In fact, name change is possible for any citizen who wishes it and is a relatively accessible procedure, but only when the new name belongs to the same gender category as the previous one or to a gender-neutral name. This last alternative is the one chosen by some transsexuals in order to avoid the complicated procedure to have gender identity recognized. For this, the person has to go through a complicated legal process, and it can only occur with the decision of a court of law.

It is only since 1996 that sex-change operations are possible and occur in Portugal, because the Portuguese Medical Order allowed it to happen. However, no information is available regarding the real number of operations performed in the national territory. The Santa Maria Hospital in Lisbon is the institution that has the major experience with these kinds of operations. Nevertheless, the process to have a sex-change operation is long and implies a severe psychological and psychiatric evaluation to verify whether the candidate is eligible for the process. This difficult process usually takes about two years. Before 1996 and still today, many Portuguese transsexuals went to other countries, like Morocco, or more recently to England, to have their operations done, sometimes under unsafe conditions.

In a study conducted with a sample of approximately 50 transsexual individuals, some of whom were sex workers and others working in various professional areas, the great majority came from rural parts of the country (72%), and many had changed from their birthplace because of their sexual orientation (28%) (Bernardo et al. 1998). This gives us important information regarding the problems that these individuals have to face related to their social adjustment. Besides, most of them do not benefit from social security.

Important problems were identified in risk behaviors and situations. Thus, 30% of these transsexuals knew they were HIV-positive, although only 61% always used a condom. Seventy percent abused alcohol, tranquilizers, or heroin on a regular basis. Fifty-seven percent of this transsexual sample were prostitutes, some having started to work as early as age 11. Eighty-six percent of the transsexual prostitutes were street workers. As this study concluded, “The transgender community in Portugal is an unknown reality, ignored by the public health system. A large majority of its members having a profession that is considered illegal, they do not benefit from any kind of social and medical assistance” (Bernardo et al. 1998).

Besides, transgender persons are not viewed in a positive light by Portuguese society, and so can be ignored, as well as discriminated against. However, as in the case of homosexuality, the traditional Portuguese tolerance is usually prevalent in personal contact with transgendered individuals.

For a couple of years now, several institutions working in the field of HIV prevention and gay rights have organized an annual transvestite gala on the first of December (World AIDS Day) to gather funding for the fight against AIDS. This gala has considerable impact in the media and is also

changing the mainstream idea about the transgendered community. Regardless of that, during Portugal's widely celebrated Carnival holiday, it is common to see men dressed as women without that being considered strange.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

The present Portuguese Legal Code was designed to protect a recent legal accomplishment: sexual self-determination and freedom. Freedom is understood not only as the free use of sex and of the body for sexual purposes, and the individual sexual freedom of option and action, but also as the right of anyone not to endure actions of a sexual nature against one's will. Coercion and public displays that adversely affect a third person or disrespect a person's sexuality are grounds for charging someone with the crime of violating another person's sexual (rights and) liberties.

The behaviors that qualify by law as sexual crimes are:

- A relevant sexual act specified in the penal code;
- Nonconsensual intercourse (coitus);
- Non-consenting artificial procreation;
- White slave traffic;
- Those who profit from adult prostitution
- Child prostitution;
- Exhibitionist actions;
- Pornography (when it involves child corruption); and
- Homosexual actions as specified in the penal code.

Sexual crimes fall under two categories: *Crimes against sexual freedom* and *Crimes against sexual self-determination*. The former involves child sexual abuse (Article 172), adolescent and dependent individual sexual abuse (Article 173), stuprum (Article 174), homosexual actions with minors (Article 175), and prostitution of minors (Article 176). The laws regarding crimes against the sexual self-determination of a child victim distinguish between a minor under age 14 years, a minor between ages 14 and 16 years, and a minor between 16 and 18 years. The penalties for conviction of a crime against self-determination depend of the age of the victim.

Justice statistics show that, during 1995, 306 individuals were convicted for sexual crimes, from a total of 433 victims (62 males and 371 females), of whom 155 were minors under age 14 and 57 between 15 and 19 years of age. However, it is well known that these figures do not correspond entirely to a social reality because of the characteristics of these phenomena: shame, taboo, hidden practices, and the need for medical evidence in order to have a legal process. According to the Legal Medicine Institute, from 1989 to 1993, of the alleged examined victims of sexual abuse, 460 or 76.4% were children or adolescents. From the total of the population studied, 380 or 63.1% did not present evidence of physical sexual abuse during observation. This absence of physical evidence, in part because of the long period of time that passed before medical observation, does not automatically exclude the possibility of abuse. This absence should be reconciled with cognitive, emotional, and affective signs and symptoms (Costa Santos 1998).

[Update 2003: After the most recent revision of the law concerning sexual crimes, the distinction between crimes against sexual freedom and crimes against sexual self-determination endures, but the categories considered underneath each of these two distinctions have slightly changed. The updated list is as follows:

[Crimes against sexual freedom:

- Sexual enforcement (Article 163)
- Violation (Article 164)

- Sexual abuse of person incapable of resistance (Article 165)
- Sexual abuse of person in an institutional setting (Article 166)
- Sexual fraud (Article 167)
- Non-consenting artificial procreation (Article 168)
- White slave traffic (Article 169)
- Taking profit from adult prostitution (Article 170)
- Exhibitionist actions (Article 171)

[Crimes against sexual self-determination:

- Child sexual abuse (Article 172)
- Sexual abuse upon dependent minors (Article 173)
- Sexual actions with adolescents (Article 174)
- Homosexual actions with adolescents (Article 175)
- Taking profit from minors' prostitution and white slave traffic. (*End of update by N. Nodin*)

### Child Sexual Abuse, Incest, and Pedophilia

No generally accepted definition of what constitutes sexual abuse exists in Portugal. In what concerns pedagogic, therapeutic, penal-judicial, and social intervention, several models of intervention coexist and are applied. However, three criteria are commonly accepted on the base definition of sexual abuse: age differences, power differences, and types of behavior. The different intervention models establish as criteria the maximum age of the victim as 15 or 17 years. Above this age, the action is considered rape or sexual harassment. According to Felix López (1991), child sexual abuse can be singly based in age asymmetry. The age difference implies a biological maturity as well as different expectations and experiences. To João Seabra Diniz (1999), a Portuguese priest and psychoanalyst, the age asymmetry is in itself a violation. It is conceived that the child has desire, but the pathology lies in the fact that the adult is taking advantage of that desire. Children do not have the physical, mental, or symbolic experience that allows them to understand the adult's sexuality.

In Portugal, the child's complaint is followed by the need for evidence. This is a long and painful process for the child. The bureaucratic machine involves a hard interinstitutional process in the several areas of intervention.

The studies published in this area are recent and use professionals as the main research population. These studies are not theoretical but practical, analyzing the national situation and characterizing the cases of sexual abuse. In the report *Violence Against Children in Portugal* (Nunes de Almeida et al. undated), the number of maltreated children is analyzed according to the family context. From the 755 cases of family violence, 13.5% or 102 cases involved sexual practices with female children. The more-affected ages are 10 to 14 years, followed by 6 to 9 years and 4 to 5 years.

The General Health Department, in collaboration with the Family and Child Support Project, implemented yet another investigation, according to which, during 1996, each of 384 health professionals from Health Centers identified at least one case of child abuse involving a minor between infancy and age 19). A second questionnaire revealed that close to half of the victims (47%) were between 10 and 14 years of age, and 28% between ages 5 and 9. When the victim was a female, 48% of the cases occurred between 10 and 14 years, and when the victim was a male, the large part of the cases occurred between 5 and 9 years of age. It is important to mention that 17% of these cases involved a mentally or physically disabled child. In 68% of these situations, there was a family tie between the perpetrator and the victim.

The Justice Ministry Studies and Planning Office (GEPMI) reveals that, during 1996, 137 children under 14

years of age and 65 adolescents between 15 and 19 years of age were sexual crime victims. Of 23 individuals tried for minors' sexual abuse, only 15 were convicted. Of a total of 137 children, 44 were rape victims, 58 coercion, abuse, and sexual fraud victims, 5 were human trade and prostitution victims, 17 were sexual abuse victims, and 13 were victims of other crimes against freedom and sexual self-determination. However, the professionals' experience reveals that many more cases exist besides the ones that were exposed. The fact is that there is a serious increase of cases and a larger visibility of the phenomenon.

In 1990, Portugal signed the Children's Rights Convention in New York and approved it to ratification through the Republic's General Assembly Resolution n° 20/90 in June of the same year. Later, in August, the President of the Republic ratified it. According to Article 8 of the Portuguese Constitution, this convention is a part of Portuguese Law and has an imperative character, which means that it can be applied by the courts. However, because of its generality, it is only used as a reference in the interpretation of the Portuguese laws.

In the sexual child abuse area, we draw attention to Article 19°—*Child protection measures are needed against sexual violence in the family performed by those who are close or by the ones that have legal paternal power*. It is also important to reflect on the 34° Article—*The states should take the adequate measures against all forms of sexual exploitation and violence at the national, bilateral and multilateral level, in order to prevent the child from being drawn to perform sexual illicit activities, to be exploited or involved in other illegal sexual practices and exploited in pornography*. In accordance with these international principles, the Portuguese Law establishes in the 69° Article of the Constitution that *children have the right to be protected by the society and by the state, in order to allow their complete development, specially against all forms of abandonment, discrimination, oppression and also against the abusive exercise of authority in the family and other Institutions; The state gives specially attention to orphan children or children that are abandoned or deprived of a typical family environment*. The law establishes that in cases of sexual abuse, the courts can take the necessary and essential measures that are nevertheless unspecified. These measures are often limited to the total or partial inhibition of paternal power, because most cases of sexual abuse take place within the family and are committed by relatives or by people very close to the child.

The Family Court or the Family and Child Court are the entities responsible for putting in action the needed measures in cases of child abuse. Any person with paternal power (meaning a relative) or someone having child custody can request it, as also can the Public Ministry. A special division of this Ministry that works inside the courts, called Minors Curator, defends and promotes child rights, protecting their complete development and rights. The Public Ministry also defends the state's public interest in the protection of people who are vulnerable and incapable of exercising their rights. According to the law, a situation of sexual abuse must be communicated to the Public Ministry, which will take action using the civil-protection structures and penal actions available against the abuser.

[Update 2003: Besides the previously mentioned mechanisms associated with interventions in child abuse situations, there are also special commissions—the Comissões de Protecção de Menores (Commissions for the Protection of Minors) that are nonjudicial official institutions aimed at the prevention or interruption of situations that may negatively affect the physical or moral integrity and welfare of the child or adolescent. These commissions are staffed by a

psychologist, a physician, and by representatives from the local political authorities, from the health, education, and social security services, as well as from the court. Their intervention is dependent upon parental (or parental-figure) consent, except when that is not possible, in which cases the court may have a direct intervention. (End of update by N. Nodin)]

### Sexual Harassment

Sexual harassment is a recent concept in Portugal. For some, it is the result of the changes in the traditional gender roles and of a growing equality between males and females. The fact that women are leaving the house and trying to get a job can be considered as an invasion of the masculine world. Sometimes, the professional dignity of women is the target of abusive behavior.

In Portugal, sexual harassment is all the manifestations of a sexual nature towards someone without that person's consent. The national newspapers and magazines regularly carry stories in which women in particular are victims of sexual discrimination and abuse. This happens mainly in institutions where males are in control. The level of dependency, the threat of unemployment, and the rightful wish to professional accomplishment reveal the exercise of a male power that often works as a barrier to the established equality of rights and opportunities in the professional world. This problem is spreading in a disturbing way, as revealed by the growing number of complaints filed, even though not always ending in legal incriminations. There are no statistics that detail this phenomenon. However, it is calculated that in Portugal, one in three women has already been a victim of this particular type of violence.

It is also common for women to be harassed on the streets by men who consider it as a sign of masculinity. However, this is becoming a rarer behavior, as new values are replacing those associated with the *machismo* culture.

As in the case of sexual abuse, sexual harassment is also based in asymmetries, not only the hierarchical, social, or economic ones, but also on age asymmetries, with the discrepancy being a particular form of power. This is apparent in cases of sexual harassment happening in Portuguese schools. Sometimes girls allow abusive behaviors from teachers in order to get higher grades or simply because they are afraid of retaliation. However, these situations are usually covered by fear and shame, leading to high levels of secrecy. As the Portuguese say: *hidden pussycat with its tail out*.

### [Domestic Violence

[Update 2003: In 2000, a new law concerning domestic violence was approved. According to this law, domestic violence is considered a public crime, which means that a complaint (charge) from the victim is no longer necessary for legal action to be taken. Legal action can now take place after the denunciation by a concerned neighbor or anyone else. (End of update by N. Nodin)]

### Rape

The crime of rape in Portugal is directly related with the exercise of power. Being perpetrated by the consort or by a stranger, it is punished with imprisonment. When it happens within marriage, it can be the cause of divorce or litigious separation. Rape, like sexual abuse, is not a statistically studied situation as it also involves some secrecy. When it happens inside the family, it is sometimes associated with domestic violence. Fear, embarrassment, and the will to forget, all joined up with self-guilt, keep the victim from filing a complaint. However, the crime does exist, and at a governmental level, there are several projects aimed at the facilitation of the denouncement process, including the training of

police officers to deal with rape victims. There is also a concern over the necessity of interinstitutional articulation in the cases of rape and violence among other situations.

New associations, like the Associação Portuguesa de Apoio à Vítima (Portuguese Association of Victim Support, APAV) or the Associação das Mulheres Contra a Violência (Women Against Violence Association) try to act in a coordinated way to provide support and guidance for the victims. This process tries to protect the victim from a double victimization and the consequences of a long process. In 1995, the APAV assisted 1,238 victims; in 1996, this number almost doubled to a total of 2,300. Adding to this number are all the victims who do not search for help. The majority of people who seek help from these associations are women victims of violence and of physical offenses. In Lisbon, most of these women are between 25 and 35 years of age; in Porto, the situation occurs mostly with women between 36 and 45 years of age.

## B. Prostitution

During the 19th century, Lisbon was the capital of an intensive bohemian life. The cultural traditions of this city were characterized by deviant behaviors forbidden by the society. The moral and decency imperatives of a society that lived on public virtues and private habits were exposed by an accepted marginality that went along with popular traditions, such as *fado vadio* (the national song), bullfighting, and a spread of popular language. During this period, the city nightlife had some preferential spaces, particularly the traditional quarters of the Bairro Alto, Alfama, and Mouraria, which were gathering places for devotees of specific socially deviant behaviors. In these quarters, the participants, prostitutes, *fadistas* (*fado* singers), *marialvas* (extravagant, indolent people, usually males), bullfighters, vagabonds, and sailors from all social backgrounds, maintained an open get-together, where all the social distinctions, values, and rules were apparently minimized (Pais 1985). The animation of these times and places is well characterized by popular songs such as this one:

*Correi a ver em cena as putas grulhas, Do Bairro Alto a corja dos pandilhas, Os fadistas pingões e bigorilhas, Que de noite incomodam as patrulhas* (Run to see the whores, in Bairro Alto, the gangs, the drunken *fadistas*, by night disturbing the patrols).

These Lisbon night places are presently neighborhoods with a significant popular traditional history. Bairro Alto and Alfama are still important local references in the traditional and modern Lisbon night. However, the changes in the entire social process that occurred in Lisbon with the turn of the 20th century had its effects on bohemian life and prostitution. The places of prostitution and bohemia survived the beginning of the 20th century, but slowly, everything related to them—words, language, body, and movements—started to have a strong commercial value (Pais 1985).

The Portuguese legal code does not penalize the act of prostitution, but only a third party who profits by it. The prostitute occupies a marginal legal and social status, a sort of no-man's land, which can be more or less accepted. There are no specific data on how many people engage in this practice, but it is a well-known fact that prostitution has increased in recent years. This phenomenon daily involves thousands of individuals—prostitutes (women, men, or children), pimps, and clients. With the spread of services with sexual connotations, such as erotic phone lines and luxury prostitution (also existing in Portugal), we could draw wrong conclusions about this activity. As in the beginning of the 20th century, prostitution is not viewed as an individual act, but as a com-

mercial enterprise that involves three individuals (the prostitute, the pimp, and the client). In some cases, prostitution occurs in environments involving specific social and economic situations, such as:

- Growing up in large families;
- Child labor;
- Abandonment and emotional privation;
- Parental alcohol-abuse problems;
- Familial disintegration;
- Rape; and
- Unemployment.

Prostitution raises issues of human rights, especially when it involves the sexual abuse of minors. The rising number of children in prostitution—boys and girls in their early teens—is the result of a large demand mostly by married men from all social classes, usually in their late 30s. Frequently, these men are still burdened with some taboos towards sexuality, but they find in prostitution a way to break away from tensions existing in their strict and conservative familial structure. On the other side, the demand for prostitution by young people has been diminishing. Before the 1970s, it was a tradition in Portugal for a young man to initiate his sexual life with a prostitute, sometimes with the father guiding that visit. This process marked the social role of the prostitute. Presently, information and counseling services in sexuality, sex education, and the fear of HIV/AIDS, have brought young people to initiate their sexual life earlier than in the past, but now in the context of an emotional involvement. One exception to this new pattern are young men from the interior of the country who enter compulsory military service and are stationed in the major Portuguese cities like Lisbon and Porto. These two cities are Portugal's main centers of prostitution, as well as a strategic entry passage for women and children from African and Latin American countries who become involved in prostitution.

Although the issue has not been studied, it is a fact that Portugal's strategic location between the rest of Europe and the countries of Latin America and western Africa, along with its tourism industry, make it a key element in the international child-prostitution nets. At present, a large number of prostitutes are also drug addicts who find in this activity a way to make money. Addiction and prostitution thus become a vicious circle of slavery. Although many think prostitution is a highly profitable activity, the fact that it is a marginal activity means that all profits are immediately used to pay bills. There are no credit lines.

Several social solidarity organizations are dealing with this problem, working side by side with prostitutes in their own activity places, providing humane and therapeutic assistance, and working for the social reinsertion of the prostitutes through professional and career training. Others provide medical support, information, and assistance. Drop-in centers exist, as well as mobile units that take professionals to places where prostitutes work. The abolition or legalization of prostitution is a hot topic of discussion. Legalization could be a way to provide effective legal, psychological, and medical support for this work group that otherwise cannot access it.

## C. Pornography and Erotica

As in other industrialized countries, pornography has gained an important place in Portugal. One has only to open the advertisement pages of a Portuguese newspaper or magazine to realize the numerous pornographic materials available. Sexuality has become a major, greatly magnified social factor, invading our lives through television, films, and magazines.

Before 1974, any kind of public or private display of pornography was forbidden and severely punished. As a result, the local production of pornographic magazines and videos did not develop in Portugal, so today, Portugal is more an importer than a producer of pornography. In the 1990s, markedly amateur pornographic films became a commercial venture. At the same time, Portugal was increasingly chosen by many foreign filmmakers and magazine owners as a cheap place to produce pornographic material.

The current visibility of pornography has made it the center of a heated debate in Portugal. Despite the fact that the first sex shops opened only a half-a-dozen years ago in Lisbon, pornographic films and magazines have been available for a long time in different kinds of shops (even in supermarkets) or through mail catalogues. There is even a cable network that broadcasts pornographic films three nights a week. While these broadcasts are popular with a considerable number of Portuguese, including teenagers, the older generations strongly oppose this development.

In general, Portuguese men have a more open attitude towards pornography, which they view as a way to improve their sexual life and as a source of diversion and entertainment. Women tend to consider pornography as immoral, and think it can degenerate in pernicious habits, and should thus be forbidden (Pais 1998). Sexual liberation seems stronger among younger age groups and also among people from higher social classes for which pornography is seen as a diversion that can improve the sexual life.

In a society just starting to develop its sex education programs, and still fighting against all kinds of anti-sexual prejudices—cultural, moral, and religious—pornography is still viewed as pernicious because of its contents.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

Contraceptives are widely available at pharmacies, hospitals, and health centers. Since 1985, contraceptive pills, IUDs, and condoms have been freely distributed at the various family planning services available. Condoms are also distributed by institutions involved in the prevention of HIV infection. The emergency contraceptive pill, *depo-provera*, which was not well known until quite recently, became available in late 1999 after some resistance from some public and private sectors of the society. However, unlike the contraceptive pill that can be easily bought in Portugal without a medical prescription, the emergency contraceptive has to be prescribed by a doctor. RU-486 or mifepristone is considered an abortifacient, and is therefore illegal.

The female condom was available in the past, but is not presently, mainly because they were not profitable. Sterilization is also available, and in the *Maternidade Dr. Alfredo da Costa*, one of the oldest and most important women's hospitals in Portugal, it is performed only after a careful evaluation of the request by a team of a gynecologist and a clinical psychologist.

More recent methods of contraception, like hormonal implants or injections, are available, but used only by a minority. The great majority of Portuguese women use the pill. In the youngest age group, 15 to 19 years of age, studied by the 1997 Inquiry on Fertility and the Family (Instituto Nacional de Estatística 1997), the pill was used by 55% of women, while in the following age group, 20 to 39 years, it is the method used by 70% of the women. In any case, the pill is followed in popularity by the condom among women, whereas for men, the condom is the most used method from

adolescence on. A significant proportion of individuals use the IUD. It is the method chosen by 10% of all women, although older women use it more than younger ones.

Among adolescents, where sexual activity is frequently unplanned and occasional, *coitus interruptus* has been used by as many as 37% of all individuals (Pais 1996). In those conditions, most times it is the only method available. Nevertheless, young adults will also use it, as well as the rhythm method, both easily fallible methods used because of the lack of knowledge related to their real efficacy to prevent a pregnancy. The first of these two is reportedly used by 9.5% of all individuals, whereas the second, many times not used in a proper way, is reported by 3.2% in the same age group (Nodin 2000).

The percentage of individuals who have not used contraceptives in their first sexual contact is very high, 65% of women and 73% of men. However, it is clear that in the younger generations, the gap between the first sexual intercourse and the first use of contraception is decreasing, when compared with older generations (Instituto Nacional de Estatística 1997).

### B. Teenage (Unmarried) Pregnancies

Portugal has a severe problem with teenage pregnancies and it has one of the highest rates of adolescent mothers in Europe. This situation is because of several factors, some of which are external and some of which are internal to the adolescent. Among the external factors, one can point to the nonexistence of sex education in schools, the difficulty that many parents have in talking about sexuality, and the lack of resources aimed at youngsters regarding family planning, especially in the rural areas where they are most needed. The internal factors are related to the idea that contraceptives are hard to obtain and to an inhibition related to the discussion of contraceptive use with the sexual partner, among others.

Among today's younger generations, the proportion of women who had their first child before 20 years of age is 3% (Instituto Nacional de Estatística 1997). In the past, this figure was significantly higher, but the social context was also significantly different. In fact, people got married younger, and because of this, many teenage pregnancies occurred within wedlock and thus in a more favorable context for the mother and child.

Almeida (1987) conducted a large research study with teenage mothers in a women's hospital. He found that the civil status of the mother had an important influence both socially and emotionally. Unmarried teenage mothers had more problems with the family and a greater intention to have an abortion. Besides that, they also had important medical complications, such as hypertension, pre-eclampsia and eclampsia, premature babies, and small babies for gestational age. However, when the father of the child was positively interested and not absent from the situation, these problems were alleviated.

Teenage pregnancies are generally not well accepted by the Portuguese family, and there are cases of girls being thrown out of their parent's home when their condition is discovered. For these, the solution is to move in with their boyfriend or with his family, or to resort to one of the existing institutions that shelter single pregnant women and mothers who have no place to go. However, in most cases, the family eventually accepts the pregnancy of the girl and tries to find the resources to receive the newcomer. This usually is done with the help of the grandparents or great-grandparents of the baby. Nevertheless, the pregnancy has a significant impact on the life of the girl, often leading to the abandonment of immediate plans of having a proper education.

Among girls who come from lower social backgrounds, in which one of the main life goals is the constitution of a family, pregnancy during adolescence means gaining status. Maternity, in these spheres, is a way to become socially accepted and recognized as a woman (Vilar & Gaspar 1999). Teenage pregnancy might challenge the traditional sexual morality, but it can also be a way for the girl to get closer to her family, to her baby's father, and most of all to her child. The child becomes, for many, a reason to be.

[*Update 2003*: The frequency of unplanned sexual intercourse, as well as of unwanted pregnancy leads to frequent abortions being used as a "contraceptive" method. This situation is also the result of a true lack of effective family planning programs and sex education. Many of these pregnancies, especially those that happen during adolescence, can be of serious risk to the mother or unborn infant, if not followed up medically. (*End of update by N. Nodin*)]

### C. Abortion

The Portuguese law on abortion was created in 1984 and changed in 1997. Currently, abortion is allowed at different times of gestation, according to the reason behind the decision to interrupt the pregnancy:

- Before 12 weeks, when a serious and lasting effect to the physical or psychological health of the pregnant women is present;
- Before 16 weeks, in the cases in which the pregnancy resulted from a rape; and
- Before 24 weeks, when there are strong indications of serious disease or malformations of the unborn baby.

Several attempts have been made to change the law to make it more extensive, but without any success. The strongest of these attempts occurred in 1998, when a national referendum, the first in the history of the Portuguese democracy, was conducted over the legalization of abortion after 12 weeks by request of the mother. This referendum launched a large-scale public debate over abortion, and several movements were formed for and against this law. Catholic sectors of the Portuguese society, in particular, responded very strongly against any kind of liberalization of abortion. However, participation in the referendum was very weak, below 50%, and the results showed a clear split in public opinion over this subject, with the number of responses against the liberalization only slightly outnumbering those in favor.

The existence of a restrictive law on abortion doesn't mean that women will not resort to it when confronted with an unwanted pregnancy. In fact, a recent national study showed that, for young adults, abortion was the option of 74.3% of women faced with an unwanted pregnancy (Nodin 2000). According to the national statistics, 5% of all Portuguese women have used abortion at least once (Instituto Nacional de Estatística 1997). However, in this area, as in others, the actual number is very likely higher than the reported number. Most times, women will not admit to having resorted to abortion as much as they really have. This is still a subject restricted to the privacy of couples and families and not spoken out loud. The legal penalty for abortion, which can be up to three years in jail for the woman, has been applied only a very few times. More often, the abortion provider has been prosecuted and convicted. But even in these cases, a legal charge or complaint is necessary for the process to begin.

While the number of legal abortions performed in hospitals in 1995 and 1996 were less than 300 annually, it is estimated that an average 20,000 to 22,000 occur every year in illegal situations (Rosendo 1998). These illegal abortions are the frequent cause of serious health problems and subse-

quent hospitalization of the women involved. Some, but not the majority, of the providers of illegal abortions have medical or nursing training. The use of traditional techniques, such as the insertion of objects into the uterus or the ingestion of toxic substances, is not as common as it was in the past, but it still occurs. Many Portuguese women also resort to abortion clinics in Spain, where, curiously, the law is very similar to the Portuguese law, except that there it has had a more liberal application that allowed the opening of abortion clinics. In 1998, 30% of all clients in one Spanish abortion clinic close to the border were Portuguese women.

Abortion is more frequent in women after the age of 20, which is also the average age for the start of the sexual life of the Portuguese. The incidence of abortion increases after age 35, and after age 45 about 70% of all pregnancies end up interrupted (Instituto Nacional de Estatística 1997). Abortion is also more common in women with a low socioeconomic status and education. However, these are also the ones who have more conservative attitudes towards abortion (Vasconcelos 1998).

[*Update 2002*: The issue of illegal abortions made news headlines in January 2002, when Maria do Ceu Ribeiro, a nurse, was sentenced to an eight-and-a-half-year prison term for running an abortion clinic and performing illegal abortions in a town north of the city of Porto in northern Portugal. Her clinic and its services were an open secret in the area. Most of her 42 codefendants, including 17 women charged with having an abortion, were acquitted by a panel of four judges. Six people who provided a referral network, and one woman who admitted to getting an abortion, were ordered to pay a fine or spend three months in prison. The trial produced considerable discussion and debate in this nation of 10 million, which has the strictest laws on abortion of any nation in the European Union outside Ireland. Abortion-rights advocates claim that between 20,000 to 40,000 illegal abortions are performed each year, and some 5,000 Portuguese women show up at hospitals each year with complications from illegal abortions (Lyll 2002). (*End of update by R. T. Francoeur*)]

### D. Population Programs

Unlike other industrialized countries where fertility rates started to decrease at the end of the 19th century, in Portugal this tendency is quite recent. It started in the 1960s, but the decrease was quite significant, and in less than 20 years, between 1970 and 1989, the fertility rate that was one of the highest in Europe dropped from 2.8 to 1.5 children per woman (Bandeira 1994). One reason for this is the changes in the mating and marrying patterns of the population, formerly restricted by social norms, but recently replaced by individuals and couples taking control over their fertility. Women are delaying the birth of their first child, many times in favor of a professional career.

Another significant demographic phenomenon affecting Portuguese society is the aging of the population. Until 1960, the proportion of people 65 years of age or older was a constant 5% to 6%; in 1991, it was 14%, and still growing. Nevertheless, there are significant differences between the rural interior and the urban littoral, the former having more older people than the latter. This situation is mostly related to migratory movements that led a considerable proportion of the rural young population towards the cities and towards other countries, like France, Germany, Switzerland, the USA, Canada, and South Africa, in search of better living conditions (Barreto & Preto 1996).

Bandeira (1994) has interpreted the aging Portuguese demographic situation as decaying and entering a potentially irreversible process. According to this author, serious

actions need to be taken in order to deal with this situation, but not much has, in fact, been done. He also argues that it is the government that should be responsible for a turnover in politics, facing the reality of the situation and supporting the high costs of having and rearing offspring, as well as creating the conditions for the resettling of the population in the interior.

Some of the more recent actions aimed at the promotion of population growth are related to the protection of maternity and paternity. New laws protect women against discrimination at work based on pregnancy, and grant them bigger maternity leaves, to a minimum of 6 weeks and maximum of 100 days. The working mother's right to breastfeed her child for at least a year after birth is also now guaranteed. For the first time in Portuguese legal history, the father now has the right to a work leave of up to 20 days subsequent to the birth of a child, and also has the possibility of absence from work to feed the child in case breastfeeding is not possible. Similar rights have been granted to grandparents when they are the baby's caretakers.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

In Portugal, the sexually transmitted disease surveillance and treatment history goes back to the 19th century with the March 27, 1879, founding of the Consulta de Moléstias Syphiliticas e Venéreas of the Desterro Hospital in Lisbon, under the direction of the prominent Portuguese physician, Thomaz de Melo Breyner. Later, in the second decade of the 20th century, the Lisbon and the Porto Dispensários Centrais de Higiene Social centralized the surveillance of venereal diseases according to Law 14-803 of December 13, 1927.

Since the 1980s and the demise of the free and confidential Central Dispensaries, monitoring STDs has become the responsibility of the Reference Health Services. Two of these services are the Dermatology service of the Curry Cabral Hospital in Lisbon and the Sexually Transmissible Diseases service in the Lapa Health Center, also in Lisbon. Nowadays, in Portugal, notification is compulsory for gonorrhea, syphilis, and the soft ulcer, all of them bacteriogenic STDs.

In 1993, the results, conclusions, and recommendations of a descriptive, cross-section, longitudinal, and retrospective study regarding sexual behavior in Portugal were published. This report, known as *Portuguese Unprotected Sexuality* (Lucas 1993), focused on the adult population, ages 18 to 49, living in cities with 10,000 or more inhabitants in the continental territory. It was supported by the World Health Organization (Social and Behavioral Investigation Unit of the AIDS Global Program) and by the National Commission Against AIDS. It showed that 12% of those surveyed admitted to having had a sexually transmitted disease. The results showed that STDs were more prevalent in the metropolitan areas of Lisbon, Porto, and in the Algarve (in the south of the country), and more common after the age of 25. The incidence of the various STDs was 5% for gonorrhea, 4% for hepatitis, 2% for herpes, and 1% for cases of syphilis and urethritis (Santos Lucas 1993). It is important to note that the data were self-reported and so it can underestimate the reality.

At the end of 1997, the Dermatology service in the Curry Cabral Hospital and the Lapa's Health Center noted the stabilized number in cases of syphilis and the lower incidence of gonorrhea and *Chlamydia trachomatis*. It is, however, important to note that the 1997 data of the STD service in

Intendente, an area of Lisbon traditionally associated with prostitution, draws attention to the fact that only 20% of the prostitutes were not infected with an STD, and the percentage of gonorrhea and chlamydia infections was above 30%.

Regarding the future of STDs in Portugal, Cardoso (1997) pointed out some difficulties related to the surveillance and treatment of these diseases that are responsible for our intermediate position between developed and less developed countries. These difficulties should be overcome by the reorganization of the STD services in Portugal, with real accessibility and confidentiality of the medical services, with free complementary exams for diagnosis and medication, with the epidemiological evaluation (overcoming sub-notification), and also with counseling.

### B. HIV/AIDS

In Portugal, human immunodeficiency virus infections and AIDS have been reported since 1983. The Epidemiological Vigilance Center of the Portuguese Health Institute in Lisbon collects the national data respecting the universal criteria of the Centers for Disease Control in the U.S. The Comissão Nacional de Luta Contra a SIDA (National Commission Against AIDS, or CNLCS.), an organization connected to the Ministry of Health, characterizes the national situation and organizes the national policy, priorities, and strategies in accordance with the United Nations AIDS (UNAIDS) policy.

According to the quarterly and annual information of this Commission, Portugal has had an annual increase of AIDS-related cases since 1983, the first year of notification (Carvalho Teixeira 1993). The official national values do not totally characterize the Portuguese reality, because they do not include untested, undiagnosed, and unreported people.

Since 1985, the year of the first 18 notified cases (and not the time of the primo-infection or first diagnosis), most cases have been related to homosexual and bisexual individuals, the same tendency as in the majority of European countries. This remained the case into the 1990s. Before 1993, the second most affected group were the heterosexuals who were not IV-drug users, as was already the trend in the rest of the Europe. After 1993, the heterosexual transmission of the virus in African emigrants from the Portuguese ex-colonies was overtaken by the greater number of reported cases of HIV/AIDS in IV-drug users (Prista Guerra 1998).

At the end of the first three months of 1999, the national percentages of accumulated cases according to the mode of viral transmission were distributed as follows: 45% homosexual or bisexual, 27% heterosexual, and 12.5% IV-drug abuse related. In 1996 and 1997, IV-drug users represented 53.8% and 61% of the total affected people, respectively (Ministério da Saúde 1997). The rates provided by the Comissão Nacional de Luta Contra a SIDA (1999abc) for the third quarter of 1999 also showed a significant increase in the HIV-infection rate in IV-drug users (46.9% in September, 46.5% in June, and 45.8% at the end of March 1999).

In the period between January 1, 1983, and September 30, 1999, 26.1% of the total number of AIDS-related reported cases was from heterosexual transmission, 19.2% was from homo-/bisexual transmission, and 1% was from vertical transmission (mother to child).

Since the beginning of the AIDS-epidemic situation, Portugal had, as of September 30, 1999, a total of 6,263 reported cases, of which 3,928 had already died because of the disease (86.2% with opportunistic infections, especially tuberculosis). Of the affected individuals, 85.8% were between 20 and 49 years.

Another existing trend in the national data is the increasing incidence of cases in the female population, although affected men still represent the large majority, as in the rest of Europe at the end of the third quarter of 1999, with the proportion 84.2% for men and 15.7% for women.

Even though the majority of Portuguese cases are HIV-1 infections, there is a great impact of HIV-2 infections and of infections with both viruses. Most European countries do not have specific numbers for HIV-2 infections, because it is almost nonexistent in those countries and the rare cases are simply combined with HIV-1 cases. In Portugal, 4.5% of cases are HIV-2 and 1.7% are infections with both viruses. Most of the notified cases until 1999 were concentrated in the capital, Lisbon, in the second major Portuguese city, Porto, in the north, and in Setúbal, approximately 30 km (18.6 mi) south of Lisbon.

Because of the epidemiological surveillance, several centers for HIV testing are available, as well as information sources from nongovernmental organizations (NGOs) and social solidarity institutions, such as Abraço (the Hug Association), Fundação a Comunidade Contra a SIDA (Foundation to the Community Against AIDS), and the Liga Portuguesa Contra a SIDA (Portuguese League Against AIDS), among others (see list at the end of the chapter). Several therapeutic resources are also available in the central and local health institutions.

Finally, it is important to note the national specificity and intervention priorities in the prevention and treatment areas of the HIV infection. In less than two decades, Portugal ranked highest regarding the dissemination and impact of HIV in Europe, and does not yet follow the stabilization trend of central and northern Europe.

Prevention, the most important weapon against AIDS, will be achieved by the reduction of risk behaviors on an individual level, but mostly by decisive investment in serious improvements in socioeconomic conditions, as well as in the educational and cultural arenas, i.e., in reducing risk situations on a community level.

These objectives imply a global Health Education Policy reaching the individuals who are considered the most vulnerable according to the data, such as homosexual and bisexual men, women, young people, children, drug users, prostitutes, people in jail, and ethnic minorities. Aspects of extreme relevance are condom access and their systematic use, with national information and promotion campaigns, free condom distribution, and initiatives created by drug-abuse prevention programs; real access to anti-HIV antibody testing; a generalized respect for informed consent and confidentiality; and the systematization of multidisciplinary structured responses for the affected persons, and particularly the creation of psychological and socioeconomic structures, such as domestic support. All of these are factors that reduce the personal, social, and financial costs of the AIDS phenomenon (Machado Caetano 1997).

[Update 2002: According to the latest data published in late 2002 by the Centro de Vigilância Epidemiológica das Doenças Transmissíveis (Center for the Control of Contagious Diseases, or CVEDT), from July 1 until December 31, 2001, 1,282 cases of HIV infection had been detected (of which 709 were of non-symptomatic individuals, 94 of AIDS Related Complex (ARC) and 479 of AIDS). Of these, 615 were caused by drug use, 517 were caused by heterosexual intercourse, and 104 by homo- or bisexual intercourse.

[During 2001, 2,543 cases of HIV cases were registered by medical doctors (incidence rate of 257.5 per million inhabitants), with 1,045 cases of AIDS (incidence rate of 105.8 per million inhabitants), and 469 of AIDS-related deaths reported. The most common way through which

people were infected was via drug use (1,339 cases), followed by heterosexual intercourse (955 cases), and finally, by homo- or bisexual intercourse (179 cases). There were also six cases of vertical transmission and one case of AIDS in a child.

[The main tendency of HIV infection in Portugal is that of a growing number of infections because of intravenous drug use, and a diminishing number of infections because of heterosexual intercourse. The exception to these numbers is that of the infections by the HIV-2. Of the total group of seropositives (76.6% of which are between 20 and 39 years old), 54.6% belong to the “drug addicted” category of infection and 30.2% to the “heterosexual” group. Something similar happened to the total group of people with ARC, that is, 45% of these belonged to the first category of infection and 29.7% to the second.

[Until the end of 2001, there were 8,710 deaths related with AIDS, of which 342 were associated with the HIV-2 infection and 126 associated with the combination of HIV-1 and HIV-2 infection.

[The prevalence of HIV infection is higher in major urban centers like Lisbon, Oporto, Setúbal (because of the region’s low economic situation and elevated number of drug users), and Faro (because of it being a high tourist region). Taken altogether, these urban centers have an average of 200 cases for each 100,000 inhabitants. Besides the cities, other areas of high incidence are those close to the border with Spain.

[According to UNAIDS, the estimate of HIV infections in Portugal is between 30,000 and 50,000 persons. Because of this fact, one of the designated areas of priority intervention for the CNLCS (Comissão Nacional de Luta Contra a SIDA—National Commission Against AIDS) is identification of the epidemiological character of the HIV infection, in particular, for small but vulnerable groups such as pregnant women, people in prison, young school-age people, drug users, sex workers, ethnic minorities, and mobile populations, in order to implement adequate actions of information and education. (*End of update by N. Nodin*)

[Update 2002: UNAIDS Epidemiological Assessment: The HIV/AIDS Surveillance System in Portugal started in 1985 and some cases were identified retrospectively. At the beginning of the epidemic, notifications were predominantly of AIDS cases, but gradually clinicians reported cases in all stages of disease progression.

[Portugal has both HIV-1 and HIV-2 circulating in the general population, and notified AIDS cases attributed to HIV-1 are 94.6% and cases attributed to HIV-2 are 3.9% of the total; dually infected AIDS cases (1.4%) have been reported.

[The overall incidence of AIDS and the annual number of reported deaths rose steadily until 2000. The HIV/AIDS epidemic shows a mixed pattern, with the proportion of AIDS cases decreasing in injecting drug user cases and with a noticeable increase in cases attributed to heterosexual contact. Trend analysis of surveillance data reflects the diversity of the HIV/AIDS situation in the country, but young adults are most affected.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	26,000 (rate: 0.5%)
Women ages 15-49:	5,100
Children ages 0-15:	350

[An estimated 1,000 adults and children died of AIDS during 2001.

[No estimate is available for the number of Portuguese children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (*End of update by the Editors*)

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

The diagnosis of sexual dysfunctions is usually done according to the existing specialty international disorders classification systems, such as the *DSM* and the *ICD*. However, despite the fact that several sexuality surveys have been conducted in the Portuguese population, questions about dysfunctions are usually left out of them. This reflects the secretive way that the Portuguese deal with these difficulties. Sexuality is a difficult subject to discuss of its own right, and all the problems affecting it are even more. The most frequent strategy used to deal with sexual difficulties is silence. It is only with some difficulty that someone will talk to a physician about a premature ejaculation problem or vaginismus, and when they do, it is usually with a professional that they trust. However, it is estimated that a large number of sexual dysfunctions go unreported.

There is a significant gender difference in the experience of these problems. For men, for whom sex is yet a means to prove their masculinity and virility, sexual problems are a major concern, especially impotence. Men make a great investment in their sexual performance and abilities, and when something goes contrary to expectations, catastrophic scenarios are built and self-esteem is severely affected. As for women, in the past they were supposed to serve their husbands sexually disregarding their own sexual pleasure. This way, many times there was not even the awareness of the existence of a sexual dysfunction when orgasm was not experienced. Today, women are more aware of their own sexuality and are able to seek help when they feel they need it, even though they are not as likely as men to seek help. In the *Alferes* 1997 survey of sexually experienced individuals, 100% of men had experienced orgasm, but only 88.5% of women had. In the portion of people who had not had sexual relations, all of the males had experienced orgasm, while only 35.5% of women had experienced it.

The sexological tradition in Portugal is strongly connected to a cognitive and behavioral perspective of sexuality. Nevertheless, nowadays, the different institutions working in this field have a broader approach to sexuality. The echoes of the International Conference for Population and Development held in Cairo in 1994, in which major emphasis was given to sexual and reproductive health, are having its effects at different levels. A greater concern is being devoted to the special sexual and reproductive needs of individuals in a holistic approach to the problems they face. To accomplish these goals, true efforts are being made especially by nongovernmental institutions (NGOs).

### B. Availability of Diagnosis and Treatment

Diagnosis and treatment of sexual dysfunctions are available in hospitals in the main urban centers. The cities where specialty sexology services can be found are: Porto, Coimbra, Leiria, Lisbon, Faro, and Ponta Delgada (in the Azores). Many private practitioners, either medical doctors or psychologists, offer their services in other parts of the country. However, not all the people can afford to go to these consultations, nor do they frequently know of their existence. In 1998, the Portuguese Society of Clinical Sexology (*Sociedade Portuguesa de Sexologia Clínica, SPSC*), together with a pharmacological company, created a telephone helpline called *SOS Dificuldades Sexuais* (*SOS Sexual Difficulties*) aimed at an adult public with sexual dysfunctions. The main goal of this helpline is to provide counseling for people with sexual problems, and also to work as a guiding

service to indicate which services, both public and private, are available for these kinds of problems.

### C. Therapist Training and Certification

Until the 1990s, no specific sexological training was available in Portugal. There was a hospital tradition that provided practical and also theoretical training for psychiatrists, gynecologists, and professionals from other medical specialties that had an interest in sexuality. Others had their training abroad in countries where this kind of training was available. Many of the great names of sexology in Portugal today, like António Pacheco Palha, Francisco Allen Gomes, José Pacheco, Júlio Machado Vaz, or Júlio Silveira Nunes, had their training as part of their specialty training or abroad.

In 1984, following the first Portuguese Congress of Sexology, a commission was formed to create a Society of Sexology, which the following year had a total of 116 members. One of the main and primary goals of this society was to promote and regulate the scientific training in sexology in Portugal. In 1992, the society began seriously exploring the legal, practical, and pedagogical aspects of organizing a postgraduate course that would grant a certified title of sexologist.

The first postgraduate course in sexology was a two-year program started in 1995 with a group of 14 medical doctors, psychologists, and nurses; a second course started in 1998. This course, organized by the SPSC, is actually the only one that grants a certificate for Sexual Therapist in Portugal. This course is interdisciplinary and aimed at professionals with some experience in the area. It has a duration of two years divided into four semesters: The first semester is solely theoretical, the following two are theoretical and practical with the discussion of clinical material provided by the students and teachers, and the last semester is devoted to the elaboration and execution of a research project.

## 12. Sex Research and Advanced Professional Education

### A. Institutes and Programs for Sexological Research

As in other behavioral areas, there is little sexological research. The tradition of research is incipient and lacks appropriate articulation between universities and companies that would provide financing and practical application of the results of the research. The few research studies that exist within Portuguese sexology occur mainly in universities, usually associated with psychology, medicine, and sociology, and also in the hospitals and centers that offer specialty services in human sexuality.

### B. Post-College and Graduate Programs in Sexology

There is no graduate level course on human sexuality. There are some initial efforts in short-duration advanced courses on the subject, but they are infrequent and irregular. There are, however, two postgraduate courses on human sexuality in the country, one of them a master's degree course.

The first postgraduate course in human sexuality ever to occur in Portugal was organized by the SPSC in 1995 (see Section 12C, Therapist Training and Certification, above). In the meanwhile, a private university, *Universidade Lusófona*, organized a master's degree course in sexology that started in 1998. Many of the teachers of this course are connected to the SPSC and are, thus, the same as the ones in the postgraduate course provided by that society. The master's degree is, however, mostly theoretical and does not grant the title of sexual therapist as the postgraduate course does. The theoretical areas discussed in the master's degree are:

- The historical, social, cultural, and anthropological aspects of sexuality;
- The human sexual response;
- Gender identity and its disturbances;
- AIDS and other sexual transmitted diseases;
- Research methods in sexology;
- Diagnosis and evaluation of the disturbances of the human sexual response;
- Treatment of the disturbances of the human sexual response;
- Minority sexual and erotic preferences;
- Couple therapy;
- Sex education and family planning; and
- Data analysis techniques in sexology.

Although these courses have played an important role in extending the offering of sexological training programs in Portugal, professionals from different areas recognize the need for a more appropriate approach to sexual problems. Many have to deal with these kinds of problems and have no appropriate training to handle them.

### C. Main Sexological Journals and Periodicals

*Acta Portuguesa de Sexologia*, Hospital de São João, 4200-319 Porto, Portugal; Tel./Fax: +351-225-508-384; email: [psiquiatria.fmp@mail.telepac.pt](mailto:psiquiatria.fmp@mail.telepac.pt).

*Sexualidade e Planeamento Familiar*, Rua da Artilharia Um, 38, 2º Dto., 1250-040 Lisboa, Portugal; Tel: +351-213-853-993; Fax: +351-213-887-379; email: [apfportugal@mail.telepac.pt](mailto:apfportugal@mail.telepac.pt).

There are also some periodicals related to AIDS worthy of note:

*Abraco*, Tr. do Noronha, 5, 3º Direito, 1250-169 Lisboa, Portugal; Tel: +351-213-974-298; Fax: +351-213-957-921.

*Informação SIDA*, Apartado 1980, 1058-001 Lisboa, Portugal; Tel: +351-213-129-290; Fax: +351-213-129-299.

### D. Important National and Regional Sexological Organizations

Sociedade Portuguesa de Sexologia Clínica, Serviço de Psiquiatria, Hospital de São João, 4200-319 Porto, Portugal; Tel./Fax: +351-225-508-384; email: [psiquiatria.fmp@mail.telepac.pt](mailto:psiquiatria.fmp@mail.telepac.pt).

Associação para o Planeamento da Família, Rua da Artilharia Um, 38, 2º Direito, 1250-040 Lisboa, Portugal (with branches in Porto, Coimbra, Lisbon, Alentejo, Algarve, and Azores); Tel: +351-213-853-993; Fax: +351-213-887-379; <http://www.apf.pt>; email: [apfportugal@mail.telepac.pt](mailto:apfportugal@mail.telepac.pt).

### *Demographics and a Brief Historical Perspective*

#### A. Demographics

ROBERT T. FRANCOEUR\*\*

Puerto Rico is the easternmost island of the West Indies archipelago known as the Greater Antilles. Cuba, Hispan-

iola (Haiti and the Dominican Republic), and Jamaica are larger islands in this group. Puerto Rico is a commonwealth of the United States. It is bordered by the Atlantic Ocean on the north and the Caribbean Sea in the south. Puerto Rico has a landmass of 3,515 square miles (9,104 km<sup>2</sup>), and is slightly smaller than the state of Rhode Island in the U.S. The climate is tropical marine and mild with little seasonal temperature variation. Three quarters of the island's land surface is mountainous, and the coastal plain belt has been used for urban development and contains most of the metropolitan area. Most of the municipalities and small towns are located in the mountainous area.

In July 2002, the island of Puerto Rico had an estimated population approaching 3,816,901 persons, based on data provided by the State Planification Board. An additional estimated 2.7 million Puerto Ricans [or Puertorricans] live in the United States mainland, mainly in the New York and northern New Jersey metropolitan area, where they are known as *NYRicans* [also *Nuyoricans/Newyoricans*] or *Jerseyricans*. There are Puerto Ricans throughout all the states, including Hawaii, where a large group was established between the 1940s and 1950s. Major migration to the New York area occurred in the 1950s and 1960s because the people were looking for better occupational opportunities. Since the mid-1970s, there has been a reverse migration back to the island. The present report will combine insights on the sexual behavior and beliefs of people living in the island commonwealth and in the New York/ New Jersey metropolitan area. Puerto Ricans on the island maintain constant contact with relatives in the eastern U.S. cities where the HIV infection rate is high (Robles et al. 1990). The so-called yo-yo migration between the island and the mainland is a significant factor in the incidence and prevalence of the AIDS (SIDA) epidemic in Puerto Rico (Castro-Alvarez & Ramirez de Arellano 1991). (Unless otherwise noted, all data in this section are July 2002 estimates from *The World Factbook 2002*, CIA).

**Age Distribution and Sex Ratios:** 0-14 years: 23.5% with 1.05 male(s) per female (sex ratio); 15-64 years: 65.8% with 0.92 male(s) per female; 65 years and over: 10.7% with 0.74 male(s) per female; *Total population sex ratio:* 0.93 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 75.96 years; *male:* 71.5 years; *female:* 80.66 years

**Urban/Rural Distribution:** 67% to 33%

**Ethnic Distribution:** Hispanic, Puertorican

**Religious Distribution:** Roman Catholic: 85%; Protestant and other: 15%. Many Puertoricans maintain a strong religious affiliation to Santería or voodoo, a mixture of Roman Catholic beliefs and practices with West African native religions.

**Birth Rate:** 15.5 births per 1,000 population

**Death Rate:** 7.6 per 1,000 population

**Infant Mortality Rate:** 9.9 deaths per 1,000 live births

**Net Migration Rate:** -2.12 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.9 children born per woman

**Population Growth Rate:** 0.51%

**HIV/AIDS** (on the island): *People living with AIDS:* 10,301; pediatric: 174; adult and adolescents: 10,127 (Puerto Rico Surveillance Report, December 31, 2002). (For additional statistics on HIV/AIDS on the island and in the New York metropolitan area, see Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 89% (1980 est.); 8.2% of the gross national product is devoted to education.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$11,200 (2001 est.); *Inflation:* 5.7%; *Unemployment:* 9.5%; *Living below the poverty line:* NA

## B. A Brief Historical Perspective CARMEN RIOS

Christopher Columbus and his crew were the first Europeans to discover the island of Puerto Rico. Arriving in November of 1493, during their second voyage to the New World, they found the island populated by about 60,000 Arawak natives, peaceful people thriving on their fishing and agricultural skills. In 1508, Spanish colonists arrived and the Arawak natives were either decimated by diseases brought from Europe by the colonists or quickly killed off by the colonists.

The Spanish newcomers originally named the island San Juan Bautista in honor of St. John the Baptist, and named the capital Puerto Rico, which means rich port. Later, the names were switched, making the capital San Juan and the island Puerto Rico. Puerto Rico also includes four other smaller islands (Vieques, Culebra, Mona, y Caja de Muerto). The city was later used as a transshipment port for gold being mined in Puerto Rico and gold and silver from South America being stored in the city for shipment on to Spain.

Concerned about threats from European enemies, Spain began constructing massive defenses around the city of San Juan in 1521. The strengthening of El Morro, San Cristóbal, San Gerónimo, and El Cañuelo forts, as well as the city walls, were the stronghold elements of these successful defenses. Sugar cane was introduced to the island in 1515 and became Puerto Rico's most important agricultural product, helping establish a thriving economy. African slaves were imported in 1518 to handle the cane harvest. Puerto Rico's gold mines were exhausted by the late 1500s. During the 1600s, Puerto Rico's settlements expanded with the establishment of such areas as Arecibo, San Blas de Illescas (later renamed Coamo), and Ponce. The 1700s brought hurricanes, droughts, plagues, and a constant threat of attack on the island's shores, because the British, Dutch, and

French were intent on capturing Spain's possessions in the New World. By 1776, the official census reported the population had grown to 70,210 people.

In 1809, Puerto Rico was recognized as an overseas province of Spain with the right to send representatives to the Spanish government. Political unrest characterized this era and, in 1868, a small group of landowners in Lares rose up in arms against Spain. The uprising was quickly put down, and is now commemorated as "El Grito de Lares." In 1897, Puerto Rico was granted a Letter of Autonomy from Spain, allowing it to enter into free commerce with the United States and European colonies. In 1898, following the Spanish-American War, Puerto Rico became a territory of the United States. Legend has it that in 1898, just before the last Spanish governor of Puerto Rico surrendered to the U.S. troops at the end of the Spanish-American War, he took a last look at La Fortaleza (the executive mansion) grandfather clock and hit it dramatically with his sword, thus stopping it at the exact moment the Spanish lost power over Puerto Rico.

The 20th century saw phenomenal growth for the island. In 1917, the U.S. Congress granted Puertoricans U.S. citizenship. Two decades later, U.S. President Franklin D. Roosevelt launched the Puerto Rican Reconstruction Administration, which provided agricultural development, public works, and electrification of the island. By 1951, Puerto Rico acquired the right to establish a government with its own constitution and, in 1952, was declared a semi-autonomous commonwealth territory of the United States. The island then entered two decades of unprecedented economic development as it heavily promoted and attracted manufacturing plants primarily from the U.S. mainland. By the 1960s, the development was being referred to around the world as the "Puerto Rico Miracle," as other developing economies looked to the island as an example of industrialization. The 1970 census showed Puerto Rico was mostly urban for the first time in its history.

During the last quarter of the 1900s, as Puerto Rico's economy diversified into commerce and services, the island's status once again dominated its politics. The Pro-Commonwealth Consensus that had ruled since 1952 broke down. Supporters of commonwealth and statehood are now at rough parity, with independence holding a 5% share of electoral support. Status plebiscites in 1993 and 1998 were inconclusive, and both the public and political leadership remain deeply divided. This dispute has not hindered the island from growing, however, because life in Puerto Rico largely resembles most U.S. mainland states in business, education, commerce, dining, day-to-day activities, and more.

The role of the women as political leaders is marked at the second half of the 20th century. San Juan, the capital of Puerto Rico, has the first mayor woman, Doña Felisa Gautier Benítez. Puerto Rico's first woman governor, Doña Sila María Calderón, was elected in 2000. Today, a large number of women have entered politics as a career. Mayors, senators, and representatives are changing from an almost exclusively men's area to gender equality.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

In describing the sexological premises commonly ascribed to by Puertoricans, it should be noted at the onset that differences still exist within the society where the population tends to agree with the more traditional values. Puertorican culture, like other Latino societies, stresses a very strong gender difference from birth on that is reflected in every aspect of sexual expression and male-female interaction. The predominant value of *machismo* sees males as superior and

females as sexual objects whose aims are to fulfill men's desires and needs (Burgos & Diaz-Perez 1985). Outside the Latino cultures, the terms *macho* and *machismo* carry a common pejorative implication of a chauvinistic, tyrannical male domination. However, in Spanish, the terms refer to male pride. *Machismo* has been defined as the set of attitudes and beliefs that sees males as physically, intellectually, culturally, and sexually superior to females (Pico 1989). Puerto Rican boys are indoctrinated in the importance of being *macho* from a very early age. New realities have emerged in the last 15 years. Formal sex education programs contribute to and increase the trends toward the quality of life for both men and women. In the professional population, the trend is that a larger group of women are elected, designated, and occupy positions at the same level and over men.

One way the male child is socialized and reminded of his maleness in the rural cultures of Puerto Rico and the Dominican Republic is by his parents and other adults admiring and fondling the baby's penis. Little boys are valued for being male from the moment they are born into the family. Even if there are older sisters, the male sibling is the dominant figure, both in the eyes of the parents and in sibling interactions. Mothers train their daughters early on to play "little women" to their fathers, brothers, and husbands, while they train their sons to be dominant and independent in relationships with their wives as well as other women (Medina 1987). Education within the family supports and maintains traditional male and female roles, but at the school level, the equality is evident between males and females. Also, throughout the educational system, the number of female teachers is higher than for male teachers.

Research about *machismo* carried out before 1975 demonstrated that males were having sex with as many females as possible. By emphasizing their capacity as procreator and their willingness to have as many children as possible, preferably males, Puerto Rican males demonstrated their *machismo* (Mejias-Picart 1975). There was practically no societal control over male sexual behavior. Meanwhile, female sexuality was openly repressed. It was expected that the males assume the active role, initiate sexual activity, and be responsible for the satisfaction of the female. This aspect of the sexuality has evolved in recent years. Females have become more active and assertive. One detail that demonstrates this trend is the attitude toward the protection from STD and condom use. Sex education in Puerto Rico promotes equal responsibility between males and females.

The female equivalent of *machismo* is *etiqueta*, a complex value system that requires Latinas to be both feminine and pure and, at the same time, very sensual and seductive. Little girls are taught to hide their genitals and not to focus much attention on their vagina. Yet girls are valued for and taught to enhance their sexual appeal. From birth on, girls are adorned with earrings, bracelets, and special spiritual amulets. Their very feminine dress makes Latina girls extremely seductive and even provocative. However, a woman's virginity is highly valued, and families are careful to protect the virginity of their daughters.

When Puerto Rico was dominated by the Catholic Church, girls were constantly reminded of their inferiority and weakness, since a vital aspect of *etiqueta* is the concept of *marianismo*, the model of the obedient and docile female. Maria is by far the most popular female name. It was common that several daughters in the same family have the first name Maria and a different second given name, a reminder that all women should model themselves on the Virgin Mary, the mother of Jesus. Women were expected to sacrifice their own needs for the sake of their children and husband (Comas-Diaz 1985). Under an incorrect interpre-

tation of Church rules, men expected their wife not to enjoy sex or to seek it—she was there simply and solely to please her husband. Females were expected to be passive, ready to respond to the male requirements, and not to assume responsibility for their own pleasure. A good woman was always ready for her man, but she should never be comfortable with sexual issues or with sexual intercourse. To do otherwise suggests a lack of feminine virtue. In a recent survey, almost 80% of the husbands surveyed were found to initiate sexual activities almost all of the time, while 90% of household chores (cooking and cleaning) were carried out by the wives (Vazquez 1986). All of these expectations and values are part of the history of sexual repression of Puerto Rican women. Today an increasing number of people in Puerto Rico accept that women are more than a sexual artifact. The sex educator promotes and claims that the women must enjoy sexual activities and Puerto Ricans must change this negative aspect of their sexual attitudes.

The Church promotes a strong pronatalist value in Puerto Rico. However, small families with one-to-three children are preferred. The surveillance statistics in Puerto Rico for girls who have a child outside marriage is 19.2%, alongside of which we have a common sexual education in pregnancy. Abortion in Puerto Rico is legal. There are some female healthcare clinics that provide counseling about choices. The clinics offer the opportunities for pregnant women to get into an adoption program if they so choose. Abortion is common among married women and among religious people. The pronatalist value is supported by the anticontraception and antiabortion position of the Catholic Church. Nevertheless, both contraception and abortion are commonly used by Puerto Ricans.

The Civil Rights Commission in 1973 concluded that discrimination against women outside and inside the home existed and subtle discriminatory practices occurred. In 1984, a study done by the Puerto Rican Senate found that the same pattern of discrimination continued to exist ten years later. Although there have been some changes in the recent past, oppression, control of women, male power, and heterosexuality continue as the dominant parameters of the Puerto Rican society (Zorrilla et al. 1993). The controversies about abortion, marriage, contraceptive devices and treatments, homosexuality, and sexual education, are ongoing.

Women themselves are in part responsible for the preservation of this situation, since they continue to accept the sole responsibility for childrearing, and play an essentially domestic role. However, this situation is changing, and the men are becoming more responsible in participating in childcare. There are laws that make women and men responsible to provide resources for childcare even if they do not live with the other parent. But this form of sexism is also "imprinted" in children who are socialized to accept the stereotypic roles from early childhood, where the main role of the female is to be mother, in spite of also working outside the home. Dependency, obedience, and submission are reinforced in daughters, while independence, aggression, and lack of emotion are reinforced in males (Burgos & Diaz-Perez 1985; Mock 1984). Females are socialized to be submissive, passive, attractive, compliant, obedient, and dependent, and they are expected to behave this way in their sexual interactions (Santos-Ortiz 1990). The fight against these stereotypes occurs continually on the professional level. Many psychologists, physicians, religious teachers, and a large group of professionals work in favor the elimination of the sexual stereotypes and look for the compliance of responsibility associated with the position of their job.

During the school years, gender roles are reinforced by a biased curriculum. A study on the illustrations and content of

social sciences texts used in primary schools (Pico 1989) found that men were portrayed as relevant and superior, while females were relegated to a secondary role, and when depicted appeared in more-traditional stereotypical roles. Men and boys appeared more frequently than girls and women, in spite of the fact that females constitute over half of the population. Women appeared mostly working in their home or engaged in passive activities, such as reading, praying, and playing with dolls, and were rarely depicted outside of the home. This is epitomized by a page in a text under the title, "What I most enjoy doing." There are pictures of sliding, swimming, bicycle riding, skating, and other activities—all of them performed by boys; not a single girl appears in those activities. Although this research was done in the early 1980s, there is no reason to think that the pervasiveness of the gender stereotypes has changed at all. At the same time, in 1992, the State Department of Education established a program to train its personnel and to develop gender-equal curricula for sexual education in schools (Mock 1992).

Fortunately, today, education professionals exist who can manage the information and teach about the qualities of male and female. The Puerto Rican sex educators, counselors, and therapist associations, and nonprofit organizations, prepare and offer training to a large group of teachers about sex education. A group of teachers have been certified as sex educators and, under the concept "train the trainer," they are offering training to their peers. The State Education Department is requesting that all teachers get into the continuing education program to satisfy and increase their knowledge according to their needs as educators. For the last 15 years, the University of Puerto Rico at Cayey has been offering a University Sexual Education Symposium focusing on teachers and health professionals. The symposium provides the newest information about sex education trends and treatments for sexually related conditions. This training and education is offered free to the community in Puerto Rico and the United States.

## B. Sociolegal Status of Males and Females

The number of common-law partnerships has increased consistently during the last few decades, in spite of the fact that they are not recognized and consequently do not have any of the entitlements of legally married couples. Children, however, are recognized as legitimate offspring of the parents and have the right to be supported by them until they are 21 years old. Legal custody of children is almost always awarded to the mother, but legal responsibility is shared. No matter who has the child custody, the other parent has to provide economic support.

## C. General Concepts of Sexuality and Love

The basic values of *machismo*, *marianismo*, and *etiqueta* are evident in various sexual behaviors. In a 1985 survey, 60% of working-class women and 50% of professional women reported faking orgasm in order to end intercourse soon or to avoid the husband's questioning about their achieving orgasm. The great majority of women surveyed did not disapprove of self-pleasuring, and very few women engage in autoeroticism, or admit to this in surveys (Burgos & Diaz-Perez 1985). Things have been changing. It is now common that women and men buy sex toys, films, and publications to improve their sexual lives and autoerotisms. The number of stores that offer this kind of merchandise is increasing rapidly. One of the stores, Condom World®, has expanded to 20 stores in the past decade on the island.

Latino men still often express their discomfort with sex in ridicule and rejection of anything that hints of homosexuality. Even in the Latino culture of Brazil, where boys are

encouraged to explore everything sexual, all men—even those who in the United States would be considered bisexual or homosexual—see themselves as *homens*, men in the sense of always taking the active phallic sexual role (Medina 1987; Parker 1987). Attitudes toward homosexuality are changing. The homosexuals are leaving the closeted life and gaining their place in Puerto Rican society. Like other Puerto Ricans, they pay taxes, have a job, and form families headed by a same-sex couple. There are cases in which homosexual couples have adopted a child legally. The State Department of Family is against adoption by homosexual families. The court, however, has been hearing cases under state law applied or created for heterosexual couple relationships. Today, there are homosexuals in all organizations, agencies, public and private institutions, professional roles, and in the churches.

As more women enter the workforce and pursue an education, the traditional maternity role has changed and continues to change. This is evidenced by the large number of Puerto Rican women who postpone marriage and childbearing until their late 30s. As mentioned before, out-of-wedlock partnerships have increased in popularity, especially among white-collar workers and educated Puerto Ricans.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A/B. Source and Character of Religious and Ethnic Values

The early pre-colonial inhabitants of Puerto Rico migrated either from Florida in the north or from the Orinoco River delta in Columbia, South America. When the Spaniards arrived in 1493, the island was inhabited by the peaceful Arawaks who were being threatened by the neighboring Carib Indians. The island was finally invaded and conquered for Spain in 1509 by Juan Ponce de Leon.

Introduction of sugar cane cultivation in 1515 was quickly followed by the importation of African slaves to work the cane fields. Although slavery was finally abolished in 1873, the impact of the forced African immigration can still be felt today in Puerto Rican society. Indigenous, Spanish, and African elements permeate Puerto Rican culture even today, with the Spanish influence dominant, since they occupied and controlled the island for nearly 400 years, until 1898.

It appears that in the island pre-Colombian societies, women had more power and were highly respected. Pre-Colombian women are also believed to have had an active sexual life. Men, especially those in the upper classes, were allowed to be polygynous.

Later on, the Spaniards introduced their patriarchal society with its values of *machismo*, *marianismo*, *etiqueta* (emphasizing female virginity), and a pronatalist familism. The popular traditions and doctrines of Catholicism introduced by the Spanish have played a major role in the shaping of the society's sexual values and attitudes. However, this influence, as will be seen, is more formal than real when it comes to some private decisions. Even though 80% of Puerto Ricans today identify themselves as Catholic, most are not highly active in the Church (Burgos & Diaz-Perez 1985).

Although the culture seems sexually repressive, in reality Puerto Rican society is quite erotic and exalts sexuality in pervasive and subtle ways. Sexual themes permeate Puerto Rican popular music and dance (salsa), radio and television communication, as well as nonverbal communications. Perhaps because of this, research about sexuality is uncommon in Puerto Rico, and there are very few written articles about sexuality. Consequently, very little is

known about sexual behavior and attitudes of Puerto Ricans (Burgos & Diaz-Perez 1985; Cunningham 1991). (See parallel discussion of *machismo* and Cuban values in the chapter on Cuba).

The reproductive function of sexuality is seen as its natural goal, while its pleasurable aspects are viewed as a necessary incentive for accomplishment of this goal. All other sexual behaviors apart from penile-vaginal intercourse are generally seen as immature and undesirable (Mock 1984). At the same time, for most Puerto Ricans all versions of sexuality and sex are acceptable inside the marriage, with the sole provision that they be mutually accepted by the couple. Nevertheless, sexuality is commercialized and widely available in both pornography and prostitution (Mock 1984). Pornography and prostitution are against the law in Puerto Rico. Recently, the prostitution houses were closed by governmental order, but prostitution still exists.

As stated before, although the influence of the Catholic Church is felt in all aspects of sexuality, studies indicate that Catholics have as many abortions as non-Catholics (Ortiz & Vazquez-Nuttall 1987), and that religious affiliation has no bearing on the use of contraceptive methods, including sterilization and the pill (Herold et al. 1989).

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

As a result of *marianismo*, the Church's opposition, and the reluctance of society and families to acknowledge female sexuality openly, many girls experience their menarche with no formal education about it. And although males are expected to have their first sexual experience before marriage, they do not receive any formal sex education either. Obviously, neither females nor males have any knowledge about the health implications of various sexual practices (Burgos & Diaz-Perez 1985).

There are no systems or districtwide sexuality education programs such as exist in most, if not all, the mainland States. A program to train sexuality education teachers has been proposed and was being developed in 1994. As in other places where formal programs have not been developed, individual teachers may take the initiative into their own hands and incorporate various aspects of sexuality education into their standard courses, such as biology and health.

#### B. Informal Sources of Sexual Knowledge

The media also plays a role in perpetuating sexist stereotypes and prejudices against women. A study found that articles in the popular media usually portrayed women as submissive, and presented acts of violence against women as normal (Maldonado 1990).

The same kind of sexual information portrayed in movies, television, and radio in the mainland United States is also available in the commonwealth island of Puerto Rico. The ready access to cable television and videotapes has permitted islanders to be exposed to the same kind of information that is available to individuals living on the mainland.

[Update 1999: In September 1999, concerned about the rising rates of pregnancy, AIDS, and chlamydia among adolescents aged 13 to 29 years, Puerto Rico's governor proposed a bill that would "give adolescents access to sex education and treatment for reproductive health, including contraceptive methods, without the knowledge or consent of their parents." The bill would require the health and education departments to offer STD treatment, reproductive health services, counseling, prenatal care, and birth control. The bill provoked a storm of protest from conservatives. Leaders in

the Legislature predicted the bill would go nowhere, but the Health Secretary and Education Secretary vowed a fight in the Capitol to push the bill through. In the end, it was rejected, and the community programs have picked up the requested services. (End of update by Carmen Rios)]

### 4. Autoerotic Behaviors and Patterns

When asked about self-pleasuring in a 1985 survey, a great majority of women did not disapprove of it. However, they reported not practicing it themselves. A survey of 191 adolescents found that 32% (61) of them engaged in self-pleasuring, 53 of them males and only 8 of them females (Burgos & Diaz-Perez 1985). But, self-pleasure has been promoted as a practice to prevent HIV infection, either alone or within the couple relationship. The discovery of erogenous areas in each person's body as a sexual therapeutic technique is recommended to increase the couple's sexual relationship. A common cause of divorce exists when couples do not understand their bodies and do not recognize that there are other sexual behaviors besides vaginal intercourse that promote a healthy couple relationship.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children

Childhood sexual rehearsal play and sexual exploration no doubt occur in private as they do in many other cultures, but there are no statistics or information on their incidence or extent. There is some indirect information about sex education and activities for and in childhood. Some teachers are including sex education concepts in the classroom, because the knowledge about sexuality is available on TV, Internet, radio, and, in general, in the media. Teachers know that there are needs; they know about the incidence of adolescent pregnancy and are reacting by promoting sex education and sex hygiene. Outreach programs have also seen that the sexuality information provided at home and in schools is not adequate, and most of the time, it is erroneous when it is offered out of the classroom by unprepared people in the community. Sex education projects are offering services in the community to prevent STD and pregnancy.

#### B. Adolescents

##### *Premarital Sexual Activities and Relationships*

Studies of adolescents in public schools have found that a good number of them are sexually active before the age of 15 and that most of them do not use contraceptives to prevent pregnancy and/or sexually transmitted diseases (Mock & Ramirez 1993). Adolescent pregnancy is 19.2% as reported in surveillance statistics for 2002. The government policies are against comprehensive sex education and they have requested that schools include abstinence education as the rule. The contraceptive education is offered outside of the academic services. We believe that comprehensive sex education has to be offered if we want to control the adolescent-pregnancy incidence. In those areas where the adolescent pregnancy rate is high, the schoolteachers are assuming responsibility and are offering sex education.

As mentioned before, the fact that more females are postponing marriage and that more couples are opting for common-law partnerships as opposed to legal marriage, has resulted in an increase of individuals engaging in premarital sex. It is estimated that almost 50% of young Puerto Ricans are sexually active (Cunningham 1991). The general trend in the world is to establish couple relationship with freedom for all components. Puerto Rico, for instance, has a swingers group, based in Puerto Rican values that accept this sexual behavior.

### *Premarital Courtship, Dating, and Relationships*

Courtship and dating behavior is governed by strong and clear gender-dimorphic roles and rules. It is very difficult for young people, particularly young women with older brothers or male cousins, to escape the pervasive pressure and surveillance of family members that enforces the dual standards of behavior expected of Puerto Rican males and females. The custom of a chaperone's accompanying a young woman disappeared long ago, since no one young or old recalls it.

Young Puerto Ricans attending colleges and universities are very similar to their student counterparts elsewhere in the world. However, some relevant differences are worth addressing here. Surveys done by Cunningham and collaborators (1991), with randomly selected students at the University of Puerto Rico, show that almost half of them are sexually active, 70% of the males and 40% of the females. Of those sexually active, 80% had experienced vaginal intercourse, more than 50% had tried oral intercourse, and over a third had tried anal intercourse.

Eighty-five percent of those practicing vaginal intercourse and 84% of those practicing oral sex reported having only one partner during the three-month period before the study. With respect to the use of condoms, 55% of the sample declared they had used one at least once; only 16.8% of the males and 13.6% of the females declared they always used a condom (Cunningham & Rodriguez-Sanchez 1991).

### **C. Adults**

#### *Marriage and the Family*

It used to be that the divorce rate was very low, probably because of the strong influence of the Catholic religion. However, there has been a dramatic increase in the rate of divorce during the past decade, as well as an increase in the number of households headed by women. In 1960, it was 18.7%; by 1980, the incidence was 25% (Vasquez-Calzada 1989). More recently, an increasing numbers of single mothers have been noticed (20.9% in 1980 to 32.9% in 1989) (Castro-Alvarez & Ramirez de Arellano 1991). In 1988, the percentage of teenagers giving birth was 17.4%, while those out of wedlock reached 32.8%.

#### *Extramarital Sex, Cohabitation, and Single Mothers*

As in any strongly patriarchal culture, the double moral standard allows males much more freedom than it does females. Macho men, but not women, are allowed and expected to have extramarital sexual relationships. However, as is happening in other cultures, the increasing incidence and recognition of cohabitation and single mothers is definitely weakening this pattern.

#### *Sexuality and Disabled and Older Persons*

There is little if any discussion, and no statistics, on the sexual needs or behaviors of physically and mentally challenged persons and older persons.

#### *Incidence of Oral and Anal Sex*

Unexpectedly, 35% of university students surveyed in 1989 and 37% of those surveyed in 1990 had participated in anal intercourse. Approximately 40% of the males who had engaged in this activity were homosexual. And although those who practice anal intercourse do it less frequently and tend to use condoms in higher percentages, they also tend to have more partners than those who practice other types of sexual activity. Results show that almost 36% of those who practice anal intercourse (22% of the females and 46.5% of the males) had two or more partners during the three months previous to answering the survey. The reasons for engaging in this practice were different for males and females, while

the males reported they did it for pleasure, females reported that they did it mostly to satisfy their partners.

No data are available on the attitudes towards or the incidence of either anal or oral sex among non-university students, and single or married adults.

### *6. Homoerotic, Homosexual, and Bisexual Behaviors*

In Puerto Rico, as in most societies of the world, being openly gay carries a negative stigma and in consequence, most of the gay community remains "invisible." Thus, no reliable information about the percentage of the population with homosexual or bisexual orientation or experience is available (Cunningham & Cunningham 1991).

There is a strong rejection of homosexuality, especially male homosexuality. [*Comment 2003*: Lesbians face even more discrimination and persecution than gay men in the island's culture. Lesbians lead even more-hidden lives than gay men, particularly if they have custody of their children. Under Puerto Rican law, lesbians can lose custody of their children. As of early 2003, repeated efforts by many groups to remove this law from the books have all failed, and the law remains in effect. (*End of comment by Carmen Rios*)] This negative attitude is present even in Puerto Rican males living in the New York area. In fact, law-enforcement officials tend to harass those who have sexual relationships with someone of their own gender or commit a crime "contrary to nature."

Because of the AIDS (SIDA) epidemic, homosexuals affected by the disease have organized support groups and have started to acknowledge their sexual orientation publicly. Within these groups, two distinct reactions have been observed: One group of individuals has reacted by increasing their sexual activity, while others have abstained almost completely from it (Ortiz-Colon 1991). However, in Puerto Rico, the main mode of transmission of HIV has been through intravenous drug use and increasingly through heterosexual contact.

There is a history of more than 20 years of gay and lesbian civil rights movements. The Comunidad de Orgullo Gay (Pride Gay Community) was founded in 1973; since then, other organizations have been established. The Coalicion Puertorriquena de Lesbianas y Homosexuales, created in 1991, publishes a bimonthly magazine dealing specifically with issues of discrimination and encouraging support among lesbians and gays. Because of the AIDS epidemic, other groups that deal specifically with this issue have been established in different parts of the island.

### *7. Gender Diversity and Transgender Issues*

As in other parts of the world, transvestites and transsexuals do exist in Puerto Rican society. Transvestites have been portrayed in the media and television for a long time, and this style of dressing has become a style of street life. There are transvestites in school, universities, and in social night style. There are male sex workers who cross-dress at night and revert back in the morning. Transsexuals are not common in Puerto Rico. But their small group makes a loud noise, with some transsexuals appearing on television and participating in top television shows to demonstrate the lifestyles and changes faced by transvestites and transsexuals. Some physicians have participated on television shows to talk about the anatomical, social, psychological, and physiological changes involved in transsexualism.

[*Comment 2003*: Many transgender Puerto Ricans visit the United States to participate in the annual Fantasia Festival in

Provincetown on Cape Cod and other transgender events in the New York metropolitan area. Transgender Puerto Ricans also maintain and participate in Internet websites, and network with transgender groups on the mainland. Transgender persons living in California and Mexico travel to the island and have been particularly supportive by helping establish transgender support groups on the island. However, scientific data on the extent of this population and its practices are unavailable. (*End of comment by Carmen Rios*)

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Sexual Abuse and Incest*

There are no reliable statistics about the incidence of family violence, including the sexual abuse of women and children and incest, but a center to protect victims of family violence, Casa Protegida Julia de Burgos, reported almost 500 cases of spouse abuse in 1984 and the Department of Social Services reported over 5,000 cases of abuse and neglect of children in 1985. The Centro de Ayuda a Víctimas de Violación reported 181 cases of rape and 21 cases of incest for the period 1984-1985 (Burgos & Diaz Perez 1985).

#### *Sexual Harassment*

This is a relatively new concept that has not been widely accepted in Puerto Rican society. Most people believe that these are the natural behavioral patterns in the relationships between men and women (Alvarado 1987). Sexual innuendoes, jokes, and repeatedly asking for dates are all expected in male-female interactions (Martinez et al 1988).

Recent studies have found harassment rates of 44% among women attending a conference on women in the workplace, to as high as 73% for women working in the healthcare sector (Alvarado 1987; Martinez et al. 1988). The great majority of these women had been harassed by supervisors (over 60%) or coworkers (almost 30%). Although more than 60% of the women confronted the harasser, only 13% reported the situation to their superiors (Alvarado 1987).

Although there is no specific law in Puerto Rico against sexual harassment in the workplace, there is a law that prohibits discrimination in any form at the workplace. Current efforts focus on raising the public's awareness of the nature, pervasiveness, and social unacceptability of sexual harassment in a culture where it has been universally accepted and expected as an important part of the behavior of *macho* males.

#### *Rape*

Outside of the scattered and nonrepresentative statistics mentioned above on incest, child sexual abuse, and spouse abuse, no data exist on the incidence of rape.

### B. Prostitution

As in other parts of the world, prostitution is tolerated in Puerto Rican society, although it is considered illegal and immoral. Males are encouraged to seek prostitutes as sexual outlets so as to maintain the purity of those whom they will eventually marry. This, however, is changing, as more and more young adults are engaging in premarital sexual relationships. Prostitution is not as common throughout the island as it is in metropolitan areas. Prostitution places have been eliminated in San Juan by a governmental action. However, street prostitution has increased as the control loosened. For many years, health education programs, STD prevention programs, and HIV testing were available to the prostitutes and their clients in places devoted to prostitution. With the elimination of brothels, there is now no site to offer these services.

In the early 1990s, the increase in AIDS among heterosexuals was attributed in part to heterosexual men having sex with prostitutes (Mock & Ramirez 1993). This is no longer true, because the homosexual has been alerted and taken control with prevention programs focused on their lifestyle. While some heterosexuals keep with their risky style, they are also exposed to another main transmission mode, IV-drug use.

### C. Pornography and Erotica

Erotic elements appear to be very common in writings (novels), and popular songs and dances. Pornography, however, is not as developed as it is on the mainland. Pornographic magazines and television channels, such as the Playboy Channel and other adult channels, are also available with cable television easily available. There is little, if any, indigenous pornographic material since a variety of such material is easily brought home by Puerto Ricans traveling back and forth between the island and the mainland to visit family and relatives. There is no frontier boundary between Puerto Rico and the world. For some people, pornography as erotic material is accepted, but others are concerned about how pornographic material affects young people. There are no controls for cable television Adult stores with pornographic material are common in Puerto Rico, but at the same time, some rules do exist. For instance, by custom, most stores do not sell adult material to people under 21 years old, or young people in student dress or school uniform.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

The first attempts to establish birth control services in Puerto Rico date to 1925, when a group of professionals, headed by Jose A. Lanauze Rolon, a physician, founded the Liga para el Control de la Natalidad (Birth Control League) in the city of Ponce. This venture paralleled Margaret Sanger's efforts on the mainland. In fact, Mrs. Sanger sent Dr. Lanauze the necessary forms and information for them to affiliate with the American Birth Control League. The goals were then the same: dissemination of information for women regarding safe and available contraceptives and maintaining appropriate statistics and studies demonstrating the negative consequences of overpopulation. Consequently, the league was very active in providing public birth control services, arguing not only from the negative consequences of overpopulation, but also from the positive outcome of reducing the high rate of abortion. However, because of strong opposition from the Church and the lack of funds, the clinic founded by the league, as well as two others founded in San Juan in the early 1930s, were eventually closed.

Federal agencies established contraceptive services in the 1930s, but these were also closed during the later years of the Roosevelt Administration because of dissatisfaction with their results and the strong opposition of the Catholic Church.

Today, contraceptive use in Puerto Rico is widespread. It is estimated that three fourths of Puerto Rican women have used contraceptives at least once (Davila 1990). Despite the purported influence of the Catholic Church, religious affiliation has no bearing on contraceptive use. Data show that Catholics use contraceptives as often as non-Catholics. Furthermore, studies have found that the level of contraceptive use is similar across socioeconomic classes, educational levels, and urban versus rural regions (Vazquez-Calzada 1988; Herold et al. 1989). It should be noted, however, that a significant number of university students were found to have little knowledge of contraception, especially regard-

ing barrier methods that may decrease the spread of STDs and AIDS (Irrizarry 1991). Overall, birth control usage reflects the prevalent belief that birth control is the main responsibility of women (Davila 1990).

The most widely used contraceptive by women who intend to have more children is the pill. Studies indicate that about half of the married women have used the pill at least once (Davila 1990). The pill is less popular nowadays, with usage decreasing from 18.9% in 1968 to 11.9% in 1982 (Vazquez-Calzada 1988).

The IUD and the diaphragm are used significantly less than the pill (Robles et al. 1990). It has been reported that about one-third of the women had used these methods once (Davila 1990). The rhythm method is used much less, 18%. However, it should be noted that the popularity of the rhythm method increased from 2.9% in 1968 to 7.7% in 1982 (Vazquez-Calzada 1988). The use of condoms is not very high. About 6.6% of women reported that their partners used condoms as a means of birth control in 1968. About the same rate was reported in 1976 and again in 1982 (Vazquez-Calzada 1988). Researchers have suggested that religious beliefs and culture norms in Puerto Rico may be responsible for men's low usage of condoms and women's inability to demand the use of condoms from their partners (Menendez 1990). The HIV/AIDS epidemic has become a way to promote the use of condoms, not only as a contraceptive method, but for HIV and STD prevention. Finally, the female condom is now available, and its use is increasing.

## B. Teenage Unmarried Pregnancies

Statistics for the year 1985 show that 17% of all pregnancies occurred among adolescents between the ages of 10 to 19 years (Mock & Ramirez 1993). The rate increased dramatically; 19.2% of pregnant Puer Rican women are adolescents (2002).

## C. Abortion

It has been estimated that between 50,000 to 75,000 abortions are performed every year in Puerto Rico (Pacheco-Acosta 1990). Abortion is more common in single than in married mothers. Furthermore, studies have found no differences between Catholics and non-Catholics in abortion incidence (Herold et al. 1989). It has been suggested that Catholics may prefer abortions to contraceptives because the former involves only one violation or sin and one confession, while the ongoing use of contraceptives requires repeated confessions in which absolution might be refused because of the lack of true repentance and the unwillingness to discontinue using contraceptives. If the abortion can be kept secret, the person in question can continue to go to church, whereas if the pregnancy were brought to term, everybody would know about it (Ortiz & Vazquez-Nuttall 1987).

## D. Population Control Efforts

Population-control policies in conjunction with migration—almost a third of Puerto Ricans live outside their country—have been long-term basic tenets of economic development on the island. This has permitted constant experimentation with contraceptives among Puer Rican women. They served as human “guinea pigs” for testing the first contraceptive hormonal pill that was later withdrawn from the market because of its severe negative side effects (Davila 1990).

During the 1940s and 1950s, family planning and population control were supported by the government, and sterilization became a common practice. By the 1970s, Puerto Rico had one of the highest rates of sterilization in the world, and it was estimated that at least 35% of the women of reproductive age were sterilized (Acosta-Belen 1986; Robles et al. 1988). Data from recent decades indicate that

sterilization increased from 56.7% in 1968 to 58.3% in 1982 (Vazquez-Calzada 1988). Sterilization remains the most accepted method of family planning among Puer Rican women and the island continues having one of the highest rates in the world (Vasquez-Calzada et al. 1989; Robles et al. 1988). The same study showed that women who had Cesarean sections also requested tubal ligation. Despite the strong influence of the Catholic Church, sterilization is as prevalent among Catholics as it is among non-Catholics (Herold et al. 1989).

It has been suggested that the high incidence of female sterilization is another manifestation of *machismo/marianismo*; since women are not expected to enjoy sexuality, they are not expected to give much importance to their sexual organs (Burgos & Diaz-Perez 1985).

Vasectomy seems to be more common now than it was a few decades ago. There has been an increase from 2.4% in 1968 to 6.6% in 1982 (Vazquez-Calzada 1988). Vasectomy is more popular among educated males living in urban areas.

## 10. Sexually Transmitted Diseases and HIV/AIDS/SIDA

### A. Sexually Transmitted Diseases

Only partial data on the incidence of sexually transmitted diseases are available. The rate for syphilis (all stages) was 33.92 per 100,000 in 2001-2002. Available data on the absolute number of cases show a decline from 1,526 cases in 1998 to 1,292 cases in 2002. The rate for gonorrhea in 2002 was 13.65 per 100,000. The cumulative number of cases reported for four years show a dramatic increase from 388 cases in 1998 to 520 cases for 2002.

The greater proportion of reported cases of sexually transmitted disease is chlamydia. The cumulative number of cases reported for the last four years shows an increase from 2,008 cases in 1998 to 2,867 cases for 2002 (data obtained from Vigilancia de Enfermedades de Transmisión Sexual, Departamento de Salud de Puerto Rico, OCASET, División de Epidemiología 2002).

The statistics also indicate that sexually transmitted diseases occur most frequently among adolescents and young adults (15 to 45 years). Adolescents and young single adults are a common high-risk group in most societies today, where barriers to adolescent sexual behavior are falling without society's recognition of the need for education in reducing the risks of sexually transmitted diseases (Mock & Ramirez 1993).

### B. HIV/AIDS/SIDA

#### *Adolescent and Adult HIV/AIDS*

The first case of AIDS in Puerto Rico was reported in 1982 and the vigilance/prevention program was started in 1983. Initially, because of physicians' reluctance to report the cases they diagnosed as being HIV-positive or having AIDS, the reported rates were very likely serious underestimates of the true number of cases. By December 2002, a total of 24,700 cases had been reported.

The greater proportion of deaths from AIDS on the island occurred among people between 20 and 39 years of age, an age of great productivity and active social and sexual life. In 1987, it was reported that AIDS was the primary cause of death for women between ages 25 and 39 and for males between 30 and 39 years of age (Cunningham 1991). In 1989, 3.7% of all deaths in Puerto Rico were because of AIDS. However, in comparison to those living on the island, Puerto Ricans living in New York City have a five-times greater chance of dying from AIDS—this is true both for men and women (Menendez 1990).

In Puerto Rico, the use of intravenous drugs constitutes the most important risk factor in the development of AIDS (Marrero-Rodriguez et al. 1993). In fact, the largest concentration of intravenous (IV) drug users among AIDS cases in the United States is found in Puerto Rico (Colon, Robles, & Sahai 1991). It is estimated that more than 51% of AIDS patients on the island are addicted to intravenous drugs. Among males, 54% of AIDS cases are associated with IV-drug use compared to only 38% for mainland women (until December 2002). The relevance of this risk factor makes the epidemiology of AIDS different in Puerto Rico from what is encountered in other parts of the world. It is estimated that there are 100,000 drug addicts in Puerto Rico, 2.7% of the total population, 80% of who are IV-drug users (Rivera et al. 1990).

Most of the 100,000 drug users are young heterosexual and homosexual males, who continue being sexually active and practicing high-risk behaviors. Thus, one can expect that their partners would be infected through sexual contact. Epidemiological data show that IV-drug user's male partners account for 84% of heterosexual transmission in women. It has been suggested that the geography of Puerto Rico, which is a relatively small island, creates an opportunity for knowing and contacting a lot of people, and thus facilitating the spread of the disease. Furthermore, given the high rate of sterilization among women, a significant number may find no incentives to use barrier methods that may decrease the risk for contracting AIDS and other STDs (Robles et al. 1990). An additional factor may be that men expect women to be responsible for birth control, and these may prefer the use of methods, particularly the pill, which in turn may decrease the possibility of men using condoms (Davila 1990).

The second most common mode of HIV transmission, and one that is on the rise, is heterosexual activity. The data until December 2002 show that heterosexual infection increased from 6% in 1988 to 24% in 2002. By 2002, heterosexual transmission had increased to 6,533 cases, 3,753 (60%) of whom were women. Heterosexual transmission in women is increasing at a much faster rate than in men. The problem of heterosexual transmission seems to be worsened by the existence of *machismo* and the subordinate role that women are expected to play in sexual matters. Within such cultural beliefs, women have little power to negotiate safer sexual behavior with their partners. Yet, women who

become infected must care for and financially support their infected male partners as well as their children (Santos-Ortiz 1991). See Tables 1 and 2.

The cumulative cases of AIDS in Puer Rican adults and children on the island as of January 1, 2002, were:

Adults ages 13-49:	24,272
Women ages 13-49:	6,301
Children ages 0-13:	401

As of July 31, 2003, Puerto Rico had 28,637 confirmed cases of AIDS. In the west, Aguadilla had 881 cases and Mayaguez 1,378. In Mid-island, Arecibo had 2,003 cases, Ponce 4,827, and Bayamou 4,804. In the east, San Juan had 6,911, cases, Area Metro 3,362, Caguas 3,395, and Fajardo 934 (Vigilancia SIDA División de Epidemiología).

### Pediatric AIDS

The first pediatric AIDS case in Puerto Rico was reported in the San Juan Municipal Hospital in 1984. By November 1991, 190 cases had been reported. This figure clearly underestimates the magnitude of pediatric AIDS, because for every one diagnosed case, there are between two and ten children who are infected, but have not been diagnosed (Beauchamp et al. 1991).

It has been estimated that 1.4% of the cumulative AIDS (1998-2002) cases are acquired perinatally. Pediatric AIDS occurs equally in female and male newborns, with a ratio of one to one. The profile shows that more than 93% of the pediatric cases acquired the disease from their infected mothers. A protocol was developed in Puerto Rico to treat serological-positive to HIV pregnant women to prevent mother-to-newborn infection.

Interestingly, most of the HIV-infected children who have been orphaned by AIDS now live with their extended family members—aunts, uncles, and grandparents. Apparently, prior to their death, infected parents make private arrangements with extended family members to insure that their children will be taken care of and legal custody established. The care of HIV-infected children is often burdensome to an extended family that may be overwhelmed by the extra services and care needed by the orphan. Shelter care for HIV-infected children is often unavailable.

**Table 1**

### Adult/Adolescent (Ages 13 to 49) AIDS Cases among Hispanics in Puerto Rico, by Exposure Category, Reported in July 31, 2003, Department of Health Statistics

Transmission Modes	Men		Women		Total	
	No.	%	No.	%	No.	%
Men who have sex with men	4,661	22%	0	0%	4,661	17%
Injection drug use	11,768	54	2,431	37	14,199	50
Men who sleep with men and inject drugs	2,063	10	0	0	2,063	7
Heterosexual contact	2,889	13	3,920	60	6,809	26
Blood transmission*	49	0	6	0	55	0
Risk not reported or identified	157	1	54	1	211	1
Totals	21,678	100%	6,525	100%	26,195	100%

\*Hemophilia/coagulation disorder or receipt of blood transfusion, blood components, or tissue

**Table 2**  
Reported Cases of AIDS and Case Fatality Rates by Year of Diagnosis

Year of Diagnosis	No. of Cases	No. of Deaths	Case-Fatality Rate
Before 1990	4,648	3,848	83.0%
1990	1,890	1,540	81.5
1991	2,375	1,902	80.0
1992	2,451	1,892	77.0
1993	2,694	1,986	74.0
1994	2,369	1,622	68.0
1995	2,093	1,311	60.5
1996	2,085	1,067	51.0
1997	1,735	713	41.0
1998	1,453	583	40.0
1999	1,265	484	38.0
2000	1,155	439	38.0
2001	1,146	370	32.5
2002	915	240	26.0
2003, January-June	313	25	6.0
Totals	26,637	18,011	

On the mainland, mothers infected with HIV are treated with a great variety of drugs to maintain low levels of the viral load. Before and during pregnancy, these treatments reduce significantly the vertical transmission of HIV.

Pediatric cases among school-age children present an additional challenge in Puerto Rico. There is a law that protects the confidentiality of all persons with HIV/AIDS. Students, teachers, and administrative personnel do not have to inform others of their status about serological conditions. On the other hand, state and federal regulations request that any school or employer provide information and workshops about blood pathogens including, HIV/AIDS and hepatitis. Employers are asked to establish a program to advise, prevent, and protect their employees against blood pathogens. In Puerto Rico, as on the mainland, prejudice and discrimination exist, so that some schools have tried to protect confidentiality by denying access to the records of children who have revealed that they are HIV-infected. Nonetheless, it should be noted that the Department of Education in Puerto Rico has an AIDS (SIDA) policy that adequately addresses the needs of HIV-infected children in the schools.

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

The data on types of sexual dysfunction are limited to small nonrandom samples. A 1985 report by Mock states that the most common sexual dysfunction among males was erectile dysfunction, followed by lack of sexual desire and premature ejaculation. For females, the most common problem was inhibited female orgasm, relationship problems, and lack of sexual desire.

In Mock's opinion, the male dysfunctions are in part because of three main factors: the belief that it is the male's responsibility to satisfy his partner, masculinity as defined by the ability to obtain and sustain erection, and the fear of homosexuality. In the case of the female, issues such as inhibitions to express their sexuality freely and the fear of losing a partner seem to play important roles in sexual dysfunctions.

### B. Availability of Counseling, Diagnosis, and Treatment

There are several private practitioners in Puerto Rico, most of whom have been trained in the United States and possess doctoral degrees as well as certification as sex counselors and/or therapists. Most of them are members of professional organizations in the United States, such as the Society for the Scientific Study of Sexuality (SSSS), the American Association for Sex Educators, Counselors, and Therapists (AASECT), and the Society for Sex Therapy and Research (SSTAR).

## 12. Sex Research and Advanced Professional Education

Human sexuality courses are part of the academic offerings in the colleges and universities in Puerto Rico. Major universities, such as the Universidad de Puerto Rico, conduct research in sexuality and AIDS (SIDA).

In the past 15 years, sex education has become a real need for teachers who deal with children and adolescents who have needs, problems, and questions related to their sexuality. The universities have prepared and offered courses in sexuality to satisfy the needs of the teachers. The University Sex Education Symposium provides the opportunities for educators and health professionals to obtain continuing education in sexuality. Unfortunately, most helping professionals do not have the opportunity of benefitting from formal

courses in sex education, because there is a deficiency of such courses in the professional curricula. Efforts are underway in Puerto Rico to introduce a sex education curriculum into the professional schools in the universities.

Because of the relevance of AIDS in Puerto Rico, there are numerous organizations and centers providing services and conducting ongoing research in this area. Worth mentioning are two publications: *El SIDA en Puerto Rico*, edited by a group of scholars working at Rio Piedras of the Universidad de Puerto Rico (Cunningham et al. 1991), and the second one by Mock & Ramirez (1993) titled *SIDA: Crisis o Reto Transformador*.

The most important center for research on general aspects of sexuality is the Instituto Puertorriqueno de Salud Sexual Integral (Address: Center Building, Oficina 406, Avenida de Diego 312, Santurce, Puerto Rico 00909; telephone: 809-721-3578). There are also several centers and associations that deal with specific aspects of sexually transmitted diseases and AIDS (SIDA).

## Final Comments

In summary, sexual behavior and attitudes in Puer-torican society reflects the social, political, and economic conditions of the country. A model of economic development based in population control and immigration has resulted in high rates of sterilization and the use of its population, especially the female, as involuntary experimental subjects for contraceptives such as the pill. This same pattern has been reported with the use of hormones to feed poultry and livestock, which has also had an impact on the health status of the inhabitants of the island.

The so-called yo-yo migration and high rates of intravenous drug use have resulted in a high incidence of AIDS (SIDA), with heterosexual transmission being more important than other means of contracting the virus.

The institutionalized inequality of women on the island contributes not only to high rates of AIDS (SIDA) among them and their newborn, but also to the repression of their sexuality and their engagement in high-risk behaviors only to satisfy their partner or because of a fear of losing them.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Russia's 6.6 million square miles (17.1 million km<sup>2</sup>), over three quarters of the total area of the former Union of Soviet Socialist Republics, makes it the largest country in the world. Russia stretches from Finland, Poland, Norway, Latvia, Estonia, and Ukraine on the west, to the Pacific Ocean in the east, spanning ten time zones. Its southern neighbors include Georgia, Azerbaijan, Kazakhstan, China, Mongolia, and North Korea.

\**Communications:* Igor Kon, Ph.D., Vavilova Str., 48-372, Moscow, Russia 117333; Igor\_kon@mail.ru, igor\_kon@yahoo.com, or <http://konigor.hypermart.net>.

In July 2002, Russia had an estimated population of 145 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 16.7% with 1.04 male(s) per female (sex ratio); 15-64 years: 70.2% with 0.94 male(s) per female; 65 years and over: 13.1% with 0.48 male(s) per female; *Total population sex ratio:* 0.88 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 67.5 years; *male:* 62.29 years; *female:* 72.97 years. Life expectancy in Russia appears to be decreasing significantly and rapidly because of the deteriorating quality of the country's infrastructure and economics. Russia's healthcare system is in decline because of serious economic troubles since the breakup of the Communist system. Many hospitals are poorly equipped and most are poorly supplied with necessary medicines.

**Urban/Rural Distribution:** 73% to 27%; Moscow has close to 9 million, St. Petersburg, 5 million, and Samara and Nizhny Novgorod, 1.5 million inhabitants each.

**Ethnic Distribution:** very socially and culturally heterogeneous, with over 100 distinct ethnic groups. Russian: 81.5%; Tatar: 3.8%; Ukrainian: 3%; Chuvash: 1.2%; Bashkir: 0.9%; Byelorussian: 0.8%; Moldavian: 0.7%; other: 8.1%

**Religious Distribution:** Russian Orthodox, Muslim, and other

**Birth Rate:** 9.71 births per 1,000 population

**Death Rate:** 13.91 per 1,000 population

**Infant Mortality Rate:** 19.78 deaths per 1,000 live births

**Net Migration Rate:** 0.94 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.3 children born per woman

**Population Growth Rate:** -0.33%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.18%; *Persons living with HIV/AIDS:* 130,000; *Deaths:* 850. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 98%; education is free and compulsory from age 7 to 17

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$8,300 (2001 est.); *Inflation:* 21.9% (2001 est.); *Unemployment:* 8.7% with considerable underem-

ployment (2001 est.); *Living below the poverty line*: 40% (1999 est.)

[Update 2002: Since the collapse of communism in 1991, a rapidly growing economic crisis, increasing alcoholism, violence, the lack of and high price of housing, and an increase in infectious diseases and the lack of medicines to treat them have all been factors in a drastic decline in Russian life expectancies, the quality of life, and the rates of marriage, divorce, and birth. In the early 1990s, life expectancies plunged, then rose steadily under Gorbachev from 1995 to 1998, and then again declined. In 1999, the last year for which statistics are available, life expectancy at birth was 59.9 years for males and 72.4 years for females. In the 1990s, Russia's marriage rate decreased by 25% while the divorce rate rose by 50%. In 2002, Russia's rate of HIV infection was almost double that of the United States.

[Meanwhile, after Russia's birthrate crept slowly downwards for decades, it fell by another 10% in the mid-1990s. Russia's birthrate in 1999 was 8.4 births per 1,000 people, compared with 13.4 in 1990. The average number of babies a Russian woman could expect to bear fell from 1.89 in 1990 to 1.17 in 1999. In the 1980s, Russia had Europe's highest fertility rate; in 1999, it ranked with Spain and Italy with the lowest birthrate. A United Nations report estimated that Russia's current population of 145 million would decrease to 121 million by 2050, the level of the country in 1960. In 2001, the Research Public Health Institute predicted a decline to 80 million people in 2050, 10 million fewer than the country had at the time of the 1917 Revolution. (End of update by I. S. Kon)]

## B. A Brief Historical Perspective

Slavic tribes began migrating into Russia from the west in the 5th century of the Common Era. The first Russian state was founded in the 9th century with centers in Novgorod and Kiev. In the 13th century, Mongols overran the country. The grand dukes of Muscovy (Moscow) led the Russians in recovering their land; by 1480, the Mongols were expelled. Ivan the Terrible (1692-1725) was the first to be formally proclaimed Tsar. Peter the Great (1672-1725) extended the domain and founded the Russian Empire in 1721.

Under the aegis of Empress Catherine the Great (1729-1796), European culture was a dominant influence among the Russian aristocracy, particularly in the years prior to the destruction of the monarchy in the French Revolution. In the 19th and early 20th centuries, Western ideas and the beginnings of modernization spread through the huge Russian empire. Political evolution, however, failed to keep pace.

Military reverses in the war with Japan (1905) and in World War I undermined the Tsarist regime. In 1917, sporadic strikes among factory workers coalesced into a revolution that deposed the Tsar and established two brief-lived provisional governments in sequence. In brief order, a Communist coup placed Vladimir Ilyich Lenin in power. Lenin's death in 1924 led to a struggle from which Joseph Stalin emerged as the leader. Purges, mass executions, mass exiles, and even a famine engineered in the Ukraine marked Stalin's regime and resulted in millions of deaths, according to most estimates.

Although Russia and Germany signed a nonaggression pact in 1939, Germany launched a massive invasion of Russia in June 1941. Counterattacks during the brutal Russian winters of 1941-1942 and 1942-1943, coupled with the Nazi failure to take and hold Stalingrad, started the German retreat and eventual defeat. After Stalin's death in 1953, the "De-Stalinization" of Russia began under Nikita Khrushchev. In 1987, Mikhail Gorbachev began a program of reform that included expanded freedoms and democratizing

the political process. This openness (*glasnost*) and restructuring (*perestroika*) was opposed by some Eastern-bloc countries and hard-line Communists in the U.S.S.R. In August, Gorbachev resigned and recommended dissolution of the Communist Central Committee. By the end of 1991, 74 years of Communist government had ended, with declarations of freedom from the Russian, Ukraine, and Kazakhstan republics, and the Union of Soviet Socialist Republics was dissolved. This opened the door for the many recent changes in the sexual lives of Russians detailed in this chapter.

## 1. Basic Sexological Premises

[Update 2002: At virtually every moment of its history, Russian sexual culture was described by both foreigners and by Russians in a highly polarized manner, and these contrasting images are reproduced in contemporary scientific literature (Kon 1995, 1997ab, 1999).

[On the one hand, medieval and early modern Russia was a patriarchal society in which women were brutally suppressed, and wife beating was considered an expression and proof of conjugal love even by the women themselves. The attitudes and practices of gender inequality, aggravated by centuries of serfdom, are abundantly reflected in Russian folklore and literature. On the other hand, Russia had always had a "powerful woman syndrome." Since the time of Hegel, German romanticism, and the Russian Slavophiles, philosophical tradition has considered the "Russian soul" or "national character" as feminine rather than masculine.

[Equally contradictory is the Russian bodily canon and body politic, including soul/body opposition, social representation of the body, attitudes to nudity, and the rules of decency. On the one hand, the Russian character, lifestyle, and mentality are often represented as a realm where spirituality is predominant (*dukhovnost*), in sharp contrast to Western materialism, pragmatism, and "body-boundedness" (*telesnost*). This ideology of disembodied spirituality, with a corresponding underestimation and denigration of the body and its physiological functions, is most clearly shown in Russian Orthodox religious art. Russian Orthodox icon painting, when done according to the Byzantine canon, is much stricter and more ascetic than Western art. Secular nude painting also appeared much later in Russia, and was under more stringent social control than in the West. On the other hand, Russian everyday life, popular culture, and language have always been anything but modest. Foreign observers of the 1600s to the 1800s expressed surprise and shock at the Russian custom of nude mixed bathing in bathhouses and rivers, and at the richness and openness of Russian obscene language (*mat*).

[This exaggerated soul/body contrast is further projected into the incompatibility between romantic love and "carnal lust" (sexuality). The normative image of love in classical Russian literature is extremely inhibited, chaste, and opposed to sexual, carnal pleasure. On the other hand, Russian folklore, language, and everyday culture have always been openly and crudely sexual. "Peasant society might be sexually repressive, but it was rarely sexually prudish" (Engel 1990, 700). As Charles-Francois Masson, an early 19th-century French diplomat, wrote:

Nowhere did so many women arrogate to themselves the right of making the first advances, and being the active party, in affairs of love. . . . A Russian youth will never feel his blood boil, and his heart palpitate, at the idea of a rising bosom. He never sighs after secret charms, at which he scarcely dares to guess; for from his infancy he has seen and examined everything. The Russian maiden will never have her cheek overspread with an involuntary blush at an

indiscreet idea or curiosity, and her husband will have nothing new to show or to teach her, nor will marriage have any novelty for her. Love is here a stranger to those delicate and exquisite approaches that constitute its true charms, and to those preludes to pleasure more delightful than pleasure itself. Where poignant sentiments do not enoble the happiest of human passions, it becomes mere momentary impulse, too easily gratified to be highly prized. (Masson 1805, 263, 266-267)

[The “civilizing process” of cultural modernization and secularization in Russia was also somewhat different from early modern Western Europe. Insofar as it was related to and associated with the development of capitalism, urbanization, and the emergence of the middle classes, the “civilizing process” in Russia was belated and labeled as “Westernization.” Because of the peculiar strength of Russian absolutism, new forms of socializing and etiquette were often introduced from above, by the Imperial court, not as mere examples for more or less voluntary imitation, but as arbitrary and compulsory prescriptions, to be carried out under close administrative supervision, and with the utmost contempt and disregard for individual preferences and tastes. There is a sort of continuity between Peter the Great’s masquerades and compulsory shaving of the *boyars* and the Communist party’s 1950s-to-1980s crusades against long hair, beards, mini-skirts, wide or narrow pants, and so on. Ideologically, these policies were quite opposed—in the first case, this was compulsory Westernization, and in the second—anti-Westernization, but the compulsory administrative methods and social-psychological consequences of both policies were similar. Since it was introduced mainly through external and repressive means, the civilizing process in Russia tended more to rigid conformity and uniformity than to pluralism and diversity.]

[Because of the dual censorship by Church and state, and the conservative public opinion, any artist or writer who attempted to initiate sexual-erotic discourse simultaneously came under withering attack from both right and left. This seriously hampered the emergence in Russia of any lofty, refined erotic art with the appropriate language and vocabulary, without which sexuality inevitably appeared vile and sullied. The predominantly negative social attitudes to sexuality and erotica began to change only in the last years of the 19th century, when “the sexual question” (*polovoi vopros*) suddenly became one of the most urgent issues in philosophy, education, politics, and the arts.]

[Yet “Silver Age” erotica, like its European counterpart, was openly decadent. Its enchantment with unusual, strange, deviant, somber, violent, “perverted” forms of sexuality was liberating, but at the same time repulsive and shocking. Decadent art openly declared itself to be both immoral and amoral, and it was generally regarded as socially and educationally subversive. After 1917, it was very easy to eradicate it.]

[Ultimately, the Bolsheviks had two alternative strategies in regard to sexuality: acceptance or suppression. The first and more liberal viewpoint was formulated by Alexandra Kollontai, but it was always marginal. The second, more rigid and dogmatic stance was taken by Aron Zalkind. Zalkind admitted the existence of a biological sexual drive in human beings and the harm of “sexual self-corking.” At the same time, however, he proposed the wholesale subordination of sexuality to the proletariat’s class interests.]

[The ideological justification of these repressive attitudes varied. In the 1920s, sexophobia had been reinforced by arguments about “class interests” and by mechanistic theories about the need to channel individual “sexual energy” into more-exalted social goals. Later, a moral concern

for marriage and the family was emphasized. Sexual intolerance became an essential aspect of global social intolerance and totalitarian control over the personality; the most important steps here were the recriminalization of homosexuality (1933), and bans on pornography (1935) and abortion (1936). But the liquidation of erotic culture produced not so much a desexualization of public and private life as its impoverishment and vulgarization. Sexuality, driven underground and degraded to the level of a “sex instinct,” became a strong anti-Soviet and anti-Communist symbol, forcing people to make their choice—and their choices were often against the regime. (*End of update by I. S. Kon*)]

### A. Character of Gender Roles

Soviet Russian general attitudes to gender roles and sex differences can be defined as a sexless sexism. On the one side, gender/sex differences have been theoretically disregarded and politically underestimated. The notions of sex and gender are conspicuously absent from encyclopedias, social science and psychology dictionaries, and textbooks. On the other side, both public opinion and social practices have been extremely sexist, all empirical sex differences being taken as given by nature.

### B. Sociolegal Status of Males and Females

A paramount slogan of the October 1917 Revolution was the liberation of women and the establishment of full legal and social gender equality. The Soviet regime revoked all forms of legal and political discrimination against women. A host of women were attracted into industrial labor, education, and public activities.

Like all other actions by the Bolsheviks, however, the program was naive and unrealistic. Gender equality was interpreted in a mechanical way, as a complete similarity. All historical, cultural, national, and religious-based gender differences were ignored, or viewed merely as “reactionary vestiges of the past,” which could and had to be removed by political means (Kon 1995, 51-127).

Soviet propaganda boasted of the fact that women, for the first time in history, had been drawn into the country’s sociopolitical and cultural life. By the time Soviet history reached its peak, women comprised 51% of the labor force. The percentage of women with university educations was even higher than that of men and, in such professions as teaching and medicine, women absolutely predominated.

Yet, it was not so much an equalization as a feminization of the lower levels of the vocational hierarchy. Women occupy the worst-paid and less-prestigious jobs and they are grossly underrepresented on the higher rungs of labor. Women’s average salary was a third less than that of men. With the transition to a market economy and the overall economic collapse of recent years, the position of women has deteriorated sharply. Entrepreneurs simply do not want to take on pregnant women or mothers with large families.

Russian public life remains dominated and governed by men. Women remain socially dependent. Seventy-three percent of the unemployed population are women, and women receive only about 40% of men’s salaries. Women are also underrepresented in political bodies (Kon 1995, 129-157).

In the family, the situation is more contradictory. About 40% of all Russian families may be considered largely egalitarian. Russian women, especially urban women, are more socially and financially independent of their husbands than at any time in the past. Very often, women bear the main responsibility for the family budget and for resolving the main issues of domestic life. Russian wives and mothers are fre-

quently strong, dominant, and sure of themselves. On the other hand, their family load considerably exceeds that of the man and is sometimes absolutely unbearable. The length of the workweek was the same for women as for men in the 1980s. Yet, women had to spend two or three times more hours than men on household work.

The fair distribution of household duties is a paramount factor in satisfaction with and the stability of marriage. Mutual recrimination and arguments about who is exploiting whom are a typical feature of Russian press comments going back many years. Women passionately and sorrowfully bemoan the lack of "real men," while men complain about the dying breed of women who show feminine tenderness and affection.

The overall trend in Soviet history has been towards the demasculinization of men. Given all the ethnic, religious, and historical variations, the traditional male lifestyle and stereotyped image have always emphasized such virtues as energy, initiative, and independence. These qualities are extremely important for male self-esteem. Yet, the economic inefficiency of the Soviet system, the political despotism, and bureaucracy left little room for individual initiative and autonomy. At any moment in his life, from the cradle to the grave, the Russian boy, adolescent, or man felt socially and sexually dependent and frustrated.

This social dependency was intensified by the global feminization of all institutions and processes of socialization. As a result of the high level of undesired pregnancies and divorces, every fifth child in the U.S.S.R. was brought up without a father or, at least, a stepfather. In the mid-1980s, some 13,500,000 children were being raised in so-called single-mother families. Yet, even where the father was physically present, his influence and authority in the family, and his role in bringing up the children were considerably less than those of the mother.

Thus, from the start of his life, the Russian boy is dependent on a loving but dominant mother. In the nursery and at school, the major authority figures are women; male teachers are extremely rare. In official children's and youth Communist organizations recognized by adults, the Pioneers and the Komsomol, it was also girls who set the tone. Junior and senior boys only found kindred spirits in informal street groups and gangs where the power and the symbols of power were exclusively male. As in the West, many of these male groups exhibit strong antifeminist tendencies.

When a young man marries, he has to deal with a solicitous, but often very dominating wife, much like his mother once was in his youth. The wife knows much better than he how to plan the family budget and what they need for the home and family. The husband ends up merely carrying out her instructions.

Finally, in public life, absolutely everything came under the control of the powerful maternal care of the Communist Party, which knew better than anyone what was best for its citizens and was ever ready to correct a citizen's mistakes by force if necessary.

This has produced three typical reactions: 1. Psychological compensation and overcompensation through the acquisition of a primitive image of a strong and aggressive male, affirming himself through drunkenness, fighting, and both social and sexual abuse; 2. The combination of humility and subservience in public life, with cruel tyranny in the home and family directed at the wife and children; and 3. Social passivity and learned helplessness, a flight from personal responsibility to the careless, play world of eternal boyhood.

All this is equally bad for both men and women. Aggressive sexism as a means of compensating for social helplessness

gives rise to sexual violence. Many Russian women are obligated to withstand patiently the vulgarity, drunkenness, and even physical abuse of their husbands, thinking that it cannot be otherwise. Sometimes, they even see in that the manifestation of love, as it was in Ancient Rus: "A man who doesn't beat his wife doesn't love her." An intelligent and educated woman frequently sacrifices her own professional and public career to maintain the family, but also because she is afraid of surpassing and thereby offending her husband.

As a result, opposition to the idea of gender equality has been mounting and widening since the 1970s. Men find it painful to lose their old privileges and accept the uncertainty of their social status. Women feel themselves deceived because they are under a double yoke. As a consequence, there is a mighty wave of conservative opinion dreaming of turning the clock back to times that were not only pre-Soviet, but prior to the industrial revolution and Peter the Great. Of course, a return to the pre-medieval (*Domostroi*) household rules is a conservative utopia. However tough life is for present-day Russian women, the overwhelming majority would never agree to reduce their social roles to being only a wife and mother. Younger and better-educated men also have more egalitarian social views and take on a greater domestic, including fatherly, responsibility.

[Update 1997: The collapse of Soviet rule changed everything in Russia, except the relationship between the sexes, which has deteriorated significantly. Expectations in heterosexual relationships have been and are low, but divorce rates remain high, and the number of single mothers, either divorced or never married, keeps growing. In contrast with the United States where single mothers have become the hallmark of the poorest urban areas, Russian women from all walks of life, domestic and factory workers, college graduates, university professors, and professionals alike, have grown inured to raising their families without men, relying on a support network of mothers, sisters, and aunts in a kind of matriarchal society with a downward spiral of poverty and limited horizons. Paternal absence and neglect is a reality widely shared by Russian women, regardless of background, aspirations, or income.

[Even in Communist times, the unhappiness of Russian families was hard to hide. The divorce rate in the 1970s was 40%; now it is 51%. In the past, sociologists blamed Soviet life—its regimentation, oppression, and lack of individual freedom—for men's alcoholism and apathy to work and family. Today, the major factor appears to be an economic freefall that humiliates men who cannot provide for their families, to the point where they just walk away with little social censure. An estimated 15% to 20% of all Russian families are now headed by a single parent, 94% of whom are women. This number is not significantly higher than those in Western and Eastern Europe and far lower than in the United States, where sociologists estimate 27% of mothers are single.

[Some Russian sociologists suggest that single mothers are not much worse off than married mothers, because so many single mothers—31%—live with their mothers or relatives. Others point out that single mothers generally do not want to live with relatives, but have no other choice. In a study begun in 1991 comparing Russian single mothers with European single mothers, half of the single mothers in countries like Switzerland were living with boyfriends, whereas only 5% in Russia had found a new partner. In addition, Russian divorce law does not allow joint custody, and child-support payments, while required by law, are difficult to collect and increasing. Given the free-market economy, men are better off hiding their real income from tax collectors and ex-wives. Many single mothers in the larger cities do not have

residency permits and cannot apply for state welfare help, minimal as that is. While Parliament is drafting a new law aimed at providing absent fathers with more-flexible child-support payments, few expect the government to have much impact on this deeply rooted social problem (Stanley 1995). (End of update by R. T. Francoeur)]

### C. General Concepts of Sexuality and Love

Contrary to an opinion widespread in the U.S.A., Russians are very attached to the ideal of romantic love, which is considered a necessary precondition of marriage and even sex. In a 1992 national public opinion poll, 53% of the men and 49% of the women said that they have experienced "real love." "Sex without love" was approved as normal by only 15% of the respondents, while 57% strongly disapproved of it (Kon 1995, 19-25, 52-53, 158-175).

But such attitudes may be unrealistic and reflect the contradictions of a classical Russian excessive romanticism that was formulated in Chekhov's short story "Ariadna" (1895):

We are not satisfied because we are idealists. We want the beings who give us birth and produce our children to be higher than us, higher than anything on earth. When we are young we romanticize and idolize those we fall in love with; love and happiness are synonyms with us. For us in Russia, loveless marriage is scorned, sensuality is mocked and induces revulsion, and those novels and stories where women are beautiful, poetic and elevated enjoy the most success. . . . But the trouble is as follows. Hardly do we marry or hit it off with a woman than, give or take a couple of years, and we feel we've been disappointed, let down; we try other women and again we find disillusion, again horror, and ultimately we convince ourselves that women are liars, petty, vain, unjust, uneducated, cruel—in a word, even immeasurably lower, not simply not higher, than us men.

According to 1990-1992 research of Russian university students, they, especially women, have more-pragmatic and less-romantic attitudes about marriage, particularly a readiness to marry without love, than their American, German, and Japanese counterparts. Nevertheless, as everywhere in the world, their real sexual-erotic motivations are mixed, contradictory, and heterogeneous. Also, general developmental trends in Russia are more or less similar to those occurring in Western countries:

- Earlier maturation and sexual initiation of boys and girls;
- Growing, and more or less universal, social and moral acceptance of premarital sex and cohabitation;
- Weakening of the traditional double standard for men and women;
- Growing recognition of the importance of sexual satisfaction for individual happiness and for marital stability;
- Growing public interest in all kinds of erotica and a demand for sexual freedom;
- Growing generational gap in sexual values, attitudes, and behaviors—many things that were considered deviant, unacceptable, and even unmentionable for parents, are normal and desirable for their children (Kon 1995, 158-175).

As in any other large country, sexual values and attitudes are heterogeneous, depending on gender, age cohort, education level, social milieu (whether the person lives in a large city, a small town, or in the countryside, and where he or she spent childhood and adolescence), ethnic identity, and religious affiliation.

Younger and better-educated people are more prone now to accept sex for pleasure only, without relation to love and

marriage. On the other hand, as a reaction to this new individualism, normative anomie, and the weakening of family ties, some conservative and religious writers and philosophers criticize not only hedonistic eroticism, but even classical romantic, passionate love, which, they claim, should be subjugated to the quiet, conjugal love and traditional family values.

Because of the economic collapse, the institution of marriage is in a deep crisis. In 1992, there were 20% to 30% fewer new marriages concluded in Russia than in 1990. In the same period, the number of divorces has risen by 15%. About half of all Russian men and women have at least one divorce during their lifetime. About a third of the divorced are young couples who live together less than five years.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

Despite the 74-year effort of communism to promote atheism, 25% of the people still adhere to Russian Orthodox Christianity. While approximately 60% of Russians were nonreligious when the communist regime fell, Christianity and Orthodoxy are experiencing a mild revival. Among the non-Russian populations, Islam and Buddhism are widespread.

Ancient Slav paganism was rich with sexual symbols and associations. Sexuality was believed to be a general cosmic force. There were numerous openly sexual rites and orgiastic festivals at which men and women bathed naked together, the men symbolically fertilizing the earth and the women exposing their genitals to heaven in order to invoke the rain. In spite of the Church's efforts to eradicate certain "devilish" pagan sex rituals, some of these survived among Northern Russia peasants until the end of the 19th century (Kon 1995, 11-49).

The Christianization of Russia, beginning in the 9th century, introduced a new philosophy of sexuality, but this influence has been slow and superficial. The Russian Orthodox Church, *volens nolens*, had to accommodate ancient sexual practices in numerous regional and ethnic diversities. On some issues, like clerical celibacy, it was more lenient, or rather, more realistic, than the medieval Catholic Church. While complete abstinence from sexual relations, even in marriage, was officially classified as a "holy deed," in everyday life, sexual activity in marriage was fully accepted. While celibacy was obligatory for the monks from whom the highest Church leaders were chosen, ordinary priests were obligated to marry and to have children. Unable to eradicate certain ancient pagan customs, the Church concentrated more on matters of social representation and verbalization.

Hence, we have the persistent normative conflict between the naturalistic pagan attitudes to sexuality in the "low" everyday peasant culture and the extreme spiritualism and otherworldly asceticism of the official "high" culture. Everyday life was openly sensual, cruel, and carnal. Debauchery, drunkenness, sexual violence, and rape were quite common. Russian folk tales are filled with polygamous heroes. Various sexual exploits, such as the rape of a sleeping beauty, are sympathetically described. It was permissible and noble, for example, "to dishonor" or rape a virgin girl in just revenge for her refusal to marry the hero. There was no place for modesty and privacy in the lives of peasants, and the nude body was often unwillingly and deliberately (ritually) displayed. Russian communal bathhouses, where men and women often washed together, surprised and shocked more than a few foreign travelers in the 16th and 17th centuries.

At the same time, the limits on symbolic, artistic representation of the body were extremely narrow. In Western religious painting since the Renaissance and even in the late Middle Ages, the entire human body was represented as real, living flesh. Only the genitals were veiled. In the Russian icons, only the face is alive. The body is entirely covered or outlined in an emaciated and ascetic manner. Nothing similar to the paintings or sculpture of Michelangelo, da Vinci, or Raphael was permitted. Secular paintings of nudes did not appear until the end of the 18th century.

Sexually explicit art emerged in Russia only in the middle of the 18th century, under the direct influence of French "libertines." The Imperial Court of Catherine the Great (1729-1796) was highly eroticized. The first explicitly sexual Russian poetry by Ivan Barkov (1732-1768) was deliberately crude and arrogant. It lacked the elegance of French "libertine" literature and was never published legally. Russian nobility took lovers and read pornographic literature (mostly imported) (Kon 1995, 23-38).

In the West, the Church and clerical forces were a major foe of the erotic art and culture of pleasure. In Russia, the Church was particularly powerful because of its close relations with the state. Russian censorship was stricter and more pervasive than in Western countries.

## B. Source and Character of Secular and Ethnic Values

Three facts are important for understanding the specific features of Russian eros.

First, the contrast between the official high culture and the low everyday culture of the common people was considerably greater in Russia than in the West. The official high culture was sanctified by the Church and antisexual by its very nature, while the low culture of the common people accorded sexuality a positive value common to all medieval European Christian cultures.

Second, refined, complex erotic art came into being and gained acceptance much later in Russia than in the West. And it is only through the medium of erotic art that sexuality could be included in high culture at all.

Third, the development of civilized forms of everyday social life was, in Russia, more closely associated with state power than with the civil society. Because new rules of propriety were often introduced by political authorities, there was more pressure towards uniformity of everyday conduct than towards individualization and diversification; and without some established and reasonably diverse subcultures, there can be no basis for normative pluralism, one manifestation of which is sexual tolerance.

These three factors are interconnected both historically and functionally.

In addition to the religious influence, one special factor has powerfully influenced sexuality in Russia: 19th-century, left-wing radical revolutionary-democratic literary criticism. Young aristocrats of the early 19th century received a good secular home education from early childhood. Whatever their moral and religious convictions, they tried to distance themselves from official bigotry and were not afraid of their own sexual feelings and experiences. The most revered Russian poet, Alexander Pushkin (1799-1837), wrote some elegant and witty erotic poetry.

For the next generation of Russian intellectuals, who came mainly from a clerical background and were often themselves former seminarists, such freedom was impossible. While breaking with some of their parent's principles and values, they were unable to overcome others. Constant inner battles against their own unconventional sexual practices and feelings, particularly self-pleasuring and homo-

eroticism, turned into a global moral and aesthetic rejection and denunciation of sexuality and hedonism as something vulgar, dangerous, and unworthy. Only broad social objectives, such as liberation of the poor and oppressed, were morally justified. Everything that was private or personal was considered secondary—and egotistical.

These antisexual, antihedonistic attitudes have become an integral part of a definite ideological trend in Russian culture. As in the West, it was a moral expression of the middle-class, bourgeoisie opposition to aristocratic individualism. In Russia, however, this opposition was more radical. While religious bigots condemned eroticism as godless and amoral, populists rejected it as politically incorrect, vulgar, and nonaesthetic.

Any artist or writer who dared to walk up that "slippery slope" came under immediate attack both from the right and from the left. This seriously hampered the birth and development of a lofty, refined erotic art and language, without which sexual discourse inevitably appears base, dirty, and squalid. Inhibitions against sexuality and sensuous pleasure are generally typical for Russian classical literature. Sex is presented as a tragedy or quasi-religious revelation, very rarely as a pleasure.

On the eve of the 20th century, the Russian cultural climate began to change. Leo Tolstoy's *Kreutzer Sonata* (1891) stimulated a philosophical dispute about the nature and relationship of love, sex, marriage, and erotica, with prominent Russian writers like Anton Chekhov and philosophers like Vladimir Solovjev, Nikolai Berdjajev, and Vassilij Rozanov taking part. While this metaphysics of sexuality tried theoretically to rehabilitate eroticism, it had no place for real, everyday, routine sexual pleasure (Kon 1995, 39-49).

While sophisticated erotic art and literature did appear in Russia in the early 20th century, the artists of that era were seeking more a legitimization of eroticism than portraying sexual enjoyment. Exceptions, like the poet Mikhail Kuzmin and the painter Konstantin Somov, only confirm this general pattern. Whatever its aesthetic and moral value, early-20th-century Russian erotic art was marginal both to the official and popular cultures. It was looked upon as decadent and was equally denounced with vehemence by the right and by the left.

In the early 1900s, the first sexual surveys were conducted among students at Moscow and other universities. Sexual concerns were raised within the disciplines of medicine, history, ethnography, and anthropology. The word "sexology" as a name for a special subdivision of science was suggested by Rosanov in 1909.

The October Revolution of 1917 liberated sexuality from its traditional religious, moral, and institutional restraints. No longer was sex a taboo subject. On the contrary, traditional sexual morality and marriage as a social institution were themselves suspect. Everywhere, there were fierce discussions of "free love" and debates over whether the proletariat needed any sexual restrictions whatsoever. The first net result, however, was sexual anarchy, the growth of unwanted pregnancies and births, induced abortions, sexually transmitted diseases, rape, and prostitution (Kon 1995, 39-49).

"The sexual question" being politically important, the Soviet government in the 1920s sponsored some sociological, biomedical, and anthropological sex research, as well as elementary sex education. Yet, the elitist, individualistic, and "decadent" erotic art was absolutely incompatible with the new revolutionary mentality. Sexual pleasure was only a hindrance and distraction from the goals of the Socialist revolution. In the 1920s, a few liberal Communists, like Alexandra Kollontai, suggested "to make way for winged Eros," but that was against the mainstream.

Already in the 1920s, erotica was treated as morally and socially subversive. The only legitimate function of sexuality was reproduction. According to the influential party educator and sexologist, Aaron Zalkind, "sexual selection should proceed according to the line of a class revolutionary-proletarian consciousness. The elements of flirtation, courtship, and coquetry should not be introduced into love relationships" (1924). In the article on "Sexual Life" in the first edition of the *Great Soviet Encyclopedia* (1940), the emphasis is exclusively on social control: The dangers of "unhealthy sexual interest" are discussed, and the aim of sex education is clearly described as the "rational transmission of sex drive into the sphere of labor and cultural interests."

Another historical factor that has affected the sexuality of the Russian people is their rather prudish approach to nudity and bodily functions. Thirty years ago, there was controversy about wearing any kind of shorts in public, including at beach resorts. Now, walking shorts are no longer prohibited in the western regions. The attitudes of Muslims in the eastern republics are even stricter. Body exposure by Muslim women is still strictly forbidden, and violating the taboo can lead to severe punishment. In these regions, shorts even on men are considered indecent.

Bodily functions are not openly acknowledged in Russian culture. Direct reference to the need for a toilet is considered impolite. Russians will just quietly disappear from a meeting or social gathering, or, at most, will simply refer to their intention to walk in a particular direction. Even young people who are dating and know each other well often make up artificial explanations before excusing themselves to find a toilet.

An additional contributor to the avoidance of overt discussion of bodily functions may be the sorry state of the country's plumbing. Part of the general breakdown of material goods and services in Russian society following the 1991 revolution includes the public restroom facilities, which are no longer free and often broken or dirty. Washbasins may stand idle, or may yield only a dribble of cold water. Toilet tissue is scarce; its substitutes include newspaper, magazine pages, used office papers, and even cardboard.

Despite the attention to cleanliness paid by many citizens, the combination of bodily inhibitions and inadequate material resources have combined to threaten their overall health, making personal hygiene difficult. Even the interest in improving physical fitness through better diet and exercise is only beginning, despite a long history of purported government commitment.

The Russian ambivalence toward nakedness, bodily functions, intimate hygiene, and sexuality combined with a history of heavy censorship and the contemporary lack of material resources to make the impact of these factors on everyday life and sexuality even greater.

Sexual enjoyment and freedom have been incompatible with totalitarian state control over personality. As George Orwell put it in 1984:

It was not merely that the sex instinct created a world of its own that was outside the Party's control and which therefore had to be destroyed if possible. What was more important was that sexual [de]privation induced hysteria, which was desirable because it could be transformed into war-fever and leader-worship. . . . For how could the fear, the hatred, and the lunatic credulity which the Party needed in its members be kept at the right pitch, except by bottling up some powerful instinct and using it as a driving force? The sex impulse was dangerous to the Party, and the Party had turned it to account.

The history of the Soviet regime was one of sexual repression. Only the means of legitimation and phraseology of

this suppression was changeable. In the 1920s, sexuality had to be suppressed in the name of the higher interests of the working class and Socialist revolution. In the 1930s, self-discipline was advocated for the sake of the Soviet state and Communist Party. In the 1950s, state administrative control was gradually transformed into moral administrative regulations, this time for the sake of stability of marriage and the family. But with all these ideological differences, the practical message regarding sex remained the same: DON'T DO IT! The Communist image of sexuality was always negative, and the need for strict external social control was always emphasized. The elimination of sexuality was beyond the abilities of the Soviet regime. But the net result of this sexophobia was an extermination of all sorts of erotic culture and the prohibition of sexual discourse, whether in the area of sex research, erotic art, or medical information. No wonder that the breakdown of the Soviet regime in 1991, and even earlier with the advent of *glasnost*, sexuality became one of the most important symbols of social and cultural liberation.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs for Sex Education

As in the former U.S.S.R., Russia today still has virtually no systematic sex education, although some efforts have been made to develop school-based programs since the early 1980s. Table 1 shows the responses in a late-1989 national public opinion poll to the question, "What channels of information on sexual life do you believe are the most acceptable and efficient?"

Clearly, a majority of the Russian people favor organized sex education. But the Communist Soviet government did not want it, and the present Russian government has no money for anything. However, an experimental 12-hour sex-education course for adolescents, based on a program from the Netherlands, was to have begun in eight schools in 1995 (Kon 1995, 75-76, 95-100, 108-110, 117-118, 192-193).

#### [Sex Education, Religion, the Clergy, and the Anti-Sex Education Crusade

[Update 2002: Naturally, since the collapse of the central Communist government, the new sexual freedom has been used by communists, the clergy, and nationalists as a political scapegoat. The first phase of the clergy/communist coalition's antisexual crusade was an unsuccessful attack on pornography (described below in Section 8C, Significant Unconventional Sexual Behaviors).

[The second crusade aimed at sex education has been much more successful.

**Table 1**

#### Preferred Sources of Sexual Information (in Percentages)

Source of Information	Percentage
Special school course	46
Special educational literature	43
Special educational films or TV	29
Conversation with a physician	22
Conversation with parents	21
Personal experience	6
Discussion with peers	5
No need for sex education	3

[Systematic sex education is long overdue in Russia. It has been discussed in the mass media since 1962. An attempt to introduce a special course in the early 1980s was welcomed by parents, but failed because teachers were not ready to teach it.

[The idea that sex education can be done by parents themselves runs counter to all of the international experience (Rademakers 1997). In Russian families, intergenerational taboos on sexuality discourse are very strong. According to the National Center for Public Opinion Research (VTsIOM) representative national survey in 1990, only 13% of parents have ever talked to their children about sexual matters.

[According to our 1997 survey, today's students have much more information about sexuality at their disposal than did their parents. For their parents' cohort, the main source of information about sexuality was conversations with peers. Today, printed materials and electronic media are most important, and the main sources of knowledge of sexuality are newspapers, books, and magazines. However, this often means merely replacing one source of misinformation by another, 'virtual' one.

[Until 1997, Russian public opinion generally favored sex education. In all national public opinion polls conducted by VTsIOM since 1989, the vast majority of adults, between 60% and 90%, depending upon age and social background, strongly supported the idea of systematic sex education in schools. Only 3% to 20% were opposed to it (Kon 2001). But who will, in fact, undertake to do this work? And what exactly should be taught?

[Teachers thought that parents should provide sex education for their children. In our 1997 survey, 78% of the teachers agreed with this. However, this same survey showed that the family cannot take on this responsibility. Only about one out of five teenagers considered it acceptable to discuss problems of sexuality with his or her parents. Parents themselves only reluctantly initiate such topics of conversation with their children. More than half of them never initiated such talks, another quarter had taken the initiative only once or twice, and only one in five mothers had such conversations with their children several times—the fathers did not do so at all. The primary inhibiting factors were a lack of psychological and educational readiness. More than three quarters of the parents said they needed special books explaining what should be told to children and how this should be done. About two thirds of the parents think it would be useful to have seminars for parents about sex education in the schools their children attend.

[But the school is also incapable of doing this. Three quarters of the teachers were convinced that form teachers (persons who are primarily responsible for social and moral education) should discuss issues of gender and sexual relations with their students. However, 65% of the teachers reported never having done this, and another 15% had done so only once or twice. It is clear why this is the case: Only 11.5% of teachers feel that they are well prepared for this task. Eighty-five percent were in favor of special courses on the fundamentals of sexology in teachers' colleges.

[In general, respondents in the 1997 survey were unanimous that sex education courses in schools must be launched. It might be expected that such courses would become one of the favorite curriculum subjects for students. Sixty-one percent of 7th grade students and 73% of the 9th graders said that they were eager to attend such classes. Only 5% of students would prefer to avoid them. There were much more serious disagreements among the interested groups, however, with respect to the content of sex education. Teachers would like to offer a detailed treatment of anatomy, physiology, and ethics, whereas students are more interested in practical issues and in sexual pleasure (see Table 2).

[In 1996, at the request of the Russian Ministry of Education, the United Nations Population Fund (UNFPA) in collaboration with UNESCO awarded a three-year grant for experimental work in 16 selected schools to develop a workable curriculum and textbooks "for classes 7, 8 and 9, considering the importance of the fact that young people should be able to make informed and responsible decisions before reaching the age for potentially starting sexual activities." There was no cultural imperialism or any attempt to invent something uniform and compulsory for the entire country. The introduction to the project emphasized that "to ensure cultural acceptability, the curricula and textbooks will be developed by Russian experts, making use of knowledge and experience from other countries, and with the input of technical assistance from foreign experts."

[The "UNESCO project" was formally initiated in October 1996. Its first step was a sociological monitoring, an attempt to assess sexual values, attitudes, and information levels of children, parents, and teachers of a few pilot schools on a strictly voluntary basis. Similar monitoring was also planned for the next stages of the experiment. Unfortunately, without consulting the experts, Ministry of Education officials announced the commencement of this sensitive undertaking without any political and psychological preparation. Even worse, the Ministry sent to 30,000

**Table 2**  
**Students' Preferences Regarding Topics for a Course in Sex Education**  
**(Those Who Indicated a Topic as 'Very Necessary,'**  
**in Percentages, in the 1997 Survey)**

Topic	Grade 7		Grade 8		Grade 9		Total	
	Male	Female	Male	Female	Male	Female	Male	Female
Psychology of gender relationships	54.6	60.8	59.8	69.8	62.2	67.0	59.8	66.4
Conception, prenatal development, and childbirth	49.7	64.9	45.5	52.7	39.6	54.3	43.6	56.2
Sexual orientation, homosexuality, etc.	27.9	26.8	27.0	24.4	18.8	24.3	23.3	24.9
Sexual techniques: how to receive more pleasure from sex	44.3	32.5	55.7	41.5	59.9	43.5	55.2	40.4
Sexual anatomy and physiology	45.4	42.8	43.0	46.5	44.4	45.8	44.2	45.3
Marriage and family life	63.4	79.4	58.2	70.2	56.6	66.5	58.6	70.5
Sexual hygiene	58.5	59.8	53.7	52.3	55.6	50.0	55.7	52.9
Methods of birth control	47.5	63.4	51.6	67.4	62.2	69.3	55.8	67.4
Sexual abuse and avoidance of sexual harassment	50.3	72.2	47.5	74.8	51.0	76.8	49.8	75.1
Prevention of sexually transmitted diseases and AIDS	72.1	82.5	76.6	83.3	78.7	84.0	76.6	83.5
Improvement of sexual health	55.7	49.0	56.6	52.7	62.4	52.8	59.2	51.9

schools a package of five self-made, sloppily edited, and unrealistic—some of them required more than 300 class hours—“alternative” sex education programs. Although these programs had never been tested in the classrooms and had nothing to do with the UNESCO project, they were perceived to be part of it.

[Before it was even born, the project came under fire and was labeled as a “Western ideological plot against Russian children.” An aggressive group of Pro-Life activists complained to the communist-dominated Parliament’s National Security Committee. In some Moscow districts, people in the streets were asked: “Do you want children to be taught in school how to engage in sex? If not, please, sign this petition to ban this demonic project.” Priests and activists told their audiences that all bad things in Western life were rooted in sex education, that Western governments are now trying to promote it, and that the corrupt Russian government, at the instigation of the “world sexological-industrial complex” was acting against the best interests of the country. All this was supported by pseudoscientific data and lies, such as, “In England, boys begin to masturbate at 9 years of age, and at 11 they are already completely impotent.”

[At an important roundtable in the Russian Academy of Education on March 6, 1997, influential priests declared that Russia does not need any sex education whatever in the schools at all, because this had always been successfully done by the Church. Church authorities claimed that up to 80% of the time people spent in the sacrament of confession was dedicated to sexual matters. Some prominent members of the Academy also attacked the “Western” spirit. As Professor Khripkova put it, “We don’t need the Netherlands’ experience, we have our own traditional wisdom.” The President of the Academy, Dr. Arthur Petrovsky, strongly dissociated himself from this nationalist position, as well as from the suggestions to reintroduce moral censorship. But the general decision was to freeze the UNESCO project, and instead of “sexuality education,” to improve moral education “with some elements of sex education” (this opportunistic formula had been used in 1962). Prof. Dmitry Kolesov proclaimed that instead of children’s “right to know,” educators should defend their “right not to know” (*pravo na neznanie*).

[After lengthy debates, a special academic commission for the preparation of a new program was formed (in which I refused to take part), but the new, openly conservative project was equally unacceptable to the clergy, and nothing came of it. In the Academy’s recent program statements on children, neither sexual health nor sex education is even mentioned. The Ministry of Education formally cancelled its previously approved programs. Now it is very dangerous for Russian school principals to introduce any elements of sex education, even at the local level on their own initiative.

[During the 1999 parliamentary elections, the Communist Party of the Russian Federation (CPRF) presented this “anti-sex education” campaign as its most important political victory. The official position of the Russian Orthodox Church, which is trying to put itself in the shoes of the former Agitprop, denounces any form of sex education. Any form of sex education is formally denounced by the Russian Orthodox Church. With the help of some prominent scientists, such as the President of the Russian Academy of Sciences, Dr. Yuri Ossipov, and the Rector of Moscow State University, Professor V. A. Sadovnichij, the Moscow Patriarchy is even attempting to introduce the teaching of theology into the state-owned secular universities, which is unconstitutional and opposed by liberal intellectuals.

[For some Russian newspapers, anything that smacks of sex education is like a red flag before a bull. Militant sexophobia is raging not only in the communist, fascist, and

clerical mass media, but also in many liberal and official media outlets. One of their main targets is the Russian Planned Parenthood Association. Since 1991, this is the only organization that took action to reduce the rate of abortion and to promote sexual and contraceptive knowledge. Now, it is being denounced by Christian fundamentalists as a “satanic institution,” propagating abortion and depopulation. The official slogan of RPPA, “The birth of healthy and wanted children, responsible parenthood” was presented in communist *Pravda* and in religious newspapers as *One Child Per Family*. The booklet *Your Friend the Condom*, published for young adults and teens, is described as if it were addressed to first-grade children.

[Since there is no sex education in Russian schools, or even in the universities, the antisexual crusaders created another target: so-called valeology (from Latin *valeo*, meaning good health). I do not know if such a discipline has ever been institutionalized anywhere in the West. Russian valeology looks like a hybrid of social hygiene and preventive medicine, with some strange and even exotic ideas. A serious criticism and discussion of it would certainly be of use. But, for the fundamentalists, any “science of health” which is not approved by the Church is anathema. Like their U.S. allies, they are absolutely indifferent to real issues of public health, social hygiene, and STD or HIV prevention. They claim that “valeology” is simply another name for “sex education,” and violently attack it for being “Western, non-Orthodox and prosexual.”

[Even the medical profession is split. In 1997, the Ministry of Health and the leading experts in gynecology, pediatrics, and other medical disciplines strongly supported the need for family planning, contraception, and sex education. But scholars and state officials are worried about their moral and political reputations. In January 1999, *Meditsinskaya Gazeta* (a professional newspaper for medical doctors) published an open letter to the Minister of Education, signed by 130 medical experts, clergymen, teachers, and writers, against valeology and sex education. The dominant values of its editor-in-chief, Andrei Poltorak, are clearly expressed in the title of his recent interview: “Honor the doctor . . . since it was God who created him” (Poltorak 2000).

[The antisexual crusade is openly nationalistic, xenophobic, sexist, misogynist, and homophobic. Everything Russian is presented as pure, spiritual, and moral, and everything Western as dirty and vile. Sex education is treated as the most serious attempt there is to undermine Russia’s national security, more dangerous than HIV. In the 1980s, Soviet propaganda attributed HIV to the Pentagon.

[The deputy editor-in-chief of *Rossiiskaya Gazeta*, Victoria Molodtsova, quotes a phrase from an unnamed educational program stating that “to become a real man, the male must not only be brave and courageous, but also acquire some traditionally ‘feminine’ qualities . . .,” such as sensitivity, compassion, and understanding. The journalist’s commentary was: “A Vologda peasant male doesn’t need feminization; the educators arguing for the ‘feminization’ of Russian males are really trying to promote homosexuality, and are being paid for their subversive activities by Western secret services.”

[The crusade against sex education is extremely militant and aggressive. The clerical site ([orthodoxy.ru](http://orthodoxy.ru)) features the slogan: “Attention! Danger! Be prepared for the most energetic means of self-defense!” According to this site, the main dangers for Russian children and their parents are not abortions, HIV, or syphilis, but the International Planned Parenthood Federation (IPPF), which expresses the interests of the contraceptive industry and the United Nations Population Fund, which is interested in the depopulation of Russia so

that the West can appropriate its natural resources. Parents are being taught how to sabotage any attempts to introduce sex education, even including taking their children out of the schools. They are told that condoms are inefficient against HIV or STDS and also against pregnancy.

[The Moscow Patriarchy published a special formal address to adolescents, formulated in words, which would be more appropriate for the General Staff or State Security than for a Christian Church:

Children! The enemies of God, enemies of Russia for hundreds of years have tried to conquer our native land with the help of fire and the sword, but each time they were shamefully defeated and sent to their graves in the boundless fields of Russia. Now they have understood that it is impossible to conquer Russia by military force. . . . Now they want to annihilate our people with the help of depravity, pornography, drugs, tobacco and vodka—by the same means by which THEIR forefathers annihilated American Indians. (*Slovok Podrostkam* 2000)

Militant Orthodox fundamentalism is not limited to sex education. There is even a protest movement against the introduction of national social security code numbers (these codes are named INN, so the movement is called “INN jihad”—Muslim sacred war). Its radical wing claimed that “the idea of a compulsory INN code for the total outside control of the population of Russia was born as a result of joint actions of the US secret services, members of Satanist organizations and of international Zionist [Russian euphemism for Jewish] financial groups (Verkhovsky 2001).

As a consequence of recent changes in adolescent sexual behavior, similar to the Western sexual revolution of the 1960s but compounded by the breakdown of state medical services and the general criminalization of the country, there exist some dangerous trends in Russian sexual life. These include but are not limited to the spread of STDs and HIV. The only reasonable answer to this challenge is sex education. But since 1997, all efforts in this direction have been blocked by a powerful antisexual crusade, organized by the Russian Communist Party and Russian Orthodox Church, and supported by “Pro Life.” Its main targets are sex education, women’s reproductive rights, and freedom of sexuality-related information. Especially vicious attacks are aimed at homosexuals. The campaign is openly nationalistic and xenophobic. In the long run, it goes against the dominant values of the young generation, and also has disastrous public health consequences. (*End of update by I. S. Kon*)

## B. Informal Sources of Sexual Knowledge

According to a 1992 national survey, only 13% of Russian parents talk with their children about sexuality. The main sources of sexual information for teenagers, therefore, are their peers and the mass media. For adults, some medical and psychological information services are available in the larger cities. Several popular Western books have been translated, and a few have been written by Russian authors after 1987. Sexual issues are now often discussed on television and in the newspapers. But there is neither strategy nor money to do this effectively. The main source of sexual knowledge for many people are pornographic magazines and erotic newspapers. The monthly newspaper *SPID-info* (AIDS-information) has the second-largest print run in the country, 4.5 million. It says little about AIDS, but gives popular information about sexuality and erotic topics.

### 4. Autoerotic Behaviors and Patterns

Children and adolescents normally have their first sexual experience through self-pleasuring. Boys generally start to

engage in self-pleasuring at the age of 12 or 13, reaching a peak at age 15 to 16. Girls begin to self-pleasure at a later age and do it less frequently. According to a 1982 survey by V. V. Danilov, 22.5% of the girls had engaged in self-pleasuring by age 13.5, 37.4% by age 15.5, 50.2% by age 17.5, and 65.8% by age 18.5.

Until the late 1970s, official attitudes to self-pleasuring were completely negative. Children were told that it results in impotence, deterioration of the memory, and similar harmful consequences. As an antidote, there was a clandestine teen ditty: “Sun, fresh air, and onanism reinforce the organism.” Nevertheless, many Russian teens and adults still have strong anxieties regarding it. Many sexual dysfunctions are attributed to self-pleasuring experiences, and adults are terribly ashamed of it (Kon 1995, 43-44, 189-199).

## 5. Interpersonal Heterosexual Behaviors A/B. Children and Adolescents Puberty

The overall trends in the psychosexual development of Russian children and adolescents are the same as in Western countries. Above all, there has been a substantial acceleration of sexual maturation. The average menarche age fell from 15.1 years to 13 among Muscovite girls over a period of 35 years, from 1935 to 1970. Similar trends are also typical for the boys.

Sexual maturation confronts the teenager with a host of bodily and psychosexual problems. Many boys are worried about delay in emergence of their secondary sexual attributes in relation to their peers—shortness of height or of the penis, gynecomastia (transitory female-breast development), and so on. Girls are concerned about hirsuteness, being overweight, the shape of their breasts, and so on (Kon 1995, 194-209).

### Premarital Sexual Activities and Relationships

There is clear evidence that sexual activity is beginning earlier for today’s Russian adolescents than in past generations. The mean age for first coitus dropped in the last ten years from 19.2 to 18.4 for males, and from 21.8 to 20.6 for females. According to the only survey of teenagers ages 12 to 17 (Chervyakov, Kon, & Shapiro 1993), sexual experience was reported by 15% of the girls and by 22% of the boys. Among 16- to 17-year-olds, 36% were sexually experienced; among 14- to 15-year-olds, 13%; and under 14 years, only 2%. Boys are generally more sexually experienced than girls, but the difference gradually disappears with age. Just as it was in the West in the late 1960s, early sexual experience is related to some form of deviant or counter-normative behavior: drinking, smoking, drug use, lower academic grades, poor school discipline, and closer association with peer group. Psychologically, sexually active 16-year-olds are more prone to be involved in different sorts of risky behavior, and some of them are from socially underprivileged families (Kon 1995, 62-63, 166-169).

The largest percentage of young people become sexually active between ages 16 and 18, with the incidence of intercourse reported in various studies ranging from 22 to 38% of the boys and 11 to 35% of the girls. “Love” is reported by many young people to be the primary motivator for sexual activity, about 30% of males and 45% of females. “Desire for enjoyment” or “pleasure” are reported by 20% of males and 10% of females. Many young people separate sexual motives from those involving marriage and engagement.

### [The Sexual Revolution and Russia’s Young Adults

[Update 2002: In the former Soviet Union, sexuality was a taboo, almost nonexistent topic. After 1987, the taboo was broken and sex became a fashionable subject for both

private and public discourse (Kon 1995, 1997ab, 1999ab). Despite the official silence, general trends in Russian sexual behavior have been similar to those in Western countries.

[According to our 1993, 1995, and 1997 surveys (the first of which took place in 1993 with 1,615 secondary school and vocational school students aged 12 to 17 in Moscow and St. Petersburg), the sexual behaviors and attitudes of urban adolescents are changing rapidly (Chervyakov & Kon 1998, 2000; Kon 2001). In 1993, 25% of 16-year-old girls and 38% of boys had coital experience; in 1995, the respective figures were already 33% and 50%. Among 17-year-olds, the respective increase is from 46% to 52% (for females) and from 49% to 57% (for males) (see Table 3). Similar overall changes took place both in secondary and in vocational schools (see Table 4).

[Similar overall changes occurred in both the secondary and vocational schools. This suggests that changes in the age of sexual debut cannot be treated as an artifact caused by changes in the sample design. We found further evidence of a dramatic change in sexual behavior between 1993 and 1995 when we analyzed answers to the question about age at first intercourse independently for different age groups within one and the same sample (survey of 1995). Among 16-year-old women, there were twice as many sexually experienced girls than among the 19-year-old respondents when they were 16 (23% vs. 11%). The same difference was found between the 17-year-old and 19-year-old women who were sexually experienced at 17 (45% vs. 24%, respectively). The same tendencies were observed among male students, although the changes were not as large.

[The absolute figures are not surprising and are quite comparable to the U.S. and West European data. But in Russia, the change is occurring very rapidly, and adolescent sexuality, which is strongly related to social class, is often violent and aggressive. Uncivilized and uncontrollable early sexual activity has serious moral and epidemiological consequences.

[Thanks to medical efforts, the abortion rate has declined in recent years. According to official figures, in

1990, women aged 15 to 49 reported having 114 abortions per 1,000 women; in 1992, 98 abortions, and in 1995, 74 abortions. Yet the figure is still very high. Child prostitution and sexual violence are flourishing. For about 10% of teenage girls, their first sexual initiation is associated with some degree of coercion. (End of update by I. S. Kon)]

### C. Adults

#### *Premarital Courtship, Dating, and Relationships*

The overall trend is towards a reduction in age and a rise in moral toleration of premarital sex and cohabitation. Among the university students surveyed by Golod in the 1978-1979 academic year, four out of every five men and every second woman had had sexual experience by the time they were surveyed. A total of 3,741 students from 18 colleges and universities were asked why they thought young men and women entered into sexual relations nowadays. The responses are shown in Table 5 (Golod 1984).

[Update 2002: The liberalization of Soviet sexual morality began long before *perestroika*, back in the 1960s and 1970s (Bocharova 1994; Kon 1997a; Haaavio-Mannila & Rotkirch 1997). According to Sergey Golod's surveys in Leningrad-St. Petersburg, in 1965, only 5.3% of sexually experienced university students reported having first had intercourse before the age of 16; in 1972, this figure was 8%, and in 1995, it had risen to 12% (see Table 6) (Golod 1996, 59).

[The breakdown of the Soviet regime brought the Russian people their long-desired sexual liberation. But, as was also the case with the economy and politics, sexual freedom was immediately transformed into anomie and anarchy, and became a controversial symbol of social and personal liberation and the object of political speculation. By the 1980s, there were two poles: conservative traditionalists, nationalists, and communists, which blended together sexophobia,

**Table 3**

#### Proportion of Sexually Active Respondents by Age and Gender, 1993 and 1995 Surveys (in Percent)

Survey	12	13	14	15	16	17	18	19

22-24	19.5	16.0	3.2
Later	2.7	1.2	1.1

(from Serguei Golod's surveys)

homophobia, anti-Semitism, and anti-Americanism, on the one hand, and liberal “Westerners” on the other side.

[The first and undeniable achievement of the current Russian sexual revolution is that sexuality has become visible. It is openly discussed and represented in the mass media and advertising. A lot of erotic publications are available. Sexuality is recognized as an important element in culture and individual life. Questions about sexual attitudes and behaviors are included in national public opinion polls. People have become much more outspoken about sexual issues. Sexual tolerance is growing. After a long debate, homosexuality was decriminalized in 1993. Despite high levels of homophobia, same-sex love is no longer a taboo topic, and public tolerance, as reflected in the polls, is growing, especially among younger, better-educated, and urban people. Several voluntary associations for the promotion of sexual knowledge and safe-sex practices, including a Russian Planned Parenthood Association and a few local centers for sex education, have been formed (with Western financial help).

[At the same time, sexual liberation entails many difficult social problems. Contemporary Russian sexual culture is completely commercialized, and this is highly frustrating for parents, teachers, and intellectuals.

[There is also tension between the processes of liberalization and gender equality in sexual values and practices. “In Russia, liberalization began during the Soviet Union and was speeded up by the free press and the commercialization of the 1980s and 1990s. In the Nordic countries, liberalization reached its height in the 1970s. Today, liberalism and permissiveness are sometimes questioned from the perspective of gender equality and/or a new morality. In Russia, on the contrary, liberalism has undermined the arguments for gender equality from the Soviet era” (Haavio-Mannila & Rotkirch 2001, 13). (*End of update by I. S. Kon*)]

It is clear from these data that certain gender differences still persist in sexual behavior and motivation; men are more likely than women to justify sex merely for pleasure and to engage in premarital sex, not only with the beloved one, but also with some occasional partners. And, in fact, the men do have more sexual partners than the women (Kon 1995, 158-177).

### *Marriage and the Family*

As in the West, individualization and intimization of the marital relationship have been taking place in Russia over recent decades. Sexual harmony is playing an increasingly important role here. According to Golod’s (1984) surveys, sexual harmony invariably takes third place among factors contributing to perceived marital success and stability, after spiritual and psychological compatibility among spouses who have been married for up to 10 years, and after spiritual and domestic compatibility for those who have been living together for between 10 and 15 years. Sexual satisfaction and general satisfaction with the marriage are closely interrelated. Practically all couples maximally satisfied with their marriages believed they were sexually compatible, while only 63% were sexually compatible among the maritally dissatisfied (Kon 1995, 158-177).

Gender inequality and sexism manifest themselves in the marital bed as well (Kon 1995, 129-157). The natural and widespread disharmony of sexual-erotic needs and desires between wives and husbands, which should be the subject of exploration and discussion, is often seen by Russian spouses and those about them as a manifestation of an ineradicable organic sexual incompatibility; the only way out is divorce. Even in the professional literature, this problem is often discussed not in process terms—how the spouses adapt and grow accustomed to each other—but in

essentialist terms—whether spouses and their individual traits are compatible to each other.

The woman is almost always the first to suffer from poor sexual adaptation. The lack of a common language and the sexological ignorance create a mass of communication difficulties among married couples. Instead of exploring their problems together or going to a doctor, the spouses run off to their same-sex friends.

Another major problem is the lack of privacy, the shortage of housing, and poor housing conditions. Millions of Russians spend many years, or their whole lifetime, living in dormitories or communal flats, sometimes several families in one room, where every movement is seen or heard by others. Among 140 Soviet immigrants living in the U.S.A. asked by Mark Popovsky in 1984, “What hindered your sexual life in the Soviet Union?” the absence of a separate apartment was mentioned by 126 (90%), the absence of a separate bedroom by 122 (87%), and the excessive attention from the neighbors living in the same apartment by 93 respondents (66%). The lack of privacy is an even worse problem for nonmarital sex. “Where?” is the desperately important and difficult question to answer. Lack of privacy is detrimental for the quality of the sexual experience and produces anxieties and neuroses.

The divorce rate is very high; approximately one marriage of three ends in divorce. More than half of all divorces are initiated by the wife.

Cohabitation is more and more widespread among younger couples. Sometimes, it is a first stage of marriage, until children are born, and sometimes an alternative form of marriage. Public opinion, especially among younger people, is gradually becoming more and more tolerant of cohabitation.

Extramarital sex, both casual and long-term, is quite common; according to S. Golod (1984), more than three quarters of the people surveyed had extramarital contacts in 1989, whereas in 1969, the figure was less than half. But public opinion is critical of extramarital sex. In the VTsIOM 1992 survey directed by Professor Yurt Levada (Kon 1995, 275), only 23% agreed that it is okay to have a lover as well as a husband or wife, while 50% disagreed. Extramarital affairs seem to be morally more acceptable for men than for women (Kon 1995, 21, 45, 63, 166-167).

### *Sexuality and the Physically Disabled and Aged*

Because of poverty and poor medical services, the sexuality of the physically disabled and the aged person has not so far attracted professional or public attention. Nothing is done to help these people.

### *Incidence of Oral and Anal Sex*

Younger and better educated Russians often complain about the poverty of their sexual techniques. Anal and oral sex are legal and quite widespread, though some people believe these behaviors are sexual perversions. In some legal documents, both anal and oral sex are referred to as unnatural forms of sexual satisfaction.

## *6. Homoerotic, Homosexual, and Bisexual Behaviors*

Although the Russian Orthodox Church has always severely condemned sodomy and other forms of male and female homosexuality—especially when it threatened the monasteries—the state tended to turn a blind eye to such things in everyday life. In 16th- and 17th-century Russia, homosexuality was not an unmentionable subject; it was, in fact, often the subject of very frank discussion and ribald jokes.

The first state laws against *muzhelozhstve* (male lechery, buggery) appeared in military statutes drawn up on the

Swedish model during the 18th-century reign of Peter the Great. The initial punishment of burning at the stake was changed to corporal punishment. The criminal code of 1832 based on the German model punished sodomy (buggery) with deprivation of all rights and exile to Siberia for four to five years. New criminal legislation adopted in 1903 reduced punishment to incarceration for no less than three months or, in aggravating circumstances, to three to eight years.

This legislation, however, was employed extremely rarely. Many Russian aristocrats, including members of the imperial family, as well as eminent artistic figures of the turn of the century openly led homosexual or bisexual lifestyles. A few lesbian couples were also quite well known at the time. Homoerotic poetry, literature, and painting began to appear. Same-sex love began to be debated seriously and sympathetically in philosophical, scientific, and artistic literature.

After the February 1917 Revolution and the demise of the old criminal code, the legal persecution of homosexuals ceased. In the Soviet Russian Criminal Codes of 1922 and 1926, homosexuality is not referred to at all, but in those parts of the old Russian Empire where it was most widespread—the Islamic republics of Azerbaijan, Turkmenia, and Uzbekistan, as well as in Christian Georgia—the legislation remained in force. In the 1920s, homosexuality was treated as a sickness rather than a crime.

Up to the 1930s, the situation of Soviet homosexuals, who frequently called themselves “blues,” was reasonably bearable and many played a prominent part in Soviet culture. However, the opportunity for an open, philosophical and artistic discussion of the theme, which began at the turn of the century, gradually diminished.

In 1933, male homosexuality (*muzhelozhstve*) again became a criminal offense and literally an unmentionable, even in scientific literature, vice in the U.S.S.R. Conviction of this crime was punishable by deprivation of freedom for up to five years, or up to eight years if compulsion, violence, a minor, or abuse of a dependent was involved. This law (Article 121 of the RSFS Criminal Code) was frequently used up until the 1980s against dissidents and to extend terms in labor camps. Application of the law has always been selective. As long as they did not fall foul of the authorities, certain homosexual cultural and artistic celebrities enjoyed relative immunity. If they overstepped the mark, however, the law descended upon them with a vengeance.

Gay men in confinement have to endure absolutely unbearable conditions. A person who ended up in prison or labor camp under Article 121 usually became straightaway a “no-rights odd-bod” and recipient of constant taunts and persecution from other prisoners. Further, the rape of adolescents and young men is widespread in both prisons and labor camps; after such assaults, the victims forfeit all human rights, become “degraded,” and have to act submissively to their violators. The status of the “degraded” is even worse than that of voluntarily passive homosexuals, who, to a certain degree, select their own partners and protectors (who perform an active, “male” sexual role that is not stigmatized and is even encouraged). The “degraded,” on the other hand, are fair game for anyone. (Some Russian medical experts still make a “fundamental” division of homosexuals into “active” and “passive,” depending on preferred sexual positions; moreover, they associate “passive” with “inborn” and “genuine,” and “active” with “acquired” homosexuality.)

In the 1980s, the AIDS epidemic worsened matters for homosexuals. When AIDS arrived in the U.S.S.R., health officials referred to morality and risk groups, especially gays, portraying them as carriers, not only of the dreaded virus, but of just about every other vice. This hypocritical moralizing and the search for scapegoats instead of a real

sociohygienic policy helped to increase HIV infection already at a high level because of contaminated blood transfusions for hemophiliacs.

While the possibility of decriminalization of homosexuality has been debated by lawyers since 1973, these arguments have been secret and did not spill over into the newspapers until 1987. Since 1987, the popular press, particularly youth papers, radio, and TV, have discussed homosexuality: What is it? How should one relate to “blues”? Should they be treated as sick, criminal, or as victims of fate? From journalistic articles and letters from gay men and lesbians and their parents, ordinary Soviet people have, for the first time, come to recognize the scarred destinies, the police cruelty, the legal repression, the sexual violence in prison, labor camps, and armed forces and, finally, the tragic, inescapable loneliness experienced by people living in constant fear and unable to meet any of their own sort. Each publication has provoked a whole stream of contradictory responses that the newspaper editors have just not known how to handle.

After the breakup of the Soviet Union, some republics, beginning with Ukraine, Estonia, Latvia, Moldova, and Armenia, revoked their antihomosexual legislation. On April 29, 1993, Russian President Boris Yeltsin signed, and lawmakers approved, a decree repealing Article 121.1 dealing with consenting adult relations. Article 121.2 regarding minors and force remains in effect. The repeal did not address gay women since lesbianism was not acknowledged by previous Soviet governments (Kon 1995, 239-264). A new 1997 criminal code may well restore the former repression of gays.

Nevertheless, homosexuals remain the most hated and stigmatized social minority. In the VTsIOM 1992 survey directed by Levada (Kon 1995, 275), the question “How ought we to act with homosexuals?” produced the following spread of answers: 33% favored exterminating homosexuals, 30% favored isolating them from society, and 10% said leave them alone. Only 6% favored helping homosexuals.

The Communist, chauvinist, and fascist media methodically and consistently lumps together Zionism, democracy, and homosexuality. With few exceptions, Russian sexopathologists and psychiatrists still regard homosexuality as a disease, and repeat in their writings the negative stereotypes prevalent in the mass consciousness. Thus, parents are likely to be both worried and defensive when they confront behavior in one of their children that might lead to questions about homosexuality. If an adolescent appears to have a “crush” on a classmate or peer of the same gender, his or her parents may consult a physician or psychiatrist who is almost certain to discourage it directly, or attempt to eradicate the feelings and prevent any erotic activity.

Most gay and lesbian adults attempt to keep their orientation a secret from family, friends, and colleagues in the workplace. The risks of public scandal and humiliation, loss of a job, and other complications are too great. Gay men and lesbian women are often physically assaulted in the streets, beaten, and even murdered.

Nevertheless, the situation is rapidly changing. By 1989, after public discussions of homosexuality began in the mass media, on television and radio, sometimes quite sympathetic, gays and lesbians themselves initiated a struggle against discrimination. In 1990, the first openly gay and lesbian organization was formed in Moscow. As of mid-1994, there were several such organizations. In 1993, the National Union of Gays, Lesbians, and Bisexuals was formed. Gay activists take part in the AIDS-prevention work. Gay themes are now represented in the theater and movies. Several legally registered gay and lesbian newspapers (*Tema*, *Risk*, *1/10*, and others) are published. In Moscow and St. Petersburg, there are gay discos, bars, and restaurants. Special

consulting services are being organized. But all these effects suffer from the shortage of both money and professional personnel, as well as the lack of internal cooperation. Political activists quarrel among themselves and have little influence in the mainstream culture and mass media.

[Update 2002: In April 2002, the People's Deputy bloc introduced legislation that would reinstate an old Soviet law that provided for prison terms for gay and lesbian sex. A phone-in poll (2,813 calls recorded in a five-minute period) by Moscow's Ekho Moskvy radio station found most people divided on the idea, with 53% of those polled opposed to the People's Deputy proposal; 47% said that homosexual acts should be illegal.

[Oleg Mironov, a Russian human rights commissioner, called the proposal to return to Soviet sexuality laws "ridiculous. The Criminal Code does in fact contain criminal provisions for homosexual acts, where they constitute rape or they involve a minor and adult. However, I do not think that we should return to the old Criminal Code in which voluntary relations of this type were punishable in law." However, Mironov did support raising the age of consent for homosexual relations to 16 rather than its current 14 years. At the moment, it is legal to have such relations if a person is 14 years old.

[The new antisexual crusade is extremely homophobic. Despite the decriminalization of homosexuality in 1993 and its formal "depathologization" in 1999, some leading Russian psychiatrists still believe that homosexuality is an illness (Tkachenko 1999, 355). (End of update by I. S. Kon)]

## 7. Gender Diversity and Transgender Issues

Among the native populations of Siberia and the Far East regions of Russia, the tradition of the *berdach*, a spiritual leader who is neither male nor female but a third gender, was widespread in the beginning of the 20th century as an aspect of shaman behavior. The present situation of this custom is unknown.

In 1960, Professor Aron Belkin began biomedical (psychoendocrinological) research on transgenderists and transsexuals. However, the psychological and social factors of gender dysphoria are largely ignored. An Association of Transsexuals was formed in 1992 in Moscow to work for the human rights of transsexuals.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Child Sexual Abuse, Incest, and Pedophilia*

Reports of child sexual abuse were extremely uncommon in the Soviet press. Officially, incest did not exist as a societal problem. Indeed, any kind of child abuse and violence in the family—and it is very widespread—is only beginning to come to the attention of authorities and the professional community (Kon 1995, 215-218).

Some health professionals and others have begun to uncover evidence of various kinds of sexual activity between adults and children, as well as between children of different ages in orphanages, youth camps, and even families. The data on sexual harassment, child abuse, and violence in Moscow and St. Petersburg are largely anecdotal and unreliable, but the problem is serious. In the 1993 adolescent sexuality survey conducted by Vladimir Shapiro and Valery Chervyakov of 1,615 students aged 12 to 17 years in Moscow and St. Petersburg, 24% of the teenage girls and 11% of the boys said they had experienced some sort of sexual pressure, someone pushing them to go further sexually than

they themselves wanted to go. Six percent of those under the age of 14 years reported such pressure, as did more than 27% of the 16- to 17-year-olds. Sometimes the perpetrators are older youths, sometimes parents and other adults. Professional medical and psychological help for the victims is at its very beginnings (Kon 1995, 276).

[Update 1997: While sexism was admittedly common during the Communist regime, sexual harassment, defined as a boss demanding sexual favors from subordinates, was a crime; it was a seldom-prosecuted offense. The current lack of laws protecting employees from exploitation and harassment, coupled with the heady sense of permissiveness fed by pornographic videos, sexy advertising, nightclubs, casinos, beauty contests (Waters 1993), nude pinups, and open prostitution, have raised the level of sexual harassment to epidemic proportions, according to aggravated feminists. Some male observers counter that women simply view their bodies as a way of furthering their careers, while most Russian men, including husbands, dismiss the issue of sexual harassment as yet another silly Western hang-up. Most employers stress youth and sex appeal in advertising for office help; some include as a prerequisite *bez kompleksov* or "without inhibitions" in their advertisements. Despite a few attempts to battle sexual harassment and initiate lawsuits in 1994, an unemployment rate for women three times higher than for men, and a decline in their wages from 75% of male salaries in 1991 to 40% in 1997 have provided fertile ground for sexual harassment (Stanley 1994). (End of update by R. T. Francoeur)]

### Rape

The number of rapes and attempted rapes is growing very fast. Since 1961, the increase in reported assaults has been 60%; since 1986, the increase has been 21.3% (Kon 1995, 207-222).

Most recorded rapes occur on the street or are gang rapes. Most date and marital rapes are not recorded in criminal statistics and remain unpunished. Of 333 persons who applied in 1992 to the St. Petersburg Helping Center for rape victims, only four also reported the crime to the police. The reasons for this unwillingness have been fear of the psychological trauma of investigation and trial; fear of information being spread in school and among acquaintances; doubts about the possibility of legal help; and fear of personal safety. All of these fears and doubts are quite justified. Even when the victims are children, the police are often unwilling to open a criminal investigation or even to initiate a medical examination.

According to criminal statistics—and these are unreliable—male youths between ages 14 and 17 commit 30% of all reported rapes; 37% of perpetrators are between ages 18 and 24; 19% between 25 and 29, and 15% over age 30. Two thirds of rapists are under age 22, with the most dangerous age being 16 to 17. Every fourth reported rape is a group or gang rape. The younger the rapists, the more often their assaults are carried out in a group. Some 40% of rapists have previous criminal records, and two thirds had been drinking prior to the attack.

The global socioeconomic, political, and spiritual crisis that Russia is now experiencing invariably causes a rise in violence and crime. Sexual violence is just one of its aspects, closely related also to the sexist psychology and cult of aggressive masculinity.

The psychological profiles of rapists are very similar to those provided by Western researchers. Sixty-one percent of convicted rapists are psychologically normal, but they perceive women as hostile, aggressive, and dominating figures towards whom they experience an unwanted sense of passivity and dependence. Sexual aggression and rape are

often a manifestation of “adolescent rebellion” against women in general.

Much of the male rape that occurs in correctional institutions is carried on to establish and maintain a social hierarchy. Coercive sexual activity is also widespread in the military, at schools, and in the arts.

At this time, Russian society is not equipped materially or attitudinally to confront these problems in a creative manner. Many Russian citizens simply lament the liberalization of traditional morality and blame the influence of “Western capitalism” and pornography. The current state of the Russian economy precludes economic or technical support for remedial services or preventive programs. The very first telephone “hotline” service for rape victims was established in 1992 in St. Petersburg. Specialized professional help focusing on sexuality is largely unavailable for sex offenders. The first registered rape recovery center and a crisis hotline for abused women opened in Moscow in 1994.

### B. Prostitution

Until 1987, the existence of prostitution in the U.S.S.R. was often publicly denied. Now, it is one of the most popular professions. It is highly stratified, beginning with those working exclusively with foreigners for hard currency, and ending at the very bottom of social life. Some prostitutes are professionals. For others, it means additional income for a family budget. Male prostitution is increasing. Prostitution is closely linked with organized crime. [Update 1997: Entrepreneurs have been quick to take advantage of the economic plight of young women in the former U.S.S.R., recruiting them to service the sexual needs and fantasies of middle- and upper-class males in some of the relatively affluent Middle Eastern countries. See parallel discussion in the chapter on Ukraine. (End of update by R. T. Francoeur)]

The legal status of prostitutes is unclear. Attempts to fight it with administrative measures have failed, but at least now, the issue can be discussed (Kon 1995, 42-43, 62-64, 222-229).

### C. Pornography and Erotica

Stalinist sexophobia had practically exterminated all Russian erotic art. Now there are two trends: 1. the revival of genuine erotic art and literature, including translations of classical novels of D. H. Lawrence, Vladimir Nabokov, Henry Miller, and others, old Chinese and Hindu treatises, and erotic films from the West, and 2. a torrent of pornographic and semipornographic books, films, and videos. All of this is very new and unusual for the Russian people (Kon 1995, 113-116).

In the spring of 1991, the Communist Party tried to use this situation for its own political purposes, initiating a big anti-pornography crusade. In whipping up a moral panic in the country, the Communist Party pursued very clear political goals. The anti-pornography campaign was used to divert popular attention from the pressing political issues and to blunt awareness of the government's economic failures. In flagging its defense of morality and the family, the Party was deflecting blame from itself for the weakening and destruction of both morals and the family. On that basis, the Party leaders were able to cement the developing alliance between the Party and conservative organizations, including the Russian Orthodox Church and blatantly fascist groups. Anti-pornography slogans have been used by the Party to direct popular fury and frenzy against *glasnost* that was so hated by the Party *apparatchiks*, by branding the democratic mass media as being part of a Jewish-Masonic conspiracy intended to corrupt the morals of young people, destroy traditional values, and so on. Under the pretext of concern for young people, the Party was endeavoring to restore its lost control over them.

However, the campaign failed when the people did not swallow the bait (see Kon 1995, 1997a). Public opinion polls show that the majority of Russians do not like pornography, but are positive about erotica. But to differentiate between the two is difficult, and there is a deep generation gap on this issue. Purely repressive police measures taken by some local authorities are ineffective. Instead of the former taboos on sexuality, it is now vulgarized, commercialized, and Americanized. The current Russian government is trying to bring the situation under control, but without much success.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

One of the most disturbing consequences of the lack of sexual culture in Soviet society has been the exceedingly limited contraception culture, as a result of which induced abortion was, and remains today, the major method of birth control and family planning (Kon 1995, 61-62, 178-193).

Already in the early part of the 20th century, Russian doctors officially recognized that the development of effective contraceptive methods was the only alternative to induced abortion with all its dangerous consequences. Soviet medicine also understood this. In 1920, induced abortion was legalized. Until the end of the 1920s, the U.S.S.R. was a leading world country in its family policies.

Nevertheless, in 1936, induced abortion was banned and no other means of birth control introduced. After the ban was lifted in 1955, induced abortion remained the principal form of birth control.

According to Andrei Popov (1992), Soviet family planning was distinguished by the following general traits right up to 1988:

- Although the right to family planning was formally proclaimed *de jure* in accordance with international conventions, this right was never *de facto* realized;
- Services were inaccessible or nonexistent owing to a total lack of information, an absence of qualified personnel and specialized medical services, and the unavailability of modern contraceptives;
- The only easily accessible method of family planning was and continues to be induced abortion; and
- Family planning behavior varies widely by region, according to the ethnographic, demographic, and socio-economic realities within each region.

Without the necessary scientific information, modern contraceptives, and the ability to use them, the Soviet public was doomed to employ traditional and largely ineffective methods (see Table 7).

Until 1987, the Soviet Ministry of Health conducted a major propaganda campaign against oral contraceptives. Most Soviet citizens are relatively ignorant about the more sophisticated forms of contraception.

Since 1987, the negative consequences of this situation have begun to be officially acknowledged, highlighting two obvious problems: the material shortage of modern hormonal, chemical, and barrier contraceptives, and the lack of information and psychological sophistication regarding sexual and reproductive practices.

In 1993, experts of the World Health Organization (WHO) found that both physicians and women in St. Petersburg were convinced that hormonal pills are terribly dangerous. And only 11% of Russian gynecologists recognized the right of teenagers to confidentiality, a condition *sine qua non* of the effective contraceptive services for teenagers.

The government survey in 1990 demonstrated that 30.5% of all girls under age 15 had no knowledge whatsoever about contraception. In the 16- to 17-year-old age group, this percentage was 24.6, and among 18 to 23 year olds, 11%. Over 96% of 16- to 17-year-old girls never used any contraceptives. Most teenage sex—and their sexual activity is growing—still goes unprotected.

### B. Teenage Unmarried Pregnancies

As a consequence of the lack of contraceptives, the number of unplanned pregnancies and unwanted births is growing, despite the prevalence of abortion. According to national statistics, the rate of extramarital births was about 10% in 1987; in 1992, it was 17%. The rates are even higher in the largest cities. The rate of premarital conception of firstborn children among married couples in Leningrad rose from 27% in 1963 to 38% in 1978. Similarly, one study in the early 1980s found that, of 1,000 first pregnancies reported in a large Russian city, 272 were aborted, 140 births occurred out of wedlock, and 271 births took place in the first months of marriage—leaving only 317 children actually conceived within marriage (Kon 1995, 169, 181-182).

[Update 2002: As a consequence, in 1989, Russia was a world champion as far as unwanted pregnancies and induced abortions were concerned. Thanks to efforts by medical personnel, the abortion rate has declined in recent years. According to official figures, in 1990, women aged 15 to 49 reported having 114 abortions per 1,000 women, compared with 98 in 1992 and 74 in 1995. Despite the significant decrease, the figure is still very high. Child prostitution and sexual violence are flourishing. For about 10% of teenage girls, their first sexual initiation is associated with some degree of coercion. No more than 5% to 7% of rapes are formally reported, and even these cases are often ignored. (End of update by I. S. Kon)]

### C. Abortion

The total annual number of abortions in the late 1980s, according to official data, amounted to 6 to 7 million. That was virtually a fifth or even a fourth of all abortions performed in the world. The number of “backstreet abortions” was estimated at 12% of the total, according to official estimates, but at 50% to 70% according to independent experts. Thus, the aggregate number of abortions in the U.S.S.R. came to 10 to 11 million a year. Even without these adjustments, the number of abortions per 1,000 women of reproductive age in 1985 surpassed by six to ten times the analogous figures for Western Europe. On average, every woman

in Russia has four to five abortions during her lifetime (Kon 1995, 61-62, 73-75, 178-193).

In 1989, a voluntary association, the Family and Health, was organized and affiliated with International Planned Parenthood World Federation to raise public awareness of family-planning options and to improve the image of contraceptive methods other than abortion. Since 1991, it is supplemented by the Russian Family Planning Association. Mass media, particularly television, have begun to deal directly and positively with birth-control issues.

Unfortunately, but not surprisingly, this work is not very effective. According to the VTsIOM 1992 survey, most women indicated that they had used some form of contraception during the last five years (Kon 1995, 275). Only 18% did not use any contraception. Most likely not to use contraception are women between the ages of 15 and 20 (40%), the unmarried (29%), the poorly educated (24%), and those living in rural areas (22%) (see Table 8).

Modern contraception tends to be popular largely with the younger (under age 25) and better-educated women, while the rest commonly employ traditional, less reliable, but more-accessible methods. A 1990 survey of Soviet-German students (average age 25) showed that 15% of the female students had already had an abortion, 6% more than once. In 1992, 297,029 Russian teenage girls had an abortion; of these 16,320 were illegal.

The most-preferred contraceptive method was the IUD, most favored by half of the women and the second choice for 25%. The pill was less popular, favored by 18% as first choice and 25% as second choice. The pill is still believed to be unsafe and unreliable. The condom was the third-ranking first choice.

If the current plans of the government to make women pay for abortions, except when medically indicated, materialize, this situation will become much worse. Even now, according to the St. Petersburg Yuventa Reproduction Center, in spite of the general availability of professional abortion services, 80% of women who contact the abortion clinics do so only after they have tried to do something, often dangerous, themselves.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

The customary hypocrisy did not allow the Soviet people to talk openly about STDs. STDs have been consistently regarded throughout the 20th century as shameful. This attitude has hampered health education, especially when new infections are confronted (Kon 1995, 229-231).

Table 7

Percentage of Users of Specific Contraceptive Methods (Moscow Sample Surveys, 1965-1983)

Method	Year of Survey Publication			
	1965-1966	1978	1982	1983
Withdrawal	32	34	14	25
Rhythm (calendar)	—	18	28	27
Condom	46	42	22	24
Diaphragm	—	1	1	1
IUD	—	8	11	10
Oral contraceptives	—	4	4	2
Spermicides	1	—	3	3
Rhythm (temperature)	—	—	2	—
Douche	—	23	17	8
Combinations	12	—	—	12

Note: Respondents were allowed to indicate more than one method used.

Table 8

Contraceptive Methods Used During the Last Five Years (in Percentages)

Method	Frequency Used		
	Always	Sometimes	Not Used
IUD	37	11	52
Condom	18	51	31
Rhythm	17	31	52
Coitus interruptus	14	46	40
Vaginal douche	10	29	61
Pill	10	19	71
Spermicidal	2	14	84
Spermicidal + condom	1	4	95
Diaphragm	0	1	99

Nonetheless, free state medicine provided treatment in special dermatological and venereological clinics, with mandatory official registration identifying the source of infection, and doctors assisted by police endeavored to follow the entire chain of dangerous contacts. Treatment was compulsory, and any infringement of that, or willful infection of anyone with an STD, was punishable under the Russian Criminal Code. This policy enabled the state to confine the danger within certain limits.

In the early 1980s, physicians noted a substantial rise, especially among young people, in the so-called minor venereal diseases that often occur without symptoms. Russians had practically no knowledge of genital herpes or chlamydia until they encountered it in their own experience.

The demise of the Soviet system has acutely affected the epidemiological situation for the worse. Extensive sexual contacts with different partners, given the ignorance and lack of observance of elementary safety and hygiene rules, is dangerous in itself. State medicine is now debilitated, and in some areas collapsed, because of lack of funds, medicine, and equipment. Private medicine is not available to all, and, when available, it is less effective, especially when it comes to maladies requiring lengthy treatment with subsequent supervision. Administrative supervision is now worse, and official statistics have become even less reliable.

So there is an increase in sexually transmitted disease, particularly among young people. People are becoming infected at a younger age. A sharp increase in the incidence of syphilis began in 1988, followed by gonorrhea in 1991. In large cities, such as Moscow, these diseases have already reached epidemic proportions. Virtually half of that increase is accounted for by children and adolescents. According to the U.S.S.R. Health Ministry figures for 1985-1987, the number of under-17 women infected by STDs increased by virtually a third throughout the country.

The overall STD picture is still not as bad as it is in many other countries. According to Russian statistics, the rate of syphilis infection is on the increase, with 9,873 cases in 1991 and 7,178 cases in the first six months of 1992. The gonorrhea rate has fallen slightly, from 180,883 in 1990, to 175,020 in 1991, and 87,724 in the first six months of 1992. These statistics do not take into account that many people use home treatment or seek help from a variety of private practitioners who are not part of the official statistical records.

A special epidemiological investigation by Olga Loseva shows that in 1991, the number of registered syphilis sufferers in Russia rose by almost 34%, in Moscow by 17% in 1991, and by another 50% in the first quarter of 1992 (Kon 1995, 277). This is primarily because of the rise in child and teenage prostitution that often begins between ages 10 and 12 for girls and age 14 for boys. No less than half of the infected go to unregistered medics for treatment.

What is to be done? There are two competing strategies. The first demands more stringent administrative measures, namely enforcement of the law prohibiting private doctors from treating STDs. The second strategy would take the social and psychological reality into account. Patients should have the right to choose whether to go to a private doctor or use the state medical system. But the private doctor must report disease cases to the epidemiological services so the epidemiological situation can be correctly evaluated, trends forecast, and preparation made for future needs.

[Update 2002: There has been an enormous growth of STDs and AIDS. Between 1990 and 1996, the incidence of syphilis increased 50-fold in Russia, and 78-fold among young people. In 1996, 265 new cases of syphilis were diagnosed per 100,000 of population. The 1999 figures for syphilis were lower (185.4 per 100,000), but those for gonorrhea

rose to 14.5% since 1998. Fourteen percent of the syphilis and 19% of the gonorrhea sufferers were 15- to 19-year-olds. See also the updates in the following section on HIV/AIDS. Both show the importance of a sex education strategy. (End of update by I. S. Kon)]

## B. HIV/AIDS

Because of its relative social isolation in the past, the former Soviet Union, for a number of years, was spared the effects of the HIV-related diseases. Even now, the number of people infected and ill is much lower than in most Western countries (Kon 1995, 203-38, 261-62).

On April 1, 1994, the number of HIV-positive persons in the Russian Federation was 740, of whom 286 were children infected in hospitals and maternity homes. The number of AIDS sufferers was 124, of whom 96 were children.

However, this lead-time on the HIV epidemic has been wasted by government authorities and medical professionals. Instead of preparing the country for the inevitable increase in infection rates, the Soviet Ministry of Health and government-sponsored mass media waged an ideological campaign in the early 1980s—even accusing the Pentagon and CIA of inventing the virus as a form of germ warfare! Next, the blame was put on homosexuals and drug addicts. Hopes for control of the disease were placed on the prisons (for homosexuals) and on moral exhortations in favor of monogamy (for the addicts and the remainder of the population). Unfortunately, this strategy continued even after the disease had claimed its first victims. As late as 1988, an appeal to explore the social and psychological aspects of AIDS, including the dangers of an AIDS-induced public hysteria, brought violent attacks in the conservative media.

The major high-risk group in Russia turned out not to be gays, drug addicts, or prostitutes, but newborn children infected in maternity homes through lack of disposable syringes and the negligence of medical staff. Now the children and their families have become victims, not only of this terrible disease, but also of an AIDS-phobia. Medical personnel are scared of treating them, coworkers do not want to work with members of their families, and some schools are demanding their removal.

Since AIDS-prevention politics are completely in the hands of epidemiologists, millions of rubles are spent on diagnostics, HIV-tests—25 million were tested in 1993, and so on, but there is no money for prevention programs and sex education. Education and prevention programs are mainly in the hands of different voluntary organizations.

[Update 2002: In addition to the increases in STDs (see update in the previous section), the incidence of HIV has also begun to grow nearly exponentially. The cumulative number of HIV-infected persons reached 24,600 in 1999. The total number of registered HIV infections more than doubled to 177,354 in 2001 from 87,177 in 2000. Experts believe that the real figures are much higher, perhaps double. In some districts, like Irkutsk, HIV has already attained epidemic proportions. These facts suggest that something must be done, and that the first step could be sex education. (End of update by I. S. Kon)]

[Update 2002: The spread of the HIV virus did not reach epidemic proportions in Russia until the mid-1990s, when the social and economic ills associated with the collapse of communism fed an explosion of intravenous drug use. By 2002, it was clear that sexual transmission of the virus was starting to rival and overtake IV transmission. In Kaliningrad, a Russian enclave between Lithuania, Poland, and the Baltic Sea, only 4% of new infections were because of sexual contact in 1996. Five years later, in 2001, the percentage of new infections in Kaliningrad attributed to sexual contact

jumped to nearly 30%. In the same year, in all of Russia, sexually transmitted HIV infections accounted for little more than 5%. Epidemiologists believe that Kaliningrad is a bellwether, marking a shift from transmission by IV-drug use to infections spread by prostitution and sexual contact. The projection is that sexual transmission will easily overtake transmission by needles through all of Russia by 2006, as young women drug addicts increasingly depend on prostitution to support their drug addiction. In 2001, an estimated 3,000 women work as prostitutes in Kaliningrad, but new clusters of prostitution have appeared on Kaliningrad's boarders with Poland and Lithuania, where they serve long lines of motorists and truckers waiting to cross. Money from the World Health Organization, the French, and private donors is supporting new clinics that distribute condoms and pamphlets on safer sex to the prostitutes (Myers 2002). (End of update by R. T. Francoeur)]

[Update 2002: UNAIDS Epidemiological Assessment: During 2000-2001, the country experienced a further dramatic increase of HIV incidence. By the end of 2001, a cumulative total of 173,068 cases of HIV infection had been reported, of which 86,000 were reported in 2001. Prevalence at the end of 2001 was 118.2 per 100,000 population. Large outbreaks of HIV in injection drug users have occurred since 1996. In 1998, 42% of the cases reported were among injection drug users and 48% were reported with undetermined transmission mode.

[Until 1995, HIV/AIDS surveillance was organized mostly through mandatory screening in most subgroups of the population, together with contact tracing. Since then, testing has remained mandatory only for blood donors, prisoners, and professionals exposed to HIV. The number of tests done has decreased by 43% between 1994 and 1996, in part because of the change in testing policies and reduced funding; there was a decrease of 33% and 54% among blood donors and prisoners for whom testing policies remained the same. Diagnosed HIV infections are reported by name in a national HIV case-reporting system.

[Prevalence data come mostly from the ongoing screening programs. Incidence of syphilis cases increased dramatically from less than 30 cases per 100,000 in 1978 to 92 to 172 per 100,000 in 1995. Incidence of gonorrhea cases increased from 75 cases per 100,000 in 1987 to 236 cases per 100,000 in 1993, and then decreased to 165 cases per 100,000 in 1995; underreporting of gonorrhea is estimated to be substantial.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	700,000 (rate: 0.9%)
Women ages 15-49:	180,000
Children ages 0-15:	NA

[An estimated 9,000 adults and children died of AIDS during 2001.

[No estimate is available for the number of Russian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

The traditions of pre-1917 Russian sex research were completely lost in the 1930s and 1940s. Revival of medical sexology (sexopathology) as an area of clinical medicine that studies the functional (behavioral, personal, and social) aspects of sexual disorders began in the 1960s with a series of seminars under the leadership of Professor N. V. Ivanov in the city of Gorky (Nizhny Novgorod) and later in Moscow at the Sexopathology Department of the Moscow Psychiatry

Research Institute. In 1973, this department gained the status of an All-Union Scientific Center on Sexopathology.

Initially, a monodisciplinary approach dominated Soviet sexopathology. Urologists, and to a lesser extent the gynecologists and endocrinologists, set the tone. Subsequently, however, when the neuropathologist Professor Georgi Vasilchenko took charge of the center, the picture changed. Vasilchenko maintained that sexopathology should not take the "brigade" approach, where the urologist treats "his" pathology, the psychiatrist "his," and the endocrinologist "his," while the sexopathologist operates as a transport controller. His approach viewed sexopathology as an independent, interdisciplinary clinical discipline. It was in this spirit that the first Russian handbooks for doctors were written under his editorship—*General Sexopathology* (1977) and *Special Sexopathology* (1983).

Professor Abram Svyadoshch set up the first Sexological Center in Leningrad. His book *Female Sexopathology* (1974) enjoyed three editions and became a genuine bestseller. The Leningrad psychiatrists Professor Dmitri Isayev and Dr. Victor Kagan began to study the formation of sexual identity and problems in juvenile and adolescent sexuality. They published the first Soviet guide for doctors *The Psycho-Hygiene of Sex among Children* (1986).

Soviet sexological service was based on the principle of ambulatory assistance, preserving a normal living pattern, carrying on normal work, and sexual activity. The need for hospitalization arises only in cases of acute psychopathological disorder (where a patient will be placed in a neurosis unit or a daytime inpatient psychoneurological clinic), vascular insufficiency of the genitalia (admission to an angi-surgical unit), acute urological illness (a urological unit), and specific endocrinopathy (an endocrinological unit). Inpatient treatment is normally followed by a period of ambulatory sexual readaptation by the partners.

Analysis of visits to sexological clinics reveals that the bulk (70 to 75%) of patients have sexual problems of a psychological nature. Women's visits to a sexopathologist account for no more than 10% of the total number of patients. The percentage of patients who come because of misinformation or distorted knowledge about sex is fairly high, up to 10 or 15%.

In 1988, in the large cities, special family medical-psychological consultation units were introduced for:

- consultative-diagnostic selection of patients needing observation and treatment in the unit;
- comprehensive therapy of patients with sexual disorders through psychotherapy, physiotherapy, reflex-therapy, pharmacotherapy, and specialized procedures;
- psychological diagnosis and correction methods for family relationship disorders; and
- hygiene-educative and psychotherapeutic work with the public and, first and foremost, with people just entering marriage and couples divorcing.

## 12. Sex Research and Advanced Professional Education

### A. Russian Sexology

Historically, the professional training of sexopathologists was delayed in favor of other priorities. The first department of sexology was organized in the Leningrad (St. Petersburg) Institute for Advanced Medical Training only in 1989. Students at other medical colleges receive no sexological training at all.

The beginning of the 1990s saw extensive promotion of individual medical activity and group work. Numerous

medical cooperatives and profit-making centers are increasingly advertising the services of sexopathologists. The development of this type of medical practice reflects the public's demand for it. The professional level of this practice is sometimes problematic.

The Russian Sexological Association Health and Culture was established in February 1991, to promote an interdisciplinary investigation of sexual behavior, sex education, and sex culture. But, like many other post-Soviet voluntary organizations, it exists only on paper and serves as a cover for private commercial activities like sex shops. Somewhat more efficient is the medically oriented Soviet Sexological Association.

## B. Recent Soviet and Russian Sexual Surveys

Because not one Soviet or Russian sexual survey was ever published in the normal scientific way, with all tables, questionnaires, and methodological discussions, sexologists, such as the present author, are forced to rely on published papers and summaries, as well as whatever unpublished data, raw tables, and so on they can obtain from colleagues (Kon 1995, 275-277). Below is a short description of the most important recent Russian surveys.

1. The VTsIOM "Culture" Poll of June 1992, was conducted by Vsesoyuznyi (since 1992, Vserossiiskii) Tsentr Izucheniya Obshchestvennogo Mneniya (VTsIOM, All-Union [since 1992, All-Russia] Center for Public Opinion Research), with Professor Yun Levada as director.

This poll involved a representative sample of about 3,500 persons in three different areas: Slav (Russia and Ukraine); Baltic (Estonia and Lithuania); and Asiatic (Uzbekistan and Tadzhikistan). In the Slav area, the population was surveyed without regard to ethnic origins or "nationality" (that is, not only ethnic Russians, but also Tatars, Jews, Germans, and others were questioned), while in the other two regions, only members of indigenous nationalities were surveyed (that is, in Estonia, Estonians but not Russians).

Questionnaires were completed by the respondents in the presence of a professional interviewer. Among many other questions, some were related to sexuality: Are people happy in love and family life? What are their family values, their attitudes to premarital and extramarital sex, conjugal fidelity, erotica, sex education, and so on?

2. The VTsIOM "The Fact" June 1993 Survey involved a representative sample for the Russian Federation, 1,665 persons. Demographics for this survey included 746 men and 909 women, aged from 16 to 84 (16-25 years, 285; 24-40 years, 546; 40-55 years, 383; and 55-84 years, 461), from 13 different regions. The subjects' educational level was: 235, university level; 803, high (secondary) school; and 616, fewer than 9 years of secondary school. The occupational demography was: nonworking pensioners, 409; manual workers, 330, professionals, 284; technicians, 136; other employees, 120; and students, 87. The subjects' place of residence included: capitals and regional cities, 604; towns, 614; and villages, 344. All standard procedures normally used in public opinion polls were used.

Some of the questions concerned attitudes toward the following aspects of sexual behavior (on 5-point scales, from "It deserves censure" to "I don't see anything wrong in it"): masturbation, premarital sex, frequent change of sexual partners, marital infidelity, viewing of pornographic films, group sex, homosexual contacts, induced abortions, and so on. There were also a few questions about personal sexual experience,

such as age at the first sexual contact, number of lifetime sexual partners, and present sexual activities. About 40% of respondents did not answer these personal questions.

3. The Adolescent Sexuality Survey published in 1993 and conducted by Vladimir Shapiro and Valery Chervyakov, Institute of Sociology, Russian Academy of Sciences, with Igor Kon as a consultant and Mana Gerasimova as the research organizer. This survey used an adapted version of American sociologist Stan Weed's questionnaire. The data were collected in late 1992 and early of 1993. The sample involved 1,615 students (50.4% boys and 49.6% girls) from 16 high (secondary) schools and eight vocational schools in Moscow and St. Petersburg. The students' ages ranged from 12 to 17 years, and their grade levels from the 7th to 11th grades.

The questionnaire contained 135 questions about aspects of sexual experience and attitudes: dating, going steady, age at, and the motives for, the first sexual intercourse, sources of sexual information, communications with parents and peers, moral and religious values, involvement in deviant behavior, and some personal psychological characteristics. The schools were selected to represent different social strata of the two cities' populations. Questionnaires were completed in the classrooms, anonymously, voluntarily, and individually, in the presence of a professional interviewer. The permission of the school administration was obtained, but none of them had access to this confidential information. There were no refusals from students to take part in the research, but some respondents did not answer certain questions. Detailed statistical analysis may be available by the time this chapter is published; however, a general popular overview of the results was published by Igor Kon, Valery Chervyakov, and Vladimir Shapiro in 1994.

4. A second survey of adolescent sexual attitudes, representations, and practices was conducted by Igor Lunin (1994) of the St. Petersburg Crisis Prevention Service for Children and Adolescents between May and September of 1993. The sample population for this survey was 370, (185 boys and 185 girls, secondary (high) school 10th graders and vocational school students from three socially and economically different districts of St. Petersburg). The average age was 15.9 years.

In this study, an anonymous questionnaire was preliminarily reviewed in teenage discussion groups. Participation, on the school premises, was individual and voluntary. Questions concerned sexual values and behavior, main sources of sexual and contraceptive information and the evaluation of its availability and reliability, sexual harassment, violence, and rape experience, and attitudes to condoms and to different forms of sex education. (In addition to Lunin (1994), see also Igor Lunin, Thomas L. Hall, Jeffrey S. Mandel, Julia Kay, and Norman Hearst, *Adolescent Sexuality in St. Petersburg: Russia in the Era of AIDS* (in press).) A detailed statistical analysis is also in progress.

5. A telephone survey was conducted by Dmitri. D. Isayev in St. Petersburg between September and December 1993. The sample for this survey was 435 people, 16 to 55 years old; 155 men (average age, 35.4 years and 67.5% married), and 280 women (average age, 37.3 years with 67% married). Questions were asked about personal sexual experience and attitudes, number of partners, safe-sex practices, and AIDS-prevention measures.

6. An epidemiological study was conducted in 1991 by Olga Loseva, a Moscow venereologist. This unpublished dissertation summarized 15 years of research of sexual behavior and sexual values of syphilitics. Loseva collected data on 3,273 heterosexual men and women at a venereological clinic in Moscow: 300 medical histories and about 3,000 questionnaires. The data came from 1,782 infected patients and 1,191 in a control group of persons without sexually transmitted diseases, plus 120 teenage girls. Sociologically, the samples were not representative, but a comparison of three control groups, divided by five-year intervals, is informative for the shifts in sexual attitudes and practices.

### Conclusion

Sexuality is just beginning to be thought of as a subject worthy of consideration and study by Russian researchers. Clearly, sexual behavior is diverse in societies as large and heterogeneous as Russia and the other republics of the former Soviet Union. Although certain values are strong within and between these societies, there is no single standard of "normal" sexuality for family members. Marriage is valued as a primary arena for sexual expression; however, sex-related ideas, attitudes, and activities are extremely diverse. Citizens are exposed to sexual information and images from a variety of public sources. Naturally, their reactions to these differ, and the impact upon their behavior is varied. Parents seem concerned about the proper sexual development of their children. Yet, some of these same parents respond by suppressing expressions of sexuality in the family, others by obsessively explicating sexual guidelines, and still others by supporting social programs of sex education in schools and community institutions (Kon 1995, 265-272).

To develop effective public policies that encourage responsible sexual expression by citizens without reactionary negativism, and to accommodate pluralistic diversity without succumbing to crippling ambivalence—these will be the challenges common to our countries as they enter the 21st century.

[Update 1997: A March 1997 Russian Academy of Education conference clearly indicated the Russian Orthodox Church is rapidly assuming the Communist ideological mantle of sexual repression. Attacking all sex education in schools and any expression of sexuality as "satanic," Orthodox clergy have demanded a United Nations-sponsored sex education project be stopped immediately because it is a Western conspiracy to depopulate Russia. Although a few medical efforts and the Russian Planned Parenthood helped reduce the abortion rate since 1991 by 50%, teen syphilis rates increased 30-fold and teenage coital experience increased and began earlier. Orthodox clergy preach that they alone can provide proper sex education for the people, claiming that Westerners are trying to exterminate Russian culture by reducing its birthrate with abortion, contraception, sexual excesses, masturbation, and homosexuality. Mass media freedom is also threatened as legislators seek to outlaw "any products of mass media, other printed and audiovisual products, including advertising, messages and materials transmitted and received by computer networks, as well as things and means satisfying needs related to the sexual drive, except for medical drugs and products." (End of update by I. S. Kon)]

[Update 2002: What may be the possible results of the current Russian sexual counterrevolution?

[Basically, this is only the tip of the iceberg. Under the guise of a moral renaissance, these people want to restore

ensorship and administrative control over private life. In the long run, this goal is virtually unattainable. Sexual attitudes and practices in Russia are already highly diversified by age, gender, education, and regional, ethnic, and social background. In the near future, this heterogeneity will probably increase and may produce new cultural tensions. But in the long run, it is the younger, urban, and better-educated people who will have the upper hand in defining what is right and what is wrong. Any attempts by the state, Church, or local community to forcibly limit their sexual freedom is doomed to failure, and will be detrimental to the authority of the institutions making such an attempt.

[The Communist Party, which has waged this new holy war, belongs to the past; it is a party of old men. The militant position of the Orthodox clergy also may have a boomerang effect. They seem to have forgotten an old Soviet joke: "How can you make art flourish and religion decay? It is very easy, you simply disconnect art from the State and make religion compulsory."

[Yet, the crusade against sex research and sex education has very dangerous practical social consequences. Without professional sex education, it is impossible to solve such urgent public health issues as teen pregnancy and STD-HIV prevention. Effective family planning is equally impossible without sexual knowledge. And, last but not least, the antisexual crusade widens the generation gap, which is already vast and yawning. (End of update by I. S. Kon)]

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

#### A. Demographics

The Republic of South Africa is situated at the southern tip of the African continent and extends over an area of 471,011 square miles (1,219,912 km<sup>2</sup>), about twice the size of the state of Texas. The country surrounds the nation of Lesotho and is bordered on the north by Namibia, Botswana, and Zimbabwe, and by Mozambique and Swaziland on the east. The large interior plateau has few major lakes

(CIA 2002)

and rivers. Rainfall is sparse in the west and plentiful in the east. The climate is mostly semiarid with subtropical along the eastern coast. Days are sunny and the nights cool.

In July 2002, South Africa had an estimated population of 43.65 million. These estimates explicitly take into account the effects of excess mortality because of AIDS. This can result in lower life expectancy, higher infant mortality and death rates, lower population and growth rates, and changes in the distribution of population by age and sex than would otherwise be expected. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 31.6% with 1.01 male(s) per female (sex ratio); 15-64 years: 63.4% with 0.94 male(s) per female; 65 years and over: 5% with 0.6 male(s) per female; *Total population sex ratio:* 0.94 male(s) to 1 female. The age profile for whites is more evenly spread across age categories. Half of the black population and a third of the white population are under 20 years of age. There are many more children between the ages of 5 and 9 than in any other age group. The white population is aging, with 13% over the age of 60, whereas only 6% of the blacks fall into this age cohort.

**Life Expectancy at Birth:** *Total Population:* 45.43 years; *male:* 45.19 years; *female:* 45.68 years. [*Update 2001:* According to a UNAIDS projection, by the year 2010, the AIDS epidemic will have reduced the average life expectancy of South Africans to 36 years, a drop of 47% from the average life expectancy of 68 years projected without AIDS. (*End of update by L. J. Nicholas*)]

**Urban/Rural Distribution:** 63% to 37%, with 90% of whites and coloreds, 95% of Asians/Indians, and over 60% of blacks living in urban areas.

**Ethnic Distribution:** Black: 75.2%; white: 13.6%; colored: 8.6%; Indian: 2.6

**Religious Distribution:** Christian: 68% (including most whites and coloreds, about 60% of blacks, and 40% of Indians); Muslim: 2%; Hindu: 1.5% (60% of Indians); indigenous beliefs and animists: 28.5%

**Birth Rate:** 20.63 births per 1,000 population

**Death Rate:** 18.86 per 1,000 population

**Infant Mortality Rate:** 61.78 deaths per 1,000 live births

**Net Migration Rate:** -1.56 migrant(s) per 1,000 population

\**Communications:* Lionel Nicholas, Ph.D., University of the Western Cape, Centre for Student Counseling; (home address: 601 Villa D'Este Private Bag X17, 257 Beach Road, Bellville, 7535 South Africa; LNicholas@uwc.ac.za.

\*\* The updates by Dr. Nicholas are based on the preliminary report of the South African Demographic and Health Survey completed in September 1998. The survey is nationally representative and the sample was selected from the 1996 census data. A total of 12,247 households were surveyed and 11,735 women were individually interviewed.

**Total Fertility Rate:** 2.38 children born per woman

**Population Growth Rate:** 0.02%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 19.94%; *Persons living with HIV/AIDS:* 4.2 million; *Deaths:* 250,000. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): Overall: 81.8; whites: 99%; Asians: 69%; coloreds: 62%; Africans: 50%. Only 10% of blacks have a secondary high school education and only 6% have any education beyond high-school level. In 1993, there were 105 colleges with 60,000 students, 21 universities with 337,120 students, 15 technical colleges with 130,000 students, and 128 technical colleges with 93,000 students (Cooper et al. 1994).

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$9,400 (2001 est.); *Inflation:* 5.8%; *Unemployment:* 37% (unemployment is a major and ever-increasing problem); *Living below the poverty line:* 50% (2000 est.)

South Africa's first democratically elected government is currently grappling with unemployment, violence, illiteracy, and numerous other problems. It does, however, have tremendous natural resources, a well-developed industrial, educational, and transportation network, and enough skilled workers to start redressing the economic havoc apartheid has wreaked on South Africa. Many diverse ethnic, cultural, and religious groups make up the South African landscape, and these groups continue to influence one another, as they are in turn being influenced by the international community. Internal migration is a problem in South Africa, as socioeconomic and political factors force large segments of the population to leave rural areas and crowd into the cities.

## B. A Brief Historical Perspective\*

The roots of today's Republic of South Africa stretch back to the Dutch East India Company's arrival on the Cape of Good Hope in 1692. By the end of the 18th century, Boer or Afrikaner colonists numbered only about 15,000. Britain occupied the Cape colony in 1814 at the end of the Napoleonic wars, bringing another 5,000 settlers. Anglicization of the government and the freeing of black slaves drove about 12,000 Afrikaners to make the "great trek" northeast into African tribal territories, where they established the republics of the Transvaal and the Orange Free State. The discovery of diamonds in 1867 and gold in 1876 brought an influx of "outlanders," whose presence spurred Cecil Rhodes to plot annexation of the British Cape and Natal colonies. A three-year war between the Boers and the British, 1899 to 1902, resulted in 1910 in the formation of the Union of South Africa, joining the two former republics and the two colonies.

South Africa became a charter member of the United Nations in 1945, but refused to sign the Universal Declaration of Human Rights. Apartheid—racial segregation—dominated domestic politics as the nationalists gained power and imposed greater restrictions on the Africans, coloreds, and Asians. In 1949, apartheid became national policy. Afrikaner opposition to South Africa's membership

\**Editors' Note:* This unique history poses a different kind of challenge for sexologists. Fortunately, Mervyn Hurwitz, the only South African member of the Society for the Scientific Study of Sexuality, accepted the editor's invitation to prepare a chapter on his country. Equally fortunate—and unexpected—Ted McIlvenna, founder of the Institute for the Advanced Study of Human Sexuality, introduced the *IES* editor to Lionel Nicholas at the 1994 meeting of the Society in Miami, and Dr. Nicholas agreed to work with a woman colleague to provide a black perspective that complements the perspective provided by Dr. Hurwitz. The two parts of this chapter are two windows on sexuality in South Africa.

in the British Commonwealth ended on May 31, 1961, with the declaration of the Republic of South Africa and the severing of all ties with the Commonwealth. In 1963, South Africa established the Transkei, the first of four partially self-governing republics, territories, or "homelands" for blacks. The Transkei consists of three discontinuous enclaves in the southeast. The seven areas of Bophuthatswana were joined in a northern Homeland in 1977. The Venda Homeland, with two discontinuous areas in the northeast, was established in 1979. In the southwest, Ciskei became a homeland republic in 1980. None of these territories has international recognition as a republic. In 1991, following negotiations between the government and the African National Congress, the Parliament scrapped the country's apartheid laws that limited ownership of property, required registration of South Africans at birth by race, and supported minority rule.

## PART 1:

### A PERSPECTIVE ON THE PEOPLE OF COLOR

LIONEL JOHN NICHOLAS and  
PRISCILLA SANDRA DANIELS

#### 1. Basic Sexological Premises

##### A/B. Gender Roles and the Sociolegal Status of Males and Females

South Africa is a strongly male-dominated society where violence against women is at a high level. Gender equality and freedom to express one's sexual orientation is enshrined in the new constitution of South Africa, but it is widely acknowledged that we have far to go before getting near to this ideal.

In general, women and men negotiate their lives differently, as well as express their sexual vulnerabilities differently. In a patriarchal society like South Africa, one may expect these differences to be more prevalent than reported in the relevant international literature. Sex counseling will have to take into account the differing sexual socialization experiences of women and men in societies that institutionally and structurally accept the dominance of men, and where many women and men may also have accepted sexist stereotypes (Nicholas 1994a, 6).

##### C. General Concepts and Constructs of Sexuality and Love

The concepts and constructs of sexuality and love differ markedly between urban and rural communities for all groups in South Africa. Much of this difference is influenced by the greater visibility of particular love or sexual behaviors and observable traditional practices in rural areas that are protected from new urban practices. The following example of peer pressure to have sexual intercourse is cited from Preston-Whyte and Zondi:

They laugh at you and say you are old-fashioned not to sleep with a boy, and they tell you that you are not in the country now, with the peer group watching to see you only do ukusoma—that was 'external' intercourse. No mothers in town examine one to see if you are a virgin—just let them try! (Preston-Whyte & Zondi 1992, 235)

African and colored groups are likely to have developed a larger range of "nontraditional" sexual behaviors because of the massive efforts to destabilize these communities, including removing parental figures through an enforced migratory labor system and high mortality rates. White and Asian groups have had more-intact family and extended-family systems in both urban and rural settings, which increased the capacity of these groups to monitor and regulate

sexual practices of their members. These groups do, however, experience the same challenge to the concepts and constructs of sexuality and love mainly informed by religious guidelines of chastity.

Loubser (1994) reported that Afrikaner junior high school pupils regularly watched pornographic videos and engaged in sexual intercourse, and many of those who were virgins anticipated that their status would change in the near future.

While all groups would consider the seduction of a young woman as a situation where reparation has to be made, the acceptable reparation would differ widely across groups, especially if a pregnancy has resulted from the seduction. The different African groups have elaborate formal negotiations involving family members on both sides. A go-between would also negotiate the amount of bridewealth on behalf of the man's family before marriage takes place.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Some Typical Religious Values

According to the 1996 census, non-Christian religious affiliation was only 3.8% (Islam 1.5%, Hinduism 1.5%, Judaism 0.2%, and other faiths 0.6%). Some 12.9% indicated no religion. The largest religious groups were Zion Christian 10.7%, Dutch Reformed 9.8%, Apostolic 9.8%, Catholic 9.5%, Methodist 7.8%, and Pentecostal/Charismatic 6.1%. Hindu, Islamic, and Jewish traditions are also major influences in particular geographic areas. The most vociferous support for censorship has come from representatives of a range of religious denominations led by the Dutch Reformed Church. The religious-influenced taboos around sexuality are particularly strong in South Africa. Public discourse on sexuality has been severely restricted by legal, political, religious, and social norms. Stringent censorship has been a central and a bizarre feature of South African life. For example, in 1965, a film, *Debbie*, was initially banned because the chairman of the censor board believed that Afrikaner women do not get pregnant while unmarried.

Every month, bookshops and libraries throughout South Africa receive a list of banned books and objects that also contains recently unbanned materials and those undergoing review. The two main foci of censorship have been sex and politics. The work of sex counselors, and access to accurate sex information, have been most adversely affected by the draconian censorship on sexuality. Liberalization of the censorship laws was presented to Parliament in 1995. The draft legislation advocates a ban on: 1. child pornography, defined as involving children younger than 16, 2. the depiction of extreme violence including rape, 3. depiction of bestiality, and 4. promotion of religious hatred (Swayer 1994).

The history of South Africa's only recently discarded miscegenation laws and prohibitions on a wide range of books on sexuality have effectively exacerbated the sex-related problems experienced, through the official encouragement of ignorance about sexuality. For example, in 1992, several books on sexuality, vibrators, and objects, such as a penis tip attached to a condom, were banned by the censor board.

Standard methods of intervention with sexual problems have not been available to sex counselors and their clients in South Africa. One cannot advise the use of a vibrator to assist in treating inhibited orgasm, because it may be illegal to own a vibrator. Similarly, the range of informative books on sexuality easily available in other countries are not available in South Africa. Some films were restricted to those over 21 years of age; films that included birth scenes or sex

education had to be shown to male or female audiences separately. Certain films were also limited to whites.

A censorship board, appointed by the President of South Africa, for example, made the decision that: "a massage instrument whose manufacturers obviously intend it to be used for purposes of masturbation does therefore not fall under the Act unless it is shaped for example like a male organ" (Van Rooyen 1987, 22). The implication here is that it is the duty of the censor board to disapprove of masturbation, but it will enforce its legal powers only if provoked.

The controversy around formal sex education is predicated on the erroneous belief that instruction about sexuality will increase premarital sexual behavior. It may in fact, however, make visible the sexuality that parents try to deny that children possess, and vice versa. When parents are considered as the ideal location for the dissemination of sex information, it is often overlooked that many children do not have both parents available to them, and that fathers have always had minimal involvement in the transmission of sex information in two-parent families.

Nicholas and Durrheim (1994) reported that negative attitudes towards homosexuality were significant, but only weakly associated with negative attitudes toward AIDS, high knowledge of AIDS, and high religiosity in a study of AIDS and knowledge, attitudes, beliefs, and practices of 1,817 black South African students. The sample was divided into those with high or low scores on Rohrbaugh and Jessor's (1975) religiosity scale (excluding virgins) by selecting individuals falling below the first quartile of the distribution of religiosity scores. The low scorers experienced their first sexual intercourse at a younger age ( $M = 15.92$  years) than did the high scorers ( $M = 17.25$  years). The high religious group was also less satisfied with their first sexual encounter, less likely to intend to be sexually active, less likely to make use of safe-sex practices, engaged in sexual intercourse with fewer partners during high school, and used condoms less frequently than the low religious group.

In a survey of 2,206 black South African students (Nicholas 1994a), 16.3% (361) of respondents indicated that they did not use condoms during sexual intercourse, because it was against their religion. While sexual stereotypes of the various ethnic groups in South Africa flourish, the paucity of research on sexuality in South Africa precludes any firm conclusions on various ethnic sexual practices. Black students who have consulted the first author have ascribed folk religious practices as being the cause of their sexual problems. It would not be uncommon to find a client consulting an indigenous healer for a sexual problem ascribed to witchcraft, in the belief that many approaches to the same problem would bring more-effective relief. These beliefs could be located within Christian faith healing, Islamic faith healing, or African herbal or psychic remedies.

[Update 2003: Sishana and Simbayi's (2002) national household study found that 35% of males were circumcised, with the mean age of circumcision being 15 years. Some 3.4% of married respondents ( $n = 3,594$ ) reported that they were in polygamous relationships. Some 50.2% of those who were married ( $n = 3,374$ ) reported that *lobola* or dowry had been paid when they got married. Some 57% of widows ( $n = 467$ ) indicated that they were required to abstain from sex during the mourning period and 53% (256) indicated that they were required not to have any relationships with men. (End of update by L. J. Nicholas)]

### B. Source and Character of Ethnic Values

The sociopolitical context of South African blacks, and South African black higher education students, renders them very vulnerable to sexuality-related problems. Most

black schools provide very poor guidance to their pupils, and sex education is the exception in schools. This lack of guidance and other resources is politically determined, in that the bulk of the financing for these resources had been reserved for whites. Even in 1993, there still existed a disparity in the allocation of resources to blacks and whites at all educational levels. Political decisions have also ensured that blacks lived in extremely crowded conditions by legally allowing blacks residential access to only 13% of the land of South Africa. These factors contribute significantly to sexual abuse, divorce, age-inappropriate exposure to sexual contact, and other high-profile sexuality problems prevalent in the black community (Nicholas 1994a, 4).

### 3. Knowledge and Education about Sexuality

#### A/B. Government Policies and Programs, and Informal Sources

Failure to use contraception is a critical problem on university campuses and in schools. While sex counseling is being neglected at schools in South Africa, it is likely to take up an increasing amount of resources elsewhere. For example, parents and religious leaders attacked the introduction of sex education in South African Indian schools as a pilot program in 1993, expressing fears that their children would be corrupted. Such programs had not been taught before in these schools (Chothia 1993). Cilliers (1989) found that all the school departments he consulted supported the idea of the school as a means for AIDS prevention, yet it is evident that sex education does not have similar support (Kagan 1989). Some sex and AIDS education programs have been initiated in the 1990s, but these are experiencing some opposition from parents and others (Gevisser 1993). In 1992, service points at which family planning was provided numbered 65,182 (Cooper et al. 1994). As a result of these programs, 2,301,152 women were using contraceptives.

#### Intrafamilial Communications

The following findings regarding intrafamilial communication about sex in South Africa were obtained in 1990 from 1,902 black first-year students at a South African university (Nicholas 1991).

*Age at Which Sex Information Was Acquired.* Table 1 shows how respondents to questions on age at which sex information was acquired reflect the small percentage of students who first learned certain concepts before the age of 10 years, and the relatively large per-

centage who learned about these sexual concepts when they were 16 years and older.

Statistically significant gender differences existed in the acquisition of sex information for the terms shown in Table 1, except for the acquisition of information on pregnancy, female prostitution, and male and female homosexuality.

*Manner in Which Sex Information Was Acquired.* Males and females in this sample acquired their initial learning about these concepts from different sources (see Table 2). Friends and the mass media are consistently ranked as the major source of initial sex information for this study, whereas school training showed severe limitations.

*Preferred Source of Information about Sexuality.* The preferred source of sex information for this sample is school training, 27.5%; friends, 26.7%; and mother, 17.7%. Fathers were chosen as the preferred source only by 5.1%: 4.5% of male respondents and 0.6% of females. The high percentage of students with a preference for friends points to the potential value of peer counseling programs for sexuality-related issues.

*Parental Provision of Sex Information.* Thirty-eight percent of respondents indicated that they had received no sex information from their mothers; 8.2% of females and only 3.8% of males indicated that they received much information from mothers. As expected, 65.5% of respondents indicated that fathers had given no sex information; 4.5%, 3.1% of males and 1.4% of females, reported their fathers provided much sex information.

*Provision of Sex Information at School.* Sixty-two percent of respondents indicated that they received no sex information at primary school, whereas only 10.9% indicated that they received no sex information at high school. Guidance teachers seem to provide much of the sex information at school, with 30.3% of respondents indicating that they received much information from guidance teachers.

*Approval for Sex Education.* A large percentage of students are against the provision of sex education in kindergarten (69.5%). Almost a quarter of respondents (23.4%) are against provision of sex information in primary school, 1.8% are against sex education in high school, and 2.6% are against sex education at the university.

*Attitudes Toward Premarital Intercourse.* Forty-five percent of respondents disapprove of premarital intercourse

**Table 2**

**Main Sources of Sexual Information (in Percentages) for 1,902 First-Year Black University Students**

Topic	Age at Which Sex Information Was Acquired (in Percentages)	
	Before Age of 10	After Age of 16
Sexual intercourse	17.6	1.8
Pregnancy	16.6	21.9
Abortion	1.8	36.6
Venereal disease	0.6	44.8
Menstruation	3.8	22.9
Female prostitution	4.7	32.4
Erection	12.9	32.5
Condoms	1.0	43.3
Male homosexuality	2.6	42.4
Female homosexuality	1.3	45.5
Fertilization	1.7	42.9

Topic	Source				
	Mothers	Schools	Friends		Mass Media
			Same Sex	Other Sex	
Intercourse			33.4	20.7	
Pregnancy	28.7			24.3	
Males	8.3				
Females	20.4				
Abortion		21.2		c. 21.7	30.1
STDs		28.5		c. 17.1	27.2
Menstruation	28.2			c. 33.0	
Erection				c. 38.0	20.8
Female prostitution				c. 27.3	37.0
Male homosexuality				c. 20.9	43.0
Lesbianism				c. 23.5	57.0
AIDS				c. 4.5	61.0

(17% male and 28% female). As expected, males have significantly higher approval ratings for engaging in premarital intercourse than females.

*Sex Myths.* The endorsement of sex myths by male and female students were statistically significantly different for 30 of 49 myths included in the survey. Large percentages of students also indicated “don’t know” to many of the questions, with females indicating “don’t know” more frequently than male students for most of the questions. The “don’t know” responses are consistent with the lack of sex-information resources, the inadequacy of sex education programs in the schools where they exist, and the writer’s experience of counseling and teaching hundreds of university students who did not possess extremely basic sex information.

*Summary.* Because males and females do experience sexual socialization differently, it can be expected that females will endorse sex myths differently, or discuss sexuality differently, from men. Programs designed to intervene in problem behaviors stemming from beliefs in sex myths may have to target male and female students separately. A large percentage of students used the “don’t know” option, indicating that hardly any discussion on those topics had taken place for those students within the family or school system, and that they may be genuinely uncertain.

South African students in this sample are less knowledgeable about sexuality and AIDS than North American students as indicated by North American research studies. South African students have less access to a range of sexuality resources that may better inform them, and researchers have to acknowledge that many students may simply not have been exposed to sex information in a number of areas related to sexuality.

Mosher (1979) contends that there may be more “heat” than “light” in the sex lives of university students in the U.S.A., making the point that the North American student may not be very knowledgeable about sexuality even with access to a variety of resources. It is clear from the results of this study that South African students are even less knowledgeable about sexuality than North American students.

Male students were more knowledgeable at the age of 9 or younger about all the terms listed than female students in this sample, except for menstruation. Very few students had acquired knowledge of these terms by age 10 compared to similar EuroAmerican studies. The percentage of knowledgeable students in this sample ranged from 0.6% for knowledge of venereal disease to 17.6% for knowledge about sexual intercourse.

It is generally assumed that children and young people are learning about sex at considerably younger ages than did their parents and grandparents. Gebhard (1977) verified this assumption, comparing unpublished data collected by the Kinsey Institute for Sex Research between 1938 and 1960 with data collected in the mid-1970s. No such earlier South African data exist to compare with the recent study, but comparison with the two samples in Gebhard (1977), called the “Kinsey Sample” and the “Recent Sample,” illustrates the comparatively late acquisition of sex information of the 1990 South African sample on all items of sex knowledge acquisition. Initiatives are therefore necessary to establish the extent of late acquisition of sex knowledge and its implications for safer-sex practices and the development of sexuality-related problems, and they should enjoy high priority among research initiatives.

The implications of this study for research and education point to the potential usefulness of same-sex peer sexuality counseling as a primary method of prevention and intervention. Those who have not had access to sex resources

may more readily accept advice in same-sex groups or present themselves for participation in such groups on sexuality.

This study confirms the fathers’ lack of involvement in intrafamilial communication about sexuality, and emphasizes the need for research on South African fathers in this regard. Mothers are the most-preferred source of information about sexuality for female respondents, and school training is the most-preferred source for all respondents. The dynamics of mother-daughter communication about sexuality requires investigation in the South African context, as mothers may be a useful resource to school- and university-based sexuality programs, either by supporting such programs or through actively becoming part of campus-based extracurricular programs.

The overwhelming disapproval of the provision of sex education in kindergarten by 69.5% of respondents reflects the myth of the asexual child. A priority of sex education and sexuality courses should, therefore, be the acknowledgment of childhood sexuality. Myths that parents and teachers may hold in this regard also need to be investigated.

Forty-eight percent of respondents indicated experience in premarital sexual intercourse, while only 30% approve thereof. It is likely that the number of first-year students who experience premarital sex will increase during their first year of study on campus. Counselors are required to prepare students for that probability and offer resources to facilitate decision making about engaging in premarital intercourse.

Of respondents, 75.6% consider abortion as an unacceptable means of terminating pregnancy. Yet a number of respondents will find themselves either pregnant or responsible for a pregnancy, given the high pregnancy statistics at the campus serving as a site for this study. Abortion is illegal in South Africa and counselors cannot, therefore, advocate this as an option, except in rare cases. Providing information and resources to promote safer sex should therefore be a high priority for campus counselors in South Africa.

These studies present findings of significant differences between male and female students in their experience of a range of sexuality-related problems. In South Africa, where sexuality programs are not well established, counselors may be advised to structure intervention groups on a same-sex basis in the first stage of intervention for some problems.

The significant differences for gender that have been found for most sexuality-related concerns in this study require that a sex-counseling program includes a focus on particular gender-related needs of students. More emphasis may need to be placed on homophobia, prejudice, contraception, and belief in sex myths for male students, and emphasis on sex and AIDS knowledge acquisition, safety, and assertiveness for female students in such a program.

A 1994 study of 1,737 black South Africans in their first year attending a university conducted by the first author adds to the understanding of sexual education and the sources on sex information among black South Africans (Nicholas 1994a). The mean age of the subjects was 20.4 years with a range from 16 years old to 50 years old. Peers were reported as the overall primary first source of learning about sexual intercourse (see Table 3). Male and female respondents received the information much more from opposite-sex friends, 35% and 25.2%, respectively, than from same-sex friends, 18.2% and 19%, respectively. Together with reading, this accounts for 73% of the sources of learning for this topic.

Although peers are still ranked as the preferred source of information about sexual intercourse, approximately only half of the respondents who indicated peers as their first source of knowledge also include it as their preferred source (see Tables 4 and 5). The respondents indicated a much greater role for the school or guidance teacher (18.3%),

mothers (18.2%), and fathers (5.1%). Peers are the preferred source of sex information for only a quarter of respondents. Peers are also supplanted by "reading" as the most important source of sexuality information. The father's current role in imparting important sexuality information is negligible, but he is the preferred source for 8.1% of males, rivaling the same-sex peer that is the preferred source for 8.3% of male respondents.

#### 4. Autoerotic Behaviors and Patterns

A survey of 1,896 black university students revealed that 34.2%, 348 males and 288 females, worried about the

**Table 3**

#### Sources of Learning About Sexuality (in Percentages): Most Important Source of Sexuality Information

Source	Male	Female	Total
Reading	33.0	27.2	30.3
Same-sex friend	17.0	14.0	15.5
Opposite-sex friend	14.1	12.7	13.5
School/guidance teacher	17.0	19.4	18.1
Mother	4.8	13.4	8.9

Other relative	3.4	1.2	2.4
Father	0.0	0.7	0.4

Statistically significant gender differences:  $\chi^2 = 36.28$ ;  $df = 8$ ;  $p = 0.0000$

effect of masturbation (Nicholas 1993b). Of these students, 28.7%, 348 males and 190 females, also believed that women commonly insert foreign objects into the vagina. Over half, 51.9%, did not know whether or not masturbation causes pimples and acne, while 8.5% believed it does have these consequences. Fourteen percent of respondents believed that sexually fulfilled, mature adults do not masturbate, while 54.5% indicated "don't know." Similarly, 16.5% believed that most adults do not masturbate, and 58% indicated they did not know on this point.

#### 5. Interpersonal Heterosexual Behaviors

##### A/B. Children and Adolescents

A 1995 survey of South African teenagers by a national newspaper revealed the following. Of respondents whose average age was 16 years,

- 41% considered sex before marriage as unacceptable,
- 54% accepted it only with someone they cared about,
- 5% said it is something to experience with as many people as possible,
- 81% considered contraception as both partners' responsibility,
- 80% considered gay-bashing unacceptable,
- 10% indicated that they had a gay experience, and
- 71% thought that they will make a better job of marriage than their parents.

Sixty-seven percent of the respondents were female, but the number of respondents was not indicated in this anonymous 1995 report.

A 1992 survey of 7,000 adolescents found that 17% had engaged in sexual intercourse, with a median age of 15 years at first intercourse (Cooper et al. 1994). (Dating customs, sexual activities, and relationships before college are described in the discussion of first-intercourse experiences.)

Some insights into the sexual behavior of adolescent black South Africans can be drawn from a study of first intercourse and contraceptive experiences of 1,737 black South Africans conducted during their first year in a university (Nicholas 1994a). The mean age of the 754 females and 959 males was 20.4 years (with 24 missing cases). The age range was 16 years old to 50 years old. Of the sample, 37.7% spoke an African language, 28.1% spoke Afrikaans, 27% spoke English, and 7.2% indicated "other." Of respondents, 96.5% indicated that they were single. This discussion will focus on the 894 single students, 47.1% male and 52.9% female, who indicated that they had experienced sexual intercourse.

While females experienced first intercourse with a partner who was 2.5 years older, males reported experiencing first intercourse with a partner who was 1.0 year younger. Male respondents' mean age at first intercourse was 15.5 years and their partners' age was 14.5 years old. Female respondents' mean age was 17.8 years and their partners' mean age was 20.3 years old. Obviously, the first sexual partners of the female respondents were mainly outside the research group.

Most respondents indicated that they experienced their first intercourse with a steady friend. Males were, however, much more likely than females to have had their first intercourse experience with an unknown partner or casual acquaintance. It is a cause for concern that 4.1% of the sample indicated that first intercourse was experienced with a close relative (see Table 6).

Males were more likely than females to have sexual intercourse again with their first partner (see Table 7). Although most respondents had further sexual intercourse

with their first partner, 35.5% of females reported no further intercourse with their first partner, as compared to only 20.6% of the male respondents. Almost 70% of respondents had sexual intercourse between 1 and 5 times with the first partner, which points to the short-lived nature of the sexual relationship with the first sexual partner for most respondents. First intercourse may have, therefore, influenced the relationships of the 60.6% of respondents who indicated “steady friend” as their first intercourse partner, because for at least half of this group, sexual intercourse occurred only 1 to 5 times during the “steady” relationship. Of respondents, 46.3% had had one sexual partner in high school and 20.8% had had the first intercourse experience after leaving high school, but before entering university (see Table 8). Males reported significantly higher numbers of high school partners than females.

Twice as many males as females indicated that they greatly enjoyed their first sexual intercourse experience (see Table 9). A third of respondents disliked or greatly disliked their experience of first sexual intercourse, 14.4% of males and 56.9% of females.

[Update 2000: Only 3% of teenagers surveyed in the 1998 South African Demographic and Health Survey were married. More than half of the respondents indicated never

having had sexual intercourse, and 60% indicated having no sexual partner in the year prior to the interview. About one in five teenagers had sex in the month preceding the survey. Average age at first intercourse was reported as 18 years and age at menarche for most teenagers was below 15 years. By age 19, 35% of all teenagers have been pregnant or have had a child. One in eight teenage deliveries is by cesarean section. Among sexually active teenagers, almost two thirds are currently using a modern contraceptive, with injection/implants being the most popular (50%). One in every five teenaged women reported using a condom in their last sexual intercourse. Sishana and Simbayi (2002) found that some 24.7% of females and 30.3% of males used a condom during their last sexual intercourse. Younger respondents and those with multiple partners were more likely to use condoms than others. (The 1998 South African Demographic and Health Survey was a nationally representative sample selected from the 1996 census data. A total of 12,247 households were surveyed, and 11,735 women were individually interviewed.) (End of update by L. J. Nicholas)]

[Puberty Rituals and Male VirginitY Testing

[Update 2002: Traditionally, boys in one of South Africa’s biggest townships, KwaMashu, north of Durban, undergo virginitY testing, a controversial custom widely carried out among girls in KwaZulu-Natal. The idea of extending female virginitY testing to teenage and unmarried males on a monthly basis is being promoted by Isivivane Sama Siko, a group promoting African traditional cultures and a return to traditional customs. Traditional beliefs claim that young boys have a kind of hymen, a white lacy skin on the foreskin. If the foreskin on the penis slips away easily, it means this “hymen” is gone. If the foreskin is sore and hard to move, then it means he is still a virgin. Other methods include checking for a certain vein on the penis. The only time the vein can disappear is when a boy sleeps with a virgin, because her vaginal opening is still tight. Local belief also holds that a boy is a virgin if he can urinate straight up into the air. If the urine sprays, he has had sex before. Another clue used by male virginitY testers is the color of the knees: If a man’s knees are dark, it is believed he is not a virgin.

[Local physicians maintain: “There is no scientific basis for this. Men don’t have hymens and what happens if a guy masturbates, . . . it makes the foreskin looser. Some men are very hygienic and retract the foreskin to clean the penis; they are very diligent with cleaning under the foreskin and get rid of those secretions—then the foreskin will also slip back easily.” Dr. Suzanne Leclerc-Madlala, a lecturer at the University of Natal, noted that one effect of virginitY testing is to “create fear” among teenagers to prevent them from having sex. “VirginitY testing in no way helps halt the spread of AIDS unless part of the testing is done with sex education.” (Kenya Community Abroad 2/19/02. kca-aids@yahoo.com). (End of update by R. T. Francoeur)] (See also Section 1, Basic Sexological Premises).

**Table 6**

**Partner Relationship in First Sexual Intercourse (in Percentages)**

Relationship of Partner	Male	Female	Total
Engaged partner	6.7	5.7	6.2
Steady friend	44.6	75.5	60.6

Enjoyed	45.1	33.0	39.4
Disliked	10.7	39.0	23.9
Greatly disliked	3.7	17.9	10.3

Statistically significant gender differences:  $\chi^2 = 196.5$ ;  $df = 3$ ;  $p = 0.0000$

### C. Adults

#### *Sexual Behavior and Relationships of Single Adults*

Very little published South African data are available on various interpersonal heterosexual behaviors. Much of the data currently cited, especially in anthropology texts, do not accurately reflect current sexual practices that have been tremendously influenced by modern Western practices. In ten years of sex counseling, the first author found that various sex practices, like anal sex, fellatio, and cunnilingus, were not uncommon. Approximately 40% of these clients had tribal affiliations.

#### *Marriage and Family Structures*

The migratory labor system has been undeniably destructive for the black African marriage and family structure. A consequence of introducing wage earners, forced to live in single-sex hostels in close proximity to impoverished communities with high levels of unemployment, is the inevitable bartering of sex and domestic chores for food and bed; similarly, with long-distance truck drivers and their "traveling wives."

In South African women's magazines, the problems of comarital and extramarital relationships, sexual satisfaction, and sexual outlets and techniques are openly and regularly discussed in advice columns. Among Muslims and Africans, polygamy is still being practiced.

[*Update 2003*: For whites and coloreds, more marriages were solemnized by religious ceremonies than by civil ones, with the reverse for Africans and Indian/Asians. The non-recognition of traditional and religious rites forces these couples to also have a civil ceremony. The number of officially recorded marriages in 1999 was 155,807, an increase of 6.2% on the 1998 figure. This excludes marriages solemnized under customary and religious rites. The 1996 census estimates that 32.2% of all marriages are traditional and that 46.5% of African marriages are traditional. After 2000, these marriages have been included in the civil registration system, enabled by the Recognition of Customary Marriages Act (Statistics South Africa). (*End of update by L. J. Nicholas*)]

#### *Sexuality and the Disabled*

The sexual needs of the disabled are still very much a neglected topic, and the sexual rights of the disabled are not very well served in South Africa (Nicholas 1994a).

#### *Divorce*

[*Update 2003*: In 1999, 37,098 divorces were officially recorded, some 83.4 per 100,000 of population, involving 45,360 minor children. The highest percentage of divorces occurs for marriages lasting between five and nine years of marriage, 28.1%, followed by those lasting between zero and four years. Of the registered divorces occurring among Africans during 1999, 31.1% were for marriages that had lasted 5.9 years, and 18.7% were for marriages that had lasted zero to four years. This divorce peak at five to nine years of marriage is found among all the other population groups, except for whites, where the peak number of divorces is for marriages lasting zero to four years (Statistics South Africa). (*End of update by L. J. Nicholas*)]

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

Isaacs and McKendrick (1992, x) claim that an estimated one out of ten South Africans has a homosexual identity, even if this identity is disguised, denied, or suppressed. The formal gay movement, as represented by the Gay Association of South Africa (GASA), is now defunct as a result of

political and social divisions. Splinter nonracial groups, such as the Gay and Lesbian Organization of the Witwatersrand (GLOW) and the Organization of Lesbian and Gay Activists (OLGA), attempt to address gay issues in parallel with human rights (Isaacs & McKendrick 1992, 158). *Link/Skake!*, the most widely read local newspaper published by GASA, ceased publication in 1985 (Isaac & McKendrick 1992, 157). David Moolman initiated the publication of a private gay newspaper, *Exit*, which was criticized for its sexist, homoerotic, and political biases (Isaacs & McKendrick 1992, 157). A new column called "Outspeak" was introduced to expand coverage of the subject matter in *Exit*, and dealt more explicitly with issues of gay liberation and organization (Gevisser & Cameron 1994, 227).

There are only two formal organizations in South Africa that deal specifically with homosexual crises from the perspective of the crisis-intervention model. These are the Radio 702 Crisis Clinic and the GASA 60-10 Counseling Center in Cape Town (Isaacs & McKendrick 1992, 220). Homosexuals now feel safer about declaring their sexual preferences, and there have been gay-pride marches advocating gay and lesbian rights in the major cities of South Africa.

The first South African gay telephone directory was launched in Johannesburg, and the listing includes gay and gay-friendly businesses and services. The directory allows gay people to make use of the services of people who do not object to their lifestyle (Naidoo 1994).

There are not many referenced accounts of bisexual life in South Africa, but according to Zubeida, it is extremely difficult to be bisexual in a heterosexual society. The following excerpt from an interview with her illustrates her feelings:

I guess I feel oppressed as a bisexual person. Most lesbian and gay organizations don't really cater for bisexuals—I think largely because bisexuals are even less visible than homosexuals. There is also so much distrust of bisexuals in the homosexual community. Sometimes we are seen as sitting on the fence and enjoying the best of both worlds; usually we are seen as being unable to come out of the closet. (Gevisser & Cameron 1994, 191)

Local university counselors are frequently confronted with ignorance about homosexuality in the campus environment, which may exacerbate the problems their homosexual clients present. A 1990 study of 1,902 first-year students at a black university revealed the following about homophobia and prejudice. Forty-three percent of the sample, 25.5% of the males and 17.9% of the females, believe that homosexuality is immoral. Twenty-seven percent of the sample, 13.7% of the males and 13% of the females, believe that a homosexual person cannot be a good religious person. Forty-six percent, 20.8% of the males and 19.4% of the females, believe that homosexual people could become heterosexual if they chose to. A quarter of the males and 21.8% of the females believe that homosexuality is not an acceptable orientation. A campus environment pervaded with highly homophobic beliefs such as these, is hardly one that provides support for homosexual clients or those struggling with their sexual identity (Nicholas 1994a, 73-74).

### 7. Gender Diversity and Transgender Issues

A survey of 2,209 black university students in 1994 revealed that 8.8% of the respondents ( $n = 194$ ) indicated a moderate need for help with issues of sexual identity, and 8.3% ( $n = 183$ ) of the respondents indicated a high need for help with sexual identity (Nicholas 1994b).

The Groot Schuur Hospital in Cape Town offers medical services for transsexuals who would like to undergo surgery to change their sex. The program includes an assessment by a psychiatrist who evaluates the candidate and makes a recommendation whether or not the surgery should be performed. After surgery, the patient continues counseling with a psychologist and social worker. Medical services for intersexual children are provided at the Red Cross Children's Hospital. The child's sexual orientation is assessed by a psychiatrist who makes a recommendation of the sex that would be most suitable for child. Again, postsurgery counseling and support are provided.

## 8. Significant Unconventional Sexual Behaviors

### A. Sexual Coercion

#### *Rape and Sexual Abuse*

In 1992, 15,333 cases of child abuse were reported to the Child Protection Unit. Of this number, 3,639 involved rape and 4,135 involved sexual abuse, including sodomy, incest, and other forms of sexual assault (Cooper et al. 1994). [*Update 2003*: Some 52,860 cases of rape and attempted rape were reported (120.1 per 100,000) (Kane-Berman 2002). The Early Sexual Experiences checklist was completed by 1,434 South African first-year students in 2002 to assess their victimization by pedophiles and exposure to sexual abuse (43%). Some 268 respondents (18.7%) indicated that they had had unwanted sexual experiences before their 16th birthday, and 97 respondents (0.68%; 62 female, 31 male, and 4 missing data), met the *DSM-IV-TR* criteria for experience of pedophilia; some 148 indicated abuse after the age of 16. Of respondents, 62% indicated that they were moderately to extremely bothered by the experience when it occurred, and 59% indicated that they were still moderately to extremely bothered by the experience.

[Neither the relationship between gender and the perpetrator relationship nor the number of times the behavior occurred was significant. The relationship between language group and the perpetrator relationship is significant. The biggest differences between observed and expected frequencies are in the relative and friend/acquaintance categories of Afrikaans, the friend/acquaintance category of English, and the relative and stranger categories of African language. When all those who indicated abuse, 416 (205 males and 204 females), are analyzed, a different picture emerges. Women respondents were more bothered at the time, and when completing the questionnaire, than male respondents. Those experiencing relatively severe experiences were more bothered than those experiencing relatively less-severe experiences at the time, though this was not the case currently. Language remained not significant in relation to how bothered respondents were by their experience. The long-term negative effects of sexual abuse are borne out by this study for both relatively severe and less-severe victimization (Nicholas 2002). (*End of update by L. J. Nicholas*)]

The inquiry into legislation on rape (Havenga 1985) was regarded as presenting resistance to genuine reform. This inquiry was launched in May 1982, and was found to have certain inadequacies, mainly the emphasis on sexual aspects in the definition of rape (in contrast with the feminist emphasis on the violence aspects), the failure to make the definition of rape gender-neutral, and the failure to include oral and anal sex and penetration by means of an object. The recommendation that the law stating that a man could not be found guilty of raping his wife be rescinded was qualified by the requirement that prosecution in such cases cannot proceed without permission from the attorney general. The

previous sexual history of a rape victim/survivor can still be entered in evidence in camera.

The convictions for child sexual abuse for the years 1989 to 1992 were as follows: 1989, 1,086; 1990, 1,061; 1991, 1,345; and 1992, 1,124.

[*Update 2003*: In 2000, 21,438 rapes and attempted rapes of children under the age of 18 were reported. Some 113 cases of incest and 4,027 cases of indecent assault were reported (Kane-Berman 2002).

[The South African Law Commission made the following final recommendations regarding rape to the Justice Minister:

1. Intentional nondisclosure of infectivity by a life-threatening STD prior to sexual intercourse amounts to sexual relations by false pretenses, and would, therefore, constitute rape.
2. The definition of rape would be broadened to include anal penetration.
3. Men could be rape victims and women could be convicted of rape.
4. The state would no longer have to prove lack of consent, but that penetration occurred under coercive circumstances.
5. Two new crimes will carry the same penalties as rape:
  - a. where any object was used to penetrate the anus or genital organs in conditions similar to rape.
  - b. Oral-genital sexual violation, where genital organs or that of an animal penetrates the mouth in rape-like circumstances (SAPA 2003, 1, 3). Hiding HIV could turn sex into rape. (*End of update by L. J. Nicholas*)]

[*Update 2001*: According to the South African Demographic and Health Survey (1998), 4% of women who had ever been pregnant reported that they had been physically abused during pregnancy. One in eight women reported having been beaten by a partner, 6% reported abuse in the last year, and of these, 43% reported needing medical attention. Only 4% of all women reported ever having been raped. (*End of update by L. J. Nicholas*)]

### B. Prostitution

Prostitution is illegal in South Africa but has flourished in all major cities and townships for decades. In Cape Town, up to 200 prostitutes were allowed to work in the harbor area and were registered by the authorities as "port hostesses." They were recently banned from plying their trade, ostensibly because of safety concerns such as smoking on board ships carrying hazardous cargo (Underhill 1995). Daily newspapers have several columns devoted to advertisements for "escort services" that are fairly explicit offers of sexual services.

The socioeconomic status (SES) of black students has an influence on whether they are tempted to trade sexual favors for financial or educational gain. The difference in the SES between teachers and pupils led them to believe that they could have access to this perceived affluence through a sexual relationship. Pupils who trade sexual favors for financial gain are sworn to secrecy by allies and co-conspirators. In one case we are familiar with, Moses acknowledged that sex had taken place between a group of boys of whom he was one and their male teacher, but that they would "get" anyone who spoke out, as they were all "paid well."

Socioeconomic circumstances can lure pupils into prostitution, as in the case of five standard eight girls (age 15 to 16 years old) who were absent from school for three months and were subsequently found at a brothel. Female students also mentioned trading sex for grades. While these reports

may not be completely accurate, it is sufficient for such allegations to gain currency in a school to damage seriously the confidence of pupils in the grading system. The lack of opportunities to discuss sexuality openly in school would, therefore, further exacerbate this serious problem (Nicholas 1994a, 4-5).

**C. Pornography and Erotica**

South Africa now has local versions of *Penthouse*, *Playboy*, and *Hustler*. The censor board keeps a vigilant eye on these and other similar publications and recently lost a case against *Hustler* under the new constitution's freedom-of-speech provision. A new swingers' magazine, *Xpose*, with graphic closeups of male genitals and female vulvas, was recently launched (Chapel 1995). Pornographic movies are not openly available, but have a wide underground distribution. See also comments in Section 1A/B, Basic Sexual Premises, Gender Roles and the Sociolegal Status of Males and Females, above.

*9. Contraception, Abortion, and Population Planning*

**A. Contraception**

In a study of 1,737 first-year black South African students, first intercourse was primarily characterized by the lack of contraceptive use, with 35.7% of the males and 32.8% of the females indicating non-use of contraceptives, and 12.3% of the males and 7.1% of the females indicating "don't know" (see Table 10). A further 6.2% reported using the unreliable withdrawal method (Nicholas 1994a, 88-94).

The major reasons given for not using a contraceptive were that the first sexual intercourse was unplanned (36.8%) and that no thought was given to contraception at the time of the first intercourse act (38.1%) (see Table 11). The belief that if one only has intercourse "a few times," contraception is not essential, was endorsed by 31.6% of respondents. The erroneous belief that having sexual intercourse only once or a few times protects one from the risks associated with unsafe sex, may significantly influence students to make the transition from virginity to nonvirginity without using contraceptives.

The opinion of significant others also influenced respondents' use of contraceptives. Male and female respondents almost equally were uncomfortable being too prepared (23.6%). Mothers' discovery of contraceptive use was cited by 18.8% of respondents, and fathers' displeasure was cited by 17.9% of respondents, as reasons that prevented contraceptive use. Of respondents, 18.1% indicated that contraceptive use was impractical when engaging in "many rounds of sex." Most safer-sex messages assume a single encounter requiring a single condom and neglect those who continue sexual activity after the first orgasm.

**Table 10**

**Contraceptive Practices at First Sexual Intercourse (in Percentages)**

Contraception Used	Male	Female	Total
No method	35.7	32.8	34.3

This study revealed that 54.2% of female respondents and 55.5% of male respondents had experienced sexual intercourse. Darling et al. (1992) cite relevant research indicating that, while males experience first sexual intercourse at a younger age than females, the average age for females is also declining to around 16 years of age. Further research is required to establish a trend towards gender convergence among South African students. Female respondents in this sample experienced first intercourse at 17.8 years old, compared to Darling et al.'s (1992) report of 17.7 years old. Male respondents initiated first intercourse at 15.5 years old, 2.3 years younger than the sample of Darling et al. (1992). No similar South African studies on first intercourse have been done to facilitate local comparisons.

This study found that many students do not use contraception during first intercourse. Similar to other studies, this reflects the unplanned nature of first sexual intercourse. Peers are reported as the primary first source of learning about sexual intercourse and are also considered the preferred source by respondents. "Reading," however, was indicated as the most important source of information about sexuality. More emphasis should be placed on the gender differences for peers' provision of sexuality information. This study found that opposite-sex friends are more likely to be the first source of sexuality information, as well as the preferred source of sexuality information. The same-sex friend was, however, considered the most important source of sexuality information. Peer sexuality programs could be guided by the preferred source of sexuality information in relation to gender.

The provision of information on safer sex has been found to be inadequate in facilitating desired behavior change (Keeling 1991). Those students who have not developed a

It is too expensive	5.6	2.0	7.6
I thought I was sterile	4.0	2.7	6.7
I was drunk	3.6	0.3	3.9
I wanted to cause a pregnancy	2.4	1.3	3.7

pattern of risky sex practices may be more amenable to early intervention before high-risk patterns of sexual behavior set in. Students who have yet to make the transition to non-virginity, as well as those who have had only a few sexual experiences, may be more open to establish patterns of safer-sex behaviors through early intervention by counselors.

Starting in 1990, the first author and several colleagues have conducted an annual survey of first-time entry, first-year university students enrolling at a predominantly black university (Nicholas 1994b, 1993a, 1993b, 1992, 1991, 1990; Nicholas & Orr 1994; Nicholas, Tredoux, & Daniels 1994; Nicholas & Durrheim 1994). All consenting first-year students who attended the orientation program completed a

structured questionnaire on intrafamilial communication about contraception. In 1990, 1,986 students completed questionnaires that included 829 male students and 948 female students (18 missing cases). In 1991, 2,069 students completed questionnaires, 1,029 males and 1,040 females. In 1992, 1,558 students completed questionnaires that included 684 male and 834 female students (32 missing cases).

Forty-eight percent of the 1990 sample (885) indicated that they had had sexual intercourse. Fifty-four percent of the 1991 sample (1,115) indicated that they had had sexual intercourse. Fifty-three percent of the 1992 sample (793) indicated that they had had sexual intercourse. Less than 30% of the total sample indicated approval of premarital sexual intercourse, while more than 50% of the sample indicated nonvirgin status.

Approximately twice as many respondents felt that their mothers would be understanding about a problem concerning contraceptive matters, as opposed to fathers (see Table 12). The percentage of students responding affirmatively about their mothers' understanding increased from 28.5% in 1990 to 38.3% in 1992. The percentage of respondents responding affirmatively about their fathers' understanding increased by only 4% from 1990 to 1992. Most students, therefore, do not consider their parents as understanding about a problem concerning contraception. Gender differences are significant at the probability level greater than .00001 ( $p > .00001$ ) level for respondents surveyed in all three years.

Over three quarters of respondents indicated that their fathers had not given them any information about contraception, compared to approximately 55% of respondents who indicated that their mothers had not provided such information (see Table 13). There was no significant difference for gender in the 1991 and 1992 samples. For the 1990 sample,  $p = .0004$ . Slightly more males than females had received information about contraceptives from their fathers. On average, more than twice the respondents received this information from mothers than fathers. More males received information about contraception from mothers than fathers, emphasizing the lack of involvement of fathers in these discussions.

More students preferred that their fathers not know about their use of contraceptives than they did their mothers (see Table 14). Twice as many female respondents disagreed with this statement than did male respondents. Gender differences are significant at the  $p < .00001$  level for all three years.

Approximately three quarters of respondents indicated that they had not discussed contraception thoroughly with their mothers, and almost 90% of the respondents indicated this to be the case in relation to fathers (see Table 15). Fathers were conspicuously absent as far as thorough discussion of contraception is concerned. Gender differences are significant at the  $p < .00001$  level for all three years.

Approximately a third of respondents believed that their mother's estimation of them would not decrease if the mother knew they were using a contraceptive (see Table 16). Approximately a quarter of respondents be-

lied their father would not disapprove if he knew. Gender differences are significant at the  $p < .0001$  level.

Three times as many respondents were encouraged to use contraceptives by mothers as by fathers (see Table 17). Most students, however, have not been encouraged by parents to use contraceptives. Gender differences are significant at the  $p < .00001$  level.

Few students indicated that they shared the same ideas and beliefs about contraceptives as their parents, with more of such sharing being evident in relation to mothers than fathers (see Table 18). A large percentage of respondents also indicated "don't know," indicating the basic lack of communication between parents and children.

In a study to identify barriers to condom use among 700 high school students, Abdool Karim et al. (1992) found that the students were not using condoms to any significant degree, felt that condoms limited sexual pleasure, felt that condom use indicated a lack of trust in one's partner's faithfulness, challenged the male ego, and/or may indicate that one has an STD. Condom use was not well understood, and they were not accessible or available when required. Oral contraceptives cost about \$30 per month and condoms \$3 a piece. Both are available free at community clinics.

*Implications for Counselors*

Sex counseling as a discipline is not widely practiced in South Africa. The university's obligation to provide such a resource has been de-emphasized, influenced by the unresolved debate on the appropriate location of sex-counseling resources and the taboos around sexuality. The possibility that intrafamilial communication about contraception might make a major contribution towards eliminating unwanted pregnancy is slim, given the minimal involvement of parents in the provision of information about contraception, especially that of fathers. Schools are unlikely to make any major contribution to contraceptive education, and the thousands of university-bound students requiring guidance on contraception will become the responsibility of campus counselors.

The effective shouldering of this responsibility requires a knowledge of local circumstances and resources. For example, until 1996, abortion was illegal in South Africa, so counselors' efforts had to be largely focused on prevention. This would include facilitating programs that involve larger groups of students gaining access to contraceptive information, while still remaining accessible to individual clients. Knowledge of the incidence of sexual-related problems at a particular university is crucial in making students aware of the risks of unprotected sexual intercourse that could directly affect them. The availability of postcoital contraception for use up to 72 hours after sexual intercourse should also be made widely known in the campus community.

Advice on condom usage by counselors has to be specific as to local availability and practices. Sidley (1991) found that choosing a brand of condoms in South Africa is bedeviled by a range of factors. Only one brand is produced locally, Crepe de Chine, and the rest are imported without being subjected to tests before being placed on the market. The 24 brands, which the South African Bureau of Standards (SABS) tested two years ago, failed. Up to 33% of the condoms tested by the Johannesburg City Health Department failed the trials.

The SABS tests for dimensions, mass, tensile strength, elongation, breaking point, aging, freedom from holes, and leakage, but does not make a standard mark compulsory. None of the imported brands bear the quality mark of their country. Three suppliers meet SABS specifications: Vulco, which is South African, F.T.C. Aircraft, manufactured in Thailand, and

Freedom, made in Korea. One spermicide, Rendells, contains oil that can cause a rubber condom to blister and burst (Sidley 1991). Counseling clients with regard to condom usage, whether for prevention of pregnancy, STDs, or HIV transmission, has to take into account the many risks associated with condom usage (Masters & Johnson 1986). These include the care that has to be taken in avoiding having preejaculatory fluid spilling onto the labia, spillage of semen when the condom is removed or during detumescence, and the residue of semen on the penis that may come into contact with the vagina.

Effective contraceptive programs for university students must, however, not stop at providing accurate information about contraception. The acceptance of self and others as sexual beings, and of contraception as primarily a sexual rather than a reproductive decision, is essential for effective contraception programs among South African blacks.

[Update 2001: Half of the women in the South African Demographic and Health Survey (1998) are currently using a contraceptive method, and almost all women who have ever used contraception have used a modern contraceptive. The most widely used method is the injection/implantable (27%), followed by the pill and female sterilization (9%). Asian women are most likely to use contraception, followed by whites, coloreds, and Africans. Asian and white women tend to use the pill and female sterilization, while African and colored women tend to use injections. Male sterilization is commonly used by white couples. Only 53% of women were aware that abortion is legal in South Africa. (End of update by L. J. Nicholas)]

**B. Teenage (Unmarried) Pregnancies**

In a survey at a local hospital, Sapire (1988) found that 75% of the pregnancies were unintended and 20% of the pregnant women were under 19 years of age. The seriousness of the problem is exemplified by requests for pregnancy tests and the morning-after pill at black universities (Nicholas 1994a, 63).

In Cape Town in 1987, of 2,800 teenage mothers, 2,300 were unmarried. The biggest increase in illegitimacy was among whites, where the percentage has doubled since 1982. In 1986, the percentage of white illegitimate births was 11.3% of all white births in Cape Town; in 1987, this increased to 17.2%. For coloreds, the number of illegitimate births increased from 6,700 in 1986 to 7,100. The percentage of illegitimate babies born to black, colored, and Asian women in Cape Town was 47.5% in 1987 (Stander 1988). A special clinic was instituted at a local hospital for pregnant teenagers, 90% of whom were unmarried, so that they

would not have to attend with married women (Burman & Preston-Whyte 1992). Ample evidence exists that a stigma is attached to teenage pregnancy while unmarried for both the mother and child in all sections of South African society. Pregnant pupils consequently conceal their pregnancy from parents who are often absent. Burman (1992, 31) quotes a nurse in this regard:

Parents or teachers may discover when she gets labor pains that she is pregnant, and it is only then that she can be rushed to a hospital. Schoolgirls don't want to book in advance as this will require them to attend clinics on certain days, which will mean that they are absent [from school] . . . The focus will be on them and the classmates can guess their problem and will laugh at them. They don't want to be seen by neighbours frequenting the clinic as they will talk badly of them (Interview of November 23, 1988).

While stigma is attached to teenaged pregnancy, fertility also has a cultural value, as is illustrated in the following example of a 17-year-old African girl who became pregnant at 16:

I knew I might get a baby, and the sister at school warned me also. But I had been going with my boyfriend for over a year and my girl friends were beginning to laugh at me. They whispered that I must be inyumba—that is, how you say, sterile. Even my boyfriend asked why I was not having a baby. Then, when I did get pregnant, my mother and father were very cross, but I was pleased as it showed everyone I can have a baby after all. (Preston-Whyte & Zondi 1992, 237)

**C. Abortion**

The Abortion and Sterilization Act No. 2 of 1975, which was the law until late 1996, allowed abortions only for instances of rape, incest, or when there is a danger to the physical health or life of the woman. The procedure for allowing a legal abortion was often so cumbersome that many who qualified opted for illegal abortion or went to another country where abortion is legal to have the operation performed.

In November 1996, a new abortion law passed its final legislative hurdle, clearing the way for President Nelson Mandela to replace one of the world's toughest abortion laws with one of the most liberal. The Choice of Termination of Pregnancy Bill was approved by a vote of 49 to 21 in the South African Senate. Twenty senators were absent when the vote was taken. The African National Congress insisted that members who could not support the new law absent themselves from the vote. The white-separatist Freedom Front, the National Party, and the Inkatha Freedom Party opposed the measure, as did Doctors for Life, which promised an immediate appeal to the Constitutional Court.

Under the new law, women and girls are entitled to a state-financed abortion on demand during the first 12 weeks of pregnancy if they have no private medical insurance. This support also applies between 12 and 20 weeks of pregnancy, subject to widely defined conditions. Physicians and midwives are required to advise a minor female to consult her parents, but the law specifically states that abortion cannot be denied if the minor refuses to inform her parents.

In 1986 and 1987, respectively, 770 and 810 legal abortions were performed in South Africa. During the same period, 26,062 and 35,882 operations for the removal of residues of a pregnancy were performed. These opera-

**Table 18**

**Response to Statement, "I Think That My Mother's/Father's Ideas and Beliefs about Contraceptive Use Are Very Similar to My Own"**

Response	Sample Year					
	1990		1991		1992	
	Mother	Father	Mother	Father	Mother	Father
True	735 (39.5%)	507 (27.4%)	716 (36.3%)	473 (24.3%)	617 (40.6%)	417 (27.7%)
False	407 (21.9%)	472 (25.2%)	423 (21.5%)	504 (25.8%)	326 (21.4%)	396 (26.3%)
Don't know	718 (38.6%)	871 (47.1%)	832 (42.2%)	969 (49.8%)	578 (38.0%)	692 (46.0%)
Column Totals	1,860 (100%)	1,850 (100%)	1,971 (100%)	1,944 (100%)	1,521 (100%)	1,505 (100%)

tions usually follow an illegal abortion and account for an unknown proportion of illegal abortions in South Africa. In 1992, 1,027 legal abortions had been performed in the first nine months, and 82 people were convicted between July 1988 and June 1991 of performing illegal abortions. [*Update 2003*: Some 155,624 abortions were performed in public hospitals and clinics between February 1997 and January 2001 (Kane-Berman 2002). (*End of update by L. J. Nicholas*)]

Of the 1,902 first-year students at a South African university, 75.6% were against abortion (35.8% male and 39.8% female). Only 15% of respondents felt that abortion is an acceptable way to terminate a pregnancy (8.6% male and 6.4% female).

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

In South Africa as elsewhere, sexually transmitted diseases (STDs) constitute a major public health problem. The annual caseload seen only at state/municipal clinics and in private practice is estimated at more than a million patients in a population of 40 million. Management of this endemic is worsened by the wide range of STDs encountered in South Africa, where the common Western STDs of syphilis, herpes, gonorrhea, and nongonococcal urethritis (NGU) coexist with tropical and subtropical entities like chancroid, lymphogranuloma venereum (LGV), and granuloma inguinale (Donovanosis). This poses a considerable number of diagnostic and therapeutic problems, especially among the people of color, the poor, and rural people.

In South Africa, considering the character of the primary healthcare and its context where access to laboratory facilities is limited, diagnosis and treatment are based more on a clinical pathology grouping of ulcerative, discharge, lymphadenopathy, and pelvic inflammatory disease (abdominal pain and infection) than on laboratory tests for specific causative organisms. Diagnosis in South Africa is often by exclusion of other similar infections (gonorrhea), as laboratory facilities are often limited or inaccessible. Combination treatment of NGU and gonorrhea is usually cheaper than the laboratory costs.

Table 19 shows the results of research on STDs at a South African university for the years 1989 to 1991 (Nicholas 1994a).

Black secondary and post high-school students are at high risk of acquiring STDs, because they are mostly single and the highest incidence of infection occurs in people between the ages of 15 and 24. Studies have shown, however, that the STD-infection rate decreases as education increases. Still, STD-infection rates for nonspecific urethritis, trichomoniasis, and herpes may be more common in college-educated people (Nicholas 1994a, 35).

**Table 19**

#### New Cases of Sexually Transmitted Diseases (First Infection by Year)

Disease	1989	1990	1991
Syphilis	47	46	31
Gonorrhea	337	325	312
NGU	67	79	107
Other	202	239	479
Total cases	653	687	929

Total student population: 13,000

A sample of general students surveyed reported a prevalence rate of STD of 18%. Studies at another South African university revealed an STD-prevalence rate of 19.9% to 23.8% for the years 1991 and 1992. For both years, the prevalence of STD was higher than the 13% reported by the nearby general local hospital.

In another study of 1,902 black first-year students at a South African university, 17% believed that only promiscuous people contract STDs; 11% did not believe that people are ethically bound to warn potential sexual partners if they have a sexually transmitted disease, 82% of students would not have a relationship with someone who had an STD, and 35% of students indicated that if they found out someone close to them had an STD, it would negatively affect their opinion of him or her (Nicholas 1994a).

### B. HIV/AIDS

The total South African AIDS budget decreased from \$6,076,337 in 1992/1993 to \$6,045,556 in 1993/1994, a real decrease of 11%. According to the World Health Organization (WHO), South Africa should be spending \$40 million a year on AIDS (Preston-Whyte 1995; Schoepf 1995).

Between April and September 1993, 488 cases of AIDS were reported in South Africa. Of these reported cases, 81% were African heterosexual men and women and 7% were infants. In nearly all the new cases of AIDS, the virus had been transmitted by heterosexual intercourse, in comparison with the period 1982-1986, when 88% of cases of the virus had been transmitted by homosexual intercourse. The Department of National Health and Population Development has reported that 550 people in South Africa were being infected with HIV daily in 1993. About 7,000 people were expected to develop AIDS in 1993. In 1995, the rate of HIV infection was expected to rise to 2.8% for men and 4% for women (Cooper et al. 1994). Table 20 provides an overall picture of HIV infection and AIDS in South Africa.

**Table 20**

Analyzing results of an anonymous structured questionnaire designed to obtain baseline data on knowledge and attitudes of first-year black university students about AIDS and their attitudes towards homosexuals in 1990, 1991, and 1992 ( $n_s = 1,902, 2,113, \text{ and } 1,558$ ), it is obvious that the students' knowledge of AIDS was inadequate, and misconceptions about AIDS transmission abounded. Prejudiced and exclusionary beliefs about people with AIDS were also common. Little difference was evident on any of the scales over the three-year period (Nicholas et al. 1994).

An AIDS-knowledge survey of 2,209 black university students in 1994 revealed striking misinformation about the risk of contracting AIDS by giving blood (41.5% said yes, 10.5% were unsure), contracting AIDS from a toilet seat (6% said yes, 8.1% were unsure), by masturbating oneself (2.9% said yes, 26.2% were unsure), and a high risk through blood transfusion (57.4% said yes, 22.5% were unsure (see Table 21).

In 1994, the newly appointed national AIDS director stated that previous AIDS-awareness programs only served to heighten fear and increase the stigma attached to AIDS,

resulting in infected people's being reluctant to disclose their status. She promised to rebuild the AIDS program (St. Leger 1994). (See also Section 10B, HIV/AIDS, in Part 2 of this chapter.)

#### [The Incidence of HIV/AIDS in South Africa

[Update 2003: The first antenatal survey in 1990 provided a baseline from which HIV trends have been assessed annually. Anonymous, unlinked, cross-sectional surveys were conducted among first-time pregnant women attending public antenatal clinics during October. October was selected because surveys undertaken by Statistics South Africa indicated that, during this period, the population tends toward more stability and is less mobile. A weighted, systematic-cluster, random sample was used, which, in 2000, surveyed 16,607 women from 400 sites. Public antenatal clinics are attended by 80% of pregnant women in South Africa, of whom 85.2% are African (Tshabalala-Msimang 2000). In the Western Cape, 4% of attendees refused to be tested (Shaikh & Adendorff 2000). Of the 16,607 women, 24.5% were infected with HIV, an increase from 22.8% in 1998 and 22.4% in 1999. Blood specimens were tested with

**Table 21**  
**Responses to Knowledge of AIDS Scale Items**

All items commence with "Do most experts say . . ."	Yes		No		Unsure	
	%	(n)	%	(n)	%	(n)
1. . . there's a high chance of getting AIDS by kissing someone on the mouth who has AIDS?	7.1	156	84.3	1,851	8.6	189
2. . . AIDS can be spread by sharing a needle with a drug user who has AIDS?	88.9	1,947	7.0	132	5.1	112
3. . . you can get AIDS by giving blood?	41.5	907	48.0	1,049	10.5	229
4. . . there's a high chance that AIDS can be spread by sharing a glass of water with someone who has AIDS?	3.6	78	89.9	1,969	6.5	143
5. . . there's a high chance you can get AIDS from a toilet seat?	6.0	132	85.8	1,879	8.1	178
6. . . AIDS can be spread if a man has sex with a woman who has AIDS?	97.6	2,137	1.4	31	1.0	21
7. . . AIDS can be spread if a man has sex with another man who has AIDS?	84.6	1,855	3.0	65	12.4	273
8. . . a pregnant woman with AIDS can give AIDS to her unborn baby?	96.4	2,116	1.7	37	1.9	41
9. . . you can get AIDS by shaking hands with someone who has AIDS?	1.4	30	96.9	2,124	1.8	39
10. . . a woman can get AIDS by having sex with a man who has AIDS?	96.6	2,116	2.8	62	0.6	13
11. . . you can get AIDS when you masturbate yourself?	2.9	64	70.8	1,546	26.2	573
12. . . using a condom (rubber) can lower your chance of getting AIDS?	92.4	2,020	3.7	80	4.0	87
13. . . there's a high chance of getting AIDS if you get a blood transfusion?	57.4	1,255	20.1	440	22.5	491
14. . . prostitutes have a higher chance of getting AIDS?	89.7	1,958	3.1	68	7.2	158
15. . . eating healthy foods can keep you from getting AIDS?	7.2	158	77.0	1,684	15.8	345
16. . . having sex with more than one partner can raise your chance of getting AIDS?	96.2	2,104	2.3	50	1.5	32
17. . . you can always tell if someone has AIDS by looking at them?	3.5	76	84.1	1,837	12.4	272
18. . . people with AIDS will die from it?	86.8	1,898	7.9	173	5.3	115
19. . . there is a cure for AIDS?	5.3	115	86.6	1,805	12.1	265
20. . . you can have the AIDS virus without being sick from AIDS?	54.4	1,188	18.1	395	27.5	601
21. . . you can have the AIDS virus and spread it without being sick from AIDS?	52.2	1,138	20.0	437	27.8	607
22. . . if a man or woman has sex with someone who shoots up drugs, they raise their chance of getting AIDS?	55.9	1,218	12.9	282	31.2	679

Sample: 889 women; 1,318 men; Mean age: 20.6 years ( $sd = 4.2$ )

Mean Total Knowledge of AIDS Scale Score: 17.1 ( $sd = 3.3$ )  $N = 2,209$

one ELISA (enzyme-linked immunosorbent assay), except in the Western Cape, where two ELISAs were used because of the low HIV-prevalence rate. Given these results, it is estimated that approximately one in nine South Africans are infected with HIV (Tshabalala-Msimang 2000). (See Table 22.)

[Update 2003: Sishana and Simbayi (2002) conducted the first national household HIV/AIDS prevalence study. The cluster sampled 14,450 potential participants, of whom 13,518 were visited. Some 9,963 (73.7%) persons agreed to be interviewed, and 8,840 (65.4%) provided an oral-fluid specimen for an HIV test. The results for whites, adults and youths, living in informal settlements, should be treated with caution, because the estimates are at the statistical borderline. Some 32% of white households declined to be listed in phase 1 of the study. The researchers found an estimated prevalence of 11.4% (females 12.8% and males 9.5%). Some 5.6% of children were HIV-positive, 0.3% of those between 15 and 24 years old and 15.5% of those over age 25 years. Table 23 shows the overall prevalence of HIV by sex and race. The study found that the HIV-infection rate among men is 74% that of women, and the HIV prevalence in pregnant women is much higher than in nonpregnant women (24.0% vs. 14.5%). HIV estimates in South Africa that have been based on antenatal surveys have, therefore, overestimated HIV prevalence in the general population. HIV prevalence is also lowest in rural areas and highest in urban areas, particularly urban informal settlements. Statistics South Africa (2002) reported the following for a 12% stratified random sample of death notification forms for 1997 to 2001, yielding 279,581 death records. The proportion of deaths because of HIV nearly doubled from 4.6% in 1997 to 8.7% in 2001. (End of update by L. J. Nicholas)]

#### [Infant Mortality and Pediatric AIDS]

[Update 2001: In 2000, South Africa's infant mortality rate was estimated to be 45 deaths per 1,000 live births. One in about every 22 children born in South Africa died before reaching its first birthday. The infant mortality rate has shown an upward trend after declining before the 1990s, mainly because of HIV/AIDS infection. Only 8% of women reported that their partner had used a condom during their last intercourse. This figure doubled for those whose last intercourse was with a casual acquaintance or a boyfriend, but this is still very low. Overall, condom use is highest among African women and lowest among Asian women, who are, however, more likely than colored or white women to use condoms with their husbands. (End of update by L. J. Nicholas)]

#### [AIDS Prevention and the Churches]

[Update 2002: According to a news release of the European News Service, the Religious Coalition for Reproductive Choice launched a church-based HIV/AIDS initiative in South Africa in conjunction with local churches and Jewish groups. The Anglican primate of the Church in the Province of Southern Africa endorsed the initiative, saying that "discussing issues of faith and religion in relation to HIV/AIDS gives new hope."

[The coalition, established in Cape Town, opened in February 2002 with a staff coordinator assisted by a corps of volunteers. Modeled on the coalition's successful Black Church Initiative, the South African program will assist churches in reducing teenage pregnancy and AIDS infections among youth, and hold forums for clergy to introduce the initiative. Training workshops will be offered for "Keeping it Real!" the coalition's faith-based sexuality education curriculum. Plans are to expand the initiative beyond Cape Town to other major cities, such as Johannesburg, Port Elizabeth, and Durban in the next two years. (End of update by L. J. Nicholas)]

#### [HIV Prevention Programs]

[Update 2002: In February 2000, Lionel Mtshali, head of the provincial government of Kwa-Zulu-Natal Province, Durban, defied the national government by announcing his plan to distribute lifesaving drugs to every pregnant woman infected with the AIDS virus in this province in an effort to save their newborn babies. This announcement reinforced a widening campaign to challenge the national government's policy of restricting the distribution of AIDS drugs in public clinics and hospitals. Meanwhile, a small number of doctors and nurses began quietly distributing generic AIDS drugs purchased in Brazil in open defiance of South Africa's patent laws. National health officials have limited the drug to a handful of sites in each province, even though research has shown that it significantly reduces a pregnant woman's risk of transmitting HIV. Every year, 70,000 babies are born HIV-positive in South Africa, which has more people infected with the AIDS virus than any other nation. One tablet of nevirapine taken during labor—along with a single dose for the newborn—can reduce the risk of transmission by as much as 50%.

[The national government's program to distribute the drug reaches about 90,000 women a year, about 10% of those who give birth annually. In December 2001, a High Court judge ordered the government to expand the program, after advocates for AIDS patients sued. The government appealed that decision, saying it needed time to set up HIV testing and counseling and to assess the safety of the drug. Advocates for AIDS patients suspect that the government's position reflects President Thabo Mbeki's concerns about the side effects and toxicity of AIDS drugs and his widely publicized musings about whether HIV really causes AIDS. The cost of the drug is not a factor, since the drug's Belgian manufacturer has offered nevirapine for free.

[By early 2002, some government officials had acknowledged that the public outcry was mounting, as doctors, ministers, and politicians demanded a rapid expansion of the nevirapine program. These advocates say government officials are keeping a desperately needed program out of hospitals that could provide testing, counseling, and support.

Government critics

**Table 23**

#### Overall HIV Prevalence by Sex and Race, South Africa 2002

Sex and Race	N	HIV+ (%)	95% CI
Total	8,428	11.4	10.0-12.7%
Male	3,772	9.5	8.0-11.1
Female	4,656	12.8	10.9-14.6
African	5,056	12.9	11.2-14.5
White	701	6.2	3.1-9.2
Colored	1,775	6.1	4.5-7.8
Indian	896	1.6	0-3.4

**Table 22**

#### HIV Trends in Prevalence Percentages in the Western Cape, KwaZulu-Natal (KZN), and National for the Decade of 1990 to 2000 (Adapted from Tshabalala-Msimang 2000)

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
West Cape	0.1	0.1	0.3	0.6	1.16	1.66	3.1	6.3	5.2	7.1	8.7
KZN	1.6	2.9	4.5	9.5	14.4	18.2	19.9	26.9	32.5	32.5	36.2
National	0.8	1.4	2.4	4.3	7.6	10.4	14.2	16.0	22.8	22.4	24.5

have pointed out that nevirapine was approved and found safe by the United Nations and the World Health Organization (WHO).

[With an estimated 36% of adults infected with HIV based on antenatal studies in Kwa-Zulu-Natal, Mtshali approached his provincial health minister and asked him to expand the nevirapine program, which is only available in two large sites here. This health minister explained that the national government would only consider expanding the program in 2003. Faced with this postponement, the provincial government announced plans to rapidly roll out the nevirapine program by the end of 2002. The national government—which expressed reservations at first—has accepted the plan. Other provinces, including the Western Cape and Gauteng, have also forged ahead with the government's permission. Still other provinces, with fewer resources and fewer established hospitals, will adopt a slower timetable (Swarns 2000). (End of update by R. T. Francoeur)]

[Update 2002: UNAIDS Epidemiological Assessment: National sentinel surveillance surveys of antenatal clinic attendees have been conducted in South Africa since 1990 and surveillance data is available by province and at the national level. Antenatal clinic HIV prevalence in South Africa increased rapidly from 0.7% in 1990 to 10.5% in 1995, and then to 22.8% in 1998. HIV prevalence among antenatal clinic attendees was 22.4% and 24.5% in 1999 and 2000, respectively. Age-specific analysis shows a modest decline in HIV-infection rates among 15- to 19-year-old antenatal clinic attendees from 21% in 1998 to 16.5% in 1999, and continuing to decline in the year 2000. However, antenatal clinic attendees in their early 20s still exhibit HIV prevalence of over 25%. In KwaZulu-Natal, Mpumalanga, and Gauteng provinces, HIV prevalence is still exhibiting an upward trend; HIV prevalence rose rapidly from 7.1% in 1990 to 36.5% in 2000. In other provinces, HIV-infection trends seem to be stabilizing at high rates, ranging from 11.2% to 27.9%. Results from the 2001 antenatal clinic sentinel surveillance survey were not readily available at the time of the writing of this report.

[HIV prevalence among sex workers tested in Natal increased from 50% in 1997 to 61% in 1998. Among male STD clinic patients tested in Johannesburg, HIV prevalence increased from 1% in 1988 to 19% 1994. Similarly, HIV prevalence increased among female STD patients from 2% in 1988 to 25% in 1994. In 1999, 11 million STD episodes were reported.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	4,700,000 (rate: 20.1%)
Women ages 15-49:	2,700,000
Children ages 0-15:	250,000

[An estimated 360,000 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 660,000 South African children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

As mentioned several times earlier, particularly in Section 1, the sexual denial and repression maintained by the South African government and its censorship policies have severely limited the development of the facilities and properly trained personnel necessary if the average citizen is to have access to the diagnosis of sexual problems and dysfunctions, sexual counseling, and therapy. Broad-ranging government censorship of all books on sexuality, coupled

with bans on vibrators and other sexual objects, the lack of sexual-education programs, and the absence of public discussion of sexuality issues severely affected the provision of sexuality counseling and therapy in the past.

Very little government support and public funds are available for research and education on sexuality issues. Without studies of sexuality among the indigenous populations of South Africa, sexual counseling and therapy is, of necessity, exercised by health professionals trained abroad using EuroAmerican models. Sexual counseling and therapy is available only to those who can pay private practitioners, or have access to the limited counseling available while they are attending the universities, colleges, technical colleges, and schools that currently fulfill only a peripheral role in primary prevention of the development of sexuality-related problems through research and consultancy services. Primary prevention services in the area of sexuality are meager, and campus sex counselors have to assume that hardly any students would be "unaffected" by sexuality-related problems. Only the degree to which students are affected by these problems will differ (Nicholas 1994a, 116-117).

## 12. Sex Research and Advanced Professional Education

The sexual behavior of blacks has been misrepresented to such a degree that an objective discussion is very difficult. The paucity of sociological and psychological studies is striking, with even the landmark studies of Kinsey and Masters and Johnson paying scant attention to the sexuality of black Americans. An important, but still limited, remedy to this lack has been undertaken by the authors of this chapter at the University of the Western Cape and other black institutions in South Africa.

## PART 2:

### ANOTHER PERSPECTIVE

MERVYN BERNARD HURWITZ

#### 1. Basic Sexological Premises

##### A/B. Gender Roles and General Concepts of Sexuality and Love

The different ethnic groups have diverse concepts of gender roles. In the black traditional community, the male plays a dominant role. He is allowed more than one wife. When his wife is no longer able to bear children, he is allowed to find a younger, fertile wife to bear more children. This lifestyle is more prevalent in the rural areas. In the urban areas, the blacks are more Westernized and polygamy is less prevalent, with the male having a monogamous relationship with only one wife (Burman & Preston-Whyte 1992).

Traditionally, the black woman does not demand sex from her partner, nor does she make advances towards him. There is little foreplay, and once the male has been satisfied, there is little afterplay. However, recently, the urbanized black woman is becoming more demanding in her sexual relationship and the male is losing his secure dominant role. The women's liberation movement is gradually reaching the black urban woman. However, the man is still the traditional leader and plays a dominant role in decision making in the family, expecting his wife to be totally subservient (Monnig 1983).

Black males commonly become migrant laborers in the mines or in the city, leaving their wives in the rural areas to tend the farms and raise the children. The husband is usually the sole monetary supporter of the family. He returns to his rural home if there is illness or bereavement in the family, usually visiting only once or twice a year. He seldom allows his wife or family to visit him in the city.

#### 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

The South African community is made up of separate ethnic groups with different identities and affiliations and cannot be lumped together as one group. The white population is made up of two large groups, namely the Afrikaners (Boers) and the English-speaking people.

Afrikaners adhere to a strictly Calvinistic view. Sex is not taught at schools. Any discussion on sexuality is frowned upon and the topic is largely seen as taboo. In this male-dominated society, the woman has been assigned a secondary role. However, with the influence of the media and the gradual lifting of the censorship of sexually explicit information, the men are threatened by the changing role of women, who are becoming more sexually assertive. In a 1987 survey compar-

ing English-speaking and Afrikaans-speaking white South Africans, Louise Olivier found that 72.8% of Afrikaans-speaking women and 69.2% of English-speaking women could discuss sexual matters with their mothers. Only 4.4% of women could discuss sexual matters with their fathers.

In the black communities, 6 million out of nearly 18 million people are affiliated to the Church of Zion or other independent Protestant churches. Many blacks still subscribe to ancestor worship and tribal ritual, despite the strong influence of the missionaries who have tried to inculcate a Christian monotheism and ethic.

Muslim and Hindu influences are found among the Asian minorities.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

In the white population, sex education has been viewed as the parents' responsibility, with few health professionals becoming involved other than on a consultative basis.<sup>1</sup> Sometimes, sexual education is provided by the family doctor, who is approached when a young person becomes sexually active and wants counseling and instruction about the use of suitable contraception.

There is no formal sex education in either the white or black schools. Representation has been made to the Minister of Education in an effort to introduce sex education into the schools, but this has met with strong resistance. The Dutch Reformed Calvinistic approach indoctrinated by the church has been opposed to sex education in schools, and all discussion of sexuality is frowned upon. Private (nongovernment-controlled) schools do have sex-education classes. Lectures are given to pupils in the 11- to 17-year-old age group, usually by social workers and counselors at the Family Life Center, as well as by the author and other sex educators.

#### B. Informal Sources of Sexual Knowledge

In 1992, television programs on sexuality were initiated, directed primarily at the youth. Panel discussions sponsored by the media have been held to look at sex education and to expose various topics of sexual interest.

However, there is very strict censorship in South Africa, and many of the sex books that are freely available overseas are banned in South Africa. There is thus a very limited number of books on sex education or explicit books on sex. Talk shows are becoming frequent on television, and phone-in shows are available on radio. There is, however, a move afoot to ban all these sources of sexual information.

The ritual passage for black girls in the traditional tribal situation is very secretive. In the Pedi tribe, Monnig reports that these rituals are conducted by the girl's mother or grandmother. The girl is told about menstruation and informed that she must avoid sex during this time. She receives detailed instruction on the work and duties of a woman, particularly in her relationship with a man, and is instructed on sexual matters. The young Pedi girls assist one another in stretching their own labia minora, which is said to ensure greater sexual gratification for men.

#### 4. Autoerotic Behaviors and Patterns

There is no literature or data pertaining to autoerotic behavior and patterns in South African children, adolescents, or adults. "Blue movies" and autoerotic literature are banned. Pornographic programs and books are heavily censored. Studies of autoeroticism are discouraged by the church and schools. People returning from overseas with erotic literature have the publications confiscated at the airport and are liable to be punished.

In the English-speaking universities, some lectures and courses on sexuality have been introduced. Lectures in sexuality for medical students were introduced in the mid-1980s. Workshops on sexuality are given to doctors, nurses, social workers, and allied professionals to encourage them to feel more at ease with sexuality and to be able to discuss sexual problems with their patients.

## 5. Interpersonal Heterosexual Behaviors

### A. Children

Forty percent of South Africa's population is under 15 years of age. Children of preprimary school age often attend nursery schools or crèches where the sexes are mixed. They share common toilet facilities, are taught basic gender differences, and stereotypic gender-role models are reinforced. Both teachers and parents report that children play doctor-patient games and tend to explore one another. This is often a source of great anxiety to both parents and teachers.

In the black communities, there is overcrowding and a lack of privacy. The children often have to sleep in the same room as their parents, and many share a bed with parents or siblings. This early exposure to parental sexual activity sometimes causes anxiety and confusion that can affect their own sexual identity.

### B. Adolescents

#### *Puberty Rituals*

Pubertal rituals are carried out in many black tribes. Male circumcision in the black communities is common in both urban and rural areas and is seen as a prerequisite for manhood. The age of circumcision varies in different tribal groups from 9 to 22 years.<sup>2</sup> In the Xhosa tribe, for example, males are circumcised between the age of 18 and 22 years, in a ritual ceremony celebrated twice a year.<sup>3</sup> In most tribes, there is no anesthetic given for pain; the boy is simply given only a piece of wood to bite on. The youth is indoctrinated to believe that he has to endure pain to prove that he is fit to be called a "man."

Because of poor techniques and inexperienced or poorly trained traditional healers or *sangomas*, the complications of circumcision are sometimes serious, even functionally irreparable. Gangrene is not an infrequent complication following ritual circumcision.<sup>4</sup>

Courley and Kisner described 45 cases of youths who required hospitalization following ritual circumcision.<sup>3</sup> All 45 cases were septic on admission. In 5% of cases, the entire penis was necrotic; the mortality rate was 9%. Septicemia and dehydration are frequent causes of such mortality.

The chief cause of penile injury is a dressing that is too tight and applied for too long. The hemorrhage is controlled by applying leaves around the penile shaft and then binding the organ with a strip of sheepskin leather. A concerted effort is being made to educate the traditional healers in the use of commercial medicines and dressings rather than traditional leaves and sheepskin.<sup>3</sup>

Female circumcision is not carried out in South Africa, although some tribes, such as the Pedi, encourage the females at puberty to stretch the labia minora.

#### *Premarital Sexual Activities and Relationships*

Focusing on adolescent black children and teenagers, Preston-Whyte and Zondi found that both boys and girls admitted experiencing sex before their 12th or 13th year.<sup>5</sup> Some had experienced penetration before they reached physical maturity. By age 13, most had been sexually active, if not regularly, then at least on a number of occasions. Full penetration was the rule.

In a predominantly white South African survey, Olivier found that 30% of his respondents under age 17, 24 of 80,

were still virgins. In the colored community, Burman and Preston-Whyte (1992) found that 30.5% of all births occurred in teenagers, with 5% below the age of 16. Eighty-one percent of the teenage group had out-of-wedlock children.

There are no figures available on the number of teenagers who are involved in ongoing relationships while indulging in sexual activities. Peer pressure in the urban black community encourages sexual encounters that are often monitored by older teenagers.

The double standard is evident in the black communities. When a man's unmarried daughter becomes pregnant, he is enraged. Yet, when a son makes a girl pregnant, the father may be secretly and even overtly pleased. Among his peers, a boy who has many girlfriends, and who is known to have fathered a child or a number of children, is admired. His father often shares this attitude. The pressure is therefore towards, rather than away from, teenage sexual involvement. The relationship between a boy and girl who are "going together" is normally one that involves full intercourse (Burman & Preston-Whyte 1992).

### C. Adults

#### *Premarital Courtship, Dating, and Relationships*

The formal ritual of dating and courtship familiar to Western civilization is more prevalent in the white South African community, which tends to be more affluent and able to afford movies, discos, and weekends away on vacation. There are several singles clubs, discos, and bars catering to adolescents and young adults looking for dates or a "one night stand." With the incidence of sexually transmitted diseases, the educated and affluent groups are more inclined to be selective and less promiscuous in their relationships than their less-educated brothers and sisters from a lower socioeconomic class.

#### *Marriage and the Family*

Monogamy is more commonly accepted amongst the white group than the black group. Traditional black men who have not accepted the doctrine of Christianity are allowed to have more than one wife. In the rural setting, a man's wealth is assessed by the number of children and cattle he owns, and thus he may take a second wife. Cohabitation is common in the white society in nonreligious couples, but is frowned on by the church, particularly the strong Calvinistic elements of the Dutch Reformed Church. In the black traditional rural setting, marriage is not primarily concerned with legalizing sexual relations between two individuals, but rather with establishing paternity and giving the husband the right to sexual relations with his wife. In this value system, extramarital intercourse is possible and even socially accepted and provided for culturally (Monnig 1983).

Laws prohibiting interracial sex and marriage were repealed in 1985.

#### *Incidence of Oral and Anal Sex*

There are no figures available for the incidence of anal sex, fellatio, or cunnilingus. In my experience, anal intercourse is engaged in by a very small proportion of heterosexual couples. On the other hand, more than half the couples attending the Sexual Dysfunction Clinic at the Johannesburg Hospital reported engaging in cunnilingus and fellatio. Most men reported being happy to indulge in cunnilingus. Some women reported feeling uncomfortable with fellatio. In Olivier's 1987 survey, a surprising finding was that few women reported enjoying oral sex, only 9.2% in the 17- to 25-year age group and 5.9% in the over-age-25 cohort. From my personal experience in my private gynecological practice, I feel that these figures are low and that the overall figure is well over 30%.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

In Olivier's survey of 2,842 women, 89.7% were heterosexual, 0.3% were lesbian, and 2.5% were bisexual. Most of the women in this survey, 2,711 of 2,842, were white females. There is no legal status for lesbian or homosexual couples in the South African society. In 1992, homosexuality was more acceptable and less frowned upon than previously. Gay advice bureaus are available, but there is no legislation to protect the rights of homosexuals.

The incidence of homosexuality in the black population is low. This is borne out by the low incidence of HIV-positive homosexual black males (0.6%), compared to 31% of homosexual or bisexual white males.<sup>6,7</sup>

## 7. Gender Diversity and Transgender Issues

Transvestites, transgenderists, and transsexuals have no legal standing. There are very few centers available in South Africa for the treatment of these patients, and surgical operations are very rarely performed. At least two years of psychiatric treatment and evaluation are needed before any operative procedure is considered.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex Sexual Abuse

The Department of Health and Welfare keeps a social welfare register on all children who are abused. Legislation requires doctors, nurses, social workers, police officers, and members of the public to report cases of abuse. It would appear that sexual abuse is becoming more prevalent in all sectors of the community. This correlates with the escalating violence encountered throughout South Africa. Conviction for sexual abuse and rape carries a penalty of a lengthy prison sentence. In their study of teenage mothers, Burman and Preston-Whyte found that pregnancies occurred at a younger age among abused children than in the control group.

### Incest

Incest is taboo in all groups in South Africa (Zulu report by Burman and Preston-Whyte; Pedi report by Monnig). If a pregnancy results from incest, a legal abortion may be performed.<sup>8</sup> There are no available statistics for the incidence of pedophilia, but it is a punishable offense.

### Sexual Harassment

With the increase of feminism, more cases of sexual harassment are being reported in the workplace. South African men are known to be chauvinistic and to "put down" women both verbally and in terms of job opportunity. There is only recourse to the law in terms of discrimination and not in terms of harassment.

### Rape

Rape cases are reported daily. However, in cases of family rape, they often are unreported. There is still a stigma attached to the rape victim and, despite attempts at educating the public, the rape victim is still often seen as inviting the sexual advances of the male. In black urban areas, two to three rapes are reported daily and many more are unreported. These rape cases are often committed by strangers or casual acquaintances.

### B. Prostitution

Prostitution is rife, particularly in the larger cities. Escort agencies provide a front for prostitution, which is illegal in South Africa. No figures are available of the number of prac-

ting prostitutes or their activities. With the present high rate of unemployment, estimated at over 25% in the black community, prostitution is on the increase. As prostitution is illegal, there are no facilities for regular medical examinations of prostitutes to control STDs or other infections.

### C. Pornography and Erotica

As mentioned above in Sections 3B and 4, the Calvinist tradition has been very effective in maintaining severe restrictions on all pornographic and erotic material.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception and Teenage Unmarried Pregnancies

Family-planning clinics are available in many areas and provide a free service. There is a reluctance among the black males to allow their partners to use contraception. Among the more-educated population, there is an attempt to limit the size of the family and to use some form of contraception.

Adolescent pregnancies are common in the black communities. Contraception is seldom used. The reasons given for failure to use contraception include cost, not admitting sexual activity, unplanned coitus, a belief that they are too young to become pregnant, fear of the effect of contraceptive methods, and subconsciously wanting to become pregnant.

The earlier the age of menarche, the earlier the first coitus occurs.<sup>8</sup> Van Coeverden found that when the menarche occurred before the age of 12, 56% of teenagers attending a family-planning clinic experienced coitus by the age of 15.<sup>9</sup> If menarche occurred after the age of 13, then 42% were sexually active by the age of 17.

There are no statistics available as to whether the sexually active teenagers have multiple partners or are involved in steady exclusive relationships. Personal observation suggests that promiscuity is common. Peer pressure often forces teenagers to have sexual contact in order to avoid being ostracized by their peer group. Unstable home and socioeconomic factors, as well as poor school attendance, boredom, drugs, and alcohol abuse, are some factors related to the early onset of coitus.

Premarital sexual relations vary considerably between the various racial groups in South Africa. Children raised in crowded ghetto conditions often lack parental control and have fewer recreational facilities to occupy their spare time and energy. Above all, for many black girls, there is very little to look forward to except childbirth.<sup>5</sup>

### B. Abortion

Although abortion was illegal in South Africa until late 1996, the Abortion and Sterilization Act of 1975 allowed for legal abortions under four well-defined circumstances:<sup>8</sup>

1. Where the continuation of a pregnancy poses a serious threat to the mother's physical and/or mental health;
2. Where a risk exists that the child will be seriously handicapped, physically or mentally;
3. In cases of rape or incest;
4. In cases of unlawful carnal intercourse with a woman who is permanently mentally handicapped.

A 1994 review covering a six-year period quotes the number of legal abortions in South Africa as being about 1,000 per annum and the registered number of instances where products of conception were found at surgery as being about 35,000 per annum.<sup>10</sup> The number of "back street abortions" performed annually is estimated at between 10,000 and 40,000. Many of the more-affluent patients travel overseas to countries where abortions are legal to have their preg-

nancies terminated. (See discussion of the new legislation adopted in November 1996, in Section 9C, Contraception, Abortion, and Population Planning, Abortion, of Part 1.)

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Sexually transmitted diseases constitute a major public health problem in South Africa. It has been estimated that over one million patients seek treatment for sexually transmitted diseases each year at community clinics, and that more are seen at hospital outpatient departments and primary healthcare clinics. STDs in South Africa conform largely to Third World patterns. Pelvic inflammatory disease, mainly because of STDs, is the commonest reason for acute emergency admission to the gynecological wards and is the most common disease syndrome seen in gynecological outpatient departments.<sup>11</sup>

A survey in Alexandra township, a poor urban black township in Johannesburg, estimates that 20% of the population over the age of 15 is treated at least once a year for an STD.<sup>6</sup> A second study of patients seen at a university clinic in Alexandra township revealed that 10% of all patients seen were referred with an STD, 53% being men and 47% women.<sup>7</sup> Fifty-four percent of the patients were between the ages of 20 and 29. Most men presented with urethritis or an ulcer, while the women presented with pelvic inflammatory disease or a discharge.

Gonorrhea remains the most common cause of acute urethritis. Twenty percent of all cases also harbor chlamydia trachomatis, the commonest cause of nongonococcal urethritis (NGU).<sup>11</sup> The commonest organisms found in females with pelvic inflammatory disease are *Neisseria gonorrhoeae* in 65% of cases, *Mycoplasma hominis* in 53% of cases, and *Chlamydia trachomatis* in 5% of cases.

Mixed infections are common and anaerobic superinfections occur in 82% of cases.<sup>11</sup> Men are more likely to be repeat attendants for STD, and are more likely to report multiple sex partners. Professor Ron Ballard states that there are upwards of three million new cases of STDs each year in our population of 26 million.<sup>12</sup>

There are poor resources available for the treatment of STDs. Attempts are being made for a wide-ranging communication campaign to attempt to educate the population to reduce the number of sexual partners.

A major factor affecting the availability of contraception, abortion, and the diagnosis and treatment of STDs and HIV/AIDS is the state of the country's national healthcare system. In the January 1995 annual healthcare and education report, the South African bishops conference warned that the country's national healthcare system is close to collapse. The system, the report stated, is in a chaotic state because of poor coordination of services, inadequate resources, and injustice. Only 19% of South Africa's 41 million people have medical coverage through private systems. Public hospitals that offer inexpensive care to uninsured patients are crowded and understaffed. Health Minister Nkosazana Zuma initiated a study of a national health insurance plan that would provide universal coverage. This study includes examination of successful models from Kenya and Namibia that stress preventing illness by teaching healthy living habits through community health organizations.

### B. HIV/AIDS

In all of Africa, HIV infection is spread mainly through heterosexual intercourse.<sup>13</sup> Concomitant STDs, particularly genital ulcers, are implicated as cofactors in the transmission of the HIV virus.<sup>14</sup> The World Health Organization estimates

that there are 5 million HIV-infected individuals in Africa. This epidemic has only recently reached South Africa, but there is every indication that the prevalence of HIV may reach alarming proportions in the future, and no field of medicine will remain unscathed.<sup>15</sup> It is estimated by the Department of National Health that there are currently 300,000 HIV-positive people in South Africa and 400 new cases per day.<sup>16</sup> The latest available statistics of AIDS in South Africa as of September 1992, total 27,389 confirmed cases.<sup>17</sup> However, AIDS is not a reportable disease in South Africa, and thus many cases are not recorded. (See Tables 24 and 25.)

A survey carried out at the Baragwanath Hospital, in Soweto, a black town adjoining Johannesburg, has revealed that between July 1988 and December 1990, 426 HIV-positive individuals were identified.<sup>15</sup> Eighty-five percent of these cases were traced to heterosexual transmission, 0.6% to homosexual contact, and 12.6% to perinatal maternal infection. In this study, a total of 111 HIV-positive women were diagnosed in the maternity units of Baragwanath Hospital, and 51 symptomatic children with perinatally acquired HIV infection were admitted to the pediatric wards.<sup>18</sup> Late 1994 data from the Baragwanath Hospital showed that 8% of patients in the prenatal clinic were HIV-positive. At the Johannesburg Hospital, 10% of the prenatal clients were HIV-positive; a similar incidence was reported in late 1994 by the Johannesburg City Council for the inner-city population that was HIV-positive. In 1994, the number of HIV-positive South Africans doubled in 12 months.

According to McIntyre, the rate of HIV-positive pregnant women in 1992 was 4/100, with the rate doubling every nine to 12 months.<sup>19</sup> As a result of these alarming statistics, an HIV clinic has been started in the maternity unit of Baragwanath Hospital. The most-recent figures show that at least two HIV-positive women give birth daily at the hospital; 200 HIV-positive women were identified in the first eight months of 1992.

The major brunt of the HIV epidemic in South Africa is expected to be borne by black heterosexual adults and by infants.<sup>20</sup> A total of 181 HIV-positive black adults were admitted to the medical wards of Baragwanath Hospital between August 1987 and December 1990. Equal numbers of both sexes were seen, of which 34% have died.

There are no statistics of lesbian HIV-positive women in South Africa. All age groups in both sexes are at risk of ac-

**Table 24**  
AIDS Risk (as of September 1992)

AIDS Risk Category <sup>16</sup>	Percent of Total
Heterosexual	50
Homosexual/bisexual	31
Pediatric	15
Blood transfusion	1.9
Hemophiliacs	1.4
IV-drug users	0.1

**Table 25**  
Percent of AIDS Cases<sup>14</sup> (as of September 1992)

	Percentage of Cases by Race	Percentage of Nation's Population
Black	62.4	68.3
White	33.2	17.1
Colored (mixed race)	3.7	11.0
Asian	0.4	3.2

quiring HIV infections.<sup>21</sup> Tuberculosis is the commonest infectious complication of AIDS in South Africa.<sup>22</sup>

In South Africa, the HIV virus is most commonly transmitted by sexual intercourse. Transmission of the virus from mother to child is the second commonest mode of spread in all African countries, including South Africa.<sup>23</sup> Homosexuality is relatively uncommon among black South Africans, but is a common form of transmission of the HIV virus in the white population. Homosexuality, however, does not play a major role in the pandemic spread of the HIV virus in any African country.<sup>24</sup>

In the African context, black promiscuous men are very reluctant to use condoms and complain about the cost and inconvenience of the use of condoms. Since status is equated to fertility, the use of condoms and contraception is frowned upon. Condoms cannot be prescribed in the Health Service, but they can be obtained free of charge from Family Planning Clinics. Doubts have been expressed about the advisability of media advertisements on the use of condoms in South Africa, prompted by pervading Calvinistic reticence (Lachman 1990). AIDS education is available in many black schools but is not permitted in state-controlled schools for predominantly white pupils. In the conservative Calvinistic white community, AIDS is seen as a problem experienced only among homosexuals or the black community.

In a survey of 122 black mothers in the Durban area, it was found that these mothers were at a high risk of acquiring AIDS.<sup>24</sup> Urban black mothers seldom discuss the risk of unprotected sex with their daughters, despite their knowledge of transmission modes and of ways to prevent HIV infection. Fifty percent of these mothers had children by the same consort, whereas 44% had more than one partner. Ninety-two percent of these mothers stated that they would like their partners to use condoms, yet all the mothers said that they had not experienced intercourse where their partners had used condoms.

In 1989, the Johannesburg City Health embarked on an AIDS-awareness campaign using messages placed on the outside of 30 city buses.<sup>25</sup> The role of health education is to provide the entire community with a means to prevent HIV infection. A toll-free dial and listening service is available to anyone who has access to a telephone. Callers can choose to hear this information in any of the eight major languages in South Africa.

In recognition of the seriousness of the AIDS problem, the Department of National Health and Population Development recently established an AIDS unit. The unit consists of a multidisciplinary team. There are AIDS clinics in all the major cities of South Africa but these are already insufficient for the needs of the community. Counseling HIV-positive patients embodies the principles of counseling and care for all patients who have an incurable disease. It is different in that no other medical condition carries the stigma, moral censure, and societal consequences that accompany AIDS.<sup>26</sup>

An April 1995 Update: Early results of a Department of Health survey showed that two out of 25 South Africans are HIV-positive. In 1995, an estimated 850,000 to one million South Africans were infected, with over 700 new cases every day. The infection rate in Kwazulu Natal is almost three times that of the rest of the country; the number of AIDS cases for the first quarter of 1995 was double that for the same period in 1994. An estimated 15% to 19% of the people in Natal were infected in April 1995. The least-infected regions of the country were the North West and Northern Cape. The epidemiological director cautioned that the extent of underreporting was not known.

In a July 1996 report at the 11th international conference on AIDS, South Africa had an estimated 1.8 million cases of

HIV infection, second only to India's 3 million cases. In June 1996, Dr. Peter Piot, head of the United Nations Joint Program on HIV-AIDS, reported that 10% of the South African population is believed to be infected with HIV. In the province of Kwazulu Natal, the infection rate had reached 16% (Preston-Whyte 1995; Schoepf 1995). The rate was even higher in nearby Zambia and Zimbabwe, where 17% of the population lives with the virus. In South Africa's northern neighbor, Botswana, 18% of the people are infected. No one can explain this rapid rise in HIV infection in southern Africa, especially considering the fact that the infection reached South Africa later than it did other regions of Africa, and the efforts of the Mandela government in making AIDS prevention a national priority.

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

Any problem related to sexuality that may negatively affect either the male or the female, both as individuals or in a relationship, is viewed as a sexual dysfunction. In the male, the most common reasons for referral to the Sexual Dysfunction Clinic or to a sex therapist are premature ejaculation and loss of libido. Orgasmic dysfunction in the female and loss of libido are the most common sexual dysfunctions seen at the Sexual Dysfunction Clinic. In the black population, most males are worried about their performance, their ability to sustain an erection for an often-unrealistic length of time, or the inability to have intercourse up to 4 to 5 times a night.

### B. Availability of Diagnosis and Treatment

The root of many of the problems is basic ignorance. Thus, patients are given information about basic sexual anatomy and physiology. At the Sexual Dysfunction Clinic in Johannesburg, patients are preferably seen as couples by the team consisting of a gynecologist, social worker, and nurse. All patients are examined physically, and the female patients are given a complete pelvic exam. The partners are encouraged to participate in these physical examinations.

All males attending the Sexual Dysfunction Clinic at the Johannesburg Hospital are checked by Doppler flow for penile blood flow and penile blood pressure. Serum testosterone and prolactin levels are routinely carried out at the clinic on males with any form of sexual dysfunction. A urologist is available for consultation. Some couples or individuals prefer to be counseled privately and are seen by a single therapist in private practice who may be a gynecologist, urologist, psychiatrist, psychologist, social worker, or general practitioner.

Sex therapists in South Africa have been trained locally and often internationally. They attend international workshops and congresses. Sex therapists in South Africa come from many disciplines, all of which have an interest in the field of sexology.

## 12. Sex Research and Advanced Professional Education

There is very little research in the field of sexology in South Africa. There are no facilities to carry out major research programs. However, some individuals conduct sporadic research into various aspects of sexual dysfunction.<sup>27,28</sup> There are no available institutes or programs for research.

Medical students at the various medical schools receive lectures on sexual dysfunction as part of their medical curriculum. Students at the University of the Witwatersrand are encouraged to attend the Sexual Dysfunction Clinic at the Johannesburg Hospital. There are sexual dysfunction clinics at the Johannesburg Hospital, Groote Schuur Hospital in Cape Town, and the H. F. Verwoerd Hospital in Preto-

ria. There are no postgraduate facilities available for the advanced study of human sexuality.

The Sex Society of South Africa is in the process of being formed at press time. *The Medical Sex Journal of South Africa* is published quarterly by the South African Academy of Family Practice and Primary Care. The address of the editorial offices is: P.O. Box 23195, Joubert Park, Johannesburg, South Africa.

Additional information on sexuality is available from: Planned Parenthood Association of South Africa, Third Floor, Marlborough House, 60 Eloff Street, Johannesburg 2001, South Africa. Tel.: 27-11/331-2695.

### Conclusion

In the early 1990s, South Africa is faced with a major upheaval, both politically, socially, and economically. The uncertain political, social, and economic future of South Africa, faced with the transition from a white-dominated government to a multiracial or black government, poses many challenges for the country. Violence has become a way of life. Sexual abuse is common, as is murder, rape, and anarchy. The future of the medical and paramedical services is in a state of flux. It is not likely that the situation of sexology will improve significantly in the near future, simply because most of the nation's resources and the people's energies will, of necessity, be devoted to more pressing and urgent challenges, including the need to provide primary healthcare, food, housing, and basic necessities to the underprivileged masses.

### *Demographics and a Brief Historical Perspective*

#### A. Demographics

ROBERT T. FRANCOEUR

The Republic of South Korea occupies the southern half of the Korean Peninsula in northeast Asia, with North Korea on its northern border, the Sea of Japan and Japan to the east, the East China Sea and China to the south, and the Yellow Sea and northern China to the west. With a total landmass of 38,023 square miles (98,480 km<sup>2</sup>), and a coastline of 1,500 miles (2,400 km), South Korea is slightly larger than the state of Indiana. The country is mountainous, with a rugged eastern coast. The western and southern coasts are deeply indented, with many islands and harbors. The climate is temperate, with heavier rainfall in summer than in winter.

In July 2002, South Korea had an estimated population of 48.3 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

\**Communications:* Professor Hyung-Ki Choi, M.D., Yongdong Severance Hospital, Department of Urology 146-92, Dogok-dong, Kangnam-ku, Seoul 135-270, Korea; urol3887@yumc.yonsei.ac.kr. In most sections, the material these authors supplied was redacted by Huso Yi and integrated with additional information. Additional comments are indicated in brackets as [. . . (*Huso Yi*)]. In the areas where the primary authors did not supply information, Huso Yi and others have summarized key studies to complete the picture. Written in 2000-2001, this chapter was updated in 2003 by Huso Yi.

(CIA 2002)

**Age Distribution and Sex Ratios:** 0-14 years: 21.4% with 1.13 male(s) per female (sex ratio); 15-64 years: 71% with 1.03 male(s) per female; 65 years and over: 7.6% with 0.65 male(s) per female; *Total population sex ratio:* 1.01 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 74.88 years; *male:* 71.2 years; *female:* 78.95 years

**Urban/Rural Distribution:** 83% to 17%

**Ethnic Distribution:** Homogeneous, except for about 20,000 Chinese and 4,500 Chinese-Koreans

**Religious Distribution:** Christian: 49%; Buddhist: 47%; Confucianist: 3%; Shamanist and other: 1%\*\*\*

**Birth Rate:** 14.55 births per 1,000 population. Family planning has been an important task since the 1960s. Korea's TFR decreased from 6.0 births per fertile woman in 1960 to 4.5 in 1970, 2.7 in 1980, 1.6 in 1990, 1.5 in 1998, and 1.7 in 2002.

**Death Rate:** 6.02 per 1,000 population

**Infant Mortality Rate:** 7.58 deaths per 1,000 live births

**Net Migration Rate:** 0 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.72 children born per woman

**Population Growth Rate:** 0.85%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.01%; *Persons living with HIV/AIDS:* 3,800; *Deaths:* < 180. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 98% (*male:* 99.3%, *female:* 96.7%); Korean is the official language, but English is widely taught in the high schools. Education is free and compulsory from the 1st to 6th grades.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$18,000 (2001 est.); *Inflation:* 4.3%; *Unemployment:* 3.9%; *Living below the poverty line:* 4% (2001 est.)

\*\*\**Editors' Note:* The strong historical dimensions of this chapter and the recurring references to the historical and contemporary influence of Confucianism and its patriarchal views might seem to be unimportant, because 96% of Koreans are either Christian or Buddhist and only 3% identify with the Confucian/Neo-Confucian philosophy. However, Confucianism, and particularly Neo-Confucianism, continues to play a major role in Korean sexual culture.

## B. A Brief Historical Perspective

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

[*Comment 2001*: According to the *National History Compilation of the Republic of Korea* (NHCROK 2001), the beginning of Korea dates from 2333 B.C.E., when Tangun, a legendary figure born of the son of Heaven, married a woman from the bear-totem tribe and established the first kingdom, Chosun, literally meaning, "Land of the Morning Calm." Korea's early native culture was based on a warrior aristocracy, a shamanistic religion, and a subject class of rice cultivators. The ancient period was followed by the Three Kingdoms from 57 B.C.E. to 676 C.E.; the North-South Unified Shilla period (676 to 935 C.E.); and, starting as a province under the Shilla era, the Koryo dynasty from 913 to 1392 (the Koryo dynasty started as a province in 913 and governed the whole country in 935). (*End of comment by Huso Yi*) In the Yi or Chosun dynasty (1392 to 1910), during which it was known as the Kingdom of Chosun, Korea was a staunch tributary ally of China during its Ming (1368-1644) and Ch'ing (1644-1911) dynasties. The Japanese, who invaded most of Korea in 1592, were finally expelled by combined Korean and Chinese forces in the late 17th century. This relationship with China brought a strong adherence to Buddhism and a government system modeled on Chinese bureaucracy. For the next 200 years, Korea was rigorously isolated from all non-Chinese foreign influence and was known as "the Hermit Kingdom."

Korea's isolation, and its status as a tributary of China, ended in 1874, when Japan imposed the Treaty of Kangwha to guarantee Japanese commercial access to Korea and other interests. The outcome of the Sino-Japanese war (1894-1895) recognized Korea's complete independence, but made the nation a protectorate of Japan. In 1910, Japan forcibly annexed Korea as the colony of Chosun. A harsh colonial policy was established to eradicate all Korean culture and make Korea an integral part of the Japanese empire. All Korean resistance was violently repressed, although resistance movements managed to survive in exile. During World War II, tens of thousands of Koreans were conscripted to work in Japan and in the Japanese-occupied territories. At the same time, thousands of Korean women were forced into "comfort services" for the Japanese military, a reality that was not dealt with publicly until 50 years later in the late 1990s.

Following Japan's surrender in 1945, Korea was arbitrarily divided into zones of Soviet and American occupation. The 38th parallel split the country geographically, economically, and politically into North and South. Korea's industrial and hydroelectric power was concentrated in the north, where careful Soviet plans established a communist government. In the agricultural south, American attempts to reunify the country under a republican government were inept. By 1948, when it was obvious that the country could not be united, the Republic of Korea was organized in the south, and the United States withdrew its occupation forces in June 1949. In June of 1950, Northern Korean troops invaded the south in an attempt to unify the country under a communist regime. Because it boycotted the United Nations Security Council debate on what response to make to the invasion, the Soviet Union could not veto the United Nations' decision to send troops to repel the invasion. Initially, American forces were successful in driving the communist forces back to the Chinese border. However, when Chinese troops entered the war, the tide reversed and the United Nations troops were driven south. Seoul, the capital, fell to the communists on January 4, 1951. Within two months, the communist forces were driven back to the 38th

parallel, where the battle line stabilized despite intervals of fierce fighting. A truce was finally signed on July 27, 1953, with a demilitarized zone along the 38th parallel.

Postwar reconstruction of the south followed with major American support. Student demonstrations in 1960 forced the resignation of Korea's first president, Syngman Rhee. In May 1961, a military coup was established. The military government was given some democratic trappings in a 1972 referendum that allowed General Park to run for an unlimited series of six-year presidential terms. Following Park's assassination on October 26, 1979, by the government's chief of intelligence, General Chun Doo Hwan assumed power. Widespread violent political protests followed, although the nation's economy was making great strides, with modernization, industrialization, and a strong urban life. In 1986, South Korea achieved a favorable balance-of-payments ratio in its foreign trade.

Widespread demonstrations in mid-1987 led to new elections and a calmer political situation, although students called for greater efforts for reunification of the north and south, and protests of the large number of American troops continued. North-South talks in 1990 produced an agreement in principle on reunification in the near future. However, South Korea's interest in reunification became more cautious when North Korea faced a major widespread famine. The massive economic burdens West Germany encountered in helping East Germany become a part of a reunited Germany added to South Korea's growing hesitation over reunification. Establishment of diplomatic relations with China in 1992 was a clear signal that Korea will remain a major influence in the region. [*Comment 2001*: In addition, the Korean government began to build up good relationships with North Korea through the so-called "sunshine policy" of President Kim Dae-Jung, who was awarded a Nobel Peace Prize honoring his political efforts for democracy and reunification. (*End of comment by Huso Yi*)] [*Comment 2003*: In 2003, Roh Moo Hyun became the 16th President. Mr. Roh is a self-taught lawyer without a college education and acquired his liberal credentials by defending students and working-class workers involved in the democracy movement. He named his administration "Participatory Government" and swore to promote democracy and reform. In his administration, female ministers were appointed, including Ms. Kang Gum-Sil at the age of 46 years old, who would head the male-dominated Justice Ministry for the first time. (*End of comment by Huso Yi*)]

### 1. Basic Sexological Premises

#### A. Character of Gender Roles

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

[*Comment 2001*: The following examples of typical and popular Korean proverbs concerning women provide an insight into the position of women in Korean culture and the family:

"If you don't beat your woman for three days, she becomes a fox."

"If you listen to a woman's advice, the house comes to ruin; if you don't listen, the house comes to shame."

"If a woman cries, no good luck for three years."

"A woman's mouth is a cheap thing."

"You can know in water 1,000 fathoms deep, but you can't know the mind of a woman."

"When wood fire and a woman are stirred up, the outcome is a great misfortune."

"Get slapped at the government office; come home and hit your woman."

“A bad wife is a grievance for 100 years; bad bean paste is a grievance for one year.”

“The good-for-nothing daughter-in-law gets sick on the day of ancestral sacrifice.”

“A son-in-law is a guest for 100 years; a daughter-in-law is an eating mouth ’til the day she dies.” (*End of comment by Huso Yi*)

Throughout Korean history, Korean women have been treated as second-class citizens regardless of their social and familial positions. In the social system, they have been limited to being bystanders in the main cultural systems, behind bureaucratic male dominance. Korean women have been the subjects of discriminations based on their role in marriage, their fertility, and their lack of a right to end their marriage in divorce, as well as their subordinate role in the public domain.

In the Koryo dynasty, monogamy was encouraged, and divorce and remarriage were widely practiced by both men and women. However, at the end of the Koryo dynasty, polygamy emerged. The Chosun dynasty (1392-1910) proclaimed monogamy and officially frowned on polygyny as a part of a social reformation policy, although powerful men were commonly allowed to have several wives. [*Comment 2001*: The Chosun dynasty reversed the entire previous marriage system by prohibiting women’s remarriage, and furthermore, marriage between those of the same surname and family origin (Chung 1998). The law against remarriage was enforced in 1447 and lasted until 1894. The law against same-surname and family-origin marriage still exists in Korea. It will be discussed later. (*End of comment by Huso Yi*)] The conflicting system of polygyny and monogamy coexisted without much problem because of the lenient Neo-Confucian morals for males. Those who made the laws were not about to give up their privileged right. Nor were they about to improve the subordinate position of women. Women who openly opposed the practice of multiple wives were maltreated and humiliated. However, in 1899, near the end of Chosun dynasty, a formal protest against polygyny took place, headed by the newly organized woman’s association. Their protest ended without any change, but it was a herald of an active organized women’s movement in Korea.

Early marriage is another interesting feature of the Korean marriage heritage. Records of early marriage as far back as the Three Kingdom era (57 B.C.E. to 676 C.E.) document the practice of early marriage, which allowed children about 10 years old to be presented to a family as a bride or groom. The legal age for marriage in Chosun was 15 for boys and 14 for girls, with the exception of 12 years when a child had to assume responsibility for the family. At the time, the average legal age for marriage in other countries was 18 for men and 15 for women. It was generally believed that the risk of inappropriate sexual involvement increased if marriage was delayed, and so the legal age for marriage was lowered. The custom of early marriage continued well into the 20th century. In the 1991 national tax census, among 1,000 married couples, 10 men and 18 women married before the age of 5, 48 men and 132 women were married between ages 5 and 10, and 159 men and 488 women married between ages 10 and 15. In other words, 217, or one in five of the men, and 638, or nearly two thirds of the women, were married by age 15 (Chung 1998). These children had no choice in the commitment of marriage and parenthood. With no opportunity to reject or refuse their arranged partners, marriage was simply one’s fate. Another surprising fact is that among 100 murderers in prison, 31 of the 47 female prisoners murdered their husbands (Chung 1998).

## B. Women of Korea: A Historical Overview

YUNG-CHUNG KIM (Summarized by HUSO YI)

### *Women and Family*

As in other agrarian societies, the large patriarchal extended family was the basic organizational unit in Korea for many centuries, with relatively little change in its basic structure. The rule maintained in husband-wife relations was the rigid distinction drawn in their roles. Whereas the man dominated in public affairs, the woman took full responsibility in the family. The wife was responsible for the education of the children, especially the girls, up to the age of marriage. There were no educational institutions for girls, and the mother assumed the role of teacher. Her influence was not limited to her daughters’ upbringing. She was often honored and rewarded for her model behavior and contribution when her husband or sons were successful in public life.

The woman also took an active part in the family economy. She was expected to be an able and careful manager of family finances. In case the husband was disabled and could not support the family or was neglectful of his duties, the wife had to be able to use her skills to provide for the family. Also, one of the wife’s functions in the family system was the performance of rituals in ancestor worship. Filial piety was the prime virtue by which family lineage was preserved, and ancestor worship was its salient feature.

In traditional Korea, it was customary for the ruler and *yangban* (rural ruling-class males) to keep several wives. There was a clear distinction between the primary spouse and the secondary wife/wives or concubines who were at his caprice. In contrast, the woman was subject to strict chastity. When the husband died, ideally the wife must remain chaste the rest of her life; this was the virtuous conduct expected of widows. However, there was less prejudice against remarriage for women in the Koryo period than during either the United Shilla period or the Chosun dynasty. Customs concerning marriage were basic features of the social structure. Because a person’s social position was determined by bloodline and family background, a marriage violating or risking such established convention was neither desirable nor acceptable.

The marriage celebration was an expensive one. Such expensive and elaborate feasting and entertainment at weddings (and funerals) were responsible for the ruin of many of the less-affluent *yangban* in the later years of the Chosun dynasty. As the proverb goes: “If a family has three daughters, the pillars of the house will fall.” So the marriage expenditures remained a grave social problem throughout the Chosun dynasty, and even today this is true to a great extent.

The position of a woman, on the whole, depended on the status of her father, husband, or son. Women of the ruling class, either by birth or by marriage, could enjoy the same privileges of comfort and honor as men of the same class. Hence, the conduct of women was governed by the rule of three obediences: obedience to the father in childhood, to the husband during marriage, and to the son in old age. The systematic subjugation of women in Korea started during the early reigns of the Chosun dynasty within the aristocratic milieu. The Confucian government started to enact various legal measures harshly discriminatory against women. Remarriage of widowed women was strictly forbidden by law. This prohibition was enforced by disqualifying the sons and grandsons of remarried women from taking the government-service examination.

Social status and rights were transmitted only from fathers to sons. Whereas chastity was thus being forced upon women, men were allowed to expel their wives on any of seven grounds, the so-called seven evils (*ch’ilgo chiak*): dis-

obeying parents-in-law, bearing no son, committing adultery, jealousy, carrying a hereditary disease, talkative to a fault, and larceny. However, even in cases where the wife was guilty of one of these seven evils, the husband could not divorce her if she had served three years mourning for her husband's parents, if the man had gone from poverty to wealth since marrying, or if the wife had no family to depend upon when divorced.

Surprisingly, however, according to the stipulations in the new Confucian code, male and female offspring were both entitled to inherit the father's property. Although there were certain discrepancies between the law and its application, it is important to note that an equal right to property inheritance was recognized by the law, as it was during the Koryo period prior to the Chosun dynasty.

### Women "Professionals"

As pointed out earlier, because of firm adherence to the segregation of men and women, few women could engage in any form of activities outside the family compound. There were, however, some exceptions. Three special groups of women wielded considerable influence by performing certain public functions in traditional society. They were shamans, folk healers, and entertainers (*kisaeng*). The women who worked in these special jobs were, almost without exception, from lower-class families.

The mass culture of Korea since ancient times has been shamanistic in its basic character and tone. Records on female shamans first appeared during the early Shilla period. By that time, they had already outnumbered male shamans. The female shamans had three functions: as priests, as exorcists, and as diviners and fortunetellers.

The second group of women, the folk healers, were increasingly in demand during the Chosun dynasty. It was considered improper for a woman to be examined by a man even if he were a physician. When a woman healer was not available, women patients died because they refused to see male healers. It was, therefore, necessary for the government to train women in order for them to take care of female patients. Women healers could also have a law-enforcement role. When authorities needed to arrest a woman of the ruling class for some suspected crime, women healers from the lower class were called upon to act as policewomen.

The women entertainers (*kisaeng*) also belonged to the low social group. Because their occupation was to entertain men, they developed special talents and skills in poetry composition, singing, dancing, calligraphy, and painting. They were the few women who had free access to public events. For this reason, entertaining women most frequently appeared as heroines in ancient tales and novels. To romanticize the lives of the low-born women in these special cases would be wrong; however, compared to the secluded life of the court and *yangban* families, the lives of female shamans, healers, and *kisaeng* permitted them to have broader experiences and development of their talents.

### Women in the Modern Era

It is hardly accurate to speak of education for women during the Chosun dynasty. Education had barely developed even for the majority of men beyond the local village schools. Because of the new emphasis on Confucianism, and the government-service examination system, formal education facilities and curricula were expanded during the Yi dynasty. Needless to say, women were excluded from these schools.

Following the signing of treaties with Japan, the United States, and European nations in the 1880s, a modern system of schooling was introduced by government officials and

leaders who traveled abroad, and by foreign missionaries who were to play a decisive role in women's education. To be exact, school education for girls began in 1886, when a Methodist missionary founded Ewha Haktang. In spite of persistent resistance by Confucian conservatives to women's education, various women's organizations, individuals, and government leaders founded many schools for women by the government by the turn of the 19th century. During the first decade of the 20th century, numerous women's societies were organized for various purposes, including modernization and Westernization.

In 1910, following Japan's victory over imperial Russia in the Russo-Japanese war (1904-1905), Japan annexed Korea. Education was the most important method for carrying on the Japanese colonial policy in Korea. Japan hoped to assimilate Korea culturally as well as politically and economically. The discriminatory policy was even more noticeable in women's education, which was perhaps the least concern of the government during this period. No institution of higher education was founded for women by the government. The colonial policy exploited Koreans more than ever through a military draft and forced labor. Women too, were either sent to factories, into forced labor, or as "comfort women" at army camps. Women leaders could not keep their positions unless they pledged loyalty and obedience to Japan.

During the Japanese colonization, on the other hand, women were politically active in the independence movement. In 1913, a teacher at a girl's school in Pyongyang (now located in North Korea) formed an underground organization. Some of the members organized an underground society called the Patriotic Women's League. Some churchwomen were active in support of the independence movement. They collected funds for resistance fighters and succeeded in sending the money to the government-in-exile in Shanghai. Among the various women's organizations that sprang up in the first quarter of the 20th century, the one that was most outstanding and had the most lasting effect was the Young Women's Christian Association (YWCA). Founded in 1922, this organization has continued, to the present, its activities that have helped promote women's status, social programs, participation, and volunteerism.

A review of the path of women through the centuries of Korean history reveals certain contrasting traits: on the one hand, a state of subjugation, and on the other, a state of self-reliance and full social participation. The differences between the modern era and the past are striking. Women's self-consciousness, buried deep in traditional society, was awakened with the coming of the enlightenment era. By the beginning of the 20th century, women were participating in the drive for political emancipation, social justice, and equal rights. Korean women were confident in their stride and bold in their ambitions as they stepped into the new age.

### C. Sociolegal Status of Males and Females

HUSO YI

After the establishment of the Republic of Korea in 1948, a new Constitution stated the equality of all, including women and children. Other equalities were spelled out in the sectors of politics, economics, general society, and culture, but in actuality, such equalities were not well maintained or protected. According to the annual report by the National Statistical Office (1999a), the majority of employed women are limited to part-time work, the opposite of the male employment pattern. The part-time jobs of women are usually low paying and involve blue-color-type work. In 1997, the average wage of women workers was only 59.9% of their male counterparts. As for participation in

employed labor, the report indicates that in 1985, 72.3% of adult males were employed and 41.9% of the women. Twelve years later, in 1998, the data were 75.2% for men and 47.0% for women. However, when the labor participation is divided by marital status, the report indicates as follows:

1. The percentage of single women working in 1985 was 50.8%, which decreased to 46.0% in 1998.
2. The percentage of working single men increased from 43.5% in 1985 to 48.5% in 1998.
3. The percentage of married working women rose from 41.0% in 1985 to 47.3% in 1998.
4. The percentage of married working men has been relatively stable between 1985 and 1998 (86.8%), dropping slightly from a little above 86.8% between 1990 and 1997.

Therefore, unmarried women are the only group in which the participation rate has not increased since 1985.

Obviously, the labor participation rate of women has lagged far behind that of their male counterparts. Compared with statistics from developed countries, Korean women between ages 25 and 35 have an especially lower rate of labor participation. This is likely because of women in this age group being forced to choose their marital and childcare responsibilities over involvement in the workplace.

In terms of the educational status of women, as of 1995, women accounted for 34.8% of the total enrollment in high school and 13.1% of college and postgraduate educational attainment, compared to men, with 41.4% for high school and 25.6% for college and postgraduate enrollment. In addition, the serious gender imbalance in certain university departments continues to be a problem. The career consciousness of female students tends to be based on the division of societal gender roles. For example, in occupational choice, female students are accustomed to such traditional jobs as teaching and nursing, whereas male students prefer to become scientists and lawyers. In response to new educational opportunities, the average age of marriage has been pushed later, as the number of years women spend in school increases. In 1960, the average age at women's first marriage was 21.6 years old, whereas for men it was 25.4 years old, a difference of 3.8 years. In 1998, this increased to 26.2 years for women and 29.0 years for men, a difference of 2.8 years (National Statistical Office 1999a).

Meanwhile, after 1980, women began to use legal means to address and remove patriarchal structures and sex discrimination by new legislation, including the enactment of the Equal Employment Opportunity Act in 1987, the Mother-Child Welfare Act (supporting single mothers) in 1989, the Child Care Act (for support of working mothers) in 1991, and the 1993 Act Relating to Punishment of Sexual Violence and Protection of Victims, as well as the prevention of prostitution (for a review of current laws on Korean women, refer to Kim 1996). Another important issue in women's rights is the status and compensation of "comfort women" under Japanese colonialism (1910 to 1945). The Korean Council for Women Drafted into Military Sexual Slavery by Japan (2000), established in 1990, has made concerted efforts to solve the issue of comfort women and Japan's responsibilities for compensation. During World War II, women were sent to all combat areas and territories occupied by Japan. It is estimated that up to 200,000 women were drafted, of which approximately 80% were Korean women ranging from age 11 to 32.

Today, women's issues have become very important in national policy. Since 1994, the Korean Women's Development Institute (2000) has published *Women's Statistical*

*Yearbook* in order to review and analyze the existing social statistics and indicators about the status of women in comprehensive and systemic ways. The women's social indicators system in the book is composed of 36 subareas, 98 detailed concerns, and 435 indicators under eight major categories: population, family/household, education, employment/economic activities, health, social welfare, social activities, and public safety. In February 1998, the Presidential Commission on Women's Affairs (2000), under the direct supervision of the President, was initiated to promote the status of women and expand women's participation in the public domain. Following Women's Affairs, another important step for women's rights has been taken by establishing the Ministry of Gender Inequality in January 2001. The ministry aims "to develop training and educational courses for women, to devise measures to prevent domestic and sexual violence and gender discrimination, and to provide appropriate services for victims" (Han 2002).

#### D. Male Preference, Female Infanticide, and the Sex-Ratio Problem

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

The influence of Neo-Confucianism has been generally strong since the Chosun era, and it is linked with a male preference in offspring. During this era, the most legitimate method to have children was within a marriage, which was also designed as a joint commitment between two families to produce an heir for the husband's family. Contrary to Confucianism, the traditional Buddhist belief was that all human beings are just transient creatures, prone to be reborn in another life. This resulted in a certain unselfishness and less emphasis on male preference. However, in the Chosun dynasty, the long-term success of the family became the most important goal in marriage. In the eyes of parents, a son will provide economical and emotional supports after his parents' retirement. After their death, he will be in charge of funeral and memorial services. Only a male can head a Korean family. Without a son, a Korean family ceases to be a family, which was an utmost disgrace to parents and ancestors. As the importance of a son increased, his social position became more important. The son had priority in the parents' assets, and in case of the father's early demise, the son oftentimes assumed the role of father in the family.

This pattern of male preference changed social manners and it continues to this day in Korea. However, in 1962, the government introduced a family planning program as part of a powerful economic plan. It encouraged small families with fewer children. With the phenomenal economic growth, the concept of children has changed from a workforce resource to an investment, which requires much time and money. As the average length of education increased dramatically, this burden has also become more prominent. Thus, the small family has become the main pattern.

Widespread abortions have helped to preserve small families in case of unwanted pregnancies. Furthermore, with the advancement of modern reproductive medicine, such as chorionic villi sampling, amniocentesis, and ultrasound scans, the ascertainment of fetal sex has become possible, and small families with an existing male preference have resorted to so-called selective abortion or female infanticide. This has created a sex-ratio imbalance, with 113.4 males born in 1995 for every 100 female babies, much higher than the world average of 106 to 100. This imbalance has been particularly drastic for the third child, where the ratio was 179.4 males for every 100 females. This trend of female infanticide is slowing somewhat, with a ratio of

108.4 to 100 for the first child in 1997 and 134.0 to 100 for the third child (see Table 1).

According to a survey by the Korean Institute for Health and Social Welfare (1991), 71.2% of married women between ages 15 and 49 replied that a son is required in the marriage. This trend is more evident in older women with lower education. The reason for this male preference was family succession for 42.2% of the women, a sense of security for 34.2%, a balanced family for 16.8%, and economic security after retirement for 6.8% of the women surveyed. In a study of 260 married women in Seoul (Kim 1993), the preferred sex for a second child after a son was 52.8% for a daughter and 20.5% for another son. However, after an initial daughter, 83% wanted a son, and only 2.2% wanted a daughter. In a study of 1,546 married adults, 29.4% replied that a son is necessary, whereas 70.6% said a son is not a requirement (Chin et al. 1997). These results reveal an improving trend away from male preference compared to the 1991 survey. Still, the deep-seated preference continues for the next child to be a male, especially in families with daughters. Overall, the recent gender imbalance may be attributed to the easy societal acceptance of gender-selective abortion, a male-centered sexual culture in which the responsibility of contraceptive use primarily is attributed to women, and a deep-rooted patriarchal male preference (see Section 9, Contraception, Abortion, and Population Planning). [Comment 2001: In their study, as for the question of "why a son is necessary," 43.5% claimed that a son is needed for the family succession, 39.3% wanted a boy and a girl, 5.8% said "daughters will be taken to husband's family," and 5.8% "wanted to be respected by the parents of husband." (As noted in Section 1B, Basic Sexological Premises, Women of Korea: A Historical Overview, one of the seven evils for a wife is not bearing a son.) For those who needed a son for family succession, when they were asked, "who most claimed the need of a son," 54.3% said the husband himself, 35.5% said his parents, and only 6.9% said the wife.

[In the traditional idea of the Korean family system, it is said that when a woman gets married, she is no longer considered as a member of her family. This notion is indeed supported by the law of Head of Household. Thus, it should be noted that male preference is closely related to the family law that was initially established in the Chosun dynasty. First, when a woman marries, her name will be eliminated from her family register and transferred to her husband's family register. Not only ideologically, but also legally, married women are not members of their natal families. In addition, according to the law, married women cannot be the primary successor of the family inheritance. For example, when a husband, the first family head, is dead, the headship is inherited by his son or grandson. If a family does not have a male successor, the headship is taken by the family's unmarried daughter, not the wife. The wife is the third order for the headship. Even when a woman gets divorced, the headship still remains on the side of her ex-husband so that it is very difficult for women to head a family. In summary,

when a daughter is married, she is "taken" to her husband's family and then has no right for headship and inheritance unless the will specifies her inheritance. If a woman gets divorced, her name can be re-listed in her family register. It is extremely difficult for divorced women to win custody. Another case is the family without a son. After the daughter(s) leave by marriage and her/their father is dead, the headship passes to the mother. But the problem occurs after the mother is dead. Since there is no one to have headship in the family, the family becomes officially extinct (Kim 1992; Chang 1996). Active movements have been organized to correct the law/system of family headship. Critics claim that the law is unconstitutional and violates human rights. A coalition has submitted a petition to the United Nations and, as of mid-2001, was preparing for an appeal to the Supreme Court (Headquarter of the Family Headship Law Abolition 2000; Citizens for Abolition of the Family Headship (*Hoju*) System 2000).

[Such a legal system evokes bearing a son, "to be respected by the parents of husband." It is the most important obligation for married women to have a son. It is said, "A married woman should gift a son to her husband's parents." In that case, it is likely that son is regarded as a "property," as well as the source for family linkage survival. In the Chosun dynasty, if a married woman could not have a son, her husband would adopt a surrogate for a son. These days, it might be happening, but more frequently, women get abortions until they have a son. It is the fidelity and duty of married women to the husband's family. Once women "accomplish" this role, they are "accepted" and "respected."

[Selective abortion is not the only avenue to male preference. In Oriental medicine, there are treatments and pills for son-bearing. In a survey of 203 Oriental medical doctors by *Hankyere* (1996), 34% said that they learned in medical school about the treatment for son-bearing, whereas only 6% learned about the daughter-bearing treatment in school. Ninety percent of their patients asked for medications for son-bearing and 60% of the doctors prescribed it for them. Despite popular prescriptions and treatment, 45% of the doctors did not believe in their reliability and effectiveness. No clinical study has been reported about the medications. Another interesting finding was that 51% said that sex is determined when fertilization occurs and 49% said sex determination is later, around 3 months. It is believed in Oriental medicine that the third month of pregnancy is the time of sex determination, so that sex can be changed by treatment. (End of comment by *Huso Yi*)]

## E. General Concepts of Sexuality and Love

HUSO YI and KI-NAM CHIN

### *Cultural Taboos*

Parallel with family succession in Confucian sexual values is "purity of kinship." "Purity of kinship" includes not only the prohibitions of interracial and interclass marriages, but also a third, particularly Korean, prohibition against marriage between persons with the same last names. [Comment 2001: In the legal system, this prohibition is quite complicated. For our purposes here, it is sufficient to note the system of Korean kinship. According to the Committee of Korean Genealogy (2000), there are 254 surnames from 13 out of 14 Korean alphabets. The official report by the National Statistical Office (NSO 1985) revealed that, among 275 surnames, each of 44 surnames was reported by less than 100 people. As of the 1985

**Table 1**

### Sex Rate at Birth by Birth Order (Males Born per 100 Females) by Year

Birth Order	1971	1981	1985	1991	1993	1995	1997	1998
Total	109.0	107.2	109.5	112.4	115.3	113.2	108.3	110.2
First	108.1	106.3	106.0	105.7	106.5	105.8	105.1	106.0
Second	107.7	106.7	107.8	112.5	114.7	111.7	106.3	108.1
Third	109.7	107.1	129.2	179.5	202.6	177.5	133.6	118.8
Fourth & Over	110.1	112.9	146.8	194.7	237.9	205.4	155.4	155.2

population of 40,410,000 people, 5 surnames were reported by more than one million: 8,780,000 were owned by those who had the last name of Kim, 5,980,000 of Lee (or Yi or Rhee), 3,400,000 of Park, 1,910,000 of Choi (or Choy), and 1,780,000 of Chung (or Jung). (Note: there is no official romanization for Korean as in other languages, hence the alternate spellings.) Thus, 54% of the population had one of those five surnames. (The NSO recently finished another investigation in 2000, which was to be published in September 2001). It should be noted that the surname, however, is categorized by three criteria: 1. ancestor, 2. place of family origin, and 3. letter of surname (surname). For instance, although two Korean people have the same surname, they may have a different ancestor and/or place of family origin. Because the ancestor is hard to detect without genealogy, Koreans usually refer to two components, place of family origin and surname. In fact, no official classification for the place of family origin exists. Every genealogical archive shows different numbers. (According to the Committee of Genealogy, one archive reports 499 family origin places for Kim, whereas another notes 600, and others note 623. As for Lee (Yi, Rhee), in the census, only surname and origin is asked because of the incorrectness of the origin of ancestor.)

[Korean genealogy started early in the Shilla dynasty, but only people of royal class could have their surnames. In the Koryo dynasty, ordinary people started to have surnames with the place of family origin. At the time, because they made their family origin based on the current living places, it is not unusual to have the same surnames regardless of the origin of the ancestor. Thus, in the early Chosun dynasty, people paid more attention to the place of family origin rather than the letter of surname when married. But, later in the mid-Chosun dynasty, marriage within the same surname and place of family origin was prohibited by the law, which has existed to now (Chung 1998). Today, the law enforces a prohibition of marriage within the same surname and place of family origin in the eighth degree. In a sense, a marriage within the same surname and family origin is constituted as incest, which therefore can violate the purity of kinship. Some family clans even prohibit marriage only within the same surname. The law has been criticized for a long time because of its unrealistic aspects. First, it has nothing to do with the matter of family purity or incest, unless it happens within blood relatives. Second, the place of family origin is not always correct, and furthermore, the fact that two have the same family origin does not tell the status of their kinship in all senses. For example, two people who have the same name and whose family came originally from the same city do not always indicate whether or not they are close relatives. Third, it is a reality that many who have same name and family origin get married, and, because of this fact, a specific period is granted for such married couples to get a marriage license. (End of comment by Huso Yi)]

Since the Chosun dynasty, these reproduction-oriented sexual norms have traditionally surrounded sexual acts with a total secrecy. This secrecy remains dominant, within marriage, in the family, and in public. [Comment 2001: However, this secrecy is no longer an absolute and universal factor inhibiting communications about any and all sexual issues in Korea today. Modern currents of sexual liberation, and global communications about sexual topics via the Internet and World Wide Web are reducing the traditional secrecy surrounding sexuality in Korean culture. As of the end of December, 2000, the Ministry of Information and Communication reported that the number of Korean Internet users topped 19 million (Korean Government Homepage 2000). Another study by NetValue also reported that Korean

Internet users spent 18.1 hours a month online, on average, more than any of the other 12 nations, including Hong Kong (the second at 12.1 hours/month), the U.S. (at 10.8 hours/month), and Singapore (at 9.9 hours/month) (*Korea Herald* 2001). It is not difficult to assume how much the Internet will have an impact upon the lives and sexuality of Koreans. (On the very same day, the Seoul District Prosecutor's Office launched an investigation into adult Internet sites and arrested six Internet adult-TV-station operators; the office announced that "we can no longer tolerate the Internet TV's overheated competition by broadcasting lots of lewd programs," and expanded the investigation to all 40 Internet adult-TV stations (Kim 2001) (End of comment by Huso Yi)]

Nevertheless, Confucian taboos continue to hinder institutional sexuality education programs, as well as discussions about sexuality within the family. Korean children grow up with a belief that ignorance of sex is good; they are still encouraged not to talk about sexuality. During childhood, they learn negative attitudes about sexuality, which during adolescence, because of their natural curiosity about sex, often turns into irresponsible sexual activities. [Comment 2001: In a nation-state study with 2,243 adolescents, 67.2% reported sexual violence in the middle/high school, and regarding the question of asking about potential sexual violence, 75.6% of the male adolescents and 23.9% of the females reported that they felt impulsive and had a terrible desire of experiencing "violent sexual activities" in middle/high school (Chung 1990). This negative view of sexuality is also related to the prevalence of verbal and physical sexual domestic violence in Korea (see Section 8, Significant Unconventional Sexual Behaviors) (End of comment by Huso Yi)]

#### *The Double Standard in Sexual Culture*

The most outstanding aspect of sexual culture in male-dominant Confucianism is the different standards of sexual morality for men and women. Such ethical codes are formulated by stressing virginity for women. According to Confucianism, the woman is always placed lower than the man. The husband is compared to the sky and wife is depicted as the ground and, therefore, she is obedient to the husband (see *Woman's Four Book* by King Young-Jo, 1736/1987). [Comment 2001: *Woman's Four Book* was originally written by Chinese scholars. King Young-Jo imported and translated the book to correct the morals of women. In his introduction, he began with the metaphor, "Man is the sky and woman is the ground." Besides that dictum, many rules of obedience are described for women. For example, the title of the first chapter is, "The chapter of low and weak status," which implied women. The chapter begins: "The sky is high, the ground is low and *yang* is strong, *yin* is weak. The lowness and weakness is women's destiny. If the woman wants to be strong on her own, it violates the law of justice." (End of comment by Huso Yi)]

Under the ideology of the gender hierarchy, the moral superiority of the upper class and family purity, and the Chosun dynasty Constitution of 1485, women of the ruling class were prohibited from remarriage after the death of their husband. If a widow was recognized as a moral model, gracious grants were allowed for her entire family. By the end of Chosun era, the control of female virginity and fidelity had been firmly established, widely promoted by books about female domestic education. Contemporary Korean attitudes towards virginity are based on these historical events. To maintain the purity of one's family lineage, female virginity and sexual fidelity were and still are stressed for women, whereas men were and still are generously allowed the varieties of prostitution, polygyny, and other forms of sexual explorations.

### *The Phallus-Centered Sexual Culture*

The male-dominant sexual culture of Korea has been very phallic oriented. Because the male sex is considered sexually superior to the female sex, sexual intercourse is not perceived of as a mutually intimate interpersonal relationship. Rather, it is perceived as a physiological or primitive event, a kind of tension release for the male. In this view, only the phallus is worth consideration. Thus, the entire Korean sexual culture exists for satisfying the male's sexual needs, downplaying the mental and intimate relationship between partners. Women are raised to passively play up to this male-dominant action, and those who are more obedient and passive are encouraged. Men, on the contrary, are portrayed and raised as strong, aggressive, and dominating figures, and this concept is carried into everyday sexual and marital relationships. Because this sexual discrimination is regarded as natural, intimate relationships between men and women are seriously distorted.

[*Comment 2001*: The Korean metaphoric/ideological description of the phallus-centered sexual culture that one finds in Korea has interesting ritual expressions in the traditional phallus-worship ceremonies of Japanese Shintoism and *lingam* and *yoni* worship in Hinduism (Gregersen 1994, 232, 355). In Korea, the phallus is literally called "male-root" and the vulva "female-root." Although many phallic stones were destroyed during Japan's colonization and the subsequent modernization, 840 stones and wooden objects have been discovered so far (Kim & Yoon 1997). Those that are made of wood are placed in the temple or hung on the ceiling of a household. (The size and shape of the wooden phalluses are just like modern sex toys). Oh (1997) analyzed 45 historical remains that are preserved for "sexual worship": 26 stones are categorized as being used in prayers for a son, 9 for protecting the village, 5 for preventing a women's promiscuity, 3 for family well-being, and 2 for cultivation. These stones convey a male preference. However, many vulva-shaped stones can be easily found next to phallic stones in a *ying-yang* context or separately. These vulval stones, as well as vulval fountains, are also worshiped, as are phallic stones. Vulval fountains are not only natural ones, but some that are designed on purpose. In order to be pregnant with a son, women not only pray in front of the stone, but also rub their genital areas on it. Many interesting worship ceremonies are still held all over the country. For instance, in a fishing village, fishermen have for hundreds of years carved wooden phalluses and offered them to a legendary virgin of the temple twice a year. It is believed that the virgin died in the ocean longing for sex, so the villagers believe that they should appease the virgin ghost in the ocean with wooden phalluses to avoid any misfortune and accidents. (*End of comment by Huso Yi*)]

## *2. Religious, Ethnic, and Gender Factors Affecting Sexuality*

### **A. Source and Character of Religious Values**

HUSO YI

As already noted, Korea has developed and adopted several new religions that have molded its sexual values, family structure, concepts of love, and gender roles, both in public and the private space. The ancient shamanistic religion and warrior aristocracy encountered a new religious influence 2,000 years ago in Confucianism. Buddhism arrived in Korea around 400 C.E. and was actively persecuted for a hundred years. At the end of the Koryo era around 1400, Neo-Confucianism reversed the previous sex-positive attitudes in Buddhism. In the late 1700s, Catholicism arrived from Europe, followed a century later by Protestant-

ism. Today, 49% of South Koreans are Christians and 47% are Buddhists. Although only 3% of Koreans believe in Confucianism, it remains the basis of criminal law and sexual morals.

*Confucianism* HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

Confucianism was first introduced into Korea in the era of the Three Kingdom unification. The Unified Kingdom of Shilla was successful in blending the different lifestyles and cultures from the other two original kingdoms, and also was eager to accept the advanced cultures of mainland China. A new and unique cultural unification took place on the Korean peninsula, and one of the most important advancements was Confucianism. In this new era, the political idea of Confucianism, which stresses loyalty to authorities, was a convenient justification for the totalitarian rule of the kings. In the succeeding Koryo era, Confucianism continued to be the main ideological basis for the kingdom. Its beliefs were accepted as an efficient ideology supportive of the king and the ruling class. This is why, even though its official adherents are few in number in Korea, it has remained a major social influence. This practical social application is also the reason that Confucianism has flourished in the Far East.

Respected scholars were recruited to serve as high-ranking government officers, and all ceremonies and record keeping was modeled on the Confucian system. The government set up a learning center to sponsor further research and discussion of Confucianism. The kings and other nobles tried to practice the Confucian way of life in both their personal and public lives. One important aspect of Confucianism in the Koryo period 600 years ago is that it did not consider Buddhism as a hostile belief to Confucianism. The people of Koryo considered Buddhism as a personal religion for souls, and Confucianism as a bible for everyday human social lives. They respected both beliefs until the end of the Koryo era, when Buddhism became lavish and selfish. Orthodox followers of Confucianism then rejected Buddhism altogether, banning new recruits and halting financial support to the Buddhist temples. Confucianism was greatly appreciated by the reforming sect of the ruling class, which made it the official belief of the Chosun dynasty. It was the guideline of politics, society, and culture, encompassing all facets of everyday life. This marked the end of a thousand years of Buddhist public influence in Korean culture and the return of Confucianism in a Neo-Confucian form employing negativity against sexuality (Fellows 1979, 199-241; Noss & Noss 1990, 283-318).

Confucian belief regards the male as a positive being (*yang*) and the female as a negative counterpart (*ying*), based on the concept that the biological differences of the two sexes actually stem from a basic element of nature. Confucianism stresses the harmonious relationship of *yang* and *ying*, but *yang* is always more dominant than *ying* in every aspect. Thus, men are considered omnipotent compared to women, and male dominance and discrimination against women are justified. Furthermore, the Confucian way of life regards sex as an inevitable aspect needed to maintain the family and society, rather than an act of pleasure. Thus, in the Chosun era, sex was first considered as a reproductive process. The Chosun period is also known for its strict caste system, based on the Confucian theory that higher and ruling classes should be morally superior to the subjecting classes. Male preference and a double moral standard in sexual matters are only a few examples of this varied Confucian past (Fellows 1979, 199-241; Noss & Noss 1990, 283-318). [*Comment 2001*: In addition, it should be noted that these ideologies in Confucianism have been challenged by feminism since 1990, and

are having an impact on changing the laws discriminating against the status of women and individuals' lifestyles (*End of comment by Huso Yi*)

#### *Buddhism* HYUNG-KI CHOI and COLLEAGUES

Buddhism was first introduced to Korea in the year 372 C.E. during the Three Kingdom period in which it was adopted and encouraged as the new faith by the royal court. Traditional shamanism and conservative nobles opposed Buddhism for 100 years after its initial introduction, but in all three Kingdoms, it was accepted by the sponsorship of royal endorsement. In the totalitarian kingdoms, Buddhism was a practical new faith helping to unify the common people. The people considered themselves subjects of both Buddha and the king, and this helped to unify the young kingdoms. The three kings and their royal courts gave generous contributions and slaves to the Buddhist temples to support cultivation of the land. Buddhism in this era was a tool to deepen the philosophical aspects of the people, and the monks were both scholars of learning and teachers (Fellows 1979, 129-194; Noss & Noss 1990, 157-231).

After the unification of the three kingdoms, Buddhism received more attention internationally by preaching abroad. However, the lavish construction of temples wasted resources, which became one of the reasons of the demise of the unified kingdom of Shilla. In the Koryo era, Buddhism still played a major role as the main religious belief of the kingdom. The monks of the Buddhist temples were exempt from military conscription and service, and even princes became monks in this era. This gave Buddhism a flavor of nobility, but toward the end of the Koryo dynasty, the powers of the Buddhist temples and monks became excessive, and power shifted back to Confucianism. During the Neo-Confucian Chosun period, the monks were subjected to harsh rules, including closure of major temples, seclusion in the mountains, forced labor, and heavy taxes. The social position of Buddhist monks was lowered substantially. Buddhism in this era shifted its base to the poor and unfortunate. Despite this oppression and decline in public image, 47% of Korean people still consider Buddhism as their faith. Buddhists in general are instructed to give up all desires, including those related to sex, and sexual activities are prohibited in many sects.

#### *Catholicism and Protestantism*

During the mid-Chosun dynasty at the end of the 17th century, a Korean scholar introduced a Catholic publication, marking the first recorded evidence of Christianity in Korea. Other books about Christianity followed and naturally became the subject of academic interest. Because Catholic belief differed so from the realistic beliefs of Confucianism, Catholic belief was initially considered similar to Buddhism, and so drew only academic attention and interest.

Towards the end of the 18th century, Christianity began to win over increasing numbers of the common people, mostly in the northern provinces near the Chinese border. Catholicism in Korea is unique in the fact that it was not initially introduced by priests, but rather through books imported by scholars and then self-propagated among the common people. Catholicism did not acknowledge the caste system, and thus was considered by the authorities as a threat to the society. Catholic worshipers also neglected the responsibility to conduct memorial services for one's ancestors, which was considered one of the most important elements in Koreans' everyday lives. Soon Catholicism was considered illegal and officially banned. Harsh punishments were given to the worshipers. The Chosun government also prohibited the importing of any Catholic book. Around 1801, some 300

Catholic worshipers, including a priest, were executed. A Korean informer notified the archbishop in Peking and called for a military demonstration by Western powers to stop this repression. This incident only aggravated the religious oppression of Catholics, and by 1839, three Western priests had been executed along with 80 more believers. However, Catholicism gained an underground popularity, so that by 1865, there were more than 23,000 Korean Catholics, with their own Catholic school.

The increasing popularity of Catholicism was in part attributed to the extremely corrupt period of the 19th-century Chosun. After the beginning of formal diplomatic relationships with France in 1887, freedom of religion was finally guaranteed in Chosun and an official Catholic Church was established in Seoul. Missionaries quickly set up Catholic parishes and became involved in publishing numerous books.

Protestantism was first introduced into Korea in 1884 by an American Presbyterian missionary named Dr. Horace N. Allen. In the next year, Dr. Horace G. Underwood (Presbyterian) and Rev. Henry G. Appenzeller (Methodist) arrived in Korea. They started by concentrating on offering practical knowledge on health, medicine, and general education to the poorer segments of the general public. Preaching followed. The Protestant belief of equality and freedom directly confronted traditional Confucianism, and became, as it spread, the foundation of a democratic movement. The Young Men's Christian Association (YMCA) was first established in 1903 in Korea and brought with it initiatives on reforming various aspects of everyday lives, including the prohibition of alcohol, abstinence from smoking, and equal rights. In 1915, the Chosun Christian College was founded, chiefly through the efforts of Dr. H. G. Underwood, the pioneering Protestant missionary who served as the Chosun Christian College's first president. During the Japanese occupation in the early 20th century, the Protestant churches and schools became a secret stronghold for the independence movement. It is no wonder that many of prominent leaders in this era were Protestants. Both Catholics and Protestants are currently actively involved in medicine, education, and various social movements. (As noted earlier, 49% of Koreans are Protestant or Catholic.)

#### **B. Character of Ethnic Values** HUSO YI

Korea is a very homogenous country in terms of ethnicity. Until recently, it was so and it is still rare for many Koreans to have close contact with other ethnic groups. Historically, when the neighboring countries, China and Japan, began to open their borders to Western culture in the late 19th century, Korea remained closed to trade with Western countries. Opening to trade with the West might lead to colonization by Japan or by Western nations, as happened with the British in Hong Kong and the Portuguese in Macau. Another reason for this policy of seclusion may be the size of Korea and its geographical location: a small country surrounded by China and Japan. The lack of contact with other cultures naturally restricted the acceptance of various sexual attitudes and behaviors from the outside. In recent years, the influence of globalization and the immigration of foreign laborers have challenged Korea's homogenous character and traditional isolation.

### *3. Knowledge and Education about Sexuality*

#### **A. Historical Perspective**

HYUNG-KI CHOI and COLLEAGUES

Unmarried young men and women in the Chosun dynasty received a very limited form of sexuality education, focused

on how to achieve pregnancy and produce better descendants. The most important lesson was instruction on how to select the right time, as well as the best position and behaviors, for achieving pregnancy. When newlyweds started their honeymoon, the bride received a calendar with information about the fertile time. In many instances, husbands were also given this information. In some traditional extended families, married sons were not allowed to sleep in the same room with their wife unless the family patriarch approved, based on the wife's fertile period. Delivering a child was an important, often-sacred event in the Confucian Chosun family. Prenatal care was a mandatory obligation for pregnant couples and was dutifully accepted by all expectant parents. This prenatal care began even before conception and was the focus of sexuality education when taught in the elementary schools.

## B. Government Policies and Programs

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

The traditional silence of Korean society on sexuality issues and education has left its adolescents almost completely without guidance in dealing with the imported Western sexual cultures. This trend is accelerating with the fast pace of modernization, and the consequences can be observed in the increasing incidence of adolescent pregnancies, sexual abuse, and sexual crimes. The Planned Parenthood Federation of Korea (PPFK) started sexuality education in 1968. Since 1982, counseling centers for sexuality has been provided for adolescents in schools and industrial parks. Besides education and counseling, PPFK has published annual reports on counseling cases and educational projects to help understand adolescent sexuality.

In spite of such efforts and the obvious needs, formal sexuality education in schools has not been well established. What sexuality education exists in schools focuses solely on physical development and gender roles. For female students, the topics of menstruation, pregnancy, and virginity are the main content, whereas male students are taught about sexually transmitted disease and sexual activities. It is assumed that male students are sexually active but female students should not be. Research in the 1990s has noted the limitations and problems of the existing sexuality education in schools. For example, research by Lee (1996) reported that only 5.5% of students were satisfied with their school sexuality education program. [*Comment 2001*: In 1996, the Korean Government established the Korea Research Institute for Culture and Sexuality to develop effective sexuality education programs. Government policies, as stated in the Sex Education in the Adolescent Youth Protection Law, state that information and materials on homosexuality are illegal. The policies are based on homosexuals being sexually abstinent and denying themselves any sexual relationships, especially in adolescence. The policies also questioned whether homosexuality should be considered as a part of sexuality education program. (*End of comment by Huso Yi*)]

## C. Informal Sources of Sexual Knowledge

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

In the early 1990s, interest in sexual information increased enormously. Since then, books as well as other materials on sexuality have been produced. To meet academic interest, conferences on sexuality have been held and the mass media have taken up sexuality topics. In 1998, a public sexual education program was offered on television, and the instructor became a celebrity. It is now relatively easy to access information on sexuality.

In two studies by the Korean Research Institute on Sexuality and Culture (Kim et al. 1996, 1997), 37.1% of 1,976 male high school students reported that their primary source of sexual knowledge was adult materials and pornography. Fourteen percent of the males learned from their friends, whereas 37% of 3,134 female high school students obtained sexual knowledge from their peers, and 25.7% learned in school. The percentages were lower for students in the upper grades. These results show an increase in the influence of sexuality education programs in school. The study also tested sexual knowledge. Some examples of the kinds of questions asked include: "The hymen can tear during bicycle or horse riding," "The testis produces blood along with semen," "Kissing can induce fertilization in healthy couples," "Pregnancy stops periodic menstruation," "The sex of a fetus is determined at birth," "Douching immediately after intercourse prevents fertilization," "Condom use lowers risk of contacting STDs," and "Masturbation is not associated with transmission of AIDS." The mean score of the correct answers was 62 for female students and 65 for males. For the questions about STDs, the mean score was 53. The results reflected the current need for more effective sexuality education in Korean adolescents.

## 4. Autoerotic Behaviors and Patterns

### A. Children and Adolescents

HUSO YI

The Korean Research Institute of Sexuality and Culture (Kim et al. 1997) reported that 70% of female high school students agreed that "masturbation is natural to release sexual desire." In contrast with their positive attitudes, however, only 15.2% of the survey participants had experienced masturbation. For those who had masturbated, the frequency of masturbation was once a month (44.2%), two to four times per month (23.1%), and five to seven times per month (5%). With respect to self-reported feelings after masturbation, 35.6% felt guilty, 21.0% felt nothing, and 6.3% felt good. When asked about their response to a sexual urge, 41.9% "just endured," 10.5% exercised and/or engaged in favorite habits, 6.2% masturbated for relief, and 35.7% answered they had no experience of sexual urges. Meanwhile, 49.9% of male high school students reported masturbating, whereas 46.3% endured the sexual urge. There was a significant gender difference in masturbation.

### B. Adults

HUSO YI

Yoo, Oh, and Soh (1990) asked about parents' attitudes toward masturbation to see their relationship to their children's masturbation. In 75.2% of the parents showing positive attitudes toward their own masturbation, there was a linear trend by age: 77.8% in the parents in their 50s, 75.9% in their 40s, and 56.1% in their 30s. In terms of religious adherence, Buddhists were least positive about masturbation, 54.5%, compared with Protestants, 76.9%, and Catholics, 91.7%. In terms of negative views toward their own masturbation, more than 60% of the male and female respondents said, "It is against moral standards." The second reason showed a significant gender difference: 25.0% of the males answered, "It's harmful to sexual activity," whereas 12.5% of the females offered a religious reason, saying that "it evokes guilty feeling." Certainly, their attitude on masturbation was related to that of their children's masturbation. Those who feel good about their own masturbation showed positive attitudes toward their children's masturbation as well. Meanwhile, their reasons also revealed a significant gender difference. Half of the parents said children's masturbation is good because it shows "good evidence of physical development." But, in terms of gender difference, masturbation is a "unique method of resolution of sexual ten-

sion,” answered by 13.6% of the males and 33.3% of the females, a “relief of physical tension” by 4.5% of the males and 13.3% of the females, and a “relief of psychological tension” by 11.4% of the males and 2.2% of the females.

## 5. Interpersonal Heterosexual Behaviors

### A. Children

#### Male Circumcision

ROBERT T. FRANCOEUR and HUSO YI

In 1945, after World War II, very few South Koreans knew there was such a thing as a “naked penis,” a penis with no foreskin. Male circumcision was practiced only within the tiny Jewish and Muslim enclaves. Nationwide, fewer than one in 1,000 South Korean boys were circumcised, and circumcision was equally unknown in neighboring China and Japan. In Asia, only the Filipinos embraced circumcision, or at least the Spanish version, which involves cutting a slit in the top of the foreskin rather than removing the foreskin altogether. Around the world, 50 years ago, only about 15% of boys were circumcised at birth or puberty. Only one “developed nation” stood out as a champion of circumcision and that was the United States, where 90% of newborn sons were circumcised. When American soldiers arrived in Korea to implement the United Nations trusteeship (1945-1948) and returned in even greater numbers to South Korea during the Korean War (1950-1953), South Koreans came to believe that practicing circumcision was “advanced and modern.”

In the 1960s, South Koreans adopted circumcision with a passion, but also with some differences. Whereas Americans circumcise their sons soon after birth, South Korean physicians decided it was much healthier to circumcise their sons at puberty, when they were 12 years old and could understand the importance of leaving their childhood behind and becoming a man. Unlike most American circumcisers, who until recently used no anesthesia as they operated on the newborn boy, South Korean circumcisers use a local anesthesia. In the 1960s, Korean doctors and advice columnists launched a campaign in newspapers and magazines urging parents to have their adolescent sons circumcised during the long winter break before a boy enters middle school. Infections, the Korean doctors say, are much less likely if circumcision is done in the winter rather than in the summer.

Another reason Korean doctors cite in recommending circumcision is their claim that South Korean men have a gene that causes penile phimosis or “abundant foreskin.” In their view, at least 90% of Korean men have “too much” foreskin. Strangely, there is no evidence of this alleged genotype for phimosis among South Koreans, where a 1971 study of men aged 19 to 31 entering military service found only 5% to be circumcised and fewer than 1% of uncircumcised men with phimosis (Jung 1971). The incidence of phimosis is similar to that in the rest of the world. At the same time, Kim, Lee, and Pang (1999) found that most physicians could not define phimosis, yet almost all of South Korean physicians recommend universal circumcision because they believe it eliminates tight foreskins and brings many benefits. Circumcision, they wrongly claim, makes for harder penises, eliminates the bad smell of the penis, reduces susceptibility to various sexually transmitted diseases, cures premature ejaculation, and prevents penile and cervical cancer. Finally, there is the irresistible claim that circumcision produces a definite “cure-all-aphrodisiac effect” in the penis.

Those who were not circumcised believed that they were “naturally circumcised.” The common word for “natural circumcision” may be difficult to understand in other countries. But, it is a very popular Korean term, which refers to one of the following: 1. not having phimosis; 2. rela-

tively short prepuce; 3. fully retractable when penis gets erected; and 4. the penis looks more or less the same when erect. Considering the same low rate of phimosis, the uncircumcised men also think circumcision is mandatory, but they feel “naturally circumcised” (Kim et al. 1999). The researchers noted, “nearly all textbooks, encyclopedias, and newspaper articles [in South Korea] essentially advocate universal or near-universal circumcision, and the debate is about when to be circumcised or to circumcise, rather than whether to be circumcised.”

For unknown reasons deeply rooted in their ethos, South Korean doctors misinterpret the recent decrease in American parents circumcising their newborn sons—down to 59% in 1992—as recommending universal circumcision at about age 12, even though there is absolutely no evidence that American boys are now being circumcised at puberty. The doctors are also puzzled why such “advanced” countries as Japan and Denmark do not recommend universal circumcision. One advice columnist recently wrote that, “If a child feels different because he is not circumcised and his friends boast of having a superior penis because of circumcision, it is good to have him circumcised for psychological reasons.” Today, at least 95% of South Korean boys entering middle school have been circumcised. For the other 5%, the question is not whether they should give up their foreskin, but when they should be circumcised. Korean boys simply take circumcision for granted. It is their right of passage to manhood.

### B. Adolescents

HUSO YI [*Updated 2003 by H. Yi*]

According to a study among female high school students (Kim et al. 1997), 44.4% had had heterosexual relationships. Of those who had not had vaginal intercourse, 47.8% reported that they just had not had the opportunity, 18.3% did not want to because “we are students,” and 15.5% were not interested in the opposite gender. These results suggest that, if the opportunity offered itself, heterosexual relationships would be increased. With regard to a question about what sexual intimacies are permissible for unmarried adolescents, 44.7% regarded light kissing as permissible, 31.6% accepted holding hands, 19.7% regarded kissing and petting as acceptable, and only 1.4% found sexual intercourse acceptable. The results indicated that female students still wanted to keep their virginity although their attitudes toward sexuality became more open and liberal. In the study, 88.1% of the female students reported that virginity should be kept until marriage, whereas 65.7% of males favored premarital sexual activity. In their study, 91.7% had no coital experience, and only 7.5% had coital experiences. Among those who had coital experiences, 38.7% were coerced into having sex, 32.3% had sex “because of love,” and 11.9% were raped. In the study of male students, of the 16.2% who had had coital experiences, 74.7% had had sex with a girlfriend, 34.1% had had intercourse with a woman they “happened to meet,” and 16.6% had done so with prostitutes (Kim et al. 1996). A national sample of high school students indicated that the sexual intercourse rate among male students increased from 12% to 18% between 1988 and 1998, while female students’ sexual intercourse rate increased from 3% to 8% between 1988 and 1997 (Han et al. 2001).

Most of adolescents held conservative views of sexual experiences. The study also noted a difference in contraceptive use between males and females; 20.4% of female students used contraceptive methods and 52.2% of males used them (Kim et al. 1996; Kim et al. 1997). The most frequent contraceptive method was condom use (37.5% of the females and 49.1% of the males). The next most frequent “contraceptive” method was withdrawal prior to ejacula-

tion (33.3% of the females and 31.1% of the males). The low percentage of contraceptive usage may come from male partners' ignorance of condom use and/or the lack of opportunity (power) for that. Females have less opportunity to make decisions.

The Korean Sexuality Counseling Center (1997) for adolescents reported that most calls, 86.1%, were from boys. One in five boys, 20.6%, had questions about masturbation and 16.7% asked about sexual impulses. The callers were most curious about physical contacts with the other sex (50.2%), followed by pregnancy and delivery (17.4%). Boys tended to show self-centered, male-egoistic attitudes about the other sex, whereas girls focused on their responses and passive behaviors. The most frequent concern of high school girls, 31.6%, was boyfriends, followed by pregnancy, 12.4%, and abortion, 4.9%. This reflects passive attitudes about sex on the part of Korean females. The girls usually consulted with their friends, 44.5%, or with professional counselors, 33.6%. Parents and siblings were less frequently consulted, 12.2% and 4.1%, respectively. However, only 1.1% of girls considered their own schoolteachers as trustworthy consultants. A similar trend was seen with high school boys: 53.5% wanted to consult with their friends, but only a few were willing or wanted to share their sexual problems with parents (5.7%), siblings (5.1%), or teachers (1.5%). There is a substantial communication barrier between high school students and their parents and teachers, attributable to strong emotional barriers on both sides, which impede sincere discussion.

Youn's (1996) study with 849 adolescents revealed similar results that 9.8% of the female respondents had coital experiences while 22.9% of the males had it. However, the study revealed significant gender difference in sexual experiences. The male respondents reported the maximum number of sex partners, ranging between 25 and 40 partners, whereas the highest number for the females was 6. The average number of coital partners for the males steadily increased by grade, but the number of females' coital partners did not, as Table 2 shows. This may be because of the value of keeping virginity as a treasure to be maintained until marriage and a sort of sexual explosion in the first college year (grade 13). With respect to the question of practicing safer sex, 43% of the sexually active male adolescents had used contraceptive methods at least once, whereas 28% of the females had done so. But, only 7% of the respondents used contraceptives consistently.

### C. Adults

#### *Premarital Relations, Courtship, and Dating*

HUSO YI

In 1991, the Women's Studies Center of Ewha Woman's University surveyed 352 male participants ranging in age

from 20 to 40, which indicated that over 80% had had heterosexual experiences, and among those, 44.7% had their first sexual experiences with a female prostitute, 55.4% answered that prostitution should be allowed to prevent rape, and 25.6% were in favor of the legal regulation of prostitution (Chin et al. 1997).

A study of 1,596 married couples reported that 50.8% regarded premarital relations as negative and 36% as positive; 75% regarded extramarital affairs negatively and 13.2% as something positive (Chin et al. 1997). In their study, the responses of male and female participants showed significant differences. Females, and those who were younger, more educated, and had no religious affiliation, held more positive attitudes toward premarital and extramarital relations. An interesting factor was the participants' ambivalence. Around 80% were concerned about what they viewed as the current open and uncontrolled sexual culture. On the other hand, 61% agreed that Korea's sexual culture is repressed. The usual double moral standard, which is more permissive for males than for females, is more complicated in modern Korea, where premarital sexual experiences and sexual liberation are increasingly accepted, while at the same time, the traditional value of female virginity and sexual passivity is expected in a very patriarchal society. The result, obviously, is psychological stress more for women than for men.

#### *Sexual Behavior and Relationships of Single Adults*

HUSO YI

As one might suspect from what has already been discussed, sexual behavior and relationships among Korean single adults are very limited because of negative attitudes toward premarital sexual relationships and the frequency of marriages arranged by parents or according to their socioeconomic status (Kendall 1996). Thus, it is likely that single adults do not feel a need for sexual relationships. Even though sexual liberation has influenced the sexual relationships of single adults, the value of female virginity is hard to be dismissed. In a study of single-adult sexual behaviors (Kim et al. 1998), around half of the male and female adults were in heterosexual relationships. But, being in relationships did not mean having sexual relationships: 52.9% of the male respondents had positive attitudes to sexual relationships, whereas 37.6% were opposed to that. In response to the question of "how one resolves a sexual urge" (multiple answers), 60% of males exercised, 52.1% masturbated, 38.3 used hobbies as a distraction, 37.0% held in their urge, 9.6% prayed, 11.7% claimed they never had a sexual urge, and 26.2% had sex. In the female group, 35.2% exercised, 8.1% masturbated, 33.8% engaged in hobbies, 21.8% repressed their urge, 3.7% had sex, and (surprisingly) 61.1% never had sexual urges. Such female repression of the sexual urge or self-reported asexuality can be related to the most frequent female sexual dysfunction, inhibited sexual orgasm (see Section 12, Sexual Dysfunctions, Counseling, and Therapies).

#### *Hymen Reconstruction and Plastic Surgery*

HUSO YI

Hymen can be translated as "virgin-skin" in Korean. Despite the effort of educating Koreans about the meaning and function of the hymen, the existence of an intact hymen is still highly valued at marriage so that hymen reconstruction and plastic surgery is frequently popular. There was an interesting lawsuit case about the loss of a hymen. In 1994, a 40-year-old woman sued the Korean Medical Research Center because she was extremely psychologically distressed after she lost her hymen during a Pap

**Table 2**

#### **Korean Adolescents Who Experienced Sexual Intercourse by Year in School**

Grade	Males		Females		Combined	
	%	n / N	%	n / N	%	n / N
11	14.6	25 / 171	8.1	7 / 86	12.5	32 / 257
12	16.6	38 / 229	7.8	10 / 129	13.4	48 / 358
13	16.5	51 / 309	10.5	28 / 267	13.7	79 / 576
14	21.0	87 / 415	9.5	37 / 388	15.4	124 / 803
15	22.4	99 / 441	9.3	37 / 398	16.2	136 / 839
16	22.9	103 / 449	9.8	39 / 440	16.7	142 / 849

Source: Youn 1996

smear test. Even though the doctor claimed that the hymen is usually torn during the test (and can even be torn by exercise), the court said, "It is clear that the hymen is still recognized as a symbol of 'virginity' and keeping virginity is valued in society. It is admitted that she was distressed by the lost of her symbol of virginity, therefore the hospital must pay for compensation" (Park 1994). One Korean prenatal genetic clinic offers STD tests with hymen reconstructive surgery, so that women can be free from her "history" of past sexual experiences (<http://www.yunlee.co.kr>, in Korean). In addition, the vaginal-opening muscle (pubococcygeus muscle) tension surgery (called "beauty surgery") is also commonly provided after delivery or for middle-aged married women. These surgeries are not even approved by the Korean medical association (Seol 2000). Dr. Seol, one of the leading sex therapists, is strongly opposed to such surgeries, based as they are on myths (see Section 12, Sexual Dysfunctions, Counseling, and Therapies).

*Marriage and Family: Structures and Patterns*

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

In 1948, when Korea initiated its own government, the law on monogamous marriage was enforced. According to the census, the crude marriage rate had not changed from 1975 (8.0) to 1997 (8.1). The average age at first marriage in 1987 was 27.3 for males and 24.5 for females, which was delayed to 28.7 and 25.9, respectively, in 1997. However, the crude divorce rate has increased significantly from 0.5 in 1975 to 2.0 in 1997. The number of divorces in 1998 was 124,000, an increase of 30% from 1997. It is calculated that one out of three Korean marriages today end in divorce (see Tables 3 and 4). The annual report also indicated that the most common cause of divorce was the extramarital affairs of husbands. Moon (1993) addressed the factors of dissatisfaction in sexual activities with spouse, husband dominance, lack of respect and affection, male-preferred sexual position, no foreplay, and absence of communication. The sexual activities of married couples were only initiated and led by the husband. It is hardly acceptable for wives to express their sexual interests because of the cultural value of male dominance in sexual relationships.

According to a survey with 1,200 housewives in 1996, 67.2% reported dissatisfaction with their sexual lives and 30.2% responded that their sexual lives were satisfactory (Kim 1996). Such a psychological distress of sexual dissatisfaction leads to the increase of extramarital sex and divorce. In recent years, the rate of divorce caused by adultery has been increasing by 15% annually.

**D. History and Structure of the Korean Family**

*Patriarchy* PILWHA CHANG (Summarized by HUSO YI)

The recently expanding discourses on sexuality and the enlarging diversity of lifestyles in contemporary Korean society might give an impression that the reign of traditional

control over sexuality is loosening. However, "legitimate" sexual behavior has been, and still tends to be, limited to marital partners. Patriarchy has a vested interest in defining women's sexuality in a particular way. It has particular sexual scripts, which use sexuality as social control. Women and men's sexuality is treated differently. Women's sexuality has frequently been exploited and degraded and used to sell commodities, even to turn women themselves into commodities. This double standard works against women and in favor of men.

Korean history, from the 3rd century to the end of the 19th century, illustrates a gradual systematization of one of the most ideal types of patriarchy in the world. By the end of the 16th century, the state completed a patriarchal system by implementing Confucian ideology, with its gender hierarchy and sex segregation, through the gender division of labor and class divisions that upheld the patriarchal family in strict observance of patrilineage (rule of lineage, descent, or continuing family line from father to son), patriny (rule of continuing the surname of the father), and patrilocality (residential rule based on patrilineal locality). Women had to prove their worth as mothers, producing sons to continue the family line, and producing food and clothing, to survive in a woman-hostile environment. However strong and capable they might have been, Korean women were systematically denied activities outside the confines of the home, and their education was strictly prohibited.

Only in the national crisis at the end of the 19th century, when foreign powers threatened Korea's sovereignty, did some possibilities of cracking this rigidity arise. For about two centuries, some philosophical systems, among them Silhak and Tonghak, began to question the gender relations under new influences. [*Comment 2001*: Very briefly, Silhak can be compared to pragmatism and Tonghak can share its philosophy with a sort of socialism that claims the rights of lower-class people. (*End of comment by Huso Yi*)] However, it was only in a crisis situation when proper observation of traditional family rituals became difficult or impossible that such thoughts began to be heard and listened to. The national crisis created a space of critical reflection on the traditional ways of life. Within this space, reevaluation of the position of women began. Women's social participation had to be accepted, however reluctantly, as essential to national survival. The resulting discourse, however, focused on the national interests, and not on the value of education held for the personal development of women and their fuller participation in society.

In the last hundred years, Koreans have experienced crisis after crisis: the Japanese occupation, two World Wars, the division of the country into North and South, the Korean War, and the industrial war to join the world capitalist system. These crises prioritized efficiency and expediency, and justified sacrificing individual human rights for the sake of growth and stability. In this context, it was easy to brush aside women's claim for human rights as a luxury, and so the

**Table 3**

tradition of utilizing women's instrumental values persisted. At the same time, such crises opened some windows of opportunity for women to participate in sociopolitical arenas. Also, it is true that the models of the "developed" world provided a stimulus for women's rights. Consequently, women's suffrage was included in the first modern Constitution in 1947, and primary education became compulsory for girls as well as boys. In the last few decades, Korea has managed to furnish the appearance of "modernity." Despite the appearance and some changes in patriarchal families, the underlying assumptions continue to be patriarchal, with the view that women's identity is only familial, guided by the "three obediences" to father, husband, and son, and without any independent public identity based on her own personal merit.

The marginal position of a daughter in her natal family rests in her future roles as wife and daughter-in-law in another household. Because of this, she was considered only as a temporary member of her natal family, her filial piety being transferred on marriage to her parents-in-law. Her duty of filial piety towards her own parents was not to bring shame and dishonor to her natal family by misbehaving in her new family. With marriage, a daughter had to break her ties with her natal home, "she who left the family and has become a stranger." Her parents told her that she now belonged to her husband's family where she had to persevere, however hard life might have been: "She ought never return to her old home but the ghost of her husband's home." It is another example of how married women are treated. In an old saying, once they are married, they have to finish their lives no matter what happens to them. Once married, a wife who committed any of seven evils could legitimately be divorced, and a divorce brought shame to her natal family. Because a wife could not be protected by her natal family, she had no alternative but to comply with the rules of her husband and his family to survive. In this environment, the sooner a wife made the transition, the easier it was for her in her new role. Physical distance from the natal family helped the process, hence the proverb: "Toilets and the wife's home are best kept at a distance."

Even if the environment of her husband's household was alien and hostile initially, the young wife can gradually establish her own position within the household by producing her own children, particularly sons. Producing the heir secures her status and her acceptance as a full member of her husband's family. Once a wife became the senior lady of the household, mother-in-law to her sons' wives, she had

achieved a measure of power. Many women must have softened the hardships by anticipating the day when they would enter the stage of being a mother-in-law. This is another dimension of intrafamily relationships that explains why having a son was, and still is, so much more important to a mother than having a daughter. As filial piety was the supreme principle, a mother's authority was respected, and through her sons she could enjoy a measure of social power.

However, although a mother possessed considerable power and influence within the family, her power did not extend beyond its boundary. A woman's power was based on the private relationship between mother and son, and, however strong an influence she may have on him, it could not extend beyond the scope of the village. As this power was derived from the son, and his power base lay in patriarchy, the mother's power could not and did not challenge the patriarchal system. Rather, the mother actively enforced patriarchal rules in their own interest. This is why, despite the existence of powerful women, the patriarchal system was not undermined or modified to improve the situation of women, nor to institutionalize the private nature of women's power publicly. Under this system, it is far easier for women to perceive other women as a threat to their livelihood and power than as allies to fight against the system.

#### *Problems of Today's Families and Its Direction of Change* HUSO YI

There is little dispute that the family has been changing under the process of industrialization. Although this is widely acknowledged by empirical research and a broad range of data sets, the question still remains whether the external trends really confirm the change in the stereotyped ideology of the family, even with the notion that social procedures are now developing for basic functions other than the family. Besides, it is also necessary to notice that not all changes occur at an equal rate, nor do all segments of a society adjust equally to the changes taking place. Then, how much change has occurred in the Korean family and what are the implications of this change?

The decrease in average household size (from 5.2 in 1979 to 3.12 in 1995) may come from the increase in one-person households and non-family households because of the advance of the mean age of first marriage of women (from 21.5 in 1960 to 26.2 in 1998), the great flexibility in adapting to new ways of life, such as marriage, divorce, and remarriage, and more frequent family moving. Despite the changes in the physical organization of the family, traditional Confucian ethics, which stress patrilineage, filial piety, solidarity among brothers, and the importance of domestic harmony, are still pervasive in the Korean family. The unbalanced sex ratio of children, which has emerged as a serious social problem in Korea, shows a good case in point. In other words, the ideal of son preference is still pervasive as a main agent to support the male-centered norms and values of the patriarchal family. The findings from the 1981 Gallup survey of children and mothers (see Table 5) also shows that the traditional Korean concept of the family as a social institution to continue patrilineage is reflected in attitudes toward childrearing.

Despite the gradual changes in recent years, the idea that the role of homemaking belongs exclusively to women is still pervasive throughout Korean society. This has put great pressure on career women and forced them to perform dual roles. Women engaged in full-time homemaking, on the other hand, experience more social alienation and anxiety in the nuclear family life than in the traditional extended family life,

**Table 5**

#### **Meaning of Giving Birth and Raising Children**

	Mothers Only		Both Parents	
	Korea	U.S.	Korea	U.S.
To transmit my life to my child	34.0	40.8	32.2	30.5
To have a successful child who will further pursue my aspirations	43.2	10.9	32.1	11.4
To continue my family line/name	48.3	23.1	68.2	28.4
To contribute to a generation which will inherit the future society	48.4	52.6	39.6	45.6
To strengthen our family bond	24.8	44.9	25.4	49.5
To have security in my old age	26.8	5.8	37.5	7.8
To mature and enrich myself	13.5	44.2	19.2	53.5
Just to enjoy childbearing	19.3	48.6	18.9	49.8
To be recognized by society	29.3	4.0	10.9	2.2
To obtain additional work power in our family	2.2	2.6	1.8	2.6

Note: Multiple answers may exceed 100%. Source: Chang 1998

which is increasingly more difficult to maintain in modern urban life. Full-time homemakers experience a serious conflict of role expectations and their own identities. Thus, although Korean families appear to be stable, in reality, they are increasingly at a crisis level of psychological dissolution.

### *Sexuality and the Physically Disabled and Aged*

HUSO YI

In a study about sexuality in 65 spinal-cord-injured males (Oh et al. 1990), 24 had problems with erections, 23 had difficulty in maintaining erections, and 24 were unable to ejaculate. During sexual intercourse, 41 had difficulty with erections, but the rest reported suffering from fears of not reaching orgasm, and fears of a passive response and rejection from partners. After the spinal-cord injury, about 80% of them said that their sexual and marital satisfaction had decreased. Although they were aware of sexual problems, only 5 had been in sex therapy because of a lack of facilities and accessibility.

The National Rehabilitation Center started a sexual rehabilitation clinic project in 1996. The clinic has provided sex therapy and counseling, couple sex therapy, group therapy, and erectile dysfunction therapy for more than 1,000 physically disabled people and their partners. The clinic also facilitates a place, called the "shelter for love," where physically disabled people and their partners can stay over to enjoy their sexual activities. Since 1998, the clinic staff has organized conferences about sexuality and disability. In 2000, Dr. B. S. Lee, a sexual rehabilitation specialist, published a small handbook, *Sexual Rehabilitation for the Spinal Cord Injured*. The book introduced the importance of sexuality in the physically disabled, cases reports about sex therapy for the foreign and Korean disabled, sexual concerns of the female and male disabled, medical treatment for erectile dysfunction, psychological issues on sexual rehabilitation, and marriage of the physically disabled. (For information: <http://www.nrc.go.kr/eng/eindex.htm>; contact: nrc1986@chollian.net.)

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Historical Perspective

HUSO YI

The earliest Korean record of homosexuality may be from King Hye Kong, the 36th king of the Shilla dynasty in *Samguk-Yusa* (a Three Kingdoms' story) written by Il Yeon in the 13th century. King Kyungduk did not have a son, but wanted one very badly because he needed an heir. He kept asking the messenger between God and man to go to God and ask for a son. God insisted that he was not destined to have a son, only daughters, yet the King was persistent. Finally, God let him have a son, but God put a female spirit in the son's body. King Hye-Kong was very feminine and liked only being around men all the time. He became the next king at the age of 8 in 765 C.E. because his father died early. However, he was killed at the age of 22 in April 780 by his subordinates because they could not accept his 'femininity.' Another story in *Samguk Yusa* is about Myojung, a very young Buddhist monk who lived during the reign of Wonsung (785-798 C.E.), the 38th king of the Shilla dynasty. It is said that he was loved and sought after by several male Shilla aristocrats, and even by a Chinese Emperor from the Tang dynasty (618-907 C.E.).

One of the best-known homosexual histories is the *Hwarang* or *Flower Boy*, the story of a homoerotic military elite, paralleling the Egyptian *mamluks*, the Japanese *samurai*, and the Theban Band of ancient Greece (Murray 2000). Prior to the introduction of Buddhism, ancient Korea main-

tained a transgendered shamanistic tradition, in which the *hwarang* seem to have been involved. With the transfer of religious legitimization to Buddhism, the code of the *hwarang* began to change from social and religious concerns to political and military programs. In the *Haedong-Kosung-Chon* [*Lives of Eminent Korean Monks*] written by the Buddhist Kakhun in 1215, the first criterion of the *hwarang* seems to have been appearance: "It was handsome youths who powdered their faces, wore ornamented dresses, and were respected as *hwarang*." After unification of the peninsula, ruled by the Three Kingdoms, in 676, the members of *hwarang* were rewarded with land and slaves.

In the Koryo dynasty, same-sex relationships, mostly between males, were very common among the ruling class. In a historical analysis of *Hallimbuilgok* by Seong, King Chungsun (1275-1325) maintained a long-term relationship with a *wonchung* (male lover), and King Kongmin (1325-1374) appointed at least five youths as "little-brother attendants" (*chajewhi*) as sexual partners. After the fall of the Koryo dynasty in 1392, the Chosun dynasty adopted Confucianism as a governing ideology in order to confirm their dynasty as totally different from the Koryo dynasty. Even though Confucianism had negative attitudes about same-sex relationships, there were still male-to-male relationships among the Buddhists and among the rural ruling class. Lesbian relationships were not treated with the same acceptance, as the palace chronicle from the Chosun dynasty reveals. King Sejong convened a meeting of his cabinet on October 24, 1436, to discuss the rumors that his daughter-in-law had been sleeping with her maidservant. These rumors had been somehow confirmed, so the ministers advised the king to strip his daughter-in-law of her noble status in order to preserve the honor and dignity of the royal family (Chung 1998).

Another historically known homosexual group was the *namsadang* in the Chosun dynasty (Murray 1992), which existed until it was broken up by force to extinguish the national culture under the colonization of Japan in the early 1910s. As a type of indigenous theater, the *namsadang* traveled around the country with various types of entertainment, including band music, song, masked dance, circus, and puppet plays. Reflecting the common peoples' harsh living conditions and their resentment toward the upper class, the *namsadang* was the voice of lower-class people. When boys, called *midong* (beautiful boys), first joined a troupe, they played the penetrated sex role and were probably male prostitutes for the rural ruling class (Leupp 1995). In this era, many members of the rural ruling class maintained boys for sexual purposes. Because same-sex relationships, however, were generally regarded as immoral in the eyes of Neo-Confucianism, the *namsadang* performers were treated as outcasts.

### B. Children and Adolescents

HUSO YI

As mentioned below, there is a law against informing adolescents about homosexuality and, in mental health settings, it is easy for lesbian and gay adolescents to be diagnosed as having either sexual maturation disorder, egodystonic orientation, or sexual relationship disorder. In fact, it is likely that mental health professionals will claim homosexual attraction is nothing but a phase of heterosexual development (Yi 2000). In another context, homosexuality may be diagnosed as either pseudo-homosexuality or true-homosexuality (Hong 1996; Lee 1993). Although no research on homosexuality among children and adolescents has been conducted, most research on adolescent sexuality asks questions about homosexual behaviors. Instead of considering homosexual behaviors as normal, these studies by

the Korean Research Institute for Culture and Sexuality categorize homosexuality together with “sexual violence” (Lee et al. 1998), or asks females the question, “Have you ever fallen in love with a woman whom you consider as a man?” (Kim et al. 1997). Both studies found that around 13% of the female student respondents said they had had sexual relationships with the same gender.

### C. Adults

#### *Gender Roles, Courtship, and Relationship Patterns*

HUSO YI

Before the emergence of gay identity in the mid-1990s, expressing homosexuality in Korea was somewhat easier than in the West, because the existence of homosexuality was denied at the same time there was a cultural tolerance for homophilic touch. Same-sex friends can hold hands together on the streets just like heterosexual couples. However, it might be inappropriate to see such same-sex friendships as homosexual relationships in the way that Western culture does (Shong & Icard 1996). One of cultural patterns related to homophilia is that when a husband’s friend visits, his wife sleeps separately from her husband, who sleeps with his male friend. Also, because same-sex roommates before marriage are common, in fact, more acceptable than sharing with the opposite gender, living as a young “gay” couple is possible, and the neighbors hardly suspect them as lesbians or gay males (Yi 2000). But, because everyone’s first role is to continue family linkage, lesbians and gay men are compelled to be married after a certain age. In addition, Christianity is certainly another hindrance for gay courtship, particularly because Korean Christianity is strongly fundamentalist (Martin & Berry 1998). These long-established cultural norms have been challenged by the gay community. Every issue of a gay magazine since 1997 reports the commitment ceremonies of lesbian and gay couples.

#### *Social Status of Lesbians, Gay Men, and Bisexuals*

HUSO YI [Updated 2003 by H. Yi]

The modern gay community can be traced from the 1960s as a form of subculture grown in *Nakwon* (paradise). From this culture, the decorous term for homosexuals began to be constructed: A derogatory term, *pogal* (the backward reading of the word *kalbo*, which refers to the most vulgar term for prostitute, and more generically meaning “promiscuous”), was created. In public, *tongsôngyônajja* (men who only pursue sex with men) had been used to degrade homosexuals. Until the intense contact of Western gay culture, the word *homo* had been occasionally used by homosexuals themselves and later by heterosexuals as a term of insult. *Gay* had been also used, but referred to transsexuals, transvestites, or cross-dressers. Of those cultural codes, the most influential word is *iban* (other people), which has survived up to these days and represents homosexual identity, as does *gay*. The origin of *iban* is unknown, yet it is interpreted as contrasting to *iban*, which means general people or default/first-class. An interesting response from political gay activists about the word was hesitation in using *iban*, because the word does not impose any positive meaning of pride. The concept of pride was never imagined until the 1990s, and then first conflicted with the very local term for homosexual, *iban*. Regardless, *iban* indicated a new consciousness of homosexuals as a social group, but then it was classified as the first blocked LGBT-related keyword for online gay interest groups on the largest Korean website as of May 2002.

In the 1970s, around 120 lesbians and gay men held a monthly social gathering at a Chinese restaurant. But, the social group did not survive to connect with the current gay community (Lee 1997). Today’s gay movement emerged

with Sappho, the first Korean lesbian group, organized by an American lesbian soldier. When she came to Korea in November 1991 to serve in the army and found no lesbian bars, she immediately realized that living as a lesbian was very difficult in Korea. Outside of meeting a few lesbians in a gay bar, there was no chance to meet with lesbians. She decided to organize a group for lesbians and placed an advertisement for her lesbian group in English newspapers. Eight foreign lesbians from the United States and Europe gathered together at the first meeting. The membership of Sappho changed often, because most of its members returned to their homes in the U.S., Canada, Belgium, Sweden, or Australia after two or three years in Korea. Sappho was still holding its small meetings in early 2001.

In the U.S., groups for lesbian and gay Korean-Americans were founded in New York (in December 1990) and in Los Angeles (in August 1993). A few members from these Korean-American groups had been in contact with Sappho and discussed forming Korean gay and lesbian rights groups and providing outreach and support to their various friends. In the meantime, a Korean-American gay man visited Korea and organized the first Korean gay and lesbian co-gendered group in December 1993. Unlike Sappho, this group was organized by Koreans, and is recognized as the first authentically Korean lesbian and gay men’s support group.

Medicalization of homosexuality was first introduced in 1970 by a clinical case study, titled “Sexual Perversions in Korea” (Han 1970). On the basis of *Ying/Yang*, the research reporting of homosexual clients in the 1960s holds that the reason for the smaller number of homosexuals is that Koreans were sexually more mature than Westerners. By repetition of gender-related ideology and strategically importing the Western view of homosexuality as inversion, Korean psychiatry created a local stance and, even today, claims that, even though homosexuality is no longer seen as mental illness, it is still socially unacceptable and dysfunctional. Currently, the *Korean Standard Disease Classification*, adopted from WHO’s *ICD-10*, classifies three categories: “Sexual Maturation Disorder,” “Egodystonic Sexual Orientation,” and “Sexual Relationship Disorder.” However, inclusion of the words “normal heterosexuality” and “marriage” in the translation shows local homophobic motives created by a faxed culture of a psychopathological model of homosexuality. No affirmative mental health service is available. In the mental health setting, the *Korean Standard Disease Classification (KSDC)* states three “Psychological and Behavioral Disorders Associated with Sexual Development and Orientation” (<http://www.nso.go.kr/stat/dis/e-diss.htm>, in English):

- F 66.0 Sexual Maturation Disorder: The patient is suffering from uncertainty about his gender identity or sexual orientation, causing anxiety or depression. Most commonly this occurs in adolescents who are not certain whether they are homosexual, heterosexual or bisexual in orientation, or older married individuals who after a period of apparently normal heterosexuality, often within marriage, find themselves experiencing homosexual feelings.
- F 66.1 Egodystonic Sexual Orientation: The gender identity or sexual preference (either heterosexual, homosexual, bisexual, prepubertal or uncertain) is not in doubt but the individual wishes it were different because of associated psychological and behavioural disorders, and may seek treatment in order to change it.
- F 66.3 Sexual Relationship Disorder: The gender identity or sexual orientation (either hetero-, homo-, or bisexual) is responsible for difficulties in forming or maintaining a relationship with a sexual partner.

In the original text in *ICD-10*, F 66.0, Sexual Maturation Disorder, reads as follows:

F 66.0 Sexual Maturation Disorder: The patient is suffering from uncertainty about his gender identity or sexual orientation, causing anxiety or depression. Most commonly this occurs in adolescents who are not certain whether they are homosexual, heterosexual or bisexual in orientation, or *individuals who, after a period of apparently stable sexual orientation (often with a longstanding relationship), find that their sexual orientation is changing.* (italics added)

In the *KSDC* version, the italicized phrase above has been replaced by: *older married individuals who after a period of apparently normal heterosexuality, often within marriage, find themselves experiencing homosexual feelings.*

Because there is no law protecting lesbians and gay males, Korea has no sodomy laws proscribing oral or anal intercourse, except a military law against homosexual relationships in the army. Meanwhile, in 2000, Korea passed the law of Youth Protection prohibiting distribution of materials that contain incest, animal sex, and homosexuality. The following are examples of institutional homophobia. Sodomy is also proscribed behavior for members of the military, and a general statute against anything contrary to sexual customs is enforced as criminal law. In 1997, the first Seoul Queer Film Festival was banned by the government, which declared it illegal on the grounds that all homosexual materials are obscene. Since 1998, the first gay magazine has been receiving a notice from the Korean Publication Ethics Committee warning that the publication consists of obscenity, therefore, it should not be distributed among youth. In 1999, a high school textbook portrayed gay men as AIDS disease carriers and sexual perverts. Increasing concerns over AIDS revealed the possibility of an anti-gay backlash. Even though AIDS organizations are supposedly fighting against the spread of AIDS, they are in fact fighting against the spread of homosexuals by promoting homophobia and conservative sexual morals.

In October 2000, when a famous actor, Mr. Hong, first came out as gay, his jobs vanished almost overnight. His gay presence as a victim, however, made the discourse of homosexuality in ordinary lives public and led to discriminatory policies. In 2001, the Seoul City Hall authorities ordered a two-month pay cut for a male firefighter for allegedly maintaining an inappropriate relationship with a male colleague, although neither of them identified as gay. Ironically, the distaste for homosexuality created an obsession with any perceived homophile relationships. People began to be afraid of personal touch with the same sex to avoid any suspicion of being homosexuals.

In July 2001, the Ministry of Information and Communications adopted an Internet content-rating system classifying gay and lesbian websites as "harmful media" that must be blocked on all public computer facilities accessible to youth (e.g., schools, public libraries, and Internet cafes). Homosexuality is classified under the category of "obscenity and perversion" in the *Criteria for Indecent Internet Sites*. The decision was based on the Korean government's Youth Protection Act of 1997, which classifies descriptions of "homosexual love" as "harmful to youth." The first case was enacted against the owner of the first and largest gay website in November 2001, with a notice that unless it was immediately marked as a 'harmful site,' and filtering software was installed to prevent youth access, he would be penalized approximately US\$10,000 or two years' imprisonment. The first lawsuit was filed against the government, protesting the government's ban on the gay website as unconstitutional in

January 2002, and the court decision was delivered in August 2002 stating that the Constitution of freedom is not applicable to homosexual distribution on the Internet.

## 7. Gender Diversity and Transgender Issues

### A. Sociolegal Status, Behaviors, and Treatment of Transvestite, Transgendered, and Transsexual Persons

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI) [*Updated 2003 by H. Yi*]

Until the mid-1980s, the care system for transgendered people was not well established in Korea because of little understanding of transsexualism and the negative attitude and prejudices of medical doctors. In desperation, many transsexual persons turned to non-licensed facilities for sex-reassignment surgery or self-injected hormones for partial physical transition. [*Comment 2001*: Yoo (1993) has noted that doctors' prejudices and ignorance of transgenderism/transsexualism result in a boundary between them and the patient. As a consequence, it is common that transgendered/transsexual people get more information from resources in Western countries, where the doctors learn about transsexualism from their clients. (*End of comment by Huso Yi*)] In 1989, Dr. Koo Sang-Hwan conducted the first sex-reassignment surgery for a male-to-female. As of late 2000, about 50 cases of sex-reassignment surgery have been reported. In 1990, the Korean Urology Association proposed 12 criteria for sex-reassignment surgery (SRS):

1. Accurate psychiatric diagnosis.
2. No success from long-term psychiatric treatment.
3. Establishment of psychosocial adjustment for the desired gender before SRS.
4. No other psychiatric illness or depression.
5. Sufficient period of hormone-replacement treatment with no side effects.
6. Over 21 years old and past puberty.
7. Physical appearance has to fit with the desired gender.
8. Family approval for SRS.
9. Agreement of spouse and/or family regarding infertility.
10. No drug and alcohol history.
11. No criminal record and no possibility for crime.
12. Under good medical supervision.

The transgendered (transsexual) patient has to meet all the above requirements and must get two recommendations from psychiatrists.

Even after the surgery, they cannot change their gender on any legal document. In 1990, the court rejected a male-to-female transsexual's petition stating, "Because the plastic surgery only made anatomical structures that look like those of the female artificially so that it does not change the chromosomal structure, he cannot be accepted as a female from our society's common sense and value." [*Comment 2003*: Added to that, the court ruled that "he cannot legally change his gender because he has no internal parts of the female body which are very important to the woman's role of giving birth. Thus, it is not appropriate in our society to change his gender." Since then, all of the cases of gender change have followed this court decision (Cho 1993). It is likely that gender in Korea is constituted by chromosome and familial "role." In the legal system, sex-reassignment surgery is regarded only as a part of plastic surgery and not a gender transition. However, since a male-to-female transgender entertainer gained a public recognition with her success as a model, actor, and singer, public awareness and attitude have widely changed. A number of literary works of fiction and

nonfiction by transgendered people have been published. A clinic for sex-reassignment surgery has provided services for transgendered people. In November 2002, a law protecting transgendered persons' rights was submitted. The court approved a female-to-male transgender sex-change appeal in December 2002. More transgender people's sex-change petitions are expected in South Korea.

[Yet, the level of victimization of transgendered people in society is serious. In a case in which a male-to-female transsexual was raped, the judge said it was not rape, but a physical attack. The judge in this case also implied that the rape of a same-sex person could not be properly constituted as "rape," because such homosexual acts do not fit the sense of "sex." It is the court's stance that sex can only occur between the opposite sexes. (End of comment by Huso Yi)]

[Update 2003: In 1986, when a male transvestite approached Dr. Kim Seok Kwan, a plastic surgeon in Pusan, and asked if he could perform a sex-change operation, Kim told the man nobody knew anything about this operation in Korea, and that he could not help him. A few months later, a request from a second male transsexual sparked Kim's curiosity enough for him to start reading up on the subject. A short time later, Kim performed the first male-to-female sex change operation in South Korea.

[In the late 1980s, Kim's patients were overwhelmingly working class or poor—few could afford to travel abroad for the operation. (Kim still keeps the cost of his operations to \$8,000 on average, while maintaining a lucrative practice in more traditional forms of plastic surgery.) For years, he performed the operations largely in obscurity, aware that news of his special skills was spreading by word of mouth among transvestites. Strong opposition came from the country's tradition-bound medical community, his wife, and his minister.

[By most estimates, South Koreans go under the knife for cosmetic alterations more than anyone else in Asia, with everything from eye and nose operations aimed at achieving a more Western look, to breast augmentations, calf remodeling, and hymen reconstruction among the most popular types of surgery. Some still object that sex-change operations are the ultimate expression of a plastic surgery culture in South Korea that has run amok.

[Kim also asked himself "whether it was right to change the gender of a patient, whether it was right to alter their most essential nature. I really hesitated." In the end, what persuaded him to continue was the realization that "gender surgery is performed to rescue people who are trapped in the wrong body. We are offering the possibility for normal lives to people whose minds and bodies don't match, and even the psychiatrists I consulted told me that this is their only hope."

[Returning to his practice in Pusan, after a year's training at the University of California at Davis, he found a long list of candidates desperate for the operation. In 1991, Kim's

first female-to-male surgery, which he also pioneered in Korea, caught the attention of the nation's news media. The brouhaha of screaming newspaper headlines and guest appearances on television programs eventually died down, but in the process, some of the taboo on public discussion of sexual issues and mores in Korea was lifted. But it took the emergence of one of his patients as a true superstar as a fixture in the Korean entertainment world to trigger a major cultural change in Korean sexual attitudes. Miss Ha Ri Su had lived most of her 28 years, unhappily, as a man, until in 2000, Dr. Kim transformed her into a ravishing transgender beauty. Today Koreans have embraced Miss Ha, knowing full well that this slinky, silky-haired singer, actor, comedienne, and model, armed with a 35-24-35 figure, was once a man. In a personal profile in *The New York Times*, Dr. Kim admitted, "Ha Ri Su was of great benefit to social awareness of this issue. I had no idea who she was, nor how important her example would become. She has encouraged other transgender patients, who have always had trouble holding jobs; for most of them, living in secret, working in bars or as prostitutes was the only thing they could do. Nowadays these people can live regular lives, as teachers, office workers or students" (French 2003). (End of update by R. T. Francoeur)]

### 8. Significant Unconventional Sexual Behaviors

#### A. Coercive Sex HUSO YI [Updated 2003 by H. Yi]

It is very difficult to ascertain the actual frequency of sexual violence in Korea. According to the Korean Institute of Criminology (1998), the report rate for sexual assaults was estimated to be only 6.1% of actual incidents, whereas the rate in the advanced countries is around 30 to 40%. In 1998, the sexual violence counseling centers under the Ministry of Health and Welfare reported around 25,000 cases of sexual violence, which was twice the incidence in 1997. Of these cases, 33.5% involved rape; 21.9% involved physical sexual harassment, and the rest were about verbal sexual abuse. However, only 3.6% of the victims reported the incident to the police (Korean Institute for Health and Social Welfare 1999). The Korean Sexual Violence Relief Center (1999) reported that 95% of the victims are women (assaulters are mostly men) and 73% of the assaulters are acquaintances of their victims, who range in age from the teens to the 70s. Thirty percent of the victims are children under the age of 13, with 50% under the age of 19. Chang (2000) noted that sexual assaulters experienced no guilt for their behavior, believing that sexual violence may occur accidentally as an expression of a natural uncontrollable sexual urge of men. This conception leads men to look at rape as a kind of sexual act, rather than a crime infringing on a woman's body and personality. An interesting legal aspect in sexual violence is that

current law does not allow a victim to file a suit against her father, leaving some incest victims with no means to their rights.

In a nationwide survey of gender roles and sexual violence funded by the United Nations Development Plan, Byun, Won, and Chung (2000) interviewed 542 men and 558 women ranging in age from 20 to 59 (see Table 6). Frotteurism, the forceful touching and rubbing of the genital area, particularly in the subway, is another sexual assault problem not included in Table 6.

Table 6

Number (and Percentage) of Cases of Sexual Violence by Type of Offense and Age of the Victim

Age of Victim	Obscene Call	Penis Exposure	Sexual Misconduct	Attempted Rape	Rape	Others	Total
> 12		1 (7.7)	4 (17.4)				5 (7.1)
13-18	3 (10.7)	7 (53.8)	1 (4.3)	2 (100.0)		1 (25.0)	14 (19.7)
19-25	3 (10.7)	5 (38.5)	13 (56.5)		1 (100.0)	2 (50.0)	24 (33.8)

36 <	13 (46.4)		2 (8.7)				15 (21.1)
Total	28 (100.0)	13 (100.0)	23 (100.0)	2 (100.0)	1 (100.0)	4 (100.0)	71 (100.0)

Source: Korean Women's Development Institute 2000a

In 1997, 128 males were arrested by the subway police for rubbing their genitals against women, and half of these sexual offenders were college graduates.

With the effort of the women's rights movements, Korea has achieved several legal enforcements, as noted earlier, to protect victims from sexual harassment. However, research on the public awareness of the anti-sexual violence laws showed that only 2.1% were familiar with the laws, 31.6% had some familiarity with them, 46.5% had heard of them, and 22.2% had never heard of them (Kim et al. 2000). Thus, it is necessary to implement an effective educational program to make the public aware of the sexual violence laws.

*Sexual Harassment* HYUNG-KI CHOI and COLLEAGUES (Redacted by HUSO YI)

[*Comment 2001*: Cyber-sexual violence has become a major concern and issue in Korea. In July 2000, for example, a female middle-school student committed suicide after being harassed by Internet postings. In order to prevent sexual harassment on the Internet, the Ministry of Information and Communication established the Report Center of Cyber Sexual Violence in 2000 and has conducted a survey, which found that 58.9% of those surveyed had experienced cyber-sexual violence and 14.4% had witnessed it. Most cyber-sexual violence occurs in the chat rooms, bulletin boards, and email. The respondents were harassed by verbal abuse, pornographic pictures or movies, private videos (e.g., exposure of the body or sexual scenes), and suggestions of prostitution. (*End of comment by Huso Yi*)]

The issue of sexual harassment emerged when the Korean Women's Hotline opened in 1983. In the first survey of 700 married women, 42% reported that they had been hit by their husband at least once. Following up on the issue, the Hotline started to deal with the issues of kidnapping for prostitution and female sex workers. During this time, society began to pay attention to harassment against women. There were two important legal cases about sexual harassment. In 1986, Kwon In-Sook, a female college student, was interrogated by the police because of her democracy activism. During the interrogation, she was sexually harassed by the police. Later, with the help of an unprecedented 166 lawyers' arguments and human rights organizations, she was released. Another case dealt with rape. In 1988, when a woman was raped on her way home, she cut off the offender's tongue. However, she was sentenced to a year in prison. The case stimulated debates on rape and self-defense and the implication of women's self-defense. As a consequence, she was found innocent and acquitted. Confronted with societal situations such as these, the Korean Sexual Violence Relief Center was established in 1991.

*Rape* HYUNG-KI CHOI and COLLEAGUES (Redacted by HUSO YI)

In one study, almost half (45.5%) of female high school students reported having been sexually harassed by being touched on the breast, hips, and genital areas and, among them, 99.3% had been harassed by their male friends (Kim et al. 1997). The victims' responses were: 70.8% tried to avoid the situation, 11.3% showed no resistance, 10.1% confronted the harasser with shouting, and only 0.8% looked for help. After being raped, 29.2% did nothing, 25.8% talked to friends, 14.6% told their mother, 2.2% reported the assault to the police, and 1.1% spoke to a teacher. Having no education about rape and a very low reporting rate does nothing to reduce the incidence of rape, and may well promote it. [*Comment 2001*: The law dealing with rape used to be categorized under the title "Crime Against Chastity." This divided the victims of rape into two groups, respectable women who deserve legal protection and those

(fallen women) who do not. Therefore, it was irrelevant to the court decision whether or not the victim resisted. Also irrelevant was the victim's sexual history (Chang 2000). The myths of rape were still prevalent among males at that time: "Rape occurs because of men's uncontrollable sexual urge" (69.0%), "a sexy female's looks provoke rape" (93.9%), "the best prevention is women's caution" (66.2%), and "rape cannot occur if women persistently refuse" (52.6%) (Byun et al. 2000). (*End of comment by Huso Yi*)]

## B. Industrial Prostitution

WHASOON BYUN and JUNGIM HWANG  
(Summarized by HUSO YI)

### *Overview of Industrial Prostitution*

The entertainment industry in Korean society began to grow in the 1970s, based upon the material wealth of capitalism. Amidst a materialistic social environment, a great change occurred in the form of prostitution. Rather than being confined in certain districts, industrial prostitution began spreading rapidly as a form of secondary service available in new entertainment establishments that provided a primary service. Unlike traditional prostitution, industrial prostitution involves establishments centered mainly on the tertiary service industry, in which sex can be provided legally on the side. The tertiary service industry includes the restaurant and hotel/motel business, entertainment and cultural services, and individual and household services provided by individuals and by companies. The number of women employed in these businesses rose steadily from 21.2% in 1983, to 22.9% in 1986, and 23.3% in 1989. [*Comment 2001*: According to Our Society Research Center (1994), around 1.5 millions are engaged in the prostitution industry. That number was one fifth of the population aged 15 to 29 (6.2 million). Over 91% of the female prostitutes had run away from home, and more than 90% had experiences of incest and/or had been sexually abused by members of their family. (*End of comment by Huso Yi*)] These businesses hire women who then provide sex as an additional service paid for at the end by the consumer.

Establishments that incorporate "industrial prostitution" in their services include restaurants, singing-room (karaoke) salons, room salons (adults bars with private rooms served by escort women), ticket coffee shops, steam-baths, (adult) barbershops, and massage parlors. According to data from the Ministry of Health and Welfare (1998), there were 40,123 so-called singing-room and room salons under the category of liquor parlors, about 3,000 steam-baths, barbershops (under the category of sanitary parlors), and 535 massage parlors, bringing the total number of such establishments to 43,658. This is just the official count; the unofficial count is expected to be much higher than this. The prostitution at these facilities is called "second stops," and according to the specific type of establishment, sexual activities are conducted either at the same place or at another location. According to the Korea Anti-AIDS Federation's specialized analysis in 1997, 24.5% of the respondents experienced sex in singing-room salons and room salons. Other places were in the red-light district at 24%, massage parlors at 19.9%, barbershops at 17.2%, hotels and motels at 13.8%, and others at 0.6%. A survey by the Korean Research Institute on Sexuality and Culture (Kim et al. 1997) of female high school students' awareness of sex and factual findings showed 2.1% of the 773 respondents said they had part-time experience working at singing-room salons and room salons. Especially, with the economically hard times, dubbed "the IMF [International Monetary Fund] era," a number of women are likely to be lured into places where industrial prostitution is possible.

### Types of Facilities

1. **Ticket Coffee Shop:** In these shops, the customer pays for tickets sold by the hour and takes the woman out for sex. The money paid for the tickets make up for the woman's absent time from the coffee shop, whether the time is spent drinking wine, socializing, in prostitution, or other activities. When sex is provided as a service, the woman gets to keep that fee which is over and above the shop ticket.
2. **Room Salon:** Room salons and regular bars are allowed by law to hire female employees and hostesses. According to Article 6 of the eighth provision of the Food and Sanitation Law, a hostess refers to a woman, single or married, who drinks, sings, and dances with a customer to promote merrymaking. These women usually move to another place with the customer when he decides to engage in prostitution. Unlike women at ticket coffee shops, these women do not get paid for the time they lose at the shops, but go out for prostitution after reporting to their madams. The hostess gets to keep the money.
3. **Singing-Room Salon:** By law, it is illegal for singing-room salons to hire female employees. Although waitresses may be allowed, hiring a hostess is forbidden. Reality does not follow the law, and a lot of pubs have female hostesses catering to customers. The types of prostitution being conducted in these singing-room salons is identical to that at regular room salons, the only difference being that the hostesses have to report to the owner, not to the madams.
4. **Barbershops, steambaths, and massage parlors:** The female employees at barbershops, steambaths, and massage parlors provide shaving, massaging, and bathing services prior to prostitution. At barbershops, the female employees provide shaves and massages to the customers, and at steambaths, the women bathe the customers and provide massages, during which they incite sexual desires and then provide prostitution. At massage parlors, blind masseuses and female workers are employed, with the latter providing prostitution. When there were no female employees available, the blind women used to provide sex, but with the introduction of female employees, prostitution at massage parlors came into full swing. At most of these parlors, the cost for prostitution is included in the overall charge. The women take their share from the prostitution and the owners take the remainder. Prostitution is much more likely to occur in the barbershops, steambaths, and massage parlors than in the other facilities listed above.

Each facility has slightly different characteristics on the basis of its own type of services. But regardless of the type, prostitution is an important factor that maintains these facilities, where both the main service and prostitution are being conducted under the protection of the facility.

### Analysis of Industrial Prostitution

Many sociocultural, economic, and institutional factors draw women into industrial prostitution. From the perspective of sociocultural factors, a lot of women surveyed were exposed to the adult-entertainment industry at an early age because they had either run away from home or indulged in delinquency. They tended to run away because they did not want to study or because they were reared in an unfavorable home environment. More often than not, if the woman is a breadwinner for the family, albeit single or married, she usually selects the service industry after a divorce or separa-

tion to make a living. The service industry is an easy way to make a lot of money in a short period of time. Women who choose this service industry may do so because they do not have much education, have no special skills, or do not want to work in a factory. Most of the women had experience working in a legitimate company before they turned to the prostitution service industry. But, they either failed or worked at low-paying jobs. Sometimes, they had no other choice but to quit their jobs to escape a hostile work environment in which a supervisor pressured them for sex. Meanwhile, with the nationwide economic crisis of the "IMF era," women have been observed moonlighting in the sex trade because they did not make enough money.

From the institutional perspective, all work facilities have health permits, but if a woman contracts venereal disease, she tends to it on her own. That is why a health permit becomes useless in solving the problem. Also, there are no social services that prostitutes can utilize, and they do not even look for them. The health permits are taken care of by the owner. Normally, establishments involved in industrial prostitution receive permits from the government. Therefore, the exploitation link is not as conspicuous as in the case of traditional prostitution. But despite that fact, many parts of the management structure are distributed among the women, those involved in the trade and related agencies, all of whom together collude in whatever corruption is needed.

[*Comment 2001:* In a report by the Seoul Metropolitan Police Agency, among 222 teenage female prostitutes,

- 67 (30.2%) were 16 years old, 48 (21.6%) were 18 years old, 38 (17.1%) were 15 years old, 35 (15.8%) were 17 years old, 26 (11.7%) were 14 years old, and 8 girls were under the age of 13.
- 47.3% of the girls attended school and the rest were suspended.
- 23 had been sentenced to probation.

As for 282 adult male partners,

- 123 (43.6%) were in their 30s, 115 (40.8%) were in their 20s, 36 (12.7%) were in their 40s, 5 (1.5%) were in their teen years, and 3 (1.1%) were over 50.
- 137 of them had been sentenced to prison and 145 were on probation.
- Half (53.5%) of the men met the women on the Internet, 62 (22.2%) met them through "telephone rooms," 38 (13.5%) met them by voicemail, 18 (6.4%) met them through friends, and 13 (4.6%) worked on the street (Report Center of Cyber Sexual Violence 2000). (Telephone rooms are telephone booths located in private spaces where someone can call another person to arrange for sex or call a sex worker for phone sex. Telephone calls in a private home can be easily traced and show up on the telephone bill, so Koreans are more likely to use the private telephone room. (*End of comment by Huso Yi*))

### C. Pornography

WHASOON BYUN and JUNGIM HWANG (Summarized by HUSO YI)

Historically, the earliest documented erotica can be found in the Koryo period (918-1392). Since the 17th century, erotica has been freely imported from China for the enjoyment of ordinary people. Compared to China and Japan, Korea was somewhat late in developing a taste for pornography because of the unique characteristics of conservatism in the Chosun dynasty. Later in the 18th century, erotica was created and produced by Koreans and widely distributed. However, the Korean erotica was not as explicit as much of that from China and Japan. After the industrialization of the 1970s, various kinds of pornography were developed as in

other countries. Before the Internet was created, the main source for accessing pornography was at lodging houses and late-night coffee shops that served the role of adult theaters. Today, access to pornography has been much easier via Internet adult television, adult magazines, video purchases and rentals, and computer programs.

In a study of 1,976 male and 3,134 female high school students, 60.5% of the male students had seen all kinds of pornographic materials, such as magazines, adult videos, and computer-related materials, 28.1% had experience only with magazines, 27.4% only with adult videos, and 3.6% only with computer programs. Just under 2% had not seen any adult erotica. Meanwhile, 52.2% of the female students had never seen adult magazines, 36.3% no adult movies, and 93.9% no computer-related adult materials (Kim et al. 1997). Considering the lack of adequate sexuality education for Korean adolescents, the impact of their exposure to pornography remains to be studied. In 1997, for example, three 17-year-old male students and a 15-year-old female student recorded their sexual intercourse on videotape and sold it. The tape was spread nationwide. After conviction, one male was sentenced to six months in a juvenile prison, the other males were sentenced to work in social welfare, and the female student received two years of guidance. They said that they just wanted to make a tape like adults do.

### 9. Contraception, Abortion, and Population Planning

#### A. Contraception

HYUNG-KI CHOI and COLLEAGUES

After 1961, when most active contraceptive programs were started, married women who practiced contraception increased from 44.2% in 1976 to 80.5% in 1997 (see Table 7). The most common method of contraception in 1976 was vasectomy, followed by the intrauterine device (IUD), oral pills, condoms, and fallopian tubal ligation. In 1988, the most common form became tubal ligation (37.2%). In 1997, the most common form of contraception was still tubal ligation (24.1%), followed by condoms, vasectomy, the IUD, and oral pills. The usage of the IUD and oral pill is considerably low in Korea.

#### B. Teenage (Unmarried) Pregnancies

HUSO YI

As noted earlier, premarital sexual experience is still prohibited, and there is a strong denial of adolescents' sexual relationships. Besides, adolescent pregnancy and abortion are another serious problem. It is estimated that around one third of all abortions might be performed among unmarried adolescents (Youn 1995). However, no official report has been published on adolescent pregnancy and abortion. Given the fact that being a teenage mother is most undesirable, adolescents may have two choices, abortion or adoption: "Most adolescent mothers who carry their pregnancies to term surrender their babies to adoption agencies" (Youn 1996, 630). According to the Korean Ministry of Health and Welfare, the number of babies given up by adolescent mothers was 1,904 in 1993, 1,781 in 1994 (Youn 1995) and 1,802 in 1999 (Ministry of Health and Welfare, MOHW 2000) In summary, one third of the abortion cases were performed on pregnant teens and one third of the adopted babies were surrendered by teens (see Table 8).

#### C. Abortion

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

In Korean law, an induced abortion, defined as the removing of a fetus before the 28th week of gestation, is allowed in cases of genetically inherited diseases, transmitted diseases, incest, rape, and those cases that may greatly harm maternal health. However, it has been used as a form of contraception in Korea, and the number of induced abortions runs between 1.5 to 2 million cases annually. There are 600,000 newborns in Korea each year, and the number of abortions is nearly three times the number of deliveries. The total number of abortions in Korea is the second highest in the world. One out of two married women has experienced an abortion. Eighty percent of abortions are done for gender-selection purposes, using an ultrasound scan to ascertain the gender, and then selectively aborting female fetuses. Those who seek abortions for reasons defined by the law account for only 20% of all abortions. Unmarried women have 18.5% of the induced abortions; 26.5% of these women were between ages 16 and 20. The overwhelming majority of women who had an abortion, 77.9% of married women and 71.3% of unmarried women, reported satisfaction with the results of the abortion. This reflects, perhaps, the fact that abortion has become commonplace in Korea (PPFK 1996).

#### D. Cesarean Operations

HUSO YI

Korea's frequency of cesarean (c-) section delivery is the highest in the world. According to the National Health Insurance Corporation (NHIC), almost half (43%) of the Korean women who had a baby in 1999 delivered by the cesarean operation. The rate of increase has been surprisingly rapid: from 6.0% in 1985, to 13.3% in 1990, to 21.3% in 1995, and most recently, in 1999, to 43%.

By age-cohort group, 29.4% of mothers under 19 years old delivered by c-section, with 37.0% of mothers between ages 20 and 24, 40.7% between ages 25 and 29, 46.5% be-

Table 7

Contraceptive-Practice Rate of Married Women, Aged 15-44

Year	Total	Tubec-tomy	Vasec-tomy	IUD	Pills	Condom	Others
1976	44.2%	4.1%	10.5%	7.8%	7.8%	6.3%	11.3%
1979	54.5	14.5	9.6	7.2	7.2	5.2	12.1
1982	57.7	23.0	6.7	5.4	5.4	7.2	10.3
1985	70.4	31.6	7.4	4.3	4.3	7.2	11.0
1988	77.1	37.2	6.7	2.8	2.8	10.2	9.2

Number of Adopted Children, 1995-1999

	Total	Domestic	Overseas
1995	3,205	1,025	2,180
1996	3,309	1,229	2,080
1997	3,469	1,412	2,057
1998	3,675	1,426	2,249
1999	(1,802) <sup>a</sup> /4,135	(645)/1,726	(1,157)/2,409

<sup>a</sup>Numbers in parentheses are the number of adopted children surrendered by adolescent mothers; the number following the / is the total number of adopted children.

Source: Ministry of Health and Welfare 2000: Child Health

tween 30 and 34, 58.4% between 35 and 39, and 68.7% over 40 years old (see the NHIC Web site: <http://www.nhic.or.kr>, in Korean).

The highest c-section frequency rate among hospitals was 75.6% of all deliveries. Even the lowest hospital rate (16.1%) exceeded the World Health Organization (WHO) recommendation of 10%. The 1999 rates for the United States was 20% and for Japan, 15%. A survey showed that 80% of the participants were recommended by doctors for cesareans without detailed benefits and risks (Kim 2000). The main reason of the highest rate comes from the insurance policy. Natural delivery costs about US\$40 for outpatients and US\$330 for inpatients, whereas the operation costs US\$180 for outpatients and US\$860 for inpatients. In addition, in cases of natural delivery, women need to be taken care of for at least 12 hours, but cesarean operations only take 40 minutes. Lawsuit cases regarding vaginal delivery accidents ranks the first. Thus, doctors prefer the high-profit and low-risk cesarean operation. The issue received public attention right after NHIC announced the annual report on cesarean operations in July of 2000. Since then, women's rights groups have worked to promote the "right of choice" for women's bodies, together with the issue of abortion.

### E. Population Programs

HYUNG-KI CHOI and COLLEAGUES

Family planning started in Korea in 1961 with the slogan of "Two children whether they are a boy or a girl." The population-increase rate has diminished from 2.32 in 1970 to 1.54 in 1980 to 1.02 in 1997. The total fertility rate has also decreased from 4.5 in 1970 to 2.8 in 1980 to 1.6 in 1997 (see Tables 9 and 10). Korea's population-increase rate and fertility rate decreased only after considerable effort. Although the trend and current rates are encouraging, this trend has not become solid. The reasons for this uncertainty

are as follows: First, the strong preference toward boys is worsening the male-to-female ratio. Second, late deliveries for women in their later 30s are increasing. There are also significant increases in the reversal of tubal ligations and vasectomies. Third, there still exists a high rate of unwanted pregnancies, which corresponds to the high rate of induced abortion. Fourth, the number of emigrants has decreased considerably, but immigrants into Korea have increased recently. Fifth, the rapid decrease in the death ratio is producing significant increases in the adult and elderly populations.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

#### *Incidence, Patterns, and Trends*

HYUNG-KI CHOI and COLLEAGUES

Korean law lists syphilis, gonorrhea, chlamydia, herpes, candida, chancre, cancrroids, nongonococcal urethritis, and lymphogranuloma venereum as sexually transmitted diseases. The number of STDs steadily declined from 145,802 cases in 1985, to 121,585 in 1990, and to 120,320 in 1995, but it increased to 127,389 in 1996 and 134,726 in 1997. Beginning in 1984, a law mandated that those who are employed in situations with a high risk of STDs must have regular screenings. There are 324 centers designated to prevent, diagnose, and treat sexually transmitted diseases (see Table 11).

### B. HIV/AIDS

#### *Incidence, Patterns, and Trends*

HUSO YI [*Updated 2003 by H. Yi*]

The first report of an HIV-positive foreigner in Korea came in June 1985, followed by the first report of a Korean HIV-positive case (contracted abroad) in December 1985 (for review, see Oh & Choe 1999). The first AIDS patient was diagnosed in February 1987 following an unsafe transfusion in Kenya. As of the end of 1998, the total number of HIV-positive cases in Korea was 876 and the number of AIDS patients was 131 (see Table 12). The estimated number of HIV-positive cases as of the end of 2000 is around 5,000, most of them being in their 20s and 30s. According to a recent report by the National Institute of Health of South Korea (2002), as of September 2002, Korea had 1,888 HIV-positive cases; 277 new cases were reported in 2002. The annual-increase rate from 1994 to 1998 was 12.8%. In 1999, the increase was 44% compared to the previous five years. The reasons for this significant increase can be found in the increase in voluntary testing, increased awareness of HIV/AIDS prevention, and the need for HIV treatment. However, a 17.7% increase occurred from 1999 to 2000, with a 51.1% increase from 2000 to 2001 (see Table 12). The HIV infection rate in 2002 increased by 20% from the same period the previous year and, at the end of 2002, 400 new HIV cases were reported (CDCNIPIN 2002, 2003).

Table 13 shows the epidemiology of HIV infection in Korea. Sexual contact accounted for 1,505 cases (97.2%): heterosexual contact for 1048 cases (67.7%), and homosexual for 457 (29.5%).

*Availability of Treatment, Prevention Programs, and Government Policies* HUSO YI

With the initial report of an HIV-positive case in 1985, the Korean government enacted a strict law to deal with this threat. Mandatory screening of all blood products was instituted in July 1985 and expanded in July 1987. According to the AIDS Prevention Law enacted in December 1987, mandatory HIV testing was required of certain groups at high risk: overseas sailors and those female workers at coffee shops, barbershops, amusement restaurants, lodging houses, and massage parlors (note Industrial Prostitution in Section 8, above). The latter group could not get working permission without HIV testing. The mandatory HIV-testing law stopped in June 1993. Yet, the programs provided by the law include informing the spouse and friends of HIV/AIDS-infected persons and close surveillance.

People with HIV are required to receive HIV-prevention training and counseling at local health centers, as well as to report to a government office when moving. The government provides medication for HIV/AIDS for free. The problem, however, is that these patients with HIV/AIDS first have to pay for medications at the hospital and then request reimbursement. Thus, if they do not have enough money for treatment in the first 3 months, they cannot get medication. With respect to the HIV test, voluntary tests rarely occurred because of the mandatory law for reporting. Only targeted groups in the sex industry get mandatory testing. The current policy does not consider the rights of people with HIV. Once notified that they are HIV-positive, they are listed under the permanent control of the government, so they cannot guarantee their privacy. It is reported that people with HIV suffer more from government surveillance than from illness and/or the fact of HIV infection. The AIDS-related law states that if people with HIV refuse to report regularly, government officers, designated by the state governor or the Ministry of Health department, can visit them in their living places without notification and take them to separate places for treatment. In case they refuse the officer's acts, they will be sentenced for one year in prison or a US\$1,000 fine. People with HIV cannot work in the mandatory testing places. As shown, unlike those of developed countries, the AIDS-prevention law is primarily to en-

force punishment and not to protect those with HIV, so that it certainly violates human rights (Chung 1999). In order to ensure their rights, actual name reporting at government offices, mandatory testing, separation for treatment, and excessive criminal law enforcement should be revised. Meanwhile, awareness about the importance of HIV testing may be different issue. A study reported that, among 507 college students, only 5 male students and 1 female student had taken the HIV test (Kang 1994).

[Update 2002: UNAIDS Epidemiological Assessment: The Republic of Korea has a low HIV-prevalence rate. By the end of June 2000, a cumulative total of 1,282 HIV cases including 197 AIDS cases had been reported. An estimated 4,000 HIV-infected individuals were living in the country at the end of 2001 (prevalence of 0.01% among people aged 15 to 49.) The great majority (96%) of HIV infections are estimated to be sexually transmitted, with 13% occurring among women. National seroprevalence surveys have identified only sporadic cases of HIV infection.

[The seroprevalence of syphilis is also very low (0.03% among blood donors). Gonococcal antimicrobial resistance is high; in 2000, penicillin resistance was 80% and quinolone (ciprofloxacin) resistance, 79.5%. Behavioral surveys in 2001 found that 26.8% of sex workers reported using condoms during all sexual contacts.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	4,000 (rate: < 0.1%)
Women ages 15-49:	960
Children ages 0-15:	< 100

[An estimated 220 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 1,000 South Korean children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

*11. Sexual Dysfunctions, Counseling, and Therapies*

**A. Sexual Dysfunctions and Attitudes**

HYUNG-KI CHOI and COLLEAGUES

Erectile dysfunction in males and inhibited female orgasm were the most frequently reported dysfunctions (Yoo et al. 1989). Male expectation anxiety and female orgasmic disorder were highly related to morality by repressing sexual desire. In terms of morality, it was also pointed out that masturbation and sexual fantasy were effective therapy for single adults, but little research had been done with married couples. In their study, more than 90% of the 120 married-couple respondents had sexual fantasies. With respect to the content of the sexual fantasies, the female showed more various content than those of the males: replacement of the partner (52.6% of males and 38.5% of females); unusual positions (21.1% of males and 13.2% of females); unusual sexual activity (15.8% of males and 3.8% of females); group-sex experiences (7.9% of males and 1.9% of females), and the use of sex toys (2.6% of males and 3.8% of females). The following things were

**Table 12**

**HIV/AIDS Cases in Korea, 1985-2002 (September)**

	Total	1985-93	1994	1995	1996	1997	1998	1999	2000	2001	2002

only fantasized by the females: forced sexual encounters, sadistic imagery, observation of sexual activity, and sexual activities with animals. Thirty percent of the females gave no response. The findings suggested conflicts between the females' sexual desires and their activities, which results in sexual dysfunction.

## B. The Availability of Diagnosis and Treatment

HYUNG-KI CHOI and COLLEAGUES  
(Redacted by HUSO YI)

[*Comment 2001*: Sex therapy was first offered by a few psychiatrists in the 1970s, and until the early 1980s, only partial analyses through case studies were available (Yoo et al. 1990). Later in the 1980s, as Korean society became more Westernized, the issue of sexual dysfunctions received attention. The first sex therapy clinic was established in April 1986 at Yonsei Medical Center. The clinic developed a Korean version of the *Self-Evaluation of Sexual Behavior & Gratification* (Lief 1981) and *DSFI: Derogatis Sexual Functioning Inventory* (Derogatis & Melisaratos 1979). These Korean translations were evaluated for reliability and validity and have been effective in sex-therapy settings (Lee et al. 1989). In a review of the 231 patients who visited the sex therapy clinic from its opening to April 1995, 75.8% were male and 24.2% were female. The most prevalent sexual disorders were male erectile dysfunction (40.1%), premature ejaculation (20.3%), and inhibited female orgasm (10.6%). Those who underwent sex therapy with their partners were 11.5% where the male had the problem and 20.0% where it was the female, which were significantly lower than those in Western countries (Yoo 1999) (*End of comment by Huso Yi*)]

Since the 1980s, there has been a rapid increase in the number of publications associated with sexual dysfunction and andrology. In the *Journal of Urology*, there were 13 papers published by Korean researchers and clinicians in 1983. This increased to 33 in 1988, and to 52 in 1993. In an effort to accommodate this increase, the *Korean Journal of Andrology* began publishing in 1989. *Andrology*, a textbook on sexual dysfunction and infertility, was authored by Hee-Young Lee, and in 1995, Sae-Chul Kim published *Diagnosis and Treatment of Male Sexual Dysfunction*. Hyung-Ki Choi also published the experiences of a sexual dysfunction clinic to further the knowledge of the general public.

Male sexual dysfunction includes a decrease in libido, erectile dysfunction, and ejaculatory abnormality. It is estimated that there are 1.2 million such patients in Korea. This number is ever increasing because of prolonged life expectancy, stress, and various traffic and industrial accidents. Since penile prosthesis implantation was introduced by Professor Hyung-Ki Choi and Sae-Chul Kim in Korea in 1983, some 800 cases were performed as of 1995. Professor Hee-Young Lee introduced triple pharmacologic agents for corporal injection in patients with erectile dysfunction, and vascular reconstruction for arteriogenic impotence was first performed in 1989. Sildenafil sulfate (Viagra) has been available to Korean patients since October 1999. In Korea, patients over 21 can purchase a monthly allowance of 8 sildenafil pills (Viagra) with written proof from a physician that they are free from any cardiovascular diseases.

No nationwide data on the clinical profiles of sexual dysfunctions are yet available in Korea. In 1998, Hyung-Ki Choi from Yonsei University reported the results of 2,000 consecutive patients visiting a sexual dysfunction clinic from September 1995 to March 1997. Patients in their 40s were most common at 29.4%, and unmarried patients comprised 11.5%. The most common complaint was erectile dysfunction with 61.8%, premature ejaculation with 15.0%, and those with both diseases at 11.7%; 40.4% of patients had a previous ex-

perience of counseling or treatment with healthcare professionals, 70.3% being non-physician care. The most common associated diseases were diabetes (17.3%) and cardiovascular abnormality (13.8%). Medical treatment was offered in 64.7% of the patients, and among them, 21.5% gained erectile ability capable of intromission.

[*Comment 2001*: Another well-known sex therapy clinic is the Seoul-Cornell Clinic for Human Sexuality, with Dr. Hyun Uk Seol, who is a member of the Society for Scientific Study of Sexuality and was trained in sex therapy by Dr. Helen Singer Kaplan at Cornell Medical School in New York City. His clinic opened in 1995 and he has published a dozen books about sexuality from his own publisher, Sex-Academy. His sex therapy website (<http://www.sex-academy.com>; contact: [seolhu@nuri.net](mailto:seolhu@nuri.net)) has good resources with online sex counseling. (*End of comment by Huso Yi*)]

## C. Therapist Training and Certification HUSO YI

There is no organization offering a certificate for sex therapy, nor is there any institutional training program for sex therapy in Korea. Usually, medical doctors, who are trained in psychiatry, obstetrics and gynecology, urology, andrology, and its related fields, practice sex therapy. In the medical school, the need for courses about sexuality has been discussed, but the problem remains as to which department should be responsible for the curricula (Hong et al. 1993). For sexuality counseling, several organizations, such as the Sexual Violence Relief Center, the Planned Parenthood Federation of Korea (PPFK), the Young Women's Christian Association (YWCA), and other social welfare organizations have developed their own programs on sexuality counselor certification, so that no official criteria or guidelines have yet been established.

## 12. Sex Research and Advanced Professional Education

### A. Graduate Programs and Sexological Research HUSO YI

The Korean Research Institute for Culture and Sexuality was founded in July 1996 under the supervision of the Planned Parenthood Federation of Korea with funding from the Korean government. The tasks of this Institute are to resolve the problems of male preference and the imbalance of sex-ratio at birth, prevent abortion by promoting contraceptive use, and establish effective sexuality education. The Institute has conducted not only nationwide studies about the issues of adolescent and adult sexuality, but also investigated sexuality education and counseling centers all over the country. The Institute has been very successful in developing resources for sexuality education, with more than 200 visual materials and a guidebook of sexuality education. Especially, the major achievement is that the Institute has offered training programs in sexuality education and counseling for the officers at local health centers, and school teachers since 1997. The training is composed of three courses. The trainees first attend lectures and a field study at a sexuality education center, and then attend 20 sessions of sexuality education and 50 sessions of a counseling internship. In the last course, they participate in the discussion of case studies, sexuality counseling supervision, and psychological testing. Those who pass the course receive the certificate of sexuality educator/counseling specialist (PPFK 2000). For information, see <http://www.yline.re.kr>; contact: [sjoon@ppfk.re.kr](mailto:sjoon@ppfk.re.kr).

The Korean Society of Human Sexuality (KSHS) was founded in 1988 and lasted until 1995. Composed mainly of scholars in medical science, KSHS also included social sci-

entists, psychologists, relationship counselors, and other professionals. The Society published the *Journal of the Korean Society for Human Sexuality*, as well as held monthly colloquia on sexual issues and topics, such as sex therapy, sexuality and religion, sexuality education, sexual physiology, sex and art, transsexualism, homosexuality, psychosexual development, and so on. All abstracts of the journal (1989-1994) are available in English. Efforts were underway in 2001 to revive the organization.

In 1997, Ewha Woman's University\* opened the Korean Women's Institute and offered women's studies courses at the undergraduate level. The Department of Women's Studies was established in the graduate school in 1982 and expanded to offer Ph.D. degrees in 1990. Through such achievements, Ewha Woman's University has led in the development of women's studies in Korea. The Asian Center for Women's Studies (ACWS) was established in May 1995 for the purpose of fostering an understanding of women's issues in Asia through extensive research, educational programs, and international exchanges (ACWS 2000). Since then, the ACWS has conducted the "Asian Women's Studies Curriculum Development Project" and English lectures/workshops on "Women in Korea," held an international conference on women's studies, and published the *Asian Journal of Women's Studies*. For information, see [http://home.ewha.ac.kr/~ewsadmin/www\\_page/eng/](http://home.ewha.ac.kr/~ewsadmin/www_page/eng/) (in English); contact: [acwsewha@mm.ewha.ac.kr](mailto:acwsewha@mm.ewha.ac.kr).

The Korean Women's Development Institute (KWDI) is not focused mainly on sexological research itself, yet the KWDI, funded by Korean government, implements numerous research activities and projects in relation to gender and sexuality, with the Departments of Law and Politics, Education, Labor and Statistics, Family Health and Welfare, Social Culture, and Information Development. The Institute publishes an annual report comparing statistics for women and men, conducts research on sexual abuse, sexuality education, and prostitution, and produces visual materials on these topics (KWDI 1999). For information: <http://kwdi.re.kr>; contact: [S4KWDI@unitel.or.kr](mailto:S4KWDI@unitel.or.kr).

[Update 2003: The Korean Sexual-Minority Culture and Rights Center (KSCRC), founded in August 2002, was the first interdisciplinary center for research, policy advocacy, education, cultural events, and publication in the LGBTQ community. KSCRC publishes a quarterly magazine and translations in sexuality and gender studies, as well as plans to conduct research about the lives of individuals who are sexual minorities. For information: <http://ksrc.org/en/>; contact: Huso Yi, [ksrc-en@ksrc.org](mailto:ksrc-en@ksrc.org). (End of update by H. Yi)]

## B. Sexological Organization and Publications

HYUNG-KI CHOI and COLLEAGUES

In January 1982, at a World Health Organization meeting, the Korean Society of Andrology was formed with plans to publish a journal. The second meeting was held in September 1983. The interest in this new field of medicine was amplified by the first Korean implantation of a penile prosthesis in December 1983. The Korean Society enrolled as a member of the International Society of Andrology in 1985. The Asia-Pacific Society for Impotence Research (APSIR) was organized in November 1987 in Hong Kong,

and the founding delegates from Korea included Hyung-Ki Choi, first author of this chapter, Sae-Chul Kim, and Jun-Kyu Seo. Hyung-Ki Choi was elected president at this meeting for the second meeting of the Asia-Pacific Society for Impotence Research held in Seoul in November 1989, with 239 scientists and physicians attending. In June 1994, the Korean Society for Andrology held a meeting to update private physicians on erectile dysfunction.

## Demographics and a Brief Historical Perspective

ROBERT T. FRANCOEUR

### A. Demographics

Spain, with Portugal to its west, occupies the Iberian peninsula in the southwest corner of Europe, south of France. With a total area of 194,896 square miles (504,778 km<sup>2</sup>), it is the size of the states of Arizona and Utah combined. Spain has a high, arid central plateau broken by mountain ranges and river valleys. The northwest is heavily watered, while the south has lowlands and a Mediterranean climate.

In July 2002, Spain had an estimated population of just over 40 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 14.5% with 1.06 male(s) per female (sex ratio); 15-64 years: 68.1% with 1.01 male(s) per female; 65 years and over: 17.4% with 0.72 male(s) per female; Total population sex ratio: 0.96 male(s) to 1 female

**Life Expectancy at Birth:** Total Population: 79.08 years; male: 75.63 years; female: 82.76 years

**Urban/Rural Distribution:** 77% to 23%

**Ethnic Distribution:** A composite of Mediterranean and Nordic types

**Religious Distribution:** Roman Catholic: 94%, other: 6%

**Birth Rate:** 9.29 births per 1,000 population

**Death Rate:** 9.22 per 1,000 population

(CIA 2002)

**Infant Mortality Rate:** 4.85 deaths per 1,000 live births  
**Net Migration Rate:** 0.87 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.16 children born per woman  
**Population Growth Rate:** 0.09%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.58%; *Persons living with HIV/AIDS:* 120,000; *Deaths:* 2,000. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 97%; education is free and compulsory from age 6 to 16

**Per Capita Gross Domestic Product** (purchasing power parity): \$18,900 (2001 est.); *Inflation:* 3.8%; *Unemployment:* 13%

### B. A Brief Historical Perspective

Spain was settled by Iberians, Basques, and Celts, partly overrun by the Carthaginians from North Africa, and conquered by Rome about 200 B.C.E. In the 5th century of the Common Era, the Visigoths, who were then in power, adopted Christianity. By 711, an Islamic invasion from North Africa had displaced the Visigoths. Christian forces started a reconquest from the north that promoted a Spanish nationalism. The marriage of Ferdinand II of Aragon and Isabella I of Castile in 1491 led to the final expulsion of the Moors with the fall of Granada. The Spanish Inquisition, established in the 13th century, was infamous for its persecution and forced conversion of Jews and Muslims. The discovery of the New World by Columbus in 1492, the conquest of Mexico by Cortes, and of Peru by Pizarro marked the start of Spain's Colonial Empire. The Spanish Empire also included, at one time, the Netherlands, parts of Italy and Germany, the Philippines, Florida, and much of Central and South America. Cuba, Puerto Rico, and the Philippines were ceded in the Spanish-American War of 1898.

Spain's king was replaced by a dictatorship from 1923 until 1930, when the monarchy returned. A republic, declared in 1931, ended with a devastating three-year civil war (1936-1939) between the republicans and the military under General Francisco Franco. During World War II, Spain remained neutral, although favoring relations with the fascist countries. Franco set the stage for Prince Juan

\*Communications: Jose Antonio Nieto, Ph.D., Travesia de Tellez, 2, Escl. 1<sup>a</sup>-2<sup>a</sup>-A, Madrid, 28007 Spain; janieto@sr.uned.es.

Carlos to return as Spain's king after his death in 1975. Catalonia and the Basque country were granted self-rule and autonomy in 1980.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

Stereotypes of masculinity and femininity have changed. Male heterosexism is still present in society, but it has not the strength it used to have. By the same token, women express their sexuality more openly. The extreme form of masculinity, *machismo*, no longer has societal approval. On the other hand, sexual purity of women no longer depends on the claim of virginity and chastity before marriage (see Section 5A/B, Interpersonal Heterosexual Behaviors, Children and Adolescents). Men and women are sexualized human beings. There is no longer room for the radical expressions of patriarchal heterosexism that used to depict women as desexualized persons without sexual needs. "Women must stay at home with a broken leg" is the English translation of the proverb, *La mujer en casa con la pata quebrada*, that Spanish men traditionally cited to assign sexual passivity to the feminine gender role. Nowadays, this is a memory.

### B. Sociological Status of Males and Females

Politically speaking, adolescents are considered adults at age 18, when they can exercise the right to vote. However, responsibility for penal (criminal) acts is reached two years earlier, at age 16. Political and penal age are the same for males and females.

### C. General Concepts of Sexuality and Love

The Republic of 1931 recognized women's right to vote, their right to divorce, and, to a certain degree, the right to sexual liberty. With the triumph of Franco in 1939, affectionate and sexual relationships returned to the traditional model tied to the Catholic Church. Sex was considered wrong, love was eternal and only within marriage, and the moral double standard between the sexes reigned. Couples engaged in long courtships, men maintained extramarital relationships, and husbands claimed that they were defending their honor by nearly killing their wives who were presumed to have been adulterous. A very popular song expresses this love ideology: *Solamente Una Vez se Ama en la Vida* [*One Only Loves Once in Life*].

In the 1960s, tourism, the labor emigration to other European nations, and economic development introduced more-liberal customs to society. The automobile and student apartments facilitated sexual encounters without commitment. The contraceptive hormonal pill became available, despite the opposition of Franco's government. By the end of the 1960s, paternal authoritarianism had decreased, and women's presence in the labor and educational segments of society had become stronger.

The decade of the 1970s was a period of significant change. The feminist movement appeared, and couples began living together before marriage. Social pressure for sexual education appeared. A democratic free press was established. Legalized divorce recognized the right to love more than once in a lifetime.

The 1980s introduced changes of a different sort. Evidence of liberal sexual attitudes was widespread among intellectual and political activists, as expressed in the increase in premarital relationships, family planning, and voluntary interruption of pregnancy (abortion having been legalized, although with certain limits, as described in Section 9C, Contraception, Abortion, and Population Planning, Abortion. On the other hand, an economic recession, coupled with fatigue among the avant-garde minority, created more-

conservative attitudes. These forces caused older children to delay leaving their homes of origin, and to reevaluate the institution of marriage.

This panorama of attitudes is pluralistic. It encompasses a measurable degree of sexual revolution, along with a rebirth of sensitive interaction (*Reivindicación de la ternura* [recognition of emotions, affections, and tenderness]). In recent years, it has become obvious that among many young couples, there is an unstable truce between women, who have changed a great deal after having become aware of the double standard, and men, who had changed little and still avoid home and childcare tasks. A theoretical rather than real egalitarianism of the sexes has prevailed and still dominates Spanish culture.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

Although most of Spain's people are nominally Roman Catholic, the liturgical and moral orthodoxy of the Catholic Church are very weakly obeyed, except for some regions in the north. The majority of Spaniards do not accept or follow the Church's precepts regarding sexuality. Despite strict Catholic sexual expectations and the preaching on sexuality from pulpits and confessional boxes, popular and influential rituals and festivals have sexuality at their center. These celebrations are evidence of the paradoxical attitude of Spanish society to sexuality, especially that of the young. In other words, sexuality is celebrated. Maypoles, pigs, Christs, donkeys, bulls, Judas, the Carnival Kings, and similar allegories of hypergenitality and virility are keystones in Spanish Fiestas. In Spain, sexuality is an essential element and center of the festival domain.

However, in a typical paradox, the ritual reign of sexuality irreversibly leads to ceremonial destruction. Those same rituals that are centered on the metaphors of masculinity also recognize the fundamental role to which women must conform. Women are the *concitadoras* (who stir up emotions and feelings in men, stimulate them to action, and excite jealousy or hatred, interest or curiosity), as well as the watchful guardians (*vigilantes*) of their male opponents. This process of absorption is completed by converting the inappropriate sexual drives of male youth into social energy.

One has to consider the possibility that religion's cultural obsession for stimulating/repressing virility determines the expression of Spanish sexuality today. One consequence of this cultural conception of manliness as something basically extremely vulnerable, is the ambivalent tolerance of males who violate the sexual mores, as long as their noncompliance remains a private matter.

### B. Source and Character of Ethnic Values

The ethnic and religious values that serve as guidelines for the sexual behavior of the Spanish should not be perceived of as being homogeneous throughout this country. Different ethnic cultures and different social strata create contrasts, some, like the distinction between urban and rural, being more obvious than others. Keeping in mind this high level of variability, one can still identify a substratum base that determines sexual conduct and attitudes among the Spanish. This sexual ethos is characterized by a stress on (preference for) controlling the sexual conduct of the young, especially males, and mainly with the aim of guaranteeing the family procreation.

The cause of the anxiety the community associates with the sexual conduct of male youths has to deal with the strategy of socialization that they undergo. In traditional Spain, boys abandoned their childhood status to incorporate the

life of an active young man as soon as they were considered mature enough, usually around age 16. In this phase, they were expected to gain sexual experience, generally by means of masturbation, visits to brothels, and sporadic contacts with relatives, especially with female members, such as female cousins and younger aunts. These traditional avenues for sexual initiation of adolescents have been recently replaced by the growing social acceptance of premarital relations.

The culture valued the sexual exploits of male youth and provided an abundance of opportunities, including community celebrations and public dances, which generally encouraged erotic relationships.

The social education of women in traditional Spanish society encouraged them to play their appropriate role in the social order. Women had the responsibility of taking advantage of the continual erotic stimulation and the hyper-value of masculinity that drives young men in order to attract them into the courting game that ends in marriage. Young women were expected to develop strategies that produced maximum enticement and minimal satisfaction, creating for the young male a desire that was never completely in accordance with the social mores. The woman embodied a game of approach-avoidance until just before or within marriage. A young woman's ability to employ her virginity as a bargaining tool makes the impatience and lack of sexual discipline of the male socially productive and profitable. The young male is caught in an extensive web of engagements associated with courtship that resolves itself by fully assimilating him into the institution of the family.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs for Sex Education

The Spanish government has not adopted or implemented any general plan to improve the knowledge and attitudes of Spanish people toward sexuality. Indirectly, one could support sexual education in provisions of the Spanish Constitution, under the educators' "liberty of class" (Article 20.1); children's rights according to the international agreement laws (Article 39); the rights of humans in general (Article 10.2); and the right to understand the full development of personality and the liberty of teaching (Article 27). In the *Official Bulletin of the State* (January 21, March 6, 1981), the government proposed addressing some minimal sexual issues in school, from preschool through secondary school, within the areas of "affectionate and social behavior" and/or the natural sciences.

In explaining Article 27 of the Constitution, *The Organic Law of the Right to Education* (1985) insisted on the freedom of teachers and the autonomy of school centers. This autonomy provides a margin of freedom that permits schools to introduce sexual education. The most ambitious proposal from the educational point of view was created by the Minister of Education in *LOGSE, The General Organic Law of the Educational System*, approved in 1991. This law explicitly defends and reiterates the necessity of sexual education within school at different grade levels.

This law appears positive because it formulates concrete objectives and supports a place in the curricula for education in sexual topics, because it promotes attitudes of gender equality and discourages discrimination between the sexes, and because it opts for an open curriculum that permits schools and professors to include sexual topics within the context of concrete programs. However, the authors also view this law as insufficient, because it does not clearly and

systematically spell out the objectives and information contents for the different school levels.

In reality, the law contains only partial proposals. These programs treat sexuality horizontally, across all course content areas, instead of contextually and longitudinally within a concrete area of health or quality of life. Thus, sexual education is only provided in the basic course content areas and in schools with well-coordinated teams of professors who can adequately provide sexual education. However, adequate sexual education is impossible with this approach. If all teachers in the different disciplines are expected to include sexual education in their courses, they can appropriately address these issues only if they, meaning all teachers in the nation, are adequately educated in this area in addition to their main professional area. And this is impossible without massive funding for teacher education.

Although it seems progressive and favors renovation and freedom of teaching, the option of an open curriculum has limitations. Ideological premises, attitudes of fear, and simple lack of time or training prompts numerous educators to "forget" or avoid addressing sexual issues. In practice, sporadic "forgetfulness" is converted into habitual avoidance.

In summary, current Spanish legislation addresses sexual issues, provides some orientations on specific objectives, but does not guarantee that the education will be delivered. In practice, at least for the moment, there are only a few schools that provide systematic sexual education. It is only unique and isolated educators and groups based in innovative pedagogy that deal with this topic in a systematic fashion.

The most representative exception is in the Community of the Canary Islands, where the autonomous government has freed various educators of Harimaguada to form a group of sexuality educators who provide education in classrooms and systematically plan the delivery of sex education.

#### B. Informal Sources of Sexual Knowledge

Recent publications on sexuality have been translated into Spanish and are currently available to the general public. There are also numerous publications by Spanish authors. Theater, television, and general communications frequently address the topic of sexuality and sexual issues.

From this point of view, freedom of speech and expression is high. Among the more outstanding examples of informal sexuality education is the state television chain TVE1, which offers a series of 30 programs on sexuality, *We Speak of Sex*, for an adult audience. This series has had a strong social resonance.

The Ministry of Health has carried out a campaign for prevention of unwanted pregnancy geared toward adolescents, stressing the slogan *Pontelo Ponseló*, or "Put it on. Put it on him"—referring to a condom. This campaign has had widespread acceptance. The same Ministry of Health has also published slides and pamphlets on sexuality that are of a reasonably good quality. Therefore, the Spanish society's informal sources of knowledge are equivalent to those of most European countries. But from the formal point of view, education is not widespread, and seems unlikely to become widespread in the foreseeable future.

[*Comment 1997*: Educators and researchers agree that one crucial informal source of knowledge about sexual issues for children is their parents. The authors of this chapter have discussed the importance and enormity of the changes that occurred with regard to social attitudes toward sexuality in Spain after Franco's death.

[While the rapid and radical shift in sexual norms had an impact on many facets of Spanish life, one of the most important was that of parent-child communications. Young people and their parents are suffering from a significant and

atypical generation gap triggered by the political changes that occurred in Spain following Franco's death. The world in which the majority of young Spanish people are living today is tremendously different from that in which their parents grew into adults. Even those children who were born the year Franco died were only 18 in 1994. While the world around them promotes a newfound sexual freedom and liberal expression, the families in which they are being raised are based on the values of the ultratraditional model from Franco's dictatorship.

[How then must this affect the ability of parents and children to communicate about sexuality? The traditional value systems and gender-role expectations that governed the consciences of their parents' youth are in direct contrast with present-day powerful social and peer norms that encourage the sexual freedom of their children. The difference between the two sets of norms is clear when one imagines a parent who experienced adolescent dating with a mandatory chaperone or *duenna* confronting an adolescent son or daughter in a social climate in which peers are now likely to lose their virginity before the age of 18. In order for children to benefit from the wisdom and experience of their parents in Spain today, they must not only overcome a generation gap, but a generation crevice that began with the end of the Franco era and the weakening of Catholic-based social controls.

[Young people in Spain today have many choices to make about their sexuality. The next generation will not have it as difficult, because the distance between the social and sexual norms of this new generation of parents and the children they have will be much narrower than the current crevice. (End of comment by L. Berman and J. Nanin)]

#### 4. Autoerotic Behaviors and Patterns

##### A. Children and Adolescents

A national study on masturbation in children and young people found that 76.7% stated that they began masturbating between the ages of 10 to 15 years. Knowledge about masturbation came from conversations and readings (74.8% for males and 57.2% for women).

Studies carried out with 12- to 13-year-old elementary school students in *Education General Basica* (EGB) indicated that 87.74% of the girls and 38.42% of the boys had never masturbated. The numbers lessened when groups of 14- to 17-year-old high school students were studied from *Baccalaureate Unified Polyvalent* (BUP). In this study, 70.51% of the girls and 12.16% of the boys stated that they had never masturbated. All the data seem to indicate that the age of first masturbation differs notably between males and females. Almost three quarters of the boys, 71.4%, began masturbating between the ages of 10 and 12 years, while only 10% of the girls stated they have masturbated at that age. The percentages of adolescents masturbating clearly increases between 15 and 17 years.

The most-consistent masturbation frequency in children is once a month, with 25.7% of adolescents masturbating once a day. At this age, masturbation is commonly accompanied by feelings of blame, more in females (47.3%) than in males (44.3%), while the level of derived satisfaction is greater in males (60.3%) than in females (26.2%).

In university students, 19.1% of the males and 12.6% of the females report frequent masturbation. In a survey of university students, 90.8% of the males and 60.6% of the females reported that they have engaged in masturbatory behavior on some occasion.

##### B. Adults

A national survey reported that 54.8% of adult men and 33.0% of adult women reported masturbation on some oc-

casation. In a study of stable couples, it appeared that 50.1% of the men and 23.5% of the women masturbated. Frequent masturbation is greater in men than in women: 7.14% of men masturbated almost daily and only 3.8% of the women masturbated that frequently.

While 100% of men masturbate in the final years of puberty (14 to 19 years) and in early adulthood (20 to 25 years), this percentage begins to diminish starting about age 25. In general, men indicated that the practice of masturbation diminished after having established a stable relationship. On the contrary, the percentage of women who masturbate begins to increase starting at 25 years and is greater during the ages of 30 to 39 years. The majority abandon this practice at about age 50.

The principal factors affecting masturbatory practice are religion and level in school: 67.5% of the nonbelieving subjects reported masturbation, while 24% of Catholics engaged in the behavior. The higher the level of schooling, the greater the rate of practice and frequency of masturbation. Less clear is the association of political orientation as associated with attitudes toward masturbation, although voters with a resolved conservative position tend to have a more-negative attitude on masturbation.

The content of sexual fantasies that accompany masturbation is varied. Among students, images of sexual relations with the opposite sex are predominant (84% of males and 49.0% of females). Fantasies containing homosexual behavior occur in 6.3% of men and in 5.3% of women. The factors or motives that commonly inspire masturbation include: thinking about opposite-sex people (66.4%), erotic stories about the opposite sex (56%), and fantasies about a sexual act and modifications of a sexual relation or pornographic movies (42.3%).

Masturbation may be preceded by feelings of frustration or depression: 15.9% of women and 8.3% of men reported depression or irritation; 8.2% of women and 13.1% of men reported situations of anxiety. The predominant feeling after masturbation is peacefulness (58.2%), while 10.1% experience feelings of blame and remorse. Masturbation continues to have negative connotations, with 12.2% considering it a symptom of sexual immaturity and 45.8% considering it an indication of sexual dissatisfaction. Only 8% considered it an egotistic act; 4.6% considered it sinful.

The masturbatory technique most commonly used is manual stimulation. Among men, 91.7% masturbate with manual stimulation of the penis; among women, 31.7% masturbate by stimulating the clitoris, 17.8% the vagina, and 4.3% the breasts.

#### 5. Interpersonal Heterosexual Behaviors

##### A/B. Children and Adolescents

###### *Premarital Sexual Activities and Relationships*

Heterosexual conduct in Spanish children and adolescents has greatly increased in recent years. Current data indicate that more than 54% of the women and 52.7% of the men have already had their first date at 13 years. During the period of adolescence, 55% of the girls and 66% of the boys have maintained affectionate relationships.

Clear differences are observed between boys and girls in sexual behavior. Among EGB (Basic General Education) students, 12 to 13 years, 55% of the males have kissed girls, in contrast to 24% of the girls who have kissed boys. Kisses involving the tongue is practiced less: 15% of the girls and 27% of the boys.

More-pronounced gender differences are reported with breast and genital stimulation. Breast stimulation through clothes was practiced by 14% of the girls and 39% of the

boys. The difference in genital stimulation is even greater: 3.5% of girls and 33% of the boys. Data also indicate that males would rather stimulate their partner's genitals than allow themselves to be genitally stimulated; the opposite is true for girls. Genital contact without penetration is reported by 20% of the girls and 31% of the boys. In general, sexual behavior of the Spanish children and adolescents intensifies starting at 15 years in all sexual behaviors analyzed.

Attitudes regarding heterosexual relationships have changed most clearly since 1975, the year in which the *FOESSA Report* recognized the national level of intolerant attitudes among adolescents and young women (*a nivel nacional actitudes intolerantes frecuentemente asentadas entre los adolescentes y mujeres jóvenes*). Current data indicate that 46% of the girls and the 39% of the boys continue to consider virginity important, while 13% and 23%, respectively, report having engaged in coitus on some occasion. The national mean age for first genital intercourse is between 17 and 19 years, but this differs geographically, with the mean age dropping to 15 to 16 in the coastal regions. On the national level, 52% of young males and 37% of young females have maintained sexual relationships before 15 years.

Among those who have not had sexual relationships, the most important motives for maintaining virginity for women have been the fear of pregnancy (25%), the desire to remain virgins (17%), the lack of an opportunity (15%), and religious beliefs (13%). Among men, the most important motive is the lack of opportunity (56%). The data indicate that girls become sexually active within a couple (80%), while the boys engage in intercourse more within the frame of a friendship (48%). Among the motives mentioned for first sexual relations, the boys mention sexual desire (72%) and women mention love (52%). A majority of sexually active youths, 70%, experience some type of worry during sexual relationships. (See comment by L. Berman and J. Nanin at the end of Section 3B, Informal Sources of Sexual Knowledge.)

### C. Adults

#### *Premarital Courtship, Dating, and Relationships*

For comments on the never-married, see Section 5A/B, Children and Adolescents, above.

In comparison to other European countries, the occurrence of cohabitation is low. Two percent of Spaniards are involved in a relationship in which time and space is shared but a marriage contract does not exist. On the whole, consensual unions of couples living together form an experimental and symbolic framework that breaks traditional boundaries of the Spanish family structure and forces the creation of different rules for cohabitation and interpersonal relationships.

#### *Marriage and the Family*

The age at which adults marry has become clearly delayed in recent years. Various factors, including inflation in the cost of living, especially housing, the increased numbers of women in the work world and their greater sense of independence, the rise in juvenile unemployment and longer periods of education, and cultural indicators not easily quantified in percentages, such as the incidence of European patterns, all help to explain the delay of nuptials.

In 1986, the mean age for men's first marriage was 27.3 years; for women, it was 24.8. The decline in the number of births has been very important; the index of fecundity has decreased from 2.0 in 1970 to 1.4 in 1988. In 1991, 1.3 children were born per woman, well below the replacement level of 2.1.

The composition of the family structure has also suffered changes. The *familia troncal* (with several generations of the same family sharing the same dwelling), which was tradi-

tional in the rural environment, shows clear signs of retrogression. In the urban areas, the familiar typology of the nuclear family structure reflects changes including the delay of the age of marriage and an increase in marital breakups.

There has been a considerable increase in the number of women and men "singles," that is, celibates and divorced, who live alone without pair bonding. Reliable data do not exist to support conclusions around the forms of sexual expression and the satisfaction derived from sexuality for single individuals.

Between 1981 when divorce was legalized and 1988, the number of divorces continued to increase, except for slight decreases in 1983 and 1984. The 1986 rate of divorce was five for every 10,000 Spanish citizens.

Extramarital sexual relationships have been socially condemned, but with a distinct difference in treatment of men and women. A kind of tolerance (*pseudotolerancia*) existed for men who engaged in extramarital sex, while unfaithful women were socially ostracized. In traditional Spain, it was not infrequent in families of high economic standing to find a husband who, along with his wife, shared and maintained a separate living space with a *querida* (mistress). On the contrary, it was unthinkable for the wife to have a lover. Spanish culture clearly contains a sexism that favors sexual expression for men but not for women. As the autonomy and independence of the woman increases in Spanish society, inequalities in sexual extramarital relationships have been decreasing. Yet infidelity—a questionable term that needs to be reformed—is still more frequent in men than in women.

#### *Incidence of Oral and Anal Sex*

No legal restriction exists for specific practices like fellatio and cunnilingus. Men perform cunnilingus more than women perform fellatio. The practice is recognized as less frequent in older men and women. It seems that fellatio and cunnilingus are more common in sporadic sexual relationships than in established long-term sexual relationships. There are also no legal restrictions on anal intercourse. However, it is exercised less than the above-mentioned practices.

#### *Sexuality of the Disabled*

The sexuality of the mentally deficient and of the physically challenged until recently was generally considered marginal and was ignored. At the present time, it is addressed by public institutions. The Functional Unit of Sexual Rehabilitation and Assisted Reproduction at the National Hospital of Paraplegics of Toledo, specializing in spinal cord injuries, is a pioneer center where the sexuality of the physically challenged is central and considered a positive part of life. Private organizations also exist that are devoted to assisting and aiding the physically challenged in attaining open, expressive, and dignified sexual expression without taboos.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Male Homosexuality

Male homosexuality was not tolerated during the reign of Franco (1936-1975). Under Franco's *Ley de Peligrosidad Social*, the Law of Social Danger, "homosexuals," including lesbians (although these constitute a separate *terra ignota* camp), were considered a clear social danger. The political doctrine of this era was based on religious philosophy. In fact, national *catolicismo* was the political doctrine. Consequently, all attitudes and behaviors that were not in accordance with Catholic doctrines were not accepted. All kinds of stigmas were attached to homosexuals, including *grandes*

*pecadores* (those who transgress religious principles) and *rojos* ("reds" [i.e., communists], citizens not in tune with the political ideals and, therefore, anti-Franquists). When homosexuals were recognized, it was not uncommon that they became the subjects of abuse, pejorative phrases, and physical attacks.

June 23, 1977, two years after Franco's death, was celebrated as "gay pride" day, an event with clear political connotations and denotations (*connotaciones y denotaciones políticas*). The public demonstration gave public recognition to homosexuality. Homosexuals ceased to be clandestine and began to call themselves, and be recognized as, gays. In 1978, coinciding with an epoch of transition from authoritarian to democratic rules, the Law of Social Danger was repealed. Homosexuality ceased to be legally persecuted. Socially, however, homophobia continues to exist.

More or less solid homosexual support groups soon appeared all over Spain with the clear and decided intention of defending the rights of homosexuals. With different degrees of activism, they have reached out to the public with manifestos, conferences, institutes, publicity, debates, a presence in the media, and other practices that have allowed them to impart knowledge and refuse any type of social discrimination.

The vindication of these groups and movements has customarily centered on gaining social rights of homosexual couples who live together, destruction of political files where homosexuality was an element of a suspicion, fighting against employment discrimination, rejecting the relevance of sexual orientation in cases of child custody, and promoting a sane public discourse that does not believe that heterosexuality is the only normal sexual expression.

There is no one homosexual model. As with heterosexual lifestyles, plural expression includes many different patterns of expression. Next to "effeminate" roles are those who express manifestations of "virility," whose ultimate end is to highlight in exaggerated form the dress, attitudes, and conducts that sustains the image of the "male." As for the places for homosexual encounters, these are typical of that found in other Western countries: train and bus stations, parks, specific streets and squares, discos and bars, saunas, and more.

## B. Lesbianism

Like other organized phenomena, the appearance of lesbianism in Spain is tied to feminism, which exploded in 1975 after the disappearance of Franquismo and the social effervescence (*efervescencia social*) that followed. After the initial push of the gay movement, which was more visible and organized, the first collective group of lesbians appeared in 1981, surging to almost 20 lesbian organizations all over Spain in 1990.

This surge, however, can be misleading. In reality, lesbian individuals and groups have had to fight a society in denial for the very limited time and visibility they have managed to gain in general. They have also great difficulty in creating organizations with enough weight to be heard.

Some lesbians have created their own collective spaces in order to meet and defend their identity and their rights. Some lesbian bars and discos exist in some cities, and magazines sporadically appear in an attempt to create a forum for education and support. As for sexual roles, this question is debated in interested circles, although no concrete posture has been accepted as respecting the values of all the groups and collectives. In this sense, one could say that a model does not exist for those who are living a lesbian lifestyle or are in a same-sex couple, where they are left to create their own pattern dictated by their own circumstances.

This absence of social visibility has its logical consequence in the legal domain.

The period of repression of homosexuality as *conducta de peligrosidad social*, socially dangerous behavior, is now in the past. However, the Spanish legal system has avoided dealing with the topic of the regulation of established gay and lesbian couples. This lack of regulation of the rights generated by living together is creating a significant form of discrimination vis-à-vis married heterosexual couples as well as cohabiting couples. This results in multiple forms of discrimination. For instance, the fear of loss of the custody of children can be traced to the invisibility of the lesbian's right to have a family. Not recognizing marriage or cohabitation creates a negative aftermath involving loss of pensions, inheritance rights, continuity in the lease of housing in case of death of one of the couple, and the exclusion of partners in Social Security. In all these difficulties, there is one exception: *Ley de Reproducción Asistada* [*The Law of Assisted Reproduction*], approved some years ago, "permits" the utilization of these techniques by women with no heterosexual partner. There have already been some cases publicized in the press.

Despite this one legal right, it can be affirmed that there is a legal void when it comes to defining the rights and respective responsibilities of homosexuals that can only be because of the exclusive legal attention to heterosexual relationships.

## 7. Gender Diversity and Transgender Issues

A clear term does not exist in Spanish that is equivalent to "transgenderism" in English. The conversion of gender identity and gender roles is included within the terms transsexuality, homosexuality, and transvestism. The differences that American sexologists pick up between the style of life of the transgenderist, who chronically cross-codes for gender behaviors and roles, and the transvestite, who only circumstantially and episodically dresses like the opposite sex, are nonexistent in Spain. For us, a transvestite is a person who reverses roles, dresses himself in clothing that does not correspond to his sex, regardless of whether this is permanent, chronic, episodic, or entertainment-related. The typical Spanish heterosexual confuses the transvestite with the homosexual, and the homophobic attitudes and responses that occur with regard to homosexuals are thus applicable in a gross mode to the transvestite.

From a political perspective, at the end of the 1970s, the transvestites worked together with homosexuals and contributed to the ascent and recognition of gay groups. Subsequently, their politics are changing to allow an image that is in alliance with the world of entertainment, transformation, and prostitution. The figure of the female impersonator is commercially marketed.

The first legal change of sex, endorsed by the Supreme Tribunal, occurred in 1979. In 1983, a modification of the Spanish Criminal Code decriminalized sex change by surgical intervention. At present, this surgery occurs in Madrid, Barcelona, and Zaragoza. Male-to-female sex change is more frequent than the reverse. However, some confusion, contradiction, and lack of uniformity exists, as evidenced by a variety of criteria and different decisions in the legal system.

Surgically effected change of sex is recognized by changing the birth name in the Civil Register. Sex-change surgery, even when registered, brings certain restrictions. They cannot, for instance, legally marry. Transsexuals are typically portrayed as having an "erratic," "exotic," "ambiguous" character, and by their "gender indetermination" in the media.

In 1987, the transsexuals organized, creating an organization to defend their rights. This association is recognized by the Ministry of the Interior.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Sexual Abuse of Children and Incest*

Since 1988, matters involving the sexual abuse of children in our country have been handled by the Ministry of Social Matters under the Direction of Legal Protection of the Minor (Dirección de Protección Jurídica del Menor); previously, this was done under the Ministry of Justice. The Royal Ordinance 791/1988 (July 20) created the Centro de Estudios del Menor (Center of Studies of the Minor).

The scientific treatment of this problem makes clear that frequent cases of sexual abuse with children exist, but few are documented. Those cases that become known usually coincide with some other criminal act that has come to the attention of the Center. The Center, in turn, registers the abuse with the police and security bodies of the state for criminal investigation. In the *Boletín Estadístico de Datos Técnicos (Statistical Bulletin of Technical Data)* of the Ministry of Social Matters, 1992, some relatives of 16-year-old minors were included with youngsters' antisocial behaviors (such as runaways, drug use, robberies, etc.). These biographies were on many occasions marked by child abuse, including sexual abuses. But, as already stated, documentation of these cases is difficult.

In 1991, 113 cases of "criminal" accusations of sexual abuse or rape were reported. In these and other cases of rape, incest, sexual aggression, or exhibitionism, the age of the victims is not specified in the Ministry of Interior data.

As with criminal reporting, the legal system has given most of its attention to child-abuse cases that involve protection of children, their education, and safe placement within the family environment. The effective criminal code, last reformed in 1983, includes various sections on child sexual abuse.

The legal classification of sexual crimes involves the age of the victim and the level of kinship or authority that exists between those implicated in the crime. At this writing, the initial draft of the Penal Code of 1992 is being debated. The draft is designed to provide treatment that is more in accord with the social reality, and picks up the circumstances that aggravate or attenuate criminal responsibility. Chapter V, Article 22, "of the circumstance of relationship/kinship," recognizes that if the wronged person is the spouse or a person tied to a permanent relationship, he or she can attenuate or aggravate the responsibility, according to the nature of the crime.

In describing "crimes against individual or personal freedom/integrity" (*delitos contra la libertad sexual*), Title VII highlights several levels of crime in terms of the age of the person against whom the crime is committed and the level of kinship, relationship, or superiority exercised in their relationship. When Parliament approves this new Penal Code, the state will be clearly responsible for minors, the helpless, and unprotected, who suffer the exploitation and sexual oppression from parents, family members, teachers, or strangers. Spanish public opinion is very sensitive about the sexual abuse of minors, because more and more publicity is given to such cases in the mass media, sociological studies, and the research of the Centro de Investigaciones Sociológicas (Center of Sociological Studies, or CIS).

The most recent survey on "Attitudes and Opinions of the Spanish Regarding Childhood" (1991) shows that 46%

of the responding men and women over age 18 support changing the penal age, presently 16 years, to 18 years. Younger respondents, ages 18 to 25 years, and those who have voted to the political left clearly defend this posture. Over half of those surveyed, 52%, believe that the laws protecting children from parents or adults who exploit, abandon, or prostitute their children should be stricter. Spanish society is increasingly open to measures of support and care for children, including intervention by the public administrations to facilitate adoption and foster-home placement.

#### *Sexual Harassment (Acoso Sexual)*

In our usage, sexual harassment refers to a "behavior of a sexual character, not desired by the person to which it is directed." This includes not only aggression and rape, but also other behaviors, like verbal offenses, expressions, grimaces, unnecessary touching, and so on.

In spite of the many forms sexual harassment can take, central in this definition is the fact that the harassment is deliberate, the perpetrator is conscious of his or her actions and searches for trouble, and the fact that the harassment is imposed on an unwilling person.

While both men and women can be the object of sexual harassment, national and international data indicate that women suffer it most and, in this sense, it is an expression of the patriarchal society rooted in the inequality in gender relationships in both the labor world and in society in general. The first data on sexual harassment in the Spanish workforce came out of research on women from diverse labor sectors in the city of Madrid, carried out with the support of the Department of the Woman of a socialist union: Unión General de Trabajadores de Madrid (General Union of Workers of Madrid or U.G.T.).

In this study, sexual abuse and harassment are described in terms of a continuum, with five levels of intimidation and the negative aftermath in the psychological, physical, labor, and social order. In this research, 84% of the women had suffered some type of sexual harassment from companions as well as superiors through jokes, flattering remarks, and conversations containing sexual content (level 1); 55% had been objects of sexual harassment through nonverbal communication, without physical contact (level 2); 27% had suffered through strong verbal conduct and physical contact with sexual intention (levels 3 and 4); and 4% had suffered violent behavior to the point of coitus (level 5).

Older women are less subject to sexual harassment than younger women, with women ages 26 to 30 most at risk. In addition, women separated from their spouses, divorced women, and widows also suffer harassment with a greater frequency in all five types of harassment. According to this research and the women themselves, the civil status of women—divorced, widowed, or separated—allows the harasser to perceive them as "easy targets," because the male husband is legally invisible or nonexistent.

The strongest correlate for sexual aggression is the degree of vulnerability the woman has in her work position: the more insecure or vulnerable a woman is, the greater are her chances of being sexually harassed. Since harassment increases in relation to the power of males over females in any situation, the patriarchal hierarchy has been recognized as a central problem in the structural conditions of the Spanish workplace.

A sophisticated report by the (Communist) Union Labor Commissions shows that in a high percentage of the reported cases, the victims are women who are seeking employment, are pending contract renewal, or work in a masculine labor atmosphere. It is impossible to foresee a promising future if women continue to be discriminated against

and insecure in their employment, and their work conditions remain inferior to those of males.

Until 1989, the legal system had no instruments that would allow reporting and remedying these practices. The 1989 Statute for Workers deals with the personal rights and dignity of workers and civil servants and the protection from verbal or physical offenses of a sexual nature.

Progressive lawyers have proposed expanding the Penal Code to include an article referring to sexual harassment under the heading of "crimes against individual or personal freedom/integrity" (*delitos contra la libertad sexual*). Nevertheless, in the first draft of the Penal Code of 1992, sexual harassment was not included as a distinct and separate crime. Joining forces, feminist and progressive judges have concluded that the current legal system framework is not sufficient to protect people who attempt to report situations of harassment, either within or outside of the workplace.

### Rape

In 1989, an important legislative reform was enacted in Spain as a result of a widespread opinion championed by feminist groups, progressive lawyers, the Institute of the Woman, and diverse sectors of the society. The 1989 Organic Law of the Proceedings of the Penal Code replaced the previous headings of "crimes against decency" (*delitos contra la honestidad*) with "crimes against individual or personal freedom/integrity" (*delitos contra la libertad sexual*). This eliminated from the Penal Code a 19th-century sexist conceptualization of sexuality and provided strong protection for the personal freedom and integrity of women.

Under the heading of sexual crimes are included rape (*violación*), sexual aggression and statutory rape (*estupro*), and abduction (*raptó*). According to this new gender-free code, rape is not limited to a man who sexually violates a woman through carnal access, vaginally, anally, or orally. It is to have carnal access with a person using strength or intimidation, or when the person is unconscious or deprived of mental capacity. Statutory rape involves carnal access with a person between 12 and 18 years of age. Abduction against the will of the person is considered more severe when the person is under the age of 12.

In the new Spanish legislation, one speaks of "people," not just "women," as victims of rape. This breaks the association between rape and a woman's virginity that was implied in the previous laws that dealt only with vaginal penetration.

However, court procedure still requires that the accusation should be made by the victim, or in cases of a minor or handicapped person, by the parent, legal guardian, or representative, or a member of the Fiscal Ministry. Although the victim may withdraw the accusation, the Fiscal Ministry continues with the official prosecution based on the victim's testimony.

In spite of certain advances in the reformed criminal code, diverse parties have pointed out that rape remains one of the less-reported crimes in spite of its graveness and high incidence. One fundamental reason behind this is the deeply embedded societal belief "that blames the victim for the crime committed against her and for the wide repercussions she will have subsequently in life" (*que tienden a acusar a la víctima del propio delito que ha sido cometido contra ella y que tan amplias repercusiones tendrá posteriormente en su vida*).

Efforts in the legal system have been made to denounce this idea of victim precipitation, and the fact that stigmatization of women intensifies when the victims know their aggressor, since it is thought that there are other motives for their accusation. This is a particularly serious charge given that data provided by the Asociación de Asistencia a Mujeres

Violadas in its 1990 annual report noted that 55% of the victims knew their aggressor. This association was created at the state level in 1986 to provide free legal and psychological services to women, to promote public campaigns in favor of reporting such crimes, and to protect the rights of the victim under the law. However, much remains to be done in order to guarantee the utmost assistance to violated women and improve the legal protection of the victim during all prosecution. Without these changes, rape will continue to be a frequent, but rarely prosecuted crime.

### [Domestic Violence

[Update 1997: In the late 1970s, when the dictatorship of Franco was overthrown and democracy returned to Spain, women began taking more jobs outside the home and thereby gained greater economic independence. This development brought inevitable challenges for the traditional *machismo* values and began a long process of public education about the hidden secret of domestic violence. In 1996, police recorded 16,300 cases of domestic violence and battery. In 1997, 19,000 complaints were registered. The actual incidence, according to the Government's Institute for Women, is more like 200,000 cases.

[This issue came to national attention in late December of 1997 when a separated husband in southern Spain beat his 60-year-old wife of 40 years, threw her from a balcony at her home, doused her with gasoline, and burned her alive. Ms. Orantes had complained repeatedly to the authorities about her husband's violent behavior, and after they separated two years ago, a divorce court ruled that they should have joint custody of their home. She lived upstairs; he occupied the lower level. Then in early December, Ms. Orantes described on a regional television talk show nearly four decades of beatings during her marriage. Following her death, the interview was replayed several times, forcing both government and Church officials to acknowledge the problem and declare solutions would be forthcoming.

[The governing Popular Party and the leading opposition Socialist Party quickly filed separate motions in Parliament for stricter measures against domestic violence. In November, the Government announced that it was studying the creation of a separate division of prosecutors for domestic-violence cases, and the start of a media campaign about the problem. Since the killing of Ms. Orantes, Government ministers, judges, prosecutors, and associations representing divorced or separated Spaniards have spoken out against the violence, without a consensus on how to reduce the problem. The key will be "fighting *machismo* with a new mentality," said Archbishop Elias Yanes, president of the Episcopal Conference, the ruling body of the Roman Catholic Church in Spain. He warned that the Church might order "separation" in dangerous situations of domestic violence. Demonstrations in Madrid and other cities quickly followed, as the Prime Minister's spokesman took the unusual step to read aloud the toll-free number of the government's domestic violence hotline (*The New York Times* 1997). (End of update by R. T. Francoeur)]

### B. Prostitution

Prostitution is spread throughout the country in very diverse forms, involving street prostitution, housewives, students, junkies, illegal immigrants, and others. Sex workers also frequent bars, pubs, and clubs of all types, from the more sleazy to the most elegant. Escort services or agencies offer "company" for executives and businessmen. Massage services are also advertised in the press. In fact, all types of sexual services are offered by individuals or by organizations with many "employees" and a wide range of supplies.

Spain has had an abolitionist legislation since 1956 that supports the reformation of the prostitutes, the persecution of the pimps and go-betweens, and the deterrence of the clients. Prostitution is not monitored, *per se*, but the law criminalizes those who get some economical benefit from it.

In practice, sex workers have been harassed when caught in raids and/or when accused of other crimes not directly related to prostitution. The go-betweens, clients, and others, on the other hand, have been and are tolerated and only arrested when there is a scandal or someone is interested in revenge.

Nevertheless, in social debate of the first draft of the Penal Code, prostitution is completely depenalized, except in cases of minors and when coercion exists. If approved, procuring, pimping, and other activities associated with prostitution would no longer be crimes, and all forms of prostitution, including the bordellos, now forbidden, would be permitted.

Prostitution is tolerated because it is considered a necessary evil. That does not necessarily grant any freedom, and the prostitute is supposed to remain in an opaque area in which the activity is not seen or recognized, operating in the world of a hidden economy.

### C. Pornography and Erotica

During Franco's regime, pornography was completely prohibited. In recent years, sexually explicit magazines and films have appeared. After an early and short explosion of pornographic materials, prompted by the common belief that the masses were going to consume it voraciously, the situation soon settled down.

Pornographic magazines are sold at newspaper stands and in sex shops. X-rated films are shown in theaters with erotic publicity provided at the doors to entice customers inside. Sex shops increased in number, often near to areas of prostitution, where they display all types of erotic toys and devices. Some sex shops offer video booths and even live sex shows.

The onslaught of the video industry has seriously affected the market of porno theaters, many of which have closed because consumers prefer to rent a videotape and see it in their home. The many couples who now share this activity has shifted the market from the traditional consumer, the single male. Also, some regular television channels, not cable television, offer erotic movies at certain hours, not too late at night, which has also drawn customers away from the porno theaters.

Pornography no longer provokes major controversies in Spain; its "moderate" consumption passes through channels that are clearly defined and accepted.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

The data that exist on the use of contraceptives and abortion among Spanish youth is scarce, fragmentary, and rarely reliable. Nevertheless, what little data there are allow one to appreciate the fact that the use of contraceptives is very low, although it has been increasing in the last few years because of the problems of STDs and AIDS.

Current data show a linear increase in the use of contraceptives. Between ages 18 and 19, 10.9% regularly use some kind of contraceptive, 8.3% utilize effective contraceptives, and 2.6% ineffective methods. The percentage of regular contraceptive use increases to 54.3% for ages 25 to 29 years. Among 15-year-olds, 60% maintain or have been sexually active without using any method. In 1977, only 25% had utilized some effective method; in 1985 (the last year for which data are available), this percentage increased to 65.5%.

In 1985, 98.6% of the total number of women between ages 18 and 49 knew of at least one effective method of contraception. This reflects a clear improvement in comparison with 1975 when 10% of married women were not acquainted with any effective method. Today, the most utilized methods by women at risk for pregnancy, according to data of the National Survey of Fecundity are: the pill, 14%; IUD, 4.8%; condoms, 11%; rhythm method, 3.8%; and coitus interruptus, 13%. The best known method is the pill (97.6%) and the least known, the diaphragm (56.7%).

### B. Teenage Unmarried Pregnancies

The annual number of undesired pregnancies among 18- to 19-year-olds is 30,966; for those between ages 20 and 24, 190,839, of which 7.6% occurred in spite of contraceptive use.

In 1985, the last year for which official statistics exist, 29,586 children were born to adolescents under age 20; only 207 girls under age 15 gave birth, 0.04% of total births of that year.

In 1988, 14,124 women under age 24 years had IVE (*interrupción voluntaria de embarazo* [voluntary interruption of pregnancy]), 54.17% of the total number of abortions. What little data there are indicate an increase in minors giving birth, although, since 1985, that frequency seems to have stabilized. The high number of clandestine abortions among youths, because they cannot opt for IVE without the knowledge of their parents, results in unnecessary uterine perforations, hemorrhages, and infections. So, while maternal and neonatal morbidity and mortality may have diminished in Spain in recent years, adolescents are disproportionately represented in these statistics.

### C. Abortion

The law legalizing abortions was proclaimed on July 5, 1985, authorizing three types of abortions: eugenic abortion when the fetus is diagnosed with grave mental and/or physical problems; therapeutic abortion when the pregnancy is a threat to the mother's life or mental health; and ethical abortion in cases of rape or incest. An estimated total of 100,000 IVEs are performed annually in Spain, although the number of legal and recognized abortions is clearly much less. In 1990, 36,095 IVEs were performed and officially recorded in 86 different centers. This figure has been relatively stable for several years.

For a variety of reasons—religious, ethical, professional, and economic—the law legalizing abortion met great resistance in a medical profession that welcomed the right of conscience to refuse to perform abortions in official centers. The resistance is obvious in the data documenting that few legal abortions are practiced in public hospitals. Of these, 4.17% are performed to prevent physical harm to the mother; almost 100% of the abortions performed in private centers are performed for the mental health of the mother. Another pattern is that high-risk IVEs are usually performed in public facilities, while the private centers perform lower-risk IVEs.

At present, the government is studying the possibility of expanding the conditions for legal abortions, adding economic conditions as an acceptable cause for abortion, and allowing first trimester abortions on request. The latter option is advocated by the majority of Family Planning Centers and by progressive women's movements, despite strong legal difficulties.

### D. Population Control Efforts

Longstanding religious and political factors in Spain have hindered any attempt to justify the control of fecundity/fertility. The political changes that started in 1975 and the 1978 democratic constitution are changing the "old rules."

The new constitution partially legalized information about and sale of contraceptives. This same year, modification of the Penal Code enabled the government to create the Centers of Family Planning. At first, these centers were exclusively dependent on the state government. However, as such centers proliferated, more and more of them were funded by municipal governments and by private, non-governmental associations.

In 1984, the National Plan of Centers of Family Planning was developed and linked with the Ministry of Health to facilitate programs dealing with contraceptive methods, STDs, and general material on sexual education, sterility, and fertility. At present, Spain has about 700 Centers of Family Planning, actively creating an awareness of the importance of fertility control by distributing sexual information and contraceptives.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

The most reliable estimates on the epidemiology of sexually transmitted disease (STD) in Spain come from the obligatory registrations of the diseases. This registration (*Sistema de Información Sanitaria de las Enfermedades de Declaración Obligatoria*, or *SISEDO*, the *System of Sanitary Information on the Obligatory Declaration of the Illnesses*) is based on the weekly reports primary-care physicians make on a series of illnesses. However, as in other countries, only three diseases are reported: gonorrhea, syphilis, and HIV infection. Unfortunately, even with this limited requirement, an estimated 50% to 90% of actual cases go unreported. Since 1982, a laboratory in the Service of Bacteriology of the National Center of Viral Microbiology and Sanitary Immunology (CNMVVIS) has been analyzing the existence and specific characteristics of gonorrhea strains.

The number of gonorrhea and syphilis cases declined annually from 1985 to 1990, with 1,685 cases of syphilis and 13,702 of gonorrhea, 4.1 and 33.1 cases per 100,000 inhabitants, respectively, in 1990. The impact of AIDS and safer-sex practices is likely the main factor in this decline. Although a decline in STD cases has also been seen in other European countries, this tendency to decrease is not uniform. In Spain, the data document a decline for only six years, too brief a time to draw any conclusions other than that young people are more at risk, and both men and women are at risk. Among 16- to 25-year-olds, one finds more females than males infected. With syphilis and other STDs transmittable during childbirth, there is an increased risk of congenital STDs and possible serious repercussions for fertility in both sexes.

A few local or regional studies of STDs not reported to SISEDO are available, but nothing on a national level. With no uniform definitions and no standardized diagnostic methods, estimates on these STDs vary from study to study. Nevertheless, it is possible to say that chlamydia is a minor problem in Spain as compared to other European countries. But these figures should be considered with caution.

Spain does not have a significant tradition of clinics for STD treatment; patients usually seek treatment from general practitioners. In other countries, such as Italy, the situation is very similar, and efforts are being made to improve and structure national epidemiologic surveillance services for the cases of "second generation" STDs, e.g., chlamydia, genital herpes, and genital warts, among others.

### B. HIV/AIDS

Clinical criteria for AIDS cases in Spain follow those established by the Centers for Disease Control in the United

States. According to the data available from the National AIDS Registry to the end of 1991, Spain's total of 11,555 cases, 288 cases per million inhabitants, puts the nation among the top in number of cases among countries in Europe. The largest increase in cases was produced between 1986 and 1988. At present, the effectiveness of initial preventive campaigns from public organizations seems to have produced a decrease in the number of new cases reported in recent years. The initial exponential pattern seems to be giving way to a linear pattern. Nevertheless, although the tendency for growth has slowed, the number of new cases continues to grow every year (Hart 1995).

In Spain, intravenous drug users (IVDUs) account for two out of three cases, 64%. A much smaller percentage, 16%, are homosexual or bisexual. Heterosexuals account for about 5% and their linear growth pattern is still not alarming. As of mid-1993, 341 cases of pediatric AIDS have been recorded, 80% of these children born to mothers at high risk. This pattern of etiology and distribution contrasts with the predominance of homosexual/bisexual transmission in North America, Western Europe, Australia, and New Zealand, and with the predominantly heterosexual transmission in parts of the Caribbean and sub-Saharan Africa.

Finally, at the end of 1991, 39% or 4,454 of the adolescent and adult HIV-positive persons had died, and 42% of the pediatric AIDS cases. The most frequent causes of death are opportunistic infections, 67%, and frequent bouts of extrapulmonary tuberculosis, 18%. Several prevention programs from the central government are focusing on how to avoid infection, and indirectly, STDs, through safer-sex practices, use of condoms, use of clean syringes, and so on (Hart 1995).

[Update 2002: UNAIDS Epidemiological Assessment: HIV prevalence and the epidemiological situation have been tested in a variety of unlinked anonymous surveys conducted in the 1990s on the national level and in seven regions and major urban areas. There were: a national 1995-1997 survey of sex workers who were tested in several STD clinics, a 1998 national unlinked anonymous survey of STD patients, a study of female prostitutes receiving STD care in Madrid, a 1988 study of prostitutes in Oviedo, both a national and a regional survey of intravenous drug users in Valencia, a 1987-1998 national survey of blood donors, and a 1995-1997 national survey of STD patients. Sources and summary data for the published results of these surveys are available at UNAIDS (2002).

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	130,000 (rate: 0.5%)
Women ages 15-49:	26,000
Children ages 0-15:	1,300

[An estimated 2,300 adults and children died of AIDS during 2001.

[No estimate is available for the number of Spanish children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

Sexual dysfunctions are mainly associated with problems in heterosexual relationships: mainly erectile dysfunction, early ejaculation, and loss of sexual desire in men, and inhibited sexual arousal and orgasm, painful intercourse, and loss of sexual desire in women. The primary characteristic that allows one to consider these dysfunctions as problems is the suffering and malaise they can cause for the people experiencing them.

In general, men and women with a sexual dysfunction are viewed with a certain condescension and tolerance, as patients or sick persons requiring medical assistance or sexological treatment. On the other hand, many Spanish people continue to view sexual dysfunctions in terms of pathological dysfunctions, such as rape, incest, pedophilia, child sexual abuse, exhibitionism, sadomasochism, fetishism, and so on.

## B. Availability of Diagnosis and Treatment

At the present time, Spain has a considerable and growing number and variety of centers and specialists who diagnose and treat sexual dysfunctions. Treatment can be sought at both public and private facilities, although, in general, private clinics continue to provide the best environment and treatment.

As for the specialists who treat these dysfunctions, they are, in order of importance, psychologists, psychiatrists, and urologists and gynecologists. A reasonable variety of technology and instruments are available for diagnostic use, mainly adapted from those developed in European countries, although Spain is beginning to develop technology, evaluation instruments, and treatment modalities specially adapted to the Spanish people.

As for the training of therapists, a variety of possibilities currently exist. Most training is available in seminars and courses of specialization, normally lasting some months, offered by graduate programs in psychology and medicine. These courses are usually sponsored and staffed by institutes, clinical centers, and sexological associations all over the country, although they tend to be more common in the provincial capitals, like Madrid or Barcelona.

At the university level, master's and doctoral level programs are available at the University of Salamanca and at the Universidad Nacional de Educacion a Distancia (UNED) in Madrid. These programs include instruction on the many aspects of sexological knowledge, as well as training in diagnostic evaluation, counseling, and the treatment of sexual dysfunctions.

## 12. Sex Research and Advanced Professional Education

### A. Institutes and Programs for Research and Education

Sexuality research in the academic environment has been marginal and received little support. From the political transition of the late 1970s to the present, the academic gaps in this type of research have been paralleled by the proliferation of news of sexual attitudes and specific sexual practices in magazines and the daily press that is fragmentary, sensationalist, and endowed with little rigor.

The first survey of Spanish sexual behavior, *Encuesta Sobre el Sexo Masculino* [Survey on the Masculine Sex], was carried out in 1966 with 100 males. In 1972, Serrano Vicens published *La Sexualidad Femenina* [Feminine Sexuality], based on his clinical interviews of 1,417 women begun in the 1930s.

There are very few probing interviews, surveys, and empirical studies based on a quantitative methodology. Even surveys and empirical studies based on adolescents and university students are not representative because of the small size of the sample. However, studies have been conducted in Madrid, Valencia, Barcelona, Salamanca, León, Zaragoza, Pamplona, Oviedo, and other cities. Worth noting are the surveys conducted by Jose L. Zárraga (1987) and Malo de Molina, Valls Blanco, and Perez Gomez (1988). At the national level, under the auspices of the Master's in Human

Sexuality Program of the Universidad Nacional de Educacion a Distancia (UNED), a study of the sexuality of older males and females, is now under way.

Despite a glaring need, studies in sexuality are only recently appearing in Spanish universities. Specific courses in sexuality are being considered for inclusion in some programs at some universities. In 1991, a course in the psychology of sexuality was an elective in the undergraduate, Licenciatura (B.A.) program in psychology at the University of Salamanca. A Catedra in evolutionary psychology of sexuality was also introduced at the highest academic level. In the same year, the course in sexology at the School of Social Work of the University of Navarra was eliminated. A course in Sexual Anthropology was an elective in one of the UNED programs.

Various universities are currently planning to incorporate diverse viewpoints on sexuality into their Licenciatura programs. The Department of Psychology at the University of Salamanca offers a doctorate in sexology with an obvious psychological orientation. Since 1990, the Universidad Nacional de Educacion a Distancia (UNED) has offered a two-year multidisciplinary master's degree program with a clear sociocultural inclination leading to the diploma, Master in Human Sexuality. This is the first master's degree program in sexuality granted by a Spanish university. This program is sponsored and exists within the Department of Sociology.

Some private institutions, schools, associations, and clinical centers with diverse orientations outside of the university domain also offer programs in sexology: Espill Institute, Incisex, the Lambda Institute (now named Casa Lambda), and the Speculum Institute.

### B. Sexological Organizations

The offices of the Federacion Espanola de Sociedades de Sexología are at: c. Valencians 6 Principia, Valencia 46002 Spain. Local or regional Sociedades de Sexología exist in many cities and provinces in Andalucía, Castilla y Leon, Cataluña, Galicia, Madrid, Malaga, Sevilla, and Valencia. Two regional organizations are:

Societat Catalan de Sexologia, Tren de Baix, 51 2o, 2o 08223 Teraessa, Barcelona, Spain. Tel.: 34-3/788-0277.

Sociedad Sexologica de Madrid, C/Barbieri, 3.3 dcha, Madrid 28004 Spain. Tel.: 24-1/522-25-10; Fax: 24-1/532-96-19.

About two dozen bulletins and small magazines dealing with sexual issues are published by local psychiatric and psychological organizations, educators, sexological societies, and feminist, lesbian, and gay-male support groups, in such cities as Barcelona, Bilbao, Madrid, Murcia, Pamplona, Rioja, and Salamanca.

There are well over 50 gay, lesbian, feminist, and HIV-positive/AIDS collectives and support groups in Spain. Among the cities with at least one such group are Albacete, Barcelona, Bilbao y Pamplona, Cordoba y Granada, Madrid, Murcia, Malaga, Palma de Mallorca, Salamanca, Santiago de Compostela, Sevilla, Valencia, and Zaragoza. The number of such groups fluctuates, as these local support groups appear and disappear quite often. Catholic or Christian gay groups are functioning in Barcelona, Madrid, and Malaga.

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

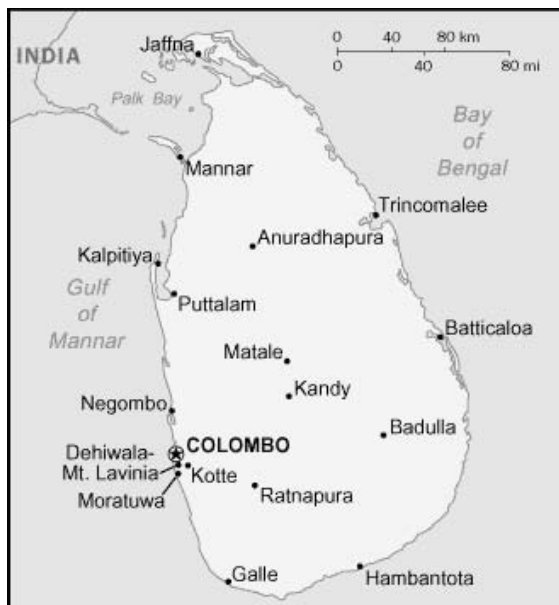

#### A. Demographics

Sri Lanka, formerly known as Ceylon, is a teardrop-shaped island about 18 miles (29 km) southeast of India in the Indian Ocean, between five and ten degrees north of the equator. It has a total area of 25,332 square miles (65,610 km<sup>2</sup>). Roughly the size of the state of West Virginia, Sri Lanka is 268 miles (432 km) along the north-south axis and 169 miles (272 km) at the island's widest point. The climate varies from a low mean temperature of about 60° F (16° C) in Nuwara Eliya, located in the central highlands, to a high of about 85° F (29° C) in Trincomalee on the eastern seaboard. Seasons are determined by the monsoon cycles rather than by temperature. The western portion of the island is wet and humid whereas the north and southeastern portions of the island are arid to semiarid. The northwest and southeast coasts receive 23.5 to 47 inches (60 to 120 cm) of rainfall per year, most of this coming during the winter monsoon between October and January. The southwest receives an average rainfall of 98.5 inches (250 cm), which is distributed throughout the year.

In July 2002, Sri Lanka had an estimated population of 19.58 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 25.6% with 1.05 male(s) per female (sex ratio); 15-64 years: 67.7% with 0.95 male(s) per female; 65 years and over: 6.7% with 0.91 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 72.35 years; *male:* 69.83 years; *female:* 75 years. Sri Lanka has an

(CIA 2002)

extensive infrastructure of free state-run health services that support both traditional Aryuvedic and modern Western medical systems. There are more than 12,000 Aryuvedic doctors employed at health clinics throughout the country. In addition, there are approximately 500 hospitals, 4,000 doctors, and 10,000 nurses trained in Western medicine. In terms of medical care, literacy, and life expectancy, the quality of life in Sri Lanka is near that of a First World country even though it is a developing nation. The HDI (Human Development Index) aggregates measures of health, education, and standard-of-living indicators into a composite index. Comparatively, the United States has an HDI rank of .929, India a rank of .563, and Sri Lanka an HDI of .737, the highest in south Asia.

**Urban/Rural Distribution:** 22% to 77%

**Ethnic Distribution:** Sinhalese: 74%; Tamil: 18%; Moor: 7%; Burgher, Malay, and Vedda: 1%

**Religious Distribution:** Buddhist: 70%; Hindu: 15%; Christian: 8%; Muslim: 7% (1999 estimate)

**Birth Rate:** 16.36 births per 1,000 population

**Death Rate:** 6.45 per 1,000 population

**Infant Mortality Rate:** 15.65 deaths per 1,000 live births

**Net Migration Rate:** -1.39 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.93 children born per woman

**Population Growth Rate:** 0.85%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.07%; *Persons living with HIV/AIDS:* 7,500; *Deaths:* 490. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 90.2% (*male:* 93.4%, *female:* 87.2%) (1995 est.). Education is free and compulsory from age 5 to 12. However, school dropout rates remain a problem and the median education level is estimated at five to nine years, with 40% of school-age children dropping out within nine years.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$3,250 (2001 est.); *Inflation:* 14.2% (2001 est.); *Unemployment:* 7.7% (2001 est.); *Living below the poverty line:* 22% (1997 est.)

#### B. A Brief Historical Perspective

The first literary reference to Sri Lanka is found in the Indian epic, the *Ramayana* written about 500 B.C.E. The epic

\**Communications:* Victor C. de Munck, Ph.D., Department of Anthropology, State University of New York–New Paltz, New Paltz, New York, USA 12561; victor@bestweb.net. *Updates:* Patricia Weerakoon, Ph.D., Department of Biomedical Sciences, Faculty of Health Sciences, University of Sydney, P.O. Box 170, Lidcombe NSW 2141 Australia; P.Weerakoon@fhs.usyd.edu.au.

tells the story of the Indian Prince Ram's 14-year exile from his homeland, Ayodhya. Accompanied by his wife, Sita, and his brother, Lakshman, the trio wandered through the north Indian forest. Ravenna, the demon king of Lanka, saw Sita and wanted her for his bride. Through magical treachery he abducted her and took her to the Island of Lanka. While she was there, she refused all his advances and was kept a prisoner. With the aid of Hanuman, the monkey-god, Ram went to do battle with Ravenna and eventually slew him. This epic has provided a mythohistorical basis for constructing a historiography of mutual enmity between Sri Lankan Tamils (of Indian origin) and the Sinhalese.

Unlike India, which has no tradition of historical writing, the Buddhist monks of Sri Lanka kept historical chronicles, the most famous of which is the *Mahavamsa* (the great dynasty or genealogy), written in the 6th century C.E. The *Mahavamsa* is a compilation of historical chapters, many of which center around the adventures of Vijaya, a Bengali prince who sailed to Sri Lanka in the 5th century B.C.E. and married the queen of the Vedas, Kuveni. Vijaya is acknowledged to be the primogeniture of the Sinhalese people.

Many of the other chapters in the *Mahavamsa* document the many Sinhalese Buddhist kings who rose up against Tamil conquerors. Aside from Vijaya, the central heroic figure in the *Mahavamsa* is King Duttugemunu, who, around 145 B.C.E., waged a 15-year war against the South Indian Tamil King Elara. Duttugemunu finally defeated Elara and is consequently considered a hero by the Sinhalese. The *Culavamsa* (or lesser dynasty) is a continuation of the *Mahavamsa*, and traces the history of Sri Lanka through the 18th century.

Both the *Mahavamsa* and *Culavamsa* were written by Buddhist monks whose main objective was to recount the glories of Buddhist kings who fought against Hindu kings. Contemporary popular accounts of the current civil war in Sri Lanka frequently cite the battle between the Tamil invader, Elara, and Duttugemunu, who is depicted as the defender of Buddhism and the freedom of the Sinhalese people, as the basis for the civil war that has been ongoing since 1982. But the actual history of Sri Lanka does not support this contention. In fact, according to Tambiah (1986), most of Sri Lankan history is marked with cordial and extensive trading relations between Tamils and Sinhalese, with only rare outbursts of interethnic violence. In fact, the last Sri Lankan king ruled from the highland city of Kandy and was of Tamil descent. In 1815, he signed a peace treaty with the British colonial government and abdicated his throne.

Sri Lanka does have a caste system, but unlike India, it is not rooted in religious scriptures. Though caste did, and to some extent still does, serve as a basis of Sri Lankan local and national-level social organization, it has always been identified with material socioeconomic differences rather than the purity-pollution ideology that is the key ideological component of the Indian caste system. Further, there are only about 20 castes in Sri Lanka and the dominant caste is the Goyigamas, a farmer caste. Goyigamas constitute about 50% of the Sinhalese population. Unlike India, which has a Brahmin caste and uncounted other castes and subcastes, there is no Brahmin population in Sri Lanka and thus, there is no Brahmanical hegemony over the 20-some caste systems in Sri Lanka.

In 1505, the Portuguese landed on the west coast of Sri Lanka. The Portuguese considered Sri Lanka an important site from which to maintain their dominance over Indian Ocean trade. At the onset of the Portuguese period, there were three independent kingdoms in Sri Lanka, a Tamil kingdom in the northern peninsula of Jaffna, a Sinhalese kingdom on the west coast in Kotte (near Colombo), and an-

other Sinhalese kingdom in Kandy in the central highlands. The Kandy and Kotte kingdoms had been at war, and the Portuguese allied themselves with the weak king of Kotte, building a fort in Colombo and eventually annexing the Kotte kingdom.

The Dutch became interested in wresting control of the western seaboard from the Portuguese, and allied themselves with the Kandyan king. After a long campaign, the combined Kandyan and Dutch forces finally defeated the Portuguese in 1656. The Dutch inflated the cost of their war efforts and presented the Kandyan king a bill that he could not repay. Through this strategy, they gained control over the Kotte and, eventually, Jaffna. The main mark that the Dutch left on Sri Lankan society is the codification of a legal system that included both indigenous and Dutch laws.

The Kandyan kings searched for allies to oust the Dutch from Sri Lanka and approached the British in the late 1700s. However, the British and Kandyans argued over the terms of their alliance, and the British managed to expel the Dutch relatively quickly with little assistance from the Kandyans. In 1815, with the aid of Sinhalese rebels, the British conquered Kandy and gained sovereignty over the entire island.

Sri Lanka was seen as a minor outpost in the British Empire until the British began to plant coffee and other plantation crops in the mid 1830s. As these crops became extremely profitable, Indian Tamils were recruited as cheap labor to work the coffee, and later, tea, coconut, and rubber plantations. After a leaf blight that decimated the coffee plant, tea became the dominant export crop. Tea plantations dominated the hillsides of Sri Lanka and required a permanent labor force, mostly of Indian Tamils. By 1911, there were 500,000 Indian Tamils (12% of the population) working in Sri Lanka.

On February 4, 1948, Sri Lanka became an independent nation, approximately six months after India, and largely as a residual result of India's fight for independence. The Sri Lankan government was organized as a Westminster-style parliamentary democracy. In 1956, partially because of a rise in jingoism and increasing ethnic strife, politicians from all parties began to "play the ethnic card." Sinhala was made the official and national language; Tamil was made an official but not the national language. The Sinhalese-controlled government began to allocate more and more development funds to Sinhalese areas and less to the Tamil north and east. The government supported colonization schemes of underdeveloped areas, primarily located in Tamil and Muslim states in the northeast. Thousands of poor Sinhalese families were recruited to apply for permits to settle in these newly colonized areas. Tamils and Muslims saw this as a government-sponsored "religious-ethnic invasion" designed to make them minorities in their own states.

Acceptance to a university was based on a merit system that was eventually replaced by a quota system. The merit system had benefited the Tamils, who made up a disproportionate number of the professional class. The quota system benefited the Sinhalese majority, who felt that the Tamils had been given an undue educational advantage by the divide-and-rule policies of the British.

The period of the 1950s to the 1980s was marked by a feeling of increasing disenfranchisement by the large Tamil minority and increasing acrimony between the two groups. In the 1970s, Tamils began to form into political factions that called for an independent Tamil state (called Eelam) in the north and east of the island. Initially, there were numerous subgroups, but by the early 1990s, only one viable group was left, the LTTE (the Liberation Tigers of Tamil Eelam), referred to in the media as the "Tigers." The LTTE was founded in 1972 by its current leader, Velupillai Prabhakaran.

In 1983, riots broke out throughout the country, but the most severe were in Colombo, where the Pettah district (the market center), controlled mostly by Tamils and Muslims, was looted and many buildings razed. After the outbreak of hostilities, several hundred thousand Tamil civilians fled the island. As of mid-1999, approximately 66,000 were housed in 133 refugee camps in south India, another 40,000 lived outside the Indian camps, and more than 200,000 Tamils had sought refuge in the West. Many fled to Germany and Canada, where they were granted political refugee status. These refugees are now the primary source of financial support for the LTTE. Besides the hundreds of dead from the rioting and the destruction of property, perhaps the biggest blow to the collective psyche of Tamils was the bombing and destruction of the Jaffna library, which housed extensive collections on Tamil culture. Tamils considered this intentional "culturocide" conducted by the Sinhalese government to be a deliberate attempt to expel Tamil culture and history from Sri Lanka.

As of 2001, the ongoing civil war had left an estimated 80,000 dead. Both sides have committed terrible atrocities against civilian populations. The LTTE has recruited young boys and girls, and Tamil "Tigers" wear a necklace with a cyanide pill, attached to it like an amulet, to swallow if they are ever captured by the enemy. The war continues despite the fact that the majority of the population on both sides seems to want peace. The LTTE demands an independent state in the northeastern portion of the country and the government, while willing to discuss federation or regional autonomy, utterly rejects the idea of dividing the island into two independent states. Most Tamils, particularly those living in the north and northeast, doubt that they can ever be incorporated into the nation-state of Sri Lanka as anything more than second-class citizens.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

All researchers agree that Sri Lanka is a patriarchal country, however, the degree of patriarchy is in dispute. Many suggest that Sri Lanka is not nearly as patriarchal as other countries in South Asia; Anju Malhotra and Amy Ong Tsui write that, "in contrast to much of the rest of South Asia, Sri Lanka has a cultural heritage of relative gender equality in terms of later marriages, bilateral descent, daughter's value in the parental home, continued kin support following marriage and widespread access to education for women" (1999, 221). Since 1900 and probably earlier, Sri Lankans have practiced "late marriages" relative to India (de Silva, Stiles, & Gibbons 1993). In 1999, the mean marriage age for a Sri Lankan woman was 24.5 years of age and for a man it was 27.9 years of age.

Both Sri Lankans and researchers attribute the relative late age of marriage to difficulties in obtaining an adequate dowry for the bride. Brothers are expected to help contribute to the dowry fund and defer their marriages until all their sisters are married. Sisters are also expected to marry in order of their age. Once the family has accrued sufficient dowry funds for the first daughter, they must continue working to accrue a similar dowry for the next daughter. Dowry funds ideally consist of a house, rice paddy land, cash, jewelry, furniture, and other moveable goods. However, while the accumulation of a dowry fund is a family effort and may be a major factor in the late age of marriage, it does not explain why Sri Lankans should marry later than members of other South Asian nations where a dowry is also a prerequisite for most marriages.

What is unique to Sinhalese dowry practices is that they serve as a form of "pre-death" inheritance in which the

dowry is legally transferred to the bride rather than to the groom's family (Tambiah 1973). McGilvray (1988) and de Munck (1996) also note that the dowry is legally transferred to the bride in Sri Lankan Tamil and Muslim communities, whereas in most of South Asia the dowry is transferred to the groom's family. In Sri Lanka, the bride retains legal control over the dowry but, on marriage, the groom acquires "proprietary" rights to the dowry funds. Malhotra and Tsui (1999) are correct in noting that relative to the rest of South Asia, there is greater gender equality in Sri Lanka, but part of that has to do with the wife's control over the dowry fund rather than the late marriages.

Nevertheless, nearly all researchers on gender roles in Sri Lanka have noted that patriarchal values pervade gender roles and relations in Sri Lanka. In a survey of 101 Sri Lankan Muslims and Sinhalese, all except one respondent said that it was "better to be born a man than a woman" (de Munck, n.d.). The main reason cited for this was that women are largely confined to the domestic compound while men control public spaces and places. Women often say that they are confined to the home like "frogs in a well." This phrase is common throughout South Asia as is evident by Patricia Jeffrey's (1979) book on gender in India, *Frogs in a Well*.

The ideal woman for Buddhists, Hindus, and Muslims is one who is obedient, modest, and hard working. She is seen predominantly in her role as mother rather than wife. In Sri Lanka, females, much more so than males, are evaluated according to a good-bad moral dichotomy. Any insinuation that a female has conducted herself immorally is enough to potentially ostracize her from the community and even her family (de Munck 1992; Hewammanne & Brow 1999; Lynch 1999). Immoral behavior consists of suspicions of sexual immorality, flirting, cursing, disobedient behavior, drinking or smoking, and walking or being in places or areas where women should not be. Sri Lankans broadly conceive of national morality in terms of a rural-urban dichotomy, with traditional values (considered "good") upheld in the villages, and modern values, such as lack of sexual modesty by women (considered "bad"), associated with urban life.

The ideal man is seen in his roles as the breadwinner for his family and as involved in civic activities. Traditionally, a man was expected to make his living through farming and industry. After independence, work in the Sri Lankan civil service was (and remains) highly valued. In contemporary urban Sri Lanka, the ideal man should be educated and make his livelihood in a well-paid white-collar profession. An adult male should also strive to build a reputation as a civic leader through charitable public-service work. A man's reputation is gained through public works and, most importantly, through the collective reputation of his core female relatives (i.e., mother, wife, sister, and daughter). In this context, part of a man's moral duty (*dhamma*) is to serve as the moral guardian of his female relatives and to punish them for real or alleged violations. Economically, the ideal man should provide for his nuclear family and, if need be, his parents, brothers, and sisters. The ideal man provisions his family and also controls their behavior, particularly that of the family women.

### B. Sociolegal Status of Males and Females

The law treats males and females equally except that women are usually granted custody of the children in the case of divorce. Divorce is very uncommon in Sri Lanka, with an annual average rate of 0.25% (Seager & Olson 1986). Virginity at the time of marriage is extremely important for a woman, but not for a man. Traditionally, the wedding sheet was displayed to the public the morning after, but this practice has been discontinued except in very tradi-

tional homes or rural areas. Nonetheless, the bride is expected to be a virgin and if it is known that she is not, it is next to impossible for her to marry into a family of the same status as her own.

Sri Lanka has made great strides in erasing the educational gap between men and women. Among the elite, the education of women has been seen as a means to obtain a groom from a good family, and after marriage, these highly educated women often do not pursue a career.

This is changing, however, and although the younger and elder generations retain the same moral worldview, the major difference between mothers and daughters, as noted by Malhotra and Tsui, is that mothers see a career for a female as something that is determined by the economic needs of the family, whereas daughters view a career as a personal choice. In their sample, 83% of all daughters thought that a woman should continue to work after marriage and 52% thought that they should continue even after having children (1999, 237). The increase in females going on to the university has been dramatic, rising from 42% of the student population in 1989 to 52% in 1999. It should be noted, however, that only an estimated 1% of Sri Lankans have access to the university and that most women work in low-status, low-paying jobs as housemaids and day laborers, and in the plantation and agricultural sectors.

A growing number of women find employment in the garment factories in the Free Trade Zones. Many obtain employment as servants and maids in the Middle East, sending money back to their natal homes. These jobs are generally reserved for young unmarried women, whose sexual-moral reputations are tarnished because they are not under the surveillance and control of male relatives. Thus, when they return after one to five years of work, they are often unable to find a suitable marriage prospect (de Soysa 2001). It has been suggested that mechanization of agricultural work has forced unmarried women in particular to look for new forms of work. The female rate of unemployment is 22%, twice that of males.

[*Comment 2002*: Another important area where women's rights are only recently being addressed is the plantation sector. The plantation women collectively number about a million residents who live and work on estates. Most of these are descendants of Indian laborers brought in by the British.

[Writing on the issue of reproductive and sexual health in the plantation sector of Sri Lanka, Morrell (2002) comments on the high incidence of incest, teenage pregnancy, and promiscuity in the estate sector. Further, a recent newspaper article reports that 230,000 estate-sector children are employed as domestic aides (Farook 2002).

[Morrell (2002) has suggested that a concerted effort is needed to understand why moral standards have disintegrated, and to then set in motion a system of changes that would arrest this predicament of decay. He continues that, fortunately for the plantation families, Dr. Indira Hettiarachchi, Director of Health and Women's Programs of the Plantation Housing and Social Welfare Trust, has been doing just that and much more. This process is supported by the estate workers union, the Ceylon Workers Congress (CWC).

[This moral dilemma involves improving maternal and child health services within the environment of plantation privatization, which began in 1976. Morrell (2002), quoting Dr. N. Vidiyasagara's article in *The Journal of the College of Community Physicians of Sri Lanka* (Millennium Supplement 2001), notes that from 1972 to 1975, infant mortality in the estate sector was 100 per 1,000 births. By the year 2000, this had been successfully reduced to 15 per 1,000 births. Morrell attributes much of this to the activi-

ties of UNICEF, and grants-in-aid programs from countries such as the Netherlands and Norway. (*End of comment by P. Weerakoon*)]

### C. General Concepts of Sexuality and Love

Sexuality is considered a natural part of life. In a survey of 101 Sri Lankan males and females, 93% thought that women have a stronger libido or sexual drive than do men (de Munck, n.d.). Women's sexuality is considered dangerous and, for this reason, young women are not usually permitted to go out in public alone. They are typically accompanied by their mother or some elder, responsible female chaperone. Any occasion where a female is actually or suspected to be alone with a male is generally interpreted to be about sex.

Sri Lankan sexual foreplay is not very elaborate and does not involve kissing, which is considered unhygienic and disgusting. The missionary position is the most common for sexual intercourse, though it is also common for males to mount the female from the rear. The female-superior position is unusual except in the most Westernized families. Similarly, anal and oral sex are atypical and practiced mostly by very Westernized Sri Lankans. During sexual intercourse, a woman is expected to be the passive recipient and the man active. The duration of sex is not usually prolonged. Sri Lankans in general have a very Victorian attitude toward sex. Husbands and wives are not expected to engage in sexual intercourse when they are past 40 or 50 years old.

Traditionally, marriages were arranged and the preferred marriage partner was a cross-cousin (either the offspring of the mother's brother or the father's sister). Distant relatives of a marriageable age are also glossed as cross-cousins. Horoscopes of the prospective bride and bridegroom are compared to determine if they are psychologically compatible. The most important issue in arranged marriages is the negotiation over the dowry. The two families meet three or more times, often with village or religious leaders as mediators, to consider the dowry. The three key topics of these negotiations are, first, the determination of the respective status of each family; second, assertions about the virtues of the prospective groom and bride by their families; and third, the relative market value of the groom. The market value is determined by what the dowry rate is for prospective grooms from families of that particular socioeconomic status. If the groom has exceptional promise or character, the dowry is negotiated toward the upper limit of other members of that status niche. If the prospective bride has a good education and/or is known to be virtuous, modest, and obedient, then her family will negotiate a dowry for their benefit toward the lower limit. Both sides must first agree on the respective statuses of their families and these statuses must be perceived as being more or less equal. The prospective bride and groom both have "veto power" over their parents' selection of a mate. However, they must be circumspect in exercising this power and typically do so only if they find their parents' choice of a mate very disagreeable.

Elopement is also a common way for young adults to circumvent their parents' choice of mates, and elopement is a common and often-accepted practice in rural areas. Sorensen (1993) has estimated that approximately 50% of the marriages in the two communities she studied were a consequence of elopement. The girl's parents will often help with the elopement. The couple will go to another community to marry, usually returning to their original community after a "cooling off" period of a month or two and then setting up residence with or near to the supportive parents. The prospective groom's family typically is incensed over elopement marriages, as they have lost all leverage to obtain an eq-

uitable dowry. The bride's family will usually provide a small dowry so as not to tarnish their reputation. Very poor families, on occasion, encourage their attractive daughters to surreptitiously flirt with a boy from a well-to-do family. If a boy falls in love with a girl, he may insist that his parents arrange a marriage between them or threaten to elope or even commit suicide (de Munck 1996). All of these possible non-normative strategies eventuate in the absence of a dowry or a drastic reduction in its value.

[*Comment 2002*: Newspaper advertisements have long been a source of spouse selection in Sri Lanka. Traditionally, marriages were viewed as a contract between two families, rather than two individuals, and usually involved a third party called the "matchmaker" or "marriage broker." The role of this person was to find a suitable son-in-law or daughter-in-law for the parents. The selection was based on existing cultural norms, such as caste, religion, family background, wealth, beauty, character, and, specifically, the horoscope.

[Dissanayake (1982) writes of the role of the newspaper "marriage columns" as strengthening and legitimizing the traditional value systems in spouse selection. This is apparent when the advertisements are compared over the past decade since 1990. It can be seen that the main differences lie in the increased educational qualification of the females and the fact that many of the advertisements are for persons already residing outside of Sri Lanka or hoping to do so in the future. Below are some examples of advertisements from 1993 and 2002. Some of these would be extremely puzzling to a Westerner unaware of the crucial role of family, caste, and social structure, but the advertisements do reflect the blend of modernization and the importance of family structure. It also appears that the "marriage broker" is being replaced by "email."

- [From the *Sunday Observer*, May 1993:

*Looking for a bridegroom*: "Colombo-based Govi [caste] Buddhist parents of good social standing seek educated professional executive or businessman preferably non smoker, teetotaler [does not take alcohol] between 26-29 years, 5' 10" or taller; for their only daughter, 24 years, 5' 3" very attractive, well mannered. Dowry available. Send all details with horoscope."

*Looking for a bride*: "Catholic Karawa parents seek educated, simple, pretty girl below 28 years for son, senior mercantile executive, earning over Rs 30,000 monthly. Kuja in 7 [horoscope]. Write all details with horoscope."

- [From the *Sunday Observer*, August 2002:

*Looking for a bridegroom*: "Influential Sri Lankan parents Canadian Permanent Residents, mother Govi Buddhist, father Hindu Vellala [caste], seek for their 27 yr old eldest daughter 5' 3", mild mannered, gentle, well brought up with Sri Lankan cultural values, studied up to O/L in a leading Colombo Convent, presently reading for an Administration Degree in a Canadian University and employed in Canada, a suitable qualified partner with the same qualifications residing especially in U.S.A. or Canada graduated in Medicine, Law, Research Sciences or Allied Fields. Apply with full particulars and horoscope contact Email [omitted]."

*Looking for a bride*: "Well connected Australia based Sinhala / Buddhist family of very substantial means seek for their professionally qualified son, tall, handsome, 29 years, a suitable bride from similar background. Apply with all details and horoscope. Email [omitted]." (*End of comment by P. Weerakoon*)

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

As a religiously pluralistic country, Sri Lankans do not have a single collective religious source or character. Buddhist and Hindu religious values center on the concepts of *dhamma* and *karma*. *Dhamma* refers to adhering to the teachings of the Buddha as they guide you to behave compassionately and properly in your everyday life; *karma* is a theory of causation that refers to how the transmigration of one's soul through a cycle of birth, death, and rebirth affects one's present-day situation. Life is thought to consist of suffering, which is based both on bad actions (*pau*) and false attachments (*maya*) to people, status, and the things that comprise this world. Through following the teachings of the Buddha, one can acquire good karma (*punya karma*) that not only minimizes suffering, but can even make life pleasurable. The following saying from the *Dhammapada*, the sayings and sermons of the Buddha, shows how good actions can lead to a good life: "If a man does what is good, let him do it again and again. Let him find pleasure therein. Blissful is the accumulation of good." (Cited in Holt 1998, 190).

"Doing good" for Sri Lankan Buddhists is guided by five precepts: 1. abstaining from destroying life; 2. abstinence from taking what is not yours—which includes not neglecting one's social responsibilities, as well as theft; 3. abstinence from fornication—which is taken to refer to any sexual misconduct; 4. abstinence from speaking falsely—which includes gossip and "ill-mannered utterances"; and 5. abstinence from intoxicating liquors, which are "the cause of sloth" (Obeyesekere 1968, 27).

Hindus and Buddhists share the same overall worldview. But there are some differences, particularly in the practice of their respective religious specialists. In Hinduism, celibacy for *swamis* or *yogis* is not absolute as it is for Buddhist *bhikkus* monks. In Hinduism, eroticism and sexual control are inextricably linked, so that control heightens eroticism, as is evident in the *Kama Sutra* and also in the images and stories of Krishna and Siva. (O'Flaherty 1973). Buddhist mythology, on the other hand, is devoid of sexual imagery. The Buddhist monk, as his Catholic counterpart, is celibate and sexless. The symbolic neutering of the Buddhist monk is signified by having his hair shorn at the time of his initiation and keeping it shorn thereafter (Obeyesekere 1981).

The Muslim worldview is very different. The Koran offers a view of heaven as a sensual and hedonistic paradise. This is evident in the following passage taken from the Koran: "He will regard them with robes of silk and the delights of paradise. Reclining upon soft couches where trees will spread their share around them, and fruits will hang in clusters over them. They shall be served with silver dishes, and beakers as large as goblets. . . . They shall dwell with bashful virgins whom neither men nor *jinn* [genie] will have touched before. . . . virgins as fair as coral and rubies" (Koran 1956, 18-20, Sura 37, 40-45).

Sri Lankan Muslims typically conceive of heaven as a libidinous world devoid of cultural controls: sex, food, drink, and comforts are there for the asking. The Koranic heaven is one created for men. It is unclear as to the position of women in heaven, as only *Hourlis*, the "bashful virgins," are mentioned.

### B. Source and Character of Ethnic Values

Sri Lanka is an ethnically heterogeneous country. The dominant ethnic group is the Sinhalese, who comprise 74% of the population. The second largest ethnic group is the Tamils, who comprise 18% of the population. There are two

important subdivisions among the Tamils. The majority of Tamils, known as Ceylon Tamils, are concentrated in Jaffna, the northernmost province, along the eastern seaboard, and in the capital of Colombo. Ceylon Tamils have been in Sri Lanka possibly as long as, or longer than, the Sinhalese, having migrated across the Palik Straits, an 18.6-mile (30-km) stretch of ocean that separates Sri Lanka from the tip of India. The second group of Tamils, known as Indian Tamils, were brought to Sri Lanka in the late 19th and early 20th century as plantation laborers and to mostly work on the tea plantations in the central highlands.

Sri Lankan Muslims or Moors, constitute the third major ethnic group and comprise 7% of the population. The Moors trace their descent back to Arab traders who came and stayed in Sri Lanka and married local Tamil or Sinhalese women. While both Tamils and Sinhalese historians and politicians have claimed that Moors are really a sub-branch of their respective ethnic groups, Moors reject all such claims, asserting that they are the descendants of Arabic merchants who settled in Sri Lanka and eventually married Tamil or Sinhala women who had converted to Islam. Sri Lankan Moors view themselves as a separate ethnic group with distinctive social, religious, and cultural customs. Indeed, there are Moor families that claim descent to the Prophet Mohammed. Another 1% of Sri Lankans are Burghers (families of mixed Sri Lankan-European heritage), Malay (traders from Malaysia), and Vedas (tribal people).

These ethnic groups are mostly divided along religious and linguistic lines; the vast majority of Sinhalese are Buddhists and speak Sinhala, an Indo-Aryan language. The vast majority of Tamils are Hindus and speak Tamil, a Dravidian language. A small but significant number of Tamils and Sinhalese, about 7% of the population, converted to Christian denominations (primarily Roman Catholicism). All Moors and Malays are Muslims, and Burghers are Christians. The Vedas, presumed to be the original inhabitants of Sri Lanka, live in dwindling numbers in the south-central and eastern forests. The Vedas adhere to a local mixture of Buddhist and folk beliefs and customs; they are reputed to possess powerful forms of magic.

The principle of *purdah* is general to the South Asian subcontinent and was brought by Muslims from Central Asia who entered and eventually conquered most of the Indian subcontinent by the 17th century. *Purdah* is an Islamic custom that refers to the concealment of women and sexual segregation. All religious and ethnic communities in Sri Lanka practice it to varying degrees. Ethnic groups can be ranked in terms of the degree of adherence to the principle of *purdah* as follows, from strict to lenient: Muslims, Tamil (Hindus), Sinhalese (Buddhists), and Burghers (Christians).

Intercaste and interethnic marriages are legally sanctioned, but sociomorphally sanctioned against. Intercaste or interethnic marriages are most likely to occur among the Westernized elite, where occupational status and Westernization have diminished the cultural force of ethnic and religious identities. Both intercaste and interethnic marriages are exceedingly rare and constitute less than 1% of all marriages. When they do occur, both sides of the family may ostracize the couple.

All ethnic groups in Sri Lanka are strongly against premarital and extramarital sex and view both acts as immoral. Not only the individual, but the entire family—and sometimes the community or ethnic group—is also held culpable for immoral sexual behavior. For this reason, pre- or extramarital sexual activity should always remain secret or private, for once it becomes public knowledge, foes can use this information to sully social as well as individual reputations.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

There is no systematic sex education in Sri Lanka although efforts have been made to develop sex education classes since the late 1980s. Advanced biology or general science courses in high school do provide information on how sexual intercourse is performed, but any additional information is at the discretion of the teacher. Most Sri Lankans acquire their knowledge about sex from their peers and, occasionally, through movies and magazines. Parents are embarrassed to broach the topic of sex with their children, and children typically respond with a shudder of disgust when asked to consider their parent's sexuality. It is for these reasons that the government has been considering implementing sex education courses in public schools in recent years.

#### B. Informal Sources of Sexual Knowledge

The primary informal sources of sexual knowledge are gossip, jokes, and stories told by peers. Most sexual knowledge is obtained through what James Scott (1991) referred to as "hidden transcripts," that is, stories or information disseminated in secret between friends. Because of the cramped sleeping quarters among the poor and in most rural homes, children have occasion to observe married adults in *flagrante delicto*. In this way, children obtain first- and second-hand information on sexual dimorphism and gendered sexual practices.

### 4. Autoerotic Behaviors and Patterns

Masturbation is considered unacceptable for girls, but is an acceptable practice for males. Most males learn about masturbation in their early teens, and it is not uncommon for boys to engage in male mutual masturbation, oral, and anal sex. It is also not considered abnormal for teenage males to practice interfemoral sex (one boy inserts his penis between the thighs of another boy), popularly called "cubbing." Among themselves, teenage boys will remark teasingly on the thighs of another boy, suggesting that these boys are potential partners for cubbing. While mutual masturbation and interfemoral sex are condoned as a "hidden transcript" of teenage male sexual life, such practices are expected to stop at the time of marriage. If they continue after marriage, peers will express strong disapproval, and may conjecture, pejoratively, that he is a homosexual.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children and Adolescents

Except in the Tamil areas, Sri Lankans typically do not construct walled domestic compounds. Rural Sinhalese homes are usually made with sun-baked brick, with tile or elephant grass for the roofing. The house compound is an open area that extends into a garden plot where manioc, banana, coconut, and vegetables are grown. Whenever possible, rice fields are adjacent to the homes, while the *chena* (or swidden) fields (where mainly maize, millet, sesame, and long beans are grown) are usually located in more remote areas of secondary scrub. In rural areas, the mud streets, footpaths, cultivation fields, scrublands, rivers, reservoirs, irrigation channels, forestlands, and garden compounds are places where children meet, work, and play. Parents are usually not overly concerned about the safety of their preadolescent children. Urban areas are, of course, much different. Homes in middle- to upper-class neighborhoods are usually protected by a fence or wall, and children are usually watched by parents or servants.

Rural children and adolescents have plenty of opportunities to meet and play away from the watchful, prying eyes of parents or other adults. Because most villages, except for those created through development projects, are comprised of dense and overlapping networks of kin, children tend to have great license to roam, and they are monitored very casually by the community as a whole. In the rural context, it is much easier for children and adolescents to experiment with sex. The frequency of sexual play by preadolescent children is hard to directly verify. Adults acknowledge that their adolescent children are “naturally” interested in sex and therefore they must be guarded, but there are no such concerns for preadolescent children.

Adolescent children are watched over by parents or guardians, but they are frequently given work, such as taking the goats or cattle to grazing lands, guarding the *chena* and paddy fields from birds and other predators, or fetching water or goods from a store. It is acknowledged by adults that when adolescents are engaged in such chores, they will flirt, display their genitals, and engage in sex play.

After menarche, parents severely limit the movement of their daughters and begin to consider prospective bridegrooms. A girl should be chaperoned by an adult if she is to go out in public, and she is to avoid all interactions with boys. The one exception to this rule is that girls are permitted to talk, and even flirt, with their male cross-cousins. For example, most rural Sri Lankans bathe at public wells or locations along a river or stream bank. Boys and girls will seek out public spots to bathe where a cross-cousin of the opposite sex is bathing, provided that there are other people present. The strictures of *purdah* are relaxed for adolescent cross-cousin interactions because of the preference for such marriages and the hope that one's child will not only agree to an arranged marriage with a cross-cousin, but will eagerly consent to the marriage. Social structure, cultural norms, and individual affections are intended to dovetail by relaxing the rules of *purdah* for cross-cousin interactions.

In urban areas, middle- and upper-class girls are expected to continue with their education. For such families, the goal of marrying their daughter to a cross-cousin has been replaced with the goal of marrying her to a doctor, lawyer, or engineer. Girls from middle- to upper-class families are encouraged to become proficient at English and English literature. The dowry transactions of the urban professional and elite differ substantially from that of the poor and rural peasants. In the former, the prospective groom is expected to bring socioeconomic prestige to the marriage, while the prospective bride brings nurturance, propriety, and high culture to the marriage. Of course, money, housing, and land are important components of the dowry transaction, but it is the prestige brought to the marriage by the prospective groom or bride that must first be settled and accepted by both families before the dowry negotiations over valued resources begins.

In urban areas, love affairs are not uncommon in high school. These are usually intensely romantic relationships and involve passing notes to one another, clandestine meetings often arranged with the help of friends, and handholding or kissing. They seldom lead to receptive-penetrative sex and seldom endure. Such romances are accepted and encouraged, and are even sources of prestige among high school or college peers, but they remain unacceptable to the parents of the lovers. The couple and their friends generally think of such romances as “young love” and do not expect them to lead to sexual intercourse. For urban females from Westernized families, kissing and handholding are daring but acceptable forms of premarital sex, but any form of receptive-penetrative sex, heavy petting, or oral sex is consid-

ered morally and socially wrong. However, the intensity of an idealized “young love” relationship can lead to tragedy if the relationship does not eventuate in marriage. The breakup of such adolescent love relationships has long been a leading cause of suicide in Sri Lanka.

## B. Adults

For a woman, all receptive-penetrative forms of sex should occur within the realm of marriage. While monogamy is both the law and the norm in Sri Lanka, Muslims are permitted to marry up to four wives, though they rarely do. Yalman (1967, 108-114) noted that polyandry and polygyny, though rare, were historically practiced among the Sinhalese, and he reported four cases of polyandry and two of polygyny at one of his fieldwork sites in 1956. At my rural fieldwork site, there was one polyandrous household. In both Yalman's and my own fieldwork case, the polyandrous marriages were not registered and were among poor rural farmers. Modern-day polygamy in Sri Lanka is a result of dire economic circumstances rather than a product of social norms.

Extramarital sex is extremely rare for wives in intact marriages, yet, it is not uncommon for husbands to visit brothels or seek out impoverished widowed or divorced women (usually those with children to support). In the area where I worked, such women were called “keeps” (using the English term) rather than “prostitutes” (“*ganika*” or “*vesi*”). In addition to money, a man would bring clothes, cooking utensils, and other gifts to his “keep” in return for sexual favors.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

Heterosexual sex is the only socially acceptable form of sex when someone is married. Homosexual sex is considered dirty and sinful; however, it is a common practice for unmarried males to engage in homoerotic and homosexual behaviors. These are not considered by the participants as homosexual acts, but as natural sexual outlets. Homosexual acts occurring between monks was documented in early Buddhist chronicles, where it was referred to as *pansalkeliya* (“temple game”). However, homosexuality is explicitly forbidden for monks.

In modern Sri Lanka, homosexual acts between men are illegal and are punishable by 12 years in jail, according to the 1883 penal code, sections 365 and 365a, which is still in effect. Lesbian sex is not acknowledged in the law. Until recently, the above discriminatory law had not been enforced, but the rise in “sex tourism,” particularly of European homosexuals and pedophiliacs, has led the criminal system to apply this penal code more frequently, and consequently, there has been a dramatic rise in convictions (Fernando 2002).

Sherman de Rose, a gay activist in Sri Lanka, founded the first gay rights group called Companions on a Journey. With support from the Dutch government, the group bought a house in a wealthy section of Colombo and opened a meeting center for Sri Lankan gays, called the Drop-in Centre. The two primary missions of the center are to decriminalize homosexual acts and to increase AIDS awareness. In 2001, a second gay rights group was formed, primarily of young adults, and there has been an annual gay rights convention in Sri Lanka since 1998 as a result of growing gay rights activism. In a 1999 interview, de Rose noted that the law against homosexuality was being used to justify beatings and extortion of gays and lesbians by the police. He also noted that there is substantial evidence that men have been thrown out of their houses and fired from their jobs solely as a consequence of their sexual orientation.

Until recently, there has been no acknowledgement of lesbianism or gender-conflicted females in Sri Lanka. This is gradually changing and there are now two "lesbian awareness" groups in the Colombo area. The first Sri Lankan national lesbian convention was held in January 2000 with an estimated attendance of 150 people. According to one of the organizers, lesbians "are generally accepted if they are financially independent and come from upper-middle-class backgrounds." However, lesbianism is not accepted for women from lower socioeconomic backgrounds.

Rural women often come to the Colombo area in search of work at one of the many factories in Sri Lanka's Free Trade Zones. After they are hired, they live in nearby dormitories for a couple of years and then return home. The dormitories are popularly thought to be dens of lesbianism, prostitution, and casual sex, and on their return home, the women are often stigmatized and unable to marry, despite having saved money expressly for this purpose.

### 7. Gender Diversity and Transgender Issues

*Ponnaya* is derogatory slang for transvestites and very effeminate males. In male-to-male penetrative-receptive sex, such as interfemoral sex, *ponnayas* tend to take the passive role. There are an estimated 300 transvestite sex workers in Sri Lanka (Ratnapala 1999, 14). Transvestites are also said to find work as "makeup experts" or to work in bridal or fashion stores. Sri Lankan society does not condone public displays of gender switching or cross-dressing unless it is part of a village or religious ritual. Westernized mothers will frequently dress their young preschool-age boys in dresses, but this practice is discontinued when the boy enters school. In rural areas, boys and girls under the age of 5 or 6 usually just wear a t-shirt and no clothes from the waist down, except for a string that is intended to ward off the "evil eye" (*as wah*).

### 8. Significant Unconventional Sexual Behaviors

#### A. Coercive Sex

##### Rape

Rape is defined by the penal code as sexual intercourse without the consent of the woman. If she is under 12 years of age, consent does not serve as a mitigating factor. Punishment for rape is up to 20 years in prison. The incidence of rape has increased every year from 1986, when it was 291, to 1996 (the last year for which data are available), when it was 716 (Fernando 2002). However, rape is notoriously underreported, as few women are willing to take the risks of humiliation and a prolonged difficult court case. If it becomes public knowledge that a woman was raped, there is a high probability that her family will be disgraced and will, in turn, cast her from the household. Chronic communal violence and interethnic hostilities have also led to higher incidences of rape across ethnic boundaries. In January 2002, for the first time, Sinhalese soldiers were brought to court for charges of raping a Tamil woman and were convicted.

[*Comment 2002*: Female victims of sexual assault are most often admitted to a gynecological ward and first seen by a gynecologist. The women are most often deprived of a prompt and appropriate forensic examination because of the lack of facilities in most rural hospitals and the lack of knowledge of many of the attending doctors. In addition, the clinician may be reluctant to be involved in a criminal investigation. Most of the rape victims are also deprived of psychiatric help. (*End of comment by P. Weerakoon*)]

#### Sexual Harassment

Until 1995, sexual harassment was not considered a crime except if it included physical violence. Public sexual harassment, such as a male pressing up against a woman and simulating intercourse on a bus, pinching, or making lascivious remarks, are all referred to as "Eve teasing." These behaviors had become so prevalent that in 1995, the government added section 345 to the penal code, stipulating that all offenses that violated the modesty of a woman were now punishable by a jail sentence. Such behaviors included any form of sexual harassment at workplaces, during public transport, or at any other public place.

#### Child Sexual Exploitation

Sexual exploitation in Sri Lanka has been closely linked with the sex-tourist industry. In 2001, an organization called Protecting Environment and Children Everywhere (PEACE) was established with the goal of protecting Sri Lankan children from sexual exploitation. PEACE is affiliated with the End Child Prostitution in Asian Tourism campaign and supported through the United Nations. In 1980, it was estimated that there were 2,000 boys between the ages of 6 and 14 involved in prostitution (Seneviratne 1995, 10). Some of the boys are self-employed, but most are either sold into prostitution by their parents or lured by older boys, taxi drivers, hoteliers, or employees of hotels and guesthouses. Current estimates of the number of child sex workers are inconsistent, ranging from an estimated (and likely false) high of 30,000 to a low of 1,500 (Ratnapala 1999, 15). The latter figure seems to be the most accurate, as it is a result of extensive and careful study.

Young girls are also lured into prostitution. Abeyesekera (1991) offers a case study of a 15-year-old girl who had become separated from her family in Kandy and was abducted by a man who brought her to Colombo. There, she became a prostitute, and as her appearance declined, so did the conditions under which she worked. She was sold repeatedly, moving from one brothel or pimp to another until she was 60. Blind from a venereal disease, her left leg amputated, and part of a stable of beggars, she had, in effect, been a slave from childhood through the rest of her life.

[*Comment 2002*: Apart from the familial abuse common in every society, Sri Lanka appears to be particularly vulnerable to sexual exploitation. Sri Lanka is well known for its boy child pedophile activity, especially of 10- to 15-year-olds (Seneviratne 1996). One hundred fifty thousand mothers work in the Middle East as housemaids, leaving children more vulnerable to abuse from relatives and neighbors (Weeramunda 1996). One hundred thousand child domestics are at high risk of physical/sexual abuse from their employers, though further research is needed to confirm this. Boys at boarding school and other children in residential care, especially children with disabilities, are more likely to be vulnerable to sexual abuse from house parents (Weeramunda 1996). Street children needing food and shelter are probably at greater risk, though further research is needed to confirm this.

[Seneviratne (1996), in her book, *An Evil Under the Sun*, emphasized that, historically, children in Sri Lankan society have been much loved. She says that although prostitution has been in existence for hundreds of years, the sexual use of young children has only developed recently. "Boy prostitution has been available in cities by organized groups for locals, but organized prostitution of boys for foreign clients is a recent phenomena."

[Weeramunda (1996) conducted a survey with schoolchildren in three schools in Kalutara District situated near tourist hotels. Of those interviewed, 87 of the children (3%)

said they had had sexual relationships with tourists. Nearly two thirds of children being sexually exploited were male, 12% had their first sexual encounter at 10 years, and the majority were between 12 and 14 years old. None of the children saw the sexual encounters as a “*rakkshawa*” or job, and surprising to Weermunda, 80% attended school regularly and did not “play truant” or drop out of school.

[Miles (2000) assessed attitudes using a self-administered questionnaire with schoolchildren aged 13 to 17 years in four schools in a high-risk beach area of Sri Lanka (Moratuwa). He reports that 10% of children said they had done sexual things, 8% with other children their age, 5% with adults, and 6% with adults for money. He further reported that most children felt it was not acceptable for children to do sexual things with adults and appeared to be strongly against the damage they felt it could do to children and their communities. (*End of comment by P. Weerakoon*)]

## B. Adult Prostitution/Sex Workers

There is a long history of prostitution in Sri Lanka. A number of Buddhist Jataka tales, whose oral sources go back to 500 B.C.E., concern sex workers. A 13th-century text on social conditions speaks of “*vesya*” (prostitutes). Extraordinarily beautiful women could become socialized as courtesans (*ganika*) to serve the king. They would be trained in the “sixty-four womanly arts” and socialized to be cultured and provide sexual satisfaction to men of high rank.

Present-day Sri Lanka has a population of approximately 15,000 adult male and female sex workers (Ratnapala 1999, 71); the vast majority are in the Colombo area. Most of their clients are Sri Lankans, but tourists are the target clientele that have spurred the rapid and extraordinary growth of the sex industry. For example, during my first visit to Sri Lanka in 1979, I saw no sex workers in Colombo. By 1982, they were not only present, but I was frequently hailed by pimps and male and female sex workers alike when walking along main streets in downtown Colombo.

There are an estimated 1,050 rural adult sex workers (Ratnapala 1999, 15). These sex workers mostly live in rural market towns, either in a hotel or rented house where they receive their clients. The clients are generally other villagers, town merchants, traders who are coming for the weekly market, and soldiers.

Ratnapala (1999, 84) estimated that the average sex worker has six clients per day, but barely makes sufficient money to meet their subsistence costs. Sex workers typically hail from very poor families. Only about 15% are educated up to the fifth year and mostly are married women, women who have a child out of wedlock, or who have been deserted by their husbands and are “single” but not able to marry. In a random sample of 100 female sex workers living at brothels, Ratnapala (1999, 10) found that 46 were married, 16 were deserted by their husbands, and the remainder (38) were single. Twenty-eight were between 18 and 25 years of age, 42 were between 26 and 30 years of age, and 30 were between 30 and 35 years of age. The majority of these sex workers did not voluntarily choose their profession, but were forced into it by dismal economic circumstances or were coerced into it, sometimes by their husbands.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

In a study of 500 Sinhalese Buddhist women in a southern town, Padma Karunaratne (1995) found that 17.4% of her sample used modern methods of contraception (i.e., the Pill, IUD, and condoms). Twelve-and-a-half percent of fe-

males opted for sterilization compared to only 0.8% of males; 21.8% used rhythm, 3.8% used withdrawal, and 2.6% used some other method of contraception. Thus, 58.8% of the adult female population used some form of contraception. However, the choice of when to use contraceptives differed substantially from that of Westerners. Women seldom chose to use any form of contraception prior to the birth of their first child. Only after the first child was born or the desired family size was reached did most women decide to adopt some form of birth control.

Husband and wife are typically too “*lajay*” (“shy”) to discuss birth control methods. Aside from the Victorian cultural norms that inhibit couples from discussing contraception with each other, the three factors that most impede the use of birth control methods among married couples are:

1. neither men nor women are instructed in the way modern contraceptives work, so that they then use them improperly;
2. rumors about the harmful effects of a particular contraceptive may spread without impediment, as no one will know enough to refute them; and
3. most doctors at family planning clinics are males, and women are often too embarrassed to ask them about contraceptive options.

Better education about contraceptive use, and directing male or female patients to doctors of their own sex to discuss sensitive matters, would help increase the use of contraceptives.

### B. Abortion

Abortion is illegal in Sri Lanka unless the pregnancy threatens the life of the mother. Since 1970, members of Parliament have sought to pass amendments to liberalize the law on abortion, thus far to no avail.

It is impossible to obtain accurate figures on abortion rates in Sri Lanka, but in a 1997 newspaper article, Dr. Nafis Sadik estimated that 500 abortions were performed daily (*Catholic World News* 1997). Dr. Sriani Bansayake, Medical Director of Sri Lanka’s Family Planning Association, estimated that, in 2001, between 765 and 1,000 abortions were performed daily. Since almost all of these abortions are carried out illegally, they are performed in unhygienic conditions with improper equipment and by untrained medical doctors. The women undergo agonizingly painful abortions that often lead to “death or serious injury” (Basnayake 2001). A study on reproductive health estimated that 12% of all maternal mortalities are a consequence of unsafe abortions (cited in *Saturday Magazine* 2002, 4).

In an article in a Sri Lankan newspaper magazine, Namini Wijedasa (2002) offered a description of an abortion clinic in a residential area of Colombo. The clinic was advertised as a maternity clinic run by a Western-trained medical doctor and his staff. The nurse is said to obtain only the first name of the patient, who gives her a “consultancy fee” of 200 rupees. The pregnant woman is told to come back the following day for a “womb wash.” The fee for an abortion ranges between 5,000 to 15,000 rupees—a fee that is beyond the reach of the average Sri Lankan. As maternity/abortion clinics run by medical doctors are usually ignored by the police, well-to-do Sri Lankans do have abortion options denied poorer Sri Lankans, a point brought out by many Sri Lankan pro-choice activists. Professor Indralal de Silva, for instance, wrote: “When the rich need an abortion—whether it is illegal or not—they will have access to safe abortion[s]. . . . However, for the poor, the chance of having a safe abortion is still relatively less satisfactory” (Wijedasa 2002, 6).

### C. Family Planning

Modern-day Sri Lankans generally favor small families. This is reflected in the dramatic decline of the fertility rate from 5.3 children in 1980 to an estimated 1.9 in 2001. Much of this decline is because of the convergence of two modernizing processes: More married women are working and more women are receiving high school and college degrees. The societal image of women is gradually being reshaped from a traditional one, where to be a successful adult woman meant only to be a mother, to one where women choose to find their sense of identity in their occupation, as well as through their family.

Padma Karunaratne (1995) found that the increased "empowerment of women" in Sri Lanka has led to increased control over reproductive choices. Empowerment is reflected by the comparatively high levels of education Sri Lankan women enjoy, the deferred age of marriage, "egalitarian welfare measures adopted by successive governments" (Karunaratne 1995), and the new economic opportunities afforded by multinational companies locating factories in Sri Lankan Free Trade Zones and domestic work opportunities abroad (Gamburd 2001). In a study of 500 women in a southern rural town, Karunaratne noted that 90% had some formal schooling and lived within 5 miles (8 km) of a government-subsidized family health clinic. Even in this rural town, the vast majority of women had access to both public education and public health facilities.

A demographic and health survey conducted by UNESCO in 1993 showed that about 96% of adolescents between the ages of 15 and 19 had some knowledge of contraception. Family planning is an accepted and well-received practice in Sri Lanka, and recent studies indicate that adolescent populations have greater knowledge of modern contraceptive methods than do their elders (UNESCO Case Study—Sri Lanka 2002, 1, 6).

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Syphilis, gonorrhea, and nongonococcal infections are the most common sexually transmitted infections. Studies indicate that 88% to 97% of Sri Lankan adolescents (depending on whether it is an urban or rural sample) are aware that infections could be sexually transmitted, but only between 47% and 52% knew that condom use could prevent the transmission of HIV (UNAIDS 2002).

### B. HIV/AIDS

No cases of HIV infection were found in testing for HIV/AIDS at an antenatal clinic in Colombo for 1990, 1993, 1995, and 1996 (UNAIDS 2002, 3). The Sri Lankan government estimated that by January 2001, there had been 89 deaths attributed to AIDS. Definite HIV-positive cases totaled 358, and 119 people had been diagnosed with AIDS. Because it is difficult to collect accurate statistics on a highly stigmatized disease, government officials believe that as many as 8,500 people may be infected with HIV (Samath 2001). United Nations projections estimate that by 2005, as many as 80,000 may be infected with HIV/AIDS, mostly because of the growth of the sex-tourist industry. It should also be noted that, at present, the Centers for Disease Control (1997, 1) does not consider HIV/AIDS to be of epidemic proportions in Sri Lanka: "The AIDS epidemic has yet to present overwhelming problems in Sri Lanka; AIDS cases are far less common there than they are in other Asian countries."

Almost all Sri Lankans are aware that condoms can prevent HIV/AIDS and other sexually transmitted diseases,

but few use them because of the cultural emphasis on monogamy and the belief that condoms reduce sexual pleasure. In a 1997 study of condom use, 44.4% of males in Colombo and 26.3% of males in Matale, a rural area on the southern tip of Sri Lanka, reported using condoms in their "most recent intercourse of risk" (UNAIDS 2002, 9). Zero percent of the women reported using condoms. Sri Lankan females are unlikely to engage in what they perceive to be "risky sex"; thus, their sexual behaviors are confined to monogamous relations. The reason why more men in Colombo than Matale used a condom is a result of the general belief that HIV/AIDS was brought to Sri Lanka by tourists and is mostly confined to the sex-tourism industry. Sri Lankan males consider themselves more at risk with Colombo sex workers than with Matale sex workers, because the former are more likely to have had sex with a tourist.

[Update 2002: UNAIDS Epidemiological Assessment: The available HIV/AIDS data for Sri Lanka indicate that extensive spread of HIV had not occurred as of the year 2001. HIV testing among antenatal clinic attendees was conducted in the capital, Colombo, in 1990, 1993, 1995, and 1996. No evidence of HIV infection was detected. Outside Colombo, HIV testing of antenatal clinic women took place in various sites, including Anuradhapura, Badulla, Galle, Kandy, Kurunegala, and Ratnapura, at various times between 1990 and 1996. As in Colombo, no evidence of HIV infection was found among the antenatal clinic women tested at that time. Among sex workers tested in Colombo from 1990 through 1998, evidence of HIV infection was found in only one site, in 1993, where 0.2% of the sex workers tested were HIV-positive. Outside Colombo, sex workers were tested for HIV infection in Kandy, Anuradhapura, Galle, Kurunegala, Ratnapura, and Badulla between 1993 and 1998. Evidence of HIV infection was found in only one site, Kurunegala, and only in 1995, where 0.5% of sex workers tested were HIV-positive.

[The best estimate of HIV prevalence in Sri Lanka, as of the end of 2001, is about 4,800. There are insufficient studies and data on the patterns and prevalence of HIV-risk behaviors in Sri Lanka to suggest that the potential for epidemic or more-extensive spread of HIV is very low. More systematic sentinel HIV surveillance needs to be developed, with primary emphasis on high-risk groups. In addition, baseline behavioral surveillance studies/surveys need to be implemented as soon as possible. Support for HIV/AIDS/STD programs needs to be expanded and focused on high-risk groups.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	4,800 (rate: < 0.1%)
Women ages 15-49:	1,400
Children ages 0-15:	550

[An estimated 250 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 2,000 Sri Lankan children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

Since the 1980s, a number of nongovernmental organizations (NGOs) have been established to counsel women and children who are the victims of rape, sexual exploitation, violence, or harassment. In 1986, the Women's Development Centre was established to address issues such as rape and domestic violence. The Bar Association of Sri Lanka, the Sri Lankan Women Lawyers' Association, and

various other organizations offer free legal aid to women and children. In addition to free legal aid, two associations—the Women’s Development Centre and Women in Need—also provide free counseling services.

In Sri Lanka, as in most countries, HIV/AIDS evokes anger and contempt among the populace rather than compassion or understanding. Dr. Kamilaka Abyeratne, a 66-year-old female doctor who contracted AIDS through a blood transfusion, was the first Sri Lankan to go public with the disease. She has been instrumental in reducing the stigma associated with AIDS and also has worked to create AIDS-awareness programs. AIDSline is a telephone counseling service started in January 2000 by the Coalition for Care, Education, and Support Services (ACCESS). ACCESS is operated by trained volunteers and is open four hours a day from 4 p.m. to 8 p.m. AIDSline also provides free advice and guidance to callers seeking information on HIV/AIDS and other sexual matters. The service is available to both heterosexuals and homosexuals.

[*Comment 2002*: Reliable figures for the incidence and prevalence of sexual dysfunctions are not available for Sri Lanka. Sex therapy is usually offered by psychiatrists and psychologists attached to psychiatric units in larger hospitals. De Silva and Rodrigo (1995), working in a sexual dysfunction clinic run as a part of the psychiatric clinic in Kandy (hill country Sri Lanka), reported that the clients were almost exclusively male, largely complaining of erectile dysfunction and premature ejaculation. In their clinic, female problems were rare and usually referred by gynecologists. These were few and related to unconsummated marriages and dyspareunia. Other professionals working in the area, however, report a high proportion of couples presenting with unconsummated marriages (Weerakoon 1987), many of these being because of vaginismus. All of these women were virgins and most believed that first sexual intercourse was a very traumatic experience, always accompanied by bleeding, and often associated with significant genital trauma. This myth is common among young people in Sri Lanka.

[It is common in Sri Lanka for practitioners of Ayurvedic medicine and folk remedies to advertise their services and products (De Silva & Dissanayake 1989), with prominent advertisements in national language papers (Sinhalese and Tamil newspapers). These advertisements advertise treatment as well as imply causation for the conditions. Some of the lead lines in these advertisements translate as:

- Do you suffer from Impotence? Try our remedy today.
- Do you suffer from nocturnal emission?
- Are you losing precious semen with your urine?
- Instant (premature) ejaculation? Do not suffer any more.
- Sexual debility—there is a cure.

[The Ayurvedic remedies offered in this way are usually herbal preparations, both for oral ingestion and external application. The folk practitioners offer various “mystical” remedies. Many of the practitioners emphasize the supposed role of semen loss in the genesis of sexual “debility” and dysfunction, both in their advertisements and in their consultation. The “excessive” loss of semen, through masturbation, wet dreams (nocturnal emissions), spermatorrhoea (interpreted as cloudiness of the urine), and frequent coitus in youth and early adult life are claimed to cause many diseases and disabilities. These would include, in addition to erectile dysfunction and premature ejaculation, a whole range of other physical and mental symptoms. These beliefs, which are widespread, derive from the Ayurvedic theories of the composition and value of semen. The result is that many men present with serious concerns, often tinged with guilt about

their sexual desire and behavior. This syndrome has been reported in several Asian countries, e.g., the Dhat syndrome in India (Bhatia & Malik 1991).

[In Sri Lanka, the condition has been called the “Loss of Semen Syndrome.” De Silva and Dissanayake (1989) assessed 28 consecutive males attending a sexual dysfunction clinic in Sri Lanka with such fears and symptoms. They reported that the four main groups of symptoms were:

- Physical symptoms, such as aches and pains, and/or mental symptoms, such as poor memory and concentration,
- Specific sexual dysfunctions,
- Anxiety about present or future sexual functioning (often associated with impending marriage and first sexual intercourse), and
- Direct complaints about the excessive loss of semen.

[They pointed out that many of the patients do not complain directly of a sexual problem; instead, they present with anxiety and depression or vague symptoms such as “general weakness,” “sleep problems,” and aches and pains—disclosing the sexual dysfunction in the course of a general history. (*End of comment by P. Weerakoon*)]

## 12. Sex Research and Advanced Professional Education

Recently, there has been an increase in research on sexuality in Sri Lanka. Most of this research is concerned with medical, epidemiological, or sex exploitation and criminal issues. A number of studies were established and planned through the International Center for Research on Women. There have also been a number of studies that were a result of a collaborative effort between the University of Connecticut Health Center, the Institute for Community Research, in the United States, and the Center for Intersectoral Community Health Studies and the University of Peradeniya in Kandy, Sri Lanka. The Family Planning Association of Sri Lanka is also active in studying and disseminating information on sex education, effective contraception methods, safe-sex practices, pregnancy, delivery, and abortion. The Sri Lankan Ministry of Health, in collaboration with UNICEF, has initiated a multimedia campaign on HIV/AIDS. PEACE (Protecting Environment and Children Everywhere) is the main organization that does research and publicizes information on the sexual exploitation of children in Sri Lanka.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

On the Scandinavian Peninsula in northern Europe, Sweden is bordered by Norway on the west, Denmark on the south, and Finland on the east. One of the oldest democracies in the world, Sweden has lived in peace for 200 years. As titular head of a constitutional monarchy, the Swedish king has no power except to represent the country symbolically within Sweden and abroad.

Sweden's landmass of 173,732 square miles (449,964 km<sup>2</sup>), larger than the state of California, is mountainous along the northwest border. A quarter of the land is flat or rolling terrain, mainly in the central and southern areas where the largest cities are located.

In July 2002, Sweden had an estimated population of 8.88 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 18% with 1.05 male(s) per female (sex ratio); *15-64 years:* 64.7% with 1.03 male(s) per female; *65 years and over:* 17.3% with 0.74 male(s) per female; *Total population sex ratio:* 0.98 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 79.84 years; *male:* 77.19 years; *female:* 82.64 years

**Urban/Rural Distribution:** 85% to 15%

**Ethnic Distribution:** Swedish: 89%; Finns: 2%; a small Sami minority, plus foreign-born or first-generation Yugoslavs, Danes, Norwegians, Greeks, and Turks

**Religious Distribution:** Lutheran: 87%; Roman Catholic, Orthodox, Baptist, Muslim, Jewish, and Buddhist minorities

### B. A Brief Historical Perspective

The Swedes have lived in present-day Sweden for at least 5,000 years, longer than nearly any other European

people. Nordic (Gothic) tribes from Sweden played a major role in the disintegration of the Roman Empire and helped create the first Russian state in the 19th century. The Swedes accepted Christianity in the 11th century and soon developed a strong centralized monarchy. In 1435, Sweden became the first European nation to develop a parliament with representatives from all segments of the population. Sweden threw off Danish rule, which began in 1397, in a 1521-1523 revolt led by Gustavus I. The Lutheran Church became the official state religion. For a time in the 17th century, Sweden was a major European power, controlling most of the Baltic seacoast. Following the Napoleonic wars, in which Sweden acquired Norway, Sweden maintained an armed neutrality in all later European wars.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

Sweden has the reputation, especially among its own inhabitants, of being the leader in gender equity. Whether this is reality or not, the early strivings for equality—thinking of men and women as equal—started more than a century ago. Women's movements were in the vanguard of these early efforts. In the family and matrimonial law reform of 1920, no differentiation was made between the rights and responsibilities of men and women, husbands and wives. Unfortunately, while the law drew no difference between the genders, the reality of social consciousness and behavior did differentiate. Thus, efforts shifted to achieving gender equity. Today, Swedes are more prone to think of and work for the process of gender equity, the fair and reasonable treatment of both men and women.

Depending on one's perspective, Sweden has come close to, or is still far from, gender equity. If one takes a public or legal perspective, Sweden has come very far. Officially, women and men are treated equally and have the same rights and responsibilities. From a historical and cultural perspective, when compared with other European countries and those in the Middle East, Sweden is a real pioneer at the cutting edge. However, if we use the ideal of gender equity as the perspective and basis for evaluation, Sweden has a very long way to go. To illustrate: Sweden has led the way for other nations with a gender-neutral parental-leave law that provides almost full salary for up to a year for either parent of a new child. This means that the mother and the father can share this leave any way they want. They can split the paid leave any way they want, or either of them can take all the leave. The reality is far from gender equity. Quite a few new mothers take all the leave of absence from work; fathers never take the full leave. Very few fathers take more than a few weeks off, although their salary is fully paid during this leave. Officially, formally, there is full gender equity; in reality, Sweden is far from gender equity on this, and many other, issues. (See also: M. J. Intons-Peterson's (1988) comparative study of the gender concepts of Swedish and American youth and D. Meyer's 1989 study of *Sex and Power: The Rise of Women in America, Russia, Sweden and Italy*.)

### B. Sociolegal Status of Males and Females

For both females and males, the age of majority is 18 years. However, it is illegal to have sexual intercourse or engage in sexual (genital) touches with a person under the age of 15 years, regardless of whether the underage person is male or female, whether the couple is same- or opposite-gendered, and whether it is voluntary or involuntary. Sexual intercourse or contact is also prohibited by law under the age of 18 when the younger person is under the custody or supervision of the older person. Otherwise, the legal status

and prohibitions, including sexual harassment and rape, are the same for all persons (Meyer 1989).

### C. General Concepts of Sexuality and Love

In general, the Swedes have a liberal and permissive attitude towards sexual relations and intercourse, although, as in all societies, some restrictions are commonly accepted. This is illustrated by a 1992 study on a representative sample of 729 Uppsala University students, aged 19 to 23. About 70% of both male and female respondents believed that it is acceptable for a 15-year-old girl to have sexual intercourse with a steady boyfriend; the same percentage approved of a 15-year-old boy having sex with his steady girlfriend. More than 90% of both male and female respondents did not approve of a 15-year-old girl having sexual intercourse with a casual partner. Only 40% of the males and 50% of the female respondents disapproved of a 15-year-old boy having sex with a casual partner. The double standard still colors what is acceptable, "even" in Sweden. It is stronger among males than among females, and this holds true even among the highly educated.

Almost all of those students disapproved of a married or cohabiting person having sexual intercourse with another person other than the spouse or cohabitation partner. In this regard, males and females did not apply a double standard and were equally restrictive in their views of "extra" sexual behavior by both men and women.

Generally speaking, females in this university sample were somewhat more restrictive or less permissive than males, but the differences are generally not significant.

## 2. Religious, Ethic, and Gender Factors Affecting Sexuality

### A/B. Source and Character of Religious and Ethnic Values

Almost 90% of Swedes are members of the state Lutheran Church. The remaining 10% are either atheists or belong to other churches, with slightly over 1% Roman Catholic and a scattering of other religious traditions, often stemming from significant immigrations. By international comparison, church attendance is very low. Annually, the 7.6 million members of the Lutheran Church attend less than 20 million services, less than three services per member per year. Stated in another way, less than 3% of the population on average attend church on any particular Sunday (*Statistical Yearbook of Sweden* 1993).

At the peak of the Viking culture around the year 1000, people in this part of the world subscribed to the Aesir (Asa) religious belief in a superior race of gods led by Odin. This Nordic religion, with its worship of Odin and Thor, the Aesirs (creators of mankind), and the Vanir (fertility deities linked with land and sea spirits and with dead ancestors), was more concerned with behavior than with doctrines and beliefs.

Around the year 1000 C.E., Christianity was introduced into Scandinavia, often with the threat to either convert to Christianity or to be decapitated. Subsequently, the kings in the various small Nordic kingdoms and their people subscribed to Christianity, at least officially. As occurred elsewhere with the imposition of Christian or other exogenous religions, this conversion did not bring a complete rejection of the early religious practices. In Iceland, for instance, the people accepted the new religion in the year 1000 C.E. only after Pope Sylvester II allowed them to keep their traditional religious customs of eating horse meat and practicing abortion/infanticide (Manniche 1989).

That Christianity's penetration of Scandinavia took centuries is evident in letters various Popes sent from Rome to

their bishops, demanding that they make sure the Swedes follow the Christian rules for marrying and not use their traditional “pagan” rituals (Carlson 1965).

In 1527, King Gustavus Vasa decided that Sweden should abandon the Church of Rome and subscribe to the Reformation ideas of Martin Luther. At the time, King Vasa was at war and needed money. Luther maintained that the churches should not be decorated, and that the churches should not own a lot of property. This teaching suited King Vasa quite nicely. It allowed him to confiscate Church properties, gold, and other valuables, including copper bells, which he had turned into cannon to support his efforts to break away from the control of the Danish monarchy. Thirty-three years after King Vasa’s death, the Swedish Parliament formally accepted his declaration of Lutheranism as the state religion at the “Uppsala Meeting” in 1593.

Today, the Swedish Lutheran Church is very liberal in action, but careful not to take formal stands in most sexual issues, such as premarital sex, cohabitation, and sex education. Like many other churches and congregations, the state church of Sweden is inclined to keep quiet on sexual issues to keep the few members they have.

### 3. Knowledge and Education about Sexuality

Carl von Linnaeus (1707-1778), a professor at Uppsala University, is internationally known for his botanical classification of all flowering plants, based on their sexual reproductive systems. A less known, but equally pioneering effort of Linnaeus (as he is more commonly known outside his homeland), was the lectures he gave his students on human sexuality. A few years ago, a manuscript was found, probably written by one of his students, Pehr Dubb, and rewritten by a young relative of Dubb’s. In this manuscript, titled *Om Sättet Att Tilhopa Gå* [*On the Way to Be Together*], Linnaeus shows a surprisingly great openness and support for sexual intercourse, considering he taught in the mid-18th century. Despite his accuracy in detailing the sexual anatomy of plants, Linnaeus had a somewhat limited, and inaccurate, knowledge of the human female’s sexual organs.

#### A. Government Policies and Programs

##### *School Programs*

During the 18th and early 19th centuries, venereal diseases flourished in Sweden. Starting in 1783, the government ordered its officials to distribute information about these diseases. An almanac published in 1814 provided a lot of information on venereal diseases without a moralistic overtone, and the straightforward message that the earlier the symptoms were taken seriously, the easier it was to treat a disease.

In 1897, the first female physician in Sweden, Karolina Widerstrom (1856-1949), started sex education in some of the schools for girls in Stockholm. She also published a pamphlet on education and sexual hygiene in 1906. Her perspective was astonishingly far ahead of the times. She claimed, for instance, that for their own health, women should be 20 years old before becoming a mother and the man 24 before becoming a father. She also added that the child had a right to be cared for, and that very young parents would find this hard to provide.

Widerstrom advocated sex education in schools and at home, in a natural environment where children could ask and get proper answers. She maintained that if physicians were the only ones providing sex education, then sex might be perceived as something special and strange, which it should not be.

In 1942, the Swedish Government decided it was preferable for pupils in regular schools to receive education on differences between men and women, and about sexual biology and hygiene. However, this was only a recommendation. Sex education did not become mandatory in all compulsory schools until 1956. Over the years, the content and form of the sexuality education program have been widely discussed. In the beginning, the education was mainly technical and biological in nature. This changed in the 1970s, as the emphasis shifted to education in sexuality, relationships, and living together. The curriculum became “softer” and more human.

Today, no one questions that there should be sexuality education in the compulsory schools. The amount of time devoted to this education and its content is very much up to the individual school, and the individual teacher. As elsewhere, some are good and some are even better.

Swedish sexuality education operates on four levels. In general, at the lowest level, education for pupils age 7 to 10 years deals with menstruation, intercourse, self-pleasuring, contraceptives, fertilization, pregnancy, and childbirth. The same topics are dealt with at higher levels, adjusted to the students’ age and maturity. At the middle level, ages 10 to 13, added topics include the physical development at puberty, venereal diseases, homosexuality, exhibitionism, and pedophilia. On the upper level, ages 13 to 16, added topics include: petting, different views of sex roles, premarital relations, marriage and family including the views in some non-Christian cultures, abortion, pornography, prostitution, HIV/AIDS and “safer sex,” and where to go for further information and advice. On the college level are included sexual desire, with its variations in the orientation and strength, falling in love, sexual problems and dysfunctions, ethical and religious viewpoints on contraception and abortion, societal support for the family (family law), sexual problems of certain immigrant groups, and the problem of world population.

A severe shortcoming is that teachers and physicians encounter almost no education and training in human sexuality within their professional curriculum. One would assume that they would receive this training, considering that they belong to professions that require education and training to teach and inform others.

Unfortunately, one has to admit that despite many years of effort on the part of some educators, the high-placed and idealistic goals set for sex education in the schools have not been reached, even if Sweden is ahead of most other countries.

##### *Youth Clinics*

In addition to sex education in the schools, Sweden has about 150 youth clinics. The first opened in the late 1960s mainly because of the many teenage abortions. Following a 1975 law allowing free abortions, the number of youth clinics increased significantly with a focus on preventing abortion by promoting contraceptive use. Other important tasks were to inform young people about STD, HIV, and AIDS prevention.

Youth clinics, headed by a midwife assisted by a gynecologist, psychologist, and social worker, deal with men and women under age 25, with most of the clients being female. The clinics provide one-on-one consultation. A great number of clients obtain contraceptive pills through these clinics. Clinic staff also participate in sex-education programs in the schools.

Some of the female clients are children of immigrant parents who have a more conservative attitude about the equality of the sexes and oppose premarital intercourse.

These situations pose new problems for the sex counselors. Resolving clashes between free Swedish sexual morality and other more-restrictive cultural codes is often difficult.

In some circles, both in Sweden and other countries, there was a fear that Sweden's liberal teenage sexuality and free abortion would increase teenage abortion. However, this did not happen. On the contrary, abortions decreased in the decade following enactment of the new law in 1975. This brought about international attention and was interpreted as a result of the Swedish school programs in sex education and the youth clinics. Many other countries then introduced sex education programs modeled on the Swedish approach.

## B. Informal Sources of Sexual Knowledge

As in other Western societies, mass media, print, broadcast, and videotaped, are important sources of information for Swedes of all ages. Friends seem to be very important for nonadults. Child pornography is the only pornography prohibited by law, but it is still available. In general, pornography seems to be an important educational resource for quite a few Swedes.

### 4. Autoerotic Behaviors and Patterns

In the Uppsala University study mentioned in Section 1C, above, about 15% of the males and the females said that to engage in self-pleasuring daily is abnormal. To me this indicates that very few find self-pleasuring abnormal unless it is done daily. As with much else in the field of sexuality, people do not talk about self-pleasuring, so little is really known about what they do and what they think.

In the Uppsala study, the median age for first self-pleasuring was about 13 for men and 14 for women. Almost none of the men had not engaged in self-pleasuring during the past year, while as many as 24% of the women had not self-pleasured in a year. Almost 70% of the men and about 25% of the women engaged in autoeroticism at least once a week.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children

No Swedish studies, either attitudinal nor behavioral, have been done on sexual exploration and sex-rehearsal play among children. These natural behaviors are probably more permitted today than half a century ago. But no one talked about this at that time, and very few talk about it now.

#### B. Adolescents

There are no puberty rituals and never have been to my knowledge. One could argue that Christian confirmation is a sort of passage rite from childhood to adulthood, but given the current lack of church attendance, that seems fully irrelevant now. Quite a few adolescents have a number of periods of going steady and no one waits until marriage for first sexual intercourse. The median age for first sexual intercourse is around 15 years for both boys and girls (Lewin & Helmius 1983).

#### C. Adults

##### *Premarital Courtship, Dating, and Relationships*

To begin, I want to emphasize the inadequacy and prejudicial tone of the term "premarital." The term presupposes the norm or model that everyone should marry, or at least that almost everyone should—and also that not to marry is deviant behavior, or to be more specific, deviant non-behavior. As will be shown, that concept has not really been an issue in Sweden. Today, with all couples starting with nonmarital cohabitation, their behavior is not "premarital," but just something they do.

Eilert Sundt, a Norwegian minister and one of the first sociologists, studied people's behavior and norms in the mid-19th century. Among other phenomena, he found the system of night courting (*nattfrieri*). In the rural areas, with often long distances between homes, the young man courting a woman would stay overnight in the same bed with her, but he was not allowed to undress or be under the blankets. This way, young persons could get to know quite a few young persons of the other gender (Sundt 1855/1975). Another important system has been, and still is, the dance places, especially during summertime, where one can invite for a dance even a complete stranger.

I would say that in more-modern times, there is no courtship or dating system. People meet at dancing places, not as commonly as previously, and at bars, schools, college, work, or through friends. There is no Swedish term for what in America is labeled dating. It is even hard to find a similar concept in Swedish for what is denoted by the term *dating*.

The term *premarital* is somewhat odd. There is really no corresponding Swedish concept. Prior to the mid-1960s, the term was understandable, but no big issue. True, there were norms against premarital sex, but these were mainly ideal rather than behavioral norms, especially during the period of engagement.

During the 1950s and first half of the 1960s, the marriage rate in Sweden was historically at its peak. Suddenly, this rate started dropping rapidly. "Rapidly," in this context, means a decrease of about 50% in less than ten years. No other country has experienced such a rapid demographic change. The marriage rate continued its decline until the beginning of the 1980s (see Figure 1). This same tendency appears in remarriage statistics for men (Trost 1993a).

What happened in the mid-1960s? Nonmarital cohabitation "under marriage-like conditions" suddenly increased (see Figure 2). Cohabitation existed previously, but it was only a very marginal phenomenon (Trost 1979). The data shown in Figure 2 are probably understated, with the actual cohabitation rate more like 25% than 20%. Cohabitation quickly became a social institution, alongside the old social institution of marriage. One could argue that this change was superficial, and that the relationships are the same, independent of the formal marital status or its absence.

When arguing that there is no real change, only a demographic one, I would say that with the Swedish laws and traditions, the dyad constituting the marriage is the same as the dyad constituting the cohabiting couple. The emotional relationships are the same, the quarrels the same, the affection

**Figure 1**

**Marriage Rates, Sweden, 1959-1991, First Marriages per 1,000 Not Married**

Sources: *Befolkningsförändringar*, different years

or lack of affection, housing subsidies, child allowance from society, just to mention a few elements, are all the same. The sole difference is the financial arrangements in case of separation/divorce and death of one of the spouses/cohabitants.

However, I would claim that the change here is in some of the norms surrounding marriage and cohabitation. Traditionally in Sweden, as elsewhere, four elements have been closely connected timewise: 1. the marriage ceremony, 2. moving in together, 3. having sexual intercourse together, and 4. having a first child about a year later.

As mentioned above, the norm against premarital sexual intercourse has never been more than an ideal norm in Sweden. Everyone has always known that Swedish couples had sex together before marriage, only usually no one talked about it. The social change that has occurred since the 1960s is that the four elements are now fully separated. Couples move in together without any ceremony, they have sex independent of the other three elements, and quite a few have children without being married. About half of all Swedish children are born to not-married mothers who are cohabiting with the fathers of the children.

This, in turn, means more than might be imagined at first sight. The social institution of the marriage ceremony has changed. Quite a few couples still marry, but the marriage does not move the couple from one situation to another; they are already living together. Today, Swedish couples do not marry and move in together at the same time; couples who marry have already cohabited as a couple. Some couples believe that a marriage ceremony will change their situation, but it changes nothing for them. For most couples, the marriage ceremony is a true ceremony, and still a sort of rite, not a passage rite but a confirmation rite. The marrying couple does not pass over to a different situation or stage, but rather confirms their relationship and its stability for themselves and for the surrounding social community.

Traditionally, prior to marriage, the couple would become engaged to be married. In Sweden, the engagement event was also a passage rite. The couple showed themselves and others that they were a serious couple. Engagement did not mean that they had decided when to marry, but just that they would marry some time in the future. Often relatives and friends would celebrate the engagement by attending a dinner party and giving the couple gifts for their future home.

Nowadays, quite a few cohabiting couples announce their engagement. However, I have never heard of any cou-

ple announcing their engagement before they started cohabiting. The Swedish term for engagement, *förlovnin*, literally means a prepromise; the couple promise to marry each other. Today, for most Swedish couples, the term has no connection with marriage. For most couples, what happens is that when they mutually fall in love, they just move in together. After some time, months or years, if they are still cohabiting, they might announce their engagement, their intention to continue as a couple. Eventually, they might also marry, in which case, the marriage means about the same as the engagement, but is a little more serious.

Obviously, more studies are needed of these terms and concepts and their various meanings for people, both for those personally involved, and for the social community.

### Sexual Behavior and Single Adults

To my knowledge, no studies of single adults and their sexual behavior can be found in Sweden. What should be remembered, however, is that quite a few of those who are officially classified as singles, and even as living in a one-person household, very often are, one way or another, living in a dyadic relationship. Here I refer to those who are nonmaritally cohabiting, but who are classified, for a number of reasons, as living alone. I also refer to what is nowadays called LAT (living alone together), couples living apart in separate households, but still together as a couple. These dyadic relationships seem to be increasing gradually (Trost 1993b).

### Marriage and the Family

The marriage and family structure in Sweden has, as far as is known, always consisted of the nuclear family as an ideal base. Heterosexual couples have married, or the equivalent, and had children. Divorce was almost nonexistent by law, as well as in reality. The number of children averaged around 4.5 per couple. The extended family has never been a Swedish social institution. In rural areas, the son took over the farm after buying out his parents with a contract that gave them a small cottage and paid them in kind until they died. The fertility rate decreased during the last part of the 19th century and the first decades of the 20th century. For a long time, the ideal number of children in Sweden has been between two and three children. The real fertility rate has, for a couple of decades, fluctuated between a total fertility rate (TFR) of 1.6 and 2.1.

The new matrimonial law in effect since 1921 made divorce easier. The divorce rates started increasing during the first decade of the 20th century, and went on increasing until 1950, when they leveled off until 1966, when the rate again started to rise. The divorce rate has continued increasing, if analyzed carefully, until the last couple of years.

### Extradyadic Sex

Nothing is known about the prevalence or incidence of extradyadic sex among Swedes. The sole study where there is some relatively reliable data is from 1967 (*Om Sexuallivet i Sverige* 1969). In this study, about 4% of the married persons surveyed had had at least two sexual partners in the previous year, one of which had to be extradyadic. What changes have occurred in the past quarter century is not known. However, the attitudes toward extradyadic sex have not changed as far as we can see, with about 95% still negative toward it.

### Divorce and Remarriage

Most of those who separate or divorce from a cohabiting relationship soon start a new relationship, a remarriage, a re-cohabitation, or however one might label it. In 1800 and 1990, the proportion of marriages that were not first mar-

**Figure 2**

#### Cohabiting Women in Percentages of All Couples (Married or Not), 1990

Source: *Folk—Och Bostadsräkningen* 1990

riages was approximately 25%. The important difference is that two centuries ago, all remarriages involved a widow or widower. Today, almost all remarriages follow a divorce, meaning that both former spouses are still alive to remarry. Between 1800 and 1990, there was a definite decrease in mortality rates and longer life expectancy, leaving fewer widowed seeking new mates. Heavy emigration at the end of the 19th century and the beginning of the 20th century also reduced the number of adults remarrying. At the same time, a rise in the divorce rate increased the number of second and subsequent marriages. In the end, the result has been a relatively stable 25% of all marriages involving second or subsequent remarriages (see Figure 3) (Zetterberg 2002).

Plural marriages (polygamy) are not legally recognized by law or in reality.

### *Sexuality and the Physically Disabled and Aged*

Sweden has pioneered in sex education for physically handicapped youth, and in training personnel working with them in institutions.

The first Nordic conference on sex and the handicapped was hosted by the Swedish Central Committee for Rehabilitation in Stockholm in 1969. An elected committee of five experts subsequently planned and provided both training for professionals in sexology and education for the disabled. This commission worked for the next ten years, arranging several seminars and courses, carrying on research, and publishing many reports and books about their work.

Students with physical handicaps get the same sex education as others in the Swedish schools. To help handicapped youths visualize love and sex between two disabled persons and between a handicapped and able-bodied person, an educational film/video, *Sex and the Handicapped*, was produced. It has been shown all over the world.

Between 1992 and 1994, a new project, *Sexology and the Handicapped*, was funded by the Swedish government to do research in the field and provide further training in sexology for personnel working with handicapped persons.

There are no studies on frequencies, occurrences, or varieties of sexual behaviors among the disabled or elderly. While the sexual needs of the disabled and older persons have received more attention in Sweden than in other countries, these phenomena are more often not talked about. There still is a prevailing public attitude that old people have left sex behind and that the disabled should be glad they are alive. Very ambitious attempts at changing this situation are being made by the Swedish association for the

disabled, which is raising the issues for both medical personnel and the disabled themselves.

### *Incidence of Oral and Anal Sex*

In the Uppsala study mentioned earlier, 10% of the 19- to 23-year-old male students, and almost 20% of the women, have had anal sex. In most cases, this appears to be an incidental or occasional experimentation rather than a reoccurring experience.

As for fellatio, about 20% of the young women and a third of the men have never experienced it. About 40% of the women and 30% of the men have practiced fellatio more often than monthly during the past year. The occurrence of cunnilingus shows a very similar picture.

As far as I know, there are no studies about Swedish attitudes about anal sex, fellatio, and cunnilingus—people just don't talk about these behaviors. There are no legal restrictions on what sexual outlets couples or individuals practice, as long as they are mutually voluntary and harmless.

## *6. Homoerotic, Homosexual, and Bisexual Behaviors*

The state Lutheran Church keeps a low profile on homosexuality, as do most of the other churches and congregations. They are not in favor of varieties other than heterosexuality, and could be interpreted as being negative at least to homosexual behavior, if not to the homosexual inclination—to be homosexual does not mean to behave accordingly.

Almost no Swede would dare to say anything negative about homosexuality or same-gender couples in the mass media or otherwise more or less openly. But all homosexuals easily and often experience hidden and/or open discrimination. The law discriminated between same- and opposite-gender sexuality until the mid-1970s. It was, for instance, illegal for an adult man to have sex with a woman younger than 15 and with another man younger than 18. There was an unspoken presumption that adult women would not have sex with a boy younger than 15. Today, the law is clear in treating males and females equally, and not discriminating by age and gender between same- and opposite-gender relationships.

In Denmark, since October 1, 1989, same-gender couples can register their partnerships. This means that the laws applicable to married couples automatically apply also to these registered couples. Two differences remain. Same-gender couples cannot adopt a child jointly, and if one has a child, the partner cannot adopt the child and become its legal parent along with the natural parent. And there is no official, legal ceremony, or ritual attached to civil registration of same-gender relationships as there is in the marriage of opposite-gender couples. Norway adopted the same law on August 1, 1993. At the time of this writing, it appeared that Sweden would follow, enacting the same law during the United Nations Year of the Family in 1994.

The experience in Denmark is that relatively few same-gender couples have registered, a few hundred in all, the majority of whom being male couples. The law has not apparently changed the social attitudes in the general population.

However, in Sweden, since the mid-1960s, many homosexuals and their organizations have been arguing for the right to marry. Sweden was first in taking a step in that direction by putting cohabitation of same-gender couples on a par with cohabiting opposite-gender couples. The 1987 law provides that in the case of separating same- or opposite-gender couples, the partner most in need of the apartment or house has the right to remain in it, even if the lease, deed, or

**Figure 3**

### **Marriages Where Both Partners Were Never Married, Sweden, in Percentages**

Sources: *Historisk Statistik* 1967, *Befolkningsrörelsen* 1990

title is written in the other cohabitant's name. The law also states that what the couple have accumulated for common usage in their household should be divided equally in case of death or separation, independent of which cohabitant actually paid for the item.

Riksförbundet för Sexuellit Likaberättigande (RFSL), founded in 1950, is a nonprofit organization working for gay and lesbian rights. A special HIV department in RFSL receives economic support from the government for their preventative measures.

## 7. Gender Diversity and Transgender Issues

Transvestites have no special legal status, but since neither they nor society looks on them as deviant or sick, there is and should be no treatment. Many transvestites are members of a chapter of Full Personality Expression (FPE), an international organization for cross-gendered persons. FPE holds monthly meetings and maintains an open house for members, as well as for other interested persons in Stockholm.

By law, transsexuals can and also, in practice, do change their sex, after following a standard course of long observation and treatment by psychiatrists. Following gender reassignment, all legal documents are changed to match the new sex. Estimates suggest that about half of those who sincerely want to change their sex follow through and are allowed to have the operation. Less than a dozen operations are performed annually in Sweden.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Sexual Abuse and Incest*

No one knows how frequent child sexual abuse or incest is. It occurs, and a certain number of cases are made known to the police. Of course, there are many more cases than those reported. However, in 1992, only 100 persons were sentenced for incest or for sexual activities with a minor. In the same year, 105 persons were sentenced for child sexual abuse and another 251 for having touched minors sexually.

The sentences for these crimes vary, with a maximum of four years imprisonment for incestuous abuse. Conviction for sexual touching of a minor can bring a sentence of up to one year's imprisonment. If these crimes are severe, the penalty can be up to eight years. These sentences are applied only if physical force or psychological coercion has not been used. If force has been used, the laws for rape are applied.

#### *Sexual Harassment*

In Sweden, as in so many other countries, sexual harassment is a new concept, even though the phenomenon is old. Studies made at universities indicate that between 10% and 25% of female students say they have been sexually harassed. Very few cases are reported. Businesses and schools have not developed any official policies to define and set policies for reporting sexual harassment. However, there is a growing awareness of sexual harassment issues among the people.

#### *Rape*

In Sweden, as elsewhere, most cases of rape are never reported and no one knows how frequent they are. It is known that among those rapes reported, most are perpetrated by a person known and trusted by the victim. In 1965, 1,565 cases of rape were reported to the police, and 203 perpetrators were sentenced to imprisonment.

The law differentiates between four types or degrees of rape or sexual assault. The most severe is what could be called flagrant rape or *grov våldtäki*, involving violence and dangerous use of physical force; conviction can bring four to ten years imprisonment. A second type of sexual assault is simple rape (*våldta-ki*), with the penalty ranging from two to six years imprisonment. Sexual force, or *sexuellt tvång*, is not defined as rape, although it involves forced sexual intercourse without the use of violence or threat of violence; the penalty can be up to four years in prison. Finally, there is sexual abuse, or *sexuellt utnyttjande*, in which the perpetrator abuses his or her position of power, authority, or guardianship.

### B. Prostitution

Prostitution is prevalent in the centers of the three largest Swedish cities: Stockholm, Gothenburg (Göteborg), and Malmö. Contacts with prostitutes can be made at bars all over the country, but these places are not directly linked with prostitution. Pimping is forbidden and conviction can result in up to four years imprisonment, up to six years if the case is severe. Very seldom is anyone reported for pimping, and almost never is anyone sentenced.

The police seldom ever take action against prostitutes and their customers, as so often occurs in some other countries. Sweden does not have as many influential moralists with double standards as are found in some other countries.

### C. Pornography and Erotica

The production, display, and sale of pornography are permitted unless children are involved in one way or another. Distasteful displays of pornography are not permitted, and involvement of a minor can bring a fine and maximum sentence of six months imprisonment. Very few cases are reported to the police for prosecution. Pornography and erotica are readily available at tobacconists, video stores, and many other places.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

Sex education, as mentioned above, has a long history in the compulsory schools. This is matched by the availability of, advertisement of, and information on condoms and other contraceptives. Vending machines for condoms can be found in hotels, bars, restaurants, and elsewhere, even at some bus stops on the street. All gas stations, groceries, supermarkets, and tobacconists openly sell condoms and often display them at the counter. Midwives and physicians prescribe contraceptive pills and fit IUDs. Male and female sterilization is free of charge upon request if the person is over age 25.

### B. Teenage Unmarried Pregnancies

It should be clear from the discussion of marriage and cohabitation rates above that almost no Swedish teenagers are married. This means that almost all pregnant teenage women are not married. Quite a few of them are cohabiting; how many is not known. About 3% of all children born in 1991 were born to mothers younger than 20. As is usually the case, it is not known how old the fathers were. Only about 15% of these mothers were married, thus less than a half percent of all children were born to a married teenage mother. The total fertility rate (TFR) for girls 15 to 19 years of age was 13.1, compared with a TFR of 154.1 for women 25 to 29 years of age.

In 1991, there were 3,564 children born to teenage mothers and 6,152 abortions performed on teenagers. Thus,

about two thirds of the teenage pregnancies end with an induced abortion.

### C. Abortion

Prior to 1939, abortion was illegal in Sweden. In 1939, the law was changed to allow abortion under certain conditions and for specific reasons. Grounds for legal abortion were connected to the eugenic ideas popular in the Western world at that time. In Sweden, as elsewhere, there was an effort to keep the national stock pure and good. Gradually, the perspective changed, more grounds were added, and the law became more liberal. A 1975 law reform gives the woman the right to a legal abortion upon request until the end of the 18th week of gestation, without any costs to her.

Prior to the early 1970s, Sweden had an unknown number of illegal abortions and relatively few legal abortions. Estimates of illegally induced abortions during the 1950s range from 10,000 to 100,000 per year; about 5,000 legal abortions were done annually in this era. Now, illegal abortions are nonexistent because the cost of an abortion is covered by national health insurance, and no one other than the pregnant woman has to be involved in the decision, even if the pregnant woman is a minor.

In 1991, the total abortion rate (TAR) was 615.3 (see Figure 4). The specific age rates vary, although the younger the age group, the higher is the abortion rate for women who are older than 19 years. Since 1975, the TAR has been fairly stable. Since coital activities vary more among teenagers than among older women, the abortion data for teens need to be considered separately. For 15- to 17-year-olds, the abortion rate has decreased; for older teens, it has remained fairly stable over the years since 1975. The 1975 rates were approximately 16 per 1,000 girls age 15, 29 for girls age 16, and 33 for girls age 17; in 1991, these figures were 9, 17, and 21, respectively, with lows in all groups in 1983-85 of about 7, 12, and 18, and highs in 1988-90 of about 10, 19, and 25, respectively. For older teens, the 1975 rates were approximately 33 per 1,000 girls age 18 and 31 for girls age 19; in 1991, the rates were 28 and 33, respectively, with lows in 1983-85 of about 23 and 26, and highs in 1988-90 of about 31 and 34, respectively.

### D. Population Control Efforts

At the end of the 19th century, the fertility rate started on a decline that went on until the mid-1930s. By the mid-1930s, the birthrate was below replacement level, and some politicians and others were concerned about the risks of immigration overwhelming ethnic Swedes. During the 1940s,

Sweden provided housing subsidies to poor households with minor children, government allowances for all mothers with a child under age 16, and other pronatal incentives. But even before these measures were enacted, the postwar baby boom came with its peak in 1946-1947.

When the fertility rate again came to a historic low in the 1960s and especially the 1970s, some politicians and demographers became emotionally concerned and involved. Discussions about new ways to make society more "child friendly" became popular. But the political decisions were hidden behind the mask of social welfare. Since the Nazis were defeated in 1945, very few Swedes have dared to admit being pronatalists.

In modern times, there have been no attempts to reduce the population, unless one counts the discussions about immigration policy as an issue in population growth.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

#### Incidence and Trends

The previously most feared STD, syphilis, is now comparatively rare, dropping from 153 new cases in 1985 to 121 new cases reported in 1991. Gonorrhea has also decreased, from 5,389 new cases in 1985 to only 617 cases in 1991. Two thirds of these STDs occur in men.

In Sweden, chlamydia was not recognized until recently as an STD. After apparently peaking in 1990 at over 21,000 new cases, a decreasing trend seems to have arrived. Most cases of chlamydia occur in persons under age 30, with two thirds of reported cases detected in females.

Trichomonas, herpes, candida, condyloma, and other diseases are not classified as STDs, and reporting by treating physicians is not required. Thus, no data are available for these infections.

#### Treatment and Prevention Efforts

Treatment for all sexual infections is available free of charge or with only a nominal fee. Propaganda for condom use has traditionally been based on preventing unwanted pregnancies, contrary to the connection made in continental Europe and North America, where condom use has been promoted for prophylactic disease prevention. Swedish propaganda now includes prophylactic use.

Changes in the frequencies of the various STDs suggest a variety of factors. Decreases in gonorrhea and syphilis are connected both with more efficient treatment and increased education about condom use and about the risks of these diseases. The rise in chlamydia in the late 1980s is explained in part by the increased use of the contraceptive pill as an efficient protection against pregnancy and its lack of protection against STDs. The recent decrease in chlamydia is because of increased education and STD prevention.

### B. HIV/AIDS

#### Incidence, Patterns, and Trends

According to mid-1993 estimates, Sweden has between 3,000 and 4,000 persons with HIV infection. Each year 300 to 400 new cases have been reported. About 150 persons with HIV convert to full-blown AIDS, according to estimates from 1990 to the present. About 60% of the HIV-positive persons are between ages 25 and 39.

#### Treatment, Prevention Programs, and Government Policies

Distribution of free syringes and condoms, more-rigorous blood tests for blood donors and transfusions, and increased information and education on safer sex are being

Figure 4

Abortion Rates in Sweden, 1939-1992,  
per 1,000 Women Aged 15-44

Sources: *Aborter*, various volumes

used to limit the spread of HIV and other sexually transmitted diseases. Local and national governments strongly support prevention, research, and treatment efforts, both to prevent further spread and to find a cure.

[Update 2002: UNAIDS Epidemiological Assessment: HIV testing is mandatory for blood donors, and systematic but voluntary for pregnant women, women having abortions, injecting drug users, STD patients, immigrants, refugees, and the deceased with autopsies. All diagnosed HIV infections are registered in the Swedish national HIV case-reporting system, using an identifying code. By mid-2001, a cumulative total of 5,523 cases of HIV infection has been notified since the beginning of the epidemic, approximately two thirds of which were in Stockholm. Among cases reported in 1997-1999, 48% were heterosexuals, 32% were homosexuals, and 8% were injecting drug users. Among heterosexual cases, 35% were diagnosed in persons originating from countries with a generalized HIV epidemic. Prevalence in pregnant women and STD patients is primarily generated through the national testing programs. Data on pregnant women revealed that the prevalence in Stockholm is four times higher than in the rest of the country. The incidence of syphilis has remained less than 2 per 100,000 since 1984.

[Data on prevalence among injecting drug users are available through a screening program of injecting drug users in the prison of Stockholm. In 1987, prevalence was 16% and 13% in 1988. Incidence was estimated around 0.9% in 1987 and 1.2% in 1988. When the HIV test was introduced in 1984, 300 injecting drug users in treatment in Stockholm were tested, resulting in a prevalence of 11%. Subsequent testing noted an incidence of 5% between 1984 and 1990, with seroconversion rates decreasing over time. As in most screening programs, persons known to be HIV infected are not retested. In the study on injecting drug users in prisons, those known positives not tested were added to both numerator and denominator; about 30% to 37% were not tested, and in addition, 15% to 25% refused to be tested. Those prevalence rates need, therefore, to be interpreted with caution. In the Stockholm area, it is estimated that there are 14,000 homosexuals, 3,000 to 4,000 drug abusers, and 9,000 immigrants from sub-Saharan Africa in the 15- to 64-year-old age group.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	3,300 (rate: 0.1%)
Women ages 15-49:	880
Children ages 0-15:	< 100

[An estimated less than 100 adults and children died of AIDS during 2001.

[No estimate is available for the number of Swedish children who had lost one or both parents to AIDS and were under age 15 at the end of 2001.

[Adults in the *UNAIDS Fact Sheet* are defined as women and men aged 15 to 49. This age range covers people in their most sexually active years. While the risk of HIV infection obviously continues beyond the age of 50, this definition covers the vast majority of those who engage in substantial risk behaviors. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A/B. Concepts of Sexual Dysfunction and Availability of Therapy

Swedish sex therapists, of which there are not many, work with both couples and individuals, using the techniques of the American pioneers William Masters and Virginia Johnson. Some therapists supplement this approach

with the psychodynamic methods of Helen Singer Kaplan. The therapists are mostly licensed medical doctors or psychologists with postgraduate training in sex therapy in Sweden, Denmark, or the U.S.A.

Most couples seeking sex therapy are in their 30s and 40s and have had their problems even before they married. Sex therapy is generally short-term therapy, lasting between 10 and 20 hours. In many cases, a combination of sex therapy and psychotherapy is needed, because the sexual problem often has its roots in a deeper and broader personality dysfunction that goes back to childhood. Such cases require more intensive, long-term individual therapy.

Treatment is generally not covered by insurance, and most patients have to cover all costs themselves.

## 12. Sex Research and Advanced Professional Education

### A/B. Sexological Research and Postgraduate Education

The best known sexological research units can be found at various departments at Swedish universities: Gothenburg (Göteborg) University, Department of Psychology; Umeå University, Department of Rehabilitation; and Uppsala University, the Neurology and Sociology Departments.

Postcollege, graduate-level programs for the advanced study of human sexuality do not exist as programs. At the above-mentioned university departments, regular doctoral degrees are offered within the specialty of sexology.

### C. Important Sexological Organizations

The Swedish Sexological Association was established in 1980 with Jan Trost as its first president. At that time, the intention was to have an association consisting of members actively working in the scientific field of sexology in various disciplines. Subsequently, the association has changed to a professional organization whose members work clinically with matters related to sexuality, including physicians, psychologists, and contraception counselors.

The address for the Swedish Sexological Association is: c/o Lars-Gösta Dahlström, Göteborg University, Department of Psychology, P.O. Box 14158, S-400 20 Göteborg (Gothenburg), Sweden.

The Swedish Institute for Sexual Research is based in Stockholm. Director: Mai-Briht Bergstrom-Walan. Address: Tystbergavägen 41, S-111 44 Stockholm, Sweden.

Riksförbundet för Sexuell Upplysning (RFSU), founded in 1933, is a not-for-profit organization working for safe and liberal sex, safe in terms of preventing STDs, unwanted pregnancies, and sexual assaults of all kinds. The address for RFSU is: Rosenlundsgatan 13, S-104 62 Stockholm, Sweden; or: P.O. Box 17006, S-104 62 Stockholm, Sweden.

Riksförbundet för Sexuellit Likaberättigande (RFSL), a gay and lesbian education and rights advocacy group, is based at: Stockholms Gay-hus, Sveavägen 57, S-104 30 Stockholm, Sweden; or: P.O. Box 350, S-101 24 Stockholm, Sweden.

In 1967, a government commission conducted a probability sample survey of about 2,000 men and women aged 18 to 60 years. The interviews, with 90% response, dealt with perception of sexual norms, attitudes, and behavior. Details were published by *Statens Offentliga Utredningar (SOU)* (Stockholm), 1969:2.

*Nordic Sexology (Nordisk Sexologi)* is published quarterly. Publisher's address: Soren Buss Jensen, M.D., Aalborg Psykiatriske Sygehus, Postboks 210, DK-9100 Aalborg, Denmark; or: Dansk Psykologisk Forlag, Hans Knudsen Plads 1 a, DK-2100 Copenhagen, Denmark.

### [13. Important Ethnic and Religious Minorities

ROBERT T. FRANCOEUR

[Update 2002: During the past 50 years, immigrants from 160 nations have transformed Sweden from an ethnically relatively homogeneous society into an intensely multiethnic one, according to Hans Lennart Zetterberg (2002), professor of social work at the University of Goteborg, Sweden. By the early 1990s, some 10% of the Swedish population was foreign born. In 2002, more than 1.3 million out of a population of nine million—15%—were immigrants or children of immigrants. Immigrants are drawn to Sweden in increasing numbers by the country's persistent labor shortage. They also take advantage of the country's liberal asylum policy, which grants refuge from the conflicts occurring in many of the Middle Eastern homelands.

[This change in Swedish life and culture has resulted in considerable cross-cultural tension and misunderstandings. According to Mansson (1993), this tension is most evident in love relationships, particularly when immigrant males from strongly patriarchal tribal cultures encounter egalitarian Swedish concepts of marriages based on love, the sexual rights and freedom of both men and women taken for granted in the prevailing Scandinavian sexual culture, and the open acceptance of premarital sex and cohabitation. As one commentator noted, "They aren't used to women being equal to men or nakedness being taken as natural instead of sexual or the idea that you can choose your own partner. They get scared and become defensive and much more fundamentalist than they would be at home." This cultural tension occurs within the context of important cultural patterns and processes that are reshaping the values, expectations, and lives of immigrant women and men, immigrant parents and their children, and the whole of Swedish culture.

[Nowhere has this been more evident than in the conflict of the tragic case of Fadime Sahindal, a 26-year-old Kurdish woman who became the victim of an "honor killing" by her father. Almost immediately after her death on January 21, 2002, Fadime became an international symbol and martyr for women's rights far beyond the borders of Sweden, and the focus of a new search for ways to protect immigrant women from patriarchal tribal values that allow "honor killing" by male relatives when a female relative brings "shame" on the clan or family by rejecting the patriarch's authority or an arranged marriage (Mojab & Hassanpour 2002; Williams 2002).

[Although Fadime's father, Rahmi Sahindal, came to Sweden from Turkey 20 years ago, he was still guided more by pressure from his Kurdish clansmen than by the rule of law or love for his daughter. In 1998, Fademi rejected a proposed marriage arranged by her father. When her father and brother threatened to kill her in 1998 for the "shame" she brought on the family, a Swedish lawmaker of Kurdish descent negotiated a compromise by which Fademi agreed to stay away from Uppsala where her parents lived. In return, her father promised not to stalk her outside their hometown while she was living in seclusion near Stockholm. Fademi continued her study for a sociology degree and became an outspoken advocate of the opportunities that Nordic immigration presented for women from fundamentalist backgrounds. In 2002, as she prepared to depart for Kenya to write her master's thesis, Fademi decided to visit her mother and sister in Uppsala to say farewell. According to friends, her sister is mentally disabled and suffered Fademi's long absence in sadness and confusion. When Fademi's father learned of her arrival in Uppsala, he showed up at the family home and shot Fademi in the head, killing her instantly.

[Following Fademi's murder, human rights activists warned that liberal European governments that continue to ignore the dangers of not integrating immigrant communities and dealing with conflicts in religious and cultural values, will do so at great peril. Dilsa Demirbag-Sten, a former government advisor on integration affairs whose Kurdish family came to Sweden from eastern Turkey when she was 7, has accused Swedish and other Scandinavian authorities of arrogance in their view that certain rights and freedoms accorded Nordic residents, such as gender equality and protection from forced marriage, are not necessarily applicable to immigrants. Swedish law, for example, allows girls from immigrant families to marry as young as 15, while marriage for Swedish citizens is not permitted until age 18. That *de facto* bow to immigrant cultural practice is expected to be legislated out of existence, as momentum gathers in a national campaign to prevent arranged and forced marriage. Currently, an estimated 30 to 40 young immigrant women in Sweden are hiding from male relatives who have vowed to kill them.

[At least 15% of Sweden's 9 million residents are non-Nordic and heavily concentrated in volatile ghettos of Somalis, Kurds, Bosnians, and dozens of other ethnic groups. There are towns and villages just outside of Stockholm and Uppsala where the entire population is foreign. This is the case in Botkyrka, a suburb only a 30-minute drive from central Stockholm where Fademi grew up. More than 80% of the 30,000 residents of Botkyrka are immigrants and refugees. Scandinavia's liberal values curry little favor in many of these settlements. Immigrants band together in these small towns and villages to protect their way of life. In such places, no Swedish is spoken, there is no Swedish television, and the people have no jobs that bring them in contact with Swedish people. A 1995 reform of laws on refugees and immigration worsened this situation by focusing training and jobs on the younger generation, causing strains within families between the older generation and their children, as well as between immigrants and Swedes.

[Fademi's death has led to support for a variety of policy changes to promote social integration. These include raising the minimum age for marriage to 18 for all women, advisory sessions for new arrivals on the vast differences in gender relations they will encounter and must respect, prohibition of head scarves or veils for girls under 16, and equal opportunity in all aspects of education. Parents from conservative religious backgrounds currently can opt to remove their children from sex education classes, swimming, and other coeducational sports, and fieldtrips.

[The significance of this and similar incidents of conflicting sexual and social values is clear, in the sense that, as birthrates in all the European countries continue to drop and shortages in the local labor pools increase, immigrants from less-economically developed countries will fill the vacuum and bring with them their highly patriarchal clan-based sexual mores. Cultural diversity is not the problem. The problem is to identify ways to improve tolerance and integration, rather than the isolating segregation of diverse cultural tradition to continue. Western cultural imperialism and hegemony will not solve the problem, because the information and energy flow in this situation is not one-way but a two-way road of cross-fertilization. (End of update by R. T. Francoeur)]

### *Demographics and a Brief Historical Perspective*

SIBYL TSCHUDIN

#### A. Demographics

Switzerland is located in central Europe and spreads over an area of 15,942 square miles (41,290 km<sup>2</sup>), about twice the size of the state of New Jersey in the U.S. Most of the country is composed of a mountainous plateau bordered by the great bulk of the Alps in the south and by the Jura Mountains in the northwest. This long, relatively narrow plateau is crossed by the Aare River and contains the lakes of Neuchâtel and Zürich. The country's largest lakes—Geneva, Constance

(Bodensee), and Maggiore—straddle the French, German-Austrian, and Italian borders, respectively. The Rhine, navigable from Basel to the North Sea, is the principal inland waterway. The strategically important alpine north-south communications are assured by numerous passes and by railroad tunnels, notably the Lötschberg, St. Gotthard, and Simplon. Switzerland consists of 26 federated states, of which 20 are called cantons and 6 are called half cantons. The cantons are Zürich, Bern, Lucerne, Uri, Schwyz, Glarus, Zug, Fribourg, Solothurn, Schaffhausen, Saint Gall, the Grisons (Graubünden), Aargau, Thurgau, Ticino, Vaud, Valais, Neuchâtel, Geneva, and Jura. Of the half cantons, Obwalden and Nidwalden together form Unterwalden, Basel-Land and Basel-Stadt form Basel, and Auser-Rhoden and Inner-Rhoden form Appenzell. The capital of Switzerland is Berne.

German, French, and Italian are Switzerland's major and official languages; Romansh (a Rhaeto-Roman dialect spoken in parts of the Grisons) was designated a "semi-official" language in 1996, and entitled to federal funds to help promote its continued use. German dialects (Schwyzerdütsch) are spoken by about 65% of the inhabitants. French, spoken by about 20% of the population, predominates in the southwest; Italian, spoken by about 8%, is the language of Ticino, in the south. The few Romansh-speakers are in the southeast.

In December 2001, Switzerland had an estimated population of 7.3 million. The largest cities by population are Zürich (about 340,000), Basel (180,000), Geneva (170,000), Berne (130,000), and Lausanne (120,000). (All data are from the latest Swiss Census unless otherwise noted; data designated (WFB) are from *The World Factbook 2002*, CIA.)

**Age Distribution and Sex Ratios (WFB):** 0-14 years: 16.8% with 1.05 male(s) per female (sex ratio); 15-64 years: 67.7% with 1.03 male(s) per female; 65 years and over: 15.5% with 0.69 male(s) per female; Total population sex ratio: 0.97 male(s) to 1 female

**Life Expectancy at Birth (in 2000):** male: 76.9 years; female: 82.6 years; (WFB Total Population: 79.86 years)

**Urban/Rural Distribution:** 85% to 15% (WFB)

**Ethnic Distribution:** German: 65%; French: 18%; Italian: 10%; Romansh: 1%; other: 6% (WFB)

**Religious Distribution:** Roman Catholic: 42%; Protestant: 35%; other Christian communities: 2%; Jewish: 0.2%; Islam: 4%; others: 1%; no religion: 11%

**Birth Rate:** 10.1 births per 1,000 population; (WFB 9.84)

**Death Rate:** 8.4 per 1,000 population

**Infant Mortality Rate:** 3.2 deaths per 1,000 live births

**Net Migration Rate:** 2.01 migrant(s) per 1,000 population; (WFB 5.54)

**Total Fertility Rate:** 1.41 children born per woman; (WFB 1.73)

**Population Growth Rate:** 0.8%; (WFB 0.24%)

**HIV/AIDS:** *Total positive HIV tests (1985-2000):* 25,007; *Persons with AIDS (1983-2000):* 7,036; *Deaths:* 5,009. (WFB 1999 estimates: *Adult prevalence:* 0.46%; *Persons living with HIV/AIDS:* 17,000; *Deaths:* 150.) (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 99%; education is free and school attendance compulsory during 9 years, from age 7 to 16

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$28,600; *Inflation:* 1.5%; (WFB 2.4%); *Unemployment:* 3.8%; (WFB 5.3%); *Living below the poverty line:* NA

## B. A Brief Historical Perspective

In 58 B.C.E., the Helvetii who inhabited the area of Switzerland (called Helvetia in those times) were conquered by the Romans. In 1033, the territory was incorporated into the Holy Roman Empire. In the 1200s, Habsburg encroachments on the privileges of the three mountainous localities of Uri, Schwyz, and Unterwalden resulted in the conclusion of a defensive league among them in 1291. In the following centuries, the Swiss Confederation slowly added new cantons. In 1648, the Treaty of Westphalia gave Switzerland its independence from the Holy Roman Empire. French revolutionary troops occupied the country in 1798 and named it the Helvetic Republic, but Napoleon in 1803 restored its federal government. By 1815, the French- and Italian-speaking peoples of Switzerland had been granted political equality. In 1815, the Congress of Vienna guaranteed the neutrality and recognized the independence of Switzerland. In the revolutionary era of 1847, the Catholic cantons seceded and organized a separate union called the Sonderbund, but they were defeated and rejoined the federation. The victorious Radicals transformed the confederation into one federal state under a new constitution adopted in 1848 and recast in 1874, establishing a strong central government while giving significant control to each canton. National unity grew as the country prospered from its neutrality. Strict neutrality was its policy in both World Wars I and II. Geneva became the seat of the League of Nations (later the European headquarters of the United Nations) and of a number of international organizations. In September 2002, Switzerland became the 190th member of the UN.

Politically, Switzerland is a direct democracy. The referendum, as well as popular initiatives, are frequently employed to achieve political change. A council of states (two members from each canton, and one from each half canton) and a 200-member national council (whose members are directly elected every four years) together form the federal assembly. The chief executive, or federal council, is composed of seven members (elected for four years by the federal assembly) and includes the president of the confederation (elected by the federal assembly annually).

### 1. Basic Sexological Premises

ELIZABETH ZEMP and JOHANNES BITZER

#### A. Character of Gender Roles

The people of Switzerland have had a longstanding history in which there was a strong traditional model, with men

being economically responsible, involved in paid work and in public issues, and women being responsible for the family and education and limited to the private sector. This system was maintained by legislation and a social security system, both of which have economic qualities. From the 1960s and 1970s on, important changes have occurred, which modified and diminished the gender-role separation. Women were given the right to vote and to be elected to Parliament in 1971. This was decided in a plebiscite by the male population. Changes in gender roles have developed heterogeneously, with traditional family concepts prevailing more in rural areas, while in urban areas, the changing roles of women became more visible and equality between men and women was achieved.

While an increasing percentage of women have entered the workforce, the childcare situation still reflects traditional family role patterns. Daycare options for children, child-nurseries, and maternity and day schools, exist for only a small percentage of children under 14 years of age. There are regional differences with regard to this situation, with childcare options for only 2% of the children in the German-speaking part, 7% of the children in the French-speaking part, and 34% of the children in the Italian-speaking area of Switzerland. The Swiss school system has not yet adapted to the needs of employed women, with schedules changing from day to day and children expected to eat their lunches at home. Persisting traditional gender roles are still reflected in inequalities with regard to education, income, and participation in political boards. It is also reflected in the higher percentage of women with part-time employment. While the percentage of women in the workforce has consistently increased in the last four decades, only 53% of working women, and around 25% of women with children under age 15, work full-time.

#### B. Sociolegal Status of Males and Females

Equal rights for women and men became part of the Swiss Constitution only in 1981. While some gender-specific differences persist in the law, such as those related to maternity and to military conscription (mandatory only for men), all others have been changed in the last decades. With regard to maternity and childcare, a 1945 plebiscite approved social security for maternity although the corresponding law was never enacted. Three related plebiscites were rejected in 1984, 1987, and 2001. Consequently, Switzerland still lacks a federal law concerning maternity policy. Since 1989, women may not be dismissed during pregnancy or the first 16 weeks after giving birth. Some cantonal laws regulate the duration and funding of maternity leaves, producing a wide range of practices among the administrative authorities. The Swiss social security system for the elderly is based on three pillars: a basic pension insurance, an occupational benefit plan, and private savings. Basic insurance was started in 1948, and is based on paid employment. Until 1997, women retired at age 62 and men at age 65. Thereafter, the age of retirement for women has risen to 64 years. As part of the ongoing revisions of the old-age and disability/invalid pension law, the government has proposed a flexible retirement age between 62 and 65 for men and women. Since 1994, women get credited to their account for each year of childcare. Widows with children are entitled to a pension, but widows without children must be at least 45 and have been married for at least 5 years.

Legal changes have also occurred with regard to domestic violence. Prior to 1992, the legal bases excluded rape that happened within marriage from being subject to litigation. In a 1992 revision, rape and sexual violence within marriage were redefined to be punishable, but only if the

wife is denouncing it. The "Victims Help Law," enacted in 1993, regulates three areas designed to improve the position of victims of violence: counseling and treatment, support throughout the legal procedure and trial, and compensation claims for damages and reparations. This law obliges the cantons to provide counseling facilities, medical, psychological, social, material, and legal assistance. Although this law is not targeting primarily victims of sexual violence, it implies also an improvement for women who experienced sexual violence.

### C. General Concepts of Sexuality, Love, Marriage, and Family

The predominant concept in the institutionalized heterosexual relationship is that it should be based on love and last lifelong. In recent years, the diversity of this concept has increased considerably, with a shift to shorter, less-stable relations, with changing partnerships over the lifecycle. This shift is reflected in increases in the divorce rate, single households, and *single educating households*. There is also an increase in the acceptance of other forms of sexualities such as homosexuality and less stigmatization for transsexual individuals.

There is also an increasing trend for a separation of fertility and sexuality. The fertility rate is rather low, around 1.5 children per fertile woman. There is also a relatively high mean age at first marriage, 27.5 years for females and 29.8 years for males. Premarital sexuality is widespread and well accepted. It goes along with the easy availability of contraceptives and widespread sexual education in schools (see Sections 3 and 9 on these topics). Sexual activity is socially accepted also among the younger. This is reflected in the so-called "*Schutzalter*" or protection age, which is set at age 16. The legal marriage age is 18. Despite a relatively high percentage of sexually active teenagers, there is a low rate of unwanted consequences, especially teenage abortions (see also Section 9B, Contraception, Abortion, and Population Planning, Teenage (Unmarried) Pregnancies).

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

ULRIKE KOSTA

According to the last census, 44% of the population in Switzerland is Roman Catholic, and 37% belong to the Protestant church. The number of Muslims has doubled since 1990 because of immigration from Kosovo, Bosnia-Herzegovina, and the Republic of Macedonia. With a population of 311,000, Muslims are the third-largest religious group in Switzerland (4.5% of the total population). The number of Greek Orthodox Church members has also increased greatly (133,000). There are also Jewish communities and Christ Catholic parishes.

The Protestant churches and the Roman Catholic Church have been losing a significant number of members for years. This trend continues and is linked to a process of secularization and changes in values. In the 1990s, the number of persons who indicated they did not belong to any church or religious group rose from 7.4% to 12% of the population.

The Protestant church in Switzerland is characterized by a variety of different regional churches. There are largely cantonal churches, which differ in their theological and organizational character and program.

An empirically conducted ecumenical study in the canton of Basel-Stadt from 1999 showed that more than two thirds of respondents described themselves as "religious in the broadest sense." There exists a great contrast between public (e.g., attending church services) and privately practiced forms of religiosity. Accordingly, religion is prac-

ticed primarily in a private setting. Christianity continues to be the determining form of religious faith. A study from 1984 stated a correlation between the religious engagement and the number of children married couples desired. Couples who are very much involved in religion want to have more children than other couples. The study showed no difference about the expected number of children between Catholic and Protestant couples.

Until the 1970s, the sexual morality of the Roman Catholic Church exercised considerable influence on the behavior and attitudes of its believers. The process of secularization has diminished this influence significantly. To this day, the Roman Catholic Church's sexual ethics are determined by the encyclicals of the popes and statements by the national Bishops' Conference. In its encyclicals and other official proclamations, the Roman Catholic Church puts marriage center-stage as the sole place of legitimate sexuality. It considers sexuality an expression of partnership, of human union, and assigns it the aims of personal encounter and procreation. It stresses the natural and central status of marriage and its sacramental character, and rejects all forms of artificial contraception (the pill was prohibited in the encyclical, *Humanae Vitae*, by Pope Paul VI in 1968). On the other hand, some Catholic authorities emphasize the individual responsibility and the quality of the relationship.

The Roman Catholic Church insists on absolute protection of nascent life and so proscribes abortion. According to their "Statement on the Blessing of Same-Sex Unions and the Ordination of Practicing Homosexuals," the Swiss bishops view marriage as an "integrating element of God's plan of creation," yet do not transfer this to partnerships between two homosexuals. The bishops also reject any discrimination of homosexuals. In brief, a deep tension exists between the official sexual morality of the Roman Catholic Church and the attitudes and behavior of the laity.

Like the Roman Catholic Church, the Protestant churches stress protection of marriage and the family. At the same time, they do not accord marriage the same sacramental and central character as the Roman Catholic Church. They also support strong protection of nascent life and reject the use of embryonic life for the purposes of acquiring stem cells, for instance. Switzerland's Protestant churches have also been at the center of years of intensive debate on the subject of homosexuality and same-sex unions.

Although religious values as applied to sexuality are still present in society, it is clear that their influence is diminishing and that sexual behavior is a decision for the individual.

## 3. Knowledge and Education about Sexuality

SIBIL TSCHUDIN

### A. Government Policies and Programs

At present, sexual education is listed as part of the compulsory school's syllabus. After the ninth school year, the basis for sex education is fragmentary and varies from canton to canton. Meanwhile, HIV-prevention education is compulsory. Although parents can veto their children's attendance in sexual education classes, the existence of a legal basis promotes sexual education. Still, the law does not guarantee its systematic realization.

Sexual education has been organized along two lines, the so-called "internal" model and the "external" model. The internal model is predominant in the German-speaking part of Switzerland and in the Ticino canton. Although theoretically responsible for the realization of sexual education, the cantonal offices just give a few pieces of advice to school headmasters and teachers and normally do not do any qual-

ity assessment. It therefore depends almost entirely on the teacher him- or herself how much emphasis is given to the topic. The teacher chooses the lesson content, as well as the number of classes she or he dedicates to sexual education. In the external model, sexual education is considered a special subject by offices and schools. Cantons and communities undertake the responsibility for its realization by engaging well-trained external experts. This procedure guarantees a qualitatively high standing and standardized education program, although only for a few lessons. The disadvantage of this model is the lack of sexual education's integration in everyday school life and the risk that the topic is totally delegated to the external expert by the teacher.

### *Coexistence of Both Models*

In some cantons with the internal model, external experts are additionally engaged quite systematically. The organization of sexual education and HIV prevention is not uniform all over the country on either the political or the administrative and practical level. This renders coordination more difficult and results in a lack of well-defined duties and responsibilities.

By a 1981 federal law, all cantons are obliged to establish an office for Planned Parenthood. The intention was mainly to guarantee adequate counseling in case of unwanted pregnancy, but these institutions also offer contraceptive counseling and sometimes even broader information concerning sexual health.

School health services make various offers for pupils, as, for example, a consultation hour on school grounds. These offers, however, vary from canton to canton. Zurich has a "*Fachstelle für Sexualpädagogik*," with a free sex consultation in person, by telephone, and via a website.

A recent study evaluated sexuality education programs and courses in Swiss schools. The researchers found there is an enormous heterogeneity between Switzerland's 26 federated states. Although the federal government has provided a legal basis for all schools to teach about HIV, the local implementation varies widely. It seems that on the obligatory school level, where students are age 7 to 16, the coverage of HIV/AIDS information is sufficient. At the higher school levels, much less time and effort are devoted to meeting this lifelong education need. In the German-speaking region, sexuality education seems to be less effective than in the French-speaking region. There is no basic sex education in the German-speaking part, which makes it more difficult for the teachers to approach AIDS as a subject.

### **B. Informal Sources of Sexual Knowledge**

Informal sources of sexual knowledge in Switzerland are magazines, telephone hotlines, and the Internet. *Bravo*, a German magazine for teenagers, is widely read in Switzerland. *Durchblick* has offered information about sex and contraception by experts (gynecologists) for over ten years, first as a telephone hotline, and nowadays mainly as an Internet forum.

## *4. Autoerotic Behaviors and Patterns*

JUDITH ALDER and JOHANNES BITZER

### **A. Children**

In Switzerland, sex education and pedagogy for children generally only start in middle school (after 6th grade); the quantity and quality of sex education as described earlier, depends mostly on the teacher. Before that, sex education is done by parents, with wide differences in the ways parents talk about sexual matters to their children according to their social and religious background. In the past ten years, it can

be observed, however, that more parents choose to explain to their children in more-concrete words what sexuality is and how children are created and born. Some children's books about reproduction have been published to help parents provide a child-concerned early sex education. Orientation about autoerotic behavior as part of a normal development process is done unsystematically by pediatricians and child therapists, but usually only if parents have questions about particular issues. There is so far no systematic survey about the autoerotic behavior of Swiss children.

Autoerotic behavior can be observed in young children by the way they touch, caress, massage, and scratch their genitals or rub themselves against, for example, a swing. Behavior like this is mostly done by coincidence, regular and planned masturbatory behavior at kindergarten age (4 to 6) being considered as abnormal. It depends mostly on the caregivers' reactions of whether they believe this behavior is normal but to be carried out in private, or if they view it as immoral and prohibited. Masturbatory behavior can be observed more in boys than in girls, which might be because of the visibility and reactivity of the genitals.

### **B. Adolescents**

No systematic surveys have been carried out on masturbation and other autoerotic behaviors in the general population of Swiss adolescents. There do exist a few Internet services and counseling centers for teenagers, which provide answers to questions about sexuality and family planning. The following information, therefore, cannot be considered as completely representative for Swiss teenagers, since only interested adolescents contact these services. However, they reflect general observations.

In boys, masturbatory experiences are reported earlier than in girls, with boys starting to masturbate between the ages 11 to 14. Some myths about damaging effects of masturbation can still be encountered (e.g., "Frequent masturbation harms the spinal cord") in boys. In contrast to boys, who talk more openly about masturbatory experiences, girls tend to be more reluctant to talk about masturbation and generally start practicing it later (beginning about 14 years). The typical questions boys 13 to 15 years of age addressed to counselors concern anatomy and the size of the penis, breast stimulation, and masturbation. Girls mostly address questions about menstruation, the time of its onset, and the nature of orgasmic response. With increasing age, the focus of questions becomes very specific; i.e., premature ejaculation, STDs, and homosexuality, but also with a concern for knowledge about normal lovemaking and a worry about not wanting it enough.

### **C. Adults**

Questions about masturbation are not asked systematically in surveys about sexuality. The estimation about experience with masturbation in men lies between around 95%, with about 70% to 85% practicing masturbation on a more regular basis. Still fewer women have experiences with masturbation (50% to 70%). Questions addressed to counselors and physicians generally concern issues of the normality of masturbation parallel to a stable relationship, and sexual fantasies that are in combination with masturbation.

## *5. Interpersonal Heterosexual Behaviors*

JUDITH ADLER

### **A. Children**

Interpersonal sexual behavior manifests around the time of kindergarten in Swiss children (ages 4 to 6). It is represented by a curious, inquiring, and exploratory behavior; boys and girls are interested in the look and size, sometimes

the smell of each other's genitals. The inquiry, however, is mostly done in private, going to the toilet together, for example. Girls and boys then might touch or caress each other's genitals. The interests, however, at this age are still very wide, with some girls and boys not being interested at all.

Role-playing is of central importance for the definition of one's own sex, representing mostly stereotypes even in children with "modern" family structures (e.g., job sharing of parents). In indirect role-play (for example, when playing with dolls) as well as in direct role-play, sexual behavior can be observed when dolls, or boys and girls, respectively, lie on each other. However, children generally name behavior like that as playing "Tarzan" or anything else they know from television or computer games, without having the concept of lovemaking. Doctor's games are another form of interpersonal sexual behavior. Again, on one hand, the main drive is curiosity about differences in anatomy and not sexual excitement. On the other hand, this is a way to be pleasantly touched and tickled by children of the same age, on "neutral" parts of the body as well as the genitals. Caregivers' reactions, again, are of importance for the development of subsequent behavior.

## B. Adolescents

In 2003, about three quarters of 14-year-old girls had had some kind of interpersonal sexual contact. In boys, interpersonal sexual behavior starts a bit later, with about two thirds having had some experience by the age of 14. The first contacts are generally through kissing. Group games ("bottle game") are still a frequent way of making first experiences. Other rituals can be observed at parties in dancing games. While boys are more aware about possible sexual reaction, many girls are still surprised and insecure when they lubricate, and do not know it as a sign of sexual arousal. "Dating" often starts before the exchange of caresses and, in the beginning, seems to be more of a definition of a relationship. Dating—"going together"—starts as early as 10 or 11 years. Again, there are wide differences in heterosexual interests at the beginning of puberty.

The legal age for the protection of minors is set at 14 years for consensual sexual relationships. The age difference between the partners is considered as relevant. The age at first sexual intercourse has changed over the past 20 years, to a greater extent for boys than for girls. Boys seem to catch up with girls, with the latter still being somewhat earlier. Intercourse experiences are reported by around 10% of 14-year-olds, while two thirds of boys and girls report intercourse experience by age 17. The step from petting to intercourse, in general, is a small step, with a stronger emphasis on intercourse being done with the right person and is, therefore, a conscious choice and planned behavior.

Relationship changes are frequent in the teenage years and in the 20s, with the tendency to last longer after the age of 18 to 20. Sexual intercourse mostly is a firm part of romantic relationships after the age of 18.

## C. Adults

Sexual intercourse before marriage is very common and in most relationships the norm. Dating in general is very casual, young men asking women out as well as vice versa. There are no firm rules about dates or when it is acceptable to initiate sexual contact. Most couples live together for many years before getting married, some moving together when moving out from the parental home. Most young women and men in their 20s, however, choose to first live alone or in communities without bonding as a couple.

With women increasingly following professional careers and having longer education periods, the age at mar-

riage and childbirth has risen significantly in the last ten years. In 2001, women were 28 and men 30.6 years on average when they got married (Bundesamt für Statistik, [www.statistik.admin.ch](http://www.statistik.admin.ch)). It was calculated that 58% of women and 53% of men under the age of 50 will get married over the course of time, if the rate of marriage in 2001 remains stable. While in 2001, almost 36,000 couples got married and 15,778 divorces were recorded—45.8% with children under age 18 years—the total population in 2001 was 7,261,210. The current statistics suggest a divorce rate of 38.5%, if the number of divorces remains stable over time. In the same year, 73,509 children were born, with 11.4% of mothers not married at the time of delivery. This number does not represent only the traditional single mother, since more and more couples choose not to get married when they start a family. The child/mother ratio in 2001 was 1.4:1.

In 1999, the Swiss people rejected implementation of a nationwide maternity insurance. This means that there is no obligation of salary payments for women who are on maternity leave. However, a 6-week maternity protection (time after birth where a woman cannot be expected to work) exists. Most governmental institutions and private enterprises, however, do provide 80% to 100% of the employee's salary during an 8- to 16-week period after birth. Also, for mothers who take unpaid maternity leave, there exists a one-year dismissal protection. Fathers do not have any paid parental leave in any institution. In all states, they have the right to one day off from work for the birth, and some states (e.g., Zürich), and some firms, offer a one- to two-week paternal leave after birth.

The interpersonal sexual behavior in the adult years has become more open minded in the past 20 years. Prevention of HIV has helped, to some degree, to open discussions about different sexual practices. Because no data are available on attitudes towards oral or anal practices for heterosexual couples, we rely on clinical observation. While anal sex is most common in gay couples, it is only occasionally used by heterosexual couples. While curiosity for many couples leads to a first tryout, women may experience it as painful and will not want to do it regularly. It is mostly women who will not be ready to try it at all, mostly because of shame feelings or fear of pain and partner reaction. The attitudes on oral sex are more alike in both sexes. Most couples do have experience with oral sex, and women, as men in general, experience it as pleasurable. Even though the attitude is more positive than with anal intercourse, oral sex is not practiced in every sexual contact.

Relationships in Switzerland, in general, are monogamously faithful. Even though most couples consider faithfulness as one of the most important premises of a functioning relationship, many couples experience at least one crisis because of an extramarital sexual contact during the course of time.

## *Sexuality and the Physically Disabled and the Aged*

In recent years, increasing efforts have been made to ameliorate the status of counseling and care for handicapped people regarding sexuality. At Nottwill, one of the large centers for paraplegics in Switzerland, courses are being offered for paraplegics and tetraplegics (quadriplegics) regarding sexuality and intimate relationships. In these courses, basic knowledge about the sexual behavior of males and females is taught, and the influence of the individual dysfunction analyzed. The focus of the courses lies in the development of new approaches to sexuality and sexual intimacy. The teaching includes communicative skills with partners, sensuality training, sensate focus, and so on. Information is also given about the use of new drugs for

erection and orgasmic dysfunction (Viagra, Cialis, etc.). The courses are given in collaboration between urologists, gynecologists, psychologists, nurses, and social workers.

As far as the sexuality of the elderly is concerned, there are also activities in the larger cities of Switzerland in health education and adult educational programs. These programs are offered either by the universities or by other public teaching institutions. These activities are focused on giving information about the organic, endocrine, and psychosocial changes of aging, and in the development of an understanding of sexual needs and behavioral patterns of elderly people. In the institutions (*Alterspflegeheime*), there is a large variety regarding the openness and the active attitude of the caregivers with respect to the sexuality of the elderly.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

UDO RAUSCHFLEITSCH

There are no representative data about the number of lesbians, gays, and bisexuals in Switzerland. Since life for homosexuals and bisexuals is by far easier in the big cities, they usually prefer to leave the rural areas and live in the big cities. Here, as in several other countries, we can assume that about 7% to 9% of the men and about 5% to 7% of the women have a homosexual or bisexual orientation. These estimates include those individuals who have homosexual relationships, but have not come out as lesbian, gay, or bisexual.

Since there is quite an open atmosphere concerning homosexuality in Switzerland, it is not too difficult for young people today to have their coming out. Many of them have an early coming out at about 16 years. Difficulties occur only in traditional Roman Catholic or fundamentalist Protestant groups. But until now, there are no announcements at schools in Switzerland about coming-out groups for the young lesbians and gays, although these groups exist in the bigger cities. Information about homosexuality is rarely given at schools. Most of the young (and elder) people get this information by newspapers, radio, TV, and scientific or popular literature. Most of the mass media report positive information and criticize discrimination against lesbians, gays, and bisexuals.

Though there is quite an open, accepting atmosphere in Switzerland, we also find violence against lesbians, gays, and bisexuals. While lesbians are more often attacked by men living or working nearby (as van den Oort reports from Germany), gays are mostly victims of young men who beat and rob them in parks, public toilets, and other areas for anonymous sexual activities. The number of victims who file a report with the police is nowadays higher than it was in former times, when the victims feared (and really experienced) that they were not taken seriously and were blamed or even accused by the police. Even so, quite a number of violent deeds still go unreported, especially if the victims are men who fear to be known officially as being involved in same-sex activities (these victims are often married men). Concerning violence, it is necessary to take into consideration that the different forms of discrimination (verbal discrimination, discrimination in the job area, not having the same rights as heterosexual couples, etc.) are also violent acts, which hurt lesbians, gays, and bisexuals and leave scars in their personality. Professionals who work in the psychosocial field with counseling and psychotherapy have to know about these psychic injuries and their consequences (Rauchfleisch 2001; Rauchfleisch et al. 2002; Wiesendanger 2001).

Coming out is not an easy process even today, since the declaration of being lesbian, gay, or bisexual always includes the risk—or at least, the person who plans her or his

coming out fears—that parents, friends, and colleagues at work may be shocked and may break with the homosexual or bisexual person. Moreover, at least in the past, the young lesbians and gays did not have models of other lesbians and gays who could give them a positive view of what it means to be lesbian or gay. This situation has changed during the last ten years, since today quite a lot of lesbians, gays, and bisexuals appear openly with their sexual orientation and their way of living.

Studies on the question of how many young people at which age have their coming out do not exist in Switzerland. But the data from other European countries and the United States lead to the conclusion that the coming out, also in Switzerland, nowadays is usually quite early, as mentioned above, at about the age of 16 years. This means that already during adolescence, lesbians and gays are sure about their same-sex orientation and look for and live a lifestyle according to this orientation.

But these statistical data of an early coming out do not mean that all gays and lesbians have their coming out already during adolescence. There are still women and men (especially bisexuals) who keep their same-sex orientation secret, and even live for some time in heterosexual relations, and have their coming out as same-sex oriented women and men in their 30s, 40s, or even 50s. Those people are in a special situation since they have emotional attachments and obligations to their spouses and children, which make their coming out more complicated than it is for people of younger age. These families especially often need professional counseling during the coming-out process, which is not only an individual step of the homosexual or bisexual person, but a step that all members of the family must undertake (Rauchfleisch 2001; Wiesendanger 2001). This counseling can be done in a few therapeutic sessions with the couple and/or with the whole family, as well as by couple therapy or by family therapy in the narrow sense. Unfortunately, there are not many therapists or centers where families with a lesbian mother or gay father can find professionals who are familiar with these problems. Because of this, the existing self-help groups for lesbian mothers and gay fathers fulfill an important function, since there they find sympathy, support, and advice in their, at times, difficult situation. There also exists a self-help group, Hetera, for wives of gay husbands, where they have the opportunity to talk about their disappointment, their grief, and their feelings of being cheated in different aspects during the time of their marriage.

Especially difficult is the situation for those lesbians, gays, and bisexuals who suffer from psychic illness. In Switzerland, as in many other European countries and in the United States, the majority of professionals nowadays have the opinion that same-sex orientation has nothing to do with psychic health or psychic disease, but that homosexuality as heterosexuality includes the whole range from psychic health to severe disturbance. It is this insight that there is no causal relationship between the sexual orientation and psychic health or disease that led the World Health Organization in 1991 to make the decision to cancel homosexuality as a diagnosis from the *ICD*.

But we know that there are interactions between psychic disturbances and same-sex orientation. On the one hand, we know from empirical studies that discrimination at work has a severe negative influence on the somatic and psychic well-being of a person (Schneeberger et al. 2002) and, as studies from other countries show, being lesbian, gay, or bisexual nowadays still means living in a special situation with specific burdens. Some symptoms (e.g., suicidal impulses, abuse of alcohol, and psychosomatic disturbances) can be understood as reactions to these stressful circumstances.

On the other hand, we must take into consideration that being resistant to stigmatization and offenses in everyday life needs a strong personality that is able to create coping strategies to handle these difficult situations. People who suffer from psychic illness (neuroses, personality disorders, or psychoses), per definition, do not have this strength and, because of this, have many more difficulties in handling the problems in the coming-out process. At times, patients with borderline personality disorders, in particular, use their same-sex orientation as an explanation for all the difficulties from which they suffer in everyday life (Rauchfleisch et al. 2002). It is important for therapists and counselors who work in the psychosocial field to know about these interactions between the same-sex orientation and the different psychic diseases.

There are not many professionals in Switzerland who are very experienced in this field. In the big cities, lesbian, gay, and bisexual therapists have formed groups where they discuss these problems. There is also a national Swiss organization called *Medi-Gays*, a group for lesbian, gay, and bisexual professionals in medicine and psychology.

Since the Roman Catholic Church as well as fundamentalist groups in the Protestant churches have a strong discriminative policy against homosexuality, lesbians and gays have founded the ecumenical group *HuK* (Homosexuelle und Kirche—Homosexuals and Church), which fights for acceptance of lesbian, gay, and bisexual Christians. In another group, *ADAMIM*, founded in the early 1990s, gay priests have found a place to share their experience in church, to draw the public's attention to their difficult situation in church, and to fight for their rights as being accepted members of their church.

There are also two large national organizations, one for lesbians, *LOS* (Lesbenorganisation Schweiz—Lesbian Organization Switzerland), and one for gays, *Pink Cross*, which work together when it is necessary to fight for the rights of lesbians and gays. There are also local homosexual groups in the big cities. Moreover, there are groups for lesbians, gays, and bisexuals who are working in different professions (e.g., in medical jobs or as teachers) and sections, formed by *Pink Cross*, and working for a better situation in church, in the working field, for legal rights, and so on.

Until now, there are only two cantons of Switzerland (Genf and Zürich) where lesbian and gay couples have the opportunity to legalize their partnership. A national law is in the works as of mid 2003, but it is not yet decided. As in other European countries that already have such a law, it will give same-sex couples the same rights as heterosexual (married) couples, but will not include the right for adoption, although long-term studies from other countries show that children who are brought up in lesbian or gay families do not differ from children who are brought up in heterosexual families, i.e., they do not show any specific pathology in their personality or behavior (Rauchfleisch 1997).

## 7. Gender Diversity and Transgender Issues

UDO RAUCHFLEITSCH

Switzerland at present has no special laws dealing with transsexuality. Though for many people, transsexuality is still something "strange" and "irritating," the acceptance of transgender persons in public has increased during the last 10 to 15 years. This leads to less discrimination and has made it easier for them to find a job and to live an "ordinary" life. Some get married in their new role (heterosexual preference), while others live in a lesbian (man-to-woman) or gay (woman-to man) relationship with a partner. This phe-

nomenon shows that transsexuality is a dimension independent from sexual orientation.

There are some centers in Switzerland at the University Hospitals where specialists of surgery, endocrinology, psychiatry/clinical psychology, urology, and gynecology treat transgender/transsexual persons. The programs are adapted to the way of treatment that developed in other countries, especially in the United States. This modality requires at least one year of an ongoing psychotherapeutic accompaniment, a psychiatric expert opinion, one year of treatment with cross-gendered hormones, and then the operation. Medical insurance companies pay for the psychotherapeutic and medical treatment if a psychiatric expert opinion states that there is an indication for those interventions. But the insurance companies still refuse to pay for epilation and logopedic (voice) treatment before operation, though these interventions are important for a good integration of the transsexual person into the new gender role. After a sex-change operation, it is possible to change the first name in the personal status in all documents.

Experience with transgender/transsexual persons shows that within this group we find the whole range from psychic health to severe psychic disturbances. Severe psychopathology, especially schizophrenia, is a contraindication for treatment with cross-gendered hormones and surgery. Studies on long-term outcome show, in accordance with the international literature about transsexuality, that generally woman-to-man transsexuals have a better prognosis than man-to-woman transsexuals. Moreover, social integration is an important predictor for outcome (Wylter et al. 1979; Rauchfleisch et al. 1998). If the passing (fitting into the new gender role by the body structure) is good, it is easier for the person to be accepted in this role, while it is a more complicated situation for those with a poor passing. On the whole, passing for woman-to-man transgender persons is much better than for man-to-woman because of the strong consequences of the treatment with testosterone (especially breaking of the voice and growing of a beard). Those transsexual persons who have a solid professional education can often stay in their jobs and do not have great difficulties in social acceptance (family, friends, or public). Experiences with the psychotherapeutic accompaniment show that it is important and fruitful that this treatment is offered during the whole process, from the time before medical interventions until the operation, and even for some time afterwards. If there are spouses or children, it is important to integrate them, at least from time to time, into psychotherapy, or recommend them (especially children) for individual psychotherapy or counseling.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sexual Behaviors

#### *Child Sexual Abuse, Incest, and Pedosexuality (Pedophilia)*

As in many other countries, child sexual abuse is a crime with a high percentage of unreported cases, especially when it is an abuse in the sense of incest (done by the father or other close family member). This fact can be understood because of the closeness of the perpetrator to the victim. Often the victim does not dare to inform other people because of fears that they will not believe her or him, or the victim feels he or she is guilty for what has happened; there might also be a loyalty conflict because the perpetrator is a person to whom the child is closely attached at the same time as the abuse is occurring, often causing total confusion about her or his own perception. Because of this emotional confusion and because

of the feelings of shame and guilt, it can take many years until sex abuse is consciously recognized and reported to psychotherapists. Eighty to 90% of the victims are girls. The perpetrators are generally up to 90% men from all social levels. To fight sexual abuse of children, an emancipating education and a change of gender-specific power structures is demanded. In Switzerland, children and parents find help in various institutions and places for maltreated and abused children, by emergency telephone hotlines for children, in child-protection centers, and in psychiatric and psychological institutions for children and families.

### *Pedosexuality*

We prefer this term instead of “pedophilia,” which by “philia” conceals the aggressive dimension of these deeds. Pedosexuality focuses on the various dynamics and interactions between perpetrator and victim. Similar to incest are those cases where the perpetrator is a leader of Boy Scout groups, a clergyperson, a trainer of sport groups, and so on, who is quite close to the child. Most of the cases of pedosexuality belong to this group. In 2002, both worldwide and in Switzerland, pedosexuality became a public issue when pedosexual crimes committed by Roman Catholic priests decades earlier became a public scandal. It seems that not all these priests are men with pedosexual preferences, but instead chose to abuse children as the way of the lowest resistance (“*Weg des geringsten Widerstandes*”). Though the officials of the Roman Catholic Church, as usual in such cases, tried to talk of “singular cases” and denied any connection with the forced celibacy of priests, it is obvious that the structures and the sexual norms of the Roman Catholic Church are important factors and are directly (causally) related to these pedosexual acts of priests.

In other, far fewer cases of pedosexuality, the victim does not know the perpetrator who tries to get into contact with the child and abuses it.

### *Sexual Harassment*

As in other European countries and in the United States, many women are victims of sexual harassment at their workplace. A study conducted in 1993 (Ducret & Fehlmann) reported that 72% of the women surveyed indicated that they had experienced sexual advances by men against their will or were victims of sexual insults at least once and usually more often. Those affected are more often single women, frequently in insecure positions, with a low self-esteem, and in a professional situation of great dependence and in jobs dominated by men. The perpetrators are “ordinary” men, frequently married, fathers of children, and mostly more than 10 years at the present workplace. As shown by this and other studies, sexual harassment has a very bad influence, not only on the victims (feelings of shame and helplessness, sleeping disorders, anxiety, depression, and disturbances in personal relationships), but also on the working place (lower efficiency of work, bad climate at the place of work, and leaving the job).

A law (*Eidgenössisches Gleichstellungsgesetz*, Arts. 3 and 4), enacted in 1996, declared sexual harassment punishable and obliged the employer to inform the employees about this law and to deal effectively with complaints. Until now, information events were undertaken in many public and private workshops, and in some cantons. Also both Protestant and Roman Catholic authorities have published information about sexual harassment and, as public and private institutions, have identified persons of confidence who, in case of sexual harassment, help women to clarify their situation, intervene at the workplace of the women, and support them if they want to start a legal procedure.

## 9. Contraception, Abortion, and Population Planning

SIBIL TSCHUDIN

### A. Contraception

In the first half of the 20th century, contraception was mainly limited to the use of natural family planning methods such as the one Knaus Ogino devised. The response to questions about family planning was strongly—and might still be slightly—influenced by social factors and religion. That means that contraceptives were more accepted and used in Protestant regions than in Catholic ones, more in cities than in rural regions, and more by better-educated persons than by people of lower social status. With the introduction of the pill on the Swiss market in the early 1960s and the development of more-convenient IUDs, as well as in consequence of the women’s emancipation movement, the demand for and use of effective contraceptives has changed drastically. Nowadays, its use is widely accepted. Birth control is still mainly left to women. After the detection of HIV/AIDS, and certainly because of information and large advertising campaigns during the last decade, the awareness of this problem and the acceptance of condom use has grown considerably.

In a survey carried out in 1996, a representative sample of 1,000 women between ages 15 to 45 were asked about the actual contraceptive method they used. The results showed a predominance of oral contraceptives (OC) by 31%, followed by condoms (17%), IUD (6%), tubal ligation (6%), vasectomy (5%), natural family planning methods (5%), coitus interruptus (2%), and depot-injections, diaphragm, and spermicides (1% each). Twenty-two percent indicated they used no contraceptive at all. Of this 22%, 18% were pregnant or intended to get pregnant; the remaining 4% would have been upset by an unwanted pregnancy. Young women (age group 20 to 25 years) use the pill in an even higher percentage of about 50%. Contraceptives are not covered by health insurance and must be paid for by the consumers themselves. This is an important factor that limits their use, especially by the young, people with low income, and asylum-seeking immigrants. Whereas condoms can be purchased easily in drugstores and supermarkets, the pill can only be bought in pharmacies on prescription.

### B. Teenage (Unmarried) Pregnancies

In comparison with some other European countries, the pregnancy and birthrate of teenagers (age 15 to 19 years) is relatively low. In 1998, 3.9 per 1,000 teenagers gave birth to a child in Switzerland, while the rates in 1997 for the U.K., Sweden, and Netherlands were 30.1, 7.2, and 4.3 per 1,000, respectively. The estimated abortion rate for teenagers in Switzerland was 6.1 per 1,000 in 1998, indicating that three of five teenage pregnancies end by artificial abortion. The estimated pregnancy rate for the age group of 15 to 19 years is about 10 per 1,000. Teenagers can make the decision on their own, and if they fear that it could be seriously harmful to them if their parents were informed about the unwanted pregnancy, their wish for secrecy will be taken into account. Single mothers are given an assistance or guardianship for their children only if they are not of age or express a need for assistance. Various institutions offer help to the young mother, if there is not sufficient support by the teenager’s parents and family.

### C. Abortion

In the 19th century, legislation concerning artificial abortion was a responsibility and duty of the cantons. From 1893 to 1938, nationwide regulation of this issue within the federal penalty legislation was discussed and a federal law

was worked out. In 1942, it came into force and reduced the more liberal management of abortion in some cantons to medical indication. That meant abortion was only legal if severe danger for the pregnant woman's life or health was feared. Otherwise, abortion was illegal and punished by prison or fine. The new legal limitation did not lead to a reduction of the number of legal abortions (about 15,000 per year in those times). But the following decades and the changing and more and more liberal attitude of Swiss people towards abortion led to a reduction in illegal abortions at first, and after the introduction of the pill, to a reduction of legal abortions as well. In the 1960s and 1970s, a so-called "abortion tourism" (mainly from Catholic and conservative cantons to more-liberal ones) was common, and the women often were made to feel guilty when seeking help in case of unwanted pregnancy. In the 1980s and 1990s, the law was interpreted very liberally. Unofficially, women were now allowed to decide themselves, and their decision was legitimated by the physician's expertise attesting to the risk of psychological sequelae if the woman were forced to keep the unwanted pregnancy. Since 1988, no woman has been punished by law for illegal abortion.

In 1971, Swiss women finally got their right to vote. Soon afterwards, an initiative to exempt abortion from punishment was launched, and then withdrawn in favor of the so-called "*Fristenregelung*" (time-limited permission that means legalization of abortion on demand of the pregnant woman within the first 12 weeks of pregnancy). In 1977, however, this law and a later law enlarged to a social indication were barely rejected by a plebiscite. Before the paragraphs concerning abortion in the penal code could be revised, a federal law charging the cantons to establish a center for planned parenthood offering counseling for free was launched in 1981 and put into operation in 1994. After years of debates and discussions, the second initiative to introduce the "*Fristenregelung*" was clearly accepted by more than 70% by plebiscite in 2002. This act legalized the practice of most cantons during the preceding two decades, and put an end to the varying, and therefore unjust, handling by the cantons. Abortion is now legal on demand of the woman when executed during the first 12 weeks of pregnancy.

The methods used are medical abortion by *mifepristone* and *misoprostol* until 49 days of pregnancy, and vacuum aspiration and curettage until 12 weeks of gestation. Medical abortion can only be offered by a physician, who can execute a curettage in case of failure of the method. The operation can be carried out in public hospitals, normally under general or epidural anesthesia, or in private practice, usually executed under local anesthesia. Private clinics generally refuse to carry out artificial abortions.

In any case, the following prerequisites must be met:

- Written demand of the pregnant woman;
- Pregnancy under a maximum of 12 weeks of gestation;
- Counseling concerning risks, complications, and possible sequelae by the physician performing a medical or surgical abortion;
- Counseling of adolescents under the age of 16 years in a specialized office;
- All abortions must be reported anonymously to the responsible health authority; and
- Beyond 12 weeks of gestation, abortion can be performed if there is a medical reason. This reason must be more severe the more the pregnancy is advanced. During the second trimester, abortion because of psychosocial or psychiatric reasons is exceptional. Most abortions at this state of pregnancy are executed on demand of the woman or couple after detection of severe fetal

malformations or chromosomal aberrations. Up to 14 weeks of pregnancy, a vacuum aspiration is the method used; afterwards, abortion is induced by *mifepristone* and *misoprostol*, occasionally followed by a curettage because of incomplete release of the placenta. The costs of any abortion procedures in the above-mentioned contexts are carried by the obligatory health assurance.

## 10. Sexually Transmitted Diseases and HIV/AIDS

JOHANNES BITZER

### A. Sexually Transmitted Diseases

Since the 1920s, there has been a political effort to control sexually transmitted diseases by reporting cases to state institutions. Registered prostitutes are legally required to be examined at regular intervals for venereal diseases.

#### *The Legal Framework*

In 1999, a modification regarding the reporting of sexually transmitted diseases was established in Switzerland. The new legal dispositions abolished the necessity for the physicians to report classic infections like gonorrhea, chlamydia, syphilis, and chancroid. In addition, the new law interrupted the automatic registration performed by the laboratories of *Treponema pallidum*. These new regulations seem to be appropriate regarding the assessment of infections. The new regulation says the following: Obligatory declaration refers to HIV and AIDS, laboratory declaration refers to HIV-positive tests, gonorrhea, chlamydia trachomatis, and hepatitis B and C. In addition, the following infections have to be declared (reported) by physicians: HIV, AIDS, and hepatitis B and C.

#### *The Epidemiology*

The incidence of the different infections is changing. Gonorrhea has diminished and syphilis seems to be increasing.

There are very few specialized STD clinics, because these are usually integrated into the dermatological department of university hospitals. Thus, patients with STDs are usually seen either in practices of general practitioners, gynecologists, or urologists, or at the outpatient departments of the dermatology, gynecology, and urology units. There are, however, specialized HIV clinics, which are usually directed by infectiologists (internal medicine). Several dermatological outpatient departments in Switzerland have decided to survey other STDs. Their list includes: orchitis in men, rectitis, cervicitis, chlamydia, gonorrhea, syphilis, chancroid, genital herpes, genital condylomata, pelvic inflammatory disease, and *Trichomonas*. Unfortunately, the data gathered by the six outpatient university departments are not representative for the Swiss population.

For the general population, there is a declaration system called *Sentinella*. Between 150 and 250 general practitioners are cooperating on a voluntary basis to report infectious diseases. Since 1995, 30 gynecologists have been included.

In 1998, gynecologists have participated in a prevalence study on chlamydia in women under 35 years of age. From this study, it has been extrapolated that the numbers given by the laboratories represent only 5% of the total reservoir of chlamydia infections of women between 20 to 35 years. It is therefore estimated that chlamydia infections have spread out in Switzerland, with 2,400 infection cases in 2000. This means, that chlamydia is the most prevalent sexual STD infection in Switzerland. Compared with AIDS, the detection and tracing of other STDs is not optimal. This

provides a reason for reconsideration, especially regarding the resurgence of classical STDs in all European countries.

The laboratory reports do not permit an in-depth epidemiological analysis. On one hand, the available data are incomplete, and on the other hand, they do not mention the total number of tests. This makes it impossible to ascertain whether an increase in positive test results is because of an increase in infections or to an increase in the number of tests.

## B. HIV/AIDS

### Overview

HIV- and AIDS-prevention programs are quite widespread in Switzerland. Two major organizations are involved in public education and programs.

The AIDS Hilfe Schweiz, l'Aide Suisse contre le SIDA (aids@aids.ch) is a private association founded in 1985 and financed by Bundesamt für Gesundheit (BAG—the Federal Administration of Health). This organization has 21 cantonal and regional subcenters. The secretariat of the organization, based in Zurich (Konradstrasse 20, 8005 Zurich; case postale 1118, 8031 Zurich), develops specially tailored programs for HIV prevention especially for homosexual and bisexual men, female and male sex workers, drug consumers, and young people. This secretariat also coordinates the action of the other centers, which are financed by the cantons. The local or cantonal centers' services include medical information, legal advice, personal counseling, networking, and group formation.

A second regular information service is the SIDA Infodoc Swiss (www.infodoc-gf.ch). This organization is responsible for the collection of bibliographic information. SIDA Infodoc publishes regularly a journal called *Aids Infothek*, which comments on the actual issues and also reviews recent publications.

The general approach in family planning consultations is to provide counsel for prevention of unwanted pregnancy in combination with protection against sexually transmitted diseases, especially HIV. This is accomplished by promoting the use of condoms. Tests can be made anonymously and free of charge at the Aidshilfe institutions. Testing is also available at the outpatient departments.

HIV-infected persons are obliged by law to inform their sexual partners about the risk. On the other hand, HIV-positive prostitutes are not obliged to inform their clients. Clients of sex workers are responsible for protecting themselves.

Partner tracing is not obligatory, nor are possibly infected persons obliged to be tested for HIV. HIV testing can be only performed with the informed consent of the person. Testing by institutions and hospitals for protection of medical personal without informed consent of the patients is not allowed. The general policy is to encourage people to get tested, but all the efforts are dealt with on a voluntary basis because coercion is thought to push people into isolation and anonymity that prevent them from collaborating with the health system. Infected persons are strongly encouraged to inform their partners. They are advised about the legal consequences of infecting another person in the presence of knowledge of one's own infection. Further obligations are not regulated by law.

### HIV Prevention Programs

For the past 14 years, since 1989, the Institute for Social and Preventive Medicine of the University of Lausanne has performed various studies regarding the global strategy of prevention of HIV infections. Global evaluation surveys, as well as specific studies in specific populations, have been performed. The last report on the global evaluation of 1996 to 1998 shows the following results:

- Public awareness of the need for ongoing HIV prevention and consciousness of risk-reduction behavior remain at a high level. The results of HIV-prevention education are steady and persistent. There is no diminution of preventive behavior in recent years and the number of new infections has continuously declined. It can be seen that there is no longer a major difference in the different regions of Switzerland, and preexisting differences between cities and rural areas and between different groups of education have diminished. There is also general agreement that the confederation has to continue health education on this issue to make it part of normal life.
- A major element of HIV prevention is a solidarity, which manifests itself on the level of solidarity with affected persons, solidarity with the manifestly ill persons, especially regarding their jobs and their insurance, and solidarity with other countries affected by the infection.
- A special program for women's health and prevention of AIDS was set up between 1994 and 1998, making it possible to form groups of experts in reproductive and sexual health to integrate women's health into gender-sensitive programs and activities at universities and hospitals.
- There is, however, still a lack of uniformity between the different cantons in Switzerland. Another study has focused on the sexuality and sexual behavioral of HIV-positive persons (published in 1998). The infected persons suffer from various psycho-effective problems, like diminution of self-esteem, fear of being rejected, the difficulties of maintaining protected intercourse, the denial of the disease, the deterioration of physical well-being, and the questioning and doubts about maternity or paternity.
- From this study, it was concluded that, besides the medical care, more intensive psychological care is necessary. Furthermore, health personal should be informed about the special emotional needs of HIV-positive persons.

Another study of the needs of HIV-positive persons found that the quality of information and of counseling is too heterogeneous across the country. There are no guidelines regarding information-giving and patient education. Moralizing continues. The insurance companies do not pay for artificial insemination for HIV-positive males who want a child, but without the risk of infecting their partner with unprotected intercourse. Psychological support during pregnancy is insufficient. There is a need for continuous education for obstetricians and midwives. There are still too many tests performed without informed consent.

Finally, a third study has evaluated sexual education at schools. As in other areas, this study showed an enormous heterogeneity between the different regions. Although there is a legal basis for all schools to teach about HIV, the practice is very different. It seems that on the obligatory school level, the coverage of the subject is sufficient, whereas at the higher school levels, it is much less. In the German-speaking region, sexuality education seems to be less effective than in the French-speaking region. There is no basic sex education in the German-speaking part, which makes it more difficult for the teachers to approach AIDS as a subject.

[Update 2002: UNAIDS Epidemiological Assessment: By the end of 2001, a cumulative total of 25,637 cases of HIV infection was reported in the country. The number of newly diagnosed AIDS cases has declined since 1995. This development is associated with improved therapy (highly active antiretroviral therapies, HAART). Injecting drug use-

ers and men who have sex with men each contributed approximately 25% to the reported AIDS cases in 2000 and 2001. The proportion of cases in the heterosexual transmission group had been steadily increasing until 1999, and seems to have stabilized since then at around 45%. As a result, the proportion of cases in women has also increased over the years to over 30%.

[The number of death reports for persons with AIDS increased until 1994 and has since declined. In 1999, approximately 120 persons with HIV or AIDS were reported to have died. This number is less than 20% of the number reported for the peak year 1994. Death reports are not complete for 2000 and 2001, but it is estimated that the decline in AIDS-related mortality is continuing, although at a slower rate.

[The number of newly diagnosed HIV infections has also been declining in Switzerland between 1992 and 1999 to 2000 and appears to be stabilizing. Heterosexual contacts have been the dominant transmission route since 1990 (over a third of all newly diagnosed HIV infections, over 50% since 1997). Men who have sex with men make up approximately 25%, and injecting drug users approximately 15% of reported positive HIV tests in 2000 and 2001. Among heterosexually infected cases, the proportion of cases with nationalities from countries with a generalized epidemic is increasing, although the absolute number of cases in this group has been more or less stable in the second half of the last decade.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	19,000 (rate: 0.1%)
Women ages 15-49:	6,000
Children ages 0-15:	300

[An estimated less than 100 adults and children died of AIDS during 2001.

[No estimate is available for the number of Swiss children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

JUDITH ALDER

The definition of sexual dysfunction followed in Switzerland is in agreement with the international classifications of mental disorders *ICD-10*, chapter F52 (sexual dysfunction not in relation to a medical factor), and *DSM-IV* (sexual and gender identity disorders). However, in the general population, there is a lack of definition of what "normal sexual behavior" is. This is particularly true in the lack of public knowledge about what is the "normal" range of frequency for sexual activity and what types of sexual behavior are considered within the "normal" range. In general, a sexual dysfunction is diagnosed only after a longer period of its persistence and not shortly after the development.

An impairment of sexual behavior/response that has the following features is understood as sexual dysfunction:

- Disorder of sexual drive or satisfaction;
- Lack of the physiological reaction needed for satisfactory sexual interaction;
- Inability to experience and control orgasm; or
- Painful intercourse.

A recent Swiss survey of sexual dysfunction in women shows that lack of libido is the most-often-named sexual problem (41%), followed by orgasmic disorders (19%), dyspareunia (painful intercourse) (12%), vaginal spasms (10%), sexual aversion (8%), and excitement disorder (1%) (Buddeberg et al. 1994). In men, the most frequent sexual

dysfunction is erectile dysfunction (41.7%), followed by early ejaculation (30.6%), lack of libido (9.7%), painful intercourse (2.8%), and sexual aversion and delayed ejaculation (both 1.4%) (Buddeberg et al. 1994). In general, sexual dysfunction certainly is not something people talk about when they are confronted with it. Even women during menopause rarely have an exchange about the changes and problems in sexuality they experience during these years.

### Availability of Diagnosis and Treatment

People with sexual problems generally consult first their family physician or gynecologist. Many patients who do not mention the problem to their doctor will not receive treatment for a long time. Questions about sexual functioning are still not part of a routine history taking. Only a few men would consult a urologist in the first place; they generally wait until their general practitioner physician refers them. If the problem is recognized, diagnosis by physicians generally is mostly adequate. However, if the problem is related to addictive behavior or medication, it may not be assessed carefully enough. Sexual problems in the first place are still looked upon from a somatic perspective and more so for men than for women. Only if a medical treatment is unsuccessful will the patient be referred for specialized counseling. However, there is a clear shortage of therapists who have special skills in sexual counseling, and it is generally rather difficult to find therapy places for patients with a sexual dysfunction. There are only a few centers in the larger cities that offer special counseling and therapy for sexual dysfunction. And these generally have waiting lists.

### Training and Certification of Therapists

A recent study assessed knowledge of and sensitivity to the sexual side effects of antidepressants in general practitioners and psychiatrists (Kunz et al. 1998). The response rate (12.5%) of the contacted physicians was very low, demonstrating at least partly the lack of relevance that healthcare providers give to sexual matters in counseling for other psychological problems. Only one half of physicians responding judged their competence in sexual medicine as fair or good. Differences in sexual history taking were observed between general practitioners and psychiatrists, the latter addressing more frequently sexual medicine-related questions. The results emphasize the importance of knowledge and competence in sexual medicine for general practitioners and psychiatrists, both showing interest in continuing education on this topic. Diagnosis and treatment of sexual dysfunction is part of most curricula in psychology and—later on—psychotherapy specialization. These curricula include sexual dysfunction as one part of the training among the other mental disorders. There are only a few private institutes, Zentrum für Agogik and Höhere Fachschule Luzern being two, which offer a specialization course in sexology and sexual counseling. However, there is no official regulation or certification for those providing sexual counseling in Switzerland.

## 12. Sex Research and Advanced Professional Education

JOHANNES BITZER

There is no Swiss professorial society for sexological research and sexology. There are, however, different professional associations that deal with sexual issues. These include the Swiss Society for Psychosocial and Psychosomatic Medicine, especially the Division of Psychosomatic Obstetrics and Gynecology; the Swiss Society for Fertility, Sterility, and Family Planning; the Swiss Society of Urology; and the Swiss Society of Gynecology and Obstetrics. In recent years, efforts have been made to integrate sexology

gy in the curricula for training medical students. Until now, there is not yet a specific training program, which could be compared to other training programs designed to teach certain skills (*Fertigkeitsausweise*).

In 1998, a collaboration between the institutes of Basel, Zurich, and Lausanne for social and preventive medicine made a survey analyzing 140 publications regarding reproductive and sexual health: 23% of the publications were routine statistics, 12% repetitive studies, 61% isolated studies, and 5% ongoing studies. The largest amount of studies, 40%, concentrated on STDs and HIV, followed by unwanted pregnancies 33%, contraception 29%, sex education 14%, sexual behavior 8%, deliveries 8%, and violence 6%. This analysis showed that there is a lack of epidemiological data regarding the country as a nation in almost all areas, including unwanted pregnancies, STDs, violence, contraceptive behavior, and so on.

A quite-positive development can be found in the recent and current research projects undertaken by several research groups in Switzerland:

- The Institutes of Social and Preventive Medicine in Switzerland are focused on epidemiological research.
- The Institute in Zürich (Schmid, Gutzwiller) has done major research projects on sexual and reproductive health of the Swiss population. Furthermore, they have made surveys regarding sexual behavior especially in the older age group. Another focus of research of this group is HIV and AIDS prevention.
- The Institute in Lausanne (Dubois-Arber, Spencer) performed several evaluation studies on HIV/AIDS prevention, unwanted pregnancies, and teenager sexuality. Another focus of their research is violence and especially sexual violence. (Hofner et al.).
- Another publication was made in 2001 by the Institute of Social and Preventive Medicine of Lausanne. The study focused on the sexual health of the canton Waadt. The study focused mainly on postcoital contraception and a knowledge of contraceptive methods.
- The Institute in Basel (E. Zemp, U. Ackermann-Liebrich) is focusing especially on women's health issues. This includes research on family planning services, maternity care, mammography, etc.
- Research on teenager health was extended by P. A. Michaud and F. Narring.
- Several research projects on violence and especially sexual violence have been performed by different research groups (Godenzi, Felber, Gilloz).
- Research on contraception and sexuality is being performed by various university groups (J. Bitzer et al., M. Bianchi-Demicheli, etc.).
- The group of C. Buddeberg at the Zürich Institute of Psychosocial Medicine has published on several issues: Sexual counseling skills, and sexual behavior of elder females and males (M. Schmid-Mast, C. Buddeberg, F. Gutzwiller).
- The group of Johannes Bitzer at the Division of Social medicine and Psychosomatic Gynecology has done research on sexual dysfunction, counseling, and adolescent and perimenopausal sexuality.
- Another important institution is the Professor Willi Pasini Institute of Sexology at the psychiatric university hospital of Geneva. The work is now continued by Dr. Dominique Chatton, a psychiatrist.
- Several groups have done prevalence studies on STDs (Feuz et al., Lauper).
- One of the most important areas of research in Switzerland is the study of sexual and reproductive health per-

formed by Karen Klaue and Brenda Spencer with the collaboration of Hugues Balthasar. This study was financed by the Office Fédéral de la Santé Publique, Berne, and was carried out at the Institut Universitaire de Médecine Sociale et Préventive, Lausanne. The background of the study is the important political initiative, called Postulate of Genner of June 2000, which demands that the government produce a survey on the report how the sexual health of the Swiss population could be improved. The study was performed from the December 1, 2001, to June 3, 2002. One of the major objectives of the study was the integration in coordination of different services and programs like mother and child healthcare, family planning, and AIDS help, prevention, and protection, with a special focus on groups like teenagers, men, and women apart from their role as mothers.

- Gender studies have also become an important part of the research and academic activities in Switzerland. The approach is multidisciplinary and includes the sensitivities and nuances of researchers in different disciplines like medicine, social signs, linguistics, history, and so on, to include in their research gender-specific questions and what is called gender mainstreaming.
- A competence center for gender studies was founded in 1998 in Zurich. In Lausanne, there is a chair for gender studies. There is a Swiss society for women and gender research, founded in 1996.

There is no official specifically sexological journal devoted to publication of sexological research. Research results are usually published in German or English journals.

### *Demographics and a Brief Historical Perspective*

PHILIP SETEL

#### A. Demographics

The United Republic of Tanzania is situated on the mainland of the East Coast of Africa and includes the Islands of Zanzibar and Pemba, separated from the mainland by a 25-mile-wide (40-km) channel. The country is one of the largest in Eastern Africa, with an area of about 364,900 square miles (945,000 square kilometers), about twice the size of the state of California in the United States. Tanzania shares borders with Kenya and Uganda to the north, Rwanda and Burundi to the northwest, Zaire to the west, Zambia to the southwest, and Malawi and Mozambique to the south.

\**Communications:* Philip Setel, Project Director, Adult Morbidity and Mortality Project (AMMP-2), Ministry of Health, P.O. Box 65243, Dar es Salaam, Tanzania; setel.ammpp@twiga.com. Eleuther Mwageni, Namsifu Mndeme, and Yusuf Hemed: ammpp.dar@twiga.com (shared email). *Comments:* Beldina Opiyo-Omolo, B.Sc., Department of Health, East Stroudsburg University of Pennsylvania, East Stroudsburg, PA 18301 USA; bopiyo@yahoo.com.

\*\**Editors' Note:* We would call the reader's attention to a simple but crucial sentence in the Brief Historical Perspective, where the authors note that "Tanzania is one of the poorest countries in the world, with a per capita gross domestic product (GDP) of US\$220." (Five years earlier, in 1997, the GDP was \$700.) Since 1990, Tanzania's economic condition has steadily worsened, stressed by a near 3% annual population growth. Between 1993 and 1996, close to a half million Rwandan Hutu fled into Tanzania to escape ethnic strife with the Tutsi. In the 1990s, the nation's infrastructure and access to medical services and commodities, well-established in the 1970s, collapsed. In the midst of the deteriorating situation, Philip Setel, Project Director, Adult Morbidity and Mortality Project in the Ministry of Health, recognized the importance of this *International Encyclopedia* and organized a team to research and write this chapter on their country. Unfortunately, deteriorating meager resources and more-urgent health priorities, including over 800,000 AIDS orphans, made it impossible for them to provide information on all the topics in our standard outline. We thank them for their sincere effort and the insights they provide that are not available elsewhere.

(CIA 2002)

Tanzania has a diverse topography. The narrow coastline lies less than 200 meters (655 ft.) above sea level. Most of the country is a plateau with an altitude of more than 1,000 meters (3,280 ft.) above sea level. The landscape rises towards the south to reach about 3,000 meters (9,840 ft.) above sea level in the Southern Highlands. Further north, the altitude reaches over 5,000 meters (16,400 ft.) in the Northern Highlands of Tanzania. Mount Kilimanjaro, the highest point in Africa, is 5,895 meters (19,340 ft.) above sea level. Tanzania contains three of Africa's best-known lakes: Victoria in the north, Tanganyika in the west, and Nyasa in the south. The highlands of Tanzania are the most fertile areas in the country, and have a denser population than other parts of the country. Tanzania's climate is reflected in the variations in altitude. The coastal area has high temperatures of about 30° C (86° F) and receives long rains between February and May and short rains during the October to December period. The plateau is subject to high temperatures during the day and is relatively cool at night. This area has a low rainfall and experiences long dry spells between May and October. The highlands as well as the western part of the country have high rainfall, especially between February and April.

In July 2002, Tanzania had an estimated population of just over 37 million. The estimates presented below explicitly take into account the effects of excess mortality because of AIDS. This can result in lower life expectancy, higher infant mortality and death rates, lower population and growth rates, and changes in the distribution of population by age and sex than would otherwise be expected. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 44.6% with 1.01 male(s) per female (sex ratio); 15-64 years: 52.5% with 0.98 male(s) per female; 65 years and over: 2.9% with 0.83 male(s) per female; *Total population sex ratio:* 0.99 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 51.98 years; *male:* 51.04 years; *female:* 52.95 years

**Urban/Rural Distribution:** 25% to 75%. In 2001, Dar es Salaam, the capital, had an estimated population of about 1.4 million and Mwanza about 225,000.

**Ethnic Distribution:** Mainland: native African 99% (of which 95% are Bantu consisting of more than 130 tribes);

other 1% (consisting of Asian, European, and Arab). Zanzibar: Arab, native African, and mixed Arab.

**Religious Distribution:** Mainland: Christian: 45%; Muslim: 35%; indigenous beliefs: 30%. Zanzibar: more than 99% Muslim. Tanzanians often affiliate with both indigenous and Western religious beliefs.

**Birth Rate:** 39.12 births per 1,000 population

**Death Rate:** 13.02 per 1,000 population

**Infant Mortality Rate:** 77.85 deaths per 1,000 live births

**Net Migration Rate:** -0.08 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.33 children born per woman

**Population Growth Rate:** 2.6%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 8.09%; *Persons living with HIV/AIDS:* 1.3 million; *Deaths:* 140,000. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 67.8% (*male:* 79.4%, *female:* 56.8%). Education is free and compulsory between ages 7 and 14. Swahili and English are the official languages of Tanzania, though the majority of people continue to use the language of their ethnic group.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$610 (2001 est.); *Inflation:* 5%; *Unemployment:* NA; *Living below the poverty line:* 51.1% (1991 est.)

Some basic demographic indicators for the country are presented in Table 1. Population growth in Tanzania, as in most African countries, is largely influenced by fertility and mortality rates, particularly deaths because of HIV/AIDS. As shown in Table 1, the total fertility rate is high, but showed a significant decline in the 1990s.

## B. A Brief Historical Perspective and Cultural Setting

The original inhabitants of Tanzania were probably hunter/gatherers of the Khoisan-speaking peoples. The remnants of these are the Sandawe and Hadzapi minorities found in central Tanzania. During the first millennium, Bantu-speaking people occupied and settled most of what is now Tanzania. The Nilotic people migrating from the Sudan and the Semi-Cushitic who settled in the northern plains of the country followed later.

Tanzanian contacts with people from outside the African continent began around 700 C.E., when Arab traders visited the East African coast. Portuguese explorers reached the coastal area around 1500 and dominated trade up to the 17th century, when the Arabs from Oman displaced them. The fluorescence of coastal trade and society gave rise to the Swahili language about 1,200 years ago. Swahili has become a *lingua franca* from south Somalia, to Kenya, Uganda, the Democratic Republic of Congo, the Comoros, and North Mozambique. Following the partition of Africa by the colonialists, Tanganyika became a colony of Germany, together with Rwanda and Burundi. After World War I, Tanganyika was taken over by British colonialists as a protectorate. Tanganyika attained its independence in 1961 after about 77 years of colonial rule. Zanzibar was under the dominance of the Oman Arabs until 1890, when it came under the British colonial rule. In 1964, Zanzibar became independent. In the same year, Tanganyika and Zanzibar united to form a United Republic of Tanzania.

Tanzania is one of the poorest countries in the world, with a per capita gross domestic product (GDP) of US\$220 (Population Reference Bureau

2000). The country has a mixed economy, with agriculture, mining, and tourism contributing the largest shares. Economic performance and trends in Tanzania have not been favorable since attaining independence in 1961. During the 1960s, the GDP was estimated to be growing at an annual rate of 6%. There was a growth decline of GDP to about 4% during the 1970s, and a further decline to less than 2% growth during the 1980s (The Planning Commission 1992).

Several internal and external factors have contributed to the dismal economic situation, especially during the late 1970s and mid 1980s. Internally, the economy was mismanaged and there were many policy failures. An annual population growth rate of about 3% during this period was another contributing factor (The Planning Commission 1992). Population growth put additional pressure on economic and social conditions, especially in terms of provision of social services and access to basic commodities. The existence and the quality of a good health infrastructure, for example, which was established in the early 1970s, deteriorated, and services collapsed because of lack of drugs and medical supplies.

Externally, the Tanzanian economy was affected by the deterioration of the country's major exports (sisal, coffee, and tea) on the world market and the oil crisis of the 1970s. Between 1978 and 1979, the country also considerably depleted its economic resources in the war against Uganda, which toppled President Idi Amin. Finally, there was a tremendous decline in external assistance as the country's external debt burden increased because of some of the factors just mentioned. The combined effects of these factors were devastating to the living standards of the population.

The economic growth rate has started to show some signs of recovery as a result of economic reforms. GDP grew 3% in 1994 and 3.9% in 1995 (Bureau of Statistics and Macro International 1997). This growth rate was still lower than the targeted 5% envisaged by the 1995-1998 Economic Recovery Programmes.

### 1. Basic Sexological Premises, and 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

#### A. Character of Gender Roles

Gender roles are shaped within the social structure. There is, however, a diversity of tribal societies often with distinct gender roles in Tanzania. In most of Tanzania, gender roles reflect the dominance of men over women. Customs tend to discriminate against women and men have an upper hand in the ownership and control of resources of pro-

**Table 1**  
Selected Demographic Indicators, Tanzania 1967-1997

Indicator	1967	1978	1988	2000	2002
Population (millions)	12.3	17.5	23.2	35.3	37
Density (pop. per km <sup>2</sup> )	14.0	20.0	26.0	37.4	—
Percent urban	6.4	13.8	18.3	20.0	25
Crude birthrate	47.0	49.0	46.0	42.0	39
Crude death rate	24.4	19.0	15.0	13.0	13
Total fertility rate	6.6	6.9	6.5	5.6	1.33
Infant mortality rate (per 1,000 live births)	155.0	137.0	115.0	99.0	78
Under-5 mortality rate per 1,000	—	—	—	143.0	—
Life expectancy at birth	41.0	44.0	48.0	53.0	52
Household size	4.4	4.9	5.2	—	—

duction and distribution (such as land, livestock, tools, and children) as well as in decision making. There is a strong sexual division of labor, especially in the domestic sphere, which is associated with women.

## B. Sociological Status of Males and Females

The social and family structures of Tanzania's many ethnic groups influence the ideological, cultural values and norms including sexuality. Traditionally, the social structure has been based on two kinship patterns, the patrilineal and matrilineal systems. In patrilineal systems, inheritance and power is vested with the husband's clan, based on the father-son relationship. In matrilineal societies, the status of children is established through their mother's clan. A woman's brother, though, has power and authority over the children of his sister and they normally inherit through him. In other words, contrary to the patrilineal system, in the matrilineal system, ties are not established between mother and daughters but between the mother's brother and her children. An estimated 80% of the Tanzania's ethnic groups are patrilineal (TGNP & SARDC-WIDSAA 1997). Matrilineal societies, historically more prevalent in coastal areas, declined in the 19th and 20th centuries.

## C. General Concepts of Sexuality and Love

Sexuality is rooted in social reproduction (Setel 1999) and is part of the social structure as stated earlier. Traditionally, in many societies, the issue of sexuality was considered secretive and the domain of adults. Sexual knowledge and education was part and parcel of initiation into adulthood for both males and females. Sexual life in Tanzania is widely considered to have three major roles: reproduction, expansion of kinship, and physical pleasure (Mbunda 1991). Sexual pleasure required expertise and the appropriate social context. Different ethnic groups had different ways of achieving sexual excitement. These included use of amulets, massage, caresses, fondling, wearing beads, waist, and belly dancing. However, sexual pleasure had to occur in a socially accepted context like marriage. Other kinds of sexual activity, such as adultery, homosexuality, child abuse, incest, and rape, were unacceptable, as they violated the social order.

Sexuality is also associated with physical and social development within the communities' social-control framework. There was a clear code of "dos and don'ts" at different stages of physical development. Members of the community are expected to observe certain norms before puberty, at puberty, and at marriage (see norms in Sections 5A, Interpersonal Heterosexual Behaviors, Children, 5B, Adolescents, and 5C, Adults). Those who conform are rewarded and those who do not are punished. For example, among the Zaramo, brides who were not virgins on their wedding day were ridiculed and were regarded as a disgrace to their family members; the marriage could be dissolved on such occasions (Mbunda 1991). Likewise, among the traditional Meru and other groups that follow the age-set system (Maasai, for example), it was considered to be incest for a man to have a sexual affair or to marry any woman other than a woman of his own age set (Haram 1999). This is because these daughters were considered as their categorical daughters. Most of these norms were not only monitored by the family, but also by the community, including neighbors, elders, and clan members.

These norms were imparted from one generation to another through socialization, a process whereby the youngest members of the community were prepared to live in the world of adults, reflecting the norms and values of the specific society. This socialization process took a variety of forms from one society to another, although at the lowest

level, it involved the family as an institution and the community at the highest level. On both levels, socialization was done separately for girls and boys. At the family level, boys were socialized at the father's fireplace school and girls by mothers in the kitchen school (Mbunda 1991). While boys were trained to be "men" (outside looking, open minded, and making decisions), girls were trained for their role of housewife and mother.

At the community level, socialization was achieved through initiation ceremonies. These were meant to transmit knowledge and values concerning procreation, mores, sexual skills, and good manners. Initiation ceremonies were offered once boys and girls had attained puberty. As stated earlier, boys and girls were separated for these rites. Boys' initiation is called (in Kiswahili) *jando* and that for girls *unyago* (Ntukula 1994). Among the Zaramo, for example, the *jando* curriculum for boys included good manners, bravery, the secrets of life, marriage, death, the responsibilities a man has to carry, and the customs and taboos to be observed. Girls were taught about male physiology, sexual intercourse, pregnancy, childbirth, and responsibilities of a good wife and mother in their *unyago* 'schools.' (Mbunda 1991). In some societies, circumcision (of both males and females) culminated the initiation ceremony.

## 3. Knowledge and Education about Sexuality

BELDINA OPIYO-OMOLO

### A. Formal Sources of Sexual Knowledge

See the preceding paragraph.

[*Comment 2003*: In Tanzania, puberty is a culturally marked period of the lifecycle in which young men and women learn about their social responsibilities, including knowledge about sexual behavior and reproduction as adults in their communities through initiation rites, or passage to adulthood.

### [B. Informal Sources of Sexual Knowledge

[Although sex education was an important component of puberty rituals for Tanzanian adolescents, in the past, such rituals were not common to all Tanzanian settings. The Shinyanga Region of west central Tanzania is a case in point. Knowledge about sexuality was not necessarily acquired through structured rituals of initiation. Young girls learned about their bodies and about the reproductive cycle in an informal, non-uniform way. For example, mothers would give some instruction on sexual techniques to daughters who were about to get married on how to satisfy their husbands, thus preventing them from wandering off elsewhere to find pleasure. Other informal networks of information available to young girls included discussion with each other, and practical experience gained through interactions with young men who visited the huts where the girls slept late at night. The girls slept in what was called *Maji*, outer rooms for grandparents where girls slept on their own. (*End of comment by B. Opiyo-Omolo*)]

## 4. Autoerotic Behaviors and Patterns

For attitudes toward masturbation and its practice by children, adolescents, and adult men and women, see Sections 5A, Children, and 5B, Adolescents, below.

## 5. Interpersonal Heterosexual Behaviors

### A. Children

The following list indicates specific sexual behaviors that are acceptable as normal before puberty by different tribal cultures. This is not a comprehensive list because atti-

tudinal information is only available for a few behaviors in the many tribal traditions in Tanzania.

- Playing with one's own genitals: Chagga
- Singing & dancing love songs: Chagga, Fipa, Nyakusa, Sukuma, Zaramo
- Touching or fondling and sucking mother's breasts: Chagga, Gogo, Makonde, Makonde Malaba, Maasai, Nyakyusa, Nyaturu Sukuma, Zaramo
- Playing father/mother games: Chagga, Fipa, Makonde, Makonde Malaba, Maasai, Nyakyusa, Nyaturu Sukuma, Zaramo
- Fondling and kissing: Chagga, Makonde, Makonde Malaba
- Masturbation: Fipa
- Interest in sexually exciting stories and games: Fipa, Nyaturu
- Interest in one's own genitals or buttocks: looking or touching: Gogo, Maasai, Nyaturu, Zaramo
- Enjoying genitals being touched during washing: Gogo, Zaramo
- Causing penis or clitoris to become erect: Gogo, Makonde, Makonde Malaba, Sukuma
- Interest in opposite sex: Maasai
- Lovemaking and sexual intercourse: age 7 to 14: Maasai (Source: Mbunda 1991)

Sexual behaviors that are unacceptable for children before they enter puberty; again this is not a comprehensive list.

- Sexual intercourse: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Maasai, Nyaturu, Sukuma, Zaramo
- Overindulgence in private masturbation: Fipa, Makonde, Makonde Malaba
- Interest in watching animals mate: Gogo, Makonde, Makonde Malaba, Nyakyusa, Nyaturu
- Watching people mating: Zaramo
- Public masturbation: Makonde, Sukuma
- Prostitution: Makonde
- Sodomy: Maasai
- Bestiality: Maasai
- Rape: Maasai
- Incest: Maasai
- Preoccupation with one's own genitals: Nyakyusa, Nyaturu, Zaramo
- Association with the other sex: Nyakyusa
- Touching another's genitals: Zaramo (Source: Mbunda 1991)

## B. Adolescents

The onset of puberty brings major changes in what behaviors the various cultures of Tanzania consider acceptable for adolescents. Acceptable behaviors include:

- Interest in the other sex: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Maasai, Nyakyusa, Nyaturu, Zaramo
- Private masturbation: Chagga, Fipa, Gogo, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Interest in sex-related stories, songs, and dancing: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Sukuma, Zaramo
- Female or male circumcision: Chagga, Gogo, Maasai, Nyaturu, Zaramo
- Interest in sex ornaments, e.g., beads: Chagga, Zaramo
- Interest in sexual development: Fipa, Gogo, Nyakyusa, Nyaturu, Zaramo
- Interest in learning lovemaking techniques: Fipa, Zaramo
- Playing father and mother: Gogo
- Sexual intercourse with several partners: Maasai
- Sexual fantasies: Gogo, Nyakyusa

- Enlargement of clitoris: Nyakyusa
- Interest in male activities: Nyaturu
- Playing *chagulaga* ("Choose the one you love"), a pre-marital sex-for-fun game often played after evening dances, where a boy runs after a girl, usually one with whom some kind of understanding has been established: Sukuma (Source: Mbunda 1991)

Sexual practices unacceptable for adolescents after the onset of puberty include:

- Public masturbation: Chagga, Makonde, Makonde Malaba, Nyakyusa, Nyaturu, Zaramo
- Interest in watching animals mate: Chagga, Fipa, Gogo, Nyakyusa, Sukuma
- Sexual intercourse: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Courtship: Makonde, Makonde Malaba, Nyakyusa
- Sodomy: Makonde, Makonde Malaba, Maasai, Nyakyusa
- Bestiality: Makonde, Makonde Malaba, Maasai
- Rape: Makonde, Maasai
- Incest: Makonde, Maasai
- Child abuse: Makonde, Makonde Malaba
- Lesbianism: Maasai, Nyakyusa
- Close association with the other sex: Nyakyusa, Nyaturu (Source: Mbunda 1991)

*Male Circumcision.* See Section 5B above.

*Female Circumcision.* The government of Tanzania has made female circumcision (genital mutilation) illegal and a punishable offense. Although it has been illegal for some time, female circumcision was traditionally and still is practiced secretly in several regions of Tanzania as an initiation ritual of preparing youth for womanhood. The justifications for female circumcision are varied. It is argued that female circumcision trained a woman to overcome the pains, and thus prepared her to bear the pains of child labor and birth (Haram 1999). It is also reported that female circumcision in some ethnic groups of Tanzania was practiced as a measure to control the sexuality of women (Mbunda 1994; Haram 1999). It is assumed that circumcision reduces the woman's sexual urge and thus makes her faithful to her partner (Mbunda 1991; Haram 1999).

Data on the levels and patterns of female circumcision in Tanzania have been documented by the 1996 DHS (Bureau of Statistics & Macro International 1997). Nationwide, about 18% of Tanzanian women have undergone circumcision, mainly in eight out of 25 regions in the country. The regions with the highest incidence are: Arusha 81.4%; Dodoma 67.4%; Mara 43.7%; Kilimanjaro 36.9%; Iringa 27%; Singida 25.4%; Tanga 25.1%; and Morogoro 20.2%.

Clitoridectomy and excision are the major types of circumcision in the country. The majority of women are circumcised between ages 6 to 20 years. Circumcision is more likely to be practiced by those living in the rural areas than their urban counterparts. As in many other parts of sub-Saharan Africa, traditional practitioners perform circumcision. These are normally elderly women who have experience in the practice.

The unhygienic condition through which female circumcision is conducted is creating serious health risks among women. Political leaders, religious organizations, and other nongovernmental agencies (NGOs) have campaigned against the practice, but without success. This is because, as stated previously, the practice is done secretly. Sometimes the victims and the practitioners are either hidden or shielded. Perhaps sensitization of the adults, the main promoters, and examination of the cultural factors underlying the practice can help.

### C. Adults

Patterns of sexual values and relations in Tanzania have changed following the influence of colonialism and imperialism since the beginning of the 19th century. However, local or "customary" norms and patterns are still practiced in many rural areas. The coming of colonialism led to the introduction of a cash economy based especially on plantation agriculture. This led to labor migration from labor-exporting areas to the plantations and mines. The process had an impact in both areas. The male labor migration led to a deficit of men in labor-exporting areas and a surplus of men in the cash-economy areas. Rural migration, urbanization, and formal education are other factors that have led to social change in traditions. As a result, family composition, structure, and functions have also changed, as they have in similar ways in much of the rest of sub-Saharan Africa. Extended family and kinship structures are changing to a more nuclear model. Parental authority is weakening, intermarriages among Tanzanian ethnic groups are on the increase, and an increasing number of people remain unmarried or are attached to temporary relationships. For example, in the past, conjugal relations were formalized with negotiations between parents and relatives of the couples (taking care of the parents' of the couples interests). Nowadays, it is not uncommon to find that such negotiations involve the partners concerned.

#### *The Ideal Spouse*

The characteristics of the ideal husband and wife vary with different cultures within Tanzania. Some examples of ideal characteristics for husbands follow with no indication of ranking:

- Sexually virile and attractive: Chagga, Fipa, Gogo, Makonde, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Graduate of puberty initiation: Chagga, Gogo, Makonde, Makonde Malaba, Zaramo
- Circumcised: Chagga, Gogo, Maasai, Nyaturu
- Uncircumcised: Nyakyusa
- Hard working and productive: Chagga, Fipa, Makonde, Maasai, Zaramo
- Able to support the family financially: Chagga, Fipa, Gogo, Nyakyusa, Nyaturu, Sukuma
- Healthy and strong: Chagga, Makonde, Makonde Malaba
- Loyal to family, clan, and in-laws: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Masai, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Affectionate to wife and children: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Sexually stimulating and appealing: Fipa, Makonde, Makonde Malaba, Maasai, Nyakyusa, Sukuma, Nyaturu, Zaramo
- Rich in cows or cattle: Gogo, Maasai
- Courageous in war: Nyakyusa
- Cooperative and helpful to in-laws: Nyaturu (*Source: Mbunda 1991*)

The characteristics valued in a wife are as follows (not ranked):

- Sexually energetic and attractive: Chagga, Gogo, Makonde, Makonde Malaba, Maasai, Sukuma, Nyakyusa, Nyaturu, Zaramo
- Enlarged clitoris: Nyakyusa
- Able to bear many children: Chagga, Fipa, Gogo, Makonde, Maasai, Nyakyusa, Nyaturu, Sukuma, Zaramo

- Able to care for family: Chagga, Fipa, Gogo, Makonde, Maasai, Nyakyusa, Nyaturu, Sukuma, Makonde Malaba
- Loyal and affectionate to husband and children: Chagga, Fipa, Gogo, Makonde, Maasai, Nyakyusa, Nyaturu, Sukuma, Zaramo, Makonde Malaba
- Affectionate to clan and in-laws: Chagga, Fipa, Makonde, Makonde Malaba, Maasai, Nyaturu, Nyakyusa, Sukuma, Zaramo
- Expert at lovemaking and sexual intercourse: Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa
- Good housewife and cook: Gogo, Makonde, Nyakyusa
- Able to get along with husband's other wives: Gogo
- Hard working: Makonde, Makonde Malaba, Nyaturu, Sukuma, Zaramo
- Well-educated sexually: Maasai
- Circumcised: Nyaturu
- Graduate of puberty initiation: Zaramo (*Source: Mbunda 1991*)

#### *Marital Norms and Values*

Just as puberty marks the transition from childhood to adolescence and a new set of behavioral values, both acceptable and unacceptable, so marriage is marked by a new set of behavioral values. Among the norms acceptable for married persons are:

- Courtship: Chagga, Fipa, Gogo, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Wedding: Chagga, Fipa, Gogo, Nyaturu, Sukuma, Zaramo
- Sexual intercourse: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Nyaturu, Zaramo
- Masturbation: Chagga, Makonde, Makonde Malaba
- Polygamy: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Nyaturu, Zaramo
- Secret liaisons for barren couples: Gogo
- Fondling: Makonde, Makonde Malaba
- Sex-related stories and dances: Makonde, Makonde Malaba
- Sexual intercourse with spouse only: Masai
- Pregnancy and childbirth: Chagga, Fipa, Gogo, Makonde, Makonde-Malaba, Masai, Sukuma, Nyakyusa, Nyaturu, Zaramo
- Playing *chagulaga*: Sukuma (*Source: Mbunda 1991*)

Unacceptable sexual behaviors for married persons include:

- Adultery: Chagga, Fipa, Makonde, Makonde Malaba, Maasai, Nyakyusa, Nyaturu, Sukuma, Zaramo. As noted later in Section 9, Contraception, Abortion, and Population Planning, available data indicate that between 14% and 26% of Tanzanian men are involved in extramarital relationships (Weinstein et al 1995; Mwangeni 1996).
- Sodomy: Chagga, Fipa, Makonde, Makonde Malaba, Maasai, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Child abuse: Chagga, Maasai, Nyakyusa, Sukuma
- Rape: Chagga, Gogo, Makonde, Makonde Malaba, Maasai, Nyaturu, Sukuma, Zaramo
- Prostitution: Chagga, Fipa, Makonde, Nyaturu, Sukuma, Zaramo
- Abortion: Chagga, Fipa, Gogo, Makonde, Makonde Malaba, Nyakyusa, Zaramo
- Incest: Chagga, Fipa, Makonde, Makonde Malaba, Maasai, Nyaturu, Sukuma, Zaramo
- Bestiality: Fipa, Maasai, Nyakyusa, Nyaturu, Sukuma, Zaramo
- Masturbation: Fipa
- Lesbianism: Makonde, Makonde Malaba, Maasai, Nyakyusa
- Polyandry: Nyakyusa (*Source: Mbunda 1991*)

[“Dry Sex” or “Wet Sex”

[*Comment 2001*: As noted earlier in the Nigeria and Kenya chapters, sexual relations in subequatorial Africa are male-dominated, with the male initiating coitus and dictating its style and pace. Female response and satisfaction are not considered important. Coitus usually takes place with no foreplay. The male-above position is standard, and marital coitus is for procreation, not for pleasure. Women in many African cultures do not even know what female orgasm is, and may have never experienced it. In describing mating customs in the chapter on Ghana, Augustine Ankoma reports that penile-vaginal penetrative sex with little foreplay is the normal sexual style. Although among the well-educated youth, some forms of foreplay are gaining a foothold, fellatio and cunnilingus are abhorrent. Genital manipulation is hardly accepted and traditionally women feel shy to touch the penis, and most men are not interested in having their genitals manipulated.

[These male-oriented cultural values underlie what is appropriately termed “dry sex,” a common practice throughout sub-Saharan Africa. The “dry sex” mating behavior fits comfortably with the male distaste for vaginal secretions, foreplay, and disinterest in female sexual arousal and orgasm. In this setting, males quickly reach orgasm and their satisfaction. Women experience painful intercourse, with no arousal and no orgasm.

[In many African cultures, women prepare themselves to pleasure their husbands with a dry vagina by mixing the powdered stem and leaf of the *Mugugudhu* tree with water, wrapped in a bit of nylon stocking and inserted into the vagina 10 to 15 minutes before intercourse. Other women use *Mutendo wegudo*, soil mixed with baboon urine, which they obtain from traditional healers. Still others use detergents, salt, cotton, or shredded newspaper. These swell the vaginal tissue, make it hot, and dry it out. The women admit that sexual intercourse is “very painful, but our African husbands enjoy sex with a dry vagina” (Schoofs 2000).

[The inevitable results of “dry sex” include increased friction, vaginal lacerations, suppression of the vagina’s natural bacteria, and torn condoms (when these are used). All these consequences increase a woman’s risk of STD and HIV infections. Fortunately, the tradition of “dry sex” is waning among the educated urban young, but any change in this traditional mating behavior is also resisted because of rejection of Western gender roles (Stellwaggon 2001).

[“Dry sex” is a well-established and more or less wide spread practice in various subequatorial African cultures. It is common in Southern Africa, particularly in Zimbabwe, Zambia, Malawi, some parts of Nigeria, some parts of Uganda, in Southern Sudan, and even in Kenya and Botswana. The only difference is in what these women use for drying up their vaginas.

[In the northwest part of Tanzania and neighboring regions, “wet sex” is widely known and practiced. “Wet sex” consists of foreplay where there is intense stimulation by the male partner on the woman’s labia and clitoral regions. This stimulation results in copious production of secretions (thought to come from Bartholin’s glands). People talk about it openly, sometimes mixed with a sense of humor and intertribe jokes. Some researchers have blamed this practice for the high incidence and prevalence of HIV and STDs. The implications of this kind of information for action plans (resource inputs and sociocultural issues) are enormous. Now that these behaviors have been brought into public attention, a well thought-out survey that is representative of different segments of the populations becomes essential for an effective public health policy (Tanzania, personal communication 2003).

[In March 2003, when the editor of *CCIES* inquired whether “dry sex” was observed in Botswana, Dr. Ian Taylor replied; “‘Dry sex’ is common in Botswana as well and leads to vaginal tears and lesions which help spread HIV/AIDS, it is true.” (*End of comment by B. Opiyo-Omolo*)]

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

[*Comment 2003*: In Tanzania, male homosexuality is illegal under the penal code inherited from the British. The law in Tanzania criminalizes gays. Male homosexual acts are punishable by up to 14 years, even though in practice, the law is rarely enforced, because it is difficult to obtain any proof that someone is a homosexual. In Swahili, there is traditionally no word for *male homosexual*. However, recently a word has been coined: *Msenge*, a Swahili word for “passive” or “femme” gay man. There is also a term for *lesbian*: *Msagaji*, literally, “one who grinds.” The verb for lesbian lovemaking, *Sagana* means “grind together.” In Tanzania, lesbians are even less visible than gay men. (*End of comment by B. Opiyo-Omolo*)]

## 7. Gender Diversity and Transgender Issues

Not reported.

## 8. Significant Unconventional Sexual Behaviors

As noted earlier, the purpose of sexual relations was traditionally viewed as having three functions: reproduction, expansion of kinship, and pleasure. It was also reported that some unconventional sexual relations that were harshly dealt with were sanctioned within a specific social context. However, sexual life, like political, religious, cultural, and social life, continues to change, and new forms of sexual behavior, some of which could be called “unconventional,” are emerging, as described in detail in the following sections.

### A. Coercive Sexual Behaviors

The penal code recognizes various sexual offenses. These offenses include forced marriage, sexual assault, and procurement of women or girls for the purpose of prostitution (The Centre for Reproductive Law and Policy 1997. In Tanzania, child sexual abuse and rape are punishable by imprisonment for life.

### *Child Sexual Abuse, Rape, and Sexual Harassment*

Reported sexual abuse of young girls is on the increase in Tanzania. In 1995, about 756 child sexual abuse cases were reported (TAMWA undated). In 1997, of the 129 reported incidences of sexual abuse, 63% were in Dar es Salaam and 8% were in Mbeya (LHRC 1997). The victims of sexual abuse are as young as nine months old while the assailants are adults mainly in their 20s or 30s, but a few are as old as 50 years (LHRC 1997). The majority of the cases, however, are not reported because of social stigma, fear, ignorance, and cumbersome legal procedures. The increase in reported sexual abuse cases could easily be because of a rise in the consciousness of women’s rights and an increased willingness to use official judicial channels to deal with such matters.

In the case of child sexual abuse, the assailant usually seduces the victim with sweets or other gifts and later abuses the child. In other incidences, the assailants are individuals trusted by mothers to take temporary care of their children while they perform other duties nearby or are a distance away doing some errand. Others are simply ambushed on their way home or to school. Sexual abuse is not limited

only to girls, but also involves boys. While sexual abuse for boys involves anal penetration, for girls it is both anal and vaginal penetration. The assailants are sometimes known to the victims and in others cases they are not.

The reasons for the increase of sexual abuse to children are not exactly known. It is argued that some adults are seeking to have sexual relations with young people thought to be free of HIV (Rajani & Kudreti 1995). Certain groups of people appear to be more vulnerable to sexual abuse than others. For example, girls, street children, the disabled, and children that are not biologically related to the family are more likely to be abused than others. Sexual abuse in such situations is made in exchange of protection offered by the assailants. Abuse to children is also caused by inability of the assailant to approach mature women. Sometimes abuse is associated with superstition; success in business is believed to be associated with having sexual relations with certain special groups of people. Usually, a traditional fortuneteller gives such advice. For example, LHRC (1997) reported that in November 1996, one assailant, assisted by his wife, abused a 9-year-old girl in one of the gold-mining areas of Tanzania dominated by small-scale miners. In other incidences, assailants claim to have irresistible sexual drive (LHRC 1997).

Reported incidences of rape increased from 81 in 1990 to 365 in 1993. It is noted that rape cases increased from 497 in 1991 to 736 in 1992, while sexual assaults increased from 8 in 1992 to 37 in 1993 (TGNP & SARDC-WIDSAA 1997).

Between 1990 and 1992, no cases of sexual harassment were recorded in Tanzania. This does not mean they were no such incidences, but, as argued earlier, people did not report such incidents. However, by 1995, 74 cases were reported (TAMWA undated). These included touches on the buttocks or breasts. Protection against sexual harassment in the working place is found in the Security of Employment Act, although the definition of harassment is not provided. Although police are responsible for arresting the accused once any offense is reported, most cases go unreported and no one is arrested.

## B. Prostitution

Prostitution is translated in Kiswahili as *umalaya* and the prostitute as *Malaya*. *Umalaya* is used to refer to the sex life of an individual considered to be promiscuous or loose in sexual relations. Prostitution is mainly urban-based and usually refers to women; in the traditional African culture, promiscuous or "loose" men are not considered as prostitutes. Traditionally, men were free to take as many sexual partners as they liked or could afford. In the 1970s and 1980s, women practicing *umalaya* were known to be from certain ethnic groups. However, currently this is not the case, as it involves many Tanzanian ethnic groups. There are no real brothels, pimps, or touts in Tanzania. Most of the *Malaya* women are working for themselves.

There are several forms of prostitution. The "classical" *Malaya* women operate indoors. They stay inside their rooms and wait for men to visit them. These women have sex with any number of men who visit them for an agreed charge. Apart from providing her customers with sexual services, such a woman can offer other services to a regular partner, like food, bath water, and breakfast, in case a man spends a night in the house. In most cases, it is the customer who pays for most of these expenses. Although this form of prostitution ensures security from police arrests, it does not allow women to control who should come to them.

Another form of prostitution involves barmaids, guest-house workers, and promiscuous married women. These types of women have their own residences like the classical *Malaya*; however, they may or may not invite their clientele

to their places. Promiscuous married women mainly prefer guesthouses or the residence of the customer, while for the other categories of women, in addition to these two places, a customer may rent a separate room. In these types of sexual relationships, a woman has several boyfriends who may provide shelter or money for food and clothing in exchange for sexual pleasure (Setel 1999).

A new form of *umalaya* has emerged in Tanzania in the late 1990s, nicknamed *Uchangu Doa* (the person is nicknamed *Changu Doa* or *CD*). The name comes from a species of fish from the Indian Ocean. These fish are small in size, abundant, easy to fish, and cheaper compared to other species. The species is also known as *janja* (literally meaning clever in a cunning way, deceitful, or crafty). These features of the fish describe why the name *Changu Doa* was adopted to label this type of sexual behavior. *CDs* are young women in their teens and 20s, who usually earn their living by having multiple sexual partners. This type of sexual behavior is normally urban-based. *CDs* use different tactics to attract their customers. The tactics include positioning themselves in very strategic locations like street junctions or near famous pubs, tourist hotels, casinos, nightclubs, and other dark spots. They dress scantily in order to attract the attention of their customers. The *CDs* "uniforms" include tights, see-through materials, miniskirts, and colorful materials. *CDs* are often assertive with their customers by calling, signaling, or revealing their most "valuable" body parts if need be. Many *CDs* acquire their training and tactics from peer groups, as well as from reading and watching pornographic magazines or films.

The *CDs* practice their operations during nights. Their "day" begins at around 9 p.m. Quitting time is largely influenced by their success in being picked by a customer, but is seldom later than 3 to 4 a.m. The main customers of the *CDs* are normally people who are seemingly rich, such as government officials and foreigners, especially the whites, tourists, and businessmen. Most of these people have money, yet do not have time to look around for women in order to satisfy their sexual desires.

Payment for services is negotiable and depends on the duration of the service, the economic and social status of the customer, status of the urban area, the location where the *CD* was encountered, time of the night, and education level of the *CD*. The longer the duration of services, the higher the price. *CDs* operate in large or well-known urban areas like Dar es Salaam, Arusha, or Dodoma. Those encountered near tourist hotels, city centers, and nightclubs or casinos are likely to be more expensive than elsewhere. Foreigners and wealthy customers are likely to be charged more than others. At times, a foreigner may even be required to pay in foreign currency. Likewise, *CDs* picked in the early hours of their operation may charge more than those picked in the late hours of the "day." Educated *CDs* have a better bargaining power and thus may be more expensive than those less educated.

Though *CDs* are mainly operating in urban areas, there are elements of this type of sexual behavior in rural areas, especially in small towns. In the rural areas, while *CDs* linger near bars and guesthouses, they are, however, not as aggressive as those found in large urban areas.

Rural women who have migrated to the city, and poor urban women, dominate the prostitution sector. Increased economic hardships, unemployment, and commercialization of goods as well as services, have contributed to the increase in prostitution. It can be argued that women engage in different forms of prostitution for economic motives as a means to secure resources that are owned and monopolized by men. Through such sexual relations, women use men as patrons to secure employment, cover for illicit business, advance their economic aspirations, purchase land, meet their

material needs, and obtain cash to make their ends meet (White 1990). In a way, such relations provide social and economic security among the women concerned. To some women, though, different forms of prostitution are practiced so as to maximize their sexual desires. The male partners, however, are after sexual pleasure, and having many sexual partners may be a symbol of virility as well as economic status. There is a feeling that a man who has several female partners has resources to do so and is thus wealthy.

Prostitution is illegal in Tanzania. Thus, such individuals are from time to time rounded up by police and the locations known to house prostitutes are raided. However, the victims of these raids are always females, as the male partners and patrons are left untouched.

### C. Pornography and Erotica

[*Comment 2003*: Pornography is illegal in Tanzania. However, with greater access to technology and increasing Internet usage, Tanzania's antipornography laws are becoming more difficult to enforce. In June 2001, Tanzanian President Benjamin Mkapa announced that his government would be cracking down on pornography, particularly on the Internet.

[At a 2002 meeting of the UN committee on the Rights of the Child in Geneva, Switzerland, the committee raised concerns about the large and reportedly increasing number of child victims of commercial sex exploitation and sex tourism in Tanzania, including pornography. Under Tanzania Sexual Offenses Act of 1998, people found guilty of sexual exploitation of children, including child pornography, can face long jail terms.

[Despite all these, Tanzania still lacks the resources to put its antipornography policies into practice. The body charged with policing the Internet, the Tanzania Communication Commission (TCC), will have to find a way of stretching resources if it is to control the problem. (*End of comment by B. Opiyo-Omololo*)

### D. Other Unconventional Sexual Behaviors

There are occasional reported cases of males having carnal knowledge with animals (donkeys, goats, and birds, mostly ducks). This behavior is associated with superstition. The few cases reported involved men working in mining areas. It is thought by some individuals that having sexual relations with animals may increase their luck.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

#### Contraceptive Knowledge

Large-scale reliable data on contraception in Tanzania has been available since 1993 following the introduction of the Demographic and Health Surveys (DHS) and the Tanzania Reproductive and Child Health Survey (TRCHS). According to TRCHS, as many as 93% of Tanzanians are aware of contraception (National Bureau of Statistics & Macro International 2000). Knowledge of modern methods is higher than it is of the traditional contraceptives, with 92% of the people aware of modern methods compared with 62% aware of traditional contraceptives. The most popular modern methods are the pill, IUD, male condom, injectables, and female sterilization, while withdrawal and periodic abstinence are the best known among the traditional ones. Men are more likely than women to be aware of the methods (92.8% vs.

90.9%). Among the currently married, men and women are more knowledgeable than sexually active unmarried men and women: 97.1% and 95.3% versus 96.1% and 91.6%, respectively.

Knowledge of modern contraceptive methods is higher among Tanzanian men and women who are: aged 20 to 34; living in urban areas; those with primary education or higher; monogamous men; those with one to three children; those who have not experienced child death; and skilled workers (Mwageni 1996; Bureau of Statistics & Macro International 1997). There are also regional variations in terms of awareness of the methods, with higher levels in Dar es Salaam, the coast, and the Lindi, Tabora, and Mbeya regions than in the rest of the country. (Compare with contraceptive use described below.)

#### Contraceptive Use

Rates of contraceptive use are inconsistent with awareness of the methods. Overall, 29.3% of men are more likely to use the methods than women (22.3%). Modern methods are more used than the traditional ones. The most popular methods are condoms, the calendar or rhythm method, pill, and injection. The discrepancy between knowledge and use calls for more promotion of family planning activities in Tanzania (National Bureau of Statistics & Macro International 2000).

The difference in use of methods between men and women needs more attention. It seems there is underreporting or exaggeration of some methods by men and women, respectively. Examination of variations in reporting usage of two methods, namely condom and withdrawal, may shed more light on this aspect (see Table 2). These two methods have been chosen because both partners have to be aware of their use. Under normal circumstances, if reporting is correct, very little difference would be expected between men and women. According to Table 2, concordance in reporting is more likely to occur with withdrawal than with the condom.

More unmarried women than married women use contraceptives, 33% compared with 25.4% (National Bureau of Statistics & Macro International 2000). However, among men, the opposite is the case (37% of husbands compared with 31% of single men). Several plausible reasons can be offered for this pattern. Firstly, it appears that the unmarried women are concerned about premarital childbearing. Secondly, a reasonable proportion of married men may have extramarital sexual relations with these single women, and use methods such as condoms both for family planning and for protection against STDs. Available data indicate that be-

**Table 2**

**Male-Female Variation in the Use of Condoms and Withdrawal in Tanzania (in Percentages)**

Category	Condom			Withdrawal		
	Men	Women	Difference	Men	Women	Difference
Tanzania (Total)	7.3	1.3	6.0	2.4	1.9	0.5
Mainland Tanzania	7.5	1.3	6.2	2.4	1.9	0.5
Total urban	15.2	3.5	11.7	1.3	1.1	0.2
Dar es Salaam	16.9	4.4	12.5	1.1	1.5	-0.4
Other urban	14.4	3.1	11.3	1.3	0.9	0.4
Total rural	5.2	0.7	4.5	2.8	2.2	0.6
Currently married	16.1	6.5	9.6	19.2	11.5	7.7
Sexually active single	35.2	18.4	16.8	11.5	8.1	3.4

Source: Compiled from Tanzania DHS 1996

tween 14% and 26% of men are involved in extramarital relationships in Tanzania (Weinstein et al. 1995; Mwageni 1996). Thirdly, it is possible that unmarried women are concerned with the costs of taking care of the children. Fourthly, this group of women may consist of students, who by law are not allowed to marry or bear children.

Data also reveal regional variation in the use of methods, with Kilimanjaro 38%, Dar es Salaam (30%), and the Coast regions (27%) leading in contraceptive use among women, while Rukwa (53%), Mbeya (39%), Singida (37%), Kigoma (33%), Dar es Salaam (32%) and Coastal regions (31%) are prominent for men using contraceptives (Bureau of Statistics & Macro International 1997). Furthermore, contraceptive use is higher for Tanzanian men and women who are: between age 30 to 40 years, living in urban areas, with secondary education or higher, with three to five living children, those with no experience of dead children, and highly skilled workers (Muvandi & Simbamwaka 1996; Mwageni 1996; Bureau of Statistics & Macro International 1997).

#### *Trends in Contraceptive Knowledge and Use*

Nationwide trends in Tanzania reveal an increase over time in awareness and use of both modern and traditional contraceptive methods. In 1991, for example, knowledge of modern and traditional contraceptive methods was 72% and 44%, respectively. By 1999, these levels had increased to 91% and 58% (National Bureau of Statistics & Macro International 2000). Use of modern contraceptive methods among women in 1991 was 10%; by 1999, this level had increased to 22% (National Bureau of Statistics & Macro International 2000).

#### *Attitudes Towards Family Planning*

Attitudes towards family planning are an important aspect in effective use of contraceptive methods. Several methods can be used to ascertain attitudes towards family planning, including surveys of approval, intention to use methods in the future, and acceptability of media messages on family planning.

Available data reveal that among the married, about 48% approve of family planning methods (Bureau of Statistics & Macro International 1997). Surprisingly, women (78%) are more likely than men (51%) to approve of family planning, although the level of knowledge and use is higher for men than for women. Otherwise, approval is likely to be higher among the educated and urban residents compared to other categories. In terms of differences between couples, approval is higher when the wife is older in age, where couples have age differences of less than four years, and where both the husband and wife are educated than the other way around. Further findings reveal that individuals with no religion and the unmarried are unlikely to approve of family planning (Muvandi & Simbamwaka 1996).

The intention to use family planning in the future is considerably high among both males and females than current actual use, although it is higher for the men than for the women. The majority of men and women accept the dissemination of family planning messages and information through media channels, especially radio and television (Bureau of Statistics & Macro International 1997).

### **B. Teenage (Unmarried) Pregnancies**

Teenage pregnancy is not an uncommon phenomenon in Tanzania. According to available data, the youngest age at which girls become sexually active in the country is 11 years (Mpangile, Leshabari & Kihwele 1993). About 26% of women in the country begin childbearing during their teen years, between 15 and 19 years of age (Bureau of Statistics & Macro International 1997). As reported earlier,

there are cases where girls had their first pregnancy at age 13 (Rugumyambeto et al. 1994; Tumbo-Masabo 1994; Mwageni 1998). Teenage pregnancy is more common among girls with no education (40%), as well as rural residents (27%), than among educated or urban residents (Bureau of Statistics & Macro International 1997).

Studies conducted in Tanzania reveal that the men responsible for adolescent pregnancies are heterogeneous. It is noted that the partner's age ranged between 16 to 52, the majority of them being over age 45 (Mpangile, Leshabari & Kihwele 1993). In another study, the partners of teenage mothers were noted to be of different social status, including the jobless, fellow students, mechanics, drivers, teachers, and managers (Mwageni 1998).

Teenage pregnancy is influenced by several factors. As noted, premarital sex was rare in the past because of earlier mean age of marriage, more parental control, as well as strong social sanctions. These conditions are no longer effective nowadays. Lack of communication between parents and children is another plausible factor. Ignorance among teenagers of the woman's physiological changes also contributes to teenage pregnancy. In a study of 40 teenage mothers in Dar es Salaam and Kigoma, Tumbo-Masabo (1994) noted that many of them learned about the relationship between menarche and conception after they had conceived. Such girls had also little knowledge of the process of labor and childbirth. One can argue that many teenage pregnancies happen because of ignorance of the consequences of sexual behavior.

Legal measures to control teenage pregnancy in Tanzania are complicated by contradictions within the existing laws. According to the Marriage Act, a man can marry upon attaining 18 years of age, and a woman at age 15. However, the Penal Code also states that "any person may marry or permit the marriage of a girl under the age of 12 years in accordance with the custom of the tribe or religion." At the same time, the law states that "any person who carnally knows any girl under age of 14 years is guilty of a felony and is liable to imprisonment for life, with or without corporal punishment."

### **C. Abortion**

Induced abortion is illegal in Tanzania except when performed to save the mother's life. However, there is widespread practice of illegal induced abortion. [*Comment 2003*: In Tanzania, young girls who find themselves pregnant are expelled from school, a stark reality that is seen as instrumental to a young girl's decision to abort. (*End of comment by B. Opiyo-Omolo*)] Using a sample of 300 respondents among women who were admitted to a hospital in Dar es Salaam, a study found that 34% of them had practiced illegal abortion (Justeen, Kapiga & Asten 1992). In another study again done in Dar es Salaam, about 35% of the respondents interviewed had admitted intentionally terminating their pregnancies (Mpangile, Leshabari & Kihwele 1993). These estimates of abortion could be on the low side, because many abortions are conducted secretly and never reported. Either the male partner or a relative—mother, sister, or aunt, or the victim herself—facilitates the connection to the abortionist, including payment. The abortionists consist mainly of health workers or sometimes quacks. Places where abortions are conducted are numerous, including health facilities, hospitals, health centers, dispensaries, ordinary bedrooms, and occasionally in a simple room.

Induced abortion is more a problem of the young, unmarried, those with primary education, those who have lived in the city for six years or more, and those who know little about modern or traditional methods of family plan-

ning. The main reasons leading to abortion decisions include: inability to take care of an additional child, accidental pregnancy, inadequate birth spacing, and because the woman concerned was a student and feared expulsion (Mpangile, Leshabari & Kihwele 1993). Stambach (1996), in a study conducted in Machame, contends that there is a feeling among the residents that abortion rates are higher among secondary school students than other categories. This is because students want to avoid having their educational aspirations terminated. Stambach (1996) also asserts that some, especially older persons, associate higher rates of abortion among schoolgirls to the abandoning of traditional norms like female circumcision.

#### D. Population Planning

The population policy of Tanzania provides the framework within which population planning is undertaken. Tanzania, like many other African countries, moved gradually from a position of implicit population policies in the 1970s to a position where active steps were taken towards the formulation of explicit policies in the mid-1980s. Early implicit population policies in Tanzania followed the country's policy of socialism and rural development introduced in 1967. As a result, several measures related to population policy were taken. These included: a spatial population distribution policy, which relocated, dislocated, and scattered rural families and the urban unemployed into planned settlements. Another policy was the growth pole policy, which was designed to promote an industrial dispersion away from the capital city (Dar es Salaam to ten other regional towns), and the Human Resource Deployment Act, which aimed at discouraging rural-to-urban migration.

Tanzania officially formulated a National Population Policy in 1992. The major objective of Tanzania's population policy is to "reinforce national development through developing available resources in order to improve the quality of life of the people" (Planning Commission 1992). The emphasis of this population policy is "on regulating population growth rate, enhancing population quality and improving the health and welfare of women and children" (Planning Commission 1992). Other concerns set forth in the policy include establishing information education and communication (IEC) systems that disseminate knowledge and information about use of services related to family planning, and making family planning means or services easily accessible. The policy also focuses on preparing young unmarried people to become responsible parents after their marriage through provision of family life education. The policy underscores the importance of educating the public on the benefits of women marrying after age 18 years. Taken together, the policy is really concerned with regulating population growth in Tanzania.

In 1959, long before the launching of the national population policy, the Family Planning Association of Tanzania (UMATI) began efforts to regulate reproductive behavior in Tanzania. During the early years, UMATI's services were urban-based (Ministry of Health 1989). As UMATI expanded, services were further extended to several other regions in the country. UMATI now has branches in all the regions, and several districts, as well as some villages of Tanzania.

The efforts of UMATI to introduce family planning (FP) in the early post-independence period were not well received by many people. The attitudes of many, including some party, government, and religious leaders, were negative. As in most parts of Africa, FP services in Tanzania were seen by many as designed by outsiders to control Tanzania's population. During the early post-independence period, the majority of African countries, including Tanzania, did not consider

population growth as a problem. This was partly because of the feeling that there were few people, while resources were plenty. In addition, the economies of many countries by then could cope well with the small population size.

However, as population growth slowly began to put pressure on resources, changes began to be implemented in many African countries. In the case of Tanzania, in 1974, FP services began to be provided officially in all government health facilities (Ministry of Health 1989). UMATI was officially recognized and given the responsibility of procuring and distributing contraceptives in all maternal and child health (MCH) clinics established in almost all health institutions. Following these developments, the Ministry of Health began to involve itself in expanding and improving the quality of FP services in the country. In 1989, the Ministry of Health developed and launched the National Family Planning Programme for the years 1989 to 1993.

The program set out national goals, targets, and strategies for achieving FP services in Tanzania. The broad objective of the program was to raise the contraceptive acceptance rate in the country from 7% to 25% by 1993. In 1999, however, only 16% of women used modern contraceptives (National Bureau of Statistics & Macro International 2000). Other specific objectives were: improvement of the quality and accessibility of FP services; improvement in the general health of mothers and children; and raising awareness and demand of FP services in the country (Ministry of Health 1989).

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### A. Sexually Transmitted Diseases

STDs other than HIV/AIDS are common and have been identified as important factors in HIV transmission. It is estimated that an average of 2,372 cases of STDs were reported per month in 1995 and, in total, there were about 28,463 STD cases in 1995 (Bureau of Statistics & Macro International 1997). More females than males are infected with STDs, 58% and 42%, respectively. These findings however, do not tell the true picture among men, since women are more frequent users of health facilities than men. Among the most common STDs in Tanzania, apart from HIV/AIDS, are discharge from the penis, gonorrhoea, penile sores/ulcers, and syphilis (Bureau Statistics & Macro International 1997). According to the Department of Health Services, sexually active persons aged 20 to 39, formerly married, urban residents, those without education, and those with complete primary education are more likely to be infected with an STD than other groups (Bureau Statistics & Macro International 1997). Policies that affect prevention of STDs are similar to those of HIV/AIDS as stated in Section 10B, below.

#### B. HIV/AIDS

[Update 2002: UNAIDS Epidemiological Assessment: Tanzania is made up of mainland Tanzania and the island of Zanzibar. HIV information among antenatal clinic attendees has been available from mainland Tanzania since the mid-1980s. Mbeya district produced more consistently better quality of data on HIV prevalence among antenatal clinic attendees than any other district. The prevalence in Mbeya shows a fluctuation of HIV-infection rates ranging from 23% to 24% in 1998, to 29.5% in 1999, and 21.6% in 2000. In Moshi district, another district outside the major urban area, HIV prevalence was 20% in 1998 and 16.6% in 2000. No antenatal clinic surveillance survey was conducted in 2001. Implementation of a 2002 antenatal clinic sentinel surveillance survey has begun and results will be available later in 2003.]

[Serial population-based surveys conducted in the Kagera region of mainland Tanzania showed a decline in HIV-1 prevalence from 24.2% in 1987 to 18.3% in 1993 in Bukoba town. HIV prevalence among women aged 15-24 years in Bukoba town declined from 27.6% in 1987 to 11.2% in 1993. For rural Bukoba, there was a decline in HIV prevalence from 10% in 1987 to 6.8% in 1996. A marked decline in HIV prevalence was also recorded among young women aged 15-24 years, from 9.7% in 1987 to 3.1% in 1996.

[In Zanzibar, fluctuating HIV-prevalence rates have been observed among antenatal clinic attendees, with rates lower than those observed in mainland Tanzania. HIV prevalence increased from 0.3% in 1987 to 3.8% in 1995, and then to 0.6% in 1996, 11.4% in 1997, and 0.7% in both 1999 and 2000. A population-based HIV serosurvey was to be conducted in 2002 to validate the magnitude of HIV infection in Zanzibar.

[Information on HIV prevalence among sex workers in Dar es Salaam has been available since the mid-1980s. HIV prevalence among sex workers tested increased from 29% in 1986 to 50% in 1993. Outside of Dar es Salaam, HIV information on sex workers is available from Kilimanjaro, Arusha, Moshi, Tanga, Dodoma, and Singida in 1988. In Zanzibar, HIV prevalence among STD clinic patients tested increased from 5% in 1992 to 28% in 1993.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	1,300,000 (rate: 7.8%)
Women ages 15-49:	750,000
Children ages 0-15:	170,000

[An estimated 140,000 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 810,000 Tanzanian children under age 15 were living without one or both parents who had died of AIDS. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

[*Comment 2003*: The most obvious sexual disorder is sterility. A barren woman is always in despair. The desire for children makes impotence in men even more disgraceful and pitiful. A childless couple is scorned and despised. The source of childlessness is usually attributed to the wife rather than the husband. Although family planning centers and general hospitals may provide some advice and counseling, professional therapy is almost nonexistent. (*End of comment by B. Opiyo-Omolo*)]

## 12. Sex Research and Advanced Professional Education

Not reported.

### A Brief Conclusion

Although this is, as explained in the Editor's opening Note, a partial report with no information on some important aspects of sexual attitudes and behavior in Tanzania, the authors and Editor hope that enough information is provided for the reader to form a clear picture of sexuality in Tanzania.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Thailand, formerly known as Siam, is a kingdom located in Southeast Asia. The total area of Thailand is 198,450 square miles (514,000 km<sup>2</sup>). The capital, Bangkok, situated in the central region, is also the largest city, with a population of 7.8 million. Thailand is bordered on the north and west by Myanmar (formerly Burma), on the north and east across the Mekong River by Laos, on the southeast by Kam-puchea (Cambodia), and on the south by Malaysia.

In July 2002, Thailand had an estimated population of 62.3 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 23.3% with 1.04 male(s) per female (sex ratio); *15-64 years:* 69.9% with 0.97 male(s) per female; *65 years and over:* 6.8% with 0.78 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 69.18 years; *male:* 66 years; *female:* 72.51 years

**Urban/Rural Distribution:** 20% to 80%

**Ethnic Distribution:** Thai: 75%; Chinese: 14%; other: 11%

**Religious Distribution:** Buddhism: 95%; Muslim: 3.8%; Christianity: 0.5%; Hinduism: 0.1%; other: 0.6% (1991 est.)

**Birth Rate:** 16.39 births per 1,000 population

**Death Rate:** 7.55 per 1,000 population

**Infant Mortality Rate:** 29.5 deaths per 1,000 live births

**Net Migration Rate:** 0 migrant(s) per 1,000 population

(CIA 2002)

**Total Fertility Rate:** 1.86 children born per woman

**Population Growth Rate:** 0.88%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 2.15%; *Persons living with HIV/AIDS:* 755,000; *Deaths:* 66,000. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 93.8% (*male:* 96%, *female:* 91.6%), with 96% attending six years of compulsory education. The chief language of Thailand is Thai, one of the 40 or so languages in the Tai family found in Thailand, Laos, North Vietnam, and parts of China (Crystal 1987). Among a number of languages previously spoken in this region, the Thai language or Siamese Tai became the language of administration and prestige in the late 12th century, with its script invented in 1283 (Wyatt 1984). Today, the regional dialects are also spoken in Thailand, as well as Lao, Chinese, and Malay. English is taught in schools and colleges and is also used in academia, commerce, and government.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$6,600 (2001 est.); *Inflation:* 1.6%; *Unem-*

\**Communications:* Kittiwut Taywaditep, M.D., 3550 North Lake Shore Dr., Apt 1402, Chicago, IL 60657 USA; U21815@uic.edu. Eli Coleman, Ph.D., Program in Human Sexuality, University of Minnesota Medical School, 1300 South Second Street, Minneapolis, MN 55454 USA; colem001@tc.umn.edu.

ployment: 3.9%; Living below the poverty line: 12.5% (1998 est.)

## B. A Brief Historical Perspective

Historians have hypothesized that Thai (or "Tai") people began migrating from southern China to the central portion of the Indochinese peninsula in the 6th century. Over the centuries, the Thai identity has emerged from the interaction between these Tai people, later immigrants, and the indigenous inhabitants of this region, namely the Mon and Khmer (Wyatt 1984). Following the Burmese destruction of their previous Ayudhya kingdom in 1767, the Thai people rose from the ruins with an astonishing vigor. The kingdom of Siam was reconstituted within a few years by combining other principalities and kingdoms (e.g., Chiangmai and Khorat), thereby expanding its territories to include a number of distinct civilizations and peoples in the Indochinese region. The new capital, Bangkok, was established on the bank of the Chaophraya River in 1782, with walls and buildings built from thousands of boatloads of bricks taken from the ruins of Ayudhya. In the new city of shining monasteries and a new royal palace, with bustling canals crisscrossing the city instead of roads, the intermingling of classes, cultures, and ethnicities in the early Bangkok Empire has been vividly depicted by David Wyatt:

[The] princes and officials constructed homes along the network of canals radiating eastward from the palace and Chinese and Indian merchants built their shops and warehouses along the river to the south. . . . [Outside the main walls of the city,] . . . the Chams attached to the army; there are a group of Malays who manned naval vessels, clustered around an Islamic house of worship; north of the city, [there was] a settlement of Roman Catholics descended from Portuguese and Japanese Christians. (1984, 146)

Thailand has been independent during most of its history, except for a few relatively brief periods of occupation by Burma or the Japanese military. This long-term independence has allowed for a very distinct blend of cultures to thrive over many centuries. Thailand is also the only country in Southeast Asia never taken over by a European power, thanks in part to King Chulalongkorn and his son, King Mongkut, who modernized the country and signed trade agreements with both Britain and France in the late 19th century and early 20th century. The kingdom's name was changed from Siam to Thailand in 1939 during a politically tumultuous time. Reflecting the nationalistic attempt to revise the country's ethnic identity, the new name had a linguistic kinship with Thai-speaking peoples in the periphery of the kingdom, therefore downplaying the powers of the central Siamese people and the Chinese, who began to gain economic significance (Wyatt 1984).

The absolute monarchy transferred power to the politicians and the military in a bloodless revolution in 1932, although the monarchy is still held in very high regard in the present Thai society. Thailand considers itself a democratic nation; however, corruption, multiple coups, and the tremendous influence of the military in politics have led journalists to ridicule the nation's democratic system as "half-democracy." After the mid-1992 bloody uprising against the military's longstanding influence in the House of Representatives, the role of the military in politics has been under scrutiny more than ever.

## C. Thai Language, Sex Research, and Resources

### *The Thai Language*

In this chapter, romanization of Thai words is adapted from the Thai Royal Academy's system, with the goal of ap-

proximating the original pronunciation (without the intonation) while maintaining the readability of the text for readers unfamiliar with the transliteration system. In general, the spelling of Sanskrit-, Pali-, or English-derived vocabulary prefers the reflection of its Thai pronunciation over the etymological origin. Aspirated consonants *p*, *t*, and *k* are represented by *ph*, *th*, and *kh*. For example, *phii* is pronounced "pee," not "fee," and the *th*, as in *kathoei*, is pronounced as the *t* in the words "to" or "ten," not as the *th* in "than" or "think." Proper nouns are represented in romanization with an initial capital letter. Romanization of personal names follows the individual's preference or the spelling in English-language print, and ranks or degrees are, with few exceptions, omitted. In order to facilitate literature searches on an international level, papers and quotations by Thai authors are referred to by their last names, not first names as is common in Thailand.

### *Gender/Sexuality Studies*

Systematic studies of gender and sexuality in Thailand are relatively new. Mostly spurred by the HIV epidemic, the majority of data on sexual behavior was collected in the early 1990s in response to the public health demands. Although considerable data have been generated, critics have pointed out that synthesis on a conceptual level is still needed. Also missing is the documentation of the ancient sexuality in this region, which would have provided a historiographic insight into the dynamics of the Thai sexuality over time. Exchange of findings and discourse among researchers are also hindered to a certain degree by the less-established avenues for publication and presentation. Many papers appear only in local academic bulletins or conferences, whereas others are published in international journals.

### *Resources*

In writing this chapter, we relied primarily on two sources: the published papers and presentations, which provided most of the reviewed empirical data, and the analysis and interpretation of the cultural phenomena in Thailand. Although our analysis of some Thai social constructions and themes (e.g., gender roles and sexual norms) may not represent a consensus, we nevertheless try to present the converged opinions among researchers and observers whom we have worked with over the years. Finally, it is important to bear in mind that what is known about gender and sexuality in Thailand is changing rapidly, and this review summarizes formal and informal observations in Thai society up until early 1997. [Update 2003: In *Woman, Man, Bangkok: Love, Sex, and Popular Culture in Thailand*, Scot Barmé (2002) has created a vibrant cultural history of early modern Thailand, with focuses on conflicts and controversies, such as the status of women, gender relations, polygamy, class antagonisms, and the emergence of a commercial mass culture. (End of update by R. T. Francoeur)]

## 1. Basic Sexological Premises

### A. The Ideal Gender Images: *Kulasatrii* and *Chaa'i Chaatrii*

#### *The Ideal Thai Woman*

There is not much question that Thailand is a male-dominated, patriarchal society, as political and corporate leadership has always been in the hands of men. On the other hand, the power of Thai women, especially in rural societies, lies in their domestic role as the mother-nurturer (see Keyes 1985; and the discussion in Section 2A, Religious and Ethnic Factors Affecting Sexuality, Religious Factors). Women in Thailand look up to the role of motherhood as an ideal. A woman's status changes to adulthood at the point of

her childbirth, after which she is recognized semiformally as *mae* or “mother” (Keyes 1984; Pyne 1994). In fact, the preparation for this “mother” title takes place informally much earlier, as young girls or unmarried women are often titled *mae* with an endearing or humorous tone. Thai men refer to the female gender with a sense of reverence as “the gender of mothers” (*phayt mae*), acknowledging women’s burden in childbearing and parenting responsibilities. The ultimate insult for Thai men is *yet mae*, which literally translates to “motherfucker” in English, indicating the utmost respect that mothers have in Thai culture.

Regarding the nurturer role, women’s specialization in economic-type occupations illustrates their powerful role in providing for the well-being of their families. Women’s dedication to nurturance is evident in the expression that a good woman “wakes up earlier and goes to sleep later than her husband.” The variety and extent of women’s nurturing responsibilities are superbly illustrated in two studies in two vastly different contexts: Penny Van Esterik (1982) depicts the household and religious responsibilities of well-to-do women in western central Thailand; Susanne Thorbek (1988) details the endless household duties of the slum-dwelling women in Khlong Toey, Bangkok. Since the economic climate changed in the 1960s and 1970s, women have accounted for almost half, and sometimes more than half, of the large number of rural Thais who migrate to the cities in order to augment the family income (Keyes 1984). Today, women account for 80% of the total employment in the ten largest export industries and 45% of the manufacturing workforce (data cited in Pyne 1994). Over the years, Thai women have made significant contributions in the arts, education, and commerce. With higher education, women have also risen to leadership positions in the middle class. The “glass ceiling” exists for women in the academic and corporate settings, as evident in the fact that, although there are many women in high positions, the topmost position of an organization still belongs to a man. Nevertheless, aside from the obvious underrepresentation in areas such as the military, law enforcement, and religion, the status of women in Thailand is perhaps higher than other countries in Asia with the exception of Singapore. For more-extensive discussions on the gender division of labor, as well as the impact of the rapid socioeconomic changes in recent decades, the reader is referred to the work by Kirsch (1982) and Hnin Hnin Pyne (1994).

The mother-nurturer role is also idealized in the female code of social and sexual conduct. Historically, the Thai tradition has defined a *kulasatrii* (“virtuous woman”) as proficient and sophisticated in household duties; graceful, pleasant, yet unassuming in her appearance and social manners; and conservative in her sexuality. These features bear striking similarities to the traditional “feminine mystique” in other cultures, which has come under the criticism of the Western feminist movement. However, the concept of *kulasatrii* has not been overtly discussed in terms of gender inequality or subordination in Thailand. There has been little dialogue devoted to whether the *kulasatrii* role has been restrictive or unjust to Thai women. On the contrary, most contemporary Thai women wholeheartedly endorse the *kulasatrii* notion without resentment, regarding it as a sign of dignity and honor, a sense of cultural identity in which they can take pride. In school, girls are taught what it means to be a *kulasatrii*, while celebrity figures constantly praise its value in the media. As more and more contemporary women work outside of their homes, the ideal image of a *kulasatrii* remains a goal for which a woman must strive, while simultaneously attempting to fulfill new responsibilities necessitated by the changing society.

### The Ideal Thai Man

There are two ideal male images available for Thai men. Corresponding to the Buddha’s biography, Thai men face the recluse/householder or monastic/secular dichotomy (P. Van Esterik 1982). The monastic-recluse image, personified by the Buddha’s life, is the *Sangha*. Through monastic discipline and practice of the *dharma*, monks not only eschew worldly attachments, but also their sexuality and male gender characteristics. On the other hand, the secular male image is represented by the notion of *chaai chaatrii*, which is an embodiment of the typical masculine features also found in other cultures: authority, courage, self-assurance, physical and emotional strengths, and sexual prowess. Various expressions for manhood and manliness reflect an image of a vigorous and muscular warrior: *chaai chaat tha-haan* (referring to the soldier), *chaai ok saam sok* (the muscular chest), *chaai chaat acha-nai* (the stallion’s stamina and perhaps muscularity), and *chaai cha-kan* (strength and vigor). In older men, these youth-typical physical features are de-emphasized as other characteristics become more salient, such as bravery, wisdom, and power (in either political, social, or metaphysical spheres). Nurturance is another ideal dimension in men, as exemplified in the image of a prestigious older man, *pho liang*, who earns respect from his community from his resourcefulness and generous contributions. Traditionally, powerful men and politicians in Thai society have always been expected to exhibit this nurturing trait, perhaps modeled after the paternalism of the Siamese kings since the beginning of the kingdom (Kirsch 1985).

The masculine attributes in the *chaai chaatrii* image have found behavioral expression in the image of a *nug layng*. Translated to a midway between “playboy” and “gangster” in English, the term portrays a powerful man of action who works hard and plays equally hard, is supportive of his friends, fierce to his foes, and also a great womanizer (Thorbek 1988). Although popularized and personified by the Prime Minister, Sarit Thanarat, in the late 1950s and early 1960s, the image was hardly a new social construction of the male image. Like Sarit’s political ideology, which “exaggerated traditional values and institutions, buttressing social and political hierarchy at the expense of egalitarianism and even human rights” (Wyatt 1984, 285), his *nug layng* image was simply a paragon of the traditional Thai male role. Sarit excelled in this role in both politics and private life. While known for his emphasis on cleanliness and orderliness and his harsh measures against crimes, Sarit was also notorious for the number of mistresses he kept, which was somewhere between 50 and 200 (Thorbek 1984). Certainly Sarit was not alone in this interpretation of manliness. Over the years, the secular image of Thai men had drifted even further away into the realm of worldly activities and became the antithesis of the *Sangha*. Manliness has become associated with almost every behavior considered by the Thai culture as vices: smoking, drinking, gambling, womanizing, commercial sex, minor wives, public brawls, petty crimes, and corruption, and the list goes on.

Despite such undesirable associations, the code of masculinity has maintained its prestige in Thai society for a long time. Its prestige has only recently been challenged after one of the male vices—commercial sex—was implicated for the spread of HIV. In part, the Theravada view that ordination is always an option for men (see Section 2, Religious and Ethnic Factors Affecting Sexuality, below) could probably account for the longstanding tolerance toward male vices. Further, the ultimate financial control in the households has usually been in the men’s hands, therefore, allowing them to foot the expenses from these vices. Another mechanism also helps prevent any violation of the

male role prescriptions: Secular men who do not participate in these male vices are often labeled by other men with a number of emasculating terms, such as “not a genuine man,” a *kathoe*y (see Section 7, Gender Diversity and Transgender Issues), or *naa tua mia* (“the female face”). The male image’s drift away from the religious ideal is best illustrated in the use of the term *tid*. Abbreviated from the Pali term *pandit* and once granted to a layman who had passed through the monkhood and held knowledge of the Buddhist teachings, *tid* has become a term of derision for “a clumsy [man] who is a tyro in the ways of worldly life” (Sathian Kosed, in Rajadhon 1961, 69).

Despite the rigidity of Thai gender-role manifestations, it is interesting to note that Thai people perceive transience in gender identity. In Buddhist philosophy, the notion of individual “personality” is false, because a being differs upon each incarnation (Kirsch 1982). Gender differs in every life, with social position, fortune or misfortune, mental and physical dispositions, life events, and even the species (human, animal, ghost, or deity) and location of rebirth (strata of heavens or hells), all of which depend on the being’s fund of merit accumulated through committing good deeds in past lives. In the Thai interpretation, women are commonly seen as lower on the hierarchy of merit because they cannot be ordained. Khin Thitsa (1980, cited in Thorbek 1988, 84) observed that according to the Theravada view, “a being is born as a woman because of bad *karma* or lack of sufficient good merit.”

In Susanne Thorbek’s study (1988, 97), a woman illustrates her frustration with being a woman: In a minor domestic crisis, she shouts, “Oh, it’s my evil fate to have been born a woman!” Somewhat more reservedly, a pious young woman in Penny Van Esterik’s study (1982), also admitted her desire to be reborn as a male in order to become a monk. Yet, another more “worldly” woman, seemingly satisfied with her female gender and hoping to be reborn as a deity of the sensuous heavens, argued that those who desired a specific gender upon rebirth would be born of indeterminate sex. Even within a lifespan, men’s transitions between the *Sangha* and the laity demonstrates the transient nature of gender as the two masculine gender roles are abruptly switched. As serious as they are in observing the gender codes, Thai men and women accept gender identities as important yet temporary. Even those in frustration learn to think life will be “better off the next time around,” especially as long as they do not question the inequity of their sometimes arduous, yet transient, states.

[*Comment 2003*: Some observers claim that Thai gender roles are astoundingly malleable and that Thai men and women are able to effortlessly slide up and down the sex/gender continuum (e.g., Morris 1994, 2000). That observation strikes me as false. In my experience, growing to manhood in Thailand and living more recently in Chicago, I would maintain that Thai men and women are no more rigid, nor less rigid, in their gender roles and identities than their Western counterparts. Morris may have misread Thai men’s soft and unassuming social demeanor as feminine, whereas in the Thai gender code, gentleness is not viewed as conflicting with ideal masculinity. Morris may also have observed contemporary Thai women being independent and masculine-appearing, but the same observations can be made by foreigners about American women wearing pants and short hair. Critics have objected to the methodology used to arrive at the conclusion about Thai gender fluidity (such as Morris’ observation), suggesting that the observers relied heavily on anecdotal reports by secondary sources.

[I wonder if the propagation of the idea that Thai’s gender roles are so different and “exotic” might have been

fueled somewhat by the orientalist fantasy. My own observations as a native of Thailand do not concur at all with Morris’ conclusions. I would add, however, that the Thai people’s conceptualization of gender and other attributes of the self are not fixed from one lifetime to another, in accordance with the idea of reincarnation. However, there is little convincing evidence that within one person’s lifetime, Thai people are fluid and malleable in regards to their gender roles (Jackson 1997; Morris 1994, 2000; Nanda 2000). (*End of comment by K. J. Taywaditep*)]

[*Comment 2003*: In the late 19th century, the women of Siam were already challenging the traditional patriarchal value system and setting the stage of today’s seeming sudden revolution in gender roles and attitudes. *Narirom*, a fortnightly magazine, first appeared in 1888, while *Maekasin Watthana*, produced by the Watthana School for Girls, appeared in 1892. The following quote from an October 14, 1914, article in *Satri Niphon [Women’s Writing]*, one of Siam’s earliest women’s magazines, is indicative of the rich history of feminist and gender debates at the roots of contemporary Thai cultural history:

[In] the past, Siamese women were like dolls kept in a cupboard . . . cut off from the outside world. They were strictly controlled and not allowed to go anywhere. . . . Nowadays the position of women is greatly improved however, they are coping out of the dark (Quoted by Barmé 2002, 17).

(For details on protofeminist discourses in early-20th-century Siam, see: Barmé 2002, 17-42). (*End of comment by R. T. Francoeur*)]

## B. Romance, Love, and Marriage

Most cultures glorify and idolize romance between men and women, and Thai people are no exception. Themes of quests for eternal love and the consequences of passion—ecstasy, aspirations, heartbreaks, jealousy, elopements, and deaths—abound in the Thai folklore, literature, and music. Borrowed from the *karma* concept, people explain an unexpected, overwhelming infatuation in metaphysical terms: They were meant for each other because of destiny (*bu-phay vassana*) or they had made merit together in previous lives.

In the Thai vocabulary, there are specific words for “love,” “lust,” “infatuation,” “love at first sight,” “sexual desire,” and so on. In particular, the words *khuaam ruk* (love) and *khuaam khrai* (lust) are distinct, although they are sometimes used together as *ruk-khrai* to connote affectionate relationships. As will be evident later in the chapter, premarital sex outside the commercial-sex context is forbidden, and the distinction between love and lust are inculcated in young people to deter them from premarital sex within a romantic relationship. In such warnings, love is usually idealized as pure, noble, and epitomized by patience, responsibility, and maturity, whereas lust embodies the qualities opposite to these virtues. The Third Buddhist Precept—to refrain from sexual misconduct, mostly understood to refer to adultery, rape, sexual abuse of children, and careless sexual activities that result in the sorrow of others—is often used as a reference for the danger and demerit of lust. It is noteworthy that in the Buddhist philosophy, both love and lust are worldly attachments, leading to suffering. Lust, however, is deemed more harmful because it violates the Third Precept. In the Thai society, where people make distinctions between “ideal Buddhism” (i.e., as in the supreme Buddhist philosophy) and “practical Buddhism” (i.e., for the laity, guided by the Five Precepts), it is easy to see why love is socially accepted and lust is not.

Because of the social acceptance of love, various expressions of romance are found in everyday life and art forms.

The English-derived term “romantic” has been widely used in Thai to connote an intimate and private ambience for a couple, often without a sexual undertone, such as “romantic” restaurant, music, or sentiment. Women, prohibited from sexual expression unless married (see below), account for a majority of the consumers of popular literature and television drama in which young women’s love lives are portrayed. These contemporary romantic tales are enormously popular, as is evident in their multiple republications and repeated television and film adaptations. Embedded in these love tales are the cultural scripts on love, romance, and marriage; these scripts reflect the corresponding constructions in the Thai culture at large, as well as provide models for the newer generations of audiences. A certain Western ethos is abundant in these novels, many of which are adaptations from the classics by Jane Austen, and Charlotte and Emily Bronte, for example. However, the ethos, particularly the Victorian values for women and the chivalrous demeanor for men, seems congruent with the Thai conceptualizations of gender and heterosexual relationships, and therefore is not seen by contemporary Thais as foreign. Emphasis on women’s virtues, such as the *kulasatrii* code, chastity, patience, and honesty, can be found across a variety of backgrounds and scenarios. The barriers the heroines face symbolize the obstructions Thai women encounter in fulfilling their love, for example, jealous and manipulative women in villain roles (the “bad girl” stereotype, see Section 5A, Interpersonal Heterosexual Behaviors, Adolescent Sexual Behavior), parental objections, and men’s exploitation and sexual discrimination. Cultural and class differences are also significant challenges, ranging from the relationship between a northern woman and a military officer from Bangkok in *Sao Khruea Faa* (which resembles *Madam Butterfly*), to the interracial love between a Thai woman and a Japanese soldier during World War II in *Khuu Kam*, to the intergenerational love between a young woman and a rich and handsome “playboy” many years older in *Salakjit*.

In urban areas, shopping malls, coffee shops, school activities, and, to a lesser extent, nightclubs and discotheques provide places for young people to meet. In rural Thailand, Buddhist temples (*wat*) are instrumental in bringing men and women together during the services, temple fairs, and fundraising ceremonies, where the atmosphere of *samuk* (fun and enjoyment) predominates (Thorbeck 1988). Young women often appear at the *wat* in their best outfits and hairstyles, and the idiomatic expression that a young woman is attractive enough “to go to the *wat*” highlights the social function of temples in rural Thailand (Sathian Kosed, in Rajadon 1961). Young women also take a keen interest in the young monks who, at the end of the Lenten retreat, will leave the monkhood to become “ripe” laymen, ready for marriage and settling down (P. Van Esterik 1982). Flirtation between men and women is allowed, and although women are somewhat restricted by the *kulasatrii* notion, in numerous age-old courting songs, women are quite bold in making allusions to sex or outright marriage propositions (Keyes 1984). However, women’s candor about romance and sex is still minimal compared to that of men, and it is even more disapproved for middle- and upper-class women. Kirsch (1984) has speculated that young women in the villages may appear to be deeply concerned with love, marriage, and family because they are striving to fulfill the traditional images of women as “mother-nurturer” in rural environments in which alternative options are severely limited.

In contrast with the passionate nature of courting, the ethos of marriage and parenting emphasizes more the practical and grounded values, such as mutual support, trust, and emotional commitment. In the contemporary Thai image of

an ideal marriage, the husband and wife live together in a harmonious, mutually respectful relationship, with the expectation on provision and security weighted towards the man, and the domestic responsibilities towards the woman. A traditional Thai expression compares a married couple to an elephant, with the husband as the two front legs and the wife as the hind ones. In an ideal couple, decision making is the man’s responsibility and the woman’s role is to be supportive and cooperative. A traditional *kulasatrii* shows deference to her husband, as he is the master of the household. In a hierarchical society such as Thailand, where people diligently make obeisance to persons of a higher status, this meant that some women in ancient times showed their husbands an extreme courtesy, which today would be reserved for the elders, teachers, or monks.

In the past few decades, lower- and middle-class women have increasingly worked outside of the homes while continuing to be in charge of the household chores and childcare. Men, however, have not been expected much to adopt the household responsibilities; it is still quite uncommon to expect married men to take on the same extent of responsibilities as their wives in cooking, cleaning, and parenting. In middle-class families, the women’s double responsibility is usually helped by live-in parent(s) or, if they can afford it, maids. In families with lesser means and no live-in parents, the burden on the women can be significant and often becomes a commonly cited cause of sexual disinterest and marital discord (Dumronggittigule, Sombathmai, Taywaditep, & Mandel 1995).

In fact, the divorce rate in Thailand has been growing steadily, paralleling an increase in economic autonomy for women. Divorce and remarrying are not uncommon, although there is a small but palpable degree of stigma, especially among the urban middle-class Thais. We will present further discussions about the tradition of marriage, family settlement, and the dynamics within a married couple in Section 5B, Interpersonal Heterosexual Behaviors, below.

### C. A Double Standard for Sexuality and Gender Stereotypes

One of the most consistent findings from sex research in Thailand is that minor wives and commercial sex are common sexual outlets for men of all ages, social standings, and marital statuses. This tolerance of married men’s extramarital sex is merely a part of the larger double standard regarding sexual practices, which mandates different rules for men and for women. As confirmed by studies on childrearing practices, Thai parents train girls more strictly than boys in the behaviors that are part of the gender roles (Archavanitkul & Havanon 1990). Girls are taught that a good woman remains a virgin until marriage and continues to be emotionally and sexually faithful to her husband afterwards. As adolescents, Thai fathers are known for being particularly protective and possessive of their daughters, exercising great control over their friendships with other teenage boys (Thorbeck 1988). For boys, however, sexual abandon is accepted or even encouraged. As Sukanya Hantrakul (1983, quoted in Kaime-Atterhog, Ard-Am, & Sethaput 1994) notes: “Culturally, Thai society flatters men for their promiscuity. . . . Women’s magazines always advise women to tolerate the situation and accommodate themselves to it.”

This double standard in sexual practices may have culminated in an undercurrent of tension between the genders, which, although not readily observable, has been felt and noted by many (e.g., Jackson 1989). Some mistrust and suspicion between the genders can be seen in the negative stereotypes men hold for women, and vice versa. For example, women are stereotyped as emotionally volatile and needy,

and they are often manipulative; a Thai proverb notes that the typical Thai woman, while maintaining the *kulasatrii* appearance, possesses “one hundred wagons full of stratagems.” Conversely, many women believe that men are often unreliable, unable to have an emotional commitment, inefficient in household management and parenting, and constantly driven by their sexual urges. Many women believe that while men get emotional support and recreation from their male peers, relationships with women exist mostly to fulfill the men’s sexual desires, as well as the societal expectations on the men to have a family. However, the men’s sexual desires are often perceived as insatiable, with an immature, uncontrollable character like a child’s craving—yet “naturally” and “instinctually” driven in a way that can hardly be limited to their spouses. As men continue to search for sexual gratification from commercial sex and minor wives, women unwillingly come to terms with the men’s extramarital escapades.

The myth that men’s sexual desires are boundless and immutable is quite pervasive (see more discussion in Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex). It is common to hear Thai women voice their concern about being raped. When activists demanded that commercial sex be eradicated, respectable men and women have publicly expressed the concern that “good women” would be endangered. Similarly, before HIV became a widespread concern in the Thai society, married women sometimes encouraged their husbands to visit sex workers, in part so they could be relieved of the obligation to serve their husband’s sexual demands, and possibly to prevent the husband’s worse crime of having a stable, emotionally committed relationship with a minor wife. These examples may reflect Thai women’s helplessness regarding the men’s presumably uncontrollable sexual drive, and consequently, their strategies to protect themselves and preserve their marriages. More recent surveys (see Section 5B, Interpersonal Heterosexual Behaviors, Adult Sexual Behavior) have found that married women in the HIV epidemic face an even more difficult dilemma as they realize that they are at risk for HIV infection from their husbands’ use of commercial sex. Encouraging the husband to have a minor wife as an alternative is still a painful decision for a woman to make.

### **D. Gender in Everyday Life: Social Manners, the Touch Taboo, Female Pollution, and Gender Segregation**

In general, Thai people are noted for their tender, friendly, and graceful ways of social and public behavior. Despite the clear masculine code of conduct, Thai men display less of the overt “masculine” behavior than men in many other cultures. Since the 1940s, urban middle- and upper-class men have adopted the Western chivalrous and “gentlemanly” social manners of “honoring” women, such as opening doors for women, and the “ladies first” etiquette. In addition, nurturance, as stated above, is a quality expected in Thai men, even among those in the position of power (see Kirsch 1985). Therefore, Thai men are often known for their polite, sweet, and caring gestures, as well as their respect for others. Women are expected to be all of these and more: the code of *kulasatrii* contains numerous guidance and taboos for the “proper woman.” Thus, the Thai gender-coded rules of conduct seem to place more demands on women than on men, as reflected in an oft-quoted phrase from a poem that “It is hard to be born a woman.” The famous male poet who immortalized this phrase, Soonthon Phuu, in fact wrote “but being a man is actually many times more difficult” as a retort to this phrase, but somehow the complete quote never became as popular.

Although urban Thais have adopted Western clothing styles since the early 1940s, formal social situations, such as the workplace, school, and university, still demand that trousers are strictly for men, and skirts or dresses are for women. Because motorcycles are one of the most popular means of transportation in urban Thailand, women who work in offices and female students struggle every day in their dresses while commuting to and from work. As a passenger, women must sit facing the side of the motorcycle to avoid an unseemly sitting position, compromising their balance and safety in so doing. Perhaps it is small, everyday things like this that best illustrates how the life of a *kulasatrii* is not any easier today than it was in Soonthon Phuu’s time 200 years ago.

In ancient Thailand, acquiring an expertise in certain exclusive areas, such as occultism or martial arts, was seen metaphorically as endowing the apprentice with the mentor spirits, known as *mii khruu* or “under mentorship.” Among the numerous rules of conduct for the learned men, some suggest a belief that men are superior to women, and others indicate some anxiety and animosity surrounding sex and the female anatomy. For example, some learned men must refrain from having sex with a woman. Many men were also prohibited from socializing with women (occasionally including the sister or mother) or their mentor spirits might be weakened by the “weaker sex.” Certain parts of the female body, such as genitalia, buttocks, or menstrual blood, and anything that contacts these body parts, such as sarongs, were considered sacrilegious and harmful to the learned men. Folklore anecdotes portray a vicious sabotage done by a piece of fabric from a woman’s sarong, and a learned man who lost his powers because he had unwittingly walked underneath an elevated house where a woman was physically above him.

Over the years, despite the decline of occultism and superstition, these folk beliefs remain even in those who are not learned men themselves. Tied into the still-popular fatalism (*duang*), many men today believe their destiny can be jeopardized (*choak suay* or “bad luck”) by circumstances such as walking under a row of laundry containing women’s skirts or underwear, or engaging in cunnilingus. Men are also told not to have sex with a menstruating woman or they might become seriously ill (Fuller, Edwards, Sermsri, & Vorakitphokatorn 1993). Even men who are not superstitious keep away from these situations to protect the integrity of their “manhood” or to avoid social disgrace. Even women themselves observe the behavioral restrictions which flow from this idea of symbolic female pollution. A woman who wears a Buddhist amulet is advised to step out of her sarong instead of pulling it over her head, and sarongs are often separated from men’s wear or upper garments in laundry (Manderson 1992).

Examples of gender segregation abound in Thai society. One of the 227 monastic rules of the monks dictates that in addition to being celibate, monks are not to have any physical contact with women. Women, including the monks’ family members, are precluded from certain activities in religious ceremonies to prevent any possibility of ritual purity violation, even accidental contact such as a slight brush of hands. Interestingly, this practice can also be seen in the way modern, urbane gentlemen act toward women: A proper gentleman does not touch a woman in casual circumstances. If he transgresses this social etiquette, an apology is in order. To Thai people, this decorum is impelled by two remarkably different, yet compatible cultural imperatives: firstly, the chivalrous, gentlemanly manners of “honoring” women adopted from the West, and secondly, the animistic belief which prohibits men from touching an unmarried woman to prevent an

offense to her guardian spirits (*phii puu yaa*). However, one can also discern the prevailing myth of men's boundless sexual desires behind this touch taboo. A man's touching of a woman is assumed to have a sexual intention unless otherwise explained. Gender segregation can also be seen on a more formal, institutionalized level. Thai people are socialized to mingle mostly with members of the same gender from a young age. Single-sex schools are very common. In colleges, all dormitories are men- or women-only, with strict rules prohibiting visitations from the other gender, even the students' family members.

Given the foregoing discussion about the touch taboo and gender segregation, it should come as no surprise that open physical expression of affection between men and women is deemed socially inappropriate in the Thai society. Until very recently, a (presumably unmarried) young couple would be frowned upon if they walked hand-in-hand affectionately in public. Conservatives openly condemn the influence of Western culture and the media on younger Thais' public behavior toward the other gender. In contrast, public expressions of affection among members of the same gender are quite common. As pointed out by Jackson (1989), Westerners often misinterpret such displays of same-gender affection as an expression of homoeroticism, or misconstrue it as a lack of homophobia among the Thai people. In fact, this same-gender physical intimacy is not viewed in any sexual way by Thai men or women. It is something similar to the sports camaraderie among Western men or casual affection among Western women, and not associated with either homosexuality or an absence of homophobia. Contrary to the Westerners' misperceptions, anti-homosexual attitudes exist in Thai society as they do elsewhere in the world (see Section 6, Homoerotic, Homosexual, and Bisexual Behaviors).

In summary, we have outlined a number of key belief systems that underlie the gender construction in Thai society: the Theravada gender roles, folk myths and animistic beliefs, and traditional class-relevant ideals, among others. Although diversified in origins, these belief systems share common elements which enable their assembly into a coherent cultural structure. To illustrate, men in general are allowed greater latitude in their sexual and moral conduct, perhaps because religious salvation awaits them as a viable option; the myth of masculinity which associates maleness with vices and sexual freedom, therefore, finds a corresponding solution in the Theravada role for men. Similarly, a consistent dictum about women can be found across these diverse belief systems. A woman's virtue is based on the degree to which she excels in promoting the well-being of religion and family, and it also depends upon her sexual conduct with men. A woman's moral status, therefore, is always relational and conditional. She is either higher or lower than men because of what she does (and does not do) with men. This idea is consistent with the Theravada role for women, the *kulasatrii* code of the female ideal, and a number of practices couched as ways to protect women from men's exploits.

It is noteworthy that the cultural construction determines whether or not a new practice or idea from another cultural origin will "fit" into the prevailing coherent structure. The relatively Western chivalrous manners, for example, have been assimilated into the Thai culture because they correspond to the indigenous notion that women are "noble" yet "weaker," thus needing honoring treatment and protection. The relatively recent rise of commercial sex in Thailand may be an adoption of capitalism, but Thai people have always been familiar in Buddhist tales with prototype women who commoditize sex in dire straits (Keyes 1984). The popularity of female meditation teachers in the 1970s in Bangkok was a unique phenomenon (J. Van Esterik 1982), but the

acceptance seemed to rest upon the perception that these lay teachers, like *mae chii*, would never pursue political or monastic goals. Some Thais did not even see the female meditation teachers as women, because these women did not fit conventional female images. Western feminism has been met with objection as being too radical, unrealistic, or culturally inappropriate, probably because the feminist manifestos do not find much corresponding agenda in the Thai gender construction. While the Thai society is undergoing rapid changes, the fundamental gender construction remains, and it determines which new influences will be selected and which will be discarded. Whatever the result of the transformation may be, the key in predicting the future of gender relations in Thailand lies in unraveling the gender constructions of the past and the present.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Religious Factors

#### *Buddhism, the Dominant Religious Factor*

The main and official religion of Thailand is Theravada Buddhism, with more than 90% of the population following this tradition. The profound influences of Buddhism on gender and sexuality in Thailand are intertwined with Hinduist practice, local animistic beliefs, and popular demonology from ancient times. The predominant animistic belief system involves *phii*, or the spirits, either of ancestral origin or those residing in natural objects. The spirits can inflict illnesses and misfortune upon individuals for deviant conduct, or, on the contrary, they can provide protection, healing, and bring about fortune for those who follow ethics and placate the spirits. In addition, about 4% of the population are Muslim, mostly living in the southern part of Thailand. Christianity has become steadily more popular, and over a century of work by the missionaries can be seen in many schools which offer good education to Thai children without seeking to convert them.

The tolerant philosophy of Buddhism and the constitutional guarantees of religious freedom have provided a fertile ground for adoption and admixing new religious beliefs with traditional beliefs. In the Thai eyes, the superstition and metaphysics in animism, demonology, and Hinduist cosmology are not at odds with the Buddhist cosmology depicted in the Buddhist canon and religious folk tales. These strands of belief systems maintain peaceful coexistence, and many Thais follow some of these practices to a certain degree during different parts of their lives.

Although the guidelines to achieve *nirvana* are offered, Buddhism emphasizes to the laity "the middle way" and the importance of avoiding extremism. This pragmatic approach is also seen in the domain of sexuality. Despite the deprecation of sexuality in the ideal Buddhism, celibacy is likely to be pertinent only to the monastic lifestyle, while diverse sexual expression has been tolerated among the lay followers, especially the men for whom sexual, military, and social prowess has always been extolled (Cabezón 1993). The Five Precepts are guidelines for lay Buddhists "for a socially-just life, free of exploitation of oneself and others." Again, pragmatism prevails: All of the Precepts are not rigidly expected in most lay Buddhists in Thailand (as well as in other Buddhist cultures) except for the elderly or extraordinarily pious laypersons (Cabezón 1993).

The Third Buddhist Precept specifically addresses human sexuality: Refrain from sexual misconduct or "wrong doing in sexual matters." Although being open to various interpretations, depending on the different contexts, malfeasance is usually considered by Thai people to mean adultery,

rape, sexual abuse of children, and careless sexual activities that result in the sorrow of others (Allyn 1991). Premarital sex, prostitution, masturbation, cross-gendered behavior, and homosexuality, on the other hand, are not explicitly mentioned. Any objection to some of these sexual phenomena is perhaps grounded in other non-Buddhist beliefs, such as classism, animism, or Western medical theories. In subsequent sections, we will present further discussions on the Buddhist attitudes toward homosexuality (Section 6, Homosexual, Homosexual, and Bisexual Behaviors) and commercial sex (Section 8B, Significant Unconventional Sexual Behaviors, Prostitution).

### *Gender Roles in Theravada Buddhism and Their Implications*

Many ideal images for men and women are found in religious folk tales, which the monks read or retell during sermons (*thetsana*). These sermons, although rarely translated from the Buddhist canon (*Tripitaka* or *Phra Trai-pidok* in Thai), are taken by most Thais as the authentic teachings of the Buddha (Keyes 1984). Similarly, other ritual traditions, folk operas, and local legends contain gender-relevant images in the depiction of men and women's lives, both sovereign and common, showing their sins and merits through their actions and relationships, all of which purportedly convey Buddhist messages. Thereby, the Theravada worldview, both authentic and interpreted through the Thai eyes, has exerted enormous influences on the gender construction in Thailand.

With a firm belief in *karma* and reincarnation, Thai people are concerned with accumulating merit in everyday life in order to attain an enhanced status in rebirth rather than striving for *nirvana* (Kirsch 1982). Earning merit and an enhanced rebirth status are depicted in the story of Prince Vessantara (or *Phra Vessandon* in Thai pronunciation), who is reborn in his next life as the historic Buddha because of his unconditional generosity expressed by giving away his valuables, including his wealth, children, and wife. In real life, men and women "make merit," and the Theravada culture prescribes different ways for this quest. The ideal "merit making" for men is through ordination in the *Sangha* (order of monks, or in Thai, *Phra Song*). Women, on the other hand, are not allowed to be ordained. Although the order of *Bhikkhuni* (the female equivalent to the *Sangha* monks) was established by the Buddha with some reluctance, the practice disappeared from Sri Lanka and India after several centuries and never existed in Southeast Asia (Keyes 1984; P. Van Esterik 1982). Today, laywomen can intensify their Buddhist practice by becoming *mae chii* (often erroneously translated to "nun"). These are lay female ascetics who shave their heads and wear white robes. Although *mae chii* abstain from worldly pleasures and sexuality, the laity consider giving alms to *mae chii* a lesser merit-making activity than alms given to the monks. Hence, these women usually depend on themselves and/or on their relatives for the necessities of life. Obviously, *mae chii* are not as highly regarded as monks, and indeed many *mae chii* are even perceived negatively (P. Van Esterik 1982).

The fact that the Buddhist religious roles for women are underdeveloped has led Kirsch (1985) to comment that women in Theravada societies are "religiously disadvantaged." Conventionally, the exclusion of women from monastic roles has been rationalized by the view that women are less ready than men to attain the Buddhist salvation because of their deeper enmeshment in worldly matters. Instead, women's greatest contribution to Buddhism lies in their secular role through enabling the religious pursuit for the men in their lives. Hence, the role for women in religion is characterized by the mother-nurturer image: Women sup-

port and provide for Buddhism by way of "giving" young men to the *Sangha*, and "nurturing" the religion by alms giving (Keyes 1984). The ways in which Thai women constantly support Buddhist institutions and contribute to various spiritual functions in their communities have been well illustrated in Penny Van Esterik's work (1982).

This mother-nurturer image is also prominent in the Thai women's secular pursuits. Women are expected to provide for the well-being of their husbands, children, and parents. As pointed out by Kirsch (1985), this historical mother-nurturer role has had a self-perpetuating effect on the exclusion of women from monastic roles. Because women are barred from the monastic position, and because the weight of filial and family obligations falls more on women than on men, women are doubly locked in the same secular mother-nurturer role with no other options. They, therefore, are indeed enmeshed in worldly matters, and their redemption lies in the actions of the men in their lives.

Two important religious texts illustrate this condition. In the tale of Prince Vessantara, his wife, Queen Maddi, is praised because of her unconditional support of his generosity. In *Anisong Buat* ("Blessings of Ordination"), a woman with no merit is saved from hell because she had allowed her son to be ordained as a monk (Keyes 1984). In reality, the mother-nurturer image entails a certain life path for women, as noted by Kirsch (1985, 319): "Under typical circumstances young women could expect to remain rooted in village life, eventually snaring a husband, having children, and 'replacing' their mothers."

Men, as seen in the depiction of Prince Vessantara and the young son with religious aspirations in the "Blessings of Ordination," are afforded autonomy, as well as geographic and social mobility, to pursue both religious and secular goals, therefore "affirming" the conventional wisdom that men are more ready than women to give up attachments.

Undoubtedly, these differential role prescriptions for men and women have led to a clear division of labor along gender lines. Thai women's role of mother and their routine merit-making activities necessitate their specialization in economic-entrepreneurial activities, such as small-scale trading, productive activities in the field, and craft work at home. Thai men, encouraged by the logistic freedom, prefer political-bureaucratic activities, particularly those in government service (Kirsch 1982). The connection between monastic institutions and polity has always been salient to Thai people (see Kirsch 1982; J. Van Esterik 1982), therefore, positions in bureaucracy and politics represent a man's ideal pursuit should he choose to excel in the secular role. In the 19th century, more Thai men began to strive for secular success when the Buddhist reformation in Thailand demanded more intensified discipline in monks; this coincided with an expansion of government occupations that resulted from a bureaucratic system reorganization in the 1890s (Kirsch 1982).

Becoming a temporary member of the monkhood has long been seen in Thailand as a rite of passage which demarcates Thai men's transformation from "raw" to "ripe," or from immature men to scholars or wise men (*bundit*, from Pali *pandit*). In Sathian Kosed's *Popular Buddhism in Thailand* (published in Rajadhon 1961), young Buddhist men, upon turning 20 years old, are expected to become a monk for the period of about three months during the Buddhist Lenten period. Because the merit from ordination of a married man will be transferred to his wife (and because she must consent to his ordination), parents are understandably anxious to see that their sons are ordained before they get married. Traditionally, a "raw" unordained adult man would be seen as uneducated and, therefore, not a suitable man to be a husband or son-in-law. The man's girlfriend or fiancée,

therefore, delights in his temporary monkhood as it should enhance her parents' approval of him. She often sees this as a sign of relationship commitment, and promises to wait patiently for the day he leaves his monkhood at the end of the Lenten period. In Thai society today, this practice of ordination has changed and is less significant, as men are more involved in secular education or occupied by their employment. Statistics show that today, members of the *Sangha* account for a smaller percent of the male population than in earlier times (Keyes 1984). As early as the late 1940s, when Sathian Kosed wrote *Popular Buddhism in Thailand*, there were already some signs of weakening customs around the Buddhist ordination.

Many other phenomena related to gender and sexuality in Thailand today can be traced to the Theravada worldview. As will be more evident in subsequent discussions, the Thai culture exhibits a double standard, which gives men a greater latitude to express their sexuality and other "deviant" behaviors (e.g., drinking, gambling, and extramarital sex). Keyes (1984) has pointed out that whereas women are seen as inherently close to the Buddha's teachings about sufferings, men require the discipline of ordination in order to achieve this insight, for they tend to digress from the Buddhist Precepts. With Keyes' notion in mind, we can speculate that Thai men perceive that demeritorious behaviors can be amended through their eventual ordination. Up to 70% of all men in central Thailand become monks on a temporary basis (J. Van Esterik 1982). Other adult males renounce "worldly" living to be ordained to the *Sangha*, living a midlife or old age "robed in yellow" as is commonly said in Thai. With such redemptive options, Thai men may feel little need to suppress their passions and vices. These attachments are, after all, easy to give up and are insubstantial compared to the salvation available to them in their twilight years.

On the contrary, women's lack of access to direct religious salvation makes them work harder to maintain virtuous lives, which means refraining from and disapproving of sexual indulgences, in order to keep their demerit to a minimum. With no access to formal Buddhist scholastic activities, it is unlikely that women would be able to discern which virtues and sins were defined by the Theravada values and which by the local gender construction (see discussion of *kulasatrii* in Section 1A, Basic Sexological Premises, Ideal Gender Images). Further, because women believe that their strongest merit is to be a mother of a son who is ordained, the pressure on women to marry and have a family is heightened. They must do everything to enhance their likelihood of marriage, perhaps including adherence to the ideal female images no matter how difficult. Viewed this way, both men and women in Thai society strongly endorse a double standard regarding gender and sexuality, albeit for different reasons.

### *Key Beliefs in the Thai Constructions of Gender and Sexuality*

Before we proceed to other topics, it may be helpful to summarize the key strands of worldviews which will be apparent in subsequent discussions of gender and sexuality in Thailand. The most important influences are religious belief systems. Not only do the Five Buddhist Precepts constitute the ethical guidelines for laypeople, the Theravada gender images have been passed on to the society through sermons, folk tales and operas, and rituals. Animistic and Hinduist beliefs are embedded in the Thai consciousness through these folk tales, as is evident in metaphysical cosmology and entities, angels and ghosts, heavens and hells.

Other influences can also be identified in contemporary Thai society. For example, the consumerist and capitalist

ideology is evident in commercial sex and pornography industries. More recently added to the mix is the newer generation's perception of sexuality in contemporary Europe, North America, and Japan, often interpreted as "modern," liberal, or hedonistic. Another school of thought present in the educated, urban middle class is the Western medical models of diseases and deviance, as well as psychological theories of sexuality; the Thai translations for "the subconscious," "latent," or "ego" are not uncommon in the conversation among the educated. Among other members of the same social strata, one can also discern the rise of contemporaneous Western ideological and political movements, such as feminism, women's studies, and the gay/lesbian identity. In a similar vein, the humanistic approach to understanding sexuality has become more visible in recent years, although it is often mislabeled as "modern," "Western," or "radical." Unfortunately, the humanistic movement may suffer from such misrepresentations in the present cultural climate, in which Thai tradition is seen as threatened by Western influences, and many Thai intellectuals are paying lip service to the conservation of traditional Thai identity.

### **B. Ethnic Differences and Social Structure**

Today, there are four regions of Thailand with distinct cultures: the north, the northeast, the central area, and the south. Although regional and cultural differences exist, there is a strong national identity, and the central Thai language is taught and understood throughout the country. This is enhanced by a well-developed mass media and communications system, a good telephone service, and a reliable transportation system servicing all parts of the country. The only exception to this is the hill tribe people in the mountainous regions that surround northern Thailand. The hill tribe people migrated south from China and have remained relatively separate and distinct. However, as the government cracks down on the growing of poppies (for opium and heroin production) and deforestation, the hill tribe people have been moving into the lowlands of Thailand or, through better roads and transportation, commute regularly into the lowland cities for work. Hill tribe people have maintained their own languages, cultures, and customs in the past several centuries. More details on the lives of hill tribe populations can be found in the books edited by Nancy Eberhardt (1988) and McKinnon and Bhruksasri (1983).

Other cultural differences also exist. The stratification of upper, middle, and lower classes is mostly based on the past social hierarchy (*sakdi na*) and the family's financial powers. This social stratification is no longer enforced by contemporary law, but its presence is recognized by most Thais. There is also a distinction between urban and rural Thais. Constituting a majority of the Thai population, people in the rural villages of Thailand have led more-simple lives rooted in rich traditions, with less interference from international cultures or capitalism. Urban Thailand, on the other hand, has gained its cultural richness from the diverse social classes, ethnicities, and international cultures. The rural/urban division is still highly salient to most Thais, even though the differences have become gradually smaller because of the media, improved communication and transportation, and the migration of rural Thais to find work in big cities. Among other changes, gender and sexuality in rural villagers today have been greatly adulterated by the urban cultural images through the ubiquitous popular media (Keyes 1984).

In addition, there is also an ethnic division between the Thais and the 10% of the population who are of Chinese descent. Mostly excluded from the upper echelons of nobility, Sino-Thai people have gained power and status through commerce. The ethnic Chinese in Thailand have managed to

blend well into the urban middle-class communities with particularly great contributions in commerce and, more recently, the sciences, while still maintaining their traditional heritage through customs and Confucian family values. Despite the longstanding tradition of classes, social mobility is common, and the ethnic Chinese stand as examples of “rags-to-riches” possibilities (Kirsch 1982). Racial prejudice exists on a subtle level, but has never resulted in overt segregation or violence, even during the anti-Chinese nationalistic government in 1939. Readers who are interested in the lives of Chinese and Sino-Thai peoples in Thailand are referred to the work of Anne Maxwell Hill (1988) and William Skinner (1957).

It is important to bear in mind these cultural, regional, and ethnic differences, because they significantly limit generalizations about the sexual attitudes and values in Thailand. In this chapter, a majority of the research data on sexual attitudes and behavior has been derived from samples of lower- and middle-class ethnic Thais. Most empirical studies have been conducted in urban cities, such as Bangkok and Chiang-mai, although data from the rural villages of the north and the northeast account for a considerable portion of our review. In addition, Thailand’s rapid economic progress in recent decades has had a dramatic impact on every level of socio-cultural structures. Likewise, the nature of gender and sexuality in Thai society is undergoing rapid transformations. As a result, the great degree of flux and heterogeneity in Thai society demands that we pay great attention to the contexts in our attempt to understand gender and sexuality in Thailand.

### 3. Knowledge and Education about Sexuality

Like parents in many other cultures, most Thai parents do not educate their children about sexuality, and when children ask about sex, they are likely to avoid answering or they provide incorrect information. Since parents are unlikely to display affection in front of their children, role-modeling of affection between the genders is usually derived not from parents, but from literature or the media. Men are more likely to discuss sex with other men, especially when they are socializing and drinking with each other. Women also prefer to discuss sex and their marital issues with their same-gender peers (Thorbeck 1988). Sexual communication between a married couple has received much attention among Thai sex and AIDS researchers recently, but data are still scarce (see Section 5B, Interpersonal Heterosexual Behaviors, Adult Sexual Behavior).

Sexual matters are not typically discussed in a serious fashion in the Thai society. When sex is mentioned, it is often in the context of playful banter or humor. Playful joking about sex with striking curiosity and candor is not uncommon. For example, a newlywed couple would be teased lightheartedly and openly: “Did you have fun last night? Was last night happy? How many times?” (Allyn 1991). As in many cultures, Thai people have an extensive sexual vocabulary (see Allyn 1991). For every colloquialism that Thai people find offensive or obscene, there are a number of euphemistic equivalents. Euphemistic substitutes are made by way of symbolic animals or objects (e.g., “dragon” or “dove” for penis, “oyster” for vagina, and “eggs” for testicles); children’s language (e.g., “little kid” or “Mr. That” for penis); extreme obscurity (e.g., “said activity” for having sex, “using mouth” for oral sex, and “Miss Body” for prostitute); literary references (e.g., “Lord of the world” for penis); or medical terms (e.g., “birth canal” for vagina).

With such a variety of alternative terms, Thai people feel that sexual matters in everyday conversation should be tastefully alluded to in moderate amounts, with an artful choice of

words, timing, and comic sensibility. Thai people do have a strict sense of social appropriateness surrounding such humor, especially in the presence of elders or women. Discussions about sex are uncomfortable when they are excessively crude or straightforward, overly solemn or intellectual, and socially inappropriate. Such discomfort is reflected in the Thai words which are equivalent to “one-track mind,” “dirty mind,” “lewd,” “sex-obsessed,” “sex-crazed,” or “nympho” in English, with a variety of nuances ranging from playful to pathologizing to disapproving. Such attitudes have been one of the barriers for sexuality education; rather than objecting to content of sexuality education *per se*, adults and educators feel embarrassed by discussions about sex that seem too intellectual and straightforward.

Sexuality education was introduced in Thai schools in 1978. Although the curriculum has been revised over the years, it has been limited to reproductive issues and sexually transmitted diseases (STDs). As in many other countries, sexuality education in Thailand has been rarely taught in a comprehensive manner. Embedded in the contexts of health education and biology, attention to sociocultural contexts was more an exception than a rule. Although family planning and population control is practiced by most Thais, contraception is not emphasized in school. Instead, a typical Thai gains this knowledge from family planning media campaigns, clinics, and physicians.

Dusitsin (1995) has expressed concerns that Thai people can no longer rely on learning about sex from sexual humor, which contains alarming amounts of sexual myths and misinformation. Dusitsin’s proposal of a Program for the Promotion of Sexual Health (see Sections 12, Sexual Dysfunctions, Counseling, and Therapies, and 13, Research and Advanced Education) gives a priority to developing curricula for sexuality education for both students and non-student populations. Other Thai researchers and experts have voiced the same philosophy and have called for more comprehensive curricula, with greater coverage of psychosocial issues, such as a discourse on gender, homophobia, and sexual commercialism. They have also urged that sexuality education must have its own identity and objectives clearly distinguished from the highly visible AIDS-prevention campaigns, in order to avoid the constricted scope and sex-negative attitudes. Others have also enthusiastically supported the idea of covering non-student populations, who usually have limited access to services and education.

### 4. Autoerotic Behaviors and Patterns

Very few of the sex surveys conducted in the wake of the HIV epidemic have reported any data about the incidence of masturbation, let alone discussed the attitudes and behaviors surrounding this behavior. This may be because of the fact that masturbation, like most other sexual matters, is somewhat a taboo subject in Thailand, and has been ignored perhaps because it does not have a direct bearing on the public-health agenda.

One study did examine adolescent autoerotic attitudes and behaviors (Chompootaweep, Yamarat, Poomsuwan, & Dusitsin 1991). Many more male students (42%) than female students (6%) reported having masturbated. The modal age of first masturbatory experience was 13 years. Adolescents were likely to maintain negative attitudes about masturbation, viewing it as “unnatural,” or citing myths about masturbation, such as a belief that it causes sexually transmitted diseases. The gender difference found in the rates of reported masturbation is striking, although it is also typical of other domains in sexual surveys in Thailand. Within the same socioeconomic stratum, Thai men

always report having much more sexual interest and experience than Thai women. Young women, in particular, might be uncomfortable with the idea of masturbation because it is an acknowledgment of sexual curiosity, which is deemed inappropriate and shameful for women (Ford & Kittisuksathit 1994).

Data on the masturbatory experiences of adults are also scarce. In one study of army conscripts in northern Thailand, 89% of the men (age 21) reported having masturbated (Nopkesorn, Sungkarom, & Sornlum 1991). There is little or no formal information on adults' attitudes about masturbation, but the myths held by adults are likely to be different from those of adolescents. One common myth among male adults is that men are endowed with a finite number of orgasms, thus it is advisable to indulge in masturbation in moderation.

Perhaps the general attitudes of Thai people regarding masturbation can be inferred from the terms used to describe the act. The formal Thai terminology for masturbation, *sumrej khuam khrai duay tua eng*, which simply means "to consummate sexual desire by yourself," has replaced a former technical term *atta-kaam-kiriya*, which means "sexual act with oneself." The tone of these rather clinical and inconvenient terms is neutral, strictly free of judgment or implications about health consequences. There is really no clear discussion about masturbation, either positive or negative, in the Third Buddhist Precept or in animistic practice. Therefore, any disapproval of masturbation in the Thai society is likely to be a result of the general anxiety surrounding sexual indulgences, or perhaps from the Western anachronism introduced to the Thai thinking by way of past medical education.

Most Thais, however, prefer the playful vernacular *chak wow*, meaning to "fly a kite." The term compares male masturbation to the hand action of flying a kite, a popular Thai pastime. An even more euphemistic term for male masturbation is *pai sa-naam luang*, which means "to go to the grand field," referring to the very popular park area near the royal palace in Bangkok where people fly kites. For women, the slang term *tok bed* is used, meaning "to use a fishing pole." These playful and euphemistic expressions reflect the acknowledgment that masturbation occurs for both men and women, and yet some discomfort prevents a straightforward verbal expression.

## 5. Interpersonal Heterosexual Behaviors

### A. Adolescent Sexual Behavior

Numerous studies up to the mid-1990s have shown that about half of Thai men have sexual intercourse before they are 18 years old, and that most of them have their first experience with a commercial sex worker (e.g., Sittitrai, Phanuphak, Barry, & Brown 1992; Udomratn & Tungphaisal 1990). Justified as a way of preserving the virtue of "good women," Thai adolescents seek premarital sexual experience from commercial sex workers. Prior to the HIV epidemic, there was virtually no stigma attached to this practice. Sex with a sex worker has often been considered a rite of passage and an accepted manner of learning about sex for young men. Some Thai fathers were known to pay sex workers to have sex with their sons as a way of giving their youngsters some sex education or acknowledging their adulthood. In primarily male colleges, senior students welcomed freshmen, most of whom had no prior sexual experience, by accompanying them to the local brothel or bars/cafes which offer commercial sex. In the contemporary Thai society where increasingly fewer men are interested in the *Sangha*, the young men's use of sexual intercourse as a rite of passage seems like a symbolic commen-

tary on how the male image has drifted further away from the monastic role in the direction of worldliness.

Thai male adolescents eagerly look forward to their first intercourse and, as its slang term (*khuen khruu*) roughly implies, a learning process with someone sexually experienced. For many young Thai men, this practice continues beyond their first sexual experience, and commercial sex becomes a bachelor's recreation. In fact, the phrase *pai thiow*, meaning "to go out for fun," is a euphemism for a visit to the brothel. Going to a brothel with friends is a social as well as a sexual experience, often occurring after an evening of drinking or social gathering. Young men who do not seem interested in joining their peers at a brothel are sometimes teased for being homosexual (Ford & Kittisuksathit 1994). This pattern of sexual behavior in young Thai men will be confirmed by more findings reviewed in the section on the premarital sex of adults (see Section 5B, Interpersonal Heterosexual Behaviors, Adult Sexual Behavior).

On the other hand, young women are supposed to be virgins until they are married. Sex is thus not a recreational option for unmarried women as it is for men. Violation of this rule occurs in the cases of prostitutes and "carefree women." A "carefree woman," or an unmarried woman who seeks sexual pleasure from casual partners, is stereotyped as shallow, emotionally disturbed, and self-destructive. She presumably has lost her virginity because she was amoral, careless, gullible, or blindly following the Western code of sexual behavior. Needless to say, sex before marriage for women is the key criterion that distinguishes a "bad woman" from a "good woman." Female sex workers are subject to the same stereotype, but perhaps to a lesser degree, possibly because they are perceived to be forced into commercial sex by poverty. In addition, the *kulasatrii* notion mostly pertains to the upper and middle classes (Pyne 1994), and thus has less to do with the lower-class origin of most sex workers. Despite such class difference, the *kulasatrii* status is much like the Buddhist concept of merit in that it is based on the person's conduct, not on the social standing *per se*, and it is subject to decline for any transgression. Inasmuch as social mobility and merit accumulation are afforded everyone in Thailand (although perhaps not with equal ease), every woman, every *kulasatrii* can fall from grace if her conduct is compromised. Therefore, gender segregation, the stringent rules of *kulasatrii*, and strict parental supervision all are useful mechanisms for maintaining the virtue of "good" women.

In keeping with the value on women's virginity, the Thai culture prescribes that romantic relationships between young men and women must be without sex. In general, young people in Thailand today choose their own romantic partner, although parents exercise sanctions on their choice and limit their premarital sexual interaction (Ford & Kittisuksathit 1994). As a man and a woman enter a purely romantic premarital relationship, they are known as being each other's *fan*, an originally English term used in Thai with a different connotation. When in a relationship, many young women start to act as if they are practicing the traditional gender script of husband and wife (without the sex) by adopting a more submissive and deferential role with their *fan*. Even under such a nonsexual premise, many young Thai lovers are still very reluctant to reveal that they have a *fan* to parents or adults for fear of disapproval. In the conservative middle-class ethic, romantic interest is inappropriate for adolescents because they cannot support themselves. Many young lovers simply refer to their *fan* as a male or a female friend. This reluctance to disclose romantic relationships remains in many married adults, who refer to a spouse as a *fan* even after years of marriage.

In an exceptional study of adolescence, Chompootaweep et al. (1991) randomly surveyed secondary-level schools in Bangkok and collected questionnaires from 4,337 students (mean age = 14.7) and 454 teachers. Both male and female students reported that the best age to develop a romantic relationship was 18 to 20 years of age, in contrast to the ages 21 to 25, which their teachers thought was the appropriate age to start romantic relationships. This demonstrates the intergenerational difference in attitude toward adolescent romantic relationships; Thai teachers, like Thai parents, see romance between adolescents as precocious and inappropriate. Fifty-five percent of the male students subscribed to the idea that men should have some sexual experience before getting married, while only 24% of the female students thought this was appropriate for men. Among the teachers, 74% of the male teachers and 58% of the female teachers endorsed men's premarital sexual experience. A double standard was clearly illustrated, as only 15% of both male and female participants endorsed premarital sex for women. In terms of sexual behavior, 12% of the male students and only 1% of the female students reported having had intercourse.

These observations have been further confirmed in another excellent study (Ford & Kittisuksathit 1994) which we have cited throughout this chapter. In this study, qualitative data were obtained from focus groups with young factory workers (ages 15 to 24) whose socioeconomic status was more representative of the general Thai youth populations than high-school or college samples. Sexual desire was perceived by both young men and women to be a male attribute. The young men openly expressed their sexual feelings and experiences; the young women felt ashamed of their sexual curiosity and thought women should wait until they were older and married before they found out about sex. In the minds of the young men, sexual intercourse seemed like an adventure, a gain, a forceful act, or an act of satisfying one's greed. Some slang terms used by the young men for sexual intercourse can be roughly translated to "taking," "earning," "playing," "grinding," "gobbling," and "poking the yolk." On the contrary, sexual intercourse was seen by the young women as a loss of their body/self (*sia tua*), and women who have lost their virginity were seen as "impure," "soiled," or "tarnished." In addition, there is a belief that a forbidden sexual experience can predispose a young woman to becoming sexually out of control, (*jai taek*), especially if the liaison ends with the man deserting her. Such a woman might turn into a "carefree woman" or even a prostitute (Thorbek 1988).

In addition to demonstrating a double standard among Thai adolescents, Chompootaweep et al. (1991) also found that the gender and sexual attitudes of Thais in the same urban environment differed as a function of their ages. The young factory workers in Ford and Kittisuksathit's study (1994) pointedly articulated this sense of being in the midst of social transformation. Repeatedly referring to "[things are] different today," these adolescents were acutely aware of their living in a period in which sexual constructions were rapidly changing from the clear prescriptions of the "traditional" norms to the more amorphous and perplexing "modern" ways.

## B. Adult Sexual Behavior

### *Premarital and Adult Sexual Experience*

The *Survey of Partner Relations and HIV Infection* (Sittitrai et al., 1992; referred to hereafter as "the *Partner Relations Survey*") is a large population-based study that examined sexual attitudes and behaviors among 2,801 men and women. Currently married men reported an average of 30.2 premarital sexual partners. Never-married men reported an average of 14.3 premarital sexual partners. The picture was completely different for women, who reported

little or no premarital sexual experiences, with means of 0.03 and 0.01 premarital sexual partners for married women and never-married women, respectively. This gender difference again reflects a double standard on premarital sex for men and women. Although the extent of reporting biases could not be determined, as in most sex surveys, the social-desirability biases could have influenced men to overreport and/or women to underreport their premarital sexual experiences. The biases, if there were any, did indeed reflect the double standard that promotes premarital sex in men and discourages it in women.

Many researchers have studied Thai military conscripts in order to describe the sexual behaviors of the general populations of young Thai men. Thai men ages 20 to 22, who are not in higher education, are inducted to the Royal Thai Army by lottery; randomly selected samples, therefore, provide an excellent representation of men in the lower socioeconomic strata of Thai society (Beyrer, Eiumtrakul, Celentano, Nelson, Ruckphaopunt, & Khamboonruang 1995). In a study of conscripts from northern Thailand in 1990 and 1991 (Nopkesorn et al. 1991), 97% of these 21-year-old men reported having had sexual intercourse, with about 54% reporting having the first intercourse before the age of 16. The first sexual intercourse for 74% of the men was with a female sex worker, compared to 12% with a lover, and 8% with a girlfriend. A majority of men, 90%, had had sex with a female sex worker, mostly starting between the ages of 15 to 18. By the age of 16, about half of the sample had had their first visit to a female sex worker.

Until AIDS became a widespread anxiety in the mid-1990s, commercial sex had been the primary sexual outlet for Thai bachelors, justified as a means of protecting virtuous Thai women from premarital sex. For Thai male adults, the use of commercial sex continues in the same way as it began in adolescence (see Section 5A, Interpersonal Heterosexual Behaviors, Adolescent Sexual Behavior), only with less economic restriction. Taking care of men's sexual needs by offering services from a sex worker is considered part of hospitality in many business dealings. Upon arrival in a new city, traveling men or male tourists often make a point of visiting local brothels or erotic massage parlors as local attractions.

This picture may, however, be changing with a new generation of Thais because of several factors. Young women have been found to be more likely to engage in premarital sexual activity than the previous generations. Western culture, as perceived and interpreted through the Thai eyes, has been implicated in this change over the last few decades. More recently, it has also been attributed to the men's heightened fear of HIV. As prevention campaigns have publicized high rates of HIV infection among female sex workers, Thai men have become more wary of visiting professional sex workers. For example, a decrease in the use of commercial sex workers among the northern Thai conscripts, for example, has been documented over the few years prior to 1996 (Nelson et al. 1996).

In response to the worries about AIDS and commercial sex, Thai men have turned to a number of other ways of fulfilling their sexual desires. While many Thai men have become less sexually active, others, especially those in the urban middle-class settings, have been paying for sex with non-professional sex workers who are not in the sex establishments. Others turn to the big-city singles or nightlife scenes for casual sex with pickup partners. Finally, there is a growing number of men who have sex with their girlfriends in the context of a committed romantic relationship. Helped by the anonymity of big cities and the widely available contraceptive methods, there are increasing numbers of cohabiting couples, much to the chagrin of conservatives who are concerned

with the virtue of Thai women. Although this phenomenon has been consistently observed in recent studies (e.g., Nelson et al. 1996), many researchers feel that there is much resistance from the Thai public, who are not quite ready to formally approve of these unmarried sexual couples.

Thai women, not unlike those in many other cultures, take risks in having sexual experience. In addition to concerns about pregnancy and health, they face the risks of stigmatization for losing their virginity outside a marriage. As many sex workers have reported, because an unmarried woman's virtue is eminently tied to her virginity, a woman who has lost her virginity has nothing to lose in choosing the path of commercial sex (Thorbeck 1988). Other women keep their premarital sexual experience a secret, although the psychological repercussions may continue. A small number of women who are neither secretive nor disturbed by their premarital sex are suspected to have had a "bad influence" from Western culture, or are pathologized as sensation-seeking, promiscuous, or morally corrupt (see the "bad girl" stereotype in Section 5A, Interpersonal Heterosexual Behaviors, Adolescent Sexual Behavior). The expressions which characterize women who seek sexual gratification with little restraint are *jai ngai* ("feeble mind/heart"), and *jai taek* ("broken mind/heart"), suggesting that the women are morally corrupt or out of control. Together, the nonprofessional women who exchange sex for money and the "carefree" single women in the urban nightlife and singles scenes are categorized as *ying ruk sanuk*, or "fun-loving women," or the slang *kai long*, or "stray chicken." These "depraved" women are seen as "only good for sex but not suitable for being the mother of your children."

In spite of the blame on Western influence, the image of "bad" women who seek sexual pleasures is not new. Kirsch (1985) has observed that in the 19th century, King Mongkut characterized "spinners and divorcees" as "artful women" who viewed monks as "fattened hogs" (i.e., potential husbands); monks exposed to such women's seduction "are likely to be driven crazy by their new found love" (p. 311). Similarly, Penny Van Esterik (1982) has found that some lay villagers were suspicious of *mae chii* (female ascetics) who lived near the temples in which monks resided. She further cites a story recorded by Attagara about a woman who dressed up as a *mae chii* and seduced a local abbot who was so ashamed of his weakness that he held his breath and died. A line in the *Jataka* tales (tales about the Buddha's past lives) says that "Women desire rich lovers like cows seeking new pastures" (p. 76). These illustrations suggest that women who did not fit the model of motherhood, like unmarried women, divorcees, or *mae chii*, might have always been viewed with suspicion, with a projection of the male-typical boundless and uncontrollable sexual desires on to them.

In addition to the well-known "bad woman" stereotype and the *kulasatrii* ideal, there is yet another type of women in the Thai consciousness, namely the widows. (Although this word in Thai can also refer to divorced women, this discussion pertains only to women whose husbands are deceased). Mostly of middle- and lower-class social strata, many widows seem to be less bound by the conservatism of a *kulasatrii*, yet they are not stigmatized as depraved. Because a widow presumably has had sexual experience in her prior marriage, virginity no longer is an issue of virtue for her. Therefore, she can seek sexual pleasure without severe social stigma, given that, of course, scandals such as affairs with married men or pregnancy out of wedlock are avoided. With the exception of female sex workers, widows seem to be the only women in Thai society "allowed" to have sex outside of marriage. In literature, jokes, and popular song lyrics, widows are portrayed as temptresses: straightfor-

ward about their sexual interest—often toward younger men—witty and flirtatious, exuberantly sensual and seductive, and well versed in their sexual practices. To many heterosexual male adolescents, an idealized fantasy of their first sexual experience is an encounter with such a woman who is sexually disinhibited, yet not a sex worker. The Thai culture seems to have an alternative for a woman to be sexually active with fewer reservations, but she needs to have lost a husband who had introduced her to the joy of sex.

### Marriage and Family Dynamics

Choice of a marriage mate is usually based on the individual's preference. Thai women have greater power in their spouse selection than do Chinese-Thai women in Thailand (Pyne 1994). Elopements are also, however, well known, indicating the power of parental objection (Kirsch 1982). A married couple may reside for a time with the wife's family, but their ideal residence is an independent nuclear household. In extended families, the strong matrilineal ties generally entail men's moving into the woman's family. Well-known exceptions to this custom exist, especially among the ethnic Chinese in Thailand as exemplified in the work with Yunnanese families by Hill (1988). With the couple establishing an independent household in the wife's family compound, both usually continue to work the land owned by the wife's parents, with the son-in-law's labor construed as a form of brideprice. Despite such a matrilineal pattern of postnuptial residence, authority is passed down through the men in the family, and the son-in-law eventually becomes the head of the household (Pyne 1994).

Women maintain strong connections with their mothers, even when migration and poverty make contacts difficult (Thorbeck 1982). Women working in cities often send money to their families upcountry, visit them annually, and most return to the villages when their target income is achieved (Pyne 1994) or when their employment or marriage ends.

A traditional Thai marriage is symbolized by tying the bride and groom's wrists with holy string during a ceremony at which the family and community are present (Pyne 1994). A woman changes her surname to her husband's upon marriage and her title changes from *naangsa* ("Miss") to *naang* ("Missus"). In addition to the informal gender-neutral *fan*, a variety of terms for husband and wife exist for use in different contexts, ranging from the playful and frank (*phua* for husband, and *mia* for wife) to the formal and polite (*saamii* for husband, and *phan-ya* for wife). There is a slight discomfort with the frank terms for husband and wife, and most Thai people see the formal, legal, slightly detached terms as more civilized and polite. The importance of the couple's image as parents can be seen in the endearing terms for husband and wife, *pho baan* and *mae baan* (father and mother of the home). In fact, the birth of the first child is a critical event for a traditional Thai couple, as it denotes the union and symbolizes a stable relationship (Pyne 1994). Although a preference for having sons has been documented elsewhere (e.g., P. Van Esterik 1982), and it is particularly strong in the Chinese-Thai families, both sons and daughters are valued for different reasons. While the son's potential ordination in the *Sangha* can accumulate merit for the parents (Rajadon 1961), a daughter is viewed as being reliable and dependable, especially for the care of parents in old age (Pyne 1994). Data from the *Demographic and Health Survey* (cited in Pyne 1994) indicate that half of all married women (ages 15 to 49) intend to have two children, and 80% want two or three.

The nurturing responsibilities of contemporary Thai women are undeniable in the statistics of women who work outside of their homes, as well as the proportions of women among migrants and the workforce (see Pyne 1994). Em-

ployers consider female workers to be hard working, enthusiastic, loyal, patient, and attentive to detail. Interestingly, centuries ago, the same qualities in Thai women did not escape the eyes of foreign observers. In the 17th century, Simon La Loubère (1693, quoted in Kirsch 1982, 16) noted on his visit to Siam: “how lazy the ordinary life of the Siamese [commoner] is . . . he does almost nothing but continue sitting or lying, playing, smoking, and sleeping.” In contrast, he observed that the Siamese women “plow the land, they sell and buy in the cities”; and “The women . . . are always busy . . . trafficking in the bazaars, doing the light work in the fields and marketing.” Similarly, a Chinese visitor to Siam during the Ming dynasty observed that “when there are affairs to be settled [in Siam,] they are settled by women. In determination and judgment the women really surpass the men” (Kirsch 1988, 27).

In Thai households today, men are typically the main source of income in a married couple. Major decisions of allocating resources thus remain in the hands of the men, whereas the women often manage the finances on a day-to-day basis (Pyne 1994; Thorbek 1988). In general, women are often more organized and economical than their husbands. Many women spend much energy trying to keep their husbands’ vices in check with varying degrees of success. Thai women also engage in small homegrown businesses, such as vegetable gardening, market-vendor trading, and fabric weaving, if the family earning from the men is not adequate. Nevertheless, these earning women seem to spend most of their own incomes on the necessities of the family and often give sums of money to their mothers (Thorbek 1988). Similarly, a majority of women in commercial sex businesses send their income to parents, siblings, and other relatives in their native villages (Wawer, Podhisita, Kanungsukkasem, Pramualratana, & McNamara 1996). Thai women take their “nurturer” role seriously and few things can deter them from their mission.

### *Incidence of Vaginal, Oral, and Anal Sex*

Data on the incidence of vaginal, oral, and anal sex among Thai people have been provided by the large-scale *Partner Relations Survey* (Sittitrit et al. 1992). Among sexually experienced participants, vaginal intercourse was by far the most frequent sexual behavior, reported by 99.9% of the male and 99.8% of the female participants. Other sexual behaviors, however, are much more rare: Performing oral intercourse (presumably on the other gender) was reported by only 0.7% of the male and 13% of the female participants. Receiving oral sex was reported by 21% of the male participants and no data were available for the female participants’ experience of receiving oral sex. Receptive anal intercourse was experienced by 0.9% of the male and 2% of the female participants. Insertive anal intercourse was experienced by 4% of the male participants.

The striking rarity of the non-genitogenital sexual acts, especially cunnilingus, among Thai people illustrates some sociocultural constructions that play important roles in the Thai sexuality. Even if reporting biases were operating in these findings, the reluctance toward having or reporting oral sex may suggest some aversion to certain body parts, especially the vagina or anus. As previously mentioned, Thai men’s anxiety about losing dignity or masculinity from performing oral sex on a woman might have been a cultural residue from occultism and superstition of the past (see previous discussion on *mii khruu* in Section 1D, Basic Sexological Premises, Gender in Everyday Life). In addition to this superstitious reasoning, Thais also apply the concepts of social hierarchy and dignity to body parts: Certain parts of the body, such as the head or the face, are associated with personal

honor or integrity, whereas other “inferior” parts, such as the legs, feet, anus, and the female reproductive organs, are associated with impurity and baseness. This belief is still extremely common in Thai society, even among those who are not particularly superstitious. In the updated belief of body hierarchy, the impurity of inferior body parts is associated with germs or crudeness, while violation is framed as poor hygiene or lack of social etiquette.

In social interactions, the body hierarchy prohibits some behaviors, such as raising one’s lower extremities high in the presence of others or touching an older person’s head with one’s hand (or even worse, with one’s foot). In sexual situations, this belief also prevents certain sexual acts. Viewed in this cultural context, one can understand Thai people’s repulsion toward oral or anal sex, as well as other sexual acts, such as oral-anal sex or foot fetishism. In these acts, “lowering” a highly guarded body part (e.g., a man’s face or head) to contact an organ of a much lower order (e.g., feet or a woman’s genitals) can cause damage to the man’s personal integrity and dignity. Many Thais today openly disapprove of these sexual acts as deviant, unnatural, or unsanitary, while others are excited by the lack of inhibition they find in Western erotica.

Perhaps because of the lack of direct public health implications, very few studies have generated data on the sexual behavior within married couples. In a 1981 study, a majority of married Thai women (ages 17 to 65) randomly sampled in Bangkok reported low sexual desire or enjoyment after the birth of their children (Bussaratid, Na Ranong, Boonyaparakob, & Sitasuwan 1981). Frequency of sexual intercourse was once a week or less in 49% of the women. Only 24% reported having orgasm with every intercourse; women 35 years or older reported fewer experiences of orgasm. In another study of female outpatients in 1975, the mean frequency of intercourse was 2.3 per week (Pongthai, Sakornratanakul, & Chaturachinda 1980). Another study examined the sexual behavior in pregnant women ages 17 to 44 in Bangkok and found that sexual abstinence increased as pregnancy progressed, ranging from 4% of the women in the first trimester to 56% of the women in the third trimester (Aribarg, Aribarg, Rakiti, & Harnroongroj 1982). The most common reasons for abstinence and decreased frequency of sex were fear of fetal injury (reported by 30% of the women), and somatic symptoms of pregnancy (22%). A number of the pregnant women also abstained from sex to protect their fetuses from STD, as 13% of the women knew that their husbands had had extramarital sex.

Unfortunately, most of the available data on the sexual behavior within Thai couples are from research conducted prior to 1982. The paucity of more-recent findings points to the need for more research. Information in this area will afford us a better understanding of extramarital sex, sexual dysfunctions, heterosexual transmission of HIV and sexually transmitted diseases, and marital satisfaction and discord.

### *Extramarital Sex*

Perhaps extramarital sexual practices in Thailand are best illustrated by the findings from the *Partner Relations Survey* by Werasing Sittitrit and his colleagues (1992). They found that 31% of urban male participants and 12% of rural male participants—17% overall—reported having had sex outside their relationship in the previous 12 months. The data from women were quite different: only 1% of the urban female participants and 0.7% of the rural female participants—0.9% overall—reported sex outside their relationship in the previous 12 months. The remarkable gender difference in extramarital sex in these findings will be more extensively discussed below.

Despite the historical acceptance, male polygamy is no longer legally or socially acceptable in the contemporary Thai society. However, the tradition continues in modern days in a more secretive fashion. Whereas a “virtuous woman” or *kulasatrii* (see traditional female gender role in Section 1, Basic Sexological Premises) must remain faithful to her husband, there were no equivalent rules in history mandating fidelity in the “virtuous man.” In fact, upper-class Thai men were historically known to maintain mansions with a co-residence of multiple wives and their children. Among the royalty and courtiers in the past, wives were classified as principal, secondary, and slave (Pyne 1994). Today, the tradition of “minor wives” still remains, but the practice is different from that of the past. Also, because of the expense involved, minor wives are mostly limited to the wealthy men, although Thorbek (1988) has also documented the practice in men of lower socioeconomic strata. [Comment 2003: Barmé (2002, 157-178) has provided a history of Thai polygyny in the 20th century, tracing its variations and cultural response in government and public debates, cartoons, cinema, and pop media, from pre-modern Siam to modern Thai culture. (End of comment by R. T. Francoeur)]

Euphemistically called having a “little home,” the practice of keeping a minor wife usually occurs today in secrecy from the “primary wife,” and minor wives rarely share the home with the man and his family as in the old days. While almost all married women today object to this practice, and indeed for many it has been grounds for divorce, other women learn to cope with their anger and emotional betrayal. Minor wives are viewed with contempt by the Thai society along the lines of being amoral women or home breakers. They do not achieve social or legal recognition as a spouse. A Thai phrase “drinking water from underneath someone else’s elbow” illustrates the humiliation and powerlessness of a minor wife, often used to deter young women from considering a relationship with a married male suitor.

Frustrated with the husband’s infidelity, potential or real, some married women have been taught by older women and sex journalists to break out of the conservative sexual norms of a *kulasatrii* by adopting the dual role of “a *kulasatrii* outside the bedroom, and a prostitute inside.” Extramarital sex for a married woman is, however, not a viable option. In a seminar with participants from rural villages in northern Thailand, men told Pacharin Dumronggittigule and her colleagues (personal communication 1995) that if a woman had more sexual desire than her husband could satisfy, she should “hit her feet with a hammer,” indicating their belief that the use of drastic means was needed to suppress women’s sexual desires. In a folk-tale epic, *Khun Chaang, Khun Phaen*, the heroine, Wanthong, was persecuted for being torn between her relationships with the two male protagonists. Although women today are not persecuted, as was Wanthong, her tragic fate reflects the society’s clear prohibitive rule against women’s emotional and sexual infidelity.

Whereas minor wives are the secret sexual indulgence for wealthy men, sex with commercial sex workers is widely accepted by almost all male adults, regardless of age, socioeconomic class, or marital status. After marriage, Thai men seem to be monogamous with their wives for a period of time, although the duration of this monogamy has not been investigated. A great number, however, resume their use of commercial sex, often in the context of all-male, “husbands’ night out” socialization with their peers.

Dumronggittigule and her colleagues (1995) examined the married men’s use of commercial sex by conducting focus groups with married villagers in northern Thailand. They found that the cultural processes behind this phenomenon were different from the processes for the Thai bachelors.

Thai men visit commercial sex workers after socializing with male friends, a pattern established since the start of their experience with commercial sex. For married men’s gatherings, women are not necessarily precluded from the social gatherings, as the meals are often prepared by women, but excessive alcohol consumption and gambling repel women from further participation. Married men reported that their sexual desires are enhanced because of the alcohol and the sex talk among the men. Married women, on the contrary, reported that after a long day of work outside and inside the home, they were not sexually thrilled by their husbands’ drunken manners and alcohol smells, and many refused to have sex. Other couples reportedly avoided this conflict by having an a priori agreement that the husbands could take their sexual desire elsewhere.

Moreover, the villagers reported other common causes of diminished sexual attraction within the couple. Women reported that the strenuous work inside and outside the home caused them to be exhausted, irritable, and uninterested in sex, and their husband’s drinking and gambling with male friends did not help. Men, on the other hand, commented on their wife’s homely appearance, angry temperament, and sexual unresponsiveness, all of which made them turn to drinking, gambling, and commercial sex as recreation. As this spiral of blame and self-defense continued, conflicts and resentment grew. Following what they had seen in other couples, many women decided that consenting to their husband’s use of commercial sex could relieve this dilemma. Thus, the use of commercial sex by married men is often consented to or known by their wives. For both men and women, the husband’s extramarital sex is not a cause of marital conflicts, but an attempted solution designed to preserve their marriage.

Married women, therefore, do not simply consent to their husband’s use of commercial sex because “Thai people have permissive attitudes toward men’s extramarital sex,” as is often quoted. In the same study cited above, Dumronggittigule and colleagues (1995) used anonymous questionnaires to collect data from 170 married couples in the villages. They found feelings of frustration, worry, and helplessness among the women who believed their husbands had regular sex with sex workers. Almost all the married women objected to their husband visiting sex workers. Ninety-one percent of these women had asked their husband to refrain from such behavior, but 47% of the women believed their husbands would visit or had visited sex workers. Although they felt vulnerable to HIV infection, these married women still did not think that their husband would respond to their fears. Instead, these women would rather protect themselves from HIV by having protected sex with their husbands; 83% reported they would be willing to have their husbands use condoms with them. The women’s interest in self-protection, however, might not lead to an actual prevention; most couples had never used condoms with each other and were unlikely to change upon the women’s requests.

#### *Alcohol Use and Sexual Behavior*

The use of alcohol is a regular part of Thai culture and tradition despite the prohibition in the Buddhist Fifth Precept. Many male adolescents in northern Thailand begin drinking commercially produced whiskey or village-prepared liquor at the age of 14 or 15. They will often drink alcohol with a few friends and go as a small group to have sex with sex workers (van Landingham et al. 1993). Adolescent girls will often start drinking at the age of 17 or 18. They are more likely to drink when there are parties as part of a celebration. Drinking and sex in combination is a common way for adolescents to be sexual with one another (Nopkesorn, Sweat,

Kaensing, & Teppa 1993). Thai men often report that alcohol makes them "horny," although using condoms is usually more difficult in an intoxicated state. Data confirm that alcohol use does interfere with the use of condoms in the commercial sex settings (Mastro & Limpakarnjanarat 1995).

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Attitudes Toward Homosexuality in Buddhism and Thai Society

Although homosexual behavior in Thailand is assumed to be quite common, little formal research has been done. Most of the available data pertain to men, and there is a paucity of information regarding women. There has been a general reluctance, as with other Asian cultures, to openly discuss or scientifically study homosexual behaviors. In a large 1990 population-based survey (Sittitai et al. 1992), extremely low rates of male homosexual behavior were reported; the authors cautioned that, because of societal attitudes, these estimates were probably too low and reflected the research participants' underreporting of homoerotic and homosexual experiences (the prevalence of same-gender sexual behavior will be further reviewed below).

The attitudes toward homosexuality are quite complex: On the one hand, the behavior is clearly stigmatized, and on the other, tolerated. Probably the manner in which it is expressed is a more critical variable for social acceptance. In the culture in which men's sexual desires are exaggerated, it is understandable that men might, from time to time, hypothetically engage in sexual behavior with other men for pragmatic purposes (e.g., when women are not available or when they need money). Women may face stronger negative sanction than men. Again, a double standard regarding general sexuality may be at play here. Homosexual behavior for women is less tolerated, probably because virtuous women express their sexuality only with their husbands.

Overall, most contemporary Thais view heterosexuality as the norm; homosexuality is seen as a deviance or an unnatural act, often resulting from one's bad *karma* or the lack of merit in past lives. To the more superstitious Thais, homosexual acts, which are an aberration from "how nature intends," are punishable by animistic powers. Contemporary Thais still express their disapproval of homosexuality by saying, often blithely, that "lightning will strike" those who engage in sex with a person of the same gender. The educated Thais understand homosexuality in terms of mental problems or illness. Many think homosexuality is caused by problems in upbringing or parental characteristics (e.g., a domineering mother and a passive father), while others also attribute it to the child's oversocialization with the opposite gender, e.g., a boy spending too much time with his aunts, sisters, or female peers, or not having a father around as a male role model. This pathology model of homosexuality most likely originated in the Western psychiatric theories of sexuality which dominated Western medicine and psychology until the 1960s and 1970s. Many Thai physicians and psychologists still subscribe to these antiquated theories and remain impervious to new research findings or the American Psychiatric Association's declassification of homosexuality as a mental illness in 1974.

Buddhism is mostly silent on the topic of homosexuality. Despite some ambivalence toward homosexuality in many Buddhist cultures, Cabezón (1993) notes Buddhism only condemns homosexuality more for being an instance of sexuality rather than its same-gender sex. "The principal question for Buddhism has not been one of heterosexuality versus homosexuality, but one of sexuality versus celibacy" (p. 82).

Cabezón further notes that, as far as the laity are concerned, homosexuality is rarely mentioned as a transgression of the Third Precept in Buddhist texts and oral commentaries.

References to homosexuality have been found in the Buddhist canon and the *Jataka*, the stories of the Buddha's previous lives. Leonard Zwilling has noted that only in the *Vinaya*, the monastic discipline which forms one of the three sections of the Buddhist canon, is there mention of same-gender attraction and effeminacy in men. These instances were, according to Zwilling, "derogated much to the same degree as comparable heterosexual acts" (quoted in Cabezón 1993, 88). As for other sections of the Buddhist canon, John Garret Jones (cited in Cabezón 1993) has concluded that there is an implicit affirmation from the silence regarding homosexuality, and the silence is certainly not because of the lack of material.

Whereas the canon is silent about homosexuality, the *Jataka* literature, in which the previously mentioned tale of Prince Vessantara is embedded, is replete with sentiments about same-gender affection. One example can be found in the eloquent past-life stories of the Buddha and his disciple and attendant, Ananda. In one scenario, the Buddha and Ananda are depicted as two deer who "always went about together . . . ruminating and cuddling together, very happy, head to head, nozzle to nozzle, horn to horn." In another story, a serpent king who falls in love with Ananda "encircled the ascetic with snakes folds, and embraced him, with his great hood upon his head; and there he lay a little, till his affection was satisfied" (Jones 1979, quoted in Cabezón 1993, 89). These examples are but a few of many instances which articulate same-gender affection in the context of friendships between men in the *Jatakas*. Considering the enormous number of warnings about the dangers of heterosexual relationships, Cabezón argues that the absence of warning about same-gender relationship is remarkable. It suggests that the attitude toward homosexuality in the Indian *Jataka* texts is one of acceptance, and occasionally even a eulogy, of these feelings.

Allyn (1991) cites yet another Buddhist story, possibly a folk version, told on Thai radio about a male disciple who had fallen in love with the Buddha. The disciple expresses admiration for the Buddha's beauty. The Buddha responded to these acts of admiration by a gentle reminder of the body's impermanence, a likely response for a female admirer as well. Taken together with the analysis of the canon and the *Jataka* tales, this story illustrates Buddhism's neutral position on the issue of homosexuality. Nevertheless, it should be noted that some negative attitudes can be found in the Buddhist practice today. For example, some Thai people have heard that a man who acknowledges his homosexuality will be denied Buddhist ordination, although such instances may have been very rare or never enforced.

In contrast to the neutral position of Buddhism, anti-homosexual attitudes are quite common among Thai people. Chompootaweep and colleagues (1991) found that 75% of both male and female adolescents reported negative attitudes toward homosexuality. In addition to these disapproving attitudes, Thai people who have sex with the same gender also have other important considerations when they make sexual and relationship decisions. Thais are concerned about matters which would cause an individual or family to lose face, and maintaining relationships with their family is of an extreme importance. To reveal one's homosexual orientation to one's parents would, in a sense, violate the Third Precept of Buddhism, and this has caused many Thai gays and lesbians to hide their homosexuality from their parents for fear of causing them sorrow (Allyn 1991). On the other hand, what an individual does in privacy is less of a concern. Thus, a per-

son's homosexual sex, *per se*, may be easier for his or her family than other more visible features, such as long-term same-gender relationships (Jackson 1989) or coming out as an openly gay or lesbian person.

The fact that same-gender sex is less stigmatized than the public disclosure of this behavior deserves some discussion. Same-gender sexual experience does not necessarily carry the assumption of homosexuality or a homosexual identity in Thailand (Sittitrai, Brown, & Virulak 1991). There are no laws prohibiting homosexual behavior (Jackson 1989). On the other hand, the social pressure to be in conformity with the expectations of family and culture is extremely intense. Indeed, these sanctions may have a stronger effect than religious or legal sanctions. A public statement of homosexual identity would violate two important values of Thai culture: harmony—not to confront disagreements or conflicts—and the great value placed upon preservation of family units and preserving lineage through marriage and procreation. Allyn (1991) also contends that the anti-homosexual attitudes in the Thai society are primarily the discrimination against the feminine *kathoei* (see Section 7, Gender Diversity and Transgender Issues) who, according to stereotype, display overt and loud gender-atypical social manners.

## B. Social Constructions of Sexual Orientation in Thailand

The labels homosexual, bisexual, and heterosexual are Western constructs and do not exactly fit the traditional social constructions in Thailand. Assuming a gay or bisexual identity is also a new, if not foreign, concept; for example, there is no translation or the equivalent Thai word for "gay," and as of 1996, the construct "sexual orientation" had not been translated even for academic use. In the past few decades, Thai people have increasingly used the English words "gay" and "lesbian" in both the mainstream and academic contexts. The terms "homo" and "homosexual" are also used. Conventionally, the most widely used term for "homosexual" was an extremely obscure euphemism *len phuean*, roughly translated as "playing with friends." Another popular usage employs a literary analogy, *mai paa deow kan*, meaning "trees in the same forest" (Allyn 1991). The now-rare term *lakka-phayt*, roughly translated to "sexual perversion" in English, was sometimes used to describe homosexuality within the medical context, therefore illustrating the past influence of Western psychiatry.

The technical terms "heterosexual" and "homosexual" were transliterated into Thai 20 or 30 years ago for academic purposes. The term for "heterosexual" was *rug taang phayt*, meaning "loving the different gender" and the term for "homosexual" was *rug ruam phayt*, meaning "loving the same gender." This might indicate that the Thai construct of loving another is inseparable from eroticizing another. By the same logic, bisexuality was subsequently translated to *rug song phayt*, meaning "loving two genders." However, the directly borrowed term "bisexual" and its shortened derivative, *bai*, are more popular and have been part of the Thai sexual vocabulary of late.

More recently, with influences from Western cultures, the concepts of homosexuality and sexual orientation have infiltrated the Thai thinking. These concepts quickly became popularized and transformed to fit the indigenous constructs (see also Section 7, Gender Diversity and Transgender Issues, for the discussion of the indigenous concept of *kathoei*). In the following discussions, the Thai social constructions of homosexuality in men and women will be examined separately to maximize clarity. We realize that this approach has its own shortcomings, as male and female

homosexualities in most cultures are, conceptually and politically speaking, not discrete entities. However, much more has been written about male homosexuality in Thailand, and a discourse to conceptually bridge the parallel phenomena in men and women has yet to be made. There is still little evidence that the discussion about this construct in one gender can be generalized to the other.

## C. Homosexuality in Men

A small number of studies have attempted to find the prevalence of homosexual behavior in men. In a population-based study (Sittitrai et al. 1992), only 3.1% of the men reported having had sex with men and women, and 0.2% reported it with men exclusively. The authors of the study speculated that these statistics were an underestimation because of underreporting. Cohorts of military conscripts, comprised of men mostly age 21 from lower socioeconomic populations, have also shown varying rates of male-male sexual experience. Among the 1990 conscripts from northern Thailand (Nopkesorn et al. 1991), 26% reported having had sex with a man, 15% reported past anal intercourse with a man, and 12% reported sexual arousal in response to male nudes. In the 1992 conscripts from northern Thailand (Nopkesorn, Sweat et al. 1993), 14% reported having had at least one instance of insertive anal sex with a *kathoei* in their lifetimes, 3% with non-*kathoei* men, and 3% reported having had receptive anal sex. In another study of 2,047 military conscripts from northern Thailand (Beyrer, et al. 1995), 134 men (7%) reported having had sex with men; most of these men were also more likely to have higher numbers of female sexual partners than other men who had sex with women exclusively.

In Thai society today, men who have sex with men are either *gay king* or *gay queen*: A *gay king* is a man who plays the insertive role in sex, whereas a *gay queen* takes a passive and receptive role in sex (Allyn 1991). Versatility in sexual behavior is obviously not a traditional construct, and the gender dichotomy pervades the Thai conceptualization of sex between men. Gender dimorphism also necessitates that the society views homosexuality in reference to the fundamental genders of male and female. Also, cross-gendered manners and behavior are seen as indicating the essence of homosexuality in a person (other terms for male homosexuality related to cross-gendered behaviors will be discussed in Section 7, Gender Diversity and Transgender Issues). *Gay queens* are assumed to have feminine characteristics, and are therefore, "true homosexuals." On the other hand, *gay kings*, stereotyped as male-acting and male-appearing, are seen as less likely to be "permanently" homosexual. Thai people think that *gay kings* are simply heterosexual men going through a phase of sexual experimentation with other men. *Gay kings* are also variously referred to as "100% male" (*phuu-chaai roi poe-sen*) and "a complete man" (*phuu-chaai tem tua*) (Jackson 1989), which reflects the belief that the insertive homosexual sex act does not jeopardize one's masculinity. The idea that *gay kings* are confused or adventurous heterosexuals can be seen in many Thai movies and fiction about gay relationships with a tragic ending, when the *gay king* hero leaves a devastated *gay queen* to marry a woman. Moreover, the Thai myth of men's boundless sexuality states that "a real man" (i.e., real heterosexual) can derive sexual pleasure from anyone, regardless of gender. The playful term for bisexual men, *suea bai* (meaning "bisexual tiger") connotes this admiration of bisexual men's sexual vigor (Allyn 1991). Bisexual behavior, therefore, is seen as an attribute of *gay kings*, bisexual men, and "indiscriminate" heterosexual men alike.

Actual data on sexual behavior confirm the fluidity of sex between men in Thailand as implied by the classification

above. For example, military conscripts who reported same-gender sexual behavior were more likely to be married, have girlfriends, and visit female sex partners more often than their counterparts who have had sex with women exclusively (Beyrer et al. 1995). Northeastern men recruited through the social network of men who had sex with men demonstrated equally complicated behaviors. Their reported sex acts covered a whole gamut of insertive and receptive intercourse, both oral and anal; their sexual partners included both genders of commercial sex workers, casual partners, and lovers (Sittitrai, Brown, & Sakondhavat 1993).

Primary affectional and sexual relationships between men are quite common, although these relationships are not akin to the Western concept of the gay couple. These relationships may be of very short duration, without much long-term commitment, and without much social or familial recognition. There are distinct problems maintaining homosexual relationships. First, because long-term relationships by nature end up being more public, they invite more public scrutiny and negative sanction. Second, the same-sex relationships would interfere with what the heterosexist norm expects of a man: to get married to a woman and have children. Finally, there are no models for same-sex relationships within Thai culture. The only role models would come from *farang* (Westerners), but their codes of conduct would not necessarily work in the Thai culture. This lack of role models and solutions for the Thai male couples has caused much jealousy and conflicts around infidelity, creating many heartaches and failed relationships (Jackson 1989). For many other couples, however, male romantic and sexual relationships adhere closely to the heterosexual model of sex roles: in fact, a *gay king* almost always pairs with a *gay queen*, and Thais find it difficult to comprehend if two *gay kings* or two *gay queens* would settle down together. Following the traditional Thai heterosexual relationship which prescribes monogamy in the women and sexual freedom in the men, *gay kings* also have a tendency to seek out sexual pleasures outside their relationship with a *gay queen*.

In reaching "gay men," *gay kings*, *gay queens*, and *kathoey* for HIV prevention, there is an effort in Thai society to organize and empower these individuals. This attempt follows HIV-prevention strategies from Western cultures. Local activists and international agencies in Thailand are fostering an adoption of the gay-identity concept to identify, reach, and empower men who have sex with men, in an effort to prevent the spread of HIV among them and their partners, both male and female. There remains an ethical question regarding the cultural imperialism of the West, which is imposing Western-constructed identities on a culture which has maintained different constructs of sexual orientation and sexual behavior. Examination of Thai and other cultures which have diverse constructs of sexual orientation has challenged the universality of categories of sexual orientation adopted by the West. This has forced HIV-prevention campaigns in the West to employ strategies which take into account the fact that not all segments of society identify themselves as gay, straight, or bisexual. One example of such attempts is to identify the population of interest based on their sexual behavior (e.g., "men who have sex with men" or "men who have sex with both men and women"), instead of selecting them by their "risk group" or "gay" or "bisexual" self-identity. Hopefully, the cultural exchange will lead to greater understanding of homosexuality and the promotion of sexual health among those individuals who engage in same-gender sex in any society (Coleman 1996).

Regarding the gay identity in Thailand, there has been a rapid development since the mid-1980s of a gay identity with a Thai twist. Meanwhile, gay enterprising and political activ-

ities began to thrive in Bangkok and other big cities. Until the late 1980s, the only regular media coverage on homosexuality was an advice column in the widely popular tabloid *Plaek* ("Strange") titled *Chiiwit Sao Chao Gay* ("The Sad Lives of Gays") in which Go Paaknaam, a straight-identified columnist, published letters about sexual and relationship problems from men who have sex with men (Allyn 1991). In contrast to the previous coverage which tended to be rare and eccentric, in recent years Thailand has seen a proliferation of magazines in the format of erotica for gay men. In addition to erotica, these publications also provide an avenue for men to meet through personal advertisements, as well as the new forum for exchanging social and political views. More social networks have been formed, often composed of previously isolated gay men, many of whom do not have access to or participate in the thriving gay bar scenes in big cities. A more solidified yet multifaceted gay identity has slowly evolved as Thai men participate in the discourse on their sexuality through these publications. In the meantime, Thai mainstream media, especially newspaper and magazines, have increased accurate representations of gay life, as well as progressive treatises on homosexuality, although sensationalistic coverage is still common.

In addition, entertainment businesses for gay men have flourished in big cities. A variety of gay restaurants and pubs have been opened, with and without *deg off* ("off-boys," or male sex workers), providing places for leisure, sex, and socialization. Bangkok sports one of the world's most famous gay saunas (bathhouses). Men in these surroundings are motivated not only by a bit of the Thai *sanuk* (fun, pleasure, and enjoyment), but also the camaraderie and the search for a relationship partner (Allyn 1991). These new developments represent a remarkable difference in how men who have sex with men meet one another today; in the past, these encounters were non-public, secretive and often involved commercial sex workers. Instead, the thriving of Bangkok gay scenes allows men who have sex with men to have more continuity between their sexual activities, their social life, and their sexual identity. As Allyn notes: "Love stories were being made here, most of them bittersweet ones. Gay Thai men have perhaps added the key ingredient to the development of a gay identity: love" (p. 157). Allyn further notes that, "Over the past two decades, superficial aspects of Western, particularly American gay culture, have been imported to a certain degree but, as the kingdom traditionally has done, by adaptation, not adoption" (p. 158).

One example of such an adaptation is the recent concept of *kulagay* invented by the Thai gay media, although it is still not widely in use. As in *kulasatrii*, *kula* being "virtuous" or "decent," a *kulagay* is a virtuous Thai gay man who adheres to traditional Thai values, contributes to society, and rejects the Thai stereotypes of the *kathoey* and promiscuity (Allyn 1991). The invention of the *kulagay* identity reflects the movement's attempt to assimilate homosexuality into the social fabric of Thai society by way of deference to the traditional values.

In 1981, a "gay rights" organization called Chaai Chawb Chaai (men liking men) was established, but was disbanded shortly thereafter because there was no evidence of discrimination (Allyn 1991). In 1989, two organizations were formed in response to the HIV epidemic: Fraternity for AIDS Cessation in Thailand (FACT), and Gay Entrepreneurs Association of Thailand (GEAT). GEAT is made up of Bangkok bar owners and is concerned with issues of business. After great success from their educational theater group, the White Line, FACT also developed a subsidiary group called FACT Friends, which began weekly support groups for the many Thai gay men who were tired of the commercial gay scene.

By 1991, FACT was awarded international grants and transformed from a grassroots volunteer organization to a foundation with a formal structure (Allyn 1991).

Despite the many developments of a gay identity in Thailand, the average Thai gay man lives his gay life separately from the other parts of his life. Allyn (1991) speculates that this way of life is sufficient for many, as many Thai gay men have expressed satisfaction. Allyn further suggests that Thai people are trained since childhood to accept their lot in life. Similar to the way the perceived transience of gender helps many Thai women to accept their role (see Section 1, Basic Sexological Premises), Thai gay men perhaps think that their sexual orientation is only one of the many sufferings a being faces in different incarnations. Therefore, a private sex life and the constraint of being a "model Thai" may not be fraught with as much psychological pain as his Western counterparts might experience. To date, there is no evidence that gay men in Thailand are more psychologically distressed than heterosexual men.

#### D. Homosexuality in Women

There is an extreme paucity of information on women who have sex with women. Adopted several decades ago, the term "lesbian" is now recognized by most Thai people as describing love or sex between women, along with its derivatives *ael bii* (Thai acronym for "L.B.") and *bian*, which could be used pejoratively or euphemistically. Also, a rather vulgar slang *tii ching*, or "playing [small, paired] cymbals," compares two vaginas in lesbian sex with a pair of opposing, identical concave musical instruments. In the past decade, other terms for lesbianism have come into vogue. Paralleling the *gay king-gay queen* dichotomy in male homosexuality, lesbians are categorized into *thom* (derived from "tomboy") and *dii* (short for "lady"), mostly based on their social manners and appearances. The *thom* women, with the masculine appearance, are assumed to have a dominant role in the relationship. Women who are *dii*, on the other hand, are feminine looking and passive in gender role. Because of the extreme popularity of these terms, most Thais now refer to lesbianism (female homosexuality) as "women being *thom-dii*."

Thai people are quite confused by the feminine *dii* women because they are indistinguishable from the typical Thai women in their social manners. Most Thais speculate that *dii* women will eventually grow out of their phase of experimentation or confusion, and commit to a relationship with a man (much as they think of the *gay king* men). On the other hand, the masculine *thom* women are seen by Thais as women who want to be a man, much as feminine homosexual men are assumed to want to be a woman. Androgynous behavior in women, although not traditionally praised, has been relatively tolerated in adolescents. Popular fiction has portrayed a number of female protagonists who have "tomboy" demeanor: bold, assertive, and boyishly naughty, while nonchalant and unaware of their feminine attractiveness hidden inside. Nevertheless, these characters are unmistakably heterosexual, as there is never any depiction of homoeroticism or lesbian character in the lives of these tomboys. As a rule, these young heroines always outgrow their tomboy phase as they are transformed into a "fully grown woman" by their first love with a man whom they marry at the end of the story.

Prior to the late 1980s, Thai people in general seemed to show little awareness of the existence of love and sex between women. In the 1980s, a tabloid ran an advice column for lesbians, *Go Sa Yaang*, by a straight man, Go Paaknaam, following the popularity of his column for gay men (Allyn 1991). Yet, lesbian women never had erotic publications or enterprises as these businesses began to flourish for gay

men. However, sex and love between women started to come into public attention in the late 1980s and early 1990s. As more and more young women have shown up in public looking like pairs of a *thom* and a *dii*, displaying public intimacy slightly beyond the usual confines of peer manners, the media have called it an epidemic of *thom-dii-ism*. Much anxiety and concerns have been expressed by parents and the media regarding this increased visibility of lesbianism. Many conservatives search for a cause of lesbianism in the modern or Western values, claiming that women today are taught to strive for power and autonomy. For these conservatives, women are attracted to other women because they have become more like men. Others have blamed androgynous women in the Thai pop culture for modeling gender-atypical behavior and, in turn, inducing lesbian interests among the adoring young fans.

Sensationalistic media and conservatives aside, women who love (and have sex with) women have recently emerged in Thai society with an agenda to forge ahead with a Thai lesbian identity in their own right. Anjaree is a new organization for Thai lesbian women which came into public attention in 1992. The name of the organization comes from merging two words, *anya* and *jaree*, to denote "a different path" (Otaganonta 1995). Aside from publishing a newsletter, *Anjaree Sarn*, the organization also played a key role in setting up the Asian Lesbian Network, which hosted its first meeting in 1990 in Bangkok. This initiative earned Anjaree the Filipa de Sausa Award, presented by the International Gay and Lesbian Rights Commission based in New York, which is given to individuals and groups that take initiatives to promote the rights of sexual minorities. One of the group's founders states in a *Bangkok Post* interview:

I don't think people need to identify themselves as heterosexuals or homosexuals. American society places much importance on defining oneself as this or that, but in Thailand, sexual orientation has never been a major part of self identity. But we are aware of the obstacles that Thai lesbians face. That's why we have to assert ourselves in this way. Still there is no need for us to identify ourselves only as lesbians. (Otaganonta 1995, 36)

As evident in the discussions about homosexuality in men and women above, Western constructions of homosexuality have had inevitable influences in the ways contemporary Thais understand sex and love between people of the same gender. The Thai vocabulary for homosexuality, lesbian, gay, *gay king*, *gay queen*, *thom*, *dii*, all had their origin in the English language. Alternative to the simplistic notion that Thai people are emulating Western sexuality, we argue that Thai people might have found that their indigenous constructions could no longer explain or fit their observations of sexual phenomena. In an attempt to find satisfactory explanations, Thai people have found plausible frameworks in the Western paradigm of sexual orientation and homosexuality which complements their indigenous construction. In the following section, we turn to a review of the *kathoei*, which was possibly the only indigenous social construction of non-heterosexuality in Thailand before the arrival of the Western paradigm.

### 7. Gender Diversity and Transgender Issues

As noted in the previous section, traditional Thai sexuality did not reflect clear distinctions between homosexuality, bisexuality, and heterosexuality as explicitly drawn by Western cultures. Rather, the most salient of all sexual distinctions is the bipolarity of gender: A person is either a man or a

woman. Based on these two fundamental male and female genders, the *kathoey* exists as another gender identity in the Thai society. Roughly equivalent to the English term “hermaphrodite,” *kathoey* (pronounced “ka-toey”) has been defined as a “person or animal of which the sex is indeterminate” in the Thai-English dictionary (McFarland 1982). Despite such a medical connotation, *kathoey* has been used, at least in the last several decades, to describe a biologically male person who has sex with men, therefore covering a gamut of male homosexualities.

The use of the term *kathoey* to describe male homosexualities, however, has slowly given way to the more contemporary *gay* and its derivatives. Today, *kathoey* mostly refers to men who have feminine social behaviors, without much specific reference to their biological gender or sexual behavior. Being associated with feminine characters and other stereotypes (see below), the term is considered derogatory by Thai gay men today, many of whom adamantly distinguish themselves from *kathoey*. Other derogatory slang words, applied to both gay men and *kathoey*, are *tut* and *tutsii* (the latter from the title of an American movie, *Tootsie*, starring cross-dressed Dustin Hoffman), which, because their pronunciations are close to the derogatory Thai word for “ass,” suggest anal intercourse (Jackson 1997; Nanda 2000).

As implied in the usage today, a *kathoey* is a man who sees himself more as a woman and often dresses, to varying degrees, as a woman, and is likely to have sex with men. Some take estrogens and progesterone to facilitate breast development and other body transformations. A few will undergo surgical sex-reassignment surgery. This surgery is well known and available in Thailand, although it is extremely expensive by Thai standards. In Western conceptualization, the *kathoey* may be considered either effeminate homosexual men, transvestites, or pre- or post-operative transsexuals, none of which is readily applicable to the traditional construction of sexuality in Thailand. Thai people mainly see the *kathoey* as either the “third gender,” or a combination of the male and female genders. Alternatively, they are also seen as a female gender, but of the “other” variety, as reflected in a synonym *ying pra-phayt song*, meaning “women of the second kind.”

These understandings of the *kathoey* suggest that Thai people have traditionally tried to make sense of this phenomenon in fundamental male-female terms. As a result, the Thai interpretations of the *kathoey* have been within the confines of the gender bipolarity. Nevertheless, the *kathoey* have been a well-known category in the sexual and gender typology of the Thai culture. Children and adults can often identify at least one *kathoey* in every village or school. Despite their subtle “outcast” status, the village *kathoey* are often given duties in local festivities and ceremonies, mostly in female-typical roles such as floral arrangements or food preparation. The *kathoey* seem to have adopted the “nurturer” role prescribed to Theravada women, and ideas of female pollution (e.g., the touch taboo and fear of menstruation) are extended to the *kathoey* as well. Social discrimination varies in degrees, ranging from hostile animosity to stereotypic assumptions. Some of the assumptions are based on the idea that the *kathoey* are unnatural, a result of poor *karma* from past lives; other assumptions are typical of generalizations about women as a whole.

To illustrate the stereotype, the Thai cinema and contemporary literature usually dramatize the *kathoey* as highly histrionic in gestures, emotionally unstable, subject to men’s abandonment, and thus leading lives of bitterness, loneliness, suicides, or promiscuity. Although there are plenty of *kathoey* who hold other professions, stereotype predicates that many *kathoey* become street sex workers or small-time criminals, and others become beauticians, fashion designers,

hairdressers, florists, artists, or entertainers (Allyn 1991). A few comedians and media personalities have been publicly known for their *kathoey* sensibilities and camp humor, while other *kathoey* celebrities have caused public sensations by their flamboyance or eccentricities. Many *kathoey* have healthy long-term relationships with men, although Jackson (1989) has noted the stereotype of *kathoey* providing financial support to young men with whom they are in a romantic relationship. This “kept boy” tradition is an interesting reverse of the minor wife tradition in straight men. Stereotype notwithstanding, the image of *kathoey* as a resourceful member of the community and a benefactor of young men is remarkably more positive than the Western images that most cross-gendered individuals are street transsexuals who live marginalized lives in the underworld of drugs and prostitution. In Thailand, *kathoey* find each other or married women for social support and, despite a degree of discrimination from the new gay-identified men, they are well accepted into the contemporary gay scenes.

Because for most Thais, the concepts of gay and *kathoey* are not clearly distinguished from one another, the stereotypical features of the *kathoey* are thought to be also attributes of gay men, particular *gay queens*. Some Thai men who have sex with men alternately refer to themselves as gay for political reasons, and *kathoey* for self-deprecating humor. These images of the *kathoey* (and to a lesser degree, “gay men”) in the Thai society bare striking similarities to the stereotyped lives of gay men and drag queens in Western societies before the gay liberation movement in the late 1960s and early 1970s. Interestingly, the American play, *The Boys in the Band* by Mart Crowley, was translated to the Thai context in the late 1980s and became an immensely popular show. The appreciation that the mainstream audience had for the images of *kathoey* and gay men—as individuals struggling with societal pressure and self-hatred—sums up the overall social climate toward homosexuality today: characterized by sympathy, fascination, and curiosity, yet riddled with ambivalence and stereotyping.

Another cross-gendered phenomenon is found primarily in women in the cults of the ancestral spirits (*phii*) in northern Thailand (see also Manderson 1992). Members of the *phii* cults believe that ancestral guardian spirits are passed on matrilineally to young women in order to maintain health, harmony, and well-being in the family. Certain women, by becoming “possessed” by the *phii*, serve as mediums for the spirits, and they are called *maa khii*. In their annual ritual, these women, and sometimes children, are possessed by their ancestral spirits and perform dances, which include displays of wild and rude behaviors (e.g., drinking, smoking Thai cigars, and shouting expletives and insults), as well as stereotypically masculine behaviors (e.g., wearing men’s clothes and flirting and dancing with young women). However, because of their revered role as *maa khii*, many of these women are held in high esteem. Outside these rituals and performances, these women, most of whom are married to a man and hold respectable roles (e.g., healers and midwives) in their village community, return to their everyday behavior typical of the female gender. Although most of these women do not remember the specific events during the trance, they are well aware of the male characters they take on during the dances. In an interesting twist of role, these women hold positions of power, in contrast to the general patriarchal Thai society and the male domination in Buddhism.

While most *maa khii* are women, a noticeable minority are male, and many are also *kathoey*. We have observed that the *maa khii* who are *kathoey* also enjoy a more-revered place in the community, overcoming some of the ordinary stigma they would otherwise experience. During the spiri-

tual dance (*fawn phii*), the mediums who are *kathoe*, like their female counterparts, exhibit male-stereotypical behavior remarkably different from their own manners during ordinary circumstances.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

As discussed earlier in Section 1B, Basic Sexological Premises, Romance, Love, and Marriage, the Third Precept of Buddhism professes to refrain from sexual misconduct, mostly understood to refer to adultery, rape, sexual abuse of children, and careless sexual activities that result in the harm to others. Rape is a criminal offense but the law is rarely enforced. However, rape crime reports are abundant in mainstream and tabloid journalism, often written in a sensational and graphic style which seems designed to titillate the reader. No data exist regarding the extent of the problem. In a study of northern Thai men conscripted to the army in 1990 (Nopkesorn et al. 1991), 5% of the 21-year-old men reported having forced or coerced a woman for sex. The incidence of incest is not known. These matters are rarely discussed or reported.

Young men in Ford and Kittisuksathit's focus groups (1994) made references to the use of violence in order to force women to acquiesce to intercourse. They rationalized that coercion occurred when their sexual desire was provoked by women beyond self-control, and it was mostly directed to women in casual encounters not their *fans*. Numerous folk music and literature provide a cultural script for courtship and sexual persuasion, as apparent in this study. Men see that intercourse involves prior steps of cunning moves, social pressuring, and physical advances, whereas women see intercourse in terms of "submission" or "surrender." Aside from the cultural script, men perhaps generalize from their own experiences of erotic stimulation and ejaculation to the larger patterns of male sexuality. They, therefore, perceive that sexual arousal in men, once initiated, takes its own course and is not subject to control, as characterized by the term *naa meued*, or a state of "black-out" from lust.

Social support for women who have been raped or victimized by incest is not widely available. Consistent with the men's rationalization that they are provoked beyond control, a woman is sometimes viewed as provoking rape because of her appearance (e.g., wearing a provocative dress) or her social behavior (e.g., drinking or frequenting potentially unsafe places). Consequently, Thai parents teach their girls not to dress improperly, and not to go alone to unfamiliar places in order to avoid being raped, as if rape is a price one pays for violating the code of *kulasatrii*. Others, following the cultural script of courtship and sex, see rape as an obscure area, where men's coercion and women's surrendering cannot be clearly differentiated. Women who have been raped or experienced incest in Thailand are socially stigmatized based on these attitudes, in addition to the perception that the woman is flawed because she has been "violated." Understandably, women or their families rarely report these incidents.

### B. Prostitution—Commercial Sex

Although the topic of commercial sex appears under the general section of unconventional behaviors, it should be noted that this phenomenon is not considered unconventional in Thailand. However, the topic deserves a focus separate from the general patterns of sexuality as already covered in the sections on adolescent and adult sexual behaviors (Sections 5A and 5B, Interpersonal Heterosexual Behaviors, Adolescent Sexual Behavior and Adult Sexual Behavior). In our discussion of this topic, we use the more value-neutral

terms, such as "sex worker" and "commercial sex," while reserving the terms "prostitute" and "prostitution" for the contexts which require expression of sociocultural values.

### History and Current Situations of Commercial Sex in Thailand

Among Thai people, there is a general attitude that prostitution has always been, and will always be, a part of the social fabric of Thailand. This attitude is primarily rationalized by the prevailing myth that men have a greater sexual desire than women. The endorsement of prostitution does not come from men only; a majority of Thai women, especially of the upper and middle classes, readily agree with this logic. In college-level sexuality education courses, female students openly say that prostitution exists to protect "good women" from being raped. Married women from northern Thai rural villages talk in focus groups about their preference for the husbands to seek out sex workers (given a condom is used) rather than taking on a minor wife. Reflecting the general societal attitudes, the married women believe that prostitution is a practical solution for married men whose greater sexual demand cannot be met by their wives (Dumronggittigule et al. 1995).

Thailand is well known throughout the world for its highly organized and diverse commercial sex businesses. Many tourists visit Thailand for this special interest, although many others are obviously drawn by the culture and nature of Thailand, as well as the charming hospitality of Thai people. Tourism caters to men seeking sex in Thailand, and this aspect, which most Thais are not proud of, has been openly acknowledged and advertised. Through the assistance of tour guides or hotel services, commercial sex is available to any male tourist as it is for Thai men. Even outside of Thailand, a large number of Thai sex workers have been working in European countries and Japan since the 1980s; an estimate of 70,000 Thai women are working in commercial sex in Japan alone (Hornblower 1993).

Since the abolition of slavery in 1905, brothels have proliferated steadily and eventually became commonplace throughout the country. The sex industry proliferated during the Vietnam War in the 1960s and 1970s. As military bases of the United States of America were built up in Thailand, many women were induced into the entertainment and sex businesses for American servicemen. When the war ended in 1976, tourism began to grow and has become the largest source of foreign income. Meanwhile, commercial sex became an inevitable part of the tourist attraction (Limanonda 1993).

Prostitution became technically illegal in 1960 from the United Nations' pressure (Brinkmann 1992). In 1966, the Entertainment Places Act led to a plethora of new businesses which served as fronts for commercial sex, such as erotic massage parlors, bars, nightclubs, coffee shops, and barber shops (Manderson 1992). Ironically, although prostitution is illegal, these sex businesses often have government or police officials among their owners. In other cases, these officials are paid by the establishment owners to avoid enforcing the law (Brinkmann 1992). Subsequent attempts from the Thai government to eradicate prostitution have occurred over the years, most notably in 1981 and 1982, but all have been quickly abandoned (Rojanapithayakorn & Hanenberg 1996). Instead, the Thai government has focused on controlling sexually transmitted diseases (STDs) among sex workers using the police authorities and the structure of public-health services (see below).

The number of commercial sex workers in Thailand was estimated to be around 500,000 to 700,000 in 1980 (Thepanom Muangman, Public Health Faculty, Mahidol University;

cited in Keyes 1984). The clientele of these sex workers have been estimated to be about 80% Thai (data cited in Manderson 1992). Most sex workers in rural and urban areas work in establishments such as brothels, restaurants, bars, or erotic massage parlors, all of which are under the management of men. "Direct" sex workers, or those who have sex with their clients on the premises, such as in brothels or erotic cafes, usually charge lower fees and, therefore, are popular among working-class and younger men. "Indirect" sex workers work under the premise of selling other services, such as massage or dancing, with the option to have sex with clients who offer to *off* them (or take them out) for an additional sum or fee. The fee for "direct" sex workers varies from 50 baht (US\$2.00) to 500 baht (US\$20.00), while that of "indirect" sex workers varies from 500 baht (US\$20.00) to several thousands of baht (Weniger et al. 1991).

The demographic and socioeconomic characteristics of female sex workers have been reported in a study of 800 female sex workers from two provinces, one in the north and another in the south (van Griensven, Limanonda, et al. 1995). Only 1% of the women reported that they were younger than 16 years of age, and 11% reported starting working in commercial sex before the age of 16. The national origin was Thai for 85% of the women, with 8% Burmese and 1% Chinese, and 6% from a northern hill tribe. Most of the women, 80%, were from rural areas, while 89% had moved directly from their village of origin to an urban area primarily to work as sex workers. Most had low levels of education: 87% completed less than seven grades of school and 25% could not read or write.

### *[The Complexity of Thai Commercial Sex]*

RYAN BISHOP and LILLIAN S. ROBINSON

*[Comment 2003:* Commercial sex in Thailand provides a complex set of complementary and conflicting intra- and international forces, systems, and trajectories, constituting what might be called a political economy of desire in the second half of the 20th century and beyond, but relying upon a much longer institutional, intellectual, and representational tradition.

[For commercial sex within the kingdom catering to Thai nationals, there is an equally complex set of practices in play, including regional and racial typologies and hierarchies. The indigenous sex industry is clearly much larger than the international sex industry in terms of bodies serving and serviced, although not in terms of revenue generated or circulated.

[Some commentators, including Truong (1990), Hill (1993), and Brock and Thistlethwaite (1996) maintain that Buddhism plays a large role in perpetuating male dominance in Thai culture, thus making it easier for a sex industry to develop and subjugate women. But virtually all of the world's major religions, especially the three Jerusalemic monotheistic ones, include patriarchal power structures that do not necessarily lead to the establishment of prostitution as a major industry, and few other Buddhist societies have developed this industry to the extent that Thailand has. Further, despite allegations to the contrary, Theravada Buddhism as practiced and institutionalized in Thailand explicitly prohibits the practice of prostitution.

[We argue that international sex tourism in Thailand is a complex industry that brings together Cold War geopolitical strategies, international banks, alienated, if comparatively privileged workers from around the globe, and sex workers in girlie bars to constitute the linchpin of a \$5-billion-a-year industry. The discussion that follows, drawn from our fieldwork in Thailand, concentrates solely on the emergence of international sex tourism to Thailand, which has become a synecdoche for prostitution itself in interna-

tional consciousness (Bishop & Robinson 1998, 1999a, 1999b, 2002a, 2002b).

[Sex tourism to Thailand arose in a context informed by the availability in the First World of paid and in some cases lengthy holiday time and, because of the promotion of mass tourism, the growing affordability of foreign travel for those with a modest amount of discretionary income. Unlike sex tourism sites in Africa and the Caribbean, where sun, sand, and, in the former case, safaris preceded sex in the chronology of seductive sibilants, in Thailand the sex preceded the tourism. Building upon the vast sex industry serving a local clientele, there emerged a parallel set of institutions tailored to the needs and desires of U.S. and other foreign servicemen present during the Vietnam War period. These included men stationed at the enormous American airbases in Thailand itself, as well as the thousands who were rotated in each week from the combat zone for R&R, rest and recreation. Providing for the needs of troops in the country and those on leave from the front naturally entailed offering accommodations, food and drink, souvenirs of all sorts, and nonsexual entertainment facilities along with sex, all of which assumed significant weight within the Thai economy.

[The establishment in 1967 of U.S. government contracts with Thailand, along with several other sites, to provide R&R for the leisure time of foreign troops clearly brings together key notions of labor, masculinity, and sexuality. There is, after all, no job traditionally reserved to men that is more structured around the body, in its existential dimension, than the military, nor any in whose performance notions of masculinity and male sexuality are more openly deployed to manipulate the men doing the job. From the commonplace that army service will "make a man" of the boy joining up, through training by means of gendered and sexualized insults to the structures of command and compliance, the military relies on a definition of the person-gendered male. For this reason, when the combat soldier's perquisites on the job include opportunities for sexual release in the form of camp followers, military brothels, sanctioned rape, or leaves spent in tolerated red-light districts, that release is understood as an integral part of his functioning on the job.

[In Thailand during the Indochina (Vietnam) War, a new sexual institution, the go-go or dance bar, sprang up to supplement traditional bordellos, massage parlors, sexual exhibitions, and "pickup" bars. These dance bars, which have become permanent fixtures in the commercial sex zones of Bangkok and the beach resorts, were modeled, superficially at least, on similar establishments in North America—featuring the same strobe lights, 30-year-old rock music, dancers on display, and promise of sexual encounters. The chief difference is that, instead of one or two dancers on platforms suspended overhead, the Thai bars feature dozens of dancers on a stage, performing with the crotch at eye level, and virtually no female customers. So, instead of the sexual opportunities being consensual arrangements between customers, it is the dancers who also offer that form of entertainment. The Sexual Revolution enacted in late-1960s America is thus parodied—or exposed—in its Bangkok offshoots.

[Typically, there are so many entertainers working on any given night, that each can dance for only a couple of cuts on the tape before being cycled offstage. The message is about sexual abundance. It is while onstage, wearing a button with her identifying number, that a performer is likeliest to catch the eye of a potential customer, who can order her from the waitress along with his beer. When this happens, she steps down and joins him, and he orders a "lady drink" (non-alcoholic) for her. They will fool around for a while, joking and touching, before coming to an agreement to have sex in a room onsite or at a hotel. If such an agreement is reached, the

man pays the bar a fine for taking away a dancer, the amount he pays her directly being understood as a tip. If their relationship is limited to a drink or two, she will rejoin the dancers waiting to go back on stage. The dancer gets some credit for having drinks bought for her, and is expected to go out with customers a minimum of twice a week.

[What happens sexually in these encounters tends to be fairly vanilla or mainstream vaginal and oral sex, with the exotic making its appearance in the erotic chiefly through the customers' sense of abundance and availability, as well as the comparatively low cost of sexual services. What Thai sex workers have to offer the foreign customer is a sense of readiness—indeed, eagerness—to serve sexually, assuring acceptance without the necessity of engaging anything in the transaction but cash, and without the possibility of rejection.

[As our use of the present tense suggests, the girlie bars survived the war that brought them into being. This is because, like the World War II military aircraft factories, they too were converted to civilian use. In 1971, while the Vietnam War continued to rage, Robert McNamara, President of the World Bank and, by no means incidentally, U.S. Secretary of Defense when the R&R contracts were signed, led a World Bank mission to Thailand. When highly placed officials in the Kingdom's governmental and financial classes expressed concern about what would happen to their country's economy once the foreign troops were gone, McNamara assigned a team of World Bank development experts to the problem, and their report, issued in 1975 as the last Americans left Vietnam, recommended that Thailand's path to economic development be through the establishment of a mass-tourism industry.

[That the recommended mass tourism would necessarily build on the infrastructure set up to entertain the troops—an infrastructure itself dependent on commercial sex—went without saying. Although the industry has grown enormously, with tourism replacing rice-export as the country's largest source of foreign exchange by the mid-1980s, the continuity is still apparent, as military R&R contracts were replaced by corporate ones covering oil-industry workers in all-male Middle Eastern environments, and corporate-incentive travel complemented appeals to individual men traveling on their own seeking sexual fulfillment through the commercial transaction. The customers' relation to the larger structures that institutionalize their sexuality parallels Thai peasant girls' need for an adequate livelihood and to create the political economy of desire that characterizes commercial sex in Thailand today. (*End of comment by R. Bishop and L. S. Robinson*)]

### *Government Surveillance of Commercial Sex Workers*

A system of monitoring sex workers has been in place because the government has long implicated them for the spread of STDs (Rojanapithayakorn & Hanenberg 1996). Most "direct" sex workers in Thailand are under the STD monitoring system, which the Department of Communicable Disease Control (DCDC) has adapted over a period of 40 years. There are hundreds of government STD/AIDS clinics all over Thailand, each keeping a logbook of its local commercial sex establishments. The logbook contains location of the businesses, and it is frequently updated with the help of STD patients who show up for services. The officers semiannually visit these establishments to assess the numbers of sex workers and other changes; their enumeration of establishments has been reported regularly since 1971.

In 1990, the Sentinel Surveillance reported that each sex worker had an average of two customers per night, with the

mean of 2.6 for direct sex workers, and 1.4 for indirect sex workers (unpublished data, cited in Rojanapithayakorn & Hanenberg 1996). In 1994, the compiled lists of commercial sex establishments showed 37 different kinds of sex businesses, mostly concentrated in Bangkok and provincial towns. The report also showed there were on average 67 commercial sex establishments in most provinces, with an average of 663 female sex workers per province. The total number of sex workers who worked in listed establishments was approximately 67,000 in 1994. These numbers reflect sex workers who are under the surveillance system by the government.

Vithayasai and Vithayasai (1990) provided the first evidence that by 1988, HIV was already spreading among female sex workers and their customers in northern Thailand. Many other studies have consistently shown that female sex workers in the north have disproportionately higher rates of HIV infection than those in other parts of Thailand; brothel-based female sex workers were found to have an HIV incidence of 20 seroconversions per 100 person-years of follow-up (cited in Mastro & Limpakarnjanarat 1995). In 1994, the national median prevalence of HIV infection was 27% among brothel-based commercial sex workers (Division of Epidemiology, Thai Ministry of Public Health; data cited in Mastro & Limpakarnjanarat 1995).

Female sex workers have many barriers to having protected sex with their clients, for example, clients' insistence on not using condoms (Pramualratana, Podhisita, et al. 1993), lack of negotiation strategies (Brinkmann 1992), clients' healthy and attractive appearance and the sex workers' trust in "regular" acquainted clients (Wawer et al. 1996), and alcohol use by either the client or the sex workers (Mastro & Limpakarnjanarat 1995). However, this picture has changed dramatically by the mid-1990s, as the government's nationwide 100 Percent Condom Program came into effect. Whereas the 1989 survey of sex workers found that 14% of their sex acts were with a condom, the rate increased to over 90% in December 1994 (Rojanapithayakorn & Hanenberg 1996; see more discussion in Section 10B, HIV/AIDS).

### *Male Commercial Sex Workers*

The number of male sex workers in Thailand has been estimated to be approximately 5,000 to 8,000 (Brinkmann 1992), a number much smaller than the estimates of female sex workers. Although there are very few studies on male sex workers, a study has provided a glimpse of the demographics and sexual behavior of men who work in gay bars with commercial sex (Sittitrai, Phanuphak, et al. 1989). Many of these men, referred to in Thai as "business boys," stated that their primary sexual attraction was for women. They reported that their sexual behavior outside of the bars was predominately heterosexual and many had sex with female sex workers for sexual pleasure. Similar findings were found in the study of male commercial sex workers in northern Thailand: 58% of them described themselves as preferring female partners outside of work, and 14% of all men were married (Kunawararak et al. 1995).

At the beginning of the 1990s, male sex workers' HIV seroprevalence remained comparatively low compared to the alarmingly high rates in female sex workers, and this was hypothesized to be because of the male sex workers' use of condoms from early on in the HIV epidemic. However, recent findings can no longer sustain this optimism. In a recent study (Kunawararak et al. 1995) in which male sex workers were followed prospectively from 1989 to 1994, their HIV prevalence increased from 1.4% to 20%, with an overall incidence of 11.9 per 100 person-years, a rate con-

siderably higher than those found in any other groups of Thai men.

Most sex workers in Thailand enter the commercial sex business in their late teens or early 20s, and many others in their early teens. The phenomenon of children in commercial sex will be the focus of the following section. However, it is important to note that much of the discussion about the sociocultural factors that lead young women and men into the sex industry will be applicable to both child, adolescent, and adult sex workers as well.

### Child Sex Workers

Much to the embarrassment of the Thai officials and activists alike, commercial sex involving children has become a tourist draw to Thailand. The HIV pandemic has fueled the demand of a great number of customers for younger sex workers because of their perceived likelihood of being free of HIV infection and other STDs. In many brothels, children as young as 10 and 11 are promoted by managers as “fresh” and “healthy,” and the price is prorated accordingly. In contrast to this myth, child sex workers are reported to have very high HIV seroprevalence, above 50% according to Hiew (1992). New evidence suggests that women who start as sex workers at a young age might be more susceptible to HIV infection than those who start later, even after controlling for the effects from the work duration (van Griensven et al. 1995).

Children proven to be virgins are especially sought after by Chinese and Middle Eastern clients. There is an ancient Chinese myth that “deflowering” a virgin girl will revitalize the sexual potency of an old man and make him prosper in business (O’Grady 1992). Others are sexually attracted to children and adolescents because of their youthful qualities. Because child sex workers are accessible in Thailand, the country has become a tourist destination for those who believe in these myths, as well as pedophiles and ephebophiles around the world. In their own countries, they could be imprisoned, castrated, or killed for being caught having sex with a child. In Thailand, however, their sexual behaviors go unnoticed and only cost them some money.

In theory, sex with children is illegal in Thailand, but the law has rarely been enforced. More-recent external and internal pressures on the exploitation of children in commercial sex have led to some changes, but to what extent is unknown (see below). These pressures also have made it difficult to estimate the number of child sex workers in Thailand, as they are “going underground” (Boonchalaksi & Guest 1994). The estimates have ranged from 30,000 to 40,000 proposed by the Thai Red Cross and Sittitrai and Brown (1991), to 800,000 suggested by the Center for the Protection of Children’s Rights. Estimates have been calculated based upon the ratio of child to adult sex workers, with children making up 20 to 40% of all the sex workers in Thailand. The most-scientific report available to us has estimated the prevalence of child sex workers to be 36,000 (Guest 1994). This number comprises 1.7% of the female population who are below the age of 18.

The buying and selling of child sex workers in Thailand is a lucrative business, as it is elsewhere in Asia (*End Child Prostitution in Asian Tourism*, ECPAT, 1992, cited in Kaime-Atterhog, Ard-Am, and Sethaput 1994). Girls and boys (albeit mostly girls) are brought into Thailand from the hill tribe areas, Myanmar (Burma), China, Kampuchea (Cambodia), and Laos (Friends of Women Foundation 1992). In addition, they are also bought from rural Thailand for as high as US\$8,000 (Serrill 1993) and brought to the cities and larger tourist locations. Farmers under greater economic pressures have been forced to make many sacrifices, including sending

their children to work in the cities in order to send money home (Srisang 1990). These farmer parents are not always aware that their children are to become sex workers. In other cases, the entry into the sex industry does not happen until after an initial period of working in other low-paying jobs.

The business of finding job placements in the cities for rural children is not a new phenomenon. However, the growth of this business, and its connection to the sex industry, have been boosted by the socioeconomic shift in recent decades, and now it can be found in most parts of the country. As Thailand is moving toward the status of a newly industrialized country (NIC), most of the rapid economic development is concentrated in urbanization and industrialization. Although all socioeconomic strata have enjoyed their share of the country’s economic boom, income inequalities have widened and poverty persists (Pyne 1994). Wealth is concentrated in the cities, while the rural poor are becoming more and more landless, and profits from their domestic businesses in rural areas are diminishing. Poverty, combined with the women’s obligation to provide for their parents, and the lack of job opportunities for unskilled laborers, create an enormous pressure that has forced many Thai women to consider the sex industry as an occupation.

While many children and young women have been bought, most available data suggest that the process is not involuntary or forced. Hantrakul (1988, quoted in Manderson 1992) has pointed out that, “More and more prostitutes . . . have shown their strong determination in stepping in the profession. Sex is harnessed to an economic end. Men are seen as targets, a source of income” (p. 467). Data from van Griensven et al. (1995) support this notion: When asked how they entered commercial sex, 58% of the female sex workers said it was their own decision, and 37% said a friend or relative had advised them. Only 3% reported that they were either sold by their parents or recruited by an agent or employer. A number of the women, 14%, also had one or more sisters in commercial sex. Poverty was the most common reason for entering the profession, reported by 58% of the women.

After years of living through the sociocultural changes that have put more strains on rural women, being a sex worker to support one’s family has become an acceptable value in several communities in the north. Some children go into this business without reservation and with full parental permission and support. Many of these girls return home with honor, marry, and repeat the cycle by sending their own daughters into the sex business when they come of age (Phongpaichit 1982; Limanonda 1993). This phenomenon is also true of some of the hill tribe villagers. Almost all sex workers are clear about their desire to quit working in the sex industry once their goals of income are met, and many would return to their native villages to marry and take care of their parents. Upon reintegration into the village, women who have worked as sex workers may be subject to condemnation, but it is usually based not on their prostitution, but on their having sex outside of marriage (Manderson 1992). This offense, however, can be amended by their active accumulation of merit, such as caretaking of parents and helping local charities. In any case, many women have already been recognized by family and the community for their previous remittances during the years of work in the city, as their financial contributions are already evident in the family’s house, motorcycle, and even donations to the local temple. Although the cults of ancestral spirits (*phii puu yaa*) frown upon women’s premarital sex, the act of kinship loyalty and filial piety is considered adequate to propitiate the spirits. In fact, when commercial sex agents recruit women from the villages, they frequently offer some “customary

payments” to the family and the ancestral spirits much like a brideprice. With an income up to 25 times the median income of women in factories and clerical jobs (Phongpaichit 1982), sex workers can easily redress their sexual misdemeanors by their generous support of kinship.

Nonetheless, other evidence suggests that many children and families are deceived by the brokers, and that the children are led to believe they will go to the cities to work as domestic servants or waiters/waitresses, only to find themselves forced into commercial sex. Sometimes, coercion takes the form of financial threats rather than physical confinement of the women. Many women must continue working to earn the sum of money for which their families are indebted to the commercial sex agents. For example, 31% of the female sex workers in van Griensven’s study (1995) reported they were in debt to their employer. Worse cases are seen in women in commercial sex businesses in foreign countries. In a 1993 article in *Time* magazine, Hornblower (1993) reported that numerous Thai women are working in Japan as “virtual indentured sex slaves” in bars controlled by Japanese gangsters. These women, mostly from rural villages of Thailand, are usually sold by Thai brokers for an average of US\$14,000 each, and then resold to the clubs by Japanese brokers for about US\$30,000. The women are obligated and threatened to work under hostile circumstances to earn this sum of money, but very few can.

The recent concern about child sex workers in Thailand seems to have been fueled by the awareness of the HIV pandemic and the growing anguish about child victimization around the world. Initially, the pressure for a governmental policy towards child sex workers came from foreign sources, with the pressure more recently internalized. When the government of Prime Minister Chuan Leekpai took office in 1992, he promised to eliminate child sex workers during his term of office. Impressive work has been done by the Task Force to End Child Exploitation in Thailand, a coalition of 24 government and private agencies dedicated to exposing European links of child sex trade in Thailand (Serrill 1993). Brothels in Thailand known to employ children were raided and closed, and the events were highly publicized in Thai newspapers (Kaime-Atterhog et al. 1994). However, data are still lacking regarding the extent of success in reducing the child sex trade. Although some reports have mentioned the age restriction that sex workers must be at least 18 years old (e.g., Kunawarak et al. 1995), statistics still show a small number of female sex workers under 15 years old in brothels (e.g., van Griensven et al. 1995).

### *Sociocultural Factors Behind the Entry to Commercial Sex*

One consistent finding across many studies of female and child sex workers is that a large number come from the northern provinces of Thailand (Redd Barna 1989; Archavanitkul & Havanon 1990; van Griensven et al. 1995; Wawer et al. 1996). It has been theorized that these young women are especially in demand because of the long-held admiration for their lighter skin compared to their counterparts in the northeast or the south of the country. Others have theorized that working in the sex business is a tradition long present in the north. Formerly part of the kingdom of Lanna, this part of the country was more often at war with other kingdoms and had a history of being colonized. It was the custom to use women from the area to placate the occupying forces through the offering of sex services (Skrobanek 1988).

In addition to these perspectives, others have offered hypotheses that take into account sociocultural factors that are not unique to northern Thailand and are thus applicable to the general Thai culture as well. Lenore Manderson (1992),

for example, eloquently argues that commercial sex, much like Buddhist monasteries, provides alternatives for both men and women to step out of their ordinary cultural roles. For men, the alternative is in the sexual realm; commercial sex provides a sexual outlet for the unmarried men and a way for married men to step temporarily outside their marriage while avoiding a divorce. For young women, she argues, the process of leaving behind (temporarily) their kinship as well as their “normal sexuality” (i.e., sex with affectional ties) gives women an alternative option to become self-sufficient. By supporting themselves and their family through the commoditization of sex, these young women achieve a degree of autonomy without having to enter the role of “mother” or marriage. Traditionally, *mae chii* undergo a similar process of abandoning attachments (in their case, worldly and sexual pleasures) in order to achieve autonomy in the spiritual realm. In a society in which women are expected to be mother or wife, female sex workers and *mae chii* reject both roles in the way they use (or do not use) their bodies and sexuality.

Other scholars, such as Khin Thitsa, Thomas Kirsch, and Charles Keyes, have looked even deeper into the Theravada gender construction for the cultural explanation of commercial sex. Keyes (1984) acknowledges that prostitutes have never been stigmatized in Buddhist societies, because the women still have the opportunity to alter their behavior at some time; prostitutes and courtesans were indeed among the alms of women in early Buddhist society. Despite such tolerance in the Buddhist society, he suggests that the rise of commercial sex in contemporary Thailand has more to do with the emergence of the new images of men and women, which are associated with sex without any tempering moral irony found in traditional popular Buddhism. According to Keyes, the decision to enter commercial sex in Thailand today is the women’s “participation in the increasingly materialistic culture of Thailand” (p. 236), probably driven by the “secularized image of woman as sex object” (p. 236). A number of scholars and activists have made similar comments. The growth of commercial sex in Thai society cannot be explained by the traditional gender roles in Buddhism; quite the opposite, it thrives on the increasingly consumerist and materialistic nature of the contemporary Thai culture.

On the other hand, Kirsch (1985) argues that women’s choice of entering commercial sex is not necessarily at odds with the range of “ideal” female images in Buddhism. In particular, the Buddhist-sanctioned mother-nurturer image of women has found a new expression in the new socio-cultural context, where young rural women have expanded their means of providing for the family to a new arena, “in towns, cities, the nation, and beyond” (p. 313).

### **C. Pornography and Erotica**

The popularity of pornography and erotica in contemporary Thailand cannot be denied, although we were not able to identify formal data on its extent and variety. Erotic magazines and videotapes, most of which are designed for the male customer, are available in street markets, newsstands, and video stores. Imports and unauthorized copies of foreign (mostly American, European, and Japanese) erotica are easily available and popular. Thai-produced erotica tends to be more suggestive and less explicit than the XXX-rated erotica produced in the West. Heterosexual erotica has a greater market, but same-sex erotica is also available.

By exploring the production and consumption of pornographic and erotic materials in Thailand, we can better understand Thai people’s attitudes toward this topic, as well as the underlying social constructions of gender and sexuality. While there is no equivalent of the term “pornography,” the

nonjudgmental colloquialism is the suffix *po*, (“nude”) added to the format of the medium (e.g., books, magazines, pictures, movies, and dances); hence *phaap po* is a nude picture. The more judgmental suffix *laa-mok* (“obscene”) is also used, especially by the press to convey journalistic technicality or even an air of morality. Sex videos are also called *nang ek*, or “X movies,” although censorship in Thailand does not use the nominal rating system used in the United States. There is also a tongue-in-cheek distinction of *po tae mai plueay*, or “nude but not naked,” implying the more discreet depiction of the unclothed bodies.

Although none of these terms indicates the gender of the customers or users, Thai people generally see that pornography is chiefly men’s indulgence, consistent with the idea that vices and sex are men’s recreation.

Depictions of nude female bodies or women in swimsuits on calendars are not an uncommon sight in male-dominated settings, such as bars, construction sites, warehouses, and auto shops. Caucasian and Japanese models are also as popular as Thai models. In fact, until a few decades ago when domestic production of pornography was prohibited by poor technology and strict laws, Thai men relied on pirated copies of Western porn and imported magazines, such as *Playboy*. Hence, the last few generations of Thai men have been exposed to Western sexuality primarily through pornography from Europe and North America. Because these materials portray sexual practices with the variety and explicitness unprecedented in the Thai media, Thai people who are acquainted with Western pornography have come to associate Westerners with sexual disinhibition and hedonism.

Prior to the popularity of videotapes, imported and pirated, Western erotica was available in the underground market in the formats of print, 8-millimeter film, and photographic slides. Illegal prints of Western hardcore pornography, known as *nangsue pok khao*, or “white-cover publication” were produced by small, obscure publishers, and surreptitiously sold in bookstores, by mail order, or by solicitors in public areas. Nationally distributed magazines on display at newsstands and bookstores have burgeoned since the late 1970s. Following the format of American publications such as *Playboy*, these magazines, such as *Man*—among the earliest of its genre—print glossy photographs of Thai female models, and feature regular as well as erotic columns. The proliferation of gay men’s erotic magazines followed in the mid-1980s.

The legal status of these magazines, straight and gay, is somewhat ambiguous. While sometimes up to 20 or 30 different publications compete on the newsstands for years, the police have also made numerous raids on publishers and bookstores that carry these so-called “obscene” magazines. Such raids often follow a moral surge in politics or an administrative reform in the police department. Similar arrests have been made with the video rental stores that carry pornographic films. Interestingly, grounds for objection to these pornographic materials have never been based on the material’s unauthorized status or even the exploitation of women. As known by all the customers and providers of pornography in Thailand, the disapproval is because of the “sex and obscenities” involved. In news coverage of these raids, officials commonly espouse Buddhist moral messages about sexual stoicism and, less often, the degradation of the *kulasatrii* image. Thai censorship of films has also been stricter on sexual matters than on violence, even when the sex or body exposure appears in nonexploitative contexts. In formality and the law, the Thai society is more sex-negative than what its sex industry has led most outsiders to believe.

The depiction of the Thai female models in Thai erotic magazines for heterosexual men is perhaps an embodiment

of the modern, urban “bad girl” image. Although many of them are indeed recruited from the commercial sex scenes in Bangkok, the glossy images and the accompanying biographies suggest that the models are single, educated, and middle-class adventurous women who do these poses on a one-time-only basis. To the reader, these women might as well be *kulasatrii* elsewhere, but here they let their hair down in front of the camera and become modern, beautiful, and sensual women who are in touch with their sexuality. Neither are these models the ordinary “carefree” women available in the one-night-stand scenes; their model-quality appearance is more than what the reader could expect in those environments. Hence, these models represent a high-end variant of carefree women, characterized by their overwhelming sexual magnetism, an excellent match indeed for men and their boundless sexual desires. A few famous models in the erotica industry have gone on to fashion, music, and acting in television or film with great success.

The image of these celebrity erotica models can be juxtaposed, like the other side of the coin, with that of the beauty-pageant winners, such as Miss Thailand, who also frequently become media celebrities. Both images are of Thai women who achieve success and fame because of their appearance. Pageant contestants and winners always take great pains to extol the virtues of Thai women in their public statements, and many openly object to the pageant’s swimsuit display requirement. Pageant winners invariably stress their “nurturer” ideology by speaking of helping children, the elderly, and the disabled. In contrast, erotica models send off an air of iconoclastic indifference in their seductive, hedonistic, and “I don’t care” statements. Interestingly, women’s indifferent and autonomous attitudes, along the lines of “I am who I am” or “I don’t give a damn,” have become fashionable and used in numerous poetry and song lyrics by female pop stars. This image, however, is not a new image for women in Thai society, because the “bad women” image has always been around. Nevertheless, the tough “I-am-who-I-am” statements are urban women’s announcement of their moral independence, setting them in contrast with the conventional perceptions that women in the sex industry and “carefree” women are fooled into their positions, and that women in general are helpless abiders of societal values. As more and more contemporary women are becoming dissatisfied with the traditional role or the victim stereotype, these iconoclastic sentiments seem refreshing: Adopting the role opposite to a *kulasatrii* by choice is an act of liberation.

Thailand is also famous for its sex shows in the go-go nightclubs (*baa a-go-go*), most notoriously in the red-light districts of Patpong, Pattaya, and Chiangmai. Approaching these performances of dances, sexual tricks, and intercourse as cultural texts, Lenore Manderson (1992) has examined the continuity which links these public sex shows with the disempowerment of women, prostitution, and the Thai social constructions of sex and gender. Although the extreme explicitness and violent themes in these shows undeniably reflect misogyny and subordination of women, she also notices that the themes reflect what Thai people understand about the sexuality of Thai men and of the Westerners in the audience. These acts are what the sex industry thinks will captivate the (mostly) male clientele. The themes thus represent not the everyday sexuality, but the erotic possibilities on the edge of male libidinal fantasy, their “wildest dreams.”

Salient in the imageries designed to excite, thrill, or even shock the male customers is the ruleless, “anything goes” atmosphere. Disinhibition pervades the bars in which customers have quick access to sex on the premises. The unpredictable, even improbable, performances, including genital ma-

nipulation of objects or snakes, and sex between women, all affirm a polysexual theme. Another theme designed to excite is the extreme objectification of women as sex objects for sale. Sex workers are numbered for customers' selection, and their nakedness (or uniform bar costume) enhances their anonymity. Finally, there is a theme of satire in which men are insulted and parodied for their fear of the female genitalia, the widespread touch taboo and gender segregation are overturned, and the Thai gender-power hierarchy toppled. Naked women dance on a raised platform, literally placing men under the female genitalia (Manderson 1992).

## 9. Contraception, Abortion, and Population Planning

### A. Contraception and Population Control

Thailand is extremely proud of its relatively high rates of contraceptive use and successful population control. Birthrates have been declining over the years. In 1995, the Institute for Population and Social Research at Mahidol University reported that the natural growth rate was about 1%. The fertility rates have also decreased significantly in the last few decades, from six births per woman in the 1960s to two births per woman in the late 1980s (cited in Pyne 1994).

The contraceptive prevalence rates have increased dramatically in the last two decades, from 15% to 68% among married women (cited in Pyne 1994). Contraceptive methods are readily available and utilized (Sittitrai et al. 1992). Common methods of contraception in Thailand include hormone pills and injections, intrauterine devices (IUDs), vaginal inserts, rhythm, condoms, withdrawal, vasectomy, and female tubal ligation. For women, the contraceptive hormonal pill is by far the more-preferred method. However, the most-prevalent method today is female sterilization, followed by the pill, while the least-popular method is the condom (cited in Pyne 1994).

The success of contraception in Thailand has been invariably linked to Mechai Viravaidya, the man *Time* magazine called "a champion of condoms, a pusher of the Pill, a voice for vasectomies." ("The Good News," *Time* 1989). Launched by Viravaidya in 1974, the private nonprofit organization, Population and Community Development Association (PDA), has tackled overpopulation by promoting family planning and distributing birth control devices. The PDA proactively places temporary birth control clinics where people gather, in bus terminals, village fairs, and buffalo markets. At these unconventional sites, they dispense condoms and the pill; free IUDs and vasectomies are even offered on special occasions. Playful but persuasive jingles promoting family planning punctuate music and soap operas on the radio, reaching every household in Thailand. Helped by his humor, creativity, and charisma, the success of the PDA and Viravaidya can be seen in the growing financial support from the government. Moreover, Thai people now use the term *mechai* as a slang term for condoms.

In the *Partner Relations Survey* (Sittitrai et al. 1992), the research participants reported that condoms were readily available. Considerable proportions of the participants reported having used them some time in their lifetimes: 52% of the men, 22% of the women, or 35% overall. Attitudes toward condoms were not especially surprising. Most men feared a lack of pleasure or diminished sexual performance with the use of the condom, and couples found using condoms threatening to the trust in their relationship.

Recently, the heightened HIV awareness and the government-sanctioned 100 Percent Condom Program have significantly increased the use of condoms, especially in the con-

text of commercial sex (see also Sections 8B, Significant Unconventional Sexual Behaviors, Prostitution, and 10B, HIV/AIDS). Although the government received condoms from foreign donors before 1990, all condoms provided to sex workers since 1990 have been bought by the country's own funds (Rojanapithayakorn & Hanenberg 1996). In 1990, the government distributed about 6.5 million condoms; in 1992, they spent US\$2.2 million to buy and distribute 55.9 million condoms. Commercial sex workers receive as many free condoms as they require from government STD clinics and outreach workers. On the national level, the recent increase in condom use has been documented to relate in time and magnitude with the overall decline of STDs and HIV incidence.

### B. Abortion

Abortion is illegal in Thailand except when performed for medical reasons. Most Thais are strongly anti-abortion, mainly because of the First Precept of Buddhism which prohibits killing of living beings. In general, "living beings" are interpreted as people, animals, and sometimes small creatures, but most Thais also see this Precept as pertaining to the aborting of a fetus as well. Again, premarital or extramarital sex is frowned upon and there is little sympathy for the woman who becomes pregnant out of wedlock. She is most likely to be viewed as at fault for becoming pregnant, because only women (not men) can control their sexual desire. Thus, abortion has often been associated with a lack of morals and virtue on the woman's part.

In Ford and Kittisuksathit's study (1994), the young women who worked in factories were well aware of the dilemma of premarital pregnancy in the lives of their friends or siblings. Most expressed great concerns about unwanted, premarital pregnancy, which is a clear indicator of "sinful behavior" they have committed. In discussing the consequences of sex, women mostly talked about the feared premarital pregnancy, with allusions to "baby dumping," infanticide, and abortion, whereas young men focused on issues of STD and HIV. Most women expressed the hope that their partner would care for and marry them, and the child could be kept. Other young women clearly insisted that they would seek an abortion because they were emotionally and financially not ready for having a child. The blame for unwanted pregnancy, as expressed by both the young men and women, was placed on the woman for "allowing" intercourse to occur.

Apart from the social stigma, there are other important reasons behind Thai women's decision to have abortion. Pregnancy presents a grave problem for women in low-paying jobs in which employers have little tolerance of absenteeism (Pyne 1994). Having a child in urban environments is expensive, and, because few companies offer support for maternal and childcare, a woman risks losing her employment because of the additional task of parenting. For rural women who migrate to work in the cities, losing their jobs means jeopardizing their only source of income on which they and their family upcountry depend.

In curious contrast to the prevailing anti-abortion attitudes, abortion is not rare in practice. Illegal abortion clinics, many of which are run by nonprofessional women, offer traditional but unsafe techniques of abortion, such as forceful massage or injecting chemicals into the uterus. Thorbek (1988) has documented experiences of women who had undergone such traumatic procedures and the adverse health consequences. A more-pragmatic approach has been developed in recent years, thereby allowing women to have safe, confidential abortion operations in many urban clinics. In these clinics, medically trained professionals use standard

medical procedures, such as suction, to remove the fetus. Never advertising openly, these urban clinics rely on word of mouth to draw clients, and fairly large fees are charged. To date, there has not been a Thai-equivalent of the Western movement that has gained recognition of a women's right to choose to have an abortion.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Thailand reports high rates of sexually transmitted diseases (STDs). In the *Partner Relations Survey* (Sittitrai et al. 1992), the lifetime prevalence rates of STDs were 49% among urban men and 33% among rural men, or 38% overall. Much lower proportions of women reported a history of STDs: 11% in urban women and 9% in rural women, or 10% overall. Gonorrhea and nongonococcal urethritis (NGU) were the most common STDs in male participants, whereas chlamydia and urethritis were the most common in female participants. Knowledge about STD prevention and treatment was inadequate, especially in the face of the HIV pandemic. Data from military conscripts have confirmed the linkage between STDs and HIV infection. In these young men from lower socioeconomic backgrounds, HIV infection was strongly associated with a history of STDs (Nelson et al. 1996), particularly a positive serology for syphilis, a history of gonorrhea, syphilis, genital herpes, genital warts, and genital ulcers (Beyrer et al. 1995).

Almost all STD cases in Thailand could be traced to commercial sex. In a 1989 report, 96% of male clients at government STD clinics attributed their infection to having had sex with a sex worker (cited in Rojanapithayakorn & Hanenberg 1996). The government STD clinics carry out the Ministry of Public Health's sentinel surveillance (previously described in Section 8B, Significant Unconventional Sexual Behaviors, Prostitution) and have notably provided STD-related services to the general population and medical examinations to sex workers for at least 20 years. Although sex workers are encouraged to have a weekly examination, records show that they visited government STD clinics only once every seven weeks in 1994. Male sex workers have been also included in sentinel surveillance since 1989 (Kunawarak et al. 1995). In addition, these clinics trace the partners of individuals with STD. The male clients are asked to name the establishments from which they might have contracted STD, and outreach workers are then dispatched for further tests or scheduling treatment for the sex workers. The government STD clinics also have good collaboration with the police offices, allowing enforcement against uncooperative establishments.

### B. HIV/AIDS

HIV was first detected in Thailand in 1984 (Limsuwan, Kanapa & Siristonapun 1986). The government was slow to respond to the pandemic and its entry into Thailand. Economic pressures created by the need for tourist dollars and the early low numbers of actual AIDS cases slowed the government's response to the pandemic (Sricharatchanya 1987).

This slow response caught Thai governmental officials and healthcare providers unprepared for the rapid explosion of new cases of HIV infection and AIDS. Infection rates remained quite low through 1987, mostly affecting men who had sex with men. Then, there was a rapid increase in seroprevalence among injecting drug users (IDUs). In 1988, 86% of known seropositive cases were among IDUs, 4% were men who had sex with men, and 2% were heterosexual women. By 1990, another shift had oc-

curred and shortly thereafter, female sex workers showed extremely high seroprevalence rates. This phase of the pandemic was first detected in northern Thailand in 1989 (Limanonda, Tirasawat, & Chongvatana 1993; Vithayasai & Vithayasai 1990). As injecting drug use was shown to be very rare among sex workers, heterosexual intercourse was then identified as a potentially effective mode of HIV transmission in Thailand. In 1991, the HIV seroprevalence among urban brothel sex workers in a northern province rose to 49% (Ministry of Public Health 1991). Because many Thai men have unprotected sex inside and outside of their marriage, high rates of HIV infection were soon detected not only in sex workers, but also in their clients, pregnant women, and newborns. The 1994 national median prevalence rates of HIV infection were 8.5% among men attending STD clinics, and 1.8% among women attending prenatal clinics (Division of Epidemiology, Thai Ministry of Public Health; data cited in Mastro & Limpakarnjanarat 1995).

A series of studies have focused on the men newly conscripted to the military in order to infer the extent of HIV infection among Thai men at large. Prior to 1993, the HIV-seroprevalence rates in these northern conscripts ranged between 10% and 13% (Beyrer et al. 1995; Nelson et al. 1996), considerably higher than the rates among conscripts from other parts of the country. Some unique sexual patterns of the young men in northern Thailand have been linked to their greater risk of HIV infection. When compared to men from other provinces, upper-northern young men were more likely to have initiated sexual activity at a younger age—before age of 16—to have had their first experience with a female sex worker, to have had more-frequent sexual contacts with sex workers, and to have reported a history of STDs (Nopkesorn, Mastro et al. 1993; Nopkesorn, Sweat et al. 1993).

Estimates have indicated that the number of persons living with HIV totals several hundreds of thousands (Division of Epidemiology, MOPH 1984-1993). The forecast is grim in terms of further HIV infection and its socioeconomic impact on the entire country (Sittitrai et al. 1992). However, by the mid-1990s, there has been some good news of behavioral change and decreasing new cases of HIV infection. Paralleling the success of the mass advertising campaign and the 100 Percent Condom Program, condom use in commercial sex increased from 14% of the sex acts in 1989 to 90% of the sex acts in 1994 (Rojanapithayakorn & Hanenberg 1996). As the government distributed massive amounts of condoms to commercial sex establishments all over the country, the incidence of STDs correspondingly decreased by over 85%. Meanwhile, the HIV seroprevalence among the military conscripts from northern Thailand declined from 10.4% in 1991 to 6.7% in 1995 (Nelson et al. 1996). New conscripts have greater proportions of men who never had sex with sex workers, and greater proportions of men who never had STDs.

Initiated in 1989 on a small-scale basis, the widely successful 100 Percent Condom Program was later adopted nationwide, with participation from every province in Thailand by April 1992 (Rojanapithayakorn & Hanenberg 1996). The program promotes condom use by sex workers and their clients without exception. Sex workers are instructed to withhold service and refund the fee upon the client's refusal to use a condom. The program utilizes the preexisting structures of the police and the Ministry of Public Health's STD surveillance system to enforce compliance from commercial sex establishments. STDs, monitored by the hundreds of government STD clinics around the country, are used as a marker of noncompliance with the program. When the source of STD is

traced to a noncompliant establishment, temporary or indefinite closure of the business by the police is warranted. With the cooperation from every sex establishment, customers quickly learn that they cannot go elsewhere to find a sex worker who would allow unprotected sex, and the commercial sex establishments understand that they are not losing clients to competitors.

[Update 2002: UNAIDS Epidemiological Assessment: Thailand was the first country in Asia to document HIV epidemics among injection drug users and female sex workers and their clients. After a brief period of denial, the country organized a national program, supervised from the highest levels of government, to respond to the epidemic.

[Thailand has a comprehensive HIV Sentinel Surveillance (HSS) system, started in 14 provinces in 1989 and expanded to all 76 provinces by 1990. The system includes blood donors, antenatal clinic attendees, injection drug users, male STD clinic patients, and both direct (brothel-based) and indirect (massage parlors and others) female sex workers. HIV data on injection drug users have been supplemented by separate serosurveys.

[Surveillance data indicate that HIV prevalence peaked among female sex workers and their clients in the mid-1990s and has since been slowly decreasing. In Bangkok, 1% of injection drug users were HIV-positive in late 1987, increasing to 30% by the end of 1998; since then, HIV prevalence among injection drug users tested has remained between 20% and 50% both in and outside Bangkok. As of the end of 2001, an estimated 1.79% of the population aged 15 to 49 years was infected with HIV.

[HIV/AIDS is monitored and projected by the Thai Working Group on HIV/AIDS Projection. Estimates developed in 2000 indicate that approximately 2% of men and 1% of women are living with HIV; infection levels among adult males will remain above 1.5% until the end of 2006. Until the end of 2006, over 50,000 will die annually from AIDS-related causes; over 90% of these deaths will occur in people aged 20 to 44.

[Recognizing that most HIV transmissions were occurring through commercial sex, efforts focused on reducing the number of males visiting female sex workers and on promoting condom use in all commercial and casual sexual contacts. These efforts substantially changed levels of risk behavior. The percentage of adult men visiting female sex workers has fallen from almost 25% of the population to roughly 10%, and condom use when visiting sex workers has become the norm. The success of Thailand's "100 percent condom program" has not had much effect on the slow but steady transmission of HIV from infected male clients of female sex workers or from infected male injection drug users to their regular sex partners. There has also been limited success in reducing HIV prevalence among the injection drug user population. At present, 670,000 are living with HIV/AIDS; close to 30,000 new infections occur each year. The Ministry of Public Health budget for HIV decreased following the crisis in 1997; many of the international donors who left Thailand during the economic boom years have not returned.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	650,000 (rate: 1.8%)
Women ages 15-49:	220,000
Children ages 0-15:	21,000

[An estimated 55,000 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 290,000 Thai children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

Within Thai psychiatry and psychology, there has not been much focus on the treatment of sexual dysfunctions or disorders. There is recognition of some sexual dysfunctions, but it is mostly limited to male erectile or ejaculatory problems. Vernacular expressions exist for these male sexual dysfunctions, suggesting Thai people's familiarity with these phenomena. For example, *kaam tai daan* means "sexual unresponsiveness" in men or women. There are a few terms for male erectile dysfunction: the playful *nokkhao mai khan* ("the dove doesn't coo") and the more cruel *ma-khuesa phao* ("roasted eggplant"; Allyn 1991). Another slang, *mai soo* ("not up for a fight"), suggests an injury on the man's male pride for not being able to enter a "battle" with prowess. Premature ejaculation is referred to with a playful yet humiliating analogy *nokkra-jok mai than kin naam*, or "faster than a sparrow can sip water."

The incidence of various sexual dysfunctions have not yet been investigated. However, in the past two or three decades, many sex columns have appeared in the mainstream newspapers and magazines, offering advice and counsel in rather sexually explicit, but technical, detail. These are most often written by physicians who claim expertise in treating sexual problems and disorders. Other columnists in women's fashion and housekeeping magazines present themselves as older, experienced women who offer sage advice to younger ones about sex and relationships. The concepts of "squeeze technique" or "start-stop" techniques have been introduced to the typical middle-class Thai through these extremely popular advice columns.

A more systematic and academic effort to establish therapeutic services for sexual dysfunctions is underway. In the proposal for a multi-component interdisciplinary Program for the Promotion of Sexual Health (to be housed within the Chulalongkorn University in Bangkok), Nikorn Dusitsin (1995) included a counseling clinic and hotline counseling as one of the program's main components. Responding to the need for more sex counselors and educators, the program also contains workshops and courses aimed at training intermediate-level educators, including social workers, teachers, and military personnel, in order to provide sexuality counseling and education. Dusitin proposed a problem-based, participatory format for the curricula of these intensive workshops. The content of the curriculum was proposed to combine physiology, psychology, and sociocultural contexts.

## 12. Sex Research and Advanced Professional Education

In a review of the history of sex research in Thailand, Chanya Sethaput (1995) noted the remarkable changes in methodologies and scope of sex research before and after the HIV epidemic in Thailand. These differences lent themselves to a pragmatic classification of pre- and post-AIDS eras of Thai sex research. She noted that only a handful of sex surveys were conducted before the HIV epidemic started in Thailand in 1984. In the pre-AIDS era, she identified the earliest study in 1962 in which the focus was on attitudes towards dating and marriage. In fact, most of the pre-AIDS research was concerned with the attitudes and knowledge in premarital sex, extramarital sex, cohabitation of unmarried couples, sexually transmitted diseases, and abortion. Sampled mostly from the educated, urban populations, such as college or high-school students, these early studies found gender differences in the attitudes of men and women, confirming the existence of a double standard in the sexual domain. Assessment of sexual behaviors was more of an excep-

tion than a rule. Early findings on sexual knowledge among Thai people had been used in the design of a curriculum for sexuality education, which was later enforced by the Ministry of Education in schools across the country.

An abundance of studies have emerged after the first cases of AIDS were identified in Thailand about 1984. Driven by a public-health agenda, the post-AIDS sex research expanded its objectives to include more-diverse questions (Sethaput 1995). Initially focused on "high-risk groups" such as sex workers and "gay" men, the populations of interest subsequently expanded to the customers of commercial sex (college students, soldiers, fishermen, truck drivers, and construction and factory workers), spouses and partners of men who visited sex workers, and other "vulnerable" groups, such as adolescents, and pregnant women. Present samples are no longer limited to convenience samples in urban cities or colleges, but include also rural villages, housing projects for the poor, and work sites, for example. Face-to-face interviews, which previously would have been difficult or unacceptable, have become a more-common assessment method, along with focus-group discussions and other qualitative techniques. Sexual behaviors have become more prominent in the researchers' inquiry, as questionnaires and interview schedules have become increasingly candid and explicit, with a newfound assumption that respondents are more open about sexuality. Previously ignored topics have become main research questions, for example, AIDS knowledge, attitudes toward condoms, masturbation, and same-gender attraction and homosexuality. New research questions have also attempted to identify vulnerability factors to HIV-risk behavior. Guided by the theory of reasoned behavior and the health-belief model, this entails the assessments of psychological variables and individual differences.

Sethaput (1995) briefly reviewed findings, which have formed the basis of the current understanding of sexuality in Thailand. The following findings are now widely known and accepted:

- most populations have a saturation of knowledge regarding HIV transmission,
- extramarital and premarital sexual practices are common in men,
- married women are often well aware of their husbands' use of commercial sex,
- there is a double standard regarding gender and sexual expressions for men and women, and
- the discovery of new, evolving sexual patterns, such as the formation of a sexual network among unmarried men and women in urban settings.

This accrued fund of knowledge from cumulative research has also formed the foundation of our review in this chapter.

A recent publication on *General Sex Education* by Wasikasin, Aimpradit, et al. (1994) represents a renewed and integrative energy in sexology and research in Thailand (1994). This work, published by the Thammasat University, Bangkok, was written by two social workers, two physicians, and a lawyer. As a textbook, it offers an unprecedented integration of disciplines, and its attention to psychosocial contexts is far from the sole emphasis on reproductive biology common in earlier publications.

To date, there is no training in sexological research *per se*. Most researchers in the area of HIV/AIDS have received training from Western institutions, or have applied their basic training in other areas of research to sexual topics. There are a few notable sexologists, for example, Dr. Suwattana Aribarg at the Chulalongkorn University in Bangkok. Dr. Aribarg and her husband give lectures in human sexuality to medical students and she provides counseling through the

Chulalongkorn Psychiatric Clinic. Other sex researchers in various institutes and universities in Thailand have also put forth their efforts to the academic and public attention, and many have gradually received greater national and international recognition over the years.

In late 1995, the Mahidol University Institute for Population and Social Research organized an important seminar on sex research. Charged with enthusiasm, the event brought together key sex researchers in Thailand and their body of knowledge, symbolizing a renaissance of sex research in Thailand. Fongkaew (1995), for example, delineated basic paradigms and constructs commonly used in sex research, and cautioned Thai sex researchers to be aware of their own assumptions and values. Some researchers challenged fellow researchers to theorize and problematize data on sexuality and gender, pushing toward the formation of a theoretical model that could capture the sexual complexities in Thailand. Other researchers urged that investigations must be led by pragmatic implications; much data are still needed for the advancement of social issues, for example, the improvement of the status of women and increasing social acceptance of gays and lesbians. Key ingredients for effective interventions are yet to be identified, especially the often overlooked "positive factors" which might protect individuals from behavioral or attitudinal problems. Finally, there was a consensus that researchers should take a more-assertive role in making specific recommendations based on the findings from their research.

As of 1995, advanced education in human sexuality was not available in Thailand, and most Thai scholars still needed to study abroad. In the aforementioned seminar on sex research in Thailand, Dusitsin (1995) stated that the training of new sexological researchers was one of the priorities of his proposed Program for the Promotion of Sexual Health. Through the efforts of the Asian Federation of Sexology and the World Association for Sexology, increasing numbers of Thai sexologists have been identified. The first sexological organization in Thailand, the Sexology Society, was formed in May, 1995. The organization, chaired by Dr. Nikorn Dusitsin, is located at the Institute of Health Research, Chulalongkorn University, in Bangkok.

### Summary

Sexuality in Thailand, like the country's peaceful yet interesting coexistence of peoples and cultures, is a convergence of values and practices resulting from admixing of cultures over the centuries. In recent years, these sexual attitudes and behaviors have undergone enormous changes influenced by the rapid economic growth, urbanization, exposure to Western cultures, and, most recently, the HIV epidemic. While economic growth has afforded the country more-effective population control and improved public health services, certain strata of the society have suffered from socioeconomic pressures. The growth of tourism, combined with the indigenous attitudes toward sexuality, commercial sex, and homosexuality, have provided fertile grounds for the commercial sex industry to flourish in Thailand despite its illegal status. Exploitation of children for commercial sex purposes, and the high rates of HIV infection among sex workers and the population at large, are some of the many problems that have followed. The rise of HIV infection has caused Thai people to question and challenge many sexual norms and practices, most notably the men's rite-of-passage practice of having the first sexual intercourse with a female sex worker.

Although well known for their general tolerance and harmony, the lack of conflicts or hostility in the Thai society

does not necessarily indicate that Thai people always maintain embracing attitudes about gender inequality, homosexuality, abortion, or sexuality in general. The Third Buddhist Precept clearly prohibits sex that causes sorrow in others, such as irresponsible and exploitative sex, adultery, sexual coercion, and abuse. Other phenomena, such as masturbation, prostitution, subordination of women, and homosexuality, remain uncertain. Most of the current attitudes about these practices can be traced to non-Buddhist sources. Today, these non-Buddhist beliefs are primarily a blend between indigenous concepts (e.g., class structures, animism, and gender codes) and Western ideologies (e.g., capitalism and medical and psychological theories of sexuality).

Thailand is noted for being a male-dominated patriarchal society, and the gender roles and expectations for Thai men and women differ accordingly. Despite the fact that many Thai men in the past had households with many wives, polygamy is no longer socially or legally acceptable. Mutual monogamy as well as emotional commitment constitute today's ideal marriage. Traditionally, men and women in Thai society depend on each other for the fulfillment of both religious and secular goals, as well as their needs for love and passion. Despite such reciprocal needs, the existence of power differential is clear, and it may have been affirmed by the gender hierarchy sanctioned by Theravada Buddhism. Passion, courtship, romance, and love between men and women are glorified, and the love-inspired sentiments in Thai literature and music can rival the jubilation and pathos in any other culture.

Nonetheless, an uneasy tension between the genders is evident in the way Thai men and women view one another, especially in the areas of intimacy, trust, and sexuality. A double standard for men and women still exists in the practices of premarital and extramarital sex. Manliness, or *chai chaatrii*, has become increasingly associated with various vices, especially the search for sexual gratification. A man is encouraged to seek sexual pleasure as recreation, and sex with commercial sex workers represents an acceptable and "responsible" behavior to fulfill the sexual desires of single and married men. On the other hand, the dichotomous stereotype of the good-woman/bad-woman exists: a "good" woman, personified in the image of a *kulasatrii*, is expected to be a virgin when she marries and to remain monogamous with her husband; otherwise she is categorized as "bad." Men and women are socialized to maintain distance from the opposite gender. Newer generations of Thai people are finding that the clear-cut traditional gender constructions can no longer explain their evolving, amorphous forms of gender relations.

In the traditional household, Thai women have always excelled at their mother-nurturer role. Outside the household context, women have made tremendous contributions, especially in the areas of the arts, business, and academia. Women are still a long way from achieving equal recognition in the political and religious hierarchies. Today, Thai women struggle with modern realities in the workforce while simultaneously striving toward the positive, if difficult, ideal of a *kulasatrii*.

Another area that has received recent attention is male and female homosexual behaviors. Same-gender sexual behavior was traditionally recognized as associated with the gender-nonconformity among the *kathoei*, who were seen as a "third gender." Indigenously, the *kathoei* were relatively tolerated and often held some special social roles in the community. Previously an undiscussed topic, the Thai vocabulary managed without a word for homosexuality by using a euphemism such as "trees in the same forest" until the past few decades. More recently, the words "gay" and

"lesbian" have been adopted from English, illustrating the search for vocabularies to represent types of homosexualities, which had existed without labels. Homophobia, stereotypes, and misconceptions about homosexuality are common, especially among the middle class who have learned antiquated Western psychiatric theories. On the other hand, gay businesses and the sex industry have grown to significant visibility. Meanwhile, a few advocate groups have emerged to advance their agenda and formulate new social identities for gays and lesbians in Thailand.

Sexological research in Thailand is at an exciting stage. Prompted by the HIV/AIDS epidemic and the controversies regarding the commercial sex industry, large amounts of data have been collected on sexual behaviors and attitudes. Descriptive studies on sexual practices and norms have offered valuable insights into the sexuality of Thai people, although much more data are needed, especially in certain areas not directly associated with public health (e.g., abortion, rape, and incest). Still in its infancy stage, sex therapies and counseling in Thailand are starting to adopt Western psychology, and the providers could learn much more from further research to help customize their services to fit the unique features of the Thai sexuality. Care must be taken when Western models or assumptions are applied to Thai sexual phenomena. Characterized by interwoven traditions over centuries, the people of Thailand defy such simplification, as their constructions of gender and sexuality continue on an evolving course that is as mystifying as it is enlightening.

## *Demographics and a Brief Historical Perspective*

HAMDULLAH AYDIN and ZEYNEP GÜLÇAT

### A. Demographics

Turkey is located at the intersection of two continents, with the small region of Thrace and the ancient city of Istanbul in Europe, and the larger part of the country, Anatolia, in Asia Minor. Turkey is twice the size of the state of California,

with an area of 301,380 square miles (780,580 km<sup>2</sup>). Anatolia (Asia Minor or Asiatic Turkey) is surrounded by the Black Sea, the Aegean Sea, and the Mediterranean. An inland sea, the Marmara, separates Anatolia from Thrace to the northwest. Turkey has 4,470 miles (7,200 km) of coastline. Rectangular in shape, Turkey stretches 972 miles (1,565 km) east to west, and 404 miles (650 km) north to south. Its neighbors are Greece and Bulgaria to the west, Georgia and Armenia on the northeast, Nakhitchevan and Iran to the east, and Iraq and Syria on the south. Central Anatolia and the eastern regions are typically hot and dry during the summer and cold and rainy during winter. The coastline along the north, west, and south of Turkey has a milder climate throughout the year.

Turkey's agricultural production is, on the whole, self-sufficient, while the natural resources, although rich, are not fully utilized at present. A radical transition toward industrial development has occurred in Turkey's economy, which was mainly based on agriculture in the past. State intervention in the economy has gradually diminished since the 1980s, and at present, the economy relies on free market rules. Turkey possesses a wealth of historical sites with rich potential for summer as well as winter tourism. Many ancient cultures of Anatolia, including the Mesopotamian, Sumerian, and Hittite, constitute Turkey's basic cultural heritage. An Islamic culture is woven into this background.

In 2000, Turkey had an estimated population of 67.8 million (State Institute of Statistics, SIS). [Update 2002: In July 2002, the estimated population was 67.3 million [WFB]. (Data were provided by the authors from Turkish sources; the editors added some alternate data given in parentheses with WFB in brackets from *The World Factbook 2002* (CIA 2002).)

**[Age Distribution and Sex Ratios:** 0-14 years: 30.9% (27.8% with 1.04 male(s) per female sex ratio [WFB]); 15-64 years: 63.4% (65.9% with 1.03 male(s) per female [WFB]); 65 years and over: 5.7% (6.3% with 0.85 male(s) per female [WFB]); Total population sex ratio: 1.02 male(s) to 1 female [WFB]. More than half of Turkey's population are under age 24.

**[Life Expectancy at Birth:** Total Population: 71.52 years [WFB]; male: 70.8 (69.15 [WFB]) years; female: 75.9 (74.01 [WFB]) years

**[Urban/Rural Distribution:** 71% to 29% [WFB]. Ankara, the capital of Turkey, with 2.8 million people, is in the center of Anatolia. Turkey's largest city, Istanbul, has a

population of 9.5 million. Located in the northwest, along the shores of the Bosphorus River, the point where East and West meet, Istanbul and its environs are the most densely populated, urbanized, and developed part of the country. The city is a center of trade, large and small-scale industry, as well as a center of arts and historical places.

**[Ethnic Distribution [WFB est.]:** Turkish: 80%; Kurdish: 20%. The authors wish to emphasize that there are a number of ethnic groups in Turkey, but their percentage in the population is not known. The same is true for religion (below): Their percentage in the population is not known also. The Turkish State is based on secularity and nationality. Each person who holds a Turkish identity card is considered as a Turkish citizen, no matter which ethnic origin he or she is from or which religious belief he or she holds.

**[Religious Distribution [WFB est.]:** Muslim: 99.8% (mostly Sunni); other: 0.2% (Christian and Jewish)

**[Birth Rate:** 20.9 births per 1,000 population and declining; (17.95 [WFB])

**[Death Rate:** 5.27 per 1,000 population; (5.95 [WFB])

**[Infant Mortality Rate:** 35.8 deaths per 1,000 live births; (45.77 [WFB])

**[Net Migration Rate:** 0 migrant(s) per 1,000 [WFB]

**[Total Fertility Rate:** 2.5 children born per woman; (2.12 [WFB]); *Mean Family Size:* 4.75 people

**[Population Growth Rate:** 1.57%; (1.24% [WFB])

**[HIV/AIDS (1999 est. [WFB]):** *Adult prevalence:* 0.01%; *Persons living with HIV/AIDS:* NA; *Deaths:* NA. (For additional details from www.UNAIDS.org, see Section 10B.)

**[Literacy Rate (defined as those age 15 and over who can read and write):** 82% (85%; *male:* 94%, *female:* 77% [WFB]); 95% attendance for free and compulsory school between ages 6 and 14

**[Per Capita Gross Domestic Product (purchasing power parity):** \$6,700 (2001 est. [WFB]) (1997 government est.); *Inflation:* 69%; *Unemployment:* 10.6% plus underemployment of 5.6%; *Living below the poverty line:* NA [WFB]. (*End of update by Robert T. Francoeur*) After consecutive economic crises that Turkey faced during the last few years, per capita income dropped to about \$3,000 in early 2002. Following the elections and the establishment of the new government in late 2002, per capita GDP has shown an inclination to increase.

Turkey, like many countries, has experienced a huge population shift in the past 50 years. The percentage of the population living in cities had doubled in 35 years, from 25% in 1950 to 53% in 1985. In 2000, it was nearly 70%. Istanbul is one of the most densely populated cities in Europe, with 9.5 million inhabitants. Ankara, the capital, has 2.8 million. This dramatic population shift can almost entirely be attributed to the massive departure of people from the rural areas of central, eastern, and southeastern regions of Anatolia. The population shift facilitated changes in the family structure from the patriarchal to the nuclear model. The rapid transformation and urbanization also created difficulties in religious, moral, and sociocultural adaptation. Housing problems in urban areas induced migrants into building shanty houses called *gecekondu* ("built overnight") in the vicinity of big cities. These *gecekondu* are lacking in municipal services and facilities. As a result, a whole new subculture has emerged with its own lifestyle, bringing with it many social and economic problems. *Gecekondu* families are employed in small-scale or marginal jobs. Although they have now become permanent and essential factors in the urban economy, they are not yet fully integrated into the urban culture because of their low education levels, limited income, and cultural differences reflecting both "tradition" and "modernity."

Another important social phenomenon has been the out-migration of labor from the rural parts of Turkey to the countries of Western Europe, beginning in the early 1960s. It is estimated that two to three million Turkish workers currently reside in Western European countries. The so-called "second generation" born in these countries are subject to identity problems. They call themselves "European Turks," while they are labeled as *Almançılar* (Germans) in Turkey. A considerable number of workers have migrated back to Turkey in the last decade, bringing back Western values, which probably have affected male and female roles, as well as relations between men and women. The response to this process depends on many factors, including environmental support, family background, and individual characteristics. It remains to be seen how this out-migration and back-migration will affect the overall sexual attitudes and behavior in Turkey.

Thus, as Kağıtçıbaşı (1982a) has noted, Turkish society presents a highly complex, heterogeneous picture, with diverse backgrounds differentiating along social class, rural-urban, and regional development dimensions. From the historical point of view, various cultural influences, which include the nomadic-Turkish, ancient Anatolian, Islamic-Middle Eastern, Mediterranean, and contemporary Western attitudes and values have shaped and are still shaping Turkish society today.

## B. A Brief Historical Perspective

The ancient inhabitants of present-day Turkey were among the world's first agriculturalists. The Hittite, an Indo-European people, created an empire in central Anatolia over 4,000 years ago and controlled much of what is modern-day Turkey for a thousand years. Phrygian and Lydian cultures also flourished in Anatolia. The rise of Greek civilization, with city-states like Troy on the coast of Anatolia and expansion of the Assyrian Empire led to the collapse of the Hittite about 900 B.C.E.

In the early centuries, among the ancient Turkish tribes in central Asia, both sexes were considered as equals, where men and women took equal share of responsibility in affairs of the country, although there had been a dominance of patriarchal or matriarchal families in different Turkish tribes throughout history. Records of ancient Turkish families revealed that monogamy was the basic model, although some tribes were polygynous. Also, in some tribes, marital union became valid only after the birth of the first child (Tezcan 1998). There are also records indicating that there was an annual tradition of freedom in terms of social and sexual interaction, which could be an ancient model of some contemporary carnivals or Mardi Gras in the West.

In the 6th century B.C.E., Anatolia, except for some city-states on the Aegean coast, was incorporated into the Persian Empire. Alexander the Great conquered the area, but it returned to Persian rule when his empire collapsed around 300 B.C.E. By the end of the 1st century of the Common Era, Thrace and Anatolia were incorporated into the Roman Empire. Constantine the Great founded the city of Constantinople on the site of ancient Byzantium in 330 as the Empire's eastern capital. Following the decline of the Roman Empire in the west, Constantinople became the capital of the independent Eastern Roman (Byzantine) Empire in the 7th century and retained this role for a thousand years. Repeated attacks by Islamic forces were fought off in the 7th and 8th centuries, but the empire lost control of central Anatolia to the Seljuk Turks. The 13th-century Mongol invasions left Anatolia mainly untouched, but they weakened both Byzantine and Seljuk power. In 1453, the Byzantine Empire fell to the Ottoman Turks, led by Fatih Sultan Mehmet (the Conqueror). The Ottomans established a vast empire that lasted until the end of World War I.

After embracing the Muslim religion, the social life of Turkish women became restricted and they lost most of the rights of their ancestors. In the six centuries of Islamic influence and Ottoman control prior to the 20th century, discrimination between the sexes grew and women were forced to live as a separate group. The harem life was introduced and in the 15th century, the palace of the sultan was divided into *Harem* (women's section) and *Selamlık* (men's section). Soon, harem life and polygyny became customary throughout the state. According to the Islamic family laws adopted by the Ottomans, women could not choose their husband, marriages were arranged by the older members of the family. A woman was not supposed to be seen by her husband before or during the marriage ceremony, and could easily be divorced by her husband, who alone could decide to do so.

Towards the end of the 19th century, with the penetration of Western ideas into Ottoman society, women were allowed some education, and their status began to improve. Turkey's Independence War under the leadership of Mustafa Kemal Atatürk resulted in the fall of the sultanate and abolishment of the religious authority and spiritual leadership of the caliphate. Thus, the religiously based system of the Ottoman Empire was ended. The Turkish Republic was declared in 1923 and a sudden break was made with old values and concepts. Secularism, Statism, Nationalism, Reformism, Populism, and Republicanism were declared as the ideologies of the new state. Turkish civil law was accepted in 1926, triggering a wave of rapid change in social life throughout the country. Polygyny was ended and religious marriages were rendered legally (but not always socially) invalid. Women gained equal rights with men, including the rights of inheritance, divorce, and owning property. In 1934, Turkey was among the first nations to give women the political rights to vote and hold elected office. At the beginning, however, these radical changes could not be assimilated equally in all parts of the country. Thus, for example, polygyny can still be seen today in the less-developed regions of Turkey, though it is rare. Many uneducated women are still not aware of their civil rights. Also, for many women, legal rights may have little practical value if social and economic pressures do not allow them to use these rights.

In summary, with the declaration of the Turkish Republic and the adoption of Western values and lifestyle in the first quarter of the 20th century, a sudden break has occurred in the community. Such an abrupt change affected concepts and experiences in sexuality in contradictory ways in the community, which had a rich and complex background. While liberating women and mitigating segregation between male and female roles, it has, at the same time, created gaps between generations and social structures that were, and still are, in the process of integration.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

#### *The Effects of Social Change*

At the beginning of the 20th century, a movement against Ottoman marriage customs concerned with the plight of Turkish women began. The protesters were mostly upper and middle-class men who were allowed by Islamic rules to marry up to four wives, supplemented by concubines, repudiate them at will, and exercise strict control over their mobility outside the household. These protesters were against arranged marriages; they desired educated wives with whom they could have intellectual, as well as emotional communication, and a social life where the sexes could mingle freely (Kandiyoti 1995).

In this period, the Turkish nationalist movement also introduced new elements into the debate between Western ide-

ologies and Islam. The ideologues of the Turkish nationalism asserted that ancient Turkish customs in Central Asia involved total equality between conjugal partners in a monogamous and democratic family. In 1917, the Family Code was accepted, and represented the first intervention of the central state into the family, which had previously been under the control of the religious authorities. With the establishment of the Turkish Republic in 1923, a major break had taken place, and the caliphate was abolished. The new constitution was based on secularism, and measures were taken to heighten Turkey's national consciousness in place of an Islamic identification. Revolutionary changes in the new state included the romanization of the alphabet, the new dress code, and an interpretation of Turkish history stressing its pre-Islamic cultural heritage. Laws were enacted for compulsory and standard primary education throughout the country. The state and the parents of children were made responsible for the education of each child. The modern woman of the Turkish Republic experienced a kind of metamorphosis, becoming a prominent figure, dressed in the Western style in a school or military uniform, and wearing evening dresses in ballroom dances. In the male-oriented society where son-preference was the main attitude, Mustafa Kemal Atatürk, the founder of the Turkish Republic, set a new tone by adopting daughters. Highly trained professional women started working in the republican offices. However, as members of a strictly segregated society in which male honor was dependent on the behavior of their womenfolk, women could only enter the public arena by emphasizing their respectability and nonavailability as sexual objects (Kandiyoti 1995).

Initially, these changes affected only a small urban layer. The spread of schooling and health services throughout the country proceeded gradually. Marriage alliances remained firmly under the control of local communities and followed customary practices, which were now denounced as 'traditional' or even 'backward' by the enlightened technocrats of the Republic. Turkey was assumed to be moving from tradition to modernity, and the idealized model of the 'modern' nuclear family involved companionate marriage, role-sharing between spouses, and child orientation. The ideology of the modern nuclear family was a radical departure from the pressures and control of older kin characteristic of Muslim societies. However, Kağıtçıbaşı (1982b) argued that the "modern" Turkish family was not based on the autonomy of its members, which modernization theory implied, and that emotional interdependence between family members persisted. Ayata (1988) commented that tradition and modernity are being lived concretely in Turkish households as a literal "split" between the styles of consumption, formal dress, and conduct displayed in the guest room, and those adopted in the intimate inner space of the rest of the house, which is a place of informality and closeness.

Social change is almost an everyday matter for people in Turkey. Technological innovation and a new monetary economic base for agriculture, land fragmentation and shifts in income distribution, the growth of industry, cultural diffusion, education, and the mass media have all helped precipitate this social change, along with internal and international migration. This unceasing mobility has caused people to change and adopt themselves into a more "modern" lifestyle in terms of contemporary paradigms and technology. As a result of this adaptation process, perhaps Turkish people have learned to realize their potential capabilities more rapidly. However, these changes probably could not be assimilated in the same rate/speed in all parts, resulting in a kind of splitting between layers of the Turkish society.

The Turkish State, through family legislation and the inclusion of women in the definition of full citizenship, has

brought about a decrease in the legitimacy of patriarchy. On the other hand, discriminatory practices in many areas, such as employment, education, and social welfare have not ended, and women's basic role as caretaker within the family has not changed substantially. Meanwhile, women's monetary contributions have become necessary for the survival of households leading to some conflict in the sexual division of labor within the family.

### *Family, Kinship, and Community*

In traditional Turkey, members of a whole village are often related to each other through marriages and blood relations. Thus, kinship forms the basis of social relations in the rural setting. Brothers and nephews stand together in disputes and are called upon for help, support, defense, or even revenge.

With economic change, out-migration from the village occurred and accordingly, the pattern of daily contact, mutual services, and solidarity has been weakening. Still, in times of need and crisis, family and kin are called upon for help. Whenever the husband has to leave the village for long periods to work in the city or abroad, he may leave his wife with his parents, as she is accepted as a member of her husband's core family when she marries. When this is not possible, other kin take over this function. Similarly, kinship ties are functional in shared agricultural work, constructing housing, childcare, and so on, and this function continues even in the urban *gecekondu* context.

If, as a result of migration, kinship bonds weaken, and the neighborhood assumes greater importance as a support system, because public services are still insufficient in rural areas. Thus, as family extends into kin, so kinship extends into neighborhood and community in terms of networks of bonds involving duties, responsibilities, common concerns, support, and help.

It appears that male power is more prominent in lower-class families, where males have less resources in terms of income and occupation than in the middle classes. Kuyas (1982) found that middle-class women perceive mutuality or sharing between spouses and think this is how it should be, whereas lower-class women perceive almost total male control, but again feel this is how it should be.

Despite the overwhelming prevalence of nuclear family residences, "extended" families and wider kinship ties have not decreased in importance in the city.

### *Sex Roles*

Although Turkey is in the process of rapid social change, it can safely be claimed that the general family pattern is predominantly patriarchal. While there are powerful crosscurrents acting both to reinforce and to mitigate male dominance in different contexts, the second-class status of women in the Middle East still prevails in Turkey. Clearly defined sex roles, division of labor, and separate social networks both help the women endure the status difference and yet, at the same time, serve to reinforce and perpetuate this difference. Supportive same-sex friendship/kinship networks further contribute to this separation (Kağıtçıbaşı 1982a).

The concept of honor, referring to the sexual modesty of a woman, implies that men control the sexuality of women. Honor is largely dependent on others' evaluations, and an insult to honor results in disputes, fights, or even blood feuds. The ties among the family members, kin, and community are so close that sometimes the honor of a whole village or community is affected by the honor of one man.

Özgür and Sunar (1982), who examined the problem of homicide in Turkey, attributed the high rates of homicide to a traditional system of norms that condone and require a violent response to violations of personal honor. Male homi-

cide was found to stem from more normatively approved motives, such as self-defense, property defense, or honor, whereas a greater proportion of female homicides stemmed from domestic quarrels, jealousy, and similar motives.

Within the family, young women are controlled and their status is low. The young bride, in particular, is expected to serve all adults within the patrilocal household. Once she bears a son, however, her status improves, especially when the son grows up and brings in a bride and the cycle thus repeats itself. Hence, every woman in the traditional rural society prefers a son as a child; if she does not bear one, her marriage may be threatened (Kağıtçıbaşı 1982a).

The preference for sons does not only depend on an economic basis. The son, especially the eldest one, is responsible for all women in the family, including his mother in the absence of his father. In contrast to the central role of the son in the patrilocal family, a daughter leaves the household to get married when she reaches an age to be "useful." However, Kiray (1976) noted the changing value placed on daughters, who now often replace sons as the "dependable" child.

In the traditional Turkish family, the mother's relationship to her son is intimate and affectionate, in contrast with that of the father who is authoritative and distant. In some conservative groups, the father is such an authority figure that his son cannot even talk to his own wife or show affection to his own children in the presence of his father. In fact, the mother often protects the son from the father's disciplinary acts. The mother-son relationship is generally stronger than the husband-wife relationship in the traditional family, where any public show of affection between spouses is disapproved. A man does not even talk about his wife in the company of others, and if he has to, often he uses the word "family" to mean "wife." Communication and role sharing between spouses is limited, sex roles well differentiated and non-overlapping. Males are the decision makers in the family.

### *Status of Women as Laborers and Professionals*

The effect of introducing modern technology into agriculture and the resultant economic-structural change for rural woman has been a general reduction in her workload. With farm mechanization and the monopoly of such farming by men, women's farming decreased. With the introduction of ready-made goods, such as clothing and food, women's domestic chores have also decreased. This change has been considered to have a positive effect on women's well-being, relieving them from some of their heavy burdens. However, it can also be claimed that decreased workload has alienated women from production and has stressed their reproductive role (Kağıtçıbaşı 1982a).

In some areas, with the participation of men in factory work, an opposite outcome of economic-structural change has taken place, with women again being disadvantaged, as they are completely tied down in agricultural and domestic work and do not have access to education and mobility. Most "unskilled" women in rural Turkey are engaged in the production of handicrafts, such as embroidery and carpet-making, which is also considered a part of women's duties and responsibilities for her home. Years before they marry, young girls and their mothers begin preparing *çehiz* (handmade carpets, rugs, quilts, tablecloths, and scarves), which will be needed when they establish their own homes. These handicrafts constitute a major part of the folk arts, and during the past few decades, they have become a source of income for the households because they have gained monetary value as well.

Women's work in the rural economy is often not considered "work," for it is, rather, a total lifestyle. It is not differentiated as to locality or time. Different types of work may be done in the same place and at the same time, such as food

production, housework, and childcare. Neither does it involve specialization or formal training.

Underestimation of women's work also derives from social values, which assign the provider role to men. In the idealized image of the affluent family, the woman does not have to work, an image that is especially prevalent in urban and small-town culture and that is spreading among *gecekondu* dwellers and villagers, who emulate townspeople (Kağıtçıbaşı 1982a).

Kandiyoti (1982) noted that urban Turkish women do not in any way challenge the male role. Lower-class urban women may retreat into domesticity, or if they have to work, it is considered unimportant or temporary. In the case of lower- and middle-class women, subordination is reflected in their very limited access to the outside world. In the case of professional women, husbands are still reluctant to take over roles traditionally accepted as belonging to women, such as taking care of children or sharing housework.

In rural areas, a negative relationship pertains between socioeconomic development and women's labor participation. Özbay (1982) pointed to the fact that women's labor-force participation is decreasing, though it is still high; and women's literacy is increasing, though it is still low. In urban areas, on the other hand, the substantial percentage of professional, highly educated, highly skilled women is notable in view of the low overall female education and skills in Turkey. The overall figures show that the proportion of working women has been declining in Turkey. According to the 1997 figures of the State Institute of Statistics (SIS), women's labor-force participation was 34.7% in 1990, 31.4% in 1992, and 25.2% in 1997 (Aydin 1998).

Erkut (1982) addressed the fact that, "despite the low levels of educational attainment for women in general, substantial numbers of Turkish women obtain professional degrees and practice in what are considered to be male-dominated occupations in the West." She explained that this has happened as women have been able to pursue professional careers without posing a threat to the male sex role and its privileged status. Highly educated women have had access to the support and services of other women, from the extended family and kin or from among the less advantaged, so that their professional roles have not had to hinge upon their husbands' help in carrying out their domestic chores. Men have thus enjoyed the enhanced family prestige and income provided by career women, without themselves changing their status or incurring more work. Erkut (1982) pointed out that men are the real beneficiaries of "the rise of a few women made possible by the exploitation of many." Thus, positive attitudes toward professional education of elite women exist side by side with negative attitudes toward women's universal education deriving from traditional culture.

### *Fertility and the Value of Children*

As a result of high fertility rates in the past, the population of Turkey is young. Government policy changed from a pronatalist to an antinatalist one during the 1960s, and accordingly, fertility rates started to decline.

In the village setting, the child is socialized not only in a family, but also in a kinship-community system characterized by mutual obligations. Expectations from the child, accordingly, are not only individual and familial, but communal as well. In the face-to-face interpersonal relations of the small community, everybody is a "significant other," and no one can be ignored; thus, other-directed behavior tendencies develop from childhood on.

Kağıtçıbaşı (1982b) noted that with development, and especially with education, the perceived economic value of children decreases, but their perceived psychological value

increases, at least in relative terms. When the economic value of children is high, the number of children increases, whereas when a low economic value is coupled with a high psychological value, the result is lowered fertility. Thus, the value of children forms an explanatory link, at the individual level, between the level of development and fertility rates. The economic value of children goes hand in hand with son preference, as sons are more dependable sources of economic benefits, especially in old age. This is of key importance in the sociocultural economic context, where patriarchal traditions are strong and institutional support of the elderly is lacking. The dependent, inferior status of the uneducated woman is crucial in this context. It is apparent in the widespread male decision making and the low levels of communication and role sharing between spouses. It is an inherent part of a general pattern of interdependent relationships, appearing first as dependency of the child on the parents and then as the reversal of this relationship. Socioeconomic development, and especially women's education and professionalization, are the key precipitators of change in this pattern.

The traditional Turkish way of adopting a child, which was also prevalent during the Ottoman Empire, is significant in some aspects. Wealthy traditional families usually adopt a child who is in economic or social need. Moreover, it is usually a girl, which seems to reflect the inclination to protect the weak. The child, called an *evlatlık*, is sometimes of an age when she (or he) is well aware that she is adopted and has a different status in the family. The *evlatlık* is well-cared for, is educated like other children, and is provided for, until she marries. On the other hand, she is expected to help with the housework, which constitutes her different role in the household. This traditional practice, which, partly because of economic and social changes, is on the decline, may be considered as an informal social-support system to protect the child where state supports are lacking. The *evlatlık* tradition does not exclude the more contemporary legal adoption system. Couples who wish to legally adopt a child must meet specific strict rules and usually have to wait for long periods. The couples (on the whole, those without children) usually prefer to adopt a newborn child, probably because they wish the child to think that she (or he) is their biological offspring.

Another type of adoption is seen in infertile couples in traditional Turkish communities in which one child of a relative (who is usually a brother or sister of one of the spouses) is adopted. The purpose of choosing a close relative's child seems to be related to the wish to keep the family ties together.

### **B. Sociolegal Status of Males and Females**

Today, civil marriage is generally practiced with or without an additional religious ceremony. However, the practice of religious marriage alone has not disappeared. Polygyny was prohibited in 1926 with the acceptance of the Civil Code. Nevertheless, it is still possible to see it in some regions, although it is rare and was not very common even before 1926.

According to the Constitution of the Republic of Turkey, citizens cannot be discriminated against on the basis of their gender, and all individuals have personal, inviolable, non-transferable, vested basic rights and liberties. In spite of this legal foundation for equality between the sexes, there were articles in laws that contradicted this principle. For example, according to the Civil Code, the husband was the head of the marital union and was in charge of the choice of residence. The Civil Code stated that the husband spoke for and represented the marital union; the woman only had the right to represent the union for the permanent needs of the house (Ergöçmen 1997). The latest changes in the Civil Code were made in 2001, which discarded some regulations that

held inequalities between men and women. One of the changes, for example, which was made in 1997, is the legislation concerning the wife's taking her husband's family name. Another important change involves the regulation of equal sharing between husband and wife of the property that was obtained during marriage in case of divorce.

Equality between the sexes was introduced in the legal structure through the reforms implemented following the declaration of the Republic, and opportunities were provided for effective participation of women in public life. One of the most important steps in this respect was recognizing women's right to vote and hold elected office as early as 1934. In spite of this relatively early access to participation in the political decision-making process, women in Turkey have limited political involvement in terms of representation in the Parliament.

Even though under the civil code women have inheritance rights equal to men's, in some rural areas women still get either nothing or much less than what men get, and inheritance issues are resolved informally within the family or the village. This practice is, however, on the decline and equal sharing is the rule for urban people.

On the other hand, there are two types of regulations with regard to women in the labor force. The first set of regulations prevents women from undertaking dangerous work, while the second set relates to protective measures regarding maternal activities of women.

Since the foundation of the Turkish Republic in 1923, the basic principles in education have been the universality of services and the equality of opportunities. There are also principles like coeducation and the right of all to education. Primary education, which had been five years, but was recently raised to eight years after long debates in the Parliament, is compulsory for every Turkish child, and is free in public schools. At present, debates between politicians, and in public continue as to whether compulsory education should be raised to 12 years.

Almost all boys and girls attend primary education, although the dropout rate at later stages of education is higher for girls. For instance, whereas 91% of boys and 87% of girls attended primary school in the 1994-1995 academic year, 78% of boys continued on to secondary school while only 53% of the girls continued into secondary schools. Women, thus, still lag behind men in literacy and level of education (Ergöçmen 1997).

The legal age of marriage, which had been 15 for females and 17 for males until recently, was raised to 18 for both sexes. To secure the family unit is both a part of the main Turkish traditional approach and the official policy of the state. Thus, for example, if both the husband and the wife are government employees appointed in different cities, they have the right to demand to be employed in the same town to maintain the family union. In 1989, the State Department of Family Research was established as an independent branch under the Prime Ministry to develop national policies for the maintenance and welfare of the Turkish family.

In the past, punishment for *zina* (adultery) for women constituted the husband's right to divorce her, while the woman was also sentenced to imprisonment. For men, adultery was not punished as severely. Recent regulations in the civil code abolished this inequality, and adultery is currently not considered a criminal act for either men or women.

On the other hand, adultery is severely punished by religious tradition or by some radical groups in the society. In Islam, a woman who commits the crime of adultery (which has to be witnessed by four adult Muslim males to be considered as evidence for adultery) is supposed to be stoned to death, whereas no such strict punishment exists for adulter-

ous men. Interestingly, there had been no recorded case of punishment for adultery during the whole history of the Ottoman Empire, which implies that religious rules were less harshly practiced during the Ottoman reign.

The civil law of Turkey accepts the absolute divorce of couples. Moreover, a legal separation period for the married couple is also possible before absolute divorce. Turkish divorce law has been revised as a result of changes in social life, and the new regulations of 1988 made attaining a divorce much easier. For example, at present, a three-year period of separation is sufficient to grant a divorce, even if one of the spouses disagrees.

Divorce rates showed an increase in 1988 because of the enactment of the new law, but have stabilized and remained constant during subsequent years. The most commonly cited cause of divorce is incompatibility between spouses, with willful desertion and adultery following (SIS 1995). As far as women are concerned, the causes of divorce are adultery (81.3%), intrafamilial violence (65.5%), and alcoholism (59%).

### C. General Concepts of Sexuality and Love

Reflections of the Oedipal theme can be traced in the Anatolian culture and folklore. The colloquial Turkish language and Turkish slang is full of examples of male sexual aggression toward women or threats of castration directed toward men. In rural Turkey, the custom of firing guns during the wedding ceremony, sometimes with fatal consequences, can also be regarded as an example of the Oedipal theme.

Physical contact between same-sex people is common in Turkey. It is socially acceptable for women and men to embrace, kiss, and hold hand-in-hand with same-sex friends or relatives in public. However, physical closeness and any show of affection between the sexes in public are generally not condoned even between husband and wife.

In Turkish folklore and legends (such as those of Yusuf and Züleyha, Ferhat and Şirin, Kerem and Aslı, and Leyla and Mecnun) the main theme is longing for the loved one. Love and passion, almost devoid of bodily senses and sexuality, is experienced as a search for the mystical, a way to reach God. Ancient Turkish verses, tales, and music reflect the mystical quality of love. In traditional Turkish arts, such as carpetmaking, which is usually woven by women, decorations and ornaments carry messages for the loved one.

Turkish melodrama represents the woman by her changing status in society as well as by the split in her identity. Films present prudent, poor, but highly talented women who are exploited in the patriarchal household and become very famous and rich by the help of a man who is financially and socially in a higher position. However, fame and fortune do not help her to form a stable identity; she is abused again, because she cannot attain the idealized love and security she has aspired to.

With few exceptions, Turkish media serve to accentuate traditional gender roles. İmamoğlu (1996), in her review of newspapers, noted that whether representing leftist, rightist, or liberal viewpoints in the political spectrum, Turkish newspapers share the ideology of perpetuating gender stereotypes in a subtle but consistent way. She concludes that, similar to Western newspapers, women seem to be defined in terms of their relationship to men. Women's maternal and marital roles and sex-object images are emphasized, while their femininity is defined from a male perspective.

In summary, it is not easy to reach a conclusion regarding the basic concepts of sexuality, love, and sexual attitudes of the society. Besides the media, which carry Western values into the very homes of the most isolated, reflections of many ancient cultures and civilizations can also be found alongside

Islamic, Arabic, and Persian influences. These can be traced in Turkish legends and folk tales, sharing common themes with Middle Eastern and Mediterranean cultures.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

Turkey is a secular state according to the Constitution. Although the community is predominantly Muslim, mostly Sunni, with a considerable part belonging the Alevi tradition, Turkish people are unique in their mild interpretation of Islam. A number of varieties of Islamic interpretation exist side by side, as well as non-Muslim groups. In the past decade, radical religious movements in the Middle East have found supporters in Turkey, and these fundamentalist groups had exerted pressure in favor of a return to *şeriat* (laws according to the Koran). Their political party was closed down in early 1998, their activities being against the Constitution. Another political party with a much milder religious discourse was successful in the November 2002 elections, and a new government was established. The Turkish Constitution is based on secularity, not permitting any religious ideology to control the political system.

Contemporary interpreters of the Koran believe in the equality of males and females, although some fundamentalists refrain from any other interpretation of the Koran, even mildly deviating from the original. On the other hand, the effects of Islamic tradition on many sexual behavior patterns of Turkish men and women can be discerned, except for the educated urban minority. Significant differences probably exist in the sexual attitudes or behavior of people from rural and urban areas. In terms of sexual behavior, Turkey manifests a very complex picture, as the Turkish cultural mosaic is made up of many different value systems. There are insufficient data to support a conclusion. As Tekeli (1995) said, along with ancient Turkish traditions and Islamic influences, elements of secular Western culture, atheistic socialism, and various regional cultures interact with each other to create an extremely rich and complex whole. This mix gives Turkish citizens their distinctive, more liberal characteristic.

Early in the Ottoman reign, the presence of two witnesses who testified to the decision of the woman and the man (or their representatives) was a sufficient condition to form a marital bond. Marriages were not officially recorded until the establishment of the Turkish Republic. The marital union was basically a contract between two partners. Thus, no official approval was considered necessary. Later, this ceremony took place in the presence of an *imam*, a religious leader, and this practice was called *imam nikahi*, a religious marriage.

On the other hand, the religious marital union could easily be broken if the husband alone so desired. This marital arrangement rested on the absolute fidelity of the woman, while permitting the man sexual freedom. The woman could not divorce her husband and marry again under any circumstance, except when her husband divorced her. The most she could do was to leave home if her husband brought in a new wife.

According to Islamic rules, a man can marry again as soon as he divorces his wife, whereas a woman has to wait for at least three months if she wishes to marry another because of possible pregnancy from former husband. However, if the man divorces his wife more than twice, he cannot marry her again; an exception arises if the woman marries another man and is divorced by him. This is called *hülle*, and has, in a way, a protective function for women. In modern Turkey, which generally interprets Islam in a very

mild manner, it is not seen. A kind of Islamic marriage contract called *mut'a*, which is valid for a short period of time or under certain conditions, is also very rare in Turkey, although in some fundamentalist religious groups, it is sometimes resorted to, presumably with the purpose of justifying sexual involvement.

*Mehir* (a kind of dowry), which involves paying an amount to the bride's parents, has been known from ancient times, probably originating in the process of transition to the patriarchal social order, when women began to be regarded as commodities with a price that could be paid for. Starting with the early years of Islam, it took the form of a payment made directly to the woman for her security. Thus, while the woman was withdrawn from social life and productivity, some means of security was provided for her. This practice, which could be regarded as "progressive" centuries ago, is maintained today as a tradition. Today, in rural areas mostly, it prevails as *başlık* (brideprice or dowry), an amount of money paid by the groom or his family to the girl's parents. *Başlık* is an indication of social and economic power for both sides. This practice is declining with urbanization and nuclearization of the family.

Another practice, although rare, seen in Turkey, as in many other predominantly Islamic countries, is polygamous marriages. Only 1.6% of all married women are or once were, in religion-based polygynous marriages according to a nationwide survey in 1988 (HIPS 1989a). Thus, it is obvious that polygynous marriages are not widespread. However, there are some variations by rural/urban, geographical, socioeconomic, and sociocultural characteristics. For example, polygynous marriages are more widespread in the east, in rural areas, and among those who have no education.

Contemporary authorities of Islam in Turkey do not regard polygamy as a valid norm of religion in modern times, and most approve only of monogamy. In spite of this, again, most men and women prefer a religious ceremony in addition to the official marriage, as it is accepted rather as a declaration of the marital union before God and society. On the other hand, while religious marriages are socially recognized, they have no legal standing. Surveys imply that the prevalence of such marriages is of a sizable magnitude. Among all marital unions in Turkey, 8.3% are based only on religious ceremonies, whereas 80.5% of the officially married couples have chosen to have both a civil and a religious ceremony (HIPS 1989b). Since marital unions based only on religious ceremonies are not legally recognized, the partners are deprived of their institutional rights within the family, such as inheritance, or parental rights on the education of their children. Whereas 4% of urban women live in religious unions, three times as many do so in rural areas.

More legendary than real, in Islam, a man who intended to marry was supposed to present the bride with the amount of gold which equaled her body weight. Thus, heavier women were more precious in the past, when religious marriages were the only form of marital union. A man could marry four wives, but had to treat them all equally.

### B. Character of Ethnic Values

The family, as a valued social system, has always been important for Turkish people. According to the traditions of ancient Turkish states, such as Hun Turks and Göktürks, which served to keep the family secure and united, men would marry their stepmother or their brother's wife if their husbands died.

Since the acceptance of Islam, religious and ethnic factors have become so mingled with each other through the centuries, that it is not always possible to distinguish their separate effects on sexual attitudes and behavior. Although

a variety of ethnic groups exist in Turkey, they are not recognized by the state, which accepts each person as a Turkish citizen, regardless of ethnicity. Statistical data are not available for these groups as separate entities.

If the agrarian society and its values are taken as the core society or as a reference point, modifications in outlooks and ways of life can probably be better understood: The family system in the small agricultural community is generally assumed to be patriarchal with close kin and family relations. On the other hand, surveys have shown that the majority of families are nuclear and probably have always been.

Kağıtçıbaşı (1982a) noted that the extended family has been an ideal, especially in rural areas, which involves expectations of living in old age with the adult son's family and being supported by him. Underlying this ideal is, on the one hand, economic necessity, mainly, lack of institutional support or other means of old-age security, resulting in dependence on children and a consequently high value put on children's loyalty to the parents and the family. On the other hand, idealization of the extended family is partly the continuation of a tradition or a sign of longing for the past, as well as a sort of status aspiration. In the past, generally, rural patriarchal extended families have been the rich families, which could afford to keep all the family members under the same roof, as they had large land holdings to live on. Consequently, in the eyes of the poor peasant, the extended family has been identified with wealth, thus symbolizing an ideal.

According to Kağıtçıbaşı (1982a), the dynamic nature of the family underwent modifications in the face of changing socioeconomic conditions in Turkey. A typical pattern of change through the lifecycle of the rural family involves, first, the newly married couple living with the husband's parents (the patriarchal extended family) as a valued pattern, and, because of economic necessities, moving out as the young man gains more income and autonomy (the nuclear family), and then later on, the aged parent(s) moving in again for protection in old age (the transient extended family).

Even when conjugal families live in separate households, the functions of an extended family are served by them, in that they are called upon to provide material support when needed, forming what might be called the "functionally extended family." Thus, close family ties extending into kinship relations serve an important function of security in times of crises and conflicts, which are often faced by the families undergoing change in both the rural and the marginal urban context (Kağıtçıbaşı 1982a).

The spatial proximity of the separate family and kin households, even in the cities, symbolizes and may even strengthen the close mutual bonds of family and kin. Mutual support within the family is the rule. Thus, for example, older brothers are expected to finance younger siblings' education and be available for assistance for their parents in old age. Family relations are mostly patriarchal, with men having authority over their wives and children. Young brides in rural areas often have to live within their husband's family, which can cause many interpersonal and role problems between her and the in-laws. This "extended family" holds, at least, three generations in the same household, with grandparents having authority over the family income and childcare. After the bride gives birth to a child, particularly if it is a son, she ascends to a higher status in the family.

Endogamous marriage—marriage within one's own religious, ethnic, or kinship group—which is still commonly practiced in some regions, has various social functions, such as maintaining local cohesiveness, control over land, and protection of the family from "strangers." Twenty-one percent of marriages were found to be consanguineous. It increases to 31% in the east and decreases to 13% in western Turkey. Edu-

cational level of women seems to be an important determinant. The percentage of consanguineous marriages drops with women's increased education (HIPS 1989b).

Marriage in the rural context appears to assume more of a social than an individual or conjugal character, as a means of maintaining economic and social ties. It is especially instrumental in strengthening existing kinship relations or extending them outside the village to similar ethnic groups or in forming neighborhood and territorial ties, and in increasing the number of relatives and friends who are potential sources of aid. Thus, arranged marriages are common in rural parts of Turkey and not rare in small towns or even cities.

Related to the social function of marriage, a tradition called *kız isteme* ("asking for" the girl) involves asking the girl's parents' permission for her to marry. The elderly, respectable members of the boy's family pay a visit to ask for the permission of her parents to *kız alma* ("taking" the girl). In other words, they ask for the permission of the girl's family for the young couple to get married. The girl and the boy may or may not know each other; may not even have met each other before the visit. That is, they themselves may have decided to get married, or the marriage may be arranged by their parents, in which case the girl is usually "selected" by the boy's mother or other female kin for her beauty, her wealth, her parents' social status, or other qualities valued by the community. The boy's parents should bring special presents for the *kız isteme* occasion, such as flowers and sweets, which may also show variations according to regional custom. *Kız isteme* has been modified throughout the modernization process and may vary in different socioeconomic subcultures. In transitional families, for example, who mostly live in small towns and *gecekondu* areas, parents bargain on the household needs of the young couple. Sometimes the process may take months until the families agree.

Abduction and elopement still exist in the peasant culture, although not condoned. Only 1.3% of marriages in 1989 involved elopement. The responses to such action range from tolerance to strong disapproval and even vengeance and strife between the families involved. It is also seen as a breach of the proper standards for formal marriage and the financial contract, namely, the dowry.

Weddings are important in the social life of Turkish people. Mothers, especially in the traditional context, prepare themselves and their daughters or sons for their wedding ceremony, and their marriage in general, almost before the child is born! During the marriage ceremony, relatives bring the newlyweds presents, such as household needs, or jewelry and gold, if wealthy. These presents are accepted to belong to the woman and constitute a kind of security for her. If, later, it has to be exchanged for money, her husband is obliged to ask her permission. Valuable presents given during the engagement period are to be returned if the engagement is broken.

In arranged marriages, the man is not supposed to see the bride until the wedding night. After the wedding ceremonies, the husband presents his wife a gold coin as a gift in exchange for seeing her in person. This is called *yüz görümlülüğü* (a "price" for seeing the bride's face).

Another traditional practice, the dowry, has functions such as the economic gains it brings to the family in exchange for the loss of labor of the girl, or, providing security for the wife if her husband dies. However, if the man is unable to pay the dowry, abduction may provide a solution. Another function of the dowry is providing support for the wife in case of divorce; yet divorce is quite rare in rural Turkey, as it is not condoned and is resorted to only under extreme conditions. Since endogamy is more prevalent in rural Turkey, or, at least because people are tied in close kinship bonds with patriarchal, authoritarian relations, individual acts such

as divorce are limited. One socially acceptable reason for divorce may be evidence, or even suspicions, about fidelity.

Some personal and social conditions, such as infertility or failure to give birth to a son, may lead the man to another marital union. In this case, he usually does not leave his first wife if she does not intend to divorce him. He behaves as a responsible husband for both women.

In summary, it can be said that, although some groups organize their life according to Islam, it cannot be generalized to the whole community. Ancient Turkish influences and Anatolian civilizations constitute the main background, while Islamic and Western effects are woven into this pattern. Traditional institutions, such as marriage and kinship relations, serve both individual and social functions. Such “ceremonial” patterns help people perceive themselves both as individuals and as a part of the Turkish community.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

The Turkish State, as well as the “elite” or “intellectual” men and women in Turkey have always been concerned about “sexual education in the society” since the establishment of the Turkish Republic. What they did, for example, was to translate the Western classics into the Turkish language and, thereby, in a subtle and indirect way, introduce the Turkish society to Western ideologies, among which is the more “liberal” approach to sexuality. Along this line of thought, Mustafa Kemal Atatürk founded the first music school in the 1920s in Ankara, which gave education in Western classical music and instruments, and which later became the first conservatory of music in modern Turkey.

At present, sexual education is formally or informally given on different levels, depending on the age, education, socioeconomic status, and the needs of groups. One example of the more “formal” efforts for sexual education is the “parenting” schools, which were started about a decade ago. Also, about 15 years ago, the Turkish Family Planning Association organized a workshop on sexual education and therapeutic intervention in sexual disorders in Ankara for professionals such as urologists, psychiatrists, and clinical psychologists working in the area.

During the last 20 years, sexual education has been a topic of debate in professional circles in Turkey. Previously, even in medical schools, sexual education was limited to courses on the anatomy and physiology of the sexual organs. Recently, in medical schools and in some psychology undergraduate and graduate programs, human sexuality, sexual functions, and dysfunction have become a part of the curriculum.

In the past, in elementary education and high schools, there were no formal sexual education programs. In primary education, biology courses included information only about reproduction in various life forms, including humans. While it remains to be decided on which level sexual education programs should be given, a preliminary “trial” sexual education program in some chosen primary schools was started nearly five years ago. The “trial” program mainly consists of basic information about the anatomy and physiology of both sexes, including information about intra-uterine development and childbirth. The courses are taught by trained lecturers to girls and boys separately, who can ask questions and discuss the topics during lessons.

In a study on the sexual attitudes of adolescents by Başgöl (1997), 12- to 15-year-old students reported that sexual education should be included in the curriculum. In another study, which included 13,000 female high school students, it was found that 75% had some information on

sexuality, including contraceptive methods and sexually transmitted diseases, although, on the whole, the level of sexual knowledge was limited in this group (Vicdan 1993).

In the 1999-2000 academic year, a project for ‘sexual education’ in primary and secondary schools was put into practice by the Ministry of National Education. The program covers topics such as physical growth, development, and maturation, male and female reproductive systems, adolescence, sexuality and sexual identity, contraception, and sexually transmitted diseases (Millî Eğitim Bakanlığı 2000). Attempts to integrate sexual education programs into primary education continue, and although still not a formal part of the curricula, are given on a “trial” basis in some schools in 2003.

To summarize, as a state policy, attempts have started to integrate sexual education into formal school curricula, and Turkish students, on the whole, seem to be emotionally ready and willing to receive such education. On another line of sexual education, a number of nongovernmental organizations, among which is the Family Planning Association and various other associations, provide educational programs on family planning and contraceptive methods in rural and *gecekondu* areas.

#### B. Informal Sources of Sexual Knowledge

A conservative and “reserved” attitude in discussing sexual matters with children is apparent in Turkish families. Moreover, parents may not possess the knowledge about how and what kind of information or experience they should share with their children. On the other hand, some parents with little or no formal education probably lack even the basic information in sexuality. Thus, most teens in Turkey obtain information about sex and sexuality from popular publications, or share experiences and information with each other. For some, fear and anxiety about sexuality stemming from tales about, for example, “the first night” experience, prevail, and some girls expect great pain or to have excessive bleeding during intercourse. Many young boys, and even men worry about the size of their sexual organ or their performance, or whether they will be able to “satisfy” their partner.

Various studies indicate that the main sources of sexual information are peers and publications for adolescents. A study by Ekşi (1982) revealed that for 15%, the source of sexual knowledge was the family, for 35% peers, for 20% the media, for 8% the school, and for 12% other sources. One quarter of adolescents reported that they had no information about sexual matters before puberty. Negative feelings toward changes in puberty were much more prominent in girls. On the other hand, 7% of college students reported that the most important problem for them was sex and sexuality, among various psychosocial problems. In another study, adolescents’ same-sex peer group was found to be the main source of information about sexuality, followed by the mother for girls and the father for boys. Within same-sex peer groups, sex was a frequent subject of talk among friends. Younger members learned about sex in these intimate groups. The media was again another important source of sexual information for both male and female students (Başgöl 1997).

In rural communities, the elders traditionally supply the adolescents with information about sexuality. Adolescents also learned by watching the copulation of animals, before popular magazines, TV programs, video films, and, recently, DVD became a part of most households, even in isolated rural communities.

From the religious point of view, parents are responsible to provide information for their children. Every adolescent is personally responsible for his (or her) own thoughts and behavior regarding religion, and on reaching puberty, is

obliged to follow Islamic rules as a proper Muslim, performing the rituals of Islamic belief. One of the rituals is called *abdest*, which involves bathing parts of the body in a predetermined order before praying and after any type of sexual activity, whether intentional or spontaneous. Parents have to teach their children to *take abdest* whenever they have a "wet dream." This is called *şeytan aldatması* (deception or misleading of the devil). Parents' traditional approach to pubertal or prepubertal children, which is also apart of religious education, has been carried over generations throughout centuries in history. On the biological basis, it implies that a "wet dream" or nocturnal ejaculation is not provoked by erotic stimuli alone, and sexual content in dreams may occur without any experience or information about sexuality.

Another religion-based attitude is the responsibility of elder family members to provide sexual information to the bride and the groom before marriage. The *sağdıç* (best man) talks to the groom, giving information before the wedding, while the *yenge* (chaperon), a female family member, informs the bride about sexual issues.

In summary, while there are no clear state policies to regulate formal sexual education, in rural communities at least, the traditional Turkish family system supplies some information about sex and sexuality to children and adolescents.

#### 4. Autoerotic Behaviors and Patterns

A large-scale survey on autoerotic activity in Turkey does not exist. Studies in student populations showed that, for 50%, the main sexual activity was masturbation (Çok et al. 1998). In Erkmen et al.'s (1990) study, 11.5% of female and 87.2% of male university students reported to have masturbated, while 21.0% of females and 26.0% of males reported that they considered masturbation as "unhealthy." Similarly, Ekşi (1990) reported that, male students regarded masturbation as "distressing," particularly if fathers were less educated. Taken together, these studies imply that while autoerotic activity is not rare among adolescents and young adults in Turkey, it is, nevertheless, a source of distress. Even among the highly educated, masturbation is not always regarded as an acceptable sexual outlet.

Clinical observations and self-report studies with sexually dysfunctional patients in Turkey show that masturbation is more commonly reported by males, while sexual fantasies and autoerotic activities are rarely reported by Turkish females. However, these observations rest on clinical samples and may not reflect patterns of sexual behavior in the "normal" population. Attempts to study sexual attitudes and behavior of the Turkish population are hindered by reluctance in responding to questionnaires, and so on, because sexuality is considered as a taboo by the larger part of the community.

Regarding religion and its practice, masturbation is regarded as a kind of "sin" by many Muslims. Although there appears to be no written rule in the Koran that prohibits it, most people who refrain from autoerotic activities believe that such behavior is sinful.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children

According to Islam, puberty is a stage when a child is ready to take on some adult responsibilities. As a part of this, while adolescent girls are expected to behave and dress as mature women, every male child should be circumcised before he reaches puberty. In the traditional context, *sünnet* (circumcision) is usually performed by a *sünnetçi*, always a male, trained and experienced in circumcision, but without a medical degree. During the operation, which usually takes place at home, the *kirve* (a close friend or relative, always a

male) holds the child, apparently to soothe him if he is scared, and the *sünnetçi* conducts the operation, usually without anesthesia if performed in the traditional way.

Great importance is attached to the *sünnet* ritual traditionally. The ceremony involved in *sünnet* is called *düğün* (wedding), carrying the implication that it is regarded as a step toward manhood. A special feast is prepared, and the child is dressed in a white gown and a cap adorned with decorations. Following the *sünnet*, he is laid down with prayers in a decorated bed, and guests bring in presents while being offered food and sherbet.

*Sünnet* is a religious rule, although many people believe that it is also a requirement for healthy sexuality, both in the medical and functional sense. Because of this, if the child is born in a hospital, many parents now prefer *sünnet* to take place in the hospital setting.

Although circumcision is an obligation for males according to the Islamic rules, it is also seen in many pre-Islamic cultures and religious practices. The age of circumcision in Islam varies from birth to adolescence, while Turkish boys are mostly circumcised between 3 and 6 years (Öztürk 1963). As is well known, this period is regarded as a critical stage in psychosexual development, and circumcision at this age might be risky for later development. Öztürk (1963), who studied this phenomenon in Turkish males, found no evidence to support the hypothesis that circumcision at an early age (or during the phallic stage) might have a negative effect later.

#### B. Adolescents

The primary and secondary sexual characteristics of Turkish boys develop at roughly the same age as Europeans, whereas the rate of physical development for girls is closer to the Mediterranean region, where puberty begins at an earlier age. Along with the development of secondary sex characteristics, menarche and first nocturnal ejaculation are accepted as an indication to begin sexual education in the traditional sense.

During the Ottoman Empire, private teachers educated young girls in special subjects, such as music, literature, and the arts, while boys attended public schools, which also provided religious education. After the establishment of the Turkish Republic, a revolutionary project in the educational system was put into practice, and during the 1960s, sexual segregation in schools was totally abolished.

Studies indicate that, about half of unmarried male college students report having experienced sexual intercourse, whereas the percentage drops to between 4% to 19% for college girls (Çok et al. 1998; Ekşi 1990). This big difference probably reflects males' experiences with prostitutes. Overall, 66.2% of male and 8.5% of female university students reported premarital sexual intercourse (Erkmen et al. 1990).

#### C. Adults

##### Marriage

About 92% of Turkish citizens marry to establish a family. In rural communities, the age of marriage is quite low, although it is expected that a young man complete military service before he can support a family, or indeed, to be regarded as a "man." For urban men and women, because of longer time spent in education, the age of marriage is higher.

Marriages are highly concentrated in the 15 to 24 years for females, and 20 to 29 years for males. Medical screening is obligatory for men and women before marriage, according to the law enacted in 1930. As a preventive measure, the aim was to recognize and cure those with contagious diseases. The law was passed in the period between the two World Wars, when serious economic and social problems

had to be overcome. At that time, one of the main concerns of the newly established Turkish Republic was to prevent epidemics of tuberculosis, syphilis, malaria, and others.

In the social sphere, *hamams* (Turkish baths) had been a major locus of social interaction until modern facilities supplied hot water to houses. There were, and still are, separate sections or days for men and women in *hamams*. Children of both sexes are accepted into the women's section. In the past, women went to *hamams* with their female friends and kin and spent long hours bathing, chatting, gossiping, singing, dancing, and sharing the food they prepared for this occasion. Older women looked for young girls whom they could choose as wives for their sons. And, there used to be tales about young girls getting pregnant in baths while sitting on the marble seats, presumably from men who sat in the same place to take a bath during men's hours!

*Hamams* are still a social factor in traditional Turkish life. They are still popular for some sections of the community, especially for the lower socioeconomic groups in cities, or in small towns with no hot water supplies in houses. Interestingly, *hamams* are also popular in the high society in Turkey, probably as an eccentric activity, universally common for people with very high income.

#### *Weddings, Virginity, Potency, and Childbirth*

Traditional wedding ceremonies in Anatolia last for four to seven days. The ceremony starts with music, played on local instruments. A flag is hung over the groom's house as an announcement of the wedding, and guests are accepted. Men and women entertain themselves separately until the *gerdek* (first night of the wedding). Some traditional activities common during the ceremonies are: *hamam* (Turkish bath), lasting for hours during which food is served, and *kına gecesi* ("henna night"), during which the hands of the bride and groom are colored with henna. Guests sing and dance and are served food and drinks. On the wedding day proper, a group of men and women take the bride from her home. She rides on horseback to the groom's house with the crowd, while everyone is singing and dancing. When the bride enters the house, coins (or gold, if wealthy) are spread over her. The groom's friends punch him before the newlyweds are left by themselves, representing rejection as a bachelor. The ceremonies end with prayers.

As a symbol of passing from virginity to womanhood, a lock of the bride's hair is cut on the day after the wedding. Magical practices, such as holding a mirror to the bride's face, and spilling water as the bride leaves her home, are believed to facilitate the her "adaptation" to marriage.

Virginity is still a treasured value for women in most parts of Turkey. Even educated young people who flirt reserve sexual intercourse until wedding. In traditional regions, parents or older members of the family wait outside the couples' room, to see whether intercourse has taken place. Traditionally, a blood stain on the bed sheet caused by the perforation of the hymen should be displayed to the waiting family, and is taken as proof of chastity on the part of the woman, as well as the honor of the man who has successfully performed the sexual act. Psychiatrists or gynecologists sometimes observe that it is a source of great pressure on the couple. The bride is expected to have no sexual experience, and, for many young men also, the first night of marriage is the first time he experiences intercourse. There are many cases of erection or intromission difficulties (i.e., erectile dysfunction and vaginismus) that can be attributed to the embarrassing and stressful events on the wedding night, plus, a general lack of sexual knowledge. Tragic consequences may ensue if the bride is not a virgin, or, if it is a case of a penetrable hymen often mistaken for previous loss

of virginity. However, it is not unheard of that the newlyweds show their families red paint or some other blood to escape the embarrassment.

Sexual potency and fertility have been important aspects of sexual identity of the Turkish male throughout history. Thus, methods to enhance potency and fertility, such as *kuvvet macunu* (herbal pastes) and potions were invented, and selected food recommended. Pastes and potions are still prepared today and handed out freely in some regions on special feasts. The preparations may take days, and large amounts of herbs are boiled in huge pots during the festivals. These annual ceremonies are local organizations, led by townsmen dressed in traditional costumes. As a part of the ceremonies, *kuvvet macunu* are handed out with prayers. They are believed to protect the user from diseases, make him sexually potent, and promote the health of children born that year.

After childbirth, the *lohusa* period is the 40 days during which it is believed that both the mother and the child require special care. The mother is usually confined to bed in the first ten days. A special bed, adorned with ornaments is prepared for her. She puts on her best traditional dress and jewelry, accepting guests in her bed during the first ten days. She is fed with sweets and dishes believed to make her physically stronger and to "increase her milk." Guests bring presents such as gold coins or clothes for the child. Prayers are said and guests are offered *lohusa şerbeti* (a special sweet sherbet). After the ten-day period, if her health permits, she gets up, but does not leave the house. She is helped by her female kin for her personal and the child's care, and for her responsibilities in the house. In the *lohusa* period, the woman is restricted in her sexual activities also.

#### *Divorce and Widowhood*

The crude divorce rate of Turkey, less than one in 1,000 marriages per year, is low, compared to divorce rates in many other countries. Reasons for this could be the strong religious and family ties, and the traditional nature of Turkish society. However, it should be noted that official figures do not reflect the divorces among religious marriages. (See also earlier comments about divorce in Section 2B, Religious and Ethnic Factors Affecting Sexuality, Character of Ethnic Values).

In Turkey, 49% of all divorces occur in the first five years of marriage, and 45% occur in childless couples, an indication that children help to keep the continuity of marriages (SIS 1995). In other words, not having children may be considered as a social implication and probably a reason for divorce.

Levine (1982), who investigated the nature of divorce in Turkey, considered divorce as a "barometer of social change," "a struggle against conservatism," and "an act of female emancipation." Reviewing national divorce statistics, he noted that divorce is associated more with urbanism and urban occupations, with a higher level of development, with changing women's roles, with developed agriculture rather than with full-scale industry, and with being barely literate (especially among women). Thus, it is the people "caught in the middle of economic and structural change" who are most vulnerable to divorce, as they are subject to the most stress. In effect, the urban poor who are dislocated and economically vulnerable are more likely to get divorced. Levine views the patriarchal family as a hindrance to individual autonomy and initiative, in which the needs of the family hold primacy over those of individual members. In these families, divorce can be seen as a liberating act, although it brings with it serious problems of readjustment, especially for the woman, in a society which does not condone it.

By tradition, in the east and in southeast Turkey especially, if the husband died, it used to be the duty of one of his

brothers to marry the widow. This was functional in providing security for the woman and her children, but is very rare at present.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Children and Adolescents

Case histories of psychiatric patients sometimes reveal homoerotic activity during childhood, although systematic research in Turkey for this period is not available. On the other hand, a number of retrospective self-report studies with late adolescent male homosexuals and transsexuals imply that, in both groups, the first sexual experience occurs at an early age. Most transsexuals and about one third of homosexuals reported that they had their first sexual experience before age 12 (Gülçat et al. 1988; İnci 1993), which appears to be quite early compared to the general population. These studies also showed that sexual intercourse was mostly initiated by the subjects themselves, that is, without being forced, which seems particularly to be the case for transsexuals. Most homosexuals and transsexuals came from families with more than three children, had pathological relations with parents, and traumatic childhood experiences, such as the loss of one or both parents, or physical and/or sexual abuse.

Based on the MMPI results of subjects in the 20- to 25-year-old age group, Battal et al. (1989) argued that transsexuals were characterized by the existence of early infantile conflicts and fixations, while homosexuals showed pathological resolutions for identification processes. Comparing homosexuals and transsexuals, İnci (1993) found that self-esteem and self-image of homosexuals were lower than that of transsexuals in the late adolescent group. Anxiety, depression, and oversensitivity were also characteristic of homosexuals, while suicide attempts seemed to be common in both groups.

### B. Adults

#### *Same Sex Behavior Versus Homosexual Identity*

Turkish males who play the "active" role in homosexual relations are not socially regarded as homosexuals in the Turkish culture. The active homosexual role is more likely to be assumed as a variety of sexuality experienced by a heterosexual male. That is, homosexuality is rather restricted in meaning, and covers almost exclusively effeminacy and the "passive" homosexual role. This attitude is even apparent in some legal and official practices of establishments like the armed forces. Homosexuals are not accepted in the army, and if such acts are witnessed during the military service, which is compulsory for every Turkish male citizen, the effeminate, passive partner is sent for medical evaluation, and discharged from the army if diagnosed.

Little is known about lesbians in the present-day Turkey. Legends about females who lived and fought like brigands are still told, without their sexual orientation being directly mentioned or alluded to. It can be claimed that there is no observable negative attitude in the society as far as lesbianism is concerned.

## 7. Gender Diversity and Transgender Issues

Sex-reassignment operations are occasionally performed in Turkey. In recent years, debates centering on ethical issues about the incompleteness of medical and/or psychological evaluation processes took place in the media. It is legally accepted that transsexuals obtain an identity in accordance with their acquired sex; they can change their name with a court order and they can officially marry.

It can be claimed that there is a double standard concerning attitudes toward male homosexuals and transsexuals in Turkey. On the one hand, they are alienated, ridiculed, and even persecuted by the society in general, and by the police, as they are regarded as a threat to social values. On the other hand, they are also condoned, especially those in the show business, who usually publicly claim that "God had willed them to be" as they are. Although very rare, female-to-male sex-reassignment operations are performed in Turkey.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Child Sexual Abuse and Incest*

Statistical data about child sexual abuse is almost nonexistent in Turkey. During the last decade, several initiatives were started to prevent child sexual abuse with the support of international organizations. Several associations, such as Çocuk İhmal ve İstismarını Önleme Derneği (The Association for the Prevention of Child Neglect and Abuse), were founded to help abused children and to conduct studies (TC Hükümeti ve UNICEF 1991).

Although no statistical data are available, child sexual abuse does not seem to be rare in Turkey. Occasional news in the media indicate that child sexual abuse, including incest, occurs. However, such acts are not condoned, and child molesters, whether homosexual or heterosexual, are strongly disapproved of in the community. Indeed, prisoners convicted of such acts are alienated or even killed by other prisoners. For this reason, child molesters are usually kept in separate cells.

Among cases of child abuse, sexual abuse seems to be the most frequent type. It is estimated that child sexual abuse is involved in approximately 50% of all kinds of child abuse, including unreported and unregistered cases. According to forensic medical records, 350 to 400 cases of child sexual abuse are documented each year. These figures are not conclusive though, because Turkish society is sensitive in sexual matters, and a considerable proportion of cases may not even come to the attention of legal authorities, because families are concerned about the protection of children and the honor of the family from publicity. On the other hand, because scandalous news sells, the media may also be exaggerating the news and figures to increase their sales (Kozcu 1991).

Child sexual abuse rehabilitation services have been established in a number of university and state hospitals in Turkey. Victims of abuse are generally referred to these centers by legal authorities.

Although incest is defined in all cultures, the boundaries of definition may vary. The Turkish culture does not consider sexual relations and marriage between, for instance, cousins, as incestuous. Thus, it is not uncommon for daughters and sons of brothers and sisters to marry. In fact, arranged marriages, especially in the eastern parts of Turkey, are often preferred, if it also serves to keep the unity of land and power.

#### *Other Unconventional Sexual Outlets*

There are no recorded cases, although it is claimed that males occasionally use animals (such as sheep) for sexual outlets in rural areas. Especially in isolated villages, where acceptable sexual outlets for unmarried adolescents are lacking, intercourse with animals should probably not be viewed as perversion.

### B. Prostitution

Commercial sex is legal in Turkey, and registered prostitutes are under periodic medical control. Illegal prostitution also exists, which stems mostly from immigrants from

neighboring countries. Many unregistered prostitutes constitute a threat for public health, because they are not subject to routine medical checkups. Because of this, in metropolitan areas, STD appears to spread rapidly.

Prostitutes may be playing a special role for adolescent males in their first sexual intercourse. An older male kin may facilitate the adolescent's first experience by offering to take the boy to a prostitute, who is usually informed beforehand.

### C. Pornography and Erotica

Many publications on sexuality can be found in bookstores and newsstands. A number of popular magazines publish articles on sexuality frequently, which mostly focus on enhancing sexual satisfaction. Serious publications on sexuality, including an encyclopedia and books on sexuality for children and adolescents, are available in many bookstores.

Although there is no strict control over them, pornographic publications are not distributed freely in Turkey. Selling and purchasing them under the age of 18 is illegal. In one 1990 study by Erkmen et al., 26% of women and 48% of men reported that pornographic material should be freely published. On the other hand, many organizations have campaigns against pornography, with the aim of protecting children and moral values.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

The shift from a pronatalist to an antinatalist policy during the 1960s influenced contraceptive use by the introduction of modern methods to the public. In the early 1960s, only one fifth of Turkish women used some method of contraception. Traditional methods were more common then. The Family Planning Project was implemented by the end of the 1960s. The proportion of users was 38% in 1978, increased to 51% in 1983, and to 64% in 1988. By 1988, modern methods accounted for almost half of all contraceptive use, which shows significant changes in contraceptive methods (Hancioğlu 1997). In general, Turkish women believe that lactation prevents pregnancy, and many breastfeed their children.

Almost all women (99.1%) between 15 and 49 have some idea about contraceptive methods, and 62.6% currently use some method of contraception. The most common is the IUD (18.8%), followed by condoms (6.6%) and contraceptive pills (4.9%). Regional differences in terms of contraceptive use are very high. In the east, 42% use a contraceptive, whereas in the west, the proportion is 72% (HIPS 1989a).

Among the reasons of *not* using contraceptives, the most common one is health concerns related to the method. Other reasons are husbands' opposition, lack of knowledge, difficulty in availability, and religious beliefs (HIPS 1989a).

The preferred method of contraception for Turkish males seems to be withdrawal. More than one quarter of sexually active males report using the withdrawal method, while 6.6% use condoms and 1.0% refrain from intercourse during the ovulation period (HIPS 1989a).

There is a strong positive correlation between education and the use of modern contraceptives such as the pill, the diaphragm, and IUDs. In urban areas, the main source of obtaining IUDs is doctors in private practice, whereas in rural parts, women obtain IUDs from Health Centers (HIPS 1989a).

The majority of college students claim that they would refrain from unsafe sexual activities that might expose them to AIDS, and most are willing to use condoms during sex (Çok et al. 2001). The media has played an important role in campaigns for condom use in the prevention of HIV/AIDS, which has also promoted indirectly their usefulness as a contraceptive.

There are also some interesting traditional methods of contraception in Turkey. These include swallowing herbal preparations made from local plants or vegetable skins, and homemade or readymade materials, such as soap inserted into the vagina. There is also a local belief that if the woman is able to pass a kitten over the saddle of a horse while riding, she will be protected from pregnancy!

### B. Teenage (Unmarried) Pregnancies

In 1995, the State Department of Social Services started a project for teenage mothers. Although statistical data are not yet available, unmarried teenage pregnancies are probably quite rare in Turkey. Since pregnancy out of wedlock is traumatic for both parties involved, if it occurs, the incident is probably covered up. Generally, these cases are not referred to state hospitals, where the signed consent of a parent is required before any medical measure is taken. Those who can afford to do so seek abortion in some private offices. In small towns or villages, where the risk of scandal is high, or where private services are not available, traditional methods of abortion are resorted to. On the other hand, pregnancy in the married adolescent presents a more common problem for Turkey, because the age of marriage is quite low, especially in rural areas. In 1991-1992, 4% of all pregnancies were to teenagers. These pregnancies are usually unplanned, and antenatal followup is lacking. Risks of pregnancy increase with low education and with younger age of the mother where symptoms may not be understood and spontaneous abortions may occur. However, if the pregnant adolescent is living in the traditional household with the family, there is a good chance that she will be well cared for, even if medical care may not be sought.

### C. Abortion

Until 1983, induced abortion in Turkey was prohibited except for eugenic reasons or when the woman's life was threatened by pregnancy. In May 1983, the law on population planning was liberalized to provide abortion in a legal and safe manner. At present, women may obtain an abortion on request up to the 10th week of pregnancy for medical or social reasons.

In 1988, 23.6% of all pregnancies were terminated by induced abortion, 8.2% by spontaneous miscarriages, and 1% by stillbirths (HIPS 1989b). The number of abortions induced for legal and medical indications was 15,571, while there were 49,655 abortions for unspecified causes, with 121 deaths in 1995.

Traditional methods of abortion, such as pushing sticks or long feathers into the uterus are probably still occasionally resorted to in rural areas. To induce abortion, some women take herbal preparations, such as boiled onions or aspirin, to trigger bleeding in the uterus. Carrying heavy loads or heavy massage on the lower back are some other traditional methods to induce abortion.

### D. Population Programs

Following the loss of males during the War of Independence (1918-1924), a shortage of manpower and a high mortality rate led the State toward a pronatalist policy to promote population growth until the mid 1960s. As a part of this policy, the government provided financial support for each child. During the late 1950s, public opinion began to change, and the adverse effects of rapid population growth were gradually accepted. An antinatalist population planning law was enacted in 1965, legalizing contraception and promoting avoidance of unwanted pregnancies by public education.

Illegal abortion under unhealthy conditions was a cause behind high maternal mortality rates until 1983. The population planning law was revised, and abortions up to the

10th week of pregnancy and voluntary surgical contraception were legalized, while midwives were permitted to insert IUDs (Hancıoğlu 1997). In 1996, mother and child health and family planning centers throughout Turkey were increased to 274, while the number of units giving exclusively family planning services was 532.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Among STDs, syphilis is one that is compulsory to be reported to the Ministry of Health. Because of its high incidence, a concentrated syphilis control program was started in 1925, and was carried out in the regions where it was widespread. The medical staff included control committees composed of a bacteriologist as a laboratory director, medical specialists, and specially trained health personnel.

Statistical data about syphilis cases are reported by the health control committees in the provincial directorates and by venereal disease dispensaries in certain cities. The patients are obliged to seek treatment at least once a week. The cases are recorded and sent to the Ministry of Health monthly. The registered syphilis patients were 3,841 in 2000. Out of this number, 3,416 were previously registered, 3,313 were still in the treatment program, and 443 were completely cured; 11 of these patients died (SIS 2001).

Information on syphilis and other sexually transmitted diseases was an important part of the curricula of medical schools in the past when they were widespread. Each case of syphilis has been followed up until treatment is completed. It does not constitute a major health problem now; its prevalence rate has decreased from 7.1 per 100,000 to 5.1 in the 10 years between 1987 and 1997.

### Incidence, Patterns, and Trends of STD

The Ministry of Health declared that the number of cases with gonococcal infections was 1,071 and cases of hepatitis B was 2,435 in 1996. Out of 3,267 prostitutes screened in 1997, 1,136 were infected with gonorrhea, 36 with syphilis, and 27 with hepatitis. Only a small percentage of college students reported gonorrhea (1.3%) and hepatitis B (3%), whereas none reported having a history of syphilis (Çok et al. 1998).

### Availability of Treatment and Prevention Efforts

There are 12 venereal disease dispensaries in Turkey, in addition to services for sexually transmitted diseases in most public hospitals. The Ministry of Health has organized courses and conferences, and prepared brochures and booklets for the public and professionals, in accordance with the World Health Organization for the control, prevention, and care of STD and HIV infections.

### B. HIV/AIDS

The number of diagnosed HIV/AIDS cases was 753 by the end of 1997 in a population of about 63 million in Turkey. Regarding the 1997 Turkish HIV/AIDS statistics, the Ministry of Health stated that 84.6% of HIV/AIDS cases were Turkish citizens, while 15.4% were foreigners; 9% of the HIV cases were infected by homosexual contact, 11.2% by intravenous injections, 6.4% by blood transfusions, 44.2% by heterosexual contact, 0.9% by infected mothers, and 28.3% by unknown causes.

Because of low public awareness of HIV/AIDS, the prevalence of commercial sex, the lack of educational campaigns, immigration patterns, tourism, and returning workers from Europe, HIV/AIDS is considered as a potentially serious health problem in Turkey.

Çok et al. (2000) reported that, while the majority of college students were aware of the disease, 30% stated they did not discuss HIV/AIDS with anyone. Students learned about AIDS from a variety of sources, including the media, booklets, and peers. Only a small percentage of the students obtained information from health professionals, family members, or at school. The study also revealed that Turkish students had a moderate level of knowledge about the transmission, symptoms, and prevention of HIV/AIDS. The majority believed that they were not at risk for getting AIDS or that the risk was very low. Six percent stated that AIDS did not concern them. About half of the students stated that they would avoid people with AIDS, whereas 23% were willing to open their houses to anyone with AIDS.

The figures for HIV/AIDS cases, covering a period of 10 years, are given in Table 1 (SIS 2001).

[Update 2002: UNAIDS Epidemiological Assessment: By mid 2001, a cumulative total of 1,245 cases of HIV had been reported, transmitted primarily through sexual contact and injection drug use. HIV testing is mandatory for blood donors, prostitutes, and military conscripts abroad. All diagnosed HIV infections are reported in a national HIV case-reporting system. The numbers of cases diagnosed among injection drug users are small. Universal assessment testing (UAT) surveys have been conducted in injection drug users and STD patients in Istanbul in 1992 and 1995.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49: 3,700 (rate: 0.1%)

Women ages 15-49: NA

Children ages 0-15: NA

[No estimate is available for the number of adults and children who died of AIDS during 2001.

[No estimate is available for the number of Turkish children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

Because children are socially regarded as a natural consequence of marriage in Turkey, there is a strong expectation of a child almost immediately after marriage. Indeed, most young men and women expect to have a child in a short time after they marry. In cases of unconsummated marriage, the young couple faces an additional burden in explaining to others the reasons for not having a child. Thus, the majority of these couples seek sex therapy to make conception possible.

In childless couples, the blame is usually attributed to the wife. In such cases, couples often seek help from traditional healers who supply the couple with charms, prayers or sacred objects as a remedy for infertility or sexual dysfunction. Visits to *türbe* (tombs of holy persons) are another traditional way to deal with various social and health problems, especially for women. During the *türbe* visit, the usual practice is to pray for the spirit of the holy person, and to ask for his or her help. Sometimes pieces of rags or col-

**Table 1**  
Cases of HIV/AIDS in Turkey, 1991-2000

	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Total	38	64	74	86	91	119	143	109	119	158
Cases	17	28	29	34	34	37	38	29	28	46
Carriers	21	36	45	52	57	82	105	80	91	112

ored strings are tied to the branches of trees around the *türbe* or just left over the tombs. While unmarried women may pray for husbands, childless women pray for a child.

Sexual dysfunction is most commonly perceived as a failure of men in Turkish society. Sex therapists usually have difficulty in getting in contact with wives, even as a part of therapy. It is considered socially inappropriate for a woman to have a sexual problem, because she is not even expected to desire sex. On the other hand, sometimes men resist participating in sex therapy if they think the problem belongs exclusively to the wife.

Various magical practices are still met in some parts of Turkey, as a remedy for almost each problem a person can face, among which are sexual problems, childbearing, or infertility. One such practice is a vow or a promise to God that if the woman can give birth to a son, his hair shall not be cut, he will be dressed as a girl, and sacrifices made each year until his 7th birthday (Soylu et al. 1997).

Traditionally, sexual dysfunction and infertility, along with many other health problems and diseases, have been explained by folkloric beliefs, some of them based in Islam, and others apparently unrelated to religion. There are still many people who believe that erectile dysfunction, vaginismus, or lack of sexual desire are consequences of evil forces, such as *büyü*, or magical procedures conducted by those who mean to destroy the happiness of the couple. In other cases, the supposed cause is the *nazar*, or the evil eye, or the *djins*, spirits described in the Koran, which sometimes reveal themselves to human beings. One example of such a *djin* is *alkarısı*, a witch-woman who visits those who have just given birth to a child. *Alkarısı* is believed to inflict a disease called *albasması*, characterized by the woman seeing everything in red, turning hot, getting cramps, and choking.

If the cause of the sexual dysfunction or infertility is attributed to magical forces, treatment is usually sought from traditional healers called *hoca*, *medyum*, *falci*, and so on, rather than medical doctors. Although prohibited by law, such paramedical healers provide their clients with preventive or curative measures, such as charms, prayers, and specific rituals. Doctors or psychologists have observed that many young couples with sexual problems, while claiming that they do not believe in supernatural phenomena, were pressed to seek a solution from traditional healers.

A study of patients at a primary healthcare unit revealed that one in 13 patients had a symptom of sexual dysfunction during the previous month, and one in 20 had a sexual dysfunction sometime in the past. Lack of sexual desire was the most prevalent symptom, occurring in 3.9% of all patients (Sağduyu et al. 1997).

In a survey by Sağduyu et al. (1997), which included patients in the 15- to 65-year age group referred to a primary healthcare unit, 32.1% refused to participate in a study related to sexuality, 11.8% reported having no sexual experiences, while 92.8% of males and 54.0% of females valued sexuality positively. Negative feelings about sexuality were prominent in the older age group. Among patients with sexual dysfunction, 25% of females and 5% of males suffered from lack of sexual desire.

Kayır (1990) reported that among women with sexual dysfunction, vaginismus was diagnosed in 52%, low sexual desire in 25%, anorgasmia in 15%, and painful intercourse (dyspareunia) in 2%. Among male sexual dysfunction patients, 48% experienced erectile dysfunction, 20% had premature ejaculation, 5% had low sexual desire, and 2% experienced inhibited ejaculation, while 22% had more than one sexual dysfunction. Özkan (1981) reported similar findings in a psychiatric population, with 49% of male patients having erectile dysfunction. He found that 52.9% complained

of premature ejaculation, whereas 35.5% of female psychiatric patients complained of dyspareunia, 53.3% of vaginismus, 66.6% of anorgasmia, 60% of lack of sexual arousal, and 84.4% of low sexual desire.

The figures and clinical observations imply that vaginismus is seen relatively frequently in Turkey, compared to Western countries. Five to 10% of patients with sexual dysfunction suffer from vaginismus. Many of these can be traced back to lack of sexual education and conservative attitudes, which, in turn, lead women to see sexual intercourse as an activity to be feared and avoided. During the evaluation process, it is observed that the majority of sexually dysfunctional couples' problems are initially related to mild or moderate vaginismus-like complaints, which, on further interview, turn out not to be true vaginismus cases. Rather, the vaginismus-like symptoms are the result of the wife consciously or otherwise taking over the sexual problem (or, in other words, she assumes the blame for her husband's lack of desire or erectile problem). Thus, the problem becomes more complicated, where tactful and original approaches on the part of the therapist may be needed.

## B. Availability of Diagnosis and Treatment

Centers for sexual dysfunction in university-associated hospitals have been established in Turkey during the past 20 years. In these units, patients are fully screened upon admission. The screening covers psychological and physical examinations. Methods such as Doppler ultrasonography and endocrinologic and neurologic examinations are available in most centers. In some sexual dysfunction units, more-detailed examinations, such as neuropsychological and neuropsychological evaluations, and nocturnal penile tumescence (NPT) can be made if necessary.

Kayır (1995) argued that the improvement in diagnostic and therapeutic services has encouraged people with sexual dysfunction to refer to centers, while perhaps also leading to the idea that each sexual problem is an illness that can be treated by doctors.

Treatment is available according to the etiology of the sexual problem and the specific needs of the patient. The first step in therapy consists of providing basic information about sex and sexuality if the therapist decides that the couple lacks sexual knowledge. The information may range from basic anatomy and physiology of male and female sex organs, to the concept of marriage and marital relationship, according to the needs of the couple. Sometimes, especially with couples who come from low sociocultural backgrounds, this approach proves to be sufficient in solving the problem and no further therapy may be needed.

Couples therapy, based on Masters and Johnson's techniques, is the main approach if both partners are willing to attend therapy sessions, whether the etiology is psychological and/or organic. Group therapies for men and women with similar sexual problems are also available in some centers. In spite of the availability of a variety of therapy techniques, traditional values may sometimes hinder persons with sexual problems from taking part in therapeutic attempts to solve problems that prevail in the sexual area.

Many couples who seek treatment for their sexual problem are not highly motivated for sex therapy, because they expect the therapist to almost magically "cure" the problem by a simple intervention, such as by prescribing a drug (Sungur 1998).

Generally, professional help is not sought when the couple is first faced with a sexual problem, especially if it is a case of female sexual dysfunction. The typical Turkish couple at first communicates the problem to their families and tries to tackle the problem within the family's own re-

sources, such as by taking the advice of the more experienced members, or to seek solutions with the help of traditional healers. In some cases, suggestions, reassurance, and parapsychological approaches work and the presenting problem is solved. In many cases, as expected, the difficulties persist and the marital relationship is threatened. The couple and families begin to split and blame each other. Usually, it is only then that the couple is referred for sex therapy. The delay and the introduction of other variables, such as the couple's blaming attitude and the families' concern, and even intrusion are factors which make the therapeutic process more difficult and complicated. The sexual problem of the couple can easily become a problem of the whole family, including the parents, siblings, and even relatives, which places an additional burden on patients and therapists. When incomplete sexual knowledge, erroneous expectations, lack of sexual experience, fears, and false beliefs are added to the picture, therapists are faced with multifaceted problems which they have to deal with, even though the couple is initially referred with a sexual dysfunction problem. Thus, the therapy proceeds on several levels at the same time, which may range from a teaching process to marital counseling and even to an insight-oriented approach. Thus, as Sungur (1994) has pointed out, formal training in sex therapy in Turkey is not sufficient for sex therapists, who must also have experience in handling marital problems, as well as giving special attention to cultural factors which may necessitate modifications in treatment programs.

In some cases with organic etiology, a psychotherapeutic approach is also utilized to help the adaptation of the patients before or after organic interventions. Penile prosthesis is the most common method for male organic sexual dysfunction. A penile revascularization operation is made for some patients.

Sildenafil (Viagra) became very popular in Turkey as soon as it was marketed. It was approved by the Ministry of Health and became available in the market in May 1999. Although strict regulations on the prescription were imposed in the beginning, these were shortly changed, and specialists, such as urologists, cardiologists, psychiatrists, and endocrinologists can now freely prescribe the medication.

## 12. Sex Research and Advanced Professional Education

Two main lines of sexual research can be delineated in Turkey: The first consists of surveys in the student population which mainly cover sexual attitudes, knowledge, and experience. Some of these studies have been reviewed elsewhere in this chapter. The second sexual research area is the clinical population, mainly, those who are referred with sexual problems. A series of studies have focused on psychological factors involved in sexual dysfunction: Işıklı (1993) found that sexually dysfunctional couples' problems in the relationship accumulated around emotions, cognition, and communications.

Bozkurt (1996) found that patients with psychogenic erectile problems were significantly more anxious and depressed when compared to organic patients. In the psychogenic impotence group, who were referred to the Psychiatry Clinic of Gülhane Military Medical Academy, 19.4% had mood disorders, 5.6% had anxiety disorders, and 22.2% had mixed mood and anxiety disorders. In the organically impotent group, no pathology in the mood and anxiety disorders spectrum was found.

The MMPI profiles of psychogenic erectile dysfunctional subjects had more similarity with neurotics than with normal controls. The personality characteristics of the psy-

chogenic groups, revealed by the MMPI, suggested that, while there was no problem with the sexual role, depressive tendencies with difficulty in implementing activities, and an inclination to introversion could be expected (Aydin 1991).

Özgen et al.'s (1993) study indicated that organic causes more commonly underlie sexual dysfunction in the older age group, whereas psychological factors predominated in younger patients. If a dysfunction appeared in one area of sexuality, it tended to spread to other areas, causing problems in experiencing sexuality. As a result, it was claimed that the person's perception of and being in the sexual sphere were distorted.

Beyond clinical samples, in a recent population survey on the prevalence of erectile dysfunction, in a sample comprised of 1982 males, 64.3% who were over 40 years of age reported some degree of erectile dysfunction (35.7% minimal; 23% moderate; and 5.6% complete). The prevalence of erectile dysfunction increased with age, with diabetes, and with cardiovascular and prostatic disease (Akkuş et al. 1999). Gülçat (1995) found that 30% of nonclinical male subjects had some kind of mild to moderate degrees of problems related to sexual functioning. While these findings are in accordance with surveys in Western countries, it also implies the need for further studies in the area of sexuality and sexual problems in Turkey.

Advanced education in sexual dysfunction, evaluation methods, and treatment have been offered in some University Hospitals for nearly 20 years. There has been a growing interest and data accumulation in studies on sexuality in the last two decades. Since 1988, congresses and symposia are organized on issues in sexual dysfunction and treatment. The main aim has been to adopt a multidisciplinary approach in which psychiatrists, psychologists, urologists, and gynecologists work together in the assessment and treatment of sexual disorders. In late 1999, the Sexual Education, Treatment, and Research Association was founded to integrate the studies of various disciplines, prepare educational programs for the layman as well as for professionals, conduct research, and set ethical standards in the patient-therapist relationship.

The Turkish Family Planning Association, located at 73/1, Ataç-2 Sokak, 06420 Kocatepe, Ankara, Turkey, is the main organization dealing with sexuality issues, family planning, and sexual health. The website of the association is [www.ada.net.tr/tapd](http://www.ada.net.tr/tapd); email: [tapd@ada.net.tr](mailto:tapd@ada.net.tr).

### *A Final Remark—February 2003*

Social change involving modifications in social structure, attitudes, beliefs, and norms is rapidly altering the Turkish society. Shifts in the demographic composition of rural and urban areas, industrial growth, and related changes in the economy and social structure precipitate modifications in family structure, functions, and dynamics, as well as in traditional male and female roles.

Globalization is one of the most important factors that force people to reorganize their lives according to modern and even postmodern paradigms. Turkish society has a rich cultural accumulation, which gave the chance for the majority of Turkish people to go through this shift without any serious consequences.

Thus, the Turkish panorama of sexuality reveals that traditional and modern attitudes coexist side by side, and this fact, while constituting a fertile ground for social, interpersonal, and intrapsychic conflicts, also adds to the richness of the Turkish culture.

In the global sense, it can be claimed that the traditionally "reserved" Turkish society has become more comfort-

able in personally or publicly discussing sexual matters in recent decades. It is apparent in the frequency of sexually related material that appear in the press and other media. It can also be observed by the increasing number of people with sexual problems who seek help from health professionals, which can also be related to the increasing level of knowledge and experience of the latter in dealing with such problems.

In the general frame of Turkish State policies, rapid changes toward modernization, or, in many ways, toward Westernization in social life and relations occur continuously. In this respect, during the last years, and also a part of Turkey's integration process into the European Union, some changes in the legislation in the Civil Code were enacted, which improved the regulations regarding the equality of civil rights of men and women. (The latest changes in the Civil Code were mentioned in Section 1, Basic Sexological Premises.)

In this process of modernization, or namely, Westernization, some communities, among which are ethnic groups, women's organizations, and gay unions, have been voicing their demands more freely. Various organizations of Turkish women are becoming more active in securing and 'updating' women's rights in the last decades. Gay unions now claim their right not to be treated as 'queers,' but to be accepted as "normal" or ordinary members of the society. Some ethnic and religious groups have also been more accepted by the Turkish society in general.

## *Demographics and a Brief Historical Perspective*

### A. Demographics

ROBERT T. FRANCOEUR

Located in southeastern Europe, Ukraine is bordered on the north by Belarusia, by the Russian Federation on the northeast and east, by Moldova and Romania on the southwest, and by Hungary, Poland, and the Slovak Republic on the west. It shares a Black Sea border with Turkey. Ukraine's territory is 233,090 square miles (603,700 km<sup>2</sup>),

slightly smaller than Texas, or as large as France and Denmark combined.

According to the last all-Ukrainian census (2001), Ukraine had an estimated population of 48.457 million, 53.7% females and 46.3% males. (Unless otherwise indicated by *AUC* (all-Ukrainian census), all data are from *The World Factbook 2002* (CIA 2002).)

**Age Distribution and Sex Ratios:** *0-14 years:* 16.8% with 1.04 male(s) per female (sex ratio); *AUC* (1999): *0-16 years:* 19.4%; *15-64 years:* 68.7% with 0.91 male(s) per female; *AUC* (1999): Working age: 57.2%; *65 years and over:* 14.5% with 0.5 male(s) per female; *AUC* (1999): Above working age: 23.4%; *Total population sex ratio:* 0.86 male(s) to 1 female; *AUC* (2000) *Total:* 67.9 years; *male:* 62.4 years; *female:* 73.6 years

**Life Expectancy at Birth:** *Total Population:* 66.33 years; *male:* 60.86 years; *female:* 72.06 years

**Urban/Rural Distribution:** 67.2% to 32.8%

**Ethnic Distribution:** Ukrainian: 73%; Russian: 22%; Jewish: 0.2%; other: 4%

**Religious Distribution:** Ukrainian Orthodox–Moscow Patriarchate, Ukrainian Orthodox–Kiev Patriarchate, Ukrainian Autocephalous Orthodox, Ukrainian Catholic (Uniate), Protestant, Jewish

**Birth Rate:** 9.59 births per 1,000 population; *AUC* (2001): 7.7 births per 1,000 population

**Death Rate:** 16.4 per 1,000 population; *AUC* (2001): 15.2 per 1,000 population

**Infant Mortality Rate:** 21.14 deaths per 1,000 live births; *AUC:* 10.57 during 9 months in 2002

**Net Migration Rate:** -0.42 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.32 children born per woman

**Population Growth Rate:** -0.72%; *AUC* (2001): -0.75%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.96%; *Persons living with HIV/AIDS:* 240,000; *Deaths:* 4,000. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 98% (*male:* 100%, *female:* 97%) (1989 est.); education is free and compulsory from age 7 to 15

**Per Capita Gross Domestic Product** (purchasing power parity): \$4,200 (2001 est.); *Inflation:* 12%; *Unemployment:* 3.6% officially registered, with large numbers

of unregistered and underemployed workers (November 2001); *Living below the poverty line*: 29%

## B. A Brief Historical Perspective

TAMARA HOVORUN and BORYS VORNYK

For most people, Ukraine was unknown as a country until recent times, although it has a very ancient and rich history and a highly developed national identity and culture. Its relative obscurity is because of the fact that Ukraine has been an independent free nation for only eight years in this century. Although the Ukrainians gave the world the first example of a democratic constitution and republic under the Cossacks in the 1500s and 1600s, and never waged war against any other country, they continually had to resist numerous invasions by neighboring nations. For almost 300 years prior to 1917, part or all of Ukraine was a colonial part of Czarist Russia. At the turn of the last century, Austria-Hungary controlled part of Ukraine within its empire. Ukraine was an independent nation for three years from the end of World War I in 1918 until it was taken over by the Russian Communists in 1921. Seventy years as part of the Soviet Union under Moscow followed, with independence and freedom regained with the collapse of the Soviet Union in 1991. The national flag of Ukraine has the most-peaceful colors: the upper half blue as a symbol of a cloudless sky or birth-giving water and the lower half yellow as a symbol of ripe wheat or the sun. Its modern state insignia, the Triad (*Tryzub*) can be traced back to Kyiv Rus. The interpretation of its meaning is multiseismic. Some suggest that it symbolizes the triangular unity of creation, the universe, spirit, wisdom, and will as the source of individual and national development. (For additional historical and ethnic perspectives, see Section 2A, Religious, Ethnic, and Gender Factors Affecting Sexuality, Character of Ethnic Values, below.)

### 1. Basic Sexological Premises

#### A. The Character of Gender Roles

In order to draw connections between contemporary problems and historical setting attention must be paid to the main feature in gender relationships that distinguishes Ukraine from Russia and from the other former Soviet states. This is the high status of Ukrainian women as mother, sister, and wife. Throughout history, Ukraine had not been characterized by the traditional patriarchal family structure that existed, for example, in Russia; gender roles in Ukraine contrast sharply with female dependency and submissiveness. There was no male-domination marriage relationships, and Ukrainian women held high positions in both family and community settings. This was in part because of sociocultural circumstances. Throughout the several different periods of sexual culture development in Ukraine, sex and gender behavior grew from beliefs in ancient pagan cultures that valued the feelings, sensations, desires, and pleasures of sexual intercourse. Intimacy was considered to be harmonious with nature and male-female relationships.

The origin of Ukraine, the Kyiv Rus, was governed by a highly educated woman, Queen Olga (reign 946-966), who began the country's conversion to Christianity. There are also many historical witnesses of the gender-equality norms in later times, particularly during the rule of the grand dukes of Kyiv in the 11th century. The marital agreement, for example, was based on mutual desires of both the male and the female to establish a family. Mutual respect for male and female was the norm, as well as respect for responsibilities in housekeeping and childrearing. In Ukrainian customs, tradition, mythology, and folklore, it is hard to find accounts of

either physical or mental abuse of women, or inequalities in family relationships between husband and wife.

In many Ukrainian regions, the woman selected her spouse and often initiated the marriage relationship. Later, especially during the period of the Cossack Republic during the 16th and 17th centuries, the women educated the children, organized the communities, and maintained their own organizations of social activity while men were away on military service. According to the numerous historical evidences, there was no wide gap between the observed behavior patterns of men and women. The roles of Ukrainian women and men in the family and the social continuum were mutually inclusive.

Traditional Ukrainian culture reflects no rigid stereotypical perceptions of gender roles. Though labor activities were gender-specific, neither male nor female tasks were considered superior. Similarly, the concepts of masculinity and femininity were not characterized by rigid boundaries and were mutually permeable. The self was seen as individualized and not tied to a particular gender scheme. Ukrainian folklore reflects the notion that an individual is shaped more by situational influences than by certain gender-specific predispositions. Thus, a strong woman and a sensitive man were not seen as deviant, but rather as products of specific life circumstances. Such democratic receptions on gender roles are remarkable, given the dominance of patriarchal models in many other cultural systems.

Leopold von Sacher-Masoch (1999), who got to know Galician Ukrainians in terms of identity, wrote the following:

The Polish woman wants to give orders, while the Ukrainian one wants to be free. While the Polish woman rules over her husband, the Russian one wants to submit to him, just like the German one, and the Ukrainian woman demands equality with him. At any opportunity her unrestrainable Cossack spirit goes ablaze, recognizing no master and no servant. Between the Don and the Carpathians live the natural born democrats; neither Byzantine emperor, nor the Vikings, nor any Polish king or Russian czar have broken their spirit, have suppressed their consciousness. They are always ready to trade the flow for a spear, they live in small republican communities as equal among equals; for the Eastern Slavs, they are the sprouts of the future, the sprouts of freedom.

Sadly, 300 years of Russian oppression, and especially 70 years of Soviet governance, have greatly affected family and gender development in Ukraine.

Ukraine scores on the Gender Development Index (GDI, *Ukraine Human Development Report 2002*), which measures the degree of disparities between the status of men and women, reflects an equality in the workplace that is greater than in many countries. In fact, in 1997 and 1998, the Ukrainian GDI scores were especially equal to the human development index, indicating a high level of gender equality. However, further progress in the area of gender equality is needed.

The development of gender issues in the Soviet period was characterized by a lot of contradictory tendencies. On the one hand, all women and men received equal access to education and professional activity. And this has had notable effects on the formation of gender dimensions. Thus, at the beginning of the 1940s, women held 39% of the jobs in the workplace and 53% in 1990, in comparison to 32% in Western Europe. In the public sector, women still continue to be the main labor in heavy and dangerous jobs that jeopardize their reproductive health. Women perform 45% of trade and care-providing services, constitute 82% of employed workers in public nourishment, in healthcare 81%, in public education 75%, and in culture 73%.

The ratio of women and men graduating from the university is 45% to 35%. The prevalence of women shows up in the total number of specialists with college and university degrees. Thus, women constitute 58% of engineers, 67% of physicians, 87% of economists, 89% of bookkeepers, 91% of librarians, 45% of agrarians, and 45% of scientists. Despite unprecedented rates of educational levels, the status of women in the government and politics is very low, only about 6%. There is no woman minister in contemporary Ukrainian Government. Even in those spheres of the economy, where women hold 80% to 90% of the jobs as in manufacturing, the share of women at the level of state power is about 5.1%. There are no women among the heads of regional (*oblast*) administrations and there is usually only a handful among the heads of district administrators.

The number of women in decision-making positions is very small—the Ukrainian Parliament has been traditionally dominated by men. Though women make up more than a half of Ukraine's population, they account for only 7% of the Verkhovna Rada's deputies. In Soviet times, there were institutionalized quotas at all the levels of positions—not less than 30% of administrative seats were reserved for women. Now, the inclusion of women in state power, in politics, defense, finances, and entrepreneurship affairs is not adequate to the gender ratio.

Although the Constitution of Ukraine proclaims the rights of men and women are equal, a lot of things still need to be done in order to alter the mass consciousness.

In many ways, the Ukrainian society has remained sexist because gender differences were emphasized in many spheres. It imposed separateness between women and men in traditional responsibilities for child and family care. Even in the secondary school curriculum, a course in "home servicing" is only for girls and assumed different experiences for boys and girls with wide-ranging consequences. It supported women's attachment to the family and their concern with cooking, caring, and nurturing, while autonomy and public involvement were expected of men.

Women remained socially dependent because society maintains a lot of prejudice against women occupying high positions, especially in the social structure. Only a small number of the 27% of women holding doctorates, and the 11% of women with doctorates in the sciences, have received academic grants, prestigious positions, or social recognition as politicians. Instead of the state developing support industries to lighten the burden in housekeeping, men and women engaged in an endless and fruitless discussion of which gender is/was the stronger.

Social, economic, and political inefficiency—we are still discussing whether Ukrainian society should recognize private property—has left almost no opportunities for effective problem solving, training in management skills, persistence, and competitiveness. Lack of autonomy, self-sufficiency, pursuit of self-interest, and competence have contributed very much to the demasculinization of the male population in Ukraine. Males are at greater risk healthwise than women. The mortality rate is an example, especially for those aged 35 to 39, which is more than three times higher for men than for women. Men are more likely to experience premature death. Tuberculosis and HIV infections, which are considered in Ukraine as epidemics, are mainly found estimated among men. The male suicide rate is 50% higher than that of women. Men have the highest smoking rates as well as drug and alcohol use involving criminal activity. Also contributing to men's mortality are job-transition-related stress and unhealthy lifestyles. Examples of sexism are quite obvious in the male population, when women retain custody of children and do not support men's involvement in family life.

Finally, in the society where there was a lack of responsibility and respect for personality, both genders were losing such human characteristics as being cooperative, warm, sympathetic, loving, creative, and altruistic in relationships, sensitive to others, and intelligent in communications.

Although the Constitution of Ukraine proclaims equal rights for both sexes, a lot of things still need to be done in order to overcome gender differences in social and family status for men and women. A broad media campaign is still going in order to ensure that the best things for her are still to be found in children-church-kitchen and for him to be masculine in earning money, drinking alcohol, and so on. The slogan of gender equality, which became very popular in recent years among some NGO democratic organizations, does not correspond to the social processes in the country. Ukrainian society is not yet ready to accept a woman as a parliamentarian and men as care-providers. The gender problem is not the provision of equal access for men and women to education, health protection, or economic resources, but in raising the mass consciousness on equalitarian ideas. On one hand, Ukraine needs to take measures that will give women greater equality with men in terms of political power. On the other hand, women will not be elected unless they start to conduct election campaigns for themselves.

## B. General Concepts and Constructions of Sexuality and Love

The sexuality of Ukrainians is strongly influenced by gender factors such as the high authority of women in family settings. Boys and girls in adolescence were given a great freedom in heterosexual communication, in interactions during dating nights (*vetchornytsi*), but without engaging in premarital intercourse. Even though Ukraine was a colony of Russia, there was *not* a landowner's serfdom right for the first conjugal night (*jus primae nocte*).

The Ukrainian ethnosexology has been described in marriage customs and traditions, as well as in the contents of erotic folklore—love songs, proverbs, proverbial phrases, or riddles. So-called obscene songs are widely represented in ethnology studies conducted by Ivan Franco, Pavlo Chubinsky, Phedir Vovk, Mychailo Maksymovych, and others. Ethnologic studies have uncovered in Ukrainian folklore considerable information on sexual techniques, interactions, and building the sexual relationship. They also emphasize the representation of sexuality as a harmonious part of human existence, equally esteemed by both sexes. Sexual desire is seen as a harmonic part of human life and is often paralleled to various natural phenomena.

Historical research shows that the emotional side, love and communication of the partners, plays a major part in the sexual expression of Ukrainians. Sexual behavior is considered to be natural for lovers, which in turn is based on a loving attachment and a mutual agreement as an important part of the relationship's development. In central Ukraine, the roles that males and females play in sexual relations is more equal or blessed by woman's initiative than in western parts of the country, which is more characterized by Puritanic values. Traditional Ukrainian culture is characterized by self-disclosure in intimate communication, which contributes to dating, going steady, and getting engaged.

The general trend in erotic folklore is expressed in jokes about partners making love, keeping sex alive, mutual desire in order to avoid rejection, equal roles of husband and wife interested in sex, a vulnerability of engaging in extramarital sex, men and women receiving intimate satisfaction, and keeping a sexual appetite, not only in young age, but in the older years. Ukrainian folklore emphasizes the essential role of sexuality for maintaining physical and psychological

well-being. Notably, sexuality is presented as equally important to both men and women and is often portrayed as an object of preoccupation for both sexes; women's natural clothing, emphasizing and at times revealing their physique, testifies to the value placed on sexual attraction.

During the Soviet period in Ukraine, human sexuality was a taboo subject as far as the mass media, scientific investigation, and education were concerned. After the 1920s, the only legitimate function of sexuality was reproduction. The emphasis on sex education for adults was exclusively focused on information about the reproductive systems and on social and moral control of sexual behavior. The information that was communicated in sex education focused on physiology and commitment, while avoiding discussion of values, trust, intimacy, self-awareness, and concern for others.

Society is always a kind of external support for personal development and self-conception providing values and orientation for sexual behavior. The image of sexual behavior was always negative. Sex was considered a "bad" part of one's personality that was in disharmony with the "good" part that involved strict conscious control and abstinence. This viewpoint grew out of the prevailing negative attitude toward personal freedom and intimacy, self-respect, and personal responsibility. It is apparent that the totalitarian Soviet society could not help children understand the changes of their bodies and emotions, or teach them responsible decision making. Even in the mid-1980s, when schools recognized the necessity of sex education and faced the task of informing teenagers about love and intimacy, the compulsory course in ethics and psychology of the family did not include any information about sexual activity. It was a sexless course about sexless behavior. The same situation exists in contemporary Ukrainian society in general.

Although Ukrainian society has become more permissive sexually in recent years, it still does not provide adequate values for human sexuality. With the breakdown of the Soviet regime, sexuality became one of the most important symbols of social and cultural liberation. Widespread public silence and ignorance about sex in former years has been replaced by everyday representations in commerce and movies. Television programs and filmmakers exploit sex, but still present it as a part of personality that is hardly related to the self-ideal and is quite dissonant with accepted family gender roles. Public display of the bodies of young women as available sexual objects for men, and sexual intercourse as something far from personal relationships in advertising and the mass media perpetuate the distances between men and women as social beings and between sex and the family.

Ethnicity, culture, national customs, and traditions help create models of gender behavior, develop respect for values, and develop some interpersonal skills. Sexual competence involves many personality qualities and activities that should be taught to children as they develop. Family-oriented customs and traditions that help gender-socialization processes, such as marriage, housekeeping, and parenthood, have almost been destroyed in most regions of Ukraine because of the Soviet ideal of creating a new society without ethnicity and religion. The incidence of divorce and child abuse and neglect documented in the Ukraine reflects this influence. The incidence of divorce and abuse is two-and-a-half times higher in the eastern part of the Ukraine, where traditional values were more quickly lost, than in the western regions that retained many of their traditions after they were joined to the Ukraine during the 1940s. In the west, teenage girls and boys are quite knowledgeable about housekeeping, bringing up children, and the proper treatment of relatives, because they are involved in sophisticated and living traditions that are maintained by their families.

For three generations, the Ukrainians have grown up in a system which neglected personal dignity and expressions of respect. The social system as well as family communications were mostly oriented to punishment rather than to the encouragement of self-worth. Another evidence of this distortion can be found in the language people use to address each other in public places. In the Ukraine, there are proper words for addressing a person as a sexual human being, as there are in America or other countries, such as miss, missus, lady, sir, mister, gentlemen, and so on. As a result of the Soviet imposition of the word "comrade," referring to persons who share political ideas in common, the salutations *panni* and *pan*, "respectful woman or man," were almost totally eliminated from usage. Today, Ukrainians address a person mostly by their gender identity "woman" or "girl" for females, and "man," "young man," or "guy" for males. So, the social and sexual identity of the individual oppose each other. Such greetings are mutual and cause no offense or embarrassment to anyone. The fact that most Ukrainians consider these sexual definitions of the self as a normal social greeting does not mean that it is unimportant to the sexual culture. Those Ukrainians who allow themselves to be defined by belonging to a particular sex are those who were raised with a lack of respect for individual personality.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Character of Ethnic Values

Ukrainians have developed as an ethnic group over a period of at least three to four thousand years. Scientists distinguish several periods in the development of Ukrainian religious values. At the beginning of the 20th century, scientists found the first archeological evidence of an ancient settlement and culture on the territory of Ukraine. These have been dated back to 4500 to 2000 before the Common Era and the birth of Christ. The culture was named Trypil'ska, after the name of the village Trypillja near Kyiv (Kiev) where the first signs of this ancient culture were discovered. Similarities in gender roles and behaviors between this ancient culture and elements of the modern Ukrainian culture make this discovery particularly significant. The people of the Trypil'ska culture were agricultural, living in small and large families in separate two-story buildings usually situated in circles near rivers. The largest of these ancient towns discovered recently in Dnipro region is five times larger than the well-known Babylon. The most wonderful of the remains of this civilization unearthed were ceramic figures of different women and the special places or shrines in houses where these were placed. All of the figures showed obvious evidence of a connection with religious beliefs, specifically a Mother cult and worship to the female. These figures have pronounced sexual signs and even such details as fatness and hairdos. The principal role of a woman in Trypil'ska culture was connected with a highly developed agricultural cult in which the female symbolized fertility and the Goddess Earth. It all gave a woman the right to be a priestess and a head of the family.

From the 7th to the 3rd centuries B.C.E., Indo-European Scythian tribes controlled the Ukrainian steppes.

The period from 500 to 900 C.E. is the time of the Slavic tribes and Slavic community development as a separate ethnic population. Slavic tribes began migrating from the northwest into what is now Russia in the 5th century. The division of the ancient Slavs into various tribes began in the 2nd to 4th centuries when the Goth and Huns forced them to split. In the south, they eventually formed the tribes of the Polianians, Siverianians, Derelianians, and so on. Some of these tribes

were united in Kyivan Rus by the spread of Christianity from Byzantium (Constantinople) in the 10th and 11th centuries; Volodymyr the Saint was converted in 988.

Western historians give greater importance than do Ukrainian historians to the role of Scandinavian chieftains, Norsemen or Vikings, in the 9th century. A common western view claims that the Viking Rurik founded the first Russian dynasty in 862 in Novgorod—hence the distinction between Novgorod and Kyivan Rus, and the possible origin of the term *Russian*. Ukrainian scholars trace the origin of the term *Rus* to the common root of many Ukrainian rivers, Ros', Rosavitsa, Rosava, and so on, where Slavic tribes settled. Hence, the Slavs were called Rusychi or Rusyny, and Rus is the synonym of Ukraine but not Russia. Ukrainian historians note that Rus existed long before the arrival of the Norsemen and that the word Russia referring to a nation does not occur until Peter the Great.

The Moguls overran the country in the 13th century, destroying Kyiv in 1240. Kyiv was freed from Mogul conquest after 80 years in 1320, when the Lithuanian Duke Gedimin (ca. 1275-ca. 1340) together with Rus dukes and their military troops fought the Moguls in three battles, the last and largest held by the river Irpin' near Kyiv. After that victory, the Lithuanians ruled the country with the help of Rus Dukes. In 1386, when the Lithuanian Kingdom united with Poland, Rus, according to the convention, received a separate government, which was called Het'man. As time passed, Poland extended its power over Ukraine. In addition, while the 11th-century grand dukes of Kyivan Rus held such centralized power as existed, most of the sons of the Kyivan Rurikovechi Dynasty ruled in Novgorod.

From the 13th to the 16th centuries, Kyiv was under the influence of Poland and Western Europe, with the 1500s and 1600s being the time of the Cossack Republic. In 1547, Ivan the Terrible formally proclaimed himself the first czar of the Rus, and Russia the true successor of the fallen Roman and Byzantine Empires. In 1654, Ukraine asked the czar of Muscovy for protection against Poland and signed the treaty of Pereyasav, which recognized the suzerainty of Moscow. The Cossacks under Chemelnytsky may have wanted a full defensive partnership such as now exists between Canada and the United States. Moscow, however, interpreted the treaty as an invitation to take over Kyiv. Peter the Great (1682-1725) extended Moscow's domain, and in 1721, founded the Russian Empire, which included Ukraine.

As described by Veles (Rehbinder 1993), the Slavic culture was pagan, based on the worship of the numerous gods of the Great Mother Nature. The unity of female and male substances was considered a kind of magical activity for enriching the fertility of the Earth. Even today, the Ukrainians sing some seasonal songs (*koljadky, tsedivky*), which are a kind of communication and dialogue of the individual with nature—animals, plants, sun, moon, and wind. A summer holiday of love, Kupala, has persisted from ancient times down to the present. In this ancient context, sexual intercourse was viewed as a relationship, the attachment feeling to the partner.

Nestor the Chronicler (ca. 1056-1114) supplemented and continued the primary Rus chronicles in *Povist Vremennykh Lit* (*A Tale of Bygone Years* 1990). A monk in the Kyivan Cave Monastery and the most educated man of his time, Nestor described the differences in sex and gender behavior between the tribes: "Polyany—Slavs who lived in the central regions of what is now modern Ukraine—maintain their parents' traditions, peaceful and obedient, and their marriage customs." The neighboring Derevljany "lived like animals, killed each other . . . and there was no marriage customs other than kidnapping the young women." Nestor the Chronicler

also condemned another neighboring culture, where the people "had vulgar, disgraceful words and used them in the presence of parents and women. And they did not know about marriage, but cavorted between villages. The men traveled around, playing, dancing, and singing all kinds of devil songs, stealing wives for themselves—women they found agreeable—and having two or three wives." His view was certainly colored by his perspective as a Kyivan monk. The Derevljany had killed Ihor, the husband of Queen Olga (ca. 890-969), who in turn wiped out several of their towns.

The prominent feature of the ancient Slavic psychology was love-living, life-loving, and a tenderness and joyful mood. When Nestor the Chronicler wrote about Ihor's campaign, he described the feelings of attachment and emotional involvement of the ancient Slavs. Later on, when Kyivan (Kievan) Rus reached its heyday in the reign of Grand Prince Jaroslav the Wise (1019-1054), the Church, which represented Christianity, could not eliminate this sensitive character of pagan culture. Christianity, with its cult of emotionless asceticism and abstinence, could not overcome the cheerful character of folk traditions, and either tried to adopt and incorporate some of them into religious holidays or to prohibit them altogether. Thus the Christian tradition began its long coexistence with ancient ethnic values. (See Section 1 in the chapter on Russia for further elaboration on this coexistence.)

## B. Sources and Character of Religious Values

Three quarters of the Ukrainian people are Eastern Orthodox, 13.5% Ukrainian Catholic or Uniate, 2.3% Jewish, and 8.2% Baptist, Mennonite, Protestant, and Muslim.

From the 8th century, Ukraine was also known as Rus. In 988, the rulers and people of Kyiv adopted Christianity. During the reign of Prince Oleg, Kyiv was referred to as the "mother of Rus cities," which explains the particular importance given to the development of Christianity in this region. As a result of a jurisdictional division between church and secular power, matrimonial and family cases fell within the Church's competence and domain. Legislation of the norms of matrimonial law dates from the second half of the 11th century. As recorded in the legislative code of Prince Jaroslav the Wise, and later in other books, the new legal code incorporated the centuries-old experience of eastern Slavic social life.

The Church assumed an exclusive right to register marriages and insisted on rooting out pagan traditions. For example, marriage without a religious ceremony was considered to be void. In its views of marriage and family life, the Church was guided by the norms of Christian morality. The Church sought to incorporate into the mass consciousness ideas of the sanctity and inviolability of marriage and conjugal fidelity.

Men and women who were related up to the sixth generation were forbidden to marry. In addition, children from one family could not marry the brothers or sisters in another unrelated family. These restrictions were obviously adopted from Byzantine law, but were less strictly enforced. In Kyivan Rus, men married when they were 15 years old, while women married between ages 13 and 14. The Church forbade marriage of Christians with non-Christians. Engagement usually involved mutual consent and was followed by a festive dinner. Cheese was an obligatory dish shared by the bride and groom; the ritual of cutting cheese and bread meant that agreement had been reached. A lack of virginity in either partner was not an obstacle to marriage. There was a law that proclaimed the woman-slave free if she was tempted into intercourse and gave birth to a child. In case an unmarried woman gave birth to a child, she had to

live in some church facility and was socially culpable. It was forbidden to have two spouses. Divorce was allowed only in exceptional cases and only after a court trial. A wife's adultery could be a serious reason for divorce; not so with a husband's adultery. After divorce, a husband had to pay his former wife a large financial compensation.

The Church in Kyivan Rus controlled norms of sexual behavior. First of all, it was forbidden to have any sexual relations between relatives and even relatives-in-law. Any intercourse outside the marital union was considered sinful, even when totally secret. Considerable attention was paid to any sexually deviant behavior. Thus, punishment for zoophilia was recorded in the statutes of Kyivan Rus. Child-bearing was protected, and the Church took care of pregnant women and helped them. Anyone associated with an abortion or attempted abortion was guilty of a serious crime.

Within a marriage, and in society in general, there was a moral responsibility to respect all persons, regardless of gender, in Kyivan Rus. Thus, in the *Edification to Children* by Volodymyr Monomach (1052-1125), one finds a great appreciation of the individual: "Protect widows, do not let the powerful ruin anyone. . . . Let your eyes look down but your soul aspire to height. . . . Love your wife, but don't let her control you" (1991).

The ancient and cheerful ethnic culture, coupled with moral Christian demands, helped to produce gender behavior patterns based on mutual respect of men and women, feelings of connection and attachment to each other, and the capacity to appreciate the romantic love as well as erotic sensations (Chubyns'kyj 1994). For the Ukrainian couple, intimacy was characterized by affection, consent, and long-lasting commitment. The psychology of love is widely described in Ukrainian songs, which are considered the best in the world and expressive of the national character (Shlemkevych 1992). The respect for women was so appreciated among the Ukrainians that Mirza-Avakjants wrote in 1920 that "the modern woman of every country could envy the position of Ukrainian woman in the sixteenth and seventeenth." More than a century and a half of Cossack Republic strengthened the independent women's position in family life and made this a national characteristic.

### 3. Knowledge and Education about Sexuality

The sexual health of young Ukrainians is a real problem. There is a considerable gap between young people's sexual activity and their level of sociopsychological and moral responsibility. The main problem in Ukraine is a lack of information for adolescents about sexuality, family planning, safer sex, and so on. Although several National Programs for Family Planning have been developed during the period of independence, there is still no compulsory sex education. Sexuality and related issues continue to be regarded by teachers and parents as prohibited. Only in recent years have some efforts been undertaken in order to develop sex education in a curriculum of the discipline "Healthy Education" (technically referred to as *valeology*).

The main idea is to supply all children from preschool to college with a compulsory sex education program that provides adequate knowledge of the emotional, psychological, and physical aspects of gender and sexual behavior. In addition, this program includes discussions of self-understanding, intimacy, family life, values, attitudes, orientations, and skills concerning the behavior and relationships of both genders.

Teachers, psychologists, and sexologists are collaborating in developing a program to provide information about

human sexuality, including discussions of human reproduction, pregnancy, childbirth, sexual responses, contraception, abortion, and sexually transmitted diseases. They are conscious that the most important value for children of postcommunist society is to develop the ability to understand and respect the individual. That is the reason the context of *valeology* leads children to question, "Where did I come from?" "What do I want to be?" and "Who am I?" The development of self-reflecting capacity with regard to gender and sexual behavior is emphasized at every age level.

To a large degree, sex and gender behavior begins in the home. At various stages, children should receive knowledge about sex and reproduction from their parents. Thus, the new program initiated efforts to encourage family-based sexuality education. A substantial gap, however, exists between the knowledge provided by the family and the average child's curiosity needs. This gap makes clear the need for child- and parent-oriented knowledge that revives national family customs and traditions.

The society is interested in exploring the social influences, especially television, which create the sexual environments in which children are growing up. Ukrainian mass media, however, are preoccupied with non-family-oriented commerce and movies. Still, many scientists have begun to collaborate with the mass media, especially television, to prepare sexually oriented programs for adolescents, teenagers, and their parents.

Sex education has been an important part of some national programs, in particular, the National Family Planning Program 1995-2000, the National Program "Reproductive Health 2001-2005," and both the National AIDS Prevention Program 2001-2003 and the National AIDS Prevention Program 2003-2008—now in preparation. Some international agencies, such as UNFPA, UNAIDS, UNICEF, DTID, and others are major donors of developing educational programs on safe sexual behavior among children and youth. (See section 5A, Interpersonal Heterosexual Behaviors, Children, for more details on the sexual knowledge of children and their sources of such information.)

### 4. Autoerotic Behaviors and Patterns

Ukrainian folk beliefs, proverbs, parables, and humorous refrains condemn autoerotic behavior and ridicule it as unnatural and abusive for the potential marital partner. This widespread opinion contributes very much to the contemporary Ukrainian negative attitude towards autoerotic behaviors.

#### A. Children and Adolescents

There is a lot of misunderstanding and fear among adults concerning children's autoeroticism. As the young child starts to explore his or her genitals, a strong punishment usually follows when adults detect this natural curiosity. Thus, from early childhood, the deliberate manipulation of genitals is mostly prohibited by the family and social environment. Most children do not receive any information about their genitals as the source of pleasure and good feelings. Parents usually worry about the occurrence of masturbation, that this initial sexual experience is immediately suppressed whenever discovered.

Normally, the second period of interest in exploration of one's own body appears at puberty. The practice of masturbation considerably increases during these years and occurs alone or with other children in pairs or small groups. There are a lot of myths among the people about the harmful results of masturbation. Some boys believe it will impair or make intercourse impossible in the future, or result in mental retardation. Similarly, many physicians commonly consider ado-

lescent masturbation to be harmful when it becomes a dominant concern, the focus for leisure activity, or a source of strong feelings of guilt. There is, however, some shift among healthcare professionals to accept adolescent masturbation as a normal activity. Still, most parents try to restrict teenager masturbation. In comparison to the Western experience in sex education, autosexuality during childhood is considered by most Ukrainians not as a pleasurable kind of sexual expression, but as a hindrance to sexual pleasure. This may be partly connected with the former imposition of ideas about sex as shameful, and not a useful human activity for the socialist society.

For children who are being raised in orphanages outside a family, the opening of the sexual sensations generated in the genital areas usually becomes a habit. Thus, masturbation provides an easy way for self-soothing, reducing tension, and calming down for many boys and girls. Children raised in an emotionally deprived environment frequently seek consolation in their own bodies.

## B. Adults

Autoerotic satisfaction among adults is widespread. It often occurs as a part of intercourse for sexual stimulation. Adults who are not in some sexual relationships are very often engaged in self-stimulation. Masturbation is also engaged in, despite moral and social prohibitions, as a way for releasing sexual excitement and tension.

Modern sexological clinics and sex shops sell devices for genital massage to stimulate an orgasm. The most usable by women, and rather popular for sexual self-pleasuring, are vibrators and dildoes for clitoral and vaginal stimulation. Among men, the most enjoyable are active devices that substitute for intercourse.

## 5. Interpersonal Heterosexual Behaviors

The complexity of interactions between the former ideological system and indigenous Ukrainian traditions has resulted in many areas of tension and confusion in sexual behavior and gender identity.

### A. Children

#### *Sexual Knowledge and Attitudes*

Juvenile sexual behavior is a kind of a mirror of the social problems and their influence on the development of gender consciousness.

Findings indicate that more than 70% of children ages 6 to 8 could not identify the right words for the sexual parts of the body for either the same or opposite sex. Those who could give some kind of explanation used many crude words and felt embarrassed and shy. More than 75% of the children did not understand the meaning of "birth control". Less than 20% of those that age knew from where a baby comes, and only 30% of those who did know received this knowledge from parents or another adult relative. Only 15% of the children could explain the intimate behavior in connection with human feelings of love, friendship, and the desire to have a baby.

Children's awareness of their own body was extremely narrow. About half of the children considered the sexual parts of the body as places of the most bad feelings and experienced shame in being naked or seeing an adult naked. The shame of body exposure is even greater in children from small towns and villages. The rather prudish approach to nudity and bodily functions has greatly affected the sexual behavior of children. In observing some paintings with nude bodies, most elementary school children express their confusion by laughing, chattering, and showing some kind of ignorance.

### *Gender Images*

There is a lot of confusion about gender roles among our youth. Children understand that the roles of male and female in family and social life are becoming more interchangeable, although the mass media follow the traditional divisions and propagate gender stereotypes; even school textbooks are mostly oriented on gender division of household functions. That's why children assume a contradictory model of gender behavior and interaction within the family and society. Though boys and girls seek an equally high social position within the society, that achievement requires a wide spectrum of habits, skills, and knowledge. But even today, the family orients the children to fulfill the traditional roles. The husband-father fulfills instrumental roles and deals with problems of the outside environment, and the wife-mother handles the relational and upbringing nurture functions and deals with problems of emotions and attitudes. Both of these roles are becoming very important for gender socialization and gender identification despite one's sexual identity.

### B. Adolescents

#### *Attitudes Toward Nudity and Body Functions*

The ambivalence toward nudity, bodily functions, personal hygiene, and patterns of sexual behavior, combined with the lack of proper sexual education, increases during adolescence and has an impact on sexual and gender self-perception. We asked 12- to 13-year-old boys and girls questions concerning their knowledge of the main physiological changes in bodily functions during adolescence. More than 70% of the boys demonstrated poor understanding of the indicators of growing up as a man or a woman. Although many adolescents have seen many movies with sexual themes, only a third of them had ever discussed sexual topics with a relative or teacher. Most boys were extremely shy when explaining the function of a condom or the origin of a baby. More than 60% used the pronoun "it" rather than the terms penis, vagina, breast, and uterus. (See Igor Kon's comments on similar issues in Section 1B, Basic Sexological Premises, Sociolegal Status of Males and Females, in the chapter on Russia.)

In comparison to boys, 70% of the girls interviewed had discussed the topic of male and female body maturation at puberty with their mothers, grandmothers, or elder sisters. The topic of bodily functions, however, remained uncomfortable for girls to discuss. More than 60% of the girls replied to the questions, "Are you glad to be growing up as a woman?" and "What feelings do you experience during your period?" that it would be better without the menstruation cycle, pubic hair, or breast development, that it made them feel dirty, sick, or bad.

Their reaction might be more positive if they did not have difficulties and anxiety connected with school toilet facilities. Is it partly connected with pain or feeling unwell? The interviews revealed that menstrual periods make them more serious (heavy) because of hygiene problems and the embarrassment before classmates, boys, and teachers of physical education. Many Ukrainians continue to experience emotional problems as they get older, because of the social taboos surrounding menstruation and the social embarrassment of talking about the subject.

Ukrainian adolescent boys experienced the same discomfort answering the questions "What do you know about menstruation?" and "What do you know about erections and pollution?"

Was the sexual knowledge expanded substantially throughout the adolescent years? Most of the children obtained good information about the reproductive system from

school lessons on biology. But, most adolescents of both sexes still showed a poor understanding of the questions concerning sexual behavior and sexual feelings. Such questions as “What is AIDS?” “How does one protect him/herself from contracting AIDS?” “Can a condom prevent pregnancy or transmitted diseases?” “Is masturbation harmful to ones health?” “Can a child in adolescent age become a father or a mother?” and “What do you know about using birth control?” embarrassed the adolescents. In talking about sexual subjects, most adolescents could not find appropriate words for the sexual organs.

These findings suggested that children viewed these topics regarding body functions, intercourse, and relationships to be shameful aspects of their personality. The adolescent sex vocabulary of most boys and girls was full of vulgar (“dirty”) words. Most Ukrainian adolescents consider clothing as an important expression of masculine or feminine behavior, and regard it as an important factor in their personality and physical beauty.

When assessing the problems of gender self-consciousness in teenagers in Ukraine, we see a growing gap between the lack of sexual knowledge and sexual experience, the practice of gender behavior, and moral/psychological maturity.

#### *Satisfaction with Parental Lifestyles*

Observing the wealth of the West, combined with the poverty of their native country, has had an impact on gender self-consciousness and sex orientations of youth. Ukraine is rearing a third generation of children who are strongly dissatisfied with their parents’ family and social life. Fathers and especially mothers with double duties are rarely viewed as role models.

#### *Sexarche and Teenage Pregnancy*

There is a growing tendency for Ukrainian youth to become involved in sexual intercourse at an earlier age. According to studies conducted in large industrial cities among the students at professional high schools, more than 50% of the women and 80% of the men have engaged in sexual activity before age 17.5. In 1980, the average age of first sexual experience was 19 years for men and 20 for women. According to survey data, more than 50% of teenagers are sexually active with at least three partners before the age of 20. For most of teenagers, sex exists as a curiosity that may involve a kind of commitment, but not love and passionate feelings. Most sexually active teenagers do not protect themselves from an unwanted pregnancy, because sexual knowledge, including information about contraceptives, remains low and comes mainly through interaction with peers. (For more information, see Section 9, Contraception, Abortion, and Population Planning.)

Ukrainian teenagers usually plan their nearest future with the creation of their own families, as the median age for marriage is now 19 to 21 years for females and 21 to 23 for males. Ukrainian teenagers usually do not consider economic and psychological maturity as necessary conditions for getting married. More than 80% of teenagers who get married consider themselves very dependent on their parents and family for financial support, for help with housing, and assistance in taking care of their children. A lack of privacy and opportunity for experiencing premarital sexual relationships lead teenagers to consider their sexual (physical) maturity sufficient basis for marriage. That is why about 45% of young couples are divorced within the first year of their marriage.

As evidence of the separateness between the sexual sphere and personality itself in mass consciousness, we

might consider the content of the sex vocabulary of Ukrainians. The Ukrainian youth have adopted a lot of abusive words from the Russian sexual vocabulary that express bondage of women, rape, and humiliation of the people engaging in sexual intercourse. This is partly a result of the authoritarian society that encouraged cruel attitudes toward women and a misconception of male behavior.

### **C. Adults**

#### *Premarital Sexual Relationships, Dating, and Courtship*

In the late 1960s, premarital sex in men’s consciousness was a taboo for both the fiancé and fiancée, as the bride should be a virgin until marriage. The ethic of premarital virginity during dating was a major theme in sex education and mass media. To abstain from sex meant to escape from being betrayed by the groom or from potential pregnancy. The statistics of those years reveal the increasing quantity of unmarried mothers and forced weddings. In recent decades, the situation has changed considerably. Today, most teenagers and adults consider sex before marriage rather acceptable, and thus, premarital sex relations are widespread.

The initial selection of a potential mate usually occurs among a reference group—college mates, colleagues at work, or a common-interest community that brings together people with similar values, educational, or cultural levels. The length of courtship for young couples is usually about 12 to 18 months between meeting and marriage, with dating two to three times a week. In various strata of people, dating activity takes different forms. Dating is mostly oriented toward dancing, visiting friends, parties, cinemas, bars, and cafeterias.

The discovery of one other person in a romantic relationship is followed by the wedding arrangements initiated mostly by the man. The choice of a mate is determined by the young people themselves as it was in ancient Ukraine, although the parents usually have to confirm the engagement. The final ceremony of marriage depends on religious, ethnic, and cultural level, and social group.

In Soviet times, a lot of Communist symbols were included in the wedding process—a ritual of laying flowers at the local Lenin monument, special greetings, and promises. Wedding ceremonies in a church were prohibited and couples who had religious weddings were often prosecuted by the authorities. Nowadays, the wedding ceremony has become more relaxed, but it is still formalized. In the countryside, people keep traditions of a large wedding celebration with almost all villagers invited as guests. A lot of fun, music, singing of celebration songs, dancing, treating, and role playing characterize such family holiday. Usually, any large wedding celebration is very expensive for parents, who have to carry the burden of wedding debts sometimes after the young have divorced.

A few years ago, some registry offices started to propose that couples use a relationship contract to define some problems of their future family life. These contracts usually do not include any legal documentation and are used as a moral obligation that helps the bride to clear up some unexpected areas of marital interaction.

#### *Sexual Behavior and Relationships of Single Adults*

The number of single Ukrainians is increasing significantly, especially among highly educated people—teachers, physicians, engineers, and business owners. Psychologists trace this phenomenon to increasing levels of personal aspirations and expectations of potential partners of the opposite sex. The single trend is occurring in every age group and for both sexes.

It is difficult to tell with any accuracy how many persons remain single because of unrealistic expectations of a significant other, immaturity in emotional responses and communications, or egocentrism. Singles include adults who have never been married and divorced women with children. Most of them are lonely and have many problems in maintaining a relationship with a person of the opposite sex. Most places of entertainment cater to teenagers for meetings with mates. Because of the lack of privacy in their own flat or available rooms in hotels, it becomes embarrassing and hard for a single person to get together and be intimate with a partner.

During the last two decades, some marriage bureaus, consultation family centers, and radio programs have started providing matrimonial services, advertising in order to introduce the partners and help with dating. There are obvious proposals in some newspapers for dating that serve sexual purposes.

### *Marriage and Family*

Despite an increasing number of singles, most Ukrainians live in families. In 2003, Ukraine legislated the new Family Code, which determined the basics of marriage, spouses' property rights, parents' and children's rights and duties, as well as those of adopters and adopted, and so on. New clauses in the Code have been introduced dealing with the process and responsibility of engagement, the guarantee of rights for supporting a parent or caregiver for a disabled child, setting a contract for married life and the terms for its validity, the child's right for a proper upbringing by the parents or relatives, parental duties before and after childbirth, and so on. In Ukraine, the minimum age for marriage is 17 years for women and 18 for men. The marriage can be dissolved by mutual consent of the spouses. The divorce is equally available to both men and women. The husband is required to provide the maintenance of children until they are 18 years old. Custody of children, maintenance, and property must be decided before the couple divorce.

The main stream in developing marriage and family during the transition period involves replacing the patriarchal model of family functioning and shifting to a self-sufficient model. The phenomenon of increasing numbers of street children—about 53,000 children are in out-of-home care across the country—has been promoted in part by destructive tendencies during transition. A growing number of infants are abandoned soon after birth. Most of these infants receive institutional care. Thus, in 1991, the rate of children (aged 0 to 3) in infant homes was 153.4 per 100,000 population. In 2000, this increased to 308.5 per 100,000. Some children receive care in foster families, which are starting to develop in Ukraine in the adoption system. The recent transition period has also caused a rise in the age of first marriage. Thus, in 1997, the average age of first marriage for women was 21.6 years and for men 23.5. In 2000, it rose to 22.8 and 25.3, correspondingly. As a result, the Ukrainian family produces fewer children, with an increase in the share of nonmarital births from 11.9% of total live births to 17.3% in 2001.

The typical family in Ukraine is a nuclear family. This kind of family started to increase from the 1930s after the dissolution of the extended family pattern. Shifts in family structure were mostly triggered by increasing urbanization. Millions of young people were induced to migrate to urban industrial regions in search for employment, education, and occupational mobility. In 1920, 20% of Ukrainians lived in city areas; by 1980, this percentage had more than tripled. This process has increased labor participation rates for women and decreased the size of the nuclear family. More than half of all Ukrainian families are one-child families.

The nuclear family has increased the demands for equal sharing of responsibilities and household roles between the spouses, as well as raised the intrafamily factors like emotional support, shared values, sexual satisfaction, common income distribution, attention and expression, mutual assistance, and moral protection.

### *Divorce and Remarriage*

The increasing divorce rates are a reflection of the diminished dependence of spouses on each other and the desire of obtaining a legal marital dissolution rather than remaining in a harmful relationship.

The incidence of divorce has increased rapidly since the 1960s. The failure of a marriage usually stems from a multiplicity of factors. A marital relationship breaks down as the result of failure of spousal and parental roles. Marriage failures then correlate with such factors as early marriage, addiction to alcohol, material and financial needs, and lack of interpersonal communication. The incidence of marriage failure is still growing. The general rate of divorce in Ukraine per 100 marriages in 1990 was about 39.9, in 1991 40.7, in 1995 45.9, in 1990 51.0, and in 2000 71.9 per 1,000. The rate of children (age 0 to 17) involved in divorce per 1,000 population was 12.9 in 1991 and 13.0 in 2000. According to statistics, Ukrainian men seldom want to divorce; the initiative usually comes from women. There is a great difference in the divorce rates for urban and rural citizens, 5.5 per 1,000 compared with 1.9 per 1,000 in rural areas. Surveys indicate that about 75% of divorced men remarry within five years and only half of divorced women within 10 to 15 years after their divorce. In the case of remarriage, the rights of all children of every spouse are protected as stepchildren.

### *Cohabitation*

In the past 25 years, as the marriage rate slowly declined, the number of unmarried cohabiting couples quadrupled. Cohabitation among Ukrainians is called "to live on trust." The estimated rate of cohabitation is about 17% among all couples, and it has been increasing during the past decade, especially among the young generation. The process of mate selection has passed from the state and relatives' control to personal choice. In Ukraine, there is no special law regulating cohabitation, but legislation does offer some protection for the rights and responsibilities of cohabiting partners, and their children, who are protected as though the couple were married. While the legal system provides some rights for persons who cohabit for some period of time, these rights are much less than those of married couples.

### **D. Persons with Physical Disabilities, and Older Persons**

Unfortunately, most individuals with disabilities are cut off from the active contacts with the social environment. The services for any social assistance, education, welfare, and transportation facilities are almost totally absent, as they were in former Soviet times when the needs of this population were mostly ignored by society and treated as a family concern. Privacy and independence are vital for the physically handicapped. Even in large cities, it is hard to find the convenient access and passages across the streets, as well as a lot of other facilities for the disabled. These necessities affect the development of sexuality very much because of the personal isolation. Only specialized sanatoriums offer places for temporary relationships of individuals with special needs. In Ukraine today, there are about 60 disabled persons per 1,000 under 60 years of age.

Only recently has the Ukrainian society begun to recognize the abused fate of the physically handicapped, and to

break their isolation by improving the conditions of their existence by providing for common interests—sports, education, hobbies, and therapy—and by slowly increasing their access to social allowances.

The Ukrainian society also needs to overcome a rather strict and condemnatory attitude toward any sexual activity by older people or public acknowledgment of same. In comparison to Western contemporaries, Ukrainian women over 40 years old usually consider themselves too old for any sexual intimacy, and thus stop taking care of their own appearance and sexual attractiveness.

### E. Incidence of Oral and Anal Sex

Traditionally, in Ukraine, sex is an extremely personal and very private matter. Moral, emotional, gender, and age factors influence attitudes toward anal sex and its enjoyment. While anal sex holds a great attraction for male homosexuals, and heterosexual couples may engage in anal sex for the enjoyment of one or both partners, there are no special studies undertaken to discover the frequency of anal sex. What data are available usually comes from sexological clinics. According to this data, more than 30% of males have had an experience with anal sex, either with a woman or with a man, prior to age 30 years. In jails, anal sex is usually engaged in as a temporary substitute for heterosexuality, or for maintenance of power.

Oral sex is rather popular for both heterosexual and homosexual couples. It is also very often practiced by adolescents as a part of youth subculture which is largely propagated by mass media, especially by commercials. Cunnilingus is mostly a part of couple foreplay during lovemaking in order to stimulate female orgasm. It is used in many cases by men with sexual dysfunctions. Fellatio is much more widespread as a kind of foreplay for intercourse, or as a separate sexual activity. Fellatio technique involving partial penis penetration into the woman's mouth or penis licking or sucking or kissing are very popular among the lovers of all ages, but mostly among teenagers and persons under age 30.

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

Historically, gender and sexual behavior in Ukraine were strongly influenced by the Christian tradition, which restricted any manifestation of sexuality and considered homosexual orientation as a great sin.

The concept of a homosexual identity as same-sex attractions and sexual behavior has some historical evidence in Ukrainian history. Tolerance towards homosexuality can be traced to the Cossack Republic (1500s to 1600s), where liberation and personal freedom had become the key notions of social activity. Later, during the period of Russian oppression, there was evidence of a homosexual underground for men. The development of lesbian networks is a modern-day phenomenon.

Ukraine, as well as the other states of the former Soviet Union, was and still remains a very heterosexist society with strict gender stereotyping. All social institutions and social opinion place considerable pressure on gay men and lesbian women. Most individuals with a same-sex orientation kept their sexual drives and orientation deeply hidden.

The democratic processes in the newly independent Ukraine gave the opportunity for the people to share the discovery of their sexual-orientation and gender-identity problems within sympathetic communities and support groups, in the mass media, and with specialists—physicians, sexologists, and psychologists. However, most Ukrainians still consider homosexual behavior as abnormal and socially unacceptable and reject both male and female homosexuality.

This is partly because of the rigid manifestation of cultural heterosexism, as well to a reminiscence of Soviet mass psychology and nontolerance to another one.

### A. Children

Because information on sexology and psychology of gender was prohibited in former Soviet Ukraine, little is known about the early experiences of those who today identify themselves as gay or lesbian. No national research on developmental sexuality in childhood was conducted.

In an ideological system that denies any non-heterosexual form of behavior, children with the same-sex orientation encounter a lot of discrimination and even violence. Atypical gender behavior during childhood is usually ridiculed within the society and results in being rejected by parents, relatives, or teachers as not adjusted to the male or female social role. In early childhood, the measurement of gender-role behavior includes easily observable facts, as preference for same play interests, toys, sex peers, dressing, and so on.

The behavior markers of gender identity emerge in Ukrainian children typically between ages 2 and 5 years. At puberty, a child's sexual interests and desires normally emerge. In many features, lesbian, gay, and bisexual youths are similar to other children. However, a pervasive heterosexism of the social environment at home and school causes young gay men or lesbians to experience their cross-gender feelings and behavior in isolation from the significant others. Because of the inner conflict stirred by social and family rejection, they must hide their sexual attraction from others at the very time they are becoming aware of it. Growing up with forbidden and unacceptable sexual attractions influences personality development, often resulting in a negative image of the self as a homosexual female or male.

The initial recognition of same-sex attraction usually becomes evident at puberty and adolescence. Discovery of one's orientation often leads to some sexual activity involving persons of the same sex, starting with simple touching, kissing, petting, stroking the genitals, oral-genital contact, and more rarely, anal intercourse.

Although attendance at a professional high school or summer camp provides wide opportunity for teenage sexual experimentation, and many adolescents have even more homosexual than heterosexual encounters, they are not considered as really gay or lesbian behaviors. The capacity to respond sexually to a person of the same gender in the teenage years is considered being bisexual rather than homosexual. Many teenagers who identify themselves as homosexual in fact are bisexual. Many such Ukrainian youths try to change their sexual orientation by different kinds of therapies. These usually are not successful in reaching the desired goal.

A predominant sexual attraction to persons of the same gender with a constitutional lack of attraction to members of the opposite gender in late teenage years signals the development of a homosexual orientation.

### B. Adults

#### *Gender Roles, Courtship, and Relationship Patterns*

In the Ukrainian society, where intimacy and relationships have been focused primarily on heterosexual patterns of behavior, the sexual minority groups try to develop their own language for communicating with similarly minded peers about courtship and discovering sexual roles for future intercourse. The image of the self as a homosexual female or male is mostly dependent on the success of lifelong intimacy with a partner and on the opportunity for the self-extension in experiencing the feelings of sexual attractiveness, physical fitness, and good looks. In a traditionally

hostile society, coming out as a homosexual poses great problems. The inability to define one's self in terms of social and private activities thus becomes a common characteristic of adults with gender dysphoria.

Many lesbian women and gay men are modeling their relationships on heterosexual behavior forms and communication. A lifelong monogamous commitment is often a desirable model of homosexual relationship. The partners share household and home labor in accordance with active (masculine) and passive (feminine) roles in sexual intercourse. There are a lot of jealous feelings in the attitudes towards each other, passionate love, and sympathy. Many homosexual adults develop their sexual and romantic relationships much as heterosexual couples do, but with the significant difference of fear for manifesting that love and attachment in a hostile environment. In contrast to gay men, many lesbian couples have made parenting an important part of their life. But because homosexual relationships are usually hidden, long-term monogamous homosexual couples are rare in Ukraine.

Despite the hostile social environment, homosexual adults elaborate some elements in dressing, gestures, and behavior that signal a homosexual orientation to knowledgeable observers. Still, even in metropolitan Kyiv, homosexual persons meet each other in covert ways and endure some period for tentative exploration before overtly connecting. Usually there are some places in cities and towns where homosexual individuals can meet each other. In such public places, including sections of certain parks, certain bars, and steam baths, homosexual persons can safely meet, interact, and relate to each other.

In former Soviet times, disclosure or discovery of homosexual orientation meant destruction, ostracism in the workplace and family, forced hospital treatment, and even prison. Lesbians and gays today are as diverse as the society to which they belong. They differ widely in both educational level and economic status. Depending on their social status, they may either conceal their sexual orientation or be open about it. They may have multiple partners or prefer one. Feelings of unhappiness because of the lack of a mate, feelings of alienation, a minimum of understanding regarding their situation, stressful life experiences, anxiety, depression, and substance abuse are common difficulties in the private lives of homosexual persons in Ukraine.

### *Social Status*

The social attitude regarding homosexual persons in the former Soviet Ukraine was determined by Statute N121 in the criminal code, which supported penalties for the male homosexuality, as well as for the homosexual seduction of children, teenagers, and adults, and punishment for homosexual rape. Female homosexuality was not noted as criminal in that law.

In postliberation Ukraine, researchers and clinicians studying the patterns and quantity of homosexual, lesbian, and bisexual behavior have rejected the Soviet diagnosis of homosexuality as deviant and a mental illness and now make use of the Western paradigms, statistics, and assessment measures, particularly those of the American, Alfred Kinsey, and his colleagues.

This dramatic shift, coupled with the beginning of the democratic process in Ukraine, has given impetus for homosexuals to "come out from the closet." Today, Ukrainians can openly visit a consulting center to meet a sexologist or psychologist to discuss some private problems concerning lesbian or gay orientation or activity. Today, lesbian women and gay men are becoming more open about their sexual identities, social processes in which developmental changes

affect their life. One can easily find many advertisements in the erotic newspapers placed by homosexuals of both sexes seeking a partner. There have also been some recent efforts to organize a gay liberation movement. In May 1995, the First Ukrainian International Congress of Homosexuals and Lesbians, which called itself Two Colors, was held in Kyiv. The association was organized to serve the social, political, and cultural needs of the gay and lesbian population by promoting a positive image for homosexual status in society. In comparison to Western gay liberation movements, Ukrainian lesbians and gays are not separate in their social needs; they are one in their efforts to promote common ideas.

In the late 1990s, the first Ukrainian magazine for gays began publication. Called *One of Us*, it explores different intimate and social factors that are important in the gay lifestyle for men trying to create their non-heterosexual identities in community life.

Although homosexuals in post-socialist Ukraine are not relegated to a deviant status, there is still a lot of prejudice against gay and lesbian persons, and many individuals oriented toward same-sex sexuality keep their attitudes hidden. This is partly because of the rigid manifestation of cultural heterosexism, as well as a reminiscence of Soviet mass psychology of nonreconciliation and nontolerance of anyone who does not fit the majority model. Homophobic tendencies among Ukrainians were and are mostly connected with gay men but not lesbians. This is in part because of a fear for the younger generation being molested, seduced, or infected by HIV. But another factor is an ancient blame for men's abstinence from heterosexual intercourse causing a decrease in childbirth, threatening the future of the nation.

### *The Ukrainian Homosexual Culture*

The basic demographic characteristics and size of the homosexual population in Ukraine remains a subject of debate. Little is yet known about the relationships of homosexual couples, as well as about the functioning and life course of families with lesbian and gay adults.

As mentioned, most homosexual women and men try to remain invisible. The dominance of exclusively heterosexual orientations in Ukrainian society presses homosexuals to hide their drives and attitudes. One result of this hostile environment is the number of men and women who pose as transsexuals to obtain sex-change surgery in order to change their sex on their passports and thus obtain the opportunity for a legal relationship with a partner of the desired sex. Ukrainian scientists have suggested the significant importance of social factors in the origin of such orientation because of the high valuation by the Soviet system for manifestation of masculine features and of masculine traits expressed by women. Thus lesbian women are more independent, dominant, unconventional, and self-sufficient than most Ukrainian heterosexual women.

The patterns of a sexual partnership among gays and lesbians are significantly influenced by the sexist society with strict polarization of gender roles in housekeeping, raising the children, and in the social sphere. What limited statistics are available suggest that only about 1.5% of gay male couples achieve a stable, long-lasting relationship of more than five years; 2.7% have relationships that last three years, while about 7% have relationships that last a year or so. Lesbians and gays have occasional sexual encounters for anonymous short-time enjoyment; some have sex in pairs or in groups. Some homosexual couples emphasize social needs rather than pure sexual contacts.

Homosexual as well as bisexual relationships satisfy many social, sexual, and emotional needs—many homosexual couples enjoy common professional interests, shared

lifestyle, cognitive satisfaction, and cooperation, although their welfare in Ukrainian society is generally not so high. Although there are many different challenges in gay and lesbian experiences, including communications and intimacy, the main widespread problems involve a special need for a positive self-redefinition, coming out as a part of personality development and interpersonal growth, and social activity and well-being as an affirmation of the personality. Ukrainian society needs to provide a social environment in which gay and lesbian persons can feel that their sexual orientation is not pathological or immoral.

### 7. Gender Diversity and Transgender Issues

The beginning of the democratic processes in Ukraine allowed the problems of people with gender conflicts to surface. Because of this, Ukrainian society faces some new questions about the status of such individuals in post-socialist society and the ways in which they interact with the public, family, and friends.

Ukrainian scientists consider that the cases of gender dysphoria, in which a person rejects his or her biological sex and requests surgery and the gender identity of the opposite sex, occurs in about 1 out of every 30,000 to 50,000 persons.

During the Soviet rule, the only center that provided medical treatment and sex-change surgery for transsexuals was in Moscow. In the late 1980s, when legal and medical procedures for altering sex were for the first time performed in Kyiv, female-to-male transsexuals outnumbered male-to-female transsexuals seven to one. In Western countries, the proportion is about equal or favors male-to-female by about three to one. The reasons for this sharp difference might be social-learning experience and the prevailing status of men in Soviet society.

A government commission for transsexualism has recently been organized in Kyiv to deal with individuals with gender dysphoria. The chairman is Professor Borys Vornyk (Address: 8 Smolenska vul., Kyiv 02057). Its members include qualified transgendered "alienist" persons, surgeons, sexologists, psychologists, and lawyers. The clinical and psychological strategy for managing sex change and identity cases is based on the best of foreign experience and practice. The procedure of personality evaluation before undergoing sex reassignment are based on preliminary criteria: originally over age 21, but since 1995, over age 25; having no children under age 18; no criminal offenses; a consistent gender disorder not connected with psychosis—absence of mental diseases or psychosis; a long-standing (from early childhood age), irreversible, cross-gender identification with positive self-conception, physical appearance, and demeanor as a member of the opposite sex, and a strong identity with the opposite sex; and referral to "nuclear" transsexual by a psychiatrist and psychologist based on at least one year of psychotherapy—a stable ego conception; economic and residence stability—minimum problems in self-support; sexual satisfaction of self and the partner, if involved; a positive relationship with family; adequate psychological support; and an adequate understanding of the hazards of the operation.

The commission considers the importance of family diagnosis in an evaluation of gender identity, as the transsexuals will meet a lot of psychological problems involving military registration and alienation from and nonacceptance by society.

Many people react negatively to the phenomena of transsexualism and transvestism because these contradict traditional gender behavior and assumptions.

A transvestite's social and family situation is usually very difficult, because the lack of privacy in everyday life does not allow him to have the opportunity to dress even partially as a member of the opposite sex. The cases of male-to-female cross-dressing are usually connected with a hyperfeminine expression. The lack of community and nonavailability of public places for mixing with others as a woman restrict the options for cross-dressing.

Cases of berdachism and other atypical sexual identities are extremely rare in Ukraine and exist mostly as rumors rather than as clinical or scientific studies.

### 8. Significant Unconventional Sexual Behaviors

The incidence of socially unaccepted kinds of sexual behaviors are increasing rapidly as the process of political and economic transition affects the whole culture and everyone in it.

#### A. Coercive Sexual Behavior

##### *Child Sexual Abuse, Incest, and Pedophilia*

Any kind of child molestation has always been condemned in Ukrainian society, and Ukrainian folk traditions consider any sexual abuse of children as the most heinous of crimes.

Known cases of sexual abuse are mostly connected with girls assaulted between 3 and 7 or 8 years old. More than half of the offenders are close friends or neighbors of the parents. More than half the victims have been killed by the seducers after the pedophilic acts because of the fear for criminal responsibility and punishment. The penalty for sex molestation is the same as for the rape of minors or incest; Statute 117 of the criminal code mentions the penalty from three to 15 years in jail and even death. Most of the perpetrators of this crime are men 20 to 30 years old.

More often than not, cases of pedophilia are not connected with penetration, only with genital fondling or handling. The children involved in such sex games with adults are about equally male or female.

The frequency of pedophilia in our country is sometimes connected with homeless girls and boys who run away from home to escape from parents and are in turn victimized by adult male strangers in return for some food, money, reward, and temporary shelter. Usually, they do not report their offenders and keep the sexual experience secret from parents and others. Cases of incest are a rather rarely reported form of child sexual abuse. Accounts of sex between a parent and child are more frequent than are officially reported. Sexual relations between a mother and son or a father/stepfather and daughter are seldom discovered or reported. Very few scientific statistics and little information are available about sexual relations between brothers and sisters. The recent development of sexual consultation centers with psychoanalytic services will help in obtaining data on the incestuous involvement of children in Ukraine.

##### *Sexual Harassment*

[*Editors' Note:* In this section, the Ukrainian authors adopt a broader and less specific definition of sexual harassment than is common in Western usage.]

Violations of personal boundaries, a basic element in the administrative-commanding system of the former Soviet Ukraine, made sexual harassment an everyday normative behavior in official and informal relations. Fear of the authority that was taught by the Soviets fostered a tolerant attitude towards sexual harassment as a usual and expected behavior of authorities and subordinate persons. Although Statute 119 in the Ukrainian criminal code deals with a pen-

ality for forcing a woman to engage in sex, no incidents of such violations were ever reported or registered.

Sexual harassment behavior is widespread, especially among youths. Sexual remarks, jokes, explicit conversation about having sex, as well as such behavior as following, staring, leering, and taunting are regarded by both men and women as inoffensive and even just larking. Such behavior is mostly considered to be an acceptable way of getting acquainted in public places, and as normal masculine communication in mixed-gender interactions.

According to a survey conducted in different regions of Ukraine, one in seven students in secondary school and college has been subject of undesirable contact, and one in six students is confronted with sexual harassment. The incidence of teenager sexual harassment is strongly determined by the type of child educational institution. Girls become the object of sexual harassment much more often than boys. Every third girl has experienced sexual harassment, every fifth girl has experienced undesirable touch, and one in ten has been the subject of sexual abuse as a strong traumatic experience. Sexual harassment is accepted as an inevitable in receiving a prestigious job. Young women also have more chances to be an object of sexual harassment in the job market. There are many economic factors that contribute to sexual violence against women.

### *Sexual Assault and Rape*

The incidence of rape is growing very quickly. Stranger rape accounts for about 94% of all reported rape cases; 67% involve group or gang rape; 13% result in serious physical harm. According to the criminal statistics for the Kyiv region, most of the reported perpetrators were under age 20. Most of the victims are under the age of 18. Most of the rapists did not have a previous criminal record and used alcohol.

### **B. Prostitution**

The danger of prosecution does not limit the offers of sexual services in return for financial gain. Historically in the Ukrainian community, there was always a negative attitude toward women who had sexual relations with men outside marriage. But starting at least in the early 1970s, the attitude towards prostitution, especially among youth and middle-aged adults, has shifted to be very permissive. Prostitution is spreading among young women and girls as young as 10 to 15 years old. Poverty and transition-related issues, such as unemployment, have increased the need to earn money on the streets. These young girls are the victims of drug and alcohol abuse, poor diets, venereal diseases, and sexual abuse. Another phenomenon linked with prostitution is trafficking in persons. Many women and some men, discouraged by job opportunities at home, look for a work abroad. In many cases, Ukrainian migrants are being engaged in prostitution, becoming the victim of exploitation and violence.

Ukraine is considered to be a major source of young girls and women sold into international commercial sex markets, especially in the Middle East and Balkans. As the result of being trafficked, a lot of women have found themselves trapped in slavery dependence and had to solve their problems by sexual servicing.

### **C. Pornography and Erotica**

A Project of Law prohibiting the production and distribution of pornography, and the formation of the Presidential commission on obscenity were still being discussed in the Ukrainian Parliament as of mid-1995.

Although Ukrainian society has become more permissive sexually, it does not provide adequate values of human sexual activity. With the breakdown of the Soviet regime, sexuality became one of the most important symbols of social and

cultural liberation. Widespread public ignorance about sex in former years has been replaced by everyday representations in commerce and movies. Television programs and filmmakers have exploited sex; the display of the bodies of young women as available sexual objects are not only on cinema screens, but in advertising, on posters, photographs, and drawings. After 70 years of repression, Ukraine has a large market for pornographic products. Television programs portray and revel in various types of sexual experience, and frank expressions of nudity with erotic excitement are displayed in public places for everybody.

The public discussion of the harmful role of pornography for grownup sexual expectations and values makes it clear that, under the slogans of democracy, new businessmen are exploiting sex roles, promoting the image of a happy life associated with sexual pleasure, drinking, smoking, and male control of the opposite sex.

Newly opened sex shops and the appearance of such newspapers as *Pan Plus Pani* and the sex magazine *Lel'* have broken all previous taboos on sexual subjects, recognizing the sexual culture and providing sexual education for different age groups. Artistic eroticism has started to recover from years of repression, producing pictures, stories, and theater plays in the best national traditions, based on gender equality in relationships, personal freedom and dignity, Ukrainian humor, and the pursuit of a full-blooded life.

## *9. Contraception, Abortion, and Population Planning*

### **A. Attitudes, Education, Availability, and Usage of Contraceptives**

The maintenance of an appropriate population level is vital to the survival of any society, but especially for Ukraine after the Soviet takeover. During the famines deliberately created by Soviet policy in 1920 and especially 1933, six million Ukrainian peasants from the central, east, and south regions died from artificial hunger or were removed from their native land to Siberia and the Far East. The devastation of World War II also reduced Ukraine's population significantly.

From the middle of 1979, the Ukraine birthrate started to drop rapidly; since the end of 1980, the birthrate has remained below the replacement rate. Although the former Soviet authorities tried to encourage families to have more children in order to get a larger labor force, their efforts did not reverse the trend. By the end of 1960, most Ukrainian women had to combine parenthood with professional work because of economic needs and the necessity of guaranteeing family income.

As a consequence, Ukraine is characterized by the rapidly increasing proportion of older persons. In 1960, there was one person of pension age for every 11.5 nonpension persons. Today the ratio is one in every six. And the birthrate continues to decline. Under such circumstances, the social and economic situation has had a great impact on the family: We have an increase of single persons of marriageable age, and a high proportion of divorce and one-parent families (the number of one-parent families in 2002 constituted 14.0% of all families).

Historically, most Ukrainian families did not limit the number of their children, nor did religious doctrine permit use of contraception. However, sexual intercourse was forbidden during major religious festivals. And most women knew about medicinal herbs that could be used to prevent pregnancy or induce a miscarriage. In the 11th century, the daughter of King Jaroslav Mudryj Jevpraksija wrote the first book on the medical use of herbs, describing their use in pre-

venting or terminating pregnancy. The average Ukrainian family was large, with the women sometimes having more than ten childbirths and five to nine surviving children.

The involvement of Ukrainian women in the labor force in 1930 and in 1950 reduced the number of childbirths and increased the number of induced abortions, even though from 1936 to 1955, abortion was forbidden by Soviet law. In the end, economic factors enabled the government to give impetus to a family planning policy and promote the development of contraception. Nevertheless, from the late 1960s to the present, Ukraine remains at the head of countries where abortion is the main form of birth control.

Induced abortion is not a method of contraception, but one of family planning. In 1998, 45 pregnancies out of 100 ended in abortion. The number of abortions has been decreasing in recent years (see Table 1).

Overall, the number of abortions among women of reproductive age in 1998 was as follows: ages 18 to 34, 79.1%; ages 35 to 49, 18.3%; ages 15 to 17, 2.6%; and under age 14, 0.05%. In recent years, the situation has improved. There has been no increase in the number of abortions among girls under the age of 14 and teenagers aged 15 to 17. Among girls aged 10 to 14 years who interrupted their pregnancy, the number having an abortion increased from 47.4% to 94.0%. This was promoted by the creation of a network of family planning centers and work with girls who have already become pregnant.

Since sex-education programs were focused on adults, the sexual behavior of youths was not regarded as important for family planning. In the context of such policies, the incidence of teenage pregnancy started to rise. A second reason for the failure of the government program to promote contraception was the fact that the sex-education programs were focused mostly on women in gynecological clinics, and not on all women of childbearing age. This policy ignored the family as a unit of a man and a woman and the male's responsibility in family planning. With this policy, husbands simply assumed that the wife would take responsibility for contraception, which they sometimes, but not always, did.

But the major factor was that the most effective birth-control methods, such as oral contraceptives and hormonal implants, were not recommended by the physicians, and remained unpopular among both adults and teenagers. In addition to the strong prejudice against the hormonal contraceptive pills, another factor in their nonuse is their high cost in Ukraine.

From 1994 on, tubal ligation for the female and male vasectomy have been increasingly chosen by Ukrainian couples who do not want any more children or who prefer to remain childless.

In general, Ukraine needs a greater availability of contraception and improved sex information in order to reduce the increasing numbers of unwanted pregnancies.

**Table 1**

**Abortion Rates in Ukraine for Selected Years**

Year	Abortions per 100 pregnancies	Abortions per 100 deliveries
1991	60.1	145 (est.)
1995	59.2	119
1998	54.4	106
2000	55.0	—
2001	48.1	92

## B. Teenage Pregnancies

Teenage pregnancy is often a motivation for establishing a marriage relationship. According to one survey, unmarried pregnancy occurred among 83% of young couples under 20 years old; most of them considered the childbirth undesirable. The decision to have an abortion or to keep a child is made by the young woman with additional agreement of parents or relatives when the girl is under 16 or 17 years old. There are no special schools or classes for pregnant teenagers. Usually, the relatives take the responsibility for a newborn baby. The destiny of such babies is often unhappy when a young mother gives her child up for adoption or to an orphanage. During recent decades, the population of the rejected babies in an orphanage has increased many times in comparison to the number of the orphaned children in Ukraine after World War II. The high rate of adolescent pregnancy demonstrates that Ukraine needs to improve its school and community sex-education programs and to provide free or low-cost contraceptive services to all teenagers who need them.

## C. Abortion

Abortions have been legal in Ukraine since 1955. They are available to any woman after the age of 18 years and are mostly free of charge—the state pays the medical expenses of low-income women. The abortion is usually done at a special clinic or gynecology department up to 12 weeks after the last menstrual period. Although abortions usually are medically safe, many factors affect the women after an operation: anxiety, depression, and complications in reproductive function.

In Ukraine, abortion is the main cause of infertility. More than 200,000 cases of inflammatory diseases of the fallopian tubes and ovaries are recorded annually, of which 130,000 are first occurrences among women aged 18 years. Among teenagers aged 15 to 17 years, about 10% have inflammatory diseases of the reproductive system. Twenty-six women died in 1998 as a result of an abortion, for a rate of 0.05 deaths per 1,000 abortions. Seven deaths occurred as a result of an abortion that was not performed in a medical establishment.

The percentage of miscarriages out of the total number of pregnancies also increased as a result of abortions. In 1998, the percentage increased by 1.8 times in comparison to 1990. About 60% of stillbirths are premature births, and from 50% to 70% are first births. There has been a growing antiabortion movement in Ukraine, especially among some religious denominations, scientists, teachers, and some social organizations. These groups emphasize that a woman should take responsibility either for preventing pregnancy or for giving the life to a new baby because of the right to life of the unborn fetus.

## D. Efforts to Regulate Population Growth

With regard to the demographic situation, the Ukrainian government considers the improvement of living standards for all women, but especially for young couples, as a measure of fertility, womanhood, and parenthood. For this purpose, the Committee of Women's Affairs, the Children, and the Population was organized in April 1995 by the cabinet of the ministers of Ukraine. The committee started to develop family-planning policy and different social programs to permit the women and the families to promote their well-being, their health, and parenthood.

Since Ukraine became an independent state, a series of strategic national programs have been adopted. Among them: a Long-Term Program on Improvement of the Status of Women, Family, Protection of Maternity, and Childhood;

a National Program on Family Planning, and a National Program "Children of Ukraine." In 1997, the National Plan of Action for 1997-2000 "on the improvement of status of women and their role in society" was approved. The National Program of Family Planning has the following strategic objectives:

- Form regional institutions for family planning;
- Prepare medical and educational personnel to work on family planning;
- Meet the population's contraception needs;
- Prevent undesired pregnancies; and
- Create an infrastructure for infertility treatment.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

The history of the medical treatment of sexually related diseases in the 19th century was connected with such scientists as J. Zelenev, J. Popov, B. Zadoroznij, and J. Mavrov. In Czarist Russia, around 1850, it was estimated that about 10% of all reported illnesses involved venereal diseases. Syphilis and gonorrhea were found mostly in the large industrial centers like Kyiv, Kharkiv, Odesa, and Mykolajiv. In 1901, *The Journal of Skin and Venereal Diseases* was founded in Charkiv; it carried articles describing the symptoms of common sexually transmitted diseases and their complications.

World War I and the October 1917 Revolution led to widespread sexual promiscuity and increasing cases of venereal diseases. In 1920 in Ukraine, special dispensaries for treating STDs were organized in all large cities. This helped to slow the spread of these infections. World War II created a huge new public health problem, which lasted until 1950. In comparison to other former Soviet republics, Ukraine was characterized by the lowest level of STDs, because of the sanitary preventive measures.

#### *Incidence, Patterns, and Trends*

After the dissolution of the U.S.S.R., social factors such as large-scale migrations, the ease of reproducing erotic and pornographic videos and their availability, changes in the economic situation, and the double moral standard have influenced the recent outburst of venereal diseases. In Ukraine, as in other countries, the teenaged population appears hardest hit by the STD epidemic. Venereal diseases are increasing in epidemic proportions among teenagers because of lack of knowledge, early sexual experience, multiple sexual partners, and a high level of sexual activity.

In the past five years, syphilis cases among 14-year-old boys has increased about 400%, and for 15- to 17-year-olds by about 800%. Among teenage girls, syphilis has increased by about 500%. Venereal diseases such as gonorrhea and syphilis are now the chief sexually related diseases in Ukraine. The incidence of gonorrhea and syphilis began to climb in 1992. In 1995, 208.5 new cases were reported per 100,000 population. In 1996, the rate was 226.5, declining to 144.8 in 2000. Among 15- to 19-year-old girls and 12- to 14-year-olds, an epidemic has become a national pandemic. There has been an unprecedented increase in the incidence of syphilis among women. The indicator rose from 6.2 cases per 100,000 in 1990 to 134.8 in 1998, which naturally has created a favorable environment for the spread of HIV infection. Females and males between the ages of 17 and 27 are most at risk of infection, and they account for the majority of all STD cases reported. In the past five years, the common infections, like syphilis, gonorrhea, herpes, and chlamydia, have increased about 300% in

adult females and by 400% in adult males. This continuing increase in the incidence of STDs is creating urgent social problems.

#### *Availability of Treatment and Prevention Efforts*

In Ukraine today, there is a system of STD control, and appropriate healthcare is available throughout the country for people of all ages, in the rural areas as well as in the cities and large metropolitan areas. Everyone can obtain free and confidential routine medical testing and care. It is obligatory for all the personnel of medicine, nutrition, and provision services to be tested periodically for STDs and HIV, since the best way to fight the epidemic process is to block it. Some clinics provide resident treatment, and some dispensaries provide outpatient care with pre- and post-test counseling. All services are free, with the patient paying only for medication when they can afford it. Besides medical services, these clinics provide free printed contraception and HIV/AIDS information.

The program for high-risk youth includes testing and follow-up care. Special venereal departments provide a wide range of medical services, all free and confidential. The only requirement for the patient is to identify all the partners, so they can be tested and referred to medical services in case treatment is needed. Some venereal clinics offer extensive treatment for individuals addicted to drugs or alcohol, or to a person whose behavior put him or her at risk for being infected.

Ukrainian physicians prepare special information for adolescents aged 14 to 18 in order to give them the facts they need to protect themselves from STDs. But this work is insufficient in the area of mass media, especially television, and in educational programs in the schools, where some are still embarrassed when speaking of "sexually transmissible." A sexually enlightened society is not afraid to influence the consciousness and attitudes of the masses with an honest voice.

According to a UNAIDS report for 2002, the incidence of syphilis cases increased dramatically from less than 10 cases per 100,000 in 1990 to 118 per 100,000 in 1995; in some regions this rate reached 220 per 100,000. Over 60,000 new syphilis cases were reported in 1995 alone. Gonorrhea has been underreported.

### B. HIV/AIDS

The epidemiology of HIV and AIDS infection in Ukraine demonstrates worrisome trends.

#### *Incidence, Patterns, and Trends*

The epidemic of HIV/AIDS in Ukraine has progressed in two stages: The first phase started in 1987 when the first six cases of HIV infection were registered among Ukrainian citizens. Until 1994, annually about 40 HIV-infected people were registered. Geographically, the cases of infection concerned large industrial cities and the spreading speed was quite slow. The main way of infection transmission was heterosexual. The number of HIV-positive Ukrainians during that period was 183. The second stage started in 1995 when the two first cases of HIV infection among intravenous drug users (IDUs) were found in Mykolajiv. Since that time, the rate of infected IDUs has been growing rapidly. By January 1, 2002, there were 43,600 HIV/AIDS IDU cases.

Starting from 1998, consecutive substantial reduction in the rate of HIV-registered cases can be explained not by the slowing down of the epidemic, but by the adoption in 1998 of a new law "About HIV/AIDS Prevention and Social Defense of Population." In accord with the United Nations Declaration, that law initiated the use of HIV-testing on a volunteer basis.

In 1997, HIV/AIDS infection reached all regions of the country. By the end of 2000, the eastern and southern regions of Ukraine were most affected by the epidemic. The Odessa, Dnipropetrovsk, and Donetsk regions contained 60% of the entire HIV-positive population of Ukraine.

The explosive character of the HIV/AIDS epidemic in Ukraine is connected with the dramatic growing of the number of IDUs, the peculiarities of intravenous drug use, the late initiation of prophylactic work inside the IDU group, and the lack of attention to such work by the official authorities and establishments.

The period between 1990 and 2000 was characterized by a sharp increase in drug dependency. In 1990, narcotic services were monitoring 22,466 individuals, while by the beginning of 2001, there were 75,489 clients. The experts estimate that the real number of drug users can be five to ten times higher. Nearly 95% of the registered drug users are actually IDUs.

The rates of the HIV/AIDS-epidemic spread in Ukraine are the highest in the Central and Eastern Europe. During the recent years, the number of people registered as ill or dead from AIDS has increased dramatically.

The maximum loss from AIDS among males in the age group 30-to-34 years was 29%, while in females, this was true for 26% of the age group 25-to-29 years. The data of AIDS rates and deaths from AIDS are lower than actual rates because of insufficient levels of medical diagnostics; 84% of all individuals who died from AIDS were only diagnosed with AIDS when they were in the terminal stage of the disease or after they had died.

The epidemiological situation in Ukraine becomes even worse: The number of people who donate their blood while being HIV-infected is getting larger (from 0.06% in 1997 to 0.07% in 2000); as are those who have other sexually transmitted diseases (from 0.5% to 0.71%); those with multiple sexual partners (from 0.55% to 1.02%); and pregnant women (from 0.09% to 0.17%). Among European countries, Ukraine is the leader in the level of HIV-infected blood donors, as well as in the speed of the epidemic's spread, in the Central and Eastern Europe.

The trends of the epidemic development remain vague because of lack of adequate information. We can assume the beginning of the dangerous tendency of the epidemic to transfer to the "main" groups of the population. This assumption is supported by the fact that the rate of individuals infected by sexual activity through sexual ways, and not through intravenous drug use or transfusion, is getting larger. The rate of those infected through intravenous drug use in 1997 constituted 83%; in 1998, 77%; in 1999, 65%; and only 62% in 2000. But between 1997 and 2000, the percentage of pregnant women who were infected through sexual relations grew from 66% to 75%.

#### *Availability of Treatment and Prevention Programs*

The first national program for HIV/AIDS prevention was adopted in February 1992 and ran through 1994. Now the fourth one is running out, and the next has been developed for years 2004-2006. All plans were developed by a national committee against AIDS and are supported by a number of organizations: the Ministry of Public Health, the Ministry of Economics, the Social Defense Ministry, and the Department for Family and Youth. The general lines of the programs include promotion of condom use, an educational project, mass media action, and providing healthcare clinics.

The general goal is to slow down the epidemic of HIV and save thousands of lives. Medical aspects of the program are designed to reduce or eliminate the risk of getting HIV. The health workers have set themselves an ambitious goal:

mass awareness and understanding of how sexual intercourse can be made safer to reduce the risk of getting HIV. Another effort is to supply the population with condoms; approximately 150 million condoms will be provided annually for the needs of the Ukrainian population. The medical campaign against AIDS also requires testing donated blood and blood products by checking two million blood samples annually on a voluntary basis. Testing is compulsory for pregnant and some categories of the population.

Special attention will be given to laboratory testing for HIV-infection. More than 170 institutions will make four million tests a year, using clinical tests produced by the American firm Abbott and the French firm Sanofi Diagnostic Pasteur. The state will also promote development of a national industry for transfusion blood screening. The program also contains measures for healthcare of laboratory and hospital personnel in order to reduce the risk of their becoming infected.

The development of AIDS service organizations requires special training programs for responding without fear to the needs of all HIV-infected people who require medical or psychological help. Already, clinics in regional centers serve people with HIV or AIDS. Usually, they offer confidential medical services, pre- and post-test counseling, meals, housing and rental assistance, and complete medical evaluations. Again, all such services are free and confidential. The national program includes research studies of the viral causes of AIDS, the development of new diagnostic and treatment methods, and the search for an AIDS vaccine.

The main program direction is on promoting AIDS awareness among the population. A mass media effort on radio and television and in the newspapers should be effective in raising the knowledge about AIDS, especially how everyone can gain some protection. The information-educational work is focused on separating the scientific facts from the myths and providing information about the connection between sexual intercourse, oral and anal sex, and HIV transmission. High-risk groups will receive special attention, for example, prevention of mother-to-child HIV/AIDS transmission.

In November 2000, the President of Ukraine issued a decree, "About Urgent Steps to Prevent HIV/AIDS Spread." In order to fulfill this decree, the Government created a committee, which is responsible for inventing and monitoring strategic programs; coordinating central and peripheral executive authorities; and keeping the President, the Parliament, and the international public informed about the state of anti-epidemic measures.

Because of this Decree, the number of centers for AIDS prophylactics and control is getting larger. By November 2001, there were 27 such centers, seven of them had inpatient departments. Meanwhile, the National Program "Reproductive Health 2001-2005" (passed by Presidential Decree) and the HIV/AIDS Prophylactics Program of 2001-2003 (passed by Decree of the Cabinet of Ministers) have assumed governmental control over the epidemiological situation, medical examination on a voluntary basis together with after-test counseling, and regular and complete informing of the public about HIV/AIDS.

The main obstacle to realization of the governmental program lies in absence of its adequate regulation, monitoring, and effectiveness examination. The Program is missing the chapters about estimated results, effectiveness, criteria, and evaluation of fulfilled projects. The coordination of actions between different Ministries, departments, and specialized governmental institutions is a separate difficult question. Governmental programs on HIV/AIDS preven-

tion assume counseling services for the public. But the realization of the corresponding measures still remains in the initial stage.

The effectiveness of the existing counseling services is not sufficient, particularly for teenagers, youth, and especially for those groups who are at high risk for HIV-infection.

The most difficult obstacles on the way to effective counseling are:

- insufficient training of the specialists who deal with HIV/AIDS prevention and high-risk groups;
- lack of knowledge among children and youth about governmental establishments that give counseling services on HIV/AIDS;
- negative attitudes towards HIV-positive individuals on the part of both society and medical staff; and
- absence of control over the quality of counseling services as for HIV/AIDS.

[Update 2002: UNAIDS Epidemiological Assessment: By the end of 2001, a cumulative total of 39,752 cases of HIV infection had been reported to the National Health Authorities. Until 1991, HIV/AIDS surveillance was organized mostly through mandatory screening in subgroups of the population, together with contact tracing. Testing policies changed in 1991 with the introduction of anonymous voluntary testing. Testing remained compulsory for sex workers, IDUs, STD patients, blood donors and "other populations based on epidemiological considerations." In reality, few changes occurred; voluntary, anonymous, and free testing was less than 5% of all testing done in 1996. Diagnosed HIV infections that have been officially investigated are reported nationally with the name of the individual.

[In early 1995, HIV started to spread very rapidly among IDUs. The number of diagnosed infections increased from 398 cases for the whole period 1987 to 1994, to 1,490 in 1995, 5,400 in 1996, and a total of 23,315 in 1997 to 1999. These figures represent only officially registered cases and therefore underestimate the number of diagnosed cases. Highest rates of reported HIV infections were initially found in the region of Odessa and Nykolayev, but cases are now reported from all 27 regions of the country. Increases in HIV prevalence were also seen among STD patients and blood donors.

[Prevalence is mostly estimated from the screening programs. Sentinel surveillance is being implemented in IDUs in Odessa. Data on the relatively low HIV spread among homosexuals should be interpreted with caution in the context of a society where, until 1991, homosexuality was illegal and punishable. The diffusion of the epidemic through heterosexual contact is difficult to assess. Proportions of HIV-positive tests among pregnant women in Odessa and Nykolayev have reached levels similar to those of Western European cities. However, because the mode of transmission is not available in most cases, it is not possible to determine to what extent pregnant women have been infected through IDU or other means.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	250,000 (rate: 1.0%)
Women ages 15-49:	76,000
Children ages 0-15:	NA

[An estimated 11,000 adults and children died of AIDS during 2001.

[No estimate is available for the number of Ukrainian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction

A network of sexological consulting centers started to appear in Ukraine in 1965. It was a time when the first Scientific Research Institute of Kidney and Urinogenital Diseases started to function. There was a lab of endocrinology, which in 1972 was renamed the department of sexopathology, with two laboratories, endocrinology and spermatology. In 1974, the department was redesignated the Ukrainian Scientific Counseling and Organizational Methodical Center of Sexopathology and Andrology. The inspiration for its development belonged to Ivan Junda (1924-1994)—the honored scientist, State prize-winner, doctor of medical sciences, and professor. The main direction of his research was the etiology, pathogenesis, clinical symptoms, and methods of sexual dysfunction, treatment, men's infertility, and its prophylactics.

From the time of the Chernobyl catastrophe, the main direction of the research has been the occurrence of erectile dysfunction, urinary tract diseases in the territory of radiation dissemination, risk factors in the development of men's barrenness and women's infertility, and new methods of treatment of sexological and preventative measures for andrological diseases.

In 1992, the Ministry of Health renamed the department the Department of Sexology and Andrology. The head of the department is Honored Physician of Ukraine, Doctor of Medical Sciences, Professor Ihor Horpinchenko. The main direction of the research and treatment has been generative and copulative function in survivors of the Chernobyl catastrophe, an approbation of nontraditional treatment methods, and development of surgical methods for vascular forms of erectile dysfunctions. Special attention is paid to the research of the prevalence of some dysfunctions and infertility of nucleosides. The sexological investigation of such patients has led to development of tactics for their rehabilitation.

### B. The Availability of Diagnosis and Treatment

Ukraine was the first of the former Soviet republics where the system of regional counseling centers was created. Since the beginning of the 1990s, every large city in Ukraine has had its family or sexology consultation centers where sexologists and psychologists have begun to work together. Medical examination of the individual or couple is accompanied by psychological testing. This cooperation became more widespread with the creation in 1997 of Family Planning Centers.

Many women and men are seeking help at these centers, be it guidance, information, or reassurance. The number of sexological problems are considerable, but most are connected with the individual psychological culture. The diagnostic services of the consultation centers focus on the communications abilities and relationships between wife and husband or lovers, and the psychology of human sexual response. The latter is not limited to coitus, but extends to all the pleasurable and negative sensations associated with any sexueroetic contact.

The treatment part of the counseling deals with couple guidance and relationship problems, and on teaching interpersonal skills that can be applied in their everyday interactions as a couple. The program, usually a combination of traditional psychotherapy with behavioral-oriented therapy, is aimed at personal growth of the patient(s), and sexual healing, using dialogue, role playing, and group therapy. Constant efforts are made to help the patient(s) develop a warm and well-functioning relationship.

Most counseling services are free of charge and confidential. There are some nongovernmental family consultation services, available for those who can afford them.

### C. Therapist Training and Certification

There is no special licensing for sexologists at the Ukrainian universities. Mostly, sexologists by profession are those who hold the position of urologists (about 50%), psychiatrists (about 40%), and endocrinologists (about 10%), all with the education of a physician. Nevertheless, in 1988, a new physician speciality as sexologist was introduced by an order passed by Ministry of Health. In 1992, an order from the Ministry of Health regarding improvement of serological services stimulated development of medical-psychological and andrological counseling centers, as well as the Ukrainian Center of Sexopathology and Andrology at the Institute of Urology and Nephrology of the Academy of Medical Sciences. The Academic Director is Prof. O. Vozianov and the Center's Head is Prof. I. Horpinchenko. Since 1997, each regional (*oblast*) center has a department of medical-psychological family counseling, which is functioning under the guidance of regional head sexopathologist. Mostly, they deal with andrology diseases and infertility problems and are free of charge.

Sexological or family consultation centers are staffed primarily by physician-sexologists and by psychologists. Medical sexology as a discipline for physicians is taught by gynecologists, psychiatrists in graduate courses at the medical universities in Kyiv, Odesa, Dnipropetrovsk, and other cities, and in postgraduate courses at the Chair of Sexology and Medical Psychology, the Ukrainian Medical Postgraduate Academy (Kharkiv). Psychological problems in sexology are studied at the Teachers Training Universities in graduate courses, and in the candidate and doctoral program at the Institute of Psychology. The Ministry of Public Health of Ukraine, the Ministry of Education, the State Universities, and their scientific boards establish the criteria for programs, coursework, and requirements for education and certification in fields involved in diagnosis and treatment of sexual dysfunctions.

## 12. Sex Research and Advanced Professional Education

### A. Institutes and Programs for Sexological Research

Several government agencies are involved in and support sexological research. These include some divisions of the Ministry of Public Health of Ukraine and Ministry of Science and Education of Ukraine, Academy of Pedagogical Sciences, and Academy of Medical Sciences.

Institute of Urology and Nephrology: Professor Olexandr Vozianov, director. Department of Sexopathology, Andrology, and Sexology Clinic: Professor Ihor Horpinchenko, chairperson. Address: 9a, Kotsubinskyj vul., Kyiv 04053; tel.: 38-044-216-5054; fax 38-044-244-6862. Research includes: the sexology and andrology of aging; the Chernobyl catastrophe and changes in the reproductive function; development of objective diagnostic methods for sexual dysfunctions; investigation of the pathospermia factors in infertility couples; and biochemical aspects of erectile dysfunction.

Kyiv Research Institute of Clinical and Experimental Surgery: Professor Valerej Saenko, director. Address: 30 Herojiv Sevastopolia vul., Kyiv 04180; tel.: 38-044-483-1374; fax 38-044-483-5219. Research includes: improvement and development of body surgery corrections of transsexual persons; diagnosis and treatment of the vascular impotence; and endoorthopedic prosthetic appliances.

Kyiv Medical Postgraduate Academy, the section of Parenatology of Child Obstetrics and Gynecology: Professor Zoreslava Shkiriak-Nyzhnyk, chairperson. Address: 8 Manujil'skoho vul., Kyiv 04050; tel.: 380-44-213-6271; fax 380-44-213-6271, chislow@public.ua.net. Research includes: family and female reproductive health; sexual enlightenment; sexual morality; and bioethics.

Kyiv Research Sexology and Andrology Center: Head: Holotsvan Olena, Ph.D. Address: 8 Smolenska vul., Kyiv 04057; tel.: 380-044-228-0103; fax 380-44-543-8421. Research includes: adult sexual dysfunction; male and female infertility; personal disharmonies in sexual relationship; social and biological factors in transsexuality and homosexuality; hospital investigation and the treatment of sexual diseases (prostatitis, urethritis, epidermitis, etc.); and treatment of gender identity disorders and conditions.

Ukrainian Postgraduate Academy (Kharkiv). The Chair of Sexology and Medical Psychology: Professor Valentyn Kryshchal'. Address: 81/85 Myronositska vul. Charkiv 310023; tel.: 38-057-245-1056. Research includes: gender dysphoria; sexual identity disorders; prophylactics of sexual dysfunctions; VCT counseling; matrimonial disharmonies; causes as well as medical and psychological methods for the evaluation of dysfunctional couples; marital therapy and treatment programs.

Other major institutes with programs for sexology and gender-related research are governed by the Ministry of Science and Education and Academy of Pedagogical Sciences.

National Pedagogical M. Dragomanov University, Institute of Psychology and Pedagogy. Address: 9 Pyrohova vul., Kyiv; tel.: 380-044-216-3007; fax 380-44-224-2251. Research includes: techniques for teaching human sexuality courses; childhood sexual development and behavior; and comparisons of gender behavior in cross-cultural investigations.

Ukrainian Academy of Pedagogical Sciences, H. Kostjuk Institute of Psychology, Prof. P. Chamata's Laboratory of the Psychology of Personality: Professor Myroslav Boryshevskiy, chairperson. Address: 2 Pan'kivs'ka vul., Kyiv 01033; tel.: 380-44-244-3320; fax 380-44-244-1963. Research includes: development of gender self-consciousness in childhood and adolescence; parental roles in developing child sexuality; and development of sex-education programs for children and teenagers.

V. Hnatjuk Ternopil Pedagogical University, Institute of Psychology. Head of the Institute: Professor Volodymyr Kravets; tel.: 380-353-3-1297. Research program manager: Dotsent Oksana Kikinezhadi. Address: 2 Maksyma Kryvonosa vul., Ternopil, 46027; tel.: 380-35-222-1587; email: okikinezhad@tspu.edu.ua. Research includes: gender socialization; psychosexual development; and sexual education.

### B. Graduate Programs and the Advanced Study of Human Sexuality

According to the basic college education, there are a variety of postgraduate advanced courses of study available in Ukraine. Some of these are listed here with their focus, sponsoring agency, and address.

Master's degree programs in human sexuality: Ministry of Public Health of Ukraine, Ukrainian Postgraduate Academy. The chair of sexology and medical psychology: Professor Valentyn Kryshchal'. Address: 81/85 Myronositska vul., Kharkiv 310023; tel.: 380-57-245-1056.

Graduate courses in sexology for the physicians' advanced training; doctorate programs in sexuality and family studies: Ministry of Public Health of Ukraine. Address: Kyiv Research Institute of Urology and Nephrology, 9 a In. Kotsubinskyj vul., Kyiv 252053; fax: 380-44-244-6862.

Postgraduate courses on sexual behavior for an academic degree in developmental psychology: Mychailo Drahomanov National Pedagogical University, Address: 9 Pyrohova vul, Kyiv 01601; fax: 380-44-224-2251.

### C. Ukrainian Sexological Journals

Four sexological journals are published in Ukraine:

*The Journal of Sexology and Andrology.* Address: Editor, 9 a Kotsubynskoho vul., Kyiv 04053; fax: 380-44-244-6862.

*All-Ukrainian Scientific-Practical Journal: Man's Health.* Edited by Kyiv State Department of the Ministry of Public Health, Institute of Urology and Nephrology Academy of Medical Sciences. Address: 53 Hlybochitskaja vul., Kyiv, 04050; tel.: 380-44-23784; tel./fax: 380-44-243-3533; email: elenaprofessional@svitonline.com.

*Scientific Medical Journal: Dermatology, Cosmetology, Sexopathology.* Established in 1997, and edited by Dnipropetrovsk State Medical Academy, Sexual Health Center. Address: 3a, Artema vul., Dnipropetrovsk, 49001; tel.: 380-562-44-0562; fax: 380-567-44-3140.

*The Journal of Sexopathology and Andrology.* Address: Borys Vornyk, Ph.D., editor, 8 Smolenska vul., Kyiv 02057; fax: 380-44-456-2203. (A semi-annual publication).

Two important popular mass-media publications in Ukraine deal with sexuality:

*Lel'.* Editor: S. Chyrkov. Address: 38-44 Dehtjarivs'ka vul., Kyiv 04119; tel.: 380-44-211-0268; 213-3220; email: lel@torba.com. (A quarterly Ukrainian erotic magazine).

*Family Medical-Social Problems* (a quarterly journal) Editor: V. Chajka. Address: Panfilova Prospect 3, Donetsk 83114; tel.: 380-622-58-4366.

### D. Major Sexological Organizations

The Ukrainian Society of Sexologists. Address: 9 a In. Kotsubynskiy vul., Kyiv 04053; tel.: 380-044-216-5054; fax 380-44-244-6862. This national professional organization includes physicians, psychologists, and teachers of secondary high schools, colleges, and graduate schools who unite their efforts in a scientific research and applied work on human sexuality.

The European-Asian Association of Sexologists. Address: P.O. Box 274., Kyiv 01034; tel.: 380-44-455-0280; email: eaas@ukr.net. This is an international organization of sexologists from former Soviet republics and of professionals from abroad. Its annual meetings in sexual science are usually held in September in Kyiv, the capital of Ukraine.

Ukrainian Family Planning Association. Address: Pr. Pobedy 30, apt. 32 Kyiv, 03055; tel.: 380-44-236-6540; fax: 380-44-236-9704; email: ufpa@semja.kiev.ua.

## 14. Ethnic Minorities

Ukraine is motherland to more than 130 ethnic groups. Bulgarians, Serbs, and Poles have been settled in Ukrainian territory since the 18th century, Moldavians since the 16th century, gypsies since the 15th century, and Jews since the 14th century. Most of these ethnic minorities identify themselves with some nation in the world, but some of them, like the Budjak Gagauzers and Tavrida Tartars, have developed as an ethnic group within Ukraine, and thus consider themselves a native minority population.

### A. The Tartars

In the 1940s, all Tartars, descendants of various Mogul and Turkish tribes, were forced to leave their homes in Ukraine. Today, those who survived Stalin's genocide policies are trying to return to the Crimea and Tavrida steppes.

According to the all-Ukrainian census in 2001, 248,200 Tartars were registered, which is 5.3 times higher than in 1989. In the Crimea, there are 243,400 Tartars, 12% of the population, which is 6.3 times higher than in 1989.

The Tartar family, as any family, is a system for social control and inculcating cultural behavior patterns for all its members. Before their forced eviction, the Tartars lived mostly in extended families. These family communities included two or more brothers with their wives, married children, and grandchildren. Such kin constituted an independent economic and social group, which remained a primary vehicle for preserving and transferring customs and traditions.

Most Tartar families today are nuclear, although the authority of males, especially older males, is maintained as a tradition. In all family settings, the superiority of males is considered normal and natural. Marriage is prohibited within seven generations of blood kinship. Tartar sexual culture is more permissive for men, whether young or old; women are held to much stricter standards. The wife's devotion to her husband is very much appreciated and expected, as well as the obedience of all women to their father, brothers, and male relatives by marriage. The family is viewed as a social, religious, and moral unity, based on the wife's efforts to support her husband and maintain a positive psychological climate among the relatives. That is why developing honesty and innocence is the main focus in raising girls. The Tartars have different rituals to protect virginity, and its public manifestation indicates the important role virginity plays in the appreciation of marital intimacy. It is taboo for bridegrooms to admit sexual competence before their wedding.

In modern Tartar wedding celebrations, a lot of ethnic prescriptions are maintained. The women's and men's communities are located in different rooms. Newlyweds are expected to show the groom's relatives the signs of the bride's virginity by the time of marriage. The young wife puts a red kerchief on her head, while her husband wears a red ribbon-belt around his waist as a symbol of sexual innocence. Red strings link the generations, as well as brothers, sisters, and relatives by marriage. All play special roles during the wedding ceremony and try to help the young couple as they settle into married and family life. According to ethnic beliefs, sexual feelings and private matters should be subject to human reason and the stability of marital relationships. Some traditional presents for newlyweds symbolize the support of the family: a wedding candle to make life light and clear, and a round meat pie (*kobete*) to symbolize good health and children.

### B. Koreans

Koreans as an ethnic minority came to Ukraine mostly after World War II. In families where one spouse is Korean and the other non-Korean, national customs are much more carefully maintained when the wife is Korean than when the husband is Korean and his wife non-Korean. Korean gender behavior is determined by the commandments of *Conphutsy* [Confucian?] ideals of great respect for ancestors, harmony within the marital unit and society, strict subordination of the younger to their elders, and the high authority of the father and male relatives.

Korean marriage is considered not only the unity of husband and wife, but of two families or kinships. Although the dominant position of the male is preserved in all family matters, the Korean woman does not change her last name after marriage. Thus, many Korean families in Ukraine have doubled names with two surnames. The Korean minority has adjusted to Ukrainian holidays but try to preserve their national festivals. One of the more important of these

is the commemorative feast in which every person celebrates in him- or herself the past, the present, and the future of parentage.

An appreciation of the growing personality and the older generation is at the core of most Korean family holidays. Among these is the celebration of a hundred days after the baby's birth. The belief is that if a hundred guests share in the banquet that day, the child will live a happy and long life. When a baby is 1 year old, he or she may foretell his or her future destiny. For that purpose, the parents place some different toys before the child. If the baby chooses the money, it will be successful in business in the future; if a book is chosen, the future adult will be lucky in science and intellectual pursuits, and so on.

Since Korean marriage is considered to be a union of two kinships, special gender behavior patterns are honored during the wedding ceremony. The bride and groom stand face-to-face, bow to each other, ritually clean the hands, exchange goblets of wine, and drink from the cup. Usually, Korean families remember and commemorate four times a year at least four generations of their ancestors who are known by name and profession.

The sexual attitudes and customs of Tartar and Korean ethnic minorities in Ukraine, like any ethnic minority in any country, are continually undergoing change and adapting, being influenced by the majority culture and, at the same time, more or less influencing and changing that majority culture.

## *Demographics and a Brief Historical Perspective*

### A. Demographics

ROBERT T. FRANCOEUR

The United Kingdom, composed of England, Wales, Scotland, and Northern Ireland, faces the northwestern edge of Europe. The British Isles, with 94,525 square miles (244,820 km<sup>2</sup>) is about the size of New York State. The English Channel separates the British Isles from France on the south, Belgium, the Netherlands, Denmark, and the southern tip of Norway to the east. To the west, across the Irish Sea, is the Republic of Ireland. In 1920, the British Parliament divided Northern Ireland from Southern Ireland and gave each its own parliament and government. A few years later, when Ireland became a dominion and then an inde-

(CIA 2002)

pendent republic, six of the nine counties of Ulster in the northeast corner of the country chose to remain a part of the United Kingdom. The Crown Colony of Hong Kong and Asia is now part of the People's Republic of China (see separate chapter on Hong Kong). There was devolution to a Scottish Parliament in 1999. The formation of a multiparty Northern Ireland assembly was initiated in 1999, although it was temporarily suspended in early 2000.

Geographically and culturally, the main island of the British Isles has three regional entities, England, Scotland, and Wales. The Principality of Wales in western Britain has an area of 8,019 square miles (20,769 km<sup>2</sup>) and a population of about three million. After early Anglo-Saxon invaders drove the Celtic people into the mountains of Wales, these people, who became known as Welsh ("foreign"), developed their own distinct nationality. English is the dominant language, with less than 20% of the people of Wales speaking both English and Welsh; some 32,000 speak only Welsh. The former kingdom of Scotland occupies the northern third of the main British island. The central lowlands, a belt approxi-

\**Communications:* Kevin R. Wylie, M.B., Whiteley Wood Clinic, Woofindin Road, Sheffield S10 3TL England, United Kingdom; k.r.wylie@sheffield.ac.uk.

mately 60 miles (96.5 km) wide stretching from the Firth of Clyde to the Firth of Forth, divides the farming region of the Southern Uplands from the granite Highlands in the north. About three quarters of Scotland's five million people live in the Lowlands, concentrating in the industrial center of Glasgow (population: three quarters of a million) and the capital, Edinburgh (population: half a million). The Hebrides, Orkney, and Shetland Islands are also part of Scotland. England, the heart of the United Kingdom, has a population of close to 50 million people. London, the capital, has a population of about seven million; Birmingham, the second largest city, has a population of about a million.

The United Kingdom of Great Britain also includes the Channel Islands, the Isle of Man, Gibraltar (between Spain and Africa), the British West Indies and Bermuda in the Caribbean, the Falkland Islands and dependencies in the South Atlantic, and Pitcairn Island in the Pacific Ocean. This chapter focuses on the sexuality in England, Wales, and Scotland.

In July 2002, the United Kingdom had an estimated population of 60 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 18.7% with 1.05 male(s) per female (sex ratio); *15-64 years:* 65.5% with 1.02 male(s) per female; *65 years and over:* 15.8% with 0.72 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 77.99 years; *male:* 75.29 years; *female:* 80.84 years

**Urban/Rural Distribution:** 89% to 11%

**Ethnic Distribution:** English: 81.5%; Scottish: 9.6%; Irish: 2.4%; Welsh: 1.9%; Ulster: 1.8%; West Indian, Indian, Pakistani, and other: 2.8%

**Religious Distribution:** Anglican: 27 million; Roman Catholic: 9 million; Muslim: 1 million; Presbyterian: 800,000; Methodist: 760,000; Sikh: 400,000; Hindu: 350,000; Jewish: 300,000

**Birth Rate:** 11.34 births per 1,000 population

**Death Rate:** 10.3 per 1,000 population

**Infant Mortality Rate:** 5.45 deaths per 1,000 live births

**Net Migration Rate:** 1.06 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.73 children born per woman

**Population Growth Rate:** 0.21%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.11%; *Persons living with HIV/AIDS:* 31,000; *Deaths:* 450. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 100%; education is compulsory from age 5 to 16

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$24,700 (2001 est.); *Inflation:* 1.8%; *Unemployment:* 5.1%; *Living below the poverty line:* 17%

## B. A Brief Historical Perspective KEVAN R. WYLIE

Until about 10,000 years ago, Britain was connected to the European continent by a land bridge that made it convenient for peoples to migrate back and forth. With the end of the last great Ice Age, and the slow but inevitable melting of the ice masses that covered Europe and North America, the sea level gradually rose, separating the continent from the British Isles with the English Channel. Despite the new obstacle, people continued migrating, as the Celts did to the isles some 2,500 to 3,000 years ago. This Celtic influence can still be found in the language and culture of the Welsh and Gaelic (Irish) enclaves. England became part of the Roman Empire in 43 of the Common Era. The Roman legions withdrew in 410. In subsequent centuries, particularly the

8th through 11th centuries, waves of Germanic Jutes, Angles, and Saxons competed with Danish invaders for control of the island. In 1066, Duke William led the Norman conquest of Britain, bringing continental feudalism and the French language, essential elements in later English culture.

In 1215, the nobles forced King John to sign the Magna Carta, guaranteeing the rights of the people and the rule of law, and setting the stage for the development of a parliamentary system of government. Defeat in the Hundred Years War with France (1338-1453) was followed by a long civil war, the War of the Roses (1455-1485). While European countries were racked by wars, English culture and a strong economy flourished under the powerful Tudor monarchy and a long period of domestic peace. Establishment of the Church of England in 1534 under the monarch separated England's religious institutions from the authority of Rome. Under Queen Elizabeth I, England became a major naval power, with colonies in the Americas. Britain's trade throughout Europe and the Orient also expanded. Scotland became part of England in 1603 when James VI of Scotland became James I of England. A struggle between Parliament and the Stuart kings, a bloody civil war (1642-1649), and establishment of a republic under the Puritans, ended with the restoration of the monarchy in 1688. The sovereignty of Parliament was confirmed in the "Glorious Revolution" of 1688 and a Bill of Rights in 1689.

The 18th century in England was distinguished by a strengthening of the parliamentary system and technical and entrepreneurial innovations that produced the Industrial Revolution. England lost its colonies in the American Revolution, expanded its empire with growing colonies in Canada and India, and strengthened its position as a leading world power. The 19th century was marked by extension of the vote in 1832 and 1867, formation of trade unions, development of universal public education, the spread of industrialization and urbanization, and, under Queen Victoria (1837-1901), the addition of large parts of Africa and Asia to the empire.

Britain suffered huge casualties and economic dislocations as a result of World Wars I and II. Although industrial growth returned after the wars, Britain lost its leadership role to other nations. Ireland became an independent republic in 1921, but the Irish question has persisted. In recent years, the socialized medicine, social security support systems have posed increasing questions for the government and people.

## 1. Basic Sexological Premises

PAULA NICOLSON [*Rewritten and updated in late 2001 by P. Nicolson*]

### A. Character of Gender Roles

Gender roles in the United Kingdom have been influenced both by social class, which has ensured the maintenance of gender segregation, particularly among the upper and working classes, and fluctuating demographic, political, and cultural changes over the past 80 years, which have stimulated shifts in traditional patterns. For example, during World War II, women were employed in manufacturing, commerce, and agriculture, accompanied by good state provision of daycare for children. However, following the demobilization of the male population in the 1950s, there was a political emphasis on 'pronatalism' in order to replenish the population and to free up employment possibilities for men. Therefore, women's responsibility for the mental and *physical* health of their families was encouraged, which meant a return to traditional gender lifestyles.

Although since the mid 1980s there has been a clear political commitment to seeing men and women as equal, a division of labor remains in the home, which spills over into

the workplace. This distinguishes men's and women's behavior and expectations along traditional stereotypical lines: Men are seen as powerful, rational, and "naturally" the breadwinners, and women are seen as dependent, emotional, and "naturally" suited to the domestic sphere.

Feminist influence, hand in hand with high levels of male unemployment since the early 1980s among all social classes, has meant that many men have taken greater responsibility and interest in childcare than previously. The resulting image of the "new man" in touch with his emotions, with nurturing skills, remains a contestable one, however.

Increased educational opportunities have enabled women to enter professional life, a process that has increased since the 1970s, although few women rise above middle-management level.

During the 1990s, biological essentialist explanations of gender roles have emerged as a "backlash." Darwinist natural selection theory, embraced by evolutionary psychology and sociobiology, has been enthusiastically taken up by the conservative forces within the academic community and the British media. They espouse the view that there are natural, irrefutable, and irreversible reasons why women are better suited to childcare than men. Also, women are less suited by their "natures" to reach the top of their professions. Women are "naturally" averse to the risk-taking and aggressive behaviors appropriate to high-powered work. These are the predominant explanations of gender-role differences as we enter the 21st century.

## B. Sociolegal Status of Males and Females

Males and females officially have equal status in the United Kingdom in terms of human rights, but there remain certain sociopolitical distinctions. For instance, many women receive reduced unemployment benefits and pensions because they have not had to pay full contributions during their working lives and have had career breaks. However, women are entitled to a retirement pension at the age of 60, while the retirement age for men remains 65. This is currently the subject of political debate and statutory changes.

The legal age of consent for heterosexual women and men is 16. It is only recently that the age of consent for homosexual men was reduced from 21 to 18. The ban on homosexuals of both sexes in the armed services was lifted at the end of 1999.

The age of heterosexual consent means that it remains illegal for doctors to prescribe contraceptives to women and men under the age of 16 without parental consent, a contentious issue, which remains unresolved. The Labour Government elected in 1997 pledged to cut teenage pregnancies. However, recent evidence suggests that teenage girls do not wish to take oral contraception on a regular basis because of the well publicized "health scares." Many consider an abortion to be safer.

Certain legal judgments have demonstrated inequalities in attitudes towards women and men. For instance, some adolescent and older men found guilty of rape have received relatively light punishments; in some rape cases, women have been portrayed as guilty of "contributory negligence"; men who have killed their female partners because they "nagged" or were unfaithful were given light sentences or had the murder charge changed to manslaughter; conversely, women who killed male partners after years of violent physical and sexual abuse have been found guilty of murder and given long-term prison sentences. This is indicative of the underlying ideology that favors male domestic authority and the traditional view of the male sex drive as dominant.

One mothers are frequently portrayed by politicians as irresponsible, and their entitlement to state benefits questioned. This was counterbalanced to some extent by the creation of

the controversial Child Support Agency, which pursued absent fathers for maintenance. Recent developments, however, have encouraged single parents to work outside the home, and benefits have been withdrawn from those who resist.

## C. General Concepts of Sexuality and Love

The majority of the population in the United Kingdom are able to choose their sexual partners on the basis of attraction and love. This, however, does not apply among some minority ethnic groups, nor to social-class groups where a socially suitable marriage is encouraged.

Since the late 1960s, there has been an increased liberalization of attitudes towards sexuality. The age of first heterosexual intercourse for women has come down from a median age of 21 for those born in the 1930s and 1940s, to 17 for those born between 1966 and 1975. The gap between the age of first intercourse for women and men has decreased over the past 50 years, and for the current generation of young people, it is virtually the same for both sexes. A sizeable minority of both sexes is sexually active before the age of 16. A high proportion of sexually active 16-year-olds do not use contraception (Wellings et al. 1994).

The category 'homosexual' is no longer seen as discrete and exclusive, with more people changing sexual orientation over the course of their life (Dancey 1994). However, it remains the case that heterosexuality is taken as the norm, and sexual satisfaction is understood to be orgasm for both partners during intercourse (Nicolson 1993). There has been an increase in the availability of practitioners, and the willingness of couples and individuals to seek psychosexual counseling when they fail to achieve sexual satisfaction. The availability of Viagra has influenced the debate on sexual satisfaction, and declarations that a female version will soon be on the market have been welcomed as an antidote to anorgasmia in women.

Serial monogamy rather than lifetime marriage remains the norm in the U.K. as in the U.S.A., with fewer people getting married and as many as one-in-two marriages ending in divorce.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

JOSÉ VON BÜHLER

### A. Sources and Character of Religious Values

Since the 1950s, Britain has become increasingly a pluralistic country in terms of cultures, ethnicity, and religion. Hinduism mixes with Roman Catholicism, Islam with Judaism, and Methodism with Buddhism. Some of these religions are almost inseparable from their social fabric, culture, and ethnic grouping. Others offer a moral and spiritual framework separate from ethnic practices. The common denominator in the existence of this pluralism is that, apart from the establishment franchise of Anglicanism, which in reality makes it the "state religion," all religious bodies in the United Kingdom are equal under the law of the land. This equality confers certain rights and privileges in respect of education, worship, social welfare, and democratic political rights.

However, the multifaceted character implied in interdenominationality in many instances is generally not understood by the public at large, or even the members of the various groups. Philosophically and socially, there is frequently a disconnection that does not allow for cross-fertilization of ideas. Nor does it allow for comparative analysis of the positive approach to sexual concepts and even sexual activities in many religions when their scriptures are properly understood! In this climate, it is easy for fundamentalists of every denomination to represent human sexuality in the religious/spiritual content as negative and somehow

taboo. This tension was noted in a 1992 report from the Sex Education Forum, an umbrella body for several religious and secular organizations concerned with providing and supporting sex education for young people. The report, *An Enquiry into Sex Education: Report of a Survey of LEA Support and Monitoring of School Sex Education* (Thompson & Scott 1992), clearly identified “anxieties concerning ethnicity and religious issues to be a significant barrier to the effective provision of sex education.” Indirectly, the report confirmed that the distance between religious legal equality and ethnic, social, and moral framework patterns and concepts is rather unequal among the various religious and ethnic groups in the United Kingdom.

Prior to the 1950s, the religious influences forming sexual constructs came almost exclusively from “the official church” of England, and “unofficially” from the other Christian denominations. In recent decades, the picture has become more complex. Since midcentury, the Church of England’s approach to social morality and sexuality has fluctuated between two poles, the traditionalists and the modernists, or the “permission givers” and the “orthodox moral directors.” With the national religious scene resembling the circular approach of the politicians to sexual knowledge and attitudes, the sociosexual control and influence appears to bounce back and forth between church and state according to a mutually cooperative formula. In many cases, however, liberal attitudes have triumphed, as evidenced by the Church’s acceptance of divorce, homosexuality, and contraception. In other cases, the traditionalists have retained a firm moral control. This doctrinal “pendulum” is confusing for the majority of the population who are not experts at moral and theological niceties and subtleties. The people themselves are part of the system of confusion: While expecting clear and definite moral messages from both establishment and Church, they reserve the right to judge the validity of those messages, even when they are biblically based.

With quiet, behind-the-curtains efficiency, the Roman Catholic Church has been influential in shaping national morality and sexuality. Its most authoritarian pronouncements about homosexuality and abortion have been tempered by professions of love for the individual while condemning same-gender sexual activity. To the democratic soul of the British people, Roman Catholic moral doctrine appears autocratic and dictatorial, even while it provides a secure, unchangeable frame of reference that is not answerable to cultural and ethnic differences, a characteristic attractive to the orderly British. Other Christian denominations, such as Methodism and the evangelical Protestant churches, swing between permission and condemnation. Methodists, for instance, accept that sexual learning should present the biologically functional principles and, at the same time, should be equally aware of human relationships and their influence in the happiness of the individual.

Whatever the sexual-moral code of the many Christian traditions in Britain, the individual appears to have the final word in moral choices, as long as these choices are based on “fairness” and “not hurting other people.” Nonetheless, it appears that religious beliefs are still a major influence on sexual attitudes and values. In this regard, for instance, the findings of the research study, *Sexual Attitudes and Life Styles* (Johnson, Wadsworth, Wellings, & Field 1994), regarding first sexual intercourse are rather revealing:

Respondents belonging to the Church of England or other Christian Churches (excluding the Roman Catholic Church) were less likely to experience sexual intercourse before the age of 16, and those from non-Christian reli-

gions even less likely to do so. More surprisingly perhaps, given the position of the Roman Catholic Church on sexual behaviour, those reporting Roman Catholic affiliation are no less likely than those reporting other affiliations to report intercourse before the age of 16, and if anything slightly more so.

Notice that this applies exclusively to first sexual intercourse and not to other sexual intimacies.

In the ever-swinging pendulum of action and counteraction, an example of final-choice control is that of the decision made recently by members of the Church of England regarding homosexuality. Whereas the moral traditionalists within the hierarchy of the Church have tried to reverse the acceptance of gay priests, priest advocates of homosexual rights have topped the polls in the Southward and London dioceses in elections for the Church of England’s General Synod, the “church’s parliament.”

Nonetheless, Christianity no longer has total influencing control over the sexual morality of the British people. The pluralistic and interdenominational society in existence in Britain has seen to that. The influence of Islam, for instance, is evident in national moral pronouncements because of the increasing number of adherents to the faith and its sexual moral code. In common with Catholicism, Islamic sexual and moral teachings transcend ethnicity and culture. Human sexuality is not a taboo subject, but must be dealt with in the context of the family with an open mind and in a way enriching to the individual’s developmental and religious perspectives.

The influence of Hinduism and its sexual-moral code on the general population has not been as public. Hinduism is a pragmatic religion, and perhaps because of this pragmatism, issues of sex and sexual activities and practices are rarely discussed. Traditionally, there is an association between religion, erotica, and the highly culturally priced art of love, but in modern culture, one suspects that this connection is the domain of the “literati” and quite foreign to the contemporary Hindu family. Judaism teaches that sexual pleasure is an integral part of the marital/sexual relationship. In its positive view of sexual relations, the principle of pleasure and sharing mutual happiness by a physical relationship is validated.

[Update 2001: The dawn of the 21st century brought with it, contrary to liberal expectations, a much greater re-entrenchment of the ecclesiastical negative status in terms of sexual freedoms. The axis of dialogue and understanding moved considerably to the right. Within the Anglican Church, the sense of fear about individualistic decision-making was significantly expressed in some of the pronouncements of individual bishops. These pronouncements traveled uncomfortably between narrow lines. The Anglican Church, or at least one of its Bishops, apparently chastised married couples who did not respond to the extraordinary insistence of the churches in the procreative model for the “selfishness” of not having children. The whole episode, as is often the case in modern times, became the domain of all the spin-doctors, albeit of the theological variety, and in doing so, lost all of its potential strength for change.

[The Roman Catholic Church seemed to forget, at least temporarily, its focus on the sins of the flesh in favor of a partial examination of conscience in the matters of violence, cruelty, and persecution of others by Church members in the past. In what I believe to be one of the most personally brave and spiritually significant gestures of any Pope in history, John Paul II knelt and expressed his sorrow for past injustices of the Roman Catholic Church in a special penitential on Sunday, March 12, 2000. The reaction by friend and foe was mixed, precisely because of the partial condition of the ex-

pression of sorrow. The apology was about the past. The apology was further diluted by considering that historical activities, however much in error, cannot be judged with the same measuring rods of the present. George Monbiot in *The Guardian* (March 9, 2000) made the comment, in discussing Cardinal Biffi's "medievalist" approach, that "those who believe in absurdities will commit atrocities." The Papal apology recognized, directly or indirectly, that the belief in the exclusive goodness of one religion might have led to the atrocities leading to the apology, that perhaps, in the past, the Church believed in absurdities and committed atrocities. In the light of history and future revision, might it not be possible that the Roman Catholic Church might acknowledge an absurdly fundamental antipathy towards sexuality and its scientific and humanistic study? Might it not be possible that the Church's undoubtedly rich and full contribution to the healthy study of sexual processes and their spiritual value might lead to a further apology? An apology this time in terms of all those, regardless of sexual orientation, whose sexuality is denied or condemned without the compassion of, at least, analysis of the life journey of that individual?

[The impact of the millennial developments, either from Rome or Canterbury, as it affects the British, is still to be seen. There is no doubt that new avenues for dialogue, criticism, expressed resentments, and outright dismissal of the religious developments will exist. We must wait to see if what appears to be the fear of the religious establishment about secularization are realized. History has a proven record for reinventing the wheel, and spirituality can be reinvented too. In the midst of this confusion, sexology in England has a unique opportunity to restructure its approach in relation to its preparedness to encounter spirituality ecumenically. (End of update by J. von Bühler)]

### B. Character of Ethnic Values

As suggested above, ethnicity plays an important part in the development of sexual and moral values, sometimes in connection with and sometimes apart from its religious connections. Four major cultural and ethnic components constitute the United Kingdom, the Irish, Scottish, Welsh, and the English themselves. Even within these groups, geographical position and class are influential. It is interesting to see that, although the various Christian denominations have adherents in every area of the British Isles, the ethnic groupings are numerically visible in the denomination of choice geographically. The Scottish have a tradition of Calvinism and Presbyterianism, the Northern Irish of Orange Protestantism, the Welsh of Chapel Christianity and Methodism, and the English as loyal but convenient subjects of Anglicanism in the tenets of the Church of England. This is, of course, a simplification of the religious/ethnic distribution, but it gives an idea of the association between ethnic values, religious tradition, and the influence of moral-theological principles on sexual values, and the acceptance or denial of sexual behavior. In this mixing pot of cultures, colors, religions, and nationalities, the views are almost infinite, and the British public has an almost inexhaustible amount of choices, although the majority of them are still of the prohibitive (sex-negative) kind. Yet, despite the many ethnic and religious prohibitions of sex, the British show an almost universal acceptance of sex before marriage, teenage sexuality, and the public discussion of topics, such as homosexuality, that were avoided not too long ago.

The British, according to Johnson et al. (1994), view sex outside a regular relationship as wrong, monogamy is upheld more by women than men, women show a greater tolerance of homosexuality than men, and, in general, there appears to be an attitudinal trait for permissiveness. In the

United Kingdom today, moral, religious, and ethnic influences on sexual attitudes, values, and behavior are no longer a case of *Roma locuta est, causa finita est* ("Rome has spoken, the argument is closed"), but more one of *Vox Populi* ("the voice of the people") with spiritual insurances.

### 3. Knowledge and Education about Sexuality

JOSÉ VON BÜHLER and PATRICIA BARNES

#### A. Government Policies and Programs

Historically, there has been a reluctance to legislate in the area of sex education in England and Wales. The government has taken formal responsibility for this only in recent years, prior to that issuing general "guidelines" on the general content and moral code. The actual responsibility for the delivery of sex education was undertaken by independent voluntary agencies. Prior to World War II, the focus was on social hygiene, public health, and personal morality, addressing predominantly issues of sexually transmitted disease and unplanned pregnancy.

In the postwar years, educational philosophy and research adopted a sociological perspective and centered on the family. A partnership developed between educational and health establishments, and slowly the form and content of sex education became more concerned with the general well-being of the individual.

In 1968, the government provided funding to the newly formed Health Education Authority and the voluntary agencies, particularly the Family Planning Association (F.P.A.) and National Marriage Guidance Council (N.M.G.C.), to train teachers and provide resources for sex education. Although the political agenda was predominantly preventative in terms of public health, developments in sociological and psychological thinking were woven into educational efforts. These Personal and Social Educational Programmes (PSE) inevitably had a heterosexual and reproductive orientation. The medical and nursing professions began to teach from a "humanistic" platform, but it would be some time before a clear definition of humanistic principles in the discussion and delivery of sex education existed. The union of social trends and public policy brought about the beginning of social awareness of a sexuality in which the individual's personal growth mattered and sexual concepts started moving away from the purely biological.

The late 1970s and early 1980s saw the public face of feminism, antiracism, and gay liberation. The impact on local government and education was in the form of legislation on equal opportunities and antiracist policies. Despite a growing social need and awareness, a formal educational curriculum in sexuality for secondary, higher, and professional education did not exist. Some medical schools experimented, not without problems, with seminars and study days. They were influenced by a growing number of professional counselors and sex therapists, pioneers in the principles of particularity and personal entitlements in the field of sexual development. The Local Education Authorities, for example, were responsible for providing sexual curriculum guidance to schools, but the government did not involve itself in the growing revisionist consensus developing between education, health, and voluntary agencies, which put the person at the center of this consensus.

The political ethos of the 1980s concentrated on a dramatic return to a "new moral framework," which in essence represented a return to Victorian values. The role and function of the local education authorities and F.P.A. were inherently discredited. The responsibility for sex education in secondary schools (11- to 18-year-olds) suddenly trans-

ferred to the individual school governing bodies (H.M.S.O. 1987). The requirement was that sex education should be delivered within a moral framework, and that parents had to be consulted about the curricular nature. In 1987, the Department for Education issued guidelines and specific directives to school governors on the teaching of so-called controversial subjects, such as HIV, AIDS, and homosexuality. The guidelines and directives conveyed a clear public message that sex education was viewed by the government as inherently controversial. This message caused a fundamental dilemma between the needs of pupils and the requirements of the system. This dilemma was also present between the health needs in an age in which sexual awareness became part of a larger social picture and the apparent reluctance of responsible government bodies to accept sex education in its wider context of human sexuality.

At this time, there was politically little to be done regarding sex education in colleges, universities, and medical and nursing education. The academic input in these areas was neither of an official nature nor sufficiently effective to present a case for socially individualistic approaches. In many ways, this was supportive of the political status quo. The legislative disinterest in the activities of higher and professional education in the field of human sexuality and the dedicated work of individuals allowed universities and medical schools to design and deliver functional and integrative programs in human sexuality. Thankfully, these educational programs provided the United Kingdom with practitioners, teachers, and researchers in the field of sexuality since the mid-1980s. At the same time, voluntary agencies became repositories of the considerable body of knowledge and skills in the education and therapeutic interventions in human sexuality. It is difficult to understand today how such dichotomies could exist hand in hand with the World Health Organization's definition of sexual health. That definition clearly affirms the primacy of a "social and personal ethic." It also affirms the need for "freedom from fear, shame, guilt, false beliefs and other psychological factors inhibiting sexual response and impairing sexual relationships." University, medical, and professional education and the therapeutic professions tried to synthesize the issues of education and health, particularly by establishing working and investigative groups. The advantage of these groups was that many of their members were experts in the field of human sexuality.

In 1988, Section 28 of the Local Government Act was enacted to prohibit the Local Education Authorities from "promoting homosexuality." Much confusion ensued. In reality, this clause only applied to the Local Education Authorities' activities and not to educational processes in the classroom. However, this act firmly reestablished the religious/moral influence on sex education.

Also in 1988, a National Curriculum in education was introduced. This differentiated between the "core" or mandatory subjects of mathematics, English, and science that had specific curricula to cover at different key stages and the "noncore" subjects. Sex education was a "noncore" item. In the interest of public health, however, the reproductive and disease components were included in the core science curriculum, and therefore were obligatory to teach.

In 1990, the National Curriculum Council published *Curriculum Guidance 5: Health Education*, which recommended that the nine health education themes (of which sex education was one) should be coordinated across the curriculum. Four key stages representing age bands were identified to assist delivery of appropriate information in a developmental manner. However, many revisions in both guidance and legislation occurred subsequently with particular reference to the sex education component.

Advised by counselors and sexual and marital psychotherapists, the medical and nursing professions perceived sex education as important in their own clinical effectiveness in the treatment of sexual dysfunction. Some medical schools and nursing colleges established their own sexual health curriculum, but once more, the teaching input focused primarily on the organic and health content of sexuality. The integrative delivery of the subject, supposedly suited to increase knowledge and change attitudes both in higher and professional education (von Bühler & Tamplin 1995), depended on the clinical and scientific expertise of a few professionals, who, in many cases, had to fight against long-held concepts and prejudices. This situation led to an educational lottery with little academic cohesion and, of course, the unavoidable controversy between the purely medical and the more-eclectic approach.

Health economics and a realistic awareness of social needs obliged the government to produce the *Health of the Nation* document in 1992, identifying key areas for intervention. Among the goals listed were the reduction of pregnancies of girls aged 13 to 15 by 50%, from 9.5 per 1,000 girls in 1989 to no more than 4.8 per 1,000 girls by the year 2000. England has the highest rate of teenage pregnancies among western European countries. In the document, school sex education was seen as a central means by which the pregnancy targets might be achieved.

Meanwhile, an amendment to the Education Act of 1993 was passed without debate in Parliament (effective from September 1994). This required:

1. all secondary schools to have a sex education policy that includes teaching on HIV/AIDS and sexually transmitted disease,
2. biological aspects of sexual behavior to be taught in the science curriculum, and
3. a parental right to withdraw children from all or part of the nonscience sex education.

The implications of these amendments are daunting, both in terms of the individual and society. There is much evidence to suggest that the majority of parents do not have the skills or desire to be responsible for the sex education of their children (Allen 1987). More often than not, the needs of girls are understood and addressed more effectively than those of the boys or groups of people with special needs.

The recent authoritative study by Wellings, Field, Johnson, and Wadsworth (1994), *Sexual Behaviour in Britain: The National Survey of Attitudes and Lifestyles*, examined trends in age at first sexual intercourse, and these trends show that during the past four decades, the median age at first heterosexual intercourse has fallen from 21 years to 17 years for women and from 20 to 17 for men. The proportion of respondents reporting sexual intercourse before the age of 16 has increased from fewer than 1% in women aged 55 and over, to nearly one in five of those in their teens. (*Note:* This study has also been published as Johnson et al. 1994, *Sexual Attitudes and Lifestyles.*)

The people of the United Kingdom need to ask what are the real risks for sexually active children and young people? What are the implications for children who receive either none or fragmented and perhaps unreliable sex education? Human sexual activity is associated with increasing levels of risk and disease, unplanned pregnancy, and marital relationship breakdown. The health and sex education of the British government are far too vulnerable to the swings of political and moral pressures. Adolescent sexuality and sexual activity are realities. Effective sex education should offer adequate information, enable the development of communication and social skills, and provide opportunities

to explore attitudes, values, and beliefs in a pluralistic society. The balance of these three elements is crucial if sexual issues for the individual and the nation are to be tackled realistically.

[Update 2001: The General Election of 1997 appeared to have brought a wind of sexual education fresh air. The Blair Government wanted to modernize Britain and, what better vehicle of modernization than to overhaul the education system? Part of that overhaul was to address the evidently comatose life of Section 28 of the Local Government Act. Britain has never been clear about the social position of this legal clause. Does it deal with fundamental homosexual issues, with human rights issues, or with purely educational curricular issues? Does it deal with the responsibilities of local councils or moral boundaries for teaching? Whatever the reason behind its enactment during the Thatcher administration, its re-presentation for repeal to the House of Lords has been fraught with political danger for the present-day authorities. Similar attempts to sexual modernization, such as the reduction of the age of consent to 16 in parity with heterosexual usage for homosexual acts, met with a barrage of loudly expressed prejudice by the right tendency in the establishment. Neither those for repeal nor those against repeal have been able to present a research-validated argument, perhaps sending a clear message for sexology to address scientifically issues of everyday importance, of humanistic importance. The opponents of the repeal of Section 28 have expansively used the word "promotion" of homosexuality in the national debate. This has needed a strong voice advocating the "promotion" of health and knowledge of those being educated, as well as the obligation of education authorities to protect those being educated against man's inhumanity to man. Unfortunately, such a voice has not usually been provided by sexology, but by voluntary pressure groups.

[Significantly, the drive against change comes strongly from the newly devolved Scotland, where an alliance of commerce, politics, and religion demands the recognition by the rest of the country to acknowledge the devolved political muscle.

[On Thursday, March 16, 2000, England awoke to an announcement by the Education Secretary: There would be new rules on sex education via an amendment to the Learning Skills Bill. The amendment supposedly gives legal backing to teaching that describes "marriage and permanent relationships as key building blocks of community and society." The morning newspapers commented that the announcement was a "bid to defuse the row over Clause 28 [Section 28] of the Local Government Act, which forbids the 'promotion' of homosexuality." One evening paper published a column titled, "Pupils may not be taught that marriage is best." The journalists appear as confused as the Education Secretary in the issue of the academic administration of a good, positive, nonpartisan sexual education.

[It appears that the change will be slow in the ability of politicians in the United Kingdom to enact intelligent legislation in favor of a comprehensive sexual education curriculum. (End of update by J. von Bühler)]

## B. Informal Sources of Sexual Knowledge

In common with most Western European countries, the media plays an important and increasingly more acceptable role in popular sex education. British television frequently uses specialists in human sexuality and human relationships in research and program presentation. Sex programs are scientifically based in some instances, and in others positive learning occurs through humor and candid discussion of issues. These programs are pluralist. Likewise, radio has increased its importance and credible influence in sex educa-

tion. Magazines for all ages are available, usually with literary articles of sexual relevance. In 1993, a new educational resource emerged: that of the Sex Education Video in which sexually explicit images are used to teach, for instance, the nature of orgasm and the importance of masturbation. Accustomed to total censorship of more-explicit material, the British public still has to pass judgment on these "educational videos."

Professional and voluntary agencies independent of the government frequently publish books or guides on sexuality covering all aspects of sexual function and meaning, from infertility to menopause, from the realities of being gay to the psychodynamics of marriage. Of course, the newspapers are a good fountain of information reporting on sexual matters, particularly after these have been debated in Parliament. Unfortunately, not all newspapers are married to the truth scientifically or philosophically. The theater, cinema, music, and advertising images are also part of the informal sex education movement. Finally, the United Kingdom is rich in voluntary and professional organizations dealing with sexual and relationship issues whose members are active in teaching and bringing to the notice of the general public the importance of sexual knowledge in ownership of their sexuality.

## 4. Autoerotic Behaviors and Patterns

MARGOT HUISH

The *Shorter Oxford Dictionary* cites the derivation of the word *masturbate* from the Latin root *manus* (hand) and *stuprare* (to defile) and defines "to masturbate" as "to practice self abuse," with the added definition of "abuse or revilement of oneself, self-pollution." Colloquial and slang forms of the word continue to be used as terms of abuse and derision. However, there are many rich colloquial words and phrases for masturbation, such as "the five knuckle shuffle," "playing the one-eyed piccolo," and "tossing the caber," which graphically describe male rather than female activity. Sex therapists often find that clients express discomfort with the word *masturbation* and all that it implies. The impression is that clients will use *masturbate* to describe autoerotic behavior, but will frequently use other forms of expression to describe similar mutual activity in their relationship. This perhaps reinforces the notion that sole masturbation is considered undesirable, whereas mutual or shared masturbation is more acceptable.

Historically, attitudes regarding masturbation have been negative and condemnatory. Masturbation has been seen both as a sin and as a sickness in the teachings of Judaism and Christianity. Not until the end of the 19th century was there a shift from the belief that masturbation was the cause of insanity to the suggestion that it was the cause of neurosis and neurasthenia. David S. G. Kay (1992) comments that:

Following World War I, the major focus shifted from the purely medical to the psychological and to psychiatric analysis of masturbation. . . . Between the two world wars, medical professionals began to perceive masturbation as a harmless sexual behaviour. . . . The Psychoanalytic Society reinforced a conviction that masturbation was not the cause of medical or psychiatric disorders. Recidivistically, various preachers and educators continued to reinforce the Judeo-Christian sex ethic with their condemnation of masturbation. . . . [while] psychologists and psychiatrists began to research the relationship between anxiety, guilt and masturbation, since the guilt and anxiety related to masturbation were considered emotionally damaging when transmitted by the family, religion, medicine, law and education.

The impression gathered informally from seven United Kingdom sex therapists is that a high percentage of clients and their partners regard self-masturbation as embarrassing, while others view it as an undesirable practice, cloaked in secrecy and creating feelings of shame and guilt. These negative views appear to have been replicated by respondents involved in the question design work for the survey of *Sexual Attitudes and Lifestyles in the United Kingdom* (1990/1991) (Wellings 1994). Questions on masturbation were reluctantly excluded because the discussion on masturbatory practice had met with distaste and embarrassment. The view of masturbation as a sexually separate, secret, and dark activity may be reinforced in some people's minds when they read national newspaper reports of occasional accidental deaths resulting from unusual autoerotic practices, such as autoasphyxiation and various extreme forms of bondage.

Despite, or perhaps because of, the Victorian legacy of repression and negative attitudes towards masturbation, the activity is frequently mentioned in some comedy programs on United Kingdom television and radio. However, the subject has also been presented with a refreshingly positive image in television and video sex education programs. This reflects the therapeutic value of masturbation as held by professionals within the psychosexual counseling and therapy practices, which reinforces its "normality" and status as a pleasurable sexual expression in its own right. It is perhaps also reflective of the need to encourage safer sex in the age of HIV and AIDS. Therapists have noticed how clients have responded to the "permission giving" aspects of the recent programs when they discuss masturbation. However, within the multicultural mix in the United Kingdom, there are many who associate masturbation, and especially ejaculation, with illness, fatigue, anxiety, mental illness, and loss of power. The more "open" attitude towards masturbation is reflected in radio phone-in programs and in magazines, especially those geared towards the young.

In a recent sex survey in *More!* magazine, completed by over 3,000 females aged between 16 and 25 years, 33% said they never masturbated, 33% did so rarely, 15% masturbated once a week, and 14% did so more than once weekly. Forty-four percent of the respondents used fantasies during masturbation, but surprisingly, only 11% reported masturbation as the best way to reach orgasm—oral sex and penetrative sex scored higher at 41% and 28%, respectively.

In an unpublished study, Sevda Zeki reported that out of 20 women aged 65 to 74 years, and 20 aged 75 to 91 years, more-permissive attitudes towards sex had significant statistical relationships with higher reported amounts of masturbation and orgasms in masturbation. A higher level of composite knowledge had a significant relationship with higher reported amounts of masturbation, while women who knew the role of the clitoris in achieving orgasm were more likely to masturbate than those who did not understand clitoral function. Women who had the most-permissive attitudes towards women masturbating in their later years were more likely to report that they themselves masturbated.

Sex therapists confirm that sexual knowledge, education, and permissiveness are significant in all age groups when considering views, attitudes, and experience of sex in general and masturbation in particular. The impression given by sex therapy clients during history taking is that a small number of male clients report self-masturbation between ages 4 and 10, but the highest percentage recall starting masturbation between 10 and 14 years. Female clients report starting to masturbate anywhere between 10 and 25 years, but far greater numbers are concentrated at 15 years and upwards, with an impression that a significant number of women have never chosen self-masturbation as a way of

expressing their sexuality. It is also the impression that male partners are less likely to expect their female partners to self-masturbate, while these same female partners expect that their husbands/boyfriends do masturbate in secret, especially when there is a sexual dysfunction that precludes or limits the opportunity for penetrative sex. Clients, especially female clients, in individual therapy sessions often admit to self-masturbation, but do not wish their partners to know this information. Therapists report a greater acceptance of masturbation among single clients, and point out that there are many people with physical and learning disabilities for whom masturbation may be the only outlet for the expression of sexual feelings.

Project SIGMA, the first British in-depth study of sex, gay men, and AIDS, surveyed 1,083 gay and bisexual men over a four-year period between 1987 and 1991. Self-masturbation was reported during their lifetime by 99.5% of men, while 90% reported doing so within the previous month (average 17 times). The percentages by age group of those engaging in self-masturbation during the previous month were: under age 21, 86%; 21 to 30, 92%; 31 to 40, 94%; and 40-plus, 81%. As David S. G. Kay (1992) states:

Although the high incidence of masturbation is useful information for encouraging its acceptance by clients, the ability of masturbation to produce orgasm has more therapeutic importance. Masturbation has been used in the treatment of erectile failure, premature and retarded ejaculation, general sexual dysfunction, and primary and secondary orgasmic dysfunction. . . . There appear to be no rational arguments for regarding masturbation as undesirable as a private form of sexual activity.

[Update 2001: The last two years prior to March 2000 saw an increase in U.K. television airtime given to shows with a sexual content, whether educational, informative, comedy, news, specialist subject area, or soft pornography. While the subject of masturbation does crop up on these programs, it has found a regular forum in some late-evening light-entertainment hosted shows in front of live audiences. One show host has frequently and openly discussed various aspects of masturbatory practice with members of his audience, has shown Internet images of masturbation, and on one occasion, discussed the potential merits of a tongue-shaped vibrator with a female guest who is a Member of Parliament. Some magazines also appear to be more forthcoming about mentioning masturbation. *More* magazine, which focuses on a readership from age 19 to 27 years, published a supplement in April 1999 called "Back to Basic Bonking Guide," featuring a step-by-step master class in masturbation and education called "know your bits." In mid-2000, this magazine ran an article featuring men and masturbation. During 1999, *More* encouraged readers to send in their most embarrassing sex questions, one of which was concerned with potential health problems following the use of inserting various fruits during masturbation. While there has always been a U.K. market for masturbatory devices through sex shops and mail-order catalogues, masturbation seems to have finally arrived in the mainstream of U.K. acceptability, now that the National Family Planning Association has produced a "Sexwares" catalogue of vibrators for men and women. ## 5. Interpersonal Heterosexual Behaviors

### A/B. Children and Adolescents DANYA GLASER

Little research has been conducted on the sexual behavior of children and adolescents in the United Kingdom. Findings from one study of children in different preschool

settings show that many children are curious about each others' genitalia, expressing this curiosity by looking at and touching each other. The extent to which such exploratory behavior has mature sexual meaning is unclear. A smaller proportion of preschool children enact sexual intercourse, usually by lying on top one another while fully dressed. It is likely that such behavior is imitative of adult behavior based on prior observation. These behaviors do not generally give rise to adult concerns unless the children appear preoccupied by genitally oriented activity or the behavior is coercive towards other children.

Oral-genital contact appears to be very rare, as are attempts to insert fingers or objects into another child's vagina or anus. Coercive, preoccupied, or very explicitly imitative behavior is associated with previous significant and inappropriate exposure to adult sexual activity, or sexual abuse of the child.

**C. Adults** JANE WADSWORTH, ANNE M. JOHNSON, KAYE WELLINGS, and JULIA FIELD

*The National Survey of Sexual Attitudes and Lifestyles*

In 1990 and 1991, Wadsworth, Johnson, Wellings, and Field undertook a large population survey in Great Britain, *The National Survey of Sexual Attitudes and Lifestyles* (Johnson et al. 1992, 1994; Wellings et al. 1994). A key aim of this survey was to provide information for models to predict the epidemic of HIV using data on partnerships and activity, but in addition, this study provided valuable information about sexual behavior in the United Kingdom, as well as specific information of practical use in the planning of sexual health services—genitourinary medicine clinics, family planning, and sex education—and health promotion strategy.

The national study involved interviews of a random sample of 18,876 men and women aged 16 to 59. The responses were obtained partly through a face-to-face interview and partly from a booklet, which was completed by the respondent and sealed in an envelope out of sight of the interviewer to ensure complete confidentiality. Questions were asked about first sexual experiences, sex education, contraception, fertility, numbers and sex of partners, frequency of sexual intercourse, prevalence of different sexual practices, and, for men, contact with prostitutes. Other topics included attitudes towards sexual behavior and AIDS, family of origin and current family circumstances, educational achievements, and employment. The full methodology has been published (Johnson et al. 1994; Wadsworth et al. 1993). Among the more important findings were the following:

1. *Age at First Heterosexual Intercourse (Sexarche)*. The median age at first intercourse for men and women now in their 50s was 20, while for those under 20, it was 17, a decline of three years over three decades. An increase among young people in intercourse under the age of 16—in Britain the age of legal consent for women—is closely associated with this change. Seven percent of men and 1% of women now in their 50s first had intercourse before they became 16, while 28% of the men and 19% of the women aged 16 to 19 had done so.

2. *Number of Partners of the Opposite Sex*. The numbers of heterosexual partners reported in different time intervals are shown in Table 1. Very similar proportions of both men and women had no partners in the previous year, in the last five years, or ever. Three quarters of men and women had only one partner in the previous year, while half the men and two thirds of the women had one partner in the previous five years. However, men were more likely to report large numbers of partners than women.

The number of partners was strongly related to age and marital status. Twenty percent of young people, aged 16 to 24, reported no partners in the previous five years, but they were twice as likely as those aged 25 to 34 to report ten or more partners. In contrast, over 80% of those aged 45 to 59 had one partner in the previous five years. Married people were less likely to have had more than one partner in the previous year (5% of men and 2% of women) than single people (28% of men and 18% of women).

Those who were cohabiting (by their own description as living with a partner of the opposite sex to whom they were not married) were less likely to have had only one partner than those who were married (15% of men and 8% of women had more than one partner in the last year). Multivariate analysis showed that age and marital status were most strongly associated with numbers of partners, but first intercourse before age 16 was also positively associated with numbers of partners.

3. *Frequency of Sexual Intercourse*. The median frequency of intercourse was three times during the preceding four weeks. But this varied with age as well as with the length and status of the current relationship. Among married or cohabiting people aged 16 to 24, the median frequency was seven times in the previous four weeks. Multivariate analysis showed that in addition to age and marital status, frequency of intercourse was inversely related to the duration of the current relationship, but positively associated with numbers of partners in the last five years.

4. *Sexual Practices*. For the majority of respondents, sexual intercourse involved vaginal intercourse. Oral sex (fellatio and/or cunnilingus), anal sex, and nonpenetrative sex were less commonly practiced (see Table 2). Younger people were more likely to report sexual practices other than vaginal intercourse, as were those in long-term relationships.

Those who had more than one partner in the previous year were also more likely to report oral, anal, and nonpenetrative sex than those who had one partner. Oral sex and nonpenetrative sex have become more commonly prac-

**Table 1**

**Number of Partners of the Opposite Sex in Different Time Intervals (in Percentages)**

Time Interval	Number of Partners	Male (n = 8,047)	Female (n = 10,059)
Ever	0	6.8	5.9
	1	20.9	39.1
	2	10.7	17.0
	3-4	18.6	18.4
	5-9	19.5	13.2
	10+	24.5	6.8
In the past 5 years	0	8.9	9.3
	1	56.4	67.1
	2	10.1	11.3
	3-4	12.2	8.2
	5-9	8.1	3.7
	10+	4.8	0.2
In the past year	0	13.3	14.2
	1	72.5	78.6
	2	8.4	4.9
	3-4	4.1	1.8
	5+	1.8	0.1

Percentages approximated from the authors' bar graph (adapted from Johnson, Wadsworth, Wellings, and Fields 1994, 115).

ticed among respondents who became sexually active in recent decades compared with those who became sexually active in the 1950s and 1960s, but no such trend is shown for anal sex.

**5. Sexual Diversity.** Sexual experience with a partner of the same sex at some time in their lives was reported by 3.6% of the men and 1.8% of women. These proportions appear not to have changed with successive generations, but there are pronounced geographical variations, particularly among men. In the previous five years, 1.4% of the men had had a male partner in Great Britain as a whole. In greater London, however, this proportion was 4.6%, just over three times as many.

Considering only those who have ever had a homosexual partnership (see Table 3), only 9% of men and 5% of women have been exclusively homosexual throughout their life. In the last year, 19% of the men had male partners, 62% had female partners, and 10% had both male and female partners. Similar patterns were found for women respondents, but a slightly higher proportion had exclusively male partners.

**6. Attitudes to Sexual Behavior.** Data on attitudes towards sexuality showed that people in Great Britain have a strong commitment to monogamy, together with marked toleration of premarital sex. Fewer than 10% of respondents believed that sex before marriage is wrong, but 80% of respondents felt that sex outside marriage is wrong.

Commitment to a regular ("steady") relationship was valued almost as highly as marriage, particularly among women. Homosexual relationships were considered to be wrong by almost 60% of women and 70% of men. Attitudes towards sexuality varied considerably with experience. For example, fewer than 50% of the men who have experienced sex outside marriage considered adultery to be wrong, compared with 80% of the men who had not had this experience.

These data show considerable diversity of sexual behavior in the general population of the United Kingdom. The majority have faithful relationships with one partner ("se-

rial monogamy"), even if during their lifetime the majority of British men and women have had more than one partner.

Frequency of sexual intercourse is strongly related to the duration of the relationship, as well as to the respondent's age. Vaginal intercourse is the most popular form of having sex, and experience of anal intercourse is reported by only about one in 20 respondents, slightly more by men than women. Greater diversity in sexual practices is more likely among those who report more partners.

Patterns of homosexual behavior show geographical variations, with a markedly increased prevalence in central London. More than half of those of either sex who have ever had a partner of the same sex have had one or more partners of the opposite sex also. There have been changes in heterosexual behavior across the generations, particularly in the age of first sexual intercourse and the increase in those who have experienced sexual intercourse before the age of 16.

The pattern of partnerships clearly shows that people in Great Britain have larger numbers of partners when they are young and if they have not settled into a committed relationship. Men have more partners than women and nearly a quarter of men reported ten or more partners. There are, however, some differences between couples who are married and those who are living together without being married. In particular, the data suggest that extra relationships are more likely among those who are cohabiting than among married couples.

[Update 2003: As mentioned earlier in this section on adult heterosexual behavior, Wadsworth, Johnson, Wellings, and Field undertook a large population survey in Great Britain in 1990 and 1991, *The National Survey of Sexual Attitudes and Lifestyles* (Johnson et al. 1992, 1994; Wellings et al. 1994). In 2001, Johnson et al. published the results of a second *National Survey of Sexual Attitudes and Lifestyles*, conducted in the late 1990s. These two surveys have resulted in new and more-robust estimates of the distribution of sexual behavior within the population of the United Kingdom. The 1990-1991 survey and a comparison between findings in the two surveys provide evidence of increased reporting of a range of sexual behaviors within the population. The authors recognize that the magnitude of measured change is likely to be a combination of both actual changes in behaviors, along with increasing willingness to report previously socially censored behaviors, such as tolerance of homosexuality and casual partnerships.

[Some differences merit consideration. Just over three quarters of men and women report more than one lifetime partner, although the number reporting at least 10 lifetime partners is substantially lower in women (19.4%) than in men (34.6%). These numbers decline with increasing age for both genders, although the survey is limited to men and women 16 to 44 years of age. Nearly a third of men and just over a fifth of women had formed new heterosexual or homosexual relationships in the previous year, ranging from a mean of 2.04 new relationships among single men aged 25 to 34 years to 0.05 new relationships among married women aged 35 to 44 years. New partner acquisition is highest among the single or previously married. The authors estimate that 14.6% of men and 9% of women had concurrent partnerships at some time in the past year, although, again, the prevalence declined with increasing age. More than twice as many men as women reported new sexual partners outside the U.K. in the past five years.

[Overall, according to the authors' review, the number of single, separated, divorced, and widowed individuals remained unchanged over the decade. However, the number of people reporting cohabitation rose from 9.6% in 1990 to

**Table 2**

**Prevalence of Different Sexual Practices in the Previous Year (in Percentages)**

	Men (n = 7,870)	Women (n = 9,786)
Vaginal intercourse	85.6	84.7
Cunnilingus/fellatio	62.6	56.6
Nonpenetrative sex	65.6	60.5
Anal sex	6.9	6.1

Percentages approximated from the authors' bar graph (adapted from Johnson, Wadsworth, Wellings, and Fields 1994, 164).

**Table 3**

**Sex of the Partners of Respondents Who Ever Had a Homosexual Relationship**

Time Interval		Exclusively Male	Exclusively Female	Male & Female	No Partners
Ever	Men	10.0%	0.0%	90.0%	0.0%
	Women	0.0	5.0	95.0	0.0
Last 5 years	Men	16.8	56.2	22.0	5.0
	Women	58.0	9.0	27.0	6.0
Last year	Men	20.0	61.0	9.0	10.0
	Women	66.0	11.0	9.0	14.0

Percentages approximated from the authors' bar graph (adapted from Johnson, Wadsworth, Wellings, and Fields 1994, 210).

17.3% in 2000. During the same period, the number reported as married dropped from 51.5% in 1990 to 42% in 2000. First sex with a new partner took place within one month of meeting their most recent sexual partner for 56.5% of all men, compared with 42.8% of all women. Cohabitation is associated with a higher rate of partner change. The authors suggest that the proportion of the population reporting two or more sexual partners in the past year and inconsistent condom use in the past month is an indicator that unsafe sex has increased significantly among both men and women between the two surveys. The proportion of the population who regarded themselves as at-risk of HIV/AIDS remained low (4.5% of men and 2.9% of women).

[Looking at heterosexual practices, the proportion reporting vaginal intercourse in the previous month has varied very little over the past decade, whereas there has been an increase in oral-genital contact in the previous year for both genders and a considerably increased practice of anal sex in the previous year for both men and women. There was also an increase in reported homosexual partnerships, at any time and in the previous five years, among both women and men (Johnson, Mercer, Erens et al. 2001). (*End of update by K. R. Wylie*)]

## D. Sex and Persons with Disabilities TINA BALL

Historically, the whole area of sexuality for people with disabilities has been seen as problematic and negative within the United Kingdom. Fears of "moral degeneracy" and eugenic theories led to the mass segregation of people with learning disabilities in institutions throughout most of the 20th century (Burns 1993). People with physical disabilities have often been seen as asexual (Williams 1993). The sexual and relationship difficulties of people with acquired cognitive impairments (and their partners) have been particularly unmentionable and even unthinkable.

At present, there are several strands contributing to changes in this picture. Some people continue to believe that sexuality should not be considered for those with disabilities. Some parents of young people with congenital disabilities often express fears and anxieties as their children begin to express sexual interests and wish they could stay as "holy innocents." However, the growing self-advocacy movements and the political movements of people with disabilities have ensured that disabled people's own voices have been heard asserting their sexual natures and needs. An example of this would be the way in which the leadership of the Association to Aid the Sexual and Personal Relationships of People with a Disability (formerly SPOD) has been taken over by people with disabilities.

Professionals have developed a range of sex education approaches and packages for persons with disabilities. Typical of these materials are those designed for people with learning disabilities (Craft 1991; McCarthy & Thompson 1992). Involving parents in these educational initiatives has been shown to be very valuable (Craft & Crosby 1991). Another example is the sex education materials created by people with learning disabilities for their own use (People First 1993).

The incidence of sexual problems is probably higher among people with all kinds of disabilities than it is in the general population. Negative attitudes towards people with disabilities lead to restricted opportunities for the development of sexual relationships; at the same time, an impaired or negative self-image can inhibit healthy sexual functioning. Some kinds of physical disabilities directly cause sexual problems, e.g., spinal cord injuries and multiple sclerosis. The growth in importance of physical treatments for erectile dysfunction, in particular, appears to be leading to a

much more active approach to the assessment and treatment of such difficulties in specialist services, with many employing nurses and other healthcare professionals to work with persons who have sexual problems linked with or resulting from their disabilities. There remains much room for improvement in this area. The awareness and understanding of the impact of particular disabling conditions on women's sexual functioning and relationships remains less well understood and has certainly received less attention in the literature (Williams 1993).

Sexual dysfunction in people with learning disabilities has also received little attention. Studies have indicated a high level of negative experiences of sex, including dyspareunia in women with learning disabilities (e.g., McCarthy 1993). There is undoubtedly a higher than average incidence of sexual abuse of both women and men with learning disabilities (Turk & Brown 1993). The law recognizes this vulnerability and there are specific laws designed to protect people with learning disabilities from sexual exploitation (Gunn 1991). The complexity of the legal situation at times deters staff members who are working with people with learning disabilities from offering appropriate support and education, especially if they are already uneasy with sexual issues. Several local authorities, health authorities, and voluntary agencies have designed policy statements on sexuality in an attempt to provide clear guidelines for care staff and other professionals (e.g., East Sussex 1992; Hertfordshire County Council 1989). There are also increasing moves to work to prevent and treat sexual abuse in people with learning disabilities (Craft 1993).

## E. Incidence of Oral Sex and Anal Sex

KEVAN R. WYLIE

The *National Survey of Sexual Attitudes and Lifestyles* (1994) revealed that oral sex was a common experience, although less so than vaginal intercourse and nonpenetrative sex. Experience of cunnilingus was slightly greater for both men (72.9%) and women (66.2%) than fellatio (69.4% of men and 64.0% of women). Overall experience of oral sex was reported by 75.2% of men and 69.2% of women. More than 80% reported practicing both forms of oral sex in the previous year, and it was usually practiced alongside vaginal intercourse.

Anal intercourse was practiced by less than 7% of all men and women, although a higher percentage of men had experience with it (13.9% of men and 12.9% of women). It was rarely practiced in isolation from other sexual activities. At the time of the survey, legal restrictions made such a practice an offense, which has subsequently been changed. (See also Section 8C, Significant Unconventional Sexual Behaviors, on rape.)

[*Update 2001*: The United Kingdom sociosexual investigations of gay men and AIDS (Project SIGMA) was used to analyze the extent to which acts of anal intercourse are distributed among gay men (Coxon & McMannus 2000). Most individuals (60%) who engage in anal intercourse do so only once or twice a month, but there is also a long tail of the sample who engage in this activity much more, with one tenth of the individuals performing half of the total acts of anal intercourse. The factors which most affected rates in concentration of risk behavior included relationship status, HIV-negative status, and concordant/disconcordant partner status. Highest-risk anal intercourse is primarily in the relatively infrequent acts of a relatively large number of gay men (rather than in the very frequent acts of a few), and it is this which is likely to lead to more-rapid diffusion of infection and ultimately higher levels of infected individuals. (*End of update by K. R. Wylie*)]

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

ANTHONY BAINES

Heterosexism, the assumption that everyone is heterosexual and the subsequent discrimination against same-sex desire and attraction in men and women, is a significant cultural ideology in the United Kingdom. Sexual diversity in all its manifestations is not encouraged legally, socially, or politically.

The legal situation for lesbians and gay men in the United Kingdom is not a positive one. There are no laws to protect lesbians and gay men from discrimination. Male homosexuality was only partially decriminalized in 1967, for those men over the age of 21, with the stipulation that it would occur in private and with no more than two persons present. The age of consent for sex between men has since been reduced to age 18 (The Criminal Justice and Public Order Act 1994), but this is still two years above that for heterosexuals. Significantly, legislation has never stipulated an age of consent for lesbians, because of the invisibility of, and public refusal to accept, lesbian sexuality.

Other examples of discrimination against lesbians and gay men include their being banned from the Armed Forces and being ineligible for marriage under British law. A piece of legislation in the late 1980s also legitimized prejudice and discrimination against homosexuals. Section 28 added a new Section 2A to the Local Government Act of 1986, which states that a local authority shall not "intentionally promote homosexuality or publish material with the intention of promoting homosexuality." It would appear that such legislation is supported to a significant extent by social attitudes. Wellings et al. (1994) reported that 70.2% of men and 57.9% of the women surveyed believe that sex between two men is always or mostly wrong.

The experience of institutionalized or personal homophobia and heterosexism can affect the self-esteem of lesbians, gay men, and bisexuals, with implications for their emotional and mental well-being. In the face of such marginalization and stigmatization, the process of "coming out"—informing people of one's homosexuality or bisexuality and thus challenging preconceptions of heterosexuality—can be incredibly empowering. Acknowledging one's own sexual identity, informing those who share one's surroundings, and meeting people who share one's sexual identity to gain support and solidarity can be a major step on the road to healthy self-acceptance for many lesbians, gay men, and bisexuals.

In spite of the oppressive culture towards lesbians, gay men, and bisexuals—or perhaps because of this—strong, diverse lesbian, gay, and bisexual communities have developed, predominantly in the larger cities of the United Kingdom, such as London, Manchester, and Edinburgh. There are networks across the United Kingdom, reaching into the more rural areas, to provide a range of services to lesbians, gay men, and bisexuals, including telephone helplines, counseling, and social groups. There are also numerous lobbying groups from all shades of the political spectrum, working for lesbian, gay, and bisexual rights.

The emergence of HIV and its devastating impact on gay communities has led to a huge community response, with many of the United Kingdom's major national and local voluntary groups being set up by gay men.

Lesbians, gay men, and bisexuals meet each other in a variety of settings, and through various means, at pubs and cafés, saunas, social groups, parties, parks, and other "cruising areas," as well as through personal advertisements in a variety of publications. Most of the United Kingdom's

larger cities and towns have a commercial gay scene and some semblance of a visible lesbian, gay, and bisexual community. The media has also been used to exchange information and promote this sense of community. There are national and local lesbian and gay newspapers, magazines, radio programs, and film festivals. The mainstream-quality media also often run stories and features from a lesbian and gay perspective. Lesbian and gay film seasons and programs have also been screened on television.

The growing confidence among lesbian, gay, and bisexual communities has also been illustrated by the increasing number and scale of festivals and parades around the United Kingdom, where lesbians, gay men, and bisexuals have come together, building and promoting a sense of community. In 1995, the annual Lesbian, Gay, and Bisexual Pride Festival in London attracted approximately 200,000 people.

The lesbian, gay, and bisexual communities of the United Kingdom are diverse, with same-sex desire cutting across age, class, ethnicity, religion, culture, ability, and health status. This is illustrated by the plethora of support and interest groups that have emerged to address these concerns.

[*Update 2003:* There have been some changes in the legal, social, and political lives of lesbians and gay men in the U.K. since the original United Kingdom chapter was written in 1996.

[The European Court recently ruled that the ban on lesbians and gay men serving in the Armed Forces is unlawful. As of 2002, the U.K. Forces were reviewing their employment policies in light of this. In relation to immigration rules, same-sex couples can apply to stay in the U.K. if the foreign partner is living in the country legally, and the relationship has existed for at least two years. However, the age of consent for gay men remains at 18 (two years above that for heterosexuals) despite attempts by the Labour Government to reduce it to 16. This should change within the life of the current Parliament. Section 28 also remains on the statute books despite promises of repeal.

[Rather more positively, developments in HIV treatments have raised optimism among people affected by HIV, particularly gay and bisexual men, who have been one of the communities most affected by the epidemic. Combination therapy has reduced levels of illness in people with HIV and enabled some people to return to work. (*End of update by A. Baines*)]

[*Update 2003:* In December 2002, Barbara Roche, U.K. minister for social exclusion and equalities, announced that gay men, lesbians, and bisexuals would be granted many of the same rights as married couples in Britain, though not the legal status of marriage itself, under government plans to officially recognize civil same-sex partnerships. The partnerships would give homosexual and bisexual couples property and inheritance rights and grant each person the status of next-of-kin to the other. According to Roche, the proposals would end situations where homosexuals were refused hospital visits to partners or excluded from funerals.

[Arguing that there was now an "extremely strong case" for giving legal recognition to gay unions, she said, "I do think society has moved on, and I think that we recognize that there are very many people in gay relationships who are in very loving relationships—indeed they may have been very long enduring relationships—but their partnership has no recognition in law."

[Detailed legislation will not be worked out at least until early 2004, and even then, the proposals would not amount to "gay marriages." However, same-sex couples would be free to arrange their own private ceremonies to mark the event.

[The opposition Conservatives, who have frequently seen their traditional and liberal wings fall out over gay

rights and “family values” issues, came out in support. “Whilst we attach a huge importance to the institution of marriage, we do recognize that gay couples suffer from some serious particular grievances,” the party’s shadow home secretary, Oliver Letwin, said. The third-party Liberal Democrats said the proposals were “welcome but long overdue. Couples of any sex must be made equal before the law.”

[In leading up to this legislation, homosexuality was legalized in 1967; the age of consent for gay men was cut to 18 from 21 in 1994, and then to 16 in 2000; in 2001, the mayor of London set up the first register for gay couples, and in November 2002, gay couples gained the same legal right as heterosexual couples to adopt (Hoge 2002).

[While the government debates the issue of civil rights of gay couples, an ongoing, often emotional debate has heated up in the Church of England over the ordination of homosexual clergy, with warnings from the Archbishop of Canterbury, Dr. George Carey, that this issue could provoke a schism. Unexpectedly, a triad of events, in the U.K., Canadian and American branches of the Anglican Church, provoked extensive and emotional public debate of what had been an “in-house” issue.

[In October 2002, news reports confirmed that Canon Gene Robinson, who left his wife and children to move in with his male lover, was almost certain to stand for election as the next bishop of New Hampshire in the United States. In June 2003, Canon Robinson was elected bishop of New Hampshire on the second ballot. In July, following heated debate and refutation of allegations of “inappropriate behavior,” the bishops, clergy, and lay delegates at the late-July 2003 General Convention of the national Episcopal Church in the U.S.A. ratified Canon Robinson’s election as bishop of New Hampshire by a two-thirds majority.

[Meanwhile, in Vancouver, British Columbia (Canada), Bishop Michael Ingham announced that he would be the first bishop in the Anglican Communion to bless same-sex unions. In a strongly negative response, the bishops representing 38 million Anglicans in Africa and Asia said that Ingham’s decision represented “a defining moment in which the clear choice has to be made between remaining a communion or disintegrating into a federation of churches (Kraus 2003).

[In June, while the Canadian and American debates fueled extensive media coverage, the Reverend Jeffrey John was nominated as the new bishop of Reading, south of London. John confirmed his nomination in a *Times of London* interview, and also the fact that he is homosexual and in a 27-year relationship with a fellow clergyman. He added that the relationship has been platonic for years—in keeping with church policy opposing homosexual acts by clergy members. Despite his celibate life, Jeffrey John was pressed to withdraw his candidacy after a private meeting with the new Archbishop of Canterbury, Rowan Williams, that lasted hours. (*End of update by R. T. Francoeur*)]

## 7. Gender Diversity and Transgender Issues

STEPHEN WHITTLE and GWYNETH A. SAMPSON  
[*Rewritten and updated in late 2001  
by S. Whittle and G. A. Sampson*]

Transvestism and transsexualism are moderately visible phenomena in United Kingdom society in the 21st century. However, this is a recent state of affairs, visibility having grown considerably in the 1990s. The reasons for this are manifold, despite the fact that there is still little legal recognition of the new gender status of a person who has undergone sex-reassignment treatment.

Male transvestism has long been a feature of the theater from the late medieval period when cross-dressing males

provided the female characters for the stage. Cross dressing, or drag as it is referred to, as a stage act remains popular, with artists such as Danny la Rue and, more recently, Lily Savage gaining a national popularity. Female cross-dressing has not had such prominence, the writer Radclyffe Hall and the entertainer Vesta Tilly being notable exceptions in the 1920s and 1930s.

However, transvestism has remained a peripheral activity, with little social acceptance on a more personal level. Since the organization of the Beaumont Society in the late 1960s, which was originally founded to provide advice and safe social meeting venues for heterosexual transvestites, there has been a gradual proliferation of similar groups. There now exist a variety of organizations and settings throughout the country where men may cross dress in discrete venues. The development of “gay village” areas in the late 1980s and 1990s in many major cities also provided other locales, such as public houses and clubs where heterosexual and homosexual transvestites may meet and socialize. There is also a large underground network of “contact magazines,” which allow homosexual and bisexual transvestites to make sexual contacts. It is difficult to estimate the total numbers of transvestites in the United Kingdom, as there has been little, if any, work to extrapolate figures.

There is little social acknowledgement of female cross dressing, it being seen to belong to some radical lesbians and “butch dykes” and a subgrouping of lesbian culture. However, the U.K.’s first “drag king” club, Naïve, opened in London, and several temporary venues now exist where events such as “drag king” competitions take place.

Transsexual people are a much more visible feature of British society, having gained considerable media interest. Newspapers, women’s magazines, and television have regular features concerning transsexualism. Nonetheless, the individual transsexual person may be, in fact, far more hidden than this media interest otherwise portrays. The first recorded transsexual surgery in Britain was performed in 1944 by Sir Harold Gilles, an eminent plastic surgeon, on Michael Dillon, a (female-to-male) transsexual man. Since then, several thousand transsexual people have gained sex-reassignment surgery in the U.K. or abroad. Again, little work has been done to count the total number of transsexual people, but estimates based upon the numbers who have attended recognized Gender Identity Clinics, those who have joined self-help organizations, and those who have gained media attention, put the figures at around 10,000 to 15,000 transsexuals in the United Kingdom (McMullen & Whittle 1995). Several have published highly regarded autobiographical accounts, most notably racing-car driver Roberta Cowell (1954), the Mt. Everest climber and *Times* journalist Jan Morris (1974), and models April Ashley (1982) and Caroline Cossey (Tula) (1991). In recent years, there have appeared autobiographies from (female-to-male) transsexual men, including journalist Paul Hewitt (1995), Raymond Thompson, (1995) and Mark Rees (1996).

The first formal Gender Identity Clinic was set up by psychiatrist John Randell at Charing Cross Hospital in London in the early 1970s. Specifically catering to the needs of transsexual people, this clinic remains at the forefront of psychiatric and surgical services in this field. Currently, it has as its Head of Research, Richard Green, former president of the Harry Benjamin International Gender Dysphoria Association, which provides an academic and medical research base for those working in the field. There are several other clinics throughout the country, as well as a small clinic catering to the needs of transsexual adolescents and their families at the Portman Clinic in London.

The current legal position for transsexual people was embodied in the common-law decision in the case of *Corbett v Corbett* (1970, 2 All E.R., 33-48). In this case, the marriage between a male-to-female postsurgical-reassignment transsexual woman and a male partner was declared to be void. It was held that, for the purposes of marriage, a transsexual person would always be of their original sex designation at birth. It has also been held that the birth certificate records in the United Kingdom are a record of historical fact and, hence, are unalterable unless there was a substantial mistake at the time of registration. As a result, though, transsexual people, on one level, seem to be accommodated by the U.K. law, in that most of their personal documentation can be altered to show their new gender grouping and their new name; their birth certificate records, which are used as a form of identification for many purposes, will still show their old status and name, and they cannot marry a member of the opposite gender (i.e., same-sex) grouping. This means that for all legal purposes, they remain a member of their natal sex grouping. The iniquities that result from this, not only in terms of personal privacy, but also inadequate protection in employment legislation, have meant that transsexuals in the United Kingdom have taken the government to the European Court of Human Rights on several occasions. The case of *Rees v UK* (1987, 9 E.H.R.R. 56) led to a compromise solution whereby passports may now record the new name and gender status of the transsexual person on production of a sworn declaration of name change and a doctor's letter to the effect that the gender change undergone is permanent. Similarly, driving licenses will now record the new gender role, as can all other documents apart from the birth certificate.

However, transsexual people have not been satisfied with this solution and have continued to plead their cause to the government through the campaigning group, Press for Change (PFC). Press for Change provides legal advice and encourages parliamentary lobbying. Currently (2000), PFC is supporting cases concerning an issue of pension rights, which has been referred to the European High Court of Justice; a request for the declaration of validity of a transsexual person's marriage before the High Court; many employment cases; and cases involving several other areas of the law.

There are numerous self-help organizations for transsexual people, and many join these, albeit often only in their initial stages of transition. The largest are: the Gender Trust, which predominately caters to male-to-female transsexual women, and the FTM Network, which caters to female-to-male transsexual men. At any one time, both of these organizations have almost 2,000 members between them. Transsexualism is becoming increasingly socially accepted in the United Kingdom, with transsexual people finally succeeding in retaining or obtaining high-status job positions, including positions in education and local government, and high-profile positions in the entertainment industry.

In May 1999, the Home Secretary, Jack Straw, announced the creation of a Government Inter-Departmental Working Group with the following terms of reference:

to consider, with particular reference to birth certificates, the need for appropriate legal measures to address the problems experienced by transsexual people, having due regard to scientific and societal developments, and measures undertaken in other countries to deal with this issue.

The report was published in April 2000, and the Working Group identified three options for future consideration by the government of the United Kingdom:

1. to leave the current situation unchanged;
2. to issue birth certificates showing the new name and, possibly, sex; and
3. to grant full legal recognition of the acquired sex, subject to certain criteria and procedures.

The report indicates that the first two of these options would be unlikely to resolve the problems that transsexual people face because of their current lack of appropriate legal status. As such, the report indicates that the U.K. government would only meet its obligations under Human Rights legislation if they granted full recognition of the transsexual person's acquired sex. It must now only be a matter of time before transsexual people obtain full legal recognition of their new status alongside their increased social acceptance.

## 8. Significant Unconventional Sexual Behaviors

KEVAN R. WYLIE

### A. Child Sexual Abuse, Incest, and Pedophilia

Any form of sexual contact between adults and children evokes an emotive reaction. Sexual abuse of young children, intrafamilial sexual abuse (usually incestuous), and extrafamilial (usually pedophilia) are all offenses in the United Kingdom. Increasing awareness of child sexual abuse (CSA) has ensured a more-sympathetic approach to dealing with victims. It is accepted that sexual abuse is a traumatic event for most children, and for some, that it is followed by a post-traumatic stress reaction. The advantages and limitations in applying therapy to such a framework in the United Kingdom have been described by Jehu (1991).

There is evidence of an increased number of proceedings against offenders over the last decade, but it remains unclear whether this is a real increase in the number of offenses or improved methods of securing evidence for prosecution. While real or reporting patterns may have changed through the influences of feminism, media attention, academic acceptance, and public sensitization to such crimes, it is probably the case that "old attitudes die hard." There have been cases in the United Kingdom in which public opinion has turned surprisingly against those reporting child sexual abuse (the Cleveland affair, Orkney ritual abuse, and Rochdale Satanic abuse cases).

Police, social services, educational, and health services are now duty-bound to inform each other when cases of alleged abuse occur. Regional units within the United Kingdom have facilities to record interview sessions on video of children being asked open questions about the alleged abuse. Recent changes brought about by the Criminal Justice Act (1994) allow the use of video disclosure of abuse to a social worker for presentation in court. Video links within the court allow questioning of the minor in a room separate from the court to avoid the minor's facing the offender directly. Social workers have a statutory duty to be involved with families when children are placed on the "At Risk" register and must act on the balance of probability. The police, on the other hand, must establish beyond reasonable doubt that an offense has occurred. Offenders are charged with indecent assault. Inappropriate touching and the circumstances of the event are pivotal in deciding to embark with criminal proceedings. Corroborative statements, whenever possible, and medical evidence are often vital. There is however, no time limit for bringing such offenses to court.

There is currently debate in the United Kingdom regarding the reality of "false memory syndrome," with cases of

abuse being alleged up to 20 years or later than the alleged offenses took place. There are reports in the United Kingdom of men in their 60s and 70s being given short custodial sentences for offenses of sexual abuse or incest that occurred many years previously.

In 1994, prosecution of around 2,000 cases of indecent assault on females under 16 years of age were initiated and around 65% of those charged were found guilty. Only half of these were given custodial sentences. The punishment can be ten years imprisonment. It has been argued by Fisher and Howells (1993) that significant social-skill deficits occur in some sex offenders. Where these exist, the deficit is in the cognitive component of social competence. Sex offenders often have major difficulties in establishing and maintaining longer-term intimate relationships, with factors likely to include empathy deficits and inappropriate culturally induced expectations concerning sexual relationships. A recent article presented opinion as to whether a sexual offender should be allowed castration where there is a history of persistent sexual abuse (Alexander et al. 1993).

In law, incest is the act of intercourse by a man with a woman he knows to be his daughter, granddaughter, sister (or half sister), or mother. Three quarters of the cases reported involve father-daughter incest. Incest implies consent—although this is no defense—and is differentiated from unlawful sexual intercourse with a girl under the age of 13 or 16. All are offenses under the Sexual Offences Act 1956. The punishment for incest is seven years custodial sentence, unless the girl is under 13. If this is the case (effectively constituting rape), the punishment is life imprisonment. The number of persons proceeded against on the offense of incest are a small proportion of those charged with child sexual abuse.

The incidence of pedophilia is unknown in the United Kingdom. A small central unit exists to investigate this area, and while the offense is abhorred, limited resources are available to seek out actively and investigate crimes being committed by pedophiles. Several lobby groups now exist to promote awareness of the existence of this problem and the need for active targeting of police time towards preventing the continuation of such practices. Further, to date no national register exists to identify individuals when changing residence. It is not normally the case that such offenders are offered therapy unless supervised probation is ordered. (See also Section 8E below for information on child pornography.)

[Update 2001: In July 2000, the Home Office released a summary report and recommendations to reform the law on sex offenses: *Setting the Boundaries*. This is a consultation document. As a matter of public policy, the age of legal consent is recommended to remain at 16 years of age. With regard to specific offenses against children, the law should state that below the age of 13, a child cannot effectively consent to sexual activity. A recommendation of an offense of adult (over 18) sexual abuse of a child (under 16) is recommended, which would cover all sexual behavior that was wrong because it involved a child, and would compliment other serious nonconsensual offenses, such as rape, sexual assault by penetration, and sexual assault. It is recommended there should be no time limit on prosecution for the new offense of adult sexual activity with a child. An offense of the persistent sexual abuse of a child reflecting a course of conviction should be reintroduced. There is some recognition that children sexually abuse other children and that sentencing decisions should reflect specialist assessment of risk and potential for longer-term offending and include treatment options. The concept of familial sexual abuse for the modern family is suggested. (End of update by K. R. Wylie)]

## B. Sexual Harassment

HELENE MOTT and ROHAN COLLIER  
[Rewritten and updated in late 2001  
by H. Mott and R. Collier]

### Incidence

Sexual harassment is a widespread problem in British society. What marks it as an unconventional behavior, therefore, is not a question of rarity, but the fact that it is recognized as wrongful conduct under the law, particularly in the workplace (see below). Its roots in patriarchal society mean that, for the most part, it is women who suffer most from sexual harassment inflicted by men, although the concept has been extended to cover alternative permutations. While sexual harassment, as an exercise in gendered power relations, can be seen to affect women in all walks of life (cf. Wise & Stanley 1997), in general usage, the term is understood to refer primarily to the experience of women in the workplace.

There are as many definitions of sexual harassment as there are theoretical approaches to it, although most contain the common elements of citing conduct based on sex or of a sexual nature that is unwelcome or offensive, and/or detrimental to the interests of the recipient. The emphasis on the recipient creates a tension between objective and subjective standards, so that although the term *sexual harassment* is common currency, the people's ideas about what constitutes it can vary widely. Thus, a National Opinion Polls survey in 1991 found that one in six women said they had experienced sexual harassment, but when they were asked whether they had experienced certain kinds of (unwanted sexual) behavior that offended them, the figure rose to one in three (Collier 1995). The results of this survey, and others like it, suggest that people may be reluctant to label the full range of potentially sexually harassing behaviors as harassment *per se*.

The likelihood of a formal complaint being made to the authorities in the case of sexual harassment also appears to be low. Davidson & Earnshaw (1991) found that 65% of personnel directors in their study believed that between 70% and 100% of cases were never reported to them. This supports North American research (e.g., Livingston 1982, which claims that only 2.5% of harassment victims took any official action). For reasons such as these, it is, therefore, very difficult to attempt to quantify the incidence of sexual harassment. Recent surveys in Britain seem to show that, on average, between 30% and 50% of women claim to have experienced sexual harassment at work (Alfred Marks 1991; Industrial Society 1993; London Buses Ltd. 1991; Mott & Condor 1995), although in certain occupations, such as the police force, the figure has been as high as 90% (Her Majesty's Inspectorate of Constabulary 1993). The scale of the problem suggests that it is ill advised to concentrate upon the likely psychological profile of the harasser (or indeed the recipient). While individual factors may be relevant to individual cases, it is clear that sexual harassment is essentially a social problem.

### Legal Penalties

As noted above, it is rare for complaints to reach any level of authority and it is, therefore, rarer still for the legal system to become formally involved. Sexual harassment cases in Britain can be brought within the ambit of several laws. Presently, most cases are dealt with by the Industrial Tribunal under the Sex Discrimination Act (1975). This act, which is applicable to all institutions, makes it unlawful to discriminate by treating a woman less favorably on the grounds of her sex. It also makes it unlawful to victimize a woman who has complained of sexual harassment, to promise or withhold benefits in exchange for sexual favors, or to subject her to detri-

ment. All of these elements of the Sex Discrimination Act can be relevant to sexual harassment in the workplace, and are applicable to men as well as women, although the scarcity of recorded cases successfully brought by men tends to suggest that this application is more theoretical than practical. Generally, both the individual harasser and the relevant organization will be jointly liable, unless the organization can prove that it has taken reasonable steps to prevent sexual harassment. Complainants can expect to receive monetary compensation (for which there is no upper limit) for financial loss, medical expenses, and damages, such as injury to feelings. Tribunals may also require that the organization take steps to prevent harassment happening again, or to transfer the harasser within the organization. Cases can also be brought to the Industrial Tribunal under the Employment Protection (Consolidation) Act (1978) when a person has been an employee of the relevant organization for at least two years full-time. Victims of harassment might claim constructive dismissal if they were in fact obliged to resign, or unfair dismissal if, as a direct or indirect consequence of being sexually harassed, they were dismissed from work. The Tribunal can rule for the reinstatement, re-engagement, or compensation of the injured party (subject to certain financial limits).

The number of cases involving sexual harassment brought to the Industrial Tribunal in Britain under the Sex Discrimination Act has been steadily increasing since 1986. There has been concern that the requirement under the Act to prove disparate treatment of the sexes prevents some cases from being adequately addressed. The aim of the Tribunal is to uphold the rights of the victim, and thereby, to provide a remedy, such as compensation. This can certainly penalize the perpetrator by the award of damages, but there is no power to punish. For these reasons, legal commentators such as Dine & Watt (1995) have called for more victims of harassment to take their cases to the civil or criminal courts, a practice which was rare, given that victims needed to mould their experiences to existing law, e.g., suing for breach of contract; trespass to the person (civil courts); or assault or false imprisonment (criminal courts).

In 1991, the EC issued a Code of Practice concerning sexual harassment following a Recommendation asking member states to promote awareness of the unacceptable nature of sexual harassment. This Code points out that sexual harassment is a form of sex discrimination and is, therefore, unlawful under the Equal Treatment Directive (1976). The Code also provides for the inclusion of harassment on the grounds of sexuality (in addition to gender) as sexual harassment. In addition, the Code recommends that organizations provide a clear policy prohibiting sexual harassment in the workplace and guaranteeing prompt and efficient action in the event of harassment. This Code of Practice strengthened the hand of those seeking to challenge the prevalence of sexual harassment in the workplace.

In 1997, a new law, the Protection from Harassment Act, came into force. The intention behind the Act was primarily to deal effectively with stalkers, although all types of harassment are theoretically covered. The Act states that a person must not pursue a course of conduct, which a reasonable person should know would amount to the harassment of another. It is necessary for two incidents constituting harassment to have occurred. The Act gives powers to both the criminal and the civil courts. Harassment is now an arrestable criminal offense carrying a maximum of six months in prison and/or a fine of up to £5,000. Should the offender have caused fear of violence, the offense carries up to 5 years' imprisonment and unlimited fine. The Court may also issue a Restraining Order upon the offender. A victim of harassment may also bring a civil claim under the Act, and may be awarded damages (in-

cluding damages for anxiety), and may be granted an injunction against the perpetrator, the violation of which would constitute a criminal offense.

### Social Response

The category of behavior, which we now call sexual harassment, has a very long history, although its naming has only come into being very recently. Sexual harassment as a concept came to Britain from North America in the late 1970s and early 1980s with the publication of Farley's (1978) and MacKinnon's (1979) highly influential texts. These texts, however, were academic, and it is only much more recently that "sexual harassment" has passed into the wider domain, so that since the late 1980s, it has been a topic for public discussion and debate. Since that time, there has been coverage in the press of successful Industrial Tribunal cases, and the subject has been addressed as a storyline in the two most popular television soap operas. In the year running from May 1993 to 1994, no less than 90 articles in *The (London) Times* newspaper discussed sexual harassment.

Women are now much more aware of their rights, and have higher expectations in terms of how they are treated at work than in the past. However, a recent study (Mott & Condor 1995) revealed that women continue to find it difficult to confront sexual harassment, as dominant workplace ideologies that legitimize unsolicited sexual behavior and mitigate against confrontation, remain. It is also clear that the pervasive and everyday nature of much sexual harassment (especially in the form of sexual remarks and joking) in many workplaces makes it unrealistic to expect an immediate changeover to zero tolerance.

Results from many studies have shown that sexual harassment can have a devastating effect for victims, both in terms of their performance at work and their personal well-being. Eighty-six percent of harassment victims in the COHSE (1991) study reported an adverse effect on emotional well-being, while 33% said that their quality of work deteriorated. Despite this, and despite the potential risks of litigation, the response of many organizations and trade unions to the problem has not been adequate. In the study mentioned above, over half the employees who complained of harassment felt that their complaints had not been dealt with adequately, and 10% found that they (rather than the harasser) had effectively been punished by being transferred to another job or department. An Industrial Society Survey (1993) found that 60% of British employers had no sexual harassment policy in place.

### C. Rape

KEVAN R. WYLIE

In England and Wales, rape is defined as sexual intercourse with a woman without her consent. This must involve penile penetration "to the slightest degree" of the vagina. Emission is not necessary for the act to constitute rape. Penetration of the anus constitutes "buggery," and penetration of the mouth constitutes "gross indecency" or "indecent assault." Attitudes towards rape have changed over the last couple of decades, with women feeling more able to report cases to the police. There was a twofold increase in the proportion of rapes committed by "intimates" (30% of all rapes by 1985) and in the number of rapes taking place indoors, particularly in the home of the victim, which had similarly doubled (30% of all rapes by 1985).

Police forces now have dedicated nonpolice-station units where persons alleging rape are counseled. These units often resemble living dwellings rather than the institutional nature of the police station. Within the units are video interview rooms and a medical suite. Premises and facilities of victim

examination suites are reviewed by Lewington and Rogers (1995). Should the victim be willing to make a formal statement, attempts to trace the offender take place to allow for questioning of the suspect. It remains the case that victims of rape experience anonymity during court proceedings, while the offender is not offered such protection.

Victims are offered support by Rape Crisis and Victim Support units. Cohn (1990) found that the incidence of rape, as well as assault, burglary, collective violence, and domestic violence, increased with ambient temperature, at least up to about 85° Fahrenheit (29° C), and concluded that, in general, the most violent crimes against persons occurred linearly with increasing ambient temperature, while property crimes did not strongly relate to temperature changes.

The issue of "date rape" has started to make an impression in the United Kingdom, although it does not constitute a specific offense as such. The issue of stranger rape has been construed by some as "clumsy seduction." Marital rape is now accepted as an offense.

Rape is an offense under the Sexual Offences Act 1956 and there has been a threefold increase in the number of cases in which proceedings have started in the courts in England and Wales over the last decade. Of the 1,625 cases proceeded against in 1994, just under a quarter were found guilty and sentenced. Almost all of these cases were punished with immediate custodial sentences, which is normally life imprisonment. Sentencing has shown a general trend towards an increased length of custodial sentence passed. In sentencing, judges are less likely to regard prior consensual contact as a valid reason for passing noncustodial sentences on convicted rapists (Lloyd 1991).

A number of male partners of rape victims remain seriously troubled many months after the rape (Bateman & Mendelsohn 1989) and have become profoundly worried about their identity as men, shunning their male friends, avoiding sexual contact with their partner, and withdrawing from regular social interaction. They may require intensive psychoanalytic therapy to begin to understand what it means for them that their partner has been raped.

In a review of sexual offenders, rapists were found more likely to report having a current female partner and to have experienced consenting heterosexual intercourse with an adult, than were nonincest offenders against male children. However, no evidence emerged that rapists and nonincest offenders against female children differed significantly in this respect (Bownes 1993). Using the GRIMS and GRISS questionnaires, the investigation found evidence of marital and relationship difficulties and sexual problems among all offense categories of those sentenced for sexual offenses as being substantially higher than those among the general population. A prevalence of 62% for marital/relationship dysfunction among offenders who had a current relationship with an adult female partner, and a prevalence of 57% for sexual dysfunction amongst offenders who had experienced heterosexual intercourse with an adult, were reported. Treatment programs need to address these elements.

Until recently, buggery with a male under the age of 21, or with a woman or with an animal, led on conviction to punishment with life imprisonment. However, when Section 143 of the Criminal Justice and Public Order Act 1994 came into force on November 3, 1994, the amended Section 12 of the Sexual Offences Act 1956 (The Acts of Buggery) in effect legalized anal intercourse for consenting couples over 18 years of age, be they gay or heterosexual. About 10% of cases are thought to be heterosexual and, unless force accompanies the act, these cases rarely proceed to court. Where anal intercourse occurred as a result of sexual assault, this amendment would obviously not apply.

While Mezey and King (1989) had difficulty in getting victims to cooperate with an interview for their research project on male rape, their results indicated that failure to report to the police was a problem. Most of the assailants and subjects were homosexual or bisexual, and only a few cases conformed to the stereotype of sudden unprovoked attack by complete strangers in a public place. The assault had considerable impact on the subjects' sexual identity. It was concluded that these findings suggest that male victims' immediate and long-term responses were similar to those described by female rape victims.

A study by Hickson et al. (1994) reported the prevalence of nonconsensual sex amongst homosexually active men as 27.6%, of which 3.9% involved female assailants. A third of the men had been forced into sexual activity, usually anal intercourse, by men with whom they had previously had consensual sexual activity. These results supported the belief that male rape is not usually committed by men identified as heterosexual.

The majority of those persons found guilty of buggery were given immediate custodial sentences. Around 40% were found guilty of the 379 cases in which proceedings took place in 1994.

What is commendable is the high detection rate by the United Kingdom police of sexual offenses that are reported as having been committed, particularly for rape, unlawful sexual intercourse with girls under 16, incest, and buggery. There are less-successful detection rates with indecent assault on females aged 16 years and over, when compared to the offenses of indecent assault on females under 16 years of age, with a similar but less marked pattern seen with indecent assault on a male in both age groups. The "clear-up" rates for sex crimes are generally considered to be substantially higher than those for other crimes. There are, of course, an unestimatable number of sex crimes never reaching the police.

[Update 2001: A Government consultation paper detailing law changes, giving better protection for victims of child sex abuse and rape, went into effect in the summer of 2000. A sexual offenses review group is currently advising the Government. In 1999 to 2000, rape and other sex crimes rose overall by 4.5%, with a 10% rise in rape of women and a 19% rise in rape of males. Experts believe part of this, especially the male rape figures, is also because of more reporting of the crime. Increasing numbers of the accused are friends or ex-boyfriends of the victims, indicating a greater willingness to report date or acquaintance rapes—notoriously the most difficult type to prove in court.

The above mentioned Home Office document setting the boundaries (for consultation) recommends the offence of rape should be retained as penile penetration without consent and extend it to include oral penetration. This should be defined as penetration of the anus, mouth or genitalia to the slightest extent and for the avoidance of doubt, surgically reconstructed male or female genitalia should be included in the definition in law. ("Attacks and Sex Crime Up as Robberies Soar," *Daily Mail* newspaper, July 18, 2000)

[A new offense of sexual assault by penetration should be introduced for all other penetration without consent. Consent should be defined in law as "free agreement." A non-exhaustive list of examples is given within the draft documentation. (End of update by K. R. Wylie)]

#### D. Prostitution

KEVAN R. WYLIE

It has been estimated that in major cities in the United Kingdom outside of London, between 800 and 1,000 women work as prostitutes at any one time. An excess of 10,000

male clients use such services in any one city. Paying for sex remains a stigmatized behavior, although 6.8% of men reported paying for sex with a woman at some time and 1.8% had done so within the last five years (Wellings et al. 1994). Recent experience was most common in the age group of men aged 25 to 44, although prevalence of ever paying for sex was five times more common in the older age group (10.3% vs. 2.1%). It was most common in widowed, separated, and divorced men within the last five years, and the men were more likely to be from social classes I and II (possibly away from home on business). A history of a homosexual partner (at any time) was associated with specifically raised odds of commercial sex contact (possibly some bisexual men).

The prostitute population is not stable. Women enter and leave, depending upon life circumstances. The risk of HIV through sexual services is very low, and the risk of contracting HIV is much greater through the use of drug injecting. It has been argued that if a sexual act is consensual and does not harm others, it should be acceptable to repeal the laws prohibiting soliciting. By doing so, it would free street workingwomen from harassment, and reduce police and court time of those who are attempting to uphold a law that does little to abolish the "trade" (Carr 1995). The *National Vice Squad Survey* (Benson & Matthews 1995) found that one third of police vice squads want brothels to be legalized.

Prostitution can constitute one of several offenses. These include "curb crawling" (approaching a prostitute and being a "nuisance") and soliciting under the Sexual Offences Act 1985, behaving in an indecent manner in a public place under the Vagrancy Act 1824, loitering or soliciting for the purposes of prostitution under the Street Offences Act 1959, and procurement of persons for immoral purposes under the Sexual Offences Acts 1956 and 1967. Women offer sexual services to men within several settings. Such services are usually offered within the so-called red light areas of a town or city. Establishments offering saunas and massage parlors are usually a cover for offering such services. These can range from masturbation of the man ("hand relief") and oral sex to intercourse (usually with the insistence of using a condom).

Establishments known as brothels exist, usually a house with several rooms being used by women offering sexual services. Such brothels are usually run by a "madam." The equivalent on the street are girls working for a "pimp." Both the provider and organizer, as well as the user, can be charged with one or more of the above offenses. The policy of many police forces in the United Kingdom would be to caution a prostitute on a couple of occasions and advise her of support services to try and help her move away from using such activity as the route for financial gain. Often such persons need assistance in severing the link with their "pimp," to whom they may be in debt or exploited through addiction to drugs. Many of the punishments carry short custodial sentences as an option, although the vast majority are dealt with by fine. The average fine for curb crawlers in 1995 was £110. The exceptions are conviction of living on the earnings of prostitution or exercising control over a prostitute, where a custodial sentence is much commoner. However, cases cannot be brought on the uncorroborated word of a prostitute or solely on police evidence.

Soliciting by a man is an offense usually dealt with by the courts by a fine, if indicted. There is increasing awareness of male prostitution, particularly in the capital city. Such men are called "call boys" and many offer their services to visiting businessmen in hotels. This is an area where detection by the police is very low. Low levels of reporting occur and usually the police are only aware as a con-

sequence of robbery or associated assault. Of the 124 cases proceeded against in 1994, 89 were found guilty.

It is generally felt that the tolerance towards prostitution in England and Wales is fairly high, provided that such occurs in private. Much of the action of the police is in an attempt to appease complaining residents. An interesting development in the United Kingdom has been the call by the Inland Revenue for disclosure of such income by prostitutes for payment of Income Tax.

In mid-1996, the Government-controlled telephone company, British Telecom, joined Westminster, London's largest borough, in a crackdown on prostitutes who paste sexually explicit business cards advertising their services on the 700 bright red phone kiosks available to the public on the streets. After using computers to locate the offending prostitutes, telephone inspectors notify them they have one week to cease their postings. If the postings continue, the telephone company blocks their incoming calls. In announcing their effort, authorities said their objection "is not with prostitution as such, but with the people who illegally litter and deface the city's streets with this offensive and often pornographic advertising material." School teachers had complained that schoolchildren have been found collecting and trading the cards, many of which are illustrated.

In early 1996, British Telecom and Westminster sanitation teams, starting as early as 6 A.M. each day, removed 150,000 cards a week, 1.1 million such cards in an eight-week period; an estimated seven million cards are removed in a year. "Vice-carders," mostly young men hired by a half dozen prostitutes to post their cards, follow the sanitation teams, creating a no-win situation.

In 1991, the last time Westminster officials tried a similar scheme, OfTel, the Government telecommunications-regulating authority, said that blocking incoming calls was a violation of advertisers' rights. Before the current campaign, British Telecom changed its contract for all its customers, stipulating that they cannot advertise their telephone number in public phone kiosks. Whatever the success this effort has in controlling this advertising, it will not stop prostitutes from advertising their sexual services. Prostitution is legal in Britain, and so sex workers will continue advertising in other outlets, such as community newspapers. (See the discussion of *pikku bira* in Section 8B of the chapter on Japan.)

[*Update 2001*: A redefinition of terms such as *prostitution* was part of the U.K. government consultation paper to change the sex laws in Britain. The document, *Setting the Boundaries*, suggests consideration be given to the regulation of soliciting by men for the purposes of prostitution under Section 1 of the Street Offences Act 1959 on the same basis as soliciting by women. It also recommended that a specific trafficking offense with powers to trace assets overseas be introduced. Offenses regarding commercial sexual exploitation of children will be listed. It also recommended a new offense for the sexual exploitation of adults to include an offense for anybody in England and Wales who recruits people for sex work anywhere in the world. (*End of update by K. R. Wylie*)]

## E. Pornography and Erotica KEVAN R. WYLIE

There has been a general relaxation within England and Wales over erotica and nudity when displayed within newspapers and on television. There has been a trend away from the "page 3" bare-breasted girl in the tabloid press, in part fueled by complaints from feminists, but also because of increased availability of such material elsewhere. Hard pornography cannot be shown on British television, nor can scenes of an erect penis or bondage. Among European

nations, only Ireland appears stricter than the United Kingdom, with no nudity or pubic hair permitted.

Despite such liberalism, there remains tight enforcement against many forms of pornographic material. Possession of adult pornography does not in itself constitute an offense. However, possessing obscene material for gain, whether that be to lend, publish, or display, would constitute an offense under the Obscene Publications Act 1959/1964. The law explicitly forbids pornography involving minors and extends to taking indecent photographs of children (Protection of Children Act 1978). The sentence on conviction is three years imprisonment. Possession of photographs of child pornography carries punishment usually by fine (but six months custodial sentence is possible), and associated investigation may ensue for possible child sexual abuse and of pedophilia. A proactive measure against pedophilia exists whereby photographic developers are requested to inform the police when they notice suspicious photographs of young children. The increasing incidence of transfer of pornographic material using personal computers over the Internet has led to rising concern. However a group, Parents Against Injustice (PAIN), campaigns against overzealous misinterpretation of innocent family photographs of children bathing, running in the garden naked, or being bounced on grandfather's knee. The fact is that photographs can be very subjective.

Many book classics were banned under the Obscene Publications Act, and the infamous 1960 obscenity trial prevented copies of *Lady Chatterley's Lover* and *Queen Mab*, first published in 1829, from home ownership. Daniel Defoe was one of the earliest English authors to include super-permissive parent figures, incestuous relationships, and lower-class characters who were all sexually uninhibited, passionate, and with responsive female characters. The links between poverty and exploitation and between sexual attitudes and cultural practice have been noted many times over. However, pornography has certainly moved more from the "peep shows" and cinemas to the home, with the increasing numbers of videotapes displaying such material.

Pornographic videotapes are now obtainable through mail order, both within the United Kingdom and from Europe. Self-help videos, like *The Lover's Guide*, had sold 1.3 million copies by late 1995. Although explicit, they are considered educational and have a license. The importation of obscene pornography, however, constitutes a criminal offense, although it is acknowledged that it occurs in considerable volume, given relaxed cross-country border controls within Europe. Political action was taken in 1993 to prevent satellite programming of pornographic material from Red Hot Dutch into the United Kingdom. This involved making it an offense to sell "smart cards" or advertise and publish information about the service. A similar course of action was taken in 1995 to ban the Swedish channel TV Erotica. The 1990 Broadcasting Act forbids programs that might "seriously impair the physical, mental or moral development of minors."

The United Kingdom now has three subscription-pay-TV adult soft-porn channels, Adult Channel, Television X, and Playboy TV, all of which operate in a scrambled form at nighttime. There are approximately 100,000 subscribers. The Church of England and Methodist Church have sold their shares in the BSkyB company because of this new venture.

[Update 2001: Recent court rulings have introduced a "Restricted 18" or R18 certification for explicit-sexual-act videotapes which are on sale only in the U.K. through official sex shops. In 2000, the High Court ruled that "extremely explicit" videos could go on sale in licensed sex shops, and

dismissed a challenge by the British Board of Film Classification against the decision of its own Video Appeals Committee (VAC). The VAC was established by Parliament in 1984 to rule on appeals from firms that feel they have been harshly treated by the British Board of Film Classification. The Home Secretary (Home Office) responded by stating that ways of protection of children from exposure to sexually explicit material was under consideration. The British Board of Film Classification Guidelines reads as follows:

'R18'—TO BE SUPPLIED ONLY IN LICENSED SEX SHOPS TO PERSONS OF NOT LESS THAN 18 YEARS

The 'R18' category is a special and legally restricted classification for videos where the focus is mainly on real sexual activity and the purpose is primarily to induce sexual arousal. Such videos may be supplied to adults only in licensed sex shops, of which there are only about 60 in the UK. 'R18' videos may not be supplied by mail order.

The sex scenes in all 'R18' videos must be non-violent and between consenting adults. They must also be legal, both in the acts portrayed and in the degree of explicitness shown. There are no limits on length and strength apart from those of the criminal law. Group sex is allowed and, insofar as the law permits, there is parity as between homosexual and heterosexual sex.

Erections may be shown, as may a broader range of mild fetish material, but no threats of humiliation or realistic depictions of pain are permitted.

There must be no clear sight of penetration, oral, vaginal or anal, or of masturbation.

Ejaculation must not be shown.

Context may justify exceptions.

[(End of update by K. R. Wylie)]

## 9. Contraception, Abortion, and Population Planning

### A. Contraception Attitudes and Use

FRAN READER [Rewritten and updated in late 2001 by F. Reader]

Contraception is widely accepted, although there remains considerable variance between knowledge about and actual use of contraception. There is a constant trend towards a more open discussion about contraception and sexuality that has been accelerated by the arrival of HIV and AIDS.

The Education Reform Act of 1988 places a statutory responsibility on schools to provide a broad and balanced curriculum that "promotes a spiritual, moral, cultural, mental, and physical development of pupils at the school and in society," and which "prepares pupils for the opportunities, responsibilities, and experiences of adult life." This philosophy forms the basis of Personal and Social Education (PSE), which is a theme running throughout a child's life at school. Sex education is part of the wider topic of health education. Health education is not a mandatory foundation subject, but it is expected to be a theme that is incorporated across the whole curriculum. School governors have the responsibility to decide whether and/or what sex education should be taught. Parents have the right to withdraw their children from the PSE aspect of sex education, but not from the biological science aspects of the National Curriculum, which provide information about human sexual behavior and sexually transmitted infections, including HIV and AIDS. In Scotland, there is no legislation regarding the teaching of sex education in schools. Each Local Authority decides or delegates the decision to the individual school, and the curriculum guidelines define sexuality and relation-

ships as an important area of health education. In Northern Ireland, health education is given as one of six mandatory cross-curricula themes in the Education Reform Order of 1989. Sex education is not specifically mentioned, but it is widely expected to form a major component of health education.

The age of consent for heterosexual sexual activity is 16 in England, Wales, and Scotland, and 17 in Northern Ireland. Doctors may prescribe contraception to those under 16 years old. The present legislation in England and Wales follows the House of Lords Ruling in the Gillick case of 1985. In that case, the Lords ruled that "a girl under 16 of sufficient understanding and intelligence may have the legal capacity to give valid consent to contraceptive advice and treatment including necessary medical examination." In Scotland, the Age of Legal Capacity Act came into force in September 1991, bringing Scotland in line with England and Wales. In Northern Ireland, a similar legal situation exists, except the age of consent for medical advice is 17.

In 1993, the Conservative Government launched a *Health of the Nation* initiative. Sexual Health was one of the key sections, with one of the targets being to halve the rate of unplanned pregnancy in under-18-year-olds by the year 2000. This did not happen. The present New Labour Government has therefore established a Teenage Pregnancy Unit to research the reasons for unplanned teenage pregnancy and establish strategies that will tackle the problem effectively. This forms part of a wider Government initiative to address the causes of social exclusion. A Sexual Health Strategy document was anticipated in the autumn of 2000.

Since 1974, all contraceptive advice provided by the National Health Services, and all prescribed supplies, were made available free of charge, irrespective of age and marital status. In the United Kingdom, most contraceptive services are provided by either general practitioners (GPs) or by Community and Hospital Clinics. Community and Hospital Family Planning Clinics have always been able to supply condoms free of charge. This has not been available to GPs, although some medical practices now offer this service. Government policy supports the dual provision and choice to maximize the use of services; however, there has been a marked reduction in the number of Community Family Planning Clinics with a shift to GP providers. Since 1990, new contractual arrangements were introduced for GPs that affected their fees and allowances, encouraging a greater emphasis on Health Promotion. This system has continued to shift contraceptive care to general practice. The Community Family Planning Clinics have, therefore, looked to complement GP services, and specifically target teenagers and vulnerable groups that may have problems in accessing care from GPs.

Community Clinics, backed up by specialist contraceptive clinics in hospitals, also tend to provide a wider range of contraceptive methods than are available from GPs. Snowdens' research in 1985 showed that only 55% of the women using Family Planning Clinics were prescribed the pill as opposed to 84% of GP patients. This trend has continued. Community Clinics, therefore, remain a service of choice for those women wishing to use the less-common methods of contraception, and they remain the main source of training for physicians and nurses.

Contraception is now recognized as a part of core training for all GPs, obstetricians and gynecologists, and specialists in genitourinary medicine. Specialists in the field undergo training with the Faculty of Family Planning and Reproductive Health Care, which is part of the Royal College of Obstetricians and Gynaecologists. Initial training is recognized as

the Diploma of the Faculty of Family Planning (DFFP) and the specialist training as Membership (MFFP). The Faculty also aims to maintain standards for various skills by awarding letters of competence to practitioners who have completed training in techniques of fitting intrauterine devices or implants. The Faculty has also introduced a process of five-year recertification for all its certificates.

Since the *Health of the Nation* initiative, there has been an increasing shift to integrate the community and hospital contraceptive services with community and hospital services for sexually transmitted infections (STIs/STDs). Doctors and nurses initially trained in one or the other discipline are entering into programs of combined training, or at least improving their appreciation and understanding of the other discipline. The integration of family planning and sexual health is providing a "one stop shop" approach to the management of all potential problems arising from sexual activity. It is now common practice to be advised to use contraception to prevent unplanned pregnancy backed up by either the male or female condom for the prevention of sexually transmitted infections.

Contraceptive methods currently available in the United Kingdom are combination oral contraception, progesterone-only pills, long-acting injectable progestogens, a three-year etonogestrel implant, an intrauterine system with Levonorgestrel (IUS), copper intrauterine devices (IUD), including GyneFix, male and female condoms, diaphragms and cervical caps, natural family planning, including Persona, and male and female sterilization. The 1997 statistics for Great Britain show that the combined oral contraceptive pill is still the most common method of contraception used by women under 30. In total, it is used by 26% of women between the ages of 16 and 49. Conversely, sterilization is the most common method used over the age of 30, with male and female sterilization being equally represented. In total, 21% of 16- to 49-year-olds use sterilization as their method. Condom usage has increased in recent years, and with this, there has been a decrease in the use of oral contraceptives. The use of combined oral contraception always fluctuates, tending to fall after media-publicized concern about safety. In October 1995, the Committee on Safety of Medicines (CSM) raised concern about pills containing the progestogens, desogestrel and gestodene, and an increased risk of venous thrombosis. As with similar pill scares in the past, this generated a fall in the uptake of the combined pill, and may have been responsible for the rise in the abortion rate seen across all age groups.

Methods of contraception introduced over the past 10 years include the female condom (Femidom), introduced in 1992. So far, this method has not caught on, and the male condom maintains dominance as the most popular barrier method. The five-year capsule Levonorgestrel implant (Norplant) was introduced in 1993 and withdrawn in 1999, to be replaced by a single rod etonogestrel implant (Implanon). An intrauterine system (IUS) with Levonorgestrel (Mirena) was introduced into the United Kingdom in 1995 and now has a five-year license. This new method has been widely accepted in the United Kingdom, particularly for the management of contraception in older women as an alternative to female sterilization. The Personal Contraceptive System for the electronic prediction of the fertile phase (Persona) was introduced in 1996. It is not available on the NHS and has not proved to be as successful as was anticipated. It is mostly used by women looking to space pregnancies. In 1998, the fixed, frameless, and flexible intrauterine device (GyneFix) was introduced. A training program is underway to teach doctors the new fitting technique. The copper IUD, Gyne T 380, with a 10-year license, became unavailable in the U.K.

at the end of 1999 following its withdrawal by the manufacturer for commercial reasons. This was considered a retrograde step by family planning specialists in the U.K., who saw this device as the gold standard IUD. It is hoped that a similar device will be reintroduced, but in the meantime, the introduction of the Nova T 380 IUD has been welcomed as an alternative, although it only has a 5-year license at present, and is currently not available to GPs on their drug tariff.

Emergency contraception with both the hormonal and IUD method are widely available within the United Kingdom through general practitioners, community clinics, sexually transmitted disease (STD) clinics, and accident and emergency departments. In 2000, the progesterone-only emergency contraceptive (POEC) method was licensed and marketed as Levonelle 2. The concept of advance-prescribing of POEC is gaining favor, and there is an expectation that it will become an over-the-counter (OTC) medicine in the near future.

## B. Teenage (Unmarried) Pregnancy

MARY GRIFFIN

United Kingdom data specifically relating to unmarried teenagers are scarce. Official statistics have been collected by separate organizations in England and Wales, Scotland, and Northern Ireland, but uniform data have not been gathered for the three groupings. The information given in this section is mainly for England and Wales, with a little, where available, on Scotland and Northern Ireland.

The trend in the United Kingdom is increasingly towards teenage mothers not marrying (Family Planning Association 1994). Some prefer to cohabit with their partner, since there is little stigma attached to this, although many maintain a single-parent lifestyle. Indeed, it can be advantageous for teenagers not to marry in terms of welfare benefits and housing, although cohabiting teenage mothers do have the highest rate of reported homelessness (18%), according to recent research from the *National Child Development Survey* (Joseph Rowntree Foundation 1995). The trend away from marriage is reflected in the outcome of conceptions in England and Wales for 1992 for all women under 20, the total number being 93,000, of which 8,300 were conceptions inside marriage. Of the 84,700 conceptions outside of marriage, 37% were legally aborted, 58% led to maternity outside of marriage, and only 5% to maternity inside marriage (OPCS 1992). Looking at live births for 16- to 19-year-olds in England and Wales, in 1983, 56.3% were registered outside of marriage, but this had increased to 87.8% by 1993 (OPCS). In Scotland, for the 15-to-19 age group, the percentages rose from 54.5% in 1984 to 89.3% in 1994 (General Register Office for Scotland). Even in Northern Ireland, which tends to be more conservative and a few years behind social trends on the mainland, single parents are no longer a rarity and are increasingly accepted without social stigma.

While 16 years is legally the lowest age for marriage in the United Kingdom, parental consent is required up to the age of 18 in England, Wales, and Northern Ireland, but not in Scotland. In the first three regions, written consent of both parents is required, even if they are estranged, so that some teenagers wishing to marry may not be able to do so before the birth of the baby if this legal requirement cannot be fulfilled.

Looking at trends over the last two decades, the introduction of free contraception in 1974 led to a decline in teenage pregnancy rates. In 1973, the total conception rate per 1,000 teenagers in England and Wales was 9.2 for 13- to 15-year-olds (and therefore unmarried) and 75.2 for 15- to 19-year-olds (marital status unspecified). Ten years later,

the rates were 8.3 and 56.0, respectively, of which just over half were terminated for the 13-to-15 age group and a third for the 15-to-19 age group. Thereafter, rates increased until a peak in 1990 (10.1 for the 13-to-15 group, with half legally terminated, and 69.0 for the 15- to 19-year-olds, with just under a third terminated) (OPCS). The peak came a year later in Scotland, but there was no particular trend in Northern Ireland.

Several factors probably contributed to this phenomenon. Firstly, the Gillick case, which eventually concluded in 1985 in favor of young people's rights, caused a great deal of confusion over teenagers' access to confidential help and advice, and anxieties still persist (Wareham & Drummond 1994), despite the joint statement referred to by Mrs. Gillick in a letter to the *British Medical Journal* (Gillick 1994). Secondly, the onset of economic recession led to a decline in young people's job opportunities. A third contributory factor was cuts in family planning clinics, thereby restricting access to services (Brook Advisory Centres 1995). The Government's concern over the rise in teenage pregnancies led to teenage sexual health being identified as one of the key areas targeted for action in their policy document, *Health of the Nation* (Department of Health 1992)—a specific aim being to reduce the 1989 conception rate in under-16-year-olds by at least 50% by the year 2000. Rates are already falling again and teenagers are far less likely to have a baby today than 25 years ago.

In England and Wales, the total conception rate per 1,000 for 13- to 15-year-olds in 1993 was 8.1 (with 50% legally terminated) and for 15- to 19-year-olds, 59.6 with just over one third terminated. In Northern Ireland, the total number of live births to under-15-year-olds for 1990 to 1993 inclusive ranged between 4 to 7, but rose to 11 in 1994. Total live births to 15- to 19-year-olds (marital status unspecified) rose to 1,856 in 1992, but has since fallen to 1,486 in 1994 (General Register Office for Northern Ireland). Since Northern Ireland is not as liberal towards abortion as the other three countries, some pregnant teenagers go to the larger cities on the mainland to obtain abortions. Legally, the situation with regard to abortion in Northern Ireland is a very gray area, and those involved in women's health and welfare agencies are aware that doctors there are increasingly prepared to widen grounds for justifying therapeutic abortion in the interests of a teenager's physical or mental health. This trend may be reflected in the statistics, though official figures for terminations were unavailable because of the legal situation.

With regard to the social background of young parents, longitudinal data from the *National Child Development Survey* show that half the teenage mothers who were single when their babies were born went on to cohabit with or marry the father. The study found no significant differences in childhood factors between young parents whose babies were born within marriage and those who were single or cohabiting when they gave birth. The data also suggested that the predisposition to have a child when young was independent of any thoughts about marriage, cohabitation, or single parenthood. Sixty-seven percent of those married at the time of conception had planned the pregnancy, compared with 26% of those cohabiting, 17% who married during pregnancy, and 8% who had no live-in relationship before birth (summarized by Joseph Rowntree Foundation 1995).

Despite the expansion of services and increased provision of information for teenagers in the United Kingdom since *Health of the Nation*, it seems that risk-taking behavior, failure to anticipate risk, lack of knowledge, and errors in the use of contraception are still major causes of un-

wanted teenage pregnancies (Lo et al. 1994; Pearson et al. 1995; Wareham & Drummond 1994).

[*Summary and Update 2001*: Within Western Europe, the United Kingdom has the highest rate of teenage births. However, data specifically relating to unmarried teenagers are scarce. As noted above, the trend in the U.K. is increasing toward teenage mothers not marrying (Family Planning Association 1994). Some prefer to cohabit with their partner. Many maintain a single-parent lifestyle, although there is still stigma attached to this. Indeed, it can be advantageous for teenagers not to marry in terms of welfare benefits and housing, although cohabiting teenage mothers have the highest rate of reported homelessness, with 18% recorded in the *National Child Development Survey* (Joseph Rowntree Foundation 1995). Even in Northern Ireland, which tends to be more conservative and a few years behind social trends on the mainland, single parents are no longer a rarity and are increasingly accepted without social stigma. While 16 years is legally the lowest age for marriage in the United Kingdom, parental consent is required up to the age of 18 in England, Wales, and Northern Ireland, but not in Scotland. In the first three regions, written consent of both parents is required, even if they are estranged, so that some teenagers wishing to marry may not be able to do so before the birth of their baby if this legal requirement cannot be fulfilled.

[Looking at trends over the last three decades, the introduction of free contraception in 1974 led to a decline in the pregnancy rate. In 1973, the total conception rate per 1,000 teenagers in England and Wales was 9.2 for 13- to 15-year-olds (and therefore unmarried), and 75.2 for 15- to 19-year-olds (marital status unspecified). Ten years later, the rates were 8.3 and 56.0, respectively, all of which, just over half, were terminated for the 13-to-15 age group and a third for the 15-to-19 age group. Thereafter, rates increased until a peak in 1990 (OPCS). Several factors probably contributed to this phenomenon. First, the Gillick case, which eventually concluded in 1985 in favor of young people's rights, caused a great deal of confusion and anger over teenagers' access to confidential help and advice, and anxieties still persist despite the joint statement referred to by Mrs. Gillick in a letter to the *British Medical Journal* (Gillick 1994). Second, the onset of economic recession led to a decline in young people's job opportunities. A third contributory factor was cuts in family planning clinics, thereby restricting access to services (Brook Advisory Centres 1995).

[With regard to abortion, since Northern Ireland is not as liberal as the other three countries, some pregnant teenagers go to the larger cities on the mainland to obtain abortions. Legally, the situation with regard to abortion in Northern Ireland is a very grey area, and those involved in women's health and welfare agencies are aware that doctors are increasingly prepared to widen grounds for justifying therapeutic abortion in the interests of a teenager's physical or mental health. This trend may be reflected in the statistics, though official figures for terminations were unavailable because of the legal situation. Currently in England, just over half of all teenage pregnancies are terminated, and this ratio has changed little since the mid 1970s. Over a third of conceptions to women in their 20s are terminated, with the figure rising (ONS 1998). Pregnant teenagers are one-and-a-half times more likely than women in their 20s to have an abortion at 13 weeks or later (ONS 1997).

[The government's concern over the rise in teenage pregnancies through the 1980s led to teenage sexual health being identified as one of the key areas targeted for action in their policy document, *Health of the Nation* (Department of Health 1992). A specific aim of the new policy was to reduce the 1989 conception rate in under-16-year-olds by at

least 50% by the year 2000. However, the target was not met and U.K. rates have stuck at around 25 live births per 1,000 women aged 15 to 19. Rates for Scotland, Northern Ireland, and England have tended to be similar, but Wales has a higher rate, as have certain areas in England.

[The following information is mainly for England, and based on the Report in 1999 of the Social Exclusion Unit (SEU) on Teenage Pregnancy (Cm 4342), in response to a remit from the Prime Minister to develop an integrated strategy to reduce rates of teenage parenthood and propose solutions to combat the risk of social exclusion for vulnerable teenage parents and their children. The newly developed administrations for Scotland, Wales, and Northern Ireland, and their Government Offices, are also considering what action set out in the Report could be applied in the light of the particular circumstances present in each country.

[The report highlighted the following facts:

- There are nearly 90,000 conceptions a year to teenagers, of which approximately 7,700 are to under-16-year-olds and 2,200 to girls aged 14 or under, with 56,000 conceptions resulting in live births. However, more than two thirds of girls under 16 do not have sex, and most reach their 20s without getting pregnant.
- Teenage parenthood is more common in areas of deprivation and poverty and for those with poor educational attainment, but even in the most prosperous areas, teenage births are higher than in some comparable European countries.
- Half of those sexually active at the time they are 16 do not use contraception for the first time, and for a significant group, sex is forced or unwanted.
- Half of under-16s and more than a third of 16- and 17-year-olds opt for abortion if they get pregnant. This totals just over 15,000 abortions a year for girls under age 18.
- Ninety percent of teenage mothers have babies outside marriage (20 years ago, it was around 40%).
- Fifty percent of relationships started in the teenage years break down.
- The death rate for the babies of teenage mothers is 60% higher than those of older mothers, and these babies are more likely to be of low birthweight, have childhood accidents, and be admitted to the hospital.
- The daughters of teenage mothers have a higher chance of becoming teenage mothers themselves.

[Although the Social Exclusion Unit (SEU) on Teenage Pregnancy could not identify a single explanation for the U.K.'s relative failure to reduce teenage birthrates, they drew attention to three important factors: namely low expectations of young people disadvantaged in childhood and with little prospect of a job; ignorance about contraception, what to expect in relationships, and what it means to be a parent; and "mixed messages," with one part of the adult world bombarding teenagers with explicit messages that sexual activity is the norm and another part that is embarrassed by any mention of sex and more often silent about it, hoping that if sex is not talked about, it won't happen. In studying the phenomenon of social exclusion, the Unit identified certain risk factors for teenage parenthood—namely poverty, children who had been in foster care, children of teenage mothers, those with educational problems or not continuing in education after 16, those who had been sexually abused in childhood, mental health problems, and crime. It has been estimated that 24% of the 11,000 prisoners in Young Offenders Institutions are fathers (HMIP 1977). The unit suggests that multiple risk factors may explain the overrepresentation of some ethnic minorities

among teenage parents. Information from the *Labour Force Surveys* (1985-1995), the *Fourth National Survey of Ethnic Minorities* (1994), and the *Health and Lifestyle Surveys* (1994) show that four groups in particular—Bangladeshis, Africans, Caribbeans, and Pakistanis—are all at substantially greater risk of teenage parenthood than the national average. The Unit's analysis highlighted two main goals—reducing the rate of teenage conceptions, with a specific aim of halving the rate of conceptions among under-18-year-olds by the year 2010, and getting more teenage parents into education, training, or employment to reduce their risk of long-term social exclusion. The action plan for achieving these goals is quoted below:

- A national campaign involving government media, the voluntary sector, and others to improve understanding and change behavior.
- Collaborative action with new mechanisms to coordinate action at both the national and local levels and ensure that the strategy is on track (until now, there has not been an agency or individual prepared to take responsibility for tackling the problem as a whole).
- Better prevention of the causes of teenage pregnancy, including better education in and out of school, access to contraception, and targeting of at-risk groups, with a new focus on reaching young men . . . , who have often been overlooked in past attempts to tackle this issue.
- Better support for pregnant teenagers and teenage parents, with a new focus on returning to education with childcare to help, working to a position where no under-18 single parent is put in a lone tenancy, and pilot programs around the country providing intensive support for parents and child.

[The report recommends the implementation of a 10-year program to improve the climate in which young people prepare for adulthood and the support for teenage parents and their children. Funding some £60 million over the following three years is envisaged. A new unit in the Department of Health to coordinate the work has been set up. However, despite the expansion of services and increased provision of information for teenagers in the U.K. since *Health of the Nation*, recent studies, such as *Effective Health Care—Preventing and Reducing Adverse Effects for Unintended Teenage Pregnancies* (1997), and *Teenage Mothers—Decisions and Outcomes* (1998), indicate that risk-taking behavior, failure to anticipate risk, lack of knowledge, and errors in the use of contraception, remain major causes of unwanted pregnancies. It remains to be seen whether the changes called for in the *Report*—“fewer unwanted pregnancies, fewer children brought up in poverty, and successive generations of children and young people having better chances for the future” are achievable. (End of update by M. Griffin)]

[Update 2003: In an attempt to reduce the high rates of teenage pregnancy, the U.K. Departments of Health and Education have backed Exeter University in training teachers to discuss various pre-sex “stopping points” with teenagers under age 16 and encouraging them to discover “levels of intimacy,” including holding hands and oral sex, instead of full sexual intercourse. Early in 2003, more than 100,000 children were taking the course at one in every 30 secondary schools.

[Critics of the course, called “A Pause,” objected that the program has no framework for talking about responsibility or the emotional side of relationships and, in effect, implicitly supports underage sexual activity and excites the sexual interest of children.

[Opponents of the program expressed hope that the Sexual Offences Bill, then going through the House of Lords,

would lead to the course being banned. A provision in the Bill would make it an offense for anyone to “arrange or facilitate the commission of a child sex offence” (Owen 2003). (End of update by R. T. Francoeur)]

### C. Abortion

JANE READ and LINDA DELANEY

#### *Legal Status and Availability*

Until 1967, most pregnancies could not lawfully be terminated by abortion. The Offences Against the Person Act of 1861 specifically criminalized both successful and unsuccessful abortion attempts by those who assisted women and by pregnant women themselves (curiously, the former, but not the latter, could be convicted, even if there was found to be no pregnancy). However, as prosecutions under the 1861 Act had to establish that the accused acted “unlawfully,” it became possible to defend a criminal charge by showing that the abortion was carried out in the honest belief, based on reasonable grounds and adequate knowledge, that the continuance of the pregnancy would turn the woman into “a physical or mental wreck”; this was the outcome of the famous case of *R. vs. Bourne* (1939-1KB 687), brought after an eminent surgeon performed an abortion on a 14-year-old who had been raped and whose mental well-being was said to have been gravely threatened by the resulting pregnancy.

In 1967, Parliament provided statutory defenses by passing the Abortion Act. Substantially amended by the Human Fertilization and Embryology Act of 1990, the Abortion Act of 1967 permits abortion on liberal therapeutic and eugenic grounds if two registered medical practitioners—one would suffice in an emergency—certify the existence of such a ground, and the abortion is carried out by a registered medical practitioner. In brief, the amended law allows abortion when it is performed to prevent grave permanent injury to the mental or physical health of the woman, or risk to her life, or the birth of a “seriously handicapped” child. For these three situations, there is no time limit; in other cases, the limit is the end of the 24th week of pregnancy.

An important change in the 1967 Act resulting from enactment of the Human Fertility and Embryology Act 1990 is the severance of the link that applied previously with the Infant Life (Preservation) Act 1929. The effect of this has been, paradoxically, a slight liberalization of the Abortion Act as it was between 1967 and 1990. Prior to 1990, women could not, under any circumstance, have their pregnancy terminated after the 28th week of pregnancy, since, under the Infant Life (Preservation) Act of 1929, this was considered to be the point at which a fetus became viable. Although Clause (a) (given below) states a limit of 24 weeks of pregnancy, there is no mention of a time limit for the other three clauses. In effect, the situation in England and Wales is that abortion is rarely done after 22 weeks of pregnancy. Essentially, any woman who is considering a decision to terminate her pregnancy, whether as a result of her social, economic, personal, family, or medical circumstances, must have the consent of two medical practitioners before the abortion may be performed.

The clauses in the Abortion Act 1967, as amended by the HFE Act 1990, under which she can do this and to which the two doctors must conform are as follows:

1. that the pregnancy has not exceeded its 24th week and that the continuance of the pregnancy would involve risk to the life of the pregnant woman, or of injury to the physical or mental health of the pregnant woman or any existing children of her family, greater than if the pregnancy were terminated; or

2. that the termination is necessary to prevent grave permanent injury to the physical or mental health of the pregnant woman; or
3. that the continuance of the pregnancy would involve risk to the life of the pregnant woman, greater than if the pregnancy were terminated; or
4. that there is a substantial risk that if the child were born it would suffer from such physical or mental abnormalities as to be seriously handicapped. (The Abortion Act 1967 as amended, HMSO)

Thus, it is clear that the procedures for a woman to have a legal termination of her pregnancy are grounded not only in the medical aspects, but are based on the need to adhere to the law of abortion. When a woman presents for consideration of an abortion, therefore, she is entering a legal process.

There is no requirement on the part of Health Authorities to provide abortion services, and abortion provision is not consistent across the country. In some areas, the service may be relatively available through the Health Service, and in other areas, there will be little provision, and women will either have to pay for a legal termination in the private sector or nonprofit charity sector, as well as possibly having to travel some distance to get to a private clinic.

#### *Social Attitudes Toward Abortion*

There is evidence that attitudes toward abortion and provision of abortion have liberalized over the past 10 to 15 years. In a fact sheet on the legal and ethical issues surrounding abortion, the Family Planning Association quotes the *British Social Attitudes Survey*, in which it was shown that the number of United Kingdom people who felt abortion should be allowed when a woman's health was endangered increased from 87% in 1983 to 95% in 1989. This trend was consistent when other questions, such as the economic situation of the woman and her family, and the woman's own choice, were considered (FPA *Factsheet 6B* 1992, 4).

This trend is also reflected in the medical profession. "A national survey of consultant gynecologists in 1989 found that 73% believed that a woman should have the right to choose abortion" (Paintin 1992, 968). This same survey, carried out by Savage and Francome, also showed that 87% of gynecologists at the Royal College of Obstetricians and Gynaecologists had been right to oppose one of the more recent changes to the Abortion Act, the Alton Bill. There seems to be a general understanding that people feel that the current system works quite well.

#### *Incidence*

The latest available figures (Office of Population Census and Surveys *Monitor* April 11, 1995) show that during 1993, a total of 168,711 abortions were performed in England and Wales, 2% fewer than in 1992, when the total was 172,063. The 1992 total figure included both the resident and nonresident figures, with 160,495 resident women obtaining abortions and the remainder being accounted for mainly by Irish women seeking an abortion abroad, since it is not legal in the Republic of Ireland. The 1992 TOP (terminations of pregnancy) rate for residents of the United Kingdom was 12.51 per 1,000 women.

The reason most frequently cited by women seeking an abortion was risk of injury to the physical and mental health of the pregnant woman. The main provider was the National Health Service. Section 4 of the Abortion Act of 1967 affords legal protection to healthcare workers who refuse to participate in abortion on grounds of conscience. Prospective fathers, on the other hand, were, in *Paton vs. Trustees of*

*BPAC* (1979—QB 276), denied the right to intervene to prevent an abortion.

There has been little change in the proportion of women seeking abortion since the introduction of the 1967 Abortion Act. In a 1992 article in the *British Medical Journal*, David Paintin, then a Research Fellow at St. Mary's Hospital, London, observed that: "The lack of change in the proportion of pregnancies ending in legal abortion suggests that the behavior factors that lead to unwanted conception and abortion are intrinsic to our society and that easy availability is not a primary factor in the decision concerning abortion" (Paintin 1992, 967). This is an important point, since those who oppose abortion seem to believe that should abortion become more "freely" available, there would be a marked increase in the number of women who choose legal abortion, and that any "loosening" of the restrictions that pertain to abortion in England and Wales should therefore be opposed. In England and Wales, in 1991, the vast majority of legal abortions—88%—were performed before the 13th week of pregnancy (Family Planning Association *Factsheet 6A* 1994, Table 6, 7).

#### **D. Population Planning Programs and Policies**

PETER SELMAN

"No population policy please, we're British!" (Coleman & Salt 1992).

Despite the fact that birthrates in the United Kingdom have been falling since the late 19th century, and the fertility rate has dropped below replacement level (namely, a Net Reproduction Rate below 1.00), between 1927 and 1943 and since 1973, the population of the United Kingdom has grown steadily, with a reduction in size evident only in the late 1970s, when the population fell from 55,922,000 in 1974-1975 to 55,835,000 in 1978-1979. Since then, the population has increased steadily to 58 million in 1992. Experts project the population of the United Kingdom will surpass 62 million by the year 2031, after which a steady decline is expected, with the population returning to the 1992 level by the year 2061 (OPCS 1994).

The initial fall in the birthrate occurred, as in most countries, without any government pressure and in the face of opposition to birth control. In England and Wales, the period total fertility rate fell from 4.8 in the 1870s to a low point of 1.72 in 1933 (OPCS 1987). It was at this stage that we find the first signs of concern over population decline, as birthrates fell to below replacement level, and differences in fertility became apparent as middle-class groups married late and had few children while lower-working-class people had a substantially higher fertility. This led to concern about the quality of the population and to the development of the eugenics movement. A number of publications warned of the dangers of depopulation (Charles 1936; Glass 1936; Hogben 1938), a national decline (Reddawa 1939), "race suicide" (McCleary 1943), and a rejection of parenthood (Titmuss 1942). Charles (1938) projected the British population for 1995 at 20 million, a little more than a third of the actual population today.

In 1944, a Royal Commission on Population was set up to consider whether Britain was indeed facing a population decline and whether measures should be taken "in the national interest" to influence future trends. The Royal Commission reported in June 1949, soon after the 1947 crude birthrate was announced as 20.5, the highest figure since the end of World War I, and the net reproduction rate (NRR) had risen to 1.21. The commission saw this as a temporary aberration and projected a long-term decline in population. The Commission did not, however, recommend any counter action and no official population policy followed. Others

were less sanguine (McCleary 1943; Titmuss 1942); in the same year, Eva Hubback (1947) projected the 1999 British population at 34 million.

No one predicted that within a decade the birthrate would be rising sharply to the highest level since the end of World War I (Holmans 1963). Nor was there any expectation that migration would play a role in boosting population growth: "The Royal Commission never dreamt that 2.5 million colored immigrants and their descendants would be living in Britain just thirty years after their report" (Coleman & Salt 1992). Restrictions on Commonwealth immigration were introduced in the early 1960s and have since been maintained by both political parties. However, these policies are more because of racist concerns than to any fear of excess population. Nevertheless, it is important to note that, without such immigration and the consequent births to immigrants and their descendants, Britain's population would by now most certainly be in decline.

By 1964, the crude birthrate had risen to 18.5 and the total fertility rate to 2.93 (OPCS 1987), and in 1965 the General Register Office projected a population for England and Wales in 2001 of over 66 million. This led to new concerns about overpopulation. In 1971, a Population Panel was appointed following the publication in that year of a *White Paper* responding to a report from the House of Commons Select Committee on Science and Technology on the Population of the United Kingdom, which had concluded that "the government must act to prevent the consequences of population growth becoming intolerable for the every day conditions of life."

The *Report of the Population Panel* was published in March 1973, by which time the birthrate had fallen substantially and the net reproduction rate was once again below 1.00. It concluded that the population of Great Britain would "almost certainly rise from 54 million in 1971 to around 64 million in the course of the first decade of the next century . . . [and to] over 80 million around the middle of the next century." If, however, fertility were to fall rapidly, population could decline to 40 million by 2050, and there would be "profound changes in the age structure" with serious social consequences. Reviewing the implications of anticipated growth, the Panel concluded that "there is no reason to suppose that 64 million (by the beginning of the 20th century) would be in any way intolerable or disastrous," but that "to absorb a further 20 million by 2051 could be much more intractable" so that "a slower rate of increase . . . is clearly preferable." Less attention was paid to the possibility of a population decline, other than to state that "if there were to be a fall in fertility which led . . . to an excess of deaths over births, this should not be a cause of public concern."

No explicit population policy was recommended, although the Government was advised to extend family planning services and inform people about the fact of the population problem. The panel was less happy about persuading people of the advantages of smaller families and opposed fiscal and other disincentives to having children. By 1977, the crude birthrate had fallen to 11.5 and the total fertility rate to 1.66, the lowest levels since records began, and any further measures to discourage parenthood were viewed as inappropriate.

Since then, the crude birthrate has risen again and has remained steady between 13 and 14 since 1985. In 1990, the total fertility was 1.8, below replacement level, but high in comparison with other European countries such as Italy (1.29) and Spain

(1.3). The population is, nevertheless, projected to grow until the second quarter of the 21st century (OPCS 1994). Concern is expressed over the implications of an aging population (Johnson & Falkingham 1992), but there is no overt policy to increase fertility, and recently, more concern has been focused on rising divorce rates, the decline in marriage, and the associated increase in childbearing outside marriage, especially among teenagers (Selman 1996).

Despite two substantial reports on population, the United Kingdom has never developed a population policy, which is probably just as well, given the wrong assumptions each report made about the future. Whether this will continue to be the case in the 21st century, if a significant population decline occurs alongside a more rapidly aging population, remains to be seen.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

PETER GREENHOUSE

#### *Incidence, Patterns, and Trends*

The United Kingdom's unique network of specialist clinics (see Treatment and Prevention, below) collect detailed statistics for the Department of Health (HMSO 1995/16), which reflect trends in sexually transmitted diseases (STD) with a high degree of accuracy. These statistics give a better indication of the true incidence of STD in the United Kingdom than those of most other countries, because of the relative low proportion of infections treated outside the National Health Service (NHS). It is estimated that over 95% of the epidemic STDs, namely, syphilis and gonorrhea, are managed at the NHS clinics. The proportion is somewhat less for the more endemic diseases—chlamydia, genital herpes, and genital warts—because of their covert nature, with the proportion for chlamydia being recently reduced by a belated surge of interest among gynecologists, contraceptive-care professionals, and general practice physicians. The majority of HIV care is also organized from the NHS clinics (see Section 10B, HIV/AIDS, below).

Control of syphilis and gonorrhea has been particularly successful in the United Kingdom (see Table 4). There are fewer cases of infectious syphilis per year in men in England (194 cases in 1994) than there are clinics in the United Kingdom, 230. The figure for women was roughly half the male figure, 110 cases in 1994. Twenty percent of the male cases were acquired through homosexual contact. The median age for new cases of syphilis is higher than for other STDs, 33 for men and 28 for women. Syphilis has become an imported disease, having been virtually eliminated as a congenital infection, with only one infection reported in 700,000 live births in 1993.

The pattern of gonorrhea cases during the 1900s (see Table 4) can act as a surrogate marker for other sexual activity, closely reflecting changes caused by demographics, war, travel, contraceptive practice, and sexual mores (Greenhouse 1994). The gonorrhea pattern can also illuminate these

Table 4

#### Incidence of Gonorrhea and Syphilis, England, 1918 to 1994

Disease	Number of New Cases in Selected Years (in Thousands of Cases)										
	1918	1920	1922	1930	1940	1946	1955	1964	1977	1987	1994
Gonorrhea	17.4	37.9	27.9	40.5	26.3	47.4	17.4	37.9	58.7	24.5	11.6
Syphilis	26.8	42.1	24.2	18.9	11.4	24.2	5.0	3.8	4.2	1.8	1.3

Percentages approximated from the authors' line graph.

social trends. The post-World War II decline in gonorrhea cases was because of the arrival of penicillin and the reactionary morality of the 1950s. This was followed by a tremendous rise in the 1960s, as the baby boomers reached adolescence, sexual behavior gradually changed, and contraception increased. The maximum incidence of gonorrhea occurred in 1976, with 58,725 cases, in conjunction with the all-time peak in prescriptions for the oral contraceptive pill. Starting in 1986, the incidence of gonorrhea dropped by 50% in two years following the public HIV-education campaign directed at the heterosexual population. There is now less gonorrhea in the United Kingdom than at any time since record keeping began. The current rate is around one sixth that of 20 years ago. Statistics for 1994 record 11,574 cases, with an overall rate of 37 per 100,000 population aged 15 to 64 (HMSO 1995/16). However, the rate varies considerably with age and sex; the highest incidence occurred in women aged 16 to 19 years, and increased from 95 cases to 123 per 100,000 between 1993 and 1994 (HMSO 1995/16; *Communicable Disease Report* 1995, 62-63). Detailed information on geographic distribution, antibiotic-resistant strains, and location of acquisition is also published (*Communicable Disease Report* 1995, 62-63).

*Chlamydia trachomatis*, the principal preventable cause of pelvic inflammatory disease, infertility, and ectopic pregnancy, is the commonest curable STD in the United Kingdom. All isolation rates for chlamydia substantially underestimate its true incidence, since screening tests are, at best, 75 to 80% sensitive, and most infected men and women show no symptoms. The cases identified at NHS STD clinics represent only the tip of the iceberg. The differential age and sex rates for chlamydia (*Communicable Disease Report* 1995, 122-123) are similar in distribution to those of gonorrhea (*Communicable Disease Report* 1995, 62-63), herpes and warts (*Communicable Disease Report* 1995, 186-187), and representative of all STDs combined, with the highest rates in adolescent women, and a late lower peak in male cases. The peak incidence of 360 cases per 100,000 women aged 16 to 19 years—four times more than in men of the same age—should be compared with observed rates from 9.5% to 23% in studies of women of this age who are having an abortion. No significant differences were found in the chlamydial isolation rates (of around 10%) in women attending clinics for either contraception, abortion, or STD (Radcliffe 1993), although, even nowadays, most women are not routinely screened in the contraception clinics. Chlamydia and non-specific genital infection rose steadily until 1986, peaking at 157,792 cases, and has shown a slight decline since then, despite improved diagnostic techniques.

At least 85% of all pelvic inflammatory disease (PID) is sexually acquired, a minimum of 75% because of chlamydia. Around 10% of pelvic inflammatory disease is treated in a hospital. The massive drop in gonorrhea in the United Kingdom in 1986 to 1988 was not matched by a significant drop in hospital cases of acute salpingitis. A similar phenomenon in 1970-1977 in Sweden alerted Westrom (1988) to the true etiology of salpingitis, and appropriate diagnosis, treatment, contact tracing, and education was initiated. In both countries, salpingitis incidence had doubled between 1965 and 1974. From 1978 to 1983, salpingitis admissions were halved in Sweden (Westrom 1988), but increased by 50% from 1975 to 1984 in Britain, which almost two decades later has yet to introduce a similar salpingitis-prevention campaign. Contact-tracing studies indicate very high infection rates of over 70% in male partners of women with salpingitis, the vast majority of whom are asymptomatic.

There has been a continuing long-term upward trend in first-attack incidence of both genital herpes and genital

warts, full details of which have been published (*Communicable Disease Report* 1995, 186-187). Herpes is more common in women, increasing from 32 to 98 per 100,000 between 1981 and 1994. Seroepidemiological studies in the United Kingdom show that around 90% of men and women aged 25 to 34 have antibodies to both herpes viruses (HSV 1 and 2), of which about one third are HSV 1. Up to 50% of oral lesions have been found to harbor HSV 1. Thus, although oral and genital herpes infection is ubiquitous, relatively few individuals suffer overt symptoms, and many will have acquired oral infection in childhood. This information is of considerable value in diffusing the stress of a first-episode attack acquired sexually.

Full details of the minor STDs are also available from published statistics (HMSO 1995/16). Long-term trends in total attendance for all diagnoses shows a continuous increase to a current high of 671,281 in 1993. Records show an increasing proportion of clinic attendees are female, from one seventh in 1950 to one quarter in 1960 and one third in 1970. Now, 51% of all attendees are women, with some clinics up two thirds, depending on the extent of contraceptive and other sexual health services provided. These trends are set to continue as the clinical workload comes closer to reflecting the gross disparity in STD morbidity suffered by women.

#### *Treatment and Prevention*

Thanks to exceptional, far-sighted public-health legislation, the United Kingdom has had specialist clinics offering free and entirely confidential STD advice and treatment in every major town since 1917. Accessible care is available to all regardless of nationality or domicile. Voluntary contact tracing and treatment of partners is facilitated by health advisers, without the intrusion of coercive legislation. The United Kingdom is the only country where Venereology (currently known as Genito-Urinary Medicine) developed as a distinct medical specialty in its own right (Waugh 1990), rather than as a minor adjunct to other fields, such as dermatology in Europe, or infectious diseases and public health in the United States. Consequently, Britain has a well-trained, academically based specialist body, whose numbers have doubled in the last decade as the result of substantial government investment in improved premises, equipment, and expanded support staff. The specialty coordinates clinical care and epidemiologic research, and can implement rapid and consistent responses to changing public-health priorities in the control of STD, having been ideally placed to take the lead in caring for HIV (see Section 10B, below). The advantage of this approach is evidenced by the relatively low prevalence of HIV and other STDs compared to most countries other than Scandinavia (see Incidence, Patterns, and Trends above).

An important disadvantage is that other specialists are poorly trained or are unaware of STD, and are unlikely to be able to broach the subject (Clarke 1995) without either embarrassment or moralism. (This holds the greatest potential for damage in women's healthcare.) Not only are most genitourinary physicians untrained in gynecology, most gynecologists and family planning specialists were, until recently, ignorant of the significance of covert STD in their patients. This resulted in considerable morbidity from uterine instrumentation during abortion or IUD insertion, and multiple recurrences of salpingitis because of reinfection from untreated partners, leading to increased chronic dyspareunia, ectopic pregnancy, and infertility.

Despite governmental interference in school sex education policy (see Section 3A), there have been substantial advances in the general level of education on HIV and, to a lesser extent, on contraception, aided by the government's

*Health of the Nation* initiative on sexual health. Education on conventional STD, however, has been almost entirely neglected. Sexual health education is usually delivered by those without specific knowledge or experience of STD care. Thus, the public as a whole, including health professionals, remain largely ignorant in this area. In the recent international survey on STD awareness for the American Social Health Association (Clarke 1995), the United Kingdom compared poorly against five other countries. Only 1% of Britons had heard of chlamydia, and 75% said that their doctors would not talk about sex or STD. This ignorance, combined with the traditional British attitude of prurience and prudishness about sex, creates the societal taboo of STD. This stigma, causing guilt, shame, and blame, is based on misinformation, fear, and an automatic presumption of infidelity, which is often erroneous because of the very asymptomatic nature of most STDs that causes them to be endemic. This major pitfall results in substantial psychosexual trauma that plagues work in all fields of sexology.

A simple solution will be found in the increasing integration of sexual health promotion with clinical service provision. Teaching that most STDs produce no symptoms, can be present for many years, are acquired from partners who are likewise unaware, and may, therefore, have been present before the current relationship, should do much to destigmatize the subject. Furthermore, a national consensus of specialists in public health, family planning, genitourinary medicine, and health education has recently promoted a concise definition of sexual health: "the enjoyment of sexual activity of one's choice without causing or suffering physical or mental harm" (Greenhouse 1994). This same consensus agreed that these specialties should progressively converge to provide services for contraception, abortion, STD/HIV, sexual assault, psychosexual care, and health promotion under the banner of sexual health clinics (Greenhouse 1994). Broadening the scope of these services allows access to more appropriately coordinated care "under one roof." This is essential for the youngest in the most vulnerable situations, and may persuade people to attend a clinic to check that they are healthy rather than waiting until they are ill. With careful education input, this should improve public understanding, reduce stigma, prevent iatrogenic morbidity, and achieve even more-effective control of STD in clinical situations where they would previously have gone undetected.

## **B. HIV/AIDS** JANE CRAIG and GEORGE KINGHORN *[Rewritten and updated in late 2001 by J. Craig and G. Kinghorn]*

Based on anonymous seroprevalence data, there were, in 2001, an estimated total of 30,000 people living with HIV in the United Kingdom, a third of them undiagnosed. Newly diagnosed HIV infections appear to be increasing to over 2,900 in 1999. Antiretroviral therapy is delaying the onset of AIDS and deaths in many of those who are treated; deaths fell by two thirds between 1995 and 1991. As a result, the number of individuals living with HIV is increasing, from 16,891 in 1998 to 19,179 in 1999. Nevertheless, the prevalence still remains lower than in many European countries.

By the end of March 2000, a total of 41,174 HIV-infected individuals had been diagnosed and reported in the U.K. since 1984. Of these, 7,198 (17%) were female. A cumulative total of 16,995 (2,113, or 12% of which were female) cases of AIDS have been reported and 11,793 (69%) are known to have died. A further 1,753 HIV-infected individuals have died without AIDS being reported. A total of 967 HIV infections and 411 AIDS cases in children aged less than 15 years at diagnosis have been reported by the end of March 2000. Most were infected by maternal transmission.

London and its surrounds have reported 62% of all HIV infections and AIDS cases in the U.K. to date. Scotland reports 7% of all U.K. HIV infections and 6% of AIDS cases.

Within the U.K., sexual intercourse between men remains the major route of infection for people who have been diagnosed as having HIV. The number of infections being diagnosed where sex between men and women is the route of infection has risen steadily, so that newly diagnosed cases infected by heterosexual exposure exceeded those transmitted by sex between men in 1999. The majority of these, however, are attributed to heterosexual exposure while in areas of higher prevalence, usually sub-Saharan Africa, rather than other exposure categories, such as partners of injecting drug users. Injecting drug use has made a relatively small contribution to the HIV epidemic in the U.K., except in Scotland, where it has been responsible for more of the diagnosed infections than sex between men.

In England, Wales, and Northern Ireland, the proportion of reported HIV infections attributable to sex between men has fallen from 92% in 1985 to 46% in 1999. The proportion attributed to injecting drug use has remained fairly static over the same period (5% in 1985, and 3% in 1999), but the proportion of reported HIV infections attributed to heterosexual exposure has risen from 3% to 49%.

In Scotland, the trend is somewhat different, in that the proportion of reported HIV infections attributed to sex between men has risen from 9% in 1985 to 39% in 1999. The proportion of incident HIV infections attributed to heterosexual exposure has also risen, from 2% to 50% over the same period. Those attributable to injecting drug use have fallen from 90% to 11%. This may reflect the efforts of locally targeted prevention programs amongst drug users.

For U.K. residents, medical care and treatments are provided free of charge under the National Health Service. Genitourinary medicine (GUM) clinics offer a voluntary, open-access, confidential HIV-testing service nationwide and are the major providers for HIV treatment and care. There are ongoing anonymous unlinked HIV-seroprevalence studies at selected sites, including attendees at GUM clinics and women attending antenatal clinics. Since 1999, it has been recommended that all pregnant women throughout England should be offered HIV testing, and targets for the proportions of pregnant women accepting testing have been set. In the first half of 1999, 71% of HIV-infected pregnant women in inner London had been diagnosed by the time they gave birth. This is substantially higher than in previous years. However, elsewhere in the U.K., a majority of infected pregnant women still remain undiagnosed. This places their neonates at risk of vertical transmission, which is now largely preventable with combination antiretroviral treatment, cesarean-section delivery, and avoidance of breastfeeding. All blood donors have been tested for HIV since 1985. There have been no reports of HIV transmissions in the U.K. since the introduction of heat treatment of blood products.

The gay community has become well organized and motivated with self-initiated prevention and education campaigns. There are also numerous patient-interest and support groups. Initiatives, such as outreach work among targeted groups rather than didactic healthcare messages, seem to be more successful, and many have accepted safer-sex practices. There is also recent evidence that suggests that transmission is less common from those who have learned of their infection from voluntary testing programs, as compared with those who choose to remain ignorant of their HIV status. Nevertheless, maintenance of lifelong safer sexual practice often proves difficult for those whose prognosis has vastly improved since the advent of successful combination antiretroviral treatments. Continuing sup-

port and dialogue about the sexual health needs of HIV-positive patients is essential.

National needle and syringe-exchange programs have been operational since 1990 and have contributed to reduced transmission from the use of equipment shared by injecting drug users, although in closed communities, such as prisons, the potential for HIV spread by this route still persists. Although sexual health no longer has the key health-priority status originally set in England in 1992, a new national Sexual Health and HIV strategy is now being formulated, and a final report was due in 2001. This should help to increase better coordination and collaboration between local sexual health service providers, and increase the involvement of primary care in screening and management of sexually transmitted infections and HIV.

School sex education remains a controversial topic. Opponents often claim that such lessons reduce the age of first sexual activity. At present, attendance at sex education classes is voluntary and parents have the right to withdraw their children. However, sex education programs have been shown to be effective in delaying the onset and frequency of sexual activity, and may also result in an increased use of contraception, in particular, condoms. Effective programs seem to be those focusing on reducing specific risk behaviors, combined with opportunities to improve personal development and communication skills. This has obvious implications for the provision of school-based sex education in the future.

Overall, there is a greater awareness of HIV infection, but risk recognition remains an issue for many, as is reflected by the increasing number of heterosexual infections acquired from those parts of the world with explosive rates of HIV. Increasing rates of sexually transmitted infections among HIV-positive individuals is a concern because of the associated increased risk of HIV transmission. It also suggests increasing unsafe sexual practices. Prevention programs need to target such groups, as well as continuing their efforts amongst other high-risk communities.

[Update 2002: UNAIDS Epidemiological Assessment: By mid-2001, the country reported a cumulative total of 46,131 cases of HIV infection. Risk of HIV acquisition in the U.K. is highest for gay men. Two thirds of the U.K. burden is in London. High levels of risk behavior are present among young heterosexuals.

[There are improved survival rates, as well as a decline in numbers of deaths and new AIDS cases with the availability of antiretroviral therapies. There is rising prevalence of diagnoses of infections requiring care and treatment, a 13% increase in prevalence of diagnosed HIV infection between 1997 and 1998. From 1999 onwards, there have been more diagnoses of heterosexually acquired HIV infection; 64% of HIV diagnoses heterosexually acquired were probably acquired in sub-Saharan Africa. There has been increased sharing of injection equipment and rising hepatitis B cases among injection drug users, but so far, HIV infection rates in injection drug users remain low. In addition, there have been increases in other STDs, especially gonorrhea, chlamydia, and genital warts. Changes in HIV infection worldwide, especially in South Asia, have the potential to have an impact on the U.K. because of high immigration rates.

[Testing is mandatory for blood donors, and voluntary otherwise. All detected HIV-infected cases are reported in a national database, using an identifying code. Continuous universal assessment testing (UAT) surveys have been conducted among newborns since 1988 in the Thames region (in the southeast of England including London), Oxford, and four other regions since 1993. UAT surveys have been carried out among pregnant women since 1990 in selected

centers of England and Wales, using sera collected for rubella screening during antenatal visits. In both studies, the prevalence increased steadily in London. In parallel, UAT surveys of women having abortions found a twofold higher prevalence (4.6 to 7.8 per 1,000) compared to that found among women attending antenatal centers. The majority of HIV-infected women originate from high-prevalence countries and have mostly been infected heterosexually. In Scotland, continuous UAT of newborns indicates that prevalence was substantially higher in Edinburgh (up to 2.5 per 1,000) and Dundee (up to 2.8 per 1,000) than in the rest of Scotland (less than 0.2 per 1,000), including in Glasgow (less than 0.3 per 1,000). However, prevalence has decreased significantly in Edinburgh (from 2.5 in 1990 to 0.8 in 1994;  $p < 0.05$ ), while no clear trend could be detected in other parts of Scotland. UAT surveys have been conducted also in STD patients and injection drug users in treatment centers. A prevalence survey of all patients seen for care within the year is carried out annually; this shows rising prevalence.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	34,000 (rate: 0.1%)
Women ages 15-49:	7,400
Children ages 0-15:	550

[An estimated 460 adults and children died of AIDS during 2001.

[No estimate is available for the number of British children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

KEVAN R. WYLIE

### A. Concepts of Sexual Dysfunction

British society appears to be having a reemergence of sexual awareness. After a very conservative attitude towards sex in the first half of the 20th century, there was an awakening in the 1960s alongside the increased use of illicit drugs, the emergence of rock and roll, and a "free" society. The permissive society continued into the 1970s and early 1980s, until, like many other countries, the fear of AIDS changed the sexual behavior of many in the mid-1980s. Out of this has grown a more-cautious approach to sexual encounters with others and a reemergence of encouraging more satisfying sexual relationships within a monogamous relationship.

There is wider access to articles and books on sexual fulfillment, and awareness of dysfunction has increased, primarily as a result of articles in the popular press and lifestyle magazines. There is some evidence that there has been a reversal of the age of the first sexual experience of teenagers, and there has been an increase in patients requesting help over the wide spectrum of sexual dysfunction. One area where this has become particularly evident is male erectile disorder, for which a proliferation of treatment centers, both within the health service and in the private sector, has developed. A recent attempt to define sexual dysfunction is "the persistent impairment of the normal patterns of sexual interest or response."

### B. The Availability of Diagnosis and Treatment

[Rewritten and updated in late 2001 by K. R. Wylie]

Within the United Kingdom, all patients are entitled to free consultation under the National Health Service. The planning and availability of sexual dysfunction clinics varies widely from area to area. Traditionally, these have been within family planning clinics, and have gradually been ex-

tended by interested clinicians within gynecology, psychiatry/psychosexual, and genitourinary clinics. The Family Planning Association Service has been traditionally run by doctors, although there has been a gradual introduction of nursing and psychology staff into these and other treatment clinics. Seminars held by Drs. Balint and Main in the 1960s and 1970s developed the concept of psychosexual medicine and emphasized the importance of using the physical (vaginal) examination in the management of female sexual problems. In the 1980s, patients with male erectile disorder started to be seen within urology, rather than psychosexual clinics, although in the 1990s, it is becoming generally agreed that, because around half of these cases are of a psychological nature and a proportion have both organic and psychological components, there is a need for either dual clinics or access to either. There is an interesting awareness of the need to consider cultural factors in sexual dysfunction, and this is particularly important for various clinic groups.

A non-Health Service organization offering treatment for sexual dysfunction is available from Relate (formerly Marriage Guidance). Paul Brown, a psychologist, showed in 1974 that psychodynamically trained counselors were able to focus specifically on sexual dysfunctions using behavioral approaches. This organization has a network of specially trained sex therapists who have training in relationship work. This service is not provided free, but clients are charged nominal sums according to their income, typically £20.00 to £30.00 per session. Other agencies include the Catholic Marriage Advisory Council and the Jewish Marriage Council. Private facilities for diagnosis and treatment of sexual disorders do exist, but are primarily around major cities or areas where no NHS provision is easily accessible.

Treatment approaches include the traditional medical approach using medication, intracavernous injections, VCDs, and so on. Psychotherapeutic treatments are usually based on the behavioral model proposed by William Masters and Virginia Johnson, although increasingly with cognitive and systemic strategies incorporated. Some workers continue to use a dynamic model of working with patients. Increasingly, couple therapy is adopted incorporating both relationship and sexual therapy. Surrogacy services are available from the Birmingham clinic run by Martin Cole.

Specialist services for transsexualism and gender dysphoria exist, with assessment for treatment and surgery available at several centers in the U.K. These are primarily Charring Cross Hospital in London, and the gender-dysphoria services in Sheffield, Leicester, Nottingham, Leeds, and Glasgow. Surgery is confined to specialist centers, namely London, Brighton, Leicester, and Rhyl.

In a wider context, the funding from the government for marriage support was subject to review by Sir Graham Hart for the Lord Chancellor's Department, and a report was issued in 1999. In summary, fewer people now get married in the U.K. (around 75% now marry by the age of 50 compared to 95% in the 1960s), and marriage is much more likely to be deferred and preceded by a period of cohabitation. Divorce now occurs about seven times more often than in the 1960s, with about four in ten marriages likely to end in divorce. The United Kingdom Government through the Lord Chancellor's Department, until the year 2000, provided three million pounds sterling to marriage support in various agencies. The total allocation of funds will increase to five million in 2002-2003, covering both strategic funding of bodies with a significant national loan and research and developmental grants. Marriage-support services in the United Kingdom are provided by Relate (formerly known as the National Marriage Guidance Council), the London Marriage Guidance Council

(ex-part of the former National Marriage Guidance Council), Catholic Marriage Care, Jewish Marriage Care, Tavistock Marital Studies Institute, Family Welfare Association, and One Plus One. In addition to these seven major agencies, there are numerous other smaller bodies, which provide counseling for couples or individuals in marital difficulties.

In England and Wales, the main responsibilities for marriage, relationships, and sexual problems can be subdivided into the Lord Chancellor's Department, which includes funding of marriage-support services and deals with divorce law and private law and Children Act proceedings, and the Department of Health, which is involved with a variety of areas, including family planning, family health services, and hospital services, as well as Public Law Children Act proceedings. The Department for Education and Employment also handles a variety of areas, including personal and social education in schools. The Home Office is involved with substantive marriage law and a coordinating role on family policy and the Department of Social Security for state benefits and the Child Support Agency.

### C. Therapist Training and Certification

As of 1996, there was no central certification body within the United Kingdom. The main association is the British Association for Sexual and Marital Therapists (BASMT), which was formed in 1974. This organization approves certain training courses and provides an accreditation process for which individuals can apply. The majority of new therapists will complete an approved course and a further 200 hours of supervised work, alongside fulfilling other criteria (first detailed in 1992) before accreditation. The approved training courses are listed in Section 12. The address for BASMT is P.O. Box 62, Sheffield, S10 3TL United Kingdom.

Since 1997, a group of BASMT members (The Committee for European Affairs) has met as an approved task force for the European Federation of Sexology. The goals are to establish a consensus within Europe as to what precisely constitutes a multidisciplinary profession of sexology, and subsequently, to devise European Codes of Ethics and Practice for those defining themselves as sexologists; they also seek to define European standards of training and to draw up a European register of accredited practitioners within given subspecialities of sexology.

Medical practitioners may become members of BASMT. Alternatively, they may follow a training course of seminars run by the Institute of Psychosexual Medicine (IPM) and are subsequently examined to become members of the institute. Members are recognized as competent to receive referrals. A diploma recognizes the skills of those who have been training for two years, but do not wish to make the treatment of sexual problems a specialist field. Contact: IPM, 11 Chandos Street, Cavendish Square, London, W1M 9DE United Kingdom.

The Diploma in Sexual Medicine (DSM) is awarded to doctors who can produce evidence of training and experience, as well as successfully passing written and oral examinations in the fields of sexual medicine. Areas in which the above must be demonstrated are gynecology, sexual medicine, and the physical and psychological aspects of assessing and treating sexual problems. Details are available from the Institute of Obstetrics and Gynaecology, Queen Charlotte's Hospital, Goldhawk Road, London, W6 0XG United Kingdom.

The Royal Medical Colleges do not offer training or accreditation in sexual dysfunction, but membership does reflect postgraduate training and examination to an advanced level within a given speciality. Three relevant colleges are:

Royal College of Obstetrics and Gynaecology, 27 Sussex Place, Regents Park, London, NW1 4RG United Kingdom—The Faculty of Family Planning and Reproductive

Health Care (RCOG) have a particular interest in the field of psychosexual medicine.

Royal College of Surgeons of England, 35-43 Lincoln's Inn Fields, London, WC2A 3PN United Kingdom.

Royal College of Psychiatrists, 17 Belgrave Square, London, SW1X 8PG United Kingdom.

[Update 2001: The British Association for Sexual and Marital Therapy became known as the British Association for Sexual and Relationship Therapy, effective May 1999. The Committee for European Affairs was renamed the Committee for the International Sexological Societies (CISS). This Committee has been influential in encouraging the development of a multidisciplinary profession of sexology and European codes of ethics and practice for those defining themselves as sexologists. CISS continues to work towards defining European standards of training, with the ultimate aim of drawing up a European register of accredited practitioners within given subspecialties of sexology. (*End of update by K. R. Wylie*)]

## 12. Sex Research and Advanced Professional Education

KEVAN R. WYLIE [Rewritten and updated in late 2001 by K. R. Wylie]

### A. Institutes and Programs for Sexological Research

The support and financial availability for research within the United Kingdom remains limited. Several sexological research units exist, including the MRC unit in Edinburgh, the Institute of Psychiatry, and teams in Oxford, Sheffield, and Southampton. There remain many political pressures to frustrate sexological research, with the government declining to finance the United Kingdom National Survey of Sexual Attitudes in Lifestyle in 1989. Political influence is also exerted on education with the Health Education Authority shelving a *Pocket Guide to Sex* after the government attacked its colloquial frankness.

### B. Programs for the Advanced Study of Human Sexuality

Sex education is now compulsory in state secondary schools as a result of the 1993 Education Act, although reference to nonbiological behavior has been removed from the national science curriculum. Guidance on sex and relationship education in schools was reissued in 2000 (DFEE) "to take account of the revised National Curriculum, published in September 1999, the need for guidance arising out of the new Personal, Social and Health Education (PSHE) framework and the Social Exclusion Unit report on teenage pregnancy."

The training in human sexuality in the United Kingdom Medical Schools for medical undergraduates has been reviewed by Reader (1994). Education and training in human sexuality, including postgraduate training, has been considered by Griffin (1995).

Postgraduate training exists for various professions. These courses are usually attended by both medical graduates, as well as workers from other healthcare disciplines. As courses expand to the master's level, the qualifications required for entry into these courses become more stringent. These courses are classified as either a course approved or nonapproved by the British Association for Sexual and Relationship Therapy (BASRT). The BASRT approved courses are:

Diploma in Psychosexual Therapy (Marriage Guidance), Herbert Gray College, Little Church Street, Rugby CV21 3AP United Kingdom.

Master of Science degree; Post Graduate diploma and Post Graduate certificate in the Theory and Practice of Psychotherapy for Sexual Dysfunction, The Porterbrook Clinic, 75 Osborne Road, Nether Edge, Sheffield S11 9BF United Kingdom.

Diploma in Psychosexual Health Care, Department of Psychiatry, Withington Hospital, Didsbury, Manchester M20 8LR United Kingdom.

Master of Science degree in Human Sexuality, Human Sexuality Unit, 3rd Floor Lanesborough Wing, St. George's Hospital Medical School, Cranmer Terrace, London SW17 0RE United Kingdom.

Master of Science degree in Therapy with Couples, The Registry, Institute of Psychiatry, De Crespigny Park, Denmark Hill, London SE5 8AF United Kingdom.

Certificate in Psychosexual Counselling and Therapy, South East Hants Health Authority, c/o Myrtle Cottage, Selbourne, Nr Alton, Hants GU34 3LB United Kingdom.

The Master of Science degree in Human Sexuality and Relationship Psychotherapy offered by East Berkshire College has not been approved.

### C. Sexological Journals and Periodicals

The major sexological journals in the United Kingdom are:

*Sexual and Relationship Therapy*. Editor: Kevan R. Wylie, Porterbrook Clinic, 75 Osborne Road, Nether Edge, Sheffield S11 9BF United Kingdom (published four times a year from 1996) <http://www.tandf.co.uk/journals>.

*The International Journal for Impotence Research*. Editors: William L. Furlow and Gorm Wagner Smith-Gordon and Company Ltd., Number 1, 16 Gunter Grove, London SW10 0UJ United Kingdom (published quarterly).

*British Journal of Family Planning*. Editor: Fran Reader, RGOG, 27 Sussex Place, Regent's Park, London NW1 4RG United Kingdom.

*The Institute of Psychosexual Medicine Journal*. Editors: Dr. H. Montford and Dr. R. Skrine, c/o 11 Chandos Street, London, United Kingdom (published three times a year).

*The British Journal of Sexual Medicine*. Editor: Paul Woolley, Hayward Medical Communications Ltd., 44 Earlham Street, Covent Garden, London WC2H 9LA, United Kingdom (currently suspended).

*Journal of Sexual Health*. Editor: Dr. Alan Riley, MAP Publishing, Sussex Court, 10 Station Road, Chertsey, Surrey KT16 8BE United Kingdom (no longer published).

*Perversions: The International Journal of Gay and Lesbian Studies*. Editors: Neil McKenna and Linda Semple, BM Perversions, London WC1N 3XX United Kingdom (published three times a year).

*The Journal of Gender Studies*. Editors: Jenny Wolmark and Jenny Hockey, University of Humberside, Ing Lemine Avenue, Hill HU6 7RX United Kingdom (published twice a year).

*The Journal of Sexualities*. Editor: Ken Plummer, University of Essex, Colchester, U.K. (published by Sage Publications four times a year).

### D. Important National and Regional Sexological Organizations

Organizations dealing with sexuality include the following:

SIMSED, Bredon House, 321 Tettenhall Road, Wolverhampton WV6 0JZ United Kingdom.

British Association for Sexual and Relationship Therapy (BASRT), P.O. Box 13686, London SW20 9ZH United Kingdom.

Family Planning Association, 27-35 Mortimer Street, London W1N 7RJ United Kingdom; tel.: 44-71-636-7866; fax: 44-71-436-328.

Marie Stopes U.K., 6 Grafton Mews, London W1P 5LF United Kingdom; tel.: 44-71-382-2494; fax: 44-71-388-1885.

Sex Education Forum and National Children's Bureau, 8 Walkley Street, London C1V 7QE United Kingdom; tel.: 44-71-278-9441; fax: 44-71-278-9512.

Institute of Psychosexual Medicine, 11 Chandos Street, Cavendish Square, London W1M 9DE United Kingdom.

British Society for Psychosomatic Obstetrics, Gynaecology and Andrology, 11 Chelmsford Square, London NW10 3AP United Kingdom.

Marce Society (Mental illness related to childrearing), c/o Dr. T. Friedman, Liaison Psychiatry Service, Leicester General Hospital, Gwendoln Road, Leicester LE5 4PW United Kingdom.

Tavistock Marital Studies Institute, The Tavistock Centre, 120 Belsize Lane, London NW3 5BN United Kingdom.

Institute for Sex Education and Research, 40 School Road, Moseley, Birmingham B13 9SN United Kingdom.

Relate, Herbert Gray College, Little Church Street, Rugby CV21 3AP United Kingdom.

### 13. Significant Differences in Sexual Attitudes and Behaviors among Ethnic Minorities

KEVAN R. WYLIE

It is well acknowledged that sexual function and behavior is affected by both social and cultural influence. Until recently, there has been a trend towards trying to fit patients into existing services without considering development of new therapist skills to meet a patient's individual cultural needs. Specific skills for counseling clients of different cultures have only recently been developed. The approach proposed by d'Ardenne and Mahtani (1989) has been practiced based on using an essentially client-centered and non-hierarchical model. The use of English language and nonverbal communication, as well as bilingualism and the use of interpreters, are important factors to consider. Within their text, there is a large resource list of organizations in the United Kingdom that may help therapists develop cultural knowledge in a certain field.

Clulow (1993) has considered ethnic and religious differences in couple relationships. The presentation of ethnic minorities to sexual dysfunction clinics poses particular problems to clinicians in addition to the cultural issues mentioned above. There are high expectations that physical remedies will be available (Ghosh et al. 1985). An excellent review of presentation of sexual problems within different cultures, clinical assessment, and their management has recently been presented by Bhugra and De Silva (1993). As newer medications become recognized as having potentially beneficial applications in sexual dysfunction, the clinician may have a further armamentarium towards helping some patients within this group.

The issue of HIV, sexuality, and ethnic minorities, particularly Afro-Caribbeans, is an area where there is increasing interest in the United Kingdom.

#### [Black and Ethnic Minority Groups

DINESH BHUGRA

[Update 2001: Cultural and social factors are well known to influence attitudes towards sex, the purpose of sex (whether it is seen as a pleasurable or procreative activity), and the type of sexual activity. Therapists need to be aware of

social and cultural attitudes, taboos, and expectations arising from within the specific culture. The therapist must use strategies that are culturally appropriate and acceptable to the patients. The issues of family, the role of marriage within the relationship, and expectations from the female within a set of expected gender roles need to be part of any assessment. A non-hierarchical and client-centered approach is the way forward. The use of family or the partner as an interpreter must be avoided wherever possible.

[Differences in religious attitudes to sex and procreation will influence couple and sexual therapy. Often patients present with unrealistic expectations, such as seeking physical treatments and not using psychological approaches, because of the lack of privacy and social taboos. Under these circumstances, the therapists must be prepared to modify their approach by using a combination of strategies (see Bhugra & de Silva 1993, 2000). The role of newer therapeutic modalities, such as sildenafil (Viagra) are bound to increase demand, and expectations will change further. Homosexual orientation may well be seen as extremely negative in some cultures. It is likely that certain paraphilias may well be less or more prevalent in some cultures. The attitudes towards HIV and AIDS and preventive strategies will vary, and therapists in the U.K. need to be aware of heterogeneity and cultural differences.

[In the U.K., black and ethnic minority groups form around 6% of the population. They are not seen very frequently in sexual dysfunction clinics. It is possible that South Asians will use visiting alternative health practitioners and herbal medicines. The data on such usage are not available. For African and African-Caribbean populations, the data from sexual dysfunction clinics are even sparser. Johnson et al. demonstrated in a community survey that sexual practices do differ across ethnic groups, as do same-sex experiences and attitudes to one-night stands, abortions, and same-sex experiences. For any service, planning providers must take into account the composition of local communities. (End of update by D. Bhugra)]

## Demographics and a Brief Historical Perspective

ROBERT T. FRANCOEUR

### A. Demographics

The United States is located in the southern part of the North American continent. Its mainland is south of Canada and north of Mexico and the Caribbean Sea, Cuba, Puerto Rico, and other Caribbean island nations. The North Atlantic and North Pacific Oceans border the mainland on the east and west. The United States is the third-largest country by size, after Russia and Canada, and by population, after China and India. In comparing landmass, the U.S. is about half the size of Russia, three-tenths the size of Africa, about half the size of South America, slightly larger than China, and about two and a half times the size of Western Europe. The state of Alaska lies off Canada's northwestern border, and the islands of Hawaii are 2,090 miles (3,360 km) southwest of San Francisco in the North Pacific.

The mainland climate is mostly temperate, but it is tropical in Florida and Hawaii, arctic in Alaska, semiarid in the Great Plains west of the Mississippi River, and arid in the Great Basin of the southwest.

In July 2002, the United States had an estimated population of 280.5 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 21% with 1.05 male(s) per female (sex ratio); 15-64 years: 66.4% with 0.98 male(s) per female; 65 years and over: 12.6% with 0.72 male(s) per female; *Total population sex ratio:* 0.96 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 77.4 years; *male:* 74.5 years; *female:* 80.2 years

**Urban/Rural Distribution:** 76% to 24%

**Ethnic Distribution:** White: 77.1%; black: 12.9%; Asian: 4.2%; Amerindian and Alaska native: 1.5%; native Hawaiian and other Pacific islander: 0.3%; other: 4% (2000). *Note:* A separate listing for Hispanic is not included because the U.S. Census Bureau considers Hispanic to mean a person of Latin American descent (especially of Cuban, Mexican, or Puerto Rican origin) living in the U.S. who may be of any race or ethnic group (white, black, Asian, etc.). In January 2003, the Census Bureau announced that the Hispanic population had jumped to roughly 37 million. For the first time, Hispanics nosed past blacks (with 36.2 million) as the largest minority group in the United States.

**Religious Distribution:** Protestant: 56%; Roman Catholic: 28%; Jewish: 2%; other: 4%; none: 10%

**Birth Rate:** 14.1 births per 1,000 population

**Death Rate:** 8.7 per 1,000 population

**Infant Mortality Rate:** 6.69 deaths per 1,000 live births

**Net Migration Rate:** 3.5 migrant(s) per 1,000 population

**Total Fertility Rate:** 6.8 children born per woman

**Population Growth Rate:** 2.07%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.61%; *Persons living with HIV/AIDS:* 850,000; *Deaths:* 20,000. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 97%; education is free and compulsory from age 6 to 17

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$36,300; *Inflation:* 2.8%; *Unemployment:* 5%; *Living below the poverty line:* 12.7% (2001 est.)

### B. A Brief Historical Perspective

Britain's American colonies broke with the mother country in 1776 and were recognized as the new nation of the United States of America following the Treaty of Paris in 1783. During the 19th and 20th centuries, 37 new states were added to the original 13 as the nation expanded across the North American continent and acquired a number of overseas possessions: Cuba, the Panama Canal Zone, the Philippines, and Hawaii and Alaska. The two most traumatic experiences in the nation's history were the Civil War (1861-1865) and the Great Depression of the 1930s. Buoyed by victories in World Wars I and II and the end of the Cold War in 1991, the U.S. remains the world's most powerful nation. The economy has been marked by steady growth, low unemployment and inflation, and rapid advances in technology.

### C. Demographic Challenges and a Sketch of Diversity, Change, and Social Conflict

DAVID L. WEIS

#### Demographic Challenges

In one sense, great diversity is virtually guaranteed by the sheer size of the United States. The U.S.A. is a union of 50 participating states. It is one of the larger nations in the world, with the 48 contiguous states spanning more than 3,000 miles (4,800 km) across the North American continent, from its eastern shores on the Atlantic Ocean to its western shores on the Pacific Ocean, and more than 2,000 miles (3,200 km) from its northern border with Canada to its southern border with Mexico and the Gulf of Mexico. In addition, the state of Alaska, itself a large landmass covering thousands of square miles in the northwest corner of North America, and the state of Hawaii, a collection of islands in the mid-Pacific Ocean, are part of the union.

The United States has a population of more than 280 million racially and ethnically heterogeneous people (Wilkinson 1987; CIA 2002). A majority, about 190 million are white descendants of immigrants from the European continent, with sizable groups from Great Britain, Ireland, Italy, Germany, and Poland. The last decade of the 20th century marked a major shift in the ethnic balance of the U.S. Between 1990 and 2002, white Americans whose ancestors came from Europe dropped from 80.1% to 75.1%. African-Americans, most of whose ancestors were brought to North America as slaves before the 20th century, dropped from second to third place, from 12.1% to 12.3%. Hispanics moved from third place at 9.0% in 1990 to second place in 2002 at 12.5% (see Section 2B, Religious, Ethnic, and Gender Factors Affecting Sexuality, Racial, Ethnic, and Gender Perspectives, U.S. Latinos and Sexual Health in 2003). Their ancestors emigrated from such places as Mexico, Puerto Rico, Cuba, Haiti, and the Dominican Republic, as well as other Central and South American nations. Hispanics represent the fastest-growing minority group in the U.S. There are also more than two million Native Americans—Eskimos, Aleuts, and those mistakenly at one time called Indians—whose ancestors have occupied North America for thousands of years, and whose residence within the boundaries of what is now the U.S.A. predates all of the other groups mentioned.

Another group experiencing rapid growth in recent decades is Asian-Americans; there are now more than three million residents of Asian heritage. Substantial populations of Japanese and Chinese immigrants have been in the U.S.A. since the 19th century. More recently, there has been an increase from such nations as India, Vietnam, Korea, the Philippines, Cambodia, Indonesia, and Pakistan. Finally, there are smaller groups of immigrants from virtually every nation, with growing numbers of Muslims in recent decades. The size of the various nonwhite minority groups has

been increasing in the last 30 years, both in terms of real numbers and as a percentage of the total U.S. population (Wilkinson 1987; *World Almanac* 1993).

It is fair to conclude that the U.S.A. is generally a nation of former immigrants. Moreover, one continuing feature of American history has been the successive immigration of different groups at different points in time (Wells 1985).

Approximately two thirds of the population lives within 100 miles (160 km) of one of the coastal shorelines. Most of the largest metropolitan areas lie within these coastal areas, and it is worth noting that most sexologists in the U.S.A. also reside in these same areas.

The United States is somewhat unique among the world's economies in that it is simultaneously one of the largest agricultural producers, as well as one of the largest industrialized nations, exporting manufactured goods and technology to the rest of the world. Historically, the northeast and upper midwest have been the principal industrial centers, and the southeast and the central Great Plains have been the agricultural centers.

One of the economically richest nations in the world, America, nevertheless, has an estimated 500,000 to 600,000 individuals and 125,000 to 150,000 families homeless on any night. Overall, 15% of Americans—30% of the poor—are without health insurance. Infant-mortality rates and life-expectancy rates vary widely, depending on socioeconomic status and residence in urban, suburban, or rural settings. Fifty-two million American married couples are paralleled by 2.8 million unmarried households and close to 8 million single-parent families.

In summarizing aspects of sexuality in America, it is helpful to keep in mind that the United States of the 21st century will look profoundly different from the nation described in this chapter. Four major trends for the future have been detailed in *Population Profile of the United States* (1995), published by the U.S. Census Bureau.

- The average life expectancy for an American in 1900 was 47 years. An American born in 1970 had a life expectancy of 70.8 years. This rose to 76 years in 1993 and is projected to reach 82.6 years by 2050.
- The median age of Americans is currently 34; early in the 21st century, it will be 39. There are currently 33 million Americans over 65; this number will more than double to 80 million in 2050.
- America's ethnic minorities will continue to grow far more quickly than the majority white population, because of immigration and higher birthrates. In 1994, for the first time, more Hispanics than whites were added to the population. If current trends hold, the percentage of white Americans will decline from 73.7% in 1995 to 52.5% in 2050.
- In 1994, 24% of all children under age 18 (18.6 million) lived with a single parent, double the percent in 1970. Of these single parents, 36% had never been married, up 50% from 1985. Meanwhile, the number of unmarried cohabiting couples increased 700% in the past decade.

There is also great diversity in religious affiliation in the United States (Marciano 1987; see Section 2A). To a considerable degree, the choice of religious denomination is directly related to the ethnic patterns previously described. The overwhelming majority of Americans represent the Judeo-Christian heritage, but that statement is potentially misleading. Within the Judeo-Christian heritage, there are substantial populations of Roman Catholics, mainstream Protestants (Lutheran, Methodist, Baptist, Episcopalian, and others), and a growing number of fundamentalist Christians. There is no great uniformity in religious practice or

sexual mores shared by these various groups. In addition, there is a relatively small percentage of Americans who are Jewish and range from ultra-orthodox to conservative, reformed, and liberal. In recent decades, as immigration from Asia has increased, there has been a corresponding growth in the Muslim and Hindu faiths.

Several trends related to the practice of religion in the U.S.A. have become a source of recent social concern. These trends include: the declining attendance at the traditional Protestant and Catholic churches in what has been labeled the growing "secularization" of American culture; the "religious revivalism" reflected by the growth of fundamentalist churches; the growth of religious cults (e.g., Hare Krishna and the Unification Church); the growing power of the conservative Christian Coalition; and the emergence of the "Electronic Church" (religious broadcasting) (Marciano 1987). Throughout the history of this nation, diversity of religious beliefs and the separation of church and state have been central elements in conflicts over sexual morality.

The subcultures and peoples of the United States are as varied, diverse, and complex as any other large nation. The unique feature of sexuality in the United States is that we have far more information and data on American sexual attitudes, values, and behaviors than is available for any other country.

#### *A Sketch of Recent Diversity, Change, and Social Conflict*

A few examples will illustrate some of the issues that have been affected by this complex of influences.

[Update 1998: The dominant news story in the U.S. through much of 1998 concerned the alleged extramarital sexual practices of President Bill Clinton. Stories about Clinton's sexual experiences with a number of women routinely surfaced throughout his presidential term. Certainly, no American president has ever been subjected to as much speculation about extramarital sex while still in office. As early as his first presidential campaign in 1992, Gennifer Flowers alleged that she had had a long-term affair with Clinton while he had been governor of Arkansas. Clinton initially denied her specific allegations. He did admit in a televised interview that he had had extramarital experiences, claiming that he and his wife had resolved their marital problems. Later, after his election, he admitted to an affair with Flowers. In 1994, Paula Jones, a former Arkansas state employee, revealed at a press conference sponsored by a fundamentalist Christian group that she believed Clinton had sexually harassed her in 1991 while he was governor. Later that year, Jones filed a civil suit charging the President with sexual harassment. Jones claimed that Clinton invited her to his hotel room (using a state trooper as an intermediary), exposed himself, and asked her to perform fellatio (Isikoff & Thomas 1997; Taylor 1997). The U.S. Supreme Court ruled unanimously in 1997 that the suit could proceed while Clinton was still in office (Isikoff & Thomas 1997).

[Enter Kenneth Starr. Starr, a Republican judge, had been appointed as a special prosecutor early in the Clinton presidency to investigate possible improprieties in an Arkansas business deal involving the Clintons that had come to be known as the Whitewater investigation. By November 1996, having spent three years and roughly \$30 million and failing to generate credible evidence of wrongdoing by the Clintons, Starr's investigators began questioning women who may have had sexual encounters with Clinton (Isikoff & Fineman 1997). With the Supreme Court ruling that the Jones lawsuit could proceed, Jones's lawyers also began a search for women who could testify that they had been approached by the President while working for him. Members of the Ameri-

can press followed leads along the same lines. By early 1997, these separate lines of inquiry led all three groups to Linda Tripp, Monica Lewinsky, and Kathleen Willey.

[Kathleen Willey, a former volunteer in the White House social office, was initially called to testify in the Jones case. She made charges that Clinton had kissed and fondled her in the White House Oval Office in 1993 when she met with him there seeking a full-time job. Upon leaving Clinton's office, Willey saw Linda Tripp in the hallway. According to Tripp's affidavit, Willey had left that meeting looking disheveled and told her that the President had made sexual overtures toward her. Clinton's attorney, Robert Bennett, called the charges a lie and attacked Tripp (Fineman & Breslau 1998; Isikoff & Thomas 1998). Tripp claimed that Willey had been pleased and "joyful" about the experience. Willey later claimed that she was distraught and upset by the incident. However, a friend of Willey's claimed that Willey had instructed her to lie about being distraught over the incident. According to the friend, Willey had not been upset (Isikoff 1997). The Willey allegations did not become public until a *60 Minutes* television interview in March 1998. Clinton denied the charges.

[In January 1998, President Clinton and Monica Lewinsky each signed affidavits in the Paula Jones case that they had never had sexual relations with each other. However, throughout 1997, Lewinsky had told a friend of hers on numerous occasions that she had been having an affair with the President. The friend was Linda Tripp. Believing that she would be called to testify about what Lewinsky had told her and fearing that she would be attacked by Clinton's defense team, Tripp began taping her phone calls with Lewinsky. A week after the Lewinsky affidavit denying any sexual involvement with Clinton, Tripp approached Kenneth Starr's investigators with her story. They proceeded to wire her for subsequent conversations with Monica Lewinsky. Roughly a week later, the story hit the headlines that Clinton may have had an affair with Lewinsky, that he may have perjured himself in the Jones case by denying it, that there was taped evidence of Lewinsky telling a friend about the affair, and that Clinton and his associates may have obstructed justice by urging Lewinsky to lie under oath (Fineman & Breslau 1998; Isikoff & Thomas 1998). There seemed to be little else in the news besides this ongoing saga.

[As we went to press, it was not yet clear how these allegations would turn out. On April 1, 1998, the suit by Paula Jones was thrown out of court. The federal judge in the case ruled that Clinton had not committed a crime of either sexual assault or sexual harassment, even if Jones's claims were factual. Two thirds of American adults had indicated months earlier that they did not believe the Jones incident constituted sexual harassment (Isikoff & Thomas 1997).

[In an ironic twist, President Clinton's approval ratings increased to their highest levels ever in the months after the Lewinsky story became national news. There was considerable speculation in the press about what this meant. It seemed clear that the majority of the American public did not want to see Clinton removed from office for the charges that had surfaced thus far. Many interpreted the polls as indicating that most Americans believed that a person's sex life—even the President's—is a private matter and should not be subjected to public investigation, unless it was specifically criminal itself. The message from the American public seemed to be, "Stay out of our bedrooms."

[Another ironic consequence of these collected stories was that, at least for the time being, discourse about sexuality had never been freer or more open. Americans in general and the American media routinely discussed the President's sex life, extramarital sex, oral sex, and the like. As a culture,

we seemed to be talking about sex more than ever. (*End of update by D. L. Weis*)]

[*Update 2003*: As we went to press in 1998 with *Sexuality in America*, the single volume of the U.S. chapter taken from volume 3 of *The International Encyclopedia of Sexuality*, it was not yet clear how the allegations about President Clinton having sex with Monica Lewinski and other women would fall out. At first, Clinton denied those charges, wagging his finger at television cameras as he claimed that he had never had sex with "that woman." Of course, we know now that Clinton and Lewinsky did have oral sex together (apparently, she performed oral sex on him, but he did *not* return the favor). The U.S. House of Representatives voted—in an overwhelmingly partisan display—to impeach him, and the U.S. Senate ultimately voted *not* to convict Mr. Clinton. The entire episode left many Americans and people around the world wondering what this all meant. Our concern here is with what it tells us about American sexuality and our themes of change, conflict, and diversity.

[First, we should mention that at no point did a majority of American citizens favor ousting Mr. Clinton from office over this affair. Roughly two thirds of the American public continued to support his presidency. The Republican party pursued impeachment on the assumption that, when Americans finally learned what Mr. Clinton had done, they would want him removed from office. That never happened. Roughly one third did respond that way, but only one third. In fact, numerous polls indicated that a majority of Americans were more likely to condemn Congress for impeaching Clinton than to have believed that he should be removed from office (Schell 1999). Social disapproval was the punishment for those who were seen as trying to get Clinton. Popularity ratings for Congress, Linda Tripp, and Ken Starr sank below 10% (Leland 1998/1999). Most social observers believed that this represented a shift from what would have occurred in the past, say if the extramarital sexual adventures of Presidents Kennedy, Eisenhower, and Franklin Roosevelt had become widely known. It is not an exaggeration to suggest that this is what allowed him to finish his term in office.

[A second consequence of the Bill Clinton sex scandal would be that sexual discourse is now even more open in America. According to John Leland (1998/1999), this open discourse about sex, including the Clinton scandal, oral sex, Viagra, and so on, is the principal distinguishing characteristic of the present culture. To this, we can add that the episode has made social conservatives even more determined to reverse what they see as the moral decay of American society.

[Third, there is the issue of what we might call the Bill Clinton definition of sex, stemming from his frequently re-shown claim that he had not had sex with Monica Lewinsky. There are now several studies of what Americans think "sex" is. Sanders and Reinisch (1999) asked 599 midwestern college students in 1991 if they believed that various acts constituted "having sex." Roughly 60% indicated that they believed engaging in oral sex did *not* constitute having sex. In addition, nearly 20% indicated that anal sex was also *not* having sex. By the way, the editor of the *Journal of the American Medical Association* was fired shortly after publishing this study (Cowley & Springen 1999). Hawkins and a research group (2002) completed a study of 311 7th- to 12th-grade students in rural Arkansas (Clinton's home state). The students were asked to indicate what the words "abstinent" and "sexual activity" mean. The responses demonstrate a general lack of consensus about what these terms mean. Many of these young people, but not all, believed sex is intercourse. Similarly, abstinence was widely seen as abstaining from intercourse. Remez (2000) reported that "many"

adolescents engage in oral sex without having intercourse and that “many” do *not* regard this as sexual activity. This view is also common in the Baptist (which Clinton is) tradition. One Baptist minister described the behavior as disgusting, but insisted that it did *not* constitute having sex (Woodward 1998). Thus, many Americans do, in fact, appear to share the view that oral sex is *not* having sex. Clearly, there is great opportunity for sex education in America—even today.

[Finally, we would like to note that the 2000 presidential election in the U.S.A. also demonstrates our general themes of change, conflict, and diversity. The polls from 1998 through 2000 strongly suggest that Mr. Clinton would have been re-elected if he could have run. True, those same polls indicate that one third of Americans would have bitterly opposed him. The actual election results, with Gore and Bush drawing almost exactly 50% of the vote, demonstrates that the cultural war between competing factions (which we discuss throughout this American chapter) is about as great as it has ever been. This has played out as a regular theme of the George W. Bush administration.

[There were, of course, other examples of change, conflict, and diversity besides the Clinton affair, which we mentioned in *Sexuality in America* in 1998 and our original chapter in 1997. (*End of update by D. L. Weis*)]

- In late 1993, *Private Parts* by radio disc-jockey Howard Stern (1993), the inventor of “Shock Rock” radio, was published. Stern’s radio shows had had a large audience across the U.S.A. for more than a decade. He had been strongly condemned by some for the sexual explicitness of his shows and criticized by others for the sexist nature of those same shows. On several occasions, his shows had been investigated by the Federal Communications Commission (FCC). *Private Parts*, a lurid account of Stern’s shows and his sexual fantasies, was roundly criticized. However, it also became the bestselling book in the U.S. in 1993 (Adler 1994). By 1998, Stern had a nationally syndicated television show in addition to his nationally syndicated radio show. *Private Parts* was released as a movie in 1997 to critical acclaim and huge audiences. A compact disc of the soundtrack to the movie was also a national hit in 1997.
- Dr. Joycelyn Elders was fired in late 1994 as the Surgeon General of the United States for saying that children perhaps should be taught in school about masturbation. Elders, who was called the “Condom Queen” by conservatives in the United States, had become what the press described as a “political liability” to President Bill Clinton for expressing her views on controversial social issues, such as abortion, condom education for youth, and drug legalization (Cohn 1994). However, her firing was a direct reaction to comments she made about including masturbation as a part of sex-education programs for children. Elders made her comments on December 1, 1994, in an address to a World AIDS Day conference in New York City. In response to a question from the audience about her views on masturbation, Elders said, “I think that is something that is a part of human sexuality, and it’s a part of something that perhaps should be taught. But we’ve not even taught our children the very basics.” She added, “I feel that we have tried ignorance for a very long time, and it’s time we try education” (Hunt 1994). In announcing her dismissal, the Clinton administration pointedly indicated that the President disagreed with her views.
- By the middle of the 1990s, seven physicians and clinical staff members had been killed by anti-abortion activists. Over 80% of abortion providers in the U.S.A. have been picketed, and many have experienced other forms of harassment, including bomb and death threats, blockades, invasion of facilities, destruction of property, and assaults on patients and staff. The most recent tactic adopted by abortion opponents is to locate women who have had a bad experience with an abortion in order to persuade them to file a malpractice suit against the physician who performed the abortion.
- The term “sexual harassment” did not appear in American culture until around 1975. In the years since, there has been a tremendous growth in research on the problem and growing social conflict over its prevalence and definition. As late as 1991, when Anita Hill testified against Supreme Court nominee Clarence Thomas, only 29% of Americans believed her claims (Solomon & Miller 1994). Yet, the number of women filing claims doubled in the 1990s, and the U.S. Supreme Court ruled in 1993 that harassment could be determined if a worker demonstrated that the workplace environment was “hostile” or “abusive” to a “reasonable person” (Kaplan 1993). Workers would no longer have to demonstrate that severe psychological injury had occurred as a consequence. Similar controversies over definitions, prevalence, and credibility of claims have emerged with the issues of incest, child sexual abuse, and date or acquaintance rape.
- In June 1997, the Southern Baptist Convention, the nation’s second-largest religious denomination, called for a boycott of Walt Disney Company stores and theme parks to protest its “anti-Christian and anti-family trend” in extending health benefits to the same-sex partners of employees. The Baptists declared that such policies constituted an overly permissive stance toward homosexuality (Morganthau 1997). Gay activists were outraged by the decision, regarding it as mean-spirited.
- In April 1997, Ellen DeGeneres, star of the sitcom, “Ellen,” publicly announced that she was gay. On April 30 of the same year, her television character also came out of the closet, making Ellen the first leading lesbian in an American sitcom (Marin & Miller 1997). By early 1998, the ABC network canceled the show because of sagging ratings, a problem that had begun before the television “coming out.”
- Some years ago, the Iowa state legislature passed a bill outlawing nude dancing in establishments that serve alcohol. The activity moved to “juice bars.” In 1997, the legislature decided to make nude dancing illegal in any establishment holding a sales-tax permit, except businesses devoted primarily to the arts. As a result, the Southern Comfort Free Theater for the Performing Arts opened in Mount Joy, Iowa. Patrons are asked for “donations” and are described as “students.” In a similar story in Orlando, Florida, a ban on nude dancing has been circumvented by the establishment of “gentlemen’s clubs,” where patrons pay membership dues (*Newsweek* 1997).
- After decades of explicitly banning homosexuals from the military, President Clinton proposed ending the ban shortly after he assumed office in 1992. The policy put into place, popularly known as “Don’t ask, don’t tell,” was one in which the military agreed that they would stop asking recruits to report their sexual orientation. However, gays and lesbians can only serve in the armed forces if they keep their orientation private (*Newsweek* 1993, 6). By mid-1998, the Servicemembers Legal Defense Network reported that violations of the policy not to ask, pursue, or harass homosexuals had soared from 443 violations in 1996 to 563 violations in 1997. Reported cases of physical and verbal harassment of gay

servicemembers rose 38% from 1996 to 1997, while cases of illegal asking by military authorities increased by 39%. In 1996, an airman at Hickham Air Force Base had his life sentence for forcible sodomy reduced to 20 months in return for outing 17 other allegedly gay servicemen. All the accused airmen were discharged, while the rapist served less than a year.

- There is a growing wave of censorship being engineered by grassroots far-right organizations targeting, in particular, sexuality education textbooks and programs in local school districts throughout the country. Fear of personal attacks, disruption, controversy, and costly lawsuits have resulted in more teachers, administrators, and school boards yielding to the demands of vocal minority groups. In more than a third of documented incidents, challenged materials and programs were either removed, canceled, or replaced with abstinence-only material or curricula (Sedway 1992). In 1996, the U.S. Congress overwhelmingly passed the Communications Decency Act (CDA), a bill intended to regulate “indecent” and “patently offensive” speech on the Internet, which included information on abortion. In mid-1996, a three-judge federal panel in Philadelphia declared unconstitutional major parts of the new law. Even as the judges described attempts to regulate content on the Internet as a “profoundly repugnant” affront to the First Amendment’s guarantee of free speech, the government planned an appeal to the U.S. Supreme Court. Both the Senate and House of Representatives had overwhelmingly passed the CDA, and the President signed into law the bill that included it (Levy 1997). The law was finally ruled unconstitutional by the Supreme Court on June 27, 1997, although various government efforts continue to try to circumvent the decision (Noonan 1998).
- In the mid-1990s, a broad-based evangelical-revivalist movement, modeled in part on the Million Man March, which brought hundreds of thousands of African-American men to Washington, packed athletic stadiums across the country with men confessing their failures as husbands and fathers, and promising with great emotion to fulfill their Christian duties as men, husbands, fathers, and the heads of their families. The Promise Keepers, like the Million Men Marches, were criticized and denounced by feminists and others for their alleged devotion to traditional patriarchal and sexist values.
- In mid-1995, Norma Leah McCorvey, the Jane Roe at the epicenter of the 1973 *Roe v. Wade* Supreme Court decision legalizing abortion, announced she had quit her work at a Dallas, Texas, abortion clinic, had been baptized in a swimming pool by a minister of Operation Rescue, a national anti-abortion group, and would be working at the Operation Rescue office next door to the abortion clinic. Although there is “immense symbolic importance” in McCorvey’s announcement, it is odd that the born-again-Christian Operation Rescue group would embrace her so enthusiastically, given her declarations that she still believes “a woman has a right to have an abortion, a safe and legal abortion, in the first trimester” of pregnancy, and that she would continue living with her lesbian partner and working for lesbian rights (Verhovek 1995). In mid-1996, abortion again emerged as a major election issue when Robert Dole, the Republican Party candidate for president, called for a statement of tolerance in the Republican platform, a move vehemently opposed by conservative Republicans.
- In 1996, with the state of Hawaii on the verge of granting legal status to same-sex unions, several states moved quickly to enact laws banning the legal recognition of

such unions, despite the Constitutional requirement that all states reciprocally recognize the legal acts of other states. In June 1996, a House Judiciary Committee passed a bill that would absolve individual states from recognizing same-sex marriages if legalized in another state. The bill would also bar Federal recognition of such marriages in procedures involving taxes, pensions, and other benefits. Despite emotional debate in Congress, the measure cleared both the U.S. House of Representatives and the Senate. Although the President signed the bill into law, this debate remained a lightning-rod issue (Schmitt 1996).

[Update 2003: A few fairly obvious events in the news since 1998 are worth mentioning here to bring our central theme of change, conflict, and diversity up to the present.

- [In early 1998, Pfizer Pharmaceutical began marketing a drug for erectile dysfunction. Viagra quickly became the fastest and largest-selling pharmaceutical in world history (Watson 1998). Sales were helped when Bob Dole, an unsuccessful Republican presidential candidate, appeared in television advertisements for Viagra with his appreciative wife, Elizabeth Dole. (See details on the use of Viagra by R. Hatfield in Section 11B, Sexual Dysfunctions, Counseling, and Therapies, Current Status.)
- [On October 6, 1998, Aaron McKinney and Russell Henderson, a pair of high school dropouts, met Matthew Shepard, a slightly built gay University of Wyoming college student, at a bar in Laramie. Posing as gay men cruising, they lured Shepard into their truck. They robbed and beat him, leaving him tied spread-eagled to a fence post. He was discovered 18 hours later, but died within days of complications from the experience, including six skull fractures. The two were charged with first-degree murder. Later, there was some conflict between civil-rights crusaders, who wanted to use the incident to pass hate-crime legislation and conservative Christian groups, who claimed the story demonstrated the growing homosexual immorality of American life (Miller 1998; Hammer 1999). I remember some demonstrating their hatred at the Shepard funeral. Twenty-one Americans were murdered in 1998 because they were gay or lesbian (Alter 1998). The Matt Shepard story was turned into a Home Box Office (HBO) documentary in 2003.
- [In recent years, the American Catholic Church has been rocked by a continuing scandal over priests sexually abusing children. Much of the controversy has centered on dioceses along the eastern seaboard, although it has involved parishes across the country. Boston serves as a good example. Cardinal Bernard Law became embroiled in controversy over the handling of sexual abuse cases against priests that extended back before he came to Boston in 1984. The Rev. John J. Geoghan, convicted of sexually molesting a boy, was moved from parish to parish by the Boston Archdiocese for 30 years, even though the Church knew about his “problem.” Lawyers in the case estimate that there may, in fact, have been as many as 130 victims of this particular priest. The Cardinal apologized many times and paid out more than \$10 million to victims, but he also provided little information about any of this to the public. The Church had reversed its policy of withholding information from legal authorities and turned over records concerning 70 priests from over the last 40 years. As of 2002, there were 86 separate civil suits against the Boston Archdiocese pending (Clemerson et al. 2002; Miller et al. 2002; Woodward 2002). The National Conference of Catholic Bishops estimates that the Church

has paid out more than \$800 million to settle cases since the 1980s (Miller et al. 2002). Eventually, Cardinal Law did resign. The issue of exactly how the Church should respond to this crisis and how it ought to modify policy on these questions are still unresolved. Perhaps this is the greatest challenge ever facing the American Catholic Church. Its continuing vitality as a mainstream religion is at stake. (See details by W. Prendergast in Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex.)

- [One of the hottest trends in American television in the late 1990s and early 21st century has been the appearance of sexually pointed (though not explicit) programs, like “Sex in the City,” “Oz,” and “The Sopranos,” on cable television. The open portrayal of sex and violence in these premium cable shows would never be permitted on network television, even today. HBO is the leader in this trend. They do not have enough subscribers nationwide to pull high ratings by themselves, but they are hurting the networks. Moreover, they are pushing the envelope. On the whole, these shows are smarter, edgier, franker, better written, and better acted than the typical network programming. They also march boldly into territory where the networks fear to go. These shows appeal to female viewers, who make up 40% of the audience (Hamilton & Brown 1999; Vineberg 2001).
- [In June 2003, the U.S. Supreme Court ruled that laws which specifically criminalize homosexual behavior are unconstitutional, opening the door to a range of legal possibilities I have never seen in my lifetime. Less than a week later, U.S. Senate Majority Leader, Bill Frisk (R-Tenn.) announced that he would support a proposed constitutional amendment that would ban all gay marriages (sponsored May 21 by Marilyn Musgrave (R-Colo.) among others) (Mann 2003), opening the door to visions of legal battles that will continue for decades. (*End of update by D. L. Weis*)]

Each of the above events in the late 1990s and early 21st century serves as an intriguing indicator of the state of sexuality in the United States, and each also reveals much about the interaction of politics and sexual issues as we approached the end of the 20th century. They demonstrate that, despite the immense social changes that have occurred during the 20th century, strong elements of religious fundamentalism and conservatism remain active within the culture. In fact, a full explanation of sexuality in the United States requires an understanding of the diverse sexual, social, and political ideologies characterizing the culture and the ongoing conflict between various groups over those ideologies.

In this respect, there is a rather schizophrenic character to sexuality in the United States. On the one hand, the U.S.A. is a country with a multibillion-dollar-a-year erotica/pornography business; a mass-media system where movies, television, books, magazines, and popular music are saturated with sexually titillating content alongside serious educational material; a high rate of premarital sex (nearly 90% by the 1990s); one of the most active and open gay-rights movements in the world; and a continuing public fascination with unusual sexual practices, extramarital sex, and gender-orientation issues, including, most recently, bisexuality.

On the other hand, federal, state, and local governments have invested heavily in recent years in prosecuting businesses for obscenity, allowed discriminatory practices based on sexual orientation, largely failed to implement comprehensive sexuality-education programs in the schools, and refused to support accessibility to contraceptives for adolescents. The consequences of these failures include one of the

highest teenage-pregnancy and abortion rates in the world and increasing incidents of gay-bashing that reflect the prevalence of homonegative and homophobic attitudes in the U.S.A.

These examples illustrate one of the major themes in this chapter: the changing nature of sexuality in the U.S.A. throughout the 20th century. Although accounts of changing sexual norms and practices are frequently portrayed as occurring in a linear process, we would suggest that the more-typical pattern is one reflected by ongoing conflicts between competing groups over sexual ideology and practice. Each of the examples cited is an illustration of how those conflicts are currently manifested in the social and political arenas in the U.S.A.

A focus on the conflict between groups with contrasting ideologies and agendas over sexual issues will be a second theme of this chapter. This process of changing sexual attitudes, practices, and policies in an atmosphere that approaches “civil war” is a reflection of the tremendous diversity within American culture. In many respects, the widespread conflict over sexual issues is a direct outcome of the diversity of groups holding a vested interest in the outcomes of these conflicts, with some groups seeking to impose their beliefs on everyone.

The diversity of these groups will be the third major theme of the chapter. One example that will be apparent throughout this chapter is the question of gender. There is growing evidence that men and women in the U.S.A. tend to hold different sexual attitudes and ideologies, to exhibit different patterns of sexual behavior, and to pursue different sexual lifestyles—frequently at odds with each other (Oliver & Hyde 1993). In some ways, it may even be useful to view male and female perspectives as stemming from distinct gender cultures. In reviewing sexuality in the U.S.A., we will frequently attempt to assess how change occurs in a context of conflict between diverse social groups.

## 1. Basic Sexological Premises

DAVID L. WEIS

This overall theme of social change occurring in a process of conflict between diverse groups is woven throughout the history of the United States itself. There are at least two ways in which a study of history is important to an understanding of contemporary sexological premises and sexual patterns in the U.S.A. First, there is a specific history of sexual norms and customs changing over time. To the extent that sexual attitudes and practices are shared by the members of a social group or population in a particular time period, they can be viewed as social institutions. Unfortunately, it is exceedingly difficult to describe such sexual institutions in the U.S.A. prior to the 20th century, because there are few reliable empirical datasets available for that period. To a large extent, we have to rely on records of what people said about their own or others’ sexual attitudes and practices, and such statements may be suspect. Still, it seems reasonable to suggest that current sexual norms and customs have been shaped, at least in part, by earlier patterns.

In addition, there is a second way in which the general social history of the U.S.A. is important to understanding changing sexual institutions. Sexuality, like other social institutions, does not operate in a vacuum. It is related to and influenced by other social institutions, such as the economy, government, marriage and the family, religion, and education, as well as social patterns such as age distributions and gender ratios. As we will discuss in Section 2, Religious, Ethnic, and Gender Factors Affecting Sexuality, a good deal of research evidence indicates that such social institu-

tions are often related to various sexual variables. Researchers have not consistently tested these associations, but the point is a crucial one theoretically for explaining the dynamics of sexual processes in a culture as large and diverse as the U.S.A.

### A. From Colonial Times to the Industrial Revolution

In 1776, at the time of the War for American Independence, the U.S.A. became a nation of 13 states located along the shore of the Atlantic Ocean. Most of the inhabitants of the former British colonies were of English descent, and they tended to be Protestant. Although the first Africans had been brought to America as indentured servants as early as 1620, the practice of slavery quickly evolved. By the time of independence, an active slave trade involving hundreds of thousands of Africans and Caribbeans was well established. Of course, the Africans and Caribbeans brought their own customs with them, although they were frequently prevented from practicing them. West of the 13 original states, the remainder of the North American continent within the area now constituting the nation was inhabited by several million Native Americans representing hundreds of tribes, each with its own set of customs.

At its birth, the U.S.A. was essentially an agrarian society. More than 90% of the population were farmers. There were few cities with as many as 5,000 residents. Boston was the largest city with 16,000, and New York was the second largest with 13,000 (Reiss 1980). The Industrial Revolution had yet to begin. Few men, and virtually no women, were employed outside the family home. Although it has become common to think of the 20th-century pattern of role specialization, with the man serving as the family provider and the woman as the housekeeper and childcare provider, as the traditional American pattern, it did not characterize this early-American agrarian family. Family tasks tended to be performed out of necessity, with both men and women making direct and important contributions to the economic welfare of their families. Sexual norms and practices in early America arose in this social context.

The images of early-American sexuality in folklore are those of antihedonistic Puritanism and sexually repressed Victorianism. In popular culture, these terms have come to be associated with sexual prudishness. This view is oversimplistic and potentially misleading. Recent scholars (D'Emilio & Freedman 1988; Robinson 1976; Seidman 1991) tend to agree that sexuality was valued by the 18th-century Puritans and 19th-century Victorians within the context of marriage. To the Puritans, marriage was viewed as a spiritual union, and one that tended to emphasize the duties associated with commitment to that union. Marriage involved mutual affection and respect, and the couple was viewed as a primary social unit. Spouses were expected to fulfill reciprocal duties. One of these was sexual expression. No marriage was considered complete unless it was consummated sexually. The Puritans accepted erotic pleasure, as long as it promoted the mutual comfort and affection of the conjugal pair. The reciprocal duties of marital sexuality were justified, because they were seen as preventing individuals from becoming preoccupied with carnal desires and the temptation to practice improper sex outside of marriage (Seidman 1991). Of course, one of the principal functions of marital sex was reproduction. Pleasure alone did not justify sexual union. Instead, the regulation of sexual behavior reinforced the primacy of marital reproductive sex and the need for children (D'Emilio & Freedman 1988).

Within this context, it is certainly true that the early English settlers tried to regulate nonmarital forms of sexual ex-

pression. However, even this point can be exaggerated. Reiss (1980) has noted that Americans have always had a courtship system where individuals were free to select partners of their own choice. To some extent, this may have been because of necessities imposed by immigration to frontier territories, but it also was a consequence of the freedom settlers had from the institutions of social control found in Europe. Elsewhere, Reiss (1960, 1967) has maintained that such autonomy in courtship is associated with greater premarital sexual permissiveness.

In this regard, it is interesting to note that the settlers in New England developed the practice of bundling as a form of courtship. In colonial New England, settlers faced harsh winters. They commonly faced fuel shortages, and mechanized transportation forms had yet to be developed. Single men would travel miles to visit the home of an eligible female. Typically, they would spend the night before returning home the next day. Few New England homes of the period had multiple rooms for housing a guest, and few could heat the house for an entire 24-hour day. At night, the woman's family would bundle the man and the woman separately in blankets, and they would spend the night together talking to each other as they shared the same bed. It is worth noting that the practice of bundling was restricted to winters. Reiss (1980) has argued that the implicit understanding that the couple would avoid a sexual encounter was not always honored. In fact, a study of marriages in Groton, Massachusetts, from 1761 to 1775 found that one third of the women were pregnant at the time of their weddings (cited in Reiss 1980). This system was acceptable because betrothals were rarely broken at the time and because it served to produce the marital unions the Puritans valued so highly. Eventually, bundling was replaced by visits in the sitting parlors of 19th-century homes and by the practice of dating outside parental supervision in the 20th century (Reiss 1980).

Around 1800, the Industrial Revolution began changing this world, albeit gradually. In the two centuries since, virtually every aspect of American life has been transformed. The 19th century was marked by social turmoil, a frontier mentality open to radical change, and a resulting patchwork of conflicting trends and values. Among the events that left their mark on American culture in the 19th century were the following:

- The century started with 16 states and ended with 45 states; the 1803 Louisiana Purchase doubled the country's size. Victory in the War of 1812 with England and a war with Mexico also added territory.
- A Victorian ethic dominated the country. Preachers and health advocates, like Sylvester Graham and John Kellogg, promoted a fear of sexual excesses, such as sex before age 30 or more than once in three years, and a paranoia about the dangers of masturbation.
- Despite a dominant conservative trend and three major economic depressions, small religious groups pioneered a variety of marital and communal lifestyles, and had an influence far beyond their tiny numbers. The Perfectionist Methodists of the Oneida Community (1831-1881) endorsed women's rights and group marriage; the Church of Latter-Day Saints (Mormons) practiced polygyny; Protestant Hutterites celebrated the communal life; and the Shakers and Harmony Community promoted a celibate lifestyle.
- In 1837, the first colleges for women opened.
- In 1848, the first women's rights convention was held in Seneca Falls, New York.
- A midcentury California gold rush and completion of the transcontinental railroad opened the west to an explosive

growth. San Francisco, for example, doubled its population from 400 to 810 between 1847 and 1857; four years later, its population was 25,000. A major shortage of women led to importing thousands of women from Mexico, Chile, China, and the Pacific islands, with widespread prostitution.

- In 1861-1865, a devastating Civil War led to the abolition of slavery, as well as to new opportunities for employment, such as secretaries using the new mass-produced typewriters, and nurses using the skills they developed when they took care of the wounded in the Civil War.
- In 1869, the Territory of Wyoming gave women the vote.
- In 1873, the Comstock Law prohibited mailing obscene literature, including information about marital sex and contraception; it was finally declared unconstitutional a century later.
- In the latter part of the 1800s, a few thousand Americans were part of an influential "free love" movement, which advocated sexual freedom for women, the separation of sex and reproduction, the intellectual equality of women and men, self-health and knowledge of one's own body and its functions, and women's right to the vote, to enjoy sex, and to obtain a divorce.

Pankhurst and Houseknecht (1983) have identified five major trends that they maintain began to change and shape the modern institutions of marriage and the family in the 19th century and continued to have an impact on American culture in the 20th century. The author of this section suggests that they have had a similar influence on sexual institutions. These trends are:

1. Industrialization, with its consequent process of urbanization and the eventual emergence of suburbs surrounding metropolitan areas;
2. A shift in the family from an economic-producing unit to that of a consumer;
3. The entry of men, and later of women, into the paid labor force;
4. The elongation and expansion of formal education, especially among women and minorities; and
5. Technological change.

We do not have the space to explore fully the impact of each of these trends. However, relevant effects would include increased lifespans, decreased maternal and infant mortality at childbirth, the development of effective contraceptives, the emergence of a consumer culture that allows families to purchase most of their goods and services, the creation of labor-saving household technologies, increased leisure time, the development of modern forms of transportation, especially automobiles and airplanes, an increasing divorce rate, the increasing entry of wives and mothers into the labor force, decreasing birthrates and family size, increasing rates of single-parent families and cohabitation, increasing percentages of adults living alone, and increasing proportions of married couples with no children currently living at home (Coontz 1992). Many of these changes have resulted in greater personal autonomy for individuals. As Reiss (1960, 1967) has argued, such autonomy may be a major factor underlying several changes in sexuality throughout American history.

It should be stressed that these changes have not necessarily been linear or consistent throughout the period of the Industrial Revolution. Many began to emerge in the 19th century but accelerated and became mainstream patterns only in the 20th century. For example, as late as 1900, a majority of Americans were still farmers. The 1920 census was

the first to show a majority of the population living in towns and cities. By 1980, only 4% of Americans still lived on farms (Reiss 1980). Similarly, women began entering the labor force in the early 19th century. However, it was not until 1975 that one half of married women were employed. By 1990, 70% of married women between the ages of 25 and 44 were employed (Coontz 1992). Yet another example is provided by the divorce rate. It had been gradually increasing for decades. That rate doubled between 1965 and 1975, and for the first time, couples with children began divorcing in sizable numbers at that time (Coontz 1992; Reiss 1980; Seidman 1991).

Seidman (1991) has described the principal change in American sexuality during the 19th century as the "sexualization of love." It could also be described as a shift to companionate marriage. Marriage came to be defined less as an institutional arrangement of reciprocal duties, and more as a personal relationship between the spouses. The modern concept of love as a form of companionship, intimacy, and sharing came to be seen as the primary justification for marriage. As this process continued, the erotic longings between the partners, and the sexual pleasures shared by them, became inseparable from the qualities that defined love and marriage. By the early part of the 20th century, the desires and pleasures associated with sex came to be seen as a chief motivation and sustaining force in love and marriage (Seidman 1991). This view has come to be so dominant in the contemporary U.S.A. that few Americans today can envision any other basis for marriage.

D'Emilio and Freedman (1988) have argued that what they call the liberal sexual ethic described in the previous paragraph has been the attempt to promote this view of the erotic as the peak experience of marriage while limiting its expression elsewhere. However, as this view became the dominant American sexual ideology of the 20th century, it also served to legitimize the erotic aspects of sexuality itself (Seidman 1991). Eventually, groups emerged which have sought to value sex for its inherent pleasure and expressive qualities, as well as for its value as a form of self-expression. In effect, as the view that sexual gratification was a critical part of happiness for married persons became the dominant sexual ideology of 20th-century America, then it was only a matter of time until some groups began to question how it could be restricted only to married persons (D'Emilio & Freedman 1988).

## B. The 20th Century

The social turmoil and the pace of social change that marked the 19th century accelerated exponentially in the 20th century. American culture in the 20th century became increasingly complicated and changed by often-unanticipated developments in technology, communications, and medicine. Among the events that have been identified as significant in 20th-century United States are the following:

- In the early 1900s, Sigmund Freud and Havelock Ellis helped trigger the emergence of a more-positive approach to sexuality, especially in recognizing the normal sexuality of women and children, and the need for sex education.
- In 1916, spurred by Havelock Ellis, Margaret Sanger, a New York nurse, launched a crusade to educate poor and immigrant women about contraception, and established the first Planned Parenthood clinics.
- World War I brought women out of their Victorian homes into the war effort and work in the factories; shorter skirts and hairstyles were viewed as patriotic fashion and gave women more freedom. American soldiers encountered the more-relaxed sexual mores of France and Europe.

- The “Roarin’ Twenties” were marked by the invention of cellulose sanitary napkins, the mobility of Henry Ford’s affordable automobiles, new leisure and affluence, the advent of movies with female vamp stars and irresistible sex idols, and the appearance of the “Charleston,” the “flapper,” and cheek-to-cheek, body-clutching dancing.
- From 1929 to 1941, the Great Depression brought a return to sexual conservatism.
- World War II opened new opportunities for women, both at home and in the military support. Interracial marriages set the stage for revoking miscegenation laws later in 1967.
- In the 1940s, the advent of antibiotics brought cures for some sexually transmitted diseases.
- In 1948 and 1953, Alfred Kinsey and colleagues published *Sexual Behavior in the Human Male* and *Sexual Behavior in the Human Female*. They brought sexual topics into widespread public discussion.
- In the 1950s, Elvis Presley became the first major rock ‘n’ roll star; television became a major influence on young Americans. Senator Joseph McCarthy portrayed sex education as part of a Communist plot to take over the U.S. Coed dormitories appeared on college campuses and bikini swimsuits swept the nation. Motels became popular, providing comfort for vacationing Americans, as well as for Americans seeking privacy for sexual relations.
- In 1953, the first issue of *Playboy* magazine was published.
- In 1957, the Supreme Court decision in *Roth v. U.S.* set new criteria for obscenity that opened the door to the works of D. H. Lawrence and Henry Miller, and other classic erotic works.
- In the 1950s and 1960s, the beatniks, hippies, flower children, and drug culture emerged.
- In the early 1960s, the hormonal contraceptive pill became available.
- In 1961, Illinois adopted the first “consenting adult” law decriminalizing sexual behavior between consenting adults.
- In 1963, Betty Friedan’s *Feminine Mystique* was published, giving voice to the modern feminist movement.
- In 1968, William Masters and Virginia Johnson published *Human Sexual Response*.
- Following the 1969 Stonewall Inn Riot in Greenwich Village, New York City, homosexuals rebelled against police harassment, and launched the gay-rights and gay-pride movement.
- In the 1970s, television talk shows popularized discussions of alternative lifestyles, triggered by the publication of Nena and George O’Neill’s *Open Marriage* in 1972.
- In 1970, the White House Commission on Pornography and Obscenity found no real harm in sexually explicit material. President Richard Nixon refused to issue the report.
- In 1972, the first openly gay male was ordained to the ministry of a major Christian church.
- In 1973, the U.S. Supreme Court legalized abortion.
- In the 1980s, openly gay legislators appeared in federal and state governments, and in professional sports.
- In 1983, AIDS was recognized, leading to a new advocacy for sex education in the schools and general public.
- In the late 1980s, conservative Christian activists, including the Moral Majority, the Christian Coalition, Focus on the Family, and similar organizations, emerged as politically and socially powerful groups.

These and other events too numerous to list, let alone analyze here, both contributed to and reflect the tension be-

tween the two ideologies mentioned above—one viewing sex as legitimate only in marriage, but as a necessary component of marital happiness, and the other viewing sex as a valid and important experience in its own right. The attempt to reconcile them can be seen as an underlying dynamic for many sexual practices and changes in the 20th century. These broad-based trends include:

1. The emergence in the 1920s of dating and in the 1940s of “going steady” as courtship forms (Reiss 1980);
2. The rising percentage of young people having premarital sexual experiences (D’Emilio & Freedman 1988; Kinsey et al. 1948, 1953; Reiss 1980; Seidman 1991);
3. The greater equality between the genders (D’Emilio & Freedman 1988; Reiss 1980; Seidman 1991);
4. The eroticization of the female, including a decline in the double standard and an increased focus on female sexual satisfaction (D’Emilio & Freedman 1988; Seidman 1991);
5. The emergence of professions devoted to sexuality—research, education, and therapy;
6. The expansion of marital sexuality, including increases in frequency, satisfaction, and variation in behavior (Hunt 1974);
7. The emergence of a homosexual identity and subculture, including a gay-rights movement (D’Emilio & Freedman 1988; Seidman 1991);
8. The passage of consenting-adult laws;
9. The commercialization of sex, by which we mean the appearance of an “industry” providing sexual goods and services (D’Emilio & Freedman 1988; Seidman 1991).

Reactions to these trends, and the continuing tension between the two major ideologies we have outlined above, lie at the very heart of the ongoing conflicts over sexual issues today. Robinson (1976) has characterized this conflict as a battle between 19th-century romanticism and what he calls sexual modernism. Romanticism affirmed the essential worth of the erotic, but only within the context of an intense interpersonal relationship transformed by a spiritual and physical union. Modernism reaffirms this romantic ideal, but also transforms it by acknowledging the value of “an innocent physical need” (p. 194). Although the modernist is glad to be rid of Victorian repression and anticipates the promise of a greater sexual freedom, there is a concomitant fear of a future of emotional emptiness.

Reiss (1981) has characterized this as a conflict between what he calls the traditional-romantic and modern-naturalistic ideologies. He maintains that this distinction can be used to explain current conflicts over such issues as abortion, gender roles and differences, pornography, definitions of sexual exploitation, concepts of sexual normality, and even accounts of sexual history itself. This perspective is useful in interpreting mass-media claims about sexuality in the U.S.A. Thus, Lyons (1983), reporting for *The New York Times*, proclaimed that the “sexual revolution” was over by the 1980s and that America was experiencing a return to traditional values and lifestyles. To support his argument, he claimed that there was a recent decrease in the number of sex partners and a shift away from indiscriminate, casual sexual behavior (Lyons 1983). In contrast, Walsh (1993), writing for *Utne Reader*, proclaimed that the 1990s have been characterized by a renewed sexual revolution (second-wavers), with pioneering new philosophies and techniques employing technology (latex, computer imaging, computer networks, virtual-reality sex, phone sex, cathode rays, and group safe sex) to achieve sensual pleasure in a safe way.

From 1970 to 1990, as these social processes continued, Americans witnessed: 1. a decrease in the marriage rate;

2. an increase in the divorce rate; 3. an increase in the birthrate for unmarried mothers (although the overall adolescent birthrate decreased); 4. an increase in single-parent families; and 5. an increase in married couples without children at home (Ahlburg & DeVita 1992).

### [C. The 21st Century

#### [*Sexuality and Terrorism in the United States*

RAYMOND J. NOONAN

[*Update 2003*: On September 11, 2001, terrorists, in a spectacular, well-planned, and coordinated attack, struck the United States by flying hijacked jumbo jets into the Twin Towers of the World Trade Center in New York City and the Pentagon in Washington, D.C., with another jet apparently bound for another Washington landmark being brought down in a field in western Pennsylvania. Although it has been minimally highlighted, sexuality factors may well have been among the root causes of the attack, and, it would appear, other terrorist activities worldwide. In addition, little has been written about the impact that these attacks, as well as the subsequent “war on terrorism” or the military actions in Afghanistan and Iraq, may have had on the sexuality of Americans in the aftermath. Indeed, using the *human sexuality complex* (Noonan 1998b) as a theoretical framework, i.e., looking at our sexuality as a complex ecological system in a holistic environment, one would surmise that these events, like other outside factors, such as economic, political, and other social factors, of necessity, have had—and would have to have—an impact. Certainly, they have triggered responses that will be felt in the sexual sphere, as well as other aspects of American life, as we advance through the 21st century.

[Terrorism is a relatively simple set of destructive behaviors with a complex set of motivations. The possibility that terrorism might be ultimately rooted in sexual motivations often receives a look of incredulous bemusement. Yet, it should be apparent that sexuality factors, including profoundly different views of the roles and essence of men and women and their relative power in personal relationships and society, the value of premarital virginity and its relationship to marriage as an economic institution benefiting the extended family versus marriage and relationships as expressions of love and personal autonomy, and the conflict in demarcating masculinity and femininity arising from same-sex relationships and the globalization of American popular culture, have the capacity to provide the fuel for the intensity of the clash between civilizations that has come to define international terrorism.

[These are especially salient when religion, with its precepts and notions of purity and impurity so deeply linked to sex and the dualistic split between the body and mind/spirit, is considered. It is easier to understand territorial, political, and economic motivations—or even ancient interethnic rivalries—whereas the religious motivations, such as the Islamic fundamentalism ascribed to the 9/11 terrorists, seem incongruous with the way most Americans view religion and the efforts needed to impose it and its sexual and gender ethic on everyone. The sole exception in the United States seems to be the Christian-fundamentalist anti-abortion terrorists who attack abortion clinics and sometimes kill clinic workers, albeit on a much smaller scale than the worldwide attacks of the Islamic extremists. Still, abortion terrorists have helped to restrict access to legal abortions in hospitals, as well as to providers in many U.S. states (Baird-Windle & Bader 2001). The difference between the two groups may signify a difference between the worldviews of the monolithic entity known as Western Civilization and some of the other non-Western cultures, which will be discussed later.

[Norman Doidge (2001), a research psychiatrist and psychoanalyst who teaches at Columbia University and the University of Toronto, summarized the various news reports that several of the September 11 terrorists had visited prostitutes and lap dancers in the days prior to the attacks and noted suggestions that various commentators have made about their possible motivation for frequently behaving in ways contrary to their expressed piety: For example, they may have been using sex as an anxiety reliever prior to their suicide missions or as a confirmation of their belief that they were protecting Islam from the sexual licentiousness that they ascribed to Western cultures, in particular to that of the United States, which would then “justify” the murders in their own minds. In contrast, Doidge suggested that their behavior “reveals the ambivalent sexual undercurrent that is part of Islamic extremism with its view of woman as sin-evoking temptress, best appreciated either totally veiled, or totally unveiled.” In summarizing other terrorists with similar contradictions, he wrote further:

But fanatics throughout history have had a markedly hypocritical attitude toward sex. Most fanatical sects have an obsession with sexual purity, alongside extraordinary lapses of restraint. Most divide the world into the pure and the impure, the sacred and the profane, clean and unclean, pure ascetic man and female temptress. . . . Fanatical leaders frequently demand their members subordinate all desires to the cause. . . .

Islamic extremism doesn’t master sexuality—it exploits it by linking it to politics. In order to train Islamic suicide bombers, teenage boys are isolated from television and any outside influence when they are at the height of their sexual drive, playing on the Koranic promise to “martyrs” that, within moments of their death, they will be greeted by the 72 hours of heaven—virgins with whom they will have sex for eternity. Sex in this earthly world is devalued, but the promise of sex in the world to come is used to heat up the imaginations of these isolated, inexperienced loners. . . .

Such cults frustrate everyday erotic longing for other people, so that the devotees will turn that longing toward the cult leader and the cause. Becoming overheated “lovers of the cause,” they, like lovers everywhere, become willing to sacrifice for their beloved. At the same time, their leaders manipulate the guilt followers feel about sexual desire, saying, “If you still have sexual feelings, you obviously are not devoted enough, and must sacrifice more.”

People who deny themselves erotic outlets soon see any normal expression of eros as the devil incarnate. . . .

[It is known that sexual activity can have an ameliorative effect on suicidal ideation and depression, preventing many suicides (Planned Parenthood Federation of America 2003). It may also have the same effect on some forms of violence. Individuals who have a positive attitude toward sex, *per se*, tend not to be terrorists. However, in wars of liberation, it is known that when they are successful, there often follows a period of unrestrained sexual activities, although it may not last if the leadership turns out to be generally repressive of sexuality, as occurred in Russia following the October 1917 Revolution, as noted in the chapter on Ukraine in this volume. This sexual freedom can be attributed to the fact that sexuality often symbolizes personal liberation for many people, particularly if they have lived under sexually repressive social systems.

[Suppression of the sexual impulse allows the power of sex to be subverted for destructive political ends, as in the case of current Muslim and Christian extremists, although it

can be used for “positive” purposes, as the channeling of religious fervor for some clerics (cf. George Orwell’s 1984). Thus, combined with other factors, such as the fact that it has been almost a century since Muslim colonial aspirations, which peaked with the Ottoman Empire, were dismantled at the end of World War I, ending centuries of dominance and Arab Islamic control over vast areas of Europe, Africa, and Asia. Yet, little if anything is said about the fact that, like the European Christian colonialists of the past, the Arab Muslim colonialists of the past conquered many more lands, imposing Islam on the inhabitants. (This silence may be attributable to the anti-Western sentiments that are currently fashionable in some American circles, as well as often well-meaning efforts to promote multiculturalism and diversity.) Indeed, as noted by Wolfgang Giegerich (a Jungian psychologist, in Fraim 2002), Islam was once the leading intellectual force in the world, although it has had little to offer the world for centuries. This has resulted in a sense of inferiority and shame that few Westerners can feel, which may account for the level of desperation seen in the terrorist attacks here and abroad.

[In his essay, “Islamic Terrorism,” Giegerich (in Fraim 2002) has noted that, of the world’s great religions, Islam is the only one that does not have a significant tradition of self-reflection—one in which basic premises and human-behavioral imperatives are evaluated in light of social and other advances in civilization. In fact, Giegerich advances the theory that it is a temporal clash and not a clash of civilizations that exists, one in which Islamic thought is stuck in the Middle Ages. Thus, he believes the West must look to its own past to understand their anger in order to find solutions. Thus, one can readily imagine how sexuality factors, as very powerful modern images projected through American popular culture, are fueling the terrorists’ aggression (see the section on Sexuality and American Popular Culture at the end of this chapter).

[It is clear that one major factor in the sexual revolution in the West that has been increasingly adopted by younger people all over the world as they are exposed to Western ideals is the central importance of love and intimacy as a foundation for marriage and other sexual relationships. This is in sharp contrast to the centrality of marriage as an economic community and family institution, for example, in Islam today and most other religious traditions in both the East and West in the past if not still today. Thus, unsanctioned sexual relations threaten the power politics of traditional patriarchal societies, as younger people assume this aspect of control over their own lives.

[Another probable overlooked sex-related factor in terrorism is the Malthusian principle of population growth and its effects on the ecological psychosocial environment (Malthus 1798). Historically, programs aimed at increasing population growth have been promoted to fill the ranks of warriors, taxpayers, menial laborers, and religious adherents, to which, today, has been added consumer markets. This is in addition to the intrapsychological pressures some people feel to prove their masculinity or femininity to themselves and others by having babies.

[One of the most important sequelae of the terrorist attacks in the U.S. has been the reassertion both of male heroism and its closely allied cousin, the conservative political agenda. Much of this resurgence has as much to do with the traditional male role as protector—reinvigorated as a result of the attacks—as it probably has to do with the reaction to both the misandrist and heterophobic undercurrents that can be found in contemporary American culture, which are fueled largely by those who wish to exploit them for their own personal and political agendas on both the left and the

right. Thus, we can probably expect to see a gender shift toward the expression of more-traditional masculine posturing, which has been clearly evident in the post-9/11 world in the United States. Indeed, much was made of the exaggerated images of President George W. Bush’s genital region (reminiscent of the codpieces used to enhance the “manhood” of the aristocracy in the 15th and 16th centuries), when he descended from the cockpit of a fighter jet and crossed the deck of an aircraft carrier after the war in Iraq (Goldstein 2003). Research is needed to ascertain the impact that these new gender realities will have on American sexuality.

[*Effects of Terrorism and War on the Sexuality of Americans.* It is well known that war can have a significant impact on birthrates in the immediate areas of armed conflict (declining during a war and increasing immediately following it), as noted by the authors on the chapters on Croatia and Israel in this volume, although research on the concomitant effects on sexual behavior, *per se*, are rare, if nonexistent. Certainly, the post-World War II baby boom has been partially attributed to the impact of men returning from military service. The impact of terrorist bombings, being that they are typically more sporadic and uncertain and are directed against civilian populations, is also likely to have had an effect where they have occurred as they have had in Israel. Similar effects of the tensions of the Cold War appear not to have had an effect, although it has been conjectured that the potential nuclear threat may have encouraged early sexual experimentation in the sexual revolution of the 1960s and 1970s, combined with the introduction of the oral contraceptive pill, following the stifling 1950s. Still, even unarmed conflict can have an impact on sexuality, as noted in the chapter on Russia in this volume, where, following the collapse of Communism and the ensuing severe economic crisis, the birth and marriage rates fell sharply, as well as life expectancies, and divorce rates increased. Even population migration caused by wars can result in cross-cultural conflicts in the new lands, often surrounding sexual issues, as noted in the chapter on Sweden in this volume. In addition, the incidence of sexually transmitted diseases can increase, as noted in the chapter on Ukraine. Indeed, even wide-area events like the historic blackout of August 2003 affecting New York and several other northeastern states and parts of Canada, suggesting vulnerabilities to less-violent forms of terrorism, brought reminiscences of increased birthrates following past regional blackouts.

[The heightened levels of security also can have an effect. There is a fine line between reasonable security procedures and the enhanced anxiety generated by exaggerated security measures. In addition to keeping vigilant about one’s surroundings, such measures keep gloom-and-doom scenarios fresh in people’s minds, with the enhanced anxiety that can have an impact on intimate relationships. To be sure, terrorist attacks remain a dangerous reality and probable source of anxiety in the U.S. and worldwide. Post-traumatic stress disorder has been documented in New York City, where it was the most prevalent following the terrorist attacks, as well as in the rest of the U.S. It is likely to continue for some time, given that political and business leaders appear committed to not rebuilding the Twin Towers (Noonan 2002). Certainly, the terrorists were more aware of the symbolic value of the Towers than our leaders are. Surely, also, the Malthusian effects noted above are part of the overemphasis being placed on 9/11 memorials at the World Trade Center site, which is also working against the restoration efforts, which could accelerate the healing process. Stress is well known to disrupt sexual functioning as well as creates other strains on intimate relationships.

[Comments about the new awareness of the importance of family and personal relationships, in contrast to work and other concerns, were made in the immediate aftermath of the attacks on the United States. However, this was largely anecdotal, and may have amounted to a blip in actual practice that is beginning to shift again. Further research is needed to clarify these changes, although whether sufficient previous data are available for comparison is uncertain.]

[Americans appear to be deeply ambivalent about the leadership role in world affairs it has had roughly since World War II. The September 11 attacks may, thus, signify a turning point in American world (and domestic) consciousness, with a retreat from leadership roles in any domain (clearly evident in the failure to recognize the symbolic importance of rebuilding the Twin Towers), with the possible exception of computer technology. And this failure to lead is reflected in some areas of the sexual arena as well, as can be seen throughout this chapter. The much-touted “American Century” of the 1900s (mostly the second half), may have been our historical apogee, with the ebb and flow of dominant nations and empires about to shift. The United States has certainly lost its illusion of moral authority in the eyes of much of the world (if not in the eyes of its own people), as fundamental corruptions in the legal, political, and economic systems become more apparent—this despite the fact that much of how these American systems operate more closely approach the ideals that free peoples value than those of many other countries. Sexuality factors—including ostensibly “liberal” attitudes and behaviors, are not the predominant reason for this decline in American moral authority, although it is cited as such by some critics, both inside and outside our country—further justifying oppressive political and sexual agendas that have yet to be seen.]

[Terrorism and AIDS notwithstanding, we in the West, and Americans in particular, continue to live in a significantly less-risky era than our ancestors. As a result, women as well as men have enjoyed this relatively risk-free environment for decades, perhaps contributing to the increased devaluation of men because their traditional role as protector has been diminished. Yet, it appears that fanatical Islamic fundamentalists are intent on world domination, in a way similar to that for which fundamentalist Christians also strive. The early Arab Muslims seemed to be the Eastern equivalents of the Western colonialists of Europe. The contrast in methods of achieving it appears to be the difference between a series of conquests up to the Ottoman Empire, which fell after World War I, on the one hand, and the evangelical missionaries that have continued to thrive in many areas throughout the world. It remains to be seen to what extent the extensive out-migration of Islam to the West is, in effect, a silent evangelical push to reestablish the dominance of Islam, following the generally bloodless approach of the Christians, or is simply a search for religious freedom and the promise of a better life that is still America. In the meantime, *Cherchez le sexe* to determine the level of intensity with which terrorists will act to impose their visions on others. (End of update by R. J. Noonan)]

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

Social scientists have demonstrated an association between human behavior and such social factors as religion, race, gender, social class, and education. This is as true of sexuality as of other forms of behavior. Although sexuality researchers have not always incorporated a recognition of this principle in their designs and analyses, there is still abundant evidence that sexual practices in the U.S.A. are

strongly related to social factors. In this section, we examine several examples. First, we review the general influence of the Judeo-Christian heritage in the U.S.A. and describe the sexual culture of a particular religious group within this tradition, the Church of Jesus Christ of Latter-Day Saints (Mormons). Next, we see a brief discussion of reemerging spirituality-sexuality movements. Then we review the sexual customs of two of the largest minority groups in the U.S.A., African-Americans and Hispanic-Americans, followed by a look at Native American sexuality. Finally, we review the emergence of feminist ideology in the U.S.A., a view constructed around the concept of gender, which is contrasted with a look at emerging men’s perspectives on sex and gender and a review of the concept of heterophobia in American life. These reviews are by no means exhaustive or complete, but should serve to illustrate both the diversity of social groups within the U.S.A. and the influence that membership in such groups exerts on sexual customs and practices.

### A. Sources and Character of Religious Values

#### *General Character and Ramifications of American Religious Perspectives on Sexuality*

ROBERT T. FRANCOEUR and TIMOTHY PERPER

Sexual science in America is a mid- to late-20th-century discipline. By contrast, Western religious thought about love, sexuality, marriage, the social and familial roles of men and women, and the emotions and behavioral patterns associated with courtship, pair bonding, conception, and birth have textual bases in the Jewish *Pentateuch* and other biblical writings. In pre-Christian Hellenic thought, the first great document of sexology is Plato’s *Symposium* (ca. 400 B.C.E.). Because Judaic and Hellenic thought have strongly influenced the sexual views of Christianity and all of Western culture, one must acknowledge that the theological, religious, and secular writings that permeate American conceptions of sexuality are embedded in this 3,500-year-old matrix that gives sexuality its place in life (and unique meanings). This section will explore the sources and character of religious values in the U.S.A. and their impact on sexual attitudes, behaviors, and policies.

*Religious Groups in the U.S.A.* Statistically, Americans are 61% Protestant—21% Baptist, 12% Methodist, 8% Lutheran, 4% Presbyterian, 3% Episcopalian, and 13% other Protestant groups, including the Church of Latter-Day Saints (see the second major subsection below for a more in-depth discussion of the sexual doctrines and practices of this religious group), Seventh-Day Adventists, Jehovah’s Witnesses, Christian Scientists, and others. Roman and Eastern-rite Catholics account for 25% of Americans, Jews 2%, 5% other religious groups, and 7% are not affiliated with any church. Therefore, the two largest denominations in the U.S.A. are the Roman Catholic Church with a membership of over 50 million and Southern Baptist Conventions with between 10 and 15 million members (Greeley 1992). There are also 2.5 million Muslims in the U.S.A.

Because Americans tend to cluster geographically according to both their religious and ethnic heritages, local communities can be much more strongly affected by a small but highly concentrated religious or ethnic tradition than the above percentages might suggest at first sight. With recent public debate focusing on sexual morality (e.g., contraception, abortion, and homosexuality), a paradoxical realignment has occurred, with liberal Roman Catholics, mainstream Protestant churches, and liberal and reformed Jews lining up on one side of these issues, and conservative (Vatican) Roman Catholics, fundamentalist Protestants, in-

cluding the televangelists and Southern Baptists, Orthodox Jews, and fundamentalist Muslims on the other side.

*A Basic Conflict Between Two Worldviews.* American religious institutions on the national level, their local religious communities, and individual members are caught in a pervasive tension between the security of traditional unchanging values and the imperative need to adapt perennial religious and moral values to a radically new and rapidly changing environment. This tension permeates every religious group in the United States today, threatening schism and religious "civil war" (Francoeur 1994).

At one end of the spectrum are fundamentalist, evangelical, charismatic factions that accept as word-for-word truth the writings of the Bible as the word of God, and advocate the establishment of the United States as a Christian nation. For them, living under God's rule would be evidenced by the man firmly established as the head of each family in the U.S.A. and the woman in her God-given role as submissive wife and bearer of children for the Kingdom of Heaven. Similar fundamentalist strains in the United States are apparent among ultra-orthodox Jews and radical Muslims (LeHaye & LeHaye 1976; Marty & Appleby 1992, 1993, 1994; Penner & Penner 1981; Wheat & Wheat 1981). These embody an absolutist/natural law/fixed worldview.

On the conservative side, books about sexuality written by married couples dominate the market and sell millions of copies without ever being noticed by the mainstream publishing industry. *Intended for Pleasure* (Wheat & Wheat 1981) and *The Gift of Sex* (Penner & Penner 1981)—the latter couple having been trained by Masters and Johnson—provide detailed information on birth control and express deep appreciation of sex as a gift to be enjoyed in marriage. Tim and Beverly LeHaye's *The Act of Marriage* celebrates marital sexual pleasure, but disapproves of homosexuality and some sexual fantasy. All books in this category stress mutual pleasuring and the importance of female enjoyment of marital sex.

At the other end of the spectrum are various mainstream Protestants, Catholics, Jews, and Muslims who accept a processual/evolutionary worldview (Fox 1983, 1988; Curran & McCormick 1993; Heyward 1989; Kosnick et al. 1977; Nelson 1978, 1983, 1992; Nelson & Longfellow 1994; Ranke-Heinemann 1990; Spong 1988; Thayer 1987; Timmerman 1986) rather than the fixed fundamentalist worldview. In this processual worldview, the sacred divinely revealed texts are respected as

the record of the response to the word of God addressed to the Church throughout centuries of changing social, historical, and cultural traditions. The Faithful responded with the realities of their particular situation, guided by the direction of previous revelation, but not captive to it. (Thayer et al. 1987)

The most creative and substantive analysis of the evolution and variations in biblical sexual ethics over time is William Countryman's *Dirt, Greed, and Sex: Sexual Ethics in the New Testament and Their Implications for Today*. (For a full annotated list of sexuality texts, see Cornog & Perper 1995.)

The tension between the values and morals derived from fixed worldviews and those derived from processual worldviews is evident in official church debates about sexual morality and is also experienced by church members as they struggle to find their way through the confusion resulting from these two views. But it also affects the lives of secular Americans with no connection with a church, mosque, or synagogue, because the religious debate over sexual values permeates all levels of American society, and no one can es-

cape the impact of this debate and conflict on politics, legislation, and social policies. Table 1 is an attempt to describe in a nondefinitive way the two divergent sets of values derived from the processual and fixed worldviews. Table 2 lists some religious traditions in both the fixed and processual worldviews in the major religions around the world.

Modern America is a ferment of discourse and debate concerning relationships between sexuality and religion. This occurs on the local and personal level among church members, as well as on the administrative level among the church leadership. The vast majority of local church debates are not reported in the popular press. These debates center on the interpretations of revelation, religious truths, and the nature and place of sexuality within a particular absolutist/natural law/fixed worldview or processual/evolutionary worldview. From time to time, denominational leaders and assemblies issue authoritative statements in denominational position or workstudy papers. These formal statements are designed to answer questions of sexual morality and set church policy. However, contradictory majority and minority positions rooted in the opposing fixed and processual worldviews accomplish little beyond stirring heated debate and deferring the problem to further committee study (Francoeur 1987, 1994).

However, there is often a great difference between official church doctrine and its worldview and the views and practices of its members. For example, the most erotophilic religion in America may be grassroots Roman Catholicism as expressed and lived by the laity. Many rank-and-file American Catholics express great and amused doubt and scorn for the sexual pronouncements of the Vatican (Greeley 1995). Peter Gardella (1985) has made a strong case for the thesis that Christianity has, in fact, given America an ethic of sexual pleasure.

*The Conservative Christian Coalition.* Among the major forces in the American religious scene that affect public sexual mores is the conservative Christian Coalition. Among the fundamentalist Christians, one finds an extraordinary heterogeneity. There exists a large and virtually unstudied mixture of Pentecostal, fundamentalist, and evangelical/charismatic churches whose preachers expound on sexuality, marriage, family, and morality. Their opinions are diverse, and poorly known or understood by those outside their domain, especially sexologists. Two examples illustrate this: A religious pamphlet published by the Rose of Sharon Press in Tennessee, the buckle of the so-called Bible Belt in the U.S.A., extols the clitoris as the "cradle of love," and the Reverend Timothy LeHaye reminds his followers that God indeed created the delights of oral sex for married couples (only) to enjoy. No statistical data exist concerning these groups, and we know nothing about sexual behavior among individuals within these churches.

The current strength of the power of the American religious right is evident in the wide-reaching branches of Pat Robertson's political machine, the Christian Coalition, and the "electronic churches," including Robertson's cable television Christian Broadcasting Network (CBN), with annual revenues of \$140 million (Roberts & Cohen 1995). A parallel conservative culture is James Dobson's multimedia empire, Focus on the Family, which includes ten radio shows, 11 magazines (including speciality publications for doctors, teachers, and single parents), bestselling books, filmstrips, and videos of all kinds, curriculum guides, church-bulletin fillers, and sermon outlines faxed to thousands of pastors every week. The popularity of Dobson's first book, *Dare to Discipline*—with more than 2 million copies sold in 1977—inspired his formation of Focus on the Family,

**Table 1****A Cognitive and Normative Continuum of Sexual Values Derived from Two Distinct Worldviews, Fixed and Process, Within the Christian Tradition**

	<b>Christian Religions Type A</b>	<b>Christian Religions Type B</b>
Basic vision	<i>Cosmos</i> —a finished universe	<i>Cosmogensis</i> —an evolving universe
Typology	The universe, humankind is created perfect and complete in the beginning. Theological understanding of humans emphasizes Adam.	The universe, humankind is incomplete and not yet fully formed. Theological emphasis has shifted to Christ (The Adam) at the end of time.
Origin of evil	Evil results from primeval ‘fall’ of a perfect couple who introduce moral and physical evil into a paradisaical world.	Evil is a natural part of a finite creation, growth, and the birth pains involved in our groping as imperfect humans struggling for the fullness of creation.
Solution to the problem of evil	Redemption by identification with the crucified Savior. Asceticism, mortification.	Identification with the Adam, the resurrected but still fully human transfigured Christ. Re-creation, growth.
Authority system	Patriarchal and sexist. Male-dominated and ruled. Autocratic hierarchy controls power and all decisions; clergy vs. laity.	Egalitarian—‘In his kingdom there is neither male nor female, freeman or slave, Jew or Roman.’
Concept of truth	Emphasis on one true Church as sole possessor of all truth.	Recognition that other churches and religions possess different perspectives of truth, with some elements of revelation clearer in them than in the “one true Church.”
Biblical orientation	Fundamentalist, evangelical, word-for-word, black-and-white clarity. Revelation has ended.	Emphasizes continuing revelation and reincarnation of perennial truths and values as humans participate in the creation process.
Liturgical focus	Redemption and Good Friday, Purgatory, Supernatural.	Easter and the creation challenge of incarnation. Epiphany of numinous cosmos.
Social structure	Gender roles clearly assigned with high definition of proper roles for men and women.	There being neither male nor female in Christ, gender roles are flexible, including women priests and ministers.
Goal	Supernatural transcendence of nature.	Unveiling, Revelation of divine in all.
Ecological morality	Humans are stewards of the earth, given dominion by God over all creation.	Emphasis on personal responsibility in a continuing creation/incarnation.
Self-image	Carefully limited; isolationist, exclusive, Isaias’s ‘remnant.’ Sects.	Inclusive, ecumenical, catalytic leader among equals.
Human morality	Emphasis on laws and conformity of actions to these laws.	Emphasis on persons and their interrelationships. We create the human of the future and the future of humanity.
Sexual morality	The ‘monster in the groins’ that must be restrained. Justified in marriage for procreation. Genital reductionism. Heterosexual/monogamous. Noncoital sex is unnatural, disordered. Contraceptive love is unnatural and disordered.	A positive, natural, creative energy in our being as sexual (embodied) persons “Knowing” ( <i>yadah</i> ), Communion. An essential element in our personality in all relationships. Diffused, degeneralized sensual embodiment. “Polymorphic perversity,” “paneroticism.” Noncoital sex can express the incarnation of Christian love. Contraception can be just as creative and life-serving as reproductive love.
Energy conception	Competitive. Consumerist. Technology-driven and obsessed.	Pluralistic—sexual persons must learn to incarnate <i>chesed/agape</i> with <i>eros</i> in all their relationships, primary and secondary, genital and nongenital, intimate, and passionate. Synergistic. Conservationist. Concerned with appropriate technologies.

**Table 2**  
**A Spectrum of Ethical Systems with Typical Adherents in**  
**Different Religious Traditions**

This table is an attempt to visualize the range of sexual moralities in different religious traditions and relate them in terms of their basic worldviews. There is often more agreement between different Jews, Protestants, and Catholics at one or the other end of the spectrum, than there is between Protestants, or Catholics, or Jews who disagree in their worldviews. Protestants in the covenant tradition, for instance, have more in common with liberal Catholics who disagree with the Vatican's opposition to such practices as contraception, masturbation, premarital sex, abortion, divorce, and homosexuality, than they do with their fellow Protestants who are members of the fundamentalist Christian Coalition, Eagle Forum, or Focus on the Family.

Tradition Source	A Spectrum or Continuum	
	← Fixed Philosophy of Nature	Process Philosophy of Nature →
Roman Catholic tradition	Act-oriented natural law/divine law order ethics expressed in formal Vatican pronouncements	A person-oriented, evolving ethics expressed by many contemporary theologians and the 1977 Catholic Theological Society of America study of human sexuality.
Protestant nominalism	Fundamentalism based on a literal interpretation of the Bible, as endorsed by the Moral Majority and the religious New Right: Seventh-Day Adventists, Jehovah's Witnesses, and Church of Latter-Day Saints	An ethic based on the covenant announced between Jesus and humans—examples in the 1970 United Presbyterian workstudy document on Sexuality and the Human Community, Unitarian/Universalists, and the Society of Friends (Quakers)
Humanism	Stoicism and epicurean asceticism	Situation ethics, e.g., the 1976 American Humanist Association's "A New Bill of Sexual Rights and Responsibilities"
Judaism	Orthodox and Hasidic concern for strict observation of the Torah and Talmudic prescriptions	Liberal and reformed application of moral principles to today's situations
Islam	Orthodox; observance of female seclusion ( <i>purdah</i> ) and wearing of the veil ( <i>chador</i> ); ritual purifications associated with sexual activities	Secular; more or less adoption of Western gender equality; flexible/lax observance of sex-associated purification rituals
<p>While Eastern religions may, in some cases, fit in with this dualism of worldviews, the ascetic traditions of the East are positive traditions and lack the negativism towards sexuality that permeates the history of Christian asceticism and celibacy. Eastern asceticism is seen as a positive balance to the Eastern's embrace of sexuality as both a natural pleasure to be greatly enjoyed and a path to the divine union. Also, the relationship with the dichotomous <i>weltanschauungs</i> evident in Western traditions needs to be explored and explicated.</p>		
Hinduism	Ascetic tradition of monks with world-denying sexual abstinence; yoga; ritual taboos and purification rites associated with sexual activities	Sacramental view of sex with worship of male <i>lingam</i> and female <i>yonis</i> ; the <i>Kama Sutra</i>
Buddhism	Ascetic tradition of monks with sexual abstinence	Tantric traditions in which sexual relations are a path to divine union

which now has an annual budget of \$100 million and a staff of 1,300 workers who answer more than 250,000 telephone calls and letters a month (Roberts & Cohen 1995).

In the late 1980s, Protestant fundamentalist televangelists from the South were reaching millions of listeners. Their influence was weakened by several major sex scandals, but they continue to play a major role in the anti-abortion movement and are part of the Christian Coalition. In the same era, the National Conference of Catholic Bishops tried to establish a cable television network to bring the Catholic faith to the masses. Where they failed, a determined Catholic fundamentalist-charismatic, Mother Angelica, from Mobile, Alabama, succeeded with the Eternal Word Network, which brings ultraconservative interpretations of Catholic sexual and social morality to devoted listeners 24 hours a day.

In the southern states, on the east and west coasts, and in the populous midwest states are several hundred "mega-churches," which draw upwards of 5,000 to 20,000 faithful

every week to each church. Congregations seated in upholstered theater seats are inspired by the style of a professional theater with a large choir, orchestra, large screens displaying hymn verses for congregational singing, interpretive dance, Bible lessons with soft-rock concerts, and morality plays that rival anything on music television (MTV). These megachurches are usually huge glass and steel shopping-mall-like complexes with large theater-stage sanctuaries, scores of meeting and classrooms for a variety of activities, including aerobics, multimedia Bible classes, counseling centers, and even bowling alleys, accompanied by acres of parking space. Sermons delivered by skilled "teaching pastors" include such topics as: how to find joy in a violent world, create a "happy day" each week, find rhythm between work and rest, handle teenage children, and discipline one's mind to a biblical perspective. Youth, in particular, are attracted to the instant intimacy of this large-group, Disney-World environment. Weekly contributions from 15,000 members at one mega-church averaged \$228,000, giving the church an

annual budget of almost \$12 million (Roberts & Cohen 1995). With the mainstream small local churches suffering a steady decline in attendance and contributions, many of the more-traditional pastors are turning to the mega-churches for pastoral retraining. Thus, the mega-churches are establishing smaller, local congregations. It appears that the way these churches deal with sexual issues may have a major impact on American sexuality because of the large memberships they are attracting.

*Emergence of a Sex-Positive Individual-Based Value System.* Diotima of Mantinea, Socrates' instructress in the art of love in the *Symposium*, explained that the god Eros provides an avenue or way by which human beings reach upward to the Divine—a view modern classical scholars chauvinistically attribute to Socrates and call the "Erotic Ascent." Historically, Diotima's argument became the basis of the later Christian idea that God is Love. In Eurocentric Christianity, the first great flowering of Eros came between 1050 C.E. and 1200 C.E., when Ovid's *The Art of Love* reached Europe from Arab-Spanish sources. The synthesis of sexuality and spirituality quickly assumed major status as a popular doctrine expressed in the music of the troubadours of "courtly love."

Its most ardent opponents were the faculty of the medieval universities led by Thomas Aquinas, who developed a full and coherent alternative to the theology of the Platonic Erotic Ascent in the 13th century. The Thomistic synthesis, with its denunciation of the Erotic Ascent and analysis of the essence and goals of human sexuality in terms of a "natural law," became the official Catholic view. This synthesis is the basis on which the modern magisterium and hierarchy of the Roman Catholic Church grounds its absolute condemnation of contraception, abortion, and the practice of homosexuality. By contrast, Protestantism has been much more accepting of sexuality and sexual pleasure, and more flexible with and accommodating to such issues as divorce, contraception, abortion, masturbation, premarital sex, and even homosexuality.

However, it was not the theory of Thomistic Aristotelianism that ultimately superseded late-medieval and Renaissance beliefs in Eros. These dwindled as Europe staggered under waves of the Black Death, which ultimately killed one quarter of Europe's population; the Crusades, during which 22,000 people were killed in the Provençal city of Bezier alone; endless local wars among nobles, kings, and petty brigands where the peasants were invariably victimized; Turkish invasions; the epidemic of syphilis in 1493; peasant uprisings in Germany and England in the 1300s and 1400s; and the Inquisition, that specifically targeted women as its victims.

Protestant reformers, from Luther through Calvin, Knox, and Zwingli, not only rejected the "natural law" approach to sexual morality, but extended, strengthened, and normalized the nuclear family and the blessing of marital sex. This type of marriage was a valuable social institution for assuring the distribution of new wealth from father to son. For example, in northern European merchant families, it replaced the older, southern European models of inheritance by name, and social status by membership in a "house" (e.g., the "house of the Medici"), with this type of lineage system.

An important characteristic of the Renaissance was appreciation and acceptance of individual control of one's own life. Thus, the late 1500s and early 1600s saw a new struggle of the young to wrest control over their love affairs and marriages from their parents and families. Shakespeare's *Romeo and Juliet* epitomizes what was to become the central issue of the modern-American religious debate

about sexuality and spirituality. Who is to control the sexuality of the young? Older and more powerful individuals, who have vested interests in the outcome of youthful sexuality; celibate church leaders still convinced of the unchangeable patriarchal sexual values expressed in the Genesis story of creation; or young people, who claim for themselves the right to find the right mates and express their erotic passion in a way that, for them, brings sexuality and transcendence together?

Of growing significance in the 1990s in the U.S.A. is the question of the sacred nature of Eros. Among the liberal religious bestsellers pioneering a new synthesis of sexuality and spirituality are: *Human Sexuality: New Directions in American Catholic Thought* (Kosnick et al. 1977), which was sponsored by the Catholic Theological Society of America, but was condemned by the Vatican; *Original Blessing* (1983) and *The Coming of the Cosmic Christ* (1988) by the Dominican, Matthew Fox (censured and expelled from his community by the Vatican); sociologist and erotic-novel author, Father Andrew Greeley's *Sex: The Catholic Experience* (1995); lesbian theologian, Carter Heyward's 1989 *Touching Our Strength: The Erotic as Power and the Love of God*; Presbyterian seminary professor, James Nelson's books *Embodiment* (1978), *Between Two Gardens: Reflections on Sexuality and Religious Experience* (1983), and *Body Theology* (1992); James Nelson and Sandra Longfellow's anthology on *Sexuality and the Sacred* (1994); William Phipps' *Recovering Biblical Sensuousness* (1975); Catholic-feminist theologian, Joan Timmerman's *The Mardi Gras Syndrome: Rethinking Christian Sexuality* (1986); and Episcopalian Bishop John Shelly Spong's 1988 *Living in Sin? A Bishop Rethinks Human Sexuality*. In addition, some Christians have turned to Eastern religions, particularly in the Tantric and Taoist traditions, to seek the nexus between sexuality and spirituality (Francoeur 1992).

*Current and Future Religious Debate.* During the 1980s, the most virulently debated issue was abortion. In 1994, between U.S. Supreme Court decisions and violence and murder by extreme anti-abortionists, support for anti-abortion stands stalled. For the majority of Americans, abortion appeared to fade as the central moral dilemma and joined the list of unresolved moral issues that includes war, drugs, crime, capital punishment, discrimination, and related social ills. Certain far-right religious leaders, who still have a devoted and vocal following and claim to speak for Christ, even conceded reluctantly that they could not win their war against abortion, and seemed to refocus their crusade on homosexuality and "the danger of homosexual rights" as their mobilizing issue.

However, with the mid-1995 success of the Republicans' conservative hundred-day Contract with America, the Christian Coalition announced its own Contract with the American Family. Two-dozen legislative proposals were introduced into Congress, including an unprecedented attempt to ban and criminalize some now-legal abortions. A bill to reinstate a ban on abortions at American military hospitals overseas was passed. Other proposed bills would ban family planning programs from including abortion counseling for low-income women and adolescents; refuse funding to institutions that favor requiring obstetric/gynecology programs to provide training in abortion procedures; overturn an executive order lifting a ban against using foreign-aid money for abortion counseling or referrals; end or restrict support for agencies, including the United Nations, that offer family planning programs with abortions funded by private money; limit federal Medicaid money for abortions to situations where the woman's life is threatened and

ban it in cases of incest or rape; ban fetal-tissue research; ban clinical testing of RU-486; restore a ban on counseling women about abortion at clinics that receive any federal money; and prohibit the federal employee's health benefit plan from covering abortion. The ultimate goal is to make all abortions under all circumstances a crime.

The list of controversial sexual issues that are religiously debated with little hope of being resolved in the near future includes:

1. Individual sexual choice: Who should be in control of one's sexuality? Should it be church leaders or people themselves, who claim the right to express their sexuality with those of their own choosing in ways that would bring them mutual pleasure, eroticism, and spirituality?
2. Contraception: Should minors have access to contraception? Should condoms be distributed in the schools? Does education about contraception and sexual behaviors outside of marriage promote "promiscuity"? Should people be free to choose the best method of contraception for themselves without religious restriction?
3. Abortion: Should women have control of their own reproductive faculty? Is the embryo/fetus a person with inalienable rights at the moment of conception or does fetal personhood develop over the nine months of gestation? When do fetal rights transcend those of pregnant women, if at all?
4. Nonmarital sexuality: Can sex outside marriage be morally acceptable? If so, under what circumstances? How can it be reconciled with traditional Judeo-Christian morality that limits sexual expression to the marital union?
5. Sexual orientation: Are homosexuality and bisexuality natural and normal states of being? Should sexually active gays, lesbians, and bisexuals be welcomed into church membership? Should they be ordained into the ministry? Should variation in orientation be presented in sex-education curricula as normal, moral, and socially acceptable?
6. Masturbation: Is self-loving and autoeroticism a natural, normal, and morally acceptable expression of human sexuality? (See the first item in Section B of American Demographics at the beginning of this chapter for an illustration of the impact this issue has had on American politics.)

The American religious, and consequent social and political debates over each of these issues are not likely to be resolved in the near future. The dichotomy of the two worldviews is too deeply embedded in the American culture to allow for a quick resolution. The more likely prognosis is for continued, tension-filled confrontations within the churches, denominations, and political/legislative arenas throughout the United States.

The Religious Right's social and political agenda deeply divides American society. Although 40% of Americans express concern about the Democrats' ties to radical liberal groups, 39% are worried by Republican ties to conservative special-interest groups like the Religious Right, the Family Research Council, Focus on the Family, Eagle Forum, and the Christian Coalition (Roberts & Cohen 1995). These results reflect the continuing diversity of worldviews within the Judeo-Christian tradition. They also indicate that these religious differences not only result in contrasting sexual ideologies, but also have an important impact on political processes in the U.S.A. more broadly. As such, religion continues to be a major American social influence.

### Church of Jesus Christ of Latter-Day Saints

JEANNIE FORREST

*Mormon Origins and Polygyny.* One example of a particular religious group within the general Judeo-Christian heritage is provided by the Church of Jesus Christ of Latter-Day Saints (LDS), which is the fastest-growing religion in the world today. The over seven million members are known colloquially as the Mormons. They base their belief system on the Bible and additional scriptures, most significantly the *Book of Mormon*, which is understood to be a record of God's dealings with an ancient population of the American continent. The Mormons believe this book came from gold plates revealed to the church founder, Joseph Smith, in Ontario County, New York, in 1823. The church was officially organized in 1829.

The early Mormons were persecuted because their founder claimed the Bible had not been translated properly, that all other religions were false, that religious leaders did not have God's authority—the priesthood—to act in God's name, and finally that the practice of polygyny was a part of the divine plan. There was also the political reality that the tightknit Mormon communities exercised considerable local power. Interestingly, the term "polygamy" as used in LDS church history and old doctrine means the "condition or practice of having more than one spouse." A more-accurate definition of the Mormon practice of that century lies in the word "polygyny," meaning having more than one wife at one time. The role of polygyny in the church is a source of some embarrassment to mainstream modern-day Mormons, who may discuss the practice somewhat wryly as a revelation designed to build the church population at a time when they literally had to forge new communities under hardship. After several attempts to settle in an area and build a sectarian community, the Mormon pioneers ultimately settled in the Salt Lake City area of Utah, where the church is now headquartered.

Modern Mormon doctrine does not include the practice of polygyny. Church prophet and leader, Wilfred Woodruff, officially eliminated polygyny from doctrine in the *Manifesto of 1890* (Ludlow 1992). This proclamation against plural marriage ended a decade of hardship and persecution against the church members, particularly by the Republican Party that had as part of its platform elimination of the "immoral practice of multiple wives." While mainstream Mormons are not held accountable for not practicing plural marriage, they still must "suffer the curse of monogamy." Today, small fundamentalist splinter groups still practice polygyny, despite state laws against it and lack of official church acknowledgment. Even before the church abandoned its practice of plural marriage, only a small fraction of Mormon men, between 3 and 15%, had more than one wife (Murstein 1974, 350-364).

Perhaps the persecution faced by the early members of the LDS regarding their marital patterns has contributed to a unique and paradoxical tension around sexuality. On one hand, there is nothing more sacred than sex within the bounds of church-sanctioned marriage. On the other hand, rarely is there found a modern-American subculture more prohibitive and repressive about sexuality.

*Salvation and Sex.* To further understand this tension, one needs a basic understanding of the Mormon Plan of Salvation. Before birth, the Mormons believe, the soul is alive as an intelligence in a spirit world. During this preexistence, a variety of situations are possible, including acts of valor that would allow the soul to be born into a family of Mormons where opportunities for service abound. At birth, the soul passes through a veil of forgetfulness where all mem-

ory of the preexistence is lost (Church of Jesus Christ of Latter-Day Saints 1989; Moses 3:5, 7; Abraham 3:21-23, 35, 38; Talmage 1977).

During life on this earth, individuals face choices throughout the course of their lives that determine in which of three kingdoms they will spend eternity. The highest kingdom, the Celestial Kingdom, is reserved for those Latter-Day Saints who meet all the requirements of doctrine, one of the most important of which is marriage to another Saint in special temple rites. The exaltation and eternal life in the highest degree of the Celestial Kingdom are achieved only by faithful Mormons through the achievement and building of an eternal marriage, discussed later. (Other good people can only hope to reach the Terrestrial Kingdom, a kind of heaven on earth, while unrepented adulterers, practicing homosexuals, murderers, and other sinners are limited to the Telestial Kingdom, which some describe as a Mormon version of the Christian hell.)

[*Comment 1997*: According to Mormon tradition, “hell” is not a place, but rather a state of mind. Those who do not achieve the highest degree of glory (the Celestial Kingdom) will recognize the reward they might have had and live out their eternities with the knowledge of this lost potential. However, the Telestial Kingdom, though typically described in less-than-positive terms, is not generally thought of as the fire and brimstone of the traditional Christian hell. In fact, one prominent Mormon Church leader described the Telestial Kingdom as follows: “. . . all who receive any one of these orders of glory are at last saved, and upon them Satan will finally have no claim. Even the telestial glory ‘surpasses all understanding; And no man knows it except him to whom God has revealed it’” (Talmage 1977, 92-93). (*End of comment by M. O. Bigler*)]

In Mormon belief, one’s marital status is decisive for the life hereafter. Without marriage, one can only become a servant angel ministering to those who are far more worthy of glory, the truly married. But most of those who have married on earth are married for *time only* (until death), and not truly married unless they have their marriage sealed in the temple. In heaven, those who are married only for this life will be single, no better than bachelors and spinsters. (In the Mormon view of heaven, one can enjoy all the pleasures of sex, food, and other sensual delights.) Those who are married by a prophet in the temple are sealed to each other and married for *time and eternity*. Couples in a sealed marriage will remain married for eternity, and enjoy reigning in separate kingdoms. It is also possible to marry for eternity and not for time. Thus a kindly man may marry a spinster for eternity but not for time, leaving her to her celibate lifestyle here, but destined for all the delights of the Celestial Kingdom as his mate in eternity (Murstein 1974, 350-362).

*Gender Roles.* As with all societies, gender roles among Mormons are scripted very early in life. The LDS church plays a distinct role in gender definition and scripting. Church activities segregate children at around the age of 12: boys are guided into vigorous endeavors, such as scouting and outdoor gamesmanship, whereas girls learn household activities and crafts.

[*Comment 1997*: To clarify Forrest’s comment above, it is important to note that Mormon adolescents frequently participate in mixed-gender activities. Although young men and young women generally meet separately as a part of the official church youth program (known variously as Mutual Improvement Association (M.I.A.), Mutual, and Young Men’s/Young Women’s Program), males and females come together for Sunday School and the Mormon worship service known as Sacrament Meeting. In addition, LDS seminar-

ies—religious study programs for high-school-age teens (grades 9 through 12) that operate in virtually every location around the world where congregations of Mormons are found—are always conducted with male and female students meeting together. Furthermore, Mormon youth regularly attend church-sponsored dances and participate together in community activities, including school proms, holiday celebrations, and cultural events. Young Mormon women and men are encouraged to interact, though care is usually taken to provide chaperons or to direct young people into activities where the possibility of sexual contact is limited (e.g., Mormon youths are strongly encouraged by their church leaders and parents to date in groups and to establish curfews that will not keep them out past midnight). (*End of comment by M. O. Bigler*)]

It is not unusual for a preadolescent girl to have an LDS-designed poster on her bedroom wall urging her to remain “temple worthy,” or reminding her of gospel precepts that will keep her safe from worldly situations. For example, one poster is of a young girl looking into a mirror in whose reflection is a vision of herself as a young woman in a bridal scene with a handsome man. The caption says, “looking forward to a temple marriage.” Young men are also urged to bridle their carnal urges. Masturbation is expressly forbidden, and moral cleanliness, a requirement for any temple ceremony, essentially equates to abstaining from sexual activity before marriage.

[*Comment 1997*: In Mormon practice, “moral cleanliness” at its most basic level is understood as abstaining from sexual activity before marriage and remaining faithful to one’s spouse. It is not at all equated with celibacy, as the author has implied. A pamphlet for youth, recently published by the church, makes this position clear: “Our Heavenly Father has counseled that sexual intimacy should be reserved for his children within the bonds of marriage. . . . Because sexual intimacy is so sacred, the Lord requires self-control and purity before marriage as well as full fidelity after marriage” (Church of Jesus Christ of Latter-Day Saints 1990, 14-15). (*End of comment by M. O. Bigler*)]

Gender roles become even more firmly established during transitions into adulthood. Church officials clearly define the position, duties, and destiny of women in the divine plan. Women are to be “copartners with God in bringing his spirit children into the world” (Tanner 1973); this is generally understood metaphorically without any sexual connotation. Rather than focus on the erotic element of this distinction (having babies does require first having sexual intercourse), the LDS leaders instead urge women to stay home in order to love and care for children to ensure a generation of Mormons who learn about their “duty as citizens and what they must do to return to their Heavenly Father.” Women are regarded as sacred vessels, with important roles not only in childbearing, but also as positive influences on men’s lives. A “general authority” in the church, Hugh B. Brown, suggests that “women are more willing to make sacrifices than are men, more patient in suffering, and more earnest in prayer” (Relief Society 1965). Women in the Mormon community are indeed known for their good works. The Relief Society is the oldest women’s group in the United States and is remarkably active with community support of all kinds.

[*Comment 1997*: Most Mormons, female and male alike, continue to hold traditional views concerning gender and gender roles. In general, Mormon women today still view motherhood and caregiving as fundamental traits of a “righteous” woman. However, it is also fair to say that the beliefs of church officials and the broader membership regarding gender roles have liberalized somewhat since President Hugh B. Brown’s statement in 1965. For example, in a recent

general conference of the church, Chieko N. Okazaki, First Counselor in the Relief Society General Presidency, urged LDS women to obtain an education and career training:

Each year it becomes increasingly important for women to improve their abilities to take care of themselves and their children economically, if circumstances should require. . . . If anything, [the counsel of Elder Howard W. Hunter] has become even more relevant in the almost twenty years that have passed as the national economy has made it increasingly difficult for one wage to support a family, as more mothers are left alone to raise their children, and as more women spend lengthy portions of their lives single. He is telling all of us to use the oar of study to prepare ourselves professionally for worthy and rewarding activities, including paid employment. (Okazaki 1994) (*End of comment by M. O. Bigler*)]

LDS men have a clearly defined role as well. Men bear the responsibility and the privilege of the Priesthood, which is a spiritual calling and connection to God specifically not given to women. An exception to this is found in LDS mission work, where young women on evangelical missions for the church have a type of “priesthood calling” on a temporary basis, lasting only for the duration of the mission.

[*Comment 1997*: Throughout the church’s history, Mormon women have served missions for the church. Today, young women (typically in their early 20s) are embarking on proselytizing and church service missions in ever-increasing numbers. Although Mormon men are encouraged much more strongly than are women to go on missions, teaching and preaching are not restricted to priesthood holders (males) in the church today. In fact, the priesthood is not a prerequisite for participation in most church positions, all of which are filled by lay members. Nevertheless, church leadership at its highest levels, both locally and generally, remains a function of the priesthood (male members). (*End of comment by M. O. Bigler*)]

Through the priesthood, God governs all things. Priesthood power is considered a vital source of eternal strength and energy, a responsibility delegated to men for the well-being of mankind. Holding the priesthood means having authority to act as God’s authorized agent, which includes some church organizational duties. The right of worthy priesthood holders is to preside over their descendants through all ages, achieving its highest function in the family. As the presiding priesthood holder in the home, decisions relating to discipline often fall to the man, and the role of providing for the household is ultimately his, in spite of the presence of more employed Mormon women. Giving righteous advice, loving family members, and the laying-on-of-hands for healing purposes are all rights of the man of the house.

[*Comment 1997*: In the ideal Mormon household, discipline, family decisions, and the day-to-day management of the home are seen as a shared responsibility between a unified husband and wife. Although Mormon fathers have been designated the presiding authority in the family (once again a function of the priesthood), it is the mother who is typically responsible for managing the home and children. However, male church members are counseled against the misuse of their designation as leader in the home, and men have been encouraged by the prophet and president of the church himself to share in parenting and home management:

A man who holds the priesthood accepts his wife as a partner in the leadership of the home and family with full knowledge of and full participation in all decisions relating thereto. . . . You share, as a loving partner, the care of the children. Help her to manage and keep up your home.

Help teach, train, and discipline your children. (Hunter 1994, 5-7) (*End of comment by M. O. Bigler*)]

*Body Theology.* The Mormon doctrine about the body is worth noting since it creates another element of sexual tension. In many Christian religions, the body is considered simply a vessel housing the spirit/soul for the duration of life. For the Mormons, the body itself is highly revered and serves an eternal function. At the point of resurrection, the body of an individual is returned to “perfection,” ridding it of all the faults and defects of this life. A Mormon friend of mine often queries, “Just whose version of perfection will I get in Eternity? I have a list of modifications right here.”

One indication of the importance of the body is manifested by the wearing of “garments.” During the Temple marriage, a couple is given special “garments” to wear. This special underwear (manufactured by the Mormon church) is designed to serve as a reminder of the sanctity of the covenants made in the temple and to protect the body from harm. A quiet Mormon joke about the garments refers to them as “Mormon contraceptives,” since they must be worn next to the skin at all times and are notoriously unsexy in appearance. Women wear their foundation garments, such as brasieres and slips, over the Mormon garments. Because of the design of the garments, only modest clothing can be worn. However, the modern garments are much more relaxed and functional than traditional ones. The old versions are still available, with the tops extending just below the elbows and the bottoms below the knee, but most younger Mormon women opt for the cap sleeve and midhigh cotton versions for comfort and more choice in clothing.

[*Comment 1997*: Mormon garments (which are worn by both women and men) serve as a constant reminder of sacred covenants made in temple ceremonies. Mormons also believe that these undergarments help protect the wearer against physical and spiritual harm. In addition, the design of the underclothing encourages the wearing of modest clothing. Although temple garments are to be worn day and night under normal circumstances, church members are not required by either doctrine or dictum to keep their underclothing on during activities such as bathing or while participating in sporting events. Nor are faithful Mormons required to wear their garments during sexual activity. (*End of comment by M. O. Bigler*)]

*Adolescent Dating.* Adolescent dating rituals are very similar to those of other conservative American cultural groups. As LDS children grow older, the church plays more of a role in their lives, interweaving doctrinal and social activities. The transitions through church steps for adolescents are made in tandem with all their church peers. For instance, at 8 years old, children reach the “age of understanding” and are baptized into the church. Many of their peers are also taking this step, which takes on social significance in the form of family gatherings and informal parties. Later, dating is encouraged in group settings around church activities, since this context is most likely to encourage an interfaith marriage. Teens are often told, “if you don’t date outside, you won’t fall in love outside, and you won’t marry outside the faith.”

[*Comment 1997*: Dating among Mormon teens is not restricted solely to church activities, although local congregations do often sponsor teen-oriented events, such as dances, firesides (discussions of religious topics especially relevant to teens), and cultural activities (plays, concerts, art exhibits, etc.). While dating outside of the church is not strictly forbidden, it is, as the author states, discouraged by church leaders and parents in an effort to reduce the chances that a member will marry outside of the church. Families of particularly staunch members are likely to view the marriage of a

child to someone from outside of the church as a lamentable and perhaps even shameful event. Although Mormons who are married to nonmembers are not excluded from church activity or normal religious practice, one's relationship to the church is undoubtedly affected by the "part-member" status of the family. (*End of comment by M. O. Bigler*)

At Brigham Young University, a Mormon-owned and operated institution in Provo, Utah, approximately 45 miles (72 km) south of Salt Lake City, a subculture of dating reigns. Known to be an ideal place for Mormon youth to find a same-faith marriage partner, it is also a hotbed of sexual exploration. Mormon coeds fine-tune their "NCMOS," (pronounced "nick-moes"), which is an acronym for "noncommittal make-out sessions." These sexual forays include "everything but intercourse": extensive kissing, petting, and "dry humping" (rubbing bodies) is common, but touching of the genitals is typically off-bounds, as is penetration of any kind.

[*Comment 1997*: Brigham Young University, the oldest private university west of the Mississippi River, boasts a student body of more than 30,000, comprised almost entirely of young Mormons who come from every state in the country and many nations outside of the United States. The amount and types of sexual activities that the author reports occur among BYU students are not all that atypical of young college students in general. However, given the strict code of sexual conduct that Mormons have for themselves, even nongenital sex play and sexual activity short of intercourse give BYU the appearance of a "hotbed of sexual exploration." At the same time, such activity also suggests that young Mormons have healthy sexual appetites, and perhaps are not as peculiar as it may first appear when compared to their peers on other American campuses. (*End of comment by M. O. Bigler*)]

*Marriage, Sex, and the Celestial Kingdom.* In order to access the Celestial Kingdom, a couple must marry in the temple. These temple rites seal the two partners together not just for life, but for all eternity. When a couple is in the Celestial Kingdom together, they can enjoy the full experience of their resurrected and eternally perfect bodies. The purpose of the sealed marriage is primarily to ensure the eternal connection between partners, allowing them to procreate and populate their own worlds (eternal procreation). An essential precept, "As man is, so God once was; as God is, so man can become," guides heterosexual couples through life with the promise that they, as the God they worship has done, will become creators of their own world (Murstein 1974).

Although not formally prohibited, birth control is regarded with clear reservation by church members, since large families are viewed favorably. Women who leave the Mormon church often refer, "with tongue in cheek," to their loss of opportunity to bear children during the afterlife. One woman commented, "At least I know I won't be barefoot and pregnant through time and eternity."

[*Comment 1997*: While birth control is regarded with reservation by many church members and authorities, various forms of contraception are commonly practiced, even by active, faithful members. Today, the decision to use birth control is left to the discretion of the couple. (*End of comment by M. O. Bigler*)]

The gender roles established early in the life of the couple are metaphorically established again during the marriage ceremony. The order of the Plan of Salvation is clearly outlined during the ceremony, as is the order of the household that symbolically supports the Divine Order when it is in accord with the Plan of Salvation. An interesting element of the temple marriage is the giving of a name to the bride, known only to her husband. This name is for the use of the

husband in calling his wife to him in the afterlife. She does not have access to his secret name—the calling of partners in eternity is purely a masculine prerogative. The giving of the name to the bride is kept secret from outsiders, as is much of the rest of the ceremony, which is closed to all those without special church endowments. Mormon church weddings are different from typical American weddings in that only worthy LDS family members and friends are allowed into the temple to observe the ceremony itself. If a family member is an inactive church member or a nonmember, they will be excluded from the wedding ceremony, joining the party outside the temple or at the reception.

In the face of the lack of sexuality education, the first act of sexual intercourse for a good Mormon is likely to be ill-informed. One contemporary of mine recalls her first sexual experience, which took place after an LDS temple marriage: "We were both virgins, and it literally took us several weeks to consummate the marriage by having intercourse. We had been raised to believe sex was a sacred thing, so we just sat in bed, prayerfully, kissing gently and waiting for something to happen. Obviously, something finally did, but I was dreadfully disappointed. It not only didn't feel sacred, it didn't even feel good." This particular couple did not seek therapy for support or education, relying instead on the Holy Spirit, a decision common among LDS couples.

Because the church operates with a lay ministry, the local bishop has an enormous influence on how issues of sexuality are handled. In most instances in which married couples face difficulty with sexual relations or general marital dissatisfaction, the bishop is the first and most likely source of comfort and counsel. Often the bishop is just a kindly intentioned neighbor with limited or no training. Many times, his response is based on his own experience, attitudes, aversions, and parental training. Some extremely compassionate bishops give forgiving responses to an individual who has erred sexually. Some bishops advise specifically against such behaviors as oral or anal sex. Others, repulsed by the vulgarity of even discussing the topic of sexuality, take refuge in esoteric spiritual or academic language or avoid the topic altogether. Still others may be open-minded and suggest that either the lay ministry has an extremely limited role in the bedroom of other folks or advise liberal measures, such as doing whatever works best for the couple involved. If marriage counseling is clearly needed, a referral may be made by the bishop to the LDS Social Services or to an LDS therapist, who can give professional advice with an empathy for the doctrinal requirements. In sharp contrast, other bishops respond with an injunction to leave the fellowship if someone has premarital intercourse, commits adultery, or engages in homosexual relations, all of which are forbidden by church doctrine.

[*Comment 1997*: Problems that result from limited sexuality education coupled with well intentioned but poorly trained lay clergy are compounded for Mormons by a dearth of LDS therapists and other mental-health professionals who have specific training and experience in the area of sexuality. (*End of comment by M. O. Bigler*)]

Divorce is discouraged, but not uncommon. The divorce rate in the state of Utah, in spite of a predominantly LDS population, matches those of many states. Even marriages sealed in the temple are now relatively easy to unseal. Remarriage from a doctrinal standpoint is difficult to comprehend in light of the eternal marriage concept, but temple divorces will officially separate the couple for the purposes of the Celestial Kingdom.

[*Comment 1997*: If a temple divorce has been granted, a second marriage can be sealed in a Mormon temple. Marriages that take place outside of the temple are officially

recognized by the church as legal and valid, with the understanding that these unions will not carry on into the eternities. (*End of comment by M. O. Bigler*)

*The Mormon Family.* An ideal Mormon family works together, putting the sense of “family” first, honoring the doctrine that families will endure throughout eternity. It is a rare LDS home that lacks some visible reminder of this doctrine in an embroidered or otherwise handcrafted item proclaiming, “Families are Forever.” The cultural value placed on family as a priority distinctly impacts those who choose not to have children, making those couples at least the object of social curiosity, if not censure.

Utah, the Mormon Mecca, is culturally oriented toward family because of the LDS church influence. Exemplifying this is Enid Waldholtz, the Republican congresswoman elected to office in 1994 from Utah, who is only the second member of Congress to bear a child while in office. This choice on the part of LDS Congresswoman Waldholtz clearly cemented her popularity among her Mormon constituents. She made a clear statement about her support for family life by meeting one of the most basic expectations of a Mormon couple with this childbirth.

*Sex Education.* Children are taught about sexuality more by implicit measures than direct and overt messages. Sexual exploration at a very early age is treated with quiet but firm repression. Mormon adults often describe their sense of guilt at their developing sexuality, often beginning at a very early age. These ideas are often disseminated by parents during “morality lessons,” which might include the suggestion of singing hymns if “impure thoughts” enter one’s mind, or using affirmative reminders that one’s primary objective is to reach the Celestial Kingdom, which demands the purity of the body temple. “Impure thoughts” are usually not specifically defined, but are so pervasively assumed to be sexually related that many Mormon adults still claim to equate words such as “purity” and “morality” with specific sexual connotations.

In spite of the importance placed on having babies in a married state, very little formal education is done regarding sexuality and pregnancy. Countless times after I have made a simple junior- or high-school presentation on HIV prevention, students have lined up to ask me other “related” questions, often regarding basic body functioning, for example, “I haven’t started my period. . . . How do I know if I’m pregnant? . . . Can I get pregnant from kissing?”

[*Comment 1997:* Mormon families are counseled by their leaders to hold a weekly Family Home Evening each Monday night. This is a specially designated time during the week for the family to join together to study religious topics, enjoy activities outside of the home, or address important family issues. Family Home Evening, as it has been outlined, provides LDS families with a perfect opportunity to provide sexuality education in the home within the framework of the family’s own value system. After observing this practice among Mormon families, Dr. Ruth Westheimer and her colleague Louis Lieberman noted:

In particular, we have been impressed by the manner in which the Church of Jesus Christ of Latter-day Saints (the Mormons) has approached the difficult task of teaching moral and ethical precepts in the area of sexuality. If Jews, Italians, Chinese, and Japanese, among other groups, may be said to be child-centered societies, the Mormons must be said to be family-centered, par excellence. There appears to be a structured, systematic, integrated and total approach to morality through the family. Thus, sexual morality is taught as part of a system and way of life that fo-

cuses on the goal of eternal or celestial marriage. The church reaches out to the family through many media: songs, family meetings, family resource books, television, videos, etc., to provide the Mormon perspective on all aspects of sexuality for all family members. (Westheimer & Lieberman 1988, 109)

[Unfortunately, all too often, Mormon families fail to take advantage of this valuable resource, and miss an obvious opportunity to educate their children about matters related to human sexuality. (*End of comment by M. O. Bigler*)]

Many couples marry with limited information even about the act of intercourse. If they have been properly parented in the faith, they will have been protected from exposure to sexual or “perverted” images. A Mormon church leader, Dallin Oakes, in a speech at Brigham Young University, said “We are surrounded by the promotional literature of illicit sexual relations on the printed page and on the screen. For your own good, avoid it.” He added, “Pornographic or erotic stories and pictures are worse than filthy or polluted food. The body has defenses to rid itself of unwholesome food, but the brain won’t vomit back filth.”

Biological information about menstruation is disseminated clinically. Some women recall this clinical information as imbued with a sense of shame, in which menstruation is described as a sickness or something one does not discuss in polite company. For example, I dated a Mormon man who was so unfamiliar with menstrual issues and women’s bodies—in spite of having several sisters—that he did not know what the purpose of a tampon was or how it functioned.

*Abortion.* Abortion is considered a most venial sin. Since Mormon doctrine regards the bearing of children as an opportunity to bring “spirit” children into an earthly form, abortion is not only considered murder, but in addition, a denial of a body for a predestined soul.

*Gay Culture.* Both the San Francisco and New York gay cultures take special note of the Brigham Young University gay underground, famous for its size and covert scope. Many of the returning missionaries come back to BYU to find a mate and resolve the same-sex desires often stirred on the two-year LDS mission strongly encouraged by the Church with strictly enforced male-only companionship.\* Sometimes that resolution does not come easily. Support groups for Mormon homosexuals in the Provo and Salt Lake area around BYU give voice to the pain of these men. Lesbians face the same dilemma, since they are surrounded by the cultural pressure to marry and have families.

The divine mandate of heterosexual marriage regards homosexuality as a repudiation of the gift and giver of life. Thus, homosexuality is regarded as a direct violation of God’s plan, which is that men should cleave to women. Sexual relations between any nonmarried persons is considered sinful and homosexuality falls into this category. According

[\*A note on LDS missionary services: Mormon men are strongly encouraged (*not* required) to serve a two-year mission at the age of 19. Formal sanctions are not imposed on those males who choose not to go on a mission. However, in a strong Mormon family or LDS community, social sanctions can be quite severe. The status of “Returned Missionary” is a valuable asset to a young man’s marriage potential. In contrast, the decision not to serve a mission—or worse yet, leaving on a mission and returning home early—often brings shame to both the young man and his family. Mormon women, on the other hand, can choose to go on an 18-month mission at the age of 21. However, the expectation of service is not nearly as great for females as it is for males, and the decision not to go, particularly if a young woman opts to get married instead, results in few, if any, negative repercussions. (*End of comment by M. O. Bigler*)]

to Dallin Oaks, one of the church apostles, "Eternal laws that pertain to chastity before marriage and personal purity within marriage apply to all sexual behavior. However, marriage is not doctrinal therapy for homosexual relationships" (Ludlow 1992). Since so much of the restored gospel hinges upon the legally and temple-wedded heterosexual couple, practicing homosexuals are excommunicated.

Often the feelings of a gay person meet responses of incredulity on the part of parents and church leaders. One parent counseled his son not to act on his "supposed" same-gender feelings, "to date young women seriously, to wait and see" (Schow et al. 1991). Because homosexual couples cannot reproduce, this parent urged his son to "choose otherwise." The church offers "counseling to those who are troubled by homosexual thoughts and actions" in order that they might become acceptable to God. Repentance is offered in these circumstances. "Homosexuality and like practices are deep sins; they can be cured; they can be forgiven" (*Church News* 1978). In order to remain a Mormon in good standing, homosexuals must remain celibate and refrain from all same-gender eroticism. Acceptance is not advocated at any level.

[*Comment 1997*: The current Mormon position on homosexuality can be described as one of limited tolerance. Because sexual activity is reserved for marriage, and same-sex relationships are not recognized by most legal bodies or by the church, homosexual activity is therefore forbidden. As the author correctly notes, to continue to be a Mormon in good standing, homosexual men and women must remain celibate and refrain from all same-sex sexual activity. The church's position officially allows for individuals who are sexually attracted to members of the same gender to remain fully involved in church activities, so long as there is no sexual activity. This stance, though still extremely restrictive, is quite a departure from past policy and practice when virtually any indication of same-sex attraction could be used as grounds for excommunication. However, despite the apparent shift in thinking toward greater acceptance, it remains difficult, if not impossible, for members who feel a same-sex attraction to continue to actively practice Mormonism. Unfortunately, homophobia is often a more-powerful emotion for many church members than the New Testament challenge to "Love thy neighbor as thyself." Frequently, this homophobia is internalized and, despite Ludlow's declaration that "marriage is not doctrinal therapy for homosexual relationships," many gay, lesbian, and bisexual Mormons follow the traditional course that has been set for them by getting married and starting a family. Some carry on with a heterosexual life and take the secret of homosexuality to the grave. Others find their true sexual feelings too powerful to deny and may have clandestine same-sex relationships or seek out friendly advice, often from a bishop or other church authority. For those who acknowledge same-sex attraction, reparative or reorientation therapy is a common recommendation. These programs have demonstrated little lasting success in changing sexual orientation. Participation in reparative or reorientation therapy is often experienced as the ultimate failure, since the promise of change is directly linked to the sincerity and worthiness of one's efforts.

[Change-orientated therapy, therefore, is commonly the final step for many gay, lesbian, and bisexual Mormons before leaving the church or being asked to leave. In the end, homosexual Mormons are often left with a choice between their church and their sexuality. Because the two are diametrically opposed, there is little room for compromise. (*End of comment by M. O. Bigler*)]

*Summary.* The Mormon culture is distinct in many ways. Known for hard work, loyal families, and abstinence from

alcohol and tobacco, the Mormons are steadfast in their maintenance of traditional family values. Sexually conservative and repressive, Mormon doctrines may be the ideal for people disillusioned with or anxious about the liberalization of sexual attitudes and practices occurring in the United States in recent decades. According to the 1995 United States census, Utah—with a 70% Mormon population—ranks first in fertility and last in teen pregnancy. The Mormons, long considered remarkable for their nearly anachronistic traditional values, may actually be on the cutting edge of the Christian Right's abstinence- and morality-based vision of American family life.

### [*Spirituality-Sexuality Movements*

LORAIN HUTCHESS

[*Editors' Note*: The basic sexological premises that underlie American sexual attitudes, values, and behavior are derived from the 2,000-year-old Greco-Roman philosophies of the Stoics, Zoroastrians, Platonic and Neoplatonic dualists, and many popular Gnostics. If anything can be said about these philosophies, which the early Christians adopted, it is that they were and are clearly anti-pleasure, anti-sex and anti-woman. This is radically true of all Euro-American cultures, but especially true of American culture, because of the sex-negative values the poorer immigrants and Puritans brought with them to the colonies. With its ongoing incarnational mission, Christianity should have, but did not develop a sex-positive integration of sex and spirit. One consequence of the resulting pervasive religious repression of sex that emerged early in the sexual revolution of the 1960s was the development of grassroots, at times spontaneous-combustion efforts to rejoin and integrate sexuality and spirituality. Factors in this phenomenon include the flowering of women's liberation, the advent of the "pill," the breakdown of religious and social condemnations of premarital sex, gay/lesbian/bi/trans liberation, and a growing interest in the more sex-and-pleasure-positive philosophies of Taoism and Tantra (Francoeur 1992).]

[*Update 2003*: We could say the impulse to integrate sexuality and spirituality is at the erotic core of creation. The need to reintegrate them began when the customs of people who revered the Earth were smashed apart by dominators.

[Seeds to the emerging spirituality-sexuality movement are found in the ancient Eastern ways of Taoism and Tantra and the sexual liberation movements of the 1960s and 1970s. By the 1980s, the teachings of Baghwan Shree Rajneesh (Osho) (1977) and his many students, such as Margo Anand (1991), gave new life to practices that would heal the split between sexuality and spirituality. It is no coincidence that this erotic-spiritual awakening bloomed in the face of AIDS. The increasing visibility and leadership of women and sexual minorities also profoundly changed the face of this movement to reintegrate sex and spirit. Among the more visible are sexologists Annie Sprinkle and Joseph Kramer, who teach sacred erotic massage and sacred intimacy mentoring in ways that bridge the gaps between women and men, gays and straights. In 1997, Deborah Taj Anapol convened a national Celebration of Eros, a Conference on Sacred Sexuality, bringing together for the first time, teachers from Tantric, Taoist, Sufi, Buddhist, Jewish, Pagan, Wiccan, Occult, Native American, and Afro-Caribbean traditions. The blossoming of groups and training programs continues to grow every year.

[The U.S. spirituality-sexuality movement sparks most intensely in retreat centers and gathering places, such as Shalom Mountain (Livingston Manor, NY), Omega Institute (Rhinebeck, NY), Harbin Hot Springs (Middletown, CA), Wildwood (Guerneville, CA), Kirkridge (Bangor, PA),

Burning Man (Black Rock City, NV), the Body Sacred (Livingston Manor, NY), Esalen (Big Sur, CA), Dawn Manor (Livingston Manor), Short Mountain (Radical Faery Center, Liberty, TN), Ramblewood (Darlington, MD), Sacred Connections (various locations in CA), and American Ridge (a campsite outside Seattle, WA). Integration of different views and approaches occurs in state parks at summer festivals, in the special temple rooms of sex-workers redefining their own erotic ministries, in covens meeting down side roads, in church halls, on shores, and in meadows.

[Among the more influential resources are the following—listed alphabetically: Margo Anand's *The Art of Sexual Ecstasy: The Path of Sacred Sexuality for Western Lovers*; Bodhi Avinasha and Sunyata Sarasswati's *The Jewel and the Lotus: The Tantric Path to Higher Consciousness*; Georg Fuerstein's *Enlightened Sexuality: Essays on Body-Positive Spirituality*; Donald Kraig's *Sex Magick: Sacred Erotic Spirituality*; Miranda Shaw's *Passionate Enlightenment: Women in Tantric Buddhism*; and Kenneth Ray Stubbs' *Women of the Light: The New Sacred Prostitute*. Jenny Wade's *Transcendent Sex* presents ordinary women's and men's accounts of transcendent sex experiences (without drugs and Tantra) connecting heart, genitals, soul, and spirit. Each of these practitioners/teachers represents a different aspect of the emerging "sacred sexualities" movement in the U.S. The Quodoshka website, <http://www.spiritualsexuality.com>, is maintained by teachers trained by Harley Swift Deer and presents a very influential strain not represented in the books listed here.

[The network of modern spirituality-sexuality integration is being created at all these places, through the stories participants tell, the practices taught privately, on websites, and in chat groups. Knowledge of this reintegration lives in the doing and in being. Every time we use our spines as breath-flutes, all our organs are instruments of praise. We are just beginning to create communities that reclaim and celebrate these ancient ways of healing the broken vessel of our world, of teaching each other how to reweave the roots and impulses that make us whole. (*End of update by L. Hutchins*)]

## B. Racial, Ethnic, and Gender Perspectives

In addition to the religious factor, two other social factors continue to exert considerable influence on American sexual ideologies and practices, race/ethnicity and gender. In this section, we examine the sexual customs of two of the largest racial and ethnic minority groups in the U.S.A., African-Americans and Latino-Americans, followed by a look at Native Americans. Next, we examine the effects of feminism and feminist perspectives on sexuality in America and sexological research, and the emerging perspectives of men on these issues. Finally, we look at the concept of heterophobia.

### *African-American Sexuality* HERBERT SAMUELS

The term African-American is widely and often carelessly used to suggest or imply that the more than 30 million African-Americans constitute some kind of homogeneous community or culture. This is both contrary to reality and dangerous, as the term properly includes a rich diversity of very different, and often distinct subcultures, each with its own set of sexual values, attitudes, and behavioral patterns. Included under the rainbow umbrella of African-Americans are urban African-Americans in the northeast, ranging from Boston south to Washington, D.C., African-Americans in Los Angeles on the West Coast, and African-Americans in urban centers in the southern states. Rural African-Americans are often quite different from urban African-Americans, even in nearby metropolitan centers. Socioeconomic

and educational differences add to the diversity of African-American subcultures. This perspective is essential to avoid overgeneralizations about the observations provided here.

*Historical Perspective.* A review of the past record reveals that many white Americans have regarded the majority of African-Americans as representing the sexual instinct in its raw state. This belief that African-American sexual behavior is somehow more sordid and crude than the sexual behavior of white Americans is by no means a new concept. Reports dating from the mid-16th century depict the sexual behavior of Africans as bestial. The same descriptions were later applied to the Africans brought to the New World by the slave trade.

Moreover, the folk view of the sexuality of blacks is often hard to distinguish from what appears in the scientific literature. In the guise of science, some investigators have presented such conclusions as: 1. African-American men and women are guided by "bestial instinct" (DeRachewiltz 1964; Jacobus 1937; Purchas 1905); 2. the black man is more animalistic in bed (DeRachewiltz 1964; Jacobus 1937; Purchas 1905); 3. the black man's penis is larger than the penis of the white man (DeRachewiltz 1964; Edwardes & Masters 1963; Jacobus 1937); 4. the black man is a sexual superman whose potency and virility is greater than the white man's (DeRachewiltz 1964; Jacobus 1937; Jefferson 1954); 5. the black man's reproductive capacity is colossal (Jacobus 1937); 6. black men are obsessed with the idea of having sex with white women (Edwardes & Masters 1963; Fanon 1967); 7. all black women want to sleep with anyone who comes along (DeRachewiltz 1964; Jacobus 1937; Rogers 1967); and 8. black women respond instantly and enthusiastically to all sexual advances (DeRachewiltz 1964; Jacobus 1937). Blacks have also been characterized as holding more-permissive attitudes regarding extramarital affairs (Bell 1968; Christensen & Johnson 1978; Houston 1981; Reiss 1964, 1967; Roebuck & McGee 1977; Staples 1978). This simplistic notion may well misrepresent the complexity of African-American sexual values. According to Robert Staples (1986, 258),

Blacks have traditionally had a more naturalistic attitude toward human sexuality, seeing it as the normal expression of sexual attraction between men and women. Even in African societies, sexual conduct was not the result of some divine guidance by God or other deities. It was secularly regulated and encompassed the tolerance of a wide range of sexual attitudes and behaviors. Sexual deviance, where so defined, was not an act against God's will but a violation of community standards.

*Gender, Gender Role, Sex, Love, and Marriage.* Gender and gender roles are culturally defined constructs that determine the boundaries of acceptable and unacceptable behavior for men and women. These notions are often based on stereotypes—a fixed, oversimplified, and extremely distorted idea about a group of people. In the general American culture, the traditional stereotyped female is gentle, kind, dependent, passive, and submissive. The traditional stereotyped male is tough, brutal, independent, aggressive, and intractable. Any deviation from one's expected gender role may be met with skepticism about one's psychological health. For example, the traditional view of the black male—as it relates to gender-role identification—is that he has been emasculated by the experience of slavery and is suffering from gender-identity problems because of absent or inadequate male role models. Moreover, because of these two problems, he has a more-feminine gender identity than white males (Grier & Cobbs 1968; Glazer & Moynihan 1964; Pettigrew 1964;

Wilkinson & Taylor 1977). Grier and Cobbs (1968, 59) suggest that:

For the black man in this country, it is not so much a matter of acquiring manhood as it is a struggle to feel it is his own. Whereas the white man regards his manhood as an ordained right, the black man is engaged in a never ending battle for its possession. For the black man, attaining any portion of manhood is an active process. He must penetrate barriers and overcome opposition in order to assume a masculine posture. For the innermost psychological obstacles to manhood are never so formidable as the impediments woven into American society.

Pettigrew (1964) supported the notion that black males are more feminine than white males because of certain responses to items in the masculinity-femininity scale on the *Minnesota Multiphasic Personality Inventory (MMPI)*. Two items that Pettigrew noted were the statements, "I would like to be a singer" and "I think I feel more intensely than most people do." Black males responded more positively to these statements than did white males. This pattern was interpreted to mean that black males are more feminine than white males. Pettigrew based his conclusion regarding the black male's gender identity on two studies. One study included a sample of Alabama convicts; the other was a group of veterans with tuberculosis! As Pleck (1981) notes, these are hardly representative samples.

In contrast to the emasculated, feminine, black male hypothesis, Hershey (1978) argues that black males have a stronger masculine identity than white males. In her study of sex-role identities and sex-role stereotyping, the black men's mean masculinity score was significantly higher than the mean masculinity score of the white men in her sample.

To the extent that African-American males have been emasculated by gender-role stereotyping, African-American females have been defeminized by gender-role stereotyping. The so-called black matriarchy has been historically blamed for the deterioration of the black family, because black women have greater participation in family decision making in a society where male control is the "normal rule." Because white stereotyped norms are violated, African-American women are seen as being domineering. By virtue of the historical legacy of slavery and discrimination against African-American men, African-American women were in the labor market, received education, and supported their families.

According to Staples,

Sex relations have a different nature and meaning to black people. Their sexual expression derives from the emphasis in the black culture on feeling, of releasing the natural functions of the body without artificiality or mechanical movements. In some circles this is called "soul" and may be found among peoples of African descent throughout the world. (Cited by Francoeur 1991, 90-92)

In a practical sense, this means that black men do not moderate their enthusiasm for sex relations as white men do. They do not have a history of suppressing the sexual expression of the majority of their women while singling out a segment of the female population for premarital and extramarital adventures (Staples 1977, 141-42).

The major problem with such studies is that few have questioned the stereotyped assumptions regarding gender-role socialization upon which their conclusions are based.

*Views and Practices of Sex Education.* Black males and females are socialized very early into heterosexual relations by their culture and extended-family system. The less-stringent age and gender-role orientations that are evident in the

black community exposes children at an early age to a more permissive sexual ethos. Many African-Americans perceive sex as a natural function; thus, children are not hidden from discussions of a sexual nature.

Academically, many sexuality or family life education programs employ the Health Belief Model, not only as a way to predict sexual behavior, but to facilitate behavior change. This model has certain assumptions that are based on Euro-American social norms. These norms may not be consistent with the beliefs and values of many African-Americans. Mays and Cochran (1990) correctly maintain that such attitude-behavior models

assume that people are motivated to pursue rational courses of action. They further assume that people have the resources necessary to proceed directly with these rational decisions. . . . Black Americans confront an environment in which much of their surrounding milieu is beyond their personal control. Models of human behavior that emphasize individualistic, direct, and rational behavioral decisions overlook the fact that many blacks do not have personal control over traditional categories of resources—for example, money, education, and mobility.

For many African-Americans, educational models that place emphasis on social norms and the extent of commitment to social responsibilities, rather than those that value individualistic rational reasoning, may be better predictors of future behavior.

*Masturbation.* Most studies indicate that African-American men and women masturbate less than do white men and women. In a recent national study, *The Social Organization of Sexuality* (Laumann et al. 1994), one third of white men and 56% of white women reported that they had not masturbated at all in the past year. However, black men were almost twice as likely to report that they had not masturbated at all during the past year, and about 68% of black women reported that they did not masturbate in the past year. However, those African-Americans who do masturbate demonstrate the same childhood, adolescent, and adult patterns as their white counterparts. Blacks may not acknowledge that they masturbate as readily as whites, because of the belief that admitting that one masturbates means one is unable to find a sex partner.

*Children and Sex.* African-American children, according to Staples (1972), are socialized very early into heterosexual relations by their culture and extended-family system. This socialization pattern exposes them at an early age to a more permissive sexual ethos. Thus, African-American children may have a knowledge of sexual intercourse, masturbation, condom usage, and other sexual practices at a younger age.

*Adolescents and Sex.* Compared to white teenagers, African-American teenagers begin coitus about two years earlier, on the average, and are more likely to progress directly from light petting to sexual intercourse (Brooks-Gunn & Furstenburg 1989). Consequently, African-American females may be at greater risk of pregnancy.

Black men start dating earlier, are more likely to have a romantic involvement in high school, have the most liberal sexual attitudes, and are most inclined to have nonmarital sex without commitment (Broderick 1965; Larson et al. 1976; Johnson & Johnson 1978). (See Section 5B for additional data comparing black and white adolescent sexual patterns.)

*Adults.* In the aftermath of the Civil War, blacks married in record numbers because, under the inhumane institution of slavery, legal marriage had been denied to them. Three out of four black adults were living in intact nuclear families by

the early part of the 20th century, and the overwhelming majority of black children were born to parents who were legally married. Today, an African-American child has but a one-in-five chance of being raised by two parents (Chideya et al. 1993). Out-of-wedlock births have risen since the 1960s, particularly among African-Americans. Two out of three first births to African-American women under the age of 35 are now out of wedlock.

Traditionally, women in American society have tended to marry men in their own social class or to "marry up" to a higher socioeconomic group. This pattern has been substantially disrupted among African-Americans, largely because of a distorted gender ratio among blacks. This imbalance in the proportion of males and females of marriageable age has been present for several decades, but has become exacerbated in recent years. By the 1990s, there were roughly 50 adult African-American women for every 42 African-American men, largely because of abnormally high rates of black-male mortality and incarceration (Staples & Johnson 1993). Because the proportion of African-American women who attend college and earn degrees is much higher than the rate for men, this problem is even more severe for higher-status women. As a result, increasing numbers of black women are remaining single or marrying partners from lower-status groups (i.e., less education and/or income). There is no evidence that large groups of black women are choosing to marry outside their race (Staples & Johnson 1993).

Joseph Scott (1976) has argued that these social conditions are largely responsible for the emergence of a pattern he calls "mansharing." Mansharing is a lifestyle where a number of African-American women, each of whom typically maintains her own separate residence, "share" a man for intimate relationships. Typically, he splits time living with each of the women. Scott (1976) argued that mansharing represented the appearance of a new, polygamous family form in the African-American community. However, we want to stress that this does not mean that black women like or prefer this lifestyle. Cazenave (1979) has noted that lifestyles can sometimes be imposed by external social constraints. There is some evidence (Allen & Agbasegbe 1980) that most black women do not approve of mansharing as a lifestyle, but feel they have reduced options in an environment with few eligible male partners. Scott concluded that:

Until there is some way to correct the sex ratio imbalance and until blacks control the economic and welfare institutions in such a way to stop the breaking up of black monogamous relationships we cannot be too harsh on black men and women who find some satisfactory adjustments in sharing themselves and their economic resources in a new, at least for this society, family form which meets their most basic needs. (Scott 1976, 80)

*Homosexuality and Bisexuality.* Attitudes within the African-American community reflect those in the majority culture. According to Staples (1981), homosexuality may be tolerated in the black community but will not be approved openly. Bell and Weinberg (1978), in their study of homosexuality, found that black male homosexuals tended to be younger than their white counterparts, had less education, and were employed at a lower occupational level. Moreover, black male gays more often expressed the belief that their homosexuality and homosexual contacts had helped more than hurt their careers.

Compared to black gay males, black lesbians had fewer transient sexual partners. Most reported that the majority of their sexual encounters were with women for whom they cared emotionally.

*Coercive Sex and Pornography.* The incidence of rape among African-Americans has been subject to some controversy. According to the Department of Health and Human Services, 683,000 adult women were raped in 1990. By contrast, the National Victim Center estimated that there were 130,236 rapes in 1990 and 207,610 in 1991. Although earlier reports indicated that African-American women were more likely to be sexually assaulted than white women, newer studies do not find any statistically significant difference between African-American and white samples. The historical notion that most rapists are black men is totally without merit; indeed, most rapists and their victims are members of the same race or ethnic group.

There is an important difference between the attitudes of those whites who support the antipornography movement in the United States and the lack of interest this issue stirs among African-Americans. For African-Americans, as Robert Staples (1986, 258) argues, issues of poverty, education, job opportunities, and teenage pregnancy are far more pressing concerns than the crusade against pornography.

Rather than seeing the depiction of heterosexual intercourse or nudity as an inherent debasement of women as a fringe group as [white religious conservatives and] feminists claim, the black community would see women as having equal rights to the enjoyment of sexual stimuli. It is nothing more than a continuation of the white male's traditional double standard and paternalism to regard erotica as existing only for male pleasure and women only as sexual objects. Since that double standard has never attracted many American blacks, the claim that women are exploited by exhibiting their nude bodies or engaging in heterosexual intercourse lacks credibility. After all, it was the white missionaries who forced African women to regard their quasi-nude bodies as sinful and placed them in clothes. This probably accounts for the rather conspicuous absence of black women in the feminist fight against porn.

*Contraception and Abortion.* Since the early 1970s, many in the African-American community have viewed contraceptive use as a form of genocide advocated by whites. Thus, control over reproduction has had political and social implications.

The majority of women having abortions are white. Although 12% of the population is of African-American ancestry, black women constitute approximately 31% of the women who seek abortions. There is a history of forced sterilization against African-Americans, which many perceive as a form of genocide similar to contraception.

*STDs and HIV/AIDS.* In 1932, the United States Public Health Service recruited 600 African-American men from Tuskegee, Alabama, to participate in an experiment involving untreated syphilis. The aim of this study was to determine if there were any racial differences in the development of syphilis. The Tuskegee participants were never informed that they had syphilis. This wanton disregard for human life allowed the disease to spread to the sexual partners of these men, as well as their offspring. This experiment continued until 1972! The repercussions from the "Tuskegee Experiment" still resonate strongly through African-American communities, and have a negative impact on HIV/AIDS prevention programs.

HIV was the eighth-leading cause of death for all Americans in 1990, but it was the sixth-leading cause of death for African-Americans. It is the leading cause of death for African-American men between the ages of 35 and 44, and the second-leading cause of death for black men and women between 25 and 35. Again this raises the specter of genocide

among many members of the African-American community, in that many believe that the virus was man-made!

[Update 2003: The HIV/AIDS epidemic continues to be a major health crisis facing the African-American community. Although African-Americans make up only about 12% of the U.S. population, they accounted for half of the new HIV infections reported in the United States in 2001. And many new infections occur among young African-Americans. According to the CDC:

- African-American men accounted for 43% of new HIV cases reported among men in 2001.
- 32% of African-American men who have sex with men were found to be infected with HIV in a recent multi-city study of men ages 23 to 29 years, compared to 14% of Latinos and 7% of whites in the study.
- While information on recent HIV infection is limited, data reported to CDC through 2001 suggest that the leading cause of HIV infection among African-American men is sexual contact with other men, followed by injection drug use and heterosexual contact.
- African-American women accounted for nearly 64% of HIV-1 cases reported among women in 2001.
- The rate of HIV infection among African-American women, ages 20 to 44, in 25 states with HIV reporting before 1994, was 80.1 per 100,000 population from 1994 to 1998—four times higher than the rates among Latinas of the same age, and more than 16 times higher than the rates among white women.
- The latest data available on recent HIV infection suggest that the leading cause of HIV infection among African-American women is heterosexual contact, followed by injection drug use.

[[CDC 2001; Lee & Fleming 2001; Valleroy 1998, 2000]. (See discussion of “Brothers on the Down Low” in Section 6B, Homoerotic, Homosexual, and Bisexual Behaviors, Adults, Health Issues). (End of update by H. Samuels)]

*Sexual Dysfunction.* The stereotyped notions about the sexual experiences of African-Americans not only influence the attitudes that whites may have about African-Americans, but also affect the way in which African-Americans perceive themselves. For example, the willingness of an African-American male who is experiencing difficulty in maintaining an erection or ejaculatory control to seek help may be dependent on how closely he identifies with the myth of the “super potent” black man. Any man may feel embarrassment about a sexual problem, but for the African-American male, the embarrassment that he may feel is compounded by the images of the myth.

For clinicians, an awareness of this historical legacy is essential to the treatment process. A key component in the treatment of many sexual problems is the use of self-pleasuring exercises. These exercises are an effective method for a person to learn more about his or her own sex responses. Many African-Americans have negative feelings about masturbation that may infringe on the treatment process. First, changing these negative feelings may take more time than is typical for other clients. Second, African-Americans who do masturbate may be more reluctant to discuss this issue because, for many, admitting that they masturbate indicates that they cannot find a sexual partner.

### [The Interaction of Gender and Race

PATRICIA BARTHALOW KOCH

[Update 1998: *Sexuality and African-American Women.* Gender and race have traditionally been defined and operationalized as fixed biological categories into which

people could neatly be sorted. However, many scholars now consider gender and race as social constructions, based on social and political influences, rather than on biological characteristics (Irvine 1995; Simon 1996). Additionally, many research studies have confounded socioeconomic status with race. Shortcomings often encountered in sexuality research include the lack of historical context, cultural insensitivity, and generalizations or assumptions about gender (Burgess 1994). Various aspects of African-American women’s sexuality are quintessential examples of the salience and interaction of gender and race upon sexuality in the United States. African-American women’s sexual attitudes, values, behaviors, and relationships have been shaped by their gender and racial heritage, including the historical experience of slavery and continued marginalization in American society (Staples & Johnson 1993).

[To the extent that African-American males have been “emasculated” by gender-role stereotyping, as described by Samuels above, African-American females have often been “defeminized” by this same process. By virtue of the historical legacy of slavery and continuing discrimination against African-American men in the labor force and other aspects of “mainstream” American society, e.g., housing and education, African-American women have always needed to be in the labor force to support their families (Anderson 1996). This economic necessity has contributed to the myth of the “black matriarchy,” which has then been blamed for the deterioration of the black family. African-American women have been described as domineering authoritarians who drive away their husbands and destroy their sons’ ability to perform effectively as productive adults. These “castrating matriarchs” and “lazy black men” have been chided as the “cause” of poverty among African-American families, avoiding any search for causes in a political and economic system that provided African-Americans with few opportunities to successfully support intact families (Anderson 1996; Staples & Johnson 1993).

[In essence, there tends to be more-egalitarian gender roles and fluidity among African-Americans than among Anglo-Americans (Broman 1991; Farley & Allen 1987). White stereotypic norms seem to be violated when black women have greater participation in family decision-making than has been present within a dominant Anglo society where male control is more the “rule.” Therefore, according to Burgess (1994), African-American women are seen as domineering. African-American women have most often been portrayed in some combination of four primary images: 1. as highly maternal, family-oriented, and self-sacrificing “Mammies” or “Aunt Jemimas”; 2. as threatening and argumentative “Sapphires”; 3. as seductive, sexually irresponsible, promiscuous “Jezebels”; and 4. as ignorant, lazy, greedy, breeding “Welfare Mothers” (Collins 1990; Weitz 1993; West 1995).

[In reality, African-American women must play dual roles. They are pressured to be more androgynous or masculine in order to make it in the work world, since they are often more successful at gaining employment than are African-American men. Yet, they also often try to maintain traditional female gender roles, especially that of mothering, to sustain relationships within their domestic networks (Binion 1990). As a hedge against failure, poor black men may limit their affective and economic commitments to family, approaching marriage and fatherhood ambivalently (Anderson 1996). Black women often want to be supportive of their men, yet sometimes find the men’s behavior to be distancing, oppressive, or abusive (Lorde 1984). Lorde has noted that female-headed households in the black community do not always occur by default. She and others contend that black

women are less likely to accept oppressive conditions in their marriages than white women, and, therefore, are much more likely to leave abusive unions with males. African-American women often develop matrifocal kin networks in which female family members, e.g., grandmothers and aunts, share the family and childcare responsibilities. Compared to their Anglo-American counterparts, African-American women are less likely to marry, more likely to be divorced or separated, and less likely to remarry (Anderson 1990).

[Regarding specific sexual behaviors, black men and women appear to engage in cunnilingus and fellatio less often than their white peers (Belcastro 1985; Hunt 1974; Laumann et al. 1994). A lack of foreplay is a grievance often expressed by married black women (Staples 1981), although black women report a higher frequency of intercourse per week than white women (Fisher 1980). Concerning such differences, Staples (1972, 9) suggests that:

Unlike many white women who see sexual relations as primarily an activity designed to give men pleasure, black women expect their sexual partners to try and sexually satisfy them, and criticize him if he doesn't. Sex is not necessarily something that is done to them. . . . Also in contrast to many white women, the black woman tends to be open within the peer group about her sexual experiences. . . . [This] allows black women to develop standards of sexual conduct to which males must address themselves.

[Rape and sexual assault have a unique history for African-American women because of the sexual exploitation of slaves for over 250 years before the American Civil War (Getman 1984). Throughout America's history, sexual assault on African-American women has been perceived and treated with less concern than for Anglo-American women (Wyatt 1992). For example, by 1660 in the American South, there were laws supporting sex between black women and white men in order to insure that interracial children would be slaves owned by the white slave masters. However, sex between a black man and white woman was severely punished with the alleged black "assailant" being castrated or sentenced to death, usually by lynching. Yet, there were no penalties for the rape of black women by white men. The stereotype that black women are "oversexed" by nature and, thus, cannot be rape victims, still exists in America today (Getman 1984). When both a rape victim and defendant are black, there is less likelihood of conviction compared to both victim and defendant being white (LaFree, Ruskin, & Visser 1985). Because of this and discriminatory police practices toward other crimes in the black community, black victims may feel less support and are, therefore, less likely to report being raped (Wyatt, Newcomb, & Notgrass 1990). Hooks (1990) has emphasized that sexism and racism are "interlocking systems of domination that maintain each other." (*End of update by P. B. Koch*)]

### *U.S. Latinos and Sexual Health*

MIGUEL A. PÉREZ and HELDA L. PINZÓN-PÉREZ

by M. A. Pérez and H. L. Pinzón-Pérez]

[*Demographics.* Latinos\* in the United States are a heterogeneous group comprised of Mexicans, Puerto Ricans, Cubans, Central Americans, and South Americans. Like most other ethnic/racial groups residing in the United States, La-

tinians exist in a distinct social environment, have developed a unique culture, and are often disfranchised from mainstream society. The heterogeneity of the Latino population residing in the U.S. can be observed in each group's unique culture, beliefs, language, socioeconomic background, family name, racial ascription, and culinary preferences (Castex 1994; Neale 1989; Williams 1989). Further evidence of the heterogeneity can be found in the 2000 U.S. Census, which found that 9 out of 10 Latinos reported racial/ethnic classifications other than Hispanic on the census forms. Two characteristics have been found to unify Latinos in the U.S.: having ancestors in a Latin American country, excluding Brazil, and having one or more family members who speak or were fluent in the Spanish language.

[Latinos are one of, if not the fastest-growing population groups in the U.S. According to census data, in the last decade, the U.S. Latino population growth has been twice that of the general population (U.S. Census Bureau [USCB] 2000). As Table 3 shows, over 12% of the U.S. population is classified as being of Hispanic or Latino descent; this figure is expected to increase to 21% by the year 2050. Although Latinos can be found in almost every state, two states, Texas and California, account for over 50% of all Hispanics in the United States (USCB 2002).
