Handbook of Mineralogy

The *Handbook of Mineralogy* series is a Five Volume set authored by John W. Anthony, Richard A. Bideaux, Kenneth W. Bladh, and Monte C. Nichols, and published by Mineral Data Publishing. Each mineral known at the time of publication occupies one page of the handbook.

In 2001 the copyright for the *Handbook of Mineralogy* was given to the Mineralogical Society of America by Kenneth W. Bladh, Richard A. Bideaux, Elizabeth Anthony-Morton and Barbara G. Nichols and the remaining volumes were shipped to the MSA warehouse in Chantilly, VA.

Along with the copyright, MSA was given pdf files of each page of the handbook. These are freely distributed to the public on this website.

In 2002, the MSA council established an editorial office, headed by Dick Bideaux, for the purpose of updating and maintaining the mineral database of the *Handbook of Mineralogy* and to continue converting the text files to PDF files for on-line access through the MSA website.

After Dick Bideaux's untimely death in 2004 the MSA council organized an editorial committee in 2006 headed by Frank Dudas (MIT) to complete the task. This website is being organized to that end.

Ken Bladh (Wittenberg University), one of the original authors of the Handbook, was appointed Editor of the *Handbook of Mineralogy* database by MSA Council action in June 2010, after Frank Dudas was unable to continue in that role. Professor Bladh’s initial goal is to bring the online Handbook up to date by adding pdf pages for all new minerals approved by the IMA after the publication of each original Handbook volume. Revision of the Handbook to reflect all IMA approved changes in nomenclature and new mineral data will be undertaken after the new minerals project is completed.

Abelsonite $C_{31}H_{32}N_4Ni$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Small aggregates, to 1 cm, of thin laths or plates.

Physical Properties: *Cleavage:* Probable on $\{11\overline{1}\}$. Hardness = < 3 D(meas.) = 1.33–1.48 D(calc.) = 1.45

Optical Properties: Semitransparent. *Color:* Dark grayish purple, pale purplish red, reddish brown. *Luster:* Submetallic to adamantine.
Optical Class: [Biaxial.] *Absorption:* Strong reddish brown to reddish black. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 8.508(24)$ $b = 11.185(27)$ $c = 7.299(15)$ $\alpha = 90°51(15)'$ $\beta = 114°08(12)'$ $\gamma = 79°59(13)'$ Z = 1

X-ray Powder Pattern: Green River Formation, Utah, USA.
10.9 (100), 3.77 (80), 7.63 (50), 5.79 (40), 3.14 (40), 5.51 (35), 6.63 (30)

Chemistry: (1) Green River Formation, Utah, USA; electron microprobe analysis gave Ni 11%–14%; based on mass spectroscopic and IR results, the composition conforms to nickel porphyrin.

Occurrence: Of secondary origin on fracture surfaces in oil shale.

Association: Albite, orthoclase, pyrite, quartz, mica, dolomite, analcime.

Distribution: In the USA, in a drill core from Wosco, Big Pack Mountain Quadrangle, and several other localities in or near the Mahogany Zone, Green River Formation, Uintah Co., Utah, and in the Piceance Creek Basin, Rio Blanco Co., Colorado.

Name: Honors Philip Hauge Abelson (1913–), American organic geochemist, President of the Carnegie Institution of Washington, D.C., USA, and Editor of *Science*.

Type Material: The Natural History Museum, London, England, 1979,135; National Museum of Natural History, Washington, D.C., USA, 143566, 145712.

Abernathyite $K_2(UO_2)_2(AsO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As thick tabular crystals, composed of {001} and {110}, to 3 mm.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle. Hardness = 2–3 D(meas.) = > 3.32 D(calc.) = 3.572 Fluoresces yellow-green under LW and SW UV. Radioactive.

Optical Properties: Transparent. *Color:* Yellow. *Streak:* Pale yellow. *Luster:* Weakly vitreous.
Optical Class: Uniaxial (–), anomalously biaxial (–). *Pleochroism:* O = yellow; E = pale yellow to colorless. $\omega = 1.597$–1.608 $\epsilon = 1.570(3)$ 2V(meas.) = ∼5°

Cell Data: *Space Group:* $P4/ncc$. a = 7.176(8) $c = 18.126(10)$ Z = 4

X-ray Powder Pattern: Fuemrole No. 2 mine, Utah, USA.
9.14 (10b), 3.84 (8b), 3.34 (8), 5.63 (7), 3.59 (7), 2.79 (6b), 2.28 (6)

Chemistry:

	(1)	(2)
UO_3	57.7	56.97
P_2O_5	1.5	
As_2O_5	21.6	22.89
K_2O	9.5	9.38
H_2O^+	9.9	
H_2O^-	4.6	
H_2O		10.76
Total	104.8	100.00

(1) Fuemrole No. 2 mine, Utah, USA; microchemical analysis, H_2O^+ by loss on ignition; corresponds to $K_{1.94}(UO_2)_{1.92}[(As_{1.79}P_{0.21})_{\Sigma=2.00}O_4] \cdot 7.68H_2O$. (2) $K_2(UO_2)_2(AsO_4)_2 \cdot 6H_2O$; $6H_2O$ assigned from crystal-structure analysis.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral coating fractures in bleached asphaltic sandstone hosting a Colorado Plateau-type uranium deposit (Fuemrol No. 2 mine, Utah, USA).

Association: Scorodite, zeunerite, heinrichite.

Distribution: In the USA, found at the Fuemrole No. 2 mine, Temple Mountain, Emery Co., Utah; from Cave Hills and Slim Buttes, Harding Co., South Dakota; at the West mine, Saguache Co. and the Clyde Long property, San Juan Co., Colorado; from near Tuba City, Coconino Co., Arizona. In the Riviéral mine, Lodève, Hérault, France. At Sailauf, northeast of Aschaffenburg, Bavaria, Germany.

Name: To honor Jess Abernathy, Moab, Utah, USA, mine owner who found the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112650.

Cl	15.7	16.71
O	11.0	9.43
H	0.4	0.42
Total	100.5	100.00

(1) Sharm Abhur Cove, Saudi Arabia; Sn by wet chemical analysis, Cl by ion-specific electrode, O by neutron activation, H by CHN analyzer. (2) $Sn_{21}O_6Cl_{16}(OH)_{14}$.

Occurrence: In blisterlike protuberances on the surface of a tin ingot recovered from a ship wrecked possibly 100 years ago (Sharm Abhur cove, Saudi Arabia).

Association: Romarchite, kutnohorite, aragonite.

Distribution: From the cargo of a ship wrecked in a Red Sea cove known as Sharm Abhur, about 30 km north of Jiddah, Saudi Arabia. From the cargo of a ship wrecked off Hidra, Norway. From a ship wrecked about 30 km north-northwest of St. Ives, Cornwall, England.

Name: For the Saudi Arabian locality at Sharm Abhur Cove.

Type Material: Royal Ontario Museum, Toronto, Canada; National Museum of Natural History, Washington, D.C., USA, 162403.

(1) Kupol fumarole field, Kudryavy volcano, Iturup Island, Kurile Islands, Russia; average of 4 electron microprobe analyses, corresponding to $Pb_{1.92}Sn_{1.09}In_{1.06}Bi_{0.89}(S_{6.90}Se_{0.13})_{\Sigma=7.03}$.

Occurrence: A product of precipitation from fumarolic gases (600° C) in an active stratovolcano.

Association: Pyrrhotite, pyrite, wurzite, galena, halite, sylvite, anhydrite.

Distribution: Kupol fumarole field, Kudryavy volcano, Iturup Island, southern Kurile Islands, Russia.

Name: Honors Russian mineralogist Dmitry Vadimovich Abramov (1963–) of the A.E. Fersman Museum, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 3436/1).

(1) Evvia Island, Greece; by electron microprobe, corresponds to $(Cu_{0.88}Mn^{2+}_{0.10}Ca_{0.02})_{\Sigma=1.00}$ $(Mn^{3+}_{5.51}Fe^{3+}_{0.36}Al_{0.07}Ti_{0.02}Cu_{0.02})_{\Sigma=5.98}Si_{1.03}O_{12}$.

Polymorphism & Series: Forms a series with braunite.

Occurrence: In very low-grade, high-pressure metamorphic Mn, Al-rich quartzites.

Association: Quartz, shattuckite, tenorite, sursassite, piemontite, ardennite, rutile, hollandite, clinochlore.

Distribution: At Mili, Evvia Island, and Apikia, Andros Island, Cyclades Islands, Greece.

Name: To honor Dr. Irmgard Abs-Wurmbach (1938–), German mineralogist.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany; National Museum of Natural History, Washington, D.C., USA.

References: (1) Reinecke, T., E. Tillmanns, and H.-J. Acanthite Ag_2S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Primary crystals are rare, prismatic to long prismatic, elongated along [001], to 2.5 cm, may be tubular; massive. Commonly paramorphic after the cubic high-temperature phase ("argentite"), of original cubic or octahedral habit, to 8 cm. *Twinning:* Polysynthetic on $\{\bar{1}11\}$, may be very complex due to inversion; contact on $\{\bar{1}01\}$.

Physical Properties: *Cleavage:* Indistinct. *Fracture:* Uneven. *Tenacity:* Sectile. Hardness = 2.0–2.5 VHN = 21–25 (50 g load). D(meas.) = 7.20–7.22 D(calc.) = 7.24 Photosensitive.

Optical Properties: Opaque. *Color:* Iron-black. *Streak:* Black. *Luster:* Metallic. *Anisotropism:* Weak.
R: (400) 32.8, (420) 32.9, (440) 33.0, (460) 33.1, (480) 33.0, (500) 32.7, (520) 32.0, (540) 31.2, (560) 30.5, (580) 29.9, (600) 29.2, (620) 28.7, (640) 28.2, (660) 27.6, (680) 27.0, (700) 26.4

Cell Data: *Space Group:* $P2_1/n$. $a = 4.229$ $b = 6.931$ $c = 7.862$ $\beta = 99.61°$ Z = 4

X-ray Powder Pattern: Synthetic.
2.606 (100), 2.440 (80), 2.383 (75), 2.836 (70), 2.583 (70), 2.456 (70), 3.080 (60)

Chemistry:

	(1)	(2)	(3)
Ag	86.4	87.2	87.06
Cu		0.1	
Se	1.6		
S	12.0	12.6	12.94
Total	100.0	99.9	100.00

(1) Guanajuato, Mexico; by electron microprobe. (2) Santa Lucia mine, La Luz, Guanajuato, Mexico; by electron microprobe. (3) Ag_2S.

Polymorphism & Series: The high-temperature cubic form ("argentite") inverts to acanthite at about 173 °C; below this temperature acanthite is the stable phase and forms directly.

Occurrence: A common silver species in moderately low-temperature hydrothermal sulfide veins, and in zones of secondary enrichment.

Association: Silver, pyrargyrite, proustite, polybasite, stephanite, aguilarite, galena, chalcopyrite, sphalerite, calcite, quartz.

Distribution: Widespread in silver deposits. Localities for fine primary and paramorphic crystals include: from Jáchymov (Joachimsthal), Czech Republic [TL]. In Germany, at Freiberg, Schneeberg, Annaberg, and Marienberg, Saxony; and from St. Andreasberg, Harz Mountains. In Mexico, large paramorphs from Arizpe, Sonora; in the Rayas and other mines at Guanajuato; and from many mines in Zacatecas, Chihuahua, etc. In the USA, at Butte, Silver Bow Co., Montana; Tonopah, Nye Co., and the Comstock Lode, Virginia City, Storey Co., Nevada. From various mines at Cobalt, Ontario, Canada. At Chañarcillo, south of Copiapó, Atacama, Chile.

Name: From the Greek for *thorn*, in allusion to the shape of the crystals.

Type Material: Emperor's collection, Vienna, Austria, 2592.

Acetamide CH_3CONH_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. Crystals are prismatic, to 5 mm, with prominent $\{11\overline{2}0\}$; as small stalactites and in granular aggregates.

Physical Properties: *Fracture:* Fine conchoidal. Hardness = 1–1.5 D(meas.) = 1.17 D(calc.) = 1.15 Soluble in H_2O, taste very bitter; volatilizes on exposure to air and sunlight.

Optical Properties: Transparent. *Color:* Colorless, gray if included with carbonaceous material. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (–). $\omega = 1.495(2)$ $\epsilon = 1.460(2)$

Cell Data: *Space Group:* $R3c$ (synthetic). $a = 11.44(3)$ $c = 13.50(3)$ $Z = 18$

X-ray Powder Pattern: Chervonograd, Ukraine.
5.7 (100), 3.54 (91), 2.86 (78), 3.32 (30), 2.17 (14), 3.98 (9), 3.83 (9)

Chemistry: (1) Chervonograd, Ukraine; yields a positive qualitative test for NH_3; identification depends on close agreement of its X-ray powder pattern with that of synthetic acetamide.

Occurrence: In burning waste coal heaps, formed between 50 °C and 150 °C.

Association: Sal ammoniac (Chervonograd, Ukraine).

Distribution: From near Chervonograd, L'vov-Volyn' coal basin, Ukraine. At Shamokin, near Burnside, Northumberland Co., Pennsylvania, USA.

Name: For ACETic acid and AMIDE, for ammonia in its composition.

Type Material: Mining Museum, St. Petersburg Mining Institute, St. Petersburg, 1086/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 77109.

Actinolite $Ca_2(Mg,Fe^{2+})_5Si_8O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed crystals, to 15 cm; columnar, may be kinked or bent; radiating fibrous to asbestiform; granular to massive. *Twinning:* Simple or lamellar, common ∥ {100}; lamellar, less common ∥ {001}.

Physical Properties: *Cleavage:* Good on {110}, with intersections of 56° and 124°; parting on {100}. *Tenacity:* Brittle, tough in fibrous aggregates ("nephrite jade"). Hardness = 5–6 D(meas.) = 3.03–3.24 D(calc.) = [3.07]

Optical Properties: Transparent to translucent. *Color:* Bright green to grayish green; in thin section, colorless, pale green to deep green. *Streak:* White. *Luster:* Vitreous, silky. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; X = pale yellow, yellowish green; Y = pale yellow-green, green; Z = pale green, deep greenish blue. *Orientation:* $Y = b$; $Z \wedge c$ = 14°–18.5°. *Dispersion:* $r < v$, weak. α = 1.613–1.646 β = 1.624–1.656 γ = 1.636–1.666 2V(meas.) = 79°–86°

Cell Data: *Space Group:* $C2/m$. a = 9.891(1) b = 18.200(1) c = 5.305(1) β = 104.64(1)° Z = 2

X-ray Powder Pattern: Sobotin, Czech Republic. (ICDD 25-157).
2.719 (100), 2.543 (100), 3.401 (80), 8.47 (70), 4.91 (70), 3.143 (70), 2.959 (70)

Chemistry:

	(1)		(1)
SiO_2	55.17	MnO	0.18
TiO_2	0.17	MgO	16.21
Al_2O_3	2.69	CaO	12.08
FeO	11.07	Na_2O	0.82
		Total	98.39

(1) Southeast Anglesey, Wales; by electron microprobe, corresponding to $(Ca_{1.83}Na_{0.22})_{\Sigma=2.05}(Mg_{3.41}Fe^{2+}_{1.26}Al_{0.23}Fe^{3+}_{0.05}Mn_{0.02}Ti_{0.02})_{\Sigma=4.99}(Si_{7.79}Al_{0.21})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with tremolite and ferro-actinolite.

Mineral Group: Amphibole (calcic) group: $0.5 \quad Mg/(Mg + Fe^{2+}) \quad 0.89$; $(Na + K)_A < 0.5$; $Na_B < 0.67$; $(Ca + Na)_B \geq 1.34$; Si ≥ 7.5.

Occurrence: Produced by low-grade regional or contact metamorphism of magnesium carbonate, mafic, or ultramafic rocks; also in glaucophane-bearing blueschists.

Association: Talc, epidote, chlorite, glaucophane, pumpellyite, lawsonite, albite.

Distribution: Many localities. In Austria, on Mt. Greiner, Zillertal, and at Untersulzbachtal. From Zermatt, Valais, Switzerland. At Snarum and Arendal, Norway. From the Ural Mountains, Russia. In the USA, from Gouverneur, St. Lawrence Co., New York; Franklin and Newton, Sussex Co., New Jersey; Chester, Windsor Co., Vermont; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; Crestmore, Riverside Co., California; at Salida, Chaffee Co., Colorado. "Nephrite jade" occurs, in the USA, south and east of Lander, Fremont Co., Wyoming; north from Cape San Martin, Monterey Co., California; and around Jade Mountain, near the Kobuk River, Alaska. Along the Fraser River, British Columbia, Canada. Around Mt. Cook, South Island, New Zealand. Fine material from the Kunlun Mountains, Sinkiang Uighur Autonomous Region, China.

Name: From the Greek for *ray*, in allusion to the mineral's common radiating fibrous habit.

Total	[97.06]	100.00

(1) Ivigtut, Greenland; by AA, Al by CDTA, F by electrolysis; OH calculated from charge balance, H_2O from theory; corresponds to $Sr_{0.98}Al_{1.02}F_{4.07}(OH)_{0.93}\cdot 1.00H_2O$.
(2) $SrAlF_4(OH)\cdot H_2O$.

Polymorphism & Series: Dimorphous with tikhonenkovite.

Occurrence: In a small cavity in a specimen from a strontium-rich portion of a cryolite deposit.

Association: Fluorite, jarlite, thomsenolite, pachnolite, ralstonite, gearksutite, celestine.

Distribution: In the Ivigtut cryolite deposit, southwestern Greenland.

Name: From the Latin *acuminis*, *sharp point*, for *spear head*, the characteristic shape of the crystals.

Type Material: University of Copenhagen, Copenhagen, Denmark.

(1) Kiura mine, Japan; average of 13 electron microprobe analyses, H_2O calculated from stoichiometry, OH^- confirmed by IR spectroscopy, Fe^{2+} estimated from structural analysis; corresponding to ${}^{X}(Ca_{0.62}Na_{0.28}\square_{0.10})_{\Sigma=1.00}{}^{Y}(Fe_{1.58}Al_{0.81}Mg_{0.55}Ti_{0.06})_{\Sigma=3.00}{}^{Z}(Al_{5.81}Fe_{0.14}Mg_{0.05})_{\Sigma=6.00}$ ${}^{T}(Si_{5.15}Al_{0.85})_{\Sigma=6.00}O_{18}B_{3.01}O_9{}^{V}(OH)_3{}^{W}[(OH)_{0.56}O_{0.44}]_{\Sigma=1.00}$. (2) $CaFe_3Al_6(Si_5AlO_{18})(BO_3)_3(OH)_3(OH)$.

Mineral Group: Tourmaline group.

Occurrence: In a hydrothermal vein that cuts a lateritic metamorphic emery (corundum and hercynite) deposit.

Association: Margarite, chlorite, diaspore, schorl.

Distribution: From the Nabagasako adit, Kiura mine, Saiki City, Oita Prefecture, Japan.

Name: Honors Tomio Adachi (b. 1923), an amateur mineralogist.

Type Material: National Museum of Nature and Science, Tsukuba, Japan (NSM-M43748).

Adamite $Zn_2(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Typically as crystals elongated along [001], [010], rarely [100], to 8 cm, may be equant; showing dominant {101} and {110}, with {011}, {210}, {010}, {120}, many other forms, usually in radial aggregates, fanlike rosettes, or crystalline crusts.

Physical Properties: *Cleavage:* {101}, good; {010}, poor. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 4.32–4.48 D(calc.) = 4.435–4.444 May fluoresce and phosphoresce lemon-yellow under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Pale yellow, honey-yellow, brownish yellow, reddish; rarely white, colorless, blue, pale green to green, may be zoned; bright green (cuprian); bright pink, rose, or purple (cobaltian); in transmitted light, colorless or faintly tinted. *Luster:* Vitreous.
Optical Class: Biaxial (+), may be biaxial (–). *Pleochroism:* In pale colors if cuprian or cobaltian. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$ or $r > v$, strong. $\alpha = 1.708–1.722$ $\beta = 1.734–1.744$ $\gamma = 1.758–1.773$ 2V(meas.) = 78°–90°

Cell Data: *Space Group: Pnnm.* $a = 8.304–8.386$ $b = 8.524–8.552$ $c = 6.036–6.058$ Z = 4

X-ray Powder Pattern: Mapimí, Mexico.
2.448 (10), 4.897 (9), 2.967 (9), 2.698 (8), 1.608 (8), 5.944 (6), 4.242 (6)

Chemistry:

	(1)	(2)
As_2O_5	38.96	40.08
SiO_2	0.26	
ZnO	56.78	56.78
H_2O	3.53	3.14
Total	99.53	100.00

(1) Mapimí, Mexico. (2) $Zn_2(AsO_4)(OH)$.

Polymorphism & Series: Dimorphous with paradamite; forms a series with olivenite.

Occurrence: A secondary mineral in the oxidized zone of zinc- and arsenic-bearing hydrothermal mineral deposits.

Association: Smithsonite, hemimorphite, scorodite, olivenite, calcite, quartz, Fe–Mn oxides.

Distribution: A number of localities; some for studied material or fine specimens include: from Chañarcillo, south of Copiapó, Atacama, Chile. In Mexico, large crystals at the Ojuela mine, Mapimí, Durango; in the Hidalgo mine, Zimapán, Hidalgo; and from Santa Eulalia, Chihuahua. In the USA, at Gold Hill, Tooele Co., Utah, and in the Mohawk mine, Clark Mountains, San Bernardino Co., California. At the Cap Garonne mine, near le Pradet, Var, France. From Reichenbach, near Bensheim, Hesse, and in the Clara mine, near Oberwolfach, Black Forest, Germany. In England, from several places in Cornwall, and at Caldbeck Fells, Cumbria. In the Kamariza mine, Laurium, Greece. Large crystals from Tsumeb, Namibia. At the Puttapa zinc mine, near Beltana, and on Mt. Painter, Flinders Ranges, South Australia.

Name: Honoring Gilbert-Joseph Adam (1795–1881), French mineralogist, who supplied the first specimens.

(1) Mont Saint-Hilaire, Canada; by electron microprobe, seven analyses on three crystals, CO_2 and H_2O by TGA, confirmed by IR and crystal-structure analysis; corresponds to $Na_{1.00}(Y_{0.72}Dy_{0.06}Er_{0.05}Gd_{0.04}Nd_{0.03}Yb_{0.02}Sm_{0.02}Ho_{0.02}Ce_{0.01}Tb_{0.01}Tm_{0.01})_{\Sigma=0.99}(CO_3)_{2.04} \cdot 5.94H_2O$.
(2) $NaY(CO_3)_2 \cdot 6H_2O$.

Occurrence: A rare late-stage, low-temperature hydrothermal mineral in an alkalic pegmatite dike associated with an intrusive alkalic gabbro-syenite complex.

Association: Thomasclarkite-(Y), horváthite-(Y), donnayite-(Y), petersenite-(Ce), rhodochrosite.

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: To honor Professor Frank Dawson Adams (1859–1942), McGill University, Montreal, Canada, geologist and petrologist, who studied the Monteregian Hills, of which Mont Saint-Hilaire is one.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 82939, 82940.

Cl	trace	
H_2O	3.90	4.08
Total	100.02	100.00

(1) Långban, Sweden. (2) $CaMg(AsO_4)(OH)$.

Mineral Group: Adelite group.

Occurrence: A rare mineral in a metamorphosed Fe–Mn orebody (Långban, Sweden); on willemite-franklinite ore from a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Sarkinite, arsenoclasite, braunite, hedyphane, fredrikssonite (Långban, Sweden); hausmannite, magnetite, copper (Kittel mine, Sweden); hodgkinsonite, barite, allactite, rhodochrosite, franklinite, willemite; chlorophoenicite (Franklin, New Jersey, USA); alleghanyite, kraisslite, sphalerite, rhodochrosite, willemite, franklinite; johnbaumite–svabite, zincite, barite, calcite (Sterling Hill, New Jersey, USA).

Distribution: In Sweden, from Långban and at Jakobsberg, Värmland, and in the Kittel mine, Nordmark. At St. Andreasberg, Harz Mountains, Germany. From Sterling Hill, Ogdensburg, and Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *indistinct*, as it typically lacks transparency.

Adolfpateraite $K(UO_2)(SO_4)(OH)(H_2O)$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As hemispherical crystalline aggregates, to 3 mm.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = ~ 2
D(meas.) = n.d. D(calc.) = 4.24 Green fluorescence under LW UV.

Optical Properties: Transparent to translucent. *Color*: Sulfur-yellow to greenish yellow.
Streak: Pale yellow. *Luster*: Vitreous.
Optical Class: Biaxial (n.d.). α = 1.597(2) β = n.d. γ = 1.659(2)
Pleochroism: *X* = colorless, *Y* = n.d., *Z* = yellow.

Cell Data: *Space Group*: $P2_1/c$. a = 8.0462(1) b = 7.9256(1) c = 11.3206(2)
β = 107.726(2)° Z = 4

X-ray Powder Pattern: Svornost shaft, Jáchymov district, western Bohemia, Czech Republic.
5.386 (100), 5.218 (85), 7.658 (76), 3.718 (46), 3.700 (37), 3.489 (27), 2.747 (17)

Chemistry:

	(1)	(2)
K_2O	9.86	10.70
SO_3	18.17	18.19
UO_3	63.66	64.97
H_2O	[5.80]	6.14
Total	97.49	100.00

(1) Svornost shaft, Jáchymov district, western Bohemia, Czech Republic; average of 4 electron microprobe analyses, H_2O calculated, presence of OH, H_2O, SO_4 and $UO^{2+}{}_2$ confirmed by IR and Raman spectroscopy; corresponding to $K_{0.94}(UO_2)_{1.00}(SO_4)_{1.02}(OH)_{0.90}(H_2O)_{1.00}$.
(2) $K(UO_2)(SO_4)(OH)(H_2O)$.

Occurrence: A secondary mineral in the oxidized zone of a uranium deposit.

Association: Gypsum, schoepite, čejkaite.

Distribution: From the Geschieber vein, fifth level of the Svornost (Einigkeit) shaft, Jáchymov (Sankt Joachimsthal) ore district, western Bohemia, Czech Republic.

Name: Honors Adolf Patera (1819-1894), Czech chemist, mineralogist, and metallurgist, who invented the technology for processing uranium ores from Jáchymov for the production of uranium-based colors.

Type Material: Department of Mineralogy and Petrology, National Museum in Prague, Czech Republic (P1P 3/2011).

References: (1) Plášil, J., J. Hloušek, F. Veselovský, K. Fejfarová, M. Dušek, R. Škoda, M. Novák, J. Čejka, J. Sejkora, and P. Ondruš (2012) Adolfpateraite, $K(UO_2)(SO_4)(OH)(H_2O)$, a new uranyl sulphate mineral from Jáchymov, Czech Republic. Amer. Mineral., 97, 447-454.

Adranosite-(Fe) $(NH_4)_4NaFe_2(SO_4)_4Cl(OH)_2$

Crystal Data: Tetragonal. *Point Group*: 4/*m* 2/*m* 2/*m*. Crystals tetrahedral, to 1 mm, with dominant {100}, {110}, and {111}; also as divergent sprays of acicular crystals.

Physical Properties: *Cleavage*: Present on {001}. *Fracture*: n.d. *Tenacity*: n.d. Hardness = n.d. D(meas.) = 2.18(1) D(calc.) = 2.195

Optical Properties: Transparent. *Color*: Pale yellow. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Uniaxial (-). ω = 1.58(1) ε = 1.57(1)

Cell Data: *Space Group*: $I4_1/acd$. a = 18.261(2) c = 11.562(1) Z = 8

X-ray Powder Pattern: La Fossa Crater, Vulcano, Aeolian Islands, Italy.
9.134 (100), 4.569 (83), 3.047 (79), 6.462 (36), 3.232 (29), 2.891 (11), 4.135 (10)

Chemistry:

$(NH_4)_2O$	[15.76]	15.77
H_2O	[2.75]	2.73
–O=Cl	0.84	1.21
Total	99.05	100.00

(1) La Fossa Crater, Italy; average of 12 electron microprobe analyses, H_2O calculated from structure refinement, $(NH_4)_2O$ calculated from the difference between the theoretical value of the site and the K content; corresponding to $(NH_4)_{3.89}K_{0.11}]_{\Sigma=4.00}Na_{1.04}(Fe_{1.27}Al_{0.64})_{\Sigma=1.91}(SO_4)_{4.10}Cl_{0.67}(OH)_{1.96}$.
(2) $(NH_4)_4NaFe_2(SO_4)_4Cl(OH)_2$.

Occurrence: A sublimate found on pyroclastic breccia in volcanic fumaroles (Italy); an anthropogenic product of a burning coal dump (Anna mine, near Aachen, North Rhine-Westphalia, Germany).

Association: Thermessaite, pseudocotunnite, bismuthinite or barberiite, salammoniac, anhydrite, sassolite, sulfur (Italy); clairite, tschermigite, rostite/khademite, boussingaultite/mohrite (Germany).

Distribution: From La Fossa Crater, Vulcano, Aeolian Islands, Italy.

Name: As the Fe^{3+} analog of *adranosite* – the base name for the ancient god of fire Adranos.

Type Material: Reference Collection, Department of Chemistry, University of Milan (# 2010-02) and the Museum "C.L. Garavelli," Department of Earth and Geoenvironmental Sciences, University of Bari (N 9389), Italy. Anthropogenic material from the Natural History Museum, Vienna, Austria (N 9389).

Mineral., 99, 2437 (abs. ref. 1).

Aegirine $NaFe^{3+}Si_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Prismatic crystals, showing {110}, with blunt to steep terminations, to 35 cm, striated lengthwise, can be bent or twisted. In sprays of acicular crystals, fibrous, in radial concretions. *Twinning:* Simple and lamellar twinning common on {100}.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ $(1\bar{1}0)$ ∼87°; parting on {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 6 D(meas.) = 3.50–3.60 D(calc.) = 3.576

Optical Properties: Translucent to opaque. *Color:* Dark green to greenish black, reddish brown, black; bright green to yellow-green in thin section. *Streak:* Pale yellowish gray. *Luster:* Vitreous to slightly resinous.
Optical Class: Biaxial (–); varieties rich in Ca, Mg, Fe^{2+} are (+). *Pleochroism:* X = emerald-green, deep green; Y = grass-green, deep green, yellow; Z = brownish green, green, yellowish brown, yellow. *Orientation:* $Y = b$; $X \wedge c = -10°$ to 12°; $Z \wedge a = 6°$–28°. *Dispersion:* $r > v$, moderate to strong. *Absorption:* $X > Y > Z$. α = 1.722–1.776 β = 1.780–1.820 γ = 1.795–1.836 2V(meas.) = 60°–70°

Cell Data: *Space Group:* $C2/c$ (synthetic). $a = 9.658$ $b = 8.795$ $c = 5.294$ $\beta = 107.42°$ Z = 4

X-ray Powder Pattern: Narssârssuk, Greenland.
2.900 (100), 6.369 (90), 4.416 (80), 2.983 (70), 2.4701 (60), 1.7293 (60), 1.3975 (60)

Chemistry:

	(1)		(1)
SiO_2	51.35	CaO	1.25
TiO_2	1.10	Na_2O	12.66
Al_2O_3	2.15	K_2O	0.15
Fe_2O_3	28.66	H_2O^+	0.12
FeO	2.24	H_2O^-	0.17
MgO	0.10	Total	99.95

(1) Itapirapurã, São Paulo, Brazil; corresponds to $(Na_{0.94}Ca_{0.02}K_{0.01})_{\Sigma=0.97}(Fe^{3+}_{0.83}Fe^{2+}_{0.07}Al_{0.07}Ti_{0.03}Mg_{0.01})_{\Sigma=1.01}(Si_{1.98}Al_{0.02})_{\Sigma=2.00}O_6$.

Mineral Group: Pyroxene group.

Occurrence: Common in alkalic igneous rocks, carbonatites, and pegmatites. From regionally metamorphosed schists, gneisses, and iron formations; in blueschist facies rocks, and from sodium metasomatism in granulites. An authigenic mineral in some shales and marls.

Association: Potassic feldspar, nepheline, riebeckite, arfvedsonite, aenigmatite, astrophyllite, catapleiite, eudialyte, sérandite, apophyllite.

Distribution: Some localities for good crystals are: in Norway, at Rundemyr, near Kongsberg; from Skaadoe, near Brevik; on Låven and other islands, Langesundsfjord; and at Drammen and Arendal. In the Alnö complex, Sweden. At Huesca, Huesca Province, Spain. From the Lovozero and Khibiny massifs, Kola Peninsula, Russia. At Narssârssuk, Greenland. From Oldonyo Dili, Tanzania. Large crystals from Mt. Malosa, Zomba district, Malawi. In the USA, from Pitcairn, Russell, and LaSalle, St. Lawrence Co., and at Natural Bridge, Jefferson Co., New York; at Magnet Cove, Hot Spring Co., and from Granite Mountain, near Little Rock, Pulaski Co., Arkansas; in the Bear Paw Mountains, Hill Co., Montana. Large crystals from Mont Saint-Hilaire, Quebec, Canada.

Name: From *Ægir*, the Scandinavian sea-god, as first described from Norway.

Aenigmatite $Na_2Fe_5^{2+}TiSi_6O_{20}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\bar{1}$. Crystals poorly developed, prismatic, to 8 cm; as irregular segregations. *Twinning:* By rotation ⊥ $(01\bar{1})$ or about [010] of the pseudomonoclinic cell; polysynthetic.

Physical Properties: *Cleavage:* Good on {010}, {100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 3.81 D(calc.) = [3.84]

Optical Properties: Translucent to opaque. *Color:* Velvet-black; in thin section, reddish brown to black. *Streak:* Reddish brown. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow brown; Y = red-brown; Z = dark brown to black. *Orientation:* $Y = b$; $Z \wedge c = 45°$. *Dispersion:* $r < v$, very strong. α = 1.793–1.81 β = 1.804–1.82 γ = 1.87–1.90 2V(meas.) = 30°–50°

(1) Khibinite quarry, Kirovsk, Kola Peninsula, Russia. (2) Motzfeldt centre, Greenland; by electron microprobe. (3) $Na_2Fe_5TiSi_6O_{20}$.

Polymorphism & Series: Forms a series with wilkinsonite.

Mineral Group: Aenigmatite group.

Occurrence: A primary constituent in sodium-rich alkalic volcanics, pegmatites, and other silica-poor igneous rocks.

Association: Aegirine, augite, riebeckite, arfvedsonite, hedenbergite, fayalite, ilmenite.

Distribution: Notable studied occurrences include: at Naujakasik, near the Tunugdliarfik Fjord, and on the Kangerdluarssuk Plateau, in the Ilímaussaq intrusion; from Narssârssuk; and elsewhere in Greenland. In the Khibiny and Lovozero massifs, Kola Peninsula, Russia. At Sandefjord, Norway. From Cuddua Mida, Sicily, Italy. In the USA, from Granite Mountain, near Little Rock, Pulaski Co., Arkansas, and Santa Rosa, Sonoma Co., California. In Australia, from Warrumbungle volcano, Nandewar volcano, and the Mt. Warning complex, New South Wales; and the Peak Range Province, Queensland. From Logan Point quarry, Dunedin volcano, New Zealand.

Name: From the Greek for *riddle*, apparently an allusion to its (formerly) uncertain chemical composition.

Type Material: Mining Academy, Freiberg, Germany, 29166.

(1) Miass, Russia. (2) Hidra Island, Norway.

Polymorphism & Series: Dimorphous with lucasite-(Ce); forms series with nioboaeschynite-(Ce) and with aeschynite-(Y).

Occurrence: In nepheline syenites and alkali syenite massifs; in granite pegmatites; in carbonatites in alkalic rocks; a detrital mineral in placers.

Association: Feldspar, zircon, samarskite, columbite, allanite, titanite.

Distribution: From around Miass and Zlatoust, Vishnevy-Ilmen Mountains, Southern Ural Mountains, Russia. In Norway, on Hidra (Hitterö) Island, from near Arendal, at Frikstad, and elsewhere. In Germany, at Döbschütz and Königshaln, Lausiter Bergland. From near the Leckbachscharte, Habachtal, and in the Lohninger quarry, near Rauris, Austria. At Val Bedretto and Val Nalps, Tavetsch, Graubünden, Switzerland. In the USA, from south of Darby, Ravalli Co., Montana, and in the Henderson molybdenum mine, Clear Creek Co., Colorado.

Name: From the Greek for *shame*, in allusion to the fact that early chemists had difficulty with separations of titanium from zirconium in some samples; *cerium* for the dominant rare-earth element.

Aeschynite-(Nd) $(Nd, Ce, Ca)(Ti, Nb)_2(O, OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; metamict. *Point Group:* [$2/m$ $2/m$ $2/m$ probable] [by analogy to aeschynite-(Ce)]. As tabular and prismatic crystals, to several mm, and as equigranular and radiating clusters, massive.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–6 D(meas.) = 4.60–5.04 D(calc.) = n.d. Radioactive.

Optical Properties: Semitransparent. *Color:* Dark to pale brown, brownish black; yellowish orange to reddish orange in thin section; dark gray in reflected light. *Streak:* Pale yellowish brown. *Luster:* Adamantine.
Optical Class: Isotropic to biaxial. *Pleochroism:* Weak to distinct. *Dispersion:* Weak to strong. n = 2.1–2.4 (metamict). 2V(meas.) = 78°–82°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Bayan Obo, China; nearly metamict, with only one line, at 2.03 Å, before heating; after heating at 800 °C gives an aeschynite pattern.

Occurrence: In veins in slate and metamorphosed dolostone.

Association: Aegirine, riebeckite, barite, fluorite, albite, phlogopite, magnetite.

Distribution: From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China.

Name: For similarity to *aeschynite-(Ce)*, with *neodymium* as the dominant rare-earth element.

Type Material: n.d.

(1) Urstad, Norway; Ce_2O_3 includes $(La, Dy)_2O_3$. (2) Arendal, Norway; Ce_2O_3 includes $(La, Dy)_2O_3$.

Polymorphism & Series: Forms two series, with aeschynite-(Ce) and with tantalaeschynite-(Y).

Occurrence: In granite and granite pegmatites; in ankerite-dolomitic carbonatites; as a detrital mineral in placers.

Association: Euxenite, monazite, xenotime, allanite, zircon, fergusonite, thorite, synchysite, gadolinite, chernovite, columbite, biotite, muscovite, titanite, corundum.

Distribution: From many localities in Norway, including: at Urstad, on Hidra (Hitterö) Island; Sätersdalen; at Kåbuland, Mölland, and Birkeland; near Arendal, Mörefjär, and Salterö; at Frikstad. In Russia, at Miass, in the Ilmen Mountains, Southern Ural Mountains. In Switzerland, from Piz Lucendro, near the St. Gotthard Pass, on Pizzo Rotondo, Val Bedretto, and Val Nalps, Tavetsch, Graubünden; and elsewhere. In Italy, on Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont. At Böckstein, near Bad Gestein, Austria. From Tongafeno, Ambedabao, Ambohitromby, near Ambatofotsy, Tomboarivo, and other localities in Madagascar. From the Embabaan district, Swaziland. A number of other less-well-defined localities are known.

Name: For similarity to *aeschynite-(Ce)*, with *yttrium* as the dominant rare-earth element.

Type Material: n.d.

Afghanite $(Na, Ca, K)_8(Si, Al)_{12}O_{24}(SO_4, Cl, CO_3)_3 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $6mm$, or $\overline{6}\ m2$. As stout to slender, thin tabular laths and as rounded grains.

Physical Properties: *Cleavage:* Perfect on $\{10\overline{1}0\}$. *Fracture:* Conchoidal. Hardness = 5.5–6 D(meas.) = 2.55 D(calc.) = 2.65

Optical Properties: Transparent. *Color:* Blue; in thin section, colorless. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.523(2)$ $\epsilon = 1.529(2)$

Cell Data: *Space Group:* $P6_3/mmc$, $P6_3mc$, or $P\overline{6}2c$. $a = 12.77(3)$ $c = 21.35(4)$ $Z = 3$

X-ray Powder Pattern: Sar-e-Sang, Afghanistan.
3.688 (100), 3.298 (100), 4.82 (80), 3.997 (60), 2.865 (60), 2.130 (60), 1.792 (60)

Chemistry:

	(1)	(2)
SiO_2	30.8	32.96
Al_2O_3	25.	25.45
CaO	16.5	11.98

Total	100.8	99.88

(1) Sar-e-Sang, Afghanistan; corresponds to $(Na_{4.86}Ca_{3.52}K_{0.69})_{\Sigma=9.07}(Si_{6.13}Al_{5.87})_{\Sigma=12.00}O_{25.21}[Cl_{1.55}(SO_4)_{1.27}(CO_3)_{0.11}]_{\Sigma=2.93} \cdot 0.46H_2O$. (2) Edwards, New York, USA; by electron microprobe, corresponds to $(Na_{4.63}Ca_{2.45}K_{0.75})_{\Sigma=7.83}(Si_{6.28}Al_{5.72})_{\Sigma=12.00}O_{24.08}[(SO_4)_{1.55}Cl_{1.29}]_{\Sigma=2.84}$.

Mineral Group: Cancrinite group.

Occurrence: In thin veinlets cutting lazurite crystals (Sar-e-Sang, Afghanistan); in silicified limestone xenoliths in pumice (Pitigliano quarry, Italy).

Association: Lazurite, sodalite, nepheline, phlogopite, olivine, diopside, vesuvianite, calcite, pyrite.

Distribution: At Sar-e-Sang, Badakhshan Province, Afghanistan. In Russia, in the Malaya Bystraya and Tultuy lazurite deposits, near Lake Baikal, and in other unspecified deposits in eastern Siberia. From Lyadzhuar-Darinsk, Pamir Mountains, Tajikistan. In Italy, at the Pitigliano quarry, near Grosseto, Tuscany; on Monte Somma, Campania; from Vetralla and Bassano, Latium. In the Edwards mine, Edwards, St. Lawrence Co., New York, USA. At Lake Harbour, Baffin Island, Newfoundland, Canada.

Name: For the country of first occurrence, AFGHANistan.

Type Material: Mineralogy-Crystallography Laboratory, University Pierre and Marie Curie, Paris; National School of Mines, Paris, France; The Natural History Museum, London, England, 1969,72.

(1) Kimberley, South Africa. (2) Crestmore, California, USA. (3) $Ca_3(SiO_3OH)_2 \cdot 2H_2O$.

Occurrence: A product of contact metamorphism of limestones.

Association: Apophyllite, natrolite, thaumasite, merwinite, spurrite, gehlenite, ettringite, portlandite, hillebrandite, foshagite, brucite, calcite.

Distribution: From the Dutoitspan diamond mine, Kimberley, and the Wessels mine, near Kuruman, Cape Province, South Africa. In Ireland, at Scawt Hill, near Larne, Co. Antrim. From the Schellkopf, near Brenk, Eifel district, and on the Zeilberg, near Maroldsweisach, Bavaria, Germany. At Campomorto, Montalto di Castro, Lazio, Italy. From Nahal Ayalon, Israel. In the USA, at Crestmore, Riverside Co., California. In the Mihara mine and at Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: Honoring Alpheus Fuller Williams (1874–1953), General Manager, DeBeers Consolidated Mines, Kimberley, South Africa.

Type Material: The Natural History Museum, London, England, 1925,80; National Museum of Natural History, Washington, D.C., USA, 95237.

Agardite-(La) $(La,Ca)Cu_6(AsO_4)_3(OH)_6 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$ or 6. Crystals acicular, prismatic, to 3 mm, in tufted groups, spherical rosettes.

Physical Properties: Hardness = n.d. D(meas.) = 3.65(5) D(calc.) = 3.62(1)

Optical Properties: Semitransparent. *Color:* Grass-green to dull green, yellowish green to intense bluish green, rarely nearly colorless.
Optical Class: Uniaxial (+). $\omega = 1.715(2)$ $\epsilon = 1.795(2)$

Cell Data: *Space Group:* $P6_3/m$ or $P6_3$. $a = 13.586(4)$ $c = 5.931(5)$ $Z = 2$

X-ray Powder Pattern: n.d. ; presumably very similar to agardite-(Y).

Chemistry: (1) Red Cloud fluorite mine, New Mexico, USA; analysis not given, by electron microprobe, average of analyses on four crystals, $(OH)^{1-}$ calculated for charge balance; stated to correspond to $(Al_{0.36}La_{0.29}Ce_{0.21}Nd_{0.08}Pr_{0.03}Y_{0.02}Gd_{0.02}Sm_{0.01})_{\Sigma=1.02}(Cu_{5.50}Ca_{0.42}Pb_{0.06}Fe_{0.02}Zn_{0.01})_{\Sigma=6.01}[(AsO_4)_{2.74}(SiO_4)_{0.25}(VO_4)_{0.02}(SO_4)_{0.02}]_{\Sigma=3.03}(OH)_{5.76} \cdot 3H_2O$.

Mineral Group: Mixite group; Nd and Ce have also been noted as dominant rare-earth elements, but the corresponding species have not been fully described.

Occurrence: In small amounts in the oxidized zone of hydrothermal mineralized breccia and polymetallic mineral deposits (Red Cloud mines, New Mexico, USA).

Association: Fluorite, bastnaesite, barite, quartz (Red Cloud fluorite mine, New Mexico, USA); chrysocolla, malachite, azurite, mimetite, vanadinite, conichalcite, wulfenite, mottramite, cerussite, quartz (Red Cloud copper mine, New Mexico, USA); smithsonite, aurichalcite, hydrozincite, azurite, cuprian adamite, calcite, chrysocolla, zincaluminite, gibbsite (Kamariza mine, Greece).

Distribution: From the Red Cloud fluorite and copper mines, Gallinas district, Lincoln Co., New Mexico, USA. In the Kamariza mine, Laurium, Greece (Ce > La in part). In England, from Wheal Alfred, Phillack, Cornwall (Nd-rich); at the Brandy Gill and Deer Hills mines, Caldbeck Fells, Cumbria. In the Clara Mine, near Oberwolfach, and other localities in the Black Forest, Germany (Ce > La in part). From the Sa Duchessa mine, near Iglesias, Sardinia, Italy (Nd-rich in part, some with Ce > La).

Name: By analogy to *agardite*-(Y), with its rare-earth content dominated by *lanthanum*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 148987, 148988.

(1) Bou Skour mine, Morocco; contains very little malachite and quartz; spectrographic analysis of RE = La 0.01%, Pr, Nd 0.3%, Sm 0.15%, Gd, Tb 0.04%, Dy, Ho, Er 0.01%, Tm, Yb, Lu 0.025%; corresponds to $[(Y,RE)_{0.38}Ca_{0.12}]_{\Sigma=0.50}(Cu_{5.86}Ca_{0.23})_{\Sigma=6.09}[(AsO_4)_{2.83}(OH)_{0.68}]_{\Sigma=3.51}(OH)_6 \cdot 3H_2O$. (2) Santa Lucia mine, Sardinia, Italy; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(Y_{0.38}Pb_{0.22}La_{0.17}Nd_{0.07}Gd_{0.04}Al_{0.04}Ce_{0.03}Pr_{0.01}Ca_{0.03})_{\Sigma=0.99}(Cu_{5.91}Ca_{0.09})_{\Sigma=6.00}[(AsO_4)_{2.97}(SiO_4)_{0.03}]_{\Sigma=3.00}(OH)_6 \cdot 3H_2O$.

Mineral Group: Mixite group.

Occurrence: In the oxidation zone of some copper deposits.

Association: Azurite, malachite, chrysocolla, cuprite, copper, mimetite, quartz.

Distribution: In the Bou Skour mine, Djebel Sarhro, Morocco. At Mutoshi, Katanga Province, Congo (Shaba Province, Zaire). From the Luisito mine, Anora, Córdoba Province, Spain. At Schneeberg, Saxony; in the Clara mine, near Oberwolfach, Black Forest, Germany. In France, from the Cap Garonne mine, near le Pradet, Var, and Chessy, near Lyon, Rhône. In Wheal Alfred, Cornwall, England. At the Gwaithyrafon mine, Cwmsymlog, Wales. On Sardinia, Italy, from the Santa Lucia and Sa Duchessa mines, near Iglesias. At Hayasi, Setoda, Ikuchi Island, Hiroshima Prefecture, Japan. From Broken Hill, New South Wales, Australia. In the USA, from the Tintic district, Juab Co., Utah; in the Mohawk mine, Clark Mountains, San Bernardino Co., California; and at Granite Gap, San Simon district, Hidalgo Co., New Mexico. A few other localities are known but may require confirmation as dominantly yttrian.

Name: To honor Jules Agard, geologist, Bureau de Recherches Géologiques et Minières, Orléans, France, and dominant *yttrium*.

Type Material: Serv. Geol. Maroc, Rabat, Morocco; National School of Mines, Paris, France; The Natural History Museum, London, England, 1978,24.

(1) Villedieu Township, Canada; by wet chemical analysis, spectrophotometry, and flame photometry, total Fe as Fe_2O_3, H_2O by the Penfield method. (2) $NaCa_2Si_4O_{10}F$.

Occurrence: In pegmatite lenses and pods and in mafic gneisses in a regionally metamorphosed agpaitic alkalic rock complex (Villedieu Township, Canada).

Association: Hiortdahlite, mosandrite, miserite, britholite, vlasovite, calcite, fluorite, clinohumite, gittinsite, norbergite, zircon, biotite, phlogopite, galena (Villedieu Township, Canada); miserite, aegirine, eudialyte, quartz (Wausau, Wisconsin, USA).

Distribution: In Canada, from the Sheffield Lake complex, Kipawa River, Villedieu Township, Quebec. In the USA, in the Wausau complex, Marathon Co., Wisconsin. In the Dara-i-Pioz massif, Alai Range, Tien Shan, Tajikistan. From the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: To honor Professor Stuart Olof Agrell (1913–1996), eminent petrologist, Cambridge University, Cambridge, England.

Aguilarite Ag_4SeS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. In skeletal pseudododecahedral crystals, commonly elongated in the direction of a pseudocubic or pseudo-octahedral edge, to 3 cm; also massive and in intergrowths with acanthite or naumannite.

Physical Properties: *Fracture:* Hackly. *Tenacity:* Sectile. Hardness = 2.5
VHN = 20.5–23.8, 22.7 average (25 g load). D(meas.) = 7.40–7.53 D(calc.) = [7.65]

Optical Properties: Opaque. *Color:* Bright lead-gray on fresh surfaces; dull iron-black on exposed surfaces. *Luster:* Metallic. *Anisotropism:* Very weak or isotropic.
R_1–R_2: (400) 34.8–35.1, (420) 34.7–35.2, (440) 34.6–35.2, (460) 34.7–35.3, (480) 34.8–35.3, (500) 34.8–35.4, (520) 34.6–35.6, (540) 34.1–35.5, (560) 33.5–35.2, (580) 32.8–34.6, (600) 32.1–33.8, (620) 31.5–33.9, (640) 31.0–32.4, (660) 30.6–31.8, (680) 30.2–31.4, (700) 30.0–31.0

(1) Silver City, Idaho, USA. (2) Guanajuato, Mexico. (3) San Carlos mine, Guanajuato, Mexico; by electron microprobe. (4) Ag_4SeS.

Polymorphism & Series: Inverted from a higher temperature cubic form.

Occurrence: An uncommon, relatively low-temperature, mineral in hydrothermal deposits rich in silver and selenium, but manifestly deficient in sulfur.

Association: Acanthite, naumannite, silver, stephanite, proustite, pearceite, calcite, quartz.

Distribution: In Mexico, from Guanajuato, in the San Carlos mine [TL] and others; at the Chontalpan mine, Taxco, Guerrero. In the USA, in Idaho, from Silver City, Owyhee Co., and at the 4th of July mine, Yankee Fork, Custer Co.; from the Comstock Lode, Virginia City, Storey Co., Nevada; in Washington, at the L-D mine, Wenatchee, Chelan Co. and the Knob Hill mine, Republic, Ferry Co.; and from Cuchillo, Winston district, Sierra Co., New Mexico. At the Maritoto mine, northeast of Paeroa, New Zealand. From the Woluma goldfield, New South Wales, Australia. In the Sanru mine, Hokkaido, Japan.

Name: After Ponciano Aguilar (1853–1935), Superintendent of the San Carlos mine, Guanajuato, Mexico, where the material was originally found.

Aheylite $(Fe^{2+}, Zn)Al_6(PO_4)_4(OH)_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1 or $\overline{1}$. As crystals, interlocked in felted and matted aggregates to form botryoidal, spherulitic masses; radiating, prismatic groups, to 5 mm.

Physical Properties: *Fracture:* Hackly to splintery. *Tenacity:* May be brittle.
Hardness = 5–5.5 D(meas.) = 2.84 D(calc.) = 2.90

Optical Properties: Transparent in thin flakes. *Color:* Very pale blue, pale green, to blue-green. *Streak:* White. *Luster:* Porcelaneous to subvitreous.
Optical Class: Biaxial (+). $n = \sim 1.63$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. $a = 7.400(1)$ $b = 9.896(1)$ $c = 7.627(1)$
$\alpha = 110.87°$ $\beta = 115.00°$ $\gamma = 69.96°$ Z = 1

X-ray Powder Pattern: Huanuni mine, Bolivia.
3.670 (100), 2.888 (67), 6.146 (43), 3.27 (37), 3.436 (36), 2.914 (34), 3.398 (25)

Chemistry:

	(1)	(2)
P_2O_5	35.4	35.23
Al_2O_3	38.1	37.96
FeO	4.14	8.92
ZnO	4.02	
H_2O^+	18.5	17.89
H_2O^-	0.08	0.00
Total	100.24	100.00

(1) Huanuni mine, Bolivia; by ICP, H_2O^- by gravimetry, H_2O^+ by Karl Fischer titration, average of four analyses; corresponds to $(Fe^{2+}_{0.46}Zn_{0.40})_{\Sigma=0.86}Al_6(PO_4)_{3.72}(PO_3OH)_{0.28}(OH)_8 \cdot 4.10H_2O$.
(2) $FeAl_6(PO_4)_4(OH)_8 \cdot 4H_2O$.

Mineral Group: Turquoise group.

Occurrence: A late stage hydrothermal mineral in a base-metal-tin deposit (Huanuni mine, Bolivia).

Association: Variscite, sphalerite, vivianite, wavellite, cassiterite, pyrite, quartz (Huanuni mine, Bolivia).

Distribution: In the Huanuni mine, Oruro, Bolivia. From the Bali Lo copper prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia.

Name: To honor Allen V. Heyl (1918–), economic geologist, U.S. Geological Survey.

Type Material: n.d.

References: (1) Foord, E.E. and J.E. Taggart, Jr. (1998) A reexamination of the turquoise group: the mineral aheylite, planerite (redefined), turquoise and coeruleolactite. Mineral. Mag., 62, 93–111.

Total	100.0	100.00

(1) Pacajake mine, Bolivia; by electron microprobe, H_2O by evolved H_2O analyzer; corresponds to $(Ni_{0.90}Co_{0.10})_{\Sigma=1.00}Se_{1.00}O_3 \cdot 2.00H_2O$. (2) $(Ni, Co)SeO_3 \cdot 2H_2O$ with Ni:Co = 1:1.

Polymorphism & Series: Forms a series with cobaltomenite.

Occurrence: A rare alteration product of nickel-bearing selenides and sulfides.

Association: Penroseite, chalcomenite, olsacherite, cerussite, anglesite (Pacajake mine, Bolivia); chalcomenite, olsacherite, lepidocrocite, goethite (El Dragón mine, Bolivia).

Distribution: In Bolivia, from the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, and the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí.

Name: To honor Friedrich E. Ahlfeld (1892–1982) German–Bolivian mining engineer and mineralogist.

Type Material: The Natural History Museum, London, England, 1972,347.

(1) Beresovsk, Russia. (2) Loch Shin monzogranite, near Lairg, Scotland; by electron microprobe, average of eight analyses; corresponds to $Pb_{0.98}Cu_{0.96}Bi_{1.04}S_{3.00}$. (3) $PbCuBiS_3$.

Occurrence: Uncommon in hydrothermal veins.

Association: Gold, pyrite, galena, tennantite, bismuthinite, enargite, chalcopyrite, quartz.

Distribution: There are numerous minor localities. In Russia, from the Beresovsk district, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains [TL], exceptional crystal sprays; very large crystals at Djida, Buryat, Siberia. From Dobšiná (Dobschau), Slovakia. In France, at the Gardette mine, near Bourg d'Oisans, Isère. In the USA, in Utah, at the Sells mine, Alta, Salt Lake Co.; in Nevada, near Cucomungo Spring and near the Sylvania Mountains, Esmeralda Co.; at the Old Lout mine, Poughkeepsie Gulch, near Ouray, San Juan Co., and in the Sunnyside mine, Eureka Co., Colorado; from the Chantilly quarry, near Arcola, Loudoun Co., Virginia. At Tasco and Huitzuco, Guerrero, Mexico.

Name: For Dr. Arthur Aikin (1773–1854), English chemist and mineralogist, a founder and long-time Secretary of the Geological Society of London, England.

Ajoite $(K,Na)Cu_7AlSi_9O_{24}(OH)_6 \cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As sprays of bladed prismatic crystals, to 0.4 mm; commonly fibrous.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = n.d. D(meas.) = 2.96 D(calc.) = 2.951

Optical Properties: Translucent. *Color:* Bluish green.
Optical Class: Biaxial (+). *Pleochroism:* X = very light bluish green; $Y = Z$ = brilliant bluish green. *Orientation:* $X = b$; $Z \wedge c = 15°$. $\alpha = 1.550(1)$ $\beta = 1.583(1)$ $\gamma = 1.641(1)$ 2V(meas.) = 80(1)° 2V(calc.) = 76.4°

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. $a = 13.637(5)$ $b = 14.507(4)$ $c = 13.620(2)$ $\alpha = 107.16(2)°$ $\beta = 105.45(2)°$ $\gamma = 110.57(2)°$ Z = 3

X-ray Powder Pattern: Ajo, Arizona, USA.
12.25 (100), 2.455 (12), 4.08 (10), 3.061 (10), 3.381 (8), 2.832 (8), 2.258 (8)

Chemistry:

	(1)
SiO_2	41.2
Al_2O_3	3.81
FeO	0.11
MnO	0.02
CuO	42.2
CaO	0.04
Na_2O	0.84
K_2O	2.50
H_2O	8.35
Total	99.07

(1) Ajo, Arizona, USA; Si, Al, and Cu by electron microprobe, corresponding to $(K_{0.70}Na_{0.36}Ca_{0.01})_{\Sigma=1.07}(Cu_{6.97}Fe_{0.02})_{\Sigma=6.99}Al_{0.98}Si_{9.00}O_{24}(OH)_{6.00} \cdot 3.09H_2O$.

Occurrence: In oxidized copper-rich base-metal deposits.

Association: Shattuckite, conichalcite, quartz, muscovite, pyrite (Ajo, Arizona, USA); creaseyite, fluorite (Potter-Cramer property, Arizona, USA); shattuckite, duhamelite, sillénite (Munihuaza, Mexico); quartz, papagoite (Messina, South Africa).

Distribution: In the USA, in Arizona, from the New Cornelia mine, Ajo, Pima Co.; at the Moon Anchor mine and Potter-Cramer property, near Wickenburg, Maricopa Co.; and a prospect in Copper Creek, Pinal Co. From Munihuaza, near Alamos, Sonora, Mexico. At Messina, Transvaal, South Africa.

Name: For the type occurrence at Ajo, Arizona, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 113220.

References: (1) Schaller, W.T. and A.C. Vlisidis (1958) Ajoite, a new hydrous aluminum copper silicate. Amer. Mineral., 43, 1107–1111. (2) Kato, T. and Y. Miúra (1976) Cell dimension of ajoite. Akaganéite β–$\mathbf{Fe^{3+}O(OH,Cl)}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tiny spindlelike quasi-single crystals are up to 5 μm in length; in bundles of such rods; commonly fine-grained massive to powdery.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [3.52]

Optical Properties: Semitransparent. *Color:* Yellowish brown.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $I2/m$. $a = 10.561(4)$ $b = 3.031(1)$ $c = 10.483(4)$ $\beta = 90.63(4)^\circ$ Z = 8

X-ray Powder Pattern: Synthetic FeO(OH).
3.333 (100), 2.5502 (55), 7.467 (40), 2.2952 (35), 1.6434 (35), 5.276 (30), 2.6344 (25)

Chemistry:

	(1)	(2)	(3)
SiO_2	3.10		
Al_2O_3	1.21		
Fe_2O_3	78.23	69.0 – 76.0	89.86
FeO	0.82		
NiO		0.4 – 5.6	
Na_2O	0.62		
K_2O	0.19		
H_2O^+	10.20		10.14
H_2O^-	4.96		
Cl		3.6 – 6.3	
Total	99.33		100.00

(1) Akagané mine, Japan; Si and Al are probably impurities; other samples from the locality contain significant Cl. (2) Campo del Cielo Fe–Ni meteorite; by electron microprobe, ranges of 14 analyses, total Fe as Fe_2O_3; with O^{2+} and $(OH)^{1-}$ for charge balance, the average corresponds to $(Fe^{3+}_{0.95}Ni_{0.05})_{\Sigma=1.00}O_{0.79}[(OH)_{1.21}Cl_{0.16}]_{\Sigma=1.37}$. (3) FeO(OH).

Occurrence: Apparently formed from pyrrhotite by ferric-sulfate-bearing solutions (Akagané mine, Japan); an important constituent in some soils, and certain geothermal brines and in sea-floor nodules; also formed as a corrosion product of some meteorites.

Association: Pyrrhotite (Akagané mine, Japan); hibbingite (Hibbing, Minnesota, USA).

Distribution: From the Akagané mine, Iwate Prefecture, Japan. Found at the Las Animas mine, La Mur, Trincheras, Sonora, Mexico. In the USA, from Black Rock, Humboldt Co., Nevada; north of the Santa Niño mine, Santa Cruz Co., Arizona; at Questa, Taos Co., New Mexico; and in the Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota. At the Clara mine, near Oberwolfach, Black Forest, Germany. From Warham Marshes, Norfolk, England. At Richelle, Belgium. In brines from the Atlantis II Deep, Red Sea. Additional localities may be expected, as the mineral has the appearance of "limonite".

Name: For the Akagané mine, Japan, its original locality.

Type Material: n.d.

Akatoreite $\mathbf{Mn_9^{2+}Al_2Si_8O_{24}(OH)_8}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Rarely as sheaves, to 1 cm, of radiating prisms, elongated and striated ‖ [100]; fibrous, fine granular, massive. *Twinning:* On $\{0\overline{2}1\}$; twin axis ⊥ $\{0\overline{2}1\}$, lamellar in thin section.

Physical Properties: *Cleavage:* Good on {010}, poor on $\{0\overline{1}2\}$. Hardness = 6
D(meas.) = 3.48 D(calc.) = 3.47

Optical Properties: Transparent. *Color:* Yellow-orange to orange-brown. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Pleochroism:* X = colorless; Y = pale yellow; Z = light canary-yellow. *Orientation:* $X \wedge \{010\} = 58°$; $Y \wedge \{010\} = 30°$. $\alpha = 1.698(1)$ $\beta = 1.704(1)$ $\gamma = 1.720(1)$ 2V(meas.) = 65.5°

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.337(2)$ $b = 10.367(2)$ $c = 7.629(1)$ $\alpha = 104.46(1)°$ $\beta = 93.81(2)°$ $\gamma = 104.18(1)°$ Z = 1

X-ray Powder Pattern: Akatore Creek, New Zealand.
4.665 (100), 3.310 (90), 2.214 (80), 9.681 (60), 3.466 (50), 3.063 (50), 2.866 (50)

Chemistry:

	(1)	(2)
SiO_2	36.4	36.9
TiO_2	0.03	0.1
Al_2O_3	8.3	6.2
FeO	1.0	0.9
MnO	47.7	44.2
MgO	0.3	0.8
CaO	0.2	0.2
H_2O	6.21	[10.7]
Total	100.14	[100.0]

(1) Akatore Creek, New Zealand; by electron microprobe, corresponding to $(Mn_{8.61}Fe_{0.19}Mg_{0.09}Ca_{0.05})_{\Sigma=8.94}Al_{2.09}Si_{7.75}O_{23.17}(OH)_{8.83}$. (2) Norberg, Sweden; by electron microprobe, average of eight analyses, H_2O by difference; corresponds to $(Mn_{8.29}Mg_{0.27}Fe_{0.19}Ca_{0.05})_{\Sigma=8.80}Al_{1.64}Si_{8.16}O_{23.17}(OH)_8$.

Occurrence: In a manganiferous metachert and carbonate lens in schists (Akatore Creek, New Zealand); in manganiferous potassium-rich felsic metavolcanics (Norberg, Sweden).

Association: Rhodochrosite, pyroxmangite, rhodonite, spessartine, quartz, tinzenite, apatite, todorokite, alabandite, hübnerite (Akatore Creek, New Zealand); ganophyllite, rhodochrosite, pyrolusite (Norberg, Sweden).

Distribution: In New Zealand, three km south of Akatore Creek, east Otago, South Island. From Norberg, Sweden.

Name: For the locality near Akatore Creek, New Zealand.

Type Material: University of Otago, Dunedin; Geological Survey of New Zealand, Lower Hutt, New Zealand; National Museum of Natural History, Washington, D.C., USA, 137285, 142541.

Akdalaite $4Al_2O_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622 or 6. As hexagonal crystals, to 0.8 mm, tabular to equant; in lenslike aggregates.

Physical Properties: *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 7–7.5 VHN = 1085 D(meas.) = 3.68(2) D(calc.) = 3.673

Optical Properties: Translucent. *Color:* White; in thin section, pale greenish yellow. *Luster:* Vitreous to porcelaneous.
Optical Class: Uniaxial (–). $\omega = 1.747(3)$ $\epsilon = 1.741(3)$

Cell Data: *Space Group:* $P6_122$ or $P6_1$. $a = 12.87(1)$ $c = 14.97(1)$ Z = 18

X-ray Powder Pattern: Solnech deposit, Kazakhstan.
2.11 (10), 1.418 (10), 1.393 (10), 2.494 (9), 2.35 (9), 0.9931 (9), 2.32 (8)

Chemistry:

	(1)	(2)
SiO_2	4.74	
Al_2O_3	87.26	95.77
Fe_2O_3	0.97	
ZnO	0.90

MgO	0.97	
CaO	0.41	
F	0.68	
H_2O^+	4.23	4.23
$-O = (F, Cl)_2$	0.28	
Total	100.69	100.00

(1) Solnech deposit, Kazakhstan; after deduction of muscovite and fluorite, corresponds to $(Al_{1.91}Be_{0.04}Mg_{0.03}Fe^{3+}_{0.01}Zn_{0.01})_{\Sigma=2.00}(O_{2.91}H_{0.07}F_{0.02})_{\Sigma=3.00} \cdot 0.25H_2O$. (2) $4Al_2O_3 \cdot H_2O$.

Occurrence: In veinlets cutting amesite-fluorite-muscovite rock and fluorite-magnetite-diopside-vesuvianite skarn.

Association: Muscovite, fluorite, amesite, magnetite, diopside, vesuvianite, andradite.

Distribution: In the Solnech fluorite deposit, two km west of the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan.

Name: For the Kazakh name, *Akdala*, for the vicinity of Kara-Oba, Kazakhstan.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

CaO	39.30	40.09	41.14
Na_2O		< 0.05	
Total	100.23	[99.55]	100.00

(1) Vesuvius, Italy. (2) Cascade Mountain, New York, USA; by electron microprobe; original total given as 99.52%. (3) $Ca_2MgSi_2O_7$.

Polymorphism & Series: Forms a series with gehlenite.

Mineral Group: Melilite group.

Occurrence: A product of contact metamorphism of siliceous limestones and dolostones, and in rocks of the sanidinite facies. Also forms from alkalic magmas rich in calcium.

Association: Monticellite, wollastonite, spurrite, larnite, merwinite, "fassaite," grossular, diopside, forsterite.

Distribution: Occurrences are typically of intermediate series members; relatively pure examples have been found at Monte Somma and Vesuvius, Campania, and Monte Cavalluchio, Sacrofano, near Rome, Lazio, Italy. From Crestmore, Riverside Co., California; on Cascade Mountain, Adirondack Mountains, Essex Co., New York; and from the Tres Hermanas district, Luna Co., New Mexico, USA. On Dufresne Hill, Oka, Quebec, Canada. From near Kilchoan, Ardnamurchan, Argyllshire, Scotland. At Scawt Hill, near Larne, Co. Antrim, Ireland. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Anders Richard Åkerman (1837–1922), Swedish metallurgist.

Akhtenskite MnO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As microscopic crystals, flaky to platy on {001}, in parallel aggregates, sometimes in rows at 120°, probably due to replacement of an earlier hexagonal mineral; as flaky polycrystalline aggregates.

Physical Properties: *Cleavage:* {001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = [4.78]

Optical Properties: [Opaque.] *Color:* Pale gray to black.
Optical Class: Uniaxial.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3/mmc$. $a = 2.83$–2.85 $c = 4.47$–4.88 Z = [1]

X-ray Powder Pattern: Mt. Zarod, Russia; calculated from an electron diffraction pattern.
2.45, 2.15, 1.65, 1.42

Chemistry: Sufficient material for direct chemical analysis cannot be separated; energy-dispersive analysis shows Mn as the only cationic species; Mn^{4+} and O were established by X-ray photoelectronic spectroscopy, as was the absence of OH and H_2O.

Polymorphism & Series: Trimorphous with pyrolusite and ramsdellite.

Occurrence: In mixtures in "psilomelane" with other manganese oxides in an iron oxide deposit, probably bacterially altered from a previous mineral (Akhtensk deposit, Russia); in incrustations of ferromanganese minerals on oceanic basalt on a guyot (Mt. Zarod, Russia).

Association: Cryptomelane, nsutite, pyrolusite, todorokite, goethite (Akhtensk deposit, Russia); vernadite, manganite, Fe–Mn oxides (Mt. Zarod, Russia).

Distribution: In the Akhtensk brown ironstone deposit, north of Magnitka, Southern Ural Mountains; on Mt. Zarod, Sikhote-Alin Mountains, Primorskiy Kray, Russia.

Name: For the Akhtensk deposit, Russia, where it was first noted.

Type Material: Mining Institute, St. Petersburg, Russia, 307/5.

References: (1) Chukhrov, F.V., A.I. Gorshkov, and V.S. Drits (1987) Advances in the crystal chemistry of manganese oxides. Zap. Vses. Mineral. Obshch., 16, 210–221 (in Russian). Aklimaite $Ca_4[Si_2O_5(OH)_2](OH)_4 \cdot 5H_2O$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As spherules of columnar or lath-shaped crystals to 5 mm; crystals flattened on (001) and elongated along [010].

Physical Properties: *Cleavage:* On {001}, perfect. *Fracture:* n.d. *Tenacity:* Brittle. Hardness = 3-4 D(meas.) = 2.20(1) D(calc.) = 2.274

Optical Properties: Transparent. *Color: C*olorless or light-pinkish. *Streak:* n.d. *Luster:* Vitreous.
Optical Class: Biaxial (-). α = 1.548(2) β = 1.551(3) γ = 1.553(2)
2V(obs) > 70° 2V(calc) = 78° *Orientation*: Z = *b*.

Cell Data: *Space Group: C2/m*. *a* = 16.907(5) *b* = 3.6528(8) *c* = 13.068(4) β = 117.25(4)° *Z* = 2

X-ray Powder Pattern: Upper Chegem Caldera, Northern Caucasus, Russia.
11.64 (100), 2.948 (32), 3.073 (20), 2.320 (12), 2.901 (11), 8.30 (10), 2.576 (10)

Chemistry:

	(1)
Na_2O	0.06
K_2O	0.02
CaO	45.39
MnO	0.01
FeO	0.02
SiO_2	24.23
SO_3	0.04
F	3.22
H_2O	27.40
$-O = F_2$	1.36
Total	99.03

(1) Upper Chegem Caldera, Northern Caucasus, Russia; average of 9 electron microprobe analyses, absence of CO_2 confirmed by IR, H_2O and OH^- calculated from structural analysis; corresponding to $(Ca_{4.02}Na_{0.01})_{\Sigma=4.03}[Si_{2.00}O_{5.07}(OH)_{1.93}][(OH)_{3.16}F_{0.84}]_{\Sigma=4.00} \cdot 5H_2O$.

Occurrence: In a metasomatically altered limestone xenolith in ignimbrite.

Association: Larnite, members of the calcium humite-group, hydrogarnets, bultfonteinite, afwillite, ettringite.

Distribution: Upper Chegem (Verkhnechegemskaya) Caldera, near Mount Lakargi, Kabardino-Balkaria, Northern Caucasus, Russia.

Name: Derived from a Turkish women's name, *Aklima*, which means *bright by the mind*, in allusion to the mineral's light color and to the challenge of studying complex crystal structures with imperfect material. The name also honors the Turkish population in the Lakargi region.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia.

Akrochordite $(Mn^{2+},Mg)_5(AsO_4)_2(OH)_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are prismatic to lathlike, elongated along [201], generally splayed or tapered, to 2 mm; may be in radial aggregates and subparallel sheaves. Typically as wartlike or spherical aggregates of minute crystals.

Physical Properties: *Cleavage:* On {010}, perfect; a second, perpendicular to the first. Hardness = 3.5 D(meas.) = 3.19–3.35 D(calc.) = 3.26–3.29

Optical Properties: Translucent. *Color:* Yellowish red-brown, pale to dark brown, pale pink, colorless. *Luster:* Dull.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = \sim 45°$. *Dispersion:* $r < v$, moderately strong. $\alpha = 1.672$ $\beta = 1.676$ $\gamma = 1.683$ 2V(meas.) = Medium.

Cell Data: *Space Group:* $P2_1/c$. $a = 5.682(2)$ $b = 17.627(5)$ $c = 6.832(1)$ $\beta = 99.49(2)°$ Z = 2

X-ray Powder Pattern: Långban, Sweden.
4.40 (10), 8.79 (8), 2.750 (5), 3.62 (4), 5.31 (3.5), 3.112 (3.5), 3.062 (3.5)

Chemistry:

(1) Långban, Sweden. (2) Do.; by electron microprobe, H_2O by difference. (3) Sterling Hill, New Jersey, USA; by electron microprobe, H_2O by difference.

Occurrence: A rare mineral in hausmannite ore from a metamorphosed Fe–Mn orebody (Långban, Sweden); in a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Pyrochroite, barite, hausmannite, eveite, brandtite (Långban, Sweden); sarkinite, chlorophoenicite, carbonates (Sterling Hill, New Jersey, USA).

Distribution: From Långban, Värmland, Sweden. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: From the Greek for *wart*, for its typical habit.

Type Material: National Museum of Natural History, Washington, D.C., USA, 162614, R5396.

Aksaite $MgB_6O_7(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are elongated along [001] and flattened {100}, with {100}, {010}, {021} and rarely {001}, to 1.5 cm; prism faces are striated parallel to [100].

Physical Properties: *Cleavage:* Probable on {100} and {010}. Hardness = ∼2.5
D(meas.) = 2.066 D(calc.) = 1.972

Optical Properties: Semitransparent. *Color:* Colorless, white to pale gray.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. $\alpha = 1.473(1)$ $\beta = 1.508(1)$ $\gamma = 1.528(1)$ 2V(meas.) = 88°

Cell Data: *Space Group: Pbca* (synthetic). $a = 12.540(6)$ $b = 24.327(11)$ $c = 7.480(3)$
Z = 8

X-ray Powder Pattern: Ak-saĭ, Kazakhstan.
6.36 (10), 4.68 (9), 3.54 (9), 3.19 (9), 6.00 (8), 2.78 (8), 3.09 (7)

(1–2) Ak-saĭ, Kazakhstan; probably admixed with preobrazhenskite. (3) $MgB_6O_7(OH)_6 \cdot 2H_2O$.

Occurrence: In fine-grained halite in a salt dome.

Association: Kieserite, anhydrite, preobrazhenskite, boracite, ginorite, halurgite, strontioborite, metaborite, halite.

Distribution: From the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan.

Name: From the locality, Ak-saĭ ("White Glen"), Kazakhstan.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160056.

(1) Aktash deposit, Russia; by electron microprobe, average of two analyses. (2) Gal-Khaya deposit, Russia; by electron microprobe. (3) $Cu_6Hg_3As_4S_{12}$.

Polymorphism & Series: Forms a series with gruzdevite.

Occurrence: Uncommon, of hydrothermal origin in complex polymetallic As–Hg-bearing deposits.

Association: Stibnite, chalcostibite, mercurian tetrahedrite, tennantite, luzonite, enargite, cinnabar, chalcopyrite, pyrite, sphalerite, realgar, orpiment, dickite, quartz, calcite.

Distribution: In Russia, from the Aktash mercury deposit, Kosh-Agach district, Kurai Range, Altai Mountains [TL]; in the Gal-Khaya deposit, Sakha; at the Lukhumi arsenic deposit, central Caucasus Mountains; from the Vorontsovskoye gold deposit, Serov district, Northern Ural Mountains. At the Chauvai Sb–Hg deposit, Fergana Valley, Alai Range, southern Kyrgyzstan. In the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. At the Getchell mine, Potosi district, Humbolt Co., Nevada, USA. In the Hemlo gold deposit, Thunder Bay district, Ontario, Canada. From the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes, France.

Name: For its occurrence at the Aktash deposit, Russia.

Type Material: Central Siberian Geological Museum, Novosibirsk, Russia, III-14/1; National School of Mines, Paris, France.

Total	99.94	100.81	100.00

(1) Arizona, USA. (2) Sotkamo, Finland. (3) MnS.

Polymorphism & Series: Dimorphous with rambergite.

Occurrence: May be in large quantities in epithermal polymetallic sulfide vein and especially in low-temperature manganese deposits. An uncommon constituent of a number of meteorites.

Association: Galena, chalcopyrite, sphalerite, pyrite, acanthite, tellurium, rhodochrosite, calcite, rhodonite, quartz.

Distribution: Selected localities include: from Alabanda, 30 km south-southeast of Aydın, Aydın Province, Turkey [TL]. At Baia-de-Arieş (Offenbánya), Săcărîmb (Nagyág), and Cavnic (Kapnikbánya), Romania. From Adervielle, Hautes-Pyrénées, France. At Gersdorf, Saxony, Germany. From manganese mines in Val Graveglia, Liguria, Italy. At Nsuta, Ghana. In the Yakumo and Inakuraishi mines, Hokkaido; the Taisei mine, Akita Prefecture; and many other localities in Japan. From Broken Hill, New South Wales, Australia. In Peru, at Morococha, Junin. In the Preciosa mine, Tlalchichuca, Puebla, and at Onovas, Sonora, Mexico. In the USA, in the Lucky Cuss mine, Tombstone, Cochise Co., Arizona; the Queen of the West mine, Summit Co., Colorado; at Schellbourne, White Pine Co., Nevada; and from Butte, Silver Bow Co., Montana.

Name: For the originally reported locality at Alabanda in Turkey.

(1) Uzon caldera, Russia; by electron microprobe, average of four analyses; corresponding to $As_{0.88}S_{1.00}$. (2) AsS.

Polymorphism & Series: Trimorphous with pararealgar and realgar.

Occurrence: In hydrothermal As–S veins (Alacrán mine, Chile); in the condensation zone of a hydrothermal Hg–Sb–As system as cement in a sandy gravel (Uzon caldera, Russia); formed at low temperatures in a polymetallic hydrothermal deposit on a submarine seamount (Conical Seamount, Papua New Guinea).

Association: Realgar, orpiment, arsenic, sulfur, stibnite, pyrite, greigite, arsenopyrite, arsenolamprite, sphalerite, acanthite, barite, quartz, calcite (Alacrán mine, Chile); realgar, orpiment, uzonite, stibnite, cinnabar, pyrite, sulfur (Uzon caldera, Russia); realgar, pyrite, sphalerite, galena, chalcopyrite, amorphous silica (Conical Seamount, Papua New Guinea).

Distribution: From the Alacrán Ag–As–Sb mine, Pampa Larga district, Copiapó, Chile [TL]. In the Uzon caldera, Kamchatka, Russia. At Tiefengraben, Reinerzau, Black Forest, Germany. On Conical Seamount, ten km south-southeast of Lihir Island, Papua New Guinea.

Name: For the occurrence in the Alacrán deposit, Chile.

Type Material: Il'menskii Preserve Museum, Miass; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Alamos, Mexico. (2) Tsumeb, Namibia; by electron microprobe. (3) $PbSiO_3$.

Occurrence: As a rare secondary mineral in the oxidized zone of lead-bearing base metal deposits.

Association: Wulfenite, leadhillite, cerussite (Alamos, Mexico); leadhillite, anglesite, melanotekite, fleischerite, kegelite, hematite (Tsumeb, Namibia); diaboleite, phosgenite, cerussite, wulfenite, willemite (Tiger, Arizona, USA); melanotekite, shattuckite, wickenburgite (Rawhide mine, Arizona, USA).

Distribution: From Mexico, in Sonora, at Alamos, and the San Pascual mine, near Zimapán, Hidalgo. In the USA, from Arizona, in the Mammoth-St. Anthony mine, at Tiger, Pinal Co., the Lucky Cuss mine, Tombstone, Cochise Co., and the Rawhide mine, Artillery Mountains, Maricopa Co. As exceptional crystal groups from Tsumeb, Namibia.

Name: For the Mexican type locality at Alamos.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 84859, 85509.

(1) Tolbachik volcano, Russia; by electron microprobe, average of 20 analyses, total Fe as Fe_2O_3; corresponds to $(Al_{1.04}Fe_{0.01}Cu_{0.01})_{\Sigma=1.06}As_{0.96}O_4$. (2) $AlAsO_4$.

Occurrence: A fumarolic mineral.

Association: Fedotovite, klyuchevskite, lammerite, nabokoite, atlasovite, langbeinite, hematite, tenorite.

Distribution: Occurs at the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For ALuminum and ARSenic in the composition.

Type Material: Mining Institute, St. Petersburg, Russia.

Albite $\mathbf{Na_{1.0-0.9}Ca_{0.0-0.1}Al_{1.0-1.1}Si_{3.0-2.9}O_8}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals commonly tabular ∥ {010}, may be curved, to 3 cm; divergent aggregates, granular, cleavable massive. *Twinning:* Common around [010] or ⊥ {010}, giving polysynthetic striae on {001} or {010}; many other laws, contact, simple and multiple.

Physical Properties: *Cleavage:* Perfect on {001}, very good on {010}, imperfect on {110}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 2.60–2.65 D(calc.) = 2.609–2.621

Optical Properties: Transparent to translucent. *Color:* White to gray, bluish, greenish, reddish; may be chatoyant. *Streak:* White. *Luster:* Vitreous, typically pearly on cleavages. *Optical Class:* Biaxial (+) (low); (–) (high). *Dispersion:* $r < v$, weak (low). $\alpha = 1.526–1.530$ $\beta = 1.531–1.533$ $\gamma = 1.534–1.541$ 2V(meas.) = 85°–90° (low); 52°–54° (high).

Cell Data: *Space Group:* $C\overline{1}$ (low). $a = 8.137(1)$ $b = 12.785(1)$ $c = 7.1583(4)$ $\alpha = 94.26(1)°$ $\beta = 116.60(1)°$ $\gamma = 87.71(1)°$ Z = 4, or *Space Group:* $C\overline{1}$ (high). $a = 8.149$ $b = 12.880$ $c = 7.106$ $\alpha = 93.37°$ $\beta = 116.30°$ $\gamma = 90.28°$ Z = 4

X-ray Powder Pattern: Amelia, Virginia, USA (low).
3.196 (100), 3.780 (25), 6.39 (20), 3.684 (20), 4.030 (16), 3.663 (16), 2.933 (16)

Chemistry:

K_2O	0.03		
Total	100.31	100.00	100.00

(1) Alp Rischuna, Switzerland. (2) $NaAlSi_3O_8$. (3) $Na_{0.90}Ca_{0.10}Al_{1.10}Si_{2.90}O_8$.

Polymorphism & Series: Low- and high-temperature structural modifications are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: A major constituent of granites and granite pegmatites, alkalic diorites, basalts, and in hydrothermal and alpine veins. A product of potassium metasomatism and in low-temperature and low-pressure metamorphic facies and in some schists. Detrital and authigenic in sedimentary rocks.

Association: Quartz, orthoclase, muscovite, biotite, "hornblende."

Distribution: Widespread; a few localities for good crystals are: in Switzerland, from St. Gotthard, Ticino and Tavetsch, Graubünden. From Roc Tourné, near Modane, Savoie, France. On Mt. Greiner, Zillertal, Tirol, Austria. At Baveno, Piedmont, and in the Pfitschtal, Trentino-Alto Adige, Italy. From Mursinka, Ural Mountains, and Miass, Ilmen Mountains, Southern Ural Mountains, Russia. In the USA, at Haddam and Middletown, Middlesex Co., Connecticut; Amelia, Amelia Co., Virginia; from Diana, Lewis Co., and Dekalb, Macomb, and Pierrepont, St. Lawrence Co., New York. On Prince of Wales Island, Alaska; in the Pala and Mesa Grande districts, San Diego Co., California. At Bathurst, and Wicklow Township, Hastings Co., Ontario, Canada. From Virgem da Lapa and Morro Velho, Minas Gerais, Brazil.

Name: From the Latin, *albus*, for *white*, its characteristic color.

Albrechtschraufite $Ca_4Mg(UO_2)_2(CO_3)_6F_2 \cdot 17H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystalline.

Physical Properties: Hardness = 2–3 D(meas.) = 2.6 D(calc.) = 2.67 Radioactive.

Optical Properties: Semitransparent. *Color:* Yellow-green.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$. $a = 13.562(3)$ $b = 13.406(3)$ $c = 11.636(3)$
$\alpha = 115.75(2)^\circ$ $\beta = 107.66(2)^\circ$ $\gamma = 92.86(2)^\circ$ Z = 2

X-ray Powder Pattern: n.d.

Chemistry: (1) Jáchymov, Czech Republic; composition merely stated to be $MgCa_4F_2[(UO_2)(CO_3)_3]_2.17H_2O$.

Occurrence: On a museum specimen of schröckingerite.

Association: Schröckingerite, uraninite, dolomite.

Distribution: From Jáchymov (Joachimsthal), Czech Republic.

Name: To honor Professor Albrecht Schrauf (1837–1897), Austrian crystallographer, University of Vienna, Vienna, Austria.

Type Material: Natural History Museum, Vienna, Austria, A.a.6740.

MgO	8.4	9.35
CaO	1.2	
H_2O	36.1	35.93
Total	100.0	100.00

(1) Moculta quarry, Australia; by electron microprobe, average of several analyses, H_2O by loss on ignition; corresponds to $(Mg_{4.53}Ca_{0.47})_{\Sigma=5.00}Al_{12.12}(PO_4)_{7.94}(OH)_{22.5}\cdot 31H_2O$. (2) $Mg_5Al_{12}(PO_4)_8(OH)_{22}\cdot 32H_2O$.

Occurrence: As a secondary mineral in cavities in a brecciated metamorphosed sedimentary phosphate deposit, formed by the alteration of fluellite (Moculta quarry, Australia).

Association: Fluellite.

Distribution: At the Moculta phosphate quarry, northeast of Angaston, South Australia.

Name: Honors Arthur Richard Alderman (1901–1980), Professor of Geology and Mineralogy, University of Adelaide, Adelaide, Australia.

Type Material: C.S.I.R.O. Division of Mineral Chemistry, Melbourne, M636; Museum Victoria, Melbourne, Australia, M34778.

Ce_2O_3	0.04	$–O = F_2$	0.72
MgO	0.05	Total	99.10

(1) Darai-Pioz glacier, Tajikistan; average of 17 electron microprobe analyses, H_2O calculated from stoichiometry, Li calculated from Li/K and Li/Ca ratios; corresponding to $(K_{0.93}Na_{0.10})_{\Sigma=1.03}Li_{3.02}(Ca_{6.82}Sr_{0.06}Mn_{0.04}Mg_{0.02})_{\Sigma=6.94}(Sn_{1.28}Ti_{0.54}Zr_{0.15}Fe_{0.05}Nb_{0.01})_{\Sigma=2.03}(Si_{11.98}Al_{0.02})_{\Sigma=12}O_{36.00}[F_{1.35}(OH)_{0.65}]_{\Sigma=2.00}$.

Occurrence: In a zoned microcline-calcite vein with aegirine-hedenbergite, quartz, and albite in a glacial moraine boulder. The region contains carbonatites and an alkaline massif.

Association: Miserite, baratovite, katayamalite, Zr and hydroxyl analogues of alexandrovite, fluorite, Sn-titanite, bazirite, pabstite, Sn-sogdianite, sugilite, turkestanite, fluorapatite.

Distribution: From the Darai-Pioz glacier, at the junction of the Turkestan, Zeravshan, and Alay Mountain Ranges, Tajikistan.

Name: Honors the Russian geochemist, geologist, and mineralogist Stanislav Mikhailovich Aleksandrov (b. 1932) for his contributions to the geology, geochemistry, and mineralogy of tin.

Type Material: A.E. Fersman Mineral Museum, Academy of Sciences, Moscow, Russia (3825/1).

(1) Santa Rosa Mine, Sijes, Salta Province, Argentina; electron microprobe analyses, H_2O from structure analysis and IR spectrum, corresponding to $Ca_{4.07}(H_2O)_4[B_{3.99}O_4(OH)_6]_4(H_2O)_{15}$.
(2) $Ca_4(H_2O)_4[B_4O_4(OH)_6]_4(H_2O)_{15}$.

Occurrence: A secondary mineral in a cavity in fractured mudstone in a playa-hosted borate deposit.

Association: Colemanite, hydroboracite, ulexite, inyoite, gypsum, anhydrite.

Distribution: Santa Rosa Mine, Sijes, Salta Province, Argentina.

Name: Honors Dr. Alfred Wilhelm Stelzner (1840–1895), first professor of geology at the University of Córdoba and founder of the Mineralogical Museum.

Type Material: Facultad de Ciencias Exactas Físicas y Naturales, Universidad Nacional de Córdoba, Argentina (catalog no. MS003266).

(1) Rancagua, Chile. (2) Champion mine, Michigan, USA. (3) Cu_6As.

Occurrence: Uncommon in hydrothermal deposits, intimately associated with other copper arsenides.

Association: Copper (typically arsenian), silver, domeykite, koutekite.

Distribution: In Chile, from the Algodones silver mine, near Coquimbo [TL], and the Cerro de las Seguas, Rancagua, O'Higgins Province. At Corocoro, Bolivia. In the Kokito II mine, Neuquén Province, Argentina. In the USA, in Michigan, from Keweenaw Co., at the Mohawk, Pewabic, Seneca, Ahmeek, and Champion mines, and at Painesdale, Houghton Co., also from Baraga Co.; in Colorado, from the Cashin mine, Montrose Co. At Långban, Värmland, Sweden. In France, from the Roua copper mines, about 50 km north of Nice, Alpes-Maritimes. At Tsumeb, Namibia. In the Talmessi mine, 35 km west of Anarak, Iran.

Name: For the Algodones mine, Chile.

(1) Taro Valley, Italy; by AA and XRF.

Polymorphism & Series: Talc-saponite mixed-layer mineral.

Mineral Group: Smectite group.

Occurrence: An alteration product in serpentinized ophiolites and residual in soils derived therefrom; in altered dolostones.

Association: Talc, chlorite, serpentine, calcite.

Distribution: In Italy, in Emilia-Romagna, at Monte Chiaro, Taro Valley; Frassinoro, Modena; and Ferriere, Nure Valley. From Kinshasa, Katanga Province, Congo (Shaba Province, Zaire).

Name: To honor Professor Andrea Alietti (1923–), of the University of Modena, Modena, Italy, who first studied the structure of the mineral.

Type Material: n.d.

(1) Långban, Sweden. (2) Franklin, New Jersey, USA; by electron microprobe, total Mn as MnO, H_2O calculated from stoichiometry. (3) $Mn_7(AsO_4)_2(OH)_8$.

Occurrence: As a rare secondary mineral in veinlets through metamorphosed manganese deposits (Sweden); in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA).

Association: Synadelphite, hematolite, hausmannite, pyrochroite, fluorite (Moss mine, Sweden); pyroaurite, leucophoenicite, hodgkinsonite, adelite, franklinite, willemite, friedelite, caryopilite, sphalerite, fluorite, barite, calcite, serpentine, chlorite (Franklin, New Jersey, USA).

Distribution: In Sweden, from the Moss and Brattfors mines, Nordmark, and at Långban, Värmland. From Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: From the Greek, *to change*, a reference to the strong pleochroism.

Y_2O_3	0.04	FeO	9.02	H_2O^-	0.10
La_2O_3	7.2	MnO	0.85	Total	100.37

(1) Luangwe Bridge area, Zambia; wet chemical and spectrographic analysis; $RE_2O_3 = Pr_2O_3$ 1.0%, Nd_2O_3 3.10%, Sm_2O_3 0.60%, Gd_2O_3 0.06%, Er_2O_3 0.02%. Analyses have been made of materials rich in La and Y but they are not otherwise described.

Mineral Group: Epidote group.

Occurrence: An accessory in some granites and granite pegmatites, syenites, more rarely in gabbroic pegmatites. Rarely in schists, gneisses, and some contact metamorphosed limestones; a clastic component of sediments.

Association: Epidote, muscovite, fluorite.

Distribution: Widespread; some localities affording good crystals or rich material follow. From Qáqarssuatsiaq, Alluk, south Greenland. At Ytterby and Finbo, Sweden. From Kragerö, Arendal, and on Hitterö Island, Flekkefjord, Norway. From Sillböle, Stansvik, and Vaarala, Finland. At Miass, Ilmen Mountains, Southern Ural Mountains, Russia. From the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. In the USA, at Pacoima Canyon, Los Angeles Co., California; in the Baringer Hill pegmatite, 26 km west of Burnet, and on the Rode Ranch, Llano Co., Texas. In Canada, from Olden Township, Frontenac Co., Quebec; in the McDonald mine, Hybla, Ontario; and at Hoidas Lake, near Nisikkatch Lake, Saskatchewan. From near Telixtlahuaca, Oaxaca, Mexico. In the Mary Kathleen mine, Queensland, and at Broken Hill, New South Wales, Australia. From Ribuae, Mozambique.

Name: For Thomas Allan (1777–1833), Scottish mineralogist who discovered the species.

Type Material: University of Copenhagen, Copenhagen, Denmark, 5, 6; The Natural History Museum, London, England, 94377.

(1) Cobalt, Canada; by electron microprobe, average of 15 analyses. (2) Wasserfall, France; by electron microprobe. (3) Ag_6Sb.

Occurrence: In high-grade Ag–Sb ores.

Association: Silver containing antimony and mercury, dyscrasite, breithauptite, domeykite, kutínaite, stephanite.

Distribution: In Canada, in Ontario, from the Hi-Ho mine, Cobalt [TL], and abundant in many mines of the Cobalt district; also in the Red Lake area. At the Calliope mine, Ouray district, Ouray Co., Colorado, USA. From the Consols and Junction mines, Broken Hill, New South Wales, and North Arm, Queensland, Australia. At Wasserfall, about 20 km northwest of Belfort, Haute-Saône, France. From Rejská, near Kutná Hora, and at Příbram, Czech Republic. In Germany, at Hartenstein, Saxony. From Hällefors, Bergslagen metallic province, Sweden. In the Aktepe district, near Tahkent, Uzbekistan.

Name: From the Greek for *another* and the Latin *argentum*, silver.

(1) Bald Knob, North Carolina, USA. (2) Do.; by electron microprobe; H_2O calculated from stoichiometry. (3) $Mn_5(SiO_4)_2(OH)_2$.

Polymorphism & Series: Dimorphous with ribbeite; forms a series with chondrodite.

Mineral Group: Humite group.

Occurrence: Hydrothermally deposited, in lenses in a manganese-bearing vein (Bald Knob, North Carolina, USA); in veins crosscutting franklinite ore near pegmatites in a metamorphosed stratiform Zn–Mn deposit (Franklin, New Jersey, USA).

Association: Spessartine, rhodonite, galaxite (Bald Knob, North Carolina, USA); kolicite, holdenite, magnussonite, adelite, kraisslite, chlorophoenicite, franklinite, willemite, barite, calcite (Sterling Hill, New Jersey, USA).

Distribution: In the USA, from Bald Knob, near Sparta, Alleghany Co., North Carolina; crystals from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Germolis prospect, Fiddleton, Amador Co., and at Alum Rock Park, Santa Clara Co., California; at Eureka, Hinsdale Co., and the Sunnyside mine, San Juan Co., Colorado. In the Benallt mine, Rhiw, Lleyn Peninsula, Wales. From Långban, and in the Brattfors mine, Nordmark, Värmland, Sweden. In the Hanawa mine, Iwate Prefecture; the Kaso mine, Tochigi Prefecture; the Taguchi mine, Shidara, Aichi Prefecture; and the Rito mine and Hamayokokawa mine, Nagano Prefecture, Japan. In Kyrgyzstan, on Inyl'chek Ridge, Tien Shan.

Name: For the occurrence in Alleghany Co., North Carolina, USA.

Type Material: n.d.

Alloclasite $(Co, Fe)AsS$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. Crystals are prismatic ‖ [010], to 5 mm, in columnar to radiating aggregates; commonly massive.

Physical Properties: *Cleavage:* Perfect on {101}, distinct on {010}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5 VHN = 818–940 (100 g load). D(meas.) = 5.91–5.95 D(calc.) = 6.188

Optical Properties: Opaque. *Color:* Steel-gray to silver-white. *Streak:* Nearly black. *Luster:* Bright metallic.
R_1–R_2: (400) 49.5–48.2, (420) 48.7–48.3, (440) 48.2–48.6, (460) 47.8–48.8, (480) 47.6–49.2, (500) 47.6–49.7, (520) 47.8–50.1, (540) 48.0–50.4, (560) 48.1–50.5, (580) 48.4–50.6, (600) 48.6–50.7, (620) 48.8–50.7, (640) 49.0–50.5, (660) 49.1–50.3, (680) 49.1–50.1, (700) 49.2–49.9

Cell Data: *Space Group:* $P2_1$. $a = 4.661$ $b = 5.602$ $c = 3.411$ $\beta = 90°2(5)'$ Z = 2

X-ray Powder Pattern: Oraviţa, Romania.
2.750 (100), 2.469 (90), 1.817 (70), 2.401 (50), 3.58 (30), 2.802 (30), 1.707 (30)

Chemistry:

S	19.9	20.9	20.7
Total	100.2	99.1	99.0

(1) Elizabeth mine, Romania; by electron microprobe, corresponding to $(Co_{0.76}Fe_{0.21}Ni_{0.03})_{\Sigma=1.00}As_{1.13}S_{1.11}$. (2) North Rhine-Westphalia, Germany; by electron microprobe, corresponding to $(Co_{0.71}Fe_{0.29})_{\Sigma=1.00}As_{1.08}S_{1.15}$. (3) Dogatani mine, Japan; by electron microprobe, corresponding to $(Co_{0.74}Fe_{0.26})_{\Sigma=1.00}As_{1.20}S_{1.23}$.

Polymorphism & Series: Dimorphous with glaucodot.

Occurrence: In calcite or quartz veins of apparently low-temperature, late-stage hydrothermal origin. Also in silicified, recrystallized metamorphic rock.

Association: Gold, silver, glaucodot, cobaltite, cobaltian arsenopyrite, emplectite, bismuthinite, sphalerite, calcite, quartz.

Distribution: In Romania, from Oraviţa (Oravicza)[TL], as in the Elizabeth mine. At Bieber, near Hanau, Hesse, Germany. From the San Juan de Plan mine, Gistain Valley, Huesca, Spain. In the Silverfields mine, Cobalt, and the Siscoe Metals mine, Miller Lake, Gowganda, Ontario, Canada. In the USA, in the Kibblehouse quarry, Perkiomenville, Montgomery Co., Pennsylvania. From Bou Azzer, Morocco. At the Scar Crag mine, Braithwaite, Cumbria, England. In the Lautaret Pass, Hautes-Alpes, France. From the Dogatani mine, [??Prefecture-ck Min Japan], Japan. In Australia, at Mount Isa, Queensland, and in the Moonta mines, Yorke Peninsula, South Australia.

Name: From the Greek for *other*, and *to break*, because its cleavage was believed to be different from marcasite, which it resembles.

Type Material: n.d.

Allophane $Al_2O_3 \cdot 1.3-2.0(SiO_2) \cdot 2.5-3.0(H_2O)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Amorphous (?). *Point Group:* n.d. Rarely observed as ring-shaped particles, with diameters of 50 Å, which in three dimensions may represent sections through hollow spherules or polyhedra. As hyaline crusts and masses; stalactites and flowstones.

Physical Properties: *Fracture:* Conchoidal to earthy. *Tenacity:* Brittle. Hardness = 3
D(meas.) = 2.75 D(calc.) = n.d.

Optical Properties: Translucent. *Color:* White, pale blue to sky-blue, green, brown.
Luster: Vitreous to earthy, waxy.
Optical Class: Isotropic. n = 1.468–1.512 (air-dried).

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

				Total	99.41	99.76	[99.84]

(1) Allentown, Lehigh Co., Pennsylvania, USA; CaO as $(Ca, Mg)CO_3$. (2) Iijima, Japan.
(3) Kanuma, Japan; original total given as 99.81%.

Occurrence: A weathering product of volcanic ash. In hydrothermally altered igneous rocks, from the breakdown of feldspars, and in hydrothermal veins, typically related to copper deposits. In sedimentary rocks, including chalk and coal beds.

Association: Quartz, cristobalite, imogolite, gibbsite, vermiculite, chrysocolla, "limonite".

Distribution: Of widespread occurrence. From Gräfenthal, near Saalfeld, Thuringia, and at Schneeberg and Schwarzenberg, Saxony, Germany. From Jáchymov (Joachimsthal), Czech Republic. In the Calabona mine, Alghero, and the Rosas mine, Sulsis, Sardinia, Italy. At Laurium, Greece. From near Woolwich, Kent, and Wheal Hamblyn, Devon, England. At the Chessy copper mine, near Lyons, Rhône, France. In the USA, from Bisbee, and the Maid of Sunshine mine, Gleeson, Cochise Co., Arizona; from Kelly, Socorro Co., New Mexico; at Cerro Gordo, Inyo Co., California; and at Friedensville, Lehigh Co. and Cornwall, Lebanon Co., Pennsylvania. In the Mbobo Mkulu Cave, Transvaal, South Africa. From Japan, in the Misotsuchi volcanic ash bed at Iijima, Nagano Prefecture, and the Kanumatsuchi bed at Kanuma, Tochigi Prefecture. At Mt. Shank, South Australia.

Name: From the Greek for *other* and *to appear*, referring to a change of appearance under the blowpipe.

Type Material: Mining Academy, Freiberg, Germany, 26104.

(1) Mt. Cavalluccio, Sacrofano caldera, Latium, Italy; electron microprobe analysis, water by Penfield method, CO_2 by selective sorption, anionic groups confirmed by IR, corresponding to $Na_{19.16}K_{6.21}Ca_{4.87}(Si_{25.26}Al_{22.74}O_{96})(SO_4)_{4.88}(CO_3)_{0.70}Cl_{0.46}(OH)_{0.76}\cdot 4.73H_2O$ (for Z = 1).
(2) $Na_5K_{1.5}Ca(Si_6Al_6O_{24})(SO_4)\cdot(OH)_{0.5}\cdot H_2O$ (for Z = 4).

Mineral Group: Cancrinite group.

Occurrence: Lining the walls of small miarolitic cavities in a sanidine-syenite volcanic bomb.

Association: Sanidine, biotite, andradite, apatite.

Distribution: Mt. Cavalluccio, Campagnano di Roma, Sacrofano caldera, Rome Province, Latium, Italy.

Name: Honors Roberto Allori (b. 1933), an amateur mineralogist who has studied the Latium region.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 3459/1.

Ce_2O_3	0.8	Cl	0.8
Nb_2O_5	3.9	H_2O	1.7
MnO	3.6	$-O = Cl_2$	0.2
CaO	8.6	Total	99.3

(1) Mt. Alluaiv, Russia; by electron microprobe, average of three grains, H_2O by coulometry; corresponding to $(Na_{17.47}Sr_{0.28}Ce_{0.14}K_{0.12}Ba_{0.11}La_{0.03})_{\Sigma=18.15}(Ca_{4.46}Mn_{1.47})_{\Sigma=5.93}(Ti_{2.18}Nb_{0.85}Zr_{0.05})_{\Sigma=3.08}Si_{25.82}O_{73.26}Cl_{0.66} \cdot 2.75H_2O$.

Occurrence: In ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Eudialyte, nepheline, sodalite, potassic feldspar, arfvedsonite, aegirine.

Distribution: On Mt. Alluaiv, in the Lovozero massif, Kola Peninsula, Russia.

Name: For its occurrence on Mt. Alluaiv, Kola Peninsula, Russia.

Type Material: Mining Museum, St. Petersburg Mining Institute, 1993/1–2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; The Natural History Museum, London, England, 1994,1.

Alluaudite $(Na, Ca)Mn^{2+}(Fe^{3+}, Mn^{2+}, Fe^{2+}, Mg)_2(PO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals platy to fibrous, to 1 cm; usually radiating fibrous, in nodular aggregates; granular, massive. *Twinning:* Polysynthetic, with $\{\bar{1}01\}$ as composition plane, seen in thin section.

Physical Properties: *Cleavage:* {010}, {110}, and $\{1\bar{1}0\}$, good. Hardness = 5–5.5 D(meas.) = 3.45 D(calc.) = 3.62

Optical Properties: Subtranslucent to opaque. *Color:* Dirty yellow to brownish yellow, grayish green; surficially dull greenish black, brownish black, black, when altered; yellow to yellow-green in transmitted light. *Streak:* Dirty yellow.
Optical Class: Biaxial (+). *Pleochroism:* X = pale olive-green, straw-yellow to greenish yellow; Z = pale olive-greenish to brownish yellow. *Dispersion:* $r > v$, moderate, crossed. *Absorption:* $Z \gg X$. $\alpha = 1.782(5)$ $\beta = 1.802(2)$ $\gamma = 1.835(1)$ 2V(meas.) = 79.2°

Cell Data: *Space Group:* $C2/c$. $a = 12.004(2)$ $b = 12.533(4)$ $c = 6.404(1)$ $\beta = 114°22(5)'$ Z = 4

X-ray Powder Pattern: Chanteloube, France.
2.73 (10), 6.36 (8), 3.51 (7), 2.74 (7), 3.08 (5), 5.52 (4), 2.53 (3)

(1) Buranga pegmatite, Rwanda; neglecting H_2O, corresponds to $(Na_{0.63}Mn^{2+}_{0.19}Ca_{0.12}Li_{0.03})_{\Sigma=0.97}(Mn^{2+}_{0.95}Mg_{0.05})_{\Sigma=1.00}(Fe^{3+}_{1.96}Mg_{0.04})_{\Sigma=2.00}(PO_4)_3$. (2) Rapid Creek, Canada; by electron microprobe, Fe^{2+}:Fe^{3+} from stoichiometry; corresponds to $(Na_{0.80}Ca_{0.18}Fe^{2+}_{0.02})_{\Sigma=1.00}Na_{0.50}(Mn^{2+}_{0.89}Fe^{2+}_{0.11})_{\Sigma=1.00}(Fe^{3+}_{0.84}Fe^{2+}_{0.48}Mg_{0.42}Al_{0.27})_{\Sigma=2.01}[(PO_4)_{2.96}F_{0.06}]_{\Sigma=3.02}$.

Polymorphism & Series: Forms a series with ferroalluaudite.

Mineral Group: Alluaudite group.

Occurrence: Very common in granite pegmatites, formed by sodium metasomatism of triphylite–lithiophilite, heterosite–purpurite, or ferrisicklerite; in phosphatic nodules in shales.

Association: Triphylite, arrojadite, satterlyite, wicksite, wolfeite, pyrite.

Distribution: Numerous occurrences: in the La Vilate quarry, near Chanteloube, Haute-Vienne, France. At Dolní Bory, near Velkého Meziříčí, Czech Republic. From the Varuträsk pegmatite, Västerbotten, Sweden. In England, at the Tremearne pegmatite, Breage, Cornwall. From the G.E. Smith mine, near Newport, Sullivan Co., New Hampshire; at many localities in the Black Hills, Pennington and Custer Cos., South Dakota, USA. From Rapid Creek, Yukon Territory, Canada. At Sidi-Bou-Othmane, Morocco. From the Buranga pegmatite, near Gatumba, Rwanda. In Zimbabwe, at Mterikati, Miami. In Namibia, at the Tsaobismund pegmatite, 60 km south of Karibib.

Name: Honoring François Alluaud, mining engineer of Limoges, France, who discovered the species.

(1) Falun, Sweden; corresponds to $(Fe^{2+}_{2.49}Mn_{0.14}Ca_{0.05})_{\Sigma=2.68}(Al_{1.94}Fe^{3+}_{0.05}Ti_{0.01})_{\Sigma=2.00}(Si_{2.99}Al_{0.01})_{\Sigma=3.00}O_{12}$. (2) $Fe_3Al_2(SiO_4)_3$.

Polymorphism & Series: Forms two series, with pyrope, and with spessartine.

Mineral Group: Garnet group.

Occurrence: The most common garnet, typically in mica schists and gneisses, from regionally metamorphosed argillaceous sediments and pelites; also in contact metamorphic hornfels. In granites and eclogites; in sedimentary rocks; as a detrital mineral.

Association: Biotite, cordierite, chlorite, staurolite, andalusite, kyanite, sillimanite, hematite, plagioclase, amphibole, pyroxene.

Distribution: Widespread. Some localities for fine crystals include: in the Zillertal, Tirol, Austria. At Falun, Sweden. In Norway, from near Bodø. From the Akhmatovsk deposit, near Zlatoust, Ural Mountains, Russia. In the USA, from Roxbury, Litchfield Co., and Southbury, New Haven Co., Connecticut; at Auburn, Androscoggin Co., and Topsham, Sagadahoc Co., Maine; from Westfield and Russell, Hampden Co., Massachusetts; and at Hanover, Grafton Co., New Hampshire. From Avondale, Chester Co., Pennsylvania; a large commercial deposit at the Barton mine, North Creek, Warren Co., New York; at Michigamme, Marquette Co., Michigan; from Salida, Chaffee Co., Colorado; and at Ft. Wrangell, Stikine River, Alaska. In Brazil, at Pernambuco, Bahia. From the Miami district, Zimbabwe. At Broken Hill and Thackaringa, New South Wales, and in the Harts Range, Northern Territory, Australia. From Yamanoo, Ibaragi Prefecture, and the Ishikawa district, Fukushima Prefecture, Japan.

Name: For Alabanda in Turkey, a cutting center in antiquity.

Alstonite $BaCa(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudo-orthorhombic. *Point Group:* $\overline{1}$ or 1. Steep pseudohexagonal dipyramids bounded by pseudohexagonal prisms, to 6 mm, striated strongly $\perp$ pseudohexagonal [0001] and commonly exhibiting a medial re-entrant $\parallel$ pseudohexagonal [0001]. *Twinning:* Common on pseudo-orthorhombic $\{1\overline{1}0\}$ and $\{310\}$, forming pseudohexagonal groups.

Physical Properties: *Cleavage:* On pseudo-orthorhombic $\{110\}$, imperfect. *Fracture:* Uneven. Hardness = 4–4.5 D(meas.) = 3.707(4) D(calc.) = 3.69 Fluoresces yellow under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to snow-white; also pale gray, pale cream, pink to pale rose-red, which may fade on exposure to light; colorless in transmitted light, showing six or twelve domains. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, weak. $\alpha = 1.526$ $\beta = 1.671$ $\gamma = 1.672$ 2V(meas.) = 6°

Cell Data: *Space Group:* $C\overline{1}$ or $C1$. $a = 30.14$ $b = 17.40$ $c = 6.12$ $\alpha = 90°$ $\beta = 90°$ $\gamma = 90°$ Z = 24

X-ray Powder Pattern: Alston, England; essentially identical to paralstonite. 3.55 (100), 2.507 (35), 2.050 (23), 1.941 (19), 1.846 (15), 2.835 (10), 1.589 (8)

Chemistry:

	(1)	(2)
CO_2	29.41	29.59
CaO	17.60	18.85
SrO	4.25	
BaO	48.54	51.56
Total	99.80	100.00

(1) Alston, England. (2) $CaBa(CO_3)_2$.

Polymorphism & Series: Trimorphous with barytocalcite and paralstonite.

Occurrence: Typically in low-temperature hydrothermal Pb–Zn deposits; rare in carbonatites.

Association: Calcite, barite, ankerite, siderite, benstonite, galena, sphalerite, pyrite, quartz.

Distribution: In England, from the Bromley Hill Pb–Zn mine, near Alston, Cumbria, in the Fallowfield lead mine, near Hexham, Northumberland, and at New Brancepeth, Durham. From Mine BK-3, Llantrisant, 10 km north of Cardiff, Wales. From the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. Found in the Tajno borehole, 70 km north of Bialystok, Poland. From the Garaoulère Zn–Pb orebody, Pierrefitte, Pyrénées, France. In the USA, at the Minerva No. 1 mine, Cave-in-Rock, Hardin Co., Illinois. From the Wittingham Coal Measures, Hunter Valley, New South Wales, Australia.

Name: For the original locality near Alston, England.

Type Material: Mining Academy, Freiberg, Germany, 15818.

Altaite PbTe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Rarely in very small cubes and octahedra; massive, as cleavages, to 1 cm; granular, myrmekitic in other sulfides.

Physical Properties: *Cleavage:* {001}, perfect. *Fracture:* Subconchoidal. *Tenacity:* Sectile. Hardness = 3 VHN = 47–53, 51 average. D(meas.) = 8.19 D(calc.) = 8.27

Optical Properties: Opaque. *Color:* Tin-white with yellowish tint, tarnishes bronze; in polished section, white with a delicate greenish hue. *Luster:* Metallic.
R: (400) 59.6, (420) 62.6, (440) 65.2, (460) 67.5, (480) 69.3, (500) 70.6, (520) 71.2, (540) 71.1, (560) 70.1, (580) 68.7, (600) 66.8, (620) 65.1, (640) 63.4, (660) 61.9, (680) 60.6, (700) 59.4

Bi		0.2	
Te	38.48	37.2	38.09
Total	100.00	100.2	100.00

(1) Red Cloud mine, Colorado, USA. (2) Campbell mine, Bisbee, Arizona, USA; by electron microprobe. (3) PbTe.

Occurrence: Typically in hydrothermal vein Au–Te-bearing deposits.

Association: Gold, silver, antimony, tellurium, tellurantimony, galena, pyrite, hessite, nagyágite, tetrahedrite, sylvanite, petzite, calaverite, arsenopyrite, sphalerite, chalcopyrite, jamesonite, boulangerite, bournonite, aguilarite, pyrrhotite, siderite, cerussite, quartz.

Distribution: Occurrences are too numerous to fully list. Selected localities are: in the Zavodinskii mine, near Ziryanovsk, Altai Mountains, Kazakhstan [TL], hundreds of kg. At the Bereznyakov gold deposit, Southern Ural Mountains, Russia. From Săcărîmb (Nagyág), Romania. At Kalgoorlie, Western Australia. In the Fiji Islands, in the Tuvatu Au–Ag–Te deposit, Viti Levu. From the Bulawan deposit, Negros Occidental, Phillipines. At several mines in the Kirkland Lake area, Ontario, Canada. In the USA, in the Foote mine, Kings Mountain, Cleveland Co., North Carolina; the Red Cloud mine, Gold Hill, Boulder Co., Colorado; the Mayflower mine, Tobacco Root Mountains, Madison Co., Montana; the Hilltop mine, near Las Cruces, Doña Ana Co., New Mexico; the Stanislaus mine, Carson Hill district, Calaveras Co., California; and the Minnamax Cu–Ni–sulfide deposit, Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota. From the San Francisco mine, 145 km north of Hermosillo, Sonora, Mexico.

Name: After the locality in the Altai Mountains, Kazakhstan.

(1) Tingelstadtjern quarry, Norway. (2) Do.; recalculated after deduction of apatite and excluding minor constituents; then corresponding to $Mg_{2.00}(PO_4)_{1.00}[(OH)_{0.37}F_{0.25}O_{0.19}]_{\Sigma=0.81}$. (3) Overntjern quarry, Norway; by electron microprobe, total Fe as FeO.

Polymorphism & Series: Dimorphous with holtedahlite.

Occurrence: In serpentine–magnesite deposits (Norway).

Association: Apatite, magnetite, xenotime, holtedahlite, szaibelyite, talc, magnesite (Tingelstadtjern quarry, Norway); apatite, enstatite, talc, magnesite (Overntjern quarry, Norway); fluorapatite, wolfeite, topaz, muscovite, sphalerite, quartz, chalcopyrite, pyrrhotite, siderite, arsenopyrite, chlorite, vivianite, panasqueiraite, thadeuite (Panasqueira, Portugal).

Distribution: From the Tingelstadtjern and Overntjern quarries, Modum, Norway. In the Panasqueira Sn–W deposit, Portugal.

Name: To honor Professor Egon Althaus (1933–), Karlsruhe University, Karlsruhe, Germany.

Type Material: Mineralogical-Geological Museum, Oslo University, Oslo, Norway, 22044, 22045.

Althupite $ThAl(UO_2)_7O_2(PO_4)_4(OH)_5 \cdot 15H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As thin tabular crystals, flattened on {100} and terminated by {011} and {021}, to 0.1 mm, and in parallel groups.

Physical Properties: Hardness = n.d. D(meas.) = 3.9(1) D(calc.) = 3.98 Radioactive.

Optical Properties: Transparent. *Color:* Yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = very pale yellow; $Y = Z$ = darker yellow.
Orientation: $X \simeq a$; $Z \wedge c = 15°$. *Dispersion:* $r < v$, strong. $\alpha = 1.620(3)$ $\beta = 1.661(2)$ $\gamma = 1.665(2)$ 2V(meas.) = 31(3)° 2V(calc.) = 34°

Cell Data: *Space Group:* $P\overline{1}$. $a = 10.953(3)$ $b = 18.567(4)$ $c = 13.504(3)$ $\alpha = 72.64(2)°$ $\beta = 68.20(2)°$ $\gamma = 84.21(2)°$ Z = 2

X-ray Powder Pattern: Kobokobo pegmatite, Congo.
10.2 (100), 5.09 (70), 5.80 (50), 4.41 (50), 2.896 (50), 6.67 (40), 4.91 (40)

Chemistry:

	(1)	(2)

H_2O	[9.92]	10.81
Total	[100.00]	100.00

(1) Kobokobo pegmatite, Congo; by electron microprobe, average of 10 analyses, H_2O by difference; corresponds to $Th_{1.16}Al_{0.88}(UO_2)_{7.12}O_2(P_{1.07}O_4)_4(OH)_5 \cdot 15H_2O$.
(2) $ThAl(UO_2)_7O_2(PO_4)_4(OH)_5 \cdot 15H_2O$.

Occurrence: A secondary mineral in the uraniferous zone of an altered granite pegmatite.

Association: Beryl, columbite, ranunculite, upalite, phuralumite, threadgoldite, mundite, triangulite, meta-autunite.

Distribution: At the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire).

Name: For the major cations in the composition, ALuminum, THorium, Uranium, Phosphorus.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG6178.

Aluminite $Al_2(SO_4)(OH)_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As needles and fibers, to 0.1 mm, commonly in reniform, nodular, or spherulitic masses, and as veinlets.

Physical Properties: *Fracture:* Earthy, in aggregates. *Tenacity:* Friable. Hardness = 1–2 D(meas.) = 1.66–1.82 D(calc.) = 1.794

Optical Properties: Translucent, opaque if massive. *Color:* White to grayish white; colorless in transmitted light. *Luster:* Dull to earthy.
Optical Class: Biaxial (+). *Orientation:* X = elongation. $\alpha = 1.459–1.460$ $\beta = 1.464$ $\gamma = 1.470$ 2V(meas.) = $\sim 90°$

Cell Data: *Space Group:* $P2_1/c$. $a = 7.440(1)$ $b = 15.583(2)$ $c = 11.700(2)$ $\beta = 110.18(2)°$ Z = 4

X-ray Powder Pattern: Gánt, Hungary.
7.93 (100), 9.01 (90), 3.7224 (72), 4.760 (71), 3.7419 (70), 5.033 (63), 4.868 (63)

Chemistry:

(1) Newhaven, England; recalculated to 100% after deduction of a small amount of gypsum.
(2) $Al_2(SO_4)(OH)_4 \cdot 7H_2O$.

Occurrence: Typically in clays or lignites, formed by the reaction of sulfate-bearing solutions from the decomposition of marcasite or pyrite at moderate temperatures with aluminous silicates; as a volcanic sublimate; in sulfur deposits; rarely in caves.

Association: Basaluminite, gibbsite, epsomite, gypsum, celestine, dolomite, goethite.

Distribution: In Germany, from Morl, near Halle, Saxony-Anhalt. In the Czech Republic, at Milevsko (Mühlhausen), near Kralupy, Kuchelbad, Miletic, and Velvary. From Gánt, Vértes Mountains, and at Nagyegyháza, Hungary. In France, at Mont Vernon, near Épernay, Marne, and in the Auteuil district, Paris. At Newhaven, Sussex, England. On Vesuvius, Campania, Italy. In Ukraine, from the Beregovo district, near Mukachevo; in the Rozdol deposit; and at the Gornostayevka sulfur prospect, Kerch Peninsula. In Russia, at Vodino, near Samara, and on Mount Sokolovaya, near Saratov. Found near Zaglik, Azerbaijan. In the Mbobo Mkulu Cave, near Ngodwana, Transvaal, South Africa. Found in the Salt Range, Punjab, India. In the USA, from Joplin, Jasper Co., Missouri; in the Green River Formation, Emery Co., Utah; at Creston, southwest of Rawlins, Carbon Co., Wyoming; in Cottonwood Cave, Guadalupe Mountains, Eddy Co., New Mexico.

(1) Tolbachik volcano, Russia; by electron microprobe. (2) Getang, China; by electron microprobe.

Occurrence: In a gabbro-dolerite massif (Billeekh intrusion, Russia); in aluminum-rich rocks; in high-temperature hydrothermal Sn–W deposits and their alteration zones; in volcanic ash.

Association: Cu, Zn, Sn, Pb, Cd, Fe, Sb, moissanite (Billeekh intrusive, Russia); magnetite, ilmenite, hematite, pyrite, iron (Tolbachik volcano, Russia); Cu, S, jarosite (Getang, China).

Distribution: In Russia, in Siberia, from the Billeekh [TL], Tsepochechnyi, and Ust-Khann'ya intrusives, Vilyui River Basin; in the Nizhefokinskii intrusion, Norilsk district; from the Ukachilkan tin deposit, northeastern Sakha; and at the Tolbachik fissure volcano, Kamchatka Peninsula. In a mud volcano on Bulla Island, Caspian Sea. At Kyzylcheku, Karamazar, Tajikistan. From Getang, Guizhou Province, and in the Lianhuashan tungsten deposit, Guangdong Province, China.

Name: Named *aluminum* by Humphry Davy, who discovered the element.

Type Material: Geological Museum, Academy of Sciences, Yakutsk, Russia.

(1) 1-B mine, Canada; calculated from original elemental analysis, H_2O by difference; corresponds to $(Al_{0.70}Fe^{2+}_{0.18}Mg_{0.09}Na_{0.06}Mn_{0.01}Ca_{0.01})_{\Sigma=1.05}(Fe^{3+}_{3.95}Al_{0.05})_{\Sigma=4.00}(SO_4)_{6.24}(OH)_{2.26} \cdot 18.79H_2O$.
(2) Forty Mile River, Alaska, USA; original total given as 99.69%, corresponds to $(Mg_{0.59}Al_{0.32}Fe^{2+}_{0.03}Co_{0.03}Cu_{0.01})_{\Sigma=0.98}(Fe^{3+}_{3.57}Al_{0.43})_{\Sigma=4.00}(SO_4)_{6.02}(OH)_{2.22} \cdot 19.67H_2O$.
(3) $Al_{2/3}Fe^{3+}_4(SO_4)_6(OH)_2 \cdot 20H_2O$.

Mineral Group: Copiapite group.

Occurrence: A secondary mineral typically formed by the oxidation of pyrite in shales and coal; may be a fumarolic reaction product.

Association: Pyrite.

Distribution: In the USA, from "Temple Rock", [probably the Temple Mountain district, Emery Co.,] Utah; at Island Mountain, Trinity Co., and the Champion mine, White Mountains, Mono Co., California; in the Coeur d'Alene mine, Central City district, Gilpin Co., Colorado; from the Mosquito Fork of the Forty Mile River, Eagle A-3 quadrangle, Alaska. In the 1-B mine and the Emery seam at Glace Bay, Sydney Coalfield, Cape Breton, Nova Scotia, Canada. At Cerritos Bayos, southwest of Calama, Antofagasta, Chile. In Italy, from the Cetine mine, 20 km southwest of Siena, Tuscany, and at the Grotto de Faraglione, Port de Levante, Vulcano, Lipari Islands. In the Dolcoath mine, Camborne, Cornwall, England. From Morl, near Halle, Saxony-Anhalt, Germany.

Name: For its content of *aluminum* and relation to the *copiapite* group.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93834, 103544.

Aluminocoquimbite $AlFe(SO_4)_3 \cdot 9H_2O$

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\,2/m$. As intergrown tabular or short hexagonal prismatic crystals, to 0.5 mm.

Physical Properties: *Cleavage:* Imperfect, {101}. *Fracture:* n.d. Hardness = n.d. D(meas.) = 2.03(1) D(calc.) = 2.044

Optical Properties: Transparent. *Color:* Colorless to pale pink. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.53$ $\varepsilon = 1.56$

Cell Data: *Space Group:* $P\bar{3}\,1\,2/c$. $a = 10.7065(7)$ $c = 17.3077$ $Z = 4$

X-ray Powder Pattern: Aeolian Islands (Vulcano), Italy.
9.251 (100), 5.310 (83), 3.152 (43), 4.087 (33), 1.765 (20), 2.112 (17), 8.710 (13)

Chemistry:

	(1)
Fe_2O_3	13.96
Al_2O_3	10.30
SO_3	44.24
H_2O	[31.50]
Total	100.00

(1) Aeolian Islands (Vulcano), Italy; electron microprobe analysis, H_2O by difference, corresponding to $Al_{1.07}Fe_{0.92}S_{2.92}H_{18.49}O_{21}$.

Occurrence: A precipitate from volcanic vapors in a fumarole (< 100° C).

Association: Alunogen, coquimbite, krausite, tamarugite, yavapaiite, voltaite, pertlikite, pickeringite, metavoltine.

Distribution: Alum Grotto, Aeolian Islands (Vulcano), Italy.

Name: For its high *aluminum* content and relation to *coquimbite*.

Type Material: Department of Structural Chemistry and Inorganic Sterochemistry, University of Milan, Italy (2009-03).

Mineral., 98, 279 (abs. ref. 1).

Aluminum Al

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Typically granular massive, may be platy or scaly, to 1 mm.

Physical Properties: *Tenacity:* Malleable. Hardness = 2–3 D(meas.) = 2.707 D(calc.) = 2.697

Optical Properties: Opaque. *Color:* Grayish white. *Luster:* Metallic.
Optical Class: Isotropic.
R: n.d.

Cell Data: *Space Group:* $Fm3m$ (synthetic). $a = 4.0494$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.338 (100), 2.024 (47), 1.221 (24), 1.431 (22), 0.9289 (8), 0.9055 (8), 0.8266 (8)

Al	99.99 – 100.0	97.81
Total		

(1) Tolbachik volcano, Russia; by electron microprobe. (2) Getang, China; by electron microprobe.

Occurrence: In a gabbro-dolerite massif (Billeekh intrusion, Russia); in aluminum-rich rocks; in high-temperature hydrothermal Sn–W deposits and their alteration zones; in volcanic ash.

Association: Cu, Zn, Sn, Pb, Cd, Fe, Sb, moissanite (Billeekh intrusive, Russia); magnetite, ilmenite, hematite, pyrite, iron (Tolbachik volcano, Russia); Cu, S, jarosite (Getang, China).

Distribution: In Russia, in Siberia, from the Billeekh [TL], Tsepochechnyi, and Ust-Khann'ya intrusives, Vilyui River Basin; in the Nizhefokinskii intrusion, Norilsk district; from the Ukachilkan tin deposit, northeastern Sakha; and at the Tolbachik fissure volcano, Kamchatka Peninsula. In a mud volcano on Bulla Island, Caspian Sea. At Kyzylcheku, Karamazar, Tajikistan. From Getang, Guizhou Province, and in the Lianhuashan tungsten deposit, Guangdong Province, China.

Name: Named *aluminum* by Humphry Davy, who discovered the element.

Type Material: Geological Museum, Academy of Sciences, Yakutsk, Russia.

Alumoåkermanite $(Ca,Na)_2(Al,Mg,Fe^{2+})(Si_2O_7)$

Crystal Data: Tetragonal. *Point Group*: $\bar{4}\,2m$. Crystals, tabular, to 1.5 mm.

Physical Properties: *Cleavage*: none discernable. *Fracture*: Uneven.
Tenacity: Brittle. Hardness = 4.5-5 D(meas.) = 2.96(2) D(calc.) = 3.00

Optical Properties: Transparent. *Color*: Light brown. *Streak*: White. *Luster*: Vitreous.
Optical Class: Uniaxial (-). ω = 1.635(1) ε = 1.626(1)

Cell Data: *Space Group*: $P\bar{4}\,2_1m$. a = 7.7620(7) c = 5.0311(5) Z = 2

X-ray Powder Pattern: Oldoinyo Lengai volcano, northern Tanzania.
2.859 (100), 2.4563 (32), 3.075 (25), 1.7569 (19), 1.8303 (13) 1.7364 (13), 1.3859 (13)

Chemistry:

	(1)
SiO_2	43.73
TiO_2	0.09
Al_2O_3	8.32
Fe_2O_3	2.14
FeO	4.55
MnO	0.22
MgO	4.36
CaO	30.24
SrO	0.91
Na_2O	5.70
K_2O	0.10
Total	100.36

(1) Oldoinyo Lengai volcano, northern Tanzania; average of 8 electron microprobe analyses, corresponding to $(Ca_{1.48}Na_{0.50}Sr_{0.02}K_{0.01})_{\Sigma=2.01}(Al_{0.44}Mg_{0.30}Fe^{2+}_{0.17}Fe^{3+}_{0.07}Mn_{0.01})_{\Sigma=0.99}(Si_{1.99}Al_{0.01}O_7)$.

Mineral Group: Melilite group.

Occurrence: As phenocrysts in olivine-free melilite-nephelinitic ashes and lapilli-tuffs produced by a carbonatite volcano.

Association: Nepheline, aegirine-augite.

Distribution: From Oldoinyo Lengai volcano, northern Tanzania.

Name: For its composition and relationship to other members of the melilite group.

Type Material: Mineralogical Museum, Department of Mineralogy, St. Petersburg State University, St. Petersburg, Russia (OL218, catalog no. 1/19407); the Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (OL244, catalog no. 3823/1).

Alumohydrocalcite $CaAl_2(CO_3)_2(OH)_4 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As fibers and needles, to 2.5 mm; commonly in radial aggregates and spherulites, feltlike crystal linings, and powdery to chalky masses.

Physical Properties: *Cleavage:* {100} perfect; {010} imperfect. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.21–2.24 D(calc.) = 2.213 Decomposes in boiling H_2O to calcite and hydrous aluminum oxide.

Optical Properties: Transparent to opaque. *Color:* Chalky white to pale blue, pale yellow, cream, gray; pale rose or brownish pink to dark violet in chromian varieties; colorless in transmitted light. *Luster:* Vitreous to pearly, earthy.
Optical Class: Biaxial (–). *Orientation:* $X = b$; extinction inclined 6°–10°. α = 1.485–1.502 β = 1.553–1.563 γ = 1.570–1.585 2V(meas.) = 64° 2V(calc.) = 50°–55°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$ (chromian). $a = 6.498(3)$ $b = 14.457(4)$ $c = 5.678(3)$ $\alpha = 95.83(5)°$ $\beta = 93.23(3)°$ $\gamma = 82.24(3)°$ Z = 2

X-ray Powder Pattern: Bergisch-Gladbach, Germany.
6.25 (100), 6.50 (70), 3.23 (60), 2.039 (50), 2.519 (40), 7.21 (30), 2.860 (30)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
CO_2	24.2	26.4	26.19	CaO	17.8	16.5	16.68
Al_2O_3	31.3	22.0	30.33	H_2O	26.7	26.6	26.80
Cr_2O_3		8.3		Total	100.0	99.8	100.00

(1) Bergisch-Gladbach, Germany; $(CO_3)^{2-}$, $(OH)^{1-}$, and H_2O confirmed by IR. (2) Mount Hamilton area, California, USA; chromian, CO_2 by Leco carbon analyzer, H_2O by CEC moisture analyzer; corresponds to $Ca_{1.00}(Al_{1.57}Cr_{0.43})_{\Sigma=2.00}(CO_3)_2(OH)_4 \cdot 3H_2O$.
(3) $CaAl_2(CO_3)_2(OH)_4 \cdot 3H_2O$.

Occurrence: Formed at low temperature by the action of carbonated waters on allophane or dickite in dolomites and limestones; chromian varieties are typically formed near altering chromite from serpentinites.

Association: Allophane, dickite, gibbsite, gypsum, aragonite, barite, Fe–Mn oxides.

Distribution: From a Cu–V orebody near Potekhina village, 40 km northeast of Sorsk, Khakassia district, Siberia, Russia. In Germany, in a dolomite quarry near Bergisch-Gladbach, from the Kalem quarry, near Birresborn, Eifel, and at Ramsbeck, North Rhine-Westphalia. Near Ladomirov, Slovakia. From Bicske-Csordakút, Hungary. In England, at Scarborough, North Yorkshire; Weston Favell, Northamptonshire; and in the Woodleaze quarry, Tytherington, Avon. At Montcada, Barcelona Province, Spain. From Chitral, North-West Frontier Province, Pakistan. Chromian varieties occur at: the Ruben mine, Kohlendorf, Nowa Ruda (Neurode), Silesia, Poland. In the Akenobe mine, Hyogo Prefecture, Japan. From east of Mount Hamilton, Santa Clara Co., California, USA. Several other poorly defined localities are known.

Name: From *aluminum*; water, *hydro*; and calcium carbonate, *calcite*, in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 77088.

Alumotungstite $(W, Al)(O, OH)_3(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; may be rhombohedral, pseudocubic. *Point Group:* $4/m\ \bar{3}\ 2/m$ (probable). As octahedra, to 250 μm, may be flattened with a hexagonal outline, and as rounded groups of octahedra; zoned with a separable outer shell. In microcrystalline patches; intimately intergrown with yttrotungstite or ferritungstite. *Twinning:* Interpenetrant octahedra may represent twins on {111}.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = [4.52]

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Isotropic; commonly weakly anisotropic. $n = 1.935(5)$; birefringence 0.02.

Cell Data: *Space Group:* $Fd3m$ (probable). $a = 10.20$ $Z = 16$

X-ray Powder Pattern: Kramat Pulai mine, Malaysia; some lines are finely split; may be confused with ferritungstite, with which it is commonly intergrown.
5.86 (vvs), 3.07 (vs), 2.93 (vs), 1.80 (s), 1.96 (ms), 1.72 (ms), 1.54 (ms)

Chemistry:

	(1)
WO_3	88.0
SiO_2	0.24
Al_2O_3	8.3
Fe_2O_3	0.06
CaO	0.77
Total	[97.4]

(1) Kramat Pulai mine, Malaysia; by electron microprobe, here calculated to oxides from original analysis W 69.8%, Al 4.4%, Si 0.11%, Fe 0.04%, Ca 0.55%, K trace, Y not detected.

Occurrence: In fine-grained aggregates of yttrotungstite (Kramat Pulai mine, Perak, Malaysia); lining cavities relict after ferberite, which has replaced scheelite, in fine-grained graphitic schists and contained quartz veins (Uganda and Rwanda).

Association: Yttrotungstite (Kramat Pulai mine, Malaysia); ferritungstite, cerotungstite, anthoinite, ferberite (Uganda and Rwanda).

Distribution: At the Kramat Pulai mine, Kinta district, Perak, Malaysia. From the Nyamulilo and Kirwa mines, Kigezi district, Uganda. At Gifurwe, Rwanda.

Name: For its ALUMinum content, by analogy to ferriTUNGSTITE.

Type Material: The Natural History Museum, London, England, 1927,1157.

References: (1) Davis, R.J. and G.W. Smith (1971) Yttrotungstite. Mineral. Mag., 38, 261–285. (2) Davis, R.J., J.G. Francis, and S.J.B. Reed [alumotungstite]. In: M. Fleischer (1977) U.S. Geol. Surv. Alunite $KAl_3(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$ or $3m$. Crystals typically pseudocubic $\{01\overline{1}2\}$ or tabular $\{0001\}$ with flat vicinal rhombohedra, to 1 cm; fibrous to columnar, porcelaneous, commonly granular to dense massive.

Physical Properties: *Cleavage:* On $\{0001\}$, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.6–2.9 D(calc.) = 2.82 Strongly pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless if pure; may be white, pale shades of gray, yellow, red, to reddish brown. *Streak:* White. *Luster:* Vitreous, somewhat pearly on $\{0001\}$.
Optical Class: Uniaxial (+). $\omega = 1.572$ $\epsilon = 1.592$

Cell Data: *Space Group:* $R\overline{3}m$ or $R3m$ (synthetic). $a = 6.981(1)$ $c = 17.331(4)$ Z = 3

X-ray Powder Pattern: Marysvale, Utah, USA.
2.89 (100), 2.99 (94), 2.293 (76), 1.926 (66), 4.96 (50), 1.503 (34), 5.77 (26)

Chemistry:

	(1)	(2)
SO_3	38.34	38.66
P_2O_5	0.58	
SiO_2	0.22	
Al_2O_3	37.18	36.92
Na_2O	0.33	
K_2O	10.46	11.37
H_2O	12.99	13.05
Total	100.10	100.00

(1) Marysvale, Utah, USA. (2) $KAl_3(SO_4)_2(OH)_6$.

Polymorphism & Series: Forms a series with natroalunite.

Mineral Group: Alunite group.

Occurrence: Formed between 15 °C and 400 °C by the action of sulfate, which may be generated from pyrite or solfataric action, on aluminous rocks, commonly accompanied by kaolinitization and silicification.

Association: Kaolinite, halloysite, diaspore, pyrite, gypsum, quartz.

Distribution: Many localities, some with deposits of immense size. From Tolfa, 14 km east-northeast of Civitavecchia, Lazio, Italy. At Mukacheve (Muzijeva) and from Beregavo, near Mukachevo, Ukraine. At Rodalquilar, Almeria Province, Spain. From Décazeville, Aveyron, France. In the USA, in a very large deposit near Marysvale, Ohio district, Piute Co., Utah; in Colorado, at South River, Mineral Co., Red Mountain, Hinsdale Co., in the Rosita Hills, Custer Co., and approximately 100 million t in the Calico Peak porphyry, Rico district, Dolores Co.; at Meiklejohn Mountain, near Beatty, Nye Co., Nevada; in Lassen Volcanic National Park, Shasta Co., California. From Hickory's Pond, near Placentia Bay, Newfoundland, Canada. At Hilton, Bernborough, and other localities in the Mount Isa district, Queensland; from Bullah Delah, New South Wales, Australia.

Name: A contraction of the earlier name *aluminilite*.

Alunogen $Al_2(SO_4)_3 \cdot 17H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals rare, as thin plates or prismatic [001] or {010} with a six-sided outline about [010], very complex, with about 60 forms noted. Commonly fibrous, to 5 mm, forming delicate masses, crusts, and efflorescences. *Twinning:* On {010}.

Physical Properties: *Cleavage:* {010}, perfect; probable on {100} and {$\overline{3}13$}.
Hardness = 1.5–2 D(meas.) = 1.72–1.77 D(calc.) = 1.79 Soluble in H_2O; taste alumlike, acid and sharp.

Optical Properties: Transparent. *Color:* Colorless in crystals, aggregates white, or pale yellow or red from impurities; colorless in transmitted light. *Luster:* Vitreous to silky.
Optical Class: Biaxial (+). *Orientation:* $X \simeq b$; $Z \wedge c = 42°$. α = 1.459–1.475
β = 1.461–1.478 γ = 1.470–1.485 2V(meas.) = 31°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.420(6)$ $b = 26.97(2)$ $c = 6.062(5)$ $\alpha = 89°57(5)'$
$\beta = 97°34(5)'$ $\gamma = 91°53(5)'$ Z = 2

X-ray Powder Pattern: Nová Baňa, Slovakia.
4.489 (100), 4.390 (81), 3.969 (81), 4.329 (76), 13.46 (54), 3.897 (52), 3.675 (45)

Chemistry:

	(1)	(2)
SO_3	37.74	37.04
Al_2O_3	16.59	15.73
H_2O	44.64	47.23
insol.	0.94	
Total	99.91	100.00

(1) Pintado Canyon, Guadalupe Co., New Mexico, USA. (2) $Al_2(SO_4)_3 \cdot 17H_2O$.

Occurrence: Forms by reaction of sulfates from decomposing sulfides with aluminous minerals in shales and slates; in gossan or altered wall rock of pyritic deposits in arid regions; in coal seams; in relatively low-temperature fumaroles.

Association: Pyrite, marcasite, halotrichite, pickeringite, epsomite, alum, melanterite, gypsum.

Distribution: Many localities, at some in large amounts. From near Nová Baňa (Königsberg), Slovakia. In Italy, on Vesuvius, and from Solfatara di Pozzuoli, Campi Flegrei, and at Miseno, near Naples, Campania; on Vulcano, Lipari Islands. In France, at Sain-Bel, Rhône; in coal at Ronchamp, Haute-Saône. At Libros, near Teruel, Teruel Province, Spain. From the Stamm Asser mine, near Schwartzenberg, and at Bräunsdorf, near Freiberg, Saxony, Germany. From the Avacha and other volcanoes, Kamchatka Peninsula, Russia. In Chile, at Francisco de Vergara, Antofagasta, and from Cerros Pintados, near Iquique, Tarapacá. On Mount Pelée, Martinique. In the USA, abundant at Smoky Mountain, Jackson Co., North Carolina; at Alum Cave Bluff, Sevier Co., Tennessee; extensive deposits in the Alum Mountain district, Grant Co., New Mexico; at The Geysers, Sonoma Co., California; good crystals from the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah; from the Mount St. Augustine volcano, Alaska. In Canada near Vernon, British Columbia; and Scotia mine, Cumberland Co., Nova Scotia. At geothermal areas of Tengchong, Yunnan Province, China. Found in the Heritage Range, Ellsworth Mountains, Antarctica. From near Joadja, New South Wales, Australia.

Name: From the Latin for *alum* and the Greek for *to make*.

Alvanite $(Zn, Ni)Al_4(VO_3)_2(OH)_{12}\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In hexagonal platelets, micalike, with forms {001}, {010}, {100}, and {101}. *Twinning:* Polysynthetic, ∥ {010}.

Physical Properties: *Cleavage:* Perfect on {010}. Hardness = 3–3.5 D(meas.) = 2.49 D(calc.) = 2.492

Optical Properties: Semitransparent. *Color:* Pale bluish green to bluish black. *Streak:* White. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (–). *Orientation:* $X \wedge \{010\} = 14°$. *Dispersion:* $r < v$, strong. $\alpha = 1.658$ $\beta =$ n.d. $\gamma = 1.714$ 2V(meas.) = 80°–85°

Cell Data: *Space Group:* $P2_1/n$. $a = 17.808(8)$ $b = 5.132(3)$ $c = 8.881(4)$ $\beta = 92.11(3)°$ Z = 2

X-ray Powder Pattern: Kazakhstan.
4.46 (100), 8.91 (90), 7.85 (80), 5.02 (50), 1.973 (40), 3.287 (35), 2.957 (35)

Chemistry:

FeO		0.3	H_2O		[26.2]
			Total	99.4	[100.0]

(1) Kazakhstan; several values are averages of two determinations. (2) Do.; by electron microprobe, H_2O by difference; corresponding to $(Zn_{0.57}Ni_{0.34}Fe_{0.02})_{\Sigma=0.93}Al_{4.09}V_{1.84}O_{20.50}H_{17.69}$.

Occurrence: In the oxidation zone of a vanadiferous clay-anthraxolite horizon.

Association: Mica, roscoelite (?).

Distribution: In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan.

Name: For ALuminum and VANadium in the composition.

Type Material: Mining Institute, St. Petersburg, 1249/2; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 65614.

Amakinite $(Fe^{2+}, Mg)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$ $2/m$, $3m$, or 32. Rhombohedra $\{10\overline{1}1\}$ modified by $\{10\overline{1}2\}$, $\{10\overline{1}4\}$, $\{11\overline{2}3\}$, $\{20\overline{2}5\}$, $\{0001\}$, to 2 cm; typically in irregular grains.

Physical Properties: *Cleavage:* Poor, observed in some grains. *Fracture:* Irregular. Hardness = 3.5–4 D(meas.) = 2.925–2.98 D(calc.) = [2.74] Weakly magnetic.

Optical Properties: Semitransparent. *Color:* Pale green to yellow-green; rapidly turns brown when exposed to air, due to formation of $Fe(OH)_3$.
Optical Class: Uniaxial (+). $\omega = 1.707(2)$ $\epsilon = 1.722(2)$

Cell Data: *Space Group:* $R\overline{3}m$, $R3m$, or $R32$. $a = 6.917(3)$ $c = 14.52(1)$ $Z = 12$

X-ray Powder Pattern: Lucky Eastern pipe, Russia.
2.30 (10), 1.728 (9), 2.80 (8), 1.530 (8), 5.49 (7), 1.551 (7), 1.386 (7)

Chemistry:

	(1)	(2)
SiO_2	0.43	
TiO_2	0.00	
Al_2O_3	0.32	2.50
Fe_2O_3	31.58	
Cr_2O_3	0.00	
FeO	30.40	55.84
MnO	3.63	2.94
MgO	10.10	11.60
CaO	trace	
H_2O^+	23.04	26.13
H_2O^-	0.09	0.49
CO_2	0.32	
Total	99.91	99.50

(1) Lucky Eastern pipe, Russia; corresponds to $(Fe_{0.73}Mg_{0.22}Mn_{0.05})_{\Sigma=1.00}(OH)_2$. (2) Do.

Mineral Group: Brucite group.

Occurrence: Noted in drill core, in thin veins and pockets in kimberlite.

Association: Serpentine, carbonate.

Distribution: In the Udachnaya-Vostochnaya kimberlite pipe, Daldyn-Alakit region, western Sakha, Russia.

Name: For the Amakin Expedition, which prospected the Sakhan diamond deposits.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69547.

References: (1) Kozlov, I.T. and P.P. Levshov (1962) Amakinite, a new mineral of the brucite-pyrochroite group. Zap. Vses. Mineral. Obshch., 91, 72–77 (in Russian). (2) (1962) Amer. Amarantite $Fe_2^{3+}O(SO_4)_2 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals, to 2 cm, elongated along [001], with dominant {100} and {010}, and square cross section; also flattened [100] and striated on {001}; more than 60 forms recorded; typically in radiating or matted aggregates of needles; columnar or bladed.

Physical Properties: *Cleavage:* Perfect on {010} and {100}. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.189–2.286 D(calc.) = 2.14 Decomposes in H_2O, leaving an insoluble residue.

Optical Properties: Transparent. *Color:* Amaranth-red to brownish red and red-orange. *Streak:* Lemon-yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = pale yellow; Z = reddish brown. *Orientation:* X (82°,72°); Y (178°,68°); Z (–44°,29°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r < v$, horizontal. $\alpha = 1.516$ $\beta = 1.598$ $\gamma = 1.621$ 2V(meas.) = 30°–36°

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.976(1)$ $b = 11.678(2)$ $c = 6.698(2)$ $\alpha = 95.65(2)°$ $\beta = 90.36(1)°$ $\gamma = 97.20(2)°$ Z = 2

X-ray Powder Pattern: Sierra Gorda [district], Chile.
11.25 (FFF), 8.69 (FFF), 3.57 (FF), 3.05 (FF), 3.11 (F), 5.16 (mF), 4.98 (mF)

Chemistry:

	(1)	(2)
SO_3	36.18	35.91
Fe_2O_3	35.92	35.81
H_2O	28.13	28.28
Total	100.23	100.00

(1) Paposa, Chile. (2) $Fe_2O(SO_4)_2 \cdot 7H_2O$.

Occurrence: A secondary mineral formed especially in arid climates.

Association: Hohmannite, fibroferrite, chalcanthite, copiapite, coquimbite, sideronatrite.

Distribution: In Chile, in Antofagasta, from the Union mine, Reventon district, near Paposo, at the Compania mine, east of Sierra Gorda; from Quetena, west of Calama, Alcaparrosa, near Cerritos Bayos, southwest of Calama, and at Chuquicamata; at Tierra Amarilla, southeast of Copiapó, Atacama. In the USA, in the Santa Maria Mountains, Riverside Co., California. At Saghand, Yazd, Iran.

Name: From the Greek for *amaranth*, an imaginary purplish red undying flower, for its color.

Type Material: BAF, 44700.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 611–613. (2) Cesbron, F. Amarillite $NaFe^{3+}(SO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Equant, complexly faceted crystals, thick tabular or rarely prismatic ‖ [001], with common forms {001}, {100}, {110}, {$\bar{1}$01}, and {111}; as groupings of parallel individuals, to 2 mm.

Physical Properties: *Cleavage:* {110}, good, but difficult. *Fracture:* Conchoidal. Hardness = 2.5–3 D(meas.) = 2.19–2.20 D(calc.) = 2.22 Soluble in H_2O; taste astringent.

Optical Properties: Transparent. *Color:* Pale yellow with a greenish tint. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = -39°$; $Z \wedge c = 51°$. *Dispersion:* $r < v$. $\alpha = 1.532(2)$ $\beta = 1.555(3)$ $\gamma = 1.591(2)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $C2/c$. $a = 8.4190(61)$ $b = 10.8409(40)$ $c = 12.4717(50)$ $\beta = 95.495(47)°$ Z = 4

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
SO_3	43.59	42.24
Fe_2O_3	21.39	21.06
Na_2O	7.14	8.18
H_2O	28.45	28.52
Total	100.57	100.00

(1) Tierra Amarilla, Chile. (2) $NaFe(SO_4)_2 \cdot 6H_2O$.

Occurrence: Formed in the oxidation zones of sulfide deposits.

Association: Coquimbite, other sulfates.

Distribution: From Tierra Amarilla, southeast of Copiapó, Atacama, Chile. At the Xitieshan Pb–Zn mine, south of Mt. Qilianshan, Chaidamu, Qinghai Province, China.

Name: For the locality at Tierra Amarilla, Chile.

Type Material: National School of Mines, Paris, France, 133.69.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 468–469. (2) Li Jia-Ju, Zhou Jing-Liang, and Dong Wei (1990) The structure of amarillite. Chinese Science Bulletin, 35(24), 2073–2075 (in English).

Amblygonite $LiAl(PO_4)(F,OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crude crystals, typically equant with complex form development, to 1.5 m; massive. *Twinning:* On several laws, with microscopic polysynthetic twinning common.

Physical Properties: *Cleavage:* {100}, perfect; {110}, good; {$0\overline{1}1$}, distinct; {001} imperfect [morphological orientation of ref. (1)]. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 3.04–3.11 D(calc.) = [3.13]

Optical Properties: Transparent to translucent. *Color:* Milk-white, pale yellow, beige, salmon-pink, pale green, pale blue, gray, may be colorless; colorless in transmitted light. *Luster:* Vitreous to greasy, pearly on good cleavages.
Optical Class: Biaxial (–). *Orientation:* Euler angles $\phi = 55.5°$; $\psi = 30.0°$; $\theta = 18.2°$ [for amblygonite 92%]. *Dispersion:* $r > v$. $\alpha = 1.577$–1.591 $\beta = 1.592$–1.605 $\gamma = 1.596$–1.613 2V(meas.) = 107°–129.5°

Cell Data: *Space Group:* $C\overline{1}$. $a = 6.644(2)$ $b = 7.744(2)$ $c = 6.910(1)$ $\alpha = 90.35(2)°$ $\beta = 117.33(2)°$ $\gamma = 91.01(2)°$ Z = 4

X-ray Powder Pattern: Chursdorf, Germany.
3.151 (vvsb), 4.642 (vs), 2.955 (vs), 3.237 (ms), 1.935 (ms), 3.300 (m), 2.384 (m)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	48.44	48.31	F	13.06	6.47
Al_2O_3	33.90	34.70	H_2O	0.00	3.07
Li_2O	10.12	10.17	$-O = F_2$	5.50	2.72
			Total	100.02	100.00

(1) [Chursdorf, Germany]; by electron microprobe, corresponds to $Li_{1.00}Al_{0.98}(PO_4)_{1.01}F_{1.02}$.
(2) $LiAl(PO_4)(F,OH)$ with F:OH = 1:1.

Polymorphism & Series: Forms a series with montebrasite.

Mineral Group: Amblygonite group.

Occurrence: An uncommon accessory mineral in zoned granite pegmatites; in high-temperature tin veins and greisens.

Association: Lacroixite, apatite, lithiophilite, spodumene, lepidolite, petalite, pollucite, tourmaline (pegmatites); cassiterite, topaz, mica (greisens).

Distribution: Much less common than montebrasite. The few localities for analyzed material include: from Chursdorf and Arnsdorf, near Penig, Saxony, Germany. On Utö Island, near Stockholm, Sweden. In the USA, at Hebron, Oxford Co., Maine; large crystals in San Domingo Wash, northeast of Wickenburg, Maricopa Co., Arizona. From the Tanco pegmatite, Bernic Lake, Manitoba, Canada. At Coolgardie, Western Australia. From near Karibib, Namibia. In the Muiâne pegmatite, Alto Ligonha district, Mozambique.

Name: From the Greek for *blunt* and *angle*, for its ∼90° cleavage angle.

Type Material: Mining Academy, Freiberg, Germany, 20336.

Ameghinite $NaB_3O_3(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated along [010], may be bent or curved, showing {001}, {010}, {100}, {110}, {011}, {101}, {$\overline{1}$01}, {310}, to 5 mm; as cluster of crystals and nodular masses.

Physical Properties: *Cleavage:* {100}, very good; {001} and {010}, poor. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.030(6) D(calc.) = 2.037 Soluble in H_2O; pale blue fluorescence and phosphorescence under SW and LW UV.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 9°$. *Dispersion:* $r < v$, weak. $\alpha = 1.429(1)$ $\beta = 1.528(1)$ $\gamma = 1.538(1)$ 2V(meas.) = 33°

Cell Data: *Space Group:* $C2/c$. $a = 18.428(3)$ $b = 9.882(2)$ $c = 6.326(2)$ $\beta = 104°23(6)'$ Z = 8

X-ray Powder Pattern: Tincalayu deposit, Argentina.
3.064 (100), 3.147 (76), 2.548 (29), 3.352 (17), 2.914 (17), 4.951 (13), 2.655 (11)

Chemistry:

	(1)	(2)
B_2O_3	59.3	60.91
Na_2O	19.5	18.08
H_2O^+	20.7	
H_2O^-	0.6	
H_2O		21.01
Total	100.1	100.00

(1) Tincalayu deposit, Argentina; corresponds to $Na_{1.11}B_{3.00}O_3(OH)_{4.05}$. (2) $NaB_3O_3(OH)_4$.

Occurrence: Formed in massive borax in a borate-rich playa.

Association: Tincalconite, borax, ezcurrite, rivadavite.

Distribution: From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina.

Name: Honors two brothers, Carlos Ameghino (1865–1936) and Florentino Ameghino (1854–1911), Argentine geologists.

Type Material: Natural History Museum, Paris, France; Harvard University, Cambridge, Massachusetts, 109054; National Museum of Natural History, Washington, D.C., USA, 137297.

References: (1) Aristarain, L.F. and C.S. Hurlbut, Jr. (1967) Ameghinite, $Na_2O•3B_2O_3•4H_2O$, a new borate from Argentina. Amer. Mineral., 52, 935–945. (2) Dal Negro, A., J.M.M. Pozas, and L. Ungaretti (1975) The crystal structure of ameghinite. Amer. Mineral., 60, 879–883.

Amesite $Mg_2Al(SiAl)O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1. As tapering pseudohexagonal prisms elongated along [001], to 2 mm; also tabular. *Twinning:* Common as six-fold sector twins on {001} and polysynthetic twins ∥ {010} prism edges.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 2.78 D(calc.) = 2.70

Optical Properties: Transparent. *Color:* Colorless, white, pink to lilac, or pale green. *Streak:* White with pale green tint. *Luster:* Pearly to somewhat metallic on cleavage surfaces. *Optical Class:* Biaxial (+). *Dispersion:* $r < v$. $\alpha = 1.5967(5)$ $\beta = 1.5986(5)$ $\gamma = 1.615(1)$ 2V(meas.) = 18°

Cell Data: *Space Group:* $C1$. $a = 5.307(1)$ $b = 9.195(2)$ $c = 14.068(3)$ $\alpha = 90.09(2)°$ $\beta = 90.25(2)°$ $\gamma = 89.96(2)°$ Z = [4]

X-ray Powder Pattern: Saranovskoye deposits, Russia; $2H_2$.

Total	100.92	[100.00]	100.00

(1) Chester, Massachusetts, USA. (2) Pensacola Mountains, Antarctica; by electron microprobe, H_2O by difference. (3) $Mg_2Al(SiAl)O_5(OH)_4$.

Polymorphism & Series: $2H_1$, $2H_2$, 6R polytypes.

Mineral Group: Kaolinite-serpentine group.

Occurrence: A product of low-grade metamorphism of Al, Mg-rich rocks.

Association: Vesuvianite, chlorite (Pensacola Mountains, Antarctica); magnetite, rutile, diaspore (Chester, Massachusetts, USA); grossular, calcite, diopside, clinozoisite (Black Lake, Canada).

Distribution: At the Emery mine, Chester, Hampden Co., Massachusetts, USA. From the Lake Asbestos mine, Black Lake, Quebec, Canada. In Antarctica, in the Dufek mafic massif, Pensacola Mountains. From the Postmasburg manganese deposits, Cape Province, South Africa. From Russia, at the Saranovskoye chromite deposits, Northern Ural Mountains. At Hällefors, Sweden. On Mt. Sobotka, Silesia, Poland.

Name: Honors James Ames, a mine owner.

Type Material: National Museum of Natural History, Washington, D.C., USA, 80715.

(1) Hegau, Germany; by electron microprobe; corresponds to $K_{1.88}Na_{1.80}Ca_{0.02}Al_{3.93}Si_{4.12}O_{16}\cdot 4.84H_2O$. (2) $K_2Na_2Al_4Si_4O_{16}\cdot 5H_2O$.

Mineral Group: Zeolite group.

Occurrence: In veinlets cutting melilite-nephelinite volcanic rocks and pyroclastics (Hegau, Germany); in natrolite veinlets cutting ijolite-urtite pegmatites and apatite-nepheline rocks (Kola Peninsula, Russia).

Association: Merlinoite, aragonite, calcite (Hegau, Germany); natrolite (Kola Peninsula, Russia).

Distribution: In the Höwenegg quarry, Hegau, Baden-Württemberg, Germany. From the Kukisvumchorr apatite deposit, Khibiny massif, Kola Peninsula, Russia. In a quarry near Cuidad Real, ?? Province, Spain.

Name: To honor Giovan Battista Amici (1786–1863), physicist, optician, and inventor of microscope optical elements.

Type Material: University of Modena, Modena, Italy; The Natural History Museum, London, England; National Museum of Natural History, Washington, D.C., USA, 145843.

Aminoffite $Ca_3Be_2Si_3O_{10}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. As small, euhedral, pyramidal crystals, to 1 mm. *Twinning:* Commonly twinned, polysynthetically on {001}.

Physical Properties: *Cleavage:* Poor on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.94 D(calc.) = 2.86 Strongly piezoelectric.

Optical Properties: Transparent. *Color:* Colorless to light yellowish. *Luster:* Vitreous. *Optical Class:* Uniaxial (–); may be abnormally biaxial. $\omega = 1.647$ $\epsilon = 1.637$

Cell Data: *Space Group:* $P4_2/n$. $a = 9.865(2)$ $c = 9.930(2)$ $Z = 4$

X-ray Powder Pattern: Långban, Sweden.
2.614 (100), 2.84 (90), 4.02 (80), 2.141 (80), 6.97 (70), 4.40 (70), 3.48 (70)

Chemistry:

	(1)	(2)
SiO_2	42.49	43.28
Al_2O_3	4.41	
Fe_2O_3	0.31	
MnO	0.19	
BeO	6.20	12.01
CaO	40.27	40.39
H_2O	6.45	4.32
Total	[100.32]	100.00

(1) Långban, Sweden; original total given as 100.33%. (2) $Ca_3Be_2Si_3O_{10}(OH)_2$.

Occurrence: In cavities in massive magnetite (Långban, Sweden); in fluorite veins at the contact between marbles and "hornblende" granites associated with hastingsite nepheline syenites (Dugdinsk massif, Russia); in fluorite veins in tinguaite and nephelinite dikes (Bayankolsk dike field, Russia).

Association: Magnetite, goethite (Långban, Sweden); fluorite (Russia).

Distribution: From Långban, Värmland, Sweden. In Russia, found in the Bayankolsk dike field, Tuva, and in the Dugdinsk massif; also in the Lake Baikal area, eastern Siberia. From Hall's Grampians, eight km northwest of Emmaville, New South Wales, Australia.

Name: To honor Dr. Gregori Aminoff (1883–1947), Swedish mineralogist and expert on Långban mineralogy, associated with the Riksmuseum, Stockholm, Sweden.

Type Material: Harvard University, Cambridge, Massachusetts, 94627, 106916, 106917; National Museum of Natural History, Washington, D.C., USA, 137291, R7823; The Natural History Museum, London, England, 1984,423.

Ammonioalunite $(NH_4)Al_3(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ or $3m$. As rhombohedral crystals, to 20 μm, forming granular masses.

Physical Properties: *Cleavage:* On [{0001}, perfect.] (by analogy with the alunite group). Hardness = 2–3 D(meas.) = 2.4 D(calc.) = 2.58

Optical Properties: Semitransparent. *Color:* Grayish white; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.590(5)$ $\epsilon = 1.602(5)$

Cell Data: *Space Group:* $R\overline{3}m$ or $R3m$. $a = 7.013(1)$ $c = 17.855(5)$ $Z = 3$

X-ray Powder Pattern: The Geysers, California, USA.
3.023 (100), 5.04 (93), 2.996 (50), 1.917 (32), 2.353 (31), 1.753 (21) 3.514 (19)

Chemistry:

	(1)	(2)	(3)
SO_3	35.96	41.35	40.73
SiO_2	11.6

$(NH_4)_2O$	5.39	6.20	6.62
Na_2O	0.17	0.20	
K_2O	0.19	0.22	
H_2O	12.24	14.08	13.75
Total	98.6	[100.00]	100.00

(1) The Geysers, California, USA; by inductively coupled Ar-plasma spectrometry, S by a Leco S analyzer, K by AA, and H and N by a CHN analyzer. (2) Do.; analysis (1) recalculated after deduction of amorphous SiO_2; corresponds to $[(NH_4)_{0.92}Na_{0.02}K_{0.02}]_{\Sigma=0.96}Al_{2.88}(SO_4)_{2.00}(OH)_{5.60}\bullet 0.23H_2O$. (3) $(NH_4)Al_3(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: Formed in hot springs under very acid conditions, rich in ammonium and sulfate, poor in potassium, below 100 °C.

Association: Ammoniojarosite, amorphous SiO_2.

Distribution: From The Geysers, Sonoma Co., California, USA.

Name: As the *ammonium* analog of *alunite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 145596.

References: (1) Altaner, S.P., J.J. Fitzpatrick, M.D. Krohn, P.M. Bethke, D.O. Hayba, J.A. Goss, and Z.A. Brown (1988) Ammonium in alunites. Amer. Mineral., 73, 145–152.

Ammonioborite $(NH_4)_3B_{15}O_{20}(OH)_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Microscopic plates, grouped in parallel; commonly as fine-grained granular masses.

Physical Properties: Hardness = n.d. D(meas.) = 1.765(4) D(calc.) = 1.76 Slowly soluble in H_2O.

Optical Properties: Semitransparent. *Color:* White; colorless in transmitted light. *Optical Class:* Biaxial (+). *Orientation:* $Z \wedge$ elongation $\simeq 7°$–$13°$; $Y = b$. *Dispersion:* $r < v$, slight. $\alpha = 1.470$ $\beta = 1.487$ $\gamma = 1.540$ 2V(meas.) = $\sim 60°$

Cell Data: *Space Group:* $C2/c$. $a = 25.27(5)$ $b = 9.65(3)$ $c = 11.56(3)$ $\beta = 94°17(5)'$ Z = 4

X-ray Powder Pattern: Synthetic.
3.16 (100), 3.09 (100), 5.70 (60), 2.876 (60), 3.01 (50), 8.98 (40), 5.44 (30).

Chemistry:

$(NH_4)_2O$	9.8	10.49
H_2O	[16.0]	19.36
Total	[100.0]	100.00

(1) Larderello, Italy; H_2O by difference. (2) $(NH_4)_3B_{15}O_{20}(OH)_8 \cdot 4H_2O$.

Occurrence: In boric acid-rich fumarolic lagoons.

Association: Sassolite, larderellite.

Distribution: From Larderello, Val di Cecina, Tuscany, Italy.

Name: For its composition, *ammonium borate*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 93756, 94172, R6167.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 366–367. (2) Clark, J.R. and C.L. Ammoniojarosite $(NH_4)Fe_3^{3+}(SO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ or $3m$. Microscopic tabular crystals, some with hexagonal outlines, rhombohedral or short prismatic; in granular lumps and irregular nodules.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.112

Optical Properties: Semitransparent. *Color:* Pale ocherous yellow; in transmitted light, pale yellow to nearly colorless. *Luster:* Dull, may be waxy to earthy.
Optical Class: Uniaxial (–). $\omega = 1.800(5)$ $\epsilon = 1.750(5)$

Cell Data: *Space Group:* $R\overline{3}m$ or $R3m$. $a = 7.028$ $c = 17.00$ $Z = 3$

X-ray Powder Pattern: Synthetic.
3.114 (100), 3.097 (100), 5.123 (58), 1.988 (30), 1.832 (30), 2.318 (21), 5.811 (14).

Chemistry:

K_2O	1.56	
H_2O	9.86	11.26
insol.	0.76	
Total	100.62	100.00

(1) Utah, USA; corresponds to $[(NH_4)_{0.75}K_{0.16}Mg_{0.06}Na_{0.04}]_{\Sigma=1.01}Fe_{2.87}(SO_4)_{2.00}(OH)_6$.
(2) $(NH_4)Fe_3^{3+}(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: Formed in black lignitic shales containing pyrite (Utah, USA).

Association: Tschermigite, epsomite, jarosite (Utah, USA); gypsum (Buffalo, Wyoming, USA); aluminite, natrojarosite (Zlatá Baňa district, Slovakia).

Distribution: In the USA, from an undefined locality on the "west side of the Kaibab fault, Kane Co., Utah"; from near Buffalo, Johnson Co. and about 5 km south of Wamsutter, Sweetwater Co., Wyoming; at the Sulphur Bank mine, Lake Co. and The Geysers, Sonoma Co., California. From Cebadillas, Potosí, Bolivia. In the Zlatá Baňa district, Slanské Mountains, Slovakia. From Le Kaymar, Aveyron, France. At the Hüttelkogel quarry, near Voightsberg, Austria.

Name: As the *ammonium* analog of *jarosite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 95654.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 562–563. (2) Odum, J.K., P.L. Hauff, and R.A. Ammonioleucite $(NH_4, K)AlSi_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. As minute aggregates replacing analcime crystals. *Twinning:* Common, repeated on {110}.

Physical Properties: Hardness = n.d. D(meas.) = 2.29(5) D(calc.) = 2.24

Optical Properties: Translucent. *Color:* White. *Luster:* Resinous to vitreous. *Optical Class:* Uniaxial (+). $n = 1.518(2)$

Cell Data: *Space Group:* $I4_1/a$. $a = 13.214(1)$ $c = 13.713(2)$ $Z = 16$

X-ray Powder Pattern: Fujioka, Japan.
5.43 (100), 3.30 (80), 5.53 (50), 3.43 (40), 2.955 (20), 2.859(20), 2.839 (10)

Chemistry:

	(1)
SiO_2	62.67
Al_2O_3	22.43
K_2O	4.43
$(NH_4)_2O$	8.70
H_2O	1.77
Total	[100.00]

(1) Fujioka, Japan; by electron microprobe; after subtraction of elements attributed to dolomite and analcime contamination, recalculated to 100.00%; corresponds to $[(NH_4)_{0.68}K_{0.19}]_{\Sigma=0.87}Al_{0.89}Si_{2.12}O_6$.

Occurrence: In veinlets, fractures, and cavities in hydrothermally altered crystalline schist, as powdery pseudomorphous replacements of analcime crystals.

Association: Analcime, dolomite.

Distribution: In the Tatarazawa quarry, Fujioka, Gumma Prefecture, Japan.

Name: For *ammonia* in its chemical composition and its relation to *leucite*.

Type Material: National Science Museum, Tokyo, Japan; National Museum of Natural History, Washington, D.C., USA, 165991.

References: (1) Hori, H., K. Nagashima, M. Yamada, R. Miyawaki, and T. Marubashi (1986) Ammonioleucite, a new mineral from Tatarazawa, Fujioka, Japan. Amer. Mineral., 71, 1022–1027.

Ammoniomagnesiovoltaite $(NH_4)_2Mg_5Fe^{3+}{}_3Al(SO_4)_{12}•18H_2O$

Crystal Data: Isometric. *Point Group*: 4/*m* $\bar{3}$ 2/*m*. As crusts of intergrown equant crystals to 0.05 mm, displaying {111}, {100} and minor {110}.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 2-3 D(meas.) = 2.55(1) [value ascribed to analytical error] D(calc.) = 2.351 Dissolves in water.

Optical Properties: Translucent. *Color*: Pale yellow to yellow-brown. *Streak*: White. *Luster*: Vitreous.
Optical Class: Isotropic. n = 1.60(1)

Cell Data: *Space Group*: *Fd*$\bar{3}$ *c*. a = 27.260(2) Z = 16

X-ray Powder Pattern: Synthetic $(NH_4)_2Mg_5Fe^{3+}{}_3Al(SO_4)_{12}•18H_2O$.
5.59 (100), 3.420 (72), 3.562 (66), 1.7836 (25), 1.5582 (25), 6.85 (24), 3.059 (22)

(1) Köves Hill, Pécs-Vasas, Southern Hungary; average of 5 electron microprobe analyses, H_2O calculated from stoichiometry, $(NH_4)_2O$ by spectrophotometry, presence of H_2O, $(SO_4)^{2-}$, $(NH4)^+$ confirmed by IR spectroscopy, Fe^{2+} and Fe^{3+} determined assuming $(Mg+Fe^{2+}+Mn^{2+})/(Fe^{3+}+Al)$ = 5/4; corresponding to $[(NH_4)_{2.18}K_{0.02}]_{\Sigma=2.20}(Mg_{3.19}Fe^{2+}{}_{1.51}Mn_{0.30})_{\Sigma=5.00}(Fe^{3+}{}_{2.81}Al_{1.19})_{\Sigma=4.00}S_{10.87}O_{44.70}•18H_2O$. (2) $(NH_4)_2Mg_5Fe^{3+}{}_3Al(SO_4)_{12}•18H_2O$.

Mineral Group: Voltaite group.

Occurrence: As efflorescences formed by the chemical reactions as ground water interacts with organic matter from coal and oxidizing pyrite and marcasite on a burning coal dump.

Association: Tschermigite, sabieite, kieserite, pickeringite, hexahydrite.

Distribution: From near Köves Hill, Pécs-Vasas, Mecsek Mountains, Southern Hungary.

Name: As an analog of *voltaite* with essential ammonium and magnesium in the composition.

Type Material: In Hungary at the Herman Ottó Museum, Miskolc, (# 2008.233) and at the Department of Mineralogy and Petrology, Hungarian Natural History Museum, Budapest (Gyn.1590).

(1) Amstall, Austria; by electron microprobe, corresponds to $Ca_{0.98}Al_{1.78}Si_{3.26}O_{12.80}Cl_{0.20}H_{5.46}$.

Occurrence: In open fissures cutting pegmatitic schlieren, in hydrothermally altered graphite-bearing metamorphic rocks.

Association: Apatite, rutile, siderite, albite, laumontite, calcite, vivianite.

Distribution: In the Amstall graphite quarry, Amstall, Austria.

Name: For the type locality at Amstall, Austria.

Type Material: Institute of Mineralogy and Crystallography, Vienna University; Natural History Museum, Vienna, Austria.

References: (1) Quint, R. (1987) Description and crystal structure of amstallite, $CaAl(OH)_2[Al_{0.8}Si_{3.2}O_8(OH)_2] \cdot [(H_2O)_{0.8}Cl_{0.2}]$, a new mineral from Amstall, Austria. Neues Jahrb. Mineral., Monatsh., 253–262. (2) (1988) Amer. Mineral., 73, 1492–1493 (abs. ref. 1).

Analcime $NaAlSi_2O_6 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic; tetragonal, orthorhombic, or monoclinic, pseudocubic, with degree of ordering. *Point Group:* $4/m\ \bar{3}\ 2/m$; $4/m\ 2/m\ 2/m$, $2/m\ 2/m\ 2/m$, or $2/m$. Crystals commonly trapezohedra {211}, to 25 cm. Also granular, compact, massive, typically showing concentric structure. *Twinning:* Polysynthetic on {001}, {110}.

Physical Properties: *Cleavage:* Very poor on {100}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.24–2.29 D(calc.) = 2.271 Weakly piezoelectric; weakly electrostatic when rubbed or heated.

Optical Properties: Transparent to translucent. *Color:* White, colorless, gray, pink, greenish, yellowish; in thin section, colorless. *Luster:* Vitreous.
Optical Class: Isotropic; anomalously biaxial (–). n = 1.479–1.493 2V(meas.) = 0°–85°

Cell Data: *Space Group:* $Ia3d$; $I4_1/acd$, $Ibca$, or $I2/a$. a = 13.723–13.733 Z = 16 (cubic).

X-ray Powder Pattern: Låven Island, Langesundsfjord, Norway.

(1) Cyclopean Islands, Italy. (2) Mazé, Niigata Prefecture, Japan. (3) $NaAlSi_2O_6 \cdot H_2O$.

Polymorphism & Series: Forms a series with pollucite.

Mineral Group: Zeolite group.

Occurrence: In the groundmass or vesicles of silica-poor intermediate and mafic igneous rocks, typically basalts and phonolites, from late-stage hydrothermal solutions, or disseminated due to deuteric alteration. In lake beds, altered from pyroclastics or clays, or as a primary precipitate; authigenic in sandstones and siltstones.

Association: Zeolites, prehnite, calcite, quartz, glauconite.

Distribution: Some localities for outstanding specimens follow. In Italy, at Aci Castello, Cyclopean Islands, and from Val di Fassa and Alpe di Siusi, Trentino-Alto Aldige. Large crystals from Kotchechovmo, Krasnoyarski Territory, Russia. At Breidhdalsheidhi, Iceland. In the Dean quarry, St. Keverne, Lizard Peninsula, Cornwall, England. Around Glasgow, Dumbartonshire, Scotland. In the USA, from the Lake Superior district, Houghton Co., Michigan; at Cornwall, Lebanon Co., Pennsylvania; from Bergen Hill, Hudson Co., and West Paterson, Passaic Co., New Jersey; on Table Mountain, Jefferson Co., Colorado; in the Price Creek quarry, Benton Co., Oregon. From the Bay of Fundy district, Nova Scotia; large crystals from Mont Saint-Hilaire, Quebec, Canada. From Flinders, Victoria, Australia.

Name: From the Greek for *weak*, alluding to the weak electrostatic charge developed when heated or rubbed.

Type Material: Natural History Museum, Paris, France, 13.77, H4154.

(1) Wilagedera iron prospect, Sri Lanka. (2) Do.; by electron microprobe; Mössbauer spectroscopy indicates Fe^{2+}:Fe^{3+} = 1.19.

Polymorphism & Series: 2O, $2M_1$, 1M polytypes.

Mineral Group: Mica group.

Occurrence: As monomineralic veinlets and lenses in a banded magnetite deposit capped by banded magnetite-barite rock. The ore zone and associated interbedded calc-schists and gneisses are of metasedimentary origin, of approximately granulite facies grade.

Association: Magnetite, chalcopyrite, pyrite, pyrrhotite, barite.

Distribution: At the Wilagedera iron prospect, North Western Province, Sri Lanka.

Name: Honoring Dr. Ananda Kentush Coomaraswamy (1877–1947), the first Director of the Mineral Survey of Ceylon (Sri Lanka).

Type Material: n.d.

(1) Taman Peninsula, Russia. (2) $Ca_2Fe(PO_4)_2 \cdot 4H_2O$.

Occurrence: In oolitic iron ore, and in the stems of fossil trees (Anapa, Russia); in lacustrine sediments.

Association: Fairfieldite, vivianite, siderite.

Distribution: In Russia, at an iron mine on Cape Zheleznyi Rog Cape, near Anapa, Taman Peninsula. As fine specimens at Kerch, Crimean Peninsula, Ukraine. In the Castelnuovo and Allori mines, Santa Barbara lignite district, near San Giovani, Tuscany, Italy. At Messel, Hesse, Germany. In the Cerdanya basin, east to southwest of Belver, Catalonia Province, Spain. In the USA, from Lewis Well, near Corcoran, Kings Co., California; at the MacArthur mine, near Yerington, Lyon Co., Nevada; in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire.

Name: For its first discovery near Anapa, Russia.

Type Material: n.d.

Total	101.13	100.00

(1) La Vendida mine, Sierra Gorda mining district, near Antofagasta, Chile; electron microprobe analysis, H_2O calculated from stoichiometry; corresponding to $Cu_{1.97}Ni_{0.03}(OH)_{2.99}Cl$.
(2) $Cu_2(OH)_3Cl$.

Polymorphism & Series: Polymorphous with atacamite, botallackite and clinoatacamite.

Occurrence: In the oxidation zone of a polymetallic sulfide deposit

Association: Atacamite, belloite, as well as alunite, clinoatacamite, chalcanthite, coquimbite, eriochalcite, jarosite, kröhnkite, magnesioaubertite, tamarugite, voltaite.

Distribution: La Vendida mine (an abandoned open pit copper mine), Sierra Gorda mining district, northeast of Antofagasta, Chile.

Name: For its triclinic symmetry and polymorphism with *atacamite*.

Type Material: Mineralogical Museum, University of Hamburg, Germany (MD 199).

References: (1) Malcherek, T. and J. Schlüter (2010) Anatacamite from La Vendida mine, Sierra Gorda, Atacama desert, Chile: a triclinic polymorph of $Cu_2(OH)_3Cl$. Neues Jahrbuch für Mineralogie Abhandlungen, 187, 307-312. (2) (2014) Amer. Mineral., 99, 551 (abs. ref. 1).

Anatase TiO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals typically acute dipyramidal {011}, often highly modified; obtuse pyramidal or tabular on {001}; less commonly prismatic on [001], with {110}, {010}, to 3.75 cm. *Twinning:* Rare, on {112}.

Physical Properties: *Cleavage:* Perfect on {001} and {011}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 VHN = 616–698 (100 g load). D(meas.) = 3.79–3.97 D(calc.) = [3.89]

Optical Properties: Transparent when light colored, to nearly opaque when deeply colored. Pyramidal crystals may appear opaque because of total reflection. *Color:* Brown, pale yellow or reddish brown, indigo, black; pale green, pale lilac, gray, rarely nearly colorless; brown, yellow-brown, pale green, blue in transmitted light. *Streak:* White to pale yellow. *Luster:* Adamantine to splendent, metallic.
Optical Class: Uniaxial (–); anomalously biaxial in deeply colored crystals. *Pleochroism:* Weak; stronger in deeply colored crystals. *Absorption:* Commonly $E > O$; may be $O < E$. $\omega = 2.5612$ $\epsilon = 2.4880$ 2V(meas.) = Small.

(1) Rio Cipo, Minas Gerais, Brazil. (2) Brazil.

Polymorphism & Series: Trimorphous with brookite and rutile.

Occurrence: Usually secondary, derived from other titanium-bearing minerals. In Alpine veins, derived from the enclosing gneisses or schists by hydrothermal solutions. In igneous and metamorphic rocks; in pegmatites; from a carbonatite. A common detrital mineral.

Association: Brookite, rutile, titanite, ilmenite, titanian magnetite, hematite, quartz.

Distribution: A very wide-spread mineral; only a few occurrences can be noted. In Alpine veins at many localities throughout the Swiss, French, and Italian and Tirolian Alps: large crystals from Binn, Valais, and at Cavradi, Tavetsch, Graubünden, Switzerland. From LaGrave, Hautes-Alpes, and Bourg d'Oisans, Isère, France. In Norway, at Kragerø; fine crystals from Hardangervidda, Ullensvang; Slidre, Valdres; and Gudbrandsdalen. From the Khodrovy Mountains, Sakha, Russia. In the Virtuous Lady mine, Devonshire, England. At Fron Oleu, near Tremadog, Gwynned, Wales. In several carbonatite deposits, aggregating 500 million tons, in Minas Gerais and Pará, Brazil. In the USA, at many localities in Burke Co., North Carolina; Buckingham Co., Virginia; from Quincy, Norfolk Co., Massachusetts; at Placerville, Eldorado Co., California. In Canada, at Sherbrooke Township, Nova Scotia, and in Henvey Township, Ontario.

Name: From the Greek meaning *extension*, for the greater length of the usual pyramid compared with other tetragonal minerals.

Type Material: Natural History Museum, Paris, France.

Ancylite-(Ce) $Sr(Ce,La)(CO_3)_2(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are typically pseudo-octahedral {111}, modified by {120}, with curved faces, or short prismatic [001], to 6 mm; as groups of crystals and forming crusts.

Physical Properties: *Fracture:* Splintery. *Tenacity:* Tough. Hardness = 4–4.5
D(meas.) = 3.82–4.30 D(calc.) = 4.15

Optical Properties: Translucent. *Color:* Pale yellow-orange, pink, yellowish brown to brown, gray; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to dull on crystal faces, greasy on fracture surfaces.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r < v$.
$\alpha = 1.615–1.654$ $\beta = 1.695–1.733$ $\gamma = 1.730–1.772$ 2V(meas.) = 70(5)°

Cell Data: *Space Group: Pmcn.* $a = 4.97–5.03$ $b = 8.49–8.53$ $c = 7.24–7.29$ Z = 2

X-ray Powder Pattern: Narssârssuk, Greenland; nearly identical to ancylite-(La).

(1) Narssârssuk, Greenland. (2) Khibiny massif, Kola Peninsula, Russia; by electron microprobe, original total 99.51%; corresponds to $(Sr_{0.86}Ca_{0.09}Ba_{0.01}Fe_{0.01})_{\Sigma=0.97}(Ce_{0.53}La_{0.30}Nd_{0.12}Pr_{0.04}Sm_{0.01}Th_{0.01})_{\Sigma=1.01}(CO_3)_2(OH)\cdot H_2O$. (3) $SrCe(CO_3)_2(OH)\cdot H_2O$.

Occurrence: An uncommon accessory mineral in some nepheline syenites and carbonatites.

Association: Parisite-(Ce), synchysite-(Y), cordylite-(Ce), eudidymite, aegirine, microcline.

Distribution: From Narssârssuk, Greenland. In Canada, large crystals at Mont Saint-Hilaire, in the Miron quarry, Montreal, and from near Saint-Amable, Quebec; at the Ice River complex, near Field, British Columbia; in the Desmont mine, Wilberforce, Ontario. In the USA, in the Sheep Creek vein, Ravalli Co., and the "vermiculite prospects", Bearpaw Mountains, Hill Co., Montana; at Gem Park, Fremont Co., Colorado. In Russia, from the Lovozero, Khibiny, and other massifs, Kola Peninsula. From Langesundsfjord, Norway. At Weishan, Shandong Province, China. In the Jacupiranga mine, São Paulo, Brazil. At the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire).

Name: From the Greek for *curved*, in allusion to the characteristically curved crystals.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Ancylite-(La) $Sr(La,Ce)(CO_3)_2(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are dipyramidal {111}, with {120}, {101}, platy or short prismatic, faces typically curved, to 2 mm; in druses and uncommonly as skeletal or dendritic aggregates.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 3.69(5) D(calc.) = n.d.

Optical Properties: Translucent. *Color:* Colorless, pale yellowish gray, yellowish brown, yellow; colorless to pale yellow in thin section. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Dispersion:* $r < v$. $\alpha = 1.640(3)$ $\beta = [1.717]$ $\gamma = 1.731(3)$ 2V(meas.) = 70(5)°

Cell Data: *Space Group:* [*Pmcn*] [by analogy to ancylite-(Ce)]. $a = 5.072(3)$ $b = 8.589(3)$ $c = 7.276(3)$ Z = 2

X-ray Powder Pattern: Mt. Kukisvumchorr, Kola Peninsula, Russia; nearly identical to ancylite-(Ce).
2.955 (100), 4.36 (92), 3.705 (90), 2.664 (89), 3.738 (88), 2.358 (87), 2.092 (80)

Chemistry:

(1) Mt. Kukisvumchorr, Kola Peninsula, Russia; by electron microprobe, average of seven analyses, H_2O by the Penfield method; corresponds to $(Sr_{0.89}Ca_{0.11}Ba_{0.02})_{\Sigma=1.02}(La_{0.60}Ce_{0.38}Nd_{0.02})_{\Sigma=1.00}(CO_3)_{1.96}(OH)_{1.12}\cdot H_2O$. (2) $SrLa(CO_3)_2(OH)\cdot H_2O$.

Occurrence: A rare mineral in nepheline syenites in differentiated alkalic massifs.

Association: Aegirine, astrophyllite, loparite-(Ce), donnayite-(Y), belovite-(Ce), kukharenkoite-(Y), nenadkevichite, "biotite", eudialyte, catapleiite, apophyllite, fluorapatite, calcite. (Mt. Kukisvumchorr, Kola Peninsula, Russia).

Distribution: On Marchenko Peak, northern part of Mt. Kukisvumchorr, Khibiny massif, Kola Peninsula, Russia. In Canada, from near Saint-Amable, Quebec.

Name: For its relation to *ancylite*-(Ce) and its dominant content of *lanthanum*.

Type Material: St. Petersburg Mining Institute, St. Petersburg, 2092/1; Geological Museum, Kola Scientific Center, Apatity, Russia.

Andalusite Al_2SiO_5

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As euhedral crystals or columnar aggregates having nearly square cross sections, commonly elongated ‖ [001], to 20 cm. Also fibrous, compact, massive. *Twinning:* On {101}, rare.

Physical Properties: *Cleavage:* Good on {110}, poor on {100}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6.5–7.5 D(meas.) = 3.13–3.16 D(calc.) = 3.149

Optical Properties: Transparent to nearly opaque with inclusions. *Color:* Pink, violet, yellow, green, white, gray; in thin section, colorless to pink or green. *Streak:* White. *Luster:* Vitreous to subvitreous.
Optical Class: Biaxial (–) or (+). *Pleochroism:* Weak; X = reddish pink; $Y = Z$ = greenish yellow. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, strong. $\alpha = 1.632$ $\beta = 1.636$ $\gamma = 1.643$ 2V(meas.) = 71°–86°

Cell Data: *Space Group: Pnnm.* $a = 7.7980(7)$ $b = 7.9031(10)$ $c = 5.5566(5)$ Z = 4

Total	100.14	100.00

(1) Goat Mountain, Shoshone Co., Idaho, USA. (2) Al_2SiO_5.

Polymorphism & Series: Trimorphous with kyanite and sillimanite; forms a series with kanonaite.

Occurrence: A result of contact metamorphism of argillaceous sediments, also in regionally metamorphosed schists. Rare in granites and pegmatites, which however afford the largest crystals. Detrital in some sandstones.

Association: Kyanite, sillimanite, cordierite, corundum, garnet, tourmaline, mica.

Distribution: Widespread; some localities for good crystals follow. From Hornachuelos, near Córdoba, Córdoba Province, Spain. On the Lisens Alp, Selraintal, Tirol, Austria. At Gefrees, Bodenmais, and elsewhere in Bavaria, Germany. From the Claggau quarry, Co. Galway, Ireland. In the USA, from Lancaster, Worcester Co., Massachusetts; Leiperville, Delaware Co., Pennsylvania; around Custer, Custer Co., South Dakota; in California, from Fresno, Fresno Co., near Ogilby, Cargo Muchacho Mountains, Imperial Co., and near Daltons Ranch, Madera Co. From Mt. Howden, Bimbowrie, South Australia. At Nawalapitiya, Sri Lanka. Gem crystals from the Santa Teresa district, Espírito Santo, Brazil.

Name: For an occurrence in the Andalusia region, Spain.

Andersonite $Na_2Ca(UO_2)(CO_3)_3 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}m$. As rhombohedra, pseudocubic or flattened and with complex form development, to 1 cm; typically in crystalline crusts, granular.

Physical Properties: Hardness = n.d. D(meas.) = 2.8 D(calc.) = 2.86 Radioactive; soluble in H_2O; fluoresces bright pale green to yellow-green under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Bright green to yellow-green. *Optical Class:* Uniaxial (+). *Pleochroism: O* = colorless; *E* = pale yellow. $\omega = 1.520$ $\epsilon = 1.540$

Cell Data: *Space Group:* $R\overline{3}m$ (synthetic). $a = 17.902(4)$ $c = 23.734(4)$ Z = 18

X-ray Powder Pattern: Hillside mine, Arizona, USA.
13.0 (10), 7.97 (10), 5.68 (10), 5.22 (10), 3.71 (8), 3.00 (7), 4.35 (6)

Chemistry:

	(1)	(2)

Na_2O	9.3	9.62
H_2O	[16.7]	16.78
Total	[100.0]	100.00

(1) Hillside mine, Arizona, USA; after deduction of gypsum 3.4%, H_2O by difference; corresponds then to $Na_{2.00}(Ca_{0.92}Mg_{0.08})_{\Sigma=1.00}(UO_2)_{1.01}(CO_3)_{2.97} \cdot 5.92H_2O$. (2) $Na_2Ca(UO_2)(CO_3)_3 \cdot 6H_2O$.

Occurrence: An uncommon secondary mineral, formed in the oxidized zone of uranium-bearing hydrothermal polymetallic deposits; may be post-mine, coating walls of mine tunnels.

Association: Schröckingerite, bayleyite, shwartzite, boltwoodite, liebigite, gypsum.

Distribution: In the USA, in Arizona, from the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., and in the Cameron area, Coconino Co.; in Utah, in Grand Co., from the Parco No. 23 mine and Skinny No. 1 mine, southeast of Thompsons, with large crystals at the Bumblebee mine, Seven Mile Canyon, and elsewhere; in Emery Co., at the Delta mine; in San Juan Co., large crystals from the Atomic King No. 2 mine, south of Moab, and nearby mines in Cane Wash, and at the Repete mine. In Colorado, from the Deremo-Snyder mine, San Miguel Co.; large crystals found in the Ambrosia Lake district, McKinley Co., New Mexico; at Jim Thorpe, Carbon Co., Pennsylvania. From Myrthengraben, Semmering Pass, Austria. In the Geevor mine, St. Just, Cornwall, England. At Stripa, Västmanland, Sweden. From Rozna and Jáchymov (Joachimsthal), Czech Republic. In the Huemul mine, Malargüe district, Mendoza Province, Argentina.

Name: Honors Charles Alfred Anderson (1902–1990), geologist with the U.S. Geological Survey, who collected the first samples.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106112–106115.

Andesine $Na_{0.7-0.5}Ca_{0.3-0.5}Al_{1.3-1.5}Si_{2.7-2.5}O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals rare, to 2 cm; commonly massive, cleavable, or granular. *Twinning:* Commonly twinned after Albite, Pericline, and Carlsbad laws. Also twinned after a law similar to the Manebach law.

Physical Properties: *Cleavage:* Perfect on {001}, less perfect on {010}; {110} also observed. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 2.66–2.68 D(calc.) = 2.68

Optical Properties: Transparent to translucent. *Color:* White, gray, green, yellow, flesh-red. *Streak:* White. *Luster:* Subvitreous to pearly.
Optical Class: Biaxial (+). *Dispersion:* $r > v$, weak. $\alpha = 1.545–1.556$ $\beta = 1.548–1.558$ $\gamma = 1.552–1.563$ 2V(meas.) = 78°–90° (low); 73°–80° (high).

Cell Data: *Space Group:* $P\overline{1}$. $a = 8.151(3)$ $b = 12.829(5)$ $c = 14.206(7)$ $\alpha = 93.62(3)°$ $\beta = 116.21(2)°$ $\gamma = 89.70(2)°$ Z = 8

X-ray Powder Pattern: Crestmore, Riverside Co., California, USA (low).
3.21 (100), 3.18 (90), 4.04 (80), 3.76 (70), 3.65 (70), 3.14 (70), 2.93 (70b)

MgO	trace			H_2O^-	0.05		
CaO	8.45	6.30	10.38	Total	100.11	100.00	100.00

(1) Beaver Bay, Lake Co., Minnesota, USA. (2) $Na_{0.70}Ca_{0.30}Al_{1.30}Si_{2.70}O_8$. (3) $Na_{0.50}Ca_{0.50}Al_{1.50}Si_{2.50}O_8$.

Polymorphism & Series: Low and high temperature variants differing in structural detail are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: Widespread in igneous rocks of intermediate silica content, as syenites and andesites. Characteristic of granulite to amphibolite facies metamorphism, commonly as antiperthite; as detrital grains in sedimentary rocks.

Association: Quartz, potassic feldspar, biotite, "hornblende," magnetite.

Distribution: A widespread mineral, although crystals are not common. In the andesite lavas of the Andes Mountains, South America, as at Marmato, Columbia. Around St. Raphaël, Estérel Mountains, Var, and near Chagey, Haute-Saône, France. At Bodenmais, Bavaria, Germany. On Mt. Arcuentu, Sardinia, Italy. From Vapnefjord, Iceland. At Sannidal and Arendal, Norway. In the USA, at Sanford, York Co., Maine. In Japan, at Kaneda, Miyagi Prefecture; Naka, Iwojima Island; Kuzuhara, Toyama Prefecture; and a number of other places. From Minsen, Korea. At Cape Grant, Victoria, Australia.

Name: For the Andes Mountains of South America where it is abundant in the lavas.

(1) Oruro, Bolivia. (2) Baia Sprie, Romania. (3) $PbAgSb_3S_6$.

Occurrence: In low-temperature polymetallic hydrothermal veins.

Association: Stibnite, sphalerite, barite, fluorite, siderite, quartz (Baia Sprie, Romania); cassiterite, arsenopyrite, stannite, zinkenite, tetrahedrite, pyrite, alunite, quartz (Itos mine, Bolivia); pyrargyrite, stephanite, sphalerite, rhodochrosite, quartz (Morey, Nevada, USA).

Distribution: In Romania, from Baia Sprie (Felsőbánya) [TL]. In the Czech Republic, at Třebsko, near Příbram. In the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. From the Les Farges mine, near Ussel, Corrèze; and at Bournac, Montagne Noire, Finistère, France. In the USA, at the Keyser and Morey mines, Morey district, Nye Co., Nevada; in the Thompson mine, Darwin district, Inyo Co., California; and at Bear basin, King Co., Washington. From near Takla Lake, British Columbia, and near Nansen Creek, Yukon Territory, Canada. In Bolivia, in the Itos and San José mines, Oruro; at the Tatasi mine, and Cerro Rico, Potosí. In Australia, from the Meerschaum mine, north of Omeo, Victoria.

Name: For Andor von Semsey (1833–1923), Hungarian nobleman, who was also an amateur mineralogist.

(1) Oruro, Bolivia. (2) Baia Sprie, Romania. (3) $PbAgSb_3S_6$.

Occurrence: In low-temperature polymetallic hydrothermal veins.

Association: Stibnite, sphalerite, barite, fluorite, siderite, quartz (Baia Sprie, Romania); cassiterite, arsenopyrite, stannite, zinkenite, tetrahedrite, pyrite, alunite, quartz (Itos mine, Bolivia); pyrargyrite, stephanite, sphalerite, rhodochrosite, quartz (Morey, Nevada, USA).

Distribution: In Romania, from Baia Sprie (Felsőbánya) [TL]. In the Czech Republic, at Třebsko, near Příbram. In the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. From the Les Farges mine, near Ussel, Corrèze; and at Bournac, Montagne Noire, Finistère, France. Andradite $Ca_3Fe_2^{3+}(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly well-crystallized dodecahedra, trapezohedra, or combinations, to 5 cm. Also granular to massive.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 6.5–7 D(meas.) = 3.8–3.9 D(calc.) = 3.859

Optical Properties: Transparent to translucent. *Color:* Yellow, greenish yellow to emerald-green, dark green; brown, brownish red, brownish yellow; grayish black, black; may be sectored. *Streak:* White. *Luster:* Adamantine to resinous, dull.
Optical Class: Isotropic; typically weakly anisotropic. $n = 1.887$

Cell Data: *Space Group: Ia3d.* $a = 12.056$ Z = 8

X-ray Powder Pattern: Synthetic.
2.696 (100), 3.015 (60), 1.6112 (60), 2.462 (45), 1.9564 (25), 1.6728 (25), 1.1195 (25)

Chemistry:

	(1)	(2)
SiO_2	34.91	35.47
TiO_2	trace	
Al_2O_3	0.69	
Fe_2O_3	30.40	31.42
MgO	0.58	
CaO	33.20	33.11
H_2O^-	0.19	
Total	99.97	100.00

(1) Reškovic stream, Serbia, Yugoslavia; corresponds to $(Ca_{3.01}Mg_{0.07})_{\Sigma=3.08}(Fe^{3+}_{1.94}Al_{0.02})_{\Sigma=1.96}(Si_{2.95}Al_{0.05})_{\Sigma=3.00}O_{12}$. (2) $Ca_3Fe_2(SiO_4)_3$.

Polymorphism & Series: Forms two series, with grossular, and with schorlomite.

Mineral Group: Garnet group.

Occurrence: In skarns from contact metamorphosed impure limestones or calcic igneous rocks; in chlorite schists and serpentinites; in alkalic igneous rocks, then typically titaniferous.

Association: Vesuvianite, chlorite, epidote, spinel, calcite, dolomite, magnetite.

Distribution: Widespread; fine examples from; in Italy, at Frascati, Alban Hills, Lazio; the Val Malenco, Lombardy; the Ala Valley, Piedmont; and Larcinaz, Val d'Aosta. At Dognecea (Dognaczka) and Oraviţa (Oravicza), Banat, Romania. From Ocna de fier, Romania (Vaskö, Hungary). At Zermatt, Valais, Switzerland. From Arendal, Norway. In the Wessels mine, near Kuruman, Cape Province, South Africa. In Russia, gem crystals from the Bobrovka River, Nizhni Tagil district, and the Sissertsk district, Ural Mountains; at Sineretschenskoje, north of Vladivostock. In the USA, from Stanley Butte, Graham Co., Arizona; on Garnet Hill, Calaveras Co., and around the Gem mine, San Benito Co., California; at Franklin and Sterling Hill, Sussex Co., New Jersey; from Magnet Cove, Hot Spring Co., Arkansas; and on Prince of Wales Island, Alaska. In Mexico, found near Charco de Peña, about 75 km east of Lázaro Cárdenas, Chihuahua.

Name: After J.B. d'Andrada e Silva (1763–1838), Brazilian mineralogist who described a variety.

K_2O	0.65	
Total	100.91	100.00

(1) Mt. Nyiragongo, Congo; by electron microprobe. (2) $BaFe_2Si_2O_7$.

Occurrence: In vesicles of melilite-leucite-nephelinite; may represent crystallization of an associated green glass.

Association: Nepheline, leucite, clinopyroxene, kirschsteinite, melilite, apatite, magnetite, götzenite, troilite, glass.

Distribution: From the rim of Mt. Nyiragongo volcano, Kivu Province, Congo (Zaire).

Name: To honor André Marie Meyer (1890–?), Belgian geologist with the Geological Survey of the Belgian Congo, who first collected the mineral.

Type Material: University of Helsinki, Helsinki, Finland.

Polymorphism & Series: Forms a series with omeiite.

Occurrence: Of magmatic origin, as very rare inclusions in chromian spinel in chromitite bodies enclosed variously by augite peridotite, serpentinized dunite, harzburgite, and pyroxenite.

Association: Chromian spinel, pyrite, pyrrhotite, marcasite, magnetite, chalcopyrite, molybdenite, galena, millerite, violarite. Other platinum group minerals present are ruthenarsenite, sperrylite, ruthenian iridarsenite, irarsenite, irarsite, osarsite, osmiridium, ruthenian osmiridium, laurite, rutheniridosmine (Anduo, Tibet, China); chromian spinel, sperrylite, hollingworthite (Maja e Sukës deposit, Albania).

Distribution: From the Anduo chromite deposit, northern Tibet, China. At the Kapitanov chromite deposit, near Zvenyhorodka, Ukraine. From the Maja e Sukës chromite deposit, Tropoja massif, Albania.

Name: For the Chinese locality at Anduo.

Type Material: Chinese Geological Museum (City ?).

Angarfite $NaFe^{3+}_5(PO_4)_4(OH)_4 \cdot 4H_2O$

Crystal Data: Orthorhombic. *Point Group*: 222. Crystals prismatic to needle-like, elongate on [001], with poorly formed chisel-like terminations, to 2 mm.

Physical Properties: *Cleavage*: Poor on {010}. *Fracture*: Splintery. *Tenacity*: Brittle, slightly flexible splinters. Hardness = 2.5 D(meas.) = 2.76(3) D(calc.) = 2.771

Optical Properties: Transparent. *Color*: Orange-brown to red-brown. *Streak*: Pale brown. *Luster*: Vitreous.
Optical Class: Biaxial (+). α = 1.688(1) β = 1.696(1) γ = 1.708(2) 2V(meas.) = 80(3)° 2V(calc.) = 79° *Orientation*: $X = b$, $Y = c$, $Z = a$. *Pleochroism*: X = tan, Y = medium red-brown, Z = dark red-brown. *Absorption*: $X < Y < Z$. *Dispersion*: Strong, $r > v$.

Cell Data: *Space Group*: $C222_1$. a = 12.788(3) b = 17.894(4) c = 8.195(2) Z = 4

X-ray Powder Pattern: Angarf-Sud pegmatite, Tazenakht, Souss-Massa-Draâ region, Morocco. 9.016 (100), 3.355 (51), 10.463 (43), 6.459 (42), 1.463 (36), 1.926 (33), 3.026 (29)

Chemistry:

	(1)
Na_2O	2.69
MgO	4.76
Mn_2O_3	1.79
Fe_2O_3	37.36
P_2O_5	34.68
H_2O	[14.63]
Total	95.91

(1) Angarf-Sud pegmatite, Tazenakht, Souss-Massa-Draâ region, Morocco; average of 5 electron microprobe analyses, H_2O calculated from structure analysis; corresponding to $Na_{0.71}(Fe^{3+}_{3.83}Mg_{0.97}Mn^{3+}_{0.19})_{\Sigma=4.99}(P_{1.00}O_4)_4(OH)_{2.71}(H_2O)_{1.29} \cdot 4H_2O$.

Occurrence: Occurs in phosphate nodules in the intermediate zone of a granitic pegmatite by the reaction of Na-bearing hydrothermal solutions with primary triphylite.

Association: Triphylite, lipscombite–barbosalite, jahnsite-(NaFeMg), bederite.

Distribution: Angarf-Sud pegmatite, Tazenakht, Ouarzazate Province, Souss-Massa-Draâ region, Morocco.

Name: For the pegmatite body from which the first specimens were collected.

Type Material: Natural History Museum of Los Angeles County, California, USA (63428 and 63429).

References: (1) Kampf, A.R., S.J. Mills, R.M. Housley, G. Favreau, J.-C. Boulliard, and V. (2) (2014) Amer. Mineral., 99, 1511 (abs. ref. 1).

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals are tabular, with a number of forms, to 1 cm, generally in crystalline and globular incrustations.

Physical Properties: *Cleavage:* On {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 4.867 D(calc.) = 4.862

Optical Properties: Semitransparent. *Color:* Dark brown. *Streak:* Reddish brown. *Luster:* Adamantine to semimetallic.
Optical Class: Biaxial (+). *Pleochroism:* Strong; deep blood-red to reddish brown.
Absorption: $X < Z$. $\alpha = 2.13$ $\beta = \sim 2.2$ $\gamma = 2.40$ 2V(meas.) = Medium large.
Anisotropism: Strong.

Cell Data: *Space Group:* $P\bar{1}$. $a = 6.461(5)$ $b = 6.594(3)$ $c = 5.036(3)$ $\alpha = 106.21(5)°$ $\beta = 98.35(5)°$ $\gamma = 108.86(5)°$ Z = 1

X-ray Powder Pattern: Cerro Pululus, Argentina.
3.152 (10), 2.997 (7), 2.856 (5), 2.489 (5), 2.072 (5), 2.960 (4), 2.955 (4)

Chemistry:

	(1)	(2)
As_2O_5	32.2	41.85
SiO_2	5.81	
SnO_2	2.92	
Al_2O_3	2.82	
Fe_2O_3	55.8	58.15
Total	99.55	100.00

(1) Cerro Pululus, Argentina; contains Fe_2O_3 in excess, as hematite; about 3% Sb found in a separate determination; Fe_2O_3:As_2O_5 = 2.49 but found = 2 by XRF in comparison with synthetic material. (2) $Fe_4O_3(AsO_4)_2$.

Occurrence: Probably of exhalative origin, in tin ore.

Association: Cassiterite, hematite.

Distribution: From the Vela Yareta tin mine, on Cerro Pululus, east of Laguna Vilama, Jujuy Province, Argentina.

Name: To honor Dr. Victorio Angelelli (1908–), Argentinian mining geologist, Director of the Argentinian Geological Survey.

Type Material: n.d.

References: (1) Ramdohr, P., F. Ahlfeld, and F. Berndt (1959) Angelellit, ein natürliches triklines Eisen-Arsenat, $2Fe_2O_3 \cdot As_2O_5$. Neues Jahrb. Mineral., Monatsh., 145–151 (in German). Anglesite $PbSO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are typically elongated with rhomboidal cross-section, prismatic with large {210}, vertically striated, or large {011} with {101} and {102}; tabular on {001} or {100}; equant {111} and {211}, may exhibit 20 other minor forms, to 0.5 m. Also nodular, stalactitic, granular, massive, banded around a core of galena.

Physical Properties: *Cleavage:* {001}, good; {210}, distinct; {010}, less distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 6.38 D(calc.) = 6.36 May fluoresce yellow under UV.

Optical Properties: Transparent to opaque. *Color:* Colorless to white, commonly tinted gray; orange, yellow, green, blue, rarely violet; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine, resinous to vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, strong.
$\alpha = 1.877$ $\beta = 1.883$ $\gamma = 1.894$ 2V(meas.) = 68°–75°

Cell Data: *Space Group: Pnma.* $a = 8.482(2)$ $b = 5.398(2)$ $c = 6.959(2)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.001 (100), 4.26 (87), 3.333 (86), 2.067 (76), 3.220 (71), 3.813 (57), 2.028 (48)

Chemistry: (1) Modern analyses are lacking; identification depends on coincidence of X-ray and optical properties with those of the synthetic compound.

Mineral Group: Barite group.

Occurrence: Common in the oxidized zone of lead deposits, where it may constitute an important ore.

Association: Cerussite, leadhillite, lanarkite, caledonite, linarite, brochantite, malachite, mimetite, pyromorphite, wulfenite, massicot, gypsum, sulfur, galena.

Distribution: A few localities for well-crystallized specimens include: from Parys Mountain, Anglesey, Wales. In England, at Matlock and Cromford, Derbyshire, and Caldbeck Fells, Cumbria. From Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire, Scotland. At Bleiberg, Carinthia, Austria. From Mežica (Mies), Slovenia. In Germany, at Müsen, Littlefeld, Siegen, and other places in Siegerland. From Monteponi and Montevecchio, near Iglesias, Sardinia. In Russia, at Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, and at Nerchinsk, Siberia. From Sidi-Amor-ben-Salem, Tunisia. Fine crystals at the Touissit mine, near Oujda, Morocco. Very large crystals from Tsumeb, and in the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. In the USA, from the Wheatley mine, Phoenixville, Chester Co., Pennsylvania; in Idaho, from the Bunker Hill mine, Coeur d'Alene district, in the Hypotheek mine, south of Kingston, and the Last Chance and Tyler mines, Wardner, Shoshone Co.; in the Eureka Hill mine, Tintic district, Juab Co., Utah; from the Grand Reef mine, Graham Co., Arizona. In Mexico, from Los Lamentos, Chihuahua; in the Amelia mine, Santa Rosalia, Baja California; at San Felipe Canyon, Aconchi, Sonora. In Australia, large crystals from Broken Hill, New South Wales, and at Dundas, Tasmania.

Name: For its occurrence on the island of Anglesey, Wales.

Anhydrite $CaSO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals tabular on {010}, {100}, or {001} or equant with large pinacoidal faces; elongated along [100] or [001], to 15 cm, with about 40 forms recorded. Typically granular, nodular, parallel or divergent fibrous, massive. *Twinning:* Simple or repeatedly on {011}, common; contact twins rare on {120}.

Physical Properties: *Cleavage:* On {010}, perfect; on {100} nearly perfect; on {001} good to imperfect, yielding pseudocubic fragments. *Fracture:* Uneven to splintery. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 2.98(1) D(calc.) = 2.95

Optical Properties: Transparent to translucent. *Color:* Colorless to pale blue or violet if transparent; white, mauve, rose, pale brown or gray from included impurities; colorless in transmitted light. *Streak:* White to pale gray. *Luster:* Pearly on {010}, vitreous to greasy on {001}; vitreous on {100}.
Optical Class: Biaxial (+). *Pleochroism:* For violet varieties; X = colorless to pale yellow or rose; Y = pale violet or rose; Z = violet. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.567$–1.574 $\beta = 1.574$–1.579 $\gamma = 1.609$–1.618 2V(meas.) = 42°–44°

Cell Data: *Space Group: Amma.* $a = 6.993(2)$ $b = 6.995(2)$ $c = 6.245(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.499 (100), 2.849 (29), 2.3282 (20), 2.2090 (20), 1.8692 (16), 1.6483 (15), 1.7500 (11)

Chemistry:

	(1)	(2)		(1)	(2)
SO_3	58.37	58.81	CaO	41.13	41.19
CO_2	0.17		FeS_2	0.02	
$(Al,Fe)_2O_3$	0.06		Total	99.75	100.00

(1) Yonaibata mine, Hukusima Prefecture, Japan; after deduction of CO_2 as calcite, corresponds to $Ca_{0.99}S_{1.00}O_4$. (2) $CaSO_4$.

Occurrence: A major component in sedimentary evaporite deposits and in the cap rocks above salt domes, commonly formed by dehydration of gypsum; in igneous rocks, fumarolic deposits, and in seafloor hydrothermal chimneys, also an alteration product in hydrothermal mineral deposits.

Association: Gypsum, halite, sylvite, polyhalite, dolomite, calcite, magnesite, celestine, sulfur.

Distribution: Numerous occurrences worldwide. In Austria, from Hall, Tirol, at Ischl and Hallein, Salzburg, and Aussee, Styria. In Germany, in Saxony-Anhalt, from Stassfurt-Leopoldshall and Douglashall, near Westeregeln; at Wathlingen, near Celle, Lower Saxony, and elsewhere. Gemmy crystals from the Simplon Tunnel, Valais, Switzerland. In Italy, from the Campiano mine, Boccheggiano district, Tuscany; on Vesuvius, Campania. From the Faraday mine, Bancroft, Ontario, Canada. In the USA, from Paterson, Passaic Co., New Jersey; in the Fairfax quarry, Centreville, Fairfax Co., Virginia; large deposits in the Carlsbad potash district, Eddy Co., New Mexico; at the Boiling Salt Dome, Wharton Co., Texas. From Naica, Chihuahua, Mexico. In the Salt Range, Punjab, India. On Mt. Pinatubo, Philippines. At Morococha, Peru.

Name: From the Greek for *without water*, in contast to hydrous calcium sulfate minerals.

Type Material: Mining Academy, Freiberg, Germany, 16538.

Anilite Cu_7S_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As prismatic or platy crystals, to 5 mm. *Twinning:* Very common; the twin operations are symmetry operations that act on a pseudocubic subcell, producing "neighboring twins" in which individuals are difficult to distinguish.

Physical Properties: *Tenacity:* Sectile. Hardness = ∼3 VHN = n.d. D(meas.) = n.d. D(calc.) = 5.68

Optical Properties: Opaque. *Color:* Bluish gray. *Streak:* Black. *Luster:* Metallic. R_1–R_2: n.d.

Cell Data: *Space Group: Pnma.* $a = 7.89$ $b = 7.84$ $c = 11.01$ $Z = 4$

X-ray Powder Pattern: Ani mine, Japan. Many of the reported associations of digenite and djurleite, identified by powder diffraction, could be anilite and djurleite, as anilite transforms to digenite during grinding.
1.956 (100), 2.77 (65), 3.20 (57), 2.16 (39), 1.677 (35), 2.54 (31), 2.59 (29)

Chemistry:

	(1)	(2)	(3)
Cu	79.2	80.1	77.6
S	21.7	22.7	22.4
Total	100.9	102.8	100.0

(1–2) Ani mine, Japan; by electron microprobe. All specimens contained some djurleite, $Cu_{31}S_{16}$. (3) Cu_7S_4.

Occurrence: In a drusy quartz vein (Ani mine, Japan); in a Kuroko ore deposit (Matsumine mine, Japan).

Association: Djurleite, covellite (Ani mine, Japan); yarrowite, spionkopite, djurleite, wittichenite, tennantite, chalcopyrite, bornite (Yarrow Creek, Canada); in red beds (Timna Formation, Israel; near Zurich, Switzerland).

Distribution: In Japan, in Akita Prefecture, from the Ani mine [TL], and in the Matsumine mine. At Neudorf, Harz Mountains, Germany. Found northeast of Zurich, Switzerland. From the Lubin and Rudna copper mines, near Legnica, Zechstein copper district, Lower Silesia, Poland. At Bor, Serbia. In the Castletown mine, Lochgilphead, Scotland. From near Nizhni Tagil, Ural Mountains, Russia. In the Timna Formation, southern Israel. In the Estrella mine, Atacama, Chile. From Yarrow Creek, southwestern Alberta, Canada. At Wallaroo, South Australia.

Name: For the Ani mine, Japan.

Type Material: National Science Museum, Tokyo, Japan.

Total	99.0852

(1) Ankang Co., China; by electron microprobe, V^{3+} verified by X-ray photoelectron spectroscopy; corresponding to $Ba_{1.09}(Ti_{5.48}V_{2.41}Cr_{0.22})_{\Sigma=8.11}O_{16}$.

Mineral Group: Cryptomelane group.

Occurrence: In a quartz vein.

Association: Barite, barytocalcite, roscoelite, diopside.

Distribution: From the Shiti barite deposit, Ankang Co., Shaanxi Province, China.

Name: For Ankang Co., Shaanxi Province, China, where it occurs.

Type Material: n.d.

Ankerite $Ca(Fe^{2+}, Mg, Mn^{2+})(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Crystals rhombohedral $\{10\overline{1}1\}$, with curved or saddle-shaped faces; prismatic to tabular $\{11\overline{2}0\}$ with $\{0001\}$, or pseudo-octahedral with equal development of $\{10\overline{1}1\}$ and $\{0001\}$, to 5 cm; columnar, stalactitic, granular, massive. *Twinning:* Simple twins with $\{0001\}$, $\{10\overline{1}0\}$, or $\{11\overline{2}0\}$ as twin plane.

Physical Properties: *Cleavage:* On $\{10\overline{1}1\}$, perfect. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.93–3.10 D(calc.) = 3.11

Optical Properties: Translucent to transparent. *Color:* Brown, yellow, white; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to pearly. *Optical Class:* Uniaxial (–). *Dispersion:* Strong. $\omega = 1.690–1.750$ $\epsilon = 1.510–1.548$

Cell Data: *Space Group:* $R\overline{3}$. $a = 4.8312(2)$ $c = 16.1663(3)$ $Z = 3$

X-ray Powder Pattern: Minntac mine, Mountain Iron, St. Louis Co., Minnesota, USA. (ICDD 41-586).
2.906 (100), 1.7974 (6), 2.203 (5), 1.818 (5), 2.024 (4), 3.714 (3), 2.414 (3)

Chemistry:

	(1)		(1)
CO_2	[42.30]	MgO	7.73
FeO	17.56	CaO	27.49
MnO	4.92	Total	[100.00]

(1) Sokoman Formation, Canada; by electron microprobe, total Fe as FeO, total Mn as MnO, CO_2 by difference; corresponding to $Ca_{0.98}(Fe_{0.49}Mg_{0.38}Mn_{0.14})_{\Sigma=1.01}(CO_3)_{2.00}$.

Polymorphism & Series: Forms two series, with dolomite and with kutnohorite.

Mineral Group: Dolomite group.

Occurrence: Formed in low-grade metamorphosed ironstones and sedimentary banded iron formations; in carbonatites; authigenic, diagenetic, or the product of hydrothermal alteration of carbonate sediments and in hydrothermal sulfide veins.

Association: Siderite, dolomite.

Distribution: Many localities, but only a few have fine crystals or abundant material; regarded as a variety of dolomite by many older authors. In Austria, in Styria, from the Erzberg, Eisenerz, and at Gollrad; Steiermark. In the Brosso mine, northwest of Ivrea, Torino, Italy. From the Oldham area, Lancashire, England. In the USA, at the Roxbury iron mine, Litchfield Co., Connecticut; in the Jeffrey quarry, near Little Rock, Pulaski Co., Arkansas; from the Eagle mine, Gilman district, Eagle Co., and many other places in Colorado. At Muzo, Boyacá Province, Colombia. Large crystals from the Tui mine, North Island, New Zealand. Abundant worldwide in iron formation, with studied material from: the Mesabi Range, Minnesota, USA. In the Sokoman Iron Formation, Howells River area, Quebec, Canada. From the Dales Gorge Member, Hamersley Group, Western Australia.

Name: Honors Professor Matthias Joseph Anker (1772–1843), Austrian mineralogist.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 208–217. (2) Chang, L.L.Y., R.A. Howie, and J. Ankinovichite $(Ni,Zn)Al_4(VO_3)_2(OH)_{12}•2H_2O$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As prismatic to bladed crystals to 0.5 mm. V-shaped twins noted.

Physical Properties: *Cleavage:* Perfect (010). *Fracture:* n.d. *Tenacity:* Brittle. Hardness = 2.5-3 VHN = 68 D(meas.) = 2.48(2) D(calc.) = 2.476

Optical Properties: Transparent. *Color:* Colorless to bluish light green. *Streak:* n.d. *Luster:* Vitreous.
Optical Class: Biaxial (+). α = 1.653(2) β = 1.677(2) γ = 1.706(3) 2V(meas.) = 86(2)° 2V(calc.) = 86° *Dispersion:* Strong, $r < v$. *Pleochroism:* None.

Cell Data: Space Group: $P2_1/n$. a = 17.8098(8) b = 5.1228(2) c = 8.8665(4) β = 92.141(1)° Z = 2

X-ray Powder Pattern: Mount Kara-Chagyr, Krygyzstan.
8.89 (100), 7.83 (100), 1.970 (80), 1.904 (70), 3.266 (50), 1.605 (50), 3.354 (40)

Chemistry:

	(1)
Al_2O_3	33.82
SiO_2	0.59
V_2O_5	28.41
FeO	0.14
NiO	8.43
CuO	0.27
ZnO	2.24
H_2O	23.30
Total	97.20

(1) Mount Kara-Chagyr, Krygyzstan; electron microprobe analysis, H_2O by Penfield method, VO_4 confirmed by IR spectroscopy, corresponding to $(Ni_{0.68}Zn_{0.17}Cu_{0.02}Fe_{0.01})_{\Sigma=0.88}Al_4(VO_3)_{1.88}Si_{0.06}(OH)_{12.12}(H_2O)_{2.67}$.

Occurrence: A low-temperature hydrothermal or weathering-derived mineral. As overgrowths on alvanite in vanadium-bearing schists (Kurumsak); also occurs in fractures and as cement in schist fragments within a serpentinite matrix (Mount Kara-Chagyr).

Association: Alvanite, volborthite, carnotite, goethite (Kurumsak); allophone, kolovratite, volborthite, nickelalumite, metatyuyamunite, roscoelite, tangeite, gypsum (Mount Kara-Chagyr).

Distribution: Kurumsak, Chemkent Oblast, Kara-Tau Range, southern Kazakhstan, and Mount Kara-Chagyr, Isfayramsay River, Osh Oblast, Krygyzstan.

Name: Honors mineralogist Ekaterina Aleksandrovna Ankinovich (1911-1991) and geologist Stepan Gerasimovich Ankinovich (1912-1985).

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 6798.

Annabergite $Ni_3(AsO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare crystals, typically poorly formed, elongated along [001], flattened on [010], with {001}, {010}, {100}, several modifying forms, to 5 mm; usually as fibrous veinlets, crystalline crusts, or earthy.

Physical Properties: *Cleavage:* {010}, perfect; {100}, {$\bar{1}$02}, indistinct. *Tenacity:* Sectile; thin {010} laminae flexible. Hardness = 1.5–2.5 D(meas.) = 3.07 D(calc.) = 3.146

Optical Properties: Transparent to translucent. *Color:* Apple-green, pale green, pale rose or pale pink, white, gray; may be zoned. *Streak:* Pale green to white. *Luster:* Subadamantine, pearly on cleavages, may be dull, earthy.
Optical Class: Biaxial (+), may be biaxial (–). *Orientation:* $X = b$; $Z \wedge c = 36°$.
Dispersion: $r > v$. $\alpha = 1.622$ $\beta = 1.658$ $\gamma = 1.687$ 2V(meas.) = 84°

Cell Data: *Space Group:* $C2/m$. $a = 10.179(2)$ $b = 13.309(3)$ $c = 4.725(1)$ $\beta = 105.00(1)°$ Z = 2

X-ray Powder Pattern: Locality unknown. (ICDD 11-625).
6.58 (100), 2.98 (30), 3.18 (26), 7.82 (25), 4.33 (20), 2.71 (18), 2.67 (14)

CoO	3.40		Total	100.48	100.00

(1) Cobalt, Canada. (2) $Ni_3(AsO_4)_2 \cdot 8H_2O$.

Polymorphism & Series: Forms a series with erythrite.

Mineral Group: Vivianite group.

Occurrence: An uncommon secondary mineral, formed by the alteration of Co–Ni-bearing arsenides and sulfides, in the oxidized zone of hydrothermal mineral deposits.

Association: Erythrite, retgersite, gersdorffite, nickeline, maucherite, nickel-skutterudite.

Distribution: Many localities, but typically in small amounts. In Germany, from Annaberg and Schneeberg, Saxony; at Richelsdorf, Hesse. From Dobšiná (Dobschau), Slovakia. At Leogang, Salzburg, Austria. In the Sierra Cabrera, Almería Province, and at Molvizar, Granada Province, Spain. In England, in the Dolcoath mine, Cornwall; from the Coniston mines, Coniston, Cumbria. At Strathclyde and Galloway, Leadhills-Wanlockhead district, Scotland. Fine examples from the Kamariza, Plaka, and Verzekos mines, and along the road to Laurium, Greece. From the Bou Azzer district, Morocco. In the Tchah Shurch, and at the Talmessi mine, Anarak district, Iran. At the La Sorpresa mine, Tapacari, Cochabamba, Bolivia. In the Gloria mine, Alisito, Sinaloa, Mexico. In the USA, at the Ore Hill mine, Pacoima Canyon, Los Angeles Co., and in the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; from the Nickel and Lovelock mines, Table Mountain district, Churchill Co., Nevada; at the Snowbird mine, Mineral Co., Montana; and in the Alhambra mine, Grant Co., New Mexico. At Cobalt, Ontario, Canada. In the 132 North deposit, Widgiemooltha district, Western Australia, and at several localities in the Flinders Ranges, South Australia. From the Horai mine, Hyogo Prefecture, and at Kuchisaka, Osaka Prefecture, Japan.

Name: For its originally noted occurrence at Annaberg, Germany.

(1) Moina skarn, Tasmania; by electron microprobe, original total given as 97.78%. (2) Kawai mine, Japan; by electron microprobe. (3) $KFe_3AlSi_3O_{10}(OH)_2$.

Polymorphism & Series: 1M polytype.

Mineral Group: Mica group.

Occurrence: In magnesium-poor igneous and metamorphic rocks.

Association: /Fluorite, zircon (Rockport, Massachusetts, USA).

Distribution: In the USA, from Cape Ann, east of Rockport, Essex Co., Massachusetts, and on Pikes Peak, El Paso Co., Colorado. From Mont Saint-Hilaire, Quebec, Canada. In the Moina tungsten skarn deposit, 40 km southwest of Devonport, Tasmania. From the Kawai mine, Ena, Gifu Prefecture, Japan. In Russia, at Katugin, Siberia, and Sludorudnik, Ural Mountains. From Flowerdale, near Gairloch, Scotland.

Name: For the first-noted occurrence at Cape Ann, Massachusetts, USA.

Chemistry:

	(1)	(2)
As	58.21	60.91
S	38.72	39.09
Total	96.94	100.00

(1) Palomo mine, Castrovirreyna Province, Huancavelica Department, Peru; average of 4 electron microprobe analyses, corresponding to $As_{1.96}S_{3.04}$. (2) As_2S_3.

Polymorphism & Series: Dimorphous with orpiment.

Occurrence: A very low-temperature hydrothermal mineral.

Association: Dufrénoysite, muscovite, orpiment, pyrite, realgar.

Distribution: At the Palomo mine, Castrovirreyna Province, Huancavelica Department, Peru.

Name: Alludes to the mineral's triclinic (*an*orthic) symmetry and dimorphous relation to *orpiment*.

Type Material: Natural History Museum of Los Angeles County, USA, # 63514 & 63544; Mineral Museum of the University of Arizona, Tucson, USA, #19326.

(1) Crookdene, Northumberland, England. (2) $Na_{0.10}Ca_{0.90}Al_{1.90}Si_{2.10}O_8$. (3) $CaAl_2Si_2O_8$.

Polymorphism & Series: Trimorphous with dmisteinbergite and svyatoslavite; low- and high-temperature structural modifications are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: A rare constituent of mafic plutonic and volcanic rocks. In some granulite facies metamorphic rocks; in metamorphosed carbonate rocks; with corundum deposits. Known from meteorites.

Association: Olivine, pyroxene, corundum.

Distribution: A widely distributed rock-forming mineral. Classic occurrences include: from Monte Somma and Vesuvius, Campania; on Mt. Monzoni, Val di Fassa, Trentino-Alto Adige; and from the Cyclopean Islands, Italy. At Tunaberg, Södermanland, Sweden. From near Lojo, Finland. At Bogoslovsk and Barsowka, Ural Mountains, Russia. On Miyakejima Island, Tokyo Prefecture; at Toshinyama, Tochigi Prefecture; the Zao volcano, Yamagata Prefecture; Otaru, Hokkaido; and other places in Japan. In the USA, on Great Sitkin Island, Aleutian Islands, Alaska; from Grass Valley, Nevada Co., California. On Amitok Island, Labrador, Newfoundland, Canada.

Name: From the Greek for *oblique*, for its triclinicity.

(1) Mt. Erebus, Ross Island, Antarctica; corresponds to $(Na_{0.64}Ca_{0.18}K_{0.17})_{\Sigma=0.99}(Al_{0.98}Fe^{2+}_{0.02}Fe^{3+}_{0.01})_{\Sigma=1.01}(Si_{2.81}Al_{0.19})_{\Sigma=3.00}O_8$.

Mineral Group: Feldspar (alkali) group; intermediate between low sanidine and high albite.

Occurrence: In high-temperature sodic volcanic and hypabyssal rocks.

Association: Typically in a fine-grained groundmass or weathered out as loose crystals.

Distribution: Rather abundant worldwide. Some localities for well-characterized material include: on Pantelleria and Ustica Islands, Italy. At Larvik, Norway. From Berkum, North Rhine-Westphalia, Germany. On Grande Caldeira Island, Azores. At Ropp, Nigeria. On Mt. Kenya, Kenya. From Kilimanjaro, Tanzania. At Chilposan, near Minchon, North Korea. From Ogaya, Toyama Prefecture, and Madarajima, Saga Prefecture, Japan. At Kakanui, New Zealand. From Mt. Anakie and Mt. Franklin, Daylesford, Victoria, Australia. Large crystals from Mt. Erebus, Ross Island, Antarctica. At Boron, Kern Co., California, USA.

Name: From the Greek for *oblique* and *fracture*, descriptive of the cleavage.

(1) Don Juan Pond, Antarctica; corresponding to $Ca_{1.00}Mg_{0.04}Na_{0.03}Cl_{2.11} \cdot 6.25H_2O$. (2) Bristol Dry Lake, California, USA. (3) $CaCl_2 \cdot 6H_2O$.

Occurrence: A precipitate from highly saline brines under very arid conditions (Don Juan Pond, Antarctica; Bristol Dry Lake, California, USA); in stratified fresh to brackish to salt water columns in onshore "blue holes" (North Andros Island, Bahamas); an abundant component of inclusions in quartz in a zoned mafic pegmatoid (Bushveld complex, South Africa).

Association: Halite, gypsum, celestine (Bristol Dry Lake, California, USA).

Distribution: From Don Juan Pond, Wright Valley, and elsewhere around Mt. Erebus, Victoria Land, Antarctica. At Bristol Dry Lake, San Bernardino Co., California, USA. On North Andros Island, Bahamas. From the Bushveld complex, on Driekop Farm, Transvaal, South Africa.

Name: For its occurrence on the continent of Antarctica.

Type Material: n.d.

(1) Mt. Misobo mine, Congo; average of two analyses. (2) Bugarama mine, Rwanda; corresponds to $W_{1.00}Al_{0.97}O_{2.90}(OH)_{3.10}$. (3) $WAlO_3(OH)_3$.

Occurrence: In placers with cassiterite and wolframite and in quartz veins with ferberite, which appears to replace it (Mt. Misobo mine, Congo); in altered skarn (Kara mine, Tasmania).

Association: Ferberite, scheelite (Mt. Misobo mine, Congo); mpororoite, scheelite (Kara mine, Tasmania); raspite, ferberite, ferritungstite (Gifurwe mines, Rwanda): ferberite, scheelite, ferritungstite, russellite, mpororoite (Kalzas Mountain, Canada).

Distribution: From the Mt. Misobo tungsten mine, Kalima-Maniema district, and the Mierge mine, Kivu Province, Congo (Zaire). In the Bugarama and Gifurwe mines, Rwanda. In very large crystals from Bengo-Biri, Kalima, Congo Republic. In the Nyamulilo mine, Kigezi district, and the Bjordal mine, Kabole, Uganda. At the Kara mine, southwest of Burnie, Tasmania, Australia. From the Flo property, Kalzas Mountain, 67 km southeast of Mayo, Yukon Territory, Canada.

Name: For Raymond Anthoine (1884–?), Belgian mining engineer.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RGM2426.

Cu	41.3
AgCl	0.24
Cl	6.3
$H_2O^+ + OH$	35.5
H_2O^+	16.4
Total	99.74

(1) Centennial mine, Michigan, USA; Cu by electrolysis, H_2O:OH from charge balance, corresponding to $Cu_{1.00}[(OH)_{1.72}Cl_{0.28}]_{\Sigma=2.00} \cdot 2.80H_2O$.

Occurrence: In cavities and fractures in basalt, formed by the action of chlorine-bearing connate waters on copper (Centennial mine, Michigan, USA).

Association: Tremolite, quartz, epidote, monazite, copper, cuprite, paratacamite (Centennial mine, Michigan, USA).

Distribution: In the Centennial mine, Calumet, Houghton Co., Michigan and the Cole mine, Bisbee, Cochise Co., Arizona, USA. From Villa Hermosa, Sonora, Mexico. In Germany, at Richelsdorf, Hesse, in slag. From Laurium, Greece, in slag.

Name: For Professor John Williams Anthony (1920–1992), American mineralogist, University of Arizona, Tucson, Arizona, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 142653, 162617.

Fe_2O_3	0.65	CaO	0.17	Total	[99.87]

(1) Ochsenkogel, Gleinalpe, Austria; by electron microprobe, Fe^{2+}:Fe^{3+} by wet chemical analysis, H_2O calculated from stoichiometry; corresponding to $(Mg_{5.71}Fe^{2+}_{1.17}Fe^{3+}_{0.07}Ca_{0.02}Mn_{0.02}Na_{0.01})_{\Sigma=7.00}(Si_{7.95}Al_{0.05})_{\Sigma=8.00}O_{22}(OH)_{2.00}$.

Polymorphism & Series: Forms a series with magnesio-anthophyllite and ferro-anthophyllite.

Mineral Group: Amphibole (Fe–Mn–Mg) group: 0.1 $Mg/(Mg + Fe^{2+})$ 0.89; $(Ca + Na)_B < 1.34$; Li < 1.0; Si ≥ 7.0.

Occurrence: From medium- or high-grade metamorphism, in amphibolites, gneisses, metaquartzites, iron formations, granulites, and schists derived from argillaceous sediments, ultramafic, or mafic igneous rocks; a retrograde reaction product.

Association: Cordierite, talc, chlorite, sillimanite, mica, olivine, "hornblende," gedrite, magnesio-cummingtonite, garnet, staurolite, plagioclase.

Distribution: From Kongsberg and Snarum, Norway. At Schneeberg, Saxony, Germany. From Norberg, Sweden. At Heřmanov, Czech Republic. In Greenland, from Fiskenæsset. In the USA, from Chesterfield, Hampshire Co., Massachusetts; the Carleton talc mine, near Chester, Windsor Co., Vermont; near Media, Delaware Co., Pennsylvania; the Day Book deposit, near Spruce Pine, Mitchell Co., North Carolina; in California, at the Winchester quarry, Riverside Co., and near Coffee Creek, Carrville, Trinity Co.; in the Copper Queen mine, Prairie Divide, Park Co., Colorado. From Munglinup, Western Australia.

Name: From the Latin *anthophyllum*, meaning *clove*, in allusion to the mineral's color.

Antigorite $(Mg, Fe^{2+})_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. Minute crystals, typically platy along [001], rarely elongated along [010]; some plates have rectangular outline due to cleavage; commonly bladed or fibrous. *Twinning:* May exhibit two- or three-fold twins rotated 60° about an axis ⊥ [001].

Physical Properties: *Cleavage:* Perfect on {001}, observed on {100} and {010}. *Fracture:* Conchoidal or splintery. Hardness = 2.5–3.5 D(meas.) = 2.65 D(calc.) = 2.61

Optical Properties: Translucent to opaque. *Color:* Green, blue-green, white; colorless to pale green in thin section. *Streak:* White. *Luster:* Resinous, greasy, silky, waxy, earthy. *Optical Class:* Biaxial (–). *Orientation:* $X = c$. *Dispersion:* $r > v$. $\alpha = 1.558$–1.567 $\beta = 1.565$ $\gamma = 1.562$–1.574 2V(meas.) = 37°–61°

Cell Data: *Space Group:* Cm. $a = 43.53(1)$ $b = 9.259(3)$ $c = 7.263(7)$ $\beta = 91°8.4(1.6)'$ Z = 16

X-ray Powder Pattern: Griffen Range, Westland, New Zealand.

Polymorphism & Series: Polymorphous with clinochrysotile, lizardite, orthochrysotile, and parachrysotile.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Commonly replaces ultramafic rocks, pervasively or in crosscutting veinlets. As a replacement of siliceous dolostone along contacts with diabase sills.

Association: Chromite, magnetite, chrysotile, olivine.

Distribution: Widespread; less common however than lizardite. Some localities for well-studied material include: in the Val Antigorio, Piedmont, Italy. From Prägraten, Tirol, Austria. At Glen Urquhart, Inverness-shire, Scotland. From Hsiu-Yen Hsien, Liaoning Province, China. In the Nishisonnogi area, Nagasaki Prefecture, and the Sasagure area, Fukuoka Prefecture, Japan. From Woodsreef, New South Wales, Australia. In the USA, at Texas, Lancaster Co., Pennsylvania; around Baltimore, Baltimore Co., Maryland; from Brewster, Putnam Co., New York; and at Buck Creek, Clay Co., North Carolina. At Asbestos, Quebec, and Timmins, Ontario, Canada.

Name: For the occurrence at Val Antigorio, Italy.

Type Material: Swiss Federal Institute of Technology, Zurich, Switzerland, Wi4868.

(1) Guanajuato, Mexico; corresponds to $(Ag_{14.49}Cu_{1.84})_{\Sigma=16.33}(Sb_{2.00}As_{0.15})_{\Sigma=2.15}S_{11.00}$.
(2) Sonora, Mexico; corresponds to $(Ag_{11.60}Cu_{2.80})_{\Sigma=14.41}(Sb_{1.59}As_{0.38})_{\Sigma=1.97}S_{11.00}$.

Occurrence: Uncommon in epithermal precious metal veins.

Association: Acanthite, amethyst.

Distribution: In Mexico, from Guanajuato [TL] and an unknown locality in Sonora [TL]. In the USA, at the North Lily mine, Tintic district, Juab Co., Utah. From the Clara mine, near Oberwolfach, Black Forest, Germany. At Serra S'Ilixi, Sarrabus, Sardinia, Italy. In the Barquilla deposit, Salamanca Province, Spain. From the Zlata Bana deposit, Slanske vrchy Mountains, Slovakia. In the Pentire vein system, St. Minver, Cornwall, England. From the Seikoshi mine, Shizuoka Prefecture, Japan. Several additional poorly located occurrences are known.

Name: For its compositional relation to pearceite.

(1) Near Kaiyang, China; by electron microprobe, average of 14 analyses; corresponds to $(Sb_{1.87}Hg_{0.06}Cu_{0.05}As_{0.01})_{\Sigma=1.99}(Se_{2.99}S_{0.02})_{\Sigma=3.01}$. (2) Bentou deposit, China; by electron microprobe, corresponding to $Sb_{1.88}(Se_{2.96}S_{0.04})_{\Sigma=3.00}$. (2) Sb_2Se_3.

Occurrence: In uraniferous calcite veins in a hydrothermal U–Hg–Mo polymetallic deposit (near Kaiyan, China).

Association: Pyrite, sphalerite, galena, ferroselite, clausthalite, uraninite, cinnabar, hematite, calcite (near Kaiyan, China); gold, clausthalite, selenian famatinite, selenian gersdorffite, trüstedtite, selenian stibnite, quartz, barite (Qiongmo deposit, China).

Distribution: In China, from near Kaiyang, Guizhou Province [TL]; in the Bentou uranium deposit, not otherwise located in Hunan Province; and from the Qiongmo gold deposit, western Qinling Mountains, Shaanxi Province.

Name: For ANTIMONy and SELenium in the composition.

Type Material: Chinese Museum of Geology, Guizhou(?), China.

Antlerite $Cu_3(SO_4)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are thick tabular {010}, equant or short prismatic [001], with dominant {110}, another twenty-odd forms, to 2 cm; commonly fibrous and in cross-fiber veinlets, feltlike, granular or powdery lumps and aggregates.

Physical Properties: *Cleavage:* {010}, perfect; {100}, poor. *Tenacity:* Brittle.
Hardness = 3.5 D(meas.) = 3.88 D(calc.) = 3.93

Optical Properties: Translucent. *Color:* Emerald-green, blackish green, pale green.
Streak: Pale green. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = yellow-green; Y = blue-green; Z = green.
Orientation: $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, very strong. $\alpha = 1.726$ $\beta = 1.738$ $\gamma = 1.789$ 2V(meas.) = 53°

Cell Data: *Space Group: Pnam.* a = 8.244(2) $b = 11.987(3)$ $c = 6.043(1)$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 7-407).

(1) Chuquicamata, Chile; average of two analyses. (2) $Cu_3(SO_4)(OH)_4$.

Occurrence: Uncommon, typically formed in the oxidized zone of copper deposits under highly acid conditions, especially in arid regions.

Association: Brochantite, atacamite, chalcanthite, kröhnkite, natrochalcite, linarite, gypsum.

Distribution: In the USA, in Arizona, from the Antler mine, near Yucca Station, Mohave Co., large crystals at several mines in Bisbee, Cochise Co., from the Grandview mine, Grand Canyon, Coconino Co., in Copper Basin, between Skull Valley and Prescott, and at Jerome, Yavapai Co.; from the Blanchard mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; in the Darwin district, Inyo Co., California; from the Northern Light mine, near Black Mountain, Mountain View district, Mineral Co. and other minor occurrences in Nevada; at Kennicott, Alaska. From Puerto de Gomez, Chihuahua, Mexico. An important copper ore at Chuquicamata, Antofagasta, and from Remolinos, Atacama, Chile. At Ober-Planitz, near Zwickau, Saxony, Germany. From Caldbeck Fells, Cumbria, and at several mines in Cornwall, England. From Capdella, Lerida, Spain. A number of additional poorly characterized localities are known.

Name: For the Antler mine, Arizona, USA, where the first specimens were collected.

Type Material: NMNH, 47698.

Anyuiite $Au(Pb,Sb)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Rounded, elongated to platy polymetallic grains, to 0.9 mm, with rhombic to square outline; typically fine-grained granular massive.

Physical Properties: *Tenacity:* Plastic, malleable. Hardness = n.d. VHN = 142–153, 146 average (20 g load); 101–104, 101 average (20 g load) antimonian. D(meas.) = n.d. D(calc.) = 13.49

Optical Properties: Opaque. *Color:* Silvery gray, becoming dull lead-gray on oxidation; in reflected light, pale silvery gray with faint creamy tint, becoming dark gray with blue-black overtones. *Luster:* Metallic.
Optical Class: Biaxial. *Anisotropism:* Weak, silvery gray to gray. *Bireflectance:* Barely noticable.
R_1–R_2: (400) —, (420) 50.3–56.7, (440) 52.9–59.0, (460) 55.0–60.7, (480) 56.2–62.0, (500) 57.7–62.4, (520) 58.3–63.2, (540) 59.3–63.9, (560) 59.9–64.6, (580) 60.7–65.1, (600) 61.4–65.6, (620) 62.1–66.0, (640) 62.1–66.1, (660) 63.0–66.2, (680) 63.4–66.5, (700) 63.7–66.8

Cell Data: *Space Group:* $I4/mcm$ (by analogy to synthetic $AuPb_2$). $a = 7.39(2)$ $c = 5.61(3)$ $Z = 4$

X-ray Powder Pattern: Bol'shoi Anyui River basin, Russia.
5.22 (60), 2.33 (30), 3.74 (20), 2.59 (20), 1.55 (20), 1.130 (20), 2.82 (10)

Ag	0.35		
Au	32.6	34.3	36.7
Pb	64.8	59.0	52.9
Sb	0.3	5.8	10.2
Total	98.05	99.1	99.8

(1) Bol'shoi Anyui River basin, Russia; by electron microprobe, corresponding to $(Au_{1.05}Ag_{0.02})_{\Sigma=1.07}(Pb_{1.98}Sb_{0.02})_{\Sigma=2.00}$. (2) Do.; corresponding to $Au_{1.05}(Pb_{1.71}Sb_{0.29})_{\Sigma=2.00}$. (3) Do.; corresponding to $Au_{1.10}(Pb_{1.51}Sb_{0.49})_{\Sigma=2.00}$.

Occurrence: In placer concentrates derived from small ultramafic-gabbroid masses in a dunite-harzburgite formation (Bol'shoi Anyui River basin, Russia); in gold concentrates from placers (Hunchun River, China).

Association: Lead, gold, ilmenite, titanian magnetite, chrome spinel, hematite, pyrite, chalcopyrite, apatite (Bol'shoi Anyui River basin, Russia); gold, lead, hunchinite, pyrite, pyrrhotite, magnetite, ilmenite (Hunchun River, China).

Distribution: From tributaries of the Bol'shoi Anyui River, Chukot Peninsula, far northeastern Siberia, Russia [TL]. In the Sandogou placers, along the Hunchun River, Jilin Province, China.

Name: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Type Material: For its occurrence in the Bol'shoi Anyui River basin.

Apachite $Cu_9Si_{10}O_{29}\cdot 11H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, probable. *Point Group:* n.d. As minute, twisted or curved beaded spherules of radial fibers, composed of crystals; in seams, exhibiting a silky, fibrous structure on broken surfaces.

Physical Properties: Hardness = 2 D(meas.) = 2.80(2) D(calc.) = [3.26]

Optical Properties: Transparent to translucent. *Color:* Faïence-blue; in thin section, rich blue. *Luster:* Nonmetallic, silky.
Optical Class: Biaxial (–). *Orientation:* $Y \simeq$ length. $\alpha = 1.610$ $\beta = 1.650$ $\gamma = 1.650$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. $a = 12.89$ $b = 6.055$ $c = 19.11$ $\beta = 90.42°$ Z = [2]

X-ray Powder Pattern: Christmas, Arizona, USA.
12.89 (100), 3.168 (70), 7.663 (50), 10.62 (40), 9.556 (40), 4.491 (40), 4.174 (40)

Chemistry:

	(1)	(2)
SiO_2	40.8	39.66
FeO	0.3	
CuO	43.6	47.26
MgO	1.7	
CaO	1.8	
H_2O	13.8	13.08
Total	102.0	100.00

(1) Christmas, Arizona, USA; average of two analyses; after recalculation to 100%, corresponds to $(Cu_{7.87}Mg_{0.61}Ca_{0.46}Fe_{0.06})_{\Sigma=9.00}Si_{9.75}O_{28.5}\cdot 11H_2O$. (2) $Cu_9Si_{10}O_{29}\cdot 11H_2O$.

Occurrence: A retrograde metamorphic or mesogene mineral, formed at the expense of a prograde calc-silicate and sulfide assemblage in tactites; typically in fractures or crackled zones cutting garnet-diopside rock, replacing both these silicates and calcite.

Association: Kinoite, gilalite, stringhamite, junitoite, clinohedrite, xonotlite, apophyllite, calcite, tobermorite.

Distribution: In the Christmas copper mine, Gila Co., Arizona, USA.

Name: For the Apache Indians who inhabit the region in Arizona, USA, where it occurs.

Type Material: University of Arizona, Tucson, Arizona, USA; The Natural History Museum, London, England, 1980,532.

References: (1) Cesbron, F.P. and S.A. Williams (1980) Apachite and gilalite, two new copper silicates from Christmas, Arizona. Mineral. Mag., 43, 639–641. (2) (1980) Amer. Mineral., 65, 1065 (abs. ref. 1).

Aphthitalite $(K, Na)_3Na(SO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As crystals, tabular on {0001}, with trigonal appearance, to 7 cm; also in distorted pseudo-orthorhombic habits. In bladed aggregates, imperfectly mammillary, and in crusts. *Twinning:* On {0001} or repeated on $\{11\overline{2}0\}$, producing tabular pseudohexagonal composites.

Physical Properties: *Cleavage:* On $\{10\overline{1}0\}$, fair; on {0001}, poor. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.66–2.71 D(calc.) = 2.697 Soluble in H_2O, taste saline and bitter.

Optical Properties: Transparent to opaque. *Color:* White, colorless; gray, blue, green due to inclusions and impurities; colorless in transmitted light. *Luster:* Vitreous to resinous. *Optical Class:* Uniaxial (+), may be anomalously biaxial. ω = 1.487–1.493 ϵ = 1.492–1.503 2V(meas.) = Small.

Cell Data: *Space Group:* $P\overline{3}m1$. $a = 5.677$ $c = 7.3331$ Z = 1

X-ray Powder Pattern: Synthetic $K_3Na(SO_4)_2$.
2.839 (100), 2.940 (75), 2.042 (45), 4.09 (30), 3.67 (20), 2.443 (16), 2.330 (14)

Chemistry:

	(1)	(2)
SO_3	47.46	48.17
Na_2O	10.67	9.32
K_2O	41.87	42.51
Total	[100.00]	100.00

(1) Eddy Co., New Mexico, USA; recalculated to 100% after deduction of NaCl 2.15% and insoluble 0.06%, from an original total of 99.88%. (2) $K_3Na(SO_4)_2$.

Occurrence: An uncommon incrustation around volcanic fumaroles; a component of evaporite deposits; in guano deposits, then typically ammonian.

Association: Thénardite, jarosite, sylvite, hematite (fumaroles); blödite, syngenite, mirabilite, picromerite, borax, halite (evaporites); syngenite, whitlockite, monetite, niter, gypsum (guano).

Distribution: From Italy, in Campania, at Vesuvius and Monte Somma, in the Cesano geothermal field, east of Lake Bracciano, Lazio, and on Etna, Sicily. At Douglashall, near Westeregeln, Saxony-Anhalt, Germany. At Stebnyk and Kalusz, Ukraine. In the Boulby potash mine, northwest of Whitby, Yorkshire, England. Large crystals from Kuh-E-Namak, Qom salt dome, Iran. In the "Q" Basin [Jianghan Plain] potash deposits, Hubei Province, China. In the USA, from Searles Lake, San Bernardino Co., California; in the Carlsbad potash district, Eddy Co., New Mexico; on Kilauea, Hawaii; and on the Mount St. Augustine volcano, Alaska. From Paricutín volcano, near Uruapan, Michoacán, Mexico. On the Merapi volcano, Indonesia. In the Murra-el-elevyn, Petrogale, and Toppin Hill Caves, Western Australia.

Name: From the Greek for *unalterable* and *salt*, in allusion to its stability in air.

Apjohnite $Mn^{2+}Al_2(SO_4)_4 \cdot 22H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As fibrous to acicular crystals, to 3 cm; asbestiform, in crusts, massive.

Physical Properties: Hardness = 1.5 D(meas.) = 1.78–1.81 D(calc.) = 1.836 Soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* Colorless to white, also tinted pale red, green, or yellow. *Luster:* Silky in aggregates.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c \simeq 30°$. $\alpha = 1.478$ $\beta = 1.482$ $\gamma = 1.482$
2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1/c$. $a = 6.198(2)$ $b = 24.347(4)$ $c = 21.266(4)$
$\beta = 100.28(3)°$ Z = 4

X-ray Powder Pattern: Terlano, Italy.
3.515 (100), 4.82 (90), 3.792 (33), 4.33 (27b), 3.967 (23), 4.13 (22), 6.07 (20)

Chemistry:

	(1)	(3)
SO_3	33.51	36.00
Al_2O_3	10.65	11.46
MnO	6.60	7.98
MgO	0.36	
H_2O	48.15	44.56
Total	99.27	100.00

(1) Maputo Bay, Mozambique. (2) Terlano, Italy; AA partial analysis not given, corresponding to $(Mn_{0.64}Mg_{0.28}Zn_{0.06}Fe_{0.02})_{\Sigma=1.00}Al_2(SO_4)_4 \cdot 22H_2O$. (3) $MnAl_2(SO_4)_4 \cdot 22H_2O$.

Mineral Group: Halotrichite group.

Occurrence: As efflorescences.

Association: Halotrichite, pickeringite, gunningite, copiapite, epsomite.

Distribution: From Maputo (Delagoa) Bay, near Maputo (Lourenço Marques), Mozambique. At Terlano, Bolzano, Trentino-Alto Adige, Italy. From Smolník (Szomolnok), 16 km northeast of Rožňava, Slovakia. At Jáchymov (Joachimsthal), Czech Republic. In the USA, in Alum Cave, Sevier Co., Tennessee; at Alum Point, Salt Lake Co., Utah; from Creede, Mineral Co., Colorado; in Nevada, at the Twentieth Century mine, Nye Co., and long fibers at the Urania mine, Cactus Peak district; in the Dolores Tunnel mine, Old Placers district, Santa Fe Co., New Mexico.

Name: Honors Dr. James Apjohn (1796–1886), Professor of Chemistry and Mineralogy, Trinity College, Dublin, Ireland.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 527–528. (2) Menchetti, S. and C. Sabelli (1976) The halotrichite group: the crystal structure of apjohnite. Mineral. Mag., 40, 599–608.

Aplowite $(Co, Mn^{2+}, Ni)SO_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As finely granular efflorescences.

Physical Properties: Hardness = ∼3 D(meas.) = 2.33 D(calc.) = 2.36 Soluble in H_2O; dehydrates in air.

Optical Properties: Semitransparent. *Color:* Bright pink; light pink in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). $\alpha = 1.528$ $\beta =$ n.d. $\gamma = 1.536$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/n$. $a = 5.94$ $b = 13.56$ $c = 7.90$ $\beta = 90°31'$ Z = 4

X-ray Powder Pattern: Magnet Cove mine, Canada.
4.46 (10), 5.44 (9), 3.95 (8), 2.95 (7), 3.39 (6), 3.22 (5), 6.78 (4)

Chemistry: (1) Magnet Cove mine, Canada; partial X-ray spectrographic analysis corresponds to $(Co_{0.50}Mn_{0.25}Ni_{0.22}Cu_{0.01}Fe_{0.01}Zn_{0.01})_{\Sigma=1.00}SO_4 \cdot 4H_2O$.

Mineral Group: Rozenite group.

Occurrence: As efflorescences with sulfides (probably cobaltian and nickelian pyrite) on siderite–barite matrix from a hydrothermal Pb–Zn–Cu orebody associated with a large barite deposit.

Association: Moorhouseite, siderite, barite.

Distribution: From the Magnet Cove barite mine, four km southwest of Walton, Nova Scotia, Canada.

Name: Honors Albert Peter Low (1861–1942), Canadian geologist, former Director of the Geological Survey of Canada.

Type Material: National School of Mines, Paris, France; Canadian Geological Survey, Ottawa, Canada, 12145.

References: (1) Jambor, J.L. and R.W. Boyle (1965) Moorhouseite and aplowite, new cobalt minerals from Walton, Nova Scotia. Can. Mineral., 8, 166–171. (2) (1965) Amer. Mineral., 50, 809 (abs. ref. 1).

Apuanite $Fe^{2+}Fe^{3+}_4Sb^{3+}_4O_{12}S$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Very rarely as crystals, prismatic, thick tabular on {001} and bounded by {110}, {112}, and {114}; commonly massive.

Physical Properties: *Cleavage:* Perfect on {110}. Hardness = n.d. VHN = 240–480 (20 g load). D(meas.) = 5.33 D(calc.) = [5.22]

Optical Properties: [Opaque.] *Color:* Black. *Luster:* Metallic.
Optical Class: Uniaxial.
R_1–R_2: (470) 19.1–20.8, (546) 21.9–19.6, (589) 21.6–18.4, (650) 19.6–16.9

Cell Data: *Space Group:* $P4_2/mbc$. $a = 8.372(5)$ $c = 17.974(10)$ $Z = 4$

X-ray Powder Pattern: Buca della Vena mine, Italy.
3.168 (100), 1.922 (47), 2.957 (43), 1.647 (30), 2.646 (23), 2.434 (17), 5.90 (15)

Chemistry:

	(1)	(2)
Fe_2O_3	26.88	32.25
As_2O_3	3.48	
Sb_2O_3	53.82	58.87

ZnO	0.62	
S	2.70	3.24
$-O = S$	1.35	1.62
Total	93.19	100.00

(1) Buca della Vena mine, Italy; by electron microprobe, Fe^{2+}:Fe^{3+} from crystal-structure analysis; corresponds to $Fe^{2+}_{1.04}Zn_{0.08}Fe^{3+}_{3.57}(Sb^{3+}_{3.91}As^{3+}_{0.37})_{\Sigma=4.28}O_{12}S_{0.89}$. (2) $Fe^{2+}Fe^{3+}_4Sb_4O_{12}S$.

Occurrence: In an iron deposit in barite formed by low-grade metasomatic processes at the contact between phyllites and dolostones.

Association: Versiliaite, barite, magnetite, hematite, pyrite.

Distribution: In the Buca della Vena mine, northeast of Stazzema, Apuan Alps, Tuscany, Italy.

Name: For the Apuan Alps, Italy, where it was found.

Type Material: University of Pisa, Pisa, Italy, 3202; National School of Mines, Paris, France.

References: (1) Mellini, M., S. Merlino, and P. Orlandi (1979) Versiliaite and apuanite, two new minerals from the Apuan Alps, Italy. Amer. Mineral., 64, 1230–1234. (2) Mellini, M. and S. (1) Inagli massif, Sakha Republic, Russia; average of 5 electron microprobe analyses, H_2O by Penfield method, IR confirms H_3O^+, corresponding to $[(H_3O)_{7.94}Na_{2.74}K_{1.20}Sr_{0.49}Ba_{0.46}Fe_{0.23}Mn_{0.12}]_{\Sigma=13.18}Ca_{5.79}REE_{0.19})_{\Sigma=5.98}(Zr_{2.92}Ti_{0.08})_{\Sigma=3}(Si_{25.57}Ti_{0.21}Al_{0.19}Nb_{0.03})_{\Sigma=26}[O_{66.46}(OH)_{5.54}]_{\Sigma=72.0}[(OH)_{2.77}Cl_{1.23}]_{\Sigma=4.0}$.

Mineral Group: Eudialyte group.

Occurrence: In a hydrothermally altered perakaline pegmatite in an alkaline massif.

Association: Natrolite, microcline, eckermanite, aegirine, batisite, innelite, lorenzenite, thorite, galena.

Distribution: Inagli massif, ~30 km ESE of Aldan, Sakha Republic (former Yakutsk), Russia.

Name: From the Latin *aqua* in allusion to the role of "water" in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 2668/1).

References: (1) Khomyakov, A.P., G.N. Nechelyustov, and R.K. Aragonite $CaCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$. Isolated crystals short to long prismatic along [010], also acicular with chisellike terminations, dipyramidal, thick tabular with forms {001}, {110} and {010}, to 30 cm; as columnar crystal aggregates and crusts, globular, reniform, pisolitic, coralloidal, stalactitic, internally fibrous or banded. *Twinning:* Common by repeated contact twinning on {110}, yielding pseudohexagonal columnar trillings; also polysynthetic lamellae and striations ‖ [001].

Physical Properties: *Cleavage:* {010}, distinct; {110} and {011}, imperfect. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 2.95 D(calc.) = 2.930 Cathodoluminescent, fluorescent red or yellow under LW and SW UV, phosphorescent.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, also gray, pale shades of yellow, blue, violet, green, red; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, resinous on fracture surfaces.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.530$ $\beta = 1.681$ $\gamma = 1.685$ 2V(meas.) = 18°

Cell Data: *Space Group: Pmcn.* $a = 4.9611(4)$ $b = 7.9672(6)$ $c = 5.7407(4)$ Z = 4

X-ray Powder Pattern: Synthetic.

(1) Matsushiro, Japan. (2) $CaCO_3$.

Polymorphism & Series: Trimorphous with calcite and vaterite.

Mineral Group: Aragonite group.

Occurrence: Converts to calcite over geologic time. A primary precipitate in warm marine waters, as oolites and carbonate mud, a principal detrital sedimentary component as the hard parts of many marine micro-organisms, shells and skeletons; also from evaporite deposits; in sinter at hot springs and dripstone in caves; characteristic of high-pressure, low-temperature (blueschist facies) metamorphism; as amygdules in basalt and andesite; a secondary component in altered ultramafic rocks.

Association: Gypsum, sulfur, celestine (evaporite deposits); pumpellyite, lawsonite, glaucophane, quartz (blueschist); calcite, dolomite, hydromagnesite, brucite, magnesite (altered ultramafics).

Distribution: Many localities, but fine crystals are uncommon. From Molina, Guadalajara Province, Spain. Fine crystals from Racalmuto, Cianciana, and Agrigento, Sicily, Italy. At Dognácska and Špania Dolina (Herrengrund), Slovakia. From Tarnowitz, Silesia, Poland. At the Erzberg, near Eisenerz, Styria, and from Leogang, Salzburg, Austria. On the Spitzberg, Hořenz, near Bílina, Czech Republic. From Frizington and Cleator Moor, Cumbria, England. Fine examples at the Touissit mine, near Oujda, and from Tazouta, near Sefrou, Morocco. Large crystals from Tsumeb, Namibia. In the USA, in caves at Bisbee, Cochise Co., Arizona; large crystals from near Lake Arthur, Chavez Co., also near Santa Rosa, Guadalupe Co., New Mexico; in the Passaic mine, Sterling Hill, Ogdensburg, Sussex Co., New Jersey.

Name: For its first-noted occurrence in the Aragon region, Spain.

(1) Petrogale Cave, Western Australia; partial analysis, corresponding to $[K_{0.74}(NH_4)_{0.26}]_{\Sigma=1.00}H_2PO_4$.

Occurrence: As a component of stalactites and crusts on the walls of caves containing bat guano deposits.

Association: Biphosphammite, aphthitalite, halite, syngenite, stercorite, oxammite, weddellite, whitlockite, guanine, newberyite, calcite, mundrabillaite.

Distribution: In Petrogale Cave, near Madura Motel, Eucla, and in Murra-el-elevyn Cave, Cocklebiddy, Western Australia.

Name: Honors Dr. Michael Archer (1945–), Curator of Mammals, Queensland Museum, Brisbane, Australia, who discovered the first specimens.

Type Material: Western Australian Museum, Perth, Australia, MDC5901.

Aramayoite $Ag_3Sb_2(Bi,Sb)S_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As thin plates parallel to (010), showing striations along {100} and {001}, to 1 cm. *Twinning:* About [$\overline{1}$01] with the composition plane near {$\overline{1}$01}.

Physical Properties: *Cleavage:* Perfect on {010}, fair on {100}, poor on {001}. *Tenacity:* Sectile, thin flakes are flexible but not elastic. Hardness = 2.5 VHN = n.d. D(meas.) = 5.602 D(calc.) = 5.88

Optical Properties: Nearly opaque. *Color:* Iron-black, with thin edges showing deep blood-red; white in reflected light. *Streak:* Black to red-brown. *Luster:* Brilliant metallic. *Pleochroism:* Distinct in oil. *Anisotropism:* Very high in oil.
R_1–R_2: (400) 38.9–43.4, (420) 38.8–42.5, (440) 38.5–41.9, (460) 38.4–41.6, (480) 38.2–41.1, (500) 38.0–40.9, (520) 37.8–40.5, (540) 37.5–40.2, (560) 37.3–40.0, (580) 37.1–40.1, (600) 37.0–40.1, (620) 36.7–39.9, (640) 36.6–39.5, (660) 36.2–39.1, (680) 36.1–39.0, (700) 36.3–39.8

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.813(2)$ $b = 8.268(2)$ $c = 8.880(2)$ $\alpha = 100.32(2)°$ $\beta = 104.07(2)°$ $\gamma = 90.18(2)°$ Z = 2

X-ray Powder Pattern: Animas mine, Bolivia; similar to baumstarkite.
2.806 (100), 3.21 (40), 1.940 (30), 3.43 (20), 2.048 (20), 1.705 (20), 1.402 (20)

Chemistry:

	(1)	(2)
Ag	34.74	34.3
Cu	0.53	
Fe	trace	
Sb	29.95	30.6
Bi	13.75	14.1
As		0.2
S	20.87	20.8
Total	99.84	100.0

(1) Animas mine, Bolivia; corresponding to $(Ag_{2.97}Cu_{0.07})_{\Sigma=3.04}Sb_{2.00}(Bi_{0.61}Sb_{0.27})_{\Sigma=0.98}S_{6.00}$.
(2) Do.; by electron microprobe, average of nine analyses, corresponding to $Ag_{2.94}Sb_{2.00}(Bi_{0.62}Sb_{0.32}As_{0.02})_{\Sigma=0.96}S_{6.00}$.

Occurrence: Rare, typically in vein-controlled hydrothermal Sn–Ag ores.

Association: Tetrahedrite, miargyrite, stannite, pyrite, quartz.

Distribution: From the Animas mine, Chocaya, Potosí, Bolivia [TL]. At Herminia, Julcani district, and in the San Genaro mine, Huancavelica, Peru. From the Armonia mine, El Quevar, Salta Province, and in the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. From Portugalete, Bolivia. At the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile. From the Flathead mine, about 13 km north of Niarada, Flathead Co., Montana, USA. At Monts de Blond and Le Bourneix, Hautes-Vienne, and Sainte-Marie-aux-Mines, Haut-Rhin, France. From Altenberg, fSalzburg, Austria.

Name: For Felix Avelino Aramayo (1846–1929), former Managing Director of the Compagnie Aramayo de Mines en Bolivie.

Type Material: The Natural History Museum, London, England, 1926,292, 1940,10; Royal Ontario Museum, Toronto, Canada, M15125; National Museum of Natural History, Washington, D.C., USA, 95553.

Arangasite $Al_2(PO_4)(SO_4)F•7.5H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As elongated lamellar crystals, to 200 μm. Typically in parallel or divergent aggregates, forming dense chalklike masses to 3 cm.

Physical Properties: *Cleavage*: Imperfect basal. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = 1-2 D(meas.) = 2.01(1) D(calc.) = 2.001

Optical Properties: Transparent. *Color*: Colorless. *Streak*: White. *Luster*: Dull to silky. *Optical Class*: Biaxial (+) [by analogy to sanjuanite]. α = 1.493(5) β = n.d. γ = 1.485(5) *Pleochroism*: None. *Orientation*: $Z \perp$ to elongation, $X \parallel$ to elongation.

Cell Data: *Space Group*: *P*2/*a*. a = 7.073(1) b = 9.634(2) c = 10.827(2) β = 100.40(1)° Z = 2

X-ray Powder Pattern: Alyaskitovy deposit, Arangas Creek, eastern Sakha (Yakutia), Russia. 9.64 (100), 4.201 (51), 10.64 (29), 5.325 (25), 3.142 (18), 3.482 (14), 3.216 (14)

Chemistry:

	(1)	(2)	(3)
Al_2O_3	25.36	26.64	25.54
P_2O_5	18.50	17.20	17.78

$–O=F_2$		1.93	2.00
H_2O		34.24	33.86
Total		99.83	100.00

(1) Alyaskitovy deposit, eastern Sakha (Yakutia), Russia; average of 6 electron microprobe analyses, presence of H_2O, $(SO_4)^{2-}$, $(PO_4)^{3-}$ confirmed by IR spectroscopy. (2) Alyaskitovy deposit, eastern Sakha (Yakutia), Russia; average of 2 wet chemical analyses, H_2O by the Penfield method; corresponding to $Al_{2.08}(P_{0.97}O_4)(S_{0.95}O_4)F_{0.96}•7.48H_2O$. (3) $Al_2(PO_4)(SO_4)F•7.5H_2O$.

Occurrence: In cavities in quartz–muscovite–tourmaline–sulfide veins and adjacent rock, as a secondary mineral from near-surface oxidation and weathering of a strongly greisenized Li–F two-mica, leucogranite porphyry containing Sn and W mineralization.

Association: Phosphorscorodite, fluellite, gypsum, colquiriite, strengite, mansfieldite, sinkankasite.

Distribution: From the Alyaskitovy cassiterite-silicate-sulfide deposit, lower reaches of Arangas Creek, a tributary of the Elga River, Indigirka River basin, eastern Sakha (Yakutia), Russia.

Name: For *Arangas* Creek, located near the site from which the first specimens were collected.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 4254/1).

Aravaipite $Pb_3AlF_9 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1 or $\overline{1}$. As plates, to 3 mm, flattened on {010}. *Twinning:* Polysynthetic on {010}, universal.

Physical Properties: *Cleavage:* Perfect micaceous {010}; {100}, {001}, {101}, {$10\overline{1}$}, good. *Fracture:* Irregular. *Tenacity:* Flexible. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 6.37 Slightly soluble in H_2O.

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (–). *Orientation:* Euler angles $\phi = 67°$; $\psi = 60°$; $\theta = 76°$.
Dispersion: $r < v$, strong. $\alpha = 1.678(2)$ $\beta = 1.690(2)$ $\gamma = 1.694(2)$ 2V(meas.) = 70(3)° 2V(calc.) = 66°

Cell Data: *Space Group:* $P1$ or $P\overline{1}$. $a = 5.842(2)$ $b = 25.20(5)$ $c = 5.652(2)$ $\alpha = 93.84(4)°$ $\beta = 90.14(4)°$ $\gamma = 85.28(4)°$ Z = 4

X-ray Powder Pattern: Grand Reef mine, Arizona, USA.
3.134 (100), 12.5 (80), 3.65 (70), 3.50 (60), 3.33 (60), 2.916 (40), 2.822 (40)

Chemistry:

	(1)	(2)
Pb	73.8	74.22
Al	3.6	3.22
F	21.0	20.41
H_2O	[3.0]	2.15
Total	[101.4]	100.00

(1) Grand Reef mine, Arizona, USA; by electron microprobe, H_2O estimated from IR; corresponds to $Pb_{2.90}Al_{1.09}F_9 \cdot 1.36H_2O$. (2) $Pb_3AlF_9 \cdot H_2O$.

Occurrence: In the oxidized zone of an epithermal Pb–Cu–Ag deposit hosted by a silicified rhyolite-schist breccia.

Association: Grandreefite, pseudograndreefite, laurelite, fluorite, galena, anglesite, linarite, caledonite, quartz.

Distribution: From the Grand Reef mine, near Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: For the Aravaipa mining district, Arizona, USA, where the mineral occurs.

Type Material: Natural History Museum, Los Angeles, California, 33608; National Museum of Natural History, Washington, D.C., USA, 166058.

References: (1) Kampf, A.R., P.J. Dunn, and E.E. Foord (1989) Grandreefite, pseudograndreefite, laurelite, and aravaipaite: four new minerals from the Grand Reef mine, Graham County, Arizona. Amer. Arcanite K_2SO_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As thin cyclically twinned pseudohexagonal tablets, to 1 cm; typically in crusts and coatings. *Twinning:* On {110}, cyclic.

Physical Properties: *Cleavage:* On {010} and {001}, good. Hardness = n.d. D(meas.) = 2.66 D(calc.) = [2.667] Soluble in H_2O.

Optical Properties: Transparent to translucent. *Color:* White to colorless, yellow. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r > v$, moderate. $\alpha = 1.494$ $\beta = 1.495$ $\gamma = 1.497$ 2V(meas.) = 67°20′

Cell Data: *Space Group:* *Pnam* (synthetic). $a = 7.746(3)$ $b = 10.071(4)$ $c = 5.763(2)$ Z = 4

X-ray Powder Pattern: Synthetic.
2.903 (100), 3.001 (77), 2.886 (53), 4.176 (28), 2.422 (25), 2.089 (25), 2.082 (25)

Chemistry:

	(1)	(2)
SO_3	45.37	45.95
Na_2O	< 0.01	
K_2O	47.50	54.05
$(NH_4)_2O$	5.14	
Total	98.01	100.00

(1) Chincha Islands, Peru; original total given as 97.87%; corresponds to $[K_{1.78}(NH_4)_{0.35}]_{\Sigma=2.13}SO_{4.00}$. (2) K_2SO_4.

Polymorphism & Series: Forms a series with mascagnite.

Occurrence: In a pine railroad tie (Santa Ana mine, California, USA); in hydrothermally altered rock in a geothermal field (Cesano geothermal field, Italy); derived from bird guano on islands and bat guano in caves.

Association: Syngenite (Cesano geothermal field, Italy); swaknoite, mundrabillaite, dittmarite (Arnhem Cave, Namibia).

Distribution: From the Santa Ana tin mine, Trabuco Canyon, Orange Co., California, USA. On the Chincha Islands, off the coast of Peru. At the Cesano geothermal field, Latium, Italy. From the Arnhem, Arun Aas, Baobab, Gâuan Aas, Né-rab-aas, Temple of Doom, and Uisib Caves, Namibia. In the Lobatse Cave, Botswana. From Timbavati Cave, South Africa. In the Murra-el-elevyn Cave, Cocklebiddy, Western Australia.

Name: From the Latin *arcanum duplicatum*, for *double secret*, a medieval alchemical name.

Type Material: University of California, Berkeley, California; Harvard University, Cambridge, Massachusetts, USA, 100763.

(1) Madjarovo, Bulgaria; by electron microprobe, average of six analyses. (2) Gruvåsen, Sweden; by electron microprobe, average of 17 analyses. (3) $Pb_{19}Sb_{13}S_{35}Cl_7$. (4) $Pb_{10}Sb_6S_{17}Cl_4$.

Occurrence: Very rare in polymetallic ore deposits.

Association: Galena, nadorite, chlorian robinsonite, chlorian semseyite, pyrostilpnite, argentian tetrahedrite, anglesite (Madjarovo, Bulgaria); sphalerite, pyrrhotite, chalcopyrite, magnetite, scheelite, stannite, pyrargyrite, silver, antimony, arsenopyrite, nisbite, graphite (Gruvåsen, Sweden).

Distribution: From Madjarovo, eastern Rhodope Mountains, Bulgaria [TL]. In the Dressfall mine, Gruvåsen, Bergslagen metallic province, Sweden.

Name: For the Arda River, Bulgaria, which runs through the Madjarovo deposit.

Type Material: n.d.

(1) Cioclovina Cave, Romania; H_2O by the Penfield method. (2) La Guangola Cave, Italy; average of three analyses. (3) $Ca_2(HPO_4)(SO_4)\cdot 4H_2O$.

Occurrence: In limestone caves, as an early stage of the breakdown of bat guano, in reaction with calcite.

Association: Brushite, gypsum, carbonate-hydroxylapatite, newberyite, taranakite.

Distribution: From the Cioclovina Cave, Transylvania, Romania. In Italy, in the La Guangola Cave, near Altamura, Apulia. At the Magurata and Bacho Kuo Caves, Bulgaria. From the Baobab and Uisib Caves, Namibia. In the Moora Pave Cave, Jurien Bay, Western Australia. At the Onino-Iwaya Cave, Hiroshima Prefecture, Japan. From the Niah Great Cave, Sarawak, Malaysia.

Name: From *Ardeal*, the old Romanian name for Transylvania.

Type Material: The Natural History Museum, London, England, 1933,87.

(1) Sparone, Piedmont, Italy; electron microprobe analysis, Mn calculated to fill appropriate structural sites, H_2O calculated for charge balance; corresponding to $[Mn^{2+}_{3.221}Ca_{0.774}Na_{0.006}]_{\Sigma=4.001}$ $[Al_{4.456}Mg_{1.127}Fe^{3+}_{0.210}Mn^{3+}_{0.137}Cr_{0.046}Ti_{0.027}]_{\Sigma=6.003}$ $[Si_{5.000}][V_{0.518}Si_{0.315}Al_{0.080}P_{0.055}As_{0.033}]_{\Sigma=1.001}$ $O_{21.433}(OH)_{6.475}F_{0.092}$.

Occurrence: In a quartz veinlet in piemontite-bearing mica schist.

Association: Quartz, piemontite, hematite, muscovite.

Distribution: At Sparone, Locana Valley (TO), Piedmont, Italy.

Name: As the vanadium analog of *aredennite*, first described from Salmchäteau, Ardennes Mountains, Belgium.

Type Material: Museum of Natural History, University of Pisa, Italy (15525), and Regional Museum of Natural History, Turin, Italy (M/U 15544).

(1) Salmchâteau, Belgium. (2) Haute-Maurienne, France; by electron microprobe, confirmed by XRF and wet analysis, H_2O by coulometry; corresponds to $(Mn^{2+}_{2.75}Ca_{0.81}Mg_{0.43})_{\Sigma=3.99}(Al_{4.65}Mg_{0.98}Fe^{3+}_{0.36})_{\Sigma=5.99}(As_{0.91}O_4)Si_{5.10}O_{18}(OH)_6$.

Occurrence: In pegmatites and quartz veins in schist (Salmchâteau, Belgium); in highly oxidized Mn, Al-rich metasediments (Andros Island, Greece).

Association: Quartz, albite, pyrolusite, piemontite, spessartine, braunite, hematite.

Distribution: At Salmchâteau, near Ottré, and at Bihain, Belgium. From Ala, Piedmont, Italy. At Bonneval-sur-Arc, Haute-Maurienne, Isère, France. In the Merehead quarry, Shepton Mallet, Somerset, England. On Evvia and Andros Islands, Cyclades Islands, Greece. At the Kajlidongri manganese mine, Jhabua district, Madhya Pradesh, India. Along the Asemi-gawa River, Kochi Prefecture, Japan.

Name: For the initial occurrence at Salmchâteau, in the Ardennes Mountains, Belgium.

(1) Red Wine complex, Labrador, Newfoundland, Canada; by electron microprobe, averaged with wet chemical analysis, original total given as 100.18%; corresponding to $(K_{0.71}Na_{0.29})_{\Sigma=1.00}(Na_{1.84}Ca_{0.16})_{\Sigma=2.00}(Fe^{2+}_{3.60}Fe^{3+}_{0.92}Al_{0.15}Mn_{0.13}Mg_{0.11}Ti_{0.09})_{\Sigma=5.00}(Si_{7.83}Al_{0.17})_{\Sigma=8.00}O_{22}$
(2) Kangerdlugssuaq Fjord, Greenland; by electron microprobe, H_2O calculated from stoichiometry.

Polymorphism & Series: Forms a series with magnesio-arfvedsonite.

Mineral Group: Amphibole (alkali) group: $Fe^{2+}/(Fe^{2+} + Mg) \geq 0.5$; $Fe^{3+}/(Fe^{3+} + Al^{vi}) \geq 0.5$; $(Na + K)_A \geq 0.5$; $Na_B \geq 1.34$; $Mn_C < 2.5$.

Occurrence: Common in alkalic granites and other alkalic plutonic rocks and pegmatites.

Association: Nepheline, albite, aegirine, riebeckite, katophorite, magnesio-katophorite, quartz.

Distribution: Notable occurrences are: in Greenland, in the Ilímaussaq intrusion, from Kangerdlugssuaq Fjord, at Narssârssuk, and in the Ivigtut cryolite deposit. Around the Langesundsfjord, Norway. At Buchans, Newfoundland, and Mont Saint-Hilaire, Quebec, Canada. In the USA, from St. Peters Dome, near Pikes Peak, El Paso Co., Colorado; on Hurricane Mountain, Intervale, Carroll Co., New Hampshire; at Magnet Cove, Hot Spring Co., Arkansas; near Burnsville, Yancey Co., North Carolina. From the Lovozero massif, Kola Peninsula, Russia. At Bitola, Macedonia. On Mbolwe Hill, Mkushi River area, Central Province, Zambia. From Mt. Malosa, Zomba district, Malawi. In Australia, from Mittagong, New South Wales.

(1) Tintic Standard mine, Utah, USA. (2) $AgFe_3(SO_4)_2(OH)_6$.

Mineral Group: Alunite group.

Occurrence: An uncommon secondary mineral in the oxidized portions of silver- and sulfide-bearing mineral deposits.

Association: Anglesite, barite, quartz (Tintic Standard mine, Utah, USA).

Distribution: In the USA, an ore mineral in the Tintic Standard mine, near Dividend, East Tintic district, Utah Co., Utah; in the Philadelphia mine, Organ district, Doña Ana Co., New Mexico; from the Cactus Queen mine, Kern Co., California. At the Santa Ana mine, Caborca, Sonora, Mexico. In England, in the West Turf Pits mine, Grassington Moor, Yorkshire; from the Treore mine, St. Teath, and at Wheal Ludcott, St. Ives, Cornwall. From the Rio Tinto, Huelva and La Union mines, Murcia, Spain.

Name: As the silver, *argentum*, analog of *jarosite*.

Type Material: The Natural History Museum, London, England, 1957,357; National Museum of Natural History, Washington, D.C., USA, 104272–104274, 94707, R6309.

(1) Oktyabr mine, Russia; by electron microprobe, corresponds to $Ag_{1.01}(Fe_{5.08}Ni_{2.97})_{\Sigma=8.05}S_{8.00}$.
(2) Talnotry mine, Scotland; by electron microprobe, corresponds to $Ag_{0.91}(Fe_{5.19}Ni_{2.78})_{\Sigma=7.97}S_{8.00}$.

Mineral Group: Pentlandite group.

Occurrence: In pyrite and cubanite-chalcopyrite hydrothermal veins in ultramafic rocks and in skarn; in hydrothermal veins in acidic volcanics; rare in carbonatites.

Association: Pyrite, pyrrhotite, mackinawite, cubanite, chalcopyrite, stannite, galena, sphalerite, calcite, quartz.

Distribution: In Russia, in the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia [TL], and the Khovu-Aksy Co–Ni deposit, Tuva [TL]. In the Vuonos, Miihkali, Hietajärvi, and Outokumpu deposits, Finland. In Scotland, at the Talnotry mine, Newton Stewart, Kirkcudbrightshire. From El Charcón, Murcia Province, Spain. At Koronuda, Macedonia, Greece. From Bottino, Tuscany, Italy. In the Loolekop carbonatite, Phalaborwa, Transvaal, South Africa. From Bird River, and the Agassiz gold deposit, Lynn Lake region, Manitoba, Canada. In the USA, from near Silver City, Ontonogan Co., Michigan. From Windaira, Western Australia. In the Juimao tin mine, Guangxi Province, China.

Name: For the similarity in composition to pentlandite.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 74159.

Argentopyrite $AgFe_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$.
As thick tabular pseudohexagonal prisms, may have rough pyramidal terminations {011}.
Twinning: Pseudohexagonal twins common ‖ [001] by interpenetration of {120}; lamellar twinning is also present.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5–4
VHN = 225–242 (100 g load). D(meas.) = 4.25 D(calc.) = 4.27

Optical Properties: Opaque. *Color:* Bright gray-white when fresh, commonly tarnished iridescent in greens, blues, yellows, purples, and browns; grayish to yellowish white in reflected light. *Luster:* Metallic. *Anisotropism:* Strong, deep blue to pale blue-gray.
R_1–R_2: (400) 20.5–29.4, (420) 21.6–30.2, (440) 22.7–30.8, (460) 23.8–31.6, (480) 24.6–32.2, (500) 25.3–32.8, (520) 25.8–33.5, (540) 26.3–34.1, (560) 26.8–34.8, (580) 27.4–35.6, (600) 28.1–36.3, (620) 28.7–36.9, (640) 29.4–37.5, (660) 30.0–38.0, (680) 30.4–38.4, (700) 30.9–38.7

Cell Data: *Space Group: Pmmn.* $a = 6.639(4)$ $b = 11.463(6)$ $c = 6.452(3)$ $Z = 4$

X-ray Powder Pattern: Měděnec, Czech Republic.
3.320 (10), 3.316 (9), 1.807 (7), 5.746 (5), 3.104 (5), 1.927 (5), 3.603 (4)

Chemistry:

Ag	32.89	34.55	34.17
Fe	35.89	35.03	35.37
Cu	0.19	0.17	
As		0.05	
S	30.71	30.15	30.46
Total	99.68	99.95	100.00

(1) St. Andreasberg, Germany. (2) Měděnec, Czech Republic; by electron microprobe, corresponding to $Ag_{1.02}Cu_{0.01}Fe_{2.00}S_{3.00}$. (3) $AgFe_2S_3$.

Polymorphism & Series: Dimorphous with sternbergite.

Occurrence: Rare in silver-bearing hydrothermal veins.

Association: Arsenic, proustite, pyrargyrite, pyrostilpnite, xanthoconite, sternbergite, stephanite, pyrite, nickel-skutterudite, dolomite, calcite, quartz.

Distribution: In the Czech Republic, at Jáchymov (Joachimsthal) [TL], Příbram, and in the Krušné hory Mountains, at Měděnec. From St. Andreasberg, Harz Mountains; Marienberg, Schneeberg, Johanngeorgenstadt, and Freiberg, Saxony; and at the Anton mine, Wieden, Black Forest, Germany. At the Tynebottom mine, Garrigill, near Alston, Cumbria, England. From Broken Hill, New South Wales, Australia. In the Omidani mine, Hyogo Prefecture, Japan. At Colquechaca, Potosí, Bolivia. In the Silvana mine, Sandon, British Columbia, Canada.

Name: For its composition and physical similarity to pyrite.

Type Material: Royal Ontario Museum, Toronto, Canada, M13001.

Argentotennantite $(Ag, Cu)_{10}(Zn, Fe)_2(As, Sb)_4S_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $[\bar{4}3m]$ (by analogy to tetrahedrite–tennantite). As small grains, to 0.1 mm; and surrounding tennantite.

Physical Properties: *Fracture:* Conchoidal. Hardness = 3.4 VHN = 285–320, 305 average. D(meas.) = n.d. D(calc.) = 5.05

Optical Properties: Opaque. *Color:* Gray-blue; pale gray to greenish gray with a faint bluish tint in polished section. *Streak:* Reddish brown to black. *Luster:* Resinous.
R: (400) 30.9, (420) 30.9, (440) 30.8, (460) 30.7, (480) 30.5, (500) 30.4, (520) 30.4, (540) 30.4, (560) 30.4, (580) 30.3, (600) 29.9, (620) 29.4, (640) 28.8, (660) 28.4, (680) 28.2, (700) 27.8

Cell Data: *Space Group:* $[I\bar{4}3m]$ (by analogy to tetrahedrite–tennantite). $a = 10.584(3)$. Z = [2]

X-ray Powder Pattern: Kvartsitoviye Gorki deposit, Kazakhstan.
3.06 (100), 1.869 (80), 1.595 (40), 2.65 (30), 2.073 (20), 1.230 (20), 1.214 (20)

Chemistry:

Total	100.04	99.85

(1) Kvartsitoviye Gorki deposit, Kazakhstan; by electron microprobe, corresponding to $(Ag_{5.67}Cu_{4.48})_{\Sigma=10.15}(Zn_{1.52}Fe_{0.37}Pb_{0.01}Cd_{0.01})_{\Sigma=1.91}(As_{2.14}Sb_{1.89})_{\Sigma=4.03}S_{12.90}$.
(2) Silvermines, Ireland; by electron microprobe, corresponding to $(Cu_{6.32}Ag_{3.70})_{\Sigma=10.02}(Zn_{1.15}Fe_{0.90})_{\Sigma=2.05}(As_{2.15}Sb_{2.13})_{\Sigma=4.28}S_{12.66}$.

Polymorphism & Series: Forms a series with freibergite.

Mineral Group: Tetrahedrite group.

Occurrence: In a polymetallic deposit (Kvartsitoviye Gorki deposit, Kazakhstan); in a stratiform Pb–Zn orebody (Silvermines, Ireland).

Association: Tennantite–tetrahedrite, freibergite, stibnite, mercurian gold, pyrite, galena, siderite, ankerite, quartz (Kvartsitoviye Gorki deposit, Kazakhstan); geocronite, proustite–pyrargyrite, galena (Silvermines, Ireland).

Distribution: In the Kvartsitovye Gorki [Quartzite Hills] deposit, Akmola district, northern Kazakhstan [TL]. At Silvermines, Co. Tipperary, Ireland.

Name: For the chemical composition and by analogy to tennantite.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 84396.

Argutite GeO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$ (synthetic). As subhedral crystals, to 20 μm, showing {111}, {100}, and {101}, included in sphalerite. *Twinning:* Occasionally twinned on {101}.

Physical Properties: Hardness = [6–7] (about the same as associated cassiterite). D(meas.) = n.d. D(calc.) = [6.28]

Optical Properties: Semitransparent. *Color:* Light gray in reflected light. *Optical Class:* Uniaxial. *Anisotropism:* Distinct.
R: (400) 14.8, (420) 13.7, (440) 12.6, (460) 11.6, (480) 11.2, (500) 11.0, (520) 11.0, (540) 11.0, (560) 11.0, (580) 10.9, (600) 10.9, (620) 10.9, (640) 10.9, (660) 10.9, (680) 11.0, (700) 11.0

(1) Argut deposit, France; by electron microprobe, average of seven analyses; corresponds to $(Ge_{0.94}Zn_{0.04}Fe_{0.02})_{\Sigma=1.00}O_{1.94}$.

Mineral Group: Rutile group.

Occurrence: In a zinc deposit formed in metamorphosed lower Paleozoic sediments.

Association: Sphalerite, cassiterite, siderite, briartite.

Distribution: From the Argut deposit, central Pyrénées, Haute-Garonne, France.

Name: For the occurrence in the Argut deposit, France.

Type Material: n.d.

References: (1) Johan, Z., E. Oudin, and P. Argyrodite Ag_8GeS_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $mm2$. Pseudo-octahedra, dodecahedra, cubes, or as combinations of these forms, in crystals as large as 18 cm. Also radiating crystal aggregates, botryoidal crusts, or massive. *Twinning:* Pseudospinel law {111}; repeated interpenetration twins of pseudododecahedra on {111}.

Physical Properties: *Fracture:* Uneven to slightly conchoidal. *Tenacity:* Brittle. Hardness = 2.5–3 VHN = n.d. D(meas.) = 6.29 D(calc.) = 6.32

Optical Properties: Opaque. *Color:* Steel-gray with a red tint, tarnishes black; in polished section, gray-white with a violet tint. *Streak:* Gray-black. *Luster:* Strong metallic. *Pleochroism:* Very weak. *Anisotropism:* Weak.
R_1–R_2: (400) 28.9–29.5, (420) 27.9–28.5, (440) 27.1–27.7, (460) 26.3–26.9, (480) 25.8–26.3, (500) 25.3–25.8, (520) 25.0–25.4, (540) 24.7–25.2, (560) 24.6–25.0, (580) 24.5–24.9, (600) 24.4–24.9, (620) 24.5–24.8, (640) 24.6–24.9, (660) 24.5–24.9, (680) 24.6–25.0, (700) 24.7–25.0

Cell Data: *Space Group:* $Pna2_1$. $a = 15.149(1)$ $b = 7.476(2)$ $c = 10.589(1)$ $Z = 4$

X-ray Powder Pattern: Machacamarca, Bolivia.
3.02 (100), 1.863 (50), 2.66 (40), 3.14 (30), 2.44 (30), 2.03 (30), 1.784 (20)

Chemistry:

	(1)	(2)	(3)

(1) Chocaya, Bolivia. (2) Aullagas, Bolivia. (3) Ag_8GeS_6.

Polymorphism & Series: Forms a series with canfieldite.

Occurrence: In low-temperature polymetallic deposits with silver sulfosalts (Freiberg, Germany); in high-temperature Sn–Ag deposits (Bolivia).

Association: Canfieldite, stephanite, acanthite, pyrargyrite, polybasite, aramayoite, diaphorite, marcasite, pyrite, galena, sphalerite, cassiterite, siderite.

Distribution: In Germany, in Saxony, from the Himmelsfürst [TL] and other mines, Erbisdorf, near Freiberg. In the Fournial mine, Massiac region, Cantal, France. At the Vale das Gatas tungsten mine, near Vila Real, northern Portugal. From Silvermines, Co. Tipperary, Ireland. At a number of localities in Bolivia, including Aullagas, Colquechaca, Potosí, Oruro, Porco, Chocaya, and Machacamarca. At the Dolly Varden mine, Alice Arm, British Columbia, Canada. From Rico, Dolores Co., Colorado, USA. In the Wolyu mine, Youngdong district, South Korea. From Shuiji, Fujian Province, and in the Baiguoyuan deposit, Hubei Province, China.

Name: From the Greek for *silver-containing*.

Type Material: Mining Academy, Freiberg, Germany, 7058.

Arhbarite $Cu_2(AsO_4)(OH)\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. As needlelike individual crystals, in spherulitic or disklike aggregates, to 0.5 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark blue. *Streak:* Sky-blue.
Luster: Vitreous.
Optical Class: Biaxial. *Pleochroism:* X' = turquoise-blue; Z' = deep turquoise-blue.
Orientation: Extinction ∼45° to elongation. $\alpha = 1.720(5) \parallel$ length. β = n.d. $\gamma = 1.740(5) \perp$ length. 2V(meas.) = ∼90°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Arhbar mine, Morocco.
4.57 (100), 4.51 (90), 3.72 (60), 2.603 (50), 2.474 (50), 3.25 (40), 2.891 (40)

Chemistry:

	(1)	(2)
As_2O_5	29.19	29.38
FeO	0.04	
CoO	0.03	
CuO	41.00	40.68
ZnO	0.01	
H_2O	[29.73]	29.94
Total	[100.00]	100.00

(1) Arhbar mine, Morocco; by electron microprobe, average of three analyses, H_2O by difference.
(2) $Cu_2(AsO_4)(OH)\cdot 6H_2O$.

Occurrence: A rare secondary mineral in polymetallic hydrothermal ore deposits.

Association: Dolomite, hematite, löllingite, pharmacolite, erythrite, talc, mcguinnessite (Arhbar mine, Morocco); chrysocolla, brochantite, olivenite, iodargyrite, dolomite (Emma Louisa mine, Chile).

Distribution: From the Arhbar mine, Bou Azzer district, Morocco. In the [Emma Luisa gold mine,] Guanaco district, about 100 km east-northeast of Taltal, Antofagasta, Chile.

Name: For the Arhbar (Aghbar) mine, Morocco, in which the mineral was first found to occur.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160383.

References: (1) Schmetzer, K., G. Tremmel, and O. Medenbach (1982) Arhbarit, $Cu_2[OH|AsO_4]\cdot 6H_2O$, ein neues Mineral von Bou-Azzer, Marokko. Neues Jahrb. Mineral., Monatsh., 529–533 (in German with English abs.). (2) (1983) Amer. Mineral., 68, 1038 (abs. ref. 1).

Aristarainite $Na_2MgB_{12}O_{16}(OH)_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular {100} or elongated [010] crystals, to 0.4 mm, comprised of {100}, {001}, {110}, {210}, and several less common forms. As rosettelike aggregates and efflorescent crusts.

Physical Properties: *Cleavage:* {001} and {100}, perfect; {110}, fair. *Fracture:* Splintery ∥ [010]. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.027(5) D(calc.) = 2.005 Moderate cream-white fluorescence under SW UV; weak phosphorescence.

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y \wedge c = -38°$; $Z \wedge a = 46°$. *Dispersion:* $r > v$, weak. $\alpha = 1.484(1)$ $\beta = 1.498(1)$ $\gamma = 1.523(1)$ 2V(meas.) = 70°

Cell Data: *Space Group:* $P2_1/a$. $a = 18.886(4)$ $b = 7.521(2)$ $c = 7.815(1)$ $\beta = 97.72(1)°$ Z = 2

X-ray Powder Pattern: Tincalayu deposit, Argentina.
7.74 (100), 2.579 (19), 3.037 (13), 3.869 (12), 5.40 (11), 2.400 (10), 3.782 (9)

Chemistry:

	(1)	(2)
B_2O_3	59.5	62.90
MgO	5.65	6.07
Na_2O	7.3	9.33
K_2O	1.05	
H_2O	25.7	21.70
insol.	0.5	
Total	99.7	100.00

(1) Tincalayu deposit, Argentina; with $(OH)^{1-}$ calculated for charge balance, corresponds to $(Na_{1.65}K_{0.16})_{\Sigma=1.81}Mg_{0.98}B_{12.00}O_{16.00}(OH)_{7.76} \cdot 6.14H_2O$. (2) $Na_2MgB_{12}O_{16}(OH)_8 \cdot 4H_2O$.

Occurrence: In a playa evaporite sequence (Tincalayu deposit, Argentina); at a desert borax spring (Eagle Borax Spring, California, USA).

Association: Borax, kernite, rivadavite, ezcurrite, ameghinite, mcallisterite, kurnakovite, searlesite, probertite, ginorite, tincalconite, ulexite, halite, magnesite (Tincalayu deposit, Argentina); thénardite, blödite, mcallisterite, santite, hexahydrite, halite, gypsum (Eagle Borax Spring, California, USA).

Distribution: From the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province, Argentina. In the USA, on the South Meridian claim and at Eagle Borax Spring, Furnace Creek district, Death Valley, Inyo Co., California.

Name: Honors Professor Lorenzo Francisco Aristarain (1926–), Argentine mineralogist specializing in borate deposits, La Plata University, Buenos Aires, Argentina.

Type Material: Natural History Museum, Paris, France; Harvard University, Cambridge, Massachusetts, 109679; National Museum of Natural History, Washington, D.C., USA, 136046, 137296.

References: (1) Hurlbut, Jr., C.S. and R.C. Erd (1974) Aristarainite, $Na_2O \cdot MgO \cdot 6B_2O_3 \cdot 10H_2O$, a new mineral from Salta, Argentina. Amer. Mineral., 59, 647–651. Armalcolite $(Mg, Fe^{2+})Ti_2O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As subhedral to anhedral grains, to 300 μm.

Physical Properties: Hardness = [< 5] (less than ilmenite). D(meas.) = 4.94 D(calc.) = 4.64

Optical Properties: Opaque. *Color:* Gray to tan in reflected light. *Luster:* Metallic. *Optical Class:* Biaxial. *Pleochroism:* Observed. *Anisotropism:* Strong; pale gray to dark bluish-gray.
R_1–R_2: (450) 14.1–15.2, (470) 14.0–15.0, (500) 13.8–14.7, (520) 13.7–14.5, (546) 13.4–14.4, (586) 13.3–14.3, (620) 13.2–14.2, (640) 13.0–14.1

Cell Data: *Space Group: Bbmm.* a = 9.743(30) b = 10.023(20) c = 3.738(30) Z = 2

X-ray Powder Pattern: Tranquillity Base, Moon.
3.468 (100), 1.958 (80), 2.763 (25), 2.454 (25), 2.235 (15), 2.199 (15), 2.414 (10)

Chemistry:

	(1)	(2)		(1)	(2)
TiO_2	72.0	76.2	FeO	14.7	10.7
Al_2O_3	1.48	1.65	MnO	0.07	0.83
V_2O_5	0.07		MgO	8.7	9.4
Cr_2O_3	1.94	0.34	CaO	0.32	0.1
			Total	99.28	99.2

(1) Tranquillity Base, Moon; by electron microprobe, total Fe as FeO; corresponds to $(Mg_{0.46}Fe^{2+}_{0.44}Al_{0.06}Cr_{0.06}Ca_{0.01})_{\Sigma=1.03}Ti_{1.92}O_5$. (2) Disko Island, Greenland; by electron microprobe, total Fe as FeO; corresponds to $(Mg_{0.49}Fe^{2+}_{0.32}Al_{0.07}Mn_{0.02}Cr_{0.01})_{\Sigma=0.91}Ti_{2.02}O_5$.

Occurrence: Formed typically at low pressures and high temperatures; in Ti-rich basalts and microbreccias of lunar samples; in salic volcanics; rarely in granite pegmatite; in ultramafic rocks, lamproites, kimberlites; in terrestrial impact craters; in inclusions in a carbonaceous chondrite.

Association: Ilmenite, Fe–Ti oxides, iron, graphite (Disko Island, Greenland); phlogopite, analcime, diopside (Smoky Butte, Montana, USA); rutile, ilmenite (Kimberley, South Africa).

Distribution: From Mare Tranquillitatis at Tranquillity Base; the Taurus-Littrow site; and the Descartes site, Moon. In the Knippa quarry, near Uvalde, Uvalde Co., Texas, and at Smoky Butte, near Jordan, Garfield Co., Montana, USA. From the El Toro cinder cone, near San Luis Potosí, Mexico. In the Nördlinger Reis crater, Bavaria, Germany. From Jumilla, Murcia Province, and Cancarix, Albacete Province, Spain. On Disko Island, Greenland. From the Jagersfontein, Bultfontein, and Dutoitspan diamond mines, Kimberley, Transvaal, South Africa. In the Mwenezi area, Zimbabwe. From several undefined localities in Russia, and elsewhere.

Name: An acronym derived from the last names of Neil Alden ARMstrong (1930–), Edwin Eugene ALdrin (1930–), and Michael COLlins (1930–), the Apollo XI astronauts who collected the type samples.

Type Material: Lunar Science Institute, Houston, Texas, USA.

Armangite $Mn^{2+}_{26}As^{3+}_{18}O_{50}(CO_3)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. As tiny short hexagonal prisms, terminated by a trigonal pyramid. *Twinning:* On $\{11\overline{2}0\}$.

Physical Properties: *Cleavage:* {0001}, fair to poor. Hardness = ∼4 D(meas.) = [4.43] (calculated from material with 12% admixed carbonate). D(calc.) = 4.406

Optical Properties: Opaque, transparent in thin fragments. *Color:* Black to pale brown; yellow to brown in transmitted light. *Streak:* Brown.
Optical Class: Uniaxial (–). $\omega = 2.01$ $\epsilon = 1.99$

Cell Data: *Space Group:* $P\overline{3}$. $a = 13.491(2)$ $c = 8.855(1)$ $Z = 1$

X-ray Powder Pattern: Långban, Sweden. (ICDD 19-780).
2.762 (100), 2.94 (70), 2.428 (70), 1.759 (60), 3.92 (50), 1.676 (50), 1.459 (50)

Total	99.91	100.49	100.00

(1) Kongsberg, Norway. (2) Rémigny, Canada; by electron microprobe; average of 38 analyses on six samples; corresponds to $(Ba_{0.89}Na_{0.10}K_{0.04})_{\Sigma=1.03}(Ca_{1.92}Sr_{0.07}Na_{0.03})_{\Sigma=2.02}$ $Al_{3.02}(Al_3Si_9O_{30})\cdot 2[(H_2O)_{0.91}(CO_2)_{0.04}]$. (3) $BaCa_2Al_6Si_9O_{30}\cdot 2H_2O$.

Mineral Group: Milarite group (?).

Occurrence: In calcite veins (Kongsberg, Norway); in manganese-metasomatized diorite included in later granodiorite (Rémigny, Canada).

Association: Axinite, pyrrhotite, quartz (Kongsberg, Norway); albite, manganiferous zoisite, piemontite, prehnite, epidote, muscovite (Rémigny, Canada); celsian, bytownite (Broken Hill, Australia).

Distribution: From the Armen mine, near Kongsberg, Norway. In the Su Zurfuru mine, Fluminese, Sardinia, Italy. Large crystals from the Wasenalp, near Simplon, Valais, Switzerland. At Coire Loch Kander, 11 km south-southeast of Braemar, Scotland. From Chvaletice, Czech Republic. At Rémigny, Quebec, Canada. From 16 km northeast of North Bend, King Co., Washington, USA. At Broken Hill and Pernamoota, 30 km north of Broken Hill, New South Wales, Australia.

Name: For the Armen mine, Kongsberg, Norway.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1947,290.

(1) Khan-Bogdinskii massif, Mongolia. (2) $CaZrSi_6O_{15}\cdot 2.5H_2O$.

Occurrence: In schlieren of alkalic granite pegmatite, at the contact of arfvedsonite granite with xenoliths of felsic volcanic rocks.

Association: Quartz, microcline, albite, aegirine, arfvedsonite, monazite, synchesite, titanite, other titanosilicates.

Distribution: In the Khan-Bogdinskii granitic massif, Gobi, Mongolia. In the Strange Lake complex, southeast of Lac Brisson, Quebec and Labrador, Newfoundland, Canada.

Name: Honoring Neil Alden Armstrong (1930–), American astronaut, first man to walk on the Moon.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Nickel Plate mine, South Dakota, USA. (2) $KNa_4Ca(Fe,Mn)_{14}Al(PO_4)_{12}(OH)_2$ with Fe:Mn = 1:1.

Polymorphism & Series: Forms a series with dickinsonite.

Occurrence: A high-temperature (≈ 800 °C) primary mineral in granite pegmatites.

Association: Graftonite, cassiterite, spodumene, beryl, muscovite (Nickel Plate mine, South Dakota, USA).

Distribution: In Brazil, from the Serra Branca pegmatite, 13 km south of Pedra Lavrada, Picuí, Paraíba; in the Énio pegmatite mine, northeast of Galiléia, and the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais. In the USA, in New Hampshire, from the G.E. Smith mine, Newport, Sullivan Co., and at the Rice, Nancy #2, and Palermo #1 mines, near North Groton, Grafton Co.; in South Dakota, from the Nickel Plate and White Cap mines, near Keystone, Pennington Co., and in the Victory mine, four km northeast of Custer, Custer Co. From the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In the Mangualde pegmatite, near Mesquitela, Portugal. From Glenbuchat, Aberdeenshire, Scotland. In the Norrö pegmatite, on Rånö Island, Sweden. At Sidi-Bou-Kritcha, Morocco. In Zimbabwe, from Ruwanzi Ranch, Karoi East, Miami, and on the Star Twin, Pearl and Chiwya claims, Urungwe district. In the Buranga pegmatite, near Gatumba, Rwanda.

Name: To honor Miguel Arrojado Ribeiro Lisbôa (1872–1932), Brazilian geologist.

Total	99.67

(1) Tsumeb, Namibia; by electron microprobe, total Fe as Fe_2O_3.

Mineral Group: Brackebuschite group.

Occurrence: In fissures in dolomite breccia in the oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia); in a hydrothermal polymetallic barite–fluorite deposit (Clara mine, Germany).

Association: Beudantite, anglesite, mimetite, bayldonite, stolzite (Clara mine, Germany).

Distribution: From Tsumeb, Namibia. In the Clara mine, near Oberwolfach, Black Forest, Germany. From Brixlegg, Tirol, Austria. At the Hornet mine, Hachita, Grant Co., New Mexico, USA.

Name: As the arsenate analog of *brackebuschite*.

Type Material: Institute for Geosciences, University of Mainz, Mainz; Institute for Mineralogy and Crystallography, University of Stuttgart, Stuttgart, Germany.

(1) Tsumeb, Namibia; by electron microprobe, H_2O by TGA; corresponding to $Pb_{1.06}(Zn_{1.03}Fe_{0.02})_{\Sigma=1.05}(AsO_4)(OH)_{1.4}$. (2) Gejiu mine, China. (3) $PbZn(AsO_4)(OH)$.

Mineral Group: Adelite group.

Occurrence: A secondary mineral in oxidized hydrothermal polymetallic deposits.

Association: Tennantite, chalcocite, willemite, mimetite, quartz, goethite (Tsumeb, Namibia).

Distribution: From Tsumeb, Namibia. In the Gejiu Pb–Zn deposit, not otherwise located, China. From the Toroku mine, Miyazaki Prefecture, Japan. At the Ojuela mine, Mapimí, Durango, Mexico. From the Silver Coin mine, near Valmy, Iron Point district, Humboldt Co., Nevada, USA. At the Michael mine, Weiler, near Lahr, Black Forest, Germany.

Name: As the arsenate analog of *descloizite*.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany, NM08; National Museum of Natural History, Washington, D.C., USA, 148303.

Arsenic As

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. Commonly granular, massive, and in concentric layers; may be reticulated, reniform, stalactitic; rarely columnar or acicular; also as rhombohedra, to 1 mm. *Twinning:* Rare on twin plane $\{10\overline{1}4\}$; pressure twinning on $\{01\overline{1}2\}$ develops delicate lamellae.

Physical Properties: *Cleavage:* Perfect on {0001}, fair on $\{10\overline{1}4\}$. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3.5 VHN = 72–173 (100 g load). D(meas.) = 5.63–5.78 D(calc.) = 5.778

Optical Properties: Opaque. *Color:* Tin-white, tarnishes to dark gray. *Streak:* Tin-white. *Luster:* Nearly metallic. *Pleochroism:* Feeble. *Anisotropism:* Distinct, yellowish brown and light gray to yellowish gray.
R_1–R_2: (400) 56.0–57.5, (420) 55.1–56.8, (440) 54.2–56.2, (460) 53.3–55.8, (480) 52.7–55.7, (500) 52.4–55.7, (520) 52.0–55.7, (540) 51.7–55.7, (560) 51.5–55.6, (580) 51.2–55.4, (600) 51.0–55.2, (620) 50.8–55.0, (640) 50.6–54.9, (660) 50.5–54.8, (680) 50.4–54.7, (700) 50.4–54.6

Cell Data: *Space Group:* $R\overline{3}m$ (synthetic). $a = 3.7598(1)$ $c = 10.5475(2)$ $Z = 6$

X-ray Powder Pattern: Synthetic.
2.771 (100), 3.52 (30), 1.879 (30), 2.05 (20), 1.556 (10), 1.768 (10), 1.757 (7)

Chemistry:

Sb	1.65	0.2
S	0.16	
insol.	0.15	
Total	100.10	99.3

(1) Mount Royal, near Montreal, Quebec, Canada. (2) Sainte-Marie-aux-Mines, France; by electron microprobe.

Polymorphism & Series: Dimorphous with arsenolamprite.

Mineral Group: Arsenic group.

Occurrence: In hydrothermal veins and deposits that contain other arsenic minerals; may be in Co–Ag sulfide veins.

Association: Arsenolite, cinnabar, realgar, orpiment, stibnite, galena, sphalerite, pyrite, barite.

Distribution: Numerous localities are known, most of only minor interest. In Germany, from Freiberg, Schneeberg, Johanngeorgenstadt, Marienberg, and Annaberg, Saxony; Wolfsberg and St. Andreasberg, Harz Mountains; and Wieden, Black Forest. In the Gabe-Gottes mine, Rauenthal, near Sainte-Marie-aux-Mines, Haut-Rhin, France. At Jáchymov (Joachimsthal), Příbram, and Cínovec (Zinnwald), Czech Republic. In Romania, from Săcărîmb (Nagyág), Hunyad, and Cavnic (Kapnikbánya). At Sterling Hill, Ogdensburg, Sussex Co., New Jersey and Washington Camp, Santa Cruz Co., Arizona, USA. In the Huallapón mine, Pasto Bueno, Ancash Province, Peru. At Bidi, Sarawak Province, Borneo. In the Akatani mine, Fukui Prefecture, Japan. From the Dajishan tungsten deposits, Jianxi Province, China.

Name: From the Latin *arsenicum*, earlier Greek *arrenikos*, or *arsenikos*, *masculine*, an allusion to its potent properties.

Arseniopleite $NaCaMn^{2+}(Mn^{2+},Mg)_2(AsO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Rarely as elongated or lenticular crude crystals; more commonly granular, massive.

Physical Properties: *Cleavage:* On pseudo-$\{10\bar{1}1\}$. *Fracture:* Conchoidal. Hardness = 3–4 D(meas.) = 4.17–4.22 D(calc.) = 4.17

Optical Properties: Opaque to translucent. *Color:* Brownish red to cherry-red, yellow, dark green, gray; orange, light apricot-orange, or brownish orange in transmitted light. *Streak:* Yellowish brown. *Luster:* Dull.
Optical Class: Uniaxial (+), or nearly so. $\omega = 1.794(3)$ $\epsilon = 1.803(3)$ 2V(meas.) = Small, anomalous.

Cell Data: *Space Group:* $P2_1/c$. $a = 11.31$ $b = 13.06$ $c = 6.86$ $\beta = [99°]$ $Z = 4$

X-ray Powder Pattern: Sjö mine, Sweden.
2.825 (10), 2.676 (6), 2.993 (4.5), 1.693 (4.5), 6.52 (4), 3.27 (4), 2.793 (4)

			Total	98.27	99.49

(1) Sjö mine, Sweden. (2) Do.; by electron microprobe, total Fe as Fe_2O_3, As as As_2O_5, by microchemical test, total Mn as MnO, Na by flame photometry, H_2O by the Penfield method; corresponds to $Na_{1.07}(Ca_{0.71}Pb_{0.10}Mn^{2+}_{0.09}Na_{0.09}Ba_{0.01})_{\Sigma=1.00}Mn^{2+}(Mn^{2+}_{1.31}Mg_{0.40}Fe^{3+}_{0.28})_{\Sigma=1.98}[(AsO_4)_{2.93}(PO_4)_{0.02}]_{\Sigma=2.95}$.

Mineral Group: Alluaudite group.

Occurrence: As fracture fillings and thin veins in banded dolostone (Sjö mine, Sweden); in a metamorphosed Fe–Mn orebody (Långban, Sweden).

Association: Rhodonite, tephroite, hedyphane, dolomite, calcite (Sjö mine, Sweden); calcite, berzeliite, kutnohorite, sarkinite, gonyerite, katoptrite (Långban, Sweden).

Distribution: From the Sjö mine, Örebro, and at Långban, Värmland, Sweden.

Name: From *arsenic* and the Greek for *more*, as it added to the number of related minerals previously described.

Type Material: n.d.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 844. (2) Moore, P.B. (1968) Contributions to Swedish mineralogy. I. Arseniosiderite $Ca_2Fe_3^{3+}O_2(AsO_4)_3 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. Euhedral crystals very rare, to 2 mm; usually as flattened fibers, in radial aggregates, and felted to granular masses.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = 4.5 D(meas.) = 3.58–3.60 D(calc.) = [3.78]

Optical Properties: Opaque, translucent through thin edges. *Color:* Golden yellow, yellowish brown, reddish brown, brownish black, black. *Streak:* Ocher-yellow. *Luster:* Submetallic to silky.
Optical Class: Biaxial (–); pseudouniaxial (–). *Pleochroism:* Strong; X = nearly colorless to pale brownish or brownish red; $Y = Z$ = brownish red to dark reddish brown. *Absorption:* $Y = Z \gg X$. $\alpha = 1.792$–1.815 $\beta = 1.870$–1.898 $\gamma = 1.870$–1.898 2V(meas.) = Small.

Cell Data: *Space Group:* $[A2/a]$ (by analogy to robertsite and mitridatite). $a = 17.76(4)$ $b = 19.53(1)$ $c = 11.30(1)$ $\beta = 96.0°$ Z = 12

X-ray Powder Pattern: Mapimí, Mexico.
8.84 (10), 2.772 (8), 5.62 (5), 2.945 (5), 3.28 (4), 3.22 (4), 2.213 (4)

Chemistry:

	(1)	(2)

insol.	0.40	
Total	100.57	100.00

(1) Mapimí, Mexico. (2) $Ca_2Fe_3O_2(AsO_4)_3 \cdot 3H_2O$.

Occurrence: A rare secondary mineral formed by the oxidation of earlier arsenic-bearing minerals, typically scorodite or arsenopyrite.

Association: Beudantite, carminite, scorodite, dussertite, pharmacolite, pitticite, adamite, erythrite, arsenopyrite, löllingite.

Distribution: From Romanèche, Saône-et-Loire, France. At Hüttenberg, Carinthia, Austria. In Germany, at Schneeberg, Saxony, and at Wittichen and Neubulach, Black Forest. In England, at Carrock and Caldbeck Fells, Cumbria; from the Penberthy Croft mine, St. Hilary, Cornwall; in the Huckworthy Bridge mine, Sampford Spiney, Devon. From the Kamariza mine, Laurium, Greece. At Tsumeb, Namibia. In the USA, from Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at the Mohawk mine, San Bernardino Co., and in the Kalkar quarry, Santa Cruz, Santa Cruz Co., California; from the Gold Hill mine, Tooele Co., and the Mammoth and other mines, Tintic district, Juab Co., Utah. In Mexico, from the Jesus Maria mine, Mazapil district, Zacatecas; in the Ojuela mine, Mapimí, Durango; and at the Las Animas mine, La Mur, Sonora. In the Negra mine, near Cosca, north of Ollague, Bolivia. Found at the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia. A few other localities are known, several requiring confirmation.

Name: For essential *arsenic* in the composition, and *sideros*, Greek for *iron*.

Total	100.1

(1) Neubulach, Germany; by electron microprobe, total Fe as Fe_2O_3, H_2O taken as loss on ignition; corresponds to $(Ca_{0.61}Sr_{0.29}Ba_{0.14}Bi_{0.05})_{\Sigma=1.09}(Al_{2.79}Cu_{0.11}Fe^{3+}_{0.07}Zn_{0.02})_{\Sigma=2.99}$ $[(AsO_4)_{0.99}(PO_4)_{0.75}(SiO_4)_{0.26}]_{\Sigma=2.00}(OH)_{4.63} \cdot H_2O$.

Mineral Group: Crandallite group.

Occurrence: A secondary mineral on specimens from a mine dump (Neubulach, Germany).

Association: Brochantite, chalcophyllite, parnauite, barian pharmacosiderite, bulachite, arseniosiderite, mansfieldite, tetrahedrite–tennantite, azurite, malachite, barite, goethite, quartz (Neubulach, Germany); arsenogoyazite, beudantite, olivenite (Centennial Eureka mine, Utah, USA).

Distribution: From Neubulach, and in the Clara mine, near Oberwolfach, Black Forest, Germany. At the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: For *arsenic* in the composition, and relation to *crandallite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150251.

Arsenoflorencite-(Ce) $(Ce, La)Al_3(AsO_4, PO_4)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As scalenohedral crystals, showing $\{10\overline{1}1\}$ and $\{10\overline{1}2\}$, composed of misoriented domains; generally as subhedral grains, to 0.5 mm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. VHN = 170 (10 g load). D(meas.) = 4.096 D(calc.) = 4.091

Optical Properties: Transparent to translucent. *Color:* Colorless, creamy white, light brown; light gray in reflected light.
Optical Class: Uniaxial (+). $\omega = 1.739$ $\epsilon = 1.745$

Cell Data: *Space Group:* $[R\overline{3}m]$ [by analogy to florencite-(Ce)]. $a = 7.029$ $c = 16.517$ Z = 3

X-ray Powder Pattern: Near Kimba, Australia.
2.963 (10), 3.513 (6), 1.905 (5), 2.201 (4), 1.753 (4), 2.752 (3), 1.627 (3)

Chemistry:

Sm_2O_3	0.38
Gd_2O_3	1.38
SrO	1.99
H_2O	9.36
Total	102.11

(1) Near Kimba, Australia; by electron microprobe, average of three analyses, H_2O calculated from $(OH)^-$ for charge balance; corresponding to $(Ce, La, Pr, Sr, Nd, Gd, Sm)_{\Sigma=1.12}Al_{3.00}[(As, P, Al, S)_{\Sigma=1.00}O_4]_2(OH)_{5.91}$. Arsenoflorencites with dominant La and Nd are known but are not fully described.

Mineral Group: Crandallite group.

Occurrence: As detrital grains in heavy mineral concentrates.

Association: Alunite, florencite-(Ce), quartz.

Distribution: In Australia, from the vicinity of Kimba, Eyre Peninsula, South Australia, and from the Northern Territory–Queensland border near the Gulf of Carpentaria.

Name: As the *arsenic* analog of florencite and for the dominant rare earth element, *cerium*.

Type Material: Museum Victoria, Melbourne, M38084, M38085; South Australian Museum, Adelaide, Australia, G14965; The Natural History Museum, London, England, 1986,481; National Museum of Natural History, Washington, D.C., USA, 163782.

Arsenogorceixite $BaAl_3(AsO_4)(AsO_3OH)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As rhombohedral crystals, flattened to pseudo-octahedral, showing $\{10\overline{1}1\}$ and $\{0001\}$, to 0.2 mm; in spherulitic aggregates of radiating crystals.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼4 D(meas.) = 3.65(5) D(calc.) = 3.71

Optical Properties: Transparent. *Color:* Colorless, white, yellow, pale yellow, pale blue. *Luster:* Vitreous.
Optical Class: Uniaxial, nearly isotropic. $n = 1.645(2)$ ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $[R\overline{3}m]$ (by analogy to the crandallite group). $a = 7.10(3)$ $c = 17.39(4)$ Z = 3

X-ray Powder Pattern: Clara mine, Germany.
3.02 (10), 5.84 (8), 3.55 (8), 2.30 (6), 1.930 (6), 1.774 (5), 1.515 (5)

(1) Clara mine, Germany; by electron microprobe, total Fe as FeO, H_2O by difference; corresponding to $(Ba_{0.92}Sr_{0.05}Fe_{0.05}Ca_{0.02})_{\Sigma=1.04}Al_{3.09}[(AsO_4)_{1.34}(PO_4)_{0.47}]_{\Sigma=1.81}$ $[(OH)_{5.19}F_{0.73}]_{\Sigma=5.92} \bullet 0.83H_2O$. (2) $HBaAl_3(AsO_4)_2(OH)_6$.

Mineral Group: Crandallite group.

Occurrence: A rare secondary mineral in the oxidized zone of a hydrothermal polymetallic barite–fluorite deposit (Clara mine, Germany).

Association: Arsenogoyazite, brochantite, agardite, malachite, barian pharmacosiderite, olivenite, fluorite, barite, "limonite", quartz (Clara mine, Germany); mimetite, adamite, beudantite, tsumcorite (Michael mine, Germany).

Distribution: Found in the Clara mine, near Oberwolfach, and the Michael mine, Weiler, near Lahr, Black Forest, Germany. From the Bali Lo copper prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia.

Name: For its *arsenic* content and relation to *gorceixite*.

Type Material: n.d.

Arsenogoyazite $(Sr, Ca, Ba)Al_3(AsO_4, PO_4)_2(OH, F)_5 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ or $3m$. Crystals indistinctly rhombohedral, may show {0001}, to 30 μm, aggregated into reniform crusts with a radial structure.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼4 D(meas.) = 3.35(5) D(calc.) = 3.33

Optical Properties: Translucent. *Color:* Pale green to gray-green, white to yellowish.
Luster: Vitreous.
Optical Class: Isotropic, or nearly so; weak birefringence. $n = 1.64(3)$

Cell Data: *Space Group:* $R\overline{3}m$ or $R3m$. $a = 7.10$ $c = 17.16$ Z = 3

X-ray Powder Pattern: Clara Mine, Germany.

(1) Clara Mine, Germany; by electron microprobe, total Fe as FeO, H_2O by difference; corresponds to $(Sr_{0.49}Ca_{0.25}Ba_{0.21}Fe^{2+}_{0.01})_{\Sigma=0.96}Al_{3.04}[AsO_4)_{1.10}(PO_4)_{0.63}]_{\Sigma=1.73}$ $[(OH)_{4.05}F_{0.95}]_{\Sigma=5.00} \cdot 2.07H_2O$.

Mineral Group: Crandallite group.

Occurrence: A secondary mineral in a hydrothermal polymetallic barite–fluorite deposit (Clara mine, Germany).

Association: Olivenite, cornwallite, malachite, brochantite, barian pharmacosiderite, arsenogorceixite, cualstibite, quartz, barite (Clara mine, Germany); arsenocrandallite, beudantite, olivenite (Centennial Eureka mine, Utah, USA).

Distribution: From the Clara Mine, near Oberwolfach, Black Forest, Germany. In the Centennial Eureka mine, Tintic district, Juab Co., Utah, USA.

Name: For *arsenic* in the composition, and its relation to *goyazite*.

Type Material: University of Stuttgart, Stuttgart, Germany; National Museum of Natural History, Washington, D.C., USA, 150232.

(1) Vermilion mine, Sudbury, Canada; by electron microprobe, corresponding to $(Ni_{17.8}Fe_{0.6}Co_{0.2})_{\Sigma=18.6}Bi_{3.0}As_{1.4}S_{16.0}$. (2) $Ni_{18}Bi_3AsS_{16}$.

Mineral Group: Hauchecornite group.

Occurrence: In hydrothermal Ni–Co–Cu sulfide veins.

Association: Chalcopyrite, pyrrhotite, gersdorffite, pyrite, gold, nickeline, galena, copper, sperrylite, michenerite, froodite (Vermilion mine, Canada).

Distribution: From the Vermilion mine, Sudbury, Ontario, Canada [TL]. At Karagaily, central Kazakhstan. In the Tsumo mine, near Hiroshima City, Shimane Prefecture, Japan.

Name: Alludes to its chemical relation to the hauchecornite group.

Type Material: Royal Ontario Museum, Toronto, Canada, M29206–M29208.

References: (1) Gait, R.I., and D.C. Harris (1980) Arsenohauchecornite and tellurohauchecornite: new minerals in the hauchecornite group. Mineral. Mag., 43, 877–878. (2) (1981) Amer. (1) Tsumeb, Namibia; average of 8 electron microprobe analyses; H_2O calculated and confirmed by Raman spectroscopy, high Total attributed to dehydration under the electron beam; corresponding to $(Zn_{2.80}Fe_{0.06}Mn_{0.04}Mg_{0.03})_{\Sigma=2.93}(As_{1.01}O_4)_2 \cdot 4H_2O$. (2) $Zn_3(AsO_4)_2 \cdot 4H_2O$.

Occurrence: A rare secondary mineral formed by alteration of tennantite-rich ore in the oxidized zone of a dolostone-hosted, polymetallic, hydrothermal ore deposit.

Association: Köttigite, adamite, leiteite, schneiderhöhnite.

Distribution: Tsumeb, Namibia.

Name: For the relationship to *hopeite* $[Zn_3(PO_4)_2 \cdot 4H_2O]$, as its arsenate analogue.

Type Material: Natural History Museum, Vienna, Austria (N 8167).

References: (1) Neuhold, F., U. Kolitsch, H.-J. Bernhardt, and C.L. Lengauer (2012) Arsenohopeite, a new zinc arsenate mineral from the Tsumeb mine, Namibia. Mineral. Mag., 76, 603-612. (2) (2012) Amer. Mineral., 97, 1524 (abs. ref. 1).

Arsenolamprite As

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ (synthetic). As needles, to 8 mm, foliated, radial aggregates of plates, and massive.

Physical Properties: *Cleavage:* Perfect, in one direction. Hardness = 2 VHN = n.d. D(meas.) = 5.3–5.5 D(calc.) = 5.577

Optical Properties: Opaque. *Color:* Gray-white, altering to a dull black coating. *Streak:* Black. *Luster:* Metallic, brilliant. *Anisotropism:* Weak.
R_1–R_2: (400) —, (420) 42.8–56.8, (440) 43.6–55.4, (460) 44.3–54.0, (480) 44.7–52.8, (500) 44.8–51.6, (520) 44.6–50.5, (540) 44.0–49.6, (560) 43.1–48.7, (580) 42.7–48.0, (600) 42.6–47.4, (620) 42.7–46.8, (640) 43.0–46.3, (660) 43.4–45.8, (680) 43.8–45.5, (700) 44.4–45.0

Cell Data: *Space Group: Bmab* (synthetic). $a = 3.63$ $b = 4.45$ $c = 10.96$ $Z = 8$

X-ray Powder Pattern: Alacrán mine, Chile.
5.76 (10), 2.72 (10), 2.745 (8), 1.875 (7), 1.730 (7), 3.48 (6), 2.230 (5)

Chemistry: Nearly pure As, with up to 3% Bi.

Polymorphism & Series: Dimorphous with arsenic.

Occurrence: As plates and veinlets in carbonate rocks (Černý Důl mine, Czech Republic); in calcite veins (Mackenheim, Germany).

Association: Arsenic, bismuth, silver, sternbergite, emplectite, safflorite, löllingite, pyrite, galena, orpiment, realgar, calcite.

Distribution: In Germany, from the Palmbaum mine, Marienberg, Saxony [TL]; from Schweisweiler, Rhineland-Palatinate; at Mackenheim, Odenwald, and Wittichen, Black Forest. From the Černý Důl mine, Krkonoše (Giant Mountains), and Jáchymov (Joachimsthal), Czech Republic. At Sainte-Marie-aux-Mines, Haut-Rhin, France. In Switzerland, at the Lengenbach quarry, Binntal, Valais. From the Alacrán Ag–As–Sb mine, Pampa Larga district, Copiapó, Chile. In the Goldstrike mine, Lynn district, Eureka Co., Nevada, USA.

Name: From its composition and the Greek for *brilliant*, in allusion to its reflectance.

Arsenolite As_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Commonly as tiny octahedra, sometimes modified by the dodecahedron, in aggregates or crusts; botryoidal, stalactitic, earthy to pulverulent.

Physical Properties: *Cleavage:* {111}. *Fracture:* Conchoidal. Hardness = 1.5
D(meas.) = 3.87(1) D(calc.) = 3.88 Taste astringent, sweetish; a very toxic substance.

Optical Properties: Transparent. *Color:* White, pale blue, pink to pale yellow if impure with realgar or orpiment; colorless in transmitted light. *Streak:* White to pale yellowish white. *Luster:* Vitreous to silky.
Optical Class: Isotropic; may be anomalously anisotropic. $n = 1.755$

Cell Data: *Space Group:* $Fd3m$ (synthetic). $a = 11.074$ $Z = 16$

X-ray Powder Pattern: Synthetic.
3.195 (100), 6.39 (63), 2.541 (38), 2.7687 (28), 1.957 (27), 1.551 (22), 1.670 (21)

Chemistry: There are no analyses of natural material.

Occurrence: An oxidation product of other arsenic-bearing sulfides in hydrothermal veins; may be formed in mine fires or in burning coal seams.

Association: Claudetite, realgar, orpiment, erythrite.

Distribution: In Germany, from Wittichen, Black Forest; at Lauta, near Marienberg, Johanngeorgenstadt, and Annaberg, Saxony. In the Czech Republic, at Jáchymov (Joachimsthal) and Kuttenberg. At Saint-Etienne, Loire, and elsewhere in France. From the Dolcoath mine, Cambourne, the Phoenix United mines, Linkinhorne, and elsewhere in Cornwall, England. In the Plaka mine, Laurium, Greece. In Italy, at Sondalo, Sondrio, and Borgofranco, Torino. In the USA, from Manhattan, Nye Co., in the Ophir mine, Comstock Lode, Storey Co., at the Getchell mine, Humboldt Co., and from Simon, Mineral Co., Nevada; in the United Verde mine, Jerome, Yavapai Co., Arizona; and at the Armagosa mine, San Bernardino Co., California. In Canada, at Lake Wanapitei, Sudbury, Ontario, and on Watson Creek, British Columbia.

Name: For ARSENic in the composition.

Arsenopalladinite $Pd_8(As,Sb)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. As rounded grains, to 1.8 mm.

Physical Properties: *Tenacity:* Malleable. Hardness = n.d. VHN = 379–449 (100 g load). D(meas.) = 10.40 D(calc.) = 11.028

Optical Properties: Opaque. *Color:* White, with yellowish creamy tint, in polished section. *Luster:* Metallic. *Anisotropism:* Strong, red and golden brown to blue-gray in air, khaki-brown to blue-gray and bright steel-gray in oil.

R_1–R_2: (400) 43.9–44.5, (420) 44.7–45.8, (440) 45.7–46.5, (460) 46.8–47.8, (480) 48.1–49.4, (500) 49.4–50.8, (520) 50.8–52.4, (540) 52.1–53.9, (560) 53.2–55.1, (580) 54.4–56.4, (600) 55.4–57.3, (620) 56.4–58.1, (640) 57.0–58.8, (660) 57.7–59.2, (680) 58.2–59.8, (700) 58.8–60.0

Cell Data: *Space Group:* $P1$. $a = 7.43$ $b = 13.95$ $c = 7.35$ $\alpha = 92°53'$ $\beta = 119°30'$ $\gamma = 87°51'$ Z = 6

X-ray Powder Pattern: Itabira, Brazil.
2.13 (100), 2.34 (60), 1.41 (40), 1.24 (30), 1.21 (30), 2.28 (20), 2.19 (20)

Chemistry:

	(1)
Pd	77.56
Cu	0.02
As	17.08
Sb	5.15
Total	99.81

(1) Itabira, Brazil; by electron microprobe, average of 13 grains; corresponds to $Pd_{8.10}(As_{2.53}Sb_{0.47})_{\Sigma=3.00}$.

Occurrence: In gold concentrates.

Association: Hematite, palladian gold, atheneite, stillwaterite, palladseite, isomertieite, quartz (Itabira district, Brazil); gpold, palladium, palladesite (Cauê mine, Brazil); stillwaterite, braggite, vysotaskite, sperrylite, hollingworthite (Siikakama intrusion, Finland).

Distribution: In Brazil, from Minas Gerais, in the Itabira district [TL], and at the Caue iron mine. In the Stillwater complex, Montana, USA. From the Merensky Reef, Bushveldt complex, Transvaal, South Africa. In the Siikakämä and Konttijarvi intrusions, northern Finland.

Name: For the composition.

Type Material: The Natural History Museum, London, England, 1934,72, 1977,258; Royal Ontario Museum, Toronto, Canada, M34726; National Museum of Natural History, Washington, D.C., USA, 142504.

Arsenopyrite FeAsS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals, to 30 cm, flat tabular to blocky to prismatic, striated ‖ [001]. Also compact, granular, columnar. *Twinning:* Common on {100} and {001}; as contact or penetration twins on {101}; on {012} to produce star-shaped trillings or cruciform twins.

Physical Properties: *Cleavage:* Distinct on {101}; {010} in traces. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5.5–6 VHN = 1081 on (001) section (100 g load). D(meas.) = 6.07(15) D(calc.) = 6.18

Optical Properties: Opaque. *Color:* Silver-white to steel-gray; in polished section, white with faint yellow tint. *Luster:* Metallic. *Pleochroism:* Weak, in white or bluish tint and faint reddish yellow. *Anisotropism:* Strong, red-violet.
R_1–R_2: (400) 50.3–51.8, (420) 50.3–51.8, (440) 51.3–51.8, (460) 50.6–51.8, (480) 51.0–51.9, (500) 51.4–51.9, (520) 51.8–51.9, (540) 52.2–51.9, (560) 52.5–51.9, (580) 53.0–51.8, (600) 53.4–51.6, (620) 53.6–51.5, (640) 53.6–51.3, (660) 53.6–51.3, (680) 53.4–51.2, (700) 53.2–51.0

Cell Data: *Space Group:* $P2_1/c$. $a = 5.744(2)$ $b = 5.675(1)$ $c = 5.785(2)$ $\beta = 112.17(2)^\circ$ Z = 4

X-ray Powder Pattern: Freiberg, Germany.

Total	99.97	101.16	100.00

(1) O'Brien mine, Cobalt, Canada. (2) Franklin, New Jersey, USA. (3) FeAsS.

Mineral Group: Arsenopyrite group.

Occurrence: Of hydrothermal origin, typically one of the earliest minerals to form. Found in pegmatites, high-temperature gold-quartz and tin veins, and in contact metamorphic sulfide deposits; less commonly of low-temperature hydrothermal origin. Also in gneisses, schists and other metamorphic rocks.

Association: Pyrrhotite, pyrite, chalcopyrite, galena, gold, scheelite, cassiterite, many other species.

Distribution: The most abundant and widespread arsenic mineral; only a few localities for large and fine crystals can be mentioned. In Germany, from Altenberg, Ehrenfriedersdorf, and Freiberg, Saxony. In the Stari Trg mine, Trepča, Serbia. From Panasqueira, Portugal. At Sala, Tunaberg, Stollberg, Boliden, and Nordmark, Sweden. From Stratonik, Greece. In England, from a number of mines in Cornwall, and in Devonshire, at Tavistock. In the USA, from Franconia, Grafton Co., New Hampshire and Franklin, Sussex Co., New Jersey. From Hidalgo del Parral and Santa Eulalia, Chihuahua, Mexico. In Canada, in the Cobalt district, Ontario. In Japan, large crystals in the Obira mine, Bungo, Oita Prefecture; the Ashio mine, Tochigi Prefecture; and many other localities.

Name: A contraction of *arsenical pyrites*.

Arsenosulvanite $Cu_3(As,V)S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $\bar{4}3m$. As grains, which may be subhedral, to 0.15 mm.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.5 VHN = 412–488
D(meas.) = 4.01–4.2 D(calc.) = 4.39

Optical Properties: Opaque. *Color:* Bronze-yellow to pale brownish yellow.
Luster: Metallic.
Optical Class: Isotropic. *Pleochroism:* Yellowish brown.
R: (400) 23.5, (420) 24.9, (440) 26.3, (460) 27.4, (480) 28.6, (500) 29.8, (520) 30.7, (540) 31.7, (560) 32.4, (580) 32.7, (600) 32.4, (620) 31.8, (640) 31.4, (660) 31.1, (680) 30.9, (700) 30.4

Cell Data: *Space Group:* $P\bar{4}3m$. $a = 5.257(3)$ $Z = 1$

X-ray Powder Pattern: Bor, Serbia.
3.054 (10), 1.865 (9), 1.591 (8), 2.638 (6), 1.210 (6), 1.076 (6), 1.318 (5)

V	4.16	3.4	insol.	1.01	
			Total	99.95	100.04

(1) Mongolia; corresponds to $Cu_{2.97}(As_{0.66}V_{0.32})_{\Sigma=0.98}S_{4.00}$. (2) Bor, Serbia; by electron microprobe, average of five grains; corresponds to $Cu_{3.17}(As_{0.70}V_{0.27}Ge_{0.03})_{\Sigma=1.00}S_{4.00}$.

Polymorphism & Series: Forms a series with sulvanite.

Occurrence: In quartz-calcite veins cutting bituminous limestone (Mongolia); in a porphyry copper deposit (Bor, Serbia; Oyu Togoi deposit, Mongolia).

Association: Pyrite, enargite, luzonite, tennantite, tetrahedrite, sulvanite, chalcocite, covellite, bornite, chalcopyrite, galena, sphalerite, ankerite, hematite, quartz, calcite.

Distribution: From the Lebedinoye gold deposit, near Aldan, southern Sakha, Russia [TL]. At an undefined locality in Mongolia, later found in the Oyu Togoi porphyry Cu–Au deposit. In the Tilva Mika deposit, Bor, eastern Serbia. At Baia Borşa, Romania. From the Kafan copper deposit, Armenia. In the Osarizawa mine, Akita Prefecture, and the Hayakawa Cu–Pb–Zn deposit, Hokkaido, Japan. At Bisbee, Cochise Co., Arizona, and in the Geis Au–Ag–Te deposit, Judith Mountains, Fergus Co., Montana, USA.

Name: For the chemical relation with sulvanite.

Type Material: n.d.

Arsenpolybasite $(Ag, Cu)_{16}(As, Sb)_2S_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Thin pseudohexagonal crystals, tabular on {001}, to 6 cm. *Twinning:* Twin plane {110}, repeated.

Physical Properties: *Cleavage:* Imperfect on {001}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2–3 VHN = n.d. D(meas.) = 6.18–6.23 D(calc.) = n.d.

Optical Properties: Opaque, translucent in thin fragments. *Color:* Black; dark red in transmitted light. *Streak:* Black. *Luster:* Metallic.
Optical Class: Biaxial (–). *Pleochroism:* In reflected light, weak. *Orientation:* $X = c$; $Y = a$. *Dispersion:* Very strong. $n = > 2.72$ (Li). 2V(meas.) = 22° *Anisotropism:* Moderate.
R_1–R_2: n.d.

Cell Data: *Space Group:* $C2/m$. $a = 26.08$ $b = 15.04$ $c = 23.84$ $\beta = 90°$ Z = 16

X-ray Powder Pattern: Synthetic $(Ag_{14.32}Cu_{1.68})_{\Sigma=16.00}As_2S_{11}$.
3.010 (100), 1.8414 (60), 3.081 (40), 2.839 (35), 2.0935 (30), 6.38 (25), 6.02 (25)

Chemistry:

(1) Freiberg, Germany; corresponding to $(Ag_{14.09}Cu_{1.10}Fe_{0.14})_{\Sigma=15.33}(As_{1.96}Sb_{0.14})_{\Sigma=2.10}S_{11.57}$.

Occurrence: Formed in silver-bearing hydrothermal veins of low to medium temperature.

Association: Pyrargyrite, stephanite, tetrahedrite, acanthite, silver, gold, pyrite, quartz, calcite, dolomite.

Distribution: At the Neuer Morgenstern mine, Freiberg, Saxony, Germany [TL]. In Chile, at Quespisiza. From Creede, Mineral Co., Colorado, USA. In the Santo Niño Ag–Pb–Zn vein, Fresnillo district, Zacatecas, Mexico.

Name: For the chemical composition and close relation to polybasite.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 82633, 110527.

Arsentsumebite $Pb_2Cu(AsO_4)(SO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As distorted crystals, to 2 mm, in aggregates and crusts. *Twinning:* Complex, observed.

Physical Properties: *Fracture:* [Uneven] (by analogy to tsumebite). *Tenacity:* [Brittle.] Hardness = [3.5] D(meas.) = 6.46 D(calc.) = 6.39

Optical Properties: Semitransparent. *Color:* Grass-green to apple-green. *Luster:* [Vitreous.] *Optical Class:* Biaxial (–). *Pleochroism:* X = pale pistachio-green; $Y = Z$ = bottle-green. $\alpha = 1.970$ $\beta = 1.992$ $\gamma = 2.011$ 2V(meas.) = 88°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.85$ $b = 5.92$ $c = 7.84$ $\beta = 112.6°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia; close to tsumebite. (ICDD 25-456). 3.25 (100), 4.80 (65), 2.76 (60), 3.64 (46), 2.96 (40), 3.01 (32), 2.094 (30)

Chemistry:

	(1)	(2)
SO_3	9.36	10.97
P_2O_5	0.55	
As_2O_5	13.45	15.74
CuO	10.61	10.90
PbO	61.91	61.16
H_2O	1.58	1.23
Total	97.46	100.00

(1) Tsumeb, Namibia; by electron microprobe, As_2O_5 originally given as As_2O_3, H_2O by CHN analyzer. (2) $Pb_2Cu(AsO_4)(SO_4)(OH)$.

Mineral Group: Brackebuschite group.

Occurrence: A rare mineral in the oxidized zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia); in a hydrothermal polymetallic barite–fluorite deposit (Clara mine, Germany).

Association: Malachite, cerussite, azurite, smithsonite, mimetite, bayldonite, conichalcite, duftite, quartz, iron oxide (Tsumeb, Namibia).

Distribution: From Tsumeb, Namibia. In the Clara mine, near Oberwolfach, Black Forest, Germany. At Moldava, 20 km northwest of Teplice, Czech Republic. From the Buckhorn mine, Red Cloud district, Lincoln Co., New Mexico, USA. From the From the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia, and at Broken Hill, New South Wales, Australia.

Name: As the *arsenate* analog of *tsumebite*.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 134586.

References: (1) Bideaux, R.A., M.C. Nichols, and S.A. Williams (1966) The arsenate analog of tsumebite, a new mineral. Mineral. Soc. Amer. Annual Meeting. Amer. Mineral., 51, 258–259 (abs.). Arsenuranospathite $HAl(UO_2)_4(AsO_4)_4 \cdot 40H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudotetragonal. *Point Group:* n.d. As crusts of wedgelike bladed or acicular crystals, to 0.3 mm, exhibiting {100}, {010}, {001}, and rarely {110}.

Physical Properties: *Cleavage:* Perfect on {001}; good on {100} and {010}. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 2.54 Weak greenish fluorescence under SW UV. Radioactive. Dehydrates readily in air.

Optical Properties: Transparent to translucent. *Color:* Pale yellow, yellowish brown. *Streak:* White.
Optical Class: Biaxial (–). *Orientation:* $X = c$; Z = elongation; length positive.
Dispersion: $r > v$. $\alpha = \ll 1.538$ $\beta = \simeq 1.538$ $\gamma = 1.542(3)$ $2V(meas.) = \sim 52°$

Cell Data: *Space Group:* $P4_2/n$ (pseudocell). $a = 7.16$ $c = 30.37$ Z = 2

X-ray Powder Pattern: Menzenschwand, Germany.
14.62 (10), 7.62 (10), 3.49 (9), 5.03 (8), 3.59 (5), 3.24 (4), 2.25 (3)

Chemistry: (1) Menzenschwand, Germany; Al, As, and U confirmed by microchemical and spectrochemical techniques, formula established by analogy to uranospathite and similarity of X-ray pattern to synthetic material.

Occurrence: A very rare secondary mineral in uranium deposits.

Association: Zeunerite, uranophane, studtite, uranospinite, ianthinite, metakirchheimerite, "uranocircite"–heinrichite, barite, "limonite".

Distribution: In Germany, in the Black Forest, at Menzenschwand and on the dump of the Sophia mine, near Wittichen. From the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France.

Name: As the *arsenate* analog of *uranospathite*.

Type Material: n.d.

References: (1) Walenta, K. (1978) Uranospathite and arsenuranospathite. Mineral. Mag., 42, 117–128. (2) (1979) Amer. Mineral., 64, 465 (abs. ref. 1).

Polymorphism & Series: Forms a series with routhierite.

Occurrence: In a lens of microcrystalline barite near the contact between schist and pyrite-rich dolostone. The assemblage interpreted as crystallized from a sulfide melt during greenschist-facies metamorphism.

Association: Protochabournéite, cinnabar, laffittite, pyrite, realgar, Hg-bearing sphalerite, stibnite, barite.

Distribution: From near the junction of the Sant'Olga tunnel and Farioli shaft, Monte Arsiccio mine, near Sant'Anna di Stazzema, Apuan Alps, Tuscany, Italy.

Name: For the mine that produced the first specimens.

Type Material: Natural History Museum, University of Pisa, Italy (# 19659), and the Natural History Museum, Università degli Studi di Firenze, Florence, Italy (# 3132/I).

(1) Hingston Down Consols mine, England; H_2O by loss on ignition; after deduction of quartz 27.4%, and addition of SO_3 and P_2O_5 from analysis (2); then corresponds to $Cu_{1.02}Fe_{1.98}[(As_{0.69}P_{0.20}S_{0.11})_{\Sigma=1.00}O_4]_2(O,OH)_2 \cdot 4H_2O$. (2) Do.; by electron microprobe, H_2O by difference.

Mineral Group: Arthurite group.

Occurrence: A rare secondary mineral in the oxidized zone of some copper deposits, formed by alteration of arsenopyrite or enargite.

Association: Pharmacosiderite, scorodite, conichalcite, chenevixite, chalcophyllite, brochantite, quartz.

Distribution: In England, in Cornwall, from the Hingston Down Consols mine, Calstock, the Gunheath china clay pit, St. Austell, and the Cligga Head mine, Perranzabuloe. From the Clara mine, near Oberwolfach, Black Forest, Germany. In the Bendada pegmatite, near Guarda, Portugal. From Rodalquilar, Almería Province, Spain. At the Potrerillos mine, Atacama, Chile. Fine crystals from the Majuba Hill mine, Antelope district, Pershing Co., Nevada; at the Black Pine mine, near Philipsburg, Granite Co., Montana; from Gold Hill, Tooele Co., Utah, USA. In the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia.

Name: Honors Sir Arthur Edward Ian Montagu Russell (1878–1964) and Arthur William Gerald Kingsbury (1906–1968) for their substantial contributions to British mineralogy.

Type Material: The Natural History Museum, London, England, 1964,74–75 and 1964,80.

Artinite $Mg_2(CO_3)(OH)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically acicular along [010], to 2.5 cm, forming cross-fiber veinlets, botyroidal crusts, and spherical or bow tie aggregates of divergent crystals.

Physical Properties: *Cleavage:* {100}, perfect; {001}, good. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.02–2.03 D(calc.) = 2.047

Optical Properties: Transparent. *Color:* White; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, silky to satiny in aggregates. *Optical Class:* Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 30°$. $\alpha = 1.488(1)$ $\beta = 1.534(1)$ $\gamma = 1.556(1)$ 2V(meas.) = 70°

Cell Data: *Space Group:* $C2/m$. $a = 16.561(5)$ $b = 6.298(3)$ $c = 6.220(3)$ $\beta = 99°9(10)'$ Z = 1

X-ray Powder Pattern: Locality not stated. (ICDD 6-484).
2.736 (100), 5.34 (65), 3.69 (50), 2.210 (40), 8.18 (30), 2.672 (20), 2.271 (20)

Chemistry:

	(1)	(2)
CO_2	22.36	22.38
MgO	40.97	40.98
H_2O	36.62	36.64
Total	99.95	100.00

(1) Monte Ramazzo, Italy. (2) $Mg_2(CO_3)(OH)_2 \cdot 3H_2O$.

Occurrence: A low-temperature mineral in weathered or altered ultramafic rocks, typically serpentinites, likely occurring worldwide.

Association: Brucite, hydromagnesite, pyroaurite, chrysotile, aragonite, calcite, dolomite, magnesite.

Distribution: Well-studied or good specimen material, from: in Italy, in Lombardy, from the Franscia asbestos mine, at Torre Santa Maria and Rocca Castellaccio, Val Lanterna, all in Val Malenco; at Emarese and Cogne, Val d'Aosta, Piedmont; from Viu, near Fubina, Val di Lanzo; and on Mont Ramazzo, north of Borzoli, Liguria. From Kraubath, Styria, Austria. Near Javornica, Bulgaria. In the USA, in California, from northwest of Coalinga, Fresno Co. and into San Benito Co., as fine examples at the Clear Creek mine, west of San Benito Mountain, and elsewhere in the New Idria district; at the Gabbs mine, Gabbs district, Nye Co., Nevada; from Spring Street, Staten Island, New York; at Signal Hill, Hoboken, Hudson Co., New Jersey; in the Belvidere Mountain quarry, Orleans Co., Vermont. In Japan, from Nakauri, Aichi Prefecture, at Hirotani, Fukuoka Prefecture, and along the Utonai River, Hokkaido. From the Ijim massif, Sayan Mountains, Siberia, Russia.

Name: Honors Professor Ettore Artini (1866–1928), Italian mineralogist, University of Milan and Director of the Natural History Museum, Milan, Italy.

Type Material: Natural History Museum, Milan, Italy, 13215, 13217, 22182, 22191.

F	16.1	17.52
H_2O	6.0	5.54
$-O = F_2$	6.8	7.38
Total	98.4	100.00

(1) Grand Reef mine, Arizona, USA; by electron microprobe, average of ten analyses, H_2O by TGA; corresponds to $Pb_{1.00}Al_{1.01}F_{2.80}(OH)_{2.20}$. (2) $PbAlF_3(OH)_2$.

Occurrence: In the oxidized zone of an epithermal Cu–Pb–Ag deposit.

Association: Calcioaravaipaite, quartz, anglesite, fluorite, galena, linarite, muscovite.

Distribution: From the Grand Reef mine, near Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: Honors Dr. Arthur Roe (1912–1993), American chemist and collector of microscopic minerals, Tucson, Arizona, USA.

Type Material: Natural History Museum, Los Angeles, California, USA, 39338.

CoO	0.39	
NiO	40.18	43.92
H_2O	[27.30]	28.25
Total	[100.00]	100.00

(1) Santa Catherina meteorite; by electron microprobe, total Fe as FeO, H_2O by difference; corresponds to $(Ni_{2.78}Fe^{2+}_{0.33}Co_{0.03})_{\Sigma=3.14}(PO_4)_{2.01}O_{0.12}\bullet 7.84H_2O$. (2) $Ni_3(PO_4)_2\bullet 8H_2O$.

Mineral Group: Vivianite group.

Occurrence: A weathering product of a nickel-rich iron meteorite.

Association: Reevesite, honessite, akaganéite, hematite, goethite, magnetite.

Distribution: In the Santa Catherina iron meteorite.

Name: To honor Hans Henning Arup (1928–), Director of the Danish Corrosion Center, Copenhagen, Denmark.

Type Material: Division of Meteorites, National Museum of Natural History, Washington, D.C., USA, 659, 804, 877.

Arzakite $Hg_3S_2(Br,Cl)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (perhaps triclinic). *Point Group:* $2/m$, 2, or m. As complex intergrowths with lavrentievite, to 0.2 mm. *Twinning:* Noted.

Physical Properties: *Cleavage:* Perfect in two directions parallel to elongation. *Fracture:* Rough. *Tenacity:* Brittle. Hardness = 2.0–2.5 VHN = 85–90 (10 g load). D(meas.) = n.d. D(calc.) = 7.69

Optical Properties: Transparent. *Color:* Colorless to yellow, pale bog-brown, reddish brown, deepening on exposure to light; grayish to yellowish brown in thin section; gray in reflected light, with pale yellow to pale brown internal reflections. *Luster:* Vitreous to adamantine. *Streak:* Grayish yellow.
Optical Class: Biaxial. *Pleochroism:* Weak. *Orientation:* Extinction parallel to cleavage. *Bireflectance:* Very weak, grayish white to gray.
R_1–R_2: (546) 16.5–17.0, (590) 15.2–16.7, (620) 14.8–16.0, (656) 14.5–16.0

Cell Data: *Space Group:* $P2/m$, $P2$, or Pm. $a = 8.99(4)$ $b = 5.24(1)$ $c = 18.45(8)$ $\beta = 92.28(15)^\circ$ $Z = 5$

X-ray Powder Pattern: Arzak deposit, Russia; differs only by intensities from lavrentievite. 2.63 (10), 3.02 (6), 3.41 (5), 3.99 (4), 2.313 (4), 1.594 (4), 5.05 (3)

Chemistry:

	(1)	(2)
Hg	76.74	77.02
S	7.80	8.21
Br	12.06	10.23
Cl	3.29	4.54
Total	99.89	100.00

(1) Arzak deposit, Russia; by electron microprobe, average of five grains; corresponding to $Hg_{3.08}S_{1.96}(Br_{1.22}Cl_{0.75})_{\Sigma=1.97}$. (2) $Hg_3S_2(Br,Cl)_2$ with Br:Cl = 1:1.

Polymorphism & Series: Forms a series with lavrentievite.

Occurrence: In the oxidized zone of a hydrothermal deposit.

Association: Lavrentievite, cinnabar, corderoite, quartz, kaolinite.

Distribution: From the Arzak deposit, Pii-Khem district, Uyuk Range, Tuva, Siberia, Russia [TL].

Name: For the occurrence in the Arzak deposit, Russia.

Type Material: Mining Institute, St. Petersburg, 1677/1; Central Siberian Geological Museum, Novosibirsk, Russia, VI-24/1.

Asbecasite $\mathbf{Ca_3(Ti,Sn^{4+})As_6^{3+}Si_2Be_2O_{20}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $3m$. As rhombohedral crystals, up to 5 mm, flattened on {0001}, with $\{01\bar{1}2\}$.

Physical Properties: *Cleavage:* Rhombohedral. Hardness = 6.5–7 D(meas.) = 3.70 D(calc.) = 3.71

Optical Properties: Transparent. *Color:* Lemon-yellow or citron-yellow. *Luster:* Vitreous. *Optical Class:* Uniaxial (–); anomalously biaxial. $\omega = 1.86$ $\epsilon = 1.83$ 2V(meas.) = 0°–17°

Cell Data: *Space Group:* $P3c1$. a = 8.36(2) $c = 15.30(3)$ Z = 2

X-ray Powder Pattern: Cherbadung, Switzerland.
3.231 (100), 2.404 (70), 1.929 (60), 1.571 (50), 1.154 (50), 1.746 (50), 4.030 (50)

Chemistry:

	(1)
SiO_2	12.3
TiO_2	6.3
SnO_2	2.1
Al_2O_3	1.2
As_2O_3	58.7
Tl_2O_3	1.0
BeO	2.3
CaO	15.4
Total	99.3

(1) Cherbadung, Switzerland; purity confirmed by electron microprobe; corresponds approximately to $Ca_{2.67}(Ti_{0.67}Sn_{0.13}Tl_{0.04})_{\Sigma=0.84}As^{3+}_{6.67}Si_{2.00}Al_{0.27}Be_{1.00}O_{20}$.

Occurrence: On cleft faces in orthogneiss (Cherbadung, Switzerland).

Association: Magnetite, hematite, titanite, apatite, anatase, malachite, azurite, tennantite, molybdenite (Cherbadung, Switzerland).

Distribution: On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Italy. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland.

Name: For elements in the composition, *As, Be, Ca, Si.*

Asbolane $(Ni, Co)_xMn^{4+}(O, OH)_4 \cdot nH_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. Platelets, to several μm, in thin lamellar aggregates; massive.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: [Opaque.] *Color:* Brownish black.
Optical Class: Uniaxial.
R_1–R_2: n.d.

Cell Data: *Space Group:* n.d. $a = 2.832$ $c = 9.34$, or $a = 3.04$ $c = 9.34$ Z = n.d.

X-ray Powder Pattern: Lipov deposit, Russia.
4.82 (s), 2.445 (mw), 9.6 (w), 1.7 (vw), 1.419 (vw)

Chemistry:

	(1)
SiO_2	0.6
Al_2O_3	0.1
Fe_2O_3	0.9
Co_2O_3	1.0
MnO	66.7
NiO	17.9
H_2O	[12.8]
Total	[100.0]

(1) New Caledonia; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference. (2) Lipov deposit, Russia; TEM energy-dispersive analysis, supported by TGA and IR, not given, is stated to correspond to $(Ni_{0.28}Co_{0.12}Ca_{0.05})_{\Sigma=0.45}MnO_{1.5}(OH)_2 \cdot 0.64H_2O$.

Occurrence: As a weathering product in silicic rocks (Russia); in siliceous schists (Kara-Chagyra, Uzbekistan); widespread in residual soils above ultramafic rocks (New Caledonia).

Association: Goethite.

Distribution: From Kamsdorf, Thuringia, Germany. In the Lipov and Tyulenev deposits, Middle Ural Mountains, and the Buranov deposit, Southern Ural Mountains, Russia. At Kara-Chagyra, Uzbekistan. In the San Luis mine, Chulchucani, Potosi, Bolivia. Found at a number of places in New Caledonia. Probably from additional localities, but careful characterization is required.

Name: From the Greek for *to soil like soot*.

Type Material: n.d.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$, m, or 2. As prismatic, lathlike crystals, to 5 cm; also as thick, slightly bent plates.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. VHN = 150–181 (25 g load). D(meas.) = n.d. D(calc.) = 7.33

Optical Properties: Opaque. *Color:* Lead-gray; creamy white in reflected light. *Luster:* Metallic. *Anisotropism:* Moderate, from gray to red-brown.
R_1–R_2: (470) 45.1–48.1, (546) 43.4–46.3, (589) 42.9–46.3, (650) 42.9–46.3

Cell Data: *Space Group:* $C2/m$, Cm, or $C2$. $a = 13.71$ $b = 4.09$ $c = 31.43$ $\beta = 91.0°$ Z = 4

X-ray Powder Pattern: Ascham Alm, Austria.
3.426 (100), 3.378 (88), 2.941 (54), 2.926 (54), 2.861 (48), 3.525 (42), 2.067 (42)

Chemistry:

	(1)	(2)
Pb	62.95	63.76
Bi	22.56	21.44
S	14.89	14.80
Total	100.40	100.00

(1) Ascham Alm, Austria; by electron microprobe, corresponding to $Pb_{5.89}Bi_{2.05}S_{9.00}$.
(2) $Pb_6Bi_2S_9$.

Occurrence: In alpine veins, cutting gneiss.

Association: Cosalite, galena, quartz, albite, orthoclase, calcite, chlorite.

Distribution: From near Ascham Alm, Untersulzbachtal, Salzburg, Austria [TL]. At Granite Gap, Hidalgo Co., New Mexico, USA.

Name: For its occurrence at Ascham Alm, Austria.

Type Material: Museum of Natural History, Vienna, Austria; Division of Mineral Chemistry, C.S.I.R.O., Port Melbourne, Victoria, Australia; National Museum of Natural History, Washington, D.C., USA, 160379.

Ashanite $(Nb, Ta, U, Fe, Mn)_4O_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Single crystals are mentioned but the habit is not stated.

Physical Properties: *Fracture:* Conchoidal to subconchoidal. Hardness = 5.8–6.6 VHN = 570–851 D(meas.) = 6.61(1) D(calc.) = 6.60

Optical Properties: Opaque, translucent on thin edges. *Color:* Dark brown to pitch-black; brownish red in thin section; pale bluish gray in reflected light. *Streak:* Brown. *Luster:* Semimetallic to pitchlike.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = pale brownish red; Z = dark brownish red. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Absorption:* $Z > X$. $\alpha = 2.31$ $\beta = 2.35$ $\gamma = 2.40$ 2V(meas.) = 70°–75°
R_1–R_2: (440) 12.1–12.1, (460) 11.4–11.5, (480) 11.2–11.3, (500) 11.0–11.0, (520) 11.0–11.0, (540) 10.9–10.9, (560) 10.9–10.8, (580) 10.8–10.8, (600) 10.8–10.7, (620) 10.7–10.7, (640) 10.7–10.6, (660) 10.6–10.6, (680) 10.6–10.6, (700) 10.6–10.6

Cell Data: *Space Group: Pcan.* $a = 5.869$ $b = 4.873$ $c = 5.216$ Z = 1

X-ray Powder Pattern: Altai Mountains, China.
2.95 (10), 3.65 (5), 2.54 (3), 2.51 (3), 2.38 (3), 1.729 (3), 2.874 (2)

Chemistry:

	(1)
U_3O_8	23.81
Nb_2O_5	36.76
Ta_2O_5	23.41
RE_2O_3	1.40
FeO	8.25
MnO	7.77
Total	101.40

(1) Altai Mountains, China; corresponds to $(Nb_{1.61}Fe_{0.66}Mn_{0.63}Ta_{0.61}U_{0.51}RE_{0.07})_{\Sigma=4.09}O_{7.98}$.

Occurrence: In the central part of a pegmatite in albitized two-mica granite.

Association: Tantalum-rich columbite, thorium-rich monazite, ishikawaite.

Distribution: From an undefined locality in the Altai Mountains, Sinkiang Uighur Autonomous Province, northwestern China.

Name: From Altai and SHAN, Chinese for *mountains*, for the occurrence in the Altai Mountains, China.

Type Material: n.d.

Ashburtonite $HPb_4Cu_4Si_4O_{12}(HCO_3)_4(OH)_4Cl$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m$. Prismatic along [001], to 0.4 mm, showing {110}, {100}, {001}, and {301}.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = > 4.07 D(calc.) = 4.69

Optical Properties: Transparent. *Color:* Blue. *Streak:* Light blue. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.786(3)$ $\epsilon = 1.800(4)$

Cell Data: *Space Group:* $I4/m$. $a = 14.1852(8)$ $c = 6.0759(8)$ $Z = 2$

X-ray Powder Pattern: Anticline prospect, Western Australia.
10.2 (100), 4.495 (100), 3.333 (100), 3.013 (90), 5.644 (70), 2.611 (50), 2.805 (30)

Chemistry:

	(1)
SiO_2	14.07
CuO	18.66
PbO	52.17
Cl	2.28
H_2O	[4.22]
CO_2	[10.31]
$-O = Cl_2$	0.51
Total	[101.20]

(1) Anticline prospect, Western Australia; by electron microprobe, average of four analyses, OH and CO_2 confirmed present by infrared spectroscopy, H_2O and CO_2 calculated from stoichiometry; corresponds to $Pb_{3.99}Cu_{4.01}HSi_{4.00}O_{12.03}(HCO_3)_{4.00}(OH)_{4.00}Cl_{1.10}$.

Occurrence: In a weathered shear zone cutting shales and graywackes, as an alteration of galena and probably chalcopyrite.

Association: Diaboleite, duftite, beudantite, caledonite, plattnerite, cerussite, malachite, brochantite.

Distribution: From the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia.

Name: For its occurrence near the Ashburton Downs pastoral lease and homestead, Western Australia.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 58391; Museum Victoria, Melbourne, Australia, M40712.

References: (1) Grice, J.D., E.H. Nickel, and R.A. Gault (1991) Ashburtonite, a new bicarbonate-silicate mineral from Ashburton Downs, Western Australia: description and structure determination. Amer. Mineral., 76, 1701–1707.

Ashcroftine-(Y) $K_5Na_5(Y,Ca)_{12}Si_{28}O_{70}(CO_3)_8(OH)_2 \cdot 8H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As fibrous prismatic crystals, to 2 cm, striated ‖ [001]; in divergent sprays; as a fine, crystalline powder.

Physical Properties: *Cleavage:* Perfect on {100}, distinct on {001}. *Tenacity:* Flexible. Hardness = 5 D(meas.) = 2.61 D(calc.) = [2.59]

Optical Properties: Transparent to translucent. *Color:* Pale pink, white, pinkish brown, pinkish purple, deep violet-brown. *Streak:* White. *Luster:* Vitreous, may be silky. *Optical Class:* Uniaxial (+). $\omega = 1.536–1.537$ $\epsilon = 1.545–1.549$

Cell Data: *Space Group:* $I4/mmm$. $a = 24.01(1)$ $c = 17.52(1)$ Z = 4

X-ray Powder Pattern: Narssârssuk, Greenland.
17.027 (100), 12.043 (90), 7.615 (60), 3.114 (50), 2.687 (50), 5.379 (35), 6.014 (30)

Chemistry:

	(1)	(2)
SiO_2	38.09	42.69
Y_2O_3	26.61	34.37
MnO	0.79	
MgO	0.87	
CaO	5.72	
Na_2O	3.62	3.93
K_2O	5.65	5.97
H_2O^+	4.8	4.11
H_2O^-	6.40	
CO_2	7.2	8.93
Total	99.75	100.00

(1) Narssârssuk, Greenland; Y_2O_3 originally determined as Al_2O_3. (2) $K_5Na_5Y_{12}Si_{28}O_{70}(CO_3)_8(OH)_2 \cdot 8H_2O$.

Occurrence: In cavities in augite syenite (Narssârssuk, Greenland); in igneous breccia and pegmatites in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Calcite, elpidite, albite, quartz, aegirine, orthoclase, zinnwaldite, graphite (Narssârssuk, Greenland); aegirine, bastnäsite, lorenzenite, brookite, elpidite, leucosphenite, cordylite, narsarsukite (Mont Saint-Hilaire, Canada).

Distribution: From Narssârssuk, Greenland. At Mont Saint-Hilaire, Quebec, Canada. From Cava del 'Osa, near Rome, Lazio, Italy.

Name: To honor Frederick Noel Ashcroft (1878–1949), benefactor to the British Museum (Natural History), London, England.

Type Material: The Natural History Museum, London, England, 1924,867; University of Copenhagen, Copenhagen, Denmark; Harvard University, Cambridge, Massachusetts, 110266; National Museum of Natural History, Washington, D.C., USA, 95320, R4333.

Ashoverite $Zn(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$, $\bar{4}2m$, or $4mm$. Crystals are square plates, to about 0.5 mm, which thin markedly toward their edges; commonly in stellate groups of crystals intersecting at angles of 60°–70°.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. D(meas.) = 3.3 D(calc.) = 3.44 Fluoresces bluish white under SW UV.

Optical Properties: Translucent. *Color:* Colorless to milky in the center of crystals. *Streak:* White. *Luster:* Dull to vitreous.
Optical Class: Uniaxial (+). $\omega = 1.629(2)$ $\epsilon = 1.639(2)$

Cell Data: *Space Group:* $I4_1/amd$, $I\bar{4}2d$, or $I4_1md$. $a = 6.825(2)$ $c = 33.36(4)$ Z = 32

X-ray Powder Pattern: Near Ashover, England.
2.902 (100), 1.819 (33), 1.702 (21), 1.470 (19), 3.031 (13), 1.0063 (13), 3.332 (11)

Chemistry:

	(1)	(2)
ZnO	84.46	81.88
PbO	2.06	
CdO	0.71	
CaO	0.15	
H_2O	14.9	18.12
Total	102.28	100.00

(1) Near Ashover, England; by electron microprobe, average of eight analyses; H_2O by CHN analyzer, thought to lose H_2O under the electron beam; on recalculation to 2(OH,O) corresponds to $(Zn_{1.18}Pb_{0.01}Cd_{0.01})_{\Sigma=1.20}[(OH)_{1.60}O_{0.40}]_{\Sigma=2.00}$. (2) $Zn(OH)_2$.

Polymorphism & Series: Trimorphous with sweetite and wülfingite.

Occurrence: In an oxidized vein in limestone (near Ashover, England).

Association: Sweetite, wülfingite, fluorite (near Ashover, England).

Distribution: In a limestone quarry 200–300 m northwest of Milltown, near Ashover, Derbyshire, England. From Jüliushutte, Astfeld, Harz Mountains, Germany, in slag.

Name: For the locality at Ashover, England, where it was first found.

Type Material: The Natural History Museum, London, England, 1982,5.

References: (1) Clark, A.M., E.E. Fejer, G. Cressey, and P.C. Tandy (1988) Ashoverite, a new mineral, and other polymorphs of $Zn(OH)_2$ from Milltown, Ashover, Derbyshire. Mineral. Asisite $Pb_7SiO_8Cl_2$

Crystal Data: Tetragonal. *Point Group*: 4/m 2/m 2/m. Platy, to about 0.5 mm.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = n.d. VHN = 146-186 (50 g load). D(meas.) = n.d. D(calc.) = 8.041

Optical Properties: Transparent. *Color:* Yellow to yellow-green. *Streak:* Light yellow to white. *Luster:* Adamantine.
Optical Class: Uniaxial (-). ω = 2.39 ε = 2.32 *Anisotropism*: Weak in oil, gray; not noticeable in air.
R_1-R_2: (400) 20.6-20.7, (420) 19.8-19.8, (440) 19.0-19.15, (460) 18.5-18.65, (480) 18.1-18.2, (500) 17.7-17.9, (520) 17.4-17.55, (540) 17.15-17.3, (560) 16.9-17.0, (580) 16.7-16.8, (600) 16.6-16.7, (620) 16.5-16.5, (640) 16.3-16.4, (660) 16.2-16.3, (680) 16.1-16.2, (700) 16.0-16.1

Cell Data: *Space Group*: *I4/mmm*. a = 3.897(2) c = 22.81(2) Z = 1
A tetragonal supercell of 14×14×23 Å, is created by strong ordering of Si within the PbO sheet structure, yielding $Pb_{12}(SiO_4)O_8Cl_4$ with Z = 8.

X-ray Powder Pattern: Kombat mine, Namibia.
2.957 (100), 2.752 (60), 1.627 (60), 1.602 (50), 3.46 (40), 1.984 (40), 1.747 (40)

Chemistry:

	(1)
SiO_2	2.0
PbO	93.7
Cl	4.4
$-O = Cl_2$	1.0
Total	99.1

(1) Kombat mine, Namibia; by electron microprobe, average of three analyses, corresponding to $Pb_7Si_{0.55}O_{7.07}Cl_{2.02}$.

Occurrence: In manganese silicate lenses nearby a sulfide ore body.

Association: Hematophanite, barite, jacobsite, hematite, copper, molybdophyllite, chlorite.

Distribution: In the Kombat mine, 49 km south of Tsumeb, Namibia.

Name: For the Asis Farm, location of the Kombat mine, which in the Nama language means drinking place.

Type Material: Canadian Geological Survey, Ottawa, Canada, 64565; The Natural History Museum, London, England, 1986,304.

References: (1) Rouse, R.C., D.R. Peacor, P.J. Dunn, A.J. Criddle, C.J. Stanley, and J. Innes (1988) Asisite, a silicon-bearing lead oxychloride from the Kombat mine, South West Africa (Namibia). Åskagenite-(Nd) $Mn^{2+}NdAl_2Fe^{3+}(Si_2O_7)(SiO_4)O_2$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. Crystals prismatic, sometimes flattened with rectangular cross-sections, to 4 cm.

Physical Properties: *Cleavage*: None. *Fracture*: Conchoidal. *Tenacity*: Brittle. Hardness = 6 D(meas.) = 3.737(5) (for metamict material) D(calc.) = 4.375 (sample heated at 600° C) Slightly radioactive.

Optical Properties: Translucent. *Color*: Black, brown in thin fragments. *Streak*: Brown. *Luster*: Resinous.
Optical Class: Isotropic. n = 1.712(2)

Cell Data: *Space Group*: $P2_1/m$. a = 8.78(1) b = 5.710(6) c = 10.02(1) β = 114.6(2)° Z = 2

X-ray Powder Pattern: Near Åskagen quarry, Sweden. (amorphous until heated to 600° C)
2.897 (100), 2.850 (73), 2.687 (73), 1.630 (59), 3.22 (50), 2.121 (48), 3.50 (46)

Chemistry:

	(1)		(1)
CaO	0.27	ThO_2	0.72
Y_2O_3	2.27	MnO	7.98
La_2O_3	0.44	FeO	[7.75]
Ce_2O_3	7.99	Fe_2O_3	[9.16]
Pr_2O_3	1.76	Al_2O_3	15.85
Nd_2O_3	11.21	SiO_2	29.51
Sm_2O_3	3.01	H_2O	0.55
Yb_2O_3	0.21	Total	98.75

(1) Near Åskagen quarry, Värmland, Sweden; average of 4 electron microprobe analyses, H_2O by the Alimarin method, Fe^{+3}/Fe^{+2} calculated from Mössbauer spectrum, Mn^{+2} confirmed by XANES spectroscopy; corresponding to $(Mn^{2+}_{0.69}Fe^{2+}_{0.26}Ca_{0.03})_{\Sigma=0.98}(Nd_{0.41}Ce_{0.30}Y_{0.12}Sm_{0.10}Pr_{0.07}La_{0.02}Th_{0.02}Yb_{0.01})_{\Sigma=1.05}(Al_{1.90}Fe^{3+}_{0.70}Fe^{2+}_{0.40})_{\Sigma=3.00}Si_{2.99}O_{12.63}(OH)_{0.37}$.

Mineral Group: Epidote group.

Occurrence: In a granite pegmatite.

Association: Potassic feldspar, quartz, bastnäsite, thorite, Nd-dominant analogue of allanite-(Ce), brookite, gadolinite-(Y), allophane.

Distribution: Near Åskagen quarry, mining village Torskebäcken, about 12 km east of Filipstad, Värmland, Sweden.

Name: For the quarry that produced the first specimen and indicating the predominance of Nd over other REE in the A2 structural site.

Type Material: Technische Universität, Bergakademie, Freiberg, Germany (82194 and 82218).

Asselbornite $(Pb,Ba)(UO_2)_6(BiO)_4(AsO_4)_2(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$, 432, $2/m\ \overline{3}$ or 23. Crystals are cubes modified by tetrahedra or pseudotetrahedra, to 0.3 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.6 Radioactive.

Optical Properties: Translucent. *Color:* Brown to lemon-yellow; yellow in transmitted light. *Luster:* Greasy to adamantine.
Optical Class: Isotropic. $n = \sim 1.9$

Cell Data: *Space Group:* $Im3m$, $I432$, $Im3$ or $I23$. a = 15.66 Z = 4

X-ray Powder Pattern: Schneeberg, Germany.
4.185 (100), 3.196 (80), 4.520 (70), 3.691 (60), 5.536 (40), 2.609 (40), 3.501 (35)

Chemistry:

	(1)	(2)
UO_3	56.00	57.77
P_2O_5	1.11	1.36
As_2O_5	6.42	6.23
Bi_2O_3	33.27	32.55
PbO	5.88	3.61
BaO	1.84	2.29
Total	104.52	103.81

(1) Schneeberg, Germany; by electron microprobe, average of eight analyses of the central part of a crystal; H_2O 5.6% by TGA, the loss of which is assumed to account for the high total; corresponds to $(Pb_{0.77}Ba_{0.35})_{\Sigma=1.12}(UO_2)_{5.78}(BiO)_{4.18}[(AsO_4)_{1.63}(PO_4)_{0.46}]_{\Sigma=2.09}(OH)_{12}\cdot 3H_2O$.
(2) Do.; by electron microprobe, average of eight analyses of the exterior part of a crystal; corresponds to $(Pb_{0.48}Ba_{0.45})_{\Sigma=0.93}(UO_2)_{5.87}(BiO)_{4.07}[(AsO_4)_{1.57}(PO_4)_{0.57}]_{\Sigma=2.14}(OH)_{12}\cdot 3H_2O$.

Occurrence: On a museum specimen initially, later at the locality.

Association: Uranospinite, uranophane, uranosphaerite, quartz.

Distribution: In the Walpurgis vein, Weisser Hirsch mine, Neustädtel-Schneeberg, Saxony, Germany.

Name: For Eric Asselborn (1954–), surgeon and mineral collector, of Dijon, France, in whose collection the mineral was first found.

Type Material: Museum of Natural History, Geneva, Switzerland, 435/50; National Museum of Natural History, Washington, D.C., USA, 142229.

References: (1) Sarp. H., J. Bertrand, and J. Deferne (1983) Asselbornite, $(Pb,Ba)(UO_2)_6(BiO)_4[(As,P)O_4]_2(OH)_{12}\cdot 3H_2O$, a new uranium, lead and barium hydrous arsenate. Neues Jahrb. Mineral., Monatsh., 417–423. (2) (1984) Amer. Mineral., 69, 565 (abs. ref. 1).

(1) Kamoto-East mine, Congo; by electron microprobe, average of six analyses, CO_2 by CHN, H_2O by difference; corresponds to $Cu_{2.02}Ca_{0.11}(Ce_{0.74}Nd_{0.60}La_{0.22}Pr_{0.16}Sm_{0.12}Y_{0.01})_{\Sigma=1.85}(UO_2)_{1.02}(CO_3)_{5.02} \cdot 2.70H_2O$.

Occurrence: In the oxidation zone of the uranium-bearing portion of a Cu–Co deposit.

Association: Uraninite, uranophane, kamotoite-(Y), françoisite-(Nd), shabaite-(Nd), schuilingite-(Nd), masuyite.

Distribution: From the Kamoto-East Cu–Co mine, five km west of Kolwezi, Katanga Province, Congo (Shaba Province, Zaire).

Name: From the Greek *astro* and *kyanos*, alluding to the starlike habit and blue color, and for *cerium* as the dominant rare-earth element.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, RC3513.

References: (1) Deliens, M. and P. Piret (1990) L'astrocyanite-(Ce), $Cu_2(TR)_2(UO_2)(CO_3)_5(OH)_2 \cdot 1,5H_2O$, nouvelle espèce minérale de Kamoto, Shaba, Zaïre. Eur. J. Mineral., 2, 407–411 (in French with English abs.). (2) (1991) Amer. Mineral., 76, 665 (abs. ref. 1).

Astrophyllite $(K,Na)_3(Fe^{2+},Mn)_7Ti_2Si_8O_{24}(O,OH)_7$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals tabular ⊥ {001}, bladed or acicular, some faces commonly striated, to 10 cm; groups may be stellate.

Physical Properties: *Cleavage:* Perfect on {001}, poor on {100}. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 3.2–3.4 D(calc.) = n.d.

Optical Properties: Opaque to translucent in thin leaves. *Color:* Bronze-yellow to gold-yellow, brown to reddish brown. *Streak:* Golden. *Luster:* Submetallic, pearly, greasy. *Optical Class:* Biaxial (+). *Pleochroism:* Strong; X = deep orange-red; Y = orange-yellow; Z = lemon-yellow. *Orientation:* $X \simeq c$; $Y \simeq b$; $Z \simeq a$. *Dispersion:* $r > v$, strong. *Absorption:* $X > Y > Z$. α = 1.678–1.695 β = 1.703–1.726 γ = 1.733–1.758 2V(meas.) = 66°–84°

Cell Data: *Space Group:* $A\overline{1}$. $a = 5.36$ $b = 11.76$ $c = 21.08$ $\alpha = 85°8'$ $\beta = 90°0'$ $\gamma = 103°13'$ Z = 2

X-ray Powder Pattern: Låven Island, Norway; nearly identical with kupletskite. (ICDD 14-194).
10.6 (100), 3.51 (80), 2.77 (60), 2.64 (60), 2.57 (60), 9.82 (30), 1.76 (30)

Chemistry:

	(1)		(1)
SiO_2	36.64	MnO	5.68
TiO_2	10.76	CaO	0.98
ZrO_2	0.66	Na_2O	2.52
Nb_2O_5	0.77	K_2O	5.13
FeO	31.50	H_2O	[4.92]
		Total	[99.56]

(1) Kangerdlugssuaq Fjord, Greenland; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $(K_{1.40}Na_{1.04}Ca_{0.22})_{\Sigma=2.66}(Fe_{5.62}Mn_{1.03})_{\Sigma=6.65}(Ti_{1.73}Nb_{0.07}Zr_{0.07})_{\Sigma=1.87}Si_{7.82}O_{24}(OH)_{7.00}$.

Polymorphism & Series: Forms a series with kupletskite.

Mineral Group: Astrophyllite group.

Occurrence: In nepheline syenites, alkali granites, and their pegmatites; less commonly in fenites and other metasomatized rocks; in nepheline syenite gneisses and paragneisses.

Association: Albite, aegirine, arfvedsonite, nepheline, natrolite, zircon, biotite, leucophanite, eudialyte, catapleiite, djerfisherite, rasvumite, delhayelite, kupletskite.

Distribution: Some prominent localities include: on Låven Island and near Brevik, Langesundsfjord, Norway. In Greenland, at Narssârssuk, in the Ilímaussaq intrusion, and elsewhere. In Spain, south of La Guia, and at Monte Galiñeiro, Vigo, Pontevedra Province. In the USA, in Colorado, at St. Peters Dome, near Pikes Peak, El Paso Co., and in Maine, near Biddeford, York Co. From Mont Saint-Hilaire, Quebec, and the Red Wine complex, Labrador, Newfoundland, Canada. On Rouma Isle, Los Islands, Guinea. From Pilansberg, Transvaal, South Africa. In the Khan-Bogdinskii granitic massif, Gobi, Mongolia. From Mts. Yukspor and Eveslogchorr, Khibiny massif; in the Lovozero massif, Kola Peninsula; and other less-well-defined localities in Russia.

Name: From the Greek for *star* and *leaf*, for the stellate and foliated micaceous habit.

Type Material: Mining Academy, Freiberg, Germany, 26244.

Atacamite $Cu_2Cl(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As slender crystals, to 10 cm, prismatic along [001]; striated ‖ [001], on {010} ‖ $[1\bar{1}0]$; commonly tabular ⊥ {010} or pseudo-octahedral with {110} and {011}. Fibrous, sandy granular to compact, massive. *Twinning:* Twin plane {110}, composition plane {110}, rare; about [544], more common. Doublets, triplets, both contact and penetration, and complex groups result from twinning.

Physical Properties: *Cleavage:* {010}, perfect; {101}, fair. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 3.745–3.776 D(calc.) = 3.756

Optical Properties: Transparent to translucent. *Color:* Bright green, dark emerald-green to blackish green; shades of green in transmitted light. *Streak:* Apple-green. *Luster:* Adamantine to vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = pale green; Y = yellow-green; Z = grass-green. *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, strong. $\alpha = 1.831$ $\beta = 1.861$ $\gamma = 1.880$ 2V(meas.) = n.d. 2V(calc.) = 74°56′

Cell Data: *Space Group: Pnam.* $a = 6.030(2)$ $b = 9.120(2)$ $c = 6.865(2)$ Z = 4

X-ray Powder Pattern: Inca de Oro mine, Copiapó, Chile.
5.48 (100), 5.03 (70), 2.278 (69), 1.6060 (57), 2.759 (55), 2.836 (51), 2.779 (51)

				Total	100.07	99.67	100.00

(1) Collahurasi, Chile. (2) Boleo, Mexico. (3) $Cu_2Cl(OH)_3$.

Polymorphism & Series: Polymorphous with botallackite, clinoatacamite, and paratacamite.

Occurrence: An oxidation product of other copper minerals, especially under arid, saline conditions; in fumarolic deposits; a weathering product of sulfides in subsea black smoker deposits; an alteration of bronze and copper objects of antiquity.

Association: Cuprite, brochantite, linarite, caledonite, malachite, chrysocolla, paratacamite, botallackite.

Distribution: In small amounts from many copper deposits worldwide. In Chile, originally from an undefined locality in the Atacama Desert; now known from many places, as at Copiapó, Carrizal, Tierra Amarilla, and Remolinos, Atacama; Collahurasi, Tarapacá; an ore mineral at Chuquicamata, Antofagasta. From Boleo, Baja California, Mexico. In the USA, in Arizona, at Bisbee, Cochise Co., in large amounts in the Santa Cruz porphyry deposit, in the Mammoth-St. Anthony mine, Tiger, and in the San Manuel mine, Pinal Co.; from the Tintic district, Juab Co., Utah. In South Australia, large crystals from Moonta, in the Burra district, and from Mt. Howden. At Vesuvius, Campania, and Etna, Sicily, Italy. From Laurium, Greece, in slag. At the Turinsk copper mine, Bogoslovsk, Ural Mountains, Russia. From Kara-Kamys, Kazakhstan. In England, at Roughtongill, Caldbeck Fells, Cumbria; and in the Penberthy Croft mine, St. Hilary, and at Botallack, St. Just, Cornwall. From Tsumeb, Namibia. Along the Mid-Atlantic Ridge, in the TAG Hydrothermal Field.

Name: For the undefined occurrence in the Atacama Desert, Chile.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 110816.

Atelestite $Bi_2O(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As tabular to prismatic crystals, to 2 mm, with $\{10\overline{1}\}$, $\{010\}$, $\{100\}$, $\{20\overline{1}\}$, $\{11\overline{1}\}$, $\{110\}$, $\{21\overline{1}\}$. Also as mammillary crystalline or smooth spherical aggregates.

Physical Properties: *Cleavage:* $\{100\}$, indistinct. *Fracture:* Subconchoidal. Hardness = 4.5–5 D(meas.) = 7.14 D(calc.) = 6.95

Optical Properties: Transparent to translucent. *Color:* Sulfur-yellow, pale yellow, yellowish green, black; in transmitted light, pale yellow to colorless. *Luster:* Resinous to adamantine. *Optical Class:* Biaxial (+). *Dispersion:* $r < v$, strong. $\alpha = 2.14(1)$ $\beta = 2.15(1)$ $\gamma = 2.18(1)$ 2V(meas.) = 44(2)°

Cell Data: *Space Group:* $P2_1/c$. $a = 10.831(2)$ $b = 7.430(2)$ $c = 7.000(2)$ $\beta = 107.08(2)°$ Z = 4

X-ray Powder Pattern: Neuhilfe mine, Germany.
3.239 (100b), 3.116 (40), 2.725 (30), 6.62 (20), 4.233 (20), 2.526 (20), 2.201 (20)

Chemistry:

	(1)	(2)	(3)
P_2O_5		1.63	
As_2O_5	14.12	16.52	19.48
Bi_2O_3	82.41	80.08	78.99
Fe_2O_3	0.51		
H_2O	1.92	1.54	1.53
Total	98.96	99.77	100.00

(1) Neuhilfe mine, Germany. (2) Do.; corresponds to $Bi_{2.00}O[(AsO_4)_{0.84}(PO_4)_{0.13}]_{\Sigma=0.97}(OH)_{0.99}$. (3) $Bi_2O(AsO_4)(OH)$.

Occurrence: As a rare secondary mineral in the oxidized zone of bismuth- and arsenic-bearing mineral deposits.

Association: Bismutite, eulytite, erythrite, bismutostibiconite, beyerite, preisingerite, walpurgite, mixite, conichalcite, torbernite, quartz.

Distribution: In Germany, in Saxony, at the Neuhilfe, the Weisser Hirsch, and the Junge Kalbe mines, Neustädtel-Schneeberg; from Gadernheim, near Bensheim, Hesse; and at Neubulach and the Schmiedestollen, near Wittichen, Black Forest. From near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně (Marienbad), Czech Republic. In the USA, in Utah, at the Mammoth mine, Tintic district, Juab Co., on Gold Hill, Tooele Co., and from the Northern Spy mine, Utah Co.

Name: Derivation not explicitly stated. Probably from the Greek for *incomplete*, as the composition was undetermined when the mineral was first described.

SiO_2	18.73
Y_2O_3	45.67
Yb_2O_3	11.81
Gd_2O_3	2.09
Tb_2O_3	0.54
Dy_2O_3	2.61
Ho_2O_3	0.62
Er_2O_3	4.72
H_2O	[12.2]
Total	98.99

(1) Stetind quarry, Tysfjord, Norway; average of 20 electron microprobe analyses, presence of OH^- confirmed by Raman spectroscopy, H_2O calculated for charge balance; corresponding to $(Y_{3.11}Yb_{0.46}Er_{0.19}Dy_{0.11}Gd_{0.09}Ho_{0.01}Tb_{0.02})_{\Sigma=3.99}(Si_{2.4}[H_4+]_{0.605})_{\Sigma=3.01}O_8(OH)_8$.

Occurrence: A late, hydrothermal mineral in dissolution cavities in fluorite in niobium-yttrium-fluorine (NYF) type, quartz-microcline pegmatite.

Association: Xenotime-(Y), calcioancylite-(Nd), La-dominant calcioancylite.

Distribution: From the Stetind quarry, Tysfjord, Nordland, Norway.

Name: From Greek "*atels*", meaning deficient, in allusion to the Si-deficiency of the mineral.

Type Material: Museum of the University of Hamburg, Germany (NO-004).

References: (1) Malcherek, T., B. Mihailova, J. Schlüter, and T. Husdal (2012) Atelisite-(Y), a new rare earth defect silicate of the KDP structure type. European Journal of Mineralogy, 24(6), 1053-1060. (2) (2014) Amer. Mineral., 99, 2151-2152 (abs. ref. 1).

Athabascaite Cu_5Se_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As crystal laths, to 100 μm; also massive.

Physical Properties: Hardness = n.d. VHN = 78 (15 g load). D(meas.) = n.d. D(calc.) = 6.59

Optical Properties: Opaque. *Color:* Pale gray to white. *Luster:* Metallic. *Pleochroism:* Distinct, pale gray to blue-gray. *Anisotropism:* Strong, creamy white to dark blue. R_1–R_2: (400) 21.2–25.1, (420) 19.9–25.2, (440) 19.6–25.3, (460) 19.3–25.4, (480) 19.0–25.5, (500) 18.6–25.6, (520) 18.3–25.6, (540) 17.8–25.5, (560) 17.4–25.4, (580) 16.9–25.1, (600) 16.3–25.0, (620) 15.5–24.5, (640) 15.0–24.2, (660) 14.2–23.7, (680) 13.4–23.1, (700) 12.5–22.4

Cell Data: *Space Group:* n.d. $a = 8.227$ $b = 11.982$ $c = 6.441$ Z = 4

X-ray Powder Pattern: Martin Lake mine, Canada.
3.235 (100), 1.997 (80), 3.015 (60), 1.893 (50), 1.664 (40), 3.44 (30), 1.817 (30)

(1) Martin Lake mine, Canada; by electron microprobe; corresponds to $Cu_{5.11}Se_{4.00}$.
(2) Chaméane mine, France; by electron microprobe; corresponds to $(Cu_{4.88}Ag_{0.02})_{\Sigma=4.90}$ $(Se_{3.60}S_{0.40})_{\Sigma=4.00}$. (3) Cu_5Se_4.

Occurrence: As inclusions in and replacements of umangite, as stringers and veinlets in carbonate veins cutting basalt (Martin Lake mine, Canada).

Association: Umangite, clausthalite, eucairite, berzelianite, sulfatian berzelianite, klockmannite, eskebornite, tyrrellite, copper, silver, uraninite, hematite, pyrite, calcite, barite, quartz, feldspar (Martin Lake mine, Canada); berzelianite, eucairite, crookesite, tyrrellite, ferroselite, bukovite, kruťaite, calcite, dolomite (Petrovice, Czech Republic); umangite, berzelianite (Sierra de Umango, Argentina).

Distribution: At the Martin Lake mine, northeast of Martin Lake, Saskatchewan, Canada [TL]. In the Petrovice uranium deposit, near Ždăr; the Předbořice uranium deposit, near Krásna Hora; and on Koksín Hill, near Mitov, Czech Republic. At the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France. From Skrikerum, near Tryserum, Kalmar, Sweden. At Sierra de Umango, La Rioja Province, Argentina.

Name: For Lake Athabasca, northern Saskatchewan, Canada.

Type Material: National Museum of Canada, Ottawa; Royal Ontario Museum, Toronto, Canada, M29432.

Atheneite $(Pd,Hg)_3As$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As tiny blebs; crystal outlines seldom displayed, grain boundaries being commonly embayed.

Physical Properties: Hardness = n.d. VHN = 419–442, 431 average (100 g load).
D(meas.) = 10.2 D(calc.) = 10.16

Optical Properties: Opaque. *Color:* In reflected light, white with bluish tint compared to arsenopalladinite. *Luster:* Metallic. *Pleochroism:* Very weak, in pale yellow to pale bluish gray. *Anisotropism:* Distinct.
R_1–R_2: (400) 46.1–48.3, (420) 47.4–49.8, (440) 48.5–50.9, (460) 49.7–52.4, (480) 50.8–53.6, (500) 51.9–54.8, (520) 53.0–55.8, (540) 54.0–56.7, (560) 54.8–57.3, (580) 55.7–57.8, (600) 56.4–58.3, (620) 57.0–58.5, (640) 57.4–58.6, (660) 57.6–58.7, (680) 57.9–59.0, (700) 58.2–59.1

Cell Data: *Space Group:* $P6/mmm$. $a = 6.798$ $c = 3.483$ $Z = 2$

X-ray Powder Pattern: Itabira, Brazil.
2.423 (vvs), 2.246 (vs), 1.371 (s), 1.302 (s), 1.259 (s), 1.871 (ms), 1.034 (ms)

Chemistry:

Cu	0.1	< 0.07
As	19.0	17.48
Sb	0.1	
Total	100.6	100.93

(1) Itabira, Brazil; by electron microprobe; corresponds to $(Pd_{2.66}Hg_{0.32}Cu_{0.01}Au_{0.01})_{\Sigma=3.00}As_{1.09}$.
(2) Serra Pelada, Brazil; by electron microprobe, corresponds to $(Pd_{2.67}Hg_{0.29}Pt_{0.04}Au_{0.01}Fe_{0.01})_{\Sigma=3.02}As_{1.09}$.

Occurrence: In concentrates from gold washings.

Association: Arsenopalladinite, palladseite, isomertieite, hematite (Itabira, Brazil).

Distribution: In Brazil, from Itabira [TL], and in the Cauê and Conceição iron mines, Minas Gerais, and in the Serra Pelada Au–Pd–Pt deposit, Pará. In the Merensky Reef, Bushveldt complex, Transvaal, South Africa. Found around Zlatoust, Ural Mountains, Russia.

Name: After the Greek goddess *Pallas Athene*, in allusion to its palladium content.

Type Material: The Natural History Museum, London, England, 1934,72, 1977,259; National Museum of Natural History, Washington, D.C., USA, 142504.

Atlasovite $KCu_6Fe^{3+}BiO_4(SO_4)_5Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal (by analogy to nabokoite). *Point Group:* $4/m\ 2/m\ 2/m$. Eight-sided crystals are tabular with prominent {001} modified by {110}, {012} and {014}, to 1 mm; typically intergrown with nabokoite.

Physical Properties: *Cleavage:* On {001}, perfect. Hardness = 2–2.5 D(meas.) = 4.20(5) D(calc.) = 4.12

Optical Properties: Transparent. *Color:* Dark brown; pale gray with yellow internal reflections in reflected light. *Streak:* Pale brown. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). *Pleochroism:* O = red-brown; E = pale yellow. $\omega = 1.783(3)$ $\epsilon = 1.776(3)$

Cell Data: *Space Group:* $P4/ncc$. $a = 9.86(2)$ $c = 20.58(2)$ $Z = 4$

X-ray Powder Pattern: Tolbachik volcano, Russia.
10.41 (10), 10.75 (9), 2.446 (8), 3.431 (7), 2.890 (7), 4.57 (5), 7.14 (4)

Total	100.90	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, average of four analyses, total Fe as Fe_2O_3; corresponding to $K_{1.01}(Cu_{5.90}Zn_{0.15})_{\Sigma=6.05}(Fe_{0.97}V_{0.11})_{\Sigma=1.08}(Bi_{0.68}Pb_{0.12}Te_{0.10})_{\Sigma=0.90}O_{4.19}(SO_4)_{4.95}Cl_{1.01}$. (2) $KCu_6FeBiO_4(SO_4)_5Cl$.

Polymorphism & Series: Forms a series with nabokoite.

Occurrence: As a volcanic sublimate.

Association: Nabokoite, anglesite, dolerophanite, euchlorine, chloroxiphite, atacamite, piypite, chalcocyanite, alarsite, fedotovite, lammerite, klyuchevskite, langbeinite, hematite, tenorite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For Vladimir Vasil'evich Atlasov (1661/1664–1711), Russian traveller who first explored the Kamchatka Peninsula.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Atokite $(Pd,Pt)_3Sn$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As small grains, less than 100 μm in diameter, rarely showing {100}.

Physical Properties: Hardness = n.d. VHN = 357 (25 g load). D(meas.) = n.d. D(calc.) = 14.19

Optical Properties: Opaque. *Color:* In polished section, pale cream. *Luster:* Metallic. *Pleochroism:* None to slight. *Anisotropism:* Slight, due to strain.
R_1–R_2: (480) 57.4–60.8, (546) 59.2–65.1, (589) 60.4–63.5, (656) 62.2–65.8

Cell Data: *Space Group:* $Fm3m$. $a = 3.991$ $Z = 4$

X-ray Powder Pattern: Merensky Reef, South Africa.
2.295 (100), 1.202 (100), 1.408 (90), 0.9153 (90), 0.8145 (90), 1.992 (80), 0.8922 (80)

Chemistry:

	(1)
Pt	43.74
Pd	38.35
Sn	18.65
Total	100.74

(1) Merensky Reef, South Africa; by electron microprobe, corresponding to $(Pd_{1.46}Pt_{0.91})_{\Sigma=3.00}Sn_{0.81}$.

Polymorphism & Series: Forms a series with rustenburgite.

Occurrence: As very sparse grains in concentrates of ore (Merensky Reef, South Africa).

Association: Unspecified platinum tellurides (Merensky Reef, South Africa); keithconnite, palladoarsenide (Stillwater complex, Montana, USA).

Distribution: From the Atok [TL] and Rustenburg mines, on the Merensky Reef, Bushveld complex, Transvaal, South Africa. From the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia, Russia. In Montana, in the Stillwater complex, and the Revais Creek district, [??Flathead Ind Res, check mining districts??] ?? Co., USA.

Name: For its occurrence in the Atok mine, South Africa.

Type Material: n.d.

References: (1) Mihálik, P., S.A. Hiemstra, and J.P.R. de Villiers (1975) Rustenburgite and atokite, two new platinum-group minerals from the Merensky Reef, Bushveld Igneous Complex. Can. Mineral., 13, 146–150. (2) (1976) Amer. Mineral., 61, 340 (abs. ref. 1).

			Total	99.89	[100.0]

(1) Västanå mine, Sweden; contaminated with calcite 1.30% and svanbergite 0.76%. (2) Do.; by electron microprobe, total Fe as Fe_2O_3 on crystallo-chemical grounds, H_2O by difference; corresponds to $(Ca_{0.81}Sr_{0.20})_{\Sigma=1.01}Mn_{0.95}(Al_{3.65}Fe^{3+}_{0.34})_{\Sigma=3.99}[H(Si_{0.68}P_{0.28})_{\Sigma=0.96}O_4](PO_4)_3(OH)_4$.

Occurrence: In an iron deposit.

Association: Berlinite, lazulite, trolleite, apatite, svanbergite, pyrophyllite, hematite, calcite, quartz.

Distribution: From the Västanå mine, near Näsum, Skåne, Sweden.

Name: From the Greek for *salmon*, for the pale red color.

Al_2O_3	10.61
P_2O_5	0.89
As_2O_5	45.45
SO_3	1.39
H_2O	7.61
Total	100.00

(1) Christiana no. 132 mine, Kamareza, Laurion District, Attika, Greece; average of 4 electron microprobe analyses, H_2O by difference, IR confirms OH and H_2O, corresponding to $Ca_{2.94}Cu^{2+}_{1.93}Al_{1.97}Mg_{0.04}Fe^{2+}_{0.02}[(As_{3.74}S_{0.16}P_{0.12})_{\Sigma=4.02}O_{16.08}](OH)_{3.87} \cdot 2.05H_2O$.

Occurrence: In the oxidized portions of polymetallic sulfide-quartz veins.

Association: Arsenocrandallite, arsenogoyazite, conichalcite, olivenite, philipsbornite, azurite, malachite, carminite, beudantite, goethite, quartz, allophane.

Distribution: Christiana no. 132 mine, Kamareza, Laurion District, Attiki Prefecture (Attika), Greece.

Name: For the place of its first occurrence, the historically significant region, Attika, Greece.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 3435/1).

References: (1) Chukanov, N.V., I.V. Pekov, and A.E. Zadov (2007) Attikaite, $Ca_3Cu_2Al_2(AsO_4)_4(OH)_4 \cdot 2H_2O$, a new mineral. Zap. Ross. Mineral. Obshch., 136(2), 17–24 (in Russian, English abstract); (2007) Geology of Ore Deposits, 49, 720–726 (in English).

Total	99.33		100.00

(1) Västanå mine, Sweden; after deduction of quartz impurity. (2) Mt. Perry, Australia; by electron microprobe, partial analysis; corresponding to $Al_{2.01}(PO_4)_{0.99}(OH)_3$. (3) $Al_2(PO_4)(OH)_3$.

Occurrence: Formed by hydrogen metamorphism of phosphate-bearing rocks in peraluminous sediments; in some high-temperature hydrothermal ore deposits.

Association: Attakolite, svanbergite, lazulite, hematite, trolleite, berlinite (Västanå mine, Sweden); lazulite, rutile, pyrophyllite, barite (Champion mine, California, USA); arsenopyrite, stannite, pyrite, andorite, cassiterite, zinkenite (Bolivia).

Distribution: From the Västanå mine, near Näsum, Skåne, and at Hålsjöberg, Värmland, Sweden. At Mbale, Uganda. In the Buranga pegmatite, near Gatumba, Rwanda. In the USA, large crystals from the Champion mine, White Mountains, Mono Co., California; in New Hampshire, at the Palermo #1 mine, near North Groton, Grafton Co., and the G.E. Smith mine, Newport, Sullivan Co.; in the Hugo and Ingersoll mines, near Keystone, Pennington Co., South Dakota; in the White Picacho district, Maricopa and Yavapai Cos., Arizona. From the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In Bolivia, from the Socavón mine, San José, and Itos mines, Oruro; at Llallagua, Machacamarca, Tatasi, and Portugalete, Potosí. From Mt. Perry, 75 km southwest of Bundaberg, Queensland, Australia. Additional localities are known.

Name: From the Greek for *luster*, for its pearly luster on the cleavage.

Type Material: n.d.

Augite $(Ca, Na)(Mg, Fe, Al, Ti)(Si, Al)_2O_6$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Stubby prismatic crystals, square or octagonal in section, to 10 cm; elongated ‖ [001], acicular, skeletal, dendritic. Exsolution lamellae and overgrowths common. *Twinning:* Simple or multiple on {100}, common; also on {001}.

Physical Properties: *Cleavage:* Good on {110}, (110) ∧ $(1\bar{1}0)$ ~87°; partings on {100} and {010}. *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 3.19–3.56 D(calc.) = 3.31

Optical Properties: Transparent to opaque. *Color:* Black, brown, greenish, violet-brown; in thin section, colorless to gray; clear cores zoned to dark rims common, also oscillatory and sector zoning. *Streak:* Gray-green. *Luster:* Vitreous, resinous to dull.
Optical Class: Biaxial (+). *Pleochroism:* X = pale green, pale brown, green, greenish yellow; Y = pale brown, pale yellow-green, violet; Z = pale green, grayish green, violet. *Orientation:* $Y = b$; $Z \wedge c = -35°$ to $-50°$; $X \wedge a = -20°$ to $-35°$. *Dispersion:* $r > v$, weak to moderate. *Absorption:* Weak; $Y > Z > X$. $\alpha = 1.671–1.735$ $\beta = 1.672–1.741$ $\gamma = 1.703–1.774$ 2V(meas.) = 25°–61°

Cell Data: *Space Group:* $C2/c$. $a = 9.699$ $b = 8.844$ $c = 5.272$ $\beta = 106.97°$ Z = 4

X-ray Powder Pattern: Locality unknown. (ICDD 24-203).

(1) Stillwater complex, Montana, USA; corresponds to $(Ca_{0.76}Fe^{2+}_{0.22}Na_{0.02})_{\Sigma=1.00}(Mg_{0.88}Al_{0.05}Fe^{3+}_{0.04}Ti_{0.01}Mn_{0.01})_{\Sigma=0.99}(Si_{1.92}Al_{0.08})_{\Sigma=2.00}O_6$. (2) Stöffel, Germany; corresponds to $(Ca_{0.91}Na_{0.07}Fe^{2+}_{0.04})_{\Sigma=1.02}(Mg_{0.66}Fe^{3+}_{0.13}Fe^{2+}_{0.09}Ti_{0.08}Al_{0.04})_{\Sigma=1.00}(Si_{1.69}Al_{0.31})_{\Sigma=2.00}O_6$.

Mineral Group: Pyroxene group.

Occurrence: Essential in mafic igneous rocks, basalt, gabbro; common in ultramafic rocks; in some high-grade metamorphic rocks and metamorphosed iron formations.

Association: Orthoclase, sanidine, labradorite, olivine, leucite, amphiboles, pyroxenes.

Distribution: Widespread; only a few classic localities, much studied or providing fine examples, are listed. From Arendal, Norway. In Italy, from Vesuvius, Campania; around Frascati, Alban Hills, Lazio; on Mt. Monzoni, Val di Fassa, Trentino-Alto Adige; at Traversella, Piedmont; and on Mt. Etna, Sicily. Around the Laacher See, Eifel district, Germany. At Ústí nad Lábem (Aussig), Bílina, and Vlčí Hora, near Černošín, Czech Republic. On the Azores and Cape Verde Islands. In Canada, from Renfrew and Haliburton Cos., Ontario; at Otter Lake, Pontiac Co., Quebec; and many other localities. In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; and at Diana, Lewis Co., and Fine, St. Lawrence Co., New York. From Tomik, Gilgit district, Pakistan. At Kangan, Andhra Pradesh, India.

Name: From the Greek for *luster*, apparently based on the appearance of its cleavage surface.

(2) $Fe^{3+}Cu^{2+}AsO_4O$.

Polymorphism & Series: Forms a series with olivenite.

Group: Olivenite group.

Occurrence: A secondary mineral in the weathering zone of a polymetallic sulfarsenide deposit.

Association: Segnitite, brochantite, malachite, tetrahedrite, pyrite.

Distribution: Black Pine mine, 14.5 km NW of Philipsburg, Granite County, Montana, USA.

Name: From the Latin *auri* (golden yellow) and *acus* (needle), in reference to its color and habit.

Type Material: Mineral Sciences Department, Natural History Museum of Los Angeles County, California, USA (catalog no. 62374); Canadian Museum of Nature, Ottawa, Canada (catalog no. CMNMC 86090).

Aurichalcite $(Zn, Cu)_5(CO_3)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic by twinning. *Point Group:* $2/m$. As acicular to lathlike crystals with prominent {010}, commonly striated ‖ [001], with wedgelike terminations, to 3 cm. Typically in tufted divergent sprays or spherical aggregates, may be in thick crusts; rarely columnar, laminated or granular. *Twinning:* Observed in X-ray patterns.

Physical Properties: *Cleavage:* On {010} and {100}, perfect. *Tenacity:* "Fragile". Hardness = 1–2 D(meas.) = 3.96 D(calc.) = 3.93–3.94

Optical Properties: Transparent to translucent. *Color:* Pale green, greenish blue, sky-blue; colorless to pale blue, pale green in transmitted light. *Luster:* Silky to pearly. *Optical Class:* Biaxial (–). *Pleochroism:* Weak; X = colorless; $Y = Z$ = blue-green. *Orientation:* $X = b$; $Y \simeq a$; $Z \simeq c$. *Dispersion:* $r < v$; strong. α = 1.654–1.661 β = 1.740–1.749 γ = 1.743–1.756 2V(meas.) = Very small.

Cell Data: *Space Group:* $P2_1/m$. a = 13.82(2) b = 6.419(3) c = 5.29(3) $\beta = 101.04(2)°$ Z = 2

(1) Utah; corresponds to $(Zn_{3.63}Cu_{1.37})_{\Sigma=5.00}(CO_3)_2(OH)_6$.

Occurrence: In the oxidized zones of copper and zinc deposits.

Association: Rosasite, smithsonite, hemimorphite, hydrozincite, malachite, azurite.

Distribution: Widespread in small amounts. Localities noteworthy for good specimens include: from the Loktevskii mine, upper Loktevka River, west Altai Mountains, Russia. At Monteponi, and in the Rosas mine, Sulcis, Sardinia, Italy. From Laurium, Greece. At Chessy, near Lyon, Rhône, France. In the USA, in Arizona, fine examples from Bisbee, Cochise Co., in the Silver Hill mine, Pima Co., and at the 79 mine, Gila Co.; from Cerro Gordo, Inyo Co., California; at the Kelly and Graphic mines, Magdalena, Socorro Co., New Mexico. In Utah, from the Tintic district, Juab Co., at the Hidden Treasure mine, Tooele Co., in the Apex mine, near St. George, Washington Co., and from Big Cottonwood Canyon, Salt Lake Co.; at Leadville, Lake Co., Colorado. In Mexico, rich specimens from the Ojuela mine, Mapimí, Durango, Mexico. At the Tchah Khuni mine, Anarak district, Iran. From Tsumeb, Namibia. At Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire).

Name: From the Latin for *golden copper*, brass, for the copper and zinc content of the mineral.

Type Material: The Natural History Museum, London, England, 31118.

Auricupride Cu_3Au

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive, as rims less than 100 μm, irregular patches, and platy aggregations.

Physical Properties: Hardness = ∼3.5 VHN = 54 (10 g load). D(meas.) = 11.5 D(calc.) = [13.77]

Optical Properties: Opaque. *Color:* Yellow with a reddish tint; in reflected light, violet-rose. *Luster:* Highly metallic.
R: n.d.

Cell Data: *Space Group: Pm3m.* a = 3.753(5) (synthetic). Z = [1]

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
Au	53.11	50.82
Cu	45.96	49.18
Total	99.07	100.00

(1) Karabash deposit, Russia; by electron microprobe. (2) Cu_3Au.

Occurrence: In serpentinites as the product of low-temperature ordering and unmixing of Au–Cu solid solution alloys (Karabash deposit, Russia); in reduction halos in Permian red beds (near Zurich, Switzerland).

Association: Gold, copper, other Au–Cu alloys.

Distribution: In Russia, from the Karabash gold deposit, Soimon Valley, Southern Ural Mountains [TL] and at the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia. From Laksia and Pefkos, Cyprus. Found northwest of Zurich, Switzerland. In the El Indio mine, El Indio-Tambo district, east of La Serena, Coquimbo, Chile.

Name: For the composition.

Type Material: n.d.

Aurivilliusite $Hg^{2+}Hg^{1+}OI$

Crystal Data: Monoclinic. *Point Group:* 2/*m*. As irregular patchy coatings, to 0.5 mm. Twinning noted in quantitative reflectance study.

Physical Properties: *Cleavage:* Distinct on{100}. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness < 5 D(meas.) = n.d. D(calc.) = 8.96

Optical Properties: Opaque. *Color:* Dark gray-black, exhibits an unusual 'red light' coalescing phenomenon in reflected light. *Streak:* Dark red-brown. *Luster:* Metallic. Extremely light-sensitive.
Optical Class: n.d. n = 2.35-2.38

Cell Data: *Space Group: C*2/*c* (synthetic analog). a = 17.580(6) b = 6.979(1) c = 6.693(3) β = 101.71(4)° Z = 8

X-ray Powder Pattern: New Idria district, San Benito County, California, USA.
3.275 (100), 2.993 (80), 2.873 (80), 8.547 (70), 2.404 (50b), 1.878 (50), 4.796 (30)

Chemistry:

Total	100.30	100.00

(1) New Idria district, San Benito County, California, USA; average of 5 electron microprobe analyses, Hg^{2+} and Hg^{1+} partitioned as in the synthetic analog; corresponding to $Hg^{2+}_{1.00}Hg^{1+}_{1.00}O_{1.01}(I_{0.97}Br_{0.01}Cl_{0.01})_{\Sigma=0.99}$. (2) $Hg^{2+}Hg^{1+}OI$.

Occurrence: A rare mineral of uncertain paragenesis in a suite of Hg-bearing oxy-halide phases.

Association: Native mercury, cinnabar, edgarbaileyite.

Distribution: From a prospect pit near the former Clear Creek mercury mine, New Idria district, San Benito County, California, USA.

Name: Honors Dr. Karin Aurivillius (1920–1982) University of Lund, Sweden, who synthesized and determined the crystal structures of many Hg compounds.

Type Material: Systematic Reference Series, Geological Survey of Canada, Ottawa, Canada; NMC 68087.

(1) Hillgrove deposit, Australia; by electron microprobe, average of 15 analyses; corresponding to $Au_{1.00}Sb_{2.05}$. (2) $AuSb_2$.

Mineral Group: Pyrite group.

Occurrence: In hydrothermal gold-quartz veins, in portions deficient in sulfur and containing other antimony minerals.

Association: Gold, freibergite, stibnite, jamesonite, chalcostibite, bournonite, boulangerite, arsenopyrite, pyrite, chalcopyrite, sphalerite, galena, tetrahedrite.

Distribution: In Canada, from the Giant Yellowknife mine, Yellowknife, Northwest Territories [TL]; the Chesterville mine, Larder Lake and the Hemlo gold deposit, Thunder Bay district, Ontario. At Krásná Hora, near Milesov, Czech Republic. From the Viges Au–Sb deposit, Creuse, France. In the Langsele deposit, Skellefte district, Sweden. At the Kallisalo gold deposit, Seinajoki district, western Finland. From Sulitjelma, northern Norway. In the Bestyube goldfield, northern Kazakhstan. In Australia, at the Costerfield Au–Sb mine and the Nagambie gold deposit, Victoria, and in the Hillgrove Sb–Au deposit, 25 km east of Armidale, New South Wales. From the Woxi gold deposit, Hebei Province, China. In the Lone Hand and Jessie gold mines, Gwanda district; and the Indrarama Au–Sb mine, Sebakwe area, Que-Que, Zimbabwe. From the Mobale mine, Kivu Province, Congo (Zaire). At the Ashanti gold deposit, Obuasi, Ghana. Additional localities are known.

Name: In reference to its composition.

Type Material: Canadian Geological Survey, Ottawa; Royal Ontario Museum, Toronto, Canada.

Austinite $CaZn(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. As enantiomorphous bladed crystals exhibiting {011}, {111}, {1$\bar{1}$1}, {010} and several other forms, sometimes forming scepters. Also as radially fibrous crusts and nodules. *Twinning:* Left- and right-handed individuals joined on (100), with (010) and (001) coincident.

Physical Properties: *Cleavage:* Good on {011}. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 4.13 D(calc.) = [4.31]

Optical Properties: Translucent to transparent. *Color:* Colorless, white to pale yellowish white, green. *Luster:* Subadamantine to silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$, weak.
$\alpha = 1.759(3)$ $\beta = 1.763(3)$ $\gamma = 1.783(3)$ 2V(meas.) = ∼45°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 7.505$–7.509 $b = 9.037$–9.046 $c = 5.921$–5.934 Z = 4

X-ray Powder Pattern: Gold Hill, Utah, USA.
3.171 (10), 2.801 (10), 2.637 (10), 1.616 (9), 1.509 (7), 2.529 (6), 5.781 (5)

ZnO	32.5	30.10	31.14				

(1) Gold Hill, Utah, USA; insoluble is quartz, some adamite adhering. (2) Kamariza mine, Greece; by electron microprobe, H_2O by difference; corresponding to $Ca_{1.00}(Zn_{0.96}Cu_{0.03}Fe_{0.01})_{\Sigma=1.00}[(As_{0.97}P_{0.03})_{\Sigma=1.00}O_4](OH)$. (3) $CaZn(AsO_4)(OH)$.

Polymorphism & Series: Forms a series with conichalcite.

Mineral Group: Adelite group.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-rich base-metal deposits.

Association: Adamite, talmessite, "limonite", quartz (Gold Hill, Utah, USA).

Distribution: In the USA, in the Western Utah mine, Gold Hill, Tooele Co., Utah; at the Mohawk mine, Clark Mountains, San Bernardino Co., California; from the Table Mountain mine, Galiuro Mountains, Pinal Co., Arizona; at Sterling Hill, Ogdensburg, Sussex Co., New Jersey; in the Tucker's tunnel uranium deposit, near Durango, Hinsdale Co., Colorado. From the Ojuela mine, Mapimí, Durango, Mexico. At the Lili mine, near Lomitos, Bolivia. From the Kamariza mine, Laurium, Greece. At Tsumeb and Guchab, Otavi district, Namibia. In the Puttapa zinc mine, near Beltana, South Australia.

Name: To honor Professor Austin Flint Rogers (1877–1957), American mineralogist, Stanford University, Palo Alto, California, USA.

Autunite $Ca(UO_2)_2(PO_4)_2 \cdot 10–12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As thin to moderately thick crystals, tabular on {001} and with rectangular or octagonal outline, to 2 cm; commonly in subparallel growths, foliated or scaly aggregates, and in crusts. *Twinning:* On {110}, interpenetrant, rare.

Physical Properties: *Cleavage:* Perfect on {001}; {100}, indistinct. Hardness = 2–2.5 D(meas.) = 3.05–3.2 (varies with hydration). D(calc.) = 3.14 (for $10.5H_2O$). Strong yellow-green fluorescence in UV. Dehydrates in air. Radioactive.

Optical Properties: Transparent to translucent. *Color:* Lemon-yellow to sulfur-yellow, greenish yellow to pale green; may be dark green to greenish black. *Streak:* Pale yellow. *Luster:* Vitreous, pearly on {001}.
Optical Class: Uniaxial (–), commonly anomalously biaxial (–). *Pleochroism:* $X =$ colorless to pale yellow; $Y = Z =$ yellow to dark yellow. *Orientation:* $Z = c$; $Y = \{110\}$. *Dispersion:* $r > v$, strong. $\omega = 1.575$ $\epsilon = 1.572$ $\alpha = 1.553–1.555$ $\beta = 1.575$ $\gamma = 1.577–1.578$ 2V(meas.) = 10°–53°

Cell Data: *Space Group:* $I4/mmm$. $a = 6.989$ $c = 20.63$ Z = 2

X-ray Powder Pattern: Les Oudots mine, France. (ICDD 41–1353).
3.569 (100), 10.35 (85), 5.185 (65), 2.074 (60), 3.502 (40), 2.187 (40), 4.930 (35)

Total	99.88	100.00

(1) Autun, France. (2) $Ca(UO_2)_2(PO_4)_2 \cdot 12H_2O$.

Mineral Group: Autunite group.

Occurrence: A secondary mineral derived from primary uranium-bearing minerals under oxidizing conditions, in hydrothermal veins, granite pegmatites, etc.

Association: Meta-autunite, torbernite, phosphuranylite, saléeite, uranophane, uranophane-beta, sabugalite.

Distribution: Widespread, many minor localities, but few for outstanding specimens. In France, at L'Ouche d'Jau, Saint-Symphorien-de-Marmagne, and the Les Oudots mine, Autun district, Saône-et-Loire; from the Margnac mine, Compreignac, Haute-Vienne; large crystals from the Gagnol mine, Lachaux, Puy-de-Dôme. From Sabugal, Urgeiriça, and elsewhere in Portugal. At Peveragno, near Cúneo, Piedmont, Italy. Large crystals from Bergen, Vogtland, Germany. From a number of localities in Cornwall, England. Fine groups from the Dahl (Daybreak) mine, near Mt. Spokane, east of Elk, Spokane Co., Washington, USA. At Malacacheta, Minas Gerais, Brazil. Large crystals from Mt. Painter, Flinders Ranges, South Australia.

Name: For Autun, France, near to which the first specimens to be analyzed were collected.

Type Material: Natural History Museum, Paris, France, H6307.

Avdoninite $K_2Cu_5Cl_8(OH)_4 \cdot H_2O$

Crystal Data: Monoclinic. *Point Group*: 2/*m*, *m* or 2. As crusts; crystals, poorly formed, short-prismatic to thick tabular, to 0.2 mm; with {001}, {100}.

Physical Properties: *Cleavage*: Perfect on {001}. *Fracture*: Stepped. *Tenacity*: Brittle. Hardness = 3 D(meas.) = 3.03(3) D(calc.) = 3.066

Optical Properties: Transparent. *Color*: Bright green. *Streak*: Pale green. *Luster*: Vitreous. *Optical Class*: Biaxial. $\alpha = 1.669(2)$ $\beta = 1.688(2)$ $\gamma = 1.707(5)$ 2V = 90(2)°
Orientation: $Y = c$; $X = b$ (?).

Cell Data: *Space Group*: *P*2/*m*, *Pm*, or *P*2. $a = 24.34(2)$ $b = 5.878(4)$ $c = 11.626(5)$ $\beta = 93.3(1)°$ $Z = 4$

X-ray Powder Pattern: Tolbachik Volcano, Kamchatka Region, Russia.
11.63 (100), 5.80 (27), 5.88 (20), 2.518 (19), 5.73 (17), 2.321 (17), 3.052 (15)

Chemistry:

	(1)
K_2O	11.94
CuO	51.43
Cl	37.07
H_2O	6.9
$-O=Cl_2$	8.37
Total	98.97

(1) Tolbachik Volcano, Kamchatka Region, Russia; average of 4 electron microprobe analyses, H_2O by Penfield method, IR confirms OH and H_2O, corresponding to $K_{1.96}Cu_{5.00}Cl_{8.09}(OH)_{3.87} \cdot 1.03H_2O$.

Occurrence: A product of precipitation from fumarolic gases (Tolbachik Volcano, Russiaa); also reported as an alteration on massive sulfide ore exposed at the Earth's surface.

Association: Euchlorite, paratacamite, belloite, langbeinite, atacamite.

Distribution: Yadovitaya ("Poisonous") fumaroles, Second Cinder Cone, Northern Breach of the Tolbachik Large Fissure Eruption, Tolbachik Volcano, Kamchatka Region, Russia; also reported from the Blyava deposit, Orenburg oblast and dumps at the Degtyarka deposit, Sverdlovsk oblast, Russia.

Name: Honors Ural mineralogist Vladimir Nikolaevich Avdonin (1925–), senior scientist of the Ural Geological Museum, Ural State Mining University, Russia.

Type Material: Mineralogical Museum of the Department of Mineralogy, St. Petersburg State University, St. Petersburg, Russia (catalog no. 19175).

Averievite $Cu_5O_2(VO_4)_2 \cdot CuCl_2 \cdot (Cs,K,Rb)Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. As pseudohexagonal crystals, to 0.3 mm, with $\{10\bar{1}0\}$, $\{01\bar{1}0\}$, $\{0001\}$, $\{000\bar{1}\}$.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, good. *Tenacity:* Brittle. Hardness = ∼4 VHN = 258 (20 g load). D(meas.) = 3.54 (thought low due to adhesion of air bubbles). D(calc.) = 4.01(1)

Optical Properties: Opaque. *Color:* Black. *Streak:* Black. *Luster:* Metallic to resinous. *Optical Class:* Uniaxial.
R_1–R_2: n.d.

Cell Data: *Space Group: P*3. $a = 6.375(1)$ $c = 8.399(1)$ Z = 1

X-ray Powder Pattern: Tolbachik volcano, Russia.
2.315 (10), 3.43 (7), 2.810 (4), 1.598 (4), 2.131 (3), 3.048 (2), 1.871 (2)

Chemistry:

	(1)
MoO_3	1.51
V_2O_5	23.84
Fe_2O_3	0.62
CuO	62.01
K_2O	0.98
Rb_2O	0.82
Cs_2O	3.35
Cl	7.56
$-O = Cl_2$	1.70
Total	98.99

(1) Tolbachik volcano, Russia; by electron microprobe, average of 17 analyses, total Fe as Fe_2O_3; with chloride compounds in open structural channels, corresponds to $Cu_{5.00}O_{2.19}[(V_{0.94}Mo_{0.04}Fe_{0.02})_{\Sigma=1.00}O_{3.89}]_2 \cdot Cu_{0.56}Cl_{1.12} \cdot (Cs_{0.17}K_{0.15}Rb_{0.06})_{\Sigma=0.38}Cl_{0.40}$.

Occurrence: In volcanic fumaroles.

Association: Piypite, alumoklyuchevskite, fedotovite, alarsite, nabokoite, tenorite, lammerite, langbeinite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: To honor Valerii Viktorovich Aver'ev [Averiev] (1929–1968), volcanologist, Institute of Volcanology, Petropavlovsk-Kamchatskii, Russia.

Type Material: Mining Museum, St. Petersburg Mining Institute, St. Petersburg, Russia, 2102/2.

Avicennite Tl_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $2/m\ \overline{3}$. As crystals, less than 1 mm, some showing subhedral octahedral faces; as porous grains, and as a coating on carlinite.

Physical Properties: *Fracture:* Conchoidal to hackly, uneven. *Tenacity:* Very brittle. Hardness = 1.5–2.5 VHN = 46–80 (15 and 25 g loads). D(meas.) = 8.9 D(calc.) = 10.34

Optical Properties: Opaque. *Color:* Grayish black with brownish black tint; pale to medium gray under reflected light. *Streak:* Grayish black, black with a brownish tint. *Luster:* Metallic. *Optical Class:* Isotropic.
R: (400) 11.5, (470) 12.5, (500) 13.0, (546) 12.7, (589) 12.3, (650) 10.6, (700) 11.5

Cell Data: *Space Group:* $Ia3$. a = 10.5468(3) Z = 16

X-ray Powder Pattern: Carlin mine, Nevada, USA.
3.044 (100), 1.864 (38), 2.637 (37), 1.590 (30), 4.307 (17), 2.068 (7), 2.486 (6)

Chemistry: (1) Near Dzhuzumli, Tajikistan; Tl 79.52% by microchemical methods, corresponding to Tl_2O_3 88.86%, Fe_2O_3 4.46% an impurity. (2) Carlin mine, Nevada, USA; by electron microprobe, average of three analyses, Tl 89.6% corresponding to Tl_2O_3 100.1%.

Occurrence: In the weathered zone of a hematite-calcite vein cutting banded marmorized and silicified limestones near a granite-gneiss contact (near Dzhuzumli, Tajikistan); formed by oxidation of carlinite in carbonaceous gold ores in silicified limestones and quartz (Carlin mine, Nevada, USA).

Association: Hematite, "limonite", ferruginous clay minerals (near Dzhuzumli, Tajikistan); carlinite, hematite, quartz (Carlin mine, Nevada, USA); parapierrotite (Lookout Pass, Utah, USA).

Distribution: From near the village of Dzhuzumli, Mt. Zirabulaksk region, Samarkand district, western Uzbekistan. In the USA, from the Carlin mine, 50 km northwest of Elko, Lynn district, Eureka Co., Nevada, and near Lookout Pass, Tooele Co., Utah.

Name: For the medieval Uzbek (Persian) scholar and physician, Abū 'Alī al-Husayn ibn 'Abd Allāh ibn Sīnā (Avicenna) (930–1037), who lived in Bukhara, Tajikistan.

Type Material: n.d.

(1) South Fork, Smith River, California, USA. (2) Gorge River, New Zealand. (3) Ni_2Fe. (4) Ni_3Fe.

Occurrence: In river placers, from serpentinized peridotites and ophiolites; rare in meteorites.

Association: Gold, magnetite (placers); copper, heazlewoodite, pentlandite, violarite, chromite, millerite (peridotites); kamacite, allabogdanite, schreibersite, graphite (meteorites).

Distribution: From the Red Hills and the Gorge River draining them, near Awarua Bay [TL], south Westland, New Zealand. At Coolac, New South Wales, and in the Lord Brassey mine, Tasmania, Australia. From the Bobrovka River, Nizhni Tagil, Ural Mountains, Russia. In the Feragen ultramafic body, Sør-Trøndelag, Norway. From Vadu Dobrii, Poiana Ruscă Mountains, Romania. In the Elvo River, Piedmont, Italy. From Poschiavo, Bergell, Switzerland. In the USA, from Josephine and Jackson Cos., Oregon; South Fork, Smith River, Del Norte Co., California; and in the Line Pit mine, Cecil Co., Maryland. From the Lillooet district, Fraser River, British Columbia; and at Holle Canyon, Pelly River, Yukon Territory, Canada. From Oko, Kochi Prefecture, Japan. In the Sakhakot-Qila complex, Malakand Agency, Pakistan. A number of additional localities are known, many as widely dispersed occurrences in large ultramafic bodies.

Name: For the locality near Awarua Bay, New Zealand.

Type Material: Geological Survey of New Zealand, Lower Hutt, New Zealand, P21969.

Azoproite $(Mg, Fe^{2+})_2(Fe^{3+}, Ti, Mg)BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As prismatic crystals, often striated and skeletal, to 2 cm, typically poorly terminated, with a diamond-shaped outline on {001}.

Physical Properties: *Cleavage:* On {010}, good, may be a parting; on {001}, distinct. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼5.5 D(meas.) = 3.63(2) D(calc.) = [3.63] Paramagnetic.

Optical Properties: Translucent to nearly opaque; transparent in thin section. *Color:* Black. *Luster:* Adamantine.
Optical Class: Biaxial (+). *Pleochroism:* Strong; X = pale bluish green; Y = dark green; Z = brownish red. *Absorption:* $Z > Y > X$. $\alpha = 1.799(2)$ $\beta = 1.822(3)$ $\gamma = 1.855(5)$ 2V(meas.) = $> 70°$ 2V(calc.) = 80°

Cell Data: *Space Group: Pbam.* $a = 9.26(1)$ $b = 12.25(1)$ $c = 3.01(1)$ Z = 4

X-ray Powder Pattern: Tazheran massif, Russia.
2.52 (10d), 5.07 (8), 2.16 (6), 2.02 (6), 2.77 (5b), 2.11 (5), 1.900 (5)

Chemistry:

	(1)
TiO_2	15.40
B_2O_3	19.07
Fe_2O_3	16.01
FeO	5.16
MnO	0.11
MgO	45.01
Na_2O	trace
Total	100.76

(1) Tazheran massif, Russia; after deduction of calcite, spinel, forsterite, corresponds to $(Mg_{1.82}Fe^{2+}_{0.13})_{\Sigma=1.95}(Fe^{3+}_{0.37}Ti_{0.36}Mg_{0.25})_{\Sigma=0.98}B_{1.02}O_{5.00}$.

Mineral Group: Ludwigite group.

Occurrence: An uncommon late-stage mineral in the border zone in magnesian contact-metamorphic rocks associated with syenites; the deposit is estimated to contain 350 kT B_2O_3.

Association: Calcite, ludwigite, brucite, clinohumite, baddeleyite, tazheranite, perovskite, geikielite, forsterite.

Distribution: From the Tazheran alkalic massif, west of Lake Baikal, eastern Siberia, Russia.

Name: A Russian acronym honoring the Study of Deep Zones of the Earth's Crust (AZOPRO in Russian) sponsored in 1969 by the International Geological Association.

Type Material: Mining Institute, St. Petersburg, 1481/1–1481/3; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72890–72892; Natural History Museum, Paris; National School of Mines, Paris, France, V16383.

Azurite $Cu_3(CO_3)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are typically complex, with over 100 forms recorded, to 30 cm. Tabular on {001}, less commonly so on {102} or {$\bar{1}$02}; short to long prismatic along [001], with prominent {110} and {100}, or along [010], with wedgelike terminations. As rhomboidal, lenticular, or spherical subparallel aggregates, which may form rosettes; also as internally radial stalactitic or columnar aggregates; botryoidal, drusy, earthy, massive. *Twinning:* Rare; twin planes {$\bar{1}$01}, {$\bar{1}$02}, {001}.

Physical Properties: *Cleavage:* On {011}, perfect but interrupted; on {100}, fair; on {110}, poor. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5–4 D(meas.) = 3.773(3) D(calc.) = 3.78

Optical Properties: Transparent to translucent. *Color:* Azure-blue, Berlin blue, very dark to pale blue; pale blue in transmitted light. *Streak:* Pale blue. *Luster:* Vitreous to subadamantine.
Optical Class: Biaxial (+). *Pleochroism:* In shades of blue. *Orientation:* $X = b$; $Z \wedge c = -12°36'$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.730$ $\beta = 1.754$–1.758 $\gamma = 1.835$–1.838 2V(meas.) = 67°

Cell Data: *Space Group:* $P2_1/c$. $a = 5.0109(5)$ $b = 5.8485(6)$ $c = 10.345(2)$ $\beta = 92.43(3)°$ Z = 2

X-ray Powder Pattern: Tsumeb, Namibia.
3.516 (100), 2.224 (70), 5.15 (55), 3.674 (50), 2.510 (35), 2.287 (35), 5.08 (30)

Chemistry:

	(1)	(2)
CO_3	25.46	25.54
CuO	69.08	69.23
H_2O	5.46	5.23
Total	100.00	100.00

(1) Chessy, France. (2) $Cu_3(CO_3)_2(OH)_2$.

Occurrence: In the oxidized zones of copper deposits associated with carbonate rocks; may constitute an ore of copper.

Association: Malachite, chrysocolla, brochantite, antlerite, cuprite, cerussite, smithsonite, calcite, dolomite.

Distribution: Widespread, with many localities producing good crystals. From Chessy, near Lyon, Rhône, France. At Alghero and elsewhere on Sardinia, Italy. In the Zmeinogorsk (Schlangenberg) and Zolotuskinskii mines, Altai Mountains, Russia. Large crystals at the Touissit mine, near Oujda, Morocco. An ore at the Chingola mine, Nchanga, Zambia. Extraordinary examples from Tsumeb, Namibia. In the USA, in Arizona, fine examples from the Copper Queen and other mines of the Warren district, Bisbee, Cochise Co.; at Morenci, Greenlee Co.; in the Mammoth-St. Anthony mine, Pinal Co.; from the New Cornelia mine, Ajo, Pima Co.; at the Kelly and Graphic mines, Magdalena, Socorro Co., New Mexico; in Utah, in the Apex mine, St. George, Washington Co., and at the Big Indian mine, near La Sal, San Juan Co. Fine crystals from the El Cobre mine, Concepcion del Oro, and at the San Carlos mine, Mazapil, Zacetecas, Mexico. In Australia, many localities, as in New South Wales, at Broken Hill, also fine crystals from the Girilambone mine, north of Nyngan. In China, from the Yang Chweng mine, Shilu, Guangdong Province, China.

Name: From the Persian *lazhward*, for its characteristic blue color.

Type Material: Natural History Museum, Paris, France, 103.

Babefphite $BaBe(PO_4)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudotetragonal. *Point Group:* 1. As anhedral, equant to flattened grains, to 1.5 mm; may be in aggregates.

Physical Properties: *Tenacity:* Very brittle. Hardness = [3.5] VHN = 140–200
D(meas.) = 4.31 D(calc.) = 4.325

Optical Properties: Transparent. *Color:* White. *Luster:* Vitreous to greasy.
Optical Class: Biaxial; pseudouniaxial (+). *Orientation:* Negative elongation. $\omega = 1.629(2)$
$\epsilon = 1.632(2)$

Cell Data: *Space Group:* $P1$. $a = 6.889(3)$ $b = 16.814(7)$ $c = 6.902(3)$ $\alpha = 90.01(3)^\circ$
$\beta = 89.99(3)^\circ$ $\gamma = 90.32(3)^\circ$ Z = 8

X-ray Powder Pattern: Aunik deposit, Russia.
3.190 (10), 2.163 (10), 1.516 (10), 2.760 (8), 2.440 (7), 2.033 (7), 1.135 (7b)

Chemistry:

	(1)	(2)
P_2O_5	26.55	27.26
Fe_2O_3	0.3	
BeO	11.63	9.61
CaO	0.00

F	7.27	7.30
H_2O	[0.64]	
$-O = F_2$	3.05	3.07
Total	[99.84]	100.00

(1) Aunik deposit, Russia; by microchemical analysis, with $(OH)^{1-}$ for charge balance, corresponds to $Ba_{0.99}Be_{1.20}(PO_4)_{1.00}[F_{1.02}(OH)_{0.36}]_{\Sigma=1.38}$. (2) $BaBe(PO_4)F$.

Occurrence: In eluvium directly above rare-metal skarn deposits associated with alkaline intrusions.

Association: Zircon, ilmenorutile, fluorite, phenakite, scheelite, bertrandite, albite, microcline, quartz.

Distribution: Occurs in the Aunik fluorite-rare metals deposit, Buryatia, Siberia, Russia.

Name: For BArium, BEryllium, Fluorine, and PHosphorous in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72021.

(1) Arendal, Norway. (2) Holyoke, Hampden Co., Massachusetts, USA; original total given as 99.82%. (3) $Ca_2Fe^{2+}Fe^{3+}Si_5O_{14}(OH)$.

Polymorphism & Series: Forms a series with manganbabingtonite.

Occurrence: In veins cutting granite pegmatite and diorite; in cavities and vugs in mafic volcanic rocks and gneisses; in skarns.

Association: Prehnite, calcite, epidote, albite, orthoclase, garnet, quartz, "hornblende," zeolites.

Distribution: Known from a number of localities, most minor; some providing good crystals are: in Norway, at the Brastad mine, Oyestad, near Arendal. From Gronsjöberg, Dalarma, Sweden. In Germany, at Herbornseelbach, Hesse. From Baveno, Piedmont, Italy. In the Khandivali quarry, near Bombay, Maharashtra, India. At Mitani, Kochi Prefecture, Japan. From Noril'sk, western Siberia, Russia. In the USA, in Massachusetts, exceptional crystals from Lane's quarry, Westfield, Hampden Co.; in the Cheapside and Deerfield quarries, East Deerfield, Franklin Co.; also at Winchester Highlands, Uxbridge, Norfolk Co. At Paterson, Passaic Co., and Mine Hill, Morris Co., New Jersey; from the Goose Creek quarry, Leesburg, Loudoun Co., Virginia; and at Lenoir, Caldwell Co., North Carolina.

Babkinite $Pb_2Bi_2(S,Se)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ or $\overline{3}$. As thin tablets, in aggregates, to 2 mm across.

Physical Properties: *Cleavage:* Perfect, on {001}. Hardness = ∼2. VHN = 71–91, 82 average, ⊥ to cleavage; 90–112, 100 average, ∥ to cleavage (10 g load). D(meas.) = n.d. D(calc.) = 8.096

Optical Properties: Opaque. *Color:* Silvery gray; in reflected light, white with yellowish tint. *Streak:* Gray. *Luster:* Metallic.
Optical Class: Uniaxial. *Pleochroism:* Weak in pale bluish brown tints. *Anisotropism:* Distinct. *Bireflectance:* Negligible.
R: (400) 51.3, (420) 50.7, (440) 49.6, (460) 48.7, (480) 48.6, (500) 48.5, (520) 47.8, (540) 47.5, (560) 48.2, (580) 47.0, (600) 46.5, (620) 46.5, (640) 46.1, (660) 46.5, (680) 46.2, (700) 46.7

Ag	0.13
Pb	42.58
Sb	0.08
Bi	42.02
Se	10.60
S	5.80
Total	101.21

(1) Nevskoye deposit, Russia; by electron microprobe, average of 23 analyses; corresponds to $(Pb_{1.99}Ag_{0.01})_{\Sigma=2.00}(Bi_{1.95}Sb_{0.01})_{\Sigma=1.96}(S_{1.75}Se_{1.30})_{\Sigma=3.05}$.

Occurrence: In a hydrothermal deposit in sediments, near their contact with a granite intrusion.

Association: Arsenopyrite, stannite, tetrahedrite, wittite, laitakarite, selenian cosalite, cassiterite, wolframite.

Distribution: From the Nevskoye W–Sn deposit, 25 km northwest of Omsukchan, Magadan region, Russia.

Name: To honor Petr Vasil'evich Babkin (1929–1977), Russian geologist, Northeast Geological Administration of Mingeo, Magadan, Russia, who first studied the Nevskoye deposit.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p806/1.

Baddeleyite ZrO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly tabular on {100} and somewhat elongated on [010], or short to long prismatic along [001], to 6 cm; rarely equant; prism faces striated ‖ [001]; radially fibrous with concentric banding in botryoidal masses. *Twinning:* Ubiquitous; on {100} and {110}, both may be polysynthetic; rare on {201}.

Physical Properties: *Cleavage:* {001} nearly perfect, {010} and {110} less perfect. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 5.40–6.02 D(calc.) = [5.83] Blue-green cathodoluminescence.

Optical Properties: Transparent; in dark-colored specimens, only in thin fragments. *Color:* Colorless to yellow, green, greenish or reddish brown, brown, iron-black; colorless to brown in transmitted light. *Streak:* White to brownish white. *Luster:* Greasy to vitreous; nearly submetallic in black crystals.
Optical Class: Biaxial (–). *Pleochroism:* X = yellow, reddish brown, oil-green; Y = oil-green, reddish brown; Z = brown, light brown. *Orientation:* $X \wedge c = 13°$; $Y = b$. *Dispersion:* $r > v$, rather strong. *Absorption:* $X > Y > Z$. $\alpha = 2.13(1)$ $\beta = 2.19(1)$ $\gamma = 2.20(1)$
2V(meas.) = 30(1)° 2V(calc.) = 28°

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 5.1505(1)$ $b = 5.2116(1)$ $c = 5.3173(1)$ $\beta = 99.230(1)°$ Z = 4

(1) Balangoda, Sri Lanka. (2) Axel Heiberg Island, Canadian Arctic Archipelago; by electron microprobe, average of 35 analyses.

Occurrence: An accessory mineral in carbonatites and kimberlites; in syenites, diabases, gabbros, anorthosites; detrital in gem gravels. In lunar basalt, tektites, and meteorites.

Association: Ilmenite, zirkelite, apatite, magnetite, perovskite (Jacupiranga mine, Brazil); fluorite, nepheline, pyrochlore, allanite (Monte Somma, Italy).

Distribution: At Rakwana and Balangoda, Sri Lanka. From Monte Somma, Campania, Italy. In Russia, large crystals from the Kovdor massif, and in the Gulinskii massif, the Vuoriyarvi carbonatite complex, and the Imandrovsky layered intrusion, Kola Peninsula; in the Lukkulaisvaara layered intrusion, Karelia. At the Jacupiranga mine, São Paulo, and at Poços de Caldas, Minas Gerais, Brazil. From Bozeman, Gallatin Co., Montana, USA. In the Bingo deposit, Kivu Province, Congo (Zaire). From Catanda, Angola. At Benfontein, and in large crystals from Phalaborwa, Transvaal, South Africa. Other minor occurrences are known.

Name: For Joseph Baddeley, who first called attention to the Sri Lankan material.

Type Material: The Natural History Museum, London, England.

Bafertisite $\mathbf{Ba(Fe^{2+},Mn^{2+})_2TiOSi_2O_7(OH,F)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group: m.* Crystals of simple rhombic habit, elongated along [100] and flattened on {001}. As aggregates of acicular crystals, to 1.5 cm. *Twinning:* Ubiquitous on {001}, polysynthetic.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = ∼5 D(meas.) = 3.96–4.25 D(calc.) = 3.8

Optical Properties: Semitransparent. *Color:* Bright red, yellowish red to light brown, straw-brown to tan.
Optical Class: Biaxial (–). *Pleochroism:* X = yellow-red to reddish brown; Y = yellow; Z = pale yellow to greenish yellow. *Orientation:* $Y = b$; $X \wedge a = 5.5°$. *Absorption:* $X > Z$.
$\alpha = 1.805$–1.808 $\beta = 1.835$ $\gamma = 1.860$–1.862 2V(meas.) = 54°–86°

Cell Data: *Space Group: Cm.* $a = 10.60$ $b = 13.64$ $c = 12.47$ $\beta = 119°30'$ Z = 8

X-ray Powder Pattern: Baiyun-Obo deposit, China.
2.65 (100), 2.11 (40), 1.72 (40), 2.52 (30), 2.23 (30), 2.07 (30), 1.75 (30)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	23.68	25.18	BaO	29.98	26.59
TiO_2	15.39	14.27	K_2O	0.12	0.33
Al_2O_3	0.29	1.00	Na_2O	0.49	0.38
Fe_2O_3	1.08	3.67	F		3.50
Nb_2O_5	0.84	0.32	Cl	0.63	
FeO	22.56	10.82	H_2O^+	1.65	2.16
MnO	1.62	12.77	H_2O^-	1.14	
MgO	0.50		$-O = (F,Cl)_2$	0.14	1.47
CaO	0.37	0.30	Total	100.20	99.82

(1) Baiyun-Obo deposit, China. (2) Burpala massif, Russia; corresponding to $Ba(Mn_{0.90}Fe^{2+}_{0.76}Fe^{3+}_{0.33})_{\Sigma=1.99}TiOSi_2O_7(OH,F)_2$.

Polymorphism & Series: Forms a series with hejtmanite.

Occurrence: In hydrothermal veins (Baiyun-Obo deposit, China); in a dike of microcline granite-aplite (Burpala massif, Russia).

Association: Aegirine, fluorite, barite, bastnäsite (Baiyun-Obo deposit, China).

Distribution: In China, from the Baiyun-Obo mine, near Pao-t'ou, Inner Mongolia. From the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, Russia. At an undefined locality in Kazakhstan. In the Fountain quarry, near Fountain, Pitt Co., North Carolina, USA.

Name: For elements in the composition, BArium, iron (FERrum), TItanium, and SIlicon.

Type Material: n.d.

Baghdadite $Ca_3(Zr,Ti)Si_2O_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals stumpy prismatic, to 250 μm. *Twinning:* Contact twins, individuals having [010] in common.

Physical Properties: *Fracture:* Conchoidal. Hardness = ~6 VHN = 725–783, 750 average (50 g load). D(meas.) = n.d. D(calc.) = 3.48 Cathodoluminescence, dull gray with greenish tint.

Optical Properties: Transparent. *Color:* Colorless. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = 1.652$ $\beta = 1.658$ $\gamma = 1.670$ 2V(meas.) = ~72°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.42$ $b = 10.16$ $c = 7.36$ $\beta = 91.1°$ Z = 4

X-ray Powder Pattern: Dupezeh Mountain, Iraq.
2.84 (100), 2.98 (85), 3.23 (80), 3.04 (75), 2.88 (70), 7.30 (45), 1.702 (40)

Chemistry:

	(1)
SiO_2	29.26
TiO_2	2.11
ZrO_2	27.00
Al_2O_3	0.03
Fe_2O_3	0.11
MgO	0.05
CaO	41.44
Na_2O	0.02
Total	100.02

(1) Dupezeh Mountain, Iraq; by electron microprobe, average of 26 analyses of four crystals; estimated to contain HfO_2 ~0.16%; corresponds to $Ca_{3.00}(Zr_{0.89}Ti_{0.11})_{\Sigma=1.00}(Si_{1.98}Fe_{0.01})_{\Sigma=1.99}O_9$.

Occurrence: In a melilite skarn in contact with banded diorite, in roof pendant xenoliths of calc-silicate marbles and hornfels.

Association: Åkermanite, perovskite, schorlomite, monticellite, wollastonite, foshagite, calcite, phlogopite, spinel, cuspidine, baddeleyite, pyrrhotite, djerfisherite, valleriite (melilite skarn); andesine, kaersutite, titanian augite, ilmenite, titanian magnetite, xonotlite (banded diorite).

Distribution: On Dupezeh Mountain, near Hero Town, Qala-Diza region, northeastern Iraq.

Name: For Baghdad, the capital of Iraq.

Type Material: n.d.

References: (1) Al-Hermezi, H.M., D.M. McKie, and A.J. Hall (1986) Baghdadite, a new calcium zirconium silicate mineral from Iraq. Mineral. Mag., 50, 119–123. (2) (1987) Amer. Mineral., 72, 222 (abs. ref. 1).

Bahianite $Al_5Sb_3^{5+}O_{14}(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As water-worn, bean-shaped pebbles, to 10 cm, with polycrystalline or radial-fibrous structure; also as curved and striated crystals, diamond-shaped or rectangular, lining pockets in the pebbles. *Twinning:* As pseudohexagonal multiple contact twins, chrysoberyllike.

Physical Properties: *Cleavage:* {100}, perfect. *Fracture:* Uneven. Hardness = 9 VHN = 1605 (100 g load). D(meas.) = 4.78–5.29; 5.46 for a crystal. D(calc.) = 5.26

Optical Properties: Transparent to translucent. *Color:* Tan, cream, orange-brown, brown; crystals colorless, tan, pale violet; yellow internal reflections in transmitted light. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* Weak. *Dispersion:* $r > v$. $\alpha = 1.81(1)$ $\beta = 1.87(1)$ $\gamma = 1.92(1)$ 2V(meas.) = Large.

Cell Data: *Space Group:* $C2/m$. $a = 9.406(6)$ $b = 11.541(8)$ $c = 4.410(3)$ $\beta = 90.94(3)^\circ$ Z = 2

X-ray Powder Pattern: Paramirim region, Brazil.
3.241 (100), 3.194 (100), 2.156 (80), 4.712 (70), 2.457 (70), 2.411 (70), 1.648 (70)

Chemistry:

	(1)	(2)	(3)
WO_3	1.20	0.3	
Sb_2O_5	57.28	61.9	64.00
SiO_2	1.03	3.5	
TiO_2		0.2	
Al_2O_3	35.37	30.6	33.62
Fe_2O_3	1.04	1.3	
BeO	0.75	0.75	
MgO		0.1	
H_2O	2.77	0.85	2.38
Total	99.44	99.50	100.00

(1) Paramirim region, Brazil; by electron microprobe, average of four analyses, total Fe as Fe_2O_3, H_2O by the Penfield method; corresponds to $Al_{5.49}Be_{0.24}Si_{0.14}Fe^{3+}_{0.10}W_{0.04}Sb_{2.80}O_{14}(OH)_{2.44}$.
(2) Do. (3) $Al_5Sb_3O_{14}(OH)_2$.

Occurrence: In potholes as stream-worn pebbles and as residual concentrates above weathered volcanic rock.

Association: Quartz, andalusite, kyanite, diaspore, phenakite, eskolaite, cassiterite, gold.

Distribution: About eight km southeast of the village of Paramirim das Crioulas, and elsewhere in the region around Rio do Picos das Almas, Serra das Almas, south-central Bahia, Brazil.

Name: For the occurrence in Bahia, Brazil.

Type Material: Harvard University, Cambridge, Massachusetts, 119088; National Museum of Natural History, Washington, D.C., USA, 133875, 135922.

Baileychlore $(Zn, Fe^{2+}, Al, Mg)_6(Si, Al)_4O_{10}(OH)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As fine-grained transverse fibers of very small size.

Physical Properties: *Cleavage:* Perfect micaceous. Hardness = < 5 D(meas.) = 3.18(2) D(calc.) = 3.195

Optical Properties: Transparent. *Color:* Green, zoned.
Optical Class: Biaxial. *Pleochroism:* Weak; green to yellow-green. $\alpha = 1.582$ β = n.d. $\gamma = 1.614$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $C\overline{1}$ or $C1$ (uncertainty due to random stacking of chlorite layers). $a = 5.346(3)$ $b = 9.257(4)$ $c = 14.40(7)$ $\beta = 97.12(5)^\circ$ Z = [2]

X-ray Powder Pattern: Red Dome deposit, Australia.
7.14 (100), 14.3 (90), 1.542 (60), 2.660 (50), 3.573 (40), 2.450 (35b), 4.600 (30)

Chemistry:

	(1)
SiO_2	32.0
Al_2O_3	12.4
FeO	12.9
MnO	0.15
ZnO	30.5
MgO	4.6
CaO	1.0
H_2O	n.d.

(1) Red Dome deposit, Australia; by electron microprobe; excluding CaO, corresponds to $(Zn_{2.50}Fe_{1.20}Al_{1.17}Mg_{0.76}Mn_{0.01})_{\Sigma=5.64}(Si_{3.55}Al_{0.45})_{\Sigma=4.00}O_{10}(OH)_8$.

Mineral Group: Chlorite group.

Occurrence: As rims on colloform calcite veins, within a strongly oxidized collapse karst-breccia containing skarn clasts.

Association: Andesine, garnet, vesuvianite, zincian chamosite, goethite, hematite, chalcocite, copper, malachite, calcite.

Distribution: From the Red Dome deposit, 15 km west-northwest of Chillagoe, Queensland, Australia.

Name: For Professor Sturges W. Bailey (1919–1994), Department of Geology and Geophysics, University of Wisconsin, Madison, Wisconsin, USA.

Type Material: Geological Museum, University of Wisconsin, Madison, Wisconsin, 6000/1; National Museum of Natural History, Washington, D.C., USA, 164430; South Australian Museum, Adelaide, Australia, 13592.

Bakerite $Ca_4B_4(BO_4)(SiO_4)_3(OH)_3 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rarely as single crystals, to 0.2 mm, stout, rhombic prisms having oblique terminations or as thin diamond-shaped tablets. As botryoidal and drusy crusts and nodules; most commonly as dense fine-grained aggregates or massive.

Physical Properties: Hardness = 4.5 D(meas.) = 2.88 D(calc.) = 2.94

Optical Properties: Translucent to opaque from clay inclusions. *Color:* Colorless to white. *Luster:* Vitreous to porcelaneous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 44°$. $\alpha = 1.624$ $\beta = 1.635$ $\gamma = 1.654$
2V(meas.) = 87°–88°

Cell Data: *Space Group:* $P2_1/c$. a = 4.83 $b = 7.60$ $c = 9.60$ $\beta = 90°2'$ Z = [1]

X-ray Powder Pattern: Sterling Borax mine, California, USA.
3.11 (100), 2.85 (60), 2.236 (60), 3.74 (50), 2.51 (50), 2.18 (50), 2.99 (40)

Chemistry:

	(1)	(2)
SiO_2	27.90	28.90
B_2O_3	27.58	27.91
CaO	35.14	35.97
H_2O^+	8.60	7.22
H_2O^-	0.30	
rem.	0.65	
Total	100.17	100.00

(1) Corkscrew Canyon, Death Valley, California, USA; remainder is oxides of trivalent elements.
(2) $Ca_4B_4(BO_4)(SiO_4)_3(OH)_3 \cdot H_2O$.

Mineral Group: Gadolinite group.

Occurrence: As irregular veins in altered volcanic rock (Baker Canyon, Death Valley, California, USA).

Association: Natrolite, thomsonite (Baker Canyon, Death Valley, California, USA); danburite, calcite, stilbite, datolite, quartz (Charcas, Mexico).

Distribution: In the USA, in California, the mineral probably never occurred at the type locality given as "16 miles northeast of Daggett" which is Borate, 14 km east of Yermo, San Bernardino Co.; it more likely was from later authenticated localities in the Black Mountains, west of Furnace Creek, Death Valley, Inyo Co.; also in the Sterling Borax mine, Tick Canyon, Los Angeles Co. Found near Tory Hill, Bancroft, Ontario, Canada. At Charcas, San Luis Potosí, Mexico. From Sivas, Turkey. In Italy, from near Sestri Levante, Liguria.

Name: To honor Richard C. Baker, of Nutfield, Surrey, England, Mining Director of the Pacific Coast Borax Co., who discovered the mineral.

Type Material: The Natural History Museum, London, England, 86511; Harvard University, Cambridge, Massachusetts, 92735; National Museum of Natural History, Washington, D.C., USA, 94820.

Baksanite $Bi_6Te_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Granular, dropletlike and in spherical aggregates, to 13 mm.

Physical Properties: *Cleavage:* Perfect, on {0001}. *Tenacity:* Flexible, but not elastic. Hardness = 1.5–2 VHN = 62 (5 g load). D(meas.) = 8.1(1) D(calc.) = 8.07

Optical Properties: Opaque. *Color:* Steel-gray; in reflected light, bright white. *Streak:* Black. *Luster:* Metallic.
Optical Class: Uniaxial. *Anisotropism:* Distinct, in yellowish gray tints. *Bireflectance:* Weak. R_1–R_2: (400) 46.3–50.1, (420) 47.5–50.2, (440) 48.9–50.5, (460) 48.1–52.2, (480) 48.2–52.0, (500) 47.7–52.4, (520) 47.7–52.2, (540) 48.1–52.4, (560) 48.7–52.6, (580) 48.6–52.1, (600) 49.0–51.6, (620) 49.3–51.0, (640) 49.2–51.1, (660) 49.2–50.8, (680) 48.7–51.1, (700) 48.5–51.2

Cell Data: *Space Group:* $P\overline{3}m1$. a = 4.249(2) c = 62.82(5) Z = 3

X-ray Powder Pattern: Tyrnyauz deposit, Russia.
3.09 (100), 4.50 (46), 2.255 (38), 2.126 (25), 3.58 (22), 3.30 (20), 3.53 (15)

Chemistry:

	(1)	(2)
Pb	2.15	
Te	14.33	15.90
Se	0.00	
Sb	0.12	
Bi	76.40	78.11
S	6.64	5.99
Total	99.64	100.00

(1) Tyrnyauz deposit, Russia; by electron microprobe, average of 20 analyses; corresponds to $(Bi_{5.78}Pb_{0.16}Sb_{0.02})_{\Sigma=5.96}Te_{1.77}S_{3.27}$. (2) $Bi_6Te_2S_3$.

Occurrence: In altered magnetite–andradite skarn.

Association: Gold, bismuthinite, ingodite, joséite, andradite, calcite, chlorite, stilpnomelane.

Distribution: From the Tyrnyauz W–Mo deposit, left bank of the Baksan River Valley, northern Caucasus Mountains, Russia [TL].

Name: For the Baksan River Valley, in which the mineral occurs.

Type Material: Mining Institute, St. Petersburg, 2082/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p1112/1.

Balangeroite $(Mg, Fe^{2+}, Fe^{3+}, Mn^{2+})_{42}Si_{16}O_{54}(OH)_{40}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Fibrous, both loose and compact; asbestiform, elongated along [001], to several cm.

Physical Properties: *Cleavage:* One or more on $\{hk0\}$ are very good. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 2.96–3.10 D(calc.) = 3.098

Optical Properties: Transparent only in thin section. *Color:* Brown. *Luster:* Vitreous, greasy.
Optical Class: Biaxial (–). *Pleochroism:* Distinct; dark brown ∥ [001]; yellow-brown ⊥ [001]. $\alpha = 1.680(5) \perp [001]$. β = n.d. $\gamma = \sim 1.680 \parallel [001]$. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2/n$. $a = 19.40$ $b = 9.65$ $c = 19.40$ $\beta = 91.1°$ Z = [2]

X-ray Powder Pattern: Balangero mine, Italy.
2.714 (100), 6.77 (80), 2.674 (75), 3.378 (45), 9.59 (40), 3.278 (40), 2.516 (40)

Chemistry:

	(1)
SiO_2	28.37
TiO_2	0.03
Al_2O_3	0.27
Fe_2O_3	8.89
Cr_2O_3	0.03
FeO	16.95
MnO	3.59
MgO	31.81
CaO	0.13
H_2O	[9.93]
Total	[100.00]

(1) Balangero mine, Italy; by electron microprobe, average of 16 analyses; Fe^{2+}:Fe^{3+} = 2.12 was deduced from wet chemical analysis, H_2O by difference; corresponds to $(Mg_{26.74}Fe^{2+}_{7.99}Fe^{3+}_{3.77}Mn^{2+}_{1.71}Al_{0.18}Ca_{0.08}Cr_{0.01}Ti_{0.01})_{\Sigma=40.49}Si_{16}O_{55.81}(OH)_{37.35}$.

Occurrence: In schistose serpentinite in proximity to a large ultramafic massif.

Association: Chrysotile, magnetite, Fe–Ni alloy, olivine, chlorite, titanian clinohumite, diopside, antigorite, calcite, aragonite, "opal", "chalcedony", clay minerals.

Distribution: In the Balangero (San Vittore) mine and at Ponte del Diavolo, Lanzo Valley, and from Santa Maria della Neve, Fiano, Piedmont, Italy.

Name: For the Balangero mine, Piedmont, Italy.

Type Material: Mineralogy Institute, Turin University, Turin, Italy, 14873.

Balipholite $BaMg_2LiAl_3(Si_2O_6)_2(OH,F)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals needlelike and fibrous, elongated ‖ [001], up to 1 mm; as radiating or parallel sheaflike aggregates.

Physical Properties: *Cleavage:* Perfect on {010}, distinct on {100} and {110}.
Hardness = n.d. D(meas.) = 3.32–3.35 D(calc.) = [3.32]

Optical Properties: Transparent to translucent. *Color:* Pale yellowish white; in thin section, colorless. *Luster:* Silky.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. α = 1.5807–1.5810 β = 1.5954–1.5958 γ = 1.5984–1.6008 2V(meas.) = 68°–72°

Cell Data: *Space Group: Ccca.* $a = 13.60$ $b = 20.24$ $c = 5.16$ Z = [4]

X-ray Powder Pattern: Hsianghualing area, China.
10.12 (100), 3.39 (91), 4.05 (78), 2.605 (31), 2.390 (28)

Chemistry:

	(1)		(1)
SiO_2	33.44	CaO	0.28
TiO_2	0.11	BaO	19.07
Al_2O_3	23.43	Li_2O	2.00
Fe_2O_3	0.32	Na_2O	0.26
FeO	0.58	K_2O	0.47
MnO	0.05	H_2O^+	10.30
BeO	0.01	P_2O_5	0.03
MgO	9.68	Total	100.03

(1) Hsianghualing area, China; corresponding to $(Ba_{0.88}K_{0.07}Na_{0.06}Ca_{0.03})_{\Sigma=1.04}(Mg_{1.69}Al_{0.17}Fe^{2+}_{0.06}Fe^{3+}_{0.03})_{\Sigma=1.95}Li_{0.95}Al_{3.00}(Si_{3.93}Al_{0.07})_{\Sigma=4.00}O_{11.96}(OH)_{8.07}$.

Occurrence: In a miarolitic cavity.

Association: Zinnwaldite, quartz.

Distribution: From the Hsianghualing area, Linwu, Hunan Province, China.

Name: For BArium and LIthium in the composition, and the Chinese for *fibrous*.

Type Material: n.d.

Balkanite $Cu_9Ag_5HgS_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222, $mm2$, or $2/m\ 2/m\ 2/m$. As rodlike prismatic crystals, to 0.2 mm, elongated and striated ‖ [001], and in grains, to 3 mm. *Twinning:* Lamellar in several directions, common.

Physical Properties: Hardness = ∼3.5 VHN = 79.4–91.6 (100 g load). D(meas.) = 6.318 (synthetic). D(calc.) = 6.421

Optical Properties: Opaque. *Color:* Steel-gray; pale gray in polished section. *Luster:* Metallic. *Anisotropism:* Strong.
R_1–R_2: (400) — , (420) — , (440) 35.4–30.6, (460) 35.6–31.0, (480) 35.4–31.0, (500) 35.0–30.2, (520) 34.0–28.9, (540) 34.0–28.0, (560) 33.4–27.2, (580) 32.8–26.5, (600) 32.4–26.0, (620) 32.1–25.6, (640) 31.8–25.1, (660) 31.5–24.9, (680) — , (700) —

Cell Data: *Space Group:* $P222$, $Pmm2$, or $Pmmm$. $a = 10.62(2)$ $b = 9.42(2)$ $c = 3.92(4)$ $Z = 1$

X-ray Powder Pattern: Sedmochislenitsi deposit, Bulgaria.
2.98 (10), 2.55 (10), 1.955 (9), 2.61 (8), 2.45 (8), 1.985 (8), 3.09 (7)

Chemistry:

	(1)	(2)
Cu	37.4	37.1
Ag	33.1	33.3
Hg	14.0	13.8
S	17.2	16.9
Total	101.7	101.1

(1) Sedmochislenitsi deposit, Bulgaria; by electron microprobe, corresponding to $Cu_{8.78}Ag_{4.58}Hg_{1.04}S_{8.00}$. (2) Do.; corresponding to $Cu_{8.76}Ag_{4.69}Hg_{1.04}S_{8.00}$.

Occurrence: In high-grade copper ores in a stratiform Pb–Zn–Cu deposit (Sedmochislenitsi deposit, Bulgaria).

Association: Bornite, chalcocite, chalcopyrite, djurleite, digenite, tennantite, stromeyerite, mckinstryite, wittichenite, bismuth, rammelsbergite, mercurian silver, cinnabar, pyrite, calcite, barite, aragonite.

Distribution: In the Sedmochislenitsi mine, Vratsa district, western part of the Stara Planina (Balkan Mountains), Bulgaria [TL]. From Manhattan, Nye Co., Nevada, USA. From about 20 km southwest of Agua Prieta, Sonora, Mexico.

Name: For the medieval and popular name of the Stara Planina (Balkan Mountains), the main mountain range giving its name to the Balkan Peninsula.

Type Material: Mineralogical Museum of the Higher Institute of Mining and Geology, 619; Museum of the University of Sofia "Kliment Ohridsky", Sofia, 1351; National Museum of Natural History, Sofia, Bulgaria, 2339.

$-O=Cl_2$	1.68
Total	99.63

(1) Monte Somma–Vesuvio volcanic complex, Campania, Italy; average of 5 analyses, CO_2 by selective sorption, H_2O by Penfield method and confirmed by IR, corresponding to $Na_{4.70}Ca_{2.53}K_{0.73}(Si_{6.02}Al_{5.98}O_{23.995})Cl_{2.34}(CO_3)_{0.82}(SO_4)_{0.27}\cdot 0.12\ H_2O$.

Mineral Group: Cancrinite group.

Occurrence: A product of metasomatic reaction between alkaline magma and limestone.

Association: Orthoclase, phlogopite, clinohumite, calcite, diopside, pargasite, haüyne, apatite.

Distribution: Monte Somma–Vesuvio volcanic complex, Campania, Italy.

Name: Honors the Italian crystallographer Paolo Ballirano (b. 1964), Department of Earth Sciences, University of Rome, for contributions to the crystal chemistry of cancrinite group minerals.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (catalog no. 3756/1).

Balyakinite $CuTeO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As minute short prismatic crystals, and as grains, to 0.5 mm.

Physical Properties: Hardness = n.d. VHN = 80–125, 105 average (10 g load).
D(meas.) = 5.6 D(calc.) = 5.64

Optical Properties: Semitransparent. *Color:* Grayish green, bluish green, blue to pale blue; in reflected light, gray, bluish gray. *Streak:* Pale bluish green.
Optical Class: Biaxial (–). *Pleochroism:* Weak; in greens. *Orientation:* $X = a$; $Y = b$; $Z = c$.
$\alpha = 2.11$ $\beta = 2.18$ $\gamma = 2.22$ 2V(meas.) = $> 80°$ *Anisotropism:* Slight.

Cell Data: *Space Group: Pmcn.* $a = 7.604(6)$ $b = 5.837(4)$ $c = 12.705(6)$ Z = 8

X-ray Powder Pattern: Russia.
2.85 (10), 2.84 (8), 3.09 (5), 1.711 (5), 4.34 (4), 3.18 (4), 2.28 (3.5)

Chemistry:

	(1)	(2)
TeO_2	67.54	66.74
SeO_2	0.03	
Sb_2O_3	1.12	
FeO	0.08	
CuO	33.42	33.26
PbO	0.62	
Ag_2O	0.26	
Total	103.07	100.00

(1) Russia; by electron microprobe, calculated from average of three elemental analyses; corresponding to $(Cu_{1.01}Ag_{0.01}Pb_{0.01})_{\Sigma=1.03}(Te_{1.02}Sb_{0.02})_{\Sigma=1.04}O_{2.93}$. (2) $CuTeO_3$.

Occurrence: A rare mineral formed in the oxidation zone as an alteration product of Cu–Te sulfides.

Association: Tetrahedrite, chalcopyrite, tellurite, bilibinskite, bogdanovite, teineite, quartz (Aginsk deposit, Russia).

Distribution: In Russia, from the Pionersk deposit, eastern Sayan, and the Aginsk gold telluride deposit, Kamchatka, Far Eastern Region.

Name: To honor Tat'yana Stepanovna Balyakina (1906–1986), Geology Instructor, Moscow University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80669.

Bambollaite $Cu(Se, Te)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal, pseudocubic. *Point Group:* $4/m$ or $4/m\ 2/m\ 2/m$. Fine granular aggregates and lenses, intimately intermixed with klockmannite.

Physical Properties: *Fracture:* Fine conchoidal. Hardness = n.d. VHN = n.d. D(meas.) = 5.64 (synthetic). D(calc.) = [5.02]

Optical Properties: Opaque. *Color:* In polished section, creamy white. *Anisotropism:* Slight. R_1–R_2: n.d.

Cell Data: *Space Group:* $P4_2/n$ or perhaps $I4_1/amd$. a = 5.466 c = 5.632 Z = [2]

X-ray Powder Pattern: Moctezuma mine, Mexico.
3.19 (100), 1.961 (70), 1.653 (50), 1.931 (40), 1.689 (30), 1.270 (20), 1.121 (20)

Chemistry:

	(1)
Cu	25.1
Se	44.5
Te	31.0
Total	100.6

(1) Synthetic material matching the X-ray powder pattern of the natural mineral; by electron microprobe, corresponding to $Cu_{1.00}(Se_{1.43}Te_{0.62})_{\Sigma=2.05}$.

Occurrence: In oxidized Au–Te ore in subparallel quartz veins in a hydrothermally altered tuff.

Association: Klockmannite, tellurium, selenium, chalcomenite, tellurite, paratellurite, illite, calcite, quartz.

Distribution: In the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico [TL].

Name: For the Spanish nickname "La Bambolla" of the mine where it occurs, which roughly translates into "hot air" in allusion to exaggerated tales of rich gold ore.

Type Material: Royal Ontario Museum, Toronto, Canada, M27177; National Museum of Natural History, Washington, D.C., USA, 128391.

References: (1) Harris, D.C. and E.W. Nuffield (1972) Bambollaite, a new copper telluro-selenide. Can. Mineral., 11, 738–742. (2) (1973) Amer. Mineral., 58, 805 (abs. ref. 1).

Bamfordite $Fe^{3+}Mo_2O_6(OH)_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As tabular, diamond-shaped crystals, to 0.05 mm, showing {001}, {100}, {010}, {110}, {$1\overline{1}0$}, in aggregates.

Physical Properties: *Cleavage:* {100}, traces. *Tenacity:* Compact to friable in aggregates. Hardness = 2–3 D(meas.) = 3.620(8) D(calc.) = 3.616

Optical Properties: Transparent. *Color:* Bright apple-green with slight yellowish tinge. *Streak:* Greenish yellow. *Luster:* Vitreous, earthy in aggregates.
Optical Class: Biaxial (–). *Pleochroism:* Pale to moderate; in yellowish greens. *Orientation:* $Y \simeq$ a; $c \wedge Z' = 7°$; length-slow. $\alpha = 1.91(1)$ $\beta = 2.03(1)$ $\gamma = 2.11(1)$ 2V(meas.) = ∼90° 2V(calc.) = 74°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 5.889(5)$ $b = 7.545(5)$ $c = 9.419(5)$ $\alpha = 71.46(4)°$ $\beta = 83.42(4)°$ $\gamma = 72.78(4)°$ Z = 2

X-ray Powder Pattern: Bamford Hill, Australia.
3.319 (100), 3.232 (90), 5.620 (70), 4.095 (70), 4.711 (50), 2.614 (50), 1.956 (50)

Chemistry:

	(1)	(2)
MoO_3	68.93	69.75
WO_3	1.90	
P_2O_5	0.39	
Fe_2O_3	18.93	19.34
H_2O	9.9	10.91
Total	100.05	100.00

(1) Bamford Hill, Australia; by electron microprobe, H_2O by CHN analyzer; with $(OH)^{1-}$ calculated for charge balance, corresponds to $Fe_{1.00}(Mo_{2.01}W_{0.03}P_{0.02})_{\Sigma=2.06}O_6(OH)_{3.34} \cdot 0.64H_2O$.
(2) $FeMo_2O_6(OH)_3 \cdot H_2O$.

Occurrence: Formed in miarolitic cavities and vugs by oxidation of molybdenite under strongly acidic conditions in a W–Mo–Bi deposit.

Association: W–Mo–Bi oxides, "clay", muscovite, quartz.

Distribution: On Bamford Hill, 85 km west-southwest of Cairns, Queensland, Australia.

Name: For its occurrence on Bamford Hill, Australia.

Type Material: South Australian Museum, Adelaide, 20653; Museum of Victoria, Melbourne, Australia, M7424.

References: (1) Birch, W.D., A. Pring, E.M. McBriar, B.M. Gatehouse, and C.A. McCammon (1998) Bamfordite, $Fe^{3+}Mo_2O_6(OH)_3 \cdot H_2O$, a new hydrated iron molybdenum oxyhydroxide from Queensland, Australia. Amer. Mineral., 83, 172–177.

Banalsite $BaNa_2Al_4Si_4O_{16}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Very rarely showing traces of crystal faces; coarsely crystalline to compact, massive.

Physical Properties: *Cleavage:* Good on {110} and {001}. Hardness = 6.5
D(meas.) = 3.065 D(calc.) = 3.073

Optical Properties: Translucent to transparent in thin flakes. *Color:* White.
Luster: Vitreous, pearly on cleavage.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. $\alpha = 1.5695$ $\beta = 1.5710$
$\gamma = 1.5775$ 2V(meas.) = 41(3)°

Cell Data: *Space Group: Ibam.* $a = 8.496(2)$ $b = 9.983(2)$ $c = 16.755(3)$ Z = 4

X-ray Powder Pattern: Benallt mine, Wales; close to stronalsite.
3.53 (100), 5.20 (90), 8.50 (80), 3.21 (80), 2.90 (80), 2.09 (80), 3.77 (70)

Chemistry:

	(1)	(2)
SiO_2	34.74	36.44
Al_2O_3	31.20	30.92

Total	99.94	100.00

(1) Benallt mine, Wales. (2) $BaNa_2Al_4Si_4O_{16}$.

Mineral Group: Feldspar group.

Occurrence: In veinlets through manganese ore and in lenses in metamorphosed mudstone (Benallt mine, Wales).

Association: Tephroite, alleghanyite, jacobsite, barite, calcite (Benallt mine, Wales).

Distribution: In the Benallt mine, Rhiw, Lleyn Peninsula, Wales. At Långban, Värmland, Sweden. From the Kalahari manganese field, Cape Province, South Africa.

Name: Derived from the chemical symbols for the major constituents, *Ba, Na, Al, Si.*

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1944,420–423; Harvard University, Cambridge, Massachusetts, 108656; National Museum of Natural History, Washington, D.C., USA, 105854.

Bandylite $CuB(OH)_4Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As crystals, typically tabular on {001} or pyramidal, to 5 mm; dominant forms are {001}, {111}, {201}, and {110}; also as radial clusters, almost lichenlike, in joints in the rock.

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Very flexible; easily deformed. Hardness = 2.5 D(meas.) = 2.810 D(calc.) = 2.81 Soluble in H_2O; alters to eriochalcite on exposure to air.

Optical Properties: Transparent. *Color:* Deep blue with greenish portions; cendre blue to Italian blue, becoming greener with atacamite inclusions; blue in transmitted light. *Streak:* Pale blue. *Luster:* Vitreous, pearly on cleavage surfaces; dull when altered.
Optical Class: Uniaxial (–). *Pleochroism:* Strong; O = deep cendre blue; E = pale greenish yellow. $\omega = 1.691–1.692$ $\epsilon = 1.640–1.641$

Cell Data: *Space Group:* $P4/n$. $a = 6.19$ $c = 5.61$ Z = 2

X-ray Powder Pattern: Quetena, Chile.
5.59 (10), 3.08 (8), 2.54 (8), 1.952 (7), 4.35 (6), 1.655 (6), 4.13 (5.5)

Chemistry:

	(1)	(2)
Cu	34.94	35.73

SO_3	0.05	
insol.	1.84	
Total	100.10	100.00

(1) Quetena, Chile. (2) $CuB(OH)_4Cl$.

Occurrence: Of secondary origin, in a leached zone above massive iron sulfates (Quetena, Chile).

Association: Atacamite, eriochalcite (Quetena, Chile); starkeyite (near Taltal, Chile).

Distribution: In Chile, from Quetena, west of Calama, and near Taltal, Antofagasta.

Name: For Dr. Mark Chance Bandy (1900–1963), American mining engineer, mineralogist, and mineral collector, who first collected the mineral.

Type Material: Harvard University, Cambridge, Massachusetts, 94625, 97381; National Museum of Natural History, Washington, D.C., USA, C5459.

Bannermanite $(Na, K)_x V_x^{4+} V_{6-x}^{5+} O_{15}$ (x = 0.7)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As incrustations of subhedral to euhedral lathlike crystals, flattened on {001} and elongated along [010], up to 250 μm.

Physical Properties: *Cleavage:* {100}, perfect; {010}, fair. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = 3.5(2) D(calc.) = 3.55

Optical Properties: Opaque, transparent on thin edges. *Color:* Black; light brown on thin edges in transmitted light. *Streak:* Dark gray-black. *Luster:* Submetallic. *Optical Class:* Biaxial. *Orientation:* [010] $\parallel$ Y or Z; length-slow. *Absorption:* $Y > X$ or $Z > X$. n = [2.2] (rule of Gladstone and Dale).

Cell Data: *Space Group:* $C2/m$. $a = 15.413(7)$ $b = 3.615(2)$ $c = 10.066(8)$ $\beta = 109.29(8)^\circ$ Z = 2

X-ray Powder Pattern: Izalco volcano, El Salvador. (ICDD 35-713).
7.24 (100), 3.367 (100), 3.068 (80), 2.911 (80), 9.47 (70), 3.491 (70), 2.725 (60)

Chemistry:

	(1)
V_2O_5	95.98
Na_2O	3.03
K_2O	1.26
Total	100.27

(1) Izalco volcano, El Salvador; by electron microprobe, average of six analyses, V^{4+}:V^{5+} from charge balance; corresponds to $(Na_{0.56}K_{0.15})_{\Sigma=0.71}V_{0.71}^{4+}V_{5.29}^{5+}O_{15}$.

Occurrence: In vanadium-bearing sublimates in fumaroles on a basaltic volcanic cone.

Association: Shcherbinaite, stoiberite, ziesite, fingerite, chalcocyanite, chalcanthite.

Distribution: From Izalco volcano, El Salvador.

Name: To honor Dr. Harold MacColl Bannerman (1897–1976), American economic geologist, U.S. Geological Survey and Dartmouth College, Hanover, New Hampshire, USA.

Type Material: Department of Earth Sciences, Dartmouth College, Hanover, New Hampshire; Harvard University, Cambridge, Massachusetts, 126482; National Museum of Natural History, Washington, D.C., USA, 148832, 160385.

(1) Baiyun-Obo mine, China; corresponds to $(Ba_{3.82}Ca_{0.11})_{\Sigma=3.93}(Ti_{5.84}Nb_{1.35}Fe_{0.60}Al_{0.18})_{\Sigma=7.97}(Si_{3.68}Al_{0.32})_{\Sigma=4.00}O_{28}Cl_{0.88}$. (2) Šebkovice, Czech Republic; by electron microprobe, corresponding to $(Ba_{4.00}Ca_{0.06})_{\Sigma=4.06}(Ti_{7.91}Fe_{0.04}Al_{0.02}Nb_{0.01})_{\Sigma=7.98}(Si_{3.99}Al_{0.01})_{\Sigma=4.00}O_{28}Cl_{0.73}$.

Occurrence: In quartz veins cutting quartzite near alkalic granite and syenite (Baiyun-Obo mine, China); in a carbonate vein cutting "hornblende" gneiss intruded by diabase sills and small pegmatites (Ravalli Co., Montana, USA).

Association: Quartz, calcite, aegirine, galena, pyrite, alkalic amphiboles (Baiyun-Obo mine, China); calcite, dolomite, ancylite, aeschynite, monazite, sodic amphiboles, barite (Ravalli Co., Montana, USA); benitoite, bario-orthojoaquinite, fresnoite, natrolite (Gem mine, California, USA).

Distribution: In China, from the Baiyun-Obo mine, near Pao-t'ou, Inner Mongolia. In the USA, on Sheep Creek, Ravalli Co., Montana, and at the Gem mine, San Benito Co., California. From Šebkovice, Czech Republic. At Karlstein and Jarolden, Waldviertel region, Austria. In the Garaoulère mine, Pierrefitte, Hautes-Pyrénées, France.

Name: For the locality, Pao-t'ou (Baotou in Russian), China.

Type Material: National School of Mines, Paris, France.

Barartite $(NH_4)_2SiF_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Minute crystals, flattened on {0001}, may be elongated ⊥ [0001]. Arborescent, mammillary; commonly included within cryptohalite. *Twinning:* Dartlike or paddlewheel twins, with twin plane inclined to {0001}.

Physical Properties: *Cleavage:* Perfect on {0001}. Hardness = ∼2.5 D(meas.) = 2.152 (synthetic). D(calc.) = 2.144 Soluble in H_2O, with a saline taste.

Optical Properties: Transparent. *Color:* White; colorless in thin section. *Luster:* Vitreous. *Optical Class:* Uniaxial (–). $\omega = 1.406(1)$ $\epsilon = 1.391(3)$

Cell Data: *Space Group:* $C\overline{3}m$ (synthetic). $a = 5.77$ $c = 4.78$ Z = 1

X-ray Powder Pattern: Kehley's Run mine, Pennsylvania, USA.
4.84 (100), 2.42 (45), 2.09 (40), 2.22 (35), 3.45 (30), 5.00 (20), 4.20 (20)

Chemistry: Analyses of natural material have not been made.

Polymorphism & Series: Dimorphous with cryptohalite, the higher-temperature form.

Occurrence: Above a burning coal seam (Barari, India); a sublimation product at fumaroles (Vesuvius, Italy); a sublimation product in burning anthracite piles (Pennsylvania, USA).

Association: Cryptohalite, sal ammoniac, sulfur.

Distribution: In India, at the Bararee colliery, Barari, Jharia coalfield, West Bengal. From Vesuvius, Campania, Italy. In the Clara mine, near Oberwolfach, Black Forest, Germany. From the Kehley's Run mine, Shenandoah, Schuylkill Co., Pennsylvania, USA.

Name: For the occurrence at Barari, India, from which it was first characterized.

Type Material: n.d.

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals rare, pseudohexagonal, tabular to platy on {001}, typically elongated along [010] or [100], to 300 μm; commonly in globular aggregates, to 2 mm.

Physical Properties: Hardness = n.d. VHN = 13.0–15.4, 14.2 average (25 g load). D(meas.) = 1.89(3) D(calc.) = 1.90 Very soluble in H_2O; decomposes in humid air.

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial, (+) or (–). n = [1.3081] 2V(meas.) = 90(2)°

Cell Data: *Space Group: Pnma.* $a = 9.0615(7)$ $b = 5.6727(6)$ $c = 7.2672(6)$ Z = 4

X-ray Powder Pattern: Vulcano, Italy.
3.183 (100), 3.540 (90), 2.898 (80), 4.472 (75), 2.163 (70), 2.536 (65), 2.282 (65)

Chemistry:

	(1)	(2)
Na	0.4	
K	2.2	
NH_4	16.6	17.21
BF_4	79.8	82.79
F	0.3	
Cl	0.6	
Br	0.1	
Total	100.0	100.00

(1) Vulcano, Italy; by ion chromatography, after deduction of some NH_4, F, Cl, and Br as sal ammoniac, corresponds to $[(NH_4)_{0.96}K_{0.06}Na_{0.02}]_{\Sigma=1.04}BF_4$. (2) NH_4BF_4.

Occurrence: Formed by fumarolic activity, stable at ground temperatures between 200 °C and 600 °C.

Association: Malladrite, realgar, bismuthinite, cannizzarite, galenobismuthite, sphalerite, sulfur, sal ammoniac, sassolite.

Distribution: From the Fossa crater, Vulcano, Lipari Islands, Italy.

Name: To honor Franco Barberi, Professor of Vulcanology, University of Pisa, Pisa, Italy, who promoted studies of Vulcano.

Type Material: Bari University, Bari, Italy (4/nm).

References: (1) Garavelli, A. and F. Vurro (1994) Barberiite, NH_4BF_4, a new mineral from Vulcano, Aeolian Islands, Italy. Amer. Mineral., 79, 381–384. (2) Caron, A.P. and J.L. Barbertonite $Mg_6Cr_2(CO_3)(OH)_{16}\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As plates, flattened on {0001}, in fibrous matted masses, and as cross-fiber veinlets.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Flexible but not elastic. Hardness = 1.5–2 D(meas.) = 2.10(5) D(calc.) = 2.11 Greasy feel.

Optical Properties: Transparent. *Color:* Intense violet to rose-pink; violet to pale rose-pink in transmitted light. *Streak:* Very pale violet to white. *Luster:* Waxy to pearly. *Optical Class:* Uniaxial (–); may be biaxial due to strain. *Pleochroism:* Weak; O = dark rose-pink to violet; E = pale rose-pink to violet. $\omega = 1.557(3)$ $\epsilon = 1.529(3)$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. $a = 6.17$ $c = 15.52$ Z = 1

X-ray Powder Pattern: n.d.

Chemistry: Intimately intermixed with stichtite; analyses of pure material are therefore lacking. The species is supported by X-ray diffraction patterns showing group membership.

Polymorphism & Series: Dimorphous with stichtite.

Mineral Group: Manasseite group.

Occurrence: An alteration product of chromite in serpentinite.

Association: Stichtite, chromite, antigorite.

Distribution: From the Kaapsehoop asbestos mine, Kaapse Hoop, Barberton district, Transvaal, South Africa. In the Adelaide Ag–Pb mine, Dundas, Tasmania, Australia. At Hoo Field, Cunningsburgh, Shetland Islands, Scotland.

Name: For the Barberton district, South Africa, where it was first found.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 92549.

Barbosalite $Fe^{2+}Fe_2^{3+}(PO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudotetragonal. *Point Group:* $2/m$. As stout prismatic to pseudocubic crystals, may have a mosaic texture, to 0.25 mm; generally as microcrystalline to powdery coatings. *Twinning:* Contact twins with (001) as composition surface.

Physical Properties: Hardness = 6 D(meas.) = 3.60–3.62 D(calc.) = 3.71

Optical Properties: Translucent to nearly opaque. *Color:* Dark blue, blue-green. *Streak:* Dark blue. *Luster:* Vitreous to earthy. *Optical Class:* Biaxial (+). *Pleochroism:* $X = Y$ = dark blue-green; Z = dark olive-green. *Dispersion:* $r > v$, strong. *Absorption:* Strong; $X = Y > Z$. $\alpha = 1.76$–1.78 $\beta = 1.77$–1.81 $\gamma = 1.835$–1.84 2V(meas.) = 64°.

Cell Data: *Space Group:* $P2_1/c$. $a = 7.25$ $b = 7.46$ $c = 7.49$ $\beta = 120°15'$ Z = 2

X-ray Powder Pattern: Sapucaia mine, Brazil.
3.361 (10), 3.313 (8), 4.84 (6), 3.239 (6), 3.160 (6), 2.327 (4), 1.309 (4)

Chemistry:

	(1)	(2)
Fe_2O_3	40.92	40.79
FeO	18.38	18.35
MnO	0.30	
P_2O_5	36.07	36.26
H_2O	[4.33]	4.60
Total	[100.00]	100.00

(1) Criminoso mine, Brazil; by electron microprobe, Fe^{2+}:Fe^{3+} from stoichiometry, H_2O by difference. (2) $Fe^{2+}Fe_2^{3+}(PO_4)_2(OH)_2$.

Mineral Group: Lazulite group.

Mineral Group: Dimorphous with lipscombite.

Occurrence: In complex granitic pegmatites, formed by oxidation and hydration of primary phosphates.

Association: Tavorite, huréaulite, heterosite, triphylite, vivianite, roscherite, rockbridgeite.

Distribution: In Brazil, in Minas Gerais, at the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, and in good crystals from the Criminoso pegmatite mine, about 35 km north of São Jose da Safira, Agua Boa. In the USA, at the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from the Bull Moose and Tip Top mines, near Custer, Custer Co., South Dakota; at the Williams pegmatite, Coosa Co., Alabama. In Australia, from Wilson's quarry, Thackaringa district, 40 km southwest of Broken Hill, New South Wales, and in the Wiperaminga Hill West quarry, Boolcoomata, South Australia. From the Buranga pegmatite, near Gatumba, Rwanda. At the Angarf-Sud pegmatite, Tazenakht Plain, Morocco. In the Mangualde pegmatite, near Mesquitela, Portugal.

Name: Honors Aluizio Licinio de Miranda Barbosa (1916–), Professor of Geology, School of Mines, Ouro Preto, Brazil.

Type Material: National Museum, Rio de Janeiro, Brazil; The Natural History Museum, London, England, 1965,209; National Museum of Natural History, Washington, D.C., USA, 106842.

Barentsite $H_2Na_7Al(CO_3)_4F_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudohexagonal. *Point Group:* $\overline{1}$ or 1. Granular, to 5 mm.

Physical Properties: *Cleavage:* {001} and {110}, perfect. *Tenacity:* Brittle. Hardness = 3 VHN = 86–172, 100–165 averages. D(meas.) = 2.56 D(calc.) = 2.55 Alters surficially to a white powder in air; slowly decomposed by H_2O.

Optical Properties: Transparent. *Color:* Colorless if fresh. *Luster:* Vitreous, pearly on cleavages; dull when altered.
Optical Class: Biaxial (–). *Orientation:* $X \simeq \{001\}$; $X \wedge a \simeq 45°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.358(2)$ $\beta = 1.479(2)$ $\gamma = 1.530(2)$ 2V(meas.) = 62°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 6.472(2)$ $b = 6.735(2)$ $c = 8.806(2)$
$\alpha = 92.50(2)°$ $\beta = 97.33(2)°$ $\gamma = 119.32(2)°$ Z = 1

X-ray Powder Pattern: Mt. Restin'yun, Kola Peninsula, Russia.
2.778 (100), 2.658 (100), 2.887 (84), 2.169 (70), 2.316 (50), 1.870 (42), 2.543 (30)

Chemistry:

	(1)	(2)
CO_2	31.45	34.79
Al_2O_3	10.5	10.08
Na_2O	44.1	42.87
F	14.0	15.02
H_2O	3.59	3.56
$-O = F_2$	5.9	6.32
Total	97.74	100.00

(1) Mt. Restin'yun, Kola Peninsula, Russia; by electron microprobe, average of three analyses, H_2O and CO_3 by microchemical methods; CO_3^{2-} and $(OH)^{1-}$ confirmed by IR; corresponds to $H_{1.96}Na_{6.99}Al_{1.01}(CO_3)_{3.51}F_{3.62}$. (2) $H_2Na_7Al(CO_3)_4F_4$.

Occurrence: Rare in hydrothermal veinlets in alkalic pegmatites in a differentiated alkalic massif.

Association: Shortite, villiaumite, cryolite, neighborite, bonshtedtite, natrite, albite.

Distribution: From Mt. Restin'yun, Khibiny massif, Kola Peninsula, Russia.

Name: To honor Willem Barents (1550–1597), the famous Dutch seafarer, for whom the Barents Sea, northeast of the Kola Peninsula, was named.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity; Mining Institute, St. Petersburg, 2046/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82753.

Bariandite $Al_3(V^{5+},V^{4+})_{40}O_{100}\cdot 45H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* m or $2/m$. Crystals elongated ‖ [010], forming fibers, platy on {001}, to 3 mm; in sheeted aggregates of parallel fibers, such layers sometimes stacked.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = n.d. D(meas.) = ∼2.7 D(calc.) = 2.50

Optical Properties: Nearly opaque. *Color:* Black to dark green; in reflected light shows green internal reflections.
Optical Class: Biaxial. *Pleochroism:* Greenish brown ‖ [010], bottle-green ⊥ [010] in transmitted light; strong in brownish gray under reflected light. $n = > 1.85$ 2V(meas.) = n.d.

Cell Data: *Space Group:* Cc or $C2/c$. $a = 11.70(3)$ $b = 3.63(1)$ $c = 20.06(5)$ $\beta = 101°30(20)'$ Z = 2

X-ray Powder Pattern: Mounana mine, Gabon.
14.20 (FFF), 3.480 (F), 3.430 (F), 5.72 (mF), 2.852 (mF), 1.939 (mF), 1.827 (mF)

Chemistry:

	(1)
V_2O_5	63.26
V_2O_4	14.19
Al_2O_3	3.75
Fe_2O_3	0.17
H_2O	18.11
Total	[99.48]

(1) Mounana mine, Gabon; original total given as 100.08%; corresponds to $Al_{0.68}[(V^{5+},V^{4+})_{7.90}Fe^{3+}_{0.02}]_{\Sigma=7.92}O_{20}\cdot 9.14H_2O$.

Occurrence: In the oxidation zone of a uranium mineral deposit (Mounana mine, Gabon); in the oxidation zone of a vanadium deposit (Minasragra, Peru).

Association: Duttonite, lenoblite (Mounana mine, Gabon); roscoelite, gypsum (Minasragra, Peru).

Distribution: From the Mounana uranium mine, Franceville, Gabon. At Minasragra, 46 km from Cerro de Pasco, Peru.

Name: To honor Dr. Pierre Bariand (1933–), Curator of Mineralogy, University of Paris, Paris, France.

Type Material: National School of Mines, Paris, France; The Natural History Museum, London, England, 1970,151.

(1) Yukon Territory, Canada; Fe^{2+}:Fe^{3+} = 7.98:1 by TGA, H_2O by TGA; corresponding to $(Mg_{1.64}Fe^{2+}_{1.21}Fe^{3+}_{0.15})_{\Sigma=3.00}(PO_4)_2(OH)_{0.15} \cdot 7.85H_2O$. (2) Marlborough Province, New Zealand; Fe^{2+}:Fe^{3+} from (1); correcting from average of three microprobe analyses for Mn and Ca, then corresponding to $(Mg_{2.04}Fe^{2+}_{0.86}Mn_{0.21}Ca_{0.04}Fe^{3+}_{0.01})_{\Sigma=3.16}(PO_4)_{2.04} \cdot 7.90H_2O$. (3) $(Mg, Fe^{2+})_3(PO_4)_2 \cdot 8H_2O$ with Mg:Fe^{2+} = 1:1.

Mineral Group: Vivianite group.

Occurrence: As fracture fillings in sideritic iron formation (Yukon Territory, Canada); as a folded ribbonlike mass in sediment from a raised beach (Marlborough Province, New Zealand).

Association: Siderite, vivianite, lazulite, whiteite, collinsite, childrenite, quartz (Yukon Territory, Canada).

Distribution: From the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In Marlborough Province, New Zealand.

Name: Honors Dr. Ljudevit Barić, former Director of the Mineralogical Museum and Professor of Mineralogy, University of Zagreb, Zagreb, Croatia.

Type Material: Mineralogical and Petrological Musuem, Zagreb, Croatia; Royal Ontario Museum, Toronto, Canada, M34169, M35430; National Museum of Natural History, Washington, D.C., USA, 135698, 137303, 145736.

Bari-olgite $Ba(Na,Sr,REE)_2Na[PO_4]_2$

Crystal Data: Hexagonal. *Point Group:3*. As irregular, equant or flattened crystals, sometimes with a hexagonal outline, to 1.5 cm. Dominant forms are trigonal prisms.

{100}, {$\bar{1}$ 00} and trigonal pyramids {101}, {$\bar{1}$ 01}, {10$\bar{1}$ }, {$\bar{1}$ 0$\bar{1}$ }. Resembles quartz.

Physical Properties: *Cleavage:* Imperfect on (00*l*) and (*hk*0). *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4.5-5 D(meas.) = 3.986 D(calc.) = 4.000
Fluoresces bright pink-orange in SW UV and weak pink-red in LW UV.

Optical Properties: Transparent. *Color:* Light green, colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (-). ε = 1.623(3) ω = 1.628(2) *Pleochroism:* None.

Cell Data: Space Group: *P3*. *a* = 5.541(2) *c* = 7.020(3) Z = 1

X-ray Powder Pattern: Palitra (Palette) pegmatite, Kola Peninsula, Russia.
2.839 (100), 2.774 (100), 3.964 (60), 1.984 (40), 1.611 (26), 7.044 (22), 2.344 (20)

(1) Palitra (Palette) pegmatite, Kola Peninsula, Russia; electron microprobe analysis, corresponding to $(Na_{2.14}K_{0.08}Ca_{0.03}Mn_{0.02}Sr_{0.72}Ba_{0.91}La_{0.07}Ce_{0.05})_{\Sigma=4.02}P_{2.01}O_8$.

Polymorphism & Series: Forms a series with olgite.

Occurrence: A late-stage crystallization product of a dry melt supersaturated in Na and F at temperatures of 300-350° C.

Association: Intermixed with manaksite, natrosilite, villiaumite; also aegirine, analcime, chkalovite, natrolite, serandite, sodalite, ussingite, vuonnemite.

Distribution: At the Palitra (Palette) pegmatite, Mt. Kedykverpakhk, Lovozero alkaline massif, Kola Peninsula, Russia.

Name: Reflects the dominant presence of BARI um in the composition and the relation to *olgite*.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Science, Moscow, Russia; 2908/1.

(1) Chi-Chico, Brazil; after deduction of microlite 3.68%, tantalite 0.26%, cassiterite 0.12%, quartz, and feldspar (with thallium considered a contaminant introduced during separation), corresponds to $(Ba,Fe,U,...)_{\Sigma=0.31}(Ta,Nb,Ti,Sn)_{\Sigma=2.00}O_{5.32}(H_2O)_2$.

Mineral Group: Pyrochlore group, microlite subgroup; $Ba_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: In a concentrate from alluvium derived from a pegmatite.

Association: Microlite, tantalite, cassiterite, quartz, feldspar.

Distribution: Found at Chi-Chico, São João del Rei, Minas Gerais, Brazil.

Name: Assigned by the IMA Committee on pyrochlore nomenclature for the predominant *barium* content and relation to *microlite* in the pyrochlore group.

Type Material: n.d.

Bario-orthojoaquinite $(Ba,Sr)_4Fe^{2+}_2Ti_2Si_8O_{26}\cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As pseudotetragonal crystals, steep dipyramidal {111} and truncated by {001}, to 8 mm; pyramidal faces are curved and striated; as aggregates.

Physical Properties: *Cleavage:* {001}, good. Hardness = 5.5 D(meas.) = 3.96 D(calc.) = 3.96

Optical Properties: Transparent to translucent. *Color:* Yellow-brown. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = very pale yellow; Y = pale yellow; Z = yellow. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Dispersion:* $r > v$, strong. *Absorption:* $Z \gg Y > X$.
$\alpha = 1.735$ $\beta = 1.737$ $\gamma = 1.800$ 2V(meas.) = 10°–15°

Cell Data: *Space Group:* $Ccmm$, $Cc2m$, or $Ccm2$. $a = 10.477(5)$ $b = 9.599(1)$ $c = 22.59(1)$ Z = [4]

X-ray Powder Pattern: Gem mine, California, USA.
2.997 (100), 2.953 (95), 2.824 (90), 5.64 (70), 2.935 (70), 4.30 (62), 3.203 (50)

Chemistry:

	(1)
SiO_2	35.15
TiO_2	11.33
Al_2O_3	0.57
RE_2O_3	0.00
FeO	9.47
MnO	0.62
CaO	0.17
SrO	3.34
BaO	38.56
Na_2O	0.12
H_2O	1.3
Total	100.63

(1) Gem mine, California, USA; by electron microprobe, corresponds to $(Ba_{3.44}Sr_{0.44}Al_{0.15}Ca_{0.04})_{\Sigma=4.07}(Fe^{2+}_{1.80}Mn_{0.12}Na_{0.05})_{\Sigma=1.97}(Ti_{1.94}Al_{0.06})_{\Sigma=2.00}Si_{8.00}O_{26}\cdot 0.93H_2O$.

Mineral Group: Joaquinite group.

Occurrence: In a block of highly fractured basalt subjected to high-pressure metamorphism and serpentinization.

Association: Benitoite, baotite, fresnoite, natrolite.

Distribution: At the Gem mine, San Benito Co., California, USA.

Name: For its BARIum content, ORTHOrhombic symmetry, and membership in the *joaquinite* group.

Type Material: University of California, Santa Barbara, California; Harvard University, Cambridge, Massachusetts, 119525; National Museum of Natural History, Washington, D.C., USA, 149428.

References: (1) Wise, W.S. (1982) Strontiojoaquinite and bario-orthojoaquinite: two new members of the joaquinite group. Amer. Mineral., 67, 809–816.

Bariopharmacoalumite $Ba_{0.5}Al_4(AsO_4)_3(OH)_4 \cdot 4H_2O$

Crystal Data: Isometric. *Point Group:* $\bar{4}$ 3*m*. As encrustations of isolated or interpenetrating cubes, to 0.5 mm.

Physical Properties: *Cleavage:* Imperfect, {001}. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3.5 VHN = 165-327 (245.75 mN load). D(meas.) = n.d. D(calc.) = 2.580

Optical Properties: Transparent to translucent. *Color:* Colorless to pale yellow, deep blue internal reflections in reflected light. *Streak:* White.
Luster: Adamantine.
Optical Class: Isotropic. *n* = [1.573]

Cell Data: *Space Group: P*$\bar{4}$ 3*m.* *a* = 7.742(4) *Z* = 1

X-ray Powder Pattern: Cap Garonne, Var, France.
7.759 (100), 5.485 (27), 3.878 (27), 4.454 (18), 3.159 (16), 2.738 (16), 3.456 (14)

Chemistry:

	(1)
K_2O	0.07
BaO	11.35
CuO	0.35

H_2O	14.58
Total	101.71

(1) Cap Garonne, Var, France; average of 16 electron microprobe analyses, H_2O and OH^- confirmed by crystal structure analysis, corresponding to $(Ba_{0.54}Cu_{0.03}K_{0.01})_{\Sigma=0.58}(Al_{3.99}Fe_{0.02})_{\Sigma=4.01}(AsO_4)_{3.00}(OH)_{3.85}O_{0.15} \cdot 4H_2O$.

Group & Series: Pharmacosiderite supergroup; pharmacoalumite group.

Occurrence: A secondary mineral coating fractures and cavities in tetrahedrite-tennantite bearing rocks undergoing near-surface weathering.

Association: Mansfieldite, philipsbornite, beudantite, carminite, duftite, mimetite, scorodite, olivenite, arsentsumebite, lavendulan, foretite (Cap Garonne mines, France); bariopharmacosiderite, quartz, chalcedony, goethite (Mina Grande, Chile).

Distribution: From the Cap Garonne mines, near Le Pradet, Var, France; at Mina Grande, Chile; from the Gambatesa mine, Val Graveglia, Liguria, Italy.

Name: Recognizes the species as the barium dominant analogue of *pharmacoalumite*.

Type Material: Natural History Museum, London, England (BM 2010,82).

References: (1) Mills, S.J., M.S. Rumsey, G. Favreau, J. Spratt, M. Raudsepp, and M. Dini (2011) Bariopharmacoalumite, a new mineral species from Cap Garonne, France, and Mina Grande, Chile. Mineral. Mag., 75, 135–144. (2) (2013) Amer. Mineral., 98, 279-280 (abs. ref. 1).

Bariopyrochlore $(Ba,Sr)_2(Nb,Ti)_2(O,OH)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As crude to anhedral crystals, to 1 mm, showing cube and octahedron faces; granular, porous due to alteration or recrystallization.

Physical Properties: *Cleavage:* {111}, very poor. *Fracture:* Conchoidal. *Tenacity:* [Brittle] (by analogy to the pyrochlore group). Hardness = 4.5–5 VHN = 550 (100 g load). D(meas.) = 3.85–4.15 D(calc.) = 4.01

Optical Properties: Translucent to opaque with inclusions. *Color:* Yellowish gray, light olive-gray to very pale orange; white with many fine, colorless inclusions; internal reflections are colorless to white, occasionally brownish to reddish. *Luster:* [Vitreous to resinous.] *Optical Class:* Isotropic. n = 2.07–2.11

Cell Data: *Space Group:* $Fd3m$. a = 10.562(6) Z = 8

(1) Panda Hill, Tanzania; by spectrographic methods, Na and K by flame photometry, H_2O by the Penfield method; then corrected for zircon 0.42%, phlogopite 0.27%, orthoclase 0.42%, apatite 0.92%, cassiterite 0.32%, quartz 0.33%, rutile 0.15%, CuO 0.01%, PbO 0.01%, and CO_2 0.01%; corresponds to $(Ba_{0.30}Sr_{0.22}Ca_{0.05}Ce_{0.04}Na_{0.03}Fe_{0.02}K_{0.01}Th_{0.01})_{\Sigma=0.68}(Nb_{1.83}Ti_{0.17})_{\Sigma=2.00}O_{5.61}(H_2O)_{0.80}$. (2) Mrima Hill, Kenya; H_2O by loss on ignition; after deduction of gorceixite 9.8%, barite 0.6%, quartz 1.1%, hematite 1.0%, Al_2O_3 0.2%, corresponds to $(Ba_{0.36}Ca_{0.09}Mg_{0.05}Ce_{0.05}Na_{0.03}K_{0.02}Th_{0.01})_{\Sigma=0.61}(Nb_{1.78}Ti_{0.21}Ta_{0.01})_{\Sigma=2.00}O_{5.52}(H_2O)_{1.64}$.

Mineral Group: Pyrochlore group and subgroup; $Ba_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: At the contact zone of a highly weathered, biotite-rich rock in a roof pendant in a carbonatite (Panda Hill, Tanzania); in weathered carbonatite (Araxá,Brazil); in an alkalic aegerine-albite-microcline metasomatite in nepheline syenite (Stettin, Wisconsin, USA).

Association: Biotite, kaolinized feldspar, fluorite, quartz, apatite, zircon, chlorite, plagioclase, rutile, hematite, "limonite" (Panda Hill, Tanzania); aegirine, zircon (Wisconsin, USA).

Distribution: From the Mbeya carbonatite, Panda Hill, near Mbeya, Tanzania. In the Mrima Hill carbonatite, Kenya. From the Bingo deposit, Kivu Province, Congo (Zaire). In a deposit of several hundred million tons at Araxá, Minas Gerais, and in the Catalão II carbonatite, Goiás, Brazil. From Dehnel's pit, Stettin, Marathon Co., Wisconsin, USA. At an undefined locality in Primorskiy Kray, Russia. Known from a few other carbonatites.

Name: Assigned by the IMA Committee on pyrochlore nomenclature for the predominant *barium* content and membership in the *pyrochlore* group.

Type Material: n.d.

(1) Yukon Territory, Canada; Fe^{2+}:Fe^{3+} = 7.98:1 by TGA, H_2O by TGA; corresponding to $(Mg_{1.64}Fe^{2+}_{1.21}Fe^{3+}_{0.15})_{\Sigma=3.00}(PO_4)_2(OH)_{0.15} \cdot 7.85H_2O$. (2) Marlborough Province, New Zealand; Fe^{2+}:Fe^{3+} from (1); correcting from average of three microprobe analyses for Mn and Ca, then corresponding to $(Mg_{2.04}Fe^{2+}_{0.86}Mn_{0.21}Ca_{0.04}Fe^{3+}_{0.01})_{\Sigma=3.16}(PO_4)_{2.04} \cdot 7.90H_2O$. (3) $(Mg, Fe^{2+})_3(PO_4)_2 \cdot 8H_2O$ with Mg:Fe^{2+} = 1:1.

Mineral Group: Vivianite group.

Occurrence: As fracture fillings in sideritic iron formation (Yukon Territory, Canada); as a folded ribbonlike mass in sediment from a raised beach (Marlborough Province, New Zealand).

Association: Siderite, vivianite, lazulite, whiteite, collinsite, childrenite, quartz (Yukon Territory, Canada).

Distribution: From the Big Fish River–Rapid Creek area, Yukon Territory, Canada. In Marlborough Province, New Zealand.

Name: Honors Dr. Ljudevit Barić, former Director of the Mineralogical Museum and Professor of Mineralogy, University of Zagreb, Zagreb, Croatia.

Type Material: Mineralogical and Petrological Musuem, Zagreb, Croatia; Royal Ontario Museum, Toronto, Canada, M34169, M35430; National Museum of Natural History, Washington, D.C., USA, 135698, 137303, 145736.

Total	99.63	[100.00]	100.00

(1) Cactus Rat mines, Utah, USA. (2) Kazakhstan; recalculated to 100% after deduction of 9.14% impurities; corresponds to $(Na_{1.13}Ca_{0.45})_{\Sigma=1.58}(V_{5.51}^{5+}V_{0.49}^{4+})_{\Sigma=6.00}[O_{15.55}(OH)_{0.45}]_{\Sigma=16.00}\cdot 2.69H_2O$. (3) $Na_2V_6O_{16}\cdot 3H_2O$.

Occurrence: In small cavities and fractures and as interstitial filling in sandstone in the oxidized zone of a vanadiferous uranium deposit, possibly formed as an oxidation product of hewettite (Cactus Rat mines, Utah, USA); in weathered black schist (Kazakhstan).

Association: Metahewettite, thenardite (Cactus Rat mines, Utah, USA); bokite (The Fish, Nevada, USA); hewettite, metahewettite, jarosite, alunite, gypsum, barite (Kazakhstan).

Distribution: From the Cactus Rat mine group, Yellow Cat district, 24 km southeast of Thompson, Grand Co., Utah and The Fish, Eureka Co., Nevada, USA. In several mines of the Kurumsak and Balasauskandyk districts, northwestern Kara-Tau Mountains, Kazakhstan.

Name: To honor Dr. William H. Barnes (1903–), National Research Council of Canada, Ottawa, Canada, authority on the crystallography of many vanadium minerals.

Type Material: n.d.

Mineral Group: Zeolite group.

Occurrence: On the walls of large fractures in deeply weathered andesitic and rhyolitic lavas.

Association: Heulandite.

Distribution: Found near Capo Pula, below South Efisio Tower, Nora, Sardinia, Italy.

Name: For Richard Maling Barrer (1910–), New Zealand-born British teacher and student of the chemistry of zeolites.

Type Material: University of Modena, Modena, Italy; National Museum of Natural History, Washington, D.C., USA, 128521.

Barringerite $(Fe, Ni)_2P$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{6}m2$. As bands, 10–15 μm wide and several hundred μm long, consisting of individual grains less than 1 μm in diameter, along the contact between schreibersite and troilite.

Physical Properties: Hardness = > 7 VHN = 1097 (20 g load). D(meas.) = n.d. D(calc.) = 6.92

Optical Properties: [Opaque.] *Color:* White, similar to kamacite; bluish compared to schreibersite, in reflected light.
Optical Class: Uniaxial. *Anisotropism:* Noticeable; white to blue.
R: (Slightly higher than that of schreibersite; lower than that of kamacite).

Cell Data: *Space Group:* $P\overline{6}2m$. $a = 5.87(7)$ $c = 3.44(4)$ $Z = 3$

X-ray Powder Pattern: Synthetic Fe_2P.
2.237 (100), 1.28 (100), 1.21 (100), 1.10 (100), 2.048 (95), 1.920 (90), 1.694 (80)

Chemistry:

	(1)	(2)	(3)
Fe	44.3	75.1	76.22
Cr			0.73
Ni	33.9	0.04	2.85
Co	0.25	0.21	
P	21.8	22.8	20.21
Total	100.25	98.15	100.01

(1) Ollague meteorite; average of several analyses by electron microprobe, corresponding to $(Fe_{1.16}Ni_{0.84}Co_{0.01})_{\Sigma=2.01}P$. (2) Y-793274 meteorite; by electron microprobe. (3) China; corresponding to $(Fe_{2.09}Ni_{0.07}Cr_{0.02})_{\Sigma=2.18}P$.

Occurrence: Along the contacts between schreibersite and troilite in a Fe–Ni meteorite (Ollague); as a single grain in a brecciated lunar meteorite of mixed mare and highland origin (Y-793274 meteorite); in the oxidation zone of a platinum-bearing Cu–Ni sulfide deposit (China).

Association: Kamacite, olivine, schreibersite, troilite (Ollague meteorite); plagioclase, glass (Y-793274 meteorite) schreibersite, wüstite, lawrencite (Canyon Diablo meteorite).

Distribution: In the Imilac (Ollague) pallasite meteorite [an extraterrestrial origin has been questioned]. In the Yamato-793274 meteorite, from the Moon. In the Canyon Diablo iron meteorite. Found in an unspecified mineral deposit in China.

Name: To honor Daniel Moreau Barringer (1860–1929), early proponent of the meteor impact origin of Meteor Crater, near Canyon Diablo, Arizona, USA.

Type Material: Nininger collection, Center for Meteorite Studies, Arizona State University, Tempe, Arizona, USA.

Barringtonite $MgCO_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As needles and radiating fibers, to 0.03 mm, in nodular incrustations.

Physical Properties: *Cleavage:* Good on {100}, {010}; on {001}, probable. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.825

Optical Properties: Semitransparent. *Color:* Colorless.
Optical Class: Biaxial (+). *Orientation:* Length-slow. $\alpha = 1.458$ $\beta = 1.473$ $\gamma = 1.501$
2V(meas.) = 68°–80° 2V(calc.) = 73°44′

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 9.155$ $b = 6.202$ $c = 6.092$ $\alpha = 94°00'$ $\beta = 95°32'$ $\gamma = 108°42'$ Z = [4]

X-ray Powder Pattern: Barrington Tops, Australia.
8.682 (vs), 3.093 (vs), 2.936 (vs), 6.087 (s), 5.816 (s), 2.495 (s), 2.309 (s)

Chemistry:

	(1)	(2)	(3)
CO_2	34.8	36.5	36.57
MgO	31.8	33.5	33.49
H_2O	33.4	30.0	29.94
Total	[100.0]	[100.0]	100.00

(1) Barrington Tops, Australia; corresponds to $Mg_{1.00}C_{1.00}O_3 \cdot 2.35H_2O$ (2) Do.; corresponds to $Mg_{1.00}C_{1.00}O_3 \cdot 2.00H_2O$ (3) $MgCO_3 \cdot 2H_2O$.

Occurrence: Formed by leaching of magnesium from olivine basalt under a waterfall by meteoric water.

Association: Nesquehonite.

Distribution: In Australia, under Rainbow Falls, Sempill Creek, Barrington Tops, New South Wales.

Name: For its occurrence near Barrington, Australia.

Type Material: n.d.

Barroisite $[NaCa][(Mg,Fe^{2+})_3Al_2](Si_7Al)O_{22}(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rims on, or cores of, other mixed-species amphibole crystals.

Physical Properties: *Cleavage:* [Perfect on {110}, intersecting at ∼56° and ∼124°; partings on {100}, {001}.] *Tenacity:* [Brittle.] Hardness = [5–6] D(meas.) = n.d. D(calc.) = 3.21

Optical Properties: Semitransparent. *Color:* Green; dark green in thin section.
Luster: [Vitreous.]
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $[C2/m.]$ $a = 9.759(1)$ $b = 17.921(2)$ $c = 5.290(1)$ $\beta = 104.49(1)°$ Z = [2]

(1) Nordfjord, Norway; by electron microprobe, Fe^{2+}:Fe^{3+} by diffraction; corresponds to $Na_{1.04}Ca_{1.10}(Mg_{3.82}Al_{0.70}Fe^{2+}_{0.42}Fe^{3+}_{0.20}K_{0.07}Ti_{0.03})_{\Sigma=5.24}(Si_{7.40}Al_{0.60})_{\Sigma=8.00}O_{22}(OH)_2$. (2) Anglesey, Wales; by electron microprobe, corresponds to $Na_{1.07}Ca_{0.93}(Mg_{1.73}Fe^{2+}_{1.58}Fe^{3+}_{0.86}Al_{0.77}Mn_{0.04}K_{0.04}Ti_{0.02})_{\Sigma=5.04}(Si_{7.21}Al_{0.79})_{\Sigma=8.00}O_{22}(OH)_2$.

Polymorphism & Series: Forms a series with ferro-barroisite.

Mineral Group: Amphibole (sodic-calcic) group: $Mg/(Mg + Fe^{2+}) \geq 0.5$; $(Na + K)_A < 0.5$; $0.67 \quad Na_B \quad 1.33$; $(Ca + Na)_B \geq 1.34$; $Si < 7.5$.

Occurrence: In blueschist facies metamorphic rocks.

Association: Omphacite, glaucophane, crossite, actinolite, calcite.

Distribution: Along Cleary Creek, 20 km north of Fairbanks, and on the northwest side of Kodiak Island, Alaska, USA. In Wales, on Anglesey, near Llanfairpwllgwyngyll. From the Nybö eclogite pod, Nordfjord, Norway.

Name: n.d.

Type Material: n.d.

Barstowite $Pb_4(CO_3)Cl_6 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are elongated, to 2 cm, commonly in subparallel aggregates.

Physical Properties: *Cleavage:* Prismatic, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3 VHN = 108–117, 111 average (100 g load). D(meas.) = 5.71(23) D(calc.) = 5.77

Optical Properties: Transparent to opaque. *Color:* Colorless to white; in reflected light shows abundant colorless internal reflections. *Streak:* White. *Luster:* Adamantine.
Optical Class: [Biaxial.] α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d. *Anisotropism:* Weak to moderate. *Bireflectance:* Moderate, gray to dark gray.
R_1–R_2: (400) 14.2–14.8, (420) 14.0–14.6, (440) 13.8–14.4, (460) 13.7–14.1, (480) 13.4–13.9, (500) 13.2–13.7, (520) 13.1–13.5, (540) 12.9–13.4, (560) 12.8–13.2, (580) 12.7–13.1, (600) 12.6–13.0, (620) 12.5–12.9, (640) 12.5–12.9, (660) 12.4–12.8, (680) 12.3–12.8, (700) 12.3–12.7

Cell Data: *Space Group:* $P2_1/m$. a = 4.2043(8) b = 9.199(2) c = 16.663(3) β = 91.82(1)° Z = 2

X-ray Powder Pattern: Bounds Cliff, England.
4.02 (10), 2.296 (8), 2.377 (6), 4.16 (5), 2.108 (4), 3.79 (3), 3.045 (3)

Chemistry:

	(1)	(2)
CO_2	4.10	3.93
PbO	81.30	79.75
Cl	18.67	19.00
H_2O	1.61	1.61
$-O = Cl_2$	4.21	4.29
Total	101.47	100.00

(1) Bounds Cliff, England; by electron microprobe, Pb and Cl average of three analyses, C and H by CHN analyzer, presence of $(CO_2)^{2-}$ and H_2O confirmed by IR; original elemental analysis here converted to oxides; corresponds to $Pb_{4.02}(CO_3)_{1.03}[Cl_{5.82}(OH)_{0.16}]_{\Sigma=5.98} \cdot 0.90H_2O$.
(2) $Pb_4(CO_3)Cl_6 \cdot H_2O$.

Occurrence: A rare reaction product of sea water with a metal-bearing vein exposed at sea level (Bounds Cliff, England); produced by the action of sea water on lead-bearing slag (Laurium, Greece; Baratti Beach, Italy); a corrosion product of lead object (Mahdia, Tunisia).

Association: Phosgenite, galena, jamesonite, cerussite, pyrite, sphalerite, chalcopyrite, dolomite, quartz (Bounds Cliff, England).

Distribution: From Bounds Cliff, St. Endellion, Cornwall, England. Large crystals at Laurium, Greece, in slag. At Baratti Beach, Tuscany, Italy, in slag. In the Kairakty polymetallic barite deposit, central Kazakhstan. From a shipwreck near Mahdia, Tunisia.

Name: Honors Richard William Barstow (1947–1982), mineral collector and dealer of Cornwall, England.

Type Material: The Natural History Museum, London, England, 1990,25 and E.1353.

FeO	12.1
PbO	34.0
Total	99.8

(1) Tsumeb, Namibia; by electron microprobe, Fe^{2+} valence determined microchemically; corresponding to $Pb_{0.97}Fe^{2+}_{0.99}Ge_{3.02}O_8$.

Occurrence: A very rare mineral in cavities in oxidized primary germanium ore from a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Germanite, reniérite, tennantite, galena.

Distribution: From Tsumeb, Namibia.

Name: For Wolfgang Bartelke (1949–), German mineral collector and specialist in the minerals of Tsumeb, Namibia.

Type Material: University of Stuttgart, Stuttgart, Germany, NM07; National Museum of Natural History, Washington, D.C., USA, 148302.

(1) Långban, Sweden. (2) Franklin, New Jersey, USA. (3) Narssârssuk, Greenland; by electron microprobe, BeO from stoichiometry; corresponds to $Ba_{0.99}Be_{2.00}Si_{2.02}O_{7.03}$.

Polymorphism & Series: Dimorphous with clinobarylite.

Occurrence: In a banded vein in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA); in an “amazonite" pocket (Park Co., Colorado, USA); in narrow veins in chertlike silica and albite in fenitized gneisses (Seal Lake, Canada); in calcite veins cutting amphibole gneisses (Vishnevye Mountains, Russia); in nepheline syenite pegmatite (Narssârssuk, Greenland).

Association: Hedyphane (Långban, Sweden); hedyphane, willemite (Franklin, New Jersey, USA); microcline, barite, fluorite (Park Co., Colorado, USA); eudialyte (Seal Lake, Canada); bastnäsite, aeschynite, barite, strontianite, thorogummite, harmotome, fluorite, quartz (Vishnevye Mountains, Russia).

Distribution: At Långban, Värmland, Sweden. In Norway, on Arø Island, Langesundsfjord, and at Bratthagen, 10 km northwest of Larvik, Lågendal. From Narssârssuk, Greenland. In the USA, at Franklin, Sussex Co., New Jersey, with exceptional crystals from an undisclosed locality in Park Co., Colorado. In Canada, at Seal Lake and Letitia Lake, Labrador, Newfoundland, and Mont Saint-Hilaire, Quebec. In Russia, from the Vishnevy-Ilmen Mountains, Southern Ural Mountains. In the Pokrovo-Kireevsk structure, Kazakhstan.

Name: From the Greek for *heavy*, for its high density.

Total	99.70	99.8	100.00

(1) Franklin, New Jersey, USA. (2) Do.; by electron microprobe. (3) $Pb_8Mn(Si_2O_7)_3$.

Occurrence: In iron ores (Harstigen mine, Sweden); as thin films and veinlets in a metamorphosed zinc orebody (Franklin, New Jersey, USA).

Association: Garnet, willemite, axinite, hardystonite (Franklin, New Jersey, USA).

Distribution: In the Harstigen mine, near Persberg, and Långban and Jakobsberg, Värmland, Sweden. From Franklin, Sussex Co., New Jersey, USA.

Name: From the Greek for *heavy* and for SILicon in its composition.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 114630.

Barite $BaSO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Commonly in well-formed crystals, to 85 cm, with over 70 forms noted. Thin to thick tabular {001}, {210}, {101}, {011}; also prismatic along [001], [100], or [010], equant. As crested to rosettelike aggregates of tabular individuals, concretionary, fibrous, nodular, stalactitic, may be banded; granular, earthy, massive.

Physical Properties: *Cleavage:* {001}, perfect; {210}, less perfect; {010}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 4.50 D(calc.) = 4.47 May be thermoluminescent, may fluoresce and phosphoresce cream to spectral colors under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, yellow, brown, gray, pale shades of red, green, blue, may be zoned, or change color on exposure to light; colorless or faintly tinted in transmitted light. *Streak:* White. *Luster:* Vitreous to resinous, may be pearly. *Optical Class:* Biaxial (+). *Pleochroism:* Weak. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, weak. *Absorption:* $Z > Y > X$. $\alpha = 1.636$ $\beta = 1.637$ $\gamma = 1.648$ 2V(meas.) = 36°–40°

Cell Data: *Space Group: Pnma.* $a = 8.884(2)$ $b = 5.457(3)$ $c = 7.157(2)$ $Z = 4$

X-ray Powder Pattern: Synthetic.
3.445 (100), 3.103 (95), 2.121 (80), 2.106 (75), 3.319 (70), 3.899 (50), 2.836 (50)

Chemistry:

	(1)	(2)
SO_3	34.21	34.30
CaO	0.05	
BaO	65.35	65.70
Total	99.61	100.00

(1) Svárov, Czech Republic. (2) $BaSO_4$.

Polymorphism & Series: Forms a series with celestine.

Mineral Group: Barite group.

Occurrence: A gangue mineral in low-temperature hydrothermal veins; in residual deposits from weathered barite-bearing limestones; an accessory mineral in igneous rocks; in carbonatites; a primary component of submarine volcanogenic massive sulfide deposits and sea-floor chimneys.

Association: Fluorite, calcite, dolomite, rhodochrosite, gypsum, sphalerite, galena, stibnite.

Distribution: The most common barium mineral; many localities, even for fine crystals. From Alston Moor, Frizington, Cleator Moor, and elsewhere in Cumbria, England. At Baia Sprie (Felsőbánya) and Cavnic (Kapnikbánya), Romania. From Příbram, Czech Republic. In Germany, from the Beihilfe mine, near Freiberg, and the Pöhla mine, Schwarzemberg, Saxony; in the Clara mine, near Oberwolfach, Black Forest, and at many other places. In the Rock Candy mine, north of Grand Forks, British Columbia, Canada. In the USA, from the Book Cliffs, near Grand Junction, Mesa Co., at Stoneham, Weld Co., in the Bulldog Mountain mine, Creede District, Mineral Co., and elsewhere in Colorado; at Elk Creek and Box Elder Creek, Meade and Pennington Cos., South Dakota; from Palos Verdes, Los Angeles Co., California; in the Magma mine, Superior, Gila Co., Arizona; very fine crystals from the Miekle mine, Elko Co., Nevada. At the El Solar mine, Taxco, Guerrero, Mexico. Immense crystals from the Elandsrand gold mine, Carletonville, South Africa.

Name: From the Greek for *weight*, in allusion to the high specific gravity.

Barytocalcite $BaCa(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as elongated crystals, short to long prismatic and striated parallel [101], to 5 cm, or equant, showing large {100}, {$\bar{1}$11}, {$\bar{1}$31}, {210}, minor {001},{110}, {101}; may be massive, cleavable.

Physical Properties: *Cleavage:* On {210}, perfect; on {001}, imperfect. *Fracture:* Uneven to subconchoidal. Hardness = 3.5–4 D(meas.) = 3.66–3.71 D(calc.) = 3.72 Pale yellowish to red fluorescence under SW and LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to white, pale gray, bright to pale green, pale yellow; colorless in transmitted light. *Luster:* Vitreous to resinous.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 64°$; $Y \wedge c = -26°$. *Dispersion:* $r > v$, weak. $\alpha = 1.525$ $\beta = 1.684$ $\gamma = 1.686$ 2V(meas.) = 15°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.092(1)$ $b = 5.2344(6)$ $c = 6.544(1)$ $\beta = 106.05(1)°$ Z = 2

X-ray Powder Pattern: Alston, England. (ICDD 15-285).
3.125 (100), 3.140 (90), 4.018 (40), 4.345 (25), 2.157 (25), 2.512 (20), 2.379 (20)

Chemistry:

	(1)	(2)
CO_2	29.95	29.59
MgO	0.50	
CaO	18.75	18.85
SrO	1.81	
BaO	48.92	51.56
Total	99.93	100.00

(1) Vuoriyarvi massif, Russia; corresponds to $Ba_{0.92}Ca_{1.03}Sr_{0.08}Mg_{0.03}(CO_3)_{2.00}$.
(2) $BaCa(CO_3)_2$.

Polymorphism & Series: Trimorphous with alstonite and paralstonite.

Occurrence: A relatively uncommon accessory mineral in metallic veins, formed by reaction of hydrothermal fluids with limestone; however it may be the dominant barium-bearing species; rarely in carbonatites and Alpine veins.

Association: Barite, calcite, strontianite, siderite, alstonite, benstonite, witherite, norsethite, fluorite, sphalerite, pyrrhotite, quartz.

Distribution: In England, from the Bleagill mine, Alston, Cumbria, and at Holwell, Mendip Hills, Somerset. From Llantrisant, Wales. In the Himmelsfürst mine, Freiberg, Saxony, Germany. At Stříbro, Czech Republic. In the Vuoriyarvi carbonatite complex, and from the Khibiny massif, Kola Peninsula, Russia. At the Ediacara mine, west of Beltana, and from north of Angaston, Mount Lofty Ranges, South Australia. From the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. On the Rough claims, north of Sifton Pass, British Columbia, and at the Jason Pb–Zn deposits, Macmillan Pass, Yukon Territory, Canada. In the USA, from the Westvaco trona mine, about 30 km west of Green River, Sweetwater Co., Wyoming; in the Pigeon Roost mine, 5 km northeast of Glenwood, Montgomery Co., Arkansas; at the Juanita mine, Magdalena district, Socorro Co., New Mexico.

Name: For *barium* with calcium and carbonate (*calcite*) in its composition.

CaO	1.70	$-O = (F,Cl)_2$	0.78
SrO	1.47	Total	[99.47]

(1) Kola Peninsula, Russia; original total given as 99.34%; corresponds to $(Na_{2.47}K_{0.53})_{\Sigma=3.00}(Ba_{1.05}Fe^{2+}_{0.28}Ca_{0.24}Mn_{0.20}Mg_{0.20}Sr_{0.12})_{\Sigma=2.09}(Ti_{2.68}Fe^{3+}_{0.28})_{\Sigma=2.96}(Si_{3.82}Al_{0.18})_{\Sigma=4.00}O_{14}[F_{0.68}(OH)_{0.62}O_{0.57}Cl_{0.14}]_{\Sigma=2.01}$.

Occurrence: In ijolite (Lovozero massif, Russia).

Association: Aegirine, nepheline, potassic feldspar, cancrinite, apatite (Lovozero massif, Russia); amphibole, eudialyte, natrolite, pectolite (Gardiner complex, Greenland).

Distribution: From Mts. Kukisvumchorr, Rasvumchorr, and Koashva, Khibiny massif, Kola Peninsula, and in the Murun massif, southwest of Olekminsk, Yakutia, Russia. At Kahlenberg, Graulai, and Üdersdorf, Eifel district, Germany. From Coyote Peak, near Orick, Humboldt Co., California, USA. In the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland.

Name: For the BARium in its composition and its relation to *lamprophyllite*.

Type Material: Beijing University, Beijing, China.

Basaluminite $Al_4(SO_4)(OH)_{10}\cdot 4-5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Microcrystalline, as crystals with rhombic outlines, to about 2 μm; commonly in compact masses.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 2.08–2.12 D(calc.) = 2.12

Optical Properties: Semitransparent. *Color:* White to pale yellow, pale brown. *Optical Class:* [Biaxial.] *Orientation:* Negative elongation. n = 1.515–1.540, 1.525 average. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. a = 14.857(3) b = 10.011(3) c = 11.086(3) β = 122.28(3)° Z = 4

X-ray Powder Pattern: Chickerell, England.
9.36 (100), 4.681 (27), 4.273 (20), 5.91 (13), 1.888 (12), 3.687 (10), 2.720 (10)

Chemistry:

	(1)	(2)	(3)
SO_3	17.15	18.10	17.25
Al_2O_3	42.85	44.75	43.94
CaO		0.20	
H_2O	[40.00]	35.60	38.81
insol.		0.72	
Total	[100.00]	99.37	100.00

(1) Irchester, England; average of two analyses, after deduction of Fe_2O_3 and allophane, H_2O by difference, corresponds to $Al_{3.92}(SO_4)_{1.00}(OH)_{9.76}\cdot 5.48H_2O$. (2) Chickerell, England; corresponds to $Al_{3.88}(SO_4)_{1.00}(OH)_{9.64}\cdot 3.92H_2O$. (3) $Al_4(SO_4)(OH)_{10}\cdot 5H_2O$.

Occurrence: Typically a weathering product of clays, as the result of acid released from the oxidation of pyrite; probably always a dehydration product of hydrobasaluminite; as coatings on joint surfaces and veinlets in ironstone (Irchester, England); in chalk (Clifton Hill, England); a reaction rim surrounding carbonate concretions (Chickerell, England); on fractures in garnet–sillimanite laterite (Kanogami, Japan).

Association: Hydrobasaluminite, hydroargillite, meta-aluminite, allophane, gibbsite, gypsum, aragonite.

Distribution: In England, from the Lodge pit, Irchester, Northamptonshire; on Clifton Hill, Brighton, Sussex; at the Crook Hill brickyard, Chickerell, near Weymouth, Dorset. From Moel Goedog, near Harlech, Merioneth, Wales. Found north of Ballybunion, Co. Kerry, Ireland. At Épernay, Marne, France. In the Vodino and Chekur-Koyashe sulfur deposits, along the middle Volga, and at the Kaluginsk deposits, Middle Ural Mountains, Russia. In the USA, from Shoals, Martin Co., Indiana; in the Flemming coal bed, Crawford Co., Kansas; at the Fuemrole mine, Temple Mountain, Emery Co., Utah; near Fort Foote, Prince Georges Co., Maryland; in Arizona, in the Lavender pit, Bisbee, Cochise Co. From Kanogami, Fukushima Prefecture, Japan. Several additional localities are known.

Name: As a BASic sulfate of ALUMINum.

Type Material: The Natural History Museum, London, England, 1950,56–61; Harvard University, Cambridge, Massachusetts, USA, 101819.

Bassanite $2CaSO_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* 2. As needlelike crystals, to 0.1 mm, typically in parallel aggregates. *Twinning:* About [010], twin plane {101}, may be sectored (synthetic).

Physical Properties: Hardness = n.d. D(meas.) = 2.69–2.76 D(calc.) = 2.731

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Biaxial (+). *Orientation:* Positive elongation, parallel extinction,
$\alpha = 1.550–1.559$ $\beta = 1.560$ $\gamma = 1.577–1.584$ 2V(meas.) = 10°–15°

Cell Data: *Space Group:* $I2$ (synthetic). $a = 12.0317(4)$ $b = 6.9269(2)$ $c = 12.6712(3)$
$\beta = 90.27(1)°$ Z = 12

X-ray Powder Pattern: Synthetic.
3.006 (100), 2.807 (86), 6.00 (70), 1.847 (56), 3.469 (54), 2.139 (22), 3.042 (15)

Chemistry:

	(1)	(2)
SO_3	54.19	55.16
CaO	37.75	38.63
H_2O	6.37	6.21
Total	98.31	100.00

(1) Danby Lake, California, USA. (2) $2CaSO_4 \cdot H_2O$.

Occurrence: Altered from gypsum in leucite tephrite blocks; fumarolic (Vesuvius, Italy); in dry or perennially dry lake beds (California, Australia); in caves, interlayered with gypsum.

Association: Gypsum, anhydrite, celestine, calcite, gibbsite.

Distribution: From Vesuvius, Campania, Italy. At Wadi Mestaoua, east of Foum Tataouine, Tunisia. In the USA, in caves in Big Bend National Park, Brewster Co., Texas; in California, from Danby [dry] Lake, San Bernardino Co., at a dry lake near Ballarat, Inyo Co., and in the S.A.M. Corporation sulfur mine, near Taft, Kern Co. Found near Nappan, Nova Scotia, Canada. In the Hutt and Leeman [pond-playa] lagoons, north of Perth, Western Australia. From South Victoria Land, Antarctica. Probably more widespread than the above listing of localities would indicate.

Name: To honor Francesco Bassani (1853–1916), Professor of Paleontology, University of Naples, Naples, Italy.

Type Material: n.d.

(1) Wheal Basset, Cornwall, England. (2) Arcu su Linnarbu, Italy. (3) $Fe(UO_2)_2(PO_4)_2 \cdot 8H_2O$.

Mineral Group: Meta-autunite group.

Occurrence: A rare secondary mineral in the oxidized zone of some uranium-bearing hydrothermal mineral deposits.

Association: Uranospathite, torbernite, uraninite, pyrite (Basset mines, England); meta-autunite, torbernite (Arcu su Linnarbu, Italy); saléeite, metanováčekite (Sue mine, Arizona, USA).

Distribution: In England, from the Basset group of mines, Illogan, and the South Terras mine, St. Stephen-in-Brannel, Cornwall. At Arcu su Linnarbu, Capoterra, near Cagliari, Sardinia, Italy. From Daverdisse, Belgium. At the Los Ratones and Pedro Alvaro vanadium mines, Salamanca Province, Spain. From the La Crouzille mine, Haute-Vienne, France. In the USA, on Overland Mountain, Jamestown district, Boulder Co., Colorado; in Utah, from the Denise No. 1 mine and in the Fuemrol mine, Temple Mountain, Emery Co., Utah; in Arizona, at the Sue and Red Bluff mines, Sierra Ancha Mountains, and widespread in the Dripping Springs quartzite in the northwestern part of Gila Co.; from the Merry Widow mine, Grant Co., New Mexico.

Name: For the Basset mine group, Cornwall, England, from which it was first described.

Type Material: Mineralogical Museum, Cambridge, 1297; [Museum of Practical Geology, Ludlam collection L1936, L1941, L1946] now in The Natural History Museum, London, England; National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, USA.

(1) Molinello mine, Val Graveglia, Italy; average of 7 electron microprobe analyses, H_2O calculated from stoichiometry and confirmed by Mössbauer spectroscopy; corresponding to $(Sr_{0.97}Ca_{0.02}Na_{0.01})_{\Sigma=1.01}V_{3.00}O_7 \cdot 4H_2O$. (2) $SrV_3O_7 \cdot 4H_2O$.

Occurrence: In a metamorphosed bedded chert and Mn ore deposit.

Association: Rhodonite, quartz, braunite.

Distribution: At the Molinello manganese mine, Val Graveglia, eastern Liguria, northern Apennines, Italy.

Name: Honors Riccardo Basso (b. 1947), Professor of Mineralogy and Crystallography, University of Genoa, Italy.

Type Material: Dipartimento per lo Studio del Territorio e delle sue Risorse, Università di Genova, Italy, (M0480).

References: (1) Bindi, L., C. Carbone, R. Cabella, and G. Lucchetti (2011) Bassoite, $SrV_3O_7 \cdot 4H_2O$, a new mineral from Molinello mine, Val Graveglia, eastern Liguria, Italy. Mineral. Mag., 75, 2677-2686. (2) (2012) Amer. Mineral., 97, 1525 (abs. ref. 1).

Bastnäsite-(Ce) $(Ce, La)(CO_3)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{6}2c$. Commonly in tabular to equant crystals, with {0001} and {$10\bar{1}0$}, may be modified by {$11\bar{2}0$}, {$10\bar{1}1$}, {$10\bar{1}2$}, {$10\bar{1}3$}, {$11\bar{2}2$}, horizontally striated, may be elongated, commonly in syntaxic intergrowth with röntgenite-(Ce), synchysite-(Ce), parisite-(Ce), or cordylite-(Ce), to 20 cm; granular, massive.

Physical Properties: *Cleavage:* On {$10\bar{1}0$}, indistinct; {0001}, a parting, distinct to perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–4.5 D(meas.) = 4.9–5.2 D(calc.) = 5.12 (for $Ce(CO_3)F$). Strongly piezoelectric; dark red cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Wax-yellow, honey-yellow, reddish brown; in transmitted light, pale yellow to colorless. *Luster:* Vitreous to greasy, pearly on basal partings.
Optical Class: Uniaxial (+). *Pleochroism:* Faint. *Absorption:* $O < E$. $\omega = 1.717$–1.722 $\epsilon = 1.818$–1.823

Cell Data: *Space Group:* $P\bar{6}2c$. a = 7.118(1) c = 9.762(1) Z = 6

X-ray Powder Pattern: Stove Mountain, Colorado, USA.
2.88 (100), 3.56 (71), 2.06 (50), 1.892 (50), 4.90 (35), 2.01 (35), 1.675 (24)

(1) Madagascar. (2) Gallinas Mountains, New Mexico, USA; analysis not given, corresponds to $(Ce_{0.48}La_{0.37}Nd_{0.10}Pr_{0.04}Sm_{0.01})_{\Sigma=1.00}(CO_3)F$. (3) $(Ce, La)(CO_3)F$ with Ce:La = 1:1.

Polymorphism & Series: 4H, 6R, 3R polytypes; forms a series with hydroxylbastnäsite-(Ce).

Occurrence: The most abundant RE-bearing mineral, typically hydrothermal, although primary igneous occurrences are known. In granite and alkali syenites and pegmatites; in carbonatites; in contact-metamorphic deposits; rarely as a detrital mineral in placers.

Association: Allanite-(Ce), cerianite-(Ce), synchysite-(Ce), parisite-(Ce), cerite-(Ce), fluocerite-(Ce), fluorite.

Distribution: In Sweden, from the Bastnäs mine, near Riddarhyttan, Västmanland. At the Trimouns talc deposit, six km northeast of Luzenac, Ariège, France. In a large deposit at Karkin, near Eskiçehir, Eskiçehir Province, Turkey. Fine crystals from Shinwaro, Kunar Province, Afghanistan. On Zegi Mountain, Fata, Pakistan. Large crystals from Andakatany, Ambatofangehana, and elsewhere in Madagascar. At Karonge, Burundi. On Wigu Hill, Tanzania. From Nkombwa Hill, Zambia. In the USA, from near Stove Mountain, in the St. Peters Dome area, and at Crystal Park, near Pikes Peak, El Paso Co., Colorado; at the Red Cloud fluorite mine, Gallinas Mountains, Lincoln Co., New Mexico; in a large deposit at Mountain Pass, San Bernardino Co., California; from Granite Mountain, near Little Rock, Pulaski Co., Arkansas; in the Trout Brook Valley, near Ticonderoga, Essex Co., New York. At Mont Saint-Hilaire, Quebec, Canada. A major ore mineral in the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China. There are numerous minor localities.

Name: For its first-noted occurrence in the Bastnäs mine, Sweden, and content of *cerium*.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 23:0476.

Bastnäsite-(La) $(La, Ce)(CO_3)F$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: [Hexagonal.] [by analogy to bastnäsite-(Ce)]. *Point Group:* $\overline{6}2c$. Fine-grained massive.

Physical Properties: Hardness = [4–4.5] D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark brown.
Optical Class: Uniaxial (+). ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* [$P\overline{6}2c$] [by analogy to bastnäsite-(Ce)]. a = n.d. c = n.d. Z = n.d.

X-ray Powder Pattern: Probably nearly identical to bastnäsite-(Ce).

Chemistry:

	(2)	(3)
CO_2	n.d.	20.14
La_2O_3	55.04	37.28

Total		100.00

(1) Belaya Zima deposit, Russia; analysis not given but stated to correspond to $(La_{0.44}Ce_{0.41}Nd_{0.14})_{\Sigma=0.99}(CO_3)F$. (2) Near Odegi, Nigeria; partial analysis by electron microprobe, corresponding to $(La_{0.71}Nd_{0.14}Ca_{0.09}Pr_{0.06})_{\Sigma=1.00}(CO_3)F$. (3) $(La, Ce)(CO_3)F$ with La:Ce = 1:1.

Occurrence: In late ankerite carbonatites (Belaya Zima deposit, Russia).

Association: Fluocerite, cerianite-(Ce) (near Odegi, Nigeria).

Distribution: From the Belaya Zima RE–Nb deposit, eastern Sayan, Siberia, Russia. Found near Odegi, Afu Hills, Nigeria.

Name: For its relation to *bastnäsite*-(Ce) and dominant *lanthanum* in its composition.

Type Material: n.d.

(1) Verkhne-Espe massif, Kazakhstan; original total given as 100.12%, RE = Y 40.1%, La 1.4%, Ce 7.0%, Pr 1.8%, Nd 6.2%, Sm 5.3%, Eu 0.6%, Gd 6.8%, Tb 1.6%, Dy 11.0%, Ho 2.6%, Tm 1.1%, Yb 5.3%, Lu 1.7%; after deduction of microcline 2.4%, hematite 3.3%, fluorite 3%, and quartz 1.5%, corresponds to $[(Y_{0.36}Dy_{0.10}Er_{0.07}RE_{0.37})_{0.90}Ca_{0.09}Th_{0.01}]_{\Sigma=1.00}(CO_3)_{1.00}[F_{0.73}(OH)_{0.19}]_{\Sigma=0.92}$.

Occurrence: A rare secondary mineral in a microcline–quartz pegmatite vein.

Association: Gagarinite-(Y), fluorite, microcline, hematite, quartz.

Distribution: In the Verkhne-Espe alkaline massif, Tarbagatai Range, Kazakhstan.

Name: As a *bastnäsite* species with dominant *yttrium*.

Type Material: Institute of Mineralogy, Geochemistry and Crystal Chemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, vis1961 and vis1962.

MnO	0.09	LOI	0.10
MgO	trace	Total	99.95

(1) Inagli massif, Russia; corresponds to $(Na_{1.66}K_{0.34})_{\Sigma=2.00}(Ba_{0.88}Ca_{0.03}Mn_{0.01})_{\Sigma=0.92}(Ti_{1.68}Fe^{3+}_{0.14}Al_{0.11}Zr_{0.09})_{\Sigma=2.02}Si_{3.97}[O_{13.66}(OH)_{0.34}]_{\Sigma=14.00}$.

Occurrence: In aegirine-arfvedsonite-microcline pegmatites in dunites (Inagli massif, Russia).

Association: Microcline, nepheline, aegirine, arfvedsonite, lorenzenite, uranian thorite, eudialyte, apatite, orthoclase (Inagli massif, Russia).

Distribution: From the Inagli massif, 30 km west of Aldan; the Murun massif, southwest of Olekminsk, Yakutia; and on Mt. Rasvumchorr, Khibiny massif, Kola Peninsula, Russia. At Liley, near Üdersdorf, Graulai, and Altburg, Eifel district, Germany.

Name: For *Ba, Ti, Si* in the composition.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; Moscow Geological Survey Institute, Moscow; Vernadsky State Geological Museum, Moscow, 46244; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61316, vis3299.

(1) Slyudyanka Complex, southern Baikal region, Russia; average of 237 electron microprobe analyses, VO_2:V_2O_3 calculated, absence of OH confirmed by Raman spectroscopy, corresponding to $(V^{3+}_{4.77}V^{4+}_{0.75}Cr_{2.20}Fe_{0.25}Nb_{0.03})_{\Sigma=8.00}(Ti_{5.41}V^{4+}_{0.59})_{\Sigma=6.00}[Ba_{1.01}Mg_{0.02}(Si_{1.40}Al_{0.48}O_{0.94})]O_{28}$.
(2) $V_8Ti_6[Ba(Si_2O)]O_{28}$.

Mineral Group: Derbylite group.

Occurrence: An accessory mineral, frequently intergrown with schreyerite in quartz bands, in a Cr-V-rich quartz-diopside metamorphic rock.

Association: Cr-V-bearing diopside and tremolite, calcite, schreyerite, berdesinskiite, V-bearing titanite, ankangite, chromite-coulsonite series spinels, Fe-bearing members of the eskolaite-karelianite series, uraninite, chernykhite-roscoelite series micas, Cr-bearing goldmanite, dravite-vanadiumdravite tourmalines, albite, barite, zircon, unnamed U-Ti-V-Cr oxide phases.

Distribution: Slyudyanka Complex, southern Baikal region, Russia.

Name: For its major cations (Ba, Ti, Si, V).

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow.

H_2O^+	3.56	
H_2O^-	0.32	1.93
Total	99.60	100.00

(1) Mesa Grande district, California, USA; corresponds to $Ca_{4.11}Be_{2.95}Al_{1.22}Si_{9.22}O_{26}\bullet 1.90H_2O$.
(2) $Ca_4Be_2Al_2Si_9O_{26}(OH)_2$.

Occurrence: As druses in miarolitic cavities in granite and associated pegmatites, formed by alteration of beryl and other beryllium-bearing minerals. Also in hydrothermal veins and skarns.

Association: Beryl, helvite, phenakite, bertrandite, quartz, epidote, stilbite, albite, orthoclase, titanite, chlorite, clinozoisite, tremolite.

Distribution: From Baveno and Val d'Ossola, Piedmont, Italy. At Strzegom (Striegau), Silesia, Poland. From the Czech Republic, at Jeclov, Věžná, and near Drahonín. At Takelund, southeast of Halden, Østfold, Norway. In Switzerland, from the Muotta Nera, Piz Lai Blau, Val Nalps and at Val Casaccia, Val Cristallina, Graubünden. In the USA, from the Himalaya mine, Mesa Grande district, and in the Rincon district, San Diego Co., California; at the Foote mine, Kings Mountain, Cleveland Co., North Carolina; from the Rutherford mine, Amelia, Amelia Co., Virginia; and elsewhere. In the Londonderry quarry, near Coolgardie, Western Australia. From Batystau, central Kazakhstan. In Russia, as large crystals at Akoudertia, Siberia; Malyshero, Ural Mountains; and a number of other less-well-defined localities.

Name: For the original occurrence at Baveno, Italy.

Type Material: Municipal Museum of Natural History, Milan, Italy; Natural History Museum, Paris, France, 108.1881, 108.1882

Bayerite $Al(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As very fine fibers; also as flaky and tabular crystals, to 0.1 mm; in radiating hemispherical aggregates and crusts.

Physical Properties: Hardness = n.d. D(meas.) = 2.53 D(calc.) = 2.54

Optical Properties: Semitransparent. *Color:* White.
Optical Class: Biaxial (+). *Orientation:* Extinction negative, parallel to fiber length.
α = 1.565–1.574 β = n.d. γ = 1.580–1.584 2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1/a$; $P2_1/n$ (synthetic). $a = 5.0626(2)$ $b = 8.6719(2)$ $c = 9.4254(3)$ $\beta = 90.26(1)^\circ$ Z = 8

X-ray Powder Pattern: Hatrurim Formation, Israel.
4.73 (s), 2.21 (s), 4.36 (ms), 1.720 (m), 3.19 (w), 2.70 (vw), 2.16 (vw)

Chemistry: No chemical analysis appears to have been published.

Polymorphism & Series: Polymorphous with doyleite, gibbsite, and nordstrandite.

Occurrence: Probably precipitated from high-aluminum gels on carbonates at pH > 5.8 (Hatrurim Formation, Israel); as weathered crusts on amphiboles and pyroxenes (Dnieper region, Russia); in bauxites.

Association: Calcite, gypsum, portlandite, ettringite, vaterite, thaumasite (Hatrurim Formation, Israel).

Distribution: In the Hatrurim Formation, Israel. From an undefined area in the Dnieper region, and in the Listvennoye deposit, Yenisei Ridge, Siberia, Russia. In the San Elias mine, San Luis Province, Argentina. On Raoul Island, Kermadec Group, South Pacific.

Name: The artificial compound is thought to have been named for the 19th-century German metallurgist Karl J. Bayer; the name was then applied to the natural mineral.

Type Material: n.d.

Bayldonite $PbCu_3O(AsO_3OH)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Rare as crystals, to 1 cm. Usually as mammillary crusts, powdery, fine-grained massive. *Twinning:* As pseudoscalenohedral trillings with composition plane $(\bar{3}11)$.

Physical Properties: *Fracture:* Conchoidal to irregular. Hardness = 4.5 D(meas.) = 5.24–5.65 D(calc.) = 5.707

Optical Properties: Translucent. *Color:* Siskin-green, apple-green, yellow-green, grass-green; dark green to black in crystals; may show sector twinning in thin section. *Luster:* Resinous. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y \wedge$ elongation $\simeq 45°$. *Dispersion:* $r < v$, strong. $\alpha = 1.95(1)$ $\beta = 1.97$ $\gamma = 1.99(1)$ 2V(meas.) = Large. 2V(calc.) = 89°

Cell Data: *Space Group:* $C2/c$. $a = 10.147(2)$ $b = 5.892(1)$ $c = 14.081(2)$ $\beta = 106.05(1)°$ Z = 4

X-ray Powder Pattern: Tsumeb, Namibia.
3.148 (100), 2.932 (78), 3.231 (72), 4.516 (65), 2.723 (60), 2.658 (55), 2.260 (54)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
SO_3		1.00		PbO	30.13	32.60	30.67
P_2O_5		0.20		H_2O	4.58	4.20	4.95
As_2O_5	31.76	30.09	31.59	rem.	2.65		
CuO	30.88	31.70	32.79	Total	100.00	99.79	100.00

(1) St. Day, Cornwall, England; after deduction of remnant Fe_2O_3, CaO, and loss on ignition, corresponds to $Pb_{1.03}Cu_{2.97}O(As_{1.06}O_3OH)_2(OH)_{2.22}$. (2) Kayrakty, Kazakhstan; $(OH)^{1-}$ confirmed by IR, corresponding to $Pb_{1.00}Cu_{3.00}O[(As_{0.98}P_{0.01})_{\Sigma=0.99}O_3OH]_2(OH)_{1.77}$. (3) $Cu_3PbO(AsO_3OH)_2(OH)_2$.

Occurrence: A rare secondary mineral in the oxidized zone of some polymetallic deposits.

Association: Mimetite, olivenite, azurite, malachite, tsumebite, cuprian adamite, duftite, keyite, schulténite, philipsbornite (Tsumeb, Namibia); beudantite, anglesite, cerussite, malachite, azurite, barite (Kayrakty, Kazakhstan).

Distribution: In England, in Cornwall, from the Penberthy Croft mine, St. Hilary; at Wheal Carpenter, near Gwinear; from Wheal Gorland, Gwennap; and at Wheal Alfred, Phillack; from many mines at Caldbeck Fells, Cumbria. In the Tynagh mine, near Loughrea, Co. Galway, Ireland. In France, at the Cap Garonne mine, near le Pradet, Var; La Rabasse, Hérault; Les Ardillats, Rhône; and elsewhere. Large crystals from Tsumeb, Namibia. At Kayrakty, Kazakhstan. In Australia, from Broken Hill, New South Wales; in the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia; at the Mt. Malvern mine, near Clarendon, South Australia. In the USA, from the Killie mine, Spruce Mountain district, Elko Co., Nevada; in Arizona, at Bisbee, Cochise Co., and from the Frijole prospect, Santa Rita Mountains, Pima Co.; in the Black Pine mine, near Philipsburg, Granite Co., Montana.

Name: Honors John Bayldon, English physician who collected the original specimens.

Type Material: The Natural History Museum, London, England, 1921,433.

Bayleyite $Mg_2(UO_2)(CO_3)_3 \cdot 18H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are well-formed, short prismatic along [001], to 0.1 mm; typically in globular aggregates and crusts of divergent crystals.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2–2.5 D(meas.) = 2.05 D(calc.) = 2.06 Radioactive. Soluble in H_2O; may rapidly dehydrate; weak fluorescence of uncertain yellow-green to pale greenish under LW and SW UV.

Optical Properties: Semitransparent. *Color:* Sulfur-yellow. *Luster:* Vitreous, dulling with dehydration.
Optical Class: Biaxial (–). *Pleochroism:* X = pale pink; $Y = Z$ = pale yellow to greenish yellow. *Orientation:* $Z = b$; $X \wedge c = 8°$–$15°$. $\alpha = 1.454$–1.455 $\beta = 1.490$–1.492 $\gamma = 1.500$–1.502 2V(meas.) = 30° 2V(calc.) = 45°–57°

Cell Data: *Space Group:* $P2_1/a$. $a = 26.65(5)$ $b = 15.31(5)$ $c = 6.53(2)$ $\beta = 93°04'$ Z = 4

X-ray Powder Pattern: Hillside mine, Arizona, USA.
7.66 (10), 13.1 (9), 3.83 (6), 2.69 (5), 2.21 (5), 6.53 (4), 5.85 (4b)

Chemistry:

	(1)	(2)		(1)	(2)
UO_3	35.28	34.76	Na_2O	0.21	
SO_3	0.02		K_2O	0.10	
CO_2	16.72	16.04	H_2O	37.91	39.40
MgO	9.76	9.80	Total	[100.00]	100.00

(1) Hillside mine, Arizona, USA; recalculated from an original total of 100.78%, after deduction of gypsum 8.45% and insoluble 0.45%; corresponds to $Mg_{2.00}(UO_2)_{1.02}(CO_3)_{3.15} \cdot 17.43H_2O$.
(2) $Mg_2(UO_2)(CO_3)_3 \cdot 18H_2O$.

Occurrence: As a coating or efflorescence with other secondary uranium minerals, which may be post-mining, typically in sediment-hosted uranium-bearing deposits.

Association: Schröckingerite, andersonite, swartzite, gypsum (Hillside mine, Arizona, USA); schröckingerite, gypsum (Hideout mine, Utah, USA); tyuyamunite, uranophane, liebigite, carnotite (Powder River Basin, Wyoming, USA).

Distribution: In the USA, in Arizona, from the Hillside mine, about 5.5 km north of Bagdad, Eureka district, Yavapai Co., and in the Cole shaft, Bisbee, Cochise Co.; at Ambrosia Lake, Grants district, McKinley Co., New Mexico; in Utah, from the Hideout No. 1 (Tiger) mine, Deer Flats, White Canyon district, on the Coral claim, Elk Ridge, at the Mi Vida mine, San Juan Co., and from the Delta Group mine, San Rafael Swell, Emery Co.; in Colorado, at the Garfield and Rifle mines, north of Rifle, Garfield Co., from the J.J. mine, Montrose Co., and well-crystallized in the Schwartzwalder mine, Jefferson Co.; in Wyoming, from the Pumpkin Buttes area, Powder River Basin, Niobrara Co. In the Rabbit Lake uranium mine, Saskatchewan, Canada. From near Azegour, Morocco. In the Huemul mine, Malargüe district, Mendoza Province, Argentina. From the Mas-d'Alary uranium deposit, three km south-southeast of Lodève, Hérault, France. In the Hatrurim Formation, Israel.

Name: To honor Professor William Shirley Bayley (1861–1943), American mineralogist and geologist, University of Illinois, Urbana, Illinois, USA, and the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106101–106104.

Baylissite $K_2Mg(CO_3)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. In fine-grained crusts of anhedral crystals. *Twinning:* Polysynthetic, probably universal.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2–3 D(meas.) = 2.06(1) (synthetic). D(calc.) = 2.04 Decomposes in H_2O and in a humid atmosphere.

Optical Properties: Transparent to translucent. *Color:* Colorless.
Optical Class: Biaxial (+). $\alpha = 1.462(2)$ $\beta = [1.483]$ $\gamma = 1.531(2)$. 2V(meas.) = $\sim 64°$

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 11.404(4)$ $b = 6.228(2)$ $c = 6.826(2)$ $\beta = 99.66(2)°$ Z = 2

X-ray Powder Pattern: Gerstenegg-Sommerloch tunnel, Switzerland.
2.98 (10b), 3.12 (8), 2.47 (8), 2.56 (7), 2.06 (7), 6.33 (6), 4.20 (4)

Chemistry: (1) Identity determined by microchemical determination of the presence of K and Mg, in conjunction with optical and X-ray data similar to the synthetic compound.

Occurrence: A secondary mineral in fractures in aplite granite and granodiorite.

Association: Grimselite, schröckingerite, calcite, monohydrocalcite.

Distribution: In the Gerstenegg-Sommerloch cable tunnel, north of the Grimsel Pass, Bern, Switzerland.

Name: Honoring Noel Stanley Bayliss, Professor of Chemistry, University of Western Australia, Nedlands, Western Australia, who characterized the synthetic compound.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany.

Bazhenovite $CaS_5 \cdot CaS_2O_3 \cdot 6Ca(OH)_2 \cdot 20H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed or platy crystals, to 5 mm, showing {110}, {011}, {101}, and {111}, flattened on {010}, elongated along [001]; in aggregates, to 1 cm.

Physical Properties: *Cleavage:* {010}, very good. *Fracture:* Uneven. *Tenacity:* Brittle but elastic. Hardness = 2 D(meas.) = 1.83(1) D(calc.) = 1.845 Soluble in H_2O, hydrolyzes in air, with sulfur evident in the residue.

Optical Properties: Transparent in thin crystals, translucent in aggregates. *Color:* Orange to yellow. *Streak:* Pale yellow. *Luster:* Vitreous, pearly on intergrowths of parallel plates. *Optical Class:* Biaxial (+). *Pleochroism:* Strong; X = deep yellow-green; Y = greenish yellow; Z = pale greenish yellow. *Orientation:* $X = b$; $Y = a$; $Z \wedge c = 30°$. *Absorption:* $X > Z > Y$. $\alpha = 1.595(2)$ $\beta = 1.619(2)$ $\gamma = 1.697(3)$ 2V(meas.) = n.d. 2V(calc.) = 60°20′.

Cell Data: *Space Group:* $P2_1/c$. $a = 8.45(1)$ $b = 17.47(1)$ $c = 8.24(1)$ $\beta = 119.5°$ Z = 1

X-ray Powder Pattern: Chelyabinsk coal basin, Russia.
8.76 (10), 4.39 (10), 1.996 (7), 2.91 (6), 2.81 (5), 2.62 (5), 2.28 (5)

Chemistry:

	(1)	(2)
Fe	1.34	
Ca	28.12	27.58
O	[9.08]	12.20
S	19.56	
S^s		6.11
S^p		7.25
S^t		6.20
OH		9.46
H_2O	41.9	31.20
Total	[100.00]	100.00

(1) Chelyabinsk coal basin, Russia; H_2O by TGA. (2) Analysis (1) after deduction of Fe as impurity, portlandite 1%, adsorbed H_2O 1%, recasting S as S^s = sulfide S, S^p = polysulfide S, S^t = thiosulfate S; then corresponding to $Ca(S^p_{2.63}S^s_{2.22})_{\Sigma=4.85} \cdot Ca(S^t_{2.25}O_{3.00}) \cdot Ca_{6.00}(OH)_{12.20} \cdot 20.14H_2O$.

Occurrence: Among the melt products of old, burning coal dumps.

Association: Siderite, pyrite, iron, sulfur, oldhamite, portlandite, periclase, troilite, pyrrhotite, fluorite.

Distribution: In the Chelyabinsk coal basin, Southern Ural Mountains, Russia.

Name: For Alfre Georgievich Bazhenov (1931–), geochemist and petrologist, and Lyudmila Fedorovna Bazhenova (1938–), analytical chemist, of the Il'menskii Preserve, Miass, Russia.

Type Material: Mining Institute, St. Petersburg, 1956/1; Il'menskii Preserve Museum, Miass, Russia, 5873–5875; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Bazirite $BaZrSi_3O_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. Crystals rarely entirely euhedral, prismatic with partially developed pyramidal terminations, more commonly anhedral to subhedral, < 1 mm. Also as clusters of crystals.

Physical Properties: *Cleavage:* Pyramidal, probably $\{10\bar{1}4\}$; poor on $\{10\bar{1}0\}$; strong parting $\|$ {0001}. Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.82 Moderately strong pale bluish fluorescence under SW UV; strong blue cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Colorless.
Optical Class: Uniaxial (+). $\omega = 1.675$–1.681 $\epsilon = 1.685$–1.688

Cell Data: *Space Group:* $P\bar{6}c2$. a = 6.737–6.769 $c = 9.997$–10.020 Z = 2

X-ray Powder Pattern: Rockall Island, Scotland.
3.80 (100), 2.800 (100), 5.85 (35), 3.38 (35), 2.93 (30), 2.012 (30), 2.213 (25)

Chemistry:

	(1)	(2)	(3)
SiO_2	39.71	39.59	39.46
TiO_2	0.17	0.51	
ZrO_2	26.38	26.12	26.98
SnO_2	0.06	0.11	
BaO	33.69	34.12	33.56
Total	100.01	100.45	100.00

(1–2) Rockall Island, Scotland; by electron microprobe. (3) $BaZrSi_3O_9$.

Occurrence: A late-stage interstitial mineral in aegirine-riebeckite granite (Rockall Island, Scotland); in granular celsian-bearing rocks near contacts with granite (Big Creek, California, USA).

Association: Elpidite, aegirine, albite, cristobalite, leucophosphite, monazite, quartz, apatite, eudialyte, magnetite, pyrochlore, xenotime, barite, titanite (Rockall Island, Scotland); taramellite, celsian, diopside, actinolite (Big Creek, California, USA).

Distribution: On Apex Ridge, Rockall Island, in the North Atlantic Ocean, 294 km west of St. Kilda Island, Outer Hebrides, Scotland. At the Esquire No. 8 claim, Big Creek, Fresno Co., California, USA.

Name: For BArium and ZIRconium in the composition.

Type Material: The Natural History Museum, London, England, MI 36445.

References: (1) Young, B.R., J.R. Hawkes, R.J. Merriman, and M.T. Styles (1978) Bazirite, $BaZrSi_3O_9$, a new mineral from Rockall Island, Inverness-shire, Scotland. Mineral. Mag., 42, 35–40. (1) Central Kazakhstan; corresponds to $Be_{3.06}(Sc_{1.26}Fe^{2+}_{0.31}Fe^{3+}_{0.17}Mn_{0.13}Mg_{0.12}Al_{0.03})_{\Sigma=2.02}(Si_{5.93}Be_{0.07})_{\Sigma=6.00}O_{18}\bullet 0.87H_2O$, with $(Na_{0.55}K_{0.03}Cs_{0.01})_{\Sigma=0.59}$ in the channels. (2) Heftetjern, Norway; by electron microprobe, average of three analyses; total Fe as Fe_2O_3, Be and Li by AA on bulk sample; corresponds to $Be_{3.1}(Sc_{1.24}Fe_{0.42}Mn_{0.12}Al_{0.10}Mg_{0.02})_{\Sigma=1.90}(Na_{0.30}Cs_{0.12}Li_{0.05}Rb_{0.02}K_{0.01})_{\Sigma=0.50}(Si_{5.7}Be_{0.3})_{\Sigma=6.00}O_{18}\bullet 0.36H_2O$.

Occurrence: In miarolitic cavities in granite (Baveno, Italy); in alpine veins (Switzerland); in granite pegmatite (Heftetjern, Norway).

Association: Quartz, orthoclase, muscovite, laumontite, albite (Baveno, Italy); quartz, hematite, calcite, chlorite, albite, fluorite (Switzerland); beryl, bavenite (Heftetjern, Norway).

Distribution: From Baveno, Piedmont, Italy. In Switzerland, at Val Strem and elsewhere in Graubünden; on the Witenalp; at Wiler, Reusstal; and on Stollen Oberaar, Grimsel Pass. Near Heiligenblut, Carinthia, Austria. Large crystals from Heftetjern, Tørdal, Norway. At an undisclosed locality in central Kazakhstan. On Mts. Antero and White, Chaffee Co., Colorado, USA.

Name: To honor Alessandro E. Bazzi, discoverer of the material from Baveno, Italy.

Type Material: Municipal Museum of Natural History, Milan; University of Milan, Milan, Italy; The Natural History Museum, London, England, 1925,534; Natural History Museum, Paris, France, 115.132.

MgO	0.61	
CaO	1.40	
H_2O	> 29.0	32.96
Total		100.00

(1) Bota-Burum deposit, Kazakhstan; partial analysis by microchemical methods. Identity depends on the correspondence of the X-ray powder pattern with moraesite.
(2) $Be_2(AsO_4)(OH)\cdot 4H_2O$.

Occurrence: As a secondary mineral formed during the oxidation of an arsenic-bearing metal sulfide deposit associated with a felsite porphyry containing beryl.

Association: Pharmacosiderite, arseniosiderite, scorodite–mansfieldite, conichalcite, tyrolite, sodium uranospinite, metazeunerite, arsenopyrite, molybdenite, galena, pyrite, sphalerite, realgar, orpiment, uraninite, beryl.

Distribution: Found in the Bota-Burum uranium deposit, 15 km south of Alakol' Lake, Chu-Ili Mountains, Kazakhstan.

Name: For BEryllium and ARSenic in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

(1) Stockhorn, Switzerland; by electron microprobe, average of four analyses, $(OH)^{1-}$ shown present by Raman IR and crystal-structure analysis, added here for charge balance; corresponding to $(Ca_{1.87}Sr_{0.11})_{\Sigma=1.98}(Al_{0.99}Mg_{0.01})_{\Sigma=1.00}[(P_{1.98}Si_{0.02})_{\Sigma=2.00}O_4]_2[(OH)_{0.85}F_{0.08}]_{\Sigma=0.93}$. (2) Val Po, Italy; by electron microprobe; corresponding to $(Ca_{1.77}Sr_{0.08}Ce_{0.06}La_{0.03}Nd_{0.02})_{\Sigma=1.96}(Al_{0.86}Mg_{0.14}Fe_{0.01})_{\Sigma=1.01}[(P_{1.98}Si_{0.02})_{\Sigma=2.00})O_4]_2[(OH)_{0.79}F_{0.10}]_{\Sigma=0.89}$. (3) $Ca_2Al(PO_4)_2(OH)$.

Mineral Group: Brackebuschite group.

Occurrence: In synmetamorphic quartz segregations and as an accessory mineral in high-pressure metamorphic rocks. Experimental study indicates that the stability of bearthite is restricted to very Ca-poor or P-rich rocks under moderate to high-temperature conditions.

Association: Lazulite, apatite, kyanite, coesite, pyrope, paragonite, muscovite, almandine, rutile, augelite, wardite, goyazite, hydroxylherderite, quartz, albite, talc.

Distribution: Found on the western ridge of the Stockhorn, Zermatt Valley, Valais, Switzerland. In Italy, in the Dora Maira massif, between the Po and Varaita Valleys, Piedmont, and around Passo di Vizze, Alto Adige. In Austria, near the Höllkogel, 12 km south-southwest of Mürzzuschlag, Styria. From the Västanå mine, near Näsum, Skåne, Sweden.

Name: Honors Professor Peter Bearth (1902–1989), for his pioneering petrologic studies of the high-pressure terranes of the western Alps.

Type Material: Mineralogic-Petrographic Institute, University of Basel, Basel, Switzerland, PB100f; National School of Mines, Paris, 84DM54, 85DM45, 85DM70; Natural History Museum, Paris, France.

Beaverite-(Zn) $Pb(Fe_2Zn)(SO_4)_2(OH)$

Crystal Data: Hexagonal. *Point Group*: $\bar{3}$ 2/*m*. As a powdery coating of hexagonal plates.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle. Hardness = n.d.
D(meas.) = n.d. D(calc.) = 4.25

Optical Properties: Transparent. *Color*: Brownish yellow to yellow. *Streak*: Yellow ochre.
Luster: Vitreous to subadamantine.
Optical Class: n.d. $n > 1.800$ *Pleochroism*: Pale to dark yellow.

Cell Data: *Space Group*: $R\bar{3}\,m$. $a = 7.3028(2)$ $c = 17.0517(4)$ Z = 3

X-ray Powder Pattern: Mikawa mine, Niigata Prefecture, Japan.
5.930 (100), 3.072 (61), 3.110 (43), 3.651 (39), 2.273 (39), 2.273 (33), 1.826 (33)

Chemistry:

	(1)
PbO	31.94
Fe2O3	22.46
ZnO	10.15
CuO	3.59
l2O3	0.78
SO3	23.95
H2O	[7.22]
Total	100.00

(1) Mikawa mine, Niigata Prefecture, Japan; average of dozens of electron microprobe analyses, H_2O by difference, OH and SO_4 confirmed by FT-IR spectroscopy; corresponding to $Pb_{0.95}(Fe_{1.88}Al_{0.10})(Zn_{0.83}Cu_{0.30})(SO_4)_2[(OH)_{5.36}O_{0.38}]$.

Mineral Group: Alunite group.

Occurrence: A secondary mineral in the oxidized zone of a hydrothermal Cu-Pb-Zn ore deposit.

Association: Anglesite, galena, pyrite, sphalerite, quartz.

Distribution: At the Mikawa mine, Mikawa, Aga-machi, Higashikanbara-gun, Niigata Prefecture, Japan.

Name: As the Zn-analogue of *beaverite*-(Cu), $[Pb(Fe_2Cu)(SO4)_2(OH)_6]$.

Type Material: National Museum of Nature and Science, Tokyo, Japan (NSM-M28910).

References: (1) Sato, E., I. Nakai, , Y. Terada, Y. Tsutsumi, K. Yokoyama, R. Miyawaki, and S. (1) Horn Silver mine, Utah, USA; recalculated after deduction of 10.05% insoluble, then corresponding to $Pb_{0.99}(Fe^{3+}_{1.62}Cu_{0.92}Al_{0.54})_{\Sigma=3.08}(SO_4)_{2.00}(OH)_6$. (2) Grand Reef mine, Arizona, USA; by electron microprobe, average of three analyses; corresponds to $Pb_{0.94}(Fe^{3+}_{1.62}Cu_{1.12}Al_{0.12})_{\Sigma=2.86}(SO_4)_{2.00}(OH)_6$.

Mineral Group: Alunite group.

Occurrence: An uncommon secondary mineral in the oxidized zone of Pb–Cu deposits.

Association: Olivenite, conichalcite, duftite, beudantite, osarizawaite, hidalgoite, corkite, carminite, bindheimite, plumbojarosite, bayldonite, brochantite, chrysocolla, galena.

Distribution: In the USA, rich masses from the Horn Silver mine, near Frisco, San Francisco district, Beaver Co., at the Centennial Alta mine, Little Cottonwood Canyon district, Salt Lake Co., from the Hidden Treasure mine, Ophir district, Tooele Co., and elsewhere in Utah; in the Boss mine, Goodsprings district, Clark Co., Nevada; at Tombstone, Cochise Co., and from the Grand Reef mine, Graham Co., Arizona; in the Blanchard mine, near Bingham, Socorro Co., New Mexico. From a number of mines in Caldbeck and Carrock Fells, Cumbria, England. In the Cap Garonne mine, near le Pradet, Var, France. In Japan, at the Osarizawa mine, Kazuno, and the Kosaka mine, Akita Prefecture. From Tsumeb, Namibia. At Kipushi, Shaba Province, Congo (Zaire). In the Whim Creek copper mine, Pilbara district, Western Australia. At the Tui mine, Mount Te Aroha, New Zealand. Most occurrences are minor; a number of others are known.

Name: For Beaver Co., Utah, USA, from which the mineral was first recognized.

Type Material: Natural History Museum, Paris, France, 11244; The Natural History Museum, London, England, 1912,615; National Museum of Natural History, Washington, D.C., USA, 86986, R6314.

Bechererite $Zn_7Cu[SiO(OH)_3]SO_4(OH)_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3. Steep trigonal hemimorphic crystals, to 0.25 mm, with $\{12\bar{3}0\}$, $\{24\bar{6}1\}$, $\{62\bar{8}1\}$, and $\{000\bar{1}\}$.

Physical Properties: *Cleavage:* On {0001}. *Tenacity:* Brittle. Hardness = 2–3
D(meas.) = 3.45(5) D(calc.) = 3.51

Optical Properties: Semitransparent. *Color:* Colorless, pale blue, ice-green, pale green.
Streak: White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.705(1)$ $\epsilon = 1.611(1)$

Cell Data: *Space Group:* $P3$. $a = 8.319(2)$ $c = 7.377(1)$ Z = 1

X-ray Powder Pattern: Tonopah-Belmont mine, Arizona, USA.
7.37 (100), 2.556 (50), 3.282 (30), 2.724 (30), 3.623 (25), 1.572 (20), 2.191 (15)

Chemistry:

	(1)
SO_3	9.5
SiO_2	6.1
CuO	8.6
ZnO	60.6
H_2O	[15.2]
Total	[100.0]

(1) Tonopah-Belmont mine, Arizona, USA; by electron microprobe, average of five analyses, H_2O by difference; corresponds to $Zn_{6.93}Cu_{1.01}[Si_{0.95}O(OH)_3]S_{1.10}O_4(OH)_{13}$.

Occurrence: A very rare secondary mineral in the oxidized zone of a hydrothermal base-metal deposit (Tonopah-Belmont mine, Arizona, USA); a post-mine mineral (Frongoch mine, Wales).

Association: Rosasite, willemite, hydrozincite, smithsonite, paratacamite, boleite (Tonopah-Belmont mine, Arizona, USA); susannite, hemimorphite, namuwite, cerussite (Frongoch mine, Wales).

Distribution: From the Tonopah-Belmont mine, Osborne district, Maricopa Co., Arizona, USA. In Wales, in Dyfed, at the Frongoch mine and from the Nantycagl (Eaglebrook) and Esgair Hir mines, Ceulanymaesmawr. At Broken Hill, New South Wales, Australia;

Name: To honor Dr. Karl Becherer (1926–), University of Vienna, Vienna, Austria, for his work on the related mineral spangolite.

Type Material: Institute for Mineralogy and Crystallography, University of Vienna, 8B/10-030#1; Natural History Museum, Vienna, Austria, M6789.

Total	99.51	[100.0]	100.00

(1) Shinkolobwe, Congo. (2) Congo; by electron microprobe, average of two analyses, H_2O by difference; corresponding to $Ca_{1.15}(UO_2)_6O_4(OH)_6 \cdot 8.6H_{1.97}O$. (3) $Ca(UO_2)_6O_4(OH)_6 \cdot 8H_2O$.

Occurrence: A weathering product of uraninite in the oxidized portions of uranium deposits and, more rarely, in pegmatites.

Association: Uraninite, schoepite, soddyite, curite, fourmarierite, dewindtite, ianthinite, wölsendorfite, rutherfordine, masuyite, kasolite (Shinkolobwe, Congo); johannite, uranopilite, zippeite (Happy Jack mine, Utah, USA).

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire). At Schlema-Harlenstein, Saxony, and Wölsendorf, Bavaria, Germany. From Mitterberg, Salzburg, Austria. In the Geevor mine, St. Just, Cornwall, England. From the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. In the USA, in the Monument No. 2 and Cato Sells mines, Apache Co., Arizona; in Utah, at the Delta, Consolidated, and Lucky Strike No. 2 mines, San Rafael Swell, Emery Co., from Seven Mile Canyon, Grand Co., in the Posey and Frey No. 4 mines, Red Canyon district, the Big Buck mine, Big Indian district, and the Happy Jack and Hideout mines, White Canyon district, San Juan Co.; at Pumpkin Buttes, Campbell Co., Wyoming; from Paguate, Valencia Co., New Mexico; and a few others of the Colorado Plateau uranium deposits. In Canada, from the Lake Athabaska district, and the LaRonge uranium mines, near Nistowiack Lake, Saskatchewan. In the South Alligator Valley, Northern Territory, Australia.

Name: For French physicist Antoine Henri Becquerel (1852–1908), who discovered radioactivity in 1896.

Type Material: Natural History Museum, Paris, France, 122.135.

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are pseudo-octahedral {011}, to 7 mm; may be intergrown with schiavinatoite.

Physical Properties: *Cleavage:* On {110} and {010}, distinct. *Fracture:* Subconchoidal. Hardness = 7–7.5 D(meas.) = 7.86(5) D(calc.) = 7.91

Optical Properties: Translucent. *Color:* Grayish pink. *Streak:* White.
Luster: Adamantine.
Optical Class: Uniaxial (+), high birefringence. $\omega = > 2.00$ $\epsilon = > 2.00$

Cell Data: *Space Group:* $I4_1/amd$. $a = 6.206(5)$ $c = 5.472(5)$ $Z = 4$

X-ray Powder Pattern: Manjaka, Madagascar; very close to schiavinatoite.
4.10 (100), 3.10 (71), 2.327 (71), 2.478 (50), 1.600 (50), 1.939 (35)

Chemistry:

	(1)	(2)
B_2O_3	[15.77]	16.44
Nb_2O_5	21.73	31.38
Ta_2O_5	63.95	52.18
Total	[101.45]	100.00

(1) Antsongombato, Madagascar; by electron microprobe, B_2O_3 calculated from stoichiometry; corresponds to $(Ta_{0.64}Nb_{0.36})_{\Sigma=1.00}BO_4$. The original X-ray fluorescence analysis of type material from Manjaka, Madagascar is stated to have shown Ta:Nb:Zr = 18:1:0.4. (2) $(Ta, Nb)BO_4$ with Ta:Nb = 1:1.

Occurrence: Very rare, in granite pegmatites.

Association: Elbaite, pollucite, manganoan apatite, lepidolite, quartz, albite (Manjaka, Madagascar); schiavinatoite, rhodizite, elbaite–liddicoatite, quartz, feldspar (Antsongombato, Madagascar).

Distribution: From Manjaka and Antsongombato, south of Betafo, Madagascar. In the Animikie Red Ace pegmatite, near Pine River, Florence Co., Wisconsin, USA.

Name: To honor Jean Béhier (1903–1965), French mineralogist, Geological Survey of Madagascar, who discovered the mineral.

Type Material: National Museum of Natural History, Washington, D.C., USA, 139602.

References: (1) Mrose, M.E. and H.J. Rose (1962) Behierite $(Ta, Nb)BO_4$, a new mineral from Manjaka, Madagascar. Geol. Soc. Amer., Annual Meeting Abs. with Prog., 235 (abs.). (2) (1962) Amer. Mineral., 47, 414 (abs. ref. 1). (3) Demartin, F., V. Diella, C.M. Gramaccioli, and F. Pezzotta (2001) Schiavinatoite, $(Nb, Tb)BO_4$, the Nb analogue of behierite. Eur. J. Mineral., 13, 159–165.

Behoite $Be(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. Crystals pseudo-octahedral, {011} and {110}, or sphenoidal, to 7 mm; faces show striae and etch pits; subhedral, as rounded crystal aggregates and crusts. *Twinning:* Probably polysynthetically twinned, observed optically.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼4 D(meas.) = 1.92(1) D(calc.) = [1.93]

Optical Properties: Translucent to opaque, rarely transparent. *Color:* Colorless or white, rarely pale pink to pale gray; may show anomalous blue and brown interference colors in transmitted light. *Luster:* Vitreous; greasy to dull.
Optical Class: Biaxial (–). *Orientation:* [$X = b$; $Y = a$; $Z = c$] (by analogy to isotypic synthetic ϵ-$Zn(OH)_2$). *Dispersion:* $r < v$, strong. $\alpha = 1.533(3)$ $\beta = 1.544(3)$ $\gamma = 1.548(3)$ 2V(meas.) = 82°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 4.62(2)$ $b = 7.05(2)$ $c = 4.55(3)$ Z = 4

X-ray Powder Pattern: Rode Ranch pegmatite, Texas, USA.
2.39 (vs+), 3.88 (vs), 3.83 (vs), 2.95 (m), 2.79 (m), 1.99 (m), 1.96 (m)

Chemistry: Emission spectroscopy shows Be as the only major element.

Polymorphism & Series: Polymorphous with clinobehoite.

Occurrence: In granite pegmatite as a near-surface alteration product of gadolinite (Rode Ranch pegmatite, Texas, USA); in altered volcanic tuff (Honeycomb Hills, Utah, USA); in pegmatite veins and miarolitic cavities in nepheline syenite (Mont Saint-Hilaire, Canada).

Association: Gadolinite, bastnäsite, tengerite, quartz, albite, microcline, montmorillonite, fluorite, calcite (Rode Ranch pegmatite, Texas, USA).

Distribution: In the USA, from the Rode Ranch pegmatite, Llano Co., and the Clear Creek pegmatite, Burnet Co., Texas, and in the Honeycomb Hills, Juab Co., Utah. In Canada, at Mont Saint-Hilaire, Quebec. In the Saga larvikite quarry, Tvedalen, near Larvik, Norway.

Name: For beryllium, Be, and hydroxyl, OH, in its composition.

Type Material: n.d.

References: (1) Ehlmann, A.J. and R.S. Mitchell (1970) Behoite, beta-$Be(OH)_2$, from the Rode Ranch pegmatite, Llano County, Texas. Amer. Mineral., 55, 1–9. (2) Horváth, L. and R.A. Gault (1990) The mineralogy of Mont Saint-Hilaire, Quebec. Mineral. Record, 21, 284–359, esp. 299.

Beidellite $(Ca_{0.5}, Na)_{0.3}Al_2(Si, Al)_4O_{10}(OH)_2 \cdot nH_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. As thin plates, laths, and ribbons, to 30 μm; in veinlets filling fractures and as claylike masses.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 1–2 D(meas.) = 2–3 depending on hydration. D(calc.) = n.d. Positive identification of minerals in the smectite group may need data from DTA curves, dehydration curves, and X-ray powder patterns before and after treatment by heating and with organic liquids.

Optical Properties: Translucent. *Color:* White, reddish brown, brownish gray. *Luster:* Waxy to vitreous.
Optical Class: Biaxial (–). $\alpha = 1.494$ $\beta = 1.536$ $\gamma = 1.536$ 2V(meas.) = 9°–16°

Cell Data: *Space Group:* $C2/m$. $a = 5.179$ $b = 8.970$ $c = 17.57$ $\beta =$ [$\sim 90°$]
Z = n.d.

X-ray Powder Pattern: Black Jack mine, Idaho, USA; glycolated, diffuse pattern.
17.6 (100), 4.42 (100), 3.95 (100), 3.54 (100), 2.50 (100), 1.498 (100), 2.57 (80)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	45.32	45.83	CaO	2.76	1.41
TiO_2		0.46	Na_2O	0.10	0.16
Al_2O_3	27.84	22.79	K_2O	0.12	0.09
Fe_2O_3	0.70	5.71	H_2O^+	14.48	9.79
FeO		0.28	H_2O^-	8.16	12.55
MgO	0.16	0.86	Total	99.64	99.93

(1) Black Jack mine, Idaho, USA; corresponds to $(Ca_{0.23}Na_{0.02}K_{0.01})_{\Sigma=0.26}(Al_{1.96}Fe^{3+}_{0.04}Mg_{0.02})_{\Sigma=2.02}(Si_{3.46}Al_{0.54})_{\Sigma=4.00}O_{10}(OH)_2$. (2) Velka Kopan, Ukraine; corresponds to $(Ca_{0.12}Na_{0.02}K_{0.01})_{\Sigma=0.15}(Al_{1.62}Fe^{3+}_{0.33}Mg_{0.10}Ti_{0.03}Fe^{2+}_{0.02})_{\Sigma=2.10}(Si_{3.54}Al_{0.46})_{\Sigma=4.00}O_{10}(OH)_2$.

Mineral Group: Smectite group.

Occurrence: A constituent of bentonitic clays; an alteration product in hydrothermal mineral deposits, especially porphyry Cu-Mo systems; in soils derived from mafic rocks.

Association: Plagioclase, quartz, orthoclase, montmorillonite, kaolin, allophane, muscovite.

Distribution: Of worldwide occurrence, but pure and well-characterized materials are uncommon. In the USA, from Beidell, Saguache Co., and at Wagon Wheel Gap, Mineral Co., Colorado; in the Black Jack mine, Carson district, Owyhee Co., Idaho; from Arizona, at Morenci, Greenlee Co., Ajo, Pima Co., in the San Manuel mine, Pinal Co., and in the Globe-Miami district, Gila Co.; at Boron, Kern Co., California. In the Princess mine, Namiquipa, Chihuahua, Mexico. From Sibert, Rhône, France. At Unterrupsroth, Bavaria, Germany. From Velka Kopan, Khust, Ukraine.

Name: For Beidell, Colorado, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, R4762 (Black Jack mine, Idaho, USA); R4761 (Beidell, Colorado, USA, material determined to be a mixture in part).

Belakovskiite $Na_7(UO_2)(SO_4)_4(SO_3OH)(H_2O)_3$

Crystal Data: Triclinic. *Point Group*: $\bar{1}$. As fibers to 22 mm. Soluble in water.

Physical Properties: *Cleavage*: None. *Fracture*: Irregular. *Tenacity*: Brittle, flexible and elastic. Hardness = 2 D(meas.) = n.d. D(calc.) = 2.953

Optical Properties: Transparent. *Color*: Pale yellowish green. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Biaxial (+). $\alpha = 1.500$ $\beta = 1.511$ $\gamma = 1.523$ *Orientation*: $X \approx a$.

Cell Data: *Space Group*: $P\bar{1}$. $a = 5.4581(3)$ $b = 11.3288(6)$ $c = 18.4163(13)$ $\alpha = 104.786(7)°$ $\beta = 90.092(6)°$ $\gamma = 96.767(7)°$ $Z = 2$

X-ray Powder Pattern: Blue Lizard Mine, Utah, USA.
5.19 (100), 3.057 (59), 4.66 (58), 3.568 (37), 8.96 (35), 8.46 (29), 1.8320 (29)

Chemistry:

	(1)
Na_2O	21.67
UO_3	30.48
SO_3	40.86
H_2O	[6.45]
Total	99.4

(1) Blue Lizard Mine, Utah, USA; average of 9 electron microprobe analyses, H_2O calculated from structural analysis; corresponding to $Na_{6.83}(U_{1.04}O_2)(SO_4)_4(S_{0.99}O_3OH)(H_2O)_3$.

Occurrence: A secondary efflorescence on sandstone in the oxidation zone of a Colorado Plateau type uraninite deposit.

Association: Blödite, ferrinatrite, kröhnkite, meisserite, metavoltine.

Distribution: From the Blue Lizard Mine, Red Canyon, White Canyon district, San Juan Co., Utah, USA.

Name: Honors Dmitry Ilych Belakovskiy (b. 1957), a prominent Russian mineralogist and Curator of the A.E. Fersman Mineralogical Museum, Moscow, Russia.

Type Material: Natural History Museum of Los Angeles County, California, USA (# 64055) and the A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (4410/1).

References: (1) Kampf, A.R., J. Plášil, A.V. Kasatkin, and J. Marty (2014) Belakovskiite, $Na_7(UO_2)(SO_4)_4(SO_3OH)(H_2O)_3$, a new uranyl sulphate mineral from the Blue Lizard mine, San Juan County, Utah, USA. Mineral. Mag., 78(3), 639-649. (2) (2015) Amer. Mineral., 100, 658 (abs. ref. 1).

Belendorffite Cu_7Hg_6

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $3m$. Massive, a nugget.

Physical Properties: Hardness = n.d. VHN = 45–206, 125 average (25 g load).
D(meas.) = 13.2(1) D(calc.) = 13.15

Optical Properties: Opaque. *Color:* Silvery, tarnishing rapidly to blackish brown; in reflected light, bright white with a yellowish tint. *Streak:* Silvery. *Luster:* Metallic.
Optical Class: Uniaxial. *Anisotropism:* Very weak.
R: (400) 66.2, (420) 67.0, (440) 67.6, (460) 68.3, (480) 69.7, (500) 70.2, (520) 71.0, (540) 71.9, (560) 72.8, (580) 73.4, (600) 74.1, (620) 74.7, (640) 75.3, (660) 76.0, (680) 76.4, (700) 76.9

Cell Data: *Space Group:* $R3m$ (by analogy to synthetic). $a = 9.4024(4)$ $c = ??$
alpha=90.425°??must convert to a and c??; $Z = 4R??$

X-ray Powder Pattern: Landsberg, Germany.
2.523 (100), 2.227 (100), 2.221 (100), 2.208 (100), 2.983 (80), 2.966 (80), 6.68 (60)

Chemistry:

	(1)	(2)
Cu	25.61	26.98
Hg	74.06	73.02
Total	99.67	100.00

(1) Landsberg, Germany; by electron microprobe, average of ten analyses, probably contains some mercury; corresponds to $Cu_{6.78}Hg_{6.22}$. (2) Cu_7Hg_6.

Polymorphism & Series: Dimorphous with kolymite.

Occurrence: In a mercury deposit.

Association: Mercury.

Distribution: From Landsberg, near Obermoschel, Rhineland-Palatinate, Germany [TL].

Name: In honor of Klaus Belendorff (1956–), mineral collector of Münster, Germany, who first noted the mineral.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany.

References: (1) Bernhardt, H.-J. and K. Schmetzer (1992) Belendorffite, a new copper amalgam dimorphous with kolymite. Neues Jahrb. Mineral., Monatsh., 21–28. (2) (1992) Amer. Belkovite $\mathbf{Ba_3(Nb,Ti)_6(Si_2O_7)_2O_{12}}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}m2$. As crystals, prismatic to barrel-shaped, with triangular cross section and stepped faces, showing the forms $\{11\bar{2}0\}$ and $\{0001\}$, to 1 mm.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Moderately brittle. Hardness = 6–7 VHN = 900–1030, average 970 (40 g load). D(meas.) = 4.16(3) D(calc.) = 4.25

Optical Properties: Transparent. *Color:* Brown to brownish red. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial (+); anomalously biaxial. $\omega = 1.928(2)$ $\epsilon = 2.002(5)$
2V(meas.) = 0°–10°

Cell Data: *Space Group:* $P\bar{6}2m$. $a = 8.966(3)$ $c = 7.799(3)$ $Z = 1$

X-ray Powder Pattern: Vuoriyarvi complex, Russia.
2.937 (100), 3.888 (51), 7.81 (35), 1.948 (26), 2.750 (25), 3.481 (24), 2.154 (22)

Chemistry:

	(1)
SiO_2	17.80
TiO_2	5.60
ZrO_2	1.20
Al_2O_3	0.14
Fe_2O_3	1.78
Nb_2O_5	42.20
Ta_2O_5	0.15
CaO	0.05
SrO	0.00
BaO	30.30
Na_2O	0.20
K_2O	0.55
Total	99.97

(1) Vuoriyarvi complex, Russia; by electron microprobe, corresponding to $(Ba_{2.74}K_{0.16}Na_{0.09}Ca_{0.01})_{\Sigma=3.00}(Nb_{4.41}Ti_{0.97}Fe^{3+}_{0.31}Zr_{0.13}Al_{0.04}Ta_{0.01})_{\Sigma=5.87}Si_{4.12}O_{24.90}$.

Occurrence: Of secondary origin, formed by alteration of barium-rich pyrochlore during dolomitization of calcite carbonatites in pyroxenites.

Association: Magnetite, pyrochlore, phlogopite, chlorite, pyrite, pyrrhotite, dolomite, carbonate-apatite, barite, alstonite, nenadkevichite.

Distribution: In the Vuoriyarvi carbonatite complex, Kola Peninsula, Russia.

Name: For Igor Vladimirovich Bel'kov (1917–1989), Soviet mineralogist, Director, Kola Scientific Center, Apatity, Russia, who explored the Kola Peninsula.

Type Material: Mining Institute, St. Petersburg, 2036/1; Geology Museum, Kola Branch, Academy of Sciences, Apatity, 6014; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p584.

Bellbergite $(K, Ba, Sr)_2Sr_2Ca_2(Ca, Na)_4Al_{18}Si_{18}O_{72}\cdot 30H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $\overline{6}m2$, or $6mm$. Rarely as hexagonal dipyramidal crystals, consisting of $\{10\overline{1}2\}$, to 0.3 mm; commonly subparallel intergrowths elongated along [0001].

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼5 D(meas.) = 2.20(2) D(calc.) = 2.19

Optical Properties: Transparent. *Color:* Colorless to white; crystals zoned, with transparent ends and white sides. *Streak:* [White.] *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.522(2)$ $\epsilon = 1.507(2)$

Cell Data: *Space Group:* $P6_3/mmc$, $P6_3mc$, or $P\overline{6}2c$. $a = 13.244(1)$ $c = 15.988(2)$ Z = 1

X-ray Powder Pattern: Bellerberg volcano, Germany.
3.80 (100), 6.58 (80), 2.95 (70), 2.21 (70), 2.70 (50), 2.50 (50), 1.83 (50)

Chemistry:

	(1)
SiO_2	34.41
Al_2O_3	27.90
CaO	9.31
SrO	7.63
BaO	1.22
Na_2O	0.70
K_2O	1.95
H_2O	[16.88]
Total	[100.00]

(1) Bellerberg volcano, Germany; by electron microprobe, H_2O by difference; corresponds to $K_{1.33}Na_{0.72}Ca_{5.32}Sr_{2.36}Ba_{0.26}Al_{17.55}Si_{18.36}O_{72}\cdot 30H_2O$.

Mineral Group: Zeolite group.

Occurrence: In leucite tephrite lava at contacts between lava and calcium-rich xenoliths.

Association: Sanidine, clinopyroxene, pyrrhotite, thompsonite, ettringite, willhendersonite, gismondine, jasmundite, mayenite, srebrodolskite, calcic olivine, portlandite.

Distribution: From the Bellerberg volcano, two km north of Mayen, Eifel district, Germany.

Name: For its occurrence at the Bellerberg (also Bellberg) volcano, Germany.

Type Material: University of Vienna, Vienna, Austria.

References: (1) Rüdinger, B., E. Tillmanns, and G. Hentschel (1993) Bellbergite – a new mineral with the zeolite structure type EAB. Mineral. Petrol., 48, 147–152.

Bellidoite Cu_2Se

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$. As anhedral grains, to 0.3 mm in diameter.

Physical Properties: Hardness = < 3 VHN = 33–41 (100 g load). D(meas.) = n.d. D(calc.) = [7.01]

Optical Properties: Opaque. *Color:* Creamy white in reflected light. *Luster:* Metallic. *Pleochroism:* Very weak. *Anisotropism:* Very weak, in gray colors.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P4_2/n$. $a = 11.52$ $c = 11.74$ Z = [32]

X-ray Powder Pattern: Habrí, Czech Republic.
2.06 (100), 3.38 (80), 1.763 (70), 2.25 (50), 6.80 (30), 3.50 (10), 2.32 (10)

Chemistry:

	(1)	(2)
Cu	61.5	61.62
Se	38.0	38.38
Total	99.5	100.00

(1) Habrí, Czech Republic; by electron microprobe. (2) Cu_2Se.

Polymorphism & Series: Dimorphous with berzelianite.

Occurrence: Formed at medium to low temperatures with other hydrothermal selenides and sulfides.

Association: Berzelianite, umangite, eskebornite, klockmannite, djurleite, digenite, siderite, calcite.

Distribution: From Habrí, near Tisnova, Czech Republic. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: For Eleodoro Bellido Bravo, Director of Servicio de Geología y Minería, Peru.

Type Material: n.d.

References: (1) De Montreuil, L. A. (1975) Bellidoite, a new copper selenide. Econ. Geol., 70, 384–387. (2) (1975) Amer. Mineral., 60, 736 (abs. ref. 1). (3) Paar, W.H., D. Topa, A.C. Roberts, A.J. Bellingerite $Cu_3(IO_3)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Complex euhedral crystals, to 2 mm, elongated along [010] and flattened on [100], show {100}, {010}, {001}, {102}, {201}, {20$\overline{1}$}, {011}, {02$\overline{1}$}, and 20 other forms; {100} striated parallel [010]. *Twinning:* On {$\overline{1}$10}, common, but may not show re-entrants.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = ∼4 D(meas.) = 4.89(1) D(calc.) = 4.932 Slightly soluble in hot H_2O.

Optical Properties: Semitransparent. *Color:* Pale green; pale bluish green in transmitted light. *Streak:* Very pale green.
Optical Class: Biaxial (+). *Pleochroism:* X = Y = pale bluish green; Z = blue-green. *Orientation:* X (70°,–70°); Y (38°,175°); Z (59°,34°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r > v$, strong. *Absorption:* $Z > X = Y$. $\alpha = 1.890$ $\beta = 1.90$ $\gamma = 1.99$ 2V(meas.) = Medium.

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.2560(23)$ $b = 7.9503(15)$ $c = 7.8559(17)$ $\alpha = 105.096(16)°$ $\beta = 92.945(22)°$ $\gamma = 96.952(21)°$ Z = 1

X-ray Powder Pattern: Chuquicamata, Chile. (ICDD 19-393).
3.72 (100), 3.35 (90), 3.17 (90), 3.82 (70), 3.07 (65), 3.13 (60), 3.57 (55)

Chemistry:

	(1)	(2)
I_2O_5	18.65	18.70
CuO	77.55	78.48
H_2O	3.22	2.82
Total	99.42	100.00

(1) Chuquicamata, Chile; corresponds to $Cu_{3.00}(IO_3)_{5.94} \cdot 2.28H_2O$. (2) $Cu_3(IO_3)_6 \cdot 2H_2O$.

Occurrence: A rare secondary mineral in veinlets in a porphyry copper deposit.

Association: Leightonite, gypsum.

Distribution: From Chuquicamata, Antofagasta, Chile.

Name: To honor Herman C. Bellinger (1867–1940), General Manager of the Chile Exploration Company, who submitted the first specimens.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 95026.

(1) Mt. Punkaruaiv, Kola Peninsula, Russia; Ce:La = 1:0.6. (2) Kola Peninsula, Russia; by electron microprobe, original total given as 100.06%; corresponds to $Na_{0.93}(Sr_{2.77}Ca_{0.10}Ba_{0.04})_{\Sigma=2.91}(Ce_{0.55}La_{0.39}Nd_{0.07}Pr_{0.03})_{\Sigma=1.04}[(P_{1.03}Si_{0.01})_{\Sigma=1.04}O_{4.04}]_3[F_{0.71}(OH)_{0.35}]_{\Sigma=1.06}$.

Mineral Group: Apatite group.

Occurrence: As a secondary mineral in pegmatites in differentiated alkalic massifs.

Association: Ussingite, natrolite, chkalovite, epistolite, tugtupite, mangan-neptunite, murmanite, gaidonnayite, nordite-(La), lamprophyllite, fluorcaphite, lomonosovite, deloneite-(Ce), sitinakite, aegirine, eudialyte, sodalite, microcline, nepheline.

Distribution: Found in Russia, on Mts. Punkaruaiv, Lepkhe-Nelm, Sengischorr, Karnasurt, Kedykvyrpakhk, and Alluaiv, Lovozero massif; and on Mts. Kukisvumchorr and Koashva, Khibiny massif, Kola Peninsula.

Name: Honoring Russian crystallographer and academician Nikolai Vasil'evich Belov (1891–1982), former Head of the Crystallography and Crystallochemistry Department, Moscow Lomonosov State University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 56440.

(1–2) Kola Peninsula, Russia.

Occurrence: Included in aegirine and microcline, in nepheline syenite pegmatite in an alkalic massif, in part probably as a replacement of murmanite.

Association: Aegirine, microcline, nepheline, zeolites, eudialyte, lorenzenite, lamprophyllite, titanium oxides.

Distribution: From [Mt. Karnasurt,] Lovozero massif, Kola Peninsula, Russia.

Name: For Dmitry Stepanovich Belyankin (1876–1953), prominent Russian mineralogist and petrographer.

Type Material: n.d.

(1) Franklin, New Jersey, USA; FeO lost, estimated by difference. (2) Do. (3) $Mn_5Si_4O_{10}(OH)_6$.

Occurrence: Layered parallel to the walls of secondary veins of calcite in a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA); intimately intergrown with other manganese minerals (Olympic Peninsula, Washington, USA).

Association: Calcite, willemite (Franklin, New Jersey, USA); hausmannite, jacobsite, braunite, alleghanyite, barite, grossular, johannsenite, calcite (Olympic Peninsula, Washington, USA); hausmannite, rhodochrosite, inesite (Hale Creek, California, USA).

Distribution: In the USA, at Franklin, Sussex Co., New Jersey; in Washington, on the Olympic Peninsula, an ore mineral at a number of small deposits in Clallan, Jefferson, and Mason Cos.; from Ray, Pinal Co., Arizona; at Hale Creek, Trinity Co., California; and from the Black Diablo mine, Black Diablo district, Pershing Co., Nevada. In the Treburland mine, Altarnun, Cornwall, and near Chillaten, Devon, England. From Langbån, Värmland, Sweden. In Russia, at a number of poorly-defined localities. In the Tokuzawa mine, Fukushima Prefecture; the Ichinomata mine, Kumamoto Prefecture; and at Kunimiyama, Kochi Prefecture, Japan. In the Wessels mine, near Kuruman, Cape Province, South Africa.

Name: For Clarence Sweet Bement (1843–1923), American mineral collector of Philadelphia, Pennsylvania, USA.

(1) Clara mine, Germany; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; stated to correspond to $(Sr_{0.67}Ba_{0.16}Pb_{0.07}Ca_{0.01}K_{0.01})_{\Sigma=0.92}(Fe^{3+}_{2.90}Al_{0.03})_{\Sigma=2.93}[(PO_4)_{1.48}(SO_4)_{0.48}(AsO_4)_{0.04}]_{\Sigma=2.00}(OH,H_2O)_{8.3}$.

Mineral Group: Crandallite group.

Occurrence: A secondary mineral in the oxidized zone of a hydrothermal polymetallic barite–fluorite deposit.

Association: Kidwellite, fluorite, goethite.

Distribution: From the Clara mine, near Oberwolfach, Black Forest, Germany.

Name: For the Benauer Berg, Germany, near which the Clara mine is situated.

Type Material: Institute for Mineralogy and Crystal Chemistry, University of Stuttgart, Stuttgart, Germany; Museum Victoria, Melbourne, Australia.

(1) Uchuc-Chacua deposit, Peru; by electron microprobe, corresponding to $Pb_{4.06}(Mn_{0.84}Fe_{0.30})_{\Sigma=1.14}Sb_{6.00}S_{13.80}$. (2) Sätra mine, Sweden; by electron microprobe, average of five analyses, corresponding to $Pb_{4.09}(Mn_{0.69}Fe_{0.42}Cu_{0.03}Zn_{0.03})_{\Sigma=1.17}(Sb_{5.74}Bi_{0.26})_{\Sigma=6.00}S_{14.38}$.

Polymorphism & Series: Forms a series with jamesonite.

Occurrence: In a metamorphosed iron sulfide deposit associated with submarine felsic volcanism (Sätra mine, Sweden); in telescoped polymetallic mineralization associated with dacitic intrusions (Uchuc-Chacua deposit, Peru).

Association: Galena, manganoan sphalerite, pyrite, pyrrhotite, alabandite, uchucchacuaite, quartz, bustamite, rhodonite, calcite (Uchuc-Chacua deposit, Peru); galena, freibergite, gudmundite, manganoan sphalerite, bismuth, spessartine (Sätra mine, Sweden); pyrite, calcite (Dachang district, China).

Distribution: From the Uchuc-Chacua deposit, Cajatambo Province, Peru [TL]. In the Sätra mine, Doverstorp, Bergslagen metallic province, Sweden [TL]. In the Dachang district, Guangxi Autonomous Region, China.

Name: To honor the contributions of Alberto Benavides (1920–), Peruvian mining engineer, to the development of mining in Peru.

Type Material: National School of Mines, Paris, France (Uchuc-Chacua deposit, Peru); Institute of Earth Sciences, Free University of Amsterdam, Amsterdam, The Netherlands (Sätra mine, Sweden).

Benitoite $BaTiSi_3O_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $\bar{6}2m$. Flat pyramidal crystals, tabular on {0001}, triangular or hexagonal in outline, to 6 cm. *Twinning:* By rotation about [0001].

Physical Properties: *Cleavage:* Poor on $\{10\bar{1}1\}$. *Fracture:* Conchoidal. Hardness = 6–6.5 D(meas.) = 3.65 D(calc.) = 3.68 Blue fluorescence under SW UV; intense blue cathodoluminescence.

Optical Properties: Transparent to translucent. *Color:* Sapphire-blue, white to colorless, pink; commonly bicolored. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Pleochroism:* O = colorless; E = purple, indigo, greenish blue.
ω = 1.756–1.757 ϵ = 1.802–1.804

Cell Data: *Space Group:* $P\bar{6}2c$. $a = 6.6410(7)$ $c = 9.7597(10)$ $Z = 2$

X-ray Powder Pattern: San Benito Co., California, USA. (ICDD 26-1036).
3.71 (100), 2.72 (90), 2.86 (75), 5.73 (65), 2.169 (60), 3.30 (50), 3.13 (50)

Chemistry:

	(1)	(2)	(3)
SiO_2	43.68	42.62	43.60
TiO_2	20.09	19.44	19.32
BaO	36.33	37.27	37.08
Na_2O		0.14	
Total	100.10	99.47	100.00

(1) San Benito Co., California, USA. (2) Do.; by electron microprobe. (3) $BaTiSi_3O_9$.

Occurrence: In natrolite veins cutting glaucophane schist in a serpentine body (San Benito Co., California, USA); in a magnesio-riebeckite-quartz-phlogopite-albite dike cutting serpentinite (Ohmi, Japan).

Association: Neptunite, joaquinite, natrolite (San Benito Co., California, USA); ohmilite, bario-orthojoaquinite, leucosphenite (Ohmi, Japan).

Distribution: In the USA, in California, at the Gem mine, Mina Numero Uno, the Victor and Junilla claims, and on Santa Rita Peak, San Benito Co.; from Big Creek–Rush Creek, Fresno Co.; and on Trumbull Peak, near Incline, Mariposa Co.; in the Diamond Jo quarry, Magnet Cove, Hot Spring Co., Arkansas From Ohmi, Niigata Prefecture, Japan. At Broken Hill, New South Wales, Australia.

Name: For the occurrence in San Benito Co., California, USA.

Type Material: n.d.

Benjaminite $(Ag, Cu)_3(Bi, Pb)_7S_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Massive and as laths, to 6 mm, which are complex intergrowths of several closely related phases. *Twinning:* Polysynthetic, common.

Physical Properties: *Cleavage:* Fair, parallel to the elongation. Hardness = 3.3–3.5 VHN = 186–232 (50 g load). D(meas.) = n.d. D(calc.) = 6.68

Optical Properties: Opaque. *Color:* Gray on fresh fracture, tarnishing dull or yellow to coppery red; in polished section, creamy white to very pale brownish. *Luster:* Metallic, with greasy appearance. *Anisotropism:* Strong.

R_1–R_2: (400) 44.2–47.2, (420) 44.8–47.8, (440) 45.2–48.6, (460) 45.2–49.0, (480) 45.0–49.2, (500) 44.8–49.2, (520) 44.5–49.0, (540) 44.0–48.6, (560) 43.6–48.0, (580) 43.3–47.6, (600) 43.1–47.2, (620) 43.0–46.8, (640) 42.8–46.3, (660) 42.7–45.9, (680) 42.6–45.6, (700) 42.5–45.2

Cell Data: *Space Group:* $C2/m$. $a = 13.25(2)$ $b = 4.05(1)$ $c = 20.25(3)$ $\beta = 103.14(07)^\circ$ Z = 2

X-ray Powder Pattern: Camsell River, Canada. Easily mistaken for pavonite. 2.851 (100), 3.539 (80), 3.427 (80), 2.813 (60), 2.022 (60), 2.007 (60), 3.302 (50)

Chemistry:

	(1)	(2)		(1)	(2)
Ag	12.6	14.2	Bi	65.1	64.8
Cu	1.4	0.0	Sb		0.0
Pb	3.7	0.6	S	16.4	18.0
			Total	99.2	97.6

(1) Round Mountain, Nevada, USA; by electron microprobe, average of four analyses; corresponding to $(Ag_{2.74}Cu_{0.52})_{\Sigma=3.26}(Bi_{7.31}Pb_{0.42})_{\Sigma=7.73}S_{12.00}$. (2) AW mine, Australia; by electron microprobe, corresponding to $Ag_{2.82}(Bi_{6.62}Pb_{0.06})_{\Sigma=6.68}S_{12.00}$.

Occurrence: In a quartz vein near the contact of a soda-granite and an intrusive rhyolite (Outlaw mine, Nevada); with arsenides (Camsell River, Canada); in a veinlet in calcite (Cobalt, Canada); in a molybdenite pipe deposit (AW mine, Australia).

Association: Aikinite, chalcopyrite, pyrite, covellite, muscovite, molybdenite, quartz (Outlaw mine, Nevada); safflorite, skutterudite, rammelsbergite, arsenopyrite, nickeline, matildite, bismuthinite, chalcopyrite, pyrite, sphalerite, galena, bismuth, silver (Camsell River, Canada); molybdenite, bismuth, bismuthinite (AW mine, Australia).

Distribution: In the USA, from the Outlaw mine, about 17 km north of Manhattan, Round Mountain district, Nye Co., Nevada [TL]; in the Alaska mine, Poughkeepsie Gulch, near Ouray, San Juan Co., Colorado. From the Terra Company mine, Camsell River, Northwest Territories; and in the Canadian Keely mine, Cobalt, Ontario, Canada. In the Porvenir mine, Cerro Bonete, Potosí, Bolivia. At the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. From the AW mine, south of Tenterfield, New South Wales, Australia. In the Nanten and Daimaru veins, Ikuno deposits, Hyogo Prefecture, Japan. At the Svishti Plaz gold deposit, central Balkan Mountains, Bulgaria. In the Waschgang Au–Cu deposit, Goldberg Mountains, Upper Carinthia, Austria.

Name: Honors Dr. Marcus Benjamin (1857–1932), U.S. National Museum, marine taxonomist and long-time editor of U.S.N.M. publications.

Benleonardite $Ag_8(Sb,As)Te_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$, $\overline{4}2m$, $4mm$, 422, $4/m$, $\overline{4}$, or 4. As crusts and fracture fillings composed of grains and laths, to 100 μm. *Twinning:* According to some simple law.

Physical Properties: Hardness = n.d. VHN = 105–125, 117 average (25 g load). D(meas.) = n.d. D(calc.) = 7.76

Optical Properties: Opaque. *Color:* In polished section, very pale blue. *Anisotropism:* Moderate to strong, in tints of brown, blue, and gray. R_1–R_2: (400) 35.6–36.8, (420) 35.7–36.6, (440) 35.8–36.2, (460) 35.7–35.6, (480) 35.5–34.9, (500) 35.1–34.1, (520) 34.7–33.2, (540) 34.1–32.2, (560) 33.5–31.4, (580) 32.9–30.7, (600) 32.4–30.0, (620) 32.0–29.5, (640) 31.6–29.1, (660) 31.4–28.7, (680) 31.1–28.4, (700) 30.8–28.1

Cell Data: *Space Group:* $P4/mmm$, $P\overline{4}m2$, $P\overline{4}2m$, $P4mm$, $P422$, $P4/m$, $P\overline{4}$, or $P4$. $a = 6.603(5)$ $c = 12.726(6)$ Z = 2

X-ray Powder Pattern: Moctezuma mine, Mexico. 2.936 (100), 12.7 (70), 2.608 (35), 2.158 (35), 3.188 (30), 2.863 (25), 2.328 (20)

Chemistry:

	(1)	(2)	(3)
Ag	64.5	62.99	64.59
Cu	0.1	1.65	
Sb	7.3	5.33	9.11
As	1.4	1.70	
Te	18.7	19.06	19.10
S	8.0	8.33	7.20
Total	100.0	99.06	100.00

(1) Moctezuma mine, Mexico; by electron microprobe, average of 14 analyses, corresponding to $Ag_{7.80}Cu_{0.02}(Sb_{0.78}As_{0.24})_{\Sigma=1.02}Te_{1.90}S_{3.25}$. (2) Gies deposit, Montana, USA; by electron microprobe, average of four analyses; corresponding to $Ag_{7.53}Cu_{0.33}(Sb_{0.56}As_{0.29})_{\Sigma=0.85}Te_{1.93}S_{3.35}$. (3) $Ag_8SbTe_2S_3$.

Occurrence: In fractures in an intensely silicified rhyolitic vitrophyre (Moctezuma mine, Mexico); in a limestone-hosted disseminated Au–Ag–Te deposit (Mayflower mine, Montana, USA); in an epithermal Au–Ag-Te vein system along the contact between alkaline intrusives and sediments (Gies mine, Montana, USA).

Association: Silver, acanthite, hessite, cervelleite, pyrite, sphalerite, dolomite, quartz (Moctezuma mine, Mexico); tetrahedrite, hessite, gold, sphalerite (Mayflower mine, Montana, USA); hessite, tetrahedrite (Gies mine, Montana, USA).

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico [TL]. In the Mayflower mine, Tobacco Root Mountains, Madison Co., and the Gies mine, Judith Mountains, Fergus Co., Montana, USA. From the Emperor mine, Vatukoula, and the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands.

Name: For Dr. Benjamin Franklin Leonard (1921–), of the U.S. Geological Survey, Denver, Colorado, USA.

Type Material: The Natural History Museum, London, England, 1985,354 and E.1611; National Museum of Natural History, Washington, D.C., USA, 165226.

Benstonite $(Ba,Sr)_6Ca_6Mg(CO_3)_{13}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Rhombohedral crystals, to 1 cm; typically as cleavable masses with a fine mosaic structure.

Physical Properties: *Cleavage:* On $\{31\overline{4}2\}$, good. Hardness = 3–4 D(meas.) = 3.596–3.66 D(calc.) = 3.695 Fluoresces red or yellow under LW UV, SW UV, and X-rays; strong red phosphorescence.

Optical Properties: Translucent. *Color:* Snow-white, ivory, very pale yellow, pale yellowish brown.
Optical Class: Uniaxial (–). $\omega = 1.690(1)$ $\epsilon = 1.527(1)$

Cell Data: *Space Group:* $R\overline{3}$. $a = 18.280(9)$ $c = 8.652(8)$ Z = 3

X-ray Powder Pattern: Magnet Cove, Arkansas, USA.
3.08 (95), 3.92 (38), 2.536 (28), 2.127 (23), 1.905 (17), 4.19 (16), 3.53 (10)

Chemistry:

	(1)	(2)
CO_2	31.35	30.61
MnO	0.35	
MgO	1.69	2.16
CaO	19.52	18.00
SrO	4.02	
BaO	43.05	49.23
Total	99.98	100.00

(1) Magnet Cove, Arkansas, USA; corresponds to $(Ba_{5.27}Sr_{0.73})_{\Sigma=6.00}Ca_{6.00}(Mg_{0.79}Ca_{0.12}Mn_{0.09})_{\Sigma=1.00}(CO_3)_{13.00}$. (2) $Ba_6Ca_6Mg(CO_3)_{13}$.

Occurrence: In a barite deposit (Magnet Cove, Arkansas, USA); in Alpine veins cutting a carbonatite (Bayan Obo deposit, China).

Association: Barite, calcite, quartz (Magnet Cove, Arkansas, USA); calcite, alstonite, fluorite, sphalerite (Cave-in-Rock, Illinois, USA); huntite, barytocalcite, strontianite, pyrite, phlogopite, monazite, daqingshanite (Bayan Obo deposit, China).

Distribution: In the USA, from the Baroid barite mine about four km east-northeast of Magnet Cove, Hot Spring Co., Arkansas, and in the Minerva No. 1 mine, near Cave-in-Rock, Hardin Co., Illinois. From the Jason Pb–Zn deposits, Macmillan Pass, Yukon Territory, Canada. At Långban, Värmland, Sweden. From Rosh Pinah, Namibia. In the Murun massif, southwest of Olekminsk, Sakha, Russia. From the Jogipatti carbonatite, near Samalpatti, Tamil Nadi, India. In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China.

Name: Honoring Orlando J. Benston (1901–1966), metallurgist for the Baroid Division, National Lead Co., Malvern, Arkansas, USA, who supplied the first specimens.

Type Material: Victor Goldschmidt University, Göttingen, Germany, S21351; National Museum of Natural History, Washington, D.C., USA, 120234, 120236.

Bentorite $\mathbf{Ca_6(Cr,Al)_2(SO_4)_3(OH)_{12}\cdot 26H_2O}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As stout hexagonal prisms, $\{10\bar{1}0\}$, $\{10\bar{1}1\}$, $\{0001\}$, to 0.25 mm; commonly in fibrous masses, granular aggregates, and thin films. *Twinning:* On $\{10\bar{1}0\}$ as composition plane.

Physical Properties: *Cleavage:* $\{10\bar{1}0\}$, perfect; $\{0001\}$, distinct. Hardness = 2
D(meas.) = 2.025 D(calc.) = 2.021

Optical Properties: Transparent. *Color:* Bright violet. *Streak:* Very pale violet.
Luster: Vitreous.
Optical Class: Uniaxial (+). *Pleochroism:* O = nearly colorless; E = pale violet.
Absorption: $O < E$. $\omega = 1.478(2)$ $\epsilon = 1.484(2)$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 22.35$ $c = 21.41$ Z = 8

X-ray Powder Pattern: Hatrurim Formation, Israel.
9.656 (100), 5.592 (40), 1.942 (20), 3.60 (10), 3.23 (10), 2.772 (10), 3.89 (8)

Chemistry:

	(1)
SO_3	14.99
CO_2	6.70
SiO_2	2.50
Al_2O_3	1.01
Fe_2O_3	0.10
Cr_2O_3	7.48
MgO	0.00
CaO	29.90
H_2O	37.70
Total	100.38

(1) Hatrurim Formation, Israel; by AA, SO_3 by gravimetric analysis, CO_2 and H_2O by TGA; after deduction of CaO and CO_2 as calcite and CaO, SiO_2, H_2O as truscottite, the remainder (about 80%) corresponds to $Ca_{5.88}(Cr_{1.61}Al_{0.32}Fe^{3+}_{0.02})_{\Sigma=1.95}(S_{1.02}O_4)_{3.00}(OH)_{11.97}\cdot 28.06H_2O$.

Mineral Group: Ettringite group.

Occurrence: In low-temperature hydrothermal veins in black calcite–spurrite marble.

Association: Calcite, thaumasite, truscottite, vaterite, jennite, tobermorite, brownmillerite, mayenite, melnikovite, "chlorite".

Distribution: In a marble quarry in the Hatrurim Formation, near the Arad-Sodom road, Negev Desert, Israel.

Name: To honor Professor Y.K. Bentor, University of California, San Diego, California, USA, for his contributions to geology and mineralogy in Israel.

Type Material: Geochemistry Department, Geological Survey of Israel, Jerusalem, Israel, SG644; Fairleigh-Dickinson University, Madison, New Jersey, USA.

References: (1) Gross, S. (1980) Bentorite. A new mineral from the Hatrurim Area, west of the Dead Sea, Israel. Israel J. of Earth Sci., 29, 81–84. (2) (1981) Amer. Mineral., 66, 639 (abs. ref. 1).

Benyacarite

$(H_2O, K)_2(Mn^{2+}, Fe^{2+})_2$
$(Fe^{3+}, Ti, Al)_2Ti(PO_4)_4(O, F)_2 \cdot 14H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 2 mm, tabular on {010}, equant {111}, with {001}, more rarely {100}.

Physical Properties: *Cleavage:* Perfect on {010}; parting on {101}. *Fracture:* Uneven. *Tenacity:* Very brittle. Hardness = 2.5–3 D(meas.) = n.d. D(calc.) = 2.37

Optical Properties: Transparent to translucent. *Color:* Greenish yellow, may be pale brown, almost colorless; pale yellow to colorless in thin section. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Orientation:* $X = b$; $Y = c$; $Z = a$. $\alpha = 1.612(3)$ $\beta = 1.621(3)$ $\gamma = 1.649(3)$ 2V(meas.) = 60(3)°

Cell Data: *Space Group: Pbca.* $a = 10.561(5)$ $b = 20.585(8)$ $c = 12.516(2)$ Z = 4

X-ray Powder Pattern: El Criollo pegmatite, Argentina.
6.26 (100), 3.13 (100), 10.29 (90), 7.51 (80), 3.76 (50), 5.16 (40), 3.96 (40)

Chemistry:

	(1)		(1)
P_2O_5	28.1	CaO	0.1
TiO_2	12.3	Na_2O	0.2
Al_2O_3	0.7	K_2O	1.6
Fe_2O_3	11.0	F	1.5
FeO	2.8	H_2O	[28.9]
MnO	11.2	$-O = F_2$	[0.6]
MgO	0.3	Total	[98.1]

(1) El Criollo pegmatite, Argentina; by electron microprobe, FeO:Fe_2O_3 and H_2O assumed from crystal-structure determination; corresponding to $[(H_2O)_{0.78}K_{0.32}Na_{0.06}]_{\Sigma=1.16}(Mn^{2+}_{1.50}Fe^{2+}_{0.42}Mg_{0.07}Ca_{0.01})_{\Sigma=2.00}(Fe^{3+}_{1.36}Ti_{0.56}Al_{0.14})_{\Sigma=2.06}Ti_{1.00}(PO_4)_4(O_{1.20}F_{0.80})_{\Sigma=2.00} \cdot 14H_2O$.

Occurrence: A rare secondary mineral in a complex zoned granite pegmatite.

Association: Phosphosiderite, strengite, pachnolite, apatite, torbernite.

Distribution: From the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. In Germany, at Hagendorf, and on the Kreuzberg, Pleystein, Bavaria. From Folgosinho, near Gouveia, Portugal.

Name: To honor María Angélica R. de Benyacar (1928–), National Atomic Energy Commission, Buenos Aires, Argentina, for her mineralogical studies.

Type Material: Department of Earth Sciences, University of Milan, Milan, Italy.

Beraunite $Fe^{2+}Fe_5^{3+}(PO_4)_4(OH)_5 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Commonly as crystals, tabular on {100}, elongated along [010], to 1 cm; striated on {100} ‖ [010]. In coarse radially fibrous aggregates, globular or discoidal, and in crusts. *Twinning:* On {100}, may be interpenetrant.

Physical Properties: *Cleavage:* On {100}, good. Hardness = 3–4 D(meas.) = 2.8–3.08 D(calc.) = 2.894 (greenish black); 2.970 (orange).

Optical Properties: Translucent. *Color:* Dull greenish to greenish brown when fresh, may be color banded; reddish brown to hyacinth-red, blood-red on exposure. *Streak:* Olive-drab when fresh; yellow, brownish yellow on exposure. *Luster:* Vitreous, pearly on cleavages, resinous on fractures.
Optical Class: Biaxial (+), may be biaxial (–). *Pleochroism:* X = pale flesh-pink, yellow, blue-green; Y = pale flesh-pink, yellow, pale olive-green; Z = carnelian-red, reddish brown, olive-green. *Orientation:* $Z = b$; $Y \wedge c = 1.5°$–$5°$. *Dispersion:* $r > v$, marked, may be $r < v$. $\alpha = 1.707$–1.775 $\beta = 1.735$–1.786 $\gamma = 1.738$–1.820 2V(meas.) = Moderate to large.

Cell Data: *Space Group:* $C2/c$ (greenish black) with $a = 20.953(5)$ $b = 5.171(1)$ $c = 19.266(4)$ $\beta = 93.34(2)°$ Z = 4, or *Space Group:* $C2/c$ (orange) with $a = 20.646(5)$ $b = 5.129(7)$ $c = 19.213(5)$ $\beta = 93.67(7)°$ Z = 4

X-ray Powder Pattern: Palermo #1 mine, New Hampshire, USA.
10.37 (10), 4.825 (6), 3.082 (6), 9.58 (5), 7.229 (5), 4.418 (5), 3.187 (4), 3.747 (3)

Chemistry:

	(1)	(2)
P_2O_5	30.17	31.26
Al_2O_3	0.02	
Fe_2O_3	54.41	43.97
FeO	1.92	7.91
H_2O	13.45	16.86
Total	99.97	100.00

(1) Middletown, New Jersey, USA; partially oxidized. (2) $Fe^{2+}Fe_5^{3+}(PO_4)_4(OH)_5 \cdot 6H_2O$.

Occurrence: A component of bog iron ores; a cement in clays, sands, and bone material; an alteration product of triphylite in granite pegmatites.

Association: Vivianite, dufrénite, rockbridgeite, cacoxenite, wavellite, ferrostrunzite, ferristrunzite, frondelite, huréaulite, mitridatite, stewartite, laueite, leucophosphite, triphylite, "limonite".

Distribution: Many localities are known; some with well-studied material include: in the Hrbek mine, at St. Benigna, near Beroun, Czech Republic. In Germany, from the Eleonore and Rotläufchen iron mines, near Giessen, Hesse; and at Hühnerkobel, near Zwiesel, from Hagendorf, and on the Kreuzberg, Pleystein, Bavaria. From the Gravel Hill mine, Perranzabuloe, Cornwall, England. In the Mangualde pegmatite, near Mesquitela, Portugal. From the Leveäniemi mine, Svappavaara, near Kiruna, Sweden. In the USA, from the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire; at Raccoon Creek, Mullica Hill, Gloucester Co., New Jersey; in the Hesnard mine, three km southwest of Keystone, and the Big Chief mine, one km south of Glendale, Pennington Co., South Dakota; from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina. In the Moculta phosphate quarry, northeast of Angaston, South Australia.

Name: For its occurrence near Beroun (formerly Beraun), Czech Republic.

Type Material: Mining Academy, Freiberg, Germany, 21359.

Berborite $Be_2(BO_3)(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 3, $3m$, or 6. As crystals showing {0001}, {$10\bar{1}1$}, {$11\bar{2}1$}, with half-a-dozen less common forms, typically hemihedral, or prismatic along [0001], to 1.5 cm. *Twinning:* Noted, complex.

Physical Properties: *Cleavage:* Perfect on {0001}. *Fracture:* Irregular. Hardness = 3 VHN = 85 D(meas.) = 2.03–2.06 D(calc.) = 2.04

Optical Properties: Transparent to translucent. *Color:* Colorless to white, may be zoned. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.5804$–1.5817 $\epsilon = 1.485$–1.4928

Cell Data: *Space Group:* $P3$ (1T), with $a = 4.4328(8)$ $c = 5.337(1)$ Z = 1, or *Space Group:* $P3c1$ (2T), with $a = 4.4348(4)$ $c = 10.664(1)$ Z = 2, or *Space Group:* $P6_3$ (2H), with $a = 4.4403(8)$ $c = 10.655(2)$ Z = 2

X-ray Powder Pattern: Saga quarry, Norway (1T).
5.35 (100), 2.666 (50), 3.120 (45), 2.046 (20), 3.840 (5), 2.218 (5), 1.780 (5)

Chemistry:

	(1)	(3)
B_2O_3	23.5	31.12
BeO	39.3	44.72
H_2O		24.16
LOI	33.2	
Total	96.0	100.00

(1) Luppikko deposit, Russia; hambergite and fluorite estimated 2%–3%. (2) Saga quarry, Norway; stated to have Be:B = 1.99–2.02:1.00. (3) $Be_2(BO_3)(OH)\cdot H_2O$.

Polymorphism & Series: 1T, 2T, 2H polytypes.

Occurrence: In serpentinized dolostone associated with W–Sr–B–Be-bearing skarns (Pitkäranta district, Russia); in vugs with natrolite (Saga quarry, Norway).

Association: Hambergite, schoenfliesite, helvite, apatite, cassiterite, fluorite, calcite, dolomite, magnetite, sphalerite, vesuvianite, chondrodite, diopside, smithsonite, goethite (Pitkäranta district, Russia); natrolite, thomsonite (Saga quarry, Norway).

Distribution: From the Luppikko deposit, Pitkäranta district, Lake Ladoga, Karelia, Russia. In the Saga and Tuften larvikite quarries, Tvedalen, and at Brønnebukta, Siktesøya Island, Langesundsfjord, Norway.

Name: For BERyllium and BORate in the composition.

Type Material: Mineralogical Museum, St. Petersburg, 15180; Mining Institute, St. Petersburg, 1003/1–1003/5; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 69274.

Berdesinskiite $V_2^{3+}TiO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. As grains, rarely up to 70 μm, and as rims around schreyerite.

Physical Properties: Hardness = [6–6.5] (polishing hardness close to that of rutile). D(meas.) = n.d. D(calc.) = 4.536

Optical Properties: Opaque. *Color:* Black; reddish brown under reflected polarized light. *Luster:* Metallic.
Optical Class: Biaxial. *Bireflectance:* Weak.
R_1–R_2: (400) 16.6–17.1, (420) 17.1–17.5, (440) 17.4–18.0, (460) 17.9–18.4, (480) 18.3–18.9, (500) 18.8–19.4, (520) 19.2–19.8, (540) 19.5–20.3, (560) 19.8–20.8, (580) 20.0–21.1, (600) 20.3–21.3, (620) 20.4–21.4, (640) 20.5–21.5, (660) 20.6–21.6, (680) 20.4–21.6, (700) 20.2–21.5

Cell Data: *Space Group:* [$C2/c$ or Cc; $P2_1/c$; $P2/c$ or Pc] (by analogy to synthetic V_2TiO_5). $a = 10.11(1)$ $b = 5.084(4)$ $c = 7.03(1)$ $\beta = 111.46(6)°$ Z = 4

X-ray Powder Pattern: Near Lasamba Hill, Kenya; line intensities not given.
4.721, 4.492, 3.316, 2.895, 2.676, 2.543, 2.447

Chemistry:

	(1)	(2)
TiO_2	34.13	34.77
Al_2O_3	0.76	
V_2O_3	64.35	65.23
Cr_2O_3	1.39	
MnO	0.01	
Total	100.64	100.00

(1) Near Lasamba Hill, Kenya; by electron microprobe, average of five analyses; corresponding to $(V_{1.96}Cr_{0.05}Al_{0.03})_{\Sigma=2.04}Ti_{0.98}O_5$. (2) V_2TiO_5.

Occurrence: In strongly weathered gneiss with quartzite in a gem kornerupine deposit of Precambrian age.

Association: Schreyerite, rutile, kornerupine, diopside, epidote, graphite, quartz, biotite, tourmaline.

Distribution: From six km southeast of Lasamba Hill, Kwale district, south of Voi, Kenya.

Name: For Professor Waldemar Berdesinski (1911–1990), crystallographer, University of Heidelberg, Heidelberg, Germany.

Type Material: Universities of Bochum, Hamburg, and Heidelberg, Germany; National Museum of Natural History, Washington, D.C., USA, 147362.

Bergenite $(Ba,Ca)_2(UO_2)_3(PO_4)_2(OH)_4 \cdot 5.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As thin tabular to needlelike crystals, to 3 mm.

Physical Properties: Hardness = n.d. D(meas.) = ∼4.1 D(calc.) = 4.98 Radioactive; pale green fluorescence under SW UV.

Optical Properties: Semitransparent. *Color:* Yellow to greenish yellow. *Streak:* Pale yellow. *Optical Class:* Biaxial (–). $\alpha = 1.660$ β = n.d. $\gamma = 1.722$ 2V(meas.) = 60°

Cell Data: *Space Group:* $P2_1/c$. $a = 23.32$ $b = 17.19$ $c = 20.63$ $\beta = 93.0°$ Z = 18

X-ray Powder Pattern: Streuberg, Germany.
7.73 (100), 3.837 (80), 3.054 (60), 2.874 (50), 2.826 (50), 8.54 (40), 3.742 (40), 3.415 (40)

Chemistry:

	(1)	(2)
UO_3	62.54	62.4
P_2O_5	10.98	11.4
CaO	2.44	2.5
BaO	13.98	13.2
H_2O	[10.06]	[10.5]
Total	[100.00]	[100.0]

(1) Streuberg, Germany; by electron microprobe, average of five analyses, H_2O by difference; corresponds to $(Ba_{1.22}Ca_{0.58})_{\Sigma=1.80}(UO_2)_{2.93}(PO_4)_{2.07}(OH)_4 \cdot 5.5H_2O$. (2) Do.; by electron microprobe, H_2O by difference.

Occurrence: On a mine dump (Streuberg, Germany).

Association: "Uranocircite", torbernite, autunite, dewindtite, barian uranophane (Streuberg, Germany).

Distribution: In Germany, from the Streuberg, near Bergen, Saxony, and at Menzenschwand, Black Forest.

Name: For the first-noted occurrence of the mineral near Bergen, Germany.

Type Material: n.d.

Bergslagite $CaBe(AsO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic or triclinic, pseudomonoclinic. *Point Group:* $2/m$ or $\overline{1}$. As elongated, flattened crystals, to 1 cm, showing {100} and {001}; in crusts.

Physical Properties: *Fracture:* Uneven. Hardness = 5 D(meas.) = 3.40(2) D(calc.) = 3.40 Fluoresces pale shades of yellowish brown, greenish, or bluish under SW UV.

Optical Properties: Translucent. *Color:* Colorless, white or gray, dark gray-brown, brownish black; may be green or pink. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (–). *Orientation:* $X \simeq a$; $Y = b$; $Z \simeq c$. *Dispersion:* $r \gg v$.
$\alpha = 1.659$–1.660 $\beta = 1.678$–1.681 $\gamma = 1.690$–1.694 2V(meas.) = ∼70° 2V(calc.) = 74°–78°

Cell Data: *Space Group:* $P2_1/c$. $a = 4.8818(9)$ $b = 7.809(1)$ $c = 10.127(1)$ $\beta = 90.16(1)°$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
3.200 (10), 3.519 (8), 4.879 (7), 3.905 (7), 3.046 (7), 2.917 (7), 2.409 (6)

Chemistry:

	(1)	(2)
As_2O_5	51.58	56.06
SiO_2	2.48	
BeO	13.0	12.20
CaO	28.57	27.35
H_2O	6.0	4.39
Total	101.63	100.00

(1) Långban, Sweden; by electron microprobe, average of ten analyses, BeO from average of three determinations, by AA, emission spectroscopy, and the Weisz Ring-Oven technique, H_2O by TGA; corresponds to $Ca_{0.99}Be_{1.02}[(AsO_4)_{0.87}(SiO_4)_{0.08}]_{\Sigma=0.95}(OH)_{1.30}$. (2) $CaBe(AsO_4)(OH)$.

Occurrence: In thin veins in pieces of hematite ore found on mine dumps from a metamorphosed Fe–Mn orebody (Långban, Sweden); in rhyolite (Sailauf, Germany).

Association: Manganoan diopside, manganberzeliite, tilasite, svabite, hematite, calcite, barite (Långban, Sweden); hematite, muscovite (Sailauf, Germany).

Distribution: From Långban, Värmland, Sweden. In Switzerland, in the Falotta mine, Oberhalbstein, and in the Fianel mine, Val Ferrera, Graubünden; on the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais. At Sailauf, northeast of Aschaffenburg, Spessart Mountains, Bavaria, Germany.

Name: For the occurrence at Långban, which is in the *Bergslagen* region of Sweden.

Type Material: University of Copenhagen, Copenhagen, Denmark; National Museum of Natural History, Washington, D.C., USA, 162582.

References: (1) Hansen, S., L. Fälth, O.V. Petersen, and O. Johnsen (1984) Bergslagite, a new mineral species from Långban, Sweden. Neues Jahrb. Mineral., Monatsh., 257–262. (2) Hansen, S., L. Berlinite $AlPO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 32. Granular, to 6 mm, massive.
Twinning: Subparallel twinning lamellae.

Physical Properties: *Fracture:* Conchoidal. Hardness = ∼6.5 D(meas.) = 2.64–2.66 D(calc.) = 2.618 May fluoresce dark red under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, pale gray, may be pale rose; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.524(1)$ $\epsilon = 1.532(1)$

Cell Data: *Space Group:* $P3_121$ (synthetic). $a = 4.941(2)$ $c = 10.940(3)$ Z = 3

X-ray Powder Pattern: Synthetic.
3.369 (100), 4.28 (25), 1.835 (16), 2.471 (12), 2.306 (12), 1.393 (12), 1.389 (12)

Chemistry:

	(1)	(2)
P_2O_5	58.43	58.20

Total	100.48	100.00

(1) Mt. Perry, Australia; by electron microprobe, total Fe as Fe_2O_3. (2) $AlPO_4$.

Occurrence: A rare high-temperature hydrothermal or metasomatic mineral.

Association: Augelite, attakolite, kyanite, pyrophyllite, scorzalite, lazulite, gatumbaite, burangaite, amblygonite, phosphosiderite, purpurite, apatite, muscovite, quartz, hematite (granite pegmatites); alunite, aragonite, collophane, crandallite, francoanellite, gypsum, huntite, hydromagnesite, leucophosphite, nesquehonite, niter, nitrocalcite (Paddy's River mine, Australia).

Distribution: In the Västanå mine, near Näsum, Skåne, and at Hålsjöberg, Värmland, Sweden. In Rwanda, in the Buranga and Rusororo pegmatites, Gatumba district. In Australia, on Mt. Perry, 75 km southwest of Bundaberg, Queensland, and at Paddy's River mine, Australian Capital Territory. From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil.

Name: Honoring Professor Nils Johan Berlin (1812–1891), pharmacologist, University of Lund, Lund, Sweden.

Type Material: Wroclaw University, Wroclaw, Poland, II–9574; Harvard University, Cambridge, Massachusetts, USA, 101252.

Bermanite $Mn^{2+}Mn^{3+}_2(PO_4)_2(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals are tabular on {010}, with additional forms, to 5 mm; as sheaflike aggregates and rosettes; generally as thin films or druses on fractures. *Twinning:* Polysynthetic about [101] with composition plane $\{\overline{1}01\}$ or about $[\overline{1}01]$ with composition plane {101}, common; as reflection twins, on {001} about [100], or with two more individuals twinned on $\{\overline{3}01\}$ about [100] producing composite fourlings.

Physical Properties: *Cleavage:* Perfect on {001}; imperfect on {110}. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 2.84–2.85 D(calc.) = 2.87

Optical Properties: Translucent. *Color:* Reddish brown, darkening on exposure; yellowish brown to brownish red, with red internal reflections, in transmitted light. *Luster:* Vitreous to slightly resinous, dull.
Optical Class: Biaxial (–). *Pleochroism:* X = light red; Y = pale yellow; Z = deep red. *Orientation:* $X = b$; $Y \wedge a = 32.5°$; $Y \wedge c = -36.5°$. *Dispersion:* $r < v$, strong. *Absorption:* $Z > X > Y$. α = 1.685–1.690 β = 1.725–1.729 γ = 1.748–1.751 2V(meas.) = 72°–75°

Cell Data: *Space Group:* $P2_1$. a = 5.425–5.446 b = 19.206–19.25 c = 5.425–5.428 β = 110.29°−110.40° Z = 2

X-ray Powder Pattern: 7U7 Ranch, Arizona, USA.
9.63 (100), 2.905 (36), 4.82 (28), 3.263 (23), 3.673 (19), 5.10 (16), 3.062 (11)

Chemistry:	(1)	(2)		(1)	(2)		(1)	(2)

(1) 7U7 Ranch, Arizona, USA; corresponding to $(Mn^{2+}_{0.82}Mg_{0.12}Ca_{0.06})_{\Sigma=1.00}(Mn^{3+}_{1.75}Fe^{3+}_{0.18}Al_{0.02})_{\Sigma=1.95}(PO_4)_2(OH)_2 \cdot 3.99H_2O$. (2) $Mn^{2+}Mn^{3+}_2(PO_4)_2(OH)_2 \cdot 4H_2O$.

Occurrence: A late-stage hydrothermal mineral replacing primary phosphate phases, usually triplite or lithiophilite, in complex granite pegmatites.

Association: Triplite, strengite, leucophosphite, huréaulite, lithiophilite, stewartite, sicklerite, rockbridgeite, phosphosiderite, strunzite, switzerite, paulkerrite.

Distribution: In the USA, from the 7U7 Ranch, 40 km west of Hillside, Bagdad district, Yavapai Co., Arizona; in the Williams pegmatite, Coosa Co., Alabama; at the Stewart Lithia mine, Pala, San Diego Co., California; from the White Elephant, Bull Moose, Linwood, and Tip Top mines, near Custer, Custer Co., South Dakota; in the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., New Hampshire. At the El Criollo pegmatite, Cerro Blanco, Tanti district, 45 km west of Córdoba, Córdoba Province, Argentina. From the McMahon quarry, near Olary, and in the Wiperaminga Hill West quarry, Boolcoomata, South Australia. From the Sapucaia pegmatite mine, about 50 km east-southeast of Governador Valadares, Minas Gerais, Brazil. At the Buranga pegmatite, near Gatumba, Rwanda. In the Kobokobo pegmatite, Lusungu River district, Kivu Province, Congo (Zaire). From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. At Hagendorf, Bavaria, Germany. Other minor localities have been noted.

Name: In honor of Dr. Harry Berman (1902–1944), Professor of Mineralogy, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 97863–97865, 119698; National Museum of Natural History, Washington, D.C., USA, 120405.

Bernalite $Fe(OH)_3 \cdot nH_2O$ (n = 0.0 to 0.25)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. As flattened pyramidal crystals and pseudo-octahedra, to 3 mm, with slightly concave faces. *Twinning:* Polysynthetic, crosshatched, observed in thin section, probably pinacoidal.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 3.32(2) D(calc.) = 3.35

Optical Properties: Transparent to opaque due to goethite inclusions. *Color:* Dark bottle-green to yellow-green; in thin section, yellowish bottle-green. *Streak:* Apple-green. *Luster:* Vitreous to adamantine when fresh; resinous on crystal surfaces. *Optical Class:* Biaxial. n = 1.92–1.94 2V(meas.) = n.d.

Cell Data: *Space Group:* $Pmmn$, probable, or $Immm$, possible. a = 7.544(2) b = 7.560(4) c = 7.558(2) Z = 8

X-ray Powder Pattern: Broken Hill, Australia.
3.784 (100), 1.692 (17), 2.393 (16), 2.676 (15), 1.892 (10), 1.545 (9), 2.023 (6)

Chemistry:

	(1)
SiO_2	2.99
Fe_2O_3	65.53
ZnO	1.13
PbO	2.70
H_2O	25.2
CO_2	1.0
Total	98.55

(1) Broken Hill, Australia; by electron microprobe, average of eight analyses, Fe^{3+} confirmed by Mössbauer spectroscopy, H_2O and CO_2 by CHN analyzer; corresponds to $(Fe^{3+}_{0.93}Si_{0.06}Zn_{0.01})_{\Sigma=1.00}[(OH)_{2.95}O_{0.04}]_{\Sigma=2.99} \cdot [(H_2O)_{0.04}(CO_2)_{0.03}Pb_{0.01}]_{\Sigma=0.08}$.

Occurrence: On a museum specimen from a metamorphosed Pb–Zn deposit, probably from the surface oxidation zone.

Association: Goethite, coronadite.

Distribution: From the Proprietary mine, Broken Hill, New South Wales, Australia.

Name: To honor John Desmond Bernal (1901–1971), eminent British crystallographer and historian of science.

Type Material: Museum Victoria, Melbourne; South Australian Museum, Adelaide, Australia, G17627.

Bernardite $Tl(As,Sb)_5S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are thick tabular, partly corroded and striated, with prominent {100}, {012}, {210}, and {201}, {$\overline{2}$01}, {010}, to 4 mm.

Physical Properties: *Fracture:* Subconchoidal to uneven. Hardness = ∼2 D(meas.) = 4.5(1) D(calc.) = 4.105

Optical Properties: Semitransparent. *Color:* Black. *Streak:* Red. *Luster:* Dull. *Optical Class:* Biaxial.
R_1–R_2: (400) 29.6–32.3, (420) 28.9–31.8, (440) 28.1–31.3, (460) 27.4–30.6, (480) 26.8–29.9, (500) 26.0–28.9, (520) 25.4–27.8, (540) 25.0–26.7, (560) 24.5–25.8, (580) 24.0–25.1, (600) 23.6–24.4, (620) 23.3–23.9, (640) 23.1–23.4, (660) 22.9–23.0, (680) 22.8–22.8, (700) 22.8–22.5

Cell Data: *Space Group:* $P2_1/c$. $a = 15.647(4)$ $b = 8.038(3)$ $c = 10.750(3)$ $\beta = 91.27(3)^\circ$ Z = 4

X-ray Powder Pattern: Alšar, Macedonia (calculated).
3.06 (100), 4.28 (74), 4.46 (65), 3.07 (65), 3.68 (63), 2.68 (59), 3.72 (55)

Chemistry:

	(1)	(2)	(3)
Tl	23.3	22.7	24.46
As	43.7	35.2	44.84
Sb	0.1	10.4	
S	31.5	29.8	30.70
Total	98.6	98.1	100.00

(1) Alšar, Macedonia; by electron microprobe, corresponding to $Tl_{0.93}(As_{4.75}Sb_{0.01})_{\Sigma=4.76}S_{8.00}$.
(2) Do.; by electron microprobe, corresponding to $Tl_{0.96}(As_{4.04}Sb_{0.74})_{\Sigma=4.78}S_{8.00}$. (3) $TlAs_5S_8$.

Occurrence: In a hydrothermal deposit with other As–Tl sulfide minerals.

Association: Realgar, orpiment, hutchinsonite, wallisite, hatchite, lorandite, edenharterite, erniggliite, stalderite (Binntal, Switzerland).

Distribution: From Alšar (Allchar), near Rošden, Macedonia [TL]. At the Lengenbach quarry, Binntal, Valais, Switzerland.

Name: In honor of Dr. Jan H. Bernard, mineralogist, Geological Survey of Czechoslovakia, who first noted the mineral.

Type Material: Národni Museum, Prague, Czech Republic; Natural History Museum, Vienna; Institute for Mineralogy and Crystallography, University of Vienna, Austria.

Berndtite SnS_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ (2T) and $6mm$ (4H). Tabular hexagonal crystals, to 0.01 mm, in powdery aggregates.

Physical Properties: *Cleavage:* {0001}, marked. Hardness = Very soft. VHN = n.d. D(meas.) = 4.5 (synthetic). D(calc.) = [4.55]

Optical Properties: Translucent to transparent. *Color:* Pale yellow; in polished section, gray, with intense brownish to yellow-orange internal reflections. *Luster:* Resinous. *Streak:* Golden yellow. *Pleochroism:* Strong. *Anisotropism:* Dark greenish gray.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P\overline{3}m1$ (2T), with $a = 3.639$ $c = 5.868$ Z = 1, or
Space Group: $P6_3mc$ (4H), with $a = 3.650$ $c = 11.811$ Z = 2

X-ray Powder Pattern: Synthetic.
5.89 (100), 2.784 (55), 3.162 (30), 1.824 (30), 2.155 (25), 1.743 (20), 1.669 (8)

Chemistry: Sn and S are major constituents.

Polymorphism & Series: Stacking polytypes 2T and 4H are known.

Mineral Group: Melonite group.

Occurrence: A secondary mineral in tin sulfide ores (Cerro de Potosí, Bolivia); a secondary mineral in a tin-bearing pegmatite (Lagares-do-Estanho tin pegmatite); in a high-temperature deposit, hydrothermally altered (Arandis, Namibia).

Association: Stannite, pyrite, cassiterite, sulfur.

Distribution: From Cerro [Rico], Potosí, Bolivia [2T TL]. In Portugal, at Panasqueira [4H TL] and from the Lagares-do-Estanho tin pegmatite. In the Stiepelmann mine, Arandis, Namibia. From Forestville, Northumberland Co., Pennsylvania, USA.

Name: For Dr. Fritz Berndt, German mineralogist, Corporatión Minera de Bolivia, Oruro, Bolivia.

Type Material: National Museum of Natural History, Washington, D.C., USA, 114486, C5354A.

References: (1) Moh, G.H. and F. Berndt (1964) Two new natural tin sulfides, Sn_2S_3 and SnS_2. Neues Jahrb. Mineral., Monatsh., 94–95. (2) (1965) Amer. Mineral., 50, 2107 (abs. ref. 1). Berryite $Pb_3(Cu,Ag)_5Bi_7S_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$ or 2. Lathlike aggregates of several not quite parallel individuals, to a maximum length of 1 mm; granular, massive. *Twinning:* Repeated.

Physical Properties: *Cleavage:* Poor. Hardness = n.d. VHN = 131–152 (100 g load), 171 (100 g load). D(meas.) = 6.7, corrected for admixed quartz. D(calc.) = [6.83]

Optical Properties: Opaque. *Color:* White to pale gray in polished section.
Pleochroism: Weak to distinct. *Anisotropism:* Distinct to strong, from pale gray to red-brown and green.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P\ 2_1/m$ or $P2_1$. $a = 12.72$ $b = 4.02$ $c = 58.07$ $\beta = 102.5°$
Z = [4]

X-ray Powder Pattern: Nordmark, Sweden.
3.47 (10), 2.89 (8), 2.80 (7), 2.18 (4), 3.70 (2), 2.86 (2), 3.23 (1)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Pb	21.6	20.8	20.9	Bi	49.2	47.5	49.5
Ag	4.9	6.8	7.4	S	[17.2]	[17.2]	17.0
Cu	7.1	7.8	5.3	Total	[100.0]	[100.1]	100.1

(1) Ivigtut, Greenland; by electron microprobe, sulfur by difference, recalculated to be near 100%; corresponds to $Pb_{3.15}(Cu_{3.40}Ag_{1.35})_{\Sigma=4.75}Bi_{7.10}S_{16.20}$. (2) Do.; corresponds to $Pb_{2.95}(Cu_{3.60}Ag_{1.80})_{\Sigma=5.40}Bi_{6.65}S_{15.65}$. (3) Owen Lake, Canada; by electron microprobe, average of several grains; corresponds to $Pb_{3.09}(Cu_{2.55}Ag_{2.10})_{\Sigma=4.55}Bi_{7.25}S_{16.25}$.

Occurrence: In quartz veins with other sulfides and sulfosalts, and in siderite-rich cryolite (Ivigtut, Greenland).

Association: Emplectite, aikinite, cuprobismutite, cupropavonite (Colorado, USA); galena, chalcopyrite, sphalerite, quartz (Nordmark, Sweden); galena, cosalite, ourayite, matildite, aikinite (Ivigtut, Greenland); aikinite, matildite, benjaminite, quartz, barite (Tary Ekan deposit, Kazakhstan).

Distribution: In the USA, in Colorado, from the Missouri mine, Park Co. [TL], the Mike mine, Silverton district, San Juan Co., and Cinnamon Gulch, Northeast Montezuma district, Clear Creek Co.; at the Outlaw mine, Round Mountain, Manhattan, Nye Co., Nevada. From near Owen Lake, south of Houston, British Columbia, Canada. In the Ivigtut cryolite deposit, southwestern Greenland. At Nordmark, Värmland, Sweden. From the Catarama mine, Baia Borşa district, Baia Mare (Nagybánya), Romania. In the Svishti Plaz gold deposit, central Balkan Mountains, Bulgaria. From two km west of Lairg, Scotland. In the Adrasman, Kaptar-Hana, and Tary Ekan deposits, eastern Karamazar, Tajikistan. From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan. At the Funiushan copper skarn deposit, near Nanjing, Jiangsu Province, China. Several additional localities are known.

Name: In honor of Professor Leonard Gascoigne Berry (1914–1982), Canadian mineralogist, Queen's University, Kingston, Ontario, Canada, who obtained the first X-ray powder pattern of the mineral.

Type Material: University of Copenhagen, Copenhagen, Denmark; National Museum of Natural History, Washington, D.C., USA, 92902.

(1) Belgorod district, Kursk, Russia; corresponds to $(Fe^{2+}_{1.48}Al_{0.96}Fe^{3+}_{0.22}Mg_{0.16})_{\Sigma=2.82}(Si_{1.15}Al_{0.85})_{\Sigma=2.00}O_{5.04}(OH)_{3.93}$. (2) Kaňk, Czech Republic; corresponds to $(Fe^{2+}_{1.81}Mg_{0.53}Al_{0.36}Fe^{3+}_{0.23})_{\Sigma=2.93}(Si_{1.52}Al_{0.48})_{\Sigma=2.00}O_{5.00}(OH)_{4.00}$.

Polymorphism & Series: 1M and 1H polytypes.

Mineral Group: Kaolinite-serpentine group.

Occurrence: Common in unmetamorphosed marine sediments; in lateritic and polar soils.

Association: Glauconite, chlorite-vermiculite interstratified with mica-smectite, siderite, calcite.

Distribution: Widespread; a few localities for studied material are: at Hayange, Meurthe-et-Moselle, France. In several mines in the Weardale fluorite district, Durham; in the Stanion Lane pit, Corby, Northamptonshire; on the Worth Farm and in the Philpots quarry, West Sussex, England. From the Belgorod district and the Voronezh anticline, Kursk, Russia. In the Chichibu mine, Saitama Prefecture, Japan. On Ellef Ringnes Island, Northwest Territories; from near Picton, Ontario; and at Mont Saint-Hilaire, Quebec, Canada.

Name: Honors the French geologist, Pierre Berthier (1782–1861).

(1) Herja, Romania; corresponds to $Fe_{1.05}Sb_{2.01}S_{4.00}$. (2) $FeSb_2S_4$.

Occurrence: In low-temperature hydrothermal antimony veins, in portions deficient in sulfur.

Association: Stibnite, arsenopyrite, pyrite, barite, calcite, quartz.

Distribution: Localities are numerous. In France, from Chazelles, Auvergne [TL], Pontgibaud, Puy-de-Dôme, and Valcros, Provence. At Herja (Kisbánya), Baia Mare (Nagybánya) district, and Baia Sprie (Felsőbánya), Romania. From Příbram and Kutná Hora, Czech Republic. At Bräunsdorf, near Freiberg, Saxony, Germany. From Ribnova, southern Rhodope Mountains, Bulgaria. In the Niccioleta mine, Tuscany, Italy. In Mexico, from San Martin, Concepción del Oro, Zacatecas; and from mines near Triunfo, Baja California. At Chashan, Guangxi Province, China. [ck??Japan??]

X-ray Powder Pattern: Buranga pegmatite, Rwanda. (ICDD 41-1450).
3.059 (100), 3.104(84), 2.411 (63), 3.295 (60), 2.881 (57), 2.577 (40), 4.32 (33)

Chemistry: (1) Buranga pegmatite, Rwanda; an analysis was not published - based on other properties it is stated to be the calcium analog of palermoite, $(Sr, Ca)(Li, Na)_2Al_4(PO_4)_4(OH)_4$.

Occurrence: Thought to be formed during a late calcium-rich phase of mineralization in a lithium-bearing granite pegmatite.

Association: Amblygonite, lazulite-scorzalite, augelite, brazilianite, apatite, crandallite, trolleite, samuelsonite, quartz.

Distribution: In the Buranga pegmatite, near Gatumba, Rwanda.

Name: Honoring Antonio Bertossa, Director of the Geological Survey of Rwanda.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMB11232; National Museum of Natural History, Washington, D.C., USA, 141000.

Bertrandite $Be_4Si_2O_7(OH)_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Crystals thin tabular, commonly prismatic to needlelike, to 5 cm; in radial aggregates. *Twinning:* Common on {011} or {021}; twins heart-shaped or V-shaped with axes crossing at angles of about 60° and 120°.

Physical Properties: *Cleavage:* Perfect on {001}; distinct on {100}, {010}, and {110}. Hardness = 6–7 D(meas.) = 2.59–2.60 D(calc.) = [2.61] Pyroelectric.

Optical Properties: Transparent. *Color:* Colorless to slightly yellow. *Luster:* Vitreous, pearly on {001}.
Optical Class: Biaxial (–). *Orientation:* $X = a$; $Y = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.583–1.591$ $\beta = 1.598–1.605$ $\gamma = 1.608–1.614$ 2V(meas.) = ∼75°

Cell Data: *Space Group:* $Cmc2_1$. $a = 8.7135(4)$ $b = 15.268(1)$ $c = 4.5683(3)$ Z = 4

X-ray Powder Pattern: Mica Creek, Mt. Isa, Queensland, Australia.
4.38 (100), 3.19 (90), 2.54 (80), 2.28 (60), 2.22 (50), 3.94 (40), 1.305 (40)

Chemistry:

	(1)	(2)
SiO_2	49.26	50.44
Al_2O_3	trace	
Fe_2O_3	1.40	
BeO	42.0	42.00
H_2O	6.90	7.56
Total	99.56	100.00

(1) Barbin, France. (2) $Be_4Si_2O_7(OH)_2$.

Occurrence: In fissures in granites and associated pegmatites and in miarolitic cavities in greisens; commonly an alteration product of beryl, more rarely as a primary mineral.

Association: Beryl, phenakite, herderite, tourmaline, muscovite, fluorite, quartz.

Distribution: In small amounts at numerous localities. A few affording pure material or larger crystals include: in France, near Nantes, in the Barbin quarries at Petit-Port, Loire-Atlantique. At Val Vigezzo, Piedmont, Italy. From Písek, Czech Republic. In the USA, in the Strickland quarry, Portland, Middlesex Co., Connecticut; in Virginia, at Amelia, Amelia Co.; in Colorado, on Mt. Antero, Chaffee Co. and elsewhere. At Spor Mountain, Juab Co., Utah, a large commercial deposit; in the Pala district, San Diego Co., California. In a large deposit at Sierra de Aguachile, Acuña, Coahuila, Mexico. Large crystals at the Golconda mine, near Governador Valadares, Minas Gerais, Brazil. From Klein Spitzkopje, Namibia. In the Tae Hwa mine, Chung Cheong Buk Do, South Korea. From Akchatau, Kara-Oba, and Kounrad, Kazakhstan.

Name: Honoring Emile Bertrand (1844–1909), French mineralogist.

Type Material: National School of Mines, Paris, France.

Beryl $Be_3Al_2Si_6O_{18}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals prismatic to tabular, with $\{10\bar{1}0\}$, $\{0001\}$, and $\{11\bar{2}0\}$; may be complexly terminated by pyramids, to 18 m and 180 t. Also radial, trapiche, columnar; granular to compact. *Twinning:* On $\{hk\bar{i}l\}$ forms, rarely.

Physical Properties: *Cleavage:* Imperfect on $\{0001\}$. *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 7.5–8 VHN = 1190–1450, 1300 average. D(meas.) = 2.63–2.97 increasing with alkali content; 2.7 average. D(calc.) = 2.640

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale blue to sky-blue, bluish green through green to greenish yellow or yellow, rose to peach, deep pink to raspberry-red; may be zoned; commonly colorless in thin section. *Streak:* White. *Luster:* Vitreous, resinous. *Optical Class:* Uniaxial (–). *Pleochroism:* Weak to distinct; O = colorless, yellowish green, light blue, yellowish red; E = sea-green, blue, purplish red. ω = 1.567–1.610 ϵ = 1.565–1.599; increasing with alkali content.

Cell Data: *Space Group:* $P6/mcc$. a = 9.205–9.274 c = 9.187–9.249 Z = 2

X-ray Powder Pattern: Royalston, Massachusetts, USA.

(1) Mursinka, Russia; by electron microprobe. (2) Nuristan district, Laghman Province. Afghanistan; by electron microprobe. (3) $Be_3Al_2Si_6O_{18}$.

Occurrence: In granites and granite pegmatites, rarely in nepheline syenites. Also in mafic metamorphic rocks, low- to high-temperature hydrothermal veins and in vugs in rhyolite.

Association: Quartz, feldspar, muscovite, lepidolite, spodumene, amblygonite, tourmaline, topaz, cassiterite, columbite, tantalite.

Distribution: Prominent localities for fine specimens include: in Russia, in the Mursinka-Alabashka area, near Yekaterinburg (Sverdlovsk), Ural Mountains, and from Nerchinsk south to Borzya, Adun-Chilon Mountains, Siberia. At Volhynia, Ukraine. In the Muiâne pegmatite, Alto Ligonha district, Mozambique. From Madagascar, especially around Mt. Bity, south of Antsirabe, with giant crystals from the Malakialina district. In the Rafin-Gabas Hills, near Jos, Nigeria. In the Sandawana-Belingwe area, Mweza Range, Zimbabwe. Exceptional green crystals from the Muzo and Chivor districts, Boyacá Province, Colombia. In Brazil, from Minas Gerais, in large districts around Teófilo Otoni, Governador Valadares, Conselheiro Pena, and Itabira. Around Mingora, Swat district; from Dassu and the Skardu district; at Kunar and Nagar, near Karimabad, Hunza district, Pakistan. In Afghanistan, around Khenj, Panjshir Valley. In the USA, from the Pala and Rincon districts, San Diego Co., California; at Hiddenite, Alexander Co., North Carolina; fine red crystals in the Wah Wah Mountains, Beaver Co., Utah; on Mt. Antero, Chaffee Co., Colorado; and in the Sawtooth Mountains area, Idaho.

Name: From the Greek *beryllos*, original significance unknown.

Beryllite $Be_3SiO_4(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic or monoclinic. *Point Group:* n.d. As fine spherulites, to 3 mm; as drusy segregations and fibrous crusts; powdery masses and coatings on other minerals.

Physical Properties: Hardness = 1 in aggregate. D(meas.) = 2.196 D(calc.) = n.d.

Optical Properties: Transparent. *Color:* White. *Luster:* Silky.
Optical Class: Biaxial (–). $\alpha = 1.50–1.544$ $\beta = 1.553(2)$ $\gamma = 1.52–1.562$ 2V(meas.) = $< 45°$

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Lovozero massif, Russia.
4.01 (100), 2.34 (100), 3.64 (90), 1.351 (80), 3.39 (70), 3.19 (70), 2.90 (70)

Chemistry:

Total	100.97	100.00

(1) Lovozero massif, Russia. (2) $Be_3SiO_4(OH)_2 \cdot H_2O$.

Occurrence: In the center of a zoned pegmatite cutting arfvedsonite-bearing nepheline syenite (Lovozero massif, Russia); in analcime-rich veins (Ilímaussaq intrusion, Greenland).

Association: Albite, epididymite, bertrandite, natrolite, sodalite (Lovozero massif, Russia); analcime, sørensenite, chkalovite, epididymite, tugtupite (Ilímaussaq intrusion, Greenland).

Distribution: From the Natrolite Stock pegmatite, Mt. Karnasurt, Lovozero massif, Kola Peninsula, Russia. At Kvanefjeld and on the Taseq slope, in the Ilímaussaq intrusion, southern Greenland.

Name: In allusion to the BERYLLium in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 57361.

Beryllonite $NaBePO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Tabular on {010} to short prismatic ‖ [010]; crystals may have many forms, especially ‖ [100] and [010]; some faces typically etched to dullness, to 25 cm; also in spherical aggregates, fibrous, massive. *Twinning:* On {101}, contact and penetration twins; on {110} and {100} polysynthetic and pseudohexagonal stellate twins.

Physical Properties: *Cleavage:* {010}, perfect; {100}, good, interrupted; {101}, indistinct; {001}, in traces. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.77–2.84 D(calc.) = 2.805

Optical Properties: Transparent to translucent. *Color:* Colorless, white to pale yellow; in transmitted light, colorless. *Luster:* Vitreous to adamantine, may be pearly on {010}. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r < v$, weak. $\alpha = 1.552$ $\beta = 1.558$ $\gamma = 1.561$ 2V(meas.) = 67°56′

Cell Data: *Space Group:* $P2_1/n$. $a = 8.178(3)$ $b = 7.818(2)$ $c = 14.114(6)$ $\beta = 90.00(2)°$ Z = 12

X-ray Powder Pattern: Stoneham, Maine, USA.
2.84 (10), 3.65 (9), 2.28 (7), 3.92 (6), 2.37 (6), 4.44 (4), 1.965 (4)

Chemistry:

	(1)	(2)
P_2O_5	55.86	55.89
BeO	19.84	19.70
Na_2O	23.64	24.41
LOI	0.08	
Total	99.42	100.00

(1) Stoneham, Maine, USA; composite average of six partial analyses. (2) $NaBePO_4$.

Occurrence: As a rare secondary mineral in granitic and alkalic pegmatites.

Association: Herderite, triplite, beryl, apatite, cassiterite, columbite, eosphorite, morinite, väyrynenite, lithiophilite, elbaite, pollucite, petalite, lepidolite, albite, orthoclase, quartz.

Distribution: In the USA, in Maine, found on Sugarloaf Mountain, near Stoneham, at the Dunton quarry and the Bell Pit, Newry, Oxford Co., and other minor occurrences. In Canada, occurs at Mont Saint-Hilaire, Quebec. Found at the Viitaniemi pegmatite, Eräjärvi, Finland. From the Norrö pegmatite, on Rånö Island, Sweden. In England, in the Meldon aplite, Okehampton, Devonshire. Large crystals from Paprock, Laghman Province, Afghanistan. Occurs in the Énio pegmatite mine, northeast of Galiléia; at the Lavra da Ilha pegmatite, in the Jequitinhonha River, three km north of Taquaral; and from the Almerindo mine, Linópolis, Minas Gerais, Brazil.

Name: For one of the major constituents in the composition, BERYLLium.

Type Material: Yale University, New Haven, Connecticut, USA, 3.1946.

Berzelianite Cu_2Se

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As thin dendritic crusts; fine grained and disseminated as powdery inclusions.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Somewhat malleable. Hardness = 2.7 VHN = 21–24 (100 g load). D(meas.) = 6.71 D(calc.) = [7.28]

Optical Properties: Opaque. *Color:* Silver-white, tarnishing. *Streak:* Shining. *Luster:* Metallic. *Anisotropism:* Isotropic, may be slightly anisotropic.
R: (400) 25.8, (420) 28.9, (440) 30.0, (460) 30.7, (480) 31.1, (500) 31.0, (520) 30.2, (540) 28.7, (560) 27.0, (580) 25.5, (600) 24.1, (620) 22.9, (640) 21.8, (660) 20.7, (680) 19.7, (700) 18.7

Cell Data: *Space Group:* $Fm3m$ (synthetic). $a = 5.694(7)$ $Z = 4$

X-ray Powder Pattern: Skrikerum, Sweden.
2.03 (100), 3.33 (90), 1.729 (80), 1.171 (40), 1.434 (30), 1.317 (20), 1.105 (20)

Chemistry:

	(1)	(2)
Cu	57.21	61.62
Ag	3.51	
Se	39.22	38.38
Total	99.94	100.00

(1) Skrikerum, Sweden. (2) Cu_2Se.

Polymorphism & Series: Dimorphous with bellidoite.

Occurrence: With other selenides in hydrothermal veinlets in dolostone (Clausthal, Germany); in iron ores (Lerbach, Germany); with other selenides in calcite veins in serpentine (Skrikerum, Sweden); in a gold-quartz-orthoclase deposit (Redjang-Lebong, Sumatra).

Association: Eucairite, clausthalite, tiemannite, umangite, klockmannite, aguilarite, crookesite, athabascaite, stromeyerite, polybasite, pearceite, gold, uraninite, pyrite, marcasite, calcite.

Distribution: At Skrikerum, near Tryserum, Kalmar, Sweden [TL]. From Lerbach, Tilkerode, Zorge, Clausthal, and St. Andreasberg, Harz Mountains; at Niederschlema, Saxony; and the Mullenbach uranium deposit, Black Forest, Germany. In the Czech Republic, in the Habrí and Bukov mines, near Tisnova; at the Petrovice uranium deposit, near Ždár; and the Předbořice uranium deposit, near Krásna Hora. From the Kyzylalmasay gold deposit, [??where in?? or drop] Uzbekistan. In the Sierra de Umango, and at Tuminico, Sierra de Cacho, La Rioja Province, Argentina. From the Elefante prospect, near the Serra Pelada Au–Pd–Pt deposit, Pará, Brazil. At Redjang-Lebong, Sumatra. From Kalgoorlie and in the Copper Hills prospect, East Pilbara region, Western Australia, and at El Sharana, Northern Territory, Australia. In the Pinky Fault uranium deposit, Lake Athabasca, Saskatchewan, Canada. From the Durant vein, Aurora district, Mineral Co., Nevada, USA.

Name: For Jöns Jacob Berzelius (1779–1848), Swedish chemist, who discovered selenium.

Polymorphism & Series: Forms a series with manganberzeliite.

Occurrence: In metamorphosed Fe–Mn orebodies.

Association: Hausmannite, rhodonite, tephroite, hedyphane, caryinite, manganoan biotite, långbanite, braunite, hematite, dolomite, barite, calcite.

Distribution: In Sweden, found at Långban and Nordmark, Värmland, and in the Sjö mine, near Grythyttan, Örebro.

Name: In honor of the noted Swedish chemist and mineralogist, Jöns Jacob Berzelius (1779–1848).

Polymorphism & Series: Dimorphous with fergusonite-(Ce).

Occurrence: In magnesian skarn around carbonatite-derived dolomitic marble ("Northern China"); in carbonatite (Chernigovsky region, Ukraine).

Association: Diopside, phlogopite, cerian apatite, calcite ("Northern China"); olivine, phlogopite, calcite, magnetite, monazite (Chernigovsky region, Ukraine).

Distribution: From an undisclosed locality [eastern Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia] in "Northern China". In the Chernigovsky region, Ukraine.

Name: In allusion to its dimorphous relation to *fergusonite-(Ce)*.

Type Material: n.d.

Fergusonite-beta-(Nd) $(Nd, Ce)NbO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, metamict. *Point Group:* n.d. As prismatic dipyramidal crystals, to 0.25 mm, also as irregular grains.

Physical Properties: *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = [5.5–6.5] [by analogy to fergusonite-(Y)]. D(meas.) = n.d. D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Brownish red, red, yellowish brown, or yellowish red. *Streak:* Pale brown. *Luster:* Vitreous to greasy.
Optical Class: Isotropic to weakly anisotropic. $n = 2.0$

Cell Data: *Space Group:* n.d. $a = 5.07$ $b = 5.62$ $c = 5.41$ $\beta = 93.0°$ Z = [2]

X-ray Powder Pattern: Bayan Obo, China; untreated material.
3.2064 (10), 3.0253 (10), 1.8832 (9), 2.7976 (5), 2.6961 (5), 2.0648 (5), 1.9549 (5)

Fergusonite-beta-(Y) $YNbO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic; typically metamict. *Point Group:* n.d. Crystals prismatic, to 0.2 mm in cross section.

Physical Properties: Hardness = [5.5–6.5] [by analogy to fergusonite-(Y)]. D(meas.) = 5.65 D(calc.) = [5.63]

Optical Properties: Semitransparent. *Color:* Light yellow.
Optical Class: [Isotropic when metamict.] n = n.d.

Cell Data: *Space Group:* n.d. $a = 5.12$ $b = 10.89$ $c = 5.20$ $\beta = 88°10'$ Z = [4]

X-ray Powder Pattern: n.d.

Chemistry: (1) "Central Asia"; X-ray spectrographic analysis showed major Y, Nb, U; Fe ∼2.5%; Ta, Th ∼1%; Ca, Zr ∼0.5%; Ti ∼0.2%; Pb ∼0.1%.

Polymorphism & Series: Dimorphous with fergusonite-(Y).

Occurrence: In microcline-bearing granite stocks.

Association: Microcline, quartz.

Distribution: From an undisclosed locality [Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, China] in "Central Asia".

Name: In allusion to its dimorphous relation to *fergusonite-(Y)*.

Type Material: n.d.

Betafite $(Ca, U)_2(Ti, Nb, Ta)_2O_6(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; typically metamict. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals commonly octahedra modified by {110}, {100}, {113}, {233}, and {230}; some crystals elongated ‖ [001] or [111]; to 15 cm.

Physical Properties: *Fracture:* Conchoidal to uneven. *Tenacity:* Brittle. Hardness = 3–5 VHN = 354–412 (Norway); 249–287 (Madagascar). D(meas.) = 3.7–4.9 D(calc.) = [3.79–4.01] Radioactive.

Optical Properties: Translucent to opaque. *Color:* Red; greenish brown, dark brown to black when metamict, commonly superficially altered yellow; almost colorless in transmitted light.
Luster: Waxy, greasy to adamantine, semimetallic.
Optical Class: Isotropic. $n = 1.910$–2.197
R: (400) 13.5, (420) 13.2, (440) 13.0, (460) 12.8, (480) 12.6, (500) 12.4, (520) 12.3, (540) 12.2, (560) 12.0, (580) 11.9, (600) 11.7, (620) 11.6, (640) 11.6, (660) 11.6, (680) 11.5, (700) 11.5

Cell Data: *Space Group:* $Fd3m$ (heat-reconstituted metamict material). $a = 10.20$–10.42 $Z = 8$

X-ray Powder Pattern: Antanifotsy, Madagascar; after heating at 1000 °C.

(1) Ambolotara, Madagascar; corresponds to $(U_{0.32}Ca_{0.21}Mg_{0.03}Y_{0.03}Ce_{0.01})_{\Sigma=0.60}(Nb_{0.90}Ti_{0.79}Al_{0.14}Fe_{0.12}Th_{0.03}Sn_{0.01})_{\Sigma=1.99}[O_{4.09}(OH)_{2.91}]_{\Sigma=7.00}$. (2) Ambalahazo, Madagascar; corresponds to $(U_{0.30}Ca_{0.18}K_{0.03}Ce_{0.02})_{\Sigma=0.53}(Nb_{0.84}Ti_{0.65}Al_{0.09}Fe_{0.02}Th_{0.01}Sn_{0.01}Ta_{0.01})_{\Sigma=1.63}[O_{2.56}(OH)_{4.44}]_{\Sigma=7.00}$.

Mineral Group: Pyrochlore group, betafite subgroup; $U_A > 20\%$; $2Ti_B \geq (Nb + Ta)_B$.

Occurrence: Typically a primary mineral in granite pegmatites; rare in carbonatites.

Association: Thorite, allanite, zircon, beryl, titanite, magnetite, biotite, microcline, quartz.

Distribution: In Madagascar, large crystals at a number of localities, including: from Ambolotara, west of Betafo; Ambatolampikely; Ambatofotsy; Ambatomboahangy; Ambalahazo; Tomboarivo; and Antanifotsy. In Norway, at Höysjåen, near Kragerø; Landsverk quarry, near Evje; and Ljosland. From Slyudyanka, near Lake Baikal, Siberia, Russia. In the Silver Crater mine, Wilberforce, Ontario, and elsewhere in Canada. In the USA, in the Brown Derby pegmatite, Gunnison Co., Colorado; in the Pidlite pegmatite, Mora Co., New Mexico; and from the Cady Mountains, San Bernardino Co., California.

Name: For the locality near Betafo, Madagascar.

Type Material: n.d.

Roselite-beta $Ca_2Co(AsO_4)_2 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. As granular aggregates.

Physical Properties: *Cleavage:* On {010}, perfect. Hardness = 3.5–4 D(meas.) = 3.71 D(calc.) = 3.77

Optical Properties: Semitransparent. *Color:* Dark rose-red. *Luster:* Vitreous. *Optical Class:* Biaxial (–) [*sic*]. *Pleochroism:* X = pink; Y = pale pink; Z = nearly colorless. *Dispersion:* $r < v$, strong, crossed. $\alpha = 1.723$ $\beta = 1.737$ $\gamma = 1.756$ 2V(meas.) = 80°–90°

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 5.88$ $b = 7.67$ $c = 5.58$ $\alpha = 112°19'$ $\beta = 71°21'$ $\gamma = 119°41'$ Z = 1

X-ray Powder Pattern: Schneeberg, Germany; nearly identical to talmessite. 2.75 (10), 3.08 (9), 3.59 (6), 3.98 (4), 3.22 (4), 1.894 (4), 1.719 (4)

Chemistry:

	(1)	(2)
As_2O_5	49.66	50.74
FeO	0.32	
CoO	13.28	16.54
NiO	1.43	
MgO	0.92	
CaO	26.29	24.76
H_2O	8.41	7.96
Total	100.31	100.00

(1) Schneeberg, Germany. (2) $Ca_2Co(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with roselite.

Mineral Group: Fairfieldite group.

Occurrence: A rare secondary mineral in cobalt-bearing hydrothermal mineral deposits.

Association: Roselite, calcite, pyrite, quartz (Schneeberg, Germany); erythrite, arthurite, conichalcite, chenevixite, scorodite, cobaltaustinite, heterogenite (Dome Rock mine, Australia).

Distribution: From Schneeberg, Saxony, and at the Bauhaus district, Richelsdorf Mountains, Hesse, Germany. At Bou Azzer, Morocco. From Tsumeb, Namibia. In the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia. From the San Jose del Carmen mine, Copiapó, Atacama, Chile.

Name: As a monoclinic dimorph of *roselite*.

Type Material: The Natural History Museum, London, England, 1956,196; Harvard University, Cambridge, Massachusetts, USA, 105301.

Total	99.67	100.11

(1) Mansfeld, Germany. (2) Dzhezkazgan, Kazakhstan.

Occurrence: In veins cutting the black cupriferous shale (Mansfeld, Germany).

Association: Bornite, chalcocite, chalcopyrite, galena, silver, celestine, anhydrite, calcite.

Distribution: In Germany, in the Mansfeld Kupferschiefer at Eisleben, Saxony-Anhalt [TL], and at Waschenbach, Odenwald, Germany. In the Radka deposit, Pazardzhik, and the Propada deposit, Malko-Tarnovo district, Bulgaria. From near Lairg, Sutherlandshire, Scotland. On the Mürtschenalp, Switzerland. From Långban, Värmland, Sweden. In the Bulancak deposit, Giresun, Turkey. At Tsumeb, Namibia. Rich specimens from Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire). At the St. Cloud mine, Sierra Co., New Mexico, USA. In the La Leona mine, Santa Cruz Province, Argentina. At the Yoshino mine, Yamagata Prefecture, Japan. From Mt. Lyell, Tasmania, Australia. Richly crystallized at Dzhezkazgan, Kazakhstan. Probably yet to be recognized in many other mineral deposits.

Name: For Anatolii Georgievich Betekhtin (1897–1962), Russian mineralogist and economic geologist.

Type Material: Mineral Museum, Humboldt University, Berlin, Germany.

(1) Kara-Oba deposit, Kazakhstan. (2) Tsumeb, Namibia; by electron microprobe, total Fe as Fe_2O_3, H_2O calculated for stoichiometry; corresponds to $Ca_{2.1}Mg_{1.0}Fe_{3.1}Mo_{8.00}As_{1.9}O_{36}(OH)\cdot 23H_2O$. (3) $Ca_2MgFe_3Mo_8As_2O_{36}(OH)\cdot 23H_2O$.

Occurrence: Filling cracks in leached pyrite in the oxidized zone of a mineral deposit (Kara-Oba deposit, Kazakhstan); on vein quartz (Krupka, Czech Republic); in a deep oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit (Tsumeb, Namibia).

Association: Ferrimolybdite, gypsum, jarosite, hydromica, "limonite", "opal" (Kara-Oba deposit, Kazakhstan); molybdenite, molybdite, quartz (Krupka, Czech Republic); scorodite, powellite, adamite, gerdtremmelite, wulfenite, hidalgoite, chalcocite, digenite, kaolinite, quartz, hematite (Tsumeb, Namibia).

Distribution: In the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan. At Krupka, Krušné hory Mountains, Czech Republic. From Vaulry, Haute-Vienne, France. At Tsumeb, Namibia. From Elsmore, New South Wales, Australia.

Name: For the original occurrence in the Bet-Pak-Dal Desert, Kazakhstan.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 62532, 62533.

Beudantite $PbFe_3^{3+}(AsO_4)(SO_4)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\overline{3}\ 2/m$. As tabular crystals, pseudocubes, or pseudo-octahedra, to 5 mm; also microcrystalline massive.

Physical Properties: *Cleavage:* Good on {0001}. Hardness = 3.5–4.5 D(meas.) = 4.48(2) D(calc.) = 4.49

Optical Properties: Transparent to translucent. *Color:* Yellow, greenish yellow, red, dark green, brown, black; crystals may exhibit biaxial sectoring. *Streak:* Grayish yellow to green. *Luster:* Vitreous, resinous, may be frosted.
Optical Class: Uniaxial (–), commonly anomalously biaxial. *Pleochroism:* O = yellow to red-brown; E = colorless to yellow. $\omega = 1.957$ $\epsilon = 1.943$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 7.315$–7.339 $c = 17.034$–17.036 Z = 3

X-ray Powder Pattern: Washington mine, Montana, USA.
3.078 (100), 2.865 (80), 2.290 (70), 5.725 (50), 3.108 (50), 5.089 (45), 1.979 (35)

Chemistry:

	(1)	(2)
SO_3	11.15	11.25
As_2O_5	16.02	16.15
Fe_2O_3	33.48	33.65
CuO	0.22	
ZnO	0.11	
PbO	31.22	31.36
H_2O	[7.80]	7.59
Total	[100.00]	100.00

(1) Washington mine, Montana, USA; by electron microprobe, H_2O by difference, corresponding to $(Pb_{0.99}Cu_{0.02}Zn_{0.01})_{\Sigma=1.02}Fe_{2.98}(AsO_4)_{0.99}(SO_4)_{0.99}(OH)_{6.07}$. (2) $PbFe_3(AsO_4)(SO_4)(OH)_6$.

Mineral Group: Beudantite group.

Occurrence: A secondary mineral in the oxidized zone of polymetallic deposits.

Association: Carminite, scorodite, mimetite, dussertite, arseniosiderite, pharmacosiderite, olivenite, bayldonite, duftite, anglesite, cerussite, azurite.

Distribution: Many localities are known. In Germany, at the Louise mine, Horhausen, and the Schöne Aussicht mine, near Dernbach, Rhineland-Palatinate; at Reichenbach, near Bensheim, Hesse; from the Clara mine, near Oberwolfach, and elsewhere in the Black Forest. In France, from the Cap Garonne mine, near le Pradet, Var, and Blond, near Vauly, Haute-Vienne. In England, at many mines in Caldbeck Fells, Cumbria, and in Cornwall. In Greece, from Laurium, pure masses in the Kamariza mine, and in the slags. Superb crystals at Tsumeb, Namibia. In Mexico, from the Ojuela mine, Mapimí, Durango, and at La Mur, Trincheras, Sonora. From the Mohawk mine, Clark Mountains, San Bernardino Co., California; abundant at Bisbee, Cochise Co., Arizona, USA. In the Belvedere Au–Pb mine, near Mt. McGrath, Western Australia.

Name: Honors François Sulpice Beudant (1787–1850), French mineralogist, University of Paris, Paris, France.

Beusite $(Mn^{2+}, Fe^{2+}, Ca, Mg)_3(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As rough prismatic crystals, to 30 cm; usually in laminated or granular intergrowths with lithiophilite, perhaps by exsolution.

Physical Properties: *Cleavage:* Good on {010}; fair on {100}. Hardness = 5
D(meas.) = 3.60–3.70 D(calc.) = [3.60]

Optical Properties: Translucent. *Color:* Pale reddish brown. *Streak:* Pale pink or brown. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X = b$; $Z \wedge c = -36°$. *Dispersion:* $r > v$, strong.
$\alpha = 1.685–1.708$ $\beta = 1.688–1.711$ $\gamma = 1.700–1.723$ 2V(meas.) = 25°–45°

Cell Data: *Space Group:* $P2_1/c$. $a = 8.797(3)$ $b = 11.758(4)$ $c = 6.170(2)$
$\beta = 99.31(2)°$ Z = 4

X-ray Powder Pattern: Los Aleros pegmatite, Argentina.
3.49 (100b), 2.863 (100b), 2.708 (60), 3.13 (40), 1.926 (40b), 3.01 (35), 2.89 (30)

Chemistry:

	(1)	(2)		(1)	(2)
P_2O_5	40.2	41.6	CaO	4.64	16.1
SiO_2	1.5		Li_2O	0.14	
FeO	14.2	19.8	H_2O^+	0.8	
MnO	35.5	23.1	H_2O^-	0.17	
MgO	2.56	0.0	Total	99.71	100.6

(1) Los Aleros pegmatite, Argentina; after deduction of SiO_2, Li_2O, and H_2O as impurities, corresponds to $(Mn_{1.77}Fe_{0.70}Ca_{0.29}Mg_{0.22})_{\Sigma=2.98}(PO_4)_2$. (2) Yellowknife district, Canada; by electron microprobe, total Fe as FeO, total Mn as MnO; corresponds to $(Mn_{1.10}Ca_{0.98}Fe_{0.94})_{\Sigma=3.02}(PO_4)_{1.99}$.

Polymorphism & Series: Forms a series with graftonite.

Occurrence: A late-stage accessory mineral in complex granite pegmatites. As euhedral inclusions in troilite nodules in an iron meteorite.

Association: Lithiophilite or triphylite (pegmatites); troilite, sarcopside (iron meteorite).

Distribution: In Argentina, large crystals from the Los Aleros pegmatite, and at the Amanda and San Salvador pegmatites, San Luis Province. In Canada, near upper Ross Lake, Yellowknife district, Northwest Territories, and at the Gotcha claim, on an island in Cross Lake, Manitoba. In the USA, in the Storm Mountain and Crystal Snow pegmatites, Crystal Mountain district, Larimer Co., Colorado. From the Eräjärvi area, Orivesi, Finland. At the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. From Kyrk-Bulak, Turkestan Range, Kirgizia. In the El Sampal type IIIA iron meteorite.

Name: Honors Dr. Alexey Alexandrovich Beus, Professor of Mineralogy and Geochemistry, Moscow Polytechnical Institute, for his work on minerals of this group.

Type Material: Harvard University, Cambridge, Massachusetts, 109052, 134312, 134313; National Museum of Natural History, Washington, D.C., USA, 137294.

Beyerite $(Ca,Pb)Bi_2O_2(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals are thin rectangular plates, with large {001}, modified by {111}, to 0.5 mm, in rosettes and subparallel aggregates; commonly compact earthy, in thin films, and massive.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2–3 D(meas.) = 6.56 D(calc.) = [6.61]

Optical Properties: Transparent to opaque. *Color:* Bright yellow, lemon-yellow, pale yellow, grayish green, gray, white; pale yellow to colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (–); may be anomalously biaxial. $\omega = 2.13(2)$ $\epsilon = 1.99(2)$

Cell Data: *Space Group:* $I4/mmm$. $a = 3.78(1)$ $c = 21.77(5)$ Z = 2

X-ray Powder Pattern: Schneeberg, Germany.
2.851 (10), 2.721 (9), 1.755 (8), 1.530 (8), 1.688 (7), 3.632 (6), 3.354 (6)

Chemistry:

	(1)	(2)
CO_2	13.89	14.43
Bi_2O_3	75.29	76.38
PbO	1.77	
CaO	9.05	9.19
Total	[100.00]	100.00

(1) Mica Lode pegmatite, Colorado, USA; recalculated from an original total of 99.83%, neglecting CuO 1.10%, MnO 0.12%, and insoluble 0.79%, corresponds to $(Ca_{0.99}Pb_{0.04})_{\Sigma=1.03}$ $Bi_{2.00}O_2(CO_3)_{1.95}$. (2) $CaBi_2O_2(CO_3)_2$.

Occurrence: A rare secondary mineral in hydrothermal mineral deposits and granite pegmatites, formed by alteration of bismuth-bearing sulfides and sulfosalts.

Association: Bismutite, bismutostibiconite, atelestite, preisingerite, pucherite, eulytite, namibite, clinobisvanite, bismutotantalite, bismuthinite, bismuth.

Distribution: In Germany, from Schneeberg, Saxony; in the Black Forest, in the Clara mine, near Oberwolfach, from Neubulach, and at Hechtsberg, near Hausach. In the Eliáš and Rovnost mines, Jáchymov (Joachimsthal), Czech Republic. From the Bisundi pegmatite, Bhilwara district, Rajasthan, India. At the Chinorsayskiy granodiorite massif, Tajikistan. In the USA, in California, from the Stewart mine, Pala district, and in the Mesa Grande district, San Diego Co., and the Jensen quarry, Riverside Co.; at the Harding mine, Dixon, Taos Co., New Mexico; in pegmatites in the White Picacho district, Maricopa and Yavapai Cos., and on the Gettysburg claims, Copperopolis, Yavapai Co., Arizona; from the School Section and Mica Lode pegmatites, Eight Mile Park area, Fremont Co., and the Meyers Ranch pegmatite, Park Co., Colorado; at the Boss mine, Goodsprings district, Clark Co., Nevada. From the Northern Spy mine, Tintic district, Juab Co., Utah. In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada. In Argentina, from the San Elías mine, San Luis Province.

Name: To honor Adolph Beyer (1743–1805), mining engineer and mineralogist, Schneeberg, Germany, who first recognized bismutite.

Type Material: Harvard University, Cambridge, Massachusetts, 91593, 111598; National Museum of Natural History, Washington, D.C., USA, 94017, C2251, R2756.

Bezsmertnovite $Au_4Cu(Te, Pb)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. As tabular or irregular grains, up to 0.2 x 0.05 mm.

Physical Properties: Hardness = n.d. VHN = 310–374, 353 (10 g load). D(meas.) = n.d. D(calc.) = 16.3

Optical Properties: Opaque. *Color:* In polished section, bright yellow-orange, resembling gold but having lower reflectivity. *Anisotropism:* Weak, in neutral gray shades.
R: (400) — , (420) 15.1, (440) 15.1, (460) 15.7, (480) 17.5, (500) 21.2, (520) 29.0, (540) 37.5, (560) 45.6, (580) 52.4, (600) 55.7, (620) 57.4, (640) 58.3, (660) 58.7, (680) 58.6, (700) 58.2

Cell Data: *Space Group:* n.d. $a = 4.036$ $b = 4.025$ $c = 4.061$ Z = n.d. [*needsckZandcell*??]

X-ray Powder Pattern: Kamchatka, Russia.
2.33 (10), 1.744 (8-9), 2.61 (8), 3.30 (7), 1.144 (4), 1.405 (4), 1.073 (4)

Chemistry:

	(1)	(2)
Au	72.3	72.6
Ag	3.77	4.05
Cu	6.27	6.28
Fe	0.72	0.92
Pb	8.95	9.54
Te	7.16	7.15
Total	99.2	100.54

(1) Kamchatka, Russia; by electron microprobe, average of seven analyses of three samples, corresponding to $(Au_{3.65}Ag_{0.35})_{\Sigma=4.00}(Cu_{0.98}Fe_{0.13})_{\Sigma=1.11}(Te_{0.56}Pb_{0.43})_{\Sigma=0.99}$. (2) Do.; by electron microprobe, corresponding to $(Au_{3.63}Ag_{0.37})_{\Sigma=4.00}(Cu_{0.97}Fe_{0.16})_{\Sigma=1.15}(Te_{0.55}Pb_{0.45})_{\Sigma=1.00}$.

Occurrence: In the cementation zone of a volcanogenic gold telluride deposit, rarely as rims around grains of gold.

Association: Bilibinskite, bogdanovite, gold, tellurides of Cu, Fe and Pb.

Distribution: From the Aginsk gold telluride deposit, Kamchatka, Far Eastern Region, Russia.

Name: For Dr. Marianna Sergeevna Bezsmertnaya (1914–1991), Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, and Dr. Vladimir Vasil'evich Bezsmertnyi (1912–), All-Union Pedagogy Institute, Moscow, Russia, Soviet geologists and researchers on ore deposits.

Type Material: Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 79408.

Total	99.92	100.00

(1) Raibl mine, Italy. (2) $ZnSO_4 \cdot 6H_2O$.

Mineral Group: Hexahydrite group.

Occurrence: A post-mine mineral, typically in efflorescences on mine walls, an alteration product of oxidizing sulfides.

Association: Goslarite, melanterite, hydrozincite, gypsum (Raibl mine, Italy).

Distribution: From the Cave del Predil, Raibl mine, south of Tarvisio, Friuli-Venezia Giulia, Italy. At Bleiberg, Carinthia, Austria. From Boleslaw, near Olkusz, Poland. At Wittichen, Black Forest, Germany. In the Borieva mine, Madan region, Bulgaria. From Glomsrudkollen, near Vikersund, Norway. At the Paddy's River mine, Australian Capital Territory. In the USA, from Bisbee, Cochise Co., Arizona; in the Silver Plume district, Clear Creek Co., Colorado; at Sterling Hill, Sussex Co., New Jersey; in the Ueberroth zinc mine, Friedensville, Lehigh Co., Pennsylvania.

Name: To honor Angelo Bianchi (1892–1970), Italian mineralogist, University of Padova, Padova, Italy.

Type Material: University of Padova, Padova, Italy, 1039/1774; The Natural History Museum, London, England, 1933,90; National Museum of Natural History, Washington, D.C., USA, R6735.

(1) Fuka, Japan; mixed with vesuvianite. (2) Do.; contaminated by small amounts of gehlenite, vesuvianite, and hydrogrossular. (3) $Ca_2Al_2SiO_6(OH)_2$.

Polymorphism & Series: Dimorphous with kamaishilite.

Occurrence: In skarns in limestones, formed through alteration of gehlenite subjected to later retrograde hydration reactions.

Association: Vesuvianite, hydrogrossular, gehlenite, melilite, calcite.

Distribution: From Fuka, near Bicchu, Okayama Prefecture, and in the Akagané mine, Iwate Prefecture, Japan. At Carneal, Co. Antrim, Ireland.

Name: For Bicchu, the town encompassing the Japanese type locality.

Type Material: Department of Earth Sciences, Okayama University, Okayama, Japan, ONM-01; Institute of Geological Sciences, London, England.

References: (1) Henmi, C., I. Kusachi, K. Henmi, P.A. Sabine, and B.R. Young (1973) A new mineral bicchulite, the natural analogue of gehlenite hydrate, from Fuka, Okayama Prefecture, Japan, and Carneal, County Antrim, Northern Ireland. Mineral. J. (Japan), 7, 243–251.

Bideauxite $Pb_2AgCl_3(F,OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals, to 7 mm, are dominated by {100}, {111}, {011}, with {113}, {114}, {112}, {116}, and {029}.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle to sectile. Hardness = 3
D(meas.) = 6.274(8) D(calc.) = 6.26

Optical Properties: Transparent. *Color:* Colorless, becoming pale lavender on exposure to light. *Streak:* White. *Luster:* Adamantine, dull after exposure to light.
Optical Class: Isotropic. *Dispersion:* Low. $n = 2.192(15)$

Cell Data: *Space Group:* $Fd3m$. a = 14.1273(6) Z = 16

X-ray Powder Pattern: Tiger, Arizona, USA.
2.718 (10), 3.530 (9), 2.497 (9), 4.259 (7), 4.076 (7), 3.240 (7), 1.839 (6)

Chemistry:

	(1)
Ag	15.74
Pb	62.66
F	3.26
Cl	14.74
OH	[2.78]
Total	[99.18]

(1) Tiger, Arizona, USA; average of two analyses, Ag and Pb by AA, $(OH)^{1-}$ calculated from charge balance; corresponds to $Pb_{2.02}Ag_{0.97}Cl_{2.77}F_{1.14}(OH)_{1.09}$.

Occurrence: Rarely enclosing and replacing boleite, with other oxidized Pb and Cl minerals, from an oxidized base-metal mineral deposit (Tiger, Arizona, USA).

Association: Boleite, diaboleite, matlockite, leadhillite, anglesite, cerussite, dioptase, covellite, quartz (Tiger, Arizona, USA); boleite, atacamite (Iquique, Chile).

Distribution: From the Mammoth-St. Anthony mine, Tiger, Pinal Co., Arizona, USA. In Chile, at a prospect about 20 km east of Iquique, Tarapacá.

Name: For Richard August Bideaux (1935–), of Oro Valley, Arizona, USA, American mineralogist and mineral collector.

Type Material: National Museum of Natural History, Washington, D.C., USA, 114583.

References: (1) Williams, S.A. (1970) Bideauxite, a new Arizona mineral. Mineral. Mag., 37, 637–640. (2) (1971) Amer. Mineral., 56, 634–635 (abs. ref. 1). (3) Cooper, M.A., F.C. Hawthorne, S. Merlino, M. Pasero, and N. Perchiazzi (1999) Stereoactive lone-pair behavior of Pb in the crystal structure of bideauxite: $Pb_2^{2+}Ag^{+}Cl_3F(OH)$. Can. Mineral., 37, 915–921.

Bieberite $CoSO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As stalactites and crusts of minute crystals.

Physical Properties: *Cleavage:* On {001}, perfect; on {110}, fair. Hardness = 2
D(meas.) = 1.96 D(calc.) = 1.942 Soluble in H_2O; easily dehydrates to the hexahydrate.

Optical Properties: Translucent. *Color:* Rose-red, flesh-red; in transmitted light, pale rose-red to colorless. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = b$; $Z \wedge c = 29°18'$. $\alpha = 1.475$–1.477
$\beta = 1.482$–1.483 $\gamma = 1.488$–1.489 2V(meas.) = $88°01'$

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 14.040$ $b = 6.495$ $c = 10.923$
$\beta = 105.27°$ Z = 4

X-ray Powder Pattern: Synthetic. (ICDD 16-487).
4.87 (100), 3.76 (75), 4.82 (55), 2.725 (25), 3.71 (20), 4.02 (14), 3.25 (14)

Chemistry:

H_2O	46.83	44.86
Total	99.65	100.00

(1) Bieber, Germany. (2) $CoSO_4 \cdot 7H_2O$.

Mineral Group: Melanterite group.

Occurrence: An uncommon oxidation product of cobalt-bearing sulfide–arsenides.

Association: Erythrite, annabergite, pharmacolite, cobaltite, linnaeite.

Distribution: In Germany, from Bieber, near Hanau, Hesse; at Siegen, Westphalia; from Wittichen, Black Forest. At Leogang, and in the Rauris Valley, Salzburg, Austria. In the Penberthy Croft mine, St. Hilary, and at Wheal Alfred, Phillack, Cornwall, England. From Minas de Riotintó, Huelva Province, Spain. At Chalanches, Isère, France. In the Dome Rock copper mine, South Australia. From the Copper King mine, Lomagundi district, Zimbabwe. At Island Mountain, Trinity Co., California; from Ajo, Pima Co., Arizona; and in the Dolly prospect, Emery Co., Utah, USA. From Tres Puntos, near Copiapó, Atacama, Chile.

Name: For its first-noted occurrence at Bieber, Germany.

Biehlite $(Sb^{3+}, As^{3+})_2MoO_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are fibrous, to 1 cm, elongated along [001], in felted masses and irregular aggregates.

Physical Properties: *Tenacity:* Flexible. Hardness = "Soft". D(meas.) = n.d. D(calc.) = 5.23

Optical Properties: Translucent. *Color:* White. *Streak:* White. *Luster:* Silky. *Optical Class:* [Biaxial.] n = [2.13] (by the rule of Gladstone and Dale). α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $C2/c$. a = 18.076(5) b = 5.920(5) c = 5.083(5) β = 96.97(1)° Z = 4

X-ray Powder Pattern: Tsumeb, Namibia; shows strong preferred orientation. 2.990 (100), 2.960 (100), 5.622 (65), 3.104 (61), 2.104 (42), 3.376 (39), 1.962 (32)

Chemistry:

	(1)
MoO_3	33.76
Sb_2O_3	60.99
As_2O_3	4.95
Total	99.70

(1) Tsumeb, Namibia; by electron microprobe, average of five analyses; corresponds to $(Sb_{1.79}As_{0.21})_{\Sigma=2.00}Mo_{1.00}O_6$.

Occurrence: A rare secondary mineral from an oxidized zone in a dolostone-hosted hydrothermal polymetallic ore deposit.

Association: Anglesite, wulfenite.

Distribution: From Tsumeb, Namibia.

Name: To honor Dr. Friedrich Karl Biehl (1887–?), mineralogist, Westfälische-Wilhelms University, Münster, Germany, who authored an early dissertation on Tsumeb species.

Type Material: Hamburg University, Hamburg, Germany.

Bijvoetite-(Y) $(Y,Dy)_8(UO_2)_{16}(CO_3)_{16}O_8(OH)_8 \cdot 39H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Platy crystals, flattened on {001} and elongated along [110], showing $\{\bar{1}10\}$, $\{\bar{1}30\}$, {010}, {130}, $\{1\bar{1}0\}$, to 3 mm.

Physical Properties: *Cleavage:* On {001}, good. Hardness = 2 VHN = 36
D(meas.) = n.d. D(calc.) = 3.907 Radioactive.

Optical Properties: Transparent to translucent. *Color:* Sulfur-yellow. *Luster:* Vitreous. *Optical Class:* Biaxial (+). *Pleochroism:* X = colorless; Y = pale yellow; Z = deep yellow. *Orientation:* $X = c$; $Y = a$; $Z = b$; $Z \wedge [110] = 25.1°$. $\alpha = 1.600(2)$ $\beta = 1.650(2)$ $\gamma = 1.722(2)$ 2V(meas.) = 84° 2V(calc.) = 83°

Cell Data: *Space Group:* $C2ma$, $Cm2b$, or $C222_1$. $a = 21.22(3)$ $b = 45.30(7)$ $c = 13.38(2)$ Z = 4

X-ray Powder Pattern: Shinkolobwe, Congo.
6.70 (100), 8.61 (80), 4.16 (60), 2.996 (60), 3.52 (50), 3.36 (50), 3.111 (40)

Chemistry:

	(1)
UO_3	60.66
CO_2	8.88
Y_2O_3	7.52
Gd_2O_3	2.80
Tb_2O_3	0.96
Dy_2O_3	5.61
H_2O	[13.57]
Total	[100.00]

(1) Shinkolobwe, Congo; by electron microprobe, CO_2 by chromatography, H_2O by difference; corresponds to $(Y_{4.57}Dy_{2.06}Gd_{1.06}Tb_{0.36})_{\Sigma=8.05}(UO_2)_{14.54}(CO_3)_{13.83}O_8(OH)_{9.57} \cdot 38.86H_2O$.

Occurrence: Very rare, in the lower portion of the oxidation zone developed above uraninite-bearing dolomitic rocks.

Association: Lepersonnite-(Gd), sklodowskite, curite, uranophane, becquerelite, rutherfordine, studtite, torbernite, soddyite, kasolite, schoepite, oursinite.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire).

Name: Honors Professor Johannes Martin Bijvoet (1892–1980), Dutch crystallographer.

Type Material: Royal Museum of Central Africa, Tervuren, Belgium, RMG13781.

References: (1) Deliens, M. and P. Piret (1982) Bijvoetite et lepersonnite, carbonates hydratés d'uranyle et de terres rares de Shinkolobwe, Zaïre. Can. (1) Bikita, Zimbabwe. (2) Do.; by electron microprobe, Li by AA, H_2O by TGA.
(3) $LiAlSi_2O_6 \cdot H_2O$.

Mineral Group: Zeolite group, probable.

Occurrence: As a late-formed mineral in fractures in lithium-rich pegmatites.

Association: Eucryptite, quartz, petalite, feldspar, calcite, stilbite, allophane (Bikita, Zimbabwe); albite, quartz, fairfieldite (Foote mine, North Carolina, USA).

Distribution: From Bikita, Zimbabwe. In the Foote mine, Kings Mountain, Cleveland Co., North Carolina, USA.

Name: For the locality, Bikita, Zimbabwe.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 106822.

Bilibinskite $Au_3Cu_2PbTe_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic (pseudocell). *Point Group:* n.d. Massive.

Physical Properties: Hardness = n.d. VHN = 329–419, 381 average (20 g load).
D(meas.) = 12.7 D(calc.) = [14.44]

Optical Properties: Opaque. *Color:* Pale brown, rose-brown. *Streak:* Gold-brown to brown. *Luster:* Semimetallic.
R: n.d.

Cell Data: *Space Group:* n.d. $a = 4.095$ Z = [0.5]

X-ray Powder Pattern: Aginsk deposit, Russia.
2.37 (100), 1.232 (80), 2.05 (70), 1.448 (60), 3.06 (40), 1.184 (20), 3.00 (10)

Chemistry:

	(1)	(2)
Au	48.4	50.06
Ag	1.54	
Cu	9.35	10.77
Fe	0.19	
Pb	19.2	17.55
Te	21.6	21.62
Se	0.34	
Total	100.6	100.00

(1) Aginsk deposit, Russia; by electron microprobe, average of eight analyses on two samples, leading to $(Au_{2.90}Ag_{0.17})_{\Sigma=3.07}(Cu_{1.74}Fe_{0.04})_{\Sigma=1.78}Pb_{1.10}(Te_{2.00}Se_{0.05})_{\Sigma=2.05}$. (2) $Au_3Cu_2PbTe_2$.

Occurrence: In the zone of weathering of tellurium deposits.

Association: Gold, bogdanovite, bezsmertnovite, belyakinite, other tellurides of Au, Cu, Pb, Fe (Aginsk deposit, Russia); sylvanite, krennerite (Southern Dzhelambet deposit, Kazakhstan).

Distribution: From the Aginsk gold telluride deposit, Kamchatka, Far Eastern Region, Russia [TL]. At the Southern Dzhelambet deposit, central Kazakhstan [TL].

Name: For Soviet geologist Yuri Aleksandrovich Bilibin (1901–1952), Karpkinskii All-Union Research Institute, St. Petersburg, Russia, specialist in gold deposits.

Type Material: Mining Institute, St. Petersburg, 101/1–2; Institute of Mineralogy and Geochemistry of Rare Elements, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 78385, vis207.

Total	99.67	100.48	100.00

(1–2) Shaba Province, Congo. (3) $Ba(UO_2)_6O_4(OH)_6 \cdot 4H_2O$.

Occurrence: An uncommon alteration product of uraninite.

Association: Uranophane, fourmarierite, metatorbernite, rutherfordine, becquerelite, studtite, soddyite.

Distribution: From Shinkolobwe and in the Musonoi mine, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). From the La Crouzille mine, and the Margnac mine, Compreignac, Haute-Vienne, and in the Rabéjac uranium deposit, seven km south-southeast of Lodève, Hérault, France. In Germany, at Wölsendorf, Bavaria; from Menzenschwand, and at Wittichen, Black Forest; and at Bergen, Vogtland, Saxony. On Mauch Chunk Ridge, Jim Thorpe, Carbon Co., Pennsylvania, and in the Delta mine, Emery Co., Utah, USA.

Name: For Valère Louis Billiet (1903–1945), Belgian crystallographer, University of Ghent, Ghent, Belgium.

Type Material: Harvard University, Cambridge, Massachusetts, 104455; National Museum of Natural History, Washington, D.C., USA, 160496.

(1) Tintic, Utah, USA; corresponding to $Ag_7(As_{0.86}Sb_{0.14})_{\Sigma=1.00}S_6$.

Occurrence: Believed to have occurred in a body of high-grade silver ore.

Association: Acanthite, tennantite, bismuthinite, galena, pyrite.

Distribution: In the North Lily mine, East Tintic district, Utah Co., Utah, USA [TL].

Name: For Paul Billingsley (1887–1962), mining geologist, who discovered the North Lily mine, and collected the type material.

Type Material: National School of Mines, Paris, France; Harvard University, Cambridge, Massachusetts, 110530; National Museum of Natural History, Washington, D.C., USA, R18987.

Billwiseite $Sb^{3+}_5(Nb,Ta)_3WO_{18}$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As blocky crystals displaying {100}, {011} and {410}, to 0.50 mm. *Twinning:* Common on (100).

Physical Properties: *Cleavage*: {100} indistinct. *Fracture*: Hackly. *Tenacity*: Brittle. Hardness = 5 D(meas.) = n.d. D(calc.) = 6.330

Optical Properties: Transparent. *Color*: Pale yellow with a hint of green, colorless in transmitted light. *Streak*: Colorless to very pale yellow. *Luster*: Vitreous.
Optical Class: Biaxial. *n*(calc.) = 2.3 2V(meas.) = 76(2)° *Orientation*: $X \parallel b$, $Y \wedge c = 72.8°$ (in β acute).

Cell Data: *Space Group*: *C*2/*c*. $a = 5.5482(5)$ $b = 4.9143(5)$ $c = 5.5482(5)$ $\beta = 90.425(2)°$ Z = 4

X-ray Powder Pattern: Stak Nala, Karakoram Mountains, 70 km east of Gilgit, Pakistan.

(1) Stak Nala, Karakoram Mountains, 70 km east of Gilgit, Pakistan; average of 8 electron microprobe analyses, absence of OH and H_2O confirmed by IR spectroscopy, valence state of Sb determined by crystal structure analysis; corresponding to $Sb^{3+}_{4.87}(Nb_{1.33}Ta_{1.28}Ti_{0.18}W_{1.26})_{\Sigma=4.05}O_{18}$.

Occurrence: In a complex zoned granitic pegmatite of the LCT (Li–Cs–Ta) type.

Association: Lepidolite, B-rich muscovite.

Distribution: At Stak Nala, Karakoram Mountains, 70 km east of Gilgit, Pakistan.

Name: Honors William Stewart Wise (b. 1933), Professor of Geology Emeritus, University of California at Santa Barbara, USA, for his contributions to mineralogy and his inspiration and mentoring of mineralogy students.

Type Material: Department of Natural History, Royal Ontario Museum, Toronto, Canada (M55951).

Bindheimite $Pb_2Sb_2O_6(O,OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Fibrous, perhaps due to pseudomorphism; as dense to earthy cryptocrystalline masses and incrustations; rarely opaline.

Physical Properties: *Fracture:* Earthy, conchoidal. Hardness = 4–4.5 D(meas.) = 4.6–8.4 D(calc.) = [6.78–6.88]

Optical Properties: Translucent to opaque. *Color:* Yellow, yellow-brown, brown, white, gray, greenish; colorless to yellow and brown in transmitted light. *Streak:* White, yellowish white. *Luster:* Resinous, dull, earthy.
Optical Class: Isotropic. n = 1.84–1.87

Cell Data: *Space Group:* $Fd3m$. a = 10.37–10.42 Z = 8

X-ray Powder Pattern: Unknown locality.

(1) Wamsley mine, Mineral Co., Nevada, USA. (2) Otjimboyo East, Namibia; remnant is SiO_2 6.4%, insoluble 1.6%. (3) $Pb_2Sb_2O_7 \bullet H_2O$.

Mineral Group: Stibiconite group.

Occurrence: Common in the oxidized portions of antimony-bearing lead deposits.

Association: Galena, pyrite, chalcopyrite, tetrahedrite, jamesonite, bournonite, zinkenite, cerussite, plumbojarosite, argentojarosite, minium, massicot, quartz, barite, calcite, dolomite.

Distribution: A widely distributed mineral, but rarely in large amounts. From Nerchinsk, Siberia, Russia. In Austria, at Oberzeiring, Styria, and Hüttenberg, Carinthia. In Italy, at Camerata Cornello, Val Brembana, and at Gorno, Val Seriana, Lombardy. In the Bodannon mine and Wheal Boys, St. Endellion, and elsewhere in Cornwall, and at Caldbeck Fells, Cumbria, England. From Otjimboyo East, Karibib, Namibia. At Hamman N'bail, Qacentina (Constantine), Algeria. From Broken Hill, New South Wales, Australia. In the Chichibu mine, Saitama Prefecture, Japan. At Machacamaraca, Potosi, Bolivia. From the Ojuela mine, Mapimí, Durango, Mexico. In the USA, at the Montezuma and other mines, Arabia district, Pershing Co., Nevada; from the Coeur d'Alene district, Shoshone Co., Idaho; in several mines in the Tintic district, Juab Co., and the Horn Silver mine, San Francisco district, Beaver Co., Utah; at Cerro Gordo, Inyo Co., and elsewhere in California.

Name: For Johann Jacob Bindheim (1750–1825), German chemist who made the first chemical analysis of the mineral.

Biotite $\mathbf{K(Mg,Fe^{2+})_3(Al,Fe^{3+})Si_3O_{10}(OH,F)_2}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Uncommon in good crystals, tabular or short prismatic, with pseudohexagonal outline, to 3 m. Typically irregular foliated or bent masses; in scaly aggregates or disseminated grains. *Twinning:* On composition plane {001}, twin axis [310].

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Brittle to flexible, elastic. Hardness = 2.5–3 D(meas.) = 2.7–3.3 D(calc.) = 3.25

Optical Properties: Semitransparent. *Color:* Dark green, brown, black, reddish brown, light yellow, grayish yellow, brownish green, brown; yellow to reddish brown in thin section. *Streak:* White. *Luster:* Splendent to submetallic, vitreous, pearly on cleavage. *Optical Class:* Biaxial (–). *Pleochroism:* Strong; X = gray-yellow, yellow-brown, orange-brown; $Y = Z$ = dark brown, dark green, dark red-brown. *Orientation:* $Y = b$; $X \wedge c = 0°$–$3°$; $Z \wedge a = 0°$–$9°$. *Dispersion:* $r < v$, Fe-rich; may be $r > v$, Mg-rich; weak. *Absorption:* $Y \simeq Z \gg X$. $\alpha = 1.565$–1.625 $\beta = 1.605$–1.696 $\gamma = 1.605$–1.696 2V(meas.) = $0°$–$25°$

Cell Data: *Space Group:* $C2/m$. $a = 5.3$ $b = 9.2$ $c = 10.2$ $\beta = 100°$ Z = 2

(1) Vercelli, Italy; by electron microprobe, average of six analyses on one grain, Fe^{3+} by a semimicrovolumetric method, H_2O by TGA; corresponds to $(K_{0.94}Na_{0.02})_{\Sigma=0.96}(Mg_{1.35}Fe^{2+}_{0.95}Mn_{0.03})_{\Sigma=2.33}(Fe^{3+}_{0.39}Ti_{0.20}Al_{0.05}Li_{0.01})_{\Sigma=0.65}(Si_{2.79}Al_{1.21})_{\Sigma=4.00}[O_{10.55}(OH)_{1.44}Cl_{0.01}]_{\Sigma=12.00}$, in the general structural formula $K(Mg,Fe^{2+})_{3-2}(Al,Fe^{3+},Ti)_{0-1}(Si_{3-2.5}Al_{1--1.5})_{\Sigma=4}O_{10--11}(OH,F)_{2--1}$.

Polymorphism & Series: 1M, $2M_1$, 3A polytypes.

Mineral Group: Mica group.

Occurrence: An important rock-forming mineral under a wide range of conditions. In regionally metamorphosed schists and gneisses, and in contact metamorphosed rocks; in granites to nepheline syenites; less common in extrusive igneous rocks, from rhyolites to basalts. Characteristic of potassic hydrothermal alteration; in detrital sediments.

Association: Quartz, potassic feldspar, plagioclase, nepheline, muscovite, pyroxenes, amphiboles, andalusite, cordierite, garnet, spinel.

Distribution: Good crystals from: in Italy, at Vesuvius and Monte Somma, Campania, and in the Pfitschtal and on Mt. Monzoni, Val di Fassa, Trentino-Alto Adige. At Brevik and Arendal, Norway. From near Miass, Ilmen Mountains, Southern Ural Mountains, Russia. In the USA, from Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; Monroe, Orange Co., and Russell, St. Lawrence Co., New York; at Easton, Northampton Co., Pennsylvania; from the Pala and Rincon districts, San Diego Co., California. In Canada, in Ontario, at Bancroft, Wakefield, and Otter Lake, Parry Sound; in Quebec, in the Bear Lake mine, Pontiac Co.

Name: For the French mineralogist and physicist, Jean Baptiste Biot (1774–1862).

Biphosphammite $(NH_4, K)H_2PO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. As crystals, to 2 mm, tapering, prismatic, in radiating groups; stalactitic and in crusts; fine granular, powdery.

Physical Properties: Hardness = Very soft. D(meas.) = 2.04(2) D(calc.) = [2.02] for NH_4:K = 1:1.

Optical Properties: Semitransparent. *Color:* White, pale buff, to deep shades of brown; colorless in transmitted light. *Streak:* White to pale buff. *Luster:* Dull, earthy; crystals rarely vitreous.
Optical Class: Uniaxial (–). $\omega = 1.525$ $\epsilon = 1.480$

Cell Data: *Space Group:* $I\bar{4}2d$. $a = 7.4935(5)$ $c = 7.340(3)$ Z = [4]

X-ray Powder Pattern: Murra-el-elevyn Cave, Australia.
3.75 (10), 5.24 (9), 3.02 (9b), 1.993 (8), 2.650 (7), 2.368 (7), 1.593 (6)

Chemistry:

	(1)	(2)
SO_3	5.59	
P_2O_5	51.1	56.52
Na_2O	0.16	
K_2O	14.2	18.76

H_2O		14.35
insol.	0.81	
rem.	[16.14]	
Total	[100.3]	100.00

(1) Murra-el-elevyn Cave, Australia; partial analysis, remainder mostly CaO and H_2O; stated to correspond to $[(NH_4)_{0.62}K_{0.38}]_{\Sigma=1.00}H_2PO_4$ 88%, syngenite 11.5%, insolubles in H_2O, 0.81%.
(2) $(NH_4, K)H_2PO_4$ with NH_4:K = 1:1.

Occurrence: An alteration product of phosphammite in guano, due to loss of NH_4 (Guañape Island, Peru); a byproduct of the reaction between the liquid fraction of bat guano and urea (Murra-el-elevyn Cave, Australia).

Association: Phosphammite (Guañape Island, Peru); syngenite (Murra-el-elevyn Cave, Australia).

Distribution: On Guañape Island, south of Trujillo, Peru. In Murra-el-elevyn Cave, Cocklebiddy, and in Petrogale Cave, near Madura, Western Australia. From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana.

Name: As a BIPHOSPHate of AMMonium.

Type Material: Western Australian Museum, Perth, MDC3977.

Biringuccite $Na_2B_5O_8(OH)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tiny crystals and microcrystalline clusters, in earthy masses.

Physical Properties: Hardness = n.d. D(meas.) = 2.32(1) (synthetic). D(calc.) = 2.297 Soluble in H_2O.

Optical Properties: Transparent. *Color:* White to pale yellow.
Optical Class: Biaxial (–) (synthetic). *Orientation:* $Y = b$; $Z \wedge a = 5.4(6)°$ $\alpha = 1.496(2)$ $\beta = 1.539(2)$ $\gamma = 1.557(2)$ 2V(meas.) = 62.7° 2V(calc.) = 64.6°

Cell Data: *Space Group:* $P2_1/c$ (synthetic). $a = 11.1955(7)$ $b = 6.5607(4)$ $c = 20.7566(9)$ $\beta = 93.891(6)°$ Z = 4

X-ray Powder Pattern: Synthetic.
3.45 (100), 10.32 (80), 3.05 (55), 3.03 (55), 2.589 (45), 5.18 (40), 2.853 (40)

Chemistry: (1) Larderello, Italy; identification depended on the chemical analysis interpreted as a mixture with nasinite, and the correspondence of lines in the mixture's X-ray powder pattern with those of synthetic material.

Occurrence: As scales on piping in a geothermal field.

Association: Nasinite, thénardite, orpiment, quartz.

Distribution: From Larderello, Val di Cecina, Tuscany, Italy.

Name: To honor Vannoccio Biringuccio (1480–1538/9), alchemist and metallurgist, author of the *Pirotechnia*.

Type Material: University of Florence, Florence, Italy, 16802/703; National Museum of Natural History, Washington, D.C., USA, 163785.

Birnessite $(Na, Ca)_{0.5}(Mn^{4+}, Mn^{3+})_2O_4 \cdot 1.5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Rarely in platelets, to 50 μm; commonly extremely finely crystalline, spherulitic, cellular.

Physical Properties: Hardness = 1.5 D(meas.) = 3.0 D(calc.) = [3.4]

Optical Properties: Nearly opaque. *Color:* Black; dark brown in transmitted light.
Luster: Dull.
Optical Class: Pseudouniaxial (–); identification by optical properties is impossible. $\omega = \sim 1.73$ $\epsilon = \sim 1.69$

Cell Data: *Space Group:* $C2/m$ (synthetic $\approx Na_{0.58}(Mn^{4+}_{1.42}Mn^{3+}_{0.58})_{\Sigma=2.00}O_4 \cdot 1.5H_2O$).
$a = 5.175(1)$ $b = 2.850(1)$ $c = 7.337(3)$ $\beta = 103.18(2)^\circ$ Z = 1

X-ray Powder Pattern: Marine nodule, Caribbean; all reflections are typically very broad.
7.08 (100), 2.333 (43), 1.711 (29), 3.547 (28), 2.031 (24), 2.468 (17), 1.426 (17)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	0.9		CaO	0.39	
MnO_2	75.8	61.40	Na_2O	1.9	7.30

CoO	0.14		H_2O	[10.89]	12.72
NiO	0.80		S	0.2	
CuO	0.33		rem.		
MgO	6.2		Total	[100.0]	100.00

(1) Marine nodule, Caribbean; by electron microprobe, total Mn as MnO_2, H_2O by difference.
(2) $Na_{0.50}(Mn^{4+}_{1.50}Mn^{3+}_{0.50})_{\Sigma=2.00}O_4 \cdot 1.5H_2O$.

Occurrence: A major manganese-bearing mineral of many soils; a common alteration product of manganese-rich mineral deposits; a component of bacterially-precipitated manganese oxides; an important constituent of "desert varnish" and marine manganese nodules.

Association: Rhodonite, rhodochrosite, tephroite, spessartine, alleghanyite, cummingtonite (Cummington, Massachusetts, USA); manganese and iron oxides, calcium carbonate (marine nodules).

Distribution: Increasingly recognized as a common manganese oxide mineral. From Birness, Aberdeenshire, Scotland. In the Treburland mine, Altarnun, and the Penberthy Croft mine, St. Hilary, Cornwall, England. On Groote Eylandt, Northern Territory, and near Noarlunga, Mount Lofty Ranges, South Australia. At the Ioi mine, Ritta, Shiga Prefecture, Japan. In the USA, at Sterling Hill, Sussex Co., New Jersey; from Cummington, Hampshire Co., Massachusetts; in the Kramer borate deposit, Boron, Kern Co., California; at Silver Cliff, Custer Co., Colorado; and elsewhere. From Mont St. Hilaire, Quebec, Canada. A number of oceanic sea floor and sea mount occurrences are now known.

Name: For the type locality at Birness, Scotland.

Type Material: n.d.

(1) Leopoldshall, Germany; H_2O by difference. (2) Stassfurt, Germany; by electron microprobe, H_2O by difference. (3) $MgCl_2 \cdot 6H_2O$.

Occurrence: In saline deposits; probably in part secondary, formed from carnallite.

Association: Carnallite, halite, kieserite.

Distribution: In Germany, from Stassfurt-Leopoldshall, 34 km south of Magdeburg, Saxony-Anhalt; at Vienenburg and Aschersleben, Lower Saxony. From Lake Inder, Kazakhstan.

Name: For Karl Gustav Bischof (1792–1870), German geologist and mineral chemist, University of Bonn, Bonn, Germany.

Bismite α–Bi_2O_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals microscopic, rare; earthy to pulverulent, compact granular, massive.

Physical Properties: *Fracture:* Uneven to earthy when massive. Hardness = 4.5 D(meas.) = 8.64–9.22 D(calc.) = 10.4

Optical Properties: Transparent in very small fragments. *Color:* Grayish green, greenish yellow to bright yellow. *Streak:* Gray to yellow. *Luster:* Subadamantine to dull, earthy. *Optical Class:* Biaxial. *Dispersion:* High. $n = > 2.42$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. $a = 5.851$ $b = 8.169$ $c = 7.513$ $\beta = 112°58'$ Z = 4

X-ray Powder Pattern: Colavi, Bolivia.
3.232 (10), 2.676 (9), 1.670 (8), 1.640 (8), 1.951 (7.5), 1.740 (7.5), 1.167 (7)

Chemistry: Modern analyses of authenticated material are lacking.

Polymorphism & Series: Dimorphous with sphaerobismoite.

Occurrence: An oxidation product of bismuth.

Association: Bismuth, bismutite, cassiterite.

Distribution: From near Colavi, at Tazna, and Llallagua, Bolivia. In the USA, at the Harding mine, Dixon, Taos Co., New Mexico; at the Victor mine, Rincon, and in a number of the pegmatites at Pala, San Diego Co., and near Baker, San Bernardino Co., California; an ore mineral in the Missouri mine, Park Co., Colorado. In the Ebisu mine, Gifu Prefecture, Japan. Numerous localities for bismuth oxides have been reported, but modern confirmation is required, as most have proven to be carbonates, etc.

Name: For BISMuth in its composition.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 97831.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 599–601. (2) Frondel, C. (1943) Mineralogy of the oxides and carbonates of bismuth. Bismoclite BiOCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals minute, scaly or thin rectangular, rarely with corners truncated at 45°; platy, columnar-fibrous, earthy, compact massive.

Physical Properties: *Cleavage:* Perfect on {001}. *Tenacity:* Very plastic. Hardness = 2–2.5 D(meas.) = 7.36 D(calc.) = 7.784

Optical Properties: Opaque, transparent in fine grains. *Color:* Cream-white, pale gray, yellowish brown; colorless in thin section. *Luster:* Greasy, silky, pearly on cleavage surfaces; dull to earthy when massive.
Optical Class: Uniaxial (–). $\omega = 2.15$ (synthetic). ϵ = n.d.

Cell Data: *Space Group:* $P4/nmm$ (synthetic). $a = 3.887$ $c = 7.354$ Z = 2

X-ray Powder Pattern: Synthetic.

(1) Jakkalswater, South Africa. (2) Goldfield, Nevada, USA; recalculated to 100% after deduction of quartz 34.81%, Fe_2O_3 0.28%. (3) BiO(Cl, OH) with Cl:OH = 1:1.

Occurrence: In an alluvial specimen, found near bismuth-bearing granite pegmatites (Jackals Water, South Africa); in greisen (Bygoo, Australia).

Association: Bismutite, mica (Jackals Water, South Africa); bismuthinite (Bygoo, Australia); bismutite, jarosite, alunite, cerussite (Tintic district, Utah, USA); atacamite, connellite, uranium minerals (near Dalbeattie, Scotland).

Distribution: In South Africa, about 25 km northwest of Jakkalswater, near Steinkopf, Cape Province. From Mt. Holland, Western Australia, and Bygoo, New South Wales, Australia. In the USA, from the Eagle and Blue Bell mines, Tintic district, Juab Co., Utah; in the Grizzly Bear and other mines, Goldfield, Esmeralda Co., Nevada. In the Falcacci mine, Rio Marina, Elba, Italy. From near Dalbeattie, Kirkcudbrightshire, Scotland. At the Croft Gothal mine, Cornwall, England. From Wittichen, Black Forest, Germany. At Tary-Ekan, Karamazan, Tajikistan. From the Kara-Oba Mo–W deposit, Bet-Pak-Dal Desert, central Kazakhstan.

Name: In allusion to its composition, a *bismuth oxychloride*.

Type Material: n.d.

Bismuth Bi

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. Crystals, to 12 cm, but indistinct, commonly in parallel groupings, or hoppered; reticulated, arborescent, foliated, granular. *Twinning:* Polysynthetic, common.

Physical Properties: *Cleavage:* Perfect on {0001}, good on $\{10\overline{1}1\}$, poor on $\{10\overline{1}4\}$. *Tenacity:* Sectile, brittle. Hardness = 2–2.5 VHN = 16–18 (100 g load). D(meas.) = 9.70–9.83 D(calc.) = 9.81

Optical Properties: Opaque. *Color:* Silver-white, with reddish hue, tarnishes iridescent; in polished section, brilliant creamy white, tarnishing yellow. *Streak:* Pale silver. *Luster:* Metallic. *Pleochroism:* Feeble. *Anisotropism:* Distinct.

R_1–R_2: (400) 47.0–58.2, (420) 49.3–58.8, (440) 51.4–59.7, (460) 52.9–60.9, (480) 54.4–62.4, (500) 56.2–63.9, (520) 57.8–65.3, (540) 59.3–66.6, (560) 60.4–67.8, (580) 61.4–69.0, (600) 62.4–69.9, (620) 63.1–70.7, (640) 63.6–71.5, (660) 63.9–72.2, (680) 64.0–72.8, (700) 64.1–73.2

(1) Durango, Mexico.

Mineral Group: Arsenic group.

Occurrence: In hydrothermal veins with ores of Co, Ni, Ag, and Sn; in pegmatites and topaz-bearing Sn–W quartz veins.

Association: Chalcopyrite, arsenopyrite, pyrrhotite, pyrite, cobaltite, nickeline, breithauptite, skutterudite, safflorite, löllingite, bismuthinite, silver, cubanite, molybdenite, sphalerite, galena, scheelite, wolframite, calcite, barite, quartz.

Distribution: From numerous localities, but typically as a minor accessory mineral. From Altenberg, Schneeberg, and Annaberg, Saxony, Germany. At Jáchymov (Joachimsthal), Czech Republic. From near Villanueva de Córdoba, Córdoba Province, Spain. In the Dolcoath and other mines, Cornwall, England. From Uncia, Chorolque, Llallagua, and Tazna, Potosí, Bolivia, economically important. An 11 kg nugget found at Velaque, La Paz, Bolivia. In the Mt. Arthur mine, Queensland, and from Kingsgate, New South Wales, Australia. At Natsukidani, Oita Prefecture, Japan, large crystals. From Cobalt, Ontario, Canada.

Name: From the German *weisse masse*, later *wismuth*, *white mass*.

Bismuthinite Bi_2S_3

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, up to 12 cm, stout prismatic to acicular, elongated and striated ‖ [001]. Commonly massive with foliated or fibrous texture.

Physical Properties: *Cleavage:* {010}, perfect and easy, {100} and {110}, imperfect. *Tenacity:* Flexible, somewhat sectile. Hardness = 2–2.5 VHN = n.d. D(meas.) = 6.78 D(calc.) = 6.81

Optical Properties: Opaque. *Color:* Lead-gray to tin-white, with a yellowish or iridescent tarnish. *Streak:* Lead-gray. *Luster:* Metallic. *Anisotropism:* Strong, especially in oil.

(1) Guanajuato, Mexico. (2) Jonquiére, Quebec, Canada. (3) Riddarhyttan, Västmanland, Sweden. (4) Bi_2S_3.

Mineral Group: Forms a series with stibnite.

Occurrence: Typically in low- to high-temperature hydrothermal vein deposits, in tourmaline-bearing copper deposits in granite, in some gold veins formed at high temperatures, and in recent volcanic exhalation deposits.

Association: Bismuth, aikinite, arsenopyrite, stannite, galena, pyrite, chalcopyrite, tourmaline, wolframite, cassiterite, quartz.

Distribution: Widespread. From the Llallagua, Huanuni, Tazna, and Chorolque districts, Potosí, Bolivia. From Guanajuato, Mexico. In the USA, large crystals at the Victoria mine, Dolly Varden district, Elko Co.; in a number of mines in the Goldfield district, Esmeralda Co., and elsewhere in Nevada. From Moravicza and Băiţa (Rézbánya), Romania. At Schneeberg and Altenberg, Saxony, Germany. From a number of mines in Cornwall, England. In the Mt. Biggenden mine, Queensland, Australia. At Fefena, Madagascar. Exceptional crystals from Spind, Farsum, Norway.

Name: From the composition.

Bismutite $Bi_2O_2(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Very rare in platy crystals, to 0.5 mm; typically radially fibrous to spheroidal, in crusts and earthy to dense massive aggregates.

Physical Properties: *Cleavage:* On {001}, probable. Hardness = 2.5–3.5
D(meas.) = 6.1–7.7; 8.11 D(calc.) = 8.25

Optical Properties: Opaque to transparent in small grains. *Color:* Straw-brown, brown, brownish yellow, pale yellow, pale green, greenish gray, gray, may be dark gray to black in dense pseudomorphs; colorless to pale yellow or pale green in transmitted light. *Streak:* Gray. *Luster:* Vitreous, waxy, may be dull to earthy.
Optical Class: Uniaxial; moderate birefringence. *Orientation:* Positive elongation, parallel extinction. n = 2.12–2.30

Cell Data: *Space Group:* $I4/mmm$. a = 3.867–3.870 c = 13.686–13.697 Z = 2

X-ray Powder Pattern: Marropino mine, Zambezia, Mozambique.
2.953 (100), 2.737 (41), 3.724 (30), 1.6184 (30b), 2.137 (25), 1.7502 (22b), 1.9354 (20)

H_2O	trace	
Total	99.97	100.00

(1) Guanajuato, Mexico. (2) $Bi_2O_2(CO_3)$.

Occurrence: A relatively common alteration product of other bismuth-bearing minerals in hydrothermal mineral deposits and granite pegmatites.

Association: Bismuth, bismuthinite, tetradymite, many other bismuth-bearing minerals.

Distribution: Some well-confirmed occurrences include: in Germany, from Ullersreuth, Thuringia; at Schneeberg, Johanngeorgenstadt, and elsewhere in Saxony. At Meymac, Corrèze, France. In England, from Wheal Owles, Wheal Coates, the South Crofty mine, the Penberthy Croft mine, and others in Cornwall, and at Caldbeck Fells, Cumbria. From Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. At Tazna and many other places in Bolivia. In the USA, at the Harding mine, Dixon, Taos Co., New Mexico; in the Trout Creek Pass pegmatites, Chaffee Co., Colorado; from the Comstock mine, Dos Cabezos Mountains, Cochise Co., Arizona; at the Mammoth mine, Tintic district, Juab Co., Utah. From Kingsgate, New South Wales, Australia. At many other minor localities.

Name: In allusion to *bismuth* in the composition.

(1) Schneeberg, Germany. (2) Do.; corresponds to $Bi_{0.92}(Fe^{3+}_{1.86}Fe^{2+}_{0.25}Al_{0.03})_{\Sigma=2.14}Si_2O_8(OH)$. (3) $BiFe_2(SiO_4)_2(OH)$.

Occurrence: Probably of hydrothermal origin, in veins cutting shale (Schneeberg, Germany).

Association: Quartz, "chalcedony," bismuth, cobaltite, arsenopyrite, chlorargyrite (Schneeberg, Germany); quartz, bismuth, galena, silver ores (Johanngeorgenstadt, Germany); clinobisvanite (Lodi # 4 claim, California, USA).

Distribution: In Germany, at Schneeberg, Johanngeorgenstadt, and Gersdorf, Saxony. From near Smrkovec, Slavkovský Les Mountains, about 10 km north-northeast of Mariánské Lázně, Czech Republic. In England, at the South Terras mine, St. Stephen-in-Brannel, and the Hingston Down quarry, Calstock, Cornwall, and at Buckbarrow Beck, Carney Fell, Cumbria. From the Lodi # 4 claim, Plumas Co., California, and in the Organ Mountains, Dona Ana Co., New Mexico, USA.

Name: For BISMUTh and iron, (FERRum), in the composition.

(1) Oktyabr mine, Russia; by electron microprobe, corresponding to $(Ni_{8.90}Co_{0.16}Fe_{0.04})_{\Sigma=9.10}(Bi_{1.94}As_{0.08})_{\Sigma=2.02}S_{8.00}$. (2) Zimmer Lake, Canada; by electron microprobe, corresponding to $(Ni_{8.92}Co_{0.13}Fe_{0.04})_{\Sigma=9.09}(Bi_{1.52}As_{0.11})_{\Sigma=1.63}S_{8.00}$. (3) $Ni_9Bi_2S_8$.

Mineral Group: Hauchecornite group.

Occurrence: Of hydrothermal origin; as secondary pore-fillings and replacements of sandstone and conglomerate (Zimmer Lake, Canada); in ultramafic rocks (Liu Zhuang, China).

Association: Chalcocite, galena, pentlandite, altaite (Oktyabr mine, Russia); chalcopyrite, pyrrhotite, millerite (Zimmer Lake, Canada).

Distribution: In the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL]. From near Zimmer Lake, northern Saskatchewan, Canada. At the Mihara mine, Okayama Prefecture, and the Tsumo mine, Shimane Prefecture, Japan. In China, from Liu Zhuang, Tongbai Co., Henan Province.

Name: For the relation to hauchecornite.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 77168.

Bismutomicrolite $(Bi, Ca)(Ta, Nb)_2O_6(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As crystals, octahedral, to 2 mm; commonly massive, in veinlets.

Physical Properties: *Fracture:* Uneven. *Tenacity:* [Brittle] (by analogy to the pyrochlore group). Hardness = 5 D(meas.) = ∼6.5 D(calc.) = 6.83–6.97

Optical Properties: Semitransparent. *Color:* Yellow, pink, brown; dark gray to black.
Luster: Dull, resinous.
Optical Class: Isotropic. $n = > 2.00$

Cell Data: *Space Group: Fd3m.* a = 10.430–10.485 Z = 8

X-ray Powder Pattern: Tromba pegmatite, Brazil.

(1) Wampewo pegmatite, Uganda. (2) Tromba pegmatite, Brazil; original total given as 99.97%, after deduction of Fe_2O_3 corresponds to $(Bi_{0.64}Ca_{0.36})_{\Sigma=1.00}(Ta_{1.69}Nb_{0.31})_{\Sigma=2.00}O_6(OH)$.

Mineral Group: Pyrochlore group; microlite subgroup: $Bi_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Ta_B \geq Nb_B$.

Occurrence: A late hydrothermal replacement of bismutotantalite in a lithium-bearing pegmatite (Wampewo pegmatite, Uganda).

Association: Waylandite, bismutotantalite (Wampewo Hill, Uganda); bismutite, bismuth (Tromba pegmatite, Brazil).

Distribution: In the Wampewo pegmatite, Gamba Hill, near Kampala, southwest Uganda. In the Tromba pegmatite, Goiás; at Alto Manoel, Baldoino, Paraíba; and at Lavra Ermo, Carnauba dos Danta, Rio Grande del Norte, Brazil. From the Solnetchnaya mine, Malkhan Range, central Tranbaikalia, Russia.

Name: Assigned by the IMA Committee on pyrochlore nomenclature for the predominant *bismuth* content and relation to *microlite* in the pyrochlore group.

Type Material: n.d.

(1) Gamba Hill, Uganda; contains additionally U_3O_8 0.06%. (2) Acari, Brazil. (3) Muiâne mines, Mozambique; partial analysis by XRF and electron microprobe. (4) $BiTaO_4$.

Occurrence: In granite pegmatite (Uganda and Mozambique); as stream-rounded pebbles (Acari, Brazil).

Association: Muscovite, schorl, cassiterite (Gamba Hill, Uganda).

Distribution: On Gamba Hill, near Kambala, southwest Uganda. In the Muiâne pegmatite, Alto Ligonha district, Mozambique. At Analamisakana, Madagascar. In Brazil, in Rio Grande do Norte, from Acari, near Picuí, Campina Grande, at Carnauba dos Dantas, Saco do Onca, at Parelhas, near Recife, and at Currais Novos; in the Baldino mine, Junco, Paraíba. In Japan, at Nagatareyama, Fukuoka Prefecture. From an undisclosed locality [Kjoktogoi] in the Altai Mountains, Sinkiang Uighur Autonomous Province, China.

Name: For BISMuth in its composition, and relation to *tantalite*.

Type Material: The Natural History Museum, London, England, 1929,160; National Museum of Natural History, Washington, D.C., USA, 96044.

(1) Mt. Bity, Madagascar; BeO apparently partially determined as Al_2O_3. (2) Londonderry, Australia. (3) $CaLiAl_2(AlBeSi_2)O_{10}(OH)_2$.

Polymorphism & Series: $2M_1$ polytype.

Mineral Group: Mica group.

Occurrence: A late-stage mineral in lithium-bearing pegmatites.

Association: Tourmaline, albite, lepidolite (Mt. Bity, Madagascar); bavenite, beryl, albite, cassiterite, columbite, tourmaline (Londonderry, Australia); calcite, albite (Strickland quarry, Connecticut, USA).

Distribution: In Madagascar, from Maharitra, on Mt. Bity. In the Namherere mine, Aukole, Uganda. In the USA, from the Strickland quarry, Portland, Middlesex Co., Connecticut, and the Harding pegmatite, Dixon, Taos Co., New Mexico. On the Huron claims, 16 km north of Point du Bois, Manitoba, Canada. At Pizzo Marcio, Val Vigezzo, Piedmont, Italy. From the Maantienvarsi pegmatite dike, Eräjärvi pegmatite area, Orivesi, Finland. At Tittling, near Passau, Bavaria, Germany. At Londonderry, Western Australia.

Name: For the locality, Mt. Bity, Madagascar.

Type Material: Natural History Museum, Paris, France; Harvard University, Cambridge, Massachusetts, USA, 87680.

(1) Thomas Range, Utah, USA; average of two analyses. (2) Postmasburg, South Africa; by electron microprobe. (3) $(Mn, Fe)_2O_3$ with Mn:Fe = 1:1.

Occurrence: In lithophysal cavities in rhyolite; in metamorphosed manganese ores.

Association: Topaz, spessartine, beryl, quartz, sanidine, pseudobrookite, hematite (rhyolites); braunite (manganese ores).

Distribution: In the USA, from the Thomas Range, Juab Co., Utah; at a number of places in the Black Range, Sierra and Catron Cos., New Mexico; and near Saddle Mountain, Pinal Co., Arizona. In Mexico, at Cerro de Mercado, Durango; the Barranca del Cobre, Chihuahua; and Tepetate, San Luis Potosi. From Ribes, Gerona Province, Spain. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. At Långban, Värmland, near Murjek, and at Sörhårås, Ultevis, Sweden. From Sitapár, Chindwara district, Central Provinces, and the Kajlidongri mine, Jhabua district, Madhya Pradesh, India. At Cobatla, near Postmasburg, Transvaal; a major ore in the Kuruman district, Cape Province, South Africa. In the Lomagundi district, Zimbabwe. Large crystals from the Otjiwarango district, Namibia. A few additional localities are known.

Name: For Maynard Bixby, mineral dealer of Salt Lake City, Utah, USA, who provided the first specimens.

Type Material: Yale University, New Haven, Connecticut, USA, 1.6369.

(1) Palermo #1 mine, New Hampshire, USA; by electron microprobe, partial analysis, total Fe as FeO, total Mn as MnO; corresponds to $(Ba_{1.1}Sr_{0.1})_{\Sigma=1.2}Al_{1.8}(Mn_{0.9}Fe_{0.9}Mg_{0.2})_{\Sigma=2.0}(PO_4)_3(OH)_3$.
(2) Buranga mine, Rwanda; average of two analyses, corresponding to $Ba_{1.00}(Mn_{1.45}Fe_{0.53})_{\Sigma=1.98}(Al_{1.67}Fe^{3+}_{0.28})_{\Sigma=1.95}(PO_4)_{2.97}(OH)_{2.90}$.

Mineral Group: Bjarebyite group.

Occurrence: A rare late stage reaction product of triphylite and amblygonite in complex granite pegmatites.

Association: Palermoite, augelite, childrenite, montebrasite, scorzalite, whitlockite, carbonate-apatite, siderite (Palermo #1 mine, New Hampshire, USA); bertossaite, lazulite-scorzalite, burangaite, trolleite, apatite, quartz (Buranga mine, Rwanda).

Distribution: From the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire, USA. At the Buranga pegmatite, near Gatumba, Rwanda. In the Västanå mine, near Näsum, Skåne, Sweden.

Name: Honors Alfred Gunnar Bjareby (1899–1967), Swedish-American student of New England pegmatite minerals, Boston, Massachusetts, USA, who collected the first specimen.

Type Material: n.d.

Blatonite $(UO_2)CO_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As distorted acicular crystals, typically in asbestiform bundles, to 1 mm.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Flexible. Hardness = 2–3 D(meas.) = 4.05(2) D(calc.) = 4.02 Radioactive; strongly fluoresces greenish yellow under LW UV.

Optical Properties: Translucent. *Color:* Canary-yellow. *Streak:* White. *Luster:* Silky. *Optical Class:* Uniaxial (+). *Orientation:* Length-fast. $\omega = 1.588(2)$ $\epsilon = 1.612(2)$

Cell Data: *Space Group:* n.d. $a = 15.79(1)$ $c = 23.93(3)$ Z = 36

X-ray Powder Pattern: Jomac mine, Utah, USA.
3.056 (100), 6.56 (77), 6.91 (55), 7.86 (47), 4.76 (40), 4.34 (36), 3.39 (33)

(1) Jomac mine, Utah, USA; by electron microprobe and TGA, $(CO_3)^{2-}$ and $(OH)^{1-}$ confirmed by IR; corresponds to $(UO_2)_{0.99}(CO_3)_{1.00} \cdot 1.03H_2O$. (2) $(UO_2)CO_3 \cdot H_2O$.

Occurrence: In seams of gypsum in the oxidized portions of a roll-front-type uranium deposit in silty conglomerate.

Association: Gypsum, boltwoodite, coconinoite, metazeunerite, rutherfordine, azurite, brochantite, carbonate-cyanotrichite, malachite, manganoan smithsonite.

Distribution: From the Jomac mine, White Canyon district, San Juan Co., Utah, USA.

Name: Honors Dr. Norbert Blaton (1945–), crystallographer and specialist in uranium minerals, Catholic University of Leuven, Leuven, Belgium.

Type Material: Royal Belgian Institute of Natural Sciences, Brussels, Belgium, R.C.4788.

References: (1) Vochten, R. and M. Deliens (1998) Blatonite, $UO_2CO_3 \cdot H_2O$, a new uranyl carbonate monohydrate from San Juan County, Utah. Can. Mineral., 36, 1077–1081. (2) (1999) Amer. Mineral., 84, 990 (abs. ref. 1).

Blatterite $(Mn^{2+},Mg)_{35}(Mn^{3+},Fe^{3+})_9Sb_3^{5+}(BO_3)_{16}O_{32}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Lathlike crystals, to 5 mm, elongated and striated parallel [001], showing {110}, poorly terminated, may be slightly curved.

Physical Properties: *Cleavage:* On {001}, perfect; on {100}, imperfect, a parting. *Tenacity:* Brittle. Hardness = ∼6 VHN = 814–940, 877 average (100 g load). D(meas.) = 4.7(4) D(calc.) = 4.25

Optical Properties: Opaque. *Color:* Black; exhibits red-orange internal reflections. *Streak:* Brown. *Luster:* Metallic to submetallic. *Optical Class:* Biaxial (–). *Orientation:* $X = a$; $Y = c$; $Z = b$. *Anisotropism:* Weak to distinct; shades of grayish brown. *Bireflectance:* Buff, creamy buff, pale buff. R_1–R_2: (400) 11.1–12.4, (420) 10.9–12.2, (440) 10.7–12.0, (460) 10.5–11.9, (480) 10.4–11.8, (500) 10.3–11.7, (520) 10.2–11.6, (540) 10.1–11.5, (560) 10.0–11.4, (580) 9.98–11.4, (600) 9.97–11.3, (620) 9.95–11.3, (640) 9.93–11.2, (660) 9.91–11.2, (680) 9.88–11.1, (700) 9.86–11.1

(1) Nordmark, Sweden; by ICP, total Sb as Sb_2O_5, total Fe as Fe_2O_3, Mn^{2+}:Mn^{3+} calculated for charge balance; then corresponds to $(Mn^{2+}_{22.38}Mg_{12.62})_{\Sigma=35.00}(Mn^{3+}_{4.91}Fe^{3+}_{1.71}Mn^{2+}_{3.12})_{\Sigma=9.74}Sb^{5+}_{3.06}(B_{1.01}O_3)_{16.00}O_{32}$. (2) Långban, Sweden; by electron microprobe, total Sb as Sb_2O_5, total Fe as Fe_2O_3, Mn^{2+}:Mn^{3+} calculated for charge balance; then corresponds to $(Mn^{2+}_{20.87}Mg_{14.06})_{\Sigma=34.93}(Mn^{3+}_{7.73}Fe^{3+}_{0.93}Al_{0.25}Ti_{0.09})_{\Sigma=9.00}Sb^{5+}_{3.01}(BO_3)_{16.00}O_{32}$.

Occurrence: From metamorphosed Fe–Mn orebodies.

Association: Manganosite, pyrochroite, hausmannite, katoptrite, calcite.

Distribution: From [the Brattfors mine,] Nordmark, and at Långban, Värmland, Sweden.

Name: Honoring Fritz Blatter (1943–), German mineral collector, who provided the original material.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden; Mineralogical-Geological Museum, University of Oslo, Oslo, Norway; The Natural History Museum, London, England1986,112, E.1168.

(1) Lake Boga, Victoria, Australia; electron microprobe analysis, H_2O by difference; corresponding to $(Ca_{1.63}Fe^{3+}_{0.46})_{\Sigma=2.09}Cu_5(Bi_{0.80}Cu_{0.25})_{\Sigma=1.05}[(PO_4)_{3.67}(AsO_4)_{0.04}]_{\Sigma=3.71}[Cl_{0.34}(OH)_{6.15}]\cdot 7.7H_2O$.

Occurrence: A secondary mineral from cavities in weathered uraniferous granitic pegmatite containing partly oxidized copper sulfide minerals.

Association: n.d.

Distribution: From Lake Boga, Swan Hill Rural City, Victoria, Australia.

Name: Honors the Reverend John I. Bleasdale (1822-1884) for of his promotion of mineralogy in Victoria.

Type Material: Museum of Victoria, Melbourne (M44699), and in the South Australian Museum, Adelaide, Australia.

References: (1) Birch, W.D., A. Pring, and U. Kolitsch (1999) Bleasdaleite, $(Ca,Fe^{3+})_2Cu_5(Bi,Cu)(PO_4)_4(H_2O,OH,Cl)_{13}$, a new mineral from Lake Boga, Victoria, Australia. Austral. J. Mineral., 5(2), 69-75. (2) (2000) Amer. Mineral., 85, 1321 (abs. ref. 1).

Blixite $Pb_2Cl(O,OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* n.d. Massive, in films.

Physical Properties: *Cleavage:* One direction, distinct. Hardness = ∼3 D(meas.) = 7.35 D(calc.) = [7.35]

Optical Properties: Semitransparent. *Color:* Pale yellow, yellow-orange, to grayish yellow. *Streak:* Pale yellow. *Luster:* Vitreous, may be dull.
Optical Class: Biaxial (+). *Orientation:* Extinction ∥ cleavage; OAP ⊥ to cleavage. α = ∼2.05 β = n.d. γ = ∼2.20 2V(meas.) = ∼80°

Cell Data: *Space Group:* n.d. $a = 5.832(3)$ $b = 5.694(5)$ $c = 25.47(2)$ Z = 8

X-ray Powder Pattern: Långban, Sweden.

(1) Långban, Sweden; corresponds to $(Pb_{1.95}Ca_{0.02})_{\Sigma=1.97}Cl_{1.02}[O_{1.27}(OH)_{0.41}]_{\Sigma=1.68}$. (2) Elura deposit, Australia; by electron microprobe, average of two analyses, original analyses elemental, here converted to $PbCl_2$ and oxides; S probably in anglesite.

Occurrence: In hausmannite-rich dolomite and manganophyllite skarn in a metamorphosed Fe–Mn orebody (Långban, Sweden); a reaction product in slag immersed in sea water (Laurium, Greece).

Association: Dolomite, hausmannite, copper, manganophyllite (Långban, Sweden); brucite, hydrocerussite (Mendip Hills, England); mendipite, anglesite (Elura deposit, Australia).

Distribution: From Långban, Värmland, Sweden. In the Merehead quarry, Mendip Hills, Somerset, England. At Laurium, Greece, in slag. Found in the Elura Zn–Pb–Ag deposit, 43 km northeast of Cobar, New South Wales, Australia.

Name: For Dr. Ragnar Blix (1898–1985), chemist at the Swedish Museum of Natural History, who performed analyses of many Långban minerals.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 251539; National Museum of Natural History, Washington, D.C., USA, 114720.

(1) Ischl, Austria. (2) $Na_2Mg(SO_4)_2 \cdot 4H_2O$.

Occurrence: In lacustrine salt deposits and salt efflorescences; probably a product of metamorphism of marine salt deposits; in nitrate deposits; may be a volcanic sublimate.

Association: Halite, kainite, carnallite, polyhalite (marine salt deposits); halite, thénardite, mirabilite (lacustrine salt deposits).

Distribution: From Ischl and Hallstatt, Austria. In the Stassfurt district, Saxony-Anhalt, Germany. From Kaluszyn, Poland. In Italy, at Monte Sambuco, Sicily. In the USA, from the Green River Formation, Garfield and Rio Blanco Cos., Colorado; at the Great Salt Lake, Davis Co., Utah; large crystals from Soda Lake, Carrizo Plain, San Luis Obispo Co., and at Bertram Siding, Salton Sea, Imperial Co., California; from Laguna Salina, Estancia Valley, Torrance Co., New Mexico. At Chuquicamata, Antofagasta, Chile. In the Mayo and Warcha mines, Salt Range, Punjab, India. Additional localities are known, most as widespread surficial efflorescences.

Name: To honor the German chemist Carl August Blöde (1773–1820).

(1) Izalco volcano, El Salvador; by electron microprobe. (2) $Cu_2V_2O_7$.

Polymorphism & Series: Dimorphous with ziesite.

Occurrence: A very rare sublimate, probably formed between 100–200 °C, from the outer sulfate zone of a fumarole in the crater of a basaltic composite volcano.

Association: Fingerite, stoiberite, mcbirneyite, ziesite.

Distribution: From the summit crater of Izalco volcano, El Salvador.

Name: To honor Dr. F. Donald Bloss (1920–), American mineralogist, Virginia Polytechnic Institute, Blacksburg, Virginia, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 164270.

(1) Blue Lizard U mine, Utah, USA; average of 5 electron microprobe analyses, H_2O by structural analysis, presence of SO_4, H_2O, UO_2 confirmed by Raman spectroscopy; corresponding to $Na_{6.94}(U_{1.02}O_2)(SO_4)_{4.00}Cl_{0.94}O_{0.06}(H_2O)_2$. (2) $Na_7(UO_2)(SO_4)_4Cl(H_2O)_2$.

Occurrence: An oxidation product as efflorescence on tunnel walls in sulfide-bearing sandstone in an abandoned underground Colorado Plateau-type uranium mine.

Association: Chalcanthite, copiapite, ferrinatrite, gypsum, kröhnkite, johannite, and a few new unnamed uranyl sulfates of Na and Mg.

Distribution: From the Blue Lizard U mine, Red Canyon, White Canyon district, San Juan County, Utah, USA.

Name: For the mine that produced the first specimens.

Type Material: Natural History Museum of Los Angeles County, California, USA (# 64060, 64061, 64062, 64063).

References: (1) Plášil, J., A.R. Kampf, A.V. Kasatkin, and J. Marty (2014) Bluelizardite, $Na_7(UO_2)(SO_4)_4Cl(H_2O)_2$, a new uranyl sulfate mineral from the Blue Lizard mine, San Juan County, Utah, USA. Journal of Geosciences, 59, 145-158. (2) (2014) Amer. Mineral., 99, 1806-1807 (abs. ref. 1).

Crystal Data: Monoclinic. *Point Group:* $2/m$. As equant anhedral crystals, to 1 cm, and in nodular aggregates.

Physical Properties: *Cleavage:* On {010}, perfect; a parting on {100}. *Tenacity:* Brittle. Hardness = 4 D(meas.) = 3.54(1) D(calc.) = 3.57

Optical Properties: Transparent. *Color:* Green-brown to red-brown. *Streak:* Yellow-brown. *Luster:* Resinous, bronzy on parting planes.
Optical Class: Biaxial (+). *Pleochroism:* Moderate; $X = Y$ = yellow-orange; Z = orange. *Orientation:* $Y = b$; $X \wedge a = 10°$. *Absorption:* $Z > X \simeq Y$. $\alpha = 1.694(1)$ $\beta = 1.698(1)$ $\gamma = 1.715(2)$ 2V(meas.) = 46.4(2)° 2V(calc.) = 52°

Cell Data: *Space Group:* $P2_1/n$. $a = 12.776$–12.843 $b = 12.478$–12.518 $c = 10.966$–11.035 $\beta = 97.21°$–$97.47°$ $Z = 4$

X-ray Powder Pattern: Cross Lake, Canada.

(1) Cross Lake, Canada; by electron microprobe, average of five analyses, red-brown material; Fe^{2+}:Fe^{3+} by Mössbauer spectroscopy; H_2O by TGA; from crystal structure analysis, the semi-empirical formula is $(Na_{2.07}Mn_{0.53}Ca_{0.20})_{\Sigma=2.80}(Mn^{2+}_{3.68}Al_{1.39}Fe^{3+}_{0.81}Mg_{0.07}Fe^{2+}_{0.04}Zn_{0.01})_{\Sigma=6.00}$ $P_{5.99}[O_{23.69}(OH)_{0.31}]_{\Sigma=24.00}$. (2) Do.; by electron microprobe, average of two analyses, green-brown material. (3) $Na_2Mn_5FeAl(PO_4)_6$.

Occurrence: An uncommon primary mineral in the intermediate zone of a granite pegmatite enriched in manganese and fluorine.

Association: Beusite, fillowite, triplite, apatite, alluaudite.

Distribution: From the Gotcha claim, on an island in Cross Lake, Manitoba, Canada.

Name: To honor Emeritus Professor Robert Bury Ferguson (1920–), Canadian mineralogist, University of Manitoba, Winnipeg, Canada, especially for his contributions to pegmatite mineralogy.

Type Material: University of Manitoba, Winnipeg, Manitoba, M6083; Royal Ontario Museum, Toronto, Canada, M42687.

Bobierrite $Mg_3(PO_4)_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are usually acicular, fibrous, and lath-shaped, elongated ‖ [001] and flattened on {010}, may be diamond-shaped, to 4 cm; as crystalline aggregates, typically in the form of fans and rosettes, fine-grained, massive.

Physical Properties: *Cleavage:* {010}, perfect. Hardness = 2–2.5 D(meas.) = 2.195 (synthetic). D(calc.) = 2.133

Optical Properties: Transparent. *Color:* Colorless, white, may be blue; in transmitted light, colorless. *Luster:* Nearly vitreous to pearly on cleavages.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c = 27°$–$29°$. *Dispersion:* $r < v$, weak.
$\alpha = 1.508$–1.512 $\beta = 1.514$–1.520 $\gamma = 1.541$–1.543 2V(meas.) = 71(3)° 2V(calc.) = 73°

Cell Data: *Space Group:* $C2/c$. $a = 4.667(1)$ $b = 27.926(8)$ $c = 10.067(3)$
$\beta = 105.01(2)°$ Z = 4

X-ray Powder Pattern: Synthetic.

(1) Mejillones, Chile. (2) Ødegården, Sweden. (3) $Mg_3(PO_4)_2 \cdot 8H_2O$.

Occurrence: Formed from the chemical alteration of guano deposits (Mejillones, Chile; Imperial Canyon lava tubes, Kenya), and an elephant tusk (Edgerton, Minnesota, USA). As a rare alteration product of primary phosphate-bearing minerals (Wodgina, Australia; Bendada pegmatite, Portugal).

Association: Hannayite, schertelite, lithiophilite, sicklerite, purpurite, collinsite, apatite, dolomite, calcite.

Distribution: Found on Mejillones Island, Chile. In Western Australia, found in the Pilbara district, at Wodgina. From Marlborough, New Zealand. In the USA, found near Edgerton, Pipestone Co., Minnesota. At the Ødegården apatite mines, Bamble, Norway. In the Bendada pegmatite, near Guarda, Portugal. Fine large crystals found in the Zheleznyi iron mine, Kovdor massif, Kola Peninsula, Russia. In Kenya, occurs in the Imperial Canyon lava tubes, Northern Chyulu Hills.

Name: In honor of Pierre Adolphe Bobierre (1823–1881), French agricultural chemist, who first described the mineral.

Bobtraillite $(Na,Ca)_{13}Sr_{11}(Zr,Y,Nb)_{14}Si_{42}B_6O_{132}(OH)_{12}\cdot 12H_2O$

Crystal Data: Hexagonal. *Point Group*: $\bar{3}$ 2/*m*. As blocky to prismatic crystals, elongated along [001] and exhibiting {100} and {001}, to 2 mm, as parallel 2- to 3-member aggregates and rosettes; rarely as plates, flattened along [001].

Physical Properties: *Cleavage*: None. *Fracture*: Uneven to conchoidal. *Tenacity*: Brittle. Hardness = 5.5 D(meas.) = n.d. D(calc.) = 3.16

Optical Properties: Transparent. *Color*: Gray to pale green or brown, rarely black. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Uniaxial (+). ω = 1.627(1) ε = 1.645(1) *Pleochroism*: None.

Cell Data: *Space Group*: $P\bar{3}c_1$. a =19.720(1) c = 9.9788(5) Z = 1

X-ray Powder Pattern: Mont Saint-Hilaire, Quebec, Canada [also a calculated peak at 17.08 (44)]. 2.752 (100), 3.13 (70), 3.96 (51), 3.76 (49), 6.46 (38), 5.43 (33), 1.990 (27)

(1) Poudrette quarry, Mont Saint-Hilaire, Quebec, Canada; average of 7 electron microprobe analyses, H_2O calculated and confirmed by IR spectroscopy, B from structural analysis; corresponding to $(Na_{11.20}Ca_{1.22})_{\Sigma=12.42}(Sr_{10.59}Ba_{0.16})_{\Sigma=10.75}(Zr_{12.69}Y_{0.63}Nb_{0.61}Hf_{0.14})_{\Sigma=14.07}Si_{41.64}B_6O_{132}(OH)_{12}\cdot 12H_2O$.

Occurrence: A late hydrothermal mineral in cavities in igneous breccia and nepheline syenite pegmatite.

Association: An unnamed burbankite-group mineral, donnayite-(Y), clinoamphibole, albite, aegirine, pyrrhotite, pyrite, annite, analcime, microcline, a white mica (muscovite?), titanite, clinopyroxene, calcite.

Distribution: Poudrette quarry, Mont Saint-Hilaire, Rouville County, Quebec, Canada.

Name: Honors Dr. Robert ("Bob") James Traill (b. 1921), mineralogist and former head of the Mineralogy Section at the Geological Survey of Canada, Ottawa (1953-1986).

Type Material: Canadian Museum of Nature, Ottawa, Canada (CMNMC 83718).

S	2.47		1.2	
Total	99.75	98.6	99.8	100.0

(1) Kletno, Poland; by electron microprobe, average of three analyses, corresponding to $(Ag_{0.98}Cu_{0.02})_{\Sigma=1.00}(Bi_{0.97}Pb_{0.03})_{\Sigma=1.00}(Se_{1.66}S_{0.34})_{\Sigma=2.00}$. (2) Near Julianehåb, Greenland; by electron microprobe, corresponding to $(Ag_{1.01}Bi_{1.00}Se_{2.00}$. (3) Kidd Creek mine, Canada; by electron microprobe, coresponding to $(Ag_{0.99}Cu_{0.02})_{\Sigma=1.01}Bi_{1.00}(Se_{1.83}S_{0.17})_{\Sigma=2.00}$. (4) $AgBiSe_2$.

Occurrence: In fluorite and quartz in a strongly cracked zone formed in crystalline limestone adjacent to magnetite-bearing skarns (Kletno, Poland); in reduction halos in red beds (near Zurich, Switzerland).

Association: Clausthalite, tiemannite, umangite, klockmannite, wittichenite, silver, naumannite, bornite, chalcopyrite, chalcocite, uraninite, fluorite, quartz (Kletno, Poland); tennantite, carrollite, cobaltite, bornite, chalcopyrite, chalcocite, naumannite, eucairite, clausthalite (Kidd Creek mine, Canada); hessite, chalcocite, digenite, umangite, naumannite, eucairite, bornite, chalcopyrite, clausthalite, covellite, magnetite, hematite, goethite, malachite, azurite (Julianehåb, Greenland).

Distribution: From Kletno, Sudetes Mountains, Poland [TL]. In the Clara mine, near Oberwolfach, and the Mullenbach uranium deposit, Black Forest, Germany. Found northwest of Zurich, Switzerland. From Ocna de Fier (Morávicza; Vaskő), Romania. At the Kidd Creek mine, near Timmins, Ontario, Canada. In the Frederik VII's mine, 5 km east of Julianehåb, southern Greenland. From near Vanos, Chihuahua, Mexico. At the Iron Monarch quarry, Iron Knob, South Australia.

Name: Honors Professor Karol Bohdanowicz (1864–1947), Polish economic geologist, of Cracow, Poland.

Type Material: Academy of Mining and Metallurgy, Cracow, Poland.

			Total	99.91	[100.31]

(1) Vishnevy Mountains, Ural Mountains, Russia; corresponds to $Al_{0.98}[O_{0.96}(OH)_{1.04}]_{\Sigma=2.00}$.
(2) Huruni Peak, New Zealand; by electron microprobe, H_2O calculated from stoichiometry; corresponds to $Al_{0.98}Si_{0.01}O(OH)$.

Polymorphism & Series: Dimorphous with diaspore.

Occurrence: Formed from aluminosilicates during tropical weathering, commonly a major constituent of bauxites, laterites, or fireclays; a late product of low-temperature hydrothermal decomposition of corundum, nepheline in nepheline pegmatites, syenites, or ocean-ridge basalts.

Association: Kaolinite, gibbsite, diaspore (bauxites); nepheline, gibbsite, diaspore, natrolite, analcime (nepheline pegmatites).

Distribution: Widespread, but rarely well-crystallized; studied material from: in France, at les Baux, near Arles, Bouches-du-Rhône; at Recoux, Var; and Pérlille and Cadarcet, Ariège. On Montecchio Maggiore, Vicenza, Italy. At Baratka, Hungary. Crystals from the Tvedalen district and elsewhere in the Langesundsfjord area, Norway. In the Mandamus complex, 20 km west of Culverden, New Zealand. In the USA, in the Alberhill clay pits, Riverside Co., California; from the Linwood-Barton district, and at the Laurel Creek mine, Rabun Co., Georgia; on Hogback Mountain, Jackson Co., North Carolina.

Name: For Johannes Böhm (1857–1938), German geologist, who first studied the species.

Type Material: n.d.

Bokite $(Al, Fe^{3+})_{1.3}(V^{5+}, V^{4+}, Fe^{3+})_8O_{20}\cdot 7.4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, probable. *Point Group:* n.d. Platy to columnar or wedge-shaped grains, to 0.3 mm long, in reniform crusts with radiating structure; in veinlets.

Physical Properties: *Cleavage:* One direction, perfect ‖ elongation, another fair ⊥ to first. Hardness = ∼3 D(meas.) = 2.97–3.10 D(calc.) = [3.41]

Optical Properties: Opaque, translucent in thinnest fragments. *Color:* Black; pale gray in reflected light. *Streak:* Black, may be brownish black. *Luster:* Semimetallic to dull. *Optical Class:* Biaxial. *Pleochroism:* Strong; dirty olive-green to deep reddish brown. *Absorption:* $X > Z$. $\alpha = 2.01(5)$ (α') β = n.d. $\gamma = 2.06(5)$ (γ') 2V(meas.) = n.d. *Anisotropism:* Strong; brownish yellow to gray-blue.

Cell Data: *Space Group:* n.d. $a = 11.838(5)$ $b = 3.643(1)$ $c = 11.142(5)$ $\beta = 110.58(4)°$ Z = [1]

X-ray Powder Pattern: Kurumsak area, Kazakhstan.
10.47 (100), 3.452 (30), 2.907 (12), 2.592 (12), 1.8208 (11), 3.177 (9), 2.760 (9)

Chemistry:

	(1)	(2)		(1)	(2)
V_2O_5	50.30	49.70	BaO	trace	trace
V_2O_4	14.10	14.00	Na_2O	trace	trace

MgO	trace	trace	SO_3	0.00	0.60
CaO	trace	trace	Total	[97.90]	100.00

(1) Kurumsak area, Kazakhstan; original total given as 98.20%; corresponds to $(Al_{0.72}Fe_{0.60})_{\Sigma=1.32}(V_{6.80}Fe_{1.20})_{\Sigma=8.00}O_{20}\cdot 7.46H_2O$. (2) Do.; with jarosite impurity, corresponds to $K_{0.26}(Al_{0.80}Fe_{0.46})_{\Sigma=1.26}(V_{6.74}Fe_{1.26})_{\Sigma=8.00}O_{20}\cdot 7.44H_2O$.

Occurrence: In carbonaceous vanadiferous shales (Kurumsak area, Kazakhstan); in rich U–V ore in Triassic stream channels and impregnating sandstone (Monument No. 2 mine, Arizona, USA).

Association: Jarosite, kazakhstanite (Kurumsak area, Kazakhstan); navajoite (Monument No. 2 mine, Arizona, USA).

Distribution: From the Balasauskandyk and nearby Kurumsak and Ran districts, northwestern Kara-Tau Mountains, and in the Dzhebagly Mountains, Talass Alatau Range, Kazakhstan. In the USA, in the Monument No. 2 mine, Apache Co., Arizona; at The Fish, Eureka Co., and near Cockalorum Wash, Nye Co., Nevada; and from the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., Arkansas.

Name: For Ivan Ivanovich Bok (1898–1983), Kazakh geologist, Institute of Geosciences, Alma-Ata, Kazakhstan.

Type Material: National Museum of Natural History, Washington, D.C., USA, 139767.

Boleite $KPb_{26}Ag_9Cu_{24}Cl_{62}(OH)_{48}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals cubic, to 2 cm, rarely modified by {111} and {011}; commonly surficially layered with or overgrown by pseudoboleite with mutually ∥ {001}.

Physical Properties: *Cleavage:* {001}, perfect. Hardness = 3–3.5 D(meas.) = 5.054 D(calc.) = 5.082

Optical Properties: Translucent to opaque. *Color:* Deep Prussian blue to indigo; bluish green in transmitted light. *Streak:* Blue, with greenish tint. *Luster:* Weakly vitreous; pearly on cleavage surfaces.
Optical Class: Isotropic. $n = 2.05$

Cell Data: *Space Group:* $Pm3m$. $a = 15.288(2)$ $Z = 1$

X-ray Powder Pattern: Boleo, Mexico; may be totally obscured by the pattern of intergrown pseudoboleite. (ICDD 27-1206).
4.415 (100), 3.821 (80), 2.702 (60), 2.547 (40), 3.505 (35), 2.330 (35), 1.990 (35)

Chemistry:

	(1)	(2)		(1)	(2)
AgCl	12.03	11.79	Cl	17.04	16.86
Pb	49.16	49.26	H_2O	4.35	3.95
CuO	17.17	17.46	insol.	0.21	
K_2O	n.d.	0.68	Total	99.96	100.00

(1) Boleo, Mexico; corresponds to $Pb_{25.88}Ag_{9.16}Cu_{23.54}Cl_{61.58}O_{49.87}H_{52.65}$.
(2) $KPb_{26}Ag_9Cu_{24}Cl_{62}(OH)_{48}$.

Occurrence: A secondary mineral formed through reaction of chloride with primary sulfides in the oxidized zone of Pb–Cu deposits; in smelter slag immersed in and leached by sea water.

Association: Pseudoboleite, cumengeite, atacamite, anglesite, cerussite, phosgenite, gypsum (Boleo, Mexico); pseudoboleite, anglesite, cerussite, atacamite, paratacamite, leadhillite, paralaurionite, caledonite, phosgenite, matlockite, bideauxite (Mammoth-St. Anthony mine, Arizona, USA).

Distribution: In Mexico, exceptional crystals from the Amelia mine, Boleo, near Santa Rosalía, Baja California; also from an undefined locality in Sonora. In the USA, in the Mammoth-St. Anthony mine, Tiger, and the Vekol mine, Pinal Co.; the Apache mine, Gila Co.; and the Rowley mine, Maricopa Co., Arizona; from Philipsburg, Granite Co., Montana. At Laurium, Greece, in slag. In England, from Cornwall, at Tolcarne Beach, Newquay; at Newporth Beach, near Falmouth; and in the Porthilley mine, St. Minver. At Juliushütte, Astfeld, Harz Mountains, Germany, in slag. Found at an undisclosed location in the Kopet-Dag Range, Cheleken Peninsula, Central Asia, Russia. In the Tchah Khuni mine, near Anarak, Iran. From Broken Hill, New South Wales, Australia. In Chile, at Huantajaya, near Iquique, and the Pica district, Cerro de Challocallo, Tarapacá; from Mantos Blancos, and at a number of mines around Caracoles, Sierra Gorda district, southwest of Calama, Antofagasta.

Name: For the occurrence at Boleo, Mexico.

Type Material: National School of Mines, Paris, France.

Boltwoodite $HK(UO_2)(SiO_4)\cdot 1.5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2. Radiating acicular to fibrous, elongated along [010], to 1 cm.

Physical Properties: *Cleavage:* {010} perfect, {001} imperfect. Hardness = 3.5–4 D(meas.) = ∼4.7 D(calc.) = [4.46] Fluoresces dull green in both SW and LW UV; radioactive.

Optical Properties: Transparent to translucent. *Color:* Pale yellow. *Luster:* Pearly; radial aggregates vitreous to silky; dull to earthy in microcrystalline pseudomorphs.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = colorless; $Y = Z$ = yellow; anomalous blue interference colors. $\alpha = 1.668$–1.670 $\beta = 1.695$–1.696 $\gamma = 1.698$–1.703 2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1$. $a = 7.073(2)$ $b = 7.064(1)$ $c = 6.638(1)$ $\beta = 105°45(1)'$ Z = 2

X-ray Powder Pattern: Delta mine, Utah, USA.
6.81 (100), 3.40 (90), 2.95 (80), 3.54 (70), 2.91 (70), 6.40 (50), 5.45 (50)

Chemistry:

	(1)	(2)	(3)
SiO_2	14.8	13.27	14.00
Fe_2O_3		0.52	
UO_3	68.5	67.19	66.64
CaO		1.59	
Na_2O	0.4	2.54	
K_2O	9.4	7.83	10.97
H_2O	6.9		8.39
LOI		6.91	
Total	[100.0]	99.85	100.00

(1) Delta mine, Utah, USA; original total given as 99.88%, after deduction of CuO 9.61% and SO_3 2.12% as brochantite, remainder Al_2O_3, V_2O_5, PbO, CaO, MgO 0.34%, insoluble 0.19%, recalculated to 100.0%. (2) Swakopmund, Namibia; loss on ignition taken as H_2O; corresponds to $(H_3O)_{0.55}(K_{0.78}Na_{0.39}Ca_{0.14})_{\Sigma=1.31}(UO_2)(SiO_4)\cdot H_2O$. (3) $HK(UO_2)(SiO_4)\cdot 1.5H_2O$.

Occurrence: In the outer silicate zone of alteration surrounding hydrated uranyl oxides incrusting primary uraninite; also filling fractures at some distance from primary uraninite. From pegmatite and Colorado-Plateau-type sandstone uranium deposits.

Association: Uraninite, becquerelite, fourmarierite, phosphouranylite, gypsum, fluorite.

Distribution: In the USA, from the Delta mine, Emery Co., Utah; the New Method mine, near Amboy, San Bernardino Co., California; in the Marshall Pass district, at the Little Indian No. 36 mine, Gunnison Co. and the Lookout No. 22 mine, Saguache Co., and in Unaweep Canyon, Mesa Co., Colorado; in the Green Monster mine, Goodsprings district, Clark Co., Nevada; and in the Williams quarry, near Easton, Northampton Co., Pennsylvania. Exceptionally developed at the Rössing mine, near Swakopmund, Namibia. From near Dalbeattie, Kirkcudbrightshire, Scotland. At Karago, Rwanda. From Quebrada del Tigre, Córdoba Province, and near Guandacol, La Rioja Province, Argentina. From near Myponga, South Australia. In the Togo mine, Tottori Prefecture, Japan. Other minor occurrences are known.

Name: For Bertram Borden Boltwood (1870–1927), radiochemist of Yale University, New Haven, Connecticut, USA, who devised the U–Pb method of measuring geologic time.

Type Material: National Museum of Natural History, Washington, D.C., USA, 112710.

Bonaccordite $Ni_2Fe^{3+}BO_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are elongated prisms, to 400 μm, may be in rosettelike radiating groups or in veinlets.

Physical Properties: VHN = 1069, 1200 average (15 g load). Hardness = n.d. D(meas.) = n.d. D(calc.) = 5.17

Optical Properties: Opaque. *Color:* Reddish brown; in reflected light, gray with brownish tinge, with strong reddish brown internal reflections.
Optical Class: Biaxial. α = n.d. β = n.d. γ = n.d. 2V(meas.) = n.d. *Anisotropism:* Medium to strong. *Bireflectance:* Distinct, in oil.
R_1–R_2: 14.2–17.6

Cell Data: *Space Group:* [*Pbam*] (by analogy to ludwigite group). $a = 9.213(6)$ $b = 12.229(7)$ $c = 3.001(2)$ Z = 4

X-ray Powder Pattern: Bon Accord, South Africa.
2.548 (100), 2.514 (100), 5.10 (50), 1.898 (50), 4.61 (40), 2.334 (35), 2.025 (35)

Chemistry:

	(1)
SiO_2	0.4
B_2O_3	[13.0]
Fe_2O_3	31.9
MnO	0.04
CoO	1.5
NiO	52.7
MgO	0.5
Total	[100.0]

(1) Bon Accord, South Africa; presumably by electron microprobe, average of nine analyses, total Fe as Fe^{3+}, B by difference, originally given as 13.1%, presence confirmed by wet analysis; corresponding to $(Ni_{1.86}Co_{0.05}Mg_{0.03}Si_{0.02})_{\Sigma=1.96}Fe_{1.05}B_{0.99}O_5$.

Mineral Group: Ludwigite group.

Occurrence: In a small tabular body of nickeliferous serpentinite, probably a contact deposit, along the junction of quartzite and an ultramafic intrusive; it appears to have formed at ~730 °C and < 2 kbar during thermal metamorphism, possibly of a nickel-rich meteorite.

Association: Trevorite, liebenbergite, nepouite, nimite, bunsenite, gaspéite, violarite, millerite.

Distribution: Found three km west of the Scotia talc mine, Bon Accord area, Barberton, Transvaal, South Africa.

Name: For the locality at Bon Accord, South Africa.

Type Material: Royal Ontario Museum, Toronto, Canada, M33443; National Museum of Natural History, Washington, D.C., USA, 132463.

(1) Capo Calamita, Elba, Italy; corresponds to $CuSO_4 \cdot 3H_2O$ 85.15%, $CuSO_4 \cdot 5H_2O$ 14.85%. Identification rests on correspondence of the X-ray powder pattern and optical data with that of synthetic $CuSO_4 \cdot 3H_2O$. (2) $CuSO_4 \cdot 3H_2O$.

Occurrence: A secondary mineral in a pyrite deposit (Capo Calamita, Elba, Italy).

Association: Chalcanthite, pyrite (Capo Calamita, Elba, Italy); quartz, gypsum, pyrite, poitevinite, scorodite (Avoca claim, Canada).

Distribution: From [Cantiere Macei,] Capo Calamita, Elba, Italy. At the Recsk copper mine, Mátra Mountains, Hungary. On the Avoca claim, Hat Creek, Bonaparte River area, Lillooet district, British Columbia, Canada. At Steamboat Hot Springs, Steamboat Springs district, Washoe Co., Nevada, USA. In the Undu mine, Nukundamu, Vanua Levu, Fiji. From Mina Raua, near Lima, Peru.

Name: To honor Stefano Bonatti (1902–1968), Italian petrologist, University of Pisa, Pisa, Italy.

Type Material: University of Florence, Florence, Italy, 1973/I.

Bonshtedtite $Na_3(Fe^{2+},Mg)(PO_4)(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$ (probable). As tabular crystals, elongated along [010], with well developed {210}, {$\bar{1}$01}, {$\bar{1}$11} faces, to 5 mm; as fine-grained aggregates.

Physical Properties: *Cleavage:* {010}, {100}, perfect. *Tenacity:* Brittle. Hardness = ∼4 D(meas.) = 2.95–3.16 D(calc.) = 2.95

Optical Properties: Transparent. *Color:* Colorless, with a rose, pale yellow, or pale greenish gray tint; in transmitted light, colorless. *Luster:* Vitreous, pearly on cleavages. *Optical Class:* Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. α = 1.520–1.525 β = 1.568–1.570 γ = 1.591–1.597 2V(meas.) = 68°

Cell Data: *Space Group:* $P2_1/m$ (probable). $a = 8.921$ $b = 6.631$ $c = 5.151$ $\beta = 90°25'$ Z = 2

X-ray Powder Pattern: Vuonnemiok River valley, Russia.
3.318 (100), 2.662 (30), 8.923 (20), 2.578 (20), 2.146 (18), 1.658 (18), 1.851 (15b)

(1) Vuonnemiok River valley, Russia; by electron microprobe, total Fe and Mn as FeO and MnO; giving $Na_{3.00}(Fe_{0.63}Mg_{0.17}Na_{0.12}Mn_{0.06})_{\Sigma=0.98}(PO_4)_{1.01}(CO_3)_{1.00}$. (2) Kovdor massif, Russia; by electron microprobe, total Fe and Mn as FeO and MnO, contains about 1% each of forsterite and shortite; corresponding to $(Na_{2.99}K_{0.02})_{\Sigma=3.01}(Fe_{0.66}Mg_{0.28}Mn_{0.01})_{\Sigma=0.95}(PO_4)_{1.03}(CO_3)_{0.91}$.

Occurrence: In veinlets associated with alkali-carbonate metasomatism of alkalic massifs.

Association: Shortite, thermonatrite, eitelite, neighborite, trona, burbankite, barentsite, siderite, aegirine.

Distribution: Found in drill core from the Vuonnemiok River valley, and on Mts. Suoluaiv, Kukisvumchorr, Partomchorr, and Restin'yun, Khibiny massif, also in drill core from the Kovdor massif, Kola Peninsula, Russia.

Name: To honor Elsa Maksimilianovna Bonshtedt-Kupletskaya (1897–1974), Russian specialist in mineralogy of alkalic massifs.

Type Material: Mining Institute, St. Petersburg, 1198/1; Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5713/5, 5723/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81589.

Boothite $CuSO_4 \cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals very rare, complex, typically fibrous or crystalline massive.

Physical Properties: *Cleavage:* {001}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 1.94 D(calc.) = n.d. Soluble in H_2O; dehydrates to chalcanthite.

Optical Properties: Transparent to translucent. *Color:* Blue; pale blue in transmitted light. *Luster:* Vitreous, silky or pearly if fibrous.
Optical Class: Biaxial (–) or (+). *Orientation:* $Y = b$; $X \simeq c$. $\alpha = 1.47$ $\beta = 1.48$ $\gamma = 1.49$ 2V(meas.) = Large.

Cell Data: *Space Group:* n.d. Z = n.d.

(1) Alma mine, California, USA. (2) $CuSO_4 \cdot 7H_2O$.

Mineral Group: Melanterite group.

Occurrence: An alteration product of chalcopyrite (Alma mine, California, USA).

Association: Chalcanthite, melanterite, pisanite (Alma mine, California, USA).

Distribution: In the USA, at the Alma pyrite mine, near Leona Heights, Alameda Co., and from the Penn (Campo Seco) mine, Calaveras Co., California; at the Colusa mine, Butte, Silver Bow Co., Montana. At Sain-Bel, near Lyon, Rhône, France. From the Galaktos district, 15 km southeast of Veria, Greece. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: To honor Professor Edward Booth (1857–1917), American chemist, University of California, Berkeley, California, USA.

Type Material: n.d.

Boracite $Mg_3B_7O_{13}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $mm2$. Euhedral crystals, to 2.5 cm, (referred to pseudotetrahedral morphology) show prominent {001}, {110}, {111}, {$\overline{1}$11}, and a dozen other modifying forms; spherulitic, plumose to fibrous, fine granular aggregates. *Twinning:* On {111}, as penetration twins.

Physical Properties: *Fracture:* Conchoidal to uneven. Hardness = 7–7.5 D(meas.) = 2.91–3.10 D(calc.) = 2.97 Very slowly soluble in H_2O; strongly piezoelectric and pyroelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, gray, yellow; bluish green, green to dark green if ferroan; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to adamantine.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. α = 1.662–1.658 β = 1.662–1.667 γ = 1.668–1.673 2V(meas.) = 82.5°

Cell Data: *Space Group:* $Pca2_1$. $a = 8.577(6)$ $b = 8.553(8)$ $c = 12.09(1)$ Z = 4

(1) Lüneburg, Germany; average of two analyses. (2) $Mg_3B_7O_{13}Cl$.

Polymorphism & Series: Dimorphous with trembathite; forms a series with ericaite.

Occurrence: An uncommon component of bedded sedimentary salt and potash deposits of marine origin, the boron probably derived from nearby volcanic activity.

Association: Anhydrite, gypsum, halite, sylvite, carnallite, kainite, hilgardite.

Distribution: In Germany, from Lüneburg, 40 km south-southeast of Hamburg, Lower Saxony; in Saxony-Anhalt, in the Stassfurt-Westeregeln-Bernburg district, at the Douglashall, Berlepsch, Solvayhall, Wilhelmshall and other mines; in Thuringia, from Bischofferode, in the Glückauf mine, Sondershausen, and elsewhere. In France, at Lunéville, Meurthe-et-Moselle. In the Boulby potash mine, northwest of Whitby, Yorkshire, England. In the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan. Large crystals from Alto Chapare, Cochabamba, Bolivia. In the USA, in the Choctaw salt dome, Iberville Parish, Louisiana, and the Louann Salt Formation, Clarke Co., Alabama. From the Penobsquis and Salt Springs evaporite deposits, near Sussex, New Brunswick, Canada.

Name: For *boron* in the composition.

Type Material: Mining Academy, Freiberg, Germany, 19324.

Borax $Na_2B_4O_5(OH)_4 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are commonly short to long prismatic [001] and somewhat flattened on {100}, showing {100}, {110}, {001}, {$\bar{1}$12}, {$\bar{1}$11}, {010}, {021}, to 10 cm, typically distorted; commonly massive. *Twinning:* Rare on {100}.

Physical Properties: *Cleavage:* {100}, perfect; {110}, less perfect; {010}, in traces. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 1.715(5) D(calc.) = 1.70 Soluble in H_2O, slightly sweetish alkaline taste; rapidly dehydrates in air to tincalconite; diamagnetic.

Optical Properties: Translucent to opaque. *Color:* Colorless to white, pale gray, pale blue, pale green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous to resinous, may be earthy.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Z \wedge c = -55°35'$. *Dispersion:* $r > v$, strong, crossed. $\alpha = 1.4466$ $\beta = 1.4687$ $\gamma = 1.4717$ 2V(meas.) = n.d. 2V(calc.) = 39°58′

Cell Data: *Space Group:* $C2/c$. $a = 11.8790(2)$ $b = 10.6440(2)$ $c = 12.2012(2)$ $\beta = 106.617(1)°$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.576 (100), 2.565 (95), 4.86 (80), 2.848 (65), 2.833 (60), 5.69 (50), 3.936 (45)

Chemistry: (1) Modern analyses are lacking; natural occurrences produce a nearly pure mineral.

Occurrence: In evaporite deposits, salt lakes, playas, commonly well-crystallized; as an efflorescence on soils in arid regions.

Association: Inyoite, ulexite, colemanite, kernite, kurnakovite, trona, aphthitalite, glauberite, calcite, nitratine, gaylussite, hanksite, halite, gypsum.

Distribution: An ore of boron in some deposits, with numerous minor occurrences. Originally collected from a number of salt lakes in the Ladakh district, Kashmir to north of Lhasa, Tibet, China, along the Qinghai Province-Xizang Plateau. In the Kirka borate deposit, Kütahya Province, Turkey. From the Inder borate deposit, Kazakhstan. In Argentina, large reserves at the Loma Blanca deposit, eight km southwest of Coranzulí, Jujuy Province; in the Tincalayu borax deposit, Salar del Hombre Muerto, Salta Province. In the USA, in California, commercial deposits at Borax Lake, Lake Co.; Searles Lake, San Bernardino Co.; in the Kramer borate deposit, Boron, Kern Co.; from Furnace Creek and Resting Springs, Death Valley, Inyo Co.; found in Rhodes Marsh, Teels Marsh, and others in Mineral Co., Nevada; and at Alkali Flat, Doña Ana Co., New Mexico.

Name: From the Arabic for *white*.

Borcarite $Ca_4MgB_4O_6(CO_3)_2(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As euhedral crystals, to 5 mm; in subparallel growths, dense massive, and in veins.

Physical Properties: *Cleavage:* Perfect on {100} and {110}; others on {hkl} and {$h0l$}. Hardness = 4–4.5 D(meas.) = 2.77–2.56 D(calc.) = 2.790

Optical Properties: Semitransparent. *Color:* Greenish blue to bluish green, pale brown, may be nearly colorless; colorless in thin section. *Luster:* Vitreous, slightly pearly on cleavages. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $Y \wedge c = 28(4)°$. *Dispersion:* $r < v$, noticeable. $\alpha = 1.590–1.594$ $\beta = 1.632–1.653$ $\gamma = 1.641–1.660$ 2V(meas.) = 30(2)° 2V(calc.) = 20°

Cell Data: *Space Group:* $C2/m$. $a = 17.840(4)$ $b = 8.380(2)$ $c = 4.445(1)$ $\beta = 102.04(3)°$ Z = 2

X-ray Powder Pattern: Snezhnoye deposit, Russia.

(1) Snezhnoye deposit, Russia; average of two analyses. (2) Fuka, Japan; by electron microprobe, B by ICP, CO_2 and H_2O by CHNS analyzer; borate, CO_3^{2-}, and $(OH)^{1-}$ confirmed by IR; corresponds to $Ca_{3.94}(Mg_{0.82}Fe_{0.09})_{\Sigma=0.91}B_{3.98}O_{5.70}(CO_3)_{2.01}(OH)_{6.10}$.
(3) $Ca_4MgB_4O_6(CO_3)_2(OH)_6$.

Occurrence: In kotoite marbles, near the contact with granodiorite (Snezhnoye deposit, Russia); a rare secondary mineral probably formed by reaction of late hydrothermal fluids with brucite (Fuka, Japan).

Association: Szaibélyite, uralborite, sibirskite, kotoite, magnetite, spinel, calcite (Snezhnoye deposit, Russia); olshanskyite, bultfonteinite, takedaite, calcite (Fuka, Japan).

Distribution: In Russia, from the Snezhnoye boron deposit, Izvestkovyi stream, Tas-Khayakhtakh Range, Polar Ural Mountains, and in the Solongo boron deposit, Buryatia, Siberia. At Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: For BORate and CARbonate in the composition.

(1–2) Lovozero massif, Russia.

Occurrence: In the natrolite zone of alkalic pegmatites in a differentiated alkalic massif.

Association: Natrolite, lomonosovite.

Distribution: In the Jubilee pegmatite, on Mt. Karnasurt, and on Mt. Alluaiv, Lovozero massif, Kola Peninsula, Russia.

Name: To honor Irina Dmitrievna Borneman-Starynkevich (1891–1988), Russian mineralogist specializing in Khibiny and Lovozero minerals, Institute of Geology of Ore Deposits, Petrology, Mineralogy, and Geochemistry, Moscow, Russia.

Type Material: Mining Institute, St. Petersburg, 1057/3; Geology Museum, Kola Branch, Academy of Sciences, Apatity, 3274, 3308; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 75318; National School of Mines, Paris, France; The Natural History Museum, London, England, 1994,4; National Museum of Natural History, Washington, D.C., USA, 143813.

Bornhardtite $Co^{2+}Co_2^{3+}Se_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Massive.

Physical Properties: Hardness = ∼4 VHN = n.d. D(meas.) = n.d. D(calc.) = 6.166

Optical Properties: Opaque. *Color:* Rose-red.
R: (400) 41.3, (420) 42.8, (440) 44.3, (460) 45.4, (480) 46.4, (500) 47.2, (520) 47.8, (540) 48.4, (560) 49.2, (580) 49.2, (600) 49.7, (620) 50.2, (640) 50.8, (660) 51.4, (680) 52.0, (700) 52.7

Cell Data: *Space Group: Fd3m.* a = ∼10.2 Z = 8

X-ray Powder Pattern: Trogtal quarry, Germany.
2.7 (100), 2.4 (100), 2.3 (100), 2.2 (100), 2.0 (100), 1.96 (100), 1.42 (100)

Chemistry: No analysis appears ever to have been made.

Mineral Group: Linnaeite group.

Occurrence: Of hydrothermal origin.

Association: Trogtalite, hastite, clausthalite.

Distribution: In Germany, in the Harz Mountains, from the Trogtal quarry, near Lautenthal [TL], and at Tilkerode. In the Pinky Fault uranium deposit, Saskatchewan, Canada. From Cerro de Cacheuta, Mendoza Province, Argentina.

Name: Honors Dr. Wilhelm Bornhardt (1864–1946), German student of ore deposits.

Type Material: n.d.

References: (1) Ramdohr, P. and M. Schmitt (1955) Vier neue natürliche Kobaltselenide vom Steinbruch Trogtal bei Lautenthal im Harz. Neues Jahrb. Mineral., Monatsh., 133–142 (in German). (2) (1956) Amer. Mineral., 41, 164–165 (abs. ref. 1).

Bornite Cu_5FeS_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals pseudocubic, dodecahedral, octahedral, to 6 cm; commonly granular, compact, or massive, disseminated. *Twinning:* On {111}; commonly shows penetration twins.

Physical Properties: *Cleavage:* {111} in traces. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 3–3.25 VHN = n.d. D(meas.) = 5.06–5.08 D(calc.) = 5.074

Optical Properties: Opaque. *Color:* Copper-red to pinchbeck-brown on fresh surfaces, rapidly tarnishes iridescent purplish; in polished section, pinkish brown when fresh. *Streak:* Pale grayish black. *Luster:* Metallic. *Pleochroism:* Weak but noticeable. *Anisotropism:* Weak.
R: (400) 19.9, (420) 18.8, (440) 17.9, (460) 17.6, (480) 18.0, (500) 18.8, (520) 20.0, (540) 21.3, (560) 22.9, (580) 24.4, (600) 26.0, (620) 27.5, (640) 28.8, (660) 30.2, (680) 31.6, (700) 32.7

Cell Data: *Space Group: Pbca.* $a = 10.950$ $b = 21.862$ $c = 10.950$ Z = 16

X-ray Powder Pattern: Messina, South Africa.
1.937 (100), 3.18 (60), 2.74 (50), 1.258 (50), 1.119 (50), 3.31 (40), 2.50 (40)

Chemistry:

	(1)	(2)	(3)
Cu	62.99	62.8	63.33
Pb	0.10		
Fe	11.23	11.4	11.12
S	25.58	25.7	25.55
Total	99.90	99.9	100.00

(1) Superior, Arizona, USA. (2) Monte Catini, Tuscany, Italy; by electron microprobe. (3) Cu_5FeS_4.

Occurrence: Associated with and disseminated in mafic igneous rocks, in contact metamorphic skarn deposits, in pegmatites, in medium- to high-temperature hydrothermal deposits, and in sedimentary cupriferous shales; stable below ∼200 °C.

Association: Chalcopyrite, pyrite, other copper and iron sulfides, garnet, calcite, wollastonite, quartz.

Distribution: Important localities for fine crystals include: in the USA, from Butte, Silver Bow Co., Montana, and at Bristol, Hartford Co., Connecticut. In England, from the Carn Brea mine, Illogan, and elsewhere in Cornwall. Large crystals from the Mangula mine, Lomagundi district, Zimbabwe. From the Frossnitz Alpe, eastern Tirol, Austria. At Dzhezkazgan, Kazakhstan. In the N'ouva mine, Talate, Morocco. Widespread as an important ore mineral of copper, for example at the Magma mine, Superior, Pinal Co., and Bisbee, Cochise Co., Arizona; and Kennicott, Alaska, USA. At Ookiep, Namaqualand, Cape Province; and the Messina mine, Transvaal, South Africa. In Australia, from Mt. Lyell, Tasmania, and Olympic Dam, Roxby Downs, South Australia.

Name: Honoring Ignaz Edler von Born (1742–1791), distinguished Austrian mineralogist.

Borodaevite $Ag_5(Pb,Fe)Bi_7(Sb,Bi)_2S_{17}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ or m. Crystals are elongated, platy; as irregular grains, to 1.2 mm.

Physical Properties: Hardness = n.d. VHN = 165 (20 g load). D(meas.) = n.d. D(calc.) = 7.90

Optical Properties: Opaque. *Color:* Black; white in reflected light. *Streak:* Black. *Luster:* Metallic.
Optical Class: Biaxial. *Anisotropism:* Distinct, brown. *Bireflectance:* Very weak.
R_1–R_2: (400) —, (420) 39.9–41.4, (440) 40.4–42.4, (460) 39.8–42.1, (480) 39.7–42.3, (500) 39.5–42.2, (520) 39.1–41.8, (540) 39.0–41.5, (560) 38.4–41.2, (580) 38.2–41.0, (600) 37.6–40.6, (620) 37.3–40.3, (640) 37.2–40.0, (660) 36.5–39.6, (680) 36.6–39.3, (700) 36.1–39.3

Cell Data: *Space Group:* $C2/m$ or Cm. $a = 13.515(7)$ $b = 4.098(3)$ $c = 26.000(8)$ $\beta = 93.00(4)^\circ$ $Z = 2$

X-ray Powder Pattern: Alaskitovoye deposit, Russia.
2.82 (10), 3.37 (9b), 3.24 (9), 3.49 (8b), 1.992 (8), 2.01 (7), 1.967 (6)

Chemistry:

	(1)
Ag	18.23
Pb	3.22
Fe	0.43
Sb	6.42
Bi	53.47
S	17.92
Total	99.69

(1) Alaskitovoye deposit, Russia; by electron microprobe, average of three analyses; corresponds to $Ag_{5.10}Pb_{0.47}Fe_{0.23}Bi_{7.73}Sb_{1.59}S_{16.88}$.

Occurrence: In a hydrothermal Sn–W deposit.

Association: Matildite, gustavite–andorite, aramayoite, galena, pavonite, ramdohrite, owyheeite, benjaminite, molybdenite, hübnerite, triplite, quartz.

Distribution: From the Alaskitovoye Sn–W deposit, near Ust-Nera, Sakha, Russia [TL].

Name: To honor Yuri Sergeevich Borodaev (1923–), Russian mineralogist, Moscow State University, Moscow, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 87992.

Boromullite $Al_9BSi_2O_{19}$

Crystal Data: Orthorhombic. *Point Group*: *mm*2. As prisms or bundles of prisms, to 0.4 mm; typically as fine intergrowths with or overgrowths on sillimanite, or embaying werdingite.

Physical Properties: *Cleavage*: None. *Fracture*: n.d. *Tenacity*: Brittle.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.081

Optical Properties: Transparent. *Color*: Colorless. *Streak*: n.d. *Luster*: n.d.
Optical Class: Biaxial (+). α = 1.627(1) β = 1.634(1) γ = 1.649(1) 2V(meas.) = 57(2)°
2V(calc.) = 69(12)°

Cell Data: *Space Group*: $Cmc2_1$. a = 5.7168(19) b = 15.023(5) c = 7.675(3) Z = 2

X-ray Powder Pattern: Mount Stafford, central Australia.
3.38 (100), 2.19 (80), 1.512 (80), 2.67 (60), 2.51 (60), 5.37 (50), 2.11(50)

Chemistry:

	(1)
SiO_2	19.01
TiO_2	0.01
B_2O_3	6.52
Al_2O_3	74.10
MgO	0.07
CaO	0.00
MnO	0.01
FeO	0.40
Total	100.12

(1) Mount Stafford, central Australia; average of 11 electron microprobe analyses, corresponding to $Mg_{0.01}Fe_{0.03}Al_{8.88}\ B_{1.14}Si_{1.93}O_{18.94}$.

Occurrence: Product of granulite facies metamorphism of boron-rich peletic rocks.

Association: Sillimanite, werdingite, sekaninaite-cordierite, potassium feldspar, biotite, hercynite, ilmenite, ominelite-grandidierite, plagioclase, alusite, tourmaline, monazite-(Ce), an unspecified apatite-group mineral, zircon.

Distribution: Mount Stafford, ~170 km northwest of Alice Springs, central Australia.

Name: Recognizes boron as an essential constituent and for its relationship to mullite.

Type Material: South Australian Museum, Science Centre, Morgan Thomas Lane, Adelaide, South Australia 5000, Australia; SAM G31520 and SAM G31521.

References: (1) Buick, I.S., E.S. Grew, T. Armbruster, O. Medenbach, M.G. Yates, G.E. Bebout, and G.L. 		Total	100.46

(1) Little Three mine, California, USA; by a combination of electron microprobe, XRF, AA, and ICP-atomic emission spectroscopy; corresponding to $(K_{0.89}Rb_{0.02}Ca_{0.01})_{\Sigma=0.92}(Al_{1.93}Li_{0.01}Mg_{0.01})_{\Sigma=1.95}(Si_{3.06}B_{0.77}Al_{0.17})_{\Sigma=4.00}O_{9.82}[(OH)_{2.02}F_{0.16}]_{\Sigma=2.18}$.

Polymorphism & Series: $2M_1$, 1M polytypes.

Mineral Group: Mica group.

Occurrence: A coating on other minerals on the floor of a pegmatite pocket, hydrothermally deposited after rupture of the pocket.

Association: Lepidolite, quartz, microcline, topaz.

Distribution: From the Little Three mine, Ramona district, San Diego Co., California, USA.

Name: Presumably for the BOROn content and relation to *muscovite*.

Type Material: National Museum of Natural History, Washington, D.C., USA, 166821.

References: (1) Foord, E.E., R.F. Martin, J.J. Fitzpatrick, J.E. Taggart, Jr., and J.G. Crock (1991) Boromuscovite, a new member of the mica group, from the Little Three mine pegmatite, Ramona district, San Diego County, California. Amer. Mineral., 76, 1998–2002.

(1) Monte Arsiccio mine,Tuscany, Italy; electron microprobe analysis; corresponding to $Ag_{0.36}Tl_{1.23}Pb_{2.92}(Sb_{7.50}As_{2.00})_{\Sigma=9.50}S_{17.88}Se_{0.01}$. (2) Monte Arsiccio mine,Tuscany, Italy; electron microprobe analysis; corresponding to $Ag_{0.33}Tl_{1.13}Pb_{3.20}(Sb_{7.09}As_{2.25})_{\Sigma=9.34}S_{17.76}$.

Occurrence: In a quartz vein cutting dolostone, associated with a barite-pyrite-iron oxide deposit in regionally metamorphosed rocks.

Association: Zinkenite, dolomite.

Distribution: From at the Sant'Olga level, Monte Arsiccio mine, near Sant'Anna di Stazzema, Apuan Alps, Tuscany, Italy.

Name: Honors Matteo Boscardin (b. 1939) for his contribution to the knowledge of the regional mineralogy of Italy.

Type Material: Natural History Museum, University of Pisa, Pisa, Italy (# 19349).

Mineral., 99, 2152 (abs. ref. 1).

Bostwickite $CaMn_6^{3+}Si_3O_{16}\cdot 7H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic (?). *Point Group:* n.d. As divergent sprays of bladed crystals, commonly composed of tiny microcrystals, to 250 μm; as radial aggregates and hemispherules of such crystals, to 3 mm.

Physical Properties: Hardness = ~1 D(meas.) = 2.93(10) D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Dark brownish red. *Streak:* Brownish red. *Luster:* Vitreous to submetallic on prism surfaces.
Optical Class: Biaxial (–). *Pleochroism:* Strong; $X = Y$ = red-brown; Z = yellow-brown. *Dispersion:* $r < v$, very strong. *Absorption:* $X = Y > Z$. $\alpha = 1.775(5)$ $\beta = 1.798(3)$ $\gamma = 1.800(3)$ 2V(meas.) = 25°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Franklin, New Jersey, USA.
11.3 (100), 2.567 (40), 3.548 (30), 2.898 (30), 2.262 (25), 2.238 (25), 1.470 (25)

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O by difference; corresponds to $(Ca_{0.76}Mg_{0.19})_{\Sigma=0.95}(Mn^{3+}_{5.97}Fe^{3+}_{0.05})_{\Sigma=6.02}(Si_{2.80}Al_{0.16}As^{5+}_{0.07})_{\Sigma=3.03}O_{16}\cdot 7.1H_2O$.
(2) $CaMn_6Si_3O_{16}\cdot 7H_2O$.

Occurrence: In a metamorphosed stratiform zinc deposit, on surfaces of ore and on secondary carbonate minerals.

Association: Franklinite, calcite, fluorite, willemite, kittatinnyite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: For Richard C. Bostwick, collector of Franklin minerals and expert in mineral fluorescence.

Type Material: Harvard University, Cambridge, Massachusetts, 125617–125620; National Museum of Natural History, Washington, D.C., USA, C4222.

Botallackite $Cu_2Cl(OH)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crusts of minute platy interlaced crystals.

Physical Properties: *Cleavage:* One direction, good, $\perp Z$. Hardness = [Soft.]
D(meas.) = ∼3.6 D(calc.) = [3.60]

Optical Properties: Transparent to translucent. *Color:* Mountain-green, bluish green to green; pale bluish green in transmitted light.
Optical Class: Biaxial (+). *Pleochroism:* Weak; in shades of bluish green. *Dispersion:* $r > v$, strong. $\alpha = 1.775(3)$ $\beta = 1.800(5)$ $\gamma = 1.846(3)$ 2V(meas.) = Moderately large.

Cell Data: *Space Group:* $P2_1/m$. $a = 5.717(1)$ $b = 6.126(1)$ $c = 5.636(1)$
$\beta = 93.07(1)^\circ$ Z = [2]

X-ray Powder Pattern: Botallack mine, England.
5.66 (10), 2.40 (8), 2.57 (7), 2.84 (4), 1.53 (4), 2.68 (3), 1.93 (3)

Chemistry:

	(1)	(2)
CuO	66.25	74.49
Cl	14.51	16.60
H_2O	22.60	12.65

Total	100.09	100.00

(1) Botallack mine, England. (2) $Cu_2Cl(OH)_3$.

Polymorphism & Series: Polymorphous with atacamite, clinoatacamite, and paratacamite.

Occurrence: In copper-bearing deposits, in areas with high chlorine concentrations or weathered while exposed to seawater; a reaction product of slag immersed in seawater; a weathering product of sulfides in subsea black smoker deposits.

Association: Atacamite, paratacamite (Botallack mine, Cornwall, England; Bisbee, Arizona, USA); gypsum, brochantite, connellite (Dalbeattie, Scotland).

Distribution: In Wheal Cock and West Wheal Owles, the Botallack and Levant mines, St. Just, and a few other places in Cornwall, England. At the Southwick Cliffs, near Dalbeattie, Kirkcudbrightshire, Scotland. From the Castletown mine, Lochgilphead, Scotland. Found in the Dooneen mine, Allihies, Co. Cork, Ireland. From Juliushütte, Astfeld, Harz Mountains, Germany, in slag. At Laurium, Greece, in slag. In South Africa, from the Argent Pb–Zn mines, about 100 km east of Johannesburg, Transvaal, in slag. From Bisbee, Cochise Co., Arizona, USA. Along the Mid-Atlantic Ridge, in the TAG Hydrothermal Field.

Name: For the occurrence in the Botallack mine, Cornwall, England.

Type Material: The Natural History Museum, London, England, 36528; Harvard University, Cambridge, Massachusetts, USA, 100805.

Botryogen $MgFe^{3+}(SO_4)_2(OH)\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are short to long prismatic, elongated and striated ‖ [001], complex with $\{\bar{1}01\}$, {010}, {110}, {120}, $\{\bar{1}11\}$, many other forms, to several mm. Commonly in stalactitic, reniform, botryoidal or globular aggregates with internal radiating structure.

Physical Properties: *Cleavage:* {010}, perfect; {110}, good. *Fracture:* Conchoidal, irregular. *Tenacity:* Brittle. Hardness = 2–2.5 D(meas.) = 2.14 D(calc.) = 2.23 Decomposed by hot H_2O.

Optical Properties: Transparent to translucent. *Color:* Pale to dark orange. *Streak:* Ocher-yellow. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Pleochroism:* X = colorless to pale brown; Y = cinnamon-brown; Z = golden yellow. *Orientation:* $X = b$; $Z \wedge c = 12°$. *Dispersion:* $r > v$, strong. $\alpha = 1.523$ $\beta = 1.530$ $\gamma = 1.582$ 2V(meas.) = 42°

Cell Data: *Space Group:* $P2_1/n$. $a = 10.47$–10.51 $b = 17.83$–17.85 $c = 7.11$–7.14 $\beta = 100°00'$–$100°20'$ Z = 4

X-ray Powder Pattern: Quetena, Chile.
8.86 (FFF), 2.998 (F), 6.29 (mF), 5.11 (mF), 5.47 (f), 3.86 (f), 3.41 (f)

Chemistry:

	(1)	(2)

Total	99.51	100.00

(1) Redington mine, California, USA. (2) $MgFe(SO_4)_2(OH)\cdot 7H_2O$.

Occurrence: A secondary mineral, which may be in great abundance, altered from pyrite, especially in arid climates.

Association: Copiapite, amarantite, hohmannite, coquimbite, voltaite, pickeringite, epsomite, gypsum, chalcanthite.

Distribution: From Falun, Sweden. At the Rammelsberg mine, near Goslar, Harz Mountains, Germany. In Chile, in Antofagasta, at Chuquicamata, Quetena, west of Calama, and Alcaparrosa, near Cerritos Bayos, southwest of Calama. From the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. In the USA, from the Redington mine, Knoxville, and at the Palisades mine, near Calistoga, Napa Co., California; abundant as a post-mining product at Bisbee, Cochise Co., Arizona; from Cornwall, Lebanon Co., Pennsylvania. At Libiola, Liguria, and Rio Marina, Elba, Italy.

Name: From the Greek for *bunch of grapes* and *to bear*, in allusion to the globular forms exhibited by the original material.

Type Material: Natural History Museum, Vienna, Austria, A.a.185; The Natural History Museum, London, England, 1956,315.

Bottinoite $NiSb_2^{5+}(OH)_{12}\cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$, 32, or $\overline{3}\ 2/m$. Crystals tabular on {0001}, with $\{10\overline{1}0\}$, in roselike and spherulitic aggregates, to 3 mm. *Twinning:* Inability to solve the structure was attributed to possible twinning.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = ∼3
VHN = 94–110, 105 average (10 g load). D(meas.) = 2.83(1) (synthetic). D(calc.) = 2.81

Optical Properties: Transparent. *Color:* Pale blue to blue-green. *Streak:* Very pale blue.
Luster: Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.600(10)$ $\epsilon = 1.605(10)$

Cell Data: *Space Group:* $P31m$, $P3m1$, $P312$, or $P\overline{3}1m$. $a = 16.026(3)$ $c = 9.795(2)$
Z = 6

X-ray Powder Pattern: Bottino mine, Italy.

(1) Bottino mine, Italy; by electron microprobe, average of four analyses, with apparent loss of H_2O in electron beam; H_2O by TGA, $(OH)^{1-}$ and H_2O confirmed by IR. (2) Brownley Hill mine, England; by electron microprobe, average of four partial analyses. (3) Synthetic; by AA, H_2O by TGA; corresponds to $Ni_{0.99}Sb_{1.98}H_{24.13}O_{18}$. (4) $NiSb_2(OH)_{12}\cdot 6H_2O$.

Occurrence: Adjacent to and incrusting ullmannite in oxidized hydrothermal base-metal deposits.

Association: Ullmannite, galena, sphalerite, chalcopyrite, pyrite, quartz, calcite, bindheimite, cerussite, hydrozincite, chrysocolla, malachite, hemimorphite, pyromorphite, wulfenite.

Distribution: In the Bottino mine, near Seravezza, Tuscany, Italy. In England, at the Brownley Hill mine, Nenthead, Cumbria. From the Hendre Felen mine, Ysbyty Ystwyth, Dyfed, and the Mynydd Gorddu mine, Bont gôch, Ceulanymaesmawr, Wales. In Germany, from Dörnberg, Ramsbeck, North Rhein-Westphalia.

Name: For its occurrence in the Bottino mine, Italy.

Type Material: University of Florence, Florence, Italy, 1747/RI.

References: (1) Bonazzi, P., S. Menchetti, A. Caneschi, and S. Magnanelli (1992) Bottinoite, $Ni(H_2O)_6[Sb(OH)_6]_2$, a new mineral from the Bottino mine, Alpi Apuane, Italy. Amer. Mineral., 77, 1301–1304. (2) Clark, A.M. (1993) Bottinoite, a mineral new to Britain. Mineral. Mag., 57, 543–544.

(1) Cleveland mine, Stevens Co., Washington, USA; corresponding to $Pb_{5.17}Fe_{0.14}Sb_{4.04}S_{11.00}$. (2) Boliden, Sweden; by electron microprobe, corresponding to $Pb_{5.05}(Sb_{3.75}Bi_{0.28})_{\Sigma=4.03}(S_{10.72}Se_{0.28})_{\Sigma=11.00}$. (3) $Pb_5Sb_4S_{11}$.

Occurrence: In hydrothermal veins formed at low to medium temperatures.

Association: Lead sulfosalts, galena, stibnite, sphalerite, pyrite, arsenopyrite, siderite, quartz.

Distribution: Widespread; only a few localities can be given. In France, at Molières, Gard [TL], and from Saint-Pons, Alpes-de-Haute-Provence. In rings from Bottino, Tuscany, Italy. In crystals from Sala, Västmanland; Nasafjell, Lappland; and Boliden, Västerbotten, Sweden. At Wolfsberg, Harz Mountains, at Ober-Lahr, near Altenkirchen, Rhineland-Palatinate, and Waldsassen, Bavaria, Germany. From Trepča, Serbia. At Příbram, Czech Republic. In the USA, in the Coeur d'Alene district, Shoshone Co., and [??where??in] the Wood River district, Blaine Co., Idaho; in the Iron Mountain mine, Superior, Mineral Co., Montana; and at Augusta Mountain, Gunnison Co., Colorado. In Mexico, at the Noche Buena mine, Mazapil, Zacatecas. From Madoc, Ontario, Canada, as rings.

Name: Honors Charles Louis Boulanger (1810–1849), French mining engineer, who called attention to the species.

(1) Herja (Kisbánya), Romania. (2) $PbCuSbS_3$.

Polymorphism & Series: Forms a series with seligmannite.

Occurrence: In hydrothermal veins formed at medium temperatures.

Association: Galena, tetrahedrite, sphalerite, chalcopyrite, pyrite, stibnite, zinkenite, siderite, quartz, rhodochrosite, dolomite, barite.

Distribution: Numerous localities, even for fine crystals. In England, from Wheal Boys, St. Endellion [TL], and in exceptional crystals from the Herodsfoot mine, Lanreath, Cornwall. At the Mogul mine, Silvermines, Co. Tipperary, Ireland. From the Georg mine, near Horhausen, North Rhine-Westphalia, and at Clausthal, Neudorf, and Wolfsberg, Harz Mountains, Germany. From Příbram, Czech Republic. At Baia Sprie (Felsőbánya), Cavnic (Kapnikbánya), and Săcărîmb (Nagyág), Romania. In France, from Pontgibaud, Puy-de-Dôme; large crystals at St. Laurent Le Minier, Gard; and from Prunières [ck??Gard??also], Isère. In Bolivia, from Chorolque, Colquechaca, Pacuani, Machacamarca, and Oruro; at Cerro Rico, and as fine crystals from the Víboras mine, Machacamarca, Potosí. At the Quiruvilca mine, La Libertad, and from Pachapaque. Peru. At Park City, Summit Co., Utah, USA. In Mexico, in the Noche Buena mine, Mazapil, Zacatecas, and at Naica, Chihuahua. From Broken Hill, New South Wales, Australia. In the Chichibu mine, Saitama Prefecture, and the Nakaze mine, Hyogo Prefecture, Japan. At the Yaogangxian mine, Chenzhou, Hunan Provinve, China.

Name: In honor of Jacques Louis de Bournon (1751–1825), French crystallographer and mineralogist.

Boussingaultite $(NH_4)_2Mg(SO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are short prismatic along [001], showing {001}, {010}, {110}, {111}, a number of other forms. Typically in stalactites, to 20 cm, or as fibrous crusts, massive.

Physical Properties: *Cleavage:* $\{\bar{2}01\}$, perfect (synthetic). Hardness = 2 D(meas.) = 1.722 (synthetic). D(calc.) = 1.718 Soluble in H_2O, with sharply astringent and saline taste.

Optical Properties: Transparent to translucent. *Color:* Colorless, white to yellowish pink; colorless in transmitted light. *Luster:* Silky.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $Z \wedge c \simeq 12°$. *Dispersion:* $r > v$, perceptible. $\alpha = 1.470$ $\beta = 1.472$ $\gamma = 1.479$ 2V(meas.) = 51°11′

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 9.324(7)$ $b = 12.597(9)$ $c = 6.211(5)$ $\beta = 107.14(2)°$ Z = 2

X-ray Powder Pattern: Synthetic; shows preferred orientation. (ICDD 17-135).

(1) South Mountain, California, USA. (2) $(NH_4)_2Mg(SO_4)_2 \cdot 6H_2O$.

Mineral Group: Picromerite group.

Occurrence: A rare sublimate formed under fumarolic conditions.

Association: n.d.

Distribution: From Travale, Val di Cecina, and Larderello, Tuscany, Italy. At the Schoeller mine, Libušin, near Kladno, Czech Republic. In the USA, in California, from South Mountain, near Santa Paula, Ventura Co.; in substantial quantity in Geyser Creek Canyon, The Geysers, Sonoma Co.; and at Coso Hot Springs, Inyo Co. From Gcwihaba Cave, 280 km west of Maun, northwestern Botswana.

Name: Honoring Professor Jean-Baptiste Joseph Dieudonné Boussingault (1802–1887), French chemist, Lyon University, Lyon, France.

Type Material: Natural History Museum, Paris, 99.494; National School of Mines, Paris, France, 17853.

Bowieite $(Rh, Ir, Pt)_2S_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As anhedral grains, to 0.5 mm across, and as inclusions in other platinum group minerals.

Physical Properties: *Tenacity:* Very slightly brittle. Hardness = n.d. VHN = 858–1635, 1288 average (100 g load). D(meas.) = n.d. D(calc.) = 6.91–6.96

Optical Properties: Opaque. *Color:* Pale gray to pale gray-brown in reflected light. *Luster:* Metallic. *Anisotropism:* Weak, dark gray to very dark brown.

(1) Salmon River, Alaska, USA; by electron microprobe; corresponds to $(Rh_{1.14}Ir_{0.70}Pt_{0.17})_{\Sigma=2.01}S_{3.00}$ (2) Gaositai, China; by electron microprobe, corresponds to $Rh_{2.07}S_{3.00}$. (3) Gusevogorskii massif, Russia; by electron microprobe, corresponds to $(Rh_{1.13}Ir_{0.93})_{\Sigma=2.06}S_{3.00}$.

Occurrence: In platinum alloy nuggets recovered from dredging operations (Salmon River, Alaska, USA); in platinum-bearing ultramafic rocks intruded into a granite gneiss-"hornblende" gneiss complex (Gaositai, China).

Association: Platinum-iridium, platinum, osmium, laurite, silicate inclusions (Salmon River, Alaska, USA).

Distribution: From the Salmon River, Goodnews Bay, Alaska, USA [TL]. In the Santiago River, Esmeraldas Province, Ecuador. From the Gusevogorskii massif, Ural Mountains, and the Baimka placer, Chukotka, Far Eastern Region, Russia. At Gaositai, Hebei Province, China. In sediments in the Blagoevgrad graben, southwest Bulgaria. At Milverton, near Fifield, New South Wales, Australia. In the Pirogues River, New Caledonia.

Name: To honor the Scottish scientist, Dr. Stanley Hay Umphray Bowie (1917–), of the Institute of Geological Sciences, London, England.

Type Material: The Natural History Museum, London, England, 1983,70, E813.

Boyleite $(Zn, Mg)SO_4 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. In thin crusts and earthy aggregates.

Physical Properties: *Fracture:* Uneven. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 2.41 (synthetic $ZnSO_4 \cdot 4H_2O$). Soluble in H_2O; slowly alters to gunningite in a dry atmosphere.

Optical Properties: Semitransparent. *Color:* White. *Streak:* White.
Optical Class: Biaxial (–). $\alpha = 1.522(2)$ $\beta = [1.531]$ $\gamma = 1.536(2)$ 2V(meas.) = ∼70°

Cell Data: *Space Group:* $P2_1/n$ (synthetic $ZnSO_4 \cdot 4H_2O$). $a = 5.95$ $b = 13.60$ $c = 7.96$ $\beta = 90°18'$ Z = 4

X-ray Powder Pattern: Kropbach quarry, Germany.

	(1)
SO_3	38.89
ZnO	33.09
MgO	3.19
H_2O	24.83
Total	[100.00]

(1) Kropbach quarry, Germany; recalculated after deduction of estimated gypsum 11.60%, then corresponding to $(Zn_{0.84}Mg_{0.16})SO_4 \cdot 4H_2O$.

Mineral Group: Rozenite group.

Occurrence: A rare alteration product of sphalerite in a hydrothermal Pb–Zn vein (Kropbach quarry, Germany).

Association: Gypsum, gunningite, sphalerite (Kropbach quarry, Germany); gunningite, coquimbite, zincocopiapite, jarosite, melanterite, römerite, siderotil, voltaite, chalcanthite, hexahydrite, gypsum (Les Vallettes, Switzerland).

Distribution: From the Kropbach quarry, Münstertal, Black Forest, Germany. At Les Vallettes, Valais, Switzerland. From Keno Hill, Yukon Territory, Canada.

Name: Honoring Dr. Robert William Boyle (1920–), Canadian geochemist, Geological Survey of Canada, Ottawa, Canada.

Type Material: National Museum of Natural History, Washington, D.C., USA, 137413.

Brabantite $CaTh(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic; partially metamict. *Point Group:* $2/m$. Crystals are elongated, in crystalline aggregates, to 1.5 cm; fine granular, massive.

Physical Properties: *Cleavage:* On {100} and {001}. Hardness = ∼5 D(meas.) = 4.72–5.02 (after heating to 900 °C); 5.20 D(calc.) = 5.26 Radioactive.

Optical Properties: Semitransparent. *Color:* Grayish brown to reddish brown on rims, pale yellow, brownish green; brown-gray in thin section. *Luster:* Dull, greasy.
Optical Class: Biaxial (+). $\alpha = 1.691$ $\beta = 1.696$–1.73 $\gamma = 1.725$ 2V(meas.) = 44°

Cell Data: *Space Group:* $P2_1/n$. $a = 6.726(6)$ $b = 6.933(5)$ $c = 6.447(12)$ $\beta = 103°53(16)'$ Z = 2

(1) Brabant Farm, Namibia; after deduction of H_2O from admixed brockite, corresponds to $(Ca_{1.00}Mg_{0.06}Mn_{0.02})_{\Sigma=1.08}(Th_{0.94}Al_{0.07})_{\Sigma=1.01}[(P_{0.92}Si_{0.09})_{\Sigma=1.01}O_4]_2$. (2) Xinjiang Uygur Autonomous Region, China; corresponds to $Ca_{1.04}(Th_{0.86}RE_{0.08}U_{0.02})_{\Sigma=0.96}[(PO_4)_{1.78}(SiO_4)_{0.12}]_{\Sigma=1.90}$. (2) $CaTh(PO_4)_2$.

Mineral Group: Monazite group.

Occurrence: In a zoned granite pegmatite (Brabant Farm, Namibia); in a rare-metal-bearing pegmatite (Xinjiang Uygur Autonomous Region, China); an accessory mineral in peraluminous granites (Eibenstock, Germany).

Association: Hematite, brockite, thorite, uraninite, muscovite (Brabant Farm, Namibia); hafnian zircon, spodumene, manganocolumbite, albite (Xinjiang Uygur Autonomous Region, China); cheralite, huttonite (Kuttankuli, India).

Distribution: In the Van der Made pegmatite, Brabant Farm, west of Itiro, Karibib district, Namibia. In China, at an undisclosed locality in the Xinjiang Uygur Autonomous Region. From Kuttankuli (Kuttakuzhi), about 42 km east-southeast of Trivandrum, Kerala State, India. Along Cordell Creek, Dugger Community, Guadalupe Co., Texas, USA. In the Eibenstock pluton, in the Erzgebirge, Germany.

Name: For the Brabant Farm, Namibia, location of the pegmatite where the mineral was first found.

Type Material: Institute for Mineralogy and Crystallography, Berlin Technical University, Berlin, Germany.

(1) Merume River, Guyana; estimated to contain 30% eskolaite. (2) CrO(OH).

Polymorphism & Series: Trimorphous with grimaldiite and guyanaite.

Occurrence: In fine-grained intergrowth with other chromium oxide-hydroxide minerals.

Association: Eskolaite, grimaldiite, guyanaite, mcconnellite.

Distribution: In the basin of the Merume River, Guyana.

Name: For Smith Bracewell, formerly Director, British Guyana Geological Survey, who first noted the occurrence.

Type Material: The Natural History Museum, London, England, 1979,136.

Brackebuschite $Pb_2(Mn^{3+},Fe^{3+})(VO_4)_2(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as acicular crystals, elongated and striated ‖ [010], may be lathlike or wedge-shaped, flattened on {001}, with {100}, {001}, {011}, $\{10\overline{2}\}$, $\{10\overline{3}\}$, others, perhaps without terminal faces, to 1.5 mm; in sprays, dendritic, botryoidal.

Physical Properties: Hardness = n.d. D(meas.) = 6.05 D(calc.) = 6.11

Optical Properties: Translucent to nearly opaque. *Color:* Dark brown to black; reddish brown in transmitted light. *Streak:* Yellow. *Luster:* Submetallic.
Optical Class: Biaxial (+). *Pleochroism:* X = nearly colorless; Y = dark reddish brown; Z = reddish brown. *Orientation:* Y = b; $X \wedge a = 20°$. *Dispersion:* $r > v$, strong. $\alpha = 2.28$ $\beta = 2.36$–2.38 $\gamma = 2.48$–2.49 2V(meas.) = ∼90°

Cell Data: *Space Group:* $P2_1/m$. $a = 8.810$–8.880 $b = 6.135$–6.155 $c = 7.650$–7.681 $\beta = 111°30'$–$111°50'$ Z = 2

X-ray Powder Pattern: Venus mine, Argentina.

(1) "Sierra de Córdoba," Argentina; corresponds to $Pb_{1.88}(Mn^{3+}_{0.46}Fe^{3+}_{0.45}Zn_{0.11}Cu_{0.04})_{\Sigma=1.06}[(V_{0.96}P_{0.01})_{\Sigma=0.97}O_{3.72}]_2(OH)_{1.55}$. (2) Do.; by electron microprobe, average of 10 analyses, not given but stated to correspond to $(Pb_{1.96}Sr_{0.01}Ca_{0.01})_{\Sigma=1.98}(Fe^{3+}_{0.77}Mn^{3+}_{0.13}Cu_{0.03}Zn_{0.02})_{\Sigma=0.95}(V_{1.02}O_4)_2(OH)$. (3) Do.; by electron microprobe, average of 29 analyses, not given but stated to correspond to $(Pb_{1.89}Sr_{0.02}Ca_{0.03}Ba_{0.01})_{\Sigma=1.95}(Mn^{3+}_{0.96}Fe^{3+}_{0.04}Cu_{0.03}Zn_{0.01})_{\Sigma=1.04}[(V_{1.00}As_{0.01})_{\Sigma=1.01}O_4]_2(OH)$.

Mineral Group: Brackebuschite group.

Occurrence: A rare secondary mineral in the oxidized zone of hydrothermal Pb–Zn deposits.

Association: Descloizite, vanadinite, wulfenite, cerussite.

Distribution: Found in the Venus, Agua del Rubio, Bienvenida, Pilar, and Algarrobites mines, El Guaico district, Córdoba Province, Argentina. In the USA, from a prospect in the Swisshelm district, Swisshelm Mountains, Cochise Co., and at the Palmetto mine, Santa Cruz Co., Arizona; on the Hack claim, Paradox Valley, Montrose Co., Colorado. From the Kusu vanadium deposit, 85 km southwest of Kinshasa, Bas-Congo Province, Congo (Bas-Zaire Province, Zaire). In the Mounana uranium mine, Franceville, Gabon.

Name: Honoring Ludwig Brackebusch (1849–1906), Professor of Mineralogy, University of Córdoba, Córdoba, Argentina.

Type Material: The Natural History Museum, London, England, 55819; Harvard University, Cambridge, Massachusetts, USA, 96255.

Braggite (Pt, Pd, Ni)S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m$ or 4. As prisms, to 2 cm, and rounded grains. *Twinning:* Rarely observed.

Physical Properties: Hardness = n.d. VHN = 946–1064, 997 average (100 g load). D(meas.) = ∼10 D(calc.) = 9.383

Optical Properties: Opaque. *Color:* White in reflected light. *Luster:* Metallic. *Anisotropism:* Distinct, in purplish and pinkish shades of gray and brown.
R_1–R_2: (400) 41.3–41.8, (420) 41.8–42.4, (440) 42.1–43.0, (460) 42.4–43.4, (480) 42.5–43.8, (500) 42.7–44.1, (520) 42.7–44.2, (540) 42.6–44.2, (560) 42.5–44.2, (580) 42.4–44.2, (600) 42.3–44.1, (620) 42.2–44.1, (640) 41.9–44.0, (660) 41.9–43.9, (680) 41.9–43.8, (700) 41.5–43.8

Cell Data: *Space Group:* $P4_2/m$. $a = 6.367$ $c = 6.561$ $Z = 8$

X-ray Powder Pattern: Potgietersrus district, South Africa; can be confused with vysotskite.
2.86 (100), 2.93 (30), 2.64 (30), 1.852 (30), 1.423 (30), 1.713 (20), 1.595 (2)

Chemistry:

	(1)	(2)		(1)	(2)
Pt	63.2	62.1	Ni	4.4	2.0
Pd	15.4	19.0	S	17.4	16.9
			Total	100.4	100.0

(1) Potgietersrus district, South Africa; by electron microprobe, corresponding to $(Pt_{0.60}Pd_{0.27}Ni_{0.14})_{\Sigma=1.01}S_{1.00}$. (2) Stillwater complex, Montana, USA; by electron microprobe, corresponding to $(Pt_{0.60}Pd_{0.34}Ni_{0.06})_{\Sigma=1.00}S_{1.00}$.

Polymorphism & Series: Forms a series with vysotskite; dimorphous with cooperite.

Occurrence: In layered mafic intrusives, formed at high magmatic temperatures.

Association: Sperrylite, cooperite, laurite, platinum (Potgietersrus district, South Africa); pentlandite, pyrrhotite, chalcopyrite, cubanite, nickelian mackinawite, gold, cooperite, vysotskite, moncheite, isoferroplatinum, kotulskite, keithconnite, palladian tulameenite (Stillwater complex, Montana, USA).

Distribution: One of most common and economically important platinum group minerals. From the Rustenburg and Potgietersrus [TL] districts, in the Merensky Reef, Bushveld complex, Transvaal, South Africa. At the Stillwater complex, Montana, USA. From the Lac des Iles complex, Ontario, Canada. In the Santiago River, Esmeraldas Province, Ecuador. At the Luanga complex, Serra dos Carajas, Para, Brazil. From the Noril'sk region, western Siberia, and in the Lukkulaisvaara layered intrusion, Karelia, Russia. On Rum Island, Inner Hebrides, Scotland. In the Siikakama intrusion and the Kirakkajuppura deposit, Penikat layered complex, northeast of Kemi, Finland. At Little Darling Creek, east of Broken Hill, New South Wales, Australia. On Round Hill, near Orepuki, New Zealand. Additional localities are known.

Name: To honor Sir William Henry Bragg (1862–1942) and Professor William Lawrence Bragg (1890–1971), Cambridge University, Cambridge, England, pioneers in the X-ray investigation of crystals, as this was the first new mineral to be discovered by X-ray methods alone.

Type Material: The Natural History Museum, London, England, 1932,1303–1304; National Museum of Natural History, Washington, D.C., USA, 105857.

(1) Laurani, Bolivia; average of 4 electron microprobe analyses, low analytical total due to beam damage of sample, H_2O and valances assigned from structure analysis, corresponding to $Na_{0.87}Cu^{2+}_{5.17}Fe_{0.04}(Ti^{4+}_{0.90}Sb^{5+}_{1.15})_{\Sigma=2.05}O_2(As^{5+}_{0.98}O_4)_4[As^{5+}_{0.98}O_3(OH)]_2{\cdot}8H_2O$.
(2) $NaCu_5(TiSb)O_2(AsO_4)_4[AsO_3(OH)]_2(H_2O)_8$.

Occurrence: An uncommon secondary mineral in the weathering zone of a hydrothermal enargite deposit.

Association: Lammerite, lavendulan-lemmereite.

Distribution: Laurani, near Sica Sica, Bolivia.

Name: Honors Richard S.W. Braithwaite (b. 1930), chemist and mineralogist at the University of Manchester, England, for his contributions to the chemistry of secondary Cu-Pb minerals.

Type Material: Canadian Museum of Nature, Ottawa, Ontario (CMNMC 86085).

(1) Cane Creek mine, Utah, USA; by a wide variety of analytical methods, recalculated to 100% from an original total of 99.91%; after deduction of about 35% admixed quartz, dolomite, hematite, and a chloritelike mineral, corresponds to $(Ca_{6.74}Na_{0.94})_{\Sigma=7.68}(Ce_{0.81}La_{0.49}Nd_{0.38}Y_{0.23}Pr_{0.11}Sm_{0.09}Eu_{0.04}Gd_{0.03}Dy_{0.02}Tb_{0.01}Er_{0.01})_{\Sigma=2.22}B_{24.00}O_{42}(OH)_{4.54} \cdot 5.19H_2O$.

Occurrence: In anhydrite at the contact with sylvite in a thick sequence of marine evaporites, at a depth of about 1 km.

Association: Anhydrite, dolomite, halite, hematite, chalcopyrite.

Distribution: From the Cane Creek potash mine, about 13 km southwest of Moab, and in the CC-1 well, about 1.8 km south of that mine, Grand Co., Utah, USA.

Name: Honors Dr. Otto Braitsch (1921–1966), University of Freiburg, Freiburg, Germany, for his contributions to evaporate mineralogy and geochemistry.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120627.

(1) Harstigen mine, Sweden. (2) Vrančice, Czech Republic; by electron microprobe, H_2O by TGA; corresponds to $Ca_{2.01}(Mn_{0.96}Mg_{0.05})_{\Sigma=1.01}(AsO_4)_{1.99} \cdot 2.32H_2O$. (3) $Ca_2Mn(AsO_4)_2 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with parabrandtite.

Mineral Group: Roselite group.

Occurrence: In metamorphosed Fe–Mn orebody (Harstigen mine and Långban, Sweden); in a metamorphosed stratiform zinc orebody (Sterling Hill, New Jersey, USA).

Association: Lead, sarkinite, flinkite, caryopilite, galena, barite, calcite (Harstigen mine, Sweden); sarkinite, rhodochrosite, sphalerite, franklinite, willemite, barite, calcite, chalcopyrite, löllingite (Sterling Hill, New Jersey, USA).

Distribution: Found in the Harstigen mine, near Persberg, and at Långban, Värmland, Sweden. From Sailauf, northeast of Aschaffenburg, Bavaria, Germany. In the Falotta mine, Oberhalbstein, Graubünden, Switzerland. At Vrančice, near Příbram, Czech Republic. In the Ushkatyn-III deposit, Atasu district, Kazakhstan. At Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA. In the Veta Negra mine, Pampa Larga district, Tierra Amarilla, southeast of Copiapó, Chile. From the Wessel's mine, near Kuruman, Cape Province, South Africa.

Name: To honor George Brandt (1694–1768), Swedish chemist.

Brannerite $(U, Ca, Y, Ce)(Ti, Fe)_2O_6$

Crystal Data: Monoclinic; always metamict. *Point Group:* $2/m$. As indistinct prismatic crystals, to 30 cm, some showing an orthogonal prism zone; more typically as rounded, detrital grains and pebbles and as irregular embedded grains and masses.

Physical Properties: *Fracture:* Conchoidal. Hardness = 4.5–5.5 D(meas.) = 4.2–5.43 D(calc.) = [5.20]; 6.37 (synthetic UTi_2O_6). Radioactive.

Optical Properties: Opaque, transparent in very thin fragments. *Color:* Black, brownish olive-green, yellow-brown to yellow with alteration; yellowish green in transmitted light. *Streak:* Dark greenish brown to yellowish brown. *Luster:* Pitchlike to vitreous when fresh, resinous to dull when altered.
Optical Class: Isotropic. $n = 2.23$–2.30
R: (400) 13.9, (420) 13.5, (440) 13.1, (460) 12.8, (480) 12.7, (500) 12.5, (520) 12.3, (540) 12.2, (560) 12.1, (580) 12.0, (600) 11.9, (620) 11.8, (640) 11.7, (660) 11.7, (680) 11.6, (700) 11.5

(1) Custer Co., Idaho, USA. (2) UTi_2O_6.

Polymorphism & Series: Dimorphous with orthobrannerite (?); forms a series with thorutite.

Occurrence: A primary mineral in granite pegmatite and in granitic gneiss; in silicified pebble conglomerates; in hydrothermal quartz and calcite veins; detrital in placers.

Association: Uraninite, gold, rutile, xenotime, apatite, zircon.

Distribution: In the USA, from Kelly Gulch, Custer Co., Idaho; in the San Bernardino Mountains, San Bernardino Co., and about ten km south of Coleville, Mono Co., California; at the California mine, Chaffee Co., Colorado; from Penn Haven Junction, Carbon Co., Pennsylvania. In Canada, an ore mineral in the Blind River-Elliot Lake district, Ontario, and at Eldorado, Saskatchewan. From Hornachuelos, Fuente Obejuna, and El Cabril, Cordoba, Spain. At Chateâu-Lambert, Voges, France. From Hüttenberg, Carinthia, Austria. Found at Lengenbach, Binntal, Valais, Switzerland. In Morocco, at Bou-Azzer. On the Witwatersrand, Transvaal, South Africa. From Crocker's Well, near Manna Hill, and the Nichols Nob copper mine, Flinders Range, South Australia. A few other localities are known.

Name: To honor Dr. John Casper Branner (1850–1922), American geologist, formerly Professor of Geology and President of Stanford University, Palo Alto, California, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 105793, 114997.

(1) Jáchymov, Czech Republic; H_2O by difference, corresponds to $(Mg_{0.92}Ca_{0.04})_{\Sigma=0.96}$ $AsO_3OH\cdot 3.70H_2O$. (2) $Mg(AsO_3OH)\cdot 4H_2O$.

Occurrence: A rare reaction product of arsenic-rich solutions with Ca–Mg carbonates.

Association: Pharmacolite, picropharmacolite, weilite, haidingerite, rauenthalite, arsenic, realgar, dolomite.

Distribution: From Jáchymov (Joachimsthal), Czech Republic. At Bieber and Richelsdorf, Hesse, and Wittichen, Black Forest, Germany. In the Ruben mine, Kohlendorf, Nowa Ruda (Neurode), Silesia, Poland. From the Salsigne mine, 15 km north of Carcassone, Aude, France.

Name: Honoring Rèjane Brasse, who first synthesized the compound.

Type Material: National School of Mines, Paris, France, 1963.

Braunite $Mn^{2+}Mn_6^{3+}SiO_{12}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As pyramidal crystals, to 5 cm, striated on {001} and {201} ‖ [010]; also dense granular, massive. *Twinning:* On {112}.

Physical Properties: *Cleavage:* Perfect on {112}. *Fracture:* Uneven to subconchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 VHN = 920–1079, 1025–1196 (100 g load). D(meas.) = 4.72–4.83 D(calc.) = [4.86] Weakly magnetic.

Optical Properties: Opaque. *Color:* Dark, brownish black to steel-gray; in polished section, greyish white with a brownish tinge. *Streak:* Brownish black to steel-gray. *Luster:* Submetallic. *Anisotropism:* Weak in air to distinct in oil, dark to lighter slate gray.
R_1–R_2: (400) 23.4–25.4, (420) 22.7–24.5, (440) 22.0–23.6, (460) 21.5–22.9, (480) 21.0–22.4, (500) 20.5–21.9, (520) 20.0–21.5, (540) 19.6–21.2, (560) 19.3–20.9, (580) 19.0–20.6, (600) 18.8–20.3, (620) 18.6–20.0, (640) 18.5–19.8, (660) 18.3–19.6, (680) 18.2–19.5, (700) 18.1–19.4.

(1) Långban, Sweden; total Mn as MnO. (2) Tirodi, India; by electron microprobe, Mn^{2+} estimated equal to (Si + Al + Ti) − (Mg + Ca). (3) $Mn^{2+}Mn_6^{3+}SiO_{12}$.

Polymorphism & Series: Forms a series with abswurmbachite.

Occurrence: Formed by metamorphism of manganese silicates and oxides; also a product of weathering.

Association: Pyrolusite, jacobsite, hausmannite, bixbyite, rhodonite, spessartine, hematite.

Distribution: Of widespread origin; a few localities for large crystals or pure material are: in Germany, at Öhrenstock and Elgersburg, near Ilmenau, Thuringia, and at Ilfeld, Harz Mountains. From Långban, and Jakobsberg, Värmland, Sweden. In Norway, at Botnedalen. In Italy, at St. Marcel, Val d'Aosta. From Kacharwali, Nagpur district, Maharashtra, and Tirodi, Madhya Pradesh, India. In Brazil, at Miguel Burnier, near Ouro Prêto, Minas Gerais. From mines in the Kalahari manganese field, around Kuruman, Cape Province, South Africa. In the USA, at the Spiller manganese mines, 25 km northeast of Mason, Mason Co., Texas; in the Batesville district, Independence Co., Arkansas; at Cartersville, Bartow Co. Georgia; from Snowmass, Pitkin Co., Colorado; in the Black Diablo mine, Pershing Co., Nevada; and the Fort Seward mine, Humboldt Co., California.

Brazilianite $NaAl_3(PO_4)_2(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals typically equant, or spearhead-shaped, elongated along [100], with large {011}, {$\bar{1}$11}, also {010}, {110}, {$\bar{3}$01}, {$\bar{1}$01}, other forms, to 20 cm. May be radial fibrous, globular.

Physical Properties: *Cleavage:* On {010}, good. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 2.98 D(calc.) = 2.998

Optical Properties: Transparent. *Color:* Chartreuse-yellow, pale yellow, yellow-green; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Y = b$; $X \wedge c = -20°$. *Dispersion:* $r < v$, faint.
$\alpha = 1.602$ $\beta = 1.609$ $\gamma = 1.621$–1.623 2V(meas.) = n.d. 2V(calc.) = 71°–75°

Cell Data: *Space Group:* $P2_1/n$. $a = 11.229(6)$ $b = 10.142(5)$ $c = 7.098(4)$ $\beta = 97°41'$
Z = 4

(1) [Córrego Frio mine,] Brazil. (2) $NaAl_3(PO_4)_2(OH)_4$.

Occurrence: A hydrothermal mineral in phosphate-rich zones of granite pegmatites; also in metamorphosed sedimentary deposits.

Association: Muscovite, albite, apatite, tourmaline ([Córrego Frio mine,] Brazil); whitlockite, apatite, quartz (Palermo #1 mine, New Hampshire, USA); amblygonite, lazulite-scorzalite, augelite, bertossaite, apatite (Buranga pegmatite, Rwanda).

Distribution: In Brazil, from the Córrego Frio and other nearby pegmatite mines, Divino das Laranjeiras, near Linópolis, and from São Geraldo do Baixio, Minas Gerais; on Alto Patrimônio, near Pedro Lavrada, Paraíba; from Boqueirão del Parelhas and Alto do Giz, Rio Grande do Norte. In the USA, at the Palermo #1 and Fletcher mines, near North Groton, Grafton Co., and the G.E. Smith mine, Newport, Sullivan Co., New Hampshire; at the Bell Pit, Newry, Oxford Co., Maine; from the White Picacho district, Maricopa and Yavapai Co., Arizona. In the Big Fish River–Rapid Creek area, Yukon Territory, Canada. From the Buranga pegmatite, near Gatumba, Rwanda. At Millstätter Seenrücken, Carinthia, Austria. From Dolní Bory, near Velkého Meziříčí, Czech Republic. At Giogo di Toirano, Bardineto, Savona, Italy. From Hagendorf, Bavaria, Germany.

Name: For Brazil, the country in which it was first found.

Type Material: National Museum of Natural History, Washington, D.C., USA, 105048.

BaO	6.91		
F	0.16		
Total	100.00	[101.6]	100.00

(1) Synthetic, sample separated from slag; recalculated after deducting impurities. (2) Scawt Hill, Ireland; by electron microprobe, original analysis Si 17.1%, Mg 3.1%, Ca 42.8%, here converted to oxides, traces of Na, Al, P, S. (3) $Ca_7Mg(SiO_4)_4$.

Occurrence: In contact metamorphosed limestones and dolostones intruded by diabase (Scawt Hill, Ireland) or syenite monzonite (Marble Canyon, Texas, USA).

Association: Larnite, spurrite, gehlenite, melilite, perovskite, magnetite (Scawt Hill, Ireland).

Distribution: In the USA, at Marble Canyon, Culberson Co., Texas. In Ireland, at Scawt Hill and Ballycraigy, near Larne, Co. Antrim. At Camas Mòr, Isle of Muck, Inverness-shire, and at Camphouse, Ardnamurchan, Argyllshire, Scotland. In the Hatrurim Formation, Israel.

Name: For Max Albrecht Bredig (1902–), physical chemist, who studied the polymorphism of Ca_2SiO_4.

Type Material: The Natural History Museum, London, England, 1956,385.

Total	99.92	99.9	100.00

(1) Hudson Bay mine, Cobalt, Canada; in part due to nickeline. (2) St. Andreasberg, Germany; by electron microprobe. (3) NiSb.

Mineral Group: Nickeline group.

Occurrence: In hydrothermal calcite veins associated with Co–Ni–Ag ores.

Association: Silver, nickeline, maucherite, cobaltite, ullmannite, tetrahedrite, pyrrhotite, cubanite, chalcopyrite, sphalerite, galena, calcite.

Distribution: In Germany, from St. Andreasberg, Harz Mountains [TL??], and in the Merkur mine, Bad Ems, Rhineland-Palatinate. In France, at Ar, Pyrénées-Atlantiques, and Pierrefitte, Hautes-Pyrénées. On Monte Narba, Sarrabus, Sardinia, Italy. From Tunaberg, Saxberget, and Långsjön, Sweden. At Sulitjelma, Norway. From the Ilímaussaq intrusion, southern Greenland. At Broken Hill, New South Wales, Australia. From the Noril'sk region, western Siberia, Russia. In the Natsume mine, Hyogo Prefecture, Japan. At the Kolar Gold Fields, Karnataka, India. In Canada, from the Cobalt district, near Red Lake; in the Silver Islet mine and the Hemlo gold deposit, Thunder Bay district, Ontario. In the USA, from Coyote Peak, near Orick, Humboldt Co., California. Several additional localities are known.

Name: To honor Saxon mineralogist Johann Friedrich August Breithaupt (1791–1873).

CaO	62.3	62.95
F	21.3	21.33
$-O = F_2$	9.0	8.98
Total	99.2	100.00

(1) Schellkopf, Germany; C and F average of four analyses, Ca average of two analyses, recalculated to oxides from an elemental analysis. (2) $Ca_2(CO_3)F_2$.

Occurrence: In voids and fissures in a porphryritic selbergite [formerly nosean-phonolite].

Association: Phillipsite, zeophyllite, gismondine, calcite.

Distribution: At the Schellkopf, 0.5 km west of Brenk, Eifel district, Germany.

Name: For Brenk, near the locality in Germany.

Type Material: Johannes Gutenberg University, Mainz, Germany; National Museum of Natural History, Washington, D.C., USA, 137256.

Brewsterite $(Sr, Ba, Ca)Al_2Si_6O_{16} \cdot 5H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals commonly equant or prismatic, striated and elongated along [100], to 1.5 cm. Platy, radial fibrous, and in granular aggregates. *Twinning:* Lamellar ∥ {010}.

Physical Properties: *Cleavage:* {010}, perfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 5–5.5 D(meas.) = 2.45 D(calc.) = [2.42]

Optical Properties: Transparent. *Color:* White, colorless, yellowish, gray, greenish; colorless in thin section. *Streak:* White. *Luster:* Vitreous to pearly on {010}. *Optical Class:* Biaxial (+). *Orientation:* $Z \perp (010)$; $X \wedge c = 19°–34°$ in various sectors of the crystal. *Dispersion:* $r > v$, weak, crossed. $\alpha = 1.510$ $\beta = 1.512$ $\gamma = 1.523$ 2V(meas.) = 65°

Cell Data: *Space Group:* $P2_1/m$. $a = 6.793(2)$ $b = 17.573(6)$ $c = 7.759(2)$ $\beta = 94.54(3)°$ Z = 2

X-ray Powder Pattern: Strontian, Scotland.
4.53 (10), 6.15 (9), 2.885 (9), 3.209 (8), 3.867 (7), 4.98 (4), 1.989 (4)

Chemistry:

	(1)	(2)
SiO_2	54.42	54.02
Al_2O_3	15.25	15.86
Fe_2O_3	0.08	0.11
CaO	1.19	0.80
SrO	8.99	11.80

Na_2O		0.21
K_2O		0.14
H_2O	13.22	13.72
Total	99.95	99.67

(1) Strontian, Scotland; corresponds to $(Sr_{0.58}Ba_{0.30}Ca_{0.14})_{\Sigma=1.02}Al_{1.98}Si_{6.00}O_{16} \cdot 4.86H_2O$.
(2) Burpala massif, Russia; corresponds to $(Sr_{0.76}Ba_{0.13}Ca_{0.10}Na_{0.04}K_{0.02}Fe_{0.01})_{\Sigma=1.06}Al_{2.06}Si_{5.94}O_{16} \cdot 4.86H_2O$.

Mineral Group: Zeolite group.

Occurrence: Hydrothermally deposited in druses lining cavities in basalts and schists; more rarely in ore deposits.

Association: Zeolites, calcite, quartz.

Distribution: From Strontian, Argyllshire, Scotland. At St. Christophe, Bourg d'Oisans, Isère, and around Barèges, Hautes-Pyrénées, France. In the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, Russia. At Yellow Lake, near Olalla, British Columbia, Canada. Other localities are reported but require confirmation.

Name: Honoring Sir David Brewster (1781–1868), Scottish mineralogist.

Brezinaite Cr_3S_4

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$ Anhedral grains, to 3 mm.

Physical Properties: Hardness = n.d. VHN = n.d. D(meas.) = n.d. D(calc.) = 4.12

Optical Properties: Opaque. *Color:* Brownish gray in polished section; synthetic brezinaite is dull gray.
R_1–R_2: n.d.

Cell Data: *Space Group:* $I2/m$ (synthetic). $a = 5.96(1)$ $b = 3.425(5)$ $c = 11.270(15)$ $\beta = 91.54(3)°$ Z = 2

X-ray Powder Pattern: Tucson iron meteorite.
2.644 (100), 5.67 (70), 2.056 (70), 1.716 (70), 2.978 (65), 2.606 (60), 5.23 (40)

Chemistry:

	(1)	(2)
Cr	48.3	54.88
Fe	3.9	
V	1.61	
Ti	0.96	
Mn	0.86	
Ni	0.08	
S	45.0	45.12
Total	100.71	100.00

(1) Tucson iron meteorite; by electron microprobe, average of 26 grains, corresponding to $(Cr_{2.65}Fe_{0.20}V_{0.09}Ti_{0.06}Mn_{0.04})_{\Sigma=3.04}S_{4.00}$. (2) Cr_3S_4.

Occurrence: In the metal matrix and contiguous to silicate inclusions (Tucson iron meteorite).

Association: Forsterite, enstatite, aluminous diopside, anorthite, feldspathic glass, kamacite, taenite, schreibersite (Tucson iron meteorite); troilite, carlsbergite, daubréelite (New Baltimore iron meteorite).

Distribution: In the Tucson [TL], New Baltimore, and Gibeon iron meteorites.

Name: In honor of Aristides Brezina (1848–1909), past Director of the Mineralogy-Petrology Section of the Natural History Museum, Vienna, Austria.

Type Material: Meteorite Collection, National Museum of Natural History, Washington, D.C., USA.

References: (1) Bunch, T.E. and L.H. Fuchs (1969) A new mineral: brezinaite, Cr_3S_4, and the Tucson meteorite. Amer. Mineral., 54, 1509–1518. (2) Jellinek, F. Brianite $Na_2CaMg(PO_4)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As anhedral grains, to 0.2 mm. *Twinning:* Polysynthetic on {100}, showing a lamellar structure in polarized light.

Physical Properties: Hardness = 4.5 D(meas.) = 3.0–3.3 D(calc.) = [3.13]

Optical Properties: Transparent. *Color:* Colorless.
Optical Class: Biaxial (–). *Orientation:* Extinction ∧ lamellae ≈2°–3°. $\alpha = 1.598(1)$ $\beta = 1.605(1)$ $\gamma = 1.608(1)$ 2V(meas.) = 63°–65° 2V(calc.) = 66°

Cell Data: *Space Group:* $P2_1/a$. $a = 13.36(5)$ $b = 5.23(2)$ $c = 9.13(3)$ $\beta = 91.2(2)°$ Z = 4

X-ray Powder Pattern: Dayton meteorite.
2.625 (10), 3.734 (9), 2.679 (9), 1.875 (9), 2.718 (8), 3.344 (7), 2.230 (7)

Chemistry:

	(1)	(2)
P_2O_5	46.9	47.27
FeO	0.5	
MgO	12.6	13.42
CaO	18.8	18.67
Na_2O	22.1	20.64
Total	100.9	100.00

(1) Dayton meteorite; by electron microprobe, average of six grains, total Fe as FeO; corresponds to $Na_{2.16}Ca_{1.01}Mg_{0.95}Fe^{2+}_{0.02}(PO_4)_2$. (2) $Na_2CaMg(PO_4)_2$.

Occurrence: A very rare component in phosphate nodules in an iron meteorite.

Association: Panethite, whitlockite, albite, enstatite, schreibersite, kamacite, taenite, graphite, sphalerite, troilite.

Distribution: In the Dayton finest (very fine-grained) octahedrite meteorite.

Name: In honor of Dr. Brian Harold Mason (1917–), U.S. National Museum, Washington, D.C., USA, for his contributions to the study of meteorites.

Type Material: National Museum of Natural History, Washington, D.C., USA, 1506.

Brianroulstonite $Ca_3[B_5O_6(OH)_6](OH)Cl_2 \cdot 8H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* m. As thin micaceous {010} lamellae, to 0.5 mm, in aggregates. *Twinning:* About [102] on {010}, ubiquitous but observed only by X-ray diffraction.

Physical Properties: *Cleavage:* On {010}, perfect. *Tenacity:* Flexible. Hardness = ∼5
D(meas.) = 1.97(3) D(calc.) = 1.93

Optical Properties: Transparent to translucent. *Color:* Colorless to white. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $Y = a$; $Z = b$; $X \wedge c = 30°$. $\alpha = 1.506(2)$ $\beta = 1.527(2)$ $\gamma = 1.532(2)$ 2V(meas.) = 56(1)° 2V(calc.) = 51.4°

Cell Data: *Space Group:* Pa. $a = 17.367(4)$ $b = 8.079(2)$ $c = 8.693(2)$ $\beta = 121.56(2)°$
Z = 2

X-ray Powder Pattern: Penobsquis mine, Canada; admixed with halite.
8.10 (10), 4.04 (4), 3.56 (2), 2.834 (2), 2.535 (2), 2.276 (2), 7.06 (1)

Chemistry:

	(1)	(2)	(3)
B_2O_3	[33.92]	28.76	28.80
CaO	32.85	27.85	27.84
K_2O	0.05		
Cl	13.79	11.69	11.73
H_2O	[40.44]	34.29	34.28
$-O = Cl_2$	3.11	2.59	2.65
Total	[117.94]	[100.00]	100.00

(1) Penobsquis mine, Canada; by electron microprobe, average of four analyses, high total from severe burnup in the electron beam, B_2O_3 and H_2O by stoichiometry from crystal-structure analysis. (2) Analysis (1) recalculated to 100%. (3) $Ca_3[B_5O_6(OH)_6](OH)Cl_2 \cdot 8H_2O$.

Occurrence: Very rare in residues from halite–sylvite evaporites.

Association: Halite, hilgardite, pringleite, trembathite, sellaite, fluorite, hematite, muscovite, penobsquisite, "clay".

Distribution: From the Penobsquis evaporite deposit, near Sussex, New Brunswick, Canada.

Name: Honors Brian V. Roulston (1948–), geologist and specialist in evaporite deposits.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 81500.

References: (1) Grice, J.D., R.A. Gault, and J. Van Velthuizen (1997) Brianroulstonite: a new borate mineral with a sheet structure. Can. Mineral., 35, 751–758. (2) (1998) Amer. Mineral., 83, 400 (abs. ref. 1).

Brianyoungite $Zn_3(CO_3, SO_4)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic, or orthorhombic. *Point Group:* $2/m$, 2, or 222. Crystals are thin tapering blades elongated along [010], to 2 μm, aggregated in rosettes.

Physical Properties: *Cleavage:* On {100}, perfect; another perpendicular, probably on {001}. Hardness = n.d. D(meas.) = 3.93–4.09 D(calc.) = 4.11

Optical Properties: Semitransparent. *Color:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+) (probable). $\alpha = 1.635$ $\beta = 1.650$ γ = n.d. 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/m$, $P2_1$, or $P222_1$. $a = 15.724(3)$ $b = 6.256(5)$ $c = 5.427(5)$ $\beta =\sim 90°$ Z = 4

X-ray Powder Pattern: Brownley Hill mine, England.
15.44 (100), 7.88 (100), 2.714 (40), 1.565 (30b), 5.25 (20), 2.577 (20), 2.397 (20)

Chemistry:

	(1)	(2)
SO_3	6.62	6.01
CO_2	9.90	9.91
ZnO	71.47	73.27
H_2O^+	10.70	10.81
Total	98.69	100.00

(1) Brownley Hill mine, England; ZnO by ICP/OES and XRF, SO_3 by ICP/OES, H_2O by CHN analyzer; corresponding to $Zn_{2.93}[(CO_3)_{0.75}(SO_4)_{0.28}]_{\Sigma=1.03}(OH)_{3.97}$. (2) $Zn_3(CO_3, SO_4)(OH)_4$ with CO_3:SO_4 = 3:1.

Occurrence: A rare secondary post-mine mineral in limestone-hosted oxidized Pb–Zn ores (Brownley Hill mine, England).

Association: Gypsum, smithsonite, pyrite, goethite (Brownley Hill mine, England).

Distribution: From England, at the Brownley Hill mine, near Alston, and the Smallcleugh mine, Nenthead, Cumbria. In Belgium, at Altenberg, near Aachen. In Germany, at the Alexander and Bastenberg mines, Ramsbeck, Sauerland; in the Marie mine, Wilnsdorf, Siegerland; at the Friedrichssegen mine, near Bad Ems, and in the Katzental area, near Nothweiler, Rhineland-Palatinate; from the Neue Fröhlichkeit mine, near St. Andreasberg, Harz Mountains; from the mines Gelbe Birke, near Schwartzemberg, Langenau, near Brand-Erbisdorf, Fortuna, near Breitenbrunn, and Reiche Zeiche, Freiberg, Saxony; from Wittmansgereuth, near Saalfeld, Thuringia; and elsewhere. Found at Laurium, Greece. From Broken Hill, New South Wales, Australia.

Name: Honors Brian Young (1947–), field geologist and mineralogist of the British Geological Survey, who provided the first specimens.

Type Material: Royal Museum of Scotland, Edinburgh, Scotland, 1992.17.1–8.

References: (1) Livingstone, A. and P.E. Champness (1993) Brianyoungite, a new mineral related to hydrozincite, from the north of England orefield. Mineral. Mag., 57, 665–670. (2) (1994) Amer. Mineral., 79, 1009 (abs. ref. 1).

Briartite $Cu_2(Zn,Fe)GeS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4mm$ or $\overline{4}m2$. Small grains, to 2 mm, embedded, interstitial, and in networks in other sulfides. *Twinning:* Commonly shows polysynthetic twinning.

Physical Properties: Hardness = 4.5 VHN = n.d. D(meas.) = n.d. D(calc.) = 4.337

Optical Properties: Opaque. *Color:* Gray to gray-blue in reflected light.
Anisotropism: Weak in air, distinct in oil.
R: (400) 23.4, (420) 24.2, (440) 25.0, (460) 25.7, (480) 26.4, (500) 27.0, (520) 27.4, (540) 27.6, (560) 27.5, (580) 27.2, (600) 26.8, (620) 26.0, (640) 25.0, (660) 23.8, (680) 22.5, (700) 21.2

Cell Data: *Space Group:* $I4_1md$ or $I\overline{4}d2$. $a = 5.32$ $c = 10.51$ Z = 2

X-ray Powder Pattern: Kipushi, Congo.
3.06 (FF), 1.888 (m), 1.871 (m), 1.608 (m), 1.591 (m), 2.67 (f), 1.533 (f)

Chemistry:

	(1)	(2)	(3)
Cu	33.1	32.0	32.9
Fe	9.5	5.1	2.6
Zn	6.9	10.8	12.2
Ge	16.0	14.6	13.7
Ga		1.0	2.2
Sn	0.5		
S	32.4	34.8	36.1
Total	98.4	98.3	99.7

(1) Kipushi, Congo; by electron microprobe, corresponding to $Cu_{2.06}(Fe_{0.67}Zn_{0.42})_{\Sigma=1.09}(Ge_{0.87}Sn_{0.02})_{\Sigma=0.89}S_{4.00}$. (2) Do.; by electron microprobe, corresponding to $Cu_{1.86}(Zn_{0.61}Fe_{0.34})_{\Sigma=0.95}(Ge_{0.74}Ga_{0.05})_{\Sigma=0.79}S_{4.00}$. (3) Tsumeb, Namibia; by electron microprobe, corresponding to $Cu_{1.84}(Zn_{0.66}Fe_{0.16})_{\Sigma=0.82}(Ge_{0.67}Ga_{0.11})_{\Sigma=0.78}S_{4.00}$.

Mineral Group: Stannite group.

Occurrence: As rare inclusions in other Ge–Ga-bearing sulfides.

Association: Chalcopyrite, tennantite, reniérite, germanite, galena, sphalerite.

Distribution: From the Prince Leopold mine, Kipushi, 28 km southwest of Lubumbashi, Katanga Province, Congo (Shaba Province, Zaire) [TL]. At Tsumeb, Namibia. From Kabwe (Broken Hill), Zambia. In the Radka deposit, Pazardzhik, Bulgaria. From the Plan d'Argut zinc deposit, central Pyrénées, Haut-Garonne, France. At Cerro de Toro, Las Alpujarrides, Granada [could be Almería??ck] Province, Spain.

Name: For Gaston Briart, geologist who studied the Kipushi deposit.

Type Material: Catholic University of Louvain, Louvain, Belgium, U309; National School of Mines, Paris, France; The Natural History Museum, London, England, 1967,271.

Brindleyite $(Ni, Mg, Fe^{2+})_2Al(SiAl)O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or hexagonal. *Point Group:* n.d. Crystals platy, with poorly developed individuals, less than 1 μm; massive.

Physical Properties: Hardness = 2.5–3 D(meas.) = 3.17(1) D(calc.) = 3.16

Optical Properties: Semitransparent. *Color:* Dark yellow-green.
Optical Class: Biaxial. $n = 1.635(1)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* n.d. 1M and 3A assumed. $a = 5.286(5)$ $b = 9.133(3)$ $c = 7.31(1)$ $\beta = 104°9(7)'$ Z = 2, or *Space Group:* n.d. 1A assumed. $a = 5.277(1)$ b = n.d. $c = 7.09(1)$ β = n.d. Z = 2

X-ray Powder Pattern: Megara, Greece.
7.07 (100), 3.54 (80), 2.62 (18), 2.47 (18), 2.37 (18), 1.524 (17), 4.54 (10)

Chemistry:

	(1)
SiO_2	27.45
TiO_2	0.99
Al_2O_3	24.09
ΣLa_2O_3	0.35
Cr_2O_3	0.17

MgO	3.18
CaO	0.07
H_2O	[12.37]
Total	[100.00]

(1) Megara, Greece; by electron microprobe, H_2O by difference.

Polymorphism & Series: 1M plus 3A and 1A polytypes assumed.

Mineral Group: Kaolinite-serpentine group.

Occurrence: As coatings on limestone and as veinlets cutting kaolinitic clays at the base of a bauxite deposit developed on karst; also a significant component of weathered ultramafic rock (Megara, Greece).

Association: Bastnäsite, malachite, bayerite (Megara, Greece).

Distribution: In the Marmara bauxite deposit, Megara, Greece. From Victorio, Grant Co., New Mexico, USA.

Name: To honor Dr. George William Brindley (1905–1983), Professor of Mineral Science, Pennsylvania State University, University Park, Pennsylvania, USA.

Type Material: Department of Mineralogy, University of Belgrade, Belgrade, Yugoslavia; National Museum of Natural History, Washington, D.C., USA, 136982.

(1) Naujakasik, Greenland. (2) Oka, Canada. (3) Monte Somma, Italy; by electron microprobe, average of ten analyses; corresponds to $(Ca_{2.77}Ce_{0.88}Th_{0.62}La_{0.35}Nd_{0.24}Pr_{0.08}U_{0.04})_{\Sigma=4.98}(Si_{2.71}P_{0.47})_{\Sigma=3.18}O_{12}(OH)$.

Occurrence: In nepheline syenites, pegmatites, and contact deposits related to them.

Association: Zircon, pyrochlore, titanite, fluorite, diopside, andradite, allanite, vesuvianite.

Distribution: At Naujakasik, in the Ilímaussaq intrusion, southern Greenland. From about three km east of Jamestown, Boulder Co., Colorado, USA. At Oka and Mont Saint-Hilaire, Quebec, Canada. From the Pibnesburg complex, Rustenburg, Transvaal, South Africa. In the San Vito quarry, Monte Somma, Campania, Italy. At Tvedalen, Norway. From Tungpei, not otherwise located in China. In the Ishim complex, northern Kazakhstan. From the Khibiny massif, Kola Peninsula; the Kyshtym district, Ural Mountains; and other less-well-defined localities in Russia.

Name: From the Greek for *weight*, in allusion to its density, and its content of *cerium*.

Type Material: University of Copenhagen, Copenhagen, Denmark; The Natural History Museum, London, England, 85379.

(1) Suishoyama pegmatite, Japan; original total given as 99.58%. (2) "European Russia."

Occurrence: In pegmatites.

Association: Yttrialite, thorogummite, tengerite, allanite.

Distribution: In the Suishoyama pegmatite, near Iisaka, Fukushima Prefecture, and from Shinden, Gifu Prefecture, Japan. From an undefined locality given only as "European Russia."

Name: For its chemical relation to *britholite-(Ce)* and dominant *yttrium* in its composition.

Type Material: n.d.

References: (1) Hata, S. (1938) Abukumalite [britholite-(Y)], a new mineral from pegmatites of Iisaka, Fukushima prefecture. Sci. Pap. Inst. Phys. Chem. Res., Tokyo, 34, 1018–1023.

	(1)	(2)
Sb_2O_5	83.28	83.92
Na_2O	15.98	16.08
Total	99.26	100.00

(1) Cetine mine, Italy; by electron microprobe, average of 40 analyses on three grains.
(2) $NaSbO_3$.

Occurrence: A weathering product of stibnite in an antimony deposit in highly silicified limestone.

Association: Stibiconite, mopungite, cetineite, sénarmontite.

Distribution: In the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: Honors Dr. Giancarlo Brizzi (1936–1992), mineral collector who discovered the first specimens.

Type Material: University of Florence, Florence, Italy, 2037/RI.

References: (1) Olmi, F. and C. Sabelli (1994) Brizziite, $NaSbO_3$, a new mineral from the Cetine mine (Tuscany, Italy): description and crystal structure. Eur. J. Mineral., 6, 667–672.

Brochantite $Cu_4(SO_4)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are typically thick prismatic to acicular, elongated along [001] or [010], to 5 cm; may be flattened [001]; about 40 forms known; in aggregates, druses, crusts, also massive, granular. *Twinning:* On {100}, common, giving a pseudo-orthorhombic appearance.

Physical Properties: *Cleavage:* On {100}, perfect. *Fracture:* Uneven to conchoidal. Hardness = 3.5–4 D(meas.) = 3.97 D(calc.) = 4.09

Optical Properties: Transparent to translucent. *Color:* Emerald-green, blackish green, pale green; bluish green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous, somewhat pearly on cleavages.
Optical Class: Biaxial (–). *Pleochroism:* Slight; in bluish greens. *Orientation:* $Y = b$; $X \simeq a$; $Z \simeq c$. *Dispersion:* $r < v$, medium. $\alpha = 1.728$ $\beta = 1.771$ $\gamma = 1.800$ 2V(meas.) = 77(2)°

Cell Data: *Space Group:* $P2_1/a$. $a = 13.08$ $b = 9.85$ $c = 6.02$ $\beta = 103°22'$ Z = 4

X-ray Powder Pattern: Locality not stated. (ICDD 13-398).
2.521 (100), 3.90 (85), 2.678 (50), 6.38 (40), 5.36 (40), 3.19 (40), 2.923 (20)

Chemistry:

	(1)	(2)
SO_3	17.54	17.70
CuO	70.29	70.35
H_2O	11.96	11.95
Total	99.79	100.00

(1) Collahuasi, Chile; average of two analyses. (2) $Cu_4(SO_4)(OH)_6$.

Occurrence: Common in the oxidized zone of copper deposits, yet rarely an ore; formed under low acidity, principally in arid regions.

Association: Malachite, azurite, tenorite, cuprite, linarite, caledonite, cerussite, atacamite, chrysocolla, cyanotrichite, iron oxides.

Distribution: In Russia, from the Mednorudyanskoye copper deposit, near Nizhni Tagil, and at Gumeshevsk, southwest of Yekaterinburg (Sverdlovsk), Ural Mountains. At Băiţa (Rézbánya), Romania. From Rosas and Sa Duchessa, Sardinia, Italy. In Germany, at the Clara mine, near Oberwolfach, Black Forest. In England, numerous occurrences in Cornwall, and at Roughton Gill, Cumbria. From Tsumeb, Namibia. At Aïn-Barbar, Constantine, Algeria. In Australia, at Broken Hill, New South Wales. From many occurrences in Chile, as at Chuquicamata and Collahuasi, Antofagasta; from Potrerillos, Atacama; and at Challacollo, Tarapacá. In the USA, in Arizona, large crystals from Bisbee, Cochise Co., and at the Mammoth-St. Anthony mine, Tiger, Pinal Co.; in the Mammoth mine, Tintic, Juab Co., Utah; at Bingham, Socorro Co., New Mexico; from the Cerro Gordo mine, Inyo Co., California; in the Douglas Hill and Mason Pass mines, Yerington district, Lyon Co., Nevada. Many other localities are known.

Name: Honors Professor André Jean François Marie Brochant de Villiers (1772–1840), French geologist and mineralogist, School of Mines, Paris, France.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 541–544. (2) Cocco, G. and F. Mazzi (1959) La struttura della brochantite. Period. Brockite $(Ca, Th, Ce)(PO_4)\cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 622 (?). Rarely as stubby hexagonal prisms, to 50 μm; commonly granular radial, in very fine-grained massive aggregates, cryptocrystalline earthy.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 3.9(2) D(calc.) = [3.81] Radioactive.

Optical Properties: Translucent to opaque. *Color:* Pale yellow on thin edges; red-brown in reflected light, principally from included hematite. *Luster:* Greasy to vitreous. *Optical Class:* Uniaxial (+). *Orientation:* Parallel extinction, positive elongation. $\omega = 1.680(2)$ $\epsilon = 1.695(2)$

Cell Data: *Space Group:* $P6_222$ (?). $a = 6.96(3)$ $c = 6.40(3)$ $Z = 3$

X-ray Powder Pattern: Wet Mountains, Colorado, USA; cannot be distinguished from other members of the rhabdophane group.

Mineral Group: Rhabdophane group.

Occurrence: A rare accessory mineral in granite and granite pegmatites.

Association: Monazite, bastnäsite, xenotime, thorite, zircon, apatite, rutile, hematite.

Distribution: In the USA, in a prospect pit about 1 km east of the Bassick mine, Querida, Wet Mountains, and at the Hardwick mine and Nightingale shaft, Custer Co., Colorado; in the Bear Lodge Mountains, Crook Co., Wyoming; from the Diamond Creek district, Lemhi Co., Idaho and the Lemhi Pass district, Idaho-Montana; found in Monroe Canyon, Sevier Co., Utah; from the Laughlin Peak area, Colfax Co., New Mexico; in the Rawhide Mountains, Mohave Co., Arizona. At Mont Saint-Hilaire, Quebec, Canada. From Kizilcaoren, Turkey. In Japan, from Atagoyama, Shionhira, Shin-yashikiike, and Ishizuka, Ishikawa district, Fukushima Prefecture, Japan. A few other minor localities are known.

Name: To honor Maurice R. Brock, U.S. Geological Survey, who supplied the first specimen.

Type Material: National Museum of Natural History, Washington, D.C., USA, 121952.

Brodtkorbite Cu_2HgSe_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As individual anhedral grains, to 100 μm, and in aggregates.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = [2.5–3] VHN = 91–131, average 118 (10 g load). D(meas.) = n.d. D(calc.) = 7.77

Optical Properties: Opaque. *Color:* Dark gray. *Streak:* Dark gray. *Luster:* Metallic. *Optical Class:* Biaxial *Pleochroism:* Weak to moderate; pale pink to pale blue. *Anisotropism:* Weak to strong; mauve-gray to yellowish gray. *Bireflectance:* Weak to strong. R_1–R_2: (400) 30.7–38.1, (420) 30.6–38.2, (440) 30.4–37.9, (460) 29.9–37.3, (480) 29.3–36.6, (500) 28.6–36.0, (520) 28.0–35.6, (540) 27.5–35.2, (560) 27.1–35.0, (580) 26.8–34.8, (600) 26.4–34.5, (620) 26.2–34.3, (640) 26.1–34.2, (660) 26.1–33.9, (680) 26.3–33.6, (700) 26.4–33.3

Cell Data: *Space Group:* $P2_1/n$. $a = 7.492(5)$ $b = 4.177(1)$ $c = 7.239(4)$ $\beta = 114.20(5)^\circ$ $Z = 2$

X-ray Powder Pattern: Tuminico, Argentina.
2,730 (100), 3.991 (70), 2.223 (70), 3.576 (50), 3.534 (50), 3.414 (50), 2.072 (50)

Chemistry:

	(1)	(2)
Cu	26.2	26.17
Hg	40.7	41.31
Se	32.9	32.52
Total	99.8	100.00

(1) Tuminico, Argentina; by electron microprobe, average of seven analyses; corresponds to $Cu_{2.00}Hg_{0.98}Se_{2.02}$. (2) Cu_2HgSe_2.

Occurrence: Uncommon in a telethermal selenium-rich hydrothermal polymetallic deposit, in calcite veins in amphibolites, formed below 112 °C.

Association: Berzelianite, tiemannite, umangite, clausthalite, eucairite, naumannite, hematite, calcite.

Distribution: From Tuminico, Sierra de Cacho, La Rioja Province, Argentina [TL].

Name: To honor Dr. Milka Kronegold de Brodtkorb (1932–), Professor at the Universities of Buenos Aires and La Plata, Argentina, for her contributions to mineralogy and economic geology.

Type Material: Institute of Mineralogy, University of Salzburg, Austria, 14600–14602; The Natural History Museum, London, England, 1998,173.

Bromargyrite AgBr

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals cubic, with {111} and {011}, to 1 cm; in parallel or subparallel groups; commonly as crusts and coatings, massive. *Twinning:* {111}, rare.

Physical Properties: *Fracture:* Uneven to subconchoidal. *Tenacity:* Sectile, ductile, very plastic. Hardness = 2.5 D(meas.) = 6.474 D(calc.) = 6.477 May give off a strong "medicinal" odor when exposed to air.

Optical Properties: Transparent to translucent. *Color:* Pale yellow, greenish brown, bright green. *Streak:* White to yellowish white. *Luster:* Resinous to adamantine, waxy. *Optical Class:* Isotropic. $n = 2.253$

Cell Data: *Space Group:* $Fm3m$. $a = 5.7745$ (synthetic). Z = 4

X-ray Powder Pattern: Synthetic.
2.886 (100), 2.041 (55), 1.667 (16), 1.291 (14), 1.1787 (10), 3.33 (8), 1.444 (8)

Total	100.00	100.00

(1) Rancho de San Onofre, Charcas, Mexico. (2) Ag(Br, Cl) with Br:Cl = 1:1.

Polymorphism & Series: Dimorphous with chlorargyrite.

Occurrence: A rare secondary mineral in the oxidation zones of silver deposits, notably in arid regions.

Association: Silver, iodargyrite, smithsonite, Fe–Mn oxides.

Distribution: While a rare mineral, nevertheless known from a number of localities. From Huelgoet, Finistère, France. At the Schöne Aussicht mine, near Dernbach, and at Bad Ems, Rhineland-Palatinate, Germany. In the USA, at Bisbee, Tombstone, and the Commonwealth mine, Pearce, Cochise Co., Arizona; from the Silver City district, Grant Co., and elsewhere in New Mexico; at Silver Cliff, Custer Co., and on Horse Mountain, 13 km south of Eagle, Eagle Co., Colorado. From Charcas, San Luis Potosi; Plateros, Zacatecas; and many other localities in Mexico. At Chañarcillo, south of Copiapó, Atacama, Chile. From Broken Hill, New South Wales, Australia.

Name: For BROMine and the Greek for silver, *argyros*, in its composition.

Bromellite BeO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6*mm*. As prismatic crystals, elongated along [0001], to 1 mm, showing pyramidal hemimorphism, with $\{000\overline{1}\}$ and $\{10\overline{1}0\}$ well developed, $\{10\overline{1}1\}$ small; may be tabular ∥ {0001}; in randomly intergrown rosettelike aggregates; cleavage fragments, to 10 cm.

Physical Properties: *Cleavage:* $\{10\overline{1}0\}$, distinct. Hardness = ∼9 D(meas.) = 3.017 D(calc.) = 3.044 Pyroelectric; fluoresces yellowish white in both LW and SW UV.

Optical Properties: Transparent. *Color:* White to creamy white. *Luster:* Vitreous. *Optical Class:* Uniaxial (+). $\omega = 1.705–1.719$ $\epsilon = 1.733$

Cell Data: *Space Group:* $P6_3mc$ (synthetic). $a = 2.6983(4)$ $c = 4.3776(4)$ Z = 2

X-ray Powder Pattern: Synthetic.

(1) Långban, Sweden. (2) Langesundsfjord, Norway; by AA and D-C arc spectroscopy.

Occurrence: In hydrothermal calcite veins and veinlets in hematite skarn and skarnized limestones (Långban, Sweden); in vugs in natrolite, hydrothermally altered from nepheline, in syenite pegmatite (Langesundsfjord, Norway).

Association: Swedenborgite, richterite, manganophyllite (Långban, Sweden); natrolite, diaspore, chamosite (Langesundsfjord, Norway).

Distribution: From Långban, Värmland, Sweden. In the Saga larvikite quarry, Tvedalen, near Larvik, Norway. From the Izumrudnye district, Yekaterinburg (Sverdlovsk), Ural Mountains, the Pitkäranta district, Lake Ladoga, Karelia, and other less-well-defined localities in Russia.

Name: For Magnus von Bromell (1679–1731), Swedish physician and mineralogist.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden.

Brontesite $(NH_4)_3PbCl_5$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. Crystals tabular on {010}, to 0.1 mm; pseudotetragonal, exhibiting forms {110}, {011}, {121}.

Physical Properties: *Cleavage*: None observed. *Fracture*: None observed.
Tenacity: n.d. Hardness = n.d. D(meas.) = 2.72(1) D(calc.) = 2.728

Optical Properties: Translucent. *Color*: Colorless to white. *Streak*: White.
Luster: Vitreous.
Optical Class: Biaxial. n = 1.70(3) *Orientation:* n.d.

Cell Data: *Space Group*: *Pnma*. *a* = 8.434(1) *b* = 15.759(2) *c* = 8.462(1) Z = 4

X-ray Powder Pattern: La Fossa crater, Vulcano, Aeolian Islands, Italy.
3.067 (100), 2.020 (80), 2.710 (78), 1.910 (78), 2.421 (75), 1.491 (75), 1.457 (65)

Chemistry:

	(1)	(2)
K	1.1	
Pb	47.8	47.25
Cl	36.1	40.43
Br	3.7	
NH_4	11.3	12.32
Total	100.0	100.00

(1) La Fossa crater, Vulcano, Sicily, Italy; average of 6 EDS analyses, NH_4 by difference after confirmation by IR and microchemical tests, corresponding to $[(NH_4)_{2.87}K_{0.13}]_{\Sigma=3.00}Pb_{1.09}(Cl_{4.79}Br_{0.21})_{\Sigma=5.00}$. (2) $(NH_4)_3PbCl_5$.

Occurrence: A product of fumarolic activity.

Association: Bismuthinite, godovikovite, demicheleite-(Cl), demicheleite-(Br), alunite.

Distribution: La Fossa crater, Vulcano, Aeolian Islands, Sicily, Italy.

Name: For Brontes, one of the Cyclopes and a son of Uranus, helpers of the Greek god of fire whose workshops were alleged to be located at Vulcano.

Type Material: Department of Structural Chemistry and Inorganic Stereochemistry, University of Milan, Italy (reference collection 2008-03).

References: (1) Demartin, F., C.M. Gramaccioli, and I. Campostrini (2009) Brontesite, $(NH_4)_3PbCl_5$, a new product of fumarolic activity from La Fossa crater, Vulcano, Aeolian Islands, Italy, Can. Mineral., 47, 1237–1243. (2) (2010) Amer. Mineral., 95, 1122 (abs. ref. 1).

Brookite TiO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystals, to 12 cm, typically tabular on {010} and elongated and striated ‖ [001]; rarely tabular on {001}; commonly pyramidal {111} or pseudohexagonal with {120} and {111}. *Twinning:* On {120}, uncertain.

Physical Properties: *Cleavage:* {120}, indistinct; {001}, in traces. *Fracture:* Subconchoidal to irregular. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 4.08–4.18 D(calc.) = 4.133

Optical Properties: Opaque to translucent, transparent in thin fragments. *Color:* Brown, yellowish brown, reddish brown; dark brown to iron-black; yellowish brown to dark brown in transmitted light. *Streak:* White to grayish white or yellowish white. *Luster:* Metallic adamantine to submetallic.
Optical Class: Biaxial (+). *Pleochroism:* Very weak; yellowish, reddish, orange to brown.
Orientation: $Z = b$. *Dispersion:* $r > v$, very strong, with crossed axial dispersion.
Absorption: $Z > Y > X$. $\alpha = 2.5831$ $\beta = 2.5843$ $\gamma = 2.7004$ 2V(meas.) = 0°–28°, variable with wavelength.

Cell Data: *Space Group: Pcab.* $a = 5.4558$ $b = 9.1819$ $c = 5.1429$ Z = 8

X-ray Powder Pattern: Magnet Cove, Arkansas, USA.
3.51 (100), 2.900 (90), 3.47 (80), 1.893 (30), 1.662 (30), 2.476 (25), 1.691 (20)

Chemistry:

	(1)	(2)
TiO_2	98.59	98.77
Fe_2O_3	1.41	1.48
Total	100.00	100.25

(1) Snowdon, Wales; corresponds to $(Ti_{0.99}Fe_{0.01})_{\Sigma=1.00}O_2$. (2) Magnet Cove, Arkansas, USA; corresponds to $(Ti_{0.99}Fe_{0.01})_{\Sigma=1.00}O_2$.

Polymorphism & Series: Trimorphous with anatase and rutile.

Occurrence: An accessory mineral in alpine veins in gneiss and schist; in contact metamorphic zones and hydrothermal veinlets; a common detrital mineral.

Association: Anatase, rutile, titanite, orthoclase, quartz, hematite, calcite, chlorite, muscovite.

Distribution: A widespread mineral, but only a few localities afford fine crystals. At Fron Oleu, near Tremadog, Gwynned, Wales. From Bourg d'Oisans, Isère, France. In Switzerland, in the Maderanthal and Griessertal, Uri, at Salvan, Valais, and elsewhere. In Austria, found near Prägraten and Virgen, Tirol. From Hardangervidda, Norway. In Russia, at Atliansk, near Miass, Ilmen Mountains, Southern Ural Mountains, and large crystals in the Dodo mine, about 100 km west-northwest of Saranpaul, Subpolar Ural Mountains. In Italy, at Monte Bregaceto, near Genoa, Liguria. In Brazil, in the diamond placers of Bahia and Diamantina, Minas Gerais. In the USA, at Magnet Cove, Hot Spring Co., Arkansas; Ellensville, Ulster Co., New York; and near Powderhorn, Gunnison Co., Colorado.

Name: For Henry James Brooke (1771–1857), English crystallographer and mineralogist.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 588–593. (2) Deer, W.A., R.A. Howie, and J. Brownmillerite $Ca_2(Al, Fe^{3+})_2O_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As square platelets, to about 60 μm; massive.

Physical Properties: Hardness = n.d. D(meas.) = 3.76 D(calc.) = 3.68–3.73

Optical Properties: Semitransparent. *Color:* Reddish brown.
Optical Class: Biaxial (–). *Pleochroism:* Distinct; $X = Y$ = yellow-brown; Z = dark brown.
Orientation: Y and Z lie in the plane of the platelets; extinction in that plane is diagonal.
$\alpha = < 2.02$ $\beta = > 2.02$ $\gamma = > 2.02$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $Ibm2$. $a = 5.584(5)$ $b = 14.60(1)$ $c = 5.374(5)$ Z = 2

X-ray Powder Pattern: Near Mayen, Germany.
2.65 (vs), 7.19 (s), 2.78 (s), 1.93 (s), 2.05 (ms), 3.65 (m), 1.82 (m)

Total	94.4	100.3	100.6

(1) Near Mayen, Germany; by semiquantitative spectroscopy. (2) Hatrurim Formation, Israel; corresponds to $Ca_{1.99}(Al_{1.09}Fe_{0.86}Ti_{0.05})_{\Sigma=2.00}O_5$. (3) Do.; corresponds to $Ca_{1.95}(Fe_{1.31}Al_{0.64}Ti_{0.06})_{\Sigma=2.01}O_5$.

Occurrence: In thermally metamorphosed limestone blocks included in volcanic rocks (near Mayen, Germany); in high-temperature, thermally metamorphosed, impure limestones (Hatrurim Formation, Israel).

Association: Calcite, ettringite, wollastonite, larnite, mayenite, gehlenite, diopside, pyrrhotite, grossular, spinel, afwillite, jennite, portlandite, jasmundite (near Mayen, Germany); melilite, mayenite, wollastonite, kalsilite, corundum (Klöch, Austria); spurrite, larnite, mayenite (Hatrurim Formation, Israel).

Distribution: From the Ettringer-Bellerberg volcano, near Mayen, Eifel district, Germany. Found at Klöch, Styria, Austria. In the Hatrurim Formation, Israel.

Name: The artificial compound was named for Dr. Lorrin Thomas Brownmiller (1902–), Chief Chemist of the Alpha Portland Cement Company, Easton, Pennsylvania, USA, in 1932, the name then transferred to the naturally-occurring mineral.

Type Material: Mineral Museum, University of Cologne, Cologne, Germany, M5026/86; National Museum of Natural History, Washington, D.C., USA, 120045.

Brucite $Mg(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}\,2/m$. Crystals tabular {0001}, to 19 cm, in platy or foliated masses and rosettes; also fibrous, to 50 cm; granular, massive.

Physical Properties: *Cleavage:* {0001}, perfect. *Tenacity:* Sectile; separable plates are flexible, fibers are elastic. Hardness = 2.5 D(meas.) = 2.39 D(calc.) = 2.368 Pyroelectric.

Optical Properties: Transparent. *Color:* White, pale green, blue, gray; honey-yellow to brownish red and deep brown in manganoan varieties; colorless in transmitted light.
Streak: White. *Luster:* Waxy, pearly on cleavage surfaces.
Optical Class: Uniaxial (+); anomalously biaxial. ω = 1.56–1.59 ϵ = 1.58–1.60
2V(meas.) = Small.

Cell Data: *Space Group:* $P\bar{3}m1$. . $a = 3.142(1)$ $c = 4.766(2)$
Z = 1

X-ray Powder Pattern: Synthetic.
2.365 (100), 4.77 (90), 1.794 (55), 1.573 (35), 1.494 (18), 1.373 (16), 1.310 (12)

(1) Wood's Chrome mine, Pennsylvania, USA; corresponds to $(Mg_{0.99}Fe_{0.01})_{\Sigma=1.00}(OH)_2$.
(2) Asbestos, Canada; after deduction of Fe_2O_3 impurity, corresponds to $(Mg_{0.93}Fe^{2+}_{0.08})_{\Sigma=1.01}(OH)_2$. (3) $Mg(OH)_2$.

Mineral Group: Brucite group.

Occurrence: A common alteration of periclase in marble; a low-temperature hydrothermal vein mineral in metamorphic limestones and chlorite schists; formed during serpentinization of dunites.

Association: Calcite, aragonite, dolomite, magnesite, hydromagnesite, artinite, talc, chrysotile.

Distribution: Many localities, but rarely in crystalline masses. In the USA, at Hoboken, Hudson Co., New Jersey; large crystals from Wood's Chrome mine, near Texas, Lancaster Co., Pennsylvania; at the Tilly Foster mine, Brewster, Putnam Co., New York; a large deposit near Gabbs, Gabbs district, Nye Co., Nevada; at the Crestmore quarry, Riverside Co., California. In Canada, at Asbestos and Wakefield, Quebec. From Mt. Vesuvius, Campania, and at Teulada, Sardinia, Italy. On Unst, Shetland Islands, and at Camas Mòr, Isle of Muck, Scotland. At Långban and Nordmark, Värmland, Sweden. From Asbest, Ural Mountains, Russia. Fine crystals in the Ethyl mine, Mutorashanga, Zimbabwe. From Phalaborwa, Transvaal, South Africa.

Name: For Archibald Bruce (1777–1818), physician and early American mineralogist, Professor at the College of Physicians and Surgeons (later Columbia University), New York, New York, USA, who first described the species.

Type Material: The Natural History Museum, London, England, 1911,730.

Brüggenite $Ca(IO_3)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals subhedral, to 1 cm, short prismatic, elongated along [001], with {010} and {011}, other faces irregular, and a diamond-shaped cross-section showing {320}. In radiating clusters and long columnar anhedral crystals, intergrown with nitratine; as crusts.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 4.24(1) D(calc.) = 4.244 Slowly soluble in cold H_2O; readily soluble in hot H_2O.

Optical Properties: Transparent to translucent. *Color:* Colorless to bright yellow; colorless to very pale yellow in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X \wedge c = -47°$; $Z = b$. *Dispersion:* $r < v$, moderate to strong. $\alpha = 1.772–1.779$ $\beta = 1.795–1.802$ $\gamma = 1.817–1.824$ 2V(meas.) = 86°–96°

Cell Data: *Space Group:* $P2_1/c$. $a = 8.509(1)$ $b = 10.027(2)$ $c = 7.512(1)$

CaO	14.1	13.75
SrO	0.4	
H_2O	4.1	4.42
Total	[100.0]	100.00

(1) Pampa Pique III, Chile; after deduction of 1/3 admixed lautarite, CO_2 0.1%, insoluble 0.3%.
(2) $Ca(IO_3)_2 \cdot H_2O$.

Occurrence: In veins with nitratine and impregnating the enclosing decomposing rhyolite tuff in a small basin filled with nitrate caliche.

Association: Nitratine, anhydrite, lautarite, hydroboracite, halite.

Distribution: At Pampa Pique III, about one km north of Oficina Lautaro, Taltal district, Antofagasta, Chile.

Name: To honor Professor Juan Brüggen (1887–1953), University of Chile, who wrote the first textbook on the geology of Chile.

Type Material: National Museum of Natural History, Washington, D.C., USA, 122445.

References: (1) Ericksen, G.E., M.E. Mrose, and J.W. Marinenko (1974) Mineralogical studies of the nitrate deposits of Chile IV. Brüggenite, $Ca(IO_3)_2 \cdot H_2O$, a new saline mineral. J. Res. U.S. Geol. Sur., 2, 471–478.

(1) Torre di Santa Maria, Italy. (2) Viu, Italy. (3) $Mg_6Fe(CO_3)(OH)_{13}\cdot 4H_2O$.

Occurrence: A hydrothermal alteration product in serpentinite, lining cracks with other magnesium-rich species.

Association: Chrysotile, artinite, hydromagnesite, pyroaurite, magnesite, brucite, aragonite.

Distribution: In Italy, from Torre di Santa Maria, near Ciappanico, Val Malenco, and Monte Motta, Val Lanterna, Lombardy; on Monte Ramazzo, Borzoli, Liguria; at Viu, Val di Lanzo, Piedmont; and elsewhere. From Bou-Offrouh, Morocco. At Swinna Ness, Unst, Shetland Islands, Scotland. From Sannidal, Norway. In Canada, near Bancroft, Ontario, and near Notre-Dame-du-Laus, Quebec. In the Iron Hill carbonatite, Powderhorn-Cebolla district, Gunnison Co., Colorado, USA. From Higashi Kurodaguchi, Inasa, Shizuoka Prefecture; Naradani, Kiyomimura, Gifu Prefecture; Irazuyama, Ehime Prefecture; Sasaguri, Fukuoka Prefecture; Mashiki, Kumamoto Prefecture; and elsewhere in Japan.

Name: For Luigi Vincenzo Brugnatelli (1859–1928), Professor of Mineralogy, University of Pavia, Pavia, Italy.

Type Material: Municipal Museum of Natural History, Milan, Italy.

(1) Pedra Preta mine, Serra das Éguas, Brumado, Bahia, Brazil; average of 16 electron microprobe analyses, H_2O by difference, IR confirms OH, and H_2O, Te^{6+} confirmed by microchemical test, corresponding to $(Cu_{2.90}Pb_{0.04}Ca_{0.01})_{\Sigma=2.95}(Te^{6+}_{0.93}Si_{0.05})_{\Sigma=0.98}O_{3.92}(OH)_{3.84}{\cdot}5.24H_2O$.
(2) $Cu_3Te^{6+}O_4(OH)_4{\cdot}5H_2O$.

Occurrence: A late fracture-filling mineral in coarse-grained magnesite.

Association: Magnesite, mottramite, quartz.

Distribution: Pedra Preta mine, Serra das Éguas, Brumado, Bahia, Brazil.

Name: For Brumado, Bahia, Brazil, near the first described locality.

Type Material: Museu de Geociências, Instituto de Geociências, Universidade de São Paulo, São Paulo, SP, Brazil; Museu José Bonifácio de Andrada e Silva, Santos, SP, Brazil (no. M5528); National Mineral Collection, Geological Survey of Canada, Ottawa, Ontario (no. NMC 068161); Natural History Museum, London, England (no. BM 2008,32).

(1) Tsumeb, Namibia; by electron microprobe, total Fe as FeO; corresponding to $(Ge_{0.87}Fe^{2+}_{0.13})_{\Sigma=1.00}Fe_2^{3+}O_4$. (2) Do.; total Fe as FeO; corresponding to $(Ge_{0.95}Fe^{2+}_{0.05})_{\Sigma=1.00}$ $Fe_2^{3+}O_4$. (3) $GeFe_2^{3+}O_4$, with Fe reported as Fe^{2+}. (4) $GeFe_2^{3+}O_4$, with Fe reported as Fe^{3+}.

Mineral Group: Spinel group.

Occurrence: In the lower oxidation zone of a dolostone-hosted hydrothermal polymetallic ore deposit, at a depth of 930 meters (Tsumeb, Namibia).

Association: Tennantite, reniérite, zincian stottite (Tsumeb, Namibia); sphalerite, magnetite (France).

Distribution: From Tsumeb, Namibia. In France, from many deposits in the central Pyrénées, as at Cauflens, Ariège; Carboire, Couledoux, Estaing, and Pal Bidao, Haute-Garonne; and elsewhere.

Name: For Dr. Bruno H. Geier (1902–1987), formerly Chief Mineralogist, Tsumeb Corporation, Tsumeb, Namibia.

Type Material: n.d.

Total	100.46	100.00

(1) Aves Island, Venezuela. (2) $Ca(HPO_4)\cdot 2H_2O$.

Occurrence: One of the most common cave minerals, in guano deposits, and in phosphorites, formed at low pH by reaction of phosphate-rich solutions with calcite and clay.

Association: Tanarakite, ardealite, hydroxylapatite, variscite, gypsum.

Distribution: Numerous occurrences. Found on Aves Island, Venezuela, west of Dominica in the Caribbean Sea. From Sombrero Island, West Indies. On Mona Island, Puerto Rico. In the USA, in Pig Hole Cave, Giles Co., Virginia; along Rock Creek, Kankakee Co., Illinois; in Kartchner Cavern, near Benson, Cochise Co., Arizona. Large crystals from Quercy, near Limoges, Haute-Vienne, France. At Schneeberg, Saxony, Germany. From Wheal Cock, St. Just, Cornwall, England. At Oran, Algeria. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. In Kyusen-do Cave, Kumamoto Prefecture, Japan. From the Skipton lava tube caves, 40 km southwest of Ballarat, Victoria, Australia. In the Vestfold Hills, East Antarctica.

Name: To honor Professor George Jarvis Brush (1831–1912), American mineralogist, Yale University, New Haven, Connecticut, USA.

(1) Cape York meteorite; by electron microprobe. (2) $NaCaPO_4$.

Occurrence: As inclusions in troilite nodules in an iron meteorite.

Association: Troilite, chromite, other unidentified phosphates.

Distribution: In the Agpalilik and other fragments of the Cape York iron meteorite.

Name: To honor Dr. Vagn Fabius Buchwald (1929–), Technical University of Denmark, Lyngby, Denmark, for his contributions to the study of iron meteorites.

Type Material: University of Copenhagen, Copenhagen, Denmark.

Bi	18.4	12.41	17.83
S	7.8	8.17	8.21
Total	100.1	100.21	100.00

(1) Buckhorn mine, Colorado, USA; by electron microprobe, average of seven analyses; corresponds to $Au_{1.02}Cu_{0.02}Pb_{1.97}Bi_{1.04}Te_{2.06}S_{2.89}$. (2) Bohuliby mine, Czech Republic; by electron microprobe, average of 38 analyses; corresponds to $Au_{1.03}Pb_{2.13}(Bi_{0.69}Sb_{0.31})_{\Sigma=1.00}Te_{2.05}S_{2.95}$. (3) $AuPb_2BiTe_2S_3$.

Occurrence: In hydrothermal Au–Te-bearing deposits.

Association: Pyrite, aikinite, tetradymite, calaverite, gold, chalcopyrite, covellite, bornite, chalcocite, galena, sphalerite, hematite (Buckhorn mine, Colorado, USA); pyrite, nagyágite, tellurobismuthite, altaite, galena, calaverite, gold (Bohuliby mine, Czech Republic); pyrite, melonite, tetradymite (Golden Sunlight mine, Montana, USA).

Distribution: In the USA, from the Buckhorn Pb–Ag mine, 1.6 km northwest of Jamestown, Boulder Co., Colorado [TL], and at the Golden Sunlight mine, near Whitehall, Jefferson Co., Montana. In the Pepř and Bohuliby mines, Jílové gold deposit, 30 km southeast of Prague, Czech Republic. From the Megradzor district, Armenia.

Name: For its occurrence in the Buckhorn mine, Colorado, USA.

Type Material: The Natural History Museum, London, England, 1991,51, 1991,52, E.1102; Harvard University, Cambridge, Massachusetts, 126786; National Museum of Natural History, Washington, D.C., USA, ??.

Buddingtonite $(NH_4)AlSi_3O_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* 2 or $2/m$. As crystals similar in habit and interfacial angle to orthoclase, with forms {001}, {010}, {110}, {$\bar{1}$01}, to 0.05 mm. In compact masses pseudomorphous after plagioclase. *Twinning:* Noted.

Physical Properties: *Cleavage:* Good on {001}, distinct on {010}. *Tenacity:* Brittle. Hardness = 5.5 D(meas.) = 2.32(1) D(calc.) = 2.38

Optical Properties: Transparent to translucent. *Color:* Colorless. *Streak:* Light grey, yellow when impure. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $Z = b$; $X \wedge a = 4°$; $Y \wedge c = 19°$. $\alpha = 1.530(2)$ $\beta = 1.531(2)$ $\gamma = 1.534(2)$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1$ or $P2_1/m$. $a = 8.571$ $b = 13.032$ $c = 7.187$ $\beta = 112°44(1)'$ Z = 4

X-ray Powder Pattern: Sulfur Bank mine, California, USA.
3.81 (100), 6.52 (95), 3.38 (70), 3.23 (70), 4.33 (65), 3.26 (60), 3.01 (40)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	66.89	70.06	Na_2O	0.06	
Al_2O_3	20.09	19.82	K_2O	0.65	
MgO	0.22		$(NH_4)_2O$	8.34	10.12
CaO	0.04		H_2O	3.44	
BaO	0.27		Total	[100.00]	100.00

(1) Sulfur Bank mine, California, USA; probably contains a small amount of reversibly hydrated ammonian montmorillonite accounting for the remaining H_2O content; after deductions for TiO_2, FeS_2, and $H_2O^- = 4\%$, recalculated to 100.00%. (2) $(NH_4)AlSi_3O_8$.

Mineral Group: Feldspar group.

Occurrence: A low-temperature hydrothermal replacement of plagioclase in andesite altered by ammonia-bearing hot springs (Sulfur Bank mine, California, USA); in metasomatized rhyolitic ash-flow tuffs (Cedar Mountains, Nevada, USA); in the sedimentary Phosphoria Formation (Idaho, Wyoming, and Montana, USA).

Association: Plagioclase, sulfur, stibnite, pyrite, marcasite, ammoniojarosite, gypsum, barite, anatase, montmorillonite (Sulfur Bank mine, California, USA); illite, albite, montmorillonite, kaolinite (Phosphoria Formation, Idaho, Wyoming, and Montana, USA).

Distribution: In the USA, at the Sulfur Bank mercury mine, Lake Co., and on Sharon Heights, Menlo Park, Santa Clara Co., California; in the Cedar Mountains, 50 km northwest of Tonopah, Nye Co., Nevada; at a number of exposures of the Meade Peak Member of the Phosphoria Formation in Idaho, Wyoming, and Montana. In the Condor oilshale deposit, near Proserpine, Queensland, Australia. From the Toshichi Spa, Iwate Prefecture, Japan.

Name: To honor Emeritus Professor Arthur Francis Buddington (1890–1980), American geologist, Princeton University, Princeton, New Jersey, USA.

Type Material: National Museum of Natural History, Washington, D.C., USA, 116974, 132920, 147604.

(1) Předbořice, Czech Republic; by electron microprobe, corresponding to $Tl_{1.98}Cu_{3.28}Fe_{1.02}Se_{3.72}$.
(2) Bukov, Czech Republic; by electron microprobe; corresponding to $Tl_{2.01}Cu_{3.12}Fe_{1.04}Se_{3.83}$.

Occurrence: In selenium-bearing veins of hydrothermal origin.

Association: Clausthalite, eskebornite, eucairite, chaméanite, umangite, berzelianite, hakite, klockmannite, sabatierite, crookesite, ferroselite, cadmoselite, pyrite, marcasite, chalcopyrite, chalcocite, bornite, uraninite, hematite, goethite, calcite, dolomite, quartz.

Distribution: In the Czech Republic, from Bukov [TL], near Tisnova; in the Petrovice uranium deposit, near Ždăr; and the Předbořice uranium deposit, near Krásna Hora. At Skrikerum, near Tryserum, Kalmar, Sweden. In the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: For its occurrence at Bukov, Czech Republic.

Type Material: National School of Mines, Paris, France; Charles University, Prague, Czech Republic.

Bukovskýite $Fe_2^{3+}(AsO_4)(SO_4)(OH)\cdot 7H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$ or 1. Crystals, needlelike, elongated along [011], to 0.5 mm, showing {0*kl*} forms, terminated by {100} and {30$\overline{2}$}, may be in radial groups; generally in aggregates, forming nodules.

Physical Properties: *Cleavage:* On {010}, imperfect. *Fracture:* Uneven, earthy. *Tenacity:* Flexible in crystals. Hardness = Soft. D(meas.) = 2.334 D(calc.) = 2.336

Optical Properties: Semitransparent. *Color:* Yellowish green to grayish green. *Streak:* Pale yellowish.
Optical Class: Biaxial; birefringence 0.049–0.056. *Orientation:* Extinction angle = 22°.
α = n.d. β = 1.570–1.582 (β') γ = 1.626–1.631 (γ') 2V(meas.) = n.d.

Cell Data: *Space Group:* $P\overline{1}$ or $P1$. $a = 10.722(5)$ $b = 14.079(5)$ $c = 10.284(5)$
$\alpha = 93.50(4)°$ $\beta = 115.96(4)°$ $\gamma = 90.27(4)°$ Z = 4

X-ray Powder Pattern: Kaňk, Czech Republic.
9.197 (100), 8.884 (60), 9.625 (43), 3.077 (36), 3.920 (35), 2.458 (23), 5.338 (20)

Chemistry:

	(1)	(2)
SO_3	16.50	16.35
As_2O_5	22.10	23.46
Fe_2O_3	32.42	32.60
H_2O	28.12	27.59
Total	[99.14]	100.00

(1) Kaňk, Czech Republic; original total given as 99.32%, presence of AsO_4, SO_4, and $(OH)^{1-}$ confirmed by IR; assuming H_2O^- 0.69%, corresponds to $Fe_{2.00}(AsO_4)_{0.95}(SO_4)_{1.02}(OH)_{1.00}\cdot 7H_2O$.
(2) $Fe_2(AsO_4)(SO_4)(OH)\cdot 7H_2O$.

Occurrence: A post-mining surficial weathering product of Fe–As sulfides.

Association: Arsenopyrite, pyrite, quartz.

Distribution: Found in dumps of the Kuntery and other mines, Kaňk, 2.5 km north of Kutná Hora, Czech Republic.

Name: To honor Antonín Bukovský (1865–1950), Professor at the secondary school of Kutná Hora, Czech Republic, who first analyzed the mineral.

Type Material: Charles University, 14240; National Museum, Prague, Czech Republic, 53411.

Total	99.88	99.85

(1) Bultfontein mine, Kimberley, South Africa. (2) Fuka, Japan; corresponds to $(Ca_{2.04}(Si_{0.96}Al_{0.06})_{\Sigma=1.02}O_{2.13}[(OH)_{2.87}F_{1.00}]_{\Sigma=3.87}$.

Occurrence: In a large "horse" of diabase and shale fragments in a kimberlite pipe (Bultfontein mine, Kimberley, South Africa); in a contact zone in thermally metamorphosed limestone (Crestmore, California, USA).

Association: Calcite, apophyllite, natrolite (Bultfontein mine, Kimberley, South Africa); afwillite, scawtite (Crestmore, California, USA); oyelite, scawtite, xonotlite (Fuka, Japan).

Distribution: In South Africa, in Cape Province, in the Bultfontein and Dutoitspan diamond mines, Kimberley; the Jagersfontein diamond mine, Orange River Colony; and the N'Chwaning and Wessels manganese mines, near Kuruman. In the USA, at Crestmore, Riverside Co., California. In the Hatrurim Formation, Israel. In Japan, from Fuka, near Bicchu, and in the Mihara mine, Okayama Prefecture.

Name: For the Bultfontein mine, Kimberley, South Africa, where it was first discovered.

Type Material: Cambridge University, Cambridge; The Natural History Museum, London, England, 1928,78.

Bunsenite NiO

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Crystals minute octahedra, may be modified by the cube or dodecahedron. *Twinning:* Observed.

Physical Properties: Hardness = 5.5 D(meas.) = 6.898 D(calc.) = 6.806

Optical Properties: Transparent. *Color:* Dark pistachio-green. *Streak:* Brownish black. *Luster:* Vitreous.
Optical Class: Isotropic. $n = 2.37$

Cell Data: *Space Group:* $Fm3m$ (synthetic). $a = 4.1769$ $Z = 4$

X-ray Powder Pattern: Synthetic.
2.088 (100), 2.410 (91), 1.476 (57), 0.9838 (21), 0.8517 (17), 1.259 (16), 1.206 (13)

Chemistry: Analyses of natural material are lacking.

Mineral Group: Periclase group.

Occurrence: In a hydrothermal Ni–U vein (Johanngeorgenstadt, Germany); in a small tabular nickel deposit at the contact between quartzite and serpentinized ultramafics; it apparently formed at ∼730 °C and < 2 kbar during thermal metamorphism, possibly of a nickel-rich meteorite (Bon Accord, South Africa).

Association: Bismuth, annabergite, aerugite, xanthiosite (Johanngeorgenstadt, Germany); liebenbergite, trevorite, nickeloan serpentine, nickeloan ludwigite, violarite, millerite, gaspéite, nimite, bonaccordite (Bon Accord, South Africa).

Distribution: At Johanngeorgenstadt, Saxony, Germany. From three km west of the Scotia Talc mine, Bon Accord, Barberton district, Transvaal, South Africa. From Kambalda, 56 km south of Kalgoorlie, Western Australia.

Name: For Professor Robert William Eberhard Bunsen (1811–1899), German chemist of the University of Heidelberg, Heidelberg, Germany, who had observed artificial NiO.

Type Material: n.d.

(1) Buranga pegmatite, Rwanda; corresponds to $(Na_{0.70}Ca_{0.25})_{\Sigma=0.95}(Fe^{2+}_{0.65}Mg_{0.37}Mn_{0.04})_{\Sigma=1.06}(Al_{5.01}Fe^{3+}_{0.11})_{\Sigma=5.12}(PO_4)_{3.95}[(OH)_{5.58}O_{0.62}]_{\Sigma=6.20} \cdot 2H_2O$. (2) Do.; by electron microprobe, Fe^{2+}:Fe^{3+} from O^{2-} excess over FeO, total Mn as MnO, H_2O from stoichiometry; corresponds to $Na_{0.96}(Fe^{2+}_{0.55}Mg_{0.33}Fe^{3+}_{0.10}Mn_{0.02})_{\Sigma=1.00}Al_{4.89}(PO_4)_{4.06}(OH)_6 \cdot 2H_2O$.

Occurrence: In corroded aggregates of other phosphates in a zoned granite pegmatite (Buranga pegmatite, Rwanda).

Association: Scorzalite, bjarebyite, bertossaite, trolleite, samuelsonite, gatumbaite, wardite, brazilianite, apatite, quartz (Buranga pegmatite, Rwanda); berlinite, lazulite, scorzalite, augelite, gatumbaite, trölleite, rutile (Hålsjöberg, Sweden).

Distribution: In the Buranga pegmatite, near Gatumba, Rwanda. At Hålsjöberg, Värmland, Sweden. From the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada, USA.

Name: For the initial occurrence in the Buranga pegmatite, Rwanda.

Type Material: n.d.

Burbankite $(Na, Ca)_3(Sr, Ba, Ce)_3(CO_3)_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6mm$. Long dihexagonal prismatic crystals with shallow pyramidal terminations, striated parallel [001], may be in fibrous spherical aggregates; anhedral granular, to 5 cm.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$, distinct to imperfect. Hardness = 3.5–4 D(meas.) = 3.50–3.58 D(calc.) = 3.50–3.54 Piezoelectric.

Optical Properties: Transparent to translucent. *Color:* Colorless, grayish yellow, pale yellow, pink, pale greenish. *Luster:* Vitreous.
Optical Class: Uniaxial (–) $\omega = 1.616$–1.635 $\epsilon = 1.597$–1.623

Cell Data: *Space Group:* $P6_3mc$. $a = 10.41$–10.547 $c = 6.250$–6.520 Z = 2

X-ray Powder Pattern: Big Sandy Creek, Montana, USA.
2.630 (10), 3.034 (6), 5.26 (5), 3.719 (5), 2.145 (5), 1.754 (3), 1.662 (3)

(1) Big Sandy Creek, Montana, USA; by electron microprobe, corresponds to $(Na_{1.78}Ca_{0.89})_{\Sigma=2.67}(Sr_{1.60}Ba_{0.50}Ca_{0.46}La_{0.14}Ce_{0.22}Nd_{0.05}Pr_{0.02}Gd_{0.01})_{\Sigma=3.00}(CO_3)_5$. (2) Mont Saint-Hilaire, Canada; by electron microprobe, CO_2 from stoichiometry; corresponds to $(Na_{1.78}Ca_{1.07})_{\Sigma=2.85}(Sr_{2.07}Ba_{0.48}Ca_{0.35}RE_{0.10})_{\Sigma=3.00}(CO_3)_5$.

Occurrence: Typically an abundant accessory mineral in carbonatites; in an intrusive alkalic gabbro-syenite complex; may be authigenic.

Association: Ancylite, calkinsite, lanthanite, calcite, "biotite", barite (Big Sandy Creek, Montana, USA); ancylite, carbocernaite, calcite (Mont Saint-Hilaire, Canada).

Distribution: In the USA, from vermiculite prospects at the head of Big Sandy Creek, Rocky Boy's Indian Reservation, about 40 km east of Box Elder, Hill Co., Montana; in the Green River Formation, Utah and Wyoming. In Canada, at Mont Saint-Hilaire, and in the Miron quarry, Montreal, Quebec; at Chipman Lake, Ontario. In the Qaqarssuk carbonatite, near Sukkertoppen, and the Grønnedal-Ika complex, Greenland. Found in Brazil, at Poços de Caldas, Minas Gerais. In Russia, on the Kola Peninsula, from the Vuoriyarvi carbonatite and Khibiny massifs, large crystals; at the Ozernyi carbonatite, southeastern Sakha; Arbarastakh carbonatite, Aldan; and the Nizhnesayanskii carbonatite, east Sayan; and in the Vishnevogorsk complex, Vishnevy-Ilmen Mountains, Southern Ural Mountains. From the Tajno massif carbonatites, 70 km north of Bialystok, Poland. In the Zeerust district, Transvaal, South Africa.

Name: Honors Wilbur Sweet Burbank (1898–1975), geologist of the U.S. Geological Survey.

Type Material: National Museum of Natural History, Washington, D.C., USA, 106843.

Burckhardtite $Pb_2(Fe^{3+},Mn^{3+})Te^{4+}(AlSi_3)O_{12}(OH)_2 \cdot H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic (?), pseudohexagonal. *Point Group:* n.d. Rarely as hexagonal crystals, to 50 μm, typically overgrown on dickite; as crystal rosettes, < 0.2 mm.

Physical Properties: *Cleavage:* Perfect micaceous, basal. Hardness = ∼2 D(meas.) = n.d. D(calc.) = 4.96 Paramagnetic.

Optical Properties: Transparent to translucent. *Color:* Carmine to violet-red. *Streak:* Pale red. *Luster:* Adamantine to slightly pearly.
Optical Class: Biaxial (–). *Pleochroism:* X = pale magenta; $Y = Z$ = carmine. $\alpha = 1.82$ $\beta = 1.85$ $\gamma = 1.85$ 2V(meas.) = Small.

Cell Data: *Space Group:* C-centered cell (?). $a = 5.21$ $b = 9.04$ $c = 12.85$ $\beta = 90°$ Z = 2

X-ray Powder Pattern: Moctezuma, Mexico.
3.11 (100), 12.8 (90), 3.70 (90), 2.60 (70), 1.840 (60), 1.590 (50), 2.26 (30b)

Chemistry:

	(1)
SiO_2	20.28
TeO_2	17.03
Al_2O_3	5.44
Fe_2O_3	7.25
Mn_2O_3	1.18
PbO	45.23
H_2O	[3.59]
Total	[100.00]

(1) Moctezuma, Mexico; by electron microprobe, valences of Te, Fe, and Mn inferred from the oxidized state of the deposit, H_2O by difference; corresponds to $Pb_{1.83}(Fe^{3+}_{0.82}Mn^{3+}_{0.14})_{\Sigma=0.96}Te_{0.97}(Si_{3.04}Al_{0.96})_{\Sigma=4.00}O_{12.7} \cdot 1.80H_2O$.

Occurrence: In a breccia, loosely cemented by dickite, in very thin disseminations on quartz fragments.

Association: Moctezumite, zemannite, tellurite, barite, dickite, quartz.

Distribution: In the Moctezuma mine, Moctezuma, Sonora, Mexico.

Name: To honor Mexican geologist Carlos Burckhardt (1869–1935).

Type Material: University of Delaware, Newark, Delaware; Harvard University, Cambridge, Massachusetts, 125476, 119081, 119085; National Museum of Natural History, Washington, D.C., USA, 136509, 144110, 164347, 164348.

Total	101.77

(1) Keeley mine, South Lorraine Township, Timiskaming District, Ontario, Canada; average of 8 electron microprobe analyses, H_2O by difference, structure analysis and IR confirm OH and H_2O, corresponding to $(Co_{1.75}Ni_{0.23}Ca_{0.02})_{\Sigma=2.00}(AsO_3OH)_{\Sigma=2.00}(H_2O)_5$.

Occurrence: A secondary mineral along fractures in the weathering zone of a polymetallic sulfarsenate deposit.

Association: Skutterudite, cobaltite, bismuth, arsenolite, bismuthoferrite, erythrite.

Distribution: Keeley mine, South Lorraine Township, Timiskaming District, Ontario, Canada.

Name: For David Burgess (b. 1951), of Newington, Connecticut, USA, who brought the sample to the authors' attention.

Type Material: Canadian Museum of Nature, Ottawa, Ontario (CNMMC 86051).

Burkeite $Na_6(SO_4)_2(CO_3)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$ or 222. Crystals are tabular {100}, with {010}, {110}, {001}, rough and uneven, to 4 mm; as reticulated aggregates, mulberrylike nodules, commonly massive. *Twinning:* On {110}, common, forming X-shapes.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3.5
D(meas.) = 2.57 D(calc.) = 2.61 Soluble in H_2O.

Optical Properties: Transparent. *Color:* White, pale buff, grayish; colorless in transmitted light. *Luster:* Vitreous to greasy.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, distinct.
$\alpha = 1.448$ $\beta = 1.489$ $\gamma = 1.493$ 2V(meas.) = 34°

Cell Data: *Space Group:* $Pmnm$ (supercell). $a = 7.06$–7.09 $b = 9.21$–9.25 $c = 5.17$–5.19
Z = 2

X-ray Powder Pattern: Synthetic.
2.801 (100), 3.526 (80), 3.795 (75), 2.640 (75), 2.583 (75), 2.777 (55), 3.854 (40)

(1) Searles Lake, California, USA. (2) $Na_6(SO_4)_2(CO_3) = Na_4(SO_4)[(SO_4)_{1-t}(CO_3)_t]$, t=2/3.

Occurrence: An uncommon product of evaporation in dry lakes, but typical of efflorescences on saline soils.

Association: Gaylussite, trona, sulfohalite, borax, northupite, thénardite, calcite, tychite, halite, hanksite (Searles Lake, California, USA).

Distribution: In the USA, in California, from Searles Lake, San Bernardino Co. and Deep Spring Lake, Inyo Co.; at Carbonate Lake, Grant Co., Washington; from Teels Marsh, Esmeralda Co., Nevada; in the Green River Formation, northern Piceance Creek Basin, and at Hortense and Mount Princeton Hot Springs, along Chalk Creek, Chaffee Co., Colorado. At Lake Katwe, western Uganda. From near Loiengalani, Lake Turkana, Kenya. Found near Ak Göl, Great Konya Basin, Konya Province, Turkey. In the Flumen-Monegros district, Huesca Province, Spain. From the McMurdo region and around Mt. Erebus, Victoria Land, Antarctica.

Name: Honors William Edmund Burke (1880–1966), chemical engineer, who first prepared the synthetic compound.

Type Material: National Museum of Natural History, Washington, D.C., USA, 97277, 102866–102872.

Total	101.11	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, corresponding to $K_{1.08}Cd_{0.97}Cu_{6.98}O_{2.05}(Se_{1.07}O_{3.21})_2Cl_{8.53}$. (2) $KCdCu_7O_2(SeO_3)_2Cl_9$.

Occurrence: A very rare fumarolic sublimate, formed at an estimated 450 °C–500 °C.

Association: Cotunnite, sofiite, ilinskite, georgbokiite, chloromenite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: Honors Professor Peter Carman Burns (1966–), Canadian mineralogist and structural crystallographer, University of Notre Dame, Notre Dame, Indiana, USA, for his contributions to structural mineralogy.

Type Material: Mining Museum, Mining Institute, St. Petersburg, Russia.

Burpalite $Na_2CaZrSi_2O_7F_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. As tablets, elongated along [001] and flattened on {010}, to 5 mm. In fan-shaped aggregates, commonly intimately intergrown with låvenite.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5–6
D(meas.) = 3.33(15) D(calc.) = 3.27 Weak yellow-orange fluorescence in X-rays.

Optical Properties: Transparent to translucent. *Color:* Colorless, yellowish. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, weak.
$\alpha = 1.627(2)$ $\beta = 1.634(2)$ $\gamma = 1.639(2)$ 2V(meas.) = 82.1° 2V(calc.) = 80.1°

Cell Data: *Space Group:* $P2_1/a$. $a = 10.1173(8)$ $b = 10.4446(6)$ $c = 7.2555(3)$
$\beta = 90.039(7)°$ Z = 4

X-ray Powder Pattern: Burpala massif, Russia; by Gandolfi camera to exclude låvenite domains.
2.962 (vs), 1.886 (ms), 1.556 (ms), 1.787 (s), 3.035 (m), 3.306 (m), 1.678 (m)

(1) Burpala massif, Russia; by electron microprobe, average of four analyses, H_2O by Penfield method; corresponds to $(Na_{1.69}Mn_{0.03}Fe_{0.02}Y_{0.01})_{\Sigma=1.75}Ca_{0.98}(Zr_{0.96}Ti_{0.05}Nb_{0.01})_{\Sigma=1.02}Si_{2.00}O_7[F_{1.61}(OH)_{0.26}]_{\Sigma=1.87} \cdot 0.13H_2O$.

Polymorphism & Series: Dimorphous with låvenite.

Occurrence: In a fenitized hornfelsic sandstone in the contact zone of an alkalic intrusive.

Association: Låvenite, albite, nepheline, aegirine, alkalic amphibole, biotite, catapleiite, astrophyllite, fluorite, loparite.

Distribution: In the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, Russia.

Name: For its occurrence in the Burpala massif, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p300; Museum of Natural History, University of Pisa, Pisa, Italy; The Natural History Museum, London, England, 1994,5.

Chemistry:

	(1)	(2)	(3)
Pb	45.0	45.03	46.57
Ag	1.0	1.41	
Bi	38.5	37.43	37.58
Sb		0.61	
S	14.7	15.53	15.85
Total	99.2	100.01	100.00

(1) Uludağ, Turkey; by electron microprobe, corresponding to $(Pb_{4.72}Ag_{0.20})_{\Sigma=4.92}Bi_{4.00}S_{10.82}$.
(2) Shumilovsk deposit, Russia; by electron microprobe, corresponding to $(Pb_{4.83}Ag_{0.29})_{\Sigma=5.12}(Bi_{3.99}Sb_{0.11})_{\Sigma=4.10}S_{10.78}$. (3) $Pb_5Bi_4S_{11}$.

Occurrence: In a contact metamorphic scheelite deposit (Uludağ, Turkey); in sulfide veinlets around a greisen Sn–W deposit in granite (Shumilovsk deposit, Russia); in a volcanogenic massive sulfide deposit (Cofer deposit, Virginia, USA).

Association: Sphalerite, tremolite, pyrite, calcite, garnet, quartz, scheelite, chalcopyrite, bismuth (Uludağ, Turkey); kobellite, tintinaite (Boliden, Sweden); wolframite, cassiterite, bismuthinite, galena, cosalite, heyrovskýite, galenobismutite, cannizzarite, tetradymite, joséite-B, bismuth, quartz (Shumilovsk deposit, Russia).

Distribution: From Uludağ, Bursa Province, Turkey [TL]. At Hůrky, Czech Republic. From Băiţa, Romania. At Boliden, Västerbotten, Sweden. From Vulcano, in the Lipari Islands, Italy. In the Shumilovsk Sn–W deposit, western Transbaikal, and from the Strezhana pyrite-polymetallic deposit, locality not otherwise defined, Russia. In the USA, at Organ, Doña Ana Co., New Mexico; large crystals in the Abril mine, Middle Pass district, Cochise Co., Arizona; from near Austin, Reese River district, Lander Co., Nevada; in the Cofer deposit, Louisa Co., Virginia. From the Huemules deposit, Chubut Province, Argentina.

Name: For the locality in Bursa Province, Turkey.

Type Material: n.d.

Burtite $CaSn(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal, pseudocubic. *Point Group:* $\overline{3}$ (probable). As pseudo-octahedra, to 2 mm. *Twinning:* Cubic diffraction symmetry observed is likely due to twinning.

Physical Properties: *Cleavage:* Pseudocubic, good. *Tenacity:* Very brittle. Hardness = ∼3 D(meas.) = 3.28(1) D(calc.) = 3.22

Optical Properties: Semitransparent. *Color:* Surficially yellow due to alteration; colorless in transmitted light. *Luster:* Vitreous; surface typically earthy due to alteration.
Optical Class: Uniaxial (+); sections exhibit very weak birefringence and interference figures; typically appears isotropic. $n = 1.633(1)$

Cell Data: *Space Group:* $R\overline{3}$ probable, $R3$, $R32$, $R3m$, $R\overline{3}m$ possible; $Pn3$ actually observed, thought due to twinning. $a = 11.49$ $c = 14.08$ Z = 4

X-ray Powder Pattern: El Hamman, Morocco.
4.06 (vs), 1.814 (s), 1.657 (s), 0.9850 (s), 0.9576 (s), 4.68 (ms), 2.87 (ms)

Chemistry:

	(1)	(2)
SnO_2	56.3	57.78
MgO	0.3	
CaO	20.6	21.50
H_2O(I)	[20.2]	20.72
H_2O(II)	[2.6]	
Total	[100.0]	100.00

(1) El Hamman, Morocco; by electron microprobe; H_2O(I) necessary for stoichiometry, H_2O(II) by difference, excess water possibly trapped in the structure; corresponds to $(Ca_{0.98}Mg_{0.02})_{\Sigma=1.00}Sn_{1.00}(OH)_6 \bullet 0.39H_2O$. (2) $CaSn(OH)_6$.

Mineral Group: Schoenfliesite group.

Occurrence: From a garnetite in a tin-bearing skarn, formed under conditions of relatively low temperature and low X_{CO_2}.

Association: Wickmanite, stokesite, datolite, pectolite, andradite, wollastonite, malayaite, clinopyroxene, löllingite.

Distribution: On the west bank of the Beht River, near El Hamman, central Morocco.

Name: For Dr. Donald McLain Burt (1943–), Professor of Mineralogy, Arizona State University, Tempe, Arizona, USA, authority on mineral equilibria in skarn and greisen deposits, who had predicted the natural occurrence of the compound.

Type Material: Catholic University of Louvain, Louvain, Belgium, EH80016.

(1) Poudrette dike, Mont Saint-Hilaire, Quebec, Canada; average of 26 electron microprobe analyses, H_2O calculated from structural analysis, IR confirms OH and H_2O, corresponding to $(Ce_{0.823}Nd_{0.373}Y_{0.242}Th_{0.173}Pr_{0.103}Sm_{0.079}Gd_{0.078}Eu_{0.008})_{\Sigma=1.89}(Ca_{0.775}La_{0.225})_{\Sigma=1}$ $[Na_{3.000}(H_2O)_{2.500}Ca_{0.544}K_{0.015}]_{\Sigma=6.055}(Mn_{0.485}Na_{0.402}Mg_{0.012})_{\Sigma=0.899}(Si_{8.897}Be_{4.605}Al_{0.222})_{\Sigma=13.724}$ $O_{30}[F_{2.67}(OH)_{1.33}]_{\Sigma=4}$.

Occurrence: A late-stage hydrothermal mineral associated with a nepheline syenite-hosted pegmatite.

Association: Serandite, aegirine, albite, analcime, ancylite-(Ce), calcite, catapleiite, gonnardite, kupletskite, leucophanite, microcline, nenadkevichite, polylithionite, sphalerite.

Distribution: Poudrette pegmatite dike, Mont Saint-Hilaire, Quebec, Canada.

Name: Honors Antoine Alexandre Brutus Bussy (1794-1882), co-discoverer of beryllium.

Type Material: Canadian Museum of Nature, Ottawa, Ontario, Canada (catalog no. CMNMC 85929).

Bustamite $(Mn^{2+}, Ca)_3Si_3O_9$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* $\bar{1}$. Crystals prismatic, needlelike, to 2.5 cm, or tabular on {001}; commonly fibrous, cleavable massive. *Twinning:* Composition plane {110}, simple twins, uncommon.

Physical Properties: *Cleavage:* Perfect on {100}, good on {110} and {1$\bar{1}$0}, poor on {010}. Hardness = 5.5–6.5 D(meas.) = 3.32–3.43 D(calc.) = 3.421 Pink color fades on exposure to light.

Optical Properties: Transparent to translucent. *Color:* Pale pink to brownish red; in thin section, colorless to yellowish pink. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* $X = Z$ = orange; Y = rose. *Orientation:* $X \wedge a \simeq 15°$; $Y \wedge b \simeq 35°$; $Z \wedge c \simeq 30°$–$35°$. *Dispersion:* $r < v$, weak, strong crossed dispersion. α = 1.640–1.695 β = 1.651–1.708 γ = 1.653–1.710 2V(meas.) = 34°–60°

Cell Data: *Space Group:* $P\bar{1}$. $a = 15.412$ $b = 7.157$ $c = 13.824$ $\alpha = 89°29'$ $\beta = 94°51'$ $\gamma = 102°56'$ Z = 12

Total	100.63	100.05

(1) Franklin, New Jersey, USA; corresponding to $(Ca_{1.66}Mn^{2+}_{1.31}Mg_{0.06}Fe^{2+}_{0.01})_{\Sigma=3.04}Si_{2.97}O_9$.
(2) Långban, Sweden; corresponding to $(Mn^{2+}_{1.74}Ca_{0.99}Mg_{0.18}Fe^{2+}_{0.10})_{\Sigma=3.01}Si_{3.00}O_9$.

Occurrence: In manganese ores formed by metamorphism of manganese-bearing sediments with attendant metasomatism; typically associated with skarns.

Association: Rhodonite, tephroite, calcite, glaucochroite, johannsenite, wollastonite, diopside, grossular.

Distribution: "Type" material, from Tetela de Ocampo, Hidalgo, Mexico, is a mixture; well-studied material from other localities includes: in the USA, at Franklin, Sussex Co., New Jersey. At Långban and in the Harstigen mine, near Persberg, Värmland, Sweden. At the Treburland mine, Altarnun, Cornwall, and in the Railroad quarry, Meldon, near Okehampton, Devon, England. At Camas Malag, Isle of Skye, Scotland. From Băiţa (Rézbánya), Romania. At Campiglia, Tuscany, and Schio, Vicenza, Italy. From the N'Chwaning mine, near Kuruman, Cape Province, South Africa. In Australia, at Broken Hill, New South Wales. From the Obori mine, Yamagata Prefecture; the Noda-Tamagawa mine, Iwate Prefecture; the Kanoiri mine, Tochigi Prefecture; the Mikumo mine, Shiga Prefecture; and the Hijikuzu mine, Iwate Prefecture, Japan.

Name: In honor of General Anastasio Bustamente (1780–1853), of Mexico.

Butlerite $Fe^{3+}(SO_4)(OH)\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Tabular on {001} or {100}, may be pseudo-octahedral. *Twinning:* On {101}, very common.

Physical Properties: *Cleavage:* On {100}, perfect. Hardness = 2.5 D(meas.) = 2.55 D(calc.) = 2.53

Optical Properties: Semitransparent. *Color:* Deep orange; in transmitted light, pale yellow-orange. *Streak:* Pale yellow. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = very pale yellow; Z = pale yellow. *Orientation:* $Z = b$; $X \wedge c = -18°$. α = 1.593–1.604 β = 1.665–1.674 γ = 1.731–1.741 2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1/m$. a = 6.44–6.50 b = 7.31–7.37 c = 5.84–5.87 $\beta = 108°23(5)'–108°28(20)'$ Z = 2

X-ray Powder Pattern: United Verde mine, Arizona, USA.
4.97 (FF), 3.15 (F), 3.59 (mF), 3.05 (mF), 3.22 (mf), 2.48 (mf), 6.17 (ff)

Chemistry:

	(1)	(2)
SO_3	38.63	39.07
Al_2O_3	0.55	
Fe_2O_3	36.31	38.96
FeO	0.41	
Na_2O	2.73	
H_2O	22.83	21.97
Total	101.46	100.00

(1) United Verde mine, Arizona, USA. (2) $Fe(SO_4)(OH)\cdot 2H_2O$.

Polymorphism & Series: Dimorphous with parabutlerite.

Occurrence: Rarely formed from the oxidation of pyritic ore; may be formed under fumarolic conditions from mine fires.

Association: Parabutlerite, copiapite, fibroferrite, other iron sulfates.

Distribution: In the USA, from the United Verde copper mine, Jerome, Yavapai Co., Arizona; at the Lone Star mine, La Bajada district, Santa Fe Co., New Mexico; in the Dexter No. 7 mine, Calf Mesa, San Rafael district, Emery Co., Utah; from near Cimarron, Gunnison Co., Colorado. At the Santa Elena mine, Quebrada de La Alcaparrosa, San Juan Province, Argentina. From Chuquicamata and Quetena, west of Calama, Antofagasta, Chile. At Saghand, Yazd, Iran. From the Xitieshan Pb–Zn mine, south of Mt. Qilianshan, Chaidamu, Qinghai Province, China.

Name: Honors Professor Gurdon Montague Butler (1881–1961), American mining geologist, University of Arizona, Tucson, Arizona, USA.

Type Material: University of Arizona Mineral Museum, Tucson, Arizona, M52; Harvard University, Cambridge, Massachusetts, 90539; National Museum of Natural History, Washington, D.C., USA, 95953.

Bütschliite $K_2Ca(CO_3)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As microscopic barrel-shaped crystals, elongated along [0001], in earthy to porcelaneous masses.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.607

Optical Properties: Semitransparent. *Color:* Grayish yellow, brownish gray, may be pale green from admixture.
Optical Class: Uniaxial (–). $\omega = 1.595$ $\epsilon = 1.455$

Cell Data: *Space Group:* $R\overline{3}m$. $a = 5.3822(4)$ $c = 18.156(2)$ Z = 3

X-ray Powder Pattern: Synthetic. (ICDD 25-625).
2.862 (100), 3.02 (35), 1.690 (20), 1.641 (20), 1.044 (20), 0.933 (20), 2.071 (14)

Chemistry: (1) Identification depends primarily on correspondence with the X-ray powder pattern of synthetic material.

Polymorphism & Series: Dimorphous with fairchildite.

Occurrence: Formed in fused wood-ash clinkers in partly burned trees.

Association: Calcite, fairchildite.

Distribution: In the USA, many occurrences in forests from trees struck by lightning. Some studied are: from Kanabownits Canyon, Grand Canyon National Park, Coconino Co., Arizona; in the Kaniksu National Forest, near Coolin, Bonner Co., Idaho; at Long Shop, Montgomery Co., Virginia. From near Eganville and Deseronto, Ontario, Canada.

Name: To honor Johann Adam Otto Bütschli (1848–1920), Professor of Zoology at the University of Heidelberg, Heidelberg, Germany, who studied double salts of potassium and calcium.

Type Material: National Museum of Natural History, Washington, D.C., USA, 105675, 105676.

Buttgenbachite $Cu_{36}(NO_3)_2Cl_8(OH)_{62}\cdot 4{-}10H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. Crystals are hexagonal, acicular and striated ‖ [0001], terminated by $\{20\overline{2}1\}$, to 1 mm; as isolated crystals, radiating groups and felted crystal aggregates.

Physical Properties: Hardness = 3 D(meas.) = 3.36–3.42 D(calc.) = 3.23–3.25

Optical Properties: Translucent. *Color:* Deep azure-blue; blue in transmitted light. *Streak:* Pale greenish blue. *Luster:* Vitreous.
Optical Class: Uniaxial (+). $\omega = 1.738$ $\epsilon = 1.752$

Cell Data: *Space Group:* $P6_3/mmc$. $a = 15.739$–15.750 $c = 9.127$–9.161 $Z = 1$

X-ray Powder Pattern: Likasi, Congo; close to connellite.
13.70 (vvs), 7.95 (vvs), 2.75 (vvs), 2.30 (vvs), 1.621 (vs), 3.27 (s), 2.51 (s)

Chemistry:

	(1)	(5)
SO_3	0.00	
N_2O_5	5.40	2.75
CuO	71.56	72.87
Cl	6.02	7.22
H_2O	17.34	18.79
$-O = Cl_2$	[1.36]	1.63
Total	[98.96]	100.00

(1) Likasi, Congo; original total given as 99.04%; corresponds to $Cu_{36.00}(NO_3)_{4.00}Cl_{6.80}(OH)_{61.20}\cdot 7.92H_2O$. (2) Do.; crystal-structure analysis yields $Cu_{36.0}(NO_3)_{2.6}Cl_{6.6}(OH)_{62.8}\cdot 2.1H_2O$. (3) Tombstone, Arizona, USA; crystal-structure analysis yields $Cu_{36.0}(NO_3)_{1.1}Cl_{7.9}(OH)_{63}\cdot 4H_2O$. (4) Bisbee, Arizona, USA; crystal-structure analysis yields $Cu_{36.0}(NO_3)_{1.0}Cl_{8.1}(OH)_{62.9}\cdot 5.5H_2O$. (5) $Cu_{36}(NO_3)_2Cl_8(OH)_{62}\cdot 10H_2O$.

Polymorphism & Series: Forms a series with connellite.

Occurrence: A rare secondary mineral found in the oxidized portions of copper deposits; the nitrate may be of biological origin.

Association: Cuprite, likasite, gerhardtite, malachite, brochantite, silver.

Distribution: From Likasi, Katanga Province, Congo (Shaba Province, Zaire). At the Botallack mine, St. Just, Cornwall, England. In the USA, in Arizona, from the Mildren and Steppe claims, South Comobabi Mountains, Pima Co., in the Toughnut mine, Tombstone, and at Bisbee, Cochise Co; from about seven km north of Coaldale Junction, Esmeralda Co., Nevada; in the Centennial mine, near Calumet, Keweenaw Co., Michigan. At the Great Australia mine, near Cloncurry, Queensland, Australia.

Name: Honors Professor Henri Jean François Buttgenbach (1874–1964), Belgian mineralogist, University of Liège, Liège, Belgium, who long studied Congo minerals.

Type Material: University of Liège, Liège, Belgium, 9.482 and 15.915; The Natural History Museum, London, England, 1933,267.

(1) Gomel district, Belarus; by electron microprobe, average of four analyses; $RE_2O_3 = La_2O_3$ 8.33%, Ce_2O_3 12.13%, Pr_2O_3 0.58%, Nd_2O_3 2.3%, Sm_2O_3 0.1%, Gd_2O_3 0.15%; corresponds to $(Na_{0.95}K_{0.12})_{\Sigma=1.07}(Mn_{0.52}Zn_{0.27}Fe_{0.16}Mg_{0.05})_{\Sigma=1.00}(Ba_{1.90}Sr_{0.06})_{\Sigma=1.96}RE_{2.03}Ti_{2.01}Si_{8.00}O_{26}[F_{0.73}(OH)_{0.27}]_{\Sigma=1.00}\cdot H_2O$.

Mineral Group: Joaquinite group.

Occurrence: In a salband of a quartz vein in lower Proterozoic metasomatized granosyenites.

Association: Brookite, bastnäsite, montmorillonite, quartz, magnesio-riebeckite, aegirine, albite, leucophanite, titanite.

Distribution: In the Diabazov rare earth–Be deposit, near Zhitkovichi, Gomel district, Belarus.

Name: For the occurrence in Belarus (formerly Byelorussia, USSR), and the *cerium* content.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 88051.

(3) $Na_{0.10}Ca_{0.90}Al_{1.90}Si_{2.10}O_8$.

Polymorphism & Series: Low- and high-temperature structural modifications are recognized.

Mineral Group: Feldspar group, plagioclase series.

Occurrence: A rock-forming mineral typical of mafic intrusive igneous rocks, as gabbros and anorthosites; as phenocrysts in basalts; rare in metamorphic rocks.

Association: Pyroxenes, olivine.

Distribution: One of the less frequently identified feldspars, although still very common. "Type" material from Ottawa, Ontario, Canada was later shown to be a mixture. Elsewhere in Canada, from the Shawmere anorthosite, Foleyet Township, Ontario, and on Yamaska Mountain, near Abbotsford, Quebec. On Rhum Island, Scotland. At Eycott Hill, near Keswick, Cumberland, England. From Närödal, Norway. In Greenland, from Fiskenæsset and Storo. In the Bushveld complex, Transvaal, South Africa. In the USA, in the Stillwater complex, Montana; from Cornwall, Lebanon Co., and Phoenixville, Chester Co., Pennsylvania; near Lakeview, Lake Co., Oregon; in the Lucky Cuss mine, Tombstone, Cochise Co., Arizona; and from the Grants district, McKinley Co., New Mexico. From Isa Valley, Western Australia.

Name: For the "type" locality, in Ottawa (formerly Bytown), Ontario, Canada.

Occurrence: In massive mooihoekite ore, also in galena–chalcopyrite veins.

Association: Mooihoekite, sperrylite, geeversite, putoranite, paolovite, talnakhite, sobolevskite, polarite, froodite, auricupride, silver, cassiterite, stannite, chalcopyrite, valeriite, galena, sphalerite, magnetite.

Distribution: From the Oktyabr mine, Talnakh area, Noril'sk region, western Siberia, Russia [TL]. In the Minnamax Cu–Ni sulfide deposit, Duluth Gabbro complex, near Hibbing, St. Louis Co., Minnesota, USA. From the Muskox intrusion, Northwest Territories, and at Thetford Mines, Quebec, Canada. In the Onverwacht mine, in the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: For Dr. Louis J. Cabri (1934-), Canadian mineralogist at the Canadian Centre for Mineral and Energy Technology, Ottawa, Canada, describer of a number of platinum group minerals.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; Canadian Geological Survey, Ottawa, Canada.

(1) Svatá Dobrotivá (St. Benigna), Czech Republic. (2) Eleonore mine, Germany. (3) $Fe_{24}AlO_6(PO_4)_{17}(OH)_{12}\cdot 75H_2O$.

Occurrence: A common accessory mineral in oxidized magnetite and "limonite" iron ores; in Fe,Mn-bearing novaculites; a rare constituent of iron-rich sediments and soils.

Association: Dufrénite, rockbridgeite, beraunite, strengite, wavellite, magnetite, "limonite".

Distribution: Widespread in small amounts. In the Czech Republic, from the Hrbek mine, Svatá Dobrotivá (St. Benigna); at Třenice; from Zbirov; and at Cerhovice. In Germany, from the Eleonore and Rotläufchen mines, near Giessen, Hesse, and at Hühnerkobel, near Zwiesel, Bavaria. In France, at Rochefort-en-Terre, Morbihan. From Shanagolden, Co. Limerick, Ireland. At Kiruna, Sweden. In the USA, from the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from Pennsylvania, at Hellertown, Northampton Co., Moore's Mill, Cumberland Co., and Noble's mine, Lancaster Co. On Indian Mountain, Cherokee Co., Alabama, groups large for the species; in the Wilson Springs (Potash Sulphur Springs) mine, Garland Co., from the Avant claim, about three km southwest of Shady, and at Three Oak Gap, Polk Co., Arkansas; in the Vanleer mine, Iron City, Lawrence Co., Tennessee; from the Palmetto mine, southwest of Bartow, Polk Co., Florida.

Name: From the Greek for *a bad guest*, for the phosphorus content that degrades the quality of iron made from the host ores.

(1) Ust'-Khann'ya intrusive, Russia; by electron microprobe. (2) Verkhoyan'ya, Russia.

Occurrence: In the heavy, non-magnetic fraction of a mechanical concentrate from a gabbro intrusive (Ust'-Khann'ya intrusive, Russia); a product of post-magmatic activity in mineralized aleurolites, sandstones, dolostones, and mudstones (Verkhoyan'ya, Russia).

Association: Moissanite, Fe, Cu, Pb, Sn, Zn, Cu–Zn alloy, Sn–Sb alloy, sulfides, garnet, spinel, kyanite, corundum, rutile (Ust'-Khannin intrusive, Russia); monteponite, otavite, titanite, ilmenite, chalcopyrite, bornite, chalcocite, pyrite, galena (Verkhoyan'ya, Russia).

Distribution: In Russia, from the Ust'-Khann'ya intrusive, lower Khann'ya River, Vilyui River basin, eastern Siberian platform [TL]; and in southern Verkhoyan'ya. In the Burobaiskii massif, eastern Kazakhstan. At the Goldstrike mine, Lynn district, Eureka Co., Nevada, USA.

Name: From the Greek for *calamine*, as the element occurs in slags resulting from smelting smithsonite (formerly calamine) ore.

Type Material: n.d.

Cadmoselite CdSe

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6*mm*. Crystals, to 0.1 mm, show the base and horizontally striated hexagonal pyramid. Fine xenomorphic disseminations cementing sandstone.

Physical Properties: *Cleavage:* Perfect, apparently prismatic. *Tenacity:* Brittle. Hardness = 4 VHN = 203–222 D(meas.) = 5.47 D(calc.) = 5.807

Optical Properties: Opaque. *Color:* Black; pale gray in reflected light, slightly brown in oil, with brownish internal reflections. *Streak:* Black. *Luster:* Resinous to adamantine. *Anisotropism:* Weak.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3mc$. $a = 4.271$ $c = 6.969$ $Z = 2$

X-ray Powder Pattern: Ust'Uyuk deposit, Russia.
2.13 (10), 1.816 (8), 3.67 (7), 1.96 (7), 1.196 (7), 1.026 (7), 1.433 (6)

Chemistry:

	(1)	(2)
Cd	49.37	58.74
Zn	2.83	
Fe	1.95	
Se	37.50	41.26
S	[8.35]	
Total	[100.00]	100.00

(1) Ust'Uyuk deposit, Russia; Fe attributed to ferroselite, S by difference; total recalculated to 100% after deduction of insoluble 4.8%. (2) CdSe.

Occurrence: In sedimentary strata, under reducing secondary conditions of medium to high alkalinity (Ust'Uyuk deposit, Russia).

Association: Ferroselite, clausthalite, cadmian sphalerite, selenium, greenockite, pyrite, laumontite, calcite (Ust'Uyuk deposit, Russia).

Distribution: From the Ust'Uyuk V–Se–U deposit, Tuva, Russia. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: For the presence of cadmium and selenium.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72553.

Cadwaladerite $AlCl(OH)_2 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Amorphous. *Point Group:* n.d. Granular and in small masses, embedded in halite.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. D(meas.) = 1.66 D(calc.) = n.d. Weakly hygroscopic.

Optical Properties: Transparent to translucent. *Color:* Lemon-yellow. *Luster:* Vitreous. *Optical Class:* Isotropic. $n = 1.513$, variable.

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
Al_2O_3	29.34	30.25
CaO	1.60	
Cl	21.51	21.04
H_2O^+	26.27	53.45
H_2O^-	26.81	
$-O = Cl_2$	5.53	4.74
Total	[100.00]	100.00

(1) Cerro Pintados, Chile; recalculated to 100% after deduction of Na_2O 1.85% as NaCl, K_2O 0.90% as KCl, CaO 0.47% as $CaCl_2$ and with SO_3 0.82% as $CaSO_4 \cdot 2H_2O$. (2) $AlCl(OH)_2 \cdot 4H_2O$.

Occurrence: In a sulfate deposit, embedded in halite.

Association: Halite, gypsum.

Distribution: On mine dumps at Cerro Pintados, 80 km southeast of Iquique, Tarapacá, Chile.

Name: For Charles Meigs Biddle Cadwalader, formerly President of the Academy of Natural Sciences, Philadelphia, Pennsylvania, USA.

Type Material: Harvard University, Cambridge, Massachusetts, USA, 134143.

(1) Cherbadung, Switzerland. (2) Do.; by electron microprobe and AA; As^{3+} detected by an iodine test; corresponds to $(Ca_{6.35}Mn_{0.79}Na_{0.77})_{\Sigma=7.91}(Ti_{3.81}Fe_{2.34}Al_{0.30}Sn_{0.02})_{\Sigma=6.47}$ $As_{12.01}O_{36}\cdot 1.92H_2O$.

Occurrence: On cleft faces in orthogneiss (Cherbadung, Switzerland).

Association: Asbecasite, gasparite-(Ce), chernovite, synchysite (Cherbadung, Switzerland).

Distribution: On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland. On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, Italy. In the Hemlo gold mine, Ontario, Canada.

Name: For elements in the composition, CAlcium, iron (Ferrum), and ARSenic.

Type Material: Natural History Museum, Basel, Switzerland, SG749; The Natural History Museum, London, England, 1966,434.

Total	100.46

(1) Afrikanda massif, Russia; corresponds to $(Ca_{0.67}Mg_{0.21}Na_{0.06}K_{0.05}Mn_{0.02})_{\Sigma=1.01}(Fe^{3+}_{1.68}Al_{0.24}Ti^{4+}_{0.05}Ti^{3+}_{0.03})_{\Sigma=2.00}(Ti_{3.92}Si_{0.09})_{\Sigma=4.01}O_{12}\cdot 4H_2O$.

Occurrence: A late mineral in miarolitic cavities in pegmatites cutting a pyroxenite massif.

Association: Ilmenite, titanomagnetite, titanite, anatase, perovskite, baddeleyite, phlogopite, clinochlore, kassite.

Distribution: In the Afrikanda pyroxenite massif, Kola Peninsula, Russia.

Name: For CAlcium, iron (FErrum), and TITanium in the composition.

Type Material: Mineralogical Museum, St. Petersburg University, St. Petersburg, 13420-21; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72024.

Cahnite $Ca_2B(AsO_4)(OH)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\overline{4}$. Crystals, sphenoidal pseudotetrahedral or pseudo-octahedral, characteristically twinned and etched, to 18 mm, showing {100}, {110}, {111}, {1$\overline{1}$1}, {311}. *Twinning:* Common on {110}, interpenetrant, characteristically crosslike with a square cross-section.

Physical Properties: *Cleavage:* On {110}, perfect. *Tenacity:* Brittle. Hardness = ∼3
D(meas.) = 3.156 D(calc.) = [3.22] Pale yellow fluorescence under LW and SW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless to white, may be pale yellow or pale green; colorless in transmitted light. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Dispersion:* Strong; exhibits anomalous interference colors.
ω = 1.655–1.662 ϵ = 1.656–1.663

Cell Data: *Space Group:* $I\overline{4}$. $a = 7.0952$ $c = 6.104$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
3.56 (100), 1.818 (52), 2.640 (48), 5.02 (20), 4.67 (20), 2.833 (19), 2.336 (17)

Chemistry:

H_2O	12.42	12.09
Total	99.95	100.00

(1) Franklin, New Jersey, USA. (2) $Ca_2B(AsO_4)(OH)_4$.

Occurrence: A late-stage mineral in pegmatites cutting a metamorphosed stratiform zinc orebody (Franklin, New Jersey, USA); with zeolites in leucitic lava (Capo di Bove, Italy).

Association: Hedyphane, friedelite, pyrochroite, franklinite, willemite, rhodonite, datolite, axinite, jarosewichite, samfowlerite, flinkite, hodgkinsonite, hetaerolite, hausmannite, groutite, kentrolite, garnet, barite (Franklin, New Jersey, USA); phillipsite, chabazite, calcite (Capo di Bove, Italy); natronambulite, gypsum, barite, calcite (Kombat mine, Namibia); svabite, magnetite, sphalerite, garnet, calcite (Siberia, Russia).

Distribution: From Franklin, Sussex Co., New Jersey, USA. In the Klodeborg mine, Arendal, Norway. At Capo di Bove, and Vallerano, Strada Laurentina, near Rome, Lazio, Italy. In the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. In the Killik, Hisarcık, and Espey borate mines, near Emet, Kütahya Province, Turkey. In Russia, from the Solongo boron deposit, Buryatia. At Fuka, near Bicchu, Okayama Prefecture, Japan.

Name: To honor Lazard Cahn (1865–1940), mineral collector and dealer, Colorado Springs, Colorado, USA, who first noted the species.

Type Material: Harvard University, Cambridge, Massachusetts, 90010, 90015, 90016, 90019; National Museum of Natural History, Washington, D.C., USA, 95568.

X-ray Powder Pattern: Cripple Creek, Colorado, USA.
3.02 (10), 2.09 (8), 2.20 (4), 2.93 (3), 1.758 (3), 1.689 (3), 1.506 (3)

Chemistry:

	(1)	(2)	(3)
Au	41.66	42.15	43.59
Ag	0.77	0.60	
Te	57.87	57.00	56.41
Total	100.30	99.75	100.00

(1) Cripple Creek, Colorado, USA. (2) Kalgoorlie, Australia. (3) $AuTe_2$.

Polymorphism & Series: Dimorphous with krennerite.

Occurrence: Typically in veins in low-temperature hydrothermal deposits, but also in medium- and high-temperature deposits.

Association: Altaite, coloradoite, krennerite, rickardite, other tellurides, pyrite, arsenopyrite, tetrahedrite, tennantite, sphalerite, stibnite, other sulfides.

Distribution: In the USA, in California, at the Stanislaus [TL], Morgan, and Melones mines, Carson Hill district, Calaveras Co.; at the Spotted Horse mine, Maiden, Fergus Co., and the Mayflower mine, Tobacco Root Mountains, Madison Co., Montana; in Colorado, fine examples in the Cripple Creek district, Teller Co.; the Central City district, Gilpin Co.; Gold Hill, Boulder Co.; and the Bessie G and Mayday mines, La Plata Co. From the San Francisco mine, 145 km north of Hermosillo, Sonora, Mexico. At the El Indio mine, east of La Serena, Coquimbo, Chile. In several mines in the Kirkland Lake area, and in the Hemlo gold deposit, Thunder Bay district, Ontario; and the Robb-Montbray mine, Quebec, Canada. From the Lake View and North Kalgoorlie mines, Kalgoorlie, Western Australia. At Nishizaki, Gifu Prefecture,in the Date mine, Hokkaido, and the Susaki mine, Shizuoka Prefecture, Japan. In the Emperor mine, Vatukoula, and in the Tuvatu Au–Ag–Te deposit, Viti Levu, Fiji Islands. At the Bulawan deposit, Negros Occidental, Phillipines. From Klyuchi, eastern Siberia, and in the Bereznyakov gold deposit, Southern Ural Mountains, Russia.

Name: For its occurrence in Calaveras Co., California, USA.

Calcioancylite-(Ce) $(Ca,Sr)(Ce,La)_3(CO_3)_4(OH)_3 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* [*m*.] As pseudo-octahedral dipyramidal to prismatic crystals with curved faces, to 2 mm; in subparallel aggregates; may occur as zoned intergrowns with ancylite-(Ce).

Physical Properties: *Fracture:* Splintery. *Tenacity:* Somewhat brittle. Hardness = 4–4.5 D(meas.) = 3.95 D(calc.) = n.d. May be pale pink in daylight, fluorescing pale bluish gray under indoor fluorescent light.

Optical Properties: Transparent to translucent. *Color:* Pink, white, gray; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous, greasy on fractures.
Optical Class: Biaxial (–). *Dispersion:* $r < v$, barely perceptible. $\alpha = 1.654(3)$ $\beta = 1.733(3)$ $\gamma = 1.772(3)$ 2V(meas.) = 60°–70°

Cell Data: *Space Group:* [*Pm*] [by analogy to calcioancylite-(Nd)]. a = n.d. b = n.d. c = n.d. β = n.d. Z = n.d.

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.
2.94 (100), 4.32 (75), 2.33 (45), 3.66 (40), 2.07 (35), 5.54 (30), 2.00 (30)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

				Total			100.00

(1) Ilímaussaq intrusion, Greenland; partial analysis, corresponding to $(Ca_{1.04}Sr_{0.02})_{\Sigma=1.06}(Ce_{1.44}La_{1.02}Nd_{0.34}Pr_{0.12})_{\Sigma=2.92}(CO_3)_4(OH)_3 \cdot H_2O$. (2) Afrikanda massif, Russia; partial analysis, corresponding to $(Ca_{0.92}Sr_{0.50})_{\Sigma=1.42}(Ce_{1.46}La_{0.54}Nd_{0.44}Pr_{0.12}Sm_{0.02})_{\Sigma=2.58}(CO_3)_4(OH)_3 \cdot H_2O$. (3) $CaCe_3(CO_3)_4(OH)_3 \cdot H_2O$

Occurrence: A rare mineral, found in late-stage miaroles in granite (Baveno, Italy); in Alpine-cleft type fissures (Cornog, Pennsylvania, USA; Polar Ural Mountains, Russia); in alkaline igneous rocks (Mont Saint-Hilaire, Canada; Ilímaussaq intrusion, Greenland; Kola Peninsula, Russia); and in leucite-bearing lamproite dikes (Baffin Island, Canada).

Association: Potassic feldspar, natrolite, aegirine, catapleiite, perovskite, astrophyllite, titanite, apatite, anatase, synchysite, quartz, calcite, actinolite, pyrite (Cornog, Pennsylvania, USA).

Distribution: From Russia, originally found in a glacial erratic boulder; from the Afrikanda pyroxenite massif, Kola Peninsula, and at Dodo and Puiva, Polar Ural Mountains. From Baveno, Italy. In the Kalcherkogel tunnel, Styria, Austria. Found near Mendig, Eifel, Germany. From Cezlak, west-northwest of Slovenska Bistrica, Slovenia. At Tvedalen, near Larvik, Norway. In Greenland, at Narssârssuk, and near the head of the Lilleelv River, Ilímaussaq intrusion. In the USA, from the Keystone quarry, near Cornog, Chester Co., Pennsylvania, and at the Foote mine, Cleveland Co., North Carolina. From Mont Saint-Hilaire, Quebec, and at Napoleon Bay, Baffin Island, Canada.

Name: For its *calcium* content and from the Greek for *curved* in allusion to the typical rounded and distorted crystal habit; and for the dominant rare earth element, *cerium*.

		Total	[100.00]

(1) Baveno, Italy; by electron microprobe, CO_2 by elemental microanalyzer, H_2O by difference; corresponding to $Ca_{1.20}(Nd_{0.90}Ce_{0.64}Sm_{0.33}Gd_{0.28}Y_{0.26}Pr_{0.15}La_{0.14}Dy_{0.07}Tm_{0.03})_{\Sigma=2.80}(CO_3)_{3.98}(OH)_{2.84} \cdot 1.01H_2O$.

Occurrence: Coating miarolitic cavities in granite.

Association: Orthoclase, quartz, albite.

Distribution: From the Montecatini quarry, Baveno, Piedmont, Italy.

Name: For *calcioancylite* with dominant *neodymium*.

Type Material: Municipal Natural History Museum, Milan, Italy, M29872.

Total	[100.0]

(1) Grand Reef mine, Arizona, USA; by electron microprobe, average of five analyses, H_2O by difference; corresponds to $Pb_{1.02}Ca_{2.05}Al_{1.04}[F_{7.97}(OH)_{0.76}O_{0.27}]_{\Sigma=9.00}$.

Occurrence: In the oxidized zone of an epithermal Cu–Pb–Ag deposit.

Association: Artroeite, quartz, anglesite, fluorite, galena, linarite, muscovite.

Distribution: From the Grand Reef mine, near Klondyke, Aravaipa district, Graham Co., Arizona, USA.

Name: For its CALCIum content and relation to *aravaipaite*.

Type Material: Natural History Museum, Los Angeles, California, USA, 39338.

References: (1) Kampf, A.R. and E.E. Foord (1996) Calcioaravaipaite, a new mineral, and associated lead fluoride minerals from the Grand Reef mine, Graham County, Arizona. Mineral. Record, 27, 293–300.

Calciobetafite $Ca_2(Nb,Ti)_2(O,OH)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic; may be metamict. *Point Group:* $4/m\ \overline{3}\ 2/m$. As octahedra, to 0.2 mm.

Physical Properties: *Fracture:* [Conchoidal to uneven] (by analogy to betafite). *Tenacity:* [Brittle.] Hardness = [3–5.5] D(meas.) = n.d. D(calc.) = [4.12] May be radioactive.

Optical Properties: Semitransparent. *Color:* Reddish brown to black. *Luster:* [Greasy, waxy to adamantine.]
Optical Class: Isotropic. n = n.d.

Cell Data: *Space Group:* $Fd3m$. a = 10.2978(5) Z = 8

X-ray Powder Pattern: Monte di Procida, Italy.
2.973 (100), 1.820 (53), 1.552 (45), 2.574 (27), 1.181 (16), 1.151 (13), 1.051 (12)

(1–2) Monte di Procida, Italy; by electron microprobe, the average corresponding to $[(Ca,Na)_{1.52}RE_{0.20}Th_{0.08}U_{0.08}]_{\Sigma=1.88}[(Nb,Ta)_{1.16}Ti_{0.84}(Fe,Mn,Mg,Al)_{0.12}Zr_{0.04}]_{\Sigma=2.16}(O,F)_7$.

Polymorphism & Series: Dimorphous with zirkelite.

Mineral Group: Pyrochlore group, betafite subgroup; $Ca_A > 20\%$; $2Ti_B \geq (Nb + Ta)_B$.

Occurrence: In a subvolcanic rock, locally termed "sanidinite", present in a phreatomagmatic explosion breccia.

Association: Sanidine, plagioclase, polymignite, zirkelite, zirconolite, magnesian hastingsitic amphibole, clinopyroxene, biotite, magnetite, apatite, titanite.

Distribution: From Monte di Procida, Campi Flegrei, near Naples, Campania, Italy. In Canada, at Hybla, Ontario.

Name: For a mineral with the *betafite* structure with high CALCIum content.

Type Material: National Museum of Natural History, Washington, D.C., USA, 150338.

References: (1) Mazzi, F. and R. Calcioburbankite $Na_3(Ca, Ce, Sr)_3(CO_3)_5$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$, $6mm$, or $\overline{6}2c$. As imperfect prismatic crystals, elongated along [0001], to 2 cm, with dominant $\{10\overline{1}0\}$; also as equant crystals with $\{10\overline{1}0\}$ and $\{0001\}$ and fibrous terminations.

Physical Properties: *Cleavage:* Indistinct on $\{10\overline{1}0\}$. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3–4 D(meas.) = 3.45(3) D(calc.) = 3.46

Optical Properties: Translucent. *Color:* Bright orange, pale pink. *Streak:* White. *Luster:* Vitreous, silky.
Optical Class: Uniaxial (–). $\omega = 1.636(1)$ $\epsilon = 1.631(1)$

Cell Data: *Space Group:* $P6_3mmc$, $P6_3mc$, or $P\overline{6}2c$. $a = 10.447(3)$ $c = 6.318(3)$ $Z = 2$

X-ray Powder Pattern: Mont Saint-Hilaire, Canada.
2.601 (10), 2.130 (6), 3.01 (5), 2.509 (5), 1.793 (5), 1.674 (5), 1.613 (5)

Chemistry:

	(1)
CO_2	[35.13]
La_2O_3	9.30

Total	[99.40]

(1) Mont Saint-Hilaire, Canada; by electron microprobe, CO_2 calculated from stoichiometry, absence of $(OH)^{1-}$ and H_2O confirmed by IR; corresponds to $Na_{3.07}(Ca_{1.32}Ce_{0.55}Sr_{0.46}La_{0.36}Nd_{0.14}Pr_{0.05}Sm_{0.02}Ba_{0.02})_{\Sigma=2.92}(CO_3)_5$.

Occurrence: A rare late stage mineral associated with an intrusive alkalic gabbro-syenite complex.

Association: Ancylite-(Ce), calcite, donnayite-(Y), fluorapatite, natrolite, pyrite, rhodochrosite, rutile, "chlorite" (vent or altered pegmatite); aegirine, calcite, fluorite, galena, leucophanite, mangan-neptunite, microcline, molybdenite-2H and -3R, narsarsukite, pectolite, pyrite, schairerite, shortite, sodalite, sphalerite, thermonatrite, titanite (marble xenoliths).

Distribution: From Mont Saint-Hilaire, Quebec, Canada.

Name: The *calcium* analog of *burbankite*.

Type Material: Canadian Museum of Nature, Ottawa, Canada, 50804.

References: (1) Van Velthuizen, J., R.A. Gault, and J.D. Calciocatapleiite $CaZrSi_3O_9 \cdot 2H_2O$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. Lamellar crystals and grains, to a few cm. Crystals display three-fold twinning about the *c* axis.

Physical Properties: *Cleavage:* Present. Hardness = 4.5-5 D(meas.) = 2.77 D(calc.) = 2.746

Optical Properties: Opaque, translucent on thin edges. *Color:* Pale yellow to cream.
Luster: Vitreous to dull.
Optical Class: Uniaxial (+). ω = 1.603 ε = 1.639

Cell Data: *Space Group: Pbnn*. *a* = 7.378(1) *b* = 12.779(1) *c* = 10.096(1) *Z* = 4

X-ray Powder Pattern: Burpala massif, Russia; very close to catapleiite.
2.96 (100), 3.96 (80), 3.06 (80), 1.975 (80), 1.835 (80), 6.45 (70), 1.740 (70)

Chemistry:

	(1)
SiO_2	44.49
TiO_2	0.06
ZrO_2	31.00
Al_2O_3	0.60
RE_2O_3	0.28
Fe_2O_3	0.36
CaO	13.82
Na_2O	0.32
K_2O	0.10
H_2O+	9.15
H_2O^-	0.18
Total	100.36

(1) Burpala massif, Russia; leading to $(Ca_{0.98}Na_{0.04})_{\Sigma=1.02}Zr_{1.00}(Si_{2.94}Al_{0.04})_{\Sigma=2.98}O_9 \cdot 2.01H_2O$.

Occurrence: In cavities between crystals of microcline, in syenite pegmatites of a differentiated alkalic massif.

Association: Pyrophanite, pyrochlore, titanian låvenite, loparite-(Ce), kupletskite, RE-apatite, hiortdahlite, calcian seidozerite, leucophane, microcline.

Distribution: In the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, and from the Afrikanda complex, Kola Peninsula, Russia. At the Golden Horn batholith, Okanogan County, Washington, USA. From Strange Lake, Quebec-Labrador and Ice River, British Columbia, Canada. From the Norra Kärr complex, Småland, Sweden. At Cnoc Rhaonastil, Isle of Islay, Scotland, UK.

Name: For its *calcium* content and close relation to *catapleiite*. The change from the original name conforms to International Mineralogical Association guidelines.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia; 7203/5.

Calciodelrioite $Ca(VO_3)_2(H_2O)_4$

Crystal Data: Monoclinic. *Point Group*: 2/*m*. As terminated, prismatic crystals with {001} and {011} dominant. Typically as needles elongated and striated parallel to [100], forming parallel to sub-parallel intergrowths or divergent sprays to 2 mm or as very tightly intergrown broad blade-like aggregates in flat-lying "star bursts" to 2 mm.

Physical Properties: *Cleavage*: Perfect on {001}, others possible parallel [100]. *Tenacity*: Brittle. *Fracture*: Irregular to splintery. Hardness = 2.5 D(meas.) = n.d. D(calc.) = 2.451-2.503 Soluble in water.

Optical Properties: Transparent. *Color*: Colorless, tan to reddish brown, brown. *Streak*: White. *Luster*: Subadamantine (crystals), silky (aggregates).
Optical Class: Biaxial (+). $\alpha = 1.733(3)$ $\beta = 1.775(3)$ $\gamma = 1.825(3)$ 2V(meas.) = 87.3(9)° 2V(calc.) = 87° *Orientation*: $X = b$, $Z \approx a$. *Pleochorism*: None.

Cell Data: *Space Group*: *I*2/*a*. $a = 14.6389(10)$ $b = 6.9591(4)$ $c = 17.052(2)$ $\beta = 102.568(9)°$ Z = 8

X-ray Powder Pattern: West Sunday mine, Colorado, USA.
6.450 (100), 3.027 (50), 2.560 (28), 3.489 (18), 1.786 (18), 3.215 (17), 4.350 (16)

Chemistry:

	(1)	(2)	(3)
Na_2O	0.34	0.08	
K_2O	0.22	0.02	
CaO	15.83	13.39	18.09

H_2O	[23.16]	[22.66]	23.24
Total	99.99	99.98	100.00

(1) West Sunday mine, Colorado, USA; average of 11 electron microprobe analyses, H_2O calculated from structure refinement, results normalized to account for dehydration during analysis; corresponding to $(Ca_{0.88}Sr_{0.07}Na_{0.04}K_{0.01})_{\Sigma=1.00}(V_{1.00}O_3)_2(H_{2.01}O)_4$. (2) West Sunday mine, Colorado, USA; average of 10 electron microprobe analyses, H_2O calculated from structure refinement, results normalized to account for dehydration during analysis; corresponding to $(Ca_{0.76}Sr_{0.21}Na_{0.01})_{\Sigma=0.98}(V_{1.00}O_3)_2(H_{2.01}O)_4$. (3) $Ca(VO_3)_2(H_2O)_4$.

Polymorphism & Series: Forms a series with delrioite; dimorphous with rossite.

Occurrence: A secondary mineral as crystalline crusts on fracture surfaces in the oxidized portions of corvusite- and montroseite-impregnated sandstone.

Association: Gypsum, rossite, metarossite, celestine, huemulite, pascoite (West Sunday mine); delrioite, hendersonite, pascoite, powellite, schindlerite (St. Jude mine); delrioite, huemulite, hummerite, magnesiopascoite, powellite, K- and Mg-bearing decavanadate (Blue Streak mine); huemulite (Little Eva mine).

Distribution: From the West Sunday and St. Jude mines, Slick Rock district, San Miguel County; and at the Blue Streak mine, Bull Canyon, Montrose County, Colorado; and also at the Little Eva mine, Yellow Cat district, Grand County, Utah, USA.

Name: As the calcium (*Ca*) analog of *delrioite.*

Type Material: Natural History Museum of Los Angeles County, California, USA (# 63837, 63838, and 63839).

References: (1) Kampf, A.R., J. Marty, B.P. Nash, J. Plášil, A.V. Kasatkin, and R. Škoda (2012) Calciodelrioite, $Ca(VO_3)_2(H_2O)_4$, the Ca analog of delrioite, $Sr(VO_3)_2(H_2O)_4$. Mineral. Mag., 76(7), 2803-2817. (2) (2014) Amer. Mineral., 99, 2437-2438 (abs. ref. 1).

Crystal Data: Monoclinic. *Point Group:* $2/m$. As crystals, flattened on [010], to 2 mm, in parallel or radiating groups; foliated, nodular or reniform, massive.

Physical Properties: *Cleavage:* One, perfect, parallel foliation; another, interrupted, perpendicular to the first; a third, also interrupted, oblique to the first. *Tenacity:* Brittle. Hardness = 2.5 D(meas.) = 2.51–2.53 D(calc.) = 2.65

Optical Properties: Transparent to translucent, opaque if massive. *Color:* Sulfur-yellow, greenish yellow to siskin-green, yellowish white; yellow in transmitted light. *Streak:* Sulfur-yellow to white. *Luster:* Pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 61.5°$. *Dispersion:* $r < v$, strong.
$\alpha = 1.572–1.604$ $\beta = 1.579–1.610$ $\gamma = 1.583–1.612$ 2V(meas.) = 70°–80°

Cell Data: *Space Group:* $C2/c$. $a = 10.34(2)$ $b = 24.20(2)$ $c = 6.31(2)$ $\beta = 91°30'$
$Z = 2$

X-ray Powder Pattern: Kara-Tau Range, Kazakhstan.
12.10 (10), 2.903 (9), 2.652 (9), 2.592 (9), 1.578 (9b), 3.149 (7), 6.05 (6)

Chemistry:

(1) The Battenberg, Germany; Fe^{2+}:Fe^{3+} from stoichiometry; corresponds to $(Ca_{3.31}Fe^{2+}_{0.36})_{\Sigma=3.67}(Mg_{0.83}Fe^{2+}_{0.17})_{\Sigma=1.00}(Fe^{3+}_{3.29}Al_{0.71})_{\Sigma=4.00}(PO_4)_6(OH)_{3.34} \cdot 12.61H_2O$. (2) Kara-Tau Range, Kazakhstan; corresponding to $Ca_{3.88}Mg_{1.00}(Fe^{3+}_{2.08}Al_{1.97})_{\Sigma=3.99}(PO_4)_{6.02}(OH)_4 \cdot 12.85H_2O$.
(3) Moculta quarry, Australia; by electron microprobe, total Fe as Fe_2O_3, H_2O by difference; corresponding to $Ca_{3.88}Mg_{0.97}(Fe^{3+}_{2.36}Al_{1.63})_{\Sigma=3.99}(PO_4)_6(OH)_{3.67} \cdot 13.11H_2O$.

Mineral Group: Montgomeryite group.

Occurrence: As nodules in a bed of Tertiary clay (The Battenberg, Germany); in phosphatic clay (Moculta quarry, Australia).

Association: Montgomeryite, jarosite, cacoxenite, tinticite, apatite, pyrite (Moculta quarry, Australia).

Distribution: In Germany, on the Battenberg, and from Hagendorf, Bavaria. On Sal Island, Cape Verde Islands. In the Moculta phosphate quarry, northeast of Angaston, South Australia. From an undefined locality in the Kara-Tau Range, Kazakhstan.

Name: For CALCIum and iron, FERRum, in the composition.

Type Material: Type material is claimed to have been analyzed by (2) Mead and Mrose, but no further details are given.

SrO			1.76	Total	99.70	[95.51]	100.22

(1) Oktyabr'skoye U–Mo deposit; after deduction of quartz impurity, corresponds to $(Ca_{0.74}Ba_{0.13}Pb_{0.07}Na_{0.06})_{\Sigma=1.00}U_{1.7}O_7 \cdot 4.8H_2O$. (2) Do.; original total given as 96.05%, after deduction of quartz impurity, corresponds to $(Ca_{0.95}Pb_{0.06})_{\Sigma=1.01}U_2O_7 \cdot 5H_2O$. (3) Do.; after deduction of calcite 20.25% and uranophane 1–2% corresponds to $(Ca_{0.58}K_{0.18}Sr_{0.16}Pb_{0.06}Na_{0.02})_{\Sigma=1.00}U_{2.12}O_7 \cdot 3.89H_2O$.

Occurrence: In stringers in felsite, deep in the oxidation zone of a U–Mo deposit, in water-saturated ore-bearing faults.

Association: Calcite, uranophane, bauranoite, metacalciouranoite, protasite.

Distribution: From the Oktyabr'skoye U–Mo deposit, 12 km southeast of Krasnokamensk, eastern Transbaikal, Russia.

Name: For CALCIum and URANium in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81272.

Calcite $CaCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\,2/m$. Well-formed crystals are common, $\{10\overline{1}1\}$, $\{21\overline{3}1\}$, thin to thick tabular $\{0001\}$, with combinations of over 1000 forms noted, to 7 m; granular, stalactitic, in concretions, massive. *Twinning:* On $\{01\overline{1}2\}$, $\{10\overline{1}1\}$, $\{0001\}$, $\{02\overline{2}1\}$ as twin and composition planes.

Physical Properties: *Cleavage:* $\{10\overline{1}1\}$, perfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 2.7102(2) D(calc.) = 2.711 May fluoresce red, blue, yellow, and other colors under either SW and LW UV; phosphorescent, cathodoluminescent, thermoluminescent, rarely triboluminescent.

Optical Properties: Transparent to opaque. *Color:* Colorless or white, also gray, yellow, green, many other colors from included minerals; colorless in transmitted light. *Streak:* White. *Luster:* Vitreous; pearly on cleavages and $\{0001\}$.
Optical Class: Uniaxial (–); anomalously biaxial. *Dispersion:* Very strong.
Absorption: $O > E$. $\omega = 1.658$ $\epsilon = 1.486$ 2V(meas.) = 0° to small.

Cell Data: *Space Group:* $R\overline{3}c$. a = 4.9896(2) $c = 17.0610(11)$ Z = 6

X-ray Powder Pattern: Synthetic.
3.035 (100), 2.285 (18), 2.095 (18), 1.913 (17), 1.875 (17), 2.495 (14), 3.86 (12)

Chemistry:

	(1)	(2)		(1)	(2)
CO_2	[44.22]	43.97	MgO	1.74	
FeO	0.43		CaO	53.60	56.03
			Total	[99.99]	100.00

(1) Monterey Formation, California, USA, CO_2 calculated from stoichiometry. (2) $CaCO_3$.

Polymorphism & Series: Trimorphous with aragonite and vaterite; forms a series with rhodochrosite.

Mineral Group: Calcite group.

Occurrence: A major rock-forming mineral; in limestones, marbles, chalks, a common cement in clastic sedimentary rocks, and as gangue in hydrothermal veins; in alkalic to mafic igneous rocks; common as speleothems in caves.

Association: Dolomite, celestine, fluorite, barite, pyrite, marcasite, sphalerite (low-temperature veins); zeolites, chalcedony, "chlorite" (vesicles); talc, tremolite, grossular, quartz (metamorphic); nepheline, diopside, apatite, orthoclase (igneous).

Distribution: Abundant worldwide; a few of the many localities include: in Iceland, at the Helgustadanáma mine, Reydarfjord. In England, from Alston Moor, Egremont, and Frizington, Cumbria; Weardale, Durham; at Liskeard, Cornwall. From St. Andreasberg, Harz Mountains, and Freiberg, Saxony, Germany. At Herja (Kisbánya), Baia Mare (Nagybánya) district, Romania. In the USA, from Rossie and Balmat, St. Lawrence Co., New York; at Hancock, Houghton Co., and in the Phoenix mine, Keeweenaw Co., Michigan; in Missouri, from many mines in Reynolds Co., and at Joplin, Jasper Co.; Galena, Cherokee Co., Kansas; and Picher, Ottawa Co., Oklahoma, in the Tri-State district; from the Elmwood mine, near Carthage, Smith Co., Tennessee; at Bisbee, Cochise Co., Arizona. In Mexico, from Santa Eulalia, and in Areponapuchic Canyon, Chihuahua; at many mines at Guanajuato; from Charcas, San Luis Potosi. At Dal'negorsk, Primorskiy Krai, Russia. From Tsumeb, Namibia. In the Mupine mine, Katanga Province, Congo (Shaba Province, Zaire).

Name: From the Latin *calx*, for *burnt lime*, an allusion to an important commercial use.

Calcium catapleiite $CaZrSi_3O_9 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $[6/m\ 2/m\ 2/m]$ (by analogy to catapleiite). Lamellar crystals and grains, to a few cm.

Physical Properties: *Cleavage:* Present. Hardness = 4.5–5 D(meas.) = 2.77 D(calc.) = [2.75]

Optical Properties: Opaque, translucent on thin edges. *Color:* Pale yellow to cream. *Luster:* Vitreous to dull.
Optical Class: Uniaxial (+). $\omega = 1.603$ $\epsilon = 1.639$

Cell Data: *Space Group:* $[P6_3/mmc.]$ $a = 7.40$ $c = 10.07$ Z = [2]

X-ray Powder Pattern: Burpala massif, Russia; very close to catapleiite.
2.96 (100), 3.96 (80), 3.06 (80), 1.975 (80), 1.835 (80), 6.45 (70), 1.740 (70)

Chemistry:

	(1)
SiO_2	44.49
TiO_2	0.06
ZrO_2	31.00
Al_2O_3	0.60
RE_2O_3	0.28
Fe_2O_3	0.36
CaO	13.82
Na_2O	0.32
K_2O	0.10
H_2O^+	9.15
H_2O^-	0.18
Total	100.36

(1) Burpala massif, Russia; leading to $(Ca_{0.98}Na_{0.04})_{\Sigma=1.02}Zr_{1.00}(Si_{2.94}Al_{0.04})_{\Sigma=2.98}O_9 \cdot 2.01H_2O$.

Occurrence: In cavities between crystals of microcline, in syenite pegmatites of a differentiated alkalic massif.

Association: Pyrophanite, pyrochlore, titanian låvenite, loparite-(Ce), kupletskite, RE-apatite, hiortdahlite, calcian seidozerite, leucophane, microcline.

Distribution: In the Burpala massif, about 120 km north of Lake Baikal, eastern Siberia, Russia.

Name: For its *calcium* content and close relation to *catapleiite*.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 72035.

(1) Pravaya Noiba River, Russia; corresponds to $(Na_{0.87}K_{0.11})_{\Sigma=0.98}(Ca_{1.75}Sr_{0.61}Mg_{0.58}Ba_{0.16})_{\Sigma=3.10}Al_{2.94}[F_{14.06}(OH)_{1.94}]_{\Sigma=16.00}$.

Occurrence: In a fluorite vein in quartz-mica schists.

Association: Fluorite, thorite, usovite, chamosite, phillipsite, erionite, micas, halloysite.

Distribution: Near the mouth of the second tributary to the Pravaya Noyba River, tributary to the Teya River, Yenisei Ridge, Siberia, Russia.

Name: As a CALCium analog of *jarlite*.

Type Material: Mineralogical Museum, Tomsk Polytechnical Institute, Tomsk; Institute of Geology and Geophysics, Siberian Division, Academy of Sciences, Novosibirsk, Russia.

References: (1) Nozhkin, A.D., V.A. Moleva, and T.P. Chubkova (1970) First find of jarlite in the USSR. Zap. Vses. Mineral. Obshch., 99, 458–462 (in Russian). (2) Povarennykh, A.S. Calclacite $Ca(C_2H_3O_2)Cl \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (synthetic). *Point Group:* $2/m$. As silky hairlike efflorescences, to 4 cm.

Physical Properties: Hardness = n.d. D(meas.) = 1.5 D(calc.) = 1.55

Optical Properties: Semitransparent *Color:* White. *Luster:* Silky in aggregates. *Optical Class:* Biaxial (+). *Orientation:* $Z = c$; OAP = {100}. $\alpha = 1.468$ $\beta = 1.484$ $\gamma = 1.515$ 2V(meas.) = 80°

Cell Data: *Space Group:* $P2_1/a$ (synthetic). $a = 11.51$ $b = 13.72$ $c = 6.82$ $\beta = 116.7°$ Z = 4

X-ray Powder Pattern: Synthetic.

(1) On a museum specimen of calcareous schist. (2) $Ca(C_2H_3O_2)Cl \cdot 5H_2O$.

Occurrence: Forms on calcareous rock and fossil specimens and pottery sherds thorough the action of acetic acid derived from oak storage cabinets.

Association: Unspecified efflorescent salts.

Distribution: Described only from museum specimens.

Name: From the composition, CALcium, chlorine, CL, and ACetate.

Type Material: Royal Institute of Natural Sciences, Brussels, Belgium, N5518.

Calcurmolite $Ca(UO_2)_3(MoO_4)_3(OH)_2 \cdot 11H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. As prismatic crystals, to 1.5 mm, in bundles or radial platy aggregates; as crusts of vermiform spherical aggregates of platy crystals.

Physical Properties: Hardness = 2–3 D(meas.) = n.d. D(calc.) = n.d. Radioactive; strong yellowish green fluorescence under UV.

Optical Properties: Translucent. *Color:* Deep honey-yellow, bright yellow.
Optical Class: Biaxial (–). *Pleochroism:* X = colorless; Y = pale yellow; Z = yellow.
$\alpha = 1.760–1.770$ $\beta = 1.816–1.827$ $\gamma = 1.856–1.863$ 2V(meas.) = n.d. 2V(calc.) = 76°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Kadzharan deposit, Armenia.

(1) Kyzylsai Mo–U deposit, Kazakhstan; after deduction of impurities, corresponds to $Ca_{1.06}(UO_2)_3(MoO_4)_{2.98}(OH)_2 \cdot 10.88H_2O$. (2) Rabéjac deposit, France; by electron microprobe, H_2O by gas chromatography. (3) $Ca(UO_2)_3(MoO_4)_3(OH)_2 \cdot 11H_2O$.

Occurrence: A secondary mineral in the lower oxidized zone of Mo–U deposits.

Association: Uraninite, uranophane, uranospinite, halloysite, betpakdalite, jarosite, ferrimolybdite (Kadzharan deposit, Armenia); umohoite, uranophane (Rabéjac deposit, France); yingjiangite, studtite, kivuite, tengchongite, autunite (Tongbiguan village, China).

Distribution: From the Kadzharan molybdenum deposit, upper Okhcha River, Kafan district, Armenia. In the Kyzylsai Mo–U deposit, Chu-Ili Mountains, southwestern Balkhash region, Kazakhstan. At Tongbiguan village, Yingjiang Co., Yunnan Province, China. From the Rabéjac and Mas-d'Alary uranium deposits, south of Lodève, Hérault, France.

Name: For the essential chemical components, CALCium, URanium, and MOLybdenum.

Type Material: n.d.

Calderite $(Mn^{2+}, Ca)_3(Fe^{3+}, Al)_2(SiO_4)_3$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Granular, massive.

Physical Properties: Hardness = 7 D(meas.) = 4.05 D(calc.) = 4.07

Optical Properties: Semitransparent. *Color:* Dark reddish brown to dark yellowish; yellow to pale greenish yellow in thin section.
Optical Class: Isotropic; shows slight anisotropism. $n = 1.875$–1.934

Cell Data: *Space Group: Ia3d.* $a = 11.81$ $Z = 8$

X-ray Powder Pattern: Otjosondu, Namibia.
2.62 (100), 1.574 (100), 2.92 (90), 2.39 (90), 1.632 (90), 0.968 (90), 1.906 (80)

Chemistry:

	(1)	(2)
SiO_2	35.16	32.4
TiO_2	0.28	
Al_2O_3	9.04	
Fe_2O_3	16.27	31.4
FeO	0.00	
MnO	27.38	29.0
MgO	0.50	
CaO	12.12	8.5
Total	100.75	101.3

(1) Otjosondu, Namibia; by electron microprobe; corresponds to $(Mn_{1.96}Ca_{1.10})_{\Sigma=3.06}(Fe^{3+}_{1.04}Al_{0.87}Mg_{0.06}Ti_{0.02})_{\Sigma=1.99}(Si_{2.97}Al_{0.03})_{\Sigma=3.00}O_{12}$. (2) Wabush district, Canada; by electron microprobe, corresponds to $(Mn_{2.20}Ca_{0.82})_{\Sigma=3.02}Fe^{3+}_{2.02}(Si_{2.90}Al_{0.10})_{\Sigma=3.00}O_{12}$.

Mineral Group: Garnet group.

Occurrence: In a manganese deposit (Otjosondu, Namibia); in an iron formation (Wabush district, Canada).

Association: Pyrolusite, aegirine, rhodonite, hematite, rhodochrosite, quartz, kutnohorite (Wabush district, Canada).

Distribution: From Katkamsandi, Hazaribagh district, Bihar, and at Netra, Balaghat district, Madhya Pradesh, India. At Otjosondu, Namibia. In the Wabush district, near Labrador City, Labrador, Newfoundland, Canada. From the Fianel mine, Val Ferrera, Graubünden, Switzerland.

Name: For James Calder, an early writer on the geology of India; name first applied to a rock, later transferred to its predominant mineral.

Type Material: n.d.

Caledonite $Pb_5Cu_2(SO_4)_3(CO_3)(OH)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. As striated prismatic [001] crystals, to 2.5 cm, typically flattened on {100} and displaying many forms, including {010}, {100}, {120}, {101}, {131}, {011}, {111}, {121}. In divergent aggregates, rarely fibrous; as massive coatings.

Physical Properties: *Cleavage:* On {010}, perfect; on {100} and {101}, imperfect. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 2.5–3 D(meas.) = 5.6–5.76 D(calc.) = 5.69 Piezoelectric.

Optical Properties: Translucent to transparent. *Color:* Deep verdigris-green, blue-green; pale bluish green in transmitted light. *Streak:* Pale green. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (–). *Pleochroism:* Weak. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, barely perceptible. $\alpha = 1.818(3)$ $\beta = 1.866(3)$ $\gamma = 1.909(3)$ 2V(meas.) = ∼85°

Cell Data: *Space Group:* $Pnm2_1$. $a = 7.146(3)$ $b = 20.089(7)$ $c = 6.560(5)$ Z = 2

X-ray Powder Pattern: Red Gill mine, England.
3.139 (100), 4.69 (57), 3.031 (55), 1.861 (55), 2.752 (43), 3.152 (36), 2.226 (36)

Chemistry:

	(1)	(2)
SO_3	14.15	14.89
CO_2	3.16	2.73
PbO	69.18	69.17
CuO	9.73	9.86
H_2O	3.78	3.35
Total	[100.00]	100.00

(1) Challacollo, Chile; recalculated to 100% after deduction of insoluble 2.31%; corresponds to $Pb_{5.06}Cu_{2.00}(SO_4)_{2.90}(CO_3)_{1.18}(OH)_{5.96}$. (2) $Pb_5Cu_2(SO_4)_3(CO_3)(OH)_6$.

Occurrence: An uncommon secondary mineral in the oxidized portions of Pb–Cu deposits.

Association: Cerussite, anglesite, leadhillite, brochantite, linarite, azurite, malachite.

Distribution: Widely distributed, although fine specimens are uncommon. In Scotland, from Leadhills, Lanarkshire, and Wanlockhead, Dumfriesshire. At Red Gill and other mines, Caldbeck Fells, Cumbria, England. In the Preobrazhensky mine, Beresovsk, near Yekaterinburg (Sverdlovsk), Middle Ural Mountains, Russia. Large crystals from Tchah Milleh, Anarak, Iran. In the USA, in Arizona, large crystals in rich masses from the Mammoth-St. Anthony mine, Tiger, Pinal Co., in the Rowley mine, near Theba, Maricopa Co., and elsewhere; from the Mex-Tex mine, near Bingham, Hansonburg district, Socorro Co., New Mexico; large crystals from the Blue Bell mine, near Baker, San Bernardino Co., at the Chance mine, Chidago Canyon, Mono Co., and from Cerro Gordo, Inyo Co., California. At Challacollo, Tarapacá, Chile. From Paddy's River mine, Australian Capital Territory, Australia.

Name: From the Latin *Caledonia*, the Roman name for the Highlands of Scotland, the first known locality.

Type Material: Natural History Museum, Paris, France.

Calkinsite-(Ce) $(Ce,La)_2(CO_3)_3 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. As platy {010} crystals, to 1 mm. *Twinning:* Commonly twinned on {101}, compound and elongated along [100].

Physical Properties: *Cleavage:* {010}, perfect; {101}, distinct; {001}, a parting (?). Hardness = ~2.5 D(meas.) = 3.28(1) D(calc.) = [3.27]

Optical Properties: Translucent. *Color:* Pale yellow. *Optical Class:* Biaxial (–). *Pleochroism:* X = yellow; $Y = Z$ = colorless. *Orientation:* $X = b$; $Y = c$; $Z = a$. *Dispersion:* $r < v$, weak. $\alpha = 1.569$ $\beta = 1.657$ $\gamma = 1.686$ 2V(meas.) = 54° 2V(calc.) = 57.2°

Cell Data: *Space Group:* $P2_122_1$. $a = 9.57(2)$ $b = 12.65(8)$ $c = 8.94(2)$ Z = 4

X-ray Powder Pattern: Big Sandy Creek, Montana, USA.
6.54 (10b), 3.27 (5), 4.78 (4), 4.49 (4), 2.931 (3b), 2.128 (3), 2.115 (3)

Chemistry:

	(1)
CO_2	23.93
La_2O_3	19.82
Ce_2O_3	32.05
Pr_2O_3	2.89
Nd_2O_3	7.97
H_2O	13.34
Total	[100.00]

(1) Big Sandy Creek, Montana, USA; recalculated to 100% after deduction of impurities 11.65%, from an original total of 100.47%; corresponds to $(Ce_{1.03}La_{0.67}Nd_{0.26}Pr_{0.10})_{\Sigma=2.06}(CO_3)_{3.00} \cdot 4.09H_2O$.

Occurrence: A weathering product closely associated with burbankite, in calcite veins cutting shonkinite in a composite stock (Big Sandy Creek, Montana, USA).

Association: Burbankite, ancylite, lanthanite, barite, goethite, calcite, "biotite" (Big Sandy Creek, Montana, USA); barite, strontianite, pyrite (Vuoriyarvi massif, Kola Peninsula, Russia); dolomite, khanneshite, carbocernaite, mckelveyite, barite, "chlorite" (Khanneshin complex, Afghanistan).

Distribution: In the USA, from vermiculite prospects at the head of Big Sandy Creek, Rocky Boy's Indian Reservation, about 40 km east of Box Elder, Hill Co., Montana. At the Vuoriyarvi carbonatite massif, Kola Peninsula, Russia. From the Khanneshin carbonatite complex, Afghanistan.

Name: Honors Frank Cathcart Calkins (1878–1974), geologist with the U.S. Geological Survey.

Type Material: n.d.

References: (1) Pecora, W.T. and J.H. Kerr (1953) Burbankite and calkinsite, two new carbonate minerals from Montana. Amer. Mineral., 38, 1169–1183.

Callaghanite $Cu_2Mg_2(CO_3)(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are pseudo-octahedral to dipyramidal, dominated by {111} and $\{11\overline{1}\}$, modified by {122} and $\{12\overline{2}\}$, to 3 mm; as incrustations and massive in veinlets.

Physical Properties: *Cleavage:* On {111} and $\{11\overline{1}\}$, perfect. *Fracture:* Irregular. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 2.71 D(calc.) = 2.65

Optical Properties: Transparent to translucent. *Color:* Azure-blue. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* In shades of blue. *Orientation:* $Z \wedge a = 18°$. *Dispersion:* $r > v$, strong. *Absorption:* $Z > Y > X$. $\alpha = 1.559$ $\beta = 1.653$ $\gamma = 1.680$
2V(meas.) = 55°

Cell Data: *Space Group:* $C2/c$. $a = 10.0060(7)$ $b = 11.7520(8)$ $c = 8.2132(7)$ $\beta = 107°23'$ Z = 4

X-ray Powder Pattern: Gabbs, Nevada, USA.
7.45 (10), 6.17 (10), 3.87 (9), 3.18 (9), 2.30 (7), 4.80 (6), 3.72 (6)

(1) Gabbs, Nevada, USA; after deduction of calcite impurity, with $(OH)^{1-}$ calculated for charge balance, corresponds to $Cu_{1.93}Mg_{2.07}(CO_3)_{0.82}(OH)_{6.36} \cdot 2H_2O$. (2) $Cu_2Mg_2(CO_3)(OH)_6 \cdot 2H_2O$.

Occurrence: Disseminated in the contact zone between diorite and serpentinized dolostone.

Association: Magnesite, dolomite, serpentine, brucite, forsterite.

Distribution: From near Gabbs, Gabbs district, Nye Co., Nevada, USA.

Name: Honors Dr. Eugene Callaghan (1904–1990), Director of the New Mexico Bureau of Mines, Socorro, New Mexico, USA, for his work on magnesite deposits.

Type Material: National Museum of Natural History, Washington, D.C., USA, R9406.

References: (1) Beck, C.W. and J.H. Burns (1954) Callaghanite, a new mineral. Amer. Mineral., 39, 630–635. (2) Brunton, G. (1973) Refinement of the callaghanite structure. Amer. Mineral., 58, 551.

Calomel HgCl

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Of variable and complex habit; crystals commonly tabular on {001}, prismatic ‖ [001], equant pyramidal, to 1 cm; in drusy crusts, earthy, massive. *Twinning:* On {112}, contact and penetration twins, may be repeated.

Physical Properties: *Cleavage:* Good on {110}, uneven; imperfect on {011}. *Fracture:* Conchoidal. *Tenacity:* Sectile, plastic. Hardness = 1.5 D(meas.) = 7.15 D(calc.) = 7.23 Fluoresces brick-red under UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, ash-gray, yellowish gray, brown, color deepening on exposure to light; colorless in transmitted light. *Streak:* Pale yellowish white. *Luster:* Adamantine.
Optical Class: Uniaxial (+). *Pleochroism:* Weak. *Absorption:* $E > O$. $\omega = 1.973$ $\epsilon = 2.656$

Cell Data: *Space Group:* $I4/mmm$ (synthetic). a = 4.4795(5) $c = 10.9054(9)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.170 (100), 4.15 (75), 2.067 (40), 2.727 (30), 1.962 (30), 1.970 (16), 2.824 (12)

Chemistry: Analyses of natural material are not available.

Polymorphism & Series: Forms a series with kuzminite.

Occurrence: An uncommon secondary mineral formed through the alteration of other mercury minerals.

Association: Mercury, amalgam, cinnabar, mercurian tetrahedrite, eglestonite, terlinguaite, montroydite, kleinite, moschelite, kadyrelite, kuzminite, chursinite, kelyanite, calcite, "limonite", clay minerals.

Distribution: From Moschellandsberg [ck?? Landsberg, near Obermoschel??], Rhineland-Palatinate, Germany [TL]. At Alva, Serbia. Large crystals from Almadén, Ciudad Real Province, Spain. Found near Montpellier, Hérault, France. In England, at the Chatsworth mine, Grassington Moor, Yorkshire. From the Kadyrel deposit, Tuva, Siberia, Russia. Rich specimens from El Doktor, Queretaro; Huahuaxtla, Guerrero; Plateros, Zacatecas; and elsewhere in Mexico. In the USA, in California, near Palo Alto, San Mateo Co., and the Redington mine, Napa Co.; from the Sunflower district, Maricopa Co., Arizona; in the McDermitt mine, Humboldt Co., Nevada; abundant at Terlingua, Brewster Co., Texas; and from near Jackfork, Pike Co., Arkansas. Some other minor localities are known.

Name: Of uncertain origin; possibly from the Greek for *beautiful* and *honey*.

H_2O^+	16.9
Total	99.97

(1) Centennial mine, Michigan, USA; Cu by electrolysis, H_2O:OH from charge balance; corresponding to $Cu_{0.99}[(OH)_{1.78}Cl_{0.22}]_{\Sigma=2.00} \cdot 2.35H_2O$.

Occurrence: In cavities and fractures in basalt, formed by the action of chlorine-bearing connate waters on copper, cuprite being regarded as an intermediate product in the alteration (Centennial mine, Michigan, USA).

Association: Tremolite, quartz, epidote, monazite, copper, cuprite, atacamite, buttgenbachite, malachite, paratacamite, anthonyite (Centennial mine, Michigan, USA).

Distribution: In the USA, from the Centennial and other nearby mines, near Calumet, Houghton Co., Michigan. From Laurium, Greece, in slag. In Germany, from Niederfischbach, Siegerland, and at Richelsdorf, Hesse, in slag.

Name: For the town of Calumet, Michigan, USA, near which it was first discovered.

Type Material: National Museum of Natural History, Washington, D.C., USA, 115870.

Calvertite $Cu_5Ge_{0.5}S_4$

Crystal Data: Isometric. *Point Group*: n.d. As anhedral, elongate to elliptical grains, to 100 μm.

Physical Properties: *Cleavage*: None. *Fracture*: Irregular to conchoidal. *Tenacity*: Brittle. Hardness = 4-5 VHN = 268-307 (25 g load). D(meas.) = n.d. D(calc.) = 5.239

Optical Properties: Opaque. *Color*: Black; pale bluish-gray in reflected light. *Streak*: Black. *Luster*: Metallic. *Birefringence:* None. *Pleochroism:* None. *Internal reflections*: None observed. *Optical Class*: Isotropic.
R_{air}-R_{oil}: (400) 28.0-13.5, (420) 27.6-13.3, (440) 27.1-12.8, (460) 26.7-12.3, (480) 25.9-11.5, (500) 25.0-10.8, (520) 24.2-10.1, (540) 23.5-9.5, (560) 22.8-9.1, (580) 22.3-8.8, (600) 22.1-8.6, (620) 21.8-8.5, (640) 21.6-8.5, (660) 21.5-8.5, (680) 21.5-8.4, (700) 21.5-8.4

Cell Data: *Space Group*: *Fm*3*m*, *F*432, or $F\bar{4}3m$. $a = 5.337(1)$ $Z = 1$
Metastable and highly disordered; the ordered equivalent would be $Cu_{10}GeS_8$ with $a = 2 \times 5.337$ Å.

X-ray Powder Pattern: Tsumeb mine, Namibia. (Although matching the pattern for synthetic material, these 4 lines are not definitive as they match strong lines for reinerite, germanocolusite, and germanite).
3.053 (100), 1.869 (90), 1.595 (30), 2.639 (10)

(1) Tsumeb mine, Namibia; average of 8 electron microprobe analyses, corresponding to $(Cu_{4.782}Fe_{0.143}Zn_{0.041}Ga_{0.025}V_{0.005})_{\Sigma=4.996}(Ge_{0.382}\ As_{0.096})_{\Sigma=0.478}S_4$.

Occurrence: In a highly oxidized, polymetallic, fractured and brecciated dolomite and sandstone pipe.

Association: Reinerite, tennantite, gallite, chalcocite.

Distribution: Tsumeb mine, Namibia.

Name: Honors Lauriston (Larry) Derwent Calvert (1924–1993) of the National Research Council, Ottawa, Canada for his studies of metallic phases and contributions to the Powder Diffraction File (ICDD).

Type Material: Canadian Museum of Nature, Ottawa (CMNMC 85731), and the Natural History Museum, London, England (BM 2004, 78).

Calzirtite $Ca_2Zr_5Ti_2O_{16}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Single crystals exhibit a prismatic dipyramidal habit; commonly in complex pseudotrapezohedral trillings, outwardly similar to garnet crystals, or with deep re-entrants, to 5 mm. *Twinning:* Cyclic, on an unknown law.

Physical Properties: *Cleavage:* Two partings at ∼80°. *Tenacity:* Brittle. Hardness = 6–7 VHN = 626–1035 D(meas.) = 4.90–5.01 D(calc.) = [5.15] Wavy red cathodoluminescence.

Optical Properties: Transparent. *Color:* Light brown, dark brown to nearly black, light green to brownish green, reddish brown in thin fragments; light gray in reflected light, internal reflections reddish brown; variegated brown in thin section. *Streak:* Brown. *Luster:* Semimetallic to adamantine, greasy on fractures.
Optical Class: Uniaxial (+). $\omega = 2.19$–2.27 $\epsilon = 2.26$–2.36 *Anisotropism:* Pronounced.

Cell Data: *Space Group:* $I4_1/acd$. $a = 15.094(2)$ $c = 10.043(2)$ $Z = 8$

(1) Ozernyi massif, Russia; corresponds to $Ca_{1.81}Zr_{5.16}(Ti,Fe)_2O_{16}$. (2) Kugda massif, Russia; Fe_2O_3 includes FeO, ZrO_2 includes HfO_2; corresponds to $(Ca_{1.82}Ce_{0.02})_{\Sigma=1.84}(Zr_{4.79}Ti_{0.28})_{\Sigma=5.07}(Ti_{1.69}Nb_{0.11}Si_{0.11}Fe_{0.09})_{\Sigma=2.00}O_{16.00}$. (3) $Ca_2Zr_5Ti_2O_{16}$.

Occurrence: A characteristic accessory mineral in alkalic and ultramafic complexes associated with carbonatites; typically found in residual soils and alluvium.

Association: Forsterite, pyroxene, calcite, magnetite, phlogopite, niobian perovskite, apatite, rutile, anatase, baddeleyite, zirconolite.

Distribution: In Russia, from the Ozernyi massif, near Lake Gornoye, Aldan, Sakha; in the Guli ultrabasic pluton, and the Kugda, Magan, and Odikhincha massifs, between the Maimecha and Kotui rivers, far northern Siberia; in the Tazheranskii alkalic massif, west of Lake Baikal, eastern Siberia; and the Seblyavr pluton, Kola Peninsula. Found near Chiesa, Val Malenco, Lombardy, Italy. In the Kaiserstuhl, Baden-Württemberg, Germany. From the Jacupiranga carbonatite, São Paulo, Brazil. In the Bukusu carbonatite complex, southeastern Uganda.

Name: For CALcium and ZIRconium in its composition.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61743, 62363.

Chemistry:

	(1)
SO_3	4.75
CO_2	6.26
Sb_2O_3	13.55
Al_2O_3	14.54
CuO	40.56
H_2O	20.00
Total	99.66

(1) Cap Garonne mine, France; by electron microprobe, average of eight analyses, CO_2 and H_2O by CHN analyzer; corresponds to $Cu_{3.56}Al_{1.99}[(HSbO_4)_{0.59}(SO_4)_{0.41}]_{\Sigma=1.00}(CO_3)_{0.99}(OH)_{9.91}\cdot 2.12H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of polymetallic mineral deposits.

Association: Parnauite, cyanotrichite, malachite, quartz (Cap Garonne mine, France); brochantite, chalcophyllite, mimetite, azurite (St.-Luc, Switzerland).

Distribution: In France, from the Cap Garonne mine, near le Pradet, Var, and at Ceilhes, Hérault. From near St.-Luc, Val d'Anniviers, Valais, Switzerland. In the Clara mine, near Oberwolfach, Black Forest, Germany. At Špania Dolina (Herrengrund) and Piesky, Slovakia.

Name: Honors Michel Camerola, mineral collector who collected the first specimen.

Type Material: Natural History Museum, Geneva, Switzerland, 435/84.

References: (1) Sarp, H. and P. Perroud (1991) Camerolaite, $Cu_4Al_2[HSbO_4, SO_4](OH)_{10}(CO_3)\cdot 2H_2O$, a new mineral from Cap Garonne mine, Var, France. Neues Jahrb. (1) East Pacific Rise; by electron microprobe, H_2O by difference. (2) $Mg_7(SO_4)_5(OH)_4 \cdot H_2O$.

Occurrence: Formed by the reaction of sea water with hydrothermal fluids in a midocean ridge submarine chimney vent. Unstable below 130° C., below which it hydrates and redissolves in sea water.

Association: Anhydrite.

Distribution: Along the East Pacific Rise at 21° N.

Name: From the Latin *caminus*, for *chimney*, as the mineral occurs in undersea black-smoker chimneys.

Type Material: n.d.

References: (1) Haymon, R.M. and M. Kastner (1986) Caminite: A new magnesium-hydroxide-sulfate-hydrate mineral found in a submarine hydrothermal deposit, East Pacific Rise, 21°N. Amer. Campigliaite $Cu_4Mn^{2+}(SO_4)_2(OH)_6 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. In tufts of crystals, elongated along [010], bladed on {100}, to 0.2 mm. *Twinning:* Polysynthetic, with {100} as twin plane, ubiquitous.

Physical Properties: *Cleavage:* On {100}, perfect. Hardness = n.d. D(meas.) = 3.0 D(calc.) = 3.063

Optical Properties: Transparent. *Color:* Pale blue; pale greenish blue in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X \simeq a$; $Y \simeq c$; $Z = b$. *Dispersion:* $r < v$, weak.
$\alpha = 1.589$ $\beta = 1.645$ $\gamma = 1.659$ 2V(meas.) = 52°

Cell Data: *Space Group:* $C2$. $a = 21.725(8)$ $b = 6.118(6)$ $c = 11.233(7)$ $\beta = 100.40(5)°$ Z = 4

X-ray Powder Pattern: Temperino mine, Italy.
10.68 (100), 5.34 (60), 3.56 (44), 2.673 (5), 2.768 (2), 2.570 (2), 1.781 (2)

Chemistry:

	(1)	(2)
SO_3	20.15	23.71
MnO	9.95	10.50
CuO	40.60	47.11
ZnO	4.47	
H_2O	[24.83]	18.68
Total	[100.00]	100.00

(1) Temperino mine, Italy; by electron microprobe, average of three analyses, total Mn as MnO, H_2O by difference; corresponds to $(Cu_{3.62}Zn_{0.39})_{\Sigma=4.01}Mn_{0.99}(SO_4)_{1.78}(OH)_{6.44} \cdot 6.55H_2O$.
(2) $Cu_4Mn(SO_4)_2(OH)_6 \cdot 4H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of a metallic sulfide skarn deposit.

Association: Gypsum, brochantite, antlerite.

Distribution: From the Temperino mine, Campiglia Marittima, Tuscany, Italy.

Name: For the locality which provided the first specimens, Campiglia Marittima, Italy.

Type Material: Mineralogical Museum, University of Florence, Florence, 214/I; National Museum of Natural History, Washington, D.C., USA, 148483–148485.

Canaphite $CaNa_2(P_2O_7)\cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group: m.* Crystals are prismatic, elongated along [100] and tabular on {010}, to 0.5 mm, showing {010}, with {100}, and {001}, in radiating clusters; as spherical nodules.

Physical Properties: *Cleavage:* Perfect on {010}; poor on {100} and {001}. Hardness = ∼2 D(meas.) = 2.24 D(calc.) = 2.27

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). *Orientation:* $Z = b$; $X \wedge c = 25°$. $\alpha = 1.496(2)$ $\beta = 1.504(2)$ $\gamma = 1.506(4)$ 2V(meas.) = 52(5)° 2V(calc.) = 52.9°

Cell Data: *Space Group: Pc.* $a = 5.673(4)$ $b = 8.48(1)$ $c = 10.529(5)$ $\beta = 106.13(6)°$ Z = 2

X-ray Powder Pattern: Haledon, New Jersey, USA.
3.06 (100), 2.608 (90), 8.47 (80), 5.44 (80), 4.36 (70), 5.06 (60), 3.87 (60)

Chemistry:

	(1)	(2)
P_2O_5	43.4	42.75
MgO	0.2	
CaO	17.5	16.89
Na_2O	16.5	18.66
H_2O	21.8	21.70
Total	99.4	100.00

(1) Haledon, New Jersey, USA; by electron microprobe, H_2O by DTA–TGA; corresponds to $Ca_{1.03}Mg_{0.03}Na_{1.74}(P_{2.00}O_7)\cdot 3.96H_2O$. (2) $CaNa_2(P_2O_7)\cdot 4H_2O$.

Occurrence: On a museum micromount specimen presumably from a trap-rock quarry (Haledon, New Jersey, USA); in recent lake-bed sediments (La Cruz Lake, Spain).

Association: Stilbite, quartz (Haledon, New Jersey, USA).

Distribution: Attributed to [Braens quarry,] Haledon [or Great Notch quarry, near Little Falls], Passaic Co., New Jersey, USA. From La Cruz Lake, Cuenca Province, Spain.

Name: For CAlcium, sodium, NAtrium, and PHosphate in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160286.

Na_2O	8.01	7.08	Total	100.02	99.01

(1–2) Khibiny massif, Russia. (3) Murun massif, Russia; analysis not given, stated to correspond to $Na_{2.96}K_{2.94}(Ca_{4.69}Fe_{0.17}Mg_{0.08}Mn_{0.07}Al_{0.05}Ti_{0.01})_{\Sigma=5.07}Si_{12}O_{30}[(OH)_{2.27}F_{1.48}O_{0.25}]_{\Sigma=4.00}$.

Occurrence: In pegmatites in a differentiated alkalic massif (Khibiny massif, Russia); in charoitic rocks (Murun massif, Russia).

Association: Fenaksite, lamprophyllite, titanite, eudialyte, nepheline, pyroxene, orthoclase (Khibiny massif, Russia); tinaksite, miserite, charoite (Murun massif, Russia).

Distribution: On Mts. Yukspor and Rasvumchorr, Khibiny massif, Kola Peninsula, and in the Murun massif, southwest of Olekminsk, Yakutia, Russia.

Name: For CAlcium, sodium, NAtrium, and SIlicon in the chemical composition.

Type Material: Geology Museum, Kola Branch, Academy of Sciences, Apatity, 801; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 61128029; National Museum of Natural History, Washington, D.C., USA, 136472.

Canavesite $Mg_2(HBO_3)(CO_3)\cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* n.d. As fibrous [010], flattened pseudohexagonal crystals, to 3 mm, typically in rosettelike aggregates.

Physical Properties: *Cleavage:* On {*h*0*l*}, one or more sets. *Tenacity:* Slightly flexible. Hardness = n.d. D(meas.) = ∼1.8 D(calc.) = 1.790

Optical Properties: Transparent. *Color:* Colorless to milky white. *Luster:* Vitreous, silky in aggregates.
Optical Class: Biaxial (+). *Orientation:* $Z = b$. *Dispersion:* Very weak. $\alpha = 1.485(4)$ $\beta = 1.494(4)$ $\gamma = 1.505(2)$ 2V(meas.) = Very large.

Cell Data: *Space Group:* n.d. $a = 23.49(2)$ $b = 6.164(6)$ $c = 21.91(2)$ $\beta = 114.91(9)°$ Z = 12

X-ray Powder Pattern: Brosso mine, Italy.
9.54 (100), 8.12 (40), 4.56 (21), 3.110 (19), 7.80 (18), 7.53 (14), 2.233 (14)

Chemistry:

	(1)	(2)
CO_2	18.57	17.02
B_2O_3	12.70	13.47
MgO	31.60	31.18
H_2O	37.44	38.33
Total	100.31	100.00

(1) Brosso mine, Italy; average of two analyses, CO_2 and H_2O by elemental analyzer; corresponding to $Mg_{2.03}(HBO_3)_{0.94}(CO_3)_{1.09}\cdot 4.91H_2O$. (2) $Mg_2(HBO_3)(CO_3)\cdot 5H_2O$.

Occurrence: A rare secondary mineral on tunnel surfaces in an abandoned mine in weathering ludwigite–magnetite skarn.

Association: Ludwigite, magnetite.

Distribution: From the Brosso mine, northwest of Ivrea, Piedmont, Italy.

Name: For the Canavese district, in which the mine that produced the first specimens is located.

Type Material: Municipal Natural History Museum, Milan, 17349, M30079, M30099, M300100, M300102; National Museum of Natural History, Washington, D.C., USA, 148483–148485; University of Florence, Florence; University of Torino, Torino, Italy; National School of Mines, Paris, France; The Natural History Museum, London, England, 1981,468.

(1) Dungannon Township, Ontario, Canada. (2) Iron Hill, Colorado, USA.
(3) $Na_6Ca_2Al_6Si_6O_{24}(CO_3)_2$.

Mineral Group: Cancrinite group.

Occurrence: A primary mineral in some alkalic igneous rocks, including pegmatites in nepheline syenites; also as an alteration product of nepheline.

Association: Nepheline, sodalite, natrolite, orthoclase, monticellite, titanian andradite, zircon.

Distribution: At Miass, Ilmen Mountains, Southern Ural Mountains, and on the Kola Peninsula, Russia. From Tvedalen and the Langesundsfjord, Norway. Found near Loch Borolan, Assynt, Scotland. Around the Laacher See, Eifel district, Germany. From Vesuvius, Campania, Italy. In the USA, from Gardiner and Litchfield, Kennebec Co., Maine; Pennsburg, Chester Co., Pennsylvania; at Iron Hill, Gunnison Co., Colorado; and Point of Rocks, Colfax Co., New Mexico. In Canada, from Bancroft, Egan Chute, and Blue Mountain, Ontario; at Mont Saint-Hilaire, Quebec; and a number of other lesser localities.

Name: For Count Egor Frantsevich Kankrin (Georg Cancrin) (1774–1845), German-Russian Minister of Finance of Russia.

Type Material: Humbolt Museum, Berlin, Germany.

Cancrisilite $Na_7Al_5Si_7O_{24}(CO_3)\cdot 3H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6mm$. Anhedral, granular, to 3 mm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5
D(meas.) = 2.40(2) D(calc.) = 2.39 Fluoresces yellow under UV.

Optical Properties: Transparent to translucent. *Color:* Lilac; colorless in thin section.
Streak: White. *Luster:* Vitreous.
Optical Class: Uniaxial (–). $\omega = 1.509(2)$ $\epsilon = 1.490(2)$

Cell Data: *Space Group:* $P6_3mc$. $a = 12.575(3)$ $c = 5.105(2)$ $Z = 1$

X-ray Powder Pattern: Lovozero massif, Russia; resembles cancrinite.
3.22 (100), 3.65 (90), 6.30 (70), 4.61 (50), 2.722 (50), 2.597 (20), 2.402 (20)

Chemistry:

	(1)
SiO_2	43.11
Al_2O_3	24.42
Fe_2O_3	0.33
MnO	0.11
CaO	0.68
Na_2O	21.30
K_2O	0.10
H_2O	5.01
CO_2	4.82
SO_3	0.36
Total	100.24

(1) Lovozero massif, Russia, corresponding to $(Na_{6.89}Ca_{0.12}Fe^{3+}_{0.04}Mg_{0.03}K_{0.02})_{\Sigma=7.10}(Si_{7.20}Al_{4.80})_{\Sigma=12.00}O_{24.10}(CO_3)_{1.10}(SO_4)_{0.04}\cdot 2.79H_2O$.

Mineral Group: Cancrinite group.

Occurrence: In ultra-agpaitic pegmatites in a differentiated alkalic massif.

Association: Potassic feldspar, nepheline, sodalite, arfvedsonite, aegirine, manaksite, eudialyte, lamprophyllite, additional minor minerals.

Distribution: From Mts. Alluaiv and Karnasurt, and in the Chinglusuai River valley, Lovozero massif, Kola Peninsula, Russia.

Name: For the relatively high ratio of silicon to aluminum, and its relation to *cancrinite*.

Type Material: Vernadsky Geological Museum, Moscow; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, p503/1.

(1) Aullagas, Bolivia. (2) Revelstoke, Canada; by electron microprobe. (3) Ag_8SnS_6.

Polymorphism & Series: Forms a series with argyrodite; stable below 172 °C.

Occurrence: In polymetallic veins, formed very late in the paragenetic sequence.

Association: Argyrodite, pyrargyrite, stephanite, acanthite, polybasite, freibergite, stannite, stannoidite, cassiterite, arsenopyrite, jordanite, marcasite, pyrrhotite, sphalerite, galena.

Distribution: In Bolivia, exceptional crystals from the Gallofa vein, Aullagas, near Colquechaca, and at the Guadaloupe mine, Chocaya, Potosí. From the Pirquitas deposit, Riconada Department, Jujuy Province, Argentina. In Canada, from about 33 km northeast of Revelstoke, British Columbia. At the Campbell mine, Bisbee, Cochise Co., Arizona, and the Leadville district, Lake Co., Colorado, USA. In the Himmelsfürst mine, Erbisdorf, near Freiberg, Saxony, Germany. From Rejská, near Kutná Hora, and Příbram, Czech Republic. In the Ikuno and Omidani mines, Hyogo Prefecture, and the Ashio mine, Tochigi Prefecture, Japan. At Shuiji, Jianyang Co., Fujian Province, China. From the Karamken Au–Ag deposit, Okhotsk district, and at the Belukhinsk tungsten deposit, eastern Transbaikalia, Russia. Other minor occurrences are known.

Name: Honoring Frederick Alexander Canfield (1849–1926), American mining engineer and mineral collector of Dover, New Jersey, USA.

Cannizzarite $Pb_{46}Bi_{54}S_{127}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As very thin single laths, to 2 mm, straight, or commonly warped, with frayed ends; as felted masses and stellate groups. *Twinning:* Stellate trillings and as simple V-shapes.

Physical Properties: *Tenacity:* Somewhat malleable, slightly elastic, easily twisting and bending. Hardness = ∼2 VHN = 132 (20 g load). D(meas.) = 6.7 D(calc.) = 6.95

Optical Properties: Opaque. *Color:* White to silvery gray, tarnishes iridescent. *Luster:* Metallic. *Anisotropism:* Strong, from blue to gray.
R_1–R_2: (400) 49.2–51.3, (420) 49.8–52.4, (440) 50.4–53.5, (460) 50.7–53.7, (480) 50.6–53.3, (500) 50.2–52.8, (520) 49.7–52.2, (540) 49.2–51.6, (560) 48.6–51.0, (580) 48.2–50.4, (600) 47.8–50.0, (620) 47.5–49.5, (640) 47.3–49.2, (660) 47.2–49.0, (680) 47.2–49.0, (700) 47.2–49.2

Cell Data: *Space Group:* $P2_1/m$. $a = 4.13$ $b = 4.09$ $c = 15.48$ $\beta = 98.56°$ $Z = 1$

X-ray Powder Pattern: Vulcano, Italy (shows some preferred orientation).
3.82 (10), 3.01 (6), 2.68 (6), 2.87 (5), 2.22 (5), 2.03 (5), 1.910 (4)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Pb	36.21	37.51	38.30	Sb	0.02		
Ag		0.17		Te		0.21	
Fe		0.03		Se	4.56		
Bi	44.56	44.96	45.34	S	14.07	16.25	16.36
				Total	99.42	[99.13]	100.00

(1) Vulcano, Italy; by electron microprobe, average of eight analyses; corresponds to $Pb_{44.70}(Bi_{54.54}Sb_{0.02})_{\Sigma=54.56}(S_{112.23}Se_{14.77})_{\Sigma=127.00}$. (2) Mittal-Hohtenn tunnel, Switzerland; by electron microprobe, corresponding to $(Pb_{45.22}Ag_{0.39})_{\Sigma=45.61}Bi_{53.74}(S_{126.59}Te_{0.41})_{\Sigma=127.00}$. (3) $Pb_{46}Bi_{54}S_{127}$.

Occurrence: Associated with deep fumarolic activity (Vulcano, Italy); in sulfide veinlets in a greisen Sn–W deposit in granite (Shumilovsk deposit, Russia).

Association: Lillianite, mozgovaite, kirkiite, barberiite, galenobismutite, bismuthinite, galena, gold, tellurium (Vulcano, Italy); wolframite, cassiterite, bismuthinite, galena, cosalite, heyrovskýite, galenobismutite, bursaite, tetradymite, joséite-B, bismuth, quartz (Shumilovsk deposit, Russia).

Distribution: In Italy, on Vulcano, in the Lipari Islands [TL], and from the Ginevro mine, Elba. From Santa Maria, Val Medel, Graubünden, at Goppenstein, Lotschental, and in the Mittal-Hohtenn tunnel, Valais, Switzerland. From the Felbertal tungsten mine, Salzburg, Austria. In the Shumilovsk Sn–W deposit, west Transbaikal, and the Vysokogorsk deposit, Far Eastern Region, Russia. From the Hobenzan granitic complex, Yamaguchi Prefecrure, Japan. At Landsman Camp, Graham Co., Arizona, USA.

Name: Honors Stanislao Cannizzaro (1826–1910), celebrated Italian chemist, University of Rome, Italy.

Type Material: University of Florence, Florence, Italy, 14398/G; Natural History Museum, 128.28; National School of Mines, Paris, France.

Cannonite $Bi_2O(SO_4)(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As equant to prismatic crystals, elongated along $[\bar{1}02]$, to 200 μm; granular massive.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4 VHN = 183–280, 229 average (100 g load). D(meas.) = 6.5(1) (synthetic). D(calc.) = 6.515

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Adamantine. *Optical Class:* Biaxial. α = [1.91] β = n.d. γ = [1.99] 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_1/c$. a = 7.700(3) b = 13.839(6) c = 5.686(2) β = 109.11(3)° Z = 4

X-ray Powder Pattern: Tunnel Extension mine, Utah, USA.
3.206 (100), 1.984 (90), 2.924 (70), 3.644 (60), 3.466 (60), 2.782 (50), 3.513 (40)

Chemistry:

	(1)	(2)
SO_3	14.18	14.20
Bi_2O_3	82.53	82.61
H_2O	[3.29]	3.19
Total	[100.00]	100.00

(1) Tunnel Extension mine, Utah, USA; by electron microprobe, average of ten analyses, recalculated from an elemental analysis; H_2O by difference, presence of $(OH)^{1-}$ by analogy to the synthetic compound; then corresponding to $Bi_{1.99}O(S_{0.99}O_4)(OH)_{2.08}$. (2) $Bi_2O(SO_4)(OH)_2$.

Occurrence: An alteration product in a Cu–Bi–Au-sulfide deposit.

Association: Covellite, cuprobismutite, bismuthinite, quartz.

Distribution: In the USA, from the Tunnel Extension mine, Marysvale, Ohio district, Piute Co., Utah.

Name: Honors Benjamin Bartlett Cannon, V (1950–), amateur mineralogist of Seattle, Washington, USA, who recognized the first specimens.

Type Material: The Natural History Museum, London, England, 1992,239, 1992,240, and E.1456; Canadian Geological Survey, Ottawa, Canada, 67428.

References: (1) Stanley, C.J., A.C. Roberts, D.C. Harris, A.J. Criddle, and J.T. Szymański (1992) Cannonite, $Bi_2O(OH)_2SO_4$, a new mineral from Marysvale, Utah, USA. Mineral. Mag., 56, 605–609. Caoxite $CaC_2O_4 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. As elongated crystals, tabular on {010}, with polygonal outline, to 0.5 mm; as crystalline spherulites.

Physical Properties: *Cleavage:* On {010}, good. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.87

Optical Properties: Transparent. *Color:* Colorless. *Streak:* White. *Luster:* Vitreous. *Optical Class:* Biaxial (–). $\alpha = 1.483(3)$ (α') $\beta = [1.516]$ $\gamma = 1.533(3)$ (γ') 2V(meas.) = 70(2)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.097(1)$ $b = 7.145(1)$ $c = 8.434(1)$ $\alpha = 76.54(1)°$ $\beta = 70.30(1)°$ $\gamma = 70.75(1)°$ Z = 2

X-ray Powder Pattern: Cerchiara mine, Italy.
5.52 (vs), 2.834 (s), 7.92 (m), 5.26 (m), 4.99 (m), 3.643 (m), 2.758 (m)

Chemistry:

	(1)	(2)
C_2O_3	[39.54]	39.54
CaO	30.03	30.79
H_2O	[29.67]	29.67
Total	[99.24]	100.00

(1) Cerchiara mine, Italy; by electron microprobe, average of five analyses, C_2O_3 and H_2O calculated from the ideal formula; corresponds to $Ca_{0.98}C_{2.01}O_4 \cdot 3.01H_2O$ (2) $CaC_2O_4 \cdot 3H_2O$.

Occurrence: In veinlets cutting metamorphosed Mn–Ba-rich cherts in an obducted ophiolite.

Association: Quartz, barite, manganese oxides.

Distribution: From the Cerchiara mine, near Faggiona, Val di Vara, Liguria, Italy.

Name: An acronym with two meanings, for the essential chemical components, CAlcium and OXalate, or the Centennial Anniversary Of X-rays, an essential analytical tool in modern mineralogy.

Type Material: University of Genoa, Genoa, Italy.

References: (1) Basso, R., G. Lucchetti, L. Zefiro, and A. Palenzona (1997) Caoxite, $Ca(H_2O)_3(C_2O_4)$, a new mineral from the Cerchiara mine, northern Appennines, Italy. Neues Jahrb. Mineral., Monatsh., 84–96. (2) (1998) Amer. Mineral., 83, 185 (abs. ref. 1).

Capgaronnite $HgS \cdot Ag(Cl, Br, I)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As single crystals, elongated along [001] and flattened on {010}, showing {010}, {100}, {110}, and {*h*0*l*}, to 1 mm; in tufted aggregates. *Twinning:* On {*h*0*l*}, as contact twins.

Physical Properties: *Cleavage:* {010}, perfect. *Fracture:* Irregular. *Tenacity:* Sectile. Hardness = Soft. D(meas.) = n.d. D(calc.) = 6.19

Optical Properties: Translucent to opaque. *Color:* Black. *Streak:* Gray-black. *Luster:* Subadamantine to submetallic.
Optical Class: Biaxial (–) (probable). *Pleochroism:* X = dark brown; Z = gray to purple. *Orientation:* $X = c$; $Y = b$; $Z = a$. $\alpha = \sim 2.2$ β = n.d. $\gamma = \sim 2.3$ 2V(meas.) = n.d.

Cell Data: *Space Group:* $P2_12_12$. $a = 6.803(8)$ $b = 12.87(1)$ $c = 4.528(7)$ $Z = 4$

X-ray Powder Pattern: Cap Garonne mine, France.
2.664 (100), 3.762 (60), 3.637 (60), 6.43 (40), 2.265 (40), 3.283 (30), 2.047 (20)

Chemistry:

	(1)
Ag	23.99
Hg	53.92
S	7.96
Cl	10.58
Br	5.17
I	0.33
Total	101.95

(1) Cap Garonne mine, France; by electron microprobe, average of five analyses; corresponds to $Hg_{0.98}Ag_{0.80}S_{0.90}(Cl_{1.08}Br_{0.23}I_{0.01})_{\Sigma=1.32}$.

Occurrence: Probably formed from oxidation of Hg–Ag-rich tennantite exposed to seawater (Cap Garonne mine, France).

Association: Olivenite, cyanotrichite, brochantite, parnauite, tennantite, strüverite, tourmaline, perroudite.

Distribution: In the Cap Garonne mine, near le Pradet, Var, France. At Chañarcillo, south of Copiapó, Atacama, Chile. From the Broken Hill Proprietary mine, New South Wales, Australia.

Name: For the occurrence in the Cap Garonne mine, France.

Type Material: n.d.

References: (1) Mason, B., W.G. Mumme, and H. Sarp (1992) Capgaronnite, $HgS \cdot Ag(Cl, Br, I)$, a new sulfide-halide mineral from Var, France. Amer. Mineral., 77, 197–200.

Cappelenite-(Y) $Ba(Y,Ce)_6Si_3B_6O_{24}F_2$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Metamict; hexagonal after reconstitution at 725 °C. *Point Group:* 3. As crystals, thick hexagonal prismatic, showing $\{10\bar{1}0\}$, $\{0001\}$, and $\{10\bar{1}3\}$, to 2 cm.

Physical Properties: *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6–6.5 D(meas.) = 4.407 D(calc.) = [4.50]

Optical Properties: Translucent. *Color:* Greenish brown, pale yellowish. *Luster:* Vitreous to greasy.
Optical Class: Uniaxial (–). $n = \sim 1.76$; birefringence rather strong.

Cell Data: *Space Group:* $P3$. $a = 10.67(2)$ $c = 4.680(2)$ $Z = 1$

X-ray Powder Pattern: Metamict.

Chemistry:

	(1)	(2)

Total	[100.00]	100.00

(1) Lille Arø Island, Langesundsfjord, Norway; B_2O_3 by difference, corresponds to $(Ba_{0.64}La_{0.22}Na_{0.10}K_{0.05})_{\Sigma=1.01}(Y_{5.74}Ca_{0.15}Ce^{4+}_{0.09}Th_{0.04})_{\Sigma=6.02}Si_{2.91}B_{6.07}O_{24}F_2$. (2) $BaY_6Si_3B_6O_{24}F_2$.

Occurrence: In a small vein in nepheline syenite pegmatite.

Association: Wöhlerite, rosenbuschite, thorite, catapleiite, låvenite, nepheline, sodalite.

Distribution: On Lille Arø Island, in the Langesundsfjord, Norway.

Name: For D. Cappelen of Holden, Norway, a collector who discovered the mineral, and its *yttrium* content.

Type Material: University of Oslo, Oslo, Norway; National Museum of Natural History, Washington, D.C., USA, 160547.

Caracolite $Na_3Pb_2(SO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Typically as incrustations of prismatic crystals, to 3 mm. *Twinning:* Pseudohexagonal trillings are produced by twinning, which may be polysynthetic.

Physical Properties: Hardness = 4.5 D(meas.) = ∼5.1 D(calc.) = 4.50 Decomposes in H_2O, leaving $PbSO_4$.

Optical Properties: Transparent. *Color:* Colorless, pale gray, may be stained green.
Luster: Vitreous.
Optical Class: Biaxial (–). *Dispersion:* $r > v$, strong. $\alpha = 1.743(5)$ $\beta = 1.754(5)$ $\gamma = 1.764(5)$ 2V(meas.) = Very large.

Cell Data: *Space Group:* $P2_1/m$. $a = 19.62$ $b = 7.14$ $c = 9.81$ $\beta = 90°$ Z = 4

X-ray Powder Pattern: Beatriz mine, Chile. (ICDD 25-706).
2.927 (100), 1.906 (56), 3.55 (55), 2.876 (45), 2.132 (35), 8.45 (31), 4.03 (31)

Total		100.00

(1) Beatriz mine, Chile; partial analysis of impure material; composition established by crystal-structure analysis of natural and synthetic material. (2) $Na_3Pb_2(SO_4)_3Cl$.

Occurrence: A rare secondary mineral in the oxidized zone of chlorine-rich lead deposits.

Association: Boleite, pseudoboleite, bindheimite, anglesite, galena (Beatriz mine, Chile); atacamite, boleite, osarizawaite–beaverite, paratacamite (Herminia mine, Chile).

Distribution: From the Beatriz, Herminia, Santa Ana, and San Rafael mines, Sierra Gorda district, southwest of Calama, Antofagasta, Chile. In the Auguste-Victoria mine, Marl-Hüls, Ruhr Valley, North Rhine-Westphalia, Germany.

Name: For Caracoles, a town near the Beatriz mine, Chile.

(1) China. (2) $Ca_2Mg[B(OH)_4]_2(CO_3)_2 \cdot 4H_2O$.

Occurrence: In a lacustrine borate deposit.

Association: Ulexite, hydroboracite, gypsum.

Distribution: From China, at an unspecified locality [Dafangshan, Qinghai Plateau, Tibet].

Name: For the essential anionic chemical components, CARBOnate and BORate.

Type Material: n.d.

References: (1) Hsien-Te Hsieh, Tze-Chiang Chien, and Lai-Pao Liu (1964) The new mineral carboborite, $MgCa_2[CO_3|B_2O_5] \cdot 10H_2O$. Scientia Sinica, 13, 813–821 (in Russian). (2) (1965) Amer. (1) Bayan Obo deposit, China; corresponds to $(Ca_{0.78}Na_{0.26})_{\Sigma=1.04}(Sr_{0.44}RE_{0.40}Ba_{0.10})_{\Sigma=0.94}(CO_3)_2$. (2) Sarnu-Dandali complex, India; by electron microprobe, CO_2 calculated from stoichiometry; corresponds to $(Ca_{0.67}Na_{0.33})_{\Sigma=1.00}(Sr_{0.31}RE_{0.44}Ca_{0.15}Ba_{0.03}Mn_{0.03})_{\Sigma=0.96}(CO_3)_2$.

Occurrence: An uncommon accessory mineral in dolomite–calcite carbonatite associated with an alkaline ultramafic massif (Vuoriyarvi massif, Kola Peninsula, Russia); exsolved from calcite and in a carbonatite dike in fenitized melanephelinite (Sarnu-Dandali complex, India).

Association: "Chlorite", ankerite, alstonite, anatase, quartz (Vuoriyarvi complex, Kola Peninsula, Russia); dolomite, barite, "chlorite", mckelveyite-(Y), calkinsite-(Ce), khanneshite (Khanneshin complex, Afghanistan.).

Distribution: In Russia, from the Vuoriyarvi carbonatite complex and in the Khibiny massif, Kola Peninsula; at the Ozernyi carbonatite, southeastern Sakha. At the Khanneshin carbonatite complex, Afghanistan. In the Bayan Obo Fe–Nb–RE deposit, 130 km north of Baotou, Inner Mongolia, and at Weishan, Shandong Province, China. From the Phan Si Pan Range, Vietnam. At the Sarnu-Dandali alkaline complex, Barmer District, Rajasthan, India. In Canada, at Sturgeon Narrows, Sturgeon Lake, Thunder Bay district, Ontario; from Mont Saint-Hilaire, Quebec.

Name: For the essential chemical components, CARBOnate, CERium, and sodium, NAtrium.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 64100.

Carbonate-cyanotrichite $Cu_4Al_2(CO_3,SO_4)(OH)_{12}\cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: n.d. *Point Group:* n.d. Individual platelets and acicular crystals, to 5 mm, typically in radiating fibrous crusts and spherules.

Physical Properties: Hardness = < 2 D(meas.) = 2.66(1) D(calc.) = n.d.

Optical Properties: Semitransparent. *Color:* Pale blue to azure-blue. *Luster:* Silky. *Optical Class:* Biaxial (+). *Pleochroism:* Strong; X = colorless; Z = bright blue. *Orientation:* Negative elongation, parallel extinction. *Dispersion:* $r > v$, strong. $\alpha = 1.616(2)$ β = n.d. $\gamma = 1.677(2)$ 2V(meas.) = 55°–60°

Cell Data: *Space Group:* n.d. Z = n.d.

X-ray Powder Pattern: Balasauskandyk deposit, Kazakhstan.
4.21 (100), 10.13 (93), 5.03 (60), 3.33 (58), 2.01 (53), 2.51 (52), 2.77 (45)

Chemistry:

	(1)		(1)
SO_3	4.05	ZnO	0.62
CO_2	5.20	CaO	0.55
SiO_2	2.98	MgO	0.26
V_2O_4	0.16	H_2O^+	22.90
Al_2O_3	18.10	H_2O^-	1.45
CuO	44.40	Total	100.67

(1) Balasauskandyk deposit, Kazakhstan; after deducting quartz 2.98%, dolomite 0.88%, calcite 0.50%, and H_2O^- 0.80%, corresponds to $(Cu,Zn)_{3.70}Al_{2.30}(C_{0.67}S_{0.33})_{\Sigma=1.00}[O_{2.98}(OH)_{1.02}]_{\Sigma=4.00}(OH)_{12}\cdot 2H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of copper-bearing deposits.

Association: Volborthite, malachite, azurite, aurichalcite, pseudomalachite, spangolite, gibbsite, allophane (Balasauskandyk deposit, Kazakhstan); volborthite, tangeite, malachite, brochantite, langite (Menzies Bay, Canada).

Distribution: From the Balasauskandyk, Kurumsak, and other vanadium deposits, Kara-Tau Mountains, Kazakhstan. On Mt. Dzhebagly, Talass Alatau Range, and from Sary-Dzhas, Terskii Alatau Range, Kyrgyzstan. In the USA, from the Engels mine, north of Taylorsville, Plumas Co., California; in several mines at Bisbee, Cochise Co., Arizona; at the Gold Quarry mine, near Carlin, Maggie Creek district, Eureka Co., Nevada; from the Jomac mine, White Canyon district, San Juan Co., Utah; at the Emery mine, Chester, Hampton Co., Massachusetts. From Menzies Bay, Vancouver Island, British Columbia, Canada. In France, from the Cap Garonne mine, near le Pradet, Var, and in the Valcroze mine, Alzon, Gard. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland. From South Wheal Crebor, Tavistock, Devon, England. In the Wedding Cave mine, Bwlchgwyn, Clwyd, Wales. From the Maharahara mine, near Woodville, New Zealand. A few other minor localities are known.

Name: As the *carbonate*-dominant analog of *cyanotrichite*.

Type Material: Mining Museum, St. Petersburg, 1396/2–3; Vernadsky State Geological Museum, Moscow, 49844; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 65618, 65619.

(1) Wheal Franco, Devon, England; corresponding to $(Ca_{4.99}Mg_{0.01})_{\Sigma=5.00}[(PO_4)_{2.79}(CO_3)_{0.40}]_{\Sigma=3.19}[F_{1.01}(OH)_{0.26}]_{\Sigma=1.27}$. (2) Staffel, Germany (fossil bone); corresponding to $Ca_{4.78}[(PO_4)_{2.70}(CO_3)_{0.28}]_{\Sigma=2.98}[F_{0.92}(OH)_{0.08}]_{\Sigma=1.00}$.

Mineral Group: Apatite group.

Occurrence: Typically of secondary origin. An important constituent of fossil bone, teeth, and marine phosphorite deposits. In carbonatites and nepheline syenite pegmatites. In fractures in phosphate-rich nodules.

Association: Glauconite, quartz, dolomite, clay minerals (phosphorites); beryl, fluorite, calcite, hematite, phlogopite, quartz (pegmatites).

Distribution: High-carbonate fluorapatite has been analyzed from many localities, although none can be considered well-characterized, as the mechanism whereby carbonate is incorporated in the mineral is still controversial. From Wheal Franco, near Tavistock, Devon, England. In Germany, at Dehrn and Staffel, near Limburg, Hesse. In the USA, at the Little Green Monster mine, Clay Canyon, about nine km west of Fairfield, Utah Co., Utah; at Point of Rocks, Colfax Co., New Mexico; abundant (billions of tons of ore-grade material) in the Coastal Plain phosphorite deposits of the southeastern USA and western USA Phosphoria Formation. From Mont Saint-Hilaire and near Saint-Amable, Quebec, and along Rapid Creek, Yukon Territory, Canada. At the Zheleznyi iron mine, Kovdor massif, and in many pegmatites in the Lovozero massif, Kola Peninsula, Russia.

Name: For a *fluorapatite* with essential *carbonate*.

(1) The Kaiserstuhl, Germany; by electron microprobe and coulometric analysis, average of six analyses, $(OH)^{1-}$ calculated for stoichiometry; corresponding to $(Ca_{4.97}Sr_{0.02}Ce_{0.01})_{\Sigma=5.00}[(PO_4)_{2.77}(CO_3)_{0.10}(SiO_2)_{0.10}(SO_3)_{0.03}]_{\Sigma=3.00}[(OH)_{0.72}F_{0.25}Cl_{0.03}]_{\Sigma=1.00}$.

Mineral Group: Apatite group.

Occurrence: As cement in phosphatic soils and bioclastic limestones. An accessory mineral in carbonatites and alkaline igneous rocks.

Association: Calcite.

Distribution: Carbonatian hydroxylapatite has been analyzed from many localities, although the species is not well-characterized, as the mechanism whereby carbonate is incorporated is controversial. At the Ødegården apatite mines, Bamble, Norway. From the Kaiserstuhl, Baden-Württemberg, Germany. Found on Tuvalu (Ellice Islands), central Pacific. At Phalaborwa, Transvaal, South Africa. From Magnet Cove, Hot Spring Co., Arkansas, USA.

Name: For a *carbonate*-rich *hydroxylapatite*.

Type Material: n.d.

Caresite $Fe_4^{2+}Al_2(CO_3)(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\overline{1}$ or 1. As radiating tufts and bundles of crystals, to 2 mm; crystals elongated ‖ [101] and flattened on {001}. Forms observed are {100} and {001}, also (110). *Twinning:* Always, by rotation about [101].

Physical Properties: Hardness = n.d. D(meas.) = 2.86 D(calc.) = 2.89

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X \simeq b$; $Z \wedge c = 10(5)°$. $\alpha = 1.411(2)$ $\beta = 1.416(2)$ $\gamma = 1.422(2)$ 2V(meas.) = 77(2)° 2V(calc.) = 78°

Cell Data: *Space Group:* $C\overline{1}$ or $C1$. $a = 9.48(5)$ $b = 6.98(3)$ $c = 9.30(5)$ $\alpha = 91.14(10)°$ $\beta = 104.85(10)°$ $\gamma = 90.0(10)°$ Z = 4

X-ray Powder Pattern: Hagendorf, Germany.
3.48 (100), 4.56 (70), 3.69 (60), 2.852 (40), 1.460 (40), 2.277 (30), 2.242 (30)

Chemistry:

	(1)	(2)
Ca	29.86	31.05
Al	10.27	10.45
F	52.1	51.52
H_2O	7.0	6.98
Total	99.23	100.00

(1) Hagendorf, Germany; by electron microprobe, average of two analyses, H_2O by DTA–TGA; corresponds to $Ca_{1.90}Al_{0.97}F_7\cdot 0.96H_2O$. (2) $Ca_2AlF_7\cdot H_2O$.

Occurrence: Formed by hydrothermal alteration of triphyllite in a pegmatite.

Association: Rockbridgeite, pyrite, strengite, apatite.

Distribution: Originally noted on a museum specimen, labelled only "Hagendorf", the matrix of which resembles that of pegmatites in the Hagendorf area, Bavaria, Germany. Since found in the Hagendorf-Süd pegmatite.

Name: For Dr. Carl Hintze (1851–1916), Professor of Mineralogy, Univerity of Breslau, Breslau, Germany, noted for his compilation of the famous *Handbuch der Mineralogie*.

Type Material: Royal Ontario Museum, Toronto, Canada, M35498; National Museum of Natural History, Washington, D.C., USA, B20119.

Carlgieseckeite-(Nd) $NaNdCa_3(PO_4)_3F$

Crystal Data: Hexagonal. *Point Group*: $\bar{3}$. As tabular hexagonal crystals to 1.3 mm, displaying {001} and {*hk*0} striated along [001]; also epitactically overgrow on prismatic crystals of Sr-bearing fluorapatite. *Twinning:* Microtwinning on {001} observed under the microscope in polarized light.

Physical Properties: *Cleavage*: None. *Fracture*: Uneven. *Tenacity*: Brittle. Hardness = 5 D(meas.) = n.d. D(calc.) = 3.91

Optical Properties: Transparent. *Color*: Almost colorless with a greenish hue in daylight, pink in yellow electric light; colorless in transmitted light. *Streak*: White. *Luster*: Vitreous. *Optical Class*: Uniaxial (-). ω = 1.655(3) ε = 1.632(2) [can be anomalously biaxial] α = 1.632(2) β = 1.654(3) γ = 1.656(3) 2V(meas.) = 15(5)° 2V(calc.) = 33°

Cell Data: *Space Group*: $P\bar{3}$. a = 9.4553(1) c = 6.9825(1) Z = 2

X-ray Powder Pattern: Kuannersuit Plateau, Ilímaussaq alkaline complex, South Greenland. 2.815 (100), 2.727 (42), 3.923 (27), 3.463 (23), 7.02 (22), 3.095 (19), 5.33 (18)

Chemistry:

	(1)		(1)
Na_2O	5.68	Sm_2O_3	2.89
CaO	18.53	Gd_2O_3	0.52
SrO	7.55	SiO_2	0.56
BaO	0.14	P_2O_5	32.72

Ce_2O_3	10.60	Cl	0.06
Pr_2O_3	2.62	$-O=(F,Cl)_2$	1.19
Nd_2O_3	15.08	Total	99.88

(1) Ilímaussaq alkaline complex, South Greenland; average of 10 electron microprobe analyses; corresponding to $Na_{1.17}Ca_{2.11}Sr_{0.46}Ba_{0.01}La_{0.05}Ce_{0.41}Pr_{0.10}Nd_{0.57}Sm_{0.11}Gd_{0.02}Si_{0.06}P_{2.94}O_{12.05}F_{0.94}Cl_{0.01}$.

Mineral Group: Apatite group, belovite subgroup.

Occurrence: In small cavities in veins of saccharoidal albite cross-cutting augite syenite.

Association: Analcime, fluorapatite, albite.

Distribution: From the Kuannersuit (Kvanefjeld) Plateau, Ilímaussaq alkaline complex, South Greenland.

Name: Honors Carl Ludwig Giesecke (1761-1833) for pioneering research in the mineralogy of Greenland; the suffix (-*Nd*) reflects the dominance of Nd over other REE in the composition.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow, Russia (# 3996/1).

References: (1) Pekov, I.V., N.V. Zubkova, T.A. Husdal, N.N. Kononkova, A.A. Agakhanov, A.E. Zadov, and D.Yu. Puscharovsky (2012) Carlgieseckeite-(Nd), $NaNdCa_3(PO_4)_3F$, a new belovite-group mineral species from the Ilímaussaq alkaline complex, South Greenland. Can. Mineral., 50(2), 571-580. (2) (2014) Amer. Mineral., 99, 2152 (abs. ref. 1).

Crystal Data: Triclinic, pseudomonoclinic. *Point Group:* $\bar{1}$ or 1. As radiating tufts and bundles of crystals, to 2 mm; crystals elongated || [101] and flattened on {001}. Forms observed are {100} and {001}, also (110). *Twinning:* Always, by rotation about [101].

Physical Properties: Hardness = n.d. D(meas.) = 2.86 D(calc.) = 2.89

Optical Properties: Transparent to translucent. *Color:* White to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+). *Orientation:* $X \simeq b$; $Z \wedge c = 10(5)°$. $\alpha = 1.411(2)$ $\beta = 1.416(2)$ $\gamma = 1.422(2)$ 2V(meas.) = 77(2)° 2V(calc.) = 78°

Cell Data: *Space Group:* $C\bar{1}$ or $C1$. $a = 9.48(5)$ $b = 6.98(3)$ $c = 9.30(5)$ $\alpha = 91.14(10)°$ $\beta = 104.85(10)°$ $\gamma = 90.0(10)°$ Z = 4

X-ray Powder Pattern: Hagendorf, Germany.
3.48 (100), 4.56 (70), 3.69 (60), 2.852 (40), 1.460 (40), 2.277 (30), 2.242 (30)

Chemistry:

	(1)	(2)
Ca	29.86	31.05
Al	10.27	10.45
F	52.1	51.52
H_2O	7.0	6.98
Total	99.23	100.00

(1) Hagendorf, Germany; by electron microprobe, average of two analyses, H_2O by DTA–TGA; corresponds to $Ca_{1.90}Al_{0.97}F_7 \cdot 0.96H_2O$. (2) $Ca_2AlF_7 \cdot H_2O$.

Occurrence: Formed by hydrothermal alteration of triphyllite in a pegmatite.

Association: Rockbridgeite, pyrite, strengite, apatite.

Distribution: Originally noted on a museum specimen, labelled only "Hagendorf", the matrix of which resembles that of pegmatites in the Hagendorf area, Bavaria, Germany. Since found in the Hagendorf-Süd pegmatite.

Name: For Dr. Carl Hintze (1851–1916), Professor of Mineralogy, Univerity of Breslau, Breslau, Germany, noted for his compilation of the famous *Handbuch der Mineralogie.*

Type Material: Royal Ontario Museum, Toronto, Canada, M35498; National Museum of Natural History, Washington, D.C., USA, B20119.

Carlinite Tl_2S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Small, to 0.5 mm, mostly anhedral grains. A few grains show poorly defined rhombohedral and tabular forms.

Physical Properties: *Cleavage:* {0001}, perfect, and an imperfect prismatic cleavage. *Fracture:* Hackly. Hardness = ∼1 VHN = 23.5 (50 g load). D(meas.) = 8.1 D(calc.) = 8.55

Optical Properties: Opaque. *Color:* Dark gray, oxidized surfaces become dull and darker; in reflected light, white with faint bluish cast. *Streak:* Dark gray to black. *Luster:* Bright metallic. *Pleochroism:* Brownish gray to bluish gray. *Anisotropism:* Moderate to distinct. *Bireflectance:* Weak.

R_1–R_2: (470) 39.6–41.3, (546) 38.8–40.1, (589) 39.2–40.6, (650) 40.5–42.0

Cell Data: *Space Group:* $R\overline{3}$. $a = 12.12(1)$ $c = 18.175(5)$ Z = 27

X-ray Powder Pattern: Carlin mine, Nevada, USA (shows extreme preferred orientation). 3.030 (100), 2.290 (3), 2.020 (3), 1.749 (3), 2.712 (1), 1.681 (1), 1.513 (1)

Chemistry:

	(1)	(2)
Tl	92.93	92.73
S	7.17	7.27
Total	100.09	100.00

(1) Carlin mine, Nevada, USA; average of three samples. (2) Tl_2S.

Occurrence: As small grains in brecciated fragments of carbonaceous limestone, a result of epithermal mineralization.

Association: Gold, arsenic, antimony, mercury, avicennite, organic carbon, quartz.

Distribution: In the USA, from the east pit of the Carlin mine [TL], 50 km northwest of Elko, and in the Deep Post orebody, Goldstrike mine, Lynn district, Eureka Co., Nevada.

Name: For the Carlin gold deposit, Nevada, USA, in which it was discovered.

Type Material: Department of Geology, Stanford University, Palo Alto, California, Epithermal Minerals Collection; National Museum of Natural History, Washington, D.C., USA, 132497.

Total	104.41	97.43

(1) Jaguaraçu pegmatite, Minas Gerais, Brazil; average of 7 electron microprobe analyses, H_2O calculated, OH and H_2O confirmed by IR spectroscopy; corresponds to $(\square_{0.68}Ca_{0.28}Nd_{0.02}Ce_{0.02})_{\sum=1.00}[U_{1.44}\square_{0.56}O_{2.88}(H_2O)_{1.12}](Nb_{0.80}Ta_{0.52}Si_{0.27}Ti_{0.21}Al_{0.11}Fe_{0.10})_{\sum=2.01}O_{4.72}(OH)_{3.20}(H_2O)_{2.08}$.
(2) Same as above; corresponding to $(\square_{0.67}Ca_{0.27}Nd_{0.05}Ce_{0.01})_{\sum=1.00}[U_{1.04}\square_{0.96}O_{2.08}(H_2O)_{1.92}](Nb_{0.79}Ta_{0.53}Si_{0.42}Ti_{0.08}Al_{0.10}Fe_{0.08})_{\sum=2.00}O_{4.00}(OH)_{3.96}(H_2O)_{2.04}$.

Polymorphism & Series: Forms a series between end members $(UO_2)_2Nb_2O_6(OH)_2(H_2O)_2$ and $(H_2O)_4Nb_2[O_2(OH)_4](OH)_2(H_2O)_2$.

Occurrence: A late-stage cavity filling in albite in a complex pegmatite.

Association: Albite, muscovite, zircon, kaolinite, columbite-(Fe).

Distribution: From the Jaguaraçu pegmatite, Minas Gerais, Brazil.

Name: Honors Carlos do Prado Barbosa (1917-2003), a chemical engineer, who as a dealer in mineral specimens, promoted the discovery and scientific study of rare mineral species.

Type Material: Museu de Geociências, Instituto de Geociências, Universidade de São Paulo, São Paulo, Brazil (DR707) and in the Systematic Reference Series, National Mineral Collection, Geological Survey, Ottawa, Ontario, Canada.

H_2O	n.d.
Total	95.6

(1) Zapiga, Chile; by electron microprobe, average of ten analyses, amounts thought low due to decay in electron beam, H_2O confirmed by crystal-structure analysis; corresponds to $K_{6.2}Na_{6.7}Mg_{10.0}[(Se^{6+}O_4)_{6.6}(SO_4)_{4.3}(CrO_4)_{1.1}]_{\Sigma=12.0}(IO_3)_{12.0}\cdot 12H_2O$.

Polymorphism & Series: Forms a series with fuenzalidaite.

Occurrence: A rare constituent of nitrate ores.

Association: Iquiqueite, nitratine, halite, darapskite, and residues containing dietzeite, brüggenite, tarapacaite, lopezite, ulexite, probertite, and gypsum after leaching in water.

Distribution: Probably from near Zapiga, Tarapacá, Chile.

Name: Honors Carlos Ruiz F. (1916–), first Director of the Chilean Geological Survey.

Type Material: n.d.

References: (1) Konnert, J.A., H.T. Evans, Jr., J.J. McGee, and G.E. Ericksen (1994) Mineralogical studies of the nitrate deposits of Chile: VII. Two new saline minerals with the composition $K_6(Na,K)_4Na_6Mg_{10}(XO_4)_{12}(IO_3)_{12}\cdot 12H_2O$: fuenzalidaite (X = S) and carlosruizite (X = Se). Amer. Mineral., 79, 1003–1008.

MnO	0.72
MgO	39.28
H_2O	16.85
Total	99.96

(1) Near Sampeyre, Italy; by electron microprobe, average of 15 analyses, H_2O by TGA; corresponds to $(Mg_{18.88}Fe_{1.08}Ti_{0.54}Mn_{0.20}Cr_{0.06})_{\Sigma=20.76}(Si_{11.46}Al_{0.40})_{\Sigma=11.86}H_{36.26}O_{63.00}$.

Occurrence: In a network of veins crosscutting a metamorphic antigorite serpentinite, in an ophiolite.

Association: Diopside, chrysotile, brucite, magnetite, clinohumite, perovskite, uvarovite (near Sampeyre, Italy).

Distribution: In Italy, in Piedmont, at a number of localities around Sampeyre and Casteldelfino, Varaita Valley; around Crissolo, Po Valley; at Monte Nebin, Maira Valley; and around Viù, Viù Valley. From Taberg, Sweden.

Name: For Professor Carlo Sturani (1938–1976), University of Torino, Torino, Italy.

Type Material: Regional Science Museum, Torino, Italy; Natural History Museum, Vienna, Austria, L9493; National Museum of Natural History, Washington, D.C., USA, 162683.

(1) Agpalilik (Cape York) meteorite; by electron microprobe, ranges of several analyses. (2) Descubridora meteorite; by electron microprobe, N by difference, corresponding to $(Cr_{0.96}Fe_{0.02})_{\Sigma=0.98}N$. (3) CrN.

Occurrence: As minute platelets and grain boundary precipitates in kamacite and troilite, and as similar grains ringing daubreelite in iron meteorites.

Association: Kamacite, taenite, daubreelite, troilite, sphalerite.

Distribution: First noted in the Agpalilik (Cape York) iron meteorite; since identified in more than 70 meteorites, mostly of Ga–Ge group IIIA, and also in groups I and IIA.

Name: For the Carlsberg Foundation, Copenhagen, Denmark, which supported recovery and cutting of the Agpalilik meteorite.

Type Material: University of Copenhagen, Copenhagen, Denmark, 1967,410; American Museum of Natural History, New York, New York, USA.

References: (1) Buchwald, V.F. and E.R.D. Scott (1971) First nitride (CrN) in iron meteorites. Nature, Phys. Sci., 233, 113–114. (2) (1972) Amer. Mineral., 57, 1311 (abs. ref. 1). (3) Axon, H.J., J. Total	[100.00]	99.73	100.00

(1) Königslutter, Lower Saxony, Germany; H_2O by difference. (2) Eddy Co., New Mexico, USA. (3) $KMgCl_3 \cdot 6H_2O$.

Occurrence: Thought to form in saline marine deposits by reaction of pre-existing saline minerals with fluids high in potash.

Association: Kieserite, sylvite, halite, polyhalite, bischofite.

Distribution: Found in many saline marine deposits. At Leopoldshall and Westeregeln, near Stassfurt, Magdeburg district, Germany. From Kalusz, Ukraine. At Maman, Azerbaijan. In Spain, in Barcelona and Lerida Provinces. At Mt. Dallol, Danakil, Ethiopia. From Orzinki, Saratov, Russia. In England, at Aislaby, near Whitby, Yorkshire. In the USA, in New Mexico, in the Carlsbad potash district, Eddy Co., and adjacent parts of Texas; from the Paradox basin, Grand Co., and other places in Utah.

Name: For Rudolph von Carnall (1804–1874), Prussian mining engineer.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 92–94. (2) Schlemper, E.O., P.K. Sen Gupta, and T. Zoltai (1985) Refinement of the structure of carnallite, $Mg(H_2O)_6KCl_3$. Amer. Mineral., 70, 1309–1313.

Carminite $PbFe_2^{3+}(AsO_4)_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, to 2 cm, typically lathlike, flattened on {010}, elongated along [001], showing {010}, {110}, {011}, and other forms; as needlelike crystals, in spherical or tufted aggregates; fibrous, drusy, massive.

Physical Properties: *Cleavage:* On {110}, distinct. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 5.03–5.18; 5.22 D(calc.) = 5.405

Optical Properties: Translucent. *Color:* Carmine, tile-red, reddish brown; red in transmitted light. *Streak:* Reddish yellow. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* X = pale yellowish red; $Y = Z$ = dark carmine. *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r < v$, strong. *Absorption:* $Y = Z > X$. $\alpha = 2.05–2.07$ $\beta = 2.05–2.07$ $\gamma = 2.06–2.08$ 2V(meas.) = Medium.

Cell Data: *Space Group: Cccm.* $a = 16.591(2)$ $b = 7.580(1)$ $c = 12.285(1)$ Z = 8

X-ray Powder Pattern: Mapimí, Mexico.

(1) Ojuela mine, Mapimí, Mexico; estimated impurity cerussite 5%. (2) Pira Inferida mine, Sardinia, Italy; by electron microprobe, total Fe as Fe_2O_3, H_2O from theoretical composition; corresponds to $(Pb_{1.06}Co_{0.01}Cu_{0.01})_{\Sigma=1.08}(Fe_{1.90}Al_{0.02})_{\Sigma=1.92}(AsO_4)_{2.00}(OH)_{2.03}$. (3) $PbFe_2(AsO_4)_2(OH)_2$.

Polymorphism & Series: Dimorphous with mawbyite.

Occurrence: An uncommon alteration product of arsenopyrite in some oxidized lead-bearing mineral deposits.

Association: Beudantite, scorodite, dussertite, arseniosiderite, bayldonite, mimetite, cerussite, anglesite, plumbojarosite, wulfenite.

Distribution: In Germany, from the Louise iron mine, near Horhausen, and in the Schöne Aussicht mine, near Dernbach, Westerwald; at the Merkur mine, Ems, Rhineland-Palatinate. In England, from Caldbeck Fells, and in the Wanthwaite mine, St. John's in the Vale, Cumbria; at the Hingston Downs Consols mine, Calstock; from Penberthy Croft, Wheal Gorland, and other mines in Cornwall. At the Cap Garonne mine, near le Pradet, Var, France. In the USA, at Eureka, Ruby Hill district, Eureka Co., and in the Killie mine, Spruce Mountain district, Elko Co., Nevada; from the Centennial Eureka mine, Tintic district, Juab Co., and at the Gold Hill mine, Tooele Co., Utah. In Mexico, from the Ojuela mine, Mapimí, Durango, in large crystals; at Santa Ana, La Mur, and at the San Félix mine, Caborca, Sonora. From Broken Hill, New South Wales, at Wyloo, and in the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. As large crystals at Tsumeb, Namibia. Other minor localities are known.

Name: For the characteristic *carmine* color.

Carnallite $KMgCl_3 \cdot 6H_2O$

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals rare, pseudohexagonal; pyramidal, also thick tabular on pseudo-{0001}; commonly granular, massive, in beds several m thick. *Twinning:* Polysynthetic twin lamellae can be developed by pressure.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 1.602 D(calc.) = 1.598 Soluble in H_2O; deliquescent in high humidity, then dissolving; taste bitter.

Optical Properties: Transparent to translucent. *Color:* Colorless to milk-white, reddish from included hematite scales; rarely yellow or blue; colorless in transmitted light. *Luster:* Greasy, shining.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$.
$\alpha = 1.465$–1.466 $\beta = 1.474$–1.475 $\gamma = 1.494$–1.496 2V(meas.) = 70°03′ 2V(calc.) = 66°

Cell Data: *Space Group: Pnna.* $a = 16.119(3)$ $b = 22.472(4)$ $c = 9.551(2)$ $Z = 12$

X-ray Powder Pattern: Locality unknown. (ICDD 24-869).

(1) Temple Mountain, Utah, USA. (2) $K_2(UO_2)_2(V_2O_8)\cdot 3H_2O$.

Occurrence: An important ore mineral of uranium, typically in paleochannels in sandstone Colorado Plateau-type U–V deposits, found near fossil carbonaceous matter, and in calcretes and near playas; an alteration product of uraninite, montroseite, or davidite.

Association: Tyuyamunite, metatyuyamunite, volborthite, tangeite, metatorbernite, rossite, hewettite, other U–V oxides, gypsum, barite.

Distribution: Known from hundreds of localities. In the USA, in Colorado, from the Rajah mine, Roc Creek, and many other localities in the Uravan district, along Paradox Valley, Bull Canyon and La Sal Creek, also Gypsum Valley, Montrose Co., the Gateway district, Mesa Co., and the Slick Rock district, San Miguel Co.; in Utah, from the San Rafael Swell, Emery Co., around Thompsons and Richardson, Grand Co.; from mines in the Grants district, McKinley Co., New Mexico; crystallized from the Anderson mine, Yavapai Co., and an ore mineral in Monument Valley, Apache and Navajo Cos., Arizona. In Australia, at El Sherana, Northern Territories; in a large deposit at Yeelirrie, and other smaller deposits in Western Australia; from the Radium Hill mine, near Olary, South Australia. Around Tyuya-Muyun and Uigursai, Fergana Valley, Alai Range, Kyrgyzstan.

Name: To honor Marie-Adolphe Carnot (1839–1920), French mining engineer and chemist.

Type Material: University of Colorado, Boulder, Colorado, 2218; Harvard University, Cambridge, Massachusetts, USA, 106253.

Chemistry: Vesuvius, Italy; spectrographic analysis showed K and a little Na; microchemical analysis showed F and a little Cl.

Occurrence: In stalactites in cavities in lava.

Association: Halite, mercallite, hieratite.

Distribution: On Vesuvius, Campania, Italy.

Name: For Professor Guido Carobbi (1900–1983), Italian geologist, Institute of Mineralogy and Geochemistry, University of Florence, Florence, Italy, who collected the first specimens.

Type Material: University of Florence, Florence, Italy, 1972/l.

Karpatite $C_{24}H_{12}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are acicular, thin tabular parallel to [001], showing {001}, {100}, {$\overline{2}$01}, many other forms, to 1 cm; typically in bladed groups and fibrous radiating aggregates.

Physical Properties: *Cleavage:* On {001}, {100}, {$\overline{2}$01}, perfect. *Fracture:* Splintery. *Tenacity:* Flexible, nearly plastic. Hardness = ∼1 D(meas.) = 1.35–1.40 D(calc.) = 1.29–1.42 Flammable; fluoresces sky-blue under LW and SW UV.

Optical Properties: Subtranslucent. *Color:* Yellow, yellowish brown on exposure.
Luster: Vitreous.
Optical Class: Biaxial (–) or (+). *Orientation:* $X = b$; $Z \wedge c = 21°$. *Dispersion:* $r \gg v$, extreme.
$\alpha = 1.780(2)$ $\beta = 1.977$–1.982 $\gamma = 2.05$–2.15 2V(meas.) = 96°–115°

(1) Olenevo, Ukraine. (2) $C_{24}H_{12}$ (coronene).

Occurrence: In cavities at the contact of diorite porphyry with argillites (Olenevo, Ukraine); a low-temperature hydrothermal mineral (California, USA).

Association: Idrialite, amorphous organic material, calcite, barite, quartz, cinnabar, metacinnabar (Olenevo, Ukraine); cinnabar, quartz (California, USA).

Distribution: From near Olenevo, Transcarpathian region, western Ukraine. At Tamvotney, Kamchatka Peninsula, Russia. From the Picacho mercury mine, south of New Idria, San Benito Co., California, USA.

Name: From the Russian *Karpaty*, for the place of discovery in the Transcarpathian district, Ukraine.

Type Material: n.d.

References: (1) Piotrovsky, G.L. (1955) Karpatite – a new organic mineral from Transcarpathia. Lvovskoe geol. Obshch., Mineral. Sbornik, 9, 120–127 (in Russian). (2) (1957) Amer. (1) Fukuzumi mine, Japan. (2) Near Meuville, Belgium; Loss on ignition taken as H_2O. (3) $MnAl_2Si_2O_6(OH)_4$.

Polymorphism & Series: Forms a series with ferrocarpholite.

Occurrence: In low-grade metamorphosed shales.

Association: Sudoite, manganoan garnet, chlorotoid, fluorite.

Distribution: At Horní Slavkov (Schlaggenwald), Czech Republic. From near Meuville, Ardennes Mountains, Belgium. At Wippra, Harz Mountains, Germany. In England, from the Carrock mine, Caldbeck Fells, Cumbria; at Kit Hill Consols, Stokeclimsland, in the Hingston Down Consols mine, near Calstock, and in the Stenna Gwynn mine, St. Stephen-in-Brannel, Cornwall. In the Fukuzumi mine, Kyoto Prefecture, Japan.

Name: From the Greek for *straw*, in allusion to its color.

Carraraite $Ca_3Ge(SO_4)(CO_3)(OH)_6 \cdot 12H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m$. Hexagonal crystals, tabular on {0001}, to prismatic, elongated along $[10\bar{1}0]$, to 0.6 mm.

Physical Properties: Hardness = [2.5] (by analogy to the ettringite group).
D(meas.) = n.d. D(calc.) = 1.979

Optical Properties: Transparent to translucent. *Color:* Milky white. *Luster:* Vitreous.
Optical Class: Uniaxial (–) $\omega = 1.509(1)$ $\epsilon = 1.479(1)$

Cell Data: *Space Group:* $P6_3/m$. a = 11.056(3) $c = 10.629(6)$ Z = 2

X-ray Powder Pattern: Gioia quarry, Italy.
9.57 (vs), 5.53 (s), 3.83 (s), 3.56 (ms), 2.74 (ms), 3.44 (m), 2.53 (m)

Chemistry:

	(1)	(2)
SO_3	16.19	12.00
CO_2		6.60
GeO_2	18.15	15.68
CaO	35.70	25.22

Total		100.00

(1) Gioia quarry, Italy; by electron microprobe, corresponds to $Ca_3Ge(SO_4)_{1.08}(CO_3)_{0.92}(OH)_6 \cdot 12H_2O$. (2) $Ca_3Ge(SO_4)(CO_3)(OH)_6 \cdot 12H_2O$ as confirmed by crystal-structure analysis.

Mineral Group: Ettringite group.

Occurrence: A rare secondary mineral formed by late-stage hydrothermal alteration of earlier sulfides and sulfosalts.

Association: Nordstrandite, dawsonite.

Distribution: From the Gioia quarry, Colonnata Valley, northeast of Carrara, Tuscany, Italy.

Name: For its occurrence in the Carrara district, Italy.

Type Material: Natural History Museum, University of Pisa, Pisa, Italy.

References: (1) Merlino, S. and P. Orlandi (2001) Carraraite and zaccagnaite, two new minerals from the Carrara marble quarries: their chemical compositions, physical properties, and structural features. Amer. Mineral., 86, 1293–1301.

Carrboydite $(Ni, Al)_9(SO_4)_2(OH)_{18}\cdot 10H_2O(?)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* n.d. As spherical felted aggregates of platy crystals, to 1 mm, and as amorphous-appearing coatings; massive in thin veins and fracture fillings.

Physical Properties: Hardness = n.d. D(meas.) = 2.50(5), on porous impure material. D(calc.) = 2.692

Optical Properties: Translucent. *Luster:* Dull to waxy. *Color:* Yellowish green, greenish yellow, blue-green, pale green, greenish blue; pale blue-green in transmitted light. *Optical Class:* Uniaxial (–), may be biaxial (–). *Orientation:* Length-slow. $\omega = \sim 1.56$ $\epsilon = \sim 1.54$ 2V(meas.) = Small.

Cell Data: *Space Group:* n.d. $a = 9.14$ $c = 10.34$ Z = [1]

X-ray Powder Pattern: Carr Boyd Rocks mine, Australia.
10.5 (vs), 5.25 (s), 2.55 (ms), 3.48 (m), 1.51 (m), 2.62 (w), 2.36 (wb)

Chemistry:

	(1)
SO_3	14.5
CO_2	1.65
SiO_2	2.6
Al_2O_3	17.9
NiO	38.2
CuO	2.5
H_2O	20.55
Total	97.9

(1) Carr Boyd Rocks mine, Australia; by electron microprobe, C and H by microanalysis, here recalculated to oxides; after deduction of CO_2, SiO_2, and CuO, corresponds to $(Ni_{5.7}Al_{3.9})_{\Sigma=9.6}(SO_4)_{2.0}(OH)_{19.1}\cdot 3.0H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of nickel sulfide deposits.

Association: Malachite, azurite, paratacamite, brochantite, glaukosphaerite, takovite, nickeloan magnesite, chalconatronite, georgeite, halloysite, chabazite, gypsum, epsomite (Carr Boyd Rocks mine, Western Australia).

Distribution: In Australia, from the Carr Boyd Rocks nickel mine, Yerilla district, 80 km north-northeast of Kalgoorlie, and at the 132 North nickel mine, 4 km southwest of Widgiemooltha, Western Australia.

Name: For the Carr Boyd Rocks mine, Australia, the first known locality.

Type Material: Western Australian Museum, Perth, Australia, M.74.1991; National Museum of Natural History, Washington, D.C., USA, 135930.

References: (1) Nickel, E.H. and R.M. Clarke (1976) Carrboydite, a hydrated sulfate of nickel and aluminum: a new mineral from Western Australia. Amer. Mineral., 61, 366–372.

Carrollite $Cu(Co,Ni)_2S_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. Octahedral crystals, to 10 cm; commonly massive, disseminated granular to compact. *Twinning:* On {111}; may show polysynthetic twin lamellae.

Physical Properties: *Cleavage:* {001}, imperfect. *Fracture:* Uneven to subconchoidal. Hardness = 4.5–5.5 VHN = 507–586 (100 g load). D(meas.) = 4.5–4.8 D(calc.) = 4.83

Optical Properties: Opaque. *Color:* Pale gray to steel-gray, tarnishing easily to copper-red or violet-gray. *Luster:* Metallic.

R: (400) 41.4, (420) 41.5, (440) 41.6, (460) 41.8, (480) 42.0, (500) 42.3, (520) 42.6, (540) 42.9, (560) 43.1, (580) 43.3, (600) 43.5, (620) 43.9, (640) 44.3, (660) 44.7, (680) 45.0, (700) 45.3

Cell Data: *Space Group:* $Fd3m$. a = 9.458 Z = 8

X-ray Powder Pattern: N'Kana, Zambia.
2.86 (100), 1.674 (80), 1.825 (60), 2.37 (50), 0.994 (50), 3.35 (40), 1.234 (30)

Chemistry:

(1) Zaire; by electron microprobe, corresponds to $Cu_{0.99}Co_{2.04}Ni_{0.02}Fe_{0.03}S_{4.00}$. (2) Gladhammar, Sweden; corresponds to $Cu_{0.69}Co_{1.88}Ni_{0.38}Fe_{0.12}S_{4.00}$. (3) Siegen, Germany; recalculated to 100% after deduction of quartz 1.25%; corresponds to $Cu_{0.94}Co_{1.92}Ni_{0.20}Fe_{0.05}S_{4.00}$. (4) Mineral Hill mine, Maryland, USA; corresponds to $Cu_{0.48}Co_{1.88}Ni_{0.40}Fe_{0.12}S_{4.00}$.

Mineral Group: Linnaeite group.

Occurrence: In hydrothermal vein deposits.

Association: Tetrahedrite, linnaeite, siegenite, polydymite, chalcopyrite, bornite, digenite, djurleite, chacocite, pyrrhotite, pyrite, sphalerite, millerite, gersdorffite, ullmannite, cobaltoan calcite.

Distribution: In the USA, from Carroll Co., Maryland, in the Patapsco mine, Finksburg [TL], and the Mineral Hill mine, Sykesville. At Boleo, Baja California, Mexico. In the Carrizal Alto copper district, Atacama, Chile. From near Chernomorets, Burgas, Bulgaria. At Vysna Boca, Nizke Tatry Mountains, Slovakia. In the Kohlenbach mine, near Eiserfeld, and throughout the Siegerland district, North Rhine-Westphalia, Germany. From Gladhammar, Kalmar, Sweden. At Tsumeb, Namibia. Large crystals from Kambove, and in the Kamoto and Musonoi mines, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). From the Rokana mine, Kitwe, Zambia. At the Madziwa (Dry Nickel) mine, Bindura, and Shamva, Zimbabwe. In the Sazare mine, Ehime Prefecture, and the Shirataki mine, Kochi Prefecture, Japan. At the Hol Kol Au–Cu mine, about 75 km southeast of Pyongyang, Suan Co., North Korea. From Kambalda, 56 km south of Kalgoorlie, Western Australia. A substantial number of other minor occurrences are known.

Name: For its occurrence in Carroll Co., Maryland, USA.

Caryinite $(Na, Pb)(Ca, Na)(Ca, Mn^{2+})(Mn^{2+}, Mg)_2(AsO_4)_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As cleavable masses; fine-grained massive, in veins to 10 cm.

Physical Properties: *Cleavage:* On {110} and {010}, distinct. Hardness = 4
D(meas.) = 4.29 D(calc.) = [4.45]

Optical Properties: Subtranslucent. *Color:* Nut-brown to yellowish brown; in transmitted light, pale yellow-brown. *Luster:* Greasy.
Optical Class: Biaxial (+). *Orientation:* $X = c$; $Y = a$; $Z = b$. *Dispersion:* $r > v$, slight.
$\alpha = 1.776(5)$ $\beta = 1.780(5)$ $\gamma = 1.805(5)$ 2V(meas.) = 41(3)°

Cell Data: *Space Group:* $I2/a$. $a = 6.855(2)$ $b = 13.147(3)$ $c = 11.479(4)$
$\beta = 98.97(2)°$ Z = 4

X-ray Powder Pattern: Långban, Sweden.
2.868 (10), 2.849 (10), 2.686 (5), 3.03 (3), 3.29 (2), 3.14 (2), 2.903 (2)

(1) Långban, Sweden; SiO_2 determined separately and thought to be in berzeliite. (2) Do.; by electron microprobe, total Fe as FeO, Mn as MnO, Na determined by flame photometry. (3) Do.; by electron microprobe, average of two analyses, total Fe as FeO, Mn as MnO; cations apportioned by structure refinement, corresponding to $(Na_{0.61}Pb_{0.39})_{\Sigma=1.00}(Ca_{0.56}Na_{0.43}Ba_{0.01})_{\Sigma=1.00}(Ca_{0.74}Mn^{2+}_{0.26})_{\Sigma=1.00}(Mn^{2+}_{1.45}Mg_{0.54}Fe^{3+}_{0.01})_{\Sigma=2.00}[(AsO_4)_{2.89}(PO_4)_{0.09}(VO_4)_{0.02}]_{\Sigma=3.00}$.

Mineral Group: Alluaudite group.

Occurrence: In veinlets in skarn in a metamorphosed Fe–Mn orebody.

Association: Berzeliite, adelite, hedyphane, hausmannite, rhodonite, diopside, calcite.

Distribution: At Långban, Värmland, Sweden.

Name: From the Greek for *nut-brown*, for its common color.

Type Material: Swedish Museum of Natural History, Stockholm, Sweden, 221444.

Caryopilite $(Mn^{2+},Mg)_3Si_2O_5(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic (?). *Point Group:* n.d. As tabular pseudohexagonal crystals, commonly in rosettes, to 4 mm. Stalactitic, reniform with concentrically radiating fibrous internal structure, or massive.

Physical Properties: *Cleavage:* Perfect on {001}. Hardness = 3–3.5 D(meas.) = 2.83–2.94 D(calc.) = 2.788

Optical Properties: Semitransparent. *Color:* Reddish brown, tan; light brown to yellow in thin section.
Optical Class: Biaxial (–). *Orientation:* $X = c$. α = 1.602–1.624 β = 1.632–1.650 γ = 1.632–1.650 2V(meas.) = $\sim 0^\circ$

Cell Data: *Space Group:* n.d. $a = 5.668$ $b = 9.811$ $c = 7.527$ $\beta = 104.52^\circ$ Z = 2

X-ray Powder Pattern: Långban, Sweden.
2.49 (100), 7.24 (90), 3.64 (80), 2.78 (70), 2.08 (50), 1.954 (30), 1.617 (20)

Chemistry:

	(1)	(2)		(1)	(2)

			Total	[100.0]	[97.44]

(1) Sterling Hill, New Jersey, USA; by electron microprobe, H_2O by difference. (2) Bald Knob, North Carolina, USA; by electron microprobe, H_2O calculated from stoichiometry.

Occurrence: A product of the metamorphism of manganese-bearing minerals.

Association: Gonyerite (Långban, Sweden); calcite, rhodonite, lead, sarkinite, brandtite (Pajsberg, Sweden); manganoan calcite, tirodite, rhodonite, jacobsite (Bald Knob, North Carolina, USA).

Distribution: From the Harstigen mine, near Persberg, and at Långban, Värmland, Sweden. In the Molinello and Gambatesa manganese mines, near Chiavari, Val Graveglia, Liguria, Italy. At the Falotta mine, Oberhalbstein, Graubünden, Switzerland. In the Ködnitz Valley, Tirol, Austria. In the USA, at Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey; at Bald Knob, near Sparta, Alleghany Co., North Carolina; in the Hurricane mine, on the Olympic Penninsula, Washington. From the Ichinomata mine, Kumamoto Prefecture, Japan. At Watson's Beach, southeastern Otago, New Zealand. In the N'Chwaning and Wessels mines, near Kuruman, Cape Province, South Africa.

Name: From the Greek for *walnut* and *felt*, in allusion to its color and habit.

Cascandite $Ca(Sc, Fe^{2+})Si_3O_8(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic. *Point Group:* 1. As plates, to 0.2 mm, elongated along [100] and flattened ∥ {001}; forms observed are {001}, {100}, {120}, and $\{5\bar{3}0\}$.

Physical Properties: *Cleavage:* Good on {100} and {001}. Hardness = n.d.
D(meas.) = n.d. D(calc.) = [3.03]

Optical Properties: Transparent. *Color:* Pale pink. *Luster:* Vitreous.
Optical Class: Biaxial. $\alpha = 1.663$ on (001). β = n.d. $\gamma = 1.684$ on (001). 2V(meas.) = n.d.

Cell Data: *Space Group:* $P1$. $a = 9.791(8)$ $b = 10.420(9)$ $c = 7.076(6)$ $\alpha = 98.91(8)°$ $\beta = 102.63(8)°$ $\gamma = 84.17(8)°$ Z = 2

X-ray Powder Pattern: Baveno, Italy.
2.821 (s), 3.62 (m), 3.10 (m), 2.968 (m), 1.429 (m), 7.22 (w), 6.75 (w)

Chemistry:

	(1)
SiO_2	51.83
TiO_2	0.08
Al_2O_3	0.11
Sc_2O_3	14.74
FeO	4.50
MnO	2.32
MgO	0.20
CaO	16.83
Na_2O	0.06
H_2O	[2.59]
Total	[93.26]

(1) Baveno, Italy; by electron microprobe, H_2O calculated from stoichiometry.

Occurrence: In miarolitic cavities in granite.

Association: Quartz, orthoclase, albite, jervisite.

Distribution: From the Diverio quarry, Mt. Mottarone, near Baveno, Piedmont, Italy.

Name: For CAlcium and SCANDium in the composition.

Type Material: Municipal Museum of Natural History, Milan, Italy, 23270.

References: (1) Mellini, M., S. Merlino, P. Orlandi, and R. Rinaldi (1982) Cascandite and jervisite, two new scandium silicates from Baveno, Italy. Amer. Mineral., 67, 599–603. (2) Mellini, M. and S. Cassagnaite $Ca_4Fe^{3+}_4(OH)_4V^{3+}_2O_2(OH)_2(SiO_4)_2(Si_3O_{10})$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As prismatic to tabular {001} crystals, usually elongated along [100], to 0.1 mm, exhibiting forms {011}, {001} and {100}; as entangled aggregates.

Physical Properties: *Cleavage*: {001} (or parting). *Tenacity*: Brittle.
Hardness = n.d. D(meas.) = n.d. D(calc.) = 3.22

Optical Properties: Transparent. *Color*: Golden brown. *Streak*: Nearly white. *Luster*: Vitreous.
Pleochroism: Very weak; *N* = golden yellow-brown, *n* = pale golden yellow-brown.
Optical Class: Biaxial. *N* (parallel to *a*) = 1.810(5) *n* = 1.800(5)

Cell Data: *Space Group*: *Cmcm*. *a* = 6.066(1) *b* = 8.908(1) *c* = 18.995(2) *Z* = 2

X-ray Powder Pattern: Cassagna mine, Italy.
9.52 (100), 2.66 (70), 2.54 (65), 4.85 (50), 4.98 (45), 4.03 (40), 2.32 (40)

H_2O_{calc}			5.87
Total			100.00

(1) Cassagna mine, Italy; range of 7 electron microprobe analyses, OH^- confirmed by micro-Raman analysis. (2) Cassagna mine, Italy; mean of 7 electron microprobe analyses. (3) Cassagna mine, Italy; H_2O by difference, (Ca + Mn^{2+}) recalculated to equal 4 wt%; corresponding to $Ca_{3.3}Mn^{2+}_{0.7}Fe^{3+}_{1.6}Mn^{3+}_{1.4}Al_{1.5}V^{3+}_{0.7}Mg_{0.6}Si_{5.2}O_{26}H_{6.5}$.

Occurrence: Filling fractures in braunite and quartz layered mineralization developed under prehnite-pumpellyite facies metamorphism.

Association: Braunite, quartz, piemontite.

Distribution: At the Cassagna mine, Graveglia manganese district, Northern Apennines, Liguria, Italy.

Name: For the locality that produced the first specimens, the Cassagna mine, Italy.

Type Material: Dipartimento per lo Studio del Territorio e delle sue Risorse (Dip.Te.Ris), University of Genoa, Italy.

References: (1) Basso, R., C. Carbone, and A. Palenzona (2008) Cassagnaite, a new, V-bearing silicate mineral from the Cassagna mine, northern Apennines, Italy. Eur. J. Mineral., 20, 95–100.

Total		100.00

(1) Wolf Creek meteorite; partial analyses by electron microprobe. (2) $Ca_2(Ni,Mg)(PO_4)_2 \cdot 2H_2O$ with Ni:Mg = 1:1.

Mineral Group: Fairfieldite group.

Occurrence: An alteration product of a highly weathered iron-nickel meteorite, formed by alteration of schreibersite.

Association: Reevesite, goethite, nickelian maghemite, jarosite, nickel-rich serpentine, apatite, lipscombite.

Distribution: In the Wolf Creek meteorite.

Name: In honor of Dr. William A. Cassidy, who mapped the Wolf Creek, Australia, crater in 1953.

Type Material: National Museum of Natural History, Washington, D.C., USA, 119553, 119554A.

References: (1) White, J.S., Jr., E.P. Henderson, and B. Mason (1967) Secondary minerals produced by weathering of the Wolf Creek meteorite. Amer. Mineral., 52, 1190–1197.

Cassiterite SnO_2

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. Crystals short to long prismatic ‖ [001], with {110} and {100} well developed, terminated by steep pyramidal forms, to 10 cm; less commonly pyramidal. In radially fibrous botryoidal crusts and concretionary masses; coarse to fine granular, massive. *Twinning:* Very common on {011}, as contact and penetration twins, geniculated; lamellar.

Physical Properties: *Cleavage:* {100} imperfect, {110} indistinct; partings on {111} or {011}. *Fracture:* Subconchoidal to uneven. *Tenacity:* Brittle. Hardness = 6–7 VHN = 1239–1467 (200 g load). D(meas.) = 6.98–7.01 D(calc.) = 6.993

Optical Properties: Transparent when light colored, dark material nearly opaque; commonly zoned. *Color:* Black, brownish black, reddish brown, red, yellow, gray, white; rarely colorless; in transmitted light, colorless to brown, orange, yellow, green; in reflected light, light gray with white to brownish internal reflections. *Streak:* White, pale brown, pale gray. *Luster:* Adamantine to adamantine metallic, splendent; may be greasy on fractures.
Optical Class: Uniaxial (+); anomalously biaxial. *Pleochroism:* Strong to very weak; yellow, red, brown. *Absorption:* $E > O$. ω = 1.990–2.010 ϵ = 2.093–2.100 2V(meas.) = 0°–38° *Anisotropism:* Strong.

3.347 (100), 2.6427 (75), 1.7641 (57), 2.3690 (21), 1.6750 (14), 1.4155 (14), 1.4392 (12)

Chemistry:

	(1)		(1)
SiO_2	0.18	rem.	0.22
SnO_2	99.26	Total	99.66

(1) St. Michael's Mount, Cornwall, England; by electron microprobe, remnant is FeO 0.11%, In_2O_3 0.04%, Nb_2O_5 0.03%, WO_3, TiO_2, IrO_2, Ta_2O_5 each 0.01%.

Mineral Group: Rutile group.

Occurrence: In medium- to high-temperature hydrothermal veins and greisen, in granite, granite pegmatite, rhyolite; rarely in contact metamorphic deposits; in large alluvial placers.

Association: Quartz, muscovite, wolframite, tourmaline, topaz, fluorite, scheelite, lepidolite, arsenopyrite, bismuth, molybdenite.

Distribution: The principal ore of tin; deposits are widespread. Some important localities are: in Germany, in Saxony, at Marienberg, Altenberg, Johanngeorgenstadt, and many other places. At Cínovec (Zinnwald) and Horní Slavkov (Schlaggenwald), Czech Republic. From La Villeder, Morbihan, France. At Panasqueira and Cabreiros, Portugal. In England, at many mines in Cornwall, from St. Just and Carn Brae to Liskeard. From the Jos district, Nigeria. Fine crystals from Otjimbojo, Namibia. Economically important placers on the islands of Banka and Billiton, Indonesia; also in Perak and Selangor States, Malaysia. In Australia, from the New England Ranges, as at Emmaville and Elsmore, New South Wales, and from Greenbushes and Pilbara, Western Australia. At Mt. Bischoff and Mt. Zeehan, Tasmania. In China, from the Xue Bao Diang Mountains, Sichuan Province. Large crystals from Fazenda do Funil, Ferros, Minas Gerais, Brazil. Fine crystals from Bolivia, at Araca, Oruro, Potosí, Huanini, and Llallagua.

Name: From the Greek for *tin*.

(1) Norton County meteorite; by electron microprobe. (2) Qingzhen meteorite; by electron microprobe, average of three analyses. (3) $NaCrS_2$.

Occurrence: As inclusions in enstatite crystals and in the brecciated matrix of a meteorite (Norton County meteorite); between coarse pyroxene grains in chondrules in a meteorite (Qingzhen meteorite).

Association: Enstatite, cronusite, daubréelite, titanoan troilite, ferromagnesian alabandite, oldhamite, kamacite, perryite, schollhornite (Norton County meteorite); troilite, kamacite, oldhamite (Qingzhen meteorite).

Distribution: Found in the Norton County enstatite achondrite [TL] and the Qingzhen enstatite chondrite meteorites.

Name: To honor Dr. Caswell Silver (1916–), American geologist associated with the University of New Mexico, Institute of Meteoritics, Albuquerque, New Mexico, USA.

Type Material: n.d.

Catapleiite $Na_2ZrSi_3O_9 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic, pseudohexagonal. *Point Group:* $2/m$. Crystals pseudohexagonal, thin tabular on {001}, to 15 cm; as rosettes of crystal plates. *Twinning:* Polysynthetically twinned at 30°, 60°, and 90°.

Physical Properties: *Cleavage:* {100}, perfect; {101} and {102}, imperfect. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 5.5–6 D(meas.) = 2.65–2.9 D(calc.) = [2.77]

Optical Properties: Transparent, translucent to opaque. *Color:* Colorless, white, light yellow to yellowish brown, pale brown, grayish blue, violet; colorless in thin section. *Streak:* White to pale yellow. *Luster:* Weakly vitreous or dull.
Optical Class: Biaxial (+); may be uniaxial (+). *Dispersion:* $r < v$, moderate.
$\alpha = 1.582 - -1.603$ $\beta = 1.582 - -1.618$ $\gamma = 1.600 - -1.639$ 2V(meas.) = 40° untwinned; 0° twinned.

Cell Data: *Space Group:* $I2/c$. $a = 12.779$ $b = 7.419$ $c = 20.157$ $\beta = 90.41°$ Z = 8

X-ray Powder Pattern: Langesundsfjord, Norway; very close to calcium catapleiite.
3.94 (100), 3.05 (100), 2.96 (100), 2.69 (100), 6.35 (90), 1.969 (60), 5.37 (50)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	41.56	44.90	MnO	0.00	
TiO_2	0.00		CaO	5.21	
ZrO_2	32.53	30.69	Na_2O	9.74	15.44
FeO	1.02		H_2O^+	9.35	8.97
			Total	99.41	100.00

(1) Låven Island, Langesundsfjord, Norway. (2) $Na_2ZrSi_3O_9 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with gaidonnayite; forms a series with calcium catapleiite.

Occurrence: In syenites and nepheline syenites; in pegmatites, typically the result of metasomatic alteration of eudialyte.

Association: Zircon, leucophanite, rinkite, eudialyte, epididymite, låvenite, astrophyllite, sodalite, natrolite, analcime, aegirine.

Distribution: From Låven Island and other localities around the Langesundsfjord, and at Bratthagen, Norway. In the USA, at Magnet Cove, Hot Springs Co., and from Granite Mountain, near Little Rock, Pulaski Co., Arkansas; in the Rocky Boy stock, Bearpaw Mountains, Hill Co., Montana; at Wind Mountain, Otero Co., New Mexico. In Canada, in Quebec, large crystals at Mont Saint-Hilaire, from the Miron quarry, Montreal, and near Saint-Amable; along the Ice River valley, 25 km south of Field, British Columbia. In the Ilímaussaq intrusion, at Narssârssuk, and the Kangderdlugssuaq Fjord, Greenland. From the Norra Kärr complex, near Gränna, Sweden. In Russia, in the Khibiny and Lovozero massifs, Kola Peninsula, and the Inagli massif, 30 km west of Aldan, Yakutia. On the Los Islands, Guinea.

Name: From the Greek *kata*, for *with*, and *pleios*, for *many*, because it is always accompanied by other rare minerals.

Total	[100.00]	100.6	100.00

(1) Shinkolobwe, Congo; recalculated to 100% from an original total of 99.86% after deduction of quartz 0.08% and chalcopyrite 0.59%; then corresponds to $(Co_{0.89}Ni_{0.07}Fe_{0.06})_{\Sigma=1.02}S_{2.00}$. (2) Do.; by electron microprobe, corresponds to $(Co_{0.89}Fe_{0.12}Ni_{0.01}Cu_{0.01})_{\Sigma=1.03}S_{2.00}$. (3) CoS_2.

Polymorphism & Series: Forms a series with pyrite and vaesite.

Mineral Group: Pyrite group.

Occurrence: In carbonate rocks (Shinkolobwe, Congo).

Association: Pyrite, chalcopyrite, other linnaeite–polydymite group minerals.

Distribution: From Shinkolobwe, Katanga Province, Congo (Shaba Province, Zaire) [TL]. At Gänsberg, near Wiesloch, and Hohensachsen, Black Forest, Germany. In Sweden, near Filipstad, Värmland. In the USA, from Bald Knob, near Sparta, Alleghany Co., North Carolina, and in the Fletcher mine, Reynolds Co., Missouri.

Name: Honors Félicien Cattier (1869–1946), former Chairman of Union Miniére du Haut Katanga, Belgium.

Type Material: n.d.

SiO_2	49.4	53.24
VO_2	17.1	18.38
CaO	11.5	12.42
H_2O	[21.0]	15.96
rem.	0.8	
Total	[99.8]	100.00

(1) Oregon; by XRF, H_2O by estimation; actual H_2O content established by structure analysis.
(2) $Ca(VO)Si_4O_{10}\cdot 4H_2O$.

Polymorphism & Series: Dimorphous with pentagonite.

Occurrence: In a brown tuff partly filling a fault fissure (Lake Owyhee State Park, Oregon, USA); in a vesicular basalt and red tuff breccia, as cavity fillings and in calcite veinlets (Chapman quarry, Oregon, USA); in pores of altered basalt breccia and tuffaceous andesite (Poona district, India).

Association: Pentagonite, calcite, heulandite, stilbite, analcime, apophyllite, thomsonite, copper (Oregon, USA); stilbite, calcite, heulandite, mordenite, chalcocite (India).

Distribution: From near Owyhee Dam, Lake Owyhee State Park, Malheur Co., and the Chapman quarry, Columbia Co., Oregon, USA. Remarkable specimens from quarries around Wagholi, Poona district, Maharashtra, India.

Name: For CAlcium, VANadium, and SIlicon in the composition.

Type Material: National Museum of Natural History, Washington, D.C., USA, 120583, 120584, 122769.

(1) Sudbury, Canada; partial analysis by semiquantitative emission spectroscopy.

Occurrence: Sparingly, in partially absorbed inclusions of wall-rock in a dikelike zone of carbonate rock cutting nepheline syenite (Sudbury, Canada); a secondary mineral weathered from phonolites and nepheline syenites (Minas Gerais, Brazil); in pegmatite (Kåbuland, Norway).

Association: Nepheline, tremolite, feldspar, apatite, magnetite, ilmenite, calcite (Sudbury, Canada); hydromica, kaolinite, "limonite" (Morro do Ferro, Brazil); fluocerite, bastnäsite, törnebohmite (Kåbuland, Norway); fluocerite, bastnäsite (Karonge, Burundi).

Distribution: From about 11 km northeast of Nemegos, Lackner Township, Sudbury district, Ontario, and in the Lake Zone deposit, Thor Lake, Northwest Territories, Canada. In Paramount Canyon, Taylor Creek district, Catron Co., New Mexico, and on North Sugarloaf Mountain, Bethlehem, Grafton Co., New Hampshire, USA. From Cañon Colorado, Sierra de Bermjillo, Durango, Mexico. On Morro do Ferro, Poços de Caldas plateau, Minas Gerais, Brazil. In Norway, large crystals from near Kåbuland, Iveland; at Tysfjorden, Nordland; and from Høydalen, Telemark. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From the Khoda-Achkan massif, Alai Range, Kyrgyzstan. In the Karonge rare-earth deposit, Burundi. From near Odegi, Afu Hills, Nigeria. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia.

Name: For CERium in its composition, and by analogy to *thorianite* and *uraninite*.

Type Material: Canadian Geological Survey, Ottawa, 16588; Royal Ontario Museum, Toronto, Canada, M34491, M37257.

Caysichite-(Y) $\mathbf{Ca_3(Yb,Er)Y_4Si_8O_{20}(CO_3)_6(OH)\cdot 7H_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Most commonly as a pulverulent coating or stain. As radiating groups of crystals elongated ‖ [001], terminated by {001}; in thin, brittle incrustations with columnar structure.

Physical Properties: *Cleavage:* {010} (?). Hardness = 4.5 VHN = 551 D(meas.) = 3.03 D(calc.) = 3.029 Faint green cathodoluminescence.

Optical Properties: Semitransparent. *Color:* Colorless, white to pale yellow; rarely greenish. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. $\alpha = 1.586(4)$ $\beta = 1.614(1)$ $\gamma = 1.621(1)$ 2V(meas.) = 53° 2V(calc.) = 54°30′

Cell Data: *Space Group:* $Ccm2_1$. $a = 13.282(3)$ $b = 13.925(3)$ $c = 9.724(4)$ Z = 4

X-ray Powder Pattern: Evans-Lou quarry, Canada.
6.93 (100), 3.321 (90), 4.38 (60), 4.22 (60), 3.481 (60), 4.87 (40), 2.323 (40)

Chemistry:

	(1)
SiO_2	28.84
Al_2O_3	0.58
Y_2O_3	28.18
RE_2O_3	8.08
CaO	10.04
H_2O	8.6
CO_2	15.7
Total	100.02

(1) Evans-Lou quarry, Canada; by electron microprobe, H_2O by gravimetry, CO_2 by titrimetry; $RE_2O_3 = La_2O_3$ 0.08%, CeO_2 0.24%, Pr_2O_3 0.09%, Nd_2O_3 0.30%, Sm_2O_3 0.20%, Eu_2O_3 0.09%, Gd_2O_3 0.51%, Tb_2O_3 0.16%, Dy_2O_3 1.16%, Ho_2O_3 0.66%, Er_2O_3 1.84%, Tm_2O_3 0.21%, Yb_2O_3 2.12%, Lu_2O_3 0.42%; corresponds to $Ca_{2.95}RE_{0.70}Y_{4.11}(Si_{7.90}Al_{0.18})_{\Sigma=8.08}O_{20.36}(CO_3)_{5.87}\cdot 7.86H_2O$.

Occurrence: In perthite surrounding the quartz core of a granite pegmatite, coating fractures and filling cavities in quartz, perthite, or hellandite; apparently of secondary origin.

Association: Quartz, hellandite, fergusonite, kainosite, tengerite, lokkaite, yttrian thorogummite, yttrian spessartine, xenotime, wakefieldite-(Y), synchysite-(Y).

Distribution: In the Evans-Lou quarry, near Wakefield Lake, Quebec, Canada.

Name: For the chemical composition: *Ca, Y, Si, C, H.*

Type Material: Canadian Museum of Nature, Ottawa; Canadian Geological Survey, Ottawa, Canada, 10402; The Natural History Museum, London, England, 1977,278.

				Total	99.92	[100.00]	[100.00]

(1) Cebolla Creek, Colorado, USA. (2) Do.; recalculated to 100%, computed free of insolubles, taken as diopside, garnet, vesuvianite, etc., corresponds to $(Ca_{3.79}Mg_{0.69}Na_{0.24}Fe^{2+}_{0.02})_{\Sigma=4.74}(Al_{1.64}Fe^{3+}_{0.36})_{\Sigma=2.00}Si_{3.26}O_{12.08}(OH)_{4.12}$. (3) Tokatoka, New Zealand; by electron microprobe, H_2O by difference; corresponds to $(Ca_{4.77}Fe^{2+}_{0.12}Na_{0.06})_{\Sigma=4.95}Al_{2.36}Si_{3.37}O_{12.40}(OH)_{5.60}$.

Occurrence: An alteration product of melilite in a carbonatite (Iron Hill, Colorado, USA); along a diabase-chalk contact (Scawt Hill, Ireland); in zeolitized plagioclase-rich gneiss, amphibolite, and basalt xenoliths (Letseng-La-Terai kimberlite, Lesotho); a late-stage primary igneous mineral (Kimberley, South Africa).

Association: Melilite, natrolite, calcite, phlogopite, vesuvianite, garnet, diopside.

Distribution: On Iron Hill and in Cebolla Creek, near Powderhorn, Gunnison Co., Colorado, USA. From Scawt Hill, near Larne, Co. Antrim, Ireland. In the Gardiner complex, beyond the head of Kangerdlugssuaq Fjord, Greenland. In the Letseng-La-Terai kimberlite, Lesotho. From the De Beers diamond mine, Kimberley, Cape Province, South Africa. In the Tokatoka district, about 150 km north of Auckland, New Zealand.

Name: For Cebolla Creek, Colorado, in the drainage of which the mineral was first collected.

Type Material: The Natural History Museum, London, England, 1923,1022; Harvard University, Cambridge, Massachusetts, 85726; National Museum of Natural History, Washington, D.C., USA, 87530, C3217, R6451.

Čechite $Pb(Fe^{2+},Mn)(VO_4)(OH)$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are rough and rounded, to 3 mm, elongated along [001], showing {110} and {010}; as aggregates of anhedral crystals in granular masses.

Physical Properties: *Fracture:* Uneven to conchoidal. *Tenacity:* Brittle. Hardness = 4.5–5 VHN = 274–367, 316 average (100 g load). D(meas.) = 5.88 D(calc.) = 5.94 Magnetic.

Optical Properties: Opaque. *Color:* Black; gray-white with a yellowish tint in reflected blue light, yellow-brown to beige in reflected yellow light; white, pale yellow, or rosy internal reflections observed. *Streak:* Black. *Luster:* Submetallic, resinous on fractures.
Optical Class: Biaxial. *Anisotropism:* Perceptible to strong; pale gray to dark gray with brownish tint. *Bireflectance:* Weak to imperceptible.
R_1–R_2: (400) —, (420) 17.0–19.3, (440) 16.3–18.9, (460) 16.0–18.5, (480) 15.6–18.3, (500) 15.4–18.1, (520) 15.1–17.8, (540) 14.8–17.6, (560) 14.6–17.6, (580) 14.4–17.7, (600) 14.4–18.0, (620) 14.5–18.3, (640) 14.8–18.6, (660) 15.1–18.9, (680) 15.2–18.8, (700) 15.3–18.7

(1) 37 km east of Reno, Storey Co., Nevada, USA; corresponds to $(K_{0.92}Na_{0.03}Ca_{0.02})_{\Sigma=0.97}(Mg_{0.78}Fe^{2+}_{0.24})_{\Sigma=1.02}(Fe^{3+}_{0.93}Al_{0.07})_{\Sigma=1.00}Si_{4.00}O_{10}(OH)_2$.

Polymorphism & Series: 1M polytype.

Mineral Group: Mica group.

Occurrence: Replaces primary ferromagnesian silicate minerals in altered intermediate to mafic volcanic rocks, developed under low-grade zeolite facies metamorphism; as amygdule fillings in basalts or andesites.

Association: Montmorillonite, clinoptilolite, heulandite, laumontite, prehnite, chlorite, quartz, calcite.

Distribution: Many localities; a few for well-characterized material include: on Mt. Baldo, near Verona, Vicenza, and at Val di Fassa, Trentino-Alto Adige, Italy. In the Zillertal, Tirol, Austria. In Scotland, at Scuir Mohr. From Streymoy and Suduroy, Faeroe Islands. In the USA, in the John Day Formation, Grant Co., Oregon; in Mt. Rainier National Park, Pierce Co., Washington; and from Red Rock Canyon, Kern Co., California. On the Pearl Islands, off Nicaragua. In the Hosokura mine, Miyagi Prefecture; at Toyoura, Yamagata Prefecture; Nishikata, Tochigi Prefecture; Kamogawa, Chiba Prefecture; and many other places in Japan.

Name: From the French *celadon*, for *sea green*, its color.

Celestine $SrSO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Well-formed crystals are common; typically thin to thick tabular on {001} with large {210}; tabular on {001} or {100}, lathlike or with equant cross-sections; also elongated along [010] or [001], to 45 cm; may be equant with equal {001}, {011}, {101} or pyramidal with {122}, {011}, {102}. Also fibrous, lamellar, earthy, massive granular.

Physical Properties: *Cleavage:* On {001}, perfect; on {210}, good; on {010}, poor. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 3–3.5 D(meas.) = 3.97(1) D(calc.) = 3.98

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale blue, pink, pale green, pale brown, black; colorless or faintly tinted in transmitted light. *Luster:* Vitreous, pearly on cleavages.
Optical Class: Biaxial (+). *Pleochroism:* Weak; if blue, indigo-blue, lavender-blue, violet. *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r < v$, moderate. *Absorption:* $Z > Y > X$. $\alpha = 1.619$–1.622 $\beta = 1.622$–1.624 $\gamma = 1.630$–1.632 2V(meas.) = 50°

Cell Data: *Space Group: Pnma.* $a = 8.359$ $b = 5.352$ $c = 6.866$ Z = 4

Total	100.00	100.00

(1) Djebel Kebbouch, Tunisia. (2) $SrSO_4$.

Polymorphism & Series: Forms a series with barite.

Mineral Group: Barite group.

Occurrence: Of primary sedimentary origin, diagenetic, or typically as fissure and cavity fillings (including caves) precipitated by migrating strontium-bearing ground water or basinal brines in carbonate rocks, concretions and nodules; in hydrothermal veins and mafic volcanic rocks.

Association: Gypsum, anhydrite, sulfur (bedded evaporites); strontianite, calcite, dolomite, anhydrite, gypsum, fluorite (cavities in carbonate rocks); analcime, natrolite, hydroxyapophyllite, celadonite (mafic volcanoclastics).

Distribution: The most common strontium mineral; only a few localities for fine and large crystals are listed; in the USA, from near Bellwood, Blair Co., Pennsylvania; in Crystal Cave, Put-in-Bay, South Bass Island, and at Clay Center, Ottawa Co., Ohio; from Cave-in-Rock, Hardin Co., Illinois; at the Scofield quarry, Maybee, Monroe Co., Michigan; from Adamsville, Lampasas Co., Texas. At Dundas, Ontario, Canada. In Mexico, from near Matehuela, San Luis Potosi, and at Musquiz and Ramos Arizpe, Coahuila. From Girgenti, Caltanissetta, and elsewhere in Sicily, Italy. In the Konrad mine, near Salzgitter, Lower Saxony, Germany. At Yate, near Bristol, England. From Bamle, Norway. At Jebel Mokattem, near Cairo, Egypt. From Sakoany, near Mahajanga (Majunga), Madagascar.

Name: From the Latin for *celestial*, in allusion to the typical bluish color.

Total	100.82	[99.94]	100.00

(1) Jakobsberg, Sweden. (2) Aberfeldy, Scotland; by electron microprobe; original total given as 99.99%. (3) $BaAl_2Si_2O_8$.

Polymorphism & Series: Dimorphous with paracelsian; forms a series with orthoclase.

Mineral Group: Feldspar group.

Occurrence: In amphibolite-grade, regional or contact metamorphic, Mn, Ba-rich rocks, some of which probably were submarine exhalatives.

Association: Manganoan aegirine, manganoan biotite, paracelsian, jacobsite, hausmannite, rhodochrosite, rhodonite, rutile, hyalophane, barite, cymrite, taramellite, quartz, zoisite, spessartine, dolomite, muscovite.

Distribution: At Jakobsberg and Långban, Värmland, Sweden. In the Simplon region, Valais, Switzerland. In the USA, from Franklin, Sussex Co., New Jersey; near Big Creek, Fresno Co., and Trumbull Peak, near Incline, Mariposa Co., California. At the Benallt mine, Rhiw, Lleyn Peninsula, Wales. From near Aberfeldy, Scotland. In Kazakhstan, from the Burultas deposit, west of Lake Balkhash. In Namibia, at Otjosondu. From Piggery Creek, Broken Hill, New South Wales, Australia. In the Kaso mine, Totiki Prefecture, Japan.

Name: To honor the Swedish astronomer and naturalist, Anders Celsius (1701–1744).

(1) Sudbury, Canada; partial analysis by semiquantitative emission spectroscopy.

Occurrence: Sparingly, in partially absorbed inclusions of wall-rock in a dikelike zone of carbonate rock cutting nepheline syenite (Sudbury, Canada); a secondary mineral weathered from phonolites and nepheline syenites (Minas Gerais, Brazil); in pegmatite (Kåbuland, Norway).

Association: Nepheline, tremolite, feldspar, apatite, magnetite, ilmenite, calcite (Sudbury, Canada); hydromica, kaolinite, "limonite" (Morro do Ferro, Brazil); fluocerite, bastnäsite, törnebohmite (Kåbuland, Norway); fluocerite, bastnäsite (Karonge, Burundi).

Distribution: From about 11 km northeast of Nemegos, Lackner Township, Sudbury district, Ontario, and in the Lake Zone deposit, Thor Lake, Northwest Territories, Canada. In Paramount Canyon, Taylor Creek district, Catron Co., New Mexico, and on North Sugarloaf Mountain, Bethlehem, Grafton Co., New Hampshire, USA. From Cañon Colorado, Sierra de Bermjillo, Durango, Mexico. On Morro do Ferro, Poços de Caldas plateau, Minas Gerais, Brazil. In Norway, large crystals from near Kåbuland, Iveland; at Tysfjorden, Nordland; and from Høydalen, Telemark. At the Bellerberg volcano, two km north of Mayen, Eifel district, Germany. From the Khoda-Achkan massif, Alai Range, Kyrgyzstan. In the Karonge rare-earth deposit, Burundi. At Mount Weld, Laverton, Western Australia.

Name: For CERium in its composition, and by analogy to *thorianite* and *uraninite*.

Type Material: Canadian Geological Survey, Ottawa, 16588; Royal Ontario Museum, Toronto, Canada, M34491, M37257.

(1) Wasau, Wisconsin, USA. (2) Schelingen quarry, Germany; original total given as 101.18%; $RE_2O_3 = Ce_2O_3$ 8.4%, La_2O_3 1.6%, Nd_2O_3 1.2%, Pr_2O_3 0.4%, Sm_2O_3 0.2%, Gd_2O_3 0.08%, Dy_2O_3 0.03%, Eu_2O_3 0.016%; corresponds to $[Ca_{0.83}RE_{0.26}Na_{0.21}(Sr, Fe, U, Th, Ba)_{0.02}]_{\Sigma=1.32}[Nb_{1.69}Ti_{0.10}Zr_{0.10}Fe_{0.09}(Si, Ta, Al, V)_{0.02}]_{\Sigma=2.00}O_{6.17}[(OH)_{0.07}F_{0.02}]_{\Sigma=0.09}$.

Mineral Group: Pyrochlore group and subgroup; $\Sigma\ Ce_A > 20\%$; $(Nb + Ta)_B > 2Ti_B$; $Nb_B > Ta_B$.

Occurrence: In pegmatites related to alkalic igneous rocks and in nepheline syenites; in weathered residium derived from carbonatites.

Association: Aegirine, quartz, feldspar, ferrian biotite, rutile, fluorite, zirconium minerals (Wasau, Wisconsin, USA); latrappite, apatite, calcite (Oka, Canada).

Distribution: From Wasau, Marathon Co., Wisconsin, USA. At Oka, Quebec, Canada. In the Schelingen quarry, Kaiserstuhl, Baden-Württemberg, Germany. From Alpe Rosso, Val Vigezzo, Piedmont, Italy. At the Kent massif, Kazakhstan. From the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia. In the Lueshe carbonatite, 150 km north of Goma, Kivu Province, Congo (Zaire).

Name: For membership in the *pyrochlore* group and significant CERIum content.

Type Material: n.d.

Mineral Group: Stannite group.

Occurrence: A rare constituent of complex zoned pegmatites, as a component of a very minor sulfide mineral suite.

Association: Pyrrhotite, sphalerite, hawleyite, chalcopyrite, stannite, bismuth, këesterite.

Distribution: In the Hugo [TL] and Peerless mines, near Keystone, Pennington Co., South Dakota, USA. From the Tanco pegmatite at Bernic Lake, southeastern Manitoba, Canada [TL]. In the Barquilla deposit, Salamanca Province, Spain.

Name: To honor Dr. Petr Černý (1934–), Czech-Canadian mineralogist specializing in pegmatites, University of Manitoba, Winnipeg, Canada.

Type Material: University of Manitoba, Winnepeg, 5159, 5160; Canadian Geological Survey, Ottawa, 12119; Royal Ontario Museum, Toronto, Canada, M34728–M34730; Museum of Geology, South Dakota School of Mines, 5098, 5099; National Museum of Natural History, Washington, D.C., USA, 136924.

(1) Emma Louisa mine, Chile. (2) Bolivia; average of seven analyses.
(3) $Cu_2Al_7(AsO_4)_4(OH)_{13}\cdot 11.5H_2O$.

Occurrence: In the oxidized zone of arsenic-rich polymetallic mineral deposits; a post-mine product.

Association: Alumopharmacosiderite, olivenite, schlossmacherite, mansfieldite, quartz (Emma Louisa mine, Chile); mansfieldite, quartz, barite, goethite (Bolivia); liroconite, clinoclase, olivenite (Wheal Gorland, England); posnjakite, scorodite, metazeunerite, cassiterite, tourmaline, quartz (Wheal Maid, England); malachite, azurite, olivenite, mansfieldite, pharmacosiderite (Cap Garonne mine, France).

Distribution: From the Emma Louisa gold mine, Guanaco district, about 100 km east-northeast of Taltal, Antofagasta, Chile. At an unknown locality in southern Bolivia. In England, at Wheal Gorland and Wheal Maid, Gwennap, and in the Penberthy Croft mine, St. Hilary, Cornwall. From the Cap Garonne mine, near Le Pradet, Var, France. At the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. From Tsumeb, Namibia.

Name: From *cerulean*, for the sky-blue color of the mineral.

Type Material: The Natural History Museum, London, England.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 927–928. (2) Schmetzer, K., H. Bank, W. Berdesinski, and E. Kroužek (1976) Neue Untersuchungen an Coeruleit. Neues Jahrb. Mineral., Monatsh., 418–425 (in German with English abs.).

Cerussite $PbCO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals, to 0.6 m, are tabular {010}, equant to elongated on [001] or [100], or pseudohexagonal dipyramidal {111}, exhibiting combinations of {110}, {010}, {111}, {021}, {012}, {011}, {130}, {001}, with many others. Also granular, pulverulent, stalactitic, as randomly intergrown prismatic aggregates, rarely fibrous, massive. *Twinning:* Common, as simple or cyclic contact twins on {110}, producing stellate pseudohexagonal or reticulated composites; as contact twins on {130} producing heart-shaped composites. Both laws may occur in one aggregate.

Physical Properties: *Cleavage:* {110} and {021}, good; {010} and {012}, poor. *Fracture:* Conchoidal. *Tenacity:* Very brittle. Hardness = 3–3.5 D(meas.) = 6.55(2) D(calc.) = 6.577 May fluoresce yellow under LW UV.

Optical Properties: Transparent to translucent. *Color:* Colorless, white, pale yellow, smoky to dark gray, black with inclusions; colorless in transmitted light. *Streak:* White. *Luster:* Adamantine, tending toward vitreous, resinous.
Optical Class: Biaxial (–). *Orientation:* $X = c$; $Y = b$; $Z = a$. *Dispersion:* $r > v$, strong.
$\alpha = 1.803$ $\beta = 2.074$ $\gamma = 2.076$ 2V(meas.) = 8°–9°

Cell Data: *Space Group: Pmcn.* $a = 5.179(1)$ $b = 8.492(3)$ $c = 6.141(2)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.593 (100), 3.498 (43), 2.487 (32), 2.081 (27), 3.074 (24), 1.859 (21), 2.522 (20)

Chemistry:

	(1)	(2)
CO_2	16.64	16.47
PbO	83.27	83.53
insol.	0.24	
Total	100.15	100.00

(1) Tsumeb, Namibia. (2) $PbCO_3$.

Mineral Group: Aragonite group.

Occurrence: Common in the oxidized zone of lead deposits, where it may constitute an important ore.

Association: Anglesite, smithsonite, malachite, azurite, phosgenite, pyromorphite, galena.

Distribution: Some of the many localities for fine crystals include: from the Friedrichssegen mine, near Braubach, Rhineland-Pfalz, Germany. At Příbram, Czech Republic. From Mežica (Mies), Slovenia. At Leadhills, Lanarkshire, Scotland. From the Frankmills mine, Christow, Devon, England. In the Rossignol vein, Chaillac, Indre, France. At Monteponi and Montevecchio, near Iglesias, Sardinia, Italy. From Nerchinsk, Siberia, Russia. At Sidi-Amor-ben-Salem, Tunisia. From Morocco, at Mibladen, with fine twins from the Touissit mine, near Oujda. Superb crystals and twinned groups at Tsumeb and in the Kombat Cu–Pb–Ag mine, 49 km south of Tsumeb, Namibia. At the Nakhlak mine, Anarak district, Iran. In Australia, from Broken Hill, New South Wales; at the Magnet and other mines, near Dundas, Tasmania. In the USA, from the Wheatley mine, Phoenixville, Chester Co., Pennsylvania; in the Bunker Hill mine, Coeur d'Alene district, Shoshone Co., Idaho; from Leadville, Lake Co., Colorado; in Arizona, from the Mammoth-St. Anthony mine, Tiger, Pinal Co., at the Flux mine, Santa Cruz Co., and elsewhere; large twins from the Stevenson-Bennett mine, Organ district, Doña Ana Co., New Mexico.

Name: From the Latin *cerussa*, for *white lead*, synthetic lead carbonate.

La_2O_3	5.14	5.65	Total	[99.46]	[100.73]

(1) Pizzo Cervandone, Italy; by electron microprobe, Fe^{2+}:Fe^{3+} determined by Mössbauer spectroscopy, original total given as 99.47%; corresponds to $(Ce_{0.39}Nd_{0.20}La_{0.20}Y_{0.05}Th_{0.06}U_{0.03}Ca_{0.03}Pb_{0.01})_{\Sigma=0.97}(Fe^{3+}_{1.21}Ti_{0.94}Al_{0.46}Fe^{2+}_{0.40}Sn_{0.05})_{\Sigma=3.06}(Si_{1.89}As^{5+}_{1.14})_{\Sigma=3.03}O_{13}$. (2) Pizzo Cervandone, Switzerland; by electron microprobe, original total given as 100.72%; corresponds to $(Ce_{0.46}Nd_{0.23}La_{0.23}Y_{0.05}Th_{0.05}Ca_{0.03}U_{0.01}Pb_{0.01})_{\Sigma=1.07}(Fe^{3+}_{1.26}Ti_{0.93}Fe^{2+}_{0.42}Al_{0.38})_{\Sigma=2.99}(Si_{1.64}As^{5+}_{1.36})_{\Sigma=3.00}O_{13}$.

Occurrence: In narrow fissure-veins cutting two-mica gneiss.

Association: Senaite, chernovite, rutile, anatase, muscovite, albite, chlorite, tourmaline, magnetite, hematite, quartz, synchysite.

Distribution: On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Italy. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland.

Name: After the locality on the border between Italy and Switzerland where the mineral was discovered, Pizzo Cervandone.

Type Material: Natural History Museum, Bern, B3953, B4695, B4880; Natural History Museum, Basel, Switzerland, M30802.

Cervantite $Sb^{3+}Sb^{5+}O_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $mm2$. Fine-grained, massive.

Physical Properties: *Cleavage:* {001}, excellent; {100}, distinct. Hardness = 4–5
D(meas.) = > 6.5 D(calc.) = 6.64

Optical Properties: Semitransparent. *Color:* Yellow to nearly white; colorless in transmitted light. *Streak:* Pale yellow to white. *Luster:* Earthy when powdery.
Optical Class: Biaxial. n = 2.0–2.1 2V(meas.) = n.d.

Cell Data: *Space Group:* $Pna2_1$. $a = 5.43$ $b = 4.79$ $c = 11.73$ Z = 4

X-ray Powder Pattern: Brasina, Serbia.
3.06 (10), 2.91 (7), 1.854 (7), 1.635 (7), 2.70 (6), 2.38 (6), 1.774 (6)

Chemistry: The composition has been established by correspondence of other properties with synthetic $Sb^{3+}Sb^{5+}O_4$.

Occurrence: A secondary mineral formed from the oxidation of stibnite.

Association: Stibnite.

Distribution: The existence of the species was re-established on material from the Zajača-Stolice district, Brasina, Serbia. At Baia Sprie (Felsőbánya), Romania. In the Cetine mine, 20 km southwest of Siena, and the Pereta mine, Scansano, Tuscany, Italy. At the Clara Mine, near Oberwolfach, Black Forest, Germany. From Pocca, Bolivia. Material from other localities requires modern confirmation.

Name: For the supposed original occurrence at Cervantes, Spain, type material from which is not available.

X-ray Powder Pattern: Moctezuma mine, Mexico.
5.00 (vvs), 4.24 (vs), 6.29 (s), 3.766 (ms), 4.64 (m), 5.74 (w), 2.596 (w)

Chemistry:

	(1)	(2)
Ag	73.0	72.99
Cu	0.1	
Te	22.2	21.59
S	5.3	5.42
Total	100.6	100.00

(1) Moctezuma mine, Mexico; by electron microprobe, average of eight analyses; corresponds to $Ag_{3.99}Cu_{0.01}Te_{1.02}S_{0.97}$. (2) Ag_4TeS.

Occurrence: In fracture fillings in highly altered and silicified rhyolite vitrophyre in a hydrothermal Au–Te deposit.

Association: Silver, acanthite, hessite, benleonardite, pyrite, sphalerite, dolomite, quartz.

Distribution: From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico [TL]. A number of additional localities are suggested to host this species, but so far in amounts too small for complete confirmation.

Name: To honor Dr. Bernard Cervelle (1940–), French mineralogist, University of Paris, Paris, France, for his work in ore microscopy.

Type Material: The Natural History Museum, London, England, 1985,354, E1161.

$-O = (F, Cl)_2$	0.21
Total	99.12

(1) Cesano, Italy; by electron microprobe, corresponds to $(Ca_{1.54}Na_{0.44}Sr_{0.03})_{\Sigma=2.01}(Na_{2.98}K_{0.02})_{\Sigma=3.00}[(OH)_{0.44}Cl_{0.06}F_{0.06}]_{\Sigma=0.56}(SO_4)_{2.99} \bullet 0.44H_2O$.

Occurrence: As vein and cavity fillings in brecciated rock in an active geothermal field.

Association: Görgeyite, pyrite, gypsum, anhydrite, aphthitalite, kalistrontite, glauberite.

Distribution: From drill core at the edge of the Baccano caldera, Cesano geothermal field, east of Lake Bracciano, Lazio, Italy.

Name: For the locality near Cesano, Italy.

Type Material: City Museum of Natural History, Milan; Mineralogy Museum, University of Rome, Rome, Italy 24316/1; Natural History Museum, Vienna, Austria, L6891; National Museum of Natural History, Washington, D.C., USA, 150333.

Cesbronite $Cu_5(Te^{4+}O_3)_2(OH)_6 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As chisel-shaped dipyramidal crystals, to 0.5 mm, showing dominant and striated {103}, with {180}, {001}, and {010}; as hollow crusts of radiating crystals and fanlike aggregates.

Physical Properties: *Cleavage:* Poor on {010}; good on {021}. *Tenacity:* Brittle. Hardness = 3 D(meas.) = 4.45(2) D(calc.) = 4.455

Optical Properties: Transparent. *Color:* Green; dark green in transmitted light. *Streak:* Pale green.
Optical Class: Biaxial (+). *Pleochroism:* Distinct; X = pale bluish green; Y = dark yellow-green; Z = dark emerald-green. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r > v$; moderate. *Absorption:* $Z \simeq Y \gg X$. $\alpha = 1.880(8)$ $\beta = 1.928(8)$ $\gamma = 2.029(8)$ 2V(meas.) = n.d. 2V(calc.) = 72°

Cell Data: *Space Group: Pbcn.* $a = 8.624(16)$ $b = 11.878(16)$ $c = 5.872(16)$ Z = 2

X-ray Powder Pattern: Oriental mine, Mexico.
5.934 (100), 3.490 (92), 4.889 (71), 2.358 (70), 2.379 (38), 1.592 (34), 2.156 (28)

Chemistry:

	(1)	(2)
TeO_2	38.92	39.55
CuO	49.95	49.29
H_2O	11.00	11.16
Total	99.87	100.00

(1) Oriental mine, Mexico; by electron microprobe, average of four analyses, total Te as TeO_2, H_2O on a separate sample by the Penfield method; corresponds to $Cu_{5.07}(TeO_3)_{1.97}(OH)_{6.20} \cdot 1.83H_2O$. (2) $Cu_5(TeO_3)_2(OH)_6 \cdot 2H_2O$.

Occurrence: A secondary mineral in an oxidized Cu–Te–Pb sulfide deposit (Oriental mine, Mexico).

Association: Argentian gold, teineite, carlfriesite, xocomecatlite (Oriental mine, Mexico); utahite, leisingite, jensenite, hematite (Centennial Eureka mine, Utah, USA).

Distribution: From the Oriental (Bambollita) mine, northeast of the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. In the USA, at Tombstone, Cochise Co., Arizona, and from the Centennial Eureka mine, Tintic district, near Eureka, Juab Co., Utah.

Name: Honors Dr. Fabian Cesbron (1938–), French mineralogist with the Bureau de Recherches Géologiques et Minières, Orléans, France.

Type Material: Natural History Museum, Paris; National School of Mines, Paris, France; The Natural History Museum, London, England, 1976,405; National Museum of Natural History, Washington, D.C., USA, 144518.

Cesplumtantite $(Cs,Na)_2(Pb,Sb^{3+})_3Ta_8O_{24}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* n.d. As veinlets and elongated aggregates, to 0.3 mm. *Twinning:* Polysynthetic, complex, observed microscopically.

Physical Properties: Hardness = n.d. VHN = 1240 (40 g load). D(meas.) = n.d. D(calc.) = 6.87(5)

Optical Properties: Transparent. *Color:* Colorless; light gray in reflected light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Uniaxial. *Anisotropism:* Strong. *Bireflectance:* Weak.
R_1–R_2: (476) 18.2–17.1, (553) 17.3–16.5, (589) 17.1–16.5, (656) 15.6–15.3

Cell Data: *Space Group:* n.d. $a = 13.552(8)$ $c = 6.445(5)$ $Z = 2$

X-ray Powder Pattern: Manono pegmatite, Congo.
3.054 (10), 1.869 (7), 1.593 (7), 6.11 (5), 3.19 (5), 2.037 (5b), 1.181 (5)

Chemistry:

	(1)
Nb_2O_5	3.24
Ta_2O_5	63.85
SnO_2	[1.60]
Sb_2O_3	2.88
SnO	1.49
PbO	20.24
CaO	0.83
Na_2O	0.71
Cs_2O	5.37
Total	[100.21]

(1) Manono pegmatite, Congo; by electron microprobe, average of three analyses; corresponding to $(Cs_{0.94}Na_{0.57}Ca_{0.37})_{\Sigma=1.88}(Pb_{2.24}Sb^{3+}_{0.49}Sn^{2+}_{0.27})_{\Sigma=3.00}(Ta_{7.15}Nb_{0.60}Sn^{4+}_{0.26})_{\Sigma=8.01}O_{24}$.

Occurrence: In veinlets in a museum specimen from a granite pegmatite.

Association: Lithiotantite, cassiterite, calciotantite, microlite, thoreaulite.

Distribution: From the Manono pegmatite, Katanga Province, Congo (Shaba Province, Zaire).

Name: For CESium, lead (PLUMbum), and TANTalum in the composition.

Type Material: Mining Museum, State University, St. Petersburg, Russia, 1547/2.

References: (1) Voloshin, A.V., Y.A. Pakhomovskii, A.Y. Bakhchisaraytsev, and N.N. Devnina (1986) Cesplumtantite – a new cesium-lead tantalate from granitic pegmatites. Mineral. Zhurnal, 8(5), 92–98 (in Russian with English abs.). (2) (1989) Amer. Mineral., 74, 501 (abs. ref. 1).

Cesstibtantite $Cs(Sb^{3+}, Na)Ta_2(O, OH, F)_7$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* $4/m\ \overline{3}\ 2/m$. As cubo-octahedral crystals; granular, to 3 mm.

Physical Properties: *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = ∼5 VHN = 670–780 (100 g load). D(meas.) = 6.4–6.6 D(calc.) = 6.49 Fluoresces yellow-orange to orange under LW UV; weak yellowish cathodoluminescence.

Optical Properties: Transparent; may be opaque except in thinnest fragments.
Color: Colorless to gray, yellow-orange, black. *Luster:* Adamantine to vitreous.
Optical Class: Isotropic. $n = > 1.8$
R: (480) 13.8, (551) 13.6, (589) 13.6, (656) 13.0

Cell Data: *Space Group:* $Fd3m$. a = 10.496–10.515 Z = 8

X-ray Powder Pattern: Kola Peninsula, Russia.
3.04 (10), 1.860 (10), 1.587 (10), 1.012 (10), 3.17 (9), 1.370 (9), 1.017 (9)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
Nb_2O_5	2.3	2.8	1.2	CaO	0.1		0.6
Ta_2O_5	72.0	70.8	72.5	Na_2O	1.3	1.7	2.4

(1) Kola Peninsula, Russia; by electron microprobe, average of five analyses; $(OH)^{1-}$ confirmed by IR. (2) Do.; by electron microprobe, H_2O calculated from structural considerations; corresponds to $[Cs_{0.31}(OH, F)_{0.69}]_{\Sigma=1.00}(Sb_{0.57}Na_{0.31}Pb_{0.02}Bi_{0.01})_{\Sigma=0.91}(Ta_{1.88}Nb_{0.12})_{\Sigma=2.00}$ $[O_{5.69}(OH, F)_{0.31}]_{\Sigma=6.00}$. (3) Tanco pegmatite, Canada; by electron microprobe, H_2O calculated from structural considerations; corresponds to $[Cs_{0.22}K_{0.01}(OH, F)_{0.55}]_{\Sigma=0.78}(Na_{0.45}Sb_{0.40}$ $Pb_{0.14}Ca_{0.06}Bi_{0.02}Sn_{0.01})_{\Sigma=1.08}(Ta_{1.95}Nb_{0.05})_{\Sigma=2.00}[O_{5.78}(OH, F)_{0.22}]_{\Sigma=6.00}$.

Mineral Group: Pyrochlore group, intermediate between normal and inverse pyrochlores.

Occurrence: A rare accessory in some highly fractionated granite pegmatites.

Association: Simpsonite, stibiotantalite, microlite, wodginite, tantalite, pollucite, sosedkoite (Kola Peninsula, Russia); kimrobinsonite, manganotantalite, antimonian microlite (Mt. Holland, Western Australia).

Distribution: From the Leshaia pegmatite, Vuoriyarvi carbonatite complex, Kola Peninsula, Russia. In the Czech Republic, at the Dobrá Voda pegmatite, Velké Meziříčí. In the Tanco pegmatite, Bernic Lake, Manitoba, Canada. From near Mt. Holland, Western Australia.

Name: For CESium, antimony (STIBium), and TANTalum in the composition [deviant from IMA pyrochlore nomenclature].

Type Material: Mining Museum, St. Petersburg, 1324/1; Geology Museum, Kola Branch, Academy of Sciences, Apatity, 5518; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 80827, 81058, vis6317.

Cetineite $(K,Na)_{3+x}(Sb_2O_3)_3(SbS_3)(OH)_x \cdot 2.4H_2O$ (x ~0.5)

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* 6. As tufts of acicular crystals elongated ‖ [0001], to 0.5 mm in length.

Physical Properties: *Cleavage:* On $\{10\bar{1}0\}$. *Tenacity:* Somewhat sectile. Hardness = n.d. VHN = 127–156 (20 g load). D(meas.) = n.d. D(calc.) = 4.21

Optical Properties: Transparent to translucent. *Color:* Red-orange. *Streak:* Orange. *Luster:* Resinous.
Optical Class: Uniaxial (+). *Pleochroism:* Weak, from orange to slightly orange-brown.
$n = > 1.74$ 2V(meas.) = n.d.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6_3$. $a = 14.2513(3)$ $c = 5.5900(1)$ Z = 2

X-ray Powder Pattern: Cetine mine, Italy.
2.916 (100), 12.41 (80), 3.000 (74), 2.690 (61), 4.11 (55), 4.67 (54), 3.581 (44)

Chemistry:

	(1)
SiO_2	0.67
Sb_2O_3	81.06
K_2O	6.66
Na_2O	3.87
S	7.15
H_2O	[4.16]
$-O = S$	3.57
Total	[100.00]

(1) Cetine mine, Italy; by electron microprobe, average of two analyses, H_2O by difference; after deduction of SiO_2 corresponds to $(K_{1.78}Na_{1.57})_{\Sigma=3.35}(Sb_2O_3)_{3.03}(SbS_3)_{0.94}(OH)_{0.53} \cdot 2.4H_2O$.

Occurrence: From an antimony deposit in highly silicified evaporites, on ore which has been roasted, then long weathered.

Association: Mopungite, sénarmontite.

Distribution: From the Cetine mine, 20 km southwest of Siena, Tuscany, Italy.

Name: For the Cetine mine, Italy.

Type Material: University of Florence, Florence, Italy, 644/RI; National Museum of Natural History, Washington, D.C., USA, 164388.

Chabazite $CaAl_2Si_4O_{12}\cdot 6H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Triclinic, pseudohexagonal. *Point Group:* $P\overline{1}$; $\overline{3}$ $2/m$ pseudohexagonal. In pseudorhombohedral crystals, nearly cubic in aspect, to 4.5 cm; tabular, complex to rounded twinned forms; anhedral, granular, or massive. *Twinning:* About [0001], interpenetrant, simple and repeated, common; contact on $\{10\overline{1}1\}$.

Physical Properties: *Cleavage:* $\{10\overline{1}1\}$, distinct. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4–5 D(meas.) = 2.05–2.20 D(calc.) = 2.035

Optical Properties: Transparent to translucent. *Color:* White, yellow, pink, red, colorless; colorless in thin section. *Streak:* White. *Luster:* Vitreous.
Optical Class: Biaxial (+) or (–) or uniaxial; commonly shows birefringent panelling in six sections. *Orientation:* $X = c$; rarely $Z = c$. α = 1.478–1.487 β = n.d. γ = 1.480–1.493 2V(meas.) = 0°–32°

Cell Data: *Space Group:* $P\overline{1}$. a = 9.40–9.45 b = 9.40–9.44 c = 9.40–9.44 α = 94.18°−94.33° β = 94.08°−94.36° γ = 94.07°−94.45° Z = [2]

X-ray Powder Pattern: Table Mountain, Colorado, USA; very similar to herschelite. 2.925 (100), 4.32 (75), 9.35 (50), 5.02 (30), 3.87 (30), 2.890 (30), 3.59 (25)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	47.56	47.46	K_2O	0.92	
Al_2O_3	20.40	20.13	H_2O^+	16.28	
MgO	0.20		H_2O^-	3.44	
CaO	10.52	11.07	H_2O		21.34
Na_2O	0.32		Total	99.64	100.00

(1) Ritter Hot Spring, Grant Co., Oregon, USA; corresponds to $(Ca_{0.94}K_{0.10}Na_{0.05}Mg_{0.02})_{\Sigma=1.11}Al_{2.01}Si_{3.97}O_{12}\cdot 5.50H_2O$. (2) $CaAl_2Si_4O_{12}\cdot 6H_2O$.

Mineral Group: Zeolite group.

Occurrence: In volcanic rocks as basalts, andesite; rarer in limestones and schists; hydrothermally deposited in cavities and joints in ore veins. In bedded tuff in lake deposits, altered from volcanic glass.

Association: Zeolites, nepheline, melilite, olivine, pyroxenes, amphiboles, axinite, epidote, calcite, tridymite, dolomite.

Distribution: A common zeolite. Fine crystals from Idar-Oberstein, Rhineland-Palatinate, Germany. At Řepčice (Rübendörfel), near Ústí nad Lábem (Aussig), Czech Republic. At a number of localities in Co. Antrim, Ireland. In Scotland, at Kilmalcolm, Renfrewshire. From Haeddin, on Eysturoy; Dalsnipa, on Sandoy; and Skutin, on Nolsoy, Faeroe Islands. Large crystals at Breidhdalsheidhi, Iceland. In the USA, around Paterson, Passaic Co., and Bergen Hill, Hudson Co., New Jersey; on Table Mountain, Jefferson Co., Colorado; at Goble, Columbia Co., and Springfield, Lane Co., Oregon. In the Bay of Fundy district, Nova Scotia, Canada. On Table Mountain, Rosarito Beach, Baja California, Mexico. In the Khandivali quarry, near Bombay, Maharashtra, India. At Richmond and Collingwood, Victoria, and on Fairy Mount, near Kyogle, New South Wales, Australia.

Name: From the Greek *chabazios*, an ancient name of a stone.

Chabournéite $(Tl, Pb)_{23}(Sb, As)_{91}S_{147}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* 1. Rarely in crystals larger than 1 mm; typically in intimate intergrowths with pierrotite.

Physical Properties: *Fracture:* Conchoidal. Hardness = n.d. VHN = 78–124, 95 average (25 g load). D(meas.) = 5.104 D(calc.) = 5.121

Optical Properties: Opaque. *Color:* Black; white in reflected light, red internal reflections noted along cracks. *Streak:* Red-brown. *Luster:* Submetallic to greasy. *Pleochroism:* Weak. *Anisotropism:* Strong, in bluish and greenish colors.
R_1–R_2: (400) 33.8–39.7, (420) 33.5–39.1, (440) 33.2–38.6, (460) 32.8–37.9, (480) 32.3–37.2, (500) 32.0–36.6, (520) 31.7–36.1, (540) 31.4–35.6, (560) 31.1–34.9, (580) 30.7–34.3, (600) 30.3–33.7, (620) 29.7–33.0, (640) 29.1–32.2, (660) 28.5–31.6, (680) 27.9–30.9, (700) 27.3–30.3

Cell Data: *Space Group:* $P1$. $a = 16.346(5)$ $b = 42.602(10)$ $c = 8.534(3)$ $\alpha = 95.86(3)°$ $\beta = 86.91(3)°$ $\gamma = 96.88(3)°$ Z = 1

X-ray Powder Pattern: Jas Roux, France.
3.573 (10), 2.135 (9), 2.808 (8), 3.928 (7), 3.358 (7), 2.853 (7), 2.709 (7)

Chemistry:

	(1)	(2)
Tl	23.87	17.88
Pb	0.00	10.94
Sb	32.92	31.61
As	17.63	14.83
S	26.05	24.82
Total	100.47	100.08

(1) Jas Roux, France; by electron microprobe, corresponding to $Tl_{21.13}(Sb_{48.93}As_{42.58})_{\Sigma=91.51}S_{147.00}$. (2) Abuta, Japan; by electron microprobe, corresponding to $(Tl_{16.61}Pb_{10.03})_{\Sigma=26.64}(Sb_{49.31}As_{37.59})_{\Sigma=86.90}S_{147.00}$.

Occurrence: In a hydrothermal deposit in dolomitic limestones with other As–Tl minerals (Jas Roux, France).

Association: Pierrotite, parapierrotite, stibnite, pyrite, sphalerite, twinnite, zinkenite, madocite, andorite, smithite, laffittite, routhierite, aktashite, wakabayashilite, realgar, orpiment (Jas Roux, France); getchellite, sphalerite, barite (Abuta, Japan).

Distribution: In France, from the Jas Roux deposit, 10 km east of Chapelle-en-Valgaudemar, Hautes-Alpes [TL]. In the Toya mine, Abuta, Hokkaido, Japan.

Name: For Chabournéou Glacier, near the Jas Roux deposit, France.

Type Material: National School of Mines, Paris, France.

(1) Xitieshan mine, China; corresponds to $(Zn_{0.85}Fe^{2+}_{0.12})_{\Sigma=0.97}(Fe^{3+}_{1.01}Al_{0.01})_{\Sigma=1.02}(SO_4)_{2.05}(OH)_{0.90}\cdot 3.87H_2O$. (2) $ZnFe(SO_4)_2(OH)\cdot 4H_2O$.

Occurrence: A secondary mineral in the oxidized portions of a Pb–Zn–Fe sulfide deposit.

Association: Coquimbite, copiapite, butlerite, zincobotryogen.

Distribution: From the Xitieshan Pb–Zn mine, south of Mt. Qilianshan, Chaidamu, Qinghai Province, China.

Name: For the occurrence near Chaidamu, China.

Type Material: Geology Department, Lanzhou University, Lanzhou; Geology and Mineral Resources Museum, Ministry of Geology, Beijing, China.

Chalcanthite $CuSO_4 \cdot 5H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Uncommonly as short prismatic [001] to thick tabular $\{\overline{1}\overline{1}1\}$ crystals, exhibiting {100}, {130}, {120}, {110}, $\{1\overline{1}0\}$, $\{\overline{1}\overline{1}1\}$, with 25 other forms noted, to 2 cm; commonly in stalactitic to reniform crusts, cross-vein fibrous, massive, or granular. *Twinning:* Rarely as cruciform intergrowths with {010} common between individuals.

Physical Properties: *Cleavage:* Perfect on $\{1\overline{1}0\}$; interrupted on {110}. *Fracture:* Conchoidal. Hardness = 2.5 D(meas.) = 2.286 (synthetic). D(calc.) = 2.282 Soluble in H_2O, metallic taste; dehydrates in dry air.

Optical Properties: Translucent. *Color:* Berlin blue to sky-blue, greenish blue; colorless to pale blue in transmitted light. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (–). *Orientation:* X (169°,76°); Y (76°,78°); Z (–57°,18°) [with c (0°,0°) and b^* (0°,90°) using (ϕ,ρ)]. *Dispersion:* $r < v$. $\alpha = 1.514$ $\beta = 1.537$ $\gamma = 1.543$ 2V(meas.) = 56°02′

Cell Data: *Space Group:* $P\overline{1}$. $a = 6.110$ $b = 10.673$ $c = 5.95$ $\alpha = 97°35'$ $\beta = 107°10'$ $\gamma = 77°33'$ Z = 2

Total	100.19	100.00

(1) Luishia, Shaba Province, Congo. (2) $CuSO_4 \cdot 5H_2O$.

Mineral Group: Chalcanthite group.

Occurrence: A secondary mineral in the oxidized portions of copper sulfide deposits, commonly of post-mining formation; rarely as a fumarolic deposit.

Association: Melanterite, fibroferrite, rhomboclase, epsomite, goslarite, pickeringite, retgersite, morenosite, brochantite, gypsum.

Distribution: Widespread; commercial deposits may occur in arid regions. From the Island of Cyprus. On Vesuvius, Campania, Italy. From Rammelsberg and Goslar, Harz Mountains, Germany. Abundant at Rio Tinto, Huelva, Spain. In Chile, from Chuquicamata, at Quetena, near Calama, and Copaquire, Antofagasta. In the USA, in Arizona, at the United Verde mine, Yavapai Co., and in the Clifton-Morenci district, Greenlee Co.; from the Blue Bird mine, Fierro-Hanover district, Grant Co., New Mexico; commercial amounts in the Bluestone mine, Yerington district, Lyon Co., Nevada; at Butte, Silver Bow Co., Montana; from Ducktown, Polk Co., Tennessee.

Name: From an older Latin name, *chalcanthum*, for *flowers of copper*.

Chalcoalumite $CuAl_4(SO_4)(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* 2. As thin tabular enantiomorphous crystals with {100} exhibiting an equilateral triangular outline, to 0.5 mm; as spherical crystal aggregates; most commonly as fibrous to massive botryoidal crusts. *Twinning:* Typically twinned on {100} yielding composites that closely resemble thick untwinned individuals. Twinning on {010} forms diamond-shaped tablets. Twinning on $\{13\overline{6}\}$ produces a swallowtail composite with deep reentrant, or fourlings and eightlings. Diamond-shaped eightlings combining all three twin laws have been noted.

Physical Properties: *Cleavage:* On {100}, perfect. *Tenacity:* Sectile. Hardness = 2.5 D(meas.) = 2.29 D(calc.) = 2.25

Optical Properties: Transparent to translucent. *Color:* Turquoise-green to Nile blue, pale gray to nearly colorless; in transmited light, colorless. *Streak:* White. *Luster:* Vitreous to dull. *Optical Class:* Biaxial (+). *Pleochroism:* Weak; X = pale green; Y = colorless; Z = robin's-egg-blue. *Orientation:* $Y = b$; $Z \wedge c = 22°$. *Dispersion:* $r < v$, strong. $\alpha = 1.523$ $\beta = 1.525$ $\gamma = 1.532$ 2V(meas.) = Small.

Cell Data: *Space Group:* $P2_1$. $a = 17.090$ $b = 8.915$ $c = 10.221$ $\beta = 95°53'$ Z = 4

X-ray Powder Pattern: Bisbee, Arizona, USA.
8.502 (100), 4.250 (91), 4.178 (23), 7.898 (22), 4.786 (22), 5.100 (13), 2.520 (11)

Chemistry:

	(1)	(2)

insol.	0.28	
Total	98.99	100.00

(1) Bisbee, Arizona, USA. (2) $CuAl_4(SO_4)(OH)_{12}\cdot 3H_2O$.

Occurrence: A rare secondary mineral in the oxidized portions of copper deposits.

Association: Cuprite, malachite, azurite, goethite (Bisbee, Arizona, USA); mbobomkulite, hydrombobomkulite (Mbobo Mkulu Cave, South Africa).

Distribution: In the USA, from Bisbee, Cochise Co., and in the Grandview mine, Grand Canyon, Coconino Co., Arizona; at the Titusville mine, head of Kendall Gulch, San Juan Co., Colorado; and in the Lovelock mine, Table Mountain district, Churchill Co., Nevada. On the Spatsum claim, south of Ashcroft Manor, British Columbia, Canada. From the Britannia mine, Snowdonia, Gwynedd, Wales. In England, at South Wheal Crebor, Tavistock, Devon, and in the Penberthy Croft mine, St. Hilary, Cornwall. At Ottré, near Salmchâteau, Belgium. From L'ubietová, near Banská Bystrica (Libethen, near Neusohl), Slovakia. At the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy. From the Sjö mine, near Grythyttan, Örebro, Sweden. In the Mbobo Mkulu Cave, near Ngodwana, Eastern Transvaal, South Africa.

Name: For essential chemical components, from the Greek *chalkos*, for *copper* and Latin *alum*, for *aluminum sulfate*.

Type Material: Harvard University, Cambridge, Massachusetts, 87005–87008; The Natural History Museum, London, England, 1961,27; National Museum of Natural History, Washington, D.C., USA, 95226, R6326.

Chalcocite Cu_2S

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$ or m. Crystals are short prismatic [001], thick to tabular {001}, to 12 cm across, and prismatic [100], to 25 cm long; {001} is striated ‖ [100]. Massive, compact, fine powdery. *Twinning:* Common on {110} yielding pseudohexagonal stellate forms; also on {032}, {112}. Seen as lamellar twinning in polished section.

Physical Properties: *Cleavage:* Indistinct on {110}. *Fracture:* Conchoidal. *Tenacity:* Brittle, somewhat sectile. Hardness = 2.5–3 VHN = 84–87 (100 g load). D(meas.) = 5.5–5.8 D(calc.) = 5.80

Optical Properties: Opaque. *Color:* Blackish lead-gray. *Streak:* Blackish lead-gray. *Luster:* Metallic. *Anisotropism:* Weak.
R_1–R_2: (400) 37.0–36.8, (420) 37.8–37.4, (440) 37.7–37.6, (460) 37.0–37.2, (480) 36.2–36.2, (500) 35.6–35.4, (520) 34.7–34.4, (540) 33.7–33.5, (560) 32.5–32.5, (580) 32.1–31.8, (600) 31.3–31.2, (620) 30.8–30.7, (640) 30.0–30.0, (660) 29.5–30.0, (680) 29.2–29.7, (700) 29.0–29.6

$Z = 96$

X-ray Powder Pattern: Bristol, Connecticut, USA (close to djurleite).
1.8800 (100), 2.4030 (70), 1.9746 (70), 1.8811 (70), 2.4074 (50), 3.276 (35), 2.7256 (35)

Chemistry:

	(1)	(2)	(3)
Cu	79.67	79.50	79.86
Fe	0.14	0.17	
S	20.16	20.05	20.14
SiO_2	0.09	0.17	
Total	100.06	99.89	100.00

(1) Butte, Montana, USA; Fe present as pyrite. (2) New London, Maryland, USA; contains Fe as bornite. (3) Cu_2S.

Occurrence: An uncommon primary hydrothermal mineral but important as a secondary mineral. Found in or below the zone of oxidation in hydrothermal veins and in large low-grade porphyry copper orebodies.

Association: Pyrite, chalcopyrite, covellite, bornite, molybdenite, many other sulfides and their alteration products.

Distribution: An important and widely distributed ore mineral of copper. Only a few localities producing exceptional crystals or pure masses can be listed. From the Turinsk copper mine, Bogoslovsk, Ural Mountains, Russia. In England, fine crystals from Cornwall at St. Just, St. Ives, Camborne, and Redruth. In the USA, exceptional crystals from Bristol, Hartford Co., Connecticut; in Arizona, at Bisbee, Cochise Co.; from the Magma mine, Superior, Pinal Co.; in the United Verde Extension mine, Yavapai Co.; from Butte, Silver Bow Co., Montana; crystals at the Flambeau mine, southwest of Ladysmith, Rusk Co., Wisconsin; from Kennicott, Copper River district, Alaska. Large crystals from Nababiep West mine, Cape Province, and Messina, Transvaal, South Africa. At M'Passa, Niari Province, Congo Republic. In the Mashamba West mine, Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). Fine crystals from Telfer, Western Australia.

Name: For its composition, from the Greek for *chalkos*, *copper*.

Chalcocyanite $CuSO_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Crystals are tabular on {010} and slightly elongated along [001], to several mm; typically in crystalline incrustations.

Physical Properties: Hardness = 3.5 D(meas.) = 3.65(5) D(calc.) = 3.89 Soluble in H_2O; very hygroscopic, altering to chalcanthite.

Optical Properties: Transparent to translucent. *Color:* Pale green, pale brown, pale yellow, sky-blue; colorless in transmitted light.
Optical Class: Biaxial (–). *Orientation:* $X = b$; $Y = a$; $Z = c$. *Dispersion:* $r > v$, extreme.
$\alpha = 1.724(3)$ $\beta = 1.733(3)$ $\gamma = 1.739(3)$ 2V(meas.) = Large.

Cell Data: *Space Group: Pnmb.* $a = 6.709(1)$ $b = 8.409(1)$ $c = 4.833(1)$ Z = 4

X-ray Powder Pattern: Synthetic.
3.549 (100), 2.62 (95b), 4.187 (75), 2.42 (50b), 1.775 (30), 1.433 (20), 1.430 (18)

Chemistry:

	(1)	(2)
SO_3	50.30	50.16
CuO	49.47	49.84
Total	99.77	100.00

(1) Vesuvius, Italy. (2) $CuSO_4$.

Occurrence: As sublimates near volcanic fumaroles.

Association: Dolerophanite, melanothallite, eriochalcite, euchlorine (Vesuvius, Italy); euchlorine, eriochalcite, dolerophanite, melanothallite, piypite, ponomarevite, cotunnite, sofiite, fedotovite, tenorite (Tolbachik volcano, Russia); stoiberite, shcherbinaite, ziesite, bannermanite, chalcanthite (Izalco volcano, El Salvador).

Distribution: From Mount Vesuvius, Campania, Italy. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia. On Izalco volcano, El Salvador.

Name: From the Greek for *copper* and *azure-blue*, in allusion to the composition and color change caused by hydration.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 429–430. (2) Wildner, M. and G. Giester (1988) Crystal structure refinements of synthetic chalcocyanite ($CuSO_4$) and zincosite ($ZnSO_4$). Mineral. Petrol., 39, 201–209.

Chalcomenite $CuSe^{4+}O_3 \cdot 2H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* 222. As acicular to prismatic [001] crystals, dominated by {110}, {120} and {101}, typically striated or rounded, to 2 cm; also wedgelike and tabular on {010}; as powdery crusts and massive films.

Physical Properties: *Fracture:* Conchoidal. Hardness = 2–2.5 D(meas.) = 3.35 D(calc.) = [3.35]

Optical Properties: Transparent. *Color:* Bright blue; pale blue in transmitted light. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = pale blue; $Y = Z$ = darker blue. *Orientation:* $X = a$; $Y = c$; $Z = b$. *Dispersion:* $r < v$ or $r > v$, strong. $\alpha = 1.710(3)$ $\beta = 1.732(3)$ $\gamma = 1.732(3)$ 2V(meas.) = 0°–30°

Cell Data: *Space Group:* $P2_12_12_1$. $a = 6.674(2)$ $b = 9.161(1)$ $c = 7.398(3)$ Z = 4

X-ray Powder Pattern: Eagle shaft, Saskatchewan, Canada.
5.39 (10), 4.94 (9), 3.35 (8), 3.77 (7), 3.04 (7), 2.528 (7), 2.883 (6)

Chemistry:

	(1)	(2)
SeO_2	48.12	48.98
CuO	35.40	35.11
H_2O	15.30	15.91
Total	98.82	100.00

(1) Cerro de Cacheuta, Argentina. (2) $CuSeO_3 \cdot 2H_2O$.

Polymorphism & Series: Dimorphous with clinochalcomenite.

Occurrence: A rare secondary mineral in oxidized Cu–Se-bearing deposits.

Association: Umangite, clausthalite, molybdomenite, schmiederite (Cerro de Cacheuta, Argentina); penroseite, cobaltomenite, molybdomenite (Hiaco mine, Bolivia); allophane, basaluminite, malachite, clinochalcomenite (El Dragón mine, Bolivia).

Distribution: In Argentina, from Cerro de Cacheuta, Mendoza Province, and at the Cóndor mine, Los Llantenes district, Sierra de Cacheuta, in the Sierra de Umango and Sierra de Famatina, La Rioja Province. In Bolivia, at the Pacajake mine, Hiaco, 24 km east-northeast of Colquechaca, and in the El Dragón mine, 30 km southwest of Cerro Rico de Potosí, Potosí. From the Eagle shaft, Beaverlodge Lake, near Uranium City, Saskatchewan, Canada. In the USA, from the Middlemarch mine, near Pearce, Cochise Co., Arizona; at Majuba Hill, Pershing Co., Nevada; and on the Bozo No. 1 claim, Skull Creek, Moffat Co., Colorado. From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. At the Trogtal quarry, near Lautenthal, Harz Mountains, Germany. Large crystals from the Baccu Locci mine, near Villaputzu, Sarrabus district, Sardinia, Italy. At Ballybunion, Co. Kerry, Ireland. From Wheal Cock and the Botallack mine, St. Just, Cornwall, England. At Liauzun-en-Olloix, Puy-de-Dôme, France. From Skrikerum, near Tryserum, Kalmar, Sweden. From the Musonoi, Kakanda, and Kambove West mines, Katanga Province, Congo (Shaba Province, Zaire).

Name: From the Greek for *copper* and *moon*.

Type Material: Natural History Museum, Paris, France, 81.14; Harvard University, Cambridge, Massachusetts, USA, 101210.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 638–639. (2) Robinson, P.D., P.K. Sen Gupta, G.H. Swihart, and L. Chalconatronite $Na_2Cu(CO_3)_2 \cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic (synthetic). *Point Group:* $2/m$. As fine-grained crusts of pseudohexagonal plates or as laths; massive, in blebs and films.

Physical Properties: Hardness = "Soft". D(meas.) = 2.27(3) D(calc.) = 2.31 (synthetic). Partially soluble in H_2O.

Optical Properties: Transparent. *Color:* Pale blue to greenish blue.
Optical Class: Biaxial (+). *Pleochroism:* X = nearly colorless; Y = pale blue; Z = blue.
Orientation: $Z \perp$ flattening; $Y \parallel$ elongation; $Z \wedge c$ very small. $\alpha = 1.483$ $\beta = 1.530$ $\gamma = 1.576$
2V(meas.) = Large.

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 6.696(2)$ $b = 6.101(2)$ $c = 13.779(3)$
$\beta = 91.83(2)^\circ$ Z = 4

X-ray Powder Pattern: Patina on Egyptian bronze figure.
6.92 (10), 4.17 (8), 3.69 (7), 7.76 (4), 2.85 (4), 2.99 (3), 2.88 (3)

Chemistry:

	(1)	(2)
CO_2	30.5	31.04
SiO_2	0.4	
R_2O_3	0.6	
CuO	29.2	28.05
Na_2O	19.7	21.85
H_2O	19.0	19.06
Total	99.4	100.00

(1) Patina on ancient Egyptian bronze figure; CO_2 determined volumetrically, H_2O by the Penfield method; corresponds to $Na_{1.74}Cu_{1.00}(CO_3)_{1.89} \cdot 2.88H_2O$. (2) $Na_2Cu(CO_3)_2 \cdot 3H_2O$.

Occurrence: A component of patina on bronze artifacts, apparently characteristic of arid weathering environments (Egypt); an uncommon secondary mineral in the oxidation zone of polymetallic deposits.

Association: Cuprite, atacamite (patina on bronze artifact); paratacamite, gypsum, brochantite, malachite, azurite, epsomite, nickeloan magnesite, glaukosphaerite, takovite, georgeite, carrboydite (Carr Boyd Rocks mine, Australia).

Distribution: Initially characterized on several ancient Egyptian artifacts. From the Carr Boyd Rocks nickel mine, Yerilla district, 80 km north-northeast of Kalgoorlie, Western Australia. At the Glückrad mine, near Oberschulenberg, Harz Mountains, Germany. In the USA, from the Deremo-Snyder mine, San Miguel Co., Colorado, and at the White Pine mine, Ontonagon Co., Michigan.

Name: From the Greek *chalcos*, for *copper*, and *natron*, the modern name for naturally occurring sodium carbonate.

Type Material: Canadian Geological Survey, Ottawa, Canada, 17254; Fogg Museum 1943.1121.6; Harvard University, Cambridge, 105297; National Museum of Natural History, Washington, D.C., USA, 112695.

Chalcophanite $(Zn, Fe^{2+}, Mn^{2+})Mn_3^{4+}O_7 \cdot 3H_2O$

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. As tabular platelets, to 8 mm, with {0001} and {10$\bar{1}$0} giving a pseudo-octahedral appearance; commonly in drusy botryoidal or stalactitic aggregates; also colloform, granular, or massive.

Physical Properties: *Cleavage:* Perfect on {0001}. *Tenacity:* Thin plates are flexible. Hardness = 2.5 VHN = 87–166 (50 g load). D(meas.) = 4.00(10) D(calc.) = 3.827

Optical Properties: Opaque, transparent on very thin edges. *Color:* Purplish to iron black; deep red-brown to opaque in transmitted light; white with deep red internal reflections under reflected light. *Streak:* Chocolate-brown. *Luster:* Metallic to submetallic. *Optical Class:* Uniaxial (–). *Pleochroism:* Very strong, in gray and white. $\omega = \gg 2.72$ $\epsilon = \sim 2.72$ *Anisotropism:* Very strong. *Bireflectance:* Well defined; in gray and white. R_1–R_2: (400) 11.4–38.0, (420) 11.0–36.6, (440) 10.6–35.2, (460) 10.3–33.8, (480) 10.0–32.2, (500) 9.8–30.7, (520) 9.8–29.2, (540) 9.7–28.0, (560) 9.5–26.9, (580) 9.3–26.2, (600) 9.3–25.8, (620) 9.2–25.4, (640) 9.2–24.8, (660) 9.0–24.4, (680) 8.9–24.0, (700) 8.9–23.8

Cell Data: *Space Group:* $R\bar{3}$. $a = 7.541(3)$ $c = 20.824(8)$ $Z = 2$

X-ray Powder Pattern: Sterling Hill, New Jersey, USA; nearly indistinguishable from aurorite and jianshuiite.
6.96 (100), 3.50 (60), 4.08 (50), 2.24 (50), 2.57 (40), 1.597 (40), 1.900 (30)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)
MnO_2	59.94		65.82	ZnO	21.70	21.6	20.54
Fe_2O_3	0.25	0.1		H_2O	11.58	[13.0]	13.64
MnO	6.58	65.3		Total	100.05	[100.0]	100.00

(1) Sterling Hill, New Jersey, USA; average of two analyses. (2) Do.; by electron microprobe, total Mn as MnO, H_2O by difference. (3) $ZnMn_3O_7 \cdot 3H_2O$.

Occurrence: A common component of the weathered zones above zinc- and manganese-bearing base-metal deposits.

Association: Cryptomelane, manganite, hetaerolite, birnessite, todorokite, woodruffite, kaolinite, quartz.

Distribution: In the USA, at Sterling Hill, Ogdensburg, and Franklin, Sussex Co., New Jersey; from the Price mine, near Newport, Giles Co., Virginia; in the Philipsburg district, Granite Co., Montana; in Colorado, at the Wolftone mine, Leadville, Lake Co.; from the Mohawk mine, San Bernardino Co., California; in the Lone Star mine, Fierro-Hanover district, Grant Co., New Mexico; at Bisbee, Cochise Co., Arizona; and in the Tintic district, Juab Co., Utah. In Mexico, from the Ojuela mine, Mapimí, Durango. In Australia, from Broken Hill, New South Wales; at the Reaphook Hill zinc deposit, near Blinman, Flinders Ranges, and the Iron Monarch mine, 50 km northwest of Whyalla, South Australia. At Bytom, Upper Silesia, Poland. In the N'chwaning mine, near Kuruman, Cape Province, South Africa. Large crystals from Tamera, Tunisia. A number of other minor localities are known.

Name: From the Greek for *copper* and *to appear*, for the mineral's change in color on ignition.

Type Material: n.d.

Chalcophyllite $Cu_{18}Al_2(AsO_4)_4(SO_4)_3(OH)_{24}\cdot 36H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\bar{3}$. Hexagonal platy crystals, to 1 cm, flattened on [0001], prominent $\{01\bar{1}2\}$, with numerous other forms noted, may be striated triangularly on {0001}; in rosettes, drusy, foliated massive. *Twinning:* On $\{10\bar{1}0\}$ as twin plane, probably universal.

Physical Properties: *Cleavage:* {0001}, perfect, micaceous; $\{10\bar{1}1\}$, in traces. Hardness = 2 D(meas.) = 2.67–2.69 D(calc.) = 2.684

Optical Properties: Transparent to translucent. *Color:* Emerald-green, grass-green, bluish green, blue; green in transmitted light. *Streak:* Pale green to bluish green. *Luster:* Vitreous to subadamantine, pearly on {0001}.
Optical Class: Uniaxial (–). *Pleochroism:* O = bluish green; E = almost colorless. $\omega = 1.618$; 1.680 (dehydrated). $\epsilon = 1.552$; 1.618 (dehydrated).

Cell Data: *Space Group:* $R\bar{3}$. $a = 10.756(2)$ $c = 28.678(4)$ Z = 1.5

(1) Cornwall, England. (2) El Teniente mine, Chile. (3) $Cu_{18}Al_2(AsO_4)_4(SO_4)_3(OH)_{24}\cdot 36H_2O$.

Occurrence: A rare secondary mineral in the oxidized zone of some arsenic-bearing hydrothermal polymetallic deposits.

Association: Azurite, malachite, brochantite, chrysocolla, spangolite, connellite, cuprite, cyanotrichite, strashimirite, parnauite, lavendulan, cornubite, langite, clinoclase, pharmacosiderite, mansfieldite.

Distribution: In Germany, from [the Altväter samt Eschig mine, Mordelgrund,] near Sayda, and Schmiedeberg, Saxony; in the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate; at the Clara mine, near Oberwolfach, Black Forest. From Schwaz, Tirol, Austria. At Špania Dolina (Herrengrund), Slovakia. From Moldava, 20 km northwest of Teplice, Czech Republic. At Nizhni Tagil, Ural Mountains, Russia. In England, large crystals from Wheals Gorland, Muttrell, and Unity, also the Ting-Tang mine, Gwennap, and a number of other places in Cornwall; in the Old Potts Gill mine, Caldbeck Fells, Cumbria. At the Cap Garonne mine, near le Pradet, Var, and in the Salsigne mine, 15 km north of Carcassone, Aude, France. In the USA, from the Calumet and Arizona mine, Bisbee, Cochise Co., Arizona; at the Majuba Hill mine, Antelope district, Pershing Co., Nevada; in the Mammoth and Ajax mines, Tintic district, Juab Co., Utah. Fine examples from the El Teniente mine, 67 km west of Rancagua, O'Higgins Province, Chile. In the Maharahara copper mine, near Woodville, Ruahine Mountains, New Zealand. Several other minor localities are known.

Name: From the Greek for *copper* and *a leaf*, for its prominent micaceous appearance.

Type Material: Mining Academy, Freiberg, Germany.

Chalcopyrite $CuFeS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}2m$. Equant, tetrahedral-shaped crystals, may be modified by scalenohedral faces, to as large as 10 cm. Sphenoidal faces {112} typically large, dull in luster and striated ‖ [$1\bar{1}0$]; {$\bar{1}12$} faces are small and bright. Commonly massive, compact; can be botryoidal. *Twinning:* Twin plane {112}, composition surface commonly {112}; twin plane {012}; also by rotation about [001] with composition plane {110}, producing penetration twins.

Physical Properties: *Cleavage:* Poor on {011} and {111}. Hardness = 3.5–4
VHN = 187–203 (basal section); 181–192 (vertical section) (100 g load). D(meas.) = 4.1–4.3
D(calc.) = 4.283

Optical Properties: Opaque. *Color:* Brass-yellow, may be tarnished and iridescent.
Streak: Greenish black. *Luster:* Metallic. *Anisotropism:* Weak.
R_1–R_2: (400) 16.0–17.3, (420) 20.0–21.3, (440) 24.8–26.1, (460) 30.2–31.4, (480) 34.9–35.9, (500) 38.9–39.9, (520) 41.9–42.7, (540) 44.0–44.9, (560) 45.4–46.4, (580) 46.6–47.6, (600) 47.1–48.3, (620) 47.5–4.86, (640) 47.6–48.7, (660) 47.6–48.7, (680) 47.6–48.6, (700) 47.6–48.6

Chemistry:

	(1)	(2)
Cu	35.03	34.63
Fe	31.00	30.43
S	34.96	34.94
Total	100.99	100.00

(1) Western mines, Vancouver Island, British Columbia, Canada; by electron microprobe, leading to $Cu_{1.01}Fe_{1.01}S_{2.00}$. (2) $CuFeS_2$.

Polymorphism & Series: Forms a series with eskebornite.

Mineral Group: Chalcopyrite group.

Occurrence: A primary mineral in hydrothermal veins, stockworks, disseminations, and massive replacements; an exsolution product in mafic igneous rocks; of sedimentary origin controlled by redox conditions.

Association: Sphalerite, galena, tetrahedrite, pyrite, many copper sulfides.

Distribution: A very common copper mineral, so only a few outstanding localities can be mentioned. In the USA an important ore mineral at many of the copper mines of Arizona, as at Bisbee, Cochise Co.; large crystals from the Groundhog mine, Vanadium, Grant Co., New Mexico; in crystals from New York, at the Rossie lead mines, St. Lawrence Co.; at French Creek, Chester Co., Pennsylvania; in Missouri, at Joplin, Jasper Co. From Cananea, Sonora, Mexico. At Huaron, Peru. In Canada, in the Rouyn district, Quebec, at the Noranda mine; from Ontario, in the Kidd Creek mine, near Timmins, and at Sudbury. In Slovakia, at Baňská Štiavnica (Schemnitz). In the Czech Republic, at Horní Slavkov (Schlaggenwald). From Freiberg, Saxony; Dillenburg, Hesse; in the Georg mine, near Horhausen, Westerwald; and a number of mines in North Rhine-Westphalia, Germany. At Vinsknoes, Karmoen, Norway. From the Ani and Arakawa mines, Akita Prefecture, Japan. Large crystals in the Nababiep mine, Cape Province, South Africa.

Name: From the Greek for *brass* and *pyrite*.

Chalcosiderite $CuFe_6^{3+}(PO_4)_4(OH)_8 \cdot 4H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Triclinic. *Point Group:* $\overline{1}$. Crystals short prismatic, with a number of forms noted, typically in sheafs, to 3 mm; in crusts.

Physical Properties: *Cleavage:* One, perfect; another, less perfect. Hardness = 4.5 D(meas.) = 3.22 D(calc.) = [3.28]

Optical Properties: Transparent. *Color:* Pale siskin-green to dark green. *Streak:* White to greenish, pale green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* Weak; X = colorless; Z = pale green. *Orientation:* X (107°,57°); Y (–143°,68°); Z (–32°,40°) using (ϕ,ρ). *Dispersion:* $r > v$, very strong, crossed. $\alpha = 1.775$ $\beta = 1.840$ $\gamma = 1.844$ 2V(meas.) = 22(2)°

Cell Data: *Space Group:* $P\overline{1}$. $a = 7.653(4)$ $b = 7.873(4)$ $c = 10.190(4)$ $\alpha = 67.57(2)°$ $\beta = 69.17(2)°$ $\gamma = 64.93(2)°$ Z = 1

(1) West Phoenix mine, Cornwall, England. (2) $CuFe_6(PO_4)_4(OH)_8 \cdot 4H_2O$.

Polymorphism & Series: Forms a series with turquoise.

Mineral Group: Turquoise group.

Occurrence: A rare mineral in the oxidized zone of some hydrothermal mineral deposits.

Association: Dufrénite, goethite (West Phoenix mine, Cornwall, England); dufrénite, cyrilovite, leucophosphite (Gunheath china clay pit, Cornwall, England); sampleite, libethenite, crandallite, cyrilovite, pseudomalachite, saléeite, torbernite, ulrichite (Lake Boga quarry, Australia).

Distribution: In England, from the West Phoenix United mines, Linkinhorne, and the Gunheath china clay pit, St. Austell, Cornwall. In Germany, at Schneckenstein, and in the Tannenberg mine, Mühlleithen, Saxony; from Hagendorf, Bavaria. From the Miguel Vacas mine, Estremoz, Portugal. At Les Montmins, Auvergne, France. In the USA, from the Cole and Shattuck mines, Bisbee, Cochise Co., Arizona; in the Tyrone mine, Santa Rita, Grant Co., New Mexico; at the Mohawk mine, Clark Mountains, San Bernardino Co., California; from the King turquoise mine, Conejos Co., Colorado. In Australia, in the Lake Boga granite quarry, near Swan Hill, Victoria, and the Spring Creek mine, near Wilmington, South Australia.

Name: From the Greek for *copper* and *iron*, for those elements in the mineral's composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 946–951. (2) Giuseppetti, G., F. Mazzi, and C. Chalcostibite $CuSbS_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Bladed crystals, to 16 cm, flattened ∥ {010}; massive, disseminated and intergrown with other sulfides and sulfosalts. *Twinning:* Twin and composition planes {104}.

Physical Properties: *Cleavage:* Perfect on {010}; less so on {001} and {100}. *Fracture:* Subconchoidal. *Tenacity:* Brittle. Hardness = 3–4 VHN = 226–279 (010). D(meas.) = 4.95 D(calc.) = 5.011

Optical Properties: Opaque. *Color:* Lead-gray to iron-gray, rarely with a blue or green tarnish. *Luster:* Metallic. *Pleochroism:* Feeble in air, somewhat stronger in oil. *Anisotropism:* Observed.
R_1–R_2: (400) 39.2–44.2, (420) 39.3–45.3, (440) 39.4–46.2, (460) 39.4–47.0, (480) 39.5–47.4, (500) 39.5–47.0, (520) 39.1–46.2, (540) 38.2–44.4, (560) 37.0–42.2, (580) 36.1–40.7, (600) 35.3–39.7, (620) 34.7–38.9, (640) 34.4–38.3, (660) 34.2–38.0, (680) 33.8–37.9, (700) 33.4–37.9

(1) Pulacayo mine, Bolivia. (2) $CuSbS_2$.

Occurrence: Associated with other sulfosalts and sulfides in hydrothermal veins.

Association: Jamesonite, chalcopyrite, pyrite, tetrahedrite, stibnite, andorite, stannite, dadsonite, siderite, barite, quartz.

Distribution: From Wolfsberg, in the Harz Mountains, Germany [TL]. At Capileira, Sierra Nevada, Granada Province, Spain. Fine large crystals from Saint-Pons, Alpes-de-Haute-Provence, France. In Austria, at Saint Gestraudi, near Brixlegg, Tirol. From Baia Mare (Nagybánya) and Baia Sprie (Felsőbánya), Romania. At Tereksai, Kyrgyzstan. As large crystals from Rar el Anz, Wadi of Cherrat, east of Casablanca, Morocco. In Bolivia, at the Pulacayo mine, Huanchaca; Tapi near Tupiza; Torapaka, Cacachaca, Challapata, Colquechaca, Uncia, and Oruro. From Macayan, Philippines. In the Mt. Washington copper mine, Vancouver Island, British Columbia; and the Porter property, Carbon Hill, Wheaton district, Yukon Territory, Canada. From the Moctezuma (Bambolla) mine, 12 km south of Moctezuma, Sonora, Mexico. Known in small amounts from numerous other localities.

Name: From the Greek *chalkos*, *copper* and *stibium*, *antimony*.

References: (1) Palache, C., H. Berman, and C. Frondel (1944) Dana's system of mineralogy, (7th edition), v. I, 433–435. (2) Cervelle, B.D., F.P. Cesbron, M.-C. Sichère, and J. Chalcothallite $Tl_2(Cu,Fe)_6SbS_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As lamellar aggregates, to 2 cm. *Twinning:* A fine grid of lamellae are visible parallel to {110} and $\{1\bar{1}0\}$.

Physical Properties: *Cleavage:* Perfect on {001}, indistinct on {100} and {010}. *Tenacity:* Plastic, tectonically deformed. Hardness = 2–2.5 VHN = 68–76, average 71, on {001} (50 g load). D(meas.) = 6.6 D(calc.) = [6.74]

Optical Properties: Opaque. *Color:* Lead-gray to iron-black, tarnishes iridescent; creamy white to pale gray, with a brownish creamy tint in reflected light. *Streak:* Black. *Luster:* Metallic. *Pleochroism:* Notable in air. *Anisotropism:* Distinct in orange to red-browns. R_1–R_2: (400) 27.6–31.0, (420) 27.1–30.5, (440) 26.5–30.1, (460) 26.0–29.6, (480) 25.5–29.2, (500) 25.1–28.8, (520) 24.9–28.4, (540) 24.7–28.1, (560) 24.6–27.7, (580) 24.7–27.3, (600) 24.7–26.9, (620) 24.8–26.6, (640) 24.8–26.2, (660) 24.8–26.0, (680) 24.9–25.7, (700) 24.9–25.5

Cell Data: *Space Group:* $I4/mmm$. $a = 3.827(1)$ $c = 34.280(1)$ $Z = 2$

X-ray Powder Pattern: Ilímaussaq intrusion, Greenland.

Chambersite $Mn_3B_7O_{13}Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic, pseudocubic. *Point Group:* $mm2$; $\bar{4}3m$ (pseudocubic). Crystals are pseudotetrahedral {111}, modified by {001}, {110}, and {$1\bar{1}1$}, to 2 cm, paramorphous and composed of microscopically twinned aggregates of orthorhombic material inverted from the high-temperature form. *Twinning:* Rare as interpenetrant twins on [111] with twin plane {111} (pseudocubic).

Physical Properties: *Fracture:* Subconchoidal to uneven. Hardness = 7 D(meas.) = 3.49(2) D(calc.) = 3.48

Optical Properties: Transparent to opaque. *Color:* Colorless to deep purple, darkening with exposure to sunlight. *Luster:* [Vitreous.]
Optical Class: Biaxial (+). $\alpha = 1.732(1)$ $\beta = 1.737(1)$ $\gamma = 1.744(1)$ 2V(meas.) = 83(3)°

Cell Data: *Space Group:* $Pca2_1$. $a = 8.68(1)$ $b = 8.68(1)$ $c = 12.26(1)$ Z = 4

X-ray Powder Pattern: Barber's Hill salt dome, Texas, USA.
3.07 (10), 2.74 (6), 2.08 (6), 3.54 (5), 2.17 (5), 1.851 (5), 2.50 (3)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	0.32		CaO	trace	
TiO_2	trace		Na_2O	0.05	
B_2O_3	49.50	50.35	K_2O	0.03	
Al_2O_3	0.12		Cl	6.34	7.32
FeO	1.28		H_2O	0.87	
MnO	41.87	43.98	$-O = Cl_2$	1.39	1.65
MgO	0.05		Total	99.04	100.00

(1) Barber's Hill salt dome, Texas, USA; $(Mn_{2.90}Fe_{0.09}Mg_{0.01})_{\Sigma=3.00}B_{7.00}O_{13}Cl_{0.88}$.
(2) $Mn_3B_7O_{13}Cl$.

Occurrence: In brine residues from extraction wells in salt domes.

Association: Halite, anhydrite, gypsum.

Distribution: In the USA, from the Barber's Hill salt dome, Mont Belvieu, Chambers Co., Texas and the Venice salt dome, Plaquemines Parish, Louisiana. In the Jixian Mn–B deposits, Hebei Province, China. From Pomyarka, near Truskarets, Carpathian Mountains, Ukraine.

Name: For the location of the first known occurrence, Chambers Co., Texas, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 107884; National Museum of Natural History, Washington, D.C., USA, 115327.

Chaméanite $(Cu, Fe)_4As(Se, S)_4$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* Undetermined, but with a body-centered lattice. Most commonly anhedral granular, to 30 μm, but also intermixed with giraudite in a microscopic myrmekitic texture.

Physical Properties: Hardness = n.d. VHN = 247–292 (25 g load). D(meas.) = n.d. D(calc.) = 6.17

Optical Properties: Opaque. *Color:* Dark gray in reflected light. *Luster:* Metallic.
R: (400) 27.4, (420) 27.1, (440) 26.8, (460) 26.5, (480) 26.1, (500) 26.6, (520) 26.9, (540) 27.1, (560) 27.3, (580) 27.5, (600) 27.7, (620) 27.8, (640) 28.0, (660) 28.2, (680) 28.4, (700) 28.7

Cell Data: *Space Group:* n.d. $a = 11.039(4)$ $Z = 8$

X-ray Powder Pattern: Chaméane mine, France.
3.187 (100), 1.951 (90), 1.665 (80), 1.127 (70), 1.266 (60), 1.062 (50), 1.381 (40)

Chemistry:

	(1)	(2)
Cu	33.93	36.38
Fe	5.63	2.58
As	11.05	11.98
Sb	0.48	0.34
Se	47.06	46.99
S	1.59	1.56
Total	99.74	99.83

(1) Chaméane mine, France; by electron microprobe; corresponds to $(Cu_{3.36}Fe_{0.63})_{\Sigma=3.99}(As_{0.93}Sb_{0.02})_{\Sigma=0.95}(Se_{3.75}S_{0.31})_{\Sigma=4.06}$. (2) Do.; by electron microprobe, corresponds to $(Cu_{3.62}Fe_{0.29})_{\Sigma=3.91}(As_{1.01}Sb_{0.02})_{\Sigma=1.03}(Se_{3.76}S_{0.31})_{\Sigma=4.07}$.

Occurrence: As late-stage deposits in veins cutting granite (Chaméane mine, France); in a telethermal selenium-rich hydrothermal polymetallic deposit, in calcite veins in amphibolites (Tuminico, Argentina).

Association: Giraudite, eskebornite, geffroyite, ankerite (Chaméane mine, France); hakite, bukovite, cadmoselite, umangite (Tuminico, Argentina).

Distribution: From the Chaméane uranium mine, near Vernet-la-Varenne, Puy-de-Dôme, France [TL]. At Tuminico, Sierra de Cacho, La Rioja Province, Argentina.

Name: For the occurrence at the Chaméane mine, France.

Type Material: National School of Mines, Paris, France.

Chamosite $(Fe^{2+}, Mg, Fe^{3+})_5Al(Si_3Al)O_{10}(OH, O)_8$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* $2/m$. In scaly aggregates, foliated or granular; oolitic, made up of very minute radiating crystals; massive. *Twinning:* Twin and composition plane {001}, axis [310].

Physical Properties: *Cleavage:* {001}, perfect. *Tenacity:* Somewhat flexible but inelastic. Hardness = 2–3 D(meas.) = 3.0–3.4 D(calc.) = 3.129 Weakly magnetic.

Optical Properties: Translucent to almost opaque. *Color:* Green, greenish grey, black, brown; in thin section, colorless, yellowish, green. *Streak:* Green to gray. *Luster:* Pearly. *Optical Class:* Biaxial (–). *Pleochroism:* Weak to moderate; X = yellow-green to light brownish green; $Y = Z$ = green to dark green. *Orientation:* $Y = b$; $X \wedge a = 88°–90°$; $Z \wedge a = 0°–2°$: or rarely $Y = b$; $X \wedge a \simeq 0°$; $Z \wedge a \simeq 90°$. *Dispersion:* $r < v$, strong. *Absorption:* $Y \simeq Z > X$; rarely $X \simeq Y > Z$. $\alpha = 1.595–1.671$ $\beta = 1.599–1.684$ $\gamma = 1.599–1.685$ 2V(meas.) = 0°–30°

Cell Data: *Space Group:* $C2/m$. $a = 5.373$ $b = 9.306$ $c = 14.222$ $\beta = 97°53'$ Z = 2

X-ray Powder Pattern: Hermanovice, Czech Republic. (ICDD 21-1227).
7.05 (100), 3.52 (100), 2.601 (90), 1.551 (90), 2.392 (80), 14.1 (70), 2.554 (70)

Chemistry:

	(1)	(2)		(1)	(2)
SiO_2	26.40	26.65	CaO	0.42	
Al_2O_3	18.23	16.14	Na_2O	0.17	
Fe_2O_3	5.70	6.69	K_2O	0.17	
FeO	25.87	34.43	H_2O^+	10.60	11.42
MnO	0.04		H_2O^-	1.05	0.08
MgO	11.35	4.47	Total	[100.00]	99.88

(1) Wickwar, England; recalculated to 100.00%, total Fe as Fe^{2+} in empirical formula; corresponds to $(Fe^{2+}_{2.82}Mg_{1.84}Ca_{0.05}Na_{0.04}K_{0.02})_{\Sigma=4.77}Al_{1.21}(Si_{2.87}Al_{1.13})_{\Sigma=4.00}O_{10}(OH)_8$.
(2) Schmiedefeld, Germany; total Fe as Fe^{2+} in empirical formula; corresponds to $(Fe^{2+}_{3.87}Mg_{0.76})_{\Sigma=4.63}Al_{1.23}(Si_{3.05}Al_{0.95})_{\Sigma=4.00}O_{10}(OH)_8$.

Polymorphism & Series: Dimorphous with orthochamosite; forms a series with clinochlore.

Mineral Group: Chlorite group.

Occurrence: In sedimentary ironstones; authigenically formed under reducing conditions in the presence of decomposed organic material.

Association: Siderite, kaolinite, quartz, magnetite, pyroxenes, plagioclase, olivine, calcite.

Distribution: Many localities, but careful characterization is necessary. From Chamoson, Valais, and in the Maderantal, Uri, Switzerland. At Hermanovice and Kladno, Czech Republic. From Schmiedefeld, near Suhl, and Schleiz, Thuringia, Germany. In England, at Frodingham, Lincolnshire; Wickwar, Gloucestershire; at Penzance, Cornwall, and elsewhere. At Knowehead, Co. Antrim, Ireland. In the Arakawa mine, Akita Prefecture, and at Shogase, Tokushima Prefecture, Japan. From Creede, Mineral Co., Colorado; near Hot Springs, Garland Co., Arkansas; and in the Beacon Hill mine, Champion, Marquette Co., Michigan, USA. At Wabana, Newfoundland, Canada.

Name: For the locality at Chamoson, Switzerland.

Changbaiite $PbNb_2O_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$. As tabular crystals or spherules, to 5 mm, showing {0001}, {000$\overline{1}$}, {01$\overline{1}$1}, {10$\overline{1}$1}, {10$\overline{1}$2}, {01$\overline{1}$2}, and {11$\overline{2}$0}.

Physical Properties: *Cleavage:* {0001}, perfect; one rhombohedral, distinct. *Fracture:* Hackly; conchoidal for spherules. *Tenacity:* Brittle. Hardness = 5.3 VHN = 472 D(meas.) = 6.48 D(calc.) = 6.51

Optical Properties: Transparent to translucent. *Color:* Colorless, cream-white, pale brown, yellowish brown, pale yellowish green. *Streak:* White. *Luster:* Adamantine to pearly. *Optical Class:* Uniaxial (+); may be anomalously biaxial. *Dispersion:* $r > v$. $\omega = 2.476$ $\epsilon = 2.485$ 2V(meas.) = 0°–38°

Cell Data: *Space Group:* $R3m$. $a = 10.499$ $c = 11.553$ Z = 9

X-ray Powder Pattern: Tonghua, China.
3.100 (10), 3.028 (9), 1.760 (6), 2.160 (5), 1.621 (5), 1.919 (4), 1.745 (3)

Chemistry:

	(1)	(2)	(3)
Nb_2O_5	53.43	55.62	54.36
Ta_2O_5	0.37		
TiO_2	0.89	0.95	
Fe_2O_3	0.42		
FeO	0.77	0.94	
PbO	44.12	41.51	45.64
Total	100.00	99.02	100.00

(1) Tonghua, China; corresponds to $(Pb_{0.95}Fe^{2+}_{0.05})_{\Sigma=1.00}(Nb_{1.93}Ti_{0.05}Fe^{3+}_{0.02}Ta_{0.01})_{\Sigma=2.01}O_6$.
(2) Do.; by electron microprobe. (3) $PbNb_2O_6$.

Occurrence: In kaolinite-filled veins and cavities in a potassic granite.

Association: Kaolinite, quartz, potassic feldspar.

Distribution: From Changbai Mountain, Tonghua, southeastern Kirin Province, China.

Name: For Changbai Mountain, China, on which the mineral occurs.

Type Material: "Museum of Geology", location unstated [Beijing, China].

Changchenite IrBiS

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Cubic. *Point Group:* 23. In veinlets and massive aggregates, to 2 mm, replacing laurite and iridisite.

Physical Properties: *Tenacity:* Brittle. Hardness = 3.7 VHN = 140–185, 165 average (20 g load). D(meas.) = n.d. D(calc.) = 11.96

Optical Properties: Opaque. *Color:* Steel-black; in reflected light, bright white with a yellowish tint. *Streak:* Black. *Luster:* Metallic.

R: (400) 41.3, (420) 45.2, (440) 45.5, (460) 46.0, (480) 46.4, (500) 46.6, (520) 46.9, (540) 47.1, (560) 47.3, (580) 47.6, (600) 47.7, (620) 47.7, (640) 47.6, (660) 47.4, (680) 47.3, (700) 47.3

Cell Data: *Space Group:* $P2_13$. $a = 6.164(3)$ $Z = 4$

X-ray Powder Pattern: Luanhe River, China.
1.860 (100), 2.75 (70), 2.51 (60), 1.090 (50), 1.027 (50), 1.647 (40), 1.345 (40)

Chemistry:

	(1)	(2)
Ir	41.2	44.37
Pt	2.8	
Cu	0.3	
Te	0.4	
Bi	47.2	48.23
S	7.2	7.40
Total	99.1	100.00

(1) Luanhe River, China; by electron microprobe, average of seven analyses; corresponds to $(Ir_{0.94}Pt_{0.06}Cu_{0.02})_{\Sigma=1.02}Bi_{0.99}(S_{0.98}Te_{0.01})_{\Sigma=0.99}$. (2) IrBiS.

Occurrence: Of hydrothermal origin in chromite bodies in dunites and placers derived therefrom.

Association: Iridium, ferrian platinum, laurite, sperrylite, cooperite, irarsite, shuangfenite, mayingite, chromite, gold.

Distribution: From a branch of the Luanhe River, 14 km west of Chengde City, Hubei Province, China [TL].

Name: From the Chinese word for the Great Wall, situated nearby the occurrence.

Type Material: National Geological Museum, Beijing, China.

ZnO	20.62	21.67
MgO	0.05	
CaO	0.02	
Na_2O	17.31	16.50
H_2O	18.99	19.19
Total	91.84	100.00

(1) San Francisco mine, Chile; by electron microprobe, average of four analyses, H_2O by CHN analyzer; corresponding to $Na_{2.21}Zn_{1.00}(S_{0.86}O_{3.63})_2 \cdot 4.16H_2O$. (2) $Na_2Zn(SO_4)_2 \cdot 4H_2O$.

Occurrence: A secondary mineral in the oxidized portion of a Cu–Zn sulfide deposit.

Association: Thénardite, zincian paratacamite, gypsum.

Distribution: From the San Francisco mine, two km west of the Sierra Gorda railway station, Sierra Gorda district, southwest of Calama, Antofagasta, Chile.

Name: For the *Changos*, early inhabitants of Chile.

Type Material: University of Hamburg, Hamburg, Germany.

References: (1) Schlüter, J., K.-H. Klaska, and G. Gebhard (1999) Changoite, $Na_2Zn(SO_4)_2 \cdot 4H_2O$, the Zn analogue of blödite, a new mineral from Sierra Gorda, Antofagasta, Chile. Neues Jahrb. Mineral., Monatsh., 97–103. (2) (1999) Amer. Mineral., 84, 1685 (abs. ref. 1).

Chaoite C

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As thin lamellae, 3–15 μm wide, alternating with graphite.

Physical Properties: Hardness = Slightly harder than graphite [1–2]. VHN = n.d. D(meas.) = n.d. D(calc.) = 3.43

Optical Properties: Opaque. *Color:* Black.
R_1–R_2: n.d.

Cell Data: *Space Group:* $P6/mmm$. a = 8.948 c = 14.078 Z = 168

X-ray Powder Pattern: Nördlinger Ries crater, Germany.
4.47 (100), 4.26 (100), 4.12 (80), 3.03 (60), 2.55 (60), 2.28 (60), 3.71 (40)

Chemistry:

	(1)
C	99.5
Si	< 0.5
Cl	< 0.5
Total	100.0

(1) Nördlinger Ries crater, Germany; by electron microprobe, grain containing 35% chaoite.

Polymorphism & Series: Polymorphous with diamond, graphite, and lonsdaleite.

Occurrence: In shock-metamorphosed graphite gneisses and meteorites.

Association: Graphite, zircon, rutile, pseudobrookite, magnetite, nickeliferous pyrrhotite, baddeleyite.

Distribution: From Mottingen, in the Nördlinger Ries crater, Bavaria, Germany. In the Goalpara [??Goalpur??D8??ck??] and Dyalpur achondrite meteorites. [Novo Urei stony meteorite??addbutckname,type??]

Name: For Edward Ching-Te Chao (1919–), Chinese-American petrologist with the U.S. Geological Survey, Washington, D.C, USA.

Type Material: n.d.

Chapmanite $Sb^{3+}Fe_2^{3+}(SiO_4)_2(OH)$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* m. Crystals lath-shaped; powdery, compact, massive.

Physical Properties: *Fracture:* Conchoidal to irregular when compact. Hardness = 2.5 when compact. D(meas.) = 3.69–3.75 D(calc.) = [4.29]

Optical Properties: Semitransparent. *Color:* Olive-green to deep yellow. *Streak:* Greenish yellow to deep yellow. *Luster:* Nonmetallic.
Optical Class: Biaxial. $\alpha = 1.85 \perp$ flat face. β = n.d. $\gamma = 1.96 \parallel$ length. 2V(meas.) = n.d.

Cell Data: *Space Group:* Cm. $a = 5.19$ $b = 8.99$ $c = 7.70$ $\beta = 100°40'$ Z = 2

X-ray Powder Pattern: Keeley mine, Canada; could be confused with bismutoferrite.
7.63 (100), 3.58 (100), 3.88 (90), 3.19 (90), 2.90 (70), 2.59 (70), 2.54 (35)

Chemistry:

	(1)	(2)	(3)
SiO_2	27.63	26.34	27.65
Al_2O_3	0.22	0.50	
Fe_2O_3	38.98	38.13	36.74
Sb_2O_3	31.04	30.53	33.54
H_2O^+	1.89	3.62	2.07
H_2O^-	0.31	0.64	
Total	100.07	99.76	100.00

(1) Smilkov, Czech Republic; corresponding to $(Sb^{3+}_{0.93}Fe^{3+}_{0.07})_{\Sigma=1.00}$ $Fe^{2+}_{2.00}(Si_{1.98}Al_{0.02})_{\Sigma=2.00}O_{8.00}(OH)$. (2) Do. (3) $SbFe_2(SiO_4)_2(OH)$.

Occurrence: In veinlets cutting gneisses containing varying amounts of graphite (Smilkov, Czech Republic).

Association: Silver (Keeley mine, Canada).

Distribution: In the Keeley mine, South Lorrain Township, Ontario, Canada. In Mexico, at Velardeña, and in the La Papa mine, Victoria, Hidalgo, Durango. At Smilkov, near Votice, Czech Republic. In Germany, at Bräunsdorf, Freiberg, and Schneeberg, Saxony. From near Tafone, Tuscany, Italy. In the Mine de la Bessade, Massiac, Haute-Loire, France. At the Suzuyama mine, Kagoshima Prefecture, Japan.

Name: To honor Edward John Chapman (1821–1904), Professor of Geology, University of Toronto, Toronto, Canada.

Type Material: Royal Ontario Museum, Toronto, Canada, M14075; Harvard University, Cambridge, Massachusetts, USA, 91501.

Charlesite $Ca_6(Al,Si)_2(SO_4)_2B(OH)_4(OH,O)_{12}\cdot 26H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $3m$ (probable). Crystals are tabular {0001}, dominated by $\{10\bar{1}4\}$, to 6 mm, may be rounded.

Physical Properties: *Cleavage:* Perfect on $10\bar{1}0$. *Tenacity:* Brittle. Hardness = ∼2.5 D(meas.) = 1.77 D(calc.) = 1.79 Pale violet or pale green fluorescence under SW UV, weaker under LW UV.

Optical Properties: Transparent, may appear opaque due to surficial alteration. *Color:* Colorless, white, pale yellow, pale pink. *Streak:* White. *Luster:* Vitreous to dull. *Optical Class:* Uniaxial (–). $\omega = 1.492(3)$ $\epsilon = 1.475(3)$

Cell Data: *Space Group:* $[P31c]$ (by analogy to ettringite). $a = 11.16(1)$ $c = 21.21(3)$ Z = 2

X-ray Powder Pattern: Franklin, New Jersey, USA.
9.70 (100), 5.58 (80), 3.855 (80), 2.749 (70), 2.538 (70), 2.193 (70), 2.133 (50)

Chemistry:

	(1)
SO_3	12.8
SiO_2	3.1
B_2O_3	3.2
Al_2O_3	5.1
CaO	27.3
H_2O	48.6
Total	100.1

(1) Franklin, New Jersey, USA; corresponds to $Ca_{5.94}(Al_{1.22}Si_{0.63})_{\Sigma=1.85}(SO_4)_{1.95}[B(OH)_4]_{1.12}[(OH)_{10.97}O_{1.03}]_{\Sigma=12.00}\cdot 25.16H_2O$.

Mineral Group: Ettringite group.

Occurrence: Very rare, coating fractures and vugs in a metamorphosed stratiform zinc deposit.

Association: Clinohedrite, ganophyllite, xonotlite, pectolite, prehnite, "Mn-chlorite", roeblingite, willemite, datolite.

Distribution: From Franklin, Sussex Co., New Jersey, USA.

Name: Honors Dr. Charles Palache (1869–1954), eminent American crystallographer and mineralogist, Harvard University, Cambridge, Massachusetts, USA.

Type Material: Harvard University, Cambridge, Massachusetts, 107733; National Museum of Natural History, Washington, D.C., USA, 148689, C6247, C6401.

References: (1) Dunn, P.J., D.R. Peacor, P.B. Leavens, and J.L. Baum (1983) Charlesite, a new mineral of the ettringite group, from Franklin, New Jersey. Amer. Mineral., 68, 1033–1037.

Charmarite $Mn_4^{2+}Al_2(CO_3)(OH)_{12}\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As complexly faceted crystals, several cm in length, with {100}, {221}, {$2\overline{2}1$}, and {001} prominent; 28 forms have been recognized. *Twinning:* Commonly twinned on {100}, producing contact twins or finely polysynthetic lamellae.

Physical Properties: *Cleavage:* {100} and {010}. Hardness = ∼3 D(meas.) = 6.30–6.49 D(calc.) = [6.38]

Optical Properties: Transparent. *Color:* Colorless to yellow; colorless to gray or brown in thin section. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (–). *Pleochroism:* X = light brownish; Z = brownish. *Dispersion:* Weak, inclined. $\alpha = 2.250(8)$ $\beta = 2.382(8)$ $\gamma = 2.410(8)$ 2V(meas.) = 50°

Cell Data: *Space Group:* $P2_1/a$. a = 13.37–13.379 b = 7.16–7.174 c = 7.11–7.116 β = 105.96°−106° Z = 4

X-ray Powder Pattern: Mounana mine, Gabon.
3.441 (FFF), 3.428 (FFF), 3.206 (FF), 4.93 (F), 3.081 (F), 4.32 (mF), 3.569 (mF)

Chemistry:

	(1)
V_2O_5	29.1
PbO	71.6
Total	100.7

(1) Mounana mine, Gabon; by electron microprobe, corresponds to $Pb_{2.00}V^{5+}_{2.00}O_7$.

Occurrence: In the oxidized zone of a lead-bearing U–V deposit (Mounana mine, Gabon).

Association: Francevillite, wulfenite (Mounana mine, Gabon).

Distribution: In the Mounana uranium mine, Franceville, Gabon. From the Kusu deposit, 85 km south of Kinshasa, Bas-Congo Province, Congo (Bas-Zaire Province, Zaire). From St. Andreasberg, Harz Mountains, Germany. Found at Vrančice, near Příbram, Czech Republic.

Name: Honors Jean Chervet (1904–1962), French mineralogist.

Type Material: National School of Mines, Paris, France.

Charoite $\mathbf{K(Ca,Na)_2Si_4O_{10}(OH,F)\cdot H_2O}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic. *Point Group:* n.d. Fibrous, massive.

Physical Properties: *Cleavage:* Good in three directions. Hardness = n.d. VHN = 412 (50 g load). D(meas.) = 2.54 D(calc.) = [2.77] Yellow-orange cathodoluminescence.

Optical Properties: Semitransparent. *Color:* Shades of deep lilac to violet; colorless in thin section.
Optical Class: Biaxial (+). *Pleochroism:* X = rose; Z = colorless, in thick fragments.
Orientation: $X = b$; $Z \wedge c = 5°$. $\alpha = 1.550(2)$ $\beta = 1.553(2)$ $\gamma = 1.559(2)$
2V(meas.) = 28°–30°

Cell Data: *Space Group:* n.d. $a = 10.7$ $b = 32.0$ $c = 7.25$ $\beta = 113°$ Z = 18

X-ray Powder Pattern: Murun massif, Russia.
3.348 (100), 3.134 (85), 12.5 (70), 2.79 (50), 2.71 (35), 3.90 (30), 2.97 (30)

Chemistry:

	(1)	(2)
SiO_2	56.88	58.5
Al_2O_3		0.07
Fe_2O_3	0.12	
FeO		0.01
MnO		0.07
CaO	20.95	20.5
SrO	0.90	0.5
BaO	2.52	2.9
Na_2O	3.77	1.8
K_2O	10.36	8.9
F	0.92	0.7
H_2O^+	4.40	4.7
$-O = F_2$	0.39	[0.15]
Total	100.43	98.5

(1) Murun massif, Russia; corresponds to $(K_{0.93}Ba_{0.07}Sr_{0.03})_{\Sigma=1.03}(Ca_{1.57}Na_{0.51})_{\Sigma=2.08}Si_4O_{10}[(OH)_{0.58}F_{0.28}]_{\Sigma=0.86}\cdot 0.72H_2O$. (2) Do.; by electron microprobe, H_2O by TGA; corresponds to $(K_{0.88}Ba_{0.09}Sr_{0.02})_{\Sigma=0.99}(Ca_{1.71}Na_{0.28})_{\Sigma=1.99}Si_{4.55}O_{10}[(OH)_{0.78}F_{0.18}]_{\Sigma=0.96}\cdot 0.82H_2O$.

Occurrence: In potassic feldspar metasomatites at the contact of nepheline and aegirine syenites with limestones.

Association: Canasite, tinaksite.

Distribution: In the Murun massif, between the Chara and Olekma Rivers, southwest of Olekminsk, Yakutia, Russia.

Name: For the Chara River, Russia, near which it was discovered.

Type Material: University of Rome, Rome, Italy, 24352; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia.

Chatkalite $Cu_6Fe^{2+}Sn_2S_8$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $\bar{4}m2$. As rounded grains, to 100 μm, which may be included in tetrahedrite.

Physical Properties: Hardness = n.d. VHN = 258–287 (20 g load). D(meas.) = n.d. D(calc.) = 5.00

Optical Properties: Opaque. *Color:* Pale rose in reflected light. *Anisotropism:* Weak, in shades of brown.
R_1–R_2: (400) — , (420) — , (440) 24.4–25.0, (460) 25.0–25.6, (480) 25.6–26.2, (500) 26.2–26.7, (520) 26.7–27.2, (540) 27.2–27.6, (560) 27.6–28.1, (580) 27.9–28.6, (600) 28.3–29.0, (620) 28.5–29.3, (640) 28.6–29.4, (660) 28.6–29.5, (680) 28.4–29.3, (700) 27.9–28.6

Cell Data: *Space Group:* $P\bar{4}m2$. $a = 7.61(1)$ $c = 5.373(5)$ $Z = 1$

X-ray Powder Pattern: Kochbulak deposit, Uzbekistan.
1.904 (100), 3.11 (80), 1.625 (40), 1.568 (40), 2.87 (30), 1.058 (30), 2.70 (20)

Chemistry:

	(1)	(2)
Cu	41.17	40.95
Ag	0.41	
Fe	4.31	6.00
Zn	2.10	
Sn	19.11	25.50
Mo	1.08	
Sb	2.97	
As	0.80	
S	28.77	27.55
Total	[100.72]	100.00

(1) Kochbulak deposit, Uzbekistan; by electron microprobe, total originally given as 100.22%; corresponding to $(Cu_{5.97}Ag_{0.03})_{\Sigma=6.00}(Fe_{0.65}Zn_{0.30}Cu_{0.05})_{\Sigma=1.00}(Sn_{1.34}As_{0.27}As_{0.26}Fe_{0.07}Mo_{0.05})_{\Sigma=1.99}S_{7.95}$. (2) $Cu_6FeSn_2S_8$.

Occurrence: As rounded disseminations in tetrahedrite, from a sulfide-bearing quartz vein (Kochbulak deposit, Uzbekistan).

Association: Cassiterite, hemusite, hessite, tetrahedrite (Kochbulak deposit, Uzbekistan); pyrite, sphalerite, marcasite, galena, chalcopyrite, stannite, tetrahedrite–tennantite, canfieldite, arsenopyrite, digenite, covellite, chalcocite, Au–Ag alloy (Cove deposit, USA).

Distribution: From the Kochbulak gold deposit, Chatkal-Kuramin Mountains, eastern Uzbekistan [TL]. In the Cove gold deposit, McCoy district, Lander Co., Nevada, USA. At the Bitin Cu–Au–Ag deposit, Fujian Province, China.

Name: For the occurrence in the Chatkal-Kuramin Mountains, Russia.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 81595.

References: (1) Kovalenker, V.A., T.L. Evstigneeva, V.S. Malov, and L.N. Vyal'sov (1981) Chatkalite, $Cu_6FeSn_2S_8$, a new mineral. Mineral. Zhurnal, 3, 79–86 (in Russian with English abs.). Chayesite $K(Mg,Fe^{2+})_4Fe^{3+}Si_{12}O_{30}$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Hexagonal. *Point Group:* $6/m\ 2/m\ 2/m$. As tabular, euhedral to subhedral crystals, to 0.1 mm; dominant forms are {0001}, $\{10\bar{1}0\}$, $\{11\bar{2}0\}$, and $\{10\bar{1}2\}$.

Physical Properties: *Tenacity:* Brittle. Hardness = n.d. D(meas.) = n.d. D(calc.) = 2.68

Optical Properties: Transparent. *Color:* Deep blue; in transmitted light, light blue to colorless. *Streak:* White. *Luster:* Vitreous.
Optical Class: Uniaxial (+). *Pleochroism:* O = sky-blue; E = colorless. $\omega = 1.575(1)$
$\epsilon = 1.578(1)$

Cell Data: *Space Group:* $[P6/mcc]$ (by analogy to the milarite group). $a = 10.153(4)$
$c = 14.388(6)$ $Z = 2$

X-ray Powder Pattern: Moon Canyon, Utah, USA; close similarity to other milarite group minerals may require chemical analysis for identification.
5.076 (vs), 3.751 (vs), 3.238 (vs), 7.194 (s), 2.7840 (s), 4.148 (m), 2.9350 (m)

Chemistry:

	(1)	(2)
SiO_2	69.95	70.29
TiO_2	0.21	0.02
Al_2O_3	0.24	0.00
Fe_2O_3	5.28

MnO	0.23	0.23
MgO	13.64	11.44
Na_2O	0.45	0.04
K_2O	5.24	4.48
Total	100.64	99.10

(1) Moon Canyon, Utah, USA; by electron microprobe, Fe^{2+}:Fe^{3+} calculated from stoichiometry; corresponds to $(K_{1.14}Na_{0.15})_{\Sigma=1.29}(Mg_{3.48}Fe^{2+}_{0.77}Fe^{3+}_{0.68}Mn_{0.03}Ti_{0.03}Al_{0.01})_{\Sigma=5.00}(Si_{11.96}Al_{0.04})_{\Sigma=12.00}O_{30}$. (2) Cancarix, Spain; by electron microprobe, total Fe as FeO, Fe^{2+}:Fe^{3+} in empirical formula calculated from stoichiometry; corresponds to $(K_{0.99}Na_{0.01})_{\Sigma=1.00}(Mg_{2.96}Fe^{2+}_{1.20}Fe^{3+}_{0.63}Mn_{0.03})_{\Sigma=4.82}Si_{12.18}O_{30}$.

Mineral Group: Milarite group.

Occurrence: A late-crystallizing mineral, nonuniformly distributed in the groundmass of lamproites.

Association: Potassian richterite, diopside, potassic feldspar.

Distribution: From Moon Canyon, east of Francis, Summit Co., Utah, USA. In Spain, at Cancarix, Albacete Province.

Name: In honor of Dr. Felix Chayes (1916–1993) of the Geophysical Laboratory, Carnegie Institute, Washington, D.C., USA.

Type Material: Institute for Mineralogy, Ruhr University, Bochum, Germany; National Museum of Natural History, Washington, D.C., USA, 165807.

References: (1) Velde, D., O. Medenbach, C. Wagner, and W. Schreyer (1989) Chayesite, $K(Mg,Fe^{2+})_4Fe^{3+}[Si_{12}O_{30}]$: a new rock-forming silicate mineral of the osumilite group from the Moon Canyon (Utah) lamproite. Amer. Mineral., 74, 1368–1373.

Chegemite $Ca_7(SiO_4)_3(OH)_2$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. Crystals exhibit rhombic cross-sections, typically as granular aggregates, to 5 mm. *Twinning:* Probable on {110}.

Physical Properties: *Cleavage*: Imperfect on {010}. *Fracture*: Conchoidal. *Tenacity*: n.d. Hardness = 5.5-6 VHN = 306–349 (50 g load). D(meas.) = 2.86(1) D(calc.) = 2.892

Optical Properties: Transparent. *Color*: Pink, yellow-pink; white in aggregates; colorless in thin section. *Streak*: White. *Luster*: Vitreous.
Optical Class: Biaxial. α = 1.621(2) β = 1.626(3) γ = 1.630(2) $2V_Z$ (meas.) = –80(8)° $2V_Z$ (calc.) = –83° *Orientation:* $X = a$; $Y = b$; $Z = c$.

Cell Data: *Space Group*: *Pbnm*. a = 5.0696(1) b = 11.3955(1) c = 23.5571(3) Z = 4

X-ray Powder Pattern: Northern Caucasus, Kabardino-Balkaria, Russia.
1.907 (100), 2.993 (80), 2.700 (80), 3.015 (70), 2.720 (70), 2.834 (60), 3.639 (50)

Chemistry:

	(1)
SiO_2	29.76
TiO_2	0.49
Fe_2O_3	0.02
CaO	65.67
F	1.64
H_2O	2.23
-O=F	0.70
Total	99.11

(1) Northern Caucasus, Kabardino-Balkaria, Russia; average of 68 electron microprobe analyses, corresponding to $Ca_7(Si_{0.997}Ti_{0.003}O_4)_3(OH)_{1.48}F_{0.52}$.

Occurrence: A product of sanidinite facies metamorphism of calcareous xenoliths in ignimbrite.

Association: Larnite, spurrite, rondorfite, reinhardbraunsite, wadalite, lakargiite, srebrodolskite.

Distribution: Upper Chegem volcanic structure, Northern Caucasus, Kabardino-Balkaria, Russia.

Name: For the Chegem River, in the headwater area of which the new mineral was discovered.

Type Material: A.E. Fersman Mineralogical Museum in Moscow, Russia (3731/1); Museum of Natural History, Bern, Switzerland (NMBE 39571).

References: (1) Galuskin, E.V., V.M. Gazeev, B. Lazic, T. Armbruster, I.O. Galuskina, A.E. Zadov, N.N. Persev, R. Wrzalik, P. Dzierżanowski, A.G. Gurbanov, and G. Mineral., 95, 1122-1123 (abs. ref. 1).

Chekhovichite $Bi_2Te_4^{4+}O_{11}$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As subhedral platy grains, to 0.1 mm, in crusts and aggregates. *Twinning:* Polysynthetic, parallel elongation.

Physical Properties: *Cleavage:* One, ‖ elongation, perfect; another at 87° to the first, less perfect. Hardness = ∼4 VHN = 205–325, 290 average (100 g load). D(meas.) = 6.88(1.5) D(calc.) = 7.00

Optical Properties: Semitransparent. *Color:* Grayish yellow, pale gray, or grayish green; pale gray to gray with white internal reflections in reflected light. *Streak:* White. *Luster:* Adamantine.
Optical Class: Biaxial (+). *Orientation:* $X \wedge c = 21°$; $Z \wedge a = 25°$. *Dispersion:* $r < v$, distinct. $\alpha = 2.45(2)$ $\beta = 2.50(2)$ $\gamma = 2.65(2)$ 2V(meas.) = 65(3)° *Anisotropism:* Marked. *Bireflectance:* Observable.
R_1–R_2: (400) 18.9–21.4, (420) 18.8–21.4, (440) 18.7–21.3, (460) 18.6–21.3, (480) 18.3–21.2, (500) 18.1–21.2, (520) 18.1–21.1, (540) 17.9–21.0, (560) 17.7–20.8, (580) 17.6–20.7, (600) 17.4–20.6, (620) 17.3–21.5, (640) 17.3–20.4, (660) 17.2–20.3, (680) 17.2–20.2, (700) 17.1–20.2

Cell Data: *Space Group:* $P2_1/n$ (synthetic). $a = 18.8963(8)$ $b = 7.9593(3)$ $c = 6.9909(3)$ $\beta = 95.176(3)°$ Z = 4

X-ray Powder Pattern: Zod deposit, Armenia.
3.29 (100), 3.14 (100), 3.15 (94), 2.728 (48), 1.998 (45), 2.002 (42), 1.686 (32)

Chemistry:

Sb_2O_3	trace	
FeO	0.1	
PbO	0.8	
CuO	trace	
Total	100.3	100.00

(1) Zod deposit, Armenia; by electron microprobe, originally an elemental analysis, totaling 100.4%, here converted to oxides; corresponds to $(Bi_{1.96}Pb_{0.04}Fe_{0.02})_{\Sigma=2.02}Te_{3.99}O_{10.99}$.
(2) $Bi_2Te_4O_{11}$.

Occurrence: A rare oxidation product of earlier tellurium-bearing minerals.

Association: Tellurobismuthite, pyrite, chalcopyrite, emmonsite, tripuhyite, "limonite", quartz.

Distribution: From the Zod deposit, 14 km east of Vardenis, Armenia. At the Zhana-Tyube and Northern Aksu deposits, north Kazakhstan.

Name: Honors Professor Sergei Konstantinovich Chekhovich (1917–1997), mineralogist and geologist, Polytechnical Institute of Alma-Ata, Alma-Ata, Kazakhstan.

Type Material: Mining Museum, Leningrad, 1945/1; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 88052.

(1) Chelkar salt dome, Kazakhstan. (2) $CaMgB_2O_4Cl_2 \cdot 7H_2O$.

Occurrence: Very rare, in the insoluble residue of brines from a salt dome.

Association: Anhydrite, hilgardite, boracite, halite, carnallite, bischofite.

Distribution: From the Chelkar salt dome, Ak-saĭ Valley, Uralsk district, Kazakhstan.

Name: For the locality where the first samples were collected, the Chelkar salt dome, Kazakhstan.

Type Material: n.d.

Chenevixite $Cu_2Fe_2^{3+}(AsO_4)_2(OH)_4 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$. Crystals, tabular on {100} with diamond-shaped outline, to 0.5 mm; usually microcrystalline, spheroidal, earthy to compact massive. *Twinning:* Observed during crystal structure refinement, at a very fine scale.

Physical Properties: *Fracture:* Subconchoidal to earthy. *Tenacity:* Brittle.
Hardness = 3.5–4.5 D(meas.) = 4.38 D(calc.) = 4.40

Optical Properties: Semitransparent. *Color:* Greenish yellow to olive-green, dark green.
Streak: Greenish yellow.
Optical Class: Biaxial (+). *Pleochroism:* Very weak. *Orientation:* $X = b$; $Z \simeq c$. $\alpha = 1.92$
$\beta = 1.96$ $\gamma = 2.04$ 2V(meas.) = n.d. 2V(calc.) = 73°

Cell Data: *Space Group:* $P2_1/m$ or $P2_1/a$. $a = 14.985$–15.006 $b = 5.170$–5.189
$c = 5.658$–5.724 $\beta = 102°15'$–$102°55'$ Z = 2

X-ray Powder Pattern: Las Animas, Sonora, Mexico.

(1) American Eagle mine, Utah, USA; remnant is quartz. (2) Las Animas, Sonora, Mexico; average of two analyses, H_2O by the Penfield method. (3) $Cu_2Fe_2^{3+}(AsO_4)_2(OH)_4 \cdot H_2O$.

Mineral Group: Forms a series with luetheite.

Occurrence: An uncommon secondary mineral in the oxidized zone of some hydrothermal polymetallic mineral deposits.

Association: Quartz (Cornwall, England); olivenite, quartz (Tintic district, Utah, USA); olivenite, scorodite (Majuba Hill, Nevada, USA); malachite, bystromite, ordoñezite (Naco, Sonora, Mexico).

Distribution: In England, from Wheal Gorland and Wheal Unity, Gwennap, at the Phoenix United mines, Linkinhorne, and in the Old Gunnislake mine, Calstock, Cornwall; from the Brandy Gill mine, Caldbeck Fells, Cumbria. In the USA, in the American Eagle and Mammoth mines, Tintic district, Juab Co., and the Gold Hill mine, Tooele Co., Utah; at the Majuba Hill mine, Antelope district, Pershing Co., Nevada; from Alum Gulch, near Patagonia, Santa Cruz Co., Arizona. On Benjamín Hill, Las Animas, and on Cerro Morita, about 27 km southwest of Agua Prieta, Sonora, Mexico. In Chile, at Chuquicamata, and the Emma Luisa gold mine, Guanaco district, about 100 km east-northeast of Taltal, Antofagasta; from Collahuasi, Tarapacá. At Musonoi, near Kolwezi, Katanga Province, Congo (Shaba Province, Zaire). In Australia, from the Consols mine, Broken Hill, New South Wales; at the Dome Rock copper mine, about 40 km northwest of Mingary, South Australia; and from the Anticline prospect, 11 km west-southwest of Ashburton Downs homestead, Capricorn Range, Western Australia. Reported from additional localities, for some of which modern confirmation would be desirable.

(1) Near Gaotai village, China; by electron microprobe, average of 13 analyses; corresponds to $(Ir_{2.93}Pt_{0.07}Rh_{0.01})_{\Sigma=3.01}(Fe_{0.90}Cu_{0.08})_{0.98}$. (2) Ir_3Fe.

Occurrence: In chromite ores in ultramafic rocks and in placer concentrates derived therefrom.

Association: Inaglyite, osmiridium, ferrian platinum, laurite, irarsite, isoferroplatinum, erlichmannite, gaotaiite, galena, gold, chromite, magnetite.

Distribution: From a branch of the Luanhe River, near Gaotai village, Chengde Co., about 200 km north-northeast of Beijing, Hebei Province, China [TL].

Name: For Chengde Co., China, in which it was found to occur.

Type Material: Geological Museum of China, Beijing, China.

CuO	7.8	6.70
H_2O	[4.4]	4.55
Total	[100.0]	100.00

(1) Susanna mine, Scotland; by electron microprobe, H_2O by difference, presence of $(SO_4)^{2-}$ and $(OH)^{1-}$ and absence of H_2O confirmed by IR, corresponds to $Pb_{3.98}Cu_{1.17}(SO_4)_{1.98}(OH)_{6.08}$.
(2) $Pb_4Cu(SO_4)_2(OH)_6$.

Occurrence: Of rare occurrence in the oxidized portions of some Pb–Cu sulfide deposits.

Association: Caledonite, linarite, leadhillite, susannite, elyite, lanarkite, galena, chalcopyrite.

Distribution: From the Susanna mine, Leadhills, Lanarkshire, Scotland. At the Llechwedd Helyg mine, Tir-y-Mynach, Dyfed, Wales. In the Driggith mine, Caldbeck Fells, Cumbria, England. From the Virneberg mine, near Rheinbreitbach, Rhineland-Palatinate, and at Ramsbeck, North Rhine-Westphalia, Germany.

Name: Honors Dr. Tzong T. Chen (1942–), mineralogist at the Canadian Centre for Mineral and Energy Technology (CANMET), Ottawa, Canada.

Type Material: Technical University of Vienna, Vienna, Austria; University of Stuttgart, Stuttgart, Germany, NM14; Royal Ontario Museum, Toronto, Canada; National Museum of Natural History, Washington, D.C., USA, 160384.

Mineral Group: Monazite group.

Occurrence: Disseminated in a kaolinized pegmatite dike and surrounding kaolinized granite gneiss; alluvial (Kuttankuli, India); in a carbonatite (Mt. Weld, Western Australia).

Association: Tourmaline, chrysoberyl, zircon, quartz (Kuttankuli, India).

Distribution: From Kuttankuli (Kuttakuzhi), about 42 km east-southeast of Trivandrum, Kerala State, India. At Ratnapura, Sri Lanka. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia. At Binghampton, Broome Co., New York, and in the Uranium King mine, Encampment, Carbon Co., Wyoming, USA.

Name: For *Chera* (Kerala), an ancient Dravidian kingdom predating Travancore (now Kerala State), India, and its dominant *cerium* content.

Type Material: Institute of Geological Sciences, London, MI 28881; The Natural History Museum, London, England, 1947,344.

(1) Kuttankuli, India; by electron microprobe, corresponding to $[Th_{0.29}Ca_{0.26}Ce_{0.18}Nd_{0.08}La_{0.08}U_{0.04}Sm_{0.02}Pr_{0.02}Pb_{0.01}Gd_{0.01}(Eu, Y, Tm, Tb, Dy, Er, Ho)_{0.01}]_{\Sigma=0.99}(P_{0.92}Si_{0.08})_{\Sigma=1.00}O_4$.
(2) Ratnapura, Sri Lanka; corresponding to $[Ce_{0.32}Th_{0.27}(La, Pr, Nd)_{0.34}Fe_{0.05}Y_{0.02}Al_{0.01}]_{\Sigma=1.01}(P_{0.73}Si_{0.26})_{\Sigma=0.99}O_4$.

Mineral Group: Monazite group.

Occurrence: Disseminated in a kaolinized pegmatite dike and surrounding kaolinized granite gneiss; alluvial (Kuttankuli, India); in a carbonatite (Mt. Weld, Western Australia).

Association: Tourmaline, chrysoberyl, zircon, quartz (Kuttankuli, India).

Distribution: From Kuttankuli (Kuttakuzhi), about 42 km east-southeast of Trivandrum, Kerala State, India. At Ratnapura, Sri Lanka. In the Mt. Weld carbonatite, 35 km south of Laverton, Western Australia. At Binghampton, Broome Co., New York, and in the Uranium King mine, Encampment, Carbon Co., Wyoming, USA.

Name: For *Chera* (Kerala), an ancient Dravidian kingdom predating Travancore (now Kerala State), India, and its dominant *cerium* content.

Type Material: Institute of Geological Sciences, London, MI 28881; The Natural History Museum, London, England, 1947,344.

Rh	55.9	57.87
Ru	1.45	
Pt	0.61	
Ni	0.20	
As	41.6	42.13
Total	99.76	100.00

(1) Northern Pekul'nei River, Russia; by electron microprobe, average of 16 grains; corresponds to $(Rh_{0.98}Ru_{0.03}Pt_{0.01}Ni_{0.01})_{\Sigma=1.03}As_{1.00}$. (2) RhAs.

Occurrence: In a placer with other platinum group element minerals derived from an ultramafic massif in an ophiolite belt (Northern Pekul'nei River, Russia).

Association: Isoferroplatinum, tetraferroplatinum, ferronickelplatinum, rutheniridosmine, laurite, irarsite, cooperite, sperrylite, hollingworthite, chromite, olivine (Northern Pekul'nei River, Russia); isoferroplatinum, rhodian irarsite, hongshiite, sperrylite, tulameenite (Upper Miask River, Russia); laurite, erlichmannite, cuproiridisite, kashinite, rhodian pentlandite, irarsite, chromite, olivine (Ray-Iz complex, Russia).

Distribution: In Russia, from a placer of the Northern Pekul'nei River, Pekul'nei Range, eastern Chukot Peninsula [TL]; in a placer in the Upper Miask River, Ural Mountains; and at the Ray-Iz ophiolite complex, Polar Ural Mountains. In the Onverwacht pipe, in the Merensky Reef, Bushveld complex, Transvaal, South Africa.

Name: In honor of Vladimir Aleksandrovich Cherepanov (1927–1983), Russian geologist and mineralogist, Karpinskii All-Union Research Institute of Geology, St. Petersburg, Russia.

Type Material: Mining Institute, St. Petersburg, Russia, 2103/1.

Chernikovite $(H_3O)_2(UO_2)_2(PO_4)_2 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. *Point Group:* $4/m\ 2/m\ 2/m$. As thin platy crystals, elongated along [010]; as oriented inclusions in autunite and meta-autunite.

Physical Properties: *Cleavage:* Perfect on {001}; imperfect on {010}. Hardness = n.d. D(meas.) = 3.259 D(calc.) = 3.258–3.264 Intense yellow-green fluorescence. Radioactive.

Optical Properties: Transparent. *Color:* Pale yellow to lemon-green [*sic*]. *Luster:* Vitreous. *Optical Class:* Uniaxial (–), may be anomalously biaxial. *Pleochroism:* Slight to none. ω = 1.580–1.583 ϵ = 1.569–1.570 2V(meas.) = 5°–10°

Cell Data: *Space Group:* $P4/nmm$. a = 7.016–7.030 c = 9.034–9.055 Z = 1

X-ray Powder Pattern: Karakat deposit, Tajikistan.
4.99 (100), 3.54 (100), 3.26 (100), 5.51 (90), 3.82 (80), 2.16 (70), 2.09 (70)

Chemistry: (1) An analysis of natural material has not been made; the species rests on qualitative spectrographic analyses and identity of other properties with those of synthetic material.

Mineral Group: Meta-autunite group.

Occurrence: In fissures in quartz syenite and around fossil wood (Karakat deposit, Tajikistan); along fractures in tourmaline-bearing granites and granite pegmatites (Perus district, Brazil).

Association: Autunite, meta-autunite, sodium autunite (Karakat deposit, Tajikistan); autunite, meta-autunite, uranophane, uranophane-beta, phosphuranylite, torbernite, metatorbernite, haiweeite, uranian "opal" (Perus district, Brazil).

Distribution: From the Karakat uranium deposit, 60 km northwest of Khodzhent (Leninabad), Karamazar Mountains, Tajikistan. In the Perus district, 25 km north of São Paulo, Brazil. In Germany, in the Rockelmann quarry, near Schwarzenberg, Saxony, and from Ronneburg, Thuringia.

Name: To honor Dr. Andrei Andreevich Chernikov (1927–), Institute of Mineralogy and Geochemistry of Rare Elements, Moscow, Russia, who first described naturally-occurring material.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 88655.

(2) Wannigletscher, Binntal, Switzerland; by electron microprobe. (3) $Y(As,P)O_4$ with As:P = 1:1.

Polymorphism & Series: Forms a series with xenotime-(Y).

Occurrence: In piemontite veinlets in liparite porphyry (Nyarta-Syu-Yu River, Russia); in Alpine-type fissures (Binntal, Switzerland).

Association: Piemontite, molybdenian scheelite, albite, calcite, garnet, hastingsite, pyrolusite, hematite (Nyarta-Syu-Yu River, Russia); niobian rutile, magnetite, asbecasite, cafarsite (Binntal, Switzerland).

Distribution: Near the head of the Nyarta-Syu-Yu River, east of Mt. Tel'posiz, Polar Ural Mountains, Russia. On the west flank of Cherbadung [Pizzo Cervandone], Binntal, Valais, Switzerland. On the east flank of Pizzo Cervandone, Alpe Devero, Val d'Aosta, Piedmont, Italy. At Sailauf, northeast of Aschaffenburg, Bavaria, Germany. In the USA, at the Squaw Creek tin prospect and Paramount Canyon, Taylor Creek district, Sierra Co., New Mexico. Large crystals from Brumado, Bahia, also at the José Pinto pegmatite, at Jaguaraçú, near Coronel Fabriciano, Minas Gerais, Brazil.

Name: Honoring Professor Aleksandr Aleksandrovich Chernov (1877–1963), Russian geologist, Institute of Geology, Syktyvar, Russia, explorer of the Polar Urals.

(1) Mounana mine, Gabon; by electron microprobe, corresponds to $Pb_{2.00}V_{2.00}^{5+}O_7$.

Occurrence: In the oxidized zone of a vanadium- and lead-bearing uranium deposit (Mounana mine, Gabon).

Association: Francevillite, wulfenite (Mounana mine, Gabon); mottramite, cuprite, heyite, dioptase, malachite, plancheite, vanadinite, wakefieldite-(Ce) (Kusu deposit, Congo).

Distribution: In the Mounana uranium mine, Franceville, Gabon. From the Kusu deposit, 85 km south of Kinshasa, Bas-Zaire Province, Congo (Zaire). From St. Andreasberg, Harz Mountains, Germany. Found at Vrančice, near Příbram, Czech Republic.

Name: Honors Jean Chervet, French mineralogist.

Type Material: National School of Mines, Paris, France.

Chesnokovite $Na_2[SiO_2(OH)_2]\cdot 8H_2O$

Crystal Data: Orthorhombic. *Point Group*: 2/*m* 2/*m* 2/*m*. As pods to 10 cm; crystals crudely lamellar, to 2 cm, with {010} dominant.

Physical Properties: *Cleavage*: Perfect on {010}, good on {100} and {001}. *Fracture*: Stepped to conchoidal. *Tenacity*: Brittle. Hardness = 2.5 D(meas.) = 1.68(2) D(calc.) = 1.60 (empirical formula) or 1.64 (ideal formula). Highly unstable at normal atmospheric humidity and CO_2 concentration; decomposes to thermonatrite and opal.

Optical Properties: Transparent to translucent. *Color*: Colorless; aggregates white to pale brown or yellowish; colorless in thin section. *Streak*: White. *Luster*: Dull vitreous.
Optical Class: Biaxial (+). α = 1.449(2) β = 1.453(2) γ = 1.458(3) 2V(meas.) = 80(5)° 2V(calc.) = 84° *Orientation: XY* || {010}; *Z* = *b*.

Cell Data: *Space Group*: *Ibca*. *a* = 11.7119(6) *b* = 16.973(1) *c* = 11.5652(6) Z = 8

X-ray Powder Pattern: Mt. Kedykverpakhk, Lovozero alkaline massif, Kola Peninsula, Russia. 2.774 (100), 2.800 (97), 3.847 (89), 4.788 (42), 2.932 (42), 2.832 (35), 5.001 (30)

Chemistry:

	(1)	(2)
Na_2O	21.49	21.81
K_2O	0.38	
Li_2O	0.003	
SiO_2	21.42	21.14
H_2O	54.86	57.05
Total	98.15	100.00

(1) Mt. Kedykverpakhk, Lovozero alkaline massif, Kola Peninsula, Russia; electron microprobe and atomic emission analyses, H_2O by the Alimarin method, H_2O and OH confirmed by IR, corresponding to $(Na_{1.96}K_{0.02})_{\Sigma=1.98}Si_{1.005}O_2(OH)_2\cdot 7.58H_2O$. (2) $Na_2[SiO_2(OH)_2]\cdot 8H_2O$.

Occurrence: A late hydrothermal mineral, intergrown with natrophosphate in a ussingite vein in an alkaline igneous complex.

Association: Natrophosphate, natrolite, sodalite, vuonnemite, steenstrupine-(Ce), phosinaite-(Ce), natisite, gobbinsite, villiaumite, natrosilite, revdite.

Distribution: The Kedykverpakhk–22 vein, Mt. Kedykverpakhk, Karnasurt mine, Lovozero alkaline massif, Kola Peninsula, Russia.

Name: Honors mineralogist Boris Valentinovich Chesnokov (1928–2005) of the Ural Department, Russian Academy of Sciences, Miass.

Type Material: A.E. Fersman Mineralogical Museum, Russian Academy of Sciences, Moscow (catalog no. 3419/1).

References: (1) Pekov, I.V., N.V. Chukanov, A.E. Zadov, N.V. Zubkova, and D.Yu. (1) Chester, Vermont, USA; by electron microprobe, H_2O assuming (OH) sites filled by $(OH)^{1-}$.

Occurrence: In black wallrock between chlorite and actinolite zones of a metamorphosed ultramafic body.

Association: Jimthompsonite, clinojimthompsonite, anthophyllite, cummingtonite, talc.

Distribution: In the Carleton talc quarry, near Chester, Windsor Co., Vermont, USA.

Name: For the Chester, Vermont, USA, locality.

Type Material: Royal Ontario Museum, Toronto, Canada, M36083; Harvard University, Cambridge, Massachusetts, 134079; National Museum of Natural History, Washington, D.C., USA, 145869.

Chestermanite $Mg_2(Fe^{3+}, Mg, Al, Sb^{5+})O_2BO_3$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. Typically fibrous to asbestiform on [001], curved along {001} and flattened on {010}, to 2 mm. Crystals ubiquitously striated ∥ [011] and diamond-shaped in cross section. Of the nine forms noted, {110}, {210}, and {010} dominate.

Physical Properties: *Fracture:* Uneven to conchoidal, produced more easily ⊥ to length. *Tenacity:* Brittle, tougher than ludwigite. Hardness = 6 D(meas.) = 3.72(2) D(calc.) = 3.650

Optical Properties: Semitransparent. *Color:* Grayish green to black; surface (diffraction grating) iridescence is typical. *Streak:* Pale grayish green. *Luster:* Vitreous to silky. *Optical Class:* Biaxial (+). *Pleochroism:* X = dark greenish blue; Y = green; Z = pale yellowish brown. *Absorption:* $X \gg Y > Z$. $\alpha = 1.753$–1.759 $\beta = 1.763$–1.767 $\gamma = 1.791$–1.797 2V(meas.) = n.d. 2V(calc.) = 63°

Cell Data: *Space Group: Pbam.* $a = 18.525(4)$ $b = 12.272(2)$ $c = 3.0218(4)$ Z = 8

X-ray Powder Pattern: Twin Lakes region, California, USA; shows strong preferred {hk0} orientation.
5.114 (100), 2.559 (91), 2.169 (57), 2.746 (34), 1.9975 (32), 2.475 (19), 1.5300 (19)

Chemistry:

	(1)		(1)
Sb_2O_5	10.3	MgO	48.0
TiO_2	0.8	CaO	0.1
B_2O_3	[18.22]	F	0.1
Al_2O_3	5.3	$-O = F_2$	0.04
Fe_2O_3	16.0	Total	98.88
MnO	0.1		

(1) Twin Lakes region, California, USA; by electron microprobe, average of eight analyses, total Fe as Fe_2O_3, confirmed by Mössbauer spectroscopy, B_2O_3 calculated for stoichiometry; corresponds to $Mg_2(Fe^{3+}_{0.38}Mg_{0.28}Al_{0.20}Sb^{5+}_{0.12}Ti_{0.02})_{\Sigma=1.00}O_2B(O_{2.99}F_{0.01})_{\Sigma=3.00}$. (2) Do.; from crystal-structure analysis, corresponds to $Mg_{2.00}(Fe^{3+}_{0.43}Al_{0.16}Mg_{0.25}Sb_{0.13}Ti_{0.02})_{\Sigma=0.99}O_2BO_3$.

Mineral Group: Ludwigite group.

Occurrence: Rare, in veins and disseminated in a brucite marble lens contained in a multiply metamorphosed roof pendant between two plutons in a granodiorite batholith.

Association: Magnesian–aluminian ludwigite, magnesian calcite, fluoborite, wightmanite, spinel, brucite, safflorite, löllingite.

Distribution: From the north side of Kaiser Crest, about five km north of the easternmost end of Huntington Lake, Twin Lakes region, Fresno Co., California, USA.

Name: Honors Charles Wesley Chesterman (1913–1991), geologist and mineralogist, California Division of Mines and Geology, San Francisco, USA, who discovered the first specimens.

Type Material: National Museum of Natural History, Washington, D.C., USA, 160270, 165968.

(1) Ural Mountains, Russia. (2) Mohave Co., Arizona, USA.

Polymorphism & Series: Dimorphous with perrierite.

Occurrence: As an accessory mineral in some granites, and in pegmatites associated with alkalic granite and syenites; in air-fall ash deposits.

Association: Titanite, monazite, apatite, cronstedtite, quartz (Aquarius Mountains, Arizona, USA).

Distribution: From the Ilmen Mountains, Southern Ural Mountains; the Keivy massif, Kola Peninsula; and elsewhere in Russia. At Buer, Björkedalen, Norway. From Glen Bay, Na h-Eagan, and Conachair, in the Isles of St. Kilda, Outer Hebrides, Scotland. In Madagascar, from the Tordendrika-Ifasina region, Androngovato, and Ifasina, Ambatofinandrahana. In the USA, in the Aquarius Mountains, Mohave Co., Arizona; the Jemez Mountains and Pueblo Mesa, Rio Arriba Co., New Mexico; at Onion Creek, Grand Co., Utah; in Yellowstone National Park, Wyoming; from Irish Flats, Meade Co., Kansas. Also in the Spruce Pine district, Mitchell Co., North Carolina; near Martin's Store, Nelson Co., Virginia; and in New Hampshire, from near Stark, Coos Co. A few other localities have been verified.

Name: In honor of General-Major Konstantin Vladimirovich Tschevkin [Chevkin] (1802–1875), Chief of Staff of the Russian Mining Engineers Corps.

Chiavennite $CaMn^{2+}Be_2Si_5O_{13}(OH)_2 \cdot 2H_2O$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $mm2$. Crystals are hemimorphic, spearhead-shaped, flattened on {010}, and display the pyramid {161}, to 1 cm. In aggregates and spherulites of such crystals; as grains and crusts.

Physical Properties: *Cleavage:* Good to perfect on {100}, {010}, and {001}. Hardness = ∼3 D(meas.) = 2.56–2.64 D(calc.) = 2.65

Optical Properties: Translucent. *Color:* Pale orange-yellow; in thin section, colorless to yellow or orange-yellow; color sharply zoned near crystal margins. *Streak:* White to pale ocher. *Luster:* Vitreous to pearly.
Optical Class: Biaxial (+). *Pleochroism:* Weak; X = colorless to pale yellow; Z = yellow-orange. *Orientation:* $X = a$; $Y = b$; $Z = c$. *Absorption:* $Z > X$. α = 1.594–1.596 β = 1.600 γ = 1.613–1.618 2V(meas.) = n.d. 2V(calc.) = 50°

Cell Data: *Space Group:* $P2_1ab$. $a = 8.866(7)$ $b = 31.34(2)$ $c = 4.787(3)$ Z = 4

X-ray Powder Pattern: Tanno, Italy.

(1) Tanno, Italy; by electron microprobe; Be determined spectrographically, H_2O by TGA; corresponds to $(Ca_{0.97}Na_{0.05})_{\Sigma=1.02}Mn_{0.97}(Be_{1.98}Al_{0.03})_{\Sigma=2.01}(Si_{4.65}Al_{0.35})_{\Sigma=5.00}O_{12.63}(OH)_{2.37} \cdot 2.16H_2O$. (2) Langangen, Norway; by a variety of analytical methods; corresponds to $(Ca_{0.92}Na_{0.12})_{\Sigma=1.04}(Mn_{0.80}Fe_{0.15}Mg_{0.02})_{\Sigma=0.97}(Be_{1.86}Al_{0.14})_{\Sigma=2.00}(Si_{4.43}Al_{0.57})_{\Sigma=5.00}O_{12.45}(OH)_{2.49}F_{0.06} \cdot 1.83H_2O$.

Occurrence: Coating beryl in late-stage pegmatites (Tanno, Italy); in vugs in syenite pegmatites (Norway).

Association: Beryl, bavenite (Tanno, Italy); analcime, aegirine, helvite, eudidymite, natrolite, feldspar (Norway).

Distribution: From Tanno, Chiavenna, Lombardy, Italy. In Norway, in the Heia and Vevja larvikite quarries, near Larvik, Tvedalen district; near Blåfjell, Langangen, and in the Saga larvikite quarry, Porsgrunn, Langesundsfjord; and at Bakkane, Brunlanes. Large crystals on Utö Island, Sweden.

Name: For the Italian locality at Tanno, Chiavenna.

Type Material: University of Rome, Rome, Italy, 24342; University of Oslo, Norway; National Museum of Natural History, Washington, D.C., USA, 159917.

Childrenite $Fe^{2+}Al(PO_4)(OH)_2 \cdot H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic; probably monoclinic, pseudo-orthorhombic. *Point Group:* $2/m$ $2/m$ $2/m$. As equant to pyramidal crystals, may be short prismatic along [001], thick tabular on {010}, or platy on {100}, commonly doubly terminated, to 2 cm; in radiating groups and fibrous crusts; massive. *Twinning:* May show twinning on {100} and {001}, observed optically, to give pseudo-orthorhombic symmetry; may be due to oxidation.

Physical Properties: *Cleavage:* {100}, poor. *Fracture:* Subconchoidal to uneven. Hardness = 5 D(meas.) = 3.11–3.19 D(calc.) = 3.12–3.15

Optical Properties: Transparent to translucent. *Color:* Yellowish brown to brown, clove-brown. *Streak:* White. *Luster:* Vitreous to resinous. *Optical Class:* Biaxial (–). *Pleochroism:* X = yellow; Y = pink; Z = pale pink to colorless. *Orientation:* $X = b$; $Y = a$; $Z = c$; $Y \wedge c = 4°$–$8°$ in optically twinned individuals. *Dispersion:* $r > v$, strong, for near end-member composition. $\alpha = 1.644$–1.649 $\beta = 1.662$–1.683 $\gamma = 1.671$–1.691 2V(meas.) = 50° in optically twinned crystals.

Cell Data: *Space Group: Bba*2. $a = 10.395(1)$ $b = 13.394(1)$ $c = 6.918(1)$ Z = 8

X-ray Powder Pattern: Stari Trg mine, Serbia.

(1) Crinnis and Carlyon mine, Cornwall, England. (2) $FeAl(PO_4)(OH)_2 \cdot H_2O$.

Polymorphism & Series: Forms a series with eosphorite.

Occurrence: In some complex granite pegmatites, typically a low-temperature hydrothermal alteration product of primary phosphate minerals.

Association: Siderite, pyrite, apatite, quartz (Tavistock, England); zinnwaldite, tourmaline, apatite, kaolinite (Greifensteine, Germany).

Distribution: In England, from Devon, near Tavistock, at Wheal Crebor, the George and Charlotte mine, Russell United mines, Wheal Betsy, and many other places; from Cornwall, in the Crinnis and Carlyon mine, Wheal Jane, and elsewhere; from the Cobalt mine, Scar Crag, Causey Pike, Keswick, Cumbria. On the Greifensteine, near Ehrenfriedersdorf, Saxony, and Hagendorf, Bavaria. In the Stari Trg mine (Trepča), Kosovo, Serbia. At the Fram pegmatite, Kamativi, and the Kondo pegmatite, Miami, Zimbabwe. In the USA, in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire. From the Rapid Creek–Big Fish River area, Yukon Territory, Canada. Large crystals at the João Modesto dos Santos mine, and from a number of other mines around Linópolis and Mendes Pimental, Minas Gerais, Brazil. At the Siglo XX mine, Llallagua, Potosí, Bolivia. In the Moculta phosphate quarry, northeast of Angaston, South Australia. Other localities are known; the Fe:Mn ratio however should be confirmed.

Name: In honor of John George Children (1777–1852), English chemist and mineralogist.

(1) Miass, Russia. (2) Ivigtut, Greenland. (3) $Na_5Al_3F_{14}$.

Occurrence: In some granite pegmatites.

Association: Topaz, phenakite, fluorite, cryolithionite, thomsenolite (Miass, Russia); cryolite, elpasolite, pachnolite, thomsenolite, ralstonite (Amelia, Virginia, USA).

Distribution: At Miass, Ilmen Mountains, Southern Ural Mountains, Russia. From the Ivigtut cryolite deposit, southwestern Greenland. In the USA, in the Morefield pegmatite mine, Amelia, Amelia Co., Virginia.

Name: From the Greek for *snow* and *stone*, as compared to *cryolite*, *ice-stone*.

Type Material: Vernadsky State Geological Museum, Moscow, Russia, 18270, 18271.

(1) Lovozero massif, Russia. (2) $Na_2BeSi_2O_6$.

Occurrence: In veins in pegmatite in a differentiated alkalic massif (Lovozero massif, Russia); in sodalite xenoliths in an intrusive alkalic gabbro-syenite complex (Mont Saint-Hilaire, Canada).

Association: Manganoan pectolite, microcline, sodalite, eudialyte, neptunite, ussingite (Lovozero massif, Russia); villiaumite, ussingite, sodalite, aegirine, lovozerite, vuonnemite, sérandite, lueshite, steenstrupine (Mont Saint-Hilaire, Canada).

Distribution: At two locations on Mt. Punkaruaiv, Lovozero massif, and in the Khibiny massif, Kola Peninsula, Russia. On the Kangerdluarssuk Plateau and on the Taseq slope, in the Ilímaussaq intrusion, southern Greenland. From Mont Saint-Hilaire, Quebec, Canada.

Name: For Valerii Pavlovich Chkalov (1904–1938), first to fly nonstop from Moscow to the USA across the North Pole.

Type Material: Vernadsky State Geological Museum, Moscow, 18767; A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 40001.

Chladniite $Na_2CaMg_7(PO_4)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}$. Granular, to 975 μm, and as rims around other phosphates and silicates.

Physical Properties: *Cleavage:* Rhombohedral, probable. Hardness = 4.5–5
D(meas.) = n.d. D(calc.) = 3.01

Optical Properties: Transparent. *Color:* Colorless, orange-brown with included iron oxides; gray in reflected light, with orange-brown internal reflections. *Luster:* Vitreous to resinous. *Optical Class:* Uniaxial. n = 1.60–1.61 *Anisotropism:* Weak. *Bireflectance:* Weak.

Cell Data: *Space Group:* $R\overline{3}$. a = 14.967(2) c = 42.595(4) Z = 18

X-ray Powder Pattern: Carleton meteorite.
3.694 (s), 2.960 (s), 2.753 (s), 3.558 (m), 2.500 (m), 2.126 (m), 1.851 (m)

Chemistry:

	(1)	(2)	(3)

Total	99.68	99.81	100.00

(1) Carleton meteorite; by electron microprobe, average of five analyses; corresponding to $Na_{1.77}Ca_{0.96}(Mg_{6.96}Fe_{0.26}Mn_{0.04})_{\Sigma=7.26}[(P_{0.96}Si_{0.08})_{\Sigma=1.04}O_4]_6$. (2) GRA 95209 meteorite; by electron microprobe, average of 8 analyses, total Fe as FeO, total Mn as MnO; corresponds to $Na_{1.99}(Ca_{0.60}Mg_{0.43})_{\Sigma=1.03}(Mg_{3.60}Fe_{2.07}Mn_{1.33})_{\Sigma=7.00}(P_{0.98}O_4)_6$. (3) $Na_2CaMg_7(PO_4)_6$.

Occurrence: As a single grain in a phosphate-rich inclusion in an iron meteorite (Carleton meteorite); in phosphate-rich portions of an acapulcoite-lodranite meteorite.

Association: Chlorapatite, olivine, pyroxene, plagioclase, schreibersite, nickel-iron, troilite, kamacite, hydrated iron oxides [of terrestrial origin] (Carleton meteorite); magnesian graftonite, orthopyroxene, olivine, plagioclase, nickel-iron (GRA 95209 meteorite).

Distribution: In the Carleton type IIICD iron and GRA 95209 primitive achrondite meteorites.

Name: Honors Professor Ernst Florens Friedrich Chladni (1756–1827), German physicist, University of Riga, Riga, Latvia, who first published the hypothesis that meteorites were of extraterrestrial origin.

Type Material: National Museum of Natural History, Washington, D.C., USA, 2707.

Chloraluminite $AlCl_3 \cdot 6H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$. As rhombohedral crystals, showing {0001}, $\{11\overline{2}0\}$, and $\{10\overline{1}1\}$; as crusts, stalactites, compact masses.

Physical Properties: Hardness = Soft. D(meas.) = 1.644 (synthetic). D(calc.) = 1.666 (synthetic). Very soluble in H_2O; deliquescent.

Optical Properties: Transparent. *Color:* Colorless, white, yellow; colorless in transmitted light.
Optical Class: Uniaxial (–). $\omega = 1.560$ $\epsilon = 1.506$

Cell Data: *Space Group:* $R\overline{3}c$. $a = 11.827(6)$ $c = 11.895(3)$ Z = 2

X-ray Powder Pattern: Synthetic.
3.297 (100), 3.246 (55), 2.308 (50), 3.89 (40), 2.764 (40), 3.68 (35), 5.95 (25)

Chemistry: Natural material has not been analyzed.

Occurrence: As crusts around acidic fumaroles (Vesuvius, Italy).

Association: Molysite, chloromagnesite (Vesuvius, Italy); natroalunite, gypsum, anhydrite, pickeringite (Cerro Pintados, Chile).

Distribution: From Vesuvius, Campania, Italy. At Cerro Pintados, 80 km southeast of Iquique, Tarapacá, Chile. On Parícutin volcano, Michoacán, Mexico.

Name: For CHLORine and ALUMINum in its composition.

Type Material: Natural History Museum, Paris, France, 107480.

Chlorapatite $Ca_5(PO_4)_3Cl$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal or monoclinic. *Point Group:* $6/m$ or $2/m$. As prismatic hexagonal crystals, to 5 cm; granular, massive, may be in zoned intergrowths with fluorapatite.

Physical Properties: *Cleavage:* Poor on {0001} and $\{10\bar{1}0\}$. *Tenacity:* Brittle. Hardness = ∼5 D(meas.) = 3.17–3.18 D(calc.) = 3.172 (monoclinic).

Optical Properties: Transparent to translucent. *Color:* Greenish yellow, pinkish white, light greenish gray. *Luster:* Vitreous.
Optical Class: Uniaxial (–), may be biaxial (–). *Pleochroism:* Weak to moderate; in pale colors. *Absorption:* $E > O$. $\omega = 1.650$–1.667 $\epsilon = 1.647$–1.665 $\alpha = 1.665$ $\beta = 1.667$ $\gamma = \sim 1.667$ 2V(meas.) = ∼10°

Cell Data: *Space Group:* $P6_3/m$. $a = 9.5979$ $c = 6.7762$ Z = 2, or *Space Group:* $P2_1/b$. $a = 9.605$ $b = 19.210$ $c = 6.785$ $\beta = 120°$ Z = 6

X-ray Powder Pattern: Bob's Lake, Canada.
2.853 (100), 2.770 (100), 1.960 (50), 1.838 (50), 3.39 (40), 2.306 (40), 1.910 (25)

Chemistry:	(1)	(2)	(3)		(1)	(2)	(3)

F	0.13	0.84		$-O = (F, Cl)_2$	1.45	1.08	1.54
				Total	99.57	98.97	100.00

(1) Bob's Lake, Canada; $Ca_{4.95}(PO_4)_{3.02}[Cl_{0.91}(OH)_{0.05}F_{0.04}]_{\Sigma=1.00}$. (2) Fairfax, Virginia, USA; H_2O calculated for stoichiometry, corresponding to $Ca_{5.13}(PO_4)_{3.00}[Cl_{0.48}(OH)_{0.29}F_{0.23}]_{\Sigma=1.00}$. (3) $Ca_5(PO_4)_3Cl$.

Polymorphism & Series: End-member chlorapatite is monoclinic.

Mineral Group: Apatite group; Cl > F or OH.

Occurrence: Relatively much rarer than fluorapatite or hydroxylapatite, formed in F-deficient environments. In calcsilicate marble; an accessory mineral in layered mafic intrusions; in veins through diabase; replacing triphylite in granite pegmatite. In meteorites.

Association: Actinolite, diopside, calcite, quartz, talc (Bob's Lake, Canada); amphibole, chlorite, plagioclase, titanite, datolite (Bull Run quarry, Virginia, USA); olivine, orthopyroxene, phlogopite, ferroalluaudite, chromite (Angarf-Sud pegmatite, Morocco).

Distribution: Analyzed material noted from: in the USA, the Fairfax quarry, Centreville, Fairfax Co., and Bull Run quarry, Loudoun Co., Virginia; at the Stillwater complex, Montana; in the White Picacho district, Maricopa and Yavapai Cos., Arizona. From Bob's Lake, Frontenac Co., Quebec, Canada. In the Bushveld complex, Transvaal, South Africa. At the Angarf-Sud pegmatite, Tazenakht Plain, Morocco. From Rajagarh, near Ajmer, Rajasthan, India. At Kurokura, Kangway Prefecture, Japan. From Kragerøand Ødegården, Bamble, and as large crystals from Snarum, Norway.

Name: For dominant *chlorine* and membership in the *apatite* group; see fluorapatite.

(1) Chañarcillo, Chile. (2) Broken Hill, Australia. (3) Ag(Br, Cl) with Br:Cl = 1:1.

Polymorphism & Series: Dimorphous with bromargyrite.

Occurrence: May be a rich ore in the oxidized zone above silver deposits; commonly preserved in arid climates.

Association: Silver, cerussite, iodargyrite, atacamite, malachite, jarosite, Fe–Mn oxides.

Distribution: Only a few localities are given for fine crystals or exceptionally large or pure masses. In Germany, in Saxony, from Marienberg, Freiberg, Johanngeorgenstadt, Schneeberg, and others; at St. Andreasberg, Harz Mountains. From Joachimsthal, Czech Republic. In England, from the Calstock, Cambourne, and St. Just districts, and elsewhere in Cornwall. In Russia, at Schlangenberg, Altai Mountains. In the USA, from the Poorman mine, Silver City, Owyhee Co., Idaho; extraordinary masses in the Lake Valley district, near Hillsboro, Sierra Co., New Mexico; from Tombstone, Cochise Co., and Richmond Basin, near Globe, Gila Co., Arizona; in Nevada, from Bullfrog, Nye Co. and Rochester, Humboldt Co. From Santa Eulalia, Chihuahua; Catorce, San Luis Potosi; and elsewhere in Mexico. In Chile, from Chañarcillo, south of Copiapó, Atacama; at Caracoles, east of Sierra Gorda, Antofagasta; and Huantajaya, Tarapacá. At Broken Hill, New South Wales, Australia, in exceptional masses.

Name: For CHLORine, and the Greek for silver, *argyros*, in its composition.

Chlorartinite $Mg_2(CO_3)Cl(OH)\cdot 3H_2O$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Hexagonal. *Point Group:* $\overline{3}\ 2/m$ or $3m$. As granular aggregates, with grains to 0.01 mm.

Physical Properties: Hardness = n.d. D(meas.) = n.d. D(calc.) = 1.84 Slowly soluble in H_2O.

Optical Properties: Semitransparent. *Color:* White. *Streak:* White.
Optical Class: Uniaxial. $n = 1.510$ ω = n.d. ϵ = n.d.

Cell Data: *Space Group:* $R3c$ or $R\overline{3}c$. $a = 23.163(4)$ $c = 7.221(2)$ $Z = 18$

X-ray Powder Pattern: Tolbachik fissure volcano, Russia.

(1) Tolbachik volcano, Russia; $(CO_3)^{2-}$ and $(OH)^{1-}$ confirmed by IR; after deduction of halite 3.3% and gypsum 0.4%, corresponds to $(Mg_{1.82}Ca_{0.18})_{\Sigma=2.00}(CO_3)_{0.98}Cl_{1.07}(OH)_{0.98}\cdot 3.05H_2O$.
(2) $Mg_2(CO_3)Cl(OH)\cdot 3H_2O$.

Occurrence: In sublimates around a volcanic fissure.

Association: Halite, gypsum, aragonite, nesquehonite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: For essential *chlorine* and chemical relation to *artinite*.

Type Material: Mining Institute, Saint Petersburg, Russia.

(1) Crestmore, California, USA.

Mineral Group: Ellestadite group.

Occurrence: In veinlets cutting contact metamorphosed limestone.

Association: Diopside, wollastonite, vesuvianite, monticellite, okenite, calcite.

Distribution: From Crestmore, Riverside Co., California, USA.

Name: For Dr. Reuben B. Ellestad (1900–), American analytical chemist, University of Minnesota, Minneapolis, Minnesota, USA, and *chlorine* in the chemical composition.

References: (1) Palache, C., H. Berman, and C. Frondel (1951) Dana's system of mineralogy, (7th edition), v. II, 906 [ellestadite]. (2) McConnell, D. Chloritoid $(Fe^{2+}, Mg, Mn)_2Al_4Si_2O_{10}(OH)_4$

©2001 Mineral Data Publishing, version 1.2

Crystal Data: Monoclinic or triclinic, both pseudohexagonal. *Point Group:* $2/m$ or 1. Rarely as rosettes of pseudohexagonal tabular crystals; commonly coarsely foliated with foliae typically curved or bent; massive. *Twinning:* Common on {001}, may be lamellar; twin axes [100], [110], and [130] observed.

Physical Properties: *Cleavage:* Perfect on {001}, distinct on {110}; parting on {010}. *Tenacity:* Brittle. Hardness = 6.5 D(meas.) = 3.46–3.80 D(calc.) = 3.56

Optical Properties: Translucent. *Color:* Dark gray, greenish gray, greenish black; colorless to green in thin section. *Streak:* White, grayish, or very slightly greenish. *Luster:* Somewhat pearly on cleavage surfaces.
Optical Class: Biaxial (+) or (–). *Pleochroism:* X = olive-green to yellow; Y = grayish blue to blue; Z = colorless to pale greenish yellow. *Orientation:* X or $Y = b$ (monoclinic); $Z \wedge c$ = 2°–30°; $Y \simeq b$ (triclinic). *Dispersion:* $r > v$, strong. α = 1.705–1.730 β = 1.708–1.734 γ = 1.712–1.740 2V(meas.) = ∼45°–70°

Cell Data: *Space Group:* $C2/c$. a = 9.50(3) b = 5.50(2) c = 18.22(5) $\beta = 101°57(5)'$ Z = 4, or *Space Group:* $C\overline{1}$. a = 9.46(1) b = 5.50(1) c = 9.15(1) $\alpha = 97.05(2)°$ $\beta = 101.56(2)°$ $\gamma = 90.10(2)°$ Z = 4

X-ray Powder Pattern: Natick, Rhode Island, USA.
4.498 (100), 4.449 (100), 2.963 (90), 1.5813 (80), 2.367 (70), 2.306 (70), 2.639 (50)

Chemistry:

	(1)		(1)
SiO_2	23.91	CaO	0.04
TiO_2	0.20	Na_2O	0.00
Al_2O_3	40.12	K_2O	trace
Fe_2O_3	1.23	F	0.01
FeO	27.06	H_2O^+	7.03
MnO	0.16	H_2O^-	0.01
MgO	0.51	Total	100.28

(1) Natick, Rhode Island, USA; corresponds to $(Fe^{2+}_{1.89}Mg_{0.06}Mn_{0.01})_{\Sigma=1.96}$ $(Al_{3.95}Fe^{3+}_{0.08}Ti_{0.01})_{\Sigma=4.04}Si_{2.00}O_{9.80}(OH)_{3.20}$.

Polymorphism & Series: Forms a series with carboirite; monoclinic and triclinic polytypes are known.

Mineral Group: Chloritoid group.

Occurrence: In regionally metamorphosed pelitic sediments and schists in the biotite, garnet, and lower grade staurolite zones; in quartz-carbonate veins and other hydrothermal environments.

Association: Muscovite, chlorite, staurolite, garnet, kyanite, quartz, mica, rutile.

Distribution: A widely distributed mineral; only a few studied occurrences are noted. In Russia, from Kosoi Brod, Mramorskii Zavod, south of Yekaterinburg (Sverdlovsk), Ural Mountains. At Salmchâteau, near Ottré, Ardennes Mountains, Belgium. From Nadels and Zermatt, Valais, Switzerland. At Prägraten, Tirol, Austria. In Scotland, along the coast between Stonehaven and Aberdeen; and from Unst, Shetland Islands. Around Tintagel, Cornwall, England. In the USA, at Natick, Kent Co., Rhode Island; Chester, Hampden Co., Massachusetts; in Clove Valley, Duchess Co., New York; from Bull Mountain, Patrick Co., Virginia. In Canada, at Chibougamau and St. Giles, Quebec. From Kalgoorlie, Western Australia.

Name: For its resemblance to members of the *chlorite* group.

CO_2	1.10
$-O = Cl_2$	2.55
Total	100.15

(1) Kapaevskaya pipe, Russia; corresponds to $(Mg_{3.55}Fe^{2+}_{0.27}Na_{0.05})_{\Sigma=3.87}(Al_{1.93}Fe^{3+}_{0.07}Ti_{0.01})_{\Sigma=2.01}(OH)_{12}[Cl_{1.48}(\frac{1}{2}CO_3)_{0.24}]_{\Sigma=1.72}\cdot 2.42H_2O$.

Mineral Group: Manasseite group.

Occurrence: In iron-ore skarns in an explosion pipe.

Association: Magnetite, magnesian chlorite.

Distribution: In the Kapaevskaya pipe, middle Angara River, Irkutsk district,southern Siberia, Russia.

Name: For its principal components, CHLORine, MAGnesium, and ALUMINum.

Type Material: A.E. Fersman Mineralogical Museum, Academy of Sciences, Moscow, Russia, 82771.

Chloromenite $Cu_9O_2(Se^{4+}O_3)_4Cl_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. Crystals are platy on $\{\overline{1}01\}$, elongated along [111] or $[1\overline{1}1]$, may be equant, with well-developed {001}, $\{\overline{1}01\}$ {101}, {110}, {011}, $\{\overline{3}12\}$, poor $\{\overline{3}01\}$, {310}, to 0.2 mm

Physical Properties: *Cleavage:* Perfect on {101}. *Tenacity:* Plastic. Hardness = n.d. VHN = 60–63, 62 average (5 g load). D(meas.) = n.d. D(calc.) = 4.15(1)

Optical Properties: Transparent. *Color:* Tobacco-green. *Streak:* Yellowish green. *Luster:* Vitreous.
Optical Class: Biaxial (–). *Pleochroism:* X = green; Y = pale brownish green; Z = dark brownish green. *Orientation:* $Y = b$; $Z \simeq c$. *Absorption:* $Z > X > Y$. $\alpha = 1.87(1)$ $\beta = 1.92(1)$ $\gamma = 1.94(1)$ 2V(meas.) = 66(2)° 2V(calc.) = 63°

Cell Data: *Space Group:* $I2/m$. $a = 14.170(3)$ $b = 6.262(1)$ $c = 12.999(3)$ $\beta = 113.05(1)°$ Z = 2

X-ray Powder Pattern: Tolbachik volcano, Russia; shows significant preferred orientation. 3.450 (100), 5.56 (83), 11.29 (63), 2.486 (61), 3.239 (39), 2.714 (31), 3.643 (25)

Chemistry:

	(1)	(2)
SeO_2	34.37	33.51
CuO	46.23	54.05
ZnO	5.94	
Cl	16.57	16.06
$-O = Cl_2$	3.74	3.62
Total	[99.37]	100.00

(1) Tolbachik volcano, Russia; by electron microprobe, average of four analyses, original total given as 99.36%; corresponds to $(Cu_{7.71}Zn_{0.97})_{\Sigma=8.68}O_{1.80}(Se_{1.03}O_3)_4Cl_{6.20}$. (2) $Cu_9O_2(SeO_3)_4Cl_6$.

Occurrence: Formed in a volcanic fumarole.

Association: Melanothallite, sofiite, georgbokiite, ilinskite, chloromenite, burnsite, cotunnite.

Distribution: From the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: From the Greek for *green*, in allusion to its color, and for *moon*, for its *selenium* content.

Type Material: Department of Mineralogy, St. Petersburg State University; Mining Museum, St. Petersburg, Russia.

References: (1) Vergasova, L., S. Krivovichev, T. Semenova, S. Filatov, and V. Ananiev (1999) Chloromenite, $Cu_9O_2(SeO_3)_4Cl_6$, a new mineral from the Tolbachik volcano, Kamchatka, Russia. Eur. J. Mineral., 11, 119–123. (2) (1999) Amer. Mineral., 84, 1464 (abs. ref. 1).

Chlorophoenicite $(Mn, Mg)_3Zn_2(AsO_4)(OH, O)_6$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As stout to acicular prismatic crystals, elongated and striated parallel [010], to 1 cm, generally with etched and dull terminations, and prism faces uneven or warped; in divergent sprays, dense masses of acicular crystals, microcrystalline, chalky pulverulent coatings.

Physical Properties: *Cleavage:* Good on {100}. *Tenacity:* Brittle. Hardness = 3.5 D(meas.) = 3.46–3.53 D(calc.) = 3.47

Optical Properties: Translucent. *Color:* Light grayish green in natural light, pink to light purplish red in artificial light, typically white in aggregates; nearly colorless in transmitted light. *Luster:* Vitreous, silky, pearly on cleavages.
Optical Class: Biaxial (–). *Orientation:* $Y = b$. *Dispersion:* $r > v$, strong. $\alpha = 1.682$ $\beta = 1.690$ $\gamma = 1.697$ $2V(meas.) = 83(2)^\circ$

Cell Data: *Space Group:* $C2/m$. $a = 22.98(4)$ $b = 3.32(1)$ $c = 7.32(1)$ $\beta = 106^\circ00(10)'$ $Z = 2$

X-ray Powder Pattern: Franklin, New Jersey, USA; nearly identical to magnesium-chlorophoenicite. (ICDD 25-1159).
2.642 (100), 3.71 (70), 6.87 (50), 3.11 (50), 2.990 (40), 1.758 (30), 1.822 (20)

Chemistry:

	(1)
P_2O_5	0.1
As_2O_5	20.3
FeO	0.0
MnO	33.0
ZnO	30.3
MgO	1.6
CaO	0.1
H_2O	14.9
Total	100.3

(1) Franklin, New Jersey, USA; by electron microprobe, H_2O by DTA–TGA, corresponding to $(Mn_{2.65}Mg_{0.23}Zn_{0.12})_{\Sigma=3.00}Zn_{2.00}(AsO_4)(OH, O)_6$.

Occurrence: Along secondary cracks through franklinite ores in a metamorphosed stratiform zinc orebody.

Association: Leucophoenicite, hodgkinsonite, hetaerolite, tephroite, gageite, chlorophoenicite, sclarite, pyrochroite, willemite, zincite, calcite, barite, franklinite.

Distribution: From Franklin and Sterling Hill, Ogdensburg, Sussex Co., New Jersey, USA.

Name: From the Greek for *green* and *purple-red*, alluding to the mineral's colors in natural and artificial light.

Type Material: The Natural History Museum, London, England, 1925,501–502; National Museum of Natural History, Washington, D.C., USA, 94964.

Chlorothionite $K_2Cu(SO_4)Cl_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Orthorhombic. *Point Group:* $2/m\ 2/m\ 2/m$. As crystalline incrustations.

Physical Properties: Hardness = 2.5 D(meas.) = 2.69 D(calc.) = [2.68] Soluble in H_2O.

Optical Properties: Semitransparent. *Color:* Bright to pale blue, may be pale greenish blue. *Optical Class:* Biaxial (+) (synthetic). *Dispersion:* $r > v$. α = n.d. β = n.d. γ = n.d. 2V(meas.) = Moderately large.

Cell Data: *Space Group: Pnma.* $a = 7.732(15)$ $b = 6.078(1)$ $c = 16.292(3)$ Z = 4

X-ray Powder Pattern: Vesuvius, Italy.
3.04 (100), 2.187 (70), 2.847 (35), 5.69 (30), 3.26 (30), 3.15 (20), 2.491 (20)

Chemistry:

	(1)	(2)
SO_3	27.50	25.93
CuO	24.48	25.77
K_2O	31.67	30.51
Cl	20.04	22.97
LOI	1.12	
$-O = Cl_2$	4.52	5.18
Total	100.29	100.00

(1) Vesuvius, Italy; here converted to oxides from an original elemental analysis totalling 100.00%.
(2) $K_2Cu(SO_4)Cl_2$.

Occurrence: As sublimates around volcanic fumaroles.

Association: n.d.

Distribution: From Vesuvius, Campania, Italy.

Name: From the Greek for *chlorine* and *sulfur* in the composition.

Type Material: Mineralogical Museum, University of Bari, Bari, Italy.

Chloroxiphite $Pb_3CuO_2Cl_2(OH)_2$

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* $2/m$. As bladed crystals, often curved, to 4 cm, elongated along [010] and flattened on $\{\bar{1}01\}$, which is striated ‖ [010]; as subparallel groups.

Physical Properties: *Cleavage:* Perfect on $\{\bar{1}01\}$, distinct on {100}. *Tenacity:* Very brittle; friable. Hardness = 2.5 D(meas.) = 6.76–6.93 D(calc.) = 6.84

Optical Properties: Transparent. *Color:* Dull olive-green or pistachio-green. *Streak:* Pale yellowish green. *Luster:* Resinous to adamantine.
Optical Class: Biaxial (–). *Pleochroism:* Y = yellowish brown; Z = bright emerald-green. *Orientation:* $Z = b$; $X \simeq \perp \{\bar{1}01\}$. *Dispersion:* $r > v$, medium to strong. $\alpha = 2.16$ $\beta = 2.24$ $\gamma = 2.25$ 2V(meas.) = ∼70°

Cell Data: *Space Group:* $P2_1/m$. $a = 10.458(4)$ $b = 5.759(3)$ $c = 6.693(3)$ $\beta = 97.79(4)°$ Z = 2

X-ray Powder Pattern: Higher Pitts Farm, England. (ICDD 8-112).
