For updates, corrections, and links to many of the sites referenced in these chapters, visit *The Continuum Complete International Encyclopedia of Sexuality on the Web* at <http://www.SexQuest.com/ccies/>.

Readers of *CCIES* are invited to submit important news items or reports of findings of new sex research being done in any of the countries covered here, or any other country in the world. We will try to keep the SexQuest *CCIES* website updated with your help. Send items in English if possible, with appropriate citations, to Raymond J. Noonan, Ph.D., *CCIES* Editor, Health and Physical Education Department, Fashion Institute of Technology, 27th Street and 7th Avenue, New York, NY 10001 USA, or by email to [rjnoonan@SexQuest.com](mailto:rjnoonan@SexQuest.com).

# How to Use This Encyclopedia

The Editors

This encyclopedia contains virtually all of the information presented in the first four volumes of the *International Encyclopedia of Sexuality* published in 1997 and 2001, with fifteen additional countries and places. The original entries have been updated, typically by the original authors or by new authors or commentators; all have had some copyediting refinements. Some entries have been completely rewritten, as noted at the beginning of those chapters. We have endeavored to clearly notate updated material by enclosing the section, paragraph, or sentence in square brackets, starting with *Update* or *Comment* followed by the year it was written, and ending with the appropriate author. In some cases, it serves to modify the existing material when we have kept the original information in context for historical comparison; at other times, it expands the information. In most chapters, some sections were written by specific authors (or one of the editors), whose name or names appear at the beginning of the section.

The information on each country in this encyclopedia is organized mostly according to the standard outline below. The thirteen major headings are also listed on the first page of each chapter with the appropriate page numbers for that country. The reader interested in drawing comparisons on specific issues between different countries will find page references for specific topics and refinements, beyond the major headings, in the index at the end of this volume. Checking this index under a specific topic—premarital sex, teenage pregnancy, puberty rites, or sexual harassment, for example—the reader will find page references that facilitate comparisons among the five-dozen countries included in this volume.

## Demographics and a Brief Historical Perspective

- A. Demographics
- B. A brief historical perspective

## 1. Basic Sexological Premises

- A. Character of gender roles
- B. Sociological status of males and females
- C. General concepts of sexuality and love

2. Religious, Ethnic, and Gender Factors Affecting Sexuality
  - A. Source and character of religious values
  - B. Character of ethnic values
3. Knowledge and Education about Sexuality
  - A. Government policies and programs
  - B. Informal sources of sexual knowledge
4. Autoerotic Behaviors and Patterns
  - A. Children and adolescents
  - B. Adults
5. Interpersonal Heterosexual Behaviors
  - A. Children
  - B. Adolescents
  - C. Adults
    - Premarital relations, courtship, and dating
    - Sexual behavior and relationships of single adults
    - Marriage and family
    - Cohabitation and monogamy
    - Divorce, remarriage, and serial monogamy
    - Extramarital sex
    - Sexuality and the physically disabled and aged
    - Incidence of oral and anal sex
6. Homoerotic, Homosexual, and Bisexual Behaviors
  - A. Children and adolescents
  - B. Adults
7. Gender Diversity and Transgender Issues
8. Significant Unconventional Sexual Behaviors\*
  - A. Coercive sex
    - Child sexual abuse, incest, and pedophilia
    - Sexual harassment
    - Rape
  - B. Prostitution
  - C. Pornography and erotica
  - D. Paraphilias
9. Contraception, Abortion, and Population Planning
  - A. Contraception
  - B. Teenage (unmarried) pregnancies
  - C. Abortion
  - D. Population programs
10. Sexually Transmitted Diseases and HIV/AIDS
11. Sexual Dysfunctions, Counseling, and Therapies
12. Sex Research and Advanced Professional Education
  - A. Graduate programs and sexological research
  - B. Sexological organizations and publications
13. Important Ethnic, Racial, and/or Religious Minorities

## References and Suggested Readings

\*In Section 8, Significant Unconventional Sexual Behaviors, we consider coercive sexual behaviors (rape, sexual harassment, and child sexual abuse), prostitution, pornography, paraphilias, and fetishes. As a general rule, sexologists and the general public tend to view heterosexual relations between consenting adults in an ongoing relationship, such as marriage, as the norm. It is true that such sexual relations are the modal pattern or norm in every culture. However, the earlier reviews of premarital sex, extramarital sex, alternative patterns of marriage, homosexuality, and bisexuality in Sections 5 and 6 serve to illustrate that, in any country, variable percentages of people engage in sexual behaviors which depart from this assumed “conventional” norm. Sexologists have struggled for some time to develop acceptable terminology to describe these “other” sexual practices. “Unconventional behaviors” appears to be the least judgmental and restrictive label for “other behaviors,” and definitely preferable to other labels such as “sexual deviance” or “sexual variance,” which

convey a sense of pathology, dysfunction, or abnormality to such behaviors.

The social meaning of a specific “unconventional behavior” is defined by its situation and social context. Exhibitionism, for example, has one meaning when engaged in by a couple in private, a different meaning when engaged in on the stage of a “go-go” bar for patrons of that bar, and a third meaning when engaged in on a public street. Second, some of these behaviors are, in fact, quite common. Serious estimates cited in the United States chapter suggest that 10% of adult Americans engage in sadomasochist or bondage sex play, 15% of Americans have a foot or related fetish and three million Americans engage in “swinging.” Although the number of individuals who engage in any particular form of “unconventional behavior” may be small, it seems clear that in most countries, taken together and added to the forms of nonmarital sexual expression, that rather large percentages of people do participate in some “other” “unconventional” form of sexual practice.

# Foreword

---

Robert T. Francoeur, Ph.D., A.C.S.

---

Someone said, “Never tackle anything that is not a challenge.”

In 1991, a publisher invited me to edit a 350-page single-volume *International Encyclopedia of Sexuality (IES)*. The plan was to invite 20 sexologists in 20 countries to prepare 20-page chapters on sex and love, marriage and family in their countries. It seemed like an easy project to tackle after editing the 766-page *Complete Dictionary of Sexology*. Having attended national and international meetings of sexologists for 30 years, I could easily recruit 20 colleagues to write 20 chapters on their countries. The problem came when my recruits fell so in love with describing sex and love, marriage and family—and much more—in their countries, that they completely ignored my “15,000- to 18,000-word limit.” As the word spread, other sexologists offered to write about sex in their countries. After five years work, we published three volumes covering 32 countries. With even more countries already in the works, we published a fourth volume, with 17 additional countries, in 2001.

At that point, despite very enthusiastic and glowing reviews, despite international acclaim and the endorsement of *Library Journal*, *Choice*, and the World Association for Sexology, we decided not to publish a fifth volume of *IES* with even more countries. Libraries cannot afford the shelf space or the cost of a five-volume *IES*. Instead, we thought it best to update all 49 countries in the original four volumes and add a dozen new countries, all in a single, large-format volume.

Now, after 11 years of work by 270 authorities on six continents, we have a truly unique up-to-date *Continuum Complete International Encyclopedia of Sexuality (CCIES)* with in-depth studies of sexual attitudes and behavior in five-dozen countries. It is a far richer resource and reference work than we could have imagined when we started this project 11 years ago.

Looking back on this adventure, I would like to share some thoughts and ruminations with the reader. Creating this *Encyclopedia* has been a long and complex process. If it is a monument of sexual knowledge, its importance and usefulness are solely because of the magnificent contributions of 230 experts from five-dozen nations around the world. Their work, far more than mine, makes this *Complete Encyclopedia* an unequalled repository of scientific and scholarly information about human sexuality.

To be sure, many works of undeniable importance have claimed to speak about *human* sexuality, but in the *CCIES* we hear the voices of many nations and cultures. With voices from more than a quarter of the nations of the world, I believe we can speak of this volume as a true encyclopedia of *human* sexuality. Ultimately, the subjects who have provided the data are not college students, as has been so commonly the case in academic studies of sexuality in, for example, the United States. Don’t get me wrong. The sexual attitudes and behavior of college students are interesting, and their sexuality should not be ignored. But in this volume, we are hearing from a far wider and richer sample of human beings than college-aged students. Our authorities come from almost every discipline and worldview imaginable.

Without in the least minimizing the other essays in our *CCIES*, let me single out first the contributions about sexuality in China and in India. Together, these two nations comprise some 40% of humanity. When, next, we consider the contributions about other Asian nations, the Muslim nations, Africa, South America, and Europe, we begin to see a truly international picture of *human sexuality*. And it has been the immense patience and skill of the contributors to the *Encyclopedia* that have created such a worldwide scope. It has been a collaborative, and incredibly challenging adventure. Among my inspiring experiences, I include the following:

- One day I had a question about some data in the Botswana chapter. Five minutes after I emailed Dr. Ian Taylor, he emailed me back with the clarification I needed. A question to Alain Giame at INSERM in Paris brought a return cellular communication from Dr. Giame on some rain-forest tributary of the Amazon River.
- In 1995, while touring France, a fellow American I had just met quizzed me about the books I write. My rather-vague mention of *IES* prompted Julianne McCarthy to ask if I would like a chapter on Bahrain. Without knowing where Bahrain was, I said, “Of course,” never thinking anything would come from a casual, “Of course.” Months later, a FedEx package appeared in my mailbox, sent the day Julianne and her museum-director husband returned to the U.S. “The information in this chapter was gathered and written by Julianne McCarthy and 28 Bahraini professionals and expatriates who are not to be identified in any way.”
- While trying to recruit Radhouan Mhiri, M.D., president of the Arab Institute of Sexology and Somatotherapy, to write a chapter on Tunisia, he mentioned Abderrazak Moussaïd, founder of the Moroccan Society of Sexology and a physician at the University of Casablanca. Several emails and a month later, on my first night of vacation in Morocco, Dr. Moussaïd whisked me out of a hotel lobby, assuring my wife he would bring me back safe and sound. At dinner, a vehement discussion erupted as Moussaïd cajoled four colleagues—in Arabic and French, of course—to join him to write a chapter on Morocco. Very little English was spoken, but I received their chapter a few months later.

Along the way, I have learned about many different customs, and more importantly, about the social context that surrounds these customs. To name a few customs that are very foreign to my Western mind: widow inheritance, “adultery hoots” in Ghana, *Hijra* in India, living apart together (LAT) in Germany and Sweden, transgendered *kaneeths* in Bahrain and *kathoeys* in Thailand, temporary marriage (*mut’a*) in Iran, the Virgin Mary’s influence in Ireland, very different constructs of male homosexuality in the Islamic cultures, hymen reconstruction in South Korea and Greek Cyprus, *fazendo tudo* (“try everything”) advice given to both Brazilian boys and girls, taboos on sexual communications between males and females, even husbands and wives, in many cultures, and the subordinate role of women in many cultures, where female orgasm is either unknown or feared as a prelude to insanity.

Despite my pride in initiating and editing the four volumes of *IES*, and now the comprehensive updated *CCIES*, I have to admit that this *Encyclopedia* is only a beginning. As we read through the essays, we learn how very little we really know about *human* sexuality. We have only begun to touch the surface of this hugely complex and ancient phenomenon. Much work remains to be done. Yet, I feel that the contributors to these volumes have eased the way for future scholars. Our contributors have blazed new path-

ways. In the process, I have learned some lessons I would like to share:

- Whenever we talk about any sexual attitude, value, or behavior, we are talking about a cultural snapshot. Think of a tour bus stopping at a scenic lookout. Camera-toting tourists rush off the bus, flip off their lens caps, squint through the viewfinder, scan the site, and take a snapshot or two. Unlike the casual tourist, our *CCIES* authors are very familiar with their own landscapes. As professional researchers and sexologists, their snapshots are more skillfully composed, more perceptive, and more alive to the cultural context and meaning of the observations than any casual observer could present.
- The snapshots created by the 270 contributors to *CCIES* are as true to reality as possible. But we should never forget that each snapshot is also flavored by the gender, education, and professional training of the sexologist presenting it.
- Likewise, we should not forget the social/economic/political/religious/historical context in which each sexual pattern, value, behavior, or attitude developed and is now supported.
- Although we can observe many commonalities in the values, attitudes, behaviors, and trends reported in this volume, idiosyncratic variations exist within each more-general variation within any culture, and between cultures. The richness and diverse flavors of human sexualities can be fascinating.
- The English language is rich in its nuances, but often in these chapters, the reader will find descriptions of sexual concepts and constructs, such as homosexual identity versus men having sex with men, transgendered, paraphilias, and sexual satisfaction, harassment, and dysfunction, which do not translate into Western patterns of thought. Does premarital virginity and sexual abstinence, for instance, simply require no vaginal intercourse? Or does it include no oral or anal sex? No kiss-

ing before marriage? No holding hands? Or all of these, plus no visual contact before marriage?

While editing, I also became aware of some worldwide problems we face:

- How can we deal with sexual health issues—not just the obvious issue of HIV/AIDS, but also access to affordable contraception and STD diagnosis and treatment, as well as general medical care?
- How can we promote the reality of gender equality and equal legal rights for all, regardless of sexual identity, role, and orientation?
- How can we provide basic comprehensive sexuality education for all, even in countries where the traditional taboos, the government, or religious tenets restrict or prohibit comprehensive and timely education?
- How can we promote recognition of the sexual rights and needs of all humans—children, adolescents, adults, the elderly and those disabled, whether male or female?
- What strategies do we need to address issues of population growth and decline?
- And finally, what steps do the nations of the world need to take to help immigrants adjust when they find themselves living in a very different and foreign culture, with very different traditions, values, and attitudes?

I happily end this Preface by repeating my sincere thanks to everyone who has given so generously of their knowledge, time, and energy to produce what my good friend and long-time editor/adviser, Jack Heidenry, described as a “Herculean effort.” This *Complete Encyclopedia* and the four earlier volumes of *IES* are the product of a wonderful team of colleagues, my fellow editor and skillful designer/typographer, Ray Noonan, our associate editors, and many new and old friends, with whom I have had the truly exciting and great pleasure of working. They join me, I am sure, in the hope that scholars around the world will find *CCIES* a rich and useful resource and reference.

# Preface

Timothy Perper, Ph.D.

What can a modern reader make of a book calling itself *Continuum Complete International Encyclopedia of Sexuality*? In the past, it could have been a *Baedeker's*—a *Guide Michelin*—to the sexual hotspots of the world, or a swinger's and sophisticate's tourguide to the super-sexy clubs of the international sex scene. It might well have contained addresses and ratings of brothels in far-flung places. Or perhaps it was a seriocomic autobiographical tale of a young person turned loose on the world of sex.

There was also a time that an *International Encyclopedia of Sexuality* would have recounted “the curious erotic customs” of people native to Borneo, Upper Nepal, and the tributaries of the Amazon, with a chapter (once obligatory in such works) about footbinding among the Chinese, crammed between strange stories about marriage rites among Polish villagers, African pastoralists, or Paraguayan landholders. And the illustrations—old-style black-and-white photographs—would have shown a peasant wedding in the Tyrol, a bride in Hindustan, the groom's party in Southern Russia, or anywhere else older times believed dwelt “primitive” or “simple” people.

Each of these has been a genre in sexual writing, as are dry-as-dust treatises of solemn university professors awash in jargon, incomprehensible tables of statistics, and deadly dull theorizing. Any and all could fill a book called *Continuum Complete International Encyclopedia of Sexuality*.

One value of the book you now hold is to reveal how much Western sexological writing has changed over two or so centuries. The essays here were each written by a person or persons native to the land and culture described or familiar with it through years of life and study there. Each of the authors is trained in one or another academic discipline, from cultural anthropology to medical sexology. The language is international scientific English, stylistically straightforward and uncomplicated. And thanks to the Editors' foresight, the chapters all follow a common outline, covering similar topics in similar orders—which ought to facilitate comparisons among cultures. After a brief introduction, each chapter deals with a single society, discussing religious and ethnic sexual values, gender roles and the sociology of men and women, relationships between sexuality and love, sex education formal and informal, autoeroticism, heterosexuality and marriage and the family, homoeroticism, gender conflicts, and “unconventional” sexual behavior—including rape, prostitution, pornography, and erotica—followed by material on contraception, abortion, and population planning, and ending with a discussion of sexually transmitted diseases and sex counseling/therapy. It is quite a palate of topics.

And you will notice that it is a serious list of topics. Perhaps nothing else so well illustrates how Western and Westernized writing on sexuality has refocused over two centuries. Today, we “moderns”—which means only that we Westernized intellectuals proudly call ourselves modern and, by implication, think others primitive—disdain older modes of sexological writing and publication. For many years, a primary form of “sexological” writing was the illustrated book—please, to be sold only to medical professionals!—with titles like *Femina Libido Sexualis*, and contain-

ing a mish-mash (to our modern eyes) of “medico-scientific” material on female anatomy, circumcision practices, phallic worship, all ostensibly published for “the advancement of knowledge,” but actually printed as erotica and hidden from the censor's vigil by their Latinisms and their faux-science. But the mainstay of such works—definitions, discussions, and depictions of “female sexual beauty”—is absent in modern sexological writing, and is equally absent from this *International Encyclopedia of Sexuality*. Gone are the black-and-white photographs of nude women, steel engravings of Arab weddings, and suggestively titled but oh-so-innocent tales of life in the Turkish *seraglio*.

Today, sexuality has become the focus of intense concern, often outright anxiety. Topics that we today consider “sexologically appropriate” border more and more closely on psychological, medical, and social pathology. We are concerned with the criminality of sexual acts, their morality, their capacity to index—if not to stir up—social destruction and vehement conflict. Furious debates over pornography and deep concern about child sexual abuse illustrate how much, for us, sexuality no longer focuses on sexual beauty, be it male or female, but on sexual ugliness, disease, and crime.

To a large extent—though it varies by author—this focus on sexological pathology and problems is shared by all the chapters in the *International Encyclopedia*. No wonder, either we live in a world of sexual change and rearrangement, where politics, more than nudity, seems the proper companion of the goddess of love, Aphrodite herself. For us, sexuality represents the body in flux: not a Heraclitean flow of all things growing and waning, but embodied future shock and upheaval. Books celebrating “sexual beauty” or regaling the reader with “odd and curious marriage customs” of foreign people could be written only in days that themselves had firm and clear sexual guidelines—a sexual culture—to shape readers' behavior and assure them that they were culturally normal by the standards of their own Western societies. But—*rota fortuna*—things change.

There is a story told—apocryphally, I am afraid—of an Indian tourguide at the temples of Khajuraho, famed for what Westerners perceive as highly erotic sculptures. A woman ethnologist, primarily interested in these sculpted images of the most variegated forms of copulation imaginable, continued to ask to be shown those portions of the temple grounds. The guide steadfastly refused, saying only, “But they aren't interesting, miss.”

The point is not the tourguide's recalcitrance. Instead, let us wonder where he obtained the phrase he used to defend his efforts at censorship: “They aren't interesting.” Partly, to be sure, he expressed a personal emotion, but we can readily imagine British tourists in the days of the Indian Raj expressing dismay and anxiety by saying precisely the same—“These statues are not interesting.” In those days—that is, for many years indeed—sexuality was not interesting to the normal Westerner outside the bedroom and those all-male soirees with which folklore bedecks the 1890s and similar eras of “sexual excess.”

So *Continuum Complete International Encyclopedia of Sexuality* reveals a fascinating aspect of how our own—Western or Westernized—visions of sexuality have shifted. Today, we find sexuality much more openly important, even if public and media attention often focuses on its less-pleasant sides, e.g., exploitation of women in pornography. Unlike our recent ancestors, we find sexuality interesting to extents that would have deeply shocked and troubled both the British visitors to Khajuraho and its Indian tourguide.

Over the intervening century, sexuality has slipped loose from its originally tight moorings in Western and Western-

ized societies. Today, it touches all aspects of life: certainly, it seems to touch everything in the media! One can plausibly argue that these are not deep social or psychological changes, but merely that previously dominating masks and disguises have fallen away to reveal what probably was always there—widespread interest in sexuality among many people indeed.

In this newly unmasked interest, we all need good, solid information—not rumor, hearsay, travelers' tales, and secret books celebrating female pulchritude across the globe—but good data, compiled with serious intent and presented with serious purpose. Such intentions and purposes *Continuum Complete International Encyclopedia of Sexuality* achieves. I do not perceive its seriousness of outline or topic as antisexual so much as I see it as antifrivolous. We do not trivialize sexuality nowadays and we live in an era of "serious works about sex."

We cannot escape the solemnification of sexuality, not because solemnity is foisted upon us by prudes, but because we understand that sexuality is dangerous as well as pleasurable. Yet we also carry within ourselves a desire to worry about sexuality—an echo from older days when sexuality was taboo for polite discussion and a matter only of whispered gossip, something to worry about. In our modern world, sexuality is legitimated partly by surrounding it by a veil of worried concern, e.g., about pornography, child sexual abuse, sexual Satanism, and the like. Knowledge has been bought at the price of thinking that sexuality ought to be studied and worked at. Whatever instincts exist (modern sexological scholarship denies them), they do not operate easily or comfortably today. If sexuality no longer wears the obscuring masks of the past—the opaque black garb that once clothed the body—then instead it wears translucent gauze, not erotic so much as disinfectant. In modern sexology, sexuality inhabits the forums of research, and *Continuum Complete International Encyclopedia of Sexuality* is quite modern.

Its importance—considerable, I think—exhibits another change in sexological discourse, to use a revealing and portentous word made popular by academic sexologists. In older days, only one officially sanctioned form of discourse existed about sex: the language and meanings of moralists, churchmen typically, that upheld certain visions

of how we should write about sex. Though he had predecessors, Kinsey changed all that permanently, in effect substituting technicalisms for a dying moralism in sexual language. A curious consequence is that sexology no longer speaks to the masses about matters they understand and know. As modern life fractalizes, sexology has sprouted many officially sanctioned discourses, such as postmodernist criticism, feminism, conservative rhetoric, biomedicalese, all antipopulist, all above the heads of the man and woman in the street (or bedroom). Indeed, it sometimes takes an expert to understand that the topic is sex. Nonetheless, adherents of these different discourses spend much time examining each other's prose with the officiousness of churchmen hunting out sinful thoughts. Sex remains a charged, powerful topic, and its significance will not diminish soon. Its powers radiate outwards from an embodied center to touch arenas of disagreement, like politics, that nonetheless remain more comfortable than open sexuality, at least for many people.

And so this *International Encyclopedia* raises a curious question: Will there come a time when sexuality can display itself nude? Or is nude sexuality still "not interesting"? Judging from public worry over Madonna's *Sex*, with her deliberate evocation of nudity, we still share a great deal with the Indian tourguide. However, the authors of the chapters in this book are closer kin to the woman ethnologist who wished to examine those statues. For her and her modern scholarly descendants, sexuality is interesting, even if still garmented in sociological, psychological, and biomedical gauze. Whereas we Westernized intellectuals still feel that Aphrodite must be partly covered, nonetheless many layers of wrapping and disguise have been removed. To the prude, it is all to the bad (even if "not interesting"). To the scholar, it is an important step towards understanding sexuality itself. To the modern reader, *Continuum Complete International Encyclopedia of Sexuality* will be more interesting than a *Baedeker* to the world's sex clubs or an autobiography of a reprobate or even a lusciously colored edition of the once banned *Thousand and One Nights*: It provides a thoroughly scholarly examination of what is still not fully exposed even in an enlightened modern world—or, judging from the temples at Khajuraho itself, the partly enlightened and partly interested modern world.

# An Introduction to the Many Meanings of Sexological Knowledge

Ira L. Reiss, Ph.D.

Welcome to this treasure chest of sexological knowledge and understanding. You will find in this volume a wealth of information concerning sexuality in a very wide range of human societies. To introduce this extremely rare and valuable *Continuum Complete International Encyclopedia of Sexuality*, I will not review the fascinating reports of these authors. Instead, what I shall do is to try to afford the reader some perspective on the many ways that this knowledge can be understood and used. I will focus on three controversial aspects of cross-cultural work where scientific fads and fashions have tended to limit how that knowledge is presented. Having a broader view of these three aspects of cross-cultural studies should help the reader to utilize the accounts of sexuality in this *Encyclopedia* more completely.

I will first deal with the question of how our personal values and other assumptions about the world enter into the way we do our scientific work on sexuality, and what we can do about it. Secondly, I will deal with the current emphasis upon stressing the uniqueness of each society and the criticism of the search for cultural universals. And thirdly, I will deal with the important question of taking the “insider” and the “outsider” perspective when studying a society’s sexual customs. By discussing these three controversial areas and suggesting possible resolutions, the reader should be better prepared to make his or her own judgments on what is valuable in sexological knowledge.

## *Issue One: Science, Values, and Assumptions*

There are those who still perceive of science and society as properly separated by an impenetrable wall. In this “positivist” view, the scientist is protected from “bias” by his or her withdrawal from taking sides on any of the basic value disputes in a society. As a result, we supposedly get a “value-free” and “pure” form of knowledge rather than a “biased” or “value-laden” point of view. That is still a popular view concerning science and society. Nevertheless, I contend that that sort of sharp separation of science and society is based upon an erroneous view of the way science really operates in society.

In my view, science cannot be separated from society, for it is an institution existing in a human society and conducted by human beings. Science, and its practitioners, can no more avoid the influences of the broader society than can the mass media, corporate business, government, religion, education, or the family. Further, the very support of science by a society depends on people’s believing that science is useful to the solution of the problems of that society. The high value placed upon physical science emanates from the advances it has produced in valued areas such as health, industry, and warfare. Denying this connection to society does not produce a lack of bias in science. Instead, it may produce an inability to be explicit about one’s values to others, and perhaps even to oneself.

Most obviously in the social sciences and in sexual science, where we seek to understand the way humans behave and think, there can be no meaningful separation of science from society and its values. But this does not mean that we cannot avoid bias in our scientific methods. Rather, if science is to maintain its claim to being fair, reasonable, logical, precise, and cautious, then it must acknowledge the possible values of the scientist and learn how to prevent them from overwhelming our scientific methods. Scientists cannot prevent bias in their work by simply claiming to be value-free. Rather, as I shall seek to illustrate, scientists must do it by demonstrating that they are value-aware. Let me illustrate my meaning with a research project I was involved in not long ago.

In 1988, a colleague, Robert Leik, and I set out to develop a probability model that would compare two strategies for reducing the risk of an HIV infection (Reiss & Leik 1989). The two strategies to be compared were: (1) to reduce the number of sexual partners or (2) to use condoms with all partners. Although utilizing both strategies simultaneously is clearly the safest way to reduce the risk of HIV, a great many people seem to choose to do one or the other. The model we built compared the risk in these two strategies using a very wide range of estimates of several key factors: (a) the prevalence of HIV, that is, the likelihood of picking an infected partner; (b) the infectivity of the HIV virus, that is, the likelihood of becoming infected with HIV if one picked an infected partner and had unprotected sex with that person; (c) the failure rate of condoms, ranging from a low of 10% to a high of 75%; and (d) the number of partners ranging from one to 20.

What we found was virtually unqualified support for the greater probability of avoiding HIV infection by using condoms rather than by reducing partners. In almost all cases, even if one had only one or two partners over a five-year period, if one did not use condoms with them, one had a higher risk of HIV infection than someone with 20 partners who did use condoms. This was true even if condoms were assumed to have a failure rate between 10 to 25%. Our conclusion was that those giving advice and counsel should recommend condom usage as the more effective tactic.

Now this project with its probability model was surely a scientific project, and the results of testing our models seemed unequivocal. Nevertheless, although the great majority of the scientific community fully endorsed and used our findings and suggestions, a few scientists did not accept our interpretation of our results. We received criticism from scientists who said that people will not use condoms to prevent HIV infection and so our findings were meaningless in the real world. There were others who said that publishing our results would encourage people to increase the number of partners and that would lead to more HIV infections. Some other critics raised the question whether having more than one partner and using condoms was worth even the very small increased risk that we described.

This difference of interpretation of our findings is not a result of the poor scientific judgment of our critics, as much as we might have liked to think that. Rather it was basically a consequence of some scientists’ not sharing our values and assumptions about the world in which we live. Specifically, our critics did not accept our view that people will use condoms to protect themselves. Instead, our critics believed in a more emotional than rational view of human sexual choices. They held this view despite the evidence that gays have greatly increased their condom usage and even teenagers indicated similar dramatic increases in the late 1980s (Reiss 1990). Other critics rejected our assumption that motivations for having more sexual partners have very little to do with the publication of an article like ours. Finally, unlike some of our critics, we made no assumptions about whether

condom-protected sex with several partners was worth the increased risk involved.

Our critics and we clearly had different assumptions and values regarding sexuality, and that was the reason why they questioned our evaluation of the evidence from our model. They did not disagree with the results of the model, but they disagreed with our assumptions about sexuality. The reader should note that the assumptions we make about sexuality are not only factual assumptions, but they embody value judgments. For example, we valued people who learn how to protect themselves, and supported the moral right of people to make their own personal choices regarding the number of partners that they have.

We might not have become so fully aware of our assumptions if our critics had not spoken out, revealing that they made different assumptions and had different values about sexual behavior. The critics would never have undertaken our study because, lacking the belief that condoms will be used to prevent HIV infection, why should one study that strategy? Also, as one scientific journal editor wrote to us, his values would stop him from publishing an article that seemed indifferent to the norms of sexual monogamy. These differences in values and assumptions do not just enter into the choice of research projects, but as is apparent here, they enter into the very interpretation of the meaning and worth of that research.

The important point here is that no scientist can undertake a research project without making some set of assumptions regarding human behavior. And those assumptions also influence how to interpret the validity and worth of the findings. As our critics demonstrate, our interpretation that recommending condoms is the safest path to take is not one that inevitably follows from our probability model's evidence. Our recommendation of condom use follows only if you also share our assumptions about human behavior. The great majority of sexual scientists do share our view and so they agreed with our interpretation. Where all scientists share the same assumptions, we are the most likely to be blind to the fact that we are even making any assumptions. Without the critical response, we would not have become so aware of our own assumptions, and of those of our critics.

To believe that science operates in a vacuum devoid of values and assumptions about human behavior is to delude ourselves as scientists. Further, unless we realize the assumptions we are making, and put them forth explicitly, we will be unable to comprehend fully one basis upon which we are judging the worth of our scientific work. Only by becoming more value- and assumption-aware will we be able to be more even handed and fair in evaluating and understanding the basis of our scientific judgments. Such awareness makes the scientist more thoughtful about what assumptions will be accepted, and more conscious of the possibility that we must be sure not to allow these assumptions to bias our gathering of evidence.

The recent findings concerning causes of homosexuality offer another illustration of the point I am making here. The 1993 work of Dean Hamer published in *Science* created a public storm of interest. Hamer and his collaborators reported that they found on the long arm of the X-chromosome a possible location of a special set of genes that were present in 33 out of 40 families with two gay brothers. The support this finding found depended in part on the background assumptions of the particular scientists. Those who, like biologist Simon LeVay (1990), stress biological factors as determinant of human behavior, are more willing to conclude that biological factors are key pieces in the homosexual puzzle. Other scientists in social science fields where nurture is stressed more than nature, make assumptions about humans that lead them to be hesitant to accept Hamer's work as anything more than mostly speculative at this point.

There are also values associated with any position on nature and nurture. Whether we are a biologist or a sociologist, if we oppose the status quo in society, we are more likely to want to emphasize the plasticity of human inheritance. In addition, those scientists who feel that seeing homosexuality as strongly biologically determined would lessen societal prejudice, may also be more likely to accept biology as definitive. Conversely, those who, like myself, oppose prejudice, but who note that prejudice continues against groups with known biological differences such as blacks and women, do not feel pressure to endorse biological etiology.

One very important conclusion from these and other examples is that our assumptions and values can easily have an impact on our interpretation of research findings. But that does not mean that we should conclude that all sexologists are "biased" or all research on sex is "unfairly" interpreted. Rather, what it says to me is that all members of a society, including scientists, have values and make assumptions about human sexual behavior. Better than pretending that we can be neutral and value-free, we should openly assert our assumptions and values so we can check each other's scientific work and promote a clearer, and more balanced and fair-minded evaluation of the worth of our research results.

Bias or distortion of evidence is unacceptable in scientific work. We seek to use the most reliable and valid measures, to publish our results for criticism by others, and to follow rules of careful reasoning and fair gathering of evidence. Making our scientists more "value-assumption aware" will help us minimize the times when these unstated assumptions overwhelm our science. We cannot eliminate assumptions, but we can demand that they be made explicit, and require scientific rigor regardless of what assumptions are made. Then we can, as scientists, reach consensus on which explicit assumptions we are willing to accept, and thereby decide what will be accepted as knowledge in our science of sexuality. When you read the accounts in this book, try to discern the author's assumptions. Finding assumptions is not by itself an indication of a flawed account. Rather, it is a way of giving you deeper insight into the meaning of that author's account.

### *Issue Two: Scientific Fads about Cultural Universals*

There is little question that during the past several decades, the anthropological and sociological work on different societies has stressed the uniqueness of cultures and criticized attempts to find cultural universals (Suggs & Miracle 1993). If we apply our awareness of the place of assumptions in scientific work, we may surmise that this emphasis is a result of assuming that people and societies are basically different and do not universally share any significant characteristics. Further, that assumption may be based on the value judgment that stressing how different we are builds tolerance, whereas emphasizing universal traits among different societies encourages people to criticize the society that is not like their own.

All our views are but partial views of whatever reality is out there. If we all share the exact same assumptions about the world, we will never become aware of what these assumptions are, and we will not be alert to the possible biasing of our scientific evaluations. It is in this sense that accepting but one narrow view of what is worth pursuing, and making that a compulsory position, is dangerous to the growth of sound scientific methods and to the careful evaluation of evidence.

In opposition to the current scientific fad of stressing differences, David Suggs and Andrew Miracle, in their overview on cross-cultural sex research, point to the need to find commonalities in societies around the world. They say: "We need more work on sexuality from those research strat-

egies that are specifically oriented toward seeking an explanation of ‘Culture’—as opposed to ‘cultures’” (1993, 490).

They cite my 1986 book, *Journey into Sexuality: An Exploratory Voyage*, as one of the few attempts to find such commonalities while not denying the importance of cultural differences. In that book, I set out to try to locate the key areas of our social life that, in any society, most directly shape our sexuality. I started with the assumption that, unless the evidence indicated otherwise, we can assume that, “with careful attention to the social context, intercultural comparisons can be made” (Reiss 1986, 7). After examining a large number of cultures, I developed my Linkage Theory, which asserted that sexual customs in all societies were most crucially linked to the *power, ideology, and kinship* segments of that society. This I called the (PIK) Linkage Theory.

I did not ignore differences in the way individual societies create such linkages. To be sure, a class system in America may be very different from a class system in Kenya. But that does not prevent us from saying they both have a class system and examining how that class system relates to existing sexual customs. So I would say to the reader, look for the important differences among the cultures described, but also compare societies and see if you can detect some commonalities among the cultures, such as I suggest in sexuality being linked to power, ideology, and kinship systems in every society (Reiss 1989). I believe that finding commonalities in our sexual lives can enhance our tolerance for the cultural differences that exist. We can better identify and have empathy for a people with whom we believe we share some important similarities.

### *Issue Three: The Insider and the Outsider Perspective*

In the last few decades, the emphasis in cross-cultural work has been on what Kenneth Pike has called the Emic or “insider” approach and less on the Etic or “outsider” approach. The concepts of Emic and Etic were first put into print by Kenneth Pike in 1954 and have since become common jargon in anthropology. Some anthropologists, like Marvin Harris, have made modifications in Pike’s concepts but still utilize them (Headland, Pike, & Harris 1990). Let me try to clarify these very important terms and relate them to a third and final issue concerning how we view other societies.

The originator of the concepts of Emic and Etic, Kenneth Pike, indicated his current meaning in a 1990 book, when he said:

I view the emic knowledge of a person’s local culture somewhat as Polanyi views bicycle riding. A person knows how to act without necessarily knowing how to analyze his action. When I act, I act as an insider; but to know, in detail, how I act (e.g., the muscle movements), I must secure help from an outside disciplinary system. To use the emics of nonverbal (or verbal) behavior I must act like an insider, to analyze my own acts, I must look at (or listen to) material as an outsider. But just as the outsider can learn to act like an insider, so the insider can learn to analyze like an outsider. (Headland, Pike, & Harris 1990, 33-34)

Although it is a bit of a simplification, Emic can be seen as the insider view constructed by people in a culture, and Etic the outsider view constructed by science seeking to understand that culture. The recent fad in social science, as I have noted in my discussion of the emphasis placed on cultural uniqueness, is to emphasize the Emic view. The possibility of an Etic view that can conceptually compare and find commonalities in different cultures is too often overlooked and/or criticized today.

I support the essential worth of both Emic and Etic approaches and I reject the notion that we must give priority to an Emic or an Etic view. Some of the support for promoting the Emic view comes from those who feel that we should not make invidious comparisons of cultures and should rather just accept them. I, of course, share the tolerance values behind such an approach. But as a social scientist, I must be allowed to compare and contrast and to develop understandings that go beyond just saying all cultures are unique. I must also add that there are societies, like the Nazi society under Hitler and many other totalitarian reigns of terror that exist today in our world, that I do not want to tolerate. I want more than the insider view of a people on which to base my understanding of a society.

Another point to be aware of in this debate is the fact that there is much that people in any society do not understand about their own culture. How many people in Western society understand enough to be able to suggest workable solutions to the many social problems they see in their society? One of the major values of any science is to afford a broader perspective on a social problem area. It is true that the outsider view that scientific explanation can provide will be based on some assumptions about human beings, but the attempt will still be to evaluate carefully and fairly the evidence relevant to that perspective. This is precisely what Robert Leik and I were trying to do when we compared the two strategies for reducing HIV infection. Our assumptions were clear, and we attempted to evaluate fairly the choices in light of those assumptions.

If we opt only for the insider’s views and deny the possibility of an outside scientific explanation that goes beyond the insider’s views, then we are reducing ourselves to the role of stenographers writing down what people believe, and stopping there. I think an Etic science perspective is far too valuable to toss away that easily. True, science has limitations in its assumptions and in its fads and fashions. But science presents us with the opportunity to arrive at a consensus as to how to understand most effectively, and perhaps change, a particular sexual problem. Such a scientific consensus will never be the total picture of reality, but it will be valuable in our search for solutions. It offers something beyond what the partisan person can offer in his or her Emic viewpoint, and I would therefore reject any postmodern, relativist attempts to play down the value of an Etic perspective in sexology or in any science.

Readers of this *International Encyclopedia* should keep in mind the Emic and Etic distinction, the relative advantages and limitations of these vantage points, and watch for efforts by the authors to balance these views. Some authors are native to the country they are writing about. Others are not native and write from an outsider’s perspective, even though they may have lived in the country for many years. Being aware of the vantage point from which the individual contributors to this *Encyclopedia* speak will help the reader make the most advantageous use of the information presented.

### *Quo Vadis, Cross-Cultural Sexology?*

Let me try to sum up the implications of my approach to cross-cultural sexual knowledge and its value to you in reading this *Encyclopedia*. First, I would suggest that seeing how science and value assumptions interact should make us more likely to want our science of sexuality to do more than present abstract knowledge. We will want science to deal with the problem areas that mean the most to us. This sort of post-positivist view of sexual science makes science a major helper in reconstructing or reinventing ways of living that can promote the resolution of the many sexual problems that confront us.

True, there may well be conflicting solutions proposed by scientists with different value assumptions, such as I encountered with my probability model on HIV infection. But we can still examine scientifically what will best help to resolve problems from the viewpoint of the set of assumptions most of us in a community will endorse. Further, people with different assumptions can put forth different tactics to resolve social problems. We can examine the reasoning and evidence relevant to competing assumptions. We can choose based on what type of world we want to create.

The scientific search for evidence to examine our solutions can still be rigorous and will be scrutinized, particularly by those who do not fully accept our assumptions. I see the future as favoring this movement towards a sexual science that helps us create the type of world we consensually agree we want. I see the problem-resolution aspect of sexology as very important, because it will promote the value of sexual science in the minds of the public, and that will help fund the important research and theory work we want to do.

On the second issue of commonalities: If you accept my position on the legitimacy of searching for cultural universals as well as for cultural variability, then we in sexology can search for common elements in our sexual lives in societies around the world. In the over 200 societies I examined in my 1986 book, I found universal condemnation of what that society judged to be “excessive” sexual force and to what that society saw as “undue” sexual manipulation (Reiss 1986, 1990). So we have at least a minimal cross-cultural area of ethical agreement on what sexual acts ought to be prohibited: sexual force and sexual manipulation. Of course, within this area of agreement there are quite different definitions of what is “excessive” sexual force and what is “undue” sexual manipulation. But within any society, we can, as sexual scientists, seek to find what changes in custom would best avoid that culture’s conception of “unacceptable” force and manipulation.

In Western cultures, I believe we would agree that avoiding force and manipulation is best accomplished by promoting preparation for sexuality that emphasizes honesty, equality, and responsibility between the sexual actors. I have developed the evidence and reasoning on this in a recent book (Reiss 1990). Western cultures are moving towards an ethical standard that accepts a wide range of sexual acts, providing they are honestly, equally, and responsibly negotiated. As the accounts in this *Encyclopedia* will reveal, there surely are significant differences even within Western societies as to how to define unacceptable force and manipulation, and also on defining what is meant by honesty, equality, and responsibility in sexual relationships and how to achieve that. But at least there is some common ground for such a dialogue to take place, and I believe sexologists should take the lead in examining and researching this vast area of possible ethical agreement.

Although non-Western societies are pursuing the same goal of reducing unacceptable force and manipulation, there are many significant differences in the ways that these societies may seek to control these outcomes. Promoting honesty, equality, and responsibility in sexuality may not be so popular in some of these societies. So clearly individual attention to particular societies is needed. But I stress that it is in the search for universals here that we are led to explore cultural differences. These are not opposing goals.

Finally, in line with my position on the insider and outsider approaches, I encourage taking both an Emic and an Etic approach so as to gain more complete answers to the sexualological questions that interest us. The insider view is essential for any successful resolution, because it is people that must put into action any resolution to a social problem. But

we must also go beyond individual viewpoints, for it may well be that in unintended ways we promote the very outcomes that we then condemn as problems. Our conflicted and negative view of sexuality in America is a cause of the very problems that our conflicted and sex-negative people then condemn (Reiss 1990).

If we who have devoted our career to the study of sexuality cannot state what our assumptions are and offer useful resolutions to our shared sexual problems, then who can? A famous American sociologist, Robert S. Lynd (1939, 186) many years ago made this very point about social science in general:

Either the social sciences know more than do the ‘hard headed’ businessman, the ‘practical’ politician and administrator, and the other de facto leaders of the culture as to what the findings of research mean, as to the options the institutional system presents, as to what human personalities want, why they want them, and how desirable changes can be effected, or the vast current industry of social science is an empty facade.

The cross-cultural analysis of sexual customs in this encyclopedia should help us to understand and to cope better with the dramatic changes occurring in sexual customs in so many societies today. I have discussed elsewhere other reasons why we need to make our assumptions explicit and thereby make our sexology more problem-resolution centered (Reiss 1993). All I need add here is that the more society feels that sexology can aid in resolving our sexual problems, the more our field will be valued and will flourish. I hope we who are sexologists will resolve our internal disputes on issues like those discussed in this chapter by taking the broader and more eclectic view of science and its role in society that I have presented. While doing this, we must hold to the great value of scientific method—we must reject the nihilistic and relativistic conclusions that some who would dismiss science altogether promote today. I hope that as you read the fascinating chapters in this book, the key issues and ideas I have put forth will help you to obtain a deeper insight into human sexuality. I wish you all: Bon Voyage to the many societies described herein!

This miraculous indigenous America  
Made everything at a fantastic scale  
Wanting to look at the sky,  
she raised herself on the Andean Mountains  
And her cross, instead of wood,  
is made of stars.<sup>1</sup>

## Demographics and a Brief Historical Perspective

ROBERT T. FRANCOEUR

### A. Demographics

Argentina, the second-largest country in South America with 1,073,518 square miles (2,780,399 km<sup>2</sup>), occupies most of the southern tip of the American continent. It extends from slightly above the Tropic of Capricorn to Antarctica, on which it keeps a constant military and research presence. Hence, it has a variety of climates and the different natural resources associated with them, although it is best known for its fertile pampas of the temperate region. The Patagonia plateau in the south is flat or rolling. The rugged Andes Mountains mark Argentina's western border with Chile on the west. Bolivia and Paraguay are Argentina's northern neighbors, while Brazil and Uruguay lie to the northeast.

In July 2002, Argentina had an estimated population of 37.8 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 26.3% with 1.05 male(s) per female (sex ratio); 15-64 years: 63.2% with 1.0 male(s) per female; 65 years and over: 10.5% with 0.7 male(s) per female; *Total population sex ratio:* 0.98 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 75.48 years; *male:* 72.1 years; *female:* 79.03 years

**Urban/Rural Distribution:** 90% to 10%

**Ethnic Distribution:** Caucasian: 97%; Mestizo, Indian, or otherwise nonwhite groups: 3%

(CIA 2002)

**Religious Distribution:** Nominally Roman Catholic: 92%, with less than 20% practicing; Protestant: 2%; Jewish: 2%; other: 4%

**Birth Rate:** 18.23 births per 1,000 population

**Death Rate:** 7.57 per 1,000 population

**Infant Mortality Rate:** 17.2 deaths per 1,000 live births

**Net Migration Rate:** 0.63 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.41 children born per woman

**Population Growth Rate:** 1.13%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.69%; *Persons living with HIV/AIDS:* 130,000; *Deaths:* 1,800. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 96.2% (1995 est.); attendance in school is compulsory to age 14

**Per Capita Gross Domestic Product** (purchasing power parity): \$12,000 (1997 est.); *Inflation:* 4%; *Unemployment:* 25% (end of 2001); *Living below the poverty*

\**Communications:* Sofia Kamenetzky, M.D., Postal Box 352530, Palm Coast, FL 32135-9727 USA; [mkamen@aol.com](mailto:mkamen@aol.com).

line: 37% (2001 est.). By the end of 2002, half of Argentina's population was living below the poverty line. In 2001 and 2002, the economy of Argentina went into a tailspin and the nation came close to bankruptcy (see update at the end of Section 1B, A Brief Historical Perspective, below).

### B. A Brief Historical Perspective

Nomadic indigenous tribes roamed the pampas when the Spaniards arrived in 1515 and 1516. The land quickly became a part of the Spanish empire. By the late 19th century, nearly all the native peoples had been killed.

The long period of disorder that followed the colonists' declaration of independence in 1816 ended only when a strong centralized government developed. Large-scale Italian, German, and Spanish immigration after 1880 spurred modernization, and major social reforms were instituted in the 1920s. Military coups were common from 1930 to the 1946 election of General Juan Perón as president. Perón and his wife, Eva Duarte (died 1952), effected labor reforms, but suppressed freedom of speech and the press, closed religious schools, and ran the country into serious debt. A series of military and civilian regimes followed Perón's ouster in 1955. After an 18-year exile, Perón returned in 1973 and was elected president. When he died ten months later, his second wife, Isabel, who had been elected vice president, succeeded him, becoming the first woman head of state in the Western Hemisphere. Mrs. Perón was ousted in 1976, amid charges of corruption.

The military junta that followed existed in a state of siege with guerrillas and leftists. An estimated 5,000 people were killed and thousands jailed and tortured. Democratic rule returned in 1983 after Great Britain successfully defended the Falkland Islands in 1982. In 1985, five former junta members were found guilty of murder and human rights violations. By 1989, the nation suffered, as severe hyperinflation and political problems sparked looting and rioting in several large cities. Perónist President Carlos Saúl Menem, elected in 1989 and again in 1995, has introduced harsh but necessary economic measures to curtail hyperinflation, control government spending, and restructure the foreign debt.

[Update 2003: The presidency of Carlos Menem that started in 1989 with hopes of a long period of stabilization and prosperity ended with the deepest economic crisis known since Argentina organized itself as a modern nation by the end of the 19th century. Neither the International Monetary Fund, nor the World Bank or the Interamerican Development Bank, explained clearly to the world how such a profound economic deterioration took place.

[Just a few years ago, Argentina was largely a middle-class nation with the highest per-capita income in Latin America. The Gross National Product (GNP) per capita that was \$9,950 in 1997 is estimated to have fallen in 2002 to less than \$4,700, which is the threshold above which the country becomes a contributor to international organizations rather than being just a borrower (World Bank Development Report 1999; Executive Board UN Development Program 2002).

[Foreign public debt started mounting and reached \$132 billion by the end of 2001. At the same time, unemployment is estimated as being as high as 25%.

[The absence of political leaders with a clear vision of the future, and the cynicism and greediness of those in power who dispose of government revenues as their private property, led to disastrous policies. Bank assets were stripped, leaving the average citizen without access to their deposits, while rich Argentines and foreign enterprises timely sent their money to foreign accounts. The Argentine peso that remained pegged to the dollar since the early 1990s was deval-

uated, and is above three pesos to a dollar at the time of writing this update. As *The New York Times* reports, the situation of most Argentines has dramatically changed:

According to the most recent statistics, issued in January 2003, at least 60 percent of the country's 37 million people now lives in poverty, defined as an income of less than \$220 a month for a family of four. Even more alarming, more than a quarter the population is classified as 'indigent,' or living on less than \$100 a month for a family of four (Rohter 2003).

[Every day children and old people die of hunger. People in the affluent neighborhoods of Buenos Aires put leftovers from their meals in separate garbage bags to provide a concentration-camp ration for the survival of night scavengers.

[Survival, a powerful human force, is originating other, more-positive initiatives as a response to the economic and social chaos. One creative scheme is the organization of bartering networks where people can exchange goods and services. Professionals, farmers, health service workers, homemakers, teachers, and people from all occupations participate in these exchanges. (*End of update by S. Kamenetzky*)]

### 1. Basic Sexological Premises A/B. Gender Roles and Sociolegal Status of Males and Females

In Latin American societies, the sexual behavior of women is always much more conditioned by norms, rules, regulations, and taboos than the sexual behavior of men. Argentina is no exception. Women were supposed to reach marriage in a virginal state, and then take care of the home, go to church, bear and educate children, and support their men in political, professional, and economic activities.

For a long time, this double standard was accepted without open criticism. But since the late 1940s, women have taken steps towards equal rights and independence from parents, spouses, and lovers. Of course, the first steps were taken by women with college degrees and businesswomen. They started painfully opening spaces in Argentina's political, economic, legal, and educational arenas. The governments have also opened opportunities for them in political and administrative positions. Today, we see women in university chairs, legal benches, large corporations, research laboratories, journalism, medicine, and all fields of art. However, it is still possible to observe discrimination against women and privileges given to men, not because of their excelling in a job or profession, but simply because they are males.

### C. General Concepts of Love and Sexuality

Virginity is no longer a condition for marriage. On the contrary, before deciding to engage in a permanent relationship, most women want to know their future spouse in bed. Argentine women are exercising their new roles in markets and societies with a flexible mental attitude that tries to integrate all aspects of their complex new situation. They know that it is not easy to balance their responsibility as mothers and lovers with their workplace obligations; they need to walk a tightrope and compromise, giving, when needed, more visibility to their men. They do not want to renounce breastfeeding their babies, because they know its importance for healthy development; hence, they are fighting to increase the availability of daycare facilities close to their workplace. Accepting now their share of responsibility in maintaining a healthy sexual life, they take the initiative in foreplay and learn techniques to introduce variety in sexual intercourse, while at the same time, they try to increase both

depth and scope in the emotional and intellectual communications within the couple.

For males, it is sometimes difficult to internalize these changes in the patterns of family life. However, most are starting to perceive that they enrich the relationship and are beneficial for both partners. The advantages of sharing two incomes, and participating in the rearing and education of the children, awakens emotions and provides a joy never felt before. Men are also learning to relax when making love, enjoying alternate passive and active roles, and accepting the fact that they can also be seduced and excited.

Women's liberation from submission to parents, brothers, and spouses is slowly harmonizing male and female energies and leading to a win-win situation for both, although the way to this end is not yet free of obstacles that will take pain to remove. Most of the population still believes in a double standard, but increased dissatisfaction with their sexual lives shows that their rigid positions of the past are cracking.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

The influence of the Catholic Church was and is hegemonic. Ninety percent of Argentina's population identify themselves as Roman Catholic, although the percentage of active churchgoers is much less.

A very conservative interpretation of Catholic dogma shaped life during colonial times. The powerful grip of the Church in Argentina's life was not relaxed after independence from Spain in 1810, nor when the country was finally organized as a modern state towards the end of the 19th century. Throughout the history of Argentina, secular powers have had to battle against a Church determined to maintain its hold on the institutions of civil life, like education, the availability of contraception and abortion, and even the registration of major events in the lives of the people, like births, marriages, and deaths.

The values and beliefs of Catholic doctrine have been inscribed in the minds of the Argentine people in a way that has proven difficult to delete. Outstanding among these are the Church's views on the social roles of males and females, its insistence on seeing the body as a root of evil, the need to free the spirit from the urges of the flesh, and sexual intercourse viewed as a curse brought upon humans with no other objective or justification than the preservation of the human species.

The influence of this dogma has led, as one might expect, to a dichotomous, often-schizophrenic pattern of behavior. Recently, three Catholic women in Uruguay, Argentina's neighboring country, investigated Catholic women's ideas on and practices of sexuality and maternity. Their sample included hundreds of women from Argentina, Uruguay, and Paraguay, countries which share a similar historical and cultural evolution. The women commonly expressed dissatisfaction with their sexual lives, and had developed the strategy of "not feeling" or "getting used to putting up with it." Others were oppressed by the idea that sex is sinful and felt bad after each sexual encounter. While many of the women interviewed felt God as a close friend, they viewed the Church as distant, disciplinary, and controlling.<sup>2</sup>

### B. Source and Character of Ethnic Values

Before the arrival of the Spaniards in 1516, Argentina was inhabited by fierce, indomitable tribes that valued their freedom and had learned to survive by adapting to the climate and resources of the different regions of the country. Except for the Northwest, which was conquered by the Pe-

ruvian Incas, the indigenous populations of Argentina did not develop the complex, and, in some aspects, advanced civilizations whose remains can still be seen in Mexico and Peru. The indigenous people who inhabited the pampas were mercilessly condemned to extinction by the thirst for land of the Spanish conquerors first, and the new South American nation later on. A few still survive in small reserves, especially in the Northeast, where the Jesuits had organized them in productive communities that were destroyed after the expulsion of the order in 1767 from Spain and all her colonies.

This, and the fact that Argentina never had a very active slave trade, explains the predominance of a population of European origin. Between 1850 and 1940, some 6.6 million Europeans joined the 1.1 million people already living in the country in 1850.<sup>3</sup> In 1991, Argentina's population was 32.7 million, having grown in the previous decade at the rate of 1.3% per year.<sup>4</sup>

From 1810, when the links with Spain were severed, to 1853, when a unified nation started its organizational development, Argentina was a field of constant quarrels among feudal provincial warlords and between these *caudillos* and the two aristocracies of money and of culture based in the port city of Buenos Aires. The two aristocracies were trying to control the chaos, often for their own benefit, and neglecting the needs of the rural population.

From 1853 on, Argentina moved solidly on the roads of social and economic development until it ranked in the early decades of the 20th century among the ten most-developed countries of the world. In his study of Argentine history, David Rock comments:

By the outbreak of World War I, per capita income equaled that in Germany and the Low Countries, and was higher than in Spain, Italy, Sweden, and Switzerland. Having grown at an average annual rate of 6.5% since 1869, Buenos Aires had become the second largest city of the Atlantic seaboard, after New York, and by far the largest city in Latin America. . . . By 1911, Argentina's foreign trade was larger than Canada's and a quarter of that of the United States. Argentina was the world's largest producer of corn and linseed, second in wool, and third in live cattle and horses. Though it ranked only sixth as a wheat producer, it was third, and in some years the second, largest exporter. Despite the competition for land from cattle and forage crops, the expansion of wheat farming after 1900 outpaced Canada's. . . . By and large, working-class conditions in Buenos Aires were much the same as in Western European cities. . . . By comparison with American [U.S.A.] cities in this period, Buenos Aires was relatively free of ethnic ghettos, and its highly mobile labor force made it also a city with little permanent unemployment.<sup>5</sup>

However, the brightness of these figures hides the shadows and contradictions of the Argentine society and economy of that time. As the same historian points out:

By 1914 Argentina had . . . evolved into an extremely mixed and diverse society. Across the regions extreme modernity and immutable backwardness coexisted. Expectations remained high that the imbalances would steadily recede as the present wave of growth continued, for there was still much to accomplish.<sup>6</sup>

In 1930, with the global economic crises and the first local military coup, the development trend stopped and reversed. Instead of being included among the high-income economies in the World Bank tables, Argentina is now among the upper-middle-income countries, where it shares positions with Brazil, Uruguay, Mexico, and Venezuela from

the American continent, Gabon and Botswana from Africa, and Latvia, Lithuania, Portugal, and Greece from Europe.<sup>7</sup>

The economic and cultural mismanagement of the country could not, however, destroy one of the main achievements of the organizational period of the country: the establishment of a gratuitous, compulsory, tax-sustained, and public education. Although the quality of education suffered from all those years of regressive, and sometimes fascist attacks, quantitatively it still is reaching the whole of the country, allowing everybody at least to read and write, and with these instruments, giving the vast majority of Argentines access to information offered by a large market of diverse publications. In 1990, the pupil-teacher ratio in the primary schools was 19 students per teacher; 1970 data put the ratio in secondary schools at 44:1, and for colleges at 22:1.<sup>8</sup>

Argentina can be seen as a large tapestry woven with different threads, each thread representing the diverse nationalities and cultures that came to the country from different regions of the world, among them Spaniards, Italians, British, French, Germans, Polish, as well as Jews and Muslims of different ethnic origins. The basic canvas on which this tapestry is woven is the native Argentines themselves, descendants of the early *conquistadors* and the populations that inhabited the land when the *conquistadors* arrived in the 15th century. While a few represent a pure white or native lineage, most are products of hybridization. The result is a tapestry without a clear-cut design, a tapestry whose lines twist and appear as a *sfumato*.

Because the plantation economy never was important in Argentina, the introduction of African slaves never reached large proportions. The few slaves that were in the country at the time of its independence from Spain (in 1810) were freed immediately after in 1813. They gathered in the suburbs of Buenos Aires, mixed quickly with the remaining population, and gave birth to a cultural group, the *mulattos*, who have produced their own artistic expressions. From their music evolved the tango of which I will say more later.

Jorge Luis Borges, a great Argentine poet and writer, saw Argentina seesawing between the search for progress through mimicking foreign cultures, especially the European and North American cultures, and a deep-seated provincialism that refused to change inherited colonial patterns. Borges sought to transcend these trends by developing an ability to understand and talk with both the universal and the local.<sup>9</sup>

The period of accelerated economic development and social transformation (1860-1930) was a period of mimetism promoted in the school system and marketplace. During this period, provincialism found refuge among limited social groups at both ends of the economic spectrum. At the bottom level, it translated into the crude behavior of the persecuted *gauchos*, the *mestizo* cowboys of the Argentine pampas, and of the *compadritos* of the suburbs of the large cities, whom Richard Powers, a dance historian at Stanford University, defines as "a folk antihero somewhere between a bully, a thief and a pimp."<sup>10</sup> At the upper economic scale, some large land owners and church members remained nostalgic of bygone days when they were masters of the country and kept the mind of the people restrained by dogmas and myths.

Paradoxically, the provincialism of the lumpen-proletariat engendered a form of music, the tango, that would acquire universal acceptance and soon invade the salons of the sophisticated outer-oriented aristocracy. The tango expresses the sadness of displacement: from rural fields to crowded suburbs for the natives and for the immigrants from their many diverse landscapes of Europe. It also mixes instruments from the natives—the guitar—and the immigrants—the fiddle and the *bandoneón*, a concertina-

like German instrument. The words often speak of crude, brothel-oriented sex, and of betrayal and revenge, but there is also tender romance and the longing for stable relationships. Some tangos shift from individual feelings to social criticism and become vitriolic pictures of a face that Argentina hides under its economic and cultural exploits.<sup>11</sup> A few examples in Table 1 illustrate this. Somehow, the chronology of these examples reflects a parallel slow zigzagging movement of Argentine society towards more gentleness.

The tango was created by males for males. It reflected well the traits of the social structures among the poor urban population and those immigrants who decided to join them. The tango muses about the hybridization, the resentment, the sadness, and the longing for women that were scarce, because most of the immigrants who stayed in the city were single, while those who came with families looked for a piece of land in the countryside. The hybridization in the poor neighborhoods of Buenos Aires produced insecure males who resorted to macho postures when observed or ridiculed by their peers.<sup>14</sup>

[*Comment 1997*: In addition to the value of *machismo* mentioned above, Argentine sexual attitudes and behaviors are strongly influenced by three other values—*marianismo*, *ediqueta*, and *pronatalism*—which are commonly shared with some minor variations across the Latino world of South and Central America. To avoid duplication in several chapters, these four basic values are described in detail in Section 1A, Basic Sexological Premises, in the chapter on Puerto Rico in this *Encyclopedia*. (*End of comment by R. T. Francoeur*)]

Since 1953, provincialism has made repeated attempts to regain the dominant position it held before 1853, but it was often infiltrated by foreign fascist and Nazi influences. These attempts, beside damaging the country's cultural and economic development, succeeded in drastically changing the image of Argentina in the rest of the world. David Rock's seminal book on Argentina summarizes this change in two beautiful paragraphs.<sup>15</sup> Before 1930:

Indeed, for many decades many Europeans believed that Argentina offered an opportunity equal to, if not greater than, North America. The *pampas estancieros* enjoyed the reputation that Texas or Arab oil magnates have today, and the expression *riche comme un Argentin* remained a commonplace among the French until the 1930s. In 1907, George Clemenceau perceived the genesis of a great new national community originating from a spirit he equated with Manifest Destiny in the United States. "The real Argentinio [sic]," he commented, "seems to me convinced there is a magic elixir of youth which springs from his soil and makes of him a new man, descendant of none, but ancestor of endless generations to come." The Spanish philosopher José Ortega y Gasset issued a similar pronouncement in 1929. The Argentine people, he declared, "do not content themselves with being one nation among others: they hunger for an overarching destiny, they demand of themselves a proud future. They would not know a history without triumph."

In his second paragraph, David Rock reflects on the Argentina of 1987:

Such copious expectations and laudatory reflections form a stark and bitter contrast with more recent judgments. For at least the past two decades economists have classified Argentina in the underdeveloped or "third" world, and by the 1960s Argentina was becoming a byword for political instability, inflation, and labor unrest. During the 1970s a

**Table 1**  
**Sexual Implications of Tango Music**

Tango	Spanish Text	Translation
(1905) <i>La Morocha</i> Words: Angel Villoldo Music: Enrique Saborido Subject: feelings of a woman from Buenos Aires (as seen and written by a man, of course!)	Soy la morocha argentina, la que no siente pesares y alegre pasa la vida con sus cantares, Soy la gentil compañera del noble gaucho porteño, la que conserva el cariño para su dueño.	I am the dark Argentine, who never has sorrows and happily goes through life singing her songs. I am the gentle companion of the noble “gaucho porteño,” who keeps her love for her master.
(1924) <i>Griseta</i> Words: José González Castillo Music: Enrique Delfino Subject: prostitution	Mezcla rara de Museta y de Mimi con caricias de Rodolfo y de Schaunard, era la flor de París que un sueño de novela trajo al arrabal. Y en el loco divagar del cabaret, al arrullo de algún tango compadrón, alentaba una ilusión: soñaba con Des Grieux, quería ser Manon.	Strange mixture of Museta and Mimi with strokes from Rodolfo and Schaunard, <sup>12</sup> she was the flower of Paris that a romantic dream brought to the suburb [of Buenos Aires]. In the crazy rambling of the cabaret, with bully tangos for lullabies, she was cherishing an illusion: she was dreaming with Des Grieux, wanting to be Manon. <sup>13</sup>
(1926) <i>Íntimas</i> Words: Ricardo Luis Vignolo Music: Alfonso Lacueva Subject: romantic	Hace tiempo que te noto que estás triste, mujercita juguetona pizpireta Que te pasa? Desengaños que has sufrido? Hay recuerdos de amor inolvidables . . . Y hay vacíos imposibles de llenar!	Since long I see you sad, little playful and lively woman. What happens? Disappointments that hurt? There are memories of love that are unforgettable . . . And there are voids impossible to fill!
(1928) <i>Silbando</i> Words: José Gonzalez Castillo Music: Sebastián Piana y Cátulo Castillo Subject: betrayal and punishment.	Una calle . . . Un farol . . . Ella y él . . . y, llegando sigilosa, la sombra del hombre aquel a quien lo traicionó una vez la ingrata moza . . . Un quejido y un grito mortal y, brillando entre la sombra, el relumbrón con que un facón da su tajo fatal.	A street . . . A street light . . . She and he . . . and, silently approaching, the shadow of the man that she once unmindfully betrayed . . . A whine, a deathly scream, and shining from under the shadows, the flash of bright light of a knife piercing its fatal stab.
(1933) <i>Si Volviera Jesús</i> Words: Dante A. Linyera Music: Joaquín M. Mora Subject: cultural criticism	Veinte siglos hace, pálido Jesús, que miras al mundo clavado en tu cruz; veinte siglos hace que en tu triste tierra los locos mortales juegan a la guerra. Sangre de odio y hambre vierte el egoísmo.	For twenty centuries, pale Jesus, you are looking at the world nailed to your cross; for twenty centuries in your sad land crazy mortals play war. Egoism is shedding blood of hatred and hunger.
(1968) <i>Balada para un Loco</i> Words: Horacio Ferrer Music: Astor Piazzolla Subject: modern, pure poetry.	Quereme así, piantao, piantao, piantao . . . Abrite a los amores que vamos a intentar la mágica locura total de revivir . . . Vení, volá, vení!	Love me as I am, wild, wild, wild . . . Open up to love, we will attempt the magic insanity of a total renovation . . . Come, fly with me, come!

sudden procession of horror stories emanated from Argentina—unbridled popular riots, guerrilla warfare, assassinations, abductions, imprisonment of dissidents, institutionalized torture, and eventually mass murder. For a time Argentina elicited a single association: *los desaparecidos*, the thousands of students, workers, writers, lawyers, architects, and journalists, men and women alike, who had “disappeared,” simply vanished without trace. At this time too, Rio de Janeiro, Mexico City, Los Angeles, Paris, New York, London, and Rome became refuges for a vast Diaspora of political and economic exiles from Argentina.

David Rock asks: What went wrong? My response, based on my own and my husband’s studies of the socioeconomic evolution of Argentina, and our existential experience there, is that the 1930 regressive coup stopped the process by which Argentina, inspired by Jeffersonian philosophy, was con-

stantly redesigning her coat of laws and regulations in order to adjust to changes in her growing physical and economic body, these changes being in turn induced by changes in the global economy and by the scientific and technological advances that humankind was achieving. That coup pushed Argentine society into the seesawing mentioned above, and from 1930 to 1983, with successive coups, the regressive forces became increasingly powerful.

Since 1983, Argentina is slowly and painfully regaining its democratic structures and its ideals of constant progress of both economies and minds. Will she be able to go beyond mimetism and provincialism and realize the synthesis that Borges and many others were longing for?

This summary of Argentine evolution as an independent nation should help readers to see Argentine sexual mores as the result of a complex mix of influences from the regressive and progressive periods of Argentine history. More details

on Argentine history and sociology will be given in the following sections of this chapter when required for a better understanding of a particular subject.

### 3. Knowledge and Education about Sexuality

#### A. Historical Perspectives

Argentina really started its life as a modern country in 1853, when a generation of progressive politicians organized the country, promoted public education, and produced a radical transformation in the economy and society.

A census in 1869 reveals that:

four-fifths of the population was illiterate and housed in mud and straw shacks. Twenty years later, although conditions varied greatly among the regions, in some areas education, housing, and consumption standards bore comparison with the most advanced parts of the world. By the late 1880s, the nation's population was increasing by threefold every 30 years.<sup>16</sup>

Outstanding among those new politicians is Sarmiento, an Argentine educator who was president of the republic between 1868 and 1874. In his inaugural address he said: "We need to transform the poor 'gauchos' into people useful to society. For this purpose, the whole country should become a school."<sup>17</sup>

In 1847, Sarmiento had traveled through Europe to learn of the successes and failures of educational systems. Nothing of what he saw satisfied him. He wanted to know of a school system capable of developing reasoning power in the magical and mythical minds of poor peasants.

Then, one of his friends suggested that he visit the United States and get acquainted with the work that Horace Mann was doing in the school system of Massachusetts. He crossed the Atlantic and visited not only with Horace Mann, but also with other brilliant Bostonian Unitarians who were meeting at the Divinity School of Harvard, among others, Henry W. Longfellow and Ralph W. Emerson.

The friendships he established then were further cultivated during his second sojourn as Argentine Ambassador to the United States, from 1864 through 1868. When Sarmiento assumed the presidency of Argentina, Mary Mann, the widow of Horace Mann, was instrumental in sending to Argentina a group of 65 American schoolteachers, with whom Sarmiento and his Ministry of Education, Nicolás Avellaneda, who succeeded Sarmiento as president of Argentina, began to organize the country's educational system. Primary schooling was free and compulsory for all. The number of well-furnished schools constantly increased, and teachers, who were quickly formed by their American counterparts in normal schools, were conferred high social status and adequate monetary rewards.

Prior to this, the monopoly of the Catholic Church over education kept the common people ignorant of the advances in science, technology, and political organizations that were taking place in the world. The education of people of certain rank and fortune was a little better, but ineffective for the development of the country. Only a small number of young men, and even fewer young women, managed to break the fences that an education based on theology created in their minds. However, these few opened the doors to the outside world, other cultures, and great foreign thinkers. Even if they were studying in a Church-managed university, they would smuggle in, often with the help of prominent and open-minded priests, books from Jefferson and the great philosophers of the French Revolution, which they secretly read and discussed with friendly priests.

All this changed when Sarmiento and Avellaneda decided to organize the new school system to provide an education for life in the here and now. It is for this reason that Sarmiento and Mrs. Mann agreed that all the schoolteachers sent from the United States would be females, so as to serve as role models for Argentine households. Sarmiento and Mrs. Mann wanted them to bring new knowledge through words, and a new vision of life through the example of their lives. Since then, the children of poor and uneducated native peasants, and of equally poor and uneducated immigrants, had access to scientific knowledge and learned about their own nature, about what it meant to be human. They would learn how babies are born, how to cut their umbilical cords, how to change and clean their diapers, and how to take care of babies and their own bodies.

In the years of political freedom, social progress, and economic growth that followed, issues on sexuality and the status of women began to be discussed. They were introduced mainly by female politicians of the Socialist Party, and by the youth who by 1918 had achieved success in their fight to change the university system that resisted Sarmiento's reform and, although no longer managed by the Catholic Church, had remained scholastic. It is interesting to observe that while the socialists were bringing a message of sexual liberation, the communists, when they split from the democratic socialists, adopted a moral code based on strict monogamy.

Sarmiento's progressive work on the schools affected many other aspects of Argentine life. One of these aspects was a surge in bookstores that would offer writings of the most-varied orientation, writings to which youth had access and which often supplemented and amplified the information they were given at school.

The 1930 military coup started a slow process of reversing Sarmiento's ideas on education. The purpose of education now focused on keeping pace with the advances in the natural sciences and technology, while preventing students from acquiring a vision of life that would contradict the obsolete moral codes of a narrow theology. However, the alliance of the most-reactionary members of the Catholic hierarchy with the military never managed to take the schools completely backwards. Argentina's life had irreversibly changed, and what was not taught in the classrooms, the students would learn in their households and in the streets, although sometimes the information would reach them distorted or incomplete. For quite a while after the first military coup, books on sexuality could still be freely obtained in the bookstores. Later on, more-reactionary military coups would censor even this source of information.

#### B. The Situation Today

Currently there are no sexual education programs at the primary-school level. It is left to the teachers to give some information as part of the classes on biology. In the few cases in which a teacher decides to do so, it is no more than a description of the reproductive organs in plants and animals, and some references to the role of ovaries and testes in human reproduction, with no explicit mention, or even less, showing of pictures of the genitals.

It would be easy, however, to introduce full courses on sexual education in all Argentine public schools. All that is needed is an order of the National Educational Council, which by law decides on the nature and extension of primary-school programs. The members of the council are appointed by the president of the country following advice of the ministry of education. Once decided at the level of the central government, there are no elective local educational boards where parents could either oppose or suggest the

idea of providing sexual education to the students. The provincial educational councils have jurisdiction only over provincial schools, not on those established by the national government. Although a few sophisticated private schools have developed advanced programs of sexual education, these schools reach only a tiny minority of children of rich urban households.

The same possibilities of organizing national programs of sex education are open for secondary schools (high schools), because they too report to the authority of the central government. But here again, the situation changes from one school to the other, depending on its director (principal), and is, in general, well behind the demands of the present. Neither primary nor secondary schools have recovered yet from the regressive trend imposed on them by decades of regressive military coups and brief civilian intervals.

For further information about sex education, see Section 5, Interpersonal Heterosexual Behaviors, below.

#### 4. Autoerotic Behaviors and Patterns

In Argentine society, despite official Catholic negative views of sex outside the marital union, it is usually seen as normal for preteenage boys to play exploratory games with other boys, and girls with other girls. These games are seen by most parents as part of the process of growing up. It allows the child to reassure him- or herself of the normality of his or her body by comparing it with the body of a friend, relative, or schoolmate, although sometimes, instead of being a reassurance, it could generate anxieties, as when girls compare the size of their breasts and boys the size of their penises. It is also a source of anxiety when a boy feels sexually excited by another boy and fears he is becoming gay.

Freedom for these kinds of exploratory games was greater in bygone days when Argentine society had less violence, and drugs were not as common. In the past, boys would gather in parks and compete to see who threw their semen further while masturbating. Parks were also a place where couples would meet for sexual encounters, and teenagers would peep on their activities without disturbing the partners.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children

See Section 4 immediately above.

#### B. Adolescents

What is known about the sexuality of Argentine adolescents is limited to anecdotal reports, most of which deal with middle- and upper-class urban teenagers, rather than with rural poor and urban street children. In this limited context, my personal experience in the 1970s in developing a sexual education program for students, ages 13 through 17, of middle-class households may be informative. This program was for a prestigious coed secondary school of suburban Buenos Aires, the Colegio Nacional San Isidro. After a dialogue with the parents aimed at interesting them in the sexual education of their sons and daughters, an integrated approach led the students to discuss biological and social aspects of sexual behavior in relation to their personal development and the establishment of interpersonal relations.

Although the students were offered the possibility of presenting their questions anonymously in writing, they preferred to come out openly with their questions. Their greater concerns were with the emotional and spiritual aspects involved in a sexual relationship. One vividly remembered example is typical of the concerns and perspective these youth had. A 15-year-old male student asked: "Can you know when your partner is pregnant without perform-

ing a lab test?" I left the student to share first his own views, and his answer was: "I think that when one is deep in love, one can detect subtle changes in mood and behavior of his lover that indicate a potential pregnancy."

Among the biological issues, girls were more interested in knowing more about the physiology of menstruation, pregnancy, and delivery, while boys wanted to reassure themselves that masturbation and nocturnal involuntary ejaculations were normal and could be enjoyed free of guilt and shame. Both sexes converged in expressing that they were facing the awakening of their sexual potential with anguish and feelings of being all alone in this experience. They all needed to be reassured that there was nothing abnormal in their bodily sensations, and in the fantasies and feelings these sensations often evoked.

In 1931, when Argentina's freedom to experiment with and discuss these subjects was not yet fully eroded, an Argentine scholar, Anibal Ponce, studied the problems of growing up in Argentine society in a book titled *Ambition and Anguish among Adolescents*. Regarding the common feelings of being isolated and alone, he said:

With a personality not yet formed, and while trying to awkwardly build the structures of his ego, the adolescent suffers more than anybody else, the anguish of solitude, because he or she needs more than anybody else the support of the others.<sup>18</sup>

Unfortunately, since my experience in 1970, the situation has deteriorated for Argentine adolescents, who find in their society less and less support for their existential anguish. In 1993, while researching this paper, this deterioration was obvious in my talks with adolescents. In a meeting with a group of them, ages 15 to 17, they told me about the typical pattern of a course on sexual education in a school that chooses to implement it. The teacher does not allow questions from the students during the presentations. At the end, he agrees to receive a few. Sensing that the instructor is insecure and unable to facilitate a dialogue in depth, the students then prefer to end the class quickly, declaring they have nothing to ask.

The teenagers confessed that it is attitudes like this, repeated in their homes, that make them view society and family cynically. Surrounded by injustice and hypocrisy, they feel they can do little to get the adults to change. They were, for instance, very disturbed by the expulsion of two students from their schools when they became pregnant.

The situation is no better at the college level. There are no courses of sexual education in Argentine universities, except, and this only since the 1960s, at their schools of medicine (see Sections 11, Sexual Dysfunctions, Counseling, and Therapies, and 12, Sex Research and Advanced Professional Education, below).

#### *Premarital Sexual Activities*

Sexual behavior differs from one group of Argentine youth to another depending on their social class and place of residence. Social belonging and location determine different levels of knowledge, repressions, and attitudes towards life in general, and sex in particular.

In the larger cities, like Buenos Aires, Cordoba, Mendoza, Rosario, and Santa Fe, youth are exposed to a cosmopolitan vision of life and receive more information on sex and sexuality. They are also freer to experiment with this vision and information than youth living in smaller towns, where family control is strong and where cultural patterns are rather narrow.

For rural youth, it is quite different. On the one hand, they receive information on sex and sexual behavior just from observing nature in which they are totally immersed, and from

the relation between genders in the family where members enjoy little privacy, if any. On the other hand, the prevailing Catholic Church writes deep into the unconscious of every boy and girl, but especially of the latter, ideas of guilt and sin that trouble the pleasure that the early awakening of the senses in the rural milieu can bring. Neither boys nor girls are taught about the relational and recreational aspects of sex, and the possibilities offered by modern technology for keeping under control the reproductive aspects. Hence, the purely instinctive sex leads to pregnancy, confronting the boy with the responsibility of an early marriage that he is not yet ready to assume, and the girl with the responsibility of an unwanted motherhood for which she also is not prepared.

Youngsters in the big cities have easy access to magazines where sexuality is soberly analyzed, even if their parents and the Church hide such information from the youngsters. They know about contraceptive techniques and can acquire contraceptives in the pharmacies without problem. However, the guilt and shame associated with sex are also present here and, as usual, instead of promoting either safe sex or abstinence, these only lead to quick sexual contacts. Under the uncontrollable pressure of a hormonal flood released in a hurry and in the most unromantic places, boys and girls neglect prevention of pregnancy and disease. For youth in the poverty belts around the big cities, the situation is compounded by the lack of money. Even if they would prefer to use contraceptives, they cannot buy them and there are no places where they can get these free. Only the army distributes free condoms to the soldiers when they leave the barracks on their weekly leave days. Knowing the limited budget for healthcare within the army, the Church has not complained to the military, with which they keep good relations, pretending instead to ignore a practice that otherwise they could not openly accept.

### *First Sexual Experiences*

In late 1993, the author had long conversations with different groups of young people in Buenos Aires. These mainly middle-class youths, ages 18 to 24, were encouraged to bring to the meetings problems related to their sexual life and development.

One subject recurrent in these meetings was their difficulty in establishing a fruitful dialog with their parents. Repeatedly, they expressed regret that aspects of their lives that engender so many anguishes and fears could not be explicitly discussed in the intimacy of their households.

Contrasting the information gathered in these meetings with my previous experience in medical private practice in Argentina, it became clear that sexual activities are initiated at increasingly earlier ages. Most of the interviewed youths defined their first experiences as disappointing. Asked why, they always responded that it was so because of a lack of romance. Most boys had been initiated in whorehouses, under the pressure of fathers who would arrange the visit, and this happened without a previous intimate talk that could soothe the anxiety of the teenager by discussing what he may expect to happen and how to protect himself from diseases, mainly AIDS, about which the teenager had already heard at school. Such experiences, they said, left bitter memories, which for some disappeared when they fell in love and discovered the ingredient they were longing for: romance. The boys all agreed that the experience at the whorehouse was felt as an obligation to fulfill in order to affirm their virility.

Among girls, the memories of their being deflowered were somewhat different from the boys. Some did not bother to get prior information about the meaning and the possible consequences of their first sexual encounter. They perceived their first intercourse as the fulfillment of a strongly felt de-

sire that, at the same time, would transgress a social taboo. Hence, they reached the situation with many expectations, and as much anxiety as boys said they did. For other, more-entrepreneurial-type female students, it was a calculated action to get rid of their virginity, which they perceived as an obstacle to enter into a more mature and fulfilling sexual life. These girls sought information from doctors in private gynecological practice and acquired the necessary contraceptive technology to protect themselves.

### *Reflections about Sex Policies and Politics from Meetings with Youth*

The young's perception is that society is not providing appropriate responses to their needs of knowing more about sexuality and sensuality. The information they get at home, school, and church is incomplete and biased by the prejudices of the adults. Although short articles dispersed in different magazines are useful, they cannot fully fill the gap. They would prefer an honest, open, uninhibited dialogue with parents, teachers, and priests.<sup>19</sup> They see the AIDS epidemic slowly changing the situation, although they consider that their survival is in danger, because society is reacting too slowly and is still not assuming full responsibility, preferring to stick to old patterns of thought and behavior rather than save lives.

The more-enlightened youth perceive many deficiencies in the information process, deficiencies that they say may risk the future of a stable relationship. For instance, they are not told that, although syphilis and gonorrhea can still be easily cured, these diseases may make it easier for the AIDS virus to invade the immune system. Girls are not told that chronic or repeated inflammation of the genital tissues may lead to infertility and ectopic pregnancies.

A generalized opinion among youth is that it is necessary to invest in improving and updating education and information to secure the future of the country. The impression left on me by my meetings in Buenos Aires is that middle- and upper-class youth are slowly evolving from a macho behavior, which still is deeply programmed into their minds by their acculturation, to an attitude of better understanding of their own and the opposite sex's sexuality. They are learning to integrate male and female traits in their own personality, and to harmonize the roles of males and females in the marketplace, households, and political arenas. They are also starting to understand and respect those who show preferences for intimate relationships with persons of their own sex.

However, the majority of the Argentine population is unchanged. It is unclear at this time whether the elite youth of the urban middle and upper class, as they mature, will influence the democratic process that reopened in 1983 to introduce changes in the educational and legal systems that could usher larger groups into a new vision of their sexual life.

[*Update 2003:* Argentine teenagers face serious risks in their sexual life, especially concerning sexually transmitted diseases and premature maternity. Those risks arise from the lack of information, of deficient health services, and of disregarding responsibilities towards oneself and one's partners.

[The health and sanitary authorities are not lending sufficient attention to these risks, despite statistics indicating that the number of cases of AIDS among Argentine children is the highest in Latin America. Their mothers, who often are less than 20 years old, infected about 90% of those HIV-positive children (CRLP 2000).

[Around 86% of women between 15 and 19 years of age use contraceptives in the City of Buenos Aires, while the percentage is much smaller in the rest of the country—between 31% and 45%. However, these figures do not indicate the degree of responsibility and of knowledge with which

those contraceptives are being used. Independently of their diverse lifestyles, most youngsters, when interviewed, express needs for emotional support and for a complete sexual education that should include knowledge on contraceptive technologies, but not be limited to this subject alone. Public health services do not satisfy these needs.

[During the interviews sustained while writing the original chapter for this encyclopedia, youngsters expressed different approximations to sexual activity. But all of them—those who had begun to exercise their sexuality at a very early age as well as those who were not yet active, those who had multiple partners as well as those in more-stable and long-term relationships—confessed not to know much about their own bodies and about the sexually transmitted diseases. They were ashamed to seek preventive information or early treatment from medical services. The economic crisis that the country has suffered, since the 1997 publication of this chapter, adds poverty to ignorance in increasing the emotional and physical damages that Argentine youth is suffering.

[Argentina should take immediate measures to establish programs of sexual education in all the country, teaching youngsters how to protect themselves, resist pressures when sexual activity is not yet desired, and diminish the risk of their sexual encounters by negotiating with their partners. The provinces of Río Negro, Neuquén, and Mendoza have assumed leadership in this direction by establishing services in the area of sexual and reproductive health for adolescents by law.

[Those who oppose these programs argue that discussing human sexuality at an early age awakes prematurely the curiosity of the youngsters and advances their initiation in sexual activity. After evaluating 1,000 sexual programs of education in diverse countries of the world, the World Health Organization has arrived at the contrary conclusion. Courses in sexual education do not advance the age at which sexual activity usually starts in the respective culture. Moreover, in some cases, the major and better knowledge defers the experimentation (Population Information Program 1995).

[Because young Argentines are making decisions with neither knowledge nor responsibility, they compromise their health and the economy of their homes. Because the Argentine State ignores its role in the sexual education of its youth, it compromises the future of the country with a long-term social and economic overload of sexually transmitted diseases and unwanted pregnancies. (*End of update by S. Kamenetzky*)]

### C. Adults

#### *Marriage and the Family*

Mature people, who married before the recent shift in sexual behavior towards more openness and gender equity acquired the intensity and spread they now have, are being bombarded by the mass media and performing arts with messages that carry a heavy sexual and sensual content, telling about new techniques for lovemaking, new roles within the couple, new risks in extramarital relationships, and so on. These issues are also conversation matter among friends and families, and at business meetings and almost any social gatherings.

Inevitably, mature couples start imitating the open and direct language of their younger counterparts. This, and the perceived risks of extramarital affairs since the AIDS epidemic, is leading them to recreate their sexual life and expand their erotic horizon. They are discovering that fantasy and playfulness within the couple are the best antidotes of boredom. Men are learning to ask their spouses to use new

forms of stimulation with them; they are learning that it is more important for them and their partners to be mutually tender and understanding than it is to count their performance points. Oral sex and anal intercourse are losing their status, especially among younger Argentines, as techniques practiced only with prostitutes. Masturbation is increasingly viewed not only as a form of self-satisfaction, but also as a means of sharing sensual and orgasmic experiences without penetration.

#### *Extramarital Sex*

We still find married men who maintain a longstanding relationship with a second woman, sometimes with the knowledge and approval from his spouse, and even of his grownup children. For some couples, it is a solution that keeps their marriage alive: The man is free to express sexual needs that he does not dare to reveal to his wife, and the woman is relieved from pressures to change her sexual behavior, a task that for her heavily structured personality may be so painful that she prefers to share her partner with another woman. These are generally women with limited horizons in their lives and a very low sexual appetite.

Fewer are the number of couples where the man and woman both have temporary extramarital relationships under mutual knowledge and agreement. This is the most risky modality in today's Argentina, because many of the men resist the use of condoms and ignore whether their occasional partners may be HIV-positive.

#### *Older Adults*

The new ways of thinking and making love are also resounding among couples over age 55. Often it is their own children and grandchildren who awaken them to the new sexual behavioral patterns. In Argentina, there is still strong interaction among the generations, and the oldest easily perceive the freedom that the new generations have won. Nowadays, a granddaughter moving from home to the apartment of her boyfriend is not grounds for scandal. And grandparents do not stay away from a wedding where the bride in a long white gown shows signs of pregnancy.

Indeed, these are open-minded elderly who keep their own sensuality and vitality alive; they are not ashamed to show tenderness between them through hugging and kissing. These are people who consult the urologist at the first signs of impotence in the man, or the gynecologist when the woman's sex drive declines. Most elderly couples, however, have not reached this openness. They let their sexual drive disappear without seeking remedies. Many drift into depression and develop hypochondriac behavior.

#### *Incidence of Oral and Anal Sex*

In Argentine society, both oral and anal sex carry a negative connotation, especially for older persons and among the traditional middle- and upper-class families. Argentine youth, however, seems to be taking a new look at these sexual expressions, according to what they said at the meetings.

Girls were divided in their responses. One group accepts and practices oral sex as a way of avoiding the risk of pregnancy and maintaining their virginity until marriage. For another group, it was a more-intimate form of sexual relationship, somehow more romantic than intercourse. Youth holding this latter view believed that oral sex should only be engaged in with a stable partner, and not in the first exploratory encounters. Some other girls joined some boys in rejecting this way of expressing love to a partner, and thought that only prostitutes could practice fellatio on boys. The older the boys are, the more easily they accept oral sex as a normal part of dating and within marriage.

Prejudices against anal sex are even stronger among older adults, and even the younger set. A minority of the youths in the groups I spoke with accepted anal sex, and then only for fully committed couples and not as part of dating. The boys agree that: "A woman will never ask for it." The old injunction against sodomy is still well alive in their subconscious.

### 6. *Homoerotic, Homosexual, and Bisexual Behaviors*

Argentina still is, to a large extent, a macho society, and machos detest gays, whom they see as effeminate. For a majority of the population, including physicians and psychologists, homosexuality is felt to be a perversion and a disease. Teenagers who feel a strong attraction to members of their same sex experience, first, extreme confusion about their feelings. When the picture becomes clear in their mind, they awake to the unpleasant reality of belonging to a group that society marginalizes.

Gayness, however, is increasingly being tolerated, and a gay movement is gaining increased strength and fighting for its rights, which ten years ago was impossible even to think of. The scorn for gays is higher among lower- and middle-class men than among members of the upper class. There always were artists and writers whose homosexuality was known among the elites, but carefully kept out of scrutiny from the media and the masses.

Lesbians are still not too visible in Argentine society, in keeping with the Victorian tradition, which never wanted to think about sexual activities in a relationship between two females.

Contrasting the social attitude that openly scorns gays, although sheltering them when they belong to special groups, we see Argentines as quite uninhibited in publicly expressing tenderness and affection among people of the same or different sex. Men of all ages will embrace and kiss each other when meeting, and there are also exchanges of kisses among men and women who are relatives or friends, and, of course, among women themselves. The increased publicity about the spread of AIDS has not acted as a deterrent of these affectionate expressions.<sup>20</sup> (See the discussion of same-sex sex rehearsal play in Section 4, Autoerotic Behaviors and Patterns.)

To be gay or lesbian in a repressive environment whose stereotypes are the macho man and the submissive reproductive woman is not an easy task indeed. Anyone who deviates from a strict heterosexual behavior is ridiculed: A gay is not a man, a lesbian is a degenerate woman. However, to be bisexual is not so annoying, as long as one's same-sex behavior is kept very private.

The young gay faces the hostility of society by withdrawing from his heterosexual circles to a subculture where he can find both lovers and understanding study and sport mates. Successful professionals have solved their problems by choosing to retreat into more-accepting cultures where they can be openly gay without jeopardizing their future. In private discussions, young gays report that their most traumatizing experience is when they decide to open up to their families and are rejected.

With a population of 12 million in Buenos Aires, one would expect a larger number of gay and lesbians than the numbers one can estimate from the few who have left the closet. These few, however, are very active in promoting the rights of the whole community. They speak for the visible and the invisible, helping the latter to openly assume their identities. They have formed organizations that have been given legal status, they have an official meeting and business place, and they publish and distribute documents to the

press and public. In these documents, they tell of their suffering, explain their lifestyles, and ask support for their fight for more legal freedom to be themselves and for equal rights with people of other sexual orientations. There is a whole gay and lesbian culture that is emerging, with gay masseurs who announce their services in the most-important papers and gay bars and discos. (I have not heard of any lesbian bar.)

I also did not find neighborhoods exclusively or predominantly homosexual. Most mix with the mainstream population of their own social class. Those who have a well-defined and highly visible economic or political role are still in the closet. The same is true for members of the armed forces and the Church. To confess their lifestyle and orientation would be suicidal. On the other hand, among artists, writers, moviemakers, actors, dancers, and university professors, to admit openly they are gay may bring rejection from the most conservative members of society, but they end up being accepted, and sometimes even see their popularity increase.

Who are those conservative members of the Argentine society? First, of course, are the orthodox Catholics who still believe that sexuality and sensuality ought to be repressed to achieve spiritual development. If all sexual and sensual manifestations are sinful except in marriage, homosexuality is particularly so. It is unnatural, a perversion of nature. Second, the orthodox Jews who still follow the Torah's abomination of this kind of relationship that in the past deserved capital punishment.

Third, in the domain of medical science, many have not yet evolved to a humanist, integrative, harmonizing approach. Orthodox psychoanalysts still consider consistency in the male or female physical and mental development as essential to a normal personality. They believe homosexuality originates in conflicts and traumas that therapy can face and resolve. In the chairs of sexuality of the schools of medicine, complex biological schemes are used to disguise the view among traditional physicians that homosexuality violates the laws of nature.

The irrational fear of physical love between partners of the same sex still pervades Argentine society. The overall situation can be described with the same words that Erwin J. Haerberle used to describe the prevalent attitude of society in the United States 20 years ago:

Typically, they do not know any homosexuals, do not want to meet them, but would like them to be controlled, contained, put away, locked up or eliminated.<sup>21</sup>

Argentine society still is far from taking seriously the role of sexuality in the physical, emotional, and spiritual life of men and women. It still has to reflect on other words of Haerberle:

The ultimate liberation of both homosexuals and heterosexuals can lie only in the abandonment of all labels and in everyone's freedom to explore his own sexual potential, whatever it may be.<sup>22</sup>

### 7. *Gender Diversity and Transgender Issues*

Argentina was always a male-dominated society where those who do not behave in the macho way were scorned by men and women alike. However, with the return to democratic freedom, and TV messages from foreign countries penetrating into the intimacy of households, attitudes are slowly changing. Thus, the erotic minorities have had a chance to come out of the closet and express themselves.

For the moment, the masses react to them with neither violence nor acceptance, rather with curiosity. In the world of the performing arts, cases are well known of transvestism, and because these persons are celebrities, the public accepts them with smiles and gentle jokes.

If things are not easy for noneffeminate gays or nonmasculine lesbians, they are even more difficult for those who identify themselves with the opposite sex in manners and clothing, and even more so for those who want to see their bodies change towards the features of the other sex.

Some heterosexual transvestites have acceptance from their mates, and sometimes from their children, to cross-dress in the intimacy of their homes. In this way, men, who seem to outnumber women in practicing this sexual behavior, can safely express the feminine part of their personalities. In their work and social environment, these men usually return to macho stereotypes.

Those who desire to change their sex physically and be socially recognized as a member of the other sex should seek legal authorization for both procedures, the surgical acts and biochemical treatments needed, and the right to change names and status. Usually the authorization is denied on the basis of Article 91 of the Criminal Code that considers them as mutilations that would affect the capacity of women to engender children, which is considered as their primary social role. The law punishes with jail the patient who has changed sex and the doctor who performed the operation; the medical license of the latter is also revoked.

Change of sex in Argentina has a tragic history. In 1958, a prestigious physician, Dr. Defacio, went into self-imposed exile after suffering several years in prison because he had changed the sex of a man, Mauro Fernandez Vega, who, in turn, was never able to get new identity documents. Now another man, Javier Alberto Urbina, who claims to feel uncomfortable with his sexual identity and desires to be transformed into a woman, has started a public campaign for the right of any person to own his or her body. For this purpose, he has challenged government and society alike, standing before the doors of the Argentine Congress with billboards asking the abolition of Article 91. The Permanent Assembly for Human Rights is supporting his actions, according to a letter he proudly exhibits. In the letter, the President of the Assembly acknowledges Mr. Urbina's contributions to the cause of civil rights and individual freedom. The letter says that Mr. Urbina's actions may result in the legal recognition of the right to decide freely on matters that concern one's own body. However, legislators seem insensitive to this claim.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sexual Behaviors

#### *Sexual Abuse and Incest*

There are no statistics on incest. Professionals in the medical and legal fields who deal with family violence and abuse encounter cases at all social levels, but they seem to be more frequent in rural areas and among poor people.

Adolescent girls are often raped by the older males of the family, and fathers often use them as sexual objects after the death of the mother, or when the spouse's work keeps her for long periods outside the home. Abusive males are usually unemployed people with a past of family violence, high consumption of alcohol, social inadequacy, and impulsive behavior. However, although less frequent, cases are also known in which the male is the head of a well-to-do household and respected by his community.

Lawyers at the Office for the Protection of Minors who mainly deal with cases of incest among the lower classes are surprised at how often they find that the abuser has no perception of having committed a crime. This office is now working with a multidisciplinary team of professionals. This, and the recent institution of oral court hearings, is increasing knowledge about the extent and motivations of this unconventional sexual behavior.<sup>23</sup>

It is in private medical practice that cases of incest within middle- and upper-class families surface. Young females acknowledge the trauma of an early unwanted incestuous relationship when coming for treatment of sexual dysfunction in their marriages.

#### *Sexual Harassment*

On December 19, 1993, a decree of Argentina's federal government introduced the legal concept of sexual harassment in its administrative procedures and Criminal Code. The decree was prepared by the Secretariat of the Civil Service with the help of the Women's National Council.

The decree punishes sexual harassment independently of the hierarchical levels occupied by aggressor and assaulted, and regardless of their respective sex. Sexual harassment is defined as:

Any reiterative activity, whether this be a behavior, a purpose, a gesture, or a bodily contact, that is not accepted and reciprocated by the person to whom it is aimed, that humiliates her or him, and that involves a threat against the stability of employment or the opportunities for advancement.

This action by the administration was promoted by the Secretariat for Women of the civil servants' labor union (Unión del Personal Civil de la Nación) that provided information on the increase of this type of behavior in different government organizations: the Ministry of Public Health and Social Action, the Secretariat of Tourism, the National Atomic Energy Commission, the National Institute of Technology, the Ministry of Economy, Customs, National Parks Service, and many others. After the decree was issued, more than 700 cases were initiated in the city of Buenos Aires alone.

Sexual harassment is punished through an administrative indictment that may end with a dismissal from public service. The administrative procedure, however, does not preclude legal action by the offended person, because the same decree introduces in the Criminal Code, Article 124B that reads as follows:

Those who use their hierarchical position or any other situation of employment to induce another to satisfy his or her sexual requirements, be this or not carnal intercourse, will be punished with two to four years of prison.

This decree is important because it shows that Argentine women are expanding their political presence and are winning the collaboration of men who know, from well inside the system, the injustices perpetrated against women. Men and women both hope that the new legal situation will not be spuriously used to either accomplish personal vengeance or obtain undue economic gains.

#### *Rape and Family Violence*

Despite these aspects of sexual violence in Argentine society, such behaviors have been affected by the educational reforms instituted at the end of the 19th century, producing a more genteel society. However, violence within the household is still considerable, especially from husband to wife. Abuses of this kind are seldom reported to police, because women know that the members of the latter usually behave in the same manner in their homes.

Among the poorest households, since their early infancy, girls observe the violent behavior of their fathers, particularly when they return home intoxicated with alcohol. The mother is beaten and bruised, and a sexual encounter may follow that amounts to a rape. Faced with a society that, until recently, did not recognize female rights, the woman capitulates, represses her feelings, closes herself within her taciturn dreams, and continues laboring for the survival of her family, especially her offspring. Even then, if she does not manage to hide at least some of her earnings, the male may spend them with another woman and with friends imbibing alcohol.

Once more the tango draws on this popular behavior. A male songwriter puts on the lips of a female protagonist who falls in love with a hoodlum the following words:

Now, even if he beats me  
my boy from the shanties  
knows that I love him  
with all my passion  
that I am all his  
that for him is my fond attention  
and that it will be ours the child  
product of this love sickness.<sup>24</sup>

The lawyers at the judicial branch that deals with family violence estimate that there has been recently an increase of some 40% in the cases of women beaten and practically raped. However, rape in public places of the large cities or by intruders in private homes is not as frequent as in other countries, although with an increase in unemployment, especially among youth, this violent behavior is also starting to increase.

Lawyers admit that, when a girl or young woman is raped, the experience of going through the legal procedures and crude and insensitive examinations by forensic doctors could be more traumatic than the rape itself. The Argentine Criminal Code punishes with four years of prison the culprit of an incest with or rape of a minor.

A new brand of young lawyers, judges, psychologists, and sociologists are trying to uncover the economic and social roots of this violent behavior. As Martha Mercader, an Argentine writer of whom I will write more later, says, "Rape is not an animal act. Because it is a denial of human rights, it is an aberrant product of human culture."<sup>25</sup>

[Update 2003: In Argentina's daily life, whether in the households, in society, or even in cultural circles, it is easy to perceive what in the popular language is called "machismo." It is a male attitude of superiority that disregards the human dignity, intellectual merits, and economic worth of females.

[The situations in which women are victims of violence and criminal attacks have recently multiplied because of the deep political and economic crisis the country is undergoing. Corporal punishments that may end with death, forced sexual engagements that hurt the women physically and mentally, rapes, and child abuse, are all common features in Argentine society. Most of these events are not reported. There are fears of reprisals, concerns for how they may affect the offspring, worries about being left without means of subsistence, and lack of support from parental families. Women do not trust the police, because they know that the same *machista* mentality pervades its members.

[Argentine legislators have tried to modernize the laws related to acts of sexual violence against women, children, and teenagers. In 1999, laws were passed on crimes against sexual integrity. The new laws have changed most of the problems of sexual violence from the category of crimes to

that of conflicts, which authorizes the judges to arbitrate or seek conciliation.

[Rape goes well beyond conflict. Raping is a criminal attack that involves many physical and mental consequences. The attacked person may contract AIDS or other sexually transmitted diseases, could subsequently suffer depression, even suicidal thoughts, and could have difficulties in re-assuming a pleasant, satisfying sexual behavior. Legal protection and social equity for both genres of all ages require more than just changes in the laws. True protection and equity will be achieved through a profound educational reform aimed at structuring people's consciousness in the appreciation of the physical, mental, emotional, and spiritual benefits of a sexuality exercised with mutual respect and responsible freedom. (End of update by S. Kamenetzky)]

## B. Prostitution

### The Past

The *gauchos*, the native inhabitants of the country, themselves products of the heavy breeding between the early *conquistadors* and the indigenous population, and of the lower-class Spaniards who arrived in the wake of those *conquistadors*, seldom commercialized the sexual favors of women. A *gaucho* would take a woman as his sexual partner and could abandon her after some time without remorse. His mind was not programmed into thinking marriage, nor seeking stability, but neither did it contain programs that would make it acceptable, even less desirable, to make profits by exploiting his or any other woman. The *gauchos* were fearless, quarrelsome, but honest *machos*, skilled in the use of knives and *boleadoras*,<sup>26</sup> who wandered on their horses through the vast expanses of flat land that are the Argentine pampas.

After the efforts by Sarmiento and Avellaneda to build more rational structures on the magical and mythic mind of the Argentine population (see Section 3A, Knowledge and Education about Sexuality, Historical Perspectives), the situation changed for both the *gauchos* and their women. In 1880, the image of a country that would develop following European models was well set in the minds of the country's leaders. The *gauchos* had to transform themselves from vagrant free hunters who lived with women practicing subsistence gardening and husbandry into a rural labor force for the large ranches that the wealthy started to organize, or find a place in the smaller agricultural undertakings of the immigrants that started to flock to the Argentine pampas. The new generations were prepared by Sarmiento's schools to assume the new role, but they were betrayed by the large landowners, who did not treat them as salaried labor within a capitalist system, but rather as peasants attached to the lord's land who rendered services to the lord in exchange for a place where they could build their shacks and where their wives could tender a garden and raise some chickens, in addition to work as maids or cooks in the landlord's house. The older *gauchos*, not enough acculturated into the new system or economic and social relationships, would often rebel. The police would then seize them and send them to the armies that were battling the remaining southern indigenous populations and expanding the agricultural frontiers for the "civilized" land-based entrepreneurs. In brief, the displaced *gauchos* were making room for the *estancias* of the old native oligarchy and the settlements of the newly arrived middle-class Europeans.

The women of the older *gauchos* sent to the frontiers as cannon fodder were left without support and would often join the wives of the settled laborers as servants and sexual objects of the landowner families. They also became prostitutes in the small villages of the rural areas with their population of

single rural laborers and traveling salesmen. An Argentine writer, José Hernandez, who knew well the mindsets and lifestyles of the *gauchos*, wrote an epic poem about their suffering because of their inability to adjust to the transformational process, and the often rough way in which this process took place. It was a process that sacrificed the human dignity of the lower classes to the purpose of building a modern, productive nation. And the women suffered the most from this process.<sup>27</sup>

Most of the immigrants came seeking possibilities for earning their livelihood through hard work, risky but honest investments, and the use of the best available technologies. However, as in any migratory inflow, some elements came with the idea of making money quickly by exploiting native people and land. A few used prostitution as the means to accumulate wealth and wield power.

Argentina would soon become one of the most active centers of the so-called white slave traffic. In Buenos Aires, Rosario, Mendoza, and other cities of the country, powerful entrepreneurial organizations, affiliated with even more-powerful European organizations, enslaved an unbelievable number of young women lured or forced to leave their European villages to become the merchandise of a very profitable trade in a wide variety of brothels.<sup>28</sup>

Just one of the organizations, known as the Zwi Migdal, owned 2,000 brothels where 30,000 women were each producing monthly an average of 3,000 Argentine pesos for their pimps.<sup>29</sup> To put this amount in due perspective, I should remind the reader that at that time the peso had the same value as the dollar, and that a sales clerk in a department store would earn less than 100 pesos per month. This gave the exploiters a tremendous financial power, and they used it to buy cooperation and loyalty from police, city and immigration officers, judges, ministers, medical doctors, and congressmen.

Who sustained such a large demand? Although for different reasons, all social classes made their contributions. The rich were looking for the merriment and diversity of sexual practices that they would never dare to ask from their wives, the respectable matrons whose aim was only to bear and raise children, manage households, and organize social activities. The poor came to brothels because either they had to prove to themselves everyday by using many women that they were *machos*, or because they were feeling lonely. Loneliness was particularly harsh on the immigrants to the large cities, who initially were without family or social groups with which to relate. But the poor native *porteño machos*<sup>30</sup> also often felt lonely, frustrated, and sad. They put these feelings into music and created the tango. One of the tangos declares: "In my life I had many, many chicks, but never a loving woman."<sup>31</sup>

Bully *porteños* would mix in the brothels with long-shoremen, sailors, farmers seeking city fun, employees of government offices, banks, and large stores, small businessmen taking a break from their shops, and youths having their first experiences. Brothels varied in size and amenities according to the class they were catering to. Most were just a succession of small rooms that barely accommodated a double-size bed. In the remaining space, a chair would provide a place for the customer's clothes, and a washbowl would be the only available means for the customer's and prostitute's hygiene. A typical construction would be two rows of ten rooms, each with a latrine at the end of each row. In the more-expensive brothels, there would be a grand receiving hall with sofas, vases, and paintings on the walls. There, rooms were more spacious and some would have mirrors on walls and ceilings. They were the places for the rich who could afford to pay from 5 to 15 pesos.<sup>32</sup>

The white-slave traffic to Argentina continued growing during the last two decades of the 19th century and the first three decades of the 20th century. Already in 1892, a German magazine, *Das Echos*, commented on a trial that took place in Lemberg, Austria, where 22 persons were condemned for sending young women to different parts of the world under the pretext that they would be employed as maids, cooks, and nursemaids. Because the defendants were Jews, the magazine, in addition to denouncing an abominable trade, used the case to encourage anti-Semitic undercurrents of German politics that would open up in the German political arena some decades later.<sup>33</sup>

Between 1920 and 1930, Albert Londres, an officer of the French Sureté Générale investigating the ramifications of the international white-slave traffic, decided to mix himself in the life of the small Polish villages where many of the women were bought or seduced. He finally published a book, *Le Chemin de Buenos Aires (The Way to Buenos Aires)*, whose influence among Argentines who were fighting to stop the traffic proved to be decisive.<sup>34</sup>

Meanwhile, homosexuals, outcasts of Argentine society until recently, were, on the one hand, persecuted by the police, and, on the other hand, using some prostitutes and their madams for their own purposes. In Buenos Aires, for instance, a group of wealthy and influential, but closeted homosexuals organized young prostitutes to lure handsome young men into luxurious orgies in specially arranged places. They would be unwittingly photographed, and the pictures would be used to blackmail them into providing sexual favors to the hosts of the orgies.<sup>35</sup>

Finally the empire built by the traffickers, which was facilitated by the regulation of the exercise of prostitution, was destroyed when the government moved to the opposite behavior and made organized prostitution illegal. Never was the Argentine market really a free market for sexual services, meaning by this, a market where the suppliers chose the profession out of their own free will, exercised it on their own and for their own benefit, and could enter and exit the market freely. Only very recently is it possible to see a type of prostitution that can be assimilated to small businesses.

#### *From Regulation to Prohibition*

The Argentine empire of whoredom was born and grew up sheltered by the regulated status of the brothels under laws and decrees whose declared purpose was to protect both suppliers and consumers of sexual services. In fact, it protected neither and only served to replace risky capitalistic forms of exploitation of sexual services with a capitalism of political patronage that benefited bureaucrats and scoundrels.

Regulation of prostitution is always based on the premise that prostitution is an inevitable evil, hence, it should be regulated in order to minimize the damages to society from its practice. Some of the regulatory decrees dictated by city councils in Argentina were quite detailed in their requirements. One included the following rules:<sup>36</sup>

- To establish a brothel, it was necessary to file an application with the municipality indicating the location. A tax was required.
- The buildings had to be placed in a given zone, and not display any particular sign that would identify it as a brothel. They also had to have a bedroom for each woman working in the brothel. Prostitutes could not reside anywhere other than at the brothel, which was her official domicile. The women could not show themselves at the balconies or through the windows of the building, nor could they solicit in the streets.

- To work in a given brothel, each woman had to be registered with the sanitary authorities, who during the registration process, had to establish when the woman arrived to the city, from where she came and how, who was with her during the trip, and how she decided to join the brothel. If, from the interrogatory, it was established that the woman was a victim of deceit or coercion, she had to be advised that she could sue the offender and be offered assistance to do so.
- Each prostitute was then given a “sanitary notebook” with her picture, personal data, registration number, and the main articles of the decree that concerned her rights as provider of a service, among which were the following:
  - Whatever commitments she might undertake, she was free to stay or quit the brothel in which she lived and worked.
  - The woman who managed the brothel could not compel them to buy given clothes or other objects.
  - Debts were no reason to compel them to stay in a given brothel.
  - Nobody could exert violence of any kind on them, or submit them to abuse and punishments.

Later on, at the request of the Argentine Association Against White Slave Traffic, a page was added to the “sanitary notebook,” stating in Spanish, German, French, Yiddish, English, and Italian:

This is a free country. Nobody can be compelled to work as a prostitute. Whoever wants to exit from the profession can contact [here the name and address of the organization was given] that will see to her defense and help her.

In this notebook, the City Sanitary Services recorded the results of the mandatory periodical medical examinations. If the woman was found to be infected with a disease, she was to be taken to a hospital and remain there until dismissal. The sanitary notebook had to be shown to any customer that would request it to attest to her health condition.

The madam managing a brothel could not leave the brothel for more than 24 hours without notifying the sanitary authorities, who had to authorize leaves in writing and never for more than 15 days. She also could not accept any prostitute in the brothel who had not first registered and passed a medical examination. She had to take her pupils personally to the periodical medical examination at a hospital or have them ready if the examination was done at the site, in which case the brothel had to have a special room equipped with all the furniture and instruments the sanitary authorities requested. The madam also had to report immediately to the sanitary authorities whenever a prostitute felt ill, whether it be from a sexually transmitted or any other type of disease. If the woman could not be taken to the sanitary authority, a doctor would examine her at the brothel and decide whether to send her to a hospital.

It is easy to imagine the gigantic corruption that this naive attempt to protect customers and suppliers generated. The big trade organizations mentioned above bought the protection of the police, who were in charge of enforcing the regulations, and bribed justices and politicians, who all ignored the transgressions in favor of concentrating on the humanitarian provisions aimed at avoiding deceit and violence, and at protecting, at least partially, the free exercise of the profession. In reality, this approach did little to protect the health of the women and their clients, as elementary mathematics show.

With an average of ten daily services per woman and two examinations per week, and accepting that the exami-

nations were thoroughly performed, which often was not the case, only the first client after the examination could be considered free from contracting a venereal disease. The women had no protection from customers already infected. Hence the chances of safe sex for the other 30 or 40 clients that would visit the same woman before she went to the next examination were constantly decreasing. We should remember that the customers were not subject to compulsory medical control, and that many might not have shown any symptom for some time, while others would suffer in silence and continue practicing sex with prostitutes, lovers, and wives.

Although there are no official statistics from that period, we know from studies made by some concerned physicians, and from the clamor in the press, that the number of cases of gonorrhea and syphilis kept increasing. From a study by the director of the sanitary services of Rosario, Dr. José M. Fernandez, we learn that the examinations practiced during one year—October 1, 1930, through September 30, 1931—revealed that 73% of the prostitutes had a positive serological reaction to syphilis and close to 100% of them were carriers of gonococcus.<sup>37</sup>

Finally, a law was promulgated by the federal government on December 30, 1935, ordering the closure of all brothels throughout the nation. It even criminalized the provision of sexual services by a single person in her own home.

Anticipating this abrupt policy change, several measures were taken by public institutions and grassroots organizations to protect the women that the law would leave without job and home.

#### *The Situation Today*

The 1935 law ended the corrupting empire of large organizations involved in the white-slave traffic, but it could not end the exercise of individual prostitution. The application of the law to individual prostitution was even declared unconstitutional, because Article 19 of the Argentine Constitution says: “Private activities that do not affect public order and morality and do not harm other people are reserved to the judgment of God and off-limits to the authority of magistrates.”

Hence, an adult person who by spontaneous decision engages in sex with other consenting adults, for money or otherwise, cannot be penalized unless the practice takes place in such a way that it offends or harms third parties.

On the other hand, the change in mores that took place in the world after World War II was strongly felt in Argentina. Internally, the Perónist movement drastically elevated the status of the working class, including rural labor, and Eva Perón’s actions sped the recognition of women’s political, economic, and social rights. The large masses of single immigrants, to whom the brothel provided a recreational and physiological outlet, are pictures from a distant past. The *machos* of the suburbs of Buenos Aires and other big cities are drowned by a wave of proud blue-collar workers who may have consenting lovers in addition to their official spouses, but would never exploit one or the other. Contraceptives and information about them reach women and men of all social classes. For quite a while, penicillin brought control over venereal diseases. All this allowed women to consent to premarital and extramarital sexual relations.

However, prostitution has not disappeared. Teenagers, sometimes by their own initiative, but more often under the pressure of peers or their fathers, seek prostitutes for their sexual initiation. Then there are the handicapped and those who do not dare to share with lovers and spouses their need for special sexual practices. And as always, sailors and

other single travelers from the countryside and abroad. Single women and married men with hidden homosexual or bisexual tendencies are also asking for sexual services. Hence, male prostitutes have made their appearance in the market.

The modern Argentine male and female prostitutes advertise their services through newspapers. A typical announcement reads: FIRST NAME; Your place or mine from Monday to Sunday; Telephone number. Some include the price. In one single issue of a popular newspaper, I found eight advertisements with prices ranging from 15 pesos to 40 pesos, which equaled the same amount of dollars in 1993 exchange.

Another form of advertising is the use of taxi drivers and hotel bell captains as intermediaries. These agents receive part of the price in exchange for referring clients. In the large hotels, the bell captains may have an album with pictures of different prostitutes from which the guest may choose.

Sex titillation by phone is also making its inroads. It is being introduced by representatives of foreign organizations. Romance through the line, as one of the announcements reads, is offered by calling a number in the United States, Hong Kong, or Mexico.

The spread of AIDS has further reduced direct trade of services and has made room for these telephone and other electronic alternatives. They are used for those who do not find a way to create romance and introduce fantasy in their relationships. Most of the well-informed youth are now seeking to satisfy all their sexual needs through a committed relationship that may or may not end in marriage. Usually, they contract marriage when they decide to have children. Among homosexuals, who are now more accepted by society, there is also a trend toward less promiscuity and more-stable monogamous relations.

Prostitution is still a topic of discussion in the news media and for journalists. It is becoming clear that prostitution is a cultural as well as an economic problem. A morality that denies and represses bodily needs will never solve the problem. It can only increase the demand for commercial providers of sexual services. And a society where greed on one side creates poverty on the other will inevitably create greedy profiteers and needy prostitutes.

### C. Sex in Argentine Mass Media: Erotica and Pornography

#### Literature

A review of the Argentine literature of the last few decades shows that Argentine writers often describe in detail heterosexual, gay, and lesbian sexual encounters in their novels. The practice of sprinkling some sexual spices to add flavor to the narration is not limited to romantic novels; it occurs also in historical novels, and indeed in psychological novels that delve deep into the feelings of their characters.

This literature has led middle-class urban readers to rethink their own attitude towards sexuality and sensuality. It helps in lifting the last traces of *machismo*, of seeing love and sex as two separate things that are practiced with different women, and of perceiving homosexuality as a perversity. In a historical novel set between 1851 and 1862, for instance, Martha Mercader, a famous novelist, defines in just one sentence the most common mindset among young military men in the first armies of the equally young Republic: "He [the protagonist of the novel, an adjutant in the recently organized National Guard] must always be on top; on top of Indians, of the blacks, of the *gauchos*, of the peasants, and of the females."<sup>38</sup>

This same novelist dared to reveal her own sensual and sexual life in an autobiography in which she describes her

puberty within a family and a society hampered by a multitude of taboos, the fantasies of her adolescence fueled by the movies that Hollywood sent to Argentina in the 1940s, the difficulties women had to choose freely and assume responsibilities, her conflicts with the rigid mindset of an intellectual husband that was progressive in his ideology and conservative in his social and sexual behavior, and conflicts that ended in a sour divorce. Her personal history illustrates the limitations to which women were, and, to some extent, are still often subjected. For some, the limitations amounted to a veritable enslavement.<sup>39</sup>

When we compare the historical novels published in the 1980s by this writer with the books of the same genre published in the 1970s by another famous Argentine writer, Beatriz Guido, we perceive the advances made in language openness and in acknowledging women's feelings, their desires, their erotic fantasies, and their voluptuous carnality.

For instance, in one of her books,<sup>40</sup> Beatriz Guido describes the initiation of two young men with prostitutes. It is a description almost devoid of emotions: The two adolescents do not even ask one another about how they performed. They leave the brothel in silence and walk through the streets talking economics. The scene reflects what was then acceptable in Argentine society.

By contrast, Martha Mercader, in another of her novels,<sup>41</sup> talking through a heroine of the time of the war among provincial *caudillos*, recounts the sufferings of innumerable Argentine women of the past and reveals things that today's Argentine women are still longing for. The main character questions, already in the 1830s, the role of reproductive machines that the Church has assigned to women. She is a woman that is consumed by passion for life and years for opportunities to share with her husband both her sensual desires and her intellectual potential, her abilities to perceive the social, political, and even military situation in which they live. By insisting on doing so, she destroys her relationship that cannot survive a destabilization of the macho role of her husband. Through Juana Manuela, her character, Martha is calling for further changes in a society that still is repressive and castrating.

It is worth mentioning a rare book discovered while browsing in an old bookstore of a provincial city. Its title is *Textos Eróticos del Río de la Plata (Erotic Texts from the River Plate)* by Robert Lehmann Nitsche, a German anthropologist.<sup>42</sup> It was published originally in Leipzig, Germany, in 1923, under the pen name of Victor Borde, and includes an exhaustive collection of popular songs, poems, proverbs, riddles, sentences, and remarks with a high sexual, sensual, and erotic content. In 1956, after Julian Caceres Freyre, an Argentine scholar, obtained a copy of the German original from a bibliophile friend, a group of entrepreneurial editors undertook the task of translating it into Spanish. The 1981 Spanish edition contains the full original text, plus an article anonymously published by Lehmann in the journal *Kryptadia* in 1901.<sup>43</sup>

Lehmann arrived in Buenos Aires in 1897 to work at the Anthropological Museum of La Plata, the capital of the province of Buenos Aires, when he was only 25 years old, and resided there until 1930. Compelled by his curiosity and animated by a truly scientific passion for honest and forthright research, Lehmann did not hesitate to survey all sources, from ordinary rural folks to prostitutes and pimps. He questioned his students at the University of La Plata and gathered graffiti from public latrines, restrooms, and from prison walls. His work has rescued from oblivion popular customs and traditions that progress would consign to burial without a trace, because Argentine scholars considered them too vulgar and embarrassing to be scientifically studied.

Lehmann used the material he compiled to compare popular myths, prejudices, and stereotypes, some of which are still part of the collective Argentine subconscious. He dared to undertake this task at a point in the evolution of humankind when sexuality was still a bad word even in Europe, where he had to publish the result of his work either anonymously or under a false name.

After 1933, the Nazis tried to use Lehmann in their intelligence network about Argentina, given the deep knowledge the scientist had of the country, but he refused and was ostracized from the scientific community until his death in 1938.

To give the readers a flavor of this collector's work, I provide translations of one each of its riddles, sayings, and limericks. Riddles are usually innocent, but the solution is sexually charged (see Table 2).

### Popular Magazines

It is through popular magazines that we can see more clearly the changes taking place in Argentine society. The numerous, so-called magazines for women are found everywhere: homes, hairdressers, doctor's offices, almost any place there is a waiting room. And in almost every issue, there are articles about sex and eroticism, some signed by respected local and foreign professionals. Articles cover a variety of subjects, such as contraception, the influence of a healthy sexual life on the physical and mental well-being of women, or how to improve marital relationships. Three other types of magazines deal with sexuality and eroticism:

- Magazines that deal with sexual issues avoiding pornographic images, shying away from even full frontal nudity. They are rather expensive, exhibit a good quality of printing, and aim at informing a public that accepts a scientific, although popular, rather than academic language. One such magazine claims the collaboration of professionals from the Masters and Johnson Institute and the American Association of Sex Educators, Counselors, and Therapists to produce illustrative videos that are distributed together with some of the issues. One such issue included the following subjects: best techniques to enjoy an intense sexuality; the skin: an ally of eroticism; how to make of your bedroom the most erotic place; your way of kissing reveals how you make love; techniques to renew sexual passion without changing partners; initiation to anal sex without traumas; the art of

undressing to seduce your partner; the importance of oral sex during pregnancy; safe sex: condoms, a way of taking care of yourself without handicapping your pleasure.

- Magazines of sexual humor with pornographic texts and cartoons, but no pictures.
- Clearly pornographic magazines, devoid of any artistic quality, some with scatological content.

Foreign magazines like *Playboy* and *Penthouse* can also be bought in some newsstands.

### Television and the Video Industry

With the return of democracy in 1983, it became possible to openly discuss and present sexual issues on television. Well-known physicians, psychiatrists, psychologists, sexologists, and writers are invited by popular anchorpersons and questioned on all kind of sexual matters.

This situation contrasts with an experience I had in the early 1970s. As medical advisor to an Argentine enterprise, I was helping to design a strategy to introduce the first tampon manufactured in Argentina, a task of which I felt very proud, because it would allow Argentine professional and working-class women to feel more comfortable at their workplace. However, I soon discovered that the word "menstruation" could not be used in advertising the product on television or in newspapers and magazines.

Argentine television programs are now following on the line of pioneer shows in the United States and Europe that favor participation of the public and encourage them to share in a discussion of intimate problems. Argentines who know the languages can now receive these American programs, and also European programs, directly on their screens through satellite and cable.

The videotape industry is partially handicapped by the fact that Argentine television uses the so-called PAL system that cannot play either VHS or Betamax recorded cassettes. The market is composed mainly of foreign video pornography converted to the PAL system and subtitled in Spanish. It is a new market where a fast-growing demand is allowing businesses to make good profits. X-rated material is displayed in a separate room limited to adults who pay the store fees and deposit.

However, legislative revisions have not kept pace with changing public attitudes, and the old laws are used from time to time to crack down on the video-pornography business. In 1994, for instance, more than 300 titles were sequestered from one establishment and the store closed on the grounds that Article 128 of the Criminal Code considers obscene exhibitions as assaults against public morality. Some politicians and judges seem to still be under the grip of a repressive mentality, but many of them, and certainly the public in the large cities, are reacting and fighting for their freedom to see and read what pleases them. Despite obstructions from conservative forces, the public's preferences are being respected. The higher courts are also reversing conservative decisions from lower courts, although desperately slowly.

**Table 2**

### Riddles Are Usually Innocent, But the Solution Is Sexually Charged

Type of Erotic Text	Original Text	English Free Translation	Comments
Riddle	En un campo monterano Hay un pájaro francés, Tiene huevos y no pone, Tiene un ojo y no ve.	In a hunting field There is a French bird, It has eggs, but doesn't lay It has an eye, but doesn't see.	The solution is the penis. Popularly, the testicles are called eggs.
Saying	A toro viejo le gusta el pasto tierno.	Old bulls like tender pastures.	
Limerick	¡Put a que soy desgraciada!, Dice la parda Loreta; ¡Todos me meten por el culo Y ninguno por la cajeta!	Shit! I am so depressed, says the mulatto Loreta; It is always my ass that is holed, never my cunt.	

### *Movies, Theater, and the Arts*

Most of the erotic films shown in Argentina, films that would be rated R or X in the U.S.A., come from European countries, particularly France, Italy, Sweden, and lately Spain. Picaresque films, many based on classics of literature, such as Boccaccio's *Decameron* or Chaucer's *Canterbury Tales*, are shown without censoring their most realistic details, which may include frontal nudity. The United States is the source of all the violent pornography and thrillers imported.

After the return of democracy, the Argentine cinema industry has itself produced many risqué films. One describes a famous historical case of a young Argentine priest and a young lady of the Argentine aristocracy who fell desperately in love in the years just before the organization of the Republic. They leave family and Church to escape from Buenos Aires to the countryside. However, the combined powers of Church, money, and state persecute them implacably until they are detained and executed without trial. Because she is pregnant, the executioners gave her to drink a liter of holy water before facing the squad, so as to make sure that her child would die baptized. The film describes the tragedy in beautiful and poignant images, without sparing the torrid love scenes of the distressed lovers when they find themselves for the first time alone and far from their asphyxiating social environment.

There is also a mild censorship in the theater. A play called *La Lección de Anatomía (The Anatomy Lesson)*, in which the actors play their role in the nude, was playing for a long time in Buenos Aires, night after night, for nearly ten years.

In galleries of art, nudes are shown without hesitation or shyness. However, in the contradictory society that Argentina is, with regressive forces battling for survival and power, isolated episodes of censorship still happen, although a slowly operating judicial system repairs the damages in the end. For instance, in 1986, three photographic artists who were exhibiting their work at a cultural center found their pictures of nude people sequestered. The judge who issued the order resisted pressure from colleagues and public opinion, and the appeal of the lawyers of the defendants, for almost a year before returning the material to their owners.

Finally, the popular tango, whether danced in private salons or presented as part of a theatrical show, is often a display of eroticism at its purest macho style, the male proudly exhibiting his skills, his strength, and his power over women.

## 9. Contraception, Abortion, and Population Planning

### **A/B. Contraception and Population Planning**

It is estimated that the population of what is today Latin America was around 50 million at the start of its conquest by Spain and Portugal.<sup>44</sup> Wars, brutal exploitation in mines and fields, and new diseases acquired from the conquerors because a lack of antibodies among the indigenous populations soon depopulated the continent. The conquerors then resorted to two policies: In some colonies, they started importing Africans as slave labor, and in all colonies, they promoted maximum use of women's fertility, whether they be Spanish, native, or African. Every child, whether from wedlock or not, was welcomed.

Pronatalist policies were maintained after independence. The new countries needed people, first to sustain the wars of independence, then feed the armies of local warring lords, and later to develop the empty lands. More recently, it was believed that a large population would keep salaries low, neglecting the fact that impoverished masses do not

make good consumer markets for the products and services that enterprises generate. Despite the influence of Catholicism, the concept of family has remained very lax. This explains why the number of illegitimate children has continued to run high. In some countries, it averages, even recently, 70% of all newborns.<sup>45</sup>

Argentina has not been an exception to these pronatalist policies and the use of women as reproductive machines. However, its population did not grow as fast as in other Latin American countries. This is because of the formation of a well-informed large middle class that could not support families of the size that was usual among the upper class, and at the same time, did not share the loose idea about family ties expressed by the lower class. Middle-class couples quickly learned to use contraceptives acquired through private channels. In Argentina, contraceptives never were distributed or subsidized by the government, except for the army draftees who were given condoms for prophylactic reasons rather than population concerns.

During a relatively recent period, 1975-1983, during which the country was governed by repressive military juntas, there was an attempt to encourage larger families by giving monetary awards for each newborn, and by paralyzing the activity of the clinics privately supported by the Argentine Association for the Protection of the Family. Besides the fact that the amount of money was ridiculously small, the military ignored the real feelings of the women of the urban working class. They had a different program in mind than to have a lot of children. From my own work as a gynecologist at a union-supported hospital, I know their reasoning. They wanted to save from their salaries and buy a sewing machine or other equipment that would allow them to do some market work at home, postponing maternity until the couple's joint income would allow them to raise one or two children decently.

In the year 1972, the Argentine Association for the Protection of the Family managed 58 clinics around the country. That year, the number of new users of contraceptives was 23,000. Of these, 66% preferred the pill and 33% chose an IUD. The clinics were also offering services for the early detection of genital cancer and the treatment of infertility.

Nowadays, in the large cities, contraceptives of all kinds—pills, condoms, diaphragms, IUDs, and vaginal spermicides—are available. Condoms, pills, and vaginal spermicides can be freely bought in pharmacies. Women who can afford to pay, can use the services of private physicians to help them acquire the right diaphragm or to insert an IUD. Hospitals and clinics supported by the labor unions provide similar services to working women and spouses of workers.

The situation is more difficult for women who live in scarcely populated distant rural areas. There, both birth-rates and infant mortality are still high when compared with urban figures or those in the more-developed rural areas close to the large cities. In the less-developed areas, the government is now trying to organize family planning services as part of its program of mother-child care.

[Update 2003: There are no programs related to reproductive health at the national level. At the provincial level, the situation varies from one province to the other, depending on two fundamental factors. One is the magnitude of resources assigned to public health in general, and to reproductive health in particular, in each provincial budget. The other factor hinges on the predominant political influence in the respective province. This last factor refers to the long-standing conflict in Argentina's policymaking between, on the one hand, liberal leaders with a modern consciousness and concerns for the needs of the population, and, on the other hand, conservative leaders associated with an obso-

lete Catholic Church that still adamantly represses the modern expressions of sexuality, love, and life.

[Until 1998, the federal government was assigning some 4% of the GDP to public health, and close to 90% of the population had access to sanitation (World Bank Development Report 1999). That year, it was decided to transfer to the provinces the responsibility to cover 87% of the cost of their respective health systems. The majority of the provinces have neither sufficient funds, nor the appropriate leadership to articulate those programs.

[The country is now calling for a very different approach: a comprehensive national health program that includes reproductive health and links to educational reforms that introduce those subjects in all curricula. It was expected that educational establishments at all levels would teach their students how to take care of their health and to enjoy the physical, emotional, and spiritual manifestations of their sexuality with responsibility towards themselves, their partners, and the economy of their households and the nation, avoiding unwanted pregnancies and sexually transmitted diseases. The undersecretariat for population that was created in 1993 at the federal level, which included a federal counsel on population, was dedicated mainly to demographic studies and regulation of migration. It did not assume any initiative to promote policies or educational programs for a responsible procreation.

[We will mention only a few examples of the diverse provincial efforts that attempt to organize programs of reproductive health overcoming precariousness of financial resources and ideological conflicts.

#### 1. City of Buenos Aires

The city's constitution declares that the reproductive and sexual rights are part of the basic human rights, and proclaims nondiscrimination in the exercise of those rights for neither ethnic, racial, or gender reasons, nor for the sexual orientation of the citizens.

#### 2. Mendoza, Rio Negro and Neuquén

These provinces have similar laws on reproductive health and sexuality. They aim at providing information and organizing counseling services.

#### 3. Jujuy

In spite of the governor's opposition, who vetoed an initial project, the legislature unanimously insisted on approving a law creating a provincial program for maternity and the prevention of sexually transmitted diseases.

#### 4. Santa Fe

The municipality of Rosario, the most important city of this province, enforced two decrees: one creating a program for the early detection of cervical cancer, and another organizing a comprehensive program on women's health.

#### 5. Entre Rios

The legislature voted a law whose objective was to provide information and advice for a healthy and responsible exercise of sexuality. The governor vetoed it.

#### 6. San Luis

One of the most interesting experiments is taking place in this province. Working together with private organizations, the government has presented a project for a law of reproductive health that was accepted by the legislature, and is expected to soon be regulated and implemented. The activity of Gaia, a private group headed by Laura Lerner Emmer—who is joined in participation by local professionals and educators—deserves to be emphasized. They organized a Latin American encounter, "Being Born in 2002," to discuss themes centered on love, family relations, procreation, and birth. Among

the subjects explored at the encounter, we find: love and sexuality, methods for dealing with fertility and childlessness and the ethical problems raised by those methods, relations between parents and children, problems faced by single mothers and fathers, and new ways of looking after pregnant women and of delivering babies. The encounter is also a good example of efforts to transform the old unfortunate antinomies among ideologies, beliefs, and interests into constructive participatory polarities. "Being Born in 2002" was sponsored by UNICEF, the government of the province of San Luis, the municipality of the city of San Luis, the National University of San Luis, the Catholic University of Cuyo, and various foundations and private professional groups (Gaianluis).

#### 7. Tucumán

In the past, this was a rich province, known as "the garden of the republic" for the fertility of its land and the beauty of its subtropical vegetation and breathtaking panoramas. Now, it offers a deplorable picture of misery and neglect. The chaotic state of the finances of the province has reached such extremes as not to be able to provide gauze and alcohol for surgery in the public hospitals. Children die of hunger or survive in a state of cachexia. "Problems that we used to see in photographs from Africa, now we are facing them here," said Dr. Teresa Acuña, a pediatrician in one of the hospitals (Rohter 2003). Indigent women in despair seek abortions, which, because of the way they are performed, often end in deaths, which are hidden in the statistics under other gynecological categories. There are no programs for reproductive healthcare. At the initiative of some doctors, and with the support of pharmaceutical companies, oral contraceptives are now being given free to poor women, who, in some cases, sell them to buy bread. There are no programs to give advice on contraceptive technologies and monitor their use. (*End of update by S. Kamenetzky*)

### C. Abortion

Everybody who practices gynecology in Argentina knows that abortion is widely used by women of all social classes to end unwanted pregnancies. This happens despite the injunction against abortion in the Argentine Criminal Code that penalizes with prison women who have abortions and the professionals who perform this service, with the sole exception of a pregnant woman who is mentally deranged. Abortions are common despite the strong influence on personal lives and politics of the dominant Catholic Church.

Abortion is a practice that everybody knows of and practices when needed, but nobody talks about. Argentina is a society that, instead of fighting against the powerful forces that arrogate to themselves control over women's bodies, prefers to tolerate the officially condemned practice with a mischievous twinkle of tacit agreement among professionals and citizens. Criminal processes and denunciation of abortion practices are rare, and the police only intervene when a woman dies as a consequence of an abortion practiced by a non-professional.

Given these conditions, there are no figures for abortion in Argentina, but it is believed that its practice is widespread in all Latin America. In 1974, the International Planned Parenthood Federation estimated that some five million abortions were performed each year in the region. This corresponds to a rate of 65 abortions for each 1,000 women of reproductive age, and to 500 abortions for each 1,000 live births.<sup>46</sup>

In the cities, women who typically seek medical help for abortions are either married, mature women who already have several children, or very young single women, high school and college students. That women resort to abortion mainly to put a stop to the increase of family size was confirmed by surveys organized by the Centro Latinoamericano de Demografía (CELADE).<sup>47</sup> In Buenos Aires, women with two children reported 39.6 abortions per 1,000 women in their lifetimes, while women with three children reported 93.5 per 1,000.

Studies on the relationship between abortion and socioeconomic position suggested that middle-class women resorted to abortion more frequently than upper- or lower-class women. More-recent studies, in Buenos Aires during the 1960s and 1970s, revealed that the highest rate of abortion was among women with college educations. These studies tell us two things: one, that women of the upper classes can afford to raise more children than they would really want, hence avoiding inner conflicts with their deep-seated religious programming, as well as outer conflicts with their social Catholic environment; second, that abortions among the lower classes leave no written or oral record, because they are not performed by professionals, and the women deny having them to avoid problems for themselves and for those who helped them in the procedure.

When abortion is performed by obstetricians in clinics or their offices following state-of-the-art procedures, with instruments duly sterilized, use of anesthesia, and post-operation care to avoid hemorrhages and infections, it seldom leads to complications. It is quite different when abortion is practiced by folk healers and unregistered midwives, with neither asepsis nor anesthesia and using primitive instruments. It is even worse when rural women in despair resort to pouring chemicals inside their vaginas, ingest toxic substances they have heard induce abortion, or use wires and the like to destroy the fetus. The end results are hemorrhages that lead to death if the woman cannot reach a hospital for a transfusion, or infections that may also lead to death if untreated. Other frequent ailments produced by these crude abortion procedures are the destruction of the vaginal walls, and the production of adhesions on the uterine endometrium.

In the end, many of these women who provoke an abortion by themselves or with inexperienced help end up in obstetric and gynecological wards of national and provincial hospitals, overloading an already tight supply of beds, blood, drugs, and medical time. Again, there are no statistics for Argentina, but it is estimated that one of every five beds in those wards are occupied with women suffering complications from self-induced or poorly performed abortions, and statistics for Latin America disclose that up to 41% of all blood used in hospitals is consumed by those cases.<sup>48</sup>

This picture of individual suffering and high social costs indicates a need to change policies. Abortion rates and morbidity and mortality from their complications can only be reduced by:

- providing appropriate sexual education and stimulating the use of contraceptives;
- legalizing abortion to take the procedure out of inexperienced or desperate hands, making it, instead, easily available from well-trained professionals; and
- increasing accessibility to well-equipped medical centers in case of complications.

[Update 2003: Abortion continues to be illegal, with two exceptions: for the pregnant woman's life or health. These two exceptions are very seldom used, because, although the law does not require authorization from the judi-

cial system for such an abortion, health professions are reluctant to go ahead on their own, and equally reluctant to seek court approval. Inexperienced people, in sordid environments and with no asepsis, perform most abortions. This should cause alarm among the public health institutions. The total number of abortions is overwhelming. The Center for Reproductive Law and Policy (CRLP) estimates that the incidence of abortion in Argentina is somewhere between 350,000 and 400,000 abortions annually. Although it is estimated that one third of all maternal deaths are caused by abortion, the real number may be higher, because some may be hidden under other gynecological or obstetric areas (CRLP 2000).

[Rather than focusing on the costs to the economy and to the health of the Argentine family, the public discussion continues to center around ideological issues. Sexual education from an early age, and easy access to contraceptives when the age of reproduction is reached, could save money and lives, not only by avoiding abortions, but also by preventing the spread of sexually transmitted diseases. While under the present legislation, women are chastised and the medical profession is handcuffed, a wider understanding of human nature, with its need of a healthy sexuality, could make both women and men more free, and family life more happy. (End of update by S. Kamenetzky)]

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

In Argentina, the most frequently reported sexually transmitted diseases (STDs) are trichomoniasis, genital chlamydia, gonorrhea, genital herpes, syphilis, genital papilloma virus, chancroid, and indeed AIDS. There is a worrisome increase in the number of cases of the traditional STDs, particularly syphilis, gonorrhea, and human papilloma virus. Risky as they are on their own, they also increase the susceptibility to acquire genital cancer and HIV infections.

In the field of STDs, Argentina is a prime example of a global trend that took the total number of cases in the world to 250 million in 1990, at a rate of 685,000 new cases each day.<sup>49</sup> From 1987 through 1991, the number of cases of gonorrhea decreased in 15 Latin American countries, but not those of primary or secondary syphilis. Twelve of these countries also saw an increase in congenital syphilis. Although most of these figures are only approximate, they tell us that there is an urgent need to mobilize all the available technologies to check the spread of these diseases,

The real numbers are difficult to obtain. Some diseases that present undramatic symptoms are initially ignored. A case in point is chlamydia, which is only detected in 70% of the cases when women come for other reasons for a gynecological examination. Once detected, the cases are only reported to the healthcare authorities if the examination took place in a public hospital; private medical offices are not required to report this disease.

The lack of an appropriate sexual education among all social classes, an attitude of indifference and/or shame in relation to prophylactic measures, and a medical system that is not well prepared for early detection and treatment, all combine to increase the rate at which STDs are growing. Exceptions are the detection and treatment of syphilis and gonorrhea. The pronatalist policies of Argentina since the organization of the country has meant that doctors were trained and medical services organized to take special care of the health of pregnant mothers and newborns.

This occurs in three different medical environments. The most advanced environment is provided by private

medical practices in doctors' offices and *sanatorios*.<sup>50</sup> In this privileged environment, only prejudice or ignorance can prevent doctors from providing timely prophylactic advice, early diagnosis, and appropriate treatment of STDs.

Another environment is made up of the *sanatorios* organized and supported by the labor unions. The number and size of medical institutions of this type increased steadily from 1946 through 1955 during the populist administration of Juan Domingo Perón and his activist wife, Evita. Some, like the one owned by the Association of Metal Workers in Buenos Aires, were well-equipped and responded to the needs of the working class, supplying information on STDs and providing early detection and advanced treatment services. In others, equipment and services had to adjust to lesser resources. Neither individual labor unions nor their confederation ever issued policies related to the kind of services to be provided in their *sanatorios* for STDs. It all depended on the caliber and convictions of the medical personnel who were hired as management and staff. However, the wards of dermatology, urology, gynecology, and obstetrics of these union-supported medical services have helped large numbers of workers and their families to become aware of the risks of STDs and have induced them to seek early detection and treatment.

The last environment is provided by the hospitals supported by the federal and provincial governments and the municipalities. They are entrusted with two missions: One is to provide medical services to the poorest sectors of the population, those who do not have access to either private nor union-supported medical services; the other is to serve as training grounds for the students of medicine from the public universities, which in Argentina are the most prestigious. Initially, services provided at hospitals were totally free, but the disastrous management of Argentina's economy for more than 50 years slowly eroded their physical and human assets. Recently, these facilities have been charging a small fee as a contribution to the huge recurrent and investment costs involved in their maintenance.

This small fee may further discourage the population from the shantytowns in the poverty belts around the large cities from seeking early diagnosis and treatment for STDs. Although public transportation is relatively cheap and efficient, they are already discouraged by having to make more than one trip to the hospital before being given their diagnosis, and by being unable to obtain the necessary medications once the diagnosis is made.

Prostitutes form another segment of the population of the large cities that requires special consideration. In Buenos Aires, children of both sexes from the shantytowns pour into the city and become prey of drug traffickers and pimps. Through shared needles and sexual intercourse, they are infected with all kinds of STDs, further contributing to their spread in their original milieu and the city at large.

The picture of three levels of medical services describes properly the situation in Buenos Aires, the other large cities, such as Rosario and Bahia Blanca, and most of the provincial capitals. In the rural areas, we may only find small infirmaries where doctors struggle to help the poor people without having at their disposal either laboratory services or appropriate equipment, such as colposcopes and stocks of drugs for early diagnosis and treatment of STDs. To make things even worse, poor rural people are more easily programmed than their urban counterparts to feel shame and guilt when affected with an STD. This prevents them from asking for medical help even from those elementary health-care facilities, even at the cost of suffering crucial pain and loss of income, and of spreading STDs to other members of their impoverished societies.

The conditions in which the very poor rural and urban people live may require a different medical approach when dealing with STDs than the now standard scientific approach of first investigating the etiology of the disease and then establishing the appropriate treatment. If the physician tells a poor sick person that he should come again to find out the results of clinical tests, and only then get the prescription and go to the nearest pharmacy for the medication, this person may never return. Meanwhile, the disease may be spread to others. Hence, a syndrome approach has been developed in which the physician examines the person and immediately gives the patient the appropriate medication during the first office visit and at no cost.

It may sound nonsensical to propose this approach, which is widely used in the poorest countries of the world, for use in a country like Argentina that has 2.99 doctors per 1,000 population compared with only 0.03 in Tanzania and 2.38 in the United States, 5 hospital beds per 1,000 population compared again with only 0.9 in Tanzania and 5.3 in United States, but we should realize that there are poverty spots where medical services are well below the average for the country, and that the inhabitants of these poverty spots contribute greatly to the incidence and fast-growing rate of STDs.<sup>51</sup> In poverty-stricken areas, the dilemma for the physician is whether to act quickly on the basis of what he or she sees without waiting for accurate tests, or to wait and, in the process, turn the untreated STD carrier into an uncontrolled spreader.

I could not obtain precise information on the incidence of STDs at the different social levels of Argentine society, but my own experience, from the mid-1950s to the mid-1970s, and the experience of physicians I interviewed while preparing this report, show that a large number of women that come to a medical office or the outpatient services of a hospital for gynecological problems, pregnancy controls, or advice on family planning are infected with STDs.

Consider just one of these diseases, the genital human papilloma virus, which, with 30 million new cases worldwide in 1992, ranks third among STDs.<sup>52</sup> The corresponding increase in the number of cases in Argentina has led to research work and the organization of seminars on the subject. Prominent among these is the work in three hospitals of Buenos Aires under the direction of Dr. Angélica Teyssie, who also acted as vice president of the Third Argentine Congress of Virology. In one of the hospitals, the work centers around the influence of hormones on the development of the disease in pregnant women with lesions in the uterine cervix. A team at another hospital works instead with young men with penile and urethral warts, while the third hospital concentrates on young women with vulvar lesions. The latter are followed to confirm the suspicion that the papilloma virus may be responsible for the onset of cervical cancer as late as five to 30 years after the primary infection.<sup>53</sup>

STDs are having a very negative impact on the Argentine economy. This impact cannot be measured solely in terms of the number of deaths caused by STDs, because many nonfatal conditions are responsible for a great loss of healthy life and significant demands on the healthcare system. A better indicator is the one jointly developed by the World Bank and the World Health Organization, which is the number of disability-adjusted life years (DALYs) lost because of a particular disease or group of diseases in a given time period.

The DALY indicator is obtained through a rather complex statistical process. First, for each death, the number of years of life lost is calculated as the difference between the actual age of death and the expectation of life at that age in a low-mortality population. Then the disability losses are

calculated by multiplying the expected duration of a disease (to remission or to death) by a weight factor that measures the severity of the disability in comparison with loss of life—for example a weight factor of 0.22 was assigned to pelvic inflammatory disease, while dementia carries a weight factor of 0.6. Then the combined death and disability losses are further corrected by discounting them at a rate of 3%, so that future years of healthy life are valued at progressively lower levels, and by an age weight, so that years of life lost at different ages are given different relative values. By multiplying these indicators by the total number of deaths for each age and disease and summing up across all ages and conditions, it is possible to figure out the global burden of disease for a given demographic area in millions of DALYs lost in a given year. From these, two other indicators can be derived: the equivalent number of infant deaths that would produce the same effect, and the number of DALYs lost per 1,000 population.

The World Bank and the World Health Organization have estimated that in 1990, Latin America and the Caribbean area was burdened with a loss of 103 million DALYs, which is equivalent to the death of 3.2 million infants and represents an incidence of 233 DALYs per 1,000 population. STDs and HIV accounted for 6.6% of the total, ranking third, after perinatal causes (9.1%) and neuropsychiatric diseases (8%), among the different diseases included in the study. STDs and HIV contribute more to the burden of disease than cancer (5.2%), and cerebrovascular or ischemic heart disease (2.6% and 2.7%, respectively), but less than injuries, which amount to 15% of the total.<sup>54</sup>

Unfortunately, I could not find specific statistics for Argentina, but what I have heard and observed leads me to estimate that the relative contributions of STDs and HIV to the burden of disease is not too different from that for the whole of Latin America. The high burden calls for active intervention by the governments, but a solution is hampered by a lack of information about STDs across all sectors of the population, and by a lack of resources for preventing and curing the disease among the poorest sectors. The latter problem could be solved if the government reallocated its expenditures to provide financial support for essential clinical services. However, government should limit its direct involvement in the provision of the services because it generates an expensive and inefficient bureaucracy; the government should instead promote the participation of grassroots nongovernmental organizations (NGOs) in the task.

Although government and NGOs should also work together in the delivery of information, the government's role in this should be more prominent than in the delivery of services, because the structure of the Argentine educational system makes it easy and cost effective for the government to include sexual education at all levels of the system. Most of the schools are under the authority of either the federal or the provincial governments. There are no local city or county educational boards to interfere with the decisions of what should be taught, and the largest part of Argentine households send their children to the state-supported public schools. Certainly, this is the case for the poorest sectors in both rural and urban areas.

Schools should find the language that is most appropriate for conveying information on STDs to each population group and each geographical area. It should be language able to overcome deep-rooted and long-established feelings of shame and guilt. Schools can be used to teach these subjects not only to children, but also to their parents and the public at large, including the elderly whose sexuality should not be discounted, and who, by becoming better informed, could play a more positive role in reinforcing appropriate behav-

ioral patterns among the younger members of the households to which they belong.

Information useful to counteract the spread of STDs should not be limited to the causes of the disease, its symptoms, and ways of preventing and curing them. Information provided at schools, by social workers, and by NGOs should go well beyond this to develop a positive attitude towards the body, a shame- and guilt-free recognition of instinctive drive, and an ability to establish tradeoffs between the instinctual urges and the constraints imposed to the satisfaction of these urges by the need to build healthy households and societies. Poor peasants and sophisticated urbanites can both understand a well-phrased and well-delivered message that these tradeoffs do not mean a repression of one's erotic life, but rather its enhancement by seeking to make it free of disease.

In the schools of medicine, which are all state-supported, doctors, nurses, and other paramedicals should be enabled to discuss STDs openly and clearly with their clients, avoiding scientific jargon and making them feel at ease when uncovering their bodies and their feelings. Young doctors, nurses, and paramedicals so trained could, in turn, facilitate in-service seminars for older physicians, nurses, and paramedicals who have not received any information on human sexuality.

The task of fighting STDs does not, however, stop with the schools, physician offices, clinics, hospitals, and rural first-aid rooms. It is a task that should involve all social organizations. Private businesses can also play an important role. The traditional Sunday soccer games that attract huge crowds could be used to distribute witty messages on the use of prophylactic measures and the high personal and social costs that result from neglecting them.

Argentina is a society that has to come to terms with the spread of STDs and the factors that contribute to this spread, such as the existence of poverty spots, male and female prostitution, and the consignment of persons with sexual preferences that do not conform with what is considered traditional behavior to a closeted sexual life that becomes much more healthy when it is integrated into all walks of a country's life. Argentina should learn that open discussion is more cost effective than denial when facing problems.

## B. HIV/AIDS

In Latin America, Argentina ranks fourth, after Brazil, Mexico, and Colombia, in the number of people affected with HIV. In December 1993, the Argentine government approved a new plan to fight against the disease that had already afflicted 2,897 persons, while there was an estimated 100,000 other people infected with the virus but not yet showing signs of disease. In the first nine months of 1993, 411 cases were recorded by the Ministry of Public Health and Social Action. It was expected that the total number of cases for that year would reach the 1,000 mark.<sup>55</sup>

Marcelo del Castillo, a physician at the Hospital de Clinicas of Buenos Aires, believes that 30 to 50% of the people infected with HIV or suffering from AIDS are not recorded in the official statistics.<sup>56</sup>

A study by three pediatric hospitals of Buenos Aires—Garrahan, Pedro Elizalde, and Ricardo Gutierrez—found 400 children infected with HIV who were being treated. Of these, 63% lived in suburban areas, 30% within the city limits, and 7% came from other parts of the nation.<sup>57</sup>

Eduardo Lopez, the chief of the department of infectious diseases at the Hospital Gutierrez, told a journalist that most of the treated children die before their third year, and that the earlier the symptoms appear, the worse is the prognosis. Lopez, who received a prize from the National Academy of Medicine for his studies on AIDS, pointed out that 90% of

the children are infected by their mothers during pregnancy and delivery.<sup>58</sup>

According to Lopez's studies, 20% of the HIV-positive mothers are 15 to 19 years old, and those below 24 years of age amount to 70% of the total number. Most of them, 59.4%, are addicted to intravenous drugs, while the remaining 35.9% have partners who are HIV-positive and 90% are drug addicts.<sup>59</sup>

These statistics show that the fight against AIDS should be integrated with the fight against the ravages of drug addiction, and that both fights require improved education and delivery of information to the youngest segments of the population. This has been recognized in the governmental plan that proposes to introduce information on these subjects in the high schools and universities starting with the school year 1994.<sup>60</sup> The plan will evaluate the possibility of extending its action to the primary level, and the Ministries of Education, Labor, and Interior will work together with the Youth Institute in forming community leaders who are prepared to deal with the subjects of AIDS and drugs. The plan is quite ambitious. In addition to the already mentioned educational and community work, it includes medical action aimed at providing medical care and medicines to those who do not have any coverage, a better knowledge of the situation through improved statistics on the epidemics, and increased controls on the blood banks.

While the government expects these to accomplish their objectives with an investment of only \$10 million for the year 1994, the private sector is experimenting with interesting initiatives. One such private-sector experiment was designed and undertaken by the Foundation for Quality and Participation, in the small town of Rojas in the Province of Buenos Aires, where children ages 10 to 13 attending a primary school are being led by a volunteer medical doctor with full support of the principal and teachers of the school.<sup>61</sup> Students in this project focus on the following tasks:

- Search in the library and study material about AIDS to learn how the disease is contracted, its symptoms, the work of HIV in the human body, and social aspects of the AIDS epidemics.
- Discuss the subject among themselves, with their families, the teachers, and the principal.
- Visit the local hospital, get acquainted with people hospitalized with AIDS, and talk with the physicians in charge of them and with the hospital's director.
- Poll people in the street about their level of information on AIDS, the measures they were taking for their own protection, and their attitude towards people already suffering from the disease.

At the point I learned about this initiative, the children had drawn a declaration defining their own feelings and the results of their learning process. Their declaration exposed their understanding of the complexity of this problem, the difficulties doctors face in treating the disease, the high cost to individuals, families, and our community resulting from dealing with the disease and trying to prevent its dissemination, and the complications that educational authorities face in bringing appropriate information to the schools. Recognizing these key aspects of AIDS, the children then said they were willing to assume their role in the fight against the AIDS epidemic with responsibility, "engaging ourselves in contributing our grain of sand."

This experiment shows that every segment of the population can respond creatively to a well-organized stimulus to promote their participation in solving social problems. The success of the Foundation for Quality and Participa-

tion project in getting young children to assume their responsibility in dealing with AIDS raises a serious question about what is not being done in a similar way to engage the adults.

Many male heterosexual adults still believe that AIDS is a disease of homosexuals. Many married women think they will be spared until they get the disease from a bisexual or drug-addicted spouse. It is true that in Buenos Aires, three fourths of the all AIDS cases are either homosexuals or heterosexuals who got the disease through sharing needles, but the other one in four cases involves nonaddicted married women, some of whose partners are neither bisexuals nor drug addicts.

It is clear that any plan to decrease the social and economic impact of AIDS in Argentina, as in any society, requires an emotional engagement that facilitates an important paradigmatic change of beliefs and behavior. This paradigmatic change is essential to increasing the use of condoms, decreasing promiscuity, promoting the use of disposable needles among drug addicts, understanding and respecting those who suffer, and helping individuals everywhere to enjoy sex while minimizing the risks for oneself and society. In addition to emotional engagement, such changes in individual attitudes require the support of the social groups to which the individuals belong, namely, families, schools, private businesses, and churches.

[Update 2002: UNAIDS Epidemiological Assessment: As of December 31, 2001, 21,117 AIDS cases had been reported in Argentina. The incidence rate for 2000 was 48.9 per million population. The ratio of male/female is currently 3:1. The epidemic has been concentrated in the large urban areas where 87.5% of cases reported occurred, principally in the suburbs of the province of Buenos Aires. The most common mode of HIV transmission is sexual contact (37.9%), mainly heterosexual (25.3%); followed by intravenous drug users, which accounts for 37.9% of the reported cases; and, finally, perinatal transmission (6.8%).

[Information on HIV infection comes from sentinel sites, which have been systematically collecting data across the country since the beginning of 1998. All jurisdictions gather data on a semiannual basis. The National Registry of HIV-infected people was started on June 1, 2001. The number of reporting sentinel sites increased 400% between 1998 and the first semester of 2001. However, only data from pregnant women and blood donors are sent by all jurisdictions. In other selected populations, the number of reporting sites varies from one period to another. HIV prevalence among pregnant women tested has decreased from 0.75% in the first semester of 1998 to 0.46% in the first semester of 2001. Prevalence among blood donors has also diminished during the same period, from 0.23% to 0.13%. Data on the prevalence of HIV among sex workers from four jurisdictions of the country, including the city of Buenos Aires, show a reduction from 6% to 2.39% in the 1998-to-2001 period. On the other hand, HIV prevalence among inmates in penitentiary units has increased, rising from 17.91% to 23.10% during the same time period. Among STD patients, HIV prevalence has risen from 0% to 3.99% in the first semester of 2001, based on data reported from seven jurisdictions. Finally, data from two provinces (Buenos Aires and Cordoba) show that the prevalence among injecting drug users went from 18.31% to 19.44% in the semester of 2000.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	130,000	(rate: 0.7%)
Women ages 15-49:	30,000	
Children ages 0-15:	3,000	

[An estimated 1,800 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 25,000 Argentine children under age 15 were living without one or both parents who had died of AIDS. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Concepts of Sexual Dysfunction and Treatment

Until the 1960s, physicians had no better knowledge of human sexuality than the average Argentine citizen. And even after some education was introduced into the medical training, the information they received was prejudiced, biased, and antiscientific. In an interview with a physician and psychoanalyst, I was told that in the year 1963, the chair of hygiene at the School of Medicine of the University of Buenos Aires was still telling the students that “Women experience sexual needs after reaching 25 years of age and only during their ovulatory period,” and “During infancy, adolescence, and first years of youth, women have no sexual needs.”

The chairs of gynecology, genitourinary diseases, and hygiene studied and taught the pathogenic aspects of the sexual organs and reproductive mechanisms, but refused to consider with the same objective scientific approach the sexual behavior of healthy females and males. In my interviews with medical doctors during 1993, I perceived they still do not feel comfortable in discussing these issues, especially in relation with the erotic minorities, the group that Erwin Haeberle calls “the sexually oppressed,” which include the aging, the homosexuals, the handicapped and disabled, people with specialized sexual interests, and persons committed to mental hospitals or imprisoned.

Young and old physicians know that prestigious institutions, such as the American Psychiatric Association, have made clear that they do not consider homosexuality, whether masculine or feminine, a disease. However, they still feel that it is a perversion, a degeneration. I know of one male teenager who was subjected to electroshock treatment when his parents discovered his gay tendencies and put him under treatment with a psychologist. However, even in those cases in which counseling seeks to soothe the patient rather than to cure him or her, the prejudices of the therapists are perceived by their customers, making it difficult for them to assert their sexual preferences and seek a healthy insertion in a hostile society.

This is true not only for homosexuality, but also for many aspects in the sexual life of heterosexual people. When people come for advice on sexual problems—like frigidity, impotence, fast ejaculation or difficulties in ejaculating, painful sex, sex during pregnancy and after delivery, consequences on sexual life of drugs and surgical procedures, sex among the aging, etc.—gynecologists, obstetricians, urologists, and the general practitioner find that they all are confused. Although their scientific formation in the field of sexuality is incomplete, from the little they know, they perceive that science and common sense run against their ideologies and beliefs. The internal battles between these two opposing patterns of thinking and behaving only adds confusion and distress to ignorance.

Every time I talked with people suffering from sexual problems, they told me how much they would benefit from sound advice and support. They think that medical schools should not only give their students advanced training in human sexuality, but also should organize courses on human sexuality open to the population at large. My experience with

a seminar on sexuality that I facilitated for aging people confirms this need. The group of elder women and men unanimously expressed their gratitude for having been allowed, at least for a few hours, to open up their feelings and show that they still are sexual beings with their own particular needs and desires.

For the moment, this seems rather difficult to accomplish. When a program in a school of medicine goes beyond the biological subjects of sexual differentiation and human reproduction, it is to cover technological subjects like contraception and abortion, or mainstream approaches to sexuality in infancy and adolescence, masturbation, and sexual inadequacy. The move beyond conventional teaching never reaches the subject of the sexually oppressed. Argentina, however, is changing fast, and the day may be not too far away in which these subjects, and the broader implications of sexuality for our personal lives, our societies, and our economies, will be freely, honestly, and humanly discussed in all classrooms, and in all walks of Argentine life.

### B. Impact of the Psychoanalytic School

Escaping from persecution and war, some professionals and scholars in the field of psychoanalysis left Europe and found refuge in Argentina. Here, they organized the first college-level studies on psychoanalysis in all Latin America. They planted these seeds in fertile ground. The terrain was already fertilized by brilliant psychiatrists, such as José María Ramos Mejía and José Ingenieros, and a self-taught psychologist, Anibal Ponce. They reflected the state-of-the-art of a science that was trying to apply to its domain the same positivistic, mechanistic approach that was yielding dramatic results in the hard sciences. Their problem was—and still is for many scientists who have not yet evolved from those stages of development of our rational mind—that instead of creating new theories around newly observed facts, they tried to bend facts into accommodating existing theories and classifications. Some of the statements of these forerunners in the field of sexuality now make us smile. Seeking a cause-effect relationship between biology and sexual behavior, they thought that all gay men were hairless, and all lesbians were bearded women.<sup>62</sup>

However, they deserve recognition for having brought the subject to academic circles and college teachings from which they were previously excluded. They also deserve recognition for their open-mindedness; they never thought that their teachings were cast in stone or steel forever. With Renan, one of their French masters, they thought that “the greatest progress brought about by modern rationality was its replacing the condition of being with the condition of becoming, replacing the concept of the absolute with the concept of the relative, and immovability with movement.”<sup>63</sup>

The disciples of the pioneers became the first disciples of the European psychoanalysts, and the work of both found their ideas and their practice spreading quickly among the upper and middle classes of Argentina, who were suffering the stress of fast-changing social mores, an unstable economy, and cycles of stifling and fostering political freedom. The country has now one of the largest per-capita ratios of psychoanalysts and psychologists, and the highest number of people who have been psychoanalyzed.

The influence of Freudian psychology reaches even those who cannot afford to pay the high price of psychoanalytic treatment. Psychologists and psychiatrists are writing informative, easy-to-read, popular books and articles that propagate the main ideas and findings of modern psychology on sexuality and sexual behavior among a literate population. At all levels, they are helping Argentines to come to grips with their ambivalent heritage of an officially repressed sex-

uality, a society where the male is the active performer and the women the passive comptroller, both hiding their deepest feelings, and an intrinsically hedonistic way of life.

To take this movement one step further, Argentina will need to promote formal and informal sexual education that:

goes beyond the narrow subject of reproduction to include a discussion of sexual feelings and fantasies, pleasures, beliefs, superstitions, and dysfunctions. It must further discuss sexual attitudes in different societies and historic periods, erotic art, sex legislation, and indeed "sexual politics." Finally it can't be restricted to children, but must address itself to the whole population.<sup>64</sup>

## 12. Sex Research and Advanced Professional Education

Some limited research is being currently conducted on aspects of human sexuality in Argentina. These include:

- Contraception, focusing on investigations of the effectiveness of different contraceptive methods, their side effects, and the number of users, as well as surgical procedures for sterilization.
- Sexually transmitted diseases.
- Sexual behavior. Schools of psychology are currently supporting dissertation research on male, female, and child prostitution, sexual violence (rape, incest, and spousal abuse), and homosexuality. Because the results of these studies seldom reach large masses and have little impact on the population's attitudes toward diverse sexual behaviors, popular magazines and journals regularly support surveys of their own.
- Sexual dysfunctions, such as impotence, premature ejaculation, lack of orgasmic response, and aversion to sexual intercourse. Such studies usually follow the approach proposed by William Masters, Virginia Johnson, and Helen Singer Kaplan. Unfortunately, few urologists and gynecologists are informed or prepared to assist in these types of problems.

As mentioned in the section on education, very little is being done in Argentina at the university level to meet the needs of an increasingly sophisticated population with an advanced formation of professionals and technicians. Medical and paramedical personnel, along with judges, lawyers, and teachers, are increasingly aware of their need for advanced education on sexual issues and topics. They frequently feel at a loss when asked to render a judgment or verdict, or to provide guidance or information on sexual issues.

Professionals interested in advancing their own sexual knowledge, as well as contributing to sexological research, can now voice their interests and convey their suggestions to the public and to government officials and agencies through the Sociedad Argentina de Sexualidad Humana. Address: Dr. León Guimdim, Director, Darragueira 2247, P.B. "B," 1425 Buenos Aires, Argentina.

## Epilogue

Argentina is a society in transition. The rigid and hypocritical sexual mores of her past have created a double standard for males and females in Argentine society, and a double standard for women themselves that separated the virgin vestals of the households from the pleasure providers. Slowly, women and youngsters are creating more equitable, honest, and open relationships between and within the two genres. They are also seeking a difficult balance between the need to give free expression to their sexual drive and keep it alive during the whole life span, and the need to

build responsible, stable, and healthy households. Men are slowly joining the efforts and starting to perceive the benefits that the changes are bringing to them too.

Will these changes end all traces of a repressive, unjust, and often violent past? Will they finally bring integration and harmony to the sexual field, and contribute to pacifying and developing the entire Argentine society? Only the future will tell.

## Acknowledgments

There are a good many friends, colleagues, and young people who, in one way or another, have contributed to this work. I am beholden to all of them. In particular, I would like to express my heartfelt gratitude to the following:

Dra. Bacigalupo, a university lawyer who specializes in family violence, for sharing his views on the situation of males and females in Argentine households.

Licentiate Isabel Garcia, from the Argentine Council of Women, for information on sexual harassment.

Licentiate Mariana Iurcovich, from the Argentine Center for Prevention of AIDS and the International Society for AIDS Education, for orienting me to sources of data on this disease.

Dr. Alberto Woscoff, Chair of Dermatology, National University of Buenos Aires, for information on herpes.

Dr. Enrique Copolillo, the Chair of Gynecology at the National University of Buenos Aires and a dear friend, for supplying information on STDs.

Dr. Carlos Martinez Vidal, Professor Emeritus of the National University of Buenos Aires, an old friend, an early dreamer of social justice, and a proficient tango dancer, for sharing sexual memories of his youth.

Hernán Federico, a young friend, for organizing my encounters with teenagers and youth.

Dr. Kutznezoff, sexologist and sexual educator, for his observations on sexual education at the university level.

Martha Mercader, writer and Congresswoman, for the many talks in which she conveyed her views of the situation of Argentine women that she feels from the depth of her heart and the breadth of a rich experience.

Last but not least, I must express my beholdeness to my husband, Mario, a learned scholar in the field of human consciousness, with whom I share dreams and realities, and who translated and typed this report from my Spanish manuscript. Without his help, his love, and unflinching support, this work would have never been accomplished.

  8. Data is from the World Bank, *World development report 1993*, p. 295. Figures for primary education are expressed as the ratio of pupils to the population of school-age children. The gross enrollment ratio exceeds 100% because some pupils are younger or older than the country's standard primary school age. The data on secondary-school enrollment are calculated in the same manner. For Argentina, the secondary-school age is considered to be 12 to 17 years. The tertiary enrollment ratio is calculated by dividing the number of pupils enrolled in all postsecondary schools and universities by the population in the 20-to-24 age group.

  19. Teenagers from Jewish families trust a little more their rabbis than teenagers of Catholic families trust their priests. The main reason they give is that priests are not married and have more trouble with their own sexuality than they do.
  20. It is even more surprising to see that the tradition of the *mate* is kept in this time of AIDS. *Mate* is a traditional beverage prepared with the herb *Yerba mate* (*Ibex paraguayensis*), which is native to the Southeast part of South America, a region that includes the northeast of Argentina, Paraguay, and the south of Brazil. The herb is stuffed in a dried and hollowed gourd, covered with water just at its boiling point, and sipped through a metallic straw. The *mate* circulates among people who are socializing, each taking a full gourd of the beverage by turns. Many diseases of the mouth and teeth have been blamed on this custom, which some fear could also transmit AIDS from a person who ignores his or her being a carrier of the virus. *Mate* can indeed be taken also as a tea, but the traditional way in Argentina, Paraguay, and Brazil is as described.

  22. *Ibid.*, p. 453.
  23. In trying cases in which the sexual rights of a minor have been violated, some legal districts have decided to hold actual court proceedings with oral testimony. Prior to this, all legal proceedings were transacted through written reports and depositions to the judge, a procedure that placed serious limits and a heavy burden on the judge and the judge's staff. Oral testimony in court allows for elaborations, explanations, and cross-examinations that are not possible with written depositions. Oral testimony can also provide a better understanding of the nature of the crime, its motivations, and its consequences in the life of the minor.
  24. From the tango *Arrabalero*, words by Eduardo Calvo and music by Osvaldo Fresedo, as quoted in Gobello and Bossio, *Tangos, letras y letristas*, p. 24.

  26. A weapon consisting of two or more heavy balls secured to the end of one or more strong cords, hurled to entangle the legs of cattle and other animals.
  27. Hernandez has his *gaucho* hero Martin Fierro condoning the attitude of a woman who became prostitute. Knowing the desperate situation she went through when her partner was sent to the southern armies, he says about her commerce: "What else could the poor woman do to avoid starving to death!"
  28. There is no doubt that the women were considered slaves of the brothel owners, part of their chattel. I will cite just one of the innumerable stories recorded in the literature. This has been taken from Ramón Cortés Conde and E. H. Cortés Conde, *Historia negra de la prostitución*. Buenos Aires: Editorial Plus Ultra, 1978, pp. 135-136. A prostitute in a brothel of Tucumán is sold to another pimp by the pimp who was exploiting her since she was 13. During the transfer, she manages to circumvent the vigilance of her new owner and escapes hidden in a freight train to Buenos Aires where she finds work at a factory. Four years after her flight, the two old pimps find out where she is, wait for her one early morning when she is walking to the factory, beat her savagely, and permanently disfigure her face with a knife.
  29. Rafael Ielpi and Hector Zinni, *Prostitución y Rufianismo*. Buenos Aires: Editorial de la Bandera, 1986, p. 191.
  30. The inhabitants of Buenos Aires are also known as *porteños*, which means those who live at the port. *Machismo* is a Spanish expression for male chauvinism and *macho* means a male with exalted physical and cultural manhood attributes.
  31. Words from the tango, *El patotero sentimental* (*The sentimental brawler*), written by Manuel Romero (1891-1954) and taken from José Gobello & Jorge Bossio, *Tangos, letras y letristas*, p. 168). The words in Spanish are: *En mi vida tuve muchas, muchas minas, pero nunca una mujer*. The word *Nina*, which is a slang expression, could mean a lover or a prostitute; it is a woman with whom one dates or lives, who is part of one's possessions, and whom one may even exploit.
  32. The description of the brothels and the prices paid are taken from Ielpi and Zinni, *Prostitución y Rufianismo*.

33. The article is reproduced in *La Nación*, December 30, 1982, which still is one of Buenos Aires' largest newspapers. During all the decades of the infamous traffic, responsible Argentine newspapers kept denouncing the situation and the corruption of Argentine politicians and bureaucrats who were benefiting from it.
34. Ielpi and Zinni (*Prostitución y Rufianismo*, p. 18) reproduce a typical story included in Londres's book. It describes how traffickers sitting around the family table were discussing with the parents a contract that would guarantee their daughter a job (nature not disclosed) and the family a monthly stipend for three years. The young woman solemnly promises not to shame the family by breaking the contract!

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

#### A. Demographics

Australia occupies an island continent of 2,966,200 square miles (7,682,400 km<sup>2</sup>), almost as large as the continental United States, southeast of Asia. Australia is the world's sixth-largest nation. It is surrounded on the west and south by the Indian Ocean, the Pacific Ocean on the east, and the Timor Sea and Arafura Seas on the north. The nearest land neighbors are New Guinea and Indonesia on the north, the islands of New Caledonia, Vanuatu, and Solomon across the Coral Sea in the northeast, New Zealand and Fiji across the Tasman Sea in the southeast, and Tasmania 150 miles (240 km) to the south. Along the coast, east of the Great Dividing Range, the rainfall is heavy with jungles in the Cape York Peninsula reaching north toward New Guinea. The interior lands and western plateau are arid desert; the northwest and northern territories arid and hot.

The indigenous people of Australia, known collectively as Australian Aborigines, constitute 1.95% of the population; about 50,000 are full-blooded and 150,000 part-Aboriginal. The majority, mostly of mixed descent, live in urban

areas. Most full-blooded Aborigines live in rural and remote areas of the interior and the north of the continent and maintain important aspects of their traditional cultures. Because there are significant regional variations, generalizations cannot be made. There is a wide range of living conditions and adaptation to Western pressures; however, most Aborigines remain socioeconomically disadvantaged despite compensatory legislation.

Of the nonindigenous people, the longest family history of residence in Australia can be traced back eight generations. This population comprises people from all over the world, although the majority are European in origin.

Australia's population grew from 3.8 million at the turn of the 19th century to 19.2 million in 2000. Natural increase has been the main source of growth since the turn of the century, contributing two thirds of the total increase between 1901 and 2000. Net overseas migration, while a significant source of growth, is more volatile, fluctuating under the influence of government policy, as well as political, economic, and social conditions in Australia and the rest of the world. In 1999-2000, there was a 16% increase in net overseas migration over the previous year, from 85,000 to 99,100 persons. Since 1962, falling fertility has led to a fall in the rate of natural increase. ABS (Australian Bureau of Statistics 2002) population projections indicate that continued low fertility, combined with the increase in deaths from an aging population, will result in the natural increase falling below zero sometime in the mid 2030s.

Despite the concentration of people in the larger cities, Australia is not a homogeneous society, having an indigenous population, a history of European settlement, and, more recently, immigration from Asia and Africa. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 22% with 1.05 male(s) per female (sex ratio); 15-64 years: 67% with 1.03 male(s) per female; 65 years and over: 11% with 0.84 male(s) per female; *Total population sex ratio:* 0.76 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 77.78 years; *male:* 74.67 years; *female:* 81.04 years

**Urban/Rural Distribution:** 85% to 15%, with the cities scattered along the widely separated coastlines

\**Communications:* Rosemary Coates, Ph.D., Curtin University, Shelby Street, Shenton Park, Western Australia 6008, Australia; icoatesr@info.curtin.edu.au. *Updates:* Anthony Willmet, Ph.D., Australian Catholic University National, Prospect Road, Mitchelton, Queensland 4053, Australia; t.willmet@mcauley.acu.edu.au.

**Ethnic Distribution:** Caucasian: 94%; Asian: 4%; Aboriginal: 1.9%

**Religious Distribution:** Anglican: 27%; Roman Catholic: 27%; other Christian denominations 22%; non-Christian religions: 3% (more recently, immigration from Southeast Asia and the Middle East has expanded Buddhist and Muslim numbers considerably, and increased the ethnic diversity of existing Christian denominations). Approximately one quarter of all Australians either stated that they had no religion or did not adequately respond to the census question (Australian Bureau of Statistics 2002).

**Birth Rate:** 14.13 births per 1,000 population

**Death Rate:** 7.37 per 1,000 population

**Infant Mortality Rate:** 7.1 deaths per 1,000 live births

**Net Migration Rate:** 6.33 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.82 children born per woman

**Population Growth Rate:** 1.31%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.1%; *Persons living with HIV/AIDS:* 12,940; *Deaths:* < 100. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 100% (1980 est.); portion of youths attending 15 years of compulsory schooling: 95%

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$23,200 (2000 est.); *Inflation:* 1.4%; *Unemployment:* 6.4%

## B. A Brief Historical Perspective

When the British Captain James Cook explored the eastern coast of the Australian continent in 1770, it was inhabited by a variety of different tribal peoples. The first settlers, mostly convicts, soldiers, and British government officials, began arriving in 1788. By 1830, when Britain claimed the whole continent, the immigration of free settlers began to accelerate. Australia was proclaimed as a Commonwealth of the British Empire in 1901.

Racially discriminatory policies were abandoned in 1973, after three million Europeans, half of them British, had entered the country since 1945. In 1993, the Prime Minister announced a plan to make Australia a republic, independent of the British Commonwealth by the year 2001. [Update 2003: With a change in the political climate, this has not come to fruition. (*End of update by R. Coates*)]

## NON-ABORIGINAL AUSTRALIA

### 1. Basic Sexological Premises

#### A. Gender Roles

In common with many other countries, Australia is struggling with changing gender roles. Although one of the first countries in the Western world to introduce women's suffrage, other aspects of gender equality have been slower to develop. It was not until the early 1970s, through the activities of well-organized women's groups, that successive legislation has been introduced in support of women's rights. These include laws governing equal opportunity, antidiscrimination, and family law issues.

It has been claimed that, although Australia is one of the most advanced industrial democracies in the world, it is, nevertheless, a sexist society, where women are valued only in terms of being a commodity (Dixson 1976; Mercer 1975). This legacy from the original white settlement is gradually changing, although manifestations continue to be expressed in the phenomena of "mail-order brides" and "sex tours." Both of these customs tend to exploit neighbor-

ing Asian countries where poverty forces young women (and some young boys) into bargaining with their bodies.

From the time of initial white settlement up to the early 1960s, women have been "brought" to the country to fulfill the needs of men. The transportation of British convicts to the colonies of Australia is well documented. Female convicts were transported to become servants for the administrators and to meet the sexual needs of both free men and convicts. The first governor of the early colony was instructed by the British government "to keep the female convicts separate till they can be properly distributed among the inhabitants" (Clark 1950, 117). These women were used to serving the needs of men, but were not deemed suitable as wives for the free settlers. As the number of single, free male settlers increased, the British government began to offer young, single, healthy women free passage to Australia. A not dissimilar attitude persisted through to the early 1960s, where successive Australian governments gave a high priority to the immigration of young, single, healthy women.

The history of white, female settlement in Australia is one of the antecedents of the nature of male-female roles and relationships in contemporary Australia. Another significant antecedent was the nature of the pioneering activities undertaken by men in the early decades of white settlement. The concept of "mateship" is a legend of male-to-male relationships, to the extent that it has a place as a literary genre in its own right. The "typical" Australian male has been, until very recently, portrayed as a "good bloke," and a real "mate." In the early years of settlement, the harshness of the country and the nature of pioneering, gold exploration, and farming led men to work in pairs or small groups, often isolated for months at a time from other people. There was an unspoken pact of mutual protection and reliance. Folklore is rich with stories of self-sacrificing "mates." Historical accounts have continued to emphasize masculine activities and associations, and ignored the role of women in pioneering the country, thus helping to reinforce the image of an Australian man who relates to other men, with women being generally ignored. Australian participation in World Wars I and II re-emphasized masculine bonding, and the stories, fact or fiction, of "mateship" and sacrifice continue to be celebrated annually with the commemoration of Anzac Day on April 25. In the view of some, it is on this day that the divide between the white men and women of Australia is most emphasized. The emphasis on male sporting activities and the associated icons are current manifestations of traditional "mateship."

Social conventions, however, are undergoing change, albeit too slowly for supporters of the women's movement. Experiences in Australia are similar to those reported from America, Britain, and some of the European countries, in that the majority of women are in paid employment, but continue to take the major responsibility for home management (Baxter 1992; Chisholm & Burbank 1991). The concept of the "glass ceiling" is well documented, and the proportion of women in senior executive positions in all areas is very low. For example, of the 35 universities in Australia, only two have women as their vice chancellors, less than 13% of federal politicians are women, and a similar percentage of senior positions in the federal public service are held by women, with one woman judge of the high court. There is evidence to suggest that younger men do not have the same expectations of clearly defined gender roles as their fathers, although this does not translate into equal sharing of domestic duties (Edgar & Glezer 1992).

#### B. Sociolegal Status of Men and Women

In adulthood, men and women are treated equally under the law. Anomalies exist in the status of male children vis-à-

vis female children. For example, the age of consent for sexual acts is 16 years; however, the age of consent for males to have sex with other males is 21 years. There is no recognition in the law for female-to-female sexual acts. [Update 2003: In 2002, changes have been made to some State laws bringing a greater level of equality to the laws. For example, in Western Australia, various laws have been amended to ensure equal status under the law for those in same-sex or *de facto* heterosexual relationships. (End of update by R. Coates)] Women's social status, while being protected by various laws, remains, nevertheless, inhibited by misogyny and more-subtle cultural factors.

### C. General Concepts of Sexuality and Love

Sex is generally viewed as a recreational activity, serving purposes that go beyond procreative ones. It is customary for individuals to couple for reasons of love, with conventional concepts being promoted in European romantic terms. The media, including films, books, television, popular music, and advertising, promotes physical and emotional attraction and idealistic pairing.

Arranged marriage is not an acknowledged practice; however, it does occur in those ethnic groups that follow a particular cultural tradition.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

The dominant culture from the early days of European settlement was Anglo-Saxon and Gaelic, with strong Catholic and Anglican religious influences. Later large-scale migration attracted significant numbers of Italian and Greek people, thus enriching the culture and strengthening the Catholic religious traditions. More-recent migration has increased the ethnic diversity, with people from many of the African countries, the Middle East, Southeast Asia, and India. This has resulted in an increase in the number of people who follow non-Christian traditions such as Islam and Buddhism.

Recent data from the Commonwealth Bureau of Statistics show that 26.1% of the population describe themselves as Roman Catholic, 23.9% Anglican, and 23% follow other Christian movements. Twenty-five percent declare themselves as having no religion. Two percent of the population are classified as non-Christian, with 0.7% being Muslim, 0.5% Buddhist, and 0.4% Jewish (Castles 1992; Australian Bureau of Statistics 2002). Public sexual mores are influenced by traditional Judeo-Christian teachings, although there is an active, fundamentalist minority.

The legal system is unequivocally British in origin and practice. The criminal and other pertinent legislative codes in all states and territories have as their foundation British law. Modifications have occurred over the ensuing period, resulting in variations between different states and territories. [Update 2003: The decriminalization of prostitution and the establishment of procedures to conduct a brothel have occurred in some States. Contesting views, which include possible legal action and a court challenge, exist between the Catholic Church and the Queensland State government about antidiscrimination legislation, when such legislation includes shoring up the legal rights of gay and lesbian couples (*Courier Mail* 2002). (End of update by A. Willmet)]

### [A. Religious Influences and Changes

ANTHONY WILLMETT (Update 2003)

[At the turn of the 21st century, two major pillars of society—education systems and the churches—appear to be enmeshed in confusion over their roles in enhancing or con-

trolling the sexuality of young people in their care. While educators promote the importance of education for life in all the meanings of that term, the media reveal ever more incidents of inappropriate behaviors by teachers and clergy. While all agree that children must be protected from inappropriate behaviors, there is currently little agreement on how this should be achieved. Societal responses to these revelations have polarized so, that, while some wish to enforce a return to “the Bible as literal truth” or to “a morality of control,” others believe that ever more open discussion will assist young people to regain control of their own emerging sexuality.

[Australian newspapers report incidents of sexually inappropriate behavior in religiously affiliated schools, while at the same time, the list of clergy or members of religious orders of nearly all denominations who are accused and/or convicted of sexual misdemeanors with young people increases in length. For some commentators, the answer is for a “return to the old morality,” whereby sexuality is kept firmly within its place, defined strictly as within marriage and for the purposes of procreation. For others, it is precisely this “controlling morality” that has led to the current situation, whereby children appear to be most greatly at risk in precisely those institutions where they might expect to be safest.

[Auxiliary Bishop Francis Patrick Power of the Catholic Diocese of Canberra and Goulburn broke ranks by calling for a study of priestly celibacy. In a widely reported interview on ABC Radio in September 2002, he suggested that priests who have left the ministry to marry should be allowed to exercise their priestly ministry. He called for a rethinking of the Church's teaching on sexuality, and proposed that gays and lesbians should be recognized as human beings with needs and desires. He said that the Church's current teaching on the morality of homosexuality implies a “double moral standard, since a significant percentage of Australian priests are known to be gay” (*National Catholic Reporter* [U.S.] 2002). He also warned that the exclusion of women from positions of authority fosters “a feeling of disenchantment” among Catholics.

[The issue of how the Church might respond to lesbian and gay people who wish to have their commitment to a lifelong faithful relationship affirmed by the Church was vigorously debated at the Eighth Assembly of the Uniting Church in Australia. The Assembly was divided on the issue. (End of update by A. Willmet)]

## 3. Knowledge and Education about Sexuality

### A. Sexual Education in Public Schools

Each state and territory, through their respective education authority, has a curriculum that provides for personal development and education in sexuality. These have been developed by experienced educators and offer well-rounded, age-related programs for both primary and secondary education. The implementation of such programs, however, is variable, and no child in Australia is guaranteed a consistent and continuing sexuality education. Curricula packages are available, through the educational authorities, to both public and private schools. To date there is no education authority that has made sexuality and relationship education a required subject. Teachers and parents have the option of deciding what, if anything, is presented to children.

Today's young parents are more prepared to provide their children with sexual information and are offering a wider range of information than their own parents did. The result of this form of education is also variable and young people report that they would prefer to receive a comprehensive and

consistent formal education by properly trained teachers (Coates 1992). No education department offers preservice or in-service training to meet this need.

Typically, the curriculum packages often deal with a variety of health and personal development issues and integrate the sexuality elements at appropriate stages. For example, concept of self and one's position within a family structure are included in the syllabus designed for the early years of primary school, as is nutrition and personal hygiene. Biology and reproductive sexuality is generally offered before the emotional aspects of human sexuality, although personal safety and the concept of invasion of private "space" is suggested for the 6- and 7-year-olds. Information on gender identity and sexual orientation is suggested for secondary school students at about 15 and 16 years of age.

Thus, the deficiencies within the system are the facts that the curriculum is optional and that teachers are not trained specifically to teach human sexuality, and in some areas, teachers are instructed not to answer questions posed by students on certain topics.

### [B. Sexual Education in Catholic Schools

ANTHONY WILLMETT (*Update 2003*)

[An examination of teaching about sexuality in Catholic schools (Willmet 2002) reveals that there is little agreement on how best to prepare young people for a sexually healthy life through their formal educational experiences. In fact, two polarized positions have emerged. At one extreme is the suggestion that traditional moral orthodoxy should be reaffirmed fundamentally by controlling and suppressing acknowledgment of the developing sexuality of young people. At the other end is the suggestion that it is precisely because of this suppression and lack of knowledge and understanding of the role of sexuality among students and their teachers, as well as parents and the clergy, that the current situation has developed.

[The Roman Catholic Education system in Australia is the largest unified denominational system in the country. There are links between religious education and sexuality education in these schools, and when the topic is sexuality, educators register a range of reactions that have an impact on their confidence and comfort in presenting material. These dilemmas and concerns can be described in pedagogical, professional, and personal terms.

#### [Pedagogical Challenges

[Pedagogical problems in sexuality education in Catholic schools are often associated with: curriculum rationale, design, and implementation; curriculum content; teaching and learning strategies; students' classroom questions—particularly unpredictable questions; resources; and, assessment and evaluation (Bruess & Greenberg 1994; Hedgpeth & Helmich 1996; Sears 1992; Willmet 2002). Problems connected with curriculum rationale, design, and implementation, often stem from an understanding of and rationale for sexuality education in a school setting. Different outcomes will determine if sexuality education is viewed as a theological, a therapeutic, or an educational endeavor. If the program is seen in theological terms, the religious educator may seek to inculcate in students the values and beliefs of the sponsoring Church community; if the program is seen in therapeutic terms, the religious educator may seek to heal or soothe students' feelings and behaviors to conform to some desirable standard; if the religious educator sees the program in educational terms, the aim will be to enhance students' understanding and appreciation of human sexuality.

[School communities are confronted with the issue of who is responsible for the explicit sexuality education cur-

riculum. Specific outcomes will be seen to be appropriate to schools if educators acknowledge explicitly that learning about sexuality is an ongoing process that continues throughout life (Coates 1997; G. Moran 2001). Different outcomes will also be established when a curriculum is designed solely on the basis of syllabus requirements, rather than as a whole school approach. A whole school approach that employs a collaborative and consultative process involving students, parents, and community representatives, has the potential to link the school appropriately to life-long learning (Willmet, 2001).

[Problems connected with curriculum content include: identifying developmentally appropriate content material; catering for any overlap and/or repetition of material; and, determining how material that is sometimes described as "sensitive" will be handled. The relevance of the explicit program is a particular challenge to students and parents. Making education and sexuality education relevant to needs and interests is an essential element in learner empowerment (Hedgpeth & Helmich 1996). Parents, teachers, and the local community need to ask learners what they need and want to learn.

[Problems connected with teaching and learning strategies include a hesitancy to adopt teaching and learning strategies that are applied successfully in other curriculum areas. Teaching and learning strategies that invite personal responses in other curriculum areas become problematic in sexuality education, because of the perceived "private and personal" nature of the topics. This is highlighted when it comes to answering students' questions in the classroom. Cries of "What do I say?," "What am I allowed to say?," or "How far can I go?" are heard more often regarding sexuality education than other curriculum areas (Willmet 1998).

[Problems associated with resources include their availability and appropriateness. While there has been some improvement, Australian-produced resources are relatively sparse. Students may not find in the available overseas resources a context that matches their own. In addition, Church and school leaders may deem some materials unacceptable if they raise themes or issues that contradict the expressed values of their community. Resources may be inappropriate if they omit specific religious references, or if they appear to be aggressively religious or seek to preach rather than teach.

[Assessment and evaluation also pose problems, not only because they are connected with and inform the rationale, design, and implementation of sexuality education, but also because they may not exist. Teachers may be comfortable and skilled when it comes to assessing knowledge and skills, but anxious if there is a perception or expectation to assess behavior.

#### [Professional Dilemmas and Problems

[Teachers are aware of sexuality education as providing information for educated choices. They are also aware of sexuality education as an arena of professional insecurity (Willmet 2002). Teachers have a sense of the contesting views about sexuality and sexuality education—both within and outside the Catholic tradition (Chater 2001; Francoeur & Perper 1998; Hogan 1993; Lebacqz 1999; Whitehead & Whitehead 1994, 2001). Heterosexist assumptions underlying course content is one example (Bosacki 2001; Epstein & Johnson 1998; Harrison, Hillier, & Walsh 1996; Selling 2001). Other professional dilemmas and problems involve perceived or real relationships. Relationships between the classroom teacher and the parents or the employing authority, for example, the school board, diocesan authority, parish priest, or minister, can present the religious educator with

difficulties, particularly if there are philosophical and educational differences about sexuality education in the school or Church setting. In addition to problems associated with employing authorities, concern about lobby groups or the media also has an impact on teachers' professional confidence.

[Professional problems in sexuality education can be found in relation to expectations placed on classroom teachers. While they do not want to be judgmental and wish to explore contesting views about sexuality with students in the classroom, teachers do not know how to do so (Went 1985; Willmettt 2002; Ziebertz 1992). The extent to which teacher preservice and in-service programs offer method, as well as content courses on sexuality, is a problem for the profession. The absence of professional associations for teachers in this field might be linked to this situation.]

[One important professional problem that confronts the classroom teacher is how to narrow the gap between the rhetoric and the reality of an understanding about, and an approach to, sexuality and sexuality education in the school setting—including the classroom program (Sears 1992; Willmettt 2002). How well, for example, does the explicit curriculum match the lived experience of people in the school or Church community? How do the policies, practices, programs, procedures, places, and people reinforce and complement what is presented in the explicit curriculum?]

#### *[Personal Concerns]*

[Teachers experience sexuality education as a focal point for discrepancy (Willmettt 2002). Discrepancies appear in relation to the lived experience of the members of the Catholic community and the official teachings of the institutional Church (Dominian 2001; Grey & Selling 2001; Whitehead & Whitehead 1994, 2001). They also appear in relation to the role of the teacher in the classroom, for example, as a substitute parent, and in relation to the philosophy and educational approach that underpins the sexuality education program in the classroom (Hedgepeth & Helmich 1996; J. Moran 2000; Willmettt 2002). A background question for each parent, educational leader, and classroom teacher is: Do I believe sexuality is a private matter, best left to family to educate, or are there public and communal dimensions, which require intelligent conversation in other educational settings beyond family? The response to this issue will help to determine their comfort and confidence in presenting material.]

[Teachers also experience sexuality education as personal anxiety. Fear, uncertainty, and concern for their well-being are different ways teachers experience sexuality education. Fear and uncertainty about loss of employment or about being reported to relevant authorities is experienced by teachers (Willmettt 2002). Any unease or discomfort with issues of sexuality felt by Catholic educational leadership, and by classroom teachers, will be readily conveyed to students. Their uneasiness will reinforce students' suspicions that the topic of sexuality is somehow off-limits or embarrassing. At their most basic, these personal concerns confront Catholic educational leaders and classroom teachers with their own history, education, and experiences of sexuality. All adults have to confront and respond to their unique childhood experiences and formation in sexuality; this task is immediate and consequential for those responsible for presenting sexuality material in classrooms. Any sexuality educator reflects upon his or her own inventory of attitudes to a range of issues concerning the human body, sexual feelings, behavior and orientations, and the plurality of community sexual standards (Coll 1994; Francoeur & Perper 1998). Catholic educational leaders and classroom teachers may experience the need to gain certainty by

resolving all the issues and questions before venturing into the classroom.]

[As with any area of teaching and learning, classroom teachers may feel constrained by their own lack of knowledge; they may lack familiarity with some basic knowledge. They may have difficulty resolving the dilemma between sexuality being viewed as an act and as law, or as a relationship and as Gospel within the Catholic tradition (Francoeur & Perper 1998; Dominian 2001; Hogan 1993). The resolution to this dilemma will influence the selection and presentation of material. All the factors described above will contribute to a sense of the relative comfort or relative discomfort on the part of Catholic educational leadership and the classroom teacher when presenting topics on sexuality. (*End of update by A. Willmettt*)]

#### *4. Autoerotic Behaviors and Patterns*

Large-scale sexological surveys have not been conducted in Australia. As a consequence, much information offered here is based on small surveys and anecdotal evidence. Research undertaken by Coates over a period of seven years and confined to Western Australia (Coates 1987) indicates that, among a population of 678 young adults, 87% of females and 93% of males reported having engaged in self-pleasuring at least once in the preceding six months. More recent research undertaken by Ferroni (1993), who reviewed 658 women, classified into three groups—namely, women with gynecological problems, women who had had a hysterectomy, and healthy women, respectively—found that 70% of her respondents reported autoerotic behavior.

Current mores about autoerotic behavior reflect the Judeo-Christian influence coupled with a more relaxed Australian attitude toward most aspects of sexual behavior. Self-pleasuring as a topic of conversation has, to a certain extent, lost its taboo status. Likewise, the use of pornographic material as a stimulus, either alone or with a partner, is a subject of discussion for some young people.

#### *5. Interpersonal Heterosexual Behaviors*

##### **A. Children**

There is little information available about types of sexual behavior and whether patterns of sexual experimentation have changed. However, anecdotal reporting indicates that Australian children are no different from children in other countries and engage in sexual rehearsal play. This is conventionally curbed by witnessing adults, although enlightened parents will take the opportunity to educate their children about private and public, acceptable and unacceptable, behavior. Many parents will tell their children that it is acceptable to engage in self-pleasuring as long as they confine it to the privacy of the bedroom. It is not customary for children to witness adult sexual interactions nor for children to be initiated into sexual activity by an adult. There are no pubertal initiation ceremonies in the nonindigenous population.

##### **B. Adolescents**

Results of a survey of 2,000 respondents aged 16 to 25 years suggest that adolescents are probably more sexually experienced than their parents were at the same age (McCabe & Collins 1990). Intercourse is occurring at an earlier age than ten years ago and in greater numbers. The mean age of first intercourse is about 16 years, and by the age of 18, nearly 60% of young people report that they are sexually active. There is also a reported increase in the number of sexual partners at a given age.

Casual sex is still an important part of adolescent sexual activity, although most sexual experience in adolescence

probably occurs in the context of a steady relationship. Explanations for the initiation of sexual intercourse include curiosity, peer pressure, and the need to be loved. The rates of sexual experience are greater in males than in females (Dunne et al. 1993; Cubis 1992). Peer pressure from boys is strong, and many young women report that their first experience of intercourse was not a positive one.

Sexual activity and socioeconomic status have not been shown to be related, but pregnancy and carrying to term are associated with lower socioeconomic status. Pregnancy is no longer a reason to precipitate marriage, with less than 20% of detected adolescent pregnancies resulting in marriage prior to the birth of the baby.

Not surprisingly, data from the Family Planning Association and other sources indicate that adolescents are among the poorest users of contraceptives. Age, a reluctance to acknowledge to others that they are sexually active, and distrust of authorities are possible reasons for the low utilization of the services offered.

Research by Moore and Rosenthal (1991) indicate that young people continue to resist the use of condoms even in the context of safer sex practices and HIV/AIDS. Males are more likely to place the responsibility on their partners and females express a distaste for condoms. It has been suggested that heterosexuals do not believe that they are at risk, that AIDS has been seen as a disease of the sexually deviant or other stigmatized groups (e.g., drug users), and that HIV transmission has been identified with groups, not sexual practices (Kippax 1991).

### C. Adults

#### [Single Lifestyle Increasing

[Update 2001: Recent demographic studies at the Australian National University indicate that about a quarter of young Australians will never get married, and those who do will take longer than their parents to marry. Projections in early 2001 suggested that 27% of men and 23% of women ages 15 to 20 will not be married by age 50. At that age, their chances of getting married would be slim. The trend to delay marriage is affecting all age groups and both sexes in Australia. For example, in 1999, 18% of 35-year-old women were unmarried. By 2015, that percentage will nearly double to 33%. Even allowing for *de facto* cohabiting relationships, which were not counted as marriage, "coupledom" will be even rarer than in past decades. A new avenue for easier divorce through the Federal Magistrates Service, and the growing tendency for women to attend universities and undertake a career are the two driving forces behind the decline of "coupledom." Marital trends in Australia have swung wildly in the past century. In 1921, 17% of Australian women never married; in 1981, only 4% never married. In 1999, it was about 9%. Corresponding figures for men are slightly higher. (End of update by R. T. Francoeur)]

#### Cohabitation, Marriage, and Family: Structure and Patterns

Cohabitation is a common practice in Australia, to the extent that it is officially recognized for property distribution on dissolution. The term *de facto* has been in common usage for at least 30 years and is applied to couples who live together without undergoing a formal marriage ceremony. A high proportion of young people live together for a considerable period prior to marriage. Over 60% of adults believe that living together before marriage is acceptable, and about 50% of all people under the age of 30 do live together prior to marriage. Thirty percent of these say that they do not believe in marriage. One third state that they would

leave the relationship if they were not growing in it (Glazer 1993).

Since the 1970s, the age at first marriage has risen, with a resultant rise in the age of the primiparous mother. The average family size is around 2.4 children and there is a greater focus on women's having a career outside of the home.

[Update 2003: Like many of the developed countries, Australia has had a significant drop in its birthrate over the past ten years. Concern about the declining rate is being expressed through the development of support schemes to encourage women to take time out from work to have babies. There is now a greater recognition that the majority of women work, and that many of them would like to continue their career after childbirth. There is a greater level of awareness that the business environment must become both child- and woman-friendly. (End of update by R. Coates)]

#### Divorce and Remarriage

When Australians do marry, monogamy is the conventional custom. Divorce and remarriage have become increasingly accepted in the past 20 years, and it is estimated that one in four marriages will end in divorce, with the current rate being 11 per 1,000 marriages. Close to 60% of previously married men and 25% of previously married women remarry (Castles 1992, 169, 172).

#### Nonmonogamous Relationships

Recently, in at least one capital city, a group in support of nonmonogamous relationships has been established. It is distinctly different from the "swinging" groups of the 1970s. The group advertises under the rubric "Beyond Monogamy" and advocates responsible and mutual polyfidelity.

#### Sexuality and the Physically Disabled

Since the United Nations International Year of the Disabled in 1979, Australia has been making a concerted effort to make provision for, as well as change the attitudes toward, people with disabilities. Recognition has been given to emotional relationships and sexual rights and the needs of both the intellectually and physically disabled. However, once again, the provision of education, counseling, and other services is variable. Predominantly dependent upon local expertise, interest, and influence, programs may or may not be offered. In Western Australia, a comprehensive education program has been developed for the intellectually disabled, whereas very little of a formal nature is provided for the physically disabled. In other states, there have been some exceptionally enlightened programs for adults with acquired disabilities.

Legislation, governing such things as antidiscrimination and equal opportunity, provides protection for the rights of the disabled. Community housing, as opposed to institutional dwellings, enhances possibilities for the disabled to exercise their sexual options.

#### Incidence of Anal and Oral Sex

There is no reliable data on the incidence of oral and anal sexual activities in Australia. Coates' Western Australia survey (1992) indicates that at least 73% of her sample had experience at least once with both fellatio and cunnilingus; 32% had experimented with anal sex. Both oral and anal sexual practices are included in information about safer sex practices with precautions to be taken to avoid HIV transmission. The general acceptance of such messages (with few notable, and predictable, objections) may indicate an assumption that these practices are within the norms of acceptable sexual relationships.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Legal and Social Status of Gays and Lesbians

Homosexuality has been subjected to both legal and social sanctions. However, there has been a gradual reduction of hostility toward homosexuality and a concomitant change in legislation in the past 20 years. Under the equal-rights legislation, same-sex couples are generally afforded similar rights to opposite-sex couples. This recognition has been extended to residency status in this country for the partner of a gay or lesbian person. Despite official acceptance and a generally sanguine attitude, there is still a prominent homophobic element within this society. Predominantly this is expressed against gay men through so-called poofter-bashing, where gangs of youths go to public gay venues for the express purpose of assaulting (presumed) gay men. Certain fundamentalist religions actively campaign for the reintroduction of legislation against homosexuality.

All states have repealed laws against same-sex activities between consenting adults in private. In Western Australia, the legislation may be unique in the English-speaking world, where the document is prefaced with a disclaimer to the effect that the Parliament does not condone the behavior.

There is a strong and active network of gay men and lesbian women, with all the major cities and many rural areas having constituted organizations. A number of these organizations are at least 30 years old and have been at the vanguard of political activism and in the provision of counseling and education services. These organizations were also crucial to the early and positive response to HIV/AIDS policy development, education, counseling, and treatment. In addition, there are support groups throughout the country for the parents and friends of gay people.

There are a number of domestic gay publications, the most notable quality magazines being *Outrage* and *The Advocate*. Typically, women are less well catered for, although there is a national networking newsletter called *Grapevine*, which provides a contact service. Most of the cities have dedicated bookshops, and all dealers of sexually explicit material stock magazines aimed at gay men.

The Sydney Gay and Lesbian Mardi Gras, held in March each year, is reported to be the largest in the world and attracts thousands, including many international visitors. The Mardi Gras parade is conducted through the streets of Sydney and is a popular event for families to attend on what is, normally, a warm summer evening. The Sydney City Council supports the Mardi Gras as an important income-generating event. A fundamentalist Christian group prays for rain to mitigate the success of the event.

[Update 2003: In November 2002, the Gay Olympics were staged in Sydney, with 18,000 competitors and 25,000 visitors. The Governor of the State of New South Wales opened the Games after a welcoming speech from one of the country's most prominent High Court Justices. The support afforded to the Games was a clear indication that the economic value of the "pink dollar" is recognized and that there is a greater level of acceptance of people who are same-sex oriented. (End of update by R. Coates)]

### B. Sexual Outlets and Relationship Patterns

#### Gay Men

The largest gay population is in the city of Sydney, with Oxford Street being the best-known area for at least a particular subgroup to congregate. An area on this street known as "The Wall" is the place male sex workers congregate. Sydney, Melbourne, Brisbane, Perth, Adelaide, Canberra, and

the Gold Coast all have a number of acknowledged gay and lesbian venues, including bars, restaurants, nightclubs, and theaters. These venues are recorded in the publication *Gay Guide*. Smaller towns have similar venues, but tend to have a lower profile.

It is easy to stereotype the patterns of behavior for gay men; however, it would be more accurate to say that there is as much diversity in relationship and sexual patterns among the gay population as there is among the nongay population. The spectrum—from long-term monogamous relationships, serial monogamy, triads, groups, to frequent, anonymous sex, and sexual abstinence—would all be represented within the gay community.

One representative pattern of gay male behavior has most recently been documented by researchers from Macquarie University in New South Wales. The study revealed that urban gay men had high levels of knowledge about HIV transmission and had substantially changed their sexual behavior. Attachment to the gay community, defined as sexual, social, or cultural/political, was found to increase the likelihood of behavior change. Isolation and nonattachment decreased the chance of sustained behavior changes (Crawford et al. 1991).

In contrast, results of a study of men who use the beats in western Sydney differ somewhat from the Macquarie study. Wherrett and Talbot (1991) found that 40% of men reported they practiced unprotected anal intercourse with casual partners, 10% with regular partners, and 95% of the sample reported having experience of anal/genital intercourse without condoms at some time in their lives. Forty-eight percent of men stated that they had had unprotected intercourse within the last six months. The authors suggest that the findings from these and other similar studies reveal that there are large numbers of men who have sex with men who are not attached to the gay community and are the least likely to adopt safer sex practices.

#### Lesbian Women

Lesbian women have had a much lower profile until relatively recently and would appear to be less well catered for in terms of venues. Some years ago, the women shared the male venues, often having a "women only" night. Today, at least in the larger cities, there are venues just for women.

Again the relationship patterns would cover the entire spectrum. A comparison between gay men and lesbian women in terms of fidelity and number of partners would probably show similarities with matched, so-called heterosexual groups.

#### Gay Parents

A number of both gay men and lesbian women have exercised their option to become parents. The methods used have ranged from selecting a sexual partner for the specific purpose of conceiving, to artificial insemination and IVF.

There have been examples of a parent's gaining custody of children on the grounds of the homosexual orientation of the other parent. However, homosexuality, per se, would not necessarily ensure loss of child custody.

#### Bisexuality

People who actively engage in sexual relationships with both men and women may be considered the invisible group. There is frequently a lack of recognition and acceptance by the gay and lesbian community, many of whom claim that those who identify themselves as "bisexual," in fact have not come to terms with their "homosexuality." Further, the concept of bisexuality is ignored by the general community.

Personal experience as a counselor and educator leads one to believe that there is a degree of covert bisexuality

among males. One common mode of expression for married men in making regular visits to anonymous sex venues, such as "T-Rooms" and Saunas. Prior to the recognition of HIV/AIDS, the author was aware of a number of bisexual groupings, mainly triadic relationships. Whether the number of self-identified bisexuals has declined, or simply gone underground because of prevailing attitudes, is unknown.

Data collected from 1986 to 1991 by a telephone counseling service for bisexual men and their female partners revealed that 59% of the male callers were married. Over that period, there was a consistent decline in the number of bisexual men who reported participation in unprotected male-to-male anal sex, paralleled by a small, steady increase in safer-sex knowledge levels. There were, however, a number of misconceptions about safer-sex behavior, with the role of oral sex in HIV transmission the least well understood. Younger men were more likely to participate in high-risk behaviors (Palmer 1991).

## 7. Gender Diversity and Transgender Issues

### A. Transsexualism

Transsexualism is recognized as a medical condition in Australia and provision is made for sex reassignment. The program follows the model developed by John Money at Johns Hopkins University Hospital (Baltimore) in the United States. Because of the need to maintain surgical skills, there are only two designated venues for surgery to be conducted: one in South Australia, the other in New South Wales. The preparatory program, however, is offered in a number of cities.

The standard approach, after assessment and definitive diagnosis, is to provide a program of hormone therapy, social training, and counseling for a minimum period of two years prior to undergoing surgery. For some individuals, the program is too lengthy. Because of the close proximity of a number of Asian countries where relatively inexpensive surgery is offered, a number will opt out of the program and elect early surgery, not always with positive results.

All states and territories, except South Australia, have yet to make provision for changing the birth certificate and/or providing individuals with documentation that would allow recognition of their reassigned gender.

On the occasions where a transsexual has been confined to prison, there have been instances where the authorities have placed the person in a prison appropriate to her/his reassigned gender. There have also been instances where the contrary has occurred.

### B. Transvestism

Self-reporting and anecdotal information indicates that a high proportion of people who cross-dress are professional men who are heterosexually oriented, in heterosexual relationships, and have children. It has also been estimated that one in ten men cross-dress.

Support groups for both transvestites and transsexuals exist in four of the states; however, there is no national body.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Child Sexual Abuse and Incest*

The incidence of incest and child sexual abuse may be much greater than reported figures. In a survey of 1,000 university students in the State of Victoria, Goldman and Goldman (1988) asked about childhood sexual experi-

ences, and found that 28% of females and 9% of males reported some form of sexual abuse from adults; 76% of the perpetrators were known to the child. It is estimated that girls under the age of 18 face odds of between one in ten and one in four chances of sexual abuse within the family, generally by a father or stepfather (Allen 1990).

Child abuse and incest in the Aboriginal population has been noted as a major concern, anecdotal evidence suggesting that incidence may be substantial (Hunter 1992).

Legislation provides for an "age of consent," generally 16 years, and any "indecent dealings" are liable to a penalty of four years imprisonment with hard labor and "with or without a whipping."

There is legislation against "incest by an adult female," which states that any woman "who permits her father or son or other lineal ancestor or descendant, or her brother or half-brother, to have carnal knowledge of her . . . is guilty of a misdemeanor, and is liable to three years imprisonment with hard labor for three years" (Western Australia Criminal Code, 118).

Throughout the country, various crisis centers, refuges, support groups, and treatment centers provide facilities for both child and adult victims. Like most community organizations, funding is limited, volunteer support is a major factor, and there are never enough resources.

It is important to note that all facilities mentioned in this chapter pertain to the major population centers; rural Australia itself is very poorly served in all areas of sexuality.

### *Sexual Harassment and Coercion*

It is estimated that sexual harassment in the workplace occurs for young women about 50% of the time in a first paid job, and is a significant risk for women throughout their working lives. Some years ago, the Federal Labour Government introduced legislation and promoted education in the area. Throughout Australia, government instrumentalities, nongovernment organizations, and many private companies now have provision for reviewing complaints. As understanding of what constitutes harassment improves and the mechanisms for lodging a complaint tested, the number of cases reported has increased. A number of men have lodged successful claims, although the majority of complainants are women.

### *Sexual Assault and Rape*

Allen (1992) states that the so-called developed countries have comparable patterns of sexually abusive behaviors, and that although rates may vary between countries and regions, certain probabilities remain. It is estimated that occasional or habitual violence perpetrated by men against women occurs in at least a quarter (some research suggests a third) of all sexual relationships. It is estimated by workers in the area that one in five women will be a victim of sexual assault by the age of 18 years.

Most cities and large towns have counseling and other services for the victims of sexual assault. Many cases go unreported, however, a number of victims will seek the services of agencies such as a Sexual Assault Referral Center and may or may not be referred on to the police. Not all victims who report directly to the police are referred to an independent agency. Thus, it is difficult to quantify the number of cases. As an example, however, the Sexual Assault Referral Center in Perth, Western Australia, servicing a total population of a little over a million, has approximately 800 new cases reported each year.

The incidence of reported male rape seems to be increasing. Generally men are most at risk when placed in all-male environments, such as prison.

## B. Sex Workers (Prostitution)

The act of prostitution has never been illegal in Australia. But during the last decade of the 19th century and the first decade of the 20th century, a range of legislative measures were enacted that made most prostitution-related activities illegal.

In the state of Victoria and the Australian Capital Territory, prostitution-related activities have been decriminalized and legislation enacted to provide for the lawful conduct of business. In all other states and territories, "living off the earnings or keeping premises for the purposes of prostitution" are illegal. [*Update 2002*: A change in legislation in Western Australia is currently passing through the Parliament, and it is anticipated that by 2003, sex workers will be able to operate legally under certain restrictions. These restrictions deal mainly with the placement and operation of brothels and health issues. (*End of update by R. Coates*)] In most states, a policy of "control and containment" is operated through the local police (generally the vice squad). Through this policy, the number of brothels are limited, independent operators are closed down, and the workers in the brothels are required to undergo monthly medical checks. All workers must have a current health statement saying they are disease-free. Any worker who has an infective disease is not permitted to work. There is a very high level of condom usage, with most workers charging substantially more if a client insists on sex without a condom. Many workers, however, have a technique for rolling on a condom, using their mouths and without the client's being aware.

Workers have their own magazine and newsletter that is aimed at being both informative and entertaining. There are also community organizations that provide support and information for people in the sex industry.

## C. Pornography and Erotica

Since the 1970s, the dominant trend has been toward liberalization, facilitating the availability of sexually explicit material. Since 1971, principles applying to the classification and censorship of films, videos, and printed material have been generally agreed on by federal and state governments, thus abandoning the attempt to prohibit pornography. These principles relate to age, public offensiveness, consumer protection, and sexual violence against nonconsenting persons. Material classified as "restricted" may only be sold in designated areas of news agents and specialist shops, or be sealed if on open display. Films with a "restricted" category may not admit minors under the age of 18 years. One state does not permit "restricted" films to be shown on a Sunday—a rather anachronistic situation.

Much of the material is imported, although Australia also has an active production industry. It is claimed that the Australian Capital Territory has the most liberal attitude and, hence, is the source of the majority of locally produced material. This claim has not been substantiated.

Recently, in at least one state, consideration has been given to the need for, or indeed the feasibility of, monitoring pornographic material obtained through computer sources.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

According to Siedlecky and Wyndham (1990), there have been six successive waves of contraceptive innovation in Australia; the main methods used in the early part of the century were condoms, douching, withdrawal, and abortion. Later, quinine pessaries and other spermicides were the most-used methods. By the late 1940s, the diaphragm, first introduced in the 1920s, became popular, and the

intrauterine device during the 1950s and early 1960s. The introduction of the oral contraceptive in 1961 dramatically increased the number of women using contraceptives.

Oral contraception is still the most frequently used method for Australian women under the age of 30. Older women tend to return to more traditional methods (especially the diaphragm, following adverse reports about IUDs and the pill). However, couples are increasingly choosing sterilization, with more than 50,000 men and women undergoing sterilization per annum (Siedlecky & Wyndham 1990).

Depo-Provera has not been approved by the Australian Drug Evaluation Committee (ADEC) and is, therefore, still officially on trial, although it has been used for 20 years for the treatment of cancers of the breast, uterine lining, and kidney. As the drug is commercially available, the ADEC has indicated that if physicians have strong reasons for prescribing its use as a contraceptive, then they may do so. Its use in this manner has been controversial and is opposed by feminist groups. The short- and long-term side effects are not known, and indiscriminate prescription without adequate information, documentation, and follow-up for clients—particularly its disproportionate use among disadvantaged women (institutionalized, blacks, migrants, and intellectually disabled)—has given rise to controversy.

Currently, a variety of contraceptives is readily available to most Australians. The most accessible are condoms, which are sold in supermarkets as well as pharmacies and "sex shops." Oral contraceptives have been available, on prescription, in Australia since the early 1960s, and an upward trend in the age of marriage has been attributed to its widespread use (Siedlecky & Wyndham 1990). [*Update 2002*: In 2002, there have been more positive moves for the acceptance of "the morning after" pill. (*End of update by R. Coates*)] The Family Planning Association provides accessible contraceptive advice and prescriptions. School-based education programs generally offer contraceptive information as part of the curriculum.

### B. Teenage Pregnancy and Abortion

With regard to adolescent contraceptive behavior, Condon (1992) notes that approximately 25% of 15- to 19-year-olds become pregnant. Forty percent of these choose to terminate the pregnancy, which indicates that the pregnancy was unplanned and that contraceptive measures were either not used or failed.

### C. Abortion

It is estimated that, despite restrictive laws, approximately 60,000 abortions are performed annually in Australia (Siedlecky & Wyndham 1990). Regulation of abortion is a matter of state legislation. During the 1960s, abortion-law reform groups were established in all states. This was often associated with the establishment of Family Planning Clinics and pro-choice, women's health services. The struggle to liberalize the laws has been ongoing and not very successful. In 1969, South Australia was the first state to make abortion legal. The Northern Territory adopted similar legislation. In other states, wider interpretation of the laws has made abortion easier to obtain and lawful under certain circumstances. The reason is that the Australian judiciary has supported principles established by common-law decisions—for example, the Bourne case in England in 1938, in which the judge stated that abortion was lawful if performed in good faith and for the purpose of preserving the life of the mother, which is interpreted to mean not only her physical existence, but also her physical and mental health. However, in some states there have been no test cases and no precedent set, and the situation is far from satisfactory for all concerned.

Surveys of public opinion indicate that most people think that abortion should be legally available for a range of indications (Graycar & Morgan 1990; Anderson 1986). The Royal Commission on Human Relationships (1977) provided the most comprehensive account of all aspects of sexual and family behavior in Australia in the 1970s, and recommended abortion-law reform. The antiabortion lobby, represented mainly by the Right to Life Group, became organized in the early 1970s to defend the status quo against the push for legislative change from abortion-law reform groups. During the 1980s, attacks began with renewed vigor following activities in the United States and the introduction of more restrictive legislation. Activities have continued with picketing of abortion clinics and attempts at legislative change—for example, a campaign to withdraw rebates for termination procedures from the national health insurance.

In summary, it may be said that Australian women have sought abortion as a solution to unplanned pregnancy for at least the past 100 years, in spite of the legal restrictions and prevailing moral attitudes. Restrictive abortion legislation does not save more babies but rather loses more mothers. The decline in morbidity and mortality arising from abortion has been a result of better techniques, use of blood transfusion and antibiotics, but also from changes in attitudes that have brought abortion into the open and allowed women to obtain earlier operations. There is still reluctance to allow women to decide for themselves, and abortion is likely to remain a contentious issue (Siedlecky & Wyndham 1990, 101).

#### D. Population Planning Programs

The documented history of population planning in Australia began with white settlement. It commenced with attempts to control Aboriginal populations through murder, the removal of children from their parents, and deliberate attempts to “breed out.” At the same time, campaigns for increasing the white population through active immigration programs and aggressively promoting the role of wife and mother were adopted. Political, legal, medical, and religious institutions conspired to reduce women’s options and to prevent access to contraception. Despite this, Family Planning Organizations have an honorable and effective history throughout Australia.

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### A. Sexually Transmitted Diseases

Australian figures on the rate of sexually transmissible diseases are similar to the rates in other developed countries. The age groups most affected are those between 15 and 30. The most common infections are chlamydia, gonorrhea, genital herpes, HIV, genital warts, syphilis, and hepatitis B. Penicillin-resistant gonococcal infection is on the increase.

Health and education services are generally good in the major cities and towns, however, many rural areas are dependent on local general practitioners. Practitioners, especially in the designated STD (Sexually Transmitted Disease) clinics, are cognizant of the need to establish patient rapport and trust. Counseling is provided in government clinics, as well as education.

Control of infection is mediated through preventative measures, the provision of expert services, and through expeditious contact tracing. Most STDs are reportable and a national register is maintained for epidemiological purposes. The data is published through the federal health agency in the *Community Disease Intelligence*.

The rate of infection among the indigenous population is higher than in the nonindigenous population for a num-

ber of reasons, including reduced access to education, poor living conditions, and generally lower standards of health-care.

#### B. HIV/AIDS

Australia was one of the first countries to recognize the serious public health risk posed by HIV/AIDS, and instituted health promotion strategies very early. In addition, resources were allocated to both private and public organizations to cater for those who were already infected and to target those who were considered to be most at risk. Despite pockets of resistance and some cases of extreme bigotry, the overall strategy has proved to be relatively successful. The predicted rates of infection for the end of the 1980s suggested a doubling of newly diagnosed cases, when in fact there has been a slight decline.

As of December 1992, the cumulative number of diagnoses of HIV infection in Australia was 16,788, with 82% being classified as acquired through homosexual/bisexual contact, 4.9% through intravenous drug use, and 2.8% through homosexual/bisexual contact and intravenous drug use. Six percent of infections were acquired through heterosexual sex and 3.4% were infected through blood transfusion. The cumulative total of women diagnosed was 408 and the number of children was 92. The current rate of new diagnosis is approximately 96 per 100,000 (*Australian HIV Surveillance Report*, April 1993).

Although HIV infection is recognized as a serious risk, knowledge and education does not always translate into changed behavior and attitudes. High-risk groups that need particular attention are those homeless young people who are associated with prostitution and drug use.

[Update 2002: UNAIDS Epidemiological Assessment: Australia was among the first countries in the world to report AIDS cases. Retrospective analyses of epidemiological data indicate that HIV incidence peaked in 1984, followed by a rapid decline. This trend has continued in the 1990s, with a decrease in reported AIDS cases from 955 in 1994 to 212 in 2000. This decline in incidence is projected to continue. The decline in AIDS diagnoses since 1996 has been much more rapid than originally predicted in the mid 1990s. It is now clear since around 1996, that the additional decrease in the number of AIDS diagnoses is because of the use of effective combinations of antiretroviral therapy for the treatment of HIV infection. Annual reported diagnoses of HIV infection have also declined steadily, from more than 2,308 in 1987 to about 723 in 2000. An estimated 12,000 people were living with HIV/AIDS in Australia at the end of 2001. The proportion of women among reported cases has been gradually increasing, from 0% in 1983 to 10% in 2000. HIV infection in children remains rare.

[Overall rates for other STDs have declined since the mid-1980s, with particular reduction among high-risk groups, such as male homosexuals and female sex workers. However, rates of STD among indigenous populations continue to be substantially higher than in the nonindigenous population by a factor of 10 to 100 times.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	12,000 (rate: 0.1%)
Women ages 15-49:	800
Children ages 0-15:	140

[Less than 100 adults and children are estimated to have died of AIDS during 2001.

[No estimate is available for the number of Australian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

The incidence of sexual dysfunction in the community is unknown. There are, however, a number of dysfunction services, both private and public. Community-based resources include organizations such as Rape Crisis Centers, Incest Survivor's Association, Women's Health Centers, Migrant Health Centers, Gay and Lesbian Counseling Services, various AIDS organizations, Marriage Guidance, and the Family Planning Associations. These all provide both crisis assistance and counseling services to varying degrees. All of these organizations are restricted by lack of satisfactory funding, since they are dependent upon government grants and fund-raising activities.

It is difficult to quantify the number of practitioners who specialize in sexual counseling and therapy. There are two major organizations that attempt to bring these practitioners together: the Australian Society of Sex Educators, Researchers, and Therapists and the Western Australian Sexology Society. In population terms, the state of Western Australia is much smaller than the Eastern states; however, it appears to be the trailblazer in sexology and has a well-coordinated network of practitioners and resources.

## 12. Sex Research and Advanced Professional Education

### A. Advanced Education

There is only one university-accredited postgraduate program in sexology in Australia; This is offered through the Division of Health Sciences at Curtin University of Technology in Western Australia. The program was established in 1979 by this author. [Update 2002: Students have the option of taking a master's-level program focusing on sexual counseling and therapy or on forensic sexology. The latter is believed to be a world first. The unit also offers supervision for research students at the master's and Ph.D. levels. The duration of the coursework for the master's programs is three semesters, for the research master's, four semesters, and for the doctorate, a minimum of four semesters. (End of update by R. Coates)]

Throughout the Australian university system, various professional programs, such as social work, medicine, nursing, and psychology, provide some elements of sexology in their courses. However, other than the options offered through Curtin University, there is no systematic and comprehensive program for students in the health and helping professions, nor in education.

In 1992, the Australian College of Veneriologists, in collaboration with the Australian Society of Sex Educators, Researchers, and Therapists, offered a program in sexual health counseling. These two organizations provide participants with a diploma on completion.

The Family Planning Association of Australia offers regular training programs for medical practitioners and nurses. In addition, ad hoc programs are offered for professionals and nonprofessionals. The Family Planning programs are nationally accredited and various professional organizations recognize these for continuing education credits. Address: Family Planning Australia, Inc. Lua Building, Suite 3, First Floor, 39. Geils C, P.O. Box 9026, Deakin, ACT 2600 Australia (Phone: 61-6/282-5298. Fax: 61-6/285-1244). The address for Family Planning Victoria is: 266-272 Church Street, Richmond 3121 Australia (Phone: 61-3/429-1868).

The address for the Australian Association of Sex Educators, Counselors, and Therapists is: P.O. Box 346, Lane Cove NSW, 2066 Australia (Phone: 61-2/427-1292).

### B. Research

Most of the research dollars and interest have tended to be in the areas of fertility (control and enhancement) and in the area of HIV/AIDS. In-vitro fertilization programs have had a prominent profile and work is undertaken in several states.

Of the research that has been undertaken to examine behaviors or attitudes, few have been based on random samples. Most studies have been limited to small, targeted, and often self-selected samples, and frequently relatively unsophisticated survey instruments have been used.

Several areas of current research suggest new political agendas. For example, funded surveys that have used whole population samples have looked at practices and attitudes surrounding HIV/AIDS, STDs, fertility, and reproductive technology.

The address for the Australian Society of Sex Educators, Researchers, and Therapists is: 21 Carr Street, Coogee, New South Wales 2034 Australia.

The address for the Western Australian Sexology Society is: c/FPA, 70 Roe Street, Northbridge, Western Australia 6000 Australia.

*The Journal of Sex and Marriage and the Family*, published by the Family Life Movement of Australia, recently changed its name to the *Australian Journal of Marriage and Family*.

Four other Australian journals publish articles of interest to sexologists: *Australian Forum*, published bimonthly by Gordon and Gotch; *Healthright*, published quarterly by Family Planning Australia, New South Wales; *Australian and New Zealand Journal of Family Therapy*, published quarterly by the Family Therapy Association, South Australia; and *Venerology*, published quarterly by the National Venerology Council of Australia.

## Conclusion

The nonindigenous people of Australia reflect the cultural attitudes and behaviors of their predominately European origins. There are variations because of the cultural mix; however, the dominant religions, legislation, and education are essentially Western, and public sexual morality reflects the values of these institutions.

## ABORIGINAL AUSTRALIA

Aboriginal traditions are complex and varied. There are elements of the culture that are the exclusive province of certain individuals or groups and are not permitted to be revealed to others. Sensitivity on sexual matters has precluded any extensive anthropological study. The major, detailed work is that of Ronald and Catherine Berndt, who spent more than 30 years observing, participating, and documenting Aboriginal cultures in the northern regions of Australia.

It is impossible for a non-Aboriginal person to present cultural traditions accurately, and it would be impertinent to try. Through the assistance of Dr. Robert Tonkinson, Professor of Anthropology at the University of Western Australia, I present below some examples of traditional Aboriginal practices. There is no attempt to be inclusive nor comprehensive, and the material should not be viewed as generalizable, nor necessarily current.

The concept of the Dreaming is of fundamental importance to Aboriginal culture and embraces the creative past—where ancestral beings instituted the society—the present, and the future. The Aboriginal worldview integrates human, spiritual, and natural elements as parts of the whole and is expressed through rituals (Tonkinson 1991).

While the basic social unit is the family, there is a complex system of classificatory kinship that dictates marriage rules. Kinship status imposes responsibilities and behaviors toward other kin. A basic feature of the kinship system is that the siblings of the same sex are classed as equivalent, so that, for example, the sisters of a child's mother would all be classed as "mother." The children of one's parents' siblings would, therefore, be classed as "brothers" and "sisters." Through this system, kinship may be extended to include people who do not have a blood relationship.

The moiety system of social classification provides correct intermarrying categories, although it does not determine marriage partners. Within moieties, there are groupings which, for want of a better word, have been classified as "clans," although a more accurate translation of the words used by the people themselves might be "crowd" or "lot." A clan is usually identified by an association with a natural species, for example, the barramundi clans (named after a species of fish), or Eaglehawk. Each clan has a dialect and each person is a member of one linked dialect-clan pair, which is that of her or his father. This categorization has significance in all aspects of social activity and includes specific mythic and ritual knowledge and beliefs. The clan indicates territorial possession as well as belief system. Membership of the dialect-clan group defines a person's social position, as well as their belief system (Berndt 1976).

A traditional Aboriginal view of sexuality is that it is a natural urge to be satisfied. It has symbolism beyond the individual, being linked to fertility in all its manifestations. Representations of sex, through songs, dances, and paintings, relate to the human activity and to seasonal change, to the growth and decay of plants, and to the regeneration of nature. Reproduction of humans and of the natural world is vitally important, and obedience to ancestrally ordained laws is the responsibility of adult humans. The correct performance of rituals guarantees continuity of life-giving power and fertility from the spiritual realm (Tonkinson 1991).

## 1. Gender Relationships

In traditional Aboriginal societies, there was a pervasive egalitarian ethos that placed every adult as the equal of others of the same sex. The operation of the kinship system exerted an overall balance in male-female relationships (Tonkinson 1991). Earlier ethnographers have tended to present Aboriginal culture as a traditional male-dominant, female-subordinate, hunting and gathering society (Warner 1937; Parsons 1964). It has been argued, however, that this view is a narrow one generated through the androcentricity, and possibly the ethnocentricity, of the authors (Merlan 1988). Other authors have emphasized the complementary nature of gender roles, without conflict (Berndt 1980). The complexity of the Aboriginal worldview and the concept of the Dreaming may have contributed to the differing perspectives of the ethnographers. The Dreaming, which contains the lore of creation and the permanence of the interrelationship of all things, is maintained through the different contributions to it made by women and men. Women's narrative of the Dreaming deals with the rhythms of family life, while men's narrative deals with the rhythms of the life of the whole group. Thus, there are male and female domains that are connected and complementary.

Gender difference is a significant aspect of Aboriginal symbolism, and consequently, there are gender-specific rituals. Many rituals relate to productive activities and utilize parallel symbols, for example, the *woomera* (throwing stick used by males when hunting) and the digging stick (used by females when gathering insects). Certainly, men and women

share a sense that both "men's business" and "women's business" are indispensable (Merlan 1988).

Specific areas are designated for men's rituals and women's rituals, and women and men are excluded from each other's sites. Physical punishment would be incurred if there was intrusion into the domain of the opposite gender; however, the depth of meaning associated with the rituals ensures that the power of suggestion preserves sanctity. Because both men and women have ritual domains, there is a strong sense of propriety, and self-esteem is derived from this (Merlan 1988). While much ritual activity involves both sexes, mature men control both the ritual proceedings and the scheduling of activities.

## 2. Sexual Ceremonies and Rituals

### A. Puberty Rituals

Initiation ceremonies assisted the transition from childhood to adulthood with highly elaborated rituals for boys. Modeled on death (of the boy) and birth (of the man) they dramatized separation from women, in particular from the mother. Rules of kinship dictated the allocation of roles and responsibilities in initiation as in all social behavior. Guidance, reassurance, and support were guaranteed, as was chastisement if rules were broken.

For females, puberty rites were simple. The transition to adulthood was based on sexual maturation and included sexual activity. However, menarche, marriage, and childbirth have not been ritualized or publicly celebrated in Aboriginal societies.

### B. Defloration

Ritualistic defloration was practiced in some parts of Australia, but no longer occurs. Ceremonies varied; however, one example dating back to the 1940s has been described by Berndt, and related to people from the northeastern region of Arnhem Land. Girls who were to undergo the ritual were called "sacred" and deemed to have a particularly attractive quality. The men made boomerangs with flattened ends, to be used as the instrument of defloration prior to ritualistic coitus. Men, girls, and boomerangs were smeared with red ochre, symbolizing blood. A special windbreak or screen was prepared for the girls, the entrance of which was called the sacred vagina. The screen was intended to prevent men from seeing "women's business."

Prior to her defloration, a girl may have lived in seclusion for a period of time with certain older women, observing food taboos. The older women taught the girls songs, dances, and sacred myths. At the end of the seclusion period, there was a ritual bathing at dawn.

In some areas, a girl may have lived in her intended husband's camp for a period of time. After the seclusion period, she would be formally handed over to her husband and his kin, and the marriage consummated.

In other areas, a girl may have been unaware that her marriage was impending and be seized by her intended husband and his "brothers" while she was out collecting food with the older women. Her husband's "brothers" had sexual rights to the girl until she had settled down in his camp (Berndt & Berndt 1988).

Earlier anthropological reports (Roth 1897, cited in Berndt 1988) described rituals that have involved the forced enlargement of the vagina by groups of men using their fingers, with possum twine wound round them or with a stick shaped like a penis. Several men would have intercourse with the girl and later would ritually drink the semen. Mitigating this was the second part of the ritual which allowed dancing women to hit men against whom they had a grudge with fighting poles without fear of retaliation.

### C. Circumcision

Circumcision was a common, though not universal, practice. In many areas, Aboriginal men believed that the uncircumcised penis would cause damage to a woman, which was one reason why sexual activity of an uncircumcised boy was viewed negatively. Rituals associated with circumcision were secret and sacred and were considered "men's business." Full details have not been disclosed to outsiders and what is offered here are those aspects that are permitted.

Women danced close to the circumcision ground but were not permitted to watch. During totemic rituals, the boy who was about to be circumcised was present, but often could not see what was going on. It was at that time that he was told the meaning of the songs. Just before dawn, he would be led to a group of older men who used their bodies to form a "table" upon which the young boy was placed. After the circumcision, the boy returned to his seclusion camp and the rest of the group moved to another campsite, as happened after a death. In some areas, the foreskin was eaten by older men, in others the boy wore it in a small bag around his neck; in others it might have been buried.

There were a number of postcircumcision rites that included the young man's being taken on a journey around his totemic country.

At a later stage, subincision may have taken place. Again, the initiate was taken into seclusion and, later, the procedure conducted using the human "table." The partially erect penis was held up and the incision made on the underside. Subincision of the penis was regarded as the complementary right to defloration. Stone blades were prepared while thinking of coitus, and it was believed that semen flowed more rapidly after subincision (Berndt & Berndt 1988). Subincision had religious validation, proved in many areas through reference to the penile groove of the emu or the bifid penis of the kangaroo. Subincision was not for contraceptive purposes, as was commonly believed by nonindigenous people. In fact, in many areas, semen was not credited with having a role in procreation. In all areas of Australia, spiritual forces were believed to be central to procreation. Physiological maternity, as well as paternity, was denied, with the belief that a plant, animal, or mineral form, known as the conception totem, was assumed by the spirit-child, who then entered its human mother (Tonkinson 1991).

### D. Courtship and Marriage

Rules of kinship restricted sexual freedom and set the parameters for selection of spouses; however, premarital and extramarital sex was appropriate. It is expected that everyone marries. Marriage rules may give the impression that there was no room for the concept of "romantic love" in Aboriginal traditions. However, an insight into the nature of male-female sexual relationships may be obtained through some of the traditional myths, often expressed in song cycles. These include reference to affection, as well as physical satisfaction and mutual responsibility. The songs make explicit reference to circumcision rituals, to menstruation, semen, and to defloration.

One ritualistic means of courtship is reported through the Golbourn Island song cycles (Berndt 1976). In the songs, young girls engage in making figures out of string, the activity causing their breasts to undulate: This and the figures they make are designed to attract men. Undulation of the buttocks was also used, along with facial gestures, that indicate a girl was willing to meet a boy in a designated area. These activities usually occurred around the time of menarche. Menstrual blood had an erotic appeal for men and some sacred myths allude to that theme. Menstrual

blood was also seen as sacred, and, by extension, women were sacred during their menstrual period.

In song and dance, intercourse and erotic play is celebrated as joyful and beautiful. Intercourse has significance as it maintains populations, both human and nonhuman, and therefore produces food. It is through intercourse that the seasons come and go, and it is only through the changing of the seasons that plants can grow.

Infant betrothal was an important aspect of Aboriginal cultures and was often associated with men's ritual activities, especially circumcision. In the Western desert region, for example, the main circumciser had to promise one of his daughters to the novice in compensation for having ritually "killed" him.

Girls were often given to their husbands while still prepubertal, but coitus did not usually commence until her breasts had grown. In this context, girls may have had their first sexual experience by the age of 9 and boys by the age of 12.

Standards of beauty or attractiveness varied; however, obvious physical disabilities were seen to be a disadvantage and, similar to Western culture, youth is most highly valued.

### E. Love Magic

The use of songs, dances, and other rituals were used to attract a prospective lover or to rekindle passion in an existing relationship. Members of either sex employed love magic, which was thought to cause the person who was the object of it to become filled with desire. On occasions, a large-scale ritual dance of an erotic nature was used as a general enhancement of sexuality. Both sexes were involved, although the pairs of dancers who simulated intercourse were of the same sex. The intention, however, was aimed at arousing heterosexual desires (Tonkinson 1991).

## 3. Contraception and Abortion

Traditionally, the Australian Aborigine, like other hunting and gathering societies, had low levels of fertility. Ethnographers have found little evidence of plant contraceptives or abortifacients. There is no evidence of infanticide ever being used.

Current fertility rates among the indigenous population is lower than in the nonindigenous population. This, in part, may be because of the generally lower levels of healthcare and standards of hygiene, and the higher levels of STD infections, all because of a serious neglect on the part of successive governments.

## 4. Homosexuality, Bisexuality, and Gender Diversity

The Berndts (1988) have commented that the traditional way of life placed so much emphasis on heterosexual relationships that there has been little evidence (to ethnographers) of other modes of sexual expression. They do, however, mention that "homosexual experimentation and masturbation" are reported among boys and young men when temporarily segregated from the women. Berndt goes on to say that examples of female homosexuality is even more rare and that "the close physical contacts which Aborigines indulge in are deceptive in this respect" (Berndt & Berndt 1988, 195).

Contemporary urban life has demonstrated that homosexuality is known among the Aboriginal community, with gay and lesbian Aboriginals participating in the local gay culture.

There is no evidence in the literature of gender dissonance in traditional Aboriginal cultures.

## 5. Incest

The kin relationship, rather than a biological one, dictates the incest taboo (Tonkinson 1991). In traditional societies, the incest taboo extends to all the members of one's own moiety, with certain exceptions during sacred rituals. For example, during the defloration ceremony, a man inserts the defloration boomerang into a woman whose formal relationship to him is roughly the equivalent of his wife's mother; he then has coitus with her as a sacred ritual considered important from the point of view of fertility.

As mentioned previously, there is current concern that the incidence of child sexual abuse is increasing among the Aboriginal population. This may well be as a consequence of dislocation from traditional structures.

## 6. Education

Apart from the services available to all, there are a number of services specifically for Aboriginal populations. These include infant and maternal health and welfare services, fertility counseling, and STD and HIV/AIDS education programs. Nevertheless, there is a greater need for services to be extended, relevant, and accessible.

## Summary

Some aspects of Australian Aboriginal cultures have been presented within the context of traditional societies. The majority of Aborigines living in Australia today have had their cultural heritage eroded by the dominant migrant culture and the urbanization of certain regions. Current attitudes and sexual behaviors are influenced by Western religions and Western law. The attitude of earlier generations of migrants has left Australian Aborigines with a shorter life-span, lower fertility rates, and higher rates of infant mortality and sexually transmitted diseases than non-Aboriginal Australians. Various governments and other agencies are attempting to ameliorate this situation; however, there is still a long way to go to achieve equity and to dismantle prejudice.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Located in south central Europe, Austria is a landlocked nation strategically located at the crossroads of central Europe. With a landmass of 32,378 square miles (83,858 km<sup>2</sup>), Austria is slightly smaller than the state of Maine. Austria's neighbors include Switzerland and Liechtenstein on the west, Germany and the Czech Republic on the north, Slovakia and Hungary on the east, and Slovenia and Italy on the south. Austria is very mountainous, with the Alps and their foothills covering the western and southern parts of the nation. The northern margin and eastern provinces, including the capital of Vienna, are in the Danube River basin.

Since the collapse of the Habsburg (often spelled Hapsburg in English) Empire in 1918 after World War I, Austria comprises only nine states (or provinces). Clockwise, they are: Lower Austria, Vienna, Burgenland, Styria, Carinthia, Upper Austria, Salzburg, Tyrol, and Vorarlberg. In Burgenland, the smallest and farthest east, Hungarian and Croatian influences are noticeable, whereas Vorarlberg, lying farthest west, tends strongly towards Switzerland.

In July 2002, Austria had an estimated population of 8.17 million, with 20% (1.7 million) living in Vienna. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

(CIA 2002)

**Age Distribution and Sex Ratios:** 0-14 years: 16.4% with 1.05 male(s) per female (sex ratio); 15-64 years: 68.2% with 1.02 male(s) per female; 65 years and over: 15.4% with 0.62 male(s) per female; *Total population sex ratio:* 0.95 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 78 years; *male:* 74.85 years; *female:* 81.31 years

**Urban/Rural Distribution:** 53% to 47%

**Ethnic Distribution:** German: 88%; non-nationals, including Croats, Slovenes, Hungarians, Czechs, Slovaks, Roma (Gypsies): 9.3%; naturalized: 2%

**Religious Distribution:** Roman Catholic: 78%; Protestant: 5%; Muslim and other: 17%

**Birth Rate:** 9.58 births per 1,000 population

**Death Rate:** 9.73 per 1,000 population

**Infant Mortality Rate:** 4.39 deaths per 1,000 live births

**Net Migration Rate:** 2.45 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.4 children born per woman

**Population Growth Rate:** 0.23%

**HIV/AIDS** (2001 est.): *Adult prevalence:* 0.1%; *Persons living with HIV/AIDS:* 843; *Deaths:* < 100. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 98; attendance rate for nine years of compulsory school: 95% (education is free and compulsory from age 6 to 15)

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$27,000 (2001 est.); *Inflation:* 2.6%; *Unemployment:* 4.8%; *Living below the poverty line:* NA

### B. A Brief Historical Perspective

The Romans conquered Austrian lands from Celtic tribes around 15 B.C.E. In 788 of the Common Era, the territory was incorporated into Charlemagne's Holy Roman Empire. By 1300, the House of Habsburg had gained control of the land. In the next few hundred years, they added to their realm vast territories in all parts of Europe.

Austria's dominance of Germany was undermined in the 18th century and ended with the rise of Prussia in 1866. However, the 1815 Congress of Vienna confirmed Austria's control of a large empire in southeast Europe, consisting of Germans, Hungarians, Slavs, Italians, and oth-

ers. The Austro-Hungarian dual monarchy was established in 1867, when Hungary was given some autonomy. Fifty years of peace followed.

The 1914 assassination of Archduke Franz Ferdinand, the Habsburg heir, by a Serbian nationalist, led to World War I and dissolution of the Habsburg Empire when Austria, Germany, and the Ottoman Empire were defeated. Austria was then reduced to a small republic with the borders it has today. Nazi Germany invaded Austria in 1938; the republic was reestablished in 1945 under Allied occupation. Full independence and neutrality were restored in 1955.

[Update 2003: Politically, Austria is a democratic federal republic, with a proportional voting system. After the grand coalition between the moderately conservative People's Party and the moderate Social Democrats as a result of the 1995 elections, the political scene changed radically in 2000, when the nationalistic right-of-center Freedom Party received 26% of the votes, more than doubling the number from the earlier election, and was invited by the People's Party to form a coalition government. European Union sanctions, and weekly demonstrations that continued for the entire two years of the coalition government, followed. The European Court of Human Rights sent a commission, known as "The Three Wise Men," to investigate whether or not democracy was in danger, and the sanctions were lifted in September 2000. Jörg Haider, who had been the leader and loudest voice of the right-wing party, eventually lost his effectiveness. New elections were held in November 2002, and the Freedom Party lost two thirds of its support. The Greens gained in the last election, and it is not yet clear whether or not the grand coalition will again be entered into, or if there will be new political constellations. (End of update by L. Kneucker)]

There had been a radical change in Austria's political situation since October 3, 1999. The Parliamentary mandates in early 2000 were: 65 for the Social Democrats, and 52 for both the People's Party and the Freedom Party (with clear self-acknowledged fascist tendencies). The environmentalist Greens held 14 seats, and the Liberal Forum was no longer represented. There was, thus, a coalition government between the conservatives and the Freedom Party. Observers expected this alliance to bring a distinct increase of conservative, restrictive, and xenophobic ideas. The first sign of this conservative swing was seen in the abolishment of the Federal Ministry for Women's Affairs, which had, in its ten-year existence, been strongly engaged in combating violence against women and enacting harsher punishment for sexual offenses.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

At the end of the 1960s, a kind of "velvet" cultural revolution began. Austria's women became conscious of the discrimination they experienced as women, their reduced roles as reproducers, and discrimination in the labor market. Social politics, activated by women in the new feminist movement, brought considerable social change, especially in the first years of the Socialist Government, between 1970 and 1983. Two signals of this revolution were the appointment of a State Secretary for Women's Rights in 1979 and, in 1990, establishment of a Ministry for Women's Affairs.

Women benefited most from the educational reforms of the 1960s and 1970s, even if there is still a difference in educational levels between men and women. The employment of women increased at the beginning of the 1970s and, in 1992, 62% of all women between the ages of 15 and 59 were gainfully employed. Improved training and the more skilled

qualifications of women had, however, little influence on their salaries and positions. The average gross income of men was 43% higher than that earned by women.

In the course of the Family Law Reform of 1978, the marriage laws were changed from the legally incapacitating discriminatory laws against women to an emphasis on marriages based on partnership. Before this reform, the man was the "head of the family," and the woman had to take on his name. The man decided the place of residence. He could forbid his wife to work and could make all decisions concerning the children. His wife had to obey his "orders."

The practically unchanged sole responsibility of women for the care of children, the lack of institutions, such as day-care centers and kindergartens, a shortage of qualified part-time jobs, as well as potential motherhood, still greatly lessen the possibilities for women in the labor market. Women are subject to certain work prohibitions that are supposed to protect them, e.g., night shifts, but actually make entering certain occupations more difficult. Women who want both children and careers, something that is a matter of course for men, can often fulfill this only with double or triple burdens. Although it has been legally possible since January 1, 1990, for fathers to take leaves of absence from work for childcare (*Karenzurlaub*) until the child's second birthday, few men take such leaves. Many men also have difficulties with the legally established partnership in running a household, dividing the responsibilities of earnings, running the household, and raising children.

### B. Sociolegal Status of Males and Females

According to the equality principles of the Austrian constitution, all citizens (written in masculine form) are equal before the law (Article VII). Nevertheless, there are gender-specific differences in some laws that cannot be biologically justified, such as the legal protection for pregnant women and mothers.

Women and men are considered sexually mature when they are 14 years of age, i.e., they are seen as adult enough to be able to accept desired sexual contacts and refuse those they do not want (Perner 1994). In the case of homosexual contacts, however, the lawmakers believe that young men are not able to decide independently for or against them until they are 18. Women and men who are 19 are both considered to be of full legal age, but the marriageable age for women is 16, and for men 19 years. Women can retire with pension at age 60, five years earlier than men, but, as of 2019, the age will be successively raised for women who were born after 1962 and, eventually, the pension age for men and women will be the same—65 years. There is no military conscription for women.

### C. General Concepts of Sexuality and Love

The general sexual concept of love is within a heterosexual relationship. It is based on love and should be realized, preferably, in a life-long marriage, or at least as a partnership for life or a stable partnership. As a result of this attitude, practically all young Austrian women were married in the early 1960s. Since the 1970s, there has been a change to more pluralism: The age for marriage and for bearing the first child has risen; the number of those who marry and have children has fallen. The number of extramarital births has risen, as well as the possibility of divorce and remarriage of those who have divorced. Still, the wish to marry is prevalent among 70 to 80% of youth.

Norms and attitudes relating to sexuality have also changed since the end of the 1960s. The availability of different methods of birth control and the possibility for legal

abortion within the first three months (trimester) have given many women their first feelings of freedom regarding sexuality. Considering the frequent occurrence of sexual violence against women, it is, however, only possible in a limited way to talk about the sexual liberation of women.

Except in a few ethnic groups and religious minorities, virginity is not given any special value at the time of marriage. Although “wild” marriages and unmarried mothers and their children were stigmatized and legally discriminated against in the 1960s, life partnerships, “illegitimate” children, and single mothers are increasingly accepted in society. Likewise, relationships before marriage that include sexual intercourse and a series of monogamous relationships are accepted, and not only the ideal of “one great love.” Despite the Church’s opposition (e.g., by forbidding the use of most birth control methods), sexual desire and procreation are seen as separate from one another; as proven by the low fertility rate of 1.5 children per woman.

The norm for sexual intercourse is still the “complete” face-to-face heterosexual coitus with ejaculation. The attitude towards homosexuality is still negative, socially excluding, and, in traditional Catholic circles, openly hostile. Its impact can be seen in attempts to maintain legal discrimination against homosexual lovers. However, in recent years in Austria, the discussion in favor of recognition of homosexual partners is no longer taboo, and is in fact increasing.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

To be religious in Austria is a sort of “social-cultural matter of course” accompanied by a certain amount of social pressure. The majority of Austrians are members of the Roman Catholic Church, which exerts a traditionally dominant role in comparison to other religious communities. Especially during the time of Austrian Fascism, 1934-1938, the cultural and political life was determined by the Catholic Church. Austria was organized as a so-called corporate country that met the Catholic concept of a corporate system (Encyclical, *Quadragesimo Anno* of Pius XI: 15.5.1931). It was seen as the responsibility of the State to guard moral life. In this model, according to the Constitution of 1934, women were only considered equal to men if laws did not determine otherwise. In 1929 and in 1930, Pope Pius XI had confirmed the subordinate role of the woman in marriage in two encyclicals.

Since 1970, the number of withdrawals from the Catholic Church has increased dramatically, especially because of the sexual morals of the Church that are no longer accepted by many of its believers (above all, because of the prohibition of the pill in the encyclical, *Humanae Vitae*, by Pope Paul VI in 1968). These teachings define the Catholic view regarding the rigid regulations of the sexes: Mary, the Mother of God, as childbearing without sexuality (on the basis of the virgin birth) as a model for women was emphasized. Virginity was given the highest value, and a motherhood of sacrifice was propagated as the essential duty of women. During the period of National Socialism, the veneration of Mary and the ideal of chastity were mixed with ideas of “racial purity” and therefore fit into the National Socialist regime.

Sexuality in Catholicism is only permitted in the insoluble state of marriage, since for hundreds of years biological reproduction was considered the one purpose of marriage. The encyclicals of Pope Pius XI (1930) dealing with marriage underlined the value of love in marriage that was especially confirmed later by the Second Vatican Council (1962-1965): The value of this love exists, even without reference

to procreation. It is bound to marriage, with sexual intercourse, as a permanent unity. The moral system, according to the teachings of the Church, requires that heterosexual coitus must not interfere with the possibility of procreation. However, intercourse is also permitted when procreation is not possible (during the woman’s monthly infertile period) or no longer possible (after menopause).

Marriage in Catholic teaching is the replica of the love of God for human beings: Christ is the bridegroom, the Church is the bride, and the Catholic family is the smallest church community, the “home church.” The love relationship of the responsible couple, according to this concept, includes “natural birth control” (measurement of the infertile days of the woman).

According to the encyclical *Humanae Vitae* (1968), every form of active birth control is forbidden by the Church. However, this opinion does not require absolute obedience, as it is not a question of infallible dogma, but a writing of the pope. Because of the acceptance of the theological concept of “immediate animation,” the presence of the soul at the moment of conception, abortion was (and is) considered murder. In 1991, one third of all Austrians and 40% of the female population stated that religion was meaningful for conducting their life. Forty percent of those who were religious thought that sex education in schools was damaging. A third of the religious wished that homosexuality would be again legally punishable (of the non-believers, one fourth wanted this).

The 1995 encyclical *Evangelium Vitae* (John Paul II) condemned abortion, as well as birth control, as generally being enemies of “life.” Masturbation was seen as a terrible sin, or, at least, as against the rules. In the same way, practiced homosexuality was condemned as immoral.

Mostly it is the rural and farming population that lives according to Catholic norms. However, the majority of Austrians do not think highly of the ever-increasingly authoritarian path the Vatican has been taking. The comments of the official Church regarding sexual themes are reacted to with resistance.

In 1995, a Church referendum was initiated, calling for a “sisterly church,” i.e., demanding that women be admitted to Church offices. It opposed the compulsory celibacy of priests, protested against the equating of birth control with abortion, and pleaded that questions of sexual morals be the responsibility of the individual’s personal conscience.

In the minority Protestant churches, heterosexuality and one life-long marriage are seen as values that in a specific way correspond to the will of God. Marriage is, however, a worldly concern and therefore does not have a sacramental character as in the Catholic Church. For unborn life, the same rights of protection are given as for persons; but abortion is not categorically considered murder.

Discussion of homosexuality is still controversial in the Protestant church. In 1992, the theological commission published a statement declaring:

- the right of people to determine their own lifestyles;
- homosexuals must be respected and accepted in Christian communities;
- an ethical judgment on homosexuality in today’s humanistic understanding cannot be found in the Bible; and
- a homosexual identity cannot be “turned around” or cured.

In Austria’s Protestant churches today, those who identify themselves as homosexuals can be employees as well as pastors. The blessing of homosexual couples is not yet officially possible in the Protestant churches. However, an

agenda for a concept for blessings is being worked out and will probably be accepted at the next synod.

In contrast, the “Invocavit” declaration of 1995, which was signed by 150 Protestant theologians and church employees as a reaction to the General Synod, rejected homosexuality, considering it contradictory to the will of God, the creator. It was considered a “destructive aberration of emotional life.” In the view of the authors, homosexuals may not be employees in the church, and church blessings for homosexual couples are rejected as well.

The synod of the Neo-Catholic Church of Austria resolved that homosexuals are to be respected in their personalities, beliefs, and their cooperation in their communities. For homosexual life companions who intend their relationships to be permanent, church blessings were made possible at the synod of October 18, 1997.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

In the 19th century and earlier, sex education was part of the Catholic educational instructions. The emphasis was on what was forbidden, and on remaining chaste and faithful before and in marriage. Masturbation was forbidden as a sin. Sexual intercourse before marriage, with or without force, was taboo and therefore not talked about. Nevertheless, the first sexual intercourse of aristocratic young men was often arranged by their fathers, when it was clear they had completed puberty. They were taken to a brothel for their first sexual experiences. In the upper-middle class or among prosperous farmers, sexual availability was expected from the female servants. If one became pregnant, she was sent away.

After the establishment of the Republic in 1918 and the election of the first female representatives, the female pioneers of the Social Democratic Party continually demanded institutions for sex education and counseling, and their priority was to increase help with questions about birth control. The first attempts were made when the Social Democrats took over the government in the capital, Vienna, through the work of the legendary City Councilman Julius Tandler. At the same time, Wilhelm Reich, a student of Freud, established the first outpatient sex clinics. With the growing strength of National Socialism and the emigration of the leading Jewish doctors, the initiative came to a standstill. After the end of World War II, it took about 25 years until the women’s movement could push for a new abortion law and address questions of sex education. At practically the same time, at the suggestion of the parents’ council of the Education Ministry, a seminar conducted by experts in September 1969 provided the push, making possible the decree, *Sex Education in the Schools* (November 24, 1970), in which sex education was introduced as an interdisciplinary principle of instruction.

A *Media Package* was prepared by the Federal Ministry of Education and the Federal Ministry for Family Affairs (now known as the Federal Ministry for the Environment, Youth, and Family) as the main teaching tool from 1984 to 1989. This production produced a vehement argument between the Marxist-oriented progressive psychoanalysts and Christian-conservative repressive-oriented sex educators. In the final edition that came out with the title, *Love with Responsibility*, basic sexology was emphasized, and, in the didactic part, a wealth of suggestions for exercises and games for the classroom was given.

The Catholic-oriented Institute for Marriage and Family, with the support of the Education and Family Ministries, developed a program, *Working Group: Parents, Stu-*

*dents and Teachers—Partners in Sex Education*. For this, specially trained moderators in the schools offered general help in establishing communication between the groups and in working out concrete sex education projects for specific schools. This was done at no cost to the schools. (For additional information on sexuality education in the schools and at home, see Section 5B below).

In addition, both ministries offered special booklets. *Gynnie*, cosponsored by the Austrian Medical Association, provided answers to relevant gynecological questions, as well as questions about relationships. Brochures were also published for non-students; for example, the Family Ministry offered *So That Love Can Grow*, along with accompanying group discussions and help in seminars concerning topics of sexuality. Austrians seeking counseling and advice can turn to 220 family and partner counseling centers that have been established all over Austria and are financially supported by the Family Ministry. Four of these centers are explicitly declared as counseling centers for sex and sexuality. The Austrian Society for Planned Parenthood, founded in 1966, has established six counseling centers with an emphasis on birth control. These centers are in hospitals, and one is especially for young people. There, examinations can be carried out and contraception prescribed and distributed. Another initiative of this group is *Herzklopfen* (Heart Throbbing), which offers confidential telephone counseling especially for young people, and is therefore available on Saturday afternoons.

[*Update 2003*: During the Conservative Party and Freedom Party coalition, the name of the Ministry of Social Affairs and Health was changed to the Ministry of Social Affairs and Generations (BMSG). Radical social changes were not made, but the renamed ministry issued a brochure for young people, *Love, Sex and So*, in 2002, which replaced all earlier educational materials (<http://www.bmsg.gv.at/bmsg/relaunch/jugend/welcome.htm>). The new brochure has been criticized by the Catholic Church as being “too liberal.” HOSI (2003) has a comparative chart of all European countries up-to-date concerning “punishable” acts by gays and lesbians (Graupner 2003). (*End of update by L. Kneucker*)]

#### B. Informal Sources of Sexual Knowledge

*Bravo*, a German magazine for young people, is widely read in Austria, mainly, however, by less educated youngsters. In the late 1980s and early 1990s, *Rennbahn Express* (*Racetrack Express*) was quite popular and widely read by educated young people. Although it offers sexual information on two full pages 11 times a year, answers letters to the editor about sex, carries regular columns on health relating to sexuality, and has an Internet Web page offering counseling, the magazine is now decidedly out-of-fashion among young people, leaving the field open for new magazines to move in.

The media offers popular, if not always serious sexual information. The *Kronen Zeitung*, a daily newspaper in small format published in Vienna, offers “the man in the street” flowery-formulated but simply expressed answers to questions related to sex, and every Tuesday publishes letters from readers. Some newspapers in the provinces copy these letters. The original radio program, *Sex Hotline*, appreciated by many older listeners, was offered by ORF, the Austrian Radio, every two weeks on Fridays for two hours beginning at midnight. After 5 years, the program was given a new name, *Love Line*, and a year later was taken off the air, because the public was no longer as interested as in earlier years. *Zick Zack*, a program for youth that also offered young people the opportunity to call up and ask for advice, was a success, but was no longer aired after January

1995. Until 1997, there was a radio talk show that was replaced by *Joe's Nachtclub* (*Joe's Nightclub*) every Saturday from midnight until 2 a.m. While these informal sources of sexuality information come and go, Austrian media consistently provides some popular sources of information on sexuality.

#### 4. Autoerotic Behaviors and Patterns

##### A. Children and Adolescents

Austria is a country without any tradition in sex education and pedagogy. To a large extent, moral values are stamped, "Repress the bodily functions" by the Catholic Church, as well as by the Puritanism of the *petite bourgeoisie*. Masturbation may be still tainted as sinful and forbidden for many older Austrians, who view it as "tainting your soul" ("*schwarze Pädagogie*") or still believe the myth that the number of ejaculations in their lives will be limited to 1,000—"1,000 *Schuß*, dann ist *Schluß*" ("1,000 shots poured and then there is nothing more").

Nevertheless, masturbation is widespread among young people, and aside from traumatic sexual experiences, autoeroticism is among their very first conscious sexual experiences. Among boys, 60% of the 13-year-olds and 80% of the 14-year-olds have experience in masturbation, and 100% of the 16-year-olds. According to Nöstlinger and Wimmer-Puchinger (1994), girls have less experience with masturbation than boys: 25% of the 13-year-olds and 50% of the 17-year-olds. European studies indicate that masturbation is experienced earlier than it was in the 1960s, especially for girls. There are no comparative figures for Austria, but it can be assumed that the tendency is similar.

##### B. Adults

In Austrian studies, questions about masturbation are either not asked or are peripheral questions. Langbein and Fritsch (1991) remarked that masturbation was not thematically included in the basic Institut für Empirische Sozialforschung (IFES, Institute for Empirical Social Research) study, since international studies would in any case show that around 90% of all adults practice masturbation. A study by Senger and Hoffmann (1993) reported that about three quarters of all men and less than two thirds of all women masturbate, whereas the frequency of men, 1.6 times weekly, is twice that of women. Single people masturbate above the average, 2.2 times each week, and persons under the age of 40 masturbate more often than older people.

Adult heterosexuals who consult clinicians on the issue of masturbation usually do so because they view masturbation as taboo and something that is done in secret with a bad conscience. Many ask if it is "normal" to have the need to masturbate parallel to sexual intercourse.

The problem hardly affects homosexual men, because they view mutual masturbation as a favored sexual outlet. When AIDS emerged, "jack-off parties" became just as popular in Austria's gay communities as in other countries. These parties were held in private circles where community masturbation as a safer-sex method was practiced. Verified information from lesbians is not available, although the tendency is probably rising, as it is for women in general. Stronger self-determination in sexuality and more confident attitudes about their own bodies—"My body belongs to me!"—have probably contributed positively to the frequency of masturbation for both heterosexual and lesbian women.

Altogether, the viewpoint that masturbation is by all means an enrichment, and not only a substitute for one's sex life in a partnership, is gaining recognition, even if slowly and still unmentionable in public.

Masturbation does not cease when Austrians get older. Although there are no statistics available for Austria, the experiences in supervised residential situations reveal that, just as seen in international studies, masturbation in old-age homes or nursing homes is part of daily life.

#### 5. Interpersonal Heterosexual Behaviors

##### A. Children

The uncontested right of children to their individual forms of sexuality, as recognized by sexual researchers, is acknowledged only hesitantly by the general public. The only context in which children's sexuality is usually mentioned or discussed is in the context of sexual abuse.

When observed, any form of children's sexual activities—masturbation, "playing doctor," father-mother games—are often repressed and denied, because "what is not permitted, does not exist." A still-restrictive sex education concept tries to condemn children's sexual behavior with "black pedagogical" sanctions, or to keep it a secret. Rethinking these questions began slowly in the early 1990s.

##### B. Adolescents

Young people enter puberty earlier than they did a few generations ago. The first menstruation also takes place earlier. Eleven-year-olds who have their first periods are now the rule rather than the exception.

Based on law, a decree known as the "Sex Education Decree" was issued by the Ministry for Education about 15 years ago. Sex education was to be given at schools as an interdisciplinary subject, with the strong participation of parents. In the middle of the 1980s, the Austrian Institute for Family Research undertook a study to find out how far the program had actually been put into practice. The first finding of this study was that when sex education is taught, it was in two subject areas: in biology classes, where information is emphasized, and in religion classes, where values are emphasized. Thereupon, the Institute developed a model that is called *Love Talks* to coordinate the two. It is the only model for sex education in Austrian schools, and has been adopted for use in South Tyrol, Germany, and the Czech Republic. The second finding showed that sex education is not a question of knowledge, but rather a communication problem. This information was incorporated into *Love Talks*. A moderator, who comes from outside the school, works to bring parents, teachers, and students together at one table to discuss pertinent topics. In addition, a sex education program for the school (workshops, field trips, etc.) is planned for different levels and classes. How this is concretely carried out depends on the individual interests of the school. The cost of the moderator is covered by the Ministry for Education, and therefore, the model can be offered to the schools at no additional cost.

Meanwhile, time and again, there are discussions about including sex education as a regular school subject in the curriculum. Up to the present, however, sex education as an educational means to support the capability of entering and experiencing relationships in all of their complexity is only available through *Love Talks*.

Sex education is not necessarily keeping pace with the personal experiences of youth. Although sex education in schools has been established as an educational principle for more than two generations, only half of the young people are actually given sex education in schools. At home the situation is the same. In a large-scale study about the sexuality of youth in 1994, 1,108 young people between the ages of 15 and 18 were questioned. The responses were: 94% of all young people had been in love once—on average, at 12.9 years old the first time, with 14 years old most often re-

ported as the age. By age 14, 91% had had a date, and 89% had already "put their first kiss behind them" (with the average age for their first kiss at about 13). For male students, the percentages were clearly lower.

Young people reported their first romantic friendships, on average, at the age of 14, when 72% of the 1,108 students sampled had already had a steady partner. On average, at age 15, the first petting took place for 62% of those surveyed. The least experienced with petting were male students who lived in the country, 44%; the most experienced were female apprentices living in the cities, 91%. Forty-three percent of the young people reported that they already had had their first heterosexual experiences other than petting at age 15. The highest percentage was among male apprentices in cities, where 85% reported having had their first heterosexual [oral sex] experience, clearly above the average. The average young person was 15.5 years old the "first time," with the first sexual intercourse taking place at the age of 16: girls 33% and boys 36%. Among the girls, 4% were less than 13 years old; 3% of the boys were under age 13. In the 14-to-15 age group, more girls have had sexual intercourse than boys.

The sexually experienced young people reported having had sexual intercourse a number of times. The most frequent sexual intercourse took place with a steady partner (40%); and 39% reported that they had had two or three partners. Only 4.5% of the girls and 11% of the boys had had sexual experience with more than five partners. At the time of the study, 72% had a steady boy- or girlfriend. The average duration of a friendship for young people was 11 months; the response most often given was 60 days.

Kissing and cuddling are the sexual activities most often indulged in, reported by 98.5%. Eighty-five percent reported "petting" and 66% sexual intercourse. Their emotional level and sense of sexual faithfulness play an important role for young people. Only 6% reported that they had been "unfaithful" to their partners.

A lasting relationship is an ideal for 79% of young people. Almost two thirds emphasized the wish to marry, and three fourths expressed the desire to have children. There was no significant difference between boys and girls. The figures from the study coincide with information from counseling and work with young people, where the expectation of traditional values, such as partnership, faithfulness, family, and so on, are clearly articulated.

### C. Adults

The legal regulations on the protection of minors generally set the "age of consent" at 14 years for consensual sexual relationships. This applies to both heterosexual and lesbian relationships. For male homosexual relationships, the age of consent is 18. Sexual relationships between adults and minors over 15, with the exception of gay male relationships, are legally permitted, as long as force or coercion is not used, and there is no exploitation of a dependent relationship.

About 18% of the adult Austrians between the ages of 17 and 70 live as "singles." The trend towards living alone is quickly rising. In 1993, about 900,000 people lived on their own; two years later, the figure was 1.2 million, an increase of 33%.

"Typical" singles are women over 50 years of age. Twenty-five percent of this age group lives alone, although whether they are divorced, widowed, or simply without partners is not known. Other singles include young men—38% of all those under the age of 30—as well as young women in school, about 40%, and farmers, 20%. Females in colleges and universities are more likely to live alone than their non-academic peers.

The incidence of sexual intercourse among singles is low. More than half have no sexual partner, and only one in ten have intercourse once a week (Langbein & Fritsch 1991). Only 5% live as "swinging singles," i.e., have several sex partners at the same time. Of these, 42% want a steady relationship.

Another trend is a steady relationship without a common household, currently about 16%. A third of the young couples under the age of 30, and practically half of all divorced persons, have such relationships. Of those, 68% said that they have sexual intercourse at least once a week. Only 6% do without sexual activities completely. Of those couples who live separately, two thirds stated that they had happy and intensive love relationships, whereas of those pairs living together, only 56% expressed this view. Altogether, sex is more important to those who do not live together than it is to those who do live together. Nineteen percent had the opinion that sex was the strongest bond to their partners, and 59% are satisfied with their sex lives. Of those who live together, 8% felt that sex was the strongest bond, and 49% are satisfied with their sex lives.

About one third of all Austrian women between the ages of 16 and 70 live in a common household with their partners. The reference to the age limit of 70 is important, because in the study cited here, people over 70 were not included. If they are added to the figures, then the number of single households rises, and the number of pairs sharing a household becomes smaller. Higher life expectancy and lower birthrates lead to a constantly rising proportion of single older women. Senger and Hoffmann (1993) point out in their study that 22% live alone, 22% live in a partnership without children, and 56% live in a traditional family with children. The trend points clearly to families with one child.

Every third marriage does not last. In large cities, every second marriage ends in divorce. In the country, where traditional values and social controls have a stronger influence, the rate of divorce is clearly lower.

The average number of acts of sexual intercourse among adult Austrians is 2.4 times a week. The modal value is, however, once a week (21.1%). Twenty percent have intercourse up to twice a week, and just as high is the share of those who have intercourse less than once a month or never. This tendency is sinking. In 1980, only 11% of those asked answered that they had less sexual intercourse than once a month or never, and at least 63% responded with at least once a week, and in 1991 it was only 53%. Men are somewhat more active than women—2.6 times a week for men, and 2.1 times a week for women. This indicates that women are "more faithful" than men.

As varying as the survey data is for "faithfulness," the proportion has stayed the same. For every unfaithful woman there are two unfaithful men (12% to 20.7% in contrast to 29% to 40.1%, respectively). Compared to these figures, nine out of ten Austrians responded that faithfulness in a relationship is especially important.

The satisfaction with the extent and quality of one's sex life is relatively high. Sixty-seven percent (men 63%, women 71%) indicated that they did not wish for more sex. Only 16% (24% men, 8% women) were not satisfied. The sexually most active is the group of 30- to 49-year-olds (at least once a week—60%), and satisfaction is here somewhat higher than the average (men 65%; women 8%). The majority of Austrians are satisfied with the length of intercourse: 28% said that the average sexual act lasted more than half an hour, and around half spend ten to 30 minutes. There is a significant difference between housewives and working women: 70% of the housewives are content with their sexual lives, as opposed to 53% of working women.

That women are, in general, more sexually contented than men is certainly linked with the still prevailing Catholic image of the woman who is to remain passive and take the place to which she is directed. The growing employment of women appears to allow a slow but certain emancipation process to develop.

For unconventional sexual practices, there are no legal restrictions, as long as they are carried out with mutual consent and injuries do not result. There are practically no statistics about the societal acceptance of fetishes, sadomasochism, or other unconventional sex games. What pleases both is permitted, as long as this is not spoken about too publicly. Advertisements are permitted.

About 60% of Austrians practice oral sex (men 70%; women 52%). Heterosexual anal intercourse is acknowledged as a possibility by about one third (40% of the men, but less than 20% of the women).

The wish for group sex is felt by a third of Austrians. Around 1,000 persons actually look for appropriate saunas and clubs so that they can practice group sex and partner exchange, and this is done by, above all, the educated, independently employed, and freelancers. Interest is highest among young men between the ages of 16 and 29. Seven percent of the men enjoy this, but only 1% of the women.

The sexuality of the aging is an area that has undergone very little research, because the issue is largely suppressed in public. "Love," as the most important element in a relationship with a partner, is mentioned by only one quarter of the women and one third of the men, and only 4% mention sexuality as the element that binds one partner to the other. That does not mean that sexuality no longer plays a role: 45% of the men and 21% of the women between the ages of 50 and 60 stated that they had sexual intercourse at least once a week. International studies reveal regular sexual contact also by those who are over 70. In Austria, there are no figures available. Observations and experience working with aging people show, however, that sexuality in old age is not passé, only the quality changes. As with young people, manual practices have an important place, although they are often discriminated against as "senile disinhibition." A serious consideration of sex in old age has only begun, and this, slowly. Those studying this question are usually people who work in health professions.

Similarly not discussed is the sexuality of handicapped persons. The legal regulations of protection against encroachment, abuse, and exploitation of dependency are also supposed to apply to the mentally handicapped. Within these regulations is the controversy about the sterilization of mentally handicapped persons. Until 1974, compulsory sterilization was carried out on mentally handicapped persons. The basis for this was the *Reichsüberleitungsgesetze* of the National Socialist legal system. Such regulations did not exist in the Austrian penal code before 1938. Still today, the sterilization of mentally handicapped persons can be carried out against the will of the affected person, if the parents or the guardian and the responsible court give their permissions for the operation. The question does arise whether or not a mentally retarded individual has the possibility to understand the operation. According to reliable reports, this permission is given less and less in recent years, partly because of strong protests from human rights activists.

Until recently, the sexual needs and rights of handicapped persons are often ignored or denied in public discussion. Now at least, thanks to the initiative of the handicapped themselves and organizations for the handicapped, a serious discussion has begun, albeit slowly. One of the major reasons, and goals, of the discussion is so that institutions, such as homes or nursing hospitals, can create the

necessary basic conditions that permit and safeguard intimacy, as well as allow physical contact between those who live and work there.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

Data that would allow reliable conclusions about how many Austrian women and men are homosexual are scanty, and until now were only available as a "by-product" of two empirical studies about the sexual behavior of Austrians. Langbein and Fritsch reported in 1991 that 200,000 Austrians identified themselves as homosexual or bisexual, i.e., about 3% according to a representative study by Weiss and Perner in 1991 for Institut für Empirische Sozialforschung. In a study done by Senger and Hoffmann (1993) based on a questionnaire distributed by the popular newspaper, *Neue Kronenzeitung*, 6.2% of the men and 9.6% of the women who answered declared themselves homosexual. Seven percent of the women responded as bisexual. [*Comment 2000*: It was not clear from the newspaper report whether the 7% of the women who responded as bisexual were part of the 9.6% or in addition to it. (*End of comment by R. T. Francoeur*)] However, the author assumes that the differences between these Austrian data and data from other countries are not significant.

Studies concerning how many young people have homosexual experiences during adolescence, or about a "coming-out" phase do not exist. The comparison of data from other countries with testimony from those affected lead to the conclusion that the coming out of homosexual Austrians does not differ from other white Europeans or North Americans: Most of them define themselves as definitely homosexual by the ages of 19 to 21. The length of time for the coming out of girls is increasingly similar to that of boys. The differences between city dwellers and those who live in the country play a large role for both sexes. Comparatively, however, few young Austrians are without prejudices. And few have access to positive information about homosexuality. Those who do have this information are mostly homosexuals and lesbians, and most of these are in Vienna.

Gay male adolescents seeking to establish personal contact with peer or older homosexuals, or wrestling with the decision of whether or not to come out face two obstacles. Gay males over age 19 face the risk of legal charges if they develop a personal relationship with another gay under age 18. In addition, the societal reaction to AIDS resulting in negative attitudes toward homosexuals has also made coming out more difficult. In comparison, young women have an easier time coming out, since the silence about lesbians and a lesbian way of life has been broken, and consequently models of behavior have become socially visible.

However, the societal, legal, social, and political situation is, as mentioned above, typified by numerous discriminations. Basically, it has been observed and established that brutal forms of discrimination are employed against male homosexuals (in the penal code and in working situations), while lesbians are more likely to encounter silence, ridicule, or put-downs in the popular media and in the health-care community. Anti-pornography laws are seldom if ever invoked to restrict portrayals of lesbian sexuality used by the pornography industry for their erotic appeal to heterosexual men, but erotic videos made by lesbians for lesbians are very often confiscated and forbidden.

With respect to the legal situation of homosexuality, prior to the "small reform" of Austrian criminal laws in 1975, sexual acts between members of the same sex were punishable. This was a tradition that goes back to the Empress Maria

Theresia in Article 74 of the “*Constitutio Criminalis Theresiana*” (1768), a criminal code issued for the Habsburg countries, where the death penalty was permitted. In 1852, Article 129 of the Austrian Penal Code stipulated hard prison sentences between one and five years for “unnatural fornication” for both sexes. The resistance of Catholic organizations prevented removing female homosexuality from the realm of the criminal in 1930.

During the time of the National Socialist occupation, Article 129 still applied and Austrian laws concerning homosexuality remained in effect. From 1938 until 1945, an unknown number of homosexual Austrians, who were identified with a pink triangle that they were forced to sew on their clothing, were sent to concentration camps and murdered. Lesbians were persecuted as “anti-social” and sent to work and penal camps. The number of trials involving homosexuals of both sexes and the number of those condemned to prison multiplied. However, basic historiographic research has not yet been done.

Unlike other groups who have been officially recognized as victims and, as such, have received some indemnity and some compensation from the Republic of Austria, homosexuals have not been compensated, not only because of the objections of the interest groups of survivors of the concentration camps, but also because the responsible federal ministers for social affairs have refused to recognize homosexuals as political victims.

Until the “small reform” of the criminal code removed “simple homosexuality” from the criminal code in 1975, about 13,000 Austrians were convicted of “unnatural fornication” between 1950 and 1971, of which 5% were women. After 1971, because of special pressure from the Catholic Church, conservative circles, and government advisors, four articles discriminatory against homosexuals were introduced into the Austrian Criminal Code:

- Article 209 states that a sexual relationship between someone over the age of 19 with someone who is younger than 18—the “age of consent”—is a criminal act. (See Update 2003 at the end of this section.)
- Article 210, which made prostitution between men punishable and, therefore, forced it into the underground, was removed in 1989, based on arguments pertaining to AIDS prevention.
- Article 220 forbids both sexes to advertise fornication with animals or persons of the same sex.
- Article 221 forbids both sexes to establish associations with the same goals.

On November 26, 1996, Article 220 forbidding advertising and Article 221 forbidding the establishment of associations were eliminated from the criminal code. However, the age of consent for boys (Article 209) remained in effect. In Austria, the age of consent for male homosexuals was 18; for female homosexuals and heterosexuals, however, it was 14 years of age.

Other forms of discrimination can also be found in civil law, especially in rental laws, vis-à-vis life partnerships of homosexuals, and even stronger regarding laws regarding marriage, employment, and social insurance. Central to this discrimination is the definition of “relatives,” which includes marriage partners, parents, children, and in certain instances heterosexual partners. Only those mentioned, for example, have the right to be party to contracts. In 1998, the definition of “relationships” was extended to include homosexual partnerships.

Because of its important social and political position and as a regular advisor in questions of legal reforms, the Catholic Church, with its strong discriminatory policy against

homosexuals, has the possibility to act in far more cases than in those involving only religious questions. In comparison, the Protestant and Neo-Catholic churches in Austria play an insignificant political role.

In the fields of medicine, psychiatry, psychology, psychotherapy, and health institutions, there are at least no official attempts to force people to be heterosexual. In Vienna, lesbians and gay men can turn to a few homosexual or unprejudiced doctors and psychotherapists.

Although in the pedagogical professions there are no official prohibitions against the employment of homosexual educators, in practically all occupations unconventional sexual preferences are kept secret. Individual cases of firing are known. Information about homosexuality is not made available in the teacher training. However, in the last few years, students in Vienna’s Academy for Social Professions have been permitted to do internships at homosexual associations.

In scientific research, only one study of lesbians and gay men has been financially supported by the government. At Austrian universities, the personal initiative of a few dedicated scholars has introduced some lectures on lesbian and gay studies in the areas of sociology, psychology, and political science. Notice was given to self-acknowledged lesbians at the University of Vienna at the beginning in the early 1990s that lesbian and other homosexual research is not considered among the mainstream disciplines. Supporters of this research are always under pressure to scientifically prove the legitimacy of their studies.

The possibility for an undisguised and self-determined homosexual way of life depends strongly on geographical and social conditions. By and large, Austria is a country with small-town structures, and social and sociosexual control mechanisms, which have remained intact despite tourism. Hence, homosexuals avoid the cultural difficulties of living in the country and towns and move to the larger cities, especially Vienna, where there is a certain protection, on the one hand, and on the other, better opportunities for contacts. The question of “How do I tell my parents?” is much more difficult in rural villages, not only because of the possible ostracism of the person affected, but also for the family from which he or she comes.

In the past few years, the trend among homosexual men to establish permanent relationships has become apparent, on the one hand, because of the influence of AIDS, but, on the other hand, because of increasing socialization opportunities. How many lesbians or gays live in partnership is unknown. How far these structures differ from those in heterosexual partnerships is now (in late 2000) being studied for a dissertation at the Department of Psychology at the University of Vienna.

Sexual practices made a striking shift in the 1980s because of AIDS. Austria was the first country in Europe with a sex education brochure about AIDS. The brochure was done through an initiative of the gay movement. The social pressure to use protection in anal and oral intercourse is very strong, especially in towns where activist groups exist. According to Senger and Hoffmann, oral intercourse is the most frequent practice among homosexuals, followed by anal intercourse. (However, since the study is based on responses to a questionnaire in a popular newspaper to which Senger has contributed a popularly written column for years, the representativeness and lack of bias in the sample is certainly questionable). There are no researched statistics on the sexual practices of lesbians. Based on the work of Shere Hite and the Kinsey Institute, one can assume that in Austria, as elsewhere in Europe and North America, oral intercourse and digital stimulation are the most frequent sexual lesbian practices.

Lesbians and gay men have organized themselves, although rather late, because of rigorous criminal laws as well as everyday persecution, even though Vienna, at the time of the First Republic (1918-1934) was one of the European centers of homosexual subculture and a very differentiated homosexual movement existed. These early traditions were completely destroyed by Austrian fascism (1934-1938) and National Socialism (1938-1945), both in substance, in organization, and in persons.

The first modern organizations for lesbians grew out of the autonomous feminist movement in the 1970s. Today, independent lesbian separatist feminist groups exist in Vienna as well as in some other provincial capitals. Their members are usually active in various areas of the independent feminist movement. Gays began to organize themselves only at the end of the 1970s. The first institution was the Homosexual Initiative (HOSI) Vienna, which is also active in various international homosexual associations (ILGA—International Lesbian and Gay Association, ILIS—the International Lesbian Information Service, and IGLYO—International Gay and Lesbian Youth Organization). In Church circles, Homosexuality and Church, an ecumenical working group, is significant, as well as the Ecumenical Platform of Homosexual Clergymen (ÖPSSÖ). At present, there are a number of lesbian and gay pressure groups that are also active in international homosexual associations. The high point on the lesbian–gay calendar is the Gay Pride Day at the end of June that usually includes a demonstration. For lesbians, March 8, the International Women’s Day is a “must.” In 1984 and 1989, Vienna was the venue for the Annual Conference of the International Lesbian and Gay Association (ILGA), and was organized by HOSI, Vienna.

[Update 2003: Each year, a different European city is chosen to organize the events for “Europride,” a month-long festival of activities and a parade with participants from all over Europe. Vienna was the site chosen for 2001. Over 100,000 participants took part in the parade and other events, bringing gays and lesbians into an even clearer self-confidence. It also marked a major development in the visibility of the homosexual men and women in Austrian culture.

[Another important development was the repeal of Article 209, one of four articles introduced into the Austrian Criminal Code in the 1970s under strong pressure from religious conservatives, the Catholic Church, and government advisors. Article 209 stated that a sexual relationship between a man over the age of 19 with someone who is younger than 18—the “age of consent”—is a criminal act. The age of consent for female partners was already 14. In June 2002, the Federal Constitutional Court declared Article 209 PC unconstitutional. On July 10, Article 209 was repealed by Parliament; the general age of consent was set at age 14 for both gay and heterosexual relationships, and the law went into effect one month later. However, at the same time, new criminal code provisions were enacted:

[Under the provisions of 207b, it is now a criminal offense to engage in sexual activities if the older partner takes advantage of the immaturity of his partner, or takes advantage of his partner because he is more mature. The penalty for this is up to a year in jail or a fine. Sexual acts with a boy or girl under the age of 16 are illegal if the offender takes advantage of his or her situation as a drug addict, an illegal immigrant, or homeless. Here, too, the penalty is up to a year in jail or a fine. Finally, sexual acts are illegal if a remuneration of any kind is rendered to anyone under the age of 18 years. Therefore, sexual contact with child prostitutes is punishable for those who pay. The penalty can be up to three years in jail.

[Experts wonder, however, why politicians have not seen the need for such provisions before. The heterosexual

age of consent in Austria has been 14 since 1803, and for two centuries, heterosexual youth has been completely unprotected against such offenses. LGBT activists, therefore, view the new provisions with great skepticism and will closely monitor whether they are applied only or mainly against gays and lesbians.

[Despite the repeal of the old provisions, cases have been heard in court under the old, discriminatory laws. The European Court of Human Rights made known, in January 2003, that Austria was being fined for applying the paragraphs that are no longer legal. The Homosexual Initiative Vienna, at its General Assembly in 2002, demanded compensation for all those penalized under the old laws. (*End of update by R. A. Perner and L. Kneucker*)]

[Update 2003: Austria has an estimated 300,000 to 700,000 Austrian gay and bisexual males, many of whom are represented by a variety of smaller activist and support associations organized around special-interest agendas and purposes. One such subgroup, Austrian Gay Professionals (AGPRO), was organized in 1998 to represent a large number of Austrian managers. AGPRO is affiliated with the European Gay Managers Association (EGMA). In 2003, membership included more than 1,000 professional managers. Among the projects sponsored by the AGPRO with its European partners is a “Diversity Label,” given as an award to firms that offer a work environment that is free from discrimination.

[In early 2003, according to a local Viennese newspaper, the Association sent a formal request to the manager of the most famous European ball held during Carnival, the Viennese Opera Ball. The formal request was that homosexual couples, one partner in a white tuxedo, the other in black, be included in the traditional opening presentation of young debutantes and their partners. In the article, the president of AGPRO reported that the woman who is in charge of the ball turned pale for a few minutes, and then turned down the request. The AGPRO president added the comment that his organization is patient—and will ask politely again in the coming year.

[AGPRO’s request to be part of the Opera Ball may seem insignificant to those not familiar with Viennese and European social tradition. But in the European context, Vienna’s Opera Ball is one of “the most important” events of the Carnival season. People come from all over the world to attend—diplomats and politicians, the leaders of European social life. The Ball is featured on prime-time television, with careful attention to which prominent people are in which box and with whom. Being part of the opening of the ball is one of those events many upper-class young people aspire to. If gay couples were part of the opening, it would draw the world’s attention to the situation. I’m not sure that is why AGPRO wants to have gay couples there. It is more likely a question of “equal rights.” But either way, it would be a spectacular change if gay couples were part of the opening. In terms of social recognition and awareness, for “social persons,” parents who attend balls, whose families aspire to have a daughter or son “open the ball”—the girls all in white for the formal opening, and the proclamation “alles Walzer” (“Everyone waltz, the ball can begin”), it would be revolutionary to have gay couples be a part of the Opera Ball with all its media coverage. (*End of update by L. Kneucker*)]

## 7. Gender Diversity and Transgender Issues

Estimates put the number of transgendered persons in Austria between 1,000 and 2,000, but the figure might be closer to 5,000.

Austria at present has no laws dealing with transsexuality. In 1983, the Federal Ministry of Internal Affairs ascertained that there were too few cases for such laws. Nevertheless, the Federal Ministry for Work, Health, and Social Matters has published recommendations for the treatment of transsexuals. Before medical treatment, there must be an ongoing psychotherapeutic accompaniment that lasts at least one year, i.e., a minimum of 50 hours. After the psychotherapeutic findings have been established, hormone treatment and the so-called “everyday test” can be carried out.

When transsexuality is established, a doctor’s verification can be demanded, in which the diagnostic assignment to the opposite sex, as well as the correlation between the treatment and the outward appearance is presented, with the maximum validity of two years. The high costs for the treatment are only partly covered by public health insurance.

In Austria, relatively few doctors perform sex change operations (in Vienna, Salzburg, and Innsbruck) and they are considered comparatively less experienced than their foreign colleagues.

After the operation, it is possible to change the first name in the personal status in all documents, although the authorities may show resistance. Before, transsexuals could only choose a gender-neutral name. In this connection, the transgender movement advocates not having the gender recorded in the birth registry as well as all other documents. The position expressed in the movement is that many operations would be superfluous if society did not demand a strictly known identification with one of the two sexes.

Marriages of those who have undergone an operation are considered dissolved with the change of sex. Here, apparently, in the course of the acceptance of such marriages lies the fear that, as a consequence, homosexual marriages may no longer be forbidden. There is official pressure for divorce. Government officials can also make contact with the person’s own children difficult. As for employers, the pressure for agreed-upon severance is the normal practice. Many transsexual (transgendered) persons do not find new employment after they have changed their names and legal status. Prostitution is sometimes their only means of supporting themselves.

In June 1995, a four-day international human rights tribunal took place in Vienna that dealt with the discrimination against lesbians, gays, and transgendered persons. The indictment ascertained that lesbians, gays, and transsexual persons are discriminated against in various ways and that there is in no way legal protection. Accordingly, the government and Parliament were asked to initiate activities to counteract the situation. In February 1999, the first Austrian interdisciplinary symposium on transsexuality was held. As of early 2000, there were two self-help groups for transgendered persons, both in Vienna.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Child Sexual Abuse, Incest, and Pedophilia*

[Update 2003: In 1992, as the scandal of clergy sexual abuse and pedophilia spread around the world, from Canada to Australia, South Africa to Hong Kong, and across Europe from Ireland to Pope John Paul II’s native Poland, Vienna’s Cardinal Hans Hermann Groer, Austria’s ranking Catholic clergyman, was accused of repeatedly sexually molesting young boys, priests, and monks, creating a state of “spiritual dependency” among the young clergy, in which the cardinal demanded sexual favors in return for advancement in the Church’s hierarchy. For three years, the Austrian Church’s

governing body refused to investigate the case and, at the same time, defamed the accusing victims in the media, making it clear that a fundamental taboo had been touched upon. Finally, in 1995, as the Pope prepared to visit predominantly Catholic Austria, Vatican investigators confirmed that the cardinal had taken advantage of his position as father-confessor to intimidate young boys and clergy. The Pope then requested, received, and accepted the cardinal’s resignation. The cardinal retired to a monastery.

[Ten years after the scandal broke, the Austrian Bishops Conference still had not issued general guidelines for dealing with the problem, preferring instead to allow each of Austria’s nine dioceses to set up their own ombudsman, who is responsible for seeing to it that the problem is taken seriously, the dangers eliminated, and the victims are aided. As of early 2003, five dioceses had taken this action. Some Church functionaries have been removed from their posts. In Linz, basic principles have been formulated; in Vienna, such actions are being considered. Vienna’s ombudsman, who is also the student chaplain for thousands of university students, but has no authority, has stated that the situation reflects society’s ills in general. There is, both in Austria and elsewhere, still not enough consciousness and recognition of the problems, sufficient information, administrative transparency, and openness, plus too much secrecy and even cover-up. In Austria and the many other countries where this scandal has erupted, there is an obvious and urgent need for enactment of clear government and Church policies to protect the young from abuse. (*End of update by L. Kneucker*)]

The Austrian criminal code states that the sexual abuse of children—defined as sleeping with or fornication with minors—will be punished with up to ten years in prison.

About 500 cases of sexual abuse a year are reported to the authorities, but the actual frequency is estimated at from ten to 25,000. In 1997, 848 cases were reported, involving 231 male and 617 female victims (Federal Ministry of the Interior, Statistics on Victims 1997). The unusually high level of unreported cases that do not appear in statistics (*graue Zone*) can be understood because the perpetrator is usually closely associated with the close social circles of the victim—24% occur within the family, and the probability of bringing charges against someone in such a close relationship diminishes.

Eighty to 90% of the victims are girls, mostly between the ages of 6 and 11 years of age. The perpetrators are up to 80% men from all social levels. According to the Federal Ministry for Environment, Youth, and Family, every third to fourth girl and every eighth to ninth boy will be sexually abused.

To fight the sexual abuse of children, literature on the subject asks for an emancipating education and a change from gender-specific power structures. To this end, various institutions and places for maltreated and abused children have been established, including emergency telephone hotlines for children and child protection centers.

Austria has no pedophilia movement in favor of the legalization of sex with minors such as exists, for example, in the United States.

#### *Sexual Violence Against Women*

The women’s movement removed the taboo from the subject of sexual violence against women in the 1970s. It was pointed out that forced sex has less to do with sexuality than with power, conditioned by the differences between the social positions of men and women.

The first “women’s house” in Austria was built in 1978. In a short time, it was overfilled. Today, in Vienna there are three such houses, and in the other provinces another 15,

where women threatened with domestic or marital violence can seek refuge. In 1982, women set up the first emergency telephone for raped women and girls. At present, there are seven emergency telephone services in the larger towns. These refuges have been initiated for the most part by autonomous women's groups, and they experience great financial difficulties, because there is very little financial support from government agencies.

### *Sexual Harassment*

The public debate about sexual harassment at the workplace began in the late 1980s. In a study conducted in 1981, 81% of the women surveyed indicated that once, or more than once, they had experienced sexual advances by men against their will at work (Federal Ministry for Work, Health, and Social Affairs). Those affected are more often single women, frequently in insecure positions, and relatively often in typical occupations for females, especially secretaries. The perpetrators are frequently substantially older than their victims and, over-proportionally, their supervisor or manager (Federal Ministry for Work, Health, and Social Affairs 1993).

A law was enacted in 1993 that not only declared sexual harassment itself punishable, but also addressed negligence on the part of the employer in dealing effectively with the complaint. In the same way, the creation of a hostile and humiliating work environment at the workplace is forbidden. The person discriminated against has the right to demand reasonable damages, at least a minimum of ATS 50,000.

Since then, it is possible to start a legal procedure, but all women who, up to now, have sought legal process, were forced to leave their jobs while pursuing legal remedy. The official responsible for equal treatment questions has demanded protection against dismissal for victims.

### *Rape*

The crime of rape is treated in the criminal code as "punishable acts against morals." On the contrary, it would be more appropriate, at the present time, not to choose an abstract morality as a basis for protection, but rather the violation of sexual self-determination, i.e., the sexual integrity of the person. With the reform of the penal laws in 1989, rape within marriage or common-law marriage became punishable, but only upon application of the woman. In the past, the woman's inability to resist determined possible conviction as well as the extent of punishment. Today, the extent of the violence by the aggressor is decisive. Punishment for graver cases of rape is between one and ten years, for less violent assaults between six months and five years. The provisions of the law are formulated in gender-neutral language; men as rape victims are acknowledged. Still needed are improved counseling and support for women by the police and courts, help during the investigations, as well as increased claims for damages and psychological injuries suffered.

In connection with rape, old prejudices are still commonly held, such as the overpowering sexual drive of men or the alleged yearning of women for brutal sexual intercourse. The guilt is often assigned to the woman or shared guilt is assumed, as she is accused of having sexually provoked the perpetrator. Because she agreed to a meeting, the American notion of "date rape" is played down even in legal proceedings, since the woman's agreement is assumed. Rape within marriage is still represented by the notion that the husband has sexual control over his wife. It is therefore not surprising that affected women, whether out of a sense of resignation or shame, seldom report marital rapes.

According to police statistics, 507 rapes were known in 1997, of which 35 took place within marriages. Trials often

end in acquittals. In 1990, one third of the accused were found "not guilty."

### **B. Prostitution**

Provincial governments regulate prostitution in Austria and only one of the nine states outlaws it. Pimping is forbidden and punishable, but it obviously exists. Until 1989, male prostitution was a criminal offense. Prohibition was lifted especially in the interest of AIDS prevention. Officially recognized prostitutes are registered with the police, and must undergo examinations for sexually transmitted illnesses once a week. Since 1984, prostitutes must pay income tax. However, tax estimates are often too high and arbitrary to be paid, forcing many prostitutes into the underground. Although prostitution was put on an equal footing with other occupations, social and pension rights are not included. Prostitutes can voluntarily pay for health insurance, but have no rights to a pension or to the same protection as pregnant women—they fall through the loopholes of the social system.

There are hardly any studies concerning prostitution and the social situation of prostitutes. According to the Health Office of the City of Vienna, there are 630 female and 5 male prostitutes officially registered. Illegal prostitution is many times higher; many women who are registered as bartenders and hostesses work as prostitutes. In Vienna, about 5,000 prostitutes work each day. There are no figures for the whole of Austria.

The appearance of AIDS and the opening of Eastern European borders had a far-reaching influence on prostitution. HIV tests are required on a regular basis for prostitutes. As a result of the opening of the borders to the former Eastern countries (Czech Republic and Slovakia) in 1989, there was a rise in competition, and an increase of "secret" prostitution. It is known that international organizations are involved in the traffic of women. In Austria, many prostitutes come from Eastern Europe, Brazil, the Dominican Republic, Thailand, and the Philippines.

### **C. Pornography and Erotica**

Pornography is regulated through a federal law passed in 1990, "The Federal Act Against Obscene Publications and for the Protection of Youth Morally Endangered." Because this law is considered completely out-of-date in progressive circles, its total reform was begun in 1992, two years after its enactment. The reform is still being worked on in the Federal Ministry of Justice. A new version of the law has already failed to pass, because of pressure by conservatives and church groups.

The immediate cause for seeking a reform was a study initiated by the Federal Ministry of Environmental, Youth, and Family Issues about the existence and distribution of video films showing violent acts against children. The goal was to stop the production and dissemination of such films. A broad discussion began about whether punishment should be limited to trade in such videos, or extended to include ownership or possession as well. In addition, punishment was aimed at the presentation of violence; however, pornography without violence and presentations of sexual acts between members of the same sex were to be liberalized. But since no agreement could be reached with the People's Party coalition partner, the Social Democrats, who had been working for this reform, they could not carry it through. In 1994, punishment for producing, selling, and possessing child pornography was written into law.

[*Comment 2000:* A trichotomy of pornographic material is widely accepted in Austria, namely soft pornography or erotica with limited or no explicit sex acts (e.g., *Playboy*

magazine and the like), hardcore pornography with explicit sex acts, and hardcore pornography with legally prohibited “violent” content. The minimum age for a person buying soft porn/erotica, a *Playboy* magazine for instance, is 16 years. The minimum age for buying porn or entering an adult video store where hardcore pornography is available for rental or sale is 18 years. Violent content, including bestiality, sexual acts involving minors, and violent sexual acts is, of course, legally forbidden in Austria.

[Gay pornography is not forbidden in Austria, and almost every adult shop has a section featuring gay porn. Furthermore, in recent years a few gay adult stores have opened in Vienna. (End of comment by M. Vorachek)]

Punishment is limited to those who produce or distribute obscene texts, pictures, or films or other obscene objects for profit (Paragraph 1, Pornography Law). Possession or non-commercial exchanges of violent pornography is still permitted.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

The attitude of the Austrian population to questions of family planning is influenced by the Catholic sexual dogma, based on the “Pill Encyclical” (*Humanae Vitae*) of 1968, in which contraception and abortion were equally condemned.

Results from surveys show contradictory attitudes. The belief of most women in the effectiveness of family planning is confronted by the reality of unwanted pregnancies. Being relatively well informed about contraception is not borne out by the use of contraceptives. Thirty-nine percent of first live births and far more pregnancies were generated despite the use of contraceptives. Women with higher educational achievements, fewer religious bonds, and who live in cities have more faith in the planning of pregnancies. The higher the job qualifications, the fewer unwanted pregnancies occur. The same is true in cities, as compared to rural areas. In all of Austria, there are more than 200 publicly supported family and partnership counseling centers, whose responsibilities include counseling about pregnancy and informing clients about birth control methods.

Contraceptive preference and use changed drastically in the 1970s. After the rapid spread of the use of hormonal contraceptives, there followed, at the end of the decade, again a gradual turning away from the pill and turning to the coil IUD and sterilization, as well as to natural methods of contraception. The pill, however, remained the most-used contraceptive, being used by one third of all women at risk for pregnancy. Seen internationally, Austria is a “pill stronghold.” Those who use the pill, but are anxious that it may be detrimental to their health, have two more reasons for using it anyway: reliability and convenience. Birth control is still something left to women, although, since the appearance of AIDS, contraceptives are advertised by public authorities.

Forty-two percent of all sexually active and fertile women between the ages of 15 and 44 take the pill. This rate declines as women get older. Students and religious women take the pill less often. Women who use no contraceptive constitute the next largest group, at 18%. Twelve percent use unreliable contraceptive methods, mainly withdrawal or coitus interruptus. In fourth place on the frequency scale is the condom, followed by the coil IUD, and then spermicides. The diaphragm is only marginally used.

The choice of contraceptive method depends on the level of education, the importance of religion, the size of the hometown, and the age of the woman. In groups with lower

incomes, unreliable methods are often used. The higher the education, the more the pill is taken and the less coitus interruptus is employed.

In terms of convenient availability, the pill is made more difficult, because a doctor must prescribe it, whereas condoms are readily available in apothecaries, drugstores, and in machines in men’s toilets of almost all bars, restaurants, cafes, clubs, discos, and the like.

### B. Teenage (Unmarried) Pregnancies

Among nations for which out-of-wedlock pregnancy statistics are available, Austria has one of the highest rates of out-of-wedlock births. Since the 1960s, the number of illegitimate births has been rising while the rate of children born to married couples has declined. In 1998, the number of births was 80,321, of which 23,588 were born out-of-wedlock. Currently, one quarter of all live births are out-of-wedlock, double or triple the rates in the neighboring countries. This appears to be a continuing trend. Within Austria, however, there are large regional differences, with the large cities having especially high rates. [Comment 2000: With regard to these regional-level differentials, apart from the urban-rural differential, it is also noteworthy that some areas within Austria, independently from the urban-rural differential, consistently experience high out-of-wedlock birthrates. The most prominent case for this observation is Carinthia, the southernmost of Austria’s nine states, which traditionally, for centuries, has had the highest out-of-wedlock birthrates within Austria. (End of comment by M. Vorachek)]

Still higher than the rate of illegitimate births altogether is the rate of out-of-wedlock first-born children. At the end of the 1980s, about every third first-born was born to unwed parents; 60% of all women did not have their first babies conceived within marriages. From this it follows that in many regions of Austria, the out-of-wedlock birth of the first child is the rule, rather than the exception.

Since 1989, single mothers are automatically given guardianship over their children; prior to 1989, the mother had to apply for custody.

### C. Abortion

In 1787, as a result of the Enlightenment, the death penalty for abortions was removed from the “*Josephinisches Strafgesetzbuch*” (Penal Code of Emperor Joseph II), and replaced with a long prison sentence. This law is the basis for the current abortion paragraphs, which, with the exception of the era of National Socialism, was in effect until 1974. Under this law, abortion, in every case, even those carried out for medical indications, was punishable. Since 1869, according to the Roman Catholic Church, every abortion from the time of fertilization incurs an automatic penalty of excommunication.

In the 1960s, only a small percentage of abortions were actually punished by law. It was also clear that only those persons who were poor were prosecuted. Estimates from that time assume from 30,000 to 100,000 abortions per year. In addition to the illegal abortions carried out within Austria, “abortion tourism” began to countries with more liberal laws, above all, to Great Britain and Holland.

With the votes of the Social Democrats, the abortion articles were abolished as part of the amendments of the Criminal Code in 1975. Instead, time-limited permission (*Fristenlösung*) went into effect. According to the law, which is still binding, abortion is basically punishable, but will not be punished when the abortion is carried out within the first three months after implantation (nidation) or after the fourth month if a medical or eugenic indication is pre-

sented, or the person is still a minor. In order not to be punishable, the following prerequisites must be met:

- permission of the pregnant person;
- strict adherence to the three-month limit;
- counseling beforehand by a doctor; and
- neither doctors nor other medical personnel can be forced to participate.

The operation must take place in a public hospital, clinic, or private practice, normally under anesthesia by aspiration. The costs are only carried by the national health system if there is a medical necessity. In Austria, no records of abortions are kept.

If the pregnant woman is below the age of consent (i.e., has not yet completed her 14th year of age), abortions are not punishable even after the fourth month, but they require the permission of her legal representatives, usually her parents. There is no unanimous opinion in the legal literature on this question if the pregnant woman is still a minor and has not yet completed her 19th year of age.

In recent years the discussion about abortion has again flamed up. Kindled mainly by the leading members of the Catholic Church, the discussion ostensibly circles around the emphasis on the "right to life" based on the European Convention on Human Rights and Fundamental Freedoms, 1958, and the connected question: When does human life begin? In addition, the function of required counseling has become an important issue, because those who demand that abortion be punished also oppose sex education for the purpose of avoiding unwanted pregnancies. It appears obvious that opposition to the right of women to self-determination about their own bodies is the real motivation of those who oppose abortion. The opposition of these political factions delayed the government's efforts to allow distribution of Mifegyne (RU-486, the abortion pill) in Austria.

As in some other Western industrial nations, Austria has liberal abortion laws accompanied by a high degree of tabooing and insufficient infrastructure to carry out the operations. Even today, hospitals in the provinces dominated by the conservative People's Party refuse to perform abortions.

#### [Abortion and Embryonic Stem Cell Research

RAOUL KNEUCKER (Update 2003)

[In 2001, a major controversy surfaced in Europe and North America involving abortion, the definition of person, cloning, and research on the therapeutic use of embryonic stem cells. The official Austrian position regarding the use of human embryonic stem cells in scientific research is negative, without exception. The constitutional freedom of research would, of course, prevent state interference with biomedical research, but funding by state authorities can be withheld. This policy question became part of the Austrian political discourse in 2001-2002, as it has become in the U.S. The debate also erupted in all the other European Union (EU) member states, when the final decision on the European research program and grants for health research had to be made in the Council of Ministers in mid 2002.

[The European research program was adopted with Austria, Germany, Ireland, and Italy voting "no," because they did not support the funding of human embryonic stem cell research. The motives of these countries were as different as their respective national regulations. In voting together, however, they formed a "qualitative minority." In the voting regime of the EU, a qualitative minority can block any decision. Austria and all the other member states of the EU accepted a clause that, in all research activities, fundamental ethical principles must be adhered to. Stem cell research is restricted to research for improving human

health, and to countries where national legislation permits such research activities. No funds will be given to research activities aiming at human cloning for reproductive purposes, intending to modify the genetic heritage of humans, or intending to create human embryos solely for the purpose of research or procurement, including by means of cell nuclear transfer.

[In later procedures, only Austria and Italy kept to their rigorous negative positions; but instead of simply applying the majority rule, the Council decided to ask the European Commission for a status report on European stem cell research and for a comparative legal study to be completed in the Autumn of 2003, in all practical terms setting a funding moratorium (Matthies 2002). The Council made it clear that: (a) a final decision will be taken by the end of 2003, but (b) no member state should be prejudiced by the EU if they decide to reconsider their positions or rewrite their laws.

[The Austrian position (which is unlikely to change when a new government is formed during 2003) was declared by the Federal Chancellor and the Federal Minister of Education, Science, and Culture (the coordinating authority in EU matters of research and technology). The position is political and ethical in nature. Within the public discourse in Austria, it is the most rigorous view, congruent only with the position of the Roman Catholic bishops' conference in Austria. It deviates from the majority opinion of the Bioethics Commission of the Federal Chancellor rendered in January 2002 (Gmeiner & Koertner 2002). Legal regulations in Austria would permit a different position: National legislation (*Fortpflanzungsmedizingesetz*) allows in-vitro fertilization, but bars the creation of supernumerous embryos, and using embryos for research and industrial purposes. Unused embryos must be destroyed after one year. Furthermore, Austria has not ratified any of the international biomedicine conventions (e.g., Council of Europe, and United Nations). The Bioethics Commission of the Chancellery recommended ratification of the Council of Europe Convention on Human Rights and Biomedicine; however, no steps have yet been taken. As of early 2003, the Bioethics Commission was debating a recommendation to add legislation in order to protect human embryos. (*End of update by R. Kneucker*)]

#### D. Populations Programs

By international comparison, Austria is distinguished by noticeably low birthrates. In the 1980s, Austria had the third-lowest birthrate in the world after Italy and Germany; in the 1930s, it was the lowest in the world.

Despite continually pessimistic voices from the press since the 1970s that speak about a threatening situation, Austrians have very reserved attitudes towards the intervention of the state. There is no openly declared policy for a planned population. The influence of the State on reproductive behavior occurs indirectly, through establishment of financial and institutional incentives.

The population policies of the National Socialist dictatorship, the goal of which was to eliminate life that was unworthy of reproduction and to increase the "German race," led to an economic boom and a temporary increase in births, beginning in 1938. After the war, a family support policy was developed that provided both tax relief and other social support. These have been in effect since the 1950s as a permanent part of Austrian social policies.

In 1954 and 1955, a Family Support Fund was established to effect the distribution of money for family support as well as to influence pronatalist attitudes. And, indeed, there was a temporary baby boom at the end of the 1950s and beginning of the 1960s.

The decrease of births in the late 1960s and 1970s brought about a discussion about population-policy measures, in which the Social Democratic Party and the labor unions participated, in order to achieve more financial support for births, and so on. The People's Party and the Catholic Family Organization wanted to introduce more tax incentives for families with children. Altogether, Austria is one of the countries with the highest rates of family support.

In the 1980s, a program was initiated to combat sterility among women that included the possibility for artificial insemination. The "Medical Reproduction Law" of 1992 permitted in-vitro fertilization (IVF) for heterosexual infertile couples who lived together. Surrogate motherhood and ovum donation, however, are forbidden. The first Austrian test-tube baby was born in 1982. Every year, about 2,000 IVF attempts are made. The success quota is very small, among other reasons, because the majority of women give up before the completion of the very burdensome program required.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Since the 1920s, it has been compulsory to report diseases transmitted through sexual intercourse. The current law, the AIDS Act of 1986, requires reporting of: syphilis, gonorrhea, *ulcus molle* (soft ulcer, soft chancre), lymphogranuloma venereum (pudendal ulcer), granuloma inguinale (groin ulcer or ulcerating granuloma of the pudendum), as well as full-blown cases of AIDS. Registered prostitutes are also legally required to be examined at regular intervals (weekly) for venereal diseases. These statistics are maintained by the Health Office of the City of Vienna. The available statistics published in medical journals are still not reliable, because it can be presumed that only an estimated 20% of the actual cases are reported to the health authorities. Nevertheless, it is possible to understand the trend from these figures: Reported cases of syphilis and gonorrhea are diminishing, while non-reportable diseases, such as chlamydia and *Trichomonas* infections, are clearly increasing.

In Vienna, a little under 1,000 cases of syphilis and gonorrhea were reported in both 1993 and 1994, the last year for which data has been published. A slight rise in cases of syphilis can be explained by the registration of persons from former Yugoslavia, for whom genital scarring was reported but treatment could not be ascertained. In the Health Office of Vienna, from which about one fifth of all the figures in Vienna come, a tendency towards a decrease in cases of gonorrhea became apparent after the high point had been reached right after the borders to the Czech Republic and Slovakia were opened at the beginning of the 1990s.

The treatment of STDs, as well as counseling, takes place in clinics with the appropriate professional departments and with established doctors, mainly dermatologists, and less frequently, urologists and gynecologists. Vienna has a special outpatient clinic where poor people can receive counseling, examinations, and treatment at no cost.

Programs in education and prevention practically do not exist. With the exception of AIDS, sexually transmitted disease is not a topic spoken about in public. The public campaigns, such as the one carried out by the company that produces Acyclovir, are the exceptions. The manufacturing firm advertised its product, and at the same time promoted the use of condoms as protection against the contagious contraction of herpes.

### B. HIV/AIDS

#### Government Regulations

As early as 1986, Austria had its own AIDS law, since it could not be sensibly included either in the laws concerning epidemics nor venereal diseases. As a result, clear cases of AIDS, according to the American CDC classification, as well as cases of death, must reported to the Federal Ministry for Health; reports include the sex, date of birth, and the initials of the person, but not his or her name. HIV infections are not reported, to guarantee the anonymity of persons infected with HIV and to prevent possible discrimination in schools, at the workplace, and so on.

Commercial sexual activities are forbidden to those infected with HIV, and this is anchored in law. Registered prostitutes are, in addition, required every three months to undergo an HIV-antibody test. Also regulated by law is the right of an HIV-infected person to attend school, as long as the affected person is able to physically meet the demands. The same is true, *de jure*, for the carrying on of other occupations. An HIV infection is a reason for ineligibility for military service.

While HIV tests are not carried out in the standard procedure when blood tests are made, the law does not prohibit testing for HIV without the permission of the person involved. In hospitals, especially in Vienna, mass screenings were made without the permission of the patients. This doubtful procedure, which caused vehement discussion, was made legitimate in a directive issued at the beginning of the 1990s by the City Council member responsible for such matters.

Austria's health insurance regulates that those who are infected with HIV, and people ill with AIDS, may use the national insurance the same as anyone else. Private insurance companies, (e.g., organizations offering life insurance, are increasingly demanding HIV-antibody tests and/or excluding those with HIV infections and those with AIDS.

#### Statistics for HIV Infections and AIDS

Since the beginning of the AIDS pandemic in the early 1980s through 1997, the registered (cumulative) numbers for Austria were:

- 7,609 people currently infected with HIV;
- 2,036 people currently living with AIDS; and
- 1,243 Austrians who have died of AIDS.

The number of new infections in 1998 was 92 and 18 in 1999. Between January 1 and October 30, 2000, 366 new HIV-infections were registered. Although these statistics from the Department of Virology of the University of Vienna Medical School, as of October 30, 2000, and published December 1, 2000, are highly reliable, the CIA *World Factbook* (1999 estimate) gives the adult prevalence of HIV/AIDS as 0.23%, with 9,000 Austrians living with HIV/AIDS and less than 100 deaths attributed to the infection. Note the difference between 1,243 deaths and less than 100 due to HIV/AIDS. At the same time, the AIDS-Help organization in Vienna claims that the realistic number is 15,000 to 18,000 infections. [*Comment 2000*: Based on my experience at the University of Vienna General Hospital Department of Documentation and Research, I believe this estimate from AIDS-Help is exaggerated. Where are these additional cumulative 7,000 to 9,000 people? Certainly, they are not under medical treatment. Sooner or later, these unreported persons infected with HIV or AIDS will die. Then, because Austria has a very high autopsy rate and, therefore, one of the most accurate mortality statistics worldwide, such cases would be detected at least postmortem. But the autopsy and causes-of-death statistics give no evidence for

the alleged unreported cases of HIV infections and AIDS cases (*End of comment by M. Voracek*)

Homosexual and bisexual men were the main affected group, but recently, the number of new infections in this group has declined steadily. This can most likely be attributed to a change in behavior, based on the increased information available to the public. In the case of intravenous drug users, the number of new infections is stable. However, the number of cases of new infections by way of heterosexual sexual intercourse is rising drastically. In this trend, women are especially affected.

At the end of May 1999, the number of AIDS illnesses recorded cumulatively since 1983 was 1,905. Of this number, 1,198 had already died; 738 were homosexual or bisexual persons, 476 were drug users, 258 became ill through heterosexual contact, 281 persons became ill for other or not-known reasons: 74 hemophiliacs, 38 as a result of blood transfusions, 25 maternal transmission to children, and 15 homosexual or bisexual persons plus IV-drug users. The overall gender ratio was: men 1,547 (994 died), and women 358 (204 died).

[*Update 2002: UNAIDS Epidemiological Assessment: Testing is mandatory in all blood/plasma organ donors, as well as for prostitutes. Data on HIV are available through those screening programs. There is no national register for HIV cases.*

[Several surveys have been conducted among injection drug users and prisoners. HIV prevalence among injection drug users increased from 13% in 1986 to 27% in 1990 in Vienna. In Innsbruck, prevalence reached 44% in the time period of 1985-1990. Prevalence in prisons is estimated around 0.5% to 1.3%, 5 times higher than in the general population. UAT is not legal in Austria. Incidence of syphilis has decreased in the late 1980s to reach a stable level of 1 to 2.9 cases per 100,000.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	9,900 (rate: 0.2%)
Women ages 15-49:	2,200
Children ages 0-15:	< 100

[Less than 100 adults and children are estimated to have died of AIDS during 2001.

[No estimate is available for the number of Austrian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (*End of update by the Editors*)]

### *Treatment and Research*

HIV tests can be administered in hospitals, clinics, and numerous doctors' offices. Anonymous and free-of-charge tests can only be given at privately supported AIDS-help organizations. Treatment is possible at all university clinics and some larger hospitals. In Vienna, two wards for AIDS patients were set up, where stationary as well as day-care medical attention is possible. Extramural care causes personnel and financial problems and is largely limited to private nursing activities. However, people ill with AIDS can have the same social services, help at home, home food delivery, and so on, as others who are either ill or need care.

Since Austria has a very strict drug law, the treatment of AIDS is limited to traditional orthodox medicine and proven methods. The medical profession is generally skeptical about alternative ways of treatment; they are not financially supported and are exclusively available only through private initiative and payments.

In research, Immuno, a pharmaceutical company with laboratories in Austria, leads worldwide in the development of vaccines. The use of gene technology is followed by the public with skepticism. Militants active in animal protec-

tion are leading a vehement discussion about the experimentation with animals.

### *Prevention*

Despite legal requirements, there is no national policy regarding AIDS in Austria.

Homosexual and bisexual men were those most affected by AIDS at the beginning of the 1980s. Information and explanations were offered first by lesbian and gay organizations exclusively. In 1985, HOSI Vienna (Homosexual Initiative Vienna) played a decisive role in the founding of the Austrian AIDS Help organization, a private organization, but financed with help from the Federal Ministry for Health. Information, availability of tests, and the support of social workers lay mainly in the hands of this nongovernmental organization. In 1991, the Austria-wide organization was split into several regional AIDS Help organizations that are subsidized by the government.

In recent years, a number of other nongovernmental organizations have been established: the "Buddy" association, the Names Project, and other groups providing information. These groups have taken on different tasks, especially in prevention, education, and support services, but receive absolutely no governmental or public subsidy.

Information and educational campaigns are only offered sporadically by the health authorities. HIV/AIDS as a theme appears about every two years for a few weeks on billboards and in TV-spot announcements. Such campaigns are usually directed to the whole population ("AIDS Affects Us All") or to young people. Only in recent years has it been possible to talk about condoms publicly. Certain areas, for example, the theme of lesbians and AIDS, do not even appear in public discussions. Recommendations do exist that an educational campaign regarding information about AIDS be held at schools, but the means to carry out this campaign either do not exist, or the funding is inadequate.

With respect to behavior among young people, although less than 10% of sexually active girls and boys see a real danger of HIV infection, 28%—in rural areas as high as 40%—thought about AIDS at the time of their first sexual intercourse. For 31% of the young people, AIDS is a subject that they have never thought about; 13% are very concerned, and 39% reported that they never restricted their sexual lives because of AIDS; but, after all, more than half used a condom most of the time.

The amount of information known to homosexuals is especially high. In one study, 74% of the gays interviewed said that they had changed their sexual habits when AIDS appeared. Forty-one percent reduced the number of partners they had; 87% practiced "safer sex" from then on; 74% used condoms; 64% avoided ejaculation in the mouth of their partners; 22% gave up anal intercourse; 21% said that they now live in a monogamous partnership, and 36% are in a lasting relationship.

## *11. Sexual Dysfunctions, Counseling, and Therapies*

Traditionally, in "silent Catholic Austria," sexual dysfunctions are only treated, if at all, in the offices of urologists, gynecologists, or in the four specialized sexual counseling centers. [*Comment 2000: Andrology is emerging in Austria, as it is in other European countries, as a medical specialization dealing with male health and sexual problems. (End of comment by M. Voracek)*]

People who do not "function" sexually, or who suffer from failure anxieties, usually define themselves as ill. They are often treated as fools or insulted, and are often accused of deliberately refusing to have sex. There have been

cases of men murdering their sexual partners because they were laughed at or belittled by them.

There are hardly any statistical records on the incidence of various sexual dysfunctions. In a survey carried out in a newspaper by Senger and Hoffmann (1993), 5% of the women identified failure to experience orgasm, 8% had pain during sexual intercourse, and 15% had cessation of sexual arousal. Of the men who replied, the researchers found that 10.4% had erection disorders, 27.3% had premature ejaculation, and 4.7% stated that they did not achieve erection. The investigators ascertained that 36.2% of the men, but only 22.3% of the women who responded, said they had problems with sex.

In June 1991, a study was made by an institute that carries out empirical research (IFES, Institut für Empirische Sozialforschung) of various areas of sexuality. Altogether, 1,667 persons (800 men, 867 women) between the ages of 16 and 69 were surveyed. Of these, 591 (35%) answered that religion was of great importance to them, and 276 (17%) found absolutely no influence from religion. In response to the question of whether or not discussions about sexuality had taken place at home, 913 (55%) said "no," 427 (26%) said "yes," and 84 (5%) answered "yes, often." Sixty-seven percent of those asked lived together with their partners in one household, and 17% lived alone without partners. Questions about partners received the following answers: 68% of those who lived in separate households had sex with their partners at least once a week, compared to 56% of those who lived together; 4% had no sex (6% of those living together); 19% felt that sex was the strongest binding element to their partners (8% of those living together); 29% had already experienced "extramarital" affairs (18% of those living together); 78% were able to talk to their partners about sexual problems (69% of those living together); and 59% were very satisfied with the sex in their partnership (49% of those living together).

Since sexual dysfunctions are still primarily looked at as organic illnesses, patients go to their family doctors or specialists and are usually sent, only if the doctors are younger and informed, to specialized counseling centers, i.e., psychologists or therapists, after unsuccessful treatment with orthodox medicine. Full payment by the public health plan is only made, however, if the therapist is a doctor; if not, partial subsidy is available. In cases where clinical psychologists have contracts with the public health insurance authorities, the psychological diagnosis is financially covered.

[*Comment 2000:* The Vienna General Hospital, where the Medical Faculty of the University of Vienna is located, is the largest hospital facility in Middle Europe, with 40-some departments, institutes, and divisions, including psychoanalysis and psychotherapy. Sexual research, counseling, and treatment occur in these divisions even though there is not a distinct sex clinic as such. (*End of comment by M. Vorachek*)]

## 12. Sex Research and Advanced Professional Education

### A. Graduate Programs and Sexological Research

Only one working group exists in all of Austria for reproductive biology and sexual medicine, and that is located in the Department of Medical Biology and Human Genetics at the University of Innsbruck. There is no university chair (professorship) for sexology, sexual psychology, or sex education in Austria. The only postgraduate training for physicians is offered at the Vienna International Academy for Holistic Medicine (Wiener Internationale Akademie für

Ganzheitsmedizin), with educational programs in sexual pedagogy, counseling, and therapy.

Continuing education in various sexual therapy aspects are offered by some psychotherapeutic organizations. For this, the Austrian Professional Association of Psychotherapists has set up its own working group

Because there is no university professorship in sexology, there is no openly declared research on questions of sexuality. But, indeed, in the context of psychological, sociological, and medical institutes, sexual themes are researched. In addition, research on sexual topics is carried out in some of the 128 state-sponsored and non-university research institutes and facilities. Until now, individual research projects have been generously supported by certain government ministries, above all, the Federal Ministry for Women's Affairs, Family, and for Education.

The Austrian Society for Research in Sexology (Österreichische Gesellschaft für Sexuallforschung, ÖGS, Postfach 23, A-1013 Wien, Austria), founded in 1979 in Vienna, has been especially active since 1996, and wrote into its statutes the responsibility for the compilation and dissemination of research findings. The organization also reviews relevant drafts of laws and is politically active.

Up to now, private research work in sexology has been financed by daily or weekly publications. Sexual researchers have financed their studies partly through grants from the pharmaceutical industry, their own resources, and partly from their sponsoring media.

Since 1991, the main author of this chapter and chairperson of the Austrian Society for Research in Sexology, Dr. Rotraud A. Perner, has been conducting a three-year training program in sexual counseling and sexual pedagogy at the Vienna Academy for Holistic Medicine. This advanced education program has also been offered since 1999 at the Association for Prophylactic Health Work in Linz. The Austrian Institute for Family Research (Österreichisches Institut für Familienforschung, ÖIF) trains moderators for *Love Talks* that are given in the elementary and secondary schools. Within the framework of the Austrian Professional Association of Psychotherapists, continuing educational courses are offered for some branches of sexual phenomena, for example, sexual abuse of children and sexual dysfunctions.

### B. Sexological Organization and Publications

*Sexus*, the quarterly magazine of the Austrian Society for Research in Sexology (Österreichische Gesellschaft für Sexuallforschung, ÖGS), was first published in 1989, and began to appear with regularity in 1996.

The main sexological organizations in Austria are:

Austrian Planned Parenthood Society (Österreichisches Gesellschaft für Familienplanung, ÖGF), Bastiengasse 36-38, A-1180 Vienna, Austria.

Austrian Society for Research in Sexology (Österreichische Gesellschaft für Sexuallforschung, ÖGS), Postfach 23, A-1013 Vienna, Austria.

Austrian Institute for Family Research (Österreichisches Institut für Familienforschung, ÖIF), Gonzagagasse 19, A-1010 Vienna, Austria.

## 13. Important Ethnic and Religious Minorities

In Austria, Croats, Slovenes, Sinti, and Roma ("Gypsies") are considered minority groups. The majority of the guest workers, those who came to Austria for jobs, the second generation of whom live here, are citizens of former Yugoslavia and Turkey. Those who work without permits are mostly from Eastern Europe. Africans and African-Ameri-

cans are mostly students or United Nations employees. The largest non-Christian religious group is Islamic. Data about the sexual attitudes and behavior of these ethnic groups have not been gathered.

However, it is known that family members in the second generation of Muslim guest workers live in a cultural conflict that affects girls more than boys, although the fundamentalist movement has not been noticed in public until recently. The sexuality of girls is more intensely controlled than that of boys in Islamic families that defend themselves against assimilation. A double moral standard is evident. Female virginity plays a large role and homosexuality is a great taboo. According to social workers, the reconstruction of the hymen is carried out in operations in Viennese hospitals. Whether, and how often, female circumcision is carried out cannot be determined.

[*Comment 2000*: The Department of Gynecology and Obstetrics at the Vienna General Hospital/Medical Faculty, University of Vienna, has all patient information forms, including information on sexuality, family planning, birth control, AIDS, and homosexuality, in German, Turkish, and Serbo-Croatian. Most likely, other hospital facilities and counseling centers have similar patient information materials. (*End of comment by M. Vorachek*)]

### Conclusion

As the new millennium begins in Austria, several trends become clear. Religious and cultural minorities who have settled here lose their specific identities as the children are integrated into general Austrian cultural traditions, but parents within these minorities try to enforce their sexual norms as long as their influence is possible.

Sexual violence in the home is receiving more and more attention and is increasingly discussed in public. The activities connected to the Internet and child pornography do not go unnoticed here, and both the private associations of the Internet providers in Austria and the Federal Ministry of the Interior have provided "hotlines" so that people can report what they find or receive. Organizations have set up emergency telephone numbers for battered women and children subject to abuse, as well as for young people who have questions about sex or fear that they are pregnant. The first seminar to train professionals in crisis intervention for children, especially in cases of sexual abuse, was held on the campus of the University of Vienna in the summer of 1999, set up by a private association that works to combat abuse, and financially supported by the European Union. Even though basic sexual "morals" have not changed, the public is better informed, and much work is being done to give women and victims empowerment and the feeling of confidence so that they can speak up about problems that were, not so long ago, kept secret as if they did not exist.

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

#### A. Demographics

The State of Bahrain is an archipelago of some 33 islands, totaling 268 square miles (694 km<sup>2</sup>), located in the middle of the southern shore of the Arabian Gulf, almost halfway between Shatt Al-Arab in the north and Muscat to the south. The islands lie approximately 20 miles (32 km) from the eastern province of Saudi Arabia and 2 to 18 miles (3 to 29 km) from Qatar. Bahrain's neighbors are Saudi Arabia on the west and Qatar on the east. Bahrain has been joined by a causeway to Saudi Arabia since late 1986. This causeway has had a profound effect, and has greatly influenced certain aspects of Bahrain society. Bahrain Island, the largest in the group, is the location of the current capital city, Manama. It is approximately 30 miles (48 km) long and 10 miles (16 km) wide and is linked by causeways to the islands of Muharraq on the northeast and Sitra on the east coast. Outside the capital, the landscape is covered by fertile gardens and palm trees in the northern third, and there is the desert with the oil and gas reserves in the remainder. Most of the population lives in the northern portion, while the central desert area contains the remains of the 100,000 or more *tumuli* (ancient burial mounds) and a few towns and villages. The southern third of Bahrain Island is mainly a noninhabited restricted area. Most of the islands are now joined by causeways to the main island, except the Hawar Island group, which lies offshore.

In July 2002, Bahrain had an estimated population of 656,397, including 228,424 non-nationals. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 29.2% with 1.03 male(s) per female (sex ratio); 50.9% of the Bahraini people are under age 20; 15-64 years: 15-64 years: 67.7% with 1.43 male(s) per female; 65 years and over:

(CIA 2002)

3.1% with 1.03 male(s) per female; *Total population sex ratio:* 1.29 male(s) per 1 female

**Life Expectancy at Birth:** *Total Population:* 73.47 years; *male:* 71.05 years; *female:* 75.96 years

**Urban/Rural Distribution:** 82% to 18%

**Ethnic Distribution:** Bahraini: 63%; Asian: 19%; other Arab: 10%; Iranian: 8%

**Religious Distribution:** Shi'a Muslim: 70%; Sunni Muslim: 30%

**Birth Rate:** 19.53 births per 1,000 population

**Death Rate:** 3.95 per 1,000 population

**Infant Mortality Rate:** 19.18 deaths per 1,000 live births

**Net Migration Rate:** 1.09 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.75 children born per woman (1995 est.)

**Population Growth Rate:** 1.67%

**HIV/AIDS:** *Adult prevalence:* NA; *Persons living with HIV/AIDS:* NA; *Deaths:* NA (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 88.5% (*male:* 91.6%, *female:* 84.2%) (1995 est.); *attendance for nine years of compulsory school:* 95% (education is free and compulsory from age 6 to 15)

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$13,000 (2001 est.); *Inflation:* 1.5%; *Unemployment:* 15% (1998 est.); *Living below the poverty line:* NA

#### B. A Brief Historical Perspective

Bahrain has long been a port of call—for more than 6,000 years—and cuneiform tablets describe in ancient times the fresh water springs, the dates, and the marketplace in Bahrain, which attracted Gulf trading ships to the offshore harbor. These ancient travelers were shuttling between Mesopotamia, Bahrain, and the Indus Valley. Archeological finds have identified Bahrain as “Dilmun, the land of the living,” mentioned in the Sumerian epic, *Gilgamesh*. Other archeologists have suggested that Bahrain was the Garden of Eden. Traditionally, people were farmers, fishermen, and merchants. There were no Bedouins or semi-Bedouins living in Bahrain (Taki 1974). Since the late 19th century, the form of

\*The information in this chapter was gathered by the author and 28 Bahraini and expatriate professional colleagues. The original organization and presentation of this material was done by Julanne McCarthy.

government has been a traditional monarchy with succession passed from father to son (unlike other Gulf and Middle East countries where succession is brother to brother). Between 1861 and 1971, Bahrain was a British protectorate. There were three social classes in Bahrain until 1932—royalty, merchants, and farmers (Khuri 1980). The discovery of oil in 1932 led to many changes in traditional customs and initiated the beginning of a middle class in the society.

Bahrain saw a resurgence in its trading and commercial sector, and particularly growth in banking, during the 1970s because of the Lebanese civil war. Many institutions, with their expatriate workforce, moved to Bahrain, attracted by its tolerable social environment. There are now expatriates from over 60 countries living in Bahrain and working in various government agencies, private businesses, service institutions, and family homes. There are also tourists from the Gulf and around the world visiting Bahrain. These current commercial activities, and the past contact with traders and people from different cultures for centuries, has given Bahrain a unique cultural pattern and a cosmopolitan air. The latter has not been seen in other Gulf cities, like Dubai, until recently. The people of Bahrain and their respect for, and tolerance of, different cultural values makes Bahrain unique in many ways from its neighbors.

### 1. Basic Sexological Premises

There is a dearth of documented data regarding the nature of human sexuality in Bahrain. The data presented here are based on the few documented studies which are available. A thorough search was conducted of all the national bibliographies which have been compiled, government records, and the local print media, including newspapers, and local and regional journals in English. No one until recently conducted research in the realm of human sexuality in Bahrain; however, studies have been carried out on related areas by anthropologists, economists, doctors, nurses, psychologists, and social workers. All these data were pulled together, and with structured interview data, were used to write this basic document regarding the status of knowledge on, or related to, human sexuality in Bahrain according to the outline provided by the *Encyclopedia's* general editor. It is hoped that researchers will be stimulated to study this topic in Bahrain and to present supplementary data from Arabic sources.

There may be a logical explanation why there is a dearth of literature regarding human sexuality, as the local culture, predominantly based on Islam, holds as a core value the suppression of external manifestations of sexuality in public, i.e., one should not present oneself in a sexually provocative manner. Believers are extolled not to draw attention to the body form, therefore the men's *thobe* (long, loose shirt-like garment) and the women's *jellabiya* (long, loose dress) are the preferred clothing style for many, at home and at work (unless there are uniform or safety restrictions). However, expatriates of all nationalities comment on the sheerness of some of the men's' summer white *thobes* and how a person's underwear is sometimes visible, which appears in contradiction to the stated norm. Personal preference in dress is allowed, so expatriates and Bahrainis are seen wearing a variety of clothing styles. Suppression of sexuality is also seen in the practice of women covering their hair partially (*Muhtashima*) or fully (*Muhajiba*), and even their face partially (*Burga*) or fully (*Mutanaqiba*). The practice of veiling in public has increased during the last ten years and can be seen among young as well as elderly women. Use of makeup, nail polish, and perfumes intending to draw attention are discouraged in public. Modesty in dress extends into the home. If a woman has chosen to veil, then

even in the home she must veil in the presence of unrelated male relatives, but not in the presence of women, children, or her immediate male relatives. Covering of the body is also observed among siblings where even sisters, according to the Koran, are not to be uncovered among themselves. Among married couples, dress expectations vary and can cause some dissension. Some men state that in their own home they would like to wear shorts when it is hot, but their wives do not approve. The Koran's injunction is that for the man, the middle area from the waist to the knees not be naked. It is acceptable for men engaged in athletics to wear shorts, and for fisherman or men in certain other occupations. There is an ingrained belief in some communities, however, that older males can lose their dignity and respect if they run or jog "half naked" in the streets or public parks (Fakhro 1991, 48).

Unrelated males and females are not to touch. The strict conservative definition is that touching is a sin. Great effort is made by everyone not to touch accidentally. As a local sign of respect and to purify oneself, people may spit to the side first before potential contact. This is a local custom and not dictated in Islam. Then, in case of an accidental contact, e.g., while handing over change, the person is considered clean. Bahraini informants explained this is a traditional practice, and Catholic nuns reported being the recipients. Most expatriates have never seen or heard of this practice.

Other traditional social controls practiced include animadversion against eye contact between men and women, especially strangers. Lack of eye contact by a man to a woman is a traditional sign of respect. Likewise, a woman who is unveiled is strongly advised not to smile at strangers (men outside her own family), and men and women should keep their eyes down when walking in public. Today, these practices may or may not be followed in the workplace by people who see each other frequently, and also depending on the work situation (e.g., serving the public). However, in public places, many people follow these injunctions. More recently, Westernized good manners such as courtesy, politeness, and cordial relations with customers and coworkers have been promoted in the private schools and service-industry sector. Bahraini business leaders, through the public media and through in-house newsletters, are promoting good manners as being good for business. Total quality management concepts are being incorporated into the local businesses and society; however, some resistance is met because of traditional values, e.g., women should not smile at an unrelated man.

The general aversion of speaking about sexual matters, or even the urogenital system, extends to doctor-patient relationships. Patients are reluctant to discuss their genitalia, and doctors are reluctant to ask about the genitalia, and even omit these from a physical exam. This has resulted in junior doctors missing the correct diagnosis, and consultants later correcting the situation. As a result, there is suspected underreporting for various diagnoses, e.g., priapism in children with sickle cell disease (Al-Dabbous 1991). This same reluctance has influenced studies regarding menopause in women that concentrate on osteoporosis and rarely mention psychosexual symptoms (Sadat-Ali et al. 1993).

### A. The Character of Gender Roles

Gender roles in Bahrain show a variety of manifestations and reflect the person's educational level, socioeconomic level, religious sect, urban or village background, and the degree of contact with local expatriates, as well as travel, study, or work abroad. In Islam, women have the freedom to be a traditional mother or to work (Kahtanie 1992, 6). Women have had opportunities to expand their roles from their tradi-

tional roles in Bahrain during the last 30 years. Great strides have been made by many women in the fields of education, medicine, nursing, other health-related professions, finance, clerical work, computers, light manufacturing, banking, and veterinary science, for example. These women in successful jobs are having an effect on the characteristics of gender roles in Bahrain. A comparison between the past and today reveals the significant changes which have occurred, and some of the driving forces which have helped women to achieve higher economic status in Bahrain.

The traditional lifestyle of a Bahraini Shi'a village woman in 1960 was described by Hansen (1967). The Bahraini village lifestyle was similar to that described in Oman in 1974-1976 (Wikan 1982), however, with a few differences, i.e., the wives of Bahraini fisherman and farmers worked outside the home. The fisherman's wife helped to clean and sell fish, while the latter helped their husbands in the fields and in marketing (Rumaihi 1976, 153). In contrast, women living in the towns and cities were exposed to very different circumstances as they were restricted to running their household and to childrearing. As a result, they developed very different lifestyles and gender roles. Among the wealthy, the epitome of status was to have nothing to do all day and to have all work done by servants (Waly 1992).

During the latter part of the 1890s, an agent of change in the status of women was the arrival of the American missionaries sponsored by the Dutch Reformed Church of New Brunswick, New Jersey. The group established, in stages, informal classes in Arabic for boys and girls, then separate classes, and later formal classes, all held in Arabic. Families of various ethnic and religious groups in Manama sent their children to classes for free, and later for a fee. There were complaints from conservative men regarding education for women; however, some girls had been taught in Koran schools (*al mutawa*) prior to this time. The American Mission School, now Al Rajah School, had its first university graduate, a licensed teacher, as school mistress for girls in 1919 (Anthony 1984, 231). The first secular boys school, Al-Hadaya Al-Khalifiya, was opened in 1919. The first secular girls school, Al-Khadija Al-Kubra, was established in 1928, and again there were complaints from conservative males (Belgrave 1956, 94). The Government, in spite of such protests, allowed female education to continue. The Government schools have always been separate but equal for the sexes, and reportedly they follow the same curriculum and use the same textbooks. The complete history of women's secular education has been reported by Duwaigher (1964).

The early expatriate female teachers, Americans, Egyptians, and Lebanese, became role models for women in terms of possible educational achievements and different clothing fashions. As girls' schools became more prevalent, women were needed as teachers, and in the 1950s, the first Bahraini women traveled to Cairo and Beirut to study. Opportunities in the field of education working as teachers and principals were the first professional roles for women. The Government did not promote women studying abroad, but neither did it prohibit them.

A hospital-based nursing school was established in 1959, and in 1961, two male nurses were sent to London for further study. In 1976, the College of Health Science was opened and there were opportunities for women and men in nursing, and later, in other health-related fields. Women continued to travel abroad for their medical studies to Jordan, Beirut, and Egypt, and they now hold positions as heads of departments, deans, and professors. There were never any Bahrain Government restrictions prohibiting women from traveling abroad for study, even when alone. In other Gulf countries, there are now restrictions on women traveling abroad alone.

Of course, family restrictions and concerns determined, then and now, if a woman could travel abroad alone or accompanied. Women who are professionals now, when interviewed, said they knew of Bahraini women who had college degrees (their teachers or relatives), and some who had traveled abroad (doctors, teachers, or relatives), and they were their role models. When they were young, these women hoped that if they had good grades in school, then they also would have these opportunities. Of course, men always had these opportunities and were sponsored by their families or the Government.

Another important force for change was the discovery of oil in Bahrain and the operation of the Bahrain Petroleum Company (BAPCO) refinery under the auspices of Standard Oil of California and Texaco (Caltex). An influx of expatriate workers from the UK, New Zealand, U.S.A., and elsewhere moved to Bahrain and lived in the oil town of Awali. Many Bahraini men obtained training and jobs at the refinery. Some Bahraini women worked in the homes of these expatriates, while men obtained jobs as drivers. Women for the first time now had their own money and became more active in the economic system (Taki 1974). There had always been merchants in the cities in Manama and Muharraq, but now more of the economy was based on cash wages, and the refinery as a major employer contributed to the development of a new middle class (Khuri 1980). By 1995, 18.4% of Bahraini women and 55.2% of expatriate women were working.

Today many females are attending school, which is still noncompulsory. In the past, there was a gender gap; however, now, a higher percentage of girls than boys attend (Baby 1996b). Some girls still receive schooling only at home because of strict family values. Government standardized exam results show that females receive a disproportionate share of the high and excellent grades over their male counterparts. This trend has been seen for the last 40 years (Belgrave 1960, 96). These educational trends have implications for women in terms of admission and access to scholarships to Bahrain University, where in the summer semester of 1996, 52% of the new students were women (Ahmed 1996). Women have long been the majority at the university. Women with high grades are also meeting the criteria for admission to the Arabian Gulf Medical College and the College of Health Science. According to local bank managers who give applicants exams, women score higher than men, and many clerical and teller jobs have been given to women, some of whom have worked up to the position of bank branch managers and executive officers (Moore 1996). These women who have done well and obtained good jobs now have assumed some different roles in society, i.e., they may be supporting their elderly parents partially or fully; they may be making more money than their husbands who may have their *Tawwehi* (high school diploma) or less. Also, they may be more desirable to some men who want or need a partner who can help support the family and make possible extras, such as travel and private schooling for their children.

Anyone watching the Bahrain Government television channels sees what appears to be a male-dominated culture; and in the political sphere, this view reflects reality, as there are no women in the Government at the level of Undersecretary or above. There are, however, 11 Director (head of Directorate) positions now held by women (Noor 1996). Since the recent 1996 government changes, women holding government positions are less frequently seen on television as keynote speakers. This is the public "persona" of the culture. There is a wide divergence among intellectuals regarding how much power and opportunity are available to Bahraini women in reality.

One school of thought suggests that throughout a history of 6,000 years, women have held more power, authority, and responsibility in Bahrain than in other Gulf countries. Ebtihage Al-A'Ali (1991) states that since Dilmun times, men and women in Bahrain have held complementary positions, not competing positions. There was a Dilmun god of the sea, and a goddess of the land. When pearling was a major source of income, men went off in their boats for months at a time while their wives held their families together on shore (Noor 1996). Some wives even worked outside the home to supplement their husband's income. The author states that there is nothing in the Koran prohibiting women from working, only local traditions that have developed. Ms. Al-A'Ali suggests that when Western companies became active in Bahrain after 1930, the reason they did not employ women was because of their cultural values and notions of men being dominating versus complementary. She posits that these formal organizations in Bahrain are based on imported models and thought. She concluded her report stating that one of the unique attributes of Bahraini society is that its island traditions do not restrict the employment of women in top management positions. Her thesis is supported by recent newspaper articles highlighting women who have achieved top positions in private banks and government sector businesses, such as petroleum engineering, and even as Directors in the Government (Moore 1996; Noor 1996).

A completely contrasting view regarding gender roles in Bahrain is presented by Farouq Amin (1982). He notes Bahrain was the first Gulf state to have education for women (1928), and female social organizations, e.g., Bahrain Young Ladies Association (1965). However, Farouq Amin also cites values hurting working women. Employers are reluctant to hire women because of their high fertility rates (the average family size in 1983 was 7.9). Many husbands are not in favor of their wives working, so women quit after marriage. Women are responsible for child care. Twenty percent of rural women are not allowed to study in school. Women have the right to refuse a mate suggested by their family, but not the right to choose. The opening of Bahrain University meant it was no longer necessary to send women abroad for study. The Government is not actively helping women through its policy on sex segregation in the schools, and by its policy of providing women study opportunities mainly in socially acceptable jobs, such as teaching, nursing, and secretarial work. In the 1980s, neither government job bonuses nor housing benefits were given to women. In conclusion, Amin (1982) notes that a value on masculinity, based on religious and traditional values, precludes a large number of women from continuing their study, working outside the home, and even choosing their own spouse.

A second pessimistic view of gender roles is presented by Al-Sharyan who states that the division of labor in Bahrain is not just an economic division, but also reflects lifestyle, prestige, and social honor. Also he states that the labor market is made up predominantly of culturally disadvantaged categories, i.e., nondominant women and immigrants (1987, 353). Exploitation and sexual inequality have neither been reduced nor eliminated. Women did not demand more rights or could not, so, in order to establish wider access to resources, they tended to act so as to reinforce traditional social norms and values (1987, 344). Women concentrated in particular specialties and are thus confined to a fairly narrow range of jobs within the occupational structure. As a result, there is a rigid differentiation in the labor market along sexual lines based on the patriarchal characteristics of the society which are now consolidated (1987, 350). This is reflected in women being the leaders of organizations for the blind, deaf, handicapped, and nursing.

Gender roles in Bahrain probably fall in between the two extremes presented by the above studies. A Bahraini economist listed the five social ills which he felt most confined women to an inferior status in Arab society, i.e., the chastity requirement, early marriage, the dowry, polygamy, and divorce (Taki 1974, 11). Changes are slowly being seen in two of these practices, e.g., early marriage and the dowry. Another practice which prohibited women's development is veiling, which excludes women from many fields of activity (Boserup 1970, 127). Some women have made it to top positions in spite of these "social ills," and 18.4% of Bahraini women are working and 55.2% of non-Bahraini women are working. No studies have been done on working women regarding marital status and number of children; what sacrifices were made by them; and, if they are married, whether there is any correlation with their husbands' education level. Is there a "glass ceiling" in the Government, withholding jobs from women above the level of Director? What role does a girl's self-confidence play in pursuit of education, type of spouse, work opportunity after marriage, and family planning? What are the long-term implications of higher school grades of women, and their academic achievements at the college level in terms of their choices of marital partners, marital relations, the stability of their marriage, and the effect of their education on the educational success of their children? Who is the breadwinner and who is the boss? Further studies in these areas would be very informative for government planners and policymakers.

## **B. Sociolegal Status of Males and Females, Children and Adults**

The sociological status of males and females as children, adolescents, and adults are clearly defined in the Koran and interpreted by the Bahrain legal system, which is based on a combination of Sharia law and British jurisprudence which are expressed through codes (Ziskind 1990, 41). All births are recorded and rights are granted according to the nationality of the father. Everyone in the country has access to free medical care after their birth, including expatriates. Bahraini women can sign their own operation permits in hospitals or use their thumb prints; however, because of local tradition, the husband, or even other relatives, tend to sign permits. This practice is perpetuated by medical staff who ignore or who are unfamiliar with patients' rights. This practice has also been witnessed in Saudi Arabia (Abu-Aisha 1985). Hospitals in Bahrain do not have statements regarding patients' rights and responsibilities.

All local children can have a place in the Government schools. Education is free for all Bahrainis, and a place in the Government schools is provided for all who register. Girls have access to all areas, including religious studies and technical education. Expatriate parents send their children to various private schools, which are based on various preferences: ethnic (French School, Indian, Pakistani, Japanese, or Filipino), religious (St. Christopher's School—Anglican and Sacred Heart—Roman Catholic), or socioeconomic (Bahrain School, Al Hekma). Bahrainis who pass the entrance exam are entitled to attend Bahrain University and scholarships are available. The majority of students to date have been women, and more are of the Shi'ite sect.

Previously, during the 1960s, the Government made efforts to promote full employment for qualified male adults in companies such as BAPCO, the Defense Force, and other government ministries, and companies. However, now this is not economically feasible, so there is much competition for government and nongovernment jobs. Also the World Bank and other financial organizations are stressing the need for less government control and more free-market eco-

conomic activity in the country. As a result, unemployment is becoming a national concern. How this will affect women's work opportunities is not known. All workers are protected by various work laws, and due-process rules for firing workers are enforced.

Men and women can own property inherited from their parents based on the rules of Islam for the distribution of property; however, this differs according to Sunni or Shi'ite affiliation. Women keep their family name after marriage and all their property remains in their names, without becoming joint property or being held in their husband's name (Badawi 1980, 23). Women in Bahrain own many small businesses, shops, boutiques, and compounds of rental villas. All marriages and divorces are registered in the Court to ensure people are legally protected. Family disputes over property can be brought to the Courts for adjudication.

Bahrain had a "Special Treaty Relationship" with the United Kingdom until 1971. Now the political system of the country is a traditional monarchy under an Amir. All officials are appointed and there has been no suffrage for anyone since 1975 when the parliament was dissolved (Curtis 1977). Formerly, there were elections for municipal councils and women and men both had the right to vote. The one Constituent Assembly election held in 1972 allowed only men to vote and there have been no subsequent elections.

Individuals, who violate the laws of the State or strictures regarding certain behaviors, are brought before the various Courts, and fined or confined. Even expatriates appear before the Bahrain Courts, which are held in Arabic, for traffic violations, medical negligence lawsuits, drug trafficking, theft, and visa violations. Other minor violations, including being seen eating during the daylight hours of Ramadan, may result in fines for expatriates and tourists. During Ramadan, the media informs residents and visitors of all restrictions.

There are certain individuals whose legal rights are not clearly defined because of their unclear birth status. These are the foundlings (*laqeeet*) who have been abandoned, and whose family and nationality is unknown. They are basically homeless and have no papers. Between the early 1920s and the 1950s, the American Mission Hospital had an affiliated orphanage and school for these children. Later, during the 1950s and 1960s, the Government hospital was their legal residence until a job was found for them. Since the 1970s, they have been cared for in the Children's Home in Gudhaibia, which provides for these children with the help of volunteers.

Life is not easy for these individuals. The foundlings are taken care of and have access to free healthcare and education; however, they have no documents and this prohibits them from obtaining any passport, owning property, procuring government employment, and other social benefits. The female foundlings are easily placed in permanent foster homes of Muslim Bahrainis, as under Islam they are not considered adoptable in the full Western sense. The females fare better and generally marry, and can inherit special gifts if any are willed to them. The males are not placeable in foster homes as they are not related to the women in the family, so rules of seclusion and veiling restrict placement. The males spend their lives in government institutions. They cannot be raised by non-Muslim Bahrainis.

### *Voting Rights for Islamic Women*

[Update 2002: In February 2002, in a pioneering move for the Islamic nations, Bahrain's King Hamad bin Isa al-Khalifa announced a new constitution that gave women the right to vote and run for office. In May, Bahraini women participated both as voters and candidates for office for the

first time in a national election. Although many voters judged the women candidates more qualified than some male candidates, women voters, especially among the poor, tended to follow their husband's view and vote for male candidates. The results were overwhelmingly in favor of traditional religious parties, with all 31 women running in a field of more than 300 candidates losing their bid for office. One woman candidate sought a *fatwa*, a religious ruling, from Sheik Yusuf al-Qaradawi, an influential Muslim scholar who appears on *Al Jazeera*, the Arab satellite television network. Women could run for office, he said, especially after they were past their childrearing years and their wisdom could be applied outside the home, just as long as everybody avoided looking at each other unnecessarily at council meetings. The Koran only forbade a woman from running an entire nation.

[Political analysts in Bahrain, both male and female, agreed that the failure of the women to win any seats was due more to the lack of organization in their campaigns than to cultural reasons. Also, the Islamic religious parties ran a single candidate in each district while two or more women ended up splitting the vote in some districts. Women candidates quickly discovered not only the opposition of the conservative religious leaders, but also the difficulty of meeting voters and presenting their case in a society that segregates men and women in most aspects of daily life. Some women candidates were quite creative in meeting the new challenges of running for office. One woman carried a Koran and a Bible with her in all her campaign stops. When a woman promised to vote for her, she made her swear on the appropriate holy text. Later, when the voter's husband tried to make the wife vote for a male candidate, she could say she had made a holy oath and had to keep it (MacFarquhar 2002). (End of update by the R. T. Francoeur)]

### **C. General Concepts and Constructs of Sexuality and Love**

Sexual suppression, except in a heterosexual marriage, is the expected norm in Bahraini culture. Within a legal marriage, the sexual relationship of the couple is between the husband and wife, and based on their religious beliefs and personal preferences.

Cleanliness is associated with sexuality. A person should be clean and attractive before and after engaging in sexual activity. Cleanliness may include removal of part or all body hair for women, and some or all hair for men also. Activities before sex include at least partial bathing, if not full bathing; use of attractive incense or perfumes; makeup for women depending on the couple's choice; and attractive lingerie, depending on personal choice and economic status. Some women attend exercise classes to tone up their bodies, however this is not the norm, and obesity among men and women is a problem in the Gulf (Bin Hamad et al. 1991). Some couples may disrobe while others remain covered or partially covered during sexual activities. There have been no studies on practices related to sexuality in the home or bedroom. After sexual intercourse, all Muslims are expected to wash, and for the woman to wash completely, including her hair. If a woman arrives at a party with wet hair, then jokes may be made about her possibly preceding sexual activities.

Women who smoke are considered to be sexy by young men according to informants. Traditionally, some Bahraini women smoked the hubbly-bubbly (*Al-gadow*) at home, at the village springs, and at parties when offered (Hansen 1967, 89). Bahraini women do not smoke cigarettes openly at work (unlike some expatriates), and are only occasionally seen smoking in their cars or at restaurants. Recently, security guards have noted that a few teenage girls and younger

women have been noted to have cigarettes in their purses. The prevalence of smoking among working women in Bahrain is estimated to be 20% based on the one study published (Al-Khateeb 1986). Women have a meeting house in Adliya where they can go to socialize and smoke. Middle Eastern women in countries other than the Gulf area, such as Jordan, Egypt, and Turkey smoke openly; however, this is not a local custom. There have been no studies published in Bahrain regarding why women smoke; however, a study in Saudi Arabia (AlFaris et al. 1995) stated that relief of stress was the most commonly admitted reason for smoking (48.9%), followed by no reason (28.5%), and imitation (12.2%).

Children are important in an Arab family. The traditional wedding wish says "from the woman children, from the man money." All men desire a boy to retain their name, and a woman will continue getting pregnant until she has a son to please her husband, and herself. After the birth of the first child, the father and mother relinquish their name to that child, until there is a male child. They are called the "father of" *Abu* . . . and the "mother of" *Um* . . . (Curtis 1977, 55). This practice reinforces the importance of children in the society and is not meant to denigrate or detract from a woman or man's status. If a couple has difficulty conceiving, there are two in-vitro fertilization (IVF) units in the country.

The Western concept of love is used by few members of Bahraini society to describe their feelings for their spouse. Parents will clearly state they love their children and their parents and have a duty towards them. An individual's relationship, in certain cases, may be closer with their parents, siblings, and children than with their spouse; this depends on the type of marriage they entered into.

The nature of family relationships has been reported in a thesis by Kahtanie (1992) who asked married Bahraini couples about their coping strategies when facing life strains in marital and parental roles. Twenty-five married couples attending a Health Center participated. The researcher noted that marriages in Bahrain are based on mutual understanding, but conflicts and frustration can occur when confronting stress. Participants described the parental role as one of the most important roles in Bahrain (Kahtanie 1992, 1). The participants, however, were not eager to share their coping mechanisms. Eighty percent said they would rely on God. Traditionally, a couple's support system included parents, grandparents, and/or a neighbor; however, now only 84% said they would ask these people for assistance. The remainder said they would handle the problems themselves. Twenty percent said the doctor was of no help. The chief causes of marital stress included nonacceptance by spouse, non-reciprocity and lack of give-and-take in the relationship, and role frustration (Kahtanie 1992, 23). Forty percent of the men said their wife was not a good sexual partner. Most of the couples adjusted to their lives by doing things to avoid differences, solving differences between them by yelling, shouting, and keeping out of the other's way. Their coping responses included not telling anyone of their problems, because Bahrain is small and information can spread. Other coping mechanisms included controlled reflection versus emotional disharmony; comparison to other marriages; passive forbearance versus self-assertion, and selective ignoring. Sixty percent of the participants said they keep most of their feelings to themselves (Kahtanie 1992, 46).

The implications of this forbearance, ignoring, and internalization are mentioned by Kahtanie in conjunction with Chaleby's 1987 study on how unhappy marriages are reflected in various psychosomatic disorders seen, especially among women in Saudi Arabia. These women reported that incompatibility in intimacy and socializing, not meeting their husband before marriage, and polygamy lead

to stress, which was expressed as complaints of backache, headache, pain syndromes, or other symptoms suggesting underlying anxiety (Chaleby 1987).

An interesting trend detected by Kahtanie was that the higher the education of the woman, the less she was able to cope with problems in the marriage (1992, 36). Avoidance coping mechanisms elicited by Kahtanie are reflected in other aspects of family life or work, e.g., people say "it's not like we were prevented, we just did not ask or raise this issue." Personal adjustment and avoidance of confrontation is a core value in Bahraini society. This value is seen in other island cultures around the world (Hall 1996) and has implications for how change is introduced or not introduced into a society.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Religious Values (*Din*)

The predominant religion in Bahrain is Islam, which is also the state religion. This has implications on all aspects of daily life and sexuality, as there is no separation of church and state, religion and daily life. Religious affiliation is the most important single attribute determining an individual's social status in Bahraini society (Al-Sharyan 1987, 345). Religion continues as an all-encompassing pervasive guide which directs and divides up the hours of each day. Bahrainis are members of either the Sunni or Shi'ite sects of Islam, 30% and 70%, respectively. The ruling family belongs to the Sunni sect. Many expatriates living in Bahrain are non-Muslim and are free to practice their respective religions openly and at their own places of worship, such as churches (Anglican, Roman Catholic), chapels (Interdenominational, Dutch Reformed-USA), and other places of public worship (e.g., Hindu temple). Other groups meet in homes or apartments (Mormons, a few local Jewish families) for prayer. Expatriate groups retain their own cultural values and language and generally socialize among themselves. There are many ethnic, cultural, and social clubs that advertise their activities which anyone can attend. The interaction of all these expatriates among their own groups and with Bahrainis will be developed further in this report with regard to aspects of human sexuality.

During the Friday noontime service in the mosque, the imams teach their congregation the religious point of view regarding all aspects of their life. At the time of the night prayer, special lecture activities are scheduled. There are special religious booklets, e.g.: *Al-moamalal Al-islamiyah* (about banking, charity, selling, and buying) and *Al-Ebadat* (praying, social conduct, *Haj*, and fasting), available to guide people in their lives according to the Prophet's teachings. Non-Muslim expatriates are expected to respect the religion and customs of the country. There are three major illicit acts in Islam: fornication, alcohol consumption, and eating pork. According to Islam, sexual matters are private matters and sexual behaviors are appropriate only between married heterosexuals.

Islamic law requires people to be modest in their dress and the body must be covered in public. For a man, this includes the part from his hips to his knees, while for a woman this comprises all her body from the top of the head to the ankles, excluding the face, hands, and feet. Expatriate women are not required to be covered completely in Bahrain, unlike Saudi Arabia; however, they are expected to dress modestly in public.

While the practice of veiling exists in Bahrain, the percentage of women wearing a veil has varied through the years, depending on rural or urban habitation and social

class. Veiling practices posed a difficulty to the early American Mission doctors who were all men, and it was not until the 1930s that there was a female doctor, and then only for two weeks a year. In spite of this, one quarter of the operations at that time were on women, and in increasing numbers, Bahraini women gradually attended the mission hospital and were seen by male doctors (The American Mission Hospital 1933-1934, 7). In the early days, a hole was made in the veil and the specific area of the mouth, face, or body was exposed. Today, some women or their husbands still request that the woman be seen only by a female doctor; however, this is not always possible. Now more and more families choose to pay and attend the clinic of the "best" doctor in their speciality regardless of gender.

The superego, according to psychoanalytic theory, is the portion of the personality associated with ethics, self-criticism, and the moral standard of the community. Two psychiatrists in Saudi Arabia describe Arab culture, particularly in the [Arab] peninsula, as characterized by a deeply rooted set of moral codes, social values, customs, and rituals of behavior. The collective attitude toward such conventions is rather strict and inflexible (Al-Khani & Arafa 1990).

The traditional extended family (*atlab*), which has an authoritarian and hierarchical structure, has the main role in transmitting values and securing conformity, and is the basic and most influential social system. Al-Khani and Arafa state that this practice leads to the development of a superego developmental system that is characterized by the cultivation of shame (*Ayeb*) rather than guilt, and the enhancement of conformity and fear of other's criticism rather than individualism and self-criticism. A consequence in Saudi Arabia is seen in the number of patients, markedly males, who comprise 97.2% of clients who see a psychiatrist for the treatment of social phobias. These statistics reflect a cultural attitude that discourages females from seeking psychiatric care.

The study of superego development in Saudi Arabia and the concept of shame (*Ayeb*) needs to be considered as a possible explanation for some of the differences seen among Bahrainis in the practice of their stated religious beliefs. Followers of any religion vary from true and fervent believers who practice all aspects of their faith to those who follow certain aspects and disregard others. Situational ethics is a term used in the West to describe why the degree of compliance to religious rules is not always 100%, and how people justify their daily practice based on the situations encountered and what is/was the higher right. This term is not commonly used in relation to Islam; however, this report will show that men and women and/or their families decide what religious practices relating to human sexuality they will follow in their personal lives all the time, or some of the time, or which rules they will ignore completely depending on the social situation. Traditional cultural values, such as shame (*Ayeb*), at times, may supersede the higher religious ideals. Also according to Al-Sharyan, Eastern loyalty remains fixed and strong toward familial and tribal values whatever the influence of modernization (1987, 342).

Bahrainis respond to differences in people's adherence to religious values in a mature way, i.e., people know when they should pray—Shi'ite three times a day and Sunni five times a day. The call to prayer from numerous minarets announces prayer time. People are not forced out of stores and restaurants during the "exact" prayer time. Although the Government television channels announce prayer times, programs are not discontinued for 15 to 20 minutes as in Saudi Arabia. The attitude in Bahrain is that mature people and true believers know what they should do without coercion.

Islam condones sexual activity in marital heterosexual relationships (Fakhro 1991). Homosexuality is forbidden

(*haraam*). There is no enforced Bahrain state law prohibiting this practice which does exist. Anal sex is *haraam* ("the sky shakes when doing it"); however, it is practiced between men and women, and men and men. Although prostitution is discouraged in the Koran, it is legal in Bahrain. There were early attempts to regulate it by Court decree (1937). Child abuse, including sexual abuse and incest cases, are seen by health-care workers in Bahrain. Divorce is looked upon with strong disfavor by the Prophet; however, divorce rates are increasing to the detriment of children and the elderly. Islam is vehemently against drinking alcohol, and prohibits the use for pleasure of any drug that can harm the intellect or the body, including tobacco (Fakhro 1991). However, all the above practices are prevalent in Bahrain society to the detriment of health promotion programs in the society. As mentioned, while religious teachings expound ideal values, humans cannot always reach the ideal. This report will present some of the ideals and rules regarding aspects of human sexuality, and the current gaps seen between the ideal and reality.

## B. Ethnic Values

There are more than 60 nationalities represented among expatriates living in Bahrain, and they comprise about one third of the total population. Most of these individuals do not have the option of ever becoming a Bahraini citizen, unless they marry a Bahraini, perform in a special job category, or meet other stringent qualifications, such as religious or five-year residency status. As a result, most expatriates make no effort to become assimilated into the local culture. Some learn Arabic out of necessity because of their job; however, most join social organizations and clubs where they can meet their own compatriots. All these expatriate groups have brought their various religious, moral, and social values with them, and these are reflected in the variety of dress styles seen (sari, sleeveless blouses, tight pants, no bras, miniskirts, and jogging shorts) which are seen on the local streets and in shops. Likewise, attitudes towards alcohol use, pornography, prostitution, and unmarried and extramarital relationships vary from group to group and individual to individual. Concepts regarding degrees of nudity vary greatly, and differences among expatriates are reflected where they take their children swimming. There is one private beach attended only by expatriates wearing bikinis and bikini briefs (women and men). Also at this beach, women are seen topless at times when they are changing their clothes. Because of the nudity, some Westerners do not take their children to this beach and limit their outings only to clubs or their residential compound pools.

The age distributions in the Bahraini and expatriate populations are significantly different, with 52.9% of the expatriates being between age 20 and 49 while only 43.6% of the locals are in that age group. Most expatriates are between the ages of 20 and 49 because they are brought in to supplement the local workforce. Expatriates comprise a significant proportion of the workforce, approximately 33%, and, it should be noted, they are living in Bahrain during their most sexually active years. The largest group of expatriates is from South Asia, with approximately 120,000 from India, Pakistan, Bangladesh, and Sri Lanka. Another large group are the Filipinos, comprising more than 16,000 workers.

Bahrainis are very tolerant of the expatriates and their different lifestyles. No restrictive dress codes have been passed; no religious police (*Muttawa*) censure people verbally or physically. People are arrested only for blatant, public violations of the Ramadan fast during daylight hours. Bahrainis must be credited for their highly hospitable culture and tolerance of people from different cultures and religions. Occasionally, situations arise because of the dichotomy of values,

particularly regarding dress codes, which are a very obvious difference. Personal or public conflicts sometimes result which require resolution. Bahraini children are taught from a very young age that modesty and covering of the body is proper. Occasionally, a child may experience confusion when their first teacher is wearing a sari and the abdomen and arms are exposed, as well as her hair. Children report feeling uncomfortable at school during their first days because of the "embarrassment" that they feel seeing the teacher's abdomen. Parents explain about differences in national dress and these issues are resolved. More-public conflicts occur, but rarely, such as that seen in 1994 when mainly male and female expatriate runners in a competition jogged through some conservative villages wearing tank tops and jogging shorts. The local media later reported some stones were thrown at the runners. Such events subsequently have been routed through mainly desert areas away from the villages.

Ethnic attitudes towards other aspects of sexuality, such as prostitution, vary widely. In some cultures, such as Thailand, women know and accept that their husbands frequent prostitutes, while the Filipinos are mainly Catholic and such activity is considered a mortal sin. In spite of this prohibition, the Filipinos in Bahrain are attracted to the money available through prostitution and have the reputation of being one of the ethnic groups active in this practice.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs for Sex Education

There is a national curriculum which is taught in the boys and girls schools using the same textbook. The course content offered to intermediate school students is not labeled as sex education. An introduction to human anatomy and physiology is taught to students around the ages of 10 to 12, depending on a student's school entry age. This basic course is purely an anatomy and physiology approach to sexuality, and male and female informants said they learned about eggs, sperm, menstruation, etc. Family planning is now also covered in this course. There is no discussion of personal relationships or human sexuality, as this is considered *haraam*. There is little discussion of sexually transmitted diseases (STDs) as the emphasis is on normal anatomy and physiology. Some informants report that they did understand what their teacher said, so that when they started menarche, they already understood what was happening to their bodies; however, one woman reported that when she started menstruating, she was afraid she had hurt herself and cried, then told her mother. Another informant mentioned that the intermediate-level course was not enough. "She did not know how babies got out of the body, maybe through the rectum?" In her case, she did not understand about the birth process until she took another course in college. At the Tawyehi level (grades 10 to 12), further anatomy and physiology courses are taught only to those in the science stream or curriculum. Students in the arts or commercial streams have no further courses. There have been no studies reported on the effectiveness of these general intermediate-level courses, or senior school science courses, or the extent of knowledge or accuracy of knowledge among students or Tawyehi graduates.

Graduates from the College of Health Science reported that there were classes where students had to present topics and discuss material relating to the genitourinary system. The females said they were very embarrassed in the coed class, and were sweating; however, the subject was taught as scheduled. Everyone felt more comfortable with the other subjects in the curriculum.

An expatriate physician in 1987 wrote the only article regarding the sexual responsibilities of physicians seen to date in the national medical journals (Gravesen 1987). Other physicians have written on related topics, such as reproductive fertility (Rajab 1984), and urogenital problems of the elderly (E. Amin 1984). In general, the term human sexuality is simply not used.

There have been no studies published in Bahrain regarding the knowledge of women about the climacteric (menopause), and the physical changes they can expect, nor its effect on their libido. Two hospitals have started menopausal clinics to meet the needs of older women, and there have been a number of articles in the general press about the advances made in hormone replacement therapy. There are also no data available regarding women's knowledge regarding mammogram screening, pelvic screening for cancer, osteoporosis, or other preventive measures which are needed and available. Only recently have physicians in Gulf countries reported psychosocial symptoms related to menopause, in Kuwait (Al-Qattan & Omu 1996) and in Saudi Arabia (Sadat-Ali 1993). Reportedly, there is a reluctance among physicians to study osteoporosis in this age group, which showed a high incidence of the disease in the pilot study (Sadat-Ali 1993), or other related topics. The general opinion expressed by female informants is that a lot of older women "suffer at home when going through the change."

Regarding human sexuality courses for the general public, there are lectures offered at the Primary Health Centers regarding pregnancy care and delivery; however, there are no lectures addressing issues associated with "human sexuality." The Bahrain Family Planning Association (B.F.P.A.) also offers lectures; videos and booklets about family planning are available from their library.

#### B. Informal Sex Education

Informants mentioned a variety of informal sources for their early sex education, as most said parental instruction was rare and consisted of "don't touch it" or "don't let anyone touch." Regarding parental instruction, the range of responses included those who said, "I could never talk to my mother/father about that," "She/he did not encourage us to ask," "Mother didn't tell," and "We didn't ask mother," to those whose parents were supportive and "explained when asked," to parents who approached them first and "gave them books to read," and/or "explained everything to them." Some girls were told riding bikes and horses could be harmful, so they should be careful. All informants, men and women, said they discussed sex-related topics with their friends; some did or did not discuss such sex-related matters with their older or younger siblings. All informants likewise said that the media had an influence on their knowledge, including movies (Indian, Arabic, Western), music (Arabic, Western), and books and magazines. Some mentioned how their friends or co-workers, at the time of their engagement, gave them graphic information on "what to do" and "how to do it."

Human sexuality teaching to hospital patients can only be confirmed for cardiac patients attending the Shaikh Mohammed Bin Khalifa Bin Salman Al Khalifa Cardiac Center, as their patient-teaching booklet (in Arabic and English) covers all aspects of sexual behavior after heart attacks and surgery. Urologists and obstetric/gynecology staff discuss human sexuality topics with their patients; however, they have no teaching booklets for them.

### 4. Autoerotic Behaviors and Patterns

#### A. Children and Adolescents

Infibulation, clitoridectomies, and other forms of female genital mutilation have never been performed on Bahraini

females. The practice is not seen in the entire Gulf region and Hicks (1993) clearly mentions this distinction. It was practiced in the Saudi Arabian peninsula in Yemen (Muhsen & Crofts 1991). Some expatriate Muslim children and women born elsewhere, e.g., in the Sudan or Egypt, who have been circumcised, are seen in Bahrain's medical facilities. It was only in July 1996 that Egypt banned circumcision of girls in all state medical facilities ("Girl Circumcision Ban," 1996); however barbers and doctors are still performing the procedure and girls are hemorrhaging to death in Egypt.

Informants report that Bahraini children around the ages of 2.5 and 3 begin to touch themselves in the genital region like children around the world. As soon as relatives see this activity beginning, the child is taught this is not socially acceptable, and every time the behavior is seen, the child is admonished verbally not to do it (physical punishment is not used). Bahraini children do not walk around naked and always have clothes on.

All the female informants report that their mothers from a very early age taught them how to sit with their legs together, to sit carefully and to ensure they are covered properly, and how not to sit (not to squat, and "not to let anything show"). Some report that they were taught how to wash their genitals in a proper way, and now they are teaching or taught it to their female children, e.g., with a closed finger and thumb position, and not with their fingers reaching and feeling. The prevalence of this particular washing method is not known. When girls reach the age of 10 to 12, their general play activities become restricted, and all reported their mothers told them their bodies would be changing and that they needed to behave in a careful manner. The concept of virginity and being careful with sharp objects was instilled in them. The incidence or types of autoerotic behaviors in this age group have not been studied.

## B. Adults

Adult autoerotic behaviors have not been studied in Bahrain. A study was conducted in a conservative region of Saudi Arabia regarding women and breast self-exams (BSE). Half of the women attending a clinic had information about BSE; however, 12.1% said they did not think they should touch their breast, and 9.0% said it was embarrassing for them to do BSE (Akter et al. 1995). No studies have reported on whether men conduct regular self-exams for testicular cancer or have annual prostate exams. Annual prostate screening is not promoted, and rectal exams are done only upon patient request in many cases. These exams may be deleted because of the sexual overtones and the staff feeling uncomfortable conducting them. Further research on preventive health screening and cultural prohibitions would be informative.

Pornography is prohibited by law; however, its definition is not clear. Magazines are seen in the country (e.g., *Playboy*) which are illegal, while *The Sun*, the United Kingdom newspaper typically featuring a topless woman on page three, is not. Men bring these magazines into the country and some keep them at their mothers' houses when their wives do not approve of them.

There are X-rated movies or blue movies available in Bahrain, as well as what may be called provocative movies which include a few seconds of partial nudity, belly dancing, or heavy petting. There have been cases reported of couples making X-rated movies or blue movies for themselves, and later these somehow got into others' hands which caused great embarrassment to those involved. Other blue movies have been smuggled in from distribution centers in Saudi Arabia or abroad. Expatriates have been arrested at the Saudi Causeway transporting such tapes in their cars. Another video source of stimulation to men are

the wedding party videos from Bahrain, Saudi Arabia, or Qatar which are copied and distributed unknown to the sister, relative, or sister's friend who held the original. Informants report that some of their brothers have seen and even sold copies of these videos, which include Gulf women with their hair uncovered, dressed in miniskirts, with tight clothes, or low-cut necklines. The adolescent boys and young men watch these movies when available.

Sexual devices are not sold in the country; however, they are brought in by people who travel abroad. Informants said that some people keep them for their own use, while others are sold. Sexual devices are not defined as illegal by law. One incident was reported of a Saudi Arabian woman returning to Saudi Arabia who had bought a sexual device elsewhere. Saudi Arabian Customs could not take it from her, because such items are not mentioned in customs laws, and the woman retained her device.

Aphrodisiacs from various sources are used, but their prevalence has not been studied. Some compounds from local or imported herbs are thought to have beneficial powers for improving male potency, female fertility, or for curing venereal diseases. Such herbs are available from traditional herbalists (*Al Ashab*) in the various *suqs*, or from traditional midwives. References on this topic are limited in content (Bushiri & Davis 1996; Abdul & Saheb 1990; Abu-Zaid, 1966). The latter source in Arabic describes the herbs used in the Gulf and methods of treatment which were brought in from India, Syria, Sudan, and Egypt. Some individuals also request hormone shots from their physicians. Testosterone therapy should be avoided as much as possible; if used, then monitoring of the prostate is needed (E. Amin 1984, 30).

Alcoholic beverages are freely available in Bahrain through retail liquor outlets, hotel bars, and restaurants unlike other Gulf countries. Liquor is served openly to Bahrainis, expatriates, and tourists. Liquor has not always been so available. Traditionally, Arak, the local liquor made from dates, was confiscated by the police (British and local). Then foreigners were allowed to purchase liquor if they held a special permit. At this time, a black market in imported spirits flourished (Belgrave 1960), and Arak was made by hidden stills. Then retail liquor outlets were licensed and sales flourished. Islam's prohibition of alcohol is based on its intoxicating effect on the brain (*khumr*). Modern scholars in the Tufseer advise people, "Don't put your hand in a dangerous thing." Hotel bars, restaurants, and clubs frequented by locals and tourists are also frequented by prostitutes.

Some individuals experiencing difficulties of any psychological or organic nature, including sexual, traditionally would go to the *mutta wa* (religious man or woman) and ask for assistance. The *mutta wa* would say words from the Koran to cure the person (Al-Maki 1996, 16). These psychosomatic cures were reportedly effective in some cases.

Fracture of the penis is a urological emergency situation which requires immediate identification and surgery in order to prevent morbidity to the patient. Prior to 1988, there were fewer than 100 cases reported in the medical literature (Sandozi et al. 1988). Urologists in the Gulf during the last ten years have reported dozens of such cases. Fracture of the penis may occur during coitus, or by a direct blow, by abnormal bending of an erect penis, or through other sexual aberrations. Men report hearing a crack, then feel a sharp pain with subsequent loss of erection, deformity, discoloration, and swelling, but no micturation (painful urination) difficulties. If surgical treatment is not provided quickly, the condition results in serious morbidity, including deformation of the erect penis, weak erections, and reduced sexual performance. The surgical procedure is described by Taha et al. (1988).

Various reports have been published in the Gulf regarding penile fracture, including eight cases in Kuwait involving seven expatriates living without their wives. Their injury was self-inflicted in four patients and because of accidental trauma in three cases. In one case, a Sudanese male was trying to negotiate a hymen and vagina which had strictures from the ritual practice of female circumcision and clitoridectomy (Sandozi et al. 1988). Numerous other cases have been reported in Abu Dhabi (Al-Saleh et al. 1985) and Qatar (El-Sherif et al. 1991), with nine cases in four years in the United Arab Emirates (Hamarnah 1993), Bahrain (E. Amin 1994), and Iran (Asgari et al. 1996). As mentioned, the incidence of this urological injury is generally low, but review of the literature shows the incidence of this injury is higher in the Arabian Gulf region (Hamarnah et al. 1993). Some authors suggest the various etiological factors include relatively large numbers of single male expatriates, and married men living away from their spouses, in a Muslim country which contributes to the genesis of this injury. Sandozi et al. suggest that excessive libido and sexual urges which cannot be relieved may play a part in the causation of penile fracture (1988). Expatriate workers in Saudi Arabia do not usually socialize with Saudi women, and nightlife activities are rare because of segregation of the sexes, (Abbas & Satwekar 1989). In Bahrain there are many opportunities to socialize, including discos (Belgrave 1968).

Priapism is a painful, persistent, penile erection without sexual excitement and is a result of engorgement of the corpora cavernosa. Priapism can be self-induced with various drugs, and occasionally cases are seen at medical facilities. Priapism is also a known complication secondary to sickle cell disease (SSD). Reports from the U.S.A. show that 50% of boys/men with SSD can be affected, i.e., report having one occurrence or more of priapism. Studies in the Gulf show that priapism is a common complication of SSD, e.g., in Saudi Arabia with 18.4% of SSD patients reporting at least one experience (Al-Dabbous & Al-Jama 1993). In Bahrain, the incidence of priapism prevalence is low at 2.0% (Rasromani et al. 1990, 114), and the incidence of SSD is 2.0%, while the sickle cell trait is 11.2%.

Informants were asked about an incongruous aspect of culture seen in Bahrain. For example, American wrestling programs are seen on local television and in other Gulf countries. These programs are very popular and individual wrestlers are known by names. The wrestlers generally have extravagant makeups, hairstyles, and outfits. Some of these outfits are only tight bathing suits and this is shown on local TV. Informants state that wrestlers themselves are not seen as provocative, as wrestling is a traditional sport from the days of the Ottomans, and it is seen as exercise or family entertainment. However, it was noted that if a girl had tapes of wrestling matches and watched wrestling in an "entranced" manner, then that was another issue. Surprisingly, bodybuilding competitions are held annually in Bahrain, and participants are Bahraini men.

While public autoerotic behaviors are infrequently seen in Bahrain, they are occasionally reported. An elderly Western expatriate visitor attending church was horrified as an expatriate male sitting next to her masturbated during the service. She reported she was afraid, but could not get up because the church was so crowded. Female Asian expatriates report situations where taxi drivers have begun masturbating while they were in the taxi. The reputation of this Asian group is rather low morally, which may be why they are exposed to more encounters of this nature. Expatriate women all note that, in Bahrain, these incidents are very rare, unlike the frequency of similar incidents they were ex-

posed to in Saudi Arabia, i.e., you could not look men in their eyes or below their chests.

## 5. Interpersonal Heterosexual Behaviors

### A. Children

#### *Sexual Exploration, Sex Rehearsal Play, and Rites of Passage*

Children seen touching other children in any suggestive manner are firmly instructed that this behavior is not appropriate. All sexual exploration and sexual rehearsal play, if noted by the parents or relatives, is strongly extolled as forbidden.

All Bahraini boys are circumcised according to the requirement in the Koran. The procedure is usually performed in the first 40 days after birth in a hospital or Health Center Day Case Unit. Traditionally, up until about ten to 15 years ago, boys of 6 of 7 years of age were circumcised by a doctor or a traditional barber. This latter practice has been stopped in Bahrain, although it continues in Saudi Arabia and is thought to be a source of hepatitis C infections in that country (Arya 1996, 229). Traditionally, after the circumcision, money and sweets were distributed to other children in the family and to the boy's friends and neighborhood children (Curtis 1977, 55). This practice has now almost died out.

There are no ceremonies marking adolescence or adulthood. Children, upon reaching age 7, begin to attend the mosque regularly in order to learn more about their religion, and this is their rite of passage to full membership in the community.

### B. Adolescents

There are no female puberty rituals in Bahrain. Women mention that when they reached the age of menarche, they informed their mothers, and the girls in return were told, "they were now a woman," "they needed to behave like a woman," "to be careful of covering," that "they could no longer play outside with children," and "to be especially protective of their virginity." Their mothers usually told other female relatives or friends that their daughter was now a woman, but there was no party or ceremony. Women reported gossiping to their sisters and how they were happy that they were normal.

A few studies have been done regarding the experience of menstrual cycle symptoms among Bahraini women (Al-Gaseer 1990), Saudi women (Atallah et al. 1990), and Kuwaiti women (Ibrahim et al. 1979). The age of onset of menarche in the region varies from 10 to 17 years of age with an average of 13 years. Women in the younger age groups, 17 to 24 years, report more menstrual symptoms, while educated women report more menstrual and premenstrual symptoms than single women (Al-Gaseer 1990; Ibrahim et al. 1979). Some women report they called their period "my auntie"; other euphemisms include "Hajjya came," and "I gave birth."

Many Arab women reportedly do not use tampons because of the sexual connotation of placing something in the vagina; also, they fear tampons will make their vagina wide. A third belief is that "washing out is cleaner" than keeping it inside. Some Westernized married women report using tampons, but they said unmarried girls and teenagers would never use them.

The traditional notion that a menstruating woman is unclean (*Najis*) still pervades the belief system, although Al-Malki states this notion was rejected by the Prophet (1996, 19, 27). Menstruating women are not to fast on the affected days during Ramadan or on other religious days, but must make up these days later. A woman should not be divorced

by her husband when she is menstruating; likewise, sexual relations are prohibited during menstruation (Al-Faruqi 1988, 72).

Once a women's menstrual cycle has started, there is only one occasion when it needs to be strictly regulated and that is when a woman plans to go on *Umrah* or the *Haj*. A woman cannot go to Mecca and perform the prayers in the Kaabah or other rituals if she is menstruating. Girls or women with regular periods or irregular periods are given primolat N tablets for 21 days for suppression of the period, or sometimes birth control pills to regulate them, so they can plan on when to make *Umrah* or *Haj*, and they are ensured of being "clean."

The relationships between adolescent unmarried males and females, aside from family relationships, are strictly controlled by families. The majority of boys and girls attend segregated government schools until their graduation from Tawjehi (high school). There have been coeducational expatriate schools for decades in Bahrain, such as St. Christopher's, Sacred Heart, the Bahrain School (American), and the Indian School, which a percentage of Bahrainis have attended. During the last ten years, expensive coeducational private schools have opened specially catering to Arabic-speaking Bahraini and expatriate Arab students, e.g., Al Bayan, Ibn Khaldoun, and Al Hekma. In all the coeducational schools, boys and girls study together, take school trips with their parents' permission, and sometimes socialize. Dating in the Western sense is not the norm. This is the only opportunity for some students to meet members of the opposite sex. Students in mixed groups may also socialize in the shopping malls and hamburger and pizza places. Male teenagers are freer to spend time out of the house with friends, expatriate students, and workers.

### C. Adults

#### *Premarital Relations, Courtship, and Dating*

Bahraini parents strictly control, or at least monitor, their daughter's meetings with men, and discourage anything more than necessary, talking relationships. As mentioned earlier, dating in the Western sense is not the norm. There are instances known where Bahraini women dated expatriate men, including those in the American military during the time of the Gulf Crisis and Gulf War (1990-1991), and these women actively sought out these relationships. These situations are very rare as most families are very strict. One informant reported recently seeing two Persian Bahraini women trying to pick up two American military men in Manama. The two men quickly declined and kept walking, as these relationships are strongly discouraged by the U.S. military because of security and other reasons.

#### *Sexual Behavior and Relationships of Single Adults*

Single men have premarital sexual relationships, while single Bahraini women ideally do not. Single adults are expected to be chaste in their relations, and the girls are expected to be virgins at the time of marriage. A man may have an expatriate girlfriend or girlfriends, or a boyfriend in Bahrain or abroad. The prevalence of these patterns have not been studied among men, nor their prevalence in relationship to venereal disease in Bahrain.

Some Bahraini single women do have affairs. Reportedly, this behavior is very rare, and the meetings are conducted in hotels or elsewhere in Bahrain, and preferably where there are "no eyes," or when they are both abroad. A single woman who is not a virgin will face difficulty finding a husband if she is known to have lost her virginity "not by a normal condition," meaning not through marriage. An affair places her in an abnormal or doubtful situation. The

women who are known not to be chaste will find it difficult to ever get married (Taki 1974, 11). A few rare marriages do occur, informants reported, but this is not common, as the man's family will be against the marriage if they have any knowledge that the girl is not a virgin. There have been no reports about Bahraini women traveling abroad for hymen repair surgery.

When expatriate women are seen with a man, it is generally assumed that they are "friends," or lovers until it is clarified that they are married. This attitude extends to Western or Asian women, all of whom are generally considered to have loose morals until their actions prove otherwise. The Government does not get involved in the affairs of expatriates unless a man files a claim of adultery against his wife. In these cases, the residence permits of the woman and her lover are usually revoked and they are deported. This is done quietly, unlike the 1990s case in the United Arab Emirates which received worldwide press coverage.

Conservative Bahraini men and families, if they know someone is having an affair, will enforce certain rules of social behavior in order to protect their wives or families from this person's influence. They will not allow their wives to invite into their house a married or unmarried woman who is living with a man or who has a male "friend," even if the woman is the wife's coworker, compatriot, or friend. These same women are not allowed to sit in the wife's car seat, i.e., the front right passenger seat so they have to sit in the back seat. In most cases, the husband or extended family (*Allah*) even ask the woman not to see such a friend at all socially, because being together could affect the wife's name and they should not be friends. In some cases, an association is allowed to continue with conditions, and in some cases, it is continued in defiance of family wishes when the undesirable person is brought into the house.

Social sanction extends to men who bring their lovers or socially unacceptable partners to a party. One such situation occurred at an Embassy party, when an elderly man arrived with his much younger, diamond bedecked, Filipina guest. Suddenly there was a collective inhaling of breath and staring by the Bahraini dignitaries, and the frosty censure could be felt in the air immediately. The man was greeted as per custom, while the woman was totally ignored and spent her time among the women at the party.

#### *Marriage and Family*

Bahrain has the reputation among all the Gulf countries of being a place "where people can marry who they want." All informants, males and females, agree this is true to a large extent. Women clearly state that the "woman has the right to say no" to any man who is recommended by her family. Farouq Amin amends this and states women have the right to refuse, but not the right to choose (1986). Men stated that, based on their subjective knowledge, perhaps 50% of marriages in Bahrain are arranged. In reality, this figure is 75% (Kahtanie 1992, 41). This incidence is much lower than in Oman or the United Arab Emirates. In the latter country, a law was passed in 1996 stating the man should see the woman before their marriage. Regardless of the stereotype in the Gulf that Bahrainis can marry who they want, there are still six different types of marriages seen in Bahrain, according to Kahtanie (1992). They include arranged marriage, cousin marriage, couples who have not met before, couples who met, forced marriages, and educated-later marriages. Both women and men reported that some men are now showing a preference for, and are choosing, educated working women, even those years older, who can be a partner and who can help in providing financial extras for the family (Taki 1974; Kahtanie 1992, 39).

Marriage selection and choice of mates ideally follows the Islamic pattern, i.e., religion is the first selection factor, while the second factor is the monetary status or potential monetary status of the male and beauty in the female. According to the Koran, individuals cannot marry those who suckled at the same breast and are a milk brother, *Akh Bil Radha 'a*. For all types of marriage, the permission of the father or brother is required, and in addition, for soldiers, military approval is needed. For members of the royal family, Amiri Court approval is required.

Marriage brokers (*al khatba*) are still used to arrange meetings in spite of telephones and automobiles, and even though 39% of marriages are consanguineous marriages (Al-Naser 1993; S. Al-Arrayed 1995). Many marriages are still arranged between families. The Islamic associations also play a role in helping individuals find a partner. Men and women can complete a questionnaire at their local association, providing information on education, age, background, and preferences. Association staff match applicants, and they and their families can arrange to meet.

Arranged marriages can succeed or fail. Men stated that the couple may "fall in love" or find they are compatible. A lot of these mainly younger couples also divorce during the first or second year; couples in these arranged marriages stay married, especially after they have a family. In some cases, one of the spouses (either man or woman) falls in love with the other, but this feeling may never be returned, e.g., the wife may say, "our marriage was arranged and he is a good father," and the man, meanwhile, has much stronger feelings for his wife or vice versa.

The reasons given for women agreeing so easily with their parents regarding arranged marriages include the following: Girls are afraid to say no to their parents for any reason because of the way they were raised; the girl may not know any other man or does not have any feeling of attachment to anyone in particular; it is better to be married than unmarried (Taki 1974); or a girl does not want to wait too long and to be told "the train has left." For all these reasons, a girl may acquiesce to her parents' wishes. A man, likewise, may easily follow his family's choice of wife for his first marriage, but if widowed, or if he marries a second time, the woman will be of his choosing.

Consanguineous marriages now comprise 39% of marriages, down from 45.5% in previous generations (Al-Arrayed 1995). This trend for preferential first cousin marriage has serious health implications, including effects on sexual development for the children produced by these couples. The coefficient for inbreeding in Bahrain is 0.0145 (Al-Naser 1993). The child mortality rate in Bahrain is three times that of Japan, even though Bahrain is ranked as an otherwise low-mortality population. The Bahrain Child Health Survey of 1989 showed that one quarter of births occurred between first cousins. The mortality rate for these offspring during their first month and first 23 months is two times higher than children of unrelated parents. The study showed that women who marry relatives, especially their first cousin, tend to marry younger, are illiterate, their parents were illiterate, and they live in rural areas. Other practices contributing to higher mortality include polygynous marriage, remarriage after divorce, short intervals between births, employment of women only in the home, breastfeeding for an average of 10.6 months, malnutrition, and lower socioeconomic status. The author of the study suggested that the government needs to discourage first cousin marriage, to raise the marriage age to 18, to teach the illiterate about birth spacing which is part of Islamic teaching, and to allow polygamy only if the man can afford it (Al-Naser 1993). Sheikha Al-Arrayed disagrees with the contraindications

for consanguineous marriage and cites its traditional history and social benefits, even though 42.8% of her sample reported familial genetic diseases (1995).

Some Bahraini men marry expatriate women who are Muslims or non-Muslims. They meet while studying at European, American, or Asian universities, while working in hospitals, or while traveling. The man's family may accept or reject the woman, depending on her religion, country of origin, or other factors. Bahrainis may marry other Gulf Cooperation Council (GCC) nationals with family approval, and occasionally Indian or Pakistani Muslims, but rarely Westerners who have converted to Islam. In these cross-cultural marriages, it is the woman's choice what passport she wishes to maintain. Holders of non-Bahraini passports cannot own property in Bahrain.

Once the agreement of the two individuals has been given to marry, regardless of the type of marriage, then the families decide upon the monetary arrangements for the dowry (*mahr*), which is a gift symbolizing love and affection (Badawi 1980, 17). According to Islamic law, there is a marriage contract (*Al-Rayd*) for all Muslim marriages. This contract specifies the money the man and/or his family will pay at the time of the official engagement in the mosque, any "seconds" if all the money is not available at once, and the "last" money to be paid at the end of the marriage upon divorce or death. The first and second money can be paid to the woman or to her father for holding. Any "second" money, in case of the early death of the man, is paid before the money in the estate is apportioned to other heirs; or any other money he may have borrowed or was holding for his wife is paid first, as the money was hers, *fit ajulain*, in life or death. The contract once signed is a legal document and is blessed in the mosque and then registered with the Courts.

The amount of the dowry paid in 1994 at the time of the engagement varied from BD400 to more than BD2,000 according to the *Statistical Abstract 1994*. Distribution of dowries paid by non-Bahrainis are shown and also tracked in terms of amount and geographical distribution in the country (*Statistical Abstract 1994*: Table 3.53).

The current generation may use the woman's dowry to buy furnishings for the home, rather than having it held by the father or put into her separate bank account. This arrangement depends upon the couple and their relationship. The man's family may also be required to pay for an expensive hotel wedding reception. This depends on the families involved and the contract arrangements. Women report that they were told by their mothers from the time they were young, "never give your money to your husband." If their money is loaned to the husband, it is generally done legally with a contract.

The financial straits of some young men and their families make it difficult for these men to marry. During the last few years, several benevolent social organizations, including the various Islamic Associations, have arranged group weddings once a year, so some or all of the costs of the dowry and weddings are alleviated. These costs can be prohibitive for the young men and prevent them from marrying ("Mass Wedding" 1996). A description of a traditional Sunni wedding ceremony is given by Al-Khalfan (1993), and a Shi'ite ceremony is described by Hansen (1967).

After the engagement, which is equivalent legally to a Western marriage, the woman may move into the man's father's house. Ideally, women do not become pregnant during this engagement time and should wait until after the public wedding ceremony. The engagement is usually less than one year, and longer engagements are discouraged. If the woman does become pregnant, the family then decides if a family or public wedding will take place.

During the "engagement" period, some couples decide unilaterally or mutually that they are not compatible and they will divorce. According to the *Statistical Abstract 1994*, 28% of the Bahraini divorces were before there was any sexual union, 16.5% for non-Bahraini divorces (*Statistical Abstract 1994*: Table 3.74). In the 1994 report, 19% of the marriages lasted longer than one year (*Statistical Abstract 1994*: Table 3.77). Once the Court grants a divorce, a delay of three months is required (*Al' Idda*) to ensure the women is not pregnant, then the divorce is finalized. Islam discourages divorce and teaches reconciliation is better.

A man can say the word *talaq* three times in his home to divorce his wife, then the couple has two options. They can see a religious man, a sheik, for his opinion, or attend a court. In both situations, the conditions surrounding the statement will be assessed, i.e., was *talaq* said in a calm manner or was the man under stress? Was the woman in a state of purity (*tuhr*)? If under stress, then the courts will consider *talaq* as said once. If said in a calm manner, then the legal divorce proceeding will go forward with review of the provisions in the marriage contract. The specific laws pertaining to divorce and inheritance are governed by Sharia law. The Shi'ite follow the *Ja'afari*, and the Sunni the *Maliki* rite.

Women can obtain a divorce for certain prescribed reasons: The man disappears or is absent; the man is impotent; if the marriage causes the wife mental or physical illness, e.g., man is a homosexual, wife battering, or adultery; non-support by the man; or if a special condition clause was included in the contract as a condition for marriage (Ramzani 1985). In July 1996, a landmark divorce case was publicized in Bahrain's newspapers. A woman was able to divorce her husband who had AIDS, as she said she was at risk for contracting it through sexual contact.

Marriage and divorce rates are tracked by the Central Statistics Organization. The general divorce rate is 1.7/100 population, and the general marriage rate is 7.5 (*Statistical Abstract 1994*: Table 3.45). The trend is one divorce for approximately every 4 to 4.5 marriages. Eighty percent of the marriages and 85% of the divorces were among Bahraini couples (*Statistical Abstract 1994*: Table 3.44). Bahrainis in 1994 also married Asians, other Arabs, other Gulf Arabs, Europeans, and Americans. The divorces followed the same general distribution (*Statistical Abstract 1994*: Table 3.44). Among Bahraini couples, 91% were married for the first time, while among expatriate couples, only 56% of the men were married for the first time. The age range of women marrying showed 1.6% were 19 years or younger, however, this age range accounted for 8.9% of the divorces in 1994 (*Statistical Abstract 1994*: Table 3.43). Trends show young divorced men and women frequently remarry (*Statistical Abstract 1994*: Table 3.56).

If a woman was proven barren before the divorce, or if she wishes to keep her children and not have to give them to her mother or her ex-husband, then the woman may choose not to remarry, in which case, she will continue to live in her parent's house. Her family will continue to protect her and, now that she is divorced, she needs more protection from men who may assume she is "more easy" in her ways.

Ideally, a man informs his wife if he wishes to take another wife. However this is not always practiced. The woman may be told afterwards. She may discover the other marriage or marriages in a sudden way, e.g., during the Government census when the Government census taker is trying to determine which wife he is talking to; some find the other wife and husband in a new house she paid for, or in some cases, the wife may never know. There are Bahraini men who have families in Egypt, India, Philippines, or elsewhere, of which their Bahraini families are unaware. In

some cases, the family only finds out when the man dies and the various wives make inheritance claims on the estate.

A man's marriage of another wife is generally not a valid claim for divorce, as a man may legally have up to four wives at one time. Most women do not want to share their husband and their family usually supports them (Taki 1974). The possibility of polygamy makes wives anxious, especially if they are barren or fail to produce male children. Women voice their feelings of insecurity in a serious or joking manner, as they do not know if their husband already has another wife or if he plans to do so. He can also say to them, "if you do not do this, I will look for another." There is a greater risk for older women, as there is always the threat that the husband could take a younger wife. The latter is one concern which reportedly makes women keep menopause a secret, as they do not want their spouses to know of it out of fear that he may take a younger wife.

Women make great efforts to keep their husbands satisfied and, traditionally, this included placing packs of rock salt in their vagina after delivery (A. Mohammed 1978; Rajab 1978). The purpose of the salt crystals was to reduce the size of the vagina after delivery to normal or less than normal size so the man will feel more pleasure (Dickson 1915; Hansen 1967, 108). The use of rock salt and its effects has been documented since the early 20th century by the doctors at the American Mission Hospital in their annual reports, and in Kuwait and Saudi Arabia (Dickson 1915) and Oman (Doorenbos 1976). The main result was rock salt atresia of the cervix, so that in subsequent deliveries the cervix was so tough, it had to be cut to allow delivery. Another effect of the salt packs was unexplained elevation of the patients' temperature after delivery and suspected sepsis. Records show in 1938 that the first MRCOG consultant attended delivery of 84 patients and 79 had rock salt atresia. The Ministry of Health took a proactive approach to this problem and registered, trained, and supervised all the traditional midwives. By the late 1970s, this practice "was nearly died out" (Rajab 1979, 7). However cases are still seen, even as recently as 1996 in the Maternity Hospitals. In the latter case, an elevated temperature was noted and, upon examination, it was found the woman had inserted a vaginal pack of rock salt. Herbal passaries known as *mamool* were also used to tighten the vagina, drain lochia, and promote involution of the uterus (Al-Darazi 1984, 37-38). Some women used a combination of salt crystals, herbal pessaries, and antiseptic solutions. Vaginal douches of datol, a strong disinfectant, are still commonly used after childbirth. Regarding resumption of sexual relations after delivery, the wife usually stays with her mother for the first 40 days after delivery and may have also stayed with her mother for one month prior to delivery (Curtis 1977, 47).

Serial monogamy is seen in Bahrain, and some women are divorced and remarried three or more times during their lifetime, and men marry more often. As women become older, their chances for remarriage lessen. There are no reports outlining the common causes of divorce, although in the one study conducted on coping mechanisms of Bahraini couples, marital sexual satisfaction was an issue raised by 25% of the husbands (Kahtanie 1992). The Islamic rules of inheritance work against remarrying or polygamy, and the sons generally oppose remarriage which might engender other children, thereby affecting other inheritors (Taki 1974).

#### *Extramarital Relationships*

There is a type of marriage referred to in the Koran as *al Mut'a*, or temporary marriage. At the time of the Prophet, this practice was allowed for the soldiers who spent many years away from their homes. If the woman the soldier kept

became pregnant, then she was to become a full legal wife. The Prophet himself later stopped this practice, and Umar bin Khatab, shortly after the Prophet's time, again instructed men to stop these type of alliances, as women should be taken as legal wives only.

This practice of temporary marriage has continued only among the Shi'ite. One example is described as seen in Sar Village by Hansen (1967, 127). In this particular marriage, the girl did not leave her village to live with her husband in A'li. Currently, the term *Al Mut'a* has taken on a new meaning. Men who are having an affair may use this term to describe their current relationship; however, there is no legal basis for this type of relationship today (Al-Faruq 1988, 6).

The extent to which Bahraini and expatriates are involved in extramarital affairs is not known. Anecdotal stories are passed around when an incident occurs, e.g., a Bahraini store owner was called to testify to the police about the good behavior of his Bahraini worker. The worker had severely beaten an Indian neighbor who was found to have been sleeping with the man's wife. Incidentally, this woman was "covered" whenever she appeared in public.

### *The Changing Nature of Bahraini Marriage and Household*

Three major changes have occurred in Bahrain which are driving forces for change in Bahraini families and family relationships. Household structures have changed from mainly extended families (*Allah*) of 20 to 30 members living under one roof, to variable forms, including traditional extended households with several generations of family members to nuclear family households (no Arabic word to describe this) located in one of the new cities, e.g., Isa Town, Hamad Town, or a flat. Another major change in all types of households since the 1970s has been the introduction of Asian maids. These maids clean the house, cook, and, depending on the family, assume a little or a lot of influence in childrearing practices. However, these maids are economically, and in terms of power, "the lowest of the low" (Al-Sharyan 1987, 350). Their presence has helped the wife to go out and work outside the home, as childrearing is done with the help of the maid. Formerly, the presence of a grandmother would have been the only means allowing a woman to work outside. A third change was the introduction of private automobiles in the 1950s. The automobiles allowed family members to take tours together, and men took their families to beaches and oases. More activities could be planned together as a family (Taki 1974). These three factors have contributed to the breakdown of the extended family and increased prevalence of conjugal families.

Some women reportedly are very frustrated in their marriages. They are working at a job, running the house, may be making more than their husbands, and are not shown any interest or appreciation by their husbands. Some state that the husband's attitude is "I take your money and you do what I tell you." The men may be out every night visiting traditional coffeehouses smoking *shisha*, playing chess or dominoes. They may be out drinking in hotel bars or restaurants. The men receive many invitations for lunch and the tendency is for them to take every opportunity to be out of the house. The men spend little time with the children and some have the attitude, "have them and wait until they grow up." Women get frustrated if their husbands are lazy. Traditionally, men and women lived separate lives in Bahrain and their social networks were segregated (Taki 1974). The frustrations expressed by some women reflect the continuing trend of separate lives maintained by some husbands while their wives are expecting more from a marriage. Information on these divergent lifestyles and expectations

would be helpful to increase public awareness, and to teach couples how to resolve these different expectations from a marriage in order to control the number of divorces.

Children and the elderly are suffering the consequences of divorce. The woman returns to her family with the children, depending on their age, or the children go to the father and most likely a stepmother for their upbringing. If the woman remarries, her parents or the husband definitely have custody of the children. After marital breakups, society suffers a greater burden in terms of juvenile delinquency because of unsupervised children (Al-Falaj 1991), an increase of malnutrition and infant mortality (Al-Naser 1993), and abandonments of the elderly in Government hospitals.

### *Sexuality and the Physically Disabled and Older Persons*

The physically disabled can marry in Bahrain and whether they do depends on their family and the extent of their problems. There are institutes for the blind (Noor Institute for the Blind), deaf (Al-Farisi Rehabilitation Center for the Deaf), and handicapped (National Bank of Bahrain Rehabilitation Home for Handicapped Children) in Bahrain where they receive special training. Bahrain has long been the recognized leader in the Gulf for the training of those who are handicapped, and for providing them with education and employment opportunities.

If the man is affected with a handicap, the family may find him a bride locally, or more likely abroad, in India. The chance of a handicapped woman marrying depends on the effort made by the family on her behalf, and the presence of a maid to help her. Male informants stated that a handicapped woman would have difficulty marrying because of her limitations in organizing the house. People with mobility handicaps from polio, birth injuries, or later trauma injuries do marry, but this depends on the injury. Again, if there is difficulty finding a spouse, families will find a wife for their son in India, while the daughter may remain at home her entire life.

Those who are mentally retarded generally do not marry, but there is no law prohibiting marriage. A case was cited where a family employed the son in the business and found him a wife. Male informants queried why anyone would want to marry a retarded woman, as she could not organize the home.

The elderly in Bahrain comprised 5.5% of the population according to the 1991 census. The elderly are defined as older than 60 years of age. The elderly remarry, but it is more likely the men will remarry. Marriage statistics for 1994 show that the oldest age for marriages was 40 to 44 for women and 50-plus for men. However, it should be noted that age is a relative matter. All births were not recorded in the past, so many 40- to 80-year-olds do not know their exact age. Also, people adjust their birth dates, i.e., men have reported that they added years at the beginning of their working life so they could get Government employment at an earlier age. Others drop years, especially when in their 40s, by changing all their legal documents after saying a mistake was made earlier. Also when people are asked their age, many just underestimate it, e.g., one man said he was 45 when asked by a hospital surveyor. The surveyor reported she looked at him and thought to herself 60 to 65 minimum. The man saw her pausing and said, "50 to 55, whatever you like." The official Government retirement age is 55 for women and 60 for men. There has been no study on the relationship of changing of birth data in the official records and work benefits and entitlements. The life expectancy at birth in 1995 in Bahrain is 74.2 years for women and 69.9 years for men (76 and 71 respectively according to the 1996 *World Almanac*),

both figures being higher than the average for other Arab states, 64.1 and 61.5 years respectively (Baby 1996b).

Regardless of the recorded age, the physical condition of the middle-aged or elderly affects their sexual ability. Among the elderly in Bahrain, long-term complications of diabetes, hypertension, and cardiovascular diseases can result in male impotence. Since the 1980s, penile prostheses have been available to treat men who are known to have organic causes of their impotence (E. Amin 1984). This procedure is available in public hospitals and with greater confidentiality in private hospitals.

### *Incidence of Anal Sex, Fellatio, and Cunnilingus*

There are no enforced legal restrictions in Bahrain regarding the practice of oral sex or anal sex. Informants reported that according to Islam, oral sex is allowed. The rationale is mutually satisfying sexual positions including oral sex are considered normal. Some women say they are reluctant to participate in oral sex, although Bahraini and Western women participate to keep their husbands satisfied.

Anal sex is considered abnormal activity and associated more with homosexual activity, of which it is considered a possible precursor, so it is forbidden (*haraam*). Reportedly, if a man even asks his wife to perform anal sex, she has the right to file for divorce. Anal sex is practiced, however, and while the woman may not agree, the husband in some cases is threatening by saying "if you don't, I will go elsewhere." Also women do not file for divorce.

Occasionally, women discuss this activity with friends or doctors because of the discomfort they experience and the need for creams or suppositories to soothe small rectal tears. Some women find out about their brother's anal sex activities indirectly when they complain about discomfort and an inability to sit down. One informant reported that a friend's brother, who was engaging in anal sex for money, told his sister that he had no money and the man paid him BD50.

## *6. Homoerotic, Homosexual, and Bisexual Behaviors*

### **A. Children and adolescents**

There have been no studies or even articles published in English regarding these topics. In a few rare publicized cases involving a rape and/or a murder, it was revealed, for example, that an adolescent male was involved in a long-term homosexual relationship with an older expatriate male, or that a young boy was a victim of a homosexual rape by one man or a gang of boys. There are no statistics available on these topics since 1956.

### **B. Adults**

Objective data are not available regarding adult behaviors relating to homoerotic, homosexual, or bisexual behaviors. Very few male homosexuals openly admit their homosexuality and most get married to keep up appearances. Since homosexuality is *haraam* and abhorred according to Islam, most relationships are discrete in order to protect the family name or a spouse. Male informants report that there are now some Bahraini gay men who openly reveal that they are gay, and who state they have no intention of marrying, but this may be fewer than 5% of the gay men in the population. Anecdotal stories are related by informants; however, no one could contribute any information on specific behaviors, such as roles or courtship patterns. Islam prohibits homosexual or lesbian relationships, so most couples do not openly admit their relationships, and there is no way to legalize these relationships in Bahrain.

There is a homosexual community comprised of expatriates who are more open about their sexual orientation,

e.g., Filipinos and Thais, who are unlike the Bahrainis who are very careful to hide their sexual proclivities. There was an incident in the early 1990s when 20 to 30 Filipino homosexuals were deported by the Government. Despite this, the Filipino gay community now flourishes as before.

Patterns in sexual outlets for homosexual men have not been studied. Filipinos report male drivers (Arabs or Asians) put their hands on the knee of the passenger, and the Filipino has to indicate his preference. Filipino men and others working in barbershops approach their customers by offering to massage them. Such approaches are reported by many men including Bahrainis and expatriates. Men report having to shop around for a barbershop where they feel comfortable and "don't have any problems." Women report friends and families warn other families where they should take their sons to have their hair cut and where not to leave their sons alone. Some parties in the desert reportedly are another venue which men use to meet potential contacts.

Women, as they are kept under more careful watch of their parents, meet other women in school, at friends' houses, weddings, or parties. Women are free to meet at any time, as they are always encouraged to socialize with other women. Only one informant personally knew a lesbian who had told him that she and her friends meet at school or the university, and that lesbians usually marry and have children while continuing their female relationships. This woman said there were a large number of Bahraini lesbians in the community.

The prevalence of lesbian relationships in Bahrain is not known. Male and female informants all mentioned they knew about Bahraini lesbians. Female relationships are considered "safe" by parents, so the women meet easily and often. Like the gay men, lesbians are frequently married and have children. Expatriate lesbians are more open about their sexual proclivities and these women dress in a style that is immediately identifiable by their countrymen, e.g., Filipina "T-birds," or Scandinavian lesbians among others. The incidence of female-to-female STD or HIV infections has not been reported.

Bisexual adults usually marry in Bahrain and each spouse may have a lover on the side (lesbian, gay, or heterosexual). Only anecdotal stories are available regarding this topic, and there are no data on the prevalence of hidden bisexuality in Bahrain.

A question is frequently raised by expatriates regarding homosexual activity in the country. Are the men truly homosexuals, bisexuals, or heterosexuals? What role does opportunity for sexual release play in their behavior? A story was related about an incident in a hotel. Several Saudis gave money to the male Asian hotel clerk and told the clerk to find them some women. The clerk took the money. The men called down to the desk several times to find out where the women were. During the last call when the clerk said no women were available, the men said, "You come up then."

## *7. Gender Diversity and Transgender Issues*

### **A. Transvestites, Transgenderists, and Transsexuals**

Male transvestites or *benaty* (males dressing as females) are seen occasionally in public, e.g., attending a public festival, while in the hospital, or shopping. Informants report that this is "much more common in Kuwait." People are tolerant, mainly ignore them, and do not talk about them. A few comment on the behaviors seen, e.g., "high voice," "makeup," or "using a fan," but do not relate to the nature of the person. Bahraini men dressed as women have been reported as providing the entertainment at exclusive parties where expatri-

ates are rarely invited. One female British author reported attending such a party as her introduction to the country a few years ago. It is not known what proportion of these male transvestites are homosexuals, bisexuals, or heterosexuals.

In some situations, men have been known to dress as women for other reasons, mainly in order to breach security, e.g., to get into a dormitory to visit a friend, to get into a female prison to visit someone, and to hide from the police. The latter practice has caused some problems, and now female security guards are being used in Government agencies, as only a woman can touch or search a woman. One Filipino passed as a female maid for a couple of years before being caught by his employer.

Cross-dressing by males is not considered an act of juvenile delinquency in other parts of the world; however, in Bahrain, Saudi Arabia, and the rest of the Gulf region, which has strict religious-based norms, cross-dressing is seen as a clear instance of alienation from traditional values (Al-Falaj 1991). One study showed 4% of Saudi male juvenile delinquents were cross-dressing (Al-Ghamdi 1986). While there are no published data for Bahrain on cross-dressing, 12.4% of male juvenile delinquents and 16% of female delinquents in one study in Bahrain were accused of moral delinquency (Buzaboon 1986, 151).

Women in the Gulf have a long practice of wearing the *sirwal* chemise—long full pants with long loose overshirts seen among all Pakistanis (males and females) and some Indians. This fashionable ‘Punjabi-style’ outfit is worn by men and women alike in Bahrain by many nationalities and is also fashionable in the West. The only differences between men’s and women’s styles are the type of material, style of buttons, and decoration. Loose pantsuits are another preferred style of dress for women to preserve modesty. Women are frequently seen wearing loose pants in the whole Gulf region. There is no association between a woman wearing slacks and being lesbian among Gulf countries. There are lesbian Filipinas known as “T-birds” who dress like a man and who flatten their breasts. They purposely are trying to look like a man. There have been Scandinavians who have pointed out lesbians from their own country. They report, “See how they wear a shirt and pants like that. Only lesbians dress like this at home, so we can identify them easily.”

The incidence of transgenderists has not been studied at all. None of the informants reported knowing any Bahraini who said, “I am this gender but trapped in this body.” Westerners and Filipinos report knowing of people making such comments in their home countries.

Voluntary sex-change operations for completely gendered adults to the opposite sex are not done in Bahrain and they are illegal. This view is supported by the Koran and the Prophet’s teachings (Al-Herbish et al. 1996). If there is confusion regarding the sex organs of a child at birth, then investigations will be conducted to determine sex assignment of the person. Sex-change protocols followed for newborns are similar to those published in Saudi Arabia (Taha & Magbol 1995). If the sex organs are predominantly those of a male, the male sex will be assigned; likewise if those of a female, the female sex is assigned. Unfortunately, some problems are not apparent until the time of puberty (Abdul Jabbar 1980; Farsi et al. 1990). A study in Saudi Arabia on intersex disorders detected in puberty or later reported that all genetic males, known as females, accepted sex reassignment as males. Females incorrectly known as males did not readily accept sex reassignment, as culturally the male sex is preferred (Taha & Magbol 1995; Al-Herbish et al. 1996). The nature and incidence of some cases in Bahrain have been reported by S. Al-Arrayed (1996).

The man’s chances for remarriage are limited mainly by his financial resources and his ability to pay the marriage contract divorce settlement, and if he can afford the dowry for a new wife. Poor men unable to provide well for their families have been known to marry four wives, as there are currently no regulations regarding minimal income; however, this is now being recommended (Ahdeya Ahmed 1996). In other Gulf countries, men are being encouraged to take a second wife in order to reduce the numbers of unmarried local women. The U.A.E. Government extends soft loans to finance taking a second wife, and men already having foreign wives are now eligible.

## B. Specially Gendered Persons

The *kaneeth* (xanith) is a specially gendered person reported historically in the Gulf (Wikan 1982) and still seen today. The prevalence of these male transvestites/homosexuals is not known. None of our informants have personally known such individuals; however, many reported they have heard others talk about this topic. Some informants described people they have known and/or their families. One Bahraini informant reported that “the person they knew like this was Omani and he lived in our neighborhood and he was the best cook.” Another reported, “There is a man who is married, and he has children, but he is also like this.” Others said, “This was more common in the past.” Following up on this comment, a long-time expatriate resident mentioned “that soon after independence and after the British left, all the Omani men were sent back home in dhows from Manama. People went to the sea front to see the dhows cast off. These men had worked as maids, (there were no female maids then), as singers in bands at women’s parties, and were eunuchs.” These Omani men sound like the description of the third gender *kaneeth* described by Wikan in Oman in the 1970s (Wikan 1982).

When asked about the term *kaneeth*, Bahraini informants did not agree that the *kaneeth* is a third gender. The term in Arabic means a male or female homosexual. Bahrainis said some marry and have children, so are bisexuals according to the English definition. *Kaneeths* in Bahrain would not necessarily show feminine manners, or dress in a more feminine style, unlike those reported in Oman, but would wear a *thobe* or Western-style men’s clothing.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Behaviors and Neglect

#### *Child Physical Abuse and Neglect*

The incidence of child abuse has not been studied or reported in the medical literature in Bahrain. Articles published in Bahrain have alerted physicians to note and report suspected cases (Al-Ansari 1992; Molloy et al. 1993). Two hospital informants noted knowing of only two cases of child abuse in the past 11 years in Bahrain, and in one case the mother was mentally disturbed, while in the second case the child was handicapped. Similar abuse of handicapped children is also mentioned in Saudi Arabia (Al-Eissa et al. 1991). Two articles on childhood trauma in the Gulf (Bahrain and Saudi Arabia) did not mention if any of the cases were because of child abuse (E. Amin 1979; Al-Otham & Sadat Ali 1994). Nonaccidental burning of children is another type of abuse which may exist in Bahrain and which requires a team approach to detection and treatment (Saeed 1992). Child abuse does exist in Kuwait, and is reported in increasing frequency (Al-Rashied 1988), and in Saudi Arabia (Al-Essa et al. 1991; Qureshi 1992). A case of Munchausen Syndrome by proxy has been reported in Saudi Arabia (Al-Mugeiren et

al. 1990) and doctors in Bahrain have been alerted to note such cases (Molloy et al. 1993).

School teachers have also been educated regarding child abuse and are to report suspected cases of child abuse to the social worker. One study was conducted regarding teacher awareness of symptoms (Ali 1996). Since schooling is not compulsory, or may be conducted at home with home study, teachers cannot know of the full extent of this problem. According to the Koran, children are to be treasured, and strict discipline and physical means of discipline are not commonly used. From ages 1 to 7, parents are exhorted to love and care for their children, and from 7 years onward to be as a friend to guide their child.

The extent of abuse to which children are subjected from the many maids employed in the country likewise is not known. However, Al-Rashied in 1988 noted in Kuwait that child abuse has been noted more often after increased reliance on babysitters. Individuals report knowing of suspected abuse cases in Bahrain, and when they were confirmed, the maids were deported. In one example, a Filipina brought to work for a family was found using physical means to control the children and scaring them so much their personalities changed, which is how the parents first became aware of the problem. Another South Asian maid absconded, and was later caught working as a prostitute. The parents then wondered if she had been entertaining men in the home, as the children had reported previously that the maid used to lock them in their rooms when the parents were away.

Many of the cases of child abuse are not physical abuse or battered child syndrome, but neglect, or cases of failure to thrive. Bahraini doctors have been alerted to note these cases (Al-Ansari & Al-Ansari 1983). One expatriate, for example, reported thefts from her vegetable garden. The culprit was eventually caught and it was a young boy who was hungry. Investigation of the case showed there were four wives and 40 children in the family and an unemployed head of the family. The expatriate dropped all charges. Social workers have reported finding neglected handicapped children who were being kept in boxes in the home so these children had severe contractures. In these cases, the mothers had many other children to care for. Side effects of medical procedures are sometimes not noted by parents among their large number of children until the damage is irreversible. Young children are sometimes left in cars overnight and they die in the extreme heat as their absence in the house was not noted. A study on the impact of family size on morbidity showed crowding, poor sanitation practices, low education, and poor personal hygiene resulted in more family visits to health centers (Nasib et al. 1983).

The Bahrain Government has an effective means of helping abused children once identified. All reported cases of abuse and neglect are investigated and social workers and community healthcare nurses follow up each case, even daily, if it is felt this is needed. Even though all government healthcare services are free to all residents, utilization of psychiatric services for children by parents is low. In 1981 and 1982, the last published data, only .016% of children were referred for psychiatric help, while it is estimated 5 to 20% of children could benefit from the services. Boys outnumbered girls in conduct disorders, while girls had more reactive and neurotic disorders (Al-Ansari & Al-Ansari 1980). The possible underlying causes of childhood psychiatric problems were not discussed in the article.

Charity from the Government, the Red Crescent, or other family members may not be meeting all the physical needs of some families. Other agencies and social organizations provide needy families family aid (Jameyat Al-Islah, Jameyat Al-Islamiya, Jamiyat Al-Tarbiat Al-Islamiya, Sunduq Al-

Infaq Al-Khairi, and Al-Eslah Society's Welfare Committee). Only official begging is sanctioned in the country, i.e., women mainly are licensed and have a permit to visit shop owners to solicit charity and usually only during the month of Ramadan. However, beggars (men and women) can be seen in many parts of the capital city on a regular basis.

### *Child Sexual Abuse*

The worldwide current awareness of family sexual abuse started in the 1980s (Patten 1991). The incidence of child sexual abuse in Bahrain has not been documented in any published reference. Hospitals keep their own statistics which are not officially reported. In contrast to rarely seen cases of battered child syndrome, several cases of sexual abuse are seen every week by hospital medical personnel, nurses, and social workers, according to informants. The number of children seen by private doctors and in private hospitals is also not reported. A team of doctors and a psychologist are now addressing this issue, and perhaps data on prevalence and trends will be available in the future. The lasting impact on the children involved and their families, and the relationship of sexual abuse to dysfunctional families to broken homes because of other social factors, such as high unemployment, have not been studied or reported.

Sexual abuse is detected in various ways, including the wife catching the father and daughter. In some cases, bleeding in the genital or rectal area may be the first sign seen by parents or reported by the child; a skin rash or symptom of a sexually transmitted disease (STD) may be the first sign. Babies of 6 to 8 months, toddlers, preadolescent, and adolescent children are the victims. In some cases, the abuse is from a male relative (father, uncle, or brother), or outsider, or gang of boys who may be sexually abusing the male or female child in question. Cases are reported of maids playing with and sexually abusing male or female children. None of the reported cases are as extreme as the male mutilation seen in Saudi Arabia by a mentally disturbed mother (Hegazi 1990). Incest and sexual abuse cases reportedly occur among Bahraini and non-Bahrainis, including South Asian expatriates. Healthcare personnel state Pakistanis are more frequently involved; however, there are no clear data on trends.

The extent and frequency of police involvement in sexual abuse cases varies. If an outsider or group of boys is involved, and a male child was abused, then the police may be called. If a female child was abused and a male relative was involved, e.g., the father, then the police are not called. In these latter cases, the female child may more often be taken to a private doctor, or to no doctor. In the last ten years, there have been two publicized cases of young girls raped by expatriate men. One was a 5-year-old child playing outside her house. Neighbors and family members caught the expatriate Asian man and severely beat him. The second case involved an Asian school guard who raped a young preadolescent female student.

### *Pedophilia*

Pedophilia has not been studied; however, pedophilia regarding young boys is talked about and is not a new practice. During the late 1980s, there was a man reportedly raping young boys in the Muharraq area. The case was discussed opening by worried parents, but the outcome of this situation was not publicized. Bahraini pedophiles paying boys for sex both in Bahrain and abroad are known, and such cases are discussed openly by older members of the local community. Groups of older boys are sometimes involved in rapes of young boys, however, these data are not reported. Pedophilia in Saudi Arabia, in contrast, is considered a major crime, and

those caught are sometimes beheaded, depending on the extenuating circumstances such as alcohol use and kidnapping.

#### *Acquaintance, Date, Marital, and Stranger Rape*

The prevalence of rape is not reported. Isolated cases are known to occur, and a few have been reported in the print media, usually no more than one case in a year. Those reported in the media generally involved expatriates and sometimes Bahrainis. One case of homosexual rape of a young village boy by an older village boy resulted in the child's murder. Stranger rape does occur, e.g., one Asian woman (a maid), took a taxi ride late at night and was raped by the driver. She also contracted a severe case of genital herpes from this incident. The frequency of rape in Bahrain, in comparison to cities of 500,000 to 600,000 people, would provide valuable comparative data. Many Bahraini families possibly do not report rapes because of the shame involved, and Asian women are reluctant to report also, so accurate figures are difficult to obtain; but underreporting of rape is the situation in all countries around the world. Marital rape has not been studied.

### **B. Sexual Harassment**

Sexual harassment has not been studied in Bahrain in the workplace, nor in social situations. According to the Sura Al Noor, unrelated men and women ideally should talk about essential things only. Women government workers have been known to call and harass a male coworker over the telephone while at work, but this is very rare. Likewise, the occasional male coworker has been known to harass a female coworker at work or in social situations. These incidents are reported as very rare; however, the real prevalence is not known, as Asian females in particular are reluctant to report any problems or to cause trouble for fear of losing their jobs. Bahraini females are also reluctant to report such cases because of the lack of witnesses and the shame of making the problem publicly known. There was one publicized case of telephone harassment, which continued after a Bahraini woman married. The harassment resulted in a murder plot, after which the man's body was discovered in the desert. The husband was jailed for life and the woman for a shorter term.

Women report that off-color jokes may be told in their presence when they are a member of a group. The men will "look out of the corner of their eye" to see if they were overheard. The women say they have been schooled not to respond in any way, or to indicate that they heard what was said.

Touching between men and women in public, such as holding hands, is seen occasionally; however, at work it is limited to an occasional handshake. An unrelated man should not touch a woman, according to Islam. Some women refuse to shake hands even in professional situations, or some wear gloves, or a glove on the right hand. This practice can be seen on the television during graduations and other public ceremonies when an official shakes everyone's hand.

Body language has been studied among the Arabs for many years, and social distance is reportedly closer than seen in some Western countries. Men talking to men, and women talking to women may be standing within 6 to 10 inches (15 to 25 cm) of each other. In Bahrain, however, this social distance appears to be extended between members of the same sex to 12 to 18 inches (30 to 45 cm) so expatriates do not have the same "close" feelings as when talking to some Mediterranean nationalities. Among males and females, this talking distance is usually further apart at two to three feet (60 to 90 cm). Very rare exceptions to this rule occur when someone is agitated and they may poke with a finger at an expatriate person's arm while making a point and usually without realizing

what they are doing. Occasionally, a powerful man may put their hand on a woman's back, but this is rare, and the expatriates say they feel uncomfortable. Among the various expatriate groups in Bahrain, this social distance varies depending on the age (hand holding seen among male or female teenagers) or the nationality. Hugging when meeting a person is more common among the Filipinos, while casual kissing is seen among all groups, including Bahrainis, at the airport upon departure or arrival. Hand holding among men is a common sight among grown men. Bahrainis, South Asians, and Filipinos are seen holding hands on the streets. The practice is also seen among some women, but it is less common.

Kissing between men is a common practice and is seen in the media, in public, and at work. Kissing on the cheek, forehead, and shoulder is a sign of respect, and among friends a sign of welcome. Kissing between women is also seen frequently in public and at work as a sign of respect, and of greeting, especially if the women have not seen each other recently or some one is returning from a trip.

### **C. Prostitution**

Prostitution has existed in Bahrain for many years and the *British Agency Annual Reports* include data on this topic. There was an increase in prostitution reported between 1926 and 1937 in the British reports. A number of foreigners earning good pay came to Bahrain from Persia, Iraq, and India without their families, and this caused an increase in prostitution, which is a matter of supply and demand.

The history of prostitution in Bahrain since World War I has been discussed in various sources. Designated brothel areas were established (Rumaihi 1976, 193). There was formerly a section of west Manama, between Naim and the Police Fort, known as "Gubla," and an area in Muharraq known as "Al Grandol." There were brothels in these areas with female prostitutes, and the male prostitutes were almost as numerous as women. A February 8, 1937, court decree ordered that prostitutes should live and work only in these two designated places. Prostitutes living or working elsewhere would be deported. The court ruling also ordered the deportation of those "highly professional" prostitutes. The female prostitutes were predominantly from Persia, Iraq, and Oman, with Persians commanding the highest prices, then Iraqis and Omanis, respectively. The female prostitutes were all known as "Daughters of the Wind" according to Belgrave (1960); Bahraini informants report they were known as "Daughters of Love."

The male prostitutes were chiefly Omani boys (Belgrave 1960). All the Omani men did not live in this area, as some also lived with families who could afford their services. Later, there were Bahraini women who were the children of former slaves also working in these areas, while Belgrave (1960) notes the presence of foreign women "who had become Bahrain subjects by the simple expedient of marrying Bahrainis." Among these various groups of women, some were divorced, more commonly they were poor, and a few married women did it for the money or even pleasure. The brothels themselves were attended by men of all socioeconomic classes and ethnic groups.

Bahrainis now in their early 40s or older all reported a range of knowledge regarding this topic and the location of the districts. Some knew of such a former "Red Light" district, but they were not sure where it was exactly. Some said they used to visit it with their parents while on business trips, for example, to collect rent. Others reported they visited the area because it was where "all the action was." One informant said he collected bottles and cans for recycling and used the money to visit the ladies. Another informant reported she was very young, but she remembered seeing a man with a

young boy. When she asked her mother why the man had the young boy, her mother answered "he is married to him."

The term *Grandal* is still used in another context by elderly people to describe or comment on an individual whose behavior is "loose" according to preferred standards. Such a woman is called a *Grandal*, or it is said she is acting like a *Grandal*. Older people listening understand the connotations of the term. The areas designated for prostitutes started to decline in the early 1970s, and prostitution activities became more dispersed throughout the country with the opening of hotels. Still, women reportedly can be seen standing in doorways in the old Gubla area in Manama.

Various reasons are given for the decline of this area in town and the recent changes seen in prostitution patterns. First, in the early 1970s, there were major political and economic changes seen in Oman. The current Sultan deposed his father and began investing millions of riyals in major infrastructure improvements in the country. There was an improvement in job opportunities, so many Omanis returned home. Second, the local, economic development of the 1970s because of the boom in oil prices resulted in the building of many new apartment blocks so there were flats (apartments) available in many parts of the city. Also the British military wanted flats and villas in which to live, so there was a building boom, and then Bahrainis moved into these dwellings also (Taki 1974). People could have more privacy away from their families. Third, the economic boom of the 1970s also meant people had more disposable income and could afford extras like paying for a small flat or small villa. Fourth, the economic boom of the 1970s resulted in an increase of expatriate laborers between 20 and 50 years of age, including those from the Philippines and Sri Lanka. These two groups, all informants state, are highly involved in prostitution in Bahrain. Some Filipinas are paid a monthly salary or given gifts of sometimes up to BD400 (US\$1,000) or more by their male friend. Because of the low opinion of Filipinas in general, women with families, and even elderly women over 60, report being approached directly or indirectly for prostitution (money is brushed on their arm or flashed so they can see it). Finally, after Bahrain gained full independence from the United Kingdom in 1971, U.K. residents were granted special visa privileges, i.e., no visa was required for the first three months of entry. Many U.K. residents came to Bahrain and the United Arab Emirates in the Gulf looking for jobs and employment opportunities. Some of the British women found jobs, others sponsors, and others travel between Bahrain and the United Arab Emirates and are seen frequenting the hotels working as prostitutes. This visa law was changed in 1996, and a visa is now required for U.K. residents as a result of reciprocal changes instituted by the European Union.

After the opening of the Saudi Causeway in late 1986, local women experienced many problems while they were walking on the streets, in shopping malls, or attending parties in hotels. The Causeway also led to an increase in the number of incidents reported by women who said they or their friends were approached by Saudis. Western women with their children reported being approached in shopping malls by Saudi men and being offered money for their services. Bahraini women, because of the problems, began avoiding hotels even for wedding parties on Wednesdays, Thursdays, and Fridays to prevent such situations from occurring. Women working in public areas in Government buildings are given hotel phone numbers by Saudis, and many have requested job changes to less public areas as a consequence. These situations were predicted by Wilsher in 1982, and reflect an expansion of the prostitution activities described by Farouhy (1951, 20) who stated that "prostitu-

tion forbidden in Saudi Arabia has greatly increased under the complacent eyes of the authorities and Bahrein has become a kind of 'pleasure island.'"

Solicitation for prostitution is quite open. Expatriate men report being approached by women in hotels and shopping malls. One first-time consultant visitor from the U.S.A. in 1989 was invited to look at a photo album of women by a taxi driver taking him from the airport to his business appointment. The visitor reported being absolutely amazed to see this in a strict religious country. A Filipino man attending a hotel disco with a group of friends approached a Western woman and asked for a dance and was told "you cannot afford me."

The nationality of female prostitutes has changed through the 1980s and 1990s. During the 1980s, Filipinas could be seen going off with men they picked up, even while in family pizza restaurants. Sri Lankans were available on certain streets in various areas of Manama. Also, there continues to be a main street in Adliya commonly referred to as the "meat market," where Filipinas walk about at night. New nationalities of prostitutes have been seen during the 1990s. Since the breakdown of Communism, Russians began traveling freely to the Gulf. Many came to Bahrain and the United Arab Emirates for shopping, and there was a billion dollars in Russian trade for the United Arab Emirates during 1995 alone. Some of the women also came to sell small items, while others came as prostitutes. Russian women were available in some of the expensive hotel restaurants frequented by Saudis, and outside two- and three-star hotels and other restaurants frequented by other tourists. Many of them advertised their services for BD20 (\$53) by holding up two fingers. One informant asked to see the C.P.R. (Central Population Registry) residence cards of Russian women outside an expensive restaurant. They had current C.P.R. cards and their profession was listed as "business." By the summer of 1996, Bosnian female prostitutes were reportedly working out of one of the mid-size hotels. These women usually asked for the equivalent of BD25-50 or a gift, such as a watch, if money was not available. Adolescent Ethiopian prostitutes have been seen on the Exhibition Road area with pagers.

Prostitution is not illegal in Bahrain, and it must be mentioned that solicitation for prostitution is not as blatant in Bahrain as that seen in Abu Dhabi, where women constantly walk up to men standing alone on the street, or while waiting for transport.

#### D. Pornography and Erotica

All pornographic materials are strictly prohibited by law and are confiscated by customs officials if detected. Most, if not all, expatriates coming to Bahrain are told that three items are strictly prohibited, i.e., pornography, items on the Israeli boycott list or made in Israel, and cultured pearls. The latter two classes of items are seen, however. Cultured pearls are not to be sold in Bahrain, but are worn, and the boycott list has changed since the Gulf War.

Pornography is available in Bahrain, e.g., magazines, as they are not picked up by security upon arrival as easily as metal items (by the metal detector), or drugs (by drug-sniffing dogs), or computer diskettes containing pornography. All videos are viewed by customs agents at the airport upon arrival; others are retained and can be picked up later in Manama at the censorship office. Blue videos are still smuggled in, as well as items on the Israeli boycott list; these reportedly are "not that difficult to find." Arrests of individuals holding blue movies or computer diskettes containing pornography, and those caught selling them are sometimes publicized in the newspapers as a deterrent. Rel-

atives and roommates may turn in the sellers or users to the police. Names of the culprits may be publicized in the press or withheld.

### E. Sex-Related Murders, Suicide, Self-Mutilation, and Sex with Animals

Murders in Bahrain have been very rare for the first nine decades of the 20th century. The British advisor reported in the *Bahrain Government Annual Reports Volume II 1937-1941* that "usually about one or two murders are dealt with by police during the year." This general trend continued until the 1990s.

The early reports also mentioned that "occasional murders may take place which are not detected, especially women and newly born children." These women were put to death by their relations because "they had dishonored the family. Killing a woman for this reason was considered by many Arabs to be justified" (Belgrave 1960, 100). Belgrave notes that he knew of cases where an unmarried girl was "put away" because she was pregnant, but he knew of no cases of a wife being killed because she was unfaithful. One case was related in the late 1980s of an expatriate Arab man and his brothers who managed to forcibly take the man's wife to their home country. They informed the wife's Western doctor they were going to have the woman and the child killed for bringing shame on the family. No action could be taken as there was no crime in Bahrain. This practice has been stopped in Bahrain for decades.

Currently, it is reported that the majority of pregnant, unmarried Bahraini women are sent abroad for abortions or practice self-induced abortion to avoid bringing shame on themselves and their family. Others may check into a maternity hospital, sometimes under a false name, and leave the child behind in the hospital.

Prostitutes in the former brothel areas were sometimes murdered by jealous lovers, according to Belgrave (1960, 103). More recently, during the last ten years, there were two sex-related murders involving Filipinas. The media reported one was murdered at work, reportedly by a Pakistani lover, while the other body was found in a dumpster near a hotel.

Sex-related murders between individuals who are or were lovers have been reported, but they are very rare. During the last ten years, there were several publicized heterosexual cases in the media, e.g., a Filipino couple (the man murdered the woman, and then killed himself), and a South Asian woman was killed by her lover. There have been a couple of homosexual-related murders, for example, one village man killed his lover and buried him in the yard. And in another case, a younger Bahraini male (late teens) killed his elderly British lover.

Suicide because of shame about sexual matters is rare, but does occur. An Indian woman whose child was found to be HIV-positive confessed that she was involved with a Pakistani male. After an investigation, it was determined he had slept with a Filipina, who had been involved with a Saudi. The Indian woman committed suicide soon after the investigation, and her family (husband and son) were deported, as they were HIV-positive.

Successful suicides versus parasuicides appear to be more common among Asians in Bahrain, particularly Indian males and females. Firearms, except for antiques, cannot be legally held by the general public in Bahrain, so serious suicide attempts are made by means of hanging, electrocution, drinking of kerosene or self-immolation, slitting of wrists to cause arterial bleeding, and drug overdose. Investigations published in the press show that the men are usually depressed over their financial situation or illegal resi-

dency status, while the women are having work difficulties (termination or warning letters) or family difficulties in India or locally. Some Indian women are trapped in abusive marriages to Bahrainis and have no place to seek assistance. Other precipitating factors may include sexual abuse by the husband's male relatives and other family situations.

One research study on suicide has been published to date (Metery et al. 1986). In 1981, the police suicide register showed 150 people attempted suicide mainly by ingesting drugs for a rate of 0.04%. Religious values (suicide is a mortal sin in Islam) and social stigma possibly contributed to the low rate (Metery et al. 1986). This study showed more women, generally unmarried in their 20s, attempted suicide, and 60% had attended their local health centers within the previous six months complaining of somatic symptoms such as headache and body aches. This study did not indicate the number of Bahrainis or non-Bahrainis listed in the suicide register. A growing pattern of self-induced drug overdoses is reported among Saudi women (Malik et al. 1996), Kuwaiti (Emura et al. 1988), and Qatari women (El-Islam 1974). The precipitating event(s) leading to suicide need to be studied.

Parasuicide survivors (impulsive attempts) are brought to healthcare facilities. A six-month audit of Medical Department admissions between late 1995 and early 1996 in one general hospital showed 1.08% of the admissions were parasuicide attempts, with a ratio of 4.5 females to males, the same ratio of Bahrainis to non-Bahrainis, and the same ratio of impulsive situations versus psychiatric histories. Causes of impulsive attempts included exam failures, problems at work, a fight with a family member, recent divorce, recent parental death in the family, and marital arrangements.

One case of self-mutilation by a Thai male who became depressed, reportedly when his girlfriend left, was reported in the press. Urological surgeons in the large government hospital performed successful surgery in this case. Attempts of this nature are extremely rare (one case in ten years).

Another deliberate self-harm (DSH) practice known as "jumping syndrome" appears to be common in the Gulf States, and is seen increasing in prevalence in Qatar (El-Islam 1974), Saudi Arabia (Mahgoub 1990), and Kuwait (Suleiman et al. 1986). Predominantly Asians, and mainly females with an average age of 29 years, are jumping off buildings in an attempt to kill themselves. Studies show that many have died, while others have had extensive fractures and required long-term hospitalization for an average of 56 days, which places a cost burden on the Gulf States free health services. The proportion of unsuccessful attempts resulting in minor injuries is not known. The females jumping, in most cases, had no history of previous psychological illness. Sexual and physical abuse are the most important factors which push females to deliberate self-harm. Some of the jumping syndrome survivors alleged that this was the reason; however, sexual abuse was not proven (Sadat-Ali et al. 1995, 189). Reportedly, this is the method of choice for suicide in Kuwait because of the non-availability of drugs (Suleiman et al. 1986). Cases of jumping syndrome have not been reported in the media in Bahrain; however, medical personnel have been alerted to this trend.

There have been no studies conducted regarding Bahrainis having sex with animals, and there are no local anecdotal stories discussed regarding this topic. An archaeology text by Bushiri (1992) discusses seals found in Bahrain and Kuwait from the Dilmun period which show intercourse between a man and a bull, which the man performed from behind the bull while holding the rear of the bull.

## 9. Contraception, Abortion, and Population Planning

### A. Contraceptives

Attitudes regarding contraception vary from couples who accept all children as the will of God and who make no effort to prevent pregnancy, to those who plan, space, and limit their families. In the former situation, many women report it is the husband who feels more strongly about this issue and who refuses to use contraception. In some cases, the women want more children and the husband refuses, e.g., the woman may be the second or third wife and the husband has many children, including sons, from a previous marriage(s), so he may then have a vasectomy after only two children from the last wife. The wife may then feel cheated and expresses regrets. Other families quote the Koran's injunction to be able to provide for their children well, so they use various forms of birth control (condoms, IUDs, or pills) to space their children. Spacing varies from one to three or even 15 years. Women say, "My husband told me I can get pregnant again after three years," and men have said, "On my salary, I can only afford to have this number, so we needed to space our children." Among the college-educated, some boldly say, "Two is enough." One Government publication reported that 50% of Bahraini families are using some form of contraception and another report states that 54% of married women are using contraception (A. A. Ahmed 1995, 15). The local birthrate of 2.91% is still one of the highest in the world. There are other factors motivating high pregnancy rates, including certain segments of society who are having children simply to outnumber other segments of society for potential political gains.

A group of Bahraini intellectuals from several specialties organized the Bahraini Family Planning Association (B.F.P.A.) in 1975. Bahrain has the only F.P.A. in the Gulf and is one of 15 in the Arab region with their regional headquarters in Tunis. There are 165 country associations in the world with their main office in London. There are approximately 200 active members in Bahrain promoting the association's work. A survey was conducted by the association in 1983 to test the attitudes and knowledge of the population regarding contraception. This initial survey showed promising results, and the association has been active ever since. The association has facilitated other research by providing data, contacts, or support to researchers, and several theses have been completed (Al-Darazi 1984, 1986; Al-Gaseer 1990). The B.F.P.A. contributed US\$10,000 towards the costs of the 1996 National Family Health Survey of 5,000 randomly selected Bahrain families, including 26,000 individuals. The survey was sponsored by the Gulf Cooperation Council Ministers of Health and the U.N.D.P. The questionnaire included items relating to reproduction and sexual health. The report with analysis was expected in 1997.

The funding for the B.F.P.A. organization comes in part from funds redistributed by the B.F.P.A. Central Committee to countries around the world. The local president is on the B.F.P.A. Board, the Central Committee, and the Budget Committee. Other funds come from donations by local individuals, various institutions, and the Government, i.e., Ministry of Labor and Social Affairs. Contraceptive aids are given by the B.F.P.A. to the Ministry of Health for distribution to families in the Primary Health Clinics, Salmaniya Medical Center, or the Maternity Hospitals. The B.F.P.A. also accepts gifts of clothes and other items, which are distributed to needy families. Annual reports are prepared at the local, regional, and federation levels describing activities of the association.

The activities of the B.F.P.A. are geared toward increasing public awareness of the types of contraceptives available for family planning. There is no local opposition; however, an occasional non-Bahraini will raise opposition to their work. The association provides lectures to representatives of local groups who then go back and talk with members of their respective group. The B.F.P.A. has videos, cassette tapes, and pamphlets, as well as a library, at their association headquarters in Gafool. The current five-year plan has four main goals which the group is trying to reach, i.e., youth awareness, promotion of counseling and family planning, empowerment, and development of volunteerism and fundraising.

Family planning nurses working in Maternal-Child Health indicate that there has been a trend toward increasing use of tubal ligations and vasectomies for birth control, even among village residents. B.F.P.A. and the staff nurses state that people are better educated about their options for birth control, have the desire to space children, and many want to limit children out of economic necessity, e.g., because of the recession and no jobs. Nurses praise the support of the Bahrain Family Planning Association and their assistance in providing free contraceptives, and, at times, clothing or goods to needy families.

Free contraceptive aids are available from the Government at all the Primary Health Centers and at the Government hospitals for all Bahrain's residents. Free tubal ligations and vasectomies are likewise available and are being used increasingly by older couples as a means of birth control. Health education courses regarding contraception are presented at the Government Primary Health Care Centers, and videotapes are also available. The 1993 *Annual Report for Primary Health Care in Bahrain* notes that "due to religious beliefs and traditional attitudes," a total of 4,573 visits were made during 1992 for family planning services. Out of these visits, 2,917 women initiated a contraception method, and 263 received IUDs. A total of 8,660 women received family planning counseling sessions, which was 7.8% of females in the child-bearing age (Fouzi Amin 1993). A study conducted in one Health Center in the United Arab Emirates included 908 women between 15 to 44, and 50% of them were using some means of contraception (Blankensee et al. 1995).

Many doctors discuss birth control options, including sterilization, with grand multigravida (more than eight to ten children) and high-risk patients (those with repeated Cesarean sections and other complications) at the time of delivery. Doctors document when the patient refuses to have a procedure, or has signed a sterilization permit. After delivery, the doctors indicate if the patient has requested some form of birth control and what choice was made. The doctors' personal beliefs play a factor in whether birth control options, such as a tubal ligation, are even mentioned. Some couples, after making their own choice, may be told by a doctor that their choice to have a tubal ligation is *haram* (forbidden). More assertive and more educated couples will find another doctor, while others may be ashamed or afraid to discuss this matter with another doctor. There are no institutional ethical standards to guide physicians regarding this matter, or to suggest that they refer couples to another doctor who is willing to discuss such matters. If a woman is declared unfit, e.g., mentally retarded or unfit to be a mother, the family can request she be sterilized.

Condoms are sold openly in grocery stores and pharmacies. There are many private clinics in Bahrain, and three private hospitals, where birth control information and supplies are available for a fee.

Data on birth control practices of the various expatriate populations are not reported. Misconceptions regarding

pregnancy abound, and some Indian girls are prohibited by teachers and parents from swimming in coed pools for fear they will get pregnant. The knowledge of Syrian, Jordanian, Palestinian, and Beluchi women has not been studied, and they are the expatriates having the largest families.

### B. Teenage Pregnancies (Unmarried)

Although unmarried pregnancies occur, their incidence and prevalence among Bahrainis and non-Bahrainis, and teenagers specifically, are not known. A Bahraini girl/woman and her family will try to cover up such a scandalous incident. Male informants all knew of women "in trouble," while female informants rarely knew of anyone.

Teenage pregnancies are not a major problem as seen in the West, because a girl's behavior is strictly monitored by her parents. A girl, from the time she is 10 to 12, is kept close at home when not in school. Even if she attends the University, her parents know where she is and her daily schedule. Most girls are married after completion of Tawyehi or college, and some later even in their 30s; however, until she is married, a girl is expected to live at home. A Kuwaiti researcher supports this perception that "illegitimate pregnancy is a problem of small dimension in Muslim societies" (Hathout 1979). No objective data are available on this topic.

The children of unmarried women, in the early part of the 20th century, were at times murdered with the girl by family members (Belgrave 1960, 101-102). Other infants were abandoned on municipal rubbish dumps, *Samadah*, at the corners of streets, or placed outside the hospital (Belgrave 1960, 103). Some of these foundlings were looked after in the American Mission Orphanage. Others were cared for in the Government hospital, and very often foundlings were taken in by women who had no family. Another view was noted by Charles Belgrave who wrote that "for the children there was very little stigma in illegitimacy" (1960, 103). He said he knew several young men "who were proud of belonging to important families, though on the wrong side of the blanket."

Currently four to six abandoned children a year are referred to the Children's Home. The number of expatriate women and maids becoming pregnant is not known, as many return to their homes to deliver. Rare cases are reported in the media, e.g., an expatriate maid delivered a child which died and the body was buried in the garden, and later a child in the family uncovered the body while playing. In this case, the expatriate woman was deported. Other newspaper reports note court cases where, for example, a young boy found a dead baby wrapped in a cloth outside the home, and he told his mother who alerted the Police Station.

### C. Abortion

Abortions are provided in Bahrain only under strict religious regulations, i.e., a person cannot decide to have an abortion because of lack of birth control or an unwanted birth or rape. Abortions for these reasons are illegal. One study was conducted in Kuwait on "unwantedness," so it is a phenomenon seen in the Gulf. In Kuwait, the women tried to induce abortion with medicines, violent exercise, or mechanical interference (Hathout 1979). Objective data on this topic is not available for Bahrain.

A medically indicated abortion allowable by Sharia law can be obtained in a government hospital, usually before three months, if the fetus has been found to be deformed, or with a congenital defect detected through ultrasound, amniocentesis, or other tests. Early abortions can also be performed if the pregnancy poses a threat to the life of the mother, and early deliveries are done if the woman has life-threatening conditions such as PET or placenta previa. The

justification for these abortions is to save the woman's life and to preserve the family, as she has other children to care for, and "she is the root of the family while the fetus is the branch which is sacrificed to save the root" (Hathout 1979). In the case of the fetus with a defect, the rationale for abortion reportedly is to prevent suffering.

The attitude to abortion, especially in the case of an unmarried pregnancy, varies from liberal, "Why didn't she have an abortion when she was outside the country?" to very conservative, "She had an abortion outside and this needs to be reported to the religious police." Some informants report that the majority of unmarried Bahraini women have abortions outside the country because of the shame (*ayeb*) of an illegitimate birth. Illegal abortions do occur in Bahrain. Informants reported, "She drank some liquid and had an abortion." Others report, "She was told to take seven to eight birth control pills for three days, but it did not work." Nurses report this latter method is seen and is effective. Some individuals try other self-induced methods which are more dangerous, including dilatation of the cervix, and insertion of items into the uterus. A Filipina abortionist was caught operating in Bahrain in 1995 after a Saudi client became septic because of the abortion and, during interrogation, revealed the abortionist to the police. All the considerable money the abortionist had in her bank account was confiscated by the Bahrain Government and she was deported.

### D. Population Policy

The population growth of Bahrain is 2.9%, which is one of the highest in the world. The effect of this high population growth, and its effect on the country's growth and development, has been discussed in many reports and in the media. There is currently no government policy to educate people regarding the need to reduce population growth. All informants stated that there is no policy that women should be encouraged to use some means of birth control or to have a tubal ligation after so many children, e.g., four.

The Government has instituted a fee of BD100 (US\$265) for all expatriates who deliver in government facilities and who are non-entitled workers, or the spouses of non-entitled workers. This may be an indirect means of discouraging expatriate births, or a way of controlling their spacing. For many expatriates to pay BD100 a year out of a monthly salary of BD60-80 is a great burden. Likewise, the Government requires male workers to be making a minimal salary of BD250 before they can bring their families to Bahrain. Another means of controlling the number of expatriates and their burden on the health service is to deny residence visas for elderly relatives (over 65). Generally, work visas for government jobs are not given to expatriates over 60 to 65 years for men and 55 years for women.

Premarital counseling is encouraged by the Government and is provided free in the Primary Health Centers and government hospitals. In 1992, 545 couples received premarital counseling and among them, 89 abnormal findings were detected (Fouzi Amin 1993, 27). Premarital counseling is being encouraged, but is not yet required among Bahrainis because of the high incidence of first cousin marriage (39%) and the high frequency of genes for blood disorders in the population, including sickle cell disease, G6PD deficiency, a variety of major and minor thalassemias (Nadkarni et al. 1991), as well as other congenital anomalies (Sheikha Al-Arrayed 1996).

Other Arab countries, such as Egypt, have population control slogans such as "look around." Other Islamic countries, such as Pakistan and Iran, have developed programs to educate people to limit their families to two or three children. Bahrain has no public policy to date. Approximately

0.1% of the recent Ministry of Health budget has been spent on family planning, while 0.2% has been spent on control of illegal drugs, and 0.3% on medical exams of newly hired expatriate workers (1991 Ministry of Health Report).

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

#### *Incidence, Patterns, and Trends of STDs*

Venereal diseases were reported by the first American missionaries who arrived in Bahrain in the late 1890s and early 1900s (Rajab 1979). The missionary doctors were able to test for gonorrhea in the early 1900s and found it was a common disease. Venereal disease in 1914 ranked next to malaria (Patterson 1914). A high proportion of the population was suffering from the ophthalmic form of gonorrhea, which was rampant according to the *Government of Bahrain Administrative Report* for 1926-1937, and the *Bahrain Government Annual Reports 1926-1960*. Venereal infections ranked high, along with smallpox, malaria, dysentery, and trachoma.

Tracking of a second STD was started after a definite diagnosis for syphilis was possible by 1933-34 at the American Mission Hospital's Laboratory (1933-34, 9). During the 1940s, there were over a thousand cases treated annually, and by 1948, venereal infections had spread even more, and 200 patients were treated as inpatients and 1,200 as outpatients. At that time, the Government took certain stern measures against foreign women of loose character (Al-Khalifa 1982). Venereal infections started coming down after the introduction of new medicines, and Bahrain was the pioneer for the whole region in developing an infrastructure to improve healthcare. In 1952, the Public Health Department (P.H.D.) was separated out as a distinct entity, and its statistics show that after 1965, venereal infection trends are greatly reduced from the 1940s (Al-Khalifa 1982, 219). The P.H.D. laboratory is the preferred lab for testing blood samples of infectious diseases and all positive samples are sent to them for confirmation and follow-up of personal contacts.

The incidence of STDs has been studied mainly in relation to their effect on urinary tract infections and antibiotic drug resistance (Yousef et al. 1991), infertility, and impotence, rather than the epidemiology of their occurrence and relationship to various types of sexual activity.

The overall frequency of male urethritis and STDs in Bahrain is low, 108/100,000 (541/500,000) versus 1,600/100,000 in the U.S.A.; however, the isolates of *Nisseria gonorrhoea* found are often highly resistant or show diminished sensitivity to penicillin (Yousef et al. 1991, 94). The number of gonorrhea cases peaked in 1980 to over 600 cases per year. The 1994 figures were the same as 1990 (379 to 380 cases/year). Gonococcal infections in 1994 ranked third after influenza and chicken pox. In contrast to Bahrain's statistics, the first case of *Nisseria gonorrhoea* in a pregnant Saudi woman was only reported in 1988 (Abdul Khaliq & Smith 1988).

Syphilis cases reported to the P.H.D. in Bahrain have been increasing since 1990 from 37 to 104 cases in 1994 (*Statistical Abstracts 1994*). These rates (0.019%) are low in comparison to other parts of the Middle East and may reflect reporting inconsistencies or treatment outside Bahrain. A seven-year study conducted in Saudi Arabia on 90% of hospital births (Saudis and non-Saudis) showed an increase from 0.2% to 1.5% overall incidence of syphilis in 1986 (Abbas & Satwekar 1989). This rate is high in comparison to European statistics, but lower than other Middle East and African data. Endemic syphilis is prevalent in the Middle East, and all

cases of syphilis are treated as infectious until proven otherwise. Up to 20% of adult Bedouins in Saudi Arabia have been exposed to endemic syphilis *bejel* (Abbas & Satwekar 1989). Secondary syphilis symptoms may be the first noted and treated. In Saudi Arabia, this has been reported by Basri and Smith (1991). In one case, the husband was being treated in a VD clinic but did not tell either of his wives, and one wife was never brought for treatment. In another case, a Somali bisexual had many sexual contacts, and in the third case, the patient denied any extramarital contacts. A problem in Saudi Arabia, which is difficult to overcome, is tracking of contacts. The first case of congenital syphilis was reported in Kuwait in 1987 (Hariri & Helin 1987).

The seroprevalence of chlamydial infections was shown to be 44% of 100 pregnant women randomly screened in Bahrain. This suggests a high prevalence of chlamydial disease in the population, although some of the antibody-positive cases may be from old ocular infections (Rajab et al. 1995). The U.S.A. average is 3 to 5%, and 15 to 20% in an STD clinic. In Saudi Arabia, the rates ranged from 10% of women seen in a gynecology clinic to 30.6% of men attending an STD clinic. Chlamydia, overall, accounted for 11% of all gynecological infections seen in one Saudi Arabian hospital (Qadri et al. 1993). Another study in a Saudi Arabian STD clinic showed 46% of males and 36% of female were affected, while 2% of men and none of the women attending a Primary Health Care clinic were affected (Qadri et al. 1993). Genital forms in Saudi Arabia were estimated at 38.4% and ocular forms at 61.6%. Chlamydial infections can be a cause of blindness, and is a familial disease, especially where there is overcrowding, large numbers of children, lack of water, and poor hygiene. The prevalence of people with and without overt genital disease is higher in Saudi Arabia than in developed countries, but similar to rates seen in Bahrain. The role of chlamydia in female infertility because of blocked tubes was reported by Babag and Al-Mesbar (1993), who state that chlamydia is high in the Saudi Arabian population, but significantly higher in infertile women.

Hepatitis B is now classified as a sexually transmitted disease. The percentage of the Bahrain population affected is 2% (Mahnon & Fernandez 1972). This incidence is higher in Saudi Arabia (14%) and 9% in Oman (Al-Dhahry et al. 1994). Saudi Arabia and Oman have high endemicity of hepatitis B, while Bahrain has more hepatitis C (4.7%) versus Saudi Arabia (0.2 to 5.0%) (Bakir 1992). Currently, hepatitis C is not classified as an STD. A study on the risk of transmission of hepatitis B infection among family members in Bahrain showed a transmission rate of 26% (Parida & Effendi 1994).

Human papiloma virus (HPV) is a sexually transmitted agent which has been shown to have a strong relationship with neoplasms of the female genitalia. One study showed the rate of infection among 25- to 35-year-old women in Bahrain to be 63% (Sunderaj 1990).

#### *Treatment for STDs*

Treatment for STDs is provided free to all Bahrainis; however, because of the nature of the disease and its social implications, people generally attend private clinics, see consultants in the private hospitals, or even attend clinics outside Bahrain for treatment. There is a specialized private venereal disease clinic in the Gudaibiya area.

Prevention of spread of STDs through tracking of sexual contacts is a problem in the Middle East (Basri & Smith 1991). Affliction with VD is seen as a sign of low morality, so patients vehemently deny any extramarital affairs. The men may not tell even their wives they are being treated. The men may have had casual sex (as seen in Saudi studies)

while overseas, so their contacts are unknown and are lost. The Bahrain Public Health Department tries to determine all contacts. Other forms of prevention include vaccinating all newborns in Bahrain for hepatitis B according to WHO guidelines to prevent a burden later in the healthcare system. Other prevention efforts include public education lectures, programs in the media, and other methods. These programs do not include the incidence of these diseases in Bahrain nor their prevalence in the various ethnic groups, but mainly stress the need to make a general concerted effort to prevent them by good moral behavior.

One direct method for prevention of STDs has been tried in Bahrain, as in other Arab countries. During the late 1980s, the Jordanian Government started handing all single male travelers a card warning about the dangers of AIDS. Likewise in Kuwait, information pamphlets are distributed at the airport warning travelers about the dangers of sexual diseases outside the country. As many Arab men take single or male-only group vacations to the Far East and Europe, such prevention problems were instituted by several Arab countries. Traveling Bahrainis state that at the Bahraini Airport, pamphlets on STDs are likewise distributed, but men report this is not on a consistent or daily basis as in other countries. Another direct way of prevention, by prohibiting sex vacations, was in effect for awhile. Visas were required to travel to certain countries, e.g., Thailand. These restrictions have since been lifted.

There are Bahraini men who regularly travel to Thailand, Philippines, Hong Kong, or elsewhere for sex vacations. Some are unmarried, others married. Informants have reported that one single man was asked, "Aren't you afraid of contracting some disease?" he responded by saying, "God's will." He could not be convinced of the unsafe nature of his activities. Another married man makes two trips a year. When he was asked about safe sex, he shrugged his shoulders. Another man, a well educated and highly paid professional, would make Asian trips and repeatedly return with ophthalmic infections and expected his doctor to cure him again. The incidence of these trips is not known, nor how many use "safe sex" during these encounters. There are Bahraini women having affairs in Bahrain, usually in hotels or flats, as well as abroad. The number who have contracted STDs because of an affair has not been studied or reported. The annual number of venereal cases published by the Government does not distinguish among Bahrainis and non-Bahrainis, nor do they make any distinction among those who contracted the STD from their husband or wife, through a local affair, or an affair abroad. There are no statistics regarding how many are divorced or unmarried and living on their own versus individuals living in parental homes. All this information is needed to detect trends and to plan effective prevention programs.

## B. HIV/AIDS

### *Incidence, Patterns, and Trends*

Doctors in Bahrain were first alerted in 1985 to the new disease called AIDS (*flocks al mana'ah al mukta sabah*), and lectures were given in 1989 and 1990. The first public reports on the occurrence of HIV in the population appeared in 1990. At that time, 95% of the HIV carriers reportedly were drug users, and 5% had received organs or blood outside the country (Fulafel 1990). The latter group going to India have a risk of 1:12 of HIV seroconversion following transplantation in Bombay, based on figures from other Gulf countries (Al-Dhahry 1994, 314).

HIV testing is done in government facilities. No consent is obtained from individuals before testing. Now all conscripts into the Bahrain military and civilian employees of

the military are tested for HIV, HBV, HCV, sickle cell disease, G6PD deficiency, and other relevant factors, depending on family history and country of origin. Staff are tested upon employment and during retroactive screening regimens. Patients attending the Shaikh Khalifa Bin Mohammed Al Khalifa Cardiac Center for any invasive procedure are all routinely checked for blood-borne viral diseases. Expatriates positive for HIV will not be treated at the Cardiac Center unless they have an emergency condition, and like all positive expatriates, will be sent to their home country immediately under Public Health Laws. Other hospital and clinic patients, excluding dialysis patients, are not routinely tested, and are checked based on the nature of their current signs and symptoms. If an HIV-positive result is returned, generally elective surgical procedures are canceled.

Expatriate workers recruited for all government health-care facilities are tested, as well as maids, cooks, and beauticians who are processed through recruitment agencies and hired to work in Bahrain. Bahrain does not require an "AIDS-free certificate" for all expatriates, including wives and children, taking up residence before their arrival in the country, unlike Kuwait and Saudi Arabia, which require all expatriates taking up residence in the country to be HIV-free. The United Arab Emirates Health Department screens everyone in the country for HIV on a periodic basis, as their expatriate workforce comprises 70% of the population. Over 1,600 HIV-positive cases have been detected to date in the U.A.E., with the majority of cases detected among Asian expatriates, who were deported.

### *HIV Incidence among Newborns, Children, and Adults.*

HIV-positive status is seen among newborns in Bahrain. The incidence is not known, as women and babies are not being screened as done in 37 states in the U.S.A. and elsewhere. The suspected rate of infection at the time of birth, or later from breastfeeding, is not known, nor the number of newborns who later revert to HIV-negative status.

Children of various ages have been detected positive for HIV and have died from AIDS. The first AIDS death in Bahrain in the 1980s was a child infected through a blood transfusion given abroad. The known routes of HIV transmission have been vertical, mother to child, and from blood transfusions received abroad. Infections from sexual abuse have not been revealed to date, if such data are known. The rate of horizontal transmission among family members is also not known. A few adolescent HIV and AIDS cases have been seen in healthcare facilities.

The incidence of HIV infections among adults has been reported by the Government. More men than women have tested HIV-positive. The proportion of Bahrainis versus expatriates is not clearly indicated in the Government data. In 1991, according to Ministry of Health figures, 0.09% out of 7,374 blood donors were positive as were 0.01% of 8,173 reporting for their preemployment physical exam. The trends show an increasing number of reported cases each year for men and women. All expatriates who test positive for HIV are deported according to the Government's Public Health rules (as are those with hepatitis B and C, tuberculosis, and leprosy). The potential drain of these expatriate individuals on healthcare funds, and the possibility of cross infection to others, are the rationale of the Government enforcement of deportation rules.

There are three main patterns of HIV infection seen among men. Intravenous drug users comprise the largest number. During the late 1980s, government media releases indicated IV-drug use was the primary known source of HIV infection among men (Fulafel 1990). Heterosexual, bisexual, or homosexual activities, including multiple sex partners

in Bahrain or abroad, e.g., India, Thailand, Philippines, and Western countries, are the second source. Blood transfusions abroad, in countries where blood is not routinely tested, e.g., India and the Philippines, remains a third route of infection.

There is a long history of hard drug use among men in Bahrain. Iranian opium was marketed between Iran, London, and Hong Kong by the British trading ships of the East India Company during the late 19th century and into the early 20th century. Some opium was shipped to Bahrain via dhows. Opium was sold in herb shops in Manama called *Abdareen* shops. These sales continued during the 1920s and 1930s. There was widespread use among those of Persian descent, Beluchis, and Indians. People usually smoked opium, but as their tolerance developed, they began taking it orally. One man used to see his relative putting three to four pieces of opium in his mouth and drinking it with tea. Unlike the other groups, the Arabs only used opium for medicinal purposes to treat headache or stomachache, and it was given in small quantities diluted in milk to put a child to sleep.

The use of opium later declined in the early 1940s when it was outlawed and became a controlled substance. Then new types of drugs, including IV drugs became prevalent. A study from 1980 to 1984 showed an annual increase in cases of drug involvement and narcotics dependence (Mattar 1985). In 1991, the Bahrain courts heard 197 drug-related cases involving 433 drug users or traffickers of several nationalities.

Currently, drug use is strictly controlled and there are frequent arrests at the airport, mainly of expatriates who try to bring in heroin, opium, and hashish (marijuana). Other drug caches of heroin have been found at sea hanging on buoys. Occasionally, someone is caught, usually an expatriate trying to bring in drugs via the Saudi Causeway. In spite of controls at all ports of entry, supplies of drugs are readily available on the Island. School principals have openly told students what places to avoid, as they are known for drug sales. People report having relatives who are IV users of hard drugs. Money is given to them by family members to purchase drugs. Others may rob to support this habit. The Government newspapers every week contain information about court hearings for drug use, drugs confiscated at the airport, drug sales, or drug-related deaths—all among men. The incidence of these drug hauls is reported by the Ministry of the Interior. The incidence and prevalence of IV-drug use among the population is not reported, but it is a major factor in HIV transmission in the country. Narcotics Anonymous has a local chapter, and reformed addicts attend, speak at local seminars, and give public lectures upon request. They talk about the 12-step rehabilitation program and how it helped them, once they admitted they were addicted to drugs.

The extent of bisexual activities and the danger of HIV transmission because of these unsafe sex contacts has implications on the future health of the women to whom these men are married and their offspring. The frequency of interaction among homosexual and bisexual men is not known; however, anecdotal stories show that Bahraini men have been known to have Western expatriate lovers in Saudi Arabia and elsewhere, unknown to their Bahraini wives. Also, naive young women sometimes discuss their personal relations with coworkers, including their husbands' practices during intercourse, e.g., "needing a cucumber in his rectum."

The patterns of HIV infection among women in Bahrain differ from men. Their numbers are very low. The early cases in the 1980s were seen among women who contracted the virus during operations abroad, or from blood transfusions, e.g., from India. Their positive status many times was discovered when the patient attended a hospital for another procedure. More recently, women are being infected during

heterosexual activities with their husbands or a lover; fortunately, these cases are rare to date. Transmission of HIV infection from a wife to her husband has occurred, but these cases are also rare.

Among healthcare workers, there have been no documented cases of HIV contracted through blood contact or sharp injuries. However, several cases and deaths from hepatitis B and hepatitis C infections from patients are known in the community. The practice of deporting HIV-positive expatriates, and deaths of some Bahraini patients from AIDS, have kept the known number of HIV cases in Bahrain below 200 for the last ten years. The published cases of AIDS are listed as 20 (Wahdan 1995).

If there are data kept on the incidence of HIV among homosexuals, lesbians, and bisexual persons, they are not published, nor are they in the public domain.

#### *Availability of Treatment, Prevention, and Government Policy*

The Government of Bahrain provides free healthcare for all Bahrainis who are HIV carriers. Government workers must provide care for these individuals, and doctors are aware of all current treatments available abroad. All experimental medications are not available in the country; prophylactic antibiotics to prevent *Pneumocystis carinii* are available.

Regarding expatriates, the Government policy regarding HIV/AIDS includes the following:

1. Recruiting agencies need to test workers in certain service areas in their home countries, including maids, beauticians, cooks, and healthcare workers. In Saudi Arabia and Kuwait, all seeking residence, not just workers, are tested prior to arrival.
2. The above categories of workers are retested after arrival.
3. All expatriates found positive for HIV, HBV, or HCV are deported.
4. All expatriates who are later tested and found positive are deported.
5. There is no scheduled testing for all the inhabitants of the country. (Countrywide testing has been conducted in the UAE and Kuwait.)
6. Local drug users who test positive are incarcerated if their behavior shows they are a risk to others, or upon the request of concerned family members.

Research regarding the topic of HIV is scanty. The Government conducted one study in the late 1980s regarding the population's knowledge about AIDS. The majority reported it was "an expatriate problem." Another study was conducted among military conscripts, and it showed the men knew about the disease, but some were unclear about transmission routes and prevention measures (Parida 1992). A study conducted by medical students showed that only 5.9% of Bahrainis understood the modes of transmission for AIDS, and 32.2% believed it could be cured (Chand n.d.). Obviously, more public health education is needed regarding the topic. A 1995 study on nurses' knowledge about AIDS has not been reported to date. In 1995, the Government announced appointments to a National AIDS Committee.

The United Nations resident coordinator and UN Development Program (UNDP) resident representative, Dr. Faysal Abdul Gadir, has been outspoken regarding shying away from the AIDS threat:

Once again there is the problem of people not acknowledging that in fact it is a problem. . . . Forget for a minute the sociocultural view that it is impossible to contract it

due to religious and social regulations. The reality is people are contracting the disease and we can't close our eyes and say it is the problem of industrial and non-Muslim countries. We cannot say it is irrelevant to us. It will mean a drain on the budget as the State will have to take care of each patient until he dies. (Gadir 1996)

Lectures are provided occasionally to the public on HIV and AIDS in the Government Health Centers and videos are also shown. The Ministry of Health has distributed booklets in Arabic about AIDS. Indirectly, the Government provides knowledge about AIDS though the choice of movies shown on government-controlled television channels (Arabic and English). The WHO sponsored an AIDS-awareness day in 1995. Discoveries of the latest AIDS advances are sometimes published in the local government-controlled newspapers (Arabic and English). During the 1996 Ninth International AIDS Conference, daily updated information was printed in the local English-language newspaper.

Public education about the dangers of AIDS is not provided on a continuing basis. There are no active government media programs, such as the public service advertisements seen on the television in the U.K., U.S.A., or other countries. There are no large posters shown on hoardings (signboards), or at bus stops or public malls as seen in India, Hong Kong, and Botswana. There are no notices about safe sex, or clean needles on the doors of public toilet stalls, or at the airport like you see in Australia or Hong Kong. The overall health education budget for the Ministry of Health in 1991 was 0.1% of the total budget or US\$120,000 (BD56,229,000) for education regarding all areas.

[Update 2002: UNAIDS Epidemiological Assessment: Bahrain has established a regular reporting system for AIDS and HIV testing and results. Injecting drug use accounts for 67% of all AIDS cases until 2000. Although the registered prevalence of HIV among injecting drug users was in 1989 and 1990 around 8% and 3%, respectively, a steady decrease was noted from 1991 onward to reach less than 1% in 2000. HIV cases among pregnant women are sporadic and no particular HIV trends are noted among this group. Premarital testing was introduced in 1999 and seroprevalence in this group is less than 0.1%.

[Blood safety measures are strictly observed in Bahrain, and HIV screening data cannot be used to describe HIV trends nationally. Screening of TB and STD patients is reported yearly and the results are not significant. During the period 1995-2000, the seroprevalence of syphilis among blood donors and pregnant women in Bahrain was around 0.22%. During 1998-2000, the prevalence among STD patients was five times higher and exceeded 1% during 1998-2000.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	< 1,000 (rate: 0.3%)
Women ages 15-49:	150
Children ages 0-15:	NA

[No estimate is available for the number of adults and children who died of AIDS during 2001.

[No estimate is available for the number of Bahraini children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Definition of Sexual Dysfunction

The definition of sexual dysfunction can be based on the patient's perception and/or on underlying organic and psychological causes. There have been no reports published in

the Bahrain medical journals on this topic, although various lectures on related topics have been presented.

### B. Availability of Diagnosis and Treatment

The patient's perception of sexual dysfunction needs to be assessed accurately by urologists and other healthcare professionals. In some cases, the individual who is normal may be comparing himself to what others say they are capable of performing, e.g., intercourse once a week versus three times a day (E. Amin 1994). Many patients are reluctant to describe sexuality and sexual aspects of their marriage, as seen in the study among primary healthcare patients conducted by Kahtanie (1992). Once a psychological basis for sexual dysfunction is diagnosed, the patients are referred to the psychiatrist if they agree. Many patients in Bahrain and the Gulf do not seek psychiatric help until their difficulties become more prominent and continuous and interfere with their marital or social life (Al-Khani & Arafah 1990). Acceptance of psychiatric referrals has increased dramatically during the last ten years, although education level and perception of any shame associated with psychiatry still inhibit individuals getting the help they may need. Bahrain provides free psychiatric service for anyone in the country, and the Psychiatric Hospital and outpatient clinics are well staffed with highly trained Arabic- and English-speaking Bahraini and expatriate male and female doctors.

Individuals with addictions whose behavior is erratic, including their sexual activities, can receive free psychiatric treatment and can attend addiction clinics or drug detoxification programs. There are also longstanding, self-help groups, such as Alcoholics Anonymous (held at American Mission Hospital), and a new local chapter of Narcotics Anonymous (founded in 1996). There are known cases where addicted individuals having HIV continued to be irresponsible in their sexual behavior, and their families asked to have them placed in jail to control them in the interest of the public welfare and prevention of cross infection.

Organic causes of sexual dysfunction are varied and their incidence is rising. The incidence of congenital anomalies in Bahrain is 20%. This figure is based on the 80% of deliveries which are conducted in the Ministry of Health facilities (excluding the military and private hospitals, and home births). Anomalies of the genitourinary system rank second at 2.5/1,000 after musculoskeletal at 2.8/1,000 (Al-Arrayed 1987). This rate is lower than 21.6/1,000 in Al-Ain and 12.9/1,000 in Abu Dhabi, and 6.6-8.5/1,000 in Saudi Arabia (Topley & Dowda 1995). The author notes that all malformations, based on international studies, may not be noted at birth (only 43%), or during the first six months (82%). Other problems are noted later, especially those of a sexual nature, which may be detected only during adolescence, or later after marriage.

Organic causes of sexual problems seen in Bahrain and the Gulf area include undescended testes, hypospadias (Al-Arrayed 1987), webbed penis (Husa & Al-Samarrai 1990), intersex disorders requiring gender reassignment, such as Turner's Syndrome, Klinefelter's Syndrome, and XX genotype females/phenotype males, and XY women (Al-Arrayed 1996). Expert surgical help is available, as well as penile prosthesis implants. Endocrinologists can provide adjuvant hormonal therapy, as needed. Clinical psychologists or psychiatrists can provide counseling for individuals and/or their families on gender identification and possible social outcomes. In order to prevent the continual rise in occurrence of organic causes of sexual dysfunction among the young, doctors are recommending genetic counseling for individuals before marriage and after the birth of an affected child. A genetic counseling group clinic has been established; however,

participation is voluntary. Screening on 515 couples in a Health Center showed that among them, 89 had abnormal findings detected (F. Amin 1993). A similar recommendation for genetic counseling was made in Kuwait (Telbi 1988).

## 12. Sex Research and Advanced Professional Education

There are no institutes or programs for sexological research in the State of Bahrain. Nor are there any post-college or graduate-level programs for the advanced study of human sexuality, or any sexological journals or periodicals. Occasionally, a related article will be published in the two national medical journals:

*Bahrain Medical Bulletin*. Editorial Officer, Box 32159, State of Bahrain. Tel: 0973-265 258; Fax: 0973-277 036.

*Journal of the Bahrain Medical Society*. Editorial Office, Box 26136, Manama, State of Bahrain. Tel: 0973-742 666 (5-10 p.m. local time); Fax: 0973-715 559.

There are also no national or regional sexological organizations among the six Gulf Cooperation Council member states (Bahrain, Saudi Arabia, Kuwait, Qatar, United Arab Emirates, and Oman). There is a Bahrain Sociologists Society, which has published a series of monographs in Arabic. Bibliographies available on Bahrain include:

Ailan, R. M. 1996. *Bibliography for Women in the State of Bahrain* (in Arabic). Bahrain: Information Center for Women and Children.

Badu, B., & M. Awad. 1995. *Arab Women Bibliography: A Study Conducted in Eight Arab Countries*. Tunisia: Center for Arab Women Training and Research. (Includes French and English titles for Bahrain, Egypt, Jordan, Kuwait, Lebanon, Morocco, Palestine, Yemen; database to be updated annually.)

Davis, G. A. 1993. *Catalog of the Bahrain Historical and Archaeological Society Library* (English titles). Bahrain: Historical and Archaeological Society, P.O. Box 5087, Juffair, Bahrain.

Manzer, B. 1996. *BMED: An Index to Gulf Medical Journal Holdings in the Al Farsi Library (1979-1995)*. Bahrain: Ministry of Health, Al-Farsi Library, College of Health Science, P.O. Box 12, Sulmaniya, Bahrain.

Sarhan, M. M. 1995. *National Bibliography, Vol. 1*. Fakhrawi Book Shop Printing & Publishing, Translation, Bahrain: P.O. Box 1643, Manama, Bahrain.

*Statistical Abstracts 1994*. 1995. State of Bahrain, Central Statistics Organization, Directorate of Statistics.

Information is available in English and Arabic on related topics in the following libraries:

Bahrain Family Planning Association Headquarters, Al-Qufool, Bahrain Tel: 0973-232233, 256622 Fax: 0973-276408.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Botswana is located in southern Africa, just north of South Africa, with Angola to the northwest, Zambia to the northeast, Zimbabwe to the east, and Namibia to the west. With a total area of 231,800 square miles (600,370 km<sup>2</sup>), Botswana is slightly smaller than the state of Texas. In the southwest, the Kalahari Desert supports nomadic San Bushmen and wildlife. In the north, farming is carried on amid salt lakes and swamplands. Livestock graze on the rolling plains in the east. The climate is semiarid, with warm winters and hot summers.

In July 2002, Botswana had an estimated population of 1.59 million. These estimates take into account the effects of excess mortality because of AIDS. This can result in lower life expectancy, higher infant mortality and death rates, lower population and growth rates, and changes in the distribution of the population by age and sex than would otherwise be expected. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 40% with 1.01 male(s) per female (sex ratio); 15-64 years: 55.8% with 0.93 male(s) per female; 65 years and over: 4.2% with 0.68 male(s) per female; Total population sex ratio: 0.95 male(s) to 1 female

**Life Expectancy at Birth:** Total Population: 35.29 years; male: 35.15 years; female: 35.43 years

**Urban/Rural Distribution:** 63% to 37%

**Ethnic Distribution:** Tswana: 79%; Kalanga: 11%; Basarwa: 3%; others, including Kgalagadi and white: 7%. Note that these are mere estimates, as the government does not carry out ethnic censuses.

**Religious Distribution:** Indigenous religions: 85%; Christian: 15%

**Birth Rate:** 28.04 births per 1,000 population

**Death Rate:** 26.26 per 1,000 population

**Infant Mortality Rate:** 64.72 deaths per 1,000 live births

(CIA 2002)

**Net Migration Rate:** -0.24 migrant(s) per 1,000 population

**Total Fertility Rate:** 3.6 children born per woman

**Population Growth Rate:** 0.18%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 35.8%; *Persons living with HIV/AIDS:* 290,000; *Deaths:* 24,000. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 70%

**Per Capita Gross Domestic Product** (purchasing power parity): \$7,800; *Inflation:* 6.6%; *Unemployment:* 40% (the official rate is 21%); *Living below the poverty line:* 47% (2001 est.)

### B. A Brief Historical Perspective

The earliest known inhabitants of the region were the San, who were followed by the Tswana. Today, over three quarters of the population are ethnic Tswana. The terms for the country's people, *Motswana* (sing.) and *Botswana* (pl.), refer to their national rather than ethnic identities. Encroachment by the Zulus in the 1820s, and by the Boers from Transvaal in the 1870s and 1880s, threatened the peace in the region. In 1885, Britain established a protectorate, known as Bechuanaland. In 1961, Britain granted a constitution to the country. Self-government began in 1965 and the country became independent the next year. Botswana is Africa's oldest democracy.

In its early years, Botswana maintained good relations with its white-ruled neighbors, but that changed in later decades as the government harbored rebel groups from Rhodesia and South Africa. Although Botswana is rich in diamonds, it has a high unemployment rate and stratified socioeconomic classes. In 1999, the nation suffered its first budget deficit in 16 years, because of a slump in the international diamond market. Nevertheless, the nation remains one of Africa's wealthiest and most stable countries.

## *1. Basic Sexological Premises*

### A. Character of Gender Roles

In Botswana, patriarchal sex/gender systems relegate males to positions of power and women to subordinate po-

\*Communications: Dr. Ian Taylor, Department of Political and Administrative Studies, University of Botswana, Private Bag 00705, Gaborone, Botswana; [tayloric@mpopi.ub.bw](mailto:tayloric@mpopi.ub.bw).

sitions within the context of cultural beliefs and practices. Patriarchal beliefs are based in cultural beliefs. Tswana culture makes a clear division between the public-political and the private-domestic spheres—women are largely relegated to domestic activities of childcare, and home maintenance. Men continue to dominate the arena of political decision-making within traditional political forums, such as the ‘kgotla,’ the house of chiefs and parliament. While women form a significant proportion of the electorate, they hold very few political positions.

Gender differences occur in the education of females and males. While there are equal enrollment rates for females and males in the first nine years of schooling, the enrollment figures for males outnumber those of females in higher levels of education, including vocational training schools. Enrollment rates at the only university in Botswana, the University of Botswana, show that the highest gender discrepancies are in the fields of engineering and technology, as well as the Faculty of Science, where the ratios of males to females are approximately 8:1 and 3:1, respectively.

## B. Sociolegal Status of Males and Females

Botswana operates a dual legal system that consists of two ‘legal’ systems that are expected to operate side by side. On the one hand, there is what is known as Customary Law—which basically consists of laws based on the different customs and traditions of various ethnic groups. The second system is that of the General Law that is an adaptation of Roman and Dutch Law that was imposed during the colonial period from 1889 to 1966.

While the constitution of Botswana stipulates that there shall be no discrimination on the basis of sex, both legal systems reflect the strong influence of patriarchy. There are no clear distinctions between female and male children according to the laws. The distinctions begin at adolescence, largely in the area of punishment. In the context of customary law, corporal punishment is used within the context of ‘minor’ crimes, such as petty theft, and in minor civil offenses, such as indecent exposure and the use of insulting language. While both sexes may be sentenced to corporal punishment, it is largely practiced on male adolescents and adults.

There are certain aspects of the employment act that discriminate against women. The employment act prohibits the employment of women as soldiers in the army, as well as miners working underground.

## C. General Concepts and Constructs of Sexuality, Love, Marriage, and Family

It is difficult to generalize concepts and constructs of sexuality and love, as there have been very few context-based studies on these concepts and constructs from which one can draw conclusions. Worth noting, however, is the influential work of anthropologist Isaac Schapera, who documented the customs and practices of Tswana groups in present-day Botswana and South Africa during the early part of the 20th century.

Tswana groups had gender-specific rites of passage that served to prepare young persons for adulthood and to control premarital fertility. Young adolescent males would undergo *bogwera*, which included circumcision and seclusion in the wild, during which time they would be taught survival tactics, as well as tribal laws and customs. Pubescent girls would undergo *bojale* in the village, through which they received formal instruction preparing them for the assumption of domestic and agricultural chores, as well as appropriate sexual behavior upon marriage.

Marriage in traditional pre-colonial Tswana groups was a lengthy multistage affair arranged through families, rather than by individuals. Individuals typically married soon after undergoing initiation rites. Marriage negotiations were initiated by a group comprised of the groom’s ‘key’ male relatives: his paternal uncles and male representatives from his mother’s family. These representatives of the groom’s family initiated the process by meeting with representatives from the prospective bride’s kinship group. After a period of time, the groom’s family would offer a formal betrothal. The formal betrothal (*patlo*) included the provision of gifts to the woman’s family, such as a cow, and a blanket for the paternal aunt of the woman (Schapera 1966).

The effects of socioeconomic changes and cultural diffusion are evident in present-day Botswana popular culture.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

According to *The World Factbook 2002* (CIA 2002) about 85% of the people of Botswana hold to indigenous religions and only 15% are affiliated with Christian denominations. However, in our view, the predominant religious beliefs in Botswana can best be described as “modified Christian.” For the larger part of the 20th century, the religious institutions that were given legitimacy in Botswana were those from Western countries. These included: the Roman Catholic Church, the Anglican Church, the London Missionary Society, the Dutch Reformed Church, and others.

While traditional indigenous religious rites, such as ancestor rituals, were largely outlawed during the colonial era, many of these indigenous beliefs have been integrated with Christian doctrine in the new “spiritual” churches. Many of the “new” churches follow a Christian dogma that integrates aspects of traditional cultural practices—some of which have been outlawed. One example is the practice of polygamy, which was outlawed before independence. Polygamy is practiced under customary traditions among the Mazezuru; however, it is practiced “informally” within the context of some religious movements.

### B. Source and Character of Ethnic Values

Botswana is a country that is characterized by ethnocultural heterogeneity. The nation is essentially composed of a number of ethnic groups, each of which has their own languages—some of which are variations of dialects. These ethnic groups have their own peculiar customs and beliefs.

The ethnic groups can generally be divided into two main categories: Setswana-speaking and non-Setswana-speaking groups. The main Setswana-speaking groups include the Bakwena, Bangwaketse, Bangwato, Bakgatla, Barolong, Bamalete, Batawana, and Batlokwa. The common feature among these groups is that they all share Setswana as a common language. They do, however, use different dialects of Setswana. The non-Setswana-speaking groups include the Basarwa (San or Bushmen), Bakalanga, Baherero, Bayei, Bambukushu, Basubia, as well as people of European, Asian, and African origin.

It must be noted that Setswana is the official language. This is justified on the basis that most of the citizens of Botswana are Setswana-speaking groups. This integration of other ethnic groups has many implications for the interpretation of culture and tradition, and perhaps explains why there is a scarcity of information on sexuality within the context of cultural diversity.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

Botswana has no policy on sex education. Issues of sexuality are highlighted in the National Population Policy, and are discussed under Reproductive Health. The school curricula offer adolescent and sexual reproductive health through Guidance and Counseling. Other school subjects, such as science, also subscribe to the idea of Sexual and Reproductive Health. This is reflected by the topics that are integrated into the school curricula: personal guidance, social guidance, sexuality and HIV/AIDS, family life education, teenage pregnancy and HIV/AIDS, sexually transmissible infections and HIV/AIDS, as well as HIV/AIDS care and support. Topics are more comprehensive and detailed for secondary-school level than they are for primary-school level.

#### B. Informal Sources of Sexual Knowledge

There exists among the Tswana the tradition of reticence on sexual matters between parents and young people. Young people are more comfortable discussing sexuality with their friends and other members of the extended family than they are with their parents. Studies done in the country show that parents are uncomfortable talking about sexuality with their children, but for others, it may be just lack of access to sexual health information and services.

It is also evident that sexual norms have changed over time in Botswana, and parents feel they can no longer exercise control over their children as compared to the past, where relationships between young people were governed by strong societal norms that protected them. These norms also encouraged their respect for elders. However, in spite of little contribution by parents as a source of sex education, there seems to be a considerable amount of information about AIDS and increasing condom use among the youths. The sexual attitudes of youth are positive about condom use, and they are more likely to be engaged in safer sexual practices now than in the 1990s, even though their sexual behaviors are still risky.

### 4. Autoerotic Behaviors and Patterns

Most people in Botswana do not feel very comfortable talking about their own sexuality, and autoeroticism is no exception. However, negative attitudes towards such behavior appear prevalent in Botswana. As one sex education magazine put it, "masturbation has always been associated with trashy magazines and males especially 'bo-sacmen.' Society has come to define it in an extremely narrow minded manner" (University of Botswana 2001, 10).

### 5. Interpersonal Heterosexual Behaviors

#### A. Adolescents

##### *Puberty Rituals and Premarital Sexual Relationships*

Anthropologist Isaac Schapera (1970) documented the customs and practices of Tswana groups in Botswana and South Africa during the early part of the 20th century.

Tswana groups had gender-specific rites of passage that served to prepare young persons for adulthood and to control premarital fertility. Young adolescent males would undergo *bogwera*, which included circumcision and seclusion, during which time they would be taught survival tactics as well as tribal laws and customs. Pubescent girls would undergo *bojale* in the village, through which they received formal instruction that prepared them for the as-

sumption of domestic and agricultural chores, as well as what was deemed as appropriate sexual behavior upon marriage. Current indications are that these rites of passage are no longer being practiced among different ethnic groups. These processes are now mostly left to individual parents and educational institutions.

Over the years, much debate (within civil society and in certain government sectors) has focused on adolescent sexual activities. One of the key concerns has been the relatively high rate of teenage pregnancy in Botswana. Botswana Health Surveys consistently indicate that the average age at first birth for women in Botswana is 18 years. Data from the United Nations Development Programme rates teenage pregnancy at 19%. Teenage pregnancies are cited as a problem because they contribute to girls dropping out of school. Studies conducted on sexual behavior among adolescents point to the high rates at which young persons are engaging in sexual activities. While most of the sexual relationships are between young persons in the same age cohorts, indications are that many young women are engaging in sexual relationships with older men, who are often referred to as "sugar daddies" for financial reasons.

The discussion of teenage sexual relationships has been largely limited to 'problem' areas, such as teenage pregnancy and the spread of HIV/AIDS. This is partly because of the ambivalence in larger society about being seen to 'legitimate' premarital sexual relations. The HIV/AIDS prevalence rates point to the fact that up to 15% of all HIV-infected persons are in the age cohort 15 to 19 years. As a result, more attention is turning to understanding the challenges faced by young people, both females and males, in a rapidly changing environment. Within that context, the National AIDS Coordinating Agency (NACA) and the government AIDS/STD Unit are working with various nongovernmental organizations to assess youth sexuality, as well as developing appropriate measures to raise awareness and empower young people to negotiate safe sex or abstain.

#### C. Adults

##### *Premarital Relations, Courtship, and Dating*

See Section 1C, Basic Sexological Premises, General Concepts and Constructs of Sexuality, Love, Marriage, and Family.

##### *Sexual Behavior and Relationships of Single Adults*

When Botswana attained her independence from Britain in 1966, more than 80% of the population resided in the rural areas, depending on family-based subsistence agriculture for survival. In some instances, family incomes were supplemented with remittances from migrant workers in South Africa. Statistics from the 1991 census indicate that 45% of the population of Botswana currently resides in towns or 'urban villages.' The urban villages are primarily those in which the majority of the population does not rely on agriculture as their main source of livelihood. The rate of rural-urban migration is high, with both women and men leaving the rural areas in search of a 'better life.' These changes have had profound impact on individuals as well as family forms in Botswana. While gaining their independence from parents and extended family influences on the one hand, the lives of young adults in Botswana are embedded in a juxtaposition of traditional culture and the trappings of modernity.

Sexual behavior and relationships of single adults should be seen within the context of rapid socioeconomic

change, gender identities, and unequal power relations between women and men. Men are traditionally expected to initiate and control sexual activity. This places women in a subordinate position with regard to the negotiation of safe sex, particularly with regard to the use of condoms.

### *Marriage and Family: Structures and Patterns*

Table 1 presents data on marital status by sex for the three census periods 1971, 1981, and 1991. The figures on marital status reveal a significant decline in the proportion married (by over 14%) between 1971 and 1991. While the mean age at marriage for men used to be significantly higher than that for women, the gap has been closing steadily over the years. There are significant gender differences in the categories separated/divorced and widowed, with more than 50% of the female population over 65 years being widowed compared to only 10% of men. This gender difference can be attributed to the tendency for men to remarry, or establish new co-residential consensual relationships following the deaths of their spouses, while women remain single.

A study conducted by the Women and Law in Southern Africa Research Trust (WLSA) in 1996 reflected a range of family forms that reflect the rapidly changing nature of social relations. While the conventional, male-headed family-form based on marriage remains common, there is evidence that a large proportion of families consist of mother-child dyads, as well as cohabitants, both forms of which are on the increase. The study observed that while the interests of the collective remained paramount, individuals who are part of the societal collective articulate their interests and needs through a constant negotiation of cultural practices and individual autonomy. While families vary in form and content, the pursuit of material and emotional support continue to be of paramount importance in determining family membership.

## *6. Homoerotic, Homosexual, and Bisexual Behaviors*

Homosexuality is a taboo subject in Botswana, and this is generally reflected in the attitudes of the officials and the society at large. People very rarely come out publicly to declare that they are homosexuals. The homosexual community as a whole is rejected, victimized, and sometimes blackmailed. This is because of societal myths, and because homosexuality is a forbidden subject in Botswana culture. Homosexuals face stigmatization and prejudice from family members, friends, and society in general. Indeed, same-sex activity between males and females is illegal in Botswana. The Botswana Penal Code makes those

found guilty of ‘carnal knowledge of any person against the order of nature’; ‘carnal knowledge of an animal’; or ‘permits a male person to have carnal knowledge of him or her against the order of nature,’ is liable to imprisonment for a term not exceeding seven years (Republic of Botswana 1986).

Thus, the social status of homosexual, lesbian, and bisexual couples is legally illicit and there are no legal provisions providing for equality with heterosexual couples. The Lesbians, Gays and Bisexuals of Botswana (LEGABIBO) Charter was drafted in response to those amendments to the Botswana Penal Code, which came into effect on April 30, 1998, and extended the seven-year maximum penalty for men caught engaging in same-sex sexual relations to women as well. The Charter emerged at a workshop on Lesbian and Gay Rights on May 2-3, 1998, hosted by Ditshwanelo—The Botswana Centre for Human Rights. The government has so far refused to register LEGABIBO as a nongovernmental organization. Because homosexuality itself is illegal in Botswana, LEGABIBO is in an awkward position. A spokesman from the organization claimed that “the government has stated that it will refuse to register our organization because to do so would be tantamount to registering an organization of criminals. Thus we can’t raise funds to do our work” (*Sunday Independent* [Johannesburg], September 26, 1999). Homosexuals have no social or legal protection available for these experiencing prejudice or discrimination, and LEGABIBO has urged its constituency to choose very carefully those to whom they tell about their sexuality.

Prosecutions for homosexual activity are, however, rare. The last known case was the high-profile example in 2001 where a Botswana resident, who was accused of engaging in sexual relations with another man, filed an application in the country’s High Court challenging the state’s “unnatural sexual liaisons” laws. The fact remains though that homosexual liaisons are conducted furtively and there is no “out” community of any note.

In fact, the depth of opposition to homosexual behavior in Botswana runs deep. For instance, in 1999, the Botswana Christian Council called for a relaxation of social and legal prohibitions against homosexuality and organized a seminar at the University of Botswana. However, the overwhelmingly youthful student audience rejected such calls out of hand, with one youth leader quoted as saying the majority of Botswana’s people are “traumatized by homosexuality” and “other ideas from overseas and (European and American) donors.” It is very common for homosexuality to be dismissed as a “Western” disease and “un-African,” even though there are numerous indigenous societies in Africa where same-sex relations are common.

## *7. Gender Diversity and Transgender Issues*

The status of transvestites, transgenderists, and transsexuals in Botswana is not a topic of discussion in Botswana, simply because such behavior would be seen as being extremely strange and unusual. There are reports, however, that a handful of transvestites (less than ten) meet occasionally in a bar in central Gaborone. With regard to transgenderists or transsexuals in Botswana, there is no information on such people, and it is so far unheard of.

**Table 1**

**Percentage of Population by Marital Status and Gender of Persons Aged 15 and Older in 1971, 1981, and 1991**

Marital Status (%)	1971		1981		1991	
	Male	Female	Male	Female	Male	Female
Never Married	44	37	51.7	44.5	54.8	49.5
Married	47.1	42.9	44.4	41.5	29	27.2
Cohabiting	n/a	n/a	n/a	n/a	12.2	12
Separated/Divorced	5	6.6	2.1	3.3	1.7	2
Widowed	2.1	11.9	1.8	11	1.5	8.5
Mean Age at Marriage	29.4	24	30.8	26	30.8	28

(Source: Mukamaambo 1995, 58)

n/a: not covered by the census

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sexual Behaviors

#### *Child Sexual Abuse, Incest, and Pedophilia*

Child sexual abuse in Botswana occurs against the background of age and gender-based hierarchies that subordinate the status of children, particularly girl-children to adult authority. Much of the child sexual abuse takes place within homes and is perpetrated by male family members.

#### *Sexual Harassment*

The Botswana legal system is silent on the issue of sexual harassment. The University of Botswana is one of the few organizations that have a policy on sexual harassment. The policy defines sexual harassment as: any unwanted, unsolicited, and/or repeated sexually discriminatory remarks made which are offensive and objectionable to the recipient, or which cause the recipient discomfort and humiliation, or which the recipient believes interfere with the performance of his or her job or study, undermine job security or prospects, or create a threatening or intimidating work or study environment. Sexual harassment continues to be shrouded in secrecy in Botswana, and the absence of legislation contributes to the reluctance of victims to report it.

#### *Rape*

Police statistics in Botswana point to a recent increase in the frequency of rape. In a study conducted among 25 police stations comparing, among other things, the number of reported cases of rape and defilement of girls under 16 years between the years of 1995 and 1998 rose by 18.3% between 1996 and 1998, while reported cases of defilement rose by an alarming 65%. During those years, almost 58% of the victims were in the age category 16 to 30 years; those under 16 years constituted 27%. The majority of the suspects/perpetrators were between the age of 18 and 32 years. The Police Study on Rape, as well as the Study on Violence on Women, indicated that more than two-thirds of all rapes are committed by men known to their victims.

#### *"Dry Sex" or "Wet Sex"*

[*Comment 2003*: As noted in Section 8D, Significant Unconventional Sexual Behaviors, Female Genital Mutilation and Other Harmful Practices, of the Nigerian chapter, sexual relations in subequatorial Africa are male-dominated, with the male initiating coitus and dictating its style and pace. Female response and satisfaction are not considered important. Coitus usually takes place with no foreplay. The male-above position is standard, and marital coitus is for procreation, not for pleasure. Women in many African cultures do not even know what female orgasm is, and may have never experienced it. In describing mating customs in the chapter on Ghana, Augustine Ankoma reports that penile-vaginal penetrative sex with little foreplay is the normal sexual style. Although among the well-educated youth some forms of foreplay are gaining a foothold, fellatio and cunnilingus are abhorrent. Genital manipulation is hardly accepted, and, traditionally, women feel shy to touch the penis, and most men are not interested in having their genitals manipulated.

[These male-oriented cultural values underlie what is appropriately termed "dry sex," a common practice throughout sub-Saharan Africa. The "dry sex" mating behavior fits comfortably with the male distaste for vaginal secretions and foreplay, and disinterest in female sexual arousal and orgasm. In this setting, males quickly reach orgasm and satisfaction. Women are left with painful intercourse, no arousal, and no orgasm.

[In many African cultures, women prepare themselves to pleasure their husbands with a dry vagina by mixing the powdered stem and leaf of the Mugugudhu tree with water, wrapped in a bit of nylon stocking and inserted in vagina for 10 to 15 minutes before intercourse. Other women use Mutendo wegudo, soil mixed with baboon urine, which they obtain from traditional healers. Still others use detergents, salt, cotton, or shredded newspaper. These swell the vaginal tissue, make it hot, and dry it out. The women admit that sexual intercourse is "very painful, but our African husbands enjoy sex with a dry vagina" (Schoofs 2000).

[The inevitable results of "dry sex" include increased friction, vaginal lacerations, suppression of the vagina's natural bacteria, and torn condoms (when these are used). All these consequences increase a woman's risk of STD and HIV infections. Fortunately, the tradition of "dry sex" is waning among the educated urban young, but any change in this traditional mating behavior is also resisted because of rejection of Western gender roles (Stellwaggon 2001).

["Dry sex" is a well-established and more-or-less widespread practice in various subequatorial African cultures. It is very common in Southern Africa, particularly in Zimbabwe, Zambia, Malawi, some parts of Nigeria, some parts of Uganda, Southern Sudan, and even in Kenya and Botswana. The only difference is in what these women use for drying up their vaginas.

[In the northwest part of Tanzania and neighboring regions, "wet sex" is widely known and practiced. "Wet sex" consists of foreplay where there is intense stimulation by the male partner on the woman's labia and clitoral regions. This stimulation results in copious production of secretions (thought to come from Bartholin's glands). People talk about it openly, sometimes mixed with a sense of humor and intertribe jokes. Some researchers have blamed this practice for the high incidence and prevalence of HIV and STDs. The implications of this kind of information for action plans (resource inputs and sociocultural issues) are enormous. Now that these behaviors have been brought into public attention, a well-thought-out survey that is representative of different segments of the populations becomes essential for an effective public health policy (Tanzania, personal communication 2003). In March 2003, when the editor of this encyclopedia inquired whether "dry sex" was observed in Botswana, Dr. Ian Taylor replied: "'Dry sex' is common in Botswana as well and leads to vaginal tears and lesions which help spread HIV/AIDS, it is true." (*End of comment by B. Opiyo-Omolo*)

### B. Prostitution

While prostitution is outlawed by the Penal Code, it is widely practiced in Botswana, predominantly by women. The different types of prostitution include 'streetwalkers' and individuals who frequent establishments where alcohol is sold. In addition, there are an increasing number of prostitutes who focus specifically on long-distance drivers. While little is known about the incidence of child prostitution, girls and young women may engage in sex for financial and material gains from older men.

## 9. Contraception, Abortion, and Population Planning

Botswana has made remarkable progress in the provision and delivery of health facilities and services, but in spite of these improvements, aspects of reproductive health relating to abortion, teenage pregnancies, and HIV/AIDS remain issues of concern. The increase in HIV/AIDS and sexually transmitted diseases has emphasized the demands for distribution of condoms in the country.

### A. Contraception

The current use of contraception in Botswana has been reported by 44% of women aged 15 to 49 years (Central Statistics Office 2001). Majelantle and Letamo (1999) further show that 61% of women attending antenatal clinics in the country have used contraceptive methods.

The most popular method used by women is the pill, followed by condom, injection, intrauterine device, and female sterilization. Condom use is, however, low among women aged 35 years and above, despite its widespread distribution as a strategy to curb the spread of HIV/AIDS. Traditional practices of breastfeeding and postpartum abstinence continue to be important among rural women and are less favorable among urban women.

Teenagers are far less likely to use contraception than older women; however, virtually all of the sexually active youths aged 15 to 24 years had used a condom at least once. There is also high awareness of condoms, high condom use, and consistency, as well as delayed onset of sexual activity among the youth. Condom knowledge and its role in STD/AIDS prevention have been reported at 100% among urban adolescents (10 to 19 years). Attitudes towards condom use are also positive among the young people in Botswana, but the problem is still with embarrassment and the purchasing of condoms.

Women's education level has been found to correspond positively with contraceptive prevalence, and male partners still play a role in the decision of a woman to use contraceptives.

### B. Teenage (Unmarried) Pregnancies

There is a high incidence of teenage pregnancy in Botswana, and this is indicative of unprotected sex and, therefore, has serious implications for the spread of HIV infection as well as other STDs. The rate of teenage pregnancy is one in every three women aged 15 to 49 who attend antenatal clinics. The majority of these teenage women are single and their pregnancies take place outside marriage.

Teenage childbearing also poses social, economic, and reproductive health risks to the young women. These include social and economic problems, such as dropping out of school, rejection by their families and community, and unemployment, and health risks, such as low birth weight, unsafe abortions, incidence of still births, and implications for the spread of STDs, specifically HIV.

The mean age at first sexual intercourse for teenagers is 17.5 years and the mean age at first birth is 18.6 years.

### C. Abortion

There is very little information available in Botswana on abortion. This could be because of the fact that abortion is treated as a sensitive topic and is highly stigmatized in Tswana society.

Abortion is illegal in Botswana. It is only permitted within the first 16 weeks of pregnancy under the following conditions: when the pregnancy is a result of rape, defilement, or incest; when the pregnancy poses a physical or mental health risk to the pregnant woman, and finally, when the unborn child would suffer from or later develop serious physical or mental abnormalities or disease. These conditions are observed only when a medical doctor from a government or registered private hospital or clinic approved by the Director of Health Services confirms in writing that the continuation of the pregnancy would risk the life of either the mother or child.

Even though abortion is illegal, it is apparent that a substantial number of women in Botswana resort to illegally induced abortion (Majelantle & Letamo 1999). These in-

duced abortions are done under unhygienic conditions and are performed by untrained persons, who use dangerous instruments and abortifacients.

With abortion being illegal, educated and wealthy women are reported to obtain their abortion services from South Africa, because in Botswana, induced abortions are only provided for certain medical conditions. Majelantle and Letamo (1999) show that women aged 35 years and above have had multiple abortions.

In its attempts to reduce maternal mortality, the Government of Botswana is aiming to reduce the mortality rate, estimated between 200 and 300 deaths per 100,000 live births in 1991, by at least 50% in 2011. Government hospitals and clinics also provide post-abortion counseling.

### D. Population Control Efforts

Botswana has one of the highest population-growth rates in Africa, at 3.5% per year between 1981 and 1991. If, however, the population continues to grow at this rate, it will make it difficult for the economy to support gains achieved over a long period of time. Thus, the challenge the country faces is to reduce the growth rate of the population and increase the growth rate of the economy.

The young age structure of the population will persist for several years into the future as young women enter the reproductive age. The rapid population growth also places a burden on national and international efforts aimed at reducing poverty and improving the well-being of the population.

Efforts made to control the population growth include the provision of reproductive health and family planning services, counseling, and promoting modern methods of contraception, especially the condom, at all government hospitals and clinics.

The main emphasis is on human development and welfare dimensions in order to enhance the quality of population and improve the living standards, and as a result, the National Population Policy contains explicit and comprehensive strategies to influence population trends in a manner conducive to the attainment of sustainable human development. The Ministry of Finance and Development Planning is responsible for ensuring the integration of population factors in national plans and strategies for sustainable development at all levels.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Sexually transmitted diseases found in Botswana include genital warts, herpes simplex type 2, gonorrhea, and syphilis. These STDs may be the major determinants of the HIV epidemic in Botswana, as a relationship has been established between STDs and HIV transmission in the country. STDs present the third most common cause of attendance at public health facilities (NACA 2002, 30).

According to the National AIDS Coordinating Agency (2002), the prevalence of STDs in the country appears to be declining among women using family planning methods for the years 1993, 1997, and 2002. This pattern is the same for syphilis, gonorrhea, and *Trichomonas vaginalis*, but it is accelerating for *Chlamydia trachomatis* and herpes simplex type 2. The incidence of STDs among adolescents is higher as compared to women aged 35 and above. This is attributed to the low attendance of teenagers at antenatal clinics, and has worsened with the spread of the HIV/AIDS epidemic. Since STDs facilitate the transmission of HIV, and HIV prolongs the duration of symptoms, the prevention and management of STDs and HIV/AIDS has been made the highest priority in the National Sexual

Reproductive Health Programme. In addition to the prevention strategies in Botswana, data on STDs are routinely collected through the epidemiological reporting system.

However, there is still little data in the country on STD surveillance, making it difficult to give an exact picture of the magnitude of STDs in Botswana. Certain factors have been identified to influence this inability to accurately estimate STDs in the country, and include the asymptomatic nature of STDs among women, and the fact that some people with symptomatic STDs do not seek treatment from public health facilities or seek treatment at all.

Control of STDs in Botswana is considered as one of the main prevention strategies for HIV transmission, and according to the Ministry of Health (1998), STD control in Botswana encompasses a comprehensive program based on effective case management of symptomatic STDs in health-care facilities. This strategy calls for sound diagnosis, effective antibiotic treatment, preventive efforts that entail patient education on risk reduction, condom use, and the referral of sexual partners.

## B. HIV/AIDS

Botswana's 1.7 million population has the highest HIV/AIDS infection rate in the world, and HIV/AIDS affects both urban and rural areas with the same intensity. In the early stages of the epidemic, prevalence was higher in urban areas than rural, but the clear distinction does not exist anymore.

AIDS in Botswana is spreading mainly by the heterosexual route (Macdonald 1996, 1325), and several factors may have contributed to the rapid spread of HIV/AIDS in the country, among these are social/sexual factors:

- Relative gender inequality: the position of women in the society, particularly their lack of power in negotiating sexual relationships.
- High levels of STDs: The presence of STDs has been shown to facilitate transmission and acquiring of HIV infection.
- Social migration patterns: Botswana has one of the most mobile populations in the world, and for years, Botswana have had to be mobile and live regularly in two to four different abodes, on a cattle post, in farmlands, a village, and towns). Circulating often between these areas for extended periods, especially during long weekends, has proved to be one of the driving forces of the epidemic in Botswana.
- Disintegration of traditional family patterns: Most of the pregnant women in Botswana are single, and sentinel surveys done in the country show a high HIV prevalence among single mothers who attend antenatal clinics as compared to married mothers. This is also an indication that many Botswana engage in short-term relationships and have other sexual partners subsequently.
- Lack of recreation facilities in the country and lenient law enforcement on the sale of alcohol to minors also make it easy for the youth to engage in risky sexual behaviors.

Given the current infection rates, the infant-mortality rate is expected to increase from 57 to 60 per 1,000 live births by the year 2005 (National AIDS Coordinating Agency 2002, ii). The population of orphans is predicted to increase from 139,000 to 214,000 by the year 2010. As the figures indicate, many children have been orphaned, and before the introduction of the prevention of mother-to-child HIV-transmission program, many babies were born infected with the HIV virus. Other age groups are not spared. It is estimated that in 2002, about 258,000 persons aged 15 to 49 years

were infected with HIV. However, the HIV prevalence in age groups 15 to 19 and 20 to 24 years has remained fairly stable in the last three years, indicating that the rate of new infections is not increasing as it was in the last ten years. This pattern could be attributed to high condom use, a relatively high awareness level, reduced numbers of sexual partners, declining STD incidence, and delayed onset of sexual activity among the youth (Ministry of Health 2001, 3; NACA 2002, 44).

A sentinel survey done in 2002 showed the HIV infection rate to be nine times higher in females aged 15 to 19 years than in males. Higher rates in females in young age groups are attributed to behavioral data. It has been shown that condom use is higher among males than females; girls engage in sexual relationships earlier than boys. Girls also engage in sexual relationships with older men for economic reasons. The prevalence of HIV in pregnant women aged 15 to 49 and women aged 15 to 19 years is outlined in Table 2 for the years indicated.

With the first tentative HIV/AIDS case reported in 1985, there is still no preventive vaccine or cure against HIV. However, the government of Botswana has various initiatives to address the HIV/AIDS epidemic. This is evidenced by the huge political commitment, the increase in resource mobilization and utilization, and the multisectorial collaboration and cooperation at all levels. The president of Botswana, H. E. Festus Mogae, has recognized HIV/AIDS as "the greatest challenge Botswana has faced" and has warned his nation that HIV/AIDS "threatens the country with annihilation." The president even chairs the National AIDS Council, the government structure that coordinates all HIV/AIDS-related activities in the country.

The Government of Botswana pays for at least 80% of all HIV/AIDS activities in the country. Other achievements made in the combat against HIV/AIDS in Botswana include the provision of highly active antiretroviral therapy (HAART) to the public at no cost, vaccine development, the Voluntary Counselling and Testing Programmes, the Community Home Based Care, the orphan and vulnerable children program, as well as the nationwide Prevention of Mother to Child Transmission (PMTCT) program to all public health facilities. Prevention and treatment of opportunistic infections is also provided at all public health facilities in the country.

Despite the achievements, there is still no provision made in terms of the distribution of condoms or safer sex education to the homosexual community. Consensual same-sex sexual intercourse remains illegal in Botswana. [Comment 2003: The practice of "dry sex," as noted earlier, is also a factor in HIV transmission. (End of comment by R. T. Francoeur)]

[Update 2002: UNAIDS Epidemiological Assessment: HIV sentinel surveillance among antenatal clinic attendees began in Botswana in 1990. In 2001, median HIV prevalence among antenatal clinic attendees tested in Botswana

**Table 2**

### Percentage Distribution of HIV Prevalence among Women by Age and Year

Year	15-19 years	15-49 years
1992	16.4	18.1
1998	28.6	35.7
2000	—	38.5
2001	24.1	36.2
2002	—	35.4

(Source: The National AIDS Coordinating Agency, 2002, 20)

in 22 health districts (190 sites) was 36.3% with a range of 25.8 to 55.8%; 12 districts had rates between 30% and 40% and 7 districts had rates above 40%. HIV prevalence among antenatal clinic attendees in Botswana increased rapidly from 18.1% in 1992 to 32.4% in 1995, 38.5% in 2000, and 36.3% in 2001.

[Major urban areas in Botswana include Gaborone, Francistown, and Selebi-Phikwe. In Gaborone, HIV prevalence increased from 14.9% in 1992 to 39.1% in 2001, while in Francistown, the increase was from 23.7% in 1992 to 44.9% in 2001. In Selebi-Phikwe, HIV prevalence doubled from 27% in 1994 to 55.6% in 2001. Sites outside the major urban areas are also experiencing increasing HIV infection trends. In 2001, median HIV prevalence in areas outside the major urban areas was 38.6%, with rates ranging from 26.4% to 50.9%. The 15-to-19 and 20-to-24 age groups exhibit high and increasing HIV infection trends. HIV prevalence among the 15-to-19 year olds at all sites increased from 16.4% in 1992 to 24.1% in 2001. Among the 20-to-24 year olds, the increase was from 20.5% in 1992 to 39.5% in 2001. Peak HIV prevalence rates were observed among the 25-to-29-year-old antenatal clinic attendees; rates in this age group were 50.4% and 48.4% in 2000 and 2001, respectively.

[There is no information available on HIV prevalence among sex workers in Botswana. HIV prevalence among STD patients shows an upward trend. In Gaborone, HIV prevalence among male STD clinic attendees increased from 22% in 1992 to 44.1% in 1996, and then to 48.2% in 2000. Similarly in Francistown, HIV prevalence among male STD clinic patients increased from 29.7% in 1994 to 60% in 1997 and has remained around that figure since then. Outside Gaborone and Francistown, HIV prevalence among male STD clinic patients tested in six sites increased from no evidence of HIV infection in 1985 to 1987 to a median of 53% in 1998; in 1999, HIV prevalence among male STD clinic patients tested at these sites ranged from 44.2% to 62%.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	300,000 (rate: 38.8%)
Women ages 15-49:	170,000
Children ages 0-15:	28,000

[An estimated 26,000 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 69,000 Batswana children under age 15 were living without one or both parents who had died of AIDS. (*End of update by the Editors*)]

### 11. Sexual Dysfunctions, Counseling, and Therapies

There is no information or data available.

### 12. Sex Research and Advanced Professional Education

The Directorate of Research and Development at the University of Botswana is the first point of contact for all stakeholders interested in conducting or sponsoring research and development in Botswana. This office works with all University of Botswana faculties, departments, schools, centers, associated institutes, affiliated institutes, and together with the Government of Botswana and nongovernmental organizations (NGOs) to facilitate and coordinate quality research in the country. This office also advises the Office of the President on applications made by researchers. Research on sexual and reproductive health matters is done through the Ministry of Health, Family Health Division. The National AIDS Coordinating Agency is responsible for coordinating all research on HIV/AIDS in Botswana.

There are, however, no programs or NGOs which specifically deal with issues of human sexuality; instead, issues of human sexuality are often incorporated into mandates of the different NGOs. There is also no association for sexologists or journals on sexuality in Botswana.

Information on sexual and reproductive health can be obtained from the Ministry of Health, Family Health Division. The University of Botswana, Department of Nursing Education offers courses, some at the undergraduate and postgraduate levels.

## 13. Significant Ethnic Minorities

### Sexual Attitudes and Behaviors among the Basarwa/San

The Basarwa (or San) are hunters and gatherers who live in Southern Africa below the Congo-Zambezi watershed. The Republic of Botswana is home to over half (approximately 42,000) of all the San in the region. This indigenous group is distinct culturally, and their way of life is different, from other ethnic groups in Botswana. Basarwa are mostly found in the remote areas, and the population has high illiteracy levels. The Basarwa's way of life has adapted over the generations as they lived in contact with other ethnic groups; as a result, their way of life today can take the form of a sedentary villager, part- or full-time unskilled laborer, and squatters in freehold farms as herders and hunters. All these socioeconomic and cultural changes have had an impact on their sexual lifestyles. However, some of their cultural practices still hold to this day.

Basarwa culture is permissive to sexual activity at very early ages, often prior to puberty. This is because of the relative openness and acceptance of adult sexuality. Prepuberty marriages also exist. Traditional initiation customs encourage safer sex practices among the youths, and prohibit sexual intercourse outside marriage. Thus, in the Basarwa tradition, one sex partner is preferred. However, with modernization and urbanization, the traditional controls over sexuality have lapsed and the youth are now having multiple sexual partners.

Marriage relations among the Basarwa have no legal procedures, apart from gaining the mutual agreement of the spouses involved and their respective families (Guenther 1986). The majority of the marriages are monogamous, but this trait is slowly eroding as the Basarwa now live and mix with other ethnic tribes in Botswana. Marriages are within the same age group, as compared with other tribes in the country where intergenerational relationships and marriages are permissible.

Early marriages are, however, often sought for young people if they are maturing quickly to prevent the possibility of premarital pregnancies, and this contributes to nearly all children knowing their parents. Failure to marry is rare among the Basarwa, and this is in contrast to other tribes in Botswana where a lot of families are female-headed.

The use of modern contraceptives among the Basarwa is very low. This is because they live in rural areas, and their access to health facilities and services are limited in terms of distance, affordability, and acceptability. Attitudes towards condom use are positive among school-going adolescents, even though their parents do not favor modern contraceptives. Most Basarwa adults rely on traditional medicine, and this is because it is part of their culture and their primary accessible choice.

Most Basarwa children in the school-going-age group live in a boarding school, away from their parents for extended periods of time, and they miss out on their parental

guidance, chaperoning on matters of sexuality, as well as on traditional education and initiation that is conducted at puberty.

Incidence of HIV/AIDS is still quite low among the Basarwa, between 3 and 6% as compared with national averages of 20 to 35% (Lee & Susser 2002). This incidence is, however, enviable in this era, because they are found in the heart of the world region worst hit by the epidemic. Basarwa girls and women now engage in materially motivated sexual relationships with "rich" men from other ethnic groups. This, however, makes them vulnerable to reproductive health problems related to sexual debut and teenage childbearing.

## Demographics and a Brief Historical Perspective

ROBERT T. FRANCOEUR

### A. Demographics

Brazil occupies the eastern half of South America; with 3.28 million square miles (8.5 million km<sup>2</sup>), Brazil is larger than mainland United States. Its neighbors include French Guiana, Surinam, Guyana, and Venezuela on the north, Colombia, Peru, Bolivia, Paraguay, and Argentina on the west, Uruguay in the south, and the Atlantic Ocean on the east. In the north, a heavily wooded Amazon basin and tropical rain forest covers half the country. All 15,814 miles (25,450 km) of the Amazon River are navigable. The northeast is semiarid scrubland, heavily settled, and poor. With more resources and a favorable climate, the south central region has almost half the country's population, and produces three quarters of the farm goods and four fifths of the industrial output. Most of the major cities are on the 4,600 miles (7,400 km) of tropical and subtropical coastlines.

In July 2002, Brazil had an estimated population of 176.03 million. Estimates for this country explicitly take into account the effects of excess mortality because of AIDS, which can result in lower life expectancies, higher infant mortality and death rates, lower population and growth rates, and changes in the distribution of population by age and sex than would otherwise be expected. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 28% with 1.04 male(s) per female (sex ratio); 15-64 years: 66.4% with

(CIA 2002)

0.97 male(s) per female; 65 years and over: 5.6% with 0.68 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 63.55 years; *male:* 59.4 years; *female:* 67.91 years

**Urban/Rural Distribution:** 77% to 23%

**Ethnic Distribution:** Caucasian (including Portuguese, German, Italian, Spanish, and Polish): 55%; Mixed Caucasian and African: 38%; African: 6%; others, including Japanese, Arab, and Amerindian: 1%

**Religious Distribution:** Nominally Roman Catholic: 70%; Protestant: 5%; Muslim and other: 17%

**Birth Rate:** 18.08 births per 1,000 population

**Death Rate:** 9.32 per 1,000 population

**Infant Mortality Rate:** 35.87 deaths per 1,000 live births

**Net Migration Rate:** -0.03 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.05 children born per woman

**Population Growth Rate:** 0.87%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.57%; *Persons living with HIV/AIDS:* 540,000; *Deaths:* 18,000. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 83.3% for both males and females

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$7,400 (2000 est.); *Inflation:* 7.7%; *Unemployment:* 6.4%; *Living below the poverty line:* 22%; socioeconomically, 80% of Brazil's population are classified as low income

### B. A Brief Historical Perspective

The first European to reach the land that is now Brazil is generally believed to have been the Portuguese navigator Pedro Álvares Cabral in 1500. At that time, the country was sparsely settled by various indigenous tribes, whose decimated descendants survive today mostly in the Amazon basin. In the following centuries, Portuguese colonists gradually pushed inland, bringing along with them a large number of African slaves. Slavery was not abolished until 1888.

In 1808, the King of Portugal moved the seat of his government to Brazil when threatened by Napoleon's army, and Brazil became a kingdom under Dom João VI. When

\**Communications:* Main author: Sérgio Luiz Gonçalves de Freitas, M.D., Associação Brasileira de Sexologia, Rua Tamarandé 693-Conj 77, 01525-001 São Paulo-SP-Brasil. *Updates:* Raymond J. Noonan, Ph.D., Health and Physical Education Department, Fashion Institute of Technology of the State University of New York, 27th Street and 7th Avenue, New York, NY 10001 USA; 212-217-7460; rjnoonan@SexQuest.com. Luciane Raibin, M.S., 315 South Avenue, Garwood, NJ 07027 USA; L.Raibin@hotmail.com.

Dom João returned to Portugal, his son Pedro proclaimed the independence of Brazil in 1822 and he was acclaimed emperor. In 1889, when the second emperor, Dom Pedro II, was deposed, the United States of Brazil was proclaimed as a republic. The country was renamed the Federative Republic of Brazil in 1967.

A military junta controlled the government between 1930 and 1945. A democratic government prevailed from 1945 to 1964 when the institution of new economic policies aggravated inflation and triggered a military revolt. The next five presidents were military leaders. Strict censorship was imposed and political opposition suppressed amid charges of torture and other human rights violations. In the 1974 elections, when the official opposition party made significant gains, some relaxation in the censorship occurred.

Brazil's agricultural production soared between 1930 and the 1970s. In the same years, vast mineral resources and a huge labor force enabled Brazil to make major industrial advances. However, soaring inflation and an unbalanced, two-tiered society with a very wealthy few and a majority of people barely managing to survive, led to a severe economic recession. Brazil's foreign debt, one of the largest in the world, required restructuring in 1982. Announcement of a comprehensive environmental plan to develop the Amazon basin brought an international outcry from environmentalists deeply concerned about the growing destruction of the Amazon ecosystem that is so vital to the world environment.

## 1. Basic Sexological Premises

### [The New Civil Code: Update 2001-2003]

RAYMOND J. NOONAN and SANDRA ALMEIDA

[On January 10, 2003, a new civil code with 2,046 articles took effect, which included significant changes affecting the private and family lives of Brazilians. In August 2001, after 26 years of debate, Brazil's Congress, the House of Deputies, voted to replace the 1916 Civil Code. It was signed into law in January 2002 by Brazil's then-President Cardoso, and now makes women and men equal under the law (Rohter 2001; Galanternick 2002). In fact, the law places equality in the Code itself with gender-neutral terminology, referring to "person" in its second article, rather than to *woman* or *man* generally; in the old code, it used to be just *man*. In the same article, it reaffirmed the rights of the unborn from conception, while specifying that legal personhood began with a live birth, although this was apparently not related to the debate on abortion, which remains illegal under the penal code. The Code also changed the age of majority, always the same for both women and men, from 21 to 18, which is now equal in both the civil and penal codes. The age of emancipation was changed from 18 to 16, and can be effected by either the mother or the father; before, only the father had that legal power.

[Among the provisions, the new code revised the concepts of marriage and family, and established equality between the sexes in a relationship. A marriage is any planned union where a man and woman share their life together as spouses, and religious marriages became legally equal to civil marriages. Now, the *sociedade conjugal* ("conjugal society" or as-married association) rests with the couple as a whole; before, it was the sole responsibility of the male, thus ending the father's unilateral legal power. The new understanding of marriage is a planned life communion, based on the equality of rights and obligations of the spouses. The direction of the conjugal society is exercised as a collaboration by the husband and wife, always in the interests of the couple and children. This is in contrast to the past, in which, under the influence of the Roman Catholic Church, the in-

terests of the family as a symbol beyond the core individuals were paramount. The family was reconceived as a group formed through a civil or religious ceremony, a stable relationship between a man and a woman (cohabitation), or a community directed by a man or a woman, i.e., a single-parent-headed household. With respect to proving the stability of a nonmarried relationship, it is no longer necessary to wait a minimum period of two years to demonstrate it; it is enough that the union be public, continuous, and enduring.

[Under the new code, several provisions further make partners in a marriage equal, changing marriage contracts and inheritance rights. Under the old code, separate, partial, or community property was declared at the inception of a marriage; now, it can be changed during its course, facilitating access to a property change. Also, the dowry given by the father of the bride to her future husband was eliminated (it is interesting to note that only in 1962 was a law passed that allowed a wife to work without the permission of her husband). The husband now has the option of using his wife's last name, which before was only available to the wife. In inheritance, the proportions of property received by parents, children, and the spouse have changed and are now shared equally; before, the children received the greater amount, and then the parents and spouse, in that order. Adopted and "illegitimate" children also gained a right to inheritance and share equally with the others, as well as children conceived through assisted reproduction.

[Divorce and separation practices changed with the following provisions in the new code: There is no longer a minimum of two years required being married before a divorce is allowed; now a couple may divorce after one year. (It is also interesting to note that divorce in Brazil was legalized only in 1978.) After separation, if an agreement is not reached, the courts will give custody of the children to the parent who has the better living conditions (taking into account the emotional and financial stability, and the level of education of the parents) and the ability to raise them. Now, also, the desires of the children are taken into account. Before, even if the woman had guardianship of the children, the father had final patrilial authority; now, both have familial authority over major decisions related to the children. However, if a parent punishes the children too harshly, abandons the children, or practices acts against public morals and good conduct, he or she loses family authority, including guardianship, under the new code. A man is now also able to ask for alimony from his divorced spouse. Although adultery is still a reason to end a marriage, under the new code, a spouse who commits adultery can remarry without limitation; before, marrying the person with whom one had an adulterous affair was prohibited by law. The "end of love" is now a valid reason for separation, which was not allowed before (incompatibility was starting to be used by some judges, but it was not in the law).

[Some other changes might be considered curiosities by many of the world's standards. For example, the new code eliminates the annulment of a marriage by the husband if he finds out that his wife lost her virginity before marriage. It also eliminates the expressions "legitimate" and "illegitimate" from being specified on birth certificates, which used to be done, because the legal circumstance of a child's birth inside marriage versus outside marriage affected inheritance rights; if a child was not legal, the inheritance was less. Also, the state cannot require or establish rules for family planning, e.g., sterilization. Relatives by blood have also been redefined to consist of those persons only four levels away; before, six levels were included as blood relations. Still, despite these significant changes, the law is considered already outmoded in some subjects, because of the 26-year time lag

from when it was written to when it was passed. For example, nothing is said of subsequent sex-related developments, such as transsexualism, bioethics, or assisted reproduction (except with respect to the presumption of paternity for purposes of inheritance, as noted above), although some more-recent efforts to include marriages between two gay individuals failed. The following sections thus serve as a backdrop to the ideals embodied in the new code (*O Globo* 2001; *Código Civil* 2002; *Folha de S. Paulo* 2003). (*End of update by R. J. Noonan and S. Almeida*)

### A. Character of Gender Roles

Brazil being a typically Latin and machismo society, males enjoy a superior, almost demigod status. This is reinforced by the economic dependence of women. Only about 18% of the women are employed outside the home; the majority devote their time to caring for their house and children. Nevertheless, women do possess some privileges that protect them in the workplace. For example, they may retire five years earlier than men and maternal leave is available during illness of a child. A special pregnancy leave permits them to be away from work for 120 days after childbirth. However, all these apparent privileges significantly reduce the chances and competitiveness for women seeking to enter the workforce.

[*Editor's Note 1997*: In addition to the value of *machismo* mentioned above, Brazilian sexual attitudes and behaviors are strongly influenced by three other values—*marianismo*, *ediqueta*, and *pronatalism*—which are commonly shared, with some minor variations, across the Latino world of South and Central America. To avoid duplication in several chapters, these four basic values are described in detail in Section 1A, Basic Sexological Premises, in the chapter on Puerto Rico in this volume. (*End of note by R. T. Francoeur*)]

[*Comment 1997*: The structure of sexual life in Brazil has traditionally been conceived in terms of a model focused on the relationship between sexual practices and gender roles—on the distinction between masculine activity (*atividade*) and feminine (*passividade*) as central to the order of the sexual universe. *Comer* (to eat) describes the act of penetration during sexual intercourse, while *dar* (to give) describes those who passively offer themselves to be penetrated and possessed by their active partners. In some respects, these role distinctions are more fundamental than is sexual anatomy. For details on the implications of these premises, see Sections 5, Interpersonal Heterosexual Behaviors, and 6, Homosexual, Homosexual, and Bisexual Behaviors, below. (*End of comment by R. T. Francoeur*)]

[*Update 1997*: In 1986, the Delegacia da Mulher, The Women's Advocacy group, was formed to protect women against sexual and physical violence. All the employees of this agency are women, because women feel more secure filing complaints when they are speaking to other women. Only 3% of the members of Parliament are women. Feminist organizations are small, not very popular, and have little influence in society.

[Nevertheless, over 20% of Brazilian families are supported exclusively by women. Moreover, the results of a national survey (representing 35% of the economically active women in the country) by *Veja/Feedback* has described the average Brazilian woman over 25 as follows:

She's married, has two children, entered the work market in the 1980s and wants to earn more. Contrary to her mother and grandmother, she recognizes that eternal marriage does not exist. All-providing husbands do not exist. She prepares herself almost by intuition to keep going alone in life.

In everyday family life, she does everything for the children but gives less to the husband—a husband who still

identifies the woman as the support of the home and the happiness. The two become estranged. For this woman busy with her own life, criminal violence and the preservation of health are preoccupations more important than sexual pleasure or the fear of getting older. For that woman who does not work outside of the house, the model of the ideal woman is exactly of one who sweats her body and the double shift [inside and outside the home]. (*Veja* 1994, 11)

[This same 1994 survey (p. 15) reported the following primary concerns of women: violence against women, 98%; sexual abuse, 96%; daycare for children, 94%; equal salaries, 79%; free choice of contraceptives, 73%; more political participation, 73%; division of duties at home, 70%; and legalization of abortion, 56%. (*End of update by R. J. Noonan and S. Almeida*)]

[*Update 2002*: Even though Brazil is still a very male-dominated country, we are seeing slight but significant changes. Every day women are moving into strictly male-dominated professions. Kátia Alves Santos, for example, is the first Secretary of Safety in Brazil. In Bahia, a very conservative state, she is responsible for 46,000 officers and 3,000 inmates. In Bahia, women occupy 49% of all police chief positions in the state. More and more women are entering politics. Marta Suplicy, at one time a leading Brazilian sexologist, became mayor of the city of São Paulo in January of 2001, and there were rumors that she might run for president in the then-upcoming elections. The latest census shows that 26% of women are considered to be head of household. Even with these advances, women are still paid less than men for the same job. In 1999, women were paid 60.7% of what males received for comparable work. This was, however, a significant increase from 53.2% in 1992. A direct relationship between more women working and the birthrates can be drawn. In 1960, the birthrate was 6.3 children per woman. As more women entered the workforce, that number has been decreasing, 3.5 in 1985, 2.6 in 1992, and 2.3 in 1999.

[Men in Brazil have also started to change their attitudes about male and female roles. Over half of Brazilian workingmen, 51.2%, now help in house chores; this might not seem like a large number, but it was only 35.8% in the early 1990s. Those numbers indicate a change in the overall culture, clearly suggesting cultural changes toward more equality of males and females and away from the machismo culture found in South America. (*End of update by L. Raibin*)]

### B. Sociolegal Status of Males and Females

From the legal viewpoint, Brazilian males and females have equal legal rights as children, adolescents, and adults. Adults, those over 18 years of age, both men and women, have the right and obligation to vote. Voting is mandatory. Each voter receives a receipt documenting his or her fulfillment of this obligation. Wages of a worker who does not have this receipt will be attached by the state in the month following the elections. Adolescents between 16 and 18 years of age have the right to choose to vote or not to vote.

[*Comment 1997*: The traditional role of Brazilian women as housewife, derived from the 19th-century European ideal, was that of the “unproductive queen of the house,” who was responsible for the respectability and harmony of the household and envied by the working woman. When one achieved the status of housewife, she gained dignity and a higher social status. However, growing numbers of Brazilian women have finally come to recognize their own power and the possibility of being an agent of change. In the last 20 years, the number of economically active women in Brazil grew by 70% to 23 million—39% of Brazil's population of women—a figure almost equal to the populations of Holland and Den-

mark combined (Veja 1994). (End of comment by R. J. Noonan and S. Almeida)]

A law restricting abortion has produced some discussion about women's rights that developed into a sort of political campaign. Recently, the List of the Rights of Children has been promoted with considerable publicity. The intention is to provide minors with greater protection against the violence they are victims of in the large cities.

[Comment 1997: Poverty and the inability of Brazil's majority poor to limit the number of offspring they have drives many youth to abandon their families and make their own lives on the street. Typical of Brazil's urban scene is the city of Salvador. In 1993, Salvador's 2.5 million inhabitants included a floating population of some 16,000 youths, working, playing, begging, stealing, and sleeping on the street. This was up 33% from an estimated 12,000 in 1990. About 100 Salvadorian street children are murdered each year by right-wing extremists. Social recognition of this problem and efforts to remedy it are vital to Brazil's future. (End of comment by R. T. Francoeur)]

### C. General Concepts of Sexuality and Love

The development of the communication media, especially television, has greatly influenced the concept of love and sexual behavior of the population. Every day, viewers of soap operas may witness episodes in which the sexual behavior of the protagonists is very permissive. This has definitely transformed Brazilian sexual relations in two ways. Such programs decrease sexual taboos and endorse sexual permissiveness, especially in the areas of the sexually uncommon and "deviant" sexual behaviors.

Overall, the sexual attitudes of Brazilians depend on gender, age, region of residence, and religious influences. The rural population and the migrant rural workers living in large cities suffer profound influences from Catholicism's religious teachings and ceremonies. This group is also characterized by a low level of education and culture. In this group, premarital and extramarital sexual contact is condemned. The Catholic Church approves only the natural means of family planning and condemns abortion. Ignoring Church doctrine, many in this group favor the contraceptive hormonal pill and surgical sterilization; the incidence of condom use is much lower. The Evangelical churches accept the use of the contraceptive pill as well as other methods, but are also vehemently opposed to abortion. Claims that the IUD is an abortifacient rather than a contraceptive method have caused its usage to be proscribed by Evangelicals. However, some government programs support use of the IUD in women of low income with numerous children.

Among Brazilians with a higher level of education, especially in the large cities, various forms of petting are acceptable, as well as premarital sex and extramarital sex, the latter being less frequent than the former. A variety of contraceptives are accepted as normal, with a preference for the contraceptive pill, surgical sterilization, condom, and abortion, in that order. Brazil is the world champion of cesarean births, 35% of all births. The majority of cesarean section deliveries are accompanied by sterilization of the woman through tubal ligation.

In comparing attitudes toward sexuality and love among Brazilians of different socioeconomic levels and different regions of the country, it seems to us that two different societies exist. One culture maintains the traditional attitudes of the Third World; the other culture has been influenced by the modernization trends commonly seen around the world and has gradually adopted more permissive attitudes.

[Comment 1997: Popular women's magazines have the purpose of transmitting the cultural norms, such as monog-

amy, similar to those in the U.S. and other countries. The August 1994 Portuguese edition of *Cosmopolitan*, called *Nova*, for example, highlights such issues for women as "A guide to self-confidence," "Attracting the right man," and "Monogamy: Is it possible to keep the fires hot?" (End of comment by R. J. Noonan and S. Almeida)]

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

The predominant religion in Brazil is Roman Catholicism, primarily because the Roman Catholic Church has determined that newborns must be baptized and officially registered as Roman Catholic at birth. In 1992, it was estimated that of the country's 148 million people, 70% are Catholics, 20% are Protestants (Baptists, Presbyterians, Pentecostals, Evangelicals, etc.), and 10% are Spiritualists (Mystics, Umbandists, Voodooists, etc.). The predominance of Christian religions has set the stage for the war against abortion, which is officially condemned as a crime. However, in most cities, abortion occurs underground. For similar reasons, sexual education in the public schools is generally nonexistent.

[Update 2002: The religious debate over recognition and acceptance of homosexual persons in the Christian churches was accented in October 2002, when the Dean and the 3,500-member congregation of the Holy Trinity Cathedral in Recife, in the northeast of Brazil, decided to withdraw themselves from the Episcopal Church of Brazil. Holy Trinity is the largest Anglican Church in Latin America. At first, the Dean and congregation claimed the reason for the schism was the bishop's support for development of alternative rites to bless divorcées (at the end of a divorce process), and alternative rites to bless couples who are already living together or do not want to marry according to the civil law because of the economic implications. But these are issues Brazilian society has long ago debated and accepted. Holy Trinity Cathedral is a conservative evangelical church, within the mostly evangelical and conservative diocese of Brazil.

Later comments by the Dean indicated that the real issue for the schism was the "exaggerated liberty homosexual people have in the Church," even though the Recife diocesan canons clearly state that no one from a homosexual orientation, or even those who accept this orientation as normal, could be ordained within that diocese. (Ribas, Personal communication October 2, 2002) (End of update by R. T. Francoeur)]

### B. Source and Character of Ethnic Values

Brazil has four distinct races of people: Caucasians 54%; Mestizo (mixed race) 34%; Negroes 10%; and Asians 2%. There are also about 200,000 indigenous Indians. Portuguese, Africans, and mulattos make up the vast majority of the population, with Italian, German, Japanese, Indian, Jewish, and Arab minorities.

Brazil was colonized in 1500 by the Portuguese, making it the only Portuguese-speaking country in all of Latin America. Youth is highly valued in this nation where 51% of the population is under the age of 27. This is obvious in many aspects of Brazilian life. For instance, kissing and petting by couples in the streets, theaters, and public places are generally tolerated in liberal Brazilian society, despite conservative religious influences.

[Comment 1997: In this respect, Brazilians tend to allow expressions of sexuality and eroticism that are quite unacceptable in other areas of the Latino world, especially in public. This disparity can be traced to a unique blend of Roman Catholic and native Indian values with a strong African in-

fluence. Like other Latinos, Brazilians have taboos and restrictions on public sexual behavior. However, Brazilians draw an important distinction between public and private behaviors that preserves traditional Indian and African values. "Within four walls, beneath the sheets, and behind the mask of *carnaval*, everything can happen!" "Everything," or *tudo*, refers to the world of erotic experiences and pleasure. The phrase *fazendo tudo*, "doing everything," means Brazilian men and women have an obligation to experience and enjoy every form of sexual pleasure and excitement, or more precisely those practices that the public world most strictly prohibits. This, however, must all be done in private, behind the mask, between four walls, or under the sheets.

[The concept of *tudo* is the key element in the domain Brazilians call *sacanagem* (DaMatta 1983). *Sacanagem* is an extremely complex cultural category, with no suitable English translation, except perhaps "the world of erotic experience" or the "erotic universe." Within this erotic world, erotic pleasure is an end in itself, and the classifications of active/passive, the sex of the partner, and the acts engaged in are secondary. A Brazilian most clearly embodies the erotic ideal of *sacanagem* by doing everything, particularly those practices that the public world most condemns and prohibits. The transgression of public norms called for by *sacanagem* brings the playfulness of *carnaval* into everyday life (Parker 1987; Moitzoza 1982; Francoeur 1991, 43-47). (End of comment by R. T. Francoeur)]

[Comment 1997: The African influence on Brazilian life and sexuality takes many forms. For instance, at all levels of Brazilian society, it is customary to offer a guest *cafézinho*, a small cup of espresso made by pouring water over powdered coffee through a cloth strainer. One way this custom is practiced illustrates the influence of how black magic brought to Brazil by slaves from Africa is still strong in some parts of the country. This custom can give the *casadoiras*, young women looking to get married, an opportunity to enhance their prospects of getting married. The young women believe that if they pour the coffee through their own panties and give the drink to their unsuspecting boyfriends, the men will be attached to them forever and will not be able to escape marriage. In *The Scent of Eros: Mysteries of Odor in Human Sexuality* (New York: Continuum Press, 1995, 83-84), Kohl and Francoeur have suggested a possible scientific basis of this folk custom, which occurs in some African cultures, among African Americans in the southern United States, as well as in Brazil. The soiled undergarment used as a filter may contain pheromones, which have been found in primate and human vaginal secretions. Released into the coffee, these may serve as a natural sex attractant or aphrodisiac. However logical it is in terms of what we know about vaginal pheromones, this suggestion is speculation and untested by experimental research. (End of comment by R. J. Noonan and S. Almeida)]

Racial prejudices exist, but they are concealed, and racial conflict and skirmishes/clashes are rare, except when economic interests lead to attacks on indigenous peoples in the Amazon basin. Couples with clearly different ethnic origins are very commonly seen in any public gathering. There exists a great mingling of the races that gives Brazil a preeminently Mestizo population, especially in the north and northeast. In the south, those of European Caucasian descent, i.e., German, Italian, Spanish, and Portuguese, predominate.

[Comment 1997: The expression *pé na cozinha* ("foot in the kitchen") illustrates the intermixing of the white and non-white races common in Brazil. The phrase goes back to the Brazilian colonial era when the slaves brought from Africa worked in the kitchens and the white masters would

have sexual relations with them. Some of the offspring resulting from these illicit liaisons had very light traces of the African influence in their appearance and were considered to be white with their "foot in the kitchen," meaning they had some African features. *Pé na cozinha* is still used today to describe a person who has a vestige of African characteristics. (End of comment by R. J. Noonan and S. Almeida)]

### 3. Knowledge and Education about Sexuality

#### A/B. Government Policies, Sex Education Programs, and Informal Sources

It is necessary to emphasize that sexual education has been somewhat taboo in Brazil. Since the late 1980s, however, some sexual education programs have surfaced in the private schools. In São Paulo (in 1987), an experimental study of sexual education in five public schools revealed that sex education helped improve student scores in all their subjects, as well as improved the relationships between parents, students, and teachers.

Truthfully, in Brazil, there is no government program for the sexual education of its youth. Recently, in the principal cities of the country, a Program of Adolescent Support surfaced that informs, orients, and teaches adolescents about their sexuality through educational interviews and seminars.

One study revealed that 72% of the men and 45% of the women received their first information about sex from friends and schoolmates. It also showed that in the large cities, youth learned about sex mainly from movies and magazines. It seems that Brazilian families generally prefer that their offspring obtain their sexual information through the school system and published material, such as adult and pornographic magazines. This frees the parents, who feel insecure speaking about sex, from ever mentioning such a "delicate subject" in the family circle and to their children.

One consequence of this lack of sexual education was uncovered in an unusual study of 150 women treated for anorgasmia. They were very poor and worked hard in the fields. They lived in rural areas without radio or television before they married, and had no time to watch television even when it was available. None of these women ever received any sexual education from family members or school. Over a third of them did not know that the sexual act was a normal part of marriage, although they knew that prostitutes and other bad men and women engaged in *sacanagem* ("the world of erotic experience"). For these women, sexual intercourse was not a moral behavior, but immoral and indecent. When they found out what sex was and that it was a part of marriage, they thought that their husbands were crazy and felt as if they had been raped. For these women, the lack of sexual knowledge was the major cause of anorgasmia. In addition, 20% of the wives abandoned the therapy because their marriages were destroyed by violence. For 80 of the women in this study, other factors were responsible for the anorgasmia. These poor rural women are not typical of the real universe of most Brazilian women (de Freitas 1990).

These women had access to sexual therapy only because AB-SEX, headed by the main author, introduced this therapy as a free part of Public Health in 1986 in São Paulo. At present, many of these patients are living in a big city and have been married more than ten years.

[Comment 1997: On the television program, "Fantástico," in late 1994 on TV Globo, a national Brazilian network, reporters interviewed two researchers, Emídio Brasileiro and Marislei Espindola from the city of Goiânia, who had conducted a sex survey over the preceding five years. The researchers, whose book, *Sexo: Problemas e Soluções*, was to

be published by the end of the year, reported that children wanted to know what sex was for; adolescents wanted to know what sex was like; young adults at about 20 years old wanted to know how to avoid the consequences of sex; adults from about 30 wanted to know how to educate their children about sex; those over 40 think they know everything about sex; and those around 60 think it's too late. A few of the questions that these researchers said they were most often asked included: 1. Can a pregnant woman have sex? 2. When is a young person ready for his first sexual intercourse? 3. Sexually, is it easier to be a man or a woman? and 4. If I have sex before or during a sports competition, will I decrease my physical performance? (*End of comment by R. J. Noonan and S. Almeida*)

#### 4. Autoerotic Behaviors and Patterns

A 1983 questionnaire survey indicated that boys and girls in an urban group of 3- to 5-year-olds played together in such a way as to touch or see each others' sexual organs, especially when no adults were present. When this type of behavior was observed in a school setting by some teachers at Colégio Batista Brasileiro in São Paulo, the main author was invited to provide some orientation for the teachers. As we know, this type of behavior in infancy is practically universal and independent of social class or ethnic origins.

As mentioned earlier, it is uncommon for parents to speak about sex to their children at home. When childhood sexual curiosities are not satisfied by the parents, the child naturally seeks answers on their own from other sources. Usually such persons or sources they turn to are not prepared or adequate to guide them efficaciously. In terms of self-pleasuring, the child is likely to encounter one of two attitudes or value judgments. One opinion, and probably the less frequently encountered, is that self-pleasuring is a normal component in the psychosexual development of children. The other opinion views masturbation as a negative road to human development.

Regardless of the value message encountered and the lack of external support, 92% of adolescent boys and 45% of girls engage in self-pleasuring. However, the fear of being found out by parents or other kin is a common accompaniment. In our research, 66% of the boys and 36% of the girls began self-pleasuring between 10 and 15 years of age.

While the Evangelical Protestants express a great preoccupation with, and a negative view of, self-pleasuring, Roman Catholic doctrine also condemns this behavior as disordered and seriously sinful, but seldom if ever mentions it. There are no significant statistics about childhood and adolescent autoeroticism.

### 5. Interpersonal Heterosexual Behaviors

#### A. Children

In a retrospective research project about child and adolescent sexual behavior, 57% of all adults played sex games as children (de Freitas 1991). The children, in general, do not receive any sort of sexual guidance or information from their parents, yet their sexual behavior seems generally adequate and appropriate for their developmental ages as psychologists understand this.

Going through the phases of sexual self-discovery and autoeroticism characteristic of infancy, the children imitate their parents and are influenced by peers and the mass media, movies, and television.

Recent research has uncovered that 60% of those interviewed admitted to having played doctor and other games that included the mutual touching of their bodies and the sexual parts when they were children. The majority en-

gaged in this kind of play with children of both sexes. However, there was a tendency for girls to play more with girls, while boys played mostly with children of the opposite sex.

We must call attention to the fact that only 60% of the subjects interviewed revealed having practiced this type of play in childhood, when it is well known that the frequency of this activity is much higher all over the world. From this we understand that many respondents omitted the truth from their information about their infancy. To speak of childhood sexuality is an intolerable outrage for many Brazilians. Even today in our culture, childhood sexuality is a taboo theme that cannot be mentioned with total tranquillity because of the intense anxiety it awakens in adults. Most adults want to forget the sexual experiences of their childhood because they were punished for demonstrating an interest in those activities. This perhaps explains the fact that many people, especially women over 45 years of age, did not answer the questions about sexual play in childhood.

While our observations and data are limited, two general forms of childhood sexual behavior have been observed. Children, 2 to 4 years old, generally limit themselves to speaking words of sex, showing their penises or buttocks, or even lifting the little girls' skirts and making drawings of nude girls or urinating boys. Children, 5 to 7 years old, seek closer contact with the opposite sex. Meanwhile, attitudes of punishment by the older family members for erotic play reinforce fear and redirect behavior towards self-pleasuring in private.

[*Comment 1997*: In contrast with Euro-American sexual values that frown on sexual rehearsal play among children and adolescents, Brazilian culture expects young boys and girls to experiment with sexual pleasure and prepare for marriage within certain limits and in private.

[In the game *troca-troca*—literally “exchange-exchange”—pubescent and adolescent boys take turns, each inserting his penis in the other's anus. In addition, the early sexual interactions of adolescent boys and girls draw on a wide range of nonvaginal sexual practices, in particular on anal intercourse, in order to avoid both unwanted pregnancy and rupture of the hymen, still an important sign of a young woman's sexual purity (Parker 1987). (*End of comment by R. T. Francoeur*)]

Clitorectomy does not exist in Brazil. Male circumcision exists only in the Jewish community. However, postectomy to shorten the prepuce is performed for uncircumcized boys with a long prepuce.

#### B. Adolescents

##### *Puberty Rituals*

Some social celebrations are observed when girls celebrate their 15th birthday. In some rural cities, this involves a “Big Party” with the fathers presenting their daughters to society and the girls dancing their first waltz. In upper-class urban families, these girls are then allowed to court and have a boyfriend. [*Editor's Note 1997*: See also the discussion of *quinceañera* in Section 2, Latino Perspectives, of the U.S.A. chapter. (*End of note by R. T. Francoeur*)]

##### *Premarital Sexual Activities and Relationships*

The period of puberty involves biological, psychological, and sociological transformations. In Brazilian girls, menarche occurs between the ages of 10 and 13, having already had the partial growth of the breasts and the hips. Research shows that 62% of Brazilian mothers try to teach their daughters about their first menstruation before it occurs. Meanwhile, 38% of the young women confess not having any knowledge of the phenomenon before it happened.

Research indicates that the first menstruation in girls causes a strong emotional reaction that prompts the girls to inform their mothers. It is rare that girls hide their menarche from their mothers, although 15% of the subjects interviewed reported that as their response. The reaction of the boys to the signs of sexual maturation and their first nocturnal emission depends on the level of information they have received from their older friends. Unlike girls' reaction to menarche, boys almost always hide their first nocturnal emission from their parents, preferring to tell their older friends. The sexual maturation of puberty brings interest in the opposite sex, but the majority only start dating about age 15.

Sexual intercourse is generally initiated between the ages of 12 and 17 for men and 17 to 20 for women, again confirming a more permissive standard for men than for women. About the age of 16, dating becomes more intimate with noncoital sexual contact more evident. By age 16, 17% of the men and 8% of the women have had sexual intercourse. Only 40% of the women and 52% of the men revealed that their first sexual experience was positive and pleasant.

Research on adolescents in Botucatu, a rural area of the São Paulo district, and in the capital of São Paulo district revealed sharp differences in the sexual behavior of adolescents. In the rural cohort of 290 adolescents, we found that 65 youngsters or 22.4% had already had heterosexual contact between ages 13 and 19 years. Nineteen of these adolescents had experienced coitus, while 46 had only played sex games without having penile-vaginal intercourse. Of this group, 60% had a pleasant sexual experience and 40% felt guilt, mental anguish, and remorse. By comparison, in a parallel group of 290 youths in the city of São Paulo, a similar number and percentage of adolescents had already had heterosexual contact. However, the breakdown was reversed, with 41 youths or 13.8% having experienced coitus, and 24 engaging in noncoital sex play, or outercourse. In the urban cohort, sexual contact was pleasurable for 69.3%. This demonstrates that the urban Brazilians are more liberal and more venturesome in their sexual behavior.

### C. Adults

#### *Premarital Courtship, Dating, and Relationships*

In research conducted by AB-SEX (1991), 81% of adult men reported having had premarital relations, while 53% of women reported the same behavior. Again, this was more commonly reported in the large cities. The preoccupation of women with virginity is more evident in the rural zones in the interior of the country, and less so in the state capitals. Among college students in the larger cities who are politically active and quite influential, there is often a shame attached to being a virgin.

Recent data indicate that single adults suffer from pressure to be married, but about 7% of Brazilian women between the ages of 35 and 45 years of age have children without being married, only 2% of whom marry after the birth of their first child. Single men between the ages of 37 and 46 prefer to remain single, even if their partners have children. There are many couples in the lower economic class who start a family and have many children without being married. About one quarter of all women are pregnant when they get married.

#### *Marriage and the Family*

The majority of marriages occur between the ages of 20 and 25, about 65% of all marriages. As in the developed nations, the small family model has become the standard. An accentuated fall in fertility has been noticed, since we have gone from the average of 6.3 children per woman in the

1960s to a current average of 2.8 children. This has come as a result of a series of transformations to which we generally refer as the process of modernization of Brazilian society.

In Brazil, monogamy is the fundamental pattern; bigamy and polygamy are illegal. Research in 1991, reported by IPPM (Institute of Market Research of São Paulo), found that in São Paulo, 54% of the people are opposed to female adultery while an equal number are against male adultery. Extramarital sex is acceptable under "certain circumstances" to 25% of the men and 23% of the women. People in smaller cities and economically lower are more rigorous in their opposition to extramarital sexual relations.

The average frequency of marital intercourse ranges between twice a week and three times per month. However, more and more of those interviewed say that they might feel happier if they had sex more often; they often added that they would feel less anxiety (*E acrescentam que seriam menos nervosos*).

[*Comment 1997*: Based on the University of Chicago's report on sexuality in America, which had recently been released, TV Globo, a national network, in the last quarter of 1994 conducted a mini-survey of the frequency with which Brazilians have sexual relations. On the television program "Fantástico," they reported that 17.6% of Brazilians have sexual relations once a week, 35.9% have none, and 46.5% do so two or more times per week. They also interviewed two researchers, Emídio Brasileiro and Marislei Espindola, who had conducted a sex survey over the preceding five years. These researchers reported finding that men appeared to be more liberal about sex, but actually were more conservative, in comparison to women, who were apparently more conservative, but actually were more liberal. (*End of comment by R. J. Noonan and S. Almeida*)]

In 1978, divorce was legally recognized after 25 years of Parliamentary discussion. The most frequent cause of divorce is extramarital sex, 33%, followed by excessive use of alcohol, physical violence, personality incompatibility, and irreconcilable differences. Usually it takes from two to four months to obtain a divorce. Divorced persons are not allowed to remarry for at least three years. Bigamy is considered a felony and a guilty verdict is accompanied by a jail term to be determined by a judge. The majority of divorces occurs between three to seven years after marriage. Frequently the divorcing couple has no children, 41%, or only one child. Divorce after 20 to 30 years of marriage is rare, and seems to be connected with andropause (the Brazilian term for male menopause) or menopause.

In one out of every five divorces, the mother retains custody of the child, while the male must pay alimony usually equal to 30% of his salary. In cases where the male refuses or stops paying alimony to the ex-wife, he is immediately arrested by order of the courts.

#### *Sexuality and Older Persons*

[*Update 1997*: Lucia Helena de Freitas, a Brazilian psychologist and gerontologist, studied the sexuality of a group of retired commercial workers who participated in the cultural activities of a social club. She found that 73.8% of them still had sexual relations, with 35.7% doing so two or three times a week, 21.4% once a week, and 16.7% less often. Almost all the interviewees (90.5%) felt the necessity of having sexual relations; 95.2% believed that sexual desire does not end with age, with 40% saying that it increased with age and 59% thinking the opposite. However, 33.3% believed that pleasure during the sexual act increased with age, as opposed to 66.7% who said the pleasure decreased. Regarding orgasm, 28.6% said they were able to reach it quickly against 40.5% who said they needed more time. Only 13.5% of

women said they experienced a change in their sexual life as a result of menopause; some said they reached orgasm more quickly once they stopped menstruating. In the case of men, 4.8% acknowledged problems of impotency. Freitas concluded that with the advance of age, typically the frequency of sex decreases, but the quality does not. (*Manchete* 1992, 40). (*End of update by R. J. Noonan and S. Almeida*)

### *Incidence of Anal and Oral Sex*

IPPM's (Institute of Market Research of São Paulo) survey revealed that at least 23.5% of São Paulo residents (Paulistanos), 12.6% of Rio de Janeiro residents (Cariocas), and 18.8% of those in other Brazilian cities reject oral sex because they consider it abnormal. Also, 53% of the Paulistanos, 38.6% of the Cariocas and 45.7% of those in other cities consider anal sex abnormal; 10% refused to answer.

The belief that oral and anal sex are abnormal sexual practices has its origin in many sources. One of these is the moral order, based in the Catholic tradition. This tradition believes sex in itself to be a mortal sin if it does not involve vaginal intercourse for the purpose of procreation within matrimony, and condemns all other erotic practices. Thus all sexual activities without a procreative end are considered taboos and sexual perversions that should be avoided.

In spite of this prohibition, many people go against the conventional sexual standards, since the primary message of Brazilian folk culture—*fazendo tudo*—prompts a freedom of sexual expression in private where anything can happen and everything is possible, encouraging everyone to broaden one's repertoire of sexual practices even when they violate public sexual norms in private.

The IPPM survey, for example, showed that, at least occasionally, 52.9% of Cariocas, 37.8% of Paulistanos, and 42.1% of other Brazilians have practiced anal intercourse. Statistical analysis revealed that men 30 to 45 years of age were three times more likely to solicit anal sex than women. These results confirm that among married couples, as elsewhere, it is generally the male that initiates new sexual practices, while the female frequently is limited to accepting passively her partner's solicitation. This presents a "delicate situation" for the female who is pressured to accept anal or oral sex, because there are no legal restrictions in Brazil.

The emphasis on *fazendo tudo*, *tesão* (excitement), and *prazer* (enjoyment) promotes "rather elaborate and varied forms of sexual foreplay, a strong emphasis on oral sex, and especially a focus on anal sex" (Parker 1987, 164). Interviews of 5,000 men and women throughout Brazil revealed that over 50% of those surveyed in Rio de Janeiro, and over 40% of those in the rest of Brazil, reported practicing anal sex at least occasionally (Santa Inês 1983, 41).

### *Carnaval*

In Brazilian sexual culture, the annual celebration and unrestrained exuberance of Carnaval is typical of

an erotic universe focused on the transgression of public norms through a playfulness reminiscent of . . . one's adolescent sexual experience and the excitations they produced play[ing] themselves out again repeatedly throughout adult life. They undercut the effects of sexual prohibitions and make polymorphous pleasures such as oral and anal intercourse, an important part even of married, heterosexual relationships. Such acts [whether engaged in with same or other gendered persons, with a nonspouse or stranger], along with the *tesão* or excitement which is thought to underlie them and the *prazer* or enjoyment which is understood to be their aim, are essential to the Brazilian sexual culture, with its context of 'no shame,'

'within four walls,' 'beneath the sheets,' or 'behind the mask.' (Parker 1987, 165)

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

[*Comment* 1997: The categories of homosexuality (*homossexualidade*), heterosexuality (*heterossexualidade*), bisexuality (*bissexualidade*), and a distinct homosexual identity (*identidade homossexual*) were introduced into Brazilian culture in the mid-20th century by social hygienists, medical doctors, and psychoanalysts.

[Despite their current prevalence in the media, these concepts of sexual classification remain, in large measure, part of an elite discourse. As mentioned in Sections 1B, A Brief Historical Perspective, and 2A, Religious, Ethnic, and Gender Factors Affecting Sexuality, Source and Character of Religious Values, Brazilian sexual culture is centered on the distinction between masculine activity—eating (*comer*), conquering and vanquishing (*vencer*), and owning and possessing (*possuir*)—and feminine passivity (giving, being penetrated, dominated, subjugated, and submissive). In keeping with the overriding importance of every male considering himself macho, the Brazilian male considers himself heterosexual man (*homem*), as long as his dominant mode of sexual expression involves active phallic penetration, regardless of the gender of the partner being possessed and penetrated.

[If the category of "men" or *homens* seems clear, its counterpart is less so. Those who *dão* (give or submit) include biological women or *mulheres*, and others, the biologically male *viado* (deer), *bica* (worm, intestinal parasite), and the feminine form of *bicho* (best translated as queer or faggot). Though endowed with male anatomy, the *viado* or *bicha* is linked with the fundamentally passive social role of *mulher*, not *homem*. Within these categories, a male can have sexual relations with *mulheres*, *viado*, and *bicha* and maintain his masculine (heterosexual) identity, provided he exercises phallic dominance. In any discussion of sexual behaviors, gender orientation, and AIDS education, it is essential to keep in mind this Brazilian folk model.

[The interplay between traditional and modern medical models of sexual behavior is evident within the open, shifting, and flexible subculture of *entendidos* and *entendidas* ("those who know") in Brazil's larger cities. Organized around same-sex practices and desires, this subculture is found in certain bars, beaches, saunas, discos, and the like. *Entendidos* (studs) are sometimes contrasted with *homens*, and the traditional *bicha* as the passive partner of the active *bofe*. Both the *entendidos* and *bofe* are considered masculine *homens* despite their participation in same-sex activity.

[The same dichotomy structures the increasingly open presence of the once almost-invisible "lesbian" subculture, where *sapatão* (big shoe, dyke, or butch) contrasts with *sapatilhão* (slipper or femme dyke) (Parker 1987). (*End of comment by R. T. Francoeur*)]

In Brazil, homosexuals communicate among themselves with their own subcultural language, including the signal of an earring in the left ear for gay men and a left ankle bracelet for lesbians. This combination of in-group verbal and non-verbal communication allows homosexual persons to function in a generally hostile environment.

The recent IPPM (Institute of Market Research of São Paulo) survey made it clear that homosexuality is one of the areas of human sexuality most marked by prejudice. Over half, 51.5%, of Paulistanos, 57.1% of Cariocas, and 56.3% of those in other cities oppose homosexuality. On the other hand, a small number of those interviewed, only 13.5%,

8.7%, and 9.4%, respectively, in these same areas, consider homosexuality normal conduct. We do not have data concerning the number of homosexuals in the country, but it is probable that it is similar to that of other Latin American countries.

The social status of homosexuals is favorable only among those who have achieved fame in the arts, music, theater, movies, television, and haute couture. A homosexual orientation and lifestyle seem to facilitate self-promotion and professional success in these fields. In other areas of professional life, homosexuality is not a positive factor. In recent research in São Paulo, it was found that homosexuals, especially those with an exaggerated behavior, were usually rejected for employment following interviews with the company psychologists, although these same psychologists deny being prejudiced against homosexuals. In some areas, such as sales, there are minimal chances for an overt homosexual to find employment. Discrimination is also strong against overt lesbians. But, since they are generally more discreet and less overt in their behavior, they are not as easily identified. They only call attention to themselves when they are on a date with a younger (fem) lover, or when they cause a scene triggered by jealousy when the (fem) lover speaks to men.

Legal problems arise only when homosexuals become physically violent or when they wish to marry legally. Brazil's laws do not permit homosexuals or lesbians to marry.

Homosexual prostitution, especially when transvestites are involved, is the object of frequent police raids. However, this repression does not appear to have much effect on this, considering the open activity at night on the streets in the large cities.

Religious restrictions on these sexual practices are stronger among the Catholics, 68% of whom condemn homosexual behavior, even though there are cases involving homosexual priests who continue to practice their duties. The Catholic Church officially teaches that homosexual activities are contrary to the procreative purpose of sex.

The Protestants do not persecute homosexuals, but instead seek to help them recuperate through faith in God. There are many cases where homosexuals who were passive (bottoms) and prostituted themselves, have been regenerated or cured, becoming heterosexual to the extent of marrying and having children. They even lost their effeminate behaviors. (*Os protestantes não perseguem os homossexuais, mas procuram ajudá-los na recuperação, em que homossexuais passivos e que ate se prostituíam na noite, tornaram-se heterossexuais, casando-se, tendo filhos e perdendo os trejeitos efeminados.*)

## 7. Gender Diversity and Transgender Issues

There are no legal restrictions on transvestites in Brazil. However, in Brazil, transvestism is a marginal phenomenon (*um fenômeno marginal*, implying "practiced by a criminal element of society"). Transvestites are often men who work during the day, and at night apply makeup, dress as women, and work the street or nightclubs to prostitute themselves with men or bisexual couples. Legally, they are considered prostitutes and are treated as such by the police.

In Brazil, sex-change surgery for transsexuals is considered to be mutilation surgery, and legislation prohibits surgical treatment of a transsexual. Participation in such medical treatment is considered a felony for both the patient and surgeon.

Some transsexuals have gone to Europe to be operated on and change their sexual identity. However, these are isolated

cases, because the majority of the transsexuals are content to dress as women at night and prostitute themselves.

Surgical techniques are well developed in Brazil so that many cases of congenital ambiguous or anomalous genitals are regularly corrected with surgery. These operations try to preserve the sexual (gender) identity adequate to the patient.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

Sexual violence is a crime for which there are provisions in the Brazilian Penal Code. The law protects citizens against sexual assaults in four categories: *estupro* or rape; *tentativa violenta ao pudor*, a violent attempt against *pudor* (meaning chastity, decency, modesty, virtue, purity, and more), or sexual molestation involving violence; *posse sexual através de fraude*, sexual possession through fraud; and *atentado ao pudor mediante fraude sem violência*, or an attempted violation of *pudor* involving fraud.

The first two categories of sexual assaults involve violence, and if grave physical harm results, the crime is viewed as aggravated and the convicted offender subject to a heavier sentence. In some cases, even if the victim consented to or invited the sexual partner, the law considers violence to have been part of the sexual act. These are usually cases where the victim is under 14 years of age, mentally incompetent, or unable to offer physical resistance.

### *Sexual Abuse, Incest, and Pedophilia*

Sexual relations involving an adult or older adolescent with a child is legally termed sexual victimization (*victimização sexual*). When sexual victimization involves a relative of the victim, it is classified as incest.

Since 1982, there have been more reports of this type of behavior because of the feminist movement and the fact that females are the most common victims. The frequency of such acts is very difficult to establish because only the gravest and most brutal cases become known to the authorities. Research conducted in São Paulo by Azevedo between December 1982 and December 1984 showed that only a small percentage, about one in 25 cases, of incest and pedophilia are reported to the authorities.

Research in greater São Paulo found that 87% of the cases of pregnancy in girls up to the 14 years of age resulted from incest perpetrated by the father, uncle, or stepfather of the victim. About 6% of the victims surveyed by Azevedo were males. In 70% of the cases of incest, the biological father was the perpetrator. The majority of such aggressors were 30 to 39 years old and blue-collar workers.

### *Rape and Sexual Harassment*

Rape is punishable by a minimum sentence of three years solitary confinement (*reclusão*) in prison. The sexual violence documented in police and court records is deceptive, because most cases of sexual violence are not reported to crime detection units and because the requirements of the law to gain a conviction of either sexual violence or seduction are excessive. A man can only be found guilty of a crime of seduction if the woman is under the age of 18, and even then, a guilty verdict is rare. Only a male who seduces an underage, minor virgin and continues having coitus with her is at risk of being convicted of seduction. If convicted, he may be sentenced to two to four years in prison. If the woman seduced is under the age of 14, then the crime becomes one of rape and the minimum sentence is three years in jail. If the woman seduced is over 18 years of age, there is no crime unless there is a serious threat, violence, or suspected violence.

### Domestic Violence

[Update 1997: Being beaten by a husband is no longer just crying at home, suffering in silence, and ashamed to say anything. It is now judged as a crime and taken seriously by society. With the opening of the doors on August 6, 1985, of the 150 women's precincts (Delegacias da Mulher), police stations directed by women who specialize in domestic violence against women, Brazilian women made a great gain. These police stations became the arm of the judiciary most trusted and least feared to be used by the people. For many years, the beating of women was not seen by policemen as a crime, but rather a minor domestic affair that did not involve them. This picture has now changed significantly. Initially, 80% of the cases involved women who had been beaten two or three times by their husband; today, the majority file a report at the first strike. An average of 300 women are seen each day (*U.S. News & World Report* 1994, 40-41; *Veja* 1994, 20).

[In 1991, Brazil's highest appeals court threw out the "honor defense" in adultery cases that allowed men who were accused of murdering their wives and/or their wives' lovers to escape punishment by arguing that they were defending their honor (*U.S. News & World Report* 1994, 41). (End of update by R. J. Noonan and S. Almeida)]

### B. Prostitution

Prostitution, whether heterosexual or homosexual, is not a criminal offense in Brazil unless it involves public solicitation or *pudor em público* (a public violation of *pudor*, meaning chastity, decency, modesty, virtue, purity, and more). In 1970, the liberation of the press, which strongly influenced sexual liberty, accentuated the reduction in female prostitution in the larger cities. Meanwhile, the increase in libertinism (*o aumento da libertinagem*, meaning debauchery, hedonism, immorality, and more) has facilitated the appearance of male prostitution in public places, for both heterosexual and homosexual contacts. The presence of houses of prostitution (*casas noturnas*) has decreased, being replaced by massage parlors, telephone callgirls, and street soliciting. A large number of motels have appeared throughout the larger cities, often catering only to couples seeking private encounters or to prostitutes and their clients.

Statistics on the total number of prostitutes in Brazil do not exist, but the police estimate their number at about one million for the whole country.

There is a Prostitutes Association or union (Associação de Prostitutas) founded in 1986, with its main purpose to obtain recognition of prostitution as a legal profession. So far, this effort has produced no results.

### C. Pornography and Erotica

The military regime that dominated Brazil from 1964 to 1985 repressed the publication of erotica and sexually explicit films. Since 1985, there has been a great surge in the number of pornography shops and erotic films, videos, and publications. Presently both hard- and soft-core pornography is easily accessible in Brazil. Both television and cinema theaters exhibit erotic films. Scenes showing sex with children or animals are strictly avoided, as is any depiction of sadomasochism, although sexual cruelty and violence may sometimes be shown.

[Update 1997: In 1995, a growing concern about the spread of AIDS, confusion over sexual values among the young, and the competition among television's prime-time soap operas to stage the steamiest love scenes, provoked a social backlash against Brazil's fabled comfort with sensuality. In July 1995, the weekly news magazine, *Veja*, identified 95 nude shots, 74 sex acts, and 90 scenes with smutty dia-

logue in a week's worth of programming on the five major networks. Complaints from individuals, local governments, and church groups have prompted the federal government to investigate the prevalence of sex on prime-time television and recommend steps to control this (Schrieberg 1995). (End of update by R. T. Francoeur)]

### D. Paraphilias

Some specialists deal with paraphilic clients, but there are no statistics on the incidence or types of paraphilias encountered in clinical practice, or among the general population.

Bestiality or zoophilia is a widely distributed sexual practice, both geographically and historically. Its frequency is greater among adolescents in the rural areas, generally constituting a temporary sexual outlet or experimentation rather than a long-term behavior. Our surveys found that 12% of Paulistanos and Cariocas and 17% of other, non-urban respondents reported erotic contact with animals in their childhood or adolescence. This behavior is much rarer among Brazilian women.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

Forty years ago in the rural areas of Brazil, families not infrequently had between ten and 20 children. In recent years, that number has decreased, especially in the large cities. The average number of children in a family has gone from 6.3 in 1960 to 2.8 in 1993.

Some progress has been made by the federal government in contraception and sexual education. Since 1986, the government has directed its efforts to educate young women in the use of contraceptives in order to reduce the number of teenage unmarried pregnancies. The programs are run by nurses and social workers who also teach the use of the contraceptive pill and condom use for STD prevention. These programs operate mostly in the large cities, such as São Paulo, Rio de Janeiro, Brasília, Belo Horizonte, and Recife.

Some branches of the federal government, such as SUS (Sistema Único de Saúde) offer free distribution of contraceptive pills as an IUD replacement for women who do not want to become pregnant. Research undertaken by the IPPM (Institute of Market Research of São Paulo) showed that 73% of those interviewed favor family planning in Brazil. In Rio de Janeiro, the number reached 83% of the women and 78.9% of the men. Only 8.5% of those interviewed in Rio de Janeiro and 6.8% of those in other cities declared themselves totally and radically opposed to birth control.

[Update 1997: Although 75% of Brazil's 154 million people are Roman Catholic, the world's largest Roman Catholic population, every relevant statistic shows that most people ignore the Church's teachings on contraception and abortion. In a June 1994 survey of 2,076 Brazilian adults, 88% of the respondents said they did not follow the Church's teachings; for women 25 to 44, this figure was 90%. On a national scale, Brazil has experienced one of the most radical reductions in family size recorded in modern history. With 40% of adult Brazilian women working outside the home, the fertility rate in the developed south is below the replacement level of 2.1 children per woman; in the impoverished northeast, it is 4.0, but this is well below the 5.8 recorded in the region in 1980 (Brooke 1994).

[About two thirds of the married women practice some form of contraception; 43% use oral contraceptives and 42% have been sterilized. The government, pressed by the Catholic bishops, has maintained laws against abortion and sterilization and blocked legislative efforts to provide free

contraceptives through Brazil's national health service. Virtually all clinics that dispense contraceptives and information are maintained by private groups. Although opinion polls show that Brazilian women want universal access to modern contraceptives, they have little power to press this in the political establishment. Brazil has no women as state governors or Supreme Court justices; women hold only 4.7% of the seats in the 580-member Congress; and no women in the Brazilian Bar Association are directors, although 52% of the Association's members are women (Brooke 1994). (*End of update by R. T. Francoeur*)

[*Update 1997*: The Brazilian woman is having fewer children than in the past. The average number of children for Brazilian women has been steadily decreasing over the last four decades. The 1991 Census reported an average of 2.7 children as compared to 6.28 children in 1960, 5.76 children in 1970, and 4.35 children in 1980 (*Anuário Estatístico Brasileiro 1992*, cited in *Veja* 1994, 75). The decrease may be attributed to several factors, including the use of contraceptives, sterilization, and abortion, as opposed to the worldwide economic and social reasons for the decline.

[In contrast with the 1994 report by Brooke cited above, the Instituto Brasileiro de Geografia e Estatística—Anticoncepção (Institute of Geography and Statistics, IBGE, Contraception), 1988, cited in *Veja* (1994, 75), reported that the majority of women, 23 million women or 62%, do not use a contraceptive method. As a result 1.4 million unwanted pregnancies result in abortion (Alan Guttmacher Institute, cited in *Veja* 1994, 75). Of the methods of contraception that are most used, the oral contraceptive pill is used by 43% of the women, sterilization is used by 42%, 7% use the calendar method, 2% use condoms, 1% use the IUD, and 5% use other methods (Instituto Brasileiro de Geografia e Estatística—Anticoncepção 1988, cited in *Veja* 1994, 75). The pill, sterilization, and the IUD account for 86% of the contraceptive use in Brazil, as compared to their combined use of 38% in other “developed” countries (Instituto Brasileiro de Geografia e Estatística—Anticoncepção 1988, World Health Organization—Reproductive Health 1990, cited in *Veja* 1994, 75).

[Among the live births, 32% are done by cesarean section, the highest rate in the world, as compared to 29% in Puerto Rico, 24% in the United States, 10% in England, and 7% in Japan (World Health Organization 1991, cited in *Veja* 1994, 75). One reason for the high incidence of cesarean deliveries in Brazil can be traced to the high number of women who choose to have a tubal ligation done at the same time to limit future births. United Nations statistics show that maternal mortality is also high, with 150 deaths per 100,000 births, as compared to 3 deaths, 12 deaths, and 1,000 deaths per 100,000 births for Japan, the United States, and Guinea, respectively. In the rural areas, 35.6% of the births are done at home versus 7% in the urban areas.

[Of those people who use condoms, women at every age level buy fewer condoms than men. A Brazilian company reports that, on average, 12% of the condoms bought are bought by women and 88% are bought by men. The breakdown by age level is as follows: Among those 15 to 19, 5% are bought by women and 95% by men; of ages 20 to 24, 18% by women and 82% by men; of ages 25 to 29, 19% by women and 81% by men; of ages 30 to 39, 23% by women and 77% by men; and of ages 40 or older, 28% by women and 72% by men (Dispomed Comercial Ltda., cited in *Veja* 1994, 75). (*End of update by R. J. Noonan and S. Almeida*).

## B. Teenage Unmarried Pregnancies

There are no reliable statistics on the number of unwed teenage pregnancies in Brazil.

In recent research among adolescents, we found that 16% of the subjects approved of the IUD as a contraceptive method while 48% disapproved. Meanwhile, the lack of information about sexuality and contraception has caused many single adolescent females to become pregnant. In São Paulo, 54% of the adolescent males interviewed considered women's preoccupation with pregnancy a female problem for which the female is solely responsible. Even with the risk of AIDS infection, 35% of the adolescents refused to use condoms because they believe it takes away from their pleasure. All these factors contribute to an increasing number of unwed teenage pregnancies. SUS (Sistema Único de Saúde) has an unwanted pregnancy education and prevention program for female adolescents in several regions of São Paulo, and similar programs exist in other capital cities. Practically nothing is available in the rural areas.

Many young women faced with an unwanted pregnancy resort to clandestine abortion clinics to hide the pregnancy from family. When the unwanted pregnancy does not end in a clandestine abortion, it is more frequent for the unwed adolescent mother to remain single than to marry the father. In the majority of cases, 51.8%, the young fathers shirk their responsibility as a parent.

## C. Abortion

With the increase in sexual activity, the number of abortions in Brazil is slowly growing. Article 128 of the Penal Code of 1940 allows only two reasons for legal abortion: when the pregnancy is the result of rape or when there is no other way to save the woman's life.

Abortion statistics are not reliable or consistent. In 1989, the World Health Organization reported nearly 5 million abortions a year in Brazil, about 10% of the number of abortions performed worldwide. A research study in São Paulo, 1993, revealed 4.5 million induced abortions per year in Brazil. The incidence is highest among women ages 15 to 19, with 136 abortions per every 1,000 women in this age bracket. Nationally, there are 8.3 illegal abortions for every 100 pregnancies. Brazil records about 400,000 hospitalizations for medical complications of abortions annually; in the United States only 10,000 women experience complications requiring hospitalization.

In 1989, a National Research of Health and Nutrition study conducted by the Institute of Geography and Statistics (IBGE), found the index of abortions greater among women of the southeast, 16.4%, than among women of the northeast, 14.4%. These two regions accounted for 75% of all the pregnant women in Brazil. These statistics are informative when one recalls that the southeast region has a higher standard of living than the northeast. In the poorer northeast, there were 45 pregnant women per 1,000 women; in the more economically developed southeast, the rate was 33 per 1,000 women. This is in keeping with the hypothesis that a higher standard of economic development and better standard of living leads to a lower number of pregnancies. A second factor in the incidence of clandestine abortions is the number of previous pregnancies a woman has had. Of 13,862,844 women who were pregnant in the past five years, 14.9% terminated a pregnancy at least once. Among women who had had four previous pregnancies, 47.1% terminated the fifth pregnancy. Among women who had had five previous pregnancies, 77.1% terminated a subsequent pregnancy.

Several reasons are commonly cited to justify the legalization of abortion in Brazil: (1) a woman's right to control her own body, (2) socioeconomic factors, such as the lack of support and sustenance for children resulting from unwanted pregnancies, (3) “if so many people are doing it,

why not legalize it?" (4) fetal malformations, (5) therapeutic abortions are already legal to save a mother's life, and (6) abortion is already allowed in cases of rape. Other factors supporting the legalization of abortion include the increase in sexual promiscuity, which increases the number of illegal abortions, and the chaos in the official system of public health, which reduces the distribution of contraceptives that could reduce the incidence of illegal abortions.

Presently, a task force of the Federal Council of Medicine is proposing the legalization of abortion for cases where the fetus will be born with serious or irreversible physical or mental problems. If this proposal is approved by The National Congress, then abortions will become legal in private or public hospitals, up to the 24th week of gestation, with the consent of the pregnant woman and the affidavit of two doctors. However, abortion continues to be a crime in Brazil today.

#### D. Population Control Efforts

There are numerous efforts to promote a reduction in the population growth in Brazil. It is worrisome to find that São Paulo has 16.4 million inhabitants, being the second largest city in the world, second only to Tokyo, Japan, with 20 million inhabitants. Government campaigns carried on television and in newspapers inform people on the need to prevent an excessive growth of the population that does not have the necessary infrastructures, especially work and food supplies, to support it. Haphazard, uncontrolled population growth has led to the appearance of abandoned children, beggars, and would-be criminals (*marginais desocupados*) with nothing to do, all of whom are a heavy burden to a society without sufficient support structure.

The small family model has been in place in the large Brazilian cities since 1960, when the average of 6.3 children per family started to drop to the current 2.8 children per family. In rural areas, which comprises the largest area of the country, the average number of children in a family is still high at 5.7. However, we can assume that an accentuated drop in fertility in Brazil has resulted from the family planning campaigns. Reports tell us that 65% of the Brazilian couples of reproductive age use some type of contraceptive, with female surgical sterilization predominating. For example, in the United Kingdom female sterilization accounts for 8% of all contraception, in Belgium 5%, and in Italy 1%. In Brazil, female surgical sterilization accounts for 27% of the contraceptive usage. Hormonal therapies account for 25%, IUDs 1.3%, and vasectomies 0.7%. Other less-effective methods account for 11% of all contraception used.

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### A. Sexually Transmitted Diseases

##### *Incidence, Patterns, and Trends*

The incidence of gonorrhea, which had diminished considerably until 1960, increased greatly with the sexual liberty that developed in the 1970s. Syphilis also increased during that period of greater sexual promiscuity. With the advent of AIDS, the condom that had been used solely by prostitutes to avoid disease or pregnancy became the principal method of protection against the transmission of the HIV virus, and in the process benefited the campaigns against other STDs in our country.

In Brazil, STDs have increased significantly in the younger population, 15 to 20 years old. Based on statistics from several states, we estimate that 15% of the youth has already contracted a venereal disease. This amounts to about 2.2 million youths.

The Ministry of Health wants to encourage the war against the incidence of STDs through educational campaigns. They believe that any serious effort to control STDs must begin in the schools. According to Dr. Belda, venereal diseases are symptomatic of what he called a "social sickness," because their basic causes are connected to the behavior of individuals and communities. Among the factors cited as responsible for the changes in sexual conduct are the increase in promiscuity, variation in sexual customs, the migration of populations, and greater ease in transportation. We also admit that the increasing use of contraceptives also serves to increase promiscuity. Along with increased promiscuity, there is increased risk of contracting venereal diseases such as syphilis, gonorrhea, venereal lymphogranuloma, chancroids, inguinal granuloma, genital herpes, condyloma acuminatum, and HIV.

The most frequent STDs are syphilis and gonorrhea. The other STDs are not very common and escape the Health Ministry's statistical control. Syphilis is found in men in its primary phase, mostly because of its obvious clinical signs. However, it goes unnoticed in women, being confused with other vulvar inflammations. When it is diagnosed in women, it is most often in the secondary phase as a part of prenuptial exams. That is why the campaigns must especially reach groups such as prostitutes, homosexuals, and unwed youth.

Despite the lack of credible data, there is much evidence to indicate a new surge in gonorrhea in Brazil. In Rio de Janeiro, the incidence of gonorrhea grew by 120% between 1968 and 1972 while the population grew only 6%.

#### B. HIV/AIDS

##### *Incidence and Transmission*

At the end of 1992, The Ministry of Health reported a total of 31,466 cases of AIDS in Brazil. An estimated 450,000 Brazilians are infected with the HIV virus but present no clinical signs characteristic of the disease. São Paulo has the largest number of cases, 18,755 patients, followed by Rio de Janeiro with 4,933 cases and Rio Grande do Sul with 1,468 cases. Out of a total of 31,466 AIDS patients, 13,874 have already died, according to a report from the AIDS Division.

The known cases of AIDS in newborns are few and rare. Recent reports indicate only 634 perinatal cases. Of all the occurrences, 3.6% or 1,143 were found in people under 15 years of age. Among adolescents, ages 15 to 20, the incidence of AIDS associated with IV-drug use has risen from 3% in 1980 to 24% in 1993. While there has been a reduction in the number of infections transmitted by sexual contact, authorities are increasingly concerned about this rising transmission of the virus among IV-drug users. According to the latest report (1993), 19,060 of the 31,466 total AIDS cases were victims of heterosexual, bisexual, or homosexual transmission. Another 8,508 have contracted the disease through contact with infected blood. In adults, the ratio is seven infected males for every one female infected with the virus.

In a research project in Rio de Janeiro involving 1,350 men and women between 15 and 59 years of age, the authors found that 100% of homosexual and bisexual respondents were informed about AIDS. However, only 38.8% of the men and 18.3% of the women had changed their sexual practices to avoid AIDS. The government campaigns stress the importance of using the condom as a means to avoid AIDS. Many homosexuals and bisexuals do not use condoms because it "inhibits sexual pleasure." They say the use of the condom is not well accepted because a man may be offended if a woman insists he use one or a woman may become suspicious if a man uses one. Weighing the risks of losing a partner who already loves you against the risk of

contracting AIDS, many people choose to take the risk of contracting the disease.

In the Brazilian cultural tradition, the notion of homosexuality is more related to a passive (receptive) versus an active (penetrative) role. As Parker noted:

The medical/scientific model has often been reinterpreted in traditional folk concepts, with their emphasis not on sexual object choice, as in the categories *homossexualidade* or *heterossexualidade*, but rather on *atividade* and *passividade*. In popular thought, the category of *homossexuais* or 'homosexuals' has generally been reserved for 'passive' partners, while the classification of 'active' partners in same-sex interactions has remained rather unclear and ambiguous. (Parker 1987, 162)

This causes some men to classify themselves as heterosexual, when in reality they are homosexual or bisexual. The result is that many AIDS prevention programs adopted from the United States to reach males engaging in anal intercourse do not reach their target audience. The disease is spreading among homosexuals and heterosexuals alike as a consequence of poor sexual knowledge and a lack of care. There has not been any research among lesbians, but it seems to us that there has not been an increase in disease among these women except among those who use IV drugs (Paiva 1995).

#### *Availability of Treatment and Prevention Programs*

Prevention programs for AIDS using the slogans "Use a Condom" or "Practice Safe Sex" copy the North American models and do not take into account the particularities of sexuality in Brazil (Parker 1987). The practice of anal sex, as noted in Section 5C, Interpersonal Heterosexual Behaviors, Adults, is much more common between men and women in Brazil than in the United States, where it is a more frequent behavior among homosexuals.

There is a great mobilization of the community in a program of AIDS prevention through the development of several societies, the organization of lectures (*palestras*), the showing of films, professional health courses, the distribution of pamphlets, and information on radio and television programs. Meanwhile, religious groups protest and critique the campaigns because they seem to support solely the use of the condom and the disposable syringe. They believe it would be more educational and formative to discourage homosexuality, promiscuous sex, and drug use.

There has been no lack of the drug AZT. Even though it is a very expensive drug and not very efficacious in the treatment of AIDS, it has been distributed freely to patients with HIV who report to the Health Centers. Presently, Brazil is fourth worldwide in the number of AIDS cases, according to the World Health Organization. The United States has the most cases, followed by Uganda and Tanzania. France is fifth and Zaire is sixth (1992 data). Several years ago, Parker noted that:

it is clear that a careful examination of the cultural context in Brazil inevitably leads to the conclusion that the health problem posed by AIDS and facing Brazilian society is potentially far more widespread and serious than has thus far been acknowledged. . . . Brazil is facing an epidemic disease that is potentially as devastating as the other serious public health problems that already exist there, and a combination of prejudice, short-sighted planning, and economic instability has left Brazilian society almost entirely unprepared to confront it. (Parker 1987, 169)

Presently, much attention has been given to the protection of those who work in the health industry and have con-

tact with the high-risk groups in the general population, especially adolescents. The voluntary testing for HIV has been encouraged, and there is a campaign to protect those who test positive against discrimination.

#### *Government Policy*

[Update 2001: In 1997, Brazil introduced a controversial policy to manufacture its own generic AIDS medicines and distribute them free to patients. By 2001, this controversial program had turned Brazil into a global leader in fighting the AIDS pandemic. In the 1980s, Brazil was one of the hardest-hit countries. By early 2001, while 20% of South African adults and 5% of Haitians were HIV-positive, only 0.6% of Brazilians were HIV-infected. The AIDS death rate in Brazil was cut in half between 1996 and 1999. Despite opposition from the Roman Catholic Church, some 10 million condoms were distributed during Carnival celebrations in 2001. Frank prevention talk, and free medicine and treatment have put Brazil in the position of being a role model for the world (Rosenberg 2001).

[In March 2001, the first batches of the AIDS vaccines, Alavac vCP1452 (France) and MN rGP120 (United States), arrived in Brazil to be tested for human side effects by 40 volunteers. This study is part of a larger study sponsored by the United States government to study the vaccines in several developing countries. Researchers for O Projeto Praça XL, the AIDS research group of the Federal University of Rio de Janeiro (UFRJ), hope to study the side effects and immunobiological responses of the human body to the new AIDS vaccines, starting in June 2001. (*End of comment by L. Raibin*)]

[Update 2002: UNAIDS Epidemiological Assessment: The HIV/AIDS epidemic in Brazil is showing clear signs of stabilization. The incidence of AIDS has remained stable over the last five years at around 20,000 new cases per year, or 14 new cases per 100,000 population, and HIV prevalence also appears to be stabilizing across all sentinel surveillance studies conducted in the last four years.

[In 2000, 16,477 samples collected at 140 antenatal clinic sites were analyzed as part of sentinel surveillance of pregnant women. The national HIV prevalence in antenatal clinic settings was found to be 0.61%. When disaggregated by size of urban population, the prevalence in cities with more than one million inhabitants was found to be 1.25%. In cities with populations between 500,000 and 1,000,000, the prevalence was 0.34%; cities with populations between 200,000 and 500,000 had a prevalence of 0.46%, municipalities with populations 50,000 and 200,000, prevalence of 0.50%, and among cities with fewer than 50,000 inhabitants, 0.22%.

[Based on this study, it was estimated that in 2000 there were 597,443 individuals of both sexes between the ages of 15 and 49 years with HIV infection in Brazil, corresponding to a prevalence of 0.65%. UNAIDS estimates for the end of 2001 place the figure at 610,000 individuals living with HIV/AIDS, a prevalence of 0.65%.

[A 2001 study on 869 intravenous drug users in five urban areas found a median prevalence of 36.9%. A study of sex workers conducted in 2000 with 2,712 women in eight cities found median HIV prevalence to be 6.1%. Between March 1997 and October 2001 seven rounds of surveillance were conducted to establish the prevalence of HIV among STD patients. In total, 41,229 patients were tested, averaging 5,890 patients across 32 clinics per round. Median HIV prevalence for the period was 2.9%, with a decreasing trend from 4.2% in March 1997 to 2.7% in October 2001.

[In 2001, estimates of incidence and prevalence were developed for other STDs. Of the STDs examined, HPV preva-

lence was highest, at 15.17%, followed by HSV2 (0.76%), *L. vaginalis* (3.4%), syphilis (2.06%), trichomoniasis (1.92%), and gonorrhea (0.71%). Incidence was highest for *L. vaginalis* (5.1%), followed by trichomoniasis (2.32%), gonorrhea (1.82%), *L. pallidum* (1.10%), HPV (0.81%) and HSV-2 (0.76%).

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	600,000 (rate: 0.7%)
Women ages 15-49:	220,000
Children ages 0-15:	13,000

[An estimated 8,400 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 130,000 Brazilian children under age 15 were living without one or both parents who had died of AIDS.

[\*Adults in this UNAIDS Fact Sheet are defined as women and men aged 15 to 49. This age range covers people in their most sexually active years. While the risk of HIV infection obviously continues beyond the age of 50, the vast majority of those who engage in substantial risk behaviors are in the latter group. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A/B. Concepts of Sexual Dysfunction and Treatment

Sexology has been a medical specialty in Brazil since September 30, 1980. But, the majority of the physicians and the public are not aware of this. Brazilian culture exalts the virile man, and erectile dysfunction is considered a great shame. This leads men to depression and the common practice of not admitting they are impotent and blaming the woman when forced to admit it. Various sexual therapy clinics have emerged in the large cities, some of them without any modern scientific basis. There are a few legitimate groups that deal mostly with male sexual dysfunctions; a breakdown of such clinical treatment includes lack of erection 52%, ejaculatory problems 26%, and reduced libido 22%.

The use of vascular surgery is very common for male erectile dysfunction, followed by the insertion of a prosthesis to improve erection, for problems of an organic origin. Psychotherapy and hormone therapy are used in psychogenic problems.

Since 1986, the Department of Sexology of the ARE-Várzea do Carmo in São Paulo has been exclusively dedicated to the treatment of female sexual dysfunctions. Their case distribution is: inhibited sexual desire/arousal 37%, anorgasmia 61%, and vaginismus 2%. In a study of 150 clients at this clinic, Sergio L. Freitas found that 80% of the treated women were cured of their symptoms, while 20% dropped out of therapy for several reasons. Half of the women treated did so without their husband's knowledge. The husband's machismo jealousy and pride will not permit them to seek help openly. It was necessary to combine psychoanalytical and gynecological methods, and the techniques of Helen Singer Kaplan's *New Sex Therapy*, with a reconditioning and remedial sexual education. The main causes of sexual disturbances were related to sexual disinformation, negative early sexual experiences, and a poor-quality sex life. The average age was 32 years old. Treatment lasted from three to ten weeks. We found that 27% of the women were married without knowing that the sexual act was normal conduct in matrimony. Sixty percent were virgins when they married; 87.7% found their first sexual relation to be somewhere between bad and awful; 13.3%

found it to be acceptable; while none rated their early sexual experiences as either good or great.

The training of professionals for diagnosis and treatment takes place at the institutes mentioned in Section 12A, below. Certificates are awarded at a postgraduate level, following both theoretical and practical training through the observation of cases in active therapy.

Recent economic conditions have taken their toll on Brazilian sexuality. In a tropical land soaked with sensuality, economic anxieties are tarnishing a point of Brazilian national pride: bedroom performance. Harried by an annual inflation of 2,500%, two thirds of the adults surveyed in 1994 complained that the economic crisis was dampening their libido. Brazil's sex crisis is manifest at the dilapidated motels that line the roads into Rio de Janeiro. These establishments, featuring ceiling mirrors and suggestive names like "Lipstick," "Pussycat," and "L'Amour," offer hourly rates. Opened in the economic go-go years of the 1970s, many of these 225 motels in Rio are now deteriorating for lack of maintenance. Once discreet, they now fight to survive by advertising on television and offering promotions like discount lottery tickets or free lunches. Even so, Rio's motel industry trade association estimates that motels are renting their rooms at discounts averaging 40%. Respondents in a Brasmarket poll listed the following reasons in descending importance for the flagging sex drive: insecurity, lack of money for a date, street crime that keeps people at home, and lack of money for a motel.

## 12. Sex Research and Advanced Professional Education

### A. Institutes and Programs for Sexological Research

Sexology was recognized as a medical specialty in Brazil in 1980. Some postgraduate courses are offered at the Institute Saedes Sapientiae and at the Institute Havelock Ellis. These courses have been run by the Department of Sexology-ARE-Várzea do Carmo since 1986 by Dr. Sérgio Freitas. They offer practical training in sexology to professionals in the areas of psychology, nursing, social work, and medicine. The text, *Becoming a Sexual Person* (R. T. Francoeur, 2nd ed., New York: Macmillan, 1991), has been utilized as the basis for graduate courses in sexology, along with research in the area of sexuality and behavior of the Brazilian woman since 1992. Interest for this clinical specialty has had a recent impulse because of the XI World Congress of Sexology, held in June 1993 in Rio de Janeiro.

Among the organizations carrying on research, promoting courses, and running conventions on human sexuality in Brazil are the following:

Brazilian Association of Sexology (AB-SEX) (Associação Brasileira de Sexologia). Dr. Sérgio Luiz G. de Freitas, M.D., President. Address: Rua Tamarandá, 693 - Conj. 77, 01525-001 São Paulo, SP, Brazil.

Brazilian Sexual Impotency Research Society. Sociedade Brasileira de Pesquisa sobre Impotência Sexual. Roberto Tullii, M.D., Director. Address: Alameda Gabriel Monteiro da Silva, 1719, 01441-000 São Paulo, SP, Brazil.

Brazilian Sexual Education Association. Associação Brasileira de Educação Sexual. Address: Alameda Itú, 859, Apto 61, 01421-000 São Paulo, SP, Brazil.

Brazilian Society of Sexology. Isaac Charam, M.D., President. Address: Praça Serzedelo Correia, 15, Apto 703, 22040-000 Rio de Janeiro, RJ, Brazil.

Brazilian Society of Human Sexuality. Sociedade Brasileira de Sexualidade Humana. Address: Av. N.S. Copacabana, 1072, s. 703, 22020-001 Rio de Janeiro, RJ, Brazil.

Sexology Nucleus of Rio de Janeiro. Núcleo de Sexologia do Rio de Janeiro (NUDES). Address: Av Copacabana, 1018, Grupo 1109, 22060-000 Rio de Janeiro, RJ, Brazil.

National Sexology Commission of the Brazilian Federation of the Societies of Gynecology and Obstetrics. Comissão Nacional de Sexologia da Federação Brasileira das Sociedades de Ginecologia e Obstetrícia (FEBRASGO). Address: Edf. Venancio 2000, Bloco 50, Sala 137, 70302-000 Brasília, DF, Brazil.

Paranaense Commission of Sexology. Comissão Paranaense de Sexologia. Address: Rua General Carneiro, 181 - 4º andar. Maternidade do Hosp. de Clínicas, 80060-000 Curitiba, PR, Brazil.

Department of Sexology-ARE-Várzea do Carmo. Departamento de Sexologia-ARE-Várzea de Carmo. Address: Rua Leopoldo Miguez, 257, 01518-000 São Paulo, SP, Brazil.

## B. Sexological Publications and Journals

The only sexological journal published in Brazil is *Jornal da AB-SEX*, published since 1986 by the Brazilian Association of Sexology (AB-SEX) (Associação Brasileira de Sexologia). Address: Rua Tamandaré, 693, Conj. 77, 01525-001 São Paulo, SP, Brazil.

Some newspapers, magazines, and other popular periodicals publish columns dealing with sexual interests that provide an insight into Brazilian sexual cultures and behaviors. These include *Notícias Populares* (SP), *Claudia*, *Nova*, and *Caricia* (Editora Abril).

## 13. Sexual Behaviors of Aboriginal Indians

### A. Puberty Rituals and Premarital Activities

The behavior of several indigenous tribes of Brazil is similar, except for some variations particular to each native culture. The indigenous groups, such as the Kapalo, Xavantes, Tupinambas, and the Alpinages, have developed similar rituals for children and adolescents.

A girl is promised as a future bride while she is still very young, usually about 5 years of age. The future groom is a male adolescent, about 16 years old, who will marry her when she enters puberty and has her first menstruation. After her first menstruation, the girl is taken to the women's house (*Oca*). There she will remain for an entire year without being permitted to see sunlight or trim her hair. After a year's time, she is removed from the house and prepared for the nuptial party. She will be married to that same young man, who is now about 26 years of age.

Among the Kapalo, rituals of preparation for the male adolescent begin when he completes his 16th birthday. He must pass tests of courage, physical endurance, and resistance to pain. The boy must run through the forest for several kilometers while carrying a tree trunk. He must climb a tree and insert his arm into a bee or wasp hive, descending only after he has been stung several times. He must not hurry his descent nor run from the tree. He must also not scream or cry in pain. The boy must also demonstrate his skill in hunting and fishing with arrows (nets and hooks are not permitted for fishing). After passing all these tests, he is considered to be an adult. He will no longer live in the boys' house and must now reside in the unmarried men's house (*Oca*). He will then begin to take part in the adult fights and competitions.

At this point, he begins his sexual initiation. He may have sexual relations with any widow, older single women, and his older brother's wife. Sexual intercourse occurs mostly between people of different generations: the older generation teaches the younger generation.

Virginity is of secondary value. Girls usually lose their virginity before their wedding. The explanation is simple. The young women and men are not knowledgeable of the ways of the world. They marry old people of the opposite sex so they can learn from them.

## B. Sexual Behaviors of Single Adults

Because girls are married about age 5, there is a lack of young single women. Young men thus must be content with much older women. Although most are postmenopausal and sterile, there is the advantage of having a wife who knows how to cook, tend the fire, and keep the house. Thus, single young men will take any old woman for a bride, even if they do not find her attractive. As soon as it becomes possible, she will be traded for a younger wife. Men can only have sexual relations with fertile women after they have executed at least one enemy in a ritual killing.

Sometimes, the parents of the groom offer him an enemy to execute. However, if he wishes to marry a young woman, he must capture and kill an enemy himself. Because of this ritual, a single young man very seldom marries a fertile young woman before he is at least 30 years old. Men may only take part in war expeditions between the ages of 26 and 40 years of age. A man that has never imprisoned any slaves is labeled a "bad apple," or weak, timid, and cowardly (*Mebek*). He will never marry.

## C. Cohabitation, Marriage, and Monogamy

There is cohabitation without marriage, but once married, a woman's fidelity is demanded. Older men may reserve for themselves a high number of women, especially if they have gained power or prestige as warriors, medicine men, or Great Chiefs (*Caciques*). Old men are privileged; they can even reserve prepubescent (premenarche) girls for themselves. When a *Cacique* receives a young girl from her parents, he will wait for the first menstruation before having sexual intercourse with her. It is taboo to have sexual relations before menarche. There are frequent cases where there is reciprocal affection between a couple, and they remain united until the death of one of the consorts.

Dissolution of a marriage occurs with ease and frequency. Any incident as simple as a domestic disturbance or indisposition can lead to separation. The major cause of breach is the wife's adultery. In these cases, the mildest punishment is for the wife to be returned to her parents. A man may also repudiate, or even kill an adulterous woman, according to the tribe's natural laws. However, a man's adultery is received with approval by the community, which is amused by it. When a pregnant woman, widowed, divorced, or with a traveling husband, has sexual relations with another man, there is the difficulty in determining the father of the child. Such children, known as *Maraca*, "fruit of two seeds," are buried alive immediately following their birth.

This procedure also occurs any time twins are born. They believe twin children are generated by antagonistic spirits and must therefore be sacrificed.

After a birth there are some sexual prohibitions. The husband must abstain from sexual relations from the beginning of the pregnancy until the child can walk by itself or is at least a year old. This is the reason why men may have several wives (polygyny). In this manner, a man only has sexual relations with the same wife two years after the beginning of pregnancy.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Bulgaria is located in southern Europe, with Romania and the Danube River on its northern border, the Black Sea on the east, Turkey and Greece on the south, and Macedonia and Yugoslavia on its western border. With a total landmass of 42,823 square miles (110,910 km<sup>2</sup>), Bulgaria is slightly larger than the state of Pennsylvania. The terrain is mostly mountainous, with lowlands and rolling hills in the north and southeast. The Balkan Mountains cross the center of the country, east to west. The Rila, Pirin, and Rhodope Mountains are in the west and south. The climate is temperate, with cold damp winters and hot dry summers. Nearly two fifths of Bulgaria's land is arable, and a fourth of this is irrigated, mostly in the southeast during the dry summer season. About a fifth of the country is pastureland and one third forested. Over the centuries, the strategic position of Bulgaria and Turkey in the Balkan Peninsula enabled the two nations to control a key trade and migration route between Europe and the Middle East.

According to the latest national survey (National Institute of Statistics (NIS), March 1, 2001), Bulgaria had a population of 7.98 million. Since the previous census in 1992, the population has declined by 6.6%. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 14.6% with 1.06 male(s) per female (sex ratio); 15-64 years: 68.5% with 0.97 male(s) per female; 65 years and over: 16.9% with 0.72 male(s) per female; *Total population sex ratio:* 0.94 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 71.5 years; *male:* 67.98 years; *female:* 75.22 years

**Urban/Rural Distribution:** 69% to 31%

\**Communications:* Michail Alexandrov Okoliyski, Ph.D., National Center of Public Health, Sofia, Bulgaria; mental@mbox.cit.bg; Petko Velichkov, M.D., Human Sexuality Research Foundation, Sofia, Bulgaria; sexology@acad.bg; http://www.sexology.bol.bg.

(CIA 2002)

**Ethnic Distribution:** Bulgarian: 83.6%; Turk: 9.5%; Roma (Gypsy): 4.6%; Macedonian, Armenian, Tatar, Gagauz, Circassian, and others: 2.3% (NIS 2001; CIA 2002)

**Religious Distribution:** Bulgarian Orthodox: 83.8%; Muslim: 12.1%; Roman Catholic: 1.7%; Jewish 0.8%; Uniate Catholic: 0.2%; Protestant, Gregorian-Armenian, and other: 1.6% (1998 est.)

**Birth Rate:** 8.05 births per 1,000 population

**Death Rate:** 14.42 per 1,000 population

**Infant Mortality Rate:** 14.18 deaths per 1,000 live births

**Net Migration Rate:** -4.74 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.13 children born per woman

**Population Growth Rate:** -1.11% (2002 est.); -1.14% (NIS 2001 est.)

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.01%; *Persons living with HIV/AIDS:* 346; *Deaths:* < 100. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 98%; attendance for nine years of compulsory school; education is free and compulsory from age 6 to 16

**Per Capita Gross Domestic Product** (2001 est.) (*purchasing power parity*): \$6,200; \$5,720 (NIS est.); *Inflation:* 7.5%; *Unemployment:* 17.5%; 21.7% (NIS est.); *Living below the poverty line:* 35%; 21% (NIS est.)

### B. A Brief Historical Perspective

About 3500 B.C.E., the Thracians established the first civilization in what is now known as Bulgaria. In the fourth decade C.E., this region became part of the Roman Empire. As the Roman Empire declined, the Goths, Huns, and Avars moved in. In the 6th century, Slavs from what are now northwest Ukraine and southeastern Poland settled the region. In 679 C.E., the nomadic Bulgars from central Asia crossed the Danube River from the north and took control of the region, blending with the Slavs. The first Bulgarian kingdom was established in 681 and gradually became the most powerful state in the Balkans. Under Simeon I, who ruled from 893 to 927, Bulgaria experienced a golden age, as Macedonia, Albania, Serbia, and other parts of the

Byzantine Empire came under its influence. In 865, Boris I adopted Orthodox Christianity. Between 893 and 1280, the Bulgars twice conquered most of the Balkan Peninsula. In 1396, the Ottoman Turks invaded the land and made it a Turkish province until 1878. Bulgaria's position on the northern border of Turkey made its occupation by the Ottomans particularly harsh and inescapable.

In 1878, after winning the Russo-Turkish War (1877-1878), Russia forced Turkey to give Bulgaria its independence. Fearing the growing influence of Russia and Bulgaria in the Balkans, European powers intervened at the 1878 Congress of Berlin and fashioned Bulgaria's territory into a small principality ruled by Alexander, a nephew of the Russian Czar.

Prince Ferdinand of Saxe-Coburg-Gotha succeeded Alexander and declared Bulgaria a kingdom independent of Russia in 1908. After losing the Second Balkan War (June to August 1913) and all the territory it had gained in the First Balkan War (1912-1913), Bulgaria joined Germany in World War I. After being defeated in World War I, Ferdinand abdicated in favor of his son in 1934-1935. After joining the Germans in World War II, Bulgaria switched sides when Russia declared war on Bulgaria in September 1944. In three days, Russia took control of the country and installed a communist regime. The People's Republic of Bulgaria was officially established in 1946. Communist domination ended in 1990 with multiparty elections and movement toward political democracy and a free-market economy. High inflation, unemployment, corruption, and crime have been problems in recent years. In 2000, Bulgaria started on the path to eventual integration into the North Atlantic Treaty Organization (NATO) and the European Union (EU).

## *1. Basic Sexological Premises*

### **A. Character of Gender Roles** PETKO VELICHKOV

The social stereotypes concerning gender roles in Bulgaria are highly influenced by the long-lasting patriarchal tradition. Nevertheless, there are some considerable variations according to ethnic groups. In the present day, one can find some remnants of a patriarchal (men rule) model among the Turks, Armenians, Jews, and Gypsies. In general, Bulgarians did not subscribe to a macho style of social functioning. Ethnopsychological research has shown that the male domination was quite limited mostly in its outer expressions. Usually, Bulgarian men never made any major decision concerning the family's well-being without asking the opinion of their wives. In most families, women were (and often still are) the treasurers of the family's wealth. This kind of relationship was idiosyncratic for Bulgaria, but was not specific for the rest of the Balkan Peninsula (Panov 1914).

### **B. Sociological Status of Males and Females**

The United Nations Convention on the Rights of the Child is the fundamental principle of the Child's Protection Law. To monitor and enhance the implementation of this law, a State Agency for Child Protection has been in operation since October 2002.

During the totalitarian regime (1944-1989), great emphasis was put on the women's emancipation. However, Bulgarian women were already accustomed to such a model, as by the end of the 19th and the beginning of the 20th century, during three successive wars, when men were permanently absent for years, the country's economic output retained a peacetime level. Women successfully substituted for men as manpower in all kinds of labor.

In the present day, the concept of equal rights between the sexes is guaranteed by the Constitution. Article 6, paragraph 2 reads: "All persons shall be equal before the law. There

shall be no privileges or restriction of rights on the grounds of race, nationality, ethnic self-identity, sex, origin, religion, education, opinion, political affiliation, personal or social status or property status." This principle is further elaborated in the legislation and is valid for the entire legal system of Bulgaria. The age of consent in Bulgaria is 18 years.

The Constitution also regulates the protection of motherhood, the recognition of its social function, and the joint responsibility of men and women in parenthood. According to article 14, "the family, motherhood, and childhood shall enjoy the protection of the State and society." Article 47, paragraph 2 reads: "Mothers shall be the object of special protection on the part of the State and shall be guaranteed prenatal and postnatal leave, free obstetric care, alleviated working conditions, and other social assistance." Either spouse can benefit from postnatal leave.

The Republic of Bulgaria is a party to most international instruments on human rights, as well as to international conventions on the rights of women such as the Convention on the Elimination of All Forms of Discrimination against Women, the Convention on the Political Rights of Women, the Convention on the Nationality of the Married Women, the Slavery Convention, the Convention for the Suppression of the Traffic in Persons and the Exploitation of the Prostitution of Others, as well as to most of the ILO Conventions regarding the labor conditions of women.

Many women's nongovernmental organizations (NGOs) have been registered in this country and, especially, during the last decade. Their aims include promoting the accomplishments of women in social life and the observance of their rights, elaborating and implementing programs and projects on the problems of women, their development, and progress, engaging in cultural, educational, charity, and international activities, and assisting women in business, scientific, and research work. Finally, they provide legal and psychological assistance to victims of violence, and so on.

The Penal Code contains a number of provisions related to violence against women. The relevant chapters titled "Crimes Against the Person" and "Crimes Against Marriage, Family and Youth" contain provisions directly concerning women, like abduction of a female person for the purpose of forcing her to enter into marriage (article 177, paragraph 2) or a parent or other relative receiving a consideration to permit his or her daughter or relative to conclude a marriage (article 178, paragraph 1); violating an obligation to a spouse or relative in an ascending or descending line, who is incapable of caring for him- or herself, and thereby placing him or her in a position of serious embarrassment (article 181); entering into marital relations with a female person under the age of 16 (articles 190, 191, and 192); persuading a female person to practice prostitution or abducting a female person for the purpose of her being placed at the disposal of others for acts of lewdness (articles 155 and 156), and so on. Legislation is envisaged to protect women from sexual harassment and exploitation of their economic dependence or low status in the workplace (Boskova 1998).

A recent public poll has demonstrated that Bulgarian men show strong approval for the existing egalitarian model. Only 6.7% of men expressed a negative attitude toward women's emancipation. The same research demonstrated equal representation of both sexes in the structure of the workforce: 46.7% women and 53.3% men. There were no significant differences in the educational level according to sex, although women's pay is nearly 30% less than men's. One possible explanation is that most women are employed in agriculture, textiles, and sewing manufacturing, education, healthcare, and other highly underpaid areas (Sociology Agency "Pleades 2002").

### C. General Concepts of Sexuality and Love

The socioeconomic and moral values in Bulgaria tend to vary, and hence, the growing variety of sexuality concepts and constructs, as well as the ways they are expressed.

Since ancient times, women's ideal was to raise children and maintain coziness in the family's home. Men were expected to ensure material comfort and protection. At that time, the tribal tradition of marriage was quite liberal (Draganov 1984). The pairbonding process was based on mutual attraction and love. If pregnancy occurred, then marital rituals were performed (Kaloyanov 1995). In the pagan tradition, both male and female sexuality was highly prized, which is demonstrated by an unusually affluent erotic folklore (Sheytanov 1932).

In 865 C.E., Bulgarians adopted Christianity and the society switched to the Judeo-Christian patriarchal model. This transition was rather slow and was disrupted by the forced conversion to Islam of a significant portion of the population during the 14th to 19th centuries.

With the industrialization of the country in the 19th and 20th centuries, the patriarchal family model gave way to the nuclear family. Actually, the serial monogamy model is on the rise. A plausible reason behind this phenomenon might be the very high—and mostly unrealistic—expectations of modern Bulgarians toward partnership, marriage, parenthood, and children. Love, friendship, and material comfort are the key factors to a marital relationship. In 66% of families, both spouses rank love first as a reason for their marriage, 23% rank friendship first, and only 9% rank material comfort first “Pleades 2002”).

### 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

PETKO VELICHKOV

#### A. Source and Character of Religious Values

The strongest religious values among Bulgarians are rooted in Orthodox Christianity, although some vague reminiscences of the ancient pagan tradition are adding some nuances. The common Bulgarian folk have not been famous for their religiousness. As a rule, the religious doctrine is subject to rather down-to-earth interpretations, and fanaticism or fundamentalism is not prized at all. The restrictive attitude toward sexuality has vanished with the patriarchal morality.

#### B. Source and Character of Ethnic Values

The contemporary Bulgarian nation is a highly rich ethnic blend. Various cultures with their specific ethics have met and blended in this land, which has always been at a crossroad between the Western world and the East, as well as between the North and the South. Hence, the diversity in attitudes, ranging from pronounced openness and tolerance to moderation in sexual matters.

### 3. Knowledge and Education about Sexuality

MICHAIL OKOLIYSKI

*A Caution:* The short and deep political and economic changes of recent years in Eastern Europe have created a difficult situation regarding sexual behavior and AIDS prevention in Bulgaria. On the one hand, rapid modernization and the opening to the West have created an overabundance of new sexual options (pornography, commercial sex work, the self-identification of sexual minorities, etc.). On the other hand, there is no public education on the dangers of the new sexual freedom, no sex counseling, no educational literature, no outreach to persons at risk, or no concerted prevention ef-

fort. According to this situation of poverty and crime, there are some cynical voices in Bulgaria that would claim it is unnecessary to spend effort and money on empirical scientific and prognostic studies about social risks. But when we search for answers to these problems only in the “here and now” perspective without trying to learn about people's attitudes and behaviors, it is clear that the results of the health prevention programs will be negative. Under these circumstances, it is very difficult to run scientific studies. Given this reality, the picture of sexuality in Bulgaria provided in this chapter is based on the few studies and surveys available, namely:

- 2002: *Overview of HIV/AIDS in South Eastern Europe*. International Organization for Migration (I.O.M.) and UNICEF.
- 2000: A.S.A. *A representative high school students survey of Sofia and the country*. United Nations Development Program/Mental Health (UNDP/MH), conducted by A.S.A.; Sofia sample—761 students; national sample—1666 students; 9-12 grade. Comparative data for Sofia are for a comparable age (16-year-olds).
- 1999. *Conditions of AIDS prevention in Bulgaria*. Michail Okoliyski, Humboldt University (Dissertation), Berlin, <http://edoc.hu-berlin.de/abstract.php3/dissertationen/phil/okoliyski-michail-alexandrov>.
- 1996: *Reproductive Behavior Family Planning. Contraceptives Use*. (An empirical sociological survey directed by Mihail Mirchev). A.S.A.-MH, Ministry of Health, The Phare Programme, Sofia (Mirchev, Jachkova, Kasakova, Velikova).
- 1995: National Health Center. *A NHC Representative Survey of Sofia* (1044 respondents, 9-11 grade).
- 1995: *AIDS and Sexuality*; a study based on a representative sample for Sofia on 15- to 17-year-olds. The Agency for Socioeconomic Analyses—A.S.A., June-July, 1995.
- 1992: Argirova, R., D. Beschkov, O. Troschev, E. Bodscheva, V. Georgieva, *The AIDS Experience*, AIDS-Centre, Sofia.
- 1988: *Medical Academy Representative Survey of Sofia* (1100 respondents, 9-11 grade).

#### A/B. Formal and Informal Sources of Sexual Knowledge

There is very little sex education for Bulgaria's youth in the schools and at home.

For effective AIDS prevention among Bulgaria's youth and others target groups, health professionals need insights into the behavior patterns and motives that hide behind epidemiological data. In order to gain a better understanding of sexual knowledge, attitudes, and practices in Bulgaria, Michail Okoliyski (1999) undertook a survey using face-to-face interviews on the “Conditions of AIDS prevention in Bulgaria” during his doctoral studies at the Humboldt-University in Berlin under the scientific guidelines of Prof. Erwin J. Haeberle. The resulting dissertation is the result of the analysis of an initial survey of IV-drug users, persons with homosexual, bisexual, and heterosexual behavior, and people who are selling sexual services. Although the survey respondents were not a representative sample, their responses can provide, with caution, some insights into the sexual attitudes, knowledge, and behaviors of Bulgarians in general. The study was conducted in the period 1997-1998 in the capital city of Bulgaria, Sofia.

Of those answering Okoliyski's questionnaire, 84.7% received their sexual knowledge from friends, with 20.3% through the media. Only 15.3% received sex education from

their parents. This confirms the claim of many Bulgarian educators that sex is still a taboo subject in most Bulgarian families. The fact that only 13.6% learned anything about sex from their teachers reflects the general absence of sex education in Bulgarian schools, where students are taught a total of only two hours about the biological differences between the sexes. There is a total lack of formal education with regard to the psychological and social aspects of sex. As a result, Bulgarian adolescents feel abandoned by their elders as far as their own sexual problems are concerned. They still get their sexual knowledge "in the streets" (see Table 1).

Knowledge about HIV/AIDS is obtained in a quite different way. Most Bulgarians learn about it from the media, since friends and peer groups are largely uninformed because of a lack of any intensive government campaigns. Again, parents and schools play a very modest role, illustrating once again the inadequacy of formal sex education. There is one relative difference between our target groups, however. Persons with bisexual and homosexual behavior receive more AIDS information from their friends and peer groups (see Table 2).

The ideas of sexuality and sexual behavior in the youth population in Bulgaria are becoming more and more pragmatic. In 2000, 15.2% of 16-year-old students in Sofia *do not agree* that sex without love is useless (A.S.A. UNDP/MH 2000). Five years ago, they were 12.2% (NHC 1995), and in 1988, just 8.2% (Med. Academy Represent. Survey Sofia 1988). There are changing attitudes towards using commercial sex services. A third of the students (from the national sample) support a possible legalization of prostitution, and 6.7% state they have used commercial sex.

According to the same survey, 11.2% of students who have an active sexual life have a positive attitude to accidental sexual contacts, and the attitude to this is that 7.8% are neutral. In other words, 19% of the sexually active teenagers consider accidental sexual contacts permissible. Even more informative is the fact that 33.4% of surveyed students who have a sexual life would under certain circumstances take part in group sex.

There is an abrupt rise in positive attitudes towards condom use, but it is not accompanied by actual behavior. At the same time, the share of respondents who would not insist with their partner on condom use remains at the 1995 level and even increases by 2% (see Table 3). In 2000, the attitude that *condoms reduce sexual pleasure* is still the greatest obstacle to their use. The share of students who do

not share the opinion rises in comparison with 1995 by only 4%. Factors such as feeling embarrassed to buy a condom are no longer valid—over 60% of students would not feel embarrassed to buy a condom (see Table 4).

HIV/AIDS awareness among Sofia students in 2000 is almost the same as in 1995. Indicators of awareness such as the understanding that *the disease is incurable* and that *a week after sexual intercourse, transmitted virus cannot be identified* are rising. The basic knowledge that *the virus is transmitted through sperm, blood, and vaginal secretions* remains at the same level for all samples (76% to 78%).

At the same time, there are indications that anal sex risk-awareness is decreasing. In 1995, 39.8% of 15- to 16-year-old students in Sofia were aware that anal intercourse is the riskiest one, while only 32.9% of same-age students know that today. At the national level, this knowledge is common for 36.8% of high school students. Additional analyses failed to confirm the hypothesis that lowered awareness of anal sex risk is connected to the higher tolerance to homosexuals in the last few years.

HIV/AIDS awareness, as with prevention attitudes, depends on the type of school, size of settlement, and ethnic background. Thus, for instance, the knowledge of the long latent period of HIV is common for 35.7% of vocational school students, 51.1% of secondary school students, and 70.0% of high school students. Other indices do not show such substantial differences among students in vocational and secondary schools. The basic line of division is between vocational and secondary schools, on the one hand, and high schools, on the other.

Understanding of the subjective HIV-infection risk is an important indicator of awareness of the problem. Available data show little development in the understanding of the subjective HIV-infection risk. The majority (50%) of students do not *worry* that they personally can be infected. On the national level, only 19% perceive HIV as a big danger and are

**Table 1****Sources of Sexual Knowledge**

	Parents	School	Friends	Media
Bisexual behavior	6.7%	20 %	80 %	6.7%
Homosexual behavior	15	5	85	25
Heterosexual behavior	15.4	15.4	92.3	23.1
IV-drug use	27.3	18.2	81.8	27.3

**Table 2****Sources of Information about HIV and AIDS**

	Parents	School	Friends	Media
Bisexual behavior	6.7%	6.7%	73.3%	40 %
Homosexual behavior	5	30	50	75
Heterosexual behavior	14.3	14.3	21.4	71.4
IV-drug use	16.7	8.3	16.7	66.7

**Table 3****Would You Refuse Sexual Contact If Your Partner Would Not Use a Condom?**

	1988	1995	2000 (16-year-olds)
Definitely yes	13.1%	16.8%	22.9%
I think yes	14.3	22.6	19.9
I cannot say	38.8	26.8	26.3
I think I would not insist	19.9	20.2	15.3
I would definitely not insist	13.9	13.6	15.7

Source: Medical Academy, 1988; NHC/ASA, 1995; UNDP/MH/ASA, 2000; Comparable Sofia Samples.

**Table 4****Do You Think That Condom Use Makes Sexual Intercourse Unpleasant?**

	1988	1995	2000 (16-year-olds)
Definitely yes	14.2%	14.0%	12.3%
I think yes	13.9	17.2	10.2
I cannot say	52.5	35.9	38.1
Probably not	10.6	16.4	18.6
Definitely not	8.7	16.4	20.8

Source: Medical Academy, 1988; NHC/ASA, 1995; UNDP/MH/ASA, 2000; Comparable Sofia Samples.

thinking about that. An important fact is that this attitude is higher in smaller settlements and teenagers of families of lower social and economic status. Additional analyses show an important connection between HIV/AIDS unawareness and subjective risk perception. Thus, for instance, teenagers, who are not aware that the HIV virus is transmitted through blood, sperm, and vaginal secretions, perceive this risk as higher. Therefore, we are not talking so much about awareness of the problem, but rather about the higher level of concern, which is always connected to less awareness.

Be it so, this concern has changed only a fraction in the last five years. And this is only natural from the point of view of insignificant changes in HIV/AIDS awareness. Nevertheless, there is a slight increase in subjective risk perception in the last 12 years (see Table 5).

However, this is just one side of the gradation that shows how often students received information from one source or another. It must be mentioned that such data are to a large degree conditional. Respondents tend to point to sources that *should inform* and not the ones they *actually used*. A significant fact is that the influence of information sources in Sofia is different from that for the country as a whole.

Despite this conditional status of the data, it is evident that the influence the same channel (information source) exerts in Sofia and in the countryside is different. Obviously, the influence potential of Sofia schools is higher than that of the countryside. On the other hand, friendships in the province are probably closer and more influential.

#### 4. Autoerotic Behaviors and Patterns

MICHAIL OKOLIYSKI

Only a minority of the respondents of the Okoliyski survey made between 1998 and 1999 reported not engaging in this sexual practice (see Table 6). Also, the intensity and the

**Table 5**

**How Big Is the Possibility That You Will Become AIDS Infected?**

	1988	1995	2000 (16-year-olds)
No risk exists	26.1%	27.7%	21.4%
The risk is small (I am not worried)	46.5	42.0	40.3
There is some possibility	15.5	21.0	22.2
The risk is considerable, I often think about it	9.1	5.7	10.7
There is very big possibility		3.6	5.3

Source: Medical Academy, 1988; NHC/ASA, 1995; UNDP/MH/ASA, 2000; Comparable Sofia Samples.

**Table 6**

**How Often in the Week Do You Practice Masturbation?**

	Never	More than once	Every day	Several times daily
Bisexual behavior	20 %	73.3%	0%	6.7%
Homosexual behavior	10	75	15	0
Heterosexual behavior	35.7	64.3	0	0
Drug users	33.3	66.7	0	0

frequency of the masturbation were high: About two thirds of the respondents practice sexual self-sufficiency (self-stimulation) more than once a week. The survey data show that the sexual self-sufficiency and the mutual partner masturbation (hand and body massage) are an important part of the sexual lives of these people. Although these sexual practices are used mainly in connection with other sexual variations, they are an important part of the sexual lives of these people.

[Comment 2003: Sex therapists have noticed a bullish tendency of acceptance towards sexual self-gratification, especially among single males. In married couples, male as well as female masturbation is perceived as some kind of deviation rather than a sign of the couple's malfunctioning (Archives of Human Sexuality Research Foundation (H.S.R.F.) unpublished data). (End of comment by P. Velichkov)]

#### 5. Interpersonal Heterosexual Behaviors

##### A. Children

[Comment 2003: Very little is known about children's sexuality in Bulgaria, and no research has been carried out on this topic. (End of comment by P. Velichkov)]

##### B. Adolescents

PETKO VELICHKOV

Some ethnic differences have been perceived concerning menarche and the age of first sexual intercourse for females (see Table 7). The average age at which male adolescents start their sex life is 16.1 years (Tzegov 2003).

##### C. Adults

*Marriage, Affairs, and Divorce* PETKO VELICHKOV

The institution of marriage, in Bulgaria, is in a transition as more than one fifth of the households are in fact couples in a steady relationship without official marriage. Thus, in 2002, about 40% of the children are born of some kind of nonmarital relationship. As the marital index, currently at 4 per 1,000—half the rate of 20 years ago—is plunging down, it is only natural for the divorce index to be affected at a lower rate. Thus, when the number of officially registered marriages decreases, implicitly the probability for divorce also decreases, but not at the same pace of 1.3 per 1,000 (Belcheva 2002).

##### *Sexual Satisfaction*

PETKO VELICHKOV

It has been established that 63% of women in the age range of 20 to 31 years, cohabiting with a male partner, had sexual intercourse two or three times weekly. Among married women in the same age range, less than 20% attained such a frequency. In the tenth year of marriage, 38% of husbands are not happy with their marital sex; of them, 43% of men rank as a first cause the diminished interest of their wife toward sex; 67% of wives declared that they had been solicited for sex more frequently than they would have wished to be ("Pleades 2002").

##### *Sexual Relationships*

MICHAIL OKOLIYSKI

A significant majority of people were in a committed (*unpromisk* "non-promiscuous") sexual relationship: 65.6%

**Table 7**

**Estimated Age of Menarche and Sexarche (2003 Estimates)**

	Age at Menarche	Age at First Sex Contact
Roma girls	12.2	14.6
Turk	12.8	15.4
Bulgarian	13.5	16.8

were with a partner-relationship; 26.2% were without a partner-relationship; and only 29% of the respondents have more than one partner at the same time (Okoliyski 1999) (see Table 8). There are also some changes in the quantitative parameter of the partner relationships in recent years, with a decrease in the number of sexual partners.

*Incidence of Oral and Anal Sex* PETKO VELICHKOV

Anal sex, fellatio, and cunnilingus are not subject to any restrictions, provided they are practiced between consenting adults. According to therapists, anal sex in heterosexual relationships is almost exclusively initiated by the male. Nowadays, fellatio and cunnilingus are willingly accepted by most couples as an element of their loveplay. Cunnilingus is regarded as a must by most men with premature ejaculation (H.S.R.F.).

**6. Homoerotic, Homosexual, and Bisexual Behaviors**

MICHAEL OKOLIYSKI

Respondents in the Okoliyski 1999 survey engaging in same-sex and bisexual behavior were very ambivalent toward their own sexuality: 46.7% of the sample with bisexual behavior and 75% of the respondents with homosexual behavior were negative about their own sexuality (see Table 9). In our opinion, this statistic shows that they did not consider their sexuality as a common part of human sexual behavior. Since the late 1960s and early 1970s, homosexual activity between consenting adults is no longer prosecuted. This decriminalization was an official step toward emancipation of the sexual minorities made under the totalitarian regime. As we know from other researchers, two types of commercial sex workers do appear to be at risk of HIV transmission. In the first place, those without a self-identity, and in the second place, those resulting from isolation and stigmatization; the absence of social support and control may discourage condom use. Anyway, unsafe sex practices may result from this lower degree of institutionalization in prostitution, which may result in unsafe sex practices.

**Table 8**

**Adult Sexual Relationship Partner Situation\***

	Bisexual behavior	Homosexual behavior	Heterosexual behavior	Drug Use	Total
I live in a partner-relationship	73.3%	50%	78.6%	66.7%	65.6%
I live without a partner-relationship	0	45	21.4	33.3	26.2
I have more than one partner at the same time	26.7	5	0	8.3	8.2

\*confirmative answers.

**Table 9**

**Is Your Sexual Behavior Acceptable to Society?**

	Bisexual behavior	Homosexual behavior	Heterosexual behavior	Drug Use
Yes	40 %	20%	71.4%	50 %
No	46.7	75	7.1	33.3
I don't know	3.3	5	21.4	6.7

**7. Gender Diversity and Transgender Issues**

PETKO VELICHKOV

A search into the archive of the former sexology outpatient clinics has shown that, for a 35-year period, gender-conflicted clients composed only a tiny share of the patient population, only 0.1%. A total number of 47 persons were transsexuals looking for sex reassignment. Among them, as many as 38 were female-to-male patients and only 9 were diagnosed as male-to-female transsexuals. (The fact that more than half of the biologically male transsexuals emerged during the first seven years following the abolishment of the dictatorship may suggest some socioeconomic explanation to the striking discrepancy of the male/female ratio.)

Twenty-three persons, 15 female and 8 male, obtained a legal sex reassignment procedure. After at least one year of "adaptation" period, 21 patients (14 female and 7 male) proceeded with a sex-reassignment surgery. (The first operation in Bulgaria on a female-to-male transsexual after a legal sex reassignment was performed in 1988 by an andrologist and plastic surgeon team.

Two of the transsexuals decided not to undertake surgery. They felt comfortable and satisfied with the legal change of their sex alone and have not pursued surgery. The follow-up on the operated patients demonstrated a beneficial effect mostly on the quality of their lives.

Actually, there are no special legal regulations concerning transsexuals. Sex-reassignment procedures are performed on transsexuals within the existing legal framework that is being routinely applied to intersexual cases. The court presumes that sex assignment at birth, exclusively based on the appearance of the external genitalia, may be inaccurate (H.S.R.F. unpublished data).

**8. Significant Unconventional Sexual Behaviors**

**A. Coercive Sexual Behaviors** PETKO VELICHKOV

One of the most acute social problems to emerge during the political transition period is the increase in the national crime rate, which in the late 1990s reached unprecedented levels. For example, in 1989, the number of annually registered crimes was only 663 per 100,000 persons, while over the next 10 years this figure annually approximated 3,000 per 100,000. Crime is among the major sources of distress and concern of the population (see Table 10). Women in particular have become affected increasingly. Since the mid-1990s, the

**Table 10**

**2001 Crime Statistics**

	Crimes reported	Persons Convicted*
Totals	24,291	28,729
These totals included:		
Crimes against the person, comprising:	1,735	1,819
Debauchery	328	325
Rape	139	164
Crimes against marriage, family, and youth	969	952

\*The number of Crimes and Convicted persons do not match because sentences are pronounced on crimes committed during previous years.

number of women who have been victims of crime has risen by over 60% (United Nations 2001).

### **B. Prostitution** MICHAEL OKOLIYSKI *Sexual Behavior of Commercial Sex Workers (CSW)*

Under the Bulgarian penal legislation, persons who organize or distribute sex services are subject to penalty. Women introduced to this activity are not subject to penalty. Article 156, paragraph 1 of the Bulgarian Penal Code provides a penalty of 10 years in prison and a fine of up to BGN100 for anyone convicted of kidnapping a person of the female sex to commit her to obscene activities.

The legal status of prostitution determines to a large degree the non-transparency of researching and understanding thereof. The Epidemiological Control and Surveillance System does not record the professional status of infected people. It is even less possible to do that with regard to female prostitutes. However, a number of subgroups of women can be separated according to the different types of prostitution:

#### *Street and Highway Prostitution.*

These are girls who work on the outside, in central and peripheral city and town areas—railways and bus stations, streets, highways, border and roadside motels, and TIR parking lots. They are known as “crew girls.” The majority are of Roma (Gypsy) or Turkish descent, young, low-educated, with no health or sexual education. Characteristic behavior models include parental violence, selling the girl into the business, or total exploitation of her income by the procurer or the whole family. The factor that makes this group one of the highest risk groups is “regular customers.” With the flow of time, the girls start to regard them as reliable partners and, therefore, lower safety measures when serving them. Another factor is different cultural and religious attitudes to safe sex and condoms that some of the multinational customers have. A specific subgroup is notable—the group of “transit girls,” who travel with one customer from border to border, and then either return with their next customer or go to a third border. This extremely high mobility, as well as supposedly low typical level of working conditions and safety, turns it into one of the highest risk groups with regard to both HIV/STD risk and physical safety.

*Hotel Prostitution.* Hotels have a constant contingent of attending girls with set prices and working hours. In the summer, some of them are sent to the seaside “on business trips.”

*Companion Clubs.* This business is under tight control. The tariffs of all clubs offering sex services are strictly uniform. The girls are aged 18 to 22. They come from all social strata—schoolgirls and college-girls, as well as married working girls who work as call-girls. Beside Bulgarians, the clubs employ many foreigners, mainly Russian and Ukrainian. Characteristics of the clubs are unconditional safety measures and condom use; medical examinations and testing are obligatory, according to certain information.

Unofficially, there exists another subgroup of elite prostitutes. Closely related to the high levels of the business organization, they and their work gain no publicity. They are called “escort” girls.

Sociological data regarding CSWs were gathered by the Health and Social Environment Foundation for the years 1997 to 1999. These data were collected in face-to-face interviews with “highway” CSWs using standardized questionnaires. The 1997 survey covered 167 girls working in Lom, Russe, and Sofia. The 1998 and 1999 follow-up surveys covered 63 and 66 CSWs, respectively, in the same

places. The surveys were held within the framework of this project and the AIDS on Wheels project. The results were:

- *Age:* More than 10% of the girls were below age 16. Thirty to 50% were 16 to 18 years old. The other two age groups, 18 to 22 and over 22 comprise 40% of the women.
- *Education:* Elementary education was the prevailing level of education—with 40.1% of the group members. Girls who have primary and secondary education form equal proportions of the commercial sex workers—24% each.
- *Ethnic Background:* Bulgarians form the largest ethnic community within the group—46.7% of the interviewees described themselves as Bulgarians. Of ethnic minorities, girls of Roma background form a 33.5% share, Bulgarian Muslims 6.6%, and 5.4% are Turkish. A not-so-small share of Roma girls describes themselves as Bulgarians.
- *Marital Status:* 23.4% of the interviewees were divorced, 7.8% were single, 6% were married, and 5.4% stated they were living with a friend/constant partner.
- *Social Background and Material Status:* most of the group representatives are of lower social and economic status—unemployed or low-paid or unskilled workers. Most of the village girls come from families of farmers. These data apply mostly to women working on the outside.
- *Health Care Related Behavior:* No stable habits of going for prophylactic examinations were observed. For over a third of the women, the reason to seek healthcare was health disorders. On the other hand, more than 85% of the women admitted that no one had ever prevented them from seeing the doctor, regardless of whether they had had a health problem or wanted to have a prophylactic examination. Attitudes toward the quality of services offered by the respective health facilities should also be accounted for. The general attitude toward healthcare is positive. Confidence in the preservation of personal secrets, however, is low.

### **C. Pornography and Erotica** PETKO VELICHKOV

Pornography was prohibited in Bulgaria until 1989. That means there was no such business or market. But interested individuals could obtain some imported materials at their personal risk.

After the last political changes in the early 1990s, the pendulum switched to the other side and pornography flooded the market, although it could still be prosecuted. The trick is that the law does not specify what exactly pornography is, and so the business and the merchants are offering only “erotica.” In 13 years, the interest in pornography and its market has visibly shrunk.

## *9. Contraception, Abortion, and Population Planning*

PETKO VELICHKOV

### **A. Contraception**

As soon as abortion on request was legalized in the mid 1950s, it became the most common form of birth control in this country.

Nowadays, 76% of the women admit to using some kind of contraception. However, there are a great variety of methods according to socioeconomic status. A small portion of the well-to-do women (middle class included) has access to modern contraception. The rest benefits predominantly from the calendar method, withdrawal, and condoms (in order of frequent use). (Data supplied by V. Tzekov, expert in gynecology at the Human Sexuality Research Foundation).

There are very few NGOs that provide contraceptive means for the needy, and when they do, this is on a rather irregular basis.

See data on condom use in Section 10, Sexually Transmitted Diseases and HIV/AIDS.

## B. Teenage (Unmarried) Pregnancies

Each year, about 5% of Bulgarian women in their fertile age give birth between ages 15 and 19.

## C. Abortion

First-trimester abortion on request is legal, provided it takes place in a state medical institution, and post-abortion contraceptive counseling is legally required. In 2002, an estimated 41.2% of pregnancies were terminated by an abortion (V. Tzekov, expert in gynecology at Human Sexuality Research Foundation, unpublished data).

## D. Population Programs

Studies show that economic hardships have encouraged negative tendencies in reproductive and sexual behavior, hence, a negative population growth. The two-children model is still present among Bulgarians, but only as an unattainable ideal. So far, no effective pronatalistic policy has been elaborated and implemented in this country (Belcheva 2002).

### 10. Sexually Transmitted Diseases and HIV/AIDS

MICHAEL OKOLIYSKI

## A. Sexually Transmitted Diseases

### STD Trends

The rate of sexually transmitted non-HIV/AIDS infections, which is an indicator of HIV infection, has increased over the last ten years. Since 1990, there has been an alarming trend in the number of syphilis cases. Whereas, in 1990, the number of newly recorded syphilis cases was 378 (4.5 out of 100,000), in 1999, there were 2,509 new cases (30 out of 100,000). According to the World Health Organization (WHO) criteria, some regions of the country are on the verge of an epidemic outbreak. The hepatitis B and C infection rates in Bulgaria are several times higher than that in some European countries. The large number of chronic cases resulting in disability and death, combined with the considerable expenditures for their treatment, make them socially and economically important.

### Condoms and Safe and Unsafe Sexual Practices

Detailed data were collected by the first author from respondents concerning the types and safety of their sexual contacts. Respondents were asked about their specific sexual acts. The vast majority of the people with heterosexual, bisexual, and homosexual behavior, in general, often used condoms; only the group of the intravenous drug users used condoms very inconsequently—66.7% of them performed unsafe coitus and cunnilingus. Half of the drug users were willing to perform fellatio without the protection in order to secure money for drugs. This group of drug users represents diverse segments of the population, who, in turn, are characterized by inconsequent and low frequencies of condom use, a high prevalence of STDs, and inadequate knowledge of the basic concepts of HIV transmission and prevention (see Table 11). About 50% of the respondents indicated changes in their sexual behavior because of AIDS (see Table 12), but there is the potential danger of infection with HIV for about half of the respondents who do not use condoms regularly (see Table 13).

*Evaluation of Condoms.* A series of questions were asked to elicit beliefs and attitudes about condoms. In fact, the opinion of the respondents on condoms was predominantly negative.

Frighteningly, nearly half the respondents report that they do not use condoms regularly, 27.3% report that when they use alcohol or drugs, they do not care about AIDS, and 41% said they usually do not use condoms (see Table 14).

**Table 11**

### Sexual Practices of Intravenous Drug Users, With and Without Condoms During the Last Sexual Relations\*

	Not practiced	With condom	Without condom
Vaginal intercourse (Coitus)	0%	33.3%	66.7%
Masturbation/Body massage	0	0	100
Cunnilingus	33.3	0	66.7
Petting	20	0	80
Fellatio	50	0	50
Anal sex	90.9	0	9.1
Group sex	100	—	—
Sadomasochistic sex	100	—	—

\*confirmative answers

**Table 12**

### Changes of Sexual Behavior

	Bisexual behavior	Homosexual behavior	Heterosexual behavior	Drug users	Total
Yes	60%	50%	64.3%	59%	49.2%
No	40	50	35.7	50	50.8

**Table 13**

### How Often Do You Have Condoms When You Are Going Out?

	Bisexual behavior	Homosexual behavior	Heterosexual behavior	Drug users
Always	73.3%	40%	28.6%	16.7%
Sometimes	20	35	35.7	25
Never	6.7	25	35.7	58.3

**Table 14**

### Attitudes to Condoms\*

	Bisexual behavior	Homosexual behavior	Heterosexual behavior	Drug users	Total
I use condoms because of AIDS/STDs	66.7%	50 %	50 %	16.7%	47.5%
I don't use condoms	33.3	40	42.9	50	41
When I use alcohol/drugs, I don't care about AIDS	21.4	15	33.3	50	27.3

\*confirmative answers

Condoms were not only inconsequential in use, but they also are not always available for the commercial sex workers. The respondents did not seem to consider accessibility or cost to be important obstacles to condom use, but nearly 21% reported that they never have condoms when going out and 29% said condoms were sometimes unavailable when needed; 50% always have condoms.

## B. HIV/AIDS

### *HIV/AIDS History and Current Status*

The first HIV-positive case in Bulgaria was diagnosed 18 years ago, in 1989. At the start of the epidemic in the country (1985-1986), in most of the cases the virus was imported from Africa, and the infection sources were sailors who had had sexual intercourse in the ports of Zaire, South Africa, and other African countries.

In 1986-1987, all hemophiliacs living in the country were subjected to obligatory testing, and 11 HIV-positives were found among them. They were probably infected before 1985 (i.e., before testing of each donated blood unit was introduced).

A few years later, after 1991, the picture was totally changed. At present, in over 70% of the time, transmission is from an infected Bulgarian citizen to another person within the country.

Bulgaria is still considered a low HIV/AIDS-prevalence country. By May 15, 2000, there had been registered a total of 287 HIV-positive people—75 of whom have AIDS—and 73 AIDS deaths. The statistical index for the spread of the disease among adult men and women used in AIDS-related reports is 2.2—a number comparable to the figures for Africa. Analysis of the distribution of the registered HIV-positive cases by sex shows that 70% of the infected are men and 30% are women. In 2000 (May 15), the number of newly registered HIV-positives was 17, 14 of whom were men (82.3%) and 3 were women (17.7%).

Analysis of age distribution shows the majority are men aged 20 to 40, and, in particular, 21 to 30 year olds. Another worrying fact is that about 7% of HIV-positives are aged 15 to 19.

Among people living with AIDS in the period from 1977 to 1999, most affected were people in the active age—15 to 49 year olds (93%), with 7% over 50 years old; 67% of the people living with AIDS are men. There are no people living with AIDS aged 0 to 14.

The main mode of transmission in our country is sexual transmission—83%, mostly heterosexual—about 70% of the HIV-positive cases. Infected blood transfusions account for 14%, and mother-to-child transmission for 1%. So far, there have been registered 8 HIV-positive injecting drug users. Until 1993, there were no HIV-positive injecting drug users.

A comparison of these data with published data about the mode of transmission in developed countries shows considerable differences (WHO, *Weekly Epidemiological Record*, 74:409-420). The main mode of transmission in industrialized countries is homosexual/bisexual (37%), followed by heterosexual (32%), transmission through injecting drug use (26%), transmission through blood transfusion (25%), perinatal infection (1%), and other (1%).

Regarding the geographical distribution of HIV-positive cases in the country, it is notable that the biggest concentration of infected people is found in the following cities: Sofia 65, and Burgas 59 (mainly sailors working on fishing ships, who have stayed for a long time in African ports and had heterosexual relationships there). The number of HIV-positive cases in the city of Burgas continues to rise also through intracity transmission. There are 19 HIV-positive cases in

Varna. The number of HIV-positives in Gabrovo is 18 and has remained constant since 1993, although, since 1997, there have been registered 2 or 3 connected cases. Then come the cities of Plovdiv with 16, Stara Zagora with 13, and others. The Ministry of Health states that the distribution by regions of the newly registered cases by May 15, 2000, was as follows: the city of Sofia: 5, Haskovo: 2, Lovech: 2, and 1 HIV-positive person in each of the regions of Sofia, Blagoevgrad, Dobrich, Pleven, Gabrovo, Silistra, and Plovdiv. The HIV virus has spread among almost all social groups and professions, though, regrettably, not all registered HIV-positive people declare their profession. A large number of them have been transferred to less physically demanding jobs following recommendation by the state.

The WHO record ranks Bulgaria seventh of the ten countries most at risk of infection over the next 10 years. Based on the prognosis, if effective measures are taken now, the HIV epidemic could be contained in Bulgaria.

The health experts revealed the main determinants in the rapid growth of HIV/AIDS infection in Bulgaria. The following factors directly affect the infection rate: risky sexual behavior (unprotected sex); high incidence of sexually transmitted infections; and risky injecting drug use practices (shared needles and syringes). Some of the indirect factors are: poverty (economic insolvency); prostitution; drug and alcohol abuse; low health awareness; low general education of some vulnerable groups; and high (labor) mobility. The lack of an overall policy addressing high-risk behavior and HIV/AIDS prevention, as well as the ineffectiveness of the relevant institutions, agencies, and services, and the transition are other indirect factors.

In medical practice, blood products and invasive procedures pose the highest risk. Among the indirect factors are: lack of standards and good practices, and insufficient skills for diagnosis, consultation, and treatment of HIV/AIDS.

## C. Most Vulnerable Groups

Several groups have been identified by UNICEF and the International Organization for Migration (I.O.M.) (2002) as the most vulnerable to HIV/AIDS and STDs.

### *Adolescents and Young People*

The analysis indicated that young people have not developed sufficient social and life skills necessary for making responsible decisions about their sexual activities. Statistics show a marked increase in the number of ever-younger individuals engaging in risky behavior—not attending or dropping out of school, being unemployed, engaging in juvenile crime, prostituting themselves (especially those aged 16 to 24), abusing drugs (particularly injecting drugs), abusing alcohol and smoking, and engaging in risky sexual practices. The number of young girls who are pregnant for the first time (mostly unwanted and/or unplanned) and the abortion rate in Bulgaria are significantly higher than in other countries in Europe. Registered STD cases, including syphilis, are rapidly increasing. In fact, people under the age of 24 account for most of the registered HIV cases.

### *Injecting Drug Users*

Over the past few years, the number of injecting drug users has increased consistently. Currently, the number of the HIV-positive cases among injecting drug users in Bulgaria is comparatively small. However, experts indicate that there is an enormous risk of a dramatic increase of HIV among this population in the near future. One indicator is the high rate of hepatitis B and C among them. In addition, many injecting drug users engage in risky sexual behavior. Methods for early detection of the virus among injecting

drug users are necessary to prevent the rapid spread of the virus through unsafe injecting practices.

### *Prostituting Women and Men*

This is a non-homogeneous and difficult-to-access group, which is highly vulnerable to HIV/AIDS and other STDs. The risk factors include: the criminal element of the commercial sex business, violence and trafficking, marginalized social status, risky sexual practices, and social stigma.

### *Men Who Have Sex with Men*

There are three main subgroups within the gay community: the elite, which is highly restrictive; the middle, which is mobile and versatile with a high rate of mixing; and the lowest subgroup, composed mainly of outsiders and Roma. This subgroup is especially vulnerable. It is mobile with the lowest level of information, which makes intervention difficult. They engage in very risky sexual practices, they seldom use condoms, and many of them prostitute. The men-who-have-sex-with-men community as a whole is vulnerable to HIV/AIDS and other STDs because of several risk factors: inconsistent condom use, multiple casual sex partners, and relatively short permanent relationships.

### *Roma Community (Gypsies)*

Available information indicates that the Roma community is the most vulnerable among the ethnic minorities. This is because of a number of interrelated factors: a rapidly disintegrating patriarchal system, which is not being replaced by a new, sustainable social structure; ever increasing social isolation accentuated by a 90% unemployment rate; a poor economic culture; absence of social skills and motivation for socialization; increasing rates of prostitution, drug abuse, crime, and mobility; and other practices increasing the risk of HIV/AIDS and other STDs. In addition, health experts suggest that most Roma women have banal STDs, which increases the risk of more serious infections, such as HIV and hepatitis B.

The available data regarding the level of risk in Roma sexual behavior are limited and, to some extent, contradictory. There was a sociological survey conducted by Mirchev and ASSA-M in 1996, according to which 58% of Roma populations begin their sexual life before reaching the age of 16. But ASA data for the year 2000 show the average age of first sexual intercourse for Bulgarians in general is also 15 to 16.

The generalizations below are based most of all on experts' observations and on impressions from the work of nongovernmental organizations that have as their priority the Roma community. These organizations include SEGA, Georgi Bogdanov and IGA, Dimitar Russenov, and the Napredak Romany Foundation (in Pazardjik). According to these organizations, Roma women begin their sexual lives at 12 and Roma men at 14 to 15. These observations were made on the Roma communities in the vicinity of Pazardjik, Plovdiv, Stara Zagora, and Sliven. At the same time, Roma NGOs consider that early entrance into sexual life is connected with early marriage. If that is true, then the early beginning of sexual life should not be interpreted as risk behavior, since it is begun with a permanent partner.

Roma NGOs emphasize that one of the important HIV-related determinants is the repressive attitude to premarital sexual behavior and sexual behavior before living together. The belief is that the value of the unstained wife provokes premarital bisexual behavior and oral and anal sex practices. The question remains whether such premarital risk behavior exists when marriage is contracted at age 12 to 14.

Impressions of the liberalization of sexual behavior are voiced, which, by the way, is characteristic for Bulgarians too (A.S.A.—UNDP/MH 2000). What is of importance is that

with low awareness, the liberalization of sexual values can bring about an increase in the risk of sexual behavior. According to quoted NGOs, repressive attitudes towards sexual relations with members of other ethnic groups decline. The opinion is that this is more valid for men than for women. Anthropological observations by Haralan Alexandrov show that Roma values impose repressive attitudes towards the sexual behavior of women and permissive ones towards that of men. This places Roma women in a status of double minority, which makes them an especially at-risk group.

NGOs have confirmed the conclusion made earlier in discussing prostitution, about the prevalence of highway and street prostitution among Roma girls. It is considered that Roma prostitutes come from the lowest social and economic strata of the community, quite often from broken families or disintegrated clans. These girls are usually brought from another settlement—at great distance from their place of work. Roma NGOs emphasize that there exist no restrictive values suppressing the business of procurers. The community is inclined to blame the *guilt* of prostitution on the *alien* girl (that comes from another settlement) rather than on the procurer—the man who brings income into the quarter. These observations have been confirmed by police officials from Pazardjik to the IGA Foundation.

### *Pilots and Aircraft Crews*

According to a Ministry of Transport and Communication official, the sexual behavior of the mobile group of pilots and stewards/stewardesses is at highest risk with respect to the transmission of HIV or other sexually transmitted infections. Representatives of this group are in the employment of Balkan Airways, Hemus Air, Air Via, and Heli Air, the latter offering mainly tourist services in the Indian Ocean (the Maldives and Thailand). These pilots are away from their families almost throughout the year.

Statistical data about aircraft crews are available in the Ministry of Transport and Communication and the Avio-polyclinics with the Medical Transport Institute, where crews are serviced, and where certificates of professional and health fitness are issued. Experts estimate the number of pilots and stewards working for all Bulgarian airways at a little over 1,000, including people who work exclusively abroad. These estimates exclude Bulgarian pilots working for foreign airways.

Pilots' stays abroad range from some hours to some days. The mobility of aircraft crews is increased by the fact that every member of the airways' staff is entitled to a so-called service ticket. It is usually used with the family. It entitles them to free travel to any destination. On the other hand, in the last 6 or 7 years, the stay of aircraft crews is very limited—up to several days, depending on the routes.

According to a Balkan Airways official, risky sexual behavior is due *more to curiosity than to length of stay*. Balkan Airways considers this group well controlled from a medical point of view. All employees pass medical examinations on an annual or semiannual basis; this makes possible determining the level of professional fitness. Before every flight, aircraft crews pass a medical examination in a special medical room at the Sofia Airport. This is a routine medical examination, but it includes an alcohol test. Pilots are highly motivated to control their health themselves, as their job is well-paid and highly profiled: *if they lose their job, they cannot find work anywhere else, all the more so now that there have been reductions lately*.

The pilots and stewardesses are in good financial standing, which makes possible commercial sex contacts. In the opinion of a Balkan Airways official, many of them travel together with their lovers. On the other hand, pilots and

stewardesses form an extremely closed group and maintain contacts mainly among themselves. Second-family practices do occur, but unlike sailors' relationships, these are most often within the crew.

#### *Isolated Groups and Imprisoned Individuals*

Very often, the lack of opportunities for heterosexual intercourse, stress, altered values, violence within the group, and the lack of contact with the outside world result in risky homosexual behavior and prostitution, which increases the risk of HIV and STDs.

#### **D. Education of Target Groups**

Confusing messages about AIDS have repeatedly irritated the general public in Bulgaria. Modest government efforts have been undermined by contradictory reports in the mass media and by various journalistic horror scenarios that failed to become true. It seems that, in actual fact, the majority is hardly as well informed as it believes (Okoliyski 1999). Thus, it is striking to note that few actually change their risky behavior. For example, 66.7% of the IV-drug users believe themselves to be well informed, but only a few practice "safe sex" or "safe use." Moreover, fewer persons with exclusively heterosexual behavior consider themselves well informed (50%), in comparison with the other target groups (drug use: 66.7%, homosexual behavior: 60%, or bisexual behavior: 60%). This can only mean that the latter groups get their information not from public campaigns, which are still mostly directed at the heterosexual majority, but from friends and peers. Finally, although a majority feels sufficiently informed, 66.5% maintain, nevertheless, that there is not enough AIDS information and AIDS counseling in Bulgaria.

The contradiction between feeling well informed on the one hand and, on the other, believing the information to be inadequate, suggests that Bulgarians, inside or outside of any particular target group, have a different concept of AIDS prevention, and expect future prevention campaigns to be different from what has been offered so far. In particular, it seems that AIDS prevention in Bulgaria should be more specifically tailored to specific groups.

[Update 2002: UNAIDS Epidemiological Assessment: As of mid 2001, Bulgaria has reported a cumulative total of 340 cases of HIV infection acquired primarily through heterosexual transmission. HIV testing is mandatory among blood donations and systematic among many subgroups of the population. Since 1992, HIV testing is voluntary for pregnant women, STD patients, and injecting drug users in treatment centers. Diagnosed HIV-infected cases are recorded in a national HIV database. Prevalence data come mostly from ongoing testing programs. The number of pregnant women tested has dropped considerably between 1991 and 1992. It is unclear whether women having abortions continued to be tested after 1991. In addition to the change in testing policy, the economic crisis in 1991-1992 resulted in a 25% drop in birthrates. The incidence of syphilis has been in the range of 20 to 30 per 100,000 over the last few years.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	400 (rate: 0.1%)
Women ages 15-49:	NA
Children ages 0-15:	NA

[No estimate is available for the number of adults and children who died of AIDS during 2001.

[No estimate is available for the number of Bulgarian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

## *11. Sexual Dysfunctions, Counseling, and Therapies*

PETKO VELICHKOV

A study based on the records of the former sexology clinics has shown that the sex ratio of the clients is 8 males to one female. Clinic visitations initiated by both of the sexual partners together represent only 7% of all visits. Men are complaining of premature ejaculation in 48% of the cases and in 41% of some kind of erectile failure. The 11% left seek consultations for diminished sexual interest, delayed or lack of ejaculation, some orgasmic trouble, paraphilias, and so on.

Women are mostly concerned with difficult or the lack of orgasm (with or without diminished desire) in 72% of the cases, 13% with lack of sexual desire, 12% with vaginismus, and the remaining 3% are experiencing dyspareunia (coital pain), paraphilias, and so on.

The proposed treatment ranges from medicaments to some kind of psychotherapy (mostly behavioral). In the majority of cases, a combination of both is suggested.

The society is not exempt from some pejorative attitude toward sexually dysfunctional persons. However, this disposition has been on a downward trend over the past 20 years.

During the course of the healthcare reforms in Bulgaria, sexology consultations previously offered for free by the public sector were discontinued altogether. Private clinics are offering services, but their competence and level of expertise is not subject to control or certification in any way (H.S.R.F archives).

## *12. Sex Research and Advanced Professional Education*

PETKO VELICHKOV

As in the rest of the Eastern Block countries, the healthcare service in Bulgaria was highly centralized and exclusively state-owned and operated. Nonetheless, for more than 35 years, a few sexology clinics and a research unit were in operation. Because of a reform in the national healthcare service, since 1999, all sexology services were closed down and no alternative has been introduced.

In an effort to alleviate this adverse situation, the Human Sexuality Research Foundation was established. Unfortunately, this NGO is surviving practically with no external financial support and exclusively on voluntary principle. Postal address: 16, Kosta Lulchev Str., bl. 244. app. 36, Sofia 1113, Bulgaria; email address: sexology@acad.bg.

## *Conclusion*

PETKO VELICHKOV

Up until now, there has been no large-scale, systematic, and reliable research on sexuality in Bulgaria. Even if such research is carried out, it is very unlikely to demonstrate the existence of some striking peculiarity linked to the sex, sexual concepts, and practices of Bulgarian people. Because of its geographical position, the country was constantly exposed to intensive external influences by various cultures. Bearing in mind that conservatism is not a strong feature of the local mentality, one can imagine how difficult it is to keep one's own style in sexuality unaltered.

### *Preamble*

This chapter, updated to January 2003, retains much of the content of the 1996-97 version, which we use, where possible, as a basis for comparison with current data and as a reference point, where necessary, for new or revised interpretations. Given Canada's ethnocultural, linguistic, religious, and urban/rural diversity (see Section A, Demographics, below), and its sociological and gender diversity (Sections 1, Basic Sexological Premises, and 2, Religious, Ethnic, and Gender Factors Affecting Sexuality), we continue to wonder whether it is possible to present an over-

view of the sexuality of Canadians. The risk in attempting to do so is that one will "homogenize" the rich diversity by taking the "average" opinion or the median frequency of specific behaviors as a reflection of what Canadians are like sexually. On the other hand, a focus on different subgroups within the population may beg the question of whether Canada has a national identity pertaining to sexual customs, beliefs, and practices. At the national ("macro") level, there are quantitative data about some aspects of behavior—although there have been no large-scale studies of adult sexual behavior in Canada—but it is often difficult to interpret such information in ways that would further our understanding about the particularities of "Canadian" sexuality. On the other hand, studies on selected populations in specific settings, the "micro" approach, are often designed to describe or explain the behavior of that group, but they are seldom done in ways that would permit comparisons across Canada or over time. While sexological research in Canada has grown significantly over the last 20 years, it is still a new field and these limitations on our national database are neither surprising nor insurmountable. Our compromise, therefore, has been to incorporate elements of both the macro and micro approaches, to provide quantitative information where possible, and to make cautious inferences where empirical evidence is lacking.

### *Demographics and a Brief Historical Perspective*

#### **A. Demographics**

Canada occupies the northern half of the North American continent with the United States on its southern border, the North Atlantic Ocean on the east, and the North Pacific Ocean and Alaska on its western coast. Although geographically Canada is the largest country in the Western Hemisphere with 3.852 million square miles (9.976 million km<sup>2</sup>), including the Yukon, Nunavut, and Northwest Territories, only about 10% of its landmass is suitable for permanent large-scale settlement, and only slightly more than that for permanent agriculture. The population of about 31.4 million (2002 Census data) is distributed unevenly among the ten provinces and two territories, with Ontario, Quebec, British Columbia, and Alberta accounting for 85% of the total (see Table 1). About 80% of Canadians live in cities, primarily in

\**Communications*: F. Michael Barrett, Ph.D., University of Toronto, Zoology Department, 25 Harbord Street, Toronto, ON, M5S 3G5, Canada; barrett@zoo.utoronto.ca.

the southern regions of the country. In 2001, 51% of Canada's population were concentrated in four broad regions: the extended Golden Horseshoe in Southwestern Ontario; Montréal and nearby areas; the Lower Mainland of British Columbia and Southern Vancouver Island; and the Calgary-Edmonton corridor. A 3,300-mile (5,300-km) shared border with the United States, a free-trade agreement, and extensive consumption of U.S. media, expose Canadians to strong economic and cultural influences from a country with ten times its population. However, the history, composition (e.g., religious and ethnracial mix, socioeconomic diversity), and structure (e.g., legal, medical) of the two neighbors differ in ways that have an important influence on sexuality in the two countries.

Canada's ten provinces, plus the Yukon, Nunavut, and Northwest Territories, are linked through a central federal government, but the various levels of federal, provincial, regional, and municipal government have differing levels of responsibility for health, education, social welfare, legislation, and other areas that have an impact upon sexuality and sexual health.

In July 2002, Canada had an estimated population of 31.4 million. (All data are from Statistics Canada or from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 18.7% with 1.05 male(s) per female (sex ratio); 15-64 years: 68.4% with 1.01 male(s) per female; 65 years and over: 12.9% with 0.74 male(s) per female; Total population sex ratio: 0.98 male(s) to 1 female

The proportion of Canadians over age 65 increased from 12% to 12.6% from 1995 to 2001, while the proportion under 15 dropped from 21% to 18.8% over the same period. In 1991, Beaujot predicted by 2010 a rise in the proportion over 65 to 16% and a drop in the proportion under 15 to 16%. This projection was based on continuation of what was then an unprecedentedly low fertility rate in Canada (1.67 in the early 1990s). In fact, the fertility rate continued to decline to 1.52 by 2001, suggesting that the shift toward more older and fewer younger Canadians may proceed more quickly than previously projected. The large segment of the population now in the middle years, i.e., the "baby boom" generation born between the late 1940s and the early 1960s, has exerted considerable influence on social and cultural patterns in Can-

ada, from the "sexual revolution" of the late 1960s to the economic expansion of the 1980s. This generation currently holds many of the positions in government, business, health-care, and the media, and might therefore be expected to influence public policy in relation to sexuality (i.e., in areas such as education, law, healthcare, etc.).

**Life Expectancy at Birth:** Total Population: 76.8 years; male: 76.3 years; female: 83.3 years

**Urban/Rural Distribution:** 80% to 20%

**Ethnic Distribution:** British Isles origin: 28%; French origin: 23%; other Europeans: 15%; Amerindian: 2%; other (mostly Asian, African, and Arab 6%; mixed backgrounds: 26%

**Religious Distribution:** (1991 census) Roman Catholic: 46%; Protestant: 36%; Muslim and Other: 18%. The changing age structure of the population, coupled with high life expectancy and a declining rate of natural population increase (0.6% in 1995), are all characteristic of the demographic transition seen in other industrialized northern countries (see basic demographic data for Canada in Table 2).

**Birth Rate:** 11.1 births per 1,000 population

**Death Rate:** 7.5 per 1,000 population

**Infant Mortality Rate:** 4.95 deaths per 1,000 live births

**Net Migration Rate:** 6.07 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.52 children born per woman

**Population Growth Rate:** 0.96%

**HIV/AIDS** (1999 est.): Adult prevalence: 0.3%; Persons living with HIV/AIDS: 49,000; Deaths: 400. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 97%

**Per Capita Gross Domestic Product** (purchasing power parity): \$27,700 (2001 est.); Inflation: 2.8%; Unemployment: 7.2%; Living below the poverty line: 19.7% (1995; using Low Income Cut-Off)

Although the total fertility rate has been below replacement level for about 30 years (about 1.52 children per woman in 2001), a natural population increase of 0.33% per

**Table 1**

**Population Distribution in Canada (Estimated 2002)**

Province/Territory	Population (in Thousands)	Percentage of Total
CANADA (January 2002, est.)	31,414	
Newfoundland	531.6	1.7
Prince Edward Island	139.9	0.4
Nova Scotia	944.8	3.0
New Brunswick	756.7	2.4
Quebec	7,455.2	23.7
Ontario	12,068.3	38.4
Manitoba	1,150.8	3.7
Saskatchewan	1,011.8	3.3
Alberta	3,113.6	9.9
British Columbia	4,141.3	13.3
Yukon	29.9	0.1
Northwest Territories	41.4	0.1
Nunavut	28.7	0.1

**Table 2**

**Basic Demographic Data for Canada (2001)**

Total population:	31,081,900 (July 1, 2001)
Total population:	30,769,900 (July 1, 2000)
Births:	329,791
Deaths:	227,076
Natural increase:	102,715
Birth rate:	10.7/1,000 population
Death rate:	7.4/1,000 population
Rate of natural increase:	3.3/1,000 population (0.33%)
Immigration:	250,346
Net immigration:	199,605
Net immigration rate:	6.5/1,000 population (0.65%)
Total population increase:	302,320
Annual population growth rate:	0.98%
% population growth from natural increase:	34.0%
% population growth from net immigration:	66.0%
Population doubling time:	71.4 years
Total fertility rate (est.):	1.52 births/woman aged 15-49
Life expectancy at birth:	male 76 years; female 82 years

Data from: *Annual Demographic Statistics*, 2001. Statistics Canada, Catalogue No. 91-213-XPB, 2001. See also *Report on the Demographic Situation in Canada 2002*. Statistics Canada, Catalogue No.91-209-XPE.

year, coupled with a net immigration rate of 0.65%, gave Canada a growth rate of 0.98% in 2001 (see Table 2), one of the highest among the world's industrialized countries. Net immigration contributed about 66% of Canada's population increase in 2001, and projections for the future suggest that immigration will continue to have a significant impact on Canada's demography.

By law the federal government is required to state in advance of any year the intended total number of immigrants, refugees, etc., that will be admitted to Canada in that year. As a result of new legislation passed in 2002 (the Immigration and Refugee Protection Act), the most recent of these ongoing Annual Reports to Parliament on Immigration was the first to be submitted under the new Act. The plan for 2003 calls for 220,000-245,000 new permanent residents, of whom 60% are categorized as economic class, 26% as family class, and 13% as refugees. Family class refers to a foreign national who is the spouse, common-law partner, conjugal partner, child, or parent of a Canadian citizen or permanent resident. This category reflects a governmental commitment to family reunification. Economic class refers to those immigrants who are skilled workers. Unlike the earlier emphasis on occupation-based criteria, the 2003 plan looks to flexible/transferable skills in the trades, and in the technical and professional domains, as well as proficiency in English and/or French. While the government has maintained a commitment to those individuals entering Canada as Refugee class, economic and social factors (e.g., the presence of relatives in Canada) will also be taken into account. By 2011, immigration is expected to account for all of Canada's net labor force growth, and by 2031, for all net population growth.

Immigration patterns in the recent past and in the future will thus continue to alter the already varied ethnocultural composition of the Canadian population, particularly in the larger urban centers to which a high proportion of immigrants have been drawn. For example, in 2000, 90% of immigrants went to three provinces (Ontario, British Columbia, and Quebec) and 75% of these went to the largest urban centers in these provinces (Toronto, Vancouver, Montreal), with Toronto receiving well over half of this group. Canada's changing ethnocultural composition is worth considering here because the continuing trend to ethnocultural diversity means that a wide range of attitudes, traditions, and practices surrounding marriage, sexuality, sex-role expectations, and sexual taboos are now present as a source of both variety and potential challenge in Canadian society. For example, in contrast to the current national ethnic distribution data from the 1991 census, the top five sources of immigrants to Canada in 2000 were the People's Republic of China (16.2%), India (11.5%), Pakistan (6.2%), Philippines (4.4%), and Korea (3.4%). The United States and United Kingdom were seventh and tenth respectively, together representing 4.6% of immigrants in 2002.

## B. A Brief Historical Perspective

ROBERT T. FRANCOEUR

The French explorer, Jacques Cartier, who reached the Gulf of St. Lawrence in 1534, is generally regarded as the founder of Canada, although John Cabot, an English seaman had sighted Newfoundland 37 years earlier, and Vikings are believed to have reached the same area centuries before either Cartier or Cabot. The French pioneered settlement by establishing Quebec City in 1606, Montreal in 1642, and declaring Canada a colony in 1663. The British acquired Acadia (Nova Scotia) in 1717 and captured Quebec in 1759. By 1763, Britain had gained control of the rest of New France. The Quebec Act of 1774 gave the French in

Upper Canada the right to their own language, religion, and civil law. The English presence in Canada increased during the American Revolution, when many American colonists loyal to the crown moved north to Canada. Fur traders and explorers pioneered paths to the west, with Sir Alexander Mackenzie reaching the Pacific in 1793.

Upper and Lower Canada, later known as Quebec and Ontario, and the Maritime Provinces developed their own local legislative assemblies in the 1700s, and reformers called for a more responsible government. The War of 1812 between Britain and the United States delayed the move toward a more democratic government, but by 1837 political agitation had led to rebellions in both Upper and Lower Canada. Lord Durham's report recommended union of the two parts into one colony, to be called Canada. This union continued until 1867 when the Dominion of Canada was established with Ontario, Quebec, Nova Scotia, and New Brunswick. A federal system of government was developed, modeled on the British parliament and cabinet structure under the Crown. In 1982, Canada ended its last formal legislative link with Britain by assuming control over its constitution. In 1987, the so-called Meech Lake Agreement would have assured constitutional protection for Quebec's efforts to protect its French language and culture. Its failure in 1990 sparked a separatist revival which remains a major issue for the country. In 1992, the Northwest Territories approved creation of a self-governing homeland for the 17,500 Inuit living in the Territories, to be known as Nunavut, "Our Land." In June of 1993 the Canadian Parliament passed the "Nunavut Land Claims Agreement Act" and the "Nunavut Act." Finally, on April 1, 1999, the territory of Nunavut officially joined the federation of Canada.

## C. Ethnocultural Composition: Ethnic Origins and Recent Immigration

The face of Canada, as is true for the United States and Australia, has been shaped by immigrants. European settlers from the United Kingdom (U.K.) and France are considered the two founding nations of Canada (and the current ethnic composition of the population still reflects that background). However, many First Nations groups were already inhabiting the region when these settlers arrived, including Cree, Dakota, Dene, Gitksan, Gwich'in, Huron, Innu, Inuit, Mohawk, Micmac, Naskapi, Ojibway, Saukteaux, and Salish. In the 1996 census, 1.1 million people (3.9% of the population) identified either single or mixed aboriginal ancestry. Overall, 28 percent of Canada's population in 1996 reported ethnic origins other than British, French, or Canadian. Data cited above on source countries for immigration in 2000 suggest that this percentage has probably shifted upward in the last 10 years.

Canada's 1996 census (the most recent data available at writing) provides the most accurate and current profile of the ethnic origins of people living in Canada. A review of 1991 census data by Renaud and Badets (1993) and selected observations from a major study on families in Canada (Vanier Institute of the Family 1994) are also used below to summarize the increasingly diverse ethnocultural composition of Canadian society.

Ethnic origin is taken to mean the cultural or ethnic group to which one's distant relatives belonged. In the 1996 census, respondents were asked to indicate whether their ancestry was a single ethnic group (e.g., French) or multiple (two or more groups, e.g., British and French). Unlike the previous census, respondents were also given the option "Canadian" as a potential ethnic origin. It should be noted that the addition of the "Canadian" category changed the

relative distribution of ethnic origins significantly, particularly for the British and French categories, as well as rendering a direct comparison of 1991 and 1996 census data more difficult. Rounded percentages for the largest groupings for the 1996 census were:

Canadian (19%), British Isles only (17%), combination British, French, or Canadian and other (16%), combination British and French or Canadian (10%), European single origin (13%), French only, i.e., French and Acadian (9%), single East and South East Asian origin (5%), aboriginal (4%), and South Asian (2%).

A report by Badets and Chui (1994) documents the changing pattern of immigration to Canada that has produced such ethnocultural diversity. While early immigrants to Canada came predominantly from the United Kingdom and Europe, that trend has shifted, particularly during the 1980s, 1990s, and into the 21st century. Between 1981 and 1991, 48% of immigrants to Canada were born in Asian countries, 25% in Europe and the United Kingdom, 10% in Central and South America, 6% each in the Caribbean and Africa, and 4% in the United States. In 1991, about 16% of Canada's population was born outside the country, which is not much different from the 15% figure reported 30 years earlier. Of these, 54% were from Europe and the United Kingdom and 25% from Asian countries. Most of the 4.3 million people in Canada in 1991 who were born outside the country either had become or were expected to become Canadian citizens.

About 94% of them live in four provinces (Ontario, British Columbia, Quebec, and Alberta), predominantly in one of the three largest metropolitan areas (Toronto, Montreal, and Vancouver). For example, 38% of Toronto's population in 1991 was not born in Canada. This rich ethnocultural diversity in some areas of the country provides a variety of sociosexual customs and gender-role expectations that must be considered in education, healthcare, and public policy related to sexuality. These issues include: developing effective ways to prevent HIV infection among communities of First Nations people and other ethnocultural groups; differing attitudes and beliefs toward sexuality between first-generation immigrant parents and their children or between recent immigrants and the "predominant" culture; cross-cultural differences in gender-role expectations, deference to authority, emphasis on reproduction and childrearing as the rationale for marriage; arranged marriages; attitudes and policies toward women who experienced genital mutilation (female circumcision) and wish it for their children; willingness of some groups to use sex selection to provide a child of the preferred sex, usually male; and varied traditions concerning public discussion about sexuality, sex education, and discussion between the sexes about sexual problems and dysfunctions.

#### D. Linguistic Diversity

As expected from the ethnic origins of the population, 59% of Canadians reported English as their only first language (i.e., the one they learned at home in childhood and still understand), 23% French, and 18% one of the "nonofficial" languages (2001 census). In examining the ten-year trend from 1991 to 2001, the percentage of individuals claiming English as their first language changed only slightly from 61% to 59%. Similarly, the percentage claiming French as their first language dropped only slightly from 24 to 23%. The largest change, however, was noted in the percentage of individuals claiming a non-official language. This percentage rose from 13% to 17% from 1991 to 1996, and then from 17% to 18% from 1996 to 2001. The rise from 1991 to 1996 represents a 15% increase in people who claim a mother tongue other than French or English. Furthermore, this growth is 2.5 times faster than the overall growth rate of

the Canadian population. Most French-speaking Canadians live in Quebec (in 1996, 86% of Canada's French-speaking population lived in Quebec), but there are groups of Acadians in New Brunswick and French-speaking communities in other parts of Canada. Immigrants (those not born in Canada) accounted for about two thirds of those whose first language was neither English nor French and for about three quarters of those who spoke a language other than English or French at home.

### 1. Basic Sexological Premises

#### A. Character of Gender Roles

At present, over half of Canadian women who are raising children also work outside the home. As of 1998, for individuals between 25 and 54 years of age, 81% of never-married women and 85% of never-married men were working. Among married individuals age 25 to 54, 77% of women and 94% of men were working. Compared to the fewer than 50% of married women working in 1976, this represents a sizeable increase in the number of married women employed outside the home (Vanier Institute 2000). Although single (never married) women and men are equally likely to be employed (59 to 60% for both sexes in 1981 and 1991), the proportion of married women employed increased from 47% in 1981 to 56% in 1991. This represents a major change in the employment experience of women and is a reflection of changed economic circumstances, more single-parent families, and the altered gender-role expectations and opportunities for women over the last 30 years. However, the majority of women continue to work in occupations where women are traditionally concentrated. In 2001, 70% of all employed women were found in the areas of teaching, nursing and related health occupations, clerical or other administrative positions, or sales and service occupations. This is compared with 30% of employed men. Thus, although the population of women in traditional female occupations has slowly declined from 1987 to 2001 (from 74% to 70%), and men and women are approaching equality in labor force participation, the labor force remains sex segregated with men and women concentrated in different areas.

In her book, *Gender Relations in Canada*, Marlene Mackie (1991) identified the evolution of feminism and of the feminist movement in Canada as a major influence on gender-role expectations, on women's social and economic status, on their perceptions of themselves as agents for change, and, hence, on the social and interpersonal aspects of relationships within and between the sexes. The most recent wave of that movement, beginning in the late 1960s, has gradually altered the legislative landscape regarding equal employment, pay equity, access to legal abortion and contraception, sexual harassment, maternity leave, day-care, and a range of other issues that affect women's social and economic well-being. Mackie (1991) suggests that the "official" beginning of the feminist movement in Canada occurred in the period that preceded the federal government's decision, in 1967, to establish the Royal Commission on the Status of Women. The commission's mandate was to assess the prevailing situation regarding the position of women in Canada, and then to "recommend what steps might be taken by the Federal Government to ensure for women equal opportunities in all aspects of Canadian society" (Mackie 1991, 255). Three years later, after hearings across Canada, the commission issued its report which contained 167 recommendations (Mackie 1991).

Mackie suggests that three dimensions of feminism—liberal, socialist, and radical—have each had an impact on different spheres of life in Canada. Liberal feminism mobilized

action to establish the Royal Commission and guided the emergence and agenda of large national organizations, such as the National Action Committee on the Status of Women, the Canadian Advisory Council on the Status of Women, and the provincial liaison groups. These groups have acted to achieve equity in the workplace, fair property rights when marriages end in divorce, and a host of other changes that reformed the existing social system. Socialist feminists challenged the oppression of women within the economic system and within the family and approached some of the same agenda items as liberal feminism but from a different perspective. Their focus on both class and gender issues aligned this branch of feminism with the concerns of lesbians, immigrant women, and women of color (Adamson et al. 1988, as cited in Mackie 1991). Radical feminists and socialist feminists, says Mackie, share the premise “that the dominant male culture promulgates a picture of reality that buttresses patriarchy and denigrates women.” (Mackie 1991, 260). Citing Adamson et al. (1988), Mackie views radical feminism as instrumental in the establishment of rape crisis centers, in campaigns against pornography, and in founding shelters for battered women. The lesbian/gay liberation movement has taken place almost concurrently with the women’s movement and embodies and is informed by many of the same concepts of gender equality, personal freedom, and human rights.

From an institutional and legislative perspective, it would appear that liberal feminism has influenced contemporary government policy and corporate practice. These changes have been the source of some conflict. For example, the Toronto-based group R.E.A.L. Women of Canada (Realistic, Equal, Active, for Life), founded in 1983, now has chapters in all provinces and is the most prominent of the organizations opposing at least some of the legislative and social trends encouraged by the feminist movement. This group opposes policies that it believes either undermine the family or promote homosexuality as an acceptable alternative to heterosexual marriage. It advocates programs that would allow women to choose to stay at home with their children (e.g., through tax credits that would permit this option in lieu of universal daycare). The organization is on the right politically and in terms of social policy and gender relations, and it espouses a more traditional and restrictive sexual philosophy than that of most Canadians. The growth of the political and religious right in Canada, although it has occurred to a lesser extent than in the U.S., suggests strong dissatisfaction, in this group, with some aspects of the trend to more egalitarian gender relations. Men’s rights groups in Canada, e.g., In Search of Justice, also believe that some of the legislative changes influenced by the feminist movement have unfairly disadvantaged men. Most of their efforts have centered on issues of child custody and support following divorce.

The nascent men’s movement in Canada—not to be confused with men’s rights groups—has at least two “branches.” One emphasizes the consequences for men of traditional, socially imposed male roles and seeks new ways to be male. The other, represented by groups such as Men Against Sexism, considers patriarchy and men’s violence to be the major threats to women and seeks to change the structures and forms of social organization that perpetuate domination of one group by another at the interpersonal, social, or international level (see Kaufman 1987). The latter group has an annual white ribbon campaign to highlight men’s opposition to violence against women.

## B. Sociolegal Status of Males and Females

In the formation and enforcement of laws and policies, Canada is a federation of provinces and territories. Some areas of jurisdiction—e.g., the criminal code that governs

sexual assault, sex work, divorce, and censorship—are federal and require the passage and modification of laws by the Canadian Parliament. The enforcement of most laws, through policing and the courts, however, as well as jurisdiction over matters of education, civil conduct (e.g., allowable conduct in various locations, property offenses, alcohol, and tobacco laws), family law (e.g., division of property in divorce, parental rights, and responsibilities), and delivery of healthcare, are within provincial or local jurisdiction. Consequently, it is difficult to draw conclusions that apply across the country. In some locations, most notably Quebec and British Columbia, federal and local laws have been applied in a manner that supports greater equality between men and women and protection of various segments of society from discrimination. In others, e.g., Alberta and Saskatchewan, there has been a more limited interpretation and application of related federal legislation and passage of fewer provincial laws providing protection of groups and guarantees of equal treatment.

Equality before the law, regardless of gender and sexual orientation, is a relatively modern development in Canada. Legislation and court rulings that established such equality, though generally considered to have begun in the late 1800s with the “Person’s” case, in which women were included in all legal documents under the status of “person” (prior to this, only men were included), are primarily a phenomenon of the past 35 years. Several landmark changes, which will be referred to throughout this chapter, include:

- 1969—Sweeping legislative changes, referred to as “getting the government out of the bedrooms of the nation,” were initiated by Parliament. These struck down a variety of laws restricting sexual activities, including the dissemination of information on birth control, and enshrined in law the principle that any activities between two consenting adults, conducted in private, were beyond the jurisdiction of law.
- 1970s—Universal provision of medical care without direct payment was instituted in each province. With this change, medical diagnostic and treatment procedures associated with sexuality, such as treatment for gender dysphoria, difficulties in sexual functioning, birth control, abortion, and infertility, became available to all Canadians without direct cost.
- 1968–1985—A series of changes in the laws governing divorce. Prior to this period, divorce required a parliamentary decree and could be granted only for reasons of adultery. The criteria for granting divorce were broadened and their application transferred to the courts. This change saw an immediate and sharp increase in the number of divorces granted across the country. It is noteworthy that property settlements and child custody matters are within provincial jurisdiction, and so vary across the country.
- 1980s—A series of changes in Quebec family law took Quebec from the position of having the most conservative to having the most progressive set of provincial statutes. Under the new laws, women were guaranteed an economic and legal status independent of that of their husbands. This was symbolized in women’s retaining their name in marriage, and included equal sharing of family property, decision making, and of roles and rights as parents. Prior to this, for example, wives were under their husbands’ control in determination of residence, property was owned wholly by men unless special contracts were arranged prior to marriage, decisions about children (e.g., with respect to medical care, education, and residence) were exclusively under the control of fa-

thers (at least in law), and the line of inheritance was primarily from father to son, with considerably less to wives and daughters.

- 1982—The Canadian Charter of Rights and Freedoms was declared law. This has been the basis for court challenges of other legislation, policies, and actions that have restricted or dictated rights and access, primarily of women, people with various disabilities, and homosexuals to areas and services in Canadian society (e.g., jobs, housing, insurance, particular medical services, spousal benefits, and parental rights).
- 1985—“Rape” was removed from the Criminal Code and replaced by several categories of assault that involve sexual contact, and laws addressing sexual contact with children were revised. Of note is the fact that the new law removed the onus of proof of lack of consent from women, and allowed women to file charges of sexual assault against their husbands. More recent changes and court rulings have further modified legal proceedings in this area. These are discussed in Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex.
- 1988—A Supreme Court of Canada decision overturned the laws restricting women’s access to abortion. This continues to be a contentious issue among Canadians; but 15 years after this ruling, abortion still remains outside the jurisdiction of the Criminal Code.
- 1996—Sexual orientation was formally added to the Canadian Human Rights Act on June 20, 1996. Section 3(1) of the Canadian Human Rights Act was amended to prohibit discrimination based on sexual orientation.

While many other legislative changes and court rulings have influenced the sociolegal status of various groups of Canadians, these are generally considered among the landmarks that have established the contemporary position of men and women, adults and children, and people of different sexual orientations.

Today, men and women are equal before the law in Canada, and the Canadian Charter of Rights and Freedoms enshrines this principle. Both the public and private sector have adopted policies to increase the proportion of women in those work settings in which they have been traditionally underrepresented, and employment equity legislation has been implemented in the public sector in some provinces to rationalize pay scales according to job requirements. Men continue, however, to predominate in positions of power and leadership (e.g., government and major corporations).

Equal treatment of lesbian and gay individuals in law and in areas of employment, housing, and so on, is increasing, to a sizable degree because of court challenges and threatened challenges (which have used the Charter of Rights and Freedoms) to eliminate discriminatory practices. Equal treatment does not exist, however, with respect to parental rights, spousal relationships, employee benefits, and other such issues, although court decisions continue to set precedents in the absence of legislated change (see Section 6, Homoerotic, Homosexual, and Bisexual Behaviors). It is increasingly common for large corporations to extend such benefits even though they are not yet required in law to do so.

Current legislation regarding nonconsensual sexual behavior does not discriminate on the basis of sex (e.g., sexual assault law applies to both sexes). Children under the age of 14 cannot consent to sexual activity with an adult (i.e., anyone 18 or over), and an adult engaging in such activity with a child could be charged with “sexual interference,” or “sexual assault” (because consent, even if given, is not legally recognized) (MacDonald 1994). An “invitation to sexual touching” would also be illegal if the invitee was un-

der 14. In the foregoing offense categories, a person of 12 or 13 would be deemed able to give consent if the other person was not more than two years older and was not in a position of authority over the complainant.

The acts associated with sexual interference and invitation to sexual touching are also proscribed when done toward a person 14 to 17 by someone in a position of trust, authority, or dependency. The legislated age of consent for anal intercourse is 18, in contrast to 14 for other sexual activities. Specifically, individuals under the age of 18 cannot consent to anal intercourse unless legally married. However, this has been debated in the courts. In 1995, the Ontario Court of Appeal struck down the relevant section of the criminal code, with two judges finding it discriminatory with respect to age and one with respect to sexual orientation. A similar outcome was noted in a Quebec Court of Appeal in 1998.

There is also a statute on “corrupting children” (i.e., anyone under 18) by exposing them to adultery, sexual immorality, habitual drunkenness, and the like, but this provision is rarely prosecuted (MacDonald 1994). In general, the contentious nature of consent laws is also reflected in the frequent demands by various professional groups (e.g., Canadian Association of Chiefs of Police) and family and children’s rights activists to raise the age of consent to 16. However, such amendments have yet to be considered.

Although Canadian law defines adults as those 18 or over, there are provincial variations affecting such things as tobacco, alcohol use, and age of consent to medical treatment. For example, it is illegal to sell tobacco products to someone under 18 in Canada, but that age was raised to 19 in Ontario. The ages at which it is legal to sell alcohol to someone vary across the provinces, ranging between 18 and 21 years. Consent to treatment provisions also vary by province. For example, for several years Quebec has set 14 as the general age of consent, including for birth control, abortion, and STD treatment. Ontario’s Consent to Treatment Act, which became law in 1995, was designed primarily to regulate treatment, particularly of those incapacitated or vulnerable in some way, when existing law is unclear. It also applies to treatment of children. For example, physicians, nurses, and clinic staff working outside hospital settings may treat children of 12 or even 11 without parental notification based on the practitioner’s judgment of the child’s capacity to give informed consent. Contentious areas in this regard might include prescribing birth control pills, pregnancy counseling, or diagnosis, counseling, and treatment for STDs. Notification of parents when the child does not wish them to be informed is left to the prudent judgment of the practitioner, and confidentiality of records would be handled in a similar manner. However, if the treatment is given in a hospital setting, parental consent to treatment would be needed for children under 16. Some other provinces set age of consent to treatment closer to the age of 16. These issues reflect the current attempts to balance children’s rights and parents’ rights when the two appear to be in conflict. A similar balancing in relation to acceptance of children’s testimony in court is also taking place in Canada (see Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex, on sexual abuse).

Canada is in a stage of change with respect to matters of law and policy regarding the status of men, women, children, the variously abled and disabled, and individuals of differing sexual orientations. If the trends of recent years continue, the change will be in the direction of provision of greater guarantees of equal treatment, increased access to a variety of sexual health services, protection of individual rights, and protection against discrimination. However, there are segments of Canadian society that challenge these changes and have

mounted various campaigns to limit their scope. The future picture with respect to legal matters cannot be predicted.

### C. General Concepts and Constructs of Sexuality

There have been no systematic, large-scale national studies on the sexual attitudes or conduct of Canadian adults. In November 1993, a major Canadian polling agency (Decima Research) conducted a national telephone survey of 1,610 Canadian residents randomly selected from the ten provinces (*Maclean's*/CTV Poll 1994), in which a variety of questions involving sexual attitudes were included. [Note: Neither the Northwest Territories nor the Yukon were included because of their sparse population; sample sizes in the less-populated provinces were increased to reduce province-by-province errors.] The following sampling of the survey findings provides some background for subsequent speculation on Canadians' perspectives on sexuality and public policy. Given the small sample size and the methodological limitations of such a study, the results are at best indicative.

Most survey respondents felt that in the last 10 to 20 years, Canadian attitudes on sexual matters had become far more permissive (43%) or more permissive (30%), with a higher percentage of those over 55 years old viewing the change as far more permissive (e.g., 59% of 55- to 64-year-olds vs. 32% of 25- to 34-year-olds). One reflection of the change in permissiveness is Canadian attitudes toward premarital sex (i.e., premarital intercourse). In a 1990 national survey of adults, Bibby and Posterski (1992) found that 80% agreed or strongly agreed that premarital sex was acceptable. This compares to 68% in agreement in 1975. Approval ranged from 92% among 18- to 34-year-olds (vs. 90% in 1975) to 59% of those 55 and over (vs. 42% in 1975). Slightly more people disagreed than agreed that a person should have more than one sexual partner before marriage (50% disagreed, 39% agreed, and 11% had no opinion). In a 1995 study with a similarly representative sample of Canadian adults, Bibby (1995) found continued high levels of acceptance of sex outside of marriage (this includes "premarital" and "intermarital" activity) among the young (89% of 18- to 34-year-olds approved) and an ongoing increase in acceptance among older Canadians (62% of those over 55 approved vs. 42% in 1975). Bibby (1995) attributed the latter shift to aging of the baby boom generation that came of age in the 1960s, and suggested that by 2010, about 85% of Canadians would approve, with 15% remaining opposed.

With respect to having an extramarital affair, 80% of respondents to the *Maclean's*/CTV poll said it was never OK, 10% not usually OK, and 6% sometimes or always OK. This response did not differ according to gender, but respondents from Quebec, and French-speaking respondents in general, were less likely to say "never OK" (about 65 to 67% vs. 79 to 91% in the other provinces). Respondents were somewhat less likely to condemn extramarital affairs under all circumstances (e.g., "it is totally unacceptable for a married person to have an affair"). In this case, 70% agreed or strongly agreed, whereas 22% disagreed and 7% strongly disagreed. Men were slightly more likely to be accepting than women. There was no difference based on age, but respondents from Quebec were much less likely to agree strongly that it was always unacceptable (19%) and more likely to disagree or strongly disagree (45%). Bibby (1995) also found low levels of approval, in that 85% in 1995 said that extramarital sex was always or almost always wrong (compared to 78% in 1975). Although, responses differed by age (78% for 35- to 54-year-olds vs. 90% for those 18 to 34 and 55 and over), Bibby noted that overall, Canadians' attitudes toward extramarital sex have become

less approving over the last 20 years. This does not seem to be a simple reflection of aging of the population, because young people are among the most disapproving.

When asked if they considered masturbation to be a healthy part of one's sex life, 8% strongly agreed, 57% agreed, 30% disagreed, and 5% strongly disagreed. There were no sex differences in agreement, older respondents were less likely to agree (although 52% of those 65 and older agreed), and Quebec again had the highest agreement, with 78% overall considering masturbation to be a healthy part of one's sex life.

When asked if they would feel uncomfortable talking with their children about sex, few indicated that they would be uncomfortable (about 17%). This indirect declaration of comfort was evident for both sexes and for the age groups most likely to be involved in rearing young children or teens. It is unlikely that this perceived comfort always translates into actual discussion, particularly in the area of sexual decision-making. For example, Bibby and Posterski (1992) found that while a sizable percentage of teens identified parents as the first source they would consult when making decisions about what is "right and wrong" (45%), or about school (45%) or a major problem (31%), fewer chose parents first for decisions about "sex" (8%) or relationships (7%); friends were most likely to be chosen in both of the latter categories (55% and 75%, respectively).

Legislation prohibiting discrimination on the basis of sexual orientation is now common in most provinces, and this trend, although actively opposed by some individuals and groups, reflects a shift in Canadian attitudes (Section 6 discusses gay/lesbian issues in more detail). Two of the *Maclean's*/CTV survey questions assessed attitudes toward homosexuality. When asked if "it would be fine if one of my kids turned out to be gay," 11% of respondents strongly agreed, 45% agreed, 29% disagreed, and 14% strongly disagreed. Women were more accepting than men in this regard (64% of men agreed vs. 49% of women), younger were more accepting than older respondents, and those in Quebec were more likely to agree (85%) than in the rest of Canada (46%). On the statement "It would bother me if openly gay and lesbian people were teaching in the schools," the responses generally paralleled those above (56% would not be bothered, 44% agreed that they would be bothered; women were slightly more accepting than men). Bibby (1995) also found evidence of increasingly accepting attitudes toward homosexuality (32% said it was not at all wrong and 16% sometimes wrong in 1995), up from 38% acceptance in 1990 and 28% in 1975. This still leaves half the population considering homosexuality always or almost always wrong. Interestingly, Bibby (1995) also found that between 1990 and 1995, during a period of active debate about inclusion of gay rights in the Human Rights Code (which occurred in 1996), approval of the idea that gays and lesbian should have the same rights as other Canadians dropped from 80% in 1990 to 67% in 1995. Bibby saw it as somewhat paradoxical that "just when Canadians are exhibiting both an increasing acceptance of homosexuality and greater social comfort with lesbians and gays, they now are also exhibiting increasing discomfort with the idea of extending them equal rights" (Bibby 1995, 74). One might argue that this is a temporary shift based on a tendency of some Canadians to be displeased with both sides in periods of acrimonious and politicized debate.

Television, the print media, and film provide Canadians with regular reminders of social policy issues related to sexuality (pornography, prostitution, sexual abuse, etc.). While these themes will be examined in later sections, survey respondents' attitudes on selected examples give an indication

of the prevailing dynamic on such matters. For example, 52% agreed that prostitution should be legalized, with a slightly higher proportion of males than females and of Québécois versus non-Québécois agreeing. Interestingly, agreement was lowest among 18- to 24-year-olds (33% agreed but 57% disagreed, including 26% who strongly disagreed). In contrast, 60 to 64% of 35- to 54-year-olds agreed. Concerning the acceptability of people watching sexually explicit movies, 60% of males versus 34% of females said it was sometimes or always OK and 25% of males versus 48% of females said it was never OK. The statement "pornography is always degrading to women" yielded agreement from 69% of respondents (58% of men and 80% of women). Since respondents gave higher levels of agreement to the idea that "erotic magazines and movies can help make your sex life more interesting" (50% of males and 38% of females agreed) it would appear that Canadians make some distinction between the term "erotica" (which they associate with pleasure) and pornography (which they associate with harm). As we show in Section 8C, Significant Unconventional Sexual Behaviors, Pornography and Erotica, it is the latter distinction that forms the basis for current obscenity law in Canada.

Taken collectively, the foregoing observations support the conclusion that more Canadians in the 1990s than in prior years accept, or are at least tolerant of, a wider diversity of forms of sexual conduct, expression, and communication. This is particularly the case in areas outside the domain of marriage, as seen in the continued lack of acceptance of extramarital sex by the vast majority of Canadians, and by increased acceptance of an unmarried couple living together (in 1995, 78% of Canadians approved, Bibby 1995). However, as Bibby and Posterski (1992) observed, these changes are more a result of population change than of individual change.

The sexual revolution changed the way Canadians viewed sex outside of marriage. But, having succeeded in transforming attitudes and behavior about sex, the revolution has long been over. What we have witnessed in the past decade or so is the transmission of the new sexual values from first-generation revolutionists to their offspring. The reason the national figures of acceptance have risen over the past 20 years is not because young people are becoming more permissive than their parents. Rather, the protests of grandparents troubled by the changes have—with their passing—been relegated to history. (Bibby & Posterski 1992, 40)

Of note is the consistently greater acceptance and tolerance of diverse forms of sexual expression on the part of French-speaking (primarily resident in the province of Quebec) as compared to other Canadians. This theme, repeated in other sections of our review, is considered by sociologists to be related to a general decline in the influence of the Roman Catholic Church in Quebec, coupled with the rapid move of women into the labor force in this province; again, this is reflective not so much of a change in individual attitude, but of population and demographic changes over the years.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Religion and Religious Observance

In a report based on the 1996 *General Social Survey*, Clark (1998) examined the reported religious affiliations of Canadians 15 and over and found 45% to be Romans Catholic, 20% mainline Protestant (United, Anglican, Presbyterian, Lutheran), 6% conservative Protestant, and 3% claimed

affiliation with one of the Eastern non-Christian religions (Islam, Hinduism, Buddhism, or others). In general, this reflects a drop in the number of individuals claiming mainline Protestant affiliation and an increase in those with Eastern non-Christian traditions. These figures reflect the British and French origins of the country and the historical predominance of British and European immigration. Other non-Christian religious affiliations, beginning with the First Nations peoples and extending to subsequent immigration by different groups, include: Judaism, Buddhism, Islam, Hindu, and Sikh. The Christian "fundamentalist" religious presence that has challenged sex education and secular sexual laws and attitudes in some parts of the U.S. is less prevalent in Canada, although "conservative" religious groups are among the only ones that have increased in numbers in recent years. The number of individuals 15 and over claiming no religious affiliation has also risen from 1% in 1961, to 13% in 1991, and finally, to 14% by 1996.

Attendance at religious services has generally been declining since the mid-1940s. In 1990, 24% attended at least once a week, 12% once a month, and 27% once a year. By 1996, only 20% of the adult Canadian population reported attending religious services every week, and 10% said they attended only once or twice a year. A further 32% who claimed religious affiliation did not attend religious services at all. This decline has also been noted across all age groups. Those 65 and over were more likely to be weekly attenders in 1990 (42%) than those of younger ages (15 to 24 years: 15%; 25 to 44 years: 18%; 45 to 64 years: 32%). By 1996, these rates had dropped to 34% for those age 65 and over and to 12% for 15- to 24-year-olds. Nevertheless, a telephone survey of 4,510 adults conducted in 1993 by the Angus Reid Group (a major polling agency) for *Maclean's* (a national news magazine with wide distribution) (April 12, 1993) reported that 78% affiliate themselves with a Christian denomination, 74% disagree with the statement "I am not a Christian," and about 65% stated belief in traditional Christian theological doctrines. Similarly, Bibby's Project Canada survey revealed in 1995 that the vast majority of Canadians (81%) still believe in God.

The trend to secular beliefs that conflict with Church doctrine is seen in the fact that, among self-described Roman Catholics polled, 91% approve of artificial birth control, 82% condone premarital sex, 84% would allow priests to marry, 55% view homosexual behavior as morally acceptable, and only 20% support the Church's stance that abortion should be opposed in all circumstances except when the life of the woman is at risk. At the other end of the spectrum, when a church moves away from traditional patterns, as the United Church of Canada did by accepting the ordination of non-celibate, homosexual clergy, a sizable minority felt the church was becoming too liberal in its teachings. Those on the conservative end of the belief spectrum within their denominations are the most active opponents of abortion and proponents of "abstinence-only" sex education in the schools.

Among the almost 4,000 15- to 19-year-old high school students surveyed by Bibby and Posterski (1992), though 79% identified themselves with a particular organized religious denomination, only 19% of 15-year-olds and 13% of 19-year-olds attended weekly religious services, 15% said they received a high level of enjoyment from their involvement in an organized religion, and 24% viewed themselves as committed. Despite the apparently low and declining interest in organized religion (10% considered religious involvement "very important"), 24% rated "spirituality" and 46% "the quest for truth" as very important. Bibby and Posterski (1992) found that teens are highly receptive to

spiritual and values-related issues. Supernatural beliefs also appeared to be more common than one might expect based on religious involvement. For example, the percentages agreeing with various supernatural beliefs were: God exists (81%), Divinity of Jesus (80%), some people have psychic powers (69%), life after death (64%), astrology (52%), extrasensory perception (52%), contact with the spirit world (44%), and 'I will be reincarnated' (32%). These percentages are similar in most respects to those for adults asked the same questions in a 1990 survey (see Bibby & Posterski 1992).

These data suggest that while most Canadians are moving away from active involvement in religious institutions, they retain a core of religious beliefs and an interest in spiritual ideas and philosophies. Given this trend, it would be expected that the specific teachings of and stands taken by religious institutions on issues of sexuality might have less influence on Canadians today than they did in the past. This is illustrated most explicitly in the attitudes of French Canadians compared to the teachings of the Roman Catholic Church. For some newer Canadians, however, results of some research suggest that affiliation with religious institutions and involvement in their activities may remain important, with churches, temples, and mosques providing a center for activities of ethnic communities (Maticka-Tyndale et al. 1996). Though to date there are no large-scale studies of the influence of religion and religious involvement in different immigrant groups, results from research by sociologists across North America suggest that the teachings of religious institutions will have more influence on individuals and communities where involvement in those institutions is higher.

### B. Ethnocultural Diversity and Sexuality

The varied ethnocultural backgrounds of Canadians described above have significant implications for sexuality and sexual health. Behavior is strongly influenced by social and cultural factors, and recent immigrants to Canada, in particular, may face complex challenges in understanding and adapting to a new culture. However, it is difficult in a brief review to encompass the ways that cultural traditions in other spheres of social life both reflect and create expectations regarding sexual behavior for Canada's varied ethnocultural groups. In most cases, national statistical data on specific aspects of sexual behavior do not exist, and it is rare to find qualitative studies focused on the broad aspects of sexual activities and beliefs within different ethnocultural communities. Concerns about AIDS and sexual abuse have generated research within selected communities. Examples include a network of studies in several ethnocultural communities. The largest of these, the federally funded *Ethnocultural Communities Facing AIDS* study, was conducted in collaboration with representatives from six communities—Chinese, South Asian, Horn of Africa, English-speaking Caribbean, North African Muslim, and Latin American—in the three cities that receive the largest proportion of immigrants to Canada (Montreal, Toronto, and Vancouver). This project used a combination of ethnographic and survey techniques and had two goals: (1) the development of a knowledge base about cultural and psychosocial factors influencing sexual behaviors that place people at risk for HIV infection; and (2) formation of recommendations for prevention programming in these communities. Overviews of results and recommendations from the qualitative phase of research were published in the six-booklet report, *Many Voices: HIV/AIDS in the Context of Culture*. Final reports based on community surveys were also prepared (see Health Canada 1994a-f, for community reports; also Adrien et al. 1995; "HIV" 1996; Maticka-Tyndale et al. 1995).

## 3. Knowledge and Education about Sexuality

### A. Government Policies and Programs

Because Canadian political structures and social life are based on a relatively nonintrusive conception of democratic society, formal sources of sex education have, for the most part, refrained from overtly imposing specific "doctrinal" sexual values on Canadians. For example, institutions such as the public schools have generally not sought to inculcate particular views on the acceptability of premarital sex. Instead, the school is more likely to offer information and guidance intended to help students make informed decisions about their sexual behavior; counseling and health facilities generally operate from the premise of providing information and care (e.g., to decrease sexually transmitted disease and unwanted pregnancy) regardless of position or status. This is not to say that sex education in the schools is free of ideology or that some Canadians would not wish stronger influence for their particular ideological position. Nevertheless, it appears that school-based sexuality education generally aspires to a non-doctrinal stance based on democratic principles (see McKay 1997).

Because education in Canada falls under provincial rather than federal jurisdiction, the Ministry of Education (or Department of Education) for each of the ten provinces and three territories usually has its own guidelines and/or curricula for sexuality education and its own procedures for implementing them. However, there are various programs through which the national government collaborates with the provinces and/or operates independently in this area, particularly within the context of the Division of Sexual Health Promotion and STD Prevention and Control. The federal government provides funding for a variety of provincial organizations and researchers concerned with education and treatment pertaining to sexual health (AIDS, STDs, sexual-abuse prevention, women's reproductive health, etc.). For example, both the AIDS Information and Education Services Unit of Health Canada, which operates within the Programs Division of the Health Promotion Directorate of the Health Programs and Services Branch, and the AIDS Care, Treatment, and Support Unit of Health Canada, which operates within the Preventive Health Services Division of the Health Services Directorate of the same Branch, provide this kind of federal-provincial linkage.

A joint venture between Health Services and Health Promotion led to production in 1994 of the *Canadian Guidelines for Sexual Health Education*. The *Guidelines*, produced by a national working group coordinated by the Sex Information and Education Council of Canada (SIECCAN) under a contract agreement with Health Canada, provide a unifying framework, a philosophy, and a set of principles to unite and guide those providing, planning, or updating sexual health education programs and/or services for people of all ages across Canada. The *Guidelines* can be used as a frame of reference for assessing both the overall network and the individual components of existing sexual health education programs and related services at the national, provincial, or local level. However, the document cautions against a single "authoritative" definition of sexual health as a static phenomenon that can be readily identified, and hence prescribed, by experts. Sexual health education is seen as "a broadly based, community-supported enterprise in which the individual's personal, family, religious, and social values are engaged in understanding and making decisions about sexual behavior and implementing those decisions" (Minister of Supply and Services 1994, 4). A revised set of guidelines is slated to be released in mid-2003.

Another joint venture that involved the federal government and the provincial ministries of health and education supported development and evaluation of “Skills for Healthy Relationships,” a program about sexuality, AIDS, and other STDs for early high school students. Developed by the Social Program Evaluation Group at Queen’s University, Kingston, Ontario, the program is now available to any school/school board or Ministry of Education that wishes to assume the cost of duplicating the materials (available from the National AIDS Clearinghouse of the Canadian Public Health Association). An in-service training session for teachers is an important component of the program, as was the large-scale program evaluation done independently by researchers not involved with development or implementation of the program (Warren & King 1994). Other federal and provincial/territorial government programs related to HIV/AIDS prevention and treatment (see Section 10, Sexually Transmitted Diseases and HIV/AIDS) and to other aspects of sexual health will be discussed as the relevant topics arise throughout the chapter.

### *Sexuality Education in Elementary and Secondary Schools*

All provinces and territories have school programs that include sexuality education, although the content and extent of implementation varies considerably between provinces and within different parts of the same province. While school-based sexuality education programs are a provincial responsibility, the federal government has a variety of programs through which it can assist sexuality education in schools or sexual health education for all ages in the community. As noted above, the Division of Sexual Health Promotion and STD Prevention and Control, the National Health Research and Development Program, the Division of HIV/AIDS Epidemiology and Surveillance (Bureau of HIV/AIDS, STD, and TB in the Centre for Infectious Disease Prevention and Control Canada), and other government departments may support researchers and community organizations in diverse sexuality education programs and services. Local public health units within specific municipalities of each province are also actively involved in public education about contraception, AIDS and other STDs, sexual abuse, and other aspects of sexual health, and they may do so in school settings as well.

There have been only a few national surveys of the availability of sexuality education in Canadian schools (for reviews, see Barrett 1990, 1994), and no detailed national studies of the classroom content of sexuality education that would indicate the extent to which provincial guidelines and curricula are translated into classroom programming. There is, however, enough information from individual provinces to indicate significant advances in sexuality education over the past 15 years fueled to a large extent by emerging concerns about HIV/AIDS, other STDs, and sexual abuse, and also by ongoing concerns about teen pregnancy.

Survey findings throughout the 1980s, 1990s, and into 2002, have consistently shown broad public support for some form of sexuality education in the schools (Langille et al. 1996; Lawlor & Purcell 1989; McKay & Holowaty 1997; McKay, Petrusiak, & Holowaty 1998; Ornstein 1989; Weaver et al. 2001, 2002). As in earlier studies (Verby & Herold 1992), the more recent reports also show support for HIV/AIDS education, which now appears in many curricula in grades 5 and/or 6 (ages 9 to 11). Although it is often difficult for such studies to include detailed assessment of respondents’ opinions about specific content, or their views on the more subtle aspects of philosophy and attitudes that they might wish to see inculcated, Canadians

appear to be strongly supportive of the the involvement of schools in sexuality education. Nevertheless, a minority perceives contemporary sex education to be skewed toward liberal, secular attitudes, particularly in the areas of abortion, homosexuality, teen sexuality, and access to contraceptive information and services, and actively promulgates a more restrictive agenda in all of these areas. Although historically this view has been expressed as an opposition to sexuality education in the schools, at present it is more likely to focus on either the specific value positions that schools should adopt, the appropriateness of particular topics (e.g., homosexuality, contraception, and abortion), or the ways in which student behavior should be influenced (e.g., abstinence-only programs).

There are few settings other than schools through which almost all young people can be reached with a planned educational program that addresses the broad range of topics subsumed under the heading of sexuality education. Sexuality education in schools is almost invariably integrated into a broader program of Health Education, Personal and Social Relationships, Family Life Education, Religious and Moral Education, and similar subjects, but this varies between provinces (or even within provinces) and there is, therefore, no standard national curriculum for sexuality education. However, most school curricula are based on a statement of principles and a guiding philosophy that emphasizes self-knowledge, acceptance of individual development, social obligations, personal values, the avoidance of problems (e.g., sexual coercion, teen pregnancy, STDs, etc.), and to a lesser and varied extent, the development of satisfying sexual relationships. Material is presented in a hierarchy based on age appropriateness, with a number of previously excluded or delayed topics now appearing at earlier ages (e.g., AIDS and avoidance of sexual exploitation).

Sex education in schools is evolving in Canada, from first-generation programs that focused primarily on knowledge about reproduction and birth control (on the assumption that students would translate this information into self-protecting behavior), to second-generation programs that included factual information plus skills in communication and relationships (on the assumption that these generic skills would translate as above) (Kirby 1992; Kirby et al. 1994; McKay 1993), to the newly emerging programs that are rooted in conceptual models of behavior change that include knowledge acquisition, development of attitudes and behavioral intentions in support of sexual health, motivational supports, and development of situation-specific skills (see, for example, McKay 2000, 2001; McKay et al. 2001). The Skills for Healthy Relationships program for grade 9 students (aged 13-14) described above is an example of this approach (Warren & King 1994). This gradual transition in Canadian sexuality education (most programs are second-generation type) reflects an increasing desire of educators and public health professionals to design interventions that affect sexual health behavior and outcomes. There is also an emerging interest in applying these concepts to elementary school education (Wackett & Evans 2000), although deciding which behaviors to assess and the willingness of schools to survey younger students on such topics remain largely unmet challenges.

One of the complaints about traditional sex education has been that it does not work, i.e., teen pregnancies and STDs remain high. The problem is that early sex education programs simply anticipated such outcomes, although they were neither designed for nor taught in ways that would achieve these specific behavioral objectives. Students did become more knowledgeable and more insightful about their own and other people’s feelings and behavior—both desirable

outcomes—but this type of knowledge-based sex education is not generally expected to have a major impact on behavior (for a review, see Fisher & Fisher 1992, 1998). With the continued concern about AIDS and other STDs, schools are being asked to influence behavior (postponing sexual involvement, encouraging abstinence, increasing condom use and safer sex practices, etc.) and not just to increase knowledge.

While Canada has experienced localized opposition to sex education in the schools, that opposition today, as noted above, is seldom to the school's involvement in sexuality education, per se, but to the presumed "liberal" values of such programs. Public discourse on this issue has affected curriculum development to varying degrees across Canada and it is against the competing pressures of heightened expectation, anticipated "traditional" opposition, and limited resources, that school-based sexuality education continues to develop. A detailed overview of recommended or required sexuality education content in Canadian elementary and secondary schools is beyond the scope of this chapter (for a review, see Barrett 1994).

### *Outcomes of School-Based Sexuality Education*

The final report on the Skills for Healthy Relationships program (Warren & King 1994) is the largest study ever undertaken in Canada on the long-range outcome of a school-based sexuality education program. As noted above, the program was developed by the Social Program Evaluation Group at Queen's University, Kingston, Ontario, with collaboration and support from provincial and territorial ministries of education and health, the Council of Ministers of Education, Canada, the National Health Research and Development Program, and the Division of HIV/AIDS Epidemiology and Surveillance (Bureau of HIV/AIDS, STD, and TB in the Centre for Infectious Disease Prevention and Control Canada). The Skills for Healthy Relationships program provides grade 9 students (ages 13-14) with a carefully structured and theoretically based educational intervention on AIDS, other STDs, and sexuality. It features cooperative learning (small groups), parent/guardian involvement (six interactive activities), active learning (role playing, behavioral rehearsal), peer leaders (in small groups, modeling skills), video instruction, and journaling and development of a personal action plan (assertiveness goal). The skills component is a major feature of the program, and outcome measures, assessed by questionnaires just after students had taken the program and one and two years later, included indicators of change related to these skills (assertiveness, communication with parents, regular condom use if sexually active, etc.). The comparison groups in each of the four provinces in which the program was tested were students who took their school's regular grade 9 AIDS/STD program.

Two years later, students who took the program said they had been changed by the program in a number of ways: more comfort talking about personal rights with a partner (72%), talking about condoms (67%), ability to refuse or negotiate something I don't want to do (58% in both cases), more assertive (53%), and always use condoms with my partner (61%) (Warren & King 1994). Compared to the nonparticipant group, participants at the two-year follow-up:

- were more likely to have gained compassion toward people with AIDS;
- had more-positive attitudes toward homosexuality;
- showed greater knowledge of HIV/AIDS;
- were more likely to express the intent to communicate with partners about condom use;
- were no more likely to have the intent to use condoms (this was initially high in both groups);

- were no more likely to report "always" using a condom (about 41% of both groups said they always did so; about half reported using a condom the last time they had intercourse); and
- females were more likely to declare that they would respond assertively if they were pressured unwillingly to have sex.

As would be expected, in the period from grade 9 to 11, the proportion of students who had experienced intercourse increased for both sexes in both groups. However, the percentage of both sexes who said they had ever had intercourse was slightly lower in the participant group two years after the program (51% comparison vs. 42% participant for males; 49% comparison vs. 46% participant for females). The students from both groups who were most likely to have unprotected intercourse were those who took risks in areas such as alcohol consumption, use of cannabis, and skipping classes. They were also more likely to be doing poorly in school (Warren & King 1994). These latter observations highlight the important behavioral influence of social and relationship factors that may well be difficult to change through school-based interventions alone.

In Canada, Orton and Rosenblatt's (1986, 1991, 1993) pioneering research on a multisectoral approach to pregnancy prevention in Ontario showed that rates of adolescent pregnancy declined more rapidly in the late 1970s and early 1980s in those localities that provided young people with both school-based sexuality education and access to clinical services. Orton (1994) points out that the usual practice of reporting only province-wide data for teen pregnancy has tended to obscure the "inequality gap" between individual localities with respect to the decline in teen pregnancies. We have, therefore, been less likely to note the successes in localities that combined prevention programs in both the educational and public health sectors, and also less able, and willing, to recognize and target resources toward those settings that needed special assistance because they were less advantaged for providing such programs (e.g., rural and northern localities). Orton (1994) argues that: "Policies and programs of sexual health have the potential to reduce social inequalities by reducing rates of adolescent pregnancy and STDs, and also by reducing the wide variation in rates between jurisdictions and groups within Canada" (p. 223).

Based on an analysis of policies and programs in education, public health, and social services in Ontario, Orton (1994) argues that "intersectoral collaboration can contribute to greater and more equitable access to sexual health education and services," but that such collaboration requires "strong policy directives at all three ministries" (p. 222). Her findings in Ontario argue for "the effectiveness of centralized policy direction (public health), and the ineffectiveness of a decentralized approach (education and social services) to achieve equitable access to effective programs" (Orton 1994, 223).

There are numerous examples of the successful implementation of programs meeting Orton's criteria. The province of Saskatchewan is attempting to strengthen sexual health education. Its planning document, *Toward Sexual and Reproductive Health in Saskatchewan*, from a province attempting to strengthen sexual health education, shows how a centralized initiative from the Ministry of Health invited multisectoral collaboration in program and policy development (Saskatchewan Health 1993) along the lines that Orton (1994) recommends. Nova Scotia also provides another example of a multiple-component intervention (Langille 2000). Carried out between 1996 and 1999, the Amherst Initiative for Healthy Adolescent Sexuality brought together

community groups (including schools), parents, teenagers, healthcare professionals, and interested citizens to promote adolescent sexual health. Comparisons between 1996 and 1999 show important changes in knowledge, attitudes, and behavior among grade 9 to 12 students at Amherst Regional High School. Of particular note was a decrease of 31% in the age-adjusted pregnancy rate for Amherst women in 1998, compared to 1995 to 1997. Such a finding is encouraging, and certainly in support of a multisectoral approach.

[Update 1999: With a comprehensive compulsory sexuality education program in place in all of the Alberta province's schools since 1990, a recent survey found that teenagers in Alberta are postponing intercourse for longer than their counterparts in other Canadian provinces, leading some to argue that mandatory sexuality education programs play a role in encouraging teens to delay sexual activity. According to a survey of 82,000 Canadians published in the *Calgary Herald*, only 8% of females in Alberta ages 15 to 19 said they had sex before age 15, compared to the national average of 13%. Among Calgary's 15-to-19-year-olds, 7% reported having sex before age 15. Supporters of comprehensive sexuality education attribute these lower rates to a decade of comprehensive compulsory sexuality education in the schools and to easy access to family planning clinics. Calgary's teen pregnancy rate is among the lowest in Canada and the world. Critics of the program argue that an abstinence-based sexuality education program would drive the figures down even further. Critics also claim that sex education that does not specifically counsel abstinence has always increased teen pregnancy and STD rates (*Kaiser Daily Reproductive Health Report* 1999). (End of update by R. T. Francoeur)]

There are a number of issues facing the continued growth and improvement of sexuality education in Canadian schools. For example, the duration, content, and quality of such education varies considerably between schools and within and between provinces, but it is uncertain whether governments will continue to give sexuality education the required priority and resources. Canadian schools face increasing financial and staffing constraints and there is a growing demand to focus more on basic areas like language skills, science, computer technology, and so on, which may lead, by default or design, to either a lower priority for sexuality education or to a more limited, problem-centered focus on selected topics. Given the various sexual ideologies, religious traditions, and ethnocultural backgrounds within the Canadian population, it has been difficult to find a broad public consensus on how to deal with controversial issues in schools (teen sexuality, homosexuality, etc.). The past climate of cautiousness and conflict on such issues still continues to impede implementation of high-quality sexuality education programs in many areas. The goal identified in the *Canadian Guidelines for Sexual Health Education*, i.e., universal access to a broadly based, comprehensive, and integrated approach to sexual health education, suggests high national expectations and intentions, but uncertain resources and competing priorities are part of the reality facing attempts to fully implement such a program.

### *Sexuality Education and Related Services Through Public Health Units and Other Such Agencies*

Provincial and Territorial Public Health Units play a major role in sexual health education and related services in Canada, and they are often in the forefront of community sexual health education campaigns. For example, the Program Requirements and Standards section of Ontario's *Mandatory Health Programs and Services Guidelines* (Ontario Ministry of Health 1989) lists four pages of expecta-

tions and program standards for sexual health and STDs. Boards of health and public health nurses are the front-line staff involved in addressing these issues with clients of all ages and socioeconomic status. The demands on this growing bureaucracy have increased in recent years in response to changing patterns of sexual behavior among youth, increasing ethnocultural diversity and immigrant populations in cities, population aging, AIDS, concerns about sexual abuse prevention for all ages, and other such issues. In the face of growing demand and limited resources, provision of service is varied across Ontario (this is probably true for all provinces) and, for the same reasons, the additional mandate to do community needs assessments and outcome evaluations of sexual health programs is also difficult to sustain.

A variety of nongovernmental agencies are also involved in sexuality education and related services. The Sex Information and Education Council of Canada (SIECCAN), founded in 1964, maintains a resource library and information service, publishes the *Canadian Journal of Human Sexuality* and the *SIECCAN Newsletter*, provides consultation services and professional education workshops, and facilitates development of new resources, such as the *Being Sexual* series (Ludwig & Hingsburger 1993), *After You Tell* (Ludwig 1995), and the previously described *National Guidelines for Sexual Health Education*. The Planned Parenthood Federation of Canada (PPFC) has a long history of advocacy, education, and resource distribution on contraception and sexuality. PPFC administers the Sex Education and Research Clearinghouse (SEARCH), a national center for distribution and development of sexuality education resource materials. Local Planned Parenthood offices now provide sexual health education and services and some, such as The House, in Toronto, administer adolescent health centers that are equipped to address a broader range of health issues than contraception and pregnancy counseling. The Canadian AIDS Society and local AIDS committees and organizations do educational outreach that includes some aspects of sexuality education, as do other groups with particular concerns about sexuality, such as the Disabled Women's Network and the British Columbia Coalition on AIDS and Disability. The Canadian Public Health Association, the Canadian Association of School Health, the Canadian Infectious Diseases Society, the Society of Obstetricians and Gynecologists of Canada, and a number of other nongovernmental organizations contribute at the national level to public sexuality education.

### **B. Informal Sources of Sexual Knowledge**

Despite the growing role of schools and public health authorities in public education about such topics as contraception, STDs, and HIV/AIDS prevention, informal sources (peers, family, and the media) are probably the primary influence on sexual attitudes and knowledge. Adolescents have been the focus of most research in this area.

For example, when asked to list their main sources of AIDS information, grade 11 students ( $N=9,617$ ) surveyed in the *Canada Youth and AIDS Study* ranked television first, followed, respectively, by print materials, school, family, friends, and doctors/nurses (King et al. 1988). The first three rankings were the same for grade 7 ( $N=9,925$ ) and grade 9 ( $N=9,860$ ) students. Although these informal sources were identified as the main source of AIDS information for Canadian youth, a majority of the young people surveyed said they would have preferred a more formal source of information, such as doctors or nurses. A more recent study in Ontario found that school was the main and preferred source of health information (McKay & Holowaty 1997).

Ornstein's (1989) study of AIDS-related knowledge, behavior, and attitudes of Canadian adults ( $N=1,259$ )

found that, similar to the students in King et al.'s study, television (39%) and newspapers (23%) led the list of respondents' self-identified "main sources of information about AIDS." Magazines were identified by 9% and health authorities (e.g., physicians, nurses, hospitals, and clinics) by only 2.5%. Although not asked to self-identify their sources of information, one study of British Columbia youth (McCreary Centre Society 1993) indicates that 84% of participants were taught about AIDS in school and 72% knew how or where to get information. This trend was seen to increase with grade level. As well, 50% had talked with their parents about AIDS.

In the survey phase of the *Ethnocultural Communities Facing AIDS* study, conducted in English-speaking Caribbean, Latin American, and South Asian communities (only men from the South Asian communities participated in the survey), the rank ordering of where respondents preferred to get information about HIV/AIDS was identical in all three communities and to both of the two earlier studies (Maticka-Tyndale et al. 1995). Ornstein's (1989) conclusion that "in the main, Canadians rely on the mass media rather than more specialized publications to learn about AIDS" (p. 52), clearly applies regardless of age and probably also regardless of ethnocultural background. Although no more recent studies have been done, this is likely still the case.

While various forms of media, particularly television, have been Canadians' main source of information about AIDS, the picture changes somewhat when sources of information on sexuality in general are examined. Again, informal sources of information predominate. However, with sexuality in general, as opposed to AIDS, peers and family become the most commonly cited sources of information. The World Wide Web and other computer-assisted information systems are having a growing impact on students' access to sexuality-related content, but the potential of this medium as a formal resource for sexuality education (see Humphreys et al. 1996) has yet to be exploited.

When King et al. (1988) asked a national sample of students about their main sources of information about sex, grade 7 (aged 11-12) and grade 9 (aged 13-14) students ranked family first out of six possible sources of sex information. Though friends were ranked fifth by grade 7 students, they rose to third for grade 9 students, and first for grade 11 students. The latter group ranked family a close second. Friends remained first for college/university students, with family dropping to third place, replaced by print materials in second. Interestingly, school dropouts ranked previous schooling first, friends second, and family third as their main sources of sex information. In a comparable study of Newfoundland students done in 1991, Cregheur et al. (1992) found that grade 11 students (aged 16-17) ranked friends first as their main source of information about sex, followed by school, television, family, and print materials. Interestingly, compared to the King et al. (1988) national sample, grade 11 students in the Cregheur et al. study (1992) were less likely to cite friends, family, television, and print materials as their main sources of information about sex, and more likely to cite school.

The role of peers and parents as important informal sources of information and support is evident from the results of three studies. King et al.'s (1988) study of Canadian teens found that, overall, teens agreed that they talked with their close friends about sex (increasing from 56% in grade 7 to 75% in grade 11), that people of the opposite sex like them (51% in grade 7, 73% in grade 11), and that they discuss their problems with their friends (62 to 71%). Among grade 9 students questioned in a 1992 evaluation of the "Skills for Healthy Relationships" program (see Warren

& King 1994), 59% of females and 38% of males agreed that "I can talk to my mother about sexual matters" (26% of females and 41% of males agreed that they could talk to their fathers about sexual matters). Finally, Herold's (1984) study of young women visiting a birth control clinic found that two thirds of the women had received birth control information from girlfriends, about half from schools or reading materials, 25% from their mothers, and 2% from their fathers. The importance of peers is highlighted in Herold's (1984) conclusion that

peers provide teenage girls with information, legitimization and support. Girlfriends are the most important source of information about birth control, and teenage girls who are socially isolated in the sense of having few friends often delay getting birth control because they lack peer support. (p. 105)

The impact of informal sources of learning on sexual values is a much-discussed issue in Canada. In a study of values and sex education in Montreal-area English-language high schools, Lawlor and Purcell (1988) surveyed 667 grade 9 and grade 11 students about a variety of topics related to sex education. Asked where they learned their moral values related to sexuality, the students again ranked peers at the top. Friends away from school were ranked first, followed, respectively, by classmates, home, television and movies, books and magazines, in school from teachers, in school from religious teaching, and rock/pop music and lyrics. It is noteworthy that these students ranked rock/pop music and lyrics last out of a possible eight sources of sexual values, since there has been increasing speculation in the Canadian media that popular music and rock videos may have a negative impact on the sexual attitudes of young people. For the eight sources for learning sexual values, the most pronounced gender difference was for the item "in the home," which was ranked third by grade 9 girls and second for grade 11 girls, but fifth by both grade 9 and grade 11 boys.

While public policy and sex education literature generally acknowledge the important role that parents play in the sexual development of children, there has been surprisingly little research on the direct communication of sexual knowledge from parents to their children. In a study of 200 Canadian university women (Herold & Way 1983), subjects reported which sexual topics they had discussed with their parents. Eighty percent had talked about attitudes towards premarital sex with their mothers, 55% with their fathers; 70% had discussed contraception with their mothers, 29% with their fathers; 15% had discussed oral sex or masturbation with their mothers, 2% with their fathers; and 9% had talked about sexual techniques with their mothers, less than 1% with their fathers.

Several general observations can be made based on these studies. First, family, peers, and media form a triad of influence and education with respect to issues related to the sexuality of young Canadians. In general, there is a developmental shift that occurs in the relative place of family, peers, and media sources during adolescence. Between about grade 9 (13 to 15 years of age) and grade 11 (16 to 17 years of age), peer influence rises to top rank, and that of family decreases in importance, in some cases even outranked by the more impersonal media (e.g., print materials). In addition, at least for university women, mothers in particular have been a potential source of information and influence in matters of sexuality. The foregoing results support Bibby and Posterski's (1992) observation that the apparent changes in attitudes and conduct are not individual changes, but a "coming of age" of a new generation of Canadians—the children of the "sexual

revolution” generation—who are forming their own reference groups of information and influence.

#### 4. Autoerotic Behaviors and Patterns

In the insufficiently heated bedroom on the northwest corner of the house in Park Place, I was taken by surprise by the first intimations of a pleasure that I did not at first know how to elicit from or return to the body that gave rise to it, which was my own. It had no images connected with it, and no object but pure physical sensation. It was as if I had found a way of singing that did not come from my throat.

—A man’s recollection from his boyhood in *So Long, See You Tomorrow*, William Maxwell (1980)

In the early 1900s, the first sex education classes in Ontario schools taught young boys about the dangers of masturbation. Students were told that seminal fluid contained a vital force that nourished the brain and muscles, and that wasting it through any sexual excess, but particularly through masturbation, was physically and mentally depleting to the individual. Furthermore, students were also told that a man could pass this depleted condition on to his offspring. These dual beliefs in vitalist physiology and in the inheritance of acquired characteristics provided the “secular” rationale for prohibitions that were already part of the religious teachings of the time. Canada’s long-abandoned eugenic sterilization law of 1902 had its origins in the period when such teaching became popular (for review, see Bliss 1970). Sex education at that time was generally silent on female masturbation—often ignoring its very possibility—but when it was mentioned, the dire consequences for reproductive health and mental stability were strongly emphasized. Mothers were told to be watchful lest their children fall into the habit that, they were warned, was notoriously difficult to break.

Over 90 years later, masturbation has gone from being a sin to a normal part of sexual development in children and a healthy aspect of sexual expression in adults. This general impression would have to be documented from qualitative sources, since we have been unable to locate any published national data on masturbation frequency in any age group. Survey results cited in Section 1C, Basic Sexological Premises, General Concepts and Constructs of Sexuality, indicate that a majority of Canadians adults view it as a healthy expression, although a sizable minority either disagreed (30%) or strongly disagreed (5%) with this view. Sex education literature almost invariably refers to masturbation as normal, and recommendations for parents usually pertain to the importance of privacy and of not instilling guilt. Sexuality education for children and young adults with developmental disabilities places particular emphasis on teaching in this area because public masturbation, even when it arises through lack of social skills, can lead to embarrassment, restriction of social opportunities by caregivers, or exploitation by others. The Sex Information and Education Council of Canada (SIECCAN) publishes and distributes a 17-booklet sexuality education series for people with developmental disabilities—*Being Sexual: An Illustrated Series on Sexuality and Relationships*—that includes clearly illustrated, detailed, sex-positive information about female masturbation (Ludwig & Hingsburger 1993) and male masturbation (Hingsburger & Ludwig 1993). The series is designed for people who have problems with language, learning, or communication, and all books are translated into Blissymbols, making the series the only resource of its kind in the world. Blissymbolics, a symbolic language developed by C. K. Bliss and described in *Semantography*, published in 1949, was intended to be a means of communication across all language groups. It is now used by people with disabilities, and others, to facilitate

expressive speech. The Canadian organization responsible for this work is Blissymbolics Communication International.

One paper on childhood masturbation written by Canadian authors relies on U.S. statistics for occurrence and incidence data to suggest that 90 to 94% of males and 50 to 60% of females have masturbated during their lifetime, that the highest incidence is among 16- to 20-year-olds (86% masturbate; the frequency is higher in males than females), and that masturbation declines with age in men but increases toward middle age in women (Leung & Robson 1993). While some religious groups consider masturbation to be sinful or an unacceptable indulgence, the common reaction in Canada appears to range from benign acceptance (and little discussion) to enthusiastic approval, reflective of the general shift toward a larger proportion of the population’s acceptance and endorsement of various forms of sexual expression.

#### 5. Interpersonal Heterosexual Behaviors

##### A. Children

There have been no national studies on the sexual behavior or sex-role rehearsal play of Canadian children. While it seems likely that sexual curiosity and exploratory play would follow patterns similar to those described by U.S. researchers (see Martinson 1994), we do not know of any studies that would provide empirical support for this conjecture in Canada.

##### B. Adolescents

It is important to place the sexual behavior of Canadian adolescents as a group within the context of prevailing social, political, and economic conditions and of other individual variables, such as their personal characteristics and relationships, their attitudes toward sexuality, and their increasing exposure to sexual images and information through television, films, and magazines. Although it is misleading to generalize about such a diverse group, the findings of two national studies with large samples described earlier offer important background insights against which to assess more-recent reports on adolescent sexual health in Canada. The *Canada Youth and AIDS Study* (Social Program Evaluation Group, Queen’s University, King et al. 1988) is the only large-scale national study of both the attitudes and sexual behavior of Canadian adolescents and young adults. The sample included approximately 19,500 grade 9 and 11 students, 14 to 17 years of age. “Project Teen Canada” 1992, which replicated a national survey of 15- to 19-year-olds conducted in 1984, had a sample of 3,600 15- to 19-year-olds and investigated attitudes and beliefs (not behavior) about a range of topics, including sexuality (Bibby & Posterski 1992). More recently, national data assembled by the Canadian team for the Alan Guttmacher Institute’s international comparative study of adolescent sexual health in developed countries (France, England, Sweden, Canada, United States) (Darroch, Frost, Singh, et al. 2001) have provided a 1990s overview of selected aspects of the sexual health of Canadian adolescents (Maticka-Tyndale, Barrett, & McKay 2000; Maticka-Tyndale, McKay, & Barrett 2001; Singh, Darroch, Frost, et al. 2001; Darroch, Singh, Frost, et al. 2001; Maticka-Tyndale 2001). These varied sources, and others, are used below as a starting point to examine the sexual attitudes and behavior of Canadian adolescents.

##### *Sexuality and Self-Esteem*

Self-concept refers to the way individuals describe their abilities, personalities, and relationships, whereas self-esteem refers to the value placed on these personal characteristics (King et al. 1988). Research has repeatedly demonstrated strong associations between self-concept, self-es-

teen, and sexual conduct, particularly for adolescents. These are, therefore, important concepts to consider in this section on adolescent sexual conduct. In King et al.'s national study, while Canadian teens generally agreed that they had confidence in themselves (88 to 90% of grade 7, 9, and 11 males, 81 to 87% females) (King et al. 1988), ambivalence is reflected in a variety of areas, particularly for young women. Between 51% and 53% of grade 7, 9, and 11 females reported that they would "change how I look if I could" (vs. 37 to 38% for males); 37% of grade 7 females and 51% and 54% of grade 9 and 11 females agreed with the statement, "I need to lose weight" (vs. 21 to 24% for males); and 32 to 41% of females agreed that "I often feel depressed" (vs. 27 to 30% for males). At the same time, 84 to 89% said, "I have a lot of friends," 81 to 84% said "I am a happy person," and 71 to 74% said, "The future looks good to me."

Similar findings on self-esteem of Canadian 11- to 15-year-olds are reported in *The Health of Canada's Youth* (King & Coles 1992), part of an international collaborative study designed to collect comparative health-related information on young people in Austria, Belgium, Canada, Finland, Hungary, Norway, Poland, Scotland, Spain, Sweden, and Wales. In the section on social adjustment, King and Coles (1992) observe that, "compared with young people from European countries, young Canadians are experiencing more strain in their relationships with their parents and even with each other" (p. 96). Yet Canadian students were more likely than those in most other participating countries to find it easy to talk to friends of either sex about things that really bother them. This concurrence of positive self-regard on the one hand, and anxiety or dissatisfaction with specific areas of their lives on the other, has also been noted in other studies of slightly older Canadian youth as well.

For example, Bibby and Posterski (1992) also noted the generally high self-esteem of teens (e.g., 82% of females and 90% of males agreed that the statement, "I can do most things well," described them either very well or fairly well). However, these adolescents had concerns about a number of areas, including achievement in school (this was an issue for both sexes) and personal safety (a major concern for females). About three times as many females as males (56% vs. 20%) agreed that there was an area "within a mile (or kilometer) of your home where you would be afraid to walk at night." About 95% of both young women and men plan to have careers, but there appears to be a continuing gender gap in areas that may have an impact on sexual and gender relationships. For example, females were more likely than males to rate certain values as "very important" (concern for others, 75% vs. 48%; forgiveness, 71% vs. 45%, and honesty, 82% vs. 56%) (Bibby & Posterski 1992).

Though these studies support the general contention that Canadian adolescents have a relatively positive self-concept and high self-esteem, they also demonstrate clear and important gender differences. Young women express specific concerns about appearance and safety, and focus greater attention on values that relate to relationships than those of individual achievement or success. Considerably fewer young men, on the other hand, show concern for appearance or focus attention on relationship values and, by and large, they seem unconcerned about personal safety. These characteristics are of particular importance when considering their potential influence on relationships between young men and women and the ability of each to realize the expectations they have set for their futures.

### *Attitudes Toward Sexuality and Relationships*

Attitudes toward sexual intercourse before marriage (i.e., "premarital sex") have been widely used as an indicator of

sexual permissiveness. In King et al.'s study (1988), among grade 11 students (ages 15 to 17), 13% said unmarried people should not have sex and 76% said it is all right for people to have sex before marriage if they are in love (74% female, 78% male) (agreement combines the "strongly agree" and "agree" categories on a five-point Likert scale) (King et al. 1988). More recently, Maclean's (2001) reported findings based on R. Bibby's book, *Canada's Teens: Today, Yesterday and Tomorrow*, that 82% of Canadian teens believe that love is an acceptable reason for sex before marriage, while 58% feel that liking someone is sufficient.

In their slightly older sample in 1992, Bibby and Posterski found that: 86% of females and 88% of males agreed with sex before marriage for people in love (the value was 93% for both sexes in Quebec); 51% of females and 77% of males agreed with sex before marriage when the people involved liked each other (81% and 91%, respectively, in Quebec); 40% of females and 73% of males agreed that sexual relations were OK within a few dates (60% and 82%, respectively, in Quebec); and 5% of females and 20% of males agreed with sexual relations on a first date if people like each other (9% and 23%, respectively, in Quebec). A study of attitudes toward use of power in sexual relations among college students in Quebec (Samson et al. 1996) found that the majority of students refused to see the expression of sexuality as a locus of power, but viewed it more in the context of shared affection and pleasure.

The tendency toward increasing permissiveness with greater levels of affection is a longstanding North American tradition among young people and adults. In fact, Widmer, Treas, and Newcomb (1998), in an international comparison of attitudes toward nonmarital sex, found that a full 69% of Canadians felt premarital sex was "not at all wrong," with an additional 15% feeling it is "only sometimes" wrong. Similar findings were reported by Bibby (1995), with respondents endorsing "not at all wrong" 57% of the time and "sometimes wrong" 23% of the time. The greater levels of approval among Quebec students may be characteristic of the more sex-accepting attitude of Quebec society in general, and particularly of the francophone segment of the population. In contrast to their attitudes toward premarital sex, only 9% of young people in Bibby and Posterski's (1992) total teen sample approved of extramarital sex (12% vs. 9% for francophone and anglophone Quebec teens), with this figure falling to less than 5% for Catholic teens who attended church two to three times per month.

Bibby and Posterski (1992) found that 87% of teens outside of Quebec approved of unmarried people living together (95% among francophone Québécois and over 80% among Catholic students in Quebec). Among teens outside of Quebec, 65% approved of people having children without being married (88% among francophone Québécois).

In the areas of homosexuality and gay rights, teens were more likely to support social justice and rights for the gay population (68% approval overall outside of Quebec, 83% in Quebec) than to approve of homosexual relations (33% approval outside of Quebec, 55% among francophone Québécois). King et al. (1988) found a sizable percentage of grade 7, 9, and 11 students agreeing that "homosexuality is wrong" (45%, 42%, 38%, respectively) and a surprisingly small percentage agreeing that they would feel comfortable talking with a homosexual person (18%, 22%, and 29%, respectively). With increasing discussion of gay rights and homosexuality in the media, we might expect these numbers to change, although there remains a dichotomy between many young people's acceptance of gay rights and their acceptance of homosexuality. Since students with the lowest tolerance for people with AIDS also had the most negative

attitudes toward homosexuality, and vice versa (King et al. 1988), the widespread mandating of HIV/AIDS education in Canadian schools in recent years may well have led to greater compassion for people with AIDS and less stigmatizing of gay people because of their presumed association with AIDS. Indeed, a 1992 study (Warren & King 1994) of over 2,000 grade 9 students from four provinces who received an educational program about sexuality and AIDS ("Skills for Healthy Relationships") found that 23% considered homosexuality to be wrong (vs. 42% in the 1988 national sample) and 60% felt that "homosexuals should be allowed to be teachers" (vs. 39% in the 1988 study).

In fact, in a report on more recent work by R. Bibby, *Maclean's* (2001) revealed that while in the 1980s, only 26% of teens approved of same-sex relationships, a full 54% of young people now support same-sex relationships, with 75% believing that homosexuals should be entitled to the same rights as anyone else. In a slightly older sample, a study by Canadian Press/Leger Marketing (2001) shows that among 18- to 24-year-olds, 89% believe in equal rights for gays and lesbians, 81% support same-sex marriage, and 73% endorse adoption by same-sex parents. Taken together, these results suggest a growing tolerance among teens and young adults.

This background information on sexual attitudes and self-esteem provides a context for discussing the specific sexual behaviors of Canadian adolescents.

### *Sexual Behavior of Adolescents*

The 1970s and 1980s saw gradual changes in sexual behavior of Canadian young people consistent with the "sexual revolution" in attitudes that began in the 1960s. University students were the common research sample for many of the past studies on sexual behavior of youth, because parents and school boards were generally disinclined to give approval for questions on the specifics of sexual behavior in surveys of younger teens. Although similarly restricted on some topics (e.g., questions about oral sex and anal sex were asked only of college/university students, school dropouts, and "street youth"), the *Canada Youth and AIDS Study* provided evidence that "young people are more sexually active than adults may realize." For example, 31% of grade 9 males (14 to 15 years old) and 21% of females reported at least one instance of sexual intercourse. For grade 11 students (16 to 17 years old), the figures were 49% and 46% respectively. For comparison, the values for first-year college/university students (19 to 20 years old) were 77% of males and 73% of females. Hence, a sizable majority of Canadian teens have had at least one experience of vaginal intercourse by the time they are 19. In data culled from the *National Population Health Survey* in 1996-1997, Maticka-Tyndale, McKay, and Barrett (2001) state that over 70% of youth then age 20-24 had experienced first intercourse before the age of 20. These and other findings are part of a linear shift downward for both men and women in terms of age of first intercourse, a shift that has been more drastic for women who are now catching up to men.

Over half of younger teens have engaged in some form of sex play. For example, about 74% of grade 11 students (75% of the males; 73% of the females) and over half of grade 9 students (61% of the males; 53% of the females) have experienced "petting below the waist" (King et al. 1988). Among the reasons offered for their first experience of sexual intercourse, 19-year-olds in the 1988 sample reported love (48% of the females; 24% of the males), physical attraction (8% of the females; 25% of the males), curiosity (16% of the females; 12% of the males), passion (8%

of the females; 11% of the males), and drug and/or alcohol use (6% for both sexes). King, Coles, and King (1990) found that about 2% of both male and female 19-year-olds identified themselves as either homosexual or bisexual, but the details of their self-identification and behavior were not obtained.

In a late 1980s study of Quebec grade 11 high school students ( $N = 1,231$ , average age, 17 years), Otis et al. (1990) found that French- and English-speaking boys did not differ in the proportion who had experienced intercourse (62.4% vs. 54.1%), in number of partners among those with such experience (3.4 vs. 4.1), or in likelihood of condom use (46.9% vs. 48.8%). English-speaking male high school students were less likely than their francophone counterparts to report that a partner was using the birth control pill to prevent conception (33.7% vs. 48.8%). Among francophone versus anglophone high school girls, however, differences were apparent in terms of intercourse experience (61.5% vs. 30.1%), number of lifetime partners (2.8 vs. 1.8), use of the birth control pill (56% vs. 22%), and use of condoms (30.9% vs. 83.7%). These differences may reflect more longstanding relationships or sexual experience among francophone girls (age at first intercourse was 14.9 vs. 15.7) or a greater emphasis among francophone students on contraception and less so on STD prevention (see also Otis et al. 1994). In a recent review of research on the sexual behavior of different populations of high school students in Quebec, Otis (1996) noted that 12 to 23% of first-year and 47 to 69% of fifth-year high school students had ever had intercourse. Among those who had ever had intercourse, 1 to 8% reported same-sex sexual activity, 7 to 37% anal sex, and 1% involvement in prostitution. A sizeable minority of this group had six or more partners (12 to 22% for 15-year-olds; 27 to 47% for 18-year-olds, depending on the study).

Although peer pressure in its broadest definition undoubtedly affects teens in many ways, only a minority state that they feel pressure from their friends to be sexually active. Among grade 9 students, 16% of males and 8% of females agreed that they felt such pressure (21% and 6%, respectively for grade 11 students) (King et al. 1988). However, a sizable proportion of younger teens may have some uncertainty on this matter, since 55% of grade 9 students surveyed by Bibby and Posterski (1992) responded "don't know" to the statement, "I am not influenced by my peers" (41% agreed that they were not so influenced, 14% agreed, implying that they were). Even if peer group pressure does not usually influence the decision to be sexually active, peer group norms probably influence this and other important aspects of sexual behavior (e.g., decision to use condoms, safer sex practices, attitudes toward gender equity, etc.). Sexual health educators encourage the development of such peer norms as a positive reinforcement for "healthy" sexual behavior.

An evaluation study of the "Skills for Healthy Relationships" sexuality curriculum (Warren & King 1994), provides the most up-to-date national information available on the prevalence of vaginal, oral, and anal sex among grade 9 and 11 students in Canada (3,750 grade 9 and 3,000 grade 11 students from eight school boards in four provinces) (see Table 3). Overall, these findings indicate a large increase in experience of both vaginal and oral sex between grades 9 and 11, and considerable similarity between the sexes in both grades (particularly in grade 11) in terms of their reported experience of both behaviors. As we will note later in relation to sexual behavior of university students, similarity of acts between the sexes does not necessarily mean similarity of motivation, interpretation, or expectation with respect to these activities.

### C. Adults

#### *Premarital Relations, Courtship, and Dating*

This material is addressed in Section 5B, Adolescents, above, and in the section below.

#### *Sexual Behavior and Relationships of Single Adults*

Most of the research on premarital or nonmarital sexual activity of single Canadian adults has been done on university students. The *Canada Youth and AIDS Study* reported that about 77% of men and 73% of women in college/university had experienced intercourse, 68% of males and 64% of females had engaged in oral sex, and 14% of males and 16% of females had at least one experience of anal sex. Among those who had had intercourse, 23% of the females and 15% of the males said they had only ever had one partner (two partners, 9% for males, 15% for females; three to five partners, 28% for males, 35% for females; six to ten partners, 22% for males, 17% for females; and 11 or more partners, 27% for males, 11% for females) (King et al. 1988). About 7 to 8% of both sexes reported having had a sexually transmitted disease (King et al. 1988). These findings are for first-year university students and probably underestimate the average experience of students in all years.

In the most recent review of sexual behavior of college students in Quebec (1 to 2 years younger on average than university students), Samson et al. (1996) reported that 76% had ever had intercourse. Within this group, 9 to 14% reported experience of anal sex, 8% same-sex contacts, and 27 to 42% had 4 or more partners. For university students (Otis 1996), 86 to 90% had sexual intercourse, 18% had anal sexual contact, and 35% had 5 or more partners. In a study of anglophone and francophone university students ( $N = 1,450$  men and women from four universities in Montreal), Lévy et al. (1993) found that 88% of French-speaking versus 81.5% of English-speaking men had had intercourse at least once; the values for females were 88% versus 74.5%. While the sexes did not differ within language groups, French-speaking women were significantly more likely to have had intercourse than English-speaking women. This was also true for oral sex experience (86% vs. 79.2% in French-speaking vs.

English-speaking men; 85.4% vs. 73.1% in French-speaking vs. English-speaking women).

This trend toward convergence of the overt sexual behavior of male and female university students in Canada (and elsewhere) has been noted since the early to mid-1970s (Barrett 1980). In terms of the occurrence of different sexual activities in a sample of 585 francophone university students in Quebec, one might suggest that this behavioral convergence is complete (Frigault et al. 1994; see Table 4). However, it would be incorrect to assume that similarity between the sexes in terms of sexual acts implies that similar "causal paths" influenced those activities (Maticka-Tyndale 1991). For example, Table 4 shows male/female differences in the perception of which sex has the greatest influence on the decision to engage in sexual activity. While neither sex assigned that role "mostly" to their partner (about 3% for both males and females), males were much more likely to perceive themselves as the influencer, whereas females perceived the decision to be equally shared or only slightly more influenced by the male. Females were also more likely to report that they had experienced sexual harassment or mistreatment and more likely to think often or very often about AIDS in the context of their sexual relationship. Despite the

**Table 4**

#### **Sex Roles and Aspects of Sexual Experience Among Francophone University Students (1994)**

Activity or Experience (in the past year unless otherwise indicated)	Percentage Giving the Response	
	Female (N = 316)	Male (N = 269)
Ever had sexual intercourse	90.8	81.4
Ever had oral-genital sex	88.8	80.3
Ever had anal sex	18.7	18.7
Have you had a steady partner in the last year?	76.4	66.8
Who has the greatest influence on the decision to engage in sexual relations?		
Mostly you	8.4	28.1
You a little more so than partner	9.9	22.7
Equal	53.8	39.4
Partner a little more than you	24.8	6.4
Mostly partner	3.1	3.4
Have you had sexual relations with someone when you definitely didn't want to?		
Never or rarely	93.9	92.7
Have you ever given in to a partner's pressure for sexual relations?		
Never or rarely	78.3	72.4
Experiences of sexual harassment		
Unwanted physical advances (touching, kissing)	31.7	21.7
Physical violence of a sexual nature	6.7	1.1
Do you think about AIDS in the context of your sexual relationships?		
Never	41.4	42.3
Rarely, seldom	33.0	43.8
Often, very often	25.6	13.9

Data from Frigault et al. (1994). Respondents average age 21 years, 95% never married, 90% raised Catholic, all university-level students in Montreal, 1.5% said they were homosexual, 0.9% bisexual.

**Table 3**

#### **Occurrence of Vaginal, Oral, and Anal Sexual Activity in a Large Sample of Canadian Teens (1992)<sup>1</sup>**

	Percentage Responding in Each Category			
	Grade 9 (N ~ 3,750)		Grade 11 (N ~ 3,000)	
	Female	Male	Female	Male
<b>Vaginal sex</b>				
Never	80	73	53	51
1 or 2 times	7	11	8	13
3 or more	13	16	39	36
<b>Oral sex</b>				
Never	79	73	53	52
1 or 2 times	8	11	11	13
3 or more	13	16	36	35
<b>Anal sex</b>				
Never	96	94	92	90
1 or 2 times	3	3	5	3
3 or more	1	3	3	7

<sup>1</sup>Respondents were students in the experimental and comparison groups of the Skills for Healthy Relationships program evaluation (8 school boards in 4 provinces) (Warren & King 1994). Grade 9 students are generally 13-15 years old; grade 11, 16-17 years old.

convergence of behavior, we suspect that sex differences in the social and interpersonal contexts for sexual activity are important considerations, and that these differences may be even more common among university students in other parts of Canada.

Maticka-Tyndale's (1991) study of factors that predicted Quebec college (i.e., CEGEP) students' ( $N = 866$ ) perception of their susceptibility to HIV/AIDS also showed clear evidence of sex differences, despite considerable similarity between the sexes in overt behavior. (Note: Quebec is the only province with a two-year intermediate "college" program [CEGEP] between the end of grade 11 [age 16] and the beginning of university. CEGEP students are generally 17 to 21 years old and, therefore, younger than university students.) Maticka-Tyndale's conclusion about this group of students was as follows:

Though the actions may be converging, the causal factors associated with male and female sexuality are decidedly different. If there is concern for understanding male and female sexuality, or with devising programs which will encourage changes in sexuality to reduce risk, it is these causal factors which must be addressed, not merely the final acts. (Maticka-Tyndale 1991, 60-61)

Since there have been few Canadian studies on ethnocultural differences in sexual behavior, Maticka-Tyndale and Lévy's (1992) comparison of sexual experiences among Quebec CEGEP students is of interest. Their results demonstrate differences between students from different ethnic backgrounds, but since the sample size is small (total  $N = 317$ , group sizes 10 to 196), the results should be viewed with caution. In their comparison of francophone Canadian, English Canadian, Greek, Haitian, Italian, and Jewish (both English- and French-speaking) students, French Canadians ( $N = 196$ ) indicated the broadest range of heterosexual experiences (88 to 98% reported kissing, body kissing, body caressing, and genital caressing), 80% had oral sex, and 75% had experienced intercourse. At the same age, Greek (22%), Italian (33%), and anglophone Jewish students (38%) were the least likely of all groups to have engaged in intercourse, and Greek students were less likely to have participated in oral sex (27%) than were the other nonfrancophone Canadian groups (48 to 65%), and less likely to report body kissing (44%), genital caressing (29%), and the other noncoital behaviors.

Respondents who had experienced sexual intercourse were also compared on their use of various contraceptive methods. The question asked about methods they had ever used and, therefore, more than one response was possible. Among all students, the most common methods were the pill (43 to 81% across all groups), condom (45% to 88%), and withdrawal (45 to 67%). Some students may have sequentially tried several methods. For example, withdrawal, which is often employed in early experiences, was used at some time by about one half or more of all six groups (Greek students were not included in this analysis because of the small number with intercourse experience). Haitian and French Canadian students were significantly less likely to report this method (45% and 49%) than were English Canadians. Haitians were more likely to report "none" (37%), compared to 6% for French and English Canadian and francophone Jewish students and 11 and 12% for Italian and anglophone Jewish students. Haitian students were also less likely to report condom use (45% vs. 72 to 88% for the other groups). Interestingly, the differences noted above in some aspects of behavior were not generally observed in relation to personal assessment of AIDS risk among these Quebec students. The Haitian population in Montreal warrants spe-

cial mention with respect to AIDS risk because their higher incidence of AIDS at the beginning of the AIDS "epidemic" in Canada led to the early, and incorrect, assumption that Haitians had a special susceptibility within the group.

Overall, these results suggest that most Canadian young adults will experience some tension between their own attitudes, expectations, desires, and behaviors, as well as between these and the expectations set by their family and cultural milieu. The reported behaviors of young men and women suggest a move away from what was typically referred to as a "double standard" (i.e., the application of differential norms, expectations, and penalties to the sexual actions of men and women). However, if one considers both the observed differences in some aspects of self-concept, self-esteem, and relationship values and the findings from research on the situational, personal, and interpersonal factors influencing male/female sexual conduct, it is clear that certain gender differences still prevail. With respect to comparisons between ethnocultural groups, research demonstrates both differences and similarities within and between Canada's ethnic groups. These observations reinforce our introductory contention that generalizing one pattern to all Canadians is not just difficult, but probably impossible.

The ethnocultural differences in actual behavior reported in the Quebec study (Maticka-Tyndale & Lévy 1992) reflect a common phenomenon in Canada's larger cities. First- and second-generation students from different cultural backgrounds do not all adopt the behavioral pattern of the dominant culture. Agencies providing sexuality education, counseling, and related services have had to become more conscious of the impact that Canada's linguistic and ethnocultural diversity can have on gender-role behavior, attitudes toward different types of sexual activity, dating customs, and a range of other issues that can directly or indirectly affect sexual health.

The current sexual behavior of French Canadian young adults in Quebec reflects, and in many respects exceeds, the pattern of liberalization seen elsewhere in North America and in other parts of Canada. For example, a review of studies of young adults and adults in Quebec found that among 20- to 24-year-olds, 89 to 93% had intercourse, with a high proportion (over 50%) reporting four or more partners. Among adolescents and young adults who were involved with youth centers that address problems of social adaptation, 70 to 93% had intercourse, of whom 48 to 60% had more than six partners and 5 to 15% had been involved in prostitution (Otis 1996). English Canadian youth and young people from other ethnocultural backgrounds are more similar than different in many aspects of their behavior, although young adults, overall, are not as homogeneous a group as their portrayal in the media might suggest.

### *Marriage and Family: Structure and Patterns*

*Profiling Canadian Families*, a 1994 report by the Vanier Institute of the Family, used data from the 1991 Canadian census to provide a current profile of Canadian marriage patterns and family structure. A later update, *Profiling Canadian Families II* completed in 2000 provides more recent information. The Institute's broad and unconventional definition of family contrasts with the structural definition applied in statistical analyses. They state:

Family is defined as any combination of two or more persons who are bound together over time by ties of mutual consent, birth and/or adoption and who, together, assume responsibilities for variant combinations of some of the following: physical maintenance and care of group members; addition of new members through procreation and adoption; socialization of children; social control of members;

production, consumption and distribution of goods and services; and affective nurturance-love. (The Vanier Institute 1994, 10)

While this definition acknowledges the continuing trend toward varied family constellations within Canadian society, it does not easily conform to that used for the purpose of statistical data gathering. Statistics Canada defines family in structural terms as

a now-married couple (with or without never-married sons and/or daughters of either or both spouses), a couple living common-law (again with or without never-married sons and/or daughters of either or both partners), or a lone parent of any marital status, with at least one never-married son or daughter living in the same dwelling. (Dumas & Peron 1992)

The latter definition applies to the marriage, family, and divorce information that follows.

The proportion of the population living in families, while declining since 1971 when it was 89%, stabilized between 1991 and 1996 at 84%. Because Canadian law does not recognize the "spousal" relationship of gay and lesbian couples, this number probably underestimates the percentage who perceive themselves as part of a family. However, as of 2001, Statistics Canada found 34,200 individuals identifying as same-sex common-law couples. This represents 0.5% of all couples. Among Canadians in families, 45% are married with children, 29% are married without children, 15% are lone-parent families (about one fifth of these are male lone-parent families), 6% are common-law without children, and 6% are common-law with children.

Several trends have been documented in the structure and form of Canadian marriages and families that have a direct impact on sexuality. These include age of first marriage, divorce rates and subsequent remarriage, number and timing of children, and spousal and parental roles. Since 1970, there has been a steady increase in the age of first marriage for both men and women. The average age of first marriage in 1970 for men was 25.1 years and 22.7 years for women. By 1990, this age had risen to 27.9 for men and 26 for women. By 1999, the age of first marriage for men was 29.8 and 27.8 for women (Vanier Institute 2000). For both men and women, this represents an increase of four years in the average age of first marriage since the mid-1970s. This trend toward later first marriage is relatively recent and reverses the earlier trend toward younger age at first marriage observed throughout the first half of the 20th century. It has accompanied the changes in attitudes and practices with respect to premarital sexual activity, the increase in formation of common-law unions, lengthening of time of education, and entry of women into the labor force in increasing numbers.

As already discussed, initiation of sexual activity occurs well before marriage for the majority of Canadians (ten years or more on average). Though there are no reliable studies of sexual activity in the early part of the 20th century, it is generally accepted that premarital sex, to the degree it is practiced today, is a phenomenon of the latter part of that century in Canada. In addition, marriage is no longer the first step for establishing a couple union. Younger Canadian women are more likely to start their conjugal life in the context of a common-law relationship, although many of these will eventually marry. According to Statistics Canada, 42% of women ranging in age from 30 to 39 in 2001 are likely to first enter a common-law relationship, yet close to 80% are estimated to get married later in their conjugal lives. However, this finding is not representative of all of Canada's provinces. Often the exception, in Quebec, first common-law unions are less

likely to end in marriage. Among women ranging in age from 30 to 39 who began their conjugal lives in a common-law relationship, only one third of these married their common-law partner, compared with 59% for women in other Canadian provinces. In general, the total number of common-law relationships in Canada has grown significantly in the past 20 years. The proportion of all couples living in common-law relationships doubled in Canada from 6% to 10% between 1981 and 1991. In 1991, 1 in 9 Canadians lived common-law, compared to 1996 when 1 in 7 lived common-law. The shift from 1991 to 1996 represents a further growth of 28%.

In the *Ethnocultural Communities Facing AIDS* study, differences in proportion of respondents currently living common-law were documented for three participating groups. Nine percent of women and 17% of men in the English-speaking Caribbean communities, 8% of women and 5% of men in the Latin American communities, and 2% of men in the South Asian communities were in common-law relationships (Maticka-Tyndale et al. 1995). Of all the provinces, Quebec has the highest percentage of common-law families (24% of all couples were living in a common-law relationship in 1996). This represents a tripling from 8% in 1981 and indicates a general trend among the young in Canada, and particularly in Quebec, to begin their cohabiting relationships prior to marriage, and for some to continue to do so in lieu of marriage. Common-law couples are also prevalent in the Yukon (23%) and Northwest Territories (27%).

A second factor influencing marriage and family structure has been the large-scale entry of women into the labor force. In 1990, for example, 70% of couples with children under 19 had both partners employed compared to 30% in 1970 (Vanier Institute 1994). To examine the broader trend, for children under 15 years of age in two-parent families, the incidence of both parents working rose from 43% to 58% to 60% from 1981 to 1991 to 1996, according to Statistics Canada. This has provided women with greater independence and is considered an important influence on the delay in age at first marriage, age of first childbirth, single-parent (mother only) families, and divorce rate. It has also produced tensions within families, as many individuals and couples find it difficult to meet their own and others' expectations with respect to spousal, parental, broader familial, and occupational responsibilities.

Canadians are having fewer children and delaying the birth of the first child to a later age. Average age at first birth was 23.3 years in 1971, 24.8 years in 1981, and 26.4 years in 1991 (Vanier Institute 1994). As of 1995, the age of first births has remained constant at 26.4 (Vanier Institute 2000). In addition, there is an increase in the number of single-parent families, both as a result of divorce and of single women (and a small number of single men) raising children without partners. About 15% of families in Canada are "lone parent" families, with approximately 80% of these involving female parents (Statistics Canada 1996). Some of the foregoing factors are addressed more comprehensively in Section 9D, Contraception, Abortion, and Population Planning, Population Planning. Here we note only that these factors have an important influence on family structure, sexuality, and couple relationships.

Before 1968, divorce was permitted only if one of the partners had committed adultery. The divorce rate throughout the 1950s and early 1960s was around 200 divorces per 100,000 married women per year. The 1968 Divorce Act expanded the grounds for divorce to include: acts such as adultery or physical or mental cruelty; permanent marriage breakdown (e.g., desertion, imprisonment, or living apart for at least three years). The divorce rate rose steadily through the 1970s to around 1,100 per 100,000 married

women in 1981. A revised Divorce Act in 1985 made marriage breakdown the sole grounds for divorce; conditions included separation for one year or more (accounting for 93% of all divorces in 1986), adultery, physical cruelty, and mental cruelty (see Dumas & Peron 1992). By the time of the 1996 census, over 1.6 million reported being divorced, a 28% increase from 1991.

The number of years of marriage prior to divorce is decreasing and the incidence of divorce per marriage is increasing. Possibly 40% of couples married in the early 1990s will experience divorce. The rising divorce rate has increased the pool of people available for remarriage and, as a consequence, in 1996, one third of all marriages involved at least one previously married spouse. Nevertheless, the remarriage rate seems to be falling. In the 1990s, the rate of remarriage for men dropped from 63.2 per 1,000 population to 45.4, and for women from 22.8 to 19.4. The reason for this drop is likely because of the fact that many divorced people are choosing common-law unions over remarriage (Vanier Institute 2000). Despite the changing patterns described above, the average Canadian married in the 1960s will probably spend about 35 to 40 years of their life married to someone.

Of course, these data and trends can only be examined for those counted as "families" in various government and research documents. What must be remembered is that some Canadians also form what the Vanier Institute's definition would clearly identify as a "family," but their experiences are not represented in these data. These include gay and lesbian couples who form long-term commitments, share responsibilities and care for each other, and who may also raise children. They include the sometimes more communally shared commitments to fulfilling the responsibilities of family life found in some native communities. In the absence of research and documentation, we can only recognize that these alternative relationship and family forms exist, but cannot draw any conclusions about their prevalence or life course.

Together the changes described above portray Canadian marital and family relationships as units with flexible boundaries. Later marriages, common-law unions, divorce, and remarriage speak of the flexibility of boundaries, with an increasing number of individuals moving in and out of marriage or marriage-like relationships. Canadians remain committed to marriage, however, with most spending more than half of their adult lives in marriage or marriage-like relationships.

Children are more likely to experience the influence of several parent-like individuals in their lives and to be aware of and familiar with a variety of relationship types as an increasing number of parents move through several partnerships. Courts, however, remain relatively conservative in their custody and visitation rulings in cases of divorce, at times restricting custody and access to children on the part of a parent who is openly involved with a sexual partner who is not her spouse. This appears to reflect a dominant view of the preferred family form for childrearing as consisting of a heterosexual, married couple. This is evident, in particular, with respect to a parent who is gay or lesbian, with courts most commonly granting custody, whenever possible, to a nongay or lesbian parent and often restricting or placing limits on visitation on the part of the gay or lesbian parent.

### *Sexual Behavior of Adults*

In the absence of a Kinsey-type national survey of sexual behavior, Canadians have historically relied on U.S. statistics to draw inferences about the situation in Canada. Such inferences are less common today as social scientists increasingly document ways in which Canadians differ from their American neighbors in family patterns, laws, at-

titudes, and health. However, the only available Canadian data typically pertain to selected groups (teens, university students, gay men, etc.) rather than to the adult population as a whole, and come from studies done for a specific purpose (e.g., to assess risk behaviors related to HIV infection, to determine the occurrence and incidence of coercion in sexual relationships, etc.). This makes it difficult to obtain a global sense of the sexual behavior of adult Canadians.

The 1990 *Health Promotion Survey* from Statistics Canada asked a few questions about adult sexual behavior (e.g., number of partners, opinions about various methods of preventing STDs, age at first intercourse, etc.). Among the approximately 6,000 respondents to the question on the age at first intercourse (excluding those who refused to answer or had not had intercourse, approximately 3.3% in each case), the results were: under 15, 4.7%; 15 to 16, 16.3%; 17 to 19, 38.2%; 20 to 24, 32.9%; 25 to 29, 6.0%; over 29, 2.0%. These results were for the entire sample of adults of all ages. As previously mentioned, the National Population Health Survey in 1996-1997 revealed over 70% of youth then age 20 to 24 having experienced first intercourse before the age of 20 (Maticka-Tyndale, McKay, & Barrett 2001). On a much smaller scale, a 2002 poll conducted for *Maclean's*, Global TV, and *Southam News* consulted 1,400 Canadian adults by phone. Fifty-seven percent of these respondents reported first intercourse at under 19 years of age, while 15% were under 15 years of age.

Three recent surveys conducted by Health Canada provide some information on selected aspects of adult sexual behavior in Canada. These are the National Population Health Survey (NPHS), conducted in December 1994 and January 1995, and the Canada Health Monitors (CHM) surveys (1994 and 1995). Given the range of issues addressed in such surveys, the focus of sexuality-related questions that are included is often on selected behaviors associated with health risks, rather than on the broader psychosocial aspects of sexuality and relationships. For example, the CHM (1994) survey found that among 15- to 19-year-olds who had experienced intercourse in that year, 44% of males and 33% of females had more than one sexual partners. Comparable figures for 20- to 24-year-olds were 41% for males and 19% for females; for 25- to 29-year-olds, 20% for males and 8% for females; and for those 30 and over, 14% for males and 4% for females. These findings approximate those from the NPHS 1995 study which had a total sample size of approximately 7,200 (in comparison to CHM 1994 which had about 2,200). CHM 1994 also found that among 15- to 19-year-old males, 41% said they used a condom always or most of the time with a regular partner, whereas 85% did so with a non-regular partner. This type of survey information is of some interest for STD or HIV/AIDS prevention, but it does not provide the kind of insight into the social context and intra/interpersonal dynamics of behavior that would be afforded by a national study focused broadly on sexuality and sexual health (e.g., comparable to the study in the United States by Laumann et al. 1994).

The previously cited Decima Research poll (*Maclean's*/CTV Poll 1994) and a comparable national telephone survey in 1995 (*Maclean's*/CTV Poll 1995) provide information on selected aspects of adult sexual activity in Canada (see Table 5). While the decline in frequency of sexual activity with age (i.e., from the mid-50s onward) is expected, it is difficult to analyze this finding in more depth because the results are uncorrected for marital status and access to partners, and also because it is unclear how respondents interpreted the term "have sex." Similarly, the fact that about one in ten said they had had an affair while married is of interest, but we do not know how men and women of different

ages understood the term “affair” or how they might have responded to the question, “Have you ever had sex with someone other than your partner while married?” The fact that we have such limited national data on adult sexual behavior is an impediment to informed public discourse, policy development, and provision of sexual health education and related services.

Studies of adult sexual behavior and attitudes in Quebec reveal a significant shift away from the traditional sexual script that linked sex, marriage, and reproduction, to one that places greater emphasis on communication and pleasure. There are few Canadian studies that address the frequency of different sexual behaviors of married and cohabiting adults, let alone the more complex variables of pleasure, desire, and sexual satisfaction. The work of Samson et al. (1991, 1993) is therefore of particular interest in this respect. Their research addressed these questions in a study of married and cohabiting, heterosexual, French-speaking Montreal adult residents ( $N = 212$ , mean age 36.9) surveyed in the late 1980s. Based on the respondents’ estimates of their annual number of intercourse experiences, they found weekly intercourse frequency rates varied with age as follows: 3.1 times per week (18- to 24-year-olds), 2 times/week (25 to 34), 1.8 times/week (35 to 44), 1.6 times/week (45 to 54), 0.8 times/week (55 to 64), and 0.9 times/week (65 or older). Overall, male and female subjects (respondents were not each others’ partners) did not differ significantly in reported average frequency. Duration of relationship influenced intercourse frequency, with those in “new dyads” (less than two years) averaging four times per week, in “young dyads” (two to ten years) averaging 2.3 times per week, and those in “older dyads” (over ten years) averaging 1.4 times per week. This difference held even when age was factored out (Samson et al. 1991).

Composite sexual satisfaction scores were calculated from questions on frequency, desire, pleasure, and overall assessment of the respondent’s sexual life. These scores did not correlate with either age or duration of relationship, but those with the higher satisfaction scores reported significantly more frequent intercourse. Respondents also rated their general satisfaction with their regular partner. Overall, 50% of the respondents said they were “fully satisfied” with their regular sexual partner. This was the upper response on a scale that proceeded from “fully satisfied” to “not at all satisfied”

and suggests a high level of satisfaction in this sample. The fact that general satisfaction did not correlate with age or duration of relationship, but did correlate with intercourse frequency, suggests some link between intercourse frequency and relationship satisfaction, although response bias may confound the findings (e.g., satisfied subjects may overestimate intercourse frequency).

Respondents were also asked about occurrences of active oral-genital sex in the preceding year, where “active” is defined as “stimulated with the mouth the genitals of their regular sexual partner” (Samson et al. 1993). Overall, 80% had engaged in active oral-genital sex (no difference between the sexes), but the percentages were higher for younger groups (e.g., 90% for those 18 to 34, 81% for those 35 to 54, and 38% for those over 55). Those with higher than average education (13 years or more) were more likely to engage in the behavior than those with less (88% vs. 74%). The average weekly frequency rates according to age grouping were: 1.6 times per week (18 to 34), 0.8 times per week (35 to 54) and 0.4 times per week (55 plus). There was no sex difference in average reported frequency, but, as with intercourse, oral-genital sex was more frequent in new and young dyads versus older dyads. Frequency was also greater in couples with no children and in those who had one child compared to those with two or more children. These differences remained when age and length of relationship were factored out. As with intercourse frequency, oral-genital sex frequency also correlated with both sexual satisfaction and general partner satisfaction, perhaps because these behaviors are correlated with each other and are an increasingly common part of the sexual script of many adults (Samson et al. 1993). The authors also noted that for those who engaged in oral-genital sex, neither “religiosity” nor church attendance affected annual frequency (although “religious” people were less likely to include oral sex in their sexual repertoire).

During the 1960s, a number of factors began to influence sexual values in Canada, including the introduction of the contraceptive pill, the increasing media coverage of sexuality, and the opening up of public discourse about sexuality that began in the 1960s and continued into the 1970s and 1980s. The concurrent impacts of the feminist movement, the gay rights movement, changes in legislation, and the increased freedom in the media to portray and “commercialize” sexuality, produced conflict with, and gradual change of, many traditional attitudes and behaviors. These changes have occurred across Canada, but francophone Quebec appears to have changed more, and more rapidly in some respects (see Lévy & Sansfaçon 1994). The development of sexology as an academic discipline in Quebec in the early 1970s may have had a modest or—as Gemme (1990) suggests—a major influence on these changes. What can be said with certainty is that since Canada’s only university department of sexology was founded at the University of Quebec at Montreal in 1969, sexologists in Quebec have had an opportunity to document these changes in a segment of the population, francophone Québécois, in a way that has not occurred to the same extent for Canada as a whole. As is true elsewhere in Canada, the research emphasis in the 1980s and 1990s has been on youth, primarily university students, preuniversity CEGEP students, and, more recently, younger high school students.

The most recent data on sexual behavior of Canadian adults comes from a 1995 mailed survey of 1,713 respondents (return rate about 60%) who were proportionally representative of the overall population in terms of community size, gender, marital status, edu-

**Table 5**

65+	5	2	6.5	54	42	2	2

<sup>1</sup>Maclean’s/CTV Poll (1994).  $N = 1,610$  respondents across Canada contacted by telephone.

<sup>2</sup>Maclean’s/CTV Poll (1995).  $N = 1,200$  respondents across Canada. Those never married (10% women, 19% men) and not responding to this question (8% women, 3% men) are not included in the average.

cation, ethnic origins, and age. The latter included 35% aged 18 to 34, 38% aged 35 to 54, and 27% aged 55 or over (Bibby 1995). Responses to the question, "How often do you engage in sex?" yielded the following national percentages: daily (3%); several times a week (25%); once a week (25%); two-to-three times a month (14%); once a month (9%); hardly ever (13%); never (11%). Bibby noted some provincial variations (e.g., 35% of Quebec respondents said several times a week or more vs. 24% in Ontario), but gave no explanation for the differences.

Not surprisingly, people under 40 reported higher frequencies. Once a week or more was reported by 58 to 78% of men and women aged 18 to 49 (never was 2 to 7%). Although this rate was lower for 60- to 69-year-olds (men 30% with 5% never; women 25% with 41% never) and for those over 70 (22% for men with 25% never; 7% for women with 58% never), Bibby points out that about 1 in 5 men and 1 in 15 women over 70 reported this upper end of his scale of frequency of sexual activity. Bibby also found little difference in the weekly frequency of sexual activity of various religious groups, although married Roman Catholics (64%) were slightly more likely to report weekly or greater sexual activity than the conservative or mainline Protestant denominations (50 to 55%). Those with no religious affiliation reported 77%, a finding that Bibby explains as related to the younger age of this group rather than to religious affiliation. Other data on adult sexual behavior are discussed below in the context of condom use and safer sex practices (Section 10, Sexually Transmitted Diseases and HIV/AIDS).

#### *Ethnocultural Variations in Sexual Behaviors of Single Heterosexually Experienced Adults*

Because the focus of the survey phase of the *Ethnocultural Communities Facing AIDS* study was on heterosexual transmission of HIV/AIDS, only certain questions were asked about sexual activity. In this study, 377 men and women from the English-speaking Caribbean communities in Toronto, 364 men from the South Asian communities in Vancouver (the survey team was advised that it was inappropriate to survey South Asian women about sexual matters), and 352 men and women from the Latin American communities in Montreal were surveyed. Participants were located through community organizations and in locations where members of each community were known to congregate. To insure a broad representation from each community, the samples were stratified by age (respondents ranged from 16 to 50 years), time since immigration to Canada, and also by gender in the Latin American and English-speaking Caribbean communities. Great care was taken in developing appropriate wording of the survey items and in translation of those items to the dominant ethnic language in the Latin American (Spanish) and South Asian (Punjabi) surveys. Table 6 summarizes responses of single adults to questions on current sexual partnerships and sexual activity during the past year. (Note: Given the limitations of such a study, including wide age range and small sample size in particular subgroups, the results should be interpreted with caution. However, these are the only data of their kind available for specific ethnic

communities, and given Canada's changing pattern of immigration and increasing ethnocultural diversity [see Section C in the introductory demographics and historical perspective section], they merit attention in this chapter.)

Different patterns of relationship formation are evident in each of the communities as well as for men and women (Table 6). Overall, men reported a larger number of sexual partners and a higher proportion entered sexual relationships with new partners in the previous year. However, the variations between men and women across the different groups were as great as those between men and women in any one group. These results, and others from this study, support the observation that has already been made that diverse patterns of sexuality are represented in Canada's population.

#### *Sexuality and Disability*

While Canadians are aware of the social rights of people with disabilities, the issues surrounding sexuality and disability do not appear to have had a great impact on public consciousness. The concern about sexual abuse of people with disabilities may be an exception to this generalization. However, healthcare professionals and people with disabilities have raised the profile of sexual health issues (privacy, autonomy, rights to information, services, etc.) in the last 20 years, and there is a growing literature on the sexual implications of various disabling conditions and chronic illnesses.

The first major conference on sexuality and physical disability in Canada took place in Toronto in 1974. Cosponsored by the Canadian Rehabilitation Council for the Disabled and the Sex Information and Education Council of Canada (SIECCAN) and intended as a local event, it drew 150 participants from across Canada, an indication of the limited attention the topic had received prior to that time. Subsequent changes in attitudes and awareness have led to increased education on sexuality and disability among re-

<sup>1</sup>Includes never married and previously married (separated, divorced, widowed).

habilitation and healthcare professionals, either in their original training or through in-service workshops and seminars. For example, SIECCAN representatives have conducted over a hundred of the latter events in the last 20 years, and other organizations, such as the former Alberta Institute for Human Sexuality in the 1970s and 1980s, have also raised professional consciousness in this field.

In British Columbia, the Sexual Medicine Unit at the University Hospital, Shaughnessy Site, pioneered the development of assessment and treatment strategies for sex-related consequences of physical disabilities and chronic illness, including training of sexual healthcare clinicians in this specialty area (Miller et al. 1989), and research on sexuality and spinal cord injury (Szasz 1989), sperm retrieval for fertility enhancement (Rines 1992), sexual implications of multiple sclerosis in both sexes, and a variety of other such areas. Across Canada, a number of associations for people with disabilities or chronic illnesses now provide resource materials on the sex-related aspects of specific conditions, and some, such as the Multiple Sclerosis Society of Canada, have been particularly active in public education and professional training about sexuality and multiple sclerosis (Barrett 1991). Recent issues of the *Canadian Journal of Human Sexuality on Sexuality and Disability* (1992) and *Sexuality and Cancer Treatment* (1994) also reached a national audience of professionals.

The Disabled Women's Network has produced a number of publications addressing sexuality and disability issues, including a guide for healthcare professionals (DAWN 1993a) and a resource book on healthcare for women with disabilities (DAWN 1993b). Although there are no national professional or consumer groups that focus specifically on sexuality and physical disability, a variety of advocacy groups address this issue—e.g., the British Columbia Coalition for the Disabled has an AIDS and Disability program and the Coalition of Provincial Organizations of the Handicapped has also written on sexual rights of disabled persons (COPOH 1988). In 1992, Linda Crabtree began publishing *It's Okay*, which grew into a 32-page, consumer-written quarterly on sexuality, sex, self-esteem, and disability distributed across Canada and internationally (Crabtree 1994). Currently edited and published by Susan Wheeler (1996), *It's Okay* is the first and only publication of its kind in Canada that provides a forum for personalized discussion of sexual health and relationship issues for people with a variety of disabling conditions.

Sexual issues that affect people with developmental disabilities (sex education, privacy, contraception, marriage, sterilization, etc.) have been an ongoing focus of attention and policy development since the early 1970s. At the provincial level, most schools, Associations for Community Living, and residences for developmentally disabled children and adults have acknowledged the right to sexuality education and counseling, and have developed curricula and other services to meet those needs. In Ontario, a network of groups concerned with sexuality education, counseling, and related services has formed an umbrella organization, the Ontario Sexuality and Developmental Disability Network (OSDDN), to facilitate communication, professional development, resource sharing, and advocacy within the field. There is still too little training in sexuality for professionals who work with developmentally disabled clients, although in-service workshops in this area are increasingly common. These have resulted, to a great degree, in response to recognition of the frequency of occurrences of sexual abuse of people with disabilities (Roether Institute 1992; Sobsey 1994; Sobsey et al. 1994). The Federal government's Family Violence Prevention Division has funded national and local programs to prevent abuse of people with

disabilities, and the National Clearinghouse on Family Violence assembles and distributes resource materials on this topic, including those on sexual abuse. The National Health Research and Development Program (NHRDP) of Health Canada has also funded national research on sexual abuse of people with disabilities (e.g., Mansell & Wells 1991).

Sexuality education for disabled teens and adults increasingly recognizes the positive as well as the problem-prevention aspects of sexuality, and Canadian resources reflect this trend (Ludwig 1991; Maksym 1990). The previously mentioned 17-booklet series, *Being Sexual: An Illustrated Series on Sexuality and Relationships*, published by SIECCAN in 1993, is the only resource of its kind in the world to include Blissymbol translation of key messages along with the English text. It is designed specifically for use with people who have problems with language learning and communication and includes a user's guide and explanation of all Blissymbols used in the text of each book (SIECCAN 1993).

It is generally accepted that people with developmental disabilities have the right to contraception and to other services available to any individual in society, although this theoretical right implies that support will be available to access such services, and this is not always the case. The Canadian Supreme Court in the "Eve" decision effectively prohibits sterilization of people with developmental disabilities unless they are able to give informed consent. Although it is now more common for people with developmental disabilities to marry, the right to marry is confounded by at least three different types of legislation (Endicott 1992). In some settings, e.g., Ontario and the Northwest Territories, it is against the law for any person to issue a marriage license to or to perform a service of marriage for someone who the person might reasonably know is mentally handicapped. This statute has been changed in Ontario to omit reference to mental handicap and to place the restriction on people who "lack the capacity to marry," but as Endicott (1992) points out, this provision may discourage marriage even if it does not violate the Canadian Charter of Rights and Freedoms. In other provinces, e.g., Alberta, Manitoba, and Quebec, a person who has been declared incapable in other areas, such as handling finances, is considered incapable of marrying, unless he or she provides certification from a doctor or other "official" source that he or she understands the responsibilities involved in marriage. British Columbia and Prince Edward Island prohibit marriage for people with developmental disabilities, whereas Saskatchewan, New Brunswick, Nova Scotia, Newfoundland, and Yukon have no law blocking marriage (i.e., people should have the "capacity" to marry, but there are no statutes to enforce the rule about capacity) (Endicott 1992).

### *Incidence of Anal and Oral Sex*

Since the 1969 change to the Criminal Code, sexual activity in private between consenting adults has generally not been a criminal concern in Canada. Previously taboo behaviors such as oral and anal sex have become increasingly common in the heterosexual population, but even with the recent research interest generated by concerns about HIV/AIDS, there have been few population studies on the incidence of these behaviors. A late-1980s study in Montreal, Quebec, reported that 75% had engaged in oral sex and 15% in anal sex in a sample of heterosexual university students (mean age 22 years); 64% of both sexes reported engaging in unprotected (without condom use) oral sex and about 6 to 7% in unprotected anal sex (Samson et al. 1990). Previous parts of this section provide other limited data on these behaviors in adults.

In the *Ethnocultural Communities Facing AIDS* study (see Table 6 and prior references), participants who had initi-

ated new sexual partnerships in the past year were asked about anal intercourse in these relationships. In the English-speaking Caribbean communities, 20% of women and 21% of men reported anal intercourse, as did 17% of women and 41% of men in the Latin American communities, and 41% of men in the South Asian communities (Maticka-Tyndale et al. 1996). Qualitative, in-depth interview methodologies have demonstrated different meanings attached to anal intercourse. For some, for example, this is an alternative to vaginal intercourse when it is necessary to maintain virginity. Both incidence and meaning would have to be taken into consideration in creating a profile of sexuality; however, there is no research available that fully explores these issues.

Although sexual activity in private between consenting adults is not generally a concern of the Criminal Code, anal intercourse is listed as an offense punishable on summary conviction. It is not "illegal" when engaged in, "in private, by a husband and wife, or by any two persons, each of whom is 18 years of age or more, both of whom consent to the act." In law, a person under 18 cannot consent to anal intercourse; age of consent for most other sexual activities is generally 14, although a number of restrictions apply to 14- to 17-year-olds, some of which will be discussed elsewhere (for review, see MacDonald 1994). An act is considered not to have been done in private if a third person participates or is present (e.g., group sex or if someone is watching or able to observe because of the setting). This provision of the Criminal Code has been used to prosecute gay men, but it sends an indirect signal to heterosexuals about the taboo nature of anal sex, at least in the "official" sense that any law implies disapproval. This taboo may well be an impediment to safer sex practices or to disclosure of STD infections acquired in this way.

## 6. *Homoerotic, Homosexual, and Bisexual Behaviors*

### A. General Observations

There has been little historical analysis of same-gender sexual activity in Canada, and the record that exists in court documents, press reports, and other archival material is sometimes confounded by the various coded ways in which same-sex activity and relationships were described. In his history of the regulation of gay and lesbian sexuality in Canada, Kinsman (1987) notes that native societies had a variety of names and meanings for same-sex relations, that English and French colonists in the 19th century used labels such as "crime against nature," "secret sin," "sex perversion," "sexual immorality," "social evil," "sodomy," and "buggery" (the latter was proscribed in Canadian law until 1969), and that "homosexuality" and "lesbianism" appeared only with the emergence of the medical and social sciences in the early 1900s and "gay" only recently. He offers evidence of cross-dressing by white women in 19th-century Canada (this activity provided access to economic and social privilege and perhaps to erotic relationships with women) and of the emergence of male homosexual networks in the 1880s, which created a public consciousness and identity for this disapproved, and now publicly labeled, category of men called homosexuals. He recounts the recent emergence of gay and lesbian networks in the 1950s and 1960s and the legislative and political changes that led, in 1969, to the decriminalizing of homosexual acts between consenting adults over the age of 21. The subsequent legislative changes of the 1980s and 1990s reflect the emerging legal protection of the rights of gays and lesbians concurrent with a gradual shift in public acceptance of gay relationships.

As of June 20, 1996, section 3(1) of the Canadian Human Rights Act was amended to prohibit discrimination based on

sexual orientation. While the human rights codes in a number of provincial and territorial governments also reflect a commitment to protect the rights of gays and lesbians, this has not come without a certain degree of controversy. The case of *Vriend v. Alberta* (1996) is particularly noteworthy, wherein the Supreme Court of Canada reversed a 1994 ruling protecting the omission of sexual orientation from Alberta's Individual Rights Protection Act. With the reversal, the Supreme Court proclaimed that the Legislature's omission was tantamount to approving ongoing discrimination of homosexuals and was in violation of section 15 of the Canadian Charter of Rights and Freedoms. This set a precedent for all other provinces and territories whose human rights codes do not explicitly protect the rights of gays and lesbians.

Federal practice has already been altered in the military after a 1992 decision in which a woman, released from the Canadian military because of her lesbian relationship, successfully challenged the ruling. The decision noted "that the military's policy prohibiting homosexuals is not valid, because it violates the constitutional guarantee of equality and freedom of association" (Bell 1991). In October 1999, the government officially ended its policy of barring homosexuals from joining the Canadian armed forces. This followed a decision to admit women to all branches of the armed forces, except submarines and combat roles.

However, a wide range of rights now extended to married and common-law heterosexual couples are not available to gay couples, and legislative change in these areas has, therefore, been one of the focuses of gay rights activity in Canada. The presence of publicly gay members in the federal Parliament, and of an increasing number of provincial and municipal gay politicians, is a reflection of changing public attitudes in this area. Nevertheless, Kinsman's (1987) identification of homosexuality as one of the "battlefields of sex" in Canada is probably still correct—the others are prostitution, abortion, women's reproductive rights, sexuality of youth, pornography, and sexual violence against women and children. Nevertheless, a number of recent court rulings have shown movement in this area.

In May 1999, the Supreme Court of Canada handed down one of the most far-reaching homosexual rights rulings anywhere, when it declared in an 8-to-1 decision that Ontario's Family Law Act was unconstitutional in denying homosexuals the right to apply for alimony from each other. In ruling that the legal benefits available to "spouses" cannot be limited to heterosexual couples to the exclusion of same-sex partners, this decision opened a challenge to a wide range of federal and provincial laws, including those governing adoption, marriage, pensions and taxes, that include reference to "spouse."

In February 2000, the Canadian government announced an overhaul of 68 federal statutes to erase most legal differences between heterosexual and homosexual couples. When the overhaul is completed, homosexual couples will enjoy the same benefits and responsibilities as heterosexual couples, whether married or cohabiting. The only remaining differences appear to be that marriage takes effect immediately and brings the ability to get divorced and change family names, while a cohabiting or same-sex couple have to wait one year for legal recognition. Government estimates suggest there are about 140,000 homosexual households in Canada, although it is not known how many of these are actually homosexual relationships and how many are simply two persons of the same sex living together for family or convenience reasons.

In addition to securing benefits for same-sex couples, other legal work has concerned itself with the definition of marriage. Appearing as a rider to the Same-Sex Recogni-

tion Bill in 2000, marriage has been defined as a union between "one man and one woman." Given such an understanding, debate continues in Canada over marriage and legal recognition of same-sex unions, revealing a country divided, with contradictory opinions and rulings among provinces, and between the courts and Parliament. In a 2002 Discussion Paper presented by the Department of Justice, the Government of Canada has suggested that Parliament is the appropriate venue for sorting out such questions. However, the courts have made rulings that have presented a direct Parliamentary challenge. Amidst this turmoil, what can be said with great certainty is that the amount of movement in this area in recent years has been without precedent.

In the fall of 2001, the British Columbia Supreme Court upheld the opposite-sex requirement of marriage, arguing that while it results in inequality for gay and lesbian couples, it was not based on a discriminatory set of beliefs. Furthermore, they argued that the inequality was justified, as the Charter does not require that marriage be made into something that it is not by definition. Nor did they feel that the federal Parliament has the constitutional authority to alter the opposite-sex meaning of marriage.

In Ontario, the Divisional Court in 1993 also upheld the opposite-sex requirement of marriage. However, in July 2002 a different panel of the Ontario Divisional Court found this requirement to be in breach of the guarantee of constitutional equality for gays and lesbians, ruling 3 to 0 that Canada's Charter of Rights and Freedoms requires the provincial government to recognize the right of gays and lesbians to marry people of their own gender. Activists hailed the ruling as a major legal victory with national consequences. The suit was brought by a lesbian couple and a gay male couple after the Ontario government refused to register their January 2001 joint wedding ceremonies performed at a Toronto church. Parliament was given two years to address this issue and, if they fail to do so, the common law in Ontario will be automatically changed to allow unions of "two persons." In September of 2002, the Quebec Superior Court made a similar finding as that of the Ontario Divisional Court. Currently the case in Ontario and the aforementioned case in British Columbia have been merged into one and are awaiting a Supreme Court decision that will have far-reaching consequences.

In examining the position of Parliament in this domain, one finds contradiction. In 1999, Parliament voted to take all reasonable steps to maintain the opposite-sex meaning of marriage. Further, in 2000, section 1.1 was added to the Modernization of Benefits and Obligations Act, which clarified the continued understanding of marriage as the "lawful union of one man and one woman." Finally, in 2001, the opposite-sex meaning of marriage was also confirmed in Quebec in section 5 of the Federal Law-Civil Law Harmonization Act, No. 1. The decisions of the Ontario Divisional Court and the Quebec Superior Court are inconsistent with the Parliamentary stance, and some have expressed concern that the courts may be "over-stepping" their constitutional role and engaging in "judicial activism."

On a provincial level, four provinces have enacted or are considering laws relating to same-sex unions. In June 2002, the Quebec legislature unanimously granted same-sex couples the right to form "civil unions," which entitle gay couples to virtually the same rights and obligations as heterosexual married couples have. Nova Scotia and Manitoba have enacted similar legislation allowing gay and lesbian couples to record their relationships in a civil registry. Alberta, in its Marriage Act set out that marriage requires partners to be of the opposite sex for the purposes of solemnization, yet, in a bill before the legislature, raised the possibility of legal rec-

ognition of same-sex couples. With the exception of Alberta's Marriage Act, many lesbian and gay activists consider these provincial decisions to be highly positive.

Because the ten Canadian provinces have the power to register marriage ceremonies while the federal government regulates marriage qualifications, experts expect considerable legal wrangling before the issue is finally resolved by the Supreme Court (Krauss 2002). As for the role of Parliament, they are currently gathering national opinion about the issue in preparation for future action. [*Editor's Note: See "Canada" in Last-Minute Updates chapter at end of volume.*]

Metropolitan Community Church and other churches in Canada covenant gay relationships in a public ceremony, but this is not legally recognized as a marriage. While no law expressly prohibits marriage, a 1974 court decision on this matter ruled that the definition of marriage meant an opposite-sex couple. Since common-law couples in Canada now receive most of the employee benefits that accrue to married couples, many municipalities and some corporations are extending these benefits to gay couples (i.e., domestic partnerships based on the same conditions of relationship that apply for common-law couples). Since the gay and lesbian population in Canada includes people with a variety of relationship and lifestyle choices, there is no universal agreement in the gay community about whether couples in general should have privileges that others do not, or whether gay couples want to be governed by statutes designed primarily for heterosexual couples with children. Nevertheless, altering existing legislation and policies that discriminate against gay couples has been used as one way of achieving social equity. As with other areas of contention about sexuality and public policy, these issues are often decided in the courts rather than the legislature.

## B. Gay and Lesbian Adolescents

While men have generally self-identified as gay at an earlier age than women, it appears that young people of both sexes are now self-identifying as gay, lesbian, or bisexual at an earlier age. This may be explained by the increasing acceptance of gay people, the visible presence of a supportive gay community, and greater awareness of sexuality. However, many gay youth have strongly negative experiences in high school, either because of overt discrimination if they are open about their orientation or because fears of mistreatment keep them from disclosing. Gay bashing still occurs, and this fear, coupled with uncertainty and self-recrimination about their sexual feelings and the difficulty of finding people to confide in, can make this an intensely negative period in the lives of gay youth. Because they are often stigmatized and isolated, it is likely that gay youths have a higher risk of suicide than do teens on average. Counseling and support services for gay youths are now available in some cities, and a number of programs, such as the Sexual Orientation and Youth Project of Central Toronto Youth Services, have helped to sensitize and train teachers and health professionals about these issues. Overall, gay youths in Canada still face major challenges in their personal development, particularly if they live in smaller cities and rural areas. From its inception, an Ontario telephone hotline for gay, lesbian, and bisexual youths in Ontario (1994) was overwhelmed with calls for advice and information, and the provincial government, therefore, offered additional funding to meet the demand.

The process of self-identification and coming out has been discussed extensively in Canada, but there is little quantitative research done to document these experiences for gay and lesbian youth. In interviews with 60 gay and lesbian youth (average age 19), Schneider (1991) identified

the factors frequently named as contributing to their labeling themselves gay or lesbian—most chose more than one factor. Emergence of same-sex attraction and feelings was mentioned most often by both sexes, but males were more likely to identify this as “general same sex attraction” (7% of females vs. 73% of males), whereas females associated their sexual feeling with falling in love with someone of the same sex (83% of females vs. 10% of males). Same-sex sexual experience was identified by 33% of females and 37% of males as a validation of their ability to experience pleasure with the same sex and of the sense that “it seemed right for them.” Males were more likely than females to identify “casual and anonymous sex over an extended period of time” as a factor in their self-identification as gay (0% of females vs. 40% of males). Although a number of young men who listed this option said they often felt guilty about such encounters and vowed to stop them, they also noted that the experiences contributed to their recognition that their attraction was toward men.

Lack of interest in the opposite sex (10% of females vs. 33% of males) was a relevant factor in that most had dated heterosexually and were aware of their disinterest, but it was less influential as a salient clue in self-identification because many assumed early on that they would eventually be attracted to opposite-sex partners. More than half identified “contact with lesbians/gays” (67% of females vs. 50% of males) as an important influence, suggesting that positive role models reinforce self-acceptance. This seems likely since such contact was also the most common contributor to their feeling positive about their lesbian/gay identity (93% of females vs. 80% of males). First long-term relationships contributed to self-identification for 73% of females and 37% of males (Schneider 1991).

These findings are consistent with the self-identification and coming-out processes encountered in other countries with restrictive religious and social traditions surrounding homosexuality. The effect of these negative social attitudes and experiences is reflected in the high levels of thoughts of suicide or suicide attempts, periods of extreme anxiety and depression, social withdrawal, and loneliness—all of which occur in teens, but were often associated by this group with their struggles surrounding sexual orientation and acceptance by others (Schneider 1991).

Canadian schools have been slow to introduce adequate discussion of gay and lesbian sexuality into school curricula, and those that attempt to do so often encounter strong opposition from organized groups from the religious right—the larger mainstream denominations may be less restrictive and some even supportive. The only high school curriculum resource guide in Canada on homosexuality and homophobia was developed by the Toronto Board of Education in the late 1980s amidst extensive public debate. The Board approved the curriculum guide in 1992. The Toronto Board of Education’s Student Support Services program also administers a Human Sexuality program in which an educator/counselor visits local high schools to talk directly about homophobia and to let gay/lesbian/bisexual students know, without singling them out, that the board has a counseling and support group designed to address their needs. At the time of writing, this was the only program of its kind in Canada and one of two such programs in North America.

### C. Service Agencies

There is an extensive network of lesbian/gay/bisexual organizations, service agencies, and interest groups in most large Canadian cities, and national organizations such as EGALÉ (Equality for Gays and Lesbians Everywhere), and provincial ones, such as the Coalition for Les-

bian and Gay Rights in Ontario, provide a centralized focus on particular issues.

Most of the large Protestant church denominations in Canada accept ordination of gay and lesbian clergy. Unitarian-Universalist churches were the first to ordain gay and lesbian clergy who are in sexual relationships and to have an official policy of welcoming gay and lesbian members and affirming their relationships. Of the large Protestant denominations in Canada, only the United Church of Canada, after prolonged and divisive debate, has extended acceptance into the clergy to those who are in sexual relationships. All others require, at least in terms of “official” policy, that gay and lesbian clergy be celibate. This applies also in the Roman Catholic Church, in which celibacy is required of priests (only men are permitted to be priests) regardless of sexual orientation. Most large denominations also have identified groups for gay and lesbian members (Dignity—Roman Catholic and Integrity—United Church) and some, such as the United Church of Canada, are seeking ways to find congregations prepared to accept qualified openly lesbian/gay ministers.

Canada has many gay and lesbian organizations at the provincial and local levels. Some address social justice and legislative and policy issues, others emphasize community service and education. The various AIDS Committees across Canada have drawn heavily on the gay community for expertise in all areas of their mandate and also for volunteer work and peer support. In addition, local groups, such as PFLAG (Parents and Friends of Lesbians and Gays) in Ontario, also provide information and mutual support for families of gay and lesbian youth or adults.

### D. Behavioral Patterns

There have been few large-scale studies of gay male sexual behavior in Canada and none of lesbian sexual behavior. *Men’s Survey 90* surveyed the sexual practices of 1,295 men (mean age 34, 73.7% with partial or complete college education) recruited from 12 bars and three bathhouses in Toronto in 1990 (Myers et al. 1991). This is the largest number of gay and bisexual men ever surveyed in Canada, but the results may not apply to smaller cities or rural areas elsewhere in the country. The study was designed to investigate AIDS knowledge, attitudes, and behavior. The AIDS-related findings will be reported in Section 10B, Sexually Transmitted Diseases and HIV/AIDS, HIV/AIDS.

About 48% said they had had sex only with men in their lifetime, 35.3% had previously had sex with women but had only done so with men in the past year, and 13% were bisexual. The reported number of partners in the past year ranged from none (6%), one (16.8%), two to nine (37.8%), 10 to 14 (12.4%), 15 to 24 (9%), to 25-plus (18.1%). Among those who reported a current relationship with a man (35.8%), 33.9% said it was monogamous, 55.7% that it was not or presumed not to be monogamous, and 10% were uncertain; 5.4% had a regular female sex partner.

When asked about sexual activity in the past three months, 11% said none, 28.4% said no anal sexual activity, 39.9% said protected (i.e., with condom) anal sex, and 20.7% unprotected (no condom used) anal sex. In the latter group, the measure was based on even one act of unprotected anal sex and the percentage was higher for a monogamous partnership (31.4%) versus 14.1% for unpartnered men. Other sexual practices reported in the previous three months included mutual masturbation (81.7%), insertive oral-genital sex (76.2%), deep tongue kissing (75.9%), receptive oral-genital sex without seminal contact (74.1%), receptive and insertive oral-anal sex (33.9% and 27.9%), and receptive oral-genital sex with ejaculation (27%). Unprotected anal

sex in the last three months was more common in men under 35, in those with high school or less versus college education (26.7% to 30.7% vs. 17.5% to 18.6%), and in men who were previously heterosexual or previously bisexual in their behavior.

Lévy et al. (1994a) have also studied sexual behavior and safer sex practices in a sample of gay men in Montreal, Quebec; see Section 10B, Sexually Transmitted Diseases and HIV/AIDS, HIV/AIDS, Table 17.

### 7. Gender Diversity and Transgender Issues

Although Canadians have become less rigid in their gender-role expectations for both sexes in recent decades, their reaction to cross-dressing and cross-gender behavior is often a mixture of discomfort and fascination. The popular media have given considerable coverage to issues of transsexualism, transvestism, gender-reassignment surgery, and cross-dressing, although to date, no studies have formally measured Canadian's awareness of these matters, nor does knowledge always equate with tolerance. In addition to prejudice, individuals seeking gender reassignment may face additional problems financing such surgery as well. For example, as of October 1, 1998 the Government of Ontario delisted coverage for sex-reassignment surgery as a benefit of the Ontario Health Insurance Plan. Other Canadian provinces that cover the costs of surgery include Manitoba, Saskatchewan, Alberta, and Newfoundland. Furthermore, accessing such surgery in Canada has become much more difficult than in previous decades.

At the time when Blanchard and Steiner (1990) published their work on the clinical treatment of gender identity disorder, Canada had four centers that did gender-reassignment surgery as part of the treatment for gender identity disorders: the Gender Identity Clinic at the Clarke Institute of Psychiatry in Toronto, Ontario (Blanchard & Steiner 1990); the Gender Dysphoria Clinic at the Vancouver General Hospital in British Columbia (Watson 1991); the Human Sexuality Unit at the Montreal General Hospital in Quebec (Wilchesky & Assalian 1991); and the joint program of the Department of Sexology, University of Quebec at Montreal and Le Comité sur le Transsexualité of Centre Hospitalier de l'Hôtel Dieu, also in Montreal.

Since that time, however, a number of recent changes have altered this state of affairs, and while these programs continue to provide consultation, there is far less surgery done in Canada. The Gender Identity Clinic at the Clarke Institute (currently and henceforth referred to as the Centre for Addiction and Mental Health, CAMH) has largely faltered because of a lack of public (i.e., government) funding for the CAMH program. As a result, few individuals seeking assistance for transgender issues use the CAMH services. In fact, there is currently no gender-reassignment surgery conducted at all in Ontario. In the last decade, all surgeries done under the auspices of Clarke/CAMH were performed in England. Similarly, the majority of surgeries previously performed in Vancouver now take place in Colorado. In Quebec, the majority of surgery is conducted by private surgeons, Drs. Brassard and Menard, who also run a private clinic for aftercare on Yale Island.

All programs employ more or less similar formats and criteria for treatment, generally adopting the "Standard of Care" advocated by the Harry Benjamin Society. This is an internationally respected protocol observed the world over with few variations. The Vancouver program is reportedly somewhat less restrictive in the circumstances under which it approves hormone treatment and surgery. The Vancouver

program uses a variety of factors to develop a "management plan." These include "intensity of cross-gender identification, degree of obsession with cross-dressing, extent of investment in versus abhorrence of sex and reproductive organs, desire for cross-gender hormone administration, need versus fantasy of sex reassignment, and nature of eroticism." "Sexual orientation is considered an independent factor not directly relevant in the evaluation of gender disorders" (Watson 1991, 4). The plan may include a combination of hormonal treatment, psychotherapy (individual, family, and group), speech therapy, and vocational rehabilitation. The decision about referral for surgery is based on "the extent of cross-gender identification and proven ability to adapt in the chosen gender role" (Watson 1991, 8), the latter evidenced by a minimum of one year living in the new role.

The program at CAMH requires a one-year "real-life test" prior to hormonal treatment and a minimum of two years living in the cross-gender role before approval is given for surgery. Specific requirements that must be met before recommendation for surgery is approved include: employment or student status in the new role (this requirement is a potential source of conflict with current or future employers); change of all documents (bank account, driver's license, health insurance, etc.) providing proof of cross-living (employer letter, statement of earnings, etc.); proof of divorce in the case of those who are legally married (a protection for the surgeon); and other such requirements (Clemmensen 1990). The rationale for these restrictions, which can generate anxiety and animosity among patients, is that postoperative regret and poor outcome are more likely if these criteria are not followed, although there is debate in the research literature as to the actual degree of postoperative regret experienced by transsexuals choosing surgery.

The Montreal General Hospital group has similar criteria and a varied program that includes a strong emphasis on group support (Wilchesky & Assalian 1991). The Department of Sexology/Hôtel Dieu program was established in the early 1970s and follows assessment criteria similar to those described above for the Clarke Institute. It is different from the others in that the Department of Sexology does the assessments, therapy, and recommendation for surgery for the hospital clinic and is also an active center for research on gender identity. Group counseling is provided, but when the department itself offers such groups, it is because the activity includes a research component, not because it is a standing service.

The legal status of postsurgical male-to-female and female-to-male transsexuals is precarious in Canada, and they have little or no protection in 8 out of 10 provinces. However, their civil rights status is becoming clearer in Ontario and British Columbia. British Columbia has enshrined "gender identity" in their Human Rights Code and position papers have been forwarded in Ontario. Although the health plans in about one half of provinces will cover surgery and it is legal to change one's birth certificate postoperatively, the law appears to define one's sex based on chromosomal composition. A more recent case in Quebec, however, presents a better indication of the complicated picture for transsexual individuals. As it currently stands, a name can be changed only in the face of complete surgical alteration. For female-to-male, this includes a double mastectomy, hysterectomy, phalloplasty, and removal of the ovaries. For male-to-female, this entails complete neovaginal surgery. Furthermore, even with such surgical interventions, sex cannot be changed on any document.

In a 1992 legal decision in Ontario, the judge annulled the marriage of a woman and a female-to-male transsexual on the grounds that the law does not permit marriage between

two people of the same sex. This means that a postoperative male-to-female transsexual can legally marry another female (and this has occurred in Canada), and that postoperative transsexuals who marry (the issuing of a marriage license is based on appearance and not genetics) and later seek divorce, may have their marriage declared invalid.

At the social level, transsexuals face significant problems with education, employment, and social acceptance. Support groups are present in some large cities, and organizations such as the Metamorphosis Research Foundation have shown the importance of support and education services for people with gender conflicts. Other programs, like the 519 program in Toronto, one of the first outreach programs for transsexual and transgender youth and sex workers, also provides free counseling and food to a group of individuals who are multiply marginalized within the larger social matrix.

The problems and issues faced by intersex individuals—personal, legal and medical—are different, yet again, from those of transgendered individuals.

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### *Sexual Abuse of Children*

In Canada, child abuse refers to physical, sexual, and emotional abuse or neglect. All provinces and territories, except the Yukon, require any person who knows of or suspects such abuse to report it to child welfare authorities. The Yukon identifies teachers and childcare workers as the groups with a legal duty to report. It is difficult to estimate the prevalence of child abuse because of the secrecy and privacy involved, and because jurisdictions vary in what and how they report (e.g., some record both allegations and investigations while others report only the latter [Johnson 1996a]).

Sexual contact between children and adults is strongly proscribed in Canada, and the phenomenon of child sexual abuse is now increasingly recognized as a longstanding problem that has been insufficiently addressed at all levels of society. Major reports of such abuse in the past ten years have focused public and professional attention on child abuse in general, and sexual abuse in particular. For example, the criminal conviction of Catholic brothers for physical and sexual abuse of male residents at a Roman Catholic orphanage in Newfoundland, the growing reports of sexual abuse of children in some aboriginal and First Nations communities in which poverty, alcoholism, and drug use are widespread, and the response to disclosure of similar abuses of large numbers of children in a small Ontario community have been among the most publicized of many such accounts. These incidents reinforced the concerns expressed in the *1984 Badgley Commission Report, Sexual Offenses Against Children and Youth*, which indicated that by age 16, approximately 5 to 9% of males and 15 to 20% of females had experienced some form of unwanted sexual touching, and that 1 to 3% of females under 16 had experienced forced intercourse (Lindsay & Embree 1992).

Changes in the Canadian Criminal Code in 1988 expanded the old provision that prohibited sexual intercourse with a person under 14. For example, the relevant section of the code speaks of a “young person,” defined as a person 14 years of age or more but under the age of 18. Changes were also made with the inclusion of the offenses of “sexual interference” (s.151), “invitation to sexual touching” (s.152), and “sexual exploitation” (s.153). Sexual interference is explained as follows:

Every person who, for a sexual purpose, touches, directly or indirectly, with a part of the body or with an object, any part of the body of a person under the age of fourteen is guilty of an indictable offense and liable to imprisonment for a term not exceeding ten years or is guilty of an offense punishable on summary conviction. (MacDonald 1994, 16)

The addition of “invitation to sexual touching” makes it an offense

to invite, counsel, or incite a person under fourteen to touch him/herself or any other person, directly or indirectly, if the invitation is made for a sexual purpose. For example, it is a criminal offense to suggest that a young boy masturbate for the voyeuristic pleasure of the person making the suggestion. (MacDonald 1994, 16)

Finally, although including the types of acts covered under sections 151 and 152, the offense of “sexual exploitation” under the Criminal Code refers specifically to sexual acts carried out by a person

who is in a position of trust or authority towards a young person or is a person with whom the young person is in a relationship of dependency.

Section 150(2) of the Canadian Criminal Code provides further clarification of the role of consent in regard to sexual offenses with young persons. This section provides that where an accused is charged with sexual interference, invitation to sexual touching, exposure, or sexual assault with respect to a complainant at least 12 years of age but under the age of 14, it is not a defense that the complainant consented to the activity unless the accused is at least 12 years of age but under 16, is less than two years older than the complainant, and is not in a position of trust or authority towards the complainant, nor in a relationship of dependency with the claimant. In short, MacDonald (1994, 16) notes that since children under 14 are not assumed to be able to give consent, “it is not a defense that the complainant consented to the activity that forms the subject matter of the charge” (MacDonald 1994, 16). Further, MacDonald notes that the prohibition on sexual activity with a person under 14 does not apply if “the child is at least twelve years old, is consenting, and the other person involved is less than two years older than the child and is not in a position of trust, authority or support toward the child” (MacDonald 1994, 17). Sexual contact between an adult and a child would also fall under the sexual assault section of the Code (a child cannot give legal consent to the contact), thus adding to the variety of provisions in Canadian law that address sexual contact between adults and children.

*The Canadian Incidence Study of Reported Child Abuse and Neglect* (CIS) was the first nationwide study to examine child maltreatment in Canada. Conducted between October and December 1998, this study provides data on physical abuse, sexual abuse, neglect, and emotional maltreatment of children age 0 to 15 based on 7,672 investigations from 51 separate cities in all of Canada’s provinces and territories. In Ontario, it is mandatory for children’s aid societies to investigate all reports of abuse. These are then deemed “substantiated” (there is sufficient evidence for the investigator to conclude that abuse occurred), “suspected” (can neither substantiate nor rule out abuse), or “unsubstantiated” (there is sufficient evidence that maltreatment did not occur). Child sexual abuse occurs when an adult or youth uses a child for sexual purposes. Sexual abuse includes fondling, intercourse, incest, sodomy, exhibitionism, and commercial exploitation through prostitution or the production of pornographic materials.

In the case of sexual abuse investigations reported in the 1998 CIS study, the most common forms of substantiated sexual abuse were touching/fondling genitals (68% substantiated), attempted and completed sexual activity (35% substantiated), and exposure (12% substantiated). Sexual exploitation (6% substantiated) and sexual harassment (4% substantiated) were less common forms of child sexual abuse (Trocmé et al. 2001). An analysis of victim characteristics reveals that 69% of victims are girls and 31% are boys, with girls age 4-7 and 12-15 victimized about twice as often as those in the 0-3 and 8-11 age categories.

Among all cases of substantiated sexual abuse in the 1998 CIS, the majority of alleged perpetrators were either relatives (44%) or non-relatives (29%). Of those alleged perpetrators who were related to the victim, they were equally likely to be a biological father or stepfather and less likely to be the biological mother, foster, or adoptive parent. Those who fall under the category "other relatives" were by far the single most significant category comprising 44% of those who commit sexual abuse.

In the past decade, there has been an increasing involvement of police in situations that could lead to criminal charges, particularly where sexual and physical abuse are concerned. According to the 1998 CIS, sexual abuse was by far the most likely type of maltreatment to result in charges laid by police (70%).

On a provincial level, the 1998 *Ontario Incidence Study of Reported Child Abuse and Neglect* (OIS 1998) (Trocmé et al. 2002), conducted as part of the 1998 CIS study, was based on a sample of 3,053 child-maltreatment investigations. Figures do not include maltreated children who were not reported to a children's aid society. Findings from this study show that between 1993 and 1998, the estimated number of child-maltreatment investigations increased 44% in Ontario. The total number of substantiated cases doubled from 12,300 in 1993 to 24,400 in 1998. Over this time period, there was a 44% decrease (3,400 in 1993 to 1,900 in 1998) in substantiated investigations of sexual abuse. This is consistent with a similar decrease noted in the United States (Jones et al. 2001). Trocmé et al. (2002) suggest that while such a decrease could indicate more-effective prevention programs and criminal-charging policies, it is also possible that these same policies have caused victims and their parents to be less willing to disclose and report sexual abuse.

The *Étude sur l'Incidence et les Caractéristiques des Situations d'Abus, de Négligence, d'Abandon et de Troubles de Comportement Sérieux Signalés à la Direction de la Protection de la Jeunesse au Québec* (EIQ) [*Quebec Incidence Study of Reported Child Abuse, Neglect, Abandonment and Serious Behaviour Problems*] is also the first study of its kind ever to be carried out in Quebec. The EIQ was based on referrals reported to the Director of Youth Protection between October 1 and December 31, 1998. Sixteen of Quebec's 19 child-protection agencies took part in the study by documenting the child-maltreatment or serious behavior problem referrals reported during that period. The study found 3.0 per 1,000 cases of sexual abuse, with girls being reported for sexual abuse more commonly than boys. Situations of sexual abuse referred to touching/fondling in most cases (64%), with relatives (27%) often identified as perpetrators, as well as "another" person (28%). About 26% of child victims of sexual abuse lived with at least one parent who was him- or herself a victim of maltreatment during his or her childhood, suggesting a potential intergenerational reproduction of maltreatment. These findings are based on a 2002 summary posted by the Centre of Excellence for Child Welfare, with the permission of the Institut Universitaire dans le Domaine de la Violence chez les Jeunes, Les Centres Jeunesse de Montréal.

Although the overall incidence of substantiated child maltreatment in the Ontario study is about one half that in the U.S.A. in 1990 (21/1,000 vs 43/1,000), this difference is almost entirely because of the higher rate of child neglect in the U.S.A. (4.64/1,000 vs. 2.0/1,000). The substantiated sexual abuse rates were very similar in both countries (1.57/1,000 vs. 1.65/1,000 in the U.S.).

Such findings and the growing public concern about sexual abuse of children have led some to wonder about the possibility of fabrication of such allegations in divorce or child-custody proceedings.

In Canada, the Divorce Act governs both custody and access and requires that the courts consider the best interests of the child as the standard in such cases. Zarb's (1994) detailed analysis of the legal situation in Canada indicates that legal decisions in this area are rare because such matters are usually settled without a trial. When a trial does occur, transcripts are often kept confidential. She notes that when allegations are unfounded, the court generally awards unsupervised access, and sometimes full custody, and that unproven accusations lead to supervised or unsupervised access depending on the judge's perception of the best interests of the child. In weighing the rights of an accused parent (almost invariably the father) against the possible risk to the child, Zarb indicates that Canadian courts should and do err on the side of caution.

Zarb (1994) points out that there is a greater occurrence of allegations of sexual abuse on interim applications for custody, but she argues that this does not necessarily mean that false allegations are generally and cynically used as a "bargaining chip" in such cases. Among the possible reasons for unfounded allegations, she cites (1) the excessive influence of media reports that lead to overinterpretation of innocuous behavior as abuse, (2) the emotional fragility of newly separated parents, (3) the belief among some adults that children do not know enough about sex to be able to make up events and, therefore, that there is no reason to doubt their reports, (4) the lack of trust in separated couples, and (5) the fear that failure to report suspicions may lead to an accusation of negligence. When accusations are founded, Zarb notes that case law offers "no clear consensus in Canada with respect to how much contact a child victim of incest should have with his or her abusive parent after disclosure" (Zarb 1994, 108). She sees a consensus for continued access in such cases (in Canadian law access means, at a minimum, the right to make inquiries and to get information about the child's schooling, health, etc.) only when the child wants it, when the abusive parent has affirmed that the child's accusation was correct, and when the other parent can protect the child from the offending parent, if necessary.

This area is a source of debate in Canada, as is the growth of an "assessment industry" that some perceive as predisposed to finding sexual abuse when other explanations for alleged incidents are possible (Zarb 1994). In the absence of judicial consensus on many of these contentious issues, Zarb (1994) sees the need for much more research on the prevalence of sexual contact between adult relatives and children, and on the related issue of "the child's best interests," when such allegations are made and/or substantiated.

When child sexual abuse cases go to court, there have been a number of recent changes in Canadian law and procedure that make the experience less onerous for the child witness while respecting the right of an accused to a fair trial. Young's (1992) review of evidentiary issues in cases of child sexual abuse in Canada cites measures that include: use of screens so that the child witness need not see the accused while testifying, use of closed circuit television, use of videotaped statements, and increasing acceptance of children as

reliable witnesses under appropriate circumstances. All have been challenged as contrary to the rights of the accused, but Young (1992) sees the legislative trend leaning toward a balance that recognizes the past disenfranchisement of children in the courts for reasons that some now consider invalid.

In 1997, a Parliamentary committee, the Special Joint Committee on Child Custody and Access, was asked to assess the need for a more child-centered approach to family law policies and practices, and in December 1998 released its report, *For the Sake of the Children*. The Government of Canada has taken an approach to family justice reform that is consistent with the spirit of this report, in that it removes the terms custody and access from the Divorce Act and bases parenting decisions solely on the best interests of the child. While the "best interests of the child" has been the core principle of family law in Canada for some time, this core principle was reaffirmed and strengthened by adding a list of best-interest criteria to the Divorce Act. In instances where allegations of sexual abuse are present, weighing the "best interests of the child" against the threat of false allegations of abuse are identified as serious complications associated with high-conflict cases. The lack of data pertaining to the actual incidence of false allegations in Canada was identified as an additional worry in the Government of Canada's Response to the Report of the Special Joint Committee on Child Custody and Access tabled on May 10, 1999. A serious problem, though, is that the actual incidence of false allegations of child abuse in Canada is not known, and it is an inherently difficult issue to research.

This issue, moreover, is one that crosses jurisdictions and will require the cooperation of numerous agencies and organizations if it is to be addressed properly. We therefore agree with the Committee's recommendation that the Government of Canada work with the provinces and territories to encourage child welfare agencies to track investigations of allegations of abuse in the context of parenting disputes in order to provide a statistical basis for a better understanding of this problem.

### *Sexual Harassment*

Sexual harassment is illegal in Canada under the Canadian Human Rights Act and also under all provincial and territorial acts respecting human rights. Aggarwal's (1992) detailed review notes that the first such documented case in Canada occurred in Ontario in 1980, when the Ontario Board of Inquiry determined that "sexual harassment amounts to sex discrimination prohibited under the Ontario Human Rights Code." This decision has become the basis for judgments by human rights tribunals in other provinces and at the national level.

In 1983, the Canadian Human Rights Commission adopted a definition of sexual harassment as including:

- (1) verbal abuse or threats; (2) unwelcome jokes, remarks, innuendoes, or taunting; (3) displaying of pornographic or other offensive or derogatory pictures; (4) practical jokes which cause awkwardness or embarrassment; (5) unwelcome invitations or requests, whether indirect or explicit, or intimidation; (6) leering or other gestures; (7) unnecessary physical contact such as touching, patting, pinching or punching; (8) physical assault. (Aggarwal 1992)

There are now many different definitions of sexual harassment being applied in labor relations codes, university policies, and guidelines covering a range of agencies and work settings. Most definitions, such as that adopted at one Canadian university, indicate that sexually harassing behavior "is sexual in nature and is unwanted by the person to whom it is directed." In order for a behavior to constitute sexual harass-

ment, it "must affect the recipient's employment, instruction, or participation in university activity or interfere with the recipient's environment, performance, or evaluation" (cited in Aggarwal 1992).

Although the application of these codes has been a source of debate in some settings, there appears to be general agreement that sexual harassment is a problem, and that some form of control and/or redress is needed. A 1991 poll cited by Aggarwal (1992) indicated that 37% of women and 10% of men had experienced such harassment; other studies of selected groups have indicated larger percentages, mostly of women, frequently involving incidents in the workplace, and often unreported.

Most provincial human rights codes specifically identify sexual harassment in the workplace as a violation. Ontario's 1990 Code, for example, specifies that every person should be free from:

1. a sexual solicitation or advance made by a person in a position to confer, grant, or deny a benefit or advancement to the person where the person making the solicitation or advance knows or ought reasonably to know that it is unwelcome.
2. a reprisal or threat of reprisal for the rejection of a sexual solicitation or advance where the reprisal is made or threatened by a person in a position to confer, grant, or deny a benefit or advancement to the person. (Aggarwal 1992)

This definition implicitly notes that sexual harassment is a misuse of power and constitutes a "poisoning of the work environment" and is not simply misunderstood courtship behavior. Nevertheless, misunderstandings in this area abound and most procedures appear to incorporate the intentions of fairness to each party, confidentiality (although not anonymity of the complainant with respect to the respondent), adjudication, and the potential for remedy without formal disciplinary proceedings. It would be unwise to assume universal agreement and comfort with harassment codes, particularly on university campuses, where such policies have been cited as a threat to academic freedom and to open discourse on discomforting topics. Defenders claim that such policies, and the administrative machinery needed to adjudicate them, are not simply a way of reinforcing "political correctness," but a means of addressing a problem that disadvantages not only women but other groups such as gay/lesbian/bisexual students or employees.

Many policy and procedural guides on sexual harassment now include harassment on the basis of sexual orientation. This is consistent with the inclusion of sexual orientation as a protected category in most provincial human rights codes. The Criminal Code also has sections on "stalking," the persistent following or watching of someone. It is also illegal to watch or beset a person's residence or place of work. The popular media have reported on entertainment celebrities being "stalked," usually women stalked by men, and have thereby raised awareness of this phenomenon in the general population.

### *Sexual Abuse and Sexual Assault (Rape)*

Readers interested in an overview of legal and legislative aspects of sexual assault can find an excellent review of Canadian trends in the 1980s and early 1990s in *Confronting Sexual Assault: A Decade of Legal and Social Change* (Roberts & Mohr 1994). In addition, the Canadian Panel on Violence Against Women received 800 submissions and heard thousands of personal stories from individuals in 139 communities across Canada. The Panel's final report, *Changing the Landscape: Ending Violence, Achieving Equality* (Min-

ister of Supply and Services 1993), while providing a broad sampling of personal stories and recommendations concerning women's experience of violence in Canada, is less reliable as a source of statistical data on the incidence or occurrence of such experiences. The large volume of publication and government activity in the area of sexual abuse and assault during the 1980s and into the 1990s is a reflection of the consciousness raising that has occurred in the past ten to 15 years. The report of the 1984 Committee on Sexual Offenses Against Children and Youth and the more recent revelations of sexual abuse of children in care (see Gripton & Valentich 1990) are but two examples of this burgeoning awareness.

Although forced sexual intercourse is a serious offense, the word "rape" is no longer used in the Criminal Code of Canada. The offenses of rape and indecent assault were replaced in the code in 1983 by the categories of sexual assault (level I), sexual assault with a weapon (level II—victim threatened with a weapon or caused bodily harm), and aggravated sexual assault (level III—victim is maimed, disfigured, or has her or his life endangered during the assault).

The new laws have produced several important changes in how sexual assault is viewed and treated in the courts. First, it is now possible to charge one's spouse with sexual assault, something that could not be done under the former "rape" laws. Second, the law is nongender or sexual-orientation specific. Thus, assault of men by women, and assault by someone of the same gender are all offenses under this law (though, to date, charges have rarely been brought in the latter). Finally, it is less common for interrogations of victims about past sexual behaviors or the specific sexual acts that occurred to be permitted in court proceedings. The specific circumstances under which such interrogations may occur are now prescribed in a bill that outlines how questions of consent and mistaken belief of consent should be handled in court proceedings.

Possible maximum prison sentences for levels I to III sexual assaults are ten years, 14 years, and life respectively, although sentences are usually less, and many occurrences that would probably meet the legal definition of sexual assault, particularly level I, go unreported or do not go to trial.

The first level of these offenses, sexual assault, is not defined in the code. Sexual assault incorporates the legal definition of assault (use of force or threat of force on a person against her or his will) coupled with the idea that the assault was of a sexual nature or violated the sexual integrity of the victim. The prevalence of sexual assault, or of offenses that would have legally constituted sexual assault had they been reported, is difficult to assess, but some authors suggest that only one in ten of such occurrences is reported. Recorded sexual-assault statistics for Canada in 1995 list 28,216 incidents (10% of all violent incident reports) with 97% level I and 3% level II or level III. The national report rate of 124/100,000 population in 1992 was 10% higher than in 1991, consistent with a trend of about a 12%-per-year increase since the new assault law was introduced in 1983. This probably reflects an increase in reporting, although the incidence may also have increased. Rates varied from 64/100,000 in Quebec to about twice that in Ontario, and 895/100,000 in the Northwest Territories (Statistics Canada 1992; Roberts 1994). Non-sexual-assault rates show similar variability. The rate of level I sexual assault in Canada in 1995 (approximately 100 per 100,000) was 11.9% lower than in 1994, the second year in a row of decline after the prolonged period of increase from 1983. This rate was still 35.5% higher than in 1985 (Johnson 1996a; Hendrick 1996). At present, it is difficult to assess the relative contribution of the varied factors (law reform, better reporting, and increased incidence of of-

fenses) that led to the 1983-1993 increase and the recent 1994-95 decline in level I sexual assault incidents (Johnson 1996b). In contrast to level I sexual assaults, the less common level II and level III assaults have declined since 1985; both dropped about 35% between 1991 and 1995 (Hendrick 1996).

In 14% of level I incident reports in 1992, the police did not pursue the case beyond preliminary investigation. The "unfounded" rate (i.e., police have determined that a crime was not committed) for level I to III cases has been fairly consistent at 10 to 15% since 1983. To say that a report was "unfounded" does not necessarily imply that an intentionally false allegation was made. When there is sufficient evidence to lay a charge, the case is "cleared by charge." This happened 49% of the time for level I reports in 1992, 57% for level II, and 64% for level III, indicating that charges occur more often in cases in which the definition of the offense is clear, and therefore, more likely to lead to conviction. Clearance rates for all charges have increased since 1983 (43% in 1983-85 vs. 50% in 1990-92). In 1991-92, incarcerations occurred for 60% of level I convictions and 90% for levels II and III. An analysis of reports to selected police departments in Canada in 1992 found that 84% of assault victims were female, 98% of those charged were male, most of those charged were over 25 years of age (67%), and most assaulted were under age 18 (63%). About 20% of assailants were reported as strangers, 32% as casual acquaintances, and 28% as parents or other family members. The reported assaults usually took place in a private dwelling (63%), 61% involved threat of physical force, 1% involved firearms, and 18% other weapons.

To what extent do official reports reflect actual experience? Statistics Canada's *Violence Against Women Survey* (1993) surveyed 13,300 Canadian women 18 and over to assess their experience of physical and sexual violence. The study was reported to be the first national survey of its kind anywhere in the world (*The Daily*, Statistics Canada 1993). The specific findings on "sexual assault" are based on recent and lifetime experience of "unwanted sexual touching" ("Has a stranger or man other than a spouse or boyfriend ever touched you against your will in any sexual way, such as unwanted touching, grabbing, kissing, or fondling?") and of "sexual attacks" ("Has a stranger, date or boyfriend, spouse or other man ever forced you or attempted to force you into any sexual activity by threatening you, holding you down, or hurting you in some way?"). Using these definitions, 39% reported experiencing one of these since age 16 (24% sexual attack, 25% unwanted sexual touching, and 10% both). Overall, 58% had more than one lifetime experience of sexual touching and 42% of sexual attack; 5% reported at least one experience of either in the previous 12 months (Roberts 1994). While the experience had negative emotional impact in 85% of cases, only 6% said they had reported these incidents to police (11% in the case of sexual attacks, 4% for sexual touching), and of those reported to police, 63% of the complainants were under the age of 18. Reasons for not reporting included: the incident was too minor (44% overall; 28% for sexual attack vs. 53% for unwanted sexual touching), the expectation that police would not be able to do anything (12%), protection of privacy (12%), or it was dealt with in other ways (12%) (Roberts 1994).

When participants in the *Ethnocultural Communities Facing AIDS* study were asked whether they had ever been coerced or forced to have sex with someone against their will, 37% of women and 19% of men from the English-speaking Caribbean communities, 5% of men from the South Asian communities, and 8% of women and 1% of men in the Latin American communities reported they had.

Of particular interest is the fact that in the English-speaking Caribbean communities, percentages reporting coercion or force were higher for those who had been in Canada longer (34% of those in Canada longer than 15 years, men and women combined, vs. 20% of those in Canada less than 15 years). This was so even when age and marital status were held constant, suggesting that coercion is a more common experience here than in the Caribbean (Maticka-Tyndale et al. 1995).

In the *Violence Against Women Survey*, the lifetime reports of unwanted sexual touching and sexual attacks (collectively referred to as “sexual assault” according to the expanded legal definition) were usually linked to dates or boyfriends or someone known to them, and less often to strangers (19%). Based on reports of one or more such experiences in the previous 12 months (5% of the sample), Roberts (1994) estimates that 18% of women aged 18 to 24 years had experienced some form of sexual assault. Figures for the other age groups were: 8% (25 to 34), 5% (35 to 45) and 2% (45 to 54) (results exclude data involving marital partners). In addition, report rates among women with post-secondary education were double those for respondents with high school education or less (Roberts 1994).

#### *Treatment for Victims and Offenders*

Treatment for children and adults who have been sexually abused is in great demand and, despite the growth in such services in recent years, the need outstrips both financial resources and the availability of adequately trained professionals. Canada has over 70 community-based, sexual-assault services staffed primarily by volunteers. These kinds of services (telephone crisis lines, accompaniment of victims in hospital, police interviews, court, counseling and support groups, etc.) are responding not only to current reports of assault, but to past abuse that is only now being dealt with as a result of publicity surrounding this issue.

Marshall (1992) recommends three areas of societal response to sexual offenses: preventing or at least reducing the incidence; assistance to victims; dealing with offenders through incarceration and specialized cognitive-behavioral treatment programs. He notes that treatment programs for sex offenders have been employed with some success in Canadian penitentiaries, hospitals, and community-based outpatient clinics. Since most offenders will eventually be released, such treatment is considered a vital part of social policy. Marshall (1992) cites recidivism rates of 10% in a five-year follow-up study of treated offenders who had a comprehensive program that addressed five target areas: cognitive factors, sexual issues, social functioning, life management, and relapse prevention; for untreated offenders, the recidivism rate was 35%. Antiandrogen treatment is used with some offenders during treatment and subsequent to release.

“Gating” (i.e., immediate rearrest upon release) of offenders who have completed their sentences, but are still considered dangerous, has been used in Canada, as has the placing of conditions on released offenders (e.g., restricting men who have committed offenses against children from going near schools, etc.). The former has been declared in violation of charter rights, and a current test case in Ontario will determine whether the latter does so as well. Both issues reflect the extensive concern that prevails in Canada around the risk of sexual assault and abuse. Growing public awareness of the long-term consequences for many victims of sexual abuse has undoubtedly contributed to the perception of dangerousness that colors public discourse about sexuality.

#### *Sexual Coercion and Assault—College and University Students*

A large-scale study of unwanted sexual experiences conducted at the University of Alberta in 2000 (LoVerso, 2001) paints a picture of sexual assault on one university campus. This study revealed examples of sexual assault, particularly among first- and second-year students. Of the 1,297 students participating, 37% of participants’ most serious unwanted sexual experiences happened while registered at the University of Alberta. Over 90% of the most serious unwanted sexual experiences were perpetrated by men, 41.8% of which were non-romantic acquaintances compared with 27.9% who were romantic acquaintances. Physical force was reported in 23.5% of the most serious cases, while the majority involved some form of coercion or pressure.

DeKeseredy and Kelly (1993) conducted a national study of sexual mistreatment and assault on university campuses using a sample of 1,307 men and 1,835 women from classes in over 40 universities and community colleges across Canada. Respondents were young (median age 20 for females, 21 for males), unmarried (about 80% for both sexes; those married were asked to respond based on their dating relationships), and primarily in their first or second year of study (66%). The results presented here are for women’s reports of their experiences of abusive behavior in dating relationships and men’s reports of their own abusive behavior. (For commentary on the study and the circumstances of its public release, see Gartner 1993, Fox 1993, and Kelly 1994.)

The study determined incidence rates (past year) and prevalence rates (since starting university or college) for a variety of experiences that were described in detail in the research questionnaires and that corresponded, in some cases, to legal definitions of sexual harassment or level I or II sexual assault. For example, “Have you ever given in to sex play (fondling, kissing or petting but not intercourse) when you didn’t want to because you were overwhelmed by a man’s continual arguments and pressure?” yielded an 18.2% incidence response (7.8% of men said they had been the source of such an outcome for a female partner in the past year) and 31.8% prevalence (14.9% of men said they had exerted such pressure on a partner since beginning university/college; see Table 7).

DeKeseredy and Kelly (1993) suggest that their reported incidence and prevalence figures for sexual abuse in dating relationships may be underestimated, that the problem is as serious in Canada as has been reported for the U.S.A., that the attempt of some males to “mirror the dynamics of patriarchal marriages” in their dating situations may contribute to mistreatment of their partners, and that men and women bring different interpretations of consent to such relationships. Kathleen Cairns (1993) at the University Calgary has identified the different self-perceptions and scripts that many men and women in university bring to these interactions (sexual entitlement on the part of males and sexual accommodation on the part of females) and suggested that attention to such scripts could provide a basis for understanding and eventually reducing the incidence of coercive behavior. She proposes that sex education for young women should focus on assertiveness and refusal skills, on “development of a sense of self as sexual subject, and on the related understanding of the nature of female sexual desire” (Cairns 1993, 211). Young men should learn how to develop a broader awareness of sensuality, feeling, and of girls and women as persons; both sexes need to recognize that it is social-derived sexual scripts and power differences, not immutable biology, that leads to sexual coercion.

Research by Sandra Byers and her students at the University of New Brunswick also adopts a sexological rather than purely legalistic and legislative approach to understanding and changing sexually coercive behavior (see Byers 1991; O'Sullivan et al. 1994; O'Sullivan & Byers 1993). For example, Byers and Lewis (1988) found that desired level of sexual activity was the same for men and women in 90% of dating for college-age couples, that women were no more likely than men to refuse a partner's sexual initiation (although men initiated more often), that when disagreements occurred in desired level of sexual activity, men did not, in the vast majority of cases, try to persuade, coerce, or force their partners, and that most stopped the unwanted activity when asked. While these and other findings suggest that Canadian college students are at various stages in the transition to more egalitarian gender and sexual relationships, the level of mistreatment experienced and perceived by college and university women remains a significant issue on many campuses.

### *Sexual Assault and Coercion of People with Disabilities*

There is a high prevalence of sexual assault and abuse in the lives of people with physical or developmental disabilities, and this area has generated a variety of educational, research, and prevention programs (The Roehrer Institute 1992; Sobsey 1994; Sobsey et al. 1994). The Disabled Women's Network has been particularly active in raising awareness of this issue at both the local and national level through pamphlets for consumers and an educational guide for healthcare professionals. The federal government's Family Violence Prevention Division funds a variety of programs that deal with violence in general, and sexual abuse in particular, against people with disabilities.

### *Physician-Patient Sexual Contact*

Patient-physician sexual involvement is an important area of professional misconduct that has received increased attention in Canada in recent years. Subsequent to the report in Ontario of the Task Force on Sexual Abuse of Patients (TFSAP 1991), an act was passed (Regulated Health Pro-

fessions Amendment Act, 1993, SO1993, c37) which identified "strict guidelines for reporting such activity and disciplining physicians" (Lamont & Woodward 1994). A task force of the College of Physicians and Surgeons of Ontario (CPSO) mandated to respond to the report that the CPSO had commissioned, identified three categories of impropriety that would receive different penalties. They were:

1. Sexual impropriety: any behavior such as gestures and expressions that are sexually demeaning to a patient or that demonstrate a lack of respect for the patient's privacy.
2. Sexual transgression: any inappropriate touching of a patient, short of sexual violation, that is of a sexual nature.
3. Sexual violation: sex between a physician and a patient, regardless of who initiated it, including but not limited to sexual intercourse, genital-genital contact, oral-genital contact, oral-anal contact, and genital-anal contact. (CPSO 1992, as cited in Lamont & Woodward 1994, 1434).

The Committee on Physician Sexual Misconduct established by the College of Physicians and Surgeons of British Columbia (1992) proposed 97 different recommendations for responding to the issues surrounding patient-physician sexual contact. The College also funded a mailed survey of all practicing physicians in British Columbia (4,513 responses, 72.3% response rate, 78.9% males), which found that 20.7% of the responding physicians, and 62.3% of psychiatrists, had seen a patient who reported having had sexual contact with another physician (Maurice et al. 1994a). Female physicians were more likely than male physicians (31.2% vs. 17.8%) to indicate that they had heard such a revelation from a patient. Among the physicians who were asked questions about their personal behavior, 3.5% of the 1,414 who responded (69.5% response rate) said they had had at least one sexual experience with someone who was a current patient at the time of the sexual contact (3.8% of male vs. 2.3% of female respondents). This figure was 7.4% for

### **Incidence and Prevalence Rates for Different Aspects of Sexual Abuse Reported by a National Sample of Canadian University/College Students**

Situation	Incidence <sup>1</sup> (%)		Prevalence <sup>1</sup> (%)	
	Women (N = 1,835)	Men <sup>2</sup> (N = 1,307)	Women (N = 1,835)	Men <sup>2</sup> (N = 1,307)
Have you given in to sex play (fondling, kissing, or petting, but not intercourse) when you didn't want to because you were overwhelmed by a man's continual arguments and pressure?	18.2	7.8	31.8	14.9
Have you had sex play (fondling, kissing, or petting, but not intercourse) when you didn't want to because a man threatened or used some degree of physical force (twisting your arm, holding you down, etc.) to make you?	3.3	1.1	9.4	2.2
Has a man attempted sexual intercourse (getting on top of you, attempting to insert his penis) when you didn't want to because a man used some degree of physical force (twisting your arm, holding you down, etc.) but intercourse did not occur?	3.9	0.6	8.5	1.6
Have you given in to sexual intercourse when you didn't want to because you were overwhelmed by a man's continual arguments and pressure?	11.9	4.8	20.2	8.3
Have you ever had intercourse when you didn't want to because a man threatened or used some degree of physical force (twisting your arm, holding you down, etc.) to make you?	2.0	1.7	6.6	1.5
Have you had intercourse when you didn't want to because you were drunk or high?	7.6	2.2	14.6	4.7

<sup>1</sup>Incidence (in the past year), prevalence (since beginning university/college).

<sup>2</sup>Male responses indicate percentage who said they had been the source of such experiences for a woman. Data from DeKeseredy and Kelly (1993). Median age for females 20 years, for males 21 years.

those who said they had had sexual contact with a former patient (8.1% of male vs. 4.3% of female respondents).

Maurice et al. (1994b) have also surveyed members of the public in British Columbia to assess their opinions and experience concerning patient-physician sexual contact. Questionnaires mailed to 6,000 women and 2,000 men yielded 2,456 responses (2,079 women, 376 men). When asked whether a physician had ever touched their private body parts for what seemed to be sexual reasons, 4.7% of the women and 1.3% of the men said yes. In addition, 6% of women and 2.5% of men said a doctor had made sexual remarks that upset them and 0.3% reported sexual activity with a former physician (0.7% with a doctor who was their current physician at the time of the contact).

Ontario and British Columbia have now passed legislation that requires physicians to report to their provincial medical college (i.e., registration body) any suspicions or knowledge they may have of physicians engaging in sexual contact with patients.

A large sample of Canadian obstetricians and gynecologists (i.e., 782 members of the Society of Obstetricians and Gynecologists of Canada, response rate 78%) has also been surveyed on this issue via mailed questionnaire (Lamont & Woodward 1994). Based on the CPSO definitions of impropriety, transgression, and violation: 37% of female respondents and 19% of males said they were aware of actions by a colleague that fitted one of the categories; fewer (10% overall) knew another obstetrician-gynecologist who had done so; 3% of males and 1% of females reported such involvement themselves; and 4% and 2%, respectively, said they had been accused of such involvement; 97% said such contact was never therapeutic and 58% saw it as an abuse of power. Respondents varied in the type of penalty they felt should be applied for different levels of offense, with a hierarchy based on level and with females generally favoring stronger penalties (e.g., 39% of females vs. 21% of males favored permanent loss of license for a sexual violation, 11% vs. 3% for a transgression). Respondents differed on the amount of time they felt should elapse before it was permissible to begin a relationship with a former patient that might lead to sexual activity (never acceptable, 14%; 6 months to over one year, 53%; OK after public termination of the professional relationship, 11%). The Canadian Medical Association published a *Policy Summary* on these matters, both to guide physicians and the public and to generate discussion and ongoing review of the policies (CMA Policy Summary 1994).

### *Sexual Homicide*

Although sexual homicide is rare, the horror of such events and the publicity surrounding them is a source of considerable anxiety and concern in Canada. As a consequence, amendments have been proposed to the Criminal Code, the Prison Reformatories Act, and the Corrections and Conditional Release Act that would permit continued incarceration of dangerous offenders even after their court-imposed sentences for previous crimes have been completed. Using homicide statistics from 1974-86 in Canada, Roberts and Grossman (1993) found that about 4% of recorded homicides were sexual homicides (i.e., murders that occur as part of the commission of a sexual offense). Over this period, the number of such homicides did not increase nor did the proportion of homicides classified as sexual homicides. The victims were primarily female (85%) and the perpetrators were almost exclusively male (99%). Compared to the period 1961-70 when 20% of the victims were under age 21, the more recent period had 49% under the age of 21. About 30% of such crimes involved a stranger and

33% an acquaintance. Close family members were infrequently victims, in contrast to other homicides (about 12% of all murders were of spouses), and alcohol and drugs were involved in 25% of sexual homicides, slightly less than for homicides in general. The wide publicity given to sexual homicides has focused attention on all aspects of sexual assault and violence. Research and public policy initiatives address the complex problems of preventing sexual assault of all kinds, of treating victims and their families, of treating offenders, most of whom will eventually be released from prison, and of predicting dangerousness of adults after the fact and of youth before they offend.

### **B. Prostitution**

While prostitution among consenting adults has never been illegal in Canada per se, the practice has long been considered immoral, and the Criminal Code has been used to prosecute prostitutes and, more recently, their customers. In 1983, the Special Committee for the Study of Pornography and Prostitution (the Fraser Committee), established by the Justice Minister in 1983, was mandated to examine all aspects of prostitution in Canada and to make recommendations for changes in what was perceived, at the time, to be an unenforceable law on solicitation. In their 1985 report, the Fraser Committee made more than 100 recommendations, including one that prostitution-related activities by both prostitutes and customers be removed from the Criminal Code and another that small-scale, nonresidential commercial prostitution establishments should be allowed to operate. The federal government, however, did not act upon these two recommendations. The Committee's 15 recommendations dealing with adult prostitution included the proposal that, because it was the nuisance aspect of public solicitation by adult prostitutes that most concerned the public—teen prostitution will be addressed below—an addition to the nuisance provisions of the Criminal Code pertaining to solicitation would help to alleviate this problem (Gemme 1993).

In a review of legal, criminological, and sexological perspectives on prostitution in Canada, Gemme (1993) examined the implications of legal changes made subsequent to the Commission's report. He notes that although prostitution is not strictly illegal,

almost all activities which permit one to practice prostitution are illegal (solicitation; to deliver service to many in the same place; to operate or to find oneself in a bawdy house; to transport toward this place; to initiate someone into prostitution or to live from the prostitution of others. (Gemme 1993, 227)

The increased visibility of street prostitution in Canadian cities throughout the 1980s may account for both the public perception that it is a "serious problem" (about 25% of Gallup poll respondents said so in 1984, 1988, and 1992) (Wolff & Geissel 1992) and for the 1985 change in the law which prohibited not only solicitation, as in the past, but also communication for the purpose of prostitution. In attempting to eliminate the nuisance effect of prostitution on nonparticipating members of the public, the law also defined automobiles as a "public place" in which such communication might occur. These changes were intended to decrease street prostitution, to make it easier to get prosecutions, and to prosecute both clients and prostitutes (Gemme 1993).

One effect of the 1985 change in the law was an increase in the recorded number of prostitution offenses from 1,225 in 1985 to 10,134 in 1992. Of the latter, about 90% were for communicating (reflecting a significant increase in client prosecutions), with the remainder split between procuring and bawdy-house convictions (Wolff & Geissel 1992). Juris-

dictions may vary in the extent to which they prosecute and, although they cannot legislate in areas already covered by the Criminal Code, some have applied municipal regulations in order to facilitate prosecution (e.g., Montreal prostitutes convicted in one area were prohibited from being found in that area for one year). In assessing the law's application in Montreal, a city that accounted for 16% of Canada's reported prostitution offenses in 1992, Gemme (1993) and Gemme and Payment (1992) made the following observations:

1. Police efforts to implement the law in areas where prostitution was prevalent reduced the number of prostitutes in those areas, but shifted them to other areas, including residential ones, without reducing total numbers.
2. Arrests were easier and more frequent, since the courts had agreed that charges could be laid even though an undercover officer was "posing" either as a prostitute or client. The vast majority of communication arrests of potential clients involved a police officer posing as a prostitute.
3. Although 20 to 25% of prostitutes were male, only 11% of prostitution arrests were of males and no clients of male prostitutes were arrested (because police officers were less inclined to "pose" in that situation).
4. Although the pursuit of equity in application of the law has led to more clients being charged, the overall approach to prostitution in Canada continues to marginalize sex trade workers and often exposes them to mistreatment and abuse, experiences that preceded the entry of many into prostitution (e.g., 44% of Gemme's (1993) interviewees reported sexual abuse and 33% rape prior to entry into prostitution).

Adolescent prostitution is a significant concern in the large cities where adult prostitution is also more common (e.g., Toronto, Montreal, Vancouver, Calgary, and Edmonton accounted for about 80% of all recorded communicating offenses in 1992) (Wolff & Geissel 1994). Given the sizable number of runaway and subsequently homeless youths who gravitate to the urban core, service agencies are called upon to address the reasons for their running away from home (which may include physical or sexual abuse) and the subsequent consequences should they become involved in prostitution. While it is a criminal offense in Canada "to obtain or attempt to obtain the sexual services of a person under age 18, for consideration (i.e., any kind of payment or reward)" (MacDonald 1994, 19), Wolff and Geissel (1994) suggest that adolescent prostitution is a survival strategy arising from prior stressors and that supportive environments may be more important than legislative measures in addressing this problem.

### C. Pornography and Erotica

Canadians have a long history of debate over what legal sanctions the government could or should impose on sexually explicit books, magazines, films, and the like. As these materials became more readily available in the 1970s, it became popular to attempt to distinguish between obscenity and pornography on the one hand and erotica on the other. The growth of video sales, cable television, satellite technology, computer networks, and other communication technologies has made access to a wide range of sexual materials, particularly film and video, both more common and more likely to be used and approved at some level by women and men. For example, a 1992 Gallup Poll reported that 55% of Canadians 18 and over felt that adults should be able to buy or rent videos with explicit depictions of sexual intercourse; 37% said no and 7% had no opinion. Approval was highest in Quebec (69%), in accord with the more per-

missive and accepting attitudes of Québécois in the area of sexuality, and lowest in Atlantic Canada (49%). Approval was higher among men (64%) than women (46%) and among young versus older respondents (66% of those over 65 disapproved vs. 30% for those 18 to 29).

The current Obscenity Law—pornography is only mentioned in a new section on "child pornography"—applies to the making of a book, film, magazine, object, sex aid, recording, painting, and so on, that "corrupts public morals." "For the purposes of this Act," the law states, "any publication a dominant characteristic of which is the undue exploitation of sex, or of sex and any one of the following subjects, namely crime, horror, cruelty, and violence, shall be deemed obscene" (p. 22). MacDonald (1994) points out that obscenity is that which exceeds contemporary standards of community tolerance. The court's perception of this standard has shifted over time so that "nowadays hard-core pornography involving consensual adult sex is not considered legally obscene. However, scenes of sexual violence, degradation, and humiliation are still generally prohibited. Depictions of ejaculation upon another person, for example, are sometimes held to be degrading and therefore obscene" (MacDonald 1994, 22).

Despite a 1985 government committee report (Fraser Commission 1985) that could find no evidence for a causal link between pornography and crimes against women, Canadian public opinion and legislative sentiment has leaned toward legal control, particularly when sexuality and violence are involved. A 1992 Supreme Court decision in the Butler case adopted the notion that it was social harm, not necessarily the explicitness of the sexual content, that should be proscribed. Justice Sopinka's judgment argued that "we cannot afford to ignore the threat to equality resulting from exposure to audiences of certain types of violent and degrading material. Materials portraying women as a class as objects for sexual exploitation and abuse have a negative impact on the individual's sense of self-worth and acceptance." The decision, which now guides the way obscenity cases are charged, interpreted, and prosecuted in Canada, is based on the judge's definition of harm, i.e., that the material "predisposes persons to act in an antisocial manner as, for example, the physical or mental mistreatment of women by men, or what is debatable, the reverse." Avoidance of the presumed harm associated with pornography is, according to the judgment, "sufficiently pressing and substantial to warrant some restriction of the full exercise of the right of freedom of expression."

The guidance offered by the Butler decision does not alter the Criminal Code, which still includes the defense of serving the public good, i.e., "No person shall be convicted of an offense under this section if the public good was served by the acts that are alleged to constitute the offense and if the acts alleged did not extend beyond what served the public good." The notion of doing good while doing harm is difficult, but apparently not impossible, to reconcile.

In practice, it is the local police who lay charges and customs officials who detain books and magazines destined for entry into Canada. Rather than have the matter decided after the fact, some provinces such as Ontario have boards that view, in advance, all videos and films approved for distribution or showing. Nevertheless, it is still possible for local police to charge distributors of material approved by the board, and for subsequent prosecution under federal law. Despite official statements to the contrary, it appears that Canada Customs has been particularly restrictive on publications destined for the gay/lesbian/bisexual audience. Both Glad Day Books in Toronto, a pioneer in marketing gay and lesbian literature, and Little Sister's Book and Art Emporium in Vancouver, initiated lawsuits over books blocked by Customs. The latter is being supported by the British Columbia

Civil Liberties Association in a 1994-95 challenge to the provisions of the Customs Act that have allowed Customs to ban and detain books. The detentions usually apply to visual or verbal descriptions of sex with violent overtones (sadism and masochism, bondage, etc.), but other materials are also stopped if the title implies restricted content. Ironically, even a book by American feminist Andrea Dworkin, an opponent of pornography but not a proponent of Canada's new "harm-based" law as a way of dealing with it (Toobin 1994), has been stopped at Customs. Shortly before the Little Sister's case began, Canada Customs removed depictions of anal penetration from its guidelines for detaining or banning books, a restriction that probably contradicts provincial human rights code provisions that prohibit discrimination based on sexual orientation. In 1996, the court subsequently granted the plaintiff bookstore an interim injunction to enjoin the continued policy of systematic inspection by customs.

Human rights legislation in Canada may also be invoked in attempts to limit access to sexually explicit materials. For example, in early 1993 the Ontario Human Rights Commission established a board of inquiry to address complaints that local stores selling *Penthouse* and *Playboy* created a "poisoned environment" for women. Although the board of inquiry was halted in late 1993, the issues surrounding legislative regulation of sexual depictions is likely to continue.

Canada's "child pornography law," introduced in 1993, makes it an offense punishable by a maximum of ten years imprisonment to make, print, publish, or possess for the purpose of publication, any material classified as "child pornography." Possession is also prohibited and punishable by up to five years. In both cases, someone charged could be found not guilty "if the written material alleged to constitute child pornography has artistic merit or an educational, scientific, or medical purpose." Child pornography is defined as "a photographic, film, video, or other visual representation, whether or not it was made by electronic or mechanical means" that has one or more of the following features: (1) it "shows a person who is or is depicted as being under the age of 18 years and is engaged in or is depicted as engaging in explicit sexual activity"; (2) "the dominant characteristic of which is the depiction, for a sexual purpose, of a sexual organ or the anal region of a person under the age of 18 years"; or (3) "any written material or visual representation that advocates or counsels sexual activity with a person under the age of 18 years that would be an offense under this Act" (MacDonald 1994, 23).

However, the initial introduction of the child pornography law was considered hasty by some and in need of fine-tuning. A series of subsequent legal cases pertaining to this law are instructive in this regard. In October of 1993, Toronto artist Eli Langer was charged under this law for paintings of people engaged in sexual activity. Some of these individuals appeared to be males under the age of 18. A judge ruled the work to have "artistic merit" and the charges were dropped. Nevertheless, the Ontario government used a forfeiture application to seize the work as child porn. Langer's work was subsequently returned to him. In February of 2000, an Ottawa father of two children was arrested after a photo-lab technician flagged pictures of this man's four-year-old son playing without pajama bottoms. The charges were dropped, but the husband and wife involved were required to take a parenting course and spent the majority of their savings in legal expenses. Most recently, the Supreme Court of Canada ruled on the case of John Robin Sharpe, a 67-year Vancouver man charged with possession of child porn. Sharpe had pictures of boys as young as seven engaged in sex and a collection of his own writings titled "Kiddie Kink Classics." The Supreme Court and two lower

courts in British Columbia acquitted Sharpe on the basis that the charge violated his rights under the Charter of Rights and Freedoms.

Contention surrounding the child pornography law has centered around the need to balance the protection of children from sexual exploitation with the need for freedom of thought, belief, and expression this is protected in the Charter of Rights and Freedoms. One British Columbia judge who had been involved in the Sharpe case expressed concern that the law, as currently understood, was perilously close to criminalizing merely "objectionable thoughts." That said, there was agitation to remove the offense of possession from the child pornography law. However, critics pointed out that the removal of the offense of possession as unconstitutional would make it exceedingly more difficult to investigate and prosecute more serious offenses, such as the sale and distribution of pornographic materials. This debate was played out in the Supreme Court of Canada with a decision coming forth in January of 2002. The child pornography law that was ultimately upheld prohibits not only the possession of pornographic material involving children, but also written material depicting unlawful sexual activity with a child. The exceptions to this include material that is "for the public good" or otherwise defensible for its artistic, educational, medical, or scientific merit. Two further exceptions were also added at that time, the first of which speaks to written materials or visual representations created and held by the accused alone, exclusively for personal use. The latter includes visual recordings created by or depicting the accused that do not depict unlawful sexual activity and are for private use only (Baer, 2002).

Court proceedings on obscenity cases have been a common occurrence in Canada, and the courts, rather than legislators, appear to be the ultimate arbiters who weigh research evidence and public opinion in such matters. The development of phone sex lines, computer sex services, and other such means for accessing sexually explicit content are also testing the Canadian penchant for legislation in such areas. Although it is subject to some legal restriction, sexually explicit material is widely available in Canada.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception: Attitudes, Availability, and Usage

Although contraceptive pills, condoms, and other forms of contraception were available in Canada prior to 1969, it was only in that year that the law was changed to legalize the advertising, dissemination, and distribution of such methods for the purpose of contraception. The establishment of the Family Planning Division within the federal ministry of health in 1972 was consistent with the government's policy that adult Canadians should be able to determine voluntarily the number and spacing of their children. An important aspect of the division's work was to support development of community public health programs to reduce teen pregnancy. When the division was discontinued in 1976, due in part to opposition from quarters opposed to its mandate, the loss impaired development of services in smaller communities that needed both the resources and initiative provided by this kind of federal program (Orton & Rosenblatt 1993) Other divisions within Health Canada took up this mandate, as did the provinces, and contraceptive information and services are now generally available through public health units, Planned Parenthood centers, private physicians, pharmacies, and a variety of clinics and health centers. While knowledge about contraceptive meth-

ods is generally good, application of that knowledge, in terms of both motivation and finding a method suitable for each individual, is still a significant issue, not only for teens, but also for young adults who are increasingly postponing childbearing until their 30s and beyond.

While availability of contraceptive education and services for adults and teens has increased following legalization in 1969, a 1990 *Report on Adolescent Reproductive Health* (Health and Welfare Canada 1990) noted that teens, particularly in rural areas, still lacked adequate access to contraception and related sexual health services. To the extent that this deficiency reflected teen discomfort with the settings in which such services were provided, some high schools have established Sexuality Health centers (Campbell 1991) and some jurisdictions have introduced condom machines in the high schools (A. Barrett 1992). Neither of the above was then, or is now, a common occurrence in Canadian schools. Such programs generally arise only after an assessment of community needs and consultation with parents. When they do occur, they probably reflect an already high level of community acceptance. Indeed, the school-based sexuality education programs described in Section 3A, Knowledge and Education about Sexuality, Government Policies and Programs, and community agencies, such as public health units, Planned Parenthoods, and so on, are among the most common "official" sources through which students can get accurate information about contraception. Physicians also provide contraceptive information, as do websites sponsored by such organizations and by prominent medical groups such as the Society of Obstetricians and Gynaecologists of Canada. As a result, the 1998 Canadian contraception study found widespread familiarity with, and generally favorable opinions about, the contraceptive pill, condoms, and male and female sterilization among women aged 15-44 (Fisher, Boroditsky, & Bridges 1999). Familiarity and favorable ratings were lower for the female condom, injectable contraception, spermicides, cervical cap, and other such methods that might expand the range of options avail-

able to women as they make changes in contraception suitable for them at different times in their reproductive lives.

### Contraceptive Practices

The 1993, 1995, and 1999 Canadian Contraception Studies (CCS) (Fisher, Boroditsky, & Bridges 2000; Fisher & Boroditsky 2000; Boroditsky, Fisher, & Sand 1995, 1996) are among the few national sources of information on trends and current practices in contraceptive use in Canada in the 1990s. The 1995 General Social Survey also asked a national sample about current contraceptive use, but because it did not ask about current sexual activity, authors who use these findings have done so with caution (see Maticka-Tyndale, Barrett, & McKay 2000). This section relies on these national sources and a sampling of provincial studies to document current contraceptive practices in Canada and trends through the 1990s and into 2003.

For a variety of reasons, including religious conviction, some Canadians choose to use natural family planning methods (symptothermal method, etc.), and a number of organizations (e.g., SERENA) and agencies (clinics in Catholic hospitals) offer education and support for users of this method. Overall, however, Canadians are most likely to use the pill, condoms, and IUD early in their sexual lives, with sterilization (tubal ligation and vasectomy) being a popular method in later years.

Based on reports of current use among all married women aged 18-44 who were having intercourse, the 1998 CCS found that 28% used oral contraception, 31% condoms, 26% male sterilization, 14% female sterilization, 8% withdrawal, and 2-4% rhythm, IUD, or barrier methods. A small percentage used multiple methods. Among unmarried women aged 15-44, the comparable values were 66% pill, 64% condom, 1-3 sterilization, 12% withdrawal, 4% barrier methods, and 2% rhythm. Because most studies throughout the 1990s in Canada have focused on contraception and condom use among teens and young adults, these latter observations provide a reference point for the findings that follow.

Although young adults who are regularly involved with a sexual partner are most likely to use birth control pills for contraception, public health officials have encouraged the additional use of condoms as added protection against STDs. Free condom distribution by public health units has been used as a means to promote "dual protection" among pill users (Ullman & Lathrop 1996). In a survey of 249 male and 237 female urban, heterosexually active (in the past year) university students, Myers and Clement (1994) found that 52.2% of males and 39.7% of females reported condom use during vaginal intercourse. All respondents indicated at least one instance during the past year in which they had not used a condom during intercourse. Table 8 gives some of their choices from a list of 15 possible reasons for not using a condom the last time they had unprotected intercourse.

In their replies to attitudinal questions about sex and condom use (strongly agree 1 to strongly disagree 5), females more strongly disagreed than males with the statements "safer sex is boring" (mean scores of 4.1 for females vs. 3.7 for males), "condoms are a turnoff" (3.4 for females vs. 3.1 for males), "it's safe for long-term lovers to have whatever sex they want with each other" (2.6 for females vs. 2.4 for males), "it's hard to have safer sex with alcohol or drugs" (3.2 for females vs. 2.6 for males), and "it's hard to have safer sex with an attractive person" (4.0 for females vs. 3.4 for males). Although both sexes agreed that "sexual enjoyment is an important part of life," females gave slightly more agreement (1.9 for females vs. 1.7 for males) (Myers & Clement 1994). Overall, female university students showed more positive attitudes toward condom use and a stronger be-

**Table 8**

**Reasons Identified by Heterosexual University Students for Not Using a Condom the Last Time They Had Unprotected Sexual Intercourse<sup>1</sup>**

Reason for Not Using a Condom During Last Act of Unprotected Sexual Intercourse <sup>2</sup>	Percentage Citing the Reason	
	Female	Male
Was with regular sex partner	55.7	49.1
Thought we were safe	44.3	47.4
Did not have a condom <sup>3</sup>	24.6	45.6
Did not want to use one	27.0	35.3
No sex with anyone else	25.8	24.3
Sex was so exciting <sup>4</sup>	17.4	30.6
Partner didn't want to use one <sup>5</sup>	13.8	27.8
Using drugs or alcohol <sup>3</sup>	4.2	13.3
Had just met partner <sup>5</sup>	4.2	12.1
Was embarrassed to buy	3.6	5.2

<sup>1</sup>Results from Myers and Clement (1994, 52). Sample includes 249 male and 237 female heterosexually active university students (average age ~22 years); 83.6% of respondents had used condoms at some point in their lives, 69.4% in the last year.

<sup>2</sup>Percentages add up to more than 100 because some respondents picked more than one of the 15 possible reasons on a list of options.

<sup>3</sup>sig. diff.,  $p < 0.001$

<sup>4</sup>sig. diff.,  $p < 0.005$

<sup>5</sup>sig. diff.,  $p < 0.05$

lief in their ability to use condoms than did male university students. This, in turn, translated into more conscientious practices reported by women than men. Two important subtexts in negotiations about condom use are a behavioral norm of serial monogamy among Canadian university students (i.e., there is never more than one partner, but partnerships do not last for more than a few months) and the traditional cultural norm that leads women to trust and defer to their partners, and men to expect this.

In a 1991 study of young adults (aged 15 to 29) in Quebec, 14.7% of sexually active respondents said they had never used a condom (9% for ages 15 to 19, 15.2% for ages 20 to 24, 16.8% for ages 25 to 29 years old). Another 41.3% said they had stopped using them (28.5% for ages 15 to 19, 40.2% for ages 20 to 24, 48% for ages 25 to 29), and 44% said they still used them (62.5% for ages 15 to 19, 44.6% for ages 20 to 24, 35.2% for ages 25 to 29). Among those in the total sample who were respectively either currently using or had previously used condoms, the reasons for ever having used condoms (multiple choices possible) were: contraception (77%, 83%), danger of STD (65%, 45%), new partner (29%, 27%), many partners (11%, 8%), and had or have an STD (2%, 4%) (Santé Québec 1991). The findings suggest that many young people in Quebec may use condoms for contraception early in their sexual interactions and then shift to other methods of contraception and away from condoms as they get older and perhaps more established in a relationship.

Among college students (CEGEP) in Quebec, 18% said they had not used a contraceptive method the first time they had intercourse, 14% used a condom and the pill, 11% the pill only, and 55.3% a condom only. When asked about the contraceptive method used the last time they had sexual intercourse, 4.2% said none, 18% said the condom and pill, 49.2% the pill only, 26% the condom only, and 1.7% used other methods (Samson et al. 1996). In a study of contraceptive use by 745 sexually active anglophone and francophone university students in Montreal and Ontario, Lévy et al. (1994b) found that in the previous six months (1992-93) 72.4% overall reported using the pill, either alone (35.4%) or in combination with a condom (19.1%) or with other methods (17.9%), whereas condom use with the pill or other methods was less common (41.7%). The sizable percentage using some method of contraception (97.7%) and the lower percentage incorporating condom use (41.7%) is consistent with the suggestion that pregnancy prevention still predominates over STD/HIV prevention in the decision-making of a sizable percentage of university students. Although most students had only one partner in the previous six months (85.2%), having had more than one partner was the variable that correlated most strongly with condom use. Condom use was less common among those with higher coital frequency.

Tonkin's (1992) study of 15,549 students in grades seven to 12 in public and independent schools in British Columbia provided data on a variety of social and health-related issues affecting young people. With specific reference to sexual activity and contraceptive use, he found that 33% of males and 28% of females in the sample had ever had intercourse. For those in grade 12 (ages 17 to 18), the figures were 55% for males and 52% for females. Among the British Columbia high school students who were currently "sexually active," 64% of males and 53% of females said they used a condom in their last experience of sexual intercourse. Overall, 49% of sexually active students said they used condoms, 25% birth control pills, 8% withdrawal, 2% other methods, and 13% no method; 3% said "not sure."

A convenience sample of 660 15- to 18-year-old females in Toronto (Insight Canada Research 1992) found that among the 41.8% who said they were sexually active, the

contraceptive methods used were condoms (29%), condoms and the pill (24%), the pill (22%), condoms and foam (4%), other (3%), or no birth control (26%).

The 1995 Canadian Contraception Study (Boroditsky et al. 1996) used a self-administered questionnaire to assess the contraceptive attitudes and practices of a random sample of 1,428 women aged 15 to 44 (57.5% married, 42.5% unmarried) drawn from 20,000 households that had previously agreed to be subjects in market research studies. Based on all respondents in the sample, the percentages currently using various methods of birth control were as follows: the pill (30%); condom (25%); male sterilization (14%); female sterilization (12%); IUD (11%); no method (15%); none because pregnant or trying to get pregnant (7%); withdrawal (5%); hysterectomy/menopause (3%); cream/jelly/foam (3%); rhythm (3%); IUD (1%); and diaphragm (1%). Not surprisingly, sterilization (male or female) was used by 38% of all married women versus 7% of not currently married women of all ages. Since the study did not determine the proportion of young unmarried women who were sexually active, or lesbian, it is not known what proportion of the 15% of nonusers had no need of contraception. However, among teens who have ever used the pill, 35% said they started using it before their first intercourse, 22% as soon as they became sexually active, and 33% within one year.

Based on his research with university students, William Fisher (1989), from the University of Western Ontario, has described a "Contraceptive Script" that Canadians typically follow. This script outlines a common progression of contraceptive methods that are used as individuals first become sexually active and form committed relationships. When young Canadians first become sexually active they typically use either no contraception or one or a combination of condoms and withdrawal. The use of oral contraception is usually begun after a woman has been sexually active for a period of time, or when she considers her sexual partnership to have become "long-term" or "committed." When relationships are terminated, it is not uncommon for contraceptive practices to return to an earlier form (e.g., to cease using oral contraception and rely on withdrawal or condoms in new partnerships), though as women move through a larger number of partnerships, they more typically continue using oral contraceptives. Though there has been no single large-scale national study to test Fisher's script, the studies cited here, and others, consistently provide support for the conclusion that the Contraceptive Script is commonly followed.

With respect to contraception and STD prevention at first intercourse, a study of grade 10 and 12 high school students in Regina, Saskatchewan, in 2000 suggests that the stereotype of unplanned and unprotected first intercourse may be changing. Among the 539 females and 470 males who reported on their contraceptive use at first intercourse, 42.3% overall used condom only, 27.8% used condom and pill, 6.6% used pill only, and 6.8% used other methods alone or in combination (Hampton, Smith, Jeffery, & McWatters 2001). Overall, about 80% used a reliable method of contraception and 72% used a condom. Males and females did not differ in this respect, nor in the percentage who used no method (15.9% of females and 16.3% of males). Among all students who had intercourse, about half felt that their parents would strongly or somewhat disapprove of their having sex, whereas over 70% of student surveyed who had not had intercourse expected such parental disapproval. Interestingly, a high percentage of all students who anticipated parental disapproval for their having sex felt that their parents would approve of their using condoms.

Among unmarried women aged 18-29, the 1998 CCS found that well over 80% used contraception at first inter-

course with their current partner, and slightly fewer used contraception at their most recent intercourse with this partner (Fisher & Boroditsky 1999). However, condom use was noticeably higher at first than most-recent intercourse, and pill use was higher at most-recent than first intercourse.

In the *Ethnocultural Communities Facing AIDS* study, respondents in long-term relationships were asked about their current contraceptive practices. Eighteen percent of women and 28% of men from the English-speaking Caribbean communities reported no contraceptive use, compared to 12% of South Asian men, and 20% of women and 24% of men from the Latin American communities. Condoms were the most common contraceptive reported in all communities (62% of English-speaking Caribbean women and 54% of men, 47% of South Asian men, and 37% of Latin American women and 44% of men), followed by oral contraceptives (49% of English-speaking Caribbean women and 33% of men, 26% of South Asian men, and 30% of Latin American women and 22% of men) (Maticka-Tyndale et al. 1995).

## B. Teen Pregnancy

Canadian statistics on teen pregnancy do not distinguish between married and unmarried teens, nor is it possible to determine the extent to which marriage may have been precipitated by unintended pregnancy (although this tendency is much less likely than 20 years ago). Given that teen marriage rates are low and that most teen pregnancies are assumed to be unplanned and unwanted, Canadians generally approach teen pregnancy as a problem (although this may not be so in some northern aboriginal or First Nations communities where teen sexuality and pregnancy are less stigmatized).

A major review of teen pregnancies in Canada from 1974-1997 (Dryburgh 2000) plus Statistics Canada data for 1998 provide background to the current situation. The pregnancy rate is established by combining data on registered live births, therapeutic abortions in hospital (and only since the 1990s, in free-standing clinics), plus registered stillbirths, hospitalized

cases of spontaneous abortion, and so on. From 1974 to 1997, the teen pregnancy rate (births per 1,000 women aged 15 to 19) dropped from 53.7 in 1974 to 41.1/1,000 in 1987, and then, in a reversal of this downward trend, increased steadily each year to 48.8/1,000 in 1994, whereafter, it has declined each year to 41.7/1,000 in 1998. This unexplained shift upward in teen pregnancy rates in the late 1980s and early 1990s was observed in a number of developed countries (Singh & Darroch 2000). The residual effect in Canada may be a continuing public perception that teen pregnancy rates are increasing. While this is not so, the percentage decline in teen pregnancy rates in Canada from 1970-1995 was less than in some of the countries that we often use for comparison (e.g. France, Germany, Sweden, Denmark, and Australia), although comparable to others (e.g. England, New Zealand, Scotland, and Spain) (see Singh & Darroch 2000; Darroch, Singh, & Frost 2001; and Maticka-Tyndale 2001).

Teen pregnancy rates vary by province and territory, with the lowest levels in 1998 in Newfoundland and Labrador (31.5/1,000) and the highest in Yukon, Manitoba, and Northwest Territories (including Nunavut) (58.3/1,000 to 90.3/1,000) (see Table 9). Because teen abortion rates also vary by province, the birthrates to 15-19-year-olds range from 14.9/1,000 in Quebec to 90.3/1,000 in the Northwest Territories (including Nunavut), with an overall national rate of 19.8/1,000 (comparable to England, lower than the United States, and double or more the rates in Sweden and France) (see Darroch, Singh, & Frost 2001).

Given the tendency of teenaged females to have somewhat older male partners, a sizable percentage of the males involved in the pregnancies of 18- to 19-year-olds may not have been "teens" themselves. An analysis of U.S. teen pregnancies and births (which occur at a significantly higher rate than in Canada) reported that 70% of the male partners were over 20 (Males 1992). A comparable national analysis has not been done in Canada, but an update on adolescent birth statistics for the City of Toronto in 1993 (Phillips 1994) revealed a similar pattern to that in the U.S. Of the 364 births to 15- to 19-year-olds in Toronto in 1993, 54% ( $N = 196$ ) had a record of the father's age. Of these fathers, 25% were 15 to 19, 45% were 20 to 24, and 30% were over 25. Among the 18- to 19-year-old females (65% of the births in the sample), the father's age was 15 to 19 for 18%, 20 to 24 for 51%, and over 25 for 31%. Among the 15- to 17-year-old females who gave birth, fathers' ages were 15 to 19 (44%), 20 to 24 (30%), and over 25 (26%). The available data covering STD cases for 1992 also support the conclusion that a sizable percentage of STD cases in female adolescents were acquired from males over the age of 19. Although these results cannot be generalized to the entire population, they are an indication that the majority of teen pregnancies may not involve male teen partners. It is not known what proportion of the pregnancies were either planned or desired.

In 1989, 58% of pregnant 18- to 19-year-olds gave birth (66% in 1975), 36% had induced abortions (25% in 1975 when abortion was less accessible), and 6% had other recorded pregnancy terminations (9% in 1975). In 1989, the absolute number of births to 15- to 17-year-olds was 46% less than in 1975, and to 18- to 19-year-olds, 40% less. Given the personal consequences of teen pregnancy for parent and child, prevention of unwanted pregnancy remains an important sexual and reproductive health issue in Canada (Wadhwa & Strachan 1991).

## C. Abortion

In 1988, the Supreme Court of Canada effectively decriminalized abortion in Canada by declaring the existing law (revised in 1969) unconstitutional. Prior to this, abortion

**Table 9**

### Rates of Teen Pregnancy, Abortion, Miscarriage, and Birth for Canada, the Provinces and Territories in 1998<sup>1</sup>

Province/ Territory	Rate per 1,000 15-19 Year Old Females			
	Pregnancy	Abortion	Miscarriage	Birth
CANADA	41.7	20.9	1.0	19.8
Newfoundland/ Labrador	31.5	9.7	1.4	20.4
Prince Edward Island	36.4	5.6	1.0	29.7
Nova Scotia	39.7	15.3	0.4	24.0
New Brunswick	37.8	10.0	1.3	26.4
Quebec	40.0	24.4	0.7	14.9
Ontario	38.1	20.3	0.6	17.2
Manitoba	65.2	23.2	3.4	38.7
Saskatchewan	52.8	13.4	1.5	38.0
Alberta	50.9	23.3	2.2	25.4
British Columbia	38.8	21.7	0.9	16.1
Yukon	58.3	29.6	0.0	28.7
Northwest Territories <sup>2</sup>	117.0	24.9	1.9	90.3

<sup>1</sup>1998 was the fourth consecutive year of decline in Canada's teen pregnancy rate subsequent to a high of 48.8/1,000 in 1994.

was illegal unless done by a doctor in an approved hospital, following certification by the hospital's therapeutic abortion committee that the woman's life or health would be endangered if the pregnancy continued. The Supreme Court decision was based on a woman's right to "life, liberty and the security of the person" under Canada's Charter of Rights and Freedoms. That decision has not eliminated the continuing struggle by some antiabortion groups to discourage abortion and block legal access to it. Campaign Life Coalition, Alliance for Life, Canadian Physicians for Life, and Human Life International are among the best known of the groups supporting this view. The groups most identified with retaining and improving women's right and access to abortion and educating about these issues are, respectively, the Canadian Abortion Rights Action League (CARAL) and Childbirth by Choice. A major impetus to change in the Canadian law has been the repeated charging, conviction, and subsequent acquittal of Dr. Henry Morgentaler for providing illegal abortions, i.e., illegal because, although medically safe and performed in a clinical setting, it was not done in an accredited hospital.

Dr. Morgentaler (and others) have now established clinics in a number of Canadian cities; all have been extensively picketed and some have been directly attacked—the original Toronto clinic was destroyed by arson in 1983. Many providers of abortion in clinics and hospitals continue to experience varying levels of picketing and/or harassment by protesters. In several provinces (e.g., Alberta and Ontario), the harassment of patients, staff, nurses, and/or the physicians who perform abortions has led to injunctions to prevent protesters from demonstrating directly in front of some clinics or physicians' residences.

The impact of public attitudes and disagreements about abortion, and the continuing acrimony surrounding this issue, extends widely into debates about sexuality education in schools, availability of clinical services, public health policies, and religious beliefs. A 1989 national survey found that 27% of Canadians thought abortion should be legal under any circumstance, 59% legal under certain circumstances, 12% illegal under all circumstances, and 3% had no opinion. This pattern of response has been consistent since 1975 (Muldoon 1991). In 1989, at the time that the federal government was considering a bill to recriminalize abortion (i.e., effectively a return to the 1969 version of the law), a national opinion poll commissioned by CARAL found that 62% disagreed with this plan, 28% agreed, and 9% had no opinion or did not reply. One year later, after the bill had been passed by the House of Commons and sent to the Senate for approval, a similar poll had responses of 66%, 25%, and 9%, respectively. The Senate defeated the "recriminalization" bill in January 1991. This meant that no federal law was in place and that abortion would be dealt with, as in other medical matters, by provincial and medical regulations. That is the current situation.

At present, all provinces except Prince Edward Island (PEI) provide varying degrees of access to abortion in hospitals, and all but PEI (which pays under special circumstances) will pay some or all of the cost under health plan coverage. There are now a total of 17 free-standing clinics (i.e., separate from hospitals) in Canada that provide abortion (none in Saskatchewan, PEI, or the territories) with the host province paying full costs in two provinces, partial costs in four, and no costs in the remaining four. Access to abortion still varies considerably across Canada, and there is significant financial hardship involved for women in many settings, particularly in remote Northern areas and in PEI, Newfoundland, and Saskatchewan (the three most rural provinces). Abortion continues to be a focus and flashpoint for differing beliefs and ideologies about sexuality and social policy.

When asked to identify the circumstances of pregnancy under which they would consider legal abortion acceptable, Canadians surveyed in 1990 gave higher approval under conditions such as harm to the woman's health (82%), pregnancy from rape or incest (73%), or the strong chance of serious defect in the baby (69%), than under specific social conditions, such as low family income (38%) (Muldoon 1991). These distinctions have prevailed in such surveys for over 20 years and suggest that Canadians, although generally approving of legal access to safe abortion, also have opinions about the criteria they would like to see used when such decisions are made.

In 1998, there were 110,520 therapeutic abortions in Canada, 61.7% in hospitals, 38% in free-standing clinics, and slightly less than 0.3% in the U.S. (see Tables 10, 11, and 12). This represents 32 abortions per 100 live births and 15.4 abortions per 1,000 women aged 15 to 44. The inci-

dence of unreported abortions is unknown but probably quite low. It has been suggested that the increase in the absolute number of abortions in the late 1980s and early 1990s may have been because of a prolonged economic recession, but this pattern may also reflect younger women's desire for greater financial security prior to childbearing, which fits with the continued decline in fertility rates (Wadhwa & Miller 1997). In 1998, women under 20 accounted for about 21% of abortions, and about half of the women who sought abortions had one or more children. The 1998 teen abortion rate of 20.9 abortions/1,000 women aged 15 to 19 is within the range observed throughout the 1990s (19.3-22.0/1,000 15-19-year-olds) and represents about one half of all pregnancies in this age group. This rate is consistent with the national and international evidence (reviewed by Bissell 2000) that an appreciable number of teens (excluding those who are married or do not have access to abortion services) may have chosen to become pregnant or to continue an unplanned pregnancy.

One problem for Canadian women seeking access to hospital abortions has been the waiting time involved. This is an issue not only because of increased risk and anxiety, but because of the restrictions placed on late abortions in some settings. Data collected on 59,694 therapeutic abortions conducted in hospital settings in 1992 showed that almost 90% were within the first 12 weeks of pregnancy. Time since conception for all cases was: less than 9 weeks (35.5%); 9 to 12 weeks (53.5%); 13 to 16 weeks (6.7%); 17 to 20 weeks (1.7%); over 20 weeks (0.3%); and unknown (2.2%). The so-called abortion pill, RU-486, which disrupts gestation early in pregnancy, has not yet been approved for testing or release in Canada.

#### D. Population Planning

To the extent that a population policy attempts to influence the size, rate of growth, distribution, age structure, or composition of a population, Canada does not have such a policy. Federal government policy ensures the right of people to regulate the number and spacing of their children, but does not directly advocate increasing population size through more births. The fertility rate has been below replacement since 1971 and a *de facto* policy favoring con-

tinued growth was in the setting of higher immigration levels at about 250,000 per year for the 1989-94 period, which was considerably higher than in previous years. The federal government's immigration plan for 2003 projects 220,000 to 245,000 immigrants and reflects a continuing blend of economic and humanitarian goals, rather than a population policy per se.

At the provincial level, Quebec, has offered a financial incentive to women who give birth in any year, presumably as a means of maintaining the francophone population (and perhaps total population as well, since Quebec's fertility rate is the lowest in Canada). Quebec also has some influence on immigration to that province (i.e., to maintain Quebec's share of total population, which was 23.7% in 2002), an agreement arising from Quebec's relationship with the rest of Canada, and an option that some other provinces also wish to exercise. In fact, the actual proportion of immigrants to Canada who settle first in Quebec has been dropping annually from 22.4% in 1991 to 12.5% in 1994 (Dumas & Belanger 1996). Overall, Canada has no stated national policy concerning distribution of the population. Immigrants settle predominantly in only a few provinces where jobs and other family members are located (e.g., over half of all immigrants come to Ontario, 25% of these to the Metropolitan Toronto area), but this is the result of circumstance and economics and not as a guided policy decision regarding population distribution.

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### A. Sexually Transmitted Diseases

##### *Incidence, Patterns, and Trends*

The final report of the Royal Commission on New Reproductive Technologies, published in 1993, argued that a countrywide strategy was needed to prevent STDs and that this "must become a priority if we are to reduce the prevalence of infertility among Canadian couples in the future" (Royal Commission on New Reproductive Technologies 1993). Research done for the commission showed that many people lacked adequate access to quality reproductive health services that could either reduce their risk of acquiring STDs or provide rapid diagnosis and treatment. This was noted particularly for isolated and rural areas, and for many adolescents, single adult women, people with disabilities, and cultural and linguistic minorities.

Despite the decreasing incidence of some STDs in the early 1990s, Gully and Peeling (1994) reported that STDs remained the most common reportable infections in Canada. This was and is an ongoing concern because about one third to one half of women who acquire an STD (usually chlamydia or gonorrhea) will develop pelvic inflammatory disease (PID), representing about 80% of all cases of PID. While it is difficult to estimate accurately the rates of PID, Health Canada data cited in the Royal Commission report gave age-specific rates of between 243/100,000 and 306/100,000 for women in the four age groups 15 to 19, 20 to 24, 25 to 29, and 30 to 34. STDs appear to play only a small role in male infertility in Canada, but the most recently available incidence data presented in Table 13 suggest that STDs continue to be an important health concern for both sexes. In the 10 years that followed publication of the Royal Commission report, we have seen both gains and reversals in STD-prevention efforts.

**Table 13**

#### Number and Percentage of Selected Reportable Sexually Transmitted Disease Cases by Age and Sex in Canada (2000)\*

Categories (Age/Years)	Number of Reported Cases (Percentage of All Cases)			
	Gonococcal Infection	Infectious Syphilis	Chlamydia	Hepatitis B*
Rate	20.2/100,000	0.7/100,000	151.1/100,000	10.5/100,000
Total	6,222	171	46,452	2,815
Male	3,850 (61.9)	111 (64.6)	13,557 (29.2)	1,805 (64.1)
Female	2,368 (38.1)	60 (35.1)	32,869 (70.8)	984 (35.0)
Under 15	58 ( 0.9)	0 ( 0.0)	554 (11.9)	77 ( 2.8)
15-19	1,407 (22.6)	7 ( 4.1)	14,792 (31.8)	176 ( 6.3)
20-24	1,566 (25.2)	15 ( 8.8)	17,003 (36.6)	360 (12.8)
25-29	963 (15.5)	23 (13.5)	7,163 (15.4)	482 (17.1)
30-39	1,477 (23.7)	59 (34.5)	5,064 (10.9)	860 (30.6)
40-59	690 (11.1)	56 (32.7)	1,592 ( 3.4)	684 (24.3)
60+	51 ( 0.8)	11 ( 6.4)	74 ( 0.2)	135 ( 4.8)

Note: Numerical totals may not match since age and/or sex unspecified in a small proportion of cases.

\*Hepatitis B data are for 1995.

Data source: Division of Sexual Health Promotion and STD Prevention and Control, Bureau of HIV/AIDS, STD & TB, Health Canada 2002.

In 1997, Health Canada published national goals for STD prevention that set cautiously optimistic targets (based on 1995 rates) for reductions by 2000 and 2010 in the rates of all major STDs and their sequelae (see Patrick 1997a in a special theme issue of the *Canadian Journal of Human Sexuality* on STDs and Sexual/Reproductive Health). For example, based on a steady 5-year decline in reported cases of chlamydia to a rate of 127/100,000 in 1995, a goal of 80/100,000 for 2000 and 50/100,000 by 2010 was reported (Patrick 1997b). Infectious syphilis was to be maintained at less than 0.5/100,000 by 2000, with endemically acquired syphilis to be eliminated by 2010 (Romanowski 1977). Similar expectations for declines in gonorrhea (Alary 1997) and PID and ectopic pregnancy (MacDonald & Brunham 1997) were reported, as were conceptual analyses of the behavioral and social changes needed to achieve these goals (Maticka-Tyndale 1997; Fisher 1997). Health Canada's routinely updated *Canadian STD Guidelines* also provide guidance for STD prevention and management.

The most recent data available show an unexpected resurgence of STDs in the late 1990s and early 2000s (Patrick, Wong, & Jordan 2000). For example, reporting rates for gonorrhea, which had declined from over 40/100,000 in 1990 to a low of 14.9/100,000 in 1997, increased in each of the three subsequent years to a rate of 20.2/100,000 in 2000 (Table 3). Similar changes have been noted for chlamydia, which had declined to 112/100,000 by 1997, but increased yearly thereafter to 151/100,000 in 2000, and for infectious syphilis, which remained below the national goal at 0.4/100,000 in 1997, but increased to 0.7/100,000 in 2000.

About 78% of reported cases of chlamydia in 2000 (58% in the case of gonorrhea) involved youth aged 15-24 (Table 13). The reported chlamydia rate among females aged 15-19 in 2000 was over 5 times that for males, and rates for both sexes were considerably higher in 2000 than in 1997 and over double the national goal set for 2000 (Patrick et al 2000). Although some slight increase in chlamydia rates had been expected in the mid-1990s as a result of more sensitive and less-invasive testing, the recent upward trend, which is also seen in gonorrhea, is unlikely to be explained solely by improved detection of existing cases. The trend is also not unique to Canada. International comparative studies of STD rates among youth in developed countries suggest that Canada has lower gonorrhea rates among teens of both sexes than the United States, comparable rates to England and Wales, and higher rates than Sweden, France, Finland, Belgium, and Denmark (Panchaud et al. 2000). In the case of chlamydia, rates in the mid-1990s were high in all but Belgium and France among these comparator countries, with Belgium and France showing the most sizeable rates of decline in chlamydia rates among teens from 1990-1996. Subsequent increases in Canada and other developed countries will require a revisiting of this analysis, along with an explanation for the recent upward trend.

STD rates vary considerably between provinces, reflecting differences in age structure, migration, and socioeconomic circumstances. For example, in 2000, the national gonorrhea rate of 20.2/100,000 included values of 0-6/100,000 in Newfoundland, PEI, and New Brunswick, 6.0-9.1/100,000 in Nova Scotia and Quebec, respectively, 16.9-24.2/100,000 in Yukon Territories, British Columbia, Alberta, and Ontario, 44.7-57.3/100,000 in Saskatchewan and Manitoba, respectively, and 318-346/100,000 in the Northwest Territories and Nunavut. Overall, the gonorrhea rate in Canada has declined by more than 50% in the last 10 years, even with the increases from 1997-2000. The national goal to eliminate endemically acquired gonorrhea by 2010 will require efforts to reverse that trend. In the case of

infectious syphilis, the national goal set in 1996-97 was to maintain rates below 0.5/100,000, which was seen at the time as the most realistic option, given the low likelihood of a global eradication plan. More recently, in response to a localized outbreak of syphilis in Vancouver, British Columbia, and several neighboring regions, Wong and Jordan (2000) renewed the call for a national strategy to eradicate endemic syphilis in Canada.

Given that the Royal Commission on New Reproductive Technologies identified STDs as the primary preventable cause of infertility among Canadians, the continuing high incidence of chlamydial infection, particularly among young women, is a major concern that might also be well served by a national elimination strategy. Both diagnosis and treatment for chlamydia are widely available in Canada, but there are significant problems with control of this disease, because many people show no symptoms, the duration of infectiousness is long, and many people do not complete their course of medication if symptoms clear up quickly (Gully & Peeling 1994). These issues are particularly significant for teenage females who have the highest rates in Canada for chlamydia (Table 14).

Among the nonreportable STDs, herpes simplex 2, and human papilloma virus (HPV) infections are the most worrisome in Canada. Although it is difficult to obtain accurate national data, the evidence suggests that HPV is becoming more common, particularly in the younger age groups. Herpes simplex 2 seroprevalence has probably also increased in Canada in the last ten years as in the U.S. There were approximately 55,000 recorded patient visits for genital herpes in Canada in 1993, a number that includes multiple visits and probably underestimates the prevalence of infection.

There have been no studies specifically addressing perception of risk for STDs, and actions taken by individuals to prevent STDs, though studies on prevention of sexual transmission of HIV/AIDS, and some on contraceptive use also address STD prevention through condom use. In the Santé Quebec study (1991), about 50% of women and 60% of men in all age categories perceived themselves to be at risk

of contracting an STD. When asked what factors they thought would increase the likelihood of their using condoms (responses were “agree,” “more or less agree,” “disagree”), the statement “partner requested it” was the only one that received more “agree” than “disagree” responses (66% agree, 23% disagree). Other suggested options that might have influenced condom use were: if condoms were less expensive (32% agree, 54% disagree), condoms were more accessible (38% vs. 53%), thinner condoms (26% vs. 58%), better knowledge about how to use them (24% vs. 69%), and more use of condoms by those around me (36% vs. 55%).

## B. HIV/AIDS

The tragedy of HIV/AIDS has focused public attention on a wide range of sexual, ethical, and public policy issues touching all segments of society. Its devastating impact on gay men, on people with hemophilia, and increasingly on other segments in society, has forced Canadians to address not only the pragmatic aspects of prevention and treatment, but also the core questions of homophobia, discrimination (not only toward gay men and lesbians, but also toward people who are ill or disabled), our attitudes toward different sexual practices, our comfort with explicit discussions of sexual behavior, and a broad range of issues unresolved during the “sexual revolution” of the 1960s and the “gay rights revolution” of the 1970s.

### *Incidence, Patterns, and Trends*

As of June 30, 2002, Health Canada’s Centre for Infectious Disease Prevention and Control (CIPDC) had received reports of 18,336 cases of AIDS (90.9% in adult men, 7.8% in adult women, and 1.1% in children under 15 (see Table 15). However, estimates in the 1990s indicated that only about 85% of cases will eventually be reported (i.e., for a variety of reasons, underreporting is about 15%). Because there are also delays in reporting in any year and because the annual figures are corrected for such delays and for underreporting, Canada has probably had closer to 14,000 cases of AIDS in adults to the end of 1993. Based on these adjusted estimates, the growth in the number of cases

of people with AIDS in Canada is as follows (value is total cases for the indicated time period): 1979-83 (107); 1984-88 (3,889); 1989 (1,668), 1990 (1,756); 1991 (1,906); 1992 (2,267); 1993 (2,379).

During the period between April 1991 and March 1992, Canada had an annual AIDS incidence rate of 5.7 cases per 100,000 person years. Compared to the 31 European countries, this incidence rate was higher than all but Spain, Switzerland, France, and Italy. However, for this time period, Canada’s 5.7 per 100,000 incidence rate was substantially lower than the 17.7 per 100,000 rate in the United States (Remis & Sutherland 1993). Based on known cases of people with AIDS reported in Canada during 1992 ( $n = 1,330$ ), 93.9% were male and 6.1% female, distributed according to age as follows: 0 to 14 years (1.2%); 15 to 19 (0.2%); 20 to 24 (2.3%); 25 to 29 (12.9%); 30 to 39 (46.2%); 40 to 59 (34.9%), 60 and over (2.3%).

It is estimated that over 80% of the deaths to date have been gay men. While men who have sex with men accounted for 79% of all new cases of AIDS in 1987, that percentage had dropped to 69% in 1994 (CCDR 1996). In contrast, injection drug use, which was the risk factor associated with 1% of new cases in 1987, accounted for 6% of cases reported in 1994. Based on the experience of AIDS in adults to 1994, the risk factors identified with transmission were: homosexual/bisexual activity (77%), injection drug use (3%), both of the above (4%), heterosexual activity (9%), receiving HIV-infected blood or clotting factor (4%), and no identified risk factor (4%) (LCDC 1994).

It is unknown how many people in Canada are currently infected with HIV. One estimate from the *Canadian Communicable Disease Report* (1992) put the number at 30,000 to 40,000. In the 1996 CCDR, the estimate was 45,000. Estimates cited by Remis and Sutherland (1993) state that the prevalence of HIV infection among homosexually active men is 10 to 15%. The same report cites seroprevalence estimates in intravenous drug users ranging from 1 to 2% in the city of Toronto to 15 to 20% in the city of Montreal. Seroprevalence estimates from seven separate studies on adult women indicate seroprevalence rates per 1,000 adult women of 0.1 in Alberta, Saskatchewan, Manitoba, Prince Edward Island, Yukon, and Northwest Territories, 0.2 to 0.3 in British Columbia, Ontario, New Brunswick, and Nova Scotia, 0.6 in Quebec, and 1.2 in Newfoundland. Four provinces, Ontario, British Columbia, Alberta, and Quebec, account for 95% of all cases in Canada.

Shifts in the epidemiology of the disease and the potential for further change make it difficult to predict the incidence and distribution of HIV infection among specific populations. For example, the proportion of cases of AIDS in adults resulting from male-to-male sexual transmission has been steadily decreasing from 81.5% in 1988 to 73.5% in 1992 and 1993. The proportion of adults with AIDS who are injection drug users has been increasing from 4.6% in 1988 to 10.2% in 1993 (LCDC 1994). The number of people who acquired AIDS from blood products (hemophiliacs and others) peaked in 1988 and blood testing initiated in 1985 has almost eliminated this risk factor. (A national commission is currently investigating the Canadian blood supply [Krever Commission] and may identify populations who received blood products during or prior to 1985, but have not been notified or tested.) Reported cases of AIDS in women increased in each of the three-year periods between 1982 and 1990, and the cumulative incidence of AIDS in women in Quebec is almost four times the national average (probably because of the higher number of immigrants from countries where AIDS is more common) (Remis & Sutherland 1993).

<sup>2</sup>Children under 15 years of age.

<sup>3</sup>Delays for both AIDS reporting and death reporting make it inadvisable to subtract the latter from the former to calculate the number of Canadians living with AIDS.

<sup>4</sup>Subtotal includes 18 cases where gender was unknown.

<sup>5</sup>Total includes 4 cases where age was unknown.

### *Prevention, Treatment, Government Programs, and Policies*

The development of strategies and policies to prevent the spread of HIV infection has required basic research on Canadians' knowledge about AIDS, their attitudes toward people with AIDS, their perception of the government's role in prevention and treatment, and on aspects of their behavior that might place them at risk of infection. As of the mid-1980s, there had been no large-scale national surveys available as a basis for addressing such questions. In late 1988, the Institute for Social Research at York University conducted a national telephone interview survey of a representative sample of 1,259 Canadian adults to obtain data relevant to these issues (Ornstein 1989). By the time of the survey, there had been considerable public discussion about AIDS in the media and most respondents were knowledgeable about transmission, the distinction between AIDS and HIV infection, and the effectiveness of different methods of prevention. Nevertheless, 26% believed that blood donors were at risk of infection and another 5% did not know. In addition, a sizable minority (9 to 12%) believed that HIV could be spread by food preparation, that it could be cured if treated early, and that people who were infectious would show symptoms of the disease. Another 12 to 18% did not know the answers to these questions.

Among the groups or agencies that respondents perceived as having a major responsibility for AIDS education (as opposed to "some" or "should not be involved"), parents were identified most often (82%), followed by doctors and STD clinics (about 75%), and federal and provincial governments, public health agencies, and community AIDS organizations (58 to 70%). While 45.6% said churches should have some responsibility, 35.2% said they should not be involved. It is perhaps a reflection of Canadians' deference to medical and parental authority that doctors and parents were rated so highly, since neither group has been a major source of HIV/AIDS information for most people. Indeed, television and newspapers were the most frequent sources of AIDS information identified by respondents (39% and 23%, respectively).

Ornstein (1989) summarized his findings on Canadian attitudes toward some of the sociopolitical aspects of AIDS as follows:

1. Sixty-nine percent of Canadians would permit their child to continue to attend a school class taught by a teacher who was infected with HIV, and another 8% would do so with qualifications.
2. Eighty percent of Canadians believe that HIV-infected persons should be legally protected from discrimination by landlords and employers. [Note: Discrimination in employment based on HIV status is generally prohibited in Canada, and people with AIDS cannot be summarily dismissed because of that status.]
3. By more than a two-to-one majority, Canadians support anonymous testing for HIV. [Note: Although AIDS is a reportable disease, anonymous testing for HIV infection is available in some clinics. In addition, samples may be submitted anonymously by a physician who knows the identity of the donor.]
4. There is very strong support for allowing physicians to demand a test for HIV from patients they suspect to be infected, and for compelling HIV-infected individuals to disclose the names of their sexual contacts.
5. About 60% of Canadians oppose providing needles to injection drug users. [Note: Needle-exchange programs are now operating successfully in a number of Canadian cities.]

6. A nearly two-to-one majority indicates support for allowing high school students to obtain condoms in their schools (Ornstein 1989, 101).

### *HIV/AIDS Issues in Various Ethnocultural Communities*

In late 1989 and early 1990, Health Canada (then called Health and Welfare Canada) initiated national consultations to identify the specific needs of ethnocultural communities with respect to HIV/AIDS prevention. The *Ethnocultural Communities Facing AIDS* project arose from those discussions. Epidemiological and demographic data gathered in the first phase were used to identify six participating communities (South Asian and Chinese in Vancouver, communities from the Horn of Africa and English-speaking Caribbean communities, and Latin American and Arabic-speaking communities in Montreal). Community-identified representatives for each group formed the six Regional Research Groups, which met regularly with the researchers. Each community group included community leaders, healthcare professionals, people working in the AIDS field, and others. Six in-depth reports were produced as a result of the qualitative research (focus groups in each community and interviews) (Health Canada 1994a-f; available from the National AIDS Clearinghouse). The reports illustrate "the ways in which individual life experiences in the country of origin, combined with the challenges of recent emigration, can affect sexual health." Selected observations from the reports give an indication of the type and complexity of issues involved for the different communities.

Many recent immigrants find Canada to be a country of relatively liberal sexual values compared to their country of origin. Because they often come to Canada with more conservative sexual norms and customs than found in "mainstream" Canadian culture, members of some ethnocultural groups require HIV/AIDS-prevention education programs that are designed to be culturally appropriate for their particular group. In some of these ethnocultural communities, an explicit discussion of sexuality between parents and children or between men and women is taboo. For example, in a focus group, Punjabi women discussed how "some girls do have sexual experiences before marriage, but will never talk about them because doing so would 'wreck their reputation'" (Health Canada 1994e, 11). Or as a woman from the Horn of Africa commented, "Since our childhood, sex was presented to us negatively, and there is no way we can appreciate talking about it" (Health Canada 1994b, 16).

In addition, in some of these culturally distinct Canadian communities, there is a denial of the existence of gay, lesbian, and bisexual behavior among community members. As one focus-group participant from the South Asian community suggested, "A man who has sex with men won't accept the fact that he is gay" (Health Canada 1994e, 12). Or, as told by a study participant from the Horn of Africa, "People do not want to acknowledge or believe that homosexual behavior, or gay men, lesbians, and bisexuals, exist in their community. This denial leads those men and women who want to have same sex relationships to hide their behavior 'in the closet'" (Health Canada 1994b, 14).

Negotiating condom use is particularly difficult in some of these communities. For example, in the Chinese communities, "Most people who participated in interviews and focus groups report that condoms are not being used to prevent AIDS and other STDs. Women feel they are powerless to instigate condom use with their husbands or male partners, because it raises issues of 'trust' and 'promiscuity'" (Health Canada 1994f, 13). In some ethnocultural communities, condoms are seen as preventing a male from fulfill-

ing his role in procreation or in maintaining his family line or the racial group. A woman from the English-speaking Caribbean islands suggests that within her communities, "There's a general conception that the condom equals genocide. You commonly hear men saying, 'my seed has to flow'" (Health Canada 1994c, 12).

The findings of the qualitative phase of the *Ethnocultural Communities Facing AIDS* project illustrate that the values, norms, and customs related to the discussion of sexuality, sexual orientation, gender roles, and condom use, among other issues, are sometimes unique to particular ethnocultural communities. In the third survey phase of this project, questions were asked about various sexual experiences, risk perception, condom use, and psychosocial determinants of condom use with new sexual partners. Table 16 summarizes a selection of results in each of these communities.

Perceptions of personal risk and of the degree to which AIDS poses a problem varied between communities. For example, respondents from the Latin American communities were most likely, and those from the South Asian communities were least likely, to consider AIDS a problem in their communities. South Asian men were least likely, by far, to consider themselves at risk for HIV infection and also the least likely to have been tested for HIV. No more than four individuals from any of the communities reported that they had tested positive for HIV infection. Reports of condom use with new partners support the conclusion that a minority in each of the communities is using condoms consistently. There was no statistical association between frequency of condom use and perception of risk in any of the communities.

The survey also examined the major psychosocial determinants of planning to use condoms in future sexual relationships. Both the strength of these determinants and their specific content varied across the communities. These results, together with those from the qualitative phase, underscore

the need in Canada to develop HIV/AIDS intervention strategies suitable for the target audience's ethnocultural identity.

### *National, Provincial, and Local Resources for Prevention*

The Canadian AIDS Society, a coalition of over 90 local AIDS Committees and other community-based organizations, is actively involved in advocacy, public education, treatment, care, and support for people with AIDS. Most community AIDS initiatives in Canada began in, and are sustained by the gay community, with support from all levels of government and the local community. The second revised edition of the Society's *Safer Sex Guidelines* (Canadian AIDS Society 1994) provides authoritative guidance for educators and counselors on assessing the risk of HIV transmission via different sexual behaviors and on reducing that risk.

### *Safer Sex Practices of Selected Populations*

*Gay and Bisexual Men.* In 1991-92, the first national survey in Canada to assess possible effects of different variables on HIV-test-seeking and sexual behavior of men who have sex with men was conducted in 35 cities across Canada (Myers et al. 1993). The sample of 4,803 men (20.9% over the age of 22) was recruited from gay-identified settings in seven geographical regions, and questionnaires, administered in English or French, were used for data collection. The salient measure of sexual risk-taking reported in the study was at least one instance of unprotected anal intercourse in the previous three months. Overall, 22.9% reported at least one instance of unprotected anal intercourse (15% reported having had unprotected receptive anal intercourse), 64.7% said that they had had an HIV test, and 11.8% reported that they were HIV-positive.

Comparisons based on city size (cities under 500,000, 500,000 to 1 million, and over 1 million), indicated that those from smaller cities were considerably less likely to have been tested (55.2% vs. 63.2 and 69.2%) and somewhat more likely to have engaged in unprotected anal intercourse (26.3% vs. 23.5% and 20.9%).

Lévy et al. (1994a) reported higher levels of condom use during anal sex among francophone gay men who were in occasional versus stable partnerships, and lower levels of condom use in both groups during oral sex (Table 17). The findings are consistent with other reports of increased use of safer-sex practices among multi-partnered gay men.

*High School Students.* The *Canada Youth and AIDS Study* reported on the knowledge, attitudes, and behavior with respect to AIDS of over 38,000 Canadian youth aged 11 to 21 (King et al. 1988). The study, which provided a fairly comprehensive picture of the sexual behavior of Canadian high school students, found that 31% of males and 21% of females had had intercourse by grade 9. By grade 11, these percentages increased to 49% for males and 46% for females. AIDS was second to pregnancy as the outcome of sexual intercourse that high school students worried most about. Although this study did not measure condom use among high school students, 48% held negative attitudes toward condoms.

In a late-1980s study of grade 11 students ( $N = 1,275$ , average age 17 years) in

**Table 16**

### **Selected Responses to Questions Related to HIV/AIDS Risk and Perception of Risk in Communities Participating in the Ethnocultural Communities Facing AIDS Project**

	Percentage Responding in Each Category				
	English-Speaking Caribbean		South Asian	Latin American	
	Women ( $N = 190$ )	Men ( $N = 187$ )	Men ( $N = 364$ )	Women ( $N = 176$ )	Men ( $N = 176$ )
AIDS is a problem in our community:					
Agree	50	48	30	90	86

Have been tested for HIV	38	37	21	30	32
Frequency of condom use with new partners:					
Never	12	6	13	12	14
Sometimes	62	66	38	59	56
Always	26	29	47	28	30

Data adapted from Maticka-Tyndale et al. 1996.

Montreal, Quebec, Joanne Otis and her colleagues found that 53% of respondents who had had intercourse (about 60% of both sexes) said they used a condom the first time. Only 18.2% said they did so constantly thereafter; 67.2% reported using the pill for contraception (Otis et al. 1990). The best predictor of a student's stated intention to use a condom with a future new partner was whether or not the female was using oral contraception, i.e., the intention to use condoms was lowest if it was assumed that the female would be taking the pill, and greatest if she was not. Otis et al. (1990) proposed that Canadian educators should reinforce the acceptability and desirability of condom use with a new partner, even if the female partner is using oral contraception (see also Otis et al. 1994). In a recent review of studies on adolescent sexual behavior, Otis et al. (1996) made the following observations related to HIV prevention among high school students in Quebec in 1995: (1) 50 to 75% said they had used a condom at first intercourse, an increase between 1988 and 1995; (2) about 50 to 60% of all sexual contacts involved condom use and 13 to 48% used a condom in all their sexual relations; (3) 22% of 15-year-olds and 39% of 18-year-olds said they had taken an STD test and 14% of high school teens had taken an HIV test. In the population of adolescents surveyed at youth or leisure clubs and at youth centers (for young people with social or other problems), the numbers were higher in all categories. For example, at youth and leisure clubs, 65% reported condom use at first intercourse, 38% used condoms in all their sexual relations, and 41% had taken an HIV test.

Studies in the provinces of Alberta and Nova Scotia have also reported on the frequency of condom use among high school students. In the Alberta study, 41% of "sexually active" high school students indicated that they either did not or infrequently used condoms, and 59% reported that they frequently or always used condoms during sexual intercourse (Varnhagen et al. 1991). In one study of Nova Scotia high school students, 55% reported using condoms "more than just some of time"; 35% always used condoms (Langille et al. 1994). Another school-based survey in Nova Scotia (Poulin 1996) found approximately 61% of grade 12

students having had sexual intercourse during the past year, 40% indicating they had had two or more sexual partners. Of those who were sexually active, only 32% reported always using a condom.

Although the reported frequency of condom use among Canadian high school students is less than adequate for HIV/AIDS prevention, this group appears to use condoms more frequently than either college/university students (e.g., King et al. 1988; Ramsum et al. 1993) or adults (e.g., Ontario Ministry of Health 1992).

*College/University Students.* Because they are mostly young, single, highly sexually active, and accessible to researchers, college/university students have been widely used in studies of knowledge, attitudes, and behaviors related to HIV/AIDS. The *Canada Youth and AIDS* study found that among college students, 77% of males and 73% of females had at least one experience of intercourse. Sixty-eight percent of the males and 64% of the females reported having oral sex; 14% of the males and 16% of the females reported having anal sex. Numbers of partners for males and females, respectively, was: one (23%, 36%); two (12%, 17%), three to five (29%, 26%), six to ten (17%, 14%), and 11 or more (19%, 7%). Forty-four percent of males and 30% of females identified AIDS as the outcome of sex that worried them most (pregnancy was much higher at about 60%, and other STDs much lower at 4%). When those who had intercourse were asked about condom use, the responses for males and females, respectively, were: always (19%, 11%), most of the time (16%, 9%), sometimes (43%, 52%), and never (22%, 28%) (King et al. 1988).

A comparison of British Columbia university students surveyed in 1988 (in the same year as the *Canada Youth and AIDS* study), and again in 1992, indicated no change in the number who reported being sexually active within the last six months (62%), a slight decline in the proportion with multiple partners (i.e., 2 to 7 partners in the last 6 months) from 30% to 24% of those who were sexually active, and some increase in the proportion using condoms "always" (17% to 25% in 1992) or "most times" (6% to 15%). However, the number reporting never used condoms (51% vs. 40% in 1992) or sometimes used (26% vs. 20% in 1992) remained high (Ramsum et al. 1993). This study is consistent with the findings of other studies of university students that have found that, although they are highly knowledgeable about HIV/AIDS, this group's perceived risk has not been sufficient to overcome some of the barriers to consistent condom use (e.g., immediate accessibility, inconvenience, peer-group perceptions, religious beliefs, influence of alcohol, etc.) (Ramsum et al. 1993).

Another study of college students in Montreal found that perceived risk of HIV infection was correlated with having a friend who had had an HIV test and having more than one coital partner. For women, the level of trust in a relationship was also correlated with perceived risk of HIV ("I trust this person, I must be at low risk"). For men, their confidence in their ability to assess whether or not it was necessary to use condoms with a particular partner was also correlated with perceived risk of HIV infection (Maticka-Tyndale & Lévy 1993). Recent reviews on condom use among college students in Quebec (Otis et al. 1996; Samson et al. 1996) found: 47 to 67% used condoms at first intercourse, an increase from 1983-1995; condom use was less common with a regular partner (38%) than with occasional partners (66%); 34% had taken an STD test and 14% an HIV test). The comparable findings among university students (Otis et al. 1996) were: 42.5% said they used condoms at first intercourse, fewer used condoms with a regular partner (34%)

**Table 17**

**Condom Use and Sexual Behavior in Francophone Gay Men: A Comparison of Men in Stable Partnerships and Men with Occasional Partners**

Sexual Activity in Past Six Months	Percentage of the Group Reporting the Behavior	
	Stable Partnerships <sup>1</sup> (N = 276)	Occasional Partners <sup>2</sup> (N = 336)
Fellatio (active)	92.6	92.8
Used condom <sup>3</sup>	3.8	9.4
Fellatio (received)	94.1	96.7
Used condom	3.9	6.4
Anal sex (active)	54.6	43.0
Used condom	61.3	90.7
Anal sex (received)	51.5	34.8
Used condom	59.9	92.9

<sup>1</sup>66% said the relationship was exclusive.

<sup>2</sup>29% said they had one partner in the last 6 months (Average for group = 10).

<sup>3</sup>Condom used means in all such activities in the previous 6 months.

Data from Levy et al. (1994a).

than with an occasional partner (88%), and 14% had taken an HIV test. Current prevention efforts with this group are increasingly using theoretically based approaches to behavior change (Fisher & Fisher 1992) that stress information, motivation, and behavioral skills (IMB), and identification with people known to have AIDS (i.e., influencing personal perception of risk). Because empirical research increasingly indicates that educational interventions based on an IMB approach are successful in helping people perform sexual health problem-prevention behavior, the IMB approach is recommended by Health Canada's *Canadian Guidelines for Sexual Health Education* (Minister of Supply and Services Canada 1994).

*Street Youth.* Street youth represent a particularly high-risk group for HIV infection because of the greater likelihood of involvement in prostitution, IV-drug use, unprotected homosexual or bisexual activity, and backgrounds of family disruption, abuse, and attendant low self-esteem. As part of the *Canada Youth and AIDS* study, 712 street youth aged 15 to 20 were interviewed about their sexual practices and HIV-risk behavior (Radford et al. 1990). Ninety-four percent of the sample was sexually active, 32% never used condoms, 32% used condoms sometimes or most times, and 26% always used condoms; 75% used drugs and 12% occasionally injected drugs (half using shared needles). Needle-exchange programs in several major cities have helped reduce the spread of HIV in street youth, but this selected population remains at high risk and is therefore the focus of significant outreach programs by a variety of youth-serving agencies. The First National Conference on HIV/AIDS and Youth held in Toronto in 1989 led to publication of a *National Inventory of AIDS Organizations for Youth*, listing over a hundred such organizations and agencies across Canada.

More recent studies of street youth (Frappier & Roy 1995; McCreary Centre Society 1994) indicate that 85 to 98% have had sexual intercourse. For over 60%, age of first intercourse was before 13 years. Fifty-two to 78% reported having six or more sexual partners in their lifetime, with many reporting inconsistent condom use.

*First Nations People.* Few studies have investigated the incidence of HIV infection among First Nations People in Canada. One study of a high-risk population in the city of Vancouver found an infection rate of 6% among First Nations People (Rekart et al. 1991).

The *Ontario First Nations AIDS and Healthy Lifestyle Survey* (Myers et al. 1993) is the largest Canadian study to date on the HIV/AIDS-related knowledge, attitudes, and behavior of First Nations People. At the time the study was initiated in 1989-90, there was little AIDS education for this population, but there was significant concern about the risk of infection in such close communities with a tradition of early sexual activity and ongoing experience of "social, economic, psychological, spiritual, and political concerns" and of other factors contributing to "the inequities in health that First Nations People experience" (Myers et al. 1993). Consultation with four Provincial Territorial organizations (Association of Iroquois and Allied Indians, Grand Council Treaty Number Three, Nishnawbe-Aski Nation, and the Union of Ontario Indians) resulted in interviews with 658 individuals (about an equal number of males and females) from 11 First Nations communities across Ontario.

In this sample of First Nations People, overall knowledge of HIV/AIDS was relatively low. For example, although 97.6% knew that "A person can get AIDS from having sex without a condom with someone who has AIDS," 85.3% incorrectly believed that donating blood could result in HIV infection for the donor; 18.3% gave an incorrect answer and

49.1% were uncertain in response to the item "Using Vaseline with a condom makes it weak and easier to break." Of the respondents who had heard of AIDS, 6.8% reported having been tested for HIV (7.8% of this group had tested positive) and 71.9% felt they had no risk for HIV infection. An additional 18.9% felt they had only a small chance of getting AIDS. About 40% of the men and 18% of the women had two or more sexual partners in the past year. Approximately 16% of the respondents reported having participated in anal sex at least once in their lifetime. In the 12 months prior to the survey, 29.8% of the respondents reported no sexual activity, 44.8% inconsistently used HIV-infection prevention measures when having sex, 12.1% never used condoms for vaginal or anal intercourse, and 13.3% reported engaging in only mutual masturbation or always using condoms for vaginal and anal intercourse. A recent analysis of the data on condom use from the study identifies a range of sociodemographic and behavioral factors associated with use or non-use of condoms, and discusses the findings in the context of the limited research available on safer-sex practices in First Nations populations (Burchall 1997).

The authors of the Ontario First Nations AIDS and Healthy Lifestyle Survey concluded from their findings that in order to be successful, HIV/AIDS-prevention efforts aimed at First Nations People must be culturally appropriate. They write, "The approach must be holistic and rooted in the culture, traditions, and customs of aboriginal communities, and therefore must embrace the entire community including the youth, parents, elders, and community leaders" (Myers et al. 1993, 63). For a country of considerable multicultural diversity, this principle of cultural appropriateness is an important facet of HIV/AIDS-prevention efforts aimed at Canadian audiences.

### *The Direct and Indirect Costs of AIDS*

Efforts to figure the costs of AIDS commonly focus on calculating the direct medical costs of treating persons with HIV and AIDS, the costs of healthcare professionals' salaries, research, hospital care, medication, and psychological support for affected families and close relatives. The direct medical costs of treating one Canadian with HIV/AIDS from the time of infection to death is estimated at between \$150,000 and \$215,000.

Seldom, if ever, considered are the indirect costs of the disease in lost future earnings caused by AIDS-related deaths. In a pioneering 1995 study sponsored by the British Columbia Center for Excellence in HIV/AIDS, economist Robin Hanvelt and colleagues (1994) estimated that AIDS has already cost Canada \$3.3 billion in lost future earnings for all the men aged 25 to 64 years old who died from AIDS between 1987 and 1992. The average estimated loss of future earnings per death was \$651,200 in 1990 figures. The total loss in future earnings attributable to HIV/AIDS in Canada was exceeded only by those for ischemic heart disease, suicide, motor-vehicle accidents, and lung cancer. Hanvelt believes his calculations, based on a six-year study of 5,038 Canadian men who died of HIV/AIDS, are conservative. While the annual future loss of income remained relatively stable or declined for other causes of death, earnings lost through HIV- and AIDS-related deaths more than doubled from \$309 million in 1987 to \$817 million in 1992. Hanvelt estimates that the indirect costs of AIDS-related deaths in Canada will exceed \$1.5 billion in 1996.

Combining estimates of direct and indirect costs of HIV/AIDS provides a clearer and more realistic picture of the social costs in terms of lost creativity, skills, knowledge, and productivity resulting from the premature death of thousands of young people.

[Update 2002: UNAIDS Epidemiological Assessment: It is often instructive to examine the rates of HIV infection by subgroup. However, it should be noted that estimates of positive HIV-test results by exposure category are limited to the extent that such statistics reflect only those cases where exposure category is reported. As a result, these figures tend to underestimate total exposure rates by category and are much lower than overall totals.

[Information on HIV prevalence among pregnant women is available since 1989. HIV-prevalence studies among pregnant women indicate an overall rate for Canada of between 3 and 4 per 10,000. Large metropolitan areas generally have higher prevalence rates: for example, 5.1 per 10,000 for Vancouver versus 1.9 per 10,000 for the rest of British Columbia province (outside Vancouver) in 1989 to 1994; 13 to 20 per 10,000 for Montreal versus 0 to 3.5 per 10,000 for the rest of Quebec in 1994 to 1995. Although women in general continue to be a minority of those newly infected with HIV, it is noteworthy to examine the absolute number of new positive HIV-test results for females from 1995 to 2000. While a decline was noted from 1995 to 1996 to 1997 (528, 541, and 456 cases, respectively), this did not continue in 1998, 1999, and 2000 (493, 544, and 544 cases) (Health Canada 2001).

[For sex workers (both male and female), there are six HIV-prevalence studies that had such information. Overall, between 1985 and 1993 and in major urban centers, the prevalence rates ranged from 1.9% for sex workers only and 1 to 22% for sex workers who were also injection drug users.

[Recent prevalence data on men who have sex with men in Canada shows a decline until 1998, which leveled off in 1999 and appears to have increased in 2000. The 2000 increase is the first noted since the 1980s. Prior to this time, there had been a trend toward decline in positive HIV reports among men who have sex with men (Health Canada 2001). Studies of specific cohorts in Vancouver have also shown this trend, but not in Montreal (Martindale et al. 2001; Remis et al. 2001).

[In examining the rates of positive HIV-test reports among injection drug users in Canada, one sees a general decline from 1995 to 2000. For example, the highest rates of incidence and reporting in some of the larger cities in 1996 (about 500 new cases) appears to have dropped notably in 2000 (about 300 new cases) (Health Canada 2001; Patrick et al. 2001). Nevertheless, it is unclear whether this decline is a function of saturation of the highest risk populations as opposed to the success of public policy (Patrick, Wong, & Jordan 2000).

[Among clients at STD clinics, HIV prevalence rates in sites outside major urban areas were approximately constant at about 1% during 1985 to 1994. However, the rate in major urban areas appears to have decreased from 15.8% in early 1985 to 1988 to 1.5 to 6% in 1991 to 1995. Interpretation of the validity of this decrease is complicated by the paucity of truly comparable data.

[The gradual decline in the number of new cases of HIV infection in Canadian adults from 1995 to 1998 has not continued (Patrick, Wong & Jordan 2000). According to Health Canada (2000), the rate of decline has leveled off between 1998 and 2000.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	55,000 (rate: 0.3%)
Women ages 15-49:	14,000
Children ages 0-15:	< 500

[An estimated less than 500 adults and children died of AIDS during 2001.

[No estimate is available for the number of Canadian children who had lost one or both parents to AIDS and

were under age 15 at the end of 2001. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

Dr. Stephen Neiger, the founder of the Sex Information and Education Council of Canada, was probably the first practitioner to introduce "modern" sex therapy to the Canadian scene in the early 1960s. Neiger's behavioral approach to the common sexual dysfunctions (primary or secondary anorgasmia, vaginismus, and painful intercourse in women, erectile dysfunction and premature ejaculation in men) was a contrast and challenge to the traditional belief that treatment of such problems required psychotherapy to determine their root causes. Neiger viewed many such problems as a product of inadequate education, cultural taboos, and the anxiety and negative reinforcement generated by unrealistic performance expectations. The growing North American interest in sex therapy in the early 1970s, spurred by the release of Masters and Johnson's *Human Sexual Inadequacy*, and by the prospect of rapid, symptom-oriented treatment, led to increasing demand for such help and the implicit expectation that medical professionals would be adequately trained to provide it.

While such training has indeed become more available in Canada and more accessible to Canadian therapists because of developments in the U.S., the situation at present is quite limited. Canadians do have wide access to counseling about sex-related topics, since professionals from a variety of backgrounds (physicians, social workers, psychologists, public health nurses, occupational therapists, school guidance counselors, and clergy) may be trained, to varying degrees, to assist with sexual concerns as part of their broader work requirements. They do this counseling in a variety of settings, including private practice, hospitals, community health centers, family service agencies, sexual assault centers, and so on, and are bound by the ethical standards of their professions and individual agencies. Such individuals have generally not been trained as sex therapists and would probably refer clients with problems that required such therapy. There are still few people trained as sex therapists and few opportunities for such training in Canada. The Department of Sexology at the University of Quebec at Montreal and the Department of Family Studies at the University of Guelph in Ontario are the only institutions in Canada to offer postgraduate training and degrees in sex therapy (see addresses in Section 12B, Sex Research and Advanced Professional Education, Canadian Sexological Organizations and Publications).

Since there are no official self-regulating colleges of sex therapy in the provinces or nationally as there are for other medical specialties, the question of who is a sex therapist and how they are trained is a continuing issue in Canada. Alexander's (1990) review of sexual therapy in English-speaking Canada identifies this concern about standards for training and practice as a primary reason for the formation of the Board of Examiners in Sex Therapy and Counseling in Ontario (BESTCO) in 1975. The ten founding therapists, all members of the Ontario Association for Marriage and Family Therapy (OAMFT), established criteria for training and certification of therapists that they then applied to themselves and to subsequent members. They assumed that provincial or national certification of sex therapists was imminent and that the group would be prepared for that event. That step toward regulation of sex therapists has not taken place. BESTCO remains the only group in Canada that has a formal, nonstatutory certification procedure for certifying already-accredited marriage and family therapists who wish

to have their specialization in sex therapy recognized by a body of their peers.

Some sex therapists in Canada are certified by the American Association of Sex Educators, Counselors, and Therapists (AASECT), by the U.S.-based Society for Sex Therapy and Research (SSTAR), by the American Board of Sexology, and/or by other comparable international organizations specifically identified with sex therapy; others are certified for work in their field, e.g., medicine, nursing, psychology, pastoral counseling, marriage and family therapy, and related fields, which may or may not require specific advanced training before unsupervised practice in sex therapy can be done. For example, physicians can do sex therapy but do not have a formal requirement for certification of that specialty, despite the scarcity of such training in most medical schools. On the other hand, there are many physicians in Canada who are specialists in sexual medicine, but whose specialty is still not recognized by the Royal College of Physicians and Surgeons of Canada.

Only physicians and psychiatrists are permitted to bill the provincial health plans for sex therapy services, but their numbers are insufficient to meet the demand. Private sex therapy can be expensive for the average person, although some insurance plans will cover part of the cost of therapy if done by psychologists, social workers, or other health professionals covered by specific plans. Because of Canada's size and the location of therapists in large urban centers, sex therapy is simply not available to most people in smaller communities.

Canada has also had a chronic shortage of trained therapists who can work with people with paraphilias, gender disorders, psychiatric disorders, or medical conditions with sexual implications. Professionals who treat children and adults who have been sexually abused or assaulted, and those working with sex offenders, also require more training in sexuality than is currently available.

Sex therapists are expected to have accredited training in marital, family, and relationship therapy and to then acquire advanced skills and experience in sex therapy. The options for the latter in Canada include:

1. attending the week-long, Intensive Sex Therapy Training Institute offered at the University of Guelph, Ontario, prior to the annual Guelph Sexuality Conference;
2. obtaining supervision time with a therapist credentialed as a supervisor by a recognized accrediting body (AASECT, BESTCO, etc.);
3. taking the clinical training program in the Department of Sexology in the University of Quebec at Montreal (in French); or
4. becoming a member of a sexual medicine unit that trains therapists (e.g., the Sexual Medicine Unit at the University of British Columbia has had a longstanding program to train nurses and social workers as sexual healthcare clinicians, an excellent grounding for subsequent certification in sex therapy).

Continuing issues influencing the development of sex therapy in Canada include:

1. Feminist redefinition of "dysfunction" and development of new models for thinking about sexual response in the context of women's experience, rather than as a biologically mandated sequence of physiological events;
2. recent technological and pharmacological developments in the treatment of erectile dysfunction (e.g., injections and vacuum constriction devices), sexual desire disorders, and paraphilias;

3. the relationship between sex therapists and self-help movements, such as the 12-step programs for sex and love addiction (e.g., Sex and Love Addicts Anonymous);
4. the debate about the role of therapists in facilitating recovered memories of childhood sexual abuse and the therapeutic, legal, and political implications of practice in this area; and
5. dealing equitably with ethnocultural differences pertaining to sexuality. For example, the Canadian Medical Association recently banned physicians from doing the procedure referred to as ritual circumcision (Brighthouse 1992) or genital mutilation (Omer-Hashi & Entwistle 1995), which is common in some parts of Africa and requested by some immigrants to Canada.

## 12. Sex Research and Advanced Professional Education

### A. Sexological Research and Postgraduate Programs

Most sexological research in Canada is done by individuals or groups linked either directly or indirectly with universities. This work almost invariably occurs within specific academic disciplines (e.g., history, sociology, psychology, women's studies, philosophy, medicine, epidemiology and public health, education, family studies, criminology, etc.) rather than in a university department of sexology. The Department of Sexology at the University of Quebec at Montreal is the only department of sexology in Canada. Founded in 1969, it offers Bachelor's and Master's programs in human sexuality taught in French by approximately 20 full-time academic staff representing many fields of specialization. The master's program, which began in 1980 and was officially recognized by the university in 1985, offers internships, projects, courses, and other practical training in counseling and sex education (Dupras 1987). Candidates for the master's program in counseling come primarily from related fields, such as medicine, psychology, criminology, and social work, while those in the education stream usually come from the Bachelor of Human Sexuality Program (Dupras 1987; Gemme 1990). The Department is the major center for research on human sexuality in Quebec and also publishes *Bibliosex, a biannual bibliography of sexuality literature in Canada and internationally*.

Some academic departments in other parts of Canada offer graduate programs in human sexuality (e.g., University of Guelph, Department of Family Studies), but it is more common for graduate research on sexuality topics to occur within master's and Ph.D. programs in specific academic disciplines. Since 1978, the Family Studies Department has sponsored an intensive week-long annual June conference and training institute on sexuality at the University of Guelph, Ontario. The Departments of Psychology at both the University of Western Ontario and the University of New Brunswick are two examples of strong graduate research training in sexuality within a particular field. The Department of Sociology and Anthropology at the University of Windsor has the largest complement of sociologists—four—in a single department who are actively conducting research in sexuality. The department offers three undergraduate courses and one graduate seminar in sexuality, and students are able to pursue an undergraduate honors or a master's degree specializing in Family and Sexuality.

A number of medical faculties also provide postgraduate training in sexology. For example, the Sexual Medicine Unit at the University of British Columbia offers a clinical and research setting through which residents in Obstetrics and Gy-

necology and in Psychiatry can obtain advanced training. A number of other hospitals have Sexual Medicine Units or similar specialized services (e.g., the Sexual Health Unit at Montreal General Hospital), but there have been no national reviews of postgraduate sexuality training for physicians or for any of the other health disciplines, either as it pertains to research training, the subject of this section, or sex therapy training, which was discussed in Section 11, Sexual Dysfunctions, Counseling, and Therapies.

In her report to a 1994 gathering of Chinese and North American sex educators and researchers in China, Byers (1995) noted that training in sexological research within specific disciplines is highly variable across Canada. Such training often occurs only because a faculty member hired for expertise in another academic area is also interested in sexuality. This situation makes the necessary multidisciplinary requirements of sexological training more difficult to find, and trainees, particularly in smaller centers, may not have easy access to a network of like-minded colleagues. She notes that this fragmentation has made it hard for sex research to flourish as a field in English Canada, even though individual researchers and research groups have achieved considerable recognition (Byers 1995). For example, the Gender Identity Unit at Toronto's Clarke Institute of Psychiatry is internationally known for research on transsexuality, the Social Program Evaluation Group at Queen's University in Kingston, Ontario, has published major studies on adolescent sexual behavior, the Department of Psychology program at the University of New Brunswick is well known for research on the psychology of male-female sexual interactions in dating and longer-term relationships, the Sexual Medicine Unit at the University of British Columbia is known particularly for work on sexuality, disability, and chronic illness, researchers in the Sociology and Anthropology Department at the University of Windsor have developed international reputations for their qualitative and multimethod research on homosexuality and on sexual transmission of HIV, and the research done in the Department of Psychology at the University of Western Ontario has influenced Canadian policy and practice in the prevention of teen pregnancy, STDs, and HIV infection. Despite these achievements, the discipline-based focus of much sex research has made it difficult to achieve a public profile for the sexological research community in Canada.

The Canadian Sex Research Forum, founded in 1969, is Canada's only national organization dedicated to a multidisciplinary focus on sexological research. The *Proceedings* of the CSRF meetings have been published annually by the Sex Information and Education Council of Canada, first in the *SIECCAN Newsletter* (1982-1985), then in the *SIECCAN Journal* (1986-1991), and now in the *Canadian Journal of Human Sexuality* (1992-present). In Quebec, l'Association des Sexologues de Québec promotes various aspects of sexual science, and the biannual journal *Revue Sexologique/Sexological Review* publishes national and international papers, the majority in French, many by Quebec researchers.

There appear to be many more people doing sexuality research in Canada than the approximately 100 Canadians who are members of CSRF and/or the Society for the Scientific Study of Sexuality (SSSS) in the United States. A systematic record of this large group would both identify, and perhaps unify, those individuals who, despite their primary identification with another academic discipline, also share a common interest in sexology. Such a record might also enhance training and supervision of sex researchers by facilitating cross-disciplinary communication. This issue is one of many that a workshop at the 1993 Canadian Sex Research Forum meeting identified as a major deficiency in

the training of many sex researchers in Canada and internationally (Aronoff, McCormick, & Byers 1994).

## B. Canadian Sexological Organizations and Publications

### *Addresses of Organizations*

L'Association des Sexologues de Québec, 695 St. Denis, Suite 300, Montreal, Quebec, Canada H2S 2S3.

Sex Information and Education Council of Canada (SIECCAN), 850 Coxwell Avenue, East York, Ontario, Canada M4C 5R1.

Canadian Sex Research Forum, c/o Pierre Assalian, M.D., Executive Director, 1650 Cedar Avenue, Room B6-233, Montreal, Quebec, Canada H3G 1A4.

The Department of Sexology, University of Quebec at Montreal, 455 Boulevard Rene Levesque East, Montreal, Quebec, Canada H3C 3P8.

Planned Parenthood Federation of Canada, 1 Nicolas St., Suite 430, Ottawa, Ontario, Canada K1N 7B7.

### *Sexological Publications*

Three Canadian publications provide a professional focus on sexological issues and research:

*Canadian Journal of Human Sexuality* (4 issues per year), Sex Information and Education Council of Canada (SIECCAN), 850 Coxwell Avenue, East York, Ontario, Canada M4C 5R1.

*Revue Sexologique/Sexological Review* (2 issues per year), c/o Editions I.R.I.S., 4932 rue Adam, Montreal, Quebec, Canada H1V 1W3.

*Bibliosex* (2 issues per year), c/o Professor Robert Gemme, University of Quebec at Montreal, Department of Sexology, Case Postale 8888, Canada H3C 3P8.

## Conclusions

Four themes run through this profile of sexuality in Canada. The first is of a country composed of a variety of ethnocultural groups including the oldest, aboriginal inhabitants, the dominant English and French residents, and the newer arrivals from a variety of countries. Though there has been little "group specific" research, the available evidence suggests that different groups can have quite distinctive cultural attitudes and practices in the area of sexuality. Canada's French-Canadians, about whom there has been considerable research, consistently demonstrate attitudes that are more accepting and permissive than those of other Canadians; they initiate sexual activity somewhat earlier than others and are more likely to form committed partnerships without the legal status of marriage. Quebec, the province where the majority of French-Canadians live and the location of Canada's only Department of Sexology, has demonstrated the greatest acceptance of individual choice in sexual matters and has the most egalitarian family laws of any province in the nation. Considering the historical domination of the Roman Catholic Church in Quebec, these results demonstrate the reduction of influence of religious institutions in the lives of French-Canadians, a change that is now occurring for some other groups of Canadians as well. While French-Canadians set one end of a continuum of attitudes and practices, each ethnocultural group in Canada has its own distinctive pattern of attitudes and practices, each embedded in unique communities and community institutions.

The second theme is of a country in which formal services, research, and education in sexuality are scattered and varied. In some regions, these are comprehensive and sophisticated, in others they are sparse and few. Research, graduate and postgraduate training, and therapeutic and clinical work in sexuality are not organized or provided in a

coherent manner and are highly dependent on the presence of interested individuals. Sexuality as an academic discipline, and sexual health services beyond those related to reproduction and sexually transmitted diseases, are not generally recognized or supported through national associations or university departments.

The third theme is of a country that is in the process of reconceptualizing gendered and sexual relationships in its laws, culture, and policies. This is seen in the recent changes in laws, and in court challenges in areas such as sexual assault, sexual harassment, pornography and obscenity, access to medical procedures as part of sexual and reproductive health, and guarantees of equal treatment and rights for all Canadians regardless of gender, ability, or sexual orientation. It is also seen in the changing portrayals of sexuality in culture.

Finally, Canada is a country in which liberal and conservative (or permissive and restrictive) perspectives on sexuality compete for influence in the marketplace of ideas and ideology. To date, changes in legislation and policy have been in the direction of supporting individual rights, freedom of choice and expression, and recognition of diversity. Not all Canadians support these changes, however. Whether this direction will continue as part of Canada's future will be influenced, in part, by developments in all four of these themes.

### Acknowledgments

We are grateful for the diverse contributions that the following individuals made during preparation of this chapter: Diana Powell, Bill Fisher, Mary Bissell, Christine Donald, Louis-Robert Frigault, Jeanne Guillaume, Katharine Kelly, Ross Laver, Joanne Otis, Robin Rowe, Alan Mirabelli, and Dot Whitehouse. Thanks also to Robert T. Francoeur for his encouragement and support as editor of this *Encyclopedia*.

*Updates by F. Ruan and Robert T. Francoeur, Ph.D.;*  
*Comments by M. P. Lau*

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

The People's Republic of China is the largest country in Eastern Asia, embracing 3.7 million square miles (9.58 km<sup>2</sup>). China is smaller than Russia and Canada, but slightly larger than the contiguous 48 United States. China is bordered by Korea in the east, Mongolia in the north, Russia in the northeast, Kazakhstan, Kirghizstan, and Tajikistan in the northwest, Afghanistan and Pakistan in the west, India, Nepal, Sikkim, and Bhutan in the southwest, and Myanmar (formerly Burma), Laos, and Vietnam in the south, and the Pacific Ocean in the east. Only one tenth of the land is cultivated, although the eastern half of China is one of the best-watered lands in the world, with vast farmlands and three great rivers, the Yangtze or Chang, the Huang or Yellow River, and the Xi. In addition to the pressing issue of population control, China faces major environmental obstacles to its continued economic progress. China's heavy reliance on coal as a fuel produces major problems from acid rain and air pollution from greenhouse gases and sulfur dioxide. China also faces major water shortages, particularly in the north, water pollution from untreated wastes, and loss of an estimated one fifth of its agricultural land since 1949 from soil erosion, desertification, deforestation, and economic development.

In July 2002, China had an estimated population of 1.28 billion. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 24.3% with 1.1 male(s) per female (sex ratio); 15-64 years: 68.4% with 1.06 male(s) per female; 65 years and over: 7.3% with 0.89 male(s) per female; *Total population sex ratio:* 1.06 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 71.86 years; *male:* 70.02 years; *female:* 73.86 years

**Urban/Rural Distribution:** 27% to 73%

**Ethnic Distribution:** The vast majority of Chinese people, 91.9%, are Hans (ethnic Chinese, or Han Chinese). The remaining 8.1%, over 91 million people, include 55 other ethnic groups. Minority nationalities with population of over one million are the Bai, Bouyei, Dai (Thai), Dong,

\**Communications:* Fang-fu Ruan, M.D., Ph.D., P.O. 70571, Oakland, CA 94612-0571 USA; ruanff@yahoo.com; M. P. Lau, M.D., 280 Spadina Avenue, Suite 302A, Toronto, Ontario M5T 3A5 Canada.

*Editor's Note:* In this chapter, Dr. Fang-fu Ruan's report and analysis of sexual attitudes and behavior in China follows our standard 13-topic structure. In Part 2, Dr. M. P. Lau provides a summary and analysis of the Kinsey-like 1992 *Sexual Behavior in Modern China: A Report of the Nationwide "Sex Civilization" Survey on 20,000 Subjects in China*. Readers should consult Part 2 for additional information on specific topics discussed by Fang-fu Ruan in Part 1.

Hani, Hui, Kazak, Korean, Li, Manchu, Miao, Mongolian, Tibetan, Tujia, Uighur, Yao, Yi, and Zhuang (see Section 13, Ethnic Minority Resources)

**Religious Distribution:** Officially atheistic, but traditionally pragmatic and eclectic, with Daoism (Taoism) and Buddhism the most common; Muslim: 2% to 3%; Christian: 1% (est.)

**Birth Rate:** 15.85 births per 1,000 population

**Death Rate:** 6.77 per 1,000 population

**Infant Mortality Rate:** 27.25 deaths per 1,000 live births

**Net Migration Rate:** -0.38 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.82 children born per woman (1995 est.)

**Population Growth Rate:** 0.87%

**HIV/AIDS** (1999 est.): *Adult prevalence:* < 0.2%; *Persons living with HIV/AIDS:* 1.25 million (January 2001); *Deaths:* 17,000 (1999 est.). The Chinese government was challenged by the United Nations Secretary General to recognize the threat of HIV/AIDS among its 1.2 billion people and face a devastating epidemic that could destroy the nation. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 81.5% (*male:* 89.9%, *female:* 72.7%). The 1992 literacy rate was 78%, with nine years schooling required and 96% attendance in primary school.

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$4,300 (2001 est.); *Inflation:* 0.8% (2001 est.); *Unemployment:* 10% among urban Chinese. China has a substantial unemployment and underemployment problem.

[*Update 2002:* As a developing country, China has the largest population in the world, 1.28 billion in July 2001, or 22% of the world's population. The China Population and Information Network (China POPIN) estimates China's population in 2010 will be 1.380 billion people. Despite family planning programs, China's annual net population growth in recent years has still been around 13 million. China's population is also very unevenly distributed, with 94% living in the southeastern part of the country, which occupies 43% of the country's total land area. According to 1996 statistics, 71.63% of the population lives in the countryside, so the level of urbanization is very low. China's arable land is only 7% of the world's total, with a crop production that is only one quarter of the world per capita average crop. China's per capita fresh water is also one quarter of the world average. For over four decades, China has witnessed dramatic economic development, but because of rapid expansion of the population, the indices related to living standards are still very low. China's per capita grain production is less than 400 kilograms; per capita residential floor area in urban areas is 8.1 square meters; and the number of hospital beds for every 1,000 people is only 2.34. Of the country's 2,143 counties, 592 are poverty ones with an annual per capita income of less than RMB Yuan 250 (US\$43). Each year, one quarter of the increase in national income is used for the new increase in population. China has at least 20 million people reaching working age every year. Insufficient employment has produced a surplus labor force of over 100 million in the countryside. The huge population base and an annual population growth of 13 million are in serious conflict with the country's socioeconomic development, utilization of natural resources, and environmental protection. It has become a major factor that restricts socioeconomic development and the improvement of people's quality of life in China. (State Family Planning Commission Of China: <http://www.sfpc.gov.cn>, on June 2, 1999.) (*End of update by F. Ruan*)

## B. A Brief Historical Perspective

The remains of various humanlike creatures, who lived as early as several hundred thousand years ago, have been found in many parts of modern China. The oldest human remains found in China were those of "Peking man," who lived approximately 578,000 years ago. Neolithic agricultural settlements, dating from about 5000 B.C.E. have been found in the Huanghe basin. Imperial China lasted almost 4,000 years, from the Xia dynasty (c. 2200-1500 B.C.E.) to the Qing dynasty (1644-1911 C.E.). Bronze metallurgy reached a peak during the Shang dynasty of Northern China (c. 1500 B.C.E. to c. 1000 B.C.E.), along with Chinese pictographic writing. Imperial China was marked by a succession of dynasties and interdynastic warring kingdoms. The range of Chinese political and cultural domination waxed and waned, expanding from the north to the south and west at various times, as science, technology, and culture flourished in great sophistication. Rule by non-Hans (foreigners), the Mongols during the Yuan dynasty (1271-1368), and the Manchus in the Qing dynasty (1644-1911), did not alter the underlying Chinese character of the culture.

Cultural and political stagnation in the 19th century left China vulnerable to internal rebellions that left tens of millions dead and Russian, Japanese, British, and other foreign powers exercising control over some key parts of the country. Imperial rule ended in 1911 with the formation of the Republic of China in 1912. Between 1894 and 1945, China was involved in major conflicts with Japan. In 1895, China gave up Korea, Taiwan, and other territories. Japan seized the northeast provinces of Manchuria in 1931, and invaded China proper in 1937. Following World War II, China regained the territories it had previously lost to Japan. In 1949, the People's Republic of China was proclaimed by Chinese Communist leader Mao Zedong; the nationalist Republic of China (Kuomintang) retired to Taiwan.

The Great Leap Forward, 1958 to 1960, tried to force the pace of economic development through intensive labor on huge new rural communes and an emphasis on ideological purity. The program was abandoned when it encountered serious resistance. In 1965, the Great Proletarian Cultural Revolution was launched in an effort to reestablish the revolutionary purity of the principles of Chairman Mao Zedong, with massive purges and the forced relocation of millions of urban teenagers into the countryside. This effort gradually petered out as pragmatism regained its influence. Despite the violent repression of democratic demonstrations by over 100,000 students and workers in the 1989 Tiananmen Square outside Beijing's Great Hall of the People, China has followed a painfully slow, halting, but definite transition and adjustment to a partial free-market economy and more-democratic policies.

---

### PART 1.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

In order to understand and evaluate the recent situation of gender roles in China, it is necessary to begin with some understanding of the roots of female oppression in the traditional Chinese society and family. In its earliest history, China was a matriarchal society, until Confucius and Mencius defined the superior-inferior relationship between men and women as heaven-ordained more than 2,000 years ago. In traditional Chinese society, women should observe the Three Obediences and the Four Virtues. Women were to be obedient to the father and elder brothers when young, to the husband when married, and to the sons when widowed.

Thus Chinese women were controlled and dominated by men from cradle to grave. The ideal of feminine behavior created a dependent being, at once inferior, passive, and obedient. Thus, for more than 2,000 years, for the vast majority of Chinese women, belonging to a home was the only means to economic survival. But they had no right to select a husband, let alone the right to divorce or to remarry if widowed. They had no right to their physical bodies. Those who defied such institutionalized oppression were persecuted, ostracized, and sometimes driven to suicide. [Comment 1997: This may not apply to the lower class and marginal people. (End of comment by M. P. Lau)]

The functional importance of all women in traditional China lay in their reproductive role: In such a patriarchal and authoritarian society, the function of women was to reproduce male descendents. Since descent was patrilineal, a woman's position within her natal family was temporary and of no great importance. The predominant patrilineal household model, in combination with early marriage, meant that a young girl often left home before she was of significant labor value to her natal family. Hence, education or development of publicly useful skills for a girl was not encouraged in any way. Marriage was arranged by the parents with the family interests of continuity by bearing male children and running an efficient household in mind. Her position and security within her husband's family remained ambiguous until she produced male heirs. [Comment 1997: Then she might become manipulative and exploitive. (End of comment by M. P. Lau)] In addition to the wife's reproductive duties, the strict sexual division of labor demanded that she undertake total responsibility for childcare, cooking, cleaning, and other domestic tasks. Women were like slaves or merchandise.

A real liberation and revolution in the female's role has occurred in the People's Republic of China (PRC). The first law enacted by the PRC government was the Marriage Law of 1950. The law is not only about marriage and divorce, but also is a legal statement on monogamy, equal rights of both sexes, and on the protection of the lawful interests of women and children. [Comment 1997: However, it took years for the law to become more than words on paper and move into real life. (End of comment by M. P. Lau)]

## B. Sociolegal Status of Males and Females

### *The Changing/Unchanging Status of Women*

In 1954, the constitution of the People's Republic of China restated the 1950 principle of the equality of men and women and protection of women: "Article 96: Women in the People's Republic of China enjoy equal rights with men in all spheres of political, economic, cultural, social, and domestic life."

Under this principle, major changes happened in the social roles of women in the PRC, especially in the areas of

work and employment, education, freedom in marriage and divorce, and family management. For example, 600,000 female workers and urban employees in China in 1949 accounted for 7.5% of the total workforce; in 1988, the female workforce had increased to 50,360,000 and 37.0% of the total. [Comment 1997: Most women continue to be employed as cheap labor, but this is not a condition limited to China. (End of comment by M. P. Lau)]

A neighborhood survey in Nanjing found that 70.6% of the women who married between 1950 and 1965 had jobs. Of the women who married between 1966 and 1976, the percentage of those employed stood at 91.7%; by 1982, 99.2% of married women were breadwinners.

A Shanghai neighborhood survey reported that 25% of the wives declared themselves boss of the family, while 45% said they shared the decision-making power in their families. Similar surveys in Beijing found that 11.6% of the husbands have the final say in household matters, while 15.8% of families have wives who dominate family decision-making. The other 72.6% have the husband and wife sharing in decision-making. A survey in Nanjing revealed that 40% of the husbands go shopping in the morning. Many husbands share kitchen work. Similar surveys of 323 families in Shanghai found 71.1% of husbands and wives sharing housework. (Dalin Liu's study of *Sexual Behavior in Modern China* (1992) contains statistical data about domestic conflicts and the assignment of household chores.)

Although the situation of women has changed dramatically from what went before, in actuality, women still are not equal with men. For example, it is not unusual to find that some universities reject female graduate students, and some factories and government institutions refuse to hire women. The proportion of professional women is low. Women fill only 5.5% of the higher-level jobs such as technicians, clerks, and officials.'s In a country of 220 million illiterates, 70% are women. Women now make up only 37.4% of high school students and only 25.7% of the university-educated population. Moreover, actual discrimination against women still exists, and continues to develop. Many women have been laid off by enterprises that consider them surplus or redundant employees. Only 4.5% of the laid-off women continued to receive welfare benefits, including bonuses and stipends offered by their employers. Many enterprises have refused to employ women, contending their absences from work to have a baby or look after children are burdensome.

### *Male-Preferred, Female Infanticide, and the Sex Ratio Problem*

China was, and in many ways still is, a Confucianist country. Confucianism said that: "There are three things which are unfilial, and to have no posterity is the greatest of them." In Chinese society "having posterity" means "having a male child." Therefore, not having a male offspring is regarded as the worst possible problem a family can have psychologically, economically, and sociologically.

[Update 2003: Even before the founding of the People's Republic of China, at a time when very little or no contraception was available, and before the advent of the one-child-per-family policy in the PRC, female infanticide was widely used, as data on sex ratios clearly show (see Table 1).

[According to a survey done by gynecology professor Gu Zusan, 80% of rural families want a boy, not a girl. Therefore, one of the side effects of the "one child" policy is the practice of female infanticide. Certainly, female infanticide has not been a critical problem nationwide yet. But, in some places it does happen; for example: The 1982 sex ratios in villages in Wuhan and Hubei were:

**Table 1**

**Sex Ratios in China (1948)**

	Female	Male
Nationwide Average	100	109.6
Shandong ( <i>the lowest</i> )	100	99.0
Hubei	100	109.1
Wuhan	100	124.1
Beijing	100	125.7
Zungqing	100	130.4
Dalian	100	194.0

From: Long Guanhai: *Shehui Yu Ren [Society and Human Beings]*. Taipei, Taiwan: Chuanji.

Sex ratios:	in a Wuhan community		in a Hubei village	
Age	Female	Male	Female	Male
0-1	100	154	100	503
0-3	100	124	100	384
0-5	100	112	100	182

(End of update by F. Ruan)]

In the 1970s, China's newborn sex ratio was 106 males for every 100 females. It was probable that in Wuhan, Hubei, and other places as well, female infanticide was being practiced. In 1986, even the government Beijing newspaper *Zhongguo Fazibao* (*China Law News*) reported this problem (September 11, 1986): "According to the survey by Zungqing Women Association, there were 2,800 cases of female infanticide in Zungqing in 1984. It was a very serious and severe problem." The newborn sex ratio in China has risen year by year: In 1986, it was 110 males for every 100 females; in 1987, 111; and in 1990, 112. In September and October 1992, a nationwide survey of 380,000 newborns showed the sex ratio was as high as 118.5:100.

[Update 2003: In a spring 2002 report in the journal *International Security*, demographers Valerie Hudson and Andrea Den Boer estimate that China will have between 29 million and 33 million unmarried males ages 15 to 34 by the year 2020. Other estimates put the number of young, unmarried men, of *guang guan* ("bare branches" or "barren sticks") in 2020 at 40 million. That number equals the combined female population of Taiwan and South Korea. The probable main but not sole cause, according to Chinese researcher Chu Junhong in a 2001 report in the *Population and Development Review*, is prenatal screening and selective abortion of female offspring. Despite a 1995 Maternal and Child Health Law that bans use of ultrasound scanning for selective abortion, one study found that 36% of the abortions reported in a rural Chinese county were done to weed out the girls. Chinese parents are generally willing to accept a firstborn daughter if they can have a second child. In Anhui and other provinces, the firstborn male-female ratio is 111 males to 100 females, but more than 3 to 1 for second births. To avoid adding more millions of males to this unprecedented and long-term crisis, China is urging provincial governments to pass and enforce very strong laws banning the use of ultrasound scanning and selective abortion. The male surplus is also increasing because female infants are breastfed for shorter periods than boys. Female infanticide and abandonment also contribute to the male surplus: In some areas, up to 90% of young children in orphanages are female (Wiseman 2002).

[Many Asian nations are experiencing a similar sex-ratio imbalance, although none as severe as China's. Hudson and Boer estimate the number of missing women in China at 40.6 million, India 37.1 million, Bangladesh 3.5 million, Pakistan 3.3 million, Afghanistan 0.9, Taiwan 0.6 million, and Nepal 600,000.

[Social trends exacerbate the sex-ratio imbalance. There is a decline in arranged marriages, especially in the cities where women, not men, are doing the choosing. To be chosen by a woman, a man needs to be educated and have a stable good-paying job. Among unmarried rural men, 97% never finished high school and 40% are illiterate. In the migration from farm to city, women have turned to factory jobs on the booming eastern coast while the men are drawn to public-works projects in the nation's interior. Zhang Yi, a demographer at the Chinese Academy of Social Sciences, found one factory town in the southeast province of Guangdong with 200,000 migrant women and just 4,000 local men. Grossly outnumbered, the local women were very hostile to the female immigrant workers.

[Increasingly, the government and demographers are trying to anticipate the likely social consequences of this imbalance. In the mid-1800s, the Nien Rebellion broke out in the eastern city of Shandong where men outnumbered women 129 to 100. At that time, a quarter of all Chinese men could not find wives. The frustrated males turned to banditry and then to open rebellion against the Qing dynasty. At their height, 100,000 Nien rebels controlled territory with a population of 6 million. The rebels held out against the government for 17 years.

[Following historical precedents, the government may impose ever stricter authoritarian rule, thereby delaying the move to democracy. The government is already bringing poor young men into the paramilitary People's Armed Police, which is assigned to crush riots and suppress other social disturbances. Another possibility would be to stir up border wars with its neighbors that would siphon off the surplus males. Huge construction projects and public works could also help absorb the surplus males (Wiseman 2002). (End of update by R. T. Francoeur)]

### C. General Concepts of Sexuality and Love

In mainland China today, the only sexual behavior that is acknowledged to be legally and morally permissible is heterosexual intercourse within monogamous marriage. A wide variety of sexual behaviors are explicitly proscribed. Thus, prostitution, polygamy, premarital and extramarital sex (including cohabitation arrangements), homosexuality, and variant sexual behaviors are all illegal. Because even normal sexual expression is viewed with contempt as a less important activity of life, not only are pornography and nudity banned, but any social activity with sexual implications—such as dancing—may be subject to restrictions. Even the marriage relationship is given little consideration. For example, according to official statistics, approximately 360,000 married persons live apart from their spouses, and this figure increases at a rate of 100,000 per year. Most of these separations occur because individual citizens are not free to move from one place to another, or to change their places of employment.

Public policy and law related to sexuality seriously and severely have an impact on individual and social lives. Contemporary China is a noteworthy example of a totalitarian government's attempt to control or repress the sexual aspects of an individual's life. It exemplifies, as well, how sexually repressive policies are not actually effective in inhibiting sexual desire in private lives, nor in curbing the struggle for human sexual rights and freedom.

[Update 2001: As an expression of the sex-negative policies in China, many sex-related behaviors were cited and punished as "gangster activities" in the 1980 Criminal Law of the People's Republic of China. Homosexual behaviors and all kinds of paraphilias may be punished as "gangster activities." A positive change occurred in 1997 with the Revised Criminal Law of the People's Republic of China: "gangster activities" were deleted from the Criminal Law that was adopted on March 14, 1997. (End of update by F. Ruan)]

The major move toward democracy in mainland China after Mao was the "Democracy Wall" movement during 1978 and 1979. During this brief period, the government allowed young people to express their desire for personal freedom and democracy by placing "big character" posters on a wall that came to be known as the "Democracy Wall." The Democracy Wall was also used for advocating sexual liberation. The author vividly recalls visiting the wall on February 20, 1979, and seeing two poems about sexual rights. One was titled "The Eulogy of Sexual Desire," the other "Open Sex." In posters like these, China's youth first

made a courageous stand on the importance of sexual openness to their country's modernization.

Students also carried posters advocating sexual freedom during the nationwide demonstration by university students in the winter of 1986-87. While sexual liberation was not a major explicit goal of the 1989 democracy movement, its importance was understood, and its value implicit in one of the loveliest events that occurred then: During a hunger strike in Tiananmen Square, a wedding was held for one of the demonstration leaders. The bride and groom, the maid of honor (General Commander Chai Ling, now an internationally known heroine of the struggle for democracy), and the best man (Chai's husband, Vice General Commander Feng Congde) were all fasting, as were classmates attending the wedding. Yet all the celebrants were laughing joyously. The wedding was the ideal symbol of the connection between the longing for liberty and the desire for love, romance, marriage, personal happiness, and fulfillment.

[Update 1997: In 1996, Suiming Pan, head of the Institute for Research in Sexuality and Gender at the Renmin University of China in Beijing, analyzed 11 social surveys on sexuality in Chinese cities between 1986 and 1995 and reinterviewed 103 men and 73 women. The ten factors listed below, which Pan (1996) identified as affecting sexual research and studies in China, also reveal some important insights into the general concepts of love and sexuality that prevail in Chinese culture.

1. For most people, the Chinese sexual vocabulary is either cryptic or considered dirty and abusive.
2. The more familiar with each other people are, the more difficult it is to talk about sex.
3. There is often a sexual undertone to the interaction between heterosexual interviewers and interviewees.
4. Many tragic or socially illegitimate sexual matters would rather be forgotten than discussed with the interviewees.
5. Female interviewers are often considered "bad women."
6. Chinese people view pornography, sex workers, and nonmarital sex as illegal.
7. Ordinary people do not understand why researchers study sexuality.
8. Most ordinary people are unable to evaluate and express their own sexual feelings, or even their behavior.
9. Most females feel like vomiting when questioned about sexual matters.
10. Ordinary people think that if you ask a question about a kind of sexual behavior or relationship, then it means that you really like it yourself.

The first nine of these ten points reflect ignorance, stigma, and inhibition, with only the last point expressing a common viewpoint frequently encountered in other countries. (End of update by R. T. Francoeur)]

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

China is a multi-religion country, with a vast proportion of the population professing no religion. Some worship ancestors and/or Shens ("kindly spirits"). Many subscribe to more than one of the main religions: Buddhism, Taoism, Islam, Catholicism, several major Protestant religions, and Confucianism. As a religion, Taoism is considered a genuine indigenous religion of China in the sense that Buddhism, Islam, Catholicism, and Protestantism were imported from foreign countries, while Confucianism is taken to be more secularly oriented in doctrine.

Confucianism is based on writings which are attributed to Confucius (551-479 B.C.E.), the first great educator, philosopher, and statesman of China, and his followers, including Mencius (372-289 B.C.E.), a political thinker who believed in democracy. Confucianism dominated Chinese sociopolitical life for most of Chinese history.

Confucius and Mencius themselves expressed a rather positive view of human sexuality. For example, The Master (Confucius) said, "I have not seen one who loves virtue as he loves sex" (*Confucian Analects Book IX*, chapter 17); "Food and drink and the sexual relation between men and women compose the major human desires" (*The Book of Rites*, one of the major Confucianism classics, chapter 9). In *The Works of Mencius*, one of the major Confucianism classics (book 6, part 1), we find: "Eating food and having sex are both of human nature."

It was not until much later that sexual conservatism became a feature of Neo-Confucian philosophy. The crucial change was initiated by several famous Neo-Confucianists, including Ch'eng I (1033-1107), and Chu Hsi (1130-1200). Ch'eng I summarized the Neo-Confucian viewpoint as "Discard human desires to retain the heavenly principles."

When asked whether it was justifiable for a widow to remarry when pressed by poverty and hunger, he replied, "It is a small matter to die as a result of starvation, but a serious evil to lose chastity toward one's dead husband by remarrying." Chu Hsi stressed the inferiority of women and the strict separation of the sexes, and forbade any manifestation of heterosexual love outside of wedlock. Chu Hsi laid the foundations of Neo-Confucianism as the sole state religion. It encouraged a puritanical and strictly authoritarian form of government, including the establishment of censorship and thought control. However, the government had difficulty enforcing these views on the lower class or *sciao-ren* (the non-exemplary class of people).

Taoism has both a philosophical and a religious tradition in China. Although philosophical Taoism flourished early in the 5th century B.C.E., Taoism as a religion did not develop until the 1st century of the Common Era. Next to Confucianism, it ranks as the second major belief system in traditional Chinese thought. The philosophy of Taoism outlined in Lao-tzu's *Tao Te Ching* offers a practical way of life. Both philosophical and religious Taoism included in their classics some positive ideas about sex. For example, from Lao-tzu's *Tao Te Ching*: "All things have their backs to the female and stand facing male. When male and female combine, all things achieve harmony" (chapter 42, translated by S. Mitchell, Harper & Row, 1988). And from *Tai ping Jing (The Canon of Peace and Tranquility)*, an early classic of religious Taoism: "Through the way of copulation between husband and wife, the Yin and Yang all obtain what they need and Heaven and Earth become peace and tranquility;" "Based on one Yin and one Yang, Heaven allows both man and woman to exist and to be sexually attractive to each other, therefore life can be continued."

Yin-Yang is a major philosophical concept developed during the Zhou dynasty (1027-221 B.C.E.). The concepts of Yin and Yang may be found in the majority of important Chinese classics, including such a major classic of Confucianism as the *I-Ching*, and such a Taoist classic as the *Tao-te-ching*. Thus, the Yin-Yang philosophy is among the most important unifying concepts of Chinese culture. According to the Yin-Yang philosophy, all objects and events are the products of two elements, forces, or principles: Yin, which is negative, passive, weak, and destructive; and Yang, which is positive, active, strong, and constructive. It was very natural for the Yin-Yang doctrine to become the basis of Chinese sexual philosophy. The Chinese have used the words Yin and

Yang to refer to sexual organs and sexual behavior for several thousand years. Thus *Yin Fu*, “the door of Yin” means vulva, *Yin Dao*, “the passageway of Yin” means vagina, and *Yang Ju*, “the organ of Yang” means penis. The combination of these words into the phrases *Huo Yin Yang* or *Yin Yang Huo He*—“the union or combination of Yin and Yang”—describes the act of sexual intercourse.

Buddhism was first introduced into China in the 1st century C.E. from India. Chinese Buddhism was of the Mahayana (Great Vehicle) school, so named to distinguish it from the earlier form of Buddhism known as Hinayana (Lesser Vehicle). Among Tibetan peoples, it is distinguished by its emphasis on the Buddhist *Tantras*. Most Buddhist schools denied sexual desire, and traditionally Buddhist monks have been celibate. But, it is not the case of the school of Mi-tsung (Mantrayana, or Tantrism). Sex was the major subject of Mi-tsung. Mi-tsung was very similar to some sects of Taoism, and stressed the sexual union.

Even Mi-tsung said that *Buddhatvam yosidyonisamaritam* (“Buddhiteity is in the female generative organs”). In China, “Tibetan Esoteric Sect” (Tibetan Mi-tsung) flourished in the Yuan dynasty, especially from the time of Kubilai Khan (1216-1294 C.E.).

Islam reached China in the mid-7th century through Arab and Persian merchants. Islam has a large following among ten of China’s minorities: Hui, Uighur, Kazak, Tatar, Kirghiz, Tajik, Ozbek, Dongxiang, Salar, and Bonan. The number of believers is about 14 million, mostly in Xinjiang, Gansu, Ningxia, Yunnan, Qinghai, Inner Mongolia, Henan, Hubei, Shandong, Liaoning, Beijing, and Tianjin.

Catholicism was introduced into China as early as 635 C.E. By 1949, the number of Catholics in China had reached 2.7 million. Protestantism was introduced into China in 1807. After the Opium War, missionary activity increased and Christianity became a part of the Chinese culture. For example, T’ai-p’ing-T’ian-Kuo, a great peasant rebellion in the Qing dynasty, from 1851 to 1864, was conducted under the banner of God and Christianity. By 1949, China had 700,000 Christians. Generally speaking, Catholicism and Protestantism strengthened the sex-negative and repressive attitudes in China on an official level.

## B. Source and Character of Ethnic Values

There are some differences in sexual lifestyles among the different ethnic groups in China. For example, among Tibetan ethnics, plural marriages including polygyny and polyandry exist beside monogamous marriages. In some Tibetan families, brothers may share one woman as a common wife. There is also great variety in the way one religious factor has an impact on the sexual attitudes in different ethnic groups. For example, Islam takes on slightly different expressions among its many followers in ten of China’s minority nationalities: Hui, Uygur, Kazak, Tatar, Kirgiz, Tajik, Dongxiang, Salar, and Bonan. [Comment 1997: Similar accounts of the material in this section can be found in Ng and Lau (1990) and Bullough (1976). The *Yearbooks* of the *Encyclopedia Britannica* provide the latest updates on the religious and ethnic composition of the population. (End of comment by M. P. Lau)]

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs for Sex Education

In line with its general policy of suppressing any discussion of sexuality, the Chinese government neglected the development of sex education courses for the general curricu-

lum. It was not until the early 1980s that model programs were developed, and even then, discussion was usually limited to the necessity of using contraception to limit population growth. In the 1950s, 1960s, and 1970s, not only was there a complete lack of systematic sex education, but only a few booklets on sexuality had been published. The most popular one, *Knowledge of Sex (Xing-di-zhi-shi)*, was published in 1957. Most of these booklets are devoted to social topics, such as love and marriage, and medical topics, such as sexual dysfunctions. Only a few pages discuss aspects of sexual relationships, such as arousal, sexual responses, and frequency of intercourse. Yet, for more than 20 years, *Knowledge of Sex* was virtually the only sex booklet available to a population of 800 to 900 million people. (See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections B, Adolescent Sexuality, and C, College Students.)

In 1980, heartened by the end of the Cultural Revolution, a few authors and publishers began to produce new materials. The first effort was a new edition of *Knowledge of Sex* published by People’s Medical Publishing House. The first printing of 2.5 million copies, released in June 1980, was sold out almost immediately, and some people resold their copies at nearly double the original price.

Between 1980 and 1984, more than ten new sex booklets were published. Two of them became bestsellers. The first, *Required Readings in Wedding Hygiene* was originally published in September 1980, and by November 1981 had already been reprinted eight times, for a total of more than 7.5 million copies. The second, *Questions and Answers about Wedding Hygiene*, was published in July 1984 with a printing of 4.2 million copies.

Finally, in the mid-1980s, four major types of pressure led national and local officials to acknowledge the need for sex education programs. First, the population growth continued to be a very serious problem. A birth control program had been instituted in January 1973, but it became unavoidably clear that to implement the program effectively, young people would have to be given sexual information essential to understanding and using contraception. Second, rates of teenage pregnancy, juvenile sex crime, and sexually transmitted diseases seemed to be increasing. It was stated that sex education offered the best hope for diminishing these problems. Third, medical professionals felt that the numbers of patients they were treating for sexual dysfunction demonstrated a need for improved education. And finally, as a result of the new “open-door” policy of receptiveness to Western cultural influence, and a simultaneous increase in personal freedoms, the Chinese people were expressing a desire to improve their lives, including their sexual lives.

The first high school sex education courses were introduced in 1981 in Shanghai. In early 1986, 40 Shanghai middle schools, about 10% of the city’s total, introduced an experimental sex education course for coed classes in the 12- to 13-year age group. In addition to helping students understand the physiological and psychological changes they were undergoing, the course was designed to teach hygiene and sexual morality. By June 1986, nearly a 100 Shanghai middle schools gave sex education courses. And, by February 1988, 6,000 middle schools all over China had instituted sex education courses: Thirteen of the 28 provinces, including Shanghai, Jiangsu, Tianjin, and Helongjiang, had made sex education courses part of the standard middle school curriculum. In February 1988, the State Council announced that sex education courses would be established in middle schools nationwide.

From January to October 1985, a special series of columns titled “Essays on Sex Education” by the author of this chapter was published in *Required Readings for Parents*, the leading national monthly magazine on child and adolescent

education (Ruan 1985). The series consisted of ten rather long articles on various aspects of sexuality and sex education. It was the first systematic treatment of such topics to be published since the founding of the People's Republic of China in 1949. The "First National Workshop on Sex Education" was held in Shanghai on July 22 to August 7, 1985. This was the first such conference convened in mainland China since 1949. It was an interdisciplinary workshop, attended by more than 80 professionals from 18 provinces, most of them in the fields of birth control, sociology, urology, and high school and college education. The author was the major instructor. Also in 1985, the author served as chief editor, and as a major contributor, for a large updated volume of the *Handbook of Sex Knowledge*, published by the Scientific and Technological Literature Publishing House in Beijing. Although it was intended to be the most up-to-date text of its kind, the book could not include any descriptions of sexual positions or any nude illustrations (except anatomical drawings). Despite these self-imposed restrictions, the first printing was limited to 500,000 copies by the government. After the author left China for the United States at the end of 1985, he was asked to prepare a new version to include knowledge on the prevention of AIDS. In 1988, the revised edition was jointly published by the Scientific and Technological Literature Publishing House and the People's Medical Publishing House (Ruan 1985/1988), one of the two publishers officially permitted to publish books on sex. Yet in 1988, the government allowed the showing of a film that explicitly referred to the *Handbook*. The movie, titled *Mandarin Duck Apartments* (to the Chinese, a pair of mandarin ducks symbolizes an affectionate couple), includes a scene in which an old woman counsels a young newlywed who feels that sex is dirty and shameful. The old woman shows her the *Handbook*, explaining that findings in sexual science show that women have as much right as men to enjoy sex.

After the Tiananmen Square massacre in 1989, the government fell into its old habit of including sexual restrictions in a wave of political repression. But, because of huge pressure to deal with population control, STDs, and the prevention of teenager pregnancy, the government can no longer inhibit and stop sex education. Sex education classes, exhibitions, meetings, and publications are still continuing and developing in China today. [Comment 1997: Pei-Kum Yao has chronicled in detail the development of adolescent sex education since 1920 in Appendix III of Dalin Liu's *Sexual Behavior in Modern China*, 1992. (End of comment by M. P. Lau)]

[Update 2001: *Ren Zhi Chu*, a nationwide monthly sexuality education journal, is the most popular and only journal of its kind in China. This journal, which was started in 1990 by the Guangdong Committee of Family Planning in Guangzhou, has had phenomenal growth. Recent annual circulation has been one million to 1.2 million copies. In 1999, its circulation was ranked 28th among social-cultural journals in the world. (Hongling Wei, an editor of *Ren Zhi Chu*, personal communication). (End of update by F. Ruan)]

[Update 2002: Several mid-2002 reports in the *Beijing Star Daily* and the *People's Daily* described important new developments in sex education in China.

[While it has been widely acknowledged that sex and sex education have long been a sensitive issue in China and many people are too embarrassed to talk openly about the subject, Rong Hua, vice-chairwoman of the Beijing Municipal Women's Federation, described the results of a survey of 1,500 Beijing families as "astonishing." Most parents, Rong pointed out, try to avoid answering their children's questions and do not know what to do when they find their children are making opposite-sex friends.

[Seventy-four percent of the parents surveyed admitted they did not give their children any sex education at all; about 50% admitted they were too embarrassed to do so. While 28% of parents gave their children simple explanations when they asked about sex, only 3% gave detailed explanations. Some parents offered appropriate books to their children and some take them to educational exhibitions on the topic.

[According to Rong and other experts, the survey underlined the need for parents to give truthful answers to their children's questions on sex and for more sex education to be included in family education programs.

[Meanwhile, the *Beijing Star Daily* announced publication of new sex education textbooks for middle-school students that open up discussion of sex, drugs, and contraception. The Haidian District in Beijing, home to several prestigious universities, will take the lead in introducing the textbooks, the first of their kind in Beijing, to its middle schools in September 2002. The books break new ground in teaching youngsters how to deal with sexual harassment, take emergency contraception measures, and keep away from drugs. They also cover AIDS, venereal diseases, "online love," and premarital sex.

[Publication of the pilot series was a major step forward within the educational system, but teachers and parents were playing a more crucial role in guiding teenagers towards healthy ideas on sex-related issues, experts noted. At the same time, adults are being urged to overcome their embarrassment and openly talk about sex for the healthy physical and psychological growth of the younger generation.

[In June 2002, South China's Hainan province began distribution of a television series, *Sex Education for Children in Primary and High Schools*, on video compact disc. Jointly produced by the Central China University of Science and Technology and the Hainan Yongyu Filming and Cultural Communication Limited Company, the series is China's first sex-related popular-science television program targeting young people. The 10-lecture program teaches youngsters about basic sex knowledge, self-protection, sex hygiene, and how to deal with their developing sexuality. The series comes in three versions, a primary, junior high, and senior high school edition. Initially, only the primary school edition will be available on video compact disc. Because the series is specially made for children's psychology and is easy to understand, analysts said it will spare parents and schoolteachers the awkwardness that usually accompanies sex education. (End of update by R. T. Francoeur)]

## B. Informal Sources of Sexual Knowledge

Given the government's authoritarian control described in the section above, it is obvious that informal sources of sexual information, such as television talk shows, radio phone-in programs, and popular magazines, commonly found in more democratic and open countries, are very limited in China because they are illegal and are severely punished. [Comment 1997: Underground sources continue to flourish, and official control has been relaxing as more emphasis has been shifted from ideology to economy. (End of comment by M. P. Lau)]

### 4. Autoerotic Behaviors and Patterns

Self-pleasuring is still condemned by most of the Chinese people, including even some sex educators and sex researchers. It is widely said that frequent self-pleasuring will cause neuroses, sexual dysfunctions, and even severe diseases. Although in 1985, the author pointed out in his popular article, "On Masturbation", and in his *Handbook of Sex Knowledge*, that self-pleasuring is normal sexual behavior, neither harmful nor sinful, it will take time for people to accept this up-

dated viewpoint on self-pleasuring. According to *A Report of the Nationwide "Sex Civilization" Survey on 20,000 Subjects in China* (1992), only 39.0% of college and university students said that they engaged in self-pleasuring, male students (59.0%) much higher than female students (16.5%). But Dr. Lee's survey in 1989 in Shanghai showed that 93.1% of male students at colleges and universities said that they engaged in this behavior. In the "Sex Civilization" Survey, 15.9% of married couples said that they engaged in self-pleasuring. (See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections B, Adolescent Sexuality, C, College Students, and D, Married Couples, for data on masturbation in the nationwide survey by Dalin Liu.)

## 5. Interpersonal Heterosexual Behaviors

### A/B. Children/Adolescents

Because of the pervasive social pressures, reinforced by some messages given by some medical practitioners and the lack of sexual education, sexual expression other than heterosexual marital sex, (including sexual play and sex rehearsal play, both alone and with peers), is punished when discovered. Such behavior is seldom, if ever, reported or commented on in public. No puberty rites are observed to mark sexual maturation.

### Premarital Sexual Activities and Relationships

A study in a major city in Guangdong province found that of 123 young women undergoing premarital examinations, 75 (61%) had already experienced intercourse. In a 1991 survey in which questionnaires were distributed to a random sample of 1,003 unmarried university students in Beijing, including equal numbers of men and women, of 559 respondents, 106 (19%) said they had engaged in sex. Lack of private space is a major problem for young lovers. Many young people have little choice but to meet in parks. And where, five years ago, couples were likely to sit demurely together on a bench, it is now acceptable to hug and kiss, ignoring people passing by only a few feet away. Some couples disappear into the bushes. In Dalin Liu's 1992 survey, 18% of the married couples admitted to having sex with a previous partner; 86.3% of those sampled approved of such encounters. (See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections B, Adolescent Sexuality, and C, College Students, for data on premarital courtship and sexual attitudes and behavior among adolescent males and females and college students in the 1992 nationwide survey.)

### C. Adults

#### Unmarried Adults

For several thousand years, the Chinese people have tried to adhere to the simple dictum: "Get married at a marriageable age." And for centuries it would have been true to say that no Chinese would want to remain single for his or her entire life. But in recent years, China's unmarried population has been growing at a steady rate. For example, in 1982, there were 11,267,000 unmarried Chinese people aged between 28 and 49 years old, or 4.36% of the total population in the 28-to-49 age range. Of these, 10,556,000 were male (93.67%) and 714,000 female (6.33%). (See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections C, College Students, and D, Married Couples, for data on premarital sexual attitudes in the nationwide survey.)

Recently, the Chinese people have started to replace their old-fashioned social concepts with ones that respect the rights of the unmarried; to remain single is now as much a personal right as the right to marry. An important factor in this shift was a greater respect for the rights of freedom, which should prove a blessing both to individuals and society.

[Update 1997: In every public park in China, a large billboard at every entrance warns against "offence against public decency," just as there are notices in dance halls prohibiting anyone from "dancing with faces or cheeks touching the partner's." In reality, such "indecencies" are practiced by most people, and law enforcers are becoming more and more tolerant.

[An analysis of detailed observations of courtship and petting behaviors engaged in by married, unmarried, and status-unknown couples in 13 public parks in six Chinese cities, Beijing, Guangzhou, Zhengzhou, Hohehaote, Chongqing, and Xian, during the summers between 1985 and 1989, provides an insight into the heterosexual courtship behavior of young Chinese couples in that era: In the five years, from 1985 to 1989, petting behavior in public parks increased, forcing authorities to be more tolerant of behavior that previously was unacceptable. The decreasing social control by the authorities reflected more tolerance in the society's political direction. Attitudes toward public petting were the most diversified in Beijing. The most permissiveness was found mainly in parks used mostly by blue-collar workers, as compared to parks used mostly by white-collar workers and "cadres." Finally, in a country with a strong tradition of double standards in sexual morals for females and males, it was surprising that in Beijing, only 31 to 40% of the females were fully passive, and at least 18 to 27% initiated petting to a small degree when it came to less intimate petting behavior in more-private settings in the parks. "It could never be imagined in the old days that so many females would allow themselves to be petted in public, even if they were absolutely passive" (Pan 1993, 184).

[In 1987, there was the movement against "bourgeois liberalization," and in 1989, a "counterrevolutionary rebellion" in Beijing. It is uncertain whether and how these efforts could or did affect the petting limits, but it seems that the grimmer a movement is, the more timid the petting couples are, and the less permissive the nearby people are to the petting. It is also interesting to note that no amount of social control, be it by propaganda, moral condemnation, or daily administrative measures, is as effective as a large-scale political movement once every few years in reinstating the official petting limits (Pan 1993, 192; Burton 1988). (End of update by R. T. Francoeur)]

### Cohabitation

Beginning in the late 1970s, the increased tolerance of nonmarital cohabitation in the West began to influence China's younger generation. College students and young intellectuals, in particular, were attracted to this lifestyle. Some of the younger or more open-minded sociologists also asserted the necessity of overcoming the disadvantages of traditional marriage. Actually, the act of cohabitation might be an act of defiance and courage, or simply a consequence of overcrowding and the lack of living space. These young Chinese risked being arrested.

The definition of unmarried cohabitation used in compiling official statistics makes it difficult to estimate the popularity of this behavior in the sense it is understood in the West. The official figure of 2.69 million couples in unmarried cohabitation in 1989 seems low, considering that some areas report that as many as 50% of couples living together live in unmarried cohabitation. As for couples marrying under the legal age (22 for males; 20 for females), China's State Family Planning Commission reports that 6.1 million such marriages took place in 1987 alone. According to China's 1990 census, 5.8% of 15- to 21-year-old males and 15- to 19-year-old females were "married." That means that 8.5 million Chinese "married" under the legal age. Two

and a half million babies—10% of all births—were born to underage couples in that year. The same news article reports an estimate by the Marriage Administration Division of the National Department of Civil Administration that 30% of China's "married" couples are living together without having received an official marriage certificate, and that the number is growing (see Section 9D, Contraception, Abortion, and Population Planning, Population Control Efforts).

### *Marriage and the Family*

Although China has a long history of polygamy, in contemporary mainland China, only monogamy is legal and morally permissible. On May 1, 1950, a new Marriage Law was promulgated. It stated that "The New-Democratic marriage system, which is based on the free choice of partners, on monogamy, on equal rights of both sexes, and on the protection of the lawful interests of women and children, shall be put into effect," and that "Bigamy, concubinage, child betrothal, interference with the remarriage of widows, and the exaction of money or gifts in connection with marriage, shall be prohibited." The revised marriage law of 1980 followed the same principles as the 1950 law.

### *Marital Sex*

A surprising 91% of the 8,000 married couples interviewed by Dalin Liu (1992) in cities and rural areas expressed satisfaction with their spouse. However, when Dalin looked deeper, he found that the average Chinese couple has intercourse four to seven times a month, with peasants invariably reporting 25% more sex than city couples. However, 34.1% of the rural couples and 17.2% of city couples admit to less than one minute of foreplay or none at all. Consequently, 44.7% of urban wives and 37% of rural wives experience pain during intercourse. Only 16.8% of rural couples kiss or embrace apart from lovemaking. (See also Part 2. The 1992 Survey of Sexual Behavior in Modern China, Section D, Married Couples, for data on marital sex and satisfaction in the 1992 nationwide survey.)

Marital dissatisfaction is very common in China today. Some estimate that as many as 60% of the Chinese are unhappy with their marriages. A survey of 3,000 young people in Wuhan, the capital of Hubei province, showed that only 20% of respondents were satisfied with their marriage. In a survey of 600 couples, all residents of big cities, 70% said they were unhappy with their sex lives. A random survey of married couples in Shanghai found that 45% were unhappy with their sexual relationships. A survey of 6,000 divorce cases in five large cities, including Beijing, Shanghai, Guangzhou (Canton), Wuhan, and Xi'an, by ten newspapers showed that 72% of divorces are caused by disharmony in sexual life. [*Update 2001*: A four-year survey of "The Quality of Marriage in China" found that only 3% of the couples surveyed rated their marital sex as "fully satisfying," 75% rated it "so-so," while 22% rated it "low quality." (December 2, 2000, Shenzhen Evening News). (*End of update by F. Ruan*)]

### *Divorce*

Although the divorce rate is not very high in China, it is increasing rapidly. In 1978, some 170,449 couples divorced; in 1979, 192,894 couples; in 1980, 180,378 couples; 186,891 couples in 1981; 210,930 couples in 1982, 420,000 couples in 1983, and 450,000 couples in 1984. In 1985 and 1986, the annual average was 500,000 couples. The divorce figure rose to 587,000 couples in 1987, and 630,000 couples in 1988. In 1989, nationwide official statistics showed that 9,851,000 couple applied for marriage; 9,348,000 couples, about 95%, were approved and given a marriage certificate. In the same year, 1,307,000 couples applied for divorce; 752,000, about

58%, were approved and given divorce certificates. The marriage rate was 16.8 per 1,000 persons and the divorce rate 1.35 per 1,000 persons.

[*Update 1997*: With rapid economic growth creating new hopes and expectations, and Government interference in personal lives receding steadily, the divorce rate in Beijing more than doubled from 12% in 1990 to 24.4% in 1994, according to the *Beijing Youth Daily*. This statistic compares the number of marriages and divorces in a given year. While the national divorce rate in mid-1995 was 10.4, far behind that in the United States and European nations, officials admit that the divorce rate is rising all over China, and faster in the cities than in rural areas. Among the factors contributing to the new trend are the new social and economic freedoms, the rising expectations that women bring to marriage, and a remarkable increase in extramarital affairs. More than 70% of divorces are currently initiated by women with the most common reason being an extramarital affair on the part of the husband.

[Increasingly, among urban Chinese and even among government officials who once actively opposed divorce, divorce is being viewed as an acceptable alternative to an unhappy marriage. Many officials even recognize a positive side to divorce. When both parties agree, a divorce can be granted in three days; not long ago, the wait was years. Important as the government's attitudinal shift is, the larger factors are the growing expectations women bring to marriage today and their growing demands in an era of expanding opportunity. In the past, women were happy to settle for a stable income, a home, and children. To these expectations, women are now adding romance, sex, and affection. While women increasingly enjoy more independence and choices in career, place to live, husband, and lover, they are also more subject to unemployment. Meanwhile, the shift has also brought a resurgence of traditional male values, including the right to have an affair.

[Prior to the current surge in divorces, China experienced two other waves of rapidly rising divorce rates: The first occurred in the 1950s when returning victorious Communist soldiers abandoned their farms and rural wives to move to the city; the second came during and just after the Cultural Revolution, between 1966 and 1980 (Faison 1995). (*End of update by R. T. Francoeur*)]

### *[Concubinage*

[*Update 2003*: For thousands of years, Chinese emperors and government officials surrounded themselves with concubines, while traders and businessmen maintained a wife in every port. Under British rule (1841 to 1997), concubines were legal in Hong Kong. In the past generation, enough Hong Kong men have led the double life to father an estimated 520,000 children. In 1999, a local Hong Kong court exercised its separate legal jurisdiction to grant Hong Kong residency to the half-million children born to the second wives of Hong Kong men. That decision would have added significantly to Hong Kong's 6.5 million people packed into a very limited 416 square miles (1,077 km<sup>2</sup>). It also created some serious legal consequences for the "One Country, Two Systems" policy. Not surprisingly, a mainland Chinese court overturned the local decree.

[With Hong Kong and the former Portuguese colony of Macao now under mainland Chinese rule, the borders are increasingly porous, and concentrations of second wives and concubines are expanding in small cities and suburbs within commuting distance of Hong Kong and Macao and along the main rail lines from Hong Kong and Macao to Guangzhou, as well as across southeast China.

[Concerned about the negative effects of the concubine tradition on China's family-planning policies of one child

per family in the cities and a tolerated two children in the rural areas, the government is now trying to eliminate or at least reduce concubinage. This will not be easy, for both economic and jurisdictional reasons.

[Mass migration and economic dislocation have made concubines a major problem across the country wherever rural poverty meets the affluence of the new free market's restrained capitalist economy. For a modest \$200 monthly rent in a village of concubines, a moderately affluent married businessman can enjoy the comfort of an attractive devoted second wife. Second wives are easy to find on farms just outside cities. There is also a flourishing business of go-betweens who recruit young women happy to trade the hard life on a poor farm in some distant province for the luxury of a two-bedroom apartment with some modern conveniences in the bustling suburb of a modern city.

[The government tries to combat migration from the farms to the cities by issuing every adult a work permit allowing that person to work legally only within a certain distance of their birthplace. Permits to migrate to a city are strictly limited. In becoming a concubine, a young woman can leave her rural home without a work permit and be supported by a "husband."

[A law introduced in 2000 in Shenzhen, just outside Hong Kong's Kowloon district, provides a prison sentence of 10 months for "factual bigamy"; a single act of adultery is still not a crime. Under a new law in Guangdong province, which includes both Shenzhen and Dongguan, long-term cohabitation by an unmarried couple is now a crime and can bring a two-year sentence to a labor camp. However, the police face a near insurmountable obstacle proving long-term cohabitation when a monthly lease or no lease enables a man to move his second wife to a new apartment on very short notice.

[The current separate legal jurisdictions of Hong Kong, Macao, and China also make prosecution very difficult. If a Hong Kong woman wants to take her bigamist husband into a Chinese court, she must first make sure that the Chinese police can prove that the husband is living with his mistress somewhere in one of the populous mainland villages of concubines (Landler 2000; Luk 2002). (*End of update by R. T. Francoeur*)

### *Extramarital Sexual Activities*

Sex between consenting adults is technically not illegal in China, but the police have broad powers to suppress activities that they consider antisocial. Elderly women who staff local "neighborhood committees," the grassroots eyes and ears of the government, also try to stop activities of which they disapprove. But discreet affairs have a good chance of escaping detection and interference. Means of birth control were not always available to unmarried youths, but women knew they could get an abortion. Extramarital affairs seem to occur much more than generally believed, although they are conducted in such secrecy that little statistical information is available. Perhaps the best evidence of these affairs is divorce rates: about one third of the divorces in Beijing from 1984 to 1985 were caused by extramarital relationships. In the Third Symposium of Family Problems in 1991, an expert said that 40% of divorces are caused by extramarital sexual relationships. If these findings are at all typical, then the increasing divorce rate must reflect an increase in the number of extramarital relationships.

A survey in Beijing found that members of at least 10% of the sample of 600 couples had had extramarital sex. Perhaps most significant is a nationwide survey that showed that 69% of the people surveyed did not think extramarital affairs are wrong. In Dalin Liu's 1992 survey, 69% condoned extramarital sexual relations.

### *Incidence of Oral and Anal Sex*

Several factors influence both attitudes towards and experience with oral and anal sex. In a 1989 survey with 1,279 respondents in 27 cities, nearly seven out of ten Chinese reported that they have had anal sex with heterosexual partners. Professor Pan found that only 6% of the 600 heterosexual couples he surveyed in big cities had had anal intercourse at least once.

In ancient erotic art and fiction, oral sex, including mutual "69" oral sex, is not unusual. Considering the lack of information about sexual behaviors that prevailed until recently, and Dalin Liu's finding that 34% of rural couples and 17% of urban couples engaged in less than a minute of foreplay, it is not likely that oral sex is as common as it was in ancient China. No general survey data is available. Many modern Chinese think oral sex is too "dirty." In 1988, a survey of 140 homosexual males in Shanghai revealed that only 19 persons, 13.6%, said they had had oral sex, and only four persons, 2.8%, had experienced anal sex. At a 1990 World Health Organization meeting on the spread of AIDS in China, Pan reported that 7.7 out of 10 Chinese have had anal sex with a heterosexual partner. Few data are available on anal sex among homosexuals because of the taboo character of that population as well as studies of same-sex behavior (Burton 1990). (Dalin Liu's *Sex Culture in Ancient China* provides extensive information about sexual deviance in China.)

### *6. Homoerotic, Homosexual, and Bisexual Behaviors*

Male homosexuality may have been a familiar feature of Chinese life in remote ancient times. The official Chinese historical records indicate that during the Spring-Autumn and Chin-Han Era (770 B.C.E. to 24 C.E.), male same-sex behavior was not a crime or considered immoral behavior. On the contrary, it was sometimes the noble thing to do. For example, in Western Han (206 B.C.E. to 8 C.E.), ten of the 11 emperors each had at least one homosexual lover or shared some same-sex behavior. During the Western and Eastern Jin and Southern and Northern Dynasties (256 to 581 C.E.), male homosexuality seemed also acceptable in the broader upper-class society.

Considering the many and varied records of homosexuality in ancient China, one would expect to find evidence of homosexuality in modern China. However, literature regarding contemporary homosexuality is scarce at best, although it is available in Taiwan and Hong Kong. Thus it was a genuine breakthrough when, through a rather unique and unexpected set of events, the situation of homosexuality in China was openly discussed for the first time in a positive context: In 1985, Ruan, the author of this chapter, using a pen name, Jin-ma Hua, published an article in a widely circulated Chinese health magazine, *To Your Good Health*. The article pointed out that homosexuality has occurred in all nations, all social strata, and in all eras in human history, and that homosexuals deserve a reasonable social status. Many of the readers of *To Your Good Health*, most of them gay, wrote to the magazine's editor in response to the article.

By April 1986, a total of 60 letters had been received by the editor of *To Your Good Health*, and forwarded to Ruan. A striking aspect of the letters from gay men is their immense relief at having an opportunity to express their feelings. Many letters expressed the writers' pain and conflicting desires for both confidentiality and a chance to overcome their isolation. Clearly, the chief source of pain for China's gay men derives from the fear of societal punishment, including arrest, and possible sentence to labor reform camp or prison.

The mental pressure and anguish arising from the fear that their true identity might be discovered is often unbearable. The social pressure, pain, and inner conflict homosexuals suffer can be so intense that they come to consider or even attempt suicide. Of the 56 who responded to Hua's article, 15, or more than 25%, mentioned suicide attempts. Of all the hopes and dreams expressed in these moving letters, three types of aspirations were outstanding. The first concerned the human rights issue—the belief that society should accept homosexuals and their right to express their sexuality without social or legal condemnation. The second concerned the issue of freedom to interact with other homosexuals—the wish that society would provide them with means to make contacts and form relationships, just as it does for heterosexuals. The third concerned the issue of knowledge—the wish that objective and scientific studies would be conducted and publicized in order to improve societal understanding. In 20 letters, the hope that some agency would facilitate social contacts among homosexuals took the form of a request that “Dr. Hua” or his publishers do so. In Hua's article, two actual cases of gay life in Hubei and Shanghai had been described. All 20 letters requested the names and addresses of these two men in order to establish contact with them. Some men, though they did not use the word for “club,” expressed the wish to create this type of organization. There were 18 letters pointing out the need for development and/or publication of more information about homosexuality.

Regarding the legal situation of homosexuals in mainland China now, although there is no specific statement concerning the status of homosexuals in the current Criminal Law of the People's Republic of China, Article 106 says, “All hooliganism should be subjected to arrest and sentence.” In practice, homosexual activity has been included in “hooliganism.” As noted above, even the small sample of letters Ruan received contained a report of a man who received a five-year jail term for homosexuality.

Silence, especially a silence based on repression and enforced ignorance, must not be mistaken for approval or tolerance. When public figures do speak out on homosexuality, it is usually to condemn it. For example, in the 1990s, a famous attorney even wrote that “homosexuality . . . disrupts social order, invades personal privacy and rights and leads to criminal behavior.” A leading forensic psychiatrist said that “homosexuality is against social morality, interferes with social security, damages the physical and mental health of adolescents, and ought to be a crime.”

Another common reaction to the suggestion that homosexuality exists in China is denial. Clear evidence of the official denial of homosexuality was provided by the internationally well-known sexologist, Dr. Richard Green, the series editor of “Perspectives in Sexuality: Behavior, Research, and Therapy.” In his “Series Editor's Comment” for Ruan's book *Sex in China: Studies in Sexology in Chinese Culture*, he wrote:

Less than a year before the 1989 massacre in Tiananmen square, I lectured on human sexuality at Peking Union Medical College. I described my research on the nonsexual behaviors of young boys that predicted later homosexuality. I asked the physicians in the audience whether comparable childhood behaviors were found among Chinese boys. I was told that there were no homosexuals in China. (Ruan 1991)

But, this official attitude of denying homosexuality in China can no longer be justified. In late 1991, officials in Shanghai, the largest city in China, recognized that there are about 10,000 homosexuals in the city. Actually, the number of homosexuals may be over 200,000, according to the

*World Weekly* (September 1, 1991). Changzheng Hospital in Tianjin, the third largest city in China, reported in a medical paper that in the past four years, out of 366 STD cases, at least 61 cases of syphilis resulted from male homosexual behavior; 80% of the cases involved anal sex, 10% oral sex, and other 10% anal plus oral sex. Most of the cases (80%) involved sexual activity in public toilets. More than 80% of the homosexual partners were strangers. Their ages ranged from 16 years to 60 years, with two thirds of the group falling between 20 and 30 years of age. Most of them were workers, some were cadres, teachers, and others.

Yet another reaction is to admit that perhaps homosexuality does exist in China, but to insist that, when it occurs, it is the result of Western influence; it was referred to as “spiritual pollution,” and “Western social diseases,” originating in “Western ideology and thoughts.”

Finally, there are those who, when faced with undeniable evidence of homosexuality, respond by seeking to eliminate it. Even many physicians still fail to recognize homosexuality as simply one possible sexual orientation. For example, in Harbin, one of the largest cities in northeastern China, physicians now use the discredited approach of “treating” homosexuality with electric shock therapy to discourage erotic thoughts.

In ancient times, Chinese culture was characterized by a very tolerant attitude toward same-sex female behavior. Lesbians in China today are even more closeted than gay males. (See also Xiaomingxiong—alias Samshasha 1984, and Lau & Ng 1989).

When Ruan received letters from homosexuals all over China in 1985 and 1986, not one was from a woman. The only women who are willing to discuss their homosexuality are the few who have already been imprisoned for this behavior and have little to lose. An exception to the usual difficulty in locating lesbians is the experience of Chinese journalists, He and Fang, who were actually more successful in contacting lesbians than gay males in their 1989 survey of homosexuality in China. They wrote six stories about lesbians compared to one about gay males.

He and Fang had to rely on interviews with women who were jailed for “sex crimes,” or crimes of violence inspired by sexual jealousy. Because so many investigations of female homosexuality are based on interviews with prisoners, it has been all too easy for Chinese people to develop a stereotype of lesbians as immoral, frustrated people (Sheridan & Salaff 1984).

In early 1992, a new and more humane homosexual policy emerged. This started with two young lesbians in Wuwei County, Anhui province, whose parents opposed their homosexual relationship very much. The angry parents finally reported the affair to the local police department. After several months of investigation, the police department of Wuwei County arrested these two female lovers and restrained them 15 days on charges of “misconduct.”

The Wuwei County police department then referred the case to higher institutions until the Public Security Department of Central Government in Beijing heard the case. The Public Security Department replied and instructed the county police that because, under current laws, there was no article that specifies punishment for such behavior and relationship, it could not be treated as “misconduct.” Therefore, the Wuwei Police Department released the two women and let them live together as “husband” and “wife.” Usually the older woman takes the role of “husband,” and wears male clothing, while the younger one takes the role of “wife” and prefers to stay in the home. It is a very good signal to show that, at least some police officers, especially senior ones, have started to change their attitude toward homosexuality

and other sexual variations. But, recently a reversal still occurred. In May 1993, the government closed down the first gay saloon, "Men's World," located in Beijing. It had opened appeared on November 22, 1992, and came out in public on February 14, 1993.

(See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections B, Adolescent Sexuality, C, College Students, and D, Married Couples, for data on views of homosexuality and the incidence of same-sex behavior among adolescents, college students, and married couples in the nationwide survey.)

[Update 2001: Hongling Wei, editor of *Ren Zhi Chu* (sexual education journal), estimates that about 36 million to 48 million mainland Chinese men, 3 to 4% of the population, are homosexual or bisexual (Personal communication to Ruan).

[Research on homosexuality in China was pioneered in the 1990s by three noted scholars. Dr. Yinghe Li, a sociologist of sex who studied at the University of Pittsburgh (USA), Dr. Beichuan Zhang, a researcher on same-sex love, and Professor Suiming Pan, a sociologist of sex and Director of the Institute for Sociology of Sex at The People's University, Beijing. Dr. Li has interviewed and surveyed homosexuals and authored a monograph *Subculture of Homosexuality* (1998, Beijing). Dr. Zhang wrote the most comprehensive academic Chinese monograph on *Same Sex Love* (1994, Jinan: Shangdong Scientific and Technic Press). In his early investigation of homosexual behaviors in 1997 to 1998, Dr. Zhang discovered that only one third of the over 400 homosexuals he interviewed used condoms (Beichuan Zhang: "Men, sexual relationships, AIDS," *Ren Zhi Chu* 1999, 9: 36). Table 2 lists the results of a 1998 nationwide random investigation of sexual attitudes toward homosexuality among ordinary Chinese.

[In early 2001, the 8,000-member Chinese Psychiatric Association concluded that homosexuality is not a perversion and removed homosexuality from its list of mental illnesses in its new diagnostic manual. The step added to a growing tolerance of gays and lesbians in China, where an underground culture of gay bars, websites, and sports clubs flourishes. Taking advantage of loosening social restrictions over the past two decades, gay couples now live together discreetly. In major cities like Shanghai, some musicians and artists are openly gay, although many homosexuals endure harassment. The diagnostic manual retains an entry on homosexuality as a possible cause of depression, and other problems for patients who are uncomfortable with their orientation. Treatment can include therapy meant to change a patient's orientation to heterosexual, but such therapy was rare in China. (End of update by F. Ruan)]

## 7. Gender Diversity and Transgender Issues

Recognition of transsexualism in human society is a relatively recent phenomenon, especially in the closed society of mainland China. In January 1983, with the author's assis-

tance, the first male-to-female transsexual surgery was performed in the Plastic Surgery Department of the Third Hospital of Beijing Medical University.

The greatest difficulty facing transsexuals in China is that of gaining the acceptance of their families and society. It is nearly impossible to obtain permission to perform transsexual surgery. A psychiatrist told the author that he had seen two transsexual patients who, after being repeatedly denied transsexual surgery, used knives to remove the penis by themselves. The problem is not a lack of appropriate surgical techniques and facilities. In fact, both general plastic surgery and such precise surgical techniques as reimplantation of severed fingers are very advanced in China. Dr. Xia, in the Plastic Surgery Department of the Third Hospital of Beijing Medical University, has successfully operated simultaneously on a male-to-female transsexual and a female-to-male transsexual with mutual exchange and transplantation of ovaries and testicles; this surgery took 19 hours. If permission were given, transsexual surgery could be performed with little difficulty in most large hospitals. The problem is really perceptual and ideological. The absence of scientific research on the subject means that there is nothing to counteract the statements of the popular press, which describes transsexualism as not merely outlandish, but as evidence of the inroads of "decadent Western culture." This ideological tone effectively inhibits surgeons' willingness to perform transsexual surgery.

[Comment 1997: In early Chinese history, hundreds of males were castrated every year to become eunuchs. Some of these were transsexuals. In other words, transsexuals in the past had a legal option transsexuals do not have in China today. (End of comment by M. P. Lau)]

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

#### Rape and Pedophilia

Rape, pedophilia, and any behavior which "subjects women to indignities or carries out other gangster activities," are all clearly illegal, according to Articles 139 and 160 of the 1980 Criminal Law of the People's Republic of China. It is very interesting to note that although China has an official policy severely repressing sex and heavily punishing sex crime, nevertheless, such crimes in mainland China continue to increase from year to year. The Chinese government does not publicize the number of sex crimes, but some figures are available from academic articles. For example, in Shanghai, the largest city in China, the number of rapes increased from 100% (as the basis for comparison) in 1979 to 377% in 1983. Nationwide, the number of reported rapes rose from a base 100% in 1979 to 340% in 1983. (See also Part 2. The 1992 Survey of Sexual Behavior in Modern China, Section E, Sex Offenders, for data in the 1992 nationwide survey.)

Teenage rapists, in particular, increased from a base of 100% in 1980, to 150% in 1981, 192% in 1982, and 311% in 1983. While there was a slight decrease in 1984, the absolute number still increased, and in 1985, it increased by 42.5% in Shanghai over the previous year.

In China, every year, a lot of people were shot by the government as the penalty for crime. Many of them were related to crimes of sex, love, and marriage. In Beijing, the capital of the People's Republic, for instance, out of 52 cases for which executions were carried out in 1984, crimes of sex, love, and marriage accounted for 67.4% of all death penalties.

The juvenile crime rate from 1979 to 1981 increased more than 25%. Statistics from three cities from 1980 to 1983 showed 13% of juvenile crimes involved sex crimes.

Table 2

### Chinese Attitudes Toward Homosexuality

Homosexuality . . .	Completely agree	Rather agree	Rather disagree	Do not agree
Is an inversion	52.2%	30.8%	10.0%	3.7%
Is immoral	17.2	22.6	43.3	13.6
Is biological	10.1	28.9	32.9	23.3
Is normal	5.5	12.4	26.6	51.6
Gay marriage OK	4.5	6.3	20.2	65.3

Most of them involved 13- to 15-year-olds. Forty percent of male delinquents charged by the Juvenile Delinquent Correction Institution were charged with "sexual crimes and mistakes"; 95% of the female delinquents, some as young as 12 years, were charged with sexual violations, which may or may not have involved rape.

### *Incest and Sexual Harassment*

Certainly, incest and sexual harassment exist in China. No general survey data are available. "Sexual harassment" as a new word in Chinese (*Xingsaorao*) translated from English, is now used in China. Traditionally, it was included in the concept of *liumong xingwei* or *tiaoxi funu*, both terms indicating any behavior which sexually subjects women to indignities. *Liumong xingwei* and *tiaoxi funu* are clearly illegal, according to Articles 139 and 160 of the 1980 Criminal Law of the People's Republic of China.

### *[Sexual Violence and Crimes of Passion*

[*Update 2001*: In early 2001, Shanghai's State Prosecutor reported that China's massive floating population of rural migrants was playing a major role in the dramatic rise in extramarital affairs, divorces, and domestic violence. In 1999, the Prosecutor reported that over one million of the eight million Chinese in the city of Shanghai proper had obtained a divorce. Domestic violence reportedly affected a third of Shanghai's families and half of the city's homicides were crimes of passion. (*End of update by F. Ruan*)]

## **B. Prostitution**

China's first brothels were likely established in the Spring-and-Autumn period (770 B.C.E. to 476 B.C.E.) by the famous statesman and philosopher Guan Zhong (? to 645 B.C.E.), who used them as a means of increasing the state's income. It is clear that the institution of government-run prostitution reached its peak in the Tang (618 to 905 C.E.) and Sung (960 to 1279 C.E.) Dynasties. In ancient China, where most women had no opportunity to acquire an education, and formal contact between men and women was frowned upon, it was the role of the courtesan to entertain a man and be his friend. Every prominent official, writer, artist, or merchant customarily left his wife at home when he traveled; instead, he was accompanied by women skilled in making men feel comfortable. Courtesans with literary, musical, or dancing ability were especially desirable companions, and many became famous historical figures. However, the prostitutes working in privately owned brothels mainly provided sexual services. (See also the profile of a female prostitute in Part 2. The 1992 Survey of Sexual Behavior in Modern China, Section E, Sex Offenders, for data on prostitution in the 1992 nationwide survey.)

From the Sung to the Ming Dynasties, government-run and privately owned prostitution existed side by side in China. Early in the Ming dynasty, from 1651 to 1673 C.E., the Manchu Emperors Shun-chih and Kang-hsi gradually abolished both local and imperial governmental involvement in operating prostitution. Thus, for most of the Ching dynasty, prostitution in China was a private enterprise. For most of the Republican period in mainland China (1912 to 1949), some prostitutes were registered while others plied their trade illegally.

When the Chinese Communists took power, one of the first social changes they introduced was the abolition of prostitution. Only one month after the Communist army took control of Beijing (Peking) on February 3, 1949, the new municipal government announced a policy of limiting and controlling the brothels. Less than eight weeks after the founding of the People's Republic of China, on October 1, 1949, more than 2,000 Beijing policemen raided and closed all 224 of the

city's brothels, arresting 1,286 prostitutes and 424 owners, procurers, and pimps. Other cities soon followed suit. In Shanghai, China's most populous city, there were 5,333 arrests of prostitutes between 1950 and 1955.

In October 1957, in a new attempt to maintain order, the 81st Session of the Standing Committee of the First National People's Congress adopted a new law titled Rules on the Control of and Punishment Concerning Public Security of the People's Republic of China. The legislation announced the policy on banning prostitution. In 1979, at its Second Session, the Fifth National People's Congress adopted the first criminal law in the PRC, The Criminal Law of the People's Republic of China, which took effect January 1, 1980. Under this Law, the punishment for coercing prostitution was more severe: "Article 140: Whoever forces a female to engage in prostitution shall be sentenced to a fixed term of imprisonment of 3 to 10 years."

The severe repression of prostitution did not prevent its accelerated revival in the late 1970s and throughout the 1980s and 1990s. The first official report of the recurrence and development of prostitution in mainland China appeared in March 1983. It reported that

According to the incomplete statistics from the three largest cities, Beijing, Shanghai, Tianjin, and four provinces, Guangdong, Fujian, Zhejiang and Liaoning, from January, 1982 to November, 1982, more than 11,500 persons were discovered to be involved in prostitution. More than 1,200 persons were owners and pimps of underground brothels; more than 4,200 women were prostitutes; and 1,800 persons, including 223 visitors from foreign countries, Hong Kong and Macao, were customers of prostitutes. Fifteen hundred people were fined, 790 were detained, 691 were arrested, and 662 were sent to labor camps. More than 900 underground brothels were banned and closed.

The growth of prostitution in Guangzhou (Canton) alone was amazing. In 1979, only 49 pimps, prostitutes, and customers were caught. In 1985, this number had increased to approximately 2,000. In one month of 1987, 11,946 people were arrested for involvement in prostitution, and in both the preceding and following months, the figures rose to more than 13,000.

Prostitutes and their customers appeared everywhere, in hotels, inns, hair salons, single-family homes, apartments, dormitories, underground brothels, and taxis, in every city and every province. Between January 1986 and July 1987, 18 prison camps for prostitutes were opened, and by December, the number of camps had more than tripled to 62.

Statistics collected in 1986 in the city of Guangzhou (Canton), in Guangdong province, supply some information about the men who patronize prostitutes. In 1986, of 1,580 customers who were caught, 41% were from the city, 34.5% from other parts of the province, 15.3% from other provinces, 6.1% from Hong Kong and Macao, and 3.7% from other countries. Fully two thirds of the customers were Communist Party members and county officials.

There is no doubt that economic motives fuel the current rapid growth of prostitution in mainland China. The possibility of earning as much as 10,000 Yuan new income in only two or three months, versus the average Chinese income of only about 100 Yuan per month, is a powerful incentive.

Since the late 1980s, even harsher measures were taken in the effort to curtail prostitution, including arrests of foreign citizens. In June 1988, in the Shenzhen Economic Zone, which abuts Hong Kong, there was a mass arrest of 122 prostitutes and 100 customers. In the small town of Deqing, about a 100 miles (160 km) west of Canton, a man accused of being a pimp was executed.

The opposition to prostitution also has an ideological basis. In the lexicon of China's Communist leadership, "prostitution" is a very bad word. Deng Xiaoping, the top leader in China, is particularly strong in his opposition to prostitution and advocates severe penalties, because he believes it tarnishes his country's reputation. According to a formal report, more than 200,000 prostitutes and customers were caught in 1991 alone, and more than 30,000 prostitutes were sent to forced labor camps, 80% of them streetwalkers.

Some of those arrested in the anti-prostitution movement received sentences as severe as the death penalty. In Wenzhou city, Zhenjiang province, a woman and a man were sentenced to death because they had owned several underground brothels, employing 14 prostitutes. In Beijing, a 55-year-old man was given a death sentence because in 1988 he had allowed prostitutes to use the offices in a hospital about 20 times.

[Update 2001: China currently has an estimated three million female commercial sex workers, according to a personal communiqué from Hongling Wei, editor of *Ren Zhi Chu*. (End of update by F. Ruan)]

### C. Pornography and Erotica

In China, erotic painting and erotic fiction occurred over 1,000 years ago, in the Tang dynasty. The official prohibition of erotic art and literature started as early as about 800 years ago, in the Yuan dynasty. After the founding of the People's Republic of China on October 1, 1949, a strict ban on erotic fiction and pornography of any kind was imposed nationwide. In the 1950s and 1960s, the policy of banning erotica was very effective. In the whole country, almost no erotic material was to be found. There were few difficulties implementing this policy until the mid-1970s.

Then, the legalization and wide availability of pornography in several Western countries during the late 1960s and early 1970s, coupled with China's growing openness to the outside world, increased the supply of such material available for underground circulation.

In recent years, the suppression of pornography has become a very serious political and legislative concern. The number of arrests and the severity of sentences on people involved in pornography have both increased in the attempt to suppress it entirely.

By the late 1970s, "X-rated" films and videotapes were being smuggled into China from Hong Kong and other countries. (In China, these are known as "yellow videos" and "yellow" refers to erotica). Yellow videos quickly became a fad. At first, the only people who could view these tapes were rather highly placed Party members and their families, because only they had access to videotape players, which were very rare and expensive in China at that time. Before long, however, "yellow videos," including the well-known American pornographic movie *Deep Throat*, were available to more people, although still very secretly and only through small underground circles. Some people used the tapes to make money; tickets for video shows were very expensive, usually 5-10 Yuan per person (at the time most people's monthly salary was only about 40 to 50 Yuan).

Sometimes, people who were watching these tapes engaged in sexual activity, even group sex. Because yellow videos were usually shown in small private rooms to very small audiences whose members knew each other well, a party atmosphere often prevailed. It was very easy for young people to initiate sexual activity when they were aroused by what they saw.

At about the same time, erotic photographs, reproductions of paintings, and books were also smuggled into mainland China. They, too, were sold at a great profit. One small card with a nude photo would cost as much as 5 to 10 Yuan.

There was a strong reaction at the highest levels of the Chinese Communist Party and the Government. The police were ordered to confiscate every type of pornographic material, from hand-copied books to "yellow" audiotapes and films. Severe penalties were ordered for all people involved in the showing or viewing of "yellow" videos, and, in April 1985, a new antipornography law was promulgated. The nationwide crackdown on pornography led to numerous arrests and confiscations in city after city. For example, by October 1987 in Nanchang, the capital of Jiangxi province, 44 dealers in pornography had been arrested and 80,000 erotic books and magazines confiscated. It was reported that an underground publishing house with 600 salesmen had been circulating erotic materials in 23 of China's 28 provinces, making a profit of 1,000,000 Yuan (in that period about US\$300,000) in two years.

A Shanghai Railway Station employee was sentenced to death because he and four other persons organized sex parties on nine different occasions; during these, they showed pornographic videotapes and engaged in sexual activity with female viewers. The other organizers were sentenced to prison, some for life.

The climax of this wave of repression seemed to occur on January 21, 1988, when the 24th session of the Standing Committee of the Sixth National People's Congress adopted supplemental regulations imposing stiffer penalties on dealers in pornography. Under these regulations, if the total value of the pornographic materials is between 150,000 Yuan and 500,000 Yuan, the dealer shall be sentenced to life imprisonment.

In a nationwide strike against pornography beginning a few weeks after the Tiananmen Square massacre, on July 11, 1989, 65,000 policemen and other bureaucrats were mobilized to investigate publishing houses, distributors, and booksellers. By August 21, more than 11,000,000 books and magazines had been confiscated, and about 2,000 publishing and distributing centers, and 100 private booksellers were forced out of business. But then Deng Xiaoping, China's top leader, went further by declaring that some publishers of erotica deserved the death penalty. It may be at least one of the most severe political punishments against "pornography" ever suggested by a national leader anywhere in the world. After this, in July 1990, the Supreme People's Court issued a new decree stating that the death sentence is the proper penalty for traffickers in prostitution and/or pornography.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

All kinds of contraceptive measures, from condom to pill, are available and used in China's practice of family planning. In 1989, it was estimated that more than 70% of couples of child-bearing age were using contraceptives, over 8.8 million males had undergone sterilization injections or operations, including a new reversible sterility operation. For females, the most popular birth control method was the intra-uterine device (IUD). Used by 60 million women in the country, the IUD accounts for 41% of the total contraceptive measures; female sterilization operations constitute 36%. Research on a variety of oral contraceptives in the country has also reached advanced levels, and these contraceptives are available to the public. Breakthroughs have recently been reported in the development of medicines for terminating early pregnancy. In 1992, a survey showed that 83.4% of married couples have adopted contraceptive practices. [Update 2002: Table 3 shows a comparison between 1992 and 1997 contraceptive usage. (End of update by F. Ruan)] (See also Part 2, the 1992 Survey of Sexual Behavior in Modern

China, Sections B, Adolescent Sexuality, C, College Students, and D, Married Couples, for additional data on contraception usage in the nationwide survey.)

### B. Unmarried Teenage Pregnancies

See Section 5, Interpersonal Heterosexual Behaviors.

### C. Abortion

In China, abortion as a secondary measure to terminate an unwanted pregnancy is not only a legal right, it is even a legal responsibility. If a woman already has a child, she will be asked to terminate her unplanned pregnancy by abortion in the first trimester, and even as late as the second trimester. Generally speaking, in mainland China, one third of pregnant women have undergone an abortion. From 1985 to 1987, 32 million abortions were done, 80% of these pregnancies being the result of failed contraception. (See the discussion of “Fewer births—the one-child policy,” in Section D below).

### D. Population Control Efforts

China’s population policy consists of two components: decreasing and limiting the quantity of the population, and improving the quality of the population. To reduce the numerical growth of the population, three main measures are practiced: late marriage, late childbearing, and fewer births—the “one-couple-one-child policy.” The basic measure used to improve the quality of the population involves efforts to prevent birth defects. (See also Part 2, the 1992 Survey of Sexual Behavior in Modern China, Sections B, Adolescent Sexuality, C, College Students, and D, Married Couples, for data on attitudes toward government limitation of family size among adolescents, college students, and married couples in the 1992 nationwide survey.)

This dual population policy is proving to be effective: China had 200 million fewer babies born in 1988 than in 1970. The result has been a saving of 3 trillion Yuan (\$802 billion). China has successfully controlled its annual population growth rate to less than 1.5%, as compared with 2.4% in underdeveloped countries and 2.2% in Asia. During the 1960s, the average Chinese woman gave birth 5.68 times (the figure includes infant deaths, stillbirths, and abortions). This dropped to 4.01 during the 1970s and to 2.47 in the 1980s. The average population growth rate dropped from 2.02% during the period from 1949 to 1973 to 1.38% from 1973 to 1988.

#### Later Marriage

Generally, until the recent past, the Chinese people were controlled on the local level by *danwei*—the unit or institution one belongs to. In order to marry, a couple must have a legal registration and a permit letter from his or her *danwei*.

Usually one’s *danwei* leader checks one’s age—while the minimum legal marriageable age is 22 for males and 20 for females, “later marriage age” policy stipulates an age of 27 to 28 for males and 24 to 25 for females in order to help in the control of population.

A 1991 survey in Nanjing, the former capital of China and the capital of Jiangsu province, showed that the average marriage age was 27.5 for males and 25.8 for females. In 1949, the average first marriage age for females was 18.57, in 1982, it increased to 22.8 years old.

[Update 2003: In May 1971, Seymour Topping, assistant managing editor for *The New York Times*, was the first Western journalist to meet the Communist Army as it entered Nanjing, Chiang Kai-shek’s fallen capital. Late marriage was already a part of the new government’s population plan, as a physician at the commune hospital at the August First Commune north of Shenyang explained to Topping:

“We are encouraging the boys and girls to marry late. There is no fixed age, and postponing marriage is entirely voluntary. We suggest twenty-five for men and twenty-three for women in the countryside. We tell them late marriage is good for the country. It is better for their health, gives them more time to study and to make a bigger contribution to socialist construction.” In the urban areas even later marriage is urged, twenty-five or twenty-six for women and twenty-seven or twenty-eight for men. Under old Chinese customs it was common for families to arrange child marriages. (Topping 1972)

#### [Later Births

[Married women are urged not to have a baby before 25 to 28 years of age, but no later than 30 years of age, in order to achieve the twin goals of later childbearing and healthier birth.

#### [Fewer Births, the “One-Child Policy”

[From the late 1970s to the early 1980s, China’s family planning policy evolved from “One couple, two children,” to “One couple, better one child,” and then to “One couple, only one child.” From advocating “One couple, one child,” the government moved to punishing parents who have more than one child. In 1988, the “one-child policy” became a little more flexible to allow couples in rural areas with one daughter to have a second child, hopefully male, with planned spacing.

[On May 3, 1988, Ms. Peng Peiyun, the new minister in charge of the State Family Planning Commission, restated the official birth control policy at the opening ceremony of the International Conference on Strategic Management of Population in Beijing. Included was a statement of the long-term birth policy:

The country’s current family planning policy is to promote late marriage and late birth, fewer but healthier births, the practice of “one couple, one child”; to allow couples in rural areas with one daughter to have a second child with planned spacing; and to avoid second or multiple births outside their control. A certain flexibility will be given to ethnic minority peoples. (Cheng Hong: “Minister Restates Long-Term Birth Policy,” *China Daily*, May 4, 1988)

Allowing the peasants to have a second child was a welcome change. Hopefully, this will reduce the resistance to the original “one child” policy, so that China’s birth control policy will more effective. (End of update by F. Ruan)]

[Update 1997: By the mid-1990s, the “one-child policy” had produced an obvious but unintended and serious sex imbalance that is already producing some major improvements in the very low position women have traditionally

**Table 3**

#### Contraceptive Methods in China in 1992 and 1997

	1992	1997
Vasectomy	12.0%	9.2%
Female Sterilization	39.0	40.0
IUD	40.0	43.4
Implant	0.5	
Pill	5	2.1
Condom	4	4.0
Spermicide	0.2	
Others	0.6	

From: China Population Information and Research Center, <http://www.cpirc.org.cn>, on June 11, 1999.

held in this male-dominated society. Initially, the traditional preference for sons coupled with the "one-child policy" has led to ultrasound scans during pregnancy followed by selective abortion for female fetuses. In January 1994, a new family law took effect that prohibited ultrasound screening to ascertain the sex of a fetus, except when needed on medical grounds. Under the new law, physicians can lose their license if they provide sex-screening for a pregnant woman (Reuters 1994). Even after birth, "millions of Chinese girls have not survived to adulthood because of poor nutrition, inadequate medical care, desertion, and even murder at the hands of their parents" (Shenon 1994; see also Section 1B, Basic Sexological Premises, Sociolegal Status of Males and Females) (*End of comment by F. Ruan*)

[Update 1997: [The 1990 census showed about 205 million Chinese over the age of 15 were single in a total population of 1.2 billion. Overall, three out of five single adults were male. However, government figures show that, while the vast majority marry before they turn 30, eight million Chinese in their 30s were still single in 1990, with men outnumbering women by nearly ten to one. Demographics suggested that by the turn of the 20th century, tens of millions of Chinese men will be unwilling or willing lifelong bachelors.]

[A government-sponsored computer-dating service, the Great Wall Information Company, founded in Beijing in 1989, and others often sponsored by provincial and city governments, are swamped by eager men searching for a mate. One of the most popular television shows nationwide is "We Meet Tonight," a cross between a talent show and the "Dating Game," hosted by Ms. Yang Guang since its first showing in 1990.]

[With women in short supply, the men are learning to be realistic and not set their expectations too high. In reality, the women now set the standards, making their choice of a prospective husband based on the intelligence, education, and financial status of many candidates. Another benefit for the women, prompted by the concurrent move towards a free-market economy in which scarcity equals value, is that women can no longer be treated as chattel.]

[Custom has held that a man should marry a woman several years younger and with less education than he has. This left older unmarried women, especially those with more education, almost no hope of finding a husband. With the growing shortage of single women, increasing numbers of men are being forced to consider marrying an older woman. There is a saying being heard more commonly in the countryside that a man who marries a woman three or more years older has found a bar of gold and benefits from her maturity.]

[On the negative side, Chinese sociologists and journalists have suggested that the drastic increase of unwilling bachelors in a society that values the family and sons above all else may well produce an increase in prostitution, rape, and male suicide. Bounty hunters have already found a lucrative market for abducting young city women and delivering them to rural farmers desperate for brides.]

[To restore the balance of sexes, some observers suggest the government could be forced to offer incentives, like free higher education and tax breaks, to encourage couples to have girls. This could result in a huge change in the way women are treated throughout the society (Shenon 1994).]

[India is facing a similar sex imbalance with similar factors, the value of male offspring and efforts to reduce population growth. With 900 million people, India has nearly 133 single men for every 100 single women. In the industrialized world, sex ratios are more balanced; in some cases, Japan and the United States in particular, unmarried women outnumber single men, 54 to 46 (Shenon 1994). (*End of update by R. T. Francoeur*)]

### *Healthier Birth, or "Preventing Birth Defects"*

Every year in China, 13 infants per 1,000 are found to suffer from physical defects. The death rate is 26.7 per 1,000 births and the deformity rate is 35.7 per 1,000. Most are the victims of inbreeding and such hereditary diseases as some mental illnesses, hemophilia, and chromosome defects. This is a big burden to society and the families that have a child with a serious birth defect.

Since 1988, Dr. Wu Ming, a famous expert in medical genetics, has joined the author of this chapter in publications, speeches, and lectures advocating the prevention of birth defects. The basic information was written by the author of this chapter in his book *New Knowledge on Prevention of Birth Defects*, published in Beijing by People's Medical Publishing House (Ming 1981). This was the first book of its kind since 1949 and the founding of the People's Republic of China.

In the early 1980s, the concept of healthier birth, or prevention of birth defects, had already become an important component of China's policy on population control. In 1986, the Ministry of Health and the Ministry of Civil Administration stipulated that a medical examination would be a national requirement for marriage approval.

Gansu province is one of the poorer provinces in China. Out of its population of 23 million, more than 260,000 are mentally retarded. This has become a very severe social burden for the province. In 1988, Gansu province adopted a law to force persons who have severe hereditary or congenital mental retardation (I.Q. 1) to be sterilized before marriage, or abort any fetuses conceived, in order to prevent severe birth defects. From January 1989 to June 1991, 6,271 mentally retarded persons were sterilized. Later, several other provinces, including Fujian, Guangdong (Canton), Henan, Liaoning, and Sichuan, adopted the same law. Premier Li Peng and Ms. Peng Peiyun, the minister in charge of the State Family Planning Commission, have spoken out in support of this local law. This indicates that sterilization of mentally retarded persons may become national law in the near future.

In January 1994, a new family law went into effect that banned sex-screening of fetuses (mentioned above) and forbade couples carrying serious genetic diseases to have children. Marriage was prohibited for persons diagnosed with diseases that "may totally or partially deprive the victim of the ability to live independently, that are highly possible to recur in generations to come, and that are medically considered inappropriate for reproduction." A list of the applicable diseases was published shortly after the law went into effect (Reuters 1994).

### *[Challenges and Problems*

[Update 2002: *China's Huge Population Base and Unbalanced Regional Development*. Despite advances in family planning, China's huge population base increases by about 21 million births every year, producing an annual net increase of 13 million. Such a growth pattern will continue for a considerable period of time and it constitutes a heavy burden on China's socioeconomic development. In addition, the regional development is unbalanced, with major differences between urban and rural areas, among cities of different sizes, among coastal, inland, and remote areas, coupled with differences in fertility levels and family planning activities that have produced inescapable difficulties.]

[*Enforcing Training of Family Planning Professionals*. China's population and family planning activities started at a time when its economy, culture, and education were still not developed. Although family planning profession-

als have combined learning with practices through trial and error and made achievements, their ideological, educational level, limited knowledge in some relevant fields, management methods, and professional skills are still not enough to keep track of the rapid developments in the natural and social sciences and technology. At present, the proportion of professionals with a college background is still rather low (14.07%). Professionals with medium and advanced levels of expertise account for 4.52% and 0.49%, respectively. Effective measures must be taken to enforce their training.

*[Improve Family Planning Services for the Floating Population and Disadvantaged.* Services for the migrant population, the unemployed, and non-resident people are new and difficult problems that have arisen with the establishment of a market economy and a series of associated social transformations. Solutions must be sought from the management mechanism and service provisions, and so on.

*[Serving an Aging Population.* The census in 1990 and the 1% population sample survey in 1995 showed that the old-age population, those over 65 years, grew from 5.58% in 1990 to 6.69% in 1995 (80.8 million people). The census result showed that the total dependency ratio of the population has been on the rise, from 49.86% in 1990 to 50.22% in 1995. Strategies for the problems of population aging and insurance for the aged need to be further clarified.

[China has developed and improved its population and family planning programs in response to the change and evolution of domestic and international situations. Since the International Conference on Population Development (ICPD) held in Cairo in 1994, China has given much publicity to the program of action formulated at the Conference. Through a series of meetings with various state departments, NGOs, scientists, and experts, the Chinese government has been trying to work out strategies for fulfilling the program of action of ICPD in accordance with China national characteristics. Solutions include:

- Further clarify the guiding principle of coordinating population and family planning with socioeconomic development; make further efforts to control population growth; improve people's quality of life; make general and comprehensive plans for environmental and resource protection and socioeconomic development, and maintain sustainable development.
- Develop a change in the way of thinking and working: Adopt an integrated approach of closely combining the promotion of family planning with socioeconomic development, and take all measures to solve the population problems; realize a combination of social restrictions with a benefit-oriented mechanism, which is based on scientific management, including publicity and education, and the delivery of multiple services. For over a decade, Chinese family planning professionals have spared no effort to achieve the aim of controlling the population growth and improving people's life quality, and making a contribution in stabilizing the population of the world. In the face of new conditions and new problems following socioeconomic development, people have awakened to the need and possibility of change. "Quality Services," "Informed Choice," and other pilot projects have provided examples and enlightenment for change. Many new experiences and practices fitting local characteristics have been created.
- Combine family planning with reproductive healthcare, expand the scope of service, and improve the quality of service, as well as the reproductive health of all people.

- Pay attention to studies and countermeasures to new conditions and problems. Emphasis has been put on the floating-population problem in urban family planning activities. A meeting on urban family planning was held in 1996. Puberty education will continue to be an object of major importance (SFPC 1999).

*[Male-preferred, Sex Ratio, and Birth Control.* Relevant research shows that China's high sex ratio is caused by failure to register baby girls and selective abortion. This phenomenon usually happens in rural areas where the fertility rate drops quickly, where family planning consultation and good services are scarce, and where people have a preference and need for baby boys. If left unattended, the problem will affect the health and status of women and baby girls and the stability of society in the future. Therefore, efforts should be kept on publicity and education, on implementing the relevant laws and statutes, and to ensure the correct recording of statistics (SFPC 1999; Gao 1989; Legge 1970; Holly & Bransfield 1976).

*[Chinese Male-Preferred Tradition.* China was, and in many ways still is, a Confucianist country. Confucianism said that: "There are three things which are unfilial, and the greatest of these is to have no offspring." In Chinese society "having posterity" means having a male child. Therefore, having no son is regarded as the worst possible problem a family can have, psychologically, economically, and sociologically. In traditional Chinese society and the family, women had no real identity until they married, and no security until they contributed sons to their husband's patrilineage. A measure of the family's fortunes was the number of sons who survived to adulthood, and, because females were married into other families at least by puberty, they did not represent an investment which would eventually pay off for the family (Holly & Bransfield). (End of update by F. Ruan)]

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

Since the 1980s, sexually transmitted diseases have been spreading to every province and all the major cities in China. Statistics show that in 16 major cities, the average incidence of STDs was 21.02 per 100,000 in 1987. In some cities, the incidence was as high as 336 per 100,000, resembling that in some Western countries. In Helongjiang province alone, the incidence of STDs increased at the rate of 8.9 times per year from 1982 to 1988. By the end of 1988, when this province had the fourth-highest incidence in the country, 4,558 cases had been reported; and it was estimated that reported cases represented only 20% of the total incidence. Nationwide, the number of STD cases reported from 1980 through the end of 1988 was 140,648, with more than 56,000, over 39% of these, occurring in 1988 alone. In 1992, the figure of 45,996 new reported STDs cases was 4.86% higher than in 1991.

### B. HIV/AIDS

In the mid-1990s, China claimed to have one of the lowest incidences of AIDS in the world. The first case of AIDS discovered in China, in June 1985, was that of an American tourist. As of August 1989, only three cases of AIDS had been discovered. All three were infected abroad. Also, by July 27, 1989, only 26 cases of HIV infection had been diagnosed. In October 1989, the first AIDS case in a native Chinese citizen was identified. The patient had sought medical care using an assumed name and was found to be suffering from secondary syphilis. The hospital later tested his blood serum and found it was HIV-antibody positive. By the time the young man was identified, he had already left the coun-

try. According to the head of the National AIDS Center, this patient said he had had homosexual relationships with foreigners. By December 1, 1992, 969 cases of HIV-positives and 12 cases of AIDS patients were reported; nine of the 12 AIDS patients had already passed away as of mid-1993. Gil (1991) has provided a valuable early ethnographic and epidemiological perspective on HIV/AIDS in the People's Republic based on field visits to Beijing, Chengdu, and Kunming, the latter in Yunnan province, site of China's most severe nidus of HIV infection.)

In December 1996, the Health Ministry announced an official count of 4,305 cases of HIV infection. Privately, experts admit the real number already exceeds 100,000 cases (Wehrfritz 1996).

The accelerating spread of HIV/AIDS in China has recently been linked with the cultural aversion to giving blood. This aversion fosters a seller's market that all but guarantees an impending disaster. Most donors are poor migrants struggling to make ends meet. Some make their living as sex workers as well as from selling blood, and some are drug addicts. In addition, government clinics commonly reuse the needles used to draw blood, and only a third of the nation's blood supply is screened for HIV contamination.

The sale of blood inevitably leads to people willing to exploit and profit from the shortage. The government has recently broken up rings of blood brokers, known as "bloodheads," who have kidnapped or drafted people as donors by paying corrupt officials heading work units. The bloodheads then sell the blood to local government blood stations where directors may be willing to overlook the source and its risk just to have an adequate blood supply. In late 1996, a draft law was circulating among senior health officials that would outlaw the buying and selling of blood for clinical use. While such a law could definitely reduce the risk of HIV infection in the normal course of transfusions and surgery, it would leave China with a drastic shortage of essential blood. Officials could fall back on coercion, mandating regular blood donations for members of the military, police, and state unions. The cost of bringing the public health clinics' blood donation practices up to minimal standards for this age of AIDS will be prohibitively expensive, although this has to be done to avert disaster. Another approach already initiated by the government is to reeducate the people. Pop star Jackie Cheung has been recruited by China's Red Cross to help break the cultural aversion to donating blood with popular songs with the humanitarian appeal to "Reach out, spread some love today." This approach has worked in Hong Kong, but the change in attitude there took 40 years (Wehrfritz 1996).

[Update 2002: China's HIV/AIDS problem is extremely complex, and may involve four simultaneous epidemics. One is the result of transmission of contaminated blood in the Chinese blood-banking system just mentioned. A second epidemic involves the sex industry, primarily in eastern China; this is being fueled by the surplus of males and unofficial government estimates that as many as 13% of all Chinese women are involved in prostitution. Added to these two epidemics are at least two separate intravenous-drug abuse epidemics under way in the country (Garrett 2002).

[By September of 1999, official figures reported 15,088 HIV-infected persons, 477 cases of persons with AIDS, and 240 deaths because of the infection. The actual situation was much worse than these figures might indicate. One expert pointed out that before 1994 most HIV-positive persons were intravenous-drug users in Yunnan province. By June 1998, HIV-positive persons were found in all 31 provinces of China. In 1993, China had an estimated 10,000 HIV-positive cases; in 1994, 30,000; in 1995, 100,000 cases; in 1998,

300,000 cases; and in 1999, over a half million cases. Nationwide, the number of infected persons is increasing at a rate of 30% each year (*China News Weekly*, September, 2000).

[The infection is spreading much faster than 30% a year. For example, in Guangdong province the current growing rate is 89.5% per year. In the four-year period between 1986 to 1989, Guangdong province reported discovering only four HIV-positives cases; by October 30, 2000, health officials reported 1,419 HIV-positives and AIDS patients, although the number of actual cases may already have reached more than 20,000 cases. Before 1996, the infections mainly were through sexual behaviors; from 1997 to the present, transmission has been mainly through intravenous-drug use and sharing needles (*Yangcheng Evening News*, December 8, 2000). In 2001, experts estimated that in the near future the annual cost of HIV/AIDS for China will be 770 billion Yuan or Chinese dollars, or about US\$ 92.77 billion (*China News Weekly*, September 2000). (End of update by F. Ruan)]

[Update 2001: China has consistently issued totally unrealistic estimates of the number of STD and HIV/AIDS cases among its 1.2 billion people. That changed in early 2001 when the government raised its estimate of people with STDs by well over 800%, from 830,000 to more than eight million. That number is now estimated to be rising by almost 40% a year.

[In early 2001, China's national registry listed 20,711 HIV/AIDS patients among 1.2 billion people. About the same time, the state-run *China Daily* estimated that more than a half-million Chinese were HIV-positive or had AIDS. Government experts warned that this half million could double in 2001 unless some strong, fast action was taken. Experts outside China estimated that in early 2001, at least 1.2 million Chinese were already infected. After years of silence, health minister Yin Dakui called on Chinese society "to go to war against HIV/AIDS," stressing that "men are particularly important in this fight." Film stars and popular writers joined the crusade.

[The city of Chengdu (Sichuan province) announced new AIDS Prevention and Management Regulations. Scheduled to go into effect in May 2001, the law prohibits persons with HIV/AIDS from marrying and requires police to test prostitutes, drug users, and other high-risk persons within five days of their being arrested. Any Chinese returning to China after a year abroad must be tested for HIV. Pregnant women with HIV/AIDS should be persuaded to have an abortion. The law also bans HIV/AIDS persons from working as kindergarten teachers, surgeons, and in other professions. The United Nations AIDS program in Beijing and Chinese experts quickly criticized the Chengdu regulations. The draconian character of the law is not unusual in China, but the serious public protests by *The Chengdu Worker's Daily* and by Beijing-based government AIDS officials was a definitely new development.

[China faces several major obstacles in its effort to control STDs and HIV/AIDS. A widespread prejudice against people with the AIDS virus encourages local officials to conceal cases and block research, making an effective public health policy very difficult. Most Chinese doctors know very little about STDs and HIV/AIDS. The country's medical services cannot keep up with the spread of syphilis and gonorrhea. Added to the medical scene is an early-stage sexual revolution that began with U.S. President Richard Nixon's trip to China two decades ago and involves a rapid rise in prostitution and extramarital affairs, and continuing poor sex education. Patients are usually too shy to discuss their STD problem with any doctor, but they do frequent illegal roving clinics that advertise their quack remedies in

public toilets. A final factor is the fact that the government has spent very little on programs to control STDs and HIV/AIDS. From 1996 to 1997, Thailand spent \$74 million on AIDS prevention, India \$7.4 million, and Vietnam \$4.5 million. In the same two years, China spent only \$2.75 million. (End of update by F. Ruan)]

[Update 2002: UNAIDS Epidemiological Assessment: HIV/AIDS was first reported in China in 1985. By September 2001, the cumulative reported number of people with HIV/AIDS reached 28,133, with a total of 1,208 AIDS cases and 641 AIDS-related deaths. An estimated 820,000 persons were living with HIV by the end of 2001. The prevalence rate among people aged 15 to 49 years is 0.11%. However, only about 5% of estimated HIV/AIDS are reported.

[HIV prevalence data indicated a focused, explosive spread of infections among injection-drug users and no significant spread in the non-injection drug-using population. Although HIV/AIDS cases have been detected in all provinces, HIV transmission is focused primarily among injection-drug users in certain provinces. For example, the HIV prevalence rate was found to range from 44% to 85% in selected communities of drug users in Yunnan and Xinjiang.

[The percentage of female prostitutes who do not use condoms decreased from 66.7% in 1999 to 49.1% in 2000 to 37.4% in 2001 (median). The percentage of injection-drug users who report sharing of equipment increased from 31.7% in 1999 to 33.7% in 2000 to 45% in 2001. Trichomoniasis and chlamydia infections are the most prevalent STDs.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	850,000	(rate: 0.1%)
Women ages 15-49:	220,000	
Children ages 0-15:	2,000	

[An estimated 30,000 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 76,000 Chinese children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

[Update 2002: In October 2002, United Nations Secretary-General Kofi Annan warned that "The forecast for China is 5% orphans by 2010, of which 4.5% will be due to AIDS" (Garrett 2002). (See Table 4.) (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

Professor Dalin Liu's survey showed that 34% of rural couples and 17% of urban couples said they engaged in less than a minute of foreplay, sometimes none at all. Not surprisingly, 37% of rural wives described intercourse as painful. While urban couples may be more adventurous sexually, they are not necessarily more satisfied. Professor

Suiming Pan's sample of 600 couples were all residents of big cities, and 70% of them said they were unhappy with their sex lives, and a random survey of married couples living in Shanghai found that 45% were unhappy with their sexual relationships. According to Professor Kang Jin, president of the Shanghai Committee of Rehabilitation of Male Dysfunctions, in 1989 at least 20% of China's adult male population was suffering from some type of sexual dysfunction. Now, clinics of sexual counseling, sex therapy, or Western and/or traditional Chinese sexual medicines have been established in most big cities (see Section 5C, Interpersonal Heterosexual Behaviors, Adults).

## 12. Sex Research and Advanced Professional Education

No sex research existed between 1949, when Mao and his Communist Party took control over mainland China, and 1979. There were some studies on the reproductive system and reproductive endocrinology, but these were in the biological and medical fields, not behavioral studies. However, since 1979, and especially after 1985, sex research has become an apparently growing, even prosperous, field. China's sex research was started and developed under the names of "sex education" and "sexual medicine," two fields that are accepted and permitted by the government and society. Before the beginning of the open-door policy in 1979, even sex education and sexual medicine were nonexistent.

The year 1982 saw a breakthrough for sexology in China. In that year, Robert Kolodny, William Masters, and Virginia Johnson's *Textbook of Sexual Medicine* (1979) was translated into Chinese under the guidance of Professor Wu Jieping, with the actual translation being done by his graduate students. The Chinese edition, titled *Xingyixue* [*Sexual Medicine*], was published by Scientific and Technological Literature Publishing House, Beijing. It is the first contemporary and updated Western sex book published in China since the founding of the PRC in 1949.

The year 1985 marked another turning point for sexuality education and sexology in China. In that year, Ruan's article, "Outline of the Historical Development of Modern Sexual Medicine," was published by the *Encyclopedic Knowledge*, and his series, "Essays on Sex Education: Ten Lectures," were published in *Required Readings for Parents*. From July 22 to August 7, 1985, the First National Workshop on Sex Education was held in Shanghai, with Ruan as the major instructor. In October 1985, the *Handbook of Sex Knowledge*, the first large modern book on sexuality written by Chinese and in Chinese, was published in Beijing by Scientific and Technological Literature Publishing House, with Ruan as editor-in-chief. All of these events were strong signs indicating the establishment and development of sexology in China. More and more sexual social surveys, publications on sex, and development of academic sexological journals and societies have followed.

As early as 1984, a project on survey and analysis of sex, love, marriage, family conflict, and crimes was carried out by the Beijing Society for Studies on Marriage and Family. This project was headed by Ms. Wu Cangzhen, Associate Professor of Marriage Law at China Politics and Law University in Beijing.

The most famous and important sexual social survey is the Shanghai Sex Sociological Research Center's *National Sex Civilization Survey* headed by Dalin Liu, professor at Shanghai University. Using 40 paid assistants and volunteer interviewers, between February 1989 and April 1990, the center obtained responses to 239 questions surveyed from 19,559 people in over half of China's 27 provinces. The 1992

**Table 4**

### Leaders in an Expanding Pandemic: Current and Projected HIV/AIDS Infected Adults

(in millions)	Current Number Infected		2010
	Government Data	Expert Estimates	Expert Estimates
India	4.0	5 to 8	20 to 25
Nigeria	3.5	4 to 6	10 to 15
Ethiopia	2.7	3 to 5	7 to 10
China	0.80	1 to 2	10 to 15
Russia	0.18	1 to 2	5 to 8*

\*Garrett 2002

publication in China caused a sensation all over South-East Asia. Planned and executed from beginning to end without government order or interference, this survey was supported by private Chinese sponsorship. It has already greatly contributed to a more uninhibited dialogue about sexual issues within China, strengthened the status and prestige of Chinese sexologists, and facilitated the organization of various regional and national associations and national and international conferences. An American translation of this monumental work was published in 1997 by Continuum Publishing Company, New York. The most striking trend found in this study is the deterioration of the strong tie between sex and marriage. This survey was published in December 1992 in Shanghai by Joint Publishing, Sanlian Books Company, titled *Zhongguo Dangdai Xingwenhua—Zhongguo Lianwanli “Xingwenming” Diaozha Baogao [Sexual Behavior in Modern China—A Report of the Nationwide “Sex Civilization” Survey on 20,000 Subjects in China]*. It is a large volume, with 866 pages and 677,000 characters. (See Part 2. The 1992 Survey of Sexual Behavior in Modern China, Addendum, for details on this nationwide survey.)

Between 1985 and 1991, sex researcher Pan Suiming, Associate Professor at the Department of Sociology at the China Renmin University in Beijing, and his assistants conducted seven social surveys on sex. “Behavioral Analysis of Heterosexual Petting in Public—Observations on Chinese Civil Parks” reported on 23,532 cases between 1985 and 1989 in 13 parks in six cities. “Dissemination of Three Kinds of Sexual Information and the Acceptor’s Response” involved 1,610 respondents in Shanghai, 1989; “Influence of Sex Knowledge and Attitude on Sexual Behavior—The Condition, Motive, and Orgasm” had 603 samples in Beijing, 1988-89, and “Relations Between Satisfaction of Sexual Life and the Marriage” was based on 977 samples in Beijing, 1989. Seven hundred sixty-six respondents participated in the “Chinese Readers’ Answers to the Questionnaire in the Chinese Edition of The Kinsey Report Since 1989,” with the research still in progress. “Deep Sexual Behavior Survey—Relations of Sexual Mores, Ideas, Affection, and Behavior,” with 1,279 samples in 27 cities, 1989, indicated that nearly seven out of ten Chinese have had anal sex with heterosexual partners, and that men reached orgasm about 70% of the time in contrast to 40% for women. “A Sampling Survey on Students’ Sexual Behavior in Every University and College in Beijing” examined 1,026 respondents in 1991.

Between 1985 and 1992, more than 300 books on sexuality were published in mainland China, including the Chinese translations of classical works by Sigmund Freud, Havelock Ellis, Margaret Mead, Alfred C. Kinsey, and R. Van Gulik. The first professional academic journal of sexology, *Sexology of China*, was published in March 1992 by Beijing Medical University.

On May 23, 1988, the country’s first college-level sexology course was introduced at China People’s University in Beijing. This special two-week program, called “Training Workshop on Sex Science,” consisted of workshops on 20 topics, conducted by 17 professors and experts. The program was attended by 120 people from 26 of China’s 28 provinces. As of mid-1993, 26.7% of the universities and colleges in China have a course on human sexuality or sex education.

Since 1987, a series of six nationwide conferences on sexology have been held in China. For example, the “Sixth Chinese Congress of Science of Sex,” was held on May 3, 1992, in Nanjing, the capital of Jiangsu province. About 500 experts attended the congress, and over 400 academic papers in the fields of sex education, sociology of sex, psychology of sex, sexual medicine, and STDs were accepted by the Congress. The “First International Conference of Sexology”

was held on September 12 to 15, 1992, in Shanghai. Over 20 participants came from 13 foreign countries, and over 300 participants from all over China. About 100 academic papers on sexual medicine, sex education, sociology of sex, and psychology of sex were accepted by the conference.

There are two important Chinese sexological periodicals:

*Sexology* (formerly *Sexology of China*, *Journal of Chinese Sexology*) (started in 1992). Journal Address: Beijing Medical University, 38 Xue Yuan Road, Beijing 100083, The People’s Republic of China. Editor’s Address: The Public Health Building (Fourth Floor), Beijing Medical University, No. 83 Hua Yuan Road, Beijing 100086, China

*Apollo and Selene*. A bilingual Chinese/English magazine of sexology published in Shanghai by the Asian Federation for Sexology started in the summer of 1993. Address: Asian Federation (Society) for Sexology, 2 Lane 31, Hua Ting Road, Shanghai, People’s Republic of China.

The main sexological organizations in China are:

Chinese Sex Education Research Society. Director: Dr. Jiahuo Hong. (Founded in Shanghai in 1985.). Address: The Shanghai College of Traditional Chinese Medicine, 530 Ling Ling Road, Shanghai, 200032, People’s Republic of China.

Shanghai Sex Education Research Society, founded in Shanghai in 1986. Address: The Shanghai College of Traditional Chinese Medicine, 530 Ling Ling Road, Shanghai, 200032, People’s Republic of China.

Sexology of China Association (founded in Beijing in 1995; preparatory committee founded in 1990). Director: Professor Guangchao Wang, M.D. Address: Beijing Medical University, 38 Xue Yuan Road, Beijing, 100083, People’s Republic of China.

Institute for Research in Sexuality and Gender. Address: Professor Sui-ming Pan, Director, Post Office Box 23, Renmin University of China, 39# Hai Dian Road, Beijing 100872, People’s Republic of China; fax: 01-256-6380.

Chinese Association of Sex Education. Address: Mercy Memorial Foundation, 11F, 171 Roosevelt Road, Section 3, Taipei, Taiwan, Republic of China; phone: 886-2/369-6752; fax: 886-2/365-7410.

China Family Planning Association. Address: 1 Bci Li, Shengguzhuang, He Ping Li, Beijing, People’s Republic of China.

China Sexology Association. Address: Number 38, XueYuan Lu, Haidian, Beijing 100083, People’s Republic of China; phone: 86-1/209-1244; fax: 86-1/209-1548.

Shanghai Family Planning Association. Address: 122 South Shan Xi Road, Shanghai 200040, People’s Republic of China; phone: 86-21/2794968; fax: 86-21/2472262 Ext. 18.

Shanghai International Center for Population Communication China (SICPC). Address: 122 South Shan Xi Road, Shanghai 200040, People’s Republic of China; phone: 86-21/247-2262; fax: 86-21/247-3049.

## PART 2. THE 1992 SURVEY OF SEXUAL BEHAVIOR IN MODERN CHINA: A REPORT OF THE NATIONWIDE “SEX CIVILIZATION” SURVEY ON 20,000 SUBJECTS IN CHINA\*

M. P. LAU

### A. The Survey

This is the report of a survey of sexual behavior in the People’s Republic of China, conducted from 1989 to 1990.

\*Editor’s Note: The following section is adapted from M. P. Lau’s detailed analysis of the original 1989-1990 Chinese version of the nationwide Kinsey-like survey of *Sexual Behavior in China*. This

Unprecedented in scope and scale, the survey involved 28 sites (cities, towns, and villages) in 15 of the 27 provinces or autonomous regions. A total of 21,500 questionnaires, with 239 items covering a wide range of variables were distributed, and 19,559 of the returned replies were found suitable for study. About 500 investigators were involved, including about 200 field workers, most of whom were female volunteers. There was a caucus of about 40 core leaders, with coordinating headquarters at the Shanghai Sex Sociology Research Center. The main academic leaders were Dalin Liu, Liping Chou, and Peikuan Yao of Shanghai and Minlun Wu (M. L. Ng) of Hong Kong.

This study has been compared to the *Kinsey Reports* (1948, 1953) in the popular media (Burton 1990). For the first time in history, we have extensive scientific data on the sexual behavior of the contemporary Chinese, who comprise 22% of the world population. Information is available on puberty, romantic love, mating, marriage, marital life, marital sex, premarital sex, extramarital sex, abortions, divorces, as well as data on family planning, women's issues, prostitution, pornography, sexual transgressions, and sexual variances, both as to attitudes and behavior.

In this review-essay, I provide a synopsis of some of the major findings of the survey through eight profiles of male and female adolescents and college students, urban and rural married couples, a female prostitute, and a male sex offender. I will then present a brief critique of the study methodology and suggestions for future research.

## B. Adolescent Sexuality

In this section, I present two composite profiles constructed from 91 tables of statistics compiled during the national survey of 28 secondary (or middle) schools in ten Chinese cities or suburbs. Secondary schools were not common in the countryside and the rural population was difficult to survey. In all, 6,900 questionnaires were issued and 6,092 were collected and analyzed. Each questionnaire contained 42 multiple-choice questions with some open-response categories. While the sample surveyed is not representative of all secondary schools owing to resource constraints, attempts were made to achieve as much diversity as possible. Some significant influences on sexual attitudes and practices were demonstrated, such as exposure to modernization, degree of enlightenment, and gender differences.

In 1989, there were 47.7 million secondary school students in China (4.29% of the national population of 1.112 billion), of whom 58.4% were male. Fully 97.8% of children reaching school age were sent to primary schools, and 74.6% of primary school graduates proceeded to secondary schools. There are six grades in each secondary school: Junior Middle 1, 2, and 3, and Senior Middle 1, 2, and 3, and the age range is normally 12 to 18. In the sample studied, the mean age was 15.53 ( $SD = 1.78$ ). The features described in the profiles represent the means, modes, medians, or usual ranges, or the proportions in the sample. There is a wealth of detail in the book for further reference.

### *Profile 1: An Adolescent Female*

The typical female adolescent respondent is a 15.5-year-old student in an urban or suburban secondary school. She comes from a stable family of workers or cadres, and has one

sibling. She reached puberty at age 13, with menarche in the summer, and development of secondary sexual characteristics. (This is a later age compared with secondary school students in Hong Kong or Japan, but earlier than that described in China 25 years ago). At age 14.5, she began to have sexual interests, and desired to associate with boys, mostly for socialization or mutual assistance, or because of a "crush" on a boy for his good looks, but she has been too shy or "busy" to take action. (For comparison, a Japanese peer would have begun to have such interests and desires at age 12 to 13). She acquired most of her sexual knowledge from books, magazines, and movies, and would feel excited by casual physical touches and by conversation on sexual topics.

Among the secondary school girls in the survey, 7.4% wished for some bodily contact with a male, and 12.1% reported having been aroused to desire sexual intercourse. (Again, these percentages are much lower than those of Japanese peers). More than a third of secondary school girls reported having male friends since age 14, without infatuation and often in group settings. By 15.5 years of age, 11.1% were dating boys and 6% were "in love." The legal age for a female to marry in China is 20, and most girls think marrying early is not good or "would affect study."

Only 4.7% of adolescent girls reported a history of masturbation, usually since age 13.5; about 50% said they continued the practice. (In Japan, 9% of secondary schoolgirls have masturbated, and most persist in the habit). While 44.3% of female adolescents stated masturbation is "bad," almost 40% said they did not understand the question.

Less than 2% of adolescent girls have engaged in each of kissing, hugging, or sexual touching, and only 1% reported having sexual intercourse (slightly higher in southern China). These rates are far below those found among Japanese schoolgirls (up to 25.5% and 8.7%, respectively).

In well-developed urban areas, adolescent sex education has been available in classrooms, but has focused on physiology and hygiene, with little information on coitus, pregnancy, childbirth, contraception, homosexuality, paraphilias, and sexually transmitted diseases. Secondary schoolgirls would like more guidance on issues of romantic love, sexual impulses, and socialization. They discuss sexual issues with their mothers, sisters, and female peers, but not with teachers or fathers.

### *Profile 2: An Adolescent Male*

The typical male adolescent respondent is a 15.5-year-old secondary school boy who comes from a stable family of workers or cadres and has one sibling. He has had seminal emissions since age 14.5, and most have been spontaneous nocturnal emissions. He has started developing secondary sexual characteristics. (These maturational milestones are later than those of a similar youth in Japan, but earlier than those in China 25 years ago.) At age 14.5, he began to show sexual interests, and wished to associate with girls, mostly because of attraction to their appearance or "tender disposition," but he was too shy or "busy" to act upon his feelings. (A Japanese boy would have commenced to have such interests and desires at age 12 to 13). He obtained most of his sexual knowledge from books, magazines, and movies, and has seen pictures of female nudity and experienced some casual sexual touching.

About one third of adolescent males reported desire for bodily contact with females, and 42.9% said they had been aroused enough to crave sexual intercourse. (Again, these percentages are much lower than those of Japanese peers).

Although almost half of male adolescents said that they had had female platonic friends since age 14, often in group activities, only 12.7% were currently dating a girl, and

survey was published in Chinese in 1992; an English translation was published by Continuum (New York) in 1997. Lau's review-essay was published in *Transcultural Psychiatric Research Review* (1995, vol. 32, pp. 137-156). The *Encyclopedia's* editor, R. T. Francoeur greatly appreciates the permission of Dr. Lau and Laurence J. Kirmayer, M.D., editor of the *Transcultural Psychiatric Research Review*, to include Lau's critique in this chapter.

7.6% reported being "in love." The legal age for a male in China to marry is 22, and most boys agree that marrying early is not good or "would affect study."

Only 12.5% of male adolescents reported a history of masturbation, usually starting at age 13.5; half reported they had continued the practice. (In Japan, 30% of junior high school students have masturbated, and fully 81.2% of those in senior high school, with most students continuing the habit). More than half of adolescent males consider masturbation "bad," but 21.2% said they did not understand the question.

Less than 5% of secondary school males have engaged in each of kissing, hugging, or sexual touching, and 0.9% have had sexual intercourse (slightly more in Southern China). (These rates are remarkably low compared to those in Japan, where up to 23.1% of high school boys have experienced sexual kissing and 11.5% coitus).

Adolescent boys tend to discuss their needs and problems with male peers, rather than with teachers, parents, or siblings.

### C. College Students

In 1989, there were about 82,000 post-secondary students in China. A study of this group is of immense importance as they are destined to become the future leaders of the country. Intellectually well endowed and highly educated, they are still young, malleable, open minded, and sensitive to new ideas and trends. In the process of maturation as scholars, they confront the various phenomena associated with modernization and accelerating change. They interact with a "campus culture," which may be a cultural melting pot and a frontier of novel concepts and ideologies. Restricted by demands for sexual abstinence and expectations of monogamy, they try their best to cope with their libido and desire. Their perceptions, perspectives, beliefs, and behavior will have profound effects on the future of nation-building, participation in the world community, and global stability.

This section presents two composite profiles condensed from 136 tables of statistics collected during the survey of 24 post-secondary colleges (including universities, teachers' colleges, academies of traditional medicine, training centers for cadres and security personnel, and an oceanography institute) in nine metropolitan areas. The institutions were selected according to practicality and diversity. Questionnaires with 63 items were distributed in classrooms and the purpose of the investigation explained. Confidentiality was assured. In addition to the group administration, some individual interviews were conducted. A total of 3,360 valid replies were analyzed. The mean age was 20.28 years ( $SD = 3.13$ ) with 56.8% male.

#### *Profile 3: A Female University Student*

The typical female college student in the survey is a 20-year-old student in the faculty of arts. Her father was college-educated and holds a professional, technical, or managerial job. She had menarche at age 13.5, followed by the development of secondary sexual characteristics. She was unprepared for menarche and sought advice from her mother or peers. She received little sex education and acquired most of her sexual knowledge from books, news media, novels, peers, her mother, and her sisters. She found her teachers and parents "ignorant, busy, uncaring, conservative, and rigid." She would feel excited by depictions of sexual matters, and has been exposed to nudity through pictures in the media.

She thinks romantic love should be allowed but "properly guided," that the main purpose of copulation is to have a family, and that the female can be an active partner during sexual intercourse. She believes that premarital sex may be

acceptable if the partners are mutually in love and willing, but extramarital sex should be censured, even if consensual. She considers homosexuality to be a perversion or illness, and would offer comfort to a homosexual friend and advise him or her to seek psychiatric treatment. She feels that homosexuality is something to be ashamed of and pitied but not severely punished.

Fully 70% of college women were not content with their bodies, with concerns about being overweight, hirsute, or other features; 25% were not satisfied with their secondary sexual characteristics, for example, thinking that their breasts are undersized. While 15.6% did not like their own gender, 42.8% stated they would prefer to be a male if they had a choice.

Among the college women surveyed, 16.5% had a history of masturbation, starting from age 13 to 14, and 8.2% still masturbated at a frequency of about once a week. Most respondents thought masturbation is "harmless" and "normal."

While 63.4% of female college students in the sample desired a heterosexual relationship, only 6.3% of them had had a sexual partner. Sexual contacts (including kissing, embracing, genital touching, and coitus) were infrequent and covert and commonly began after age 17. Contraception involved the use of "safe periods," pills, or condoms.

While 5.8% reported an inclination towards exhibitionism and 2.8% were predisposed to transvestitism, interest in other paraphilias was uncommon. The majority (87.3%) of college women reported that on seeing a nude female in a public bathroom, they would probably feel indifferent, but 3.9% said they might "come to like it."

Homosexual contacts were infrequent: 8.4% reported having been kissed or caressed, 3.2% had experienced homosexual masturbation, and less than 3% reported genital-to-genital contacts; 0.7% reported they would engage in homosexual contact if the opportunity arose.

#### *Profile 4: A Male University Student*

The typical male college student in the survey is a 20-year-old student in the faculty of engineering, science, or medicine. His parents had post-secondary education, and his father is a professional, technical, or managerial worker. He had his first seminal emission at age 14.5, followed soon by the appearance of pubic and then facial hair. (Compared with his secondary school counterparts, his sexual development started at a slightly later age). He received little sex education and was quite unprepared when he had his first seminal emission. He did not ask anyone for an explanation.

He acquired most of his sexual knowledge from books on hygiene and health, news media, novels and pornographic art, and from his male peers. He found his parents and teachers insensitive and outdated in knowledge and attitude. He holds liberal views about romantic love and is permissive about reading sexual material. He thinks that masturbation is harmless and normal. He believes that sexual intercourse would enhance love and give physical pleasure, as well as serving the purpose of building a family. He endorses the idea of a female being an active partner during sexual intercourse.

He thinks premarital sex would be acceptable if the partners are both willing and mutually in love, especially if they are prepared to marry each other, and extramarital sex, if consensual, may be permitted under certain circumstances. He would be quite aroused by references to sexual matters, and has seen pictures of nudes in the media, but is unlikely to have seen women in the nude.

One fourth of college males were not satisfied with some of their secondary sexual characteristics, such as spar-

sity of pubic hair or perception of the penis as undersized. A larger proportion (70%) were not content with other aspects of their body, such as shortness of stature, presence of pimples or freckles, and sparsity or grayness of scalp or facial hair. Gender dysphoria was uncommon, and only 8.3% of male college students surveyed wished to be female.

Almost two thirds of college males (59%) had a history of masturbation, starting at age 14 to 16, and 39.5% continued to masturbate at the rate of about once a week. Sexual contacts, including kissing, embracing, genital touching, and coitus, were reported to be infrequent and mostly covert. These activities usually began after age 17 and the male tended to take an active role. Only 12.5% of college males reported that they had had sexual partner(s), usually only one. Contraception involved "safe periods," condoms, and coitus interruptus.

While most male college students considered homosexuality a perversion or illness to be sympathized with and offered treatment, 11.9% conceived of homosexuality as normal behavior for a small group of people. Homosexual contacts were infrequent, with 7.0% reporting kissing or caressing, 8.6% homosexual masturbation, and less than 3% genital-to-genital or anal touching; 1.5% would consider seeking someone out to engage in homosexual activity.

Paraphilias were rare among male college students, with 5.6% feeling prone to exhibitionism, but hardly any reporting other paraphilic tendencies. On seeing a nude male in a public bathroom, most would feel indifferent, but 5.4% said they might come to "like it."

When asked how they would respond if they found out that their fiancée had lost her virginity to another male, 20% of male college students said that they would leave her, but 60% would find it tolerable.

#### D. Married Couples

This section presents composite portraits of an urban couple based on 6,210 married persons surveyed in 15 cities (nine coastal and six inland urban centers), and a rural couple typical of 1,392 married residents surveyed in three villages. A mixture of random and non-random sampling methods was used, steering a fine line between what was practical (e.g., considering the difficulties of gathering data from illiterate or unsophisticated persons), and what would be theoretically desirable (e.g., relative representativeness). A total of 396 tables of actuarial data were compiled, covering a wide range of sexual, marital, and family variables. There was a preponderance of female interviewers and interviewees. Many volunteer field workers came from women's groups, such as labor unions, family planning units, and obstetrical teams, and they were able to build good rapport with women respondents, who often appeared eager to share their intimate knowledge of family life with those whom they could trust. Overall, 68.1% of urban and 78.2% of rural interviewees were female.

##### *Profile 5: An Urban Couple*

The spouses in the typical urban married couple in the survey were about 36 to 37 years of age and of above-average education compared with the general national population. They reported their health status as average or above average. The husband was a professional, technical, office, or managerial worker, and had received slightly more education than his wife, being twice as likely to have attended a post-secondary institute. The wife was a professional, technical, factory, or office worker. They have been married for about 11 years. They married of their own will, after an introduction by a third person and a period of courtship.

They consider mutual "love" and "understanding" more important in marriage than material comfort, political views, or evaluation by society. They believe that the purpose of marital sex is primarily to satisfy emotional and physical needs, rather than to fulfill an obligation or a "tradition" or to achieve reproduction, and there should be no prudery about it. They have sexual intercourse four to five times per month on average. The couple would like to have children because the latter "would add interest to life" and it is an aspect of "social responsibility." They would like to have a boy and a girl.

Of urban couples surveyed, 60% considered their marriage satisfactory, with greater satisfaction reported by the male partner, those with more education, those in professional, technical, or managerial positions, and those in the earlier years of marriage. Of those surveyed, 55.5% indicated good or fair (25.3%) levels of sexual satisfaction. Husbands reported greater enjoyment of coitus and gave more importance to coital frequency, styles of intercourse, and climaxes. The duration of foreplay tended to be brief, most often less than ten minutes, and gave less pleasure to the woman. In case of sexual disharmony, 44% felt there should be open discussion, 13.4% would seek medical help, and 24% would just "leave it" alone. Most couples endorsed women taking initiative in sex, such an attitude being especially common among males, the better educated, and in the southern cities. As urban married women gain more freedom, independence, and self-esteem, they feel less compelled to have sex against their will, and would ask to be excused without feeling guilty.

Most couples experienced their first sexual intercourse on their wedding night, but premarital sex was admitted by 24.9% of urban husbands and 15.8% of urban wives. It should be noted that premarital coitus was most often (80%) consummated with a "future spouse," and such behavior was endorsed by a majority (90%) of the urban couples polled. Sex before matrimony with someone who is not a "future spouse" tended to occur among urban youths in southern China, soldiers stationed in cities, and the less educated. (The number of abortions of premarital pregnancies has been on the rise, reaching 16% of those age 20 and over and single in a city in Jiangsu, and 90% of first abortions in a city in Zhejiang, both cities in the vicinity of Shanghai.)

Higher frequency of intercourse was associated with younger age, the earlier years in marriage, highest or lowest levels of education, being a manual or service worker, more privacy of the bedroom, temperate climate, and greater sense of obligation to perform. Sexual intercourse occurs most often just before sleep among younger and middle-aged couples, and at "no fixed time" among the young and the elderly. In terms of sexual practices, 56.5% of couples change positions during sex, and 65.2% are nude sometimes or often during sex; nudity during sex is more frequent among the young, the better educated, and in the southern cities.

Questions about orgasms were not asked, as the investigators had found it quite difficult to elicit such information, but enjoyment of "sexual pleasure" was found to depend on the techniques, experience, and relationship; sexual pleasure had a more gradual onset in women, both physiologically and psychologically. Most couples reported they experienced sexual pleasure frequently (especially males) or sometimes (especially females), with highest rates in southern China. In a sampling of 1,279 men and women in 41 cities, Suiming Pan found men reach orgasm 7.2 times out of every 10 attempts; this contrasts with 4.1 times for women. In Dalin Liu's survey, one third of the urban women and one fourth of the rural women claimed to experience a feeling of pleasure (*kuaigan*) "very often," while 58.2 and 76.8%, respectively, experienced it "sometimes."

A history of masturbation was obtained from 17.1% of respondents—much more often from husbands than from wives, and from couples in southern cities—but nearly all of the respondents claimed it happened only occasionally. While 41.7% regarded masturbation as a "bad habit" and 13.1% considered it normal, fully 30% gave no clear answer. Only 0.5% admitted homosexual experience, but considerable denial or ignorance was suspected.

Among urban husbands, 10.2% admitted to a history of extramarital sex. Extramarital sex was more common among service or manual workers, or businessmen, those less than 25 years of age or more than 56, and those espousing a liberal or hedonistic attitude towards life. Urban wives were unlikely to have risked extramarital sex, but it was more likely to occur in middle age. These rates are far below those published in the Kinsey reports (1948, 1953). Nevertheless, the impact of extramarital affairs may be considerable. During divorce proceedings in five cities in China in 1985, the occurrence of extramarital affairs was confessed in two thirds of the cases. In Shenzhen, a town bordering Hong Kong, 91.8% of divorce cases in 1987 involved a "third person." While 66.2% of married urban respondents said that they accept the national policy of having only one child per family, 28.5% think such a restriction unreasonable. If they had only a daughter, 35.5% would want to have one more child, but not if this would incur punishment from the government. Birth control measures used by urban couples included: diaphragms (42.8%), tubal ligation (9.4%), other mechanical means (18.3%), pills (5.9%), vasectomy (2.3%), other methods (e.g., "safe periods," coitus interruptus, unknown) (15.5%), and none (5.8%).

Sexual knowledge was generally quite limited and resource material not readily available, especially to women. About two thirds (62.4%) of urban couples had read one of the four popular basic manuals on sexual knowledge available at the time of the survey, such as the one written for the newly wed, which mostly consider anatomy and physiology. Additional sexual knowledge was obtained from books, movies, and radio (35.6%), through personal experience (22.7%), and from same-sex peers or those in counseling positions. Most couples (70.4%) are interested in reading or viewing media with sexual themes, but 48.9% have found opportunities lacking. Women would like to know more about child education and physical hygiene, while men are interested in sexual techniques and interpersonal skills. Although 61.8% of urban couples would explain the birth process to a child, 25.4% would evade the question, and the rest would express displeasure or indifference, or give a false answer.

### *Profile 6: A Rural Couple*

The typical rural married couple surveyed were about 35 years old, of average education compared with the general national population, and reported their health status as average or above average. They were engaged in farming, herding, fishing, or forestry, and were unlikely to have received post-secondary education. They have been married for about 11 years; he at age 23 and she at 22. They married of their own will (wholly or partly), although matchmaking was prevalent until one or two generations ago, and still occurred in a few locales.

They consider "love" and "understanding" more important in their union than the opinions of society. They believe that the main aims of marital sex are to fulfill physical and emotional needs, to go along with tradition, and to accomplish reproduction, and that they need not be prudish about it. They have sexual intercourse five to six times per month on average. They would like to have children, mostly for the sake of old-age security, but also to propagate their lineage.

Of rural couples surveyed, 65% regard their marriage as satisfactory. Greater satisfaction was reported by the female partner, those better educated, and those under 25 or over 45 years of age. In case of sexual disharmony, 44% would engage in open discussion, 23.2% would seek medical help, and 21% would just "leave it" alone.

Most married rural couples experienced sexual intercourse for the first time on the wedding night, but premarital sex was admitted by 7.3% of rural husbands and 17.3% of rural wives. Premarital coitus was usually performed with a future spouse, and such behavior was endorsed by the vast majority of rural couples surveyed. Sex before marriage with someone who was not a future spouse occurred more commonly among older males and females when the feudal system allowed sexual permissiveness in certain forms of social transactions, and also among those who are younger, more educated, and liberal minded.

Higher frequency of intercourse was associated with more demand by the husband and greater compliance by the wife, having been married for a longer duration, and temperate climate. Sexual coitus occurred most often just before sleep, but also often "at no fixed time," as rural couples tended to have a less structured schedule of daily life compared with their urban counterparts.

About half (45%) of rural couples reported changing position during sex, and 57.2% said they were nude sometimes or often during sex; sexual nudity was more common among the young, the less educated, and in southern climates. In Shanxi province, some farmers traditionally sleep naked.

A history of masturbation was obtained from 10.1% of rural husbands or wives, more often from those in the South; nearly all described it as episodic. Most (73.4%) considered masturbation a "bad habit," but 9.6% deemed it "natural." Only 2.3% admitted homosexual experiences, suggesting considerable ignorance about the term.

Among rural married couples, the level of sexual satisfaction reported was good (66.6%) or fair (27.6%), with wives more easily satisfied than husbands. The duration of foreplay tended to be brief, usually five minutes or less, but neither partner had high expectations of gratification from it. Most couples endorsed women taking initiative in sex (this attitude was more common among males, the better educated, and in south China), but they would still prefer the male partner to be more active.

Among rural husbands, 9.3% admitted to a history of extramarital sex; higher rates were found among service or manual workers or businessmen, those under 25 or over 56 years of age, and those who gave evidence of a "pleasure-seeking predisposition" on several attitude measures. Rural wives were unlikely to have experienced extramarital sex.

Most rural couples would like to have a boy and a girl, but 48.5% would accept having only one child. After having a daughter, 60.3% want an additional child, and 6% still want one at the risk of sustaining some official penalty. In a 1989 survey, 68.1% of rural women wanted to have two children, 25.7% wanted one child, and 3.1% did not want children. Slightly lower percentages were found among rural men. Contraceptive methods utilized include: diaphragm (50.8%), tubal ligation (21.8%), pills (7.5%), vasectomy (1.2%), others (12.3%), and none (6.4%). On the other hand, infertility because of sexual dysfunctions was common (e.g., more than 25% of about 40,000 family planning counseling cases seen in 1984 to 1989), but most were said to be somewhat amenable to medical or herbal therapy.

Sexual knowledge was generally quite deficient, and resources not easily available, although 77.1% of rural couples had read one of the four popular basic manuals on sexual knowledge available at the time of the survey. Other-

wise, the pattern was similar to that of urban couples. While 47.8% of rural couples would explain the birth process to a child, 33.8% would evade the question, and the rest would ignore or upbraid the child, or give a false answer.

### Comment

An overview of the accounts of urban and rural married couples given in this section shows the emergence of two patterns: (1) respondents who are traditional and conservative in ideology, cautious and guarded towards novel ideas, moralistic and suppressive of self-expression, and less imbued with modern education tend to reside inland and in rural territories, are service or manual workers, and are more commonly female; and (2) respondents who are modernistic and individualistic in orientation, liberal and open in attitude, rational and objective in deliberation, and have been exposed to more contemporary and/or Western ideology tend to reside in urban areas, near seacoasts or in southern China, are professionals or technical workers, and are more often male.

Of course, there are many exceptions to these broad generalizations. Those who are not well educated may also be gullible and suggestible, and experience sexual permissiveness as a relic of feudal systems, such as variations of a master-slave relationship, indigenous forms of marital or quasi-marital arrangements or cohabitation, such as concubinage and other forms of polygamy (McGough 1981). Other situational, subcultural, idiosyncratic, or deviant variations in sexual behavior are noted throughout the book. The investigators also present detailed analyses of factors affecting sexual satisfaction and sexual pleasure, as well as data on marital cohesion, domestic conflicts, marital breakdown, and sex in old age.

We see in this section a spectrum of variations in sexual behavior corresponding to the different stages of adaptation and change, resistance, and retrenchment in response to modern and Western ideologies. There has been a general liberalization of attitudes, which is not yet matched by comparable changes in practice. Keenly aware of the dangers of an abrupt eruption of sexual instinctual drive, and deeply ingrained in a tradition of moderation and communal responsibility, the writers of the book repeatedly urge caution, restraint, and "proper socialization." While stressing the importance of being knowledgeable and educated, and of individual entitlement and gratification, heavy emphasis is also placed on family harmony, social stability, and the inculcation of moral values by advice and counseling, didactic education, and "propaganda." An analysis of sexual mores and superego and their possible practical impacts can be found in the books by Ng (1990) and by Wen and colleagues (1990) and in the paper by Ng and Lau (1990).

### E. Sex Offenders

In the 1980s, rates of crime in China rose in leaps and bounds, with alarming increases in sexual offenses in the young and relatively less increase in violent crimes. This section presents composites of a female prostitute and a male sex offender with modal characteristics abstracted from 137 tables of statistical information gathered in a survey of inmates of prisons and reformatories, supervised by security and reform officials, with guarantees of strict confidentiality. These institutions were located in nine areas, with most of the respondents from Shanghai (49%), Chengdu (22.8%), and Soochow (11%). A total of 2,136 subjects took part, with 67.5% males; 385 were female prostitutes.

Unfortunately, the various kinds of sex offenses were lumped together (except for female prostitution), and the data analyzed as a whole. Subjects included categories of "criminals," people with "infractions of the law," and those

accused of "misconducts (wrongdoings, misdemeanors)." The judicial system gives latitude to officials to grade anti-social behavior and to dispose of violators according to pragmatic and situational considerations. For details and the extent of variations, the reader must refer to the book under review and its bibliography.

### Profile 7: A Female Prostitute

The typical incarcerated female prostitute in the survey was 20 years old and came from a rural family, financially "average" or "above average." She was discontented with her lot and inclined to seek more money, pleasure, or adventure. She left school early and may have retained some part-time manual work. She may have been betrothed or married, with an "average" or discordant relationship, but a sex life that has been mostly satisfactory. Although emphasizing feelings as an important element in human relationship, she was cynical about romantic love, and may have become bitter and vindictive after she had been cheated on or abused. She was ambivalent towards traditional feminine roles, chastity, and sexual restraint, but still viewed them as ideals and wished that she could conform.

She first ran afoul of the law after age 15. She was often seen as a victim of circumstances as well as an offender, and evoked sympathy from public officials, who would subject her to criticism, warning, "education," and "administrative discipline," before instituting legal penal measures, such as labor reform and "thought reform." While incarcerated, she would indulge in daydreaming or in artistic diversions to sublimate her libido.

The number of prostitutes, pimps, and their patrons known to the law has been increasing rapidly in China, especially in Shanghai and Guangzhou. Prostitutes make up most of the nation's female sex offenders. The survey data and clinical observation show that prostitutes tend to be young and immature, vain and "insatiable," given to pleasure-seeking rather than to toil and tedium, vulnerable to temptation, and deficient in self-restraint. Also noteworthy are the contributing social factors of inequality of gender status, lack of emotional nurturing and support for dependency needs in parental and marital homes, and the prevalence of opportunities for deviant outlets. The survey also uncovered the "low quality" or "poor civilization" of the parents and other family members, in the forms of less education, ignorance, narrow worldviews, weakness of bonding, and lack of moral guidelines. These social forces need to be considered in any plans for prevention. After release from jail, 20 to 30% of female sex offenders released in Shanghai relapse. Relapse rates depend on the intensity of rehabilitation.

### Profile 8: A Male Sex Offender

The typical incarcerated male sex offender in the survey was about 28 years old and single. He had some secondary school education and was a manual worker or tradesman. He had his first seminal emission at age 16.5, still has nocturnal emissions once or twice a month, and masturbates about six times a month. He first witnessed sexual coitus at age 17, most likely at a peer's home or in a movie or videotape. He admits having "average" or "strong" sexual desire, and exposure to sexual scenes tends to arouse him and predispose him to errant sexual behavior.

He came from a home where his parents, especially his mother, had little education but an "average" or "comfortable" income, yet he still tended to feel deprived. He seldom talked to his parents and felt that family life was dull and meaningless. The family was generally permissive, but would express anger when a sexual offense or misconduct was committed. In a small percentage of cases, there was

another family member with a history of criminal or sexually promiscuous behavior.

He emphasized the importance of sex and love, but relished instant pleasure. He would choose a partner based on appearance, feelings, and temperament, and would want a mate for sexual purposes even at an early age and outside the boundaries of wedlock. He likes movies, music, socializing, gossiping, womanizing, gambling, detective stories, and martial arts. He would be easily aroused by sexual material but may not act on it. Such material has become increasingly public and readily accessible. He probably has a few friends with a history of sexual offense or misconduct. He acquired his sexual knowledge mostly from his peers or the media, rather than from parents, siblings, or teachers, and has often found his questions unanswered.

Most offenders were convicted of their first sexual offense before age 29. The most common offenses were "hooliganism" (a vague umbrella term comprising various kinds of uncivil, indecorous, unmannerly, or licentious behavior), "promiscuity," rape, and sex with a minor. Other male sex offenses included bigamy, extramarital relations, abetting prostitution, male prostitution, incest, and enforced sex with the aged or the disabled. There has been a trend to commit crimes less by violent means, and more by deception and enticement. The survey data and clinical observation show that the male sex offenders are generally immature, chauvinistic, and emotionally needy. They are said to be of "low quality," and their families and social backgrounds are described the same way. Married male sex offenders reported fairly good marital and sexual relationships with their spouses, with frequent sexual intercourse (about ten times per month).

Upon conviction, most offenders expressed regret and cooperated with the sentence. While in prison, they try to suppress their sexual drives, but 6.3% admit to masturbation and 0.7% to homosexual activity. While some psychological or medical therapy may be provided for this sexual frustration, there has been no general policy to cope with the problem.

#### F. Comments on the Research Methods

Technically, the nature and scope of this survey made the task very difficult. Sexuality is a matter of privacy and confidentiality and a topic often misunderstood and stigmatized. The peasantry was difficult to reach, in terms of both logistics and communication. There was little financial support, especially after the Tiananmen events. However, there was a groundswell of moral support from both inside and outside China, and many "comrades" from the tightly organized, stratified bureaucratic infrastructure in the nation, especially from women's groups, contributed their time, energy, and ingenuity, frequently working "to the point of exhaustion." Professor Liu and the core leaders were able to marshal the support of diverse groups at various levels in governmental, academic, educational, legal, labor, industrial, literary, media, and publishing sectors. The results have been partially presented at conferences inside and outside China, but since the book was written in Chinese, a wider dissemination of the findings awaits translation into other languages. An English translation of this full report was published in 1997 by Continuum (New York), the publisher of this *International Encyclopedia of Sexuality*.

The investigators were well aware of the limitations of the study. They experienced numerous stumbling blocks and frustrations, and encountered criticism and derision. It was not possible to obtain a completely representative sample, but a study of selected mainstream or significant groups in accessible locales is still very meaningful. Efforts were

made to collect data from diverse parts of China, and a mixture of random and non-random sampling was used. The large sample sizes may allow statistical adjustments for some of the biases in further analysis.

The questionnaires were as comprehensive as circumstances permitted. In the interest of not being too intrusive, many questions were addressed only to attitudes and beliefs, as respondents would feel too hesitant to report actual behavior or practice in some areas.

Limitation of time and resources precluded the compilation of an index. Materials on some special topics are scattered throughout the book. For example, data on homosexuality have to be found laboriously from more than ten places, and information on premarital sex must be traced from some eight sources among the pages. Bibliographical notes are appended to each section, but even the names of European authors are written in Chinese.

#### G. Discussion and Conclusion

This groundbreaking study is of immense value from a heuristic and theoretical point of view. No study of human sexuality can be complete without including a major human culture of the world and its most populous country. This study should provoke further questions at biological, psychological, sociocultural, and historical levels, and stimulate the emergence of new hypotheses and concepts, both in Chinese and other cultures. The methodology developed can serve as a template for future testing and improvement.

The practical import of this study cannot be overemphasized. It should equip the nation with more knowledge to meet the challenges of sexuality, both at the individual and at the societal levels. Wary of the perils of a sexual "revolution" with sudden release of pent-up drives, the authors repeatedly stress the importance of an interpersonal perspective and "sociological imperative." Despite the authors' claim to be non-authoritarian, many opinions and conclusions are judgmental and moralistic and delivered in a didactic, paternalistic tone not usually encountered in scientific writing.

As much as it is a towering accomplishment, this study should be placed in perspective by considering directions for future research. Professor Liu came up with a short list of tasks: further analysis of the data collected; more publicity and application of findings; and further study of special groups, such as homosexuals, ethnic minorities, the aged, the disabled, and servicemen. This inventory, however, is very limited and should be amplified to include the following: (1) improvement of the questionnaires and methodology; (2) extension of sampling, to include more underrepresented groups, including the overseas Chinese, and to allow further cross-cultural comparisons; (3) replication of the study and follow-up in longitudinal studies; (4) detailed case studies of individuals, subcultures, communities, families, institutions, opinion leaders, practitioners, practices, policies, and politics in this field; (5) further interpretation in cultural and historical terms and contribution to theory building; and (6) study of the impact of sociocultural changes and biological breakthroughs.

### 13. Ethnic Minority Resources

ROBERT T. FRANCOEUR

As mentioned in the introductory section on demographics, China has a population of well over a billion people. The vast majority of Chinese people, 91.9%, are Hans (ethnic Chinese, or Han Chinese). The remaining 8.1%, over 91 million people, include 55 significant other ethnic groups. Minority nationalities with population of over one million are the Bai, Bouyei, Dai (Thai), Dong, Hani, Hui,

Kazak, Korean, Li, Manchu, Miao, Mongolian, Tibetan, Tujia, Uighur, Yao, Yi, and Zhuang.

In the past decade, there has been growing interest in documenting the cultures of ethnic minority women in Yunnan province in southwest China. The provincial capital is Kunming. The Yunnan Publicity Centre for Foreign Countries has undertaken a "Women's Culture Series" on the different ethnic groups found in Yunnan province. The soft-cover 100-page booklets in this series contain both color photographs and text describing the life and customs of women. This series constitutes a small but valuable library. Among the volumes are: *Flowers, Love Songs and Girls: The Bulangs; Women Bathed in Holy Water: The Dais; Women Not to Be Bound in Waistbands: The Deangs; Face-Tattooed Women in Nature: The Dulong; Holy Journey for Soul: The Huis; The Restless Female Souls: The Jinuos; Love Through Reed-Pipewind and Mouth String: The Lahus; Plateau Women in Transition: The Mongolians; Where the Goddesses Live: The Naxis*, and; *Nymphs of Folk Songs: The Zhuangs*.

This series is published by the Yunnan Publishing House, 100 Shulin Street, Kunming 65001 China, and distributed by the China International Book Trading Corporation, 35 Che-gongzhuang Xilu, Beijing 100044 China (P.O. Box 399, Beijing, China).

## Conclusion

TIMOTHY PERPER

Because the People's Republic of China is one of the most populous nations, decisions made by its people and by its government about sexuality directly affect its population growth and therefore have global importance. Since the establishment of the People's Republic in 1949, China has undergone immense, and sometimes profoundly convulsive changes. A half-century ago, China was devastated by years of civil and external war, its people widely illiterate, and its poverty profound. No matter what one feels about the Mao dynasty—if that word is metaphorically permissible—the achievements of the Chinese people in the past 50 years have been awe-inspiring. China has become a major industrial power and its population is widely literate.

From the 1949 revolution onward, China's government has increasingly become deeply involved in the reproductive decision making of its citizens. Those who study sexuality and understand its implications for world population growth must surely hope that China's own scholars, and others who know its rich history, many languages, and varied cultures, will continue and expand their studies of sexuality in China. Because China is both a crucible and a harbinger of the future, these studies will be invaluable for documenting how decisions made by the Chinese people and government will inevitably affect the future of everyone on the earth.

## Acknowledgment for Part 2: A Report of the Nationwide "Sex Civilization" Survey on 20,000 Subjects in China

M. P. gratefully acknowledges the secretarial help of Christine H. K. Lau and of Lucie A. Wilk.

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Located in the northwest corner of South America, Colombia is bordered by the Caribbean Sea on the north, Panama on the northwest, the Pacific Ocean on the west, Ecuador and Peru on the south, and Brazil and Venezuela on the east. With a landmass of 439,735 square miles (1,138,910 km<sup>2</sup>), Colombia is larger than Texas and smaller than Alaska. Three mountain ranges, the Andes, the Western, and the Central and Eastern Cordilleras, run through the country from north to south. The eastern range is mostly high tablelands and is densely populated. The Magdalena River rises in the Andes and flows north to the Caribbean Sea through a rich alluvial plain. The sparsely settled eastern plains are drained by the Orinoco and Amazon Rivers. Colombia is the only South American country with coastlines on both the North Pacific Ocean and the Caribbean Sea. The climate is tropical along the coast and in the eastern plains, and cooler in the highlands.

In July 2002, Colombia had an estimated population of 41 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 31.6% with 1.02 male(s) per female (sex ratio); *15-64 years:* 63.6% with 0.95 male(s) per female; *65 years and over:* 4.8% with 0.81 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 70.85 years; *male:* 67 years; *female:* 74.83 years

**Urban/Rural Distribution:** 73% to 27%

**Ethnic Distribution:** *mestizo:* 58%; *Caucasian:* 20%; *mulatto:* 14%; *black:* 4%; *mixed black-Amerindian:* 3%; and *Amerindian:* 1%

\**Communications:* Mtro. José Manuel González, M.A., Apartao Aereo 1190, Barranquilla, Colombia; jmgonzalez@playnet.net.co. Rubén Ardila: psycholo@latino.net.co. Bernardo Useche: busechea@aol.com.

(CIA 2002)

**Religious Distribution:** Roman Catholic: 90%

**Birth Rate:** 21.99 births per 1,000 population

**Death Rate:** 5.66 per 1,000 population

**Infant Mortality Rate:** 23.21 deaths per 1,000 live births

**Net Migration Rate:** -0.32 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.64 children born per woman

**Population Growth Rate:** 1.6%

**HIV/AIDS (1999 est.):** *Adult prevalence:* 0.31%; *Persons living with HIV/AIDS:* 71,000; *Deaths:* 1,700. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate (defined as those age 15 and over who can read and write):** 91.3%

**Per Capita Gross Domestic Product (purchasing power parity):** \$6,300 (2001 est.); *Inflation:* 7.6%; *Unemployment:* 17%; *Living below the poverty line:* 55%

### B. A Brief Historical Perspective

Prior to the arrival of Europeans, the area that is now Colombia was home to various sedentary and semi-sedentary cultures, including the kingdoms of Funza and Tunja and the semi-sedentary Chibcha, who might have numbered about a million. Some of the area was part of the Inca Empire. By the 1530s, Spain had conquered the area and in 1538 established the colony of New Granada, with its capital in Bogotá, within the jurisdiction of the Viceroyalty of Peru. In 1740, a new Viceroyalty was established that included modern-day Colombia, Ecuador, Panama, and Venezuela. In 1819, forces under Simon Bolívar defeated the Spanish at the Battle of Boyacá, and the area gained its independence in 1821.

Colombia then became part of the Federation of New Granada. Venezuela and Ecuador broke away from this federation in 1829. By the 1850s, Colombia and Panama had adopted a federal system, but the system quickly deteriorated with the semi-sovereign states locked in a constant struggle with the central government for autonomy. In 1903, when the Colombian government rejected an offer by the United States for construction of a canal in Panama, the United States supported a revolt by Panama, which then declared its independence from Colombia.

Since the 1850s, Colombian politics have been characterized by a struggle between two groups that early on coalesced into the Liberal and Conservative parties. The ongoing Liberal-Conservative struggle has led to at least six civil wars, usually ending in interparty compromise. For most of the last century, the Roman Catholic Church played a major role in Colombia's social life and political struggles. The 1987-1988 Concordat gave the Church "official protection," while the state assumed authority over public education. The Church's central position in Colombian society was not substantially affected by the Concordat of 1942.

The worldwide depression of the 1930s seriously disrupted both the economy and the politics of Colombia. The overall economic collapse, coupled with the Conservative Party's brutal repression of the labor movement, led to a Liberal victory in 1930, followed by a new civil war between peasants loyal to the two parties. By 1934, Liberal president Alfonso López had inaugurated his "Revolution on the March" program of socioeconomic reform.

During the 1946 elections, Conservatives won the presidency with a minority of the overall vote, defeating a split Liberal Party. Armed conflict instigated by leaders of the two parties erupted to start *La Violencia*, from 1948 to 1957, during which more than 200,000 people died. In the summer of 1957, the two parties reached an agreement on constitutional reform that was designed to last 16 years and allow for regular alternation of the presidency between the two parties. This agreement lasted 11 years, until 1968, when constitutional revisions allowed official recognition of other political parties.

The 1960s and 1970s were marked by the emergence of terrorist and paramilitary groups on both the right and left, some with ties to the drug trade. This violence greatly reduced the power-sharing monopoly of the two parties. Since 1989, political violence has claimed over 35,000 lives. In March 1990, one of the most notorious left-wing groups, M-19, laid down its arms, entered the political mainstream, and won 19 of the 70 seats in a constitutional convention called to rewrite the Constitution. Other left-wing groups soon followed suit.

Colombia has also had to cope with a thriving and growing narcotics trade. Throughout the 1980s, narco-terrorists murdered and kidnapped government officials, journalists, and innocent bystanders with impunity. Despite the assassination of four presidential candidates prior to the 1990 election, the Liberal Party won with a vigorous campaign against the narcotics trade. In 1994, another Liberal president was elected on the promise to invest billions of dollars to improve Colombia's infrastructure using money from newly discovered oil fields. Between the summer of 1995 and September 1996, the government arrested the seven top members of the Cali drug cartel.

[*Comment 2003*: Like most third-world countries, Colombia's economy is unstable. The instability is exacerbated by the battle between the government, the "Drug Cartel," and paramilitary groups inside the country. In the past few years, this conflict has escalated, and human life has lost much of its value. Today, someone is kidnapped every three hours in Colombia. In 2002 alone, there were 2,986 kidnappings. Since 1996, this number has grown to 18,795. In this same period, over 800 people have died in captivity. Nine out of ten kidnapping cases last for about three months. Among the victims are politicians, businessmen, professionals, and common people, whose only reason for being kidnapped is to finance the "guerrilla" and other paramilitary groups.

[In the hopes of trying to appease the "guerrilla" and paramilitary groups, the Colombian government has even given these groups control over specific territories in the

country. In these regions, cocaine plantations are common and the Revolutionary Armed Forces of Colombia (FARC) charge the growers taxes on the crops to help finance their activities. The government knows of these activities but cannot do anything to prevent it.

[The United States has partnered with the Colombian government to fight organized crime. There are close to 100,000 men involved in this effort. In 2002, the homicide rate in the country was 60 deaths per 100,000 inhabitants. In Bogotá, the capital city, the rate is a lower (31 deaths per 100,000 inhabitants).

[The victims are meticulously chosen, and it is this fact that is the most disturbing. In the past few years, four presidential candidates, two ex-ministers of justice, 10 supreme-court justices, a dozen journalists, hundreds of magistrates, and thousands of police officers have been murdered. In 2002, over 70 police officers were killed. The minister of defense, Martha Lucia Ramirez, has alerted the religious community, because the violence towards the clergy has also been escalating. In 2002, 13 clergymen were killed.

[This daily environment of unpredictable violence has, of course, widespread effects on the intimate lives, emotions, and psychology of Colombians of all classes and stations in life and society (*Estado de Sao Paulo*, March 23, 2003). (*End of comment by L. Raibin*)]

## 1. Basic Sexological Premises

BERNARDO USECHE

### A. The Cultural Legacy

Observing pieces of Pre-Colombian art and the descriptions of the historians of the Indies (when the colonists arrived), one finds strong evidence that the majority of the aboriginal tribes inhabiting the Colombian territory freely practiced the pleasurable side of sexuality. Among the art pieces of the time, one encounters representations of all possible sexual attitudes: masturbation, heterosexual activity, oral sex, homosexual activity, and bestiality. With the arrival of the Spaniards in the 16th century, the sexual interests of the conquistadors towards the Indian women made interracial marriages very popular. The evidence of interracial marriage is evident in the fact that 58% of Colombians today are *mestizo* Spanish/Amerindian and 14% *mulatto* black/Caucasian. At the same time, the Spaniards brought the Catholic religion and the repression of eroticism. The arrival of the African slaves during the 17th and 18th centuries signified a new miscegenation and the integration of new cultural elements favorable to pleasure rather than procreative sexuality. At the time of independence from Spain and the birth of the republic in the 19th century, a nation had been forged that, with respect to sexuality, was somewhere between the exalted libido of the macho population and the erotophobic restrictions of their profoundly religious culture. Toward the end of the 20th century, especially in recent decades, the progressive influences of North American culture have been added to Colombian culture. Profound transformations to the family structure and the traditional ideology have been generated by the changes in the Colombian economy at the end of the 20th century. This has opened a new sexual panorama that is much more complex than in colonial times.

Even though there are important urban, rural, and regional differences, today's sexual attitudes in Colombia are characterized by a double standard, where men are permitted all types of sexual activities while "decent" women are limited to sexual activities within the confines of marriage for reproduction purposes. There is, however, the beginning of a more permissive attitude towards a woman's sexual pleasures if she is in a serious relationship, because the im-

poverished situation of the majority of Colombians makes it very hard for couples to maintain stable ties.

Colombia continues to be a country where the majority of the population is Catholic, with traditions deeply rooted in the cultural values of Spain. But the few studies that have been done on this issue indicate that the sexual conduct of the people frequently does not conform with the Church's religious norms. This implies that *machismo* has played an important role in Colombian society. It has perpetuated discrimination towards women in family life, the work environment, and throughout society as a whole. *Machismo* places great value on female virginity, emphasizes the importance of the extended family, and supports the underlying concept of sin and guilt as it pertains to sexuality.

The modernization of Colombia, beginning in the 1930s and continuing well into the 1980s, changed many of these societal values. Colombia was transformed from a rural country to an urban country. No longer was religion the focal point of education. In spite of opposition from the Catholic Church, couples were having fewer children and birth control was more widely used. The status of women improved considerably. Employment of women outside the home has led to changes in the family structure. It allowed women to make choices, including how many children they bear, as well as changed their societal status. These societal changes, brought about by the modernization, industrialization, and urbanization of Colombia, continue into the start of the 21st century.

## B. Sexual Roles

*Machismo*, with its horrible discrimination against woman, is still present in Colombian family life, the work environment, and society. There are few men, even those in the lower socioeconomic bracket, who help with the housework or the raising of the children. With the impoverishment of the country, the number of single mothers who are head of the household increases constantly, but they are still not given the basics: same work, same salary, or even a job. This situation has driven many women and their daughters to prostitution. Politically, women were given equal rights under the law in the 1950s, but they are still the minority in positions of power or in government jobs. Only in the last decade has it been possible for Catholic couples to get a divorce. Abortion is still illegal in Colombia, even though there are estimates that over 300,000 illegal abortions are performed each year. A growing sexual liberation of women has been observed in the past 30 years, but the differences in the sexual conduct of young people of both sexes are still very significant, as seen in Table 1.

In the movement toward gender/sexual equality in Colombia, we find sexologists like Heli Alzate, who was one of the first to vehemently refute the assumed physical, intellec-

tual, and emotional inferiority of women. Also, intellectuals like Maria Lay Londoño and Florence Thomas, pioneers of the feminist movement since the 1970s, have dedicated enormous efforts to the study of couples and the promotion of sexual equality. The ground won by women in respect to their sexuality has not yet had an impact on the *machismo* attitudes of men. When it does, as it likely will in the near future, one can expect a crisis in the current model of masculinity.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

JOSÉ MANUEL GONZÁLES

Recent studies (Bodnar et al. 1999; González 1999a) show the presence of important religious beliefs related to sexuality. The concept of sin related to pleasure in sex, birth control, and some religious concepts that emphasize feminine resignation, are important in the sexual life and relationship of couples in Colombia. According to Paulo Romeo, Apostolic Nuncio in Colombia, the Catholic Church is losing 200 practitioners daily (*El Tiempo* 1997). According to the calculation presented at the Assembly of Bishops, only 60 of every 100 people baptized will take their first communion. According to Carlos Alzate of the Episcopal Conference of Colombia, only 15 out of 100 people who consider themselves Catholics on surveys go to Mass (*El Tiempo* 1997).

To better understand our sexuality, it is necessary to understand the influences of the three biggest ethnic groups in our heritage: the Spanish culture, the African culture, and the Indian culture (González 2000).

- The Spanish cultural influence, which is a mix between the Arab-Andaluzian influences, mixes the glorification of sensuality and eroticism in its most beautiful form with the Spanish Catholic Inquisition's very strong repressive ideas. This is a major influence in much of what is known about sexuality in Latin America.
- The African culture looked at sexuality, eroticism, and sexual vigor as natural phenomena. Much is known about this influence on contemporary Colombian culture.
- The sexuality of the local aborigines was quite varied, but there is not much information about their common features and differences. When the conquistadors arrived in Colombia, they encountered a wide variety of indigenous cultural attitudes regarding sex, a sample of which follows:
  - The Panches, a Caribbean culture, practiced female infanticide and clitorectomies eight days after birth. If the child survived the sexual mutilation, its marriage was immediately arranged. If the firstborn was a female, she was immediately killed.
  - Among the Lanches in the Boyacá region, if a woman had five consecutive boys, the youngest would get special attention and was expected to take on the female role. They were brought up as females and were married off to a male.
  - The Pamtagoros of Caldas were very puritanical and disapproved of any nudity. Their women were covered up to their ankles and were very careful, when sitting, not to show their legs. On the other hand, the Pijaos from Tolima would proudly show off their genitals.
  - Both male and female Quimbayas from the western side of the central Andes were very sexually active. Among the Muiscas, from Cundinamarca and Boyacá, there was total freedom with respect to premarital sex, whereas among the Pijaos, it was common for the husband to kill his bride if she was not a virgin. The Pantagoros accepted infidelity, whereas the Pijaos pun-

**Table 1**

### General Differences of Sexual Conduct

Sexual Activity	Men Percent	Number Responding	Women Percent	Number Responding
Masturbation	92.3%	379	43.2%	604
Vaginal coitus	62.2	379	30.8	604
Oral sex	44.8	353	23.1	566
Anal sex	20.6	355	7.7	560
Group sex	21.6	310	1.6	492
Same sex	17.1	346	9.3	572
Victim of rape or sexual abuse	6.4	345	13.9	583

(Useche 1999)

ished infidelity very severely. An unfaithful Pijaos woman would be given to the single men of the village for their pleasure, after which she would be buried up to her waist in a public place where she would be whipped to death. The Muiscas had similar punishments for female infidelity.

- Both the Muiscas and the Quimbayas celebrated fertility festivals where they would get drunk and have sexual relations without restrictions. The Liles from the Valle would marry their sisters and nieces. The female Guane, from Santander del Sur, were very involved with the conquistadors. They were described as being the prettiest, the whitest, the cleanest, and the ones with the greatest ability to learn Spanish.
- Among the Noanamas and the Taso, from Choco, anal sex between men was very common. Sexual relations with women were only for reproductive purposes. Most female infants were drowned at birth.

### 3. Knowledge and Education about Sexuality

PEDRO GUERRERO

#### A. Government Policies and Programs

We can affirm with full accuracy that from the Spanish Conquest to the passing of Resolution 03353 by the Ministry of Education in July 1993, sexuality education in Colombia has functioned according to the guidelines set forth by the Catholic Church. Accordingly, sermons originating from the scriptures and dictated from the pulpit were obligingly echoed in all educational institutions.

Our medical students receive their sexological training via lectures in gynecology, urology, and psychology. However, this coursework does not include the erotic aspects of sexuality. It only deals with biological reproduction and the pathologies found in the genital organs. Sexually transmitted diseases are generally discussed with apprehension. At the same time, therapy for sexual dysfunctions remains unknown, and the concept of the woman and the family is rooted in the old patriarchal ideology.

#### National Program on Sexual Education

The National Program on Sexual Education is best described as a set of principals and guidelines that collectively form the knowledge base, attitudes, behaviors, and values of sexuality. Its purpose is to meet the needs of Colombians in living a healthy, responsible, and gratifying sexual lifestyle, while promoting gender equality. Furthermore, it encourages the people to redefine the traditional roles of men and women, as well as the patriarchal family structure, thus attaining greater equality between marital couples and parents and their children. In addition, the National Program on Sexual Education encourages men and women, without coercion or pressure, to choose the appropriate time at which to bear children. As a result, they need to learn to adequately utilize effective birth control methods. The guidelines proposed by the National Program on Sexual Education should be viewed as a framework for the formation and pedagogical organization of sexual education programs in Colombian schools. Therefore, this proposal is optional and not mandatory.

The following items should be taken into consideration while reviewing these guidelines:

1. We must acknowledge the importance that culture plays in sexual education. Culture holds ethical values, morals, and spiritual and religious convictions. These not only determine the significance of the multiple dimensions of human existence, but also determine the people's level of acceptance of the academic proposals.

2. We must understand that sexuality is a fundamental dimension of humanity, which is ever-present in the lives of all men and women.
3. It is suggested that sexual education be integrated into the curriculum from a science and humanities context. This would then serve as an introduction to self-esteem, independence, interpersonal relationships, and health.
4. Sexual education is thought to be the responsibility of the educational community, including all educational institutes in both the public and private sectors, teachers and administrative staff, and parents and students.
5. The family is considered to be the primary source of education for children, as stated in Article 68 of the National Constitution of Colombia. In accordance with Article 68, the family reserves the right to choose the quality of education for their children. It is noted that the family unit serves as a model for the child's future perspectives on sexuality. It is in the family where children of both sexes learn their first lessons on solidarity, sensitivity, and gratitude. It is where a child learns to love and be loved, to tolerate and be tolerated, to hold a dialogue, to share, and to respect and value life. By the same token, it can also be the place where a child can experience and later repeat child abuse, sexual abuse, gender discrimination, and other types of domestic violence.
6. The importance of *etiquette* in sexual education is evident. The National Constitution of Colombia addresses the issue of the rights and responsibilities as they pertain to the concept of sexuality. Among other rights, the Constitution stipulates the rights of all to personal development, the equality of rights and responsibility of a couple, and the right to choose the number of children they are to bear, among other rights.
7. It is suggested that sexual education should be a pedagogical program that forms the basis of all fundamental studies. That being said, all educational institutions are left with the task of creating their own sexual education programs.
8. The proposed curriculum consists of developing programs that focus on basic sexual education themes, as they relate to the individual student, the couple, the family, and society as a whole. Each fundamental objective is to be modified to the age and grade level, the developmental level, and the specific needs of the target audience. The proposed programs target primary through secondary grade levels. Suggested topics include: identity, tolerance, reciprocity, life in general, affection, communication, love–sexuality, responsibility, imagination, and critical-thinking skills.
9. Workshops for educators are a suggested method of sharing information, as opposed to traditional methods like didactic lectures. In workshops, individuals can share information with the group in an open forum.

In order to test the effectiveness of the National Sexual Education Programs, two studies were initiated. The first case study, conducted by the Ministry of National Education, investigated 332 schools in 155 school districts in Colombia. Using quantitative methods, it was found that 92% of the schools utilized the sex education programs. These schools reported a marked improvement in school morale, as related to sexuality themes.

The second case study, also conducted by the Ministry of National Education, complimented the previous study in that it investigated the pedagogical process of the National Sex Education Programs in academic institutions. Utilizing qualitative methods to examine 16 subjects at different developmental stages in four different regions of Colombia, this

study indicates that the sex education programs are at a critical phase of development. They have been introduced to the school system, and opened up avenues of employment and a new view on sexuality, but they have also identified four areas where further effort and development are needed:

1. Restructuring the aspects of human sexuality taught;
2. Promoting policies and other movements geared towards sexual well-being and reproduction with youth, both within and outside the educational system;
3. Increased utilization of sex education programs in academic institutions and successful replication of studies indicating their effectiveness; and
4. Participation and support from the congressional body, the judicial system, and educational institutions at both the national and international levels, for human sexuality, sex education, sexual health, and reproduction.

## B. Informal Sources of Sexual Knowledge

JOSÉ MANUEL GONZÁLES

Investigations conducted by a variety of groups that strongly support sex education have found that parents are reclaiming their roles as the primary informants of sex education. Mantilla (1993) reported that men's primary sources of information on sexuality were: friends, mother, father, and school. Women reported that their primary sources of information on sexuality were: friends, mother, school, and father. Gutierrez and Franco (1989) found that women reported that their primary sources of information on sexuality were: school, mother, friends, and the general media. Men reported that their primary sources of information were: friends, school, the general media, and father. The Institute of Social Securities (Instituto de Seguros Sociales 1994) found that adolescents posed questions regarding sexuality primarily to their mothers, 47% of females and 20% of males, whereas only 16% questioned their friends and 11% questioned their fathers.

Every day, the Colombian mass media discusses sexuality more freely. Several related programs have surfaced. Maria Ladi Londoño-Cali, was one of the first pioneers in this area. Lucia Nader and Marta Lucia Palacio joined in on two major networks, Caracol and RCN (Palacio 1999), and presented a compilation of the most frequently asked questions by her viewers. In print, the pioneering column on sexuality was "Window to Sexuality" (González 1998, 1999b). This column was originated by José Manuel González and is presently written by Fernando Bohorquez, Ph.D. The *Herald* (Barranquilla) has published an entire page dedicated to human sexuality since 1999, titled "Love and Intimacy" (González 2000). The pioneering television program was *Sexology on Television*, hosted by Elkin Mesa (August 1979). Lucia Nader, Marta Lucia Palacio, Alonso Acuña, and Pedro Guerrero initiated another program, titled *It's Time to Live*. This program touched on all aspects of human sexuality. It was a popular program that also served as a basis for a book by the same name. Lucia Nader developed a magazine titled *In Private* (1996). Its theme was fundamentally sexuality. *Accent* was a magazine geared towards the gay community, published in 1997. Both publications have since gone off the market because of financial difficulties.

## 4. Autoerotic Behaviors and Patterns

### A. Children and Adolescents

Erotic autostimulation is rather common among children. Ardila (1986a) interviewed 700 mothers, pertaining to different Colombian subcultures, and found that three out of four mothers reported masturbatory behavior among children of 4 years of age. Acuña and associates (1986) ex-

plored the existence of this behavior and the anxiety that it causes for parents. In general, this type of autoexploratory and sexual gratification behavior is repressed by the adults.

Autoerotic behaviors are also common among adolescents. Masturbation generally starts between the ages of 13 and 15 (Alzate 1989; Domínguez et al. 1988; González 1995; Giraldo 1981; Gutiérrez & Franco 1989; Useche 1999). Among the adolescents, between 60% and 95% of men and 14% and 68% of women have masturbated at least once in their lives (Alzate 1989; Domínguez et al. 1988; González 1995; Giraldo 1981; Gutiérrez & Franco 1989; Useche 1999). In general, feelings of guilt and anxiety are reported with respect to masturbation (Domínguez et al. 1988; González 2000; Gutiérrez & Franco 1989).

### B. Adults

Sexual autostimulation is also very common among adults. About 90% of men and 70% of women report having masturbated at least once in their lives (Alzate 1989; Eliajike et al. 1987; González 1979, 1985, 1995, 2000). The majority of those studies report a greater incidence of masturbatory behavior in those who are less religious.

A relationship between the personality, as measured by Eysenck's MPI test, and masturbation has been detected by González (1979). Men with high scores in introversion have confirmed a higher frequency of masturbatory behavior. Women with high scores for neuroticism have demonstrated a lower frequency of masturbatory behavior as compared to woman with normal scores. With relation to age, it has been reported that in people over 60 years of age, single women masturbate more than men (Bardugo & Segura 1988, González & González in press).

Sexual autostimulation generates many negative feelings. There are many myths and misinformed beliefs on the subject (Giraldo 1981; González 2000). In a recent survey done in the four biggest cities of Colombia, it was found that only 32% of women and 53% of men find masturbation to be a healthy sexual behavior. The rest believe that it is a crazy conduct that should be avoided, because it is a sexual deviance and a sin (*Semana* 1999).

## 5. Interpersonal Heterosexual Behaviors

JOSÉ MANUEL GONZÁLES

### A. Children

Childhood sexual rehearsal play and sexual exploration are quite common. One out of every two mothers reported observing sexual rehearsal play in their 4-year-old children (Ardila 1986). Still, childhood sexuality is a theme that produces great anxiety in adults (Acuña et al. 1986; González 2000).

### B. Adolescents

There are no widespread rituals of initiation to puberty. In some rural areas on the Caribbean coast of Colombia, it is common for adolescents to engage in sexual acts with animals, namely mules (González 2000).

Sexual activity among adolescents occurs frequently and functions according to the traditional male-dominant cultural pattern. Forty-four percent of Colombians initiate sexual interactions between the ages of 11 and 18. By 18 years of age, 72% of males and 40% of females have had sexual intercourse, according to Ministry of Health of Colombia (Ministerio de Salud 1994). Generally, female adolescents' first sexual encounter occurs with their boyfriends. Often, sexual relations between Colombian adolescents stem from an intimate relationship and not from an encounter with a prostitute (Bonder et al. 1999; González 1995; González et al. 2000; Useche 1999).

### C. Adults

#### *Premarital Relations, Courtship, and Dating*

Premarital sex is quite common in Colombia. In recent studies, it was found that 90.4% of males and 62.8% of females have engaged in premarital sex prior to starting college life (González et al. 2000). Love is usually on the forefront. It is a fundamental part of Colombian culture: music, magazine articles, soap operas, and movies (Bodnar et al. 1999; González 1998; Guerrero 1996a, 1996b). In recent years, initiating friendships and intimate relationships has become easier. Formal introductions are no longer required. People have become more direct in their approach.

In recent studies, González (2000) found that men experience difficulties in expressing love and affection. It is common that people have unrealistic expectations regarding love, and, as a consequence, great frustrations and clashes between fantasy and reality in relationships. Frequently, the expectation is that the lover will satisfy all of their needs, provide unconditional love, and be who they want them to be and not who they actually are. They believe that pain, suffering, and jealousy are essential parts of a relationship. Generally, the woman is expected to be responsible for the affective part of the relationship. She is often expected to prove her love by engaging in sex with her partner. It is also believed that a sure way of keeping a man, or winning him back, is through sex. All the conditions aforementioned make choosing an appropriate mate difficult. Frequently, a partner is not chosen on reality-based merits. Instead, he or she is chosen on unrealistic expectations, which inevitably will lead to a failed relationship.

#### *Sexual Behavior and Relationships of Single Adults*

Among adults, there exists a misconception of what sexual pleasure is. Generally, they do not understand the physiological and/or psychological concepts of eroticism. As a result, there exist irrational and unhealthy beliefs (González et al. 2000). Sex is commonly seen as bad, dirty, ugly, and degrading. This sex-phobic mindset distorts and impedes a healthy sexual lifestyle (González 1981). Often egotism is perceived as a process leading towards reproduction. Anything else is seemingly considered illegal, promiscuous, and guilt-ridden (González 1999a).

According to the *machismo* ideology, males tend to initiate sexual activity earlier than females. It tends to be more intense and promiscuous (Alzate 1989; Bodnar et al. 1999; González et al. 2000; Institute of Social Securities 1993; Useche 1999). Adult males will have more sexual partners than their female counterparts: One out of every three males reported having two or more sexual partners in the last 12 months, whereas only three out of every 100 females reported multiple partners (Institute of Social Securities 1993). Generally, the male initiates sexual interactions within the relationship. Couples engage in sex frequently: 2% reported daily sexual activity, 19% reported sexual activity several times a week, 41% reported weekly sexual activity, and 16% reported monthly sexual activity (Ministerio de Salud 1994). The sexual positions most frequently practiced were the missionary man-on-top/woman-on-bottom position, the straddle where the woman sits on top of the man, and the rear-entry position with the man behind the woman (González 1994).

Eljaiek et al. (1987) found that almost 50% of the couples surveyed did not engage in sexual relations during menses, and almost 10% discontinued sexual activity during pregnancy. There also exists a great irresponsibility, for both men and women, in practicing safe sex and using some form of contraception. There is a high rate of sexual dissatisfaction for both genders (González 1998).

#### *Marriage and Family*

Colombians place a great importance on feeling as though one is "in love." Love is the primary motivating factor for matrimony, as reported by 87% of women and 69% of men (Eljaiek et al. 1987).

The marriage rate has decreased while the rate of cohabitation has increased, especially in the younger population. Mature couples in their mid-80s reported that 84% were married through the Catholic Church, while 15% cohabitated. Married couples in their mid-30s reported that 44% were married through the Catholic Church, while 54% cohabitated (Rojas 1997). The average age for matrimony or cohabitation has decreased for males and has increased for women (Presidential Council for Youth, Women, and Their Families 1994).

Rojas (1998) found that couples feel unfulfilled in their relationships. They feel that their counterparts do not demonstrate affection both physically and verbally, that they do not support their efforts, and that they do not make them feel valued. Additionally, they feel that there is a lack of communication with regards to problems, misunderstandings, and resolutions. Rojas also noted that of the couples surveyed, 50% did not have a set time in which to communicate.

The marital union in Colombia tends to be non-democratic and lacks equality between the partners. Often women seek gender equity, only to be met with violence from their counterparts. There also exist religious beliefs that support submissiveness and perpetuate this unjust marital relationship (González 2000). Misinformation pertaining to masculinity, femininity, and their interrelatedness permeates societal expectations. Men are perceived in terms of money, power, bravery, and freedom. Women, on the other hand, are perceived as tender, submissive, tolerant, able to bear suffering, and having a need to sexually satisfy their partner at the expense of her own sexual needs. These *machismo*-based values are believed to be biological in nature, disregarding educational, physiological, and/or psychological cultural factors (González 1998, 2000).

There has been an increase in separations and multiple sequential marriages in Colombia: 35% of all couples surveyed have been separated at least once (Presidential Council for Youth, Women, and Their Families 1994). Zamudio and Rubiano (1991b) found that the primary causes for separations among Colombian couples were: infidelity, jealousy, or falling in love with another person, falling out of love or falling into a rut, and financial difficulties, in that order.

According to Gutierrez de Pineda (1975), there are four types of family structures: Andino, Santandereano, Negroide, and Antioqueno. These are characterized by the following factors:

- *Andino Family Structure* in the Cundinamarca and Boyaca regions. The dominant feature in this region is the patriarchal structure in which the father is the head of the household. The mother and children are viewed as subordinates. The male children imitate the father while the girls imitate the mother. Initially, the mother is the disciplinarian. However, as the boys grow older, the father tends to intervene more frequently.
- *Santandereano Family Structure* in the Santanderes. Here, the power of the male over the female is evident. His aggressiveness and physical dominance characterize the male. He takes great pride in his sons; however, he withholds any type of affection. Great emphasis is placed on the rift between social classes.
- *Negroide Family Structure* on the Atlantic Coast, in the regions of Chocco and Magdalena, Cauca, and the lower

region of Antioquia. The basic characteristic of this family structure is the incidence of cohabitation. For men, it is considered prestigious to have multiple partners. Much attention is focused on the male genitals. The man is determined to father a vast number of children without regard for the childrearing responsibilities. Usually, the mother raises the children with the almost complete absence of the father.

- *Antioqueno Family Structure* in the regions of Antioquia, Caldas, Risaralda, Quindio, El Valle, Tolima, and parts of El Chocco. Here, religion has a great impact on the family structure. Catholic matrimonies are a dominant feature. The traditional gender roles are practiced. The man is the head of the household, but the woman rules in the home. The mother is strict with her daughters, especially as it pertains to sexuality. She is compliant with her sons, especially the youngest one.

Although these discrepancies are no longer as rigid as they once were, the general tendency continues to follow these traditional patterns (Gutierrez de Pineda 1975).

### *Extramarital Sex*

Infidelity is an important element in a Colombian marriage (González 1998). Murillo (1993) found that there were three males for every one female who engaged in extramarital sexual relationships. Nadar and Palacio (1989) found the same results. Nadar and Palacio also found that 30% of separations were a result of infidelity. Findings indicate that there is a greater incidence of infidelity for men as the socioeconomic levels rise higher. For women, infidelity is more common at the upper-middle-class levels (Rojas 1997). A common misconception is that a man's infidelity is less serious because he is biologically driven, whereas women's infidelity is not.

### *Sexuality and Physically Disabled and Elderly Persons*

Colombian sexology has little literature regarding disabled and elderly persons. The prevailing attitude is that this population is nonsexual and has no need for sexual intimacy. In a recent study of adults over the age of 60, González and González (in press) found that 94% of the men and 24% of the women maintain sexual interactions with their mates; males engaged in sex every two weeks, whereas women engaged in sex on a monthly basis. Seventy-six percent of men and 36% of women reported that there was a decrease in gratifying sexual intercourse after the age of 60. It was reported that 88% of these older men and 30% of the women are satisfied with their sex life. Eighty-two percent of the men and 18% of the women reported that they continue to seek out their partners for sexual activity. Forty percent of the men surveyed reported having sexual relations with someone other than their regular partner. Eighty percent of men and 52% of women reported that relations with their partners are at least cordial. Forty percent of all women surveyed reported that they do not have a good relationship with their partners. Seventy-two percent of men and 50% of women reported that they continue to be affectionate with their partners. The authors believe that the predominant *machismo* values distort a couple's lifestyle, resulting in resentful women.

### *Incidence of Anal and Oral Sex*

Although there are no laws prohibiting anal sex and oral sex, they continue to be highly criticized in public and frequently practiced in private. Almost 80% of men and 70% of women have engaged in oral sex, now a regular part of foreplay (Eljaiek et al. 1987; González 1994, 1998).

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

RUBEN ARDILA

There has long been an interest in homosexuality in Colombia. Behaviors that can be categorized as homosexual have been noted within the cultures that existed in Colombia during the arrival of the Europeans. However, the study of homosexuality is filled with methodological ambiguities. There are certain behaviors that may or may not be considered *homosexual* by today's societal standards. Even so, these behaviors existed long before the arrival of the Spaniards. As in other cultures, homosexual behaviors were found more frequently among men than women.

From the onset of studies on sexuality amongst Colombians, homosexuality was always an interest (Alzate 1978, 1982; Botero 1980; González 1985). It was found that there were differences in homosexual activity between men and women. In Bogotá, 28% of the men and 13% of the women reported having had same-sex relationships. Interestingly, there was a marked difference between the various cities in Colombia. These ratios are not limited to homosexual activities exclusively. It reflects the number of individuals who engaged in some type of sexual activity with someone of the same sex. It could have been an isolated incident and/or the regular practice of homosexual or bisexual behaviors.

### *Anthropological and Social Aspects*

José Fernando Serrano (1997, 1998), an anthropologist, has pointed out that the formation of the homosexual identity, as described by societal constructs, has been a long process. He reviewed sociological studies originating in Colombia and indicated which ones supported the argument of sexual orientation. He also argued the problem of collective identities at the international level.

The modernization of Colombia, which took place in the latter half of the 20th century, enabled people to look outside their immediate society and expand their provincial traditions. It enabled them to study ideas from other countries, primarily from France and other regions of Europe, and the United States. The gay and lesbian liberation movements of Germany, several other European nations, and later from the United States slowly made their way to Colombia. Nevertheless, they had a great impact on the organization of the gay and lesbian movements. Modernization gradually brought about internationalization, globalization, and societal changes that influenced people's private lives.

### *Homosexual Identity*

The beginnings of organized homosexual groups in Colombia began in 1970. Manuel Antonio Velandia, a sociologist and philosopher, initiated them. He associated with people who were interested in human rights, social change, and the general counterculture of the 1960s and 1970s on an international level. These gay and lesbian movements were difficult to organize, and were at times very short lived. Finally, in the late 1980s and 1990s, gay and lesbian groups succeeded in uniting and achieving their goals (Velandia 1999).

Velandia founded the Gay Liberation Group and the Homosexual Liberation Movement of Colombia in 1976. He also organized the first Gay Pride March in 1983 in Bogotá. These movements gained importance in 1998 and 1999 and included weeklong lectures on sexual diversity, collective identity, human rights, legislation, and other related topics. However, gay and lesbian communities are slow in coming. Although gay meeting places have been established since the 1970s, homosexual literature remains unseen. The first writings pertaining to the gay lifestyle—poetry, novels, theater,

and soap operas—surfaced in the 1980s. This is not to discount earlier works by P. Barba Jacob. Today, soap operas and movies frequently touch on homosexuality.

The Constitution of Colombia, passed in 1991, prohibits discrimination in any form or manner. It recognizes that all people have the right to free personal development. The Constitution stipulates that homosexuals may not be discriminated against based on their sexual orientation. Sexual orientation that is not shared by the majority does not justify unequal treatment.

The rights given by the Colombian Constitution pertaining to sexual orientation during the 1990s have been favorable for homosexuals and bisexuals. For example, in April 1991, a law was passed that protects an individual's rights to free sexual identity. It affirms that homosexuality should be considered valid and legitimate. The Colombian Constitution also addressed the debate regarding homosexual educators. They determined that homosexuality has no bearing on an individual's ability to teach (in September 1998). Additionally, in July 1999, the Colombian legislature passed a law protecting homosexuals in the military. It states that individuals may reveal their status as homosexuals and continue to be held to the same norms and expectations as heterosexuals.

The Colombian legislature has defined the family as a union of a man and a woman (March 7, 1996). However, it went on to acknowledge the rights of partners, including same-sex couples, in terms of inheritance, transfer of assets, and financial support, among other things. There have been several attempts to legalize homosexual marriages, as has been done in several other areas, e.g., Denmark since 1989, Norway since 1993, Sweden since 1995, Iceland since 1996, Hungary since 1996, and Holland since 1997. In some cases, there exist legal sanctions against same-sex marriages because of the possibility of adoption. There are, however, gay activist groups who support the legalization of the *gay family* in all aspects, including adoption. The Family Pride coalition is one of the most important advocates of this movement.

One of the most recent proposals, in September 1999, sought to equalize the rights of homosexual couples with those of heterosexual couples. For instance, after two years of cohabitation, the couple may apply for Social Security benefits. Additionally, should the relationship end because of death, one partner may inherit the assets of the other. There already are companies in the private and public sectors that will allow an employee's partner of the same sex to register for benefits.

### *Psychological Investigations*

Psychological studies regarding homosexuality, bisexuality, and homoeroticism have been conducted by Octavio Giraldo and his team (1979, 1981, 1982) at the University of "El Valle." Similar studies have been led by Ruben Ardila (1985, 1986, 1995, 1998) at the National University of Colombia.

Ruben Ardila has focused on sexual orientation in the studies he has conducted for the past 15 years. Some of the issues he has researched have been: adaptation of homosexual males, lesbianism, sexual orientation, heterosexual attitudes towards homosexuals, stability of the homosexual couple, the lifecycle of homosexuals and lesbians, the biological aspects of homosexuality, politics as they pertain to homosexuality, and other related topics.

One such study looked at the adaptation of male homosexuals (Ardila 1998). There were 100 subjects, between the ages of 18 and 52 years of age. They all scored a five or six on the Kinsey Scale (indicating predominantly or exclusively homosexual). The following factors were studied: depression, solitude, timidity, social alienation, interrela-

tions with heterosexuals, interrelations with homosexuals, sexual practices, traditional values, religion, morals, conformity, acceptance of homosexuality, emotional stability, guilt, concept of homosexuality as a mental illness, effeminacy, responsibility, interrelations with the opposite sex, secretiveness of homosexuality, personal adjustment, and psychosomatic symptoms.

The results indicate that Colombian homosexuals are well adapted and do not present any pathological qualities. However, 10% manifested signs of severe depression, while 44% were highly stable. Only 4% reported feeling guilty about their homosexuality. Fifty-nine percent stated that they had positive interpersonal relations, and 48% accepted their homosexuality. For further material on diverse aspects of sexual orientation for both women and men, see the References and Suggested Readings section.

### *Sexual Orientation in Colombian Society*

Our society, based on the Judeo-Christian faith, has a very negative attitude towards homosexuality. Homosexuality is viewed as a violation, an illness, or a deviation from the norm that threatens normal behaviors and society. This homophobic view has permeated Colombian society throughout its history, although there have been different levels of acceptance, depending on the individual's level of education, rural-versus-urban setting, age, and their affiliation with the Catholic Church. There is a deeply rooted belief that homosexuals are a threat to society, good upbringing, and family values. Similarly, homosexuality is thought to be related to child sexual abuse, AIDS, substance abuse, delinquency, and other serious social problems.

Homosexuals are discriminated against in education, in the workplace, in housing, in the mass media, and generally in daily living. This homophobia has its origins in the Latin American cultures, which practice *machismo*, emphasize the importance of the family unit, and are highly influenced by the Catholic Church. In spite of this, the situation has considerably improved in recent years, from the homosexual liberation movements in the 1970s to the legislative, medical, and psychological advances that occurred later. In the larger cities of Colombia, especially those with higher levels of education, homosexuals are accepted. They are respected and are considered equal to heterosexuals. In these areas, discrimination is hardly noticeable. It is no longer believed that male homosexuals are less masculine than heterosexual males or that lesbians are any less feminine than female heterosexuals are. Additionally, there are certain groups within the Church who have worked towards improving the quality of life for gays and lesbians. Social support has shown improvement, which will then lead to a more pluralistic, diversified, and egalitarian society.

## *7. Gender Diversity and Transgender Issues*

BERNARDO USECHE

As in most of the Latin American countries, Colombia also does not have serious studies or reliable statistics on the frequency or psychological evolution of those people whose sexual identity is not well-defined or is confused. But, based on clinical exams and interviews with those people, it is possible to differentiate two large groups.

In the first group, one encounters heterosexual and homosexual transvestites and a few male-to-female transsexuals who were born and raised in lower-class environments and have socially isolated themselves in areas dedicated mostly to prostitution. Because of the almost nonexistent control over the sale of hormones in the country, it is quite easy for such people to seek physical changes through

automedication with estrogen. This type of hormonal auto-medication normally starts during adolescence and has the effect of changing the body type to the feminine phenotype, even though the vast majority of this group will not seek surgical sex reassignment.

Given the context of the social problems encountered by people living in poverty, members of this first group become sexually active at a very early age and soon transition to promiscuity and prostitution. A few work as strippers in the clubs that are very common in the prostitution areas of the big cities. A few others, under the auspices of "transformists," work as singers or actresses in nightclub shows. Very seldom, and only if sex-reassignment surgery is involved, will someone from this group obtain some type of professional therapy through the almost nonexistent public health system. Members of this group also have received some help and orientation from nongovernmental agencies involved in the prevention of HIV infection.

The following quote perfectly demonstrates what happens to members of this group:

I began to dress permanently as a woman and take hormones when I was 18, and that provoked adverse emotional reaction from my parents who kicked me out of the house. They accepted me as a homosexual but not as a transsexual. The only place that accepts me as I am is the brothel where I go to work when I need money. (Author's clinical notes)

The second group is composed of those who belong to the upper classes, many of whom have college degrees and work as professionals. This group is currently composed of transvestites, fetishist transvestites, and some transsexuals who have access to information regarding their sexual identity, especially through the Internet. Some have their own Web pages and communicate among themselves, taking advantage on the initial anonymity of cyberspace to better understand themselves. Even though this group has the means to obtain professional help and counseling through private practice, they seldom do so. This is because of the fact that many therapists have no knowledge on the subject, and some even have a negative attitude to those who approach them with these problems. In the words of one client in this group:

In the anguish of my situation I went to a psychiatrist who referred me to the best sex therapist in this city. In our first meeting, the sexologist was very frustrating and I felt offended and attacked. I never returned. (Author's clinical notes)

In recent years, sex-reassignment surgery has been performed in large cities like Bogotá, Cali, and Medellín.

## 8. Significant Unconventional Sexual Behaviors

JOSÉ MANUEL GONZÁLES

### A. Coercive Sex

#### *Child Sexual Abuse and Incest*

Colombian law considers child sexual abuse a crime under Articles 303, 304, and 305 of the Penal Code. It is calculated that one Colombian child is sexually molested every six hours (Afecto Foundation 1999). In the great majority of cases, the aggressor is a person the victim knows (Florez & Consuegra 1998). These authors studied the cases of 80 girls under the age of 15 in the urban area of Barranquilla. In 53% of the cases, the aggressor was someone the victim knew but was not a family member, 41% of the perpetrators were family members, and only 6% were complete strangers. In 1.25% of the cases, pregnancy was a consequence.

Incest is also considered a crime under Article 259 of the Penal Code. Even though there are no reliable statistics, it is widely calculated that incest is a common phenomenon. In a recent survey conducted in the four largest cities, *Semana* (1999) found that 3% of males and 1% of females had had sexual relations with their father, mother, or a sibling.

In Colombia, 2 million children are victims of abuse, 850 of whom were in critical condition at the time of the Afecto Foundation survey (1999). In Colombia, an estimated 148 of every 1,000 Colombian children are abused in some way. Of these 148, 100 are verbally abused, 40 are physically abused, and 8 are sexually abused (*El Tiempo* 1999).

#### *Sexual Harassment*

Sexual harassment is not considered a crime in Colombia. Even though there are no reliable statistics, it is a very common phenomenon in academic and work environments. The *machismo* cultural pattern makes many men think it is their God-given right to sexually harass their female employees and coworkers.

#### *Rape*

Rape is considered a crime under Article 298 of the Penal Code and does happen with some frequency. Profamilia (Planned Parenthood of Colombia 1995) found that 5.3% of women in the fertile age group have been forced to have sexual relations. Before 1996, forced sexual relations within married couples were not considered a crime. With the creation of Law 294 under Article 25, forced sexual relations within married couples are now a crime.

Spousal abuse is a very common phenomenon. In 1996, of the 42,963 cases seen by the Legal Medicine group, 71% involved spousal abuse. Of those cases, 95% of the victims were women, with a ratio of 18 women for every man. The group at most risk of abuse are women between the ages of 25 and 34. In a 1998 study in several Colombian cities, 14.3% of the persons interviewed said that they had been attacked by their spouses (*El Tiempo* 1998). Further interviews showed that 60% of the women had been verbally, physically, psychologically, or sexually attacked by their husbands or partners. Twenty percent were physically attacked and 10% were forced to have sexual relations with their husbands (Profamilia 1995). Most of these women tried to solve their problems without the intervention of the police or other governmental agencies. Most of these women were completely passive regarding the attacks of their partner. Most battered women say that the main causes of the aggression are drunkenness and jealousy on the part of their partners. The most common physical abuses are punches 88%, kicks 27%, and shoves and pushes 24%. In 35% of the cases, the episode is observed by a child (Profamilia 1995).

### B. Prostitution

Prostitution is considered a crime under Articles 308, 309, 311, and 312 of the Penal Code. In 1998, the Renacer Foundation estimated 30,000 Colombian boys and girls were engaged in prostitution. At the same time, the Foundation estimated that there were 90,000 sex workers in the country. The sex trade seems to be increasing in the past five years, particularly in the tourist areas and with minors. In the most recent government administrations, there has been a greater emphasis on efforts to combat situations, such as the sex trade, that are problematic to the community.

### C. Pornography and Erotica

Pornography possession and its use among adults are not crimes. Article 312 of the Penal Code does limit and penalize the circulation of pornographic material for minors under age 18 years. Pornographic movies can be seen or

rented with great ease in the cities. Pornographic magazines circulate all over the country. A 1999 survey by *Semana* shows that 48% of men and 35% of women think that pornographic movies and magazines make their sexual life more interesting. Regarding pornographic magazines, 13% of men and 3% of women reported having read one in the previous 30 days. It is also interesting to note that 16% of men and 44% of women had never read a pornographic magazine in their lives. As for pornographic movies, 21% of men and 6% of women confirmed having had seen a pornographic movie in the previous 30 days. Also, 14% of men and 39% of women stated that they had never seen a pornographic movie in their lives. In the large cities, live sexual shows are performed, but 65% of men and 85% of women claimed they had never seen one (*Semana* 1999).

The new digital media, Internet, and World Wide Web have also been affecting sexual relationships: 17% of men and 4% of women affirmed having visited a pornographic site on the Internet. Also, 14% of men and 4% of women admitted to having engaged in phone sex.

## 9. Contraception, Abortion, and Population Planning

GLORIA PENAGOS

### A. Contraception

Birth control, more commonly known as family planning, was introduced in Colombia in 1964. It was managed under the sponsorship of population and medical specialists. The objective was to improve the health of women and their children, to facilitate the growth of women in areas related to motherhood, and population control.

Although the majority of Colombians practice Catholicism, which prohibits the use of any type of artificial birth control, economic and social needs, marital instability, and constant changes in the family structure have led to the acknowledgment of the civil rights of all couples and their children. Thus, the contradiction between what is forbidden by the Catholic Church and what is practiced by the general public has led to an appreciation of the right to the enjoyment of sexuality without the burden of pregnancy. The majority of people continue to practice Catholicism without feeling the guilt put upon them by the Church regarding birth control. Close to three quarters of all women in a relationship, 72.2%, utilize some method of birth control. However, for every six women using birth control, only one man uses a contraceptive (Profamilia 1995). Table 2 shows a comparison of the use of birth control worldwide and the usage in Colombia in 1995.

The most commonly used methods of birth control are tubal ligation and vasectomy. Recently, Colombia's Social

Security System and medical service providers, the equivalent of Medicaid in the United States, now fund these procedures. In the past, they may not have been funded by the government out of deference to religious authorities rather than for economic reasons. Nonetheless, the cost of unwanted pregnancies and abortions reinforces the current position.

Oral contraceptives are the second most frequently used contraceptive method. According to Article 100 of the Social Security act, provision of oral contraception is mandatory. However, 70% of Colombians who use oral contraceptives obtained them through the private sector, whereas 30% obtained them through the public sector. This evident lack of active participation by the state would suggest that most families prefer to incorporate the cost of oral contraceptives into the family budget rather than rely on the government.

Colombia has several laws that protect the rights of women and children; however, implementation is often lacking. Family planning is viewed as an individual's right and an obligation of the state. The Constitution of 1991, Articles 17 through 30, denounces all forms of discrimination against women: "Women have civil rights as they pertain to reproduction and the judicial system equal to men in education, nationality, employment, health, matrimony and family." Two other articles deal with pregnancy and children:

- Article 42 stipulates that a couple has the right to freely and responsibly choose the number of children they will bear. They will provide and educate them while they are minors unable to provide for themselves.
- Article 43 states that men and women have equal rights and opportunities. A woman cannot be discriminated against. The law also protects a woman while pregnant and postpartum, and the state will provide financial assistance and food supplements should she be unemployed and/or homeless. The state will assist women who are heads of households.

The aforementioned legal structure allows us to reflect on how little the state is actually doing to defend the rights of individuals, and, in failing to acknowledge the discrimination, women suffer within Colombia's poorly organized health system.

### B. Teenage (Unmarried) Pregnancies

One out of every ten adolescents has had sexual relations between the ages of 13 and 14 years. Four out of every ten adolescents have had sexual relations between the ages of 15 and 17 years. Seven out of ten have had sexual relations by the time they reach the age of 18.

One out of every three adolescents believes that abortion is unacceptable; however, 70% feel that it may be necessary in certain situations. Sixty-two percent have had some discussion on sexually transmitted diseases and 95% understand that anyone can contract AIDS. The contraceptive methods most commonly used by adolescents are: the condom (94%), oral contraceptives (77%), and contraceptive suppositories (60%). The rhythm method is the least-used method (42%), which coincides with women's lack of awareness of their menstrual cycle (Profamilia 1995).

There has been an increase in birthrates among adolescents. This may be because of several factors: earlier onset of puberty, earlier onset of sexual activities, low socioeconomic levels, low levels of education, increased age for marriage, changes in value system because of urbanization, and the increased ability of communication.

According to a study conducted by the University of Colombia (Universidad Externado de Colombia 1992), one third of all women between the ages of 15 and 19 years, of

**Table 2**

**A Comparison of Birth Control Methods Used Worldwide and in Colombia (1995)**

Contraceptive Method	Worldwide Usage	Colombian Usage
Tubal ligation	13.0%	16.9%
Vasectomy	5.9	0.7
Vaginal suppository	1.0	1.0
Oral contraceptives	8.0	8.5
Intrauterine device (IUD)	9.0	7.4
Injectable contraceptives	1.0	1.8
Coitus interruptus	4.0	6.0
Rhythm	4.0	5.3
Condom	5.0	4.3

low educational level, and who had at least one child, were single, lived in an urban area, and were more fertile than their counterparts living in rural areas.

Profamilia (1995) reported that 17% of women between the ages of 15 and 19 years were mothers or were pregnant at the time of the study. At the age of 19, four out of every ten women surveyed were mothers and 9% already had at least one child. It was also reported that 33.6% did not utilize birth control because they believed that they were infertile. Ten percent of these women and 2.8% of their contemporaries are opposed to the use of birth control. Three percent were unfamiliar with birth control methods and 7.9% were afraid of the side effects. These results reflect the lack of adequate information, existing myths, unawareness, and a lack of responsibility in spite of knowing the consequences.

Pregnancy in adolescents brings with it many consequences, including compromised physical and mental health and both economic and social challenges, which affect the mother, father, and child, as well as the family and society as a whole. The education dropout rate in this population is very high, leading to limited employment opportunities. Children born of adolescents show a higher incidence of prematurity, lower birthweight, more congenital diseases, and a higher incidence of abandonment and abuse. It is estimated that about 10% of children of teenage mothers are given up for adoption (Pardo & Uriza 1991).

### C. Abortion

The actual incidence of abortion in Colombia is unknown. It is estimated that 24% of all pregnancies end in abortion and 26% result in unwanted pregnancies (Profamilia 1995). In a 1992 study, *The Incidence of Abortion in Colombia*, researchers at the Universidad Externado de Colombia found that 30% of urban women between the ages of 15 and 49 years had had at least one abortion, with the highest incidence among women between ages 20 and 29 years. In at least 78% of those cases, no birth control was utilized; the remaining 22% had used a birth control method that failed and resulted in pregnancy. There is a 22% incidence of abortion among women ages 45 to 49 years of age, and a 19.4% incidence of abortion among women ages 50 to 55. A third of the women surveyed reported that they had been pressured by their partners to abort.

Abortion is illegal in Colombia, and women go to health clinics much too late in the pregnancy when they show complications that cannot be resolved on their own. Complications are the most common reason for aborting, and abortion is the leading cause of death for Colombian women. There is an estimated 300,000 illegal abortions yearly. In other words, for every 10 births, there are four illegal abortions, and one out of every 100 women between the ages of 15 and 49 years old has had at least one abortion. The women most likely to abort are those who failed to use contraceptives.

The majority of families in Colombia are rooted in the traditional patriarchal family structure, based on economic, political, and religious power, which conditions women to utilize family planning methods. However, contraception should not be limited only to birth control. The meaning and implications of contraception should also include the significance, attitudes, and values people place on relationships, affection, and sexuality. These factors should take us beyond the stereotypes created by patriarchal gender roles, thus facilitating a better understanding of the individual, their health, and their relationships (Londoño 1996). In this extended meaning of contraception, it is necessary for women to acquire higher educational levels to attain better employment opportunities. They should be able to access better social security and health systems. The medical assis-

tance model should not be solely based on doctors and technology, but also on the premise of caring for one's self and gaining the knowledge women need to balance, preserve, and improve their health.

### D. Population Programs

Since the introduction of contraceptives in the mid-1960s, Colombia's population growth rate has decreased steadily. Between 1980 and 1995, Profamilia estimates the population growth rate decreased by 23%. On average, there were 7 children born per family in the 1960s. In early 2001, the average Colombian family has 2.8 children per family. However, the averages vary from region to region. In the mountainous regions, the average family size is 4.3 children. Education level also plays an important role in determining the number of children per family. On average, there are 5 children per family for women with no formal education versus 1.8 children per family for women with higher levels of education (Profamilia 1995).

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

JOSÉ MANUEL GONZÁLEZ and GLORIA PEGANOS  
*Incidence*

A true evaluation of the incidence of sexually transmitted diseases (STDs) is very difficult in any country, because the percentage of actual cases is considerably higher than the number of cases reported to health officials. In 1994, the Institute of Social Security found that 2% of Colombian males and 1.1% of females had some type of STD. The most common infections were gonorrhea, condylomas (warts), genital herpes, and syphilis. The majority of cases occurred in people between the ages of 15 and 44. Useche (1999) found that 4% of male students in high school reported some type of STD. Zuluaga and contributors (1991) found that 16.4% of male and 2.4% of female Mendellin University students had had some type of STD, the most common being gonorrhea and condylomas. Among university students from Baranquilla, González (1985) found that 13% of males and 1% of females had had some type of STD. In a follow-up study ten years later, González (1995) found that 12% of males and 2% of females had had some type of STD, with gonorrhea being the most prevalent. In the last few years, the incidence of STD cases has grown considerably. This is in part because of teenagers having sexual relations earlier than in previous times, teenagers having sex without protection, and cultural stereotypes that only sex workers can get STDs and not promiscuous men. When the increase in STDs is compared to the increase in the population, however, one can actually see a slight decrease in the overall percentage of STDs in the population.

*Papilloma and Condyloma Infections.* Although the actual incidence of STD infections is not known, there has been a large increase in the number of new diagnosed cases, in conjunction with other infections like gonorrhea, syphilis, nongonococcal urinary tract infections, trichomonas, and HIV. Ninety percent of the precancerous lesions in the uterine matrix test positive for the papilloma virus. Between 75% and 80% of the atypical cell cultures in women between the ages of 15 to 25 show infections of the human papilloma virus. Based on this, when tested, 40% of their partners are also infected by the disease.

*Gonococcal Infections.* Only 33% of acute cases of inflammatory pelvic disease (IPD or PID) test positive on the Tayer

Martin test, but this result is in direct relationship to the beginning of the infection and when the sample was taken. Half of the gonococcus-infected patients are asymptomatic and therefore can present the following complications: Asymptomatic tuboperitoneal factors result in infertility in 20 to 30% of patients, chronic pelvic inflammatory disease in 20 to 25%, chronic pelvic pain in 5 to 15%, ectopic pregnancies in 7%, and irregular menstrual cycles in 5%.

*Syphilis.* The number of congenital syphilis cases has decreased in Colombia. In 1998, the following number of cases were reported in Colombia by region. Costa Atlántica, 64; Amazonia, 25; Orinoquia, 21; Oriente, 193, including Boyacá, Cundinamarca, Santanderes, Tomolina, and Bogotá; and Occidente, 347, including Caldas, Antioquia, Chocó, Quindío, and Valle. Two cities in the Occidente must be highlighted: Antioquia with 99 cases and Valle with 149 cases. The incidence of reported cases of congenital syphilis is 36.6 cases per 100,000 live newborns (Ministerio de Salud 1998, 1999).

### Treatment

There are some formal programs available for the treatment of STDs. However, they are poorly organized and not fully developed as of early 2001.

## B. HIV/AIDS

JOSÉ MANUEL GONZÁLES and GLORIA PENAGOS

On January 5, 1983, a 23-year-old woman, a known prostitute, was hospitalized at the University Hospital of Cartagena. She died four months later. She was the first person to be officially diagnosed with AIDS in Colombia (González 2000). According to the Colombian Coalition Against AIDS, there are 200,000 people living with HIV (González et al. 2000). Every hour someone new is infected.

In 1997 and 1998, 81% of all reported cases were between the ages of 15 and 44 years (Ministerio de Salud 1998). Even though the group most at risk for contracting AIDS are adolescents, the general public continues to remain unaware of the dangers involved. Of households with children under the age of 18 years, 63.3% believe that they were not at risk of contracting HIV/AIDS. There was no discussion on AIDS prevention in 39% of households where there were minors under the age of 18 years.

According to the Colombian Ministry of Health, in 1986, there was one woman for every 47 men infected with HIV. In 1997, the ratio was one woman to four males. It was estimated that in 2001, the ratio will be 1:1. The risk among women is quite high and is believed to be related to the social inequity between men and woman. Women are kept at the subordinate level socially, by marital status, and economically, which contributes to their inability to adequately protect themselves. Consequently, religious beliefs that reject the use of condoms, anal sex at the insistence of the male, failing to acknowledge adultery for fear of being accused of infidelity, all these factors and other similar ones lead to an increase in HIV/AIDS-positive women (Penagos 1997).

Sexual contact constitutes the primary mode of transmitting HIV/AIDS (Ministerio de Salud 1998). For females, heterosexual contact accounted for 91.5% of cases of HIV infection, blood transfusions for 1.7%, and 6.8% became infected during delivery or perinatally. (No percentage was given for other modes of transmission, notably intravenous drug usage.) In men, 56.1% contracted HIV through heterosexual relations, 41.8% through homosexual/bisexual contact, perinatal transmission was 0.7%, and by transfusions were 1.4%.

One of the most important factors contributing towards the transmission of AIDS is the lack of adequate information. González (2000) conducted a study with university students, in which the following information was found:

- 95% of the students were unaware that anal penetration is the most high-risk sexual activity that may lead to the transmission of AIDS;
- 78.9% were unaware that it may take three months or more for an AIDS test to come up positive once a person is infected;
- 66.4% were unaware that it may take five to ten years to develop any AIDS-related symptoms;
- 48.1% were unaware that individuals may transmit HIV as quickly as they have acquired it; and
- 41.2% were unaware that semen is the body fluid that carries the highest concentration of HIV.

The study also found that 80.2% of men and 88.5% of women believe that there is a high risk of contracting AIDS while having unprotected sex with someone you do not know. Fifty-six percent of men and 66.9% of women believe that there is a high risk of contracting AIDS while having unprotected sex with an occasional partner; 14.8% of men and 16.1% of women believe that there is a high risk of contracting AIDS while having unprotected sex with a regular partner. As is evident, there is a popular misconception that AIDS can only be transmitted through unprotected sex with a one-time partner or an occasional partner. Consequently, people who are in new (exclusive) sexual relationships fail to practice safe sex. They do not take into account previous sexual partners nor have they taken an AIDS test (González et al. 2000).

Generally, there is minimal use of condoms. González and colleagues (2000) found that 33% of males and 53% of females have never used condoms during vaginal penetration. It was also reported that 48.4% of men and 63.2% of women never used condoms during anal sex.

The Colombian Constitution of 1991 enacted laws that protects the rights of all citizens. These laws stipulate that anyone living with HIV/AIDS, with or without financial means, can receive social security benefits. Although there exists budgeting and administrative problems that may delay the process, everyone has the fundamental right to medical care, psychological care, and pharmacological care. Generally, those individuals living with HIV/AIDS have access to antiviral medication.

On June 12, 1997, the Colombian Ministry of Health passed Decree #1543. It provides a standardized protocol for people with AIDS that indicates their rights and obligations. The protocol is as follows:

- Written consent from an individual is required in order to obtain an AIDS test.
- A healthcare provider or institution cannot deny care to someone diagnosed with HIV/AIDS.
- Comprehensive care must be provided: psychological, biological, and social.
- All records pertaining to patient care must remain confidential.
- Requesting an AIDS test to secure or maintain access in an educational facility, religious center, political group, cultural center, rehabilitation center, workplace, or health-related services, or to gain entry to a country is strictly prohibited.
- AIDS-test results may only be exchanged between patient and a qualified caregiver.
- Guaranteed job relocation when needed.

The decree also created CONASIDA (National Council on AIDS). It is comprised of the Ministry of Health, Ministry of Education, Ministry of Communication, Ministry of Employment, Colombian Institute of Family Wellness, National Institute of Health, Public Defendants, the Institute of Drug Administration and Regulations, ONUSIDA (AIDS Organization of the United Nations), representatives from nongovernmental organizations (ONGs), and advocates for AIDS victims. Generally, people who are living with AIDS are involved in political development and decision-making processes, as recommended by ONUSIDA. Presently, the ONGs are changing the image of AIDS from a "terminal disease" to a "treatable chronic disease."

AIDS-prevention programs and assistance to victims of AIDS are faced with serious financial problems. There have been government budget cuts since 1998. Additionally, discrimination and rejection of AIDS victims are two problems that must be addressed in health and sexuality.

[Update 2001: According to the CIA *World Factbook*, the estimated adult prevalence rate for HIV/AIDS in 1999 was 0.31%, with 71,000 Colombians living with HIV/AIDS and 1,700 deaths because of the infection. (End of update by R. T. Francoeur)]

[Update 2002: UNAIDS Epidemiological Assessment: The first AIDS case in Colombia was recorded in 1983. As of December 2001, the reported cumulative number of persons living with HIV/AIDS was 19,603. Of this total, 6,437 are AIDS cases and 13,166 are HIV cases; 84.6% are males and 15.4% are females. According to the National Statistics Administrative Department (DANE), there are 12,410 registered AIDS deaths, although only 3,645 AIDS deaths have been registered at the MOH; 807 of the DANE-registered deaths are among children younger than 15 years. National estimates of the total number of people living with HIV/AIDS vary from 139,000 to 148,000.

[Sexual transmission accounts for 78.0% of reported cases, mother-to-child transmission for 1.6%, and blood transmission for 0.6%. In 19% of registries, mode of transmission has not been recorded. Among those with known sexual transmission, 47.7% were heterosexual, 34.0% homosexual, and 28.2% bisexual. The annual male-to-female ratio has changed from 18:1 in 1986 to 4:1 in 2000. Of the total number of HIV infections reported, 44% were in persons aged 15 to 35 years.

[The first case of vertical transmission in Colombia was reported in 1987. Since then, 615 cases have been registered, with a sustained increase since 1995. Analysis of the regional data collected between 1990 and 1995, in conjunction with the results of five sentinel anonymous unlinked studies conducted between 1992 and 1999, indicates that there are important geographical differences in the predominant mode of HIV transmission through sexual contact. Injection drug users who have sex with men (IVISM contact) remains predominant in Bogotá and in the central western region; in these areas, men who have sex with men accounted for more than 50% of infections registered between 1990 and 1995, with a male-to-female ratio of 28:1 and 9:1, respectively. In the Caribbean and in the northeastern regions, HIV infection has spread mostly through heterosexual contact, with a male-to-female ratio of 2:7.1. The estimated prevalence among the adult general population is 0.37%. Sentinel studies have been conducted in a varied number of cities. The largest study, conducted in 1999 in 11 cities, among pregnant women, female sex workers, and STD patients, found HIV-prevalence rates of 0.2%, 0.6%, and 0.8%, respectively. In 1999, a study conducted in Bogotá among men who have sex with men showed an 18% HIV-prevalence rate.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	140,000 (rate: 0.4%)
Women ages 15-49:	20,000
Children ages 0-15:	4,000

[No estimate is available for the number of adults and children who died of AIDS during 2001.

[At the end of 2001, an estimated 21,000 Colombian children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

JOSÉ MANUEL GONZÁLES

Until the 1980s, sexual dysfunction was unknown as a health-related problem. Traditionally, treatments for sexual problems were seen as something unnecessary and even excessive. Generally, people who suffered from sexual dysfunctions failed to seek professional help because of embarrassment or guilt, even though, for more than 50 years, there have been private institutions in Colombia that provided sex therapy (González 1999c).

In the last five years, there has been an important change in the outlook on sexual dysfunction. The National Program on Sexual Education has generated a change in attitude towards sexuality and sexual health. There are now a few professionals who specialize in clinical sexology. An association of professional sex therapists has yet to be organized. In the next few years, there will be an increase in the quantity and quality of sex therapists because of the high demand for their services.

Dr. Rodríguez A. [*sic*] was the pioneer in sexual therapy in Colombia (González 1999c). He studied abroad in France, where he specialized in reflexology. In the late 1940s, he returned to Santafé de Bogotá, where he founded a clinic for sexual dysfunctions. He trained prostitutes in collaboratively assisting in his patients' treatments. This is what is now called sexual surrogates, or bodywork therapists. However, an animosity developed between Dr. Rodríguez A. and his colleagues that resulted in lawsuits and other legal problems. Consequently, Dr. Rodríguez A. closed his institute in Santafé de Bogotá (Guerrero 1997) and shortly thereafter opened a sexual therapy clinic in Fusagasuga. He died in the late 1970s.

In the late 1960s, a group of doctors and psychologists, including Heli Alzate, Cecilia Cardinal de Martin, Octavio Giraldo, and German Ortiz Umana, developed an interest in sexology and sexual therapy. In 1968, Heli Alzate offered the first formal courses in sexology to medical students attending the University of Caldas in Manizales. Octavio Giraldo offered courses in sexology to medical students at the University of El Valle. In 1971, Celcilia Cardinal de Martin and German Ortiz Umana offered coursework in sexology at the University of Rosario de Bogotá. José Manuel González initiated the coursework in sexology in the Metropolitan University of Barranquilla in 1976. Luis Dragunsky offered coursework on sexology at the University of Santo Tomas in Bogotá in 1977. During this time, the first texts on sexology were published: *Medical Sexology in Summation* (Alzate 1978), *Lectures in Sexology* (Dragunsky & González 1979), and *Exploration of Human Sexuality* (Giraldo 1981).

In May 1978, the Colombian Institute on the Development of Advanced Studies (ICFES) brought together a group of specialists to discuss and evaluate the state of sexology as a science: Heli Alzate, Cecilia Cardinal de Martin, Octavio Giraldo, José Manuel González, and German Ortiz Umana. They generated an important document,

which stated specific recommendations (ICFES 1978). As a result of this meeting, the participants felt a need to develop a committee that would coordinate the efforts and publicize the findings of studies that would support the development of sexology in Colombia.

One year later, the Colombian Association of Sexology was founded in June 1979. The original founders were: Heli Alzate, Maria Clara Arango, Mario Bedoya, Cecilia Cardinal de Martin, Luis Dragunsky, Mario Gartner, Octavio Giraldo, José Manuel Gonzáles, Maria Ladi Londoño, Saulo Munoz, German Ortiz Umana, Francisco Sanchez, and Jorge Villarreal Mejia. The elected president was Heli Alzate. As a consequence, sex therapy has developed its own niche in the larger cities. The group in Manizales has generated the most investigations and published internationally. The Cali group, with Octavio Giraldo, Mari Ladi Londoño, Javier Murillo, Diego Arbelaez, Nelssy Bonilla, Monica Lozada, and other colleagues, has been most active in advocating for the rights of minorities and the oppressed: women and homosexuals. Two other active groups, in Bogotá, Medellín, have pioneered in the treatment of premature ejaculation, erectile problems, patients suffering from various psychosexual dysfunctions, prolonging the pleasure phase, transsexuals, and interesting ways of dealing with infertile couples (Acuña et al. 1997).

Sex therapy in Colombia is marked by several characteristics (González 1999c):

- It is interdisciplinary, although most of the professionals in the field are also trained in the medical or psychological fields.
- It originates mostly from behavioral psychology, cognitive psychology, and human development, with little basis in psychotherapy.
- It provides advocacy for the rights of minority groups and oppressed groups, specifically homosexuals and lesbians.
- Private practice and college coursework solely dedicated to sex therapy is nonexistent. Most sex therapists have maintained their origins in psychology and/or medicine.
- There is an absence of formal training for sex therapists. In 1983, Luis Dragunsky and José Manuel Gonzáles founded the first accrediting committee, the Colombian Association of Sexology (CAS). Only five sex therapists have been accredited by CAS and very few Colombian sex therapists are accredited by the Latin American Federation of Sexological Societies and Sexual Education (FLASSES).
- There is extensive coverage by the mass media.

There has been active participation by most sex therapists in the events sponsored by the Colombian Association of Sexology.

## 12. Sex Research and Advanced Professional Education

BERNARDO USECHE

Generally, scientific studies in Colombia are very scarce and poorly funded. In 1999, the total budget earmarked by Colciencias, a government body responsible for all studies conducted in Colombia, was approximately US\$6,000,000. Only recently have there been doctoral programs in the basic sciences. However, there are no doctoral programs offered in disciplines that could directly contribute towards the study of sexology, such as physiology, anthropology, psychology, or sociology. It is in this context that we must understand the limited development of the study of human sexuality in Colombia.

In recent years, Abel Martinez of the University of Pedagogy and Technology of Tunja has specialized in the study of *Colombian Sexual Archeology* (unpublished). He presents a poetic description of sexuality during the Spanish Conquest, colonization, independence, and the beginning of the Republic. The study of the mythology of the aborigines and the key role the erotic played in the blending of the races is evident throughout his work. In *Daughters, Wives and Lovers*, anthropologist Suzy Bermudez discusses the same timeframe covered by Abel Martinez, the Spanish Conquest to the Republic. However, she took a feminist perspective, dealing with native women, European women, African slave women, married women, widows, and single women. Although it was not her main objective, Bermudez attempted to clarify how social class, ethnicity, and age play an important role in understanding the history of women's sexuality in Colombia.

In the second half of the 20th century, Virginia Gutierrez de Pineda (1975) led an important anthropological investigation that set the foundation for the comprehension of human sexuality for Colombians. In her analysis and classification of the various cultural elements that correspond to the different regions of Colombia, Gutierrez explained the logic behind the different types of marriages and polygamy, and the significance of prostitution and homosexuality thought to be tolerated but tacitly encouraged by religious subcultures in hopes of preserving young women's virginity and protecting the institution of matrimony. Her description of families in the second half of the 20th century is considered to be a key reference for anyone wanting to study the changes in the sexuality of Colombians at the end of the century.

Heli Alzate, another pioneer of sexology in Latin America, developed an extensive and rigorous curriculum for the School of Medicine at the University of Caldas. He also published four books and numerous scientific articles in North American and European publications. A member of the editorial committee of the *Archives of Sexual Behavior* for a quarter century, Alzate has theorized a conceptual model of the function of erotica and completed three studies pertaining to sexuality:

1. Evaluation of a curriculum pertaining to sexuality (Alzate 1990);
2. Sexual behavior of secondary-level students and university-level students (Alzate 1989; Useche, Alzate, & Villegas 1990; Alzate & Villegas 1994); and
3. Studies pertaining to vaginal erogeneity (Alzate 1985; Alzate & Hoch 1986; Alzate, Useche, & Villegas 1989).

Alzate also evaluated the knowledge and sexual attitudes of his medical students with an adapted version of the Sexual Knowledge and Attitude Test, or SKAT, originally formulated by Harold Lief. Later results from his modified SKAT, or ACSEX, indicated that it is possible to impart scientific knowledge and achieve a positive attitude towards sexuality utilizing coursework in sexology, audiovisual media, and active class participation from medical students.

The studies of the sexual behavior of the younger generation with secondary- or university-level education in one of the most traditional and conservative areas of Colombian culture give a fair picture of the evolution of Colombian sexuality in the past quarter-century, the incidence of first sexual encounters, the motives behind sexual activity, the types of couples, and, above all, the differences in sexual behaviors between genders.

Of particular interest, in view of the significant growth of the women's liberation movement in recent years in Colombia, are several studies on the erogenous zones of the vagina. According to these studies, the majority of women,

if not all, have vaginal erogenous zones, frequently located in the anterior vaginal wall, which, if stimulated appropriately, will culminate in orgasm. Colombian researchers consider this a vital factor in the context of normal sexuality of the woman and also as important in the treatment of coital dysfunctions of women. Alzate believes that the theories, that have thus far been conceptualized to explain these sexual dysfunctions, should be revised. He also believes that sex therapists who are confronted with these issues should recognize the necessity of referring clients for gynecological exams so as to locate their erogenous zones (Alzate 1997b). Alzate also introduced modifications of the human sexuality functioning model originally proposed by William Masters and Virginia Johnson and later enriched by Helen Singer Kaplan. Alzate's premise was to "seek out and responsibly enjoy pleasure." Presently, there are no other systemic studies by Colombians in the field of sexology other than those provided by Alzate.

At the international level, publications by Colombians in the area of human sexuality are very scarce, almost nonexistent. However, there have been other unpublished works that originated in Colombia. Florence Thomas's 1994 *Dissertation on Love and Communication* analyzed communications from a gender perspective, and Guillermo Carvajal (1993) completed a psychoanalytic vision of the adolescent. Pedro Guerrero (1985) led a study on the use of erotica in literature by some of the most prominent writers in Colombia, and Maria Ladi Londoño has published numerous articles dealing with sexuality and reproductive rights. In a recent study, also of note, is Ruben Ardila's 1998 study of 100 male homosexuals, which found that, generally, these individuals did not have serious adaptation problems, nor did they seem to suffer from adjustment issues.

The *Latin American Journal on Sexology of Colombia* (ISSN 0120-7458), with a base in Colombia, serves as the medium for the Latin American Federation of Sexological Societies and Sexual Education (FLASSES).

The Colombian Society of Sexology, founded in 1979, has organized ten congress meetings, several seminars, and other academic events. These have involved world-renowned researchers, among others, Eli Coleman, John Money, Ira Reiss, Eusebio Rubio, Luis Dragunsky, Joseph LoPiccolo, Andres Flores Colombino, and Ruben Hernandez.

Other sexological studies in Colombia have been conducted by students in their postgraduate studies. These are generally non-funded and usually remain unpublished. Some of these studies have originated from the University of Bogotá (Bodner et al. 1999), University Simon Bolivar of Barranquilla (González 1999b; González et al. 2000), and the University of Caldas in Manizales (Useche 1999). Since the Ministry of Education established the National Project on Sexual Education in 1993, there has been a significant increase in the need for these studies. Private universities have thus developed them.

In terms of the future, we hope that the small group of dedicated and diverse Colombian professionals interested in sexological issues will be able to continue their work with sexological organizations and individuals around the world, and thereby contribute to a more solid and in-depth understanding of human sexuality, if the economic crisis in Colombia allows.

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

#### A. Demographics

This Central American country lies between Nicaragua and the Lake of Nicaragua to the north and Panama to the south. Its area of 19,730 square miles (51,100 km<sup>2</sup>) slightly exceeds that of the combined states of Vermont and New Hampshire in the U.S. Its western border is the North Pacific Ocean with a narrow Pacific coastal region. About 300 miles (480 km) offshore, the 10-square-mile (26-km<sup>2</sup>) Cocos Island is under Costa Rican sovereignty. The Caribbean Sea marks Costa Rica's eastern border.

Costa Rica's climate is tropical and subtropical, with a dry season from December to April and a rainy season from May to November. A cooler climate prevails in the highlands. Costa Rica's terrain consists of narrow coastal plains separated by rugged mountains. The country has four volcanoes, two of them active, which rise near the capital of San José in the center of the country. One of the volcanoes, Irazu, had a destructive eruption in 1963-1965.

In July 2002, Costa Rica had an estimated population of 4,008 million (1,969,680 females and 2,038,585 males). (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 30.8% with 1.05 male(s) per female (sex ratio); *15-64 years:* 63.9% with 1.02 male(s) per female; *65 years and over:* 5.3% with 0.87 male(s) per female; *Total population sex ratio:* 1.02 male(s) to 1 female

**Life Expectancy at Birth:** *Total Population:* 77.7 years; *male:* 75.6 years; *female:* 79.9 years

**Urban/Rural Distribution:** 50% to 50%

**Ethnic Distribution:** white (including *mestizo*): 96.5%; black: 1.9%; Amerindian: 1.3%; Chinese: 0.2%

**Religious Distribution:** Roman Catholic: 76.3%, Evangelical: 13.7%; Jehovah's Witnesses 1.3%, other: 4.8%; none: 3.2%

(CIA 2002)

**Birth Rate:** 21.4 births per 1,000 population

**Death Rate:** 4.1 per 1,000 population

**Infant Mortality Rate:** 10.8 deaths per 1,000 live births

**Net Migration Rate:** -0.52 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.42 children born per woman

**Population Growth Rate:** 1.61%

**HIV/AIDS** (1999 est.): *Adult prevalence:* 0.54%; *Persons living with HIV/AIDS:* 12,000; *Deaths:* 750. (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (defined as those age 15 and over who can read and write): 95.5% (education is free and compulsory from age 6 to 15)

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$8,500 (2001 est.); *Inflation:* 12.1% (2002 est.); *Unemployment:* 5.2% (2002 est.); *Living below the poverty line:* 20.6% (1999 est.)

#### B. A Brief Historical Perspective

Costa Rica was inhabited by an estimated 25,000 Guaymi Indians when Columbus explored it in 1502. Few of the indigenous people survived the Spanish conquest, which began in 1563. The region grew slowly and was administered as a Spanish province. Costa Rica achieved independence in 1821, but was absorbed for two years by Agustín de Iturbide in his Mexican empire. Costa Rica seceded from the Central American Federation in 1838 and became a republic in 1848. Except for the military dictatorship of Tomás Guardia from 1870 to 1882, Costa Rica has enjoyed one of the most democratic governments in Latin America. Since the civil war of 1948 and 1949, there has been little social conflict and free political institutions have been preserved. The presidency of Rodrigo Carazo Odio (1978-1986) was marked by a disastrous decline in the economy. Oscar Arias Sanchez, who became president in 1986, prevented the neighboring Nicaraguan Contra rebels from using Costa Rican territory as a safe haven, and played a central role in negotiating settlements in both the Nicaraguan and the Salvadoran civil wars. He was awarded the Nobel Peace Prize in 1987. During 1993, there was an unusual wave of kidnappings and hostage-taking, some of it related to the international cocaine trade. José María Figueres Olsen of the National Liberation Party be-

\**Communications:* Anna Arroba, M.A., Apt. 583-2050, San Pedro Montes de Oca, Costa Rica; [aarroba@cariari.ucr.ac.cr](mailto:aarroba@cariari.ucr.ac.cr). Research for this chapter was provided by Laura Fuentes Belgrave, B.A.

came president in 1994. He favored greater government intervention in the economy and other measures that the International Monetary Fund was unhappy about. As a result, the World Bank withheld \$100 million of financing. In 1998, Miguel Angel Rodriguez of the Social Christian Unity Party became president. A border dispute with Nicaragua has threatened Costa Rica's tourism industry in the ecologically rich San Juan River area.

Costa Rica has achieved a relatively high standard of living in comparison to the rest of the Central American countries. Its economy is based on tourism, foreign investment, and agriculture. The country is noted for its political stability, and for its relative investment in health and in education and not in maintaining an army. However, as studies show, during the last 20 years, there has developed a large gap in income between one sector of the population who live at first-world standards (levels of consumption, private bilingual education, travel, etc), and other sectors with diminishing capacities to purchase even the bare necessities.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

The situation of women's sexualities in this small country reflects some unique and particular traits in the national gender social arrangements, and it also reflects larger universal trends, which affect women individually and collectively. Unlike the rest of the Central American countries that have suffered revolutions, invasions, genocide, civil war, and natural disasters, this country has had the freedom and time to develop a women's movement, with its accompanying gender studies and theories, which in varied ways have been put into practice in different areas of the law, such as women's rights, women's studies at a graduate level, and so on. This concerted effort has had positive results. Domestic and sexual violence in all its multifaceted aspects has not only been made visible, but is being fought through a national program of prevention of violence. As a result of many years of work with lawyers, judges, and doctors, nowadays, men who rape or engage in sex with their own children or other children are sent to jail for 12 years or more. In March of 2003, an Evangelical pastor was sentenced to 61 years for repeatedly abusing a 12-year-old girl. Likewise, women's sexual and reproductive health and rights, after the world congresses in Cairo and Beijing, are on the agendas of some women's organizations and some state institutions, with projects mainly directed at young adolescent women. Progress is being made, with the creation of a National Committee on Reproductive and Sexual Health and Rights and with changes in the attention women receive in health centers, to name just a few. This is not to say that there has not been opposition, mainly from doctors, lawyers, and the Church.

These significant steps, however, must be understood in the larger context. This small country, with a "democratic" and non-military tradition, during the 1980s and early 1990s served, on the one hand, as a springboard for U.S. activities (cultural and political) throughout Central America and, on the other, as an exemplary exception, which had to be kept free of the region's endemic contamination—political upheaval. The "Americanization," or more specifically, the "Miamiification," with American influences arriving via the Cuban community in Miami, Florida, has seen the proliferation of U.S. education, products of all types, movies, cable television, and magazines, as well as U.S.-style gyms and diet or aesthetic centers, shopping malls, pornography, sex shops, and cosmetic surgery.

The body culture of this society has been affected by globalization and has undergone drastic changes in the last

20 years. The increasing secularization, where the control of women by fathers and husbands, as well as by social institutions, like the Church, has changed. The control of women's virginity, marriageability, and reproduction has loosened and has been supplanted by an emphasis on women's control of their bodies—their appearance and shape. Anorexia and bulimia are problems particularly among middle-class female adolescents. The fast turnover of women's images, through ads, pornography, and movies, emphasizing parts of the nearly always-white bodies, has also affected men's attitudes towards women and towards their own physicality and sexuality, and how they think about women.

The globalization process has deepened the differences between the rich and the poor. Since 1979, half a million Nicaraguans, 70% female, have fled the hunger and unemployment in their country, and have made Costa Rica their home. The thriving tourist industry, Costa Rica's principal income, has stimulated the prostitution and pornography industries; children are for sale to older men. At the same time, Costa Rica has become an international center for cosmetic surgery. White and slim are the models that surround us in the ads, medical pamphlets, and television. Many women and some men come to Costa Rica, principally from the United States and some from Europe, to undergo cosmetic surgery, because it is cheaper than at home.

As for sex, it would be erroneous to talk about a sexual culture in terms of "Costa Ricans do this or that . . ." as a national characteristic, or even to say that some women are liberated, others not. What becomes clear after working with hundreds of women from different social backgrounds are the common elements, such as ignorance, silence, and helplessness that color their experience, regardless of social class or religion. It is sad, though familiar, to hear women admit to faking orgasms; but it is painful to hear them admit to not knowing what an orgasm is, and even worse, to not knowing what a clitoris is—or to hear peasant women say, "My husband uses me twice or three times a week."

We could attribute this to poverty and a Third-World mentality, but this is a too-narrow perspective. Most women are ignorant about sex and their sexuality, and in particular, about their bodies, in all cultures that I know. Here, it is relevant to understand that we are talking about two very distinct but articulated worlds that exist in most nations: First and Third worlds, separated not by North/South, developed/undeveloped—but by gender constructions predicated on class differences, on maintaining power inequalities between women and men, and on the perpetuation of the "undevelopment" of all women. Ignorance about the body and sex, invisibility of the diversity of preferences and lifestyles, violence in its multifaceted forms, poverty, pornography, and so on, all contribute to maintaining women in an undeveloped status and mentality.

The situation of men's sexuality, compared with women's, reflects some unique and particular traits, as well as larger, universal trends. In the last eight years, research on the behavior of specific groups of men has initiated a process of deconstruction of the mythical, monolithic, universal male. Latin American masculinity has been conflated with *machismo*, something that is seen as particular to Latin men, hence the idea of the Latin lover, but also the idea that all Latin American men are *machistas*, and what is more, much more *machistas* than, let's say, North American or British men.

When we step out of the realm of stereotype and begin to decipher and interpret reality, in this case, the reality of how men live their sexuality in Costa Rica, we begin to detect a reality colored by ignorance, silence, and compulsion. Compulsion here denotes obligation, a performance pressure.

Men have the obligation to demonstrate their “masculinity” at all times, at work, in public, when courting, in bed. They have learned to push, cajole, and manipulate in order to get what they want sexually. This, in feminist terms, is one of the components of sexism, another word for *machismo*. *Machismo*, as defined by an 18-year-old Costa Rican youth is “men’s fear that women will surpass them.” As defined by a university professor, it is “a complex of strategies aimed at keeping male control of power resources regarding women; it is a set of beliefs and practices regarding men’s superiority over women.”

The cultural particularities of this type of sexism has different manifestations and clear guiding principles. The following are phrases from men of varying social backgrounds in a men’s support group: men are unfaithful by nature; men are polygamous by nature; it is genetic; men have the right to every female; the penis has a life and personality of its own; men have to show women about sexuality; it is a man’s job to please women sexually; and so on. Some married men have lovers. Some men have more than one, maybe two, three, or even four lovers at a time. These relationships vary in intensity and significance. Some men have additional families.

The male’s need to demonstrate his manhood is done through the constant acting out of an active sexuality, where he proves that “it can work” and that he “does it very well.” Women, on the other hand, according to these men, should be passive and ignorant. The reduction of male sexuality to a functioning virile organ precludes pleasure and sensuality and other erotic stimulants. Sex is about penetration, and all rituals—dining out, wine, and candles—that are a buildup for intercourse. If it does not take place, men are disappointed and feel that they have failed. When asked when they felt they had become men, many answered, when they first “penetrated” a woman. Only a few years ago, it was a custom for young men to be taken by their fathers to visit prostitutes in order to have their first experience of intercourse, and consequently, become a man.

It is not surprising that men live their sexuality with stress, pain, and anguish. Male sexuality, like that of women, is predicated on ignorance. Men are ignorant about their bodies and their genitals, and needless to say, they are ignorant about women’s bodies and genitals. At the same time, they feel threatened and “feminized” by ideas that point to erotic pleasure, to communication and sensuality. And they also feel threatened when asked to take responsibility for their sexuality, when asked to use the condom, for example.

In Madrigal’s 1998 study of sexual behavior of truck and trailer drivers in Central America—Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama—we find a group of men who travel from country to country, are absent from their homes and families for long periods of time, and who habitually have sexual relations with sex workers—sometimes with transvestites or with homosexuals—in the border towns of all the countries. Their truck, particularly the cabin, becomes a second home, where they keep their things, sleep, and have sexual relations. A second family is formed by becoming friends with the prostitutes. Often sex workers are picked up at one border and dropped off at the next, where they, in turn, pick up another trailer driver. Commercial sex is mobile, and they compare themselves to sailors: “To be a trailer driver is like being a sailor: The sailor has a love in every port, the trailer driver in each customs town.” Infidelity by their wives or partners is not tolerated, but they justify their own infidelity by saying, “it is men’s right,” “men never stop having sexual relations,” “it is natural in men,” or “it is impossible to hold on for 15 days,” and so on.

But sexual pleasure is not a bilateral event. A 1992 study found that two out of five women had never experienced or-

gasm. Foreplay is rare; sex is equated with intercourse, and this, says sexologist Mauro Fernandez, seldom lasts more than two or three minutes. Premature ejaculation is a problem for 70% of sexually active Costa Rican men.

A 1992 survey by *La Republica* newspaper revealed that 87% of married and cohabiting women in a sample survey said they had been unfaithful before the age of 45. Two out of every five wives or widows over age 60 reported having had extramarital affairs at some time in the past. Most of these women, however, reported only a few instances of extramarital sex, which usually occurred, they said, because they did not feel loved or valued.

## B. Current Family Patterns and Gender Roles

Until the late 1960s, the demands of farm life encouraged Costa Ricans to have large families. After living conditions improved and government health programs provided prenatal care, the birthrate reached a world high in 1960, 55.4 births per 1,000 population. Then, a phenomenon occurred that intrigued population experts: the birthrate dropped to 29.5 per 1,000 in 1975. Costa Rica is the only Latin American country—and one of very few in the world—in which the birthrate has fallen so sharply. The 25% drop between 1960 and 1968 occurred despite Church and state opposition to birth control. Since the 1970s, however, the government has promoted family planning.

The “family” in Costa Rica is a very important institution, and it is the center of people’s lives. They have been close exclusive units with extended close kinship networks, where relatives gather on important events. Nowadays, although many people strive to create secure families, there have been many social changes that have affected and changed the traditional family unit. Families are smaller, many women work outside of the home, many children have migrated to other countries, and there are more divorces and many single-parent households, particularly single mothers. In an effort to recognize the reality of women’s situation, in the process of the feminization of poverty, many feminist scholars began to change the concept to “families,” as a way of deconstructing the monolithic, naturalizing, all-encompassing concept of nuclear families—parents and their unmarried children—that made up 53% of all Costa Rican households in 1996. In four out of five of these families, the parents were married; the rest cohabited in *unión libre*, “free union,” a legally recognized relationship. Female-headed households, mostly single mothers and their unmarried children—and often their daughter’s children as well—accounted for 20% of all households. Couples without children and one-person households, mostly among the elderly, accounted for about 12%. The remaining 15% were extended-family households—couples living with at least one of their children and one or more grandchildren or other relatives. Many free unions are as stable as marriages; they are sometimes called *matrimonios de hecho—de facto* marriages. Recognizing this fact, a 1995 law gives cohabiters exactly the same rights and obligations as married couples, including “divorce” after three years with accompanying provisions for child support and division of property.

Vestiges of older gender roles are reflected in the many popular songs that depict women as willing to sacrifice everything for a man’s love. But women are increasingly challenging double standards, as did the Costa Rican suffragists before 1949. A revived women’s movement has flourished since the 1980s, when poverty, which especially affects women and children, began to increase. By 1993, some 40 well-established feminist groups existed, with goals ranging from bank credit for women to the eradication of domestic violence and gender stereotypes in schooling—

the Law Against Domestic Violence was established in 1996. Of over 180 delegations to the Fifth International Women's Conference in Beijing in 1995, Costa Rica's was one of only ten that approved the proposed platform for action without reservations.

Males increasingly have had to accept changes in gender roles. Many more fathers play with their children. Government now expresses support for gender equality. The 1990 Law for Promotion of the Social Equality of Women applies to many areas of life, ranging from political party caucuses to images used in advertisements. Violations of antidiscrimination laws are frequent. In 2002, the Law of Paternity was created to make men economically responsible for the children they engender; their DNA is tested when they contest or deny paternity.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

Costa Rica is one of the few nations in the world with an official religion: Roman Catholicism. Thus, the public education system includes religious instruction for all students. All Costa Ricans contribute through their taxes to the salaries of the clergymen. The Church is represented at all official government functions and there is no aspect of national life that is not influenced by it. Most Costa Ricans are baptized, married, and blessed before interment by Catholic priests. Crucifixes and saints' pictures are prominent in homes, schools, government offices, and motor vehicles. Shrines to the Virgin are common in public buildings, parks, and front yards. All this expresses, if not a religious practice, definitely, a deeply imbedded cultural practice.

Some four out of five Costa Ricans say they are Catholic. But their Catholicism has long been blended with indigenous, occult, and secular beliefs and practices. The Catholic majority is still reluctant to accept many Church doctrines. Many do not believe in an afterlife and have no qualms about practicing contraception or consulting witches and fortune-tellers. As school enrollment has grown, both the number and the percentage of children who receive the two weekly catechism lessons has also increased. Confirmation takes place around age 15. Many Costa Ricans consider classes in Catholic doctrine essential to the formation of the "Costa Rican character."

The 1949 Constitution retained the 1871 constitutional provision that "neither clergy nor laymen may make political propaganda of any sort by invoking religious motives or by taking advantage of religious belief." But clergy can exert political influence in other ways. Padre Benjamin Nuñez was active in the PLN (Partido Liberación Nacional) until his death in 1994. He had also been "married" two times and had children. However, the Church is very actively involved in the gender politics of the country, a politics that goes beyond political parties. One writer charges that the Catholic Church has become "a State within a State," the fourth power of the government. He regards its official status as a violation of the liberty of conscience supposedly guaranteed by the Constitution. Thanks to government policies since the 1940s and to the clergy's "constant reprimands, admonitions and social pressures on the members of the three powers of the Republic," its power is evident in all aspects of public life.

The Church has the power of veto in many public and private decisions. When a group of lesbians tried to organize an international conference in the country in 1990, the Church reprimanded the government for having given permission to the organizers, and public opinion was stirred up against the event. The minister of justice declared that for-

eign participants would be prohibited from entering the country, adding that lesbians are easy to recognize. The jokes in the press said that he had created a 'lesbometer.'

To date, the Costa Rican government has been unable to teach sex education in high schools. The Catholic Church has rejected the instruction manuals prepared for this purpose by the Ministry of Education, arguing that the texts contained "moral irregularities." The Church demanded changes be made, insisting on their own blueprint of sex education, which is opposed to premarital sex, non-reproductive sexual practices, abortions, most family planning methods including the condom, and respect for sexual diversity. It also includes an open and hostile rejection of feminism and gender theories.

In 1998, during the administration of President Miguel Angel Rodríguez, a project named Amor Joven (Young Love) was created by the INAMU (National Institute of Women's Affairs) and by the First Lady, Lorena Clare. This project followed the guidelines of the Cairo+5 proposals, and was aimed at working women and empowering adolescent mothers by preparing them from a human rights and gender perspective for a sexuality based on knowledge and negotiation. The Church hierarchies denounced the project, and for many months all priests were instructed to denounce and criticize it from their pulpits. The Church said that the project was immoral and that it would induce the youngsters to promiscuous behavior. As the Church was on the Board of this government project, they wielded considerable political clout. If the government insisted in executing the project as it stood, the Church would persuade the public to go against the government. The Church changed the project by eliminating words, such as, gender, sex, vagina, penis, self-determination, and autonomy. The project died from asphyxia.

In 1998, a group of women's NGOs, together with the Ombudswoman and the then-Vice Minister of Health, Dr. Xenia Carvajal, organized and managed to put enough pressure on the Doctor's Association of Costa Rica, which until then, made all decisions regarding sterilizations, abortions, and other sexual and reproductive matters. The demand was that these decisions should not be made by an exclusive group, but by an interdisciplinary and interinstitutional group. A committee was created, which includes members of NGOs, universities, and government institutions, as well as international organizations in the country. As a result, a decree was promulgated that declared it the right of every woman to be sterilized on demand. The Church's reaction was extreme, as was that of a certain conservative public, and it retaliated by going along with the decree on the condition that a Day of the Unborn be created in the country—July 27 is that day. All this reinforces the pro-life movement and Opus Dei, the extreme conservative wing of the Catholic Church.

How Catholicism is practiced varies greatly among the population. Some speak of having "blind faith"; young urbanites deny any religious belief. Most people fall somewhere in between, practicing their religion "their way," following a marked cultural pattern of individualism, a highly personal, syncretic approach to religion. Many Catholics question the authority of the clergy, particularly after the snowball effect regarding the sexual abuse of young boys and girls by priests, which became public and visible in the United States, and which also broke the silence of abuse in this culture. Many Costa Ricans insist on freedom to decide for themselves how many children they should have: "If the *padre* wants me to have more, let *him* feed them." A young, newly married *campesino* (farmer) told us, "The pope preaches that birth control is a sin, but I think he's mistaken in that." (Biesanz).

Likewise, many priests are tired of hearing bishops urge moral reform and charity, as well as more preaching of the

gospels, as the only solutions to poverty and other social ills. Many of these priests are active in community projects.

Many Catholics have become disillusioned with their Church and have sought alternative practices, mainly in Protestant Evangelical churches, which abound in the country. This is a worldwide phenomenon, which has forced the Vatican to renovate their zeal and direct their attention at specific topics, such as, sexuality, birth control, abortion, feminism and gender theories, and homosexuality—all the crucial points fought for by feminists in the Cairo and Beijing Conferences. At the same time, Church authorities have directed their attention to the governments of Catholic countries, and put pressure directly there.

It is interesting and fearful to see how this works in this culture. Before the Cairo+5 meeting in The Hague in 1999, a Vatican official made personal calls to different government ministers, insisting that Costa Rica adhere to the Vatican guideline in the official presentation in The Hague. To this date, this direct pressure from the Vatican has not produced anyone with the strength to tell the Church to keep out of its business. Fear of losing power and voters has made some Protestant presidents convert to Catholicism. One Vatican tactic was to invade the Beijing+5 conference in New York in 2000, with barefooted monks in subtle colored habits, which forced many of the participants to meet clandestinely. Another Vatican tactic is to invite all the presidents in the region, including some ministers, congresspersons, and their wives, to an audience with the Pope himself. The spell of obedience is cast, the conservative wing of the Church is vindicated, and the work towards change becomes even harder.

### **B. Source and Character of Ethnic Values**

Costa Rican Indians have never been a homogeneous group. The 400,000 or so aborigines living in the area in 1502 belonged to many societies, distinct both politically and culturally. Today's 30,000 Indians—about 1% of Costa Rica's population—include members of the Bribri, Huetar, and Talamanca cultures. Almost all live as subsistence farmers in 75 communities within the 22 officially designated Indian reserves, which compose about 6% of the national territory.

The fertility of Indian women is higher than the rest of the female population, with an average of 4.1 children, whereas, other women in the country have an average of 2.7. The organization by age and sex shows that this population is younger than the rest of the country. The percentage of people younger than 15 years of age is 46%, and those over 65 years only 3.7%, in contrast to the rest of the country which is at 5.6%. Illiteracy is high—the average attendance at school in the reserves is 3.6 years; in some areas, it is less than one year. Three quarters of the indigenous peoples live in dispersed rural reserves. There are no investigations about the sexuality of the Indian or the black communities.

### *3. Knowledge and Education about Sexuality*

As noted earlier, there is no sex education in Costa Rica, and there is no national policy for sexual education. The Ministry of Education is supposed to be in charge of sexual education, and although they have elaborated a conceptual document of what sexual education should contain, it has not materialized. The Church is the biggest opposition to sexual education, insisting that it should be the task of parents to educate, and to promote abstinence. The Ministry of Health also has a document about sexual education; the Faculty of Education in the University of Education has an Office of Sexual Education and a full-time professor in charge. All this with no evidence of sexual education.

### *4. Autoerotic Behaviors and Patterns*

No information is available.

### *5. Interpersonal Heterosexual Behaviors*

#### **A/B. Adolescents and Adults**

##### *Male and Female Sexuality*

The subject of human sexuality has only become evident in Costa Rica during the last ten years. This is in part because of the introduction of sexology by sexologists, to the high incidence of teen pregnancies, to the HIV/AIDs epidemic, to the introduction of gender theories and studies, and most of all, to the process of globalization and the influence of North American and European immigrants. Sexuality has been analyzed from the standpoint of the problematic consequences it has on women, and, mainly in women's magazines and journals, on how to achieve more pleasure and more orgasms. Heterosexuality as a patriarchal institution has come under scrutiny in the Woman's Studies master's program in the University of Costa Rica, and in some NGOs.

On the other hand, government projects directed at poor young women center their discourses on the sexuality of young adolescent women and on the prevention of unwanted pregnancies. Meanwhile, popular magazines dealing with sexual enhancement concentrate on male coital pleasure and ignore information that could make women the protagonists of their own sexuality. Sexual pleasure as a right is not the objective. In the case of poor women, the problem of unwanted pregnancy is frequently seen as the woman's problem only, and the men responsible disappear and are invisibilized. Women's sexuality is represented as being the cause of the problem.

##### *Negotiating Safe and/or Pleasurable Sex*

In one study of sexual behavior and expectations in relation to pregnancy prevention and family planning, Schifter and Madrigal (1996) compared a poor coastal community characterized by poverty, unemployment, and female-headed families with urban, middle-class, young women and men from stable two-parent homes.

In the poor coastal community studies by Schifter and Madrigal, the young daughters learn about sexuality from romantic or religious sources—pure and unblemished love, fidelity in marriage, and virginity before marriage. The sons, also influenced by these discourses, learn from gender discourses and from erotic literature, and concentrate more on pleasure. However, both sexes aspire to happiness in marriage and to saving their virginity for marriage. The young women clearly expressed themselves in terms of getting a man, of marrying, and of having a “normal” family, the romantic heterosexual script predominating. At the same time, in the face of a harsh reality, their bodies are the only means for obtaining recognition and pleasure. It is not surprising, say the authors, that these youngsters experiment with varied sexual practices from an early age, such as bestiality, group sex, sadomasochism, anal, and oral sex.

Despite defending the religious conceptions about sexuality, the consequences of their lack of alternatives are the contradictions between what they say and what they practice. Poverty makes the romantic ideal of marriage a material impossibility, and not having access to other status symbols, like professions or political power, they are limited to concentrating everything on their bodies and not in other aspects of life. The young women have a reputation to protect; the men have to prove their manhood and insist that their “girlfriends” prove their love by giving in to their sexual demands. “When one sins for love, everything can be forgiven,” many of the young women alleged; in this way, love

is a cleanser of sins, and a short-lived palliative. It is only when the men fall in love that they adopt a "romantic" and protective stance to their loved one, and begin to make a clear distinction between her and "other" women, and for a brief period, their idea about men's superiority diminishes.

In this community, gender roles are much more traditional, much more dichotomous than the youth community described above. Gender in the poor coastal community is determined by the physical activity that each person carries out. According to their own definition, everyone who is "active" and "aggressive" is a man. And all those who are "passive" and "dominated" are women. It is in this context that the phenomenon of the "*cachero*" and its particular symbolism emerges. In this community, similar to the marginal cultures of prisons, or in "*transvesti*" prostitution, sexuality is not defined by the sexual object, but by who dominates whom. In the case of the *cacheros*, we have heterosexual men, generally married and with children, who have sex with passive homosexuals. Nobody makes fun of these men, because they know only too well that these are very "masculine" men capable of physical aggression. For this reason, to be a *cachero* does not carry a stigma. On the contrary, a *cachero* is considered to be a *macho*, so manly in fact that he "screws" both men and women.

The other community in this study is urban and middle class, and the young women and men originate from stable two-parent homes. This group was much more informed about pregnancy, STD prevention, and AIDS. They are also very clear about the importance of both sons and daughters studying for a career, and for waiting to marry until they are established. In their case, the religious mandates to wait to have sex until married, and the prohibition of the use of contraceptives, becomes obsolete when faced with long university studies. The control of women by men, however, is done under more symbolic and mental forms. Sexuality is a restricted terrain for women, where they are prohibited from acquiring knowledge and experience, unless it is with their boyfriends. Sexual relations before marriage are permitted as long as it is under the control of a man who is their "protector." Flexibility in relation to women's virginity is contrasted with the high price that women pay when they become single mothers or are not able to marry. Single women are relegated to poverty or to taking care of their families, that is, if these forgive them their error. Working in workshops with women from this background, I have found that, despite the clarity about becoming economically solvent, many of these women live out a body culture marked by self-rejection and obsession with their size and form. Many diet constantly, some begin to have cosmetic surgery from a very early age, and some prefer to have cesarean births in order not to lose their shape. The sexuality of the women from these two communities is influenced by distinct body cultures, in the sense that there are different attitudes and expectations, and vastly different experiences. Nonetheless, the inability to negotiate safe and/or pleasurable sex marks both groups.

### *Balancing Women's Conflicting Values*

In another study of adolescent women in a marginal urban community with a high incidence of early pregnancy, illiteracy, and underemployment (Preinfalk Fernandez 1988), it became clear that the young women were pressured into having sexual intercourse by the men, and also by their girlfriends. At the same time, these young women are aware that their value resides in being virgins, but also in having a man and in keeping him. The young men's preoccupation is in "scoring" the highest number of females, and sex is practiced with no protection of any kind. Unwanted pregnancies are the result, and sometimes the man stays for a while in a stable

union. Once women have lost their virginity, they develop many different strategies to negotiate their "desirability," for an experienced woman is seen as a slut. This is also an element that exists among the middle class. We could attribute these ideas about the "good" and "bad" women to the Catholic culture, and in many ways it has a profound influence on the collective mentality, but there are many other influences that persistently devalue and debase women and their bodies. Women are depicted as objects in pornography, advertisements, television, and every medium imaginable. And this is accompanied by the increase in violence against women and in what some now term "femicide," the assassination of women.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

### A. Sociolegal Status, Issues, and Lifestyles

#### *Sociolegal Status*

Specialists who work with homosexual populations reckon that they constitute 10% of the population in Costa Rica. Homosexuality has been and still is, though to a subtly lesser degree, a taboo subject. There are gay men and lesbian women in all walks of life, government institutions, the Church, etc., and in all social classes. Many live their lives quietly, minding their own business, and not congregating; others socialize in gay or lesbian bars; some form similar-minded groups (e.g., feminists, activists). But this country is homophobic, and until some individuals began to study gender theories, and later others began to work in preventing the AIDS epidemic from spreading, homosexuality was treated as a pathology, with many stereotypes in the public mind and media.

Homosexuality is not a crime in the Penal Code of 1971. Before these reforms were introduced, the punishment for sodomy was one to three years in prison (article 233). Since 1971, there has been no basis for the prosecution of homosexuality, as long as it occurs between two consenting adults and passive participants are more than 17 years of age. Prostitution is not considered a crime either, unless it is practiced in a "scandalous" manner. There are strict laws against pimping (owning a brothel) and inducing minors to practice prostitution. Most convictions are for these two reasons. In order to prosecute an adult prostitute, there must be some other infraction, such as moral indecency, public scandal, suspicion of drugs, or vagrancy. Unlike female prostitutes, male prostitutes are not regulated by law, nor are they required to be tested for venereal diseases.

#### *Gay Lifestyles*

In many ways, in recent years, the subject of homosexuality has begun to come out of the cultural closet. This is mainly because of the political work done by both groups and to the particular ability of certain individuals who took advantage of the VIH/SIDA (HIV/AIDS) pandemic to make visible the situation of gay men, and of men who have sex with men. Through the work of a now-extinct NGO, ILPES (Instituto Latinoamericano de Prevención y Educación en Salud [Latin American Institute of Prevention and Health Education]), many research projects were carried out about homophobia, stereotypes, and sexual behavior between men in prisons, among male prostitutes, and transvestite prostitutes. Through their work with support groups of gay men, and the promotion of prevention and the use of condoms in bars and places frequented by gays, the incidence of VIH was reduced in this group. Through their work with lawyers, doctors and hospital workers, policemen, prison workers, university professors and students, and many other groups, the real situa-

tion of gay men was made visible, as well as the homophobia inherent in this culture—and in every individual, including gay men themselves. One of the aims of this work was to change the discriminatory attitude to a more tolerant attitude towards gay men. Still, at present, homosexuality is a taboo subject, and gays have suffered rejection, invisibilization, violence, and even death in recurring gay-bashing episodes.

In one of the earlier publications by Jacobo Schifter, director of ILPES, he described very clearly how homophobic attitudes amongst homosexual men worked to their detriment. There existed total mistrust between them: They would never reveal their full name and even less where their family lived or their place of work, so that an ex-lover would not be tempted, in a fit of rage, to call the family or work and reveal his true identity. Neither would they reveal who their current lover is, because they would face a barrage of insults about him: “He is *una loca* (a queen),” “He has slept with half of San José,” “He has AIDS,” etc. The ultimate violence in this chain of events, including stealing or destroying each other’s property at parties, is the murder of gays by other gays. Between 1988 and 1996, 25 gay men were tortured and then murdered by the *chulos* (pimps) that they had taken to their homes. Another violence that gays faced was with the police. These would keep vigilance on the gay bars, and at any pretext, they would charge in and beat up the gays inside and make roundups. One explanation for this could be the fact that some of the police are closet homosexuals; another could be that they share the same masculine ideology where women are not involved. They live in close physical contact with each other: They work, eat, sleep, socialize, and live together for long periods. This creates a particular erotic and dangerous dynamic within the repressive function of the police.

Another aspect of gay culture is the emphasis on youth and physical beauty. Anyone who does not fit this model is rejected without mercy. Aging is feared. In Costa Rica, to be gay is to be an adolescent, and gays are discouraged from going to gay bars and dances after they are 30. Forty is considered to be old. Relationships are short lived; even when both profess to being in love, the relationship does not transcend the passionate phase, and soon, one or other of the partners begins to look elsewhere.

During the 1950s and 1960s, gays met in distinct public places to have casual and anonymous sex: saunas, parks, cinemas, and urinals. This pattern, though still in force, has changed because of the creation of bars for gays and lesbians. This created a pattern where some gays would seek out sexual partners, but many still sought encounters in public places. Although the repression has diminished, the sexual pattern of anonymous sex continued, principally by very isolated or by closeted gays. Bisexuals and married men sporadically frequent these places. Contact is made by the individuals touching their genitals, a common practice in heterosexual men in this country, but with the particular connotation with gays of “you can have all this,” or by jangling their keys, a sign that they have a car or a house where they can go to. After this, verbal contact is made. Frequently, in the less illuminated parts of parks or urinals or narrow passages between houses, men masturbate each other or practice fellatio. Penetration and group sex take place in safer locales, like cinemas. Middle-class bisexuals and gays frequent saunas more than the other public places. Public spaces are also places for sexual workers to practice their trade. Muggings and stabbings are common occurrences, as well as police roundups. This violence and danger is part of the erotic attraction for many of these men who initiated their sexual life on the street, “I like the fear . . .” “I want to participate in the danger . . .,” two men told Schifter (1997).

By 1998, violence had noticeably increased in these public places, in part, because of the appearance of the *chapulines* or “locusts.” Locusts are male and female juvenile gang members who mug and rob people, and are compared to swarming pests. They are very antagonistic to gays and are responsible for several murders of gays in the last few years. They, like the gays, have taken over public places to impose their own culture of sex, robbery, and death. At some vague time during the past few years, the locusts ceased to be mere delinquents and became part-time *cacheros*. Many of them stopped mugging gays and began to have anal sex with them *and* then rob them (Schifter 1999).

In the interviews carried out in the El Salon ILPES project, both *cacheros* and locusts had the common history of childhood abuse. They were all beaten by their fathers; many were sexually abused. Some lived with mothers who were prostitutes or with alcoholic fathers who abused them sexually. The locust from the smallest family had seven siblings and the one from the largest had 18. The mothers, fathers, or stepfathers are often unemployed, often alcoholic, or/and addicted to drugs, lost their patience, and vented their rage on their children. These adult men were the most sadistic and brutal and imposed their power physically. No longer able to provide food regularly for their families, they maintained their macho privileges through violence. Thus, the locusts’ school of violence is closely related to gender issues; it serves to preserve gender imbalances. Most of these youngsters had been thrown out of their home and had made the streets their habitat. They make a living from robbery, the sex trade, and drugs. Inured to the penetration of their bodies by violent and inept parents or guardians, their bodies became a battlefield. The locusts are obsessed with orifices. Theirs must remain closed to the world, those belonging to others are ready to be taken, the same as open public places. To the locust, a homosexual is someone who allows his body to be invaded. Why do they, then, copy the *cachero*’s behavior? If they have *chapulinas* in their own group, why did they turn from criminals to sex workers? According to Schifter, the relationship developed through sharing the same physical spaces. But, more importantly, for the first time, someone was looking at them and finding them attractive underneath their shabby clothes. Attractive well-endowed locusts would find new benefits. Now a new class was emerging: the handsome *chapulines* with large penises and big bottoms. Those who did not satisfy the demands of the market remained as intermediaries of the “good beef.” This changed the culture in the parks and public places. For a few hours each day, undocumented delinquents, drug addicts, and criminals, who were despised and feared by decent people, became public porn stars. A new Cinderella was born. The new heroes could now have sex with their victims and make good money out of them. Some of them had queues of men waiting to perform fellatio on them (Schifter 1999).

Gays and locusts might share the same spaces, but there exists a clear clash of cultures. They do not speak the same language. For gays, with their sexual model of the body and its pleasures, and locusts with their vision of the vulnerable body, communication is a tortuous road. Some gay murders have been committed by locusts. These crimes go beyond simple robbery. They are forms of torture that are impregnated with a profound degree of rage. One gay was killed by three men; they had amputated both arms, one leg, and his penis. They had cut the flesh on his arms and legs to shreds, and he had 12 stab wounds in his rectum. Ten *chapulines* were asked to explain this and other equally violent murders, some of them having been at the point of killing—or have actually killed—a gay client, or *pagador*, as they call them. Some agreed that the motive was robbery. Another

said that they were premeditated, especially when there are three perpetrators and the assault takes place in a hotel or the victim's home. These crimes occur when the locusts have taken a combination of drugs: crack, marijuana, and alcohol. "The three victims discussed were stabbed in the ass, the mouth, and the dick," says one. "This means the locusts wanted to punish them for being gays, for letting themselves be fucked." However, there are triggers to this violence. If the client cheats them of money, when they touch them improperly, when they are humiliated, when they are feminized or asked to do "women's things," like kissing, allowing penetration, giving oral sex, if they are asked to wash dishes, or to help in preparing food for dinner like chopping onions.

For the locusts, clients are a source of income; unlike gays, sexual pleasure is totally irrelevant to them. The majority are heterosexual and do not enjoy sex with men. When a client establishes a relationship with a locust, the latter expects some form of compensation when the relationship is broken off. Juan killed Victor when, after three years of being his client, Victor found himself another locust. Gerardo cut off one of his client's testicles when he found out that he was paying another locust more than him.

### *Transvestites*

Another group studied by ILPES is the homosexual transvestite prostitute community in San José. Schifter (1997, 1999) maintains that an analysis of the Costa Rican transvestite community shows an elasticity in sexual orientation that challenges the essentialist theories. The men who practice transvestism have different sexual orientations and different degrees of femininity and masculinity. Schifter believes that the physical space, in combination with the *paqueteo* (the packaging used in order to pass as women), are very important in producing changes in sexual orientation. Many transvestites are heterosexual men, married and with children, who like to dress as women, but do not have sexual relations with men. In Costa Rica, this group is the most concealed. They do not form part of any community, nor are they prostitutes, like some homosexuals.

Most of the transvestites contacted became aware of their orientation around 12 years of age. Many of them were initiated sexually by an older man; some say they wanted that experience, although others were obviously abused. Prostitution is their only means of making a living. They are thrown out of their homes and find no other option. They spend a great deal of their earnings on their clothes, make-up, and wigs. They have clothes for work, others for shows, and more-ordinary gear for everyday activities. The padding of hips, legs, and breasts are done with foam, rolled-up toilet paper, or cloth. Others use hormones, particularly contraceptive pills, which can be bought over the counter. Some use Depo-Provera, or whatever pill is available.

They share living and workspace, often cramped apartments, or the "bunker," a heavily secured row of rooms. A minority of transvestites come from fairly affluent middle-class homes. One of these, a doctor's son, carries out his trade unbeknown to his family. One day, one of his father's colleagues, another doctor, came to buy his services and did not recognize him dressed as a woman with a blonde wig. Originally, they lived and worked in a poor red-light area of the city and attracted poorer clients. When they migrated to a lower-middle-class area, they attracted more-affluent clients.

Previously, this area was used by female prostitutes; little by little the transvestites took over, and the prostitute's clients changed from heterosexual to bisexual orientation, in a slow process that was begun by the more feminine-

looking transvestites passing with their clients. Eventually, the female prostitutes left, leaving the whole area to the transvestites. It was when cocaine became easily available and was used by the clients, that they allowed themselves to be touched and fondled by the transvestites. They began to say that they "liked it more" than with the female prostitutes, and began to recommend their friends. Some of the clients are members of Parliament and professional people.

But life is hard, and every night they expose themselves to insults, stabbings, being thrown bags of urine or excrement, or stones or bottles by men who make a sport of this violence. The priests denounce them in church, together, according to them, with other "scum," like homosexuals and prostitutes. Some defend themselves by throwing stones at cars. Much of this takes place in front of the houses where people have lived for 30 or more years; some of the neighbors have organized themselves in order to change the situation, but to little avail.

In 1990, when Schifter (1998) asked transvestites the number of sexual contacts that they had had in their lives, the average was 9,371. In 1997, the average was 4,835. In the year before the survey, the average was 830.4, making that 15.9 sexual contacts per week. In the month of the interview, there were 44.8 contacts, that is, 11.2 weekly contacts. Some transvestites say they make, on average, six contacts nightly. If we calculate that there exist 100 to 150 transvestites in San José, and each one has an average of four sexual partners, we can reckon that about 600 men use their sexual services in one day (Schifter 1998).

Many clients treat the transvestites as women with a penis, unlike their own permanent lovers, who treat them as women and do not want to see their penis. The majority of these partners were heterosexuals, some with children. Some still consider themselves heterosexual, others homosexuals or bisexuals. Interestingly, the transvestites do not consider their partners to be homosexuals.

### *Male Prostitution and Bisexuality*

Another study by Schifter (1998) focused on a very specific sexual culture within the realm of male prostitution: the young men of a lower-middle-class brothel catering to pederasts. These youths are neither homosexual nor bisexual, in the sense of being attracted to only men or both men and women. The only characteristic that identifies them as bisexual is their sexual behavior while prostituting themselves. This places them within the culture known as *cachera*—men who have sexual relations with other men, but who are heterosexual in all other respects. Some of them are students (at school) or professionals, and some still live with their families, while others have moved into their own homes. The youths are between 13 and 27 years of age. A few live in a brothel, but the majority arrive at night to attend to clients. For some, the money is spent on crack, alcohol, and luxury extras. Some of them help out at home. The clients are bisexual in their orientation. Most of them are married men with children, who are completely "in the closet," leading a heterosexual life in public, with occasional visits to the brothel. Some clients are homosexuals. They are made up of nationals and foreigners.

### *Lesbian Lifestyles*

The situation of lesbians is different. Sporadically, they were included in the ILPES project. But, as in other countries where gays and lesbians have fought together for homosexual rights, lesbian women ended up supporting the men, but this was not reciprocated. There is a new NGO, CIPAC (Centro de Investigaciones para América Central—Derechos Humanos de Gays y Lesbianas [Central Ameri-

can Research Center—Lesbian and Gays' Human Rights]), which is changing this pattern by working shoulder to shoulder with both groups. But here, lesbians are analyzing themselves from the perspective that they have more in common with other women than with men, gay or not. If women, in general, have been invisibilized in history, even more so have lesbian women. Even in the feminist movement, made up of a high percentage of lesbians, the subject is not discussed, consequently producing much tension in the groups.

For several years in the 1980s and early 1990s, the lesbian group, Las Entendidas, published a journal called *La Boletina*, with poetry and information, and analytical articles about lesbianism, feminist theories, and about lesbian women's lives. The work of Ester Serrano, based on in-depth interviews with nine lesbian women, set out to find out how some lesbians have established groups and what this has meant for them. All these women learned in their childhood that lesbian women suffer, are problematic, are abnormal, and cannot be "good" mothers. They also learned that they should make themselves invisible. All the women interviewed had absorbed these homophobic sentiments. The first gay bars opened in the 1970s, and for the first time, gays and lesbians had a place for themselves where they could enjoy themselves, and where they could meet and be with other lesbians openly. However, these bars were populated by young people, and for many older lesbians, they were aggressive, patriarchal places. Not only this, in those early years, these bars were secret places, where gays or lesbians had access only by asking to see the owner. They were regularly raided by the police. In this context, "butch" lesbians formed into a group called "The Buffaloes," who came together as protectors of the other "weaker" women. They made a buffer between the "femme" women and the police, receiving the blows, having their noses broken. Another strategy created in the still-existing La Avispa [The Wasp] bar, was to turn a red light on as a warning of a police raid. Immediately, the same-sex couples would change partners and pretend to be heterosexual.

All the lesbian women interviewed, with some exceptions, lived in the closet in relation to their families, and all hid their identity at work. This changed as they became aware of their rights, particularly in the younger generation. The older lesbians were more circumspect because of the generalized homophobia, and to the fact that the fight for gay rights had not taken place. In the beginning of the 1990s, gays and lesbians began to celebrate Abril Saliendo del Silencio ["April Coming Out of the Silence"], which publicly celebrated the existence of gays and lesbians in Costa Rica. From this time on, they decided to carry on dancing with their same-sex partners, raid or no raid, marking a hiatus in their history. The feminist movement, the gay and lesbian movement, and the distinct lesbian congresses in Europe, North America, and Latin America have also strengthened the lesbian women in Costa Rica—although it is important to emphasize, no lesbian working in a state institution has come out openly about her identity.

## 7. Gender Diversity and Transgender Issues

Transvestites have been discriminated against and scorned. Often their own families throw them out of their home. Since the 1990s and the work of ILPES in the project of men who have sex with men that was centered on prevention of HIV/AIDS, some transvestites became activists and began to defend their rights. (See discussion of transvestites in the preceding Section 6.)

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sexual Behaviors

#### *Child Sexual Abuse, Incest, and Pedophilia*

From the 1980s on, child sexual abuse and incest have been studied in Costa Rica and, as a consequence, different nongovernmental organizations specialized and grew around this subject. It is estimated that one out of three women have suffered some kind of sexual abuse before the age of 18, and one out of five men. Twenty years later, laws to prevent this abuse have been created, and a campaign organized by governmental and nongovernmental institutions and organizations have trained doctors, lawyers, social workers, teachers, and other professionals to detect this social cancer in children, and to refer the cases for investigation. Many abusers are now jailed. There are signs and information in highways, shops, and institutions, as well as television ads, that denounce sexual abuse. The effects of incest and abuse are devastating, and this is now taken into account when treating female mental patients, as well as other persons in institutions like jails.

#### *Sexual Harassment*

Through the work of organized feminists in government and nongovernmental organizations and universities, the Law Against Sexual Harassment in the Workplace and in Educational Centers was created in March 1995. The consequences can lead the abusers to be suspended or fired from their work. Sexual harassment was a serious problem for women in a culture that has permitted men to stare, whistle, make lewd remarks, and even touch women in the street or in public places. This was called *piropos*, or flattery, part of the *machistas* behavior permitted prior to the development of human rights and feminism.

### A. Prostitution, Child Prostitution, and Sex Tourism

The sexual exploitation of children and adolescents in Costa Rica is a social problem only recently recognized, even though it has a long history in the country and is documented in various texts dating back to the 18th century. Until 1997, the criminal code currently in force did not penalize the corruption of minors (premature and perverse sexual acts) if the victim had been "previously corrupted." Nor was there a legal statute against child prostitution. Through the dynamic work of NGOs (Casa Alianza, the Paniamor Foundation, Ser y Crecer Foundation, and the Procal Foundation), Costa Rica began to analyze the situation and to change its legislation.

The sexual exploitation of children occurs within the family (incest), or outside of it (prostitution, for example). But both cases involve a variety of diverse interrelated factors. For girls, several studies have shown that the vast majority entered into prostitution as a result of living on the street. In this sense, running away can be interpreted as being expelled from the family, as this act is often associated with abuse, abandonment, and neglect. In 1996, in the World Congress Against Commercial Sexual Exploitation of Children, held in Sweden, nongovernmental organization and the End Child Prostitution in Asian Tourism campaign (ECPAT) made a specific reference to the problem in Costa Rica, namely, that it attracted many tourists and residents from the United States and Europe who "take advantage of their stay" to participate in the local sexual exploitation of women, girls, and boys.

There are few studies of child prostitution in Costa Rica. Among these are the works of Tatiana Treguear and Carmen Carro (1994, 1997), who carried out two qualitative studies

on the experiences of prostituted girls. The 1994 research was part of a Central American project with 30 prostituted adolescent girls between the ages of 13 and 17 in San José. In 1997, these same authors carried out a broader research endeavor with 50 prostituted adolescent girls between the ages of 9 and 17. This work addressed the risk factors associated with prostitution and provided an analysis of the reasons why they left home and their current living conditions. Sexual abuse as an antecedent of sexual exploitation was very common, given that 41 of the 50 girls reported that they had been sexually abused. Other factors that make Costa Rican children and adolescents vulnerable to prostitution include the extreme poverty of 10% of the population and the high percentage of adolescent girls who do not attend school. In addition, many women have their first child between the ages of 15 and 18, and 41% of all children are born to single mothers. Other factors include the consumption of drugs and alcohol.

In the last 15 years, a new phenomenon in the country has been the appearance of children in the streets. The "street phenomenon" stems from poverty, urban sprawl, and lack of alternatives, and is related to mistreatment and violence within the family. In some cases, boys and girls abandon their home for the street because they have nowhere else to go or they have been forced out. In other cases, in order to survive, these children must find the resources to do so. Once on the streets, the children forge new emotional ties in the form of couples or peer groups, bonds for affection and protection that help them to survive in an environment characterized by abuse, humiliation, and persecution. Drug consumption is often linked with life in the streets and also plays an important role in sexual exploitation, because many boys and girls continue with their addiction while they are being prostituted. Alcohol and illegal drugs, such as crack, cocaine, and marijuana, as well as paint thinner and glue, are staples in this population.

Another important aspect in analyzing drug consumption is how it relates to gender. Given that prostitution is primarily associated with the female gender, the challenge is how to interpret drug and alcohol abuse of girls and women. Studies demonstrate that the risk factors associated with substance abuse among women focus on violence, child sexual abuse, and rape. Specifically, they highlight four risk factors associated with especially difficult situations: sexual harassment and abuse, prostitution, unemployment and the prevailing need for support, and domestic violence (Claramunt 1999). These youths use their addiction as a way of numbing their pain and dealing with the situation. A second important element that contributes to high rates of sexually transmitted diseases, including HIV/AIDS, is the absence of protection measures associated with high intoxication levels and the lack of *power over prostitution customers*.

Those who sexually exploit children and adolescents are supported by many social sectors in Costa Rica that tolerate and justify the sexual marketing of children and adolescents. They come from a wide range of social groups and classes. They are white-collar workers, laborers, relatives, businessmen, political leaders, government officials, and police officers. Over the last few decades, Costa Rica experienced a rise in the sex tourism so prevalent in many Third World countries. Costa Rica's principal income comes from tourism, and the attraction for sex tourists was the low cost and young age of the boys and girls, as well as by the ease of prostitution. Thousands of pedophile tourists learn about Costa Rica through the Internet and magazines, sample guides, or catalogues that include pictures of naked girls and boys, and maps or directions that point out the location where the children are. These tourists are aided directly in the street or bars and hotels by taxi drivers and waiters, who contact the pimps

or the owners of prostitution houses. In some cases, these places are known as "cradle houses," because the children that live there are given food and clothing in exchange for prostitution. The greatest demand for girls and boys are the ports on the Pacific and Atlantic coasts where expensive boats and yachts arrive.

The organization Casa Alianza has been the most dynamic in making visible and in denouncing the sexual exploitation of children and adolescents in the country. Casa Alianza, directed by Bruce Harris, established itself in the country in 1996. It regularly receives denunciations and hate mail, which are filtered and investigated and then passed on to the Prosecutor's Office of Sexual Crimes. This office was created in 1998, but it has not been institutionalized in the Judicial Power and has no resources. Casa Alianza managed to obtain funds from the British Embassy and since then, there are about 50 people condemned, arrested, or waiting trial for sexual crimes. Two thirds are Costa Rican and one third are foreign. Casa Alianza has received more death threats in Costa Rica than in Guatemala, where it also has a program with street children and where there is more overt violence. When sexual exploitation is investigated, many powerful financial interests are touched. In 2002, there were 110 convictions, which included pimps, intermediaries, and clients.

In 2002, five members of the Costa Rican Pedophile Association were condemned, but unlike Chile, which created a Pedophile Unit, which as of April 2003 has discovered 18 pedophile networks in Costa Rica, there has not been one follow up in Costa Rica. According to Harris, there are girls brought to Costa Rica from the Dominican Republic, the Philippines, Bulgaria, Russia, Colombia, Nicaragua, and Panama. They are taken to exclusive clubs, where 60% of the clients come from the United States and the rest from Europe and other countries. These are men between 55 and 60 years of age. In San José, there are an estimated 3,000 girls, nearly all between 9 and 10 years of age. Similar estimates apply to the trade in the ports on both coasts. The average price of a virgin girl is about \$400.

The pimps work in families; when one member is jailed, a daughter or son continues the activity; when they are arrested, a cousin carries on. Women are the main recruiters in the case of the girls, sometimes friends of the girl take her and receive a commission. These women are motherly; they feed and take care of the children. There are other pimps who distribute their cards in poor areas, telling the youngsters that if they want to earn some money to call them. Many do. These children do not do this because they like it; they do it to be able to eat. The Costa Rican Pedophile Association frequented the poorest areas in San José, where, for \$15, these children could eat for a whole week.

Child pornography is not illegal in Costa Rica, which is a big problem, as Harris believes that there is a direct link between the use of pornography and the subsequent use and abuse of children. There was a university professor, who also worked in the prestigious Arias Foundation (created by ex-President Oscar Arias, a Nobel Peace prize winner), who had 6,000 pictures of child pornography in his computer at work, but he could not be prosecuted, and still continues as a professor. Distribution of child pornography, but not possession, can be prosecuted.

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

In spite of the Catholic Church's prohibition, the attitude towards birth control is open. People can buy condoms at supermarkets and at pharmacies. The pill can be

bought over the counter at pharmacies. However, for the last five years, there has not existed a national campaign for birth control, and although the Social Security System provides birth control services, women in many communities do not attend these clinics, due in part to ignorance, timidity, or lack of insurance. Adolescents generally do not attend the clinics, for similar reasons as the adult women, but also because they are often turned away and told not to have sex until they are married—clearly reflecting the attitude of healthcare workers about adolescents and their being sexually active. However, the fact that 40% of pregnancies are unwanted or unplanned in Costa Rica reflects other emotional, gender, and cultural inhibitions in relation to using contraceptives. It is known that many men do not want to use condoms, and that some do not allow their partners to use protection. There is a waiting list for women waiting to be sterilized after the 1999 Reproductive Health Decree, which allowed women to be sterilized on demand, without their husband's or the doctor's permission. The middle-class consult their private doctors about contraceptives.

### B. Teenage (Unmarried) Pregnancies

More than 800 teenage girls age 14 or younger, some as young as 12 years old or even younger, have babies every year. This has been the average number for five years. In 2000, it reached the peak number of 956. PANI (Patronato Nacional de la Infancia [National Institution for the Protection of Children]), which attends these girls, says that they are the victims of sexual abuse. And 15,000 adolescents over age 14, have children every year. The PANI is preparing a campaign to prevent sexual abuse. The CCSS (the Social Security System) initiated in April 2003 a new campaign directed at this teen population, with the aim of postponing early sexual encounters. More than 50% of teenage mothers conceive during casual sexual encounters; and when it is with "boyfriends," the relationship is fragile. Sixty percent of these pregnancies take place between 14 and 16 years. Many are high-risk pregnancies. Of all the children that die each year before they are one year old, 55% are premature, and of these, 74% are children of women who are under 20 years of age. There are hotline telephone programs for people to call in about their sexual problems—73% of calls in the year 2002 were made by adolescent women.

### C. Abortion

In January 2003, Costa Ricans were moved by a story published in the major newspaper, *La Nación*, about a 9-year-old girl who had been sexually abused and was pregnant. The newspaper article read as follows:

#### **Nine Year Old Girl Three Months Pregnant. Alarm at Child's Pregnancy**

*Turrialba.* There will only be 9 years of difference between this mother and her child. This small generational gap will probably make them share children's games more than anything else. The reason being that Rosa (fictional name given in order to protect her real identity) today is 12 weeks pregnant. And she is a 9-year-old girl. This case has moved Turrialba (the town where Rosa lives). Daughter of Nicaraguan immigrants, coffee pickers, Rosa is the victim of abuse by a 20-year-old local farm worker. As a consequence, her physical and emotional state is very delicate. So much so, that the doctor's at the William Allen Hospital, have decided to keep her interned in order to observe her pregnancy. The doctor's have asked that this case be in the hands of the Ministry of Health. —Ramiro Rodríguez, reporter, *La Nación*. (Miller 2003)

This story has created a major controversy in both her homeland of Nicaragua and in Costa Rica—lawyers, physicians, Church leaders, and feminists weighing in with passion. This time, it was not because there was a proposal to amend the abortion statute in the Criminal Code, as was the case in 1993 when a Member of Congress, Nury Vargas of the PUSC (Partido Unión Social Cristiana), presented a law project in the Legislative Assembly to modify article 121 of the Penal Code. That proposal would have added a paragraph to allow abortion in the case of incest or rape. The proposal was rejected. The Catholic Church and public opinion also rejected the initiative, and Nury Vargas left the Congress under duress. This time, it was about the fact that abortion was rejected by the authorities, alleging that the consequences of an induced abortion would be more negative than her carrying the pregnancy to term and having the child. But there was another element: Rosa's parents were not informed that in the actual legislation there exists the possibility of therapeutic abortion when the "mother's health" is endangered. Rosa was moved to a hospital in the capital and kept away from her parents.

Meanwhile, feminists groups discussed this very delicate problem, and some presented a document with clear proposals in relation to Rosa's case. It was clear that there would not be an abortion for her, and it took a delegation of Nicaraguans who came and took the child to Nicaragua, where eventually, after much controversy there, an abortion was carried out in a private clinic.

This case has been positive for diverse reasons. It broke the silence on the subject of abortion in a country where it is practiced in secret, either in private clinics or by other means. Since Nury Vargas presented her proposal and was rejected, a mantle of fear, and thus, of silence, has hung over the subject. No one has wanted to bring it forward, not even feminists, except in reference to the need to do more research on the subject. Today, different women's groups, including government institutions, are discussing it, though behind closed doors. In May 2003, a forum on the subject of abortion, organized by and directed at feminists and NGOs, was held in order for this group to begin to formulate a clear standpoint.

The actual legal situation regarding abortion in the country is as follows: Induced abortion is classified as a crime in the Penal Code of 1970, included in the crimes against life. The penalties vary according to whether an abortion has been carried out with or without the woman's consent, and depending if the fetus has reached six months of gestation. Abortion is not punishable only when the woman's life is in danger, and in this case, the procedure can be carried out by a doctor or an authorized obstetric nurse. However, there are many doctors who, for reasons of religious faith, will not carry out an abortion.

The law in the country is restrictive and criminalizing, punishing women who decide to abort and those who carry out the procedure. Doctors who suspect that a woman has provoked an abortion are obliged to report this to the OIJ (Organización de Investigación Judicial [Organization of Judicial Investigation]). Years ago, operations were carried out periodically to detect and jail the doctors who practiced abortions. Very few were jailed; some left the country. Very few women were jailed also, and at the present moment in 2003, there are neither women who have aborted nor doctors in prison. However, a lay woman accused of carrying out abortions is serving a three-year sentence. She is an untrained midwife, with a lot of practical experience in her region.

This permissive attitude shows a more tolerant stance on behalf of the medical culture to a reality that affects the female population. But the subject is taboo, and abortions are

still clandestine experiences affecting women's individual and collective health. At an individual level, it affects a woman physically, emotionally, and psychologically because of the complications that could present themselves, and because of the danger and loneliness a woman faces. At a collective level, the community's health is affected when the impact is not made visible by the underrecording of cases; when appropriate reproductive health services to attend the need for contraception are not met; when post-abortion services are not available; and when women's sexual and reproductive needs are not recognized. These are needs that Costa Rica must address if it is to remain as a member country of the United Nations resolutions of the 1994 Conference in Cairo.

In spite of the fact that the United Nations Human Rights Committee (April 1999) recommended that Costa Rica's "legislation should be amended in order to introduce exceptions to the general prohibition of all abortions," the actual Costa Rican Legislature has the intention of increasing the penalties for abortions. This decision is backed by some articles in the Constitution, which point out that the religion of the State is Catholic, Apostolic, and Roman, and that human life is inviolable.

The Law Project under discussion in the Committee of Juridical Affairs of the Legislative Assembly has introduced the expression "the product of conception," eliminating the idea of the fetus. It preserves the image of abortion as unacceptable, but it incorporates the following modifications: a) the requisite for informed consent has been eliminated, and b) the figure of the *comadrona* (midwife) is included. In another attempt to control and restrict the right to choose, in November 2002, Article 379 of the Penal Code was modified and included all "those who advertise procedures, instruments, medicaments or substances destined to provoke abortions," would be fined.

The Gender Analysis Group of the Penal Code Project, headed by INAMU (Instituto Nacional de Asuntos de las Mujeres [National Institute of Women's Affairs]), and confirmed by government and nongovernmental participation, has developed an alternative document, which will be presented to the Committee of Juridical Affairs in 2003. It includes a norm in relation to abortion with impunity, which takes into account as not punishable the interruption of pregnancy in the following cases: when the person is under 12 years of age; in the case of rape; and when it is with informed consent and until 12 weeks of gestation. This would be an addition to the existing figure of therapeutic abortion.

Abortion in Costa Rica is a problem of public health; this is evident when studying the following data for the period 1990-1994:

- In 1990-1994, 12.4% of maternal deaths were because of abortions;
- In 1984-1991, the National Health Services—CCSS (Caja Costarricense de Seguro Social)—serviced an annual average of 8,669 hospitalizations for the consequences of illegal abortions.
- In 1984-1991, the rate of induced abortions per 1,000 women between 15 and 49 years in the same period was 10.36% (Brenes 1995).
- According to CCSS data for 2000, there were 9,710 abortions in Costa Rica's main hospitals.

However, these figures are aggregates, which does not permit us to see whether they were spontaneous abortions or complications because of illegally induced abortions. Also, abortions in private clinics are not registered.

It is important to point out that there does not exist a protocol in the health-system hospitals for practicing therapeutic

abortions in case the woman's life is in danger. This is pointed out in the Parallel Report of the CEDAW, which will be presented as a recommendation in June 2003.

At the present time, women in Costa Rica are ignorant about the possibilities of having therapeutic abortions in case their lives are in danger. It is known that women receiving chemotherapy have not been informed of the possibility of abortion when faced with an unplanned and unwanted pregnancy. Instead, their treatment is suspended until the pregnancy is full term, putting both lives in serious risk.

#### D. Population Programs

Costa Rica does not have a problem of overpopulation. In fact, during the coffee, sugar cane, and other harvests, there was always a shortage of labor until the Nicaraguan immigrants came. However, there are certain groups, adolescent women, Indian, and other poor women, who are the target of birth control programs. There are a few women who have as many as 18 children, but they are the exception.

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### A. Sexually Transmitted Diseases

There has been a gradual reduction in the reporting of most STDs, particularly gonorrhea, whose incidence plummeted from 433.8 per 100,000 population in 1982 to 123.7 in 1990, and 68.6 in 1995. The incidence of syphilis also decreased from 99.8 per 100,000 population in 1982 to 54.3 in 1990, and 44.7 in 1995. The persistence of congenital syphilis is noteworthy, with the number of reported cases each year somewhere between 90 and 150.

#### B. HIV/AIDS

At the end of 1987, the national record of AIDS cases showed for the first time that homosexual and bisexual men were the most affected by the epidemic. During the next few years, this pattern worsened, and of the 1,000 cases recorded by 1996, 70% were homosexual and bisexual men (Schifter 1998).

In 1990, the first National Survey on AIDS was carried out with research on Costa Rican sexuality, including questions about when they first initiated their first sexual relations and with whom, the use of condoms or contraceptives, and so on. This was the first investigation in Latin America that clearly showed that knowledge and information and praxis did not have a perfect relationship. People knew certain things about AIDS, but did not put them into practice. A very small segment of society practiced safe sex, because several cultural factors prevented them from using condoms. What was discovered is that men have ten times more sexual partners than women, that the age of initiation had not varied over the last 40 years—it varied in only 15% of men and in 16% of women—but what had changed was the person with whom they had their first experience. Generations back, men had their first sexual encounter with a sex worker; nowadays, this only applied to a small minority. Drugs and alcohol were elements linked to unsafe sexual practices, as well as a great deal of sexual ignorance and prejudices in young generations. In 1991, the first survey of men who have sex with men in Latin America was carried out in a community with homosexual practices, where high numbers of unsafe practices were discovered. Forty percent of the men engaged in unsafe sex. This 40% was 10 times higher than studies in the U.S. found. Many of these men also had sex with women, leading to a considerable number of heterosexuals being infected with HIV.

In the 1990s, new NGOs appeared with the specific aim of combating the VIH/SIDA epidemic. ILPES was princi-

pally directed at the gay community and at men who have sex with men. Fundación Vida offered psychological support for HIV persons. Members of Triángulo Rosa were activists who worked with human rights. ASOVIHIDA (Asociación de Personas VIH/SIDA [Association for Persons with HIV/AIDS]) was an association made up of HIV-infected persons, which offered legal advice and also worked in human rights. There was a prevention program in the Ministry of Health, and a national committee of governmental and nongovernmental organizations. However, by 1998, these programs had disappeared because of a lack of funds, with a couple of exceptions. In this period, gay activists won the battle for the right for persons with HIV to receive the medical cocktail to prolong their lives from the national health system. In 2003, Costa Rica received \$4 million from the Global Fund to combat the epidemic.

According to the Fundación Vida, there are 2,340 cases of AIDS diagnosed by the Ministry of Health in March 2003; these are the cases being treated in the national health system. Many people are being treated privately and their cases are not being reported. Experts estimate that there could be around 25,000 HIV-infected persons in the country.

[Update 2002: UNAIDS Epidemiological Assessment: No epidemiological assessment is available for 2002.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	11,000 (rate: 0.6%)
Women ages 15-49:	2,800
Children ages 0-15:	320

[An estimated 890 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 3,000 Costa Rican children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

Sexologists are definitely a new phenomenon in Costa Rica, and consequently, the subject of sex is treated in a more open manner on television and radio programs, in magazines, and in diverse literature. *Sexo Sentido* [Sex Sense], a very popular radio program aired by the University Radio (University of Costa Rica) is very open in its discussions of sexual topics and issues. Different sexologists who appear on *Sexo Sentido* have studied sexology in Mexico, California, Argentina, and other places, and have varied perspectives.

Viagra has made penile dysfunction a subject that can be discussed and treated. At the same time, articles about female sexual problems and therapy, and about the female Viagra or the clitoral pump to stimulate women's arousal appear in magazines and newspapers (*La Nación* 2000). We could say that at last the truth is coming out about the sexual misery lived by so many people. However, the problem that I detect is that centuries of silence and ignorance cannot be breached merely by the high production of new information or by the new discourses about the right to pleasure. What is not named does not exist, and for many women, the very process of naming is the very first step of appropriating their bodies and their genitals. On the positive side, the state of men's and women's sexuality in this country is not that different from others, but the ice has been broken on the subject of sexuality, which is the beginning of breaking the silence.

It is impossible for men, and particularly women, to identify or acknowledge that they have a sexual dysfunction when their culture gives them no basis for comparison. For instance, a 1992 study found that two out of five women

had never experienced orgasm. Although sexologists and therapists are aware that the most common female dysfunctions are lack of feeling and arousal and the inability to reach orgasm, it is likely that 40% of Costa Rican women will not even be aware of their dysfunctional sexual relationships. In a culture that has a centuries-long taboo on the discussion of sexual matters, it is also likely that men will not acknowledge any problem with premature ejaculation and lack of erection. There are, however, some positive signs that Costa Ricans are becoming more aware of and willing to talk about what constitutes normal, healthy, and pleasurable sexual relations for both women and men.

## 12. Sex Research and Advanced Professional Education

### A. Institutes and Programs for Sexological Research

In 1988, Javier Ortiz, a trained sexologist, created Fundación Gaia (Gaia Foundation), a center for health, sexual therapy, nutrition, and so on. He had the first television program where people came to talk and the public phoned in. For the first time in Costa Rica, subjects such as orgasm, lack of orgasm, and premature ejaculation were discussed. He published a book, *The Hundred Questions and the Gender Rainbow*, where he details the most frequently asked one hundred questions, that take into account: sexual desire, the orgasms, female and male ejaculation, pregnancy, birth, and postpartum.

Mauro Fernandez, a gynecologist and sexologist, founded the Costa Rican Sexologist Institute in 1990. They do not train therapists, but guided by Masters and Johnson's research, they concentrate on sexual education, and also on research. They have produced *Lola and Paco: A Sexual Education Manual*, directed at children; a guide on non-hormonal contraceptives; a guide about the human papilloma virus; and *Pillow Manual*, a sexual education guide. Dr. Fernandez, in particular, gives many talks and participates on radio shows, where the public can phone in. In 2003, 22 women and 12 men work in the Costa Rican Sexologist Institute. There are about 50 staff people working on different projects. They assist between two and 300 clients each month, and up to about 150 clients are attended to each month by staff sexologists, gynecologists, psychologists, or lawyers. Other sexologists, including some women, have private practices.

### *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

#### A. Demographics

Croatia is a former Yugoslav republic east of the Adriatic Sea and opposite the eastern coast of Italy in southeastern Europe. With approximately 21,830 square miles (56,542 km<sup>2</sup>), Croatia is slightly smaller than the state of West Virginia in the United States. The Dinaric Mountains, which run from northwest to southeast mark a barren rocky region, while the Zagorje region in the north, around the capital Zagreb, is a land of rolling hills. The Drava, Danube, and Sava Rivers border the eastern fertile agricultural region of the Pannonian plain, Slavonia. The northern part of Croatia stretches about 270 miles (435 km) from the Istrian peninsula in the northwest on the Adriatic Sea to the Vojvodina region of Yugoslavia on the east. Croatia's neighbors are Slovenia and Hungary on the north, Yugoslavia on the east, and Bosnia and Herzegovina on the southeast. In the far south, Croatia shares a small border, south of Dubrovnik, with Montenegro. Croatia's western coastline, which includes many islands, stretches about 300 miles (483 km) from Slovenia at the northern end of the Adriatic Sea to Montenegro at the Adriatic's southern end, opposite the boot of Italy.

In July 2002, Croatia had an estimated population of 4.39 million. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** *0-14 years:* 18.3% with 1.05 male(s) per female (sex ratio); *15-64 years:* 66.3% with 1.01 male(s) per female; *65 years and over:* 15.4% with 0.6 male(s) per female; *Total population sex ratio:* 0.94 male(s) to 1 female

(CIA 2002)

**Life Expectancy at Birth:** *Total Population:* 74.13 years; *male:* 70.52 years; *female:* 77.06 years

**Urban/Rural Distribution:** 56% to 44%

**Ethnic Distribution:** Croat: 89.6%; Serb: 4.5%; Bosnian: 0.5%; Muslim: 0.4%; Italian: 0.4%; Hungarian: 0.4%; Slovenian: 0.3%; Albanian: 0.3%; Montenegrin: 0.3%; Czech: 0.2%; Roma: 0.2%; others: 3.2% (2001 National Census)

**Religious Distribution:** Roman Catholic: 76.5%; Orthodox: 11.1%; Muslim: 1.2%; Protestant 0.4%, others and unknown: 10.8% (1991)

**Birth Rate:** 12.8 births per 1,000 population

**Death Rate:** 11.31 per 1,000 population

**Infant Mortality Rate:** 7.53 deaths per 1,000 live births

**Net Migration Rate:** 9.72 migrant(s) per 1,000 population

**Total Fertility Rate:** 1.93 children born per woman

**Population Growth Rate:** 1.12%

**HIV/AIDS (1999 est.):** *Adult prevalence:* 0.02%; *Persons living with HIV/AIDS:* 350; *Deaths:* < 100. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate (defined as those age 15 and over who can read and write):** 97%; education is free and compulsory from ages 7 to 15. In 1991, 9% of the population age 15 years and older had a college or university education.

**Per Capita Gross Domestic Product (purchasing power parity):** \$8,300 (2001 est.), \$4,566 (National Bank Croatia, 2001 est.); **Inflation:** 5%; **Unemployment:** 23%; **Living below the poverty line:** 5% (World Bank Study 2000)

#### B. A Brief Historical Perspective

Most probably, the Slavic Croats originally came from the region around the Polish city of Krakow. In several waves during the 6th century, Croatian tribes arrived in the region that is now Croatia, but was then the Roman provinces of Pannonia and Dalmatia. The Croats converted to Christianity between the 7th and 9th centuries and adopted the Roman alphabet under the rule of Charlemagne. In 879, Pope John XIII proclaimed the Croats independent from Byzantine and Frankish invaders. An independent kingdom was established, which reached its peak in the 11th century. Following a defeat in a war with the Hungarians in 1097, the

\*Communications: Dr. Aleksandar Štulhofer, University of Zagreb, Department of Sociology, Faculty of Philosophy, I. Lucica 3, 10 000 Zagreb, Croatia; fax: 385-1-615-6879; astulhof@ffzg.hr.

Croatian chiefs and Hungarian king politically united the two nations under the Hungarian king in 1102, although Croatia retained its autonomy.

When the Turks defeated the Hungarians in 1526, more than two thirds of Croatia fell under Ottoman rule until the end of the 17th century. Unlike other Balkan states whose religious affiliations shifted under Muslim Ottoman rule, Catholicism remained strong in Croatia, becoming in effect one of the defining traits of the Croatian identity. The rest of Croatia chose Ferdinand of Austria as its king, entering the Habsburg domain. With the 1867 establishment of the Austro-Hungarian kingdom, Croatia and Slavonia came under Hungarian jurisdiction and remained part of the Austro-Hungarian Empire until it was defeated in 1918 at the end of World War I. In October 1918, Croatia declared its independence, and on December 1, joined Montenegro, Vojvodina, Serbia, and Slovenia to become a part of the Kingdom of Serbs, Croats, and Slovenes. In 1929, the nation changed its name to the Kingdom of Yugoslavia.

When Germany invaded Yugoslavia in 1941, Croatia became a Nazi puppet state. Croatian Fascists, the Ustashe, launched a purge of Serbs and Jews. Already in June 1941, the first antifascist guerilla units, the Partisans, were organized. After Germany was defeated in 1945, Croatia became a republic in the new Socialist Republic of Yugoslavia. Unlike other communist countries in Europe, Yugoslavia was never a member of the Warsaw pact, but one of the founders of the Non-Alignment movement. On June 25, 1991, the Croatian Parliament declared its independence from Yugoslavia. A devastating six-month civil war followed, with great destruction and the loss of thousands of lives, before the advance of the Serb-dominated Yugoslav military was halted and a United Nations ceasefire was signed on January 2, 1992. In May and August of 1995, the Croatian army finally returned western Slavonia and the central region of Krajina to Zagreb's control. The last Serb-held enclave, East Slavonia, was peacefully returned to Croatian control on January 15, 1998, after being a United Nations' protected zone for several years.

## 1. Basic Sexological Premises

### A. Character of Gender Roles

Unlike other European communist countries, Tito's Yugoslavia (1945-1990), independent from Soviet influence, has been extremely open towards Western cultural production, both in terms of high and popular cultures. This influence was amplified by the fact that from the 1960s on, Croats traveled and worked extensively in the West. In addition, throughout the 1970s and 1980s, the Croatian coast on the Adriatic was a major European tourist destination. This influence changed attitudes and lifestyles in the Mediterranean part of Croatia considerably, affecting even the small island communities. As a result, contemporary Croatian culture is deeply marked by permissiveness and liberal attitudes regarding gender and sexuality. Premarital sex is an unquestionable rule, as well as the right to sexual pleasure. This is especially true for the younger generations, brought up on Hollywood movies and teen sequels, MTV, and, recently, a local edition of *Cosmopolitan* magazine.

The adult world represents a more complicated picture. In the context of sexuality, there are several lines of division within the general population. These divisions are: sex/gender, education, religiousness, and place of residence. As elsewhere, the more educated people are the more permissive and tolerant of diversity and variety. This was confirmed in numerous public-opinion surveys carried out in the last decade. Older people, who tend to be less educated, place more

importance on their religious identity, and are, consequently, less permissive and tolerant. Their attitudes toward sexuality and gender roles follow the traditional Catholic pattern of the Central European past, emphasizing a rigid division of gender roles, the sexual double standard, and the rejection of all nonstandard sexual choices, particularly homosexuality.

It should be noted that the majority of Croatian men and women define themselves as religious. However, the nature of this identity is largely generation-specific. Younger generations express their religiousness both as a part of the national tradition, a marker of ethnonational identity, and as an individualized faith. Their religious identity is secularized and oblivious to the sexual moralities of the Church. According to the World Value Survey Croatia (1995), over 70% of the respondents in a nationally representative sample disagreed with the statement that religion offers the best guidance in sexual matters.

Whereas the rural areas in Croatia still exhibit elements of Catholic patriarchy, particularly in the older generations, urban places are generators of permissiveness and, somewhat less often, gender equality. It seems that Croatian public opinion is, at the moment, almost equally divided between nontraditional and permissive (more educated, younger, and urban) residents and religiously traditional men and women. This can be illustrated by a result from the 1996 Social Capital survey (Štulhofer, Karajić, & Meštrović 1996) carried out on a representative national sample. When asked whether women and men should have equal rights to sexual expression, 57% of respondents agreed. In general, women are less supportive of the traditional gender-role division.

### B. Sociolegal Status of Males and Females

The Titoist version of "socialist" transformation stressed the importance of gender equality. This was one of the departing points for the new society in leaving behind the decaying bourgeois society. Because of this ideological stance, women and men were granted equal rights since the end of World War II, especially in education and the labor market. Sex discrimination was officially discouraged and equal salaries were guaranteed, although, in reality, little has been done to change the prevailing male-dominated culture. Because the feminist movement was regarded as liberal, middle-class, Western reformism, and therefore politically suspicious, the criticism of communist gender policy was severely limited. After 1990, the process of post-communist transition, especially the economic transformation, significantly affected certain privileges, such as long maternity leaves, and social services, such as preventive health services and free kindergartens, designed to improve women's social position.

Women composed 46% of the labor force in 1997, but their average salary was lower than men's. In addition, they were overrepresented among the unemployed in the age cohorts 25 to 34 and 35 to 44 in 1999. On the other hand, women are becoming more visible in politics. They occupy slightly more than one fifth of all parliamentary seats (7% in 1997), and have positions in higher education, the sciences, and top management. During the first half of the 1990s, a significant number of female professionals became entrepreneurs, helping in the development of the market economy and changing the old image of male-dominated industry. Still, women are far from similar representation and prominence in all the sectors mentioned.

Abortion has been legal in Croatia since the early 1970s. The secularized version of Catholicism discussed above is evident in the stability of attitudes and public perception regarding abortion. During the last decade, according to studies carried out in 1990, 1992, 1995, and 2000 by the Faculty

of Political Science in Zagreb, the percentage of pro-choice respondents was constantly over 70%. This was the reason why the previous nationalist and pro-populationist government (1990-2000), which often sought and received support from the Catholic Church, refrained from changing the abortion law, in spite of frequent appeals from Church authorities.

The legal rights of children stem from the *Convention on the Rights of the Child* ratified in the early 1990s. Although real-life situations are different, especially in the rural areas, the new Family Law (of 1998) prohibits corporal punishment. Primary education, the first eight years of schooling, is compulsory. The legal age in Croatia is set at 18, but because of meager salaries, a housing shortage, and high rents, young people rarely leave the parental home before starting a professional career. Actually, a significant number of people continue to live with their parents, even after they have married.

### C. General Concepts of Sexuality and Love

Contemporary Croatia is a relatively permissive society, especially in the large urban centers. From the 1970s on, the traditional Catholic culture has been gradually replaced with sexual permissiveness, i.e., tolerance toward premarital, nonreproductive, and even extramarital sex. For most urbanites, sexuality equals love and pleasure. However, the relationship between these two dimensions, romantic love and erotic pleasure, is often perceived as confusingly inconsistent. Apart from the intimate dilemmas and/or rebellion it causes within younger generations, the still-dominant societal script of the unity of love and pleasure supports the continuation of the double standard. Based on the popular conviction that love is more important for women than for men, sexual capital (defined as the aggregate of individual sexual experience) is almost never evaluated in a gender-neutral way. Unlike male sexual capital, female sexual capital tends to be negatively correlated with social respectability. This remains true even for Croatian teenagers.

Regardless of the fact that most people agree that there should be no gender difference in the pursuit of sexual happiness, men and women often differ in their attitudes regarding the preferred path. According to a 1998-1999 study of urban sexual styles (Štulhofer 2000), 56% of female respondents and 33% of male respondents agreed that "sex is enjoyable only with the loved one," whereas 26% and 44%, respectively, disagreed. Interestingly, the gender gap was far less pronounced in the case of romantic love. Almost 50% of women and over 40% of men did not feel that "romantic love is overrated." Of the opposite opinion were 29% of women and 25% of men. The prevalence of the *relational concept* of female sexuality, in which love (emotions) provides justification for sexual pleasure, demands the perfect match between sexual and relationship needs. As one recent study pointed out (Štulhofer 1999a), it is precisely the women with the most active sexual lives who reported the most frequent guilty feelings about sex.

In general, it can be safely said that the majority of Croats, at least at one point in their lives, firmly believe in romantic or "true love." Notions of an ideal partner and long-lasting erotic happiness are still the essence of the prevailing image of intimate life. On the other hand, there seems to be a growing number of media suggestions, recently also found in women's magazines, stressing that, if or when love fails, one should go after the pleasure.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

Patriarchal characteristics of traditional cultural patterns in Croatian villages and small towns used to permeate all sexual habits. The inherited moralities are still influen-

tial in the less urbanized parts of the country, especially in the cultural reproduction of female gender/sexuality. During the last two decades, however, traditional moral codes have been continuously losing their grip, especially in younger rural generations, and have been partially replaced by the recognition of sexuality as an essential need.

### A. Source and Character of Religious Values

Traditionally, the Roman Catholic Church has held a central role in the culture and worldview of the majority of Croats. Throughout the centuries, Catholic faith has served as an ethnic marker and common interpretative denominator, and as such, it became an integral part of all the dimensions of individual and social life. Church institutions, with their educational, cultural, and legal impact, provided a general framework of life. Naturally, this included both legal and conceptual (discursive) power over sexual meanings and practices, which is probably most transparent in the case of "unfaithfulness" and related collective sanctions. In a historical perspective, it should be noted that the Catholic Church in Croatia combined the laws of the Bible and other religious norms with elements of local pagan beliefs and traditions, bringing its teaching as close as possible to the life reality of a poor rural population.

According to Catholic teachings, everything that deviates from the religious norms had to be publicly sanctioned. In essence, the aberrations were dealt with in a gender-specific manner. Two sets of rules were tacitly developed. The first, based on the symbols of female impurity, provided concepts and methods of punishment that were utilized to control women. The second, organized around the images of almighty father, a breadwinner and the head of the family, was instrumental in tolerating the heterosexual transgressions of men. This double standard is clearly visible in the Church practice regarding confession. In the case of female sexual transgressions (premarital or extramarital sex), the institution of confessional secrecy was annulled. That has often resulted in public "trials" led by a priest in which "deviant" women were punished both socially (being expelled from home, ostracized, or isolated) and symbolically—usually by stripping off her maiden symbols (cap, scarf, sash, or apron, depending on the region). The Church was notably less vigilant in cases of polygyny, when the second woman was brought into the house after the first one, the legal wife, was announced infertile. This Church control over everyday eroticism and sexuality can still be found in some remote and underdeveloped areas.

### B. Character of Ethnic Values

The cultural tradition of Croatia is a product of various regional and ethnic influences (Stein Erlich 1971/1966). Although predominantly formed by the Croatian ethnic group, its symbols and values were profoundly influenced by historic ties—primarily of an economic, military, and marital nature—with the Serbs, Muslims, and Bosnians, and the Slovenes, Italians, Austrians, and Hungarians. However, this diversity of ethnic cultural influences has a strong common denominator—religious control of sexuality, as described in the previous section. Occasional aberrations from religious codes can be found in magical rituals and practices specific for a certain locality and time.

Often a substitute for the socially proscribed "real thing," erotic and sexual fantasies and longings are expressed through folk songs and popular sayings, male vulgarities and female curses, geographical names, and nicknames. In some regions (e.g., Slavonia), where it is freely used at collective celebrations such as marriages, obscene language is much more than a subversion. Many festivities,

especially those that take place in spring (Carnival) or summer, are rich with rituals that include sexual innuendoes. In spite of modern permissiveness and erotic saturation in the mass media, they enjoy popularity even nowadays.

Sexual codes and messages are also notable in folk dresses and their ornaments. Most often, one finds symbols or “simulations” of fertility, such as *guzalo*, a device that a woman would use to make her buttocks look fuller. Also, village women would use various techniques of deception to make their breasts look bigger, while men would use a codpiece or stuff their crotch with various objects to appear better endowed. Sometimes, the clothing ornaments would take the shape of a vulva or penis, or they would include images of sexually vigorous animals (a cock, rabbit, or horse). Pieces, like sashes, aprons, or maiden caps (and specific ornamentation or coloring) were frequently employed to signal female sexual status, i.e., virginity or marital commitment.

### 3. Knowledge and Education about Sexuality

#### A. Government Policies and Programs

Croatia has never had a systematic, school-based sex education program and is still waiting for one. Although there were some efforts as early as the mid-1960s aimed at introducing some kind of educational program in primary and secondary education (Košiček 1965), they did not accomplish much. For the last 30 years, sex education in Croatian schools amounts to infrequent STD and HIV/AIDS one-hour medical lectures in secondary schools. Not even those minimal, non-comprehensive, and non-interactive interventions are formally organized. In most cases, they are left to the initiative of a local physician, teacher, or schoolmaster. As a consequence, most teenagers outside of the big cities receive only the most elementary information on human reproduction offered in biology class.

Recently, a small network of social scientists, medical doctors, and feminists started coordinating their efforts and pushing forward an introduction of a comprehensive sex education curriculum in Croatian primary and secondary schools. Adolescents seem to be fully supportive of such an initiative. Almost 90% are in favor of school-based sex education. Public opinion is similarly favorable. In a recent national poll (Štulhofer, Karajić, & Meštrović 1996), more than 70% of respondents agreed with a compulsory sex education program.

Interestingly, during the last decade, there might have been a peculiar form of (anti)sex education in Croatian schools. Namely, one quarter of students interviewed in a study claimed that the religious education class offered in primary schools had significantly influenced their sex lives (Štulhofer, Jureša, & Mamula 1999).

[Update 2002: In spite of the fact that Croatia still lacks a systematic and comprehensive school-based sex education program, an important advance was made in the education of mentally challenged youth. Under the auspices of the Croatian Association of Societies of Persons with Mental Handicap, a sexuality counseling office for mentally challenged youth was started in 1999. Based on this experience, an excellent handbook was prepared a year later (Bratković 2000). (End of update by A. Štulhofer)]

#### B. Informal Sources of Sexual Knowledge

According to recent surveys (Hiršl-Hećej, Šikanić-Dugić, & Dobravc-Poljak 1998; Štulhofer, Jureša, & Mamula 1999), Croatian adolescents learn about sexuality primarily through youth magazines, television, and peers. The magazines, including the very popular Croatian edition of *Cosmopolitan*, extensively discuss sex, often send-

ing conflicting messages. More precisely, they emphasize both sexual liberation and equality of young women, and the “naturally given” relational concept of female sexuality. In addition, media images often stress female beauty and erotic appeal as the central personal quality.

As elsewhere, peer pressure is one of the central aspects of adolescent sexual development. In Croatia, peers are important for the timing of the first intercourse, contraceptive choices, and the formation of sexual attitudes. However, peer influence is perceived by adolescents as moderate in effect. Less than 10% of surveyed freshmen acknowledge substantial influence of friends on their sexual behavior.

A recent study pointed out intergenerational differences in the mother–daughter conversation about sexuality. According to the results, younger generations of mothers are significantly more likely to discuss sex with their preteen and teenage daughters. These conversations seem to have an effect on the daughters’ satisfaction with their first coital experience.

Although the effects are unexplored, pornography, especially explicit videotapes, is an additional source of sexual knowledge. According to a study (Štulhofer, Jureša, & Mamula 1999), 80% of female students and 98% of male students (all freshmen) are familiar with explicit movies. On average, they had their first exposure at the age of 13.

### 4. Autoerotic Behaviors and Patterns

#### A. Children and Adolescents

In the past, the autoerotic behavior of children and adolescents had an extremely negative connotation, derived both from Catholic tradition and 19th-century medical concepts. If discovered, children were punished for masturbation. Masturbatory practice, especially in preschool children, was viewed by the parents either as their own failure in childrearing or as the child’s developmental disorder. As a result, numerous adolescents grew up troubled by guilt feelings.

During the 1980s, adolescent masturbation was gradually normalized. A similar thing happened with the autoerotic behavior of children in the 1990s, at least within urban culture and educated circles. Nowadays, parents generally accept the fact that masturbation is a universal practice of children of both sexes. More and more, it is regarded as a normal expression of children’s curiosity and body explorations. However, if a child masturbates excessively (seven to eight times a day), experts suggest that parents should pay close attention, because this can be a sign of urogenital infection, neglect, or child abuse.

In a survey carried out on a large sample of urban adolescents, ages 18 to 20 just starting college, 52% of female students and 7% of male students reported that they never masturbate. One-in-two males masturbate once a week or more frequently; among female students, this is the case with one in every ten (Štulhofer, Jureša, & Mamula 1999).

#### B. Adults

According to a study on sexual attitudes and behavior in the five largest Croatian cities (Štulhofer 1999b), 3% of men between 18 and 48 years of age, and more than one fourth (28%) of women of the same age, have never masturbated. Interestingly, a significant number of respondents of both sexes (23% of women and 19% of men) stated that they ceased to masturbate. Among this group of respondents, the married ones are overrepresented, which might suggest certain moral tension between masturbation and marital sexual life.

In general, masturbation is regarded as a pleasurable and completely normal erotic activity. However, most people

are extremely secretive about it, not the least because masturbation can be perceived as a sign of an inability to attract sexual partners.

## 5. Interpersonal Heterosexual Behaviors

### A. Children

#### *Sexual Exploration and Sex Rehearsal Play*

No data exist on the sexual activities of Croatian children. In the 1990s, child sex abuse erupted, both as a moral panic and as a public recognition of a grave, long-suppressed, and overlooked problem. As an unfortunate result, systematic research on childhood sexuality is currently regarded as far too controversial.

### B. Adolescents

#### *Puberty Rituals and Premarital Relationships*

According to the research on the sexual behavior of adolescents in Croatia carried out from 1971 to the present, the proportion of adolescents with sexual experience is increasing and the age of sexual debut has decreased somewhat. In 1971, 16% of adolescent girls and 30% of adolescent boys between 15 and 19 years of age had experienced coitus (Trenc & Beluhan 1973). Twenty years later, the proportion had increased to 22.1% of girls and 48.9% of boys (Štampar & Beluhan 1991). The latest studies point out that 24.3% of girls and 46.3% of boys, high school students between 15 and 19 years of age, have experienced coitus (Hiršl-Hečej, Šikanić-Dugić, & Dobravc-Poljak 1998). Living with both parents and attendance at grammar school, which is an indicator of family socioeconomic status, decrease the probability of sexual experience in urban adolescents.

On average, young people in Croatia have their first sexual intercourse at 17, but more than a third of sexually active adolescents have their sexual debut at the age of 15 or earlier (Štulhofer, Jureša, & Mamula 1999). Adolescent girls in Croatia report fewer sexual partners than their male peers; almost 40% of girls and 65% of boys between 15 and 19 years of age have had two or more lifetime sexual partners, and 22% of girls and 44% of boys have had three or more. The pattern of sexual relationships among adolescents is the well-known serial monogamy. They remain faithful to their partner until the relationship is over and then move to another relationship.

Adolescents have sexual intercourse sporadically and less frequently than older single people. The frequency of sexual intercourse among adolescents is related to the proportion of actual sexually active youth; 35% of sexually experienced girls and 39% of sexually experienced boys did not have any sexual relationship in the last three months. Whereas 26% of girls and 35% of boys had sporadic sexual intercourse, only 27% of girls and 14% boys have had sexual intercourse regularly every week.

Generally, young women report longer sexual relationships than young men do. Almost half of sexually experienced girls, in contrast to 17% of boys, reported that their longest sexual relationship lasted six months and longer; 27% of girls, and only 5% of boys, had a sexual relationship that lasted more than a year (Štulhofer, Jureša, & Mamula 1999).

### C. Adults

Reflecting the current state of Croatian sexology, no nationally representative sexual behavior surveys are available so far. The only empirical evidence regarding adult sexual behavior comes from two studies funded by popular newspapers. Both studies used relatively large samples of over 1,000 respondents and were exclusively urban. Data on sexual behavior, presented in this chapter, were collected

in the more recent of the two studies (*Sexual Styles Survey*, 1998-1999; see also: Štulhofer 1999ab, 2000). It should be emphasized that younger, more educated, and financially better-off respondents are greatly overrepresented in the samples used for the following analyses.

#### *Premarital Relations*

Premarital sexual relations are a rule in contemporary Croatia. Most people start their sexual life as teenagers; the average age at first intercourse is 18 for women and 17 for men. Premarital sex is generally viewed as perfectly normal and its absence is often considered suspect. In a nationally representative survey on social attitudes and values (Štulhofer, Karajić, Meštrović 1996), only 16% of respondents, mostly older and of rural background, were disapproving of premarital sexual relations.

#### *Sexual Behavior and Relationships*

Heterosexual behavior in Croatia seems to be stamped by numerous gender differences. As in most international sex surveys, women have fewer lifetime sexual partners than men. On average, adult women report four sexual partners whereas men report nine partners. The difference is already present in adolescence.

The analysis of sexual pleasure points out another notable difference. Women experience orgasm every second time they have sex, whereas men climax nine times out of ten. This gap is partially responsible for the fact that almost 60% of female respondents faked orgasm at least once. However, the correlation between the frequency of orgasms and satisfaction with one's sex life is weak.

In terms of the frequency of sexual intercourse, most respondents have sex two to three times a week (39%) or once every week (32%). For an equal number of people (15%), sex happens either considerably less frequently ("once a month"), or considerably more frequently ("almost daily"). Asked whether they found the frequency of sex in their relationship "too low," "too high," or "just right," 25% of women and 40% of men answered that it was "too low." On the other hand, there are 23% of women and 13% of men who found the frequency "too high." Unexpectedly, when analyzing gender differences in accepting a partner's sexual advances for the sake of his or her pleasure, both female and male respondents rejected a traditional perception. Compared to women, men were almost twice as likely to engage in sex just because their partner wanted it (Štulhofer, Karajić, Meštrović 1996).

Because of the relational model of female sexuality and related social expectations, the ideal of romantic love has traditionally been somewhat more appealing to women. One indicator of this is the differential willingness to engage in fleeting sexual encounters or "one-night stands." More than half of women surveyed (54%) and one quarter of men claimed no such experience.

There is a popular belief in Croatia that women are more open and talkative about their sexuality. Men, it is believed, are less likely to discuss their sexual experience, either because of their "machismo" or because they lack the skills necessary to communicate emotionally charged personal matters. Empirical data provide some support for this perception. A significantly larger number of women (63%) than men (45%) "often" talk about their sex life with friends. Only 2% of women never discuss sex with their partners, in comparison to eight times as many men.

There is a notable absence of gender differences in overall sexual satisfaction, whether measured directly or indirectly. When asked directly, 59% of women and 51% of men consider their sexual lives satisfactory. On an indirect

measure, the results are similar: 37% of women and 38% of men stated that "imagination is better than sexual reality" (Štulhofer, Karajić, Meštrović 1996).

As previously mentioned, romantic love is the dominant schema of heterosexual relationships in Croatia. The ideals of long-lasting love and erotic passion, open communication and understanding, emotional support, and loyalty are the very core of the contemporary concept of intimate relationship. It is widely recognized that, in reality, one usually has a hard time trying to realize these ideals, but nevertheless, most Croats, especially younger generations, firmly believe that romantic love is the highest intimate accomplishment. Potential partners are evaluated accordingly. When asked to rank the three most important qualities in an ideal partner, women state tenderness, loyalty, and charm. According to men, the top three characteristics are charm, fidelity, and tenderness. Physical beauty, financial success, intellect, and sensuality seem to be of secondary importance.

### Marriage and Family

Marriage remains a highly important social image in Croatia. Most people regard it as a *conditio sine qua non* of happiness and fulfillment in life. According to a 1995 nationally representative survey by the Faculty of Political Science in Zagreb, 87% of Croatian citizens disagreed with the statement that "marriage is an outdated institution" (World Value Survey Croatia 1995).

In another large-scale social survey (Štulhofer, Karajić, & Meštrović 1996), 70% of respondents described marriage as "extremely important." In comparison, 85% stated that children are "extremely important in life," but only 52% said the same for sex. The high status of marriage is also reflected in the fact that Croats marry at higher rates than neighboring Slovenes, Hungarians, or nearby Austrians and Italians.

In reality, marriage in Croatia is still far from the ideal picture of gender equality that most people start with nowadays. Because most married women work outside the home, a customary practice from the 1950s on, they are quite often faced with a double workload. Homemaking and raising children are still disproportionately woman's obligations, especially outside the few metropolitan centers. It should be noted, though, that among younger couples, there seem to be a lot more equality and a less-rigid division of spousal roles than was the case before. Another important trend is an increase in the number of single households. In 1991, they comprised 18% of all the households in Croatia.

### Cohabitation

Cohabitation is rare in Croatia, even in metropolitan settings; recent surveys suggest that only 2% of the population are living together "as married." The primary reasons for such a situation are the low standard of living and high apartment rents. There is a push factor for marriage, because the resolution of a young couple's housing problem requires, in principle, the pooling of two families' resources. Even when the financial situation is not a restrictive factor, cohabitation is usually perceived, by the couple, their friends, and families, as a prelude to marriage. Only 7% of the children in Croatia are born out of wedlock.

### Divorce

Divorce rates have been surprisingly stable since the 1960s. In 1966, there were 15 divorce cases per 100 new marriages; in 1998, there were 16. As a consequence, most children grow up in families with both parents present. The situation is somewhat different in the four largest cities (Zagreb, Osijek, Rijeka, and Split), where there are, on average, 31 divorces per every 100 new marriages (Statistički Ljetopis 1999).

### Sexual Satisfaction

In comparison to sexually active singles, married individuals are more satisfied with their sex lives. Among the former, 18% are dissatisfied and 55% are satisfied with their sexual lives; only 9% of married respondents are dissatisfied and 60% are satisfied. It seems that the declining frequency of marital sex may not be of central importance for sexual (dis)satisfaction, at least for married couples under the age of 50, most of whom have sex about twice a week.

### Extramarital Sex

According to the media, there is a rampant sexual infidelity among married couples in Croatia. Thus, it is no wonder that almost 50% of urban women and almost 40% of urban men are not sure if their partner is faithful. By contrast, our data suggest a much lower incidence of extramarital sex. One third of men and 16% of women admit that they had other sexual partners while in marriage.

### Sexuality and the Physically Disabled and Aged

At the moment, there are no studies on the sexual behavior of older people, and none on the sexuality of disabled persons. In addition, these topics are never even touched upon by the media and they remain completely invisible. The only information about the social perception of older people's sexuality can be found in the jokes that circulate in public. All of them, but especially those involving older female characters, reflect extremely youth-centered, prejudicial, and negative attitudes.

[Update 2002: As previously mentioned, the Croatian Association of Societies of Persons with Mental Handicap opened a sexuality counseling office for mentally challenged youth in 1999. In 2000, the Association published an excellent handbook based on this experience (Bratković 2000). (End of update by A. Štulhofer)]

### Oral and Anal Sex

There are no legal restrictions on any type of sexual contact. Oral sex, both fellatio and cunnilingus, seems to be a widespread practice, almost universal among the younger generations. Among urbanites between 18 and 48 years of age, 10% of women and 13% of men were never orally stimulated, and 11% of women and 9% of men have never orally stimulated their partner. Most people surveyed, men and women alike, placed oral sex at the very top of the list of sexual sensations they would like to experience more often. Anal sex is considerably less prevalent: 56% of metropolitan women and 61% of men have experienced it at least once. The relatively high numbers of respondents who tried anal sex undoubtedly reflect the specific character of the sample and cannot be generalized (Štulhofer, Karajić, Meštrović 1996).

The difference between the incidence of oral and anal sex can be explained, at least partially, by pointing out the powerful negative attitudes surrounding the latter sexual outlet. Anal sex is often identified with homosexuality and, therefore, regarded as deviant. Moreover, traditional body taboos and hygienic restrictions operate against anal eroticism, suppressing experimentation.

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

To describe, in short, the position of homosexuals in Croatia, one can use the phrase "absorbed by silence." During the 1970s, in the period when the gay and lesbian movement in the United States and Western Europe was becoming a recognized political factor, Croatia was a part of communist Yugoslavia, a country where homosexuality was invis-

ble and never discussed. It was mentioned only jokingly or used as an insult. The situation changed somewhat in the 1980s. As the AIDS epidemic became a global concern, prompting discussion about various aspects of human sexual behavior—and thus raising questions about differences—the Croatian Ministry of Health started an AIDS-prevention media campaign, in which homosexuality, when mentioned, was lumped together with prostitution and drug abuse. Many gays in Croatia remember the 1980s as the beginning of an awakening. The first gay organization appeared at the time, and later, when some bars started to welcome gay audiences, a rudimentary gay scene was created.

During the first half of the 1990s, the war for national independence and a conservative right-wing government fostered the “building of a strong Croatian society” based on Catholic traditions and ethnic identity. At the same time, however, the civil sector started to develop with support from the international community. New nongovernmental organizations (NGOs) focused on the protection of human rights, which provided a much-needed counterpoint to the official line. Still, the rights of sexual minorities were never openly discussed or promoted.

Homosexuality is rarely mentioned in the Croatian media. When it is covered, there is often a criminal subtext (homosexuality is presented as a cause or facilitator of crime) or in other “scandalous” contexts which serve to reinforce prejudices. No wonder that gay men are commonly defined as effeminate types unable to resist affectation. Lesbians are usually stigmatized as heterosexual, men-hating women going through a perverse phase, or are considered to be men trapped within a female body.

According to the results of two large national surveys (Štulhofer 1999b; Črpić & Rimac 2000), around 50% of respondents are extremely homophobic. In 1995, 53% of respondents stated that they would not like to have a homosexual person as a neighbor. Four years later, 46% of respondents were of the same opinion. Among women and the younger generations, especially in large urban centers, the social distance from gays and lesbians is less pronounced. Almost two thirds of the students of the University of Zagreb stated that their friend’s sexual orientation is irrelevant to them.

It is important to note that there is no positive term for homosexual persons in Croatian. Aside from the neutral *homoseksualac* (homosexual), only demeaning and offensive labels exist, with *peder* (faggot) being used most frequently. Thus, as Croatian translators at the European Parliament have recently discovered, the word *gay* is impossible to translate.

Gay and lesbian issues are occasionally explored in off-theater plays, alternative exhibitions, and translated books. Most of these cultural events escape the public eye and media coverage. It is interesting to note that the first (and still the only) sexological book on homosexuality was published in 1986 by Košiček. Encouraging normalization and social acceptance of homosexuality, it met only marginal attention. Partially because homosexuality is still invisible, and because of the lack of self-organizing and activism, rare attempts to promote gay and lesbian rights and/or expose discrimination are usually perceived as “tasteless,” and they are dismissed with comments such as: “Why do they have to advertise their private affairs?”

[Update 2002: In 2000, the first lesbian NGO in Croatia, LORI (Lesbian Organization Rijeka), was registered. In 2002, Iskorak—the Group for Promotion and Protection of Different Sexual Orientation, founded mainly by gay men, was registered, as well as the lesbian project, Kontra. The year 2002 seems to have been a turning point for lesbians, gays, and bisexual persons in Croatia: The first Gay Pride

was organized in the capital, Zagreb. This collective coming out resulted in many public debates, but most importantly, sexual minorities became socially visible.

[In Croatian bookstores, one can find only a few books on homosexuality, none of them written by Croatians. In June 2002, as an introduction to the first Croatian Gay Pride, a gay and lesbian NGO organized the first GLBT cultural week in Zagreb, promoting and presenting queer culture. In the same year, the NGO, Center for Peace Studies, organized a queer seminar for students and citizens. Another NGO, the Center for Women’s Studies, has been organizing seminars concerning lesbian issues for several years. (End of update by S. Sagasta & G. Bosanac)]

## A. Children and Adolescents

The first sexual activities among children, often of a same-sex nature, are understood as exploratory play and, therefore, are perceived by most parents as a part of the growing-up process. For most gay men, adolescence represents the period, confusing and conflicting, in which the self-defining process and the confrontation with social expectations begin. Finding yourself different from others makes it equally hard to be accepted, as well as to accept your own difference. Bisexual feelings and activities are often a part of this self-defining phase. Unlike a couple of decades ago, first same-sex contacts and intimate relationships occur mostly among peers. Contacts between adolescents and adults, it seems, have almost disappeared.

## B. Adults

### *Sexual Outlets, Relationships, and Lifestyles*

If we analyze personal ads in newspapers and on Web pages, we notice two distinct types of partner-seeking. The first is focused on sexual encounters with a more-or-less specific outlet. The second type emphasizes meeting and befriending a man, which may or may not include sex. What seems to be most interesting is the fact that both types of partner-seeking include a similar set of criteria for “Mr. Right.” He has to be discrete, masculine, an outsider to the gay scene, and sexually inexperienced. He is someone whom you could introduce to your non-gay friends and parents as “my best pal” without arousing suspicion. The gay male who should be avoided at any cost is the *tetka* (aunt). He is too much of a “she,” i.e., effeminate and passive, well known to the homosexual community, and indiscriminate in his choice of sex partners. As one of the most frequent remarks regarding gays who are “too sensitive” goes: “They embarrass us. Just look at them—no wonder that society doesn’t like our kind.”

Beyond placing a newspaper personal advertisement, the possibilities for finding Mr. Right involve cruising areas such as parks, public toilets, and, in the summer, the beaches along the coastline. Every larger city has at least one unofficial gay place, a coffee shop or a discotheque. In 1999, the first openly gay nightclub (Bad Boy) was opened in Zagreb. For men living in smaller communities, weekend visits to the closest urban center have been a typical aspect of gay life. For many of them, these visits are the only chance to express their sexual identity. During the second half of the 1990s, the Internet has had a major role, both in finding partners and in strengthening homosexual identity. The first Croatian gay website was started in 1996. Today, there are several sites offering information on gay culture and lifestyles. They provide chat services, a virtual meeting space, and forums for discussing gay issues.

For most gay men, meeting in public is not easy. Because they are still closeted or have only partially come out, the choice of place is a difficult one. “I should avoid being seen in gay company,” and “Do I want to be spotted in a bar that is

considered to be a part of the scene?" are frequent dilemmas. An additional problem for coming out in Croatia is that, because of the economic situation, a large number of men in their late 20s still live with their parents. Economic independence is quite rare. Unlike others, gay men who manage to live with their partners have usually come out fully.

There is no specific type of relationship between gay men in Croatia. Some are open, others are monogamous. Sexual exclusivity is, usually, a matter of mutual agreement. Some couples adopt the heterosexual model of gender roles.

In regard to the lesbian population, long-term lesbian relationships are rather rare. Increased sustainability of such relationships is noticeable between more-experienced lesbians (women over 30). The economic situation, the high unemployment rate, and the pressure of Catholic and patriarchal morality all work against long-term relationships. Women who have moved to larger cities feel the need to gain experience and expand their circle of acquaintances, thus becoming the most visible lesbians on the scene. Women who are in serious relationships avoid the scene and larger gatherings in order to protect their exclusive relationships. The presence of a *butch-and-femme* dichotomy varies according to social class and the level of lesbian awareness. Copying the *macho* patterns of Croatian society, most Croatian lesbians tend to feel more *butch*. This should be partly understood as an attempt to reject the stereotype of the "real" woman. However, the *butch-and-femme* dichotomy is less present among younger lesbian women.

The lesbian community operates in small closed groups. They are highly stratified and do not allow for mixing of different social classes, professions, or social ranks in general. Within the current scene, most lesbian women have no interest in feminism or lesbian human rights. Political activism is not what the average young woman in the lesbian community has on her mind. Being interested primarily in sexual activity, they often absorb the sexism and machismo of the wider society.

Lesbian women living in provincial towns usually migrate to the capital. Some continue their migration and move permanently to Western countries, mostly the Netherlands, Finland, Sweden, the USA, and Germany.

Thus far, 1999 was the most fruitful year for lesbian activities. Kontra, the lesbian network, organized numerous workshops, and the Center for Women's Studies offered lectures in lesbian theory. Nevertheless, lesbian women are still inert when it comes to activism, so the basic need for a safe, women-only, gathering place has still not been met. Many lesbians are trying to find a substitute in cyberspace using the Croatian Lesbian website.

[Update 2002: Safe socializing of lesbians and gays is possible only within newly established gay or lesbian NGOs and in the one and only gay night bar in Croatia. The first was Bad Boy, which was opened in 1999 and closed in 2001, shortly after the opening of a second night bar, Global. However, the recent growth and development of the gay and lesbian movement now encourage young gays and lesbians to live their lives more openly. (End of update by S. Sagasta & G. Bosanac)]

### Legal Aspects and Social Status

There is no legal prohibition of different sexual practices as long as they involve consenting adults. Homosexual, both gay and lesbian, couples are not allowed to register their partnership, nor are they allowed to marry. Furthermore, they cannot seek assisted procreation nor adopt a child. During recent discussions regarding the latest changes in family legislation, some NGO activists were trying to push for a more tolerant view on same-sex unions, but without success.

The Catholic Church is very influential in Croatia. Its status has been strengthened during war times because it represented ethnonational identity and tradition. Interestingly, the Church has been extremely silent in regards to homosexuality issues. Only recently has the Catholic press begun to echo Vatican statements on the World Gay Pride parade in Rome in late 2000 and the question of same-sex marriage.

The press has also recently explored homosexuality in the army. Unfortunately, the coverage was exclusively focused on a case of alleged same-sex abuse. It remains to be seen if homosexuality in the armed forces will become an issue to be publicly discussed. So far, there have been no such indications.

[Update 2003: In January 2001, a team of two young lawyers and a professor from the Faculty of Law at the University of Zagreb started a public discussion about their proposal of a Constitutional Law on Gender Equality. In May of 2002, gay and lesbian NGOs started a campaign to change the Family Act, demanding the rights to marry or to register their partnership and to adopt children. They also proposed amending the Constitution to include a statement on the unacceptability of discrimination based on sexual orientation. The Ministry of Social Welfare proposed to the Croatian government changes in the Family Act, including legalization of registration of the same-sex partnerships. In March 2002, the Ministry of Defense publicly proclaimed that homosexuality is not an obstacle to join the armed forces. At the request of Iskorak, the Croatian Psychiatric Association (CPA) wrote a letter explaining their official position on homosexuality, stating that homosexuality cannot be characterized as an illness or any mental disorder. The same request was sent to the Croatian Medical Chamber on two occasions. As of early 2003, the Chamber had not replied. (End of update by S. Sagasta & G. Bosanac)]

### C. Activism, Problems, and Perspectives

By the end of the 1980s, the development of civic initiatives in the former Yugoslavia had some impact on gay issues. The beginning of the war put an end to further organizing and the promotion of gay and lesbian rights. The initiative was renewed in 1999, prompted by the opening of the first gay nightclub. An NGO was founded and registered, but to this day, it has not had its public debut. At the end of 2000, a fragmentary discussion of same-sex marriage began, which included several lawyers and politicians. However, it received almost no publicity.

If one can judge by mailing-list discussions on gay Web pages and personal communications, there is a palpable dissatisfaction with the state of human rights among the Croatian gay population, especially in regards to marriage and child adoption. However, gay men still seem to be reluctant to voice their interests in the real social arena.

Feminist NGOs were the starting point for lesbian organization in Croatia, and they have remained the main support. Within the women's organizations, there were a couple of lesbian women whose efforts made a lesbian network possible. In the second half of the 1990s, Kontra was founded to motivate lesbian women from all over the country to establish a communication network. It was envisioned as a community that would join the strivings and activities of lesbian women from small towns, as well as the capital, and link them to similar international organizations. Kontra's main activity is a lesbian SOS hotline—"for women who love women." It was launched on November 24, 1997. In addition, Kontra activists organize gatherings, lesbian film evenings, and lesbian exhibitions, workshops, and lectures. Parallel with the founding of Kontra, a lesbian publishing project was launched. Because Press is oriented toward the

improvement of lesbian culture and literature. In 1998, the first collection of Croatian lesbian poetry (Sagasta 1998) was published, as well as a lesbian fanzine, *Just a Girl*, serving as a discussion forum by lesbians for lesbians and a source of information for lesbian women in Croatia.

[Update 2002: The first officially registered lesbian group, LORI, was founded on October 19, 2000, in Rijeka. It is significant that the local government provided LORI with office space. In 2001 and 2002, LORI accomplished three projects: establishing an Internet center and a reference center, and initiating a research study funded by the central government to investigate media coverage of homosexuality in Croatia. The results point to a marginal position of gays and lesbians in Croatian society. Interestingly, the media covers almost twice as many stories of male homosexuality than female homosexuality (LORI 2001). In 2002, LORI started educational programs for lesbian women. LORI's activists are organizing numerous workshops dealing with the media's representation of homosexual rights, European Union and United Nations laws concerning human rights, collective action and lobbying, and so on.

[On January 12, 2002, a new GLBT NGO called Iskorak (Coming Out) was founded in Zagreb and immediately became a fact of public life because of an intensive media promotion. Within a few months after the registration, Iskorak had more than 100 members, and in August 2002, a branch was founded in Osijek, the largest town in Eastern Croatia. Together with the lesbian NGO Kontra, Iskorak launched a campaign for legislation changes designed to improve the legal status of sexual minorities. A national Internet gay portal ([www.gay.hr](http://www.gay.hr)) and a GLBT e-zine were launched; within a few months, the website was receiving more than two million visits (hits) per month. Also, in 2002, Kontra established the first Croatian lesbian library.

[In April 2002, gay and lesbian NGOs, together with other citizen initiatives for gay and lesbians rights, founded the National Coordination of LGBT Groups. As a logical result of these developments, Kontra and Iskorak decided to organize the first Gay Pride in Croatia, called *Iskorak Kontra Predrasuda (Coming Out Against Prejudice)*. The Croatian Gay Pride Organization Committee was elected with a task of raising homosexual visibility in Croatian society. Gay Pride was held in Zagreb on June 29, 2002, as a legitimate meeting of Croatian citizens. There were between 200 and 300 participants protected by almost an equal number of special police forces and security officers. Five Parliament members joined the Pride event, together with the Minister of Interior Affairs. A group of protesters, mostly skinheads, shouted insults and tried to stop the march. Real violence took place after the march, when about 20 persons were attacked and beaten in the streets. Shortly after the Pride event, a strongly negative reaction to the march appeared in the official (and most-influential) Catholic newspapers in Croatia, *Glas Koncila. (End of update by S. Sagasta & G. Bosanac)*

#### D. Bisexuality

Croatian society treats bisexuality almost the same way as it treats homosexuality. Both bisexual and homosexual men and women are "invisible." The only difference is that, whereas homosexuality occasionally finds its way into the press, this never happens with bisexuality. At the moment, there is no specific bisexual activity; bisexual men usually gravitate toward the gay community.

The relationship between the gay and bisexual populations is intriguing. Among gay men, one can often hear that bisexuals are in fact gay men who are unable or unwilling to accept their homosexuality. Although there are no reliable data on the number of bisexual men, most gay men are con-

vinced that it must be high. One often encounters men in committed heterosexual relationships who seek male sexual partners. Some of them readily admit that "It is much easier to live a double life, than to be exposed." As mentioned before, many gay men recall their bisexual attempts as a phase in life.

### 7. Gender Diversity and Transgender Issues

It is very difficult to get insight into the prevalence of gender-conflicted persons in Croatia. No public data exist, but almost 100 hospital admissions a year have been attributed to diagnoses that can be related to transgender or transsexual health problems.

Transvestites, transgenderists, and transsexuals can be regarded as a phenomenon with marginal public concern. The country's development after the disintegration of the former Yugoslavia has turned the public interest to other more-immediate concerns of daily life, such as overall well-being, unemployment, and related problems, socio-economic differentiation, and other pressing matters. However, gender-conflicted persons have been recognized, and the phenomenon has been presented in the media. In contrast to a decreasing ethnic tolerance in the last decade, public opinion regarding gender-conflicted persons has shown positive development. One could say that there is a public "silent approval" and acceptance of gender-conflicted persons. Their specific needs have been approved and their specific ways of living have been accepted.

On the other side, one could say there is a "silent disapproval" of transgender intervention among the medical professions. In spite of the absence of legislative obstacles to sex-change operations—since 1993, a person can request the change of sex in the state register—the procedure is very complicated because of the resistance of medical professionals to become involved in such procedures. Psychiatrists tend to demand extended psychological testing, counseling, and prolonged psychotherapy before approving sex-reversal surgery. Surgical procedures and hormonal treatments are difficult to fit within the health-insurance scheme, causing economic obstacles to sex change. There is neither a special institution nor doctors educated for transgender patients. A few sex-assignment-surgery procedures have been performed each year, but it is reasonable to believe that the hidden demand for transgender interventions might be much higher.

Legal issues related to sex changes are also complicated, but the law defines the problem, and the new gender status can be legally recognized. Gender-conflicted persons have not yet been organized either in formal organizations or in informal support groups. At the moment, it seems that the Internet is the most significant source of information and (international) support for transgendered people in Croatia.

[Update 2002: In 2000, *Tijelo Žene (Women's Body)*, a novel on the phenomenon of transsexualism, interesting for both its artistic and sociocultural perspectives, was published in Zagreb (Bakarić 2000). In spite of its detailed and well-researched treatment of the subject, which included a fictional political turmoil caused by the public coming-out of a male-to-female transsexual, the novel did not gain wide attention. (End of update by A. Šulhofer)]

### 8. Significant Unconventional Sexual Behaviors

#### A. Coercive Sex

##### *Child Sexual Abuse, Incest, and Pedophilia*

The child sexual abuse issue is relatively new in Croatia. It has been highlighted in the past few years because of an increase in media coverage and the efforts of professionals

working in the field. This, in turn, has led to an increased public awareness that cases of sexual abuse do occur in Croatia. Greater awareness from both professionals and the public has had an effect on the process of reporting cases of child abuse. The data from the Ministry of Internal Affairs show a substantial threefold increase in the number of reported cases of sexual offenses against children (under the age of 14) during the past five years: 1995, 63 cases; 1996, 89 cases; 1997, 72 cases; 1998, 140 cases; and 1999, 207 cases.

Along with the increased awareness, there have been a few other factors contributing to this change. One has been the formation of a special department within the police force. The Department Against Juvenile Delinquency now employs specially educated and trained professionals dealing with the issue of child sexual abuse. Furthermore, in October 1997, a hotline for abused and neglected children, Brave Telephone, was established. In the last three years of its existence, the number of calls has tripled. More than 20 calls are received each week during a six-hour daily shift.

Unfortunately, there is still a serious lack of educated professionals and dedicated institutions. The problems of identification and prosecution of child sex abuse cases (in 1999, five persons were convicted of child rape), treatment of victims and families, and possible interventions remain. It is often the case that some professionals fail to report a case because of their ignorance, lack of information or courage, or simply because they resent legal obligations (court testimony, etc.). Another problem of vital importance is the slow implementation of the existing laws that protect children in cases of sexual abuse, both in court and during the investigation. There is no multidisciplinary approach during interviews, the legislative process goes on for a long period of time, and the predominant attitude is to dismiss the child's statement because of the lack of the court-admissible evidence. Recently, there have been some new developments in the court procedure that allow for the child's testimony to be taken in front of a camera. Because it is a skilled professional who is conducting this filmed interview, which has the legal power of testimony, this situation is not nearly as stressful as the one in which the child has to confront the alleged perpetrator and be cross-examined (Šuperina & Garačić 2000).

[Update 2002: In the last few years in Croatia, the awareness of the experts and the public about child sexual abuse has grown substantially, and more attention has been drawn to the problem. However, there has not been enough research done on this subject concerning the incidence and rate of abuse or the causes and consequences of abuse. Reasons for this lack of research include not only the fear or resistance of people when it comes to discussing such a "taboo" topic in a relatively conservative society, but also the lack of scientific knowledge and the nonexistence of the validated instruments for measurement of abuse experiences.

[Another difficulty in assessing the data on child abuse involves the ethical problems regarding children as participants. Multiple questioning may additionally traumatize the child, especially the sexually abused child. Ethical issues arise when the scientist conducts research and establishes that there are children in the sample with abuse experience and, at the same time, is not allowed to use the data to provide concrete help to the child. Also, parents may not allow their children to participate in such research, and the children's therapists may find that questioning is contrary to the current therapeutic goals. On the other hand, clinical samples are usually biased in the direction of the presence of more severe problems.

[Since the original chapter on sexuality in Croatia was written in 2000, the following research studies on the sexual abuse of children were carried out:

- [The Child Abuse Experience Inventory (Karlović, Buljan Flander, & Vranić 2001), based on The Comprehensive Child Maltreatment Scale for Adults (Higgins & McCabe), was validated on a sample of 328 students at the University of Zagreb. It is a questionnaire measuring different forms of child abuse, including sexual abuse. The students were given questionnaires, which they could take home with them and return anonymously. All together, 45% of the participants returned the questionnaires. Internal reliability of the whole inventory and of the Sexual Abuse Scale were shown to be high. The principal component analysis of the whole inventory extracted four factors: 1) emotional abuse and witnessing emotional abuse; 2) mild forms of physical abuse and witnessing physical abuse; 3) emotional neglect and witnessing neglect; and 4) severe forms of physical abuse and sexual abuse. Apart from screening purposes, the inventory can be useful as a basis for structured interviews.
- [In another retrospective study (Gabelica, Karlović, & Vranić 2002) carried out on 505 university students, some form of sexual abuse in childhood was experienced by 19% of respondents (25% of the female subjects and 11% of the male). Abusers are more often male family members (29% of the abused participants experienced sexual abuse by family members), or male strangers (for 52% of these participants). Sexual abuse by a friend or known person outside the family was experienced by 39% of these participants. Some participants experienced abuse from multiple sources, not just one person. The most-often experienced forms of sexual abuse are: sexually touching a child's body, genitals, or breasts, masturbating in front of the child, showing pornography, making a child touch or masturbate the adult, penetrating the child's genitals with a finger, oral sex, and so on.

[When it comes to the age at which the abuse was experienced, about 15% to 20% of the abused population experienced it at an age below 5, 39% between age 6 and 8, 26% between age 9 and 11, and 48% between age 12 and 14. It is obvious that some experienced abuse over a number of years. Regarding the awareness of what was happening during the abuse, 53% of those who had the experience answered that they were aware of it, 19% answered they were not aware of it, while 28% were not sure.

[Most of those with abuse experience (62%) have not told anyone about what happened. Some of the reasons were: not thinking it was necessary, not knowing where to turn for help, being ashamed, being afraid of threats, and thinking no one would believe it. Regarding their present need for professional help, 57% of those with sexual abuse experience feel they do not need professional help, 14% feel they do need it, while 29% are not sure about it.

- [In another research study, child sexual abuse experiences were assessed on a sample of 310 high-school students of Sisačko-Moslavačka County in Croatia. The analyses point out that 12% of the participants (18% of the girls and 5% of the boys) had experienced some form of sexual abuse in childhood. (As in the previous study, all forms of sexual contact with an adult before the age of 14 were coded as sexual abuse.) In our view, these numbers constitute a conservative estimate. It is possi-

ble that the method of collecting data (group testing) affected the results, since the participants could not feel completely anonymous.

[A big step towards a systematic approach and multidisciplinary work in the field of child sexual abuse will be the opening of the Abused Children Center in Zagreb, which was expected in late 2002 or early 2003. This will be an independent institution established by the local government and supported by the Ministries of Social Welfare and Health. The institution would integrate a variety of activities, including provision of direct help for abused children and their families, educating professionals, supervising their work, conducting scientific research, working on raising public awareness within the field of child abuse, and forensic evaluation. (*End of update by G. Buljan-Flander & A. Karlović*)]

### Sexual Harassment

Sexual harassment became a public topic only recently. Media coverage is sporadic and unsystematic, which reflects the lack of a commonly shared definition. Thus, raising awareness about the problem is still in its infancy. Like all other forms of sexual coercion, sexual harassment is, above all, gender related. Far more women than men are its victims, whereas the perpetrators are in most cases men.

There is no integrated approach to the problem. If anything, it is usually sexual harassment at the workplace that is discussed. So far, there have been a couple of television shows on the subject, as well as a booklet published by a nongovernmental agency. Other forms of sexual harassment—obscene phone calls, sexual suggestions whispered or yelled in the street, sexist jokes in schools and academia, etc.—are only rarely mentioned. Not surprisingly, most forms of sexual harassment remain unrecognized, i.e., they are not perceived as problematic. Women's complaints are often dismissed as hysterical, humorless, or simply malicious. It is not rare that a harassed woman refrains from voicing her protest, fearing that she will be perceived as overreacting.

Sexual harassment is not punishable by criminal law, but it can be part of an offense against an employee's duties. At the moment, there is only one big company in Croatia that has incorporated sexual-harassment prevention and sanctioning. Furthermore, its workers have participated in gender-equality training provided by a women's organization.

[*Update 2002*: At the beginning of 2002, the Croatian public was overwhelmed with the issue of sexual harassment in the Croatian Army. Two high officers were accused of the sexual harassment of 18 female office workers employed in a military complex in the city of Bjelovar. Given the fact that the Ministry of Defense and the military in general are notorious for their rigidity, conservatism, and male-dominated personnel and atmosphere, the harassed women were reluctant to complain to their officers. Instead, they wrote a letter to women Members of Parliament and a head of the Parliamentary Committee of Internal Affairs and National Security. The latter called a meeting with women from the NGOs for women's rights and from the Parliamentary Committee for Gender Equality (PCGE), which resulted in a series of public letters of protest requesting an investigation of this case of sexual harassment. Under this public pressure, the Ministry of Defense created a second investigating commission. The first investigation, by an entirely male commission, reached the conclusion that there was no inappropriate behavior in the case. A second investigation, including members of both sexes and a feminist psychologist, was still investigating as of November 2002. However, three major results have already been achieved:

1. the accused officers, while under the disciplinary procedure, are out of office and unable to scare or influence the witnesses;
2. all the plaintiffs were able to keep their posts, despite the fear and threats of the loss of employment if they went public with the problem; and
3. important legal changes were introduced into the Law on Military Service. Sexual harassment became one of the legitimate reasons for undertaking internal discipline procedures, and sexual harassment is now recognized as an act that violates the rights of employees (Article 58).

[As for sexual harassment in higher education, several research projects were conducted within Croatian universities in the last couple of years (Leinert-Novosel 2000; Leinert-Novosel & Štingl 2001; Janeković Roemer, Tadinac Babić, & Štulhofer 2002: [http://www.ffzg.hr/dokumenti/suz\\_ff.pdf](http://www.ffzg.hr/dokumenti/suz_ff.pdf)). The results of these research studies have been discussed at roundtables and public panels, and published in a number of articles and interviews in daily newspapers and magazines. This publicity may have influenced the readiness to report cases of sexual harassment in higher education, as suggested by an increase in reporting following the media attention (Mamula 2002). (*End of update by M. Mamula*)]

### Rape

Sexual violence, especially rape, is still a taboo, a topic rarely discussed. In spite of the efforts of women's organizations to sensitize public opinion, the general perception is that rape is an extremely rare crime. In addition, rape myths are occasionally evoked, resulting in a trivial framing of sexual violence. Even people who encounter victims of rape in their line of duty, such as healthcare workers, the police, and court officers sometimes express similar views. This directly influences the number of filing charges and the prosecuting of such cases. On the other hand, women's experiences and data collected by women's groups and nongovernmental organizations suggest that sexual violence in Croatia is much more frequent than presented by the police, criminal courts, or media. According to the records of the State Bureau for Statistics, there were 100 cases of rape reported to the police in 1999. The prosecution was started in only 66 cases; 55 persons were convicted for rape and 13 for attempted rape (Šuperina & Garačić 2000).

However, if we take into account the records of women's organizations, the real numbers seem to be significantly higher. According to a preliminary analysis of data collected from five women's counseling centers (called Stop the Violence Against Women), for each reported rape, there may be up to 19 unreported rapes. In a study carried out on a sample of urban women between 18 and 48 years of age, only 3% of all cases of sexual victimization were reported to the police (Štulhofer 1999b). The reasons given for not reporting rape are numerous. Usually the perpetrator is an acquaintance, friend, or lover of the woman, which makes reporting socially more complicated, not to mention the additional difficulties such relationships create in the legal case. Furthermore, women often face an embarrassing and frequently humiliating court procedure, disbelief, and even ridicule. Police and court officers do not receive any training in dealing with victims of sexual violence. Finally, many sexually assaulted women, especially those living in rural areas, are unwilling to disclose what happened to them because of shame and/or fear of stigmatization, both within and outside their families.

According to the 1997 Criminal Code, rape is defined as coercive coitus or a coital equivalent (anal or oral penetration), and penalties range from 1 to 10 years of prison. It is

important to note that in present legislation, since 1997, rape is considered as a criminal offense both inside and outside of marriage. The law proscribes that if an offender and a victim live in a marital union, the offender will be prosecuted only by the victim's private lawsuit. Because the recognition of marital rape is a relatively recent legal innovation in Croatia, and also a rarely discussed one, a large number, or even the majority, of women may be unaware of it (Šuperina & Garačić 2000).

### [*Trafficking in Women and Children*

[*Update 2002:* Despite many reports about the growth in the trafficking of migrants to the West from Central and Eastern Europe and the Commonwealth of Independent States (the former Soviet Union), very little research has actually been conducted on this subject. Reports are often based on journalists' investigations and police records. Main routes from the Balkan region to Western Europe seem to lead from the Federal Republic of Yugoslavia to Hungary and Austria. Alternative routes lead through Bosnia and Herzegovina and Croatia to Slovenia, or across the sea from the Croatian coast to Italy.

[Croatia seems to be a transit country for trafficking in women and children for sexual exploitation (TWCSE) en route to Western Europe. However, during the war, because of the presence of international military forces, many foreign women ended up in Croatian illegal brothels. Croatia shares its borders with Bosnia and Herzegovina and the Federal Republic of Yugoslavia, where illegal migrations and trafficking in women are very extensive. According to the Bosnia and Herzegovina report on TWCSE, most trafficked women enter Bosnia and Herzegovina illegally. From Moldavia, Romania, and Ukraine they are brought by car to Belgrade or Novi Sad. Traffickers have "collecting centers" in Serbia, where they keep these women until they arrange their travel to Bosnia and Herzegovina. Many women trafficked from Eastern Europe enter Bosnia and Herzegovina via Bijeljina. The staging area for trafficking, near Bijeljina, is a huge unregulated marketplace, known as "Arizona," with several brothels situated near the border between the two Bosnian entities, Croatia and the Federal Republic of Yugoslavia. At this marketplace, most women are eventually sold to Bosnian, Croatian, or Slovenian traffickers.

[Over the last two years, counter-trafficking activities in Croatia have been initiated by international organizations in an attempt to target all relevant partners. As a result of this work, a roundtable on trafficking in human beings was held at the Organization for Security and Co-operation in Europe (OSCE) Mission to Croatia in cooperation with the International Organization for Migration (IOM) at the end of 2000. The reason behind the meeting was the necessity to build up a partnership among governmental agencies/institutions, parliamentarians, international organizations, embassies, and international and national NGOs in order to initiate and implement better legislation, law enforcement, prevention activities, and victim assistance and protection programs. The outcomes were the initiation of the National Counter Trafficking Body (though its coordinator was not appointed until June 2001), and subsequently, the inclusion of counter-trafficking activities in the National Plan of Action drafted by the Government Commission for Gender Equality. In addition, a team of social researchers was employed to carry out an assessment study.

[The report was presented at the end of 2001, after more than five months of fieldwork, during which numerous interviews were held with police officers, clients, traffickers, bar owners, social workers, journalists, and, despite all the ef-

forts, with only a few trafficked women (Štulhofer, Raboteg-Šarić, & Marinović 2002). The research combined field interviews, content analyses of major Croatian newspapers and magazines, a public-opinion survey (regarding the perception and information on TWCSE), and an analysis of police records. In brief, the report pointed out the changing dynamics and structure of TWCSE in the post-war period, as well as numerous problems with policing—ranging from outright corruption to systematic minimization and misrepresentation of the problem. The authors suggested nine operative measures aimed at increasing the efficiency of combating smuggling-in people, increasing the efficiency of combating TWCSE, and establishing programs providing aid to the victims of TWCSE.

[Following the recommendations and responding to the ensuing media campaign, Croatian authorities intensified collaboration with international organizations. Currently, a shelter house for the victims of TWCSE has been approved and the project is underway. Important legal reforms, informative campaigns, public education, and special training for the police and border patrols still need to be introduced in Croatia. (*End of update by A. Štulhofer*)]

## B. Prostitution

The available data concerning the scope of prostitution are very partial and more often based on estimates than on real documentation. So far, there has been only two social science studies on prostitution in Croatia, both of very limited scope. The actual number of prostitutes in Croatia, therefore, remains unknown. Here, as well as in most other countries, police reports represent the only source of information regarding the scope of prostitution. In 1999, there were 365 registered prostitutes in Zagreb only. (Some recent journalistic estimates go as high as 500.) If we talk about trends, there is a clear increase in the number of prostitutes registered by the police (120 registered in 1996 versus 365 in 1999), but it has to be taken into account that the forms, or types of prostitution, are changing too (Šuperina & Garačić 2000).

Croatian law defines prostitution and sexual solicitation as a punishable offense against public order and morality. Convicted persons are fined or sentenced with up to 60 days of prison time. On the other hand, organizing prostitution (pimping) is a criminal act. The police generally focus on prostitutes who are lower in the hierarchy, that is, those who solicit on the streets, while prostitutes from hotels, massage parlors, and the like, are usually "protected," often because of their clients' social status. Because of the legislative regulations, sex workers are not only stigmatized and marginalized, but also deprived of any kind of healthcare. There are no state or NGO-sponsored programs offering medical, legal, or educational assistance to sex workers. Recently, the STD and HIV/AIDS concerns were stated as the main reason behind a low-key initiative for decriminalization of prostitution in Croatia.

The post-communist turmoil (transition) and related social costs, the war and the arrival of international military forces, the development of a market economy and booming entrepreneurship, as well as the opening of state borders have led to the increase in prostitution and the development of different forms of prostitution, previously unknown in Croatia. This mostly applies to massage parlors, escort services, call girls, and nightclubs. Contemporary prostitution in Croatia generally exists in three forms: street prostitution, the so-called cellphone prostitution, and the elite prostitution.

The majority of women who solicit on the streets are Croatian (70%), but there is also a significant number of

women from Bosnia and Herzegovina. The majority of elite prostitutes, working in nightclubs, hotels, or escort agencies, come from Eastern Europe, mainly from the Ukraine (52%). Only 10% of the high-class prostitutes or call girls are local women. A comparison of the age of street and elite prostitutes reveals that street prostitutes are significantly older, generally 39 to 43 years old, than elite prostitutes (24 to 28 years of age). Another significant difference between street and elite prostitutes is their education. Whereas most street prostitutes have only an elementary-school education—none of them has any college or university education—those of higher rank have, on average, completed secondary-school education. In addition, every fifth elite prostitute has a college or university degree (Šuperina & Garačić 2000).

As has already been stated, the war, the arrival of international forces, and the social costs of transition have, both independently and combined, prompted the growth of prostitution in Croatia. There seems to be a growing number of trafficked women from Eastern Europe feeding this growth. According to police reports, most of them came illegally to Croatia in the hope of finding good paid work in nightclubs, massage parlors, and the like. Of those arrested and then deported, 47% have been working and living in nightclubs.

[Update 2002: In September 2002, without warning, the Minister of Internal Affairs announced his initiative to legalize prostitution. The statement immediately provoked a heated public debate. On one side, there are those who advocate decriminalization and fiercely oppose legalization, claiming that legalization will benefit the state budget, but not sex workers. On the other side are those who claim that legalization would create better conditions for control and official supervision over the activity. Interestingly, both sides agree that Croatian society is not yet ready for the legalization, having in mind the potential message this reform could send to the large contingent of the unemployed. So far, the Church has been surprisingly silent on the issue. (End of update by P. Hobljaj)]

### C. Pornography and Erotica

Croatian law does not prohibit the production and distribution of pornography, unless it is child pornography. However, legal sanctions penalize the broadcasting of pornography on radio and television. Although there is no explicit legal definition of “pornography,” public exposure and the sale of publications with explicit sexual materials are prohibited, unless wrapped in non-transparent covers, everywhere, except in sex shops. In reality, explicit magazines are sold on every newsstand.

There are a dozen sexually explicit magazines currently sold in Croatia. Soft-core magazines include Croatian editions of *Playboy* (circulation about 45,000) and *Penthouse*. Sex shops can be found in all larger cities. Explicit videotapes are available in all video-rental stores. (According to a recent study carried out on a metropolitan sample, 26% of women and 41% of men find sexually explicit movies “considerably arousing.”) The video revolution has driven all but one X-rated movie house, located in the Croatian capital, out of business. As elsewhere, the fast-growing popularity of the Internet offers wide new possibilities of pornography consumption. Although their popularity is in decline, it is interesting to note that peep-show theaters are registered as providing “cultural entertainment.”

[Update 2002: Croatian sexually explicit Internet pages started to appear only five years ago. By the beginning of 1998, the first sex site was registering up to 10,000 daily visits. In the meantime, several commercial erotic sites were started, as well as numerous amateur ones. There is no

special legal treatment of these sites, and the only requirement for starting a commercial sexually explicit website is to register a company offering online services. (End of update by P. Hobljaj)]

## 9. Contraception, Abortion, and Population Planning

### A. Contraception

How common is unprotected sex among Croatian youth? Recent surveys found that 53% of adolescents used condoms during their first intercourse; at the most recent intercourse, 48% of girls and 57% of boys used condoms. Ten years ago, the figures were 10% and 24%, respectively. The surveys confirmed that younger generations are more likely than older generations to practice safer sex at first intercourse. Still, 22% of sexually active adolescents use no means or methods of contraception, and 21% use unreliable methods such as coitus interruptus or natural methods. Only 6% of surveyed adolescents use hormone pills. Forty percent of adolescent girls and 43% of boys believe that the pill jeopardizes the health and looks of young women.

Although condom use has increased substantially, contraceptive use is far from consistent. Less than half (43%) of urban adolescents in Croatia use some form of protection regularly. We can only speculate about the rates of contraceptive use in rural areas, but they are most probably significantly lower. Because Croatia lacks any systematic sex education, inconsistent contraceptive use should not be surprising. According to Hiršl-Hečej, Šikanić-Dugić, and Dobravec-Poljak (1998), 67% of the surveyed secondary-school students received basic information about family planning and contraceptives in schools. Only 46% of them have talked with their parents about those issues.

In Croatia, teenage women can obtain hormonal pills from a gynecologist, but the low-dose pills appropriate for this age are not covered by medical insurance. Their high price makes them unaffordable for a large number of young women. The majority of contraceptives are not included in the national health-insurance system. Reproductive health and contraception counseling centers for teenagers are extremely rare, and there is a pronounced deficit of youth-friendly reproductive health services, birth control counseling, and distribution of contraceptives in Croatia.

Sexual behavior and reproductive health are still sensitive issues for youth, issues fraught with social taboos and personal inhibitions. The major source of information about protection from pregnancy and sexually transmissible diseases (STDs) are teen magazines and television. Knowledge about STDs is fragmentary, except for HIV/AIDS. Less than a quarter of adolescents have ever heard of chlamydia trachomatis (16%) and human papilloma viruses (23%). However, the knowledge and awareness of HIV/AIDS has significantly contributed to the increased use of condoms. Although the share of adolescents not using contraception has decreased and the number of adolescents using condoms has increased, there is still a high percentage of sexually active adolescents who use no protection. This reflects the lack of sexual and health education, accessibility and availability of counseling services, and affordability of contraceptives.

Because no representative sex-behavior study has ever been carried out, data on adult contraceptive use are fragmentary and illustrative at best. In a sample of metropolitan residents between 18 and 48 years of age (Stülhofer 2000), 30% stated that they always use some form of protection. On the other hand, almost every fifth respondent (19%) never uses contraception. Most urbanites use condoms (43%) and

hormonal contraception (25%). Of other methods, 14% use the IUD, 6% use "natural methods," and 10% practice coitus interruptus (withdrawal). Among those who have one-night stands, more than a third (35%) never use condoms. A slightly lower percentage of respondents (32%) use condoms every time they have a brief sexual experience. When asked if the responsibility for contraceptive use should be placed more on women than men, 27% of respondents agreed and 49% of respondents disagreed with the statement. Among the latter, women and younger respondents were overrepresented.

### B. Teenage (Unmarried) Pregnancies

Only 5.2% of all live births in 1998 were to mothers 15 to 19 years old; slightly more than one quarter of these (25.7%) were unmarried. There has been an overall decline in adolescent birthrates in the last decade. The percentage of total live births to mothers under age 20 was 8.4% in 1989, which decreased to 5.2% in 1998. In 1991, the adolescent birthrate, live births to women under 20 years of age per 1,000 women aged 15 to 19, was almost 30; in 1998, it decreased by almost half (16.5). It is unclear whether and how much the decrease in teenage pregnancies was caused by changes in female education and living conditions during the transition period.

Aside from the decline in adolescent birthrates during the last decade, another important change has occurred. Marriage rates have declined even more quickly, and more births than before are occurring among *unmarried* teen mothers. The share of nonmarital births to mothers under the age of 20 was 17.1% in 1989, which increased to 25.7% in 1998.

### C. Abortion

Since 1978, abortion can be induced on the request of a pregnant woman until the tenth week after conception. After ten weeks, an abortion has to be approved by a professional committee, taking into account medical reasons or the fact that the conception is a consequence of a sexual crime. A 16-year-old woman can seek an induced abortion by a simple request. For younger persons, the consent of the parents or another legal representative is required. In spite of legal obligations, some hospitals refused to perform abortions during the 1990s, following the neo-conservative, pro-life ideals of the right-wing government. This refusal to perform abortions was based on an organized and coordinated conscientious objection of gynecologists "following their religious and moral feelings." As of late 2000, abortion was not included in the health-insurance system. The costs, exceeding US\$200, are roughly two thirds of an average monthly salary.

In 1999, a little over 8,000 notifications of legally induced abortion were received, a continued decline in comparison to previous years. Most women who requested an abortion were between 30 and 39 years of age and already had two children. According to official statistics, the incidence of abortion remained stable for the 15 years prior to 1990, with about 40,000 to 50,000 abortions per year, or 70 to 80 abortions per 100 live births. In the last ten years, the number of legally induced abortions has declined sharply: 1990, 38,644; 1992, 26,223; 1994, 19,673; 1996, 12,339; and 1999, 8,064. However, these statistics do not include abortions carried out in private clinics, a practice that is illegal. The abortion rate (the number of legally induced abortions per 1,000 women age 15 to 49) was 34 in 1990 and 7 in 1999! The abortion rate among women under age 20 was 8 in 1991, which decreased to less than 4 in 1998. The abortion ratio, abortions per 100 live births, was 84 in 1990, which decreased to 19 in 1998.

### D. Population Programs

In the past three decades, the number of births in Croatia has decreased by more than a third, from 69,229 in 1979 to 45,179 in 1999. The falling child delivery trend in younger age groups (below age 20) and the rising child delivery trend (above the age of 35 years), characteristic of the developed countries, have also been found in Croatia. The decline in number of births that has lasted for years was accelerated by the war-related events. As a result, Croatia entered a depopulation trend (negative population growth) in 1991. The war was only one of the factors triggering negative population growth. Among others were and still are the rising unemployment rate, decreasing social and economic well-being, and other transition-related factors. During the 1990s, the government made some efforts to promote population growth. Aside from occasional nationalistic and patriarchic declarations emphasizing motherhood as the prime female contribution to the new Croatian State, there was hardly any clear and systematic policy. A limited amount of money was provided as a "child incentive," both as a bonus and tax reduction. Families with three or four children received additional benefits. None of these efforts have produced any effect.

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

#### *Incidence, Patterns, and Trends*

At present, the incidence of the "classical" sexually transmitted diseases (syphilis and gonorrhea) and HIV/AIDS is relatively low. There are no signs of an STD epidemic developing as a consequence of war-related and/or transitional conditions. The incidence of gonorrhea and syphilis steadily decreased during the 1980s and the 1990s, as shown in Table 1. Interestingly, the opposite trend is present in the adolescent population. The incidence rate of newly registered cases of syphilis and gonorrhea among individuals under the age of 20 was 8.6 in 1989, which increased to 12.9 in 1998.

Our clinical experience and STD research reveal a notable increase in the incidence and prevalence of all other sexually transmitted diseases, including chlamydia trachomatis, HPV infections, genital herpes, nonspecific urethritis, hepatitis B, pelvic inflammatory disease (PID), and dysplasias (CIN), particularly among adolescents. Within various samples of sexually active adolescent women in Croatia, the prevalence of chlamydia was 10 to 27%, HPV infections 9 to 12%, candida infections 28%, and abnormal cervical cytological findings of PAP smears (CIN I, CIN II, CIN III) 22%.

It should be noted that the accurate number of sexually transmitted diseases is currently unknown, because the

**Table 1**

#### The Incidence of Syphilis and Gonorrhea

Incidence of Syphilis		Incidence Rate of New Cases
1985	129 cases	
1989	80 cases	1.71 per 100,000 inhabitants
1995	50 cases	
1998	14 cases	0.31 per 100,000 inhabitants
Incidence of Gonorrhea		Incidence Rate of New Cases
1985	1,597 cases	
1989	446 cases	9.52 per 100,000 inhabitants
1995	52 cases	
1998	48 cases	1.07 per 100,000 inhabitants

health statistics are notoriously incomplete. Presumably, the incidence of the so-called “new” sexually transmitted diseases equals the rates in Western European countries. The incidence of the “classical” STDs seems to be much lower than reported in Eastern Europe.

#### *Availability of Treatment and Prevention Efforts*

The law requires that all new cases of the “classical” STDs must be reported to the central epidemiological service and the National Institute of Public Health. Infected persons are required to disclose information about sexual partners to health professionals. Diagnosis and treatment are easily available in all larger cities.

### **B. HIV/AIDS**

#### *Incidence, Patterns, and Trends*

Croatia is among the countries least affected by the HIV/AIDS epidemics. The incidence rate of AIDS in Croatia is less than 4 per 1,000,000 inhabitants. HIV transmission occurs through sexual activity and needle sharing. Because of the social stigmatization of homosexuality and the complete absence of relevant behavioral research, there is no systematic information about male-to-male HIV-infection routes.

The first case of AIDS in Croatia was reported in 1986. In the next 13 years, there were 151 other cases, 84% of them involving male patients. As of the end of 1999, almost two thirds of those patients had died. The number of new cases remained stable during the 1990s, with 11 cases (1989), 14 cases (1993), 15 cases (1995), 16 cases (1997), 12 cases (1998), and 15 cases (1999). The structure of all AIDS cases between 1986 and 1999 is shown in Table 2. Regarding young people, one case has been reported in the 15-to-19 age group and six in the 20-to-24 age group.

In recent years, the proportion HIV/AIDS-infected persons who are homosexual or bisexual has decreased. At the moment, the prime risk group seems to be composed of heterosexual men whose profession requires spending long periods of time abroad, such as sailors. There are no new HIV/AIDS cases among hemophiliacs, confirming that blood products are controlled and safe; HIV testing is compulsory for blood donations.

The low incidence of HIV infection in Croatia is well-demonstrated by the results of preventive and anonymous screening for HIV. In the anonymous testing of 179,919 persons in 1999, only 45 were found to be HIV-positive, a very low percentage of 0.025%. The incidence is even lower among blood donors (0.001%). Keeping in mind that a rapid assessment study of heroin use in five Croatian cities in 1998 pointed out a widespread needle-sharing practice, there is still a surprisingly low percentage of HIV-positive persons (0.6%) among drug addicts (Ajduković, Ajduković, & Prišlin 1991).

#### *Availability of Treatment and Prevention Programs*

Triple antiretroviral HIV/AIDS therapy, consisting of a protease inhibitor plus two nucleoside analogue reverse tran-

scriptase inhibitors, is currently available in Croatia. Since 1999, the therapy is covered by the national health-insurance system. (The national insurance also includes the treatment following the accidental professional exposure of health workers.) Consequently, the proportion of HIV-positive individuals who developed AIDS-related symptoms has decreased substantially. The new prognostic techniques using viral-load tests have been available in Croatia since 1998.

Serological examination regarding HIV status was inaugurated in Croatia in 1986. Voluntary testing for HIV antibodies is encouraged, and counseling for HIV-positive persons is provided. According to a special instruction, health professionals are obliged to protect the anonymity of HIV-positive persons and AIDS patients.

An HIV/AIDS-prevention and control program prepared by the National Commission for HIV/AIDS Prevention in 1990 includes the implementation of a broad range of preventive measures. These include strict control of human blood products, relevant public education, staff training, and the development of diagnostic facilities. Several NGOs joined in organizing needle-exchange programs and educational campaigns that were usually focused on adolescents. In the second half of the 1990s, the Ministry of Health started a large and expensive campaign aiming at HIV/AIDS prevention among the general population. Brochures, fliers, television advertisements, and billboards promoting responsible sexual conduct were all over the country for more than six months. The main characteristic of the campaign was the way it specified the notion of sexual responsibility. It stressed the importance of sexual monogamy and alluded to condom use, although condoms were never mentioned by name nor graphically presented. The huge campaign completely refrained from providing the central piece of information regarding condoms in HIV/AIDS prevention. No evaluation study was ever carried out.

For the majority of the Croatians, the main source of information about HIV/AIDS is the mass media. Adolescents have more and more accurate information about AIDS than the rest of the population. As could be expected, attitudes toward HIV-positive individuals and AIDS patients are more negative among older generations. In the recent European Values Survey (Črpić & Rimac 2000), 46% of respondents in a nationally representative sample said that they do not want AIDS patients as neighbors.

#### *[Rapid Assessment and Response (RAR)]*

[RAR is a means for undertaking a comprehensive assessment of public health issues, and it is particularly useful for assessing complex public health issues, such as sexual behaviors, HIV/AIDS, and other sexual and reproductive health issues. RAR is triangulating data obtained through a series of quantitative and qualitative data sources and provides insights into patterns of risk behaviors, as well as suggesting outlines required for interventions.

[RAR research in 2001 focused on the assessment of risks associated with HIV/AIDS in especially vulnerable young people in Croatia—drug users, sex workers, and out-of-school youth (Kuzman, Mimica, Mardešić, et al. 2002). The field study was carried out in the four largest cities (Zagreb, Rijeka, Osijek, and Split). The team surveyed 265 adolescents and carried out 41 in-depth interviews and 15 focus groups. In addition, a number of professional service providers and policymakers were interviewed. The findings revealed that young people do perceive recreational drugs as influencing both the frequency of sexual contacts and condom use. Even so, accidental or unplanned sexual contacts often happen under the influence of drugs, and condom use (in these episodes) is sporadic at best.

**Table 2**

#### **Populations Affected by AIDS**

<b>Population</b>	<b>Percentage of Total</b>
Homosexual/bisexual individuals	46.7%
Heterosexual individuals	25.0%
Partners of HIV-positive individuals	10.5%
IV-drug users	9.2%
Hemophiliacs	5.3%
Children of HIV-positive mothers	1.3%

[Comparing the results of RAR with earlier research findings from school-based KABP surveys, it seems that HIV/AIDS and STD-risk perception is much lower among especially vulnerable youngsters. Only about 15% of the respondents report regular condom use. The major obstacle to condom use seems to be attitudinal, as young people of both sexes associate unprotected sex with a display of trust and confidence in the partner. There is also a widespread belief that condoms reduce sexual pleasure.

[The RAR study recommended several measures that would decrease the rate of HIV/AIDS-associated risk behaviors, particularly among people belonging to highly stigmatized groups, such as drug users, sex workers, and men having sex with men. In order to achieve a desirable impact, the issues of stigmatization and marginalization must be politically addressed. (*End of update by J. Mimica*)]

[*Update 2002*: UNAIDS Epidemiological Assessment: The reported incidence of AIDS in the last few years is between 1.5 and 4.2 per 1,000,000 population. Eighty-three percent of reported AIDS cases were acquired through sexual routes of transmission. Diagnosed HIV infections are reported to a national database. By the end of 2001, a total of 327 HIV cases were reported. The rate of reported syphilis cases remains at the range of 0.2 to 0.4 per 100,000 population.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	200 (rate: 0.1%)
Women ages 15-49:	< 100
Children ages 0-15:	< 10

[An estimated less than 10 adults and children died of AIDS during 2001.

[No estimate is available for the number of Croatian children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (*End of update by the Editors*)]

## 11. Sexual Dysfunctions, Counseling, and Therapies

In contrast to the broad public and medical attention to contraception and STDs, sexual dysfunction has never been an issue of great interest for Croatian medical professionals. There is no comprehensive approach to sexual dysfunctions that makes a rather strict distinction between different types of dysfunction. At least three different types have been recognized, and each is diagnosed and treated by a different medical specialist.

Sexual dysfunctions related to an underlying chronic disease causing the dysfunction, for instance, impotence in male diabetic patients or painful intercourse in postmenopausal women with vaginal atrophy, are considered as a complication of the chronic disabling disease, and accordingly, are diagnosed and treated by an internist, a vascular surgeon, or a gynecologist. Various medicament treatment possibilities are available for these medical problems, and most of them are covered by health insurance. However, surgical procedures, such as penile prosthesis implantation, are not available and patients in need have to be surgically treated out of the country.

Sexual dysfunctions related to psychological causes are considered a psychological medical problem. Impotence or sexual aversion caused by a psychological dysfunction is usually referred to a psychiatrist or a psychologist both to confirm the diagnosis and for treatment. The treatment includes psychotropic drugs or psychotherapy, both mainly available within the health-insurance scheme.

Finally, sexual dysfunctions related to partner-relation problems are considered a relationship problem. Mostly,

these conditions are confirmed by family doctors and treated by various experts: family physicians, psychologists, marital counselors, and others. If generated in the premarital relations of youngsters, these dysfunctional problems are regarded as the problems of adolescence. Treatments are based on different psychological approaches not always covered by health/social insurance.

This division in diagnostics and treatment of sexual dysfunction problems are the result of a lack of any specific education in sexual dysfunction. There are no specialists in sexology, and sexology courses in medical training are rare and insufficient. For that reason, there is no comprehensive approach to the treatment of sexual dysfunction. Moreover, because there is no medical data collection specifically on sexual health issues, it is impossible to get an insight into the incidence and prevalence of sexual dysfunction. As previously explained, these problems can be registered as complications of chronic diseases, psychological problems, or marital problems. In these circumstances, family physicians are regarded as the medical professionals who have more experience with patient complaints related to sexual dysfunction than any other specialty. However, there is no evidence to support that estimate, nor is there any evidence about how well the family physicians respond to patients' complaints.

[*Update 2002*: In 2001, the first research study on the prevalence of sexual dysfunctions was carried out on a community sample of 547 metropolitan women between 20 and 60 years of age (Štulhofer, Gregurević, Štulhofer, 2002). (A similar study of male sexual dysfunctions was in progress as of late 2002.) The results suggest that a significant proportion of women experience moderate to severe difficulties in sexual functioning: 14.5% report the lack of sexual desire, 9.2% arousal difficulties, 20.1% orgasmic problems, and 10.4% sexual pain problems. Altogether, 36% of the respondents seem to be suffering from one or more sexual dysfunctions. Noteworthy, homosexual and bisexual women report better sexual health than heterosexual women. [There has been no significant breakthrough in the diagnostic and/or therapy of sexual disorders, apart from the registration of Pfizer's Viagra. Following the registration, a series of educational seminars on erectile dysfunction was organized for medical doctors. The main agenda was to promote the new drug. Although registered, Viagra is not covered by the national health-insurance scheme. (*End of update by A. Štulhofer*)]

## 12. Sex Research and Advanced Professional Education

### A. Graduate Programs and Sexological Research

At the moment, sex research in Croatia is an exception, a strange enterprise within the social and medical sciences. There are no sexological institutes, research units, or programs educating future sexologists. Also, there is no sexological association or any related civic initiative at the moment. The reasons behind this sorry state of affairs are several. The main one seems to be the lack of any sexological tradition in Croatia before the 1970s. In addition, sex research is considered to be of marginal scientific importance, both within social and medical science circles. Consequently, very few scholars and/or practitioners have incentives to specialize in sexology, which, as mentioned, requires studying abroad. Finally, there is a funding problem. So far, sex research in Croatia has been financially supported either by international health organizations or by local popular journals.

A brief history of sex research in Croatia begins in the 1970s, when the first surveys exploring the sexual behavior and attitudes of primary and high school students were carried out by a group of gynecologists and social medicine specialists. Similar studies, mostly small-scale, continued in the next decade. Because almost all of them were marked by a lack of theoretical concept and by methodological and statistical naiveté, they have resulted in very limited advancement in scholarly understanding of the observed phenomena.

Recognition of the HIV/AIDS problem at the end of the 1980s prompted a new phase in sex research in Croatia, marked by the entry of the social sciences. As a result, the first (and still the only) large-scale sex study was carried out on a national sample of young people (Ajduković, Ajduković, & Prišlin 1991). Theoretically and methodologically well-grounded, it measured shared information on HIV/AIDS, related-risk assessment, and risk-taking behaviors. Unfortunately, societal concerns with HIV/AIDS were too brief and failed to produce more studies or engage more than a half-a-dozen psychologists. The third phase started in the mid-1990s, with a rising affinity for sexology among the younger generation of sociologists and psychologists. Stirred by a new undergraduate course, Sociology of Sexuality, which was offered at the University of Zagreb as the first course dealing exclusively with human sexuality in the history of Croatian higher education, this interest resulted in thematic issues on human sexuality in two leading Croatian social science journals. At the moment, it seems that sex research is gaining popularity among social scientists, but losing popularity within the medical sciences.

In recent years, only two semi-training programs have been offered. Both were designed and organized by medical experts. The first, Sexology for Family Medicine Practitioners, focused on providing general information on human sexuality to family-medicine practitioners. The second and more extensive program, Knowledge, Love, and Happy Family, offered comparable content to high school teachers and school psychologists. Occasionally, there are one-day seminars on child sexual abuse and STD and HIV/AIDS prevention. In the last couple of years, various nongovernmental organizations and women's groups began organizing seminars focused mainly on sexual harassment and sexual violence. A summer school in Family Planning, held once a year at the Inter University Centre (in Dubrovnik), is an interdisciplinary seminar discussing links between reproductive health issues, reproductive rights, sexuality, and sex education.

## B. Programs for Advanced Study

There are no graduate programs in human sexuality. Because there are just a few sex researchers in Croatia, with various scholarly backgrounds, future programs will necessarily have to be of interdisciplinary character. Considering the traditionally rigid divisions between disciplines, this seems to be an additional problem for the development of sexology.

There are no sexological journals in Croatia. However, in recent years, there has been a marked increase in the number of scholarly papers on human sexuality submitted to social science journals. It is promising that most of the authors are young scholars beginning their careers.

An international conference on sexuality in post-communist countries, Sexualities in Transition, was held in Dubrovnik in 2001. The conference brought together sex researchers from central, east, and southeast Europe, and the West. Focused on the impact of a macro social change (the transitional decade: 1989-1999) on various aspects of sexuality, this event may serve as a boost to Croatian sexology.

## Demographics and a Brief Historical Perspective

### A. Demographics

MARÍA D. CÓRDOVA

Cuba is the largest island (40,520 square miles, 104,945 km<sup>2</sup>) in the Cuban Archipelago, composed of the Isle of Youth and some 1,600 isles and cays. Located in the Caribbean Sea, at the entrance of the Gulf of Mexico, Cuba is the westernmost island of the Greater Antilles. Its north shore is washed by the Atlantic Ocean, and the east shore faces the Windward Passage. Cuba is bordered on the south by the Caribbean Sea and on the west by the Yucatan Channel. The Bahamas and United States are the nearest countries to the north, Haiti to the east, Jamaica and South America to the south, and Mexico to the west.

Since Cuba has an east-west-oriented, elongated, and narrow shape, its rivers cannot be long and plentiful. Among the largest ones are the Cauto in the eastern region and the Zaza in the central region. Some relatively low mountain ranges cross the Cuban territory. The most outstanding are: the Sierra del Rosario in the west, the Trinidad mountain range in the central region, and the Sierra Maestra in the east.

The climate is semitropical, with alternating dry and rainy seasons. June through November is the hurricane season. From 1800 to 2001, 176 hurricanes have battered the island of Cuba.

In December 2002, Cuba had an estimated population of approximately 11,217,680 inhabitants. The following demographic features are from the *Anuario Estadístico de Cuba 2001* (Oficina Nacional de Estadísticas 2002) and the *UNDP Informe del Desarrollo Humano, Anuario Estadístico de Salud* (MINSAP 2002), except where supplemented with data from *The World Factbook 2002* (CIA 2002) by the Editors (notated as [WFB]).

**Age Distribution and Sex Ratios:** 0-14 years: 20.9% with 1.06 male(s) per female (sex ratio) [WFB: 20.6%, 1.06]; 15-59 years: 64.5% with 1.01 male(s) per female [WFB: 69.3%, 1.01 (15-64 years)]; 60 years and over: 14.49% with 0.86 male(s) per female [WFB: 10.1%, 0.86 (65+ years)]; *Total population sex ratio:* 1 male(s) to 1 female [WFB]

**Life Expectancy at Birth:** *Total Population:* 76.15 years; *male:* 74.20 years; *female:* 78.23 years [*WFB: Total population:* 76.6; *male:* 74.2; *female:* 79.15]

**Urban/Rural Distribution:** 75.26% to 24.71%; the capital city of Havana has 2,181,535 inhabitants.

**Ethnic Distribution:** [*WFB:* mulatto: 51%; white: 37%; black: 11%; and Chinese: 1%]

**Religious Distribution:** [*WFB:* nominally 85% Roman Catholic prior to Revolution; Protestant, Jehova's Witnesses, Jews, and Santeria also represented]

**Birth Rate:** 12.4 births per 1,000 population [*WFB:* 12.08 births per 1,000]

**Death Rate:** 7.1 per 1,000 population [*WFB:* 7.35 deaths per 1,000]

**Infant Mortality Rate:** 6.2 deaths per 1,000 live births; in-hospital live births: 99.9% [*WFB:* 7.27 deaths per 1,000]

**Net Migration Rate:** -2.9 migrant(s) per 1,000 population [*WFB:* -1.21 per 1,000]

**Total Fertility Rate:** 1.6 children born per woman

**Population Growth Rate:** 0.23% (2.3 per 1,000 inhabitants in 2001) [*WFB:* 0.35%]

**HIV/AIDS** (1999 est.) [*WFB: Adult prevalence:* 0.03%; *Persons living with HIV/AIDS:* 2,800 (2001 est.); *Deaths:* 120.] (For additional details from [www.UNAIDS.org](http://www.UNAIDS.org), see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 97%; 99.1% of primary school-age children are actually in school; education is free and compulsory from age 6 to 14 [*WFB: male:* 96.2%, *female:* 95.3%, *total* 95.7%]

**Per Capita Gross Domestic Product** (*purchasing power parity*): 2,618 Cuban pesos in 2001 (adjusted to the 1997 rate; official exchange rate: 1 Cuban peso = 1 USD) [*WFB:* \$2,300]. The GDP increased 3.0% during 2001, thus continuing a positive trend that began in 1995. However, this accumulative increase did not make possible the recovery of the standard of living and the basic social services (health, education, and housing) that prevailed prior to 1990. The lack of foreign investment and foreign exchange are the greatest obstacles for economic growth. According to the HDI, Cuba ranked 55 among 173 countries in 2002. [*WFB: Inflation:* 7.1%; *Unemployment:* 4.1% (2001 est.); *Living below the poverty line:* NA]

In Cuba, the State is fully responsible for the healthcare of the population. Health is conceived as a fundamental aspect of the quality of life and is also a strategic objective in societal development. The entire population has access to free medical services. In every neighborhood, there are a family physician and a nurse per 176 persons. General family physicians provide healthcare to 99.1% of the population. The budget allocated to health amounted to 17.2% of the total budget in 2001. Per capita healthcare costs covered by the State are US\$162.30.

## B. A Brief Historical Perspective

JORGE RENATO IBARRA GUITART

The indigenous population had lived in Cuba for about 10,000 years before they entered into contact with the European civilization. There were three main groups of Indians, in different developmental stages, living under the Primitive Community regime. The Guanahatabeyes survived by gathering plant foods, hunting, and fishing. They lived in caves and only used artifacts made of shells. The Ciboneyes lived along the coasts. Fishing was their main means of subsistence and they knew how to carve stone. The Taínos were the most numerous and developed group. They practiced agriculture and made polished stone and pottery artifacts.

On October 27, 1492, the great admiral, Christopher Columbus landed for the first time in Cuba, and explored some

sites in the northeast of the island. In 1510, a host of 300 Spanish warriors, led by Diego Velázquez, coming from Hispaniola, began the conquest of Cuba. The *conquistadores*, sword in hand and with the Christian cross as a banner, crushed the initial resistance of the natives led by Hatuey, an Indian chief, and began the occupation of the territory. Bloodshed had become the means through which the *conquistadores* forcibly imposed their rule and founded the first seven towns throughout the island.

The intense process of land occupation during the 16th century saturated the land property. Throughout the 16th and 17th centuries, land structure consisted of large haciendas in the hinterland, and small agricultural properties. The latter were located in strips next to towns and within large plantations. In Cuba, feudal production relationships did not take hold because of the scarce population—the Indians were gradually being wiped out—and because production was mainly cattle-raising. On the other hand, Spain had imposed a taxation and monopolistic system that hampered large-scale mercantile production. A subsistence economy prevailed during those early centuries.

From 1512 on, African slaves were brought to the island, but it was not until the 17th century that the large-scale introduction of black slaves began. Changes in land exploitation brought about the partition and sale of land, thus favoring the extension of sugar cane plantations and tobacco-growing lands. The occupation of Havana by the British in 1762 encouraged both free trade and the slave trade. Spain recovered its colony and, years later, promoted reforms under the "Enlightened Despotism" policy, aimed at encouraging the arrival in Cuba of new settlers and of slave manpower, which made possible large-scale mercantile production of sugar, tobacco, and coffee. From 1790 to 1868, the Cuban-born, land-owning class favored reformism and annexation alternatively; the *petite bourgeoisie* and a few landowners showed a trend toward independence from Spain; and the slaves were for abolition.

The deepening of the contradictions between the metropolis and the colony, and the failure of several reformist proposals, brought about, on October 10, 1868, a war for national liberation and the abolition of the slavery headed by the founding father of the Cuban nation, Carlos Manuel de Céspedes. During this war, known as the Ten Years' War, the Afro-Spanish culture, which brought about Cuban nationality, began to integrate. In this liberation struggle, the insurgent forces faced many divisions and material difficulties and, at its end, the land-owning civilian leadership accepted pacification proposals when there was a relative balance of forces. Other more consistent people's leaders, such as Antonio Maceo, decided to continue the war and issued the "Protest of Baraguá," a document against the capitulations agreed on with Spain.

From 1892 on, after the failure of the first independence attempt, significant activities headed for a new uprising against the colonial power began. José Martí, political leader of the new insurrection being planned by Cuban emigrants, united patriots in exile under the Cuban Revolutionary Party. Some time later, troops were recruited for a national liberation army with the collaboration of 1868-war veterans.

On February 24, 1895, the first uprising took place and a week later, the leaders of the liberation war, José Martí, Máximo Gómez, and Antonio Maceo, landed in Cuba. Martí died in combat a few days after his arrival. The rebel army, known as *mambises*, spread the war throughout the national territory by a successful campaign brilliantly led by Gómez and Maceo. Most of the sugar wealth that was to be destroyed by the insurrectionists was in the western

provinces. As a result of the revolutionary forces' advance, Spain changed its political and military tactics. In a desperate attempt to hold the island, it authorized Captain-General Valeriano Weyler to implement a concentration policy of countryside people in urban centers that brought about the starvation, destruction, and death of a large number of civilians. But this policy also failed, and the colonialists accepted a grant of autonomy to the Island. Nevertheless, Cuban troops went on fighting and controlled rural areas. Under those circumstances, the U.S. battleship *Maine* blew up in Havana's harbor, and the United States, which already had important economic interests in Cuba, declared war on Spain. Thus began the Spanish-Cuban-American war that ended with the defeat of Spain and the signing of the Paris Peace Treaty, authorizing the United States to militarily occupy Cuba for an indefinite period.

In 1901, a Constitutional Convention was called to set the political destiny of Cubans. The United States imposed on the members of the convention the adoption of the Platt Amendment as an appendix to the Cuban Constitution. The Platt Amendment considerably limited the sovereignty of the future Republic. Although it was initially rejected by the assembly, it was finally adopted under Washington's pressure. Thus came into being the Republic of Cuba on May 20, 1902. In 1903, the Trade Reciprocity Treaty with the U.S., an instrument of the economic penetration promoted by the United States to maintain its trade hegemony in Cuba, was signed.

From 1902 to 1933, successive administrations, subordinate to Washington's plans, fostered the large-scale introduction of U.S. capital and the consolidation of an oligarchy allied to them. In 1933, Gerardo Machado's dictatorial régime was toppled, after facing both the negative consequences of the ongoing world economic crisis and the strong opposition of the national revolutionary movement that had come into being in the 1920s. After a period of political instability because of the struggle between progressive and conservative forces, the failure of the 1935 general strike ended the 30-year revolutionary period. Taking advantage of the lack of unity of the revolutionaries, the new dictator, Fulgencio Batista, effectively repressed the resistance of the people's sectors. At this stage, the United States changed its political hegemony methods toward Latin America through the "Good Neighbor" policy that nullified the Platt Amendment in Cuba and paved the way for the signing of a new Trade Reciprocity Treaty and the Sugar Quota Law, which limited the free entry of Cuban sugar into the U.S. market.

Once consolidated in power, Batista's military régime considered several international circumstances and consented to a democratic opening whose high point was the calling of the 1940 Constitutional Convention. The Constitution of 1940 endorsed most of the social and political demands of the revolutionary and reformist sectors, but many of them could not be implemented because the required complementary laws were not adopted. After several years of struggle from the opposition, the Cuban Revolutionary Party (Auténtico) came into power in 1944, but it did not implement with enough depth its national-reformist platform. The Auténtico administrations sank the country into non-governance, political administrative crises, corruption, and political skepticism. Then, the Party of the Cuban People (Ortodoxo) was set up, headed by Eduardo Chibás, who launched a series of public campaigns that awoke the national revolutionary awareness.

When general elections were called, Fulgencio Batista began a new coup d'état on March 10, 1952, assuming all powers and suppressing the Constitution of 1940. From then on, the traditional parties were unable to organize a

solid popular resistance movement; thus, new revolutionary organizations came into being resolved to carry on an armed struggle to overthrow Batista's dictatorship. This new stage of armed struggle began with the attack on the Moncada and Carlos Manuel de Céspedes garrisons on July 26, 1953, by a revolutionary movement led by Fidel Castro, who launched a platform of political and social demands in a document titled, "History Will Acquit Me." Also of importance was the struggle of Cuban students led by José Antonio Echeverría, who founded the Revolutionary Directory and organized a head-on fight against the dictatorship, which reached its highest point in the attack on the Presidential Palace in 1957. The failure of reformist alternatives, especially that of the Society of Friends of the Republic, demonstrated the impossibility of a peaceful solution to the national political crisis. Fidel Castro, after some initial setbacks, organized a strong guerrilla movement in the mountains, from where he descended, after defeating Batista, on January 1, 1959.

The recently constituted revolutionary government promoted important measures to guarantee political control and promote important social and economic changes. Among the first of these were the disbanding of the army and of the political parties committed to Batista's dictatorship, and among the latter, the first Agrarian Reform Law and the nationalization of banks and other U.S. companies, as well as the confiscation of the large domestic private companies. These changes, which took place in a relatively brief time period, were accelerated by the hostile policies of the United States toward the Cuban revolution. Although the initial measures of the Cuban government were not socialist, Washington manifested its overt opposition to the path taken by the Revolution by putting an end to the sugar quota, fuel supplies, and the sale of spare parts. Finally, when the revolutionary government radicalized its stands, the United States imposed an economic blockade banning all trade, including medicines and foodstuffs. This blockade not only affects bilateral trade, but also Cuba's trade with the rest of the world.

Those measures, aimed at paralyzing the Cuban economy, were accompanied by an intense subversive campaign fostered by the CIA. The CIA gave material and logistical support to counterrevolutionary groups with headquarters in the United States and also carried on actions on the island. Especially outstanding were their support operations for the counterrevolutionary bands in the Escambray Mountains and the Playa Girón (Bay of Pigs) invasion. But the revolutionary government, whose social change policies were backed by the great majority of the people, mobilized the people and held back the counterrevolutionary offensive. After the Bay of Pigs defeat, the CIA destabilization schemes, aimed at bringing about an invasion of U.S. regular troops, gave way to the October 1962 Missile Crisis. During that crisis, the principled resolve of the revolutionary leadership was confirmed. In this conflict with the United States, Cuba received the solidarity of the Soviet Union and the socialist camp that offered markets for sugar and supplied Cuba with oil, armaments, raw materials, and inputs. Deeply involved in the transformations that were taking place, and in view of United States harassment, the Cuban revolutionaries decided to come together in a single political party that took different names until, in 1965, it became the Communist Party of Cuba (PCC).

In the social field, the revolutionary government developed important programs for the benefit of the general population, such as a literacy campaign, free education and healthcare for all, the lowering of the unemployment rate, and the improvement of social security, among others.

In 1991, with the collapse of the socialist camp and the onset of the globalization process, Cuba started a series of reforms headed toward its inclusion in the world economy, but without relinquishing its socialist-oriented model.

## 1. Basic Sexological Premises

### A. The Cultural Perspective

MARÍA D. CÓRDOVA LLORCA

To understand the sexuality of Cubans, both male and female, nowadays, it is necessary to study the development of “Cubanness” (*la cubanidad*). “Cubanness is mainly the characteristic quality of a culture, that of Cuba” (55). Both the Cuban culture and nation developed together, the former being the source and the expression of the latter. Both are the result of the *mestizaje* of Spanish culture, which was brought from its different regions by its less-favored people, and the African culture brought by thousands of slaves uprooted by force from their various tribes.

This mixture is not exclusive of Cubans, but has unique characteristics in the island. The pre-Columbian Indians, present in all Ibero-American nations, the autochthonous basis of those peoples, were wiped out in Cuba by the colonial régime. The long slavery and Spanish-rule period, the “tutelage” of the Anglo-Saxon northern neighbors, and even the Asian presence, marked the necessary differences with the other American nations of Spanish origin.

The physical location, geography, and climate of the Cuban Archipelago have also left their hallmark on our idiosyncrasy, “The hot climate of our land influences our character . . . makes our blood and mind boil, and often takes hold of our will in irrepressible hurricanes of passion. How is the Cuban soul? How is the result of the melting pot of different civilizations expressed in Cuba?” (55).

“Cuba is an ‘ajiajo.’ A miscegenation of cooking styles, a miscegenation of races, a miscegenation of cultures. A thick broth of civilization that bubbles in the Caribbean stove” (55). The daring Spaniards of the conquest and of the successive colonizing immigrations imported their adventurous temperament, their warrior impulsiveness, their intolerance in the fight against infidels, Andalusian grace, and Castilian chivalry. With them also came a sustained impermanence: “that constant restlessness, that fickle impulsiveness, that temporary nature of attitudes were the primary inspirations of our collective character, fond of impulse and the adventure of excitability and of luck, of the achievement and hope of chance” (56).

With the colony and slavery came the African blacks, brought with no will or ambition, uprooted by force from their country, and forced to work like beasts. This gave rise to their constant rage, their longing to flee, to be emancipated and to change. African culture especially influenced art, religion, and the collective emotional nature of Cubans. “The culture and soul of the blacks, always undergoing a transition crisis, penetrates Cubaness in the miscegenation of flesh and cultures, imbuing it with the juicy, sensual, frolicsome, tolerant, accommodating, talkative emotionality that is their gracefulness, their charm and their strongest resistance strength to survive in the constant boil of upsetting experiences that has been the history of this country” (56).

Cuban men and women, heirs of these roots who grew up in a perennial struggle, first to obtain and later to maintain their independence, always in defense of their mixed-blood culture, nowadays consider themselves satisfied for being Cuban, characterized by: joy and mockery, openness, sensibility, spontaneity, sociability, liveliness, mischievousness, and intelligence, as well as the bad manners on occasion, impulsiveness, a bit of superficiality, and not much self-criticism (39).

Sexuality, deeply rooted in the Cuban identity, is marked by the presence of eroticism in the image of both sexes, for its intentionality to seduce and win over the other, in his or her cult of sexuality. “Cuba is a country in which people constantly look at each other and are undressed by a glance, where skin suddenly appears and clothes become transparent” (71). Eroticism is markedly manifested in the all the gestures of Cubans, in all art expressions, especially in dance and in the popular dances known the world over.

Cuban men are perceived as flirtatious, frolicsome, and cunning with women, with high regard for manliness and *machista* par excellence (39)—authoritarian and womanizer. On the other hand, women are perceived as “coquettish, dressy and sexy with men,” and self-denying and faithful mothers and wives.

### B. Character of Gender Roles

MARÍA D. CÓRDOVA LLORCA

In a par-excellence male-centered culture, *machismo* and sexism characterize the history of gender roles in Cuba. During colonial times and for a long time in the pseudo republic period, women were always discriminated against: nice married women were discriminated against at home, fated to reproduction and subjected to their husbands. Those considered not-nice, on the streets, were rejected as “easy” or prostitutes, but were tolerated if they kept a low profile.

“Female sexuality always occupied an important place in the system of values, as norms of virtuous behavior, mainly during the 19th century. This was very evident in the periodicals of those times” (71). The ideal woman was a dedicated mother, giving birth to all the children she conceived, modest, a faithful wife, passive, and only responsive to male sexuality.

Men were seldom mentioned in the press, and if so, it was only to reassert their masculinity. They could make use of their sexuality as they pleased. Infidelity was accepted as inherent to the male role. Their wives guaranteed their descendants, since they were only the mothers of their children. Generally, sexual fantasies and enjoyment were only fulfilled outside the home with lovers and prostitutes.

On the other hand, marriage was the cornerstone of Cuban society. Frequently, it became a business to preserve or rescue family economy. Nevertheless, if discreet, concubinage and cohabitation were allowed. Cohabitation was very frequent with actual and freed slaves and among the peasants.

Sex-related crimes like abduction, rape, pederasty, and prostitution were dealt with in a sexist manner. Women were always considered guilty, and were even criticized for accusing men.

Homosexuality was also discriminated against. Although socially rejected, it was not considered a crime in the Civil Code adopted in the 1950s. Full divorce was legalized in 1934, much earlier than in other Latin American countries.

The hallmark of the 1959 victorious revolution also left its imprint on gender roles. Equality of rights is recognized in the Constitution of the Republic, which, in Chapter I, Article 9, states: “. . . all able-bodied men or women will have the opportunity to obtain employment, enabling them to contribute to the ends of society and to meet their own needs” (24).

The 1961 literacy campaign, the free access to compulsory and lay education, the sustained programs of prevention and healthcare for all, especially women, children, and youngsters, as well as the massive incorporation of women in the social and labor fields, and their resolute and demanding participation have had a gradual influence in all spheres of life: in their family, with their husband or partner, and even in the way of living their sexuality.

In Chapter IV on the family, it is recognized that: "Marriage . . . is based on the absolute equality of rights and duties of the spouses, who should undertake home-keeping and the comprehensive education of their children by common effort, in a manner compatible with the social activities of both" (24).

### C. General Concepts of Sexuality and Love

C. ALICIA GONZÁLEZ HERNÁNDEZ and  
C. BEATRIZ CASTELLANOS SIMONS

In Cuban everyday life, sexuality is associated with the couple's erotic and love relationship, which is true, but limits or stereotypes the concept to one of its spheres, leaving out all its wealth, diversity, and complexity.

Sexual life is, in essence, a dialogue, an interaction, between persons of the same sex and of the other sex, including all kinds of relationships with the desired and/or loved person.

Sexuality is a personality dimension, built and expressed from the moment of birth and during the whole lifetime, through a set of representations, concepts, thoughts, emotions, needs, feelings, attitudes, and behaviors that make up a psychologically and physically male or female sexed being, which goes beyond the couple's relationship and is evident in all that a person is and does in his or her personal, family, and social life.

Therefore, the study and description of couple relationships will allow us to probe the feelings, and the physical and spiritual experiences that are the *raison d'être* of one of the most important gifts of life: pleasure and love. But limiting sexuality only to that aspect will not cover the wide range of communication that takes place in the interactions that may occur during the lifetime of a human being.

Sexuality is developed and expressed as a manifestation of personality in several dimensions and qualities to be discussed as follows:

- Individual: Sexuality develops in the inner self that always defines itself as a human being possessing sex. It is perceived from within, and is projected without, in masculinity or femininity. This unique and unrepeatable personalized character of sexuality, as an expression of identity, makes it possible to explain the diversity of ways of living and feeling it, its flexibility and malleability, the fact that its paths are not predetermined, and that each human being can approach them in a unique manner leaving his or her imprint on them. At the same time, the individual is projected in a unique manner in the remaining dimension of his or her partner, the family, and society—thus the undeniable social content of sexuality.
- The couple represents the transcendence of sexuality to an essentially social-interaction dimension where the meeting with the other self takes place. Emotional and erotic bonds are established in physical and spiritual communication, when giving and receiving pleasure, satisfaction, love, and happiness. The human couple, as we understand it, is a dialectical dyad that differentiates itself from other persons, but each member of the couple keeps, at the same time, his or her identity, without relinquishing her or his self. When, on the contrary, there is symbiotic union, where one member of the couple absorbs the identity of the other, the couple ceases to be a space for growth, the full expression of sexuality, and self-realization of personality.
- The family is the first socialization agent of personality and sexuality. It is the most stable reference group throughout life in the formation of values, convictions, behavior patterns, conceptions, and sexual attitudes. Family bonds boost human communication and emo-

tional ties. Within the family, life is reproduced, when the couple or the individual freely decide to have a descendant. It is within this group that girls and boys, since early ages, learn the male and female behavior models, from which they build their identity and gender role, essential processes for the development of sexuality

- Society is the widest context in which the individual interacts and communicates with persons of both sexes throughout his or her life in a great diversity of activities: in games, studies, work, and participation in community life from the intellectual, political, artistic, scientific, or recreational points of view. From this dimension come culturally predominant gender models and patterns, from which the individual's sexuality is learned and evaluated. Therefore, that dimension is inherent to our total being, a human being that undoubtedly transcends biology. It isn't a mechanical exact replica of the world of social relationships. Its essence is completed and fulfilled in spirituality, in the subjective that exists as concrete reality in a unique and creative personality, capable of transforming the physical and cultural environment and itself in daily praxis.

In Cuba, from January 1959 on, objective and subjective changes of great significance have taken place in the way of life of both sexes, especially in the exercise of all the facets of women's performance, bringing about the progressive development of an ever-comprehensive male and female sexuality, on the basis of the principles of fairness and collaboration.

Although it is unquestionable that large strides have been taken towards a more responsible, pleasant, and happy sexuality, myths, taboos, and prejudices that prevent living this important sphere in all its fullness still persist. Therefore, since the 1960s, a National Sex Education Program, which will be explained further on, is being implemented with the aim of overcoming all the obstacles that still prevent many human beings from being sexually fulfilled, responsible, and authentic.

### 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

MARÍA D. CÓRDOVA LLORCA

The triumphant Revolution in 1959 brought about an increase in social justice and equality patterns, among them in religious freedom. As Aurelio Alonso, a renowned Cuban researcher, states: "Up to 1959, discrimination was not a State policy, but of the religions themselves. Catholicism was the hegemonic religion, which assured its supremacy through a close relationship with the dominant classes" (69).

From that date on, the different religious beliefs that characterize Cuban syncretism, acquired equal footing in the discourse of the State. This syncretism is nurtured by the African religions brought by the slaves during the colonial period, and by the Catholicism of the Spaniards: "Catholic aspects are present in African religions and African religious aspects are present in Catholicism" (69). However, the equality in the political discourse and in the exercise of law, was not automatically assimilated in the people's minds. Therefore, various forms of discrimination took place, at certain moments, on the part of some institutions. "Having religious beliefs became a deficit, an 'ideological weakness'" (69).

At the beginning of the 1990s, religious freedom increased qualitatively after the IV Congress of the Communist Party and the 1992 constitutional reform. "The fact that believers of all religions could join the Communist Party implied a tacit change in the way of evaluating religious faith among us, that is to say, a rectification" (69). Also, dur-

ing those years a significant increase in the membership of the Christian religions took place, for example in the Evangelical and Baptist churches, among others.

[*Comment 2003*: In connection with sexuality, there are certain differences within the religious mosaic of today. This is, for example, the case of Santería, as the “Regla de Ocha” is known in Cuba.

[Santería, arising from the Yoruban culture, is practiced, with different degrees of commitment to their religious beliefs, by men and women of different races, ages, educational levels, professions, and sexual orientation.

[The Yoruban religion consists of a group of deities possessing their own mythology, whose symbolic content becomes essential elements to be imitated by the initiated. Thus, a son or daughter of Shango, a deity considered “hot,” because his sphere of action has to do with fire and war or burning virility, will try to make those characteristics part of his or her personality traits, in order to establish a singular relationship with Shango’s nature.

[Shango, besides representing masculinity, is also considered the owner of the batá drums. The ritual dance performed for this deity is full of sensuality and eroticism, highlighting, with non-ambiguous and extremely expressive movements, the part of the body where virility and masculinity resides.

[Oshun is another deity in whose rituals, parties, and dances there is an element of sensuality, which excites the senses and provokes sexuality. She is considered the owner of the rivers and the goddess of love. Her daughters could be the archetype or, maybe, the stereotype of Cuban women disseminated throughout the world: sexy, provocative, loving, passionate, and sex symbol. (*End of comment by Sonia Jiménez Berrios*)

[*Comment 2003*: On the other hand, the Christian churches have historically considered sexuality taboo, and therefore, that topic is not mentioned. However, in the current world, and particularly in our country, in some Christian denominations, there has been an opening in their dealing with sexuality because of its importance in the education of children and youngsters and in the adoption of healthier sexual behaviors.

[For Christians, sexuality is part of God’s creation. Men and women were created as sexual, sexed beings. However, sexuality can only be fully expressed in the context of marriage. Among the purposes of sexuality in marriage, according to Christian denominations, are: satisfaction of the need for company and companionship, togetherness and stability of the couple, and mutual pleasure and enjoyment, as well as reproduction.

[All sexual practices outside of marriage, like premarital sex, adultery or conjugal infidelity, and homosexuality, are not approved by Christianity. According to Christian precepts, the persons who engage in those sexual practices run physical, psychological, and moral risks, although, at present, some denominations have assumed more flexible stands on this matter. Another non-approved practice is induced abortion. For some Christians, it is a way of putting an end to the life of a human being. (*End of comment by Daimelis Monzón*)

### 3. Knowledge and Education about Sexuality

MARIELA CASTRO ESPÍN

Cuba has traveled a long way in research on sexuality, sex education, and counseling. The outstanding studies and medical care provided by the medical doctors, Celestino Alvarez Lajonchere, R. Bustamante, and Ángel Custodio Arce, among others, date back to the beginning of the 20th century.

From 1959 on, sex education has been a priority of the Cuban social model. Since 1962, the Federation of Cuban Women (FMC) and the Ministry of Public Health launched campaigns and national programs addressing the problems of women’s sexual and reproductive health. Later on, a working group was set up, headed by the FMC. Early in 1970, the Ministry of Education and the Young Communist Union joined the working group. This group defined the main priorities of the National Sex Education Program to be implemented through public policies, mainly centered on childhood, the young, and on equality of woman’s rights (34).

In 1976, as a result of the institutionalization process in which the Constitution was revised, the Standing Commission for Children, Youth, and Women was established in the National Assembly of the People’s Power of the Republic of Cuba (Parliament). The National Working Group on Sex Education (GENTES), officially implemented in 1977, became part of the parliamentary commission.

In that context, the Provincial and Municipal Commissions on Sex Education were established to implement the National Program in their territories, and the same entities of GENTES were represented.

The actions of the National Sex Education Program had greater coverage and became more complex. Thus, in 1989, GENTES became the current National Center of Sexual Education (Centro Nacional de Educación Sexual, CENESEX), whose mission is to manage sex education policies in Cuba and coordinate the participation of governmental entities and civil society organizations in charge of education, counseling, therapy, social communication, and community work in the field of sexuality.

Since the early 1960s, this program, has maintained an interdisciplinary and intersectoral approach. It is aimed at the Cuban population as a whole, regardless of age, sex, sexual orientation, cultural level, and physical, sensory, and intellectual capacities. Among their objectives, the following stand out:

- Development of sex education as part of the individual’s comprehensive education.
- Promotion of sexual health as a fundamental part of the quality of life in the different age groups and population segments.
- Systematic reflections at the social and community levels that modify stereotypes and prejudices and promote attitudes and behaviors favoring the development of a healthy, full, and responsible sexuality.

These are the objectives that, at present, guide educational, research, healthcare, community work, and social communication actions in the fields of education, counseling, and sexual therapy, which are carried out by different government entities, especially the Ministries of Health (MINSAP), Education (MINED), and Culture (MINCULT), as well as by civil society organizations, such as the Federation of Cuban Women and the Young Communist Union.

#### A. Government Policies and Programs

GLORIA MARÍA ANTONIA TORRES CUERTO

Since the 1970s, the Ministry of Education (MINED) has been carrying out a Sex Education Program in all schools, as a prioritized objective of the Cuban educational policy. The program is based on basic educational principles, centered on the formation of values and the need for a comprehensive development of the student’s personality, as part as their training for life.

“The above-mentioned Program had to overcome important resistance to its implementation on the part of the

educational institution, although the teaching personnel receiving professional training were more open to reflection on these topics. At that time, work was essentially centered in the improvement of school texts with some reproductive health and gender equity topics" (13).

Sex education at schools is free and provided by the State. It is carried out on the same basis as the National Sex Education Program. It is included in the curriculum and supplemented with extracurricular activities and family education. It is based on the cross-section content system on sexuality included in the system of school subjects.

The program is developed through classes, extracurricular activities, and activities with the students' mothers and fathers. These activities are conceived and carried out following an alternative sex education approach, based on the determination of basic educational needs (SANEBAS), through participatory activities and the implementation of action research findings.

This program of the Cuban National Educational System is established at all educational centers of the country, in pre-school, elementary, special, junior high school, high school, technical professional, adult education, and the teacher-training universities. In the latter, sex education is included in undergraduate and graduate subjects in order to train future teachers. On-the-job training is also available to teachers.

As a result of the program, school dropouts due to pregnancy and marriage have decreased—from 1,038 in the 1997-1998 academic years to 240 in 2000-2001. On the other hand, there has been a decrease of early sexual relations from 31% to 10% in the adolescent population. At the same time, the use of birth-control methods has also increased, especially the use of condoms. Now, two thirds of the sexually active adolescents are using condoms.

On the other hand, at medical universities, sexuality and sex education topics are included in the curriculum, elective courses, and regular undergraduate courses. They are also dealt with in graduate, diploma, and master's degree courses in the continuing education of health professionals.

At the University of Havana, the Art University, and the University of Informatics, sexuality content is included in university extension activities and are widely accepted by students.

## B. Sexuality Education in the Community

ADA C. ALFONSO and MARISEL REBOLLAR

Since its inception, the revolutionary government began to carry out community education work with the aim of increasing the cultural and educational level of the population, whose great majority had been denied access to education because of economic reasons. Since the very beginning, women were the ones that benefited most, their training aimed at incorporating them into social life with resources that would allow them to join the social and labor movement.

Very soon, sexuality topics were discussed in community debates (in 1962). In the 1980s, there were specialized community sex education places and activities in the country's territories. The most outstanding are: the House for Women and Family Counseling (COMF), Adolescent and Young Men and Women Counseling Centers, health education departments, the family doctor and nurse's office, and community action undertaken by schools. They provide interdisciplinary sexual and reproductive health promotion and prevention, as well as sex education in general.

During all those years, the aims of the actions by the above-mentioned institutions have changed, according to the needs of the times and the particular conditions of the local regions. During the initial years, emphasis was given to reproductive health. The essential objectives of family plan-

ning education were to avoid the risks of abortion as a control practice and to minimize the risks of unwanted pregnancies. These objectives were accompanied by a policy of providing highly specialized abortion services at all hospitals of the country, to avoid the health risks of clandestine abortions.

Later on, healthcare services became aware that men should also take part in sexual healthcare, and programs, geared to earlier ages and adolescents at schools, were added to the above-mentioned places and activities.

With the appearance of HIV/AIDS, topics on sexually transmitted infections (STI) were broadened. Programs aimed at educating the population in general for the prevention of sexually transmitted diseases began to be implemented. Early in the 1980s, the Operative Group for Controlling and Combating AIDS (GOPELS) was established to coordinate and implement intersector work against this epidemic. In 1998, the National Center of STI-HIV/AIDS Prevention, with provincial and municipal representation, was created. This center is in charge of implementing the National Program of HIV/AIDS Prevention and Control.

"The educational aspect of this Program has, as a general objective, been to promote healthy behaviors, attitudes and sexual practices that make possible a more adequate self-evaluation of the individual's risk to be infected with HIV/AIDS and influence in the prevention of new infections" (49). Although the programs were initially centered in not very encouraging messages associated with death, very soon the messages were aimed at educating the population to coexist with HIV-infected persons and those suffering from AIDS, to sensitize the population in general and especially the more vulnerable age groups, in the importance of using protection methods and of responsible and safe sexual practices.

Recent years have witnessed an evolution of sex education topics at the community level. Pleasure and gender-equity perspectives have been included in the programs, especially in the methodological approach, among which people's education is outstanding.

Another professional community workspace is the Methodology of Community Correction Processes (ProCC), a psychosocial intervention alternative for working in "supposed health normality" (*Normalidad Supuesta Salud*, NSS), that is to say, the discomforts of daily life that are suffered day by day, but are not questioned because they are considered normal, and professional care is not sought even though they take a high toll on the health and well-being of the population.

According to Mirtha Cucco García, Dra., director of the "Marie Langerá" Community Center, Madrid, this methodology has been applied by health, education, and culture professionals to sensitive problems, such as women's mental health from a daily-life approach; ignorance and the resistance to the sex education of their children on the part of fathers and mothers; how middle-aged women experience their sexuality; being a woman and the life project as a young woman; the relationship between the roles of mother and father; professional roles and decision making; and the sexuality of third-age adults.

Following the ProCC methodology, national community-intervention programs have been carried out, for example, the Growing in Adolescence Program, financed by the Cuban government and the United Nations Population Fund with the purpose of decreasing voluntary abortion in the adolescent population.

## C. The Situation Today

MARÍA D. CÓRDOVA

According to data from *Informe de Balance Anual del CENESEX, 2001*, the actions taken by the National Pro-

gram on Sex Education benefit significant sectors of the population. For example, those carried out in 2001 were:

- In social communication: the National Center of Sexual Education (CENESEX), the Young Communist Union (UJC), and the Cuban Radio and Television Institute (ICRT) made 48 shows for national TV, such as "Our Sexuality" for adolescents, "The Charms of Sexuality" and "Speaking Seriously" for youngsters, and "Sexuality and Daily Life" for all ages; "The Sixth Sense," a weekly space in *Juventud Rebelde* newspaper; in *Mujeres, Muchachas*, and *Somos Jóvenes* magazines; as well as publishing, since 1994, the quarterly specialized magazine, *Sexología y Sociedad*, for professionals and the general population. All these initiatives have played an important advocacy role in Cuban society.
- In community work: The Ministry of Public Health, (MINSAP), the Federation of Cuban Women (FMC), the Young Communist Union (UJC), and the National Center of Sexual Education (CENESEX) have carried out over 30 community intervention programs that address sexuality at all ages: "The Family, a Place for Human Development," "Growing During Adolescence," "Discovering Roads," "Values and Sexuality," "Comprehensive Adolescent Care," and "Responsible Motherhood and Fatherhood," among others. In addition, there are also 175 Houses for Women and Family Counseling of the FMC, where 78,734 health providers, 79,237 social workers, and 13,659 professional collaborators provide individual and group counseling and carry out various community-extension processes.
- The Education Program for a Responsible Sexual Behavior, undertaken by the Ministry of Education (MINED) in collaboration with CENESEX and the UNFPA, has benefited 12,000 educational institutions, and over 2 million people, among them, boys and girls, adolescents, youngsters, mothers, fathers, and teachers.

#### 4. Autoerotic Behaviors and Patterns

MARIELA CASTRO ESPÍN

No quantitative research addressing autoerotic behavior has been reported. However, in local sex education surveys conducted by CENESEX using group methodologies and some qualitative techniques of data collecting, it has been evident that autoerotic behaviors continue to be perceived with prejudice and fear, and are more accepted and reported by males than by females. Traditional beliefs regarding their supposed negative effects were expressed, although opinions considering them a healthy behavior were also detected (63, 35, 14, 4).

In a research study conducted in the City of Havana (37) with 88 middle-aged women, 62.5% recognize masturbation with their mate as a normal practice, 20.4% consider it exclusive of men, and only 7.9% consider it immoral. In another research study conducted with 100 Havana male adolescents, only 20% experienced their first ejaculation when masturbating, which contrasts with the higher values reported in foreign studies (52).

In the educational professional context, several actions have been taken to contribute to an adequate understanding of this aspect of sexuality, for example, in the methodological guidelines for daycare-center teachers. Since the foundation of this educational institution in 1961, and later in the Childhood Institute in 1971, there were methodological guidelines for teachers for not repressing genital manipulation and/or masturbatory behaviors, as well as sexual games by the children. It is recommended to try to attract their attention to other interesting activities (45).

#### 5. Interpersonal Heterosexual Behaviors

##### A. Children

MARIELA CASTRO ESPÍN

In several local surveys conducted in two provinces, it was reported that the majority of boys and girls aged 2 to 6 (9.71%) do not know how to explain their gender identity. When interviews were carried out with sexed puppets, the girls (64.27%) recognized gender identity mainly through conventional attributes, such as clothes, length of hair, eyes with makeup, and ornaments, while the boys recognized the essential genital and secondary sexual characteristics differences (50.25%). The choice of toys and games by the majority of boys and girls (over 60% in all the investigations) followed traditional sexist patterns.

It also reported (73) that adults have no knowledge of children's sexuality, regardless of educational level, sex, or economic status. In many cases, mothers and fathers only recognize the existence of sexuality in their male children, as they can have erections at very early ages, which are related to the tendency to genitalize sexuality, still frequent in the social realm. The persistence of gender-role stereotypes among the fathers and mothers was also evident. Gender roles are learned since early childhood, in the choice of the color of clothes, expressions of affection, and toys and games, among others.

The main concerns of adults, in connection with the sexuality of their sons and daughters, are the possibility of contracting diseases, that they would turn out to be homosexuals or victims of sexual violence, and how they can provide their children with adequate sex education. Specific concerns, for example, include how to act regarding masturbation and timing of the first intercourse, among others.

A representative quantitative research study on the sexual behaviors of Cubans has not been conducted. Nevertheless, in reflection activities, parents and educators have shared their observations of children's sexual behavior, such as: sexual games, exploration of the genitals as part of getting to know their own body, masturbation, and questions relating to daily life experiences, such as, pregnancy, childbirth, the sexual body differences of children and adults, and fertilization, just to mention the most frequent.

##### B. Adolescents

NATIVIDAD GUERRERO

Research on adolescent sexuality in Cuba has focused essentially on the following: age at the first sexual relationship, gender, and sexual and reproductive health, among others.

The age at which sexual relations take place for the first time changed from one decade to the next one. In the 1980s, according to surveys (20), the first sexual relations took place between age 17 and 18 years. At the end of the 1990s, the adolescents stated that their first sexual intercourse took place between age 14 and 15 years.

Even though the majority does not use condoms (less than 50% in that population segment), more persons are using them and recognizing their importance. Contradictorily, there is greater knowledge of birth-control methods, but not an increase in their use. The contraceptives known and used by young people are condoms, the pill, and IUD, among others.

Frequently, at this age, sexual intercourse is not preceded by feelings of love and trust. Nevertheless, it is performed out of curiosity, to project an image of maturity, to enjoy the pleasure of the moment, because the situation required it, and so on.

On many occasions, this behavior is unknown by adults because of poor adult-adolescent communication. The adolescents state their need to discuss sexuality with their parents; however, adults do not feel prepared for it.

Among Cuban adolescents, casual intimate sexual relations are beginning to be seen, that is to say, a formal court-

ship does not necessarily have to exist to engage in intercourse. On particular occasions, they have intercourse with partners with whom they have interpersonal relations of friendship or companionship.

Pregnancy, abortion, and menstrual regulation—used to interrupt pregnancies—as well as sexually transmitted diseases, do not reach statistically significant figures in Cuba, because of the intervention of specialized professionals, but they must be addressed by specialists to lower their occurrence, because it is fundamentally during this stage that sexually transmitted diseases are contracted for the first time, and they can be very harmful.

For the majority of adolescents, partner choice continues to be an important process in their lives, but the traits taken into consideration vary. Love and respect are aspirations of female and male adolescents, but characteristics that go against the transparency and health of couple's relations, such as interest in material things and social status, already count, and are being reported in some surveys as motives for establishing a courtship (20).

This means that sexual intercourse does not come about out of love, understanding, and trust; these concepts are changing. The influence of "more advanced" Western cultures that also globalize hedonism, prostitution, and drug addiction all over the world cannot be denied.

In recent surveys (36) with focal groups composed of female and male adolescents, the following gender differences were found:

- Since the beginning, males showed concern with STDs and the use of condoms, although they consider it necessary to use them when having vaginal intercourse with occasional partners. They consider the use of condoms unnecessary after several weeks or a few months with the same partner.
- The girls spoke of pregnancy prevention, not about STDs.
- The boys only spoke of pregnancy when their partner was pregnant.
- No boy considers protection necessary in oral or anal sex.
- There are no differences between girls and boys in the initiation of the courtship, the negotiation for the use of condoms, and the possibility of refusing caresses, although it can have a slight prevalence in males.
- Being behind in school and dropping out of school, "doing nothing" (not working or studying), are related with pregnant adolescents or early motherhood.
- Early sexual relations are associated with dysfunctional homes and parents with social problems, such as alcoholism, imprisonment, and so on.

Adolescents require constant training. In surveys conducted by the Center for Youth Studies (20), adolescents show that sexuality is one of the topics of greatest interest. Adolescence is a stage of frequent worries, doubts, curiosity, and also risks due to the psychological characteristics of adolescents. This emphasizes the need to carry out and maintain permanent action aimed at this age group.

At these ages, educational and preventive work is essential to maintain a healthy society. Thus, programs such as "Growing in Adolescence" (16), "Discovering Roads," "Values and Sexuality," "Education for a Responsible Sexual Behavior" (47), and "Comprehensive Care for Adolescents" (49) are being implemented, and new ones are being planned to decrease negative expressions of sexuality.

Cuban professionals are constantly improving the education of youth. Their effectiveness is ever-increasing. There are advances in the quality of preventive work focusing on essential problems.

### C. Young Adults

NATIVIDAD GUERRERO

Sexual and interpersonal relationships of Cuban youth are a continuum regarding adolescence because, at this stage, expressions of sexuality, which initially could have been safe or non-safe and full of love or casualness are consolidated, depending on the sex education of the individual since childhood. Thus, as in the previous stage, the wide range of social behavior should be stressed.

During youth, a stage between ages 18 and 24, for some up to 30 years of age, cohabitation and marriage consolidate. There are also separations and divorces mainly as a consequence of the inconsistencies of couples in the psychological subjective domain.

The topic of living together is more frequent during this period. Family conflicts resulting from an unmarried couple's decision to cohabit have become very frequent. Sometimes there is a lack of understanding between various generations. Three generations sharing the same home characterizes the Cuban family, especially in the City of Havana. Therefore, preventive work is foreseen in this sensitive topic.

Among young men and women, expressions of interpersonal relationships having to do with sexuality, such as jealousy, separation, and divorce, associated with lack of experience or the making of wrong decisions based on a superficial, hasty, choice of partner, or on not knowing the partner well, are similar to those reported in other countries.

It is a stage during which couples decide to have their own family. Motherhood and fatherhood become important life events, for which young men and women do not always feel prepared, but there is willingness to become good fathers and mothers (21).

Sexuality plays a very important role in the lives of young men and women, as well as professional and general cultural education and employment. These areas are simultaneously developed in daily life throughout this lifecycle period.

In this stage of searching for and consolidating a love relationship, a change of love partners is frequent. Those changes are health risks if the necessary precautions are not taken.

"Single motherhood" as an expression of the desire to have children is not very frequent in this age group, but mainly in women near 30 years of age. The struggle for gender equity was misinterpreted by some girls when considering that they could perform simultaneously both roles of mother and father. It has been made very clear that it is an erroneous belief.

Most pregnancies leading to childbirth are wanted. It is, for the young fathers and young mothers and the whole family, a happy event that requires of a great deal of collective effort.

Possibly, during this stage, unlike any other, sexuality is enjoyed in a significant manner. When the necessary precautions are not taken, sexually transmitted diseases can be contracted. For example, most of the persons who live with HIV or have AIDS in Cuba were infected at this stage or during adolescence. There are also problems from the psychological point of view. Disillusion, despair, failure, and infidelity sometimes lead young men and women to very critical situations that are surpassed with professional help.

As in the case of adolescents, less than 50% of the young women and men use condoms. Generally, they know how to use birth-control methods, but knowing does not mean using. Nevertheless, a wider receptivity for birth-control methods has been found. Those who use them generally choose IUDs, pills, and condoms (21). Sex education programs like "My Life Project" for young men and women have also been implemented (6).

During this stage, sexual dysfunctions are rare. However, if sexual dysfunctions occur, they are associated with

premature ejaculation. Traditional gender-role demands play tricks on young men, generally associated with situational phenomena, stress, and so on.

## D. Adults

MARÍA D. CÓRDOVA

The sexuality of the Cuban adult male and female is not divergent from global patterns. As a result of the growing freedoms of the 1960s and 1970s, and the sex education received through various means, premarital intercourse soon after meeting a partner or having been formally introduced is spontaneous, frequent, and accepted, especially in the most densely populated urban areas. There are still adults who identify sexuality with sex, essentially genital sex (17). It has also been found that occasionally adults may be knowledgeable regarding sexuality, but taboos on sexuality still endure in a couple's relations and in family sex education (35).

*Machismo* is still present in the culture of adults, but change is evident. While the social recognition of woman is increasing, change in the family is slower (14, 26, 66). Several local surveys have shown that men generally approach women with strong fantasies, while women are more emotionally motivated. That is why women are generally made responsible for the affective aspect of the couple's and the family relationship (34, 65).

One of the reasons for the above changes is the increasing incorporation of women into the workforce and into social activism in general. In 2001, 37.4% of the active workforce in the state civil sector were women, as well as 68.2% of medium- and high-level technicians; 31.2% held decision-making positions and 35.96% of the Parliament's seats were occupied by women in 2003; 63.1% of higher education students were women, as well as 62.7% of the graduates at that educational level. In Cuba, 64.3% of teachers, 54.6% of doctors, 72.9% of public health providers, and 51.95% of scientists and technicians are women (53).

Another of the reasons that conditions the changes in the Cuban social realm in gender issues is the work carried out by the Federation of Cuban Women, from 1961 on, to raise the cultural, political, and technical level of women and to increase their social participation. This was done mainly through magazines such as *Mujeres* and *Muchachas*, in important segments on national and regional radio and TV stations, as well as visible positions in the communities and the federation's congresses and scientific meetings where gender issues, in Cuban society, have been addressed at length.

Marriage is the most widespread way of constituting a family. That is why the marriage rate is 4.8 and the divorce rate is 3.3 (per 1,000 inhabitants). However, cohabitation has increased among the youth. In 1981, for every 100 married youths (between 15 and 19 years old), 189 cohabited (5).

The social policy of the Cuban government, as stated in the Constitution, has among its explicit aims: to strengthen the role of the family, to protect all family members, as well as, the attainment of family relationships based on love, mutual respect, reciprocal help, and shared responsibility. In 1975, the Family Code, which legally regulates family institutions—marriage, divorce, and parental-filial relationships—was adopted. In the Constitution of the Republic of Cuba and the Civil and Penal Codes, there are provisions on all aspects that protect the family as the fundamental cell of society.

Today's Cuban family tends to be small. A significant change occurred between 1953 and 1981 when the average number of family members dropped from 4.9 to 4.1 in 1981 (5). The general fertility rate for women 15 to 49 years old dropped from 57.3 in 1992 to 45.7 in 2001 (53). Nuclear families—families made up of the couple and their chil-

dren—prevail; in 1995, they accounted for 50.9% of the total families. Extended families (40.5%) are more frequent in Havana, the capital of the country.

According to a nationwide study of 1,200 families from different social strata (60), a model of unequal distribution of domestic chores was prevalent in 59.4%. The "traditional model" prevails; therefore, the woman is solely responsible for household chores (12). Nevertheless, this fact is not homogeneously present in all the families under study; it varied in terms of social class, educational level, work activity, and occupation of the woman. In this study, a marked tendency of both parents not to assign responsibilities and housework to their sons and daughters or to allow their responsible and active participation in daily family dynamics was also reported.

Further evidence of the heavy burden borne by Cuban women was found in a survey on time use conducted in five municipalities. According to that survey, the total weekly work time of women is 20% longer than that of men. Women's household work time is equal to paid work time, and women enjoy considerably less free time than men.

In a research study conducted with 1,125 families having adolescent sons and daughters, it was observed that mothers were the ones who most frequently held conversations with their sons and daughters, expressed their love more often, were more persuasive, and had greater control of their behaviors, which indicate that women continue being mainly responsible for the education of the family (5).

In the educational process of the family, gender socialization plays an important role. An analysis of gender socialization shows a persistence of sexist behavior patterns that are transmitted within the family and also, a group of change indicators. In other words, although sons and daughters continue being educated in a differentiated manner and for a traditional family model, there is also, in many families, a more symmetrical couple model being transmitted to male and female descendants. A woman's role is not limited to being a mother and a wife. She is also a worker and a community activist, and her role includes the full exercise of the sexual and reproductive rights of the couple's members, which facilitates a greater enjoyment of sexuality and empowerment to assume fertility control.

Representative research studies on the sexual behavior of Cuban adults are few. Nevertheless, the findings of some local surveys can be discussed, for example, two surveys conducted on adult women receiving medical care for menopause at a Havana hospital. In-depth interviews showed that 69.2% identified sexuality with sex; 46.1% were anorgasmic; 76.9 had a passive attitude toward sexual relations; 61.6% had played sex games, 46.17% made love to please their husband; 61.5% felt that in middle-age their sexual desires wane; and 69.3% engaged with less frequency in sexual intercourse (37, 71). In another study conducted with 200 women receiving medical care for the same reason in other hospitals, a decrease of the libido was found in 19.5%. According to the researchers, this decrease was related to gender cultural stereotypes on menopause, not to biological causes (8).

## D. Older Adults

OSCAR DÍAZ NORIEGA

At the end of 2001, older adults over 60 years old accounted for 13.6% of the Cuban population. It is expected that in the 2025 this percentage will be 25%. According to the study, *SABE (Health and Well-Being of the Older Adult)*, carried out by the National Statistics Office in the City of Havana, 44% of the dwellings housed at least an older man or woman, and 8% of the total dwellings housed a person 80 years old and older (54).

In our country, several investigations on the elderly (both men and women) of all provinces have been conducted to learn the sexual behavior of persons over 60 years. It was found that, generally, those who have a steady partner are sexually active until more advanced ages than those who do not. In different studies, it was found that 50% to 75% of the interviewed persons were sexually active, engaging in intercourse with penis penetration as the main form of satisfaction of their sexual desires. The prevailing coitus frequency among the persons under study was once every 15 days; although a considerable number reported weekly relations and, as a curious fact, at least one person in every province reported daily sexual intercourse (30, 62, 65). It is interesting that when sexual dysfunction of one of the couple's members prevents intercourse, they give up all sexual activity, including caresses, kisses, and so on.

When analyzing the reasons for the lower level of sexual activity of persons who lack a steady sexual partner, gender must be considered. In our research, widows were the majority of those not having a steady sexual partner. Those women stated that, on occasion, they felt sexual desires, but because of self-censorship and/or social pressures, they try to channel those desires to other activities, like reading, manual work, or other ways, with the hope of focusing attention on nonsexual activities. As rule, relatives do not approve that widows begin new relations, and those who challenge that rejection are exposed to pressures that range from psychosocial to economic.

In a survey carried out in the City of Havana with old men, it was found that the reaction of the immediate family can range from mockery to physical violence or ceasing all economic support (28). In 2001, 6.47% of all marriages involved men over 60 years old, and 2.96% women that same age. That same year, men over 60 years were involved in 6.99% of the divorces, in comparison to 4.38% of women over 60 years of age (53).

The main reason that men with no steady partner gave for stopping sexual activity is fear of "not performing adequately," this is say, that their sexual performance would disappoint their sexual partner.

A very curious fact, in the interviews carried out during the last two years, is a growing trend to stop having sexual activity with occasional partners because of fear of sexually transmitted infections.

### **E. Sex Policies and Politics** MARIELA CASTRO ESPÍN

Cuban policy on sexuality, as an inalienable right of all human beings, is explicit in the priorities contained in the National Program on Sex Education, in the text of several laws of the Civil, Family, and Penal Codes, as well as in an implicit manner in the chapters on Health, Education, and Culture of the Constitution of the Republic of Cuba, currently in force.

In the Constitution of the Republic of Cuba, it is set out that: "The State guarantees the full freedom and dignity of man, the enjoyment of his rights, the exercise and fulfillment of his duties, the comprehensive development of personality" (24, Chapter I Article 9). In another article, it is specified that: "Discrimination on account of race, skin color, sex, national origin, religious beliefs and any other condition detrimental to human dignity are banned and punished by law" (Chapter VI, Article 42).

The priorities of the National Program on Sex Education (15) are:

1. The right of all persons regardless of sex, race, age, sexual orientation, sensory, intellectual, and physical abilities and skills, political and religious beliefs to receive sex education as part of their comprehensive education.

2. The right of all persons, with no exception, to receive sexual healthcare within a comprehensive conception of health.
3. The respect for human dignity, from which is derived the respect for the sexual rights of all men and women.
4. The creation of material and ideological conditions to promote the development of a full, healthy, responsible, and happy sexuality.
5. Development of local management in the communities for covering the needs of vulnerable groups of the population.

Regarding this subject, particular policies are designed and implemented by several government institutions and civil society organizations for providing care to different population groups, among which the following national programs are outstanding:

- "Toward a Responsible and Happy Sexuality," a sex education program taught at schools;
- The "Mother and Child Program," which includes several special programs, such as: "Adolescent Comprehensive Health," "Responsible Motherhood and Fatherhood," and "Infantile and Juvenile Gynecology";
- "Audiovisual Project for Children, Adolescents, and Youths";
- "Prevention and Control of STIs and HIV/AIDS"; and
- "Comprehensive Care for Older Adults," to mention a few.

The Infantile and Juvenile Gynecology Program, according to Jorge Peláez Mendoza, M.D., provides, among its services, differentiated abortion and menstrual regulation care. Among its main objectives are the lowering of abortion incidence at those early ages and, if abortion is unavoidable, offering access to a safe one, through humane and skilled care, including psychological support and education, as well as to guarantee a supply of birth-control methods in the post-abortion stage, for an free informed choice.

The necessary requirements for providing differentiated care are:

- To devote at least one day to the "sole" care of adolescents.
- All personnel working in these services should be qualified and trained in infantile and juvenile gynecology and adolescent reproductive health.
- To guarantee the active participation of a psychologist before, during, and after the procedure, and to provide emotional support to the patient and her family. Whenever possible, the family doctor accompanies his or her patient the day the procedure is performed.
- To make sure, when the patient is discharged, that she receives follow-up medical care in the infantile and juvenile consultation and control with birth-control methods.

The actions that should be carried out in the provision of medical care are:

- To give information to the adolescent and her companions about the performance of the procedure, its risks, most frequent complications, and what is done if there is evidence of complications.
- To obtain the adolescent's informed consent, as well as that of her parents or tutors.
- Performance of the procedure by a gynecology specialist, a nurse, and anesthesia personnel previously trained in infantile and juvenile gynecology.
- Give the adolescent, after being discharged, an appointment for infantile and juvenile gynecology consultation for follow-up, counseling, and monitoring of birth-con-

trol use in the infantile and juvenile gynecology consultation.

This work methodology has been implemented nationwide since at least 1998. An outstanding drop of complications has been achieved with this procedure, mainly when it is repeated. The use of birth-control methods has increased in this age bracket, and there is a non-statistically significant reduction in the overall incidence of abortion in these age groups.

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

MARIELA CASTRO ESPÍN and EDDY ABREU GUERRA

For many years, in the Cuban social realm, as in almost all Western-culture countries, there is disdain and an accusatory attitude toward homosexuality. Homosexuality is still considered by some a disease, an aberration, or an immorality, preserving some features of the traditional rejection.

The historical evolution of the modern age and the deep changes made by the Cuban Revolution in its quest for social justice for all men and women brought about a gradual favorable change of opinion on homosexuality. In the 1990s, more flexibility was observed in the understanding and acceptance of homosexuality in different social and cultural environments. However, there is still prejudice, stereotypes, and moralizing ideas that demean homosexual behavior.

As far back as the 1950s, no legal regulation penalizing homosexual behavior was stipulated in the Penal Code, although nondiscrimination for sexual preferences is not explicitly stated. There is a total absence of legislation of any kind on that topic (68).

Regarding marriage, the Family Code stipulates that it “is the concerted voluntary union of a man and a woman with legal competence, with the aim of living a common life” (43). Nevertheless, in daily practice currently, it is relatively frequent that homosexual and lesbian couples live together with steady partners.

Research on homosexuality mainly deals with the psychological and social aspects, and on the characteristics of male homosexuals. In the last two years, family dynamics studies have included homosexuals and lesbians. But there is still little research.

In those surveys that have been done, it was found that homosexuals are not exempt from family and educational conflicts. “The variable—being homosexual—within the family framework, marks the whole relationship with a sense of guilt and vulnerability, both the relation of the homosexual with his family and that of his family with him” (61).

Homosexuals, mainly in large cities like Havana, have different behaviors from the rest of the population. They go to certain public places, which have become meeting places, where they plan and carry out different activities of their daily life. They do not consider themselves either sick or morally undesirable, and do not associate their sexual orientation with pathologies, but with genetic, biological causes. There are homosexuals who consider themselves in a range from healthy to excluded.

The cultural actions undertaken, in films, plays, literature, and in other media, as well as the educational actions on the radio and TV, in the press and specialized magazines, such as *Sexología y Sociedad*, promote the debate and the sensitization of the audience receiving those messages, which contributes to the understanding and respect for homosexuals and lesbians from the scientific and artistic discourse.

On the other hand, the National Center of Sexual Education promotes respect for diversity through the implementation of the sex education policy contained in its current National Program. This shows that, currently, there are condi-

tions for deeper educational work in the promotion of respect for the different sexual orientations.

### 7. Gender Diversity and Transgender Issues

MAYRA RODRÍGUEZ LAUZERIQUE and OFELIA BRAVO FERNÁNDEZ

In Cuba, one frequently hears certain expressions—with a strong negative moral judgment—denoting the false belief among the people, and even in professional contexts, that transsexuals and transvestites are homosexuals.

Since the 1970s, a team of specialists has been working to provide medical care for patients with this identity disorder. In June 1984, a document was drafted by the National Commission on Sexual Counseling and Therapy, as part of the working strategies of the Ministry of Public Health and of the National Sex Education Center, with the aim of establishing standard approaches among our professionals and to establish the legal bases for the treatment of this identity disorder. As of that date and until the year 2002, 59 persons—predominantly white (only one black patient)—have received medical care. Of these, 57 requested a sex change from male to female and only two from female to male.

A case study performed by specialists from the National Center of Sexual Education (63) shows some characteristics of 13 transsexual Cubans that received care in 1994. The cases studied reflect the same trend as the total of cases that received care, as 13 wanted a male-to-female transformation and only two a female-to-male. Lack of conformity with their own sex was found in the subjects studied, as a trend, starting at age 3. For most, early schooling elapsed without difficulties; however, during adolescence, they experienced the first lack of understanding and rejection by their peer group. Most have a high IQ and only three were average. Adolescence was recognized by them as a difficult period, mainly because of body-image conflicts, and especially because of the rejection of their own genitals. Their sexual desires, as perceived by them, seemed to be weak or mediated by values that led them to live alone. Those who had partners insisted that they needed company and understanding. Their personal relations were friendly and, in general, they were positively valued by the community in which they lived and, in some cases, where they worked.

### 8. Significant Unconventional Sexual Behaviors

MARIELA CASTRO ESPÍN, MARÍA D. CÓRDOVA LLORCA, and LAUREN BARDISA ESCURRA

#### A. Coercive Sexual Behaviors

##### *Child Sexual Abuse*

The relations that adults establish with boys and girls are socially, historically, and economically conditioned. Children need to be in contact with others for the survival of the species, for personality development, and to grow healthy in order to become self-reliant. Adults, playing different roles, lead the socialization and learning processes of boys and girls in various contexts. The Cuban social model has an essential objective: the full development of the human being; and, therefore, it has created conditions that allow our boys, girls, adolescents, and youths to be protected in various ways.

The Penal Code identifies several crimes that are characterized by sexual acts with children. In its Title 11, “Crimes against the normal development of the sexual relations and against the family, childhood and youth” expresses the fundamental elements of unlawful acts, such as rape (Art. 298), pederasty with violence (Art. 299), sexual abuse (Art. 300), and corruption of minors (Art. 310).

Various studies have been carried out on child sexual victimization. For example, between 1990 and 1991, 209 cases of children victims of sexual abuse, in criminal proceedings at the Provincial Tribunal of the City of Havana, whose perpetrators were not acquitted, were studied (57). Among these minors, 77.9%, or 163, were female compared with 46 males, 25.4%. Of the total sample, 156 (74.6%) were under 12, while 53 (25.4%) were between 12 and 15 years of age, and the youngest victim was 1 year old.

The offenses categorized by the Court, according to the effective Penal Code, were:

- Sexual abuse: 149 (71.3%)
- Rape and attempted rape: 40 (19.1%)
- Pederasty and attempted pederasty: 10 (4.8%)
- Corruption of Minors: 10 (4.8%)

Sexual crimes usually occur in places relevant to the lives and activities of the victims and during their normal activity schedules. Whether or not there is a previous relationship between the victim and the offender may determine certain peculiarities in the crime. According to statistics, when the crime was committed by a stranger, the perpetrator was under 35 years of age, the sexual abuse was characterized by rough treatment and the presence of blood, victims were usually over 10 years of age, and the crime was committed in places where the minors did not generally carry out their activities. When the offender was someone known by the minor, the characteristics of the abuse were significantly different.

In the above-mentioned study, slightly over half of the victims suffered from psychopathological disorders previous to the abuse and with no significant statistical relationship with family dysfunction or the characteristics of the perpetrator. A fourth of the victims was behind in school according to their age or had poor academic achievement before being victims of such abuse.

When physically examined, no signs were found of the traumatic marks characteristic of the classic child abuse syndrome when minors are victims of sexual crimes.

Sexual information in these victims is usually scant; it is infrequent for the sexual crime to represent a revictimization or for the victimized minor to have his or her own criminal record.

There is a significant relationship between some characteristics of the victim's family environment and the peculiarities of the crime:

- In most cases, the background of the family is dysfunctional and is characterized by habitual beatings or punishments as forms of correction, while promiscuity was not found to be predominant. The most common family attitude regarding sexual topics with the minor is far from being educational.
- As a trend, the victimization takes place in the victim's home, particularly, when the perpetrator is the stepfather. Victimization is also significantly associated to behavioral ex-post-facto changes that do not classify in the sequelae legal category, even when they represent forms of posttraumatic stress.
- There was an almost absolute prevalence of male perpetrators, significantly above 35 years of age when compared with those who victimize adult women, but with the average age near 35. Most of the abuse was accomplished single-handedly against isolated victims.
- Adults who sexually abuse girls and boys have an average high school educational level, most of them do not typically have criminal records, and much less do they relapse in such an activity.

- The prevalence of sexual victimization of girls by men, in the family or subcultural environments or both, may be linked to a gender-based male-centered education characteristic of our environment, linking the problem under study to social actions geared to correcting such deformations and their consequences.

#### *Family Violence and Violence Against Women*

In Cuba, despite a social project granting women equal opportunities for the exercise of power and social participation, there are myths circulating in the realm of communities, as well as traditional models of gender socialization, from which violent behaviors emerge.

The following figures (2) allow us to make progress in the in-depth study and approach of the subject matter.

- There are reports showing a total of 2,690 cases of violence and, of these, 332 cases of minors who are victims of violence. Data segregated by sex were not found in all cases, but in at least 1,639 cases of abused subjects, 63% of the total were female victims, including 217 girls.
- In studies that do not deal directly with the problem of violence, 45% of the interviewees knew persons who exercised violence on their own children, punishing them strongly or hitting them.
- Between 1990 and 1995, of all the women in the files of the Institute of Legal Medicine as a result of homicides in the City of Havana, 45% died at the hands of their spouses and 52% of those homicides took place inside the victim's home. This shows the relationship between homicide and marital violence.
- The studies indicate that 46.9% of the female victims were murdered by their spouses and that only 16.2% of the men were murdered by their wives.
- All the women who committed murder and homicide against their partners did so in response to violence against them.
- The scenario where violence is mostly exercised against women is in their home.
- A study on serious crimes committed in the City of Havana reports that, of a total of 468 cases, 28.8% of the victims were women.

In research conducted in two of the provinces with the highest rate of female victimization, case studies were made. In every case, there was a background of violence in the women's families of origin and in that of their spouses, as well as a tendency to cohabitation, common-law marriages, and teenage motherhood. All the women showed a low self-esteem and felt incapable of breaking on their own the cycle of violence in which they were immersed (59). In another province, there are reports of marital violence, more physical and more sexual on the part of the man, psychological on the part of the woman (70).

In a sexual abuse study of 150 women victims and only two men, also in 1990-1991 in City of the Havana, 70% were rapes of women between 16 and 25 years of age. They were assaulted by strangers in 60% of the cases. In 87.33% of the cases, there was shedding of blood. The perpetrators were also in the same age group; they were single and, although they did not have criminal records, there were negative opinions about their social behavior in 70% of the cases (44).

The family, and in particular women, given their educational functions with their children and daughters, play a fundamental role in the socialization of violence and non-violence. Hence, women become the target population in any strategy geared at the prevention of violence in any of its manifestations, and especially, of violence against themselves.

The political will of the State to guarantee the protection of the family and of each citizen is expressed in various legislation: Constitution of the Republic, Family Code, Labor Code, Civil Code, and Penal Code. Nevertheless, the existence of family violence is not yet recognized, which could be related to the fact that it is not considered a social phenomenon.

Prevention and treatment of family violence in Cuba are carried out through comprehensive actions. In 1997, the Work Group for the Prevention and Treatment of Family Violence (10) was created, which is coordinated by the Federation of Cuban Women and made up permanently by the Ministry of Education, the Ministry of Public Health, the Ministry of the Interior, the Institute of Legal Medicine, the Attorney General of the Republic, the National Sex Education Center, the Center for Psychological and Sociological Research, the University of Havana, the Cuban Institute of Radio and Television, and the People's Higher Court. Their objective is to design and to implement a joint action plan to contribute to the prevention and treatment of this problem and to make proposals to other social organizations and entities when appropriate.

The composition of the group facilitates the implementation of objectives and tasks through the structures and functions of each member agency and organization, as well as through the people that represent them in the community: teachers, doctors, policemen, judges, and prosecutors, among others.

## B. Prostitution

MARIELA CASTRO ESPÍN and  
MARÍA D. CÓRDOVA LLORCA

In Cuba, the origins of prostitution date back to the Spanish conquest and colonization process, carried out essentially "by single men who brought harlots, fundamentally from the Canary Islands, in their ships." On the island, first aboriginal women and later black women were forced to practice prostitution. This activity was so prosperous in colonial and republican times that by the mid-1950s, Cuba was known as "The Brothel of the Caribbean." Back then, prostitution was allowed but discriminated against. Public scandal was punished, and it was said: "You can exercise prostitution, but behind closed doors. And with that they did not want to protect the prostitute; but the client" (29).

In 1959, there were around 100,000 prostitutes in Cuba in a population of six million inhabitants. The strategy to eradicate this phenomenon emerged from the certainty that the fundamental causes were associated with the conditions of exploitation and poverty to which a great number of women were subjected, contingent on the existing economic and social situation of neocolonial dependence (40).

Since its inception, the Cuban Revolutionary Government has developed social programs geared at dignifying the human condition of men, and especially of women, which allowed the elimination of the material and social supports of prostitution. Among the actions taken were the closing of all brothels and the penalizing of pimping, pimps being considered as exploiters, all of which allowed them to significantly minimize the different expressions of prostitution in Cuba for more than 20 years.

However, during the economic crisis of the 1990s, this phenomenon reemerged in the Cuban social reality. Many researchers consider the economic problems that have generated new forms of social inequality, and the subsequent damage in the ideological and moral spheres, as elements that could be conditioning the persistence of these sexual practices. Researcher Aurelio Alonso of the Center for Psychological and Sociological Research of the Ministry of Science, Technology, and the Environment, states: "Prostitution is mentioned as one of social costs of the changes, but

more serious than that is the problem of the progressive inequality of the standard of living, moreover, also a fundamental cause of the increase of prostitution. It is borne out of inequality, not out of abstract shortages, not out of abstract poverty, or abstract neglect. It is true; we have lived through this collapse without having neglect. But perhaps protection is not yet enough" (69).

A survey (22) conducted on this topic has mainly involved young females aged from 20 to 24 years, of any race, mainly single, and with no children. Their experience regarding sexuality is characterized by instability and preference for foreigners, since foreigners have more possibilities of satisfying their economic needs. They rarely acknowledge themselves as prostitutes, but as *luchadoras* or *jineteras*, and they are socially known by these terms that for them mean to go out to have a good time, to get to know good places, and to widen their circles of relations.

The bonds established with the prostituting client in many cases end up being affectionate and with a communication that goes beyond the foreigner's brief stay in the country. They are not often carriers of sexually transmitted diseases, although as of late, a slight increase is observed among the groups that are devoted to the exercise of prostitution, mostly in men that have sex with men. These women have a schooling level of 9 to 12 years.

"The reason for the re-emergence of prostitution—according to the girls' own statements—is because they have found in it a quick way to meet their economic needs and those of their family. They also state that the amount of money that is obtained from this type of sexual practice is higher than the wages earned by working" (23). Current prostitution in Cuba is distinctive, because people are responsible for their situation in the sense that "they do not do it so much to cover their basic needs, but to maintain an above-the-average consumer status" (32). This choice of lifestyle is determined, as noted previously, by the social, economic, educational, and family conditions.

Behind prostitution hide some old myths that in some way the *jineteras* themselves assume in order to justify their behavior, uplift their injured self-esteem, and alleviate their guilt. Among them are those related with the "easy life," or that it is the oldest profession. In our country, when accepting the epithet of *jinetera* or *luchadora* and not of prostitute, when saying "my body is not me," these persons alienate themselves from their own actions, trying to protect themselves from self-criticism (32). Male prostitution is hushed.

Anyway, the persons who put their body on sale, alienated or not, suffer, feel guilt, and become marginal. "In the most common practice of sex-for-sale in Cuba, the truth is that most of the times the prostitute (male or female) is a victim of him/herself, but always a victim, and contempt toward the human being has never been an option for the Cuban society." At present, different social strategies are coordinated and should continue to be improved regarding this situation.

## C. Pornography and Erotica

MARIELA CASTRO ESPÍN

Currently, the excess of (non-educational) information on sexuality is a problem for many countries: For example, pornography with exclusively commercial purposes distorts the true essence of human sexual behavior.

Up to our days, in Cuba this is not a great social concern, because there is a ban on the sale or entry into the country of literature and videos classified as pornographic, with the purpose of protecting the new generations from its harmful influences.

This is possible because a legal basis exists in Article 86 of the Code on Childhood and Youth for their protection,

which reads: "The mass media should contribute to the comprehensive training of children and youths. The Cuban Institute of Radio and Television, the Ministry of Culture and related organizations in charge of publishing written material guarantee the constant development of these resources and their highest quality" (40).

Literature available to our youth, in addition to the national radio and television programs, count on the advisory opinion of specialists, fundamentally psychologists and sociologists, who analyze the psychological particularities of the target audience of these spaces, in accordance with the ethical values promoted by our society.

Institutional policies prioritize educational messages both in literature and in the social media. In Cuban radio and TV, there are various permanent spaces on sexuality to offer popular scientific information for different age groups.

The participation of prestigious specialists on these topics in national programs with high ratings is frequent. At the moment, there is an audiovisual program sponsored by youth and student organizations, where the topics of sexuality have a strong and important presence in spaces for adolescents, with segments called "Our Sexuality," "The Charms of Sexuality" for the young, and for adults, "Sexuality and Our Daily life," among others.

In the Cuban Penal Code, Article No. 310, Corruption of Minors, penalizes the distribution and ownership of any form of pornography, which functions as a restraint for the negligible attempts at the production and introduction of these products in our country.

In recent years, the Cuban State has been able to verify that all these actions are not enough to protect some boys and girls, mainly adolescents who have been the victims of foreign pornography dealers, who have used them to make videos and take pictures that are later sold in the US and in some European countries. This has put the Cuban authorities on the alert in order to establish more effective mechanisms of control and protection in favor of our children.

#### *Cuban Eroticism* MARIELA CASTRO ESPÍN

Eroticism and sensuality are broadly visible in the daily life of Cuban men and women, as well as in all the different cultural expressions, such as theater, cinema, literature, painting and sculpture, music and contemporary folklore, popular dance, and in the world-renowned Cuban School of Ballet.

The blending of the Spanish and the African cultures in the so-called cultural syncretism that characterizes Cubaness has a singular eroticism load that is seen in the expressiveness, the gestures, way of walking, the language, and the passion of which Cuban men and women are proud.

Carolina de la Torre, a distinguished researcher of Cuban identity, stated: "I have found that, contrary to other Latin American peoples, Cubans have a high self-esteem when compared to North Americans, and that the identity of the Cuban is strong and clearly delineated, based in very solid representations and affections, and accompanied by pride and commitment with the nation. . . . Therefore, we are humane, cheerful, extroverted" (25), and Cubans assume to be *machistas* and, occasionally, bad-mannered.

### *9. Contraception, Abortion, and Population Planning*

MIGUEL SOSA MARÍN

In Cuba, after 1959, as part of the deep social transformations carried out, the Ministry of Public Health implemented its first work programs; a series of measures and actions were developed that would set down the basis for the achievements that may be shown today regarding health. Family

planning, from that time on, has been linked, mainly, with women's and children's health, and in accordance with the right of the free reproduction of the couple.

Among the most important health programs that are being implemented is the Mother and Child Program, in which care is provided during different stages of the reproductive process: prenatal, birth, and postnatal and puerperium, as well as in the follow-up and control of the healthy child. Directly linked to this program are the actions for family planning, which could be the supply of information, counseling, education, and services that have been rendered for more than 20 years, and which have improved the quality of life of the mother and child and the well-being of the family.

Although there has not been in Cuba a policy to increase or to decrease the population, there are a number of basic principles that are the right of the family, the couple, and specifically of women, to decide the number of children and birth spacing; the right to freely decide is respected, and the exercise of women's equality and actions to reduce mother and child risk are being undertaken.

Regarding the above, the Family Planning Program has been implemented since the 1980s, with the following objectives: to achieve responsible actions based on the sense of responsibility of the couple to have children, so that they may have the children they want at the favorable moment for the child, the mother, and the family, in such way that they have the appropriate conditions for their comprehensive development.

In the framework of this program, couples are offered counseling, education, and services, including couples with infertility problems. The program is based in the community and supported by the subsystem of family medicine. It is in the family physician's office (17, 217) where most of the actions are carried out to improve reproductive health and family planning. There are 444 family planning services at the community level in the entire country.

At the primary health level, in polyclinics, specialized appointments for family planning (204) are offered, with effective and modern methods for this process, geared fundamentally at caring for the cases of high reproductive risk, which cannot be solved with more traditional methods or at the family doctor's office. The specialized contraception and infertility care provided in these offices could only be offered before at a secondary care level, therefore, it has been an improvement with wider access for the users. The team of physicians who provide this medical care is made up essentially of specialists in gynecobstetrics, family medicine, psychology, and internal medicine, as well as obstetric nurses and social workers. If necessary, specialized consultations take place. Contraceptive coverage through modern devices is 72.1%. Adding 1.2% who adopt recommended traditional methods gives a total coverage of 73.3%.

In Cuba, there has been such a decrease in fertility that the country now has similar levels to those of developed countries. According to data of the Ministry of Public Health and the National Office of Statistics, the general fertility (per 1,000 women of fertile age, 15-49 years) was around 57.3 in 1992 and 45.7 in 2001. Birthrates were around 12.7 to 12.4 (per 1,000 inhabitants) between 1996 and 2001 (53). This shows that Cuba, among the developing countries, is the country that has been able to lower the Global Fertility Rate most with a moderate effort in family planning. The fertility rate according to the mother's age in 2001 is shown in Table 1.

In the 1970s, a series of local surveys on knowledge and use of birth-control methods was conducted for the first time. In 1987, a National Fertility Survey reported a high prevalence of knowledge and use of contraceptives among

the women interviewees: 84% had used them sometimes and 68% were using them at the time of the survey; 97% knew birth-control methods and classified them according to effectiveness, with first place to IUDs, oral contraceptives, and surgical sterilization.

An analysis of fertility determinants showed that the use of birth-control methods has been the most important factor in lowering the fertility rate.

Birth control usage, as well as the practice of abortion, are widespread throughout the country. Since 1965, abortions in Cuba are performed in medical institutions. Essentially, it is a reproductive right enjoyed by Cuban women and is also performed on medical grounds. An abortion is limited to the first ten weeks of gestation; at a later stage, it is only performed under extreme medical conditions. All abortions are performed by specialized personnel and under appropriate conditions in the gynecology and obstetric hospitals and other health installations. Adolescents are provided with special attention, being one of the fundamental elements of their sexual and reproductive healthcare. Since 1987, the Penal Code penalizes illegal abortions, those performed without the consent of the woman, those not performed in health institutions, and those performed by unskilled persons.

Research has shown that a considerable percentage of abortions result from the negligence of the couple and the non-use of birth-control methods. Thus, it is important to have those effective methods at hand and to use them appropriately.

### 10. Sexually Transmitted Diseases and HIV/AIDS (SIDA)

ROSAIDA OCHOA and LEONARDO CHACÓN

In our country, programs for the prevention and control of STDs and HIV/AIDS are being implemented. These programs have national coverage and are focused on three health levels. Although the spread of these diseases is not excessively alarming, actions are being multiplied to combat them. Prevention strategies are ever more specific, and

emphasis is given to the most vulnerable populations. The main mode of transmission of HIV is sexual relations.

#### A. Status of the HIV/AIDS Epidemic

The national HIV/AIDS epidemic spreads slowly but continuously. Up to December 2001, 3,874 people have been diagnosed with AIDS, of which 3,024 (78%) are men and 850 (22%) women (see Table 2). Of the total of those diagnosed with HIV, 1,526 developed AIDS and 955 died. The national estimate is 0.05%. The provinces with highest incidence are the City of Havana, Villa Clara, Sancti Spiritus, and Pinar del Río.

The youths between 15 and 35 years of age are the most affected age group. Men having sex with other men (MSM) have significantly the highest infection rate, accounting for 61.7% of the persons living with HIV and 79% of the men's total (see Table 3).

In 1996, antiretroviral treatments began to be used. Initially its use was scant, but by 2001, 98% of all AIDS cases received a range of five medications in antiretroviral treatments. At present, efforts are being made to give wider coverage and to increase the quantity of medications.

[Update 2002: UNAIDS Epidemiological Assessment: HIV seroprevalence information among antenatal clinic attendees is available since the late-1980s from Cuba. At the national level, reporting of antenatal women tested indicates there is no evidence of HIV infection in this group. There is no information available on HIV prevalence among sex workers, IV-drug users, or male STD clinic patients.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	3,200 (rate: < 0.1%)
Women ages 15-49:	830
Children ages 0-15:	< 100

[An estimated 120 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 1,000 Cuban children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

#### B. Status of STDs

The STD program considers syphilis and gonorrhea as infections that must be of compulsorily reported. Their incidence is different from HIV/AIDS. Syphilis and gonorrhea tend to annually decrease, while the spread the HIV/AIDS epidemic shows an upward trend. The reasons for that difference have not been sufficiently explained. The epidemiological data on those infections of the last decade are shown in Table 4.

At the end of 2001, the national syphilis rate was 55.5 per 100,000 inhabitants and gonorrhea was 131.7. Young-

Table 1

Fertility Rate by Mother's Age in 2001

Mother's Age	Rate*	Mother's Age	Rate*
15-19	50.3	35-39	22.1
20-24	89.5	40-44	3.7
25-29	83.9	45-49	0.2
30-34	52.3	Total	45.5

\*Per 1,000 women of that age (53).

Table 3

Total of Men Diagnosed by Year: Comparison with Men Who Have Sex with Men (MSM), 1986-2001

	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001
Men	76	61	58	87	101	125	119	73	90	88	181	295	284	413	450	523
MSM	20	33	27	57	73	105	99	62	73	69	156	251	262	352	421	406

sters and the young adults between ages 15 and 35 years account for most of the STDs. The provinces of highest incidence of gonorrhea were the City of Havana, Camaguey, Santiago de Cuba, and Guantánamo. The highest incidence of syphilis is found the City of Havana, Santiago de Cuba, and Camaguey (see Table 5).

The achievements of the Program on STD Prevention and Control are reflected in the decrease congenital syphilis cases. The data from the last decade are shown in Table 6.

### 11. Sexual Dysfunctions, Counseling, and Therapies

BEATRIZ TORRES RODRÍGUEZ

In studies conducted by several investigators on an apparently healthy population, it was shown that 30% to 40% of the subjects had sexual dysfunction. Erectile dysfunction had the highest incidence, followed by premature ejaculation (27, 75).

The incidence of women seeking sexual therapy is relatively low, but in recent years, the percentage of women under therapy is gradually increasing. For example, in a survey of cases that received medical care in the City of Havana, women accounted for 18% in 1991, and up to 27% in 1995 (11), while in another publication, the same authors stated that 30% of women receiving medical care were anorgasmic. In another survey of apparently healthy women, it was found that 35% of interviewees had orgasmic dysfunctions (76).

The specialty of clinical sexology is still nonexistent in Cuba. Sexual therapy, which would train future professionals for diagnosis and treatment of sexual dysfunctions, is not included in the syllabus of related specialties. Therefore, interdisciplinary groups were formed as a solution to the problem. At surgical clinical general hospitals, the interdisciplinary group is made up by psychiatry, psychology, internal medicine, urology, gynecology, endocrinology, and angio-

logy specialists, among others. This group carries out several psychological, pharmacological, and surgical strategies developed for the specific conditions and characteristics of each group.

Generally, the procedure of these work teams begins with a diagnostic consultation, where it is determined if there is a dysfunction or if the patient needs sexual counseling. Next, the possible causes of dysfunctions are explored. During this process specific, assays are made and appropriate action taken.

The National Program on Sex Education offers the possibility to all the interdisciplinary groups to carry out its counseling and sex education programs, with slight variations to meet specific needs. Meetings covering aspects, such as, the physiology of the male and female genitals, human sexual response, sexual dysfunction, and the importance of a couple's communication, among others, are held. In those meetings, patients and couples receive counseling and training on the sexuality aspects unknown by them. These programs are still eminently educational and are currently being improved.

The organization of sexual therapy services is not limited to the capital; in each province of the country, there is at least an interdisciplinary group providing care to patients.

A master's degree, diploma, and basic courses and work site visits to the National Center of Sexual Education (CENESEX) contributes to the scientific updating of professionals who compose those interdisciplinary groups.

The psychological techniques mostly used in sexual therapy are the following: Couple therapy, social abilities training, rational emotive therapy (myths and irrational ideas related to sexuality), and relaxation.

For diagnosing sexual dysfunctions in Cuba, interviews and physical examinations are mostly used. More than six years ago, the journal *Sexología y Sociedad* published a proposal for sexual therapy diagnosis norms and for the use of complementary tests (74).

In treatment requiring sildenafil or a penile prosthesis, which, on many occasions, are not available because of the difficult current economic conditions, the following variants have been used: 1. for diabetic polyneuropathy: ozone therapy; 2. for alcoholic polyneuropathy: ozone therapy; 3. for arterial failure: magnetic chamber and ozone therapy or hyperbaric chamber plus magnetic chamber; 4. for vein failure: acupuncture; and 5. for priapism prevention in intracavernous injections with vasoactive drugs: acupuncture.

In persons over 60 years of age, sexual therapy follows the same pattern as for earlier ages. As a rule, in our country, women don't seek medical care for sexual dysfunctions, except if they fail to give pleasure to their male partner. Therefore, there are not many female cases to report on. For example, during 2001, at a polyclinic in the City of Havana, according to Oscar Díaz Noriega, M.D., only six older women received medical care, accounting for only 8% of all those receiving care: three with lubrication dysfunction, one for sexual desire dysfunction, and two anorgasmics.

Regarding men, the main consultation cause was erectile dysfunction. The main causes of the 65 cases who received medical care in another doctor's office in the City of Havana in 2001 were: diabetic polyneuropathy 21; arterial failure 9; a mixture of the former and the latter conditions 6; hypofunction of the smooth muscle 6; Shy Dragger's syndrome 1; hypogonadism 4; Parkinson's disease 2; and a wide range of non-organic dysfunctions, including: couple-relations dysfunctions, monotonous sexual relations, not attractive partner, over demand, or false expectations of sexual performance (65).

**Table 4**

#### Cases of Gonorrhea and Syphilis, 1990-2001

	1990	1991	1992	1993	1994	1995
Gonorrhea	35,722	32,109	26,303	20,781	34,224	45,200
Syphilis	9,205	10,036	11,110	9,956	11,551	14,339
	1996	1997	1998	1999	2000	2001
Gonorrhea	40,576	33,948	29,648	23,225	19,067	14,792
Syphilis	15,818	15,814	13,400	12,285	9,198	6,233

**Table 5**

#### Rates of Syphilis per Year and Difference in Percentage

Year	Rate per 100,000	Decrease in Percentage
1998	121.1	-15.3
1999	110.2	-8.3
2000	82.1	-25.2
2001	55.5	-32.4

**Table 6**

#### Cases of Congenital Syphilis, 1990-2001

	1990	1991	1992	1993	1994	1995
Congenital syphilis	12	9	11	10	11	1
	1996	1997	1998	1999	2000	2001
	11	2	1	0	1	0

As an alternative to sildenafil and similar drugs, and to penile prosthesis and implantation, which are unavailable on occasion, the following have been used: hyperbaric chamber or rectally administered ozone therapy for polyneuropathies and hypofunction of the cavernous smooth muscle, and magnetic chamber and ozone therapy or hyperbaric chamber in arterial failure. Results have been favorable in 54% of the cases (including cured and improved) receiving these treatment variants.

The higher institutes or universities at each Cuban province have gone a long way in teaching, research, and counseling on sexuality. They have counseling centers for diagnosis and counseling on sexuality, couple and family relations for students, teaching and non-teaching personnel, and various community groups.

## 12. Sex Research and Advanced Professional Education

CARIDAD T. GARCÍA, ALICIA GONZÁLEZ,  
and MARÍA D. CORDOVA

Research on sexuality, in its widest sense, has been conducted by several government institutions and civil society organizations from the perspective of different professions. Sexuality has been studied by investigators in various medical specialties, psychologists, educators, and sociologists from the health, education, and culture sectors, as well as from the Center for Woman Studies of the Federation of Cuban Women and the Center for Youth Studies, among others.

There is a wide range of theoretical and methodological research approaches, quantitative or qualitative studies, action research, and, more recently, a coherent comprehensive approach with a wide understanding of sexuality as a research subject.

The most frequent research topics are: sexuality and gender, sexual health, sexuality at the different ages, education, counseling, and sex therapy, gender and family violence, contraception, and sexuality in the mass media, among others.

One of the first research studies on sex education is "The Improvement of Ways and Methods for Sex Education in Cuba." Conducted in the 1980s by the Ministry of Education and the "Enrique José Varona" Higher Teachers' Training Institute, this research focused on the sexuality of adolescents and school-age young men and women and their families, and the effectiveness of the educational influence of professors. This research paved the way for many other studies conducted at educational centers and teachers' training universities.

Since the early and mid-1970s, public health research on sexuality was conducted, such as research by Professor Celestino Álvarez Lajonchere, addressing sexuality from the gynecological-obstetric perspective. Other surveys were carried out with chronic disease patients, such as diabetes mellitus, by the psychologist, Rafael Alvisa, and the medical doctors, B. Arce and J. Mas of the Reproductive Health Group, National Institute of Endocrinology. The early studies of the Federation of Cuban Women and the Center of Sexual Education (CENESEX) must be highlighted.

It is important to point out that in 1987, a National Fertility Survey covered a wider range of topics, not just specific fertility data, thus contributing extensive nationwide information. This survey is the reference work for Cuban sexuality.

On the other hand, since 1979, studies were conducted on a wide variety of hormonal contraceptives (oral and vag-

inal tablets, injectables, and implants) and their relationship to women's sexual response, especially clinical manifestations and sexual desire. No negative relationship was found, except for the vaginal tablets, because of genital manipulation and when their prescription was not accompanied by specialized contraceptive advice.

Since 1975, surveys were made on men attempting to establish relationships between knowledge and use of contraceptive methods and sexuality. Among their results, myths and taboos related to the use of condoms were found. Most of the male subjects attribute the use of a condom to a decrease of sexual desire and they don't incorporate it in their foreplay.

It was also found in a group of Cuban researchers who studied sexuality during the course of diseases, such as diabetes mellitus, hyperprolactinemia, hirsutism, acromegalia, and premature menopause, among others, whose evolution is linked in the literature to such manifestations as: decrease or exacerbation of sexual desire, anorgasmia, absence of ejaculation, retrograde ejaculation, impotence, depression, and anxiety. In the Cuban findings, there is a relationship between depression and impotence, independent of the presence of diabetes mellitus, and more desire dysfunctions in hyperprolactinemic men and women, and more impotence in men suffering hyperprolactinemia. Increased desire was found in groups of women with hirsutism. In early non-surgical menopause, it was found that most of the subjects maintained sexual desire and orgasm.

Other studies on the relationship between infertility and sexuality in Cuban couples, and in connection with the "infertility crisis" and body representations and their functions, showed a higher frequency of sexual relations in infertile couples, but more difficulties in making body representations and in expressing feelings. In lower educational level groups, myths connecting fertility with sexual response were found more in men than in women.

Findings connecting aging to sexuality date back to 1990. Surveys conducted at Grandfathers' and Grandmothers' Centers on third-age subjects show clear-cut gender differences. Men reported to be still sexually active, but in a different way from previous life stages, while the majority of women do not have a partner, which is linked to the life expectancy of over 70 years for both, but which is higher in the women. Therefore, they become widows at a higher frequency.
