cleavage foliae are flexible but inelastic. Hardness = 2.5 D(meas.) = 3.01(4) D(calc.) = 3.03

Optical Properties: Translucent. *Color:* Deep brown with reddish internal reflections, light chocolate-brown; in transmitted light, pale to dark brown.
Optical Class: Biaxial (–). *Pleochroism:* X = dark brown; Z = light brown. $\alpha = 1.646$ $\beta = 1.664$ $\gamma = 1.664$ 2V(meas.) = 0°

Cell Data: *Space Group:* n.d. $a = 5.47$ $b = 9.46$ $c = 28.8$ Z = [4]

X-ray Powder Pattern: Långban, Sweden.
7.23 (10), 3.61 (8), 4.79 (5), 1.574 (5), 14.6 (3), 2.697 (3), 1.634 (3)

Chemistry:

	(1)	(2)
SiO_2	33.06	32.35
Al_2O_3	0.58	0.57
Fe_2O_3	9.42	
FeO		7.30
MnO	33.83	35.50
ZnO	0.42	0.47
PbO	0.56	
MgO	11.55	10.26

Total	99.82	[96.47]

(1) Långban, Sweden; corresponds to $(Mn^{2+}_{3.25}Mg_{1.95}Fe^{3+}_{0.64}Zn_{0.04}Pb_{0.02}Ca_{0.01})_{\Sigma=5.91}$ $(Si_{3.75}Fe^{3+}_{0.17}Al_{0.08})_{\Sigma=4.00}[O_{10.20}(OH)_{7.80}]_{\Sigma=18.00}$. (2) Do.; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Mn^{2+}_{3.64}Mg_{1.85}Fe_{0.74}Zn_{0.04}Ca_{0.01})_{\Sigma=6.28}$ $(Si_{3.92}Al_{0.08})_{\Sigma=4.00}O_{10}[(OH)_{7.99}Cl_{0.01}]_{\Sigma=8.00}$.

Mineral Group: Chlorite group.

Occurrence: In hydrothermal veinlets cutting skarn (Långban, Sweden).

Association: Caryopilite, bementite, berzeliite, barite, garnet (Långban, Sweden).

Distribution: From Långban, and at the Harstigen mine, near Persberg, Värmland, Sweden. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: In honor of Forest A. Gonyer, analytical chemist in the Department of Mineralogy and Petrography, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 112842; National Museum of Natural History, Washington, D.C., USA, 106913; The Natural History Museum, London, England, 1956,190–191.

Goosecreekite $CaAl_2Si_6O_{16}\cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. As equant euhedral crystals, highly curved, to 4 cm; in polycrystalline aggregates.

Physical Properties: *Cleavage:* {010}, perfect. Hardness = ∼4.5 D(meas.) = 2.21 D(calc.) = 2.23

Optical Properties: Transparent. *Color:* Colorless to white. *Streak:* White. *Luster:* Vitreous to pearly on crystal faces.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 46°$. $\alpha = 1.495(2)$ $\beta = 1.498(2)$ $\gamma = 1.502(2)$ $2V(meas.) = 82(5)°$

Cell Data: *Space Group:* $P2_1$. $a = 7.401(3)$ $b = 17.439(36)$ $c = 7.293(3)$ $\beta = 105.44(4)°$ $Z = 2$

X-ray Powder Pattern: Goose Creek quarry, Virginia, USA.
4.53 (100), 7.19 (50), 5.59 (50), 4.91 (50), 3.350 (40), 3.526 (25), 3.277 (25)

Chemistry:

	(1)
SiO_2	59.3
Al_2O_3	17.2
CaO	9.3
H_2O	15.0
Total	100.8

(1) Goose Creek quarry, Virginia, USA; by electron microprobe, H_2O by DTA-TGA analysis; corresponding to $Ca_{1.01}Al_{2.05}Si_6O_{16.09}\cdot 5.06H_2O$.

Polymorphism & Series: Dimorphous with epistilbite.

Mineral Group: Zeolite group.

Occurrence: A late-stage mineral in vugs and fractures in a Triassic diabase (Goose Creek quarry, Virginia, USA); in cavities in basalt (Nasik, India).

Association: Prehnite, actinolite, chlorite, epidote, babingtonite, quartz, titanite, stilbite, albite, apophyllite (Goose Creek quarry, Virginia, USA); quartz (Nasik, India).

Distribution: In the Goose Creek quarry, Leesburg, Loudoun Co., Virginia, USA. Exceptional crystals from the Pandulena quarry, Nasik, Maharashtra, India. In the Oberbaumühle quarry, Windischeschenbach, Bavaria, Germany.

Name: For the initially described occurrence in the Goose Creek quarry, Virginia, USA.

Type Material: American Museum of Natural History, New York City, New York; Harvard University, Cambridge, Massachusetts, 117087; National Museum of Natural History, Washington, D.C., USA, 145880; Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada; The Natural History Museum, London, England, 1980,579.

Gorceixite $BaAl_3(PO_4)(PO_3OH)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudorhombohedral. *Point Group: m.* Rare rhombic crystals. May be radial fibrous in spheroidal concretions, to 1 cm; in microcrystalline grains and pebbles.

Physical Properties: *Fracture:* Porcelaneous [*sic*]. Hardness = 6 D(meas.) = 3.036–3.185 D(calc.) = 3.389

Optical Properties: Transparent. *Color:* Colorless, green, brown, may be mottled; colorless in thin section. *Luster:* Vitreous.
Optical Class: Uniaxial (+); anomalous, with low birefringence. *Orientation:* Length positive, parallel extinction. $\omega = 1.610$ $\epsilon = 1.620$

Cell Data: *Space Group: Cm* (probable). $a = 12.195$–12.225 $b = 7.040$–7.056 $c = 7.055$–7.061 $\beta = 125.10°-125.30°$ Z = 2

X-ray Powder Pattern: Big Fish River, Canada.
3.010 (100), 5.769 (93), 3.529 (56), 2.292 (39), 1.9197 (29), 2.232 (23), 1.7626 (20)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

SrO	0.28		F	2.3				

(1) Sydney Basin, Australia; by electron microprobe and X-ray fluorescence, H_2O by difference; corresponds to $(Ba_{0.95}Sr_{0.01})_{\Sigma=0.96}Al_{3.02}(PO_4)_{2.01}[(OH),F]_{5.83}$. (2) $BaAl_3(PO_4)(PO_3OH)(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: Probably always a secondary mineral; in novaculites and other sedimentary rocks; in carbonatites; from hydrothermal argillic alteration zones; in topaz greisen; in the fine-grained fraction of soils; commonly as favas in diamantiferous river sands.

Association: Dawsonite, alumohydrocalcite, nordstrandite (Sydney Basin, Australia); lazulite, siderite, "limonite", quartz (Big Fish River, Canada); diamond (river sands, may be coincidental).

Distribution: In Brazil, in Minas Gerais, along the Rio Abaeté, Rio Bagagem, and Rio Douradinho, near Curralinho and Dattas, Diamantina, and in the Araxá carbonatite, containing an estimated 20 million tons; in Goyaz, in the Rio Paranaíba and at Veríssimo; in São Paulo, in the Rio Canoas and at Patrocínio de Sapucahy. At Somabula, Zimbabwe. From the Mrima Hill carbonatite, Kenya. At Issineru, Guiana. In the Bonsa River, near Dompim, Gold Coast. From the Oiyi district, Sierra Leone. In the Buffels River, Spektakel Valley, west of Springbok, Namaqualand, South Africa. From the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In the Zig Zag Mountains, about 10 km northeast of Hot Springs, Garland Co., Arkansas; at the Silver Mine area, Madison Co., Missouri; from Indian Mountain, Cherokee Co., Alabama, USA. In the Hospital quarry, Elgin, Morayshire, Scotland. At the Lengenbach quarry, Binntal, Valais, Switzerland. In Australia, from Glen Alice and elsewhere in the Sydney Basin, New South Wales, and in the Moculta phosphate quarry, northeast of Angaston, South Australia; from the Magnet and Adelaide mines, Dundas, Tasmania. A few other localities are known.

Name: To honor Henrique Gorceix (1842–1919), French mining geologist and mineralogist, Director, School of Mines, Ouro Preto, Brazil.

Type Material: n.d.

Gordaite $NaZn_4(SO_4)(OH)_6Cl \cdot 6H_2O$

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. As thin tabular flakes with hexagonal outline or as blades, to 2 cm; in rosettelike aggregates.

Physical Properties: *Cleavage:* On {0001}, perfect. *Tenacity:* Flexible. Hardness = ~2.5 D(meas.) = 2.627 D(calc.) = 2.640

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale green if cuprian. *Luster:* Vitreous to pearly.
Optical Class: Uniaxial (–). $\omega = 1.5607(8)$ $\epsilon = 1.5382(4)$

Cell Data: *Space Group:* $P\bar{3}$. $a = 8.3556(3)$ $c = 13.025(1)$ $Z = 2$

X-ray Powder Pattern: San Francisco mine, Chile; strong preferred orientation on {0001}. 12.95 (100), 6.501 (23), 4.339 (15), 3.258 (14), 2.967 (10), 2.523 (6), 2.676 (5)

Chemistry:

	(1)	(2)
SO_3	15.33	12.79
ZnO	52.85	51.99
Na_2O	9.15	4.95
Cl	6.46	5.66
H_2O	12.33	25.89
$-O = Cl_2$	1.46	1.28
Total	94.66	100.00

(1) San Francisco mine, Chile; by electron microprobe, H_2O by CHN analyzer; low analytical total due to loss of H_2O during grinding, Na too high due to peak overlaps with Zn; after adjusting Na_2O to 5.5% from AA, and partitioning H between H_2O and $(OH)^{1-}$ according to crystal-structure analysis, corresponds to $Na_{1.54}Zn_{3.39}(SO_4)_{1.00}(OH)_6Cl_{0.95} \cdot 6H_2O$.
(2) $NaZn_4(SO_4)(OH)_6Cl \cdot 6H_2O$.

Occurrence: In the oxidized portions of a Cu–Zn sulfide deposit (San Francisco mine, Chile); on weathered mine dumps (Helbra, Germany); on the outside oxidized portions of a sea floor chimney formed by the mixing of hydrothermal fluids with sea water (Juan de Fuca Ridge).

Association: Zincian paratacamite, anglesite, hemimorphite, christelite, quartz (San Francisco mine, Chile); connellite, anglesite, chlorian bromargyrite (Helbra, Germany); sphalerite, barite, pyrite, pyrrhotite, sulfur, iron hydroxides (Juan de Fuca Ridge).

Distribution: From the San Francisco mine, two km west of the Sierra Gorda railway station, Sierra Gorda district, Antofagasta, Chile. On the Juan de Fuca Ridge, southwest of Vancouver Island, Canada. From near Helbra, Mansfeld region, Saxony-Anhalt, Germany. At the Kamariza mine, Laurium, Greece.

Name: For the Sierra Gorda, Chile, from which the mineral was first fully characterized.

Type Material: University of Hamburg, Hamburg, Germany.

Gordonite $MgAl_2(PO_4)_2(OH)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. Rare prismatic to platy crystals, to 2 mm, with dominant basal pedions, many lesser forms, elongated and striated along [001]; typically in bundles and sheaflike aggregates.

Physical Properties: *Cleavage:* {010}, perfect; {100}, fair; {001}, poor.
Fracture: Conchoidal. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.23 D(calc.) = 2.22

Optical Properties: Transparent. *Color:* Smoky white, buff, to colorless, crystals pale pink or pale green on tips; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, pearly on {010}.
Optical Class: Biaxial (+). *Orientation:* $X \simeq \perp \{010\}$. *Dispersion:* $r > v$. $\alpha = 1.534$ $\beta = 1.543$ $\gamma = 1.558$ 2V(meas.) = 73°

Cell Data: *Space Group:* $P1$. $a = 5.246(2)$ $b = 10.532(5)$ $c = 6.975(3)$ $\alpha = 107.51(3)°$ $\beta = 111.03(3)°$ $\gamma = 72.21(3)°$ Z = 1

X-ray Powder Pattern: [Little Green Monster mine, near] Fairfield, Utah, USA.
9.78 (10), 3.17 (8), 2.83 (7), 2.56 (6), 6.32 (5), 4.76 (5), 3.07 (5)

Total	98.49	100.00

(1) [Little Green Monster mine, near] Fairfield, Utah, USA. (2) $MgAl_2(PO_4)_2(OH)_2 \cdot 8H_2O$.

Mineral Group: Paravauxite group.

Occurrence: Rare in variscite-rich phosphate nodules in limestones ([Little Green Monster mine, near] Fairfield, Utah, USA); a late-stage hydrothermal mineral in a complex granite pegmatite (Tip Top mine, South Dakota, USA).

Association: Variscite, crandallite, wardite ([Little Green Monster mine, near] Fairfield, Utah, USA); robertsite, collinsite (Tip Top mine, South Dakota, USA); montgomeryite, hydroxylapatite (Milgun Station, Western Australia).

Distribution: In the USA, from the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah, and at the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota. From Rapid Creek, Yukon Territory, Canada. At the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. In Australia, from 15 km northwest of Milgun Station, Western Australia, and in Oliver's quarry, near Noarlunga, Mount Lofty Ranges, South Australia. On Mt. Vasin-Myl'k, Voron'i massif, Kola Peninsula, Russia.

Name: To honor Samuel George Gordon (1897–1953), American mineralogist, Academy of Natural Sciences, Philadelphia, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137128.

(1) Ischl salt deposit, Austria. (2) Cesano, Italy; by electron microprobe. (3) $K_2Ca_5(SO_4)_6 \cdot H_2O$.

Occurrence: Typically an uncommon secondary mineral in evaporite deposits; in hydrothermal veins.

Association: Glauberite, halite, polyhalite, anhydrite, gypsum (evaporites); cesanite, pyrite (Cesano, Italy).

Distribution: From the Ischl salt deposit, near Salzburg, Austria. In drill core at the edge of the Baccano caldera, Cesano geothermal field, east of Lake Bracciano, Lazio, Italy. From Astakós, Greece. At Praid, Romania. Very large crystals from Inder Lake, Kazakhstan. From Nongle, Sichuan Province, and the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China.

Name: Honors Rolf von Görgey (1886–1915), mineralogist specializing in Austrian salt deposits.

Type Material: Natural History Museum, Vienna, Austria, M474; Harvard University, Cambridge, Massachusetts, USA, 107559.

Gormanite $Fe_3^{2+}Al_4(PO_4)_4(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$ or 1. Crystals are elongated along [010], with large {001}, giving a bladelike aspect, with smaller {100}, {102}, {$\overline{1}$02}, {010}, to 1 cm; commonly in radial aggregates. *Twinning:* Polysynthetic around [010], composition plane {001}, universal.

Physical Properties: *Cleavage:* On {001}, poor. Hardness = 4–5 D(meas.) = 3.10–3.13 D(calc.) = 3.10–3.12

Optical Properties: Semitransparent. *Color:* Blue-green. *Streak:* Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Z$ = colorless; Y = blue. *Orientation:* X (163°,7°); Y (-77.5°,86.5°); Z (12.5°,84°) [using (ϕ,ρ)]. *Dispersion:* $r > v$, very strong. *Absorption:* $Y > X = Z$. $\alpha = 1.619(3)$ $\beta = 1.653(3)$ $\gamma = 1.660(3)$ 2V(meas.) = 53(2)° 2V(calc.) = 56°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 11.79(1)$ $b = 5.11(1)$ $c = 13.61(1)$ $\alpha = 90°50(5)'$ $\beta = 99°00(5)'$ $\gamma = 90°05(5)'$ Z = 2

X-ray Powder Pattern: Yukon Territory, Canada.
3.395 (100), 2.554 (90d), 2.925 (80), 4.761 (60), 3.154 (60d), 3.062 (40), 6.72 (30)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	37.23	38.05	MgO	6.65	8.10
Al_2O_3	25.51	27.33	CaO	0.26	
Fe_2O_3	3.82		H_2O	11.45	12.07
FeO	14.68	14.45	Total	99.91	100.00
MnO	0.31				

(1) Yukon Territory, Canada; Mg, Ca, Al by AA, P by XRF, H_2O by TGA; after removal of quartz 7.0%, corresponds to $(Fe^{2+}_{1.56}Mg_{1.26}Ca_{0.04}Mn_{0.03})_{\Sigma=2.89}(Al_{3.82}Fe^{3+}_{0.36})_{\Sigma=4.18}(PO_4)_4(OH)_{6.32} \cdot 1.69H_2O$. Commonly strongly chemically zoned, although optical property variations are not a guide. (2) $(Fe^{2+},Mg)_3Al_4(PO_4)_4(OH)_6 \cdot 2H_2O$ with Fe^{2+}:Mg = 1:1.

Polymorphism & Series: Forms a series with souzalite.

Occurrence: As low-temperature fracture fillings in phosphate-ironstones (Yukon Territory, Canada); in fractures in tonalite (Bisbee, Arizona, USA).

Association: Souzalite, siderite, ludlamite, oxidized vivianite, arrojadite, kryzhanovskite, quartz (Yukon Territory, Canada); chlorite, calcite, quartz (Bisbee, Arizona, USA).

Distribution: From Rapid Creek, Yukon Territory, Canada. In the USA, in large crystals at Bisbee, Cochise Co., Arizona; in New Hampshire, from the G.E. Smith mine, Newport, Sullivan Co. and the Charles Davis pegmatite, Groton, Grafton Co. At the Tsaobismund pegmatite, 60 km south of Karibib, Namibia.

Name: Honoring Donald Herbert Gorman (1922–), Professor of Mineralogy, Department of Geology, University of Toronto, Toronto, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M35123, M35124, M37368; National Museum of Natural History, Washington, D.C., USA, 137494, 137495, 145741.

Gortdrumite $Cu_{18}FeHg_6S_{16}(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As anhedral grains, to 200 μm. *Twinning:* Fine lamellar twinning in some grains.

Physical Properties: Hardness = n.d. VHN = 186–230 (10 g load). D(meas.) = n.d. D(calc.) = [6.80]

Optical Properties: Opaque. *Color:* Blackish lead-gray, resembling chalcocite. *Luster:* Metallic. *Anisotropism:* Strong, with colors from grayish white with a bluish tint to blue. R_1–R_2: (400) 28.0–31.4, (420) 28.1–31.4, (440) 28.0–31.3, (460) 27.8–31.2, (480) 27.6–31.1, (500) 27.4–31.1, (520) 27.0–30.8, (540) 26.7–30.5, (560) 26.2–30.0, (580) 25.9–29.5, (600) 25.6–29.0, (620) 25.4–28.6, (640) 25.3–28.4, (660) 25.3–28.2, (680) 25.3–28.1, (700) 25.2–28.0

Cell Data: *Space Group:* n.d. $a = 14.958$ $b = 7.900$ $c = 24.10$ Z = 4

X-ray Powder Pattern: Gortdrum deposit, Ireland.
4.58 (100), 3.38 (70), 2.88 (50), 2.78 (50), 6.03 (40), 3.08 (30), 3.02 (30)

Chemistry:

	(1)	(2)	(3)
Cu	38.68	36.8	
Fe	2.07	2.1	
Hg	41.55	39.6	
S	16.81	21.0	
Total	99.11	99.5	

(1) Gortdrum deposit, Ireland; by electron microprobe, average of four analyses; corresponds to $Cu_{18.58}Fe_{1.13}Hg_{6.32}S_{16.00}$. (2) Do.; by electron microprobe, corresponds to $Cu_{14.15}Fe_{0.92}Hg_{4.82}S_{16.00}$.

Occurrence: Admixed with other sulfide minerals in a vein cutting dolomitized limestone; mineral associations suggest formation at less than 200 °C.

Association: Chalcopyrite, bornite, chalcocite, cinnabar, ferroan dolomite, barite.

Distribution: From the Gortdrum deposit, near Tipperary, Co. Tipperary, Ireland [TL].

Name: For the type locality, the Gortdrum deposit, Ireland.

Type Material: The Natural History Museum, London, England, 1983,62.

Goslarite $ZnSO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Typically stalactitic or in efflorescent crusts; fibrous, granular or massive.

Physical Properties: *Cleavage:* On {010}, perfect. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 1.98(5) D(calc.) = 1.972 Soluble in H_2O, taste astringent, metallic, nauseous; dehydrates in air; strongly diamagnetic.

Optical Properties: Transparent. *Color:* Colorless, white; pale shades of blue, green, or brown from impurities; colorless in transmitted light. *Luster:* Vitreous, silky if fibrous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, weak.
$\alpha = 1.463$ $\beta = 1.475$ $\gamma = 1.480$ 2V(meas.) = Small to moderate.

Cell Data: *Space Group:* $P2_12_12_1$. $a = 11.779$ $b = 12.050$ $c = 6.822$ Z = 4

X-ray Powder Pattern: Synthetic.
4.21 (100), 5.36 (80), 4.18 (50), 5.29 (35), 2.867 (35), 2.651 (30), 4.46 (25)

(1) Ushaw Moor, Durham, England. (2) $ZnSO_4 \cdot 7H_2O$.

Polymorphism & Series: Forms a series with epsomite.

Occurrence: A secondary mineral in oxidized portions of zinc sulfide deposits, particularly as coatings on walls of mine passages.

Association: Epsomite, melanterite, pickeringite, chalcanthite, gypsum.

Distribution: Widespread as post-mining efflorescences. A few notable localities include: in Germany, from the Rammelsberg mine, near Goslar, Harz Mountains, and at Freiberg and Altenberg, Saxony. From Baňská Štiavnica (Schemnitz), Slovakia. At Falun, Sweden. From Sain-Bel, near Lyon, Rhône, France. At the Almagrera mine, Tharsis, Huelva Province, Spain. In Italy, at Capanne Vecchie, Elba, and Raibl, Venezia Giulia. At Broken Hill, New South Wales, Australia. In the USA, in Arizona, at Bisbee, Cochise Co. and many other districts; from the Central district, Grant Co., New Mexico; at Island Mountain, Trinity Co., California; from Butte, Silver Bow Co., Montana; at Bingham Canyon, Salt Lake Co., Utah; in the Comstock Lode, Storey Co., Nevada; at Friedensville, Lehigh Co., Pennsylvania. From Quebrada de La Alcaparrosa, San Juan Province, Argentina.

Name: For the locality at Goslar, Germany.

(1) Mt. Shaheru, Congo. (2) Lovozero massif, Russia. (3) $Na_2Ca_5Ti(Si_2O_7)_2F_4$.

Occurrence: In a nephelinite from the wall of the crater of an extinct volcano (Mt. Shaheru, Congo); in hornfels and marble xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Combeite (Mt. Shaheru, Congo); aegirine, apatite, fersmanite, pectolite (Kola Peninsula, Russia); cancrinite, fluorite, titanite (Azov region, Ukraine).

Distribution: On Mt. Shaheru, the extinct southern cone of Mt. Nyiragongo, Kivu Province, Congo (Zaire). In Russia, from Mt. Yukspor, Khibiny massif, and the Lovozero massif, Kola Peninsula. At Barkevik, Langesundsfjord, Norway. From the Azov region, Ukraine. Near Kirchberg, Saxony; in the Kaiserstuhl, Baden-Württemberg; and around the Laacher See, Eifel district, Germany. At Mont Saint-Hilaire, Quebec, Canada.

Name: For Count Gustav Adolph von Götzen (1886–?), noted German traveller who climbed Mt. Shaheru, Congo (Zaire), in 1894.

Type Material: The Natural History Museum, London, England, 1957,702; Royal Museum of Central Africa, Tervuren, Belgium, RGM8037; National Museum of Natural History, Washington, D.C., USA, 142981.

Goudeyite $(Al,Y)Cu_6(AsO_4)_3(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6 (probable). Crystals are hairlike hexagonal prisms, elongated along [0001], to 1 cm, in tufted groups and cross-fiber veinlets.

Physical Properties: Hardness = 3–4 D(meas.) = 3.50(3) D(calc.) = [3.49]

Optical Properties: Semitransparent. *Color:* Yellow-green, blue-green.
Optical Class: Uniaxial (+). *Pleochroism:* O = pale yellow-green; E = green.
Absorption: $O < E$. $\omega = 1.704$–1.705 $\epsilon = 1.765$–1.772

Cell Data: *Space Group:* [$P6_3/m$ or $P6_3$] (by analogy to mixite). $a = 13.472(1)$ $c = 5.902(4)$ Z = [2]

X-ray Powder Pattern: Majuba Hill, Nevada, USA; identical to mixite.
11.63 (100), 2.920 (50), 3.235 (46), 2.546 (46), 4.41 (43), 2.677 (42), 3.367 (20)

Chemistry:

	(1)
P_2O_5	4.55
As_2O_5	27.85
Al_2O_3	4.00
Y_2O_3	3.40
CuO	46.77
CaO	1.37
H_2O	11.00
Total	98.94

(1) Majuba Hill, Nevada, USA; by electron microprobe, average of five analyses, H_2O by weight loss to 600 °C; corresponds to $(Al_{0.77}Y_{0.29})_{\Sigma=1.06}(Cu_{5.80}Ca_{0.24})_{\Sigma=6.04}[(AsO_4)_{2.40}(PO_4)_{0.63}]_{\Sigma=3.03}(OH)_{6.17} \cdot 2.95H_2O$.

Mineral Group: Mixite group.

Occurrence: A rare secondary mineral in a hydrothermal Cu–Sn orebody in rhyolite porphyries and breccias (Majuba Hill, Nevada, USA).

Association: Olivenite, clinoclase, cornwallite, strashimirite, scorodite, pharmacosiderite, arthurite, metazeunerite, chalcanthite, chrysocolla, spangolite, chalcophyllite, malachite, azurite, brochantite (Majuba Hill, Nevada, USA); malachite, montmorillonite (Chessy, France).

Distribution: From the Majuba Hill mine, Antelope district, Pershing Co., Nevada, USA. In the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate, Germany. At Chessy, near Lyon, Rhône, France. Large crystals from Tsumeb, Namibia.

Name: To honor Hatfield Goudey (1906–1985), American economic geologist, mineral collector and dealer in microscopic specimens, San Mateo, California, USA, who contributed to knowledge of the type locality.

Type Material: University of California, Santa Barbara, California, 8091; National Museum of Natural History, Washington, D.C., USA, 144005.

H_2O	25.76	25.37
Total	100.07	100.00

(1) Death Valley, California, USA; average of two analyses, Sr by flame photometry, H_2O by TGA; corresponds to $Ca_{1.00}B_{5.90}O_8(OH)_4 \cdot 3.05H_2O$. (2) $CaB_6O_8(OH)_4 \cdot 3H_2O$.

Occurrence: A rare weathering product of colemanite and priceite.

Association: Meyerhofferite, nobleite, hydroboracite, ulexite, ginorite, gypsum.

Distribution: From the Hard Scramble claim, the Mott colemanite prospect, and two other nearby occurrences south of Furnace Creek Wash, Death Valley, Inyo Co., California, USA.

Name: To honor Harrison Preston Gower (1890–1967), Mining Manager, U.S. Borax and Chemical Company, for his assistance to scientific studies of Death Valley borate deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, 136417, 147960.

(1) Oxford Co., Maine, USA. (2) Alto Bernardino, Brazil; by electron microprobe, H_2O by difference. (3) $SrAl_3(PO_4)(PO_3OH)(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: In granite pegmatites; from hydrothermal argillic alteration zones; in kaolinitic claystones derived from air-fall volcanic tuffs; in carbonatites; detrital.

Association: Herderite, apatite, quartz (Alto Bernardino, Brazil); monazite, sphalerite, pyrite, barite, quartz (Wigu carbonatite, Tanzania); kaolinite (alteration zones); diamonds (river sands; may be coincidental).

Distribution: In Brazil, from the Serra de Congonhas, near Diamantina, Minas Gerais, and at Alto Bernardino, about 20 km northwest of Picuí, Paraíba. In the USA, from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; in Maine, in Oxford Co., in the Bennett quarry, Buckfield, the Harvard quarry, Greenwood, the Mt. Mica quarry, Paris, at Lord Hill, Stoneham, and elsewhere. In Colorado, along the Dakota hogback, from Turkey Creek, Jefferson Co., to Boxelder Creek, Larimer Co.; at the Apex mine, near St. George, Washington Co., Utah. Large crystals from the Rapid Creek-Big Fish River area, Yukon Territory, Canada. In Germany, large crystals from the Fuchsbau quarry, Fichtelgebirge, Bavaria; at Ehrenfriedersdorf, Saxony. In the Simplon Tunnel, and at Lengenbach, Binntal, Valais, Switzerland. From the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). In the Wigu carbonatite, about 64 km south of Morogoro, Tanzania. From near Myponga Beach, Fleurieu Peninsula, South Australia. Other localities are known but may require confirmation of composition.

Name: For Goiás [Goyaz] State, Brazil.

Graemite $CuTe^{4+}O_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As divergent bladed crystals, with {100}, {010}, {001}, {021}, to 8 mm.

Physical Properties: *Cleavage:* On {010}, good; on {100}, a parting. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 4.13(9) D(calc.) = 4.24

Optical Properties: Translucent. *Color:* Blue-green, jade-green. *Streak:* Pale blue-green. *Luster:* [Vitreous.]
Optical Class: Biaxial (+). *Pleochroism:* Moderate; X = yellowish green; $Y = Z$ = blue-green. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Absorption:* $Y > X = Z$ $\alpha = 1.920(3)$ $\beta = 1.960(3)$ $\gamma = 2.20(0.5)$ 2V(meas.) = n.d. 2V(calc.) = 48.5°

Cell Data: *Space Group:* *Pcmm* (probable). $a = 6.805(6)$ $b = 25.613(15)$ $c = 5.780(6)$ Z = 10

X-ray Powder Pattern: Cole shaft, Arizona, USA.
6.395 (10), 3.434 (8), 12.803 (5), 2.558 (5), 2.873 (4), 2.343 (4), 5.640 (3)

Chemistry:

	(1)	(2)
TeO_2	61.2	62.06
CuO	31.0	30.93
H_2O	8.2	7.01
Total	100.4	100.00

(1) Cole shaft, Arizona, USA; average of three analyses, H_2O by the Penfield method, average of two determinations, $(TeO_3)^{4+}$ confirmed by microchemical tests; corresponds to $Cu_{0.98}(TeO_3)_{0.96} \cdot 1.14H_2O$. (2) $CuTeO_3 \cdot H_2O$.

Occurrence: A rare dehydration product of teineite, as pseudomorphs and incrustations.

Association: Teineite, malachite, cuprite (Cole mine, Arizona, USA); teineite, malachite, brochantite, djurleite, bornite, weissite, gold, goethite (Dome Rock Mountains, Arizona, USA).

Distribution: In the USA, in Arizona, from the Cole shaft and in the Shattuck mine, Bisbee, Warren district, Cochise Co., and in the Dome Rock Mountains, La Paz Co.

Name: Honors Richard Graeme (1941–), American mining engineer and mineral collector, Phelps Dodge Corporation, USA, who found the first specimen.

Type Material: n.d.

Graftonite $(Fe^{2+}, Mn^{2+}, Ca)_3(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very rare crude crystals, stout prismatic; usually massive, cleavable, in laminated intergrowths with triphylite, to 0.5 m.

Physical Properties: *Cleavage:* On {010}, good; on {100}, fair. *Fracture:* Uneven to subconchoidal. Hardness = 5 D(meas.) = 3.67–3.79 D(calc.) = [3.71]

Optical Properties: Semitransparent. *Color:* Salmon-pink to reddish brown, dark brown when altered; in transmitted light, nearly colorless. *Streak:* White to pale pink. *Luster:* Vitreous towards resinous.
Optical Class: Biaxial (+). *Pleochroism:* Faint; $X = Y$ = colorless; Z = pink. *Orientation:* $X = b$; $Z \wedge c = -36°$. *Dispersion:* $r > v$ or $r < v$, strong. $\alpha = 1.695–1.709$ $\beta = 1.699–1.714$ $\gamma = 1.719–1.736$ 2V(meas.) = 50°–60°

Cell Data: *Space Group:* $P2_1/c$. $a = 8.87–8.91$ $b = 11.57–11.58$ $c = 6.17–6.24$ $\beta = 98°54'–99°12'$ Z = 4

X-ray Powder Pattern: Greenwood, Maine, USA.
2.867 (10), 3.50 (9), 2.715 (7), 3.01 (4), 4.30 (3), 2.953 (3), 2.410 (2)

(1) Grafton, New Hampshire, USA. (2) Nickel Plate mine, South Dakota, USA; corresponds to $(Fe^{2+}_{1.52}Mn^{2+}_{1.09}Ca_{0.38}Na_{0.03}Al_{0.02}Mg_{0.01}Li_{0.01})_{\Sigma=3.06}(PO_4)_{1.98}$.

Polymorphism & Series: Forms a series with beusite.

Occurrence: A primary mineral or exsolution product in complex granite pegmatites.

Association: Triphylite, lithiophilite, sarcopside, ferrisicklerite, heterosite, arrojadite, fairfieldite, barbosalite, huréaulite, almandine, zircon, albite, muscovite, biotite.

Distribution: In the USA, on Melvin Mountain, about eight km west of Grafton, at the Palermo #1 and Rice mines, near North Groton, Grafton Co., at the Parker Mountain quarry, Center Strafford, Strafford Co., and many other places in New Hampshire; from the Waisenen quarry, Greenwood, Oxford Co., Maine; in the Bull Moose mine, five km southeast of Custer, Custer Co., and at the Nickel Plate mine, 1.5 km south of Keystone, Pennington Co., South Dakota. From near São Luiz do Paraitinga, São Paulo, and the Énio pegmatite mine, northeast of Galiléia, Minas Gerais, Brazil. At the Ranquel and Cacique Canchuleta mines, San Luis, Argentina. From Sidi Bou Othmane, Morocco. In the Valle della Madonna, Brissago, Tessin, Switzerland. At Olgiasca, Lake Como, Lombardy, Italy. From Hagendorf, Bavaria, Germany. In the Kondakov district, eastern Siberia, Russia. Additional localities continue to be recognized.

Name: For its first-noted occurrence near Grafton, New Hampshire, USA.

Type Material: Yale University, New Haven, Connecticut, 3.2345; National Museum of Natural History, Washington, D.C., USA, C4037, R5183.

Grandaite $Sr_2Al(AsO_4)_2(OH)$

Crystal Data: Monoclinic. *Point Group*: 2/m. As platy tablets; typically as thin fan-like masses to ~1 cm.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle.
Hardness = 6-6.5 D(meas.) = n.d. D(calc.) = 4.378

Optical Properties: Translucent. *Color*: Bright orange to salmon to brown.
Streak: Reddish brown. *Luster*: Waxy to vitreous.
Optical Class: Biaxial (+). α = 1.726(1) β = 1.731(1) γ = 1.752(1) 2V(meas.) = 52(2)°
2V(calc.) = 53°

Cell Data: *Space Group*: $P2_1/m$. a = 7.5764(5) b = 5.9507(4) c = 8.8050(6)
β = 112.551(2)° Z = 2

X-ray Powder Pattern: Valletta mine, Piedmont, Italy.
3.194 (100), 2.705 (65), 2.981 (51), 2.087 (51), 2.922 (40), 2.743 (31), 1.685 (24)

Chemistry:

	(1)	(2)
SrO	29.81	41.68
CaO	7.28	
BaO	1.56

Total	98.78	100.00

(1) Valletta mine, Piedmont, Italy; average of 8 electron microprobe analyses, H_2O calculated from structure refinement, OH^- and $(AsO_4)^{3-}$ confirmed by Raman and IR spectroscopy; corresponding to $(Sr_{1.41}Ca_{0.64}Ba_{0.05}Pb_{0.01})_{\Sigma=2.11}(Al_{0.68}Fe^{3+}_{0.14}Mn^{3+}_{0.12}Mg_{0.13})_{\Sigma=1.07}[(As_{0.96}V_{0.01})_{\Sigma=0.97}O_4]_2(OH)$.
(2) $Sr_2Al(AsO_4)_2(OH)$.

Occurrence: From a small Fe-Mn-As deposit in metamorphosed quartzites (high-P, low-T blueschist facies).

Association: Aegirine, adelite, barite, braunite, hematite, quartz, tilasite.

Distribution: Found on the dumps of the Valletta mine, Valletta Valley, Canosio municipality, Maira Valley, Cuneo province, Piedmont, Italy.

Name: For the informal appellation of the Province where the Valletta mine is located - called ‘‘la *Granda*’’ (the Big One) for its considerable areal extent, one of the biggest in Italy.

Type Material: At the Museo Regionale di Scienze Naturali di Torino, Sezione di Mineralogia, Petrografia e Geologia, Torino, Italy (# M/15999), and the mineralogical collection, Museo Civico Archeologico e di Scienze Naturali “Federico Eusebio”, Alba, Cuneo, Italy (#G. 1723 prog. 505).

(1) Sakatelo, Madagascar; corresponds to $(Mg_{0.87}Fe^{2+}_{0.12}Fe^{3+}_{0.03})_{\Sigma=1.02}Al_{3.00}(B_{0.97}O_3)(Si_{0.99}O_4)O_2$.
(2) Mt. Amiata, Italy; by electron microprobe, corresponds to $(Mg_{0.69}Fe_{0.32})_{\Sigma=1.01}$ $Al_{2.98}(BO_3)(Si_{1.00}O_4)O_2$. (3) $(Mg, Fe)Al_3(BO_3)(SiO_4)O_2$ with Mg:Fe = 1:1.

Occurrence: A rare accessory mineral in aluminous boron-rich rocks, thermally and high-grade regionally metamorphosed under low pressure; in pegmatites, aplites, gneisses; in xenoliths.

Association: Quartz, potassic feldspar, plagioclase, biotite, garnet, "hypersthene," spinel, corundum, sillimanite, andalusite, cordierite, tourmaline, kornerupine, sapphirine, serendibite, sinhalite.

Distribution: In large crystals from Andrahomana, southwest of Taolañaro (Fort Dauphin); at Marotrana, Amboasara; from Vohiboly, near Behara; Ampamatoa; and elsewhere on Madagascar. In the Kachebere Hills, Mchinji district, Malawi. From Tizi-Ouchen, Béjaia, Algeria. From near Gananoque, Ontario, Canada. At Johnsburg, Warren Co., New York, USA. On Mt. Amiata and Mt. Cimino, Tuscany, Italy. Around Vestpolltind, and on Almjotheia, 12 km north of Moi, Norway. At Maratakka, Surinam. On Cuvier Island, New Zealand. Known from a number of other minor localities.

Name: For Alfred Grandidier (1836–1912), French naturalist and explorer, an authority on Madagascar.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 86382.

References: (1) Dana, E.S. and W.E. Ford (1909) Dana's system of mineralogy, (6th edition), app. II, 47. (2) McKie, D. (1965) The magnesium aluminum borosilicates: kornerupine and grandidierite. Grandreefite $Pb_2(SO_4)F_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladelike to prismatic crystals, to 7 mm, with {120}, {130}, {101}, {293}, {$2\bar{9}3$}. *Twinning:* Coarse polysynthetic twins of undetermined law observed only in transmitted light under crossed polars.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼2.5
D(meas.) = 7.0(1) D(calc.) = 7.15 Decomposed by H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White.
Luster: Subadamantine.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.872(5)$ $\beta = 1.873(5)$ $\gamma = 1.897(5)$ 2V(meas.) = Very small. 2V(calc.) = 23°

Cell Data: *Space Group:* $A2/a$. $a = 8.667(1)$ $b = 4.4419(6)$ $c = 14.242(2)$
$\beta = 107.418(2)°$ Z = 4

X-ray Powder Pattern: Grand Reef mine, Arizona, USA.
3.159 (100), 3.116 (90), 3.084 (80), 1.806 (60), 2.281 (50), 1.824 (50), 1.370 (50b)

Chemistry:

	(1)	(2)
SO_3	13.8	14.60
PbO	82.9	81.39
F	7.1	6.93

(1) F-33 mine, New Mexico, USA; corresponds to $Na_{1.90}Ca_{0.46}Sr_{0.01}V_{6.02}O_{16} \cdot 3.49H_2O$.
(2) Golden Cycle mine, Colorado, USA; corresponds to $Na_{1.91}Ca_{0.38}V_{6.03}O_{16} \cdot 4.59H_2O$.

Occurrence: In partially oxidized portions of sandstone seams and coalified wood in vanadiferous uranium deposits of the Colorado Plateau type.

Association: Häggite, paramontroseite, corvusite, rauvite, hewettite, carnotite, tyuyamunite.

Distribution: In the USA, from the F-33 mine, Grants district, McKinley Co., New Mexico; the Golden Cycle mine, Atkinson Mesa, Uravan district, and the La Salle mine, Club Mesa, Montrose Co., Colorado; and in the Parco No. 23 mine, about 21 km southeast of Thompson, Grand Co., Utah.

Name: For the town of Grants, New Mexico, USA, near which it was first discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121956.

Graphite C

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$ (2H); $\overline{3}\ 2/m$ (3R). As hexagonal platy {0001} crystals having triangular striations on the base, to 20 cm. Massive, foliated; also scaly, columnar, granular, compact, earthy; in globular aggregates having radial structure. *Twinning:* Twin plane probably $\{11\overline{2}1\}$; twinning due to pressure gliding, produces trigonal or hexagonal striae on {0001}; also by 30° (90°) rotation about [0001].

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Flexible but not elastic; sectile. Hardness = 1–2 VHN = 7–11 (10 g load). D(meas.) = 2.09–2.23 D(calc.) = 2.26 Greasy feel.

Optical Properties: Opaque, transparent only in extremely thin flakes. *Color:* Iron-black to steel-gray; deep blue in transmitted light. *Streak:* Black to steel-gray, shining. *Luster:* Metallic; may be dull, earthy.
Optical Class: Uniaxial (–). *Pleochroism:* Strong. ω = 1.93–2.07 (red). ϵ = n.d. (extreme birefringence). *Anisotropism:* Extreme.
R_1–R_2: (400) 6.4–23.6, (420) 6.3–24.2, (440) 6.3–24.5, (460) 6.2–24.7, (480) 6.2–25.1, (500) 6.2–25.4, (520) 6.2–25.9, (540) 6.2–26.3, (560) 6.2–26.7, (580) 6.2–27.1, (600) 6.3–27.5, (620) 6.3–27.9, (640) 6.4–28.2, (660) 6.4–28.7, (680) 6.5–29.0, (700) 6.5–29.5

Cell Data: *Space Group:* $P6_3/mmc$ (2H), with $a = 2.464(2)$ $c = 6.711(4)$ Z = 4, or *Space Group:* $R\overline{3}m$ (synthetic 3R), with $a = 2.456$ $c = 10.044$ Z = 6

X-ray Powder Pattern: Sri Lanka.
3.36 (10), 1.678 (8), 2.03 (5), 1.158 (5), 0.994 (4), 0.829 (4), 1.232 (3)

Chemistry: Carbon.

Polymorphism & Series: Polymorphous with chaoite, diamond, and lonsdaleite.

Occurrence: Formed by metamorphism of sedimentary carbonaceous material, by the reduction of carbon compounds; a primary constituent in igneous rocks.

Association: A wide variety of minerals stable in the metamorphic conditions under which graphite forms. In meteorites, in nodules with troilite, silicates.

Distribution: Numerous localities, but only a few afford well-crystallized examples. In the USA, at Monroe and Ticonderoga, Essex Co., New York; at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey. In Canada, commercially significant occurrences in Quebec, at Buckingham and Grenville, and in adjacent parts of Ontario. In Russia, from Nizhni Tunguski, east of Turukhansk, near the Yenisei River, Siberia; at Shunga, Karelia. Around Ratnapura, Matara, and Kurunegale, Sri Lanka, large deposits of pure material. At Passau, Bavaria, Germany. From Pargas, Finland. In England, at Barrowdale, near Keswick, Cumbria. In Mexico, at Santa Maria, Sonora, formed by metamorphism of coal beds.

Name: From the Greek *to write*, in allusion to its use as a crayon.

Gratonite $Pb_9As_4S_{15}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals, to 5 mm, prismatic by elongation ‖ [0001] with $\{11\bar{2}0\}$ prominent; $\{02\bar{2}1\}$ is well developed and commonly the only terminal form; massive.

Physical Properties: *Tenacity:* Brittle. Hardness = 2.5 VHN = 130–146 (100 g load). D(meas.) = 6.22(2) D(calc.) = 6.17

Optical Properties: Opaque. *Color:* Dark lead-gray; in polished section, white, distinctly yellow against galena. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Very weak.
R_1–R_2: (400) 38.7–39.8, (420) 38.0–39.3, (440) 37.6–38.4, (460) 37.1–37.6, (480) 36.5–36.9, (500) 36.1–36.4, (520) 36.0–36.2, (540) 36.1–36.2, (560) 36.3–36.4, (580) 36.6–36.6, (600) 36.7–36.7, (620) 36.3–36.4, (640) 35.7–35.8, (660) 34.8–35.0, (680) 33.8–34.1, (700) 33.0–33.3

Cell Data: *Space Group:* $R3m$. $a = 17.758(14)$ $c = 7.807(6)$ $Z = 3$

X-ray Powder Pattern: Cerro de Pasco, Peru.
3.43 (100), 3.74 (80), 2.86 (70), 2.71 (70), 2.20 (60), 2.05 (60), 1.746 (40)

Chemistry:

	(1)	(2)	(3)
Pb	71.12	71.0	70.49
Fe	0.39		
As	10.82	11.0	11.33
Sb	0.21		
S	17.38	18.0	18.18
Total	99.92	100.0	100.00

(1) Cerro de Pasco, Peru. (2) Rio Tinto, Spain; by electron microprobe. (3) $Pb_9As_4S_{15}$.

Occurrence: In vugs in hydrothermal copper ores.

Association: Realgar, pyrite, sphalerite, pyrrhotite, arsenopyrite, enargite, tetrahedrite–tennantite, jordanite, canfieldite, hutchinsonite.

Distribution: In the Excelsior mine, Cerro de Pasco, Peru [TL], in large crystals. At the Santa Lucia deposit, Cuba. In abundance, in large crystals in the Blei-Scharley mine, Upper Silesia, Poland. At Zvezdel, Bulgaria. From Wiesloch, near Heidelberg, Black Forest, Germany. In the Lengenbach quarry, Binntal, Valais, Switzerland. On the Isle of Man, from the North Laxey mine. At Rio Tinto, Huelva Province, Spain. From Tsumeb, Namibia. In the Yunosawa mine, Aomori Prefecture, Japan.

Name: In honor of Louis Caryl Graton (1880–1970), Professor of Mining Geology, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 94611.

Grattarolaite $Fe_3^{3+}O_3(PO_4)$

Crystal Data: Hexagonal. *Point Group:* 3*m*. In microcrystalline nodules, intimately mixed with rodolicoite, as crystallites to < 1000 Å.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 4.08

Optical Properties: Opaque. *Color:* Reddish brown. *Streak:* Brown. *Luster:* Greasy. *Optical Class:* Uniaxial. ω = n.d. ε = n.d.

Cell Data: *Space Group:* [*R*3*m*] (by analogy to synthetic material). *a* = 7.994(4) *c* = 6.855(4) Z = 3

X-ray Powder Pattern: Synthetic.
3.09 (100), 1.623 (23), 2.078 (20), 2.446 (16), 1.440 (16), 1.997 (13), 1.545 (12)

Chemistry: (1) Due to the tiny particle sizes (average about 380 Å) only bulk composition of the mixture could be determined; this is compatible with a composition of $Fe_{2.99}P_{1.01}O_{7.00}$; the identity of the mineral rests also on its X-ray powder pattern.

Occurrence: Very rare, in microcrystalline nodules in lignite beds which appear to have burned naturally.

Association: Rodolicoite, heterosite.

Distribution: From the Castelnuovo mine, Santa Barbara lignite district, 30 km southeast of Florence, Florence, Italy.

Name: Honoring Giuseppe Grattarola (1844–1907), Professor of Mineralogy, Florence University, Florence, Italy.

Type Material: Museum of Natural History, Florence University, Florence, Italy, 2087/RI.

References: (1) Cipriani, C., M. Mellini, G. Pratesi, and C. Viti (1997) Rodolicoite and grattarolaite, two new phosphate minerals from Santa Barbara mine, Italy. Eur. J. Mineral., 9, 1101–1106. Gravegliaite $Mn^{2+}(SO_3)\cdot 3H_2O$

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As pseudohexagonal prismatic crystals elongated along [010], to 0.5 mm; typically as radial or sheaflike aggregates.

Physical Properties: *Cleavage:* One || [010]. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.39

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $Z = b$. *Dispersion:* Strong. $\alpha = 1.590(2)$ $\beta = 1.596(2)$ $\gamma = 1.636(2)$ 2V(meas.) = 41(3)° 2V(calc.) = 43°

Cell Data: *Space Group: Pnma.* $a = 9.763(1)$ $b = 5.635(1)$ $c = 9.558(1)$ $Z = 4$

X-ray Powder Pattern: Gambatesa mine, Italy.
4.33 (VS), 3.43 (VS), 6.83 (S), 2.704 (M), 2.666 (M), 2.414 (M), 1.726 (M)

Chemistry:

	(1)	(2)
SO_2	33.51	33.89
MnO	37.83	37.52
H_2O	[28.66]	28.59
Total	[100.00]	100.00

(1) Gambatesa mine, Italy; by electron microprobe, averages of 13 analyses of 3 crystals, H_2O by difference; corresponds to $Mn_{1.01}(SO_3)_{0.99}\cdot 3.01H_2O$. (2) $Mn(SO_3)\cdot 3H_2O$.

Occurrence: Very rare, along fractures in metamorphosed manganiferous layers in radiolarian cherts in an ophiolite sequence.

Association: Tephroite, bementite, braunite, hausmannite, hematite.

Distribution: From the Gambatesa mine, near Reppia, Val Graveglia, Liguria, Italy.

Name: For Val Graveglia, Italy, within which the Gambatesa mine is located.

Type Material: Department of Earth Sciences, University of Genoa, Genoa, Italy.

References: (1) Basso, R., G. Lucchetti, and A. Palenzona (1991) Gravegliaite, $MnSO_3\cdot 3H_2O$, a new mineral from Val Graveglia (Northern Apennines, Italy). Zeits. Krist., 197, 97–106.

Grayite $ThPO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622. Quasi-pyramidal grains, to 2 mm; powdery.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3–4 D(meas.) = 3.7–4.3 D(calc.) = [4.63] Radioactive. May fluoresce yellow-green under SW UV.

Optical Properties: Semitransparent. *Color:* Pale yellow, yellow, yellowish gray, reddish brown. *Luster:* Resinous to waxy.
Optical Class: Uniaxial, moderate birefringence. n = 1.66–1.69

Cell Data: *Space Group:* $P6_222$ (ICDD 42-1389). $a = 6.957(24)$ $c = 6.396(18)$ Z = 3

X-ray Powder Pattern: Gunnison, Colorado, USA; after heating to 800 °C, pattern is similar to monazite.
3.03 (vs), 2.82 (s), 2.15 (s), 4.35 (m), 1.856 (m), 6.05 (w), 3.46 (vw)

Chemistry: (1) Fremont Co., Wyoming, USA; semiquantitative spectrographic analysis shows Si and Th > 10%; Ca 7%, P and Al 3%, Fe and Mg 1.5%. The name is applied to a mineral with composition approximating $Th(PO_4)$ and showing a rhabdophane X-ray pattern, which changes to a monazitelike X-ray pattern on heating to 800 °C–900 °C.

Mineral Group: Rhabdophane group.

Occurrence: In a lithium-bearing pegmatite (Mtoko district, Zimbabwe); in an oxidized granitic vein in Precambrian rocks (Gunnison, Colorado, USA); in fracture fillings and disseminated through limestone (Fremont Co., Wyoming, USA).

Association: Thorite (Mtoko district, Zimbabwe); monazite-(Ce), xenotime-(Y), zircon (Havey quarries, Maine, USA).

Distribution: In the Gooddays mine, Mtoko district, and on the Mahaka and Verdale claims, Wedza district, Zimbabwe. From the Mungenyi pegmatite, about 65 km southwest of Mbarara, Ankole district, Uganda. In the USA, from southwest of Gunnison, Gunnison Co., Colorado; in Fremont Co., Wyoming; from the Zapot pegmatite, 25 km northeast of Hawthorne, Fitting district, Mineral Co., Nevada; at the Havey quarries, Topsham, Sagadahoc Co., Maine.

Name: In honor of Anton Gray, mining engineer, advisor to the United Kingdom Atomic Energy Authority.

Type Material: n.d.

Grechishchevite $Hg_3S_2(Br,Cl,I)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m2/m2/m, \overline{4}2m$, or $4mm$. As prismatic crystals, granular, to 0.3 mm; in coatings and powdery masses.

Physical Properties: *Cleavage:* One direction, ‖ prism elongation, distinct.
Tenacity: Brittle. Hardness = ∼2.5 VHN = 88–116, average 106 (25 g load).
D(meas.) = 7.23 (synthetic). D(calc.) = 7.16 (synthetic).

Optical Properties: Transparent. *Color:* Bright to dark orange, darkening to orange-brown, then black; in reflected light, gray-white with strong orange internal reflections. *Streak:* Deep yellow to yellow with slight orange tint. *Luster:* Vitreous to adamantine.
Optical Class: Uniaxial (+). *Pleochroism:* E = straw-yellow; O = yellow. $\omega = > 2.0$ $\epsilon = > 2.0$
Anisotropism: Observed. *Bireflectance:* Distinct; gray-white to gray.
R_1–R_2: (436) 22.8–19.2, (460) 24.5–22.2, (500) 21.4–18.9, (546) 19.8–17.3, (590) 18.8–16.5, (620) 18.9–16.7, (656) 18.1–15.9

Cell Data: *Space Group:* $[P4/mmm, P\overline{4}2m$, or $P4mm]$ (by analogy to synthetic material).
$a = 13.208(6)$ $c = 6.698(9)$ Z = 8

X-ray Powder Pattern: Arzak deposit, Russia.
2.65 (100), 3.95 (60), 3.02 (60), 2.60 (40), 2.341 (40), 2.180 (30b), 1.873 (30)

Chemistry:

(1) Mesabi Range, Minnesota, USA; recalculated to 100% after deduction of SiO_2 and other impurities; corresponds to $(Fe^{2+}_{2.34}Fe^{3+}_{0.45})_{\Sigma=2.79}Si_{2.18}O_5(OH)_{3.28}$. (2) Do.; by electron microprobe. (3) Bluebell mine, Riondel, Canada; by electron microprobe.

Polymorphism & Series: Group A (1M, $2M_1$, 3A) and Group C (1A, 2A, 3R) polytypes may be intergrown.

Mineral Group: Kaolinite-serpentine group.

Occurrence: A primary phase in some banded iron formations.

Association: Minnesotaite, stilpnomelane, siderite, chamosite, quartz, pyrite.

Distribution: Some localities for studied material follow. Widespread in the Biwabik Iron Formation, Mesabi Range, St. Louis Co., Minnesota, USA. In Canada, in the Sokoman Iron Formation, Howells River area, Labrador, Newfoundland; in the Gunflint Iron Formation, northeast of Gunflint Lake, Ontario; and in the Bluebell mine, Riondel, British Columbia. In the Matsumo mine, Kochi prefecture, Japan. From the Weld Range, northwest of Cue, Western Australia. In the Salsigne mine, 15 km north of Carcassone, Aude, France. At Glenluce, Wigtownshire, Scotland. From the San Valentin mine, Cartagena district, La Union, Murcia Province, Spain.

Name: In allusion to its *green* color.

Type Material: National Museum of Natural History, Washington, D.C., USA, 91160, 124953.

(1) Bishopton, Scotland; average of two analyses. (2) Madjarovo district, Bulgaria; by electron microprobe. (3) CdS.

Polymorphism & Series: Dimorphous with hawleyite.

Occurrence: As earthy coatings, especially on sphalerite, in which it also occurs as a substituent; also rarely as crystals in cavities in mafic igneous rocks; in high-temerature hydrothermal vein deposits.

Association: Sphalerite, smithsonite, prehnite, other zeolites (low temperature); cassiterite, tetrahedrite, herzenbergite, chalcopyrite, other sulfides (high temperature).

Distribution: In Scotland, from Bishopton, near Glasgow, Renfrewshire [TL], large crystals on prehnite; as coatings on sphalerite in the Leadhills-Wanlockhead district, Dumfries. From the Los Blancos mine, Sierra de Cartagena, ??, Spain. At Příbram, Czech Republic. In the Madjarovo district, eastern Rhodope Mountains, Bulgaria. From Pierrefitte, Hautes-Pyrénées, France. In Greece, at Laurium. Pigmenting smithsonite stalactites from Masua, Sardinia, Italy. In Russia, in the Kti-Teberda deposit, northern Caucasus Mountains. In the USA, in New Jersey, at Franklin and Sterling Hill, Ogdensburg, Sussex Co.; from Paterson, Passaic Co.; at the Fanwood quarry, Somerset Co.; from the Summit quarry, Union Co.; in the Arlington quarry, Leesburg, Loudoun Co., Virginia, as crystals; at Friedensville, Lehigh Co., Pennsylvania. In the Joplin district, Jasper Co., Missouri, on sphalerite; as bright yellow coatings on smithsonite in Marion Co., Arkansas. Complex twins from the Asunta Ag–Sn mine, four km northeast of San Vicente, Potosí, and at Llallagua, Bolivia. Numerous other minor occurrences are known.

Name: In honor of Charles Murray Cathcart (1783–1859), Lord Greenock.

Greenwoodite $Ba_{2-x}(V^{3+}OH)_xV_9(Fe^{3+},Fe^{2+})_2Si_2O_{22}$

Crystal Data: Hexagonal. *Point Group*: 3*m*. As semi-prismatic to tabular grains, to 200 μm.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: n.d. *Tenacity*: n.d. Hardness = 5
D(meas.) = n.d. D(calc.) = 4.81

Optical Properties: Opaque. *Color*: Black, gray with a weak brownish tint in reflected light.
Streak: n.d. *Luster*: Semi-metallic, dull.
Optical Class: n.d. Distinct bireflectance, pleochroism, and anisotropism.
R_1-R_2: (470) 12.5-15.75 $(2.82\text{-}4.83)_{oil}$, (546) 12.63-15.50 $(2.98\text{-}4.80)_{oil}$, (589) 12.81-15.75 $(3.31\text{-}4.95)_{oil}$, (650) 13.60-16.22 $(3.57\text{-}5.28)_{oil}$

Cell Data: *Space Group*: *P*3*m*1. a = 5.750(1) c = 14.459(1) Z = 1

X-ray Powder Pattern: Calculated pattern.
2.925 (100), 2.875 (38), 2.469 (35), 1.438 (35), 2.354 (28), 2.212 (28), 1.669 (26)

(1) Wigwam deposit, British Columbia, Canada; average of 13 electron microprobe analyses, Fe^{+2}/Fe^{+3} calculated from charge balance, H_2O determined by crystal structure analysis; corresponding to $Ba_{0.60}(V^{3+}OH)_{0.40}(V^{3+}_{8.33}Cr_{0.33}Ti_{0.13}Al_{0.13}Mn^{3+}_{0.02})_{\Sigma=9}$ $(Fe^{3+}_{1.08}Fe^{2+}_{0.60}Zn_{0.22}Al_{0.06}Mg_{0.04})_{\Sigma=2}(Si_{1.72}Fe^{3+}_{0.28})_{\Sigma=2}O_{22}$.

Occurrence: Part of the prograde assemblage in a green schist facies metamorphosed Mississippi-Valley type base-metal deposit.

Association: Quartz, celsian, apatite, sphalerite, pyrrhotite, galena, pyrite, zoltaiite, batisivite.

Distribution: At the Wigwam deposit, Akolkolex River area, southeast of Revelstoke, British Columbia, Canada.

Name: Honors Professor Hugh J. Greenwood (b. 1931), former head of the Geological Sciences Department, University of British Columbia, Vancouver, British Columbia, Canada, for his contributions to petrology.

Type Material: American Museum of Natural History, New York, New York, USA (109839).

(1) Oldoinyo Lengai, Tanzania; by electron microprobe, CO_2 presumably calculated; corresponds to $(Na_{1.56}K_{0.10}Ca_{0.17})_{\Sigma=1.83}CO_3$.

Occurrence: As phenocrysts in lengaite carbonatite lava.

Association: Nyerereite, alabandite, halite, sylvite, fluorite, calcite.

Distribution: From Oldoinyo Lengai volcano, Tanzania.

Name: Honors Professor John Walter Gregory (1864–1932), University of Melbourne, Melbourne, Australia and University of Glasgow, Glasgow, Scotland, who completed early scientific studies of the volcanism and structure of the East African Rift system.

Type Material: n.d.

References: (1) Gittins, J. and D. McKie (1980) Alkalic carbonatite magmas: Oldoinyo Lengai and its wider applicability. Lithos, 13, 213–215. (2) (1981) Amer. Mineral., 66, 879 (abs. ref. 1).

Greifensteinite $\mathbf{Ca_2Be_4(Fe^{2+},Mn)_5(PO_4)_6(OH)_4 \cdot 6H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{6}m2$. Prismatic hexagonal crystals, showing dominant $\{10\overline{1}0\}$, $\{10\overline{1}1\}$, $\{0001\}$, to 0.3 mm, commonly anhedral in fine granular crusts.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 3.30 (synthetic). D(calc.) = 3.27 Radioactive; soluble in H_2O.

Optical Properties: Translucent to transparent. *Color:* Yellow. *Streak:* Pale yellow. *Luster:* [Vitreous.]
Optical Class: Uniaxial (–) or weakly biaxial (–). *Pleochroism:* Distinct; O = yellow; E = colorless. $\omega = 1.601(2)$ $\epsilon = 1.480(2)$

Cell Data: *Space Group:* $P\overline{6}2c$. $a = 9.30(2)$ $c = 8.26(2)$ $Z = 2$

X-ray Powder Pattern: Grimsel region, Switzerland.
5.76 (10), 8.09 (8), 3.08 (8), 0.985 (8), 3.65 (7b), 2.86 (7), 2.68 (7)

Chemistry: (1) Identity confirmed by concurrence of optical properties and X-ray diffraction pattern with those of the synthetic compound; microchemical and electron microprobe analyses confirm compositional dominance of K, Na, U, and CO_2 in natural material.

Occurrence: A rare secondary mineral in veins in mineralized granodiorite.

Association: Schröckingerite, baylissite, monohydrocalcite, calcite.

Distribution: From a cable tunnel between Gerstenegg and Sommerloch, Oberhasli, north of Grimsel Pass, Bern, Switzerland.

Name: For the Grimsel region of Switzerland, which produced the first specimens.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany.

Greigite $Fe^{2+}Fe_2^{3+}S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As balls of intergrown octahedra with curved faces, to 0.5 mm, rarely as cubes; also as minute grains, and very fine-grained, disseminated.

Physical Properties: Hardness = 4–4.5 VHN = 401–423 (50 g load). D(meas.) = 4.049 D(calc.) = 4.079 Strongly magnetic.

Optical Properties: Opaque. *Color:* Pale pink, tarnishing to a metallic blue; sooty black when very fine grained; in polished section, pale creamy white. *Luster:* Metallic.
R: (400) 30.5, (420) 31.1, (440) 31.7, (460) 32.2, (480) 32.7, (500) 33.2, (520) 33.6, (540) 34.2, (560) 34.7, (580) 35.3, (600) 35.9, (620) 36.4, (640) 37.1, (660) 37.6, (680) 38.1, (700) 38.7

(1) Zacatecas, Mexico; corresponds to $(Fe_{3.08}As_{0.02}Cr_{0.01}Ni_{0.01})_{\Sigma=3.12}S_{4.00}$. (2) Cornwall, England; by electron microprobe, corresponds to $(Fe_{3.04}Sb_{0.03}Mn_{0.01}C_{0.01})_{\Sigma=3.09}S_{4.00}$.
(3) $Fe^{2+}Fe_2^{3+}S_4$.

Mineral Group: Linnaeite group.

Occurrence: Formed in lacustrine beds consisting of interbedded calcareous clays, silts, and fine- to medium-grained arkosic sands; in varvelike laminae of grayish black sulfide-bearing clays and fine silts; possibly as the result of seasonal variation in the composition and physical condition of lake waters; also in hydrothermal vein deposits; formed in magnetotactic bacteria, and by sulfate-reducing bacteria.

Association: Montmorillonite, chlorite, calcite, colemanite, veatchite (Kramer-Four Corners area, California, USA); sphalerite, pyrite, marcasite, galena, calcite, dolomite (Zacatecas, Mexico).

Distribution: In the USA, in California, from the Kramer-Four Corners area, San Bernardino Co. [TL]; about 13 km west, in the Mudd mine, Kramer borate district, Boron, Kern Co.; and at Coyote Peak, near Orick, Humboldt Co. In Mexico, near Zacatecas. From the bed of the Black Sea, and in the Gal-Khaya deposit, northeast Sakha, Russia. At Montemesola, Taranto, Italy. In the Lojane chromium deposit, 40 km northeast of Skopje, Macedonia. From the Treore mine, St. Teath, Cornwall, England. In the Hanoaka mine, Odate, Akita Prefecture, and the Akagane mine, Iwate Prefecture, Japan. Additional occurrences have been characterized.

Name: Honoring Dr. Joseph Wilson Greig (1895–1977), mineralogist and physical chemist, Pennsylvania State University, State College, Pennsylvania, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 117502, 136415.

Griceite LiF

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\overline{3}2/m$. As tiny cubes and octahedra, tapering prismatic aggregates, to 3 mm; botryoidal, as irregular grains and fine-grained powdery patches.

Physical Properties: *Cleavage:* {100}, good. *Fracture:* Uneven to conchoidal.
Hardness = ∼4.5 D(meas.) = 2.62 D(calc.) = 2.67 May fluoresce pale yellow under SW UV.

Optical Properties: Translucent, quickly becoming opaque on exposure. *Color:* Bright to dull white surfaces, pale yellowish green or light orange cores. *Streak:* White. *Luster:* Vitreous or porcelaneous to waxy or dull.
Optical Class: Isotropic. $n = 1.3986(5)$

Cell Data: *Space Group: Fm3m.* a = 4.0293(2) Z = 4

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.

Grimaldiite $Cr^{3+}O(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3*m*. Very rarely as single rhombohedral crystals; commonly as parallel intergrowths with mcconnellite in tabular rhombohedral crystals, to 1 mm; in radially bladed to platy or granular aggregates.

Physical Properties: *Cleavage:* {0001}. Hardness = n.d. D(meas.) = 4.11–4.12 (synthetic). D(calc.) = [4.13]

Optical Properties: Transparent, translucent in intergrowths with mcconnellite. *Color:* Deep red to pinkish brown.
Optical Class: Uniaxial. $n = \sim 2.05$, varies in mixtures. $\omega = 2.155$ (synthetic). $\epsilon = 1.975$

Cell Data: *Space Group: R*3*m*. $a = 2.973(2)$ $c = 13.392(1)$ $Z = 3$

X-ray Powder Pattern: Merume River, Guyana.
4.47 (vvs), 2.401 (vs), 1.857 (vs), 1.486 (ms), 1.537 (mw), 2.528 (w), 1.409 (w)

Chemistry:

	(1)	(2)

Total	99.87	100.00

(1) Merume River, Guyana; intergrowth of 80%–86% estimated grimaldiite, the balance mcconnellite and H_2O. (2) CrO(OH).

Polymorphism & Series: Trimorphous with bracewellite and guyanaite.

Occurrence: In fine-grained intergrowth with other chromium oxide-hydroxide minerals in alluvial gravels (Merume River, Guyana); in cracks and crevices in penroseite from a hydrothermal mineral deposit (Hiaco, Bolivia).

Association: Bracewellite, eskolaite, guyanaite, mcconnellite (Merume River, Guyana); penroseite, barite (Hiaco, Bolivia).

Distribution: In the basin of the Merume River, Guyana. From the Hiaca mine, 30 km north-northeast of Colquechaca, Potosí, Bolivia.

Name: For Dr. Frank Saverio Grimaldi (1915–), formerly Chief Chemist, U.S. Geological Survey.

Type Material: Harvard University, Cambridge, Massachusetts, USA; The Natural History Museum, London, England, 1979,136.

(1) Everly pegmatite, South Dakota, USA; average of two complete and three partial analyses; corresponds to $Ca_{1.00}(Mn^{2+}_{3.85}Na_{1.75}Ca_{0.31}K_{0.06}Mg_{0.04})_{\Sigma=6.01}(Fe^{2+}_{0.50}Mn^{2+}_{0.25})_{\Sigma=0.75}(Al_{1.95}Fe^{3+}_{0.05})_{\Sigma=2.00}[(PO_4)_{5.32}(OH)_{0.68}]_{\Sigma=6.00}[(OH)_{1.97}Cl_{0.03}]_{\Sigma=2.00}$. (2) Mas Claret, France; by AA, colorimetry, H_2O by the Penfield method; corresponds to $Ca_{1.00}(Mn^{2+}_{3.56}Na_{1.03}Li_{0.52}Ca_{0.41}Fe^{2+}_{0.32}Fe^{3+}_{0.09}Mg_{0.06})_{\Sigma=5.99}(Fe^{2+}_{0.70}Mn^{2+}_{0.05})_{\Sigma=0.75}Al_{2.00}[(PO_4)_{5.81}(OH)_{0.19}]_{\Sigma=6.00}[F_{1.59}(OH)_{0.37}]_{\Sigma=1.96}$. (3) Buranga pegmatite, Rwanda; by electron microprobe, total Fe as FeO; corresponds to $Ca_{1.00}(Mn^{2+}_{3.07}Na_{1.11}Fe^{2+}_{1.10}Li_{0.72}Ca_{0.06})_{\Sigma=6.06}Fe^{2+}_{0.75}Al_{1.93}(PO_4)_{6.00}F_{2.02}$.

Occurrence: An accessory mineral in complex granite pegmatites.

Association: Crandallite, apatite, montebrasite, triplite, hausmannite, albite, mica, quartz.

Distribution: From the Riverton Lode [Everly mine], near Harney City, three km east of Keystone, and in the Sitting Bull mine, 1.5 km northwest of Keystone, Pennington Co., South Dakota, USA. At Mt. Ida, about 160 km northwest of Alice Springs, Northern Territory, Australia. In the Jaffit pegmatite, Kamativu, Zimbabwe. From the Buranga pegmatite, near Gatumba, Rwanda. In a pegmatite near Rehamna, Morocco. At Mas Claret, in the Albères massif, Pyrénées-Orientales, France. From an undefined locality near the Karachin River, Turkestan.

Name: From the Greek for *enigma*, as the chemical composition was originally puzzling.

Type Material: National Museum of Natural History, Washington, D.C., USA, R5315.

Total	[100.00]	100.00

(1) Falotta mine, Switzerland; by electron microprobe, average of three analyses, total Fe as Fe_2O_3, total Mn as MnO, H_2O by difference; corresponds to $(Na_{0.72}Ca_{0.07})_{\Sigma=0.79}Ca_{2.00}Mn_{5.04}^{2+}Fe_{0.81}^{3+}(AsO_4)_{6.12} \cdot 2H_2O$. (2) $NaCa_2Mn_5Fe(AsO_4)_6 \cdot 2H_2O$.

Occurrence: An alteration product of sarkinite in a manganese deposit.

Association: Sarkinite, brandtite, manganoan berzeliite, tilasite, rhodochrosite, braunite.

Distribution: In the Falotta mine, Oberhalbstein, Graubünden, Switzerland.

Name: From the former Romansch name *Grischun* for Graubünden Canton.

Type Material: Natural History Museum, Basel, Switzerland, MB19.295.

(1) Tanco Mine, Lake Bernic, Manitoba, Canada; average of 4 electron microprobe analyses, H_2O from stoichiometry, corresponding to $Na_{1.02}Ca_{1.02}(Mn_{1.90}Fe^{2+}_{0.03})_{\Sigma=1.93}P_{3.02}O_{10}(OH)_2$.

Group: Alluaudite group.

Occurrence: A late-stage mineral, most likely derived from the dissolution of lithiophosphate and lithiophilite, in a spodumene-rich portion of a zoned petalite-subgroup pegmatite.

Association: Whitlockite, crandallite, an unidentified Na–Al phosphate, quartz.

Distribution: Tanco Mine, Lake Bernic, Manitoba, Canada.

Name: Honors Lee A. Groat (b. 1959), professor of Mineralogy at the University of British Columbia, Vancouver, British Columbia, Canada, for his extensive contributions to pegmatite mineralogy.

Type Material: Royal Ontario Museum, Toronto, Canada (M40501).

Total	99.83	100.00

(1) Acfer 182 meteorite; by electron microprobe, average of 20 grains; corresponding to $(Ca_{1.00}Fe_{0.01})_{\Sigma=1.01}Al_{3.99}O_7$. (2) $CaAl_4O_7$.

Occurrence: In argillaceous limestones metamorphosed at high temperature and low pressure (Hatrurim Formation, Israel); in Ca–Al-rich inclusions thought formed by condensation from a hot gas or molten droplets (meteorites).

Association: Brownmillerite, mayenite, larnite (Hatrurim Formation, Israel); perovskite, melilite, hibonite, spinel, calcian pyroxene (meteorites).

Distribution: In the Hatrurim Formation, Israel. From the chondritic meteorites Acfer 182, Acfer 059-El Djouf 001, ALH85085, and others.

Name: Honors Dr. Shulamit Gross (1923–), Geological Survey of Israel, Jerusalem, Israel, who noted the species in the Hatrurim Formation, Israel.

Type Material: Institute for Planetology, Münster; Natural History Museum, Humboldt University, Berlin, Germany.

Grossular $Ca_3Al_2(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \bar{3}\ 2/m$. Commonly in dodecahedra or trapezohedra, up to 15 cm, with striated faces. Also granular, compact, and massive.

Physical Properties: *Cleavage:* Parting on {110} rarely observed. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 3.594 D(calc.) = 3.594 May fluoresce weak golden yellow under LW or SW UV.

Optical Properties: Transparent to opaque. *Color:* Yellow-green, pale to dark green; golden yellow, pink, red, orange, brownish red, yellowish brown; colorless, white, gray, black; may be sectored: colorless in thin section. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Isotropic; weak strain birefringence. $n = 1.734$

Cell Data: *Space Group: Ia3d.* $a = 11.851$ Z = 8

X-ray Powder Pattern: Georgetown, Placer Co., California, USA. (ICDD 26-292). 2.647 (100), 1.581 (50), 2.959 (25), 1.921 (25), 1.643 (25), 2.417 (20), 2.321 (18)

Chemistry:

Total	99.84	100.00

(1) Georgetown, Placer Co., California, USA; corresponds to $(Ca_{3.00}Fe^{2+}_{0.02})_{\Sigma=3.02}(Al_{1.92}Fe^{3+}_{0.05})_{\Sigma=1.97}(Si_{2.97}Al_{0.03})_{\Sigma=3.00}O_{12}$. (2) $Ca_3Al_2(SiO_4)_3$.

Polymorphism & Series: Forms three series: with andradite; with hibschite and katoite; and with uvarovite.

Mineral Group: Garnet group.

Occurrence: In contact and regionally metamorphosed calcareous rocks, or rocks which have undergone calcium metasomatism; in some schists and serpentinites.

Association: Calcite, dolomite, epidote, clinozoisite, wollastonite, scapolite, vesuvianite, diopside, tremolite, quartz.

Distribution: Many localities, even for fine crystals and gem material. In Russia, near Chernyshevsk, at the confluence of the Vilyui and Akhtaragda Rivers, Yakutia. In the Ala Valley, Piedmont, Italy. From the Zillertal, Tirol, Austria. At Ocna de Fier, Romania. In the Jeffrey mine, Asbestos, Quebec, Canada. In the USA, at Standish, Cumberland Co., Maine, and at the Belvidere Mountain quarries, Lowell, Orleans Co., Vermont. In California, from Crestmore, Riverside Co., the Old Cosumnes copper mine, El Dorado Co., San Carlos mine, Mazourka Canyon, Inyo Range, Inyo Co., and Santa Rosa, Sonoma Co.; on Vesper Peak, Sultan basin, Snohomish Co., Washington. In Mexico, large crystals from Xalostoc and Morelos, Chihuahua, and from the Sierra de la Cruces, near Lake Jaco, Coahuila. Gems from the Merelani Hills, southeast of Arusha, Tanzania. In the Taita Hills, near Voi, Kenya.

P_2O_5	0.34	
Total	[99.70]	100.00

(1) Mahnomen mine, Minnesota, USA; after correction for quartz 2.39%, original total given as 99.71% (2) MnO(OH).

Polymorphism & Series: Trimorphous with manganite and feitknechtite.

Occurrence: A secondary mineral lining vugs in weathered banded iron formations (Minnesota, USA); manganiferous talc schists (Talcville, New York, USA); a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA); and a variety of hydrothermal orebodies (Arizona, USA).

Association: Manganite, hematite, goethite, lepidocrocite, quartz, calcite.

Distribution: In the USA, in significant amounts at several sites in the Cuyuna Iron Range, including the Sagamore, Mahnomen, Robert, and Mangan No. 2 mines, Crow Wing Co., Minnesota; at Franklin, Sussex Co., New Jersey; from the No. Two and One Half mine, Talcville, New York. In Arizona, in the Campbell mine, Bisbee, Cochise Co.; the Magma mine, Superior, and at Malpais Hill, Pinal Co.; the North Star and King of Arizona mines, Yuma Co.; and near Holbrook, Navajo Co. From the Walton mine, Hants Co., Nova Scotia, Canada. At Bülten-Adenstadt, near Peine, Lower Saxony, Germany. From Bleiberg, Carinthia, Austria. At Akdala, Kazakhstan. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: Honors Professor Frank Fitch Grout (1880–1958), petrologist, of the University of Minnesota, Minneapolis, Minnesota, USA.

Type Material: The Natural History Museum, London, England, 1948,106; National Museum of Natural History, Washington, D.C., USA, 105004.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Very slender prismsmatic crystals, to 1.0 mm, elongated along [010]. *Twinning:* On {001}, universal.

Physical Properties: *Cleavage:* Perfect on {001}, near micaceous. Hardness = n.d. D(meas.) = n.d. D(calc.) = 7.02

Optical Properties: n.d. *Color:* Gray-black.; creamy white in reflected light.
Luster: Metallic.
Optical Class: Biaxial. *Anisotropism:* Distinct; bluish gray to yellowish gray.
Bireflectance: Low.
R_1–R_2: (400) 33.9–36.1, (420) 34.4–36.6, (440) 35.1–37.2, (460) 35.6–37.7, (480) 35.9–38.0, (500) 35.9–38.0, (520) 35.5–37.6, (540) 35.4–37.5, (560) 35.3–37.4, (580) 35.2–37.3, (600) 34.7–36.8, (620) 34.2–36.2, (640) 33.9–35.9, (660) 33.8–35.7, (680) 33.8–35.6, (700) 33.9–35.

Cell Data: *Space Group:* $C2/m$. $a = 14.185(5)$ $b = 4.071(7)$ $c = 13.995(5)$ $\beta = 118.22(3)^\circ$ Z = 4

X-ray Powder Pattern: Levigliani mine, Italy.
3.05 (s), 2.914 (ms), 2.865 (ms), 3.86 (m), 3.55 (m), 2.644 (m), 1.913 (m)

Chemistry:

	(1)	(2)
Hg	25.4	26.86
Bi	57.6	55.97
S	17.4	17.17
Total	100.4	100.00

(1) Levigliani mine, Italy; by electron microprobe, average of 12 analyses; corresponds to $Hg_{0.94}Bi_{2.04}S_{4.00}$. (2) $HgBi_2S_4$.

Mineral Group: Benjaminite group.

Occurrence: Very rare, in quartz-carbonate veins in a mercury deposit, probably formed during retrograde metamorphism.

Association: Cinnbar, mercurian sphalerite, mercury, pyrite.

Distribution: From the Levigliani mercury mine, near Levigliani, Tuscany, Italy [TL].

Name: For the GRUppo MIneralogico e Paleontological LUcchese, a group of amateur mineralogists, including Luigi Pierotti, Ugo Quilici, and Moeno Romani, who provided the specimens for study.

Type Material: Museum of Natural History, University of Pisa, Pisa, Italy.

Grunerite $Fe_2^{2+}(Fe^{2+},Mg)_5Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly as acicular or fibrous radiating crystals; may be asbestiform. *Twinning:* Simple or multiple twinning common ∥ {100}, producing narrow twin lamellae.

Physical Properties: *Cleavage:* Perfect on {110}, with intersections of ∼56° and ∼124°. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 3.40–3.60 D(calc.) = 3.531

Optical Properties: Translucent. *Color:* Dark green to brown, gray to greenish gray; colorless to pale green or brown in thin section. *Luster:* Vitreous, silky when fibrous.
Optical Class: Biaxial (–). *Pleochroism:* With increasing Fe content, X = pale yellow; Y = pale yellow-brown; Z = pale brown. *Orientation:* $Y = b$; $Z \wedge c = -16°$ to $-12°$; $X \wedge a = -3°$ to 2°. *Dispersion:* $r > v$, weak. $\alpha = 1.663–1.688$ $\beta = 1.677–1.709$ $\gamma = 1.697–1.729$
2V(meas.) = 80°–90°

Cell Data: *Space Group:* $C2/m$. $a = 9.5642(7)$ $b = 18.393(2)$ $c = 5.3388(3)$ $\beta = 101.892(3)°$ Z = 2

X-ray Powder Pattern: Wabush Iron Formation, White Lake, Newfoundland, Canada.
8.33 (100), 3.06 (70), 2.756 (70), 2.189 (50), 4.13 (40), 3.26 (40), 2.628 (40)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	49.33	47.54	MgO	6.65	0.04
TiO_2	0.02		CaO	0.18	0.00
Al_2O_3	0.39	0.20	Na_2O	0.12	0.29
Fe_2O_3		0.71	K_2O	0.20	0.11

MnO	0.54	2.14	H_2O^+	1.54	1.55
			Total	99.91	99.84

(1) Wabush Iron Formation, Newfoundland, Canada; corresponds to $(Fe^{2+}_{5.50}Mg_{1.59}Mn_{0.08}Na_{0.04}K_{0.04}Ca_{0.03})_{\Sigma=7.28}(Si_{7.92}Al_{0.08})_{\Sigma=8.00}O_{22}(OH)_{1.64}$. (2) Rockport, Essex Co., Massachusetts, USA; corresponds to $(Fe^{2+}_{6.63}Mn_{0.30}Fe^{3+}_{0.09}Na_{0.09}K_{0.02}Mg_{0.01}Al_{0.01})_{\Sigma=7.15}(Si_{7.97}Al_{0.03})_{\Sigma=8.00}O_{22}(OH)_{1.74}$.

Polymorphism & Series: Dimorphous with ferro-anthophyllite; forms a series with cummingtonite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: $Mg/(Mg + Fe^{2+}) < 0.3$; $(Ca + Na)_B < 1.34$; $Li < 1.0$; $Mn < 0.5$.

Occurrence: Common in medium- to high-grade metamorphosed iron formations. A product of contact metamorphism, and in some blueschist facies metaquartzites.

Association: Magnetite, hematite, hedenbergite, riebeckite, fayalite, garnet, quartz.
